

## RC193xx

PCIe Gen7 1.8V 2-Input Clock Mux Family with LOS

## Description

The RC193xx (RC19302, RC19304, RC19308) ultra-high performance clock muxes support PCIe Gen 1-7. They provide a Loss-Of-Signal (LOS) output for system monitoring and redundancy. The devices also incorporate Power Down Tolerance (PDT), Flexible Power Sequencing (FPS), and Automatic Clock Parking (ACP) features, easing system design. They can drive both source-terminated and double-terminated loads, operating up to 400MHz.

The family offers 2, 4, or 8 Low-Power (LP) HCSL output pairs in  $3 \times 3$ ,  $4 \times 4$ , and  $6 \times 6$  mm packages. The buffers support both Common Clock (CC) and Independent Reference (IR) PCIe clock architectures.

## Applications

- Cloud/High-performance computing
- nVME storage
- Networking
- AI Accelerators

## Features

- Very Low Additive Phase Jitter:
  - PCIe Gen5 CC: 6.9fs RMS (typ.)
  - PCIe Gen6 CC: 4.1fs RMS (typ.)
  - PCIe Gen7 CC: 2.9fs RMS (typ.)
  - DB2000Q: 11.5fs RMS (typ.)
  - 12kHz - 20MHz (156.25MHz): 42.8fs RMS (typ.)
- 2:N or dual x 1:N/2 modes (N is number of outputs)
- Power Down Tolerant (PDT) inputs
- Flexible Startup Sequencing (FSS)
- Automatic Clock Parking (ACP) upon loss of selected CLKIN
- Spread-spectrum tolerant
- CLKIN accepts HCSL or LVDS signal levels
- Dedicated OEb pin per output
- 40 to +105°C, 1.8V  $\pm$  5% operation
- Devices provide:
  - Pin or SMBus selectable 34Ω, 85Ω, or 100Ω differential output impedance
  - Pin or SMBus selectable output slew rate
  - Pin or SMBus selectable output amplitude
  - 9 SMBus addresses plus write protection

## 1. Pin Information

### 1.1 Signal Types

Term	Description
I	Input
O	Input
OD	Open Drain Output
I/O	Bi-Directional
PD	Pull-down
PU	Pull-up
Z	Tristate
D	Driven
X	Don't care
SE	Single-ended
DIF	Differential
PWR	3.3 V power
GND	Ground
PDT	Power Down Tolerant: These signals tolerate being driven when the device is powered down (VDD is not present).

Pin Number	Pin Name	Type	Description
1	ZOUTSEL_tri	I, SE, PD	Input to select differential output impedance. 0 = $85\Omega$ , 1 = $100\Omega$ , M = $34\Omega$ ,
2	VDDDIG	PWR	Digital power.
3	PWRGD_PWRDNb	I, SE, PU, PDT	Input notifies device to sample latched inputs and start up on first high assertion. Low enters Power Down Mode, subsequent high assertions exit Power Down Mode.
4	CLKIN0	I, DIF	True clock input.
5	CLKINb0	I, DIF	Complementary clock input.
6	VDDIN0	PWR	Power supply for clock input 0.
7	SADR_tri0	I, SE, PD, PU	SMBus address bit. This is a tri-level input that works in conjunction with other SADR pins, if present, to decode SMBus Addresses. See the <a href="#">SMBus Address Selection (RC19308)</a> table and refer to the tri-level input thresholds in the electrical tables.
8	CLKIN1	I, DIF	True clock input.
9	CLKINb1	I, DIF	Complementary clock input.
10	SDATA	I/O, SE, OD, PDT	Data pin for SMBus interface.
11	SCLK	I, SE, PDT	Clock pin of SMBus interface.
12	VDDIN1	PWR	Power supply for clock input 1.
13	VDDCLK_1	PWR	Power supply for clock output bank 1.
14	CLK7	O, DIF	True clock output.
15	CLKb7	O, DIF	Complementary clock output.
16	OEb7	I, SE, PU, PDT	Active low input for enabling output 7. 0 = Enable output, 1 = Disable output.
17	CLKSEL_tri	I, SE, PD, PU	Input to select differential input clock 0 or differential input clock 1. This input has an internal pull-up and pull-down resistor to bias a floating pin to the mid-point. 0 = CLKIN0 selected for all outputs. 1 = CLKIN1 selected for all outputs. M = CLKIN0 goes to bank 0 and CLKIN1 goes to bank 1.
18	OEb6	I, SE, PU, PDT	Active low input for enabling output 6. 0 = Enable output, 1 = Disable output.
19	CLK6	O, DIF	True clock output.
20	CLKb6	O, DIF	Complementary clock output.
21	VDDCLK_1	PWR	Power supply for clock output bank 1.
22	CLK5	O, DIF	True clock output.
23	CLKb5	O, DIF	Complementary clock output.
24	OEb5	I, SE, PU, PDT	Active low input for enabling output 5. 0 = Enable output, 1 = Disable output.
25	OEb4	I, SE, PU, PDT	Active low input for enabling output 4. 0 = Enable output, 1 = Disable output.
26	CLK4	O, DIF	True clock output.
27	CLKb4	O, DIF	Complementary clock output.
28	VDDCLK_1	PWR	Power supply for clock output bank 1.
29	LOSb	O, OD, PDT	Output indicating Loss of Input Signal. This pin is an open drain output and requires an external pull up resistor for proper functionality. A low output on this pin indicates a loss of signal on the input clock.
30	VDDCLK_0	PWR	Power supply for clock output bank 0.
31	VDDA	PWR	Power supply for core multiplexer circuitry.
32	CLK3	O, DIF	True clock output.

