

# 78K0R/Kx3-L

# Clock Synchronous Single Master Control Software Using CSI Mode of Serial Array Unit

R01AN0708EJ0102 Rev.1.02 Aug 31, 2012

### Introduction

This application note explains clock synchronous control of a single master by using the 3-wire serial I/O communications (CSI mode) of the serial array unit (SAU) of the 78K0R/KE3-L and describes how to use the sample code for this application.

The SPI mode single master can be controlled by adding control of SPI slave device selection through port control.

This sample code lies in a lower-level layer of the software for controlling a SPI device as a slave device.

Software in the upper-level layer for controlling the slave device is separately available, so please obtain this as well.

### **Target Device**

Corresponding MCU: 78K0R/KE3-L

Device used for checking the operation of the sample code: Renesas Electronics R1EX25xxx Series SPI Serial EEPROM

When applying the contents of this application note to other series of microcomputers, make necessary modifications to and make extensive evaluations of the sample code according to the specifications for the microcomputer to be used.

# 1. Specifications

This software program uses the 3-wire serial I/O communications (CSI mode) of the serial array unit (SAU) of the 78K0R/KE3-L to control clock synchronous communication. The SPI mode single master can be controlled by adding control of SPI slave device selection through port control.

Table 1.1 summarizes the peripheral devices to be used and their uses. Figure 1.1 illustrates a sample configuration.

The major functions are summarized below.

- This software is a block-type device driver that uses the 3-wire serial I/O communications (CSI mode) of the SAU of the 78K0R/KE3-L as the master device in clock synchronous single master communication.
- The MCU's internal clock synchronous (3-wire) serial communication function is used. It can only be used with a single user-configured channel; that is, it cannot be used with multiple channels.
- The sample code does not support chip-select control. To control the SPI device, the chip-select control must be separately embedded.
- This software supports MSB-first transfer.
- The software supports transfer by the CPU but not by the DMAC.
- It does not support using an interrupt to start the transfer.

#### Table 1.1 Peripheral Devices Used and their Uses

Peripheral Device	Use
SAU	Clock synchronous (3-wire method) serial
	1 channel (required)
Port	For SPI slave device select control signals. As many ports as there are SPI slave
	devices in use are necessary (required).
	Not used by this sample code.

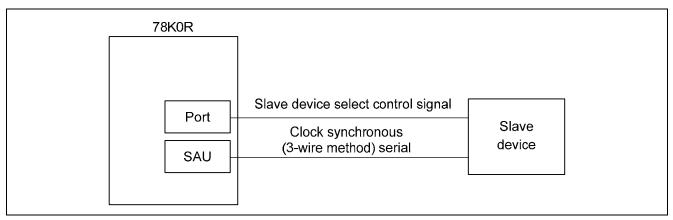

Figure 1.1 Sample Configuration

# 2. Conditions of Checking the Operation of the Software

The sample code described in this application note has been confirmed to run normally under the operating conditions given below.

Item	Description
Microcomputer used for evaluation	78K0R/KE3-L (program ROM 64 KB/RAM 3 KB)
Memory used for evaluation	Renesas Electronics R1EX25xxx Series SPI serial EEPROM
Operating frequency	Main system clock: 20 MHz
	CPU/peripheral hardware clock: 20 MHz
	Serial clock: 2.5 MHz
Operating voltage	3.3 V
Integrated development environment	Renesas Electronics
	Project manager (PM+ Ver. 6.31)
C compiler, assembler	Renesas Electronics
	78K0R C compiler (CC78K0R Ver. 2.13)
	78K0R assembler package (RA78K0R Ver. 1.33)
	Compiler options: The default settings (-azp) for the integrated
	development environment are used.
Emulator	Minicube2
Integrated debugger	Renesas Electronics
	ID78K0R-QB integrated debugger, Ver. 3.61
Version of the sample code	Ver.2.02
Software used for evaluation	Renesas Electronics
	The R1EX25xxx Series' SPI serial EEPROM control software,
	Ver. 2.01
Evaluation board used	78K0R/KE3-L Target board (QB-78K0RKE3L-TB)

# 3. Related Application Notes

The applications notes that are related to this application note are listed below. Reference should also be made to those application notes.

### 4. Hardware Description

#### 4.1 List of Pins

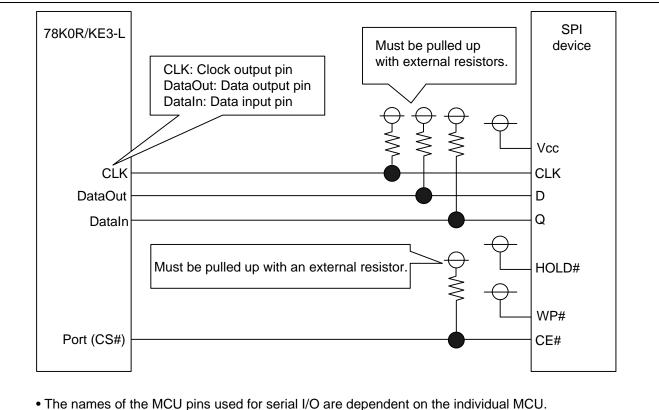

Table 4.1 lists the pins that are used and their uses.

#### Table 4.1List of Pins Used

Pin Name	I/O	Description	
SCK (CLK of figure 4.1)	Output	Clock output	
SO (DataOut of figure 4.1)	Output	Master data output	
SI (Dataln of figure 4.1)	Input	Master data input	
Port (Port(CS#) of figure 4.1)	Output	Slave device select output Not used by this sample code.	

### 4.2 Reference Circuit

Figure 4.1 shows a sample wiring configuration.

• In this application note, pin names CLK, DataIn, DataOut, and Port (CS#) are used in accordance with the sample code.

Figure 4.1 Sample Wiring Diagram for an 78K0R/Kx3-L Serial Array Unit and an SPI Slave Device

# 5. Software Description

#### 5.1 Operation Outline

The 3-wire serial I/O communications (CSI mode) of the SAU are used to implement clock synchronous single master control.

The sample code provides the following control functions:

• Controls the input/output of the data in the clock synchronous mode (using an internal clock).

In this sample code, the byte offset value of the data on the device is made equal to the byte offset value in the source or destination memory as illustrated in the figure below.

Byte offset value on the device							
0	1			508	509	510	511
Bvte	offset v	alue in memory					
0				508	509	510	511

Figure 5.1 Storage Format of the Transferred Data

### 5.1.1 Clock Synchronous Mode Timing

The SPI mode 3 (CPOL=1, CPHA=1) timing shown in figure 5.2 is used to control the SPI slave device. Therefore, the data and clock phase select bits (DAPmn and CKPmn) in the serial communication operation setting register (SCRmn) of the 78K0R/KE3-L must be set for type 1 (DAPmn=0, CKPmn=0).

CLK	
DataOut	D7 D6 D5 ···· X D0
DataIn	D7 D6 D5 ···· X D0
• MCU $\rightarrow$ S	SPI slave device transmission: Transmission of transmit data is started on the falling edge of the transfer clock.
	e device $\rightarrow$ MCU reception: The receive data is taken in on the rising edge of the transfer clock. mode transfer

The level of the CLK pin is held high when no transfer processing is in progress.

#### Figure 5.2 Clock Synchronous Mode Timing Setup

For available serial clock frequencies, see the datasheets for the individual MCUs and SPI slave devices.

