User's Manual: Hardware

32-Bit MCU

Renesas Advanced (RA) Family

Renesas RA4 Series

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
 2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
 3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
 4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
 5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
 6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
- Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
 8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
 9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
 10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
 11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
 12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
 13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
 14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document Type	Description
Microcontrollers	Data sheet	Features, overview, and electrical characteristics of the MCU
	User's Manual: Hardware	MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	User's Manual: Software	API reference and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE)
	User's Manual: Software	
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
0x1F	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h".
1234	Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

Example	Description
AAA.BBB.CCC	Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC).
AAA.BBB	A period separated a function module symbol (AAA) and register symbol (BBB).
BBB.DDD	A period separated a register symbol (BBB) and bit field symbol (DDD).
EEE[3:0]	Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0.

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Symbol	Name	Description
b	Binary Digit	Single 0 or 1
B	Byte	This unit is generally used for memory specification of the MCU and address space.
k	kilo-	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	Kilo-	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms

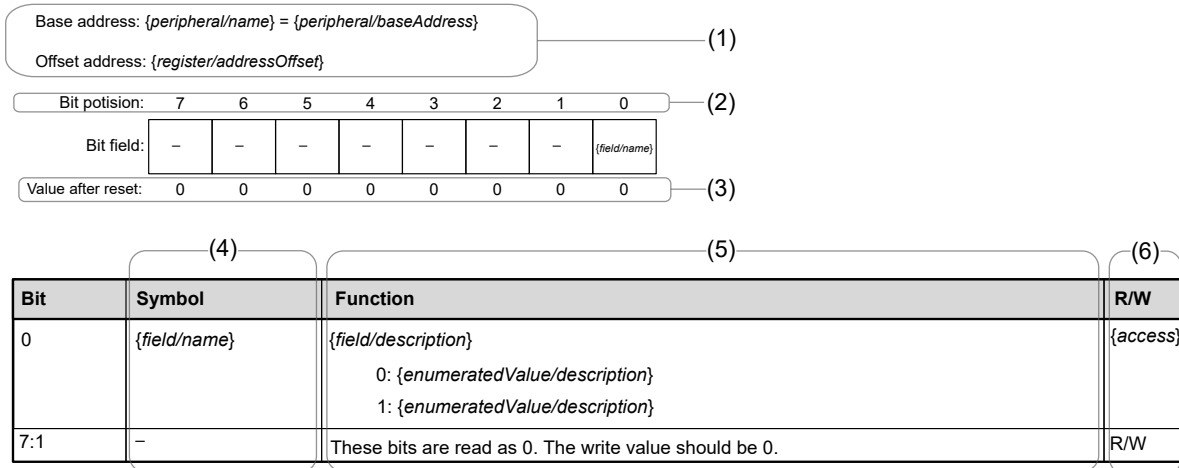

The following terms have special meanings.

Term	Description
NC	Not connected pin. This pin should be left floating unless specified otherwise.
Hi-Z	High impedance.
x	Don't care or undefined.

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XX.X.X {*register/name*} : {*register/description*}

(1) Function module symbol, register symbol, and address assignment

Function module symbol, {*peripheral/name*}, register symbol, {*register/name*}, and address assignment of this register are generally expressed. Base Address and Offset Address mean {*register/name*} : {*register/description*} of {*peripheral/name*} is assigned to address {*peripheral/baseAddress*} + {*register/addressOffset*}.

(2) Bit number

This number indicates the bit number. These bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

0: Indicates that the value is 0 after a reset.

1: Indicates that the value is 1 after a reset.

x: Indicates that the value is undefined after a reset.

(4) Symbol

{*field/name*} indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field, {*field/description*}, and enumerated values.

(6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

R/W: The bit field is readable and writable.

R: The bit field is readable only. Writing to this bit field has no effect.

W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

Abbreviations used in this document are shown in the following table.

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ARC	Alleged RC
ATB	Advanced Trace Bus
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ETB	Embedded Trace Buffer
ETM	Embedded Trace Macrocell
FLL	Frequency Locked Loop
FPU	Floating Point Unit
HMI	Human Machine Interface
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NVIC	Nested Vector Interrupt Controller
PC	Program Counter
PFS	Port Function Select
PLL	Phase Locked Loop
POR	Power-on reset
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SHA	Secure Hash Algorithm
S/H	Sample and Hold
SP	Stack Pointer
SWD	Serial Wire Debug
SW-DP	Serial Wire-Debug Port
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter
VCO	Voltage Controlled Oscillator

10.1 Overview.....	170
10.2 Register Descriptions	175
10.2.1 LPMSAR : Low Power Mode Security Attribution Register	175
10.2.2 DPF SAR : Deep Software Standby Interrupt Factor Security Attribution Register	176
10.2.3 SBYCR : Standby Control Register.....	178
10.2.4 MSTPCRA : Module Stop Control Register A	179
10.2.5 MSTPCRB : Module Stop Control Register B	179
10.2.6 MSTPCRC : Module Stop Control Register C.....	181
10.2.7 MSTPCRD : Module Stop Control Register D.....	182
10.2.8 MSTPCRE : Module Stop Control Register E	183
10.2.9 OPCCR : Operating Power Control Register	184
10.2.10 SOPCCR : Sub Operating Power Control Register	185
10.2.11 SNZCR : Snooze Control Register.....	186
10.2.12 SNZEDCR0 : Snooze End Control Register 0	187
10.2.13 SNZEDCR1 : Snooze End Control Register 1	188
10.2.14 SNZREQCR0 : Snooze Request Control Register 0	189
10.2.15 SNZREQCR1 : Snooze Request Control Register 1	191
10.2.16 DPSBYCR : Deep Software Standby Control Register.....	191
10.2.17 DPSWCR : Deep Software Standby Wait Control Register	193
10.2.18 DPSIER0 : Deep Software Standby Interrupt Enable Register 0.....	193
10.2.19 DPSIER1 : Deep Software Standby Interrupt Enable Register 1.....	194
10.2.20 DPSIER2 : Deep Software Standby Interrupt Enable Register 2.....	195
10.2.21 DPSIER3 : Deep Software Standby Interrupt Enable Register 3.....	195
10.2.22 DPSIFR0 : Deep Software Standby Interrupt Flag Register 0	196
10.2.23 DPSIFR1 : Deep Software Standby Interrupt Flag Register 1	197
10.2.24 DPSIFR2 : Deep Software Standby Interrupt Flag Register 2	198
10.2.25 DPSIFR3 : Deep Software Standby Interrupt Flag Register 3	199
10.2.26 DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0.....	200
10.2.27 DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1.....	201
10.2.28 DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2.....	202
10.2.29 SYOCD CR : System Control OCD Control Register.....	202
10.2.30 LDOSCR:LDO Stop Control Register	203
10.2.31 PL2LDOSCR:PLL2-LDO Stop Control Register	205
10.3 Reducing Power Consumption by Switching Clock Signals	206
10.4 Module-Stop Function	206
10.5 Function for Lower Operating Power Consumption.....	206
10.5.1 Setting Operating Power Control Mode	206
10.6 Sleep Mode	207
10.6.1 Transitioning to Sleep Mode.....	207
10.6.2 Canceling Sleep Mode	208
10.7 Software Standby Mode	208
10.7.1 Transitioning to Software Standby Mode	208
10.7.2 Canceling Software Standby Mode.....	209
10.7.3 Example of Software Standby Mode Application	210
10.8 Snooze Mode	211
10.8.1 Transition to Snooze Mode	211

10.8.2	Canceling Snooze Mode	212
10.8.3	Returning from Snooze Mode to Software Standby Mode	213
10.8.4	Snooze Operation Example	214
10.9	Deep Software Standby Mode	218
10.9.1	Transitioning to Deep Software Standby Mode	218
10.9.2	Cancelling Deep Software Standby Mode	218
10.9.3	Pin States when Deep Software Standby mode is Canceled	219
10.9.4	Example of Deep Software Standby Mode Application	219
10.9.5	Usage Flow for Deep Software Standby Mode	220
10.10	Usage Notes	221
10.10.1	Register Access	221
10.10.2	I/O Port pin states	223
10.10.3	Module-Stop State of DTC, DMAC	223
10.10.4	Internal Interrupt Sources	223
10.10.5	Input Buffer Control by DIRQnE Bit	223
10.10.6	Transitioning to Low Power Modes	223
10.10.7	Timing of WFI Instruction	223
10.10.8	Writing to the WDT/IWDT Registers by DTC or DMAC in Sleep Mode or Snooze Mode ...	224
10.10.9	Oscillators in Snooze Mode	224
10.10.10	Snooze Mode Entry by RXD0 Falling Edge	224
10.10.11	Using UART of SCI0 in Snooze Mode	224
10.10.12	Conditions of A/D Conversion Start in Snooze Mode	224
10.10.13	ELC Events in Snooze Mode	224
10.10.14	Module-Stop Bit Write Timing	224
10.10.15	Sleep-on-exit Function	225
10.10.16	Interruption During the Transition to Low Power Modes	225
11.	Battery Backup Function	228
11.1	Overview	228
11.1.1	Features of Battery Backup Function	228
11.1.2	Battery Power Supply Switch	228
11.1.3	Backup Registers	228
11.1.4	Time Capture Pin Detection	228
11.2	Register Descriptions	230
11.2.1	BBFSAR : Battery Backup Function Security Attribute Register	230
11.2.2	VBATTMNSLR : Battery Backup Voltage Monitor Function Select Register	231
11.2.3	VBATTMONR : Battery Backup Voltage Monitor Register	232
11.2.4	VBTBER : VBATT Backup Enable Register	232
11.2.5	VBTBKR[n] : VBATT Backup Register (n = 0 to 127)	233
11.2.6	VBTICTLR : VBATT Input Control Register	234
11.3	Operation	234
11.3.1	Battery Backup Function	234
11.3.2	VBATT Battery Power Supply Switch Usage	236
11.3.3	VBATT Backup Register Usage	236
11.4	Usage Notes	236
12.	Register Write Protection	237
12.1	Overview	237

12.2	Register Descriptions	237
12.2.1	PRCR : Protect Register	237
13.	Interrupt Controller Unit (ICU)	239
13.1	Overview.....	239
13.2	Register Descriptions	240
13.2.1	ICUSARA : Interrupt Controller Unit Security Attribution Register A.....	241
13.2.2	ICUSARB : Interrupt Controller Unit Security Attribution Register B.....	241
13.2.3	ICUSARC : Interrupt Controller Unit Security Attribution Register C	242
13.2.4	ICUSARD : Interrupt Controller Unit Security Attribution Register D	243
13.2.5	ICUSARE : Interrupt Controller Unit Security Attribution Register E.....	243
13.2.6	ICUSARF : Interrupt Controller Unit Security Attribution Register F	244
13.2.7	ICUSARG : Interrupt Controller Unit Security Attribution Register G	245
13.2.8	ICUSARH : Interrupt Controller Unit Security Attribution Register H	245
13.2.9	ICUSARI : Interrupt Controller Unit Security Attribution Register I.....	246
13.2.10	IRQCRi : IRQ Control Register (i = 0 to 9, 13)	246
13.2.11	NMISR : Non-Maskable Interrupt Status Register	248
13.2.12	NMIER : Non-Maskable Interrupt Enable Register	250
13.2.13	NMICLR : Non-Maskable Interrupt Status Clear Register.....	251
13.2.14	NMICR : NMI Pin Interrupt Control Register	253
13.2.15	IELSRn : ICU Event Link Setting Register n (n = 0 to 95).....	254
13.2.16	DELSRn : DMAC Event Link Setting Register n (n = 0 to 7).....	255
13.2.17	SELSR0 : SYS Event Link Setting Register	256
13.2.18	WUPEN0 : Wake Up Interrupt Enable Register 0	257
13.2.19	WUPEN1 : Wake Up interrupt enable register 1	258
13.3	Vector Table.....	259
13.3.1	Interrupt Vector Table	259
13.3.2	Event Number	262
13.4	Interrupt Operation	266
13.4.1	Detecting Interrupts.....	266
13.5	Interrupt setting procedure	267
13.5.1	Enabling Interrupt Requests.....	267
13.5.2	Disabling Interrupt Requests.....	267
13.5.3	Polling for interrupts	267
13.5.4	Selecting Interrupt Request Destinations	267
13.5.5	Digital Filter	269
13.5.6	External Pin Interrupts.....	270
13.6	Non-Maskable Interrupt Operation	270
13.6.1	Correspondence to TrustZone-M by NMI.....	271
13.7	Return from Low Power Modes	272
13.7.1	Return from Sleep Mode	272
13.7.2	Return from Software Standby Mode.....	273
13.7.3	Return from Snooze Mode	273
13.8	Using the WFI Instruction with Non-Maskable Interrupts	273
13.9	Reference	273
14.	Buses.....	274
14.1	Overview.....	274

14.2	Description of Buses.....	275
14.2.1	Arbitration.....	275
14.2.2	Parallel Operation.....	275
14.2.3	Restrictions.....	276
14.3	Register Descriptions.....	276
14.3.1	BUSSARA : BUS Security Attribution Register A.....	276
14.3.2	BUSSARB : BUS Security Attribution Register B.....	277
14.3.3	BUSSCNT<slave> : Slave Bus Control Register (<slave> = FHBIU, FLBIU, S0BIU, EQBIU).....	278
14.3.4	BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU).....	278
14.3.5	BUSnERRADD : BUS Error Address Register (n = 1 to 3).....	279
14.3.6	BUSnERRRW : BUS Error Read Write Register (n = 1 to 3).....	280
14.3.7	BTZFnERRADD : BUS TZF Error Address Register (n = 1 to 3).....	280
14.3.8	BTZFnERRRW : BUS TZF Error Read Write Register (n = 1 to 3).....	281
14.3.9	BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3).....	282
14.3.10	DMACDTCERRSTAT : DMAC/DTC Error Status Register.....	283
14.3.11	BUSnERRCLR : BUS Error Clear Register n (n = 1 to 3).....	283
14.3.12	DMACDTCERRCLR : DMAC/DTC Error Clear Register.....	284
14.4	Bus Error Monitoring Section.....	284
14.4.1	Bus Error Types.....	284
14.4.2	Operations When a Bus Error Occurs.....	285
14.4.3	Conditions Leading to Illegal Address Access Errors.....	286
14.4.4	Time-out.....	287
14.5	References.....	287
15.	Memory Protection Unit (MPU).....	288
15.1	Overview.....	288
15.2	Arm MPU.....	288
15.3	Bus Master MPU.....	288
15.3.1	Register Descriptions.....	289
15.3.2	Operation.....	297
15.4	References.....	300
16.	DMA Controller (DMAC).....	301
16.1	Overview.....	301
16.2	Register Descriptions.....	303
16.2.1	DMACSAR : DMAC Controller Security Attribution Register.....	303
16.2.2	DMSAR : DMA Source Address Register.....	303
16.2.3	DMSRR : DMA Source Reload Address Register.....	304
16.2.4	DMDAR : DMA Destination Address Register.....	304
16.2.5	DMDRR : DMA Destination Reload Address Register.....	304
16.2.6	DMCRA : DMA Transfer Count Register.....	305
16.2.7	DMCRB : DMA Block Transfer Count Register.....	306
16.2.8	DMTMD : DMA Transfer Mode Register.....	307
16.2.9	DMINT : DMA Interrupt Setting Register.....	308
16.2.10	DMAMD : DMA Address Mode Register.....	309
16.2.11	DMOFR : DMA Offset Register.....	312
16.2.12	DMCNT : DMA Transfer Enable Register.....	312
16.2.13	DMREQ : DMA Software Start Register.....	313

16.2.14	DMSTS : DMA Status Register	314
16.2.15	DMSBS : DMA Source Buffer Size Register	315
16.2.16	DMDBS : DMA Destination Buffer Size Register	316
16.2.17	DMAST : DMA Module Activation Register	317
16.2.18	DMECHR : DMAC Error Channel Register	318
16.3	Operation	319
16.3.1	Transfer Mode	319
16.3.2	Extended Repeat Area Function	328
16.3.3	Free-running Function	330
16.3.4	Address Update Function using Offset	331
16.3.5	Address Update Function in Repeat-Block Transfer Mode	336
16.3.6	Example of Using Repeat-Block Transfer Mode	338
16.3.7	Activation Sources	341
16.3.8	Operation Timing	341
16.3.9	DMAC Execution Cycles	342
16.3.10	Activating the DMAC	343
16.3.11	Starting DMA Transfer	345
16.3.12	Registers during DMA Transfer	345
16.3.13	Channel Priority	346
16.3.14	Channel Security	346
16.3.15	Master TrustZone Filter in DMAC	347
16.4	Ending DMA Transfer	348
16.4.1	Transfer End by Completion of Specified Total Number of Transfer Operations	348
16.4.2	Transfer End by Repeat Size End Interrupt	348
16.4.3	Transfer End by Interrupt on Extended Repeat Area Overflow	349
16.5	Processing on DMA Transfer Error	349
16.5.1	Processing on NMI handler	349
16.5.2	Processing on Error response detection interrupt request (DMA_TRANSERR) handler	352
16.6	Interrupts	358
16.6.1	Transfer End Interrupt	358
16.6.2	Transfer Error Interrupt	360
16.7	Event Link	361
16.8	Low-Power Consumption Function	361
16.9	Usage Notes	361
16.9.1	Access to the Registers during DMA Transfer	361
16.9.2	DMA Transfer to Reserved Areas	362
16.9.3	Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn n = 0 to 7)	362
16.9.4	Suspending or Restarting DMAC Activation	362
16.9.5	Precautions for Resuming DMA Transfer	362
17.	Data Transfer Controller (DTC)	364
17.1	Overview	364
17.2	Register Descriptions	365
17.2.1	DTCSAR : DTC Controller Security Attribution Register	366
17.2.2	MRA : DTC Mode Register A	366
17.2.3	MRB : DTC Mode Register B	367
17.2.4	SAR : DTC Transfer Source Register	368

17.2.5	DAR : DTC Transfer Destination Register.....	368
17.2.6	CRA : DTC Transfer Count Register A.....	369
17.2.7	CRB : DTC Transfer Count Register B.....	369
17.2.8	DTCCR : DTC Control Register	370
17.2.9	DTCCR_SEC : DTC Control Register for secure Region	370
17.2.10	DTCVBR : DTC Vector Base Register	371
17.2.11	DTCVBR_SEC : DTC Vector Base Register for secure Region	371
17.2.12	DTCST : DTC Module Start Register	371
17.2.13	DTCSTS : DTC Status Register.....	372
17.2.14	DTEVR : DTC Error Vector Register	373
17.3	Activation Sources.....	374
17.3.1	Allocating Transfer Information and DTC Vector Table	374
17.4	Operation.....	376
17.4.1	Transfer Information Read Skip Function.....	378
17.4.2	Transfer Information Write-Back Skip Function.....	378
17.4.3	Normal Transfer Mode	379
17.4.4	Repeat Transfer Mode	380
17.4.5	Block Transfer Mode	381
17.4.6	Chain Transfer.....	382
17.4.7	Operation Timing.....	383
17.4.8	Execution Cycles of DTC	385
17.4.9	DTC Bus Mastership Release Timing	386
17.4.10	Vector Security	386
17.4.11	Master TrustZone Filter in DTC.....	386
17.5	DTC Setting Procedure	386
17.6	Examples of DTC Usage	387
17.6.1	Normal Transfer	387
17.6.2	Chain transfer.....	388
17.6.3	Chain Transfer when Counter = 0	389
17.7	Processing on DTC Transfer Error	391
17.7.1	Processing on NMI handler.....	392
17.7.2	Processing on Error response detection interrupt request (DMA_TRANSERR) handler....	395
17.8	Interrupt.....	401
17.8.1	Interrupt Request for Transfer End.....	401
17.8.2	Interrupt Request for Transfer Error	401
17.9	Event Link.....	402
17.10	Low Power Consumption Function.....	402
17.11	Usage Notes.....	403
17.11.1	Transfer Information Start Address	403
18.	Event Link Controller (ELC).....	404
18.1	Overview.....	404
18.2	Register Descriptions	405
18.2.1	ELCR : Event Link Controller Register.....	405
18.2.2	ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1).....	406
18.2.3	ELSRn : Event Link Setting Register n (n = 0 to 8, 12, 14 to 17)	407
18.2.4	ELCSARA : Event Link Controller Security Attribution Register A.....	411
18.2.5	ELCSARB : Event Link Controller Security Attribution Register B.....	411

18.2.6	ELCSARC : Event Link Controller Security Attribution Register C.....	411
18.3	Operation.....	412
18.3.1	Relation Between Interrupt Handling and Event Linking.....	412
18.3.2	Linking Events.....	412
18.3.3	Example of Procedure for Linking Events.....	412
18.4	Usage Notes.....	413
18.4.1	Linking DMAC/DTC Transfer End Signals as Events.....	413
18.4.2	Setting Clocks.....	413
18.4.3	Module-Stop Function Setting.....	413
18.4.4	ELC Delay Time.....	413
19.	I/O Ports.....	414
19.1	Overview.....	414
19.2	Register Descriptions.....	415
19.2.1	PCNTR1/PODR/PDR : Port Control Register 1.....	415
19.2.2	PCNTR2/EIDR/PIDR : Port Control Register 2.....	416
19.2.3	PCNTR3/PORR/POSR : Port Control Register 3.....	417
19.2.4	PCNTR4/EORR/EOSR : Port Control Register 4.....	418
19.2.5	PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 5, n = 00 to 15).....	419
19.2.6	PWPR : Write-Protect Register.....	421
19.2.7	PWPRS : Write-Protect Register for Secure.....	422
19.2.8	PmSAR : Port Security Attribution register (m = 0 to 5).....	422
19.3	Operation.....	423
19.3.1	General I/O Ports.....	423
19.3.2	Port Function Select.....	423
19.3.3	Port Group Function for ELC.....	423
19.4	Handling of Unused Pins.....	425
19.5	Usage Notes.....	426
19.5.1	Procedure for Specifying the Pin Functions.....	426
19.5.2	Procedure for Using Port Group Input.....	426
19.5.3	Port Output Data Register (PODR) Summary.....	426
19.5.4	Notes on Using Analog Functions.....	427
19.5.5	I/O Buffer Specification.....	427
19.6	Peripheral Select Settings for Each Product.....	428
20.	Port Output Enable for GPT (POEG).....	432
20.1	Overview.....	432
20.2	Register Descriptions.....	434
20.2.1	POEGGn : POEG Group n Setting Register (n = A to D).....	434
20.3	Output-Disable Control Operation.....	435
20.3.1	Pin Input Level Detection Operation.....	435
20.3.2	Output-Disable Requests from the GPT.....	436
20.3.3	Output-Disable Control Using Detection of Stopped Oscillation.....	436
20.3.4	Output-Disable Control Using Registers.....	436
20.3.5	Release from Output-Disable.....	436
20.4	Interrupt Sources.....	437
20.5	External Trigger Output to the GPT.....	437
20.6	Usage Notes.....	438

20.6.1	Transition to Software Standby Mode	438
20.6.2	Specifying Pins Associated with the GPT	438
21.	General PWM Timer (GPT).....	439
21.1	Overview.....	439
21.2	Register Descriptions	442
21.2.1	GTWP : General PWM Timer Write-Protection Register.....	442
21.2.2	GTSTR : General PWM Timer Software Start Register	444
21.2.3	GTSTP : General PWM Timer Software Stop Register.....	445
21.2.4	GTCLR : General PWM Timer Software Clear Register	445
21.2.5	GTSSR : General PWM Timer Start Source Select Register	446
21.2.6	GTPSR : General PWM Timer Stop Source Select Register	449
21.2.7	GTCSR : General PWM Timer Clear Source Select Register.....	452
21.2.8	GTUPSR : General PWM Timer Up Count Source Select Register.....	456
21.2.9	GTDNSR : General PWM Timer Down Count Source Select Register.....	459
21.2.10	GTICASR : General PWM Timer Input Capture Source Select Register A.....	462
21.2.11	GTICBSR : General PWM Timer Input Capture Source Select Register B.....	466
21.2.12	GTCCR : General PWM Timer Control Register	469
21.2.13	GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register	471
21.2.14	GTIOR : General PWM Timer I/O Control Register	473
21.2.15	GTINTAD : General PWM Timer Interrupt Output Setting Register	477
21.2.16	GTST : General PWM Timer Status Register	478
21.2.17	GTBER : General PWM Timer Buffer Enable Register	482
21.2.18	GTCNT : General PWM Timer Counter	483
21.2.19	GTCCR _k : General PWM Timer Compare Capture Register k (k = A to F)	484
21.2.20	GTPR : General PWM Timer Cycle Setting Register	484
21.2.21	GTPBR : General PWM Timer Cycle Setting Buffer Register	484
21.2.22	GTDTCSR : General PWM Timer Dead Time Control Register	485
21.2.23	GTDVU : General PWM Timer Dead Time Value Register U.....	486
21.2.24	GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register	486
21.2.25	GTPC : General PWM Timer Period Count Register	488
21.2.26	GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register	489
21.2.27	GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register.....	490
21.3	Operation.....	491
21.3.1	Basic Operation.....	491
21.3.2	Buffer Operation	499
21.3.3	PWM Output Operating Mode.....	506
21.3.4	Automatic Dead Time Setting Function.....	516
21.3.5	Count Direction Changing Function	520
21.3.6	Function of Output Duty 0% and 100%.....	521
21.3.7	Hardware Count Start/Count Stop and Clear Operation	522
21.3.8	Synchronized Operation.....	527
21.3.9	PWM Output Operation Examples	531
21.3.10	Period Count Function	537
21.3.11	Phase Counting Function.....	538
21.3.12	Inter Channel Logical Operation Function.....	548

21.4	Interrupt Sources	550
21.4.1	Interrupt Sources.....	550
21.4.2	DMAC and DTC Activation.....	552
21.5	Operations Linked by ELC.....	552
21.5.1	Event Signal Output to ELC	552
21.5.2	Event Signal Inputs from ELC	552
21.6	Noise Filter Function.....	552
21.7	Protection Function.....	553
21.7.1	Write-Protection for Registers	553
21.7.2	Disabling of Buffer Operation	553
21.7.3	GTIOcNm Pin Output Negate Control (n = 1, 2, 4, 5, m = A, B)	555
21.8	Initialization Method of Output Pins	556
21.8.1	Pin Settings After Reset	556
21.8.2	Pin Initialization Due to Error During Operation	557
21.9	Usage Notes.....	557
21.9.1	Module-Stop Function Setting.....	557
21.9.2	GTCCRn Settings during Compare Match Operation (n = A to F).....	557
21.9.3	Setting Range for GTCNT Counter	558
21.9.4	Starting and Stopping the GTCNT Counter	558
21.9.5	Priority Order of Each Event	559
22.	Low Power Asynchronous General Purpose Timer (AGT).....	560
22.1	Overview.....	560
22.2	Register Descriptions	562
22.2.1	AGT : AGT Counter Register	562
22.2.2	AGTCMA : AGT Compare Match A Register	562
22.2.3	AGTCMB : AGT Compare Match B Register	563
22.2.4	AGTCR : AGT Control Register	563
22.2.5	AGTMR1 : AGT Mode Register 1	565
22.2.6	AGTMR2 : AGT Mode Register 2	565
22.2.7	AGTIOC : AGT I/O Control Register	567
22.2.8	AGTISR : AGT Event Pin Select Register.....	568
22.2.9	AGTCMSR : AGT Compare Match Function Select Register	569
22.2.10	AGTIOSEL : AGT Pin Select Register	569
22.3	Operation.....	570
22.3.1	Reload Register and Counter Rewrite Operation.....	570
22.3.2	Reload Register and AGT Compare Match A/B Register Rewrite Operation	572
22.3.3	Timer Mode	573
22.3.4	Pulse Output Mode	574
22.3.5	Event Counter Mode	575
22.3.6	Pulse Width Measurement Mode	576
22.3.7	Pulse Period Measurement Mode	577
22.3.8	Compare Match function	578
22.3.9	Output Settings for Each Mode	579
22.3.10	Standby Mode	580
22.3.11	Interrupt Sources.....	581
22.3.12	Event Signal Output to ELC	582
22.4	Usage Notes.....	582

22.4.1	Count Operation Start and Stop Control	582
22.4.2	Access to Counter Register	582
22.4.3	When Changing Mode	582
22.4.4	Output pin setting	582
22.4.5	Digital Filter	583
22.4.6	How to Calculate Event Number, Pulse Width, and Pulse Period.....	583
22.4.7	When Count is Forcibly Stopped by TSTOP Bit.....	583
22.4.8	When Selecting AGTn (n = 0, 2) Underflow as the Count Source	583
22.4.9	Module-stop function	583
22.4.10	When Switching Source Clock	583
23.	Realtime Clock (RTC)	584
23.1	Overview.....	584
23.2	Register Descriptions	585
23.2.1	R64CNT : 64-Hz Counter.....	586
23.2.2	RSECCNT : Second Counter (in Calendar Count Mode)	586
23.2.3	RMINCNT : Minute Counter (in Calendar Count Mode).....	587
23.2.4	RHRCNT : Hour Counter (in Calendar Count Mode)	587
23.2.5	RWKCNT : Day-of-Week Counter (in Calendar Count Mode)	588
23.2.6	BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode).....	588
23.2.7	RDAYCNT : Day Counter	588
23.2.8	RMONCNT : Month Counter	589
23.2.9	RYRCNT : Year Counter	589
23.2.10	RSECAR : Second Alarm Register (in Calendar Count Mode).....	590
23.2.11	RMINAR : Minute Alarm Register (in Calendar Count Mode)	591
23.2.12	RHRAR : Hour Alarm Register (in Calendar Count Mode)	591
23.2.13	RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode).....	592
23.2.14	BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)	593
23.2.15	RDAYAR : Date Alarm Register (in Calendar Count Mode).....	593
23.2.16	RMONAR : Month Alarm Register (in Calendar Count Mode)	594
23.2.17	RYRAR : Year Alarm Register (in Calendar Count Mode)	594
23.2.18	RYRAREN : Year Alarm Enable Register (in Calendar Count Mode).....	595
23.2.19	BCNTnAER : Binary Counter n Alarm Enable Register (n = 0, 1) (in Binary Count Mode).....	595
23.2.20	BCNT2AER : Binary Counter 2 Alarm Enable Register (in Binary Count Mode)	596
23.2.21	BCNT3AER : Binary Counter 3 Alarm Enable Register (in Binary Count Mode)	596
23.2.22	RCR1 : RTC Control Register 1	597
23.2.23	RCR2 : RTC Control Register 2 (in Calendar Count Mode).....	598
23.2.24	RCR2 : RTC Control Register 2 (in Binary Count Mode)	600
23.2.25	RCR4 : RTC Control Register 4	601
23.2.26	RFRL : Frequency Register L	601
23.2.27	RFRH : Frequency Register H	602
23.2.28	RADJ : Time Error Adjustment Register.....	602
23.2.29	RTCCR0 : Time Capture Control Register 0	603
23.2.30	RSECCP0 : Second Capture Register 0 (in Calendar Count Mode)	604
23.2.31	RMINCP0 : Minute Capture Register 0 (in Calendar Count Mode).....	605
23.2.32	RHRCP0 : Hour Capture Register 0 (in Calendar Count Mode)	605
23.2.33	RDAYCP0 : Date Capture Register 0 (in Calendar Count Mode)	606
23.2.34	RMONCP0 : Month Capture Register 0 (in Calendar Count Mode).....	606

23.2.35	BCNTnCP0 : BCNTn Capture Register 0 (n= 0 to 3) (in Binary Count Mode)	607
23.3	Operation	607
23.3.1	Outline of Initial Settings of Registers after Power On	607
23.3.2	Clock and Count Mode Setting Procedure	607
23.3.3	Setting the Time	608
23.3.4	30-Second Adjustment	609
23.3.5	Reading 64-Hz Counter and Time	610
23.3.6	Alarm Function	612
23.3.7	Procedure for Disabling Alarm Interrupt	613
23.3.8	Time Error Adjustment Function	613
23.3.9	Capturing the time	615
23.4	Interrupt Sources	616
23.5	Event Link Output	617
23.5.1	Interrupt Handling and Event Linking	618
23.6	Usage Notes	618
23.6.1	Register Writing during Counting	618
23.6.2	Use of Periodic Interrupts	618
23.6.3	RTCOU (1-Hz/64-Hz) Clock Output	619
23.6.4	Transitions to Low Power Modes after Setting Registers	619
23.6.5	Notes on Writing to and Reading from Registers	619
23.6.6	Changing the Count Mode	619
23.6.7	Initialization Procedure When the RTC Is Not to Be Used	619
23.6.8	When Switching Source Clock	620
24.	Watchdog Timer (WDT)	621
24.1	Overview	621
24.2	Register Descriptions	622
24.2.1	WDTRR : WDT Refresh Register	622
24.2.2	WDTCR : WDT Control Register	623
24.2.3	WDTSR : WDT Status Register	625
24.2.4	WDTRCR : WDT Reset Control Register	626
24.2.5	WDCSTPR : WDT Count Stop Control Register	627
24.2.6	Option Function Select Register 0 (OFS0)	627
24.3	Operation	627
24.3.1	Count Operation in each Start Mode	627
24.3.2	Controlling Writing to the WDTCR, WDTRCR, and WDCSTPR Registers	631
24.3.3	Refresh Operation	631
24.3.4	Status Flags	632
24.3.5	Reset Output	632
24.3.6	Interrupt Sources	632
24.3.7	Reading the Down-Counter Value	633
24.3.8	Association between Option Function Select Register 0 (OFS0) and WDT Registers	633
24.4	Output to the Event Link Controller (ELC)	634
24.5	Usage Notes	634
24.5.1	ICU Event Link Setting Register n (IELSRn) Setting	634
25.	Independent Watchdog Timer (IWDT)	635
25.1	Overview	635

25.2	Register Descriptions	636
25.2.1	IWDTRR : IWDT Refresh Register	636
25.2.2	IWDTSR : IWDT Status Register	637
25.2.3	OFS0 : Option Function Select Register 0	638
25.3	Operation	640
25.3.1	Auto Start Mode	640
25.3.2	Refresh Operation	641
25.3.3	Status Flags	642
25.3.4	Reset Output	643
25.3.5	Interrupt Sources	643
25.3.6	Reading the Down-Counter Value	643
25.4	Output to the Event Link Controller (ELC)	643
25.5	Usage Notes	644
25.5.1	Refresh Operations	644
25.5.2	Clock Division Ratio Setting	644
25.5.3	Constraints on the ICU Event Link Setting Register n (IELSRn) Setting	644
26.	USB 2.0 Full-Speed Module (USBFS)	645
26.1	Overview	645
26.2	Register Descriptions	646
26.2.1	SYSCFG : System Configuration Control Register	646
26.2.2	SYSSTS0 : System Configuration Status Register 0	648
26.2.3	DVSTCTR0 : Device State Control Register 0	649
26.2.4	CFIFO/CFIFOL : CFIFO Port Register	651
26.2.5	DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1)	652
26.2.6	CFIFOSEL : CFIFO Port Select Register	653
26.2.7	DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)	655
26.2.8	CFIFOCTR : CFIFO Port Control Register	656
26.2.9	DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)	658
26.2.10	INTENB0 : Interrupt Enable Register 0	659
26.2.11	INTENB1 : Interrupt Enable Register 1	660
26.2.12	BRDYENB : BRDY Interrupt Enable Register	661
26.2.13	NRDYENB : NRDY Interrupt Enable Register	662
26.2.14	BEMPENB : BEMP Interrupt Enable Register	663
26.2.15	SOFCFG : SOF Output Configuration Register	664
26.2.16	INTSTS0 : Interrupt Status Register 0	665
26.2.17	INTSTS1 : Interrupt Status Register 1	667
26.2.18	BRDYSTS : BRDY Interrupt Status Register	670
26.2.19	NRDYSTS : NRDY Interrupt Status Register	670
26.2.20	BEMPSTS : BEMP Interrupt Status Register	671
26.2.21	FRMNUM : Frame Number Register	672
26.2.22	DVCHGR : Device State Change Register	673
26.2.23	USBADDR : USB Address Register	673
26.2.24	USBREQ : USB Request Type Register	674
26.2.25	USBVAL : USB Request Value Register	675
26.2.26	USBINDX : USB Request Index Register	676
26.2.27	USBLENG : USB Request Length Register	676
26.2.28	DCPCFG : DCP Configuration Register	677

26.2.29	DCPMAXP : DCP Maximum Packet Size Register	677
26.2.30	DCPCTR : DCP Control Register	678
26.2.31	PIPESEL : Pipe Window Select Register	681
26.2.32	PIPECFG : Pipe Configuration Register	682
26.2.33	PIPEMAXP : Pipe Maximum Packet Size Register	683
26.2.34	PIPEPERI : Pipe Cycle Control Register	684
26.2.35	PIPEnCTR : PIPEn Control Registers (n = 1 to 5)	685
26.2.36	PIPEnCTR : PIPEn Control Registers (n = 6 to 9)	689
26.2.37	PIPEnTRE : PIPEn Transaction Counter Enable Register (n = 1 to 5)	691
26.2.38	PIPEnTRN : PIPEn Transaction Counter Register (n = 1 to 5)	692
26.2.39	BCCTRL1 : Battery Charging Control Register 1	693
26.2.40	BCCTRL2 : Battery Charging Control Register 2	695
26.2.41	DEVADDn : Device Address n Configuration Register (n = 0 to 5)	695
26.2.42	PHYSECTRL : PHY Single-ended Receiver Control Register	696
26.2.43	DPUSR0R : Deep Software Standby USB Transceiver Control/Pin Monitor Register	696
26.2.44	DPUSR1R : Deep Software Standby USB Suspend/Resume Interrupt Register	697
26.3	Operation	699
26.3.1	System Control	699
26.3.2	Interrupts	706
26.3.3	Interrupt Descriptions	710
26.3.4	Pipe Control	719
26.3.5	FIFO Buffer	723
26.3.6	FIFO Buffer Clearing	723
26.3.7	FIFO Port Functions	724
26.3.8	DMA Transfers (D0FIFO and D1FIFO Ports)	725
26.3.9	Control Transfers Using the DCP	725
26.3.10	Bulk Transfers (Pipes 1 to 5)	727
26.3.11	Interrupt Transfers (Pipes 6 to 9)	727
26.3.12	Isochronous Transfers (Pipes 1 and 2)	728
26.3.13	SOF Interpolation Function	735
26.3.14	Pipe Schedule	735
26.3.15	Battery Charging Detection Processing	736
26.4	Usage Notes	741
26.4.1	Settings for the Module-Stop State	741
26.4.2	Clearing the Interrupt Status Register on Canceling Software Standby Mode	741
26.4.3	Clearing the Interrupt Status Register after Setting Up the Port Function	741
27.	Serial Communications Interface (SCI)	743
27.1	Overview	743
27.2	Register Descriptions	746
27.2.1	RSR : Receive Shift Register	746
27.2.2	RDR : Receive Data Register	747
27.2.3	RDRHL : Receive Data Register for Non-Manchester mode (MMR.MANEN = 0)	747
27.2.4	RDRHL_MAN : Receive Data Register for Manchester mode (MMR.MANEN = 1)	747
27.2.5	FRDRHL/FRDRH/FRDRL : Receive FIFO Data Register	748
27.2.6	TDR : Transmit Data Register	749
27.2.7	TDRHL : Transmit Data Register for Non-Manchester mode (MMR.MANEN = 0)	750
27.2.8	TDRHL_MAN : Transmit Data Register for Manchester mode (MMR.MANEN = 1)	750

27.2.9	FTDRHL/FTDRH/FTDRL : Transmit FIFO Data Register	751
27.2.10	TSR : Transmit Shift Register.....	752
27.2.11	SMR : Serial Mode Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0).....	752
27.2.12	SMR_SMCI : Serial Mode Register for Smart Card Interface Mode (SCMR.SMIF = 1)	754
27.2.13	SCR : Serial Control Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0)	755
27.2.14	SCR_SMCI : Serial Control Register for Smart Card Interface Mode (SCMR.SMIF = 1) ...	757
27.2.15	SSR : Serial Status Register for Non-Smart Card Interface and Non-FIFO Mode (SCMR.SMIF = 0, FCR.FM = 0, and MMR.MANEN = 0)	758
27.2.16	SSR_FIFO : Serial Status Register for Non-Smart Card Interface and FIFO Mode (SCMR.SMIF = 0, FCR.FM = 1, and MMR.MANEN = 0)	761
27.2.17	SSR_SMCI : Serial Status Register for Smart Card Interface Mode (SCMR.SMIF = 1, and MMR.MANEN = 0)	764
27.2.18	SSR_MANC : Serial Status Register for Manchester Mode (SCMR.SMIF = 0, and MMR.MANEN = 1)	766
27.2.19	SCMR : Smart Card Mode Register	768
27.2.20	BRR : Bit Rate Register	770
27.2.21	MDDR : Modulation Duty Register	779
27.2.22	SEMR : Serial Extended Mode Register	782
27.2.23	SNFR : Noise Filter Setting Register.....	783
27.2.24	SIMR1 : IIC Mode Register 1	784
27.2.25	SIMR2 : IIC Mode Register 2	785
27.2.26	SIMR3 : IIC Mode Register 3	786
27.2.27	SISR : IIC Status Register.....	787
27.2.28	SPMR : SPI Mode Register.....	788
27.2.29	FCR : FIFO Control Register.....	789
27.2.30	FDR : FIFO Data Count Register	791
27.2.31	LSR : Line Status Register.....	791
27.2.32	CDR : Compare Match Data Register.....	792
27.2.33	DCCR : Data Compare Match Control Register.....	793
27.2.34	SPTR : Serial Port Register	794
27.2.35	ACTR : Adjustment Communication Timing Register	796
27.2.36	MMR : Manchester Mode Register	797
27.2.37	TMPR : Transmit Manchester Preface Setting Register	799
27.2.38	RMPR : Receive Manchester Preface Setting Register.....	800
27.2.39	MESR : Manchester Extended Error Status Register	801
27.2.40	MECR : Manchester Extended Error Control Register.....	802
27.3	Operation in Asynchronous Mode	803
27.3.1	Serial Data Transfer Format.....	803
27.3.2	Receive Data Sampling Timing and Reception Margin in Asynchronous Mode	804
27.3.3	Clock	806
27.3.4	Double-Speed Operation and Frequency of 6 Times the Bit Rate	806
27.3.5	CTS and RTS Functions	806
27.3.6	Address Match (Receive Data Match Detection) Function	807
27.3.7	SCI Initialization in Asynchronous Mode.....	809
27.3.8	Serial Data Transmission in Asynchronous Mode.....	811
27.3.9	Serial Data Reception in Asynchronous Mode.....	816
27.3.10	The function of adjust receive sampling timing (Asynchronous Mode).....	829

27.3.11	The function of adjust transmit timing (Asynchronous Mode)	833
27.4	Multi-Processor Communication Function	838
27.4.1	Multi-Processor Serial Data Transmission	839
27.4.2	Multi-Processor Serial Data Reception	842
27.5	Operation in Manchester mode	847
27.5.1	Frame Format	848
27.5.2	Clock	852
27.5.3	Initialization of the SCI in Manchester Mode	852
27.5.4	Double-speed operation	853
27.5.5	CTS and RTS functions	853
27.5.6	Serial data transmission in Manchester mode	854
27.5.7	Serial Data Reception in Manchester Mode	857
27.5.8	Operation When Multi-Processor Bit Is Used	861
27.5.9	Receive Retiming	861
27.5.10	Polarity Setting for Manchester Code	862
27.5.11	Errors in Manchester Mode	863
27.6	Operation in Clock Synchronous Mode	868
27.6.1	Clock	868
27.6.2	CTS and RTS Functions	868
27.6.3	SCI Initialization in Clock Synchronous Mode	869
27.6.4	Serial Data Transmission in Clock Synchronous Mode	870
27.6.5	Serial Data Reception in Clock Synchronous Mode	874
27.6.6	Simultaneous Serial Data Transmission and Reception in Clock Synchronous Mode	879
27.7	Operation in Smart Card Interface Mode	882
27.7.1	Example Connection	882
27.7.2	Data Format (Except in Block Transfer Mode)	882
27.7.3	Block Transfer Mode	884
27.7.4	Receive Data Sampling Timing and Reception Margin	884
27.7.5	SCI Initialization (Smart Card Interface Mode)	885
27.7.6	Serial Data Transmission (Except in Block Transfer Mode)	886
27.7.7	Serial Data Reception (Except in Block Transfer Mode)	888
27.7.8	Clock Output Control	890
27.8	Operation in Simple IIC Mode	891
27.8.1	Generation of Start, Restart, and Stop Conditions	892
27.8.2	Clock Synchronization	893
27.8.3	SDAn Output Delay	894
27.8.4	SCI Initialization in Simple IIC Mode	894
27.8.5	Operation in Master Transmission in Simple IIC Mode	895
27.8.6	Master Reception in Simple IIC Mode	898
27.9	Operation in Simple SPI Mode	899
27.9.1	States of Pins in Master and Slave Modes	900
27.9.2	SS Function in Master Mode	901
27.9.3	SS Function in Slave Mode	901
27.9.4	Relationship between Clock and Transmit/Receive Data	901
27.9.5	SCI Initialization in Simple SPI Mode	902
27.9.6	Transmission and Reception of Serial Data in Simple SPI Mode	902
27.10	Bit Rate Modulation Function	902

27.11	Interrupt Sources	903
27.11.1	Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (Non-FIFO Selected)	903
27.11.2	Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (FIFO Selected)	903
27.11.3	Interrupts in Asynchronous, Manchester, Clock Synchronous, and Simple SPI Modes	903
27.11.4	Interrupts in Smart Card Interface Mode	905
27.11.5	Interrupts in Simple IIC Mode	906
27.12	Event Linking	906
27.13	Address Non-match Event Output (SCIO_DCUF)	907
27.14	Noise Cancellation Function	908
27.15	Usage Notes	908
27.15.1	Settings for the Module-Stop Function	908
27.15.2	SCI Operation during Low Power State	909
27.15.3	Break Detection and Processing	913
27.15.4	Mark State and Production of Breaks	914
27.15.5	Receive Error Flags and Transmit Operation in Clock Synchronous Mode and Simple SPI Mode	914
27.15.6	Restrictions on Clock Synchronous Transmission in Clock Synchronous Mode and Simple SPI Mode	914
27.15.7	Restrictions on Using DTC or DMAC	915
27.15.8	Notes on Starting Transfer	916
27.15.9	External Clock Input in Clock Synchronous Mode and Simple SPI Mode	916
27.15.10	Limitations on Simple SPI Mode	916
27.15.11	Notes on Transmit Enable Bit (SCR.TE)	917
27.15.12	Note on Stopping Reception When Using the RTS Function in Asynchronous Mode	917
28.	I²C Bus Interface (IIC).....	918
28.1	Overview.....	918
28.2	Register Descriptions	920
28.2.1	ICCR1 : I ² C Bus Control Register 1	920
28.2.2	ICCR2 : I ² C Bus Control Register 2	922
28.2.3	ICMR1 : I ² C Bus Mode Register 1	925
28.2.4	ICMR2 : I ² C Bus Mode Register 2	926
28.2.5	ICMR3 : I ² C Bus Mode Register 3	927
28.2.6	ICFER : I ² C Bus Function Enable Register	929
28.2.7	ICSER : I ² C Bus Status Enable Register	930
28.2.8	ICIER : I ² C Bus Interrupt Enable Register	932
28.2.9	ICSR1 : I ² C Bus Status Register 1	933
28.2.10	ICSR2 : I ² C Bus Status Register 2	935
28.2.11	ICWUR : I ² C Bus Wakeup Unit Register	938
28.2.12	ICWUR2 : I ² C Bus Wakeup Unit Register 2	939
28.2.13	SARLy : Slave Address Register L y (y = 0 to 2)	941
28.2.14	SARUy : Slave Address Register U y (y = 0 to 2)	941
28.2.15	ICBRL : I ² C Bus Bit Rate Low-Level Register	942
28.2.16	ICBRH : I ² C Bus Bit Rate High-Level Register	942
28.2.17	ICDRT : I ² C Bus Transmit Data Register	944
28.2.18	ICDRR : I ² C Bus Receive Data Register	944

28.2.19	ICDRS : I ² C Bus Shift Register	944
28.3	Operation	944
28.3.1	Communication Data Format	944
28.3.2	Initial Settings	945
28.3.3	Master Transmit Operation	946
28.3.4	Master Receive Operation	950
28.3.5	Slave Transmit Operation	955
28.3.6	Slave Receive Operation	957
28.4	SCL Synchronization Circuit	959
28.5	SDA Output Delay Function	960
28.6	Digital Noise Filter Circuits	961
28.7	Address Match Detection	962
28.7.1	Slave-Address Match Detection	962
28.7.2	Detection of General Call Address	965
28.7.3	Device-ID Address Detection	966
28.7.4	Host Address Detection	967
28.8	Wakeup Function	968
28.8.1	Normal Wakeup Mode 1	969
28.8.2	Normal Wakeup Mode 2	972
28.8.3	Command Recovery Mode and EEP Response Mode (Special Wakeup Modes)	974
28.9	Automatic Low-Hold Function for SCL	977
28.9.1	Function to Prevent Wrong Transmission of Transmit Data	977
28.9.2	NACK Reception Transfer Suspension Function	978
28.9.3	Function to Prevent Failure to Receive Data	979
28.10	Arbitration-Lost Detection Functions	980
28.10.1	Master Arbitration-Lost Detection (MALE Bit)	980
28.10.2	Function to Detect Loss of Arbitration During NACK Transmission (NALE Bit)	982
28.10.3	Slave Arbitration-Lost Detection (SALE Bit)	983
28.11	Start, Restart, and Stop Condition Issuing Function	984
28.11.1	Issuing a Start Condition	984
28.11.2	Issuing a Restart Condition	984
28.11.3	Issuing a Stop Condition	986
28.12	Bus Hanging	986
28.12.1	Timeout Function	986
28.12.2	Extra SCL Clock Cycle Output Function	987
28.12.3	IIC Reset and Internal Reset	988
28.13	SMBus Operation	988
28.13.1	SMBus Timeout Measurement	989
28.13.2	Packet Error Code (PEC)	990
28.13.3	SMBus Host Notification Protocol (Notify ARP Master Command)	990
28.14	Interrupt Sources	990
28.14.1	Buffer Operation for IICn_TXI and IICn_RXI Interrupts	991
28.15	State of Registers When Issuing Each Condition	991
28.16	Event Link Output	992
28.16.1	Interrupt Handling and Event Linking	992
28.17	Usage Notes	993
28.17.1	Settings for the Module-Stop Function	993

28.17.2	Notes on Starting Transfer	993
29.	Controller Area Network (CAN) Module	994
29.1	Overview.....	994
29.2	Register Descriptions	996
29.2.1	CTLR : Control Register	996
29.2.2	BCR : Bit Configuration Register.....	999
29.2.3	MKR[k] : Mask Register k (k = 0 to 7)	1001
29.2.4	FIDCRk : FIFO Received ID Compare Register k (k = 0, 1)	1001
29.2.5	MKIVLR : Mask Invalid Register	1002
29.2.6	Mailbox Registers.....	1003
29.2.7	MIER : Mailbox Interrupt Enable Register	1006
29.2.8	MIER_FIFO : Mailbox Interrupt Enable Register for FIFO Mailbox Mode	1006
29.2.9	MCTL_TX[j] : Message Control Register for Transmit (j = 0 to 31)	1007
29.2.10	MCTL_RX[j] : Message Control Register for Receive (j = 0 to 31).....	1009
29.2.11	RFCR : Receive FIFO Control Register	1011
29.2.12	RFPCR : Receive FIFO Pointer Control Register	1013
29.2.13	TFCR : Transmit FIFO Control Register.....	1014
29.2.14	TFPCR : Transmit FIFO Pointer Control Register.....	1015
29.2.15	STR : Status Register	1016
29.2.16	MSMR : Mailbox Search Mode Register	1018
29.2.17	MSSR : Mailbox Search Status Register	1018
29.2.18	CSSR : Channel Search Support Register	1019
29.2.19	AFSR : Acceptance Filter Support Register.....	1020
29.2.20	EIER : Error Interrupt Enable Register.....	1021
29.2.21	EIFR : Error Interrupt Factor Judge Register	1022
29.2.22	RECR : Receive Error Count Register	1024
29.2.23	TECR : Transmit Error Count Register.....	1025
29.2.24	ECSR : Error Code Store Register.....	1025
29.2.25	TSR : Time Stamp Register	1026
29.2.26	TCR : Test Control Register	1027
29.3	Operation Modes.....	1028
29.3.1	CAN Reset Mode	1029
29.3.2	CAN Halt Mode	1030
29.3.3	CAN Sleep Mode	1031
29.3.4	CAN Operation Mode (Excluding Bus-Off State)	1031
29.3.5	CAN Operation Mode (Bus-Off State).....	1032
29.4	Data Transfer Rate Configuration.....	1032
29.4.1	Clock Setting	1032
29.4.2	Bit Timing Setting	1033
29.4.3	Data Transfer Rate.....	1033
29.5	Mailbox and Mask Register Structure.....	1033
29.6	Acceptance Filtering and Masking Functions.....	1035
29.7	Reception and Transmission	1037
29.7.1	Reception	1037
29.7.2	Transmission	1039
29.8	Interrupts	1040
29.9	Usage Notes.....	1041

29.9.1	Settings for the Module-Stop State	1041
29.9.2	Settings for the Operating Clock	1041
30.	Serial Peripheral Interface (SPI)	1042
30.1	Overview	1042
30.2	Register Descriptions	1044
30.2.1	SPCR : SPI Control Register	1044
30.2.2	SSLP : SPI Slave Select Polarity Register	1046
30.2.3	SPPCR : SPI Pin Control Register	1046
30.2.4	SPSR : SPI Status Register	1047
30.2.5	SPDR/SPDR_HA/SPDR_BY : SPI Data Register	1051
30.2.6	SPSCR : SPI Sequence Control Register	1053
30.2.7	SPSSR : SPI Sequence Status Register	1054
30.2.8	SPBR : SPI Bit Rate Register	1055
30.2.9	SPDCR : SPI Data Control Register	1056
30.2.10	SPCKD : SPI Clock Delay Register	1057
30.2.11	SSLND : SPI Slave Select Negation Delay Register	1058
30.2.12	SPND : SPI Next-Access Delay Register	1058
30.2.13	SPCR2 : SPI Control Register 2	1059
30.2.14	SPCMDm : SPI Command Register m (m = 0 to 7)	1060
30.2.15	SPDCR2 : SPI Data Control Register 2	1062
30.2.16	SPCR3 : SPI Control Register 3	1063
30.3	Operation	1064
30.3.1	Overview of SPI Operation	1064
30.3.2	Controlling the SPI Pins	1065
30.3.3	SPI System Configuration Examples	1066
30.3.4	Data Formats	1072
30.3.5	Transfer Formats	1083
30.3.6	Data Transfer Modes	1085
30.3.7	Transmit Buffer Empty and Receive Buffer Full Interrupts	1087
30.3.8	Communication End Interrupt	1089
30.3.9	Error Detection	1095
30.3.10	Initializing the SPI	1100
30.3.11	SPI Operation	1101
30.3.12	Clock Synchronous Operation	1115
30.3.13	Loopback Mode	1121
30.3.14	Self-Diagnosis of Parity Bit Function	1122
30.3.15	Interrupt Sources	1123
30.4	Event Link Controller Event Output	1124
30.4.1	Receive Buffer Full Event Output	1124
30.4.2	Transmit Buffer Empty Event Output	1124
30.4.3	Mode-Fault, Underrun, Overrun, or Parity Error Event Output	1125
30.4.4	SPI Idle Event Output	1125
30.4.5	Communication End Event Output	1125
30.5	Usage Notes	1127
30.5.1	Settings for the Module-Stop State	1127
30.5.2	Constraint on Low-Power Functions	1127
30.5.3	Constraints on Starting Transfer	1127

30.5.4	Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output	1127
30.5.5	Constraints on the SPSR.SPRF and SPSR.SPTEF Flags	1127
31.	Quad Serial Peripheral Interface (QSPI)	1128
31.1	Overview	1128
31.2	Register Descriptions	1129
31.2.1	SFMSMD : Transfer Mode Control Register	1129
31.2.2	SFMSSC : Chip Selection Control Register	1130
31.2.3	SFMSKC : Clock Control Register	1131
31.2.4	SFMSST : Status Register	1132
31.2.5	SFMCOM : Communication Port Register	1133
31.2.6	SFMCMD : Communication Mode Control Register	1134
31.2.7	SFMCST : Communication Status Register	1134
31.2.8	SFMSIC : Instruction Code Register	1135
31.2.9	SFMSAC : Address Mode Control Register	1135
31.2.10	SFMSDC : Dummy Cycle Control Register	1136
31.2.11	SFMSPC : SPI Protocol Control Register	1137
31.2.12	SFMPMD : Port Control Register	1137
31.2.13	SFMCNT1 : External QSPI Address Register	1138
31.3	Memory Map	1138
31.3.1	External Bus Space	1138
31.3.2	Address Width of the SPI Space and SPI Bus	1139
31.4	SPI Bus	1140
31.4.1	SPI Protocol	1140
31.4.2	SPI Mode	1143
31.5	SPI Bus Timing Adjustment	1144
31.5.1	SPI Bus Reference Cycles	1144
31.5.2	QSPCLK Signal Duty Ratio	1145
31.5.3	Minimum High-Level Width for the QSSL Signal	1145
31.5.4	QSSL Signal Setup Time	1146
31.5.5	QSSL Signal Hold Time	1146
31.5.6	Hold Time of the Serial Data Output Enable	1146
31.5.7	Setup Time for Serial Data Output	1147
31.5.8	Hold Time for Serial Data Output	1148
31.5.9	Serial Data Receiving Latency	1148
31.6	SPI Instruction Set Used for Serial Flash Memory Access	1149
31.6.1	SPI Instructions That Are Automatically Generated	1149
31.6.2	Standard Read Instruction	1150
31.6.3	Fast Read Instruction	1151
31.6.4	Fast Read Dual Output Instruction	1152
31.6.5	Fast Read Dual I/O Instruction	1153
31.6.6	Fast Read Quad Output Instruction	1154
31.6.7	Fast Read Quad I/O Instruction	1155
31.6.8	Enter 4-Byte Mode Instruction	1157
31.6.9	Exit 4-Byte Mode Instruction	1157
31.6.10	Write Enable Instruction	1157
31.7	SPI Bus Cycle Arrangement	1158
31.7.1	Serial Flash Memory Read Based on Individual Conversion	1158

31.7.2	Serial Flash Memory Read Using the Prefetch Function	1158
31.7.3	Halt of Prefetching.....	1159
31.7.4	Direct Specification of Prefetch Destination	1159
31.7.5	Prefetch State Polling.....	1159
31.7.6	SPI Bus Cycle Extension Function.....	1160
31.8	XIP Control	1160
31.8.1	Setting XIP Mode	1161
31.8.2	Releasing the XIP Mode	1162
31.9	QIO2 and QIO3 Pin States.....	1163
31.10	Direct Communication Mode	1164
31.10.1	About Direct Communication	1164
31.10.2	Using Direct Communication Mode.....	1164
31.10.3	Generating the SPI Bus Cycle during Direct Communication	1164
31.11	Interrupts	1168
31.12	Usage Note.....	1168
31.12.1	Settings for the Module-Stop Function.....	1168
31.12.2	Procedure for Changing Settings in Multiple Control Registers	1168
32.	Cyclic Redundancy Check (CRC)	1170
32.1	Overview.....	1170
32.2	Register Descriptions	1171
32.2.1	CRCCR0 : CRC Control Register 0	1171
32.2.2	CRCDIR/CRCDIR_BY : CRC Data Input Register.....	1171
32.2.3	CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register	1172
32.3	Operation.....	1172
32.3.1	Basic Operation.....	1172
32.4	Usage Notes.....	1175
32.4.1	Settings for the Module-Stop State	1175
32.4.2	Note on Transmission	1175
33.	Boundary Scan	1177
33.1	Overview.....	1177
33.2	Register Descriptions	1177
33.2.1	JTIR : Instruction Register.....	1178
33.2.2	JTIDR : ID Code Register	1178
33.2.3	JTBPR : Bypass Register.....	1179
33.2.4	JTBSR : Boundary Scan Register.....	1179
33.3	Operation.....	1179
33.3.1	TAP Controller	1179
33.3.2	Commands.....	1180
33.4	Usage Notes.....	1181
34.	Secure Cryptographic Engine (SCE9)	1183
34.1	Overview.....	1183
34.2	Operation.....	1184
34.2.1	Encryption Engine	1184
34.2.2	Encryption and Decryption	1185
34.3	Usage Notes.....	1186
34.3.1	Software Standby Mode.....	1186

34.3.2	Module-Stop Function Setting.....	1186
35.	12-Bit A/D Converter (ADC12)	1187
35.1	Overview.....	1187
35.2	Register Descriptions	1190
35.2.1	ADDRn : A/D Data Registers n (n = 0 to 4, 11 to 13, 16)	1190
35.2.2	ADDBLDR : A/D Data Duplexing Register	1192
35.2.3	ADDBLDRn : A/D Data Duplexing Register n (n = A, B)	1193
35.2.4	ADOCDR : A/D Internal Reference Voltage Data Register	1194
35.2.5	ARDR : A/D Self-Diagnosis Data Register	1196
35.2.6	ADCSR : A/D Control Register.....	1196
35.2.7	ADANSA0 : A/D Channel Select Register A0	1199
35.2.8	ADANSA1 : A/D Channel Select Register A1	1200
35.2.9	ADANSB0 : A/D Channel Select Register B0	1201
35.2.10	ADANSB1 : A/D Channel Select Register B1	1201
35.2.11	ADADS0 : A/D-Converted Value Addition/Average Channel Select Register 0	1202
35.2.12	ADADS1 : A/D-Converted Value Addition/Average Channel Select Register 1	1203
35.2.13	ADADC : A/D-Converted Value Addition/Average Count Select Register.....	1204
35.2.14	ADCER : A/D Control Extended Register	1205
35.2.15	ADSTRGR : A/D Conversion Start Trigger Select Register	1206
35.2.16	ADEXICR : A/D Conversion Extended Input Control Registers	1207
35.2.17	ADSSTRn/ADSSTRl/ADSSTRO : A/D Sampling State Register (n = 0 to 4, 11 to 13)....	1208
35.2.18	ADDISCR : A/D Disconnection Detection Control Register	1209
35.2.19	ADGSPCR : A/D Group Scan Priority Control Register	1210
35.2.20	ADCMPCR : A/D Compare Function Control Register	1211
35.2.21	ADCMPANSR0 : A/D Compare Function Window A Channel Select Register 0	1212
35.2.22	ADCMPANSR1 : A/D Compare Function Window A Channel Select Register 1	1213
35.2.23	ADCMPANSER : A/D Compare Function Window A Extended Input Select Register.....	1213
35.2.24	ADCMPLR0 : A/D Compare Function Window A Comparison Condition Setting Register 0	1214
35.2.25	ADCMPLR1 : A/D Compare Function Window A Comparison Condition Setting Register 1	1215
35.2.26	ADCMPLER : A/D Compare Function Window A Extended Input Comparison Condition Setting Register.....	1216
35.2.27	ADCMPDRn : A/D Compare Function Window A Lower-Side/Upper-Side Level Setting Register (n = 0, 1)	1217
35.2.28	ADWINnLB : A/D Compare Function Window B Lower-Side/Upper-Side Level Setting Register (n = L, U)	1218
35.2.29	ADCMPSR0 : A/D Compare Function Window A Channel Status Register 0	1220
35.2.30	ADCMPSR1 : A/D Compare Function Window A Channel Status Register1	1220
35.2.31	ADCMPSER : A/D Compare Function Window A Extended Input Channel Status Register.....	1221
35.2.32	ADCMPBNSR : A/D Compare Function Window B Channel Select Register.....	1222
35.2.33	ADCMPBSR : A/D Compare Function Window B Status Register	1223
35.2.34	ADWINMON : A/D Compare Function Window A/B Status Monitor Register	1224
35.2.35	ADBUFEN : A/D Data Buffer Enable Register	1225
35.2.36	ADBUFPTR : A/D Data Buffer Pointer Register	1225
35.2.37	ADBUFn : A/D Data Buffer Registers n (n = 0 to 15)	1226
35.3	Operation.....	1227

35.3.1	Scanning Operation	1227
35.3.2	Single Scan Mode	1228
35.3.3	Continuous Scan Mode	1233
35.3.4	Group Scan Mode	1236
35.3.5	Compare Function for Windows A and B	1245
35.3.6	Analog Input Sampling and Scan Conversion Time	1249
35.3.7	Usage Example of A/D Data Register Automatic Clearing Function	1251
35.3.8	A/D-Converted Value Addition/Average Mode	1252
35.3.9	Disconnection Detection Assist Function	1252
35.3.10	Starting A/D Conversion with an Asynchronous Trigger	1254
35.3.11	Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module	1255
35.3.12	Using Data Buffers	1255
35.4	Interrupt Sources and DTC, DMAC Transfer Requests	1256
35.4.1	Interrupt Requests	1256
35.5	Event Link Function	1258
35.5.1	Event Output to the ELC	1258
35.5.2	ADC12 Operation through an Event from the ELC	1258
35.6	Usage Notes	1259
35.6.1	Constraints on Setting the Registers	1259
35.6.2	Constraints on Reading the Data Registers	1259
35.6.3	Constraints on Stopping A/D Conversion	1259
35.6.4	A/D Conversion Restart and Termination Timing	1261
35.6.5	Constraints on Scan End Interrupt Handling	1261
35.6.6	Settings for the Module-Stop Function	1261
35.6.7	Notes on Entering the Low-Power States	1261
35.6.8	Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use	1261
35.6.9	Constraints on Operating Modes and Status Bits	1261
35.6.10	Notes on Board Design	1262
35.6.11	Constraints on Noise Prevention	1262
35.6.12	Port Settings When Using the ADC12 Input	1262
35.6.13	Notes on Canceling Software Standby Mode	1262
35.6.14	Calculation for Sampling Time	1263
36.	12-Bit D/A Converter (DAC12)	1264
36.1	Overview	1264
36.2	Register Descriptions	1265
36.2.1	DADR _n : D/A Data Register n (n = 0)	1265
36.2.2	DACR : D/A Control Register	1265
36.2.3	DADPR : DADR Format Select Register	1266
36.2.4	DAADSCR : D/A A/D Synchronous Start Control Register	1267
36.2.5	DAAMPCR : D/A Output Amplifier Control Register	1267
36.2.6	DAASWCR : D/A Amplifier Stabilization Wait Control Register	1268
36.2.7	DAADUSR : D/A A/D Synchronous Unit Select Register	1268
36.3	Operation	1269
36.3.1	Reducing Interference between D/A and A/D Conversion	1269
36.4	Event Link Operation Setting Procedure	1271
36.4.1	DA0 Event Link Operation Setting Procedure	1271
36.5	Usage Notes on Event Link Operation	1271

36.6	Usage Notes.....	1271
36.6.1	Settings for the Module-Stop Function.....	1271
36.6.2	DAC12 Operation in the Module-Stop State	1272
36.6.3	DAC12 Operation in Software Standby Mode.....	1272
36.6.4	Constraint on Entering Deep Software Standby Mode	1272
36.6.5	Initialization Procedure with the Output Amplifier.....	1272
36.6.6	Constraint on Usage When Interference Reduction between D/A and A/D Conversion Is Enabled	1273
37.	Data Operation Circuit (DOC).....	1274
37.1	Overview.....	1274
37.2	DOC Register Descriptions	1274
37.2.1	DOCR : DOC Control Register.....	1274
37.2.2	DODIR : DOC Data Input Register.....	1275
37.2.3	DODSR : DOC Data Setting Register	1276
37.3	Operation.....	1276
37.3.1	Data Comparison Mode	1276
37.3.2	Data Addition Mode.....	1276
37.3.3	Data Subtraction Mode	1277
37.4	Interrupt Source.....	1277
37.5	Output of an Event Signal to the Event Link Controller (ELC).....	1278
37.6	Usage Notes.....	1278
37.6.1	Settings for the Module-Stop State	1278
38.	SRAM.....	1279
38.1	Overview.....	1279
38.2	Register Descriptions	1279
38.2.1	SRAMSAR : SRAM Security Attribution Register	1279
38.2.2	PARIOAD : SRAM Parity Error Operation After Detection Register.....	1280
38.2.3	SRAMPRCR : SRAM Protection Register.....	1280
38.2.4	SRAMWTSC : SRAM Wait State Control Register	1281
38.2.5	SRAMPRCR2 : SRAM Protection Register 2.....	1281
38.3	Operation.....	1282
38.3.1	Module Stop Function	1282
38.3.2	Parity Calculation Function	1282
38.3.3	TrustZone Filter function	1284
38.3.4	Interrupt Source	1285
38.3.5	Wait state	1285
38.3.6	Access Cycle.....	1285
39.	Standby SRAM.....	1287
39.1	Overview.....	1287
39.2	Register Descriptions	1287
39.2.1	STBRAMSAR : Standby RAM memory Security Attribution Register	1287
39.3	Operation.....	1288
39.3.1	Data Retention	1288
39.3.2	Setting for the Module-stop Function	1288
39.3.3	Parity Calculation Function	1288
39.3.4	TrustZone Filter function	1289

39.3.5	Access Cycle.....	1289
39.4	Usage Notes.....	1289
39.4.1	Instruction Fetch from the Standby SRAM Area.....	1289
40.	Flash Memory	1290
40.1	Overview.....	1290
40.2	Structure of Memory.....	1292
40.3	Address Space.....	1293
40.4	Register Descriptions.....	1294
40.4.1	FCACHEE : Flash Cache Enable Register.....	1294
40.4.2	FCACHEIV : Flash Cache Invalidate Register.....	1294

Leading-performance 100 MHz Arm Cortex-M33 core, up to 512 KB code flash memory with background operation, 8 KB Data flash memory, and 128 KB SRAM with Parity. High-integration with USB 2.0 Full-Speed, Quad SPI, and advanced analog.

Features

- **Arm® Cortex®-M33 Core**
 - Armv8-M architecture with the main extension
 - Maximum operating frequency: 100 MHz
 - Arm Memory Protection Unit (Arm MPU)
 - Protected Memory System Architecture (PMSAv8)
 - Secure MPU (MPU_S): 8 regions
 - Non-secure MPU (MPU_NS): 8 regions
 - SysTick timer
 - Embeds two SysTick timers: Secure and Non-secure instance
 - Driven by LOCO or system clock
 - CoreSight™ ETM-M33
- **Memory**
 - Up to 512-KB code flash memory
 - 8-KB data flash memory (100,000 program/erase (P/E) cycles)
 - 128-KB SRAM
- **Connectivity**
 - Serial Communications Interface (SCI) × 4
 - Asynchronous interfaces
 - 8-bit clock synchronous interface
 - Smart card interface
 - Simple IIC
 - Simple SPI
 - Manchester coding (SCI3, SCI4)
 - I²C bus interface (IIC)
 - Serial Peripheral Interface (SPI)
 - Quad Serial Peripheral Interface (QSPI)
 - USB 2.0 Full-Speed Module (USBFS)
 - Control Area Network module (CAN)
- **Analog**
 - 12-bit A/D Converter (ADC12)
 - 12-bit D/A Converter (DAC12)
- **Timers**
 - General PWM Timer 32-bit (GPT32) × 2
 - General PWM Timer 16-bit (GPT16) × 2
 - Low Power Asynchronous General Purpose Timer (AGT) × 5
- **Security and Encryption**
 - Arm® TrustZone®
 - Up to three regions for the code flash
 - Up to two regions for the data flash
 - Up to three regions for the SRAM
 - Individual secure or non-secure security attribution for each peripheral
- **System and Power Management**
 - Low power modes
 - Battery backup function (VBATT)
 - Realtime Clock (RTC) with calendar and VBATT support
 - Event Link Controller (ELC)
 - Data Transfer Controller (DTC)
 - DMA Controller (DMAC) × 8
 - Power-on reset
 - Low Voltage Detection (LVD) with voltage settings
 - Watchdog Timer (WDT)
 - Independent Watchdog Timer (IWDT)
- **Multiple Clock Sources**
 - Main clock oscillator (MOSC) (8 to 24 MHz)
 - Sub-clock oscillator (SOSC) (32.768 kHz)
 - High-speed on-chip oscillator (HOCO) (16/18/20 MHz)
 - Middle-speed on-chip oscillator (MOCO) (8 MHz)
 - Low-speed on-chip oscillator (LOCO) (32.768 kHz)
 - IWDT-dedicated on-chip oscillator (15 kHz)
 - Clock trim function for HOCO/MOCO/LOCO
 - PLL/PLL2
 - Clock out support
- **General-Purpose I/O Ports**
 - 5-V tolerance, open drain, input pull-up, switchable driving ability
- **Operating Voltage**
 - VCC: 2.7 to 3.6 V
- **Operating Temperature and Packages**
 - Ta = -40°C to +85°C
 - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
 - 48-pin QFN (7 mm × 7 mm, 0.5 mm pitch)

1. Overview

The MCU integrates multiple series of software- and pin-compatible Arm[®]-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm Cortex[®]-M33 core running up to 100 MHz with the following features:

- Up to 512 KB code flash memory
- 128 KB SRAM
- Quad Serial Peripheral Interface (QSPI)
- USBFS
- Analog peripherals
- Security and safety features

1.1 Function Outline

Regarding Security function, only the access control circuit, random number generation circuit, and unique ID are supported. The operation of the other circuits is not guaranteed.

Table 1.1 Arm core

Feature	Functional description
Arm Cortex-M33 core	<ul style="list-style-type: none"> • Maximum operating frequency: up to 100 MHz • Arm Cortex-M33 core: <ul style="list-style-type: none"> – Armv8-M architecture with security extension – Revision: r0p4-00rel0 • Arm Memory Protection Unit (Arm MPU) <ul style="list-style-type: none"> – Protected Memory System Architecture (PMSAv8) – Secure MPU (MPU_S): 8 regions – Non-secure MPU (MPU_NS): 8 regions • SysTick timer <ul style="list-style-type: none"> – Embeds two SysTick timers: Secure and Non-secure instance – Driven by SysTick timer clock (SYSTICCLK) or system clock (ICLK) • CoreSight™ ETM-M33

Table 1.2 Memory

Feature	Functional description
Code flash memory	Maximum 512 KB of code flash memory. See section 40, Flash Memory .
Data flash memory	8 KB of data flash memory. See section 40, Flash Memory .
Option-setting memory	The option-setting memory determines the state of the MCU after a reset. See section 6, Option-Setting Memory .
SRAM	On-chip high-speed SRAM with or without parity bit. See section 38, SRAM .

Table 1.3 System (1 of 2)

Feature	Functional description
Operating modes	Two operating modes: <ul style="list-style-type: none"> • Single-chip mode • SCI/USB boot mode See section 3, Operating Modes .
Resets	The MCU provides 13 resets. See section 5, Resets .

Table 1.3 System (2 of 2)

Feature	Functional description
Low Voltage Detection (LVD)	The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC pin. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds. See section 7, Low Voltage Detection (LVD) .
Clocks	<ul style="list-style-type: none"> • Main clock oscillator (MOSC) • Sub-clock oscillator (SOSC) • High-speed on-chip oscillator (HOCO) • Middle-speed on-chip oscillator (MOCO) • Low-speed on-chip oscillator (LOCO) • IWDG-dedicated on-chip oscillator • PLL/PLL2 • Clock out support See section 8, Clock Generation Circuit .
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See section 9, Clock Frequency Accuracy Measurement Circuit (CAC) .
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts. See section 13, Interrupt Controller Unit (ICU) .
Low power modes	Power consumption can be reduced in multiple ways, including setting clock dividers, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes. See section 10, Low Power Modes .
Battery backup function	A battery backup function is provided for partial powering by a battery. The battery-powered area includes the RTC, SOSC, backup memory, and switch between VCC and VBATT. See section 11, Battery Backup Function .
Register write protection	The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR). See section 12, Register Write Protection .
Memory Protection Unit (MPU)	The MCU has one Memory Protection Unit (MPU). See section 15, Memory Protection Unit (MPU) .

Table 1.4 Event link

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention. See section 18, Event Link Controller (ELC) .

Table 1.5 Direct memory access

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 17, Data Transfer Controller (DTC) .
DMA Controller (DMAC)	The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 16, DMA Controller (DMAC) .

Table 1.6 External bus interface

Feature	Functional description
External bus	<ul style="list-style-type: none"> QSPI area (EQBIU): Connected to the QSPI (external device interface)

Table 1.7 Timers

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 2 channels and a 16-bit timer with GPT16 × 2 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. The GPT can also be used as a general-purpose timer. See section 21, General PWM Timer (GPT) .
Port Output Enable for GPT (POEG)	The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state See section 20, Port Output Enable for GPT (POEG) .
Low Power Asynchronous General Purpose Timer (AGT)	The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register. See section 22, Low Power Asynchronous General Purpose Timer (AGT) .
Realtime Clock (RTC)	The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 23, Realtime Clock (RTC) .
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. See section 24, Watchdog Timer (WDT) .
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers. See section 25, Independent Watchdog Timer (IWDT) .

Table 1.8 Communication interfaces (1 of 2)

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communications Interface (SCI) × 4 channels have asynchronous and synchronous serial interfaces: <ul style="list-style-type: none"> Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA)) 8-bit clock synchronous interface Simple IIC (master-only) Simple SPI Smart card interface Manchester interface The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0, 3, 4, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See section 27, Serial Communications Interface (SCI) .
I ² C bus interface (IIC)	The I ² C bus interface (IIC) has 1 channel. The IIC module conforms with and provides a subset of the NXP I ² C (Inter-Integrated Circuit) bus interface functions. See section 28, I²C Bus Interface (IIC) .
Serial Peripheral Interface (SPI)	The Serial Peripheral Interface (SPI) has 1 channel. The SPI provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices. See section 30, Serial Peripheral Interface (SPI) .

Table 1.8 Communication interfaces (2 of 2)

Feature	Functional description
Control Area Network (CAN)	The Controller Area Network (CAN) module uses a message-based protocol to receive and transmit data between multiple slaves and masters in electromagnetically noisy applications. The module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. The CAN module requires an additional external CAN transceiver. See section 29, Controller Area Network (CAN) Module .
USB 2.0 Full-Speed module (USBFS)	The USB 2.0 Full-Speed module (USBFS) can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system. See section 26, USB 2.0 Full-Speed Module (USBFS) .
Quad Serial Peripheral Interface (QSPI)	The Quad Serial Peripheral Interface (QSPI) is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface. See section 31, Quad Serial Peripheral Interface (QSPI) .

Table 1.9 Analog

Feature	Functional description
12-bit A/D Converter (ADC12)	A 12-bit successive approximation A/D converter is provided. Up to 9 analog input channels are selectable. See section 35, 12-Bit A/D Converter (ADC12) .
12-bit D/A Converter (DAC12)	A 12-bit D/A converter (DAC12) is provided. See section 36, 12-Bit D/A Converter (DAC12) .

Table 1.10 Data processing

Feature	Functional description
Cyclic Redundancy Check (CRC) calculator	The Cyclic Redundancy Check (CRC) generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available. See section 32, Cyclic Redundancy Check (CRC) .
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated. See section 37, Data Operation Circuit (DOC) .

Table 1.11 Security

Feature	Functional description
Security function	<ul style="list-style-type: none"> • ARMv8-M TrustZone security • Device lifecycle management • Debug access level • Key injection • Secure pin multiplexing
Secure Crypto Engine 9 (SCE9)	<ul style="list-style-type: none"> • Symmetric algorithms: AES • Asymmetric algorithms: RSA, ECC, and DSA • Hash-value generation: SHA224, SHA256, GHASH • 128-bit unique ID. See section 34, Secure Cryptographic Engine (SCE9) .

Note: Only access control circuit, random number generation circuit, and unique ID are supported. The operation of other circuits is not guaranteed.

Table 1.12 I/O ports

Note 1. Available pins depend on the Pin count, about details see [section 1.7. Pin Lists](#).

Note 2. Only access control circuit, random number generation circuit, and unique ID are supported. The operation of other circuits is not guaranteed.

