Implementation of Highly Accurate Interval Timer by Low-Speed On-Chip Oscillator Clock CC-RL

R01AN3997EJ0100 Rev.1.00 Nov. 9, 2017

Introduction

This application note describes how to improve the accuracy of the interval timer interval using the low-speed on-chip oscillator. For this purpose, the high-speed on-chip oscillator clock, which has high frequency accuracy, is used.

Target Device

RL78/I1D

RL78/G11

When applying the sample program covered in this application note to another microcomputer, modify the program according to the specifications for the target microcomputer and conduct an extensive evaluation of the modified program.

1. Specifications

The oscillation period of the low-speed on-chip oscillator clock is measured by using the high-speed on-chip oscillator clock, which has high frequency accuracy.

The oscillation period of the low-speed on-chip oscillator clock is measured by using the input pulse interval measurement function of the timer array unit channel 1. The compare value of the 8-bit interval timer 0 is calculated based on the measurement result of the input pulse interval.

By setting the calculated compare value to the 8-bit interval timer compare register 0 to correct the interval time, the accuracy of the interval time is improved.

With this application, a compare match interrupt request of the 8-bit interval timer 0 is generated at approximately 20-second intervals to return from STOP mode, and A/D conversion is performed. The A/D conversion result is checked, and if it is equal to or greater than the reference value, buzzer output is provided. Buzzer output is stopped by pressing the switch. In addition, the interval time of the 8-bit interval timer 0 is corrected to maintain the accuracy of the interval time.

Table 1.1 shows the peripheral functions and applications, and Figure 1.1 shows how the interval time of the 8-bit interval timer 0 is corrected.

Peripheral Function	Application
Timer array unit	Measuring the oscillation period of the low-speed on-chip oscillator clock
8-bit interval timer 0	Counting the interval time
A/D converter	Acquiring the thermistor voltage
Buzzer output	Outputting to the piezoelectric buzzer

5. Software Explanation

5.1 Operation Outline

With this application, a compare match interrupt request of the 8-bit interval timer 0 is generated at approximately 20-second intervals to return from STOP mode, and A/D conversion is performed. The A/D conversion result is checked, and if it is equal to or greater than the reference value (0x0E00), buzzer output is provided. Buzzer output is stopped by pressing the switch. In addition, the interval time of the 8-bit interval timer 0 is corrected to maintain the accuracy of the interval time.

The specific operations are described in ① to 16 below.

① Perform the initial setting of the timer array unit.

<Channel 1 setting condition>

- Set the high-speed on-chip oscillator clock 8 MHz as the operating clock.
- Set the independent channel operation function.
- Set the low-speed on-chip oscillator clock as the start trigger and capture trigger.
- Set the falling edge of the start trigger and capture trigger as the valid edge.
- Set input pulse interval measurement mode.

2 Perform the initial setting of the 8-bit interval timer 0.

<8-bit interval timer 0 setting condition>

- Set 16-bit count mode.
- Set $f_{IL}/8$ as the frequency division ratio.
- Set 0x927B as the compare value to generate a compare match interrupt request at approximately 20-second intervals.

③ Perform the initial setting of the clock output/buzzer output controller.

<Buzzer output setting condition>

- Set the low-speed on-chip oscillator clock as the PCLBUZ0 pin output clock.
- Set $f_{IL}/2^2$ as the frequency division ratio.
- ④ Perform the initial setting of the A/D converter.

<A/D converter setting condition>

- Set ANI2 as an analog input channel.
- Set select mode as the A/D conversion channel selection mode.
- Set one-shot conversion mode as the A/D conversion operation mode.
- Set a software trigger as the A/D conversion start condition.
- Set the A/D conversion time to $6.75 \,\mu s$.

RL78/I1D Implementation of Highly Accurate Interval Timer by Low-Speed On-Chip Oscillator Clock CC-RL

(5) Perform the initial setting of the external interrupt.

<External interrupt setting condition>

- Use the P137/INTP0 pin.
- Set the falling edge of the INTP0 pin as the valid edge.
- 6 After completing the initial settings, wait for the oscillation accuracy of the low-speed on-chip oscillator clock to stabilize (210 us).
- \bigcirc Start the count operation of the timer array unit channel 1 to measure the input pulse interval.
- 8 Acquire the measurement result of the input pulse interval upon generation of the second capture end interrupt request of the timer array unit.
- ③ Based on the measurement result of the input pulse interval, calculate the compare value of the 8-bit interval timer 0, and set it to the 8-bit interval timer compare register 0.
- ① Stop the count operation of the timer array unit channel 1.
- (1) Start the count operation of the 8-bit interval timer 0.
- ① Causes a transition to STOP mode.
- 13 Release the STOP mode by generation of the compare match interrupt request of the 8-bit interval timer 0.
- (1) Start A/D conversion and cause a transition to HALT mode to wait for the A/D conversion end interrupt to be requested.
- (15) When the A/D conversion result is smaller than the reference value (0x0E00), proceed to (16). When equal to or greater than the reference value (0x0E00), execute the following operations.
 - Enable buzzer output.
 - Stop the 8-bit interval timer 0.
 - Enable external interrupt processing.