### 5.1.2 SPI Slave Device CE# Pin Control

It is recommended that the CE# pin of the SPI slave device be connected to the Port pin of the 78K0R/KE3-L. This enables the SPI slave device to be controlled by using general port output from the 78K0R/KE3-L.

Secure the time between the falling edge of the CE# signal of the SPI device (the Port signal of the MCU (CS#)) and that of the CLK signal of the SPI device (the clock signal of the MCU) as the setup time of the CE# pin of the SPI device.

Secure the time between the rising edge of the CLK signal of the SPI device (the CLK signal of the MCU) and that of the /S signal of the SPI device (the Port signal of the MCU (CS#)) as the hold time of the CE# pin of the SPI device.

Check the datasheet for the SPI device in use and set up the software wait times that are appropriate to your system.

# 5.2 Software Control Outline

#### 5.2.1 Software Configuration

The sample code ranks in the lower-level layer of the SPI device control software as a slave device.

The sample code realizes the control the clock synchronous single master by using SPI mode 3 (CPOL = 1 and CPHA = 1) without controlling the CE# pin of the SPI slave device.

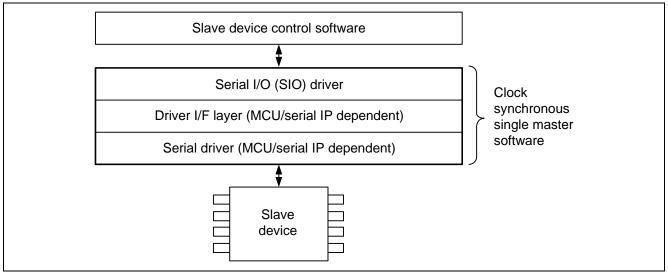

Figure 5.3 Software Configuration

The following transmission and reception are realized.

(1) Sends data using the clock synchronous single master software.

(2) Receives data using the clock synchronous single master software.

This sample code is made up of the following five basic routines:

• Serial enabling

Sets the DataIn pin for port input, sets the DataOut and CLK pins high, enables serial I/O and set the baud rate.

- Serial disabling Disables serial I/O, sets the DataIn pin for port input, sets the DataOut and CLK pins high.
- Serial opening

Disables serial I/O, sets the DataIn pin for port input, sets the DataOut and CLK pins for port input.

- Data transmission Sends data to the SPI device.
- Data reception Receives data from the SPI device.

### 5.2.2 Serial Enabling (R\_SIO\_Enable())

Sets the DataIn pin to be used for serial I/O for port input and set the DataOut and CLK pins high.

Enables the serial I/O function and switches the DataIn pin for data input, the DataOut pin for data output, and the CLK pin for clock output.

Sets the communication speed (baud rate) to be used for serial I/O.

### 5.2.3 Serial Disabling (R\_SIO\_Disable())

Switches the pins to be used for serial I/O to function as ports, sets the DataIn pin to port input, and sets the DataOut and CLK pins to high output.

#### 78K0R/Kx3-L Clock Synchronous Single Master Control Software Using CSI Mode of Serial Array Unit

### 5.2.4 Serial Opening (R\_SIO\_Open\_Port())

Switches the pins to be used for serial I/O to function as ports, sets the DataIn, DataOut, and CLK pins to port input.

### 5.2.5 Data Transmission (R\_SIO\_Tx\_Data())

Sends data using the serial I/O function.

Sends data according to the transmission setting.

### 5.2.6 Data Reception (R\_SIO\_Rx\_Data())

Receives data using the serial I/O function.

Receives data according to the transmission/reception settings.

### 5.3 Sizes of Required Memory

Table 5.1 lists the sizes of the required memory areas.

#### Table 5.1 Sizes of Required Memory

Memory Used	Size	Remarks
ROM	527 bytes	R_SIO_csi.c
RAM	0 bytes	R_SIO_csi.c
Maximum user stack size	30 bytes	
Maximum interrupt stack size		No interrupts are used.

Note: The sizes of required memory areas vary with the version and compiler options of the C compiler. The above-mentioned memory sizes vary with the endian mode adopted.

The maximum user stack size value shown is that when using the serial EEPROM control software and includes the stack of the serial EEPROM control software.

# 5.4 File Configuration

Table 5.2 lists the files that are used for the sample code. The table excludes the files that are automatically generated by the integrated development environment.

#### Table 5.2 File Configuration

\an_r01an0708ej_7	78k0rkx3l <dir></dir>	Folder for the sample code
r01an0708ej01	02_78k0rkx3l.pdf	Application note
\source	<dir></dir>	Folder for storing the programs
\com* <sup>1</sup>	<dir></dir>	Folder for storing the common functions
	mtl_com.c	Miscellaneous common function definitions
	mtl_com.h.common	Common header file
	mtl_com.h.78K0R	Common function header file
	mtl_endi.c	Common file (related to endian setting)
	mtl_mem.c	Common file (standard library function)
	mtl_os.c mtl_os.h	Common file (standard library function)
	mtl_str.c	Common file (standard library function)
	mtl_tim.c mtl_tim.h	Common file (related to loop timer)
	mtl_tim.h.sample	Sample for setting the value in the loop timer
\r_sio_csi_	_78k0r <dir></dir>	Folder for clock synchronous single master control software using the SCI for the 78K0R
	R_SIO.h	Header file
	R_SIO_csi.c	I/F module
	R_SIO_csi.h.78k0r	I/F module common definitions

Note: \*1 The files in the com folder are used in the slave device control software, too. Use the latest files.

### 5.5 List of Constants

#### 5.5.1 Return Values

Table 5.3 lists the return values that are returned by the sample code.

#### Table 5.3 Return Values

Constant Name	Value	Description
SIO_OK	(error_t)( 0)	Successful operation
SIO_ERR_PARAM	(error_t)(-1)	Parameter error
SIO_ERR_HARD	(error_t)(-2)	Hardware error
SIO_ERR_OTHER	(error_t)(-7)	Other error

#### 5.5.2 Miscellaneous Definitions

Table 5.4 lists miscellaneous definitions that are used in the sample code.

### Table 5.4 Miscellaneous Definitions

Constant Name	Value	Description
SIO_LOG_ERR	1	Log type: Error
SIO_TRUE	(uint8_t)0x01	Flag "ON"
SIO_FALSE	(uint8_t)0x00	Flag "OFF"
SIO_HI	(uint8_t)0x01	Port "H"
SIO_LOW	(uint8_t)0x00	Port "L"
SIO_OUT	(uint8_t)0x01	Port output setting
SIO_IN	(uint8_t)0x00	Port input setting
SIO_TX_WAIT	(uint16_t)50000	SIO transmission completion waiting time
		$50000 \times 1 \ \mu s = 50 \ ms$
SIO_RX_WAIT	(uint16_t)50000	SIO receive completion waiting time
		$50000 \times 1 \ \mu s = 50 \ ms$
SIO_DMA_TX_WAIT	(uint16_t)50000	DMA transmission completion waiting time
		$50000 \times 1 \ \mu s = 50 \ ms$
SIO_DMA_RX_WAIT	(uint16_t)50000	DMA receive completion waiting time
		$50000 \times 1 \ \mu s = 50 \ ms$
SIO_T_SIO_WAIT	(uint16_t)MTL_T_1US	SIO transmit and receive completion waiting polling
		time
SIO_T_DMA_WAIT	(uint16_t)MTL_T_1US	DMA transmit and receive completion waiting polling
		time
SIO_T_BRR_WAIT	(uint16_t)MTL_T_10US	BRR setting wait time

# 5.6 Structures and Unions

Shown below are the structures that are used in the sample code.

```
/* uint32_t <-> uint8_t conversion */
typedef union {
    uint32_t ul;
    uint8_t uc[4];
} SIO_EXCHG_LONG; /* total 4 bytes */
/* uint16_t <-> uint8_t conversion */
typedef union {
    uint16_t us;
    uint8_t uc[2];
} SIO_EXCHG_SHORT; /* total 2 bytes */
```

# 5.7 List of Functions

Table 5.5 lists the functions that are used in the sample code.