1.5 Pin Functions

Table 1.15 Pin functions (1 of 3)

Function	Signal	I/O	Description
Power supply	VCC	Input	Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1- μ F capacitor. The capacitor should be placed close to the pin.
	VCL	I/O	Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VBATT	Input	Battery Backup power pin
	VSS	Input	Ground pin. Connect it to the system power supply (0 V).
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOU and XCIN.
	XCOU	Output	
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin
On-chip emulator	TMS	I/O	On-chip emulator or boundary scan pins
	TDI	Input	
	TCK	Input	
	TDO	Output	
	SWO	Output	Serial wire trace output pin
	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQn	Input	Maskable interrupt request pins
	IRQn-DS	Input	Maskable interrupt request pins that can also be used in Deep Software Standby mode
GPT	GTETRG, GTETRGB, GTETRG, GTETRGD	Input	External trigger input pins
	GTIOCnA, GTIOCnB	I/O	Input capture, output compare, or PWM output pins
AGT	AGTEEn	Input	External event input enable signals
	AGTIO	I/O	External event input and pulse output pins
	AGTO	Output	Pulse output pins
	AGTOAn	Output	Output compare match A output pins
	AGTOBn	Output	Output compare match B output pins
RTC	RTCOUT	Output	Output pin for 1-Hz or 64-Hz clock
	RTICn	Input	Time capture event input pins

Table 1.15 Pin functions (2 of 3)

Function	Signal	I/O	Description
SCI	SCKn	I/O	Input/output pins for the clock (clock synchronous mode)
	RXDn	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXDn	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTS _n _RTS _n	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low.
	CTS _n	Input	Input for the start of transmission.
	SCLn	I/O	Input/output pins for the IIC clock (simple IIC mode)
	SDAn	I/O	Input/output pins for the IIC data (simple IIC mode)
	SCKn	I/O	Input/output pins for the clock (simple SPI mode)
	MISO _n	I/O	Input/output pins for slave transmission of data (simple SPI mode)
	MOSI _n	I/O	Input/output pins for master transmission of data (simple SPI mode)
	SS _n	Input	Chip-select input pins (simple SPI mode), active-low
IIC	SCLn	I/O	Input/output pins for the clock
	SDAn	I/O	Input/output pins for data
SPI	RSPCKA	I/O	Clock input/output pin
	MOSIA	I/O	Input or output pins for data output from the master
	MISOA	I/O	Input or output pins for data output from the slave
	SSLA0	I/O	Input or output pin for slave selection
	SSLA1 to SSLA3	Output	Output pins for slave selection
CAN	CRX _n	Input	Receive data
	CTX _n	Output	Transmit data
USBFS	VCC_USB	Input	Power supply pin
	VSS_USB	Input	Ground pin
	USB_DP	I/O	D+ pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus.
	USB_DM	I/O	D- pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip
	USB_OVRCURA-DS	Input	Overcurrent pins for USBFS that can also be used in Deep Software Standby mode. Connect the external overcurrent detection signals to these pins.
QSPI	QSPCLK	Output	QSPI clock output pin
	QSSL	Output	QSPI slave output pin
	QIO0 to QIO3	I/O	Data0 to Data3

Table 1.15 Pin functions (3 of 3)

Function	Signal	I/O	Description
Analog power supply	AVCC0	Input	Analog voltage supply pin. This is used as the analog power supply for the respective modules. Supply this pin with the same voltage as the VCC pin.
	AVSS0	Input	Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin.
	VREFH	Input	Analog reference voltage supply pin for the D/A Converter. Connect this pin to AVCC0 when not using the D/A Converter.
	VREFL	Input	Analog reference ground pin for the D/A Converter. Connect this pin to AVSS0 when not using the D/A Converter.
	VREFH0	Input	Analog reference voltage supply pin for the ADC12. Connect this pin to AVCC0 when not using the ADC12.
	VREFL0	Input	Analog reference ground pin for the ADC12. Connect this pin to AVSS0 when not using the ADC12.
ADC12	ANmn	Input	Input pins for the analog signals to be processed by the A/D converter. (m: ADC unit number, n: pin number)
	ADTRGm	Input	Input pins for the external trigger signals that start the A/D conversion, active-low.
DAC12	DAn	Output	Output pins for the analog signals processed by the D/A converter.
I/O ports	Pmn	I/O	General-purpose input/output pins (m: port number, n: pin number)
	P200	Input	General-purpose input pin

1.6 Pin Assignments

The following figures show the pin assignments from the top view.

Note: Several pin names have the added suffix of _A, _B, _C, _D, _E, and _F. The suffix can be ignored when assigning functionality.

2. CPU

The MCU is based on the Arm[®] Cortex[®]-M33 core.

2.1 Overview

2.1.1 CPU

- Arm Cortex-M33
 - Revision: r0p4-00rel1
 - Armv8-M architecture profile
 - Single Precision Floating-Point Unit compliant with the ANSI/IEEE Std 754-2008
- SAU (Security Attribution Unit): 0 region
- IDAU (Implementation Defined Attribution Unit): 8 regions
 - Code flash (secure/non-secure callable/non-secure)
 - Data Flash (secure/non-secure)
 - SRAM0 (secure/non-secure callable/non-secure)
- Memory Protection Unit (MPU)
 - Armv8 Protected Memory System Architecture (PMSAv8)
 - Secure MPU (MPU_S): 8 regions
 - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
 - Two SysTick timers: Secure and Non-secure instance
 - Driven by SysTick timer clock (SYSTICCLK) or system clock (ICLK)

See reference 1. and reference 2. in [section 2.13. References](#) for details.

2.1.2 Debug

- Arm[®] CoreSight[™] ETM-M33
 - Revision: r0p2-00rel0
 - ARM ETM Architecture version 4.2
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace Unit (DWT)
 - 4 comparators for watchpoints and triggers
- Breakpoint Unit (BPU)
 - Breakpoint function is available.
 - 8 instruction comparators
 - 0 literal comparators
- Time Stamp Generator (TSG)
 - Time stamp for ETM and ITM
 - Driven by CPU clock
- Debug Register Module (DBGREG)
 - Reset control
 - Halt control
- Debug Access Port (DAP)

- JTAG Debug Port (JTAG-DP)
- Serial Wire Debug Port (SW-DP)
- Cortex-M33 Trace Port Interface Unit (TPIU)
 - 4 bits TPIU formatter output
 - Serial Wire Output
- Cross Trigger Interface (CTI)
- Embedded Trace Buffer (ETB)
 - CoreSight Trace Memory Controller with ETB configuration
 - Buffer size: 2 KB

See reference 1. and reference 2. in [section 2.13. References](#) for details.

2.1.3 Operating Frequency

The operating frequencies for the MCU are as follows:

- CPU: maximum 100 MHz
- 4-bit TPIU trace interface: maximum 50 MHz
- Serial Wire Output (SWO) trace interface: maximum 50 MHz
- Joint Test Action Group (JTAG) interface: maximum 25 MHz
- Serial Wire Debug (SWD) interface: maximum 25 MHz

2.1.4 Block Diagram

[Figure 2.1](#) shows a block diagram of the Cortex-M33 core.

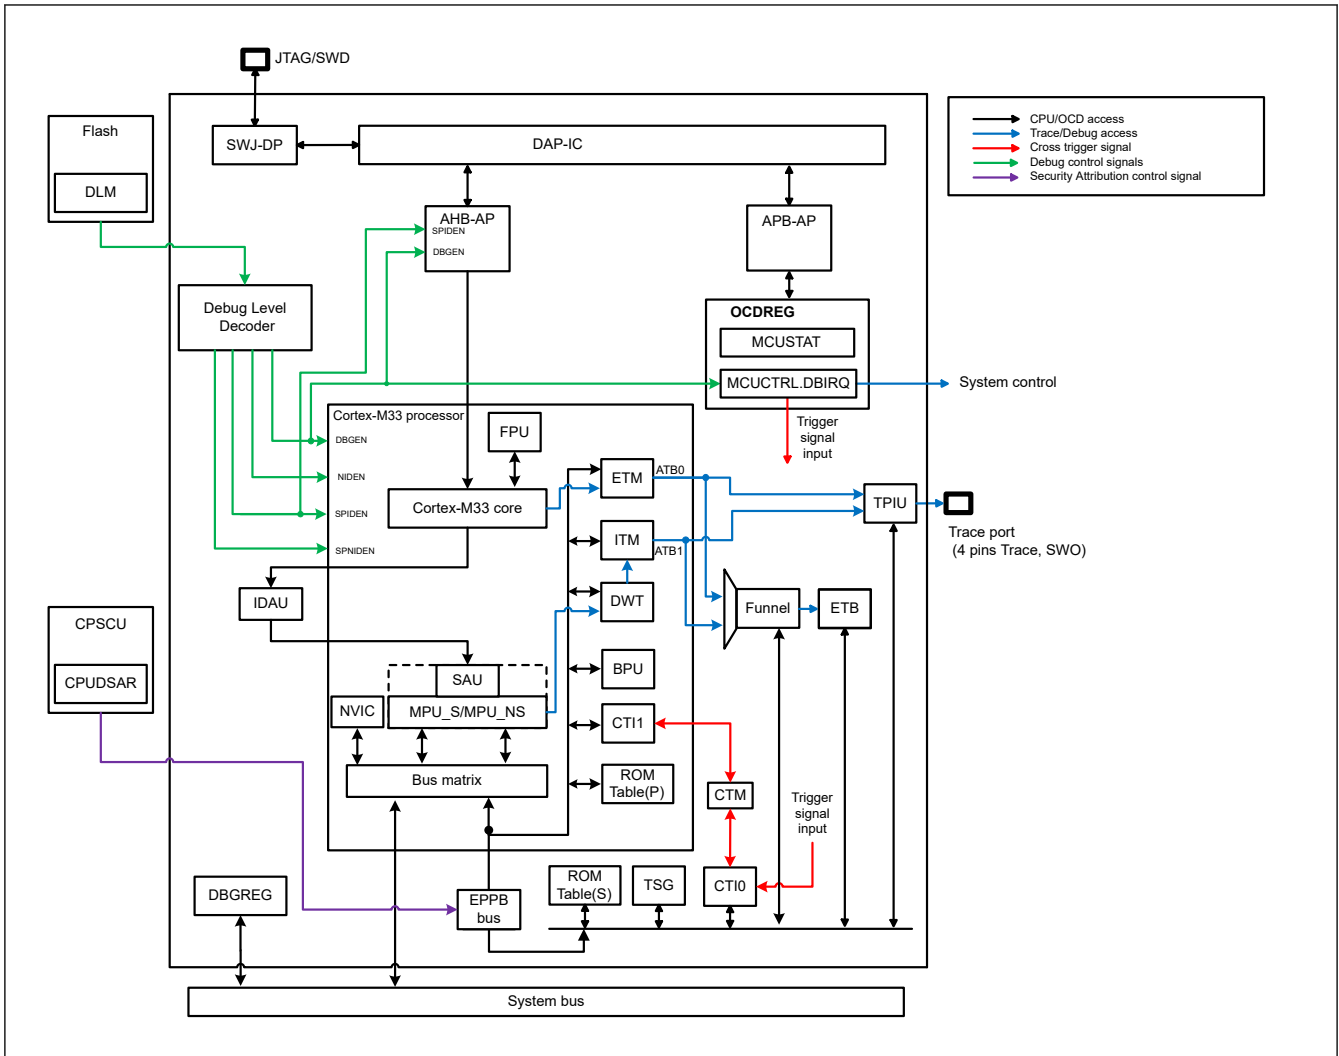

Figure 2.1 Cortex-M33 block diagram

2.2 Implementation Options

Table 2.1 shows the implementation options of the MCU.

Table 2.1 Implementation options (1 of 2)

Option	Implementation
SAU	Not included
IDAU	Included, 8 regions
MPU	Included, 8 regions for Secure and 8 regions for Non-secure
BPU	Included
Cross Trigger Interface (CTI)	Included
DWT	Included
Number of Wakeup Interrupt Controllers (WIC)	Not included ICU can wake up CPU instead of WIC. See section 13, Interrupt Controller Unit (ICU) for details.
TPIU	Included <ul style="list-style-type: none"> 4 bits TPIU formatter output Serial Wire Output
FPU	Included
DSP	Included

Table 2.1 Implementation options (2 of 2)

Option	Implementation														
Embedded Trace Macrocell (ETM)	Included														
Sleep mode power saving	Sleep mode and other low power modes are supported. For more details, see section 10, Low Power Modes . Note: SCB.SCR.SLEEPDEEP is ignored.														
Interrupts	98														
Priority bits	4 bits (16 levels)														
Endianness	Little-endian														
SysTick	Included														
SYST_CALIB register (0x4000_0147)	<table border="0"> <tr> <td>Bit [31] = 0</td> <td>Reference clock provided</td> </tr> <tr> <td>Bit [30] = 1</td> <td>TERMS value is inexact</td> </tr> <tr> <td>Bits [29:24] = 0x00</td> <td>Reserved</td> </tr> <tr> <td>Bits [23:0] = 0x000147</td> <td>TERM: (32768 × 10 ms) - 1/32.768 kHz</td> </tr> <tr> <td></td> <td>= 326.66 decimal</td> </tr> <tr> <td></td> <td>= 327 with skew</td> </tr> <tr> <td></td> <td>= 0x000147</td> </tr> </table>	Bit [31] = 0	Reference clock provided	Bit [30] = 1	TERMS value is inexact	Bits [29:24] = 0x00	Reserved	Bits [23:0] = 0x000147	TERM: (32768 × 10 ms) - 1/32.768 kHz		= 326.66 decimal		= 327 with skew		= 0x000147
Bit [31] = 0	Reference clock provided														
Bit [30] = 1	TERMS value is inexact														
Bits [29:24] = 0x00	Reserved														
Bits [23:0] = 0x000147	TERM: (32768 × 10 ms) - 1/32.768 kHz														
	= 326.66 decimal														
	= 327 with skew														
	= 0x000147														
Event input/output	Not implemented														
Global exclusive monitor	Not implemented														
System reset request output	The SYSRESETREQ bit in Application Interrupt and Reset Control Register causes a CPU reset														

2.3 JTAG/SWD Interface

[Table 2.2](#) shows the JTAG/SWD pins.

Table 2.2 JTAG/SWD pins

Name	I/O	Function	When not in use
TDI	Input	JTAG TDI pin	Pull-up
TDO/SWO	Output	JTAG TDO pin multiplexed with serial wire output	Open
TCK/SWCLK	Input	JTAG clock pin Serial wire clock pin	Pull-up
TMS/SWDIO	I/O	JTAG TMS pin Serial wire debug I/O pin	Pull-up

2.4 Security Attribution for Memory

In this MCU, SAU is not implemented and IDAU performs region definition for memory. IDAU divides the memory into 8 different areas as shown in [Figure 2.2](#).

The code flash, the data flash, and the SRAM are divided into Secure (S), Non-secure (NS) and Non-secure callable (NSC) regions. These memory security attributions are set into the nonvolatile memory by the serial programming command when the device lifecycle is in SSD state. These memory security attributions are loaded into the IDAU and the memory controller before application execution. These memory security attributions cannot be updated by application but can read through the dedicated registers.

Note: When configuring, the memory regions should satisfy the setting condition of minimum address unit shown in [Table 2.3](#).

Figure 2.2 Memory partitioning

Table 2.3 S/NS and S/NSC boundary list

Boundary	Code flash	Data flash	SRAM
S/NS	32 KB	1 KB	8 KB
S/NSC	1 KB	—	1 KB

Each region has its dedicated ID as follows. For more details, see [section 2.13. References](#).

IREGION (IDAU region number)	Description
0x0D	Non-secure SRAM
0x0E	Non-secure callable SRAM
0x0F	Secure SRAM
0x09	Non-secure data flash
0x0B	Secure data flash
0x05	Non-secure code flash
0x06	Non-secure callable code flash
0x07	Secure code flash

2.5 Debug Function

2.5.1 Debugger connectivity

In this MCU, debug function is considered in three levels, DBG0, DBG1, DBG2. At DBG0, no debug function is available. DBG1 level is defined as non-secure debug in ARMv-8 and the debugger can only access defined non-secure debug accessible regions. DBG2 level is defined as secure debug in ARMv-8 and at this level, nonsecure and secure debug function is enabled and can be accessible from the debugger.

Debug level is determined by the Device Lifecycle Management (DLM) state of the product.

See [Figure 2.1](#) for debugger accessible regions.

[Table 2.4](#) shows the CPU debug function and conditions.

Table 2.4 CPU debug function and conditions (1 of 2)

Condition			Permitted debug function
OCD connect*1	DLM State	Debug level	Description
Connected	CM	DBG2	All debug functions are available
Connected	SSD	DBG2	All debug functions are available

Table 2.4 CPU debug function and conditions (2 of 2)

Condition			Permitted debug function
OCD connect ^{*1}	DLM State	Debug level	Description
Connected	NSECSD	DBG1	Only Non-secure debug function is available
Connected	DPL	DBG0	Debugger connection is not available
Connected	LCK_DBG	DBG0	Debugger connection is not available
Connected	LCK_BOOT	DBG0	Debugger connection is not available
Connected	RMA_REQ	DBG0	Debugger connection is not available
Connected	RMA_ACK	DBG2	All debug functions are available

Note 1. OCD connect is determined by the CDBGPWRUPREQ bit output in the SWJ-DP register. The bit can only be written by the OCD. However, the level of the bit can be confirmed by reading the DBGSTR.CDBGPWRUPREQ bit.

2.5.2 Emulator Connection

Renesas provides the emulator which supports both debugging using SWD or JTAG communication and serial programming using SCI communication. This emulator makes it easy to switch between debugging and serial programming.

Table 2.5 shows the pinout of 10 pin or 20 pin socket pinouts when using this emulator. The pinout of SWD and JTAG is ARM standard, and MD, TXD, RXD pins are added for the serial programming using SCI communication.

The serial programming interface must be used to program the TrustZone IDAU boundary register settings.

It is recommended to connect P300/SWCLK/TCK and P201/MD pins using wired OR circuit on the board to use both debugging and serial programming.

Table 2.5 Pin assign for emulator

Pin No.	SWD	JTAG	Serial Programming using SCI
1	VCC	VCC	VCC
2	P108/SWDIO	P108/TMS	NC
4	P300/SWCLK Wired OR with P201/MD	P300/TCK Wired OR with P201/MD	P201/MD
6	P109/SWO/TXD9	P109/SWO/TXD9	P109/TXD9
8	P110/RXD9	P110/TDI/RXD9	P110/RXD9
9	GNDdetect	GNDdetect	GNDdetect
10	nRESET	nRESET	nRESET
12	NC	NC	NC
14	NC	NC	NC
16	NC	NC	NC
18	NC	NC	NC
20	NC	NC	NC
3, 5, 15, 17, 19	GND	GND	GND
7	NC	NC	NC
11, 13	NC	NC	NC

2.5.3 Self-Hosted Debug Function

As described in [section 2.6.6. CPUDSAR : CPU Debug Security Attribution Register](#), at the initial setting access from the CPU in non-secure state to CoreSight debug components is protected, that is, the non-secure access to CoreSight debug components from the self-hosted debugger is not allowed when the debug level is DBG2 at the initial setting. Therefore, the CPUDSAR.CPUDSA0 must be set to 1 to enable the self-hosted debug for CPU in non-secure state.

Note: There is no restriction for the self-hosted debug function while the CPU is in the secure state.

2.5.4 Effect of Debug Function

The debug function effects inside and outside of CPU.

2.5.4.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Software Standby, Snooze or Deep Software Standby mode. However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components. To request low power mode cancellation, the OCD can set the DBIRQ bit in the MCUCTRL register. For details, see [section 2.6.5.2. MCUCTRL : MCU Control Register](#).

2.5.4.2 Reset

In OCD mode, some resets depend on the CPU status and the DBGSTOPCR register setting.

Table 2.6 Reset or interrupt and mode setting

Reset or interrupt name	Control in On-Chip Debug (OCD) mode	
	OCD break mode	OCD run mode
RES pin reset	Same as user mode	
Power-on reset	Same as user mode	
Independent watchdog timer reset/interrupt	Does not occur ^{*1}	Depends on DBGSTOPCR setting
Watchdog timer reset/interrupt	Does not occur ^{*1}	Depends on DBGSTOPCR setting
Voltage monitor 0 reset	Depends on DBGSTOPCR setting	
Voltage monitor 1 reset/interrupt	Depends on DBGSTOPCR setting	
Voltage monitor 2 reset/interrupt	Depends on DBGSTOPCR setting	
SRAM parity error reset/interrupt	Depends on DBGSTOPCR setting	
Bus master MPU error reset/interrupt	Same as user mode	
Deep software standby reset	Same as user mode	
Software reset	Same as user mode	

Note: In OCD break mode, the CPU is halted. In OCD run mode, the CPU is in OCD mode and the CPU is not halted.

Note 1. The IWDT and WDT always stop in this mode.

2.6 Programmers Model

2.6.1 Address Spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has a dedicated address space (OCD address space) and is connected to the OCDREG registers.

[Figure 2.3](#) shows a block diagram of the AP connection and address spaces.

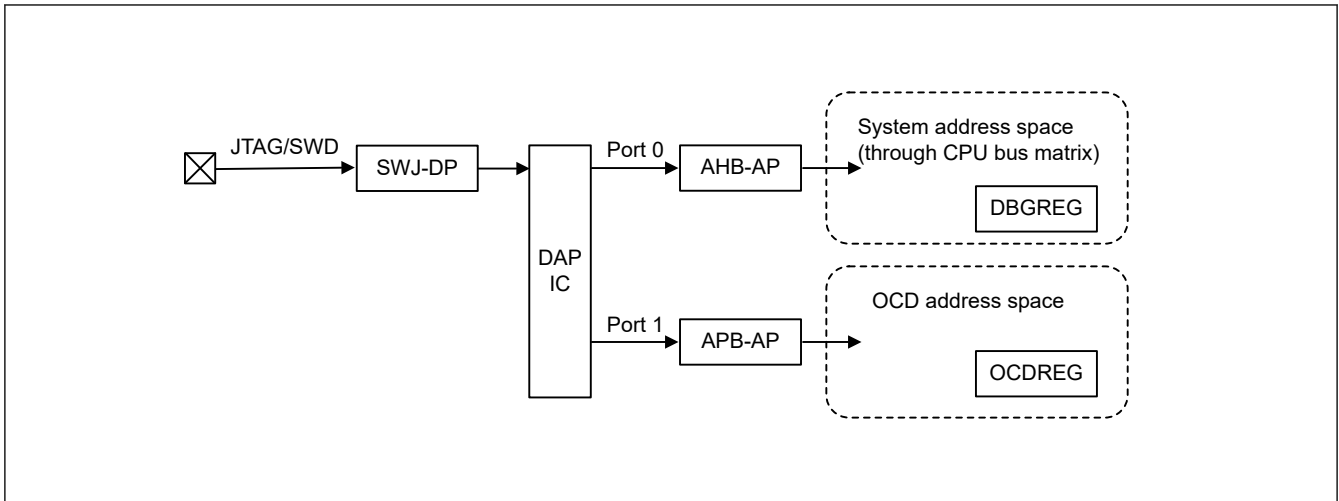

Figure 2.3 JTAG/SWD authentication block diagram

For debugging purposes, there are two register modules, DBGREG and OCDREG. DBGREG is located in the system address space and can be accessed from the OCD emulator, the CPU, and other bus masters in the MCU. OCDREG is located in the OCD address space and can only be accessed from the OCD tool. The CPU and other bus masters cannot access OCDREG.

2.6.2 Peripheral Address Map

In system address space, the Cortex-M33 core has a Private Peripheral Bus (PPB) which can be accessed only from CPU and OCD emulator. The PPB is expanded from the original implementation of the Cortex-M33 core for this MCU. Table 2.7 shows the address map of the MCU.

Table 2.7 Peripheral address map

Component name	Start address	End address	Note
ITM	0xE000_0000	0xE000_0FFF	See reference 2. in section 2.13. References
DWT	0xE000_1000	0xE000_1FFF	See reference 2. in section 2.13. References
BPU	0xE000_2000	0xE000_2FFF	See reference 2. in section 2.13. References
Secure SCS/SCS	0xE000_E000	0xE000_EFFF	See reference 1. in section 2.13. References
Non-secure SCS	0xE002_E000	0xE002_EFFF	See reference 2. in section 2.13. References
TPIU*1	0xE004_0000	0xE004_0FFF	See reference 3. in section 2.13. References
ETM	0xE004_1000	0xE004_1FFF	See reference 1. in section 2.13. References
CTI1	0xE004_2000	0xE004_2FFF	See reference 2. in section 2.13. References
CTI0	0xE004_4000	0xE004_4FFF	See reference 4. in section 2.13. References
ATB Funnel	0xE004_7000	0xE004_7FFF	See section 2.8. CoreSight ATB Funnel and reference 4. in section 2.13. References
ETB	0xE004_8000	0xE004_8FFF	See reference 4. in section 2.13. References
Time Stamp Generator	0xE004_9000	0xE004_9FFF	See section 2.10. CoreSight Time Stamp Generator and reference 4. in section 2.13. References
System ROM Table	0xE00F_E000	0xE00F_EFFF	See reference 3. in section 2.13. References
Processor ROM Table	0xE00F_F000	0xE00F_FFFF	See reference 2. in section 2.13. References

Note 1. TPIU registers should not be accessed without connection of OCD emulator to avoid stopping bus access.

2.6.3 CoreSight ROM Table

The MCU contains two CoreSight ROM Tables, the processor and system ROM Tables. The Processor ROM Table contains entries which hold a list of debug components inside the processor. The System ROM Table contains entries of Processor ROM Table and others debug components outside the processor.

2.6.3.1 ROM entries

ROM entries hold a list of components in the system. OCD emulator can use the ROM entries to determine which components are implemented in a system.

[Table 2.8](#) and [Table 2.9](#) show the System ROM entries and Processor ROM entries. See reference 5. in [section 2.13. References](#) for details.

Table 2.8 System ROM entries

#	Address	Access size	R/W	Value	Target module pointer
0	0xE00F_E000	32 bits	R	0xFFFF46003	CTI0
1	0xE00F_E004	32 bits	R	0xFFFF49003	Funnel
2	0xE00F_E008	32 bits	R	0xFFFF4A003	ETB
3	0xE00F_E00C	32 bits	R	0xFFFF4B003	TSG
4	0xE00F_E010	32 bits	R	0xFFFF42003	TPIU
5	0xE00F_E014	32 bits	R	0x00001003	Processor ROM table
6	0xE00F_E018	32 bits	R	0x00000000	End of entries

Table 2.9 Processor ROM Entries

#	Address	Access size	R/W	Value	Target module pointer
0	0xE00F_F000	32 bits	R	0xFFFF0F003	SCS
1	0xE00F_F004	32 bits	R	0xFFFF02003	DWT
2	0xE00F_F008	32 bits	R	0xFFFF03003	BPU
3	0xE00F_F00C	32 bits	R	0xFFFF01003	ITM
4	0xE00F_F014	32 bits	R	0xFFFF42003	ETM
5	0xE00F_F018	32 bits	R	0xFFFF43003	CTI1
6	0xE00F_F020	32 bits	R	0x00000000	End of entries

2.6.3.2 CoreSight component registers

The CoreSight ROM Table lists the CoreSight component registers defined in the Arm CoreSight architecture.

[Table 2.10](#) shows the registers. See reference 5. in [section 2.13. References](#) for details of each register.

Table 2.10 CoreSight component registers in the CoreSight ROM Table

Name	Address	Access size	R/W	Initial value
PID4	0xE00F_EFD0	32 bits	R	0x00000004
PID5	0xE00F_EFD4	32 bits	R	0x00000000
PID6	0xE00F_EFD8	32 bits	R	0x00000000
PID7	0xE00F_EFDC	32 bits	R	0x00000000
PID0	0xE00F_EFE0	32 bits	R	0x00000034
PID1	0xE00F_EFE4	32 bits	R	0x00000030
PID2	0xE00F_EFE8	32 bits	R	0x0000000A
PID3	0xE00F_EFEC	32 bits	R	0x00000000
CID0	0xE00F_EFF0	32 bits	R	0x0000000D
CID1	0xE00F_EFF4	32 bits	R	0x00000010
CID2	0xE00F_EFF8	32 bits	R	0x00000005
CID3	0xE00F_EFFC	32 bits	R	0x000000B1

2.6.4 DBGREG Module

The DBGREG module controls the debug functionalities and is implemented as a CoreSight-compliant component.

Table 2.11 shows the DBGREG registers other than the CoreSight component registers.

Table 2.11 Non-CoreSight DBGREG registers

Name	DAP port	Address	Access size	R/W	
Debug Status Register	DBGSTR	Port 0	0x4001_B000	32 bits	R
Debug Stop Control Register	DBGSTOPCR	Port 0	0x4001_B010	32 bits	R/W

2.6.4.1 DBGSTR : Debug Status Register

Base address: DBG = 0x4001_B000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	CDBG PWRU PACK	CDBG PWRU PREQ	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
27:0	—	These bits are read as 0.	R
28	CDBGPWRUPREQ	Debug power-up request 0: OCD is not requesting debug power up 1: OCD is requesting debug power up	R
29	CDBGPWRUPACK	Debug power-up acknowledge 0: Debug power-up request is not acknowledged 1: Debug power-up request is acknowledged	R
31:30	—	These bits are read as 0.	R

The DBGSTR register is a status register which indicates the state of the debug power-up request to the MCU from the emulator.

2.6.4.2 DBGSTOPCR : Debug Stop Control Register

Base address: DBG = 0x4001_B000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DBGS TOP_ RPER	—	—	—	—	—	DBGS TOP_ L VD2	DBGS TOP_ L VD1	DBGS TOP_ L VD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGS TOP_ WDT	DBGS TOP_ I WDT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	DBGSTOP_IWDT	Mask bit for IWDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and IWDT counter is stopped, regardless of this bit value. 0: Enable IWDT reset/interrupt 1: Mask IWDT reset/interrupt and stop IWDT counter	R/W
1	DBGSTOP_WDT	Mask bit for WDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and WDT counter is stopped, regardless of this bit value. 0: Enable WDT reset/interrupt 1: Mask WDT reset/interrupt and stop WDT counter	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W
16	DBGSTOP_LVD0	Mask bit for LVD0 reset 0: Enable LVD0 reset 1: Mask LVD0 reset	R/W
17	DBGSTOP_LVD1	Mask bit for LVD1 reset/interrupt 0: Enable LVD1 reset/interrupt 1: Mask LVD1 reset/interrupt	R/W
18	DBGSTOP_LVD2	Mask bit for LVD2 reset/interrupt 0: Enable LVD2 reset/interrupt 1: Mask LVD2 reset/interrupt	R/W
23:19	—	These bits are read as 0. The write value should be 0.	R/W
24	DBGSTOP_RPER	Mask bit for SRAM parity error reset/interrupt 0: Enable SRAM parity error reset/interrupt 1: Mask SRAM parity error reset/interrupt	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

The Debug Stop Control Register (DBGSTOPCR) controls the functional stop in OCD mode. All bits in the register are regarded as 0 when the MCU is not in OCD mode.

2.6.4.3 DBGREG CoreSight component registers

The DBGREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.12 shows the registers. See reference 4. in [section 2.13. References](#) for details of each register.

Table 2.12 DBGREG CoreSight component registers

Name	Address	Access size	R/W	Initial value
PIDR4	0x4001_BFD0	32 bits	R	0x00000004
PIDR5	0x4001_BFD4	32 bits	R	0x00000000
PIDR6	0x4001_BFD8	32 bits	R	0x00000000
PIDR7	0x4001_BFDC	32 bits	R	0x00000000
PIDR0	0x4001_BFE0	32 bits	R	0x00000005
PIDR1	0x4001_BFE4	32 bits	R	0x00000030
PIDR2	0x4001_BFE8	32 bits	R	0x0000000A
PIDR3	0x4001_BFEC	32 bits	R	0x00000000
CIDR0	0x4001_BFF0	32 bits	R	0x0000000D
CIDR1	0x4001_BFF4	32 bits	R	0x000000F0
CIDR2	0x4001_BFF8	32 bits	R	0x00000005
CIDR3	0x4001_BFFC	32 bits	R	0x000000B1

2.6.5 OCDREG Module

The OCDREG module are only accessible by the On-Chip Debug (OCD) emulator. OCDREG is implemented as a CoreSight-compliant component.

Table 2.13 lists the OCDREG registers.

Table 2.13 OCDREG registers

Name	DAP port	Address	Access size	R/W	
MCU Status Register	MCUSTAT	Port 1	0x8000_0400	32 bits	R
MCU Control Register	MCUCTRL	Port 1	0x8000_0410	32 bits	R/W

Note: OCDREG is located in the dedicated OCD address space. This address map is independent from the system address map. See section 2.6.2. Peripheral Address Map.

2.6.5.1 MCUSTAT : MCU Status Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x400

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	SECD BG	DBGF UNCEN	BOOT MD	—	—	—	—	—	—	—	—	CPUS TOPC LK	CPUS LEEP	—
Value after reset:	0	0	1/0 ^{*1}	1/0 ^{*1}	1/0 ^{*1}	0	0	1	0	0	0	0	0	1/0 ^{*1}	1/0 ^{*1}	0

Bit	Symbol	Function	R/W
0	—	These bits are read as 0.	R
1	CPUSLEEP	Sleep mode status This bit is unpredictable when the MCU is in Software Standby mode, Snooze mode, or Deep Software Standby mode. 0: CPU is not in Sleep mode 1: CPU in Sleep mode	R
2	CPUSTOPCLK	CPU clock status This bit is unpredictable when the MCU is in Deep Software Standby mode. 0: CPU clock is not stopped. 1: CPU clock is stopped.	R
7:3	—	These bits are read as 0.	R
8	—	These bits are read as 1.	R
10:9	—	These bits are read as 0.	R
11	BOOTMD	Boot mode status 0: Device is not in Boot mode 1: Device is in Boot mode	R
12	DBGFUNCEN	Debugger status 0: Debugger connection is not available 1: Debugger function is enabled	R
13	SECDBG	Secure Debug status 0: Secure Debug is not available 1: Secure Debug is available	R
31:14	—	These bits are read as 0.	R

Note 1. Depends on the MCU status.

2.6.5.2 MCUCTRL : MCU Control Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x410

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUW AIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DBIRQ	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	DBIRQ ^{*2}	Debug Interrupt Request Writing 1 to the bit wakes up the MCU from low power mode. The condition can be cleared by writing 0 to the DBIRQ bit. 0: Debug interrupt not requested 1: Debug interrupt requested	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	CPUWAIT ^{*2}	CPU Wait Setting Write 1 to assert CPUWAIT, write 0 to deassert CPUWAIT ^{*1} . 0: Clear CPUWAIT to low 1: Set CPUWAIT to high	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. CPUWAIT is used to prevent the processor from executing code immediately after reset.

Note 2. Access (R/W) to bit is valid only when Debug Level is DBG1 or DBG2.

2.6.5.3 OCDREG CoreSight component registers

The OCDREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.14 shows the registers. See reference 4. in [section 2.13. References](#) for details of each register.

Table 2.14 OCDREG CoreSight component registers

Name	Address	Access size	R/W	Initial value
PIDR4	0x8000_0FD0	32 bits	R	0x00000004
PIDR5	0x8000_0FD4	32 bits	R	0x00000000
PIDR6	0x8000_0FD8	32 bits	R	0x00000000
PIDR7	0x8000_0FDC	32 bits	R	0x00000000
PIDR0	0x8000_0FE0	32 bits	R	0x00000004
PIDR1	0x8000_0FE4	32 bits	R	0x00000030
PIDR2	0x8000_0FE8	32 bits	R	0x0000000A
PIDR3	0x8000_0FEC	32 bits	R	0x00000000
CIDR0	0x8000_0FF0	32 bits	R	0x0000000D
CIDR1	0x8000_0FF4	32 bits	R	0x000000F0
CIDR2	0x8000_0FF8	32 bits	R	0x00000005
CIDR3	0x8000_0FFC	32 bits	R	0x000000B1

2.6.6 CPUDSAR : CPU Debug Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x1B0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUDSA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	CPUDSA0	CPU Debug Security Attribution 0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, and no TrustZone access error is generated.

Note: This register is write-protected by PRCR register.

When Debug level of the MCU is DBG2, by guarding entire EPPB bus, the non-secure access from CPU to debug related components is completely controlled by the current value of the CPUDSA0 bit. Since this bit is modifiable only when CPU is in secure state, user must be aware of the CPUDSAR register before using CoreSight debug components.

CPUDSA0 bit (CPU Debug Security Attribution 0)

Security attributes of register for accessing the debug component of the CPU.

0: Debug component can only be accessed with secure access.

1: There is no restriction on accessing the debug component.

2.6.7 Processing on Error Response Generated by CPU Access

In addition to the specific-error detection specification of the Arm Cortex-M33 processor, this MCU also provides additional error information which is described in [section 14, Buses](#).

This section describes how to handle the additional error information with no conflict to that of the Arm Cortex-M33 processor.

[Table 2.15](#) shows error detection modules, which are also described in [section 14, Buses](#). These error detection modules not only provide error information on the bus module, but also notify the processor to trigger the exception handler.

Table 2.15 Error detection modules

	NMI/RESET request	Interrupt	Bus error status register	Error address register Error RW register
Slave TZF	NMISR.TZFST	Bus Fault* ¹ (Hard Fault)	BUS.BUSnERRSTAT.STERRSTAT	BUS.BTZFnERRADD BUS.BTZFnERRRW
Slave bus error	—	Bus Fault* ¹ (Hard Fault)	BUS.BUSnERRSTAT.SLERRSTAT	BUS.BUSnERRADD BUS.BUSnERRRW
Illegal address access error	—	Bus Fault* ¹ (Hard Fault)	BUS.BUSnERRSTAT.ILERRSTAT	BUS.BUSnERRADD BUS.BUSnERRRW

Note 1. A Bus Fault can be treated as HardFault. For details, see *ARM® Cortex®-M33 Device Generic User Guide* in the [section 2.13, References](#).

To prevent unexpected operation, when handling the exception, additional operation should be added into exception routing.

BusFault when occurred by error detected as shown in [Table 2.15](#):

- See [section 14, Buses](#) for the error information in the corresponding register
- Clear the data in cache for the error address
- Clear the Error Status register in the bus module
- Service exception handling with Arm-guided operation

For a Bus Fault that is not detected in the Renesas-specific error detection module (occurred inside the Arm Cortex-M33 core), see the *ARM® Cortex®-M33 Device Generic User Guide* to handle this case.

In the system bus specification, there is a specific case for Slave TrustZone Filter, that is, if an error is selected to generate an NMI, then before the processor handles the Bus Fault exception, NMI with higher priority takes the exception first. Therefore, use the BusFault handler and not NMI handler to handle this error. In other words, the NMI status should be cleared but the error status bit should not be cleared to ensure that BusFault captures all the error information.

[Figure 2.4](#) and [Figure 2.5](#) show the recommended flows for NMI handler and BusFault handler for the errors described in [Table 2.15](#).

Figure 2.4 NMI handling flowchart

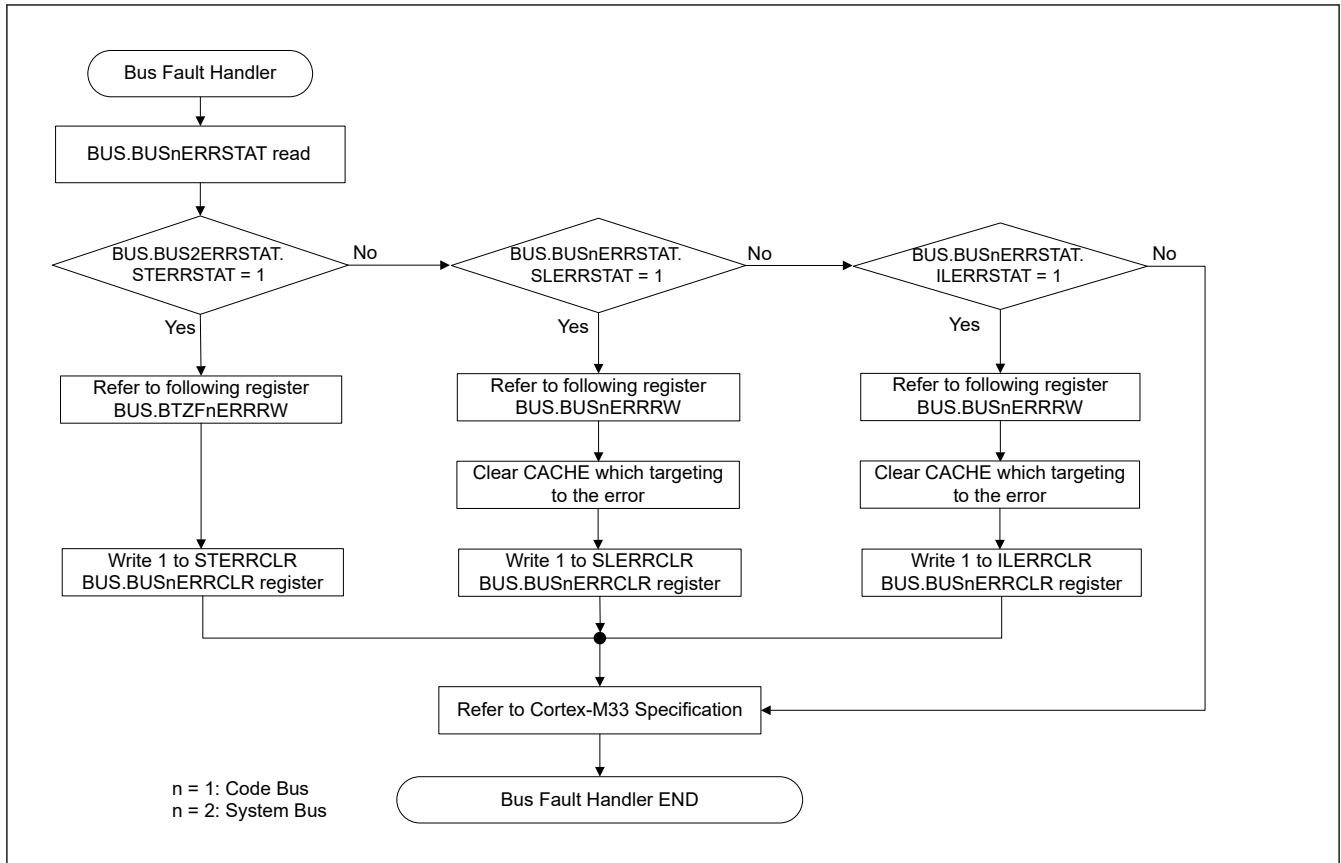

Figure 2.5 BusFault interrupt handling flowchart

2.7 CoreSight Cross Trigger Interface (CTI)

As shown in Figure 2.6, the input and output of a Cross Trigger Interface (CTI) interact with each other through four CTM channels. Input of a CTI can be used to trigger the output of another CTI using the four CTM channels.

Figure 2.6 CTI System

Debug Interrupt Request (DBGIRQ) is controlled by MCUCTRL register in OCDREG module.

Table 2.16 CTI Trigger signals

Number of CTI channel	CTITRIGIN		CTITRIGOUT	
	Channel	Signal	Channel	Signal
CTI0 (Debug common)	0	ACQCOMP	0	—
	1	FULL	1	—
	2	DBIRQ	2	ETB FLUSHIN
	3	—	3	ETB TRIGIN
	4	—	4	—
	5	—	5	—
	6	—	6	—
	7	—	7	—
CTI1 (CPU)	0	Processor Halted	0	Processor debug request
	1	DWT Comparator Output 0	1	Processor Restart
	2	DWT Comparator Output 1	2	CTIIRQ[0] (Connected to IRQ96)
	3	DWT Comparator Output 2	3	CTIIRQ[1] (Connected to IRQ97)
	4	ETM Event Output 0	4	ETM Event Input 0
	5	ETM Event Output 1	5	ETM Event Input 1
	6	—	6	ETM Event Input 2
	7	—	7	ETM Event Input 3

2.8 CoreSight ATB Funnel

There is one CoreSight ATB funnel in the MCU. The funnel has two ATB slaves and one ATB master, and it selects the debug trace source from ETM and ITM to ETB. [Figure 2.7](#) shows the CoreSight ATB connection in the MCU.

Figure 2.7 CoreSight ATB connection

Table 2.17 shows the ATB slave connection for the funnel.

Table 2.17 ATB slave connection

ATB slave number	Connected trace source
#0	ITM
#1	ETM

See reference 4. in [section 2.13. References](#) for details of the ATB and funnel.

2.9 Break Point Unit

The MCU has Break Point Unit. See Break Point Unit chapter of reference 1. in [section 2.13. References](#) for details about register description of this module.

2.10 CoreSight Time Stamp Generator

A CoreSight Time Stamp Generator provides a CPU clock-based timestamp to ITM and ETM. The timestamp is generated by a 64-bit counter. See reference 4. in [section 2.13. References](#) for details.

2.11 SysTick Timer

The MCU has SysTick timer that provides two 24-bit down counters, non-secure and secure counters. The timer can select SysTick timer clock (SYSTICCLK) or System clock (ICLK).

See [section 8, Clock Generation Circuit](#) and reference 1. in [section 2.13. References](#) for details.

Note: SysTick timer counter operation is enabled by signal synchronized with CPU clock. Therefore, the counter might not operate correctly if the CPU clock is slower than the SysTick timer clock. In other words, clock setting must satisfy the following: CPU clock \geq SysTick timer clock (LOCO: 32.768 kHz).

2.12 OCD Emulator Connection

In this product, the MCU confirms the access permission for Non-secure debug and Non-secure chip resources by checking Debug level is DBG1 or higher. For full access permission for debug and chip resources, Secure debug level DBG2 is required.

[Figure 2.8](#) shows a block diagram of SWD authentication mechanism.

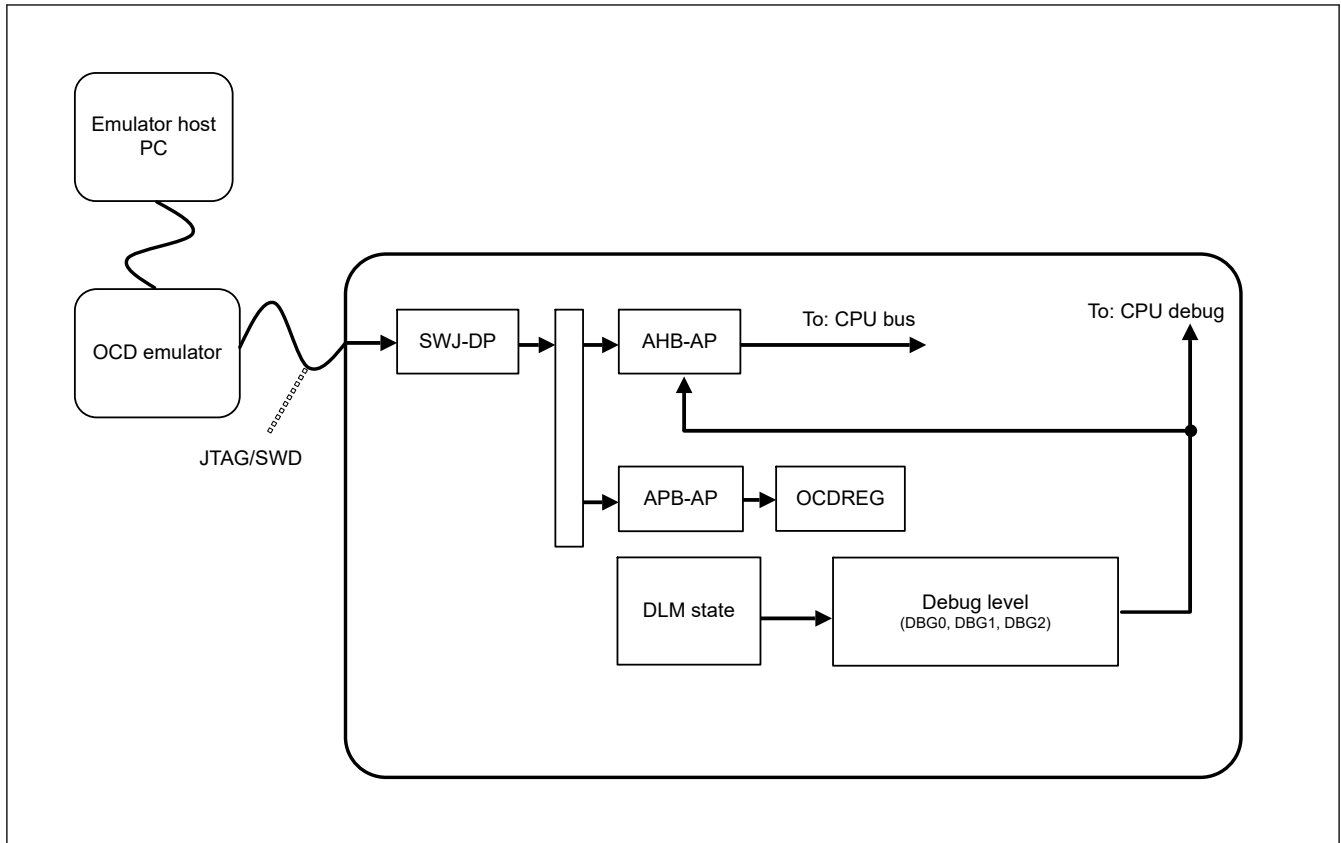

Figure 2.8 SWD Authentication mechanism block diagram

Three levels of debug capability are available, DBG0, DBG1, and DBG2, which correspond to the Device Level Management (DLM) states. When debug level is DBG0, access to debug components and system bus from OCD emulator is not permitted. When debug level is DBG1 or DBG2, the corresponding non-secure or secure debug components and system bus can be accessed from the OCD emulator. See [Table 2.4](#) for more information about debug levels.

2.12.1 DBGEN

After the OCD emulator gets access permission, the OCD emulator must set the DBGEN bit in the System Control OCD Control Register (SYOCD CR). In addition, the OCD emulator must clear the DBGEN bit before disconnecting it. See [section 10, Low Power Modes](#) for details.

2.12.2 Restrictions on Connecting an OCD emulator

This section describes the restrictions on emulator access.

2.12.2.1 Starting connection while in low power mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal or Sleep mode. If the MCU is in Software Standby, Snooze, or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.12.2.2 Changing low power mode while in OCD mode

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Software Standby, Snooze or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from the OCD emulator in these modes. [Table 2.18](#) shows the restrictions.

Table 2.18 Restrictions by mode (1 of 2)

Active mode	Start OCD emulator connection	Change low power mode	Access AHB-AP and system bus	Access APB-AP and OCDREG
Normal	Yes	Yes	Yes	Yes

Table 2.18 Restrictions by mode (2 of 2)

Active mode	Start OCD emulator connection	Change low power mode	Access AHB-AP and system bus	Access APB-AP and OCDREG
Sleep	Yes	Yes	Yes	Yes
Software Standby	No	Yes	No	Yes
Snooze	No	Yes	No	Yes
Deep Software Standby	No	Yes	No	Yes

If system bus access is required in Software Standby, Snooze, or Deep Software Standby mode, set the MCUCTRL.DBIRQ bit in OCDREG to wake up the MCU from the low power modes. Simultaneously, by asserting the MCUCTRL.DBIRQ bit in OCDREG, the OCD emulator can wake up the MCU without starting CPU execution by using a CPU break.

2.12.2.3 Connecting sequence and JTAG/SWD authentication

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus.
In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set MCUCTRL.CPUWAIT = 1.
5. Confirm the debug capability of device by reading MCUSTAT:
 - If Debug function is prohibited, this device is not able to debug.
 - If Debug function is enabled and secure debug is not available, only non-secure debug is available.
 - If Debug function is enabled and secure debug is available, full debug functions are available.

If Debug function is available, set debug-related register then clear MCUCTRL.CPUWAIT = 0.
6. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
7. Set SYOCD CR.DBGEN to 1.
8. Start accessing the CPU debug resources using the AHB-AP.

Note: Debug level is determined by the current DLM state of product.

2.12.3 Restrictions on Disconnecting an OCD Emulator

After disconnecting an OCD emulator, a device cannot fully transition to Software Standby mode.

On this situation, power consumption does not decrease as expected, because some low-consumption features do not work.

3. Operating Modes

3.1 Overview

Table 3.1 shows the selection of operating modes by the mode-setting pin. For details, see section 3.2. Details of Operating Modes. Operation starts with the on-chip flash memory enabled, regardless of the mode in which operation started.

Table 3.1 Selection of operating modes by the mode-setting pin

Mode-setting pin (MD)	Operating mode	On-chip Flash
1	Single-chip mode	Enable
0	SCI / USB boot mode	Enable

3.2 Details of Operating Modes

3.2.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs.

When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

3.2.2 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see section 40, Flash Memory. The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

3.2.3 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using the USB. For details, see section 40, Flash Memory. The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

3.3 Operating Modes Transitions

3.3.1 Operating Mode Transitions as Determined by the Mode-Setting Pin

Figure 3.1 shows operating mode transitions determined by the MD pin settings.

Figure 3.1 Mode-setting pin level and operating mode

4. Address Space

4.1 Address Space

The MCU supports a 4-GB linear address space ranging from 0x0000_0000 to 0xFFFF_FFFF that can contain both program and data. [Figure 4.1](#) shows the memory map.

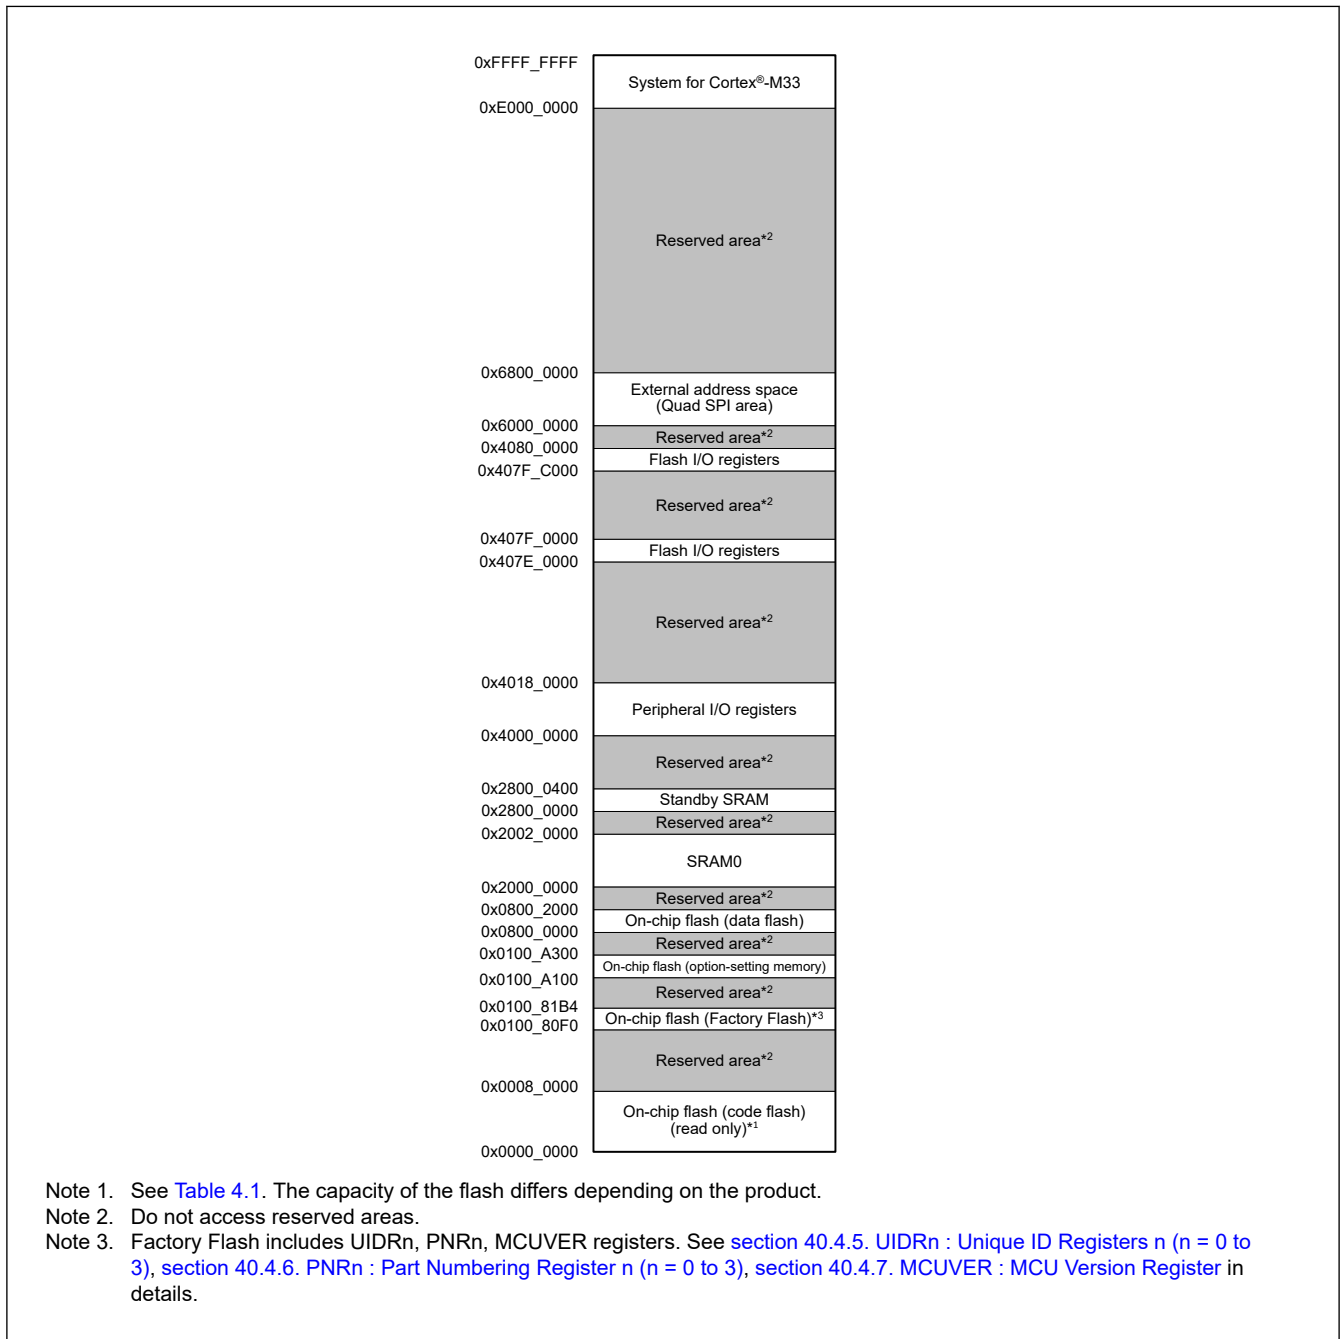

Figure 4.1 Memory map

Table 4.1 Capacity of the code flash memory, data flash memory, and SRAM0

Code flash memory		Data flash memory		SRAM0	
Capacity	Address	Capacity	Address	Capacity	Address
512 KB	0x0000_0000 - 0x0007_FFFF	8 KB	0x0800_0000 - 0x0800_1FFF	128 KB	0x2000_0000 - 0x2001_FFFF
256 KB	0x0000_0000 - 0x0003_FFFF				

5. Resets

5.1 Overview

The MCU provides 13 resets.

[Table 5.1](#) lists the reset names and sources.

Table 5.1 Reset names and sources

Reset name	Source
RES pin reset	Voltage input to the RES pin is driven low
Power-on reset	VCC rise (voltage detection V_{POR}) ^{*1}
Independent watchdog timer reset	IWDT underflow or refresh error
Watchdog timer reset	WDT underflow or refresh error
Voltage monitor 0 reset	VCC fall (voltage detection V_{det0}) ^{*1}
Voltage monitor 1 reset	VCC fall (voltage detection V_{det1}) ^{*1}
Voltage monitor 2 reset	VCC fall (voltage detection V_{det2}) ^{*1}
SRAM parity error reset	SRAM parity error detection
Bus master MPU error reset	Bus master MPU error detection
TrustZone error reset	TrustZone error detection
Deep software standby reset	Deep software standby mode is canceled by an interrupt
Software reset	Register setting (use the software reset bit AIRCR.SYSRESETREQ)

Note 1. For details on the voltages to be monitored (V_{POR} , V_{det0} , V_{det1} , and V_{det2}), see [section 7, Low Voltage Detection \(LVD\)](#) and [section 43, Electrical Characteristics](#).

The internal state and pins are initialized by a reset. [Table 5.2](#) and [Table 5.3](#) list the targets initialized by resets.

Table 5.2 Reset detect flags initialized by each reset source (1 of 3)

Flag to be initialized	Reset source

	VBTBER	—	—	—	—	—	—
Registers other than those shown, CPU, and internal state		✓	✓	✓	✓	✓	✓

Note: ✓ : Initialized
— : Not initialized

Note 1. For the initial value of each register, see [section 8, Clock Generation Circuit](#).

Note 2. The RTC has a software reset. Some control bits are not initialized by all types of resets. For details on the target bits, see [section 23, Realtime Clock \(RTC\)](#).

Note 3. Depends on the setting of DPSBYCR.IOKEEP.

Note 4. Some control bits are not initialized by all types of resets. For details on the target bits, see [section 14, Buses](#)

Note 5. Reset does not occur while the debugger is connected (DBGSTR.CDBGPWRUPREQ = 1) even if On-chip debugger is disabled (SYOCDRCR.DBGEN = 0).

Note 6. Reset does not occur while On-chip debugger is enabled (SYOCDRCR.DBGEN = 1).

The RTC is not initialized by any reset source. SOSC and LOCO can be selected as the clock sources of the RTC.

[Table 5.4](#) and [Table 5.5](#) show the states of SOSC and LOCO when a reset occurs.

Table 5.4 States of SOSC when a reset occurs

		Reset source	
		POR	Other
SOSC	Enable or disable	Initialized to enable	Continue with the state that was selected before the reset occurred
	Drive capability	Continue with the state that was selected before the reset occurred	

Table 5.5 States of LOCO when a reset occurs

		Reset source	
		POR, LVD0, LVD1, LVD2, Deep Software Standby (DEEPCUT[0] = 1)	Other
LOCO	Enable or disable	Initialized to enable	
	Oscillation accuracy ^{*1}	Initialized to accuracy before trimming by power-on (accuracy: ± 10%)	Continue with the accuracy that was trimmed by LOCOUTCR

Note 1. The LOCO User Trimming Control Register (LOCOUTCR) is reset by POR, LVD0, LVD1, LVD2, and Deep Software Standby (DEEPCUT[0] = 1) resets, returning the LOCO to the default oscillation accuracy. This can affect RTC accuracy if the RTC uses the LOCO (with a user trimming value in LOCOUTCR) as the RTC source clock. To restore the pre-reset LOCO oscillation accuracy, reload the required trimming value into LOCOUTCR after any of these resets.

When a reset is released, reset exception handling starts.

Table 5.6 lists the pin related to the reset function.

Table 5.6 Pin related to reset

Pin name	I/O	Function
RES	Input	Reset pin

5.2 Register Descriptions

5.2.1 RSTSAR : Reset Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	NONS EC2	NONS EC1	NONS EC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: Reset Status Register 0 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: Reset Status Register 1 0: Secure 1: Non-secure	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: Reset Status Register 2 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
31:3	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of RSTSR0.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of RSTSR1.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of RSTSR2.

5.2.2 RSTSR0 : Reset Status Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x410

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DPSR STF	—	—	—	LVD2R F	LVD1R F	LVD0R F	PORF
Value after reset:	x ¹	0	0	0	x ¹	x ¹	x ¹	x ¹

Bit	Symbol	Function	R/W
0	PORF	Power-On Reset Detect Flag 0: Power-on reset not detected 1: Power-on reset detected	R/W ²
1	LVD0RF	Voltage Monitor 0 Reset Detect Flag 0: Voltage monitor 0 reset not detected 1: Voltage monitor 0 reset detected	R/W ²
2	LVD1RF	Voltage Monitor 1 Reset Detect Flag 0: Voltage monitor 1 reset not detected 1: Voltage monitor 1 reset detected	R/W ²
3	LVD2RF	Voltage Monitor 2 Reset Detect Flag 0: Voltage monitor 2 reset not detected 1: Voltage monitor 2 reset detected	R/W ²
6:4	—	These bits are read as 0. The write value should be 0.	R/W
7	DPSRSTF	Deep Software Standby Reset Detect Flag 0: Deep software standby mode cancellation not requested by an interrupt. 1: Deep software standby mode cancellation requested by an interrupt.	R/W ²

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.

Note 2. The register is cleared when a reset source listed in [Table 5.2](#) occurs or when 0 is written to clear a flag. Bits other than the flag that is cleared should be set to 1.

PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When PORF is read as 1 and then 0 is written to PORF

LVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The LVD0RF flag indicates that the VCC voltage fell below V_{det0} .

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When LVD0RF is read as 1 and then 0 is written to LVD0RF.

LVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The LVD1RF flag indicates that the VCC voltage fell below V_{det1} .

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When LVD1RF is read as 1 and then 0 is written to LVD1RF

LVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The LVD2RF flag indicates that the VCC voltage fell below V_{det2} .

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When LVD2RF is read as 1 and then 0 is written to LVD2RF

DPSRSTF flag (Deep Software Standby Reset Detect Flag)

The DPSRSTF flag indicates that Deep Software Standby mode has been canceled by an external or internal interrupt and that an internal reset (Deep Software Standby reset) occurred when the exception from Deep Software Standby Mode occur.

[Setting condition]

- When Deep Software Standby mode is cancelled by an external or an internal interrupt. For details, see [section 10, Low Power Modes](#).

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs.
- When DPSRSTF is read as 1 and then 0 is written to DPSRSTF

5.2.3 RSTSR1 : Reset Status Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0C0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TZER F	—	BUSM RF	—	—	RPER F	—	—	—	—	—	SWRF	WDTR F	IWDT RF
Value after reset:	0	0	x ¹	0	x ¹	0	0	x ¹	0	0	0	0	0	x ¹	x ¹	x ¹

Bit	Symbol	Function	R/W
0	IWDTRF	Independent Watchdog Timer Reset Detect Flag 0: Independent watchdog timer reset not detected 1: Independent watchdog timer reset detected	R/W ²
1	WDTRF	Watchdog Timer Reset Detect Flag 0: Watchdog timer reset not detected 1: Watchdog timer reset detected	R/W ²
2	SWRF	Software Reset Detect Flag 0: Software reset not detected 1: Software reset detected	R/W ²
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	RPERF	SRAM Parity Error Reset Detect Flag 0: SRAM parity error reset not detected 1: SRAM parity error reset detected	R/W ²
9	—	This bit is read as 0. The write value should be 0.	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	BUSMRF	Bus Master MPU Error Reset Detect Flag 0: Bus master MPU error reset not detected 1: Bus master MPU error reset detected	R/W ²
12	—	This bit is read as 0. The write value should be 0.	R/W
13	TZERF	TrustZone Error Reset Detect Flag 0: TrustZone error reset not detected. 1: TrustZone error reset detected.	R/W ²
15:14	—	This bit is read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.

Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an independent watchdog timer reset occurs.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to IWDTRF.

WDTRF flag (Watchdog Timer Reset Detect Flag)

The WDTRF flag indicates that a watchdog timer reset occurs.

[Setting condition]

- When a watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written WDTRF.

SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a software reset occurs.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to SWRF.

RPERF flag (SRAM Parity Error Reset Detect Flag)

The RPERF flag indicates that an SRAM parity error reset occurs.

[Setting condition]

- When an SRAM parity error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read as 1 and then 0 is written to RPERF.

BUSMRF flag (Bus Master MPU Error Reset Detect Flag)

The BUSMRF flag indicates that a bus master MPU error reset occurs.

[Setting condition]

- When a bus master MPU error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to BUSMRF.

TZERF flag (TrustZone Error Reset Detect Flag)

The TZERF flag indicates that a TrustZone error reset has occurred.

[Setting condition]

- When a TrustZone error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read then and 0 is written to TZERF.

5.2.4 RSTSR2 : Reset Status Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x411

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CWSF

Value after reset: 0 0 0 0 0 0 0 0 x¹

Bit	Symbol	Function	R/W
0	CWSF	Cold/Warm Start Determination Flag 0: Cold start 1: Warm start	R/W ²
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.

Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. The determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start). CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software.

[Clearing condition]

- When a reset listed in [Table 5.2](#) occurs.

5.3 Operation

5.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time (t_{RESWT}) elapses. The CPU then starts the reset exception handling.

For details, see [section 43, Electrical Characteristics](#).

5.3.2 Power-On Reset

The power-on reset (POR) is an internal reset generated by the power-on reset circuit. A power-on reset is generated under the following conditions.

1. If the RES pin is in a high level state when power is supplied
2. If the RES pin is in a high level state when VCC is below V_{POR}

After VCC exceeds V_{POR} and the specified power-on reset time (t_{POR}) elapses, the CPU starts the reset exception handling. The power-on reset time is a stabilization period of the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset. When VCC falls below V_{POR} , a power-on reset state is occurred.

[Figure 5.1](#) shows example of operations during a power-on reset.

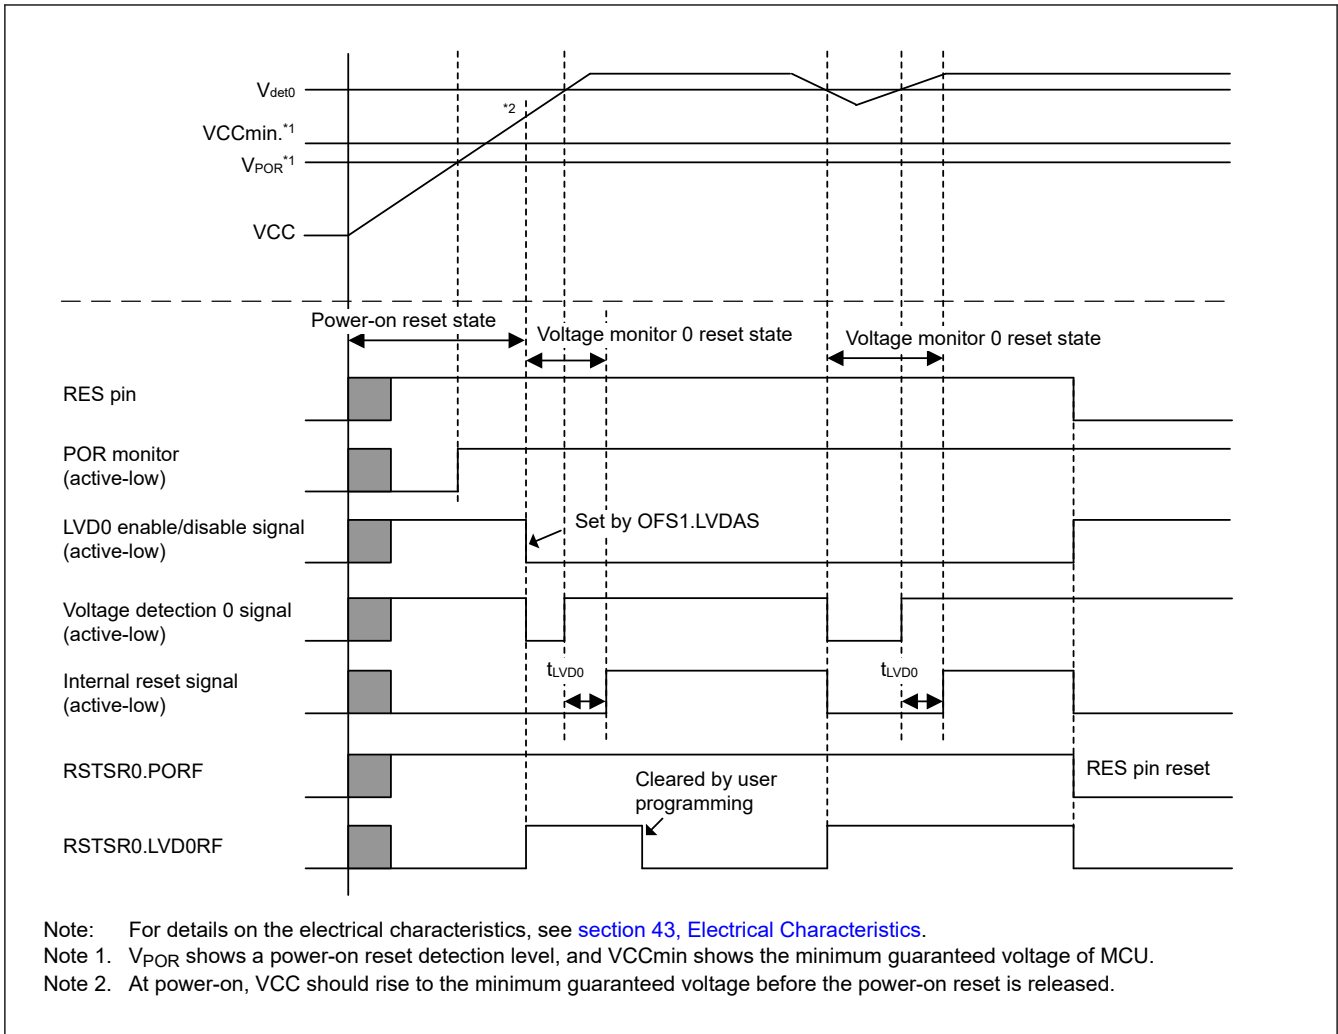

Figure 5.1 Example of operations during a power-on reset

5.3.3 Voltage Monitor Reset

The voltage monitor i ($i = 0, 1, 2$) reset is an internal reset generated by the voltage monitor i circuit. If the Voltage Detection 0 Circuit Start (LVDAS) bit in the Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below V_{det0} , the RSTSR0.LVD0RF flag becomes 1 and the voltage detection circuit generates voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds V_{det0} and the voltage monitor 0 reset time (t_{LVD0}) elapses, the internal reset is canceled and the CPU starts the reset exception handling.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0), the RSTSR0.LVD1RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 1 reset if VCC falls to or below V_{det1} .

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0), the RSTSR0.LVD2RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 2 reset if VCC falls to or below V_{det2} .

Similarly, timing for release from the voltage monitor 1 reset state is selectable with the Voltage Monitor 1 Reset Negate Select bit (RN) in the LVD1CR0. When the LVD1CR0.RN bit is 0 and VCC falls to or below V_{det1} , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time (t_{LVD1}) elapses after VCC rises above V_{det1} . When the LVD1CR0.RN bit is 1 and VCC falls to or below V_{det1} , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time (t_{LVD1}) elapses.

Likewise, timing for release from the voltage monitor 2 reset state is selectable by setting the Voltage Monitor 2 Reset Negate Select bit (RN) in the LDV2CR0 register.

Detection levels V_{det1} and V_{det2} can be changed in the Voltage Monitoring Comparator Control Register (LVD1CMPCR/LVD2CMPCR).

Figure 5.2 shows example of operations during voltage monitor 1 and 2 resets. For details on the voltage monitor 1 reset and voltage monitor 2 reset, see section 7, Low Voltage Detection (LVD).

Figure 5.2 Example of operations during voltage monitor 1 and voltage monitor 2 resets

5.3.4 Deep Software Standby Reset

This is an internal reset generated when Deep Software Standby mode is canceled by an interrupt.

When a Deep Software Standby mode cancellation source is generated, a Deep Software Standby reset is generated. The Deep Software Standby reset is canceled after t_{DSBY} (return time after Deep Software Standby mode cancellation) has elapsed. At the same time, Deep Software Standby mode is also canceled.

When t_{DSBYWT} (wait time after Deep Software Standby mode cancellation) has elapsed after Deep Software Standby mode has been canceled, the internal reset is canceled and the CPU starts the reset exception handling.

For details of the Deep Software Standby reset, see section 10, Low Power Modes.

5.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDG). Output of the reset from the IWDG can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

5.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, a watchdog timer reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see [section 24, Watchdog Timer \(WDT\)](#).

5.3.7 Software Reset

The software reset is an internal reset generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time (t_{RESW2}) elapses after the software reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the SYSRESETREQ bit, see the *ARM[®] Cortex[®]-M33 Technical Reference Manual*.

5.3.8 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

[Figure 5.3](#) shows an example of cold/warm start determination operation.

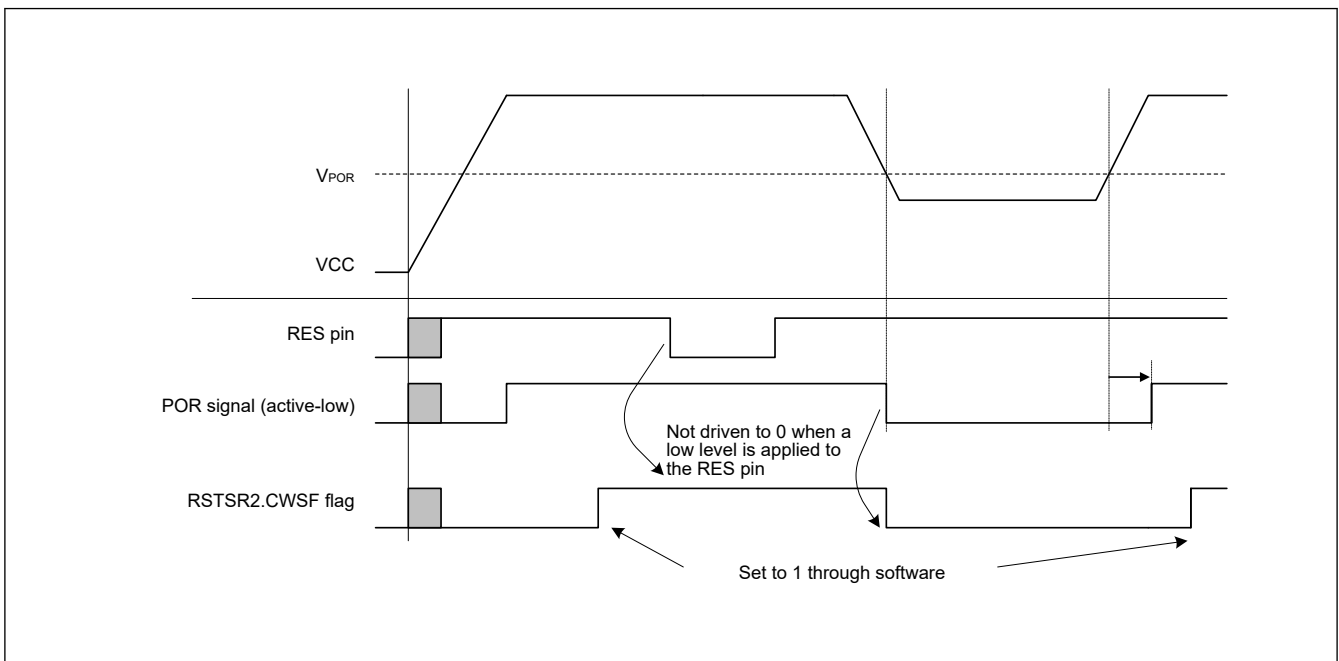

Figure 5.3 Example of cold/warm start determination operation

5.3.9 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling.

Figure 5.4 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after it is read as 1.

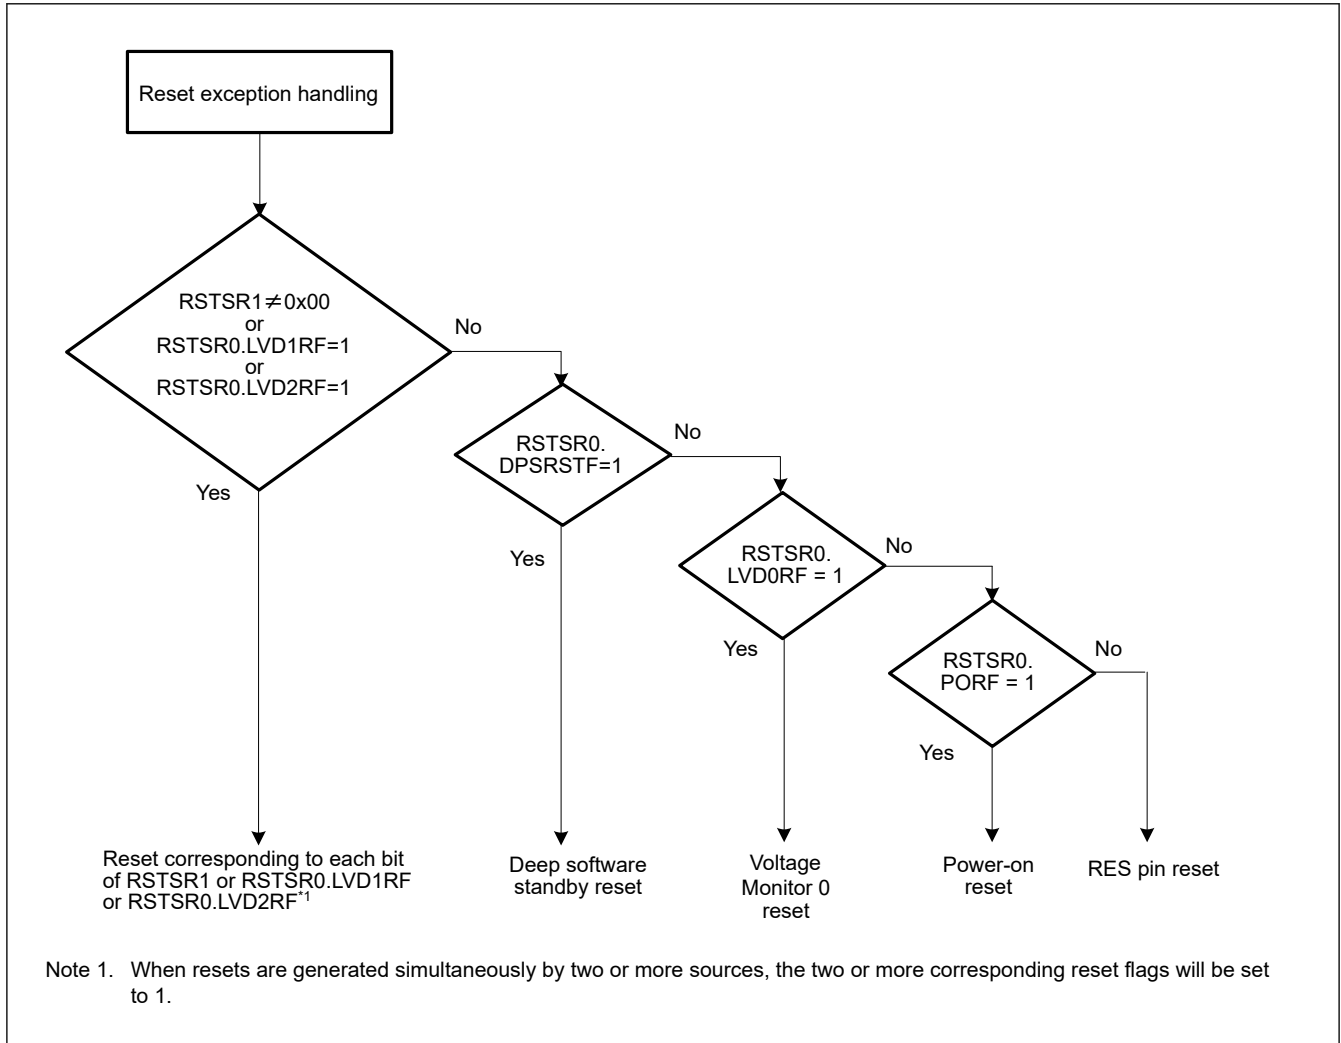

Figure 5.4 Example of reset generation source determination flow

6. Option-Setting Memory

6.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area of the flash memory.

Figure 6.1 shows the option-setting memory area. The option-setting memory area has secure region. Table 6.1 shows the programming condition of the option-setting memory area.