1. The Refclk jitter is measured after applying the filter functions found in the PCI Express Base Specification 7.0. For the exact measurement setup, see [Test Loads](#). The worst case results for each data rate are summarized in this table. Equipment noise is removed from all measurements.
2. Jitter measurements are made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements can be made with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist frequency. For PNA measurements for the 2.5GT/s data rate, the RMS jitter is converted to peak-to-peak jitter using a multiplication factor of 8.83.
3. Differential input swing  $\geq 1600\text{mV}$  and input slew rate  $\geq 3.5\text{V/ns}$ . The rms sum of the source jitter and the additive jitter (arithmetic sum for PCIe Gen1) must be less than the jitter specification listed.
4. SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2MHz taking care to minimize removal of any non-SSC content.
5. Note that 0.7ps RMS is to be used in channel simulations to account for additional noise in a real system.
6. Note that 0.25ps RMS is to be used in channel simulations to account for additional noise in a real system.
7. Note that 0.15ps RMS is to be used in channel simulations to account for additional noise in a real system.
8. Note that 0.10ps RMS is to be used in channel simulations to account for additional noise in a real system.
9. The PCI Express Base Specification 7.0 provides the filters necessary to calculate SRIS jitter values; it does not provide specification limits, therefore, the reference to this footnote in the Limit column. SRIS values are informative only. A common practice is to split the common clock budget in half. For 16GT/s data rates and above, the user must choose whether to use the output jitter specification, or the input jitter specification, which includes an allocation for the jitter added by the channel. Using 32GT/s, the Refclk jitter budget is 150fs RMS. One half of the Refclk jitter budget is 106fs RMS. At the clock input, the system must deliver 250fs RMS. One half of this value is 177fs RMS. If the clock is placed next to the PCIe device in an SRIS system, the channel is very short and the user can choose to use this more relaxed value as the jitter limit.

1. The Refclk jitter is measured after applying the filter functions found in the PCI Express Base Specification 7.0. For the exact measurement setup, see [Test Loads](#). The worst case results for each data rate are summarized in this table. Equipment noise is removed from all measurements.
2. Jitter measurements are made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements can be made with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist frequency. For PNA measurements for the 2.5GT/s data rate, the RMS jitter is converted to peak-to-peak jitter using a multiplication factor of 8.83.
3. Differential input swing  $\geq$  800mV and input slew rate  $\geq$  1.5V/ns. The rms sum of the source jitter and the additive jitter (arithmetic sum for PCIe Gen1) must be less than the jitter specification listed.
4. SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2MHz taking care to minimize removal of any non-SSC content.
5. Note that 0.7ps RMS is to be used in channel simulations to account for additional noise in a real system.
6. Note that 0.25ps RMS is to be used in channel simulations to account for additional noise in a real system.
7. Note that 0.15ps RMS is to be used in channel simulations to account for additional noise in a real system.
8. Note that 0.10ps RMS is to be used in channel simulations to account for additional noise in a real system.
9. The PCI Express Base Specification 7.0 provides the filters necessary to calculate SRIS jitter values; it does not provide specification limits, therefore, the reference to this footnote in the Limit column. SRIS values are informative only. A common practice is to split the common clock budget in half. For 16GT/s data rates and above, the user must choose whether to use the output jitter specification, or the input jitter specification, which includes an allocation for the jitter added by the channel. Using 32GT/s, the Refclk jitter budget is 150fs RMS. One half of the Refclk jitter budget is 106fs RMS. At the clock input, the system must deliver 250fs RMS. One half of this value is 177fs RMS. If the clock is placed next to the PCIe device in an SRIS system, the channel is very short and the user can choose to use this more relaxed value as the jitter limit.

$t_{jph12k-20M}$		156.25MHz (12kHz to 20MHz)	42	52.5	N/A	

1. See [Test Loads](#) for test configuration. Measured with one input at 100MHz and the other at 156.25MHz.

2. SMA100B used as signal source.

3. RC19xxx devices meet all legacy QPI/UPI specifications by meeting the PCIe and DB2000Q specifications listed in this document.

4. Differential input swing = 1600mV and input slew rate = 3.5V/ns.

5. The rms sum of the source jitter and the additive jitter must be less than the jitter specification listed.

6. Differential input swing = 800mV and input slew rate = 1.5V/ns.

**Note:** Dual-mode operation (CLKSEL\_tri = M, both CLKIN running) is recommended only for PCIe applications.

## 2.4.3 Output Frequencies, Startup Time, and LOS Timing

Table 14. Output Frequencies, Startup Time, and LOS Timing

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Unit

$t_{LATOEb}$	OEb Latency	OEb assertion/de-assertion CLK start/stop latency. Selected input clock must be running.	4	5	6	clks
$t_{LOSAssert}$	LOS Assert Time	Time from disappearance of selected input clock to LOS assert. [3][4]	-	244	289	ns
$t_{LOSDeassert}$	LOS De-assert Time	Time from appearance of selected input clock to LOS de-assert. [2][5]	6	-	7	clks

1. Measured from when all power supplies have reached > 90% of nominal voltage to the first stable clock edge on the output. PWRGD\_PGWRDNb tied to VDD in this case.

