

RX Family

Examples of Transitioning to Low Power Consumption Modes

Introduction

This application note describes the use of the low power consumption modes on the target devices listed below. It presents examples of transitioning to the various low power consumption modes. The software described in this application note also provides a simple method of measuring current values after transitioning to one of the low power modes.

Target Devices

RX Family

Confirmed Devices

- RX130 Group
- RX140 Group
- RX231 Group
- RX65N Group

When using this application note with other Renesas MCUs, careful evaluation is recommended after making modifications to comply with the alternate MCU.

1. Overview

This application note describes the use of functionality for reducing power consumption based on code generated by the Code Generator (CG) function of Smart Configurator (SC) to transition to and to resume from the low power modes.

Table 1.1 shows the supported modes for each device.

Table 1.1 Modes Supported by Devices

Mode	Device (+: Supported, -: Not supported)			
wode	RX130	RX140	RX231	RX65N
Sleep	+	+	+	+
Deep sleep	+	+	+	-
All-module clock stop	-	-	-	+
Software standby	+	+	+	+
Deep software standby	-	-	-	+
Snooze	-	+	-	-

The conditions applying to the low power mode sample program described in this application note are listed in Table 1.2 and Table 1.3. For details about how to use the snooze mode on the RX140, refer to RX140 Group Snooze Mode Usage Examples (R01AN5914).

Table 1.2	Sample Program Conditions for RX130, RX140, and RX231
-----------	---

Low Powe	er Mode	Module Stop Conditions
Sleep		State in which modules other than DMAC/DTC*1 and RAM0 are stopped
Deep sleep)	State in which modules other than DMAC/DTC*1 and RAM0 are stopped*2
Software	RTC not used	State in which modules other than DMAC/DTC*1 and RAM0 are stopped
standby	RTC used	State in which modules other than DMAC/DTC*1 and RAM0 are stopped
	or the RX130 and F ave the DMAC.	X140, only the DTC is subject to module stop because these devices do not

Note 2. The DMAC and DTC are put into the module stop state by the functionality for reducing power consumption.

Low Pow	ver Mode	Module Stop Conditions
Sleep		State in which only TSIP module is stopped
All-modul	e clock stop	State in which modules other than DMAC/DTC, EXDMAC, RAM, extended RAM, and standby RAM modules are stopped* ²
Software	standby	State in which modules other than DMAC/DTC, EXDMAC, RAM, extended RAM, and standby RAM modules are stopped
Deep software	RTC not used	State in which modules other than DMAC/DTC, EXDMAC, RAM, extended RAM, and standby RAM modules are stopped* ³
standby	RTC used	State in which modules other than DMAC/DTC, EXDMAC, RAM, extended RAM, and standby RAM modules are stopped* ³
Note 1. 7	To measure the curr	ent consumption of the RX651, use the sample program for the RX65N.
	The DMAC, DTC, ar bower consumption.	nd EXDMAC are put into the module stop state by the functionality for reducing

Table 1.3 Sample Program Conditions for RX65N*1

Note 3. The DMAC and DTC are put into the module stop state by the functionality for reducing power consumption.

The sample program described in this application note uses the peripheral functions listed in Table 1.4 to generate low power mode transition triggers. When a transition trigger occurs, the program transitions from the normal operating state to a low power mode, and when another transition trigger occurs while in low power mode, the program resume from the low power mode.

Table 1.4 Peripheral Functions and Their Applications

Peripheral Function	Application
Low power consumption function	Reducing power consumption
External pin interrupt (IRQ)	Transition to low power mode, resuming from low power mode
Realtime clock (RTC)	Current value measurement when using RTC* ¹ , Release triggered by RTC alarm interrupt* ²
I/O ports	Switch and LED control

Note 1. Used only in software standby modes that use the RTC.

Note 2. Used only in deep software standby modes that use the RTC.

2. Operation Confirmation Conditions

The operation of the sample program described in this application note has been confirmed under the conditions listed in Table 2.1.

3. Hardware

3.1 Pins Used

Table 3.1 to Table 3.4 list the pins used and their functions.

