

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

General Description

DA9233 is an ultra-low quiescent current high efficiency buck regulator and an ultra-low quiescent current LDO in a compact I²C configurable WLCSP package. The Buck regulator also features ultra-low output ripple (<10mV). It is targeting battery powered applications needing low ripple and highly efficient power supplies.

The buck regulator extends high light load efficiency down to 20 µA further extending battery life. Dynamic Voltage Control in the Buck regulator facilitates optimization across the system power modes enabling further improvement in System efficiency and battery life.

The low quiescent current LDO can be configured as a Load Switch and provides the second supply output. The LDO's uncommitted inputs can be connected to either the battery or the buck output. Connecting the input to the buck output provides the flexibility to improve the PSRR at the LDO output as needed.

DA9233 provides multiple protection features and comes with the ability to monitor the events and indicators in the GPO pin.

Suitable for space constrained applications, the DA9233 comes in a 1.65 mm x 1.25 mm x 0.5 mm, 12-pin WLCSP package.

Key Features

- 60 mA buck regulator
 - 750 nA total input current (buck enabled, no load)
 - Up to 80 % efficiency at 1.8 V output, 20 µA load currents
 - Input voltage 2.5 V to 5.5 V (Minimum 2.75 V for start-up)
 - Output voltage 0.6 V to 1.9 V Dynamic Voltage Control (DVC)
- 100 mA LDO / Load Switch
 - Ultra-low quiescent current
 - Input voltage 1.8 V to 5.5 V
 - Output voltage 0.7 V to 3.3 V
- I²C interface for device configuration and control
- Protection features and System Monitors
- Small 1.65 mm x 1.25 mm x 0.5 mm, 12-pin WLCSP package

Applications

- Wearables – wrist wear, hearables
- Smart devices - thermostats and door locks
- Smoke detectors
- Portable medical devices
- Remote sensors
- High efficiency, low power applications

4 Absolute Maximum Ratings

Table 3: Absolute Maximum Ratings

| Symbol | Description | Conditions | Min | Max | Unit |
|---------------------|--------------------------------|-----------------------------------|------|-----|------|
| T _{STG} | Storage temperature | | -65 | 150 | °C |
| T _J | Operating junction temperature | | -40 | 125 | °C |
| V _{DD} | Analog V _{IN} pin | Tied to V _{DD_SYS} | -0.3 | 6 | V |
| V _{DD_SYS} | Power V _{IN} pin | Tied to V _{DD} | -0.3 | 6 | V |
| I/O pins | Maximum voltage | I/O pin voltage ≤ V _{DD} | -0.3 | 6 | V |

Stresses beyond those listed under Absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

5 Recommended Operating Conditions

Table 4: Recommended Operating Conditions

| Parameter | Description | Conditions | Min | Typ | Max | Unit |
|-----------------------|--|---|---------------|-----|-----|------|
| V _{DD} | Analog V _{IN} | Tied to VDD_SYS | 2.5 Note 1 | | 5.5 | V |
| V _{DD_SYS} | Power V _{IN} | Tied to VDD | 2.5 Note 1 | | 5.5 | V |
| I _{OUT_BUCK} | Load Current | Output current from SW pin, continuous DC current | | | 60 | mA |
| V _{DD_LDO} | Input voltage range for LDO mode | VDD_LDO ≤ VDD | 1.8 | | 5.5 | V |
| | Input voltage range for Load switch mode | VDD_LDO ≤ VDD | 0.8 | | 5.5 | V |

Note 1 Requires minimum 2.75 V for start-up. Once started, input voltage can go down to 2.5 V.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

6 ESD Ratings

| Parameter | Description | Conditions | Value | Unit |
|-----------|-------------------------|--|------------|------|
| V_{ESD} | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 Note 1 | ± 2000 | V |
| | | Charged device model (CDM), per JEDEC specification JESD22-C101 Note 2 | ± 500 | |

Note 1 JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

Note 2 JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

7 Electrical Characteristics

$V_{DD} = V_{VDD_SYS} = 3.6 \text{ V}$, $T_A = -40^\circ\text{C}$ to 85°C . Typical values are at $T_A = 25^\circ\text{C}$ (unless otherwise noted).