#### Table 5.5 List of Functions

Function Name	Description
R_SIO_Init_Driver()	Driver initialization processing
R_SIO_Disable()	Serial I/O disable setting processing
R_SIO_Enable()	Serial I/O enable setting processing
R_SIO_Open_Port()	Serial I/O open setting processing
R_SIO_Tx_Data()	Serial I/O data transmit processing
R_SIO_Rx_Data()	Serial I/O data receive processing

# 5.8 Function Specifications

The sample code enables supply of the input clock to the serial array unit but does not include processing to control stopping of the input clock.

Therefore, the user should provide additional program code with the necessary control functions if there is a need to stop operation of individual units in order to reduce power consumption and noise, taking into account the control of channels other than the one used by the sample code.

Note that the sample code does not provide the capability to stop operation of individual units, but it can be used to stop operation of a specific channel.

Operating clock CKm0, specified in the serial clock select register (SPSm), is used as the operating clock in the sample code. If necessary, a different clock can be selected by changing the settings in the serial mode register (SMRmn) and serial clock select register (SPSm).

### 5.8.1 Driver Initialization Processing

R_SIO_Init_Driv	ver set							
Overview	Driver initialization processing							
Header	R_SIO.h, R_SIO_csi.h, mtl_com.h							
Declaration	error_t R_SIO_Init_Driver(void)							
Description	<ul> <li>Initializes the driver. Disables the serial I/O function and set the pin in the port.</li> </ul>							
	This function must be called only once at system start time.							
	<ul> <li>Set the slave device select signal high before calling this function.</li> </ul>							
Arguments	None							
Return values	SIO_OK ; Successful operation							
Notes	Performs the following processing, considering the previous use conditions.							
	<ul> <li>Enables supply of the input clock to the serial array unit.</li> </ul>							
	Stops transmission/reception.							
	<ul> <li>Sets the pins to be used for serial I/O to function as ports.</li> </ul>							

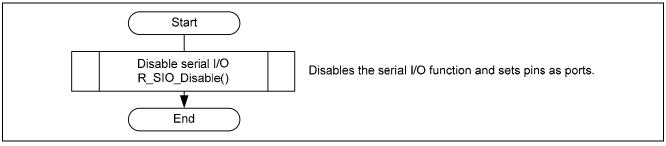

Figure 5.4 Driver Initialization Processing Outline

R_SIO_Disable					
Overview	Serial I/O disable setting processing				
Header	R_SIO.h, R_SIO_csi.h, mtl_com.h				
Declaration	error_t R_SIO_Disable(void)				
Description	<ul> <li>Disables the serial I/O function and sets the pins to function as ports. Enables supply of the input clock to the serial array unit. Disables serial I/O.</li> </ul>				
	Sets the pins to be used for serial I/O to function as ports.				
	<ul> <li>Set the slave device select signal high before calling this function.</li> </ul>				
Arguments	None				
Return values	SIO_OK ; Successful operation				
Notes	<ul> <li>Enables supply of the input clock to the serial array unit.</li> </ul>				
	Waits a minimum of 4 cycles of fCLK.				
	<ul> <li>Sets STm, SOm, and SOEm to stop operation and switches pins to function as ports.</li> <li>Sets SCRmn to set communication disabled as the communication mode.</li> <li>Writes 0020h to SMRmn (value after a reset) to initialize it.</li> <li>Sets SOLm.</li> </ul>				
	<ul> <li>This function can be called to disable the serial I/O function when serial I/O is not used.</li> </ul>				
	<ul> <li>This function does not control stopping supply of the input clock to the serial array unit.</li> </ul>				

# 5.8.2 Serial I/O Disable Setting Processing

#### 78K0R/Kx3-L Clock Synchronous Single Master Control Software Using CSI Mode of Serial Array Unit

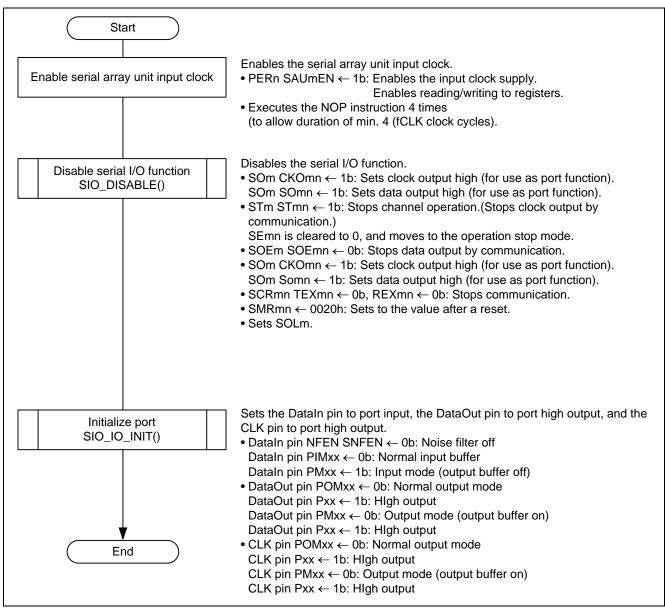

Figure 5.5 Serial I/O Disable Setup Processing Outline

R_SIO_Enable	
Overview	Serial I/O enable setting processing
Header	R_SIO.h, R_SIO_csi.h, mtl_com.h
Declaration	error_t R_SIO_Enable(uint8_t BrgData)
Description	<ul> <li>Enables the serial I/O function and sets the baud rate.</li> </ul>
	Enables supply of the input clock to the serial array unit.
	Sets the pin to be used for serial I/O in the port.
	Enables the serial I/O and sets the baud rate.
	<ul> <li>Call this function after calling R_SIO_Disable()</li> </ul>
	Call this function once before performing serial I/O data transmit processing and serial
	I/O data receive processing.
	<ul> <li>To change the baud rate, disable serial I/O setting, and then, use this function.</li> </ul>
Arguments	uint8_t BrgData ; Bit rate setting value
Return values	SIO_OK ; Successful operation
Notes	Executes the following processing according to the initial setting procedure for master
	transmission and master transmission/reception described in the hardware manual.
	(Assumes that R_SIO_Disable() has been called.)
	(1) Sets PER SAUmEN.
	Enables supply of the input clock to the serial array unit.
	(2) Waits for at least 4 fCLK clock cycles.
	(3) Initializes ports.
	(4) Sets the operating clock in SPSm.
	(5) Sets the operating mode in SSMRmn.
	(6) Sets the communication format in SCRmn.
	(7) Sets the baud rate in SDRmn.
	(8) Clears the error flags in SIRmn.

# 5.8.3 Serial I/O Enable Setting Processing

(9) Sets SOLm.