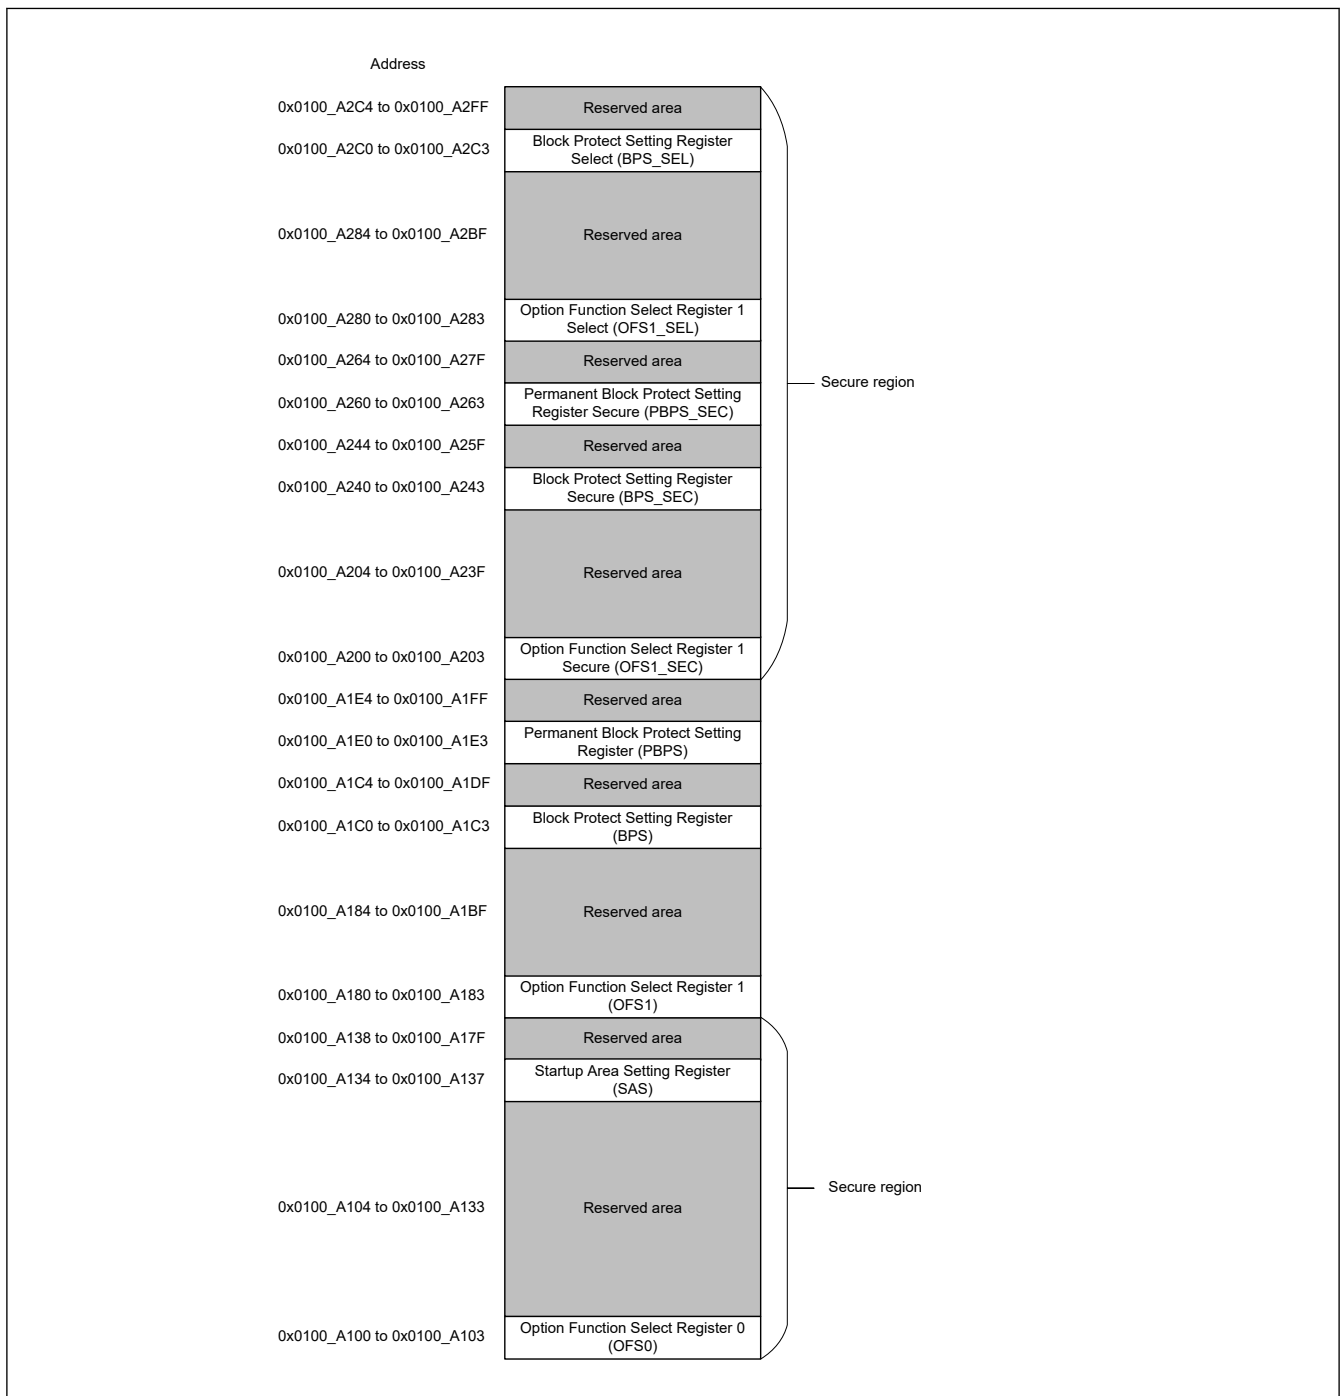

Figure 6.1 Option-setting memory area

Table 6.1 The programming condition of the option-setting memory area

	Self programming	Serial programming	Programming by the on-chip debugger
Secure region	Programming commands issued by secure access.	Programming commands issued when the device life cycle is SSD.	Programming commands issued when the debug level is DBG2.
Other region	Programming commands issued by secure or non-secure access.	Programming commands issued when the device life cycle is SSD or NSECS.	Programming commands issued when the debug level is DBG2 or DBG1.

6.2 Register Descriptions

6.2.1 OFS0 : Option Function Select Register 0

Address: 0x0100_A100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	WDTS TPCTL	—	WDTR STIRQ S	WDTRPSS[1:0]	WDTRPES[1:0]	WDTCKS[3:0]			WDTTOPS[1:0]	WDTS TRT	—				

Value after reset: User setting*1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	IWDT STPC TL	—	IWDT RSTIR QS	IWDRPSS[1:0]	IWDRPES[1:0]	IWDTCKS[3:0]			IWDTTOPS[1:0]	IWDT STRT	—				

Value after reset: User setting*1

Bit	Symbol	Function	R/W
0	—	When read, this bit returns the written value. The write value should be 1.	R
1	IWDTSTRT	IWDT Start Mode Select 0: Automatically activate IWDT after a reset (auto start mode) 1: Disable IWDT after a reset	R
3:2	IWDTTOPS[1:0]	IWDT Timeout Period Select 0 0: 128 cycles (0x007F) 0 1: 512 cycles (0x01FF) 1 0: 1024 cycles (0x03FF) 1 1: 2048 cycles (0x07FF)	R
7:4	IWDTCKS[3:0]	IWDT-Dedicated Clock Frequency Division Ratio Select 0x0: × 1 0x2: × 1/16 0x3: × 1/32 0x4: × 1/64 0xF: × 1/128 0x5: × 1/256 Others: Setting prohibited	R
9:8	IWDRPES[1:0]	IWDT Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (no window end position setting)	R
11:10	IWDRPSS[1:0]	IWDT Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (no window start position setting)	R
12	IWDRSTIRQS	IWDT Reset Interrupt Request Select 0: Interrupt 1: Reset	R

Bit	Symbol	Function	R/W
13	—	When read, this bit returns the written value. The write value should be 1.	R
14	IWDTSTPCTL	IWDT Stop Control 0: Continue counting 1: Stop counting when in Sleep, Snooze, or Software Standby mode	R
16:15	—	When read, these bits return the written value. The write value should be 1.	R
17	WDTSTRT	WDT Start Mode Select 0: Automatically activate WDT after a reset (auto start mode) 1: Stop WDT after a reset (register start mode)	R
19:18	WDTTOPS[1:0]	WDT Timeout Period Select 0 0: 1024 cycles (0x03FF) 0 1: 4096 cycles (0x0FFF) 1 0: 8192 cycles (0x1FFF) 1 1: 16384 cycles (0x3FFF)	R
23:20	WDTCKS[3:0]	WDT Clock Frequency Division Ratio Select 0x1: PCLKB divided by 4 0x4: PCLKB divided by 64 0xF: PCLKB divided by 128 0x6: PCLKB divided by 512 0x7: PCLKB divided by 2048 0x8: PCLKB divided by 8192 Others: Setting prohibited	R
25:24	WDRPES[1:0]	WDT Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (no window end position setting)	R
27:26	WDRPSS[1:0]	WDT Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (no window start position setting)	R
28	WDRSTIRQS	WDT Reset Interrupt Request Select 0: Interrupt 1: Reset	R
29	—	When read, these bits return the written value. The write value should be 1.	R
30	WDTSTPCTL	WDT Stop Control 0: Continue counting 1: Stop counting when entering Sleep mode	R
31	—	When read, these bits return the written value. The write value should be 1.	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state).

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The time it takes for the counter to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524288 IWDT clock cycles.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering Sleep mode, Snooze mode, or Software Standby mode.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

WDTSTRT bit (WDT Start Mode Select)

The WDTSTRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

WDTTOPS[1:0] bits (WDT Timeout Period Select)

The WDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDTCKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDTCKS[3:0] and WDTTOPS[1:0] bits.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTCKS[3:0] bits (WDT Clock Frequency Division Ratio Select)

The WDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDTTOPS[1:0] bits setting, the WDT counting period can be set from 4096 to 134217728 PCLKB cycles.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTRPES[1:0] bits (WDT Window End Position Select)

The WDTRPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDTRPSS[1:0] and WDTRPES[1:0] bits vary with the setting of the WDTTOPS[1:0] bits.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTRPSS[1:0] bits (WDT Window Start Position Select)

The WDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTRSTIRQS bit (WDT Reset Interrupt Request Select)

The WDTRSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTSTPCTL bit (WDT Stop Control)

The WDTSTPCTL bit specifies whether to stop counting when entering Sleep mode.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

6.2.2 SAS : Startup Area Setting Register

Address: 0x0100_A134

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting															
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FSPR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting															

Bit	Symbol	Function	R/W
14:0	—	When read, these bits return the written value. The write value should be 1.	R
15	FSPR	Protection of Startup Area Select Function This bit controls the programming of the write/erase protection for the Startup Area Select flag (SAS.BTFLG), and the temporary boot swap control. When this bit is set to 0, it cannot be changed to 1. 0: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is invalid. 1: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is valid.	R
30:16	—	When read, these bits return the written value. The write value should be 1.	R
31	BTFLG	Startup Area Select Flag This bit specifies whether the address of the startup area is exchanged for the boot swap function or not. 0: First 8-KB area (0x0000_0000 to 0x0000_1FFF) and second 8-KB area (0x0000_2000 to 0x0000_3FFF) are exchanged. 1: First 8-KB area (0x0000_0000 to 0x0000_1FFF) and second 8-KB area (0x0000_2000 to 0x0000_3FFF) are not exchanged.	R

6.2.3 OFS1, OFS1_SEC, OFS1_SEL : Option Function Select Register 1

Address: OFS1: 0x0100_A180
 OFS1_SEC: 0x0100_A200
 OFS1_SEL: 0x0100_A280

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset: The value set by the user*1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	HOCOFRQ0[1:0]	HOCOEN	—	—	—	—	—	—	LVDA S	—	VDSEL[1:0]

Value after reset: The value set by the user*1

Bit	Symbol	Function	R/W
1:0	VDSEL[1:0]	Voltage Detection 0 Level Select 0 0: Setting prohibited 0 1: Select 2.94 V 1 0: Select 2.87 V 1 1: Select 2.80 V	R
2	LVDAS	Voltage Detection 0 Circuit Start 0: Enable voltage monitor 0 reset after a reset 1: Disable voltage monitor 0 reset after a reset	R
7:3	—	When read, these bits return the written value. The write value should be 1.	R
8	HOCOEN	HOCO Oscillation Enable 0: Enable HOCO oscillation after a reset 1: Disable HOCO oscillation after a reset	R
10:9	HOCOFRQ0[1:0]	HOCO Frequency Setting 0 0 0: 16 MHz 0 1: 18 MHz 1 0: 20 MHz 1 1: Setting prohibited	R
31:11	—	When read, these bits return the written value. The write value should be 1.	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program OFS1_SEC and OFS1_SEL registers. OFS1_SEC register is for secure developer, and OFS1 register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in OFS1_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#).

VDSEL[1:0] bits (Voltage Detection 0 Level Select)

The VDSEL[1:0] bits select the voltage detection level of the voltage detection 0 circuit.

LVDAS bits (Voltage Detection 0 Circuit Start)

The LVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, you must set the HOCO Frequency Setting 0 bits (OFS1.HOCOFRQ0[1:0]*1) to an optimum value.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits when OFS1.HOCOEN = 1.

HOCOFRQ0[1:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[1:0] bits specify the HOCO frequency after a reset as 16, 18, or 20 MHz.

6.2.4 BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register

address:

BPS: 0x0100_A1C0
 BPS_SEC: 0x0100_A240
 BPS_SEL: 0x0100_A2C0

Bit position: 31

0

Bit field:

Value after reset:

User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program BPS_SEC and BPS_SEL registers. BPS_SEC register is for secure developer, and BPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#).

The BPS and BPS_SEC registers invalidate the programming and erasure to the code flash memory. When the bit of this register is set to 0, the programming and erasure to the corresponding block are invalid. [Figure 6.2](#) shows the code flash block structure of each product. [Figure 6.3](#) shows the relationship between the bit of register and the block number. Unused bits are reserved and should be set to 1.

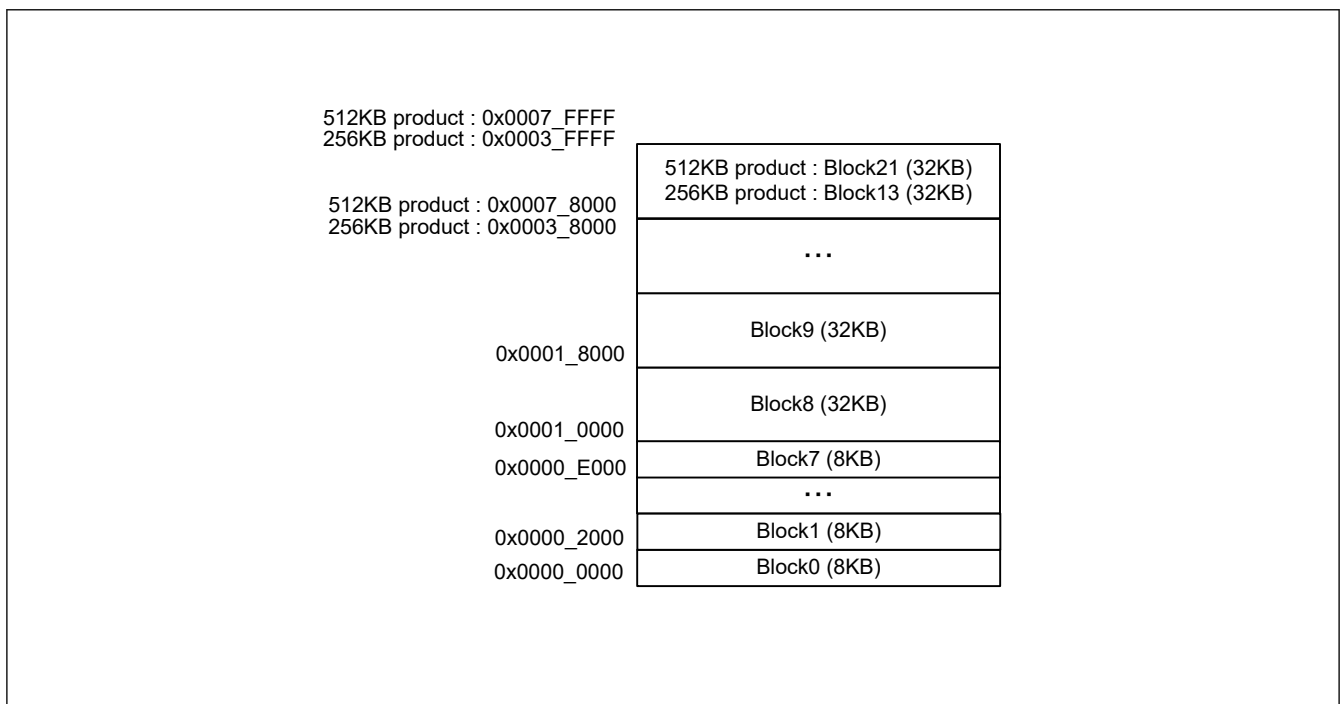

Figure 6.2 Code Flash block structure

Register	Address	+31	+30	+29	+28	+27	+26	+25	+24	+23	+22	+21	+20	+19	+18	+17	+16	+15	+14	+13	+12	+11	+10	+9	+8	+7	+6	+5	+4	+3	+2	+1	+0

Figure 6.3 The relationship between the bit of register and the block number

6.2.5 PBPS, PBPS_SEC : Permanent Block Protect Setting Register

Address: PBPS: 0x0100_A1E0
PBPS_SEC: 0x0100_A260

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program PBPS_SEC register. PBPS_SEC register is for secure developer, and PBPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#). The security attribution register is same BPS_SEL register between the block protection and permanent block protection.

The PBPS and PBPS_SEC registers invalidate writes to bits of BPS and BPS_SEC. The bit of this register can be set to 0 when corresponding bit of BPS and BPS_SEC is set to 0. When the bit of this register is set to 0, writing the corresponding bit of BPS and BPS_SEC register is invalid. Once the bit of this register is set to 0, it is impossible to change the bit to 1. [Table 6.2](#) shows the relationship between the bit of applied PBPS and bit of applied BPS.

The relationship between the bit of this register and the block number is same as BPS and BPS_SEC registers ([section 6.2.4. BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register](#)). Unused bits are reserved and should be set to 1.

Table 6.2 The relationship between the bit of PBPS, PBPS_SEC and bit of BPS, BPS_SEC

The bit of applied PBPS	The bit of applied BPS	Content
1	1	Programming and erasure to the corresponding block is valid.
1	0	Programming and erasure to the corresponding block is invalid. This protection can be canceled by FBPROT0 or FBPROT1 registers.
0	1	Cannot set this condition
0	0	Programming and erasure to the corresponding block is invalid permanently

6.3 Setting Option-Setting Memory

6.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in [Figure 6.1](#). The allocated data is used by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

6.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in [section 6.3.1. Allocation of Data in Option-Setting Memory](#), alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

(1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The option-setting memory does not support background operations (BGO). When writing the option-setting memory, jump to SRAM after copying writing software to SRAM.

For details of the configuration setting command, see [section 40, Flash Memory](#).

(2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in [section 6.3.1. Allocation of Data in Option-Setting Memory](#), from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in [section 6.3.1. Allocation of Data in Option-Setting Memory](#).

6.3.3 Security attribution of option-setting memory

Some functionality has 3 registers for non-secure (FUNC NAME), and secure (FUNC NAME_SEC), and security attribution (FUNC NAME_SEL). Only secure developer can set the registers for secure and security attribution. As shown in [Figure 6.4](#), when the bit of security attribution register is set to 0, the corresponding bit of secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of non-secure register is applied.

For example, if the secure developer wants to configure LVD of OFS1 as secure, HOCO of OFS1 as non-secure, the secure developer needs to set OFS1_SEL as follows.

OFS1_SEL = 0xFFFF_FFF8

By this setting, LVDAS and VDSEL[1:0] values of OFS1_SEC and HOCOFREQ0[1:0] and HOCOEN values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME_SEL) should be set to 1.

Figure 6.4 Selection of applied value

6.3.4 Timing of the Setting Value

For SAS, BPS, BPS_SEC, PBPS, and PBPS_SEC registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

In case the programming using the serial programming mode in customer's factory, be careful that the block protection for secure user is applied after MCU is reset. Because initial value of the security attribution registers of block protection (BPS_SEL) is 1 (non-secure), the block protection setting for secure developer (BPS_SEC/PBPS_SEC) is not applied until MCU is reset even if the corresponding bit of BPS_SEL is programmed to 0 (secure).

6.4 Usage Notes

6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

7. Low Voltage Detection (LVD)

7.1 Overview

The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC pin. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds.

Voltage monitor registers are used to configure the LVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 7.1 lists the LVD specifications. Figure 7.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 7.2 shows a block diagram of the voltage monitor 1 interrupt and reset circuit, and Figure 7.3 shows a block diagram of the voltage monitor 2 interrupt and reset circuit.

Table 7.1 LVD specifications

Parameter		Voltage monitor 0	Voltage monitor 1	Voltage monitor 2
Means for setting up operation		OFS1 register	Registers	Registers
Target for monitoring		VCC pin input voltage	VCC pin input voltage	VCC pin input voltage
Monitored voltage		V_{det0}	V_{det1}	V_{det2}
Detected event		Voltage falls past V_{det0}	Voltage rises or falls past V_{det1}	Voltage rises or falls past V_{det2}
Detection voltage		Selectable from 3 different levels in the OFS1.VDSEL[1:0] bits	Selectable from 3 different levels in the LVD1CMPCR.LVD1LVL[4:0] bits	Selectable from 3 different levels in the LVD2CMPCR.LVD2LVL[2:0] bits
Monitoring flag		None	LVD1SR.MON flag: Monitors whether voltage is higher or lower than V_{det1}	LVD2SR.MON flag: Monitors whether voltage is higher or lower than V_{det2}
			LVD1SR.DET flag: V_{det1} passage detection	LVD2SR.DET flag: V_{det2} passage detection
Process on voltage detection	Reset	Voltage monitor 0 reset	Voltage monitor 1 reset	Voltage monitor 2 reset
		Reset when $V_{det0} > VCC$ CPU restart after specified time with $VCC > V_{det0}$	Reset when $V_{det1} > VCC$ CPU restart timing selectable: after specified time with $VCC > V_{det1}$ or $V_{det1} > VCC$	Reset when $V_{det2} > VCC$ CPU restart timing selectable: after specified time with either $VCC > V_{det2}$ or $V_{det2} > VCC$
	Interrupt	No interrupt	Voltage monitor 1 interrupt	Voltage monitor 2 interrupt
			Non-maskable or maskable interrupt selectable	Non-maskable or maskable interrupt selectable
			Interrupt request issued when $V_{det1} > VCC$ and $VCC > V_{det1}$ or either	Interrupt request issued when $V_{det2} > VCC$ and $VCC > V_{det2}$ or either
Digital filter	Switching between enable and disable	No digital filter function	Available	Available
	Sampling time	—	1/n LOCO frequency × 2 (n: 2, 4, 8, 16)	1/n LOCO frequency × 2 (n: 2, 4, 8, 16)
Event link function		None	Available Output of event signals on detection of V_{det1} crossings	Available Output of event signals on detection of V_{det2} crossings
TrustZone Filter		—	Security attribution can be set for each registers

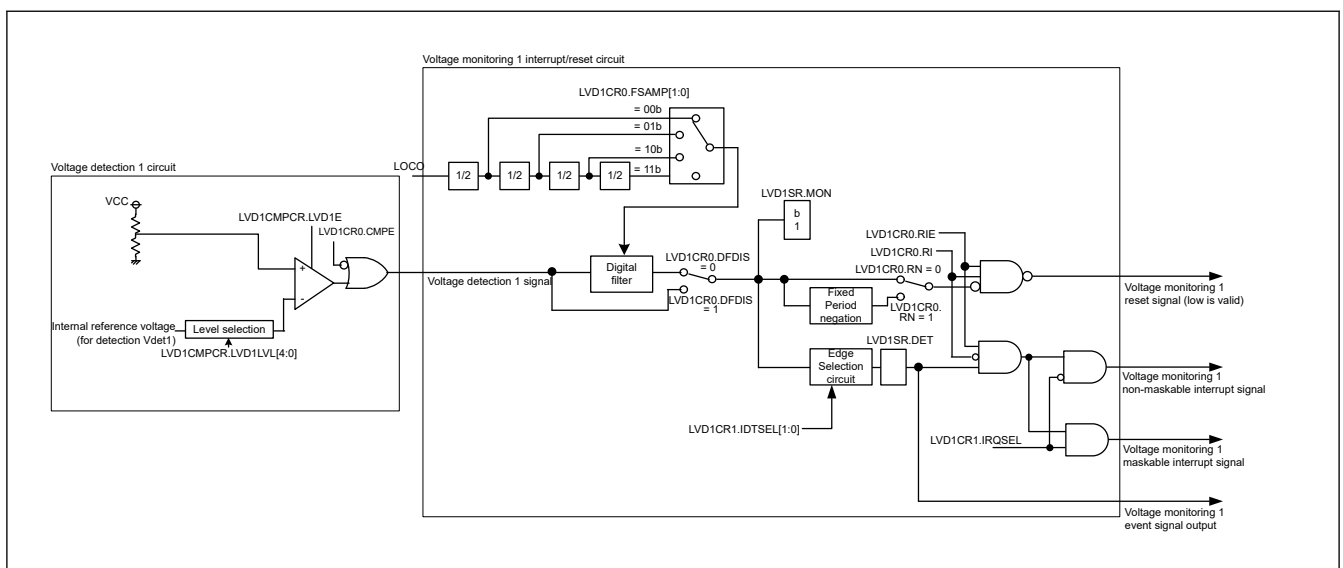

Figure 7.2 Block diagram of voltage monitor 1 interrupt and reset circuit

Figure 7.3 Block diagram of voltage monitor 2 interrupt and reset circuit

7.2 Register Descriptions

7.2.1 LVDSAR : Low Voltage Detection Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3CC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC1	NONSEC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: registers for LVD1 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: registers for LVD2 0: Secure 1: Non-secure	R/W
31:2	—	These bits are read as 1. The write value must be 1 when it is possible to write.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The LVDSAR register controls the secure attribute of LVD registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of LVD1CMPCR, LVD1CR0, LVD1CR1, LVD1SR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of LVD2CMPCR, LVD2CR0, LVD2CR1, LVD2SR.

7.2.2 LVD1CMPCR : Voltage Monitoring 1 Comparator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x417

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LVD1E	—	—	LVD1LVL[4:0]				—
Value after reset:	0	0	0	1	0	0	1	1

Bit	Symbol	Function	R/W
4:0	LVD1LVL[4:0]	Voltage Detection 1 Level Select (Standard voltage during drop in voltage) 0x11: 2.99 V (Vdet1_1) 0x12: 2.92 V (Vdet1_2) 0x13: 2.85 V (Vdet1_3) Others: Setting prohibited	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	LVD1E	Voltage Detection 1 Enable 0: Voltage detection 1 circuit disabled 1: Voltage detection 1 circuit enabled	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The LVD1CMPCR.LVD1LVL can be changed only if the LVD1CMPCR.LVD1E and LVD2CMPCR.LVD2E bits are both 0. The voltage detection circuits 1 and 2 should not be set at the same voltage detection level.

Do not change LVD1CMPCR.LVD1LVL and LVD1CMPCR.LVD1E at the same time.

LVD1E bit (Voltage Detection 1 Enable)

When using voltage detection 1 interrupt/reset or the LVD1SR.MON bit, set the LVD1E bit to 1. The voltage detection 1 circuit starts once $t_{d(E-A)}$ passes after the LVD1E bit value is changed from 0 to 1. When using the voltage detection 1 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

7.2.3 LVD2CMPCR : Voltage Monitoring 2 Comparator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x418

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LVD2E	—	—	—	—	LVD2LVL[2:0]		
Value after reset:	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
2:0	LVD2LVL[2:0]	Voltage Detection 2 Level Select (Standard voltage during drop in voltage) 1 0 1: 2.99 V (Vdet2_1) 1 1 0: 2.92 V (Vdet2_2) 1 1 1: 2.85 V (Vdet2_3) Others: Setting prohibited	R/W
6:3	—	These bits are read as 0. The write value should be 0.	R/W
7	LVD2E	Voltage Detection 2 Enable 0: Voltage detection 2 circuit disabled 1: Voltage detection 2 circuit enabled	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The LVD2CMPCR.LVD2LVL can be changed only if the LVD1CMPCR.LVD1E and LVD2CMPCR.LVD2E bits are both 0. The voltage detection circuits 1 and 2 should not be set at the same voltage detection level.

Do not change LVD2CMPCR.LVD2LVL and LVD2CMPCR.LVD2E at the same time.

LVD2E bit (Voltage Detection 2 Enable)

When using voltage detection 2 interrupt/reset or the LVD2SR.MON bit, set the LVD2E bit to 1. The voltage detection 2 circuit starts once $t_{d(E-A)}$ passes after the LVD2E bit value is changed from 0 to 1. When using the voltage detection 2 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

7.2.4 LVD1CR0 : Voltage Monitor 1 Circuit Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x41A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RN	RI	FSAMP[1:0]	—	CMPE	DFDIS	RIE	
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Function	R/W
0	RIE	Voltage Monitor 1 Interrupt/Reset Enable 0: Disable 1: Enable	R/W
1	DFDIS	Voltage monitor 1 Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter	R/W
2	CMPE	Voltage Monitor 1 Circuit Comparison Result Output Enable 0: Disable voltage monitor 1 circuit comparison result output 1: Enable voltage monitor 1 circuit comparison result output	R/W
3	—	The read value is undefined. The write value should be 1.	R/W
5:4	FSAMP[1:0]	Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency	R/W
6	RI	Voltage Monitor 1 Circuit Mode Select 0: Generate voltage monitor 1 interrupt on V_{det1} crossing 1: Enable voltage monitor 1 reset when the voltage falls to and below V_{det1}	R/W
7	RN	Voltage Monitor 1 Reset Negate Select 0: Negate after a stabilization time (t_{LVD1}) when $VCC > V_{det1}$ is detected 1: Negate after a stabilization time (t_{LVD1}) on assertion of the LVD1 reset	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor 1 Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor 1 interrupt/reset. Ensure that neither a voltage monitor 1 interrupt nor a voltage monitor 1 reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage monitor 1 Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) when this bit is 0(enabled). Set this bit to 1 (disabled) when using the voltage monitor 1 circuit in Software Standby mode or in Deep Software Standby mode.

CMPE bit (Voltage Monitor 1 Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor 1 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 1 circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection 1 circuit, disable the voltage detection 1 circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the LVD1CR0.DFDIS bit is 1 (digital filter circuit disabled). Do not rewrite these bits if the LVD1CR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor 1 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 1 reset selected), transition to Deep Software Standby mode cannot be made. In this case, transition to Software Standby mode is made. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 1 interrupt selected).

RN bit (Voltage Monitor 1 Reset Negate Select)

If the RN bit is set to 1 (negation follows a stabilization time on assertion of the LVD1 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). In addition, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows stabilization time when $VCC > V_{det1}$ is detected). Do not set the RN bit to 1 when this is the case.

7.2.5 LVD2CR0 : Voltage Monitor 2 Circuit Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x41B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RN	RI	FSAMP[1:0]	—	CMPE	DFDIS	RIE	
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Function	R/W
0	RIE	Voltage Monitor 2 Interrupt/Reset Enable 0: Disable 1: Enable	R/W
1	DFDIS	Voltage monitor 2 Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter	R/W
2	CMPE	Voltage Monitor 2 Circuit Comparison Result Output Enable 0: Disable voltage monitor 2 circuit comparison result output 1: Enable voltage monitor 2 circuit comparison result output	R/W
3	—	The read value is undefined. The write value should be 1.	R/W
5:4	FSAMP[1:0]	Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency	R/W
6	RI	Voltage Monitor 2 Circuit Mode Select 0: Generate voltage monitor 2 interrupt on V_{det2} crossing 1: Enable voltage monitor 2 reset when the voltage falls to and below V_{det2}	R/W
7	RN	Voltage Monitor 2 Reset Negate Select 0: Negate after a stabilization time (t_{LVD2}) when $VCC > V_{det2}$ is detected 1: Negate after a stabilization time (t_{LVD2}) on assertion of the LVD2 reset	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor 2 Interrupt/Reset Enable)

The RIE bit enables or disables the voltage monitor 2 interrupt/reset. Ensure that neither a voltage monitor 2 interrupt nor a voltage monitor 2 reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage monitor 2 Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) when this bit is 0 (digital filter enabled). Set this bit to 1 (digital filter disabled) when using the voltage monitor 2 circuit in Software Standby mode or in Deep Software Standby mode.

CMPE bit (Voltage Monitor 2 Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor 2 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 2 circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection 2 circuit, disable the voltage detection 2 circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the LVD2CR0.DFDIS bit is 1 (digital filter circuit disabled). Do not rewrite these bits if the LVD2CR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor 2 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 2 reset selected), transition to Deep Software Standby mode cannot be made. In this case, transition to Software Standby mode is made. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 2 interrupt selected).

RN bit (Voltage Monitor 2 Reset Negate Select)

If the RN bit is set to 1 (negating LVD2 reset in a specified time after its assertion), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Additionally, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows a stabilization time when $VCC > V_{det2}$ is detected). Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the LVD2 reset signal) when this is the case.

7.2.6 LVD1CR1 : Voltage Monitor 1 Circuit Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0E0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	IRQSEL	IDTSEL[1:0]	

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
1:0	IDTSEL[1:0]	Voltage Monitor 1 Interrupt Generation Condition Select 0 0: When $VCC \geq V_{det1}$ (rise) is detected 0 1: When $VCC < V_{det1}$ (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited	R/W
2	IRQSEL	Voltage Monitor 1 Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt*1	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the NMIER.LVD1EN bit value in the ICU from the reset state.

7.2.7 LVD1SR : Voltage Monitor 1 Circuit Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E1

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	DET	Voltage Monitor 1 Voltage Variation Detection Flag 0: Not detected 1: V_{det1} crossing is detected	R/W ¹
1	MON	Voltage Monitor 1 Signal Monitor Flag 0: $VCC < V_{det1}$ 1: $VCC \geq V_{det1}$ or MON is disabled	R
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor 1 Voltage Variation Detection Flag)

The DET flag is enabled when the LVD1CMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

When detecting V_{det1} , set the DET flag to 0 after setting LVD1CR0.RIE is 0 (disabled). When setting LVD1CR0.RIE bit to 1 (enabled) after setting it to 0, wait for 2 or more PCLKB cycles which have elapsed.

MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the LVD1CMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

7.2.8 LVD2CR1 : Voltage Monitor 2 Circuit Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0E2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	IRQSEL	IDTSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
1:0	IDTSEL[1:0]	Voltage Monitor 2 Interrupt Generation Condition Select 0 0: When $VCC \geq V_{det2}$ (rise) is detected 0 1: When $VCC < V_{det2}$ (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited	R/W
2	IRQSEL	Voltage Monitor 2 Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt ^{*1}	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the NMIER.LVD2EN bit value in the ICU from the reset state.

7.2.9 LVD2SR : Voltage Monitor 2 Circuit Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E3

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	DET	Voltage Monitor 2 Voltage Variation Detection Flag 0: Not detected 1: V_{det2} crossing is detected	R/W ¹
1	MON	Voltage Monitor 2 Signal Monitor Flag 0: $VCC < V_{det2}$ 1: $VCC \geq V_{det2}$ or MON is disabled	R
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor 2 Voltage Variation Detection Flag)

The DET flag is enabled when the LVD2CMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

When detecting V_{det2} , set the DET flag to 0 after setting LVD2CR0.RIE is 0 (disabled). When setting LVD2CR0.RIE bit to 1 (enabled) after setting it to 0, wait for 2 or more PCLKB cycles which have elapsed.

MON flag (Voltage Monitor 2 Signal Monitor Flag)

The MON flag is enabled when the LVD2CMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

7.3 VCC Input Voltage Monitor

7.3.1 Monitoring V_{det0}

The comparison results from voltage monitor 0 are not available for reading.

7.3.2 Monitoring V_{det1}

Table 7.2 shows the procedures to set up monitoring against V_{det1} . After the settings are complete, the comparison results from voltage monitor 1 can be monitored with the LVD1SR.MON flag.

Table 7.2 Procedures to set up monitoring against V_{det1}

Step		Monitoring the comparison results from voltage monitor 1
Setting up the voltage detection 1 circuit	1	Set LVD1CMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVD1CMPCR.LVD1LVL[4:0] bits.
	2	Select the detection voltage in the LVD1CMPCR.LVD1LVL[4:0] bits.
	3	Set LVD1CMPCR.LVD1E = 1 to enable the voltage detection 1 circuit.
	4	Wait for at least $t_{d(E-A)}$ for the LVD1 operation stabilization time after LVD1 is enabled.*1
Setting the digital filter*2	5	Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits.
	6	Set LVD1CR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .
Enabling output	8	Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1.

Note 1. Steps 5 to 7 can be performed during the wait time of step 4. For details of $t_{d(E-A)}$, see [section 43, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

7.3.3 Monitoring V_{det2}

[Table 7.3](#) shows the procedures to set up monitoring against V_{det2} . After the settings are complete, the comparison results from voltage monitor 2 can be monitored in the LVD2SR.MON flag.

Table 7.3 Procedures to set up monitoring against V_{det2}

Step		Monitoring the results of comparison by voltage monitor 2
Setting up the voltage detection 2 circuit	1	Set LVD2CMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVD2CMPCR.LVD2LVL[2:0] bits.
	2	Select the detection voltage in the LVD2CMPCR.LVD2LVL[2:0] bits.
	3	Set LVD2CMPCR.LVD2E = 1 to enable the voltage detection 2 circuit.
	4	Wait for at least $t_{d(E-A)}$ for the LVD2 operation stabilization time after LVD2 is enabled.*1
Setting the digital filter*2	5	Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits.
	6	Set LVD2CR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .
Enabling output	8	Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2.

Note 1. Steps 5 to 7 can be performed during the wait time of step 4. For details of $t_{d(E-A)}$, see [section 43, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

7.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1.LVDAS bit to 0 to enable the voltage monitor 0 reset after a reset. However, at boot mode, the reset from voltage monitor 0 is disabled regardless of the value of the OFS1.LVDAS bit.

[Figure 7.4](#) shows an example of operations for a voltage monitor 0 reset.

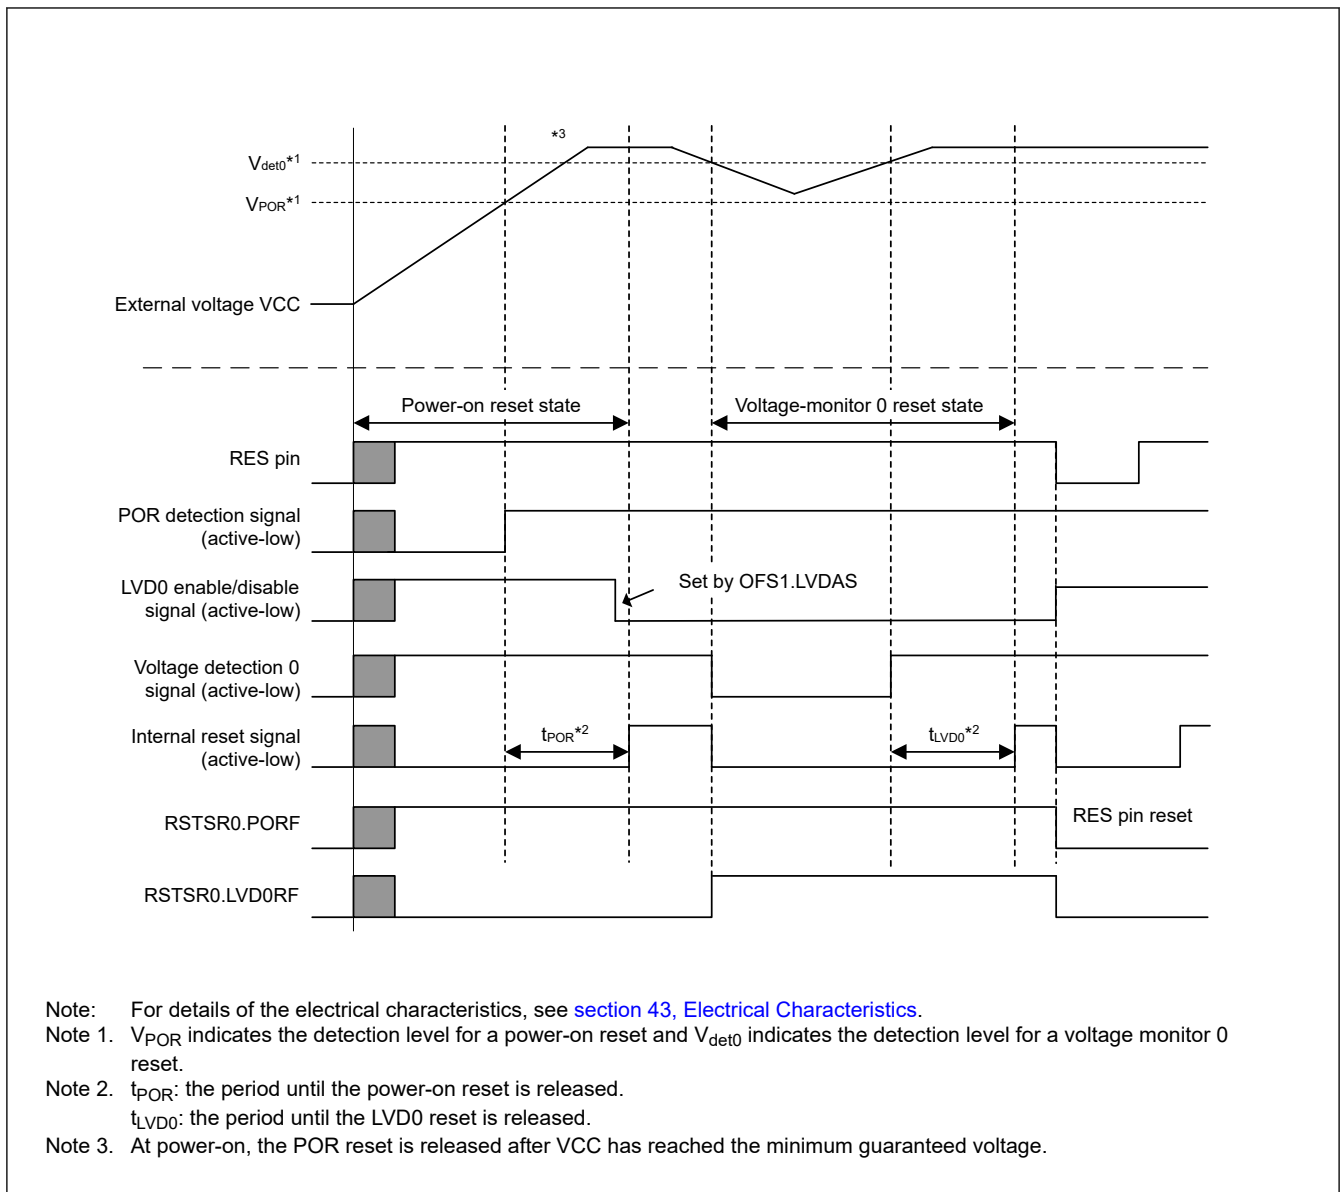

Figure 7.4 Example of voltage monitor 0 reset operation

7.5 Interrupt and Reset from Voltage Monitor 1

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 1 circuit.

[Table 7.4](#) shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring occurs. [Table 7.5](#) shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring stops. [Figure 7.5](#) shows an example of operations for a voltage monitor 1 interrupt. For the operation of the voltage monitor 1 reset, see [Figure 5.2](#) in [section 5, Resets](#).

When using the voltage monitor 1 circuit in Software Standby mode or Deep Software Standby mode, set up the circuit using the procedures in this section.

(1) Setting in Software Standby mode

- Disable the digital filter ($LVD1CR0.DFDIS = 1$).
- When $VCC > V_{det1}$ is detected, negate the voltage monitor 1 reset signal ($LVD1CR0.RN = 0$) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter ($LVD1CR0.DFDIS = 1$).

- Enable the voltage monitor 1 interrupt (LVD1CR0.RI = 0). If the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 1 circuit stops. To use the voltage monitor 1 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Table 7.4 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring occurs

Step	Voltage monitor 1 interrupt (voltage monitor 1 ELC event output)	Voltage monitor 1 reset
Setting up the voltage detection 1 circuit	1	Set LVD1CMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVD1CMPCR register.
	2	Select the detection voltage in the LVD1CMPCR.LVD1LVL[4:0] bits.
	3	Set LVD1CMPCR.LVD1E = 1 to enable the voltage detection 1 circuit.
	4	Wait for at least $t_d (E-A)$ for the LVD1 operation stabilization time after LVD1 is enabled.*1
Setting the digital filter*3	5	Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits.
	6	Set LVD1CR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .*4
Setting up the voltage monitor 1 interrupt or reset	8	Set LVD1CR0.RI = 0 to select the voltage monitor 1 interrupt. <ul style="list-style-type: none"> • Set LVD1CR0.RI = 1 to select the voltage monitor 1 reset. • Select the type of reset negation in the LVD1CR0.RN bit.
	9	<ul style="list-style-type: none"> • Select the interrupt request condition in the LVD1CR1.IDTSEL[1:0] bits. • Select the interrupt type in the LVD1CR1.IRQSEL bit.
Enabling output	10	Set LVD1SR.DET = 0.
	11	Set LVD1CR0.RIE = 1 to enable the voltage monitor 1 interrupt or reset.*2
	12	Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1.

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on $t_d (E-A)$, see [section 43, Electrical Characteristics](#).

Note 2. Step 11 is not required if only the ELC event signal is to be output.

Note 3. Steps 5 to 7 are not required if the digital filter is not in use.

Note 4. Steps 8 to 11 can be performed during the wait time of step 7.

Table 7.5 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring stops

Step	Voltage monitor 1 interrupt (voltage monitor 1 ELC event output), voltage monitor 1 reset	
Stopping the enabling output	1	Set LVD1CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 1.
	2	Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .*2
	3	Set LVD1CR0.RIE = 0 to disable the voltage monitor 1 interrupt or reset.*1
Stopping the digital filter	4	Set LVD1CR0.DFDIS = 1 to disable the digital filter.*2 *3
Stopping the voltage detection 1 circuit	5	Set LVD1CMPCR.LVD1E = 0 to disable the voltage detection 1 circuit.

Note 1. Step 3 is not required if only the ELC event signal is to be output.

Note 2. Steps 2 and 4 are not required if the digital filter is not in use.

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO clock cycles before re-enabling it.

If the voltage monitor 1 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 1 circuit is not required if the settings for the circuit do not change.
- Setting the digital filter is not required if the settings for the circuit do not change.

- Setting the voltage monitor 1 interrupt or reset is not required if the settings for the voltage monitor 1 interrupt or voltage monitor 1 reset do not change.

Figure 7.5 shows an example of the voltage monitor 1 interrupt operation.

Figure 7.5 Example of voltage monitor 1 interrupt operation

7.6 Interrupt and Reset from Voltage Monitor 2

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 2 circuit.

Table 7.6 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring occurs. Table 7.7 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring stops. Figure 7.6 shows an example of operations for a voltage monitor 2 interrupt. For the operation of the voltage monitor 2 reset, see Figure 5.2 in section 5, Resets.

When using the voltage monitor 2 circuit in Software Standby mode or Deep Software Standby mode, set up the circuit with the following procedures.

(1) Setting in Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1)
- When $V_{CC} > V_{det2}$ is detected, negate the voltage monitor 2 reset signal (LVD2CR0.RN = 0) following a LVD2 stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1).
- Enable the voltage monitor 2 interrupt (LVD2CR0.RI = 0). If the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 2 circuit stops. To use the voltage monitor 2 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Table 7.6 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring occurs

Step		Voltage monitor 2 interrupt (voltage monitor 2 ELC event output)	Voltage monitor 2 reset
Setting up the voltage detection 2 circuit	1	Set LVD2CMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVD2CMPCR register.	
	2	Select the detection voltage in the LVD2CMPCR.LVD2LVL[2:0] bits.	
	3	Set LVD2CMPCR.LVD2E = 1 to enable the voltage detection 2 circuit.	
	4	Wait for at least $t_{d(E-A)}$ for the LVD2 operation stabilization time after LVD2 is enabled.*1	
Setting the digital filter*3	5	Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits.	
	6	Set LVD2CR0.DFDIS = 0 to enable the digital filter.	
	7	Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .*4	
Setting up the voltage monitor 2 interrupt or reset	8	Set LVD2CR0.RI = 0 to select the voltage monitor 2 interrupt.	<ul style="list-style-type: none"> • Set LVD2CR0.RI = 1 to select the voltage monitor 2 reset. • Select the type of reset negation in the LVD2CR0.RN bit.
	9	<ul style="list-style-type: none"> • Select the interrupt request condition in the LVD2CR1.IDTSEL[1:0] bits. • Select the interrupt type in the LVD2CR1.IRQSEL bit. 	—
Enabling output	10	Set LVD2SR.DET = 0.	
	11	Set LVD2CR0.RIE = 1 to enable the voltage monitor 2 interrupt or reset.*2	
	12	Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2.	

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on $t_{d(E-A)}$, see section 43, Electrical Characteristics.

Note 2. Step 11 is not required if only the ELC event signal is to be output.

Note 3. Steps 5 to 7 are not required if the digital filter is not in use.

Note 4. Steps 8 to 11 can be performed during the wait time of step 7.

Table 7.7 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring stops

Step	Voltage monitor 2 interrupt (voltage monitor 2 ELC event output), voltage monitor 2 reset	
Settings to stop enabling output	1	Set LVD2CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 2.
	2	Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8, \text{ or } 16$, and the sampling clock for the digital filter is the LOCO frequency-divided by n . ^{*2}
	3	Set LVD2CR0.RIE = 0 to disable the voltage monitor 2 interrupt or reset. ^{*1}
Stopping the digital filter	4	Set LVD2CR0.DFDIS = 1 to disable the digital filter. ^{*2 *3}
Stopping the voltage detection 2 circuit	5	Set LVD2CMPCR.LVD2E = 0 to disable the voltage detection 2 circuit.

Note 1. Step 3 is not required if only the ELC event signal is to be output.

Note 2. Steps 2 and 4 are not required if the digital filter is not in use.

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO clock cycles before re-enabling it.

If the voltage monitor 2 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 2 is not required if the settings for the circuit do not change.
- Setting the digital filter is not required if the settings for the circuit do not change.
- Setting the voltage monitor 2 interrupt or reset is not required if the settings for the voltage monitor 2 interrupt or voltage monitor 2 reset do not change.

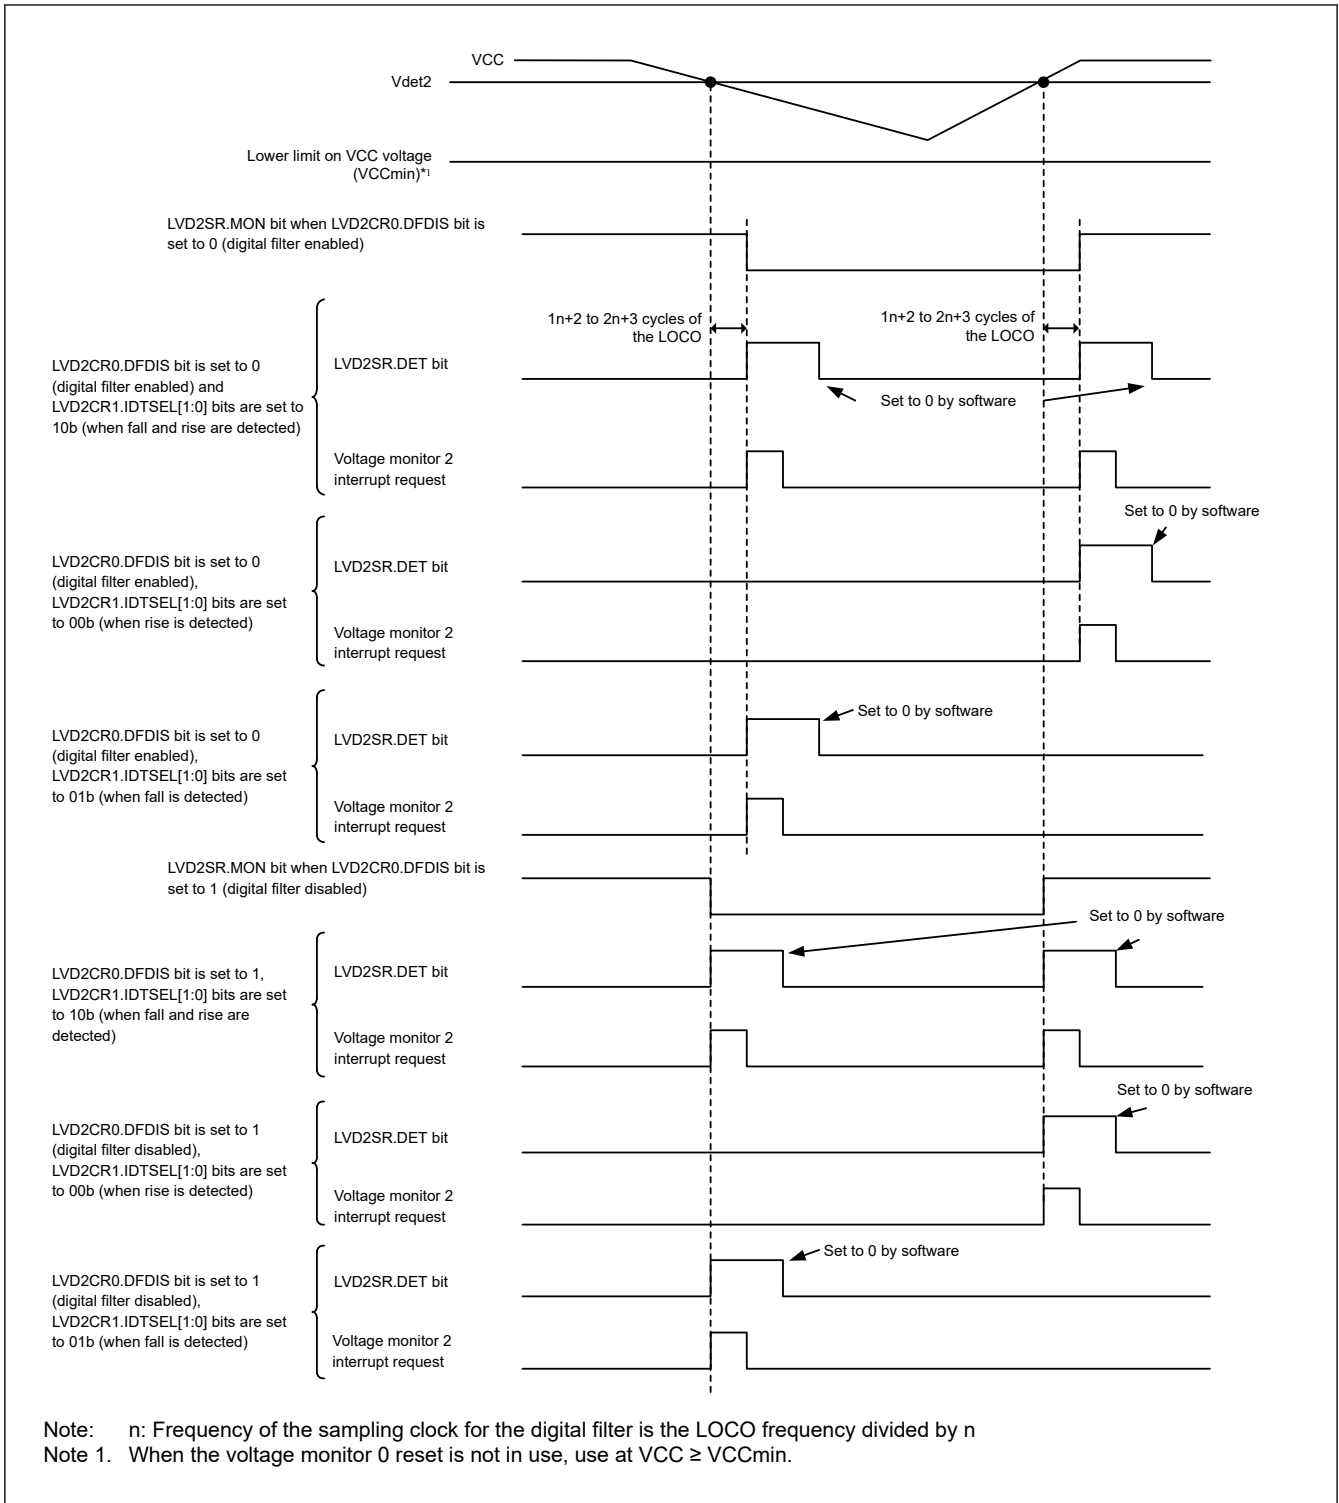

Figure 7.6 Example of voltage monitor 2 interrupt operation

7.7 Event Link Controller (ELC) Output

The LVD can output the event signals to the Event Link Controller (ELC).

(1) V_{det1} Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the V_{det1} voltage while both the voltage detection 1 circuit and the voltage monitor 1 circuit comparison result output are enabled.

(2) V_{det2} Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the V_{det2} voltage while both the voltage detection 2 circuit and the voltage monitor 2 circuit comparison result output are enabled.

When enabling the event link output function of the LVD, you must enable the LVD before enabling the LVD event link function of the ELC. To stop the event link output function of the LVD, you must stop the LVD before disabling the LVD event link function of the ELC.

7.7.1 Interrupt Handling and Event Linking

The LVD provides bits to separately enable or disable the voltage monitor 1 and 2 interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

In contrast, as soon as an interrupt source is generated, an event link signal is output as the event signal to the other module through the ELC, regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor 1 and 2 interrupts in Software Standby and Deep Software Standby modes. The event signals for the ELC in Software Standby and Deep Software Standby modes are output as follows:

- When a V_{det1} or V_{det2} passage events is detected in Software Standby mode, event signals are not generated for the ELC because the clock is not supplied in Software Standby mode. Because the V_{det1} and V_{det2} passage detection flags are saved, when the clock supply resumes after returning from Software Standby mode, the event signals for the ELC are output based on the state of the V_{det1} and V_{det2} detection flags.
- When a V_{det1} or V_{det2} passage events are detected in Deep Software Standby mode, event signals are not generated for the ELC.

8. Clock Generation Circuit

8.1 Overview

The MCU provides a clock generation circuit. [Table 8.1](#) and [Table 8.2](#) list the clock generation circuit specifications. [Figure 8.1](#) show a block diagram, and [Table 8.3](#) lists the I/O pins.

Table 8.1 Clock generation circuit specifications for the clock sources

Clock source	Description	Specification
Main clock oscillator (MOSC)	Resonator frequency	8 MHz to 24 MHz 8, 10, 16, 20, 24 MHz (USB boot mode)
	External clock input frequency	Up to 24 MHz
	External resonator or additional circuit	ceramic resonator, crystal
	Connection pins	EXTAL, XTAL
	Drive capability switching	Available
	Oscillation stop detection function	Available
Sub-clock oscillator (SOSC)	Resonator frequency	32.768 kHz
	External resonator or additional circuit	crystal resonator
	Connection pins	XCIN, XCOU
	Drive capability switching	Available
PLL circuit	Input clock source	MOSC, HOCO
	Input pulse frequency division ratio	Selectable from 1, 2, and 3
	Input frequency	8 MHz to 24 MHz
	Frequency multiplication ratio	Selectable from 10 to 30 (0.5 steps)
	Output pulse frequency division ratio	Unavailable
	PLL Output frequency	100 MHz to 200 MHz
PLL2 circuit	Input clock source	MOSC, HOCO
	Input pulse frequency division ratio	Selectable from 1, 2, and 3
	Input frequency	8 MHz to 24 MHz
	Frequency multiplication ratio	Selectable from 10 to 30 (0.5 steps)
	Output pulse frequency division ratio	Unavailable
	PLL Output frequency	120 MHz to 240 MHz
	PLL2-LDO stop function	Available
High-speed on-chip oscillator (HOCO)	Oscillation frequency	16/18/20 MHz
	FLL function	Available
	User trimming	Available
Middle-speed on-chip oscillator (MOCO)	Oscillation frequency	8 MHz
	User trimming	Available
Low-speed on-chip oscillator (LOCO)	Oscillation frequency	32.768 kHz
	User trimming	Available
IWDT-dedicated on-chip oscillator (IWDTLOCO)	Oscillation frequency	15 kHz
	User trimming	Unavailable
External clock input for JTAG (TCK)	Input clock frequency	Up to 25 MHz
External clock input for SWD (SWCLK)	Input clock frequency	Up to 25 MHz

Table 8.2 Clock generation circuit specifications for the internal clocks

Item	Clock source	Clock supply	Specification
System clock (ICLK)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	CPU, DTC, DMAC, Flash, RAM	Up to 100 MHz Division ratios: 1/2/4/8/16/32/64
Peripheral module clock A (PCLKA)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	Peripheral modules (QSPI, SCI, SPI, CRC, DOC, ADC12, DAC12, SCE9, GPT bus clock)	Up to 100 MHz Division ratio: 1/2/4/8/16/32/64
Peripheral module clock B (PCLKB)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	Peripheral modules (CAC, ELC, I/O ports, POEG, RTC, WDT, IWDT, AGT, IIC, CAN, USBFS, Standby SRAM)	Up to 50 MHz Division ratio: 1/2/4/8/16/32/64
Peripheral module clock C (PCLKC)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	Peripheral module (ADC12 conversion clock)	Up to 50 MHz Division ratio: 1/2/4/8/16/32/64
Peripheral module clock D (PCLKD)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	Peripheral module(GPT count clock)	Up to 100 MHz Division ratio: 1/2/4/8/16/32/64
FlashIF clock (FCLK)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	FlashIF	4 MHz to 50 MHz(P/E) Up to 50 MHz(read) Division ratio: 1/2/4/8/16/32/64
USB clock (USBCLK)	PLL/PLL2	USBFS	48 MHz Division ratio: 3/4/5
CAN clock (CANMCLK)	MOSC	CAN	8 MHz to 24 MHz
AGT clock (AGTSCLK)	SOSC	AGT	32.768 kHz
AGT clock (AGTLCLK)	LOCO	AGT	32.768 kHz
CAC Main clock (CACMCLK)	MOSC	CAC	Up to 24 MHz
CAC Sub clock (CACSCLK)	SOSC	CAC	32.768 kHz
CAC LOCO clock (CACLCLK)	LOCO	CAC	32.768 kHz
CAC MOCO clock (CACMOCLK)	MOCO	CAC	8 MHz
CAC HOCO clock (CACHCLK)	HOCO	CAC	16/18/20 MHz
CAC IWDTLOCO clock (CACILCLK)	IWDTLOCO	CAC	15 kHz
RTC clock (RTCCLK)	SOSC/LOCO	RTC	32.768 kHz
IWDT clock (IWDTCLK)	IWDTLOCO	IWDT	15 kHz
SysTick timer clock (SYSTICCLK)	LOCO	SysTick timer	32.768 kHz
JTAG clock (JTAGTCK)	TCK	JTAG	Up to 25 MHz
Serial wire clock (SWCLK)	SWCLK	OCD	Up to 25 MHz
Trace clock (TRCLK)	MOSC/SOSC/HOCO/MOCO/LOCO/PLL	CPU-OCD	Up to 50 MHz, Division ratio: 1/2/4
TCLK pin output (TCLK)	1/2 TRCLK	TCLK pin	Up to 25 MHz
Clock/buzzer output (CLKOUT)	MOSC/SOSC/LOCO/MOCO/HOCO	CLKOUT pin	Up to 60 MHz Division ratios: 1/2/4/8/16/32/64/128

Note: Restrictions on setting clock frequency: $ICLK \geq PCLKA \geq PCLKB$, $PCLKD \geq PCLKA \geq PCLKB$

$ICLK \geq FCLK$

Restrictions on clock frequency ratio: (N: integer, and up to 64)

$ICLK:FCLK = N:1$, $ICLK:PCLKA = N:1$, $ICLK:PCLKB = N:1$, $ICLK:PCLKC = N:1$ or $1:N$, $ICLK:PCLKD = N:1$ or $1:N$, $ICLK:TRCLK = N:1$ or $1:N$

If the A/D converter is enabled, the clock frequency ratio is constrained as follows:

$PCLKA:PCLKC = 1:1$ or $2:1$ or $4:1$ or $8:1$ or $1:2$ or $1:4$

Note: Restrictions on the minimum FCLK frequency 4MHz when P/E.

Note: The multiplication of PLL and PLL2 should be set to be within the output frequency range of PLL and PLL2, taking the frequency of HOCO into consideration when not using the FLL function.

Note: Clocks have a permissible frequency range (See Table 8.2).

Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. (See [section 38, SRAM](#), [section 40, Flash Memory](#))
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency when not using FLL function. (See [section 43, Electrical Characteristics](#)).

Figure 8.1 Clock generation circuit block diagram

Table 8.3 lists the input/output pins of the clock generation circuit.

Table 8.3 Input/Output Pins of Clock Generation Circuit

Pin name	I/O	Description
XTAL	Output	These pins are used to connect a ceramic resonator or crystal resonator. The EXTAL pin can also be used to input an external clock. For details, see section 8.3.2. External Clock Input .
EXTAL	Input	
XCIN	Input	These pins are used to connect a 32.768-kHz crystal resonator
XCOU	Output	
TCK/SWCLK	Input	This pin is used to input the clock for the JTAG/SWD
CLKOUT	Output	This pin is used to output the CLKOUT/BUZZER clock

8.2 Register Descriptions

In this section, OFS1 represents the OFS1, OFS_SEC, and OFS_SEL registers. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

8.2.1 CGFSAR : Clock Generation Function Security Attribute Register

Base address: SYSC = 0x4001_E000

18	—	This bit is read as 1. The write value should be 1.	R/W
19	—	This bit is read as 1. The write value should be 1.	R/W
20	—	This bit is read as 1. The write value should be 1.	R/W
31:21	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. It is recommended that these bits are configured as Non-secure when the device life cycle is NSECSD (DLMMON.DLMMON[3:0] = 0011b). See [section 42.6.1. Restrictions on setting the security attribution](#) for the details.

CGFSAR register controls the secure attribute of Clock Generation Function registers.

NONSEC00 bit (Non-secure Attribute bit 00)

This bit controls the security attribute of SCKDIVCR, SCKSCR.

NONSEC02 bit (Non-secure Attribute bit 02)

This bit controls the security attribute of HOCOCR, HOCOCR2, FLLCR1, FLLCR2, HOCOUTCR.

NONSEC03 bit (Non-secure Attribute bit 03)

This bit controls the security attribute of MOCOCR, MOCOUTCR.

NONSEC04 bit (Non-secure Attribute bit 04)

This bit controls the security attribute of LOCOCR, LOCOUTCR.

NONSEC05 bit (Non-secure Attribute bit 05)

This bit controls the security attribute of MOSCCR, MOSCWTCR, MOMCR.

NONSEC06 bit (Non-secure Attribute bit 06)

This bit controls the security attribute of OSTDCR, OSTDSR.

NONSEC07 bit (Non-secure Attribute bit 07)

This bit controls the security attribute of SOSCCR, SOMCR.

NONSEC08 bit (Non-secure Attribute bit 08)

This bit controls the security attribute of PLLCCR, PLLCR.

NONSEC09 bit (Non-secure Attribute bit 09)

This bit controls the security attribute of PLL2CCR, PLL2CR.

NONSEC11 bit (Non-secure Attribute bit 11)

This bit controls the security attribute of CKOCR.

NONSEC16 bit (Non-secure Attribute bit 16)

This bit controls the security attribute of USBCKDIVCR, USBCKCR.

8.2.2 SCKDIVCR : System Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x020

31	—	This bit is read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. The following relation is required between the frequencies of the system clock (ICK) and the FlashIF clock (FCLK).
 ICLK:FCLK=N:1 (N: integer)

Note 2. The following relation is required between the frequencies of the system clock (ICK) and the peripheral module clocks (PCLKA, PCLKB)
 ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)

- Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD):
 $ICLK:PCLKC,PCLKD = N:1or1:N$ (N: integer)
- Note 4. Selecting the division-by-1 to ICLK is prohibited when SCKSCR.CKSEL[2:0] bits select the system clock source faster than 100 MHz.
- Note 5. The frequency of the system clock (ICLK) is limited to the flash wait cycle register (FLWT). See [section 40, Flash Memory](#).

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD), FlashIF clock (FCLK).

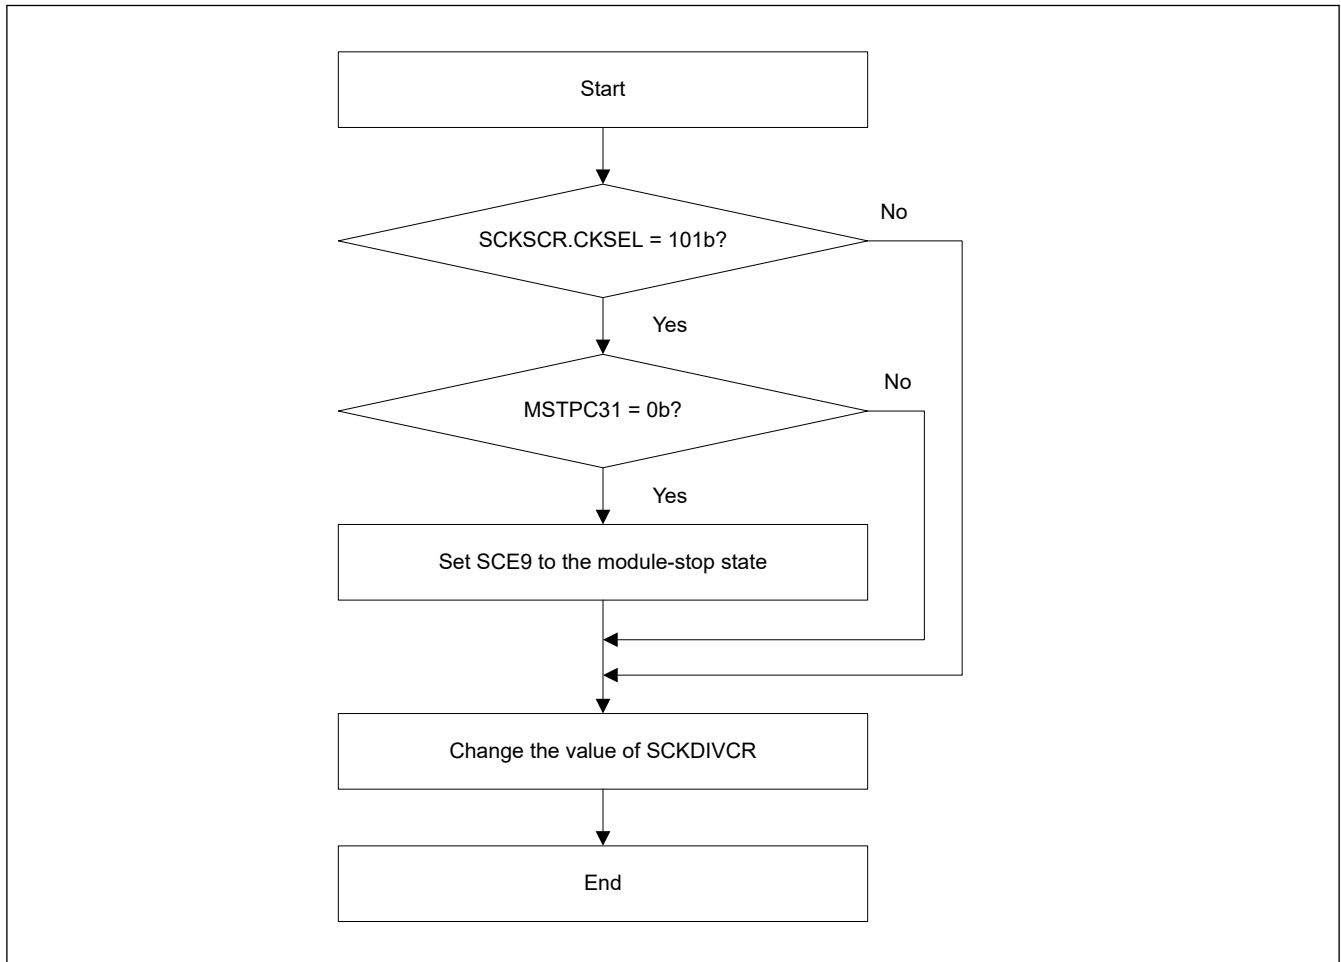

Figure 8.2 Example flow for changing the value of SCKDIVCR

8.2.3 SCKSCR : System Clock Source Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x026

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CKSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	CKSEL[2:0]	Clock Source Select 0 0 0: HOCO 0 0 1: MOCO 0 1 0: LOCO 0 1 1: Main clock oscillator (MOSC) 1 0 0: Sub-clock oscillator (SOSC) 1 0 1: PLL 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The SCKSCR register selects the clock source for the system clock.

CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

The bits select from one of the following sources:

- Low-speed on-chip oscillator (LOCO)
- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)
- Sub-clock oscillator (SOSC)
- PLL

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

Check the operation state of clock sources in each product operating mode, and do not select the clock source to be stopped in SCKSCR. The clock sources should be switched when there are no occurring internal asynchronous interrupt. For details, see [section 10, Low Power Modes](#).

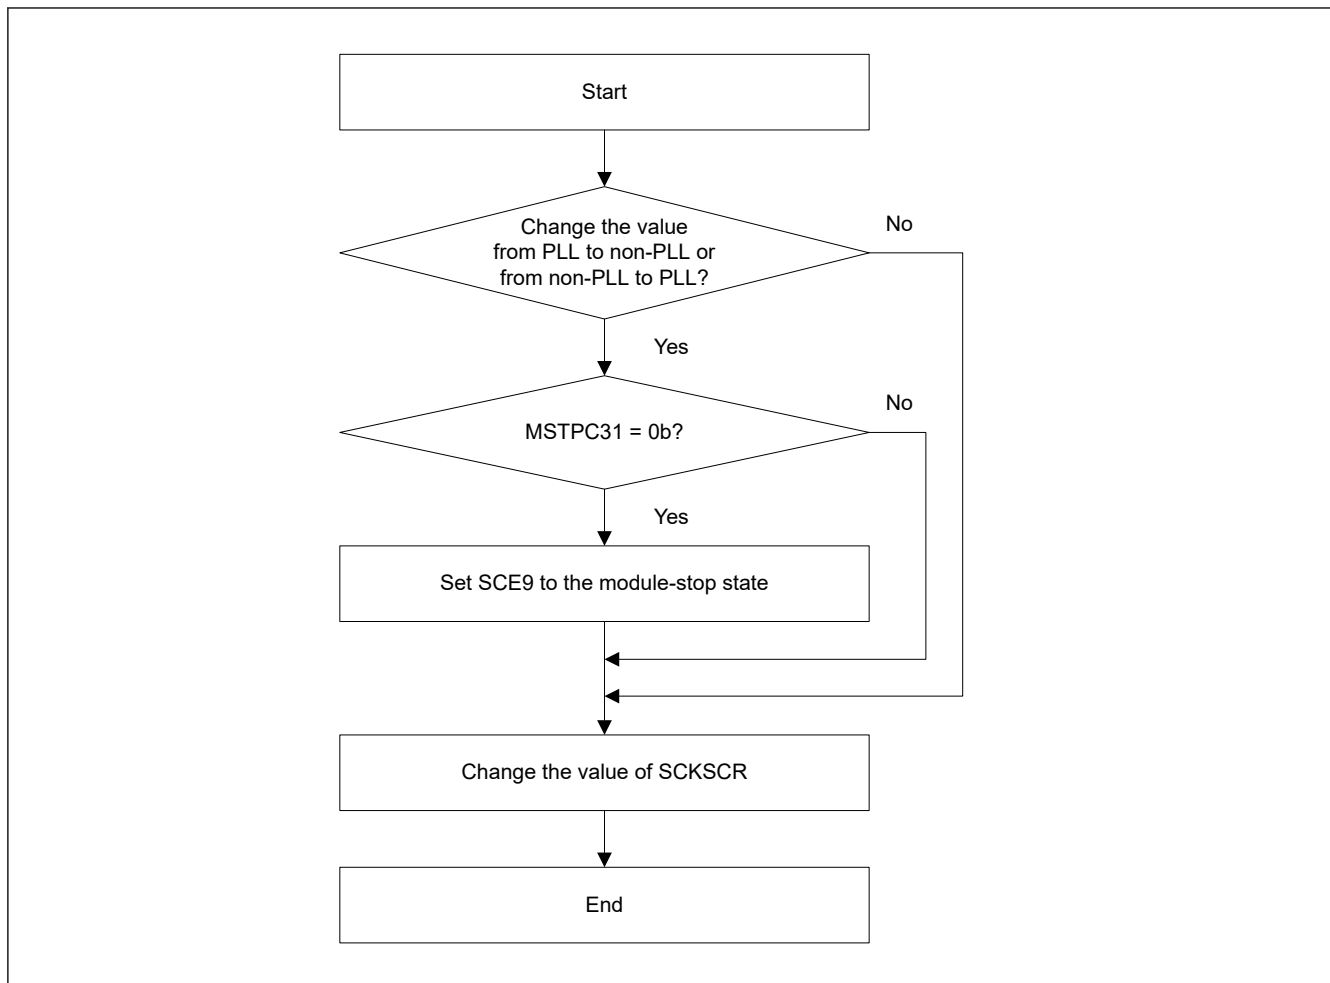

Figure 8.3 Example flow for changing the value of SCKSCR

8.2.4 PLLCCR : PLL Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x028

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	PLLMUL[5:0]					—	—	—	PLSR CSEL	—	—	PLIDIV[1:0]		
Value after reset:	0	0	0	1	0	0	1	1	0	0	0	0	0	0	0	0

4	PLSRCSEL	PLL Clock Source Select 0: Main clock oscillator 1: HOCO ^{*3}	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
13:8	PLLMUL[5:0]*2	PLL Frequency Multiplication Factor Select 0x13: × 10.0 (value after reset) 0x14: × 10.5 0x15: × 11.0 ⋮ 0x1C: × 14.5 0x1D: × 15.0 0x1E: × 15.5 ⋮ 0x3A: × 29.5 0x3B: × 30.0 Others: Setting prohibited.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PLIDIV[1:0] should be set so that the frequency of PLL input signal is within the range of [section 8.1. Overview](#).

Note 2. PLLMUL[5:0] should be set so that the frequency of PLL output signal is within the range of [section 8.1. Overview](#).

Note 3. The FLL function must be enabled when using USBCLK.

The PLLCCR register sets the operation of the PLL circuit.

Writing to the PLLCCR is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL operates).

PLIDIV[1:0] bits (PLL Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL clock source.

PLSRCSEL bit (PLL Clock Source Select)

This bit selects the clock source for the PLL.

PLLMUL[5:0] bits (PLL Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL circuit.

8.2.5 PLLCR : PLL Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x02A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLLSTP

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
0	PLLSTP	PLL Stop Control 0: PLL is operating 1: PLL is stopped.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL circuit.

PLLSTP bit (PLL Stop Control)

This bit runs or stops the PLL circuit.

If the main clock oscillator is to be selected as the clock source for the PLL by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL, only use the PLL clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL operation. A fixed time is also required for oscillation to stop after stopping the PLL operation. Additionally, apply the following limitations when starting and stopping the PLL operation by the PLLSTP bit:

- After stopping the PLL, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL.
- Confirm that the PLL is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL.
- Regardless of whether the PLL clock is selected as the system clock, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL source clock = HOCO: HOCOCCR.HCSTP = 0 (HOCO is enabled).

8.2.6 PLL2CCR : PLL2 Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x048

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	PLL2MUL[5:0]					—	—	—	PL2SRCSEL	—	—	PL2IDIV[1:0]		
Value after reset:	0	0	0	1	0	0	1	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PL2IDIV[1:0] ^{*1}	PLL2 Input Frequency Division Ratio Select 0 0: /1 (value after reset) 0 1: /2 1 0: /3 Others: Setting prohibited.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PL2SRCSEL	PLL2 Clock Source Select 0: Main clock oscillator 1: HOCO ^{*3}	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
13:8	PLL2MUL[5:0] ^{*2}	PLL2 Frequency Multiplication Factor Select 0x13: × 10.0 (value after reset) 0x14: × 10.5 0x15: × 11.0 ⋮ 0x1C: × 14.5 0x1D: × 15.0 0x1E: × 15.5 ⋮ 0x3A: × 29.5 0x3B: × 30.0 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PL2IDIV[1:0] should be set so that the frequency of PLL2 input signal is within the range of [section 8.1. Overview](#).

Note 2. PLL2MUL[5:0] should be set so that the frequency of PLL2 output signal is within the range of [section 8.1. Overview](#).

Note 3. The FLL function must be enabled when using USBCLK.

The PLL2CCR register sets the operation of the PLL2 circuit.

Writing to the PLL2CCR register is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

PL2IDIV[1:0] bits (PLL2 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL2 clock source.

PL2SRCSEL bit (PLL2 Clock Source Select)

This bit selects the clock source for the PLL2.

PLL2MUL[5:0] bits (PLL2 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL2 circuit.

8.2.7 PLL2CR : PLL2 Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x04A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLL2S TP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLL2STP	PLL2 Stop Control 0: PLL2 is operating 1: PLL2 is stopped.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLL2CR register controls the operation of the PLL2 circuit.

PLL2STP bit (PLL2 Stop Control)

This bit runs or stops the PLL2 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL2 by the PLL2CCR.PL2SRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLL2STP bit setting is changed to run the PLL2, only use the PLL2 clock after confirming that the OSCSF.PLL2SF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL2 operation. A fixed time is also required for oscillation to stop after stopping the PLL2 operation. Additionally, apply the following limitations when starting and stopping the PLL2 operation by the PLL2STP bit:

- After stopping the PLL2, confirm that the OSCSF.PLL2SF bit is 0 before restarting the PLL2.
- Confirm that the PLL2 is operating and that the OSCSF.PLL2SF bit is 1 before stopping the PLL2.

- Confirm that the OSCSF.PLL2SF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL2.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL2, confirm that the OSCSF.PLL2SF bit is cleared to 0 before executing a WFI instruction.

Confirm the following conditions before writing 0 to PLL2STP:

- When the PLL2 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When the PLL2 source clock = HOCO: HOCOCCR.HCSTP = 0 (HOCO is enabled).