When the external interrupt is generated (switch is pressed), buzzer output is stopped.

16 Execute the correction processing (7 to 10) of the interval time of the 8-bit interval timer 0, resume the count operation of the 8-bit interval timer 0, and return to 12.

5.2 Correction

The following gives a concrete explanation of the correction method in detail.

① Measuring the oscillation period of the low-speed on-chip oscillator clock

As shown in Figure 1.1, the oscillation period of the low-speed on-chip oscillator clock is measured by using the input pulse interval measurement function of the timer array unit channel 1, which operates on the high-speed on-chip oscillator clock.

After the timer array unit channel 1 starts count operation, when the first capture end interrupt request is generated, the measurement result of the input pulse interval is discarded since it is smaller than the count value corresponding to a single period. When the second capture end interrupt request is generated, the measurement result of the input pulse interval is acquired.

When the high-speed on-chip oscillator clock frequency is 8 MHz, the measurement result of the input pulse interval can be calculated by the following equation. Table 5.1 shows the range of the measurement result of the input pulse interval. Since the frequency accuracy of the high-speed on-chip oscillator clock is $\pm 1\%$, there is a margin of measurement error as shown in Table 5.1.

Measurement result of input pulse interval = (input pulse interval/period of count clock) = ((1 / 15kHz) / (1 / 8MHz))

Note Measurement result of the input pulse interval = TDR01 + 1

Table 5.1 Range of Measurement Result of Input Pulse Interval

		Low-speed on-chip oscillator clock (15kHz±15%)		
		min: 12.75 kHz	Typ: 15.00 kHz	Max: 17.25 kHz
High-speed on-chip	Max: 8.08 MHz	634	538	468
oscillator clock	Typ: 8.00 MHz	627	533	463
(8MHz±1%)	min: 7.92 MHz	621	528	459

2 Correcting the compare value of the 8-bit interval timer 0

With this application, the 8-bit interval timer 0 is used to count 20 seconds. Therefore, the following equation is used to calculate the compare value to be set to the 8-bit interval timer compare register 0 (TRTCMP0) for counting 20 seconds.

(TRTCMP0 + 1) = 20s / ((1 / 15kHz) * frequency division ratio)

In addition, the above equation can be rearranged as shown below, if the frequency accuracy of the low-speed on-chip oscillator clock is considered.

In the equation, the ideal value is 533 according to table 5.1, and the frequency division is the division ratio of the count source of the 8-bit interval timer.

(TRTCMP0 + 1) = 20s / ((1 / 15kHz) * (measurement result of the input pulse interval) / ideal value) * frequency division ratio))

> = (20s * 15kHz * ideal value/frequency division ratio) / measurement result of the input pulse interval

= (20 * 15000 * 533 / 8) / measurement result of the input pulse interval

= 19987500 / measurement result of the input pulse interval

Accordingly, the compare value to be set to the TRTCMP0 register is the result of the following equation.

TRTCMP0 = (19987500 / measurement result of the input pulse interval) – 1

Note Ideal value = (1/15 kHz) / (1/8 MHz); measurement result of the input pulse interval = TDR01 + 1

③ Correction timing

The frequency of the low-speed on-chip oscillator clock changes with the temperature. Therefore, it is necessary to correct the interval time of the 8-bit interval timer 0 in accordance with the temperature change.

For reference, the temperature characteristics of the low-speed on-chip oscillator clock measured by us are shown in Figure 5.1 and Figure 5.2.