Table 5: Input Current

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|----------------------------------|--|---|-----|------|------|------|
| Electrical performance | | | | | | |
| $I_{Q_BUCK_LD_O_ON_NO_LD}$ | Buck and LDO no load quiescent current | -40 °C < T_A < 85 °C Buck enabled and regulating with no load LDO enabled $2.5 \text{ V} \leq V_{VDD_SYS} \leq 5.5 \text{ V}$ $V_{BUCK} = 1.8 \text{ V}$ $V_{VLDO} = 0.8 \text{ V}$ | | 1.35 | 4.25 | µA |
| $I_{Q_BUCK_ON_NO_LD}$ | Buck no load quiescent current | -40 °C < T_A < 85 °C Buck enabled and regulating, no load $2.5 \text{ V} \leq V_{VDD_SYS} \leq 5.5 \text{ V}$ $V_{BUCK} = 1.8 \text{ V}$ | | 0.75 | 3.5 | µA |

Table 6: Buck Output

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|-------------------------------|--|--|-----|-----|-----|------|
| Electrical performance | | | | | | |
| R_{ON_PMOS} | On resistance of PMOS pass device | $V_{VDD_SYS} = 3.6 \text{ V}$ $I_{OUT} = 50 \text{ mA}$ | | 600 | 800 | mΩ |
| R_{ON_NMOS} | On resistance of NMOS pass device | $V_{VDD_SYS} = 3.6 \text{ V}$ $I_{OUT} = 50 \text{ mA}$ | | 300 | 450 | mΩ |
| R_{SYS_DHCG} | MOSFET on-resistance for buck discharge | $V_{VDD_SYS} = 3.6 \text{ V}$ $I_{OUT} = -10 \text{ mA}$ into V_{OUT} pin | | 33 | | Ω |
| t_{START} | Buck start-up time | $V_{VDD_SYS} = 3.6 \text{ V}$ $V_{BUCK} = 1.8 \text{ V}$ $I_{OUT} = 0 \text{ A}$ from $BUCK_EN = 1$ to switching start | | 3 | | ms |
| $I_{LIM_SW_PMOS}$ | SW current limit PMOS | $V_{VDD_SYS} = 3.6 \text{ V}$ $V_{BUCK} = 1.8 \text{ V}$ | | 550 | | mA |
| f_{sw} | Switching frequency | | | | 1.5 | MHz |
| $I_{LIM_PMOS_SOFTSTART}$ | PMOS switch current limit during softstart | Current limit is reduced during softstart | | 250 | | mA |

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|-------------------------------|---------------------------------------|--|------|-----|-----|------|
| V _{OUT_VBUCK_SNS} | Buck output voltage range | Programmable range, 50 mV steps | 0.6 | | 1.9 | V |

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

LDO V_{OUT} Accuracy

LDO V_{OUT} Accuracy is calculated based on equation:

$$100\% \times (\text{Actual LDO output voltage} - \text{Target LDO output voltage}) / \text{Target LDO output voltage}$$