8.2.8 MOSCCR : Main Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x032

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	MOSTP	Main Clock Oscillator Stop 0: Operate the main clock oscillator*1 1: Stop the main clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the main clock oscillator.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL is operating)
- PLL2CCR.PL2SRCSEL = 0 (PLL2 source clock = MOSC) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

8.2.9 SOSCCR : Sub-Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x480

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SOSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SOSTP	Sub Clock Oscillator Stop 0: Operate the sub-clock oscillator*1 1: Stop the sub-clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

SOSTP bit (Sub Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit to check that the value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

The following restrictions apply when starting and stopping the operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- After setting the SOSTP bit to 0, use the sub-clock only after the sub-clock oscillation stabilization time (t_{SUBOSCWT}) has elapsed.
- Regardless of whether the sub-clock oscillator is selected as the system clock, confirm that the sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

8.2.10 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x490

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCSTP	LOCO Stop 0: Operate the LOCO clock 1: Stop the LOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The LOCOCR register controls the LOCO clock.

LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

After setting the LCSTP bit to 0 to start the LOCO clock, only use the clock after the LOCO clock-oscillation stabilization wait time (t_{LOCOWT}) elapses. A fixed stabilization wait time is required after setting the LOCO clock to start operation. A fixed wait time is also required after setting the LOCO clock to stop.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, allow a stop interval of at least 5 LOCO clock cycles before restarting it
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Regardless of whether the LOCO is selected as the system clock, confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the LOCO clock, wait for at least 3 LOCO cycles before executing the WFI instruction.

Writing 1 to LCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 010b (system clock source = LOCO).

Because the LOCO clock measures the wait time for other oscillators, it continues to oscillate while measuring this time, regardless of the setting in LOCOCR.LCSTP. As a result, the LOCO clock might be unintentionally supplied even when the LCSTP is set to stop.

8.2.11 HOCOCCR : High-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x036

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HCSTP
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Function	R/W
0	HCSTP	HOCO Stop 0: Operate the HOCO clock *2 *3 1: Stop the HOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The HCSTP bit value after a reset is 0 when the OFS1.HOCOEN bit is 0. It is 1 when the OFS1.HOCOEN bit is 1.

Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1.HOCOFREQ[1:0] bit to an optimum value.

Note 3. The value of OFS1.HOCOFREQ[1:0] bits is automatically transferred to HOCO2.HCFREQ[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCO2.HCFREQ[1:0] bits.

The HOCO2 register controls the HOCO clock.

HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock, confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock.
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock.
- Regardless of whether the HOCO clock is selected as the system clock, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after setting HOCO operation with the HCSTP bit.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO).
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL is operating)
- PLL2CCR.PL2SRCSEL = 1 (PLL2 source clock = HOCO) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

8.2.12 HOCO2 : High-Speed On-Chip Oscillator Control Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x037

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	HCFREQ[1:0]	

Value after reset: 0 0 0 0 0 0 0 0/1*1 0/1*1

Bit	Symbol	Function	R/W
1:0	HCFRQ0[1:0]	HOCO Frequency Setting 0 0 0: 16 MHz 0 1: 18 MHz 1 0: 20 MHz 1 1: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Value after reset of the HCFRQ0[1:0] bits depend on OFS1.HOCOFRQ0[1:0] bits.

The HOCOCCR2 register controls the HOCO clock. Writing to the HOCOCCR2 is prohibited when the HOCOCCR.HCSTP bit is 0 (the HOCO operates).

8.2.13 MOCOCCR : Middle-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x038

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MCSTP

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	MCSTP	MOCO Stop 0: MOCO clock is operating 1: MOCO clock is stopped	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The MOCOCCR register controls the MOCO clock.

MCSTP bit (MOCO Stop)

The MCSTP bit starts or stops the MOCO clock.

After setting MCSTP to 0, use the MOCO clock only after the MOCO clock oscillation stabilization time (t_{MOCOWT}) elapses. A fixed stabilization wait time is required after setting the MOCO clock to start operation. A fixed wait time is also required for oscillation to stop after setting the MOCO clock to stop operation.

The following restrictions apply when starting and stopping the oscillator:

- After stopping the MOCO clock, allow a stop interval of at least 5 MOCO clock cycles before restarting it
- Confirm that MOCO clock oscillation is stable before stopping the MOCO clock
- Regardless of whether the MOCO clock is selected as the system clock, confirm that MOCO clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the MOCO clock, wait for at least 3 MOCO clock cycles before executing the WFI instruction.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).

Writing 1 to the MCSTP bit (stopping the MOCO) is prohibited if oscillation stop detection is enabled in the Oscillation Stop Detection Control Register (OSTDCR.OSTDE).

8.2.14 FLLCR1 : FLL Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x039

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FLEN

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	FLEN	FLL Enable 0: FLL function is disabled 1: FLL function is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: HOCO must be stopped (HOCO.CR.HCSTP = 1) before FLLCR1.FLEN is modified.

Note: SOSC must be operating with stabilization while FLL is enabled (FLLCR1.FLEN = 1).

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The FLLCR1 register controls the FLL function of the HOCO.

FLEN bit (FLL Enable)

This bit enables or disables the FLL function of the HOCO.

If FLL is enabled, the frequency accuracy is guaranteed after FLL is stabilized. The FLL stabilization can be checked by the CAC frequency measurement, but it must be executed after HOCO stabilization.

In addition, you must disable FLL by setting the FLEN bit to 0 before transitioning to Software Standby mode.

Table 8.4 show an example flow of the FLL setting for each case.

Table 8.4 FLL setting flow (1 of 2)

Step	Operation
After reset release/ Deep Software Standby cancellation	1 Start (After reset release / Deep Software Standby cancellation)
	2 FLL setting (FLLCR2.FLLCNTL)
	3 Enable FLL (FLLCR1.FLEN = 1) Note: SOSC must be running with the oscillation stabilization.
	4 Enable HOCO (HOCO.CR.HCSTP = 0)
	5 Wait for the FLL stabilization (t_{FLLWT})
	6 Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	7 End (HOCO can be used.)

Table 8.4 FLL setting flow (2 of 2)

Step	Operation
Software standby transition/ cancellation	1 Start (FLL is being used.)
	2 Stop HOCO (HOCOCCR.HCSTP = 1) Note: If HOCO is used as the system clock or the PLL reference clock, these clock source must be changed to another clock before HOCO is stopped.
	3 Disable FLL (FLLCR1.FLLEN = 0)
	4 WFI instruction
	5 Software standby mode
	6 Software standby cancellation
	7 Enable FLL (FLLCR1.FLLEN = 1)
	8 Enable HOCO (HOCOCCR.HCSTP = 0)
	9 Wait for the FLL stabilization (t_{FLLWT})
	10 Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	11 End (HOCO can be used.)

8.2.15 FLLCR2 : FLL Control Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x03A

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field: — — — — — FLLCNTL[10:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
10:0	FLLCNTL[10:0]	FLL Multiplication Control When OFS1.HOCOFRQ0[1:0] ^{*1} is 00b (16 MHz), these bits must be set to 0x1E9. When OFS1.HOCOFRQ0[1:0] ^{*1} is 01b (18 MHz), these bits must be set to 0x226. When OFS1.HOCOFRQ0[1:0] ^{*1} is 10b (20 MHz), these bits must be set to 0x263. Other settings are prohibited.	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCCR2.HCFRQ0[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCCR2.HCFRQ0[1:0] bits.

The FLLCR2 register controls the FLL function of the HOCO.

FLLCNTL[10:0] bits (FLL Multiplication Control)

These bits select the multiplication ratio of the FLL reference clock.

These bits must be set before FLL is enabled (FLLCR1.FLLEN = 1).

8.2.16 OSCSF : Oscillation Stabilization Flag Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PLL2SF	PLLSF	—	MOSCSF	—	—	HOCOSF
Value after reset:	0	0	0	0	0	0	0	0/1 ^{*1}

Bit	Symbol	Function	R/W
0	HOCOSF	HOCO Clock Oscillation Stabilization Flag 0: The HOCO clock is stopped or is not yet stable 1: The HOCO clock is stable, so is available for use as the system clock	R
2:1	—	These bits are read as 0.	R
3	MOSCSF	Main Clock Oscillation Stabilization Flag 0: The main clock oscillator is stopped (MOSTP = 1) or is not yet stable ^{*2} 1: The main clock oscillator is stable, so is available for use as the system clock	R
4	—	This bit is read as 0.	R
5	PLLSF	PLL Clock Oscillation Stabilization Flag 0: The PLL clock is stopped, or oscillation of the PLL clock is not stable yet 1: The PLL clock is stable, so is available for use as the system clock	R
6	PLL2SF	PLL2 Clock Oscillation Stabilization Flag 0: The PLL2 clock is stopped, or oscillation of the PLL2 clock is not stable yet 1: The PLL2 clock is stable	R
7	—	These bits are read as 0.	R

Note 1. The value after reset depends on the OFS1.HOCOEN setting.

When OFS1.HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.

When OFS1.HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags to indicate the operating status of the counters in the oscillation stabilization wait circuits for the individual oscillators. After oscillation starts, these counters measure the wait time until each oscillator output clock is supplied to the internal circuits. An overflow of a counter indicates that the clock supply is stable and available for the associated circuit.

HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- When the HOCO clock is stopped and the HOCOCR.HCSTP bit is set to 0, and then the HOCO oscillation stabilization time is counted by the LOCO clock and supply of the HOCO clock within the MCU is started. For the HOCO oscillation stabilization time, see [section 43, Electrical Characteristics](#).

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of LOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

PLLSF flag (PLL Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the operating state of the counter that measures the wait time of the PLL.

[Setting condition]

- When the PLL is stopped and the PLLCR.PLLSTP bit is set to 0, and then the PLL oscillation stabilization time is counted by the LOCO clock and supply of the PLL clock within the MCU is started. If oscillation by the PLL clock source is not stable when the PLLCR.PLLSTP bit is set to 0, counting of the LOCO cycles continues even after the PLL clock source oscillation is stabilized. For the PLL oscillation stabilization time, see [section 43, Electrical Characteristics](#).

[Clearing condition]

- When the PLL is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

PLL2SF flag (PLL2 Clock Oscillation Stabilization Flag)

The PLL2SF flag indicates the operating state of the counter that measures the wait time of the PLL2.

[Setting condition]

- When the PLL2 is stopped and the PLL2CR.PLL2STP bit is set to 0, and then the PLL2 oscillation stabilization time is counted by the LOCO clock and supply of the PLL2 clock within the MCU is started. If oscillation by the PLL2 clock source is not stable when the PLL2CR.PLL2STP bit is set to 0, counting of the LOCO cycles continues even after the PLL2 clock source oscillation is stabilized. For the PLL2 oscillation stabilization time, see [section 43, Electrical Characteristics](#).

[Clearing condition]

- When the PLL2 is operating and then is deactivated because the PLL2CR.PLL2STP bit is set to 1.

8.2.17 OSTDCR : Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x040

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OSTD E	—	—	—	—	—	—	OSTD E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDIE	Oscillation Stop Detection Interrupt Enable 0: Disable oscillation stop detection interrupt (do not notify the POEG) 1: Enable oscillation stop detection interrupt (notify the POEG)	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	OSTDE	Oscillation Stop Detection Function Enable 0: Disable oscillation stop detection function 1: Enable oscillation stop detection function	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The OSTDCR register controls the oscillation stop detection function.

OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The OSTDE bit must be set to 0 before transitioning to Software Standby or Deep Software Standby mode. To transition to Software Standby or Deep Software Standby mode, first set the OSTDE bit to 0, then execute the WFI instruction.

The following restrictions apply when using the oscillation stop detection function:

In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, PCLKA, PCLKB, PCLKC, and PCLKD is prohibited.

8.2.18 OSTDSR : Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x041

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OSTDF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDF	Oscillation Stop Detection Flag 0: Main clock oscillation stop not detected 1: Main clock oscillation stop detected	R/W ¹
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).

- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL)

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

When writing 0 after reading 1. However, it will not be 0 under the following conditions.

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source =PLL).

8.2.19 MOSCWTCR : Main Clock Oscillator Wait Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0A2

Bit	Symbol	Function	R/W
3:0	MSTS[3:0]	Main Clock Oscillator Wait Time Setting 0x0: Wait time = 3 cycles (11.4 μs) 0x1: Wait time = 35 cycles (133.5 μs) 0x2: Wait time = 67 cycles (255.6 μs) 0x3: Wait time = 131 cycles (499.7 μs) 0x4: Wait time = 259 cycles (988.0 μs) 0x5: Wait time = 547 cycles (2086.6 μs) 0x6: Wait time = 1059 cycles (4039.8 μs) 0x7: Wait time = 2147 cycles (8190.2 μs) 0x8: Wait time = 4291 cycles (16368.9 μs) 0x9: Wait time = 8163 cycles (31139.4 μs) Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.

Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.

The wait time set in these bits is counted using: 1 cycle (μs) = 1/(f_{LOCO}[MHz] × 8) = 1/(0.032768 × 8) = 3.81 (μs) (min.) The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCO.LCSTP bit. After the specified wait time elapses, supply of the main clock starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

8.2.20 MOMCR : Main Clock Oscillator Mode Oscillation Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x413

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	MOSEL	MODRV[1:0]	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
5:4	MODRV[1:0]	Main Clock Oscillator Drive Capability 0 Switching 0 0: 20 MHz to 24 MHz 0 1: 16 MHz to 20 MHz 1 0: 8 MHz to 16 MHz 1 1: 8 MHz	R/W
6	MOSEL	Main Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the pin is set as a port.

Note: The MOSCCR.MOSTP bit must be 1 (MOSC is stopped) before changing this register.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MODRV[1:0] bits (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV[1:0] bit switches the drive capability of the main clock oscillator.

MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

8.2.21 SOMCR : Sub-Clock Oscillator Mode Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x481

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SODRV	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	These bits are read as 0. The write value should be 0.	R/W
1	SODRV	Sub-Clock Oscillator Drive Capability Switching 0: Standard 1: Low	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The SOMCR register must be modified when SOSCCR.SOSTP is 1 (SOSC is stopped).

SODRV bits (Sub-Clock Oscillator Drive Capability Switching)

The SODRV bits switch the drive capability of the sub-clock oscillator. SODRV is undefined at the first Power up, but value after reset of SOSCCR.SOSTP is 0 (SOSC is operated). And therefore, please set the SOSC as follows when the first Power up:

1. Set the SOSCCR.SOSTP to 1 (SOSC is stopped)
2. Set this bit to a value corresponding to the using capacitor.
3. Clear the SOSCCR.SOSTP to 0 (SOSC is operated)

8.2.22 CKOCR : Clock Out Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CKOE N	CKODIV[2:0]			—	CKOSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CKOSEL[2:0]	Clock Out Source Select 0 0 0: HOCO (value after reset) 0 0 1: MOCO 0 1 0: LOCO 0 1 1: MOSC 1 0 0: SOSC 1 0 1: Setting prohibited Others: Setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	CKODIV[2:0]	Clock Output Frequency Division Ratio 0 0 0: × 1/1 0 0 1: × 1/2 0 1 0: × 1/4 0 1 1: × 1/8 1 0 0: × 1/16 1 0 1: × 1/32 1 1 0: × 1/64 1 1 1: × 1/128	R/W
7	CKOEN	Clock Out Enable 0: Disable clock out 1: Enable clock out	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear this bit before entering Software Standby or Deep Software Standby mode if the selecting clock out source clock is stopped in that mode.

8.2.23 LOCOUTCR : LOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x492

Bit	Symbol	Function	R/W
7:0	LOCOUTRM[7:0]	LOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The LOCOUTCR register is added to the original LOCO trimming data.

MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range. When LOCOUTCR is modified, the frequency stabilization time corresponds to the frequency stabilization time at the start of MCU operation.

Changing LOCOUTCR during RTC operation is prohibited.

8.2.24 MOCOUTCR : MOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x061

Bit	Symbol	Function	R/W
7:0	MOCOUTRM[7:0]	MOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOCOUTCR register is added to the original MOCO trimming data.

MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range. When MOCOUTCR is modified, the frequency stabilization wait time corresponds to the frequency stabilization wait time at the start of the MCU operation.

8.2.25 HOCOUTCR : HOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x062

Bit	Symbol	Function	R/W
7:0	HOCOUTRM[7:0]	HOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The HOCOUTCR register is added to the original HOCO trimming data.

MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range. When HOCOUTCR is modified, the frequency stabilization wait time corresponds to the frequency stabilization wait time at the start of the MCU operation.

These bits must be 0x00 when FLL is enabled (FLLCR1.FLLEN = 1).

8.2.26 USBCKDIVCR : USB Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x06C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	USBCKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	USBCKDIV[2:0]	USB Clock (USBCLK) Division Select 0 1 0: /4 1 0 1: /3 1 1 0: /5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKDIVCR register controls the USB clock.

USBCKDIV[2:0] bits (USB Clock (USBCLK) Division Select)

These bits select the frequency of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

When switching the division ratio setting from n ($n \neq 1$), set all of MSTPCRB.MSTPBi ($i = 11$) = 1 before setting USBCKCR.USBCKSREQ = 1.

8.2.27 USBCKCR : USB Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x074

Bit position:	7	6	5	4	3	2	1	0
Bit field:	USBC KSRD Y	USBC KSRE Q	—	—	—	USBCKSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	USBCKSEL[2:0]	USB Clock (USBCLK) Source Select 1 0 1: PLL 1 1 0: PLL2 Others: Setting prohibited.	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	USBCKSREQ	USB Clock (USBCLK) Switching Request 0: No request 1: Request switching.	R/W
7	USBCKSRDY	USB Clock (USBCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKCR register controls the USB clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[2:0], use the following procedure:

1. Write 1 to all of MSTPCR.MSTPBi ($i = 11$) (only when switching the division ratio setting from n ($n \neq 1$) to m ($m \neq 1$))
2. Wait for two USBCLK (only when switching the division ratio setting from n ($n \neq 1$) to m ($m \neq 1$))
3. Write 1 to USBCKSREQ.
4. Poll until USBCKSRDY is read as 1. While $USBCKSRDY = 1$, no clock is output to USBCLK.
5. Write to USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[2:0].
6. Write 0 to USBCKSREQ.
7. Poll until USBCKSRDY is read as 0.
8. When USBCKSRDY becomes 0, USBCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when $USBCKSREQ = 1$ and $USBCKSRDY = 0$, or when $USBCKSREQ = 0$ and $USBCKSRDY = 1$.

USBCKSEL[2:0] bits (USB Clock (USBCLK) Source Select)

These bits select the clock source of the USB clock (USBCLK) and must be modified when $USBCKCR.USBCKSRDY = 1$.

USBCKSREQ bit (USB Clock (USBCLK) Switching Request)

This bit selects the USBCLK switching request.

USBCKSRDY flag (USB Clock (USBCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the USBCLK. When $USBCKSRDY = 1$, no clock is output to USBCLK.

8.2.28 TRCKCR : Trace Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TRCK EN	—	—	—	TRCK[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	TRCK[3:0]	Trace Clock operating frequency select 0x0: /1 0x1: /2 (value after reset) 0x2: /4 Others: Setting prohibited	R/W
6:4	—	These bits are read as 0. The write value should be 0.	R/W
7	TRCKEN	Trace Clock operating Enable 0: Stop 1: Operation enable	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Trace Clock Control Register controls switching the trace clock.

TRCKCR can be written only when the debugger is connected ($DBGSTR.CDBGPWRUPREQ = 1$).

When the debugger is not connected, it is not necessary to change TRCK[3:0] even if the TRCLK frequency is higher than the maximum value of the specification.

Change the TRCLK frequency in the state of TRCKEN = 0.

Factor of the initialization of TRCKCR register is all resets.

This register is occupied by the debug tool during debugging.

8.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

8.3.1 Connecting a Crystal Resonator

Figure 8.4 shows an example of connecting a crystal resonator. A damping resistor (R_d) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (R_f), insert an R_f between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 8.1.

Figure 8.4 Example of crystal resonator connection

Figure 8.5 shows an equivalent circuit of the crystal resonator.

Figure 8.5 Equivalent circuit of the crystal resonator

8.3.2 External Clock Input

Figure 8.6 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

Figure 8.6 Equivalent circuit for external clock

8.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.

8.4 Sub-Clock Oscillator

The only way of supplying a clock signal to the sub-clock oscillator is by connecting a crystal oscillator.

8.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in [Figure 8.7](#). A damping resistor (R_d) can be added, if necessary. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the resonator manufacturer recommends the use of an external feedback resistor (R_f), insert an R_f between XCIN and XCOUT by following the instructions. When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in [Table 8.1](#).

Figure 8.7 Connection example of 32.768-kHz crystal resonator

[Figure 8.8](#) shows an equivalent circuit for the 32.768-kHz crystal resonator.

Figure 8.8 Equivalent circuit for the 32.768-kHz crystal resonator

8.4.2 Pin Handling When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOU pin open as shown in Figure 8.9. In addition, if an oscillator is not connected, set the Sub-Clock Oscillator Stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

Figure 8.9 Pin handling when the sub-clock oscillator is not used

8.5 Oscillation Stop Detection Function

8.5.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL), PLL clock remains the system clock source. However, the frequency becomes a free-running oscillation frequency.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to a high-impedance state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See [section 43, Electrical Characteristics](#).

Switching between the main clock oscillator and the MOCO clock or between the PLL clock and PLL free-running clock is controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
 - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
 - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.

- When `PLLCCR.PLSRCSEL = 0` (PLL source clock = MOSC) and `SCKSCR.CKSEL[2:0] = 101b` (System clock source = PLL):
 - When `OSTDF` changes 0 to 1, the clock source switches to the PLL free-running oscillation clock.
 - When `OSTDF` changes 1 to 0, the clock source switches back to PLL.

To switch the clock source to the main clock or PLL clock again after the oscillation stop detection, set the `CKSEL[2:0]` bits to a clock source other than the main clock or PLL clock and clear the `OSTDF` flag to 0. Also, check that the `OSTDF` flag is not 1, then set the `CKSEL[2:0]` bits to the main clock or PLL clock after the specified oscillation stabilization time elapses.

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (`OSTDCR.OSTDE`) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause. Therefore, the oscillation stop detection function must be disabled before the main clock oscillator is stopped by software or a transition is made to Software Standby or Deep Software Standby mode.

The oscillation stop detection function switches all clocks that can be selected as the MOSC clock except `CLKOUT` to the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL).

The system clock (`ICLK`) frequency during the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits (`SCKDIVCR.ICK[2:0]`)

Figure 8.10 Flow of recovery on detection of oscillator stop

8.5.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

8.6 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

8.7 Internal Clock

Clock sources for the internal clock signals include:

- Main clock
- Sub-clock
- HOCO clock
- MOCO clock
- LOCO clock
- PLL clock
- PLL2 clock
- IWDT-dedicated clock
- JTAG clock

The following internal clocks are produced from these sources.

- Operating clock of the CPU, DMAC, DTC, Flash, and RAM: System clock (ICLK)
- Operating clocks of peripheral modules: Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD)
- Operating clock of the FlashIF: FlashIF clock (FCLK)
- Operating clock for the USBFS clock (USBCLK)
- Operating clock for the CAN: CAN clock (CANMCLK)
- Operating clocks for the CAC: CAC clock (CACCLK)
- Operating clock for the RTC: RTC-dedicated LOCO clock (RTCLCLK)
- Operating clock for the RTC: RTC-dedicated sub clock (RTCSCLK)
- Operating clock for the IWDT: IWDT-dedicated clock (IWDTCLK)
- Operating clock for the AGT: AGT-dedicated LOCO clock (AGTLCLK)
- Operating clock for the AGT: AGT-dedicated sub clock (AGTSCLK)
- Operating clock for the SysTick Timer: SysTick Timer-dedicated clock (SYSTICCLK)
- Clock for external pin output: Clock/Buzzer output clock (CLKOUT)
- Operating clock for the JTAG: JTAG clock (JTAGTCK)

For details on the registers used to set the frequencies of the internal clocks, see [section 8.7.1. System Clock \(ICLK\)](#) to [section 8.7.12. JTAG Clock \(JTAGTCK\)](#)

If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

8.7.1 System Clock (ICLK)

The system clock (ICLK) is the operating clock of the CPU, DMAC, DTC, Flash, and SRAM.

The ICLK frequency is specified by the ICK[2:0] bits in SCKDIVCR, the CKSEL[2:0] bits in SCKSCR, the PLLMUL[5:0] bits and PLIDIV[1:0] bits in PLLCCR, and the HOCOFREQ[1:0] bits in OFS1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFREQ[1:0] bits is automatically transferred to HOCOCR2.HCFREQ[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFREQ[1:0] bits.

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See Figure 8.11 and Figure 8.12.

Figure 8.11 Block diagram of clock source selector

Figure 8.12 Timing of clock source switching

8.7.2 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD)

The peripheral module clocks (PCLKA, PCLKB, PCLKC and PCLKD) are the operating clocks for the peripheral modules.

The frequency of the given clock is specified in the following bits:

- PCKA[2:0], PCKB[2:0], PCKC[2:0] and PCKD[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ0[1:0] bits in OFS1*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits.

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See [Figure 8.11](#) and [Figure 8.12](#).

8.7.3 FlashIF Clock (FCLK)

The flash interface clock (FCLK) is the operating clock for the flash memory interface. In addition to reading from the data flash, FCLK is used for the programming and erasure of the code flash and data flash.

The FCLK frequency is specified in the following bits:

- FCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ0[1:0] bits in OFS1*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits.

8.7.4 USB Clock (USBCLK)

The USB clock (USBCLK) is the operating clock for the USBFS module.

A 48-MHz clock must be supplied to the USB module. When the USB module is used, setting must be made so that USBCLK is 48 MHz.

The USBCLK frequency is specified in the following bits:

- USBCKSEL[2:0] bits in USBCKCR
- USBCKDIV[2:0] bits in USBCKDIVCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR

8.7.5 CAN Clock (CANMCLK)

The CAN clock (CANMCLK) is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

8.7.6 CAC Clock (CACCLK)

The CAC clock (CACCLK) is the operating clock for the CAC. CACCLK is generated by the following oscillators:

- Main clock oscillator
- Sub-clock oscillator
- High-speed clock oscillator (HOCO)
- Middle-speed clock oscillator (MOCO)
- Low-speed on-chip oscillator (LOCO)
- IWDT-dedicated on-chip oscillator. (IWDTLOCO)

8.7.7 RTC-Dedicated Clock (RTCSCLK, RTCLCLK)

The RTC-dedicated clock (RTCSCLK, RTCLCLK) is the operating clock for the RTC.

RTCSCLK is generated by the sub-clock oscillator, and RTCLCLK is generated by the LOCO clock.

8.7.8 IWDT-Dedicated Clock (IWDTCLK)

The IWDT-dedicated clock (IWDTCLK) is the operating clock for the IWDT. IWDTCLK is internally generated by the IWDT-dedicated on-chip oscillator.

8.7.9 AGT-Dedicated Clock (AGTSCLK, AGTLCLK)

The AGT-dedicated clocks (AGTSCLK and AGTLCLK) are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator, and AGTLCLK is generated by the LOCO clock.

8.7.10 SysTick Timer-Dedicated Clock (SYSTICCLK)

The SysTick timer-dedicated clock (SYSTICCLK) is the operating clock for the SysTick timer. SYSTICCLK is generated by the LOCO clock.

8.7.11 External Pin Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. The CLKOUT is output to the CLKOUT pin when the CKOCR.CKOEN bit is set to 1. Only change the value in the CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR
- HOCOFREQ[1:0] bits in OFS1*¹

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL.

The value of OFS1.HOCOFREQ[1:0] bits is automatically transferred to HOCOCR2.HCFREQ[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFREQ[1:0] bits.

8.7.12 JTAG Clock (JTAGTCK)

The JTAG clock (JTAGTCK) is the clock for the JTAG.

JTAGTCK is generated by the JTAG external clock (TCK).

8.8 Usage Notes

8.8.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR register:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See [section 43, Electrical Characteristics](#).
- The system clock, peripheral module clock must be set according to [Table 8.2](#).

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

8.8.2 Notes on Resonator

Because various resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in [Figure 8.7](#). The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

8.8.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in [Figure 8.13](#) to prevent

electromagnetic induction from interfering with correct oscillation. Figure 8.13 shows the case which the main clock oscillator is used. In case of sub-clock oscillator, it is also same as Figure 8.13.

Figure 8.13 Signal routing in board design for oscillation circuit

8.8.4 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

8.8.5 Notes on Using Sub-Clock Oscillator

The output of the P212 (EXTAL), P213 (XTAL) pins may affect the oscillation by the sub-clock oscillator.

If the sub-clock oscillator is used, implement board design so as not to affect the oscillation. Renesas strongly recommends setting the PmnPFS.DSCR[1:0] bits to 00b or 01b when using the P212 (EXTAL), P213 (XTAL) as output pins and using the sub-clock oscillator.

In addition, when using the sub-clock oscillator in low drive capability (SOMCR.SODRV1 = 1), Renesas recommends setting the PmnPFS.DSCR[1:0] bits to 00b when using the P212 (EXTAL), P213 (XTAL) as output pins and using the sub-clock oscillator.

9. Clock Frequency Accuracy Measurement Circuit (CAC)

9.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

Table 9.1 lists the CAC specifications, Figure 9.1 shows the CAC block diagram, and Table 9.2 lists the CAC I/O pin.

Table 9.1 CAC specifications

Parameter	Specifications
Measurement target clocks	Frequency can be measured for: <ul style="list-style-type: none"> • Main clock oscillator • Sub-clock oscillator • HOCO clock • MOCO clock • LOCO clock • Peripheral module clock B (PCLKB) • IWDT-dedicated clock
Measurement reference clocks	Frequency can be referenced to: <ul style="list-style-type: none"> • External clock input to the CACREF pin • Main clock oscillator • Sub-clock oscillator • HOCO clock • MOCO clock • LOCO clock • Peripheral module clock B (PCLKB) • IWDT-dedicated clock
Selectable function	Digital filter
Interrupt sources	<ul style="list-style-type: none"> • Measurement end • Frequency error • Overflow
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security attribution can be set

Table 9.2 CAC I/O pin

Function	Pin name	I/O	Description
CAC	CACREF	Input	Measurement reference clock input pin

9.2 Register Descriptions

9.2.1 CACR0 : CAC Control Register 0

Base address: CAC = 0x4008_3600

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CFME

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	CFME	Clock Frequency Measurement Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables clock frequency measurement. Changes made to this bit are not immediately reflected to the internal circuit. Read the bit to confirm that the change has been reflected.

9.2.2 CACR1 : CAC Control Register 1

Base address: CAC = 0x4008_3600

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	EDGES[1:0]		TCSS[1:0]		FMCS[2:0]		CACR EFE	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CACREFE	CACREF Pin Input Enable 0: Disable 1: Enable	R/W
3:1	FMCS[2:0]	Measurement Target Clock Select 0 0 0: Main clock oscillator 0 0 1: Sub-clock oscillator 0 1 0: HOCO clock 0 1 1: MOCO clock 1 0 0: LOCO clock 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: IWDG-dedicated clock 1 1 1: Setting prohibited	R/W
5:4	TCSS[1:0]	Timer Count Clock Source Select 0 0: No division 0 1: × 1/4 clock 1 0: × 1/8 clock 1 1: × 1/32 clock	R/W
7:6	EDGES[1:0]	Valid Edge Select 0 0: Rising edge 0 1: Falling edge 1 0: Both rising and falling edges 1 1: Setting prohibited	R/W

Note: Set the CACR1 register when the CACR0.CFME bit is 0.

CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

TCSS[1:0] bits (Timer Count Clock Source Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

9.2.3 CACR2 : CAC Control Register 2

Base address: CAC = 0x4008_3600

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DFS[1:0]		RCDS[1:0]		RSCS[2:0]		RPS	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RPS	Reference Signal Select 0: CACREF pin input 1: Internal clock (internally generated signal)	R/W
3:1	RSCS[2:0]	Measurement Reference Clock Select 0 0 0: Main clock oscillator 0 0 1: Sub-clock oscillator 0 1 0: HOCO clock 0 1 1: MOCO clock 1 0 0: LOCO clock 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: IWDG-dedicated clock 1 1 1: Setting prohibited	R/W
5:4	RCDS[1:0]	Measurement Reference Clock Frequency Division Ratio Select 0 0: × 1/32 clock 0 1: × 1/128 clock 1 0: × 1/1024 clock 1 1: × 1/8192 clock	R/W
7:6	DFS[1:0]	Digital Filter Select 0 0: Disable digital filtering 0 1: Use sampling clock for the digital filter as the frequency measuring clock 1 0: Use sampling clock for the digital filter as the frequency measuring clock divided by 4 1 1: Use sampling clock for the digital filter as the frequency measuring clock divided by 16.	R/W

Note: Set the CACR2 register when the CACR0.CFME bit is 0.

RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency-divisor of the reference clock for measurement when an internal reference clock is selected. When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

DFS[1:0] bits (Digital Filter Select)

The DFS[1:0] bits enable or disable the digital filter and selects its sampling clock.

9.2.4 CAICR : CAC Interrupt Control Register

Base address: CAC = 0x4008_3600

Offset address: 0x03

Bit position: 7 6 5 4 3 2 1 0

Bit field:	—	OVFF CL	MEND FCL	FERR FCL	—	OVFIE	MEND IE	FERR E
------------	---	------------	-------------	-------------	---	-------	------------	-----------

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	FERRIE	Frequency Error Interrupt Request Enable 0: Disable 1: Enable	R/W
1	MENDIE	Measurement End Interrupt Request Enable 0: Disable 1: Enable	R/W

Bit	Symbol	Function	R/W
2	OVFIE	Overflow Interrupt Request Enable 0: Disable 1: Enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	FERRFCL	FERRF Clear 0: No effect 1: The CASTR.FERRF flag is cleared	W
5	MENDFCL	MENDF Clear 0: No effect 1: The CASTR.MENDF flag is cleared	W
6	OVFFCL	OVFF Clear 0: No effect 1: The CASTR.OVFF flag is cleared.	W
7	—	This bit is read as 0. The write value should be 0.	R/W

FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables or disables the frequency error interrupt request.

MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables or disables the measurement end interrupt request.

OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables or disables the overflow interrupt request.

FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

9.2.5 CASTR : CAC Status Register

Base address: CAC = 0x4008_3600

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	OVFF	MEND F	FERR F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FERRF	Frequency Error Flag 0: Clock frequency is within the allowable range 1: Clock frequency has deviated beyond the allowable range (frequency error).	R
1	MENDF	Measurement End Flag 0: Measurement is in progress 1: Measurement ended	R
2	OVFF	Overflow Flag 0: Counter has not overflowed 1: Counter overflowed	R
7:3	—	These bits are read as 0.	R

FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement ends.

[Clearing condition]

- 1 is written to the MENDFCL bit.

OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the CAICR.OVFFCL bit.

9.2.6 CAULVR : CAC Upper-Limit Value Setting Register

Base address: CAC = 0x4008_3600

Offset address: 0x06

Bit position: 15 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	n/a	The Upper Value of the Allowable Range The CAULVR register is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

9.2.7 CALLVR : CAC Lower-Limit Value Setting Register

Base address: CAC = 0x4008_3600

Offset address: 0x08

Bit position: 15 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	n/a	The Lower Value of the Allowable Range The CALLVR register is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

9.2.8 CACNTBR : CAC Counter Buffer Register

Base address: CAC = 0x4008_3600

Offset address: 0x0A

Bit position: 15 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	n/a	The Measurement Result The CACNTBR register is a 16-bit read-only register that stores the measurement result.	R

9.3 Operation

9.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. [Figure 9.2](#) shows an operating example of the CAC.

Figure 9.2 CAC operating example

The events in [Figure 9.2](#) are:

1. When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
2. When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in [Figure 9.2](#)) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in [Figure 9.2](#)) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both $CACNTBR \leq CAULVR$ and $CACNTBR \geq CALLVR$ are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If $CACNTBR > CAULVR$, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If $CACNTBR < CALLVR$, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

9.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

9.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. [Table 9.3](#) provides information on the CAC interrupt requests.

Table 9.3 CAC interrupt requests

Interrupt request	Interrupt enable bit	Status flag	Interrupt sources
Frequency error interrupt	CAICR.FERRIE	CASTR.FERRF	The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR
Measurement end interrupt	CAICR.MENDIE	CASTR.MENDF	<ul style="list-style-type: none"> • Valid edge is input from the CACREF pin or internal clock • Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit
Overflow interrupt	CAICR.OVFIE	CASTR.OVFF	Counter overflows

9.5 Usage Notes

9.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

10. Low Power Modes

10.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, stopping modules, selecting power control mode in Normal mode, and transitioning to low power modes.

[Table 10.1](#) lists the specifications of the low power mode functions. [Table 10.2](#) lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DTC, DMAC and SRAM operate.

Table 10.1 Specifications of the low power mode functions

Item	Specification
Reducing power consumption by switching clock signals	The frequency division ratio can be selected independently for the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), and flash interface clock (FCLK). *1
Module stop	Functions can be stopped independently for each peripheral module
Low-power modes	<ul style="list-style-type: none"> Sleep mode Software Standby mode Snooze mode Deep Software Standby mode
Power control modes	<ul style="list-style-type: none"> Power consumption can be reduced in Normal, Seep and Snooze modes by selecting an appropriate operating power control mode according to the operating frequency. Three operating power control modes are available: <ul style="list-style-type: none"> High-speed mode Low-speed mode Subosc-speed mode
TrustZone Filter	Security attribution can be set for each registers

Power-on reset circuit	Operating	Operating	Operating	Operating* ¹³
Other peripheral modules	Selectable	Stop (Retained)	Operation prohibited	Stop (Undefined)
I/O Ports	Operating	Retained	Operating	Retained

Note: Selectable means that operating or not operating can be selected by the control registers.

Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Operation prohibited means that the function must be stopped before entering Software Standby mode.

Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

All modules whose module-stop bits are 0 start as soon as PCLKs are supplied after entering Snooze mode. In order to avoid increase in power consumption in Snooze mode, module-stop bit of modules which are unnecessary in Snooze mode must be set to 1 before entering Software Standby mode.

Note 1. In IWDG-dedicated on-chip oscillator and IWDG, operating or stopping is selected by setting the IWDG Stop Control bit (IWDG_STOPCTL) in Option Function Select register 0 (OFS0) in IWDG auto start mode. In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDT_STOPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Power consumption can be reduced in Normal and Sleep modes by selecting an appropriate operating power control mode according to the operating frequency.

Note 2. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).

Note 3. AGT0/AGT2 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected by the AGT0/2.AGTMR1.TCK[2:0] bits. AGT1/AGT3 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101b (Underflow event signal from AGT0/AGT2) is selected by the AGT1/3.AGTMR1.TCK[2:0] bits. When 100b (AGTLCLK) is selected by AGTn.AGTMR1.TCK[2:0] bits (n = 0, 1, 2, 3), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.

Note 4. IIC0 wakeup interrupt is available.

Note 5. When using SCI0 in Snooze mode, MOSCCR.MOSTP and PLLCR.PLLSTP and PLL2CR.PLL2STP bits must be 1.

Note 6. Serial communication modes of SCI0 is only in asynchronous mode.

Note 7. Event lists the restrictions described in [section 10.10.13. ELC Events in Snooze Mode](#).

Note 8. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the oscillator status is the same as before entering Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the oscillator stops when the MCU enters Deep Software Standby mode.

Note 9. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, data in the Standby SRAM is retained in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, data in the Standby SRAM is undefined in Deep Software Standby mode.

Note 10. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the values of the USB resume detection circuit registers are retained and detection of USB resumption is enabled, and the values of other registers are undefined in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the values of all registers are undefined in Deep Software Standby mode.

Note 11. When the RCR4.RCKSEL bit set to 1 (LOCO), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.

Note 12. When using LVD in Deep Software Standby mode, DPSBYCR.DEEPCUT[1:0] bits must be 00b or 01b before entering Deep Software Standby mode.

Note 13. When the MCU enters Deep Software Standby mode with the DPSBYCR.DEEPCUT[1:0] bits set to 11b, the LVD circuit stops and the low-power function of the power-on reset circuit is enabled.

Note 14. AGT5 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected by the AGT5.AGTMR1.TCK[2:0] bits.

Note 15. When using the 12-bit A/D Converter in Snooze mode, the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits must be 1.

Note 16. Valid interrupt requests are any interrupt/exception that are not masked by the priority level of current exception and the priority level set by BASEPRI. In addition, if the interrupt request is based on IELSRn, the interrupt must be enabled by NVIC_ISERn.

Table 10.3 Interrupt Source for canceling Snooze, Software Standby and Deep Software Standby Modes (1 of 2)

Interrupt source	Name	Software Standby Mode	Snooze Mode	Deep Software Standby Mode
NMI		Yes	Yes	Yes
Port	PORT_IRQn (n = 0 to 7, 9, 13)	Yes	Yes	No
	PORT_IRQn-DS (n = 0, 1, 4 to 9)	Yes	Yes	Yes
LVD	LVD_LVD1	Yes	Yes	Yes
	LVD_LVD2	Yes	Yes	Yes
IWDG	IWDG_NMIUNDF	Yes	Yes	No

Table 10.3 Interrupt Source for canceling Snooze, Software Standby and Deep Software Standby Modes (2 of 2)

Interrupt source	Name	Software Standby Mode	Snooze Mode	Deep Software Standby Mode
USBFS0	USBFS0_USBR	Yes	Yes	Yes
RTC	RTC_ALM	Yes	Yes	Yes
	RTC_PRD	Yes	Yes	Yes
AGT1	AGT1_AGTI	Yes	Yes ^{*3}	Yes
	AGT1_AGTCMAI	Yes	Yes	No
	AGT1_AGTCMBI	Yes	Yes	No
AGT3	AGT3_AGTI	Yes	Yes ^{*3}	Yes
	AGT3_AGTCMAI	Yes	Yes	No
	AGT3_AGTCMBI	Yes	Yes	No
IIC0	IIC0_WUI	Yes	Yes	No
ADC12n (n = 0)	ADC12n_WCMPPM	No	Yes with SELSR0 ^{*1 *3}	No
	ADC12n_WCMPUM	No	Yes with SELSR0 ^{*1 *3}	No
SCI0	SCI0_AM	No	Yes with SELSR0 ^{*1 *2}	No
	SCI0_RXI_OR_ERI	No	Yes with SELSR0 ^{*1 *2}	No
DTC	DTC_COMPLETE	No	Yes with SELSR0 ^{*1 *3}	No
DOC	DOC_DOPCI	No	Yes with SELSR0 ^{*1}	No

Note 1. To use the interrupt request as a trigger for exiting the Snooze mode, the request must be selected in SELSR0. See [section 13, Interrupt Controller Unit \(ICU\)](#) for the setting of SELSR0. When a trigger selected in SELSR0 occurs after executing WFI instruction and during the transition from Normal mode to Software Standby mode, the request might or might not be accepted, depending on the timing of the occurrence.

Note 2. Only one of either SCI0_AM or SCI0_RXI_OR_ERI can be set.

Note 3. The event which is enabled by the SNZEDCRn must not be used.

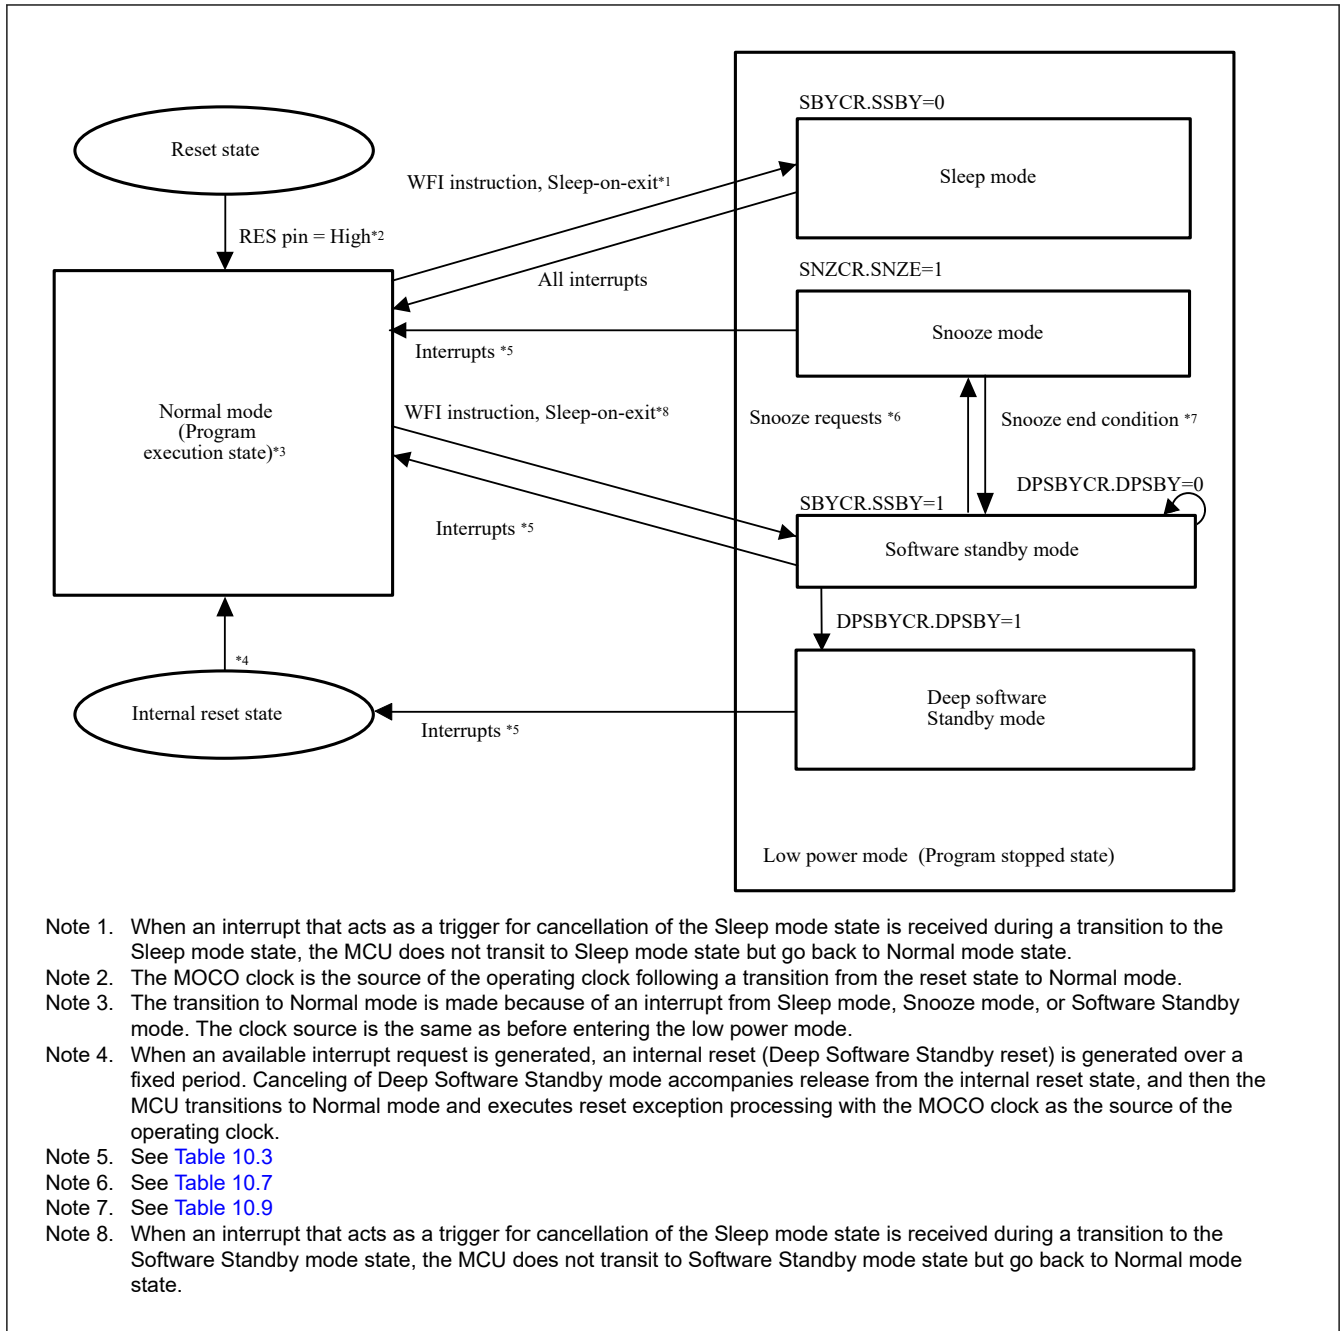

Figure 10.1 Mode Transitions

10.2 Register Descriptions

10.2.1 LPMSAR : Low Power Mode Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	NONSEC13	—	—	—	NONSEC9	NONSEC8	—	—	—	NONSEC4	—	NONSEC2	—	NONSEC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	NONSEC0*1	Non-secure Attribute bit 0 Target register: OPCCR, SOPCCR 0: Secure 1: Non-secure	R/W
1	—	This bit is read as 1. The write value should be 1.	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: SBYCR 0: Secure 1: Non-secure	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	NONSEC4	Non-secure Attribute bit 4 Target register: SNZCR, SNZEDCRn, SNZREQCRn 0: Secure 1: Non-secure	R/W
7:5	—	These bits are read as 1. The write value should be 1.	R/W
8	NONSEC8	Non-secure Attribute bit 8 Target register: DPSBYCR 0: Secure 1: Non-secure	R/W
9	NONSEC9	Non-secure Attribute bit 9 Target register: DPSWCR 0: Secure 1: Non-secure	R/W
12:10	—	These bits are read as 1. The write value should be 1.	R/W
13	NONSEC13	Non-secure Attribute bit 13 Target register: LDOSCR, PL2LDOSCR 0: Secure 1: Non-secure	R/W
31:14	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. It is recommended that these bits are configured as Non-secure when the device life cycle is NSECS (DLMMON.DLMMON[3:0] = 0011b). See [section 42.6.1. Restrictions on setting the security attribution](#) for details.

The LPMSAR register controls the secure attribute of Low Power Mode registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of OPCCR, SOPCCR.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of SBYCR.

NONSEC4 bit (Non-secure Attribute bit 4)

This bit controls the security attribute of SNZCR, SNZEDCR_n, SNZREQCR_n

NONSEC8 bit (Non-secure Attribute bit 8)

This bit controls the security attribute of DPSBYCR.

NONSEC9 bit (Non-secure Attribute bit 9)

This bit controls the security attribute of DPSWCR.

NONSEC13 bit (Non-secure Attribute bit 13)

This bit controls the security attribute of LDOSCR and PL2LDOSCR.

10.2.2 DPFSAR : Deep Software Standby Interrupt Factor Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DPFSAn (n = 16 to 31)															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DPFS A09	DPFS A08	DPFS A07	DPFS A06	DPFS A05	DPFS A04	—	—	DPFS A01	DPFS A00
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
1:0	DPFSA01, DPFSA00	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0, 1) Target register: DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0, 1) Target factor : IRQn-DS Pin (n = 0, 1) 0: Secure 1: Non-secure	R/W
3:2	—	These bits are read as 1. The write value should be 1.	R/W
9:4	DPFSA09 to DPFSA04	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 4 to 9) Target register: DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 4 to 7), DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 1) Target factor : IRQn-DS Pin (n = 4 to 9) 0: Secure 1: Non-secure	R/W
15:10	—	These bits are read as 1. The write value should be 1.	R/W
16	DPFSA16	Deep Software Standby Interrupt Factor Security Attribute bit 16 Target register: DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 Target factor : LVD1 0: Secure 1: Non-secure	R/W
17	DPFSA17	Deep Software Standby Interrupt Factor Security Attribute bit 17 Target register: DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1 Target factor : LVD2 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
18	DPFSA18	Deep Software Standby Interrupt Factor Security Attribute bit 18 Target register: DPSIER2.b2, DPSIFR2.b2 Target factor : RTC Interval 0: Secure 1: Non-secure	R/W
19	DPFSA19	Deep Software Standby Interrupt Factor Security Attribute bit 19 Target register: DPSIER2.b3, DPSIFR2.b3 Target factor : RTC Alarm 0: Secure 1: Non-secure	R/W
20	DPFSA20	Deep Software Standby Interrupt Factor Security Attribute bit 20 Target register: DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4 Target factor : NMI Pin 0: Secure 1: Non-secure	R/W
23:21	—	These bits are read as 1. The write value should be 1.	R/W
24	DPFSA24	Deep Software Standby Interrupt Factor Security Attribute bit 24 Target register: DPSIER3.b0, DPSIFR3.b0 Target factor : USBFS0 Suspend/Resume 0: Secure 1: Non-secure	R/W
25	—	This bit is read as 1. The write value should be 1.	R/W
26	DPFSA26	Deep Software Standby Interrupt Factor Security Attribute bit 26 Target register: DPSIER3.b2, DPSIFR3.b2 Target factor : AGT1 Underflow 0: Secure 1: Non-secure	R/W
27	DPFSA27	Deep Software Standby Interrupt Factor Security Attribute bit 27 Target register: DPSIER3.b3, DPSIFR3.b3 Target factor : AGT3 Underflow 0: Secure 1: Non-secure	R/W
31:28	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The DPFSA register controls the secure attribute of Deep Software Standby Interrupt Factor control registers.

DPFSA01, DPFSA00 bits (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0, 1))

These bits control the security attribute of DPSIER0.bn, DPSIFR0.bn, and DPSIEGR0.bn (n = 0, 1).

Target factor is IRQn-DS Pin (n = 0, 1).

DPFSA04 to DPFSA09 bits (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 4 to 9))

These bits control the security attribute of DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 4 to 7), DPSIER1.bn, DPSIFR1.bn, and DPSIEGR1.bn (n = 0, 1).

Target factor is IRQn-DS Pin (n = 4 to 9).

DPFSA16 bit (Deep Software Standby Interrupt Factor Security Attribute bit 16)

This bit controls the security attribute of DPSIER2.b0, DPSIFR2.b0, and DPSIEGR2.b0.

Target factor is LVD1.

DPFSA17 bit (Deep Software Standby Interrupt Factor Security Attribute bit 17)

This bit controls the security attribute of DPSIER2.b1, DPSIFR2.b1, and DPSIEGR2.b1.

Target factor is LVD2.

DPFSA18 bit (Deep Software Standby Interrupt Factor Security Attribute bit 18)

This bit controls the security attribute of DPSIER2.b2 and DPSIFR2.b2.

Target factor is RTC Interval.

DPFSA19 bit (Deep Software Standby Interrupt Factor Security Attribute bit 19)

This bit controls the security attribute of DPSIER2.b3 and DPSIFR2.b3.

Target factor is RTC Alarm.

DPFSA20 bit (Deep Software Standby Interrupt Factor Security Attribute bit 20)

This bit controls the security attribute of DPSIER2.b4, DPSIFR2.b4, and DPSIEGR2.b4.

Target factor is NMI Pin.

DPFSA24 bit (Deep Software Standby Interrupt Factor Security Attribute bit 24)

This bit controls the security attribute of DPSIER3.b0 and DPSIFR3.b0.

Target factor is USBFS0 Suspend/Resume.

DPFSA26 bit (Deep Software Standby Interrupt Factor Security Attribute bit 26)

This bit controls the security attribute of DPSIER3.b2 and DPSIFR3.b2.

Target factor is AGT1 Underflow.

DPFSA27 bit (Deep Software Standby Interrupt Factor Security Attribute bit 27)

This bit controls the security attribute of DPSIER3.b3 and DPSIFR3.b3.

Target factor is AGT3 Underflow.

10.2.3 SBYCR : Standby Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x00C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SSBY	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as reset value. The write value should be reset value	R/W
15	SSBY	Software Standby Mode Select 0: Sleep mode 1: Software Standby mode.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

SSBY bit (Software Standby Mode Select)

The SSBY bit specifies the transition destination after a WFI instruction is executed.

When the SSBY bit is set to 1, the MCU enters Software Standby mode after execution of a WFI instruction. When the MCU returns to Normal mode from Software Standby mode by an interrupt, the SSBY bit remains 1. The SSBY bit can be cleared by writing 0 to it.

While the OSTDCR.OSTDE bit is 1, setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

While the FENTRYR.FENTRYC bit is 1 setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

10.2.4 MSTPCRA : Module Stop Control Register A

Base address: MSTP = 0x4008_4000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	MSTP A22	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MSTP A7	—	—	—	—	—	—	MSTP A0
Value after reset:	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	MSTPA0	SRAM0 Module Stop Target module: SRAM0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
6:1	—	These bits are read as 1. The write value should be 1.	R/W
7	MSTPA7	Standby SRAM Module Stop Target module: Standby SRAM 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:8	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPA22	DMA Controller/Data Transfer Controller Module Stop*1 Target module: DTC, DMAC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31:23	—	These bits are read as 1. The write value should be 1.	R/W

- Note:
- If the security attribution is configured as Secure:
 - Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
 - If the security attribution is configured as Non-secure:
 - Secure and Non-secure access are allowed.

Note 1. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.

10.2.5 MSTPCRB : Module Stop Control Register B

Base address: MSTP = 0x4008_4000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTP B31	—	—	MSTP B28	MSTP B27	—	—	—	—	MSTP B22	—	—	MSTP B19	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTP B11	—	MSTP B9	—	—	MSTP B6	—	—	—	MSTP B2	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	—	This bit is read as 1. The write value should be 1.	R/W
1	—	This bit is read as 1. The write value should be 1.	R/W
2	MSTPB2	Controller Area Network 0 Module Stop ^{*1} Target module: CAN0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
5:3	—	These bits are read as 1. The write value should be 1.	R/W
6	MSTPB6	Quad Serial Peripheral Interface Module Stop Target module: QSPI 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
7	—	This bit is read as 1. The write value should be 1.	R/W
8	—	This bit is read as 1. The write value should be 1.	R/W
9	MSTPB9	I ² C Bus Interface 0 Module Stop Target module: IIC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
10	—	This bit is read as 1. The write value should be 1.	R/W
11	MSTPB11	Universal Serial Bus 2.0 FS Interface 0 Module Stop ^{*2} Target module: USBFS0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
12	—	This bit is read as 1. The write value should be 1.	R/W
15:13	—	These bits are read as 1. The write value should be 1.	R/W
17:16	—	These bits are read as 1. The write value should be 1.	R/W
18	—	These bits are read as 1. The write value should be 1.	R/W
19	MSTPB19	Serial Peripheral Interface 0 Module Stop Target module: SPI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:20	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPB22	Serial Communication Interface 9 Module Stop Target module: SC19 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26:23	—	These bits are read as 1. The write value should be 1.	R/W
27	MSTPB27	Serial Communication Interface 4 Module Stop Target module: SC14 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPB28	Serial Communication Interface 3 Module Stop Target module: SC13 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	—	This bit is read as 1. The write value should be 1.	R/W
30	—	This bit is read as 1. The write value should be 1.	R/W
31	MSTPB31	Serial Communication Interface 0 Module Stop Target module: SC10 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The MSTPB2 bit should be written after the CAN clock (CANMCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of CANMCLK following the change of MSTPB2.

Note 2. The MSTPB11 bit should be written after the USB clock (USBCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of USBCLK following the change of MSTPB11.

10.2.6 MSTPCRC : Module Stop Control Register C

Base address: MSTP = 0x4008_4000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTP C31	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MSTP C14	MSTP C13	—	—	—	—	—	—	—	—	—	—	—	MSTP C1	MSTP C0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPC0	Clock Frequency Accuracy Measurement Circuit Module Stop ^{*1} Target module: CAC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
1	MSTPC1	Cyclic Redundancy Check Calculator Module Stop Target module: CRC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
2	—	This bit is read as 1. The write value should be 1.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
7:4	—	These bits are read as 1. The write value should be 1.	R/W
8	—	This bit is read as 1. The write value should be 1.	R/W
11:9	—	These bits are read as 1. The write value should be 1.	R/W
12	—	This bit is read as 1. The write value should be 1.	R/W
13	MSTPC13	Data Operation Circuit Module Stop Target module: DOC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14	MSTPC14	Event Link Controller Module Stop Target module: ELC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30:15	—	These bits are read as 1. The write value should be 1.	R/W
31	MSTPC31	SCE9 Module Stop Target module: SCE9 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The MSTPC0 bit should be written after the slowest clock from the clocks output by the oscillators is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of the slowest clock following the change of MSTPC0.

10.2.7 MSTPCRD : Module Stop Control Register D

Base address: MSTP = 0x4008_4000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	MSTP D20	—	—	—	MSTP D16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MSTP D14	MSTP D13	MSTP D12	MSTP D11	—	—	—	—	—	—	—	MSTP D3	MSTP D2	MSTP D1	MSTP D0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPD0	Low Power Asynchronous General Purpose Timer 3 Module Stop ^{*3} Target module: AGT3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
1	MSTPD1	Low Power Asynchronous General Purpose Timer 2 Module Stop ^{*4} Target module: AGT2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

21	—	This bit is read as 1. The write value should be 1.	R/W
22	—	This bit is read as 1. The write value should be 1.	R/W
31:23	—	These bits are read as 1. The write value should be 1.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

- Note 1. When the count source is sub-clock oscillator or LOCO, AGT1 counting does not stop even if MSTPD2 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT1 registers.
- Note 2. When the count source is sub-clock oscillator or LOCO, AGT0 counting does not stop even if MSTPD3 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT0 registers.
- Note 3. When the count source is sub-clock oscillator or LOCO, AGT3 counting doesn't stop even if MSTPD0 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT3 registers.
- Note 4. When the count source is sub-clock oscillator or LOCO, AGT2 counting doesn't stop even if MSTPD1 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT2 registers.

10.2.8 MSTPCRE : Module Stop Control Register E

Base address: MSTP = 0x4008_4000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	MSTP E30	MSTP E29	—	MSTP E27	MSTP E26	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MSTP E14	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
13:0	—	These bits are read as 1. The write value should be 1.	R/W
14	MSTPE14	Low Power Asynchronous General Purpose Timer 5 Module Stop*1 Target module: AGT5 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
15	—	This bit is read as 1. The write value should be 1.	R/W
23:16	—	These bits are read as 1. The write value should be 1.	R/W

28	—	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
29	MSTPE29	GPT2 Module Stop Target module: GPT2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30	MSTPE30	GPT1 Module Stop Target module: GPT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	—	This bit is read as 1. The write value should be 1.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. When the count source is sub-clock oscillator or LOCO, AGT5 counting does not stop even if MSTPE14 is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGT5 registers.

10.2.9 OPCCR : Operating Power Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0A0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OPCM TSF	—	—	OPCM[1:0]	

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
1:0	OPCM[1:0]	Operating Power Control Mode Select 0 0: High-speed mode 0 1: Setting prohibited 1 0: Setting prohibited 1 1: Low-speed mode	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	OPCMTSF	Operating Power Control Mode Transition Status Flag 0: Transition completed 1: During transition	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The OPCCR register is used to reduce power consumption in Normal and Sleep modes by specifying a lower operating frequency. For the procedure to change the operating power control modes, see [section 10.5. Function for Lower Operating Power Consumption](#).

When transitioning from Software Standby mode to Normal or Snooze mode, the settings in the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode).

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Sleep modes. [Table 10.4](#) shows the relationship between the operating power control modes and the OPCM[1:0] and SOPPCM settings.

OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

10.2.10 SOPCCR : Sub Operating Power Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0AA

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SOPC MTSF	—	—	—	SOPC M
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SOPCM	Sub Operating Power Control Mode Select 0: Other than Subosc-speed mode 1: Subosc-speed mode	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	SOPCMTSF	Operating Power Control Mode Transition Status Flag 0: Transition completed 1: During transition	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SOPCCR register is used to reduce power consumption in Normal mode and Sleep mode. Setting this register initiates entry to and exit from Subosc-speed mode. Subosc-speed mode is available only when using the sub-clock oscillator or LOCO without dividing the frequency.

For the procedure to change operating power control modes, see [section 10.5. Function for Lower Operating Power Consumption](#).

SOPCM bit (Sub Operating Power Control Mode Select)

The SOPCM bit selects the operating power control mode in Normal and Sleep modes. Setting this bit to 1 allows transition to Subosc-speed mode. Setting this bit to 0 allows a return to the operating mode (operating mode set by OPCCR.OPCM[1:0]) that was active before the transition to Subosc-speed mode.

When transitioning from Software Standby mode to Normal mode or Snooze mode, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM settings are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode)

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

[Table 10.4](#) shows the relationship between the operating power control modes, the OPCM[1:0], and SOPPCM bits settings.

SOPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The SOPCMTSF flag indicates the switching control state when the operating power control mode is switched to or from Subosc-speed mode. This flag becomes 1 when the SOPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

Table 10.4 shows each operating power control mode.

Table 10.4 Operating power control mode

Operating power control mode	OPCM[1:0] bits	SOPCM bit	Power consumption
High-speed mode	00b	0	High
Low-speed mode	11b	0	↓
Subosc-speed mode	xxb	1	Low

For details about the operating frequency range, see [section 43, Electrical Characteristics](#).

Each operating power control mode is described below.

- High-speed mode
After a reset cancellation, the MCU is activated in this mode.
- Low-speed mode
The following constraints apply in low-speed mode:
 - Programming and erasure operations for the flash memory are prohibited
 - Using the PLL or PLL2 is prohibited. See [section 10.10.1. Register Access](#)

In this mode, lower power consumption is possible than in High-speed mode when the same operation is performed under the same conditions, such as operating frequency.

- Subosc-speed mode
The following constraints apply in Subosc-speed mode:
 - Programming and erasure operations for the flash memory are prohibited
 - Reading of the data flash is prohibited
 - Using MOSC, PLL, PLL2, MOCO, or HOCO is prohibited. See [section 10.10.1. Register Access](#)
 - Using the divided clock for ICK or FCK is prohibited. See [section 10.10.1. Register Access](#)
 - Using the oscillation stop detection function of the main clock oscillator is prohibited.

In this mode, lower power consumption is possible than in low-speed mode when the same operation is performed under the same conditions, such as operating frequency.

10.2.11 SNZCR : Snooze Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x092

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SNZE	—	—	—	—	—	SNZD TCEN	RXDR EQEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RXDREQEN	RXD0 Snooze Request Enable 0: Ignore RXD0 falling edge in Software Standby mode 1: Detect RXD0 falling edge in Software Standby mode	R/W
1	SNZDTCEN	DTC Enable in Snooze mode 0: Disable DTC operation 1: Enable DTC operation	R/W

Bit	Symbol	Function	R/W
6:2	—	These bits are read as 0. The write value should be 0.	R/W
7	SNZE	Snooze mode Enable 0: Disable Snooze mode 1: Enable Snooze mode	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

RXDREQEN bit (RXD0 Snooze Request Enable)

The RXDREQEN bit specifies whether to detect a falling edge of the RXD0 pin in Software Standby mode. This bit can be used only when SCI0 is operating in asynchronous mode. To detect a falling edge of the RXD0 pin, set this bit before entering Software Standby mode. When this bit is set to 1, a falling edge of the RXD0 pin in Software Standby mode causes the MCU to enter Snooze mode.

SNZDTCEN bit (DTC Enable in Snooze mode)

The SNZDTCEN bit specifies whether to use the DTC and SRAM in Snooze mode. To use the DTC and SRAM in Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, the DTC can be activated by setting IELSRn register.

SNZE bit (Snooze mode Enable)

The SNZE bit specifies whether to enable a transition from Software Standby mode to Snooze mode. To use Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, a trigger as shown in [Table 10.7](#) in Software Standby mode causes the MCU to enter Snooze mode. After the MCU transitions from Software Standby mode or Snooze mode to Normal mode, set 0 to the SNZE bit once then set it before re-entering Software Standby mode. For details, see [section 10.8. Snooze Mode](#).

10.2.12 SNZEDCR0 : Snooze End Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x094

Bit position: 7 6 5 4 3 2 1 0

Bit field:	7	6	5	4	3	2	1	0
	SCI0U MTED	—	—	AD0U MTED	AD0M ATED	DTCN ZRED	DTCZ RED	AGTU NFED

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	AGTUNFED	AGT1 Underflow Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request	R/W
1	DTCZRED	Last DTC Transmission Completion Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request	R/W
2	DTCNZRED	Not Last DTC Transmission Completion Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request	R/W
3	AD0MATED	ADC12 Compare Match Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request	R/W
4	AD0UMTED	ADC12 Compare Mismatch Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	SCI0UMTED	SCI0 Address Mismatch Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZEDCR0 register controls the condition of switching from Snooze mode to Software Standby mode. In order to use a trigger shown in [Table 10.8](#) as a condition to switch from Snooze mode to Software Standby mode, the corresponding bit in the SNZEDCR0 register must be set to 1.

The event that is used to return from snooze mode to normal mode as shown in [Table 10.3](#) must not be enabled in the SNZEDCR0 register.

AGTUNFED bit (AGT1 Underflow Snooze End Enable)

The AGTUNFED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an AGT1 underflow. For details on the trigger conditions, see [section 22, Low Power Asynchronous General Purpose Timer \(AGT\)](#).

DTCZRED bit (Last DTC Transmission Completion Snooze End Enable)

The DTCZRED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on completion of the last DTC transmission, that is, when CRA or CRB registers in the DTC is 0. For details on the trigger conditions, see [section 17, Data Transfer Controller \(DTC\)](#).

DTCNZRED bit (Not Last DTC Transmission Completion Snooze End Enable)

The DTCNZRED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on completion of each DTC transmission, that is, when CRA or CRB registers in the DTC is not 0. For details on the trigger conditions, see [section 17, Data Transfer Controller \(DTC\)](#).

AD0MATED bit (ADC12 Compare Match Snooze End Enable)

The AD0MATED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an ADC120 event when a conversion result matches the expected data. For details on the trigger conditions, see [section 35, 12-Bit A/D Converter \(ADC12\)](#).

AD0UMTED bit (ADC12 Compare Mismatch Snooze End Enable)

The AD0UMTED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an ADC120 event when the conversion result does not match the expected data. For details on the trigger conditions, see [section 35, 12-Bit A/D Converter \(ADC12\)](#).

SCI0UMTED bit (SCI0 Address Mismatch Snooze End Enable)

The SCI0UMTED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an SCI0 event when an address received in Software Standby mode does not match the expected data. For details on the trigger conditions, see [section 27, Serial Communications Interface \(SCI\)](#). Only set this bit to 1 when SCI0 operates in asynchronous mode.

10.2.13 SNZEDCR1 : Snooze End Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x095

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	AGT3 UNFE D
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	AGT3UNFED	AGT3 underflow Snooze End Enable 0: Disable the Snooze End request 1: Enable the Snooze End request	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZEDCR1 register controls the condition of switching from Snooze mode to Software Standby mode. In order to use a trigger shown in Table 10.8 as a condition to switch from Snooze mode to Software Standby mode, the corresponding bit in the SNZEDCR1 register must be set to 1.

The event that is used to return from Snooze mode to normal operating mode as shown in Table 10.3 must not be enabled in the SNZEDCR1 register.

AGT3UNFED bit (AGT3 underflow Snooze End Enable)

The AGT3UNFED bit specifies whether to enable a transition from Snooze mode to Software Standby mode by an underflow of the AGT3. For the detail of the condition of the trigger, see section 22, Low Power Asynchronous General Purpose Timer (AGT).

10.2.14 SNZREQCR0 : Snooze Request Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x098

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	SNZR EQEN 30	SNZR EQEN 29	SNZR EQEN 28	—	—	SNZR EQEN 25	SNZR EQEN 24	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	SNZR EQEN 13	—	—	—	SNZR EQEN 9	SNZR EQEN 8	SNZR EQEN 7	SNZR EQEN 6	SNZR EQEN 5	SNZR EQEN 4	SNZR EQEN 3	SNZR EQEN 2	SNZR EQEN 1	SNZR EQEN 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SNZREQEN0	Enable IRQ0 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
1	SNZREQEN1	Enable IRQ1 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
2	SNZREQEN2	Enable IRQ2 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
3	SNZREQEN3	Enable IRQ3 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
4	SNZREQEN4	Enable IRQ4 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W

Bit	Symbol	Function	R/W
5	SNZREQEN5	Enable IRQ5 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
6	SNZREQEN6	Enable IRQ6 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
7	SNZREQEN7	Enable IRQ7 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
8	SNZREQEN8	Enable IRQ8 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
9	SNZREQEN9	Enable IRQ9 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
12:10	—	These bits are read as 0. The write value should be 0.	R/W
13	SNZREQEN13	Enable IRQ13 pin snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
23:16	—	These bits are read as 0. The write value should be 0.	R/W
24	SNZREQEN24	Enable RTC alarm snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
25	SNZREQEN25	Enable RTC period snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
27:26	—	These bits are read as 0. The write value should be 0.	R/W
28	SNZREQEN28	Enable AGT1 underflow snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
29	SNZREQEN29	Enable AGT1 compare match A snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
30	SNZREQEN30	Enable AGT1 compare match B snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZREQCR0 register controls which trigger causes the MCU to switch from Software Standby mode to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode by setting the WUPENn register, see [section 13, Interrupt Controller Unit \(ICU\)](#), the MCU enters Normal mode when the trigger is generated while the associated bit of the SNZREQCR0 is 1. The setting of the WUPENn register always has higher priority than the setting of the SNZREQCR0 register. For details, see [section 10.8. Snooze Mode](#) and [section 13, Interrupt Controller Unit \(ICU\)](#).

10.2.15 SNZREQCR1 : Snooze Request Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x088

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SNZR EQEN 2	SNZR EQEN 1	SNZR EQEN 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SNZREQEN0	Enable AGT3 underflow snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
1	SNZREQEN1	Enable AGT3 compare match A snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
2	SNZREQEN2	Enable AGT3 compare match B snooze request 0: Disable the snooze request 1: Enable the snooze request	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZREQCR1 register controls which trigger causes the MCU to switch from Software Standby mode to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode by setting the WUPENn register, see [section 13, Interrupt Controller Unit \(ICU\)](#), the MCU enters Normal mode when the trigger is generated while the associated bit of the SNZREQCR1 is 1. The setting of the WUPENn register always has higher priority than the setting of the SNZREQCR1 register. For details, see [section 10.8. Snooze Mode](#) and [section 13, Interrupt Controller Unit \(ICU\)](#).

10.2.16 DPSBYCR : Deep Software Standby Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DPSB Y	IOKEE P	—	—	—	—	DEEPCUT[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
1:0	DEEPCUT[1:0]	Power-Supply Control 0 0: Power to the standby RAM, Low-speed on-chip oscillator, AGTn (n = 0 to 3), and USBFS resume detecting unit is supplied in Deep Software Standby mode. 0 1: Power to the standby RAM, Low-speed on-chip oscillator, AGT, and USBFS resume detecting unit is not supplied in Deep Software Standby mode. 1 0: Setting prohibited 1 1: Power to the standby RAM, Low-speed on-chip oscillator, AGT, and USBFS resume detecting unit is not supplied in Deep Software Standby mode. In addition, LVD is disabled and the low power function in a power-on reset circuit is enabled.	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	IOKEEP	I/O Port Retention 0: When the Deep Software Standby mode is canceled, the I/O ports are in the reset state. 1: When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.	R/W
7	DPSBY	Deep Software Standby 0: Sleep mode (SBYCR.SSBY=0) / Software Standby mode (SBYCR.SSBY=1) 1: Sleep mode (SBYCR.SSBY=0) / Deep Software Standby mode (SBYCR.SSBY=1)	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSBYCR register controls the Deep Software Standby mode.

DPSBYCR is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

DEEPCUT[1:0] bit (Power-Supply Control)

The DEEPCUT[1:0] bits control the internal power supply to the standby RAM, Low-speed on-chip oscillator, AGT, and USBFS resume detecting unit in Deep Software Standby mode. In addition, these bits control the state of LVD and power-on reset circuit in Deep Software Standby mode.

When a USBFS suspend/resume interrupt is used as a Deep Software Standby mode Cancelling source, the DEEPCUT[1:0] bits must be set to 00b.

When an LVD interrupt is used in Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b or 01b.

For lower power consumption, set the DEEPCUT[1:0] bits to 11b so that the LVD is stopped and the low power consumption function of the power-on reset circuit is enabled.

Regardless of the DEEPCUT[1:0] bit setting, during Deep Software Standby mode, internal power supply to SRAM other than standby SRAM is stopped.

When a Deep Software Standby mode is used, set DPSWCR.WTSTS bits depending on the value of DEEPCUT[1] before entering Deep Software Standby mode.

IOKEEP bit (I/O Port Retention)

In Deep Software Standby mode, I/O ports keep the same states as in the Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports or not when the Deep Software Standby mode is canceled.

DPSBY bit (Deep Software Standby)

The DPSBY bit controls transitions to Deep Software Standby mode.

When the WFI instruction is executed while SBYCR.SSBY bit and DPSBYCR.DPSBY bit are both 1, the MCU enters Deep Software Standby mode through Software Standby mode.

The DPSBY bit remains 1 when Deep Software Standby mode is canceled by certain pins which are sources of external pin interrupts (NMI, IRQn-DS (n = 0, 1, 4 to 9)) or a peripheral interrupt (RTC alarm, RTC interval, USB suspend/resume, voltage monitor 1, or voltage monitor 2). Write 0 to this bit to clear it.

The DPSBY bit setting is invalid when OFS0.IWDTSTPCTL bit is 0 (counting continues) regardless of the setting in OFS0.IWDTSTRT bit. In that case, even when SBYCR.SSBY bit is 1 and the DPSBY bit is 1, the transition after the execution of a WFI instruction is to Software Standby mode.

The setting of the DPSBY bit is invalid when voltage monitor 1 reset is enabled (LVD1CR0.RI = 1) or when a voltage monitor 2 reset is enabled (LVD2CR0.RI = 1). In this case, even when the SBYCR.SSBY bit is 1 and the DPSBY bit is 1, the transition after the execution of a WFI instruction is to Software Standby mode.

10.2.17 DPSWCR : Deep Software Standby Wait Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x401

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	WTSTS[5:0]					
Value after reset:	0	0	0	1	1	0	0	1

Bit	Symbol	Function	R/W
5:0	WTSTS[5:0]	Deep Software Wait Standby Time Setting Bit 0x0E: Wait cycle for fast recovery 0x19: Wait cycle for slow recovery Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSWCR register sets the wait stabilization time when a Deep Software Standby mode is canceled by certain pins that are the sources of external pin interrupts or a peripheral interrupt such as RTC alarm, RTC interval, and USB suspend/resume.

During a wait stabilization period set in this register, a Deep Software Standby reset occurs, and the MCU is initialized.

The DPSWCR register is not initialized with the internal reset signal by the cancellation of the Deep Software Standby mode. For details, see [section 5, Resets](#).

When a Deep Software Standby mode is used, set DPSWCR.WTSTS bits according to the value of DPSBYCR.DEEPCUT[1] before entering Deep Software Standby mode.

When DPSBYCR.DEEPCUT[1]=0, you can set DPSWCR.WTSTS to the wait cycle for fast recovery.

When DPSBYCR.DEEPCUT[1]=1, you must set DPSWCR.WTSTS to the wait cycle for slow recovery.

10.2.18 DPSIER0 : Deep Software Standby Interrupt Enable Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x402

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 E	DIRQ6 E	DIRQ5 E	DIRQ4 E	—	—	DIRQ1 E	DIRQ0 E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0E	IRQ0-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W

Bit	Symbol	Function	R/W
1	DIRQ1E	IRQ1-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DIRQ4E	IRQ4-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
5	DIRQ5E	IRQ5-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
6	DIRQ6E	IRQ6-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
7	DIRQ7E	IRQ7-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER0 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER0 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR0 being set to 1. Therefore, DPSIFR0 should be cleared to 0 before entering Deep Software Standby mode.

10.2.19 DPSIER1 : Deep Software Standby Interrupt Enable Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x403

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DIRQ9 E	DIRQ8 E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8E	IRQ8-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
1	DIRQ9E	IRQ9-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER1 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER1 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR1 being set to 1. Therefore, DPSIFR1 should be cleared to 0 before entering Deep Software Standby mode.

10.2.20 DPSIER2 : Deep Software Standby Interrupt Enable Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x404

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMI E	DRTC AIE	DRTC IE	DLVD2 IE	DLVD1 IE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DLVD1IE	LVD1 Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
1	DLVD2IE	LVD2 Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
2	DRTCIE	RTC Interval interrupt Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
3	DRTCAIE	RTC Alarm interrupt Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
4	DNMIE	NMI Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W ^{*1}
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. 1 can be written only once. Once 1 is written to this bit, subsequent write accesses are disabled.

DPSIER2 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER2 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR2 being set to 1. Therefore, DPSIFR2 should be cleared to 0 before entering Deep Software Standby mode.

10.2.21 DPSIER3 : Deep Software Standby Interrupt Enable Register 3

Base address: SYSC = 0x4001_E000

Offset address: 0x405

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	DAGT 3IE	DAGT 1IE	—	DUSB FS0IE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFS0IE	USBFS0 Suspend/Resume Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	DAGT1IE	AGT1 Underflow Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
3	DAGT3IE	AGT3 Underflow Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER3 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER3 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR3 being set to 1. Therefore, DPSIFR3 should be cleared to 0 before entering Deep Software Standby mode.

10.2.22 DPSIFR0 : Deep Software Standby Interrupt Flag Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x406

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 F	DIRQ6 F	DIRQ5 F	DIRQ4 F	—	—	DIRQ1 F	DIRQ0 F

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	DIRQ0F	IRQ0-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
1	DIRQ1F	IRQ1-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DIRQ4F	IRQ4-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
5	DIRQ5F	IRQ5-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
6	DIRQ6F	IRQ6-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
7	DIRQ7F	IRQ7-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR0 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER0 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR0 is cleared to 0x00.

To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0.

DPSIFR0 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0. For details, see [section 5, Resets](#).

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 0, 1, 4 to 7)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR0 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.23 DPSIFR1 : Deep Software Standby Interrupt Flag Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x407

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DIRQ9 F	DIRQ8 F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8F	IRQ8-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
1	DIRQ9F	IRQ9-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
7:2	—	This bit is read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR1 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER1 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR1 is cleared to 0x00.

To clear DPSIFR1 to 0x00 after modifying DPSIER1, wait for at least 6 PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1.

DPSIFR1 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 8, 9)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR1 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.24 DPSIFR2 : Deep Software Standby Interrupt Flag Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x408

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIF	DRTC AIF	DRTC I F	DLVD2 I F	DLVD1 I F

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	DLVD1IF	LVD1 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
1	DLVD2IF	LVD2 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
2	DRTCIF	RTC Interval Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
3	DRTCAIF	RTC Alarm Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
4	DNMIF	NMI Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR2 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER2 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR2 is cleared to 0x00.