# 5.8.6 Serial I/O Data Receive Processing

#### 78K0R/Kx3-L Clock Synchronous Single Master Control Software Using CSI Mode of Serial Array Unit

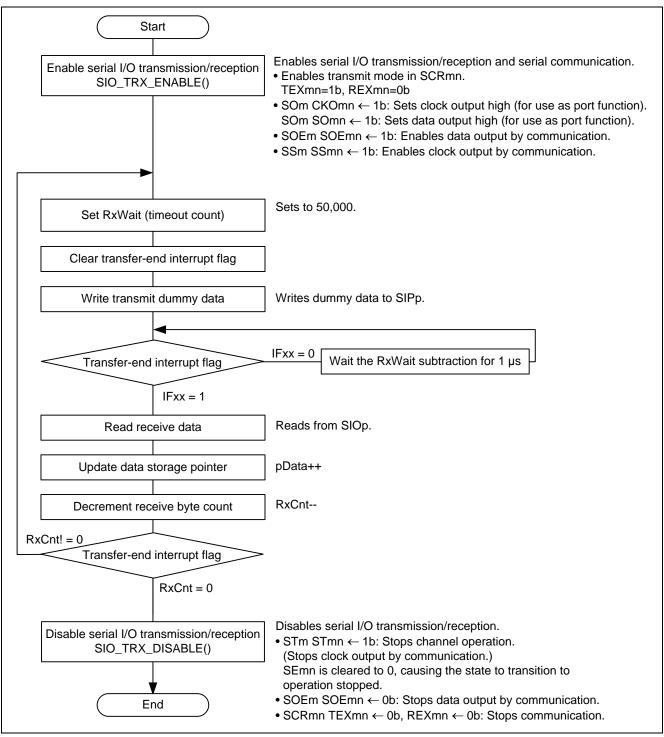

Figure 5.9 Serial I/O Data Reception Processing Outline

# 5.9 Macro Function Specifications

The macro functions used in this sample code are described below.

### 5.9.1 Macro Function SIO\_IO\_INIT()

- 1. Purpose
  - Sets the input pin to the port input state and the output pin to the port output state.
- 2. Function

Sets the DataIn pin to the port input state and the DataOut and CLK pins to the port output state.

Performs the following processing. Review the processing as necessary.

- (1) Sets the DataIn pin to port input.
- (2) Sets the DataOut pin to port high output.
- (3) Sets the CLK pin to port high output.
- 3. Remarks

Before executing this function, ensure that the pins can be used as ports.

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Executing this function sets the corresponding port registers (Pxx) to high output, so the output pin states are dependent on the settings of the corresponding CKOmn and SOmn bits in the serial output register (SOm). Before executing this function, execute SIO\_DISABLE() and set the corresponding CKOmn and SOmn bits in the serial output register (SOm) to 1 to enable the pins to function as ports.

To manipulate the registers of the serial array unit, first enable clock supply by setting the appropriate SAUmEN bit in PERn (n corresponds to the register number).

### 5.9.2 Macro Function SIO\_IO\_OPEN()

1. Purpose

Sets the input and output pins to the port input state or output buffer off state.

2. Function

Sets the DataIn, DataOut, and CLK input pins to the port input state.

Performs the following processing. Review the processing as necessary.

- (1) Sets the DataIn pin to the port input.
- (2) Sets the DataOut pin to input mode (output buffer off).
- (3) Sets the CLK pin to the port input.
- 3. Remarks

Use this function to put all the pins in the Hi-z state before connecting and after disconnecting the removable media. Execute SIO\_IO\_INIT() before executing this function.

To manipulate the registers of the serial array unit, first enable clock supply by setting the appropriate SAUmEN bit in PERn (n corresponds to the register number).

### 5.9.3 Macro Function SIO\_DATAI\_INIT()

- 1. Purpose
  - Sets the DataIn pin to the port input state.
- 2. Function
  - Performs the following processing. Review the processing as necessary.
  - (1) Sets the DataIn pin to noise filter off for CSI mode.
  - (2) Sets the DataIn pin to the normal input buffer by using the port input mode register (PIMxx).
  - (3) Sets the DataIn pin to the port input by the port mode register (PMxx).
- 3. Remarks

It may be necessary to modify the port input mode register (PIMxx) value to match the connected device. To manipulate the registers of the serial array unit, first enable clock supply by setting the appropriate SAUmEN bit in PERn (n corresponds to the register number).

### 5.9.4 Macro Function SIO\_DATAO\_INIT()

- 1. Purpose
- Sets the DataOut pin to port high output.
- 2. Function

Performs the following processing. Review the processing as necessary.

(1) Sets the DataOut pin to the normal output mode by using the port output mode register (POMxx).

(2) Sets the DataOut pin to port high output by using the port mode register (PMxx) and port register (Pxx).

3. Remarks

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Executing this function sets the corresponding port register (Pxx) to high output, so the output pin state is dependent on the setting of the corresponding SOmn bit in the serial output register (SOm). Before executing this function, execute SIO\_DISABLE() and set the corresponding SOmn bit in the serial output register (SOm) to 1 to enable the pin to function as a port.

# 5.9.5 Macro Function SIO\_DATAO\_OPEN()

1. Purpose

Sets the DataOut pin to the port input state.

2. Function

Performs the following processing. Review the processing as necessary.

(1) Sets the DataIn pin to the port input state or output buffer off state by using the port output mode register (POMxx).

3. Remarks None.

### 5.9.6 Macro Function SIO\_CLK\_INIT()

1. Purpose

Sets the CLK pin to port high output.

2. Function

Performs the following processing. Review the processing as necessary.

(1) Sets the DataOut pin to the normal output mode by using the port output mode register (POMxx).

(2) Sets the CLK pin to port high output by using the port mode register (PMxx) and port register (Pxx).

3. Remarks

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Executing this function sets the corresponding port register (Pxx) to high output, so the output pin state is dependent on the setting of the corresponding SOmn bit in the serial output register (SOm). Before executing this function, execute SIO\_DISABLE() and set the corresponding CKOmn bit in the serial output register (SOm) to 1 to enable the pin to function as a port.

# 5.9.7 Macro Function SIO\_CLK\_OPEN()

1. Purpose

Sets the CLK pin to the port input state.

2. Function

Performs the following processing. Review the processing as necessary.

(1) Sets the CLK pin to the normal input buffer by using the port input mode register (PIMxx).

(2) Sets the CLK pin to the port input by using the port mode register (PMxx).

3. Remarks

It may be necessary to modify the port input mode register (PIMxx) value to match the connected device.

# 5.9.8 Macro Function SIO\_ENABLE()

1. Purpose

Initializes serial I/O and enables the function. Note that common processing is used up to the point at which transmission, reception, and transmission/reception is enabled. Also sets the baud rate.

2. Function

Initializes serial I/O according to the hardware manual. Make modifications to the processing as necessary. Performs the following processing in the 78K0R/KE3-L.

- (1) Performs common processing to enable transmission and transmission/reception settings.
  - Sets the operating clock in SPSm. Sets CKm0. This register can be used to specify two operating clocks (CKm0 and CKm1), so the setting is determined by an OR operation.
  - Sets the operating mode in SMRmn. Sets the CKm0 prescaler output clock specified by SPSm in CKSmn. Sets the CSI mode in MDmn2 and MDmn1. Sets transfer-end interrupt as the interrupt source in MDmn0.
  - Sets the communication format in SCRmn.
     Sets the data and clock phases (DAPmn=0, CKPmn=0: SPI mode 3 compatible) in DAPmn and CKPmn.
     Sets the data transfer sequence (MSB-first) in DIRmn.
     Sets the data length (8 bits) in DLSmn2 to DLSmn0.
  - Sets the baud rate by writing to the operating clock (fMCK) division ratio setting bit field (bits 15 to 9 in SDRmn).
  - Writes 1 to flags FECTmn, PECTmn, and OVCTmn in SIRmn to clear them.
  - Sets SOLmn=0b in SOLm (depends on the channel).
- 3. Remarks

This function is the counterpart to SIO\_DISABLE(). After executing this function, execute SIO\_DISABLE() to end processing.

