

General Description

The 870919I-01 is an LVCMS clock generator that uses an internal phase lock loop (PLL) for frequency multiplication and to lock the low-skew outputs to the selected reference clock. The device offers eight outputs. The PLL loop filter is completely internal and does not require external components. Several output configurations of the PLL feedback and a divide-by-2 (controlled by FREQ_SEL) allow applications to optimize frequency generation over a wide range of input reference frequencies. The PLL can also be disabled by the PLL_EN control signal to allow for low frequency or DC testing. The LOCK output asserts to indicate when phase-lock has been achieved. The 870919I-01 device is a member of the family of high performance clock solutions from IDT.

Features

- Two selectable single-ended input reference clocks
- Eight single-ended clock outputs
- Internal PLL does not require external loop filter components
- 5V tolerant inputs
- Maximum output frequency: 160MHz, (2XQ output)
- Maximum output frequency: 80MHz, (Q0:Q4 and nQ5 outputs)
- LVCMS interface levels for all inputs and outputs
- PLL disable feature for low-frequency testing
- PLL lock output
- Selectable synchronization of output to input edge
- Output drive capability: $\pm 24\text{mA}$
- Output skew: 300ps (maximum), Q0:Q4
- Output skew: 500ps (maximum), all outputs
- Full 3.3V supply voltage
- Available in lead-free packages
- -40°C to 85°C ambient operating temperature
- Fully pin and function compatible with the IDT QS5LV919 (including 55, 70, 100, 133 and 160MHz options)
- **For functional replacement part use 8T49N285**

Table 1. Pin Descriptions

Number	Name	Type	Description	
1, 13, 17, 20, 24	GND	Power	Power supply ground.	
2	nQ5	Output	Single-ended clock output (phase is inverted with respect to other outputs). LVC MOS/LV TTL interface levels	
3, 15, 22, 27	V _{DD}	Power	Positive power supply pins.	
4	OE/nRST	Input	Output enable and asynchronous reset. Resets all outputs. Logic LOW, the outputs are in a high impedance state. Logic HIGH enables all outputs. Internally a Power On reset circuit will ensure that the nQ5 output is inverted relative to Q[4:0]. If OE/nRST is pulsed low, it must be held low for a minimum of 10 ns for a complete reset operation. This reset may be applied asynchronously to the input reference.	
5	FEEDBACK	Input	PLL feedback input which is connected to one of the clock outputs to close the PLL feedback loop. LVC MOS/LV TTL interface levels.	
6	REF_SEL	Input	Input reference clock select. Logic LOW selects the SYNC0. Logic HIGH selects the SYNC1 input as the PLL reference input. LVC MOS/LV TTL interface levels.	
7, 11	SYNC0, SYNC1	Input	Single-ended reference clock inputs. LVC MOS/LV TTL interface levels.	
8	AVDD	Power	Positive power supply for the PLL.	
9	nPE	Input	Pulldown	Output phase synchronization. In PLL mode (PLL_EN = HIGH) and when logic LOW, the rising edges of the outputs (2XQ, Q0:Q4, Q/2) are synchronized to the rising edge of the selected reference clock (SYNCn). In PLL mode (PLL_EN = HIGH) and when logic HIGH, the falling edges of the outputs (2XQ, Q0:Q4, Q/2) are synchronized to the falling edge of the selected reference clock (SYNCn). LVC MOS/LV TTL interface levels.
10	AGND	Power	Power supply ground for the PLL. Internally connected to GND.	
12	FREQ_SEL	Input	Frequency select. Logic LOW level inserts a divide-by-2 into the PLL output and feedback path. Logic HIGH inserts a divide-by-1 into the PLL output and feedback path. LVC MOS/LV TTL interface levels.	
14, 16, 21, 23, 28	Q0, Q1, Q2, Q3, Q4	Output	Single-ended clock outputs. LVC MOS/LV TTL interface levels.	
18	PLL_EN	Input	PLL enable. Enable and disables the PLL. Logic HIGH enables the PLL. Logic LOW disables the PLL and the input reference signal is routed to the output dividers (PLL bypass). LVC MOS/LV TTL interface levels.	
19	LOCK	Output	PLL lock indication output. Logic HIGH indicates PLL lock. Logic LOW indicates PLL is not locked. LVC MOS/LV TTL interface levels.	
25	Q/2	Output	Single-ended clock output. LVC MOS/LV TTL interface levels.	
26	2XQ	Output	Single-ended clock output. LVC MOS/LV TTL interface levels.	

