

The Freescale MC100ES6254 is a bipolar monolithic differential 2x2 clock switch and fanout buffer. Designed for most demanding clock distribution systems, the MC100ES6254 supports various applications that require a large number of outputs to drive precisely aligned clock signals. The device is capable of driving and switching differential LVPECL signals. Using SiGe technology and a fully differential architecture, the device offers superior digital signal characteristics and very low clock skew error. Target applications for this clock driver are high performance clock/data switching, clock distribution or data loopback in computing, networking and telecommunication systems.

## Features

- Fully differential architecture from input to all outputs
- SiGe technology supports near-zero output skew
- Supports DC to 3GHz operation<sup>(1)</sup> of clock or data signals
- LVPECL compatible differential clock inputs and outputs
- LVCMOS compatible control inputs
- Single 3.3 V or 2.5 V supply
- 50 ps maximum device skew<sup>(1)</sup>
- Synchronous output enable eliminating output runt pulse generation and metastability
- Standard 32 lead LQFP package
- Industrial temperature range
- 32-lead Pb-free package

## Functional Description

MC100ES6254 is designed for very skew critical differential clock distribution systems and supports clock frequencies from DC up to 3.0GHz. Typical applications for the MC100ES6254 are primary clock distribution, switching and loopback systems of high-performance computer, networking and telecommunication systems, as well as on-board clocking of OC-3, OC-12 and OC-48 speed communication systems. Primary purpose of the MC100ES6254 is high-speed clock switching applications. In addition, the MC100ES6254 can be configured as single 1:6 or dual 1:3 LVPECL fanout buffer for clock signals, or as loopback device in high-speed data applications.

The MC100ES6254 can be operated from a 3.3 V or 2.5 V positive supply without the requirement of a negative supply line.

$\theta_{JC}$	Thermal resistance junction to case		23.0	26.3	°C/W	MIL-SPEC 883E Method 1012.1
	Operating junction temperature <sup>(2)</sup> (continuous operation) MTBF = 9.1 years			110	°C	
$T_{Func}$	Functional temperature range	$T_A = -40$		$T_J = +110$	°C	

1. Output termination voltage  $V_{TT} = 0$  V for  $V_{CC} = 2.5$  V operation is supported but the power consumption of the device will increase.
2. Operating junction temperature impacts device life time. Maximum continuous operating junction temperature should be selected according to the application life time requirements (See application note AN1545 and the application section in this data sheet for more information). The device AC and DC parameters are specified up to 110°C junction temperature allowing the MC100ES6254 to be used in applications requiring industrial temperature range. It is recommended that users of the MC100ES6254 employ thermal modeling analysis to assist in applying the junction temperature specifications to their particular application.

**Table 6. DC Characteristics** ( $V_{CC} = 3.3\text{ V} \pm 5\%$  or  $2.5\text{ V} \pm 5\%$ ,  $T_J = 0^\circ$  to  $+110^\circ\text{C}$ )

Symbol	Characteristics	Min	Typ	Max	Unit	Condition
LVCMOS Control Inputs ( $\overline{\text{OEA}}$ , $\overline{\text{OEB}}$ , $\overline{\text{SEL0}}$ , $\overline{\text{SEL1}}$ )						
$V_{IL}$	Input Voltage Low			0.8	V	
$V_{IH}$	Input Voltage High	2.0			V	
$I_{IN}$	Input Current <sup>(1)</sup>			$\pm 100$	$\mu\text{A}$	$V_{IN} = V_{CC}$ or $V_{IN} = \text{GND}$
--+ Clock Inputs ( $\overline{\text{CLK0}}$ , $\overline{\text{CLK0}}$ , $\overline{\text{CLK1}}$ , $\overline{\text{CLK1}}$ )						
$V_{PP}$	AC differential input voltage <sup>(2)</sup>	0.1		1.3	V	Differential operation
$V_{CMR}$	Differential cross point voltage <sup>(3)</sup>	1.0		$V_{CC}-0.3$	V	Differential operation
LVPECL Clock Outputs ( $\overline{\text{QA0-2}}$ , $\overline{\text{QA0-2}}$ , $\overline{\text{QB0-2}}$ , $\overline{\text{QB0-2}}$ )						
$V_{OH}$	Output High Voltage	$V_{CC}-1.2$	$V_{CC}-1.005$	$V_{CC}-0.7$	V	$I_{OH} = -30\text{ mA}$ <sup>(4)</sup>
$V_{OL}$	Output Low Voltage	$V_{CC} = 3.3\text{ V} \pm 5\%$ $V_{CC} = 2.5\text{ V} \pm 5\%$	$V_{CC}-1.9$ $V_{CC}-1.9$	$V_{CC}-1.705$ $V_{CC}-1.705$	$V_{CC}-1.5$ $V_{CC}-1.3$	$I_{OL} = -5\text{ mA}$ <sup>(5)</sup>
Supply Current						
$I_{GND}$	Maximum Quiescent Supply Current without output termination current		52	85	mA	GND pin

1. Inputs have internal pullup/pulldown resistors that affect the input current.

2.  $V_{PP}$  is the minimum differential input voltage swing required to maintain AC characteristic.

