

# SLG59H1127V

## A 12 V, 15 mΩ, 4 A Load Switch with $V_{IN}$ Lockout Select and Power Good Output

### General Description

The SLG59H1127V is a high-performance, self-powered 15 mΩ nFET load switch designed for all 4.5 V to 12 V power rails up to 4 A. Using a proprietary MOSFET design, the SLG59H1127V achieves a stable 15 mΩ  $R_{DS(ON)}$  across a wide input voltage range. In combining novel FET design and copper pillar interconnects, the SLG59H1127V package also exhibits a low thermal resistance for high-current operation.

Designed to operate over a -40 °C to 85 °C range, the SLG59H1127V is available in a low thermal resistance, RoHS-compliant, 1.6 x 3.0 mm STQFN package.

### Features

- Wide Operating Input Voltage: 4.5 V to 13.2 V
- Maximum Continuous Current: 4 A
- Automatic nFET SOA Protection
  - 5 W SOA Protection Threshold
- High-performance MOSFET Switch
  - Low  $R_{DS(ON)}$ : 15 mΩ at  $V_{IN} = 12$  V
  - Low  $\Delta R_{DS(ON)}/\Delta V_{IN}$ : < 0.05 mΩ/V
  - Low  $\Delta R_{DS(ON)}/\Delta T$ : < 0.06 mΩ/°C
- Capacitor-adjustable Inrush Current Control
- Two stage Current Limit Protection:
  - Resistor-adjustable Active Current Limit
  - Internal Short-circuit Current limit
- Open-drain Power Good (PG) Signaling
- Open-drain FAULT Signaling
- Fast 4 kΩ Output Discharge
- Pb-Free / Halogen-Free / RoHS Compliant Packaging

### Pin Configuration

**18-pin STQFN**  
1.6 x 3.0 mm, 0.40mm pitch  
(Top View)

### Applications

- Enterprise Computing & Telecom Equipment
  - 5 V and 12 V Point-of-Load Power Distribution
- PCI/PCIe Adapter Cards
- General-purpose High-voltage, Power-Rail Switching
- Multifunction Printers
- Fan Motor Control

### Block Diagram

## SLG59H1127V

A 12 V, 15 mΩ, 4 A Load Switch  
with  $V_{IN}$  Lockout Select and Power Good Output

### Pin Description

Pin #	Pin Name	Type	Pin Description
1	ON	Input	A low-to-high transition on this pin initiates the operation of the SLG59H1127V's state machine. ON is an asserted HIGH, level-sensitive CMOS input with $ON_{V_{IL}} < 0.3\text{ V}$ and $ON_{V_{IH}} > 0.9\text{ V}$ . As the ON pin input circuit does not have an internal pull-down resistor, connect this pin to a general-purpose output (GPO) of a microcontroller, an application processor, or a system controller – do not allow this pin to be open-circuited.
2	SEL	Input	Connect this pin to GND.
3	GND	GND	Pin 3 is the main ground connection for the SLG59H1127V's internal charge pump, its gate driver and current-limit circuits as well as its internal state machine. Therefore, use a short, stout connection from Pin 3 to the system's analog or power plane.
4-8	VIN	MOSFET	VIN supplies the power for the operation of the SLG59H1127V, its internal control circuitry, and the drain terminal of the nFET load switch. With 5 pins fused together at VIN, connect a 22 μF (or larger) low-ESR capacitor from this pin to ground. Capacitors used at VIN should be rated at 20 V or higher.
9-13	VOUT	MOSFET	Source terminal of n-channel MOSFET (5 pins fused for VOUT). Connect a 22 μF (or larger) low-ESR capacitor from this pin to ground. Capacitors used at VOUT should be rated at 20 V or higher.
14	PG	Output	An open-drain output, PG is asserted within $TPG_{HIGH}$ when $V_{OUT}$ is higher than the SLG59H1127V's $PG_{TRIGGER}$ threshold. PG output becomes deasserted within $TPG_{LOW}$ when $V_{OUT}$ is less than the $PG_{HYS}$ threshold. PG is not defined for $V_{IN} < 4\text{ V}$ .
15	$\overline{\text{FAULT}}$	Output	An open-drain output, $\overline{\text{FAULT}}$ is asserted within $T\overline{\text{FAULT}}_{LOW}$ when a $V_{IN}$ overvoltage, a current-limit, or an over-temperature condition is detected. $\overline{\text{FAULT}}$ is deasserted within $T\overline{\text{FAULT}}_{HIGH}$ when the fault condition is removed. Connect an 100 kΩ external resistor from the FAULT pin to local system logic supply.
16	CAP	Output	A low-ESR, stable dielectric, ceramic surface-mount capacitor connected from CAP pin to GND sets the $V_{OUT}$ slew rate and overall turn-on time of the SLG59H1127V. For best performance, the range for $C_{SLEW}$ values are $10\text{ nF} \leq C_{SLEW} \leq 20\text{ nF}$ – please see typical characteristics for additional information. Capacitors used at the CAP pin should be rated at 10 V or higher. Please consult Applications Section on how to select $C_{SLEW}$ based on $V_{OUT}$ slew rate and loading conditions.
17	NC	NC	No Connect
18	RSET	Input	A 1%-tolerance, metal-film resistor between 18 kΩ and 91 kΩ sets the SLG59H1127V's active current limit. A 91 kΩ resistor sets the SLG59H1127V's active current limit to 1 A and a 18 kΩ resistor sets the active current limit to 5 A.