To clear DPSIFR2 to 0x00 after modifying DPSIER2, wait for at least 6 PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2.

DPSIFR2 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

DLVDMIF flag (LVDm Deep Software Standby Cancel Flag) (m = 1 to 2)

The DLVDMIF flag indicates that a cancel request by the voltage monitor m signal has been generated.

[Setting condition]

A cancel request is generated by the voltage monitor m signal that is selected in DPSIEGR2.

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTCIF flag (RTC Interval Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC interval interrupt signal has been generated.

[Setting condition]

A cancel request by the RTC interval interrupt signal is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTCAIF flag (RTC Alarm Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC alarm interrupt signal has been generated.

[Setting condition]

A cancel request by the RTC alarm interrupt signal is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DNMIF flag (NMI Pin Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the NMI pin has been generated.

[Setting condition]

A cancel request by the NMI pin specified by DPSIEGR2 is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.25 DPSIFR3 : Deep Software Standby Interrupt Flag Register 3

Base address: SYSC = 0x4001_E000

Offset address: 0x409

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	DAGT 3IF	DAGT 1IF	—	DUSB FS0IF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFS0IF	USBFS0 Suspend/Resume Deep Software Standby Cancel Flag 0: The cancel request is not generated. 1: The cancel request is generated.	R/W
1	—	These bits are read as 0. The write value should be 0.	R/W
2	DAGT1IF	AGT1 Underflow Deep Software Standby Cancel Flag 0: The cancel request is not generated. 1: The cancel request is generated.	R/W
3	DAGT3IF	AGT3 Underflow Deep Software Standby Cancel Flag 0: The cancel request is not generated. 1: The cancel request is generated.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when the corresponding cancel request is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER3 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR3 is cleared to 0x00.

To clear DPSIFR3 to 0x00 after modifying DPSIER3, wait for at least 6 PCLKB cycles, read DPSIFR3, and then write 0 to DPSIFR3. Six or more PCLKB cycles can be secured, for example, by reading DPSIER3.

DPSIFR3 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

DUSBFS0IF flag (USBFS0 Suspend/Resume Deep Software Standby Cancel Flag)

The DUSBFS0IF flag is the flag for USBFS0 that indicates that a cancel request by the USBFS0 suspend/resume has been generated.

[Setting condition]

A cancel request by the USBFS0 suspend/resume is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DAGT1IF flag (AGT1 Underflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the AGT1 underflow has been generated.

[Setting condition]

A cancel request by the AGT1 underflow is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DAGT3IF flag (AGT3 Underflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the AGT3 underflow has been generated.

[Setting condition]

A cancel request by the AGT3 underflow is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.26 DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x40A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 EG	DIRQ6 EG	DIRQ5 EG	DIRQ4 EG	—	—	DIRQ1 EG	DIRQ0 EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0EG	IRQ0-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ1EG	IRQ1-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
4	DIRQ4EG	IRQ4-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ5EG	IRQ5-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ6EG	IRQ6-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ7EG	IRQ7-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR0 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.27 DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x40B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DIRQ9 EG	DIRQ8 EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8EG	IRQ8-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
1	DIRQ9EG	IRQ9-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
7:2	—	This bit is read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR1 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.28 DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x40C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMI EG	—	—	DLVD2 EG	DLVD1 EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DLVD1EG	LVD1 Edge Select 0: A cancel request is generated when $V_{CC} < V_{det1}$ (fall) is detected 1: A cancel request is generated when $V_{CC} \geq V_{det1}$ (rise) is detected	R/W
1	DLVD2EG	LVD2 Edge Select 0: A cancel request is generated when $V_{CC} < V_{det2}$ (fall) is detected 1: A cancel request is generated when $V_{CC} \geq V_{det2}$ (rise) is detected	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DNMIEG	NMI Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR2 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.29 SYOCD CR : System Control OCD Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x040E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DBG EN	—	—	—	—	—	—	DOCD F
Value after reset:	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	DOCDF	Deep Software Standby OCD flag 0: DBIRQ is not generated 1: DBIRQ is generated	R/W ¹
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	DBGEN	Debugger Enable bit Set to 1 first in on-chip debug mode. 0: On-chip debugger is disabled 1: On-chip debugger is enabled	R/W

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Writing 0 clears the flag. Writing 1 is ignored

This register is not controlled by any security attribute register (e.g. LPMSAR, DPFSAR).

SYOCD CR can be written when DBGSTR.CDBGPWRUPREQ = 1 (the debugger is connected).

SYOCD CR is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode.

DOCDF flag (Deep Software Standby OCD flag)

DOCDF flag indicates that a cancel request of Deep Software Standby mode by the MCUCTRL.DBIRQ bit has been generated. DOCDF flag is set to 1 when a cancel request is generated. This flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode). Therefore, a transition to Deep Software Standby mode must be made after DOCDF flag is cleared to 0.

[Setting condition]

- A cancel request by the MCUCTRL.DBIRQ is generated

[Clearing condition]

- Writing 0 to the flag after reading the bit as 1
- When DBGEN bit is 0

DBGEN bit (Debugger Enable bit)

The DBGEN bit enables the on-chip debug mode. This bit must be set to 1 first in the on-chip debugger mode.

[Setting condition]

- Writing 1 to the bit when the debugger is connected.

[Clearing condition]

- Power-on reset is generated
- Writing 0 to the bit.

Note: Certain restrictions apply in terms of the MCU states in which the DBGEN bit can be set to 1. For details, see [section 2.12.2. Restrictions on Connecting an OCD emulator.](#)

10.2.30 LDOSCR:LDO Stop Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0440

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LDOS TP1	LDOS TP0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LDOSTP0	LDO0 Stop 0: LDO0 is enabled 1: LDO0 is stopped	R/W
1	LDOSTP1	LDO1 Stop 0: LDO1 is enabled 1: LDO1 is stopped	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The internal voltage is supplied from multiple built-in linear regulators (LDO). If you do not use the SCE9, LDO self-power consumption can be reduced by setting LDOSCR register to stop LDO0 and LDO1. The setting of the LDOSTPn bit must be changed under the following conditions:

- PLL, PLL2 and MOSC are stopped

- CPU clock and peripheral module clock are 2MHz or less
- All modules other than the DMAC, DTC, and SRAM modules are in the module-stop state

After changing the value of LDOSTPn, you must also insert a wait time of at least 10 μ s to stabilize the power supply capacity of the LDO. The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

This register is initialized by all reset factors. In addition, this register is initialized in the Deep Software Standby mode.

Figure 10.2 shows the flow for stopping LDO0 and LDO1, Figure 10.3 shows the flow for restarting LDO0 and LDO1.

Note: SYOCDRCR.DBGEN setting should be changed when the LDOSTPn bits are 0. It is possible to set the LDOSTPn bits to 1 after changing the SYOCDRCR.DBGEN setting.

Figure 10.2 The flow for stopping LDO0 and LDO1

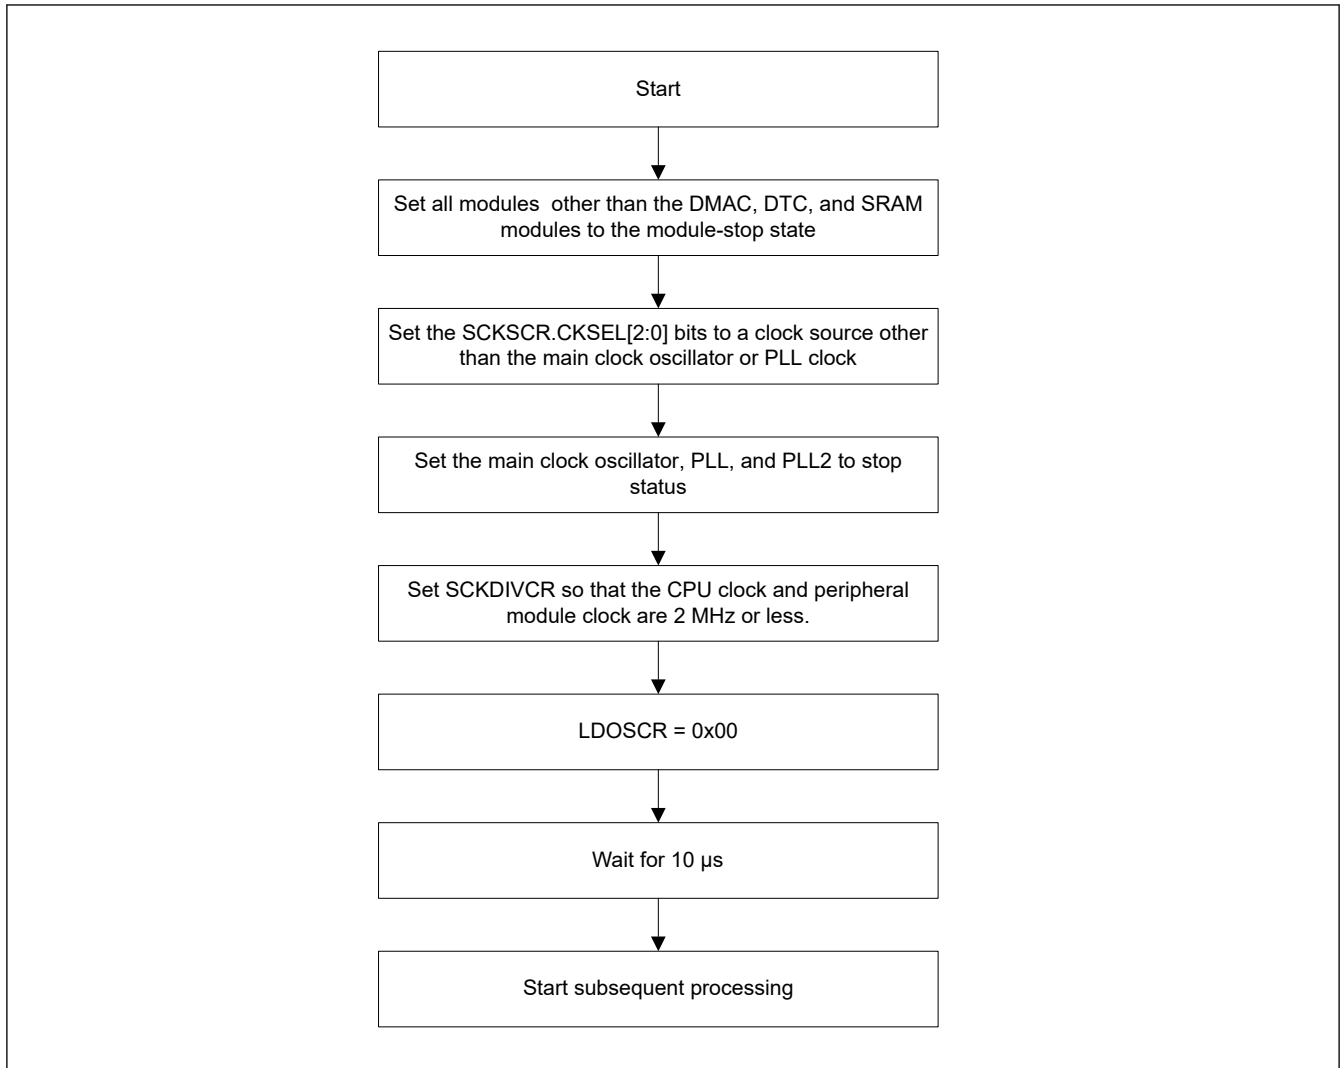

Figure 10.3 The flow for restarting LDO0 and LDO1

10.2.31 PL2LDOSCR:PLL2-LDO Stop Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0444

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PL2LD OSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PL2LDOSTP	PLL2-LDO Stop 0: PLL2-LDO is enabled 1: PLL2-LDO is stopped	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.
- Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

This MCU has a built-in LDO dedicated to PLL2. If you never use PLL2, the PL2LDOSCR can be configured to stop the LDO dedicated to PLL2 in order to reduce the quiescent current of that LDO.

Do not write 0 again after writing 1 to PL2LDOSTP.

When PL2LDOSTP is 1, do not write 0 to PLL2CR.PLL2STP.

When PLL2CR.PLL2STP is 0, do not write 1 to PL2LDOSTP.

This register is initialized by only POR reset.

10.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR register is set.

For information on module and clock associations, see [section 8.2.2. SCKDIVCR : System Clock Division Control Register](#).

10.4 Module-Stop Function

The module stop function can stop the clock supply set for each peripheral module.

When the MSTPmi bit (m = A to E, i = 31 to 0) in MSTPCRn (n = A to E) is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Setting the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn modules are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Additionally, do not set 1 to the MSTPmi bit while the corresponding module is accessed.

10.5 Function for Lower Operating Power Consumption

By selecting an appropriate operating power consumption control mode according to the operating frequency, power consumption can be reduced in Normal mode, Sleep mode, and Snooze mode.

10.5.1 Setting Operating Power Control Mode

Ensure the operating condition such as the frequency range is always within the specified range before and after switching the operating power control modes.

This section provides example procedures for switching operating power control modes.

Table 10.5 Available oscillators in each mode

Mode	Oscillator						
	PLL, PLL2	High-speed on-chip oscillator	Middle-speed on-chip oscillator	Low-speed on-chip oscillator	Main clock oscillator	Sub-clock oscillator	IWDT-dedicated on-chip oscillator
High-speed	Available	Available	Available	Available	Available	Available	Available
Low-speed	N/A	Available	Available	Available	Available	Available	Available
Subosc-speed	N/A	N/A	N/A	Available	N/A	Available	Available

(1) Switching from a higher power mode to a lower power mode

Example 1: From High-speed mode to Low-speed mode:

(Operation begins in High-speed mode)

1. Change the oscillator to what is used in Low-speed mode. Set the frequency of each clock lower than or equal to the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).
5. Confirm that OPCCR.OPCMTSF flag is 0 (indicates transition completed).

(Operation is now in Low-speed mode)

Example 2: From High-speed mode to Subosc-speed mode

(Operation begins in High-speed mode)

1. Switch the clock source to sub-clock oscillator. Turn off PLL, PLL2, HOCO, MOCO, LOCO and main oscillator.
2. Confirm that all clock sources other than the sub-clock oscillator are stopped.
3. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
4. Set the SOPCCR.SOPCM bit to 1 (Subosc-speed mode).
5. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).

(Operation is now in Subosc-speed mode)

(2) Switching from a lower power mode to a higher power mode

Example 1: From Subosc-speed mode to High-speed mode

(Operation begins in Subosc-speed mode)

1. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
2. Set the SOPCCR.SOPCM bit to 0 (High-speed mode).
3. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
4. Turn on the required oscillator in High-speed mode.
5. Set the frequency of each clock lower than or equal to the maximum operating frequency for High-speed mode.

(Operation is now in High-speed mode)

Example 2: From Low-speed mode to High-speed mode

(Operation begins in Low-speed mode)

1. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
2. Set the OPCCR.OPCM[1:0] bits to 00b (High-speed mode).
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any required oscillator in High-speed mode.
5. Set the frequency of each clock lower than or equal to the maximum operating frequency for High-speed mode.

(Operation is now in High-speed mode)

10.6 Sleep Mode

10.6.1 Transitioning to Sleep Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 0, the MCU enters Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the MCU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Counting by IWDT stops when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep mode, Software Standby mode, or Snooze mode).

Counting by IWDT continues when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep mode, Software Standby mode, or Snooze mode).

Counting by WDT stops when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in Sleep mode). Similarly, counting by WDT stops when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSLTPR.SLCSTP bit is 1 (WDT stops in Sleep mode).

Counting by WDT continues when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in Sleep mode). Similarly, counting by WDT continues when the MCU enters Sleep mode while the WDT is in register start mode and the WDCSTPR.SLCSTP bit is 0 (WDT does not stop in Sleep mode).

10.6.2 Canceling Sleep Mode

Sleep mode is canceled by:

- An interrupt
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- An SRAM parity error reset
- A bus master MPU error reset
- A TrustZone error reset
- A reset caused by an IWDT or a WDT underflow

The operations are as follows:

1. Canceling by an interrupt
When an interrupt request is generated, Sleep mode is canceled and the MCU starts the interrupt handling.
2. Canceling by RES pin reset
When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in [section 43, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset
 - Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Sleep mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
 - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
4. Canceling by WDT reset
Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in Sleep mode even when counting in Normal mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
 - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1
 - OFS0.WDTSTRT = 1 (register start mode) and WDCSTPR.SLCSTP = 1.
5. Canceling by other resets available in Sleep mode
Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see [section 13, Interrupt Controller Unit \(ICU\)](#).

10.7 Software Standby Mode

10.7.1 Transitioning to Software Standby Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 1 and DPSBYCR.DPSBY bit is 0, the MCU enters Software Standby mode. In this mode, the CPU, most of the on-chip peripheral functions and the oscillators stop. However, the contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions and the I/O ports are retained. Software Standby mode allows significant reduction in power consumption because most of the oscillators stops in this mode. [Table 10.2](#) shows the status of each on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode make the MCU to cancel Software Standby mode. See [Table 10.3](#) for available interrupt sources and [section 13.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0](#), [section 13.2.19. WUPEN1 : Wake Up interrupt enable register 1](#) for information on waking up the MCU from Software Standby mode. If using an interrupt to cancel

an interrupt, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction except when using DTC in Snooze mode. If DTC is required in Snooze mode, set DTCST.DTCST bit to 1 before executing a WFI instruction.

Counting by the IWDT stops if the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep, Software Standby or Snooze mode).

Counting by the IWDT continues if the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep, Software Standby or Snooze mode).

WDT stops counting when the MCU enters Software Standby mode because the PCLKB stops.

Do not enter Software Standby mode while OSTDCR.OSTDE = 1 (oscillation stop detection function is enabled). To enter Software Standby mode, execute a WFI instruction after disabling the oscillation stop detection function (OSTDCR.OSTDE = 0). In case of executing WFI instruction while OSTDCR.OSTDE = 1, the MCU enters Sleep mode even if SBYCR.SSBY = 1.

Do not enter Software Standby mode while the flash memory is programming or erasing. To enter Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

[Table 10.6](#) shows the setting of the related control bits and the modes to enter after executing WFI instruction.

Table 10.6 Bit settings that affect modes when executing a WFI instruction

		SBYCR.SSBY and PSBYCR.DPSBY bit settings			
		SSBY = 0, DPSBY = 0	SSBY = 0, DPSBY = 1	SSBY = 1, DPSBY = 0	SSBY = 1, DPSBY = 1
OSTDCR.OSTDE	0	Sleep	Sleep	Software Standby	Deep Software Standby
	1			Sleep	Sleep
FENTRYR.FENTRYC FENTRYR.FENTRYD	0	Sleep	Sleep	Software Standby	Deep Software Standby
	1			Sleep	Sleep
OFS0.IWDTSTPCTL	0	Sleep	Sleep	Software Standby	Software Standby
	1				Deep Software Standby
LVD1CR0.RI	0	Sleep	Sleep	Software Standby	Deep Software Standby
	1				Software Standby
LVD2CR0.RI	0	Sleep	Sleep	Software Standby	Deep Software Standby
	1				Software Standby

10.7.2 Canceling Software Standby Mode

Software Standby mode is canceled by:

- An available interrupt shown in [Table 10.3](#)
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- A reset caused by an IWDT underflow.

On exiting Software Standby mode, the oscillators that operate before the transition to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See [section 13.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0](#), [section 13.2.19. WUPEN1 : Wake Up interrupt enable register 1](#) for information on how to wake up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

1. Canceling by an interrupt

When an available interrupt request (see [Table 10.3](#)) is generated, an oscillator that operates before the transition to Software Standby mode restarts. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode and starts the interrupt handling.

2. Canceling by a RES pin reset

When the RES pin is driven low, the MCU enters the reset state, and the oscillators whose default status is operating, start the oscillation. Be sure to keep the RES pin low for the time period specified in [section 43, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

3. Canceling by a power-on reset

Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

4. Canceling by a voltage monitor reset

Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.

5. Canceling by IWDG reset

Software Standby mode is canceled by an internal reset generated by an IWDG underflow and the MCU starts the reset exception handling. However, IWDG stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following condition:

- $OFS0.IWDTSTRT = 0$ and $OFS0.IWDTSTPCTL = 1$.

10.7.3 Example of Software Standby Mode Application

[Figure 10.4](#) shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode by a rising edge of the IRQn pin.

In this example, an IRQn pin interrupt is accepted with the $IRQCRI.IRQMD[1:0]$ bits of the ICU set to 00b (falling edge) in Normal mode, and the $IRQCRI.IRQMD[1:0]$ bits are set to 01b (rising edge). After that, the $SBYCR.SSBY$ bit is set to 1 and a WFI instruction is executed. As a result, entry to Software Standby mode completes and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#). The oscillation stabilization time in [Figure 10.4](#) is specified in [section 43, Electrical Characteristics](#).

Figure 10.4 Example of Software Standby mode application

10.8 Snooze Mode

10.8.1 Transition to Snooze Mode

Figure 10.5 Snooze mode entry configuration

When the snooze control circuit accepts an available snooze request in Software Standby mode, the MCU transfers to Snooze mode. In this mode, some peripheral modules operate without waking the CPU. The peripheral modules that can operate in Snooze mode are shown in Table 10.2. Also, DTC operation in Snooze mode can be selected by the setting of SNZCR.SNZDTCEN bit.

Table 10.7 shows the Snooze requests that switch the MCU from Software Standby mode to Snooze mode. To use the listed Snooze requests as a trigger to switch to Snooze mode, the corresponding SNZREQENn bit of the SNZREQCRn register or RXDREQEN bit of SNZCR register must be set before entering Software Standby mode.

Table 10.7 Available snooze requests to switch to Snooze mode

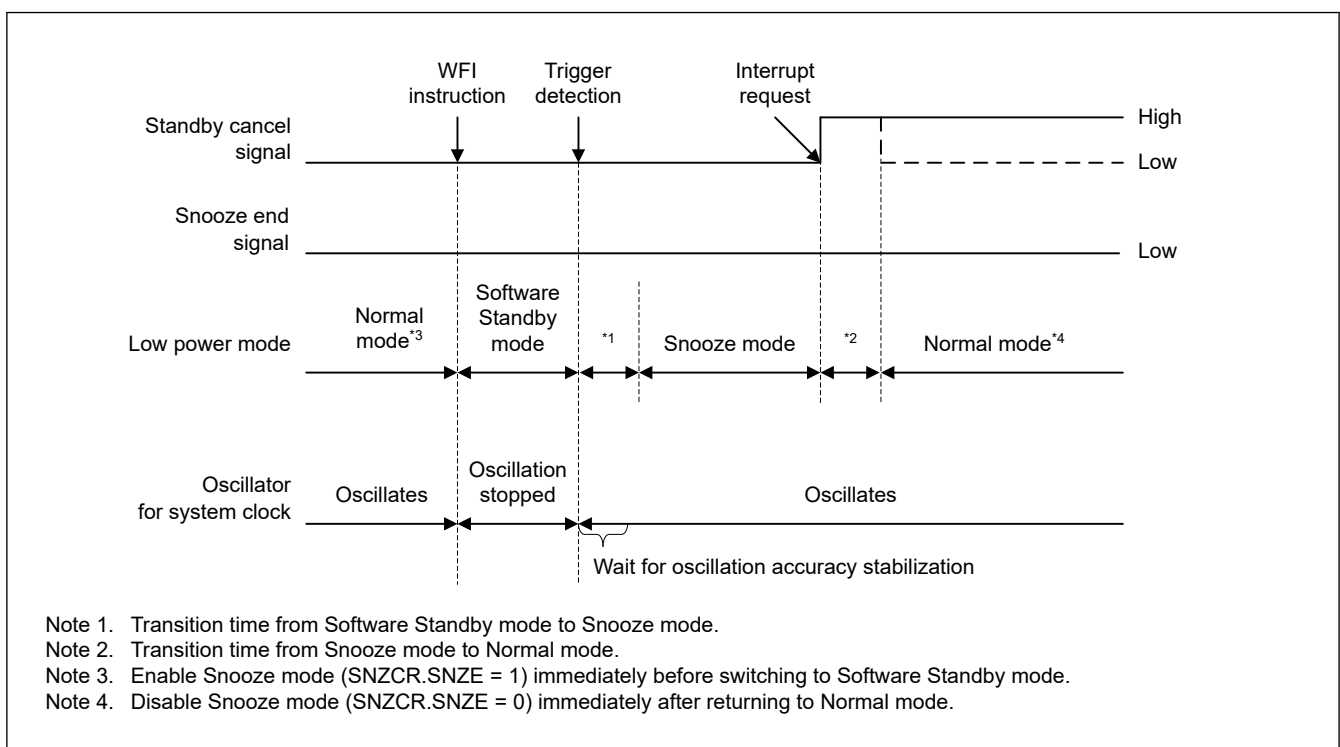

Snooze request	Control Register	
	Register	Bit*1 *3
PORT_IRQn (n = 0 to 9, 13)	SNZREQCR0	SNZREQENn (n = 0 to 9, 13)
RTC_ALM	SNZREQCR0	SNZREQEN24
RTC_PRD	SNZREQCR0	SNZREQEN25
AGT1_AGTI	SNZREQCR0	SNZREQEN28
AGT1_AGTCMAI	SNZREQCR0	SNZREQEN29
AGT1_AGTCMBI	SNZREQCR0	SNZREQEN30
AGT3_AGTI	SNZREQCR1	SNZREQEN0
AGT3_AGTCMAI	SNZREQCR1	SNZREQEN1
AGT3_AGTCMBI	SNZREQCR1	SNZREQEN2
RXD0 falling edge	SNZCR	RXDREQEN*2

- Note 1. Do not enable multiple snooze requests at the same time.
- Note 2. Do not set the RXDREQEN bit to 1 except in asynchronous mode.
- Note 3. When AGT1 is used for Snooze request factor, Snooze end factor is not allowed to set AGT3 (only AGT1).
When AGT3 is used for Snooze request factor, Snooze end factor is not allowed to set AGT1 (only AGT3).

Clear the DMAST.DMST and DTCST.DTCST bits to 0 before executing a WFI instruction, except when using the DTC in Snooze mode. If the DTC is required in Snooze mode, set the DTCST.DTCST bit to 1 before executing a WFI instruction.

10.8.2 Canceling Snooze Mode

Snooze mode is canceled by an interrupt request that is available in Software Standby mode or a reset. Table 10.3 shows the requests that can be used to exit each mode. After canceling the Snooze mode, the MCU enters Normal mode and proceeds with exception processing for the given interrupt or reset. The action triggered by the interrupt requests, selected in SELSR0, cancels Snooze mode. Interrupt canceling Snooze mode must be selected in IELSRn to link to the NVIC for the corresponding interrupt handling. See section 13, Interrupt Controller Unit (ICU) for information on SELSR0 and IELSRn registers.

- Note 1. Transition time from Software Standby mode to Snooze mode.
- Note 2. Transition time from Snooze mode to Normal mode.
- Note 3. Enable Snooze mode (SNZCR.SNZE = 1) immediately before switching to Software Standby mode.
- Note 4. Disable Snooze mode (SNZCR.SNZE = 0) immediately after returning to Normal mode.

Figure 10.6 Canceling of Snooze mode when an interrupt request signal is generated

10.8.3 Returning from Snooze Mode to Software Standby Mode

Table 10.8 shows the snooze end request that can be used as triggers to return to Software Standby mode. The snooze end requests are available only in Snooze mode. If the requests are generated when the MCU is not in Snooze mode, they are ignored. When multiple requests are selected, each of the requests invokes transition to Software Standby mode from Snooze mode.

Table 10.9 shows the snooze end conditions that consist of the snooze end requests and the conditions of the peripheral modules. The SCI0, ADC12, and DTC modules can keep the MCU in Snooze mode until they complete the operation. However, an AGTn (n = 1, 3) underflow as a trigger to return to Software Standby mode cancels Snooze mode without waiting for the completion of SCI0 operation.

Figure 10.7 shows the timing diagram for the transition from Snooze mode to Software Standby mode. This mode transition occurs according to which snooze end requests are set in the SNZEDCR0 register. A snooze request is cleared automatically after returning to Software Standby mode.

Table 10.8 Available snooze end requests (triggers to return to Software Standby mode)

Peripheral Module	Snooze end request	Enable/Disable Control	
		Register	Symbol
AGT1	AGT1 underflow (AGT1_AGTI)	SNZEDCR0	AGTUNFED
DTC	Last DTC transmission completion (DTC_COMPLETE)	SNZEDCR0	DTCZRED
DTC	Not Last DTC Transmission Completion (DTC_TRANSFER)	SNZEDCR0	DTCNZRED
ADC120	Window A/B compare match (ADC120_WCMPPM)	SNZEDCR0	AD0MATED
ADC120	Window A/B compare mismatch (ADC120_WCMPUM)	SNZEDCR0	AD0UMTED
SCI0	SCI0 address mismatch (SCI0_DCUF)	SNZEDCR0	SCI0UMTED
AGT3	Underflow or measurement complete (AGT3_AGTI)	SNZEDCR1	AGT3UNFED

Table 10.9 Snooze end conditions

Operating module when a snooze end request occurs	Snooze end request	
	AGT1/AGT3 underflow	Other than AGT1/AGT3 underflow
DTC	The MCU transfers to the Software Standby mode after all of the modules listed in this table complete operation.	The MCU transfers to the Software Standby mode after all of the modules listed to the left of this column complete the operation.
ADC12n		
SCI0	The MCU transfers to the Software Standby mode immediately after the snooze end request is generated.	
Other than specified	The MCU transfers to the Software Standby mode immediately after a snooze end request is generated.	

Note: If the DTC is used to activate the ADC12n, or SCI, the MCU transitions to Software Standby mode immediately after a snooze end request is generated.

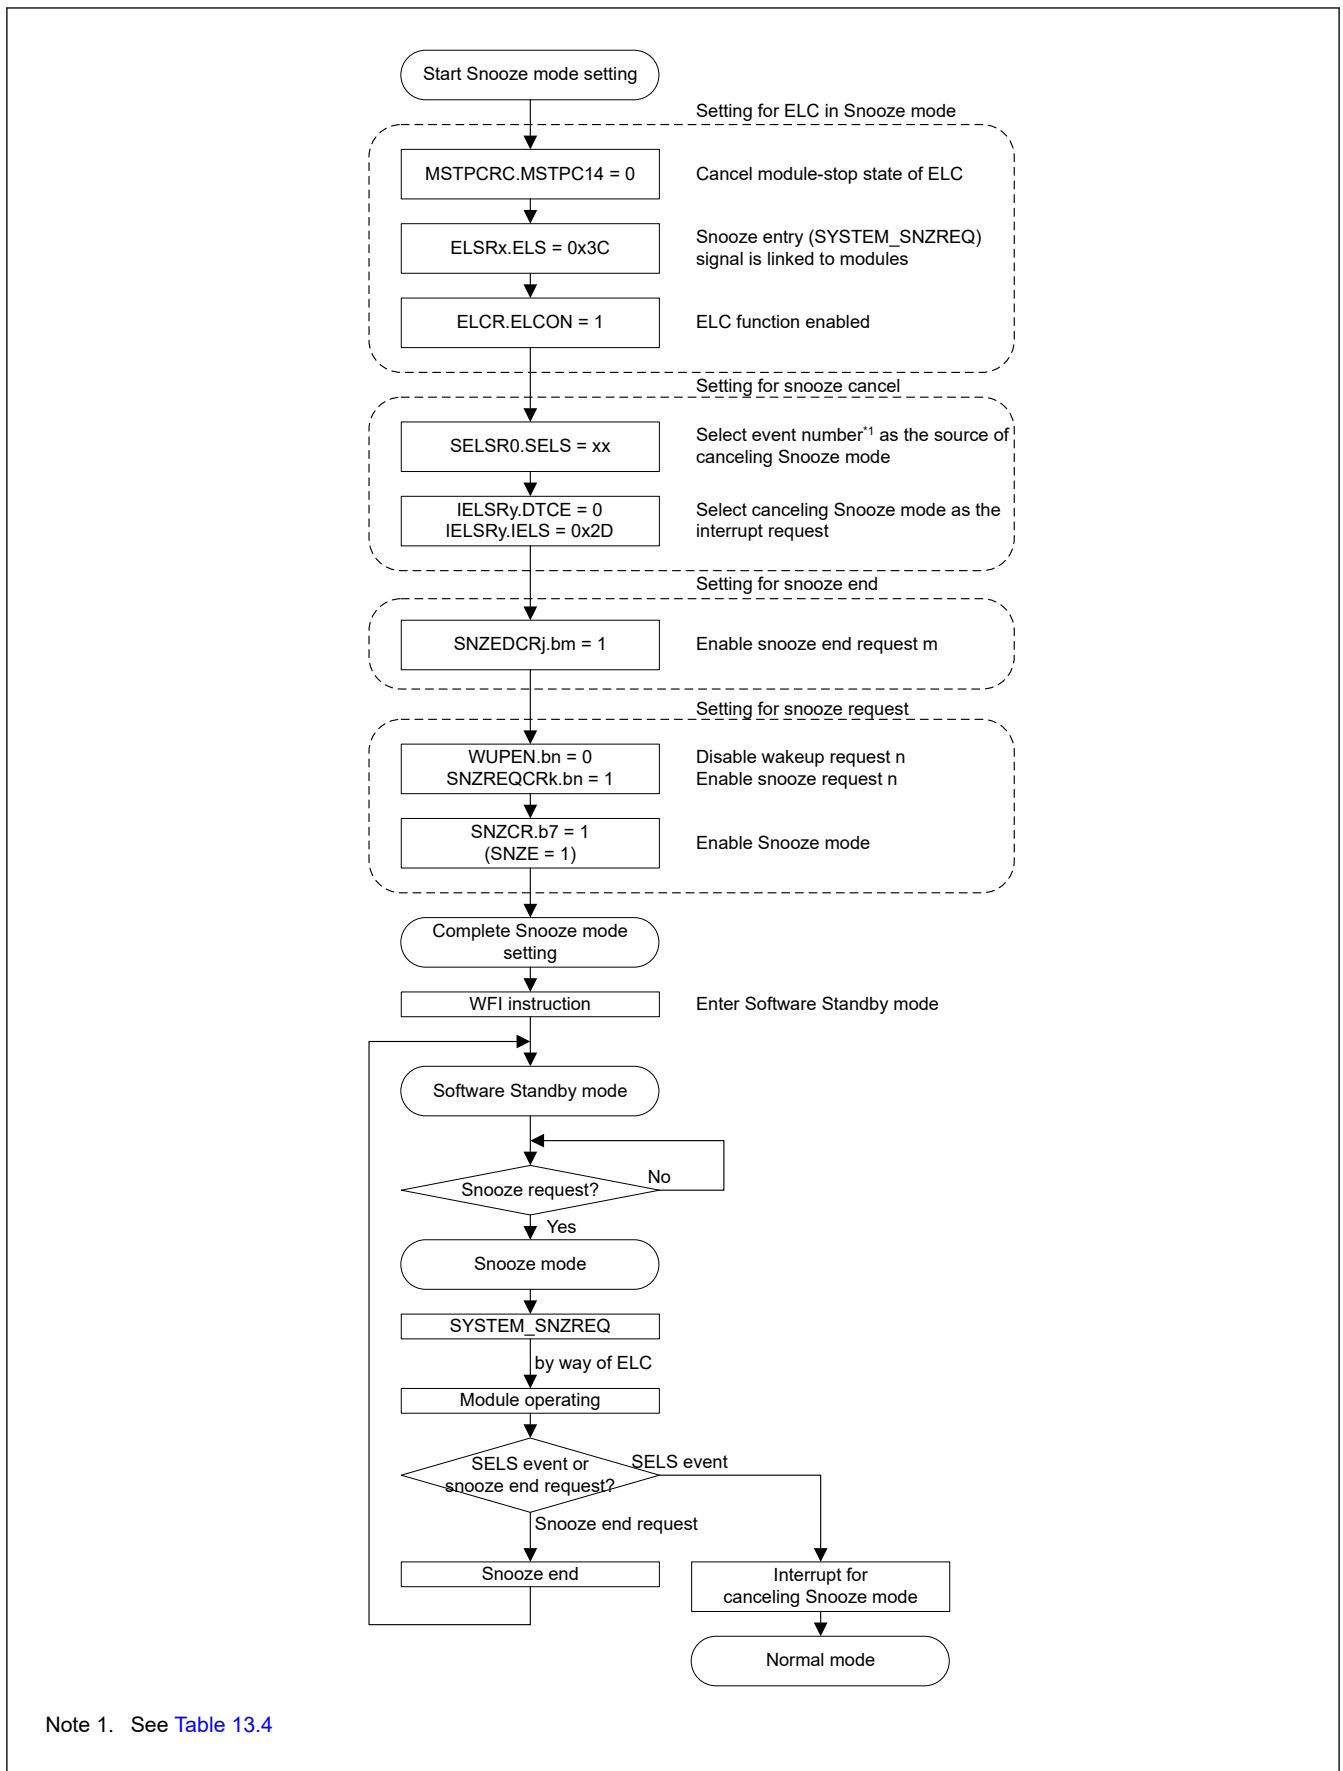

Figure 10.7 Canceling of Snooze mode when an interrupt request signal is not generated

10.8.4 Snooze Operation Example

Figure 10.8 shows an example setting for using ELC in Snooze mode.

Note 1. See [Table 13.4](#)

Figure 10.8 Setting example of using ELC in Snooze mode

The MCU can transmit and receive data in SCI0 asynchronous mode without CPU intervention. When using the SCI0 in Snooze mode, use either High-speed mode or Low-speed mode.

Do not use Subosc-speed mode. [Table 10.10](#) shows the maximum transfer rate of SCI0 in Snooze mode.

Table 10.10 HOCO: $\pm 1.4\%$ ($T_a = -20^\circ\text{C}$ to 85°C) (Unit: bps)

Maximum division ratio of ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and TRCLK	HOCO frequency					
	LOCO is not operating			LOCO is operating		
	16 MHz	18 MHz	20 MHz	16 MHz	18 MHz	20 MHz
1	2400			4800		
2						
4						
8						
16						
32	1200			2400		
64						

When using SCI0 in Snooze mode, use the following setting: BGDM = 0, ABCS = 0, ABCSE = 0. See [section 27, Serial Communications Interface \(SCI\)](#) for information on these bits.

[Figure 10.9](#) shows a setting example for using SCI0 in Snooze mode entry.

Figure 10.9 Setting example of using SCI0 in Snooze mode entry

10.9 Deep Software Standby Mode

10.9.1 Transitioning to Deep Software Standby Mode

When a WFI instruction is executed with the SBYCR.SSBY and DPSBYCR.DPSBY bits set to 1, the MCU enters Deep Software Standby mode. See [Table 10.6](#) for the setting of the related control bits. In this mode, the CPU, on-chip peripheral functions (except for RTC alarm, RTC interval, and USB suspend/resume detecting unit), SRAM (except for standby RAM), and all oscillators (except for Sub-clock oscillator and Low-speed on-chip oscillator) are stopped. Also because the internal power supply to these modules is stopped, power consumption is remarkably reduced. The contents of all CPU registers and internal peripheral modules (except for RTC alarm, RTC interval, and USB suspend/resume detecting unit) become undefined.

Data in the standby SRAM are preserved if the setting of the DEEPCUT[1:0] bits are 00b. If the setting of the DEEPCUT[1:0] bits are 01b, the internal power supply to the standby SRAM and the USB resume detecting unit is cut off, reducing power consumption. Data in the standby SRAM becomes undefined at this time. If the setting of the DEEPCUT[1:0] bits are 11b, the internal power supply to the standby SRAM, and the USB resume detecting unit is cut off, the LVD is stopped, and the low-power-consumption function of the power-on reset circuit is enabled, so power consumption is further reduced. For details, see [section 43, Electrical Characteristics](#).

When the MCU enters Deep Software Standby mode while the IWDTC is in auto start mode and the OFS0.IWDTCSTPCTL bit is 1, power supply to the IWDTC-dedicated clock and the IWDTC is cut off, and counting by the IWDTC stops.

When OFS0.IWDTCSTPCTL bit is 0, the MCU enters Software Standby mode instead of Deep Software Standby mode, regardless of the setting of OFS0.IWDTCSTRT bit or DPSBYCR.DPSBY bit. If OFS0.IWDTCSTPCTL bit is 0 while OFS0.IWDTCSTRT bit is 0 (auto start mode), IWDTC-dedicated clock and IWDTC continues the operation.

When LVD1CR0.RI = 1 (voltage monitor 1 reset selected) or LVD2CR0.RI = 1 (voltage monitor 2 reset selected), the MCU enters Software Standby mode instead of Deep Software Standby mode. The I/O port states are the same as in Software Standby mode.

Note: Conditions on the DTC, DMAC, and IWDTC for transitioning to Software Standby mode should be met before the WFI instruction is executed. For details, see [section 10.7, Software Standby Mode](#).

10.9.2 Cancelling Deep Software Standby Mode

Deep Software Standby mode is canceled by:

- An interrupt shown in [Table 10.3](#)
- A RES pin reset
- A power-on reset
- A voltage monitor 0 reset.

(1) Cancelling by an interrupt

Cancelling by interrupts is controlled by DPSIERn (n = 0 to 3) and DPSIFRn (n = 0 to 3). When a Deep Software Standby Cancelling interrupt is generated, the corresponding flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising edge or falling edge can be selected by DPSIEGRn (n = 0 to 2). The interrupts for which an edge can be selected are the NMI, IRQn-DS (n = 0, 1, 4 to 9), voltage monitor 1, and voltage monitor 2 interrupts. When a Deep Software Standby mode canceling request occurs, the internal power is supplied and MOCO starts oscillating, and an internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is supplied to the entire MCU and Deep Software Standby reset is canceled. The MCU starts reset exception handling.

When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

(2) Cancelling by RES pin reset

When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters the reset state. Keep the RES pin low for the time specified in [section 43, Electrical Characteristics](#). When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

(3) Cancelling by a power-on reset

Deep Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

(4) Cancelling by a voltage monitor 0 reset

Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit and the MCU starts the reset exception handling.

10.9.3 Pin States when Deep Software Standby mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states from Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, and reset exception handling starts immediately. The DPSBYCR.IOKEEP bit setting determines whether to initialize the I/O ports or to retain the I/O ports states for Software Standby mode. The following is the state of the I/O ports for each bit setting:

- When the DPSBYCR.IOKEEP bit = 0
I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1
Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, the I/O ports retain their states from Software Standby mode regardless of the MCU internal state. The I/O ports states remain unchanged from Software Standby mode even when settings are made to the I/O ports or peripheral modules. The retained I/O ports states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state. The DPSBYCR.IOKEEP bit is not initialized by any internal reset generated when Deep Software Standby mode is canceled.

10.9.4 Example of Deep Software Standby Mode Application

(1) Entering and exiting Deep Software Standby mode

Figure 10.10 shows an example where a transition to Deep Software Standby mode is made at the falling edge of the IRQn-DS pin, and exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge). After the DPSIEGRy.DIRQnEG (y = 0 or 1, n = 0,1,4 to 9) bit is set to 1 (rising edge) and the SBYCR.SSBY bit and DPSBYCR.DPSBY bit are both set to 1, the WFI instruction is executed. As a result, the MCU transitions to Deep Software Standby mode. Deep Software Standby mode is then canceled on the rising edge of the IRQn-DS pin.

Figure 10.10 Example of Deep Software Standby Mode Application

10.9.5 Usage Flow for Deep Software Standby Mode

Figure 10.11 shows an example flow for using Deep Software Standby mode.

In this example, the RSTSR0.DPSRSTF flag of the reset function is read after the reset exception handling to determine whether a reset was generated by the RES pin or by the cancellation of Deep Software Standby mode.

For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made.

For a reset by cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is cleared to 0 after the I/O port settings are made.

Figure 10.11 Example flow for using Deep Software Standby mode

10.10 Usage Notes

10.10.1 Register Access

(1) Invalid register write accesses during specific modes or transitions

Do not write to registers under any of the conditions listed in this section.

[Registers]

- All registers with a peripheral name of SYSTEM.

[Conditions]

- OPCCR.OPCMTSF = 1 or SOPCCR.SOPCMTSF = 1 (during transition of the operating power control mode)

- During the time period from executing a WFI instruction to returning to Normal mode
- FENTRYR.FENTRY0 = 1 or FENTRYR.FENTRYD = 1 (flash P/E mode, data flash P/E mode)

(2) Valid setting for the clock-related registers

Table 10.11 and Table 10.12 show the valid settings of the clock-related registers in each operating power control mode. Do not write any value other than the valid setting. Each register has certain prohibited settings under conditions other than those related to the operating power control modes. See section 8, [Clock Generation Circuit](#) for another condition of each register.

Table 10.11 Valid settings for the clock-related registers (1)

Mode	Valid settings								
	SCKSCR. CKSEL[2:0] CKOCR. CKOSEL[2:0]	SCKDIVC R. FCK[2:0] ICK[2:0]	PLLCR. PLLSTP	PLL2CR. PLL2STP	HOCOVR. HCSTP	MOCOVR. MCSTP	LOCOVR. LCSTP	MOSCCR. MOSTP	SOSCCR. SOSTP
High-speed	000b (HOCO) 001b (MOCO) 010b (LOCO) 011b (Main clock) 100b (Sub clock) 101b (PLL) *1	000b (1/1) 001b (1/2) 010b (1/4) 011b (1/8) 100b (1/16) 101b	0 (operating) 1 (stop)	0 (operating) 1 (stop)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)	0 (operating) 1 (stopped)
Low-speed	000b (HOCO) 001b (MOCO) 010b (LOCO) 011b (Main clock) 100b (Sub clock)	(1/32) 110b (1/64)	1 (stop)	1 (stop)					
Subosc-speed	010b (LOCO) 100b (SOSC)	000b (1/1)	1 (stop)	1 (stop)	1 (stopped)	1 (stopped)	0 (operating) 1 (stopped)	1 (stopped)	0 (operating) 1 (stopped)

Note 1. SCKSCR.CKSEL[2:0] only

Table 10.12 Valid settings for the clock-related registers (2)

Operating oscillator	Valid settings	
	SOPCCR.SOPCM	OPCCR.OPCM[1:0]
PLL, PLL2	0	00b
High-speed on-chip oscillator	0	00b, 11b
Middle-speed on-chip oscillator		
Main clock oscillator		
Low-speed on-chip oscillator	0, 1	00b, 11b
Sub-clock oscillator		
IWDT-dedicated on-chip oscillator		

(3) Invalid register write accesses in subosc-speed mode

Do not write to registers under the listed condition in this section.

[Registers]

- SCKSCR, OPCCR.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode).

(4) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE

(5) Invalid register write accesses in Snooze mode

Do not write to registers listed in this section in Snooze mode. They must be set before entering Software Standby mode.

[Registers]

- SNZCR, SNZEDCRn, SNZREQCRn.

(6) Invalid write access to FLWT.FLWT[2:0]

Do not write any value other than 000b to the FLWT.FLWT[2:0] bits under the listed condition.

[Conditions]

- SOPCCR.SOPCM = 1 (Subosc-speed mode)

(7) Invalid write access when PRCR.PRC1 is 0

Do not write to registers listed in this section when the PRCR.PRC1 bit is 0.

[Registers]

- SBYCR, SNZCR, SNZEDCRn, SNZREQCRn, OPCCR, SOPCCR, DPSBYCR, DPSWCR, DPSIERn, DPSIFRn, DPSIGRn, SYOCDRCR, LDOSCR, PL2LDOSCR

(8) Invalid write access when PRCR.PRC4 bit is 0

Do not write to registers listed in this section when the PRCR.PRC4 bit is 0.

[Registers]

- LPMSAR, DPFSAR

10.10.2 I/O Port pin states

The I/O port pin states in Software Standby mode, Deep Software Standby and Snooze mode, unless modifying in Snooze mode, are the same before entering the modes. Therefore, power consumption is not reduced while the output signals are held high.

10.10.3 Module-Stop State of DTC, DMAC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see [section 16, DMA Controller \(DMAC\)](#) and [section 17, Data Transfer Controller \(DTC\)](#).

10.10.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If setting the module-stop bit while an interrupt request is generated, a CPU interrupt source or a DTC or DMAC startup source cannot be cleared. Always disable the associated interrupts before setting the module-stop bits.

10.10.5 Input Buffer Control by DIRQnE Bit

Setting the DPSIERy.DIRQnE (y = 0 or 1, n = 0, 1, 4 to 9) bit to 1 enables the associated input buffer of the IRQn-DS (n = 0, 1, 4 to 9) pins. Although inputs to these pins are sent to the DPSIFRy.DIRQnF (y = 0 or 1, n = 0, 1, 4 to 9) bits, they are not sent to the interrupt controller (ICU), peripheral modules, and I/O ports.

10.10.6 Transitioning to Low Power Modes

Because the MCU does not support wakeup by events, do not enter the low power modes such as Sleep mode, Software Standby mode or Deep Software Standby Mode by executing a WFE instruction. Also, do not set the SLEEPDEEP bit of the System Control Register in the Cortex-M33 core because the MCU does not support low power modes by SLEEPDEEP.

10.10.7 Timing of WFI Instruction

It is possible for the WFI instruction to be executed before I/O register write is completed, in which case operation might not be as intended. This can happen if the WFI is placed immediately after a write to an I/O register. To avoid this problem, read back the register that was written to confirm that the write completed.

10.10.8 Writing to the WDT/IWDT Registers by DTC or DMAC in Sleep Mode or Snooze Mode

Do not write to the WDT or IWDT registers by the DTC or DMAC while WDT or IWDT is stopped after entering Sleep mode or Snooze mode.

10.10.9 Oscillators in Snooze Mode

Oscillators that stop on entering Software Standby mode automatically restart when a trigger for switching to Snooze mode is generated. The MCU does not enter Snooze mode until all the oscillators stabilize. If in Snooze mode, you must disable oscillators that are not required in Snooze mode before entering Software Standby mode. Otherwise, the transition from Software Standby mode to Snooze mode takes longer.

10.10.10 Snooze Mode Entry by RXD0 Falling Edge

When the SNZCR.RXDREQEN bit is 1, the falling edge of RXD0 pin is used to switch MCU from Software Standby mode to Snooze mode when using UART of SCI0 in Snooze mode. In this case an interrupt such as SCI0_ERI, SCI0_RXI or an address mismatch event is used as the source for canceling Snooze mode. However noise on the RXD0 pin might cause the MCU to transfer from Software Standby mode to Snooze mode unexpectedly. In this case if the MCU does not receive RXD0 data after the noise, an interrupt such as SCI0_ERI or SCI0_RXI, or an address mismatch event is not generated and the MCU stays in Snooze mode. This can be avoided by using AGTn (n = 1, 3) underflow interrupt to return to Software Standby mode or Normal mode unless otherwise UART receive data is completed before AGTn (n = 1, 3) underflow. However, do not use the AGTn (n = 1, 3) underflow as a source to return to Software Standby mode during an UART communication. This causes the UART to stop the operation in a half-finished state.

10.10.11 Using UART of SCI0 in Snooze Mode

When using UART in Snooze mode, ensure that the snooze request (RXD0 falling edge) does not conflict with the wakeup requests set by the WUPEN register, otherwise UART cannot be guaranteed.

When using UART in Snooze mode, the following conditions must be satisfied:

- The clock source must be HOCO
- MOCO, PLL, PLL2, and the main clock oscillator must be stopped before entering Software Standby mode
- The RXD0 pin must be kept high before entering Software Standby mode
- A transition to Software Standby mode must not occur during an SCI0 communication
- The MSTPCRC.MSTPC0 bit must be 1 before entering Software Standby mode.

10.10.12 Conditions of A/D Conversion Start in Snooze Mode

ADC120 can only be triggered by the ELC in Snooze mode. Do not use software trigger or ADTRGn (n = 0) pin.

10.10.13 ELC Events in Snooze Mode

This section lists available ELC events in Snooze mode. Do not use any other events. If starting peripheral modules for the first time after entering Snooze mode, the Event Link Setting Register (ELSRn) must set a Snooze mode entry event (SYSTEM_SNZREQ) as the trigger.

- Snooze mode entry (SYSTEM_SNZREQ)
- DTC transfer end (DTC_DTCEND)
- ADC120 window A/B compare match (ADC120_WCMPPM)
- ADC120 window A/B compare mismatch (ADC120_WCMPUM)
- Data operation circuit interrupt (DOC_DOPCI).

10.10.14 Module-Stop Bit Write Timing

It is possible that access to I/O register may be executed before the corresponding module-stop bit write completed. In this case, access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module-stop bit that was written to confirm that the write completed.

10.10.15 Sleep-on-exit Function

There are 2 ways to transition to low power modes. One is WFI instruction and the other is Sleep-on-exit. When Sleep-on-exit is used for transition to low power modes, WFI instruction comments written in User's Manual Hardware is applicable to Sleep-on-exit.

10.10.16 Interruption During the Transition to Low Power Modes

If the software meets the applicable condition listed in [section 10.10.16.1. Applicable Condition and Notes](#), you may not be able to enter the intended low power mode and transit to unintended states described in [section 10.10.16.1. Applicable Condition and Notes](#).

If the unintended states described in [section 10.10.16.1. Applicable Condition and Notes](#) notes cannot be tolerated, use [section 10.10.16.2. Workaround](#).

10.10.16.1 Applicable Condition and Notes

(1) Applicable Condition

Transition to Software Standby mode is started by a trigger (WFI instruction or SLEEPONEXIT) with SBYCR.SSBY = 1 set to use Software Standby, Snooze, or Deep Software Standby mode.

During the specified interval (ICLK 2 cycle) of transitioning to Software Standby mode, one of the following interrupt requests that is not an interrupt source to return from Software Standby mode is accepted by CPU.

1. SysTick interrupt (all of the following are applicable)
 - Exception number 15 of Interrupt vector table
 - Interrupt requests are not masked by Base Priority Mask Register (BASEPRI) (BASEPRI = 0 or BASEPRI > SHPR3.PRI_15)
2. Maskable interrupt requests that are not interrupt source to return from Software Standby mode (all of the following are applicable)
 - By WUPEN in exception numbers 16 to 111 in the interrupt vector table those not permitted to return from Software Standby mode
 - Interrupt requests are enabled by Interrupt Set-Enable Register (NVIC_ISERn)
 - Interrupt requests are not masked by Base Priority Mask Register (BASEPRI) (BASEPRI = 0 or BASEPRI > NVIC_IPRn.PRI_N)
3. Non-maskable interrupt request triggered by the following sources
 - SRAM parity error
 - SRAM ECC failure
 - MPU bus master error
 - MPU bus slave error
 - TrustZone filtering error

(2) Notes

If the above conditions are met, the MCU will transit to following unintended states. These unintended states can be resolved by a reset or returning to Normal mode with an interrupt request of an interrupt source to return from Software Standby mode.

1. When transitioning to Software Standby mode (SBYCR.SSBY = 1, DPSBYCR.DPSBY = 0, SNZCR.SNZE = 0) Only CPU clock is stopped, and the remaining clocks continue to operate as they were prior to transitioning Software Standby mode.
 - As before the transition to Software Standby mode is started, depending on the setting, timer or other peripherals continue to operate, and an interrupt request related to the peripheral is generated.
 - Because the IWDT and WDT clock-stop function is disabled, a reset or an interrupt for the IWDT and WDT is generated depending on the settings before starting the transition to Software Standby mode.

- Interrupt requests are held in IR flag (IELSRn, DELSRn).
2. When transitioning to Snooze mode (SBYCR.SSBY = 1, DPSBYCR.DPSBY = 0, SNZCR.SNZE = 1)
 The transition to Snooze mode is not possible, and the states shown in “1) When transitioning to Software Standby mode” is continued.
 To return to Normal mode by an interrupt source (SELSR0) from Snooze mode depends on whether the interrupt request (SELSR0) to returning from Snooze mode can be generated while DTC operation is disabled.
 If DTC operation is disabled (SNZCR.SNZDTCEN = 0) in Snooze mode, Normal mode can be returned because an interrupt source for the interrupt source (SELSR0) to return from Snooze mode can be generated.
 If DTC operation is enabled (SNZCR.SNZDTCEN = 1) in Snooze mode, the Normal mode cannot be returned because an interrupt request for the interrupt source (SELSR0) to return from Snooze mode cannot be generated.
 3. When transitioning to Deep Software Standby mode (SBYCR.SSBY = 1, DPSBYCR.DPSBY = 1)
 The transition to Deep Software Standby mode is not possible, and the state shown in “1. When transitioning to Software Standby mode” is continued.
 As for the interrupt source (DPSIERn) settings to returning from Deep Software Standby mode, these interrupt requests can return to Normal mode only when the interrupt source (WUPEN) to return from Software Standby mode is set.

10.10.16.2 Workaround

(1) Workaround

To avoid the unintended states described above, apply the following before the terms for transition to Software Standby mode, Snooze mode, or Deep Software Standby mode are met: (For the setting procedure, see "Setting Procedure for Transition to Software Standby, Snooze, or Deep Software Standby Mode")

1. Disable SysTick interrupt requests.
 Exception number 15 of Interrupt vector table
2. Disable maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
 Exception number 16 to 111 of Interrupt vector table that WUPEN does not allow to return from Software Standby mode.
3. Stop access from the bus master other than the CPU so that the non-maskable interrupt is not triggered by the following sources.
 - SRAM parity error
 - SRAM ECC failure
 - MPU bus master error
 - MPU bus slave error
 - TrustZone filtering error

(2) Setting Procedure for Transition to Software Standby, Snooze, or Deep Software Standby Mode

This section describes procedures for avoiding unintended states.

The handling of interrupt requests after returning from Software Standby or Snooze mode varies depending on the method used to disable the maskable interrupt request. Either one or the other should be applied.

- Procedure A: Disable maskable interrupt request acceptance.
 Any interrupt request that occurs while interrupt request acceptance is disabled is discarded.

Table 10.13 Before transitioning to Software Standby, Snooze, or Deep Software Standby mode (1 of 2)

Step	Description
1	Stop the bus access from the bus master other than CPU.*1
2	Disable the SysTick interrupt request.*2
3	Clear IELSRn in ICU to disable acceptance of maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
4	Read IELSRn in ICU to confirm that IELSRn in ICU has been cleared.

Table 10.13 Before transitioning to Software Standby, Snooze, or Deep Software Standby mode (2 of 2)

Step	Description
5	Transition to Software Standby mode (WFI instruction, SLEEPONEXIT).

Note 1. SRAM parity error interrupt, SRAM ECC error interrupt, MPU bus master error interrupt, MPU bus slave error interrupt, or TrustZone filter error interrupt is enabled as a non-maskable interrupt.

Note 2. Disabling a SysTick interrupt request may cause SysTick interrupt request to be delayed by one cycle of SysTick timer without generating the latest SysTick interrupt request.

Table 10.14 After returning from Software Standby or Snooze mode

Step	Description
1	Enable the SysTick interrupt request.
2	Set IELSRn in ICU to enable acceptance of maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
3	Enable bus access from bus masters other than CPU.

- Procedure B: Disable the maskable interrupt request

The interrupt request generated while the interrupt request is disabled is retained in IELSRn.IR flag. Therefore, after returning from Software Standby or Snooze mode and enabling the maskable interrupt, it is possible to process the interrupt.

Table 10.15 Before transitioning to Software Standby, Snooze, or Deep Software Standby mode

Step	Description
1	Stop the bus access from the bus master other than CPU.*1
2	Disable the SysTick interrupt request.*2
3	Write 1 to the corresponding bit in NVIC_ICERn in CPU to disable maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
4	Execute Data Synchronization Barrier (DSB) instruction.
5	Transition Software Standby mode (WFI instruction, SLEEPONEXIT)

Note 1. SRAM parity error interrupt, SRAM ECC error interrupt, MPU bus master error interrupt, MPU bus slave error interrupt, or TrustZone filter error interrupt is enabled as a non-maskable interrupt.

Note 2. Disabling a SysTick interrupt request may cause SysTick interrupt request to be delayed by one cycle of SysTick timer without generating the latest SysTick interrupt request.

Table 10.16 After returning from Software Standby or Snooze mode

Step	Description
1	Enable the SysTick interrupt request.
2	Write 1 to the corresponding bit in NVIC_ISErN in CPU to enable maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
3	Enable bus access from bus masters other than CPU.

11. Battery Backup Function

11.1 Overview

The MCU provides a battery backup function that maintains partial battery powering in the event of a power loss. Switching between VCC and VBATT, the battery-powered area includes RTC, SOSOC, and backup memory.

During normal operation, the battery-powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

11.1.1 Features of Battery Backup Function

The features include:

- Battery power supply switch
- Backup registers
- Time capture pin detection

11.1.2 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

11.1.3 Backup Registers

The battery-powered area provides 128-byte backup registers. These registers retain data when power is supplied from the VBATT pin even when the VCC pin is in the power-off state.

11.1.4 Time Capture Pin Detection

The RTC detects input level changes on the time capture pin. For more information, see [section 23, Realtime Clock \(RTC\)](#).

Note: When $VCC < V_{DET\text{BATT}}$ and $> (VBATT + 0.6\text{ V})$, the injected current flows from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

Note: You must enable voltage monitor 0 reset to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

[Figure 11.1](#) shows the configuration of the battery backup function.

Figure 11.1 Configuration of the battery backup function

2	NONSEC2	Non-secure Attribute bit 2 Target register: VBTICTLR 0: Secure 1: Non-secure	R/W
15:3	—	These bits are read as 1. The write value should be 1.	R/W
16	NONSEC16	Non-secure Attribute bit 16 Target register: VBTBKRn (n = 0 to 15) 0: Secure 1: Non-secure	R/W
17	NONSEC17	Non-secure Attribute bit 17 Target register: VBTBKRn (n = 16 to 31) 0: Secure 1: Non-secure	R/W
18	NONSEC18	Non-secure Attribute bit 18 Target register: VBTBKRn (n = 32 to 47) 0: Secure 1: Non-secure	R/W
19	NONSEC19	Non-secure Attribute bit 19 Target register: VBTBKRn (n = 48 to 63) 0: Secure 1: Non-secure	R/W
20	NONSEC20	Non-secure Attribute bit 20 Target register: VBTBKRn (n = 64 to 79) 0: Secure 1: Non-secure	R/W
21	NONSEC21	Non-secure Attribute bit 21 Target register: VBTBKRn (n = 80 to 95) 0: Secure 1: Non-secure	R/W
22	NONSEC22	Non-secure Attribute bit 22 Target register: VBTBKRn (n = 96 to 111) 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
23	NONSEC23	Non-secure Attribute bit 23 Target register: VBTBKRn (n = 112 to 127) 0: Secure 1: Non-secure	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The BBFSAR register controls the secure attribute of the battery backup function registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of VBATTMNSCLR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of VBTBER.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of VBTICTLR.

NONSEC16 bit (Non-secure Attribute bit 16)

This bit controls the security attribute of VBTBKRn (n = 0 to 15).

NONSEC17 bit (Non-secure Attribute bit 17)

This bit controls the security attribute of VBTBKRn (n = 16 to 31).

NONSEC18 bit (Non-secure Attribute bit 18)

This bit controls the security attribute of VBTBKRn (n = 32 to 47).

NONSEC19 bit (Non-secure Attribute bit 19)

This bit controls the security attribute of VBTBKRn (n = 48 to 63).

NONSEC20 bit (Non-secure Attribute bit 20)

This bit controls the security attribute of VBTBKRn (n = 64 to 79).

NONSEC21 bit (Non-secure Attribute bit 21)

This bit controls the security attribute of VBTBKRn (n = 80 to 95).

NONSEC22 bit (Non-secure Attribute bit 22)

This bit controls the security attribute of VBTBKRn (n = 96 to 111).

NONSEC23 bit (Non-secure Attribute bit 23)

This bit controls the security attribute of VBTBKRn (n = 112 to 127).

11.2.2 VBATTMNSCLR : Battery Backup Voltage Monitor Function Select Register

Base address: SYSC = 0x4001_E000

Offset address: 0x41D

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	VBATTMNSEL	VBATT Low Voltage Detect Function Select Bit 0: Disables VBATT low voltage detect function 1: Enables VBATT low voltage detect function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

VBATTMNSELR is the register which controls VBATT low voltage detect function.

This register is initialized by all reset sources including Deep Software Standby reset.

VBATTMNSEL bit (VBATT Low Voltage Detect Function Select Bit)

Select VBATT low voltage detect function

Consumption current increases while VBATTMNSEL = 1. So, after monitoring the VBATT voltage level, clear VBATTMNSEL to 0 in order to reduce power consumption of VBATT power supply.

11.2.3 VBATTMONR : Battery Backup Voltage Monitor Register

Base address: SYSC = 0x4001_E000

Offset address: 0x41E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	VBATT MON

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	VBATTMON	VBATT Voltage Monitor Bit Check VBATT voltage level 0 can be read when VBATT Low Voltage Detect Function Select Bit is 0. 0: VBATT ≥ Vbattldet*1 1: VBATT < Vbattldet	R
7:1	—	These bits are read as 0.	R

Note 1. Vbattldet is VBATT low voltage detection level. For more details, see [section 43, Electrical Characteristics](#).

VBATTMONR is the register that can check VBATT voltage level when VBATTMNSELR.VBATTMNSEL = 1 and also VCC is supplied.

This register is initialized by all reset sources including Deep Software Standby reset.

VBATTMON bit (VBATT Voltage Monitor Bit)

Monitor VBATT voltage level

11.2.4 VBTBER : VBATT Backup Enable Register

Base address: SYSC = 0x4001_E000

Offset address: 0x4C0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	VBAE	—	—	—

Value after reset: 0 0 0 0 1 0 0 0 0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	VBAE	VBATT backup register access enable bit 0: Disable to access VBTBKR 1: Enable to access VBTBKR	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

VBAE bit (VBATT backup register access enable bit)

You must write 1 to VBAE before accessing VBTBKR and you must write 0 to VBAE after finishing all access (write or read) to VBTBKR. If you do not write 0 to VBAE, the data of VBTBKR is not kept in VBATT mode.

To access VBTBKR, wait for at least 500 ns after writing 1 to VBAE, and then access VBTBKR.

Before entering the Deep Software Standby mode, you must write 0 to VBAE.

To enter the Deep Software Standby mode, wait for at least 250 ns after writing 0 to VBAE, then enter the Deep Software Standby mode.

If you do not use VBTBKR, you should change VBAE to 0 to reduce power consumption of VBTBKR.

11.2.5 VBTBKR[n] : VBATT Backup Register (n = 0 to 127)

Base address: SYSC = 0x4001_E000

Offset address: 0x500 + 0x001 × n

Bit	Symbol	Function	R/W
7:0	VBTBKR	VBATT Backup Register The value of this register is retained even in VBATT mode. This register is not initialized by any reset sources.	R/W

Note: If the security attribution is configured as Secure,

- Secure access is allowed,
- Non-secure access is ignored, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Table 11.1 VBATT Backup Register

Address	Symbol
0x4001_E500 to 0x4001_E50F	VBTBKR[0] to VBTBKR[15]
0x4001_E510 to 0x4001_E51F	VBTBKR[16] to VBTBKR[31]
0x4001_E520 to 0x4001_E52F	VBTBKR[32] to VBTBKR[47]
0x4001_E530 to 0x4001_E53F	VBTBKR[48] to VBTBKR[63]
0x4001_E540 to 0x4001_E54F	VBTBKR[64] to VBTBKR[79]
0x4001_E550 to 0x4001_E55F	VBTBKR[80] to VBTBKR[95]
0x4001_E560 to 0x4001_E56F	VBTBKR[96] to VBTBKR[111]
0x4001_E570 to 0x4001_E57F	VBTBKR[112] to VBTBKR[127]

11.2.6 VBTICTLR : VBATT Input Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x4BB

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	VCH0INEN
Value after reset:	0	0	0	0	0	x	x	x

Bit	Symbol	Function	R/W
0	VCH0INEN	VBATT CH0 Input Enable 0: RTCIC0 input disable 1: RTCIC0 input enable	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

VBTICTLR is the register that can select VBATT I/O direction as input. This register is not initialized by any reset.

VCHnINEN bits (VBATT CHn Input Enable Bits) (n = 0)

The VCHnINEN bit enables the input direction on the associated VBATT channel.

See [section 19.5.5. I/O Buffer Specification](#).

11.3 Operation

11.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the RTC and sub-clock oscillator from the VBATT pin. When a drop of power supply from VCC pin is detected, the power connection switches from VCC pin to the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DET\text{BATT}}$. This power supply change does not affect the RTC operation.

You must enable voltage monitor 0 reset to use the battery backup function. The RTC supports time capture detection, triggered by a change of the time capture pin input level.

The VBATT pin supplies power to the following modules:

- RTC
- Sub-clock oscillator (including XCIN and XCOU pins)
- VBATT Backup Register

[Table 11.2](#) shows the operating states in VBATT mode.

Table 11.2 Operating States in VBATT Mode (1 of 2)

Operating state	VBATT Mode
Transition condition	Detection of VCC voltage drop
Canceling method other than reset	Detection of VCC voltage rise
State after cancellation by an interrupt	—
State after cancellation by a reset	—
Main clock oscillator	Stop
Sub-clock oscillator	Operating

Table 11.2 Operating States in VBATT Mode (2 of 2)

Operating state	VBATT Mode
High-speed on-chip oscillator	Stop
Middle-speed on-chip oscillator	Stop
Low-speed on-chip oscillator	Stop
IWDT-dedicated on-chip oscillator	Stop
PLL	Stop
PLL2	Stop
CPU	Stop (Undefined)
SRAM	Stop (Undefined)
Standby SRAM	Stop (Undefined)
VBATT Backup Register	Stop (Retained)
Flash memory	Stop (Retained)
Realtime clock (RTC)	Selectable when selecting clock which is operating as the count source.
AGTn (n = 0 to 3)	Stop (Undefined)
Low voltage detection circuit (LVD)	Stop
Power-on reset circuit	Stop
Other Peripheral modules	Stop (Undefined)
I/O ports	RTCICn ports (n = 0): Operating All ports not specified here: Undefined

Note: Selectable means that operating or stopped is selectable in the control registers. Some modules are also controlled by the associated module-stop bit.

Note: Stop (retained) means that the contents of the internal registers are retained but the operations are suspended.

Note: Stop (undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Figure 11.2 shows switching sequence of Battery backup function.

Figure 11.2 Switching sequence of Battery backup function.

11.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage being applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

Note: The battery backup function should be used after the voltage monitor 0 reset is enabled (OFS1.LVDAS bit is 0). Voltage monitor 0 level should be higher than VBATT switch level.

11.3.3 VBATT Backup Register Usage

Use the VBATT backup registers VBTBKR_n, where $n = 0$ to 127, to store or restore data with an 8-bit read or write operation.

11.4 Usage Notes

1. Operation of the sub-clock oscillator and RTC are not guaranteed when the voltage level on VBATT is lower than the guaranteed operation range. When the power supply is restarted after Vbatt falls below the guaranteed operating range, the RTC must be initialized in software.
2. A reset generated while writing to registers described in this section might destroy the register value.
3. When VCC is higher than $V_{DET*BATT*1}$, the VCC pin and VBATT pin are separated. When VCC is lower than $V_{DET*BATT*1}$ and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than $(VCC - 0.6 V)$, current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
4. During RTC operation using the voltage from the VBATT pin and the I/O ports within the backup, the power supply area can only be used as time capture event input pins for the RTC.

12. Register Write Protection

12.1 Overview

The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR).

Table 12.1 lists the association between the bits in the PRCR register and the registers to be protected.

Table 12.1 Association between the bits in the PRCR register and registers to be protected

PRCR bit	Register to be protected
PRC0	<ul style="list-style-type: none"> Registers related to the clock generation circuit: SCKDIVCR, SCKSCR, PLLCCR, PLLCR, MOSCCR, HOCOCCR, HOCOCCR2, MOCOCCR, FLLCR1, FLLCR2, CKOCR, TRCKCR, OSTDCR, OSTDSR, PLL2CCR, PLL2CR, MOCOUTCR, HOCOUTCR, USBCKDIVCR, USBCKCR, MOSCWTCR, MOMCR, SOSCCR, SOMCR, LOCOCCR, LOCOUTCR
PRC1	<ul style="list-style-type: none"> Registers related to the low power modes: SBYCR, SNZCR, SNZEDCR0, SNZEDCR1, SNZREQCR0, SNZREQCR1, OPCCR, SOPCCR, DPSBYCR, DPSWCR, DPSIER0-3, DPSIFR0-3, DPSIEGR0-2, SYOCDR, LDOSCR, PL2LDOSCR Register related to the battery backup function: VBTBER, VBTICTLR, VBTBKRn (n = 0 to 127)
PRC3	<ul style="list-style-type: none"> Registers related to the LVD: LVD1CR1, LVD1SR, LVD2CR1, LVD2SR, LVD1CMPCR, LVD2CMPCR, LVD1CR0, LVD2CR0, VBATTMNSLR
PRC4	<ul style="list-style-type: none"> Registers related to the security function: CGFSAR, RSTSAR, LPMSAR, LVDSAR, BBFSAR, DPFSAR, CSAR, SRAMSAR, STBRAMSAR, DTCSAR, DMACSAR, ICUSARx, BUSSARx, MMPUSARx, TZFSAR, CPUDSAR, FSAR, PSARx, MSSAR, PmSAR, ELCSARx

12.2 Register Descriptions

12.2.1 PRCR : Protect Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3FE

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	PRC4	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Disable writes 1: Enable writes	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Disable writes 1: Enable writes	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	PRC3	Enable writing to the registers related to the LVD 0: Disable writes 1: Enable writes	R/W
4	PRC4	Enables writing to the registers related to the security function 0: Disable writes 1: Enable writes	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control the write access to the PRCR register. To modify the PRCR register, write 0xA5 to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit.	W

PRCn bits (Protect bit n) (n = 0, 1, 3, 4)

The PRCn bits enable or disable writing to the protected registers listed in [Table 12.1](#). Setting the PRCn bits to 1 or 0 enables or disables writing, respectively.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR after PRC4 change, and then write access the PRC4-controlled register.

13. Interrupt Controller Unit (ICU)

13.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

[Table 13.1](#) lists the ICU specifications, [Figure 13.1](#) shows a block diagram, and [Table 13.2](#) lists the I/O pins.

Table 13.1 ICU specifications

Item		Description
Maskable interrupts	Peripheral function interrupts	<ul style="list-style-type: none"> Interrupts from peripheral modules Number of sources: 212 (select factor within event list numbers 32 to 511)
	External pin interrupts	<ul style="list-style-type: none"> Interrupt detection on low level^{*4}, falling edge, rising edge, rising and falling edges. One of these detection methods can be set for each source Digital filter function supported 11 sources, with interrupts from IRQi (i = 0 to 9, 13) pins.
	Interrupt requests to CPU (NVIC)	<ul style="list-style-type: none"> 96 interrupt requests are output to NVIC.
	DMAC control	<ul style="list-style-type: none"> The DMAC can be activated using interrupt sources^{*1} The target interrupt source can be selected individually for every DMAC channels.
	DTC control	<ul style="list-style-type: none"> The DTC can be activated using interrupt sources^{*1} The method for selecting an interrupt source is the same as that of the interrupt request to NVIC.
Non-maskable interrupts ^{*2}	NMI pin interrupt	<ul style="list-style-type: none"> Interrupt from the NMI pin Interrupt detection on falling edge or rising edge Digital filter function supported
	WDT underflow/refresh error ^{*3}	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	IWDT underflow/refresh error ^{*3}	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	Low voltage detection 1 ^{*3}	Voltage monitor 1 interrupt of the voltage monitor 1 circuit (LVD_LVD1)
	Low voltage detection 2 ^{*3}	Voltage monitor 2 interrupt of the voltage monitor 2 circuit (LVD_LVD2)
	RPEST ^{*5}	Interrupt on SRAM parity error
	TZFST ^{*5}	Interrupt on TrustZone Filter error
	Oscillation stop detection interrupt ^{*3}	Interrupt on detecting that the main oscillation has stopped
	Bus master MPU error ^{*5}	Interrupt on bus master MPU error
Low power modes	<ul style="list-style-type: none"> Sleep mode: return is initiated by non-maskable interrupts or any other interrupt source Software Standby mode: return is initiated by non-maskable interrupts. Interrupt can be selected in the WUPEN register. Snooze mode: return is initiated by non-maskable interrupts. Interrupt can be selected in the SELSR0 and WUPEN registers. <p>See section 13.2.17. SELSR0 : SYS Event Link Setting Register and section 13.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0, section 13.2.19. WUPEN1 : Wake Up interrupt enable register 1.</p>	
TrustZone Filter	Available	

Note 1. For the DMAC and DTC activation sources, see [Table 13.4](#).

Note 2. Non-maskable interrupts can be enabled only once after a reset release.

Note 3. These non-maskable interrupts can also be used as maskable interrupts. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the LVD1CR1.IRQSEL and LVD2CR1.IRQSEL bits to 1.

Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.

Note 5. These non-maskable interrupt sources cannot be recovered if the request source clock is stopped during low power mode.

[Figure 13.1](#) shows the ICU block diagram.

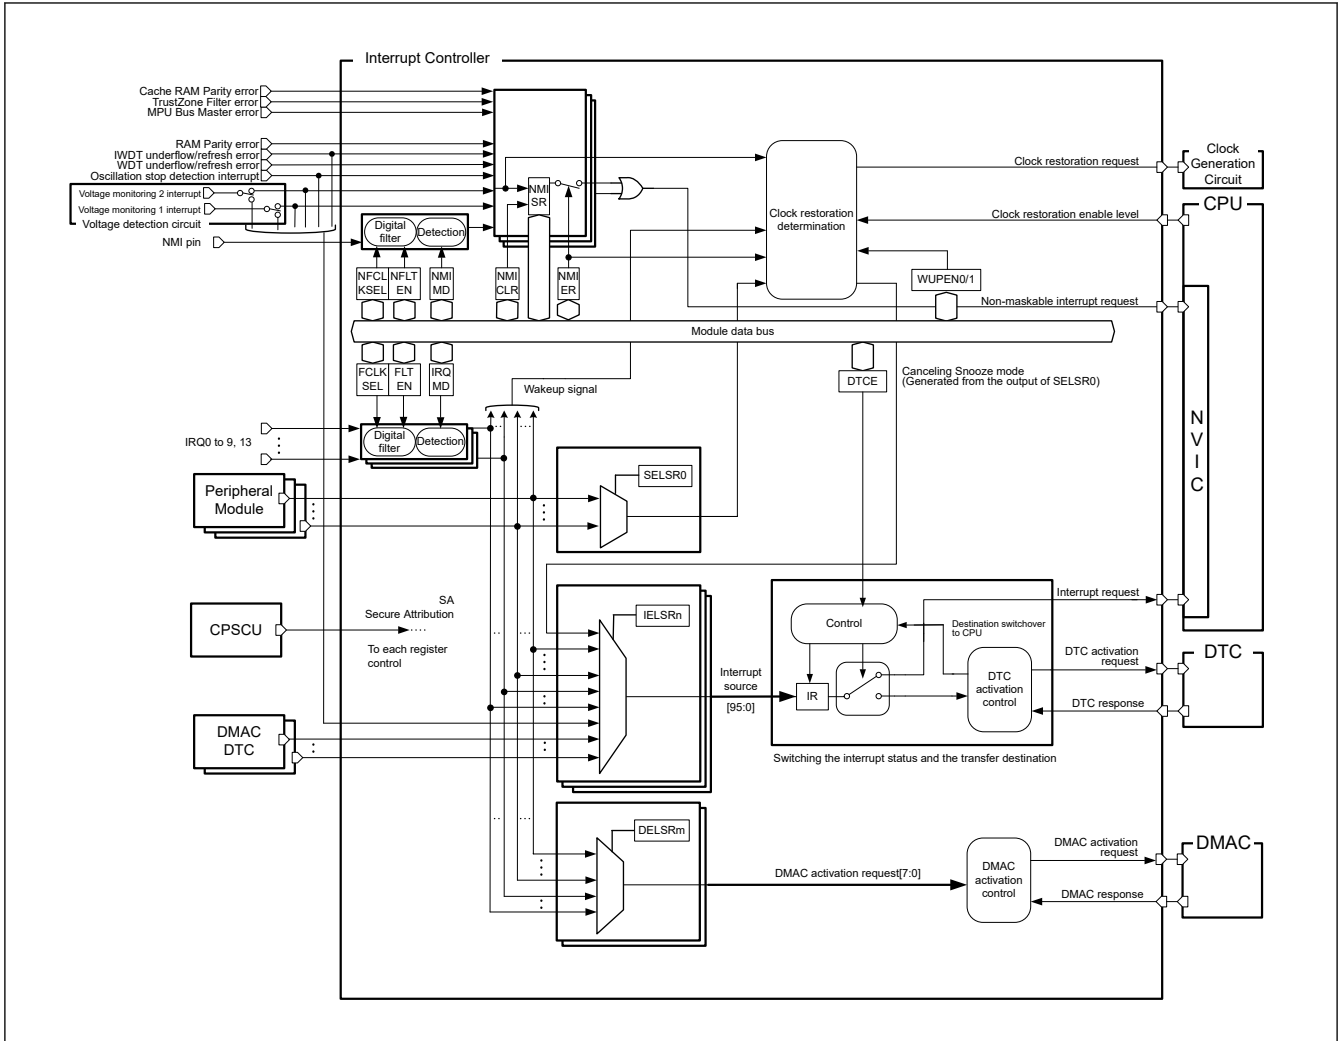

Figure 13.1 ICU block diagram

Table 13.2 lists the ICU input/output pins.

Table 13.2 ICU I/O pins

Pin name	I/O	Description
NMI	Input	Non-maskable interrupt request pin
IRQ _i (i = 0 to 9, 13)	Input	External interrupt request pins

13.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information about these registers, see ARM Limited., ARM® Cortex®-M33 Processor Technical Reference Manual (ARM 100230).