NOTE: *Pulldown* refers to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C_{IN}	Input Capacitance			4		pF
C_{PD}	Power Dissipation Capacitance (total)	$V_{DD} = AV_{DD} = 3.6V$		330		pF
$R_{PULLDOWN}$	Input Pulldown Resistor	nPE		56		k Ω
R_{OUT}	Output Impedance			11		Ω

Device Configuration

The 870919I-01 requires a connection of one of the clock outputs to the FEEDBACK input to close the PLL feedback path. The selection of the output (output divider) for PLL feedback will impact the device

configuration and input to output frequency ratio and frequency ranges. See [Table 3G](#) for details.

Function Tables**Table 3A. OE/nRST Mode Configuration Table**

Input	Operation
OE/nRST	
0	Device is reset and the outputs Q0:Q4, nQ5, 2XQ, Q/2 are in high-impedance state. This control is asynchronous.
1	Outputs are enabled.

Table 3B. REF_SEL Mode Configuration Table

Input	Operation
REF_SEL	
0	SYNC0 is the selected PLL reference clock.
1	SYNC1 is the selected PLL reference clock.

Table 3C. nPE Mode Configuration Table

Input	Operation
nPE	
0	The rising edge of the 2XQ, Q0:Q4 and Q/2 outputs and the falling edge of the nQ5 output are synchronized.
1	The falling edge of the 2XQ, Q0:Q4 and Q/2 outputs and the rising edge of the nQ5 output are synchronized.

Table 3D. FREQ_SEL Mode Configuration Table

Input	Operation
FREQ_SEL	Operation
0	The VCO output is frequency-divided by 2. This setting allows for a lower input frequency range. See also table 3G for available frequency ranges.
1	The VCO output is frequency-divided by 1. This setting allows for a higher input frequency range. See also table 3G for available frequency ranges.

Table 3E. PLL_EN Mode Configuration Table

Input	Operation
PLL_EN	Operation
0	The PLL is bypassed. The selected input reference clock is routed to the output dividers for low-frequency board test purpose. The PLL-related AC specifications do not apply in PLL bypass mode.
1	The PLL is enabled and locks to the selected input reference signal.

Table 3F. LOCK Mode Configuration Table

Output	Operation
LOCK	Operation
0	PLL is not locked to the selected input reference clock.
1	PLL is locked to the selected input reference clock.

Table 3G. Frequency Configuration Table

Outputs Used for PLL Feedback	FREQ_SEL	Input Frequency Range (MHz)	Output Frequency Range (MHz) and Output-to-Input Frequency Multiplication Factor		
		SYNC[0:1]	Q[0:4], nQ5 ^{NOTE1}	2XQ	Q/2
Q0, Q1, Q2, Q3, Q4 or nQ5	0	5 - 40	5 - 40 (1x)	10 - 80 (2x)	2.5 - 20 (0.5x)
	1	10 - 80	10 - 80 (1x)	20 - 160 (2x)	5 - 40 (0.5x)
2XQ	0	10 - 80	5 - 40 (0.5x)	10 - 80 (1x)	2.5 - 20 (0.25x)
	1	20 - 100 ^{NOTE2}	10 - 50 (0.5x)	20 - 100 (1x)	5 - 25 (0.25x)
Q/2	0	2.5 - 20	5 - 40 (2x)	10 - 80 (4x)	2.5 - 20 (1x)
	1	5 - 40	10 - 80 (2x)	20 - 160 (4x)	5 - 40 (1x)

NOTE 1: The nQ5 output is inverted (180° phase shift) with respect to Q0:Q4.