### Ordering Information

Part Number	Type	Production Flow
SLG59H1127V	STQFN 18L FC	Industrial, -40 °C to 85 °C
SLG59H1127VTR	STQFN 18L FC (Tape and Reel)	Industrial, -40 °C to 85 °C

with  $V_{IN}$  Lockout Select and Power Good Output

### Absolute Maximum Ratings

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IN}$ to GND	Load Switch Input Voltage to GND	Continuous	-0.3	--	16	V
		Maximum pulsed $V_{IN}$ , pulse width < 0.1 s	--	--	18	V
$V_{OUT}$ to GND	Load Switch Output Voltage to GND		-0.3	--	$V_{IN}$	V
ON, SEL, CAP, RSET, PG, and FAULT to GND	ON, SEL, CAP, RSET, PG, and FAULT Pin Voltages to GND		-0.3	--	7	V
$T_S$	Storage Temperature		-65	--	150	°C
ESD <sub>HBM</sub>	ESD Protection	Human Body Model	2000	--	--	V
ESD <sub>CDM</sub>	ESD Protection	Charged Device Model	500	--	--	V
MSL	Moisture Sensitivity Level		1			
$\theta_{JA}$	Thermal Resistance; 1.6 x 3.0 mm 18L STQFN	Determined using 1 in <sup>2</sup> , 1 oz. copper pads under each VIN and VOUT terminal and FR4 pcb material.	--	40	--	°C/W
		Determined using 0.25 in <sup>2</sup> , 1 oz. copper pads under each VIN and VOUT terminal and FR4 pcb material.	--	77	--	°C/W
		Determined using 0.008 in <sup>2</sup> , 1 oz. copper pads under each VIN and VOUT terminal and FR4 pcb material.	--	125	--	°C/W
MOSFET $I_{DS_{CONT}}$	Continuous Current from VIN to VOUT	$T_J < 150$ °C	--	--	4	A
MOSFET $I_{DS_{PEAK}}$	Peak Current from VIN to VOUT	Maximum pulsed switch current, pulse width < 1 ms	--	--	6	A

Note: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### Electrical Characteristics

4.5 V ≤  $V_{IN}$  ≤ 13.2 V;  $C_{IN}$  = 22 μF,  $T_A$  = -40 °C to 85 °C, unless otherwise noted. Typical values are at  $T_A$  = 25 °C

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
$V_{IN}$	Operating Input Voltage		4.5	--	13.2	V
$V_{IN(OVLO)}$	$V_{IN}$ Overvoltage Lockout Threshold	$V_{IN} \uparrow$ ; SEL = 0	13.5	14.4	15.2	V
$V_{IN(OVLOHYST)}$	$V_{IN}$ Overvoltage Lockout Hysteresis		--	2	--	%
$V_{IN(UVLO)}$	$V_{IN}$ Undervoltage Lockout Threshold	$V_{IN} \downarrow$	2.4	--	3.8	V