3.  $V_{CMR}$  (DC) is the crosspoint of the differential input signal. Functional operation is obtained when the crosspoint is within the  $V_{CMR}$  (DC) range and the input swing lies within the  $V_{PP}$  (DC) specification.

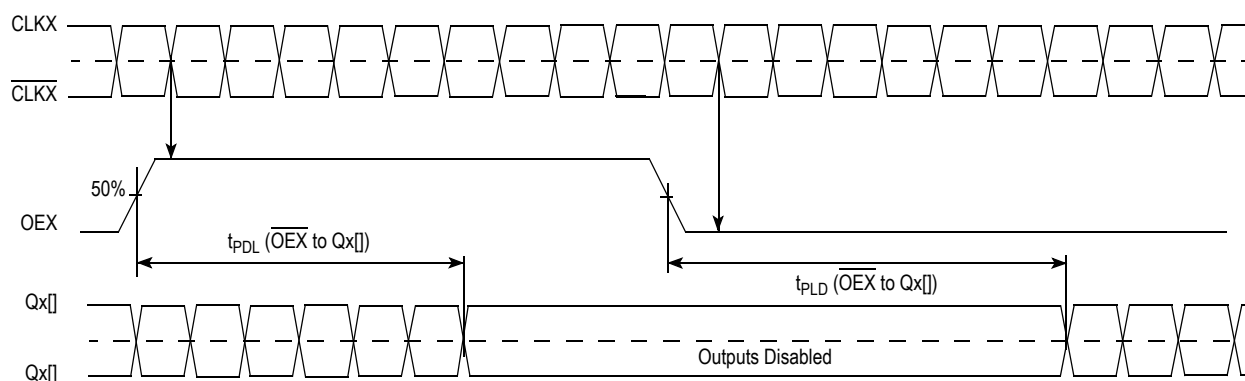

4. Equivalent to a termination  $50\ \Omega$  to  $V_{TT}$ .

5.  $I_{CC}$  calculation:  $I_{CC} = (\text{number of differential output pairs used}) * (I_{OH} + I_{OL}) + I_{GND}$   
 $I_{CC} = (\text{number of differential output pairs used}) * (V_{OH}-V_{TT}) \div R_{load} + (V_{OL}-V_{TT}) \div R_{load} + I_{GND}$

**Table 7. AC Characteristics** ( $V_{CC} = 3.3\text{ V} \pm 5\%$  or  $2.5\text{ V} \pm 5\%$ ,  $T_J = 0^\circ$  to  $+110^\circ\text{C}$ )<sup>(1)</sup>

Symbol	Characteristics	Min	Typ	Max	Unit	Condition
$V_{PP}$	Differential Input Voltage <sup>(2)</sup> (peak-to-peak)	0.3		1.3	V	
$V_{CMR}$	Differential Input Crosspoint Voltage <sup>(3)</sup>	1.2		$V_{CC}-0.3$	V	
$V_{O(P-P)}$	Differential Output Voltage (peak-to-peak) $f_O < 1.1\text{GHz}$ $f_O < 2.5\text{GHz}$ $f_O < 3.0\text{GHz}$	0.45 0.35 0.20	0.7 0.55 0.35		V V V	
$f_{CLK}$	Input Frequency	0		3000 <sup>(4)</sup>	MHz	
$t_{PD}$	Propagation Delay CLK, 1 to QA[] or QB[]	360	485	610	ps	Differential
$t_{sk(O)}$	Output-to-Output Skew			50	ps	Differential
$t_{sk(PP)}$	Output-to-Output Skew (part-to-part)			250	ps	Differential
$t_{sk(P)}$	Output Pulse Skew <sup>(5)</sup>			60	ps	
$DC_O$	Output Duty Cycle $t_{REF} < 100\text{MHz}$ $t_{REF} < 800\text{MHz}$	49.4 45.2		50.6 54.8	% %	$DC_{fref} = 50\%$ $DC_{fref} = 50\%$
$t_{JIT(CC)}$	Output Cycle-to-Cycle Jitter (SEL0 $\neq$ SEL1)			TBD		
$t_r, t_f$	Output Rise/Fall Time	0.05		300	ps	20% to 80%
$t_{PDL}^{(6)}$	Output Disable Time	$2.5 \cdot T + t_{PD}$		$3.5 \cdot T + t_{PD}$	ns	$T = \text{CLK period}$
$t_{PLD}^{(7)}$	Output Enable Time	$3 \cdot T + t_{PD}$		$4 \cdot T + t_{PD}$	ns	$T = \text{CLK period}$