2. VDD stable, measured from de-assertion of PWRGD\_PGWRDNb.

3. The clock detect circuit does not qualify the accuracy of the input clock.

4. PWRGD\_PWRDNb high. The clock detect circuit will park the outputs in a low/low state within this time.

5. PWRGD\_PWRDNb high. The clock detect circuit will drive the outputs to a high/low state within this time and then begin clocking the outputs.

3. Measured from single-ended waveform.
4. Defined as the maximum instantaneous voltage including overshoot.
5. Defined as the minimum instantaneous voltage including undershoot.
6. Measured at crossing point where the instantaneous voltage value of the rising edge of REFCLK+ equals the falling edge of REFCLK-.
7. Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.
8. Defined as the total variation of all crossing voltages of Rising REFCLK+ and Falling REFCLK-. This is the maximum allowed variance in VCROSS for any particular system.
9. Measured from differential waveform.
10. Measured from -150mV to +150mV on the differential waveform (derived from REFCLK+ minus REFCLK-). The signal must be monotonic through the measurement region for rise and fall time. The 300mV measurement window is centered on the differential zero crossing.
11. Matching applies to rising edge rate for REFCLK+ and falling edge rate for REFCLK-. It is measured using a  $\pm 75mV$  window centered on the median cross point where REFCLK+ rising meets REFCLK- falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations. The Rise Edge Rate of REFCLK+ should be compared to the Fall Edge Rate of REFCLK-; the maximum allowed difference should not exceed 20% of the slowest edge rate.

## 2.4.5 CLKIN AC/DC Characteristics

Table 22. CLKIN AC/DC Characteristics for DC-Coupled Operation<sup>[1]</sup>

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
$V_{IHMAX}$	Maximum Input Voltage	Single-ended value.	-	-	1.2	V
$V_{CROSS}$	Input Crossover Voltage	$LOW\_LOW\_DETECT$ enabled (default value). <sup>[2]</sup>	131	-	-	mV
		$LOW\_LOW\_DETECT$ disabled.	100	-	-	mV
$V_{SWING}$	Input Swing <sup>[3]</sup>	$LOW\_LOW\_DETECT$ enabled (default value). <sup>[2]</sup>	528	-	-	mV
		$LOW\_LOW\_DETECT$ disabled.	200	-	-	mV
$dv/dt$	Input Slew Rate <sup>[3][4]</sup>	-	0.6	-	-	V/ns

1. See the [Additive Phase Jitter](#) tables for values required for performance. The CLKIN is designed for a ground-referenced differential input where the cross over voltage is approximately half of the swing. For example, a differential clock with a VOH of 1.2V would ideally have a crossover voltage of approximately 600mV. For applications where the input clock is not ground-referenced (LVPECL for example), the input clock needs to be AC-coupled and re-biased. Each RC193xx CLKIN has an internal bias circuit that may be enabled as well as internal terminations that may also be enabled. This reduces external components for such scenarios to a single external AC-coupling capacitor. See the [RECEIVER\\_CONTROL](#) register for details.
2. Low/Low is an invalid differential state.  $LOW\_LOW\_DETECT$  allows the receiver turn itself off when such a condition is detected
3. Differential value.
4. Measured from -150mV to +150mV on the differential waveform (derived from REFCLK+ minus REFCLK-). The signal must be monotonic through the measurement region for rise and fall time. The 300mV measurement window is centered on the differential zero-crossing.

		Fast slew rate, double-terminated load at maximum output frequency. PWRGD_PWRDNb = 1.	-	13.0	13.4	

Table 25. Power Supply Current [1][2][3] (Cont.)