SEmn must be cleared to 0 in order to set SPSm, SMRm, and SOLm. Execute SIO\_DISABLE() before executing this function.

CKm0 is used as the operating clock.

# 5.9.9 Macro Function SIO\_DISABLE()

- 1. Purpose
  - Disables the serial I/O function.
- 2. Function

Disables the serial I/O function. Performs the common processing to disable transmission and transmission/reception setups. Reconsider the processing as necessary. Performs the following processing in the 78K0R/KE3-L.

(1) Sets the channel to operation stopped mode and switches the pins to function as ports.

- Sets CKOmn=1b and SOmn=1b in SOm so that the pins function as ports.\*<sup>1</sup>
- Sets STmn=1b in STm.
  - $\rightarrow$  Cleared the SEmn bit to 0 and stopped clock output by serial communication operation.
  - $\rightarrow$  Put the channel into the operation stopped state.
  - $\rightarrow$  The value set in the CKOmn bit in SOm is output from the serial clock output pin.
- Sets SOEmn=0b in SOEm, stopping data output by serial communication operation.
- Sets CKOmn=1b and SOmn=1b in SOm so that the pins function as ports.\*<sup>2</sup>
- Sets SOLmn=0b in SOLm (depends on the channel).
- (2) Sets TEXmn=0b and REXmn=0b in SCRmn, setting the operation mode to communication stopped.
- (3) Sets SMRmn to 0020h (value after a reset).
- 3. Remarks

This function is the counterpart to SIO\_ENABLE(). After executing SIO\_ENABLE(), execute this function to end processing.

SIO\_TX\_DISABLE() and SIO\_TRX\_DISABLE() use control by STm to stop communication operation, and this function also uses control by STm to stop communication operation.

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Executing this function sets the corresponding port registers (Pxx) to high output, so the output pin states are dependent on the settings of the corresponding CKOmn and SOmn bits in the serial output register (SOm). To manipulate the registers of the serial array unit, first enable clock supply by setting the appropriate SAUmEN bit in PERn (n corresponds to the register number).

Initially, writing to registers SPSm, SMRm, SDRm, etc., is enabled by clearing SEmn to 0.

This function is intended to be called during initialization processing and after transmission or reception has ended.

- Notes: 1. This function is executed in order to set SOm before stopping clock output by using STm and stopping data output by using SOEm. However, writing to SOm is ignored if the values of both SEmn and SOEmn are 1, so the function's effects depend on the settings of SEmn and SOEmn immediately before it is executed. Since the effects depend on the preceding state, during initialization SOm is set once again after stopping clock output by using STm and stopping data output by using SOEm (see note 2 below). When transmission or reception ends, SIO\_TX\_DISABLE() or SIO\_TRX\_DISABLE() use control by STm to stop clock output and control by SOEm to stop data output, so the SOm setting can take effect.
  - 2. SOm is set after stopping clock output by using STm and stopping data output by using SOEm. This ensures that the SOm setting takes effect.

# 5.9.10 Macro Function SIO\_TX\_ENABLE()

- 1. Purpose
  - Enables serial I/O transmission.
- 2. Function

Enables serial I/O transmission according to the hardware manual. Enables the transmission after switching the pin from the port function to serial I/O function. Reconsider the processing as necessary.

Performs the initialization procedure for the rest after SIO\_ENABLE() and for transmission setting only.

Performs the following processing in the 78K0R/KE3-L.

- (1) Sets the operating mode to transmission.
  - Sets TEXmn=1b and REXmn=0b in SCRmn, enabling transmission.
- (2) Switches the pins to the serial I/O function.
  - Sets data output high and clock output high in SOm, enabling pin output.
  - Sets SOEmn=1b in some, enabling data output by serial communication operation.
  - $\rightarrow$  The values reflected by communication operation are output from the serial data output pin
- (3) Enables serial communication operation.

Sets SSmn=1b in SSm.

- $\rightarrow$  The SEmn bit is set to 1, enabling clock output by serial communication.
- $\rightarrow$  The values reflected by communication operation are output from the serial clock output pin.
- 3. Remarks

This function is the counterpart to SIO\_TX\_DISABLE().After executing this function, execute SIO\_TX\_DISABLE() to end processing.

Before executing this function, execute SIO\_DISABLE(), SIO\_TX\_DISABLE(), or SIO\_TRX\_DISABLE() (each of which use control by STm to stop communication operation) to stop communication operation.

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Before executing this function, execute SIO\_DISABLE() and SIO\_IO\_INIT() to set the corresponding CKOmn and SOmn bits in the serial output register (SOm) and the port registers (Pxx) to 1.

## 5.9.11 Macro Function SIO\_TX\_DISABLE()

- 1. Purpose
- Disables the serial I/O transmission function.
- 2. Function

Disables transmission according to the inverse processing of SIO\_TX\_ENABLE(). Switches the pin from the serial I/O function to the port function after disabling transmission. Reconsider the processing as necessary.

Performs the following processing in the 78K0R/KE3-L.

- (1) Sets serial communication to the operation stopped state.
  - Sets STmn=1b in STm.
  - $\rightarrow$  Cleared the SEmn to 0 and stopped clock output by serial communication operation.
  - $\rightarrow$  Put the channel into the operation stopped state.
  - $\rightarrow$  The value set in the CKOmn bit in SOm is output from the serial clock output pin.
- (2) Stops output by serial communication operation.
  - Sets SOEmn=0b in SOEm, stopping data output by serial communication operation.
  - $\rightarrow$  The value set in the SOmn bit in SOm is output from the serial data output pin.
- (3) Sets the operating mode to communication disabled.
  - Sets TEXmn=0b and REXmn=0b in SCRmn, disabling communication.
- 3. Remarks

This function is the counterpart to SIO\_TX\_ENABLE(). After executing SIO\_TX\_ENABLE(), execute this function to end processing.

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Before executing this function, execute SIO\_DISABLE() and SIO\_IO\_INIT() to set the corresponding CKOmn and SOmn bits in the serial output register (SOm) and the port registers (Pxx) to 1.

# 5.9.12 Macro Function SIO\_TRX\_ENABLE()

- 1. Purpose
- Enables serial I/O transmission/reception.
- 2. Function

Enables serial I/O transmission/reception according to the hardware manual. Enables the transmission/reception after switching the pin from the port function to serial I/O function. Reconsider the processing as necessary. Performs the initialization procedure for the rest after SIO\_ENABLE() and for transmission/reception setting only. Performs the following processing in the 78K0R/KE3-L.

- (1) Sets the operating mode to transmission/reception.
  - Sets TEXmn=1b and REXmn=1b in SCRmn, enabling transmission/reception.
- (2) Switches the pins to the serial I/O function.
  - Sets data output high and clock output high in SOm, enabling pin output.
  - Sets SOEmn=1b in some, enabling data output by serial communication operation.
  - $\rightarrow$  The values reflected by communication operation are output from the serial data output pin
- (3) Enables serial communication operation.

Sets SSmn=1b in SSm.

- $\rightarrow$  The SEmn bit is set to 1, enabling clock output by serial communication.
- $\rightarrow$  The values reflected by communication operation are output from the serial clock output pin.
- 3. Remarks

This function is the counterpart to SIO\_TRX\_DISABLE().After executing this function, execute SIO\_TRX\_DISABLE() to end processing.