### Applications Information

#### High Voltage GreenFET Safe Operating Area Explained

Renesas's High Voltage GreenFET load switches incorporate a number of internal protection features that prevents them from damaging themselves or any other circuit or subcircuit downstream of them. One particular protection feature is their Safe Operation Area (SOA) protection. SOA protection is automatically activated under overpower and, in some cases, under overcurrent conditions. Overpower SOA is activated if package power dissipation exceeds an internal 5 W threshold longer than 2.5 ms. High Voltage GreenFET devices will quickly switch off (open circuit) upon overpower detection and automatically resume (close) nominal operation once overpower condition no longer exists.

One of the possible ways to have an overpower condition trigger SOA protection is when High Voltage GreenFET products are enabled into heavy output resistive loads and/or into large load capacitors. It is under these conditions to follow carefully the "Safe Start-up Loading" guidance in the Applications section of the datasheet. During an overcurrent condition, High Voltage GreenFET devices will try to limit the output current to the level set by the external  $R_{SET}$  resistor. Limiting the output current, however, causes an increased voltage drop across the FET's channel because the FET's  $R_{DS(ON)}$  increased as well. Since the FET's  $R_{DS(ON)}$  is larger, package power dissipation also increases. If the resultant increase in package power dissipation is higher/equal than 5 W for longer than 2.5 ms, internal SOA protection will be triggered and the FET will open circuit (switch off). Every time SOA protection is triggered, all High Voltage GreenFET devices will automatically attempt to resume nominal operation after 160 ms.

#### Safe Start-up Condition

SLG59H1127V has built-in protection to prevent over-heating during start-up into a heavy load. Overloading the  $V_{OUT}$  pin with a capacitor and a resistor may result in non-monotonic  $V_{OUT}$  ramping or repeated restarts (*Figure 17* and *Figure 18*). In general, under light loading on  $V_{OUT}$ ,  $V_{OUT}$  ramping can be controlled with  $C_{SLEW}$  value. The following equation serves as a guide:

$$C_{SLEW} = \frac{T_{RISE}}{V_{IN}} \times 4.9 \mu A \times \frac{20}{3}$$

where

$T_{RISE}$  = Total rise time from 10%  $V_{OUT}$  to 90%  $V_{OUT}$

$V_{IN}$  = Input Voltage

$C_{SLEW}$  = Capacitor value for CAP pin

When capacitor and resistor loading on  $V_{OUT}$  during start up, the following tables will ensure  $V_{OUT}$  ramping is monotonic without triggering internal protection:

Safe Start-up Loading for $V_{IN} = 12$ V (Monotonic Ramp)			
Slew Rate (V/ms)	$C_{SLEW}$ (nF) <sup>2</sup>	$C_{LOAD}$ (μF)	$R_{LOAD}$ (Ω)
1	33.3	500	20
2	16.7	250	20
3	11.1	160	20
4	8.3	120	20
5	6.7	100	20

Note 2: Select the closest-value tolerance capacitor.

## SLG59H1127V

A 12 V, 15 mΩ, 4 A Load Switch  
with  $V_{IN}$  Lockout Select and Power Good Output

### Setting the SLG59H1127V's Active Current Limit

$R_{SET}$ (kΩ)	Active Current Limit (A) <sup>3</sup>
91	1
45	2
30	3
18	5

Note 3: Active Current Limit accuracy is  $\pm 15\%$  over voltage range and temperature range

### Setting the SLG59H1127V's Input Overvoltage Lockout Threshold

As shown in the table below, SEL selects the  $V_{IN}$  overvoltage threshold at which the SLG59H1127V's internal state machine will turn OFF (open circuit) the power MOSFET if  $V_{IN}$  exceeds the selected threshold.

SEL	$V_{IN(OVLO)}$ (Typ)
0	14.4 V

With an activated SLG59H1127V (ON=HIGH) and at any time  $V_{IN}$  crosses the programmed  $V_{IN}$  overvoltage threshold, the state machine opens the load switch and asserts the FAULT pin within  $T_{FAULT\_LOW}$ .