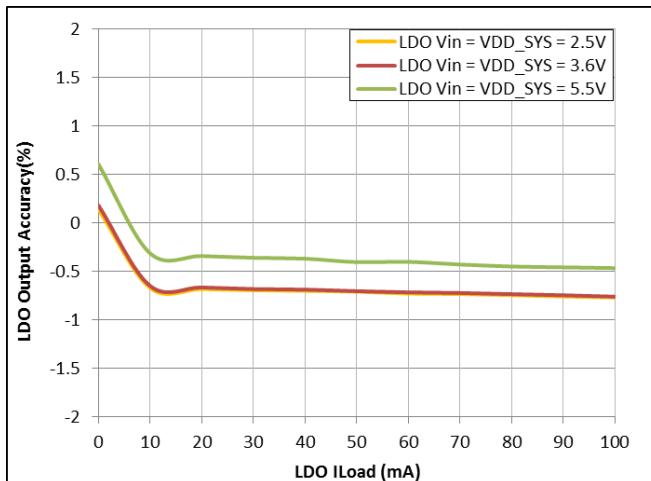

Figure 10: LDO V_{OUT} = 0.8 V

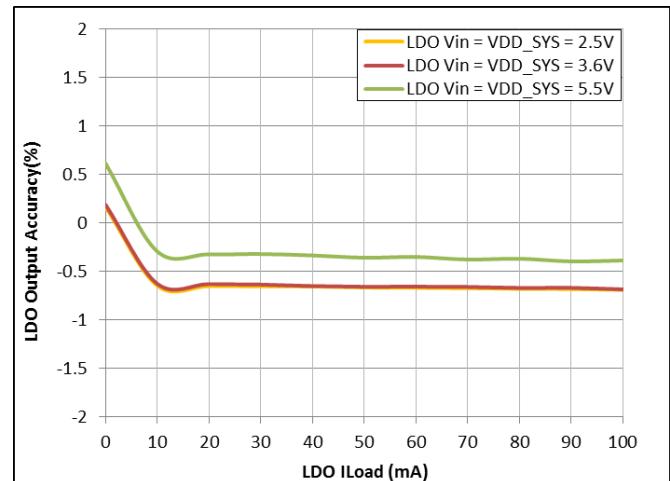

Figure 11: LDO V_{OUT} = 1.8 V

10 Feature Descriptions

10.1 Chip Enable and Disable Through IC_EN

DA9233 features a dedicated IC_EN pin to enable and disable the chip. When IC_EN = high, the device is turned on. IC_EN voltage should not exceed VDD_SYS voltage on the device. When EN = low, the device is shut down completely, including I²C communications.

10.2 VDD Under-Voltage Lockout

DA9233 features an under-voltage lockout (UVLO) on VDD. When VDD falls below UVLO falling threshold, both buck and LDO are disabled, see Section 10.4.9 for fault behaviour and control, A VIN_UV_Event will be flagged if it is not masked. When VDD rises above the UVLO rising threshold, the device will be alive. VDD should be always tied to VDD_SYS on the PCB board so both VDD and VDD_SYS will share the same UVLO protection.

10.3 Over-Temperature Protection

DA9233 also features an on-Chip over-temperature protection (TSD). The die junction temperature is monitored when LDO is ON. When the junction temperature is higher than the thermal shutdown threshold, both buck and LDO are disabled to prevent the device being damaged by over-heating, see Section 10.4.9 for fault behavior and control. An OT_Event will be flagged if it is not masked.

10.4 Buck Regulator

DA9233 includes a nano-ampere standby buck regulator with an adjustable output voltage, Dynamic Voltage Scaling capability and a maximum load current of 60 mA. It also has power saving mode operation and different protection features.

10.4.1 Buck Output Voltage Programmability

The DA9233 buck regulator can be set to two different ranges based on the value of VOUT_RANGE_HI. The value of BUCK_VOUT<4:0> is locked to a certain range based on the value of VOUT_RANGE_HI, and VOUT_RANGE_HI can only be changed while the buck is disabled. The buck can be set to the output voltages shown in Table 11. If a command is received outside of the allowable range (that is above 1.3 V for VOUT_RANGE_HI = 0 or below 1.3 V for VOUT_RANGE_HI = 1), digital will force the value of BUCK_VOUT<3:0> to 01110 (1.3 V).

Table 11: Buck Output Voltage Settings

| VOUT_RANGE_HI | BUCK_VOUT<4:0> | Buck Output Voltage (V) |
|---------------|----------------|-------------------------|
| 0 | 00000 | 0.60 |
| 0 | 00001 | 0.65 |
| 0 | 00010 | 0.70 |
| 0 | 00011 | 0.75 |
| 0 | 00100 | 0.80 |
| 0 | 00101 | 0.85 |

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

| VOUT_RANGE_HI | BUCK_VOUT<4:0> | Buck Output Voltage (V) |
|---------------|----------------|-------------------------|
| 0 | 00110 | 0.90 |
| 0 | 00111 | 0.95 |
| 0 | 01000 | 1.00 |
| 0 | 01001 | 1.05 |
| 0 | 01010 | 1.10 |
| 0 | 01011 | 1.15 |
| 0 | 01100 | 1.20 |
| 0 | 01101 | 1.25 |
| 0 or 1 | 01110 | 1.30 |
| 1 | 01111 | 1.35 |
| 1 | 10000 | 1.40 |
| 1 | 10001 | 1.45 |
| 1 | 10010 | 1.50 |
| 1 | 10011 | 1.55 |
| 1 | 10100 | 1.60 |
| 1 | 10101 | 1.65 |
| 1 | 10110 | 1.70 |
| 1 | 10111 | 1.75 |
| 1 | 11000 | 1.80 |
| 1 | 11001 | 1.85 |
| 1 | 11010 | 1.90 |
| 1 | 11011 | 1.90 |
| 1 | 11100 | 1.90 |
| 1 | 11101 | 1.90 |
| 1 | 11110 | 1.90 |
| 1 | 11111 | 1.90 |