Before executing this function, execute SIO\_DISABLE(), SIO\_TX\_DISABLE(), or SIO\_TRX\_DISABLE() (each of which use control by STm to stop communication operation) to stop communication operation.

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Before executing this function, execute SIO\_DISABLE() and SIO\_IO\_INIT() to set the corresponding CKOmn and SOmn bits in the serial output register (SOm) and the port registers (Pxx) to 1.

### 5.9.13 Macro Function SIO\_TRX\_DISABLE()

- 1. Purpose
  - Disables the serial I/O transmission/reception function.
- 2. Function

Disables transmission/reception according to the inverse processing of SIO\_TRX\_ENABLE(). Switches the pin from the serial I/O function to the port function after disabling transmission/reception. Reconsider the processing as necessary.

Performs the following processing in the 78K0R/KE3-L.

- (1) Sets serial communication to the operation stopped state.
  - Sets STmn=1b in STm.
  - $\rightarrow$  Cleared the SEmn to 0 and stopped clock output by serial communication operation.
  - $\rightarrow$  Put the channel into the operation stopped state.
  - $\rightarrow$  The value set in the CKOmn bit in SOm is output from the serial clock output pin.
- (2) Stops output by serial communication operation.
  - Sets SOEmn=0b in SOEm, stopping data output by serial communication operation.
  - $\rightarrow$  The value set in the SOmn bit in SOm is output from the serial data output pin.
- (3) Sets the operating mode to communication disabled.
- Sets TEXmn=0b and REXmn=0b in SCRmn, disabling communication.
- 3. Remarks

This function is the counterpart to SIO\_TRX\_ENABLE(). After executing SIO\_TRX\_ENABLE(), execute this function to end processing.

When in the serial communication output stopped state, the output pin state is determined by an AND operation according to the setting of the serial output register (SOm) and the output latch setting of the port register (Pxx). Before executing this function, execute SIO\_DISABLE() and SIO\_IO\_INIT() to set the corresponding CKOmn and SOmn bits in the serial output register (SOm) and the port registers (Pxx) to 1.

# 5.10 State Transition Diagram

Figure 5.10 shows the state transition diagram. Do not perform serial transmission or reception before the serial I/O function has been initialized. For details, see 7.7, Prohibition of Data Transmission and Reception.

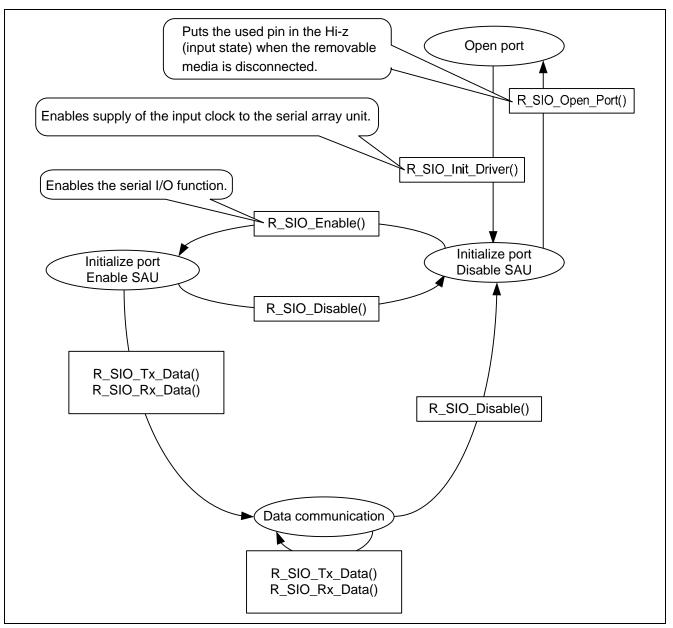

Figure 5.10 State Transition Diagram

# 6. Application Example

This section gives an example of settings for the serial I/O control section.

Examples of the settings for usage are given below.

The locations where settings are made are identified by the comments header "/\*\* SET \*\*/" in the defining file.

### 6.1 mtl\_com.h (common header file)

This is the header file for functions to be in common use.

Each mtl\_com.h.XXX (excluding mtl\_com.h.common) is made for the evaluation of a given MCU. Use the appropriate header file after renaming it mtl\_com.h. If there is no header file for the MCU to be evaluated, make mtl\_com.h with reference to mtl\_com.h.XXX.

#### (1) Defining the Header Files for the OS

This sample code is independent of the OS.

In the example given below, the OS is not to be used.

That is, the settings in the sample code are for when the OS is not to be used, so the code is independent of the OS. This sample code does, however depend on other software.

```
/* In order to use wai_sem/sig_sem/dly_tsk for microITRON (Real-Time OS)-compatible,*/
/* include the OS header file that contains the prototype declaration. */
/* When not using the OS, put the following 'define' and 'include' as comments. */
//#define MTL_OS_USE /* Use OS */
//#include <RTOS.h> /* OS header file */
//#include "mtl_os.h"
```

#### (2) Defining the Header File with the Common Access Area Defined

It is possible to include a header file of MCU function register definitions. The main reason it would be necessary to include this header file is to enable port control, etc., by the device driver. The 78K0R uses a different method to make these definitions, so the header file should be commented out in the sample code. Refer to 7.4, Method of Manipulating SFR Area, for instructions for making the necessary settings.

In the example below, the header file is not included.

#### (3) **Defining the Loop Timer**

The following header file is included so that the software loop timer is available for use.

This is used to secure waiting time for the device driver.

Comment out the "#include" directive if the software loop timer is not to be used.

The software loop timer is to be used in this example.

This header file must be included if the sample code is to be used.

```
/* When not using the loop timer, put the following 'include' as comments. */
#include "mtl_tim.h"
```

#### (4) **Defining the Endian Mode**

Either little-endian or big-endian mode can be specified.

For the 78K0R/Kx3-L, define the endian mode as little-endian.

#### (5) Defining High-Speed Endian Processing

High-speed processing by mtl\_end.c can be specified. Processing becomes high-speed if the M16C is in use.

In the case of the 78K0R/Kx3-L, leave this commented out so that the definition is not made.

#### (6) Defining the Standard Library to Be Used

Define the type of standard library to be used.

Leave the "#define" below commented out if the library attached to the compiler is to handle the indicated processing.

The library attached to the compiler is to be used in the example below.

#### (7) Defining the RAM Area to Be Accessed

Define the RAM area to be accessed.

This obtains more efficient processing by standard functions and some other processes.

Define MTL\_MEM\_NEAR in the case of the 78K0R/Kx3-L.

#### 6.1.1 mtl\_tim.h

This is included by the include directive for the loop timer in mtl\_com.h.

The effects of the settings depend on the MCU, clock, and compiler options in use.

If the system is cache-equipped, make settings on the assumption that the instruction cache is enabled and that the code for loop-timer processing is stored in the cache.

Repeat measurement and adjust the settings according to the conditions of usage.