In applications with a deactivated or inactive SLG59H1127V ( $V_{IN} > V_{IN(UVLO)}$  and ON=LOW) and if the applied  $V_{IN}$  is higher than the programmed  $V_{IN(OVLO)}$  threshold, the SLG59H1127V's state machine will keep the load switch open circuited if the ON pin is toggled LOW-to-HIGH. In these cases, the FAULT pin will also be asserted within  $T_{FAULT\_LOW}$  and will remain asserted until  $V_{IN}$  resumes nominal, steady-state operation.

In all cases, the SLG59H1127V's  $V_{IN}$  undervoltage lockout threshold is fixed at  $V_{IN(UVLO)}$ .

### Power Dissipation

The junction temperature of the SLG59H1127V depends on different factors such as board layout, ambient temperature, and other environmental factors. The primary contributor to the increase in the junction temperature of the SLG59H1127V is the power dissipation of its power MOSFET. Its power dissipation and the junction temperature in nominal operating mode can be calculated using the following equations:

$$PD = RDS_{ON} \times I_{DS}^2$$

where:

PD = Power dissipation, in Watts (W)

$RDS_{ON}$  = Power MOSFET ON resistance, in Ohms (Ω)

$I_{DS}$  = MOSFET current, in Amps (A)

and

$$T_J = PD \times \theta_{JA} + T_A$$

where:

$T_J$  = Junction temperature, in Celsius degrees (°C)

$\theta_{JA}$  = Package thermal resistance, in Celsius degrees per Watt (°C/W)

$T_A$  = Ambient temperature, in Celsius degrees (°C)

## SLG59H1127V

A 12 V, 15 mΩ, 4 A Load Switch  
with  $V_{IN}$  Lockout Select and Power Good Output

### Power Dissipation (continued)

In current-limit mode, the SLG59H1127V's power dissipation can be calculated by taking into account the voltage drop across the load switch ( $V_{IN} - V_{OUT}$ ) and the magnitude of the output current in current-limit mode ( $I_{ACL}$ ):

$$PD = (V_{IN} - V_{OUT}) \times I_{ACL} \text{ or}$$

$$PD = (V_{IN} - (R_{LOAD} \times I_{ACL})) \times I_{ACL}$$

where:

PD = Power dissipation, in Watts (W)  
 $V_{IN}$  = Input Voltage, in Volts (V)  
 $R_{LOAD}$  = Load Resistance, in Ohms ( $\Omega$ )  
 $I_{ACL}$  = Output limited current, in Amps (A)  
 $V_{OUT} = R_{LOAD} \times I_{ACL}$

## SLG59H1127V

### A 12 V, 15 mΩ, 4 A Load Switch with $V_{IN}$ Lockout Select and Power Good Output

#### Layout Guidelines:

1. Since the VIN and VOUT pins dissipate most of the heat generated during high-load current operation, it is highly recommended to make power traces as short, direct, and wide as possible. A good practice is to make power traces with absolute minimum widths of 15 mils (0.381 mm) per Ampere. A representative layout, shown in [Figure 19](#), illustrates proper techniques for heat to transfer as efficiently as possible out of the device;
2. To minimize the effects of parasitic trace inductance on normal operation, it is recommended to connect input  $C_{IN}$  and output  $C_{LOAD}$  low-ESR capacitors as close as possible to the SLG59H1127V's VIN and VOUT pins;
3. The GND pin should be connected to system analog or power ground plane.
4. 2 oz. copper is recommended for high current operation.

#### SLG59H1127V Evaluation Board:

A High Voltage GreenFET Evaluation Board for SLG59H1127V is designed according to the statements above and is illustrated on [Figure 19](#). Please note that evaluation board has D\_Sense and S\_Sense pads. They cannot carry high currents and dedicated only for  $RDS_{ON}$  evaluation.

## Basic Test Setup and Connections

Figure 21. SLG59H1127V Evaluation Board Connection Circuit

### EVb Configuration

1. Set SEL0 to GND to configure OVLO;
2. Connect oscilloscope probes to D/VIN, S/VOUT, ON, etc.;
3. Turn on Power Supply and set desired  $V_{IN}$  from 4.5 V...12 V range;
4. Toggle the ON signal High or Low to observe SLG59H1127V operation.
5. Use central SEL1 header pin for PG monitor.