10.4.2 Start-up Operation

DA9233 buck integrates a start-up circuit to minimize output voltage over-shoot and input voltage drop during start-up. When writing 1 to BUCK_EN (Bit 7 of Reg0x05), the buck is enabled and starts switching after a typical delay time of 3 ms. During start-up, the cycle-by-cycle current limit is reduced to limit inrush current.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

10.4.3 Power Saving Mode Operation

DA9233 buck regulator features power saving mode that greatly reduces the quiescent current when device has very light load condition. Buck regulator operates in discontinuous mode with Pulse Frequency Modulation (PFM). The low-side FET will be turned off based on a zero-crossing comparator to prevent negative inductor current flowing through the FET which can result in additional conduction loss. If both FETs remain in the OFF state for a certain delay time after inductor current crosses zero, the device will enter power saving mode. In power saving mode, DA9233 shuts down most of the internal circuitry to save current consumption. The lighter the load, the longer the duration of power saving mode will be, to achieve the lowest quiescent current and improve light load efficiency.

10.4.4 Dynamic Voltage Control

DA9233 buck regulator has dynamic voltage control (DVC) feature which allows the buck output voltage to track the internal reference voltage when it changes at a rate of 50 mV / 2 ms. Since the buck output voltage can only be changed within an allowable range while still keeping the buck enabled, DVC also follows the same behaviour. The DVC is done via I²C, whereby the buck output voltage setting is stepped in 50 mV steps within either the low range or high range. Each voltage step lasts for 2 ms.

10.4.5 Cycle-by-cycle Over-Current Protection

For the Over-current Protection (OCP) in DA9233, the peak current through high-side FET is monitored cycle-by-cycle. When the sensed current exceeds the pre-set current limit, the high-side FET will be turned OFF immediately to limit the inductor current. The high-side FET will be turned on again after the constant-off time expires. If the OC condition persists for 64 µs, buck will be forced off and buck output will be pull-down until the fault clears, see Section 10.4.9 for fault behavior and control and Section 10.4.8 for output voltage discharge and control. An OC_BUCK_Event will be flagged if it is not masked.

10.4.6 Output Over-Voltage Protection

DA9233 features an output over-voltage protection (OVP) to protect the load from damage. When both IC_EN and BUCK_EN are high and the buck output voltage is 200 mV greater than the internal reference voltage, the high side FET is immediately OFF, see Section 10.4.9 for fault behavior and control. Then the internal buck output discharge FET will be turned on to discharge buck output capacitor, see Section 10.4.8 for output voltage discharge and control. An OV_BUCK_Event will be flagged if it is not masked. Buck will remain off and buck output will be pull-down until the fault is cleared.

10.4.7 Output Under-Voltage Protection

When buck output short happens, inductor current will increase until the peak reaches the cycle-by-cycle current limit. Then the high-side FET turns OFF and low-side FET turns on. Since buck output is shorted, inductor current slope is very small during low-side FET on time. The inductor current could gradually go higher and higher. To effectively prevent the inductor current running away at V_{OUT} short condition, buck V_{OUT} is also monitored. If over-current condition happens and buck V_{OUT} drops 400 mV below the reference voltage, the buck regulator will be shut off immediately and an UV_BUCK_Event will be flagged if it is not masked, see Section 10.4.9 for fault behavior and control.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

10.4.8 Automatic Output voltage Discharge

To speed up the discharging of buck output capacitor and ensure a safer start-up next time, the buck regulator provides automatic output voltage discharge when IC_EN is pulled low or buck shutdown caused by any fault. Automatic output discharge when buck is forced OFF by fault needs to set register bit BUCK_PD_CFG1 = 0; automatic output discharge when buck is disabled by BUCK_EN = 0 needs to set register bit BUCK_PD_CFG2 = 0. The output of the buck regulator is discharged through VBUCK_SNS pin and an internal buck output discharge FET with typical 33 Ω resistance.

10.4.9 Event Flag and Fault Control

DA9233 has the flexibility for customers to control the behavior of buck/LDO when there is a fault condition. There are five register bits (UVLO_FRC_DIS, TSD_FRC_DIS, OV_DIS_BUCK, OC_BUCK_EVENT, SC_DIS_BUCK) controlling whether the buck/LDO will be disabled when the corresponding fault condition happens. In addition, users can choose whether to mask or unmask the event flag when the fault condition happens.