Table 3.1 Pins Used and Their Functions on the RX130-512KB

Pin Name	I/O	Description
P32/IRQ2	Input	SW2 input (transition to and resume from low power mode)
PD3	Output	LED0 output
		 After initial settings, on when in normal operating state
		Off at transition to low power mode
		On after resume from low power mode

Table 3.2 Pins Used and Their Functions on the RX140

Pin Name	I/O	Description
P32/IRQ2	Input	SW2 input (transition to and resume from low power mode)
P21	Output	LED0 output
		 After initial settings, on when in normal operating state
		Off at transition to low power mode
		On after resume from low power mode

Table 3.3 Pins Used and Their Functions on the RX231

Pin Name	I/O	Description
P34/IRQ4	Input	SW2 input (transition to and resume from low power mode)
P17	Output	LED0 output
		 After initial settings, on when in normal operating state
		Off at transition to low power mode
		On after resume from low power mode

Table 3.4 Pins Used and Their Functions on the RX65N-2MB

Pin Name	I/O	Description
P05/IRQ13	Input	SW2 input (transition to and resume from low power mode*1)
RES#	Input	Resuming from low power mode*1
P73	Output	LED0 output
		 After initial settings, on when in normal operating state
		Off at transition to low power mode
		On after resume from low power mode

Note 1. An interrupt (IRQ) applied to the SW pin of the RSK cannot be used to resume from deep software standby. Instead, reset the device using the RES# pin.

3.2 Hardware Configuration

3.2.1 Hardware Modifications

In order to confirm the operation of the functionality for reducing power consumption using the low power modes as described in this application note, modifications have been made to the RSK boards. On the RX231 RSK board jumper J8 is used to measure MCU current consumption, but in its state when shipped from the factory there is no jumper J8 on the board. Resistor R55 is used for the setting "Shorted Pin1-2." Therefore, the following modifications are necessary:

- 1. Remove resistor R55.
- 2. Place jumper J8 on the jumper pins.

Figure 3.1 and Figure 3.2 reproduce the documentation excerpts needed to modify the RSK board.

RSKRX231 6. Configuration

6.3 Power Supply Configuration

Table 6-3 and Table 6-4 below details the function of the option links associated with power supply configuration.

Reference	Configuration	Explanation Rel		
J8 *1	Shorted Pin1-2	Connects Board_VCC to UC_VCC.	R55	
J0	All open	Enables current probe for MCU current consumption.	R55	
	Shorted Pin1-2	Connects EXT_BATT to 5V power rail.		
J9	Shorted Pin2-3	Connects VBUS0 to 5V power rail.	J15	
	All open	Disconnects EXT_BATT and VBUS0 from 5V power rail.		
R244	Fit	Enables 1.8V regulator output.	U6	
	DNF	Enables 3.3V regulator output.	U6	
	Shorted Pin1-2	Connects regulator output to Board_VCC.	U6	
J11	Shorted Pin2-3	Disconnects regulator output from Board_VCC.	U6	
	All open	DO NOT USE	U6	
		Table 6-3: Power Supply Option Links (1)		

: By default, jumper J8 is not fitted to the RSK. R55 is fitted by default and becomes the same setting as 'J8 Shorted Pin1-2'.

Figure 3.1 Excerpt from RX231 Group: Renesas Starter Kit User's Manual

Figure 3.2 Excerpt from Renesas Starter Kit for RX231: CPU Board Schematics

For details, refer to RX231 Group: Renesas Starter Kit User's Manual (R20UT3027) and Renesas Starter Kit for RX231: CPU Board Schematics (R20UT3026).

4. Software

The sample program described in this application note is divided into separate projects for each low power mode. For details, refer to 4.3, Project Composition. The sample program described in this application note transitions to low power mode when a low power mode transition trigger occurs, and when another low power mode transition trigger occurs while in low power mode, it resumes from low power mode.

IRQ is used as the low power mode transition trigger. Table 4.1 lists the IRQ settings.