<pre>/* Define the counter value for the timer. /* Specify according to the user MCU, clock and wait requirements. #if 1</pre>								* / * /
/* Setting for 20 MHz no wait (Compile Option "-azp" at PM+ Ver.6.31,								
CC78KOR Ver.2.13, RA78KOR Ver.1.33)*/								
#define MTL_T_1US	3	/*	loop	Number	of	1	us	*/
#define MTL_T_2US	6	/*	loop	Number	of	2	us	*/
#define MTL_T_4US	12	/*	loop	Number	of	4	us	*/
#define MTL_T_5US	15	/*	loop	Number	of	5	us	*/
#define MTL_T_10US	30	/*	loop	Number	of	10	us	*/
#define MTL_T_20US	60	/*	loop	Number	of	20	us	*/
#define MTL_T_30US	90	/*	loop	Number	of	30	us	*/
#define MTL_T_50US	150	/*	loop	Number	of	50	us	*/
#define MTL_T_100US	300	/*	loop	Number	of	100	us	*/
#define MTL_T_200US	600	/*	loop	Number	of	200	us	*/
#define MTL_T_300US	900	/*	loop	Number	of	300	us	*/
<pre>#define MTL_T_400US ( MTL_T_200US</pre>	* 2)	/*	loop	Number	of	400	us	*/
#define MTL_T_1MS	3000	/*	loop	Number	of	1	ms	*/
#endif								

Times for the above values have not been measured, so the settings are not necessarily appropriate. Perform evaluation as required.

### 6.2 Setting up the Control Software for Clock Synchronous Single Master Operation

The locations where settings are made are identified by the comments header "/\*\* SET \*\*/" in the defining file.

### 6.2.1 R\_SIO.h

#### (1) Defining the Wait Time after Setting Up the BRR

Setting the BRR of the SAU is followed by a software wait until one bit of data is transferred. Set this wait time as required.

The default setting is for  $10 \ \mu s$ .

Supposing transfer at 100 kHz and usage with Multimedia Cards, make the setting for 10  $\mu$ s.

#define SIO\_T\_BRR\_WAIT (uint16\_t)MTL\_T\_10US /\* BRR setting wait time \*/

The 78K0RKE3-L does not require any wait after setting BRR. Since no wait processing is specified in the sample code, this line is ignored.

### 6.2.2 R\_SIO\_csi.h

This is the definition file for the SAU.

Each R\_SIO\_csi.h.XXX is made for the evaluation of a given MCU. Use the appropriate header file after renaming it R\_SIO\_csi.h. If there is no header file for the MCU to be evaluated, make R\_SIO\_csi.h with reference to the R\_SIO\_csi.h.XXX files.

#### (1) Defining the Operating Mode to Be Used

The resources of the MCU to be used can be set.

If processing is to be of MSB-first CRC-CCITT calculations, specify SIO\_OPTION\_2 as in the following example.

CRC-CCITT calculations are unnecessary when control is of serial EEPROM or serial Flash memory. In such cases, comment the definition out.

The separate R\_SIO\_csi\_rx\_mmc.c file is needed to perform CRC-CCITT calculations for controlling Multimedia Cards.

#### (2) Defining the Form of CRC Calculation to Be Used

Define the form of CRC calculation to be used.

CRC-CCITT calculation is not used when control is of serial EEPROM or serial Flash memory. In such cases, comment the definition out.

To control multimedia cards, define both CRC-CCITT calculation and CRC-CCITT calculation at the same time.

/*		*/
/* Define the CRC calculation	n.	* /
/*		*/
#define SIO_CRCCCITT_USED	/* CRC-CCITT used	* /
#define SIO_CRC7_USED	/* CRC7 used	* /

#### (3) Defining the Pins to Be Used

Define the pins to be used.

/*				*/	
/* Define the control p	port.			* /	
/* Delete comment of a	related m	acrodefini	tion, and please	validate setting. */	
/*				*/	
#define SIO_PM_DATAO	PM7.0	/* SIO	DataOut	* /	
#define SIO_PM_DATAI	PM7.1	/* SIO	DataIn	* /	
#define SIO_PM_CLK	PM7.2	/* SIO	CLK	* /	
#define SIO_P_DATAO	P7.0	/* SIO	DataOut	* /	
#define SIO_P_DATAI	P7.1	/* SIO	DataIn	* /	
#define SIO_P_CLK	P7.2	/* SIO	CLK	* /	
#define SIO_PIM_DATAI	PIM7.1	/* SIO	DataIn	* /	
#define SIO_PIM_CLK	PIM7.2	/* SIO	CLK	* /	
#define SIO_POM_DATAO	POM7.0	/* SIO	DataOut	* /	
#define SIO_POM_CLK	POM7.2	/* SIO	CLK	* /	

#### (4) Defining the Peripheral Enable Register

Specify the peripheral enable register related to the SAU to be used.

#define SIO_SAUEN SAU0EN	/* C	ontrol	of	CSI0	input	clock	supply	*/	
--------------------------	------	--------	----	------	-------	-------	--------	----	--

#### (5) Defining the CSI Channel to Be Used

Specify the CSI channel to be used. CSI01 is used in the example below.

/\*-----\*/

/* CSI01 setting example -	Set the following for the system. */
#define SIO_SPS SPS0	/* Serial clock select register */
#define SIO_SMR SMR01	/* Serial mode register */
#define SIO_SCR SCR01	/* Serial communication operation setting register*/
#define SIO_SDR SDR03	/* Serial data register */
#define SIO_TXBUF SIOO	/* SIOp data register */
#define SIO_RXBUF SIOO	/* SIOp data register */
#define SIO_SIR SIR03	/* Serial flag clear trigger register */
#define SIO_SSR SSR01	/* Serial status register */
#define SIO_SS SSOL	1 /* Serial channel start register SSmn */
#define SIO_ST STOL	1 /* Serial channel stop register STmn */
#define SIO_SE SEOL	1 /* Serial channel enable status register SEmn*/
#define SIO_SOE SOE01	.1 /* Serial output enable register SOEmn */
#define SIO_SO SOO	/* Serial output register SOmn */
#define SIO_SOL SOL0	/* Serial output level register */
#define SIO_SNFEN NFEN(	0.0 /* Use of noise filter of RXD pin SNFEN */
#define SIO_TXNEXT (SSR	01L & 0x20)/* CSI Transmit data empty */
#define SIO_RXNEXT IFOH	6 /* CSI Receive completion */
#define SIO_TXEND IFOH	6 /* CSI Transmit completion */

#### (6) Defining the Operating Clock to Be Used in the Serial Clock Select Register (SPSm)

Specify the operating clock selection in the serial clock select register (SPSm). CKm0 is used in the example below.

#### (7) Defining the Operating Clock (fMCK) Selection for the Channel to Be Used

Specify the operating clock (fMCK) selection used for the CKSmn bit in the serial mode register (SMRmn). CKm0 is used in the example below.

```
#define SIO_USMR_INIT
                          (uint16_t)0x0020
           /* 000000000000000B */ /* SMR CSI initial setting
                                                                        * /
           /* |||||||||||||||+-- Interrupt source : Transfer end interrupt */
           /*
              ||||||||||||++--- Operation mode : CSI mode
                                                                        */
              |||||||||+++---- Reserved
           /*
                                                                        */
           /*
              |||||||||+----- Reserved (Controls in UART mode)
                                                                        * /
           /* ||||||+----- Reserved
                                                                        */
           /* ||||||+----- Start trigger source : Software trigger
                                                                        */
                                                                        * /
           /* ||+++++----- Reserved
                                                                        */
           /*
              +----- ftclk clock channel setting : Divided fmck
                 ----- fMCK clock channel setting: CKm0 set
                                                                        */
```

#### (8) Defining the Serial Output Value

Set to 1 the serial output register for the channel to be used.

To accomplish this, set to 1 the SOmn bit in the serial output register (SOm) of the channel to be used. This sets to 1 the SOmn bit corresponding to the location set to 1. The setting used for the CSI01 data output pin and clock output pin is shown in the example below.