When there is a VDD Under-voltage condition, both BUCK and LDO will be forced OFF if UVLO_FRC_DIS = 1. Buck and LDO will remain alive if UVLO_FRC_DIS = 0. During the VDD Under-voltage condition, the event register bit VIN_UV_EVENT = 1 if the corresponding mask register bit M_VIN_UV is set to 0 otherwise VIN_UV_EVENT = 0.

When there is an Over-Temperature fault inside the device, both buck and LDO will be forced OFF if TSD_FRC_DIS = 1. If TSD_FRC_DIS = 0, buck and LDO will remain alive. During the over-temperature condition, the event register bit OT_EVENT = 1.

When there is an over-voltage fault at buck output, buck will be forced OFF if OV_DIS_BUCK = 1. Buck will continue switching if OV_DIS_BUCK = 0. During the fault, OV_BUCK_EVENT is set to 1 if M_OV_BUCK_EVENT = 0 otherwise OV_BUCK_EVENT = 0.

When the over-current condition in buck persists for 64 μs and M_OC_BUCK_EVENT is set to 0, OC_BUCK_EVENT will be set to 1. If OC_DIS_BUCK = 1, BUCK is forced disabled. If OC_DIS_BUCK = 0, buck will continue switching during the over-current condition.

When there is a buck Output under-voltage condition and M_UV_BUCK_EVENT = 0, UV_BUCK_EVENT is set to 1. If both buck output under-voltage and over-current condition exist and SC_DIS_BUCK = 1, buck will be forced OFF. If SC_DIS_BUCK = 0, buck will continue switching without shutting down by the under-voltage protection.

DA9233 also has a fault recovery mechanism that can be customized through the 3-bits RCVRY_NUM. This value determines the fault recovery trial number for buck and is counted down by every fault that triggers buck OFF. When RCVRY_NUM reaches 0, recovery trial is ended and buck will remain OFF even if the buck enable signals are toggled HI. If RCVRY_NUM is set to 0x7, there will be no count down on the recovery trial number and recovery trail will not be ended. Before RCVRY_NUM reaches 0, buck will be recovered automatically if the fault condition disappears.

Event flags are not automatically cleared when the fault conditions disappear. They have to be cleared by changing the values in register EVENT through I²C.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

10.5 Load Switch, LDO Output and Control

10.5.1 LDO Output Programmability

The LDO can be set to the output voltages shown in [Table 12](#). The LDO output voltage can only be changed while LDO is disabled.

Table 12: LDO Output Voltages Settings

| LDO_VOUT<4:0> | LDO Output Voltage (V) |
|---------------|------------------------|
| 00000 | 0.7 |
| 00001 | 0.8 |
| 00010 | 0.9 |
| 00011 | 1.0 |
| 00100 | 1.1 |
| 00101 | 1.2 |
| 00110 | 1.3 |
| 00111 | 1.4 |
| 01000 | 1.5 |
| 01001 | 1.6 |
| 01010 | 1.7 |
| 01011 | 1.8 |
| 01100 | 1.9 |
| 01101 | 2.0 |
| 01110 | 2.1 |
| 01111 | 2.2 |
| 10000 | 2.3 |
| 10001 | 2.4 |

| 10110 | 2.9 |
| 10111 | 3.0 |
| 11000 | 3.1 |
| 11001 | 3.2 |
| 11010 | 3.3 |
| 11011 | Load switch mode |

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

| LDO_VOUT<4:0> | LDO Output Voltage (V) |
|---------------|------------------------|
| 11100 | Load switch mode |
| 11101 | Load switch mode |
| 11110 | Load switch mode |
| 11111 | Load switch mode |

10.5.2 Automatic Output Voltage Discharge

Similar to buck regulator, the LDO also provides automatic output voltage discharge when IC_EN is pulled low or LDO turn-off caused by any fault. The internal LDO output discharge FET has a typical 25 Ω resistance.

10.5.3 Load Switch

DA9233 also features load switch mode for its LDO. When LDO_VOUT<4:0> is set to any value between 11011 and 11111, the LDO is configured as a load switch. In load switch mode, the LDO FET is fully ON. The turn-on and turn-off of load switch is controlled only through I²C command.