Table 4.1 IRQ Settings

Setting Item	Setting Description	
Detection type	Falling edge	
Digital filter	Disabled	
Priority	Level 15 (highest)	

4.1 Operation Overview

4.1.1 Sleep Mode

After initial settings, the program turns on the LED and waits for a low power mode transition trigger to occur. On the RX65N, after initial settings, the module stop state is released for all modules except the TSIP. When a low power mode transition trigger occurs, the program turns off the LED and transitions to sleep mode. When another low power mode transition trigger occurs while in sleep mode, the program resumes from sleep mode and turns on the LED.

Figure 4.1 shows an overview of sleep mode operation.

Figure 4.1 Overview of Sleep Mode Operation

4.1.2 Deep Sleep Mode

After initial settings, the program turns on the LED and waits for a low power mode transition trigger to occur. When a low power mode transition trigger occurs, the program turns off the LED and transitions to deep sleep mode. When another low power mode transition trigger occurs while in deep sleep mode, the program resumes from deep sleep mode and turns on the LED.

Figure 4.2 shows an overview of deep sleep mode operation.

Figure 4.2 Overview of Deep Sleep Mode Operation

4.1.3 All-Module Clock Stop Mode

After initial settings, the program turns on the LED and waits for a low power mode transition trigger to occur. When a low power mode transition trigger occurs, the program turns off the LED and transitions to all-module clock stop mode. When another low power mode transition trigger occurs while in all-module clock stop mode, the program resumes from all-module clock stop mode and turns on the LED.

Figure 4.3 shows an overview of all-module clock stop mode operation.

Figure 4.3 Overview of All-Module Clock Stop Mode Operation

4.1.4 Software Standby Mode

After initial settings, the program turns on the LED and waits for a low power mode transition trigger to occur. When a low power mode transition trigger occurs, the program turns off the LED and transitions to software standby mode. When another low power mode transition trigger occurs while in software standby mode, the program resumes from software standby mode and turns on the LED.

Figure 4.4 Overview of Software Standby Mode Operation

4.1.5 Deep Software Standby Mode

After initial settings, the program turns on the LED and waits for a low power mode transition trigger to occur. When a low power mode transition trigger occurs, the program turns off the LED and transitions to deep software standby mode. When a reset is applied using the RES# pin or RTC alarm interrupt occurs while in deep software standby mode, operation resumes from deep software standby mode.

Figure 4.5 and Figure 4.6 show an overview of deep software standby mode operation.

Figure 4.5 Overview of Deep Software Standby Mode Operation (Mode release by reset)

Figure 4.6 Overview of Deep Software Standby Mode Operation (Mode release by alarm interrupt)

4.2 Module Composition

The sample program described in this application note utilizes source code related to the components listed in Table 4.2, generated by the Code Generator function of Smart Configurator, in combination.

Figure 4.7 shows the module composition of the sample program described in this application note.

Table 4.2 List of Components

Component	Version	Resource
Board support package (BSP)	7.20	
Realtime clock	1.8.0	RTC
Low power consumption	2.3.0	LPC
Interrupt controller	2.3.0	ICU

Figure 4.7 Module Composition

4.3 **Project Composition**

Table 4.3 and Table 4.4 list the project composition described in this application note, and Figure 4.7 shows the project composition.

Table 4.3 List of Project Composition (1/2)

Target Device	Project Name	Contents
RX130	power_save_sleep_rx130	Project for confirming sleep mode on RX130-512KB
	power_save_deep_sleep_rx130	Project for confirming deep sleep mode on RX130-512KB
	power_save_software_standby_rx130	Project for confirming software standby mode on RX130-512KB

	power_save_deep_software_standby_rtc2_op eration_rx65n	Project for confirming deep software standby mode on RX65N-2MB with RTC operating (Release deep software standby mode by alarm interrupt)

Figure 4.8 Project Composition

Unzipping the ZIP archive in which this application note is distributed creates a folder of the same name that contains the folders and files shown above.

The "r01an4347_rx" folder contains separate folders for each target device, and each of these folders contain projects corresponding to the various low power modes. Each project can be imported into the e² studio workspace and then run.