#define SIO_USO_I	INIT (uint16_	_t)0x0A0A			*/
/* 00	000101000001010B *,	/ /* SOO initia	l set	ting	*/
/*	+ \$	SOOO output :	0		*/
/*	+ \$	SO01 output :	1	CSI01	*/
/*	+ \$	SO02 output :	0		*/
/*	+ F	Reserved :	1	Fixed	*/
/*	++++ F	Reserved :	0		*/
/*	+ (	CKOOO output :	0		*/
/*	+ (	CKO01 output :	1	CSI01	*/

#### 78K0R/Kx3-L Clock Synchronous Single Master Control Software Using CSI Mode of Serial Array Unit

#### (9) Defining the Serial Output Level Register (SOLm)

In CSI mode the inversion setting is prohibited. Set 1 in order to write 0 to the relevant SOLmn bit and reserved bits.

The reason for setting 1 is to contain the operation of writing 0 to the point that is set to 1 in the sample code,

The setting when CSI01 is used is shown in the example below.

```
#define SIO_USOL_INIT
                          (unit16_t)0xFFFA
        /* 1111111111111010B */ /* SOLm initial setting(CSI mode setting)*/
        /* |||||||||||||||+-- SOLm0 Communication data is output :
                                                                       */
        /* ||||||||||||+--- Reserved : 1
                                                                       */
                                                 Fixed
        /* |||||||||||||+---- SOLm2 Communication data is output :
                                                                       */
        /* ++++++++++++---- Reserved : 1
                                                                       */
                                                Fixed
        /* Caution: Refer to the application note for Setting method.
                                                                       */
        /*
                    Set Unit/Channel No. and reserved bit to use to 1. */
        /*
                    Because 0 is written to a register by setting 1.
                                                                      */
```

#### (10) Defining the Port Input Mode Register (PIM)

According to the pin to be used, specify PIM and POM.

```
/*----- DataIn control -----*/
#define SIO_DATAI_INIT() do { /* DataIn initial setting */ \
    SIO_SNFEN = 0; /* Noise filter OFF */ \
    SIO_PIM_DATAI = 0; /** SET **/ /* Normal input buffer */ \
    SIO_PM_DATAI = 1; /* DataIn Input */ \
} while (0)
```

# 7. Usage Notes

## 7.1 Usage Notes to be Observed when Building the Sample Code

To incorporate the sample code, include R\_SIO.h and R\_SIO\_csi.h (after renaming R\_SIO\_csi.h.XXX).

# 7.2 Unnecessary Functions

Unused functions waste ROM capacity, so we recommend excluding them by commenting them out and so on.

### 7.3 Using Other MCUs

Other MCUs can easily be used.

The files to be prepared are as follows:

- A common I/O module definition file corresponding to R\_SIO\_csi.h.XXX
- A header definition file corresponding to mtl\_com.h.XXX

Make them by referring the attachment.

# 7.4 Method of Manipulating SFR Area

The SFR area contains registers that perform special functions, such as mode registers and control registers for the peripheral hardware of the 78K0R.

It is possible to manipulate this register area at the C source code level by means of declarations using the SFR.

The SFR can be used in the C source code by means of the #pragma instruction. (It does not matter if the keyword SFR is capitalized or lowercased in the source code.)

#pragma SFR

Place #pragma SFR at the beginning of the C source code. Note that if the specification #pragma PC (device type) is also included in the source code, #pragma SFR should come after it. The following items may also precede #pragma SFR:

- 1. Comments
- 2. Pre-processing instructions that do not define or reference variables and do not define or reference functions

# 7.5 Port Control for Serial Data and Clock Output Pins

To set these pins to function as ports, set to 1 the CKOmn and SOmn bits in the serial output register (SOm). The output from these pins is determined by an AND operation using the serial output register (SOm) setting and the output latch setting of the corresponding port registers (Pxx). When the CKOmn bit and SOmn bit are set to 1, the unmodified port register (Pxx) setting value becomes the output value of the corresponding pin.

# 7.6 Enabling/Disabling Clock Supply to the Serial Array Unit

In the sample code, supply of the clock is started by the serial I/O enable setting processing (R\_SIO\_Enable()), but no control over stopping the clock is provided by the serial I/O disable setting processing (R\_SIO\_Disable()). This is because it is assumed that other programs may be using the other channels of the same unit.

Therefore, the user should provide additional program code with the necessary control functions if there is a need to stop operation of individual units in order to reduce power consumption and noise, taking into account the control of channels other than the one used by the sample code.

Note that the sample code does provide the capability to stop operation of the channel used by the application.

# 7.7 Prohibition of Data Transmission and Reception

Do not perform serial data transmission or reception if the serial I/O function has not been enabled.

In the sample code, supply of the clock to the serial array unit starts when driver initialization processing (R\_SIO\_Init\_Driver()) is performed. Executing serial I/O data transmit processing (R\_SIO\_Tx\_Data()) or serial I/O data receive processing (R\_SIO\_Rx\_Data()) in this state will cause transmission or reception processing to start even though the correct register settings for the serial I/O function have not been completed. It is not possible for transmission or reception processing to proceed properly in this state because the register settings for items such as the baud rate are not correct.

To perform serial I/O data transmit processing (R\_SIO\_Tx\_Data()) or serial I/O data receive processing (R\_SIO\_Rx\_Data()), first execute serial I/O enable setting processing (R\_SIO\_Enable()) to make the necessary register settings related to serial I/O. Also refer to 5.10, State Transition Diagram.

# 7.8 Setting Serial Output Level Register (SOLm)

In CSI mode the inversion setting is prohibited. Set 1 in order to write 0 to the relevant SOLmn bit and reserved bits.

The reason for setting 1 is to contain the operation of writing 0 to the point that is set to 1 in the sample code,

Also refer to 6.2.2 (9), Defining the Serial Output Level Register (SOLm).

# General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

- 1. Handling of Unused Pins
  - Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.
    - The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.
- 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

 The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

- 3. Prohibition of Access to Reserved Addresses
  - Access to reserved addresses is prohibited.

The reserved addresses are provided for the possible future expansion of functions. Do not access
these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.
- Differences between Products

Before changing from one product to another, i.e. to one with a different type number, confirm that the change will not lead to problems.

— The characteristics of MPU/MCU in the same group but having different type numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different type numbers, implement a system-evaluation test for each of the products.

	e disclosed by Renesas Electronics such as that disclosed through our website. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or
	echnical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or
- (	xhers.
	ou should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
	bescriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for
	he incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
	When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and
1	egulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to
,	he development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is
	rohibited under any applicable domestic or foreign laws or regulations.
	Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics
	Assessed in a many measure to an algorithm of the second of the following three quality grades: "Standard", "High Quality, and "Specific". The recommended applications for each Renease Electronics produce
	depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas
- 1	Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for
	which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the
	use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
	Standard*: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools;
	personal electronic equipment; and industrial robots.
	High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically
	designed for life support.
	Specific": Aircraft, aerospace equipment, submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical interaction of the support devices or systems) and an other series of the support devices or systems of the support devices or systems).
B. 1	implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life. 'ou should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage
	to a read use in a ready lectronic product behavior in its document many internet product phrases behaviors. Renease Electronics shall have no liability for malfunctions or damages arising out of the
1	use of Renesas Electronics products beyond such specified ranges.
9. A	Nthough Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and
	nalfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the
	ossibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as aflety design for hardware and software including but not limited to
	edundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficu
	please evaluate the safety of the final products or system manufactured by you.