See Section 10.4.9 for fault behaviour and control, and Section 10.4.8 for output voltage discharge and control.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

10.6 I²C Programming

10.6.1 Interface Description

DA9233 includes an I²C compatible interface based on the following signals:

- SCL: standard 400 kHz I²C bus serial clock generated by the Host processor
- SDA: standard 400 kHz I²C bus serial address/data input output

SDA and SCL are open drain I/O terminals. The standard frequency of the I²C bus is 400 kHz in fast mode or 100 kHz in slow mode.

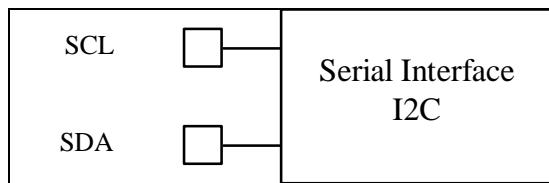

Figure 189: I²C Serial Interface Pins

The I²C bus is used to control most functions and change register values depending on the application requirements. In active battery, the I²C circuitry is powered from the battery. The interface maintains a proper operation as long as VDD_SYS is valid.

The device is compatible with the standard I²C protocol but only operates as a slave. The transfer protocol is the same whether operating in fast or slow mode.

10.6.2 Details of the I²C Protocol

The device supports 7-bit addressing only, the address is 0x2F. The 8-bit shifted address is 0x5E. A timer runs during I²C transitions. If the timer expires while SDA is held low, all additional commands are ignored and the I²C state machine is reset. The timer is reset with a START condition and stopped with a STOP condition.

The I²C bus is monitored at all times for a valid SLAVE address, and an acknowledge bit is generated if the SLAVE address was true.

- A START condition is initiated by a high to low transition on the SDA line while the SCL is in the high state.
- A STOP condition is indicated by a low to high transition on the SDA line while the SCL is in the high state.
- An ACKNOWLEDGE is indicated by the receiver pulling the SDA line low during the following clock cycle.

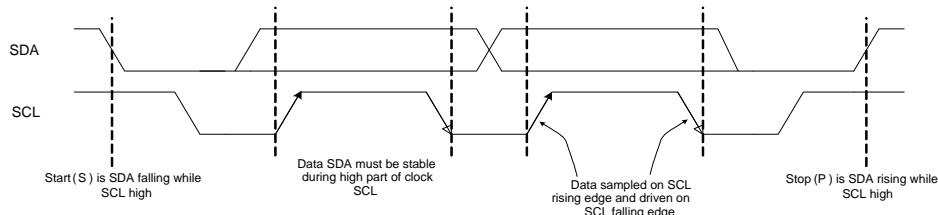

Figure 20: I²C Start and Stop Conditions

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

When the address is matching the following event sequence happens:

1. The device generates an ACKNOWLEDGE to indicate to the master that the communication link has been established
2. The master generates SCL clock cycles to transmit or receive data
3. After receiving data, an ACKNOWLEDGE is generated either by the device or the master (whichever is transmitting the data)
A data sequence is 9-bit, consisting of 8-bit data and 1-bit ACKNOWLEDGE. It can be repeated as long as necessary.
4. The master generates a STOP condition to end the data transfer

The bus returns to IDLE-mode if during a message a new START or STOP condition occurs. Data is transmitted MSB first for both R/W operations.

10.7 GPO Pin Function Programming

DA9233 has a General purpose output (GPO) pin which can be programmed to have multiple functions.

10.7.1 Power Good Indicator

When GPO pin is configured to the VDD power good indicator, it is an open drain output and can be configured to either active high or active low. When GPO status is Hi-Z, an external pull-up is required for GPO to be high.

Table 13: GPO as Power Good Indicator

| GPO Configuration | $V_{IN} > V_{IN_UVLO}$ | GPO Status |
|-------------------|-------------------------|------------|
| Active High | No | 0 |
| | Yes | Hi-Z |
| Active Low | No | Hi-Z |
| | Yes | 0 |

10.7.2 Event Indicator

GPO pin can also be configured as the event indicator in open drain output. Whenever there is an event or multiple events (VIN_UV_EVNT or OV_BUCK_EVENT or OC_BUCK_EVENT or UV_BUCK_EVENT) happen, GPO will be pulled down Low. This can be used as an interrupt to host CPU to inform events happened. When there is no event, GPO will remain in Hi-Z status and an external pull-up is required for GPO to be high.