NOTE 2: The input reference frequency is limited to 100MHz maximum.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, $V_{DD(ABS\ MAX)}$	4.6V
Inputs, V_I	-0.5V to $V_{DD(ABS\ MAX)} + 0.5V$
Outputs, V_O	-0.5V to $V_{DD(ABS\ MAX)} + 0.5V$
Package Thermal Impedance, θ_{JA} 28 Lead QSOP 28 Lead PLCC	66.0°C/W (0 lfpm) 46.4°C/W (0 lfpm)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = AV_{DD} = 3.3V \pm 0.3V$, $T_A = -40^\circ\text{C}$ to 85°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units

t_R / t_F	Output Rise/ Fall Time	Q[0:4], nQ5, 2XQ, Q/2	0.8V – 2.0V	0.2		2	ns
t_{LOCK}	PLL Lock Time					10	ms

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at $V_{DD}/2$.

NOTE 2: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 3: Measured between coincident rising output edges of Q0:Q4, 2XQ, Q/2 and the falling edge of nQ5.

NOTE 4: Defined as the time difference between the input reference clock and the average feedback input signal when the PLL is locked and the input reference frequency is stable.

NOTE 5: These parameters are guaranteed by characterization. Not tested in production.

Schematic Layout

Figure 1 shows an example of 870919I-01 application schematic. In this example, the device is operated at $VDD=AVDD=3.3V$. As with any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 870919I-01 provides separate power supplies to isolate any high switching noise from coupling into the internal PLL.

In order to achieve the best possible filtering, it is recommended that the placement of the filter components be on the device side of the PCB as close to the power pins as possible. If space is limited, the $0.1\mu F$ capacitor in each power pin filter should be placed on the device side. The other components can be on the opposite side of the PCB. Power supply filter recommendations are a general guideline to be used for reducing external noise from coupling into the devices.

The filter performance is designed for a wide range of noise frequencies. This low-pass filter starts to attenuate noise at approximately 10 kHz. If a specific frequency noise component is known, such as switching power supplies frequencies, it is recommended that component values be adjusted and if required, additional filtering be added. Additionally, good general design practices for power plane voltage stability suggests adding bulk capacitance in the local area of all devices.

The schematic example focuses on functional connections and is not configuration specific. Refer to the pin description and functional tables in the datasheet to ensure that the logic control inputs are properly set.

Figure 1. 870919I-01 Application Schematic

Power Considerations

This section provides information on power dissipation and junction temperature for the 870919I-01. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 870919I-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 0.3V = 3.6V$, which gives worst case results.

- Power (core)_{MAX} = $V_{DD_MAX} * I_{DD_MAX} = 3.6V * 5mA = 18mW$
- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DD}/2$
Output Current $I_{OUT} = V_{DD_MAX} / [2 * (50\Omega + R_{OUT})] = 3.6V / [2 * (50\Omega + 11\Omega)] = 29.5mA$
- Power Dissipation on the R_{OUT} per LVC MOS output
Power (R_{OUT}) = $R_{OUT} * (I_{OUT})^2 = 11\Omega * (29.5mA)^2 = 9.57mW$ per output
- Total Power (R_{OUT}) = R_{OUT} (per output) * number of outputs = $9.57mW * 8$ outputs = **76.56mW**

Dynamic Power Dissipation for Q = 80MHz

$$\text{Power (80MHz)} = C_{PD} * \text{Frequency} * (V_{DD})^2 = 330pF * 80MHz * (3.6V)^2 = 342mW$$

Total Power

$$\begin{aligned} &= \text{Power (core)}_{MAX} + \text{Total Power (R}_{OUT}\text{)} + \text{Power (80MHz)} \\ &= 18mW + 76.56mW + 342mW \\ &= \mathbf{436.56mW} \end{aligned}$$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C .

The equation for T_j is as follows: $T_j = \theta_{JA} * P_{d_total} + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

P_{d_total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 66°C/W per Table 6 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.437W * 66^\circ\text{C/W} = 113.8^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).