[Eunction name]	r main timer correction
[Function name] Outline	Correction processing function
Header	
Declaration	r_cg_macrodriver.h, r_cg_tau.h, r_cg_it8bit.h
	void r_main_timer_correction(void);
Description	Starts the count operation of the timer array unit channel 1, and acquires the measurement result of the input pulse interval upon generation of the second capture end interrupt request. Based on the acquired measurement result of the input pulse interval, calculates the compare value of the 8-bit interval timer 0, and sets it to the 8-bit interval timer compare register 0. Then stops the count operation of the timer array unit channel 1.
Arguments	None
Remarks	None
[Function name]	r_tau0_channel1_interrupt
Outline	Timer array unit channel1 capture complete interrupt function
Header	r_cg_macrodriver.h, r_cg_tau.h
Declaration	#pragma interrupt r_tau0_channel1_interrupt(vect=INTTM01)
Description	Stores the measurement result of the input pulse interval by the timer array unit
	channel 1 in the global variable.
Arguments	None
Remarks	None
[Function name]	r_adc_interrupt
Outline	End of A/D conversion inrterrupt processing
Header	r_cg_macrodriver.h, r_cg_adc.h
Declaration	
Declaration	static voidnear r_adc_interrupt(void)
Description	static voidnear r_adc_interrupt(void) Stores the A/D conversion result in the global variable.
Description	Stores the A/D conversion result in the global variable.
Description Arguments	Stores the A/D conversion result in the global variable. None
Description Arguments	Stores the A/D conversion result in the global variable. None
Description Arguments Remarks [Function name] Outline	Stores the A/D conversion result in the global variable. None None r_intc0_interrupt External interrupt processing
Description Arguments Remarks [Function name]	Stores the A/D conversion result in the global variable. None None r_intc0_interrupt
Description Arguments Remarks [Function name] Outline	Stores the A/D conversion result in the global variable. None None r_intc0_interrupt External interrupt processing
Description Arguments Remarks [Function name] Outline Header	Stores the A/D conversion result in the global variable. None None r_intc0_interrupt External interrupt processing r_cg_macrodriver.h, r_cg_intp.h
Description Arguments Remarks [Function name] Outline Header Declaration	Stores the A/D conversion result in the global variable. None None <u>r_intc0_interrupt</u> External interrupt processing r_cg_macrodriver.h, r_cg_intp.h #pragma interrupt r_intc0_interrupt(vect=INTP0)
Description Arguments Remarks [Function name] Outline Header Declaration Description Arguments	Stores the A/D conversion result in the global variable. None None r_intc0_interrupt External interrupt processing r_cg_macrodriver.h, r_cg_intp.h #pragma interrupt r_intc0_interrupt(vect=INTP0) Performs chattering prevention processing. Then disables the external interrupts and
Description Arguments Remarks [Function name] Outline Header Declaration Description	Stores the A/D conversion result in the global variable. None None r_intc0_interrupt External interrupt processing r_cg_macrodriver.h, r_cg_intp.h #pragma interrupt r_intc0_interrupt(vect=INTP0) Performs chattering prevention processing. Then disables the external interrupts and buzzer output, and starts the count operation of the 8-bit interval timer 0.

5.8 Flowcharts

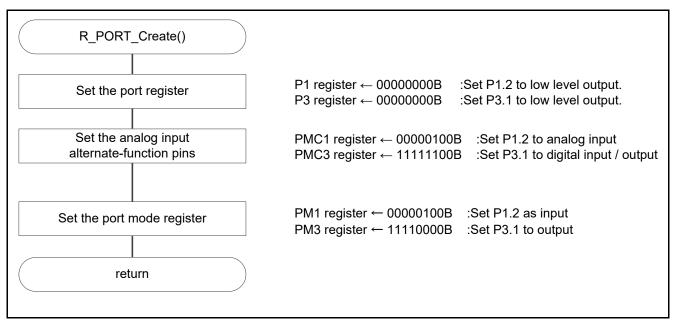

Figure 5.6 Port Initial Setting

Note: Refer to the initialization flowchart in the RL78/G13 Initialization CC-RL (R01AN2575E) Application Note for details on how to set unused ports.

Caution: When designing circuits, always make sure unused ports are properly processed and all electrical

characteristics are met. Also make sure each unused input-only port is connected to VDD or VSS through a resister.

5.8.4 CPU Initial Setting

Figure 5.7 shows the flowchart for the CPU initial setting.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

- ³⁄₄ The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.
- 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- ³⁄₄ The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.
- 3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- ³⁄₄ The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.
- 4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.
- 5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

³⁄₄ The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

- Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
- Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other disputes involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawing, chart, program, algorithm, application examples.
- 3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You shall not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics products.
- Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's guality grade. as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc. Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (space and undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.

- 6. When using the Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat radiation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions or failure or accident arising out of the use of Renesas Electronics products beyond such specified ranges.
- 7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please ensure to implement safety measures to guard them against the possibility of bodily injury, injury or damage caused by fire, and social damage in the event of failure or malfunction of Renesas Electronics products, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures by your own responsibility as warranty for your products/system. Because the evaluation of microcomputer software alone is very difficult and not practical, please evaluate the safety of the final products or systems manufactured by you.
- 8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please investigate applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive carefully and sufficiently and use Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall not use Renesas Electronics products or technologies for (1) any purpose relating to the development, design, manufacture, use, stockpiling, etc., of weapons of mass destruction, such as nuclear weapons, chemical weapons, or biological weapons, or missiles (including unmanned aerial vehicles (UAVs)) for delivering such weapons, (2) any purpose relating to the development, design, manufacture, or use of conventional weapons, or (3) any other purpose of disturbing international peace and security, and you shall not sell, export, lease, transfer, or release Renesas Electronics products or technologies, to any third party whether directly with knowledge or reason to know that the third party or any other party will engage in the activities described above. When exporting, selling, transferring, etc., Renesas Electronics products or technologies, you shall comply with any applicable export control laws and regulations promulgated and administered by the governments of the countries asserting jurisdiction over the parties or transactions.
- 10. Please acknowledge and agree that you shall bear all the losses and damages which are incurred from the misuse or violation of the terms and conditions described in this document, including this notice, and hold Renesas Electronics harmless, if such misuse or violation results from your resale or making Renesas Electronics products available any third party.
- 11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