10.7.3 Reset Pulse Generation

GPO pin can be configured to generate a reset pulse signal when buck starts. The reset signal can be used by host CPU or other device that are connected to buck output. When GPO is Low, it indicates a reset pulse period; when GPO is in Hi-Z status (An external pull-up is required for GPO to be high), it indicates a non-reset period.

There is also a timing control to negate the reset pulse signal. The GPO reset pulse width can be adjusted between 8 and 112 ms measured from written 1 to BUCK_EN register bit.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO**10.7.4 Always Pull-Down or Hi-Z**

When GPO pin is not used, it can be configured to either always Hi-Z or pull-down to Low.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

11.2 Register Definitions

11.2.1 Buck and LDO Control

11.2.1.1 Event/Status/Mask Registers

Table 16: Register EVENT

| Address | Register Name | POR Value | Event flag | | | | | | |
|----------|---------------|-----------|---------------|---------------|---------------|----------|----------|--|--|
| 0x0000 | EVENT | 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| OT_EVENT | VIN_UV_EVENT | Reserved | OC_BUCK_EVENT | OV_BUCK_EVENT | UV_BUCK_EVENT | Reserved | Reserved | | |

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

| Field Name | Bits | Type | POR | Description |
|---------------|------|------|-----|---|
| OT_EVENT | [7] | evnt | 0x0 | Over Temperature fault event flag. When Over temperature condition is detected, this bit is set to 1. When I2C writes '1' to this bit, the event flag is cleared. |
| VIN_UV_EVENT | [6] | evnt | 0x0 | Under Voltage on VDD event flag. When Under Voltage (UVLO) condition is detected, this bit is set to 1. When I2C writes '1' to this bit, the event flag is cleared. |
| OC_BUCK_EVENT | [4] | evnt | 0x0 | Over Current on BUCK OUT event flag. When the buck Over Current condition is detected (when BUCK_EN==1 && M_OC_BUCK==0), this bit is set to 1. When I2C writes '1' to this bit, the event flag is cleared. |
| OV_BUCK_EVENT | [3] | evnt | 0x0 | Over Voltage on BUCK OUT event flag. When the buck Over Voltage condition is detected (when BUCK_EN==1 && M_OV_BUCK==0), this bit is set to 1. When I2C writes '1' to this bit, the event flag is cleared. |
| UV_BUCK_EVENT | [2] | evnt | 0x0 | Under voltage on BUCK OUT event flag. When the under voltage condition (i.e. short circuit) is detected on the buck (when BUCK_EN==1 && M_UV_BUCK==0), this bit is set to 1. When I2C writes '1' to this bit, this event flag is cleared. |

Table 17: Register STATUS

| Address | Register Name | POR Value | | Status | | | | |
|--------------|---------------|-----------|-----|---|--------------|--------------|----------|--------------|