13.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	SAIRQ CR13	—	—	—	SAIRQ CR9	SAIRQ CR8	SAIRQ CR7	SAIRQ CR6	SAIRQ CR5	SAIRQ CR4	SAIRQ CR3	SAIRQ CR2	SAIRQ CR1	SAIRQ CR0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
9:0	SAIRQCR9 to SAIRQCR0	Security attributes of registers for the IRQCRn register (n = 0 to 9) 0: Secure 1: Non-secure	R/W
12:10	—	These bits are read as 1. The write value should be 1.	R/W
13	SAIRQCR13	Security attributes of registers for the IRQCR13 register 0: Secure 1: Non-secure	R/W
31:14	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIRQCRn bits (Security attributes of registers for the IRQCRn register)

The target registers are as follows:

- IRQCR0 to IRQCR9, IRQCR13 registers
- WUPEN0.IRQWUPEN[9:0], WUPEN0.IRQWUPEN[13] bits

13.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000

Offset address: 0x44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SANMI
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	SANMI	Security attributes of registers for nonmaskable interrupt 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SANMI bit (Security attributes of registers for nonmaskable interrupt)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- NMIER
- NMICLR
- NMICR

The value of AIRCR.BFHFNMINs bit [13] in Application Interrupt and Reset Control Register of ARM CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINs and the SANMI bits are different. AIRCR.BFHFNMINs is secure and SANMI is non-secure. Polarity has the same meaning so program these to match.

Note: Only one of Secure and Non-secure can set security attribution for non-maskable interrupt-related registers. If you program the Secure attribute as secure, it always goes to the Secure interrupt handler. To release any of the non-maskable interrupt sources to the non-secure user, write a function to execute a nonsecure program from the interrupt handler for Secure.

13.2.3 ICUSARC : Interrupt Controller Unit Security Attribution Register C

Base address: CPSCU = 0x4000_8000

Offset address: 0x48

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SADM AC7	SADM AC6	SADM AC5	SADM AC4	SADM AC3	SADM AC2	SADM AC1	SADM AC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	SADMAC7 to SADMAC0	Security attributes of registers for DMAC channel 0: Secure 1: Non-secure	R/W
31:8	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SADMACn bits (Security attributes of registers for DMAC channel)

Security attributes of registers for DMAC channel. This register is referred to as the security attribute of the ICU and DMAC registers.

The controlled ICU register is:

- DELSRn

The controlled DMAC registers are:

- DMACn.DMSAR
- DMACn.DMSRR
- DMACn.DMDAR
- DMACn.DMDRR
- DMACn.DMCRA
- DMACn.DMCRB
- DMACn.DMTMD

- DMACn.DMINT
- DMACn.DMAMD
- DMACn.DMOFR
- DMACn.DMCNT
- DMACn.DMREQ
- DMACn.DMSTS
- DMACn.DMSBS
- DMACn.DMDBS

For details on DMAC registers, see [section 16, DMA Controller \(DMAC\)](#).

13.2.4 ICUSARD : Interrupt Controller Unit Security Attribution Register D

Base address: CPSCU = 0x4000_8000

Offset address: 0x4C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	SAAGT3CAWUP	Security attributes of registers for WUPEN1.b1 0: Secure 1: Non-secure	R/W
2	SAAGT3CBWUP	Security attributes of registers for WUPEN1.b2 0: Secure 1: Non-secure	R/W
31:3	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

13.2.7 ICUSARG : Interrupt Controller Unit Security Attribution Register G

Base address: CPSCU = 0x4000_8000

Offset address: 0x70

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIEL SR31	SAIEL SR30	SAIEL SR29	SAIEL SR28	SAIEL SR27	SAIEL SR26	SAIEL SR25	SAIEL SR24	SAIEL SR23	SAIEL SR22	SAIEL SR21	SAIEL SR20	SAIEL SR19	SAIEL SR18	SAIEL SR17	SAIEL SR16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIEL SR15	SAIEL SR14	SAIEL SR13	SAIEL SR12	SAIEL SR11	SAIEL SR10	SAIEL SR9	SAIEL SR8	SAIEL SR7	SAIEL SR6	SAIEL SR5	SAIEL SR4	SAIEL SR3	SAIEL SR2	SAIEL SR1	SAIEL SR0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	SAIELSR31 to SAIELSR0	Security attributes of registers for IELSR31 to IELSR0 0: Secure 1: Non-secure	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIELSRn bits (Security attributes of registers for IELSR31 to IELSR0)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 0 to 31). NVIC internal registers are in NVIC_ITNS0[31:0]. The initial values of NVIC_ITNS0 and ICUSARG are different. NVIC_ITNS0 is secure and ICUSARG is non-secure. Polarity has the same meaning so program these to match.

13.2.8 ICUSARH : Interrupt Controller Unit Security Attribution Register H

Base address: CPSCU = 0x4000_8000

Offset address: 0x74

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIEL SR63	SAIEL SR62	SAIEL SR61	SAIEL SR60	SAIEL SR59	SAIEL SR58	SAIEL SR57	SAIEL SR56	SAIEL SR55	SAIEL SR54	SAIEL SR53	SAIEL SR52	SAIEL SR51	SAIEL SR50	SAIEL SR49	SAIEL SR48
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIEL SR47	SAIEL SR46	SAIEL SR45	SAIEL SR44	SAIEL SR43	SAIEL SR42	SAIEL SR41	SAIEL SR40	SAIEL SR39	SAIEL SR38	SAIEL SR37	SAIEL SR36	SAIEL SR35	SAIEL SR34	SAIEL SR33	SAIEL SR32
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	SAIELSR63 to SAIELSR32	Security attributes of registers for IELSR63 to IELSR32 0: Secure 1: Non-secure	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIELSRn bits (Security attributes of registers for IELSR63 to IELSR32)

The Secure Attribute managed within the ARM CPU NVIC must match the security attribution of IELSEn (n = 32 to 63). NVIC internal registers are in NVIC_ITNS1[31:0]. The initial values of NVIC_ITNS1 and ICUSARH are different. NVIC_ITNS1 is secure and ICUSARH is non-secure. Polarity has the same meaning so program these to match.

13.2.9 ICUSARI : Interrupt Controller Unit Security Attribution Register I

Base address: CPSCU = 0x4000_8000

Offset address: 0x78

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIEL SR95	SAIEL SR94	SAIEL SR93	SAIEL SR92	SAIEL SR91	SAIEL SR90	SAIEL SR89	SAIEL SR88	SAIEL SR87	SAIEL SR86	SAIEL SR85	SAIEL SR84	SAIEL SR83	SAIEL SR82	SAIEL SR81	SAIEL SR80
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIEL SR79	SAIEL SR78	SAIEL SR77	SAIEL SR76	SAIEL SR75	SAIEL SR74	SAIEL SR73	SAIEL SR72	SAIEL SR71	SAIEL SR70	SAIEL SR69	SAIEL SR68	SAIEL SR67	SAIEL SR66	SAIEL SR65	SAIEL SR64
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	SAIELSR95 to SAIELSR64	Security attributes of registers for IELSR95 to IELSR64 0: Secure 1: Non-secure	R/W

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIELSRn bits (Security attributes of registers for IELSR95 to IELSR64)

The Secure Attribute managed within the ARM CPU NVIC must match the security attribution of IELSEn (n = 64 to 95). NVIC internal registers are in NVIC_ITNS2[31:0]. The initial values of NVIC_ITNS2 and ICUSARI are different. NVIC_ITNS2 is secure and ICUSARI is non-secure. Polarity has the same meaning so program these to match.

13.2.10 IRQCRi : IRQ Control Register (i = 0 to 9, 13)

Base address: ICU = 0x4000_6000

Offset address: 0x000 + 0x1 × i

Bit position:	7	6	5	4	3	2	1	0
Bit field:	FLTEN	—	FCLKSEL[1:0]	—	—	—	IRQMD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	IRQMD[1:0]	IRQi Detection Sense Select 0 0: Falling edge 0 1: Rising edge 1 0: Rising and falling edges 1 1: Low level	R/W

Bit	Symbol	Function	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	FCLKSEL[1:0]	IRQi Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	FLTEN	IRQi Digital Filter Enable 0: Digital filter is disabled 1: Digital filter is enabled.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:
Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 95).
The register value should be changed only when the value of the target IELSRn register is 0x0000.
- For a DMAC trigger:
Change the IRQCRi register value before setting the target DELSRn register (n = 0 to 7).
The register value should be changed only when the value of the target DELSRn register is 0x0000.
- For a wakeup enable signal:
Change the IRQCRi register setting before setting the target WUPEN0.IRQWUPEN[n] (n = 0 to 9, 13). The register value should be changed when the target WUPEN0.IRQWUPEN[n] is 0.

IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For setting method when using external pin interrupt, see [section 13.5.6. External Pin Interrupts](#).

FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 13.5.5. Digital Filter](#).

FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 13.5.5. Digital Filter](#).

13.2.11 NMISR : Non-Maskable Interrupt Status Register

Base address: ICU = 0x4000_6000

Offset address: 0x140

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TZFST	—	BUSM ST	—	—	RPES T	NMIST	OSTS T	—	—	LVD2S T	LVD1S T	WDTST	IWDT ST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTST	IWDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
1	WDTST	WDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
2	LVD1ST	Voltage Monitor 1 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
3	LVD2ST	Voltage Monitor 2 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
5:4	—	These bits are read as 0.	R
6	OSTST	Main Clock Oscillation Stop Detection Interrupt Status Flag 0: Interrupt not requested for main clock oscillation stop 1: Interrupt requested for main clock oscillation stop	R
7	NMIST	NMI Pin Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
8	RPEST	SRAM Parity Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
9	—	This bit is read as 0.	R
10	—	This bit is read as 0.	R
11	BUSMST	Bus Master MPU Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
12	—	This bit is read as 0.	R
13	TZFST	TrustZone Filter Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
15:14	—	These bits are read as 0.	R

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

IWDTST flag (IWDT Underflow/Refresh Error Interrupt Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When the IWDT underflow/refresh error interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

WDTST flag (WDT Underflow/Refresh Error Interrupt Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When the WDT underflow/refresh error interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

LVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The LVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.LVD1CLR bit.

[Setting condition]

When the voltage monitor 1 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD1CLR bit.

LVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The LVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.LVD2CLR bit.

[Setting condition]

When the voltage monitor 2 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD2CLR bit.

OSTST flag (Main Clock Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates a main clock oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

When the main clock oscillation stop detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

NMIST flag (NMI Pin Interrupt Status Flag)

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMISTCLR bit.

[Setting condition]

When an edge specified by the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMISTCLR bit.

RPEST flag (SRAM Parity Error Interrupt Status Flag)

The RPEST flag indicates an SRAM parity error interrupt request.

[Setting condition]

When an interrupt is generated in response to an SRAM parity error.

[Clearing condition]

When 1 is written to the NMICLR.RPECLR bit.

BUSMST flag (Bus Master MPU Error Interrupt Status Flag)

The BUSMST flag indicates a bus master error interrupt request.

[Setting condition]

When an interrupt is generated in response to a bus master error.

[Clearing condition]

When 1 is written to the NMICLR.BUSMCLR bit.

TZFST flag (TrustZone Filter Error Interrupt Status Flag)

This flag indicates the TrustZone Filter error interrupt request.

[Setting condition]

When an interrupt is generated in response to a TrustZone Filter error

[Clearing condition]

When 1 is written to the NMICLR.TZFCLR bit

13.2.12 NMIER : Non-Maskable Interrupt Enable Register

Base address: ICU = 0x4000_6000

Offset address: 0x120

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TZFE N	—	BUSM EN	—	—	RPEE N	NMIE N	OSTE N	—	—	LVD2E N	LVD1E N	WDTE N	IWDT EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTEN	IWDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled.	R/W ^{*1} *2
1	WDTEN	WDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1} *2
2	LVD1EN	Voltage monitor 1 Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1} *2
3	LVD2EN	Voltage monitor 2 Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1} *2
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OSTEN	Main Clock Oscillation Stop Detection Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1} *2
7	NMIEN	NMI Pin Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}
8	RPEEN	SRAM Parity Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}
9	—	This bit is read as 0. The write value should be 0.	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	BUSMEN	Bus Master MPU Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}

Bit	Symbol	Function	R/W
12	—	This bit is read as 0. The write value should be 0.	R/W
13	TZFEN	TrustZone Filter Error Interrupt Enable 0: Disabled 1: Enabled	R/W ¹
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.

Note 2. Do not write 1 to this bit when the source is used as an event signal.

IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupt as an NMI trigger.

WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupt as an NMI trigger.

LVD1EN bit (Voltage monitor 1 Interrupt Enable)

The LVD1EN bit enables voltage monitor 1 interrupt as an NMI trigger.

LVD2EN bit (Voltage monitor 2 Interrupt Enable)

The LVD2EN bit enables voltage monitor 2 interrupt as an NMI trigger.

OSTEN bit (Main Clock Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as an NMI trigger.

NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupt as an NMI trigger.

RPEEN bit (SRAM Parity Error Interrupt Enable)

The RPEEN bit enables SRAM parity error interrupt as an NMI trigger.

BUSMEN bit (Bus Master MPU Error Interrupt Enable)

The BUSMEN bit enables bus master error interrupt as an NMI trigger.

TZFEN bit (TrustZone Filter Error Interrupt Enable)

TZFEN bit enables the TrustZone Filter error interrupt as an NMI trigger.

13.2.13 NMICLR : Non-Maskable Interrupt Status Clear Register

Base address: ICU = 0x4000_6000

Offset address: 0x130

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TZFCL R	—	BUSM CLR	—	—	RPEC LR	NMICL R	OSTC LR	—	—	LVD2C LR	LVD1C LR	WDTC LR	IWDT CLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTCLR	IWDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.IWDTST flag	R/W ¹

Bit	Symbol	Function	R/W
1	WDTCLR	WDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.WDTST flag	R/W ¹
2	LVD1CLR	Voltage Monitor 1 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LVD1ST flag	R/W ¹
3	LVD2CLR	Voltage Monitor 2 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LVD2ST flag.	R/W ¹
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OSTCLR	Oscillation Stop Detection Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.OSTST flag	R/W ¹
7	NMICLR	NMI Pin Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.NMIST flag	R/W ¹
8	RPECLR	SRAM Parity Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.RPEST flag	R/W ¹
9	—	This bit is read as 0. The write value should be 0.	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	BUSMCLR	Bus Master MPU Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.BUSMST flag	R/W ¹
12	—	This bit is read as 0. The write value should be 0.	R/W
13	TZFCLR	TrustZone Filter Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.TZFCLR flag	R/W ¹
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only write 1 to this bit.

IWDTCLR bit (IWDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

WDTCLR bit (WDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

LVD1CLR bit (Voltage Monitor 1 Interrupt Status Flag Clear)

Writing 1 to the LVD1CLR bit clears the NMISR.LVD1ST flag. This bit is read as 0.

LVD2CLR bit (Voltage Monitor 2 Interrupt Status Flag Clear)

Writing 1 to the LVD2CLR bit clears the NMISR.LVD2ST flag. This bit is read as 0.

OSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

NMICLR bit (NMI Pin Interrupt Status Flag Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

RPECLR bit (SRAM Parity Error Interrupt Status Flag Clear)

Writing 1 to the RPECLR bit clears the NMISR.RPEST flag. This bit is read as 0.

BUSMCLR bit (Bus Master MPU Error Interrupt Status Flag Clear)

Writing 1 to the BUSMCLR bit clears the NMISR.BUSMST flag. This bit is read as 0.

TZFCLR bit (TrustZone Filter Error Interrupt Status Flag Clear)

Writing 1 to the TZFCLR bit clears the NMISR.TZFST flag. This bit is read as 0.

13.2.14 NMICR : NMI Pin Interrupt Control Register

Base address: ICU = 0x4000_6000

Offset address: 0x100

Bit position:	7	6	5	4	3	2	1	0
Bit field:	NFLTE N	—	NFCLKSEL[1:0]	—	—	—	—	NMIM D
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NMIMD	NMI Detection Set 0: Falling edge 1: Rising edge	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	NFCLKSEL[1:0]	NMI Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	NFLTEN	NMI Digital Filter Enable 0: Disabled. 1: Enabled.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting NMIER.NMIEN to 1.

NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 13.5.5. Digital Filter](#).

NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1, and disabled when NFLTEN is 0. The NMI pin level is sampled at the clock cycle specified in NFCLKSEL[1:0]. When the

sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 13.5.5. Digital Filter](#).

13.2.15 IELSRn : ICU Event Link Setting Register n (n = 0 to 95)

Base address: ICU = 0x4000_6000

Offset address: 0x300 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DTCE	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	IELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	IELS[8:0]	ICU Event Link Select 0x00: Disable interrupts to the associated NVIC or DTC module Others: Event signal number to be linked. For details, see section 13.3.2. Event Number .	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	IR	Interrupt Status Flag 0: No interrupt request generated. 1: An interrupt request is generated.	R/W ^{*1}
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	DTCE	DTC Activation Enable 0: DTC activation is disabled. 1: DTC activation is enabled.	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: This register requires halfword or word access.

Note 1. Writing 1 to the IR flag is prohibited.

The IELSRn register selects the IRQi source used by the NVIC. For details, see [Table 13.3](#). IELSRn corresponds to the NVIC IRQ input source number, where n = 0 to 95.

IELS[8:0] bits (ICU Event Link Select)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. Event options are classified into 8 groups (groups 0 to 7). For details, see [Table 13.3](#) and [Table 13.4](#).

IR flag (Interrupt Status Flag)

The IR status flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- At the time other than the final transfer end in DTC transfer during DTCE = 1, IR flag repeat set and cleared by Hardware.

When DTC transfer except last transfer is completed (DTCE bit is changed from 1 to 0).

During DTCE = 1, write 0 to IR register is prohibited.

In the case of level detection, clear of the IR flag should follow the steps below.

1. Negate the input interrupt signal.
2. Read access the peripheral once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

Note: DTC transfer error in snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a wakeup request. However, interrupt requests are not issued automatically. See [section 17, Data Transfer Controller \(DTC\)](#) for how to set the interrupt when a DTC error occurs.

13.2.16 DELSRn : DMAC Event Link Setting Register n (n = 0 to 7)

Base address: ICU = 0x4000_6000

Offset address: 0x280 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DELS[8:0]	DMAC Event Link Select 0x00: Disable interrupts to the associated DMAC module. Others: Event signal number to be linked. For details, see Table 13.4 .	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	IR	DMAC Activation Request Status Flag 0: No DMAC activation request occurred. 1: DMAC activation request occurred.	R/W ¹
31:17	—	These bits are read as 0. The write value should be 0.	R/W

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Writing 1 to the IR flag is prohibited.

DELS[8:0] bit (DMAC Event Link Select)

The DELS[8:0] bits link an event signal to the associated DMAC module. Do not set the same event number in multiple DELSRn registers.

IR flag (DMAC Activation Request Status Flag)

The IR flag is the status flag of a DMAC activation request. This flag is associated with the DELS[8:0] bits of this register.

[Setting condition]

- The flag is set to 1 when a DMAC activation request is generated from the associated peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the IR flag.
- At the start of a DMA transfer after the DMAC activation request is issued.

Note: The IR flag is automatically cleared after completion of a DMA transfer. Therefore, do not write 0 unless an abort occurs. When 0 is written, DMA transfer operation cannot be guaranteed.

Note: Error during DMAC transfer

If an error response occurs during a DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSRn (n = 0 to 7). DELSRn that is not the target channel is not cleared.

13.2.17 SELSR0 : SYS Event Link Setting Register

Base address: ICU = 0x4000_6000

Offset address: 0x200

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	SELS[8:0]	SYS Event Link Select 0x00: Disable event output to the associated low-power mode module Others: Event signal number to be linked. For details, see Table 13.4 .	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The SELSR0 register selects the events that wake up the CPU from Snooze mode. You can use only the events listed in [Table 13.4](#) checked as “Canceling Snooze mode”. When ICU_SNZCANCEL is selected in the IELSRn.IELS[8:0] bits, an interrupt is generated that cancels snooze mode.

Caution: For security attribution added to parts related to a series of actions, make sure to match all security attribution so that security holes cannot be created.

About security attribution to be matched

- Event source to be set to SELSR0.
- SELSR0
- IELSRn (n = 0 to 95) to receive event No. 45 (ICU_SNZCANCEL).
- NVIC internal registers in the CPU of the interrupt specified in the previous item.
- Interrupt Handler.

13.2.18 WUPEN0 : Wake Up Interrupt Enable Register 0

Base address: ICU = 0x4000_6000

Offset address: 0x1A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	IIC0WUPEN	AGT1CBWUPEN	AGT1CAWUPEN	AGT1UDWUPEN	USBFS0WUPEN	—	RTCPRDWUPEN	RTCALMWUPEN	—	—	—	—	LVD2WUPEN	LVD1WUPEN	—	IWDTWUPEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Description is a description of each bit.

Note: The security attribution of this register is set for each wakeup event.

To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

13.2.19 WUPEN1 : Wake Up interrupt enable register 1

Base address: ICU = 0x4000_6000

Offset address: 0x1A4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	AGT3 CBWU PEN	AGT3 CAWU PEN	AGT3 UDWU PEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	AGT3UDWUPEN	AGT3 Underflow Interrupt Software Standby Return Enable bit 0: Software standby returns by AGT3 underflow interrupt is disabled 1: Software standby returns by AGT3 underflow interrupt is enabled	R/W
1	AGT3CAWUPEN	AGT3 Compare Match A Interrupt Software Standby Return Enable bit 0: Software standby returns by AGT3 compare match A interrupt is disabled 1: Software standby returns by AGT3 compare match A interrupt is enabled	R/W
2	AGT3CBWUPEN	AGT3 Compare Match B Interrupt Software Standby Return Enable bit 0: Software standby returns by AGT3 compare match B interrupt is disabled 1: Software standby returns by AGT3 compare match B interrupt is enabled	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R ^{*1}

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. This bit is read only

AGT3UDWUPEN bit (AGT3 Underflow Interrupt Software Standby Return Enable bit)

This bit is the enable bit to control the use of the AGT3 underflow interrupt as a Software standby return factor.

AGT3CAWUPEN bit (AGT3 Compare Match A Interrupt Software Standby Return Enable bit)

This bit is the enable bit to control the use of the AGT3 compare match A interrupt as a Software standby return factor.

AGT3CBWUPEN bit (AGT3 Compare Match B Interrupt Software Standby Return Enable bit)

This bit is the enable bit to control the use of the AGT3 compare match B interrupt as a Software standby return factor.

Note: The security attribution of this register is set for each wakeup event.

To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

13.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see [section 13.9. Reference](#).

13.3.1 Interrupt Vector Table

[Table 13.3](#) describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

Table 13.3 Interrupt vector table (1 of 4)

Exception number	IRQ number	Vector offset	Source	Description
0	—	0x000	Arm	Initial stack pointer
1	—	0x004	Arm	Initial program counter (reset vector)
2	—	0x008	Arm	Non-Maskable Interrupt (NMI)

13.3.2 Event Number

The following table lists heading details for [Table 13.4](#), which describes each event number.

Heading	Description
Interrupt request source	Name of the source generating the interrupt request
Name	Name of the interrupt
Connect to NVIC	“✓” indicates the interrupt can be used as a CPU interrupt
Invoke DTC	“✓” indicates the interrupt can be used to request DTC activation
Invoke DMAC	“✓” indicates the interrupt can be used to request DMAC activation
Canceling Snooze	“✓” indicates the interrupt can be used to request a return from Snooze mode
Canceling Software Standby	“✓” indicates the interrupt can be used to request a return from Software Standby mode
Canceling Deep Software Standby	“✓” indicates the interrupt can be used to request a return from Deep Software Standby mode

Note 1. Only the first edge detection is valid.

Note 2. Only interrupts after DTC transfer are supported.

Note 3. Using SELSR0.

13.4 Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation, or DMAC activation.

13.4.1 Detecting Interrupts

The ICU selects an event source input from a peripheral function interrupt or an external pin interrupt with IELSRn.IELS [8:0].

The accepted interrupt source sets the IELSRn.IR to 1 and sends an interrupt request to the NVIC.

External pin interrupt requests are detected by either:

- Edges (falling edge, rising edge, or rising and falling edges)
- Level (low level) of the interrupt signal.

Set the IRQCRi.IRQMD[1:0] bits to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see [Table 13.3](#) and [Table 13.4](#). Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

Figure 13.2 Interrupt path of the ICU and CPU (NVIC)

13.5 Interrupt setting procedure

13.5.1 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC_ISER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).

13.5.2 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).
2. Clear the interrupt source setting (IELSRn.IELS[8:0] = 0x00).
3. Clear the interrupt status flag (IELSRn.IR = 0).
4. Clear the interrupt Clear-Enable register (NVIC_ICER) and interrupt Clear-Pending register (NVIC_ICPR).

13.5.3 Polling for interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC_ICER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).
4. Poll the interrupt Set-Pending register (NVIC_ISPR).

13.5.4 Selecting Interrupt Request Destinations

The available destinations are fixed for each interrupt, as described in [Table 13.3](#), [Table 13.4](#).

The interrupt output destination, CPU, DMAC, or DTC can be independently selected for each interrupt source.

Use an interrupt request destination setting that is indicated by a “✓” in the event list (see [section 13.3.2. Event Number](#)).

Note: Setting the same interrupt source for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQCRi.IRQMD[1:0] bits for that interrupt to select edge detection.

13.5.4.1 CPU interrupt request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 0.

13.5.4.2 DTC activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

Table 13.5 shows operation when the DTC is the interrupt request destination.

Table 13.5 Operation when DTC becomes interrupt request destination

Interrupt request destination	DISEL*1	Remaining transfer operations	Operation per request	IR*2	Interrupt request destination after transfer
DTC*3	1	≠ 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	CPU (IELSRn.DTCE bit is automatically cleared)
	0	≠ 0	DTC transfer	Cleared at the start of DTC data transfer after reading DTC transfer data	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	CPU (IELSRn.DTCE bit is automatically cleared)

Note 1. DTC.MRB.DISEL bit controls the interrupt generates timing from DTC to CPU.

Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.

Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See Table 17.2 in section 17, Data Transfer Controller (DTC).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

Note: DTC transfer error in snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a Wake Up request. However, interrupt requests are not issued automatically. See section 17, Data Transfer Controller (DTC) chapter for information on how to set the interrupt when a DTC error occurs.

13.5.4.3 DMAC Activation

Events specified in the DELSRn registers are output to the DMAC.

To set the interrupt source for DMAC, use the following procedure:

1. Set the DELSRn.DELS[8:0] bits to the event to activate the DMAC.
2. When using interrupts to CPU, set the IELSRn.IELS bit to factor of DMAC interrupt and IELSRn.DTCE bit to 0.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0]) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE) to 1.
5. Set the DMAC operation enable bit (DMAST.DMST) to 1.

Figure 13.3 DMAC request trigger and interrupt path

Note: Error during DMAC transfer

If an error response occurs during DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSR_n (n = 0 to 7). DELSR_n that is not the target channel is not cleared.

13.5.5 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQ_i, (i = 0 to 9, 13) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock and removes any signal with a pulse width less than 3 sampling cycles.

To use the digital filter for an IRQ_i pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCR_i.FCLKSEL[1:0] bits (i = 0 to 9, 13).
2. Set the IRQCR_i.FLTEN bit (i = 0 to 9, 13) to 1 (digital filter enabled).

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 13.4 shows an example of digital filter operation.

Figure 13.4 Digital filter operation example

Before entering Software Standby mode, disable the digital filters by clearing the $IRQCRi.FLTEN$ and $NMICR.NFLTEN$ bits. The ICU clock stops in Software Standby mode.

On exiting Software Standby mode, the circuit detects the edge by comparing the state before standby to the state after standby release. If the input changes during Software Standby mode, an incorrect edge might be detected. The digital filters can be enabled again after exiting Software Standby mode.

13.5.6 External Pin Interrupts

To use external pin interrupts:

1. Configure I/O ports settings.
2. Clear the $IRQCRi.FLTEN$ bit ($i = 0$ to $9, 13$) to 0 (digital filter disabled).
3. Set the $IRQMD[1:0]$ bits of the given $IRQCRi$ register ($i = 0$ to $9, 13$) to select the senses of detection.
4. Set the $FCLKSEL[1:0]$ bits, and the $FLTEN$ bit of the $IRQCRi$ register.
5. Select the IRQ pin as follows:
 - If the IRQ pin is to be used for CPU interrupt requests, set the $IELSRn.IELS[8:0]$ bits and the $IELSRn.DTCE$ bit to 0.
 - If the IRQ pin is to be used for DTC activation, set the $IELSRn.IELS[8:0]$ bits and the $IELSRn.DTCE$ bit to 1.
 - If the IRQ pin is to be used for DMAC activation, set the $DELSRn.DELS[8:0]$ bits.

13.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- SRAM parity error interrupt
- Bus master MPU error interrupt

- TrustZone filter error interrupt

Non-maskable interrupts can only be used with the CPU, not to activate the DTC or DMAC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI cannot be disabled when enabled, except by a reset.

The secure attribution managed within the Application Interrupt and Reset Control Register (AIRCR) of the Arm CPU must match the security attribution of NMI.

The NMI secure of the CPU is changed by AIRCR.BFHFNMINs. It is managed by software developers who manage Secure program.

13.6.1 Correspondence to TrustZone-M by NMI

Although there is only one NMI per CPU, multiple factors can be set. This section describes the procedure for mixing Secure and Non-secure programs of NMI. When doing so, the NMI-related registers of the ICU are set to Secure.

NMI-related registers:

- NMIER
- NMICLR
- NMICR

Set the ICUSARB.SANMI bit to 0.

The value of AIRCR.BFHFNMINs[13] in the Application Interrupt and Reset Control Register of the ARM CPU must be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINs and ICUSARB.SANMI are different.

AIRCR.BFHFNMINs is for secure and ICUSARB.SANMI is for non-secure. Polarity has the same meaning so program these to match.

If NMI is issued, jump to the NMI handler. When mixing secure and non-secure program, the NMI handler must branch according to the TrustZone-M rule. [Figure 13.5](#) shows the flow.

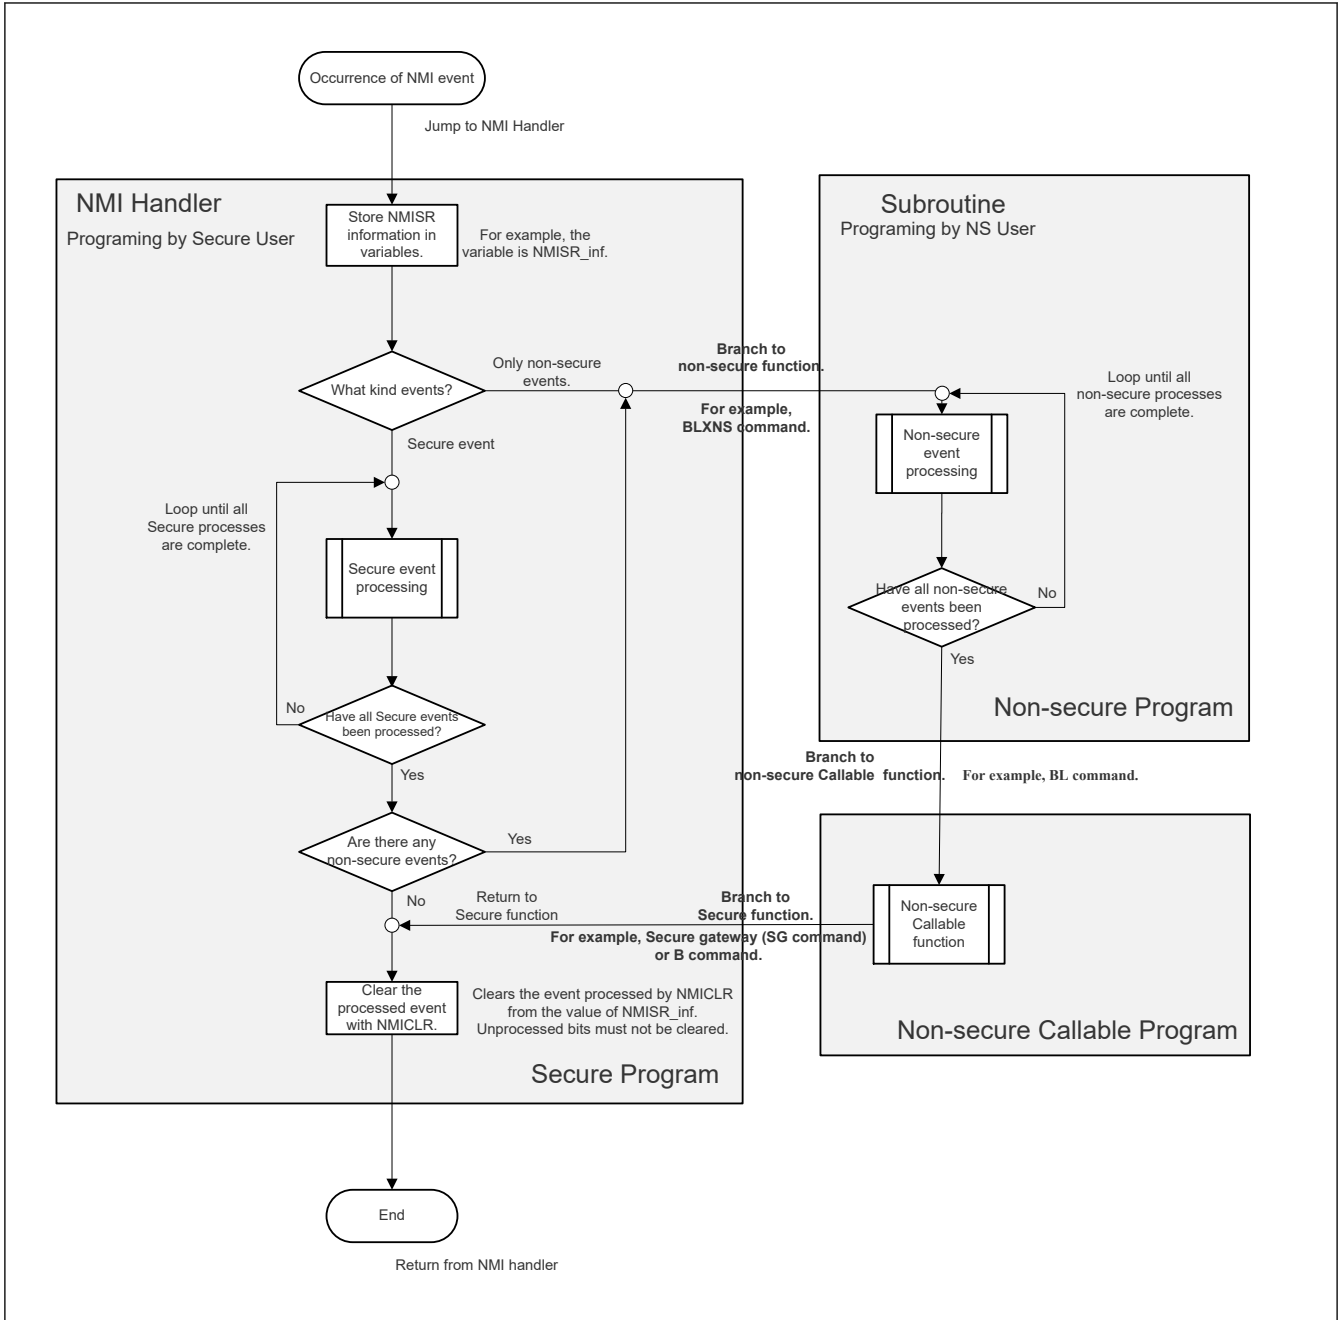

Figure 13.5 Correspondence to TrustZone-M by NMI

See the Arm documentation for details on how to move between secure and non-secure programs.

13.7 Return from Low Power Modes

Table 13.4 lists the interrupt sources that can be used to exit Sleep, Snooze, or Software Standby mode. For more information, see section 10, Low Power Modes.

13.7.1 Return from Sleep Mode

To return from Sleep mode in response to an interrupt:

non-maskable interrupt

- Use the NMIER register to enable the target interrupt request.

maskable interrupt

- Select the CPU as the interrupt request destination.
- Enable the interrupt in the NVIC.

13.7.2 Return from Software Standby Mode

The ICU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see [Table 13.4](#).

To return from Software Standby mode:

1. Select the interrupt source that enables return from Software Standby:
 - For non-maskable interrupts, use the NMIER register to enable the target interrupt request
 - For maskable interrupts, use the WUPEN register to enable the target interrupt request.
2. Select the CPU as the interrupt request destination
3. Enable the interrupt in the NVIC.

Interrupt requests through the IRQn pins that do not satisfy these conditions are not detected while the clock is stopped in Software Standby mode.

Similarly, request for a non-maskable interrupt from a request source whose clock is stopped in Software Standby mode cannot be detected.

Transition to/from Software Standby mode

1. Before Software Standby mode is entered, disable the digital filter for the interrupt source as a return target (IRQCRi.FLTEN = 0, NMICR.NFLTEN = 0).
2. To use the digital filter again after returning from Software Standby mode, enable the digital filter (IRQCRi.FLTEN = 1, NMICR.NFLTEN = 1).

13.7.3 Return from Snooze Mode

The ICU can return to Normal mode from Snooze mode using the interrupts provided for this mode.

To return to Normal mode from Snooze mode:

1. Set the number of the required interrupt request in SELSR0.SELS[8:0]
2. Set the value 0x02D (ICU_SNZCANCEL) in IELSRn.IELS[8:0] (n = 0 to 95).
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the non-maskable that do not satisfy the above conditions are not detected while the clock is stopped in snooze mode.

Note: In Snooze mode, a clock is supplied to the ICU. If an event selected in IELSRn is detected, the CPU acknowledges the interrupt after returning to Normal mode from Software Standby mode. If an event selected in DELSRn is detected, the DMAC can acknowledge the interrupt after returning to Normal mode from Software Standby mode.

13.8 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

14. Buses

14.1 Overview

The buses consists of 32 bits AHB bus matrix. [Table 14.1](#) lists the bus masters and bus slaves and [Figure 14.1](#) shows the bus configuration.

Table 14.1 Bus Specifications

Classification	Bus Master/Slave name	Bus I/F Max Freq	Sync Clock	Specifications
Bus Masters	Code bus (Cortex-M33)	100 MHz	ICLK	Connected to the CPU for instructions and operands
	System bus (Cortex-M33)	100 MHz	ICLK	Connected to the CPU for system
	DMAC / DTC	100 MHz	ICLK	Connected to the DMAC/DTC
Bus Slaves	FHBIU	100 MHz	ICLK	Connected to Code Flash memory and Configuration area
	FLBIU	50 MHz	FCLK	Connected to Data Flash memory, FACI
	S0BIU	100 MHz	ICLK	Connected to SRAM0 (Standby RAM)
	PSBIU	100 MHz	ICLK	Connected to peripheral system modules (DTC, DMAC, ICU, Flash, MPU, SRAM, Debug module, System controller, and BUS controller)
	PLBIU	50 MHz	PCLKB	Connected to peripheral modules (CAC, ELC, I/O ports, POEG, RTC, WDT, IWDI, AGT, IIC, CAN, and USBF)
	PHBIU	100 MHz	PCLKA	Connected to peripheral modules (GPT, SCI, SPI, CRC, DOC, ADC12, DAC12, and SCE9)
	EQBIU (QSPI area)	100 MHz	PCLKA	Connected to the QSPI (External Memory Interface)

Note: FHBIU: Flash High speed Bus Interface Unit.
 FLBIU: Flash Low speed Bus Interface Unit.
 S0BIU: SRAM0 Bus Interface Unit.
 PSBIU: Peripheral System Bus Interface Unit.
 PLBIU: Peripheral Low speed Bus Interface Unit.
 PHBIU: Peripheral High speed Bus Interface Unit.
 EQBIU: External memory interface Qspi Bus Interface Unit.

Figure 14.1 Bus Connection

14.2 Description of Buses

14.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected for each master. For details, see [section 14.3.3. BUSSCNT<slave> : Slave Bus Control Register \(<slave> = FHBIU, FLBIU, S0BIU, EQBIU\)](#), [section 14.3.4. BUSSCNT<slave> : Slave Bus Control Register \(<slave> = PSBIU, PLBIU, PHBIU\)](#).

14.2.2 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave modules.

[Figure 14.2](#) shows an example of parallel operations. In this example, the CPU uses code bus and system bus for simultaneous access to FHBIU and S0BIU, respectively. Furthermore, the DMAC/DTC simultaneously accesses the peripheral bus during access to FHBIU and S0BIU by the CPU.

Figure 14.2 Example of Parallel Operations

14.2.3 Restrictions

(1) Restriction on Endian

Memory space must be little-endian in order to execute Cortex code.

(2) Bufferable write access

When CPU perform Bufferable Write access to PLBIU or PHBIU, if an STZF error occurs then the error response is invalidated. So there is no error flag will be set and no NMI / RESET request is generated.

When CPU perform Bufferable Write access to PHBIU, if a Slave BUS error occurs then the error response will become invalid and the error flag will not be set.

If error response is required, set the bus master to non-bufferable access.

(3) Access to reserved area of FLBIU and S0BIU

Access to the reserved area of FLBIU and S0BIU is prohibited. Operation is not guaranteed if accessed.

(4) Clock setting

The clock division ratio prohibits setting changes during bus access.

14.3 Register Descriptions

14.3.1 BUSSARA : BUS Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x0100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	BUSSA0	BUS Security Attribution A0 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
31:1	—	These bits are read as 1.	R

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

BUSSA0 bit (BUS Security Attribution A0)

The correspondence between register and BIU name is as follows

Connection (BUSSCNT<slave> = FHBIU/FLBIU/S0BIU/PSBIU/PLBIU/PHBIU/EQBIU)

See to [Figure 14.1](#) for connection between BIU and BUS

- BUSSCNTFHBIU
- BUSSCNTFLBIU
- BUSSCNTS0BIU
- BUSSCNTPSBIU
- BUSSCNTPLBIU
- BUSSCNTPHBIU
- BUSSCNTEQBIU

14.3.2 BUSSARB : BUS Security Attribution Register B

Base address: CPSCU = 0x4000_8000

Offset address: 0x0104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSB0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	BUSSB0	BUS Security Attribution B0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 1.	R

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

BUSSB0 bit (BUS Security Attribution B0)

The BUSSB0 bit specifies the security attributes of registers for Bus Error Clear registers and DMAC/DTC Error Clear register.

BUS1ERRCLR: Code bus

BUS2ERRCLR: System bus

BUS3ERRCLR: DMAC/DTC

DMACDTCERRCLR: DMAC/DTC (Master-TZF)

See [Figure 14.1](#) for connection of each BUS.

14.3.3 BUSSCNT<slave> : Slave Bus Control Register (<slave> = FHBIU, FLBIU, S0BIU, EQBIU)

Base address: BUS = 0x4000_3000

Offset address: 0x1100 (BUSSCNTFHBIU)
 0x1104 (BUSSCNTFLBIU)
 0x1110 (BUSSCNTS0BIU)
 0x1140 (BUSSCNTEQBIU)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ARBS[1:0]	Arbitration Select for two masters Specify the priority between bus master. > : Fixed Priority ↔: Round-Robin 0 0: DMAC/DTC > CPU 0 1: DMAC/DTC ↔ CPU 1 0: Setting prohibited 1 1: Setting prohibited	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.
- Note:
- BUSSCNT<slave> : <slave> is bus interface unit name for Slave
 - The change is prohibited from initial value (0) to reserved bit. Operation when changing is not guaranteed.
- Note: While both of the following two conditions are met, the CPU may occupy the bus and DMAC/DTC data transfer may not be prioritized.
- [Condition 1]
DMAC/DTC accesses FHBIU, FLBIU, S0BIU, EQBIU, and CPU fetches instructions from the same BUS slaves.
- [Condition 2]
CPU instruction fetch loops through a specific address. For example, waiting time by software.
- Example:
- ```
loop1: subs r0, #1
 cmp r0, #0
 bne loop1
```
- To avoid this problem, set DMAC/DTC access bus and CPU instruction fetch to different BUS Slaves.  
 Example: DMAC/DTC accesses S0BIU (SRAM0 or Standby RAM), and CPU fetches instructions from FHBIU.

#### ARBS[1:0] bits (Arbitration Select for two masters)

The ARBS bits sets the arbitration method of each master.

### 14.3.4 BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU)

Base address: BUS = 0x4000\_3000

Offset address: 0x1120 (BUSSCNTPSBIU)  
 0x1130 (BUSSCNTPLBIU)  
 0x1134 (BUSSCNTPHBIU)

|                    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |      |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|------|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
| Bit field:         | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | ARBS |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    |

| Bit  | Symbol | Function                                                                                                                                                             | R/W |
|------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0    | ARBS   | Arbitration Select for two masters<br>Specify the priority between bus master.<br>> : Fixed Priority<br>↔: Round-Robin<br><br>0: DMAC/DTC > CPU<br>1: DMAC/DTC ↔ CPU | R/W |
| 15:1 | —      | These bits are read as 0. The write value should be 0.                                                                                                               | R/W |

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.
- Note:
- BUSSCNT<slave> : <slave> is bus interface unit name for Slave
  - The change is prohibited from initial value (0) to reserved bit. Operation when changing is not guaranteed.

**ARBS bit (Arbitration Select for two masters)**

The ARBS bits set the arbitration method of each master.

**14.3.5 BUSnERRADD : BUS Error Address Register (n = 1 to 3)**

Base address: BUS = 0x4000\_3000

Offset address: 0x1800 + 0x10 × (n - 1)

Bit position: 31

0

Bit field:

BERAD[31:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol      | Function                                                                         | R/W |
|------|-------------|----------------------------------------------------------------------------------|-----|
| 31:0 | BERAD[31:0] | Bus Error Address<br>When a bus error occurs, these bits store the error address | R   |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 15, Memory Protection Unit \(MPU\)](#) and [section 42.2. Arm TrustZone Security](#) .

The following bus errors correspond to the master bus:

BUS1ERRADD : Code bus

BUS2ERRADD : System bus

BUS3ERRADD : DMAC/DTC

**BERAD[31:0] bits (Bus Error Address)**

The BERAD[31:0] bits indicate the address when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 14.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 14.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the BERAD[31:0] bits store the address of the bus error access.

BERAD[31:0] bits are only valid when ILERRSTAT, MMERRSTAT, and SLERRSTAT in BUSnERRSTAT (n = 1 to 3) are set to 1.

BTZF2ERRADD : System bus

BTZF3ERRADD : DMAC/DTC

See [Figure 14.1](#) for connection of each BUS.

### BTZFERAD[31:0] bits (Bus TrustZone Filter Error Address)

The BTZFERAD[31:0] bits indicate the address, when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 14.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 14.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the BTZFERAD[31:0] bits store the address of the bus error access.

BTZFERAD[31:0] bits are only valid when STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1.

### 14.3.8 BTZFnERRRW : BUS TZF Error Read Write Register (n = 1 to 3)

Base address: BUS = 0x4000\_3000

Offset address: 0x1904 + 0x10 × (n - 1)

|                    |   |   |   |   |   |   |   |         |
|--------------------|---|---|---|---|---|---|---|---------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:         | — | — | — | — | — | — | — | TRWSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit | Symbol  | Function                                                                                                                    | R/W |
|-----|---------|-----------------------------------------------------------------------------------------------------------------------------|-----|
| 0   | TRWSTAT | TrustZone filter error access Read/Write Status<br>The status at the time of the error<br>0: Read access<br>1: Write access | R   |
| 7:1 | —       | These bits are read as 0. The write value should be 0.                                                                      | R/W |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 15, Memory Protection Unit \(MPU\)](#) and [section 42.2. Arm TrustZone Security](#).

The following bus errors correspond to the master bus:

BTZF1ERRRW : Code bus

BTZF2ERRRW : System bus

BTZF3ERRRW : DMAC/DTC

See [Figure 14.1](#) for connection of each BUS.

### TRWSTAT bit (TrustZone filter error access Read/Write Status)

The TRWSTAT bit indicates the access status, (write access or read access), when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 14.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 14.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the TRWSTAT bits store the read/write status of the bus error access. The TRWSTAT bit is only valid when STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1.

### 14.3.9 BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3)

Base address: BUS = 0x4000\_3000

Offset address: 0x1A00 + 0x10 × (n - 1)

|                    |   |   |   |               |               |   |               |               |
|--------------------|---|---|---|---------------|---------------|---|---------------|---------------|
| Bit position:      | 7 | 6 | 5 | 4             | 3             | 2 | 1             | 0             |
| Bit field:         | — | — | — | ILERR<br>STAT | MMER<br>RSTAT | — | STER<br>RSTAT | SLER<br>RSTAT |
| Value after reset: | 0 | 0 | 0 | 0             | 0             | 0 | 0             | 0             |

| Bit | Symbol    | Function                                                                         | R/W |
|-----|-----------|----------------------------------------------------------------------------------|-----|
| 0   | SLERRSTAT | Slave bus Error Status<br>0: No error occurred<br>1: Error occurred              | R   |
| 1   | STERRSTAT | Slave TrustZone filter Error Status<br>0: No error occurred<br>1: Error occurred | R   |
| 2   | —         | This bit is read as 0.                                                           | R   |
| 3   | MMERRSTAT | Master MPU Error Status<br>0: No error occurred<br>1: Error occurred             | R   |
| 4   | ILERRSTAT | Illegal address access Error Status<br>0: No error occurred<br>1: Error occurred | R   |
| 7:5 | —         | These bits are read as 0.                                                        | R   |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 15, Memory Protection Unit \(MPU\)](#) and [section 42.2. Arm TrustZone Security](#).

The following bus errors correspond to the master bus:

BUS1ERRSTAT : Code bus

BUS2ERRSTAT : System bus

BUS3ERRSTAT : DMAC/DTC

See [Figure 14.1](#) for connection of each BUS

When an illegal access error, master MPU error, and slave bus error all occurred at the same time, the STAT bit is only valid in the following order of priority. The left side has higher priority.

Master MPU Error > Illegal access error, slave bus error

Note: Illegal access error and slave bus error do not occur at the same time.

If one of ILERRSTAT, MMERRSTAT or SLERRSTAT is set, these bits are not renewed until it is cleared.

#### SLERRSTAT bit (Slave bus Error Status)

When slave error occurs by bus, BUSnERRSTAT.SLERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.SLERRCLR (n = 1 to 3) to 1. Slave error is an error that occurs on a slave such as a timeout. For detail of slave error that occurs by bus, see [section 14.4. Bus Error Monitoring Section](#).

#### STERRSTAT bit (Slave TrustZone filter Error Status)

When slave TrustZone filter error occurs by bus, BUSnERRSTAT.STERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.STERRCLR (n = 1 to 3) to 1. The STERRSTAT bit is not set when the debugger accesses the security area. For detail of slave TrustZone filter error that occurs by bus, see [section 42, Security Features](#).

**MMERRSTAT bit (Master MPU Error Status)**

When master MPU error occurs by bus, BUSnERRSTAT.MMERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.MMERRCLR (n = 1 to 3) to 1. For detail of master MPU error that occurs by bus, see [section 15, Memory Protection Unit \(MPU\)](#).

Note: At master MPU error is occurred in DMAC or DTC access, if error address value is not as master MPU area, Illegal address access error or slave error is occurring before DMAC or DTC access. Decide the what error was happened by referring the error address value.

**ILERRSTAT bit (Illegal address access Error Status)**

When illegal address access error occurs by bus, BUSnERRSTAT.ILERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.ILERRCLR (n = 1 to 3) to 1. For detail of illegal address access error that occurs by bus, see [section 14.4. Bus Error Monitoring Section](#).

**14.3.10 DMACDTCERRSTAT : DMAC/DTC Error Status Register**

Base address: BUS = 0x4000\_3000

Offset address: 0x1A24

|                    |   |   |   |   |   |   |   |               |
|--------------------|---|---|---|---|---|---|---|---------------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0             |
| Bit field:         | — | — | — | — | — | — | — | MTER<br>RSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0             |

| Bit | Symbol    | Function                                                                          | R/W |
|-----|-----------|-----------------------------------------------------------------------------------|-----|
| 0   | MTERRSTAT | Master TrustZone Filter Error Status<br>0: No error occurred<br>1: Error occurred | R   |
| 7:1 | —         | These bits are read as 0.                                                         | R   |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 15, Memory Protection Unit \(MPU\)](#) and [section 42.2. Arm TrustZone Security](#).

**MTERRSTAT bit (Master TrustZone Filter Error Status)**

When a master TrustZone filter error occurs by DMAC or DTC, DMACDTCERRSTAT.MTERRSTAT is set to 1. Clear condition is reset or set DMACDTCERRCLR.MTERRCLR to 1.

For detail of master TrustZone filter error that occurs by DMAC or DTC, see [section 16, DMA Controller \(DMAC\)](#) and [section 17, Data Transfer Controller \(DTC\)](#)

**14.3.11 BUSnERRCLR : BUS Error Clear Register n (n = 1 to 3)**

Base address: BUS = 0x4000\_3000

Offset address: 0x1A08 + 0x10 × (n - 1)

|                    |   |   |   |              |              |   |              |              |
|--------------------|---|---|---|--------------|--------------|---|--------------|--------------|
| Bit position:      | 7 | 6 | 5 | 4            | 3            | 2 | 1            | 0            |
| Bit field:         | — | — | — | ILERR<br>CLR | MMER<br>RCLR | — | STER<br>RCLR | SLER<br>RCLR |
| Value after reset: | 0 | 0 | 0 | 0            | 0            | 0 | 0            | 0            |

| Bit | Symbol   | Function                                                                                             | R/W              |
|-----|----------|------------------------------------------------------------------------------------------------------|------------------|
| 0   | SLERRCLR | Slave bus Error Clear<br>Writing 1 to the SLERRCLR bit clears the BUSnERRSTAT.SLERRSTAT (n = 1 to 3) | R/W <sup>1</sup> |

| Bit | Symbol   | Function                                                                                                          | R/W              |
|-----|----------|-------------------------------------------------------------------------------------------------------------------|------------------|
| 1   | STERRCLR | Slave TrustZone filter Error Clear<br>Writing 1 to the STERRCLR bit clears the BUSnERRSTAT.STERRSTAT (n = 1 to 3) | R/W <sup>1</sup> |
| 2   | —        | This bit is read as 0. The write value should be 0.                                                               | R/W              |
| 3   | MMERRCLR | Master MPU Error Clear<br>Writing 1 to the MMERRCLR bit clears the BUSnERRSTAT.MMERRSTAT (n = 1 to 3)             | R/W <sup>1</sup> |
| 4   | ILERRCLR | Illegal Address Access Error Clear<br>Writing 1 to the ILERRCLR bit clears the BUSnERRSTAT.ILERRSTAT (n = 1 to 3) | R/W <sup>1</sup> |
| 7:5 | —        | These bits are read as 0. The write value should be 0.                                                            | R/W              |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

The following bus errors correspond to the master bus:

BUS1ERRCLR : Code bus

BUS2ERRCLR : System bus

BUS3ERRCLR : DMAC/DTC

When writing 1 to BUSnERRCLR (n = 1 to 3), stop the bus access that causes an error in the corresponding bus master.

### 14.3.12 DMACDTCERRCLR : DMAC/DTC Error Clear Register

Base address: BUS = 0x4000\_3000

Offset address: 0x1A2C

|                    |   |   |   |   |   |   |   |              |
|--------------------|---|---|---|---|---|---|---|--------------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0            |
| Bit field:         | — | — | — | — | — | — | — | MTER<br>RCLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0            |

| Bit | Symbol   | Function                                                                                               | R/W              |
|-----|----------|--------------------------------------------------------------------------------------------------------|------------------|
| 0   | MTERRCLR | Master TrustZone filter Error Clear<br>Writing 1 to this bit clears the DMACDTCERRSTAT.MTERRSTAT flag. | R/W <sup>1</sup> |
| 7:1 | —        | This bit is read as 0. The write value should be 0.                                                    | R/W              |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

When writing 1 to DMACDTCERRCLR, stop the bus access that causes an error in DMAC/DTC.

## 14.4 Bus Error Monitoring Section

The bus error monitoring system monitors each individual area, and when an error is detected, an error is returned to the requesting master IP using the AHB-Lite error response protocol.

### 14.4.1 Bus Error Types

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- TrustZone Filter error

- Bus error transmitted from each slave IP

Table 14.2 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see section 15, Memory Protection Unit (MPU).

### 14.4.2 Operations When a Bus Error Occurs

When a bus error occurs, operation is not guaranteed and the error is returned to the requesting master IP.

Figure 14.3 shows operation from each error detection to user notification on the bus.

Figure 14.3 The operation from each error detection to user notification on the bus

#### (1) Bus Master MPU Error

The bus master of DMAC/DTC has a master MPU for access control of the set address area. The CPU does not have a master MPU because it has an Arm MPU. When a bus master MPU error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 3).
2. Store the read/write information of the error in BUSnERRRW (n = 3).
3. Set 1 to MMERRSTAT bit of BUSnERRSTAT (n = 3).

An NMI request or a reset request is generated according to the MMPUOAD.OAD setting (see section 15, Memory Protection Unit (MPU)). Since BUSnERRADD (n = 3), BUSnERRRW (n = 3), and BUSnERRSTAT (n = 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first bus master MPU error after a reset or clearing of BUSnERRSTAT.MMERRSTAT (n = 3) bit by BUSnERRCLR (n = 3).

#### (2) Illegal Access Error

section 14.4.3. Conditions Leading to Illegal Address Access Errors, describes illegal access errors. When an illegal access error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3).
3. Set 1 to ILERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be confirmed in the Bus Fault handler or the interrupt handler.

### (3) Master-TZF Error

As described in [section 42, Security Features](#), DMAC/DTC has Master-TZF errors. When a Master-TZF error is detected, 1 is set to MTERRSTAT bit of DMACDTCERRSTAT, and because the DMAC/DTC does not perform bus access, no bus error information is stored in BTZF3ERRADD and BTZF3ERRRW.

An NMI request or reset request is generated according to the setting of TZFOAD.OAD. See [section 16, DMA Controller \(DMAC\)](#), [section 17, Data Transfer Controller \(DTC\)](#) for details on Master-TZF errors. Because DMACDTCERRSTAT is held until reset other than MPU- and TZF-related resets or cleared by DMACDTCERRCLR, they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Master-TZF error after reset or clearing of the DMACDTCERRSTAT.MTERRSTAT bit by DMACDTCERRCLR.

### (4) Slave-TZF Error

As described in [section 42, Security Features](#), FHBIU (code flash), FLBIU (data flash), S0BIU (SRAM), PHBIU and PLBIU have Slave-TZF errors. When a Slave-TZF error is detected, perform the following steps:

1. Store the address of the error in BTZFnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BTZFnERRRW (n = 1 to 3).
3. Set 1 to STERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request or reset request is generated according to the setting in TZFOAD.OAD. Since BTZFnERRADD (n = 1 to 3), BTZFnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Slave-TZF error after a reset or clearing of the BUSnERRSTAT.STERRSTAT (n = 1 to 3) bit by BUSnERRCLR (n = 1 to 3).

### (5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3)
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3)
3. Set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

An NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the Bus Fault handler or interrupt handler. When a bus slave MPU error occurs, the error is returned to the requesting master IP and operation is not guaranteed.

## 14.4.3 Conditions Leading to Illegal Address Access Errors

[Table 14.2](#) lists the address spaces for each bus that trigger illegal address access errors.

**Table 14.2** Conditions leading to illegal address access errors

| Address                    | Slave bus              | Master bus |        |     |
|----------------------------|------------------------|------------|--------|-----|
|                            |                        | CPU        |        | DMA |
|                            |                        | Code       | System |     |
| 0x0000_0000 to 0x01FF_FFFF | FHBIU                  | —          |        | —   |
| 0x0200_0000 to 0x07FF_FFFF | Reserved               | E          |        | E   |
| 0x0800_0000 to 0x0803_FFFF | FLBIU                  | —          |        | —   |
| 0x0804_0000 to 0x0FFF_FFFF | Reserved               | E          |        | E   |
| 0x1000_0000 to 0x100F_FFFF | Reserved               | —          |        | E   |
| 0x1010_0000 to 0x1FFF_FFFF | Reserved               | E          |        | E   |
| 0x2000_0000 to 0x2800_FFFF | S0BIU                  |            | —      | —   |
| 0x2801_0000 to 0x3FFF_FFFF | Reserved               |            | E      | E   |
| 0x4000_0000 to 0x4007_FFFF | PSBIU                  |            | —      | —   |
| 0x4008_0000 to 0x400F_FFFF | PLBIU                  |            | —      | —   |
| 0x4010_0000 to 0x4017_FFFF | PHBIU                  |            | —      | —   |
| 0x4018_0000 to 0x407D_FFFF | Reserved               |            | E      | E   |
| 0x407E_0000 to 0x407F_FFFF | FLBIU                  |            | —      | —   |
| 0x4080_0000 to 0x5FFF_FFFF | Reserved               |            | E      | E   |
| 0x6000_0000 to 0x67FF_FFFF | EQBIU                  |            | —      | —   |
| 0x6800_0000 to 0x87FF_FFFF | Reserved               |            | E      | E   |
| 0x8800_0000 to 0xDFFF_FFFF | Reserved               |            | E      | E   |
| 0xE000_0000 to 0xFFFF_FFFF | System for Cortex®-M33 |            |        | E   |

Note: "E" : A bus error occurs.

"—" : Transfer does not occur.

"—" : A bus error has not occurred. Even if there has reserved area, a bus error has not occurred.

Do not access reserved area in FLBIU and S0BIU. If accessed, a slave TZF error might occur.

#### 14.4.4 Time-out

For some peripheral modules, a timeout error occurs with the module-stop function. When there is no response from the slave for a certain period of time, a timeout error is detected. A timeout error is returned to the requesting master IP using the AHB-Lite error response protocol.

## 15. Memory Protection Unit (MPU)

### 15.1 Overview

The MCU has one Memory Protection Unit (MPU).

[Table 15.1](#) lists the MPU specifications, and [Table 15.2](#) shows the behavior on detection of each MPU error.

**Table 15.1 MPU specifications**

| Classification        | Module/Function      | Specifications                                                                                                                                                                                          |
|-----------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Illegal memory access | Arm® Cortex®-M33 CPU | <ul style="list-style-type: none"> <li>Arm CPU has a default memory map. If the CPU makes an illegal access, an exception interrupt occurs</li> <li>The MPU can change a default memory map.</li> </ul> |
| Memory protection     | Arm MPU              | Memory protection function for the CPU: <ul style="list-style-type: none"> <li>(8+8) region MPU with sub regions and background region for secure and non-secure.</li> </ul>                            |
|                       | Bus master MPU       | Memory protection function for each bus master except for the CPU: <ul style="list-style-type: none"> <li>DMAC/DTC: 8 regions</li> </ul>                                                                |

**Table 15.2 Behavior on MPU error detection**

| MPU type       | Notification type                                                                                      | Error Response by HRESP signal of AHB I/F | Bus Access on error detection                                                                                             | Storing of error access information |
|----------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| Arm MPU        | <ul style="list-style-type: none"> <li>Hard fault</li> </ul>                                           | Not supported                             | <ul style="list-style-type: none"> <li>Does not correctly write access</li> <li>Does not correctly read access</li> </ul> | Stored in the Cortex-M33 processor  |
| Bus Master MPU | <ul style="list-style-type: none"> <li>Reset or Non-maskable interrupts</li> <li>Hard fault</li> </ul> | Supported                                 | <ul style="list-style-type: none"> <li>Write access ignore</li> <li>Read access is read as 0</li> </ul>                   | Stored                              |

For information on error access for the Arm MPU, see [section 15.4. References](#). For information on error access for other MPUs, see [section 14.3. Register Descriptions](#) and [section 14.4. Bus Error Monitoring Section](#) in [section 14, Buses](#).

### 15.2 Arm MPU

The Arm MPU monitors the addresses accessed by the CPU across the entire address space (0x0000\_0000 to 0xFFFF\_FFFF) and provides support for:

- (8 + 8) protected regions
- When memory regions overlap, the processor generates a fault if a core access hits the overlapping regions
- Setting access permissions to protected region (Read, Write, Execution)
- Export of memory attributes to the system.

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see [section 15.4. References](#).

### 15.3 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000\_0000 to 0xFFFF\_FFFF). Access-control information can be set up to 8 regions in DMAC/DTC and monitor for access to each region is in accord with this information.

If access to a protected region is detected, the bus master MPU generates an internal reset or a non-maskable interrupt. For information on error access, see [section 14.3. Register Descriptions](#) and [section 14.4. Bus Error Monitoring Section](#) in [section 14, Buses](#).

The access control information for each area consists of protected/not-protected to read or write.

[Table 15.3](#) lists the specifications of the bus master MPU.

**Table 15.3 Bus master MPU specifications**

| Parameter                                                             | Description                                                                                               |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|

| Bit  | Symbol   | Function                                                              | R/W             |
|------|----------|-----------------------------------------------------------------------|-----------------|
| 7:0  | MMPUASAn | MMPUA Security Attribution (n = 0 to 7)<br>0: Secure<br>1: Non-secure | R/W             |
| 31:8 | —        | These bits are read as 1.                                             | R <sup>*1</sup> |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. This bit is read only.

#### MMPUASAn bits (MMPUA Security Attribution (n = 0 to 7))

The MMPUASAn bits specify the security attributes of registers for the Bus Master MPU Region Setting register. The target registers are:

- MMPUSDMACn (n = 0 to 7)
- MMPUEDMACn (n = 0 to 7)
- MMPUACDMACn (n = 0 to 7)

### 15.3.1.2 MMPUSARB : Master Memory Protection Unit Security Attribution Register B

Base address: CPSCU = 0x4000\_8000

Offset address: 0x134

|                    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |           |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|

| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | MMPU BSA0 |
| Value after reset: | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1         |

| Bit  | Symbol   | Function                                                 | R/W            |
|------|----------|----------------------------------------------------------|----------------|
| 0    | MMPUBSA0 | MMPUB Security Attribution<br>0: Secure<br>1: Non-secure | R/W            |
| 31:1 | —        | These bits are read as 1.                                | R <sup>1</sup> |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. This bit is read-only.

#### MMPUBSA0 bit (MMPUB Security Attribution)

The MMPUBSA0 bit specifies the security attributes of registers for the Bus Master MPU Region Setting register, Protect register, and OAD register. The target registers are:

- MMPUENDMAC
- MMPUENPTDMAC
- MMPURPTDMAC
- MMPURPTDMAC\_SEC
- MMPUOAD
- MMPUOADPT

The Secure user provides a Secure API to Non-secure user for the modification of the MMPURPTDMAC value when MMPUBSA0 bit is set to 0 (Secure).

### 15.3.1.3 MMPUSDMACn : MPU Start Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000\_0000

Offset address: 0x0204 + 0x010 × n

|                    |             |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|--------------------|-------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit position:      | 31          |   |   |   |   |   |   |   |   |   |   | 5 |   |   |   |   | 0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Bit field:         | MMPUS[31:5] |   |   |   |   |   |   |   |   |   |   |   |   |   | — | — | — | — | — |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | x           | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol      | Function                                                                                          | R/W |
|------|-------------|---------------------------------------------------------------------------------------------------|-----|
| 4:0  | —           | These bits are read as 0. The write value should be 0.                                            | R/W |
| 31:5 | MMPUS[31:5] | Region start address register<br>Address where the region starts, for use in region determination | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Region n unit sets the ENABLE bit, the RP bit, and the WP bit each.

### ENABLE bit (Region enable)

The ENABLE bit controls the enable or disable of DMAC/DTC region n (n = 0 to 7) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit control access permission for read and write protection to MMPUSDMACn (n = 0 to 7) and MMPUEDMACn (n = 0 to 7).

When the ENABLE bit is set to 0, access to DMAC region n (n = 0 to 7) is the outside region.

### RP bit (Read protection)

The RP bit enables or disables read protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the RP bit is available.

### WP bit (Write protection)

The WP bit enables or disables write protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the WP bit is available.

**Table 15.4 Function of Region Control Circuit for DMAC**

| MMPUACDMACn (n = 0 to 7) |    |       | Access  | Region            | Output of DMAC Region n unit (n = 0 to 7) |
|--------------------------|----|-------|---------|-------------------|-------------------------------------------|
| ENABLE                   | RP | WP    |         |                   |                                           |
| 0                        | —  | —     | Read    | —                 | Outside region                            |
|                          |    |       | Write   |                   | Outside region                            |
| 1                        | 0  | 0     | Read    | Inside            | Permitted region                          |
|                          |    |       |         | Outside           | Outside region                            |
|                          |    |       | Write   | Inside            | Permitted region                          |
|                          |    |       |         | Outside           | Outside region                            |
|                          | 0  | 1     | Read    | Inside            | Permitted region                          |
|                          |    |       |         | Outside           | Outside region                            |

|                          |    |       |         | Outside           | Outside region                            |
|                          |    |       | Write   | Inside            | Permitted region                          |
|                          |    |       |         | Outside           | Outside region                            |
| 1                        | 1  | Read  | Inside  | Protection region |                                           |
|                          |    |       | Outside | Outside region    |                                           |
|                          |    | Write | Inside  | Protection region |                                           |
|                          |    |       | Outside | Outside region    |                                           |

Note: Each regions of DMAC / DTC are set for secure access and non-secure access by MMPUSARA register. In this case, Non-secure regions in secure access and secure regions in Non-secure access are outside regions.

**Table 15.5 Function of Master Control Circuit for DMAC**

| MMPUENDMAC  | Output of DMAC Region 0 unit | Output of DMAC Region 1 unit | Output of DMAC Region 2-7 unit | Function of DMAC |
|-------------|------------------------------|------------------------------|--------------------------------|------------------|
| ENABLE      |                              |                              |                                |                  |
| 1           | Protected region             | Don't care                   | Don't care                     | Generate error   |
|             | Don't care                   | Protected region             | Don't care                     | Generate error   |
|             | Don't care                   | Don't care                   | Protected region               | Generate error   |
|             | Outside region               | Outside region               | Outside region                 | Generate error   |
| Other cases |                              |                              |                                | No error         |

A master MPU error occurs on the following conditions:

1. MMPUENDMAC.ENABLE = 1, and output of one or more Region n unit is protected region.
2. MMPUENDMAC.ENABLE = 1, and output of all Region n unit are outside region.

Other cases are handled as permitted region.

### 15.3.1.6 MMPUENDMAC : MPU Enable Register for DMAC

Base address: RMPU = 0x4000\_0000

Offset address: 0x0100

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |            |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|------------|
| Bit position:      | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |            |
| Bit field:         | KEY[7:0] |    |    |    |    |    |   |   |   |   | — | — | — | — | — | — | ENAB<br>LE |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0          |

| Bit  | Symbol   | Function                                                                                                         | R/W |
|------|----------|------------------------------------------------------------------------------------------------------------------|-----|
| 0    | ENABLE   | Bus Master MPU of DMAC enable<br>0: Bus Master MPU of DMAC is disabled.<br>1: Bus Master MPU of DMAC is enabled. | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.                                                           | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the ENABLE bit.                                               | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

#### ENABLE bit (Bus Master MPU of DMAC enable)

The ENABLE bit controls enable or disable of the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACDMACn (n = 0 to 7) is valid. When the ENABLE bit is set to 0, MMPUACDMACn (n = 0 to 7) is invalid for all regions. The bus master MPU function sets the ENABLE bit of each master group. When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the ENABLE bit. When writing to the ENABLE bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

### 15.3.1.7 MMPUENPTDMAC : MMPU Enable Protect Register for DMAC

Base address: RMPU = 0x4000\_0000

Offset address: 0x0104

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |         |   |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---------|---|
| Bit position:      | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1       | 0 |
| Bit field:         | KEY[7:0] |    |    |    |    |    |   |   |   |   |   |   |   |   | PROTECT |   |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       | 0 |

| Bit  | Symbol   | Function                                                                                                                                | R/W |
|------|----------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0    | PROTECT  | Protection of register<br>0: MMPUENDMAC register writes are possible.<br>1: MMPUENDMAC register writes are protected. Read is possible. | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.                                                                                  | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the PROTECT bit.                                                                     | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

#### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the MMPUENDMAC register.

When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time. When values other than 0xA5 are written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

### 15.3.1.8 MMPURPTDMAC : MMPU Regions Protect Register for DMAC

Base address: RMPU = 0x4000\_0000

Offset address: 0x0108

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |         |   |

| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       | 0 |

| Bit  | Symbol   | Function                                                                                                                                                          | R/W |
|------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0    | PROTECT  | Protection of register<br>0: Bus Master MPU register for DMAC writing is possible.<br>1: Bus Master MPU register for DMAC writing is protected. Read is possible. | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.                                                                                                            | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the PROTECT bit.                                                                                               | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC.PROTECT controls the following registers:

- MMPUSDMAC<sub>n</sub> (n = 0 to 7) of Non-secure program
- MMPUEDMAC<sub>n</sub> (n = 0 to 7) of Non-secure program
- MMPUACDMAC<sub>n</sub> (n = 0 to 7) of Non-secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated.

The KEY[7:0] bits always read as 0x00.

## 15.3.1.9 MMPURPTDMAC\_SEC : MPU Regions Protect register for DMAC Secure

Base address: RMPU = 0x4000\_0000

Offset address: 0x010C

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |         |   |

| Bit field:         | KEY[7:0] |    |    |    |    |    |   |   |   |   |   |   |   |   | PROTECT |   |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       | 0 |

| Bit  | Symbol   | Function                                                                                                                                                                        | R/W |
|------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0    | PROTECT  | Protection of register<br>0: Bus master MPU register for DMAC secure writes are possible.<br>1: Bus master MPU register for DMAC secure writes are protected. Read is possible. | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.                                                                                                                          | R/W |
| 15:8 | KEY[7:0] | Key Code<br>These bits enable or disable writes to the PROTECT bit.                                                                                                             | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC\_SEC.PROTECT controls the following registers:

- MMPUSDMAC<sub>n</sub> (n = 0 to 7) of Secure program
- MMPUEDMAC<sub>n</sub> (n = 0 to 7) of Secure program
- MMPUACDMAC<sub>n</sub> (n = 0 to 7) of Secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated.

The KEY[7:0] bits are always read as 0x00.

**15.3.1.10 MMPUOAD : MMPU Operation After Detection Register**

Base address: RMPU = 0x4000\_0000

Offset address: 0x0000

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |     |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-----|
| Bit position:      | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
| Bit field:         | KEY[7:0] |    |    |    |    |    |   |   | — | — | — | — | — | — | — | OAD |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0   |

| Bit  | Symbol   | Function                                                           | R/W |
|------|----------|--------------------------------------------------------------------|-----|
| 0    | OAD      | Operation after detection<br>0: Non-maskable interrupt<br>1: Reset | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.             | R/W |
| 15:8 | KEY[7:0] | Key Code<br>This bit enables or disables writes to the OAD bit.    | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

**OAD bit (Operation after detection)**

The OAD bit is specified to generate either reset or non-maskable interrupt when the access to the protect region is detected by the BUS Master MPU.

When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated.

The KEY[7:0] bits always read as 0x00.

**15.3.1.11 MMPUOADPT : MMPU Operation After Detection Protect Register**

Base address: RMPU = 0x4000\_0000

Offset address: 0x0004

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |         |

| Bit | Symbol  | Function                                                                                                                          | R/W |
|-----|---------|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 0   | PROTECT | Protection of register<br>0: MMPUOAD register writes are possible.<br>1: MMPUOAD register writes are protected. Read is possible. | R/W |

| Bit  | Symbol   | Function                                                            | R/W |
|------|----------|---------------------------------------------------------------------|-----|
| 7:1  | —        | These bits are read as 0. The write value should be 0.              | R/W |
| 15:8 | KEY[7:0] | Key code<br>These bits enable or disable writes to the PROTECT bit. | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPUOADPT.PROTECT controls the following register:

- MMPUOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

### KEY[7:0] bits (Key code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

## 15.3.2 Operation

### 15.3.2.1 Memory protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If access to a protected region is detected, the bus master MPU generates a memory protection error.

Bus Master MPU can be set for up to 8 protection regions. It is protection region when set up of permission region and protection region overlaps. It is protection region when set up of two protection region overlaps.

Bus Master MPU has master groups of DMAC/DTC.

Memory protection checks the address of the bus which the master group unified. Therefore, all the access of a master group is detected by memory protection.

The region setting registers of the Bus Master MPU for DMAC/DTC can be set for secure access and Non-secure access using the MMPUSARA register. Make secure access and Non-secure access settings the same for each DMAC/DTC channel and the corresponding region setting registers of the Bus Master MPU.

Bus Master MPU is permission of all regions after reset. All region is protected by setting MMPUENDMAC.ENABLE = 1.

Each region sets up a permission region on the protection region. If access to the protected region is detected, Bus Master MPU will generate an error.

Figure 15.1 shows the use case of a bus master MPU.

**Figure 15.1 Use case of bus master MPU**

Figure 15.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

**Figure 15.2 Access permission or protection by overlap of the bus master MPU regions**

Figure 15.3 shows the register setting flow after reset. During this register setting, stop all bus masters except the CPU.

Figure 15.3 Register setting flow of bus master MPU after reset

Figure 15.4 shows the register setting flow for adding regions. During this register setting, stop all masters except the CPU.

Figure 15.4 Register setting flow for region addition

### 15.3.2.2 Protecting the registers

Registers related to the Bus Master MPU can be protected with the PROTECT bit in the MMPUENPTDMA, MMPURPTDMAC, MMPURPTDMAC\_SEC and MMPUOADPT registers.

**Table 15.6 PROTECT bit and Protected target registers**

| PROTECT bit             | Protect target registers                                                                                                                                       |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MMPUENPTDMAC.PROTECT    | MMPUENDMAC                                                                                                                                                     |
| MMPURPTDMAC.PROTECT     | The following registers set to Non-secure by MMPUSARA.MMPUASAn (n = 0 to 7).<br>MMPUSDMACn (n = 0 to 7)<br>MMPUEDMACn (n = 0 to 7)<br>MMPUACDMACn (n = 0 to 7) |
| MMPURPTDMAC_SEC.PROTECT | The following registers set to Secure by MMPUSARA.MMPUASAn (n = 0 to 7).<br>MMPUSDMACn (n = 0 to 7)<br>MMPUEDMACn (n = 0 to 7)<br>MMPUACDMACn (n = 0 to 7)     |
| MMPUOADPT.PROTECT       | MMPUOAD                                                                                                                                                        |

### 15.3.2.3 Memory protection error

If access to a protected region is detected, the bus master MPU generates an error. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or a reset.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSMST. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#). The reset status is indicated in SYSTEM.RSTSR1.BUSMRF. For details, see [section 5, Resets](#).

## 16. DMA Controller (DMAC)

### 16.1 Overview

The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 16.1 lists the DMAC specifications, and Figure 16.1 shows a block diagram of the DMAC.

**Table 16.1 DMAC specifications (1 of 2)**

| Item                              |                                    | Description                                                                                                                                                                                                                                                                                                                                               |

| Interrupt (DMA_TRANSE RR)         | Error response detection interrupt | Generated when the DMAC transfer error occurs.                                                                                                                                                                                                                                                                                                            |
| Event link activation (DMACn_INT) |                                    | An event link request is generated after each data transfer (for block transfer, after each block is transferred).                                                                                                                                                                                                                                        |

**Table 16.1 DMAC specifications (2 of 2)**

| Item                                 | Description                                                                                        |
|--------------------------------------|----------------------------------------------------------------------------------------------------|
| Master TrustZone Filter              | TrustZone violation area of Flash and SRAM is detected before a non-secure channel access the bus. |
| Power consumption reduction function | Module-stop state can be set.                                                                      |
| TrustZone Filter                     | Security attribution can be set for each channels                                                  |

Note: Security attribution Register of DMAC channel is described in ICU.ICUSARC

Note 1. For details on DMAC activation sources, see Table 13.4 in section 13, Interrupt Controller Unit (ICU).

**Figure 16.1 Block diagram of DMAC**

| Bit  | Symbol | Function                                                                                                     | R/W |
|------|--------|--------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a    | Specifies the transfer destination reload address<br>Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set DMDRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0). DMDRR is the initial value of DMDAR. In repeat-block transfer mode, DMDAR reloads the value of DMDRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMDRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

### 16.2.6 DMCRA : DMA Transfer Count Register

Base address:  $DMACn = 0x4000_5000 + 0x0040 \times n$  (n = 0 to 7)

Offset address: 0x08

| Bit   | Symbol       | Function                                                                     | R/W |
|-------|--------------|------------------------------------------------------------------------------|-----|
| 15:0  | DMCRAL[15:0] | Lower bits of transfer count<br>Specifies the number of transfer operations. | R/W |
| 25:16 | DMCRAH[9:0]  | Upper bits of transfer count<br>Specifies the number of transfer operations. | R/W |
| 31:26 | —            | These bits are read as 0. The write value should be 0.                       | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMCRAH and DMCRAL in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode, block transfer mode, and repeat-block transfer mode.

#### (1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

#### (2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

### (3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

### (4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat-block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

## 16.2.7 DMCRB : DMA Block Transfer Count Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to 7)

Offset address: 0x0C

|                    |              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| Bit field:         | DMCRBH[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position:      | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:         | DMCRBL[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit   | Symbol       | Function                                                                                                                      | R/W |
|-------|--------------|-------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0  | DMCRBL[15:0] | Functions as a number of block, repeat or repeat-block transfer counter.<br>0x0001 to 0xFFFF (1 to 65535)<br>0x0000 (65536)   | R/W |
| 31:16 | DMCRBH[15:0] | Specifies the number of block, repeat or repeat-block transfer operations.<br>0x0001 to 0xFFFF (1 to 65535)<br>0x0000 (65536) | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMCRBH and DMCRL in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH specifies the number of block, repeat and repeat-block transfer operations, and DMCRL functions as a 16-bit the number of block counter in block, repeat, and repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0x0001, 65535 when it is 0xFFFF, and 65536 when it is 0x0000.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and the final data of one repeat size or one block size is transferred, DMCRBL reloads the value of DMCRBH automatically.