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Unit
$I_{DDCLK\_X}$	$V_{DDCLK\_X}$ Operating Current per Output Pair, $85\Omega$ impedance [4]	Fast slew rate, source-terminated load at 100MHz. $PWRGD\_PWRDNb = 1$ .	-	9.8	10.4	mA
		Fast slew rate, double-terminated load at 100MHz. $PWRGD\_PWRDNb = 1$ .	-	11.5	12.1	
		Fast slew rate, source-terminated load at maximum output frequency. $PWRGD\_PWRDNb = 1$ .	-	12.4	12.8	
		Fast slew rate, double-terminated load at maximum output frequency. $PWRGD\_PWRDNb = 1$ .	-	15.0	15.4	
$I_{DDCLK\_X}$	$V_{DDCLK\_X}$ Operating Current per Output Pair, $34\Omega$ impedance [4]	Fast slew rate, source-terminated load at 100MHz. $PWRGD\_PWRDNb = 1$ .	-	9.2	10.1	mA
		Fast slew rate, double-terminated load at 100MHz. $PWRGD\_PWRDNb = 1$ .	-	14.5	15.5	
		Fast slew rate, source-terminated load at maximum output frequency. $PWRGD\_PWRDNb = 1$ .	-	15.4	16.3	
		Fast slew rate, double-terminated load at maximum output frequency. $PWRGD\_PWRDNb = 1$ .	-	21.2	21.6	
		Fast slew rate, receiver-terminated load at maximum output frequency. $PWRGD\_PWRDNb = 1$ .	-	21.2	21.6	
$I_{DDCLK\_CORE\_X}$	$V_{DDCLK\_X}$ Core Operating Current, per $V_{DDCLK\_X}$ , all Outputs Disabled	$PWRGD\_PWRDNb = 1$ , all outputs disabled, $CLKIN = 100MHz$ .	-	2.2	2.7	mA
		$PWRGD\_PWRDNb = 1$ , all outputs disabled, $CLKIN = \text{maximum operating frequency}$ .	-	5.8	7.2	
$I_{DDINx}$	$V_{DDINx}$ Operating Current	Deselected input channel, per $VDDIN$ pin. $PWRGD\_PWRDNb = 1$ .	-	1.7	2.1	mA
		Selected input channel, per $VDDIN$ pin. $PWRGD\_PWRDNb = 1$ .	-	11.1	14.3	mA
$I_{DDDIG}$	$V_{DDDIG}$ Current	$PWRGD\_PWRDNb = 0$ or 1.	-	0.12	0.18	mA
$I_{DDA}$	$V_{DDA}$ Current	Core logic supply, independent of either bank. $PWRGD\_PWRDNb = 0$ or 1.	-	0.3	0.32	mA
$I_{DDINxPD}$	$V_{DDINx}$ Power-down Current per $I_{DDINx}$ pin.	$PWRGD\_PWRDNb = 0$ (does not apply to RC19302).	-	1.6	2.1	mA
$I_{DDCLK\_xPD}$	$V_{DDCLK\_X}$ Power-down Current per output bank [5]	$PWRGD\_PWRDNb = 0$ (does not apply to RC19302).	-	1.8	2	mA

1. See [Test Loads](#).
2. Output voltage set to 800mV. Slew rate has negligible effect on current consumption, so only fast is listed.
3. Total operating current is obtained by adding  $(I_{DDCLK} \times \text{number of outputs used}) + I_{DDCLK\_CORE\_0} + I_{DDCLK\_CORE\_1} + I_{DDIN0} + I_{DDIN1} + I_{DDA} + I_{DDDIG}$ . For example, let's assume that the RC19308 is being used at 100MHz with 100ohm source terminated outputs and that only six outputs are used.  $CLKIN1$  is selected. The typical operating current would be  $I_{DDCLK} \times 6 + I_{DDCLK\_CORE0} + I_{DDCLK\_CORE1} + I_{DDIN0} + I_{DDIN1} + I_{DDA} + I_{DDDIG}$  or  $(8.5 \times 6)\text{mA} + 2.2\text{mA} + 2.2\text{mA} + 1.7\text{mA} + 11.1\text{mA} + 0.3\text{mA} + 0.14\text{mA} = 68.6\text{mA}$  typical. Note:  $VDDCLK\_0$  serves  $CLK[3:0]$ .  $VDDCLK\_1$  serves  $CLK[7:4]$ . Total power down current is obtained by adding  $I_{DDCLK\_0PD} + I_{DDCLK\_1PD} + I_{DDIN0PD} + I_{DDIN1PD} + I_{DDDIG\_PD} + I_{DDA}$ .
4. The value specified is for one output pair. Multiply this value by the number of outputs in use.
5. On the RC19308, bank 0 is powered by 3  $VDDCLK\_0$  pins and bank 1 is powered by 3  $VDDCLK\_1$  pins. This value is the total current per output bank, *not per  $VDDCLK$  pin*. This parameter needs to be counted only twice.

## 2.4.9 SMBus Electrical Characteristics

Table 26. SMBus DC Electrical Characteristics [1]

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Unit
$V_{IH}$	High-level Input Voltage for SCLK and SDATA	$VDD = 1.8V$	0.8 VDD	-	3.6	V
$V_{IL}$	Low-level Input Voltage for SCLK and SDATA	$VDD = 1.8V$	-	-	0.3 VDD	
$V_{HYS}$	Hysteresis of Schmitt Trigger Inputs	-	0.05 VDD	-	-	
$V_{OL}$	Low-level Output Voltage for SCLK and SDATA	$I_{OL} = 4mA$	-	0.28	0.4	
$I_{IN}$	Input Leakage Current per Pin	-	[2]	-	[2]	$\mu A$
$C_B$	Capacitive Load for Each Bus Line	-	-	-	400	$pF$

1.  $V_{OH}$  is governed by the  $V_{PUP}$ , the voltage rail to which the pull-up resistors are connected. The maximum  $V_{PUP}$  voltage is 3.6V.