12 Package Information

12.1 Package Outlines

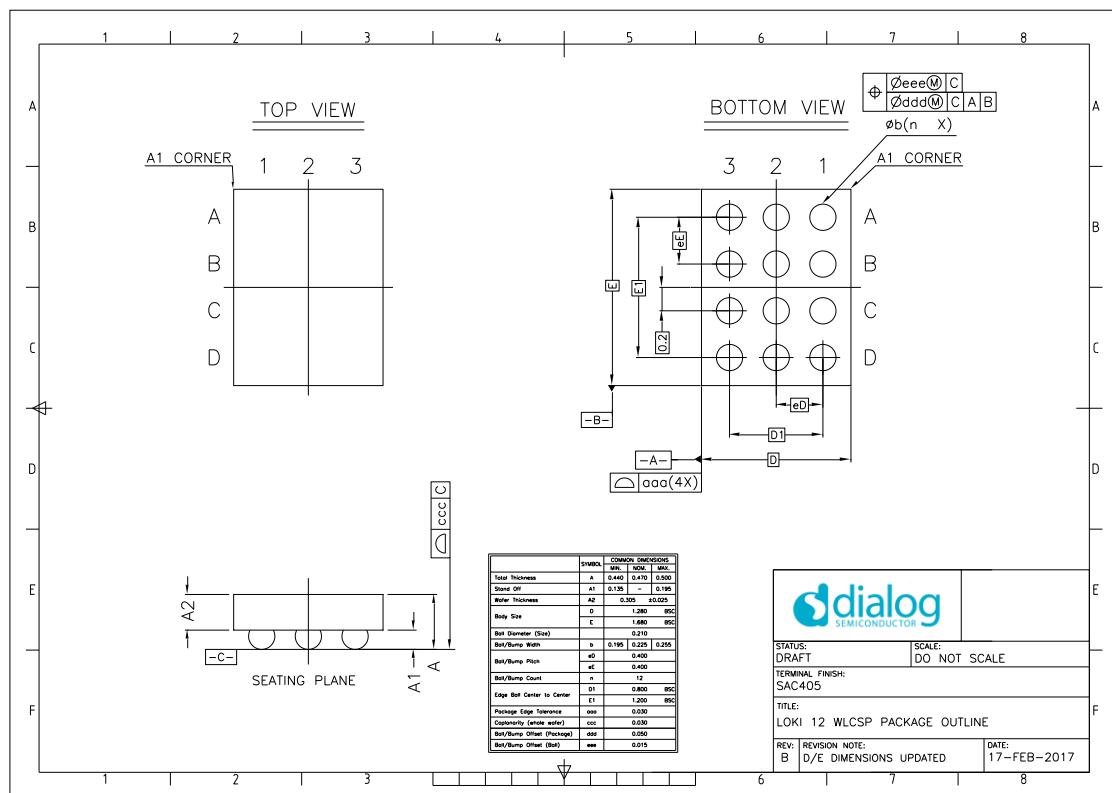

Figure 191: Package Outline Drawing

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

12.2 Moisture Sensitivity Level

The Moisture Sensitivity Level (MSL) is an indicator for the maximum allowable time period (floor lifetime) in which a moisture sensitive plastic device, once removed from the dry bag, can be exposed to an environment with a maximum temperature of 30 °C and a maximum relative humidity of 60% RH before the solder reflow process. The MSL classification is defined in [Table 30](#).

The device package is qualified for MSL 1.

Table 30: MSL Classification

| MSL level | Floor Lifetime |
|-----------|---------------------------|
| MSL 1 | unlimited at 30 °C/85% RH |

12.3 Soldering Information

Refer to the JEDEC standard J-STD-020 for relevant soldering information. This document can be downloaded from <http://www.jedec.org>.

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

13 Ordering Information

The ordering number consists of the part number followed by a suffix indicating the packing method. For details and availability or other custom OTP parts, please consult your Renesas Electronics' [local sales representative](#).

Table 31: Ordering Information

| Part number | Package | Size (mm) | Shipment Form | Pack Quantity |
|-------------|----------|-------------|---------------|---------------|
| DA9233-xxxx | WLCSP-12 | 1.25 x 1.65 | T&R | 4500 |

Table 32: OTP List

| Order number | Description | Buck V _{OUT} (V) | LDO V _{OUT} (V) |
|--------------|---|---------------------------|--------------------------|
| DA9233-A1VZ2 | OTP with Buck and LDO voltage preconfigured | 0.7 | 1.8 |

Integrated Ultra-Low Quiescent Current, Ultra-Low Output Ripple Buck Regulator with 100 mA LDO

Status Definitions

| Revision | Datasheet Status | Product Status | Definition |
|----------|------------------|----------------|---|
| 1.<n> | Target | Development | This datasheet contains the design specifications for product development. Specifications may be changed in any manner without notice. |
| 2.<n> | Preliminary | Qualification | This datasheet contains the specifications and preliminary characterization data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design. |
| 3.<n> | Final | Production | This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via Customer Product Notifications. |
| 4.<n> | Obsolete | Archived | This datasheet contains the specifications for discontinued products. The information is provided for reference only. |

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES ("RENESAS") PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for developers skilled in the art designing with Renesas products. You are solely responsible for (1) selecting the appropriate products for your application, (2) designing, validating, and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. Renesas grants you permission to use these resources only for development of an application that uses Renesas products. Other reproduction or use of these resources is strictly prohibited. No license is granted to any other Renesas intellectual property or to any third party intellectual property. Renesas disclaims responsibility for, and you will fully indemnify Renesas and its representatives against, any claims, damages, costs, losses, or liabilities arising out of your use of these resources. Renesas' products are provided only subject to Renesas' Terms and Conditions of Sale or other applicable terms agreed to in writing. No use of any Renesas resources expands or otherwise alters any applicable warranties or warranty disclaimers for these products.