4.4 File Structure

The file structure used by the sample program is shown below. The main program is generated in the folder "project folder\src\".

Example: Project for confirming sleep mode on RX231 "power_save_sleep_rx231¥src¥main.c"

Table 4.5 lists the file related to the main program of the project for confirming the low power mode.

Table 4.5 File Related to Main Program

File Name	Description
main.c	Main processing routine for confirming low power mode

The source code is generated in the folder "project folder\src\smc_gen" by the Code Generator function of Smart Configurator.

Example: Project for confirming sleep mode on RX231 "power_save_sleep_rx231¥src¥smc_gen"

Table 4.6 lists a file generated by the Code Generator function of Smart Configurator in which the source code has been modified. The folder name "project folder\src\smc_gen" is omitted.

Table 4.6 File Generated by Code Generator Function of Smart Configurator with Modified Source Code

Folder Name	File Name	Description	Remarks
Config_ICU	Config_ICU_user.c	Interrupt handler implemented by user	Processing added to r_Config_ICU_irq4_interrupt() function. For details, refer to 4.10.5, IRQ4 Interrupt Handler.

Files containing unmodified source code generated by the Code Generator function of Smart Configurator have been omitted.

4.5 Option Setting Memory

Table 4.7 and Table 4.8 list the option setting memory configuration used by the sample program. Change the settings to the optimum values for your system as needed.

Table 4.7 Option Setting Memory Configuration of Sample Program for RX130-512KB, RX140 and RX231

Symbol	Address	Setting Value	Description
OFS0	FFFF FF8Fh to FFFF FF8Ch	FFFF FFFFh	After a reset, IWDT and WDT* ¹ are stopped.
OFS1	FFFF FF8Bh to FFFF FF88h	FFFF FFFFh	Fast startup time is disabled.
			After a reset, voltage monitoring 0 reset is disabled.
			After a reset, HOCO oscillation is disabled.
MDE	FFFF FF83h to FFFF FF80h	FFFF FFFFh	Little-endian
Noto 1	WDT applies to the PV221 Croups only		

Note 1. WDT applies to the RX231 Groups only.

Table 4.8 Option Setting Memory Configuration of Sample Program for RX65N-2MB

Symbol	Address	Setting Value	Description
OFS0	FE7F 5D04h to FE7F 5D07h	FFFF FFFFh	After a reset, IWDT and WDT are stopped.
OFS1	FE7F 5D08h to FE7F 5D0Bh	FFFF FFFFh	After a reset, voltage monitoring 0 reset is disabled. After a reset, HOCO oscillation is disabled.
MDE	FE7F 5D00h to FE7F 5D03h	FFFF FFFFh	Little-endian

4.6 Constants

Table 4.9 lists the constants used by the sample program.

Table 4.9 Constants Used by Sample Program

Constant Name	Setting Value	Description
LED_ON	(0)	LED is on
LED_OFF	(1)	LED is off
LED0	(PORTD.PODR.BIT.B3)	LED0 (PD3) PODR register bit (used by sample program for RX130-512KB)
	(PORT2.PODR.BIT.B1)	LED0 (P21) PODR register bit (used by sample program for RX140)
	(PORT1.PODR.BIT.B7)	LED0 (P17) PODR register bit (used by sample program for RX231)
	(PORT7.PODR.BIT.B3)	LED0 (P73) PODR register bit (used by sample program for RX65N-2MB)
ALARMSET	(30)	Number of seconds from transition to deep software standby mode to mode release by RTC alarm interrupt (used by sample program for RX65N-2MB)

4.7 Variables

Table 4.10 lists the global variables.

Table 4.10 Global Variables

Туре	Variable Name	Description
extern volatile bool	g_sw_pressed	State indicating whether or not switch is depressed False: Not depressed True: Depressed

4.8 Functions

Table 4.11 lists the functions used by the sample program.