2. See [I/O Electrical Characteristics](#).

$t_{LOW}$	Clock Low Period	-	4.7	-	$\mu s$
$t_{HIGH}$	Clock High Period	[6]	4	50	$\mu s$
$t_{LOW:SEXT}$	Cumulative Clock Low Extend Time (target [slave] device)	[7]	N/A. The RC193xx does not extend the clock.		ms
$t_{LOW:MEXT}$	Cumulative Clock Low Extend Time (host [master] device)	[8]	N/A. The RC193xx is not a host device.		ms
$t_F$	Clock/Data Fall Time	[9]	-	300	ns
$t_R$	Clock/Data Rise Time	[9]	-	1000	ns
$t_{SPIKE}$	Noise Spike Suppression Time	[10]	-	-	ns

1. Power must be applied and PWRGD\_PWRDNb must be a 1 for the SMBus to be active.

2. A host should not drive the clock at a frequency below the minimum  $f_{SMB}$ . Further, the operating clock frequency should not be reduced below the minimum value of  $f_{SMB}$  due to periodic clock extending by target devices as defined in Section 5.3.3 of System Management Bus (SMBus) Specification, Version 3.2, dated 12 Jan, 2022. This limit does not apply to the bus idle condition, and this limit is independent from the  $t_{LOW:SEXT}$  and  $t_{LOW:MEXT}$  limits. For example, if the SCLK is high for  $t_{HIGH,MAX}$ , the clock must not be periodically stretched longer than  $1/f_{SMB,MIN} - t_{HIGH,MAX}$ . This requirement does not pertain to a device that extends the SCLK low for data processing of a received byte, data buffering and so forth for longer than 100  $\mu$ s in a non-periodic way.
3. A device must internally provide sufficient hold time for the SDATA signal (with respect to the  $VIH,MIN$  of the SCLK signal) to bridge the undefined region of the falling edge of SCLK.
4. Target devices may have caused other target devices to hold SDA low. This is the maximum time that a device can hold SDATA low after the host raises SCLK after the last bit of a transaction. A target device may detect how long SDA is held low and release SDA after the time out period.
5. Devices participating in a transfer can abort the transfer in progress and release the bus when any single clock low interval exceeds the value of  $t_{TIMEOUT,MIN}$ . After the host in a transaction detects this condition, it must generate a stop condition within or after the current data byte in the transfer process. Devices that have detected this condition must reset their communication and be able to receive a new START condition no later than  $t_{TIMEOUT,MAX}$ . Typical device examples include the host controller, and embedded controller, and most devices that can host the SMBus. Some simple devices do not contain a clock low drive circuit; this simple kind of device typically may reset its communications port after a start or a stop condition. A timeout condition can only be ensured if the device that is forcing the timeout holds the SCLK low for  $t_{TIMEOUT,MAX}$  or longer.
6. The device has the option of detecting a timeout if the SDATAAA pin is also low for this time.
7.  $t_{HIGH,MAX}$  provides a simple guaranteed method for hosts to detect bus idle conditions. A host can assume that the bus is free if it detects that the clock and data signals have been high for greater than  $t_{HIGH,MAX}$ .
8.  $t_{LOW:MEXT}$  is the cumulative time a host device is allowed to extend its clock cycles within each byte of a message as defined from START-to-ACK, ACK-to-ACK, or ACK-to-STOP. It is possible that a target device or another host will also extend the clock causing the combined clock low time to be greater than  $t_{LOW:MEXT}$  on a given byte. This parameter is measured with a full speed target device as the sole target of the host.
9. The rise and fall time measurement limits are defined as follows:
  - Rise Time Limits:  $(V_{IL:MAX} - 0.15 \text{ V})$  to  $(V_{IH:MIN} + 0.15 \text{ V})$
  - Fall Time Limits:  $(V_{IH:MIN} + 0.15 \text{ V})$  to  $(V_{IL:MAX} - 0.15 \text{ V})$
10. Devices must provide a means to reject noise spikes of a duration up to the maximum specified value.

### 3. Test Loads

Clock Source	L (cm)	C <sub>L</sub> (pF)	ZOUTSEL_tri pin	Zo (ohms)	Rs (ohms)
SMA100B	25.4	2	0 (85 ohms)	85	Internal
			1 (100 ohms)	100	Internal
			85	85	External 25.5
			100	100	External 33.3

Figure 11. AC/DC Test Load for Differential Outputs (Double-Terminated or Receiver-Terminated)

Table 29. Parameters for AC/DC Test Load (Double-Terminated)

Clock Source	L (cm)	C <sub>L</sub> (pF)	ZOUTSEL_tri pin	Zo (ohms)	Rs (ohms)
SMA100B	25.4	2	0 (85 ohms)	85	Internal
			1 (100 ohms)	100	Internal
			85	85	None <sup>[1]</sup>
			100	100	

1. This setting is designed to provide additional amplitude for receiver-terminated loads by turning off the source termination in the output driver. There is no reflection with receiver terminated loads since the receiver termination absorbs the incident waveform.

Table 30. Parameters for PCIe Jitter Measurement

Clock Source	L (cm) [1]	C <sub>AC</sub> (uF)	ZOUTSEL_tri pin	Zo (ohms)	Rs (ohms)
SMA100B	25.4	0.1	0 (85 ohms)	85	Internal
			1 (100 ohms)	100	Internal
			Mid (34 ohms)		None

1. PCIe Gen5-7 specify L = 0cm for 32, 64 and 128GT/s. L = 25.4cm is more conservative.

#### 4.5.2 OEB\_PIN\_READBACK

OEb Pin Read-back Register.