1. AC characteristics apply for parallel output termination of  $50\ \Omega$  to  $V_{TT}$ .
2.  $V_{PP}$  is the minimum differential input voltage swing required to maintain AC characteristics including  $t_{PD}$  and device-to-device skew.
3.  $V_{CMR}$  (AC) is the crosspoint of the differential input signal. Normal AC operation is obtained when the crosspoint is within the  $V_{CMR}$  (AC) range and the input swing lies within the  $V_{PP}$  (AC) specification. Violation of  $V_{CMR}$  (AC) or  $V_{PP}$  (AC) impacts the device propagation delay, device and part-to-part skew.
4. The MC100ES6254 is fully operational up to 3.0 GHz and is characterized up to 2.7GHz.
5. Output pulse skew is the absolute difference of the propagation delay times:  $|t_{PLH} - t_{PHL}|$ .
6. Propagation delay  $\overline{OE}$  deassertion to differential output disabled (differential low: true output low, complementary output high).
7. Propagation delay  $\overline{OE}$  assertion to output enabled (active).

#### 1:6 CLOCK FANOUT BUFFER

#### LOOPBACK DEVICE

SEL0	SEL1	Switch Configuration
0	0	System loopback
0	1	Line loopback
1	0	Transmit/Receive operation
1	1	System and line loopback

### Understanding the Junction Temperature Range of the MC100ES6254

To make the optimum use of high clock frequency and low skew capabilities of the MC100ES6254, the MC100ES6254 is specified, characterized and tested for the junction temperature range of  $T_J = 0^\circ\text{C}$  to  $+110^\circ\text{C}$ . Because the exact thermal performance depends on the PCB type, design, thermal management and natural or forced air convection, the junction temperature provides an exact way to correlate the application specific conditions to the published performance data of this data sheet. The correlation of the junction temperature range to the application ambient temperature range and vice versa can be done by calculation:

$$T_J = T_A + R_{thja} \cdot P_{tot}$$

Assuming a thermal resistance (junction to ambient) of  $54.4^\circ\text{C/W}$  (2s2p board, 200 ft/min airflow, refer to Table 8) and a typical power consumption of 467mW (all outputs terminated  $50\ \Omega$  to  $V_{TT}$ ,  $V_{CC} = 3.3\ \text{V}$ , frequency independent), the junction temperature of the MC100ES6254 is approximately  $T_A + 24.5^\circ\text{C}$ , and the minimum ambient temperature in this example case calculates to  $-24.5^\circ\text{C}$  (the maximum ambient temperature is  $85.5^\circ\text{C}$ , refer to Table 8). Exceeding the minimum junction temperature specification of the MC100ES6254 does not have a significant impact on the device functionality. However, the continuous use the MC100ES6254 at high ambient temperatures requires thermal management to not exceed the specified maximum junction temperature. Refer to the Freescale application note AN1545 for a power consumption calculation guideline.

Table 8. Ambient Temperature Range ( $P_{tot} = 467\ \text{mW}$ )

$R_{thja}$ (2s2p board)		$T_{A, \min}^{(1)}$	$T_{A, \max}$
Natural Convection	$59.0^\circ\text{C/W}$	$-28^\circ\text{C}$	$82^\circ\text{C}$
100 ft/min	$54.4^\circ\text{C/W}$	$-25^\circ\text{C}$	$85^\circ\text{C}$
200 ft/min	$52.5^\circ\text{C/W}$	$-24.5^\circ\text{C}$	$85.5^\circ\text{C}$
400 ft/min	$50.4^\circ\text{C/W}$	$-23.5^\circ\text{C}$	$86.5^\circ\text{C}$
800 ft/min	$47.8^\circ\text{C/W}$	$-22^\circ\text{C}$	$88^\circ\text{C}$

1. The MC100ES6254 device function is guaranteed from  $T_A = -40^\circ\text{C}$  to  $T_J = 110^\circ\text{C}$ .

## Maintaining Lowest Device Skew

The MC100ES6254 guarantees low output-to-output bank skew of 50 ps and a part-to-part skew of maximum 250 ps. To ensure low skew clock signals in the application, both outputs of any differential output pair need to be terminated identically, even if only one output is used. When fewer than all nine output pairs are used, identical termination of all output pairs within the output bank is recommended. If an entire output bank is not used, it is recommended to leave all of these outputs open and unterminated. This will reduce the device power consumption while maintaining minimum output skew.

## Power Supply Bypassing

The MC100ES6254 is a mixed analog/digital product. The differential architecture of the MC100ES6254 supports low noise signal operation at high frequencies. In order to maintain its superior signal quality, all  $V_{CC}$  pins should be bypassed by high-frequency ceramic capacitors connected to GND. If the spectral frequencies of the internally generated switching noise on the supply pins cross the series resonant point of an individual bypass capacitor, its overall impedance begins to look inductive and thus increases with increasing frequency. The parallel capacitor combination shown ensures that a low impedance path to ground exists for frequencies well above the noise bandwidth.