Function Name	Description
main	Main processing routine
save_power_port_init	Initial port settings
save_power_peripheral_init	Initial peripheral function settings
save_power_wait_trigger	Wait for low power mode transition trigger
alarm_setting	Setting RTC alarm interrupt (used by sample program for RX65N- 2MB)
convert_to_dec	Conversion process to decimal number (used by sample program for RX65N-2MB)
r_Config_ICU_irq2_interrupt*1	IRQ2 interrupt handler (used by sample program for RX130-512KB and RX140)
r_Config_ICU_irq4_interrupt*1	IRQ4 interrupt handler (used by sample program for RX231)
r_Config_ICU_irq13_interrupt*1	IRQ13 interrupt handler (used by sample program for RX65N-2MB)

Note 1. Of the functions generated by the Code Generator function of Smart Configurator, only those whose source code has been modified are listed. Functions consisting of unmodified source code generated by the Code Generator function of Smart Configurator have been omitted.

4.9 Function Specifications

The specifications of sample program functions are presented below.

main	
Outline	Main processing routine
Header	None
Declaration	void main (void)
Description	After initial settings, transitions to and then resumes from low power mode.
Arguments	None
Return Value	None

_save_power_port_init		
Outline	Initial port settings	
Header	None	
Declaration	void save_power_port_init (void)	
Description	Makes initial port settings.	
Arguments	None	
Return Value	None	

save_power_peripheral_init		
Outline	Initial peripheral function settings	
Header	None	
Declaration	void save_power_peripheral_init (void)	
Description	Makes initial peripheral function settings.	
Arguments	None	
Return Value	None	

save_power_wait_trigger		
Outline	Wait for low power mode transition trigger	
Header	None	
Declaration	void save_power_wait_trigger (void)	
Description	Waits for the low power mode transition trigger (IRQ) to occur.	
Arguments	None	
Return Value	None	

alarm_setting	
Outline	Setting RTC alarm interrupt
Header	None
Declaration	void alarm_setting(void)
Description	Sets the time to release deep software standby mode by an RTC alarm interrupt.
	The sample program only supports minutes and seconds. (used by sample program for RX65N-2MB)
Arguments	None
Return Value	None

convert_to_dec	
Outline	Conversion process to decimal number
Header	None
Declaration	uint8_t convert_to_dec(uint8_t time)
Description	Convert the value obtained from the minute and second counter bits to decimal. (used by sample program for RX65N-2MB)
Arguments	uint8_t time
Return Value	uint8_t time_dec

r_Config_ICU_irq2_interrupt		
Outline	IRQ2 interrupt handler	
Header	Config_ICU.h	
Declaration	static void r_Config_ICU_irq2_interrupt (void)	
Description	Processes the IRQ2 interrupt.	
	The IRQ2 interrupt handler sets the switch-depressed state (g_sw_pressed) to true.	
	(used by sample program for RX130-512KB and RX140)	
Arguments	None	
Return Value	None	
Notes	This function is generated by the Code Generator function of Smart Configurator.	

r_Config_ICU_irq4_interrupt		
IRQ4 interrupt handler		
Config_ICU.h		
static void r_Config_ICU_irq4_interrupt (void)		
Processes the IRQ4 interrupt.		
The IRQ4 interrupt handler sets the switch-depressed state (g_sw_pressed) to true.		
(used by sample program for RX231)		
None		
None		
This function is generated by the Code Generator function of Smart Configurator.		
1		

r_Config_ICU_irq13_interrupt		
Outline	IRQ13 interrupt handler	
Header	Config_ICU.h	
Declaration	static void r_Config_ICU_irq13_interrupt (void)	
Description	Processes the IRQ13 interrupt.	
	The IRQ13 interrupt handler sets the switch-depressed state (g_sw_pressed) to true. (used by sample program for RX65N-2MB)	
Arguments	None	
Return Value	None	
Notes	This function is generated by the Code Generator function of Smart Configurator.	

4.10 Flowcharts

As an example, a flowchart of the sample program for the RX231 is shown below. In addition, the RX65N is used as an example of the main processing routine of the sample program when transitioning to deep software standby mode.