OEB_PIN_READBACK Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7	rb_oeb_7	RO	0x0	State of OEb7 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high
6	rb_oeb_6	RO	0x0	State of OEb6 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high
5	rb_oeb_5	RO	0x0	State of OEb5 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high
4	rb_oeb_4	RO	0x0	State of OEb4 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high
3	rb_oeb_3	RO	0x0	State of OEb3 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high
2	rb_oeb_2	RO	0x0	State of OEb2 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high

OEB_PIN_READBACK Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
1	rb_oeb_1	RO	0x0	State of OEb1 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high
0	rb_oeb_0	RO	0x0	State of OEb0 pin. The default pin state is 1 if not driven to a 0. 0 = Pin low 1 = Pin high

#### 4.5.3 LOS\_CONFIG

Loss of Signal and Async Mode Configuration Register.

LOS_CONFIG Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7	los1b_rw1c_en	RW	0x1	LOS sticky bit enable for CLKIN1. Enables the CLKIN1 LOS sticky bit (B0x27[1]). This bit must be set to 1 if B0x4[2] is set to 0. 0 = Disable 1 = Enable
6	los0b_rw1c_en	RW	0x1	LOS sticky bit enable for CLKIN0. Enables the CLKIN0 LOS sticky bit (B0x27[1]). This bit must be set to 1 if B0x4[2] is set to 0. 0 = Disable 1 = Enable
5	los1b_acp1_enable	RW	0x1	Automatic clock parking enable for bank 1. Enables Automatic Clock Parking of bank 1 (CLK[7:4]) outputs to a low/low state when LOS condition occurs. 0 = Disable 1 = Enable
4	los0b_acp0_enable	RW	0x1	Automatic clock parking enable for bank 0. Enables Automatic Clock Parking of bank 0 (CLK[3:0]) outputs to a low/low state when LOS condition occurs. 0 = Disable 1 = Enable
3	los1b_config	RW	0x1	Configure LOSb pin operating mode for CLKIN1. Determines if the LOSb pin is real-time or sticky. If sticky, the LOSb pin is driven by the LOS1b RW1C sticky bit. 0 = LOSb from bank 1 RW1C sticky bit 1 = LOSb real-time
2	los0b_config	RW	0x1	Configure LOSb pin operating mode for CLKIN0. Determines if the LOSb pin is real-time or sticky. If sticky, the LOSb pin is driven by the LOS0b RW1C sticky bit. 0 = LOSb from bank 0 RW1C sticky bit 1 = LOSb real-time
1	reserved	RW	0x0	Reserved
0	async_mode	RW	0x0	Enable asynchronous operating mode. SYNC mode is the normal mode of operation, where the input clock is continuous. Outputs stop and start in a glitch free manner. ASYNC mode is used when the input is a pulse instead of a clock. All glitch-free synchronization circuits are bypassed, minimizing the latency through the device. ASYNC mode cannot be used with LOS or ACP. B0x4[6] and B0x4[4] must be set to 0 if ASYNC mode is used. 0 = SYNC mode, glitch-free outputs 1 = ASYNC mode, non-glitch-free outputs

#### 4.5.4 VENDOR\_REVISION\_ID

Vendor ID, Revision ID Register.

VENDOR_REVISION_ID Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7:4	rid	RO	0x0	Revision ID. Silicon revision. 0x0 = A revision
3:0	vid	RO	0x1	Vendor ID. Vendor ID. 0x1 = Renesas

#### 4.5.5 DEVICE\_ID

Device ID Register.

DEVICE_ID Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7:0	device_id	RO	0x38	Device ID. RC19308 listed as default. 0x38 = RC19308 0x34 = RC19304 0x32 = RC19302

#### 4.5.6 BYTE\_COUNT

Number of Bytes Returned on an SMBus Block Read.

BYTE_COUNT Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7:5	reserved	RW	0x0	Reserved
4:0	byte_count	RW	0x7	Writing to this register configures how many bytes will be returned on an SMBus block read.

#### 4.5.7 SLEW\_AMP\_SELECT

Multipfunction Pin Configuration Register.

SLEW_AMP_SELECT Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7	slew_amp_sel	RW	0x0	Multipfunction pin selection. The pin is defined as either Slew Rate Select or Amplitude Select. If Amplitude Select is chosen, refer to registers 0x10 and 0x11. 0 = Pin is Slew Rate Select pin (RC193xxA) 1 = Pin is Amplitude Select pin (RC193xxA001)
6	reserved	RW	0x0	Reserved
5:4	clksel_1_0	RW	0x0	Clock mux select. These bits allow software control of the input clock mux. 0 = Both bank from CLKIN0 1 = Bank0 from CLKIN0, bank1 from CLKIN1 2 = Invalid 3 = Both bank from CLKIN1
3:1	reserved	RW	0x0	Reserved
0	clksel_ctrl	RW	0x0	Select pin or software control of the clock mux. Pin control is the power up default. 0 = Use CLKSEL pin control 1 = Use software control (B0xA [5:4])

#### 4.5.8 INPUT\_PULLUP\_PULLDOWN\_4

Internal Pull-up / Pull-down Configuration Register.

INPUT_PULLUP_PULLDOWN_4 Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7:4	reserved	RW	0xb	Reserved
3	sdata_pullup	RW	0x0	Enable/disable internal pull-up. The default pin state is high when the internal pull-up is enabled. If the SMBus is not used, this bit may be set to hold the SDATA pin in an inactive state. It should not be set if the SMBus is used in the system. RC19308 and RC19304 only. 0 = Disable internal pull-up 1 = Enable internal pull-up
2	reserved	RW	0x0	Reserved
1	sclk_pullup	RW	0x0	Enable/disable internal pull-up. The default pin state is high when the internal pull-up is enabled. If the SMBus is not used, this bit may be set to hold the SDATA pin in an inactive state. It should not be set if the SMBus is used in the system. RC19308 and RC19304 only. 0 = Disable internal pull-up 1 = Enable internal pull-up
0	reserved	RW	0x0	Reserved

#### 4.5.9 AMP\_CTRL\_ALT

Alternate Amplitude Selection Register.

AMP_CTRL_ALT Bit Field Descriptions				
Bit Field	Field Name	Field Type	Default Value	Description
7:4	amp_ctrl_alt_bnk1	RW	0xB	Alternate amplitude control for bank 1. When the multifunction pin is configured as Amplitude Select, this field defines the single-ended output amplitude of Bank 1 (CLK[7:4]) when the pin = 1. When the multifunction pin is configured as Slew Rate Selection, this field has no impact. 0x0 = 625mV 0x1 = 650mV 0x2 = 675mV 0x3 = 700mV 0x4 = 725mV 0x5 = 750mV 0x6 = 775mV 0x7 = 800mV 0x8 = 825mV 0x9 = 850mV

## 5. Applications Information

### 5.1 Inputs, Outputs, and Output Enable Control

The CLKIN/CLKINb inputs of the RC193xx devices have an internal bias network that prevents self-oscillation from a floating input clock condition.

#### 5.1.1 Recommendations for Unused Inputs and Outputs

##### 5.1.1.1 Unused Differential CLKIN Inputs

The CLKIN/CLKINb inputs of the RC193xx devices have internal bias networks that protect the devices from a floating input clock condition. For RC193xx multiplexers that use only one input clock, the unused input can be left open. Renesas recommends that no trace be attached to unused CLKIN pins.

##### 5.1.1.2 Unused Single-ended Control Inputs

The single-ended control pins have internal pull-up and/or internal pull-down resistors and do not require external resistors. They can be left floating if the default pin state is the desired state. If external resistors are needed to change the pin state or are desired for design robustness, 10kohm is the recommended value. Tri-level inputs are internally biased to VDD/2 and will indicate the mid (M) state if left floating.

##### 5.1.1.3 Unused Differential CLK Outputs

All unused CLK outputs can be left floating. Renesas recommends that no trace be attached to unused CLK outputs. While not required (but highly recommended), the best design practice is to disable unused CLK outputs. This is easily accomplished with the dedicated OE<sub>b</sub> pin for each output.

##### 5.1.1.4 Unused SMBus Clock and Data Pins

If the SMBus interface is not used, the clock and data pins must be pulled high with an external resistor. The two pins can share a resistor if there is no possibility of using the SMBus interface for debug purposes. If the interface might be used for debug, separate resistors should be used. Lightly loaded buses may use 10kohm pull-up resistors. Heavily loaded buses will require smaller pull-up resistor values. The SMBus pins are 3.3V tolerant and may be used with a 3.3V pull-up voltage.

## 5.2 Differential CLKIN Configurations

The RC193xx input clock buffer supports four configurations:

- Direct connection to HCSL-level inputs
- Direct connection to LVDS-level inputs with *external* termination resistor
- Internal self-bias circuit for applications that *externally* AC-couple the input clock  
This feature is enabled by the **AC\_IN** bit.
- Internal pull-down resistors (Rp) to terminate the clock input at the receiver.  
This feature is enabled by the **Rx\_TERM** bit.

Devices with multiple input clocks have individual AC\_IN and Rx\_TERM configuration bits for each input. The internal input clock terminations prevent reflections and are useful for non-PCIe applications, where the frequency and transmission line length vary from the 100MHz PCIe standard. The following table summarizes the CLKIN configuration bit settings for the various configurations that are displayed in [Figure 13](#) to [Figure 16](#).

Table 32. CLKIN Configuration Bits

Configuration	CLKIN1 AC_IN1 B35[3]	CLKIN1 RX_TERM1 B35[2]	CLKIN0 AC_IN0 B35[1]	CLKIN0 RX_TERM0 B35[0]	Notes
HCSL Input Levels (PCIe Standard)	0	0	0	0	Default values
LVDS Input Levels	1	0	1	0	Eliminates need for external bias circuit. Must use external RT.
External AC-Coupling	1	0	1	0	Eliminates need for external bias circuit.
Receiver Termination	0	1	0	1	Prevents reflections for non-PCIe applications.

## 5.3 Differential CLK Output Configurations

### 5.3.1 Internal CLK Source Termination Enabled (ZOUT\_SEL\_tri = 0 or 1)

The RC193xx LP-HCSL CLK outputs have internal source terminations and directly drive industry-standard HCSL-level inputs with no external components. They support both 85 and 100 ohm differential impedances ( $Z_O = Z_{DIF} = 85$  or  $100$  ohm) in Figure 17 through Figure 19. The combination of source termination and receiver termination results in a double-terminated load. The CLK outputs can drive double-terminated loads, however, when double-terminated, the CLK output swing will be half of the source-terminated values.