The sample program described in this application note includes code generated by the Code Generator function of Smart Configurator. Refer to 4.10.5, IRQ4 Interrupt Handler, regarding the modified portions of the source code generated by the Code Generator function of Smart Configurator. Flowcharts have been omitted for unmodified source code generated by the Code Generator function of Smart Configurator.

Figure 4.16 is a flowchart of the IRQ4 interrupt handler.

Figure 4.16 IRQ4 Interrupt Handler

5. Using the Smart Configurator to Perform Configuration

When configuring the sample projects using Smart Configurator, the relevant settings for each sample project are maintained in the Configuration menu of Smart Configurator. For documentation on how to use Smart Configurator, refer to Renesas e² studio Smart Configurator User's Guide (R20AN0451).

6. Notes on Transition to a Low Power Consumption Mode

- (1) Clocks operate in some low power consumption modes such as sleep mode. To reduce current consumption, stop unnecessary clocks or lower their frequencies by changing the division ratio.
- (2) Function-specific notes might apply to some peripheral functions when the operating state changes to the module stop state or when the operating mode changes to a low power consumption mode. For the notes that apply to a specific peripheral function, refer to the documentation for the peripheral function.
- (3) In some low power consumption modes such as software standby mode, operation of the I/O ports cannot be changed. Therefore, make sure that the appropriate I/O settings are specified before the operating mode changes to such a low power consumption mode. Table 6.1 shows Setting example of I/O port.

State of the I/O port	Port settings to reduce current consumption
Input setting	Fix the input level (High or Low).
	There are many pins that become high impedance during standby mode by setting them to input.
Output setting	Output a level that does not create a potential difference in external pull-up/pull-down resistors.
	If a pin of connected device is in an input state and there is no external/internal pull-up/pull-down resistor, output low.

Table 6.1 Setting example of I/O port

- (4) A board consumes more current if an emulator is connected to the board. Therefore, when you measure the current consumption of a board, make sure that no emulator is connected to the board.
- (5) A current consumption measurement program cannot correctly measure the current consumption if the program is written from e² studio in debug mode. Use Renesas Flash Programmer or another flash memory programming software tool to write the program.

7. Appendix

7.1 Operating Frequencies of Each Project

Table 7.1 to Table 7.11 list the operating frequencies used when confirming the operation of the program described in this application note.

Table 7.1 Operating Frequencies of Project for Confirmation of Sleep Mode and Deep Sleep Mode on RX130-512KB

Name	Operating Frequency	Clock Source	Division Ratio	Multiplication Ratio
Main clock	8 MHz

Revision History

		Description		
Rev.	Date	Page	Summary	
1.10	Sep. 14, 2018		First edition issued	
1.20	Jun. 06, 2022	-	Added target devices (RX140 group).	
		-	Deleted sample program for the RX230.	
		4	Added a list of modes supported by devices.	
		4	Added the RX140 to the devices applicable to the sample	
			program conditions.	
		6	Updated the conditions under which operation was verified.	
		7	Added a list of pins used on the RX140.	
		14	Updated the version information of components.	
		15	Added projects for the RX140 in the list of projects.	
		16	Added a new project for the RX65N in the list of projects.	
		19	Added constant information about the RX140 to the table of	
			constants used by the sample program.	
		19	Added ALARMSET to the table of constants used by the	
			sample program.	
		20	Added alarm_setting and convert_to_dec to the table of	
			functions used by the sample program.	
		21, 22	Added alarm_setting and convert_to_dec to the table of	
			function specifications used by the sample program.	
		23	Updated flowchart of main function.	
		28	Added flowchart of alarm_setting function	
		29	Added flowchart of convert_to_dec function	
		30	Added a chapter on the notes on transition to a low power	
			consumption mode.	
		30	Delete the chapter on troubleshooting.	
		32, 33	Added a table of operating frequencies used for confirmation of	
			program operation on the RX140.	

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power is supplied until the power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

- Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
- Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
- 3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
- 5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
- Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

- 7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
- 8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
- 9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
- 10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
- 12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
- This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
 Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
- (Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
- (Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