Figure 17. Direct-Coupled Source-Terminated HCSL (ZOUT\_SEL\_tri = 0 or 1)

Figure 18. Direct-Coupled Double-Terminated HCSL

The RC193xx CLK outputs can directly drive AC-coupling capacitors without any source-termination components. The differential input will require an input-dependent bias network. This network may or may not be internal to the receiver. Refer to the receiver specification for detailed requirements. AC-coupling is used to connect the RC193xx to other logic families such as LVDS, LVPECL, or CML. See [AN-891](#) for examples.

0	85	85	Z <sub>DIF</sub> /2	0.1
1	100	100	Z <sub>DIF</sub> /2	0.1

### 5.3.2 Internal CLK Source Termination Disabled (ZOUT\_SEL\_tri = M)

ZOUT\_SEL\_tri = M disables the internal source termination making the differential  $Z_O = 34\text{ohms}$ . This setting is used with receiver terminated loads to provide a higher CLK amplitude to the load than can be obtained with a double terminated configuration. The minimum single-ended amplitude in this configuration targets  $\sim 500\text{mV}$ . See [Table 21](#) for detailed specifications. This setting is intended for  $Z_{\text{DIF}} = 100\text{ ohm}$  systems.

## 5.4 Power Down Tolerant Pins

Pins labeled Power Down Tolerant (PDT) can be driven by voltages as high as the normal VDD of the chip, even though VDD is not present (the device is not powered). There will be no ill effects to the device and it will power up normally. This feature supports disaggregation, where the RC193xx may be on one circuit board and devices that interface with it are on other boards. These boards may power up at different times, driving pins on the RC193xx before it has received power. NOTE: The differential CLKIN pins are limited to 1.4V. Applying a voltage higher than this may damage the part.

## 5.5 Flexible Startup Sequencing

RC193xx devices support Flexible Startup Sequencing (FSS). FSS allows application of CLKIN at different times in the device/system startup sequence. FSS is an additional feature that helps the system designer manage the impact of disaggregation. Table 35 shows the supported sequences; that is, the RC193xx devices can have CLKIN running before VDD is applied, and can have VDD applied and sit for extended periods with no input clock.

*Note:* The PWRGD\_PWRDNb is synchronized with the selected CLKIN. If CLKIN is not present, the RC193xx will not sample the pin until CLKIN is present. This applies to both powering up and powering down. If powered up when the input clock stops, ACP (default enabled) will place the outputs into a low/low state even though the RC193xx will not be completely powered down.

**Table 35. Flexible Startup Sequences**

Not present	X	Running

Present	0 or 1	Running

		Low/Low

## 5.6 Loss of Signal and Automatic Clock Parking

The RC193xx devices have a Loss of Signal (LOS) circuit to detect the presence or absence of an input clock. The LOS circuit drives the open-drain LOSb pin (the “b” suffix indicates “bar”, or active-low) and sets the LOS\_EVT bit in the SMBus register space. Figure 22 shows the LOSb de-assertion timing for the RC193xx clock multiplexers. LOSb on the RC193xx multiplexers defaults to low at power up. CLKIN is represented differentially in Figure 22 and Figure 23.

**Figure 22. LOSb De-assert Timing RC193xx Devices**

*Note:* The LOSb pin monitors the selected input clock in the RC193xx multiplexers.

The following diagram shows the LOSb assertion sequence when the *selected* CLKIN is lost. It also shows the Automatic Clock Parking (ACP) circuit bring the outputs to a Low/Low state after an LOS event. For exact timing, see [Electrical Characteristics](#).

Figure 23. LOSb Assert Timing

## 5.7 Output Enable Control

The RC193xx buffer/mux family provides two mechanisms to enable or disable clock outputs. Both mechanisms start and stop the output clocks in a synchronous, glitch-free manner. A clock output is enabled only when both mechanisms indicate “enabled.” The following sections describe the two mechanisms.

### 5.7.1 SMBus Output Enable Bits

The RC193xx clock multiplexer family has a traditional SMBus output enable bit for each output. The power-up default is 1, or enabled. Changing this bit to a 0 disables the output to a low/low state. The transitions between the enable and disable states are glitch-free in both directions.

*Note:* The glitch-free synchronization logic requires the CLKIN be running to enable or disable the outputs with this mechanism.

### 5.7.2 Output Enable (OE<sub>b</sub>) Pins

The OE<sub>b</sub> (Note: the “b” suffix indicates “bar”, or active-low) pins on the RC193xx provide flexible CLKREQb functionality for PCIe slots and/or OE control for ‘motherboard-down’ devices. If the OE<sub>b</sub> pin is low the output is enabled. If the OE<sub>b</sub> pin is high, the output is disabled to a low/low state. All OE<sub>b</sub> pins enable and disable the controlled outputs in a glitch-free, synchronous manner.

*Note:* The glitch-free synchronization logic requires the *selected* CLKIN be running to enable or disable the outputs with this mechanism.

## 5.8 PCB Layout Recommendations

Proper layout is critical to achieving the full functionality and efficiency of the device. For information on how to support optimal electrical performance, effective thermal management, and overall system reliability, see the [PCIe Buffer-Mux Layout Recommendations Application Note](#).

## 6. Package Outline Drawings

The package outline drawings are located at the end of this document and are accessible from the Renesas website (see [Ordering Information](#) for POD links). The package information is the most current data available and is subject to change without revision of this document.