### 16.2.8 DMTMD : DMA Transfer Mode Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to 7)

Offset address: 0x10

|                    |         |    |          |    |    |     |         |   |   |   |   |   |   |   |           |   |

| 10    | TKP       | Transfer Keeping<br>0: Transfer is stopped by completion of specified total number of transfer operations.<br>1: Transfer is not stopped by completion of specified total number of transfer operations (free-running).                         | R/W |
| 11    | —         | This bit is read as 0. The write value should be 0.                                                                                                                                                                                             | R/W |
| 13:12 | DTS[1:0]  | Repeat Area Select<br>0 0: The destination is specified as the repeat area or block area.<br>0 1: The source is specified as the repeat area or block area.<br>1 0: The repeat area or block area is not specified.<br>1 1: Setting prohibited. | R/W |
| 15:14 | MD[1:0]   | Transfer Mode Select<br>0 0: Normal transfer<br>0 1: Repeat transfer<br>1 0: Block transfer<br>1 1: Repeat-block transfer                                                                                                                       | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. To select the DMAC activation source, use the DELSRn registers of the ICU. For details on DMAC activation sources, see [Table 13.4](#) in [section 13, Interrupt Controller Unit \(ICU\)](#).

#### DTS[1:0] bits (Repeat Area Select)

DTS[1:0] select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

### TKP bit (Transfer Keeping)

TKP selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

### 16.2.9 DMINT : DMA Interrupt Setting Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to  $7$ )

Offset address:  $0x13$

| 3   | ESIE   | Transfer Escape End Interrupt Enable<br>0: Disables the transfer escape end interrupt request.<br>1: Enables the transfer escape end interrupt request.                                                                                                                     | R/W |
| 4   | DTIE   | Transfer End Interrupt Enable<br>0: Disables the transfer end interrupt request.<br>1: Enables the transfer end interrupt request.                                                                                                                                          | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.                                                                                                                                                                                                                      | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

#### SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

#### RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When set to repeat-block transfer mode, do not use this bit.

#### ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

#### DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

### 16.2.10 DMAMD : DMA Address Mode Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to 7)

Offset address: 0x14

| 13    | SADR    | Source Address Update Select After Reload<br>0: Only reloading.<br>1: Add index after reloading.                                                                   | R/W |
| 15:14 | SM[1:0] | Source Address Update Mode<br>0 0: Source address is fixed.<br>0 1: Offset addition.<br>1 0: Source address is incremented.<br>1 1: Source address is decremented. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

### DARA[4:0] bits (Destination Address Extended Repeat Area)

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. [Table 16.2](#) lists the settings and the corresponding extended repeat areas.

### DADR bits (Destination Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in [Table 16.13](#).

In normal, repeat or block transfer mode, this bit is ignored.

### DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

### SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. [Table 16.2](#) lists the settings and the corresponding extended repeat areas.

### SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value  $((\text{DMSBSH}-\text{DMSBSL}) \times \text{DataSize})$  is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in [Table 16.12](#).

In normal, repeat or block transfer mode, this bit is ignored.

### SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

**Table 16.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)**

| SARA[4:0] or DARA[4:0] settings | Extended repeat area                                                             |
|---------------------------------|----------------------------------------------------------------------------------|
| 00000b                          | Not specified                                                                    |
| 00001b                          | 2 bytes specified as extended repeat area by the lower 1 bit of the address      |
| 00010b                          | 4 bytes specified as extended repeat area by the lower 2 bits of the address     |

| 01110b                          | 16 Kbytes specified as extended repeat area by the lower 14 bits of the address  |
| 01111b                          | 32 Kbytes specified as extended repeat area by the lower 15 bits of the address  |
| 10000b                          | 64 Kbytes specified as extended repeat area by the lower 16 bits of the address  |
| 10001b                          | 128 Kbytes specified as extended repeat area by the lower 17 bits of the address |
| 10010b                          | 256 Kbytes specified as extended repeat area by the lower 18 bits of the address |
| 10011b                          | 512 Kbytes specified as extended repeat area by the lower 19 bits of the address |
| 10100b                          | 1 Mbyte specified as extended repeat area by the lower 20 bits of the address    |
| 10101b                          | 2 Mbytes specified as extended repeat area by the lower 21 bits of the address   |
| 10110b                          | 4 Mbytes specified as extended repeat area by the lower 22 bits of the address   |
| 10111b                          | 8 Mbytes specified as extended repeat area by the lower 23 bits of the address   |
| 11000b                          | 16 Mbytes specified as extended repeat area by the lower 24 bits of the address  |
| 11001b                          | 32 Mbytes specified as extended repeat area by the lower 25 bits of the address  |

**Table 16.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (2 of 2)**

| SARA[4:0] or DARA[4:0] settings | Extended repeat area                                                             |
|---------------------------------|----------------------------------------------------------------------------------|
| 11010b                          | 64 Mbytes specified as extended repeat area by the lower 26 bits of the address  |
| 11011b                          | 128 Mbytes specified as extended repeat area by the lower 27 bits of the address |
| 11100b to 11111b                | Setting prohibited.                                                              |

### 16.2.11 DMOFR : DMA Offset Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to  $7$ )

Offset address:  $0x18$

Bit position: 31 0

Bit field:

|  |
|--|
|  |
|--|

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol | Function                                                                                                                                                                                                                           | R/W |
|------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a    | Specifies the offset when offset addition is selected as the address update mode for transfer source or destination.<br>0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes)<br>0xFF000000 to 0xFFFFFFFF (–16 Mbytes to –1 byte) | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).

Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

### 16.2.12 DMCNT : DMA Transfer Enable Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to  $7$ )

Offset address:  $0x1C$

Bit position: 7 6 5 4 3 2 1 0

Bit field:

|   |   |   |   |   |   |   |     |
|---|---|---|---|---|---|---|-----|
| — | — | — | — | — | — | — | DTE |
|---|---|---|---|---|---|---|-----|

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function                                                                     | R/W |
|-----|--------|------------------------------------------------------------------------------|-----|
| 0   | DTE    | DMA Transfer Enable<br>0: Disables DMA transfer.<br>1: Enables DMA transfer. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.                       | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### DTE bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped by the access error occurs. See [section 16.5. Processing on DMA Transfer Error](#).

### 16.2.13 DMREQ : DMA Software Start Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to  $7$ )

Offset address:  $0x1D$

|                    |   |   |   |      |   |   |   |       |
|--------------------|---|---|---|------|---|---|---|-------|
| Bit position:      | 7 | 6 | 5 | 4    | 3 | 2 | 1 | 0     |
| Bit field:         | — | — | — | CLRS | — | — | — | SWREQ |
| Value after reset: | 0 | 0 | 0 | 0    | 0 | 0 | 0 | 0     |

| Bit | Symbol | Function                                                                                                                                                                                 | R/W |
|-----|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0   | SWREQ  | DMA Software Start<br>0: DMA transfer is not requested.<br>1: DMA transfer is requested.                                                                                                 | R/W |
| 3:1 | —      | These bits are read as 0. The write value should be 0.                                                                                                                                   | R/W |
| 4   | CLRS   | DMA Software Start Bit Auto Clear Select<br>0: SWREQ bit is cleared after DMA transfer is started by software.<br>1: SWREQ bit is not cleared after DMA transfer is started by software. | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.                                                                                                                                   | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

**CLRS bit (DMA Software Start Bit Auto Clear Select)**

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

**16.2.14 DMSTS : DMA Status Register**

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  ( $n = 0$  to  $7$ )

Offset address:  $0x1E$

|                    |     |   |   |      |   |   |   |      |
|--------------------|-----|---|---|------|---|---|---|------|
| Bit position:      | 7   | 6 | 5 | 4    | 3 | 2 | 1 | 0    |
| Bit field:         | ACT | — | — | DTIF | — | — | — | ESIF |
| Value after reset: | 0   | 0 | 0 | 0    | 0 | 0 | 0 | 0    |

|-----|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 0   | ESIF   | Transfer Escape End Interrupt Flag<br>0: A transfer escape end interrupt has not been generated.<br>1: A transfer escape end interrupt has been generated. | R/W <sup>1</sup> |
| 3:1 | —      | These bits are read as 0. The write value should be 0.                                                                                                     | R/W              |
| 4   | DTIF   | Transfer End Interrupt Flag<br>0: A transfer end interrupt has not been generated.<br>1: A transfer end interrupt has been generated.                      | R/W <sup>1</sup> |
| 6:5 | —      | These bits are read as 0. The write value should be 0.                                                                                                     | R/W              |
| 7   | ACT    | DMAC Active Flag<br>0: DMAC is in the idle state.<br>1: DMAC is operating.                                                                                 | R                |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the flag.

**ESIF flag (Transfer Escape End Interrupt Flag)**

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- When 1-block data transfer is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- When an extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

**DTIF flag (Transfer End Interrupt Flag)**

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer).
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).
- When the specified number of blocks have been transferred in block transfer mode and repeat-block transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

### ACT flag (DMAC Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation.

[Clearing condition]

- When data transfer in response to one transfer request is completed.

### 16.2.15 DMSBS : DMA Source Buffer Size Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  (n = 0 to 7)

Offset address: 0x28

|                    |              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position:      | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field:         | DMSBSH[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit field:         | DMSBSL[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit   | Symbol       | Function                                                                                                                   | R/W |
|-------|--------------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0  | DMSBSL[15:0] | Functions as data transfer counter in repeat-block transfer mode<br>See <a href="#">Table 16.3</a> for available settings. | R/W |
| 31:16 | DMSBSH[15:0] | Specifies the repeat-area size in repeat-block transfer mode<br>See <a href="#">Table 16.3</a> for available settings.     | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMSBSH and DMSBSL in repeat-block transfer mode. Write 0x00000000 to DMSBS in normal, repeat and block transfer mode.

DMSBSH specifies buffer size and DMSBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH and DMSBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMSBSL reloads value of DMSBSH. When address update mode is fixed address, this register is ignored. [Table 16.3](#) shows

the setting values of DMA Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

**Table 16.3 Available setting for DMSBS register in repeat-block transfer mode**

| Source address update mode (DMAMD.SM)                   | Transfer data size (DMTMD.SZ) | Available setting for DMSBSH and DMSBSL bits       |
|---------------------------------------------------------|-------------------------------|----------------------------------------------------|
| Source address is fixed (SM = 00b)                      | Don't care                    | 0x0000 (DMSBS is not used)                         |
| Offset addition (SM = 01b)                              | 8 bits (SZ = 00b)             | 0x0001 to 0xFFFF (1 to 65535)                      |
|                                                         | 16 bits (SZ = 01b)            | 0x0001 to 0x7FFF (1 to 32767)                      |
|                                                         | 32 bits (SZ = 10b)            | 0x0001 to 0x3FFF (1 to 16383)                      |
| Source address is incremented or decremented (SM = 1xb) | Don't care                    | 0x0000 (infinite)<br>0x0001 to 0xFFFF (1 to 65535) |

In normal, repeat and block transfer mode, DMSBS is not used. The setting is invalid.

### 16.2.16 DMDBS : DMA Destination Buffer Size Register

Base address:  $DMACn = 0x4000\_5000 + 0x0040 \times n$  (n = 0 to 7)

Offset address: 0x2C

|                    |              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position:      | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field:         | DMDBSH[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position:      | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:         | DMDBSL[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit   | Symbol       | Function                                                                                                                    | R/W |
|-------|--------------|-----------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0  | DMDBSL[15:0] | Functions as data transfer counter in repeat-block transfer mode.<br>See <a href="#">Table 16.4</a> for available settings. | R/W |
| 31:16 | DMDBSH[15:0] | Specifies the repeat-area size in repeat-block transfer mode.<br>See <a href="#">Table 16.4</a> for available settings.     | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMDBSH and DMDBSL in repeat-block transfer mode. Write 0x00000000 to DMDBS in normal, repeat and block transfer mode.

DMDBSH specifies buffer size and DMDBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by DMDBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMDBSH and DMDBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMDBSL reloads value of DMDBSH. When address update mode is fixed address, this register is ignored. [Table 16.4](#) shows the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

**Table 16.4 Available setting for DMDBS register in repeat-block transfer mode (1 of 2)**

| Destination address update mode (DMAMD.DM) | Transfer data size (DMTMD.SZ) | Available setting for DMDBSH and DMDBSL bits |
|--------------------------------------------|-------------------------------|----------------------------------------------|
| Destination address is fixed (DM = 00b)    | Don't care                    | 0x0000 (DMDBS is not used)                   |

**Table 16.4 Available setting for DMDBS register in repeat-block transfer mode (2 of 2)**

| Destination address update mode (DMAMD.DM)                   | Transfer data size (DMTMD.SZ) | Available setting for DMDBSH and DMDBSL bits       |
|--------------------------------------------------------------|-------------------------------|----------------------------------------------------|
| Offset addition (DM = 01b)                                   | 8 bits (SZ = 00b)             | 0x0001 to 0xFFFF (1 to 65535)                      |
|                                                              | 16 bits (SZ = 01b)            | 0x0001 to 0x7FFF (1 to 32767)                      |
|                                                              | 32 bits (SZ = 10b)            | 0x0001 to 0x3FFF (1 to 16383)                      |
| Destination address is incremented or decremented (DM = 1xb) | Don't care                    | 0x0000 (infinite)<br>0x0001 to 0xFFFF (1 to 65535) |

In normal, repeat and block transfer mode, DMDBS is not used. The setting is invalid.

### 16.2.17 DMAST : DMA Module Activation Register

Base address: DMA = 0x4000\_5200

Offset address: 0x00

|                    |   |   |   |   |   |   |   |      |
|--------------------|---|---|---|---|---|---|---|------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
| Bit field:         | — | — | — | — | — | — | — | DMST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    |

| Bit | Symbol | Function                                                                                   | R/W |
|-----|--------|--------------------------------------------------------------------------------------------|-----|
| 0   | DMST   | DMAC Operation Enable<br>0: DMAC activation is disabled.<br>1: DMAC activation is enabled. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.                                     | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### DMST bit (DMAC Operation Enable)

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

## 16.2.18 DMECHR : DMAC Error Channel Register

Base address: DMA = 0x4000\_5200

Offset address: 0x40

|                    |    |    |    |    |    |    |    |          |    |    |    |    |    |       |    |        |

| 15:9  | —        | These bits are read as 0. The write value should be 0.                                                                                                                                                                            | R                |
| 16    | DMESTA   | DMAC Error Status<br>0: No DMA transfer error occurred<br>1: DMA transfer error occurred                                                                                                                                          | R/W <sup>1</sup> |
| 31:17 | —        | These bits are read as 0. The write value should be 0.                                                                                                                                                                            | R                |

Note 1. Writing to DMESTA depends on the value of DMECHSAM

### DMECH[2:0] bits (DMAC Error channel)

When a transfer error due to DMA transfer occurs, the DMECH[2:0] bits store the violating DMAC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

### DMECHSAM bit (DMAC Error channel Security Attribution Monitor)

When a transfer error due to DMA transfer occurs, the DMECHSAM bit indicates the security attribution of the violating DMAC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

### DMESTA bit (DMAC Error Status)

The DMESTA bit indicates whether or not a DMA transfer error occurred.

DMECH, DMECHSAM, DMESTA are cleared by writing 1 to DMESTA. Writing 0 to DMESTA is ignored.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. DMECHSAM = 0, it cannot be cleared in the non-secure state.

## 16.3 Operation

### 16.3.1 Transfer Mode

#### 16.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting DMCRB register is invalid in normal transfer mode. Except in free-running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

[Table 16.5](#) summarizes the register update operation in normal transfer mode, and [Figure 16.2](#) shows the operation in normal transfer mode.

**Table 16.5 Register update operation in normal transfer mode**

| Register | Function                     | Update operation after completion of a transfer by one transfer request |
|----------|------------------------------|-------------------------------------------------------------------------|
| DMSAR    | Transfer source address      | Increment/decrement/fixd/offset addition                                |
| DMDAR    | Transfer destination address | Increment/decrement/fixd/offset addition                                |
| DMCRAL   | Transfer count               | Decrementd by one/not updated (in free running function)                |
| DMCRAH   | —                            | Not updated (Not used in normal transfer mode)                          |
| DMCRB    | —                            | Not updated (Not used in normal transfer mode)                          |

Figure 16.2 Operation in normal transfer mode

### 16.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCR A register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCR B register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

Table 16.6 summarizes the register update operation in repeat transfer mode, and Figure 16.3 shows the operation in repeat transfer mode.

Table 16.6 Register update operation in repeat transfer mode (1 of 2)

| Register | Function                     | Update operation after completion of a transfer by one transfer request |                                                                                                                                                                                                                                               |

**Figure 16.3 Operation in repeat transfer mode**

### 16.3.1.3 Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRAL register.

A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

Table 16.7 summarizes the register update operation in block transfer mode, and Figure 16.4 shows the operation in block transfer mode.

**Table 16.7 Register update operation in block transfer mode**

| Register | Function                            | Update operation after completion of single-block transfer by one transfer request                                                                                                                                                                      |

**Figure 16.4 Operation in block transfer mode**

### 16.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 16.5 shows an example of adding a repeat function to the transfer destination.

Figure 16.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Figure 16.5 Operation in repeat block transfer mode

Figure 16.6 Operation in repeat-block transfer mode with offset addition

Table 16.8 to Table 16.13 summarize the register update operations in repeat-block transfer mode.

### 16.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 16.7 shows an example of the extended repeat area operation.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b). The data size is eight bits (DMTMD.SZ[1:0] = 00b).

**Figure 16.7 Example of extended repeat area operation**

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 16.8 shows an example when the extended repeat area function is used in block transfer mode.

Figure 16.8 Example of extended repeat area function in block transfer mode

### 16.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

#### 16.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see [section 16.3.1.1. Normal Transfer Mode](#).

#### 16.3.3.2 In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

Figure 16.9 show an example of block transfer operation without free-running function.

Figure 16.9 Operation in block transfer mode when DMTMD.TKP bit is set to 0

Figure 16.10 show an example of block transfer operation with free-running function.

Figure 16.10 Operation in block transfer mode when DMTMD.TKP bit is set to 1

### 16.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement.

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information [section 16.3.1.4. Repeat-Block Transfer Mode](#)

Table 16.14 shows the address update method in each address update mode.

**Table 16.14 Address update method in each address update mode**

| Address update mode | Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for address update modes | Address update method (for different SZ[1:0] settings in DMTMD) |               |               |
|---------------------|----------------------------------------------------------------------|-----------------------------------------------------------------|---------------|---------------|
|                     |                                                                      | SZ[1:0] = 00b                                                   | SZ[1:0] = 01b | SZ[1:0] = 10b |
| Address fixed       | 00b                                                                  | Fixed                                                           |               |               |
| Offset addition     | 01b                                                                  | +DMOFR*1                                                        |               |               |
| Increment           | 10b                                                                  | +1                                                              | +2            | +4            |
| Decrement           | 11b                                                                  | -1                                                              | -2            | -4            |

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:  
 two's complement of a negative offset value =  $\sim(\text{offset}) + 1$  ( $\sim$  = bit inversion)

### 16.3.4.1 Basic Transfer Using Offset Addition

Figure 16.11 shows an example of address updating using offset addition.

**Figure 16.11 Example of address updating by offset addition**

Figure 16.11 shows the setting of the following.

- The transfer data is 32 bits long.
- Offset addition is set as the transfer source address update mode.

- Increment is set as the transfer destination address update mode.

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

### 16.3.4.2 Example of XY Conversion Using Offset Addition

Figure 16.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition.
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits.
- DMTMD.MD — Transfer mode select: Repeat transfer.
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10.
- DMCRA — Repeat size: 0x4.
- DMINT.RPTIE — The repeat size end interrupt is enabled.

Figure 16.12 XY conversion operation using offset addition in repeat transfer mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

[Figure 16.13](#) shows a flowchart of the XY conversion.

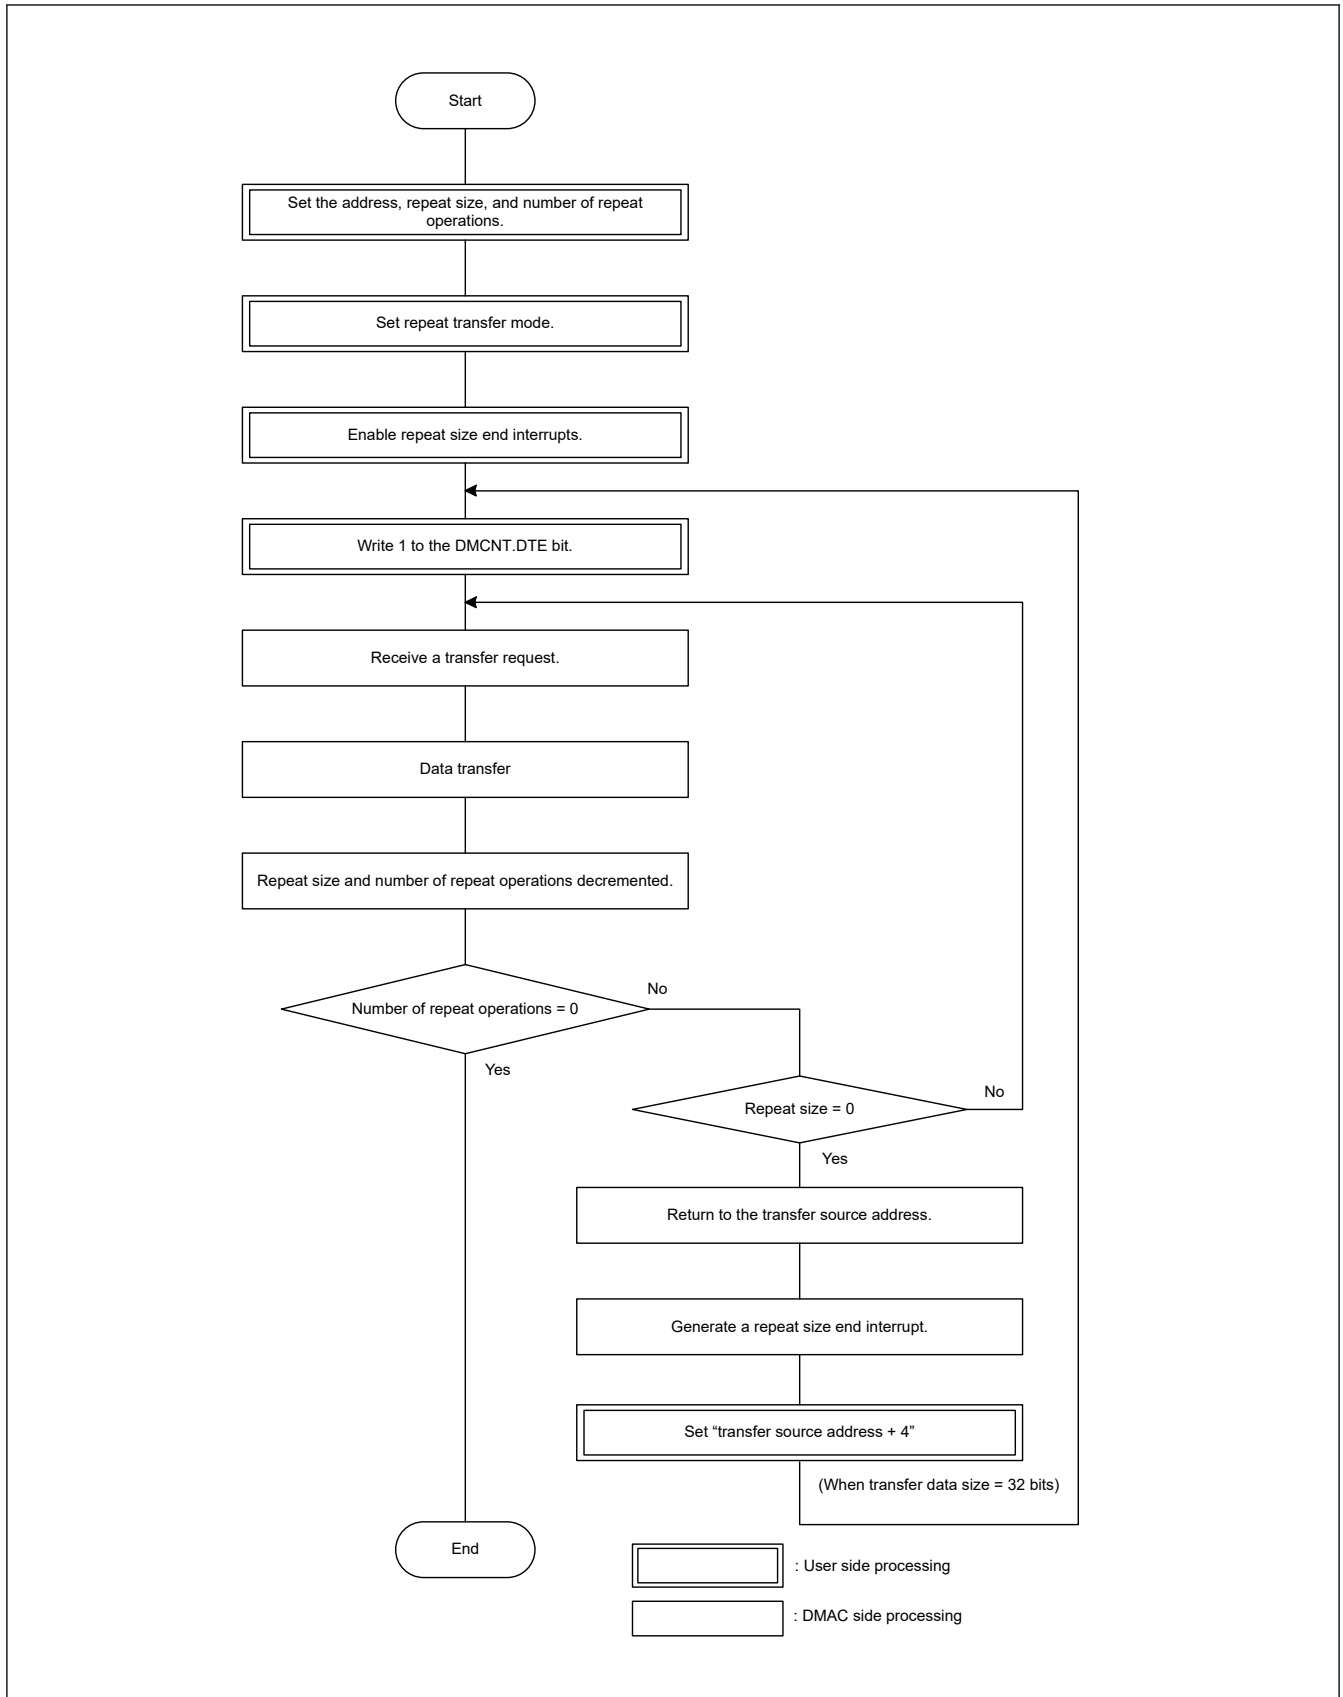

Figure 16.13 XY conversion flowchart using offset addition in repeat transfer mode

### 16.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

#### 16.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 16.14 shows address update in fixed address.

**Figure 16.14** Address update in fixed address

#### 16.3.5.2 Incremental and Decremental Address Mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 16.15 shows address update in incremental address.

**Figure 16.15 Address update in incremental address**

### 16.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

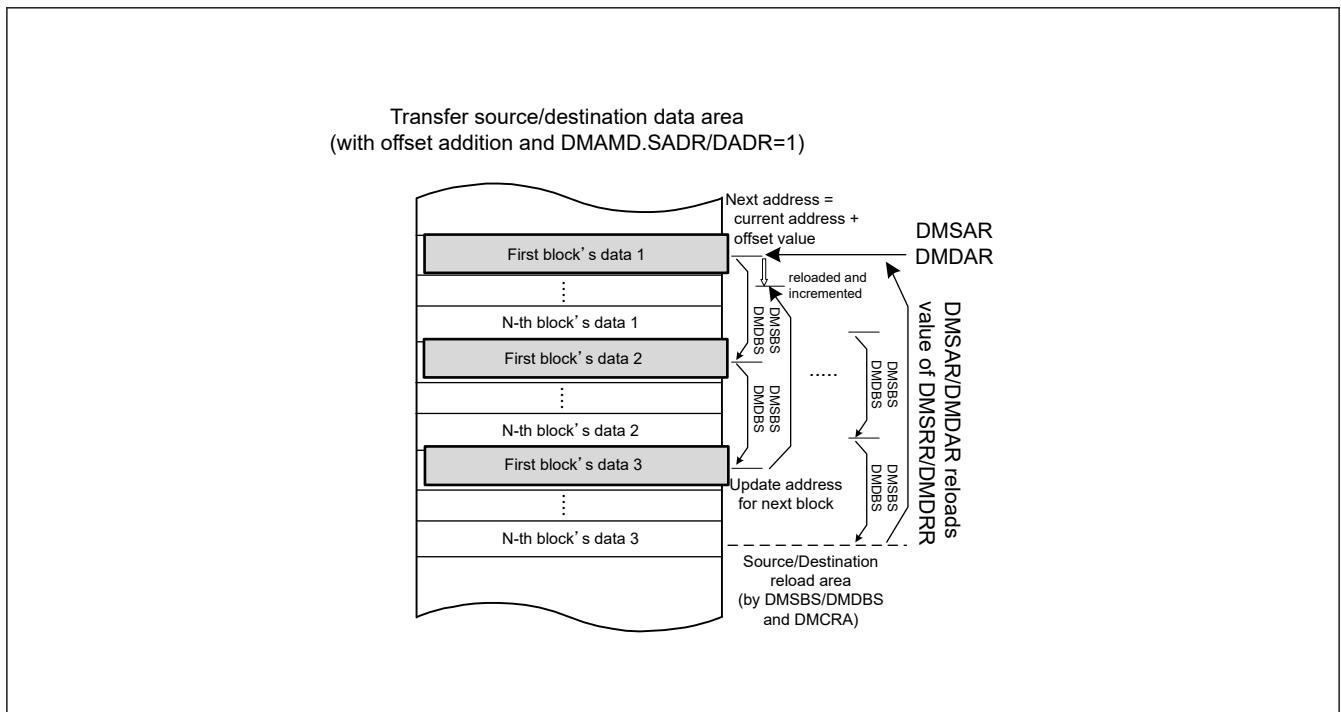

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. [Figure 16.16](#) shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

**Figure 16.16 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0**

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRAL=1. In other words, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 16.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

**Figure 16.17 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1**

### 16.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

### 16.3.6.1 Interval Address to Single Ring Buffer

Figure 16.18 shows an example of reading interval ADDRn registers (data register) of ADC12 module and storing it in single ring buffer. It transfers 2 data every 4 halfwords per 1 request. DMSAR is incremented by one data every one request. This can be achieved by setting the transfer source to offset addition and DMAMD.SADR=1, the block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 16.15 shows setting of this example.

**Table 16.15 Setting of use case: from interval address to single ring buffer**

| Register       | Value         | Description                                                                           |
|----------------|---------------|---------------------------------------------------------------------------------------|
| DMSAR, DMSRR   | 0x4017_0020   | Initial source address                                                                |
| DMDAR, DMDRR   | 0x2000_0000   | Initial destination address                                                           |
| DMTMD.SZ[1:0]  | 01b           | Data size is halfword                                                                 |
| DMAMD.SADR     | 1             | Incremental source address after reloading                                            |
| DMAMD.SM[1:0]  | 01b           | Source update mode is offset addition                                                 |
| DMAMD.DM[1:0]  | 10b           | Destination update mode is incremental address                                        |
| DMCRAH, DMCRAL | 2             | Transfer block size                                                                   |
| DMSBSH, DMSBSL | 4             | Source whole buffer size (unit is 'blocks') and Source access offset (unit is 'data') |
| DMDBSH, DMDBSL | N × 2 (DMCRA) | Destination buffer size (unit is 'data')                                              |

**Figure 16.18 Example of use case: from interval address to single ring buffer**

### 16.3.6.2 Unaligned Ring Buffer to Single Ring Buffer

Figure 16.19 shows an example of reading ADBUFn registers of ADC12 module (conversion result storage ring buffer) incrementally and storing it in single ring buffer. In this example, wrapping occurs because ADBUFn overflows in the fourth scan, but transfer source address of DMAC is also updated accordingly. This can be realized by setting the transfer source to incremental address and setting the DMSBS register to 16 which is the length of ADBUFn. This makes it possible to continue transfer without performing CPU processing using interrupts. Table 16.16 shows setting of this example.

**Table 16.16 Setting of use case: from unaligned ring buffer to single ring buffer (1 of 2)**

| Register      | Value       | Description                                    |
|---------------|-------------|------------------------------------------------|
| DMSAR, DMSRR  | 0x4017_00B0 | Initial source address                         |
| DMDAR, DMDRR  | 0x2000_0000 | Initial destination address                    |
| DMTMD.SZ[1:0] | 01b         | Data size is halfword                          |
| DMAMD.SM[1:0] | 10b         | Source update mode is incremental address      |
| DMAMD.DM[1:0] | 10b         | Destination update mode is incremental address |

**Table 16.16** Setting of use case: from unaligned ring buffer to single ring buffer (2 of 2)

| Register       | Value                      | Description                              |
|----------------|----------------------------|------------------------------------------|
| DMCRAH, DMCRAL | 5                          | Transfer block size                      |
| DMSBSH, DMSBSL | 16                         | Source buffer size (unit is 'data')      |
| DMDBSH, DMDBSL | $N \times 5(\text{DMCRA})$ | Destination buffer size (unit is 'data') |

**Figure 16.19** Example of use case: from unaligned ring buffer to single ring buffer

### 16.3.6.3 Single Block to Multi Ring Buffer

Figure 16.20 shows an example of storing the continuous ADDRn registers (data register) of ADC12 module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 16.17 shows setting of this example.

**Table 16.17** Setting of use case: from single block to multi ring buffer

| Register       | Value       | Description                                                                                     |
|----------------|-------------|-------------------------------------------------------------------------------------------------|
| DMSAR, DMSRR   | 0x4017_0020 | Initial source address                                                                          |
| DMDAR, DMDRR   | 0x2000_0000 | Initial destination address                                                                     |
| DMTMD.SZ[1:0]  | 01b         | Data size is halfword                                                                           |
| DMAMD.DADR     | 1           | Incremental destination address after reloading                                                 |
| DMAMD.SM[1:0]  | 10b         | Source update mode is incremental address                                                       |
| DMAMD.DM[1:0]  | 01b         | Destination update mode is offset addition                                                      |
| DMCRAH, DMCRAL | 3           | Transfer block size                                                                             |
| DMSBSH, DMSBSL | 3           | Source buffer size (unit is 'data')                                                             |
| DMDBSH, DMDBSL | N           | Destination whole buffer size (unit is 'blocks') and Destination access offset (unit is 'data') |

**Figure 16.20** Example of use case: from single block to multi ring buffer

### 16.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

#### 16.3.7.1 DMAC Activation by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

#### 16.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in ICU.DELSRn.DELS[8:0] (n = 0 to 7).

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set ICU.DELSRn.DELS[8:0] (n = 0 to 7) to the event number (select the DMAC event link).
2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).

For interrupt requests specified as DMAC activation sources, see [Table 13.3](#), in [section 13, Interrupt Controller Unit \(ICU\)](#).

### 16.3.8 Operation Timing

The following timing charts show the minimum number of execution cycles.

[Figure 16.21](#) and [Figure 16.22](#) show DMAC operation timing examples.

**Figure 16.21 DMAC operation timing example 1 with DMAC activation by Interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode**

**Figure 16.22 DMAC operation timing example 2 with DMAC activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4**

### 16.3.9 DMAC Execution Cycles

Table 16.18 lists execution cycles in one DMAC data transfer operation.

**Table 16.18 DMAC execution cycles**

| Transfer mode | Data transfer (read) | Data transfer (write) |
|---------------|----------------------|-----------------------|
| Normal        | Cr+1                 | Cw                    |
| Repeat        | Cr+1                 | Cw                    |
| Block*1       | P × Cr               | P × Cw                |

Note: P: Block size (DMCRAH register setting)  
 Cr: Data read destination access cycle  
 Cw: Data write destination access cycle

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle is applied.

Cr and Cw depend on the access destination. For the number of cycles for each access destination, see [section 38, SRAM](#), [section 40, Flash Memory](#), and [section 14, Buses](#). The frequency ratio of the system clock and the peripheral clock is also taken into consideration.

The unit for +1 in “Data Transfer (Read)” column is one system clock cycle (ICLK). For the operation example, see [section 16.3.8. Operation Timing](#).

### 16.3.10 Activating the DMAC

[Table 16.19](#) shows the register setting procedure of normal, repeat and block transfer mode and [Table 16.20](#) shows register setting procedure of repeat-block transfer mode.

**Table 16.19 Register setting procedure of normal transfer mode, repeat transfer mode and block transfer mode (1 of 2)**

| No. | Step Name                                                                                                                                             | Description                                                                                                                                                                                                                                                                                       |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Disable the peripheral function as the DMACn request source.                                                                                          | To use peripheral function interrupts as DMAC activation sources.<br>Disable the control register for the peripheral function.                                                                                                                                                                    |
| 2   | Disable the IRQn pin as the DMACn request source.                                                                                                     | To use external pin interrupts as DMAC activation sources.                                                                                                                                                                                                                                        |
| 3   | Set the DMACn Event Link select (ICU.DELSRn.DELS[8:0]) to 0x00.                                                                                       | Disable the DMACn request.                                                                                                                                                                                                                                                                        |
| 4   | Clear the DMCNT.DTE bit to 0.                                                                                                                         | Disable DMA transfer.                                                                                                                                                                                                                                                                             |
| 5   | Set the interrupt request as a DMACn request source in the DMAC Event Link Setting Register (ICU.DELSRn) by using the ICU.                            | To use internal peripheral interrupts or external pin interrupts as DMAC activation sources.<br>Enable the interrupt bit for the activation source. Set the DMACn activation source.                                                                                                              |
| 6   | Set the peripheral module as a DMACn request source.                                                                                                  | To use peripheral function interrupt as a DMAC activation source.<br>Set the control register for the peripheral function without starting it.                                                                                                                                                    |
| 7   | Set the IRQn pin function by using the ICU.                                                                                                           | To use external pin interrupt as a DMAC activation source.<br>Set the IRQn pin function by using the Interrupt Controller Unit.                                                                                                                                                                   |

| 13  | Set the DMCNT.DTE bit to 1.                                                                                                                                                        | Enable DMACn transfer.                                                                                                                                                                                                                                                                                                                                                                |
| 14  | Set the DMAST.DMST bit to 1.                                                                                                                                                       | Enable DMAC operation. *1                                                                                                                                                                                                                                                                                                                                                             |
| 15  | Start the peripheral function as a DMACn request source.                                                                                                                           | To use peripheral function interrupt as a DMA activation source.                                                                                                                                                                                                                                                                                                                      |
| 16  | Enable the IRQ pin as a DMACn request source.                                                                                                                                      | To use external pin interrupt as a DMA activation source.                                                                                                                                                                                                                                                                                                                             |

**Table 16.20 Register setting procedure of repeat-block transfer mode (2 of 2)**

| No. | Step name                | Description                                                                                                                                      |
|-----|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 17  | End of initial settings. | For activation by software.<br>On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer. |

Note: n: DMAC channel (n = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

### 16.3.11 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

### 16.3.12 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

#### DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.8](#) to [Table 16.13](#).

#### DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.8](#) to [Table 16.13](#).

**DMA Transfer Enable Bit (DMCNT.DTE)**

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

**DMAC Active Flag (DMSTS.ACT)**

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

**Transfer End Interrupt Flag (DMSTS.DTIF)**

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

**Transfer Escape End Interrupt Flag (DMSTS.ESIF)**

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

**16.3.13 Channel Priority**

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

- The channel priority is fixed as follows: Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

**16.3.14 Channel Security**

The security attribute of transfer access of DMACn, security attribute of access to register of DMACn, security attribute of access to the ICU.DELSRn register are controlled by ICUSARC.SADMACn bit. For details on the ICUSARC register, see [section 13, Interrupt Controller Unit \(ICU\)](#).

When the ICUSARC.SADMACn bit is 0, transfer of DMACn is secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are protected from a non-secure access.

When the ICUSARC.SADMACn bit is 1, transfer of DMACn is non-secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are non-secure attributes.

Do not write to the ICUSARC.SADMACn bit while DMA transfer of same channel is enabled or a bus master is writing to the DMA registers of same channel.

Figure 16.23 shows security attribute about each DMAC channels.

Figure 16.23 Security attribute about each DMAC channels

### 16.3.15 Master TrustZone Filter in DMAC

DMAC has the Master TrustZone Filter. The Master TrustZone Filter in DMAC can detect the security areas of Flash area (code Flash and data Flash) and SRAM area defined by IDAU. When set No-secure channel accesses those addresses, it

detects the security violation. Access of violation address is not performed. Detected the error is handled as the Master TrustZone Filter error.

## 16.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

### 16.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

#### (1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRAL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

#### (2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

#### (3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

#### (4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

### 16.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

### 16.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

## 16.5 Processing on DMA Transfer Error

DMA transfer error occurs with the Master TrustZone Filter error in DMAC, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. At this time, the ICU setting of the corresponding channel is also cleared. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, the error response is informed to the ICU.DELSRn of the corresponding channel is cleared. Write back to each register is not performed. Furthermore, it generates the error response detection interrupt request (DMA\_TRANSERR) to notify that an error has occurred by DMAC/DTC transfer.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DMAC by selecting NMI. The DMAC error channel register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DMAC, two interrupts(NMI and DMA\_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA\_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA\_TRANSERR) is not cleared in NMI handler.

[section 16.5.1. Processing on NMI handler](#) describes how to confirm the error information of the DMAC in the NMI handler.

[section 16.5.2. Processing on Error response detection interrupt request \(DMA\\_TRANSERR\) handler](#) describes how to confirm the error information of the DMAC in the DMA\_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in [section 16.6.2. Transfer Error Interrupt](#).

### 16.5.1 Processing on NMI handler

The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DMAC transfer error, the error response detection interrupt request (DMA\_TRANSERR) will occur after the end of NMI handler. It is possible to confirm the cause of the error and the DMAC channel in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in the ICU chapter.

[Figure 16.24](#) shows the flow for confirm the channel that caused the Master TrustZone Filter Error in DMAC

[Figure 16.25](#) shows the flow for confirm the channel that caused the Slave TrustZone Filter Error in DMAC

[Figure 16.26](#) shows the flow for confirm the channel and Security Attribute that caused the Master MPU error in DMAC.

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA\_TRANSERR) that occurs subsequently.

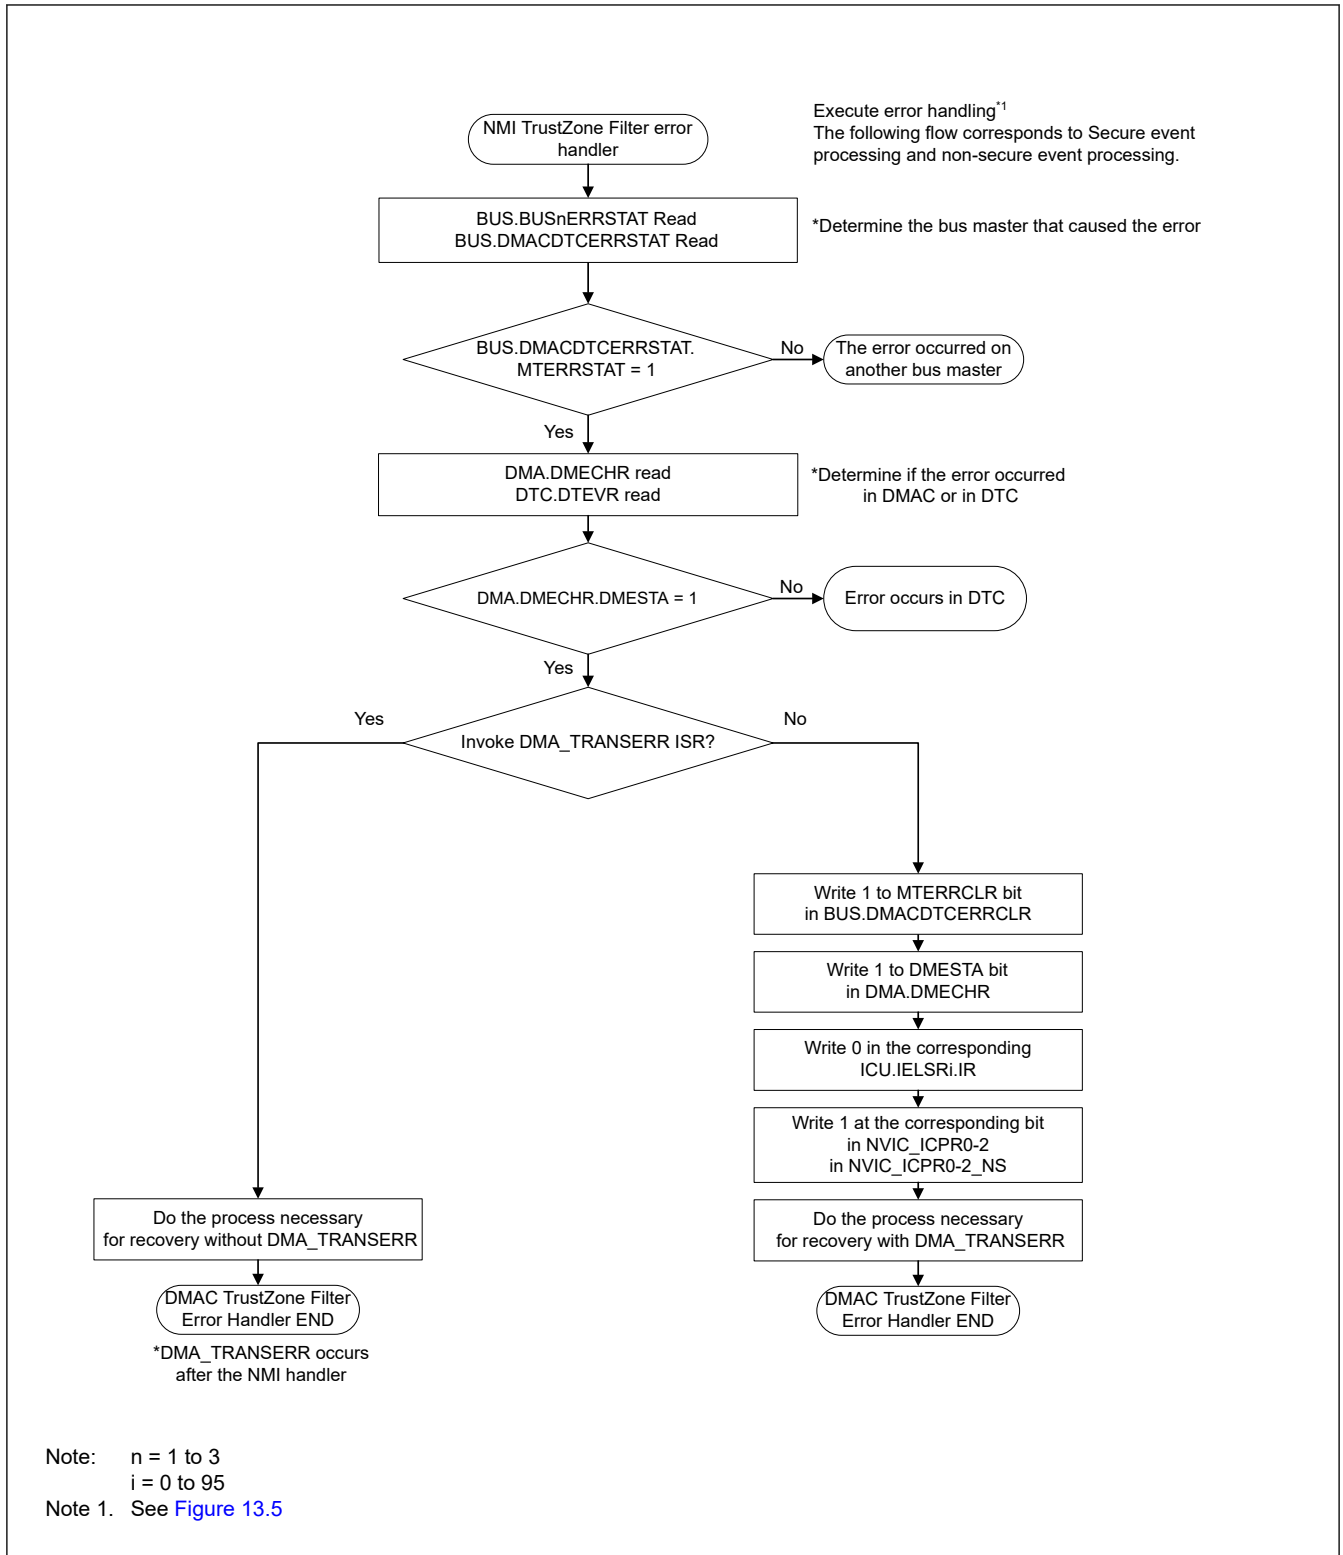

Figure 16.24 Processing in NMI handler by Master TrustZone Filter Error

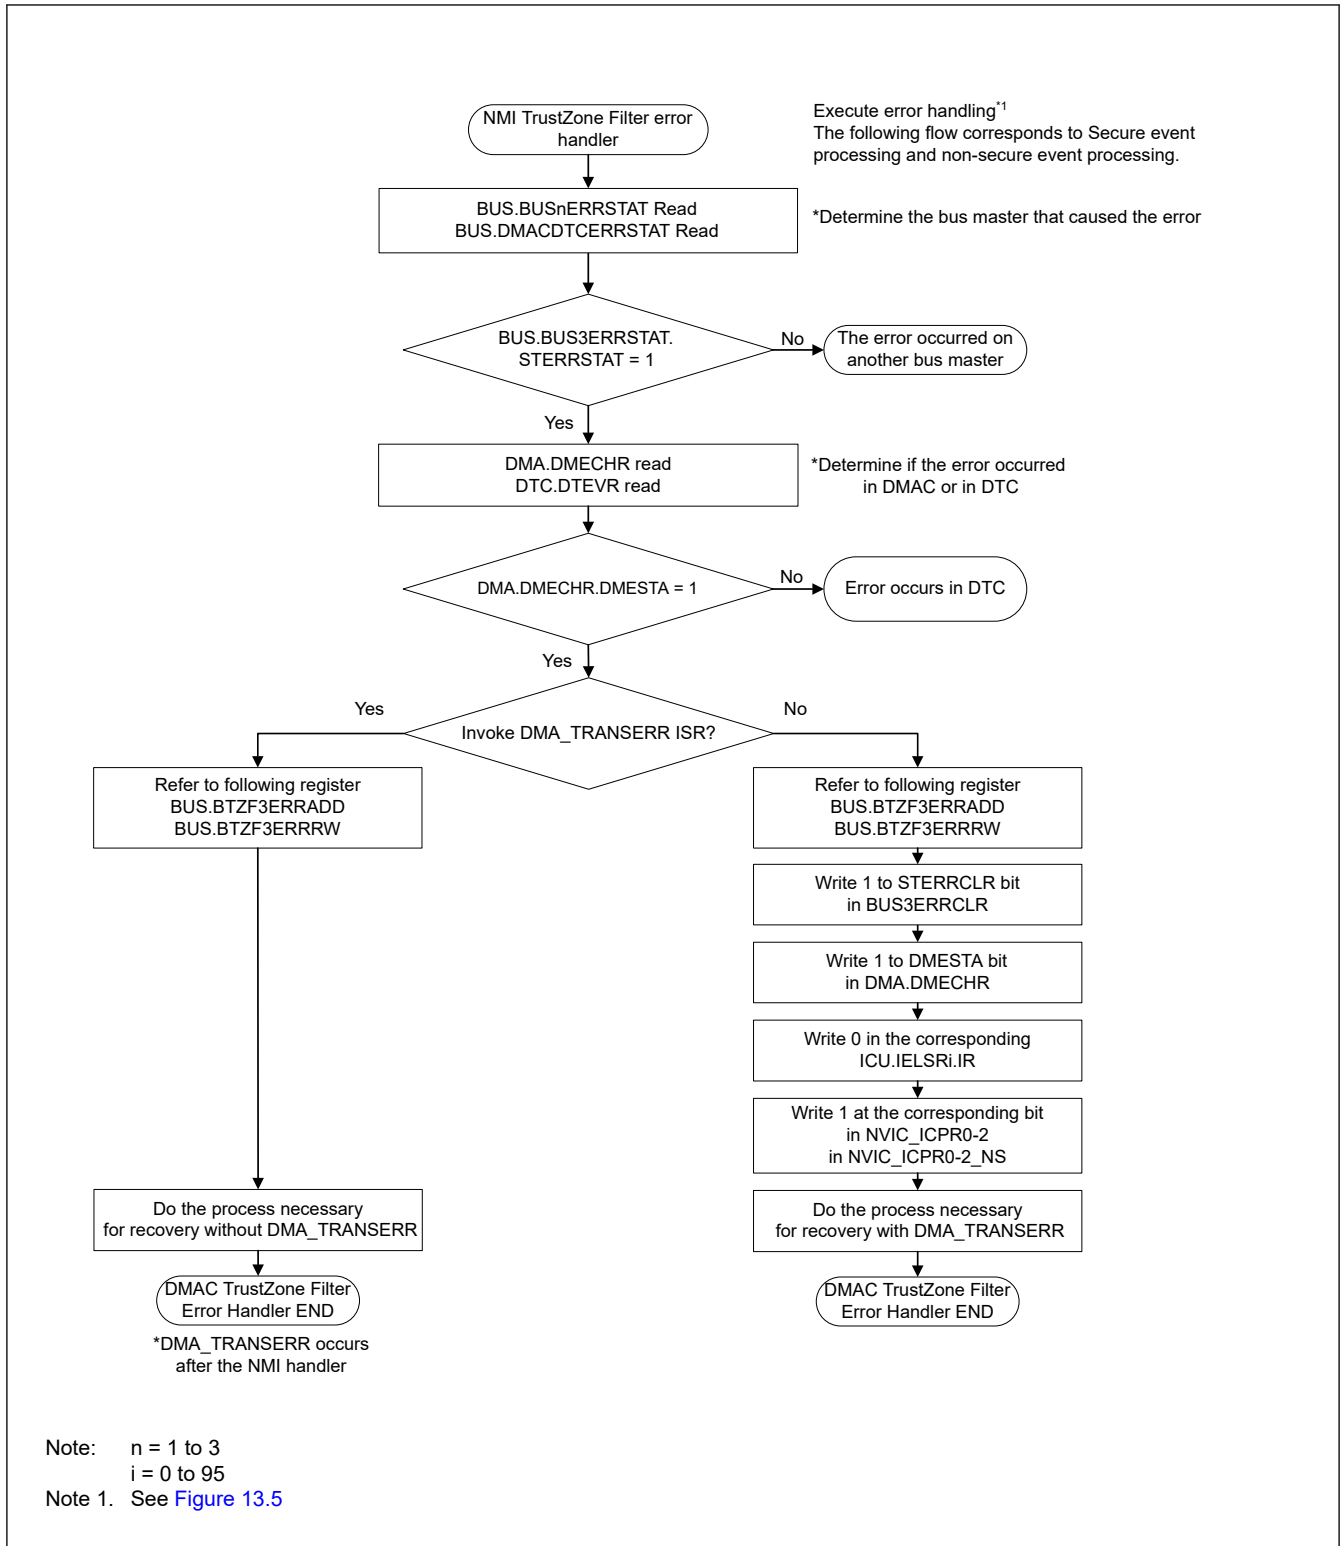

Figure 16.25 Processing in NMI handler by Slave TrustZone Filter Error

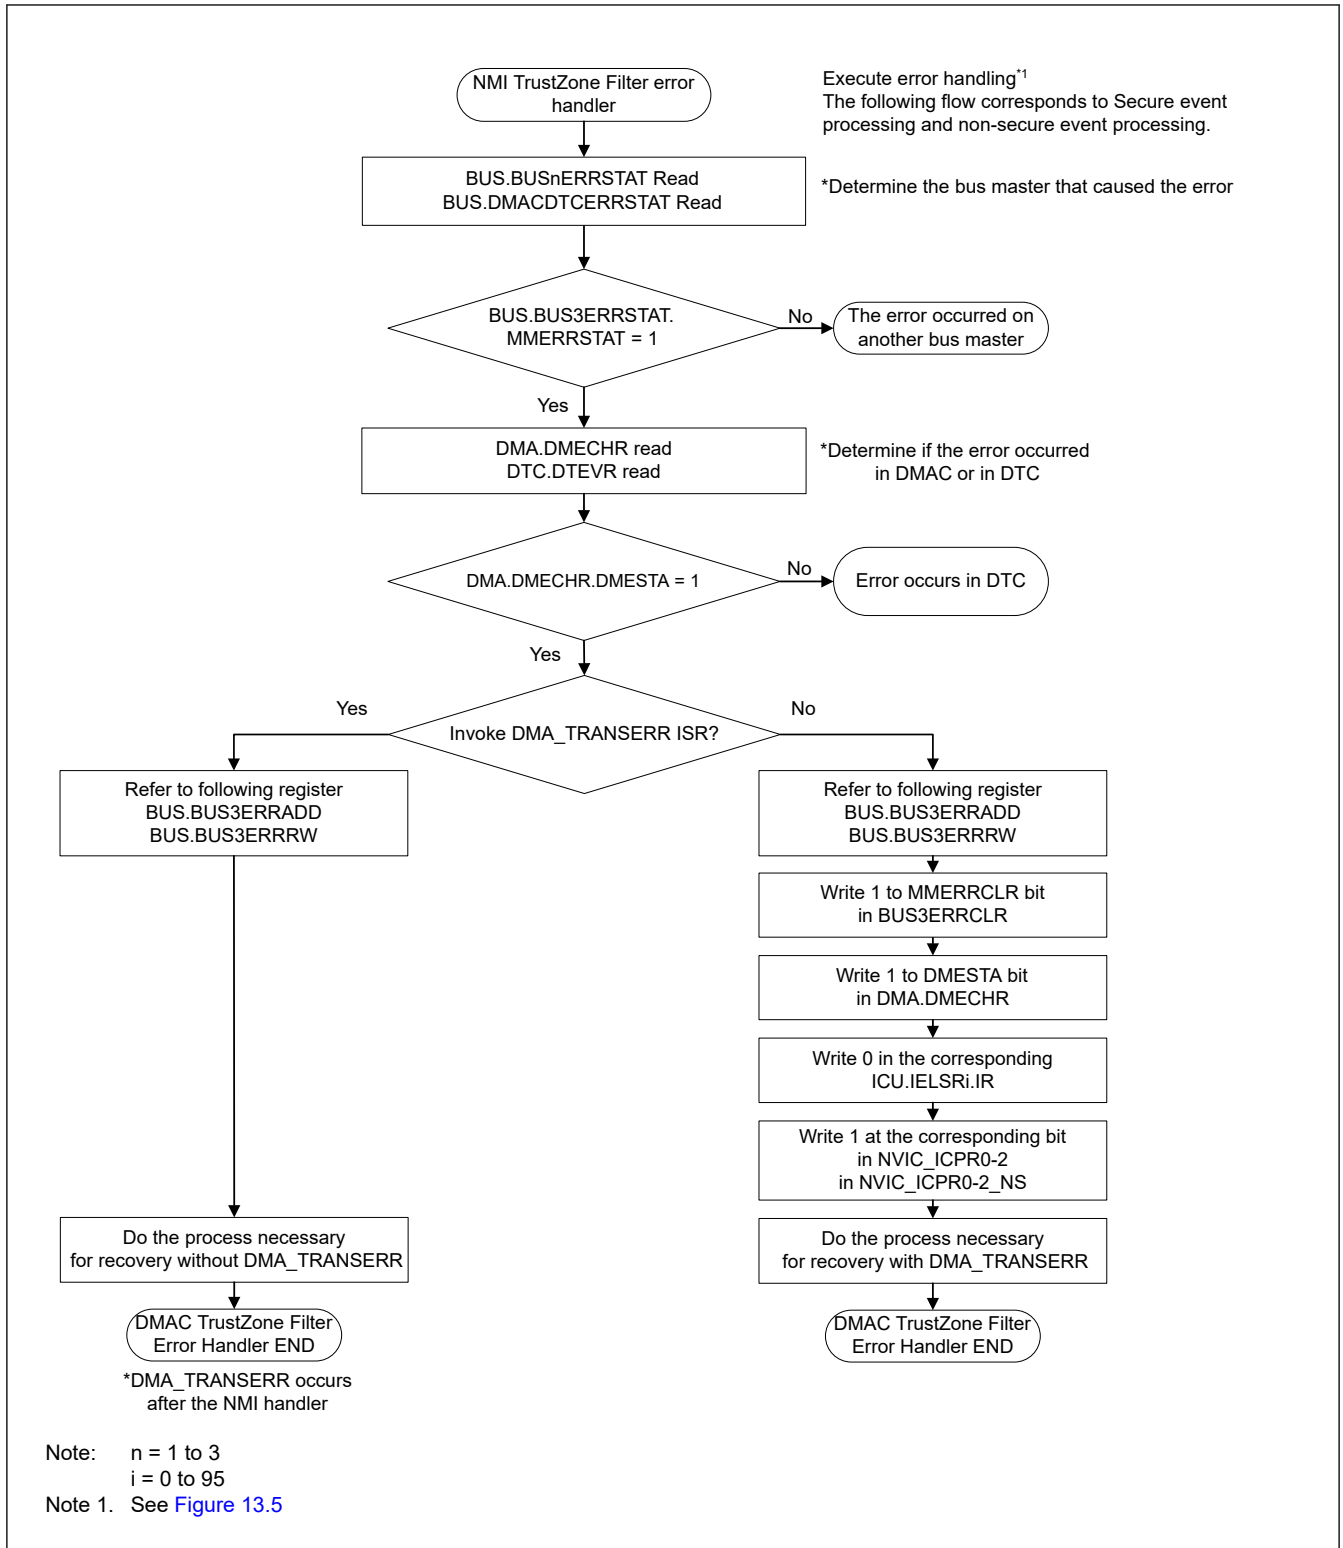

Figure 16.26 Processing in NMI handler by Master MPU Error

### 16.5.2 Processing on Error response detection interrupt request (DMA\_TRANSERR) handler

The cause of error response detection interrupt request (DMA\_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA\_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the DMAC channel in which the error occurred.

Error cause confirmation procedure is shown [Figure 16.27](#).

[Figure 16.28](#) shows the flow for confirm the channel that caused the Master TrustZone Filter Error in DMAC

[Figure 16.29](#) shows the flow for confirm the channel that caused the Slave TrustZone Filter Error in DMAC

[Figure 16.30](#) shows the flow for confirm the channel and Security Attribute that caused the Master MPU Error in DMAC

[Figure 16.31](#) shows the flow for confirm the channel and Security Attribute that caused the Slave Bus Error in DMAC

## 16.6 Interrupts

### 16.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request (DMACn\_INT) to the CPU or the DTC after transfer in response to one request is completed.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

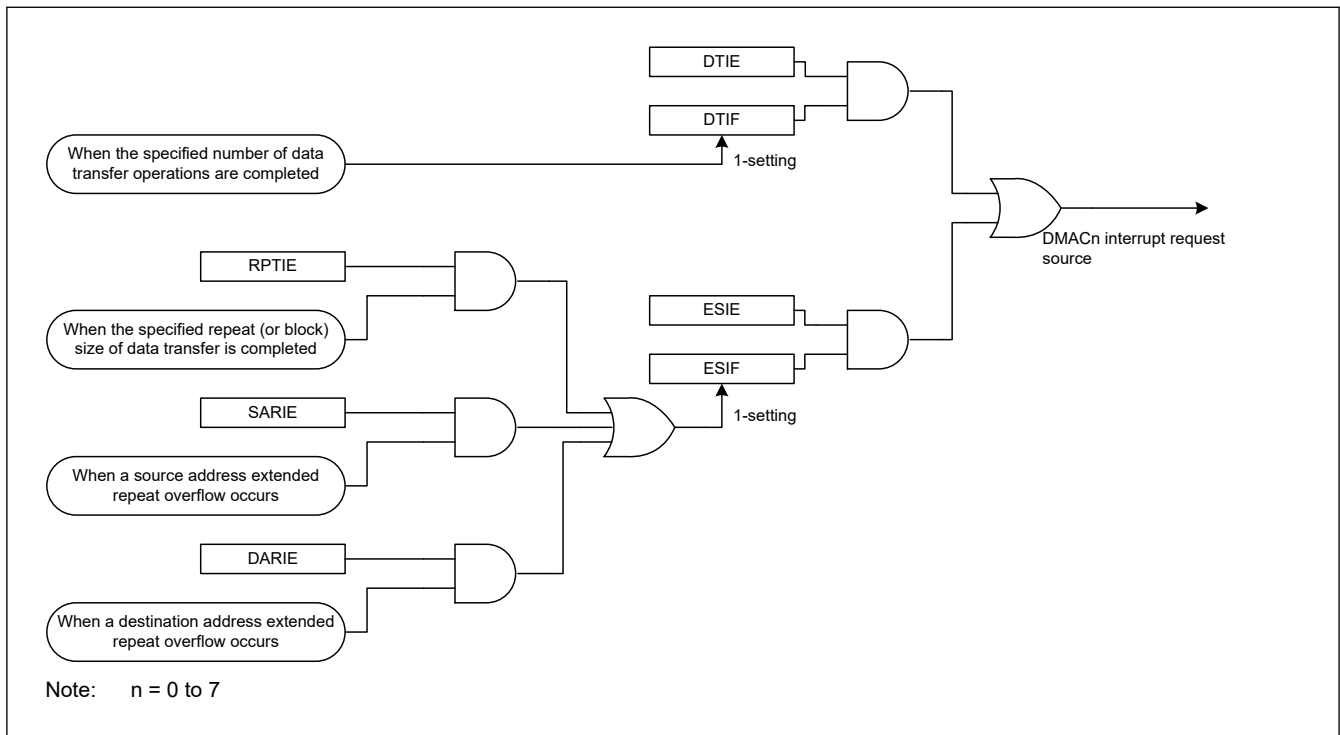

Table 16.21 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 16.33 shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). Figure 16.34 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 16.21 Relation among interrupt sources, interrupt status flags, and interrupt enable bits (1 of 2)

| Interrupt sources | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|-------------------|-----------------------|------------------------|----------------------------|
| Transfer end      | —                     | DMSTS.DTIF             | DMINT.DTIE                 |

**Table 16.21 Relation among interrupt sources, interrupt status flags, and interrupt enable bits (2 of 2)**

| Interrupt sources   |                                                   | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|---------------------|---------------------------------------------------|-----------------------|------------------------|----------------------------|
| Escape transfer end | Repeat size end                                   | DMINT.RPTIE           | DMSTS.ESIF             | DMINT.ESIE                 |
|                     | Source address extended repeat area overflow      | DMINT.SARIE           |                        |                            |
|                     | Destination address extended repeat area overflow | DMINT.DARIE           |                        |                            |

**Figure 16.33 Schematic logic diagram of interrupt output source (DMACn)**

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

### 16.6.1.1 When Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

### 16.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

Figure 16.34 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

### 16.6.2 Transfer Error Interrupt

Error response detection interrupt request (DMA\_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer. The types of interrupts that occur when a DMAC transfer error occurs are listed in the Table 16.22. The Table 16.22 also shows error information stored when a transfer error occurs.

Table 16.22 Interrupt and error information due to DMAC transfer error cause

| Transfer error factor                 | NMI/RESET <sup>*1</sup> Request | Interrupt Request | Bus Error Status                           | Error Address Error R/W           | Error Channel Information |
|---------------------------------------|---------------------------------|-------------------|--------------------------------------------|-----------------------------------|---------------------------|
| Master TrustZone Filter (in DMAC/DTC) | ICU.NMISR.TZFST <sup>*1</sup>   | DMA_TRANSERR      | BUS.DMACDTCERRSTAT.MTERRSTAT <sup>*1</sup> | —                                 | DMA.DMECHR                |
| Slave TrustZone Filter                | ICU.NMISR.TZFST <sup>*1</sup>   | DMA_TRANSERR      | BUS.BUS3ERRSTAT.SLERRSTAT <sup>*1</sup>    | BUS.BTZF3ERRADD<br>BUS.BTZF3ERRRW | DMA.DMECHR                |
| Master MPU                            | ICU.NMISR.BUSMST                | DMA_TRANSERR      | BUS.BUS3ERRSTAT.MMERRSTAT                  | BUS.BUS3ERRADD<br>BUS.BUS3ERRRW   | DMA.DMECHR                |
| Slave Bus Error                       | — <sup>*2</sup>                 | DMA_TRANSERR      | BUS.BUS3ERRSTAT.SLERRSTAT <sup>*2</sup>    | BUS.BUS3ERRADD<br>BUS.BUS3ERRRW   | DMA.DMECHR                |
| Illegal Access Error                  | — <sup>*2</sup>                 | DMA_TRANSERR      | BUS.BUS3ERRSTAT.ILERRSTAT <sup>*2</sup>    | BUS.BUS3ERRADD<br>BUS.BUS3ERRRW   | DMA.DMECHR                |

Note 1. Interrupt is generated when NMI request is selected as the operation after detection of the Master MPU error and the TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.

Note 2. If the error response detection interrupt (DMA\_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can also be determined by BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA\_TRANSERR) occurs.

## 16.7 Event Link

Each DMAC channel outputs an event link request signal (DMACn\_INT) every time it completes a data transfer, or a block transfer in block transfer mode.

For details, see [section 18, Event Link Controller \(ELC\)](#).

If a bus error occurs when writing the last data of transfer, a transfer end event and error response detection interrupt (DMA\_TRANSERR) occurs.

## 16.8 Low-Power Consumption Function

Before entering the module-stop state or Software Standby mode, or Deep Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended) and use the settings in the sections that follow.

### (1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DMAC. If a DMA transfer is in progress when 1 is written to the MSTPA22 bit, the transition to the module-stop state proceeds after the DMA transfer ends. Access to the DMAC registers is prohibited while the MSTPA22 bit is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

### (2) Software Standby mode and Deep Software Standby mode

Use the settings described in [section 10.7.1. Transitioning to Software Standby Mode](#), or in [section 10.9.1. Transitioning to Deep Software Standby Mode](#).

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

### (3) Notes on low power consumption function

For information on the WFI instruction and register settings, see [section 10.10.7. Timing of WFI Instruction](#).

To perform a DMA transfer after returning from a low power mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in [section 13.4.1. Detecting Interrupts](#), and then execute the WFI instruction.

## 16.9 Usage Notes

### 16.9.1 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMSBS
- DMDBS
- DMSRR

- DMDRR
- ICUSARC
- DMAC SAR

### 16.9.2 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see [section 4, Address Space](#).

### 16.9.3 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn n = 0 to 7)

The DMAC event link setting register (ICU.DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE (n = 0 to 95)) that corresponds to the same event number that has been set by the ICU.DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE and ICU.DELSRn, see [section 13, Interrupt Controller Unit \(ICU\)](#).

### 16.9.4 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x00 to the DMAC Event Link select bits (ICU.DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[8:0] bits following the settings shown in [section 16.3.10. Activating the DMAC](#).

### 16.9.5 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the DELSRn.DELS[8:0] bits in the ICU to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with either of the following approaches.

- Clear the DMAC activation request with a DMA dummy transfer.
- Set the DMCNT.DTE bit to 0 and then set the ICU.DELSRn.IR flag to 0.

See [Figure 16.35](#).

Figure 16.35 Example of register setting procedure to clear the DMAC activation interrupt

## 17. Data Transfer Controller (DTC)

### 17.1 Overview

A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.

Table 17.1 lists the DTC specifications and Figure 17.1 shows DTC block diagram.

**Table 17.1 DTC specifications**

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Note: Security attribution Register of DTC is described in ICU.ICUSARG, ICU.ICUSARH and ICU.ICUSARI

Figure 17.1 DTC block diagram

See [section 13.1. Overview](#) in [section 13, Interrupt Controller Unit \(ICU\)](#) for the connections between the DTC and NVIC in the CPU.

## 17.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

### 17.2.1 DTCSAR : DTC Controller Security Attribution Register

Base address: CPSCU = 0x4000\_8000

Offset address: 0x30

|                    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |          |

|------|---------|----------------------------------------------------------|-----|
| 0    | DTCSTSA | DTC Security Attribution<br>0: Secure.<br>1: Non-secure. | R/W |
| 31:1 | —       | This bit is read as 1.                                   | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

This register only sets the DTCST security attribute.

#### DTCSTSA bit (DTC Security Attribution)

Security attributes of registers for DTCST.

Do not write to the DTCSTSA bit while DTC transfer is enabled or a bus master is writing to the DTC registers.

### 17.2.2 MRA : DTC Mode Register A

Base address: DTCVBR

Offset address: 0x03 + 0x4 × Vector number  
(Inaccessible directly from the CPU. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#))

| 7   | CHNE    | DTC Chain Transfer Enable<br>0: Chain transfer is disabled.<br>1: Chain transfer is enabled.                                                                                                                                                                                                                                                                                                                                                                                   | —   |

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x02) and DTC transfers it automatically to and from the MRB register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).

### 17.2.6 CRA : DTC Transfer Count Register A

Base address: DTCVBR

Offset address:  $0x0E + 0x4 \times \text{Vector number}$   
 (Inaccessible directly from the CPU. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#))

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x

| Bit  | Symbol | Function                                                         | R/W |
|------|--------|------------------------------------------------------------------|-----|
| 7:0  | CRAL   | Transfer Counter A Lower Register<br>Specify the transfer count. | —   |
| 15:8 | CRAH   | Transfer Counter A Upper Register<br>Specify the transfer count. | —   |

Note: The function depends on the transfer mode.

Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode.

CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).

#### (1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

#### (2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

#### (3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

### 17.2.7 CRB : DTC Transfer Count Register B

Base address: DTCVBR

Offset address:  $0x0C + 0x4 \times \text{Vector number}$   
 (Inaccessible directly from the CPU. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#))

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x

The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used, and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).

### 17.2.8 DTCCR : DTC Control Register

Base address: DTC = 0x4000\_5400

Offset address: 0x00

|               |   |   |   |     |   |   |   |   |
|---------------|---|---|---|-----|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4   | 3 | 2 | 1 | 0 |
| Bit field:    | — | — | — | RRS | — | — | — | — |

Value after reset: 0 0 0 0 1 0 0 0

| Bit | Symbol | Function                                                                                                                                                      | R/W |
|-----|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | —      | These bits are read as 0. The write value should be 0.                                                                                                        | R/W |
| 3   | —      | This bit is read as 1. The write value should be 1.                                                                                                           | R/W |
| 4   | RRS    | DTC Transfer Information Read Skip Enable<br>0: Transfer information read is not skipped<br>1: Transfer information read is skipped when vector numbers match | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.                                                                                                        | R/W |

#### RRS bit (DTC Transfer Information Read Skip Enable)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

### 17.2.9 DTCCR\_SEC : DTC Control Register for secure Region

Base address: DTC = 0x4000\_5400

Offset address: 0x10

|               |   |   |   |     |   |   |   |   |
|---------------|---|---|---|-----|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4   | 3 | 2 | 1 | 0 |
| Bit field:    | — | — | — | RRS | — | — | — | — |

Value after reset: 0 0 0 0 1 0 0 0

| Bit | Symbol | Function                                                                                                                                                                   | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | —      | These bits are read as 0. The write value should be 0.                                                                                                                     | R/W |
| 3   | —      | This bit is read as 1. The write value should be 1.                                                                                                                        | R/W |
| 4   | RRS    | DTC Transfer Information Read Skip Enable for Secure<br>0: Transfer information read is not skipped.<br>1: Transfer information read is skipped when vector numbers match. | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.                                                                                                                     | R/W |

Note: Secure access is allowed. Non-secure access is read-only.

#### RRS bit (DTC Transfer Information Read Skip Enable for Secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is

set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

### 17.2.10 DTCVBR : DTC Vector Base Register

Base address: DTC = 0x4000\_5400

Offset address: 0x04

Bit position: 31 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol | Function                                                                                   | R/W |
|------|--------|--------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a    | DTC Vector Base Address<br>Set the DTC vector base address. The lower 10 bits should be 0. | R/W |

The DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000\_0000 to 0xFFFF\_FFFF (4 GB) in 1-KB units.

### 17.2.11 DTCVBR\_SEC : DTC Vector Base Register for secure Region

Base address: DTC = 0x4000\_5400

Offset address: 0x14

Bit position: 31 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol | Function                                                                                                                   | R/W |
|------|--------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a    | DTC Vector Base Address for secure region<br>Set DTC Vector Base Address for secure region. The lower 10 bits should be 0. | R/W |

Note: Secure access is allowed. Non-secure access is read-only.

The DTCVBR\_SEC sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000\_0000 to 0xFFFF\_FFFF (4 GB) in 1-KB units.

### 17.2.12 DTCST : DTC Module Start Register

Base address: DTC = 0x4000\_5400

Offset address: 0x0C

Bit position: 7 6 5 4 3 2 1 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function                                                             | R/W |
|-----|--------|----------------------------------------------------------------------|-----|
| 0   | DTCST  | DTC Module Start<br>0: DTC module stopped.<br>1: DTC module started. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.               | R/W |

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software standby mode

For details on these transitions, see [section 17.10. Low Power Consumption Function](#) and [section 10, Low Power Modes](#).

### 17.2.13 DTCSTS : DTC Status Register

Base address: DTC = 0x4000\_5400

Offset address: 0x0E

|                    |     |    |    |    |    |    |   |   |           |   |   |   |   |   |   |   |
|--------------------|-----|----|----|----|----|----|---|---|-----------|---|---|---|---|---|---|---|

| Bit field:         | ACT | —  | —  | —  | —  | —  | — | — | VECN[7:0] |   |   |   |   |   |   |   |
| Value after reset: | 0   | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0         | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol    | Function                                                                                                                                                                                                                    | R/W |
|------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0  | VECN[7:0] | DTC-Activating Vector Number Monitoring<br>These bits indicate the vector number for the activation source when a DTC transfer is in progress.<br>The value is only valid if a DTC transfer is in progress (ACT flag is 1). | R   |
| 14:8 | —         | These bits are read as 0.                                                                                                                                                                                                   | R   |
| 15   | ACT       | DTC Active Flag<br>0: DTC transfer operation is not in progress.<br>1: DTC transfer operation is in progress.                                                                                                               | R   |

#### VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

#### ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

### 17.2.14 DTEVR : DTC Error Vector Register

Base address: DTC = 0x4000\_5400

Offset address: 0x20

|                    |    |    |    |    |    |    |    |         |           |    |    |    |    |    |    |        |  |

|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0   | DTEV[7:0] | DTC Error Vector Number<br>These bits represent error vector of the DTC.                                                                             | R   |
| 8     | DTEVSAM   | DTC Error Vector Number SA Monitor<br>Indicates the SA of vector number causing the error.<br>0: Secure vector number<br>1: Non-secure vector number | R   |
| 15:9  | —         | These bits are read as 0. The write value should be 0.                                                                                               | R   |
| 16    | DTESTA    | DTC Error Status Flag<br>0: No DTC transfer error occurred<br>1: DTC transfer error occurred                                                         | R/W |
| 31:17 | —         | These bits are read as 0. The write value should be 0.                                                                                               | R   |

Note: Writing to DTESTA depends on the value of DTEVSAM

#### DTEV[7:0] bits (DTC Error Vector Number)

When a transfer error due to DTC transfer occurs, the DTEV[7:0] bits store the violating DTC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

#### DTEVSAM bit (DTC Error Vector Number SA Monitor)

When a transfer error due to DTC transfer occurs, the DTEVSAM bit indicates the SA of the violating DTC vector number.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition].

- When 1 is written to DTEVR.DTESTA.

#### DTESTA bit (DTC Error Status Flag)

The DTESTA bit indicates whether or not a DTC transfer error occurred.

DTEV, DTEVSAM, DTESTA are cleared by writing 1 to DTESTA.

Writing 0 to DTESTA is ignored.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

Note: When DTEVSAM = 1, it can be cleared in the secure state and non-secure state. DTEVSAM = 0, it cannot be cleared in the non-secure state.

### 17.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output  $n$  number set in ICU.IELSRn is defined as the interrupt vector number, where  $n = 0$  to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number  $n$  is selected in ICU.IELSRn.IELS[8:0] where  $n = 0$  to 95, as listed in [section 13.3.2. Event Number](#) in [section 13, Interrupt Controller Unit \(ICU\)](#). For activation by software, see [section 18.2.2. ELSEGRn : Event Link Software Event Generation Register n \(n = 0, 1\)](#).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until the transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, the highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU.
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer.
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

#### 17.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

DTC has two vector tables, non-secure side or secure side. Because the interrupt vector number that serves as a trigger for DTC is divided into non-secure or secure. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR\_SEC which is the secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information  $n$  with vector number  $n$  must be  $4n$  added to the base address in the vector table.

[Figure 17.2](#) shows the relationship between the DTC vector table and transfer information. [Figure 17.3](#) shows the allocation of transfer information in the SRAM area.

Figure 17.2 DTC vector table and transfer information

**Figure 17.3 Allocation of transfer information in the SRAM area**

## 17.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 17.2 describes the DTC transfer modes.

**Table 17.2 DTC transfer modes**

| Transfer mode          | Data size transferred on single transfer request                                                                        | Increment or decrement of memory address                  | Settable transfer count |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|-------------------------|
| Normal transfer mode   | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)                                                                    | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 65536              |
| Repeat transfer mode*1 | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)                                                                    | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 256*3              |
| Block transfer mode*2  | Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes)) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 65536              |

Note 1. Set the transfer source or transfer destination as the repeat area.

Note 2. Set the transfer source or transfer destination as the block area.

Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 17.4 shows the operation flow of the DTC. Table 17.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

Figure 17.4 DTC operation flow

**Table 17.3 Chain transfer conditions**

| First transfer |          |           |                                   | Second transfer <sup>*3</sup> |          |           |                                   | DTC transfer                                                        |
|----------------|----------|-----------|-----------------------------------|-------------------------------|----------|-----------|-----------------------------------|---------------------------------------------------------------------|
| CHNE bit       | CHNS bit | DISEL bit | Transfer counter <sup>*1 *2</sup> | CHNE bit                      | CHNS bit | DISEL bit | Transfer counter <sup>*1 *2</sup> |                                                                     |
| 0              | —        | 0         | Other than (1 → 0)                | —                             | —        | —         | —                                 | Ends after the first transfer                                       |
| 0              | —        | 0         | (1 → 0)                           | —                             | —        | —         | —                                 | Ends after the first transfer with an interrupt request to the CPU  |
| 0              | —        | 1         | —                                 | —                             | —        | —         | —                                 |                                                                     |
| 1              | 0        | —         | —                                 | 0                             | —        | 0         | Other than (1 → 0)                | Ends after the second transfer                                      |
|                |          |           |                                   | 0                             | —        | 0         | (1 → 0)                           | Ends after the second transfer with an interrupt request to the CPU |
|                |          |           |                                   | 0                             | —        | 1         | —                                 |                                                                     |
| 1              | 1        | 0         | Other than (1 → *)                | —                             | —        | —         | —                                 | Ends after the first transfer                                       |
| 1              | 1        | —         | (1 → *)                           | 0                             | —        | 0         | Other than (1 → 0)                | Ends after the second transfer                                      |
|                |          |           |                                   | 0                             | —        | 0         | (1 → 0)                           | Ends after the second transfer with an interrupt request to the CPU |
|                |          |           |                                   | 0                             | —        | 1         | —                                 |                                                                     |
| 1              | 1        | 1         | Other than (1 → *)                | —                             | —        | —         | —                                 | Ends after the first transfer with an interrupt request to the CPU  |

Note 1. The transfer counter used depends on the transfer modes as follows:

- Normal transfer mode — CRA register
- Repeat transfer mode — CRAL register
- Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:

- 1 → 0 in normal and block transfer modes
- 1 → CRAH in repeat transfer mode
- (1 → \*) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

### 17.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. [Figure 17.12](#) shows an example when reading the transfer information is skipped.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

### 17.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. [Table 17.4](#) lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

**Table 17.4 Transfer information write-back skip conditions and applicable registers**

| MRA.SM[1:0] bits |    | MRB.DM[1:0] bits |    | SAR register | DAR register |
|------------------|----|------------------|----|--------------|--------------|
| b3               | b2 | b3               | b2 |              |              |
| 0                | 0  | 0                | 0  | Skip         | Skip         |
| 0                | 0  | 0                | 1  |              |              |
| 0                | 1  | 0                | 0  |              |              |
| 0                | 1  | 0                | 1  |              |              |
| 0                | 0  | 1                | 0  | Skip         | Write-back   |
| 0                | 0  | 1                | 1  |              |              |
| 0                | 1  | 1                | 0  |              |              |
| 0                | 1  | 1                | 1  |              |              |
| 1                | 0  | 0                | 0  | Write-back   | Skip         |
| 1                | 0  | 0                | 1  |              |              |
| 1                | 1  | 0                | 0  |              |              |
| 1                | 1  | 0                | 1  |              |              |
| 1                | 0  | 1                | 0  | Write-back   | Write-back   |
| 1                | 0  | 1                | 1  |              |              |
| 1                | 1  | 1                | 0  |              |              |
| 1                | 1  | 1                | 1  |              |              |

### 17.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bit), 1-halfword (16 bit), 1-word (32 bit) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

[Table 17.5](#) lists register functions in normal transfer mode, and [Figure 17.5](#) shows the memory map of normal transfer mode.

**Table 17.5 Register functions in normal transfer mode**

| Register | Description                  | Value written back by writing transfer information |
|----------|------------------------------|----------------------------------------------------|
| SAR      | Transfer source address      | Increment, decrement, or fixed*1                   |
| DAR      | Transfer destination address | Increment, decrement, fixed*1                      |
| CRA      | Transfer counter A           | CRA - 1                                            |
| CRB      | Transfer counter B           | Not updated                                        |

Note 1. Write-back operation is skipped in address-fixed mode.

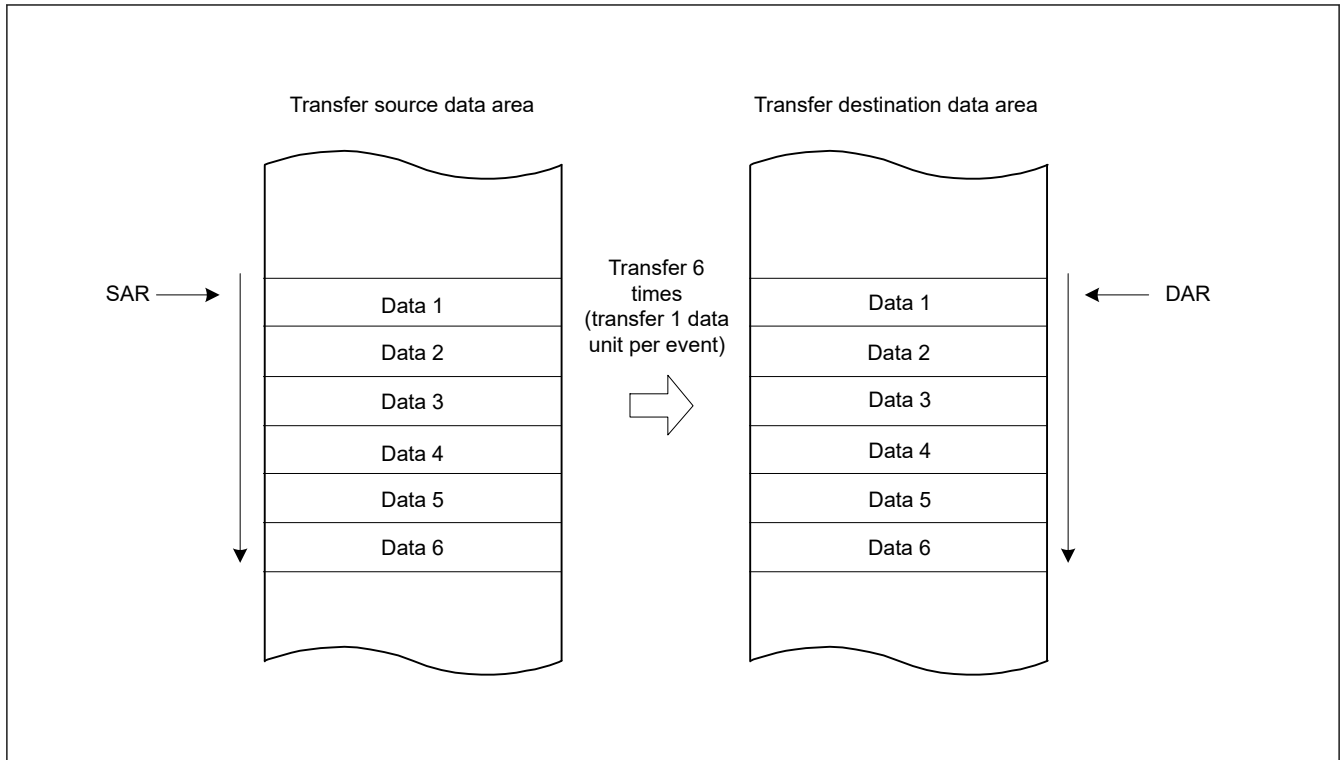

Figure 17.5 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0x0006)

### 17.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

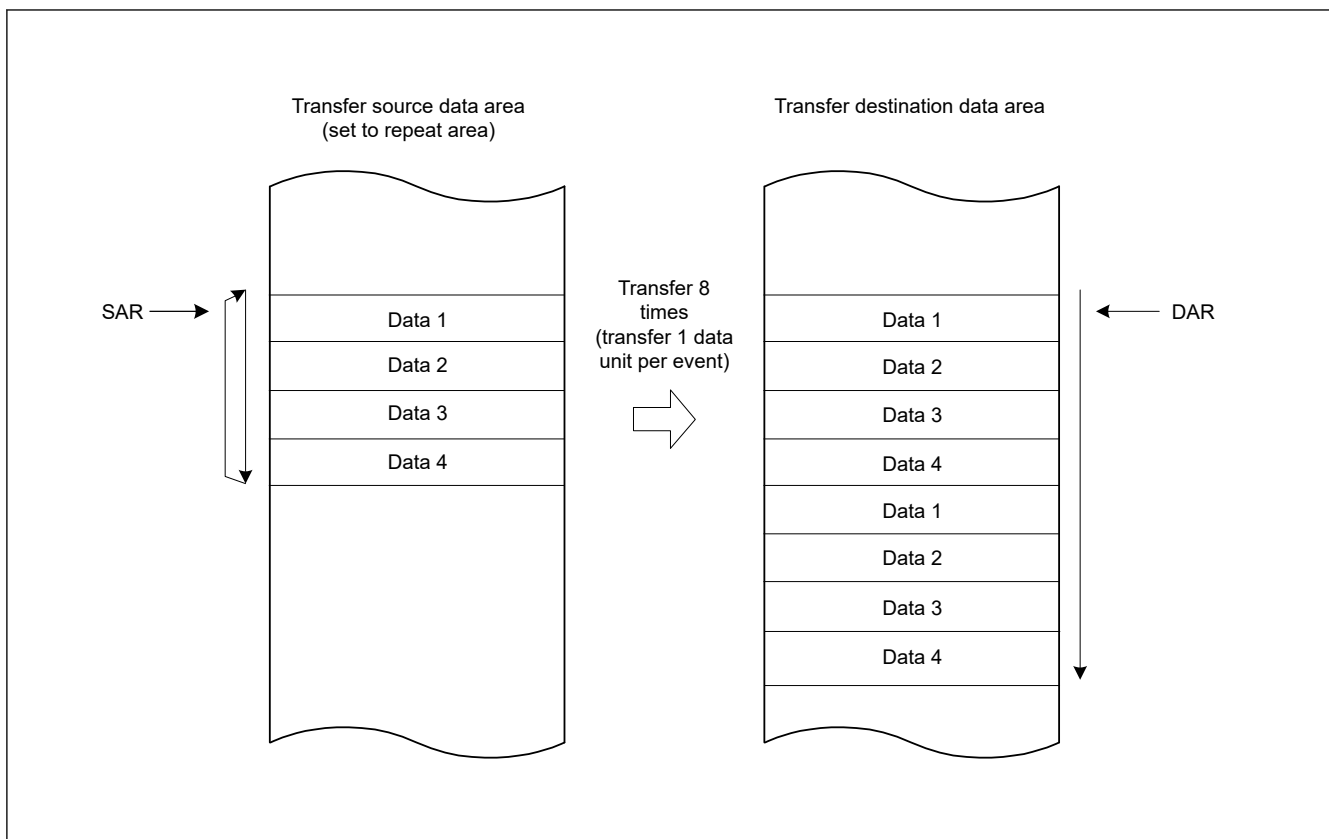

Table 17.6 lists the register functions in repeat transfer mode, and Figure 17.6 shows the memory map of repeat transfer mode.

Table 17.6 Register functions in repeat transfer mode

| Register | Description                  | Value written back by writing transfer information |                                                                                                                                                                                               |
|----------|------------------------------|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                              | When CRAL is not 1                                 | When CRAL is 1                                                                                                                                                                                |
| SAR      | Transfer source address      | Increment, decrement, fixed <sup>*1</sup>          | <ul style="list-style-type: none"> <li>When the MRB.DTS bit is 0<br/>Increment, decrement, or fixed<sup>*1</sup></li> <li>When the MRB.DTS bit is 1<br/>SAR register initial value</li> </ul> |
| DAR      | Transfer destination address | Increment, decrement, or fixed <sup>*1</sup>       | <ul style="list-style-type: none"> <li>When the MRB.DTS bit is 0<br/>DAR register initial value</li> <li>When the MRB.DTS bit is 1<br/>Increment, decrement, or fixed<sup>*1</sup></li> </ul> |
| CRAH     | Retains transfer counter     | CRAH                                               | CRAH                                                                                                                                                                                          |
| CRAL     | Transfer counter A           | CRAL - 1                                           | CRAH                                                                                                                                                                                          |
| CRB      | Transfer counter B           | Not updated                                        | Not updated                                                                                                                                                                                   |

Note 1. Write-back is skipped in address-fixed mode.

**Figure 17.6** Memory map of repeat transfer mode when transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 0x04)

### 17.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 17.7 lists the register functions in block transfer mode, and Figure 17.7 shows the memory map for block transfer mode.

**Table 17.7** Register functions in block transfer mode

| Register | Description                  | Value written back by writing transfer information                                                                                                                          |
|----------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAR      | Transfer source address      | <ul style="list-style-type: none"> <li>When MRB.DTS bit is 0<br/>Increment, decrement, or fixed*1</li> <li>When MRB.DTS bit is 1<br/>SAR register initial value.</li> </ul> |
| DAR      | Transfer destination address | <ul style="list-style-type: none"> <li>When MRB.DTS bit is 0<br/>DAR register initial value</li> <li>When MRB.DTS bit is 1<br/>Increment, decrement, or fixed*1.</li> </ul> |
| CRAH     | Holds block size             | CRAH                                                                                                                                                                        |
| CRAL     | Block size counter           | CRAH                                                                                                                                                                        |
| CRB      | Block transfer counter       | CRB - 1                                                                                                                                                                     |

Note 1. Write-back is skipped in address-fixed mode.

**Figure 17.7** Memory map of block transfer mode

### 17.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. [Figure 17.8](#) shows a chain transfer operation.

**Figure 17.8 Chain transfer operation**

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see [Table 17.3](#).

### 17.4.7 Operation Timing

[Figure 17.9](#) to [Figure 17.12](#) are timing diagrams that show the minimum number of execution cycles.

Figure 17.9 Example 1 of DTC operation timing in normal transfer and repeat transfer modes

Figure 17.10 Example 2 of DTC operation timing in block transfer mode when the block size = 4

Figure 17.11 Example 3 of DTC operation timing for chain transfer

Figure 17.12 Example of operation when a transfer information read is skipped with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

### 17.4.8 Execution Cycles of DTC

Table 17.8 lists the execution cycles of single data transfer of the DTC. For the order of the execution states, see section 17.4.7. Operation Timing.

**Table 17.8 Execution cycles of DTC**

P: Block size (initial settings of CRAH and CRAL)

Cv: Cycles for access to vector transfer information storage destination

Ci: Cycles for access to transfer information storage destination address

Cr: Cycles for access to data read destination

Cw: Cycles for access to data write destination

The unit is for system clocks (ICLK) + 1 in the Vector read, Transfer information read, and Data transfer read columns and 2 in the Internal operation column.

Cv, Ci, Cr, and Cw vary depending on the corresponding access destination. For the number of cycles for respective access destinations, see [section 38, SRAM](#), [section 40, Flash Memory](#), and [section 14, Buses](#).

The frequency ratio of the system clock and peripheral clock is also taken into consideration.

The DTC response time is the time from when the DTC activation source is detected until DTC transfer starts.

[Table 17.8](#) does not include the time until DTC data transfer starts after the DTC activation source becomes active.

| Transfer mode       | Vector read |                 | Transfer information read |                 | Transfer information write |                          |                  | Data transfer |        | Internal operation |                 |
|---------------------|-------------|-----------------|---------------------------|-----------------|----------------------------|--------------------------|------------------|---------------|--------|--------------------|-----------------|
|                     |             |                 |                           |                 |                            |                          |                  | Read          | Write  |                    |                 |
| Normal              | Cv + 1      | 0 <sup>*1</sup> | 4 × Ci + 1                | 0 <sup>*1</sup> | 3 × Ci + 1 <sup>*2</sup>   | 2 × Ci + 1 <sup>*3</sup> | Ci <sup>*4</sup> | Cr + 1        | Cw + 1 | 2                  | 0 <sup>*1</sup> |
| Repeat              |             |                 |                           |                 |                            |                          |                  | Cr + 1        | Cw + 1 |                    |                 |
| Block <sup>*5</sup> |             |                 |                           |                 |                            |                          |                  | P × Cr        | P × Cw |                    |                 |

Note 1. When transfer information read is skipped.

Note 2. When neither SAR nor DAR is set to address-fixed mode.

Note 3. When SAR or DAR is set to address-fixed mode.

Note 4. When SAR and DAR are set to address-fixed mode.

Note 5. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer applies.

### 17.4.9 DTC Bus Mastership Release Timing

The DTC does not release the bus mastership during transfer information reads. Before the transfer information is read or written, the bus is arbitrated according to the priority determined by the bus master arbitrator. For bus arbitration, see [section 14, Buses](#).

### 17.4.10 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSRn (n = 0 to 95) register of ICU are controlled by SAIELSRn bit of ICUSARx (x = G, H or I) registers in CPSCU. For details on the CPSCU.ICUSARx registers, see [section 13, Interrupt Controller Unit \(ICU\)](#).

When the CPSCU.ICUSARx.SAIELSRn bit is 0, transfer of DTC vector n is secure access for both read and write. At the same time, the IELSRn register are protected from a non-secure access.

When the CPSCU.ICUSARx.SAIELSRn bit is 1, transfer of DTC vector n is non-secure access for both read and write. At the same time, the IELSRn register are non-secure attributes.

Do not write to the CPSCU.ICUSARx.SAIELSRn bit while DTC transfer is enabled or a bus master is writing to the DTC registers of same channel.

[section 17.3.1. Allocating Transfer Information and DTC Vector Table](#) shows security attribute about each DTC vectors.

### 17.4.11 Master TrustZone Filter in DTC

DTC has the Master TrustZone Filter. The Master TrustZone Filter in DTC can detect the security areas of Flash area (code Flash and data Flash) and SRAM area defined by IDAU. When no-secure accesses those addresses, it detects the security violation. Access of violation address is not performed. Detected the error is handled as the Master TrustZone Filter error.

## 17.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). Set the ICU.IELSRn.IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in [Table 17.9](#) to set the DTC.

**Table 17.9 DTC setting procedure**

| No. | Step Name                                                                                                                           | Description                                                                                                                                                                                                                                                                                            |
|-----|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set the DTCCR <sup>*1</sup> .RRS bit to 0                                                                                           | Set the DTCCR <sup>*1</sup> .RRS bit to 0 to reset the transfer information read skip flag. After that, the transfer information read is not skipped while the DTC is activated. Be sure to specify this setting when the transfer information is updated.                                             |
| 2   | Set transfer information (MRA, MRB, SAR, DAR, CRA, and CRB)                                                                         | Allocate transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) in the data area. To set transfer information, see <a href="#">section 17.2. Register Descriptions</a> . To allocate transfer information, see <a href="#">section 17.3.1. Allocating Transfer Information and DTC Vector Table</a> . |
| 3   | Set transfer information start addresses in the DTC vector table                                                                    | Set the transfer information start addresses in the DTC vector table. To set the DTC vector table, see <a href="#">section 17.3.1. Allocating Transfer Information and DTC Vector Table</a> .                                                                                                          |
| 4   | Set the DTCCR <sup>*1</sup> .RRS bit to 1                                                                                           | Set the DTCCR <sup>*1</sup> .RRS bit to 1 to enable skipping of the second and subsequent transfer information read cycles for continuous DTC activation from the same interrupt source. The RRS bit can be set to 1, but if this is set during DTC transfer, it becomes valid from the next transfer. |
| 5   | Set the ICU.IELSRn.DTCE bit to 1.<br>Set the ICU.IELSRn.IELS[8:0] as interrupt source. The interrupt should be enabled in the NVIC. | Set the ICU.IELSRn.DTCE bit to 1. Set ICU.IELSRn.IELS[8:0] as interrupt sources that trigger DTC. The interrupt must be enabled in the NVIC. See <a href="#">section 13.3.2. Event Number</a> in <a href="#">section 13, Interrupt Controller Unit (ICU)</a> .                                         |
| 6   | Set the enable bit for an activation source interrupt                                                                               | Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources.                                                              |
| 7   | Set the DTCST.DTCST bit to 1                                                                                                        | Set the DTC Module Start bit (DTCST.DTCST) to 1.                                                                                                                                                                                                                                                       |

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.

Note: When used in non-secure state, DTCSAR.DTCSTSA = 1 or DTCST.DTCST = 1 must be set.

Note 1. When used in secure state, access DTCCR\_SEC instead of DTCCR.

## 17.6 Examples of DTC Usage

### 17.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

#### (1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

#### (2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

#### (3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[8:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

#### (4) SCI settings

Enable the SCIn\_RXI (n = 0, 3, 4, 9) interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

#### (5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn\_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

## (6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn\_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

### 17.6.2 Chain transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPTm.GTCCRC register (m = 321, 322, 164, 165). For the second transfer, normal transfer mode is specified for transfer to the GPTm.GTCCRE register (m = 321, 322, 164, 165). For the third transfer of the chained transfer, normal transfer mode for transfer to the GPTm.GTPBR register (m = 321, 322, 164, 165) is specified. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT321.GTPR register as an activating source for the DTC.

#### (1) First transfer information setting

Set up transfer to the GPT321.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT321.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (2) Second transfer information setting

Set up for transfer to the GPT321.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT321.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (3) Third transfer information set

Set up transfer to the GPT321.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT321.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

#### (4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT321.GTPBR immediately after the transfer control information for use in the GPT321.GTCCRC and GPT321.GTCCRE registers.

#### (5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT321.GTCCRC and GPT321.GTCCRE registers starts.

#### (6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT321 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] bits and specify the GPT321 counter overflow.
3. Set the DTCST.DTCST bit to 1.

#### (7) GPT settings

1. Set the GPT321.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT321.GTCCRA and GPT321.GTCCRB registers and the next PWM timer compare values in the GPT321.GTCCRC and GPT321.GTCCRE registers.
3. Set the default PWM timer period values in the GPT321.GTPR register and the next PWM timer period values in the GPT321.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

#### (8) GPT activation

Set the GPT321.GTSTR.CSTRT bits to 1 to start the GPT321.GTCNT counter.

#### (9) DTC transfer

Each time a GPT321 counter overflow is generated with the GPT321.GTPR register, the next PWM timer compare values are transferred to the GPT321.GTCCRC and GPT321.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT321.GTPBR register.

#### (10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT321 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

### 17.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. [Figure 17.13](#) shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
  - (a) Transfer source address = fixed.
  - (b) CRA register = 0x0200 (512) times.
  - (c) MRB.CHNE bit = 1 (chain transfer is enabled).
  - (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
  - (e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.

3. For the second data transfer:
  - (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
  - (b) Specify the CRA register in the first transfer information area for the transfer destination.
  - (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
  - (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
  - (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
  - (f) CRA register = 0x0101 (The transfer count is 1).
4. For the third data transfer:
  - (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
  - (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
  - (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
  - (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
  - (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

Figure 17.13 Chain transfer when counter = 0

### 17.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. To stop only the vector number that caused the error, inform the vector number that caused the error to the ICU and clear the corresponding ICU setting. After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is. The condition under which the transfer error occurs is indicated when TrustZone Filter in DTC detects a violation.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Furthermore, it generates an error response detection interrupt to notify that an error has occurred by DMAC/DTC transfer. (section 17.8.2. Interrupt Request for Transfer Error). Write back to SRAM is not performed.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DTC by selecting NMI. The DTC error vector register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DTC, two interrupts(NMI and DMA\_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA\_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA\_TRANSERR) is not cleared in NMI handler.

section 17.7.1. Processing on NMI handler describes how to confirm the error information of the DTC in the NMI handler. section 17.7.2. Processing on Error response detection interrupt request (DMA\_TRANSERR) handler describes how to confirm the error information of the DTC in the DMA\_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in [section 17.8.2. Interrupt Request for Transfer Error](#).

### 17.7.1 Processing on NMI handler

The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DTC transfer error, the error response detection interrupt request (DMA\_TRANSERR) will occur after the end of NMI handler. It is possible to confirm the cause of the error and the DTC vector number in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in the ICU chapter.

[Figure 17.14](#) shows the flow for confirm the vector number that caused the Master TrustZone Filter Error in DTC

[Figure 17.15](#) shows the flow for confirm the vector number that caused the Slave TrustZone Filter Error in DTC

[Figure 17.16](#) shows the flow for confirm the vector number and Security Attribute that caused the Master MPU error in DTC

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA\_TRANSERR) that occurs subsequently.

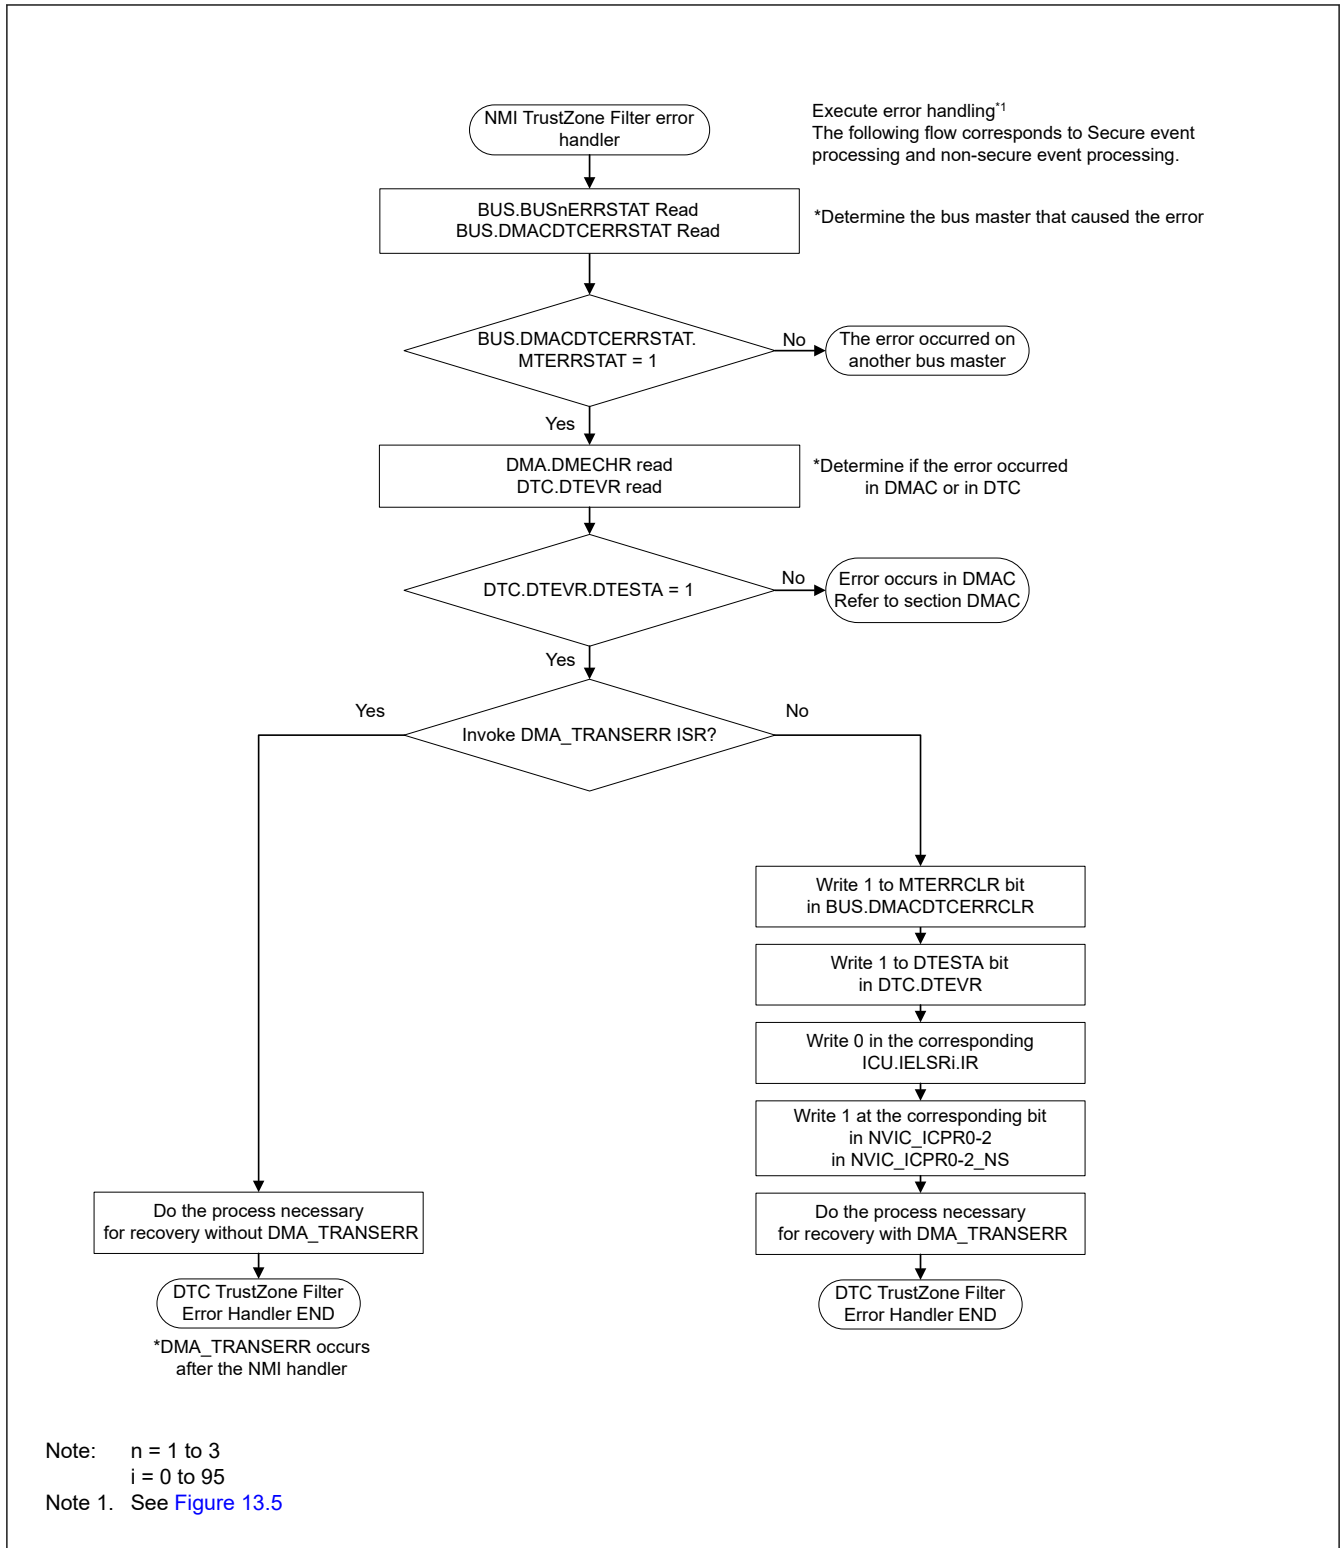

Figure 17.14 Processing in NMI handler by Master TrustZone Filter Error

Figure 17.15 Processing in NMI handler by Slave TrustZone Filter Error

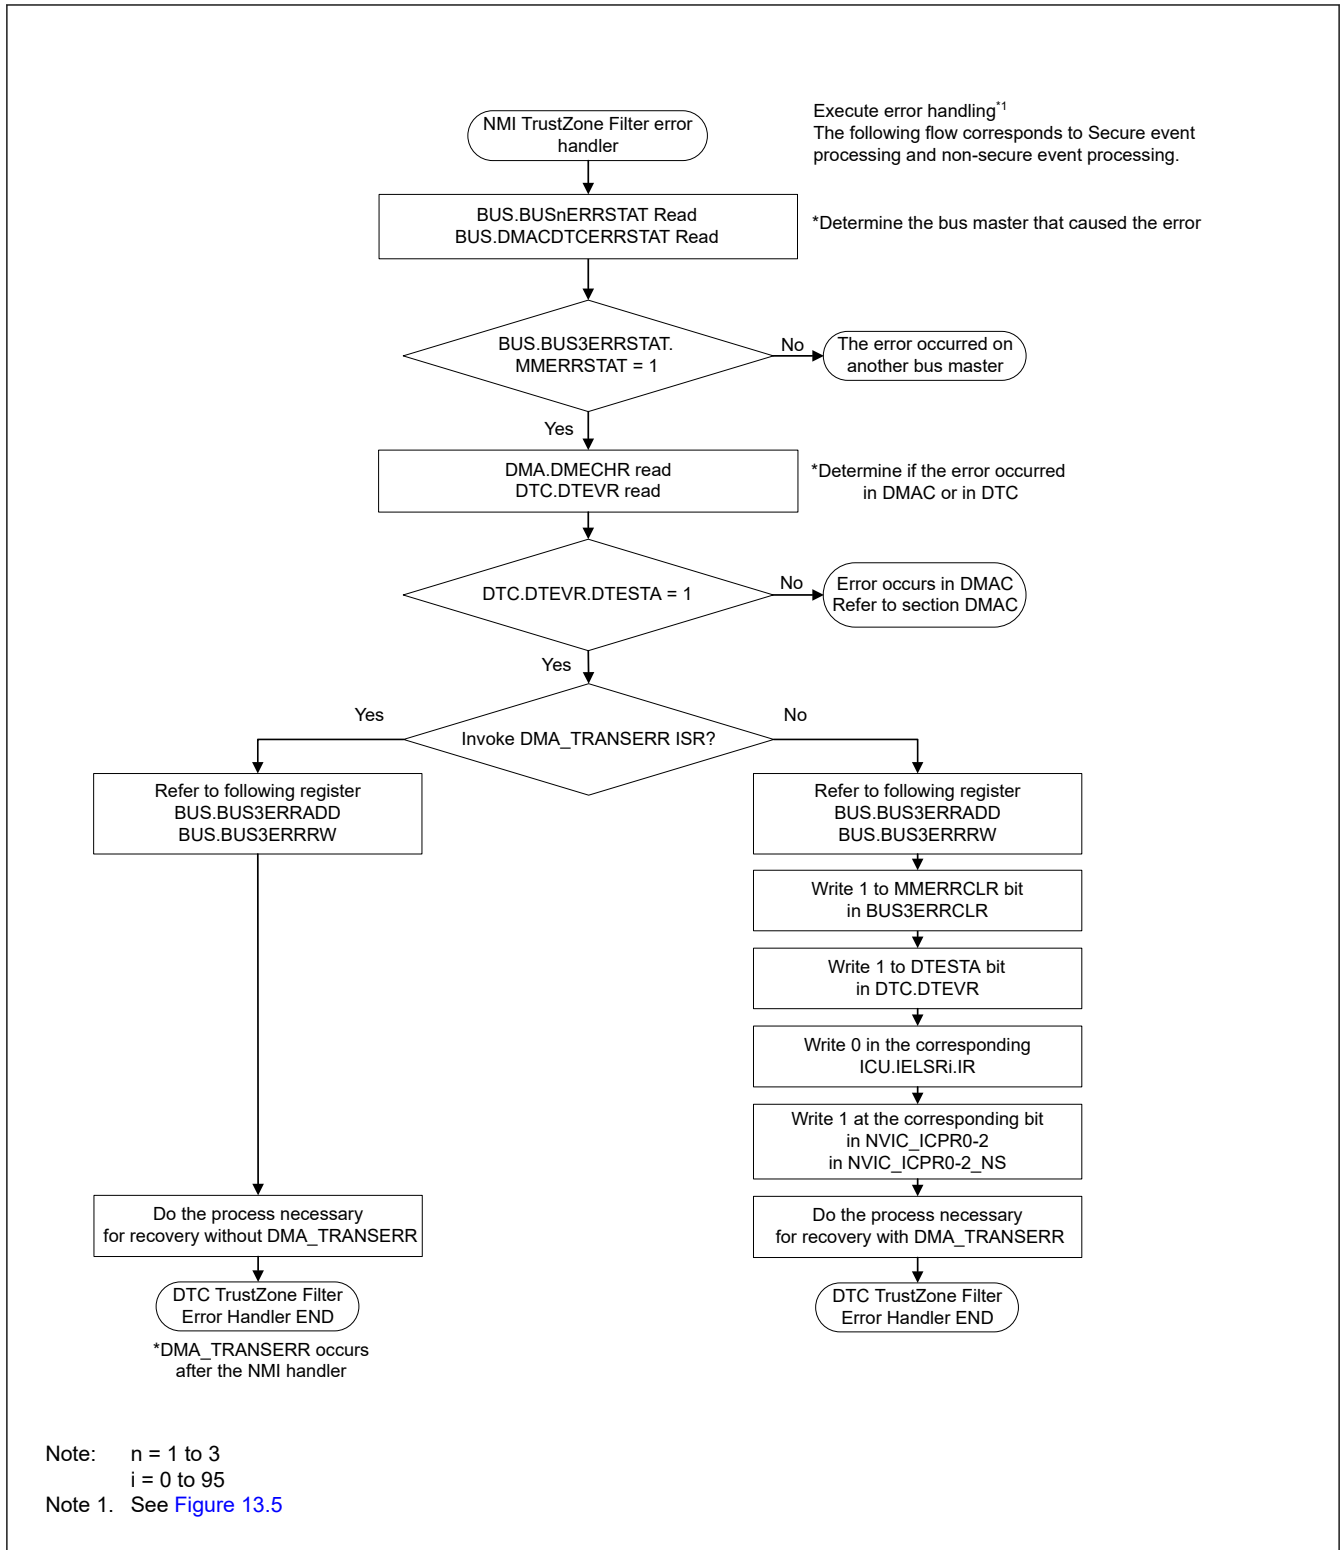

Figure 17.16 Processing in NMI handler by Master MPU Error

### 17.7.2 Processing on Error response detection interrupt request (DMA\_TRANSERR) handler

The cause of error response detection interrupt request (DMA\_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA\_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the vector number of DTC in which the error occurred.

Error cause confirmation procedure is shown [Figure 17.17](#).

[Figure 17.18](#) shows the flow for confirm the vector number that caused the Master TrustZone Filter Error in DTC

[Figure 17.19](#) shows the flow for confirm the vector number that caused the Slave TrustZone Filter Error in DTC

[Figure 17.20](#) shows the flow for confirm the vector number and Security Attribute that caused the Master MPU Error in DTC

[Figure 17.21](#) shows the flow for confirm the vector number and Security Attribute that caused the Slave Bus Error in DTC

[Figure 17.22](#) shows the flow for confirm the vector number and Security Attribute that caused the Illegal Access Error in DTC

## 17.8 Interrupt

### 17.8.1 Interrupt Request for Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Two types of interrupt are available: interrupts triggered by a DTC activation (per channel) and an interrupt triggered by the event signal DTC\_COMPLETE (common to all channels). Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[8:0] bits. See [section 13, Interrupt Controller Unit \(ICU\)](#). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

### 17.8.2 Interrupt Request for Transfer Error

The error response detection interrupt request (DMA\_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer. The types of interrupts that occur when the DTC transfer error occurs are listed in the [Table 17.10](#). The [Table 17.10](#) also shows error information stored when a transfer error occurs.

**Table 17.10** Interrupt and error information due to DTC transfer error cause

| Transfer error factor                 | NMI/RESET <sup>*1</sup> Request | Interrupt Request | Bus Error Status                           | Error Address Error R/W           | Error Channel Information |
|---------------------------------------|---------------------------------|-------------------|--------------------------------------------|-----------------------------------|---------------------------|
| Master TrustZone Filter (in DMAC/DTC) | ICU.NMISR.TZFST <sup>*1</sup>   | DMA_TRANSERR      | BUS.DMACDTCERRSTAT.MTERRSTAT <sup>*1</sup> | —                                 | DTC.DTEVR                 |
| Slave TrustZone Filter                | ICU.NMISR.TZFST <sup>*1</sup>   | DMA_TRANSERR      | BUS.BUS3ERRSTAT.STERRSTAT <sup>*1</sup>    | BUS.BTZF3ERRADD<br>BUS.BTZF3ERRRW | DTC.DTEVR                 |
| Master MPU                            | ICU.NMISR.BUSMST                | DMA_TRANSERR      | BUS.BUS3ERRSTAT.MMERRSTAT                  | BUS.BUS3ERRADD<br>BUS.BUS3ERRRW   | DTC.DTEVR                 |
| Slave Bus Error                       | — <sup>*2</sup>                 | DMA_TRANSERR      | BUS.BUS3ERRSTAT.SLERRSTAT <sup>*2</sup>    | BUS.BUS3ERRADD<br>BUS.BUS3ERRRW   | DTC.DTEVR                 |
| Illegal Access Error                  | — <sup>*2</sup>                 | DMA_TRANSERR      | BUS.BUS3ERRSTAT.ILERRSTAT <sup>*2</sup>    | BUS.BUS3ERRADD<br>BUS.BUS3ERRRW   | DTC.DTEVR                 |

Note 1. Interrupt is generated when NMI request is selected as the operation after detection of the Master MPU error and The TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.

Note 2. If the error response detection interrupt (DMA\_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can also be determined by BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA\_TRANSERR) occurs.

## 17.9 Event Link

The DTC can produce an event link request on completion of one transfer request.

## 17.10 Low Power Consumption Function

Before transitioning to the module-stop state, Software Standby mode without Snooze mode transition, Deep Software Standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections. The DTC is available in Snooze mode by setting the SYSTEM.SNZCR.SNZDTCEN bit to 1. See [section 10, Low Power Modes](#).

### (1) Module-Stop Function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If a DTC transfer is in progress when 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module-stop state proceeds after the DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

### (2) Software Standby Mode and Deep Software Standby Mode

Use the settings described in [section 10.7.1. Transitioning to Software Standby Mode](#) or [section 10.9.1. Transitioning to Deep Software Standby Mode](#).

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode is executed after the completion of the DTC transfer.

### (3) Snooze Mode

When the snooze control circuit receives a snooze request in Software Standby mode, the MCU transitions to Snooze mode. See [section 10.8.1. Transition to Snooze Mode](#). DTC operation in Snooze mode can be selected in the SYSTEM.SNZCR.SNZDTCEN bit. If DTC operation is enabled in Snooze mode, before transitioning to Software Standby mode, set the DTCST.DTCST bit to 1. To return to Software Standby mode through DTC, set SYSTEM.SNZEDCR0.DTCZRED or SYSTEM.SNZEDCR0.DTCNZRED to 1. See [section 10.8.3. Returning from Snooze Mode to Software Standby Mode](#). SYSTEM.SNZEDCR0.DTCZRED enables or disables a snooze end request on completion of the last DTC transmission, detected on DTC transmission completion when CRA and CRB are 0. SYSTEM.SNZEDCR0.DTCNZRED enables or disables a snooze end request on a not last DTC transmission completion (CRA and CRB are not 0), detected on DTC transmission completion when CRA and CRB are not 0. The DTC activation request from the ICU is stopped during Software Standby mode but not stopped during Snooze mode.

#### (4) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see [section 10, Low Power Modes](#).

To perform a DTC transfer after returning from a low power mode without a Snooze mode transition, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in [section 13.4.1. Detecting Interrupts](#), then execute the WFI instruction. If DTC operation is enabled in Snooze mode, do not use the module-stop function of the DTC.

### 17.11 Usage Notes

#### 17.11.1 Transfer Information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

## 18. Event Link Controller (ELC)

### 18.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

[Table 18.1](#) lists the ELC specifications, and [Figure 18.1](#) shows a block diagram.

**Table 18.1 ELC Specifications**

| Item                 | Description                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Event link function  | 116 types of event signals can be directly connected to modules. The ELC generates the ELC event signal, and events that activate the DTC. |
| Module-stop function | Module-stop state can be set.                                                                                                              |
| TrustZone Filter     | Security attribution can be set for each registers                                                                                         |

## 18.2 Register Descriptions

### 18.2.1 ELCR : Event Link Controller Register

Base address: ELC = 0x4008\_2000

Offset address: 0x00

|                    |           |   |   |   |   |   |   |   |
|--------------------|-----------|---|---|---|---|---|---|---|
| Bit position:      | 7         | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | ELCO<br>N | — | — | — | — | — | — | — |
| Value after reset: | 0         | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function                                                                             | R/W |
|-----|--------|--------------------------------------------------------------------------------------|-----|
| 6:0 | —      | These bits are read as 0. The write value should be 0.                               | R/W |
| 7   | ELCON  | All Event Link Enable<br>0: ELC function is disabled.<br>1: ELC function is enabled. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ELCR register controls the ELC operation.

## 18.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1)

Base address: ELC = 0x4008\_2000

Offset address: 0x02 + 0x02 × n

|                    |    |    |   |   |   |   |   |     |
|--------------------|----|----|---|---|---|---|---|-----|
| Bit position:      | 7  | 6  | 5 | 4 | 3 | 2 | 1 | 0   |
| Bit field:         | WI | WE | — | — | — | — | — | SEG |
| Value after reset: | 1  | 0  | 0 | 0 | 0 | 0 | 0 | 0   |

| Bit | Symbol | Function                                                                                                       | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------|-----|
| 0   | SEG    | Software Event Generation<br>0: Normal operation<br>1: Software event is generated.                            | W   |
| 5:1 | —      | These bits are read as 0. The write value should be 0.                                                         | R/W |
| 6   | WE     | SEG Bit Write Enable<br>0: Write to SEG bit disabled.<br>1: Write to SEG bit enabled.                          | R/W |
| 7   | WI     | ELSEGR Register Write Disable<br>0: Write to ELSEGR register enabled.<br>1: Write to ELSEGR register disabled. | W   |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

### SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

### WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

### WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

### 18.2.3 ELSRn : Event Link Setting Register n (n = 0 to 8, 12, 14 to 17)

Base address: ELC = 0x4008\_2000

Offset address: 0x10 + 0x04 × n

| Bit  | Symbol   | Function                                                                                                                                                                                                                                         | R/W |
|------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|

| 15:9 | —        | These bits are read as 0. The write value should be 0.                                                                                                                                                                                           | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ELSRn register specifies an event signal to be linked to each peripheral module. [Table 18.2](#) shows the association between the ELSRn register and the peripheral modules. [Table 18.3](#) shows the association between the event signal names set in the ELSRn register and the signal numbers.

**Table 18.2 Association between the ELSRn registers and peripheral functions**

| Register name | Peripheral function (module) | Event name |
|---------------|------------------------------|------------|
| ELSR0         | GPT (A)                      | ELC_GPTA   |
| ELSR1         | GPT (B)                      | ELC_GPTB   |
| ELSR2         | GPT (C)                      | ELC_GPTC   |
| ELSR3         | GPT (D)                      | ELC_GPTD   |
| ELSR4         | GPT (E)                      | ELC_GPTE   |
| ELSR5         | GPT (F)                      | ELC_GPTF   |
| ELSR6         | GPT (G)                      | ELC_GPTG   |
| ELSR7         | GPT (H)                      | ELC_GPTH   |
| ELSR8         | ADC12A0                      | ELC_AD00   |
| ELSR9         | ADC12B0                      | ELC_AD01   |
| ELSR12        | DAC12 channel 0              | ELC_DA0    |
| ELSR14        | PORT1                        | ELC_PORT1  |
| ELSR15        | PORT2                        | ELC_PORT2  |

| 0x1C7        |                          | SPI0_SPEI   | Error                            |
| 0x1C8        |                          | SPI0_SPCEND | Communication complete event     |
| 0x1DB        | DOC                      | DOC_DOPCI*4 | Data operation circuit interrupt |

Note 1. Only pulse (edge detection) is supported.

Note 2. This event is not supported in FIFO mode.

Note 3. ELSR8, ELSR9, ELSR14 to ELSR17, and ELSR18 can select this event.

Note 4. This event can occur in Snooze mode.

### 18.2.4 ELCSARA : Event Link Controller Security Attribution Register A

Base address: ELC = 0x4008\_2000

Offset address: 0x74

| Bit  | Symbol  | Function                                                                                                   | R/W |
|------|---------|------------------------------------------------------------------------------------------------------------|-----|
| 0    | ELCR    | Event Link Controller Register Security Attribution<br>Target register: ELCR<br>0: Secure<br>1: Non-secure | R/W |
| 1    | ELSEGR0 | Event Link Software Event Generation Register 0 Security Attribution<br>0: Secure<br>1: Non-secure         | R/W |
| 2    | ELSEGR1 | Event Link Software Event Generation Register 1 Security Attribution<br>0: Secure<br>1: Non-secure         | R/W |
| 15:3 | —       | These bits are read as 1. The write value should be 1.                                                     | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The ELCR register controls operation of the ELC.

### 18.2.5 ELCSARB : Event Link Controller Security Attribution Register B

Base address: ELC = 0x4008\_2000

Offset address: 0x78

| Bit  | Symbol     | Function                                                                                                                            | R/W |
|------|------------|-------------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | ELSR[15:0] | Event Link Setting Register n Security Attribution<br>Target register: ELSRn (n = 0 to 8, 12, 14, 15)<br>0: Secure<br>1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

This register specifies the security attribution for the Register ELSRn (n = 0 to 8, 12, 14, 15).

### 18.2.6 ELCSARC : Event Link Controller Security Attribution Register C

Base address: ELC = 0x4008\_2000

Offset address: 0x7C

| Bit  | Symbol    | Function                                                                                                                             | R/W |
|------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0  | ELSR[1:0] | Event Link Setting Register n Security Attribution (n = 16, 17)<br>Target register: ELSRn (n = 16, 17)<br>0: Secure<br>1: Non-secure | R/W |
| 15:2 | —         | These bits are read as 1. The write value should be 1.                                                                               | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

This register specifies the security attribution for the Register ELSRn (n = 16, 17)

## 18.3 Operation

### 18.3.1 Relation Between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

### 18.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 18.4 lists the operations of modules when an event occurs.

**Table 18.4 Module operations when event occurs**

| Module    | Operations When Event is Input                                                                                                                                                                                                                                                                               |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GPT       | <ul style="list-style-type: none"> <li>Start counting</li> <li>Stop counting</li> <li>Clear counting</li> <li>Up counting</li> <li>Down counting</li> <li>Input capture</li> </ul>                                                                                                                           |
| DAC12     | Start D/A conversion                                                                                                                                                                                                                                                                                         |
| I/O Ports | <ul style="list-style-type: none"> <li>Change pin output based on the EORR (reset) or EOSR (set)</li> <li>Latch pin state to EIDR</li> <li>The following ports can be used for the ELC: <ul style="list-style-type: none"> <li>Port 1</li> <li>Port 2</li> <li>Port 3</li> <li>Port 4</li> </ul> </li> </ul> |
| ADC12     | Start A/D conversion                                                                                                                                                                                                                                                                                         |
| DTC       | Start DTC data transfer                                                                                                                                                                                                                                                                                      |

### 18.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[8:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[8:0] bit associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the RTC is to be used, set the ELC after the RTC settings, for example, for initialization and time setting. Unintended events may be generated if RTC settings are made after the ELC settings.

If event link output from the LVD is to be used, set the ELC after setting the LVD. To disable the LVD, do so after setting 0x00 to the associated ELSRn register.

## 18.4 Usage Notes

### 18.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

### 18.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (Software Standby mode or Deep Software Standby mode).

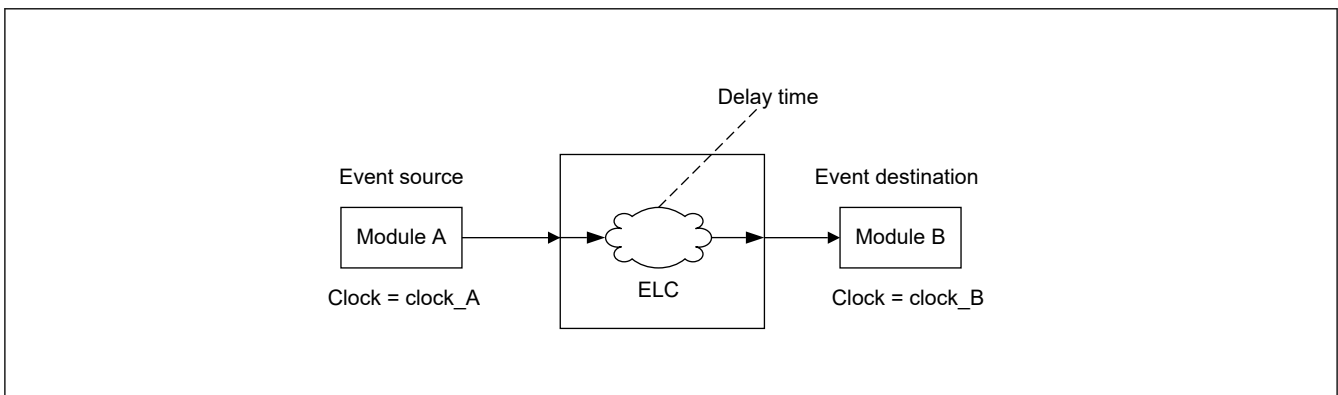

Some modules can perform in Snooze mode. For more information, see [Table 18.3](#) and [section 10, Low Power Modes](#).

### 18.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see [Table 18.3](#) and [section 10, Low Power Modes](#).

### 18.4.4 ELC Delay Time

In [Figure 18.2](#), module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. [Table 18.5](#) shows the ELC delay time.

**Figure 18.2 ELC delay time**

**Table 18.5 ELC delay time**

| Clock domain      | Clock frequency   | ELC delay time                 |
|-------------------|-------------------|--------------------------------|
| clock_A = clock_B | clock_A = clock_B | 0 cycle                        |
| clock_A ≠ clock_B | clock_A = clock_B | 1 cycle to 2 cycles            |
|                   | clock_A > clock_B | 1 cycle to 2 cycles of clock_B |
|                   | clock_A < clock_B | 1 cycle to 2 cycles of clock_A |

## 19. I/O Ports

### 19.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC.

All pins except P109 (as TDO of JTAG ports) operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 19.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 19.1 lists the I/O port specifications by package and Table 19.2 lists the port functions.

Figure 19.1 Connection diagram for I/O port registers

Table 19.1 I/O port specifications (1 of 2)

| Port  | Package                              |                | Package                            |                |
|-------|--------------------------------------|----------------|------------------------------------|----------------|
|       | 64 pins                              | Number of pins | 48 pins                            | Number of pins |
| PORT0 | P000 to P004, P013 to P015           | 8              | P000 to P002, P013 to P015         | 6              |
| PORT1 | P100 to P113                         | 14             | P100 to P104, P108 to P112         | 10             |
| PORT2 | P200, P201, P205 to P208, P212, P213 | 8              | P200, P201, P206, P207, P212, P213 | 6              |

**Table 19.1 I/O port specifications (2 of 2)**

| Port  | Package                    |                | Package            |                |
|-------|----------------------------|----------------|--------------------|----------------|
|       | 64 pins                    | Number of pins | 48 pins            | Number of pins |

Note: m = 0 to 5, n = 00 to 15

Note 1. If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 2. If the security attribution is configured as Secure:

- Secure access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

### PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See Table 19.2. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

### PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See Table 19.2. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

## 19.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2

Base address: PORTm = 0x4008\_0000 + 0x0020 × m (m = 0 to 5)

Offset address: 0x004 (PCNTR2/EIDR)  
0x006 (PIDR)

|                    |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |

| Value after reset: | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          | x          |

| Bit   | Symbol              | Function                                                                                    | R/W |
|-------|---------------------|---------------------------------------------------------------------------------------------|-----|
| 15:0  | PIDR15 to PIDR00    | Pmn State<br>0: Low level<br>1: High level                                                  | R   |
| 31:16 | EIDR15 to EIDR00 *2 | Port Event Input Data*1<br>When an ELC_PORTx signal occurs<br>0: Low input<br>1: High input | R   |

Note: If the security attribution is configured as Secure:

- Secure read access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure read access are allowed.

Note: m = 0 to 5, n = 00 to 15

Note 1. x = 1, 2, 3 or 4 for EIDR only

Note 2. Supported by ports 1, 2, 3 or 4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 represents the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

### PIDRn bits (Pmn State)

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- RTC Time Capture input (RTCIC)
- Analog function (ASEL = 1)

### EIDRn bits (Port Event Input Data)

The EIDRn bits latch a pin state when an ELC\_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

## 19.2.3 PCNTR3/PORR/POSR : Port Control Register 3

Base address: PORTm = 0x4008\_0000 + 0x0020 × m (m = 0 to 5)

Offset address: 0x008 (PCNTR3/PORR)  
0x00A (POSR)

|                    |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |

| Bit field:         | POSR<br>15 | POSR<br>14 | POSR<br>13 | POSR<br>12 | POSR<br>11 | POSR<br>10 | POSR<br>09 | POSR<br>08 | POSR<br>07 | POSR<br>06 | POSR<br>05 | POSR<br>04 | POSR<br>03 | POSR<br>02 | POSR<br>01 | POSR<br>00 |
| Value after reset: | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          |

| Bit   | Symbol           | Function                                                    | R/W |
|-------|------------------|-------------------------------------------------------------|-----|
| 15:0  | POSR15 to POSR00 | Pmn Output Set<br>0: No effect on output<br>1: High output  | W   |
| 31:16 | PORR15 to PORR00 | Pmn Output Reset<br>0: No effect on output<br>1: Low output | W   |

Note: If the security attribution is configured as Secure:

- Secure write access is allowed
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure write access are allowed.

Note: m = 0 to 5, n = 00 to 15

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSRn (bits [15:0] in PCNTR3) and the PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

### POSRn bits (Pmn Output Set)

POSR changes PODR when set by a software write. For example, for P100, when PORT1.PCNTR3.POSR00 = 1, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSRn bits are reserved. See [Table 19.2](#).

**PORRn bits (Pmn Output Reset)**

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PCNTR3.PORR00 = 1, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORRn bits are reserved. See [Table 19.2](#).

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: PORRn and POSRn should not be set at the same time.

**19.2.4 PCNTR4/EORR/EOSR : Port Control Register 4**

Base address: PORTm = 0x4008\_0000 + 0x0020 × m (m = 1 to 4)

Offset address: 0x00C (PCNTR4/EORR)  
0x00E (EOSR)

|                    |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |

| Bit   | Symbol           | Function                                                                                             | R/W |
|-------|------------------|------------------------------------------------------------------------------------------------------|-----|
| 15:0  | EOSR15 to EOSR00 | Pmn Event Output Set<br>When an ELC_PORTx signal occurs<br>0: No effect on output<br>1: High output  | R/W |
| 31:16 | EORR15 to EORR0  | Pmn Event Output Reset<br>When an ELC_PORTx signal occurs<br>0: No effect on output<br>1: Low output | R/W |

- Note: If the security attribution is configured as Secure:
- Secure access is allowed
  - Non-secure read value is 0 and TrustZone access error is not generated
  - Non-secure write access is ignored and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.
- Note: m = 1 to 4, n = 00 to 15, x = 1 to 4

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

**EOSRn bits (Pmn Event Output Set)**

EOSR changes PODR when set because an ELC\_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC\_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EOSRn bits are reserved. See [Table 19.2](#).

**EORRn bits (Pmn Event Output Reset)**

EORR changes PODR when reset because an ELC\_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EORR00 = 1 when the ELC\_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EORRn bits are reserved. See [Table 19.2](#).

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

### 19.2.5 PmnPFS/PmnPFS\_HA/PmnPFS\_BY : Port mn Pin Function Select Register (m = 0 to 5, n = 00 to 15)

Base address: PFS = 0x4008\_0800

Offset address: 0x000 + 0x040 × m + 0x004 × n (PmnPFS)  
 0x002 + 0x040 × m + 0x004 × n (PmnPFS\_HA)  
 0x003 + 0x040 × m + 0x004 × n (PmnPFS\_BY)

|                    |      |      |           |           |    |                 |    |       |    |     |    |                 |      |      |    |                 |     |

| 15    | ASEL      | Analog Input Enable<br>0: Not used as an analog pin<br>1: Used as an analog pin                                                                    | R/W <sup>*5</sup> |

| Bit   | Symbol    | Function                                                                                                                                 | R/W              |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 16    | PMR       | Port Mode Control<br>0: Used as a general I/O pin<br>1: Used as an I/O port for peripheral functions                                     | R/W <sup>5</sup> |
| 23:17 | —         | These bits are read as 0. The write value should be 0.                                                                                   | R/W              |
| 28:24 | PSEL[4:0] | Peripheral Select<br>These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter. | R/W <sup>5</sup> |
| 31:29 | —         | These bits are read as 0. The write value should be 0.                                                                                   | R/W              |

Note 1. The initial value of P108, P109, P110, P201 and P300 is not 0x0000\_0000. P108 is 0x0001\_0410, P109 is 0x0001\_0400, P110 is 0x0001\_0010, P201 is 0x0000\_0010, and P300 is 0x0001\_0010.

Note 2. Supported by PORTn (n = 1 to 4).

Note 3. If the security attribution is configured as Secure:

- Secure access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 4. If the security attribution is configured as Secure:

- Secure read access is allowed
- Non-secure read value is 0 and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure read access are allowed.

Note 5. If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Port mn Pin Function Select Register (PmnPFS/PmnPFS\_HA/PmnPFS\_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS\_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS\_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see [Table 19.1](#)

### PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

### PCR bit (Pull-up Control)

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

### NCODR bit (N-Channel Open-Drain Control)

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

### DSCR[1:0] bits (Port Drive Capability)

The DSCR[1:0] bits switches the drive capacity of the port. If the drive capacity of a pin is fixed, the associated bit is a read/write bit, but the drive capacity cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

### EOFR[1:0] bits (Event on Falling/Event on Rising)

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

**ISEL bit (IRQ Input Enable)**

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

**ASEL bit (Analog Input Enable)**

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register (PWPR). Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

**PMR bit (Port Mode Control)**

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

**PSEL[4:0] bits (Peripheral Select)**

The PSEL[4:0] bits assign the peripheral function.

**19.2.6 PWPR : Write-Protect Register**

Base address: PFS = 0x4008\_0800

Offset address: 0x503

|                    |      |       |   |   |   |   |   |   |

**PFSWE bit (PmnPFS Register Write Enable)**

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

**B0WI bit (PFSWE Bit Write Disable)**

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

### 19.2.7 PWPRS : Write-Protect Register for Secure

Base address: PFS = 0x4008\_0800

Offset address: 0x505

| Bit | Symbol | Function                                                                                                            | R/W |
|-----|--------|---------------------------------------------------------------------------------------------------------------------|-----|
| 5:0 | —      | These bits are read as 0. The write value should be 0.                                                              | R/W |
| 6   | PFSWE  | PmnPFS Register Write Enable<br>0: Disable writes to the PmnPFS register<br>1: Enable writes to the PmnPFS register | R/W |
| 7   | B0WI   | PFSWE Bit Write Disable<br>0: Enable writes the PFSWE bit<br>1: Disable writes to the PFSWE bit                     | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

#### PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register of the IO port pin set as secure by the PmSAR register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

#### B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

### 19.2.8 PmSAR : Port Security Attribution register (m = 0 to 5)

Base address: PFS = 0x4008\_0800

Offset address: 0x510 + 0x002 × m

| Bit  | Symbol      | Function                                                                            | R/W |
|------|-------------|-------------------------------------------------------------------------------------|-----|
| 15:0 | PMNSA[15:0] | Pmn Security Attribution<br>Target I/O port pin : Pmn<br>0: Secure<br>1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note: m = 0 to 5, n = 00 to 15

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the each port, the registers are accessed only in 16-bit units.

#### PMNSA[15:0] bits (Pmn Security Attribution)

The PmnSA bit specifies the Security Attribution of Pmn.

## 19.3 Operation

### 19.3.1 General I/O Ports

All pins except P108 to P110, and P300 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see [section 19.2. Register Descriptions](#).

Each port has the following bits:

- Port Security Attribution register (PmSAR)(m = 0 to 5), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states
- Event Input Data bit (EIDRn), which indicates the pin state when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs
- Port Output Set bit (POSRn), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs.

### 19.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins
- I/O configuration: CMOS output or NMOS open-drain output, pull-up control, and drive capacity
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR[1:0]: Drive capacity control bit that selects the drive capacity
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see [section 19.2.5. PmnPFS/PmnPFS\\_HA/PmnPFS\\_BY : Port mn Pin Function Select Register \(m = 0 to 5, n = 00 to 15\)](#).

### 19.3.3 Port Group Function for ELC

In the MCU, Port 1 to Port 4 are assigned for the ELC port group function.

#### 19.3.3.1 Behavior When ELC\_PORTn (n = 1, 2, 3 or 4) is Input from ELC

The MCU supports the two functions described in this section when an ELC\_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC.

### (1) Input to EIDR

For the GPI function ( $PDR = 0$  and  $PMR = 0$  in the  $PmnPFS$  register), when an  $ELC\_PORTn$  ( $n = 1, 2, 3$  or  $4$ ) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins is read into the EIDR bit. See [Figure 19.2](#)

For the GPO function ( $PDR = 1$ ) or the peripheral mode ( $PMR = 1$ ), 0 is input into the EIDR bit from the external pins.

**Figure 19.2** Event ports input data

### (2) Output from PODR by EOSR and EORR

When an  $ELC\_PORTn$  ( $n = 1, 2, 3$  or  $4$ ) signal occurs, the data is output from the PODR to the external pin based on the settings in the  $\overline{EOSR}$  and  $\overline{EORR}$  registers.

- If  $\overline{EOSR}$  is set to 1, when an  $ELC\_PORTn$  ( $n = 1, 2, 3$  or  $4$ ) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when  $\overline{EOSR} = 0$ , the PODR value is retained.
- If  $\overline{EORR}$  is set to 1, when  $ELC\_PORTn$  ( $n = 1, 2, 3$  or  $4$ ) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when  $\overline{EORR} = 0$ , the PODR value is retained.

**Figure 19.3** Event ports output data

### 19.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see [section 19.2.5. PmnPFS/PmnPFS\\_HA/PmnPFS\\_BY : Port mn Pin Function Select Register \(m = 0 to 5, n = 00 to 15\)](#). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port 1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Port n (n = 2 to 4) is also the same as Port 1. See [Figure 19.4](#).

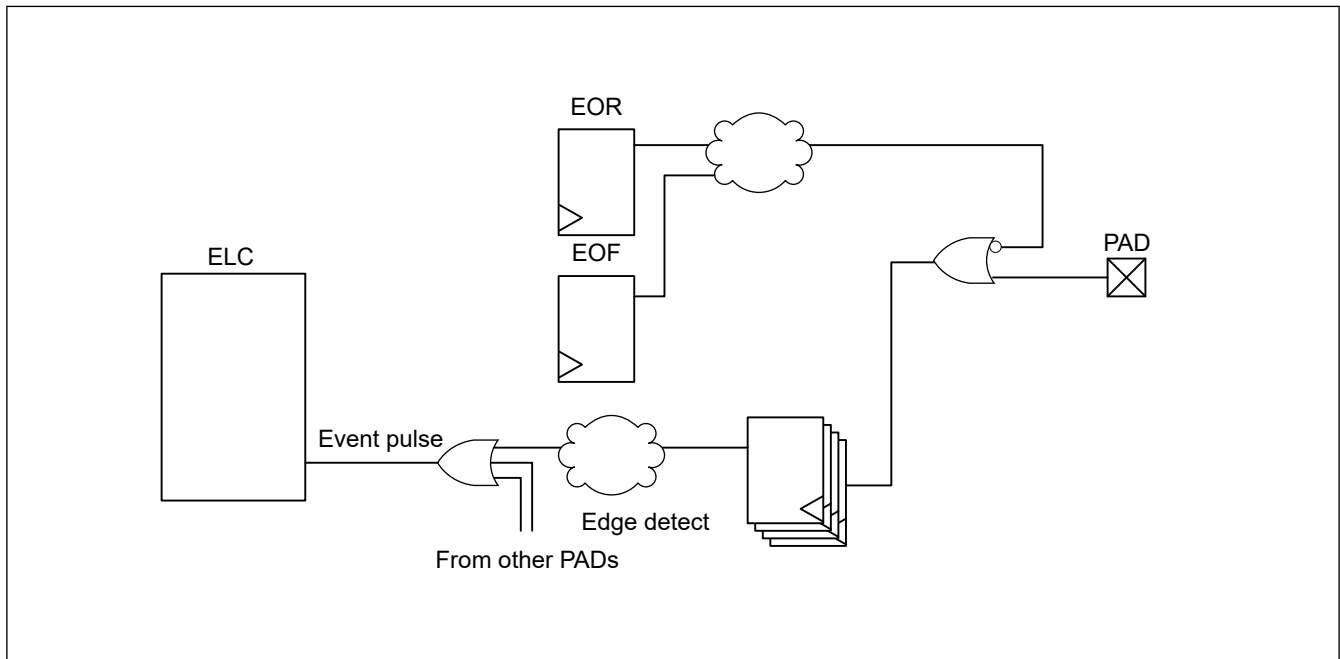

Figure 19.4 Generation of event pulse

## 19.4 Handling of Unused Pins

[Table 19.3](#) shows how to handle unused pins.

Table 19.3 Handling of unused pins (1 of 2)

| Pin name     | Description                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD           | Use as a mode selection pin                                                                                                                                                                                                                                                                                                    |
| RES          | Connect to VCC through a resistor (pulling up)                                                                                                                                                                                                                                                                                 |
| USB_DP       | Keep pin open                                                                                                                                                                                                                                                                                                                  |
| USB_DM       | Keep pin open                                                                                                                                                                                                                                                                                                                  |
| P200/NMI     | Connect to VCC through a resistor (pulling up)                                                                                                                                                                                                                                                                                 |
| EXTAL        | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as ports 1 to 5.                                                                                                                                           |
| XTAL         | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as ports 1 to 5.                                                        |
| XCIN         | Connect to VSS through a resistor (pulling down)                                                                                                                                                                                                                                                                               |
| XCOUT        | Keep pin open                                                                                                                                                                                                                                                                                                                  |
| P000 to P015 | <ul style="list-style-type: none"> <li>If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 (pulled up) through a resistor or to AVSS0 (pulled down) through a resistor <sup>*1</sup></li> <li>If the direction is set to output (PCNTR1.PDRn = 1), keep pin open. <sup>*1</sup></li> </ul> |

**Table 19.3 Handling of unused pins (2 of 2)**

| Pin name      | Description                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P1x to P5x    | <ul style="list-style-type: none"> <li>If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC (pulled up) through a resistor or to VSS (pulled down) through a resistor. *1 *2</li> <li>If the direction is set to output (PCNTR1.PDRn = 1), keep pin open. *1 *3</li> </ul> |
| VREFH0, VREFH | Connect to AVCC0                                                                                                                                                                                                                                                                                            |
| VREFL0        | Connect to AVSS0                                                                                                                                                                                                                                                                                            |
| VBATT         | Connect to VCC or VSS                                                                                                                                                                                                                                                                                       |

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.

Note 2. P108, P110, and P300 should be enabled for input pull-up from the initial value (PmnPFS.PCR = 1).

Note 3. P109 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.

## 19.5 Usage Notes

### 19.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR register. This enables writing to the PFSWE bit in the PWPR register.\*1
2. Set 1 to the PFSWE bit in the PWPR register. This enables writing to the PmnPFS register.\*1
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR register. This disables writing to the PmnPFS register.\*1
7. Set 1 to the B0WI bit in the PWPR register. This disables writing to the PFSWE bit in the PWPR register.\*1

Note 1. When the security attribution of Pmn is set to 0, set the PWPRS register to write to the PmnPFS register.

### 19.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = 1 to 4)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see [section 18, Event Link Controller \(ELC\)](#).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

### 19.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODRn is set.
6. Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

### 19.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDR<sub>n</sub>) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

### 19.5.5 I/O Buffer Specification

The P402 port can be used as the RTC input, AGT input and other peripheral functions. [Table 19.4](#) lists the P402 specifications.

**Table 19.4 P402 specifications**

| I/O port | RTC and AGT                       |        |                                      | Other peripheral                 |                                                                                              |
|----------|-----------------------------------|--------|--------------------------------------|----------------------------------|----------------------------------------------------------------------------------------------|
|          | RTC and AGT input enable register | RTC    | AGT                                  | other peripheral enable register | CAC, GPT, CAN, SCI, and interrupt                                                            |
| P402     | VBTICTLR.VCH0INEN                 | RTCIC0 | AGTIO0<br>AGTIO1<br>AGTIO2<br>AGTIO3 | P402PFS.PSEL and PMR             | For details, see <a href="#">section 19.6. Peripheral Select Settings for Each Product</a> . |

These RTC and AGT inputs are controlled by the VBTICTLR register. And this register is the highest priority which selecting the functions.

P402 can be used as IRQn-DS(n = 4, 14, 15) whether RTC and AGT inputs are selected or not. When using these interrupts, set the interrupt procedure after setting the VBTICTLR register. (see [section 11.2.6. VBTICTLR : VBATT Input Control Register](#).)

See [Figure 19.5](#).

The VBTICTLR register is not initialized on reset. Therefore, it is necessary to set the VBTICTLR register after reset as follows:

- When using RTC or AGT input: VBTICTLR = 0x01
- Without RTC or AGT input: VBTICTLR = 0x00

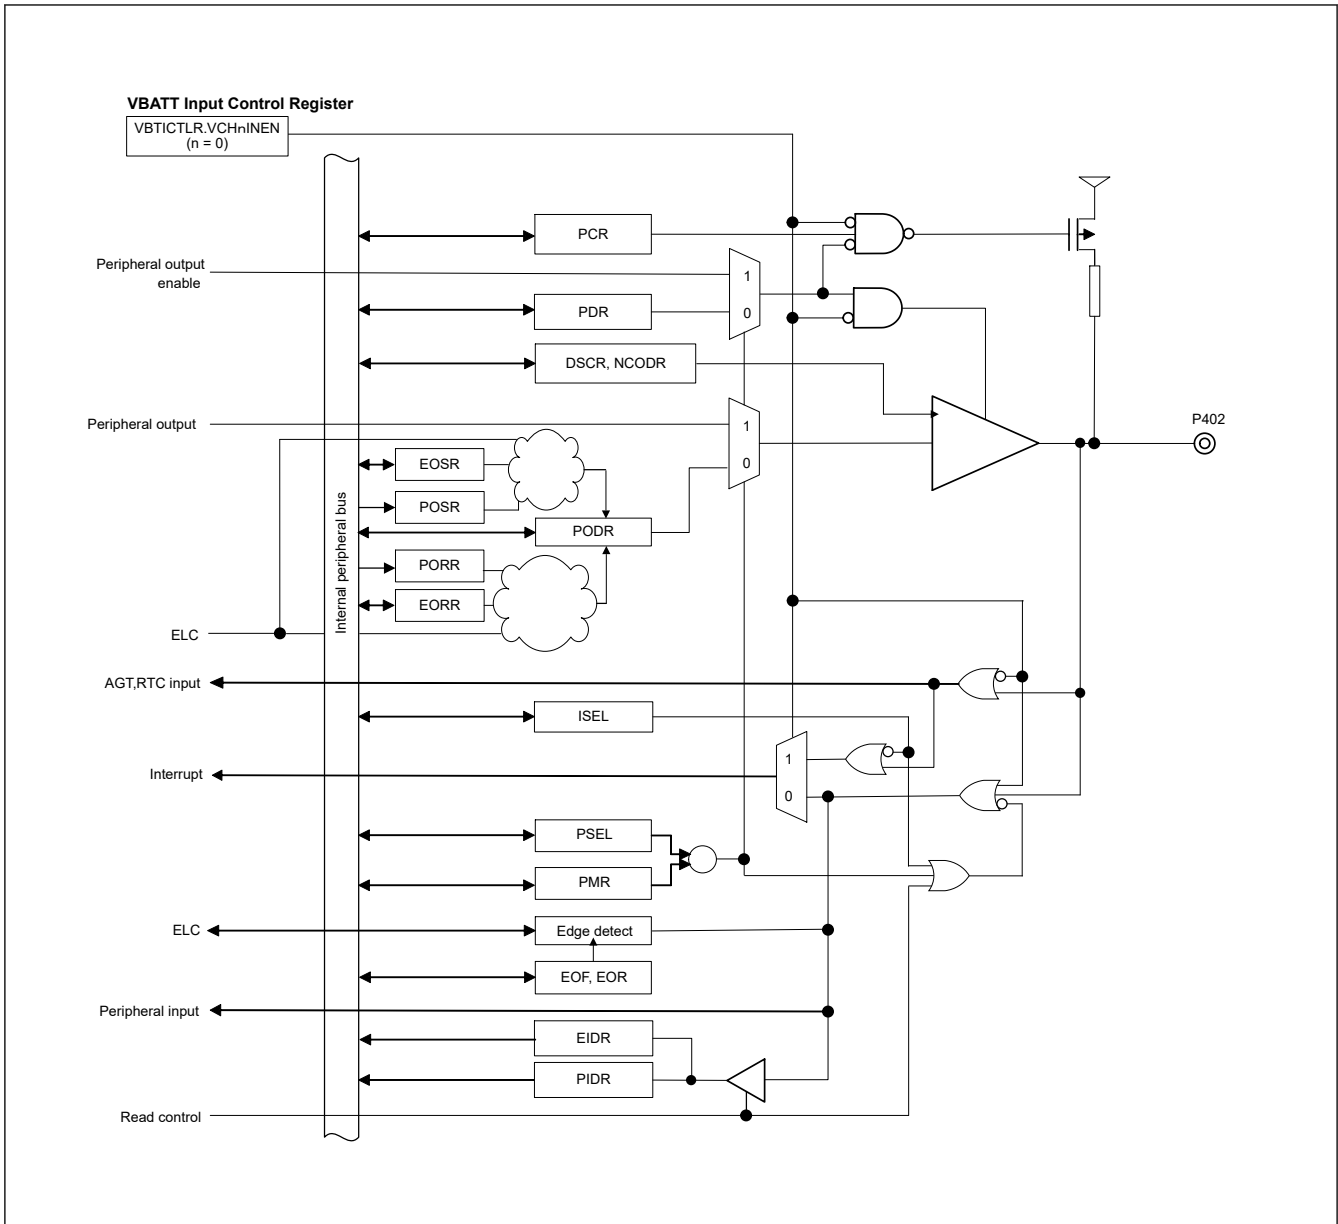

Figure 19.5 P402 diagram

### 19.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added *\_A*, *\_B*, or *\_C* suffixes. When assigning IIC functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

1. In Pmn pin function select register(PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
2. Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
3. The single function should not be assigned to the multiple pins by PmnPFS register. When the GPT1, GPT5, SCI3, IIC0 or SPI0 are configured as secure and these pin function is being assigned to the pin which security attribution is set as secure by the PmSAR register, the write access to the PSEL bits for setting same function as secure pin in other pins is ignored when the security attribution of that pin is non-secure. For example, if the PSARE.PSARE30 bit is 0 (GPT1 is secure) and the P109PFS.PSEL bits is 00011b (pin function is GTIOC1A) and the P1SAR.109SA bit is 0 (P109 is secure), the write 00011b to the P405PFS.PSEL bits is ignored when the P4SAR.405SA bit is 1 (P405 is non-secure).

4. The PORT0 and 5 have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1

**Table 19.5 Register settings for input/output pin function (PORT0)**

| PSEL[4:0] settings         | Function                            | pin     |         |         |       |         |       |           |       |  |
|----------------------------|-------------------------------------|---------|---------|---------|-------|---------|-------|-----------|-------|--|
|                            |                                     | P000    | P001    | P002    | P003  | P004    | P013  | P014      | P015  |  |
| 00000b (value after reset) | Hi-Z/JTAG/SWD                       | Hi-Z    |         |         |       |         |       |           |       |  |
| ASEL bit                   |                                     | AN000   | AN001   | AN002   | AN003 | AN004   | AN011 | AN012/DA0 | AN013 |  |

—: Setting prohibited

Note 1. Use pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are two types of output buffer which are middle drive and high drive. Use the same drive buffer for output skew spec ( $t_{GTISK}$ )

Note 3. The driver strength of this port cannot be controlled by PmnPFS.DSCR[1:0] bits.

Note 4. When using NMI pin interrupt, port-related registers setting are not required.

 —: Setting prohibited

- Note 1. To use this pin function, set the associated pin as a general input (set the PmnPFS.PDR and PmnPFS.PMR bits to 0).  
 Note 2. Use pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.  
 Note 3. There are two types of output buffer which are middle drive and high drive. Use the same drive buffer for output skew spec (t<sub>GTISK</sub>)

## 20. Port Output Enable for GPT (POEG)

### 20.1 Overview

The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETR<sub>Gn</sub> (n = A to D) pins
- Output-disable request from the GPT
- Oscillation stop detection of the clock generation circuit
- Register settings

The GTETR<sub>Gn</sub> (n = A to D) pins can be used as GPT external trigger input pins.

Table 20.1 lists the POEG specifications, Figure 20.1 shows a block diagram, and Table 20.2 lists the input pins.

**Table 20.1 POEG specifications**

| Parameter                                                 | Specifications                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Output-disable control through input level detection      | <ul style="list-style-type: none"> <li>• The GPT output pins can be disabled when a GTETR<sub>Gn</sub> rising edge or high level is sampled after polarity and filter selection.</li> </ul>                                                                                                                                                                                                                                                                              |

Note 1. Only 0 can be written to clear the flag.

Note 2. Can be modified only once after a reset.

The POEG<sub>Gn</sub> (n = A to D) registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT.

In the descriptions, POEG<sub>Gn</sub> represents the POEG<sub>Gn</sub> (n = A to D) registers.

## 20.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOC<sub>x</sub>A and GTIOC<sub>x</sub>B can be set to output-disable:

- Input level or edge detection of the GTETR<sub>Gn</sub> pins  
When POEG<sub>Gn</sub>.PIDE is 1, the POEG<sub>Gn</sub>.PIDF flag is set to 1.
- Output-disable request from the GPT  
When POEG<sub>Gn</sub>.IOCE is 1, the POEG<sub>Gn</sub>.IOCF flag is set to 1 if the disable request is enabled by GTINTAD. The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].
- Oscillation stop detection for the clock generation circuit  
While POEG<sub>Gn</sub>.OSTPE is 1, the halt status of the main clock oscillator is detected and the POEG<sub>Gn</sub>.OSTPF flag is set to 1.
- SSF bit setting  
When POEG<sub>Gn</sub>.SSF is set to 1, the GPT and PWM output are disabled.

The output-disable state is controlled in the GPT module. The output-disable of the GTIOC<sub>x</sub>A and GTIOC<sub>x</sub>B pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPT<sub>x</sub>.

### 20.3.1 Pin Input Level Detection Operation

If the input conditions set in POEG<sub>Gn</sub>.PIDE, POEG<sub>Gn</sub>.NFCS[1:0], POEG<sub>Gn</sub>.NFEN, and POEG<sub>Gn</sub>.INV occur on the GTETR<sub>Gn</sub> pins, the GPT output pins are output-disabled.

#### 20.3.1.1 Digital Filter

Figure 20.2 shows high-level detection by the digital filter. When a high level associated with the POEG<sub>Gn</sub>.INV polarity setting is detected three times consecutively with the sampling clock selected in POEG<sub>Gn</sub>.NFCS[1:0] and POEG<sub>Gn</sub>.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETR<sub>Gn</sub> pins are ignored.

**Figure 20.2** Example of digital filter operation

### 20.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOC Pin Output Negate Control in [section 21, General PWM Timer \(GPT\)](#).

### 20.3.3 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

### 20.3.4 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGn.SSF.

### 20.3.5 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all the following flags:

- POEGn.PIDF
- POEGn.IOCF
- POEGn.OSTPF
- POEGn.SSF

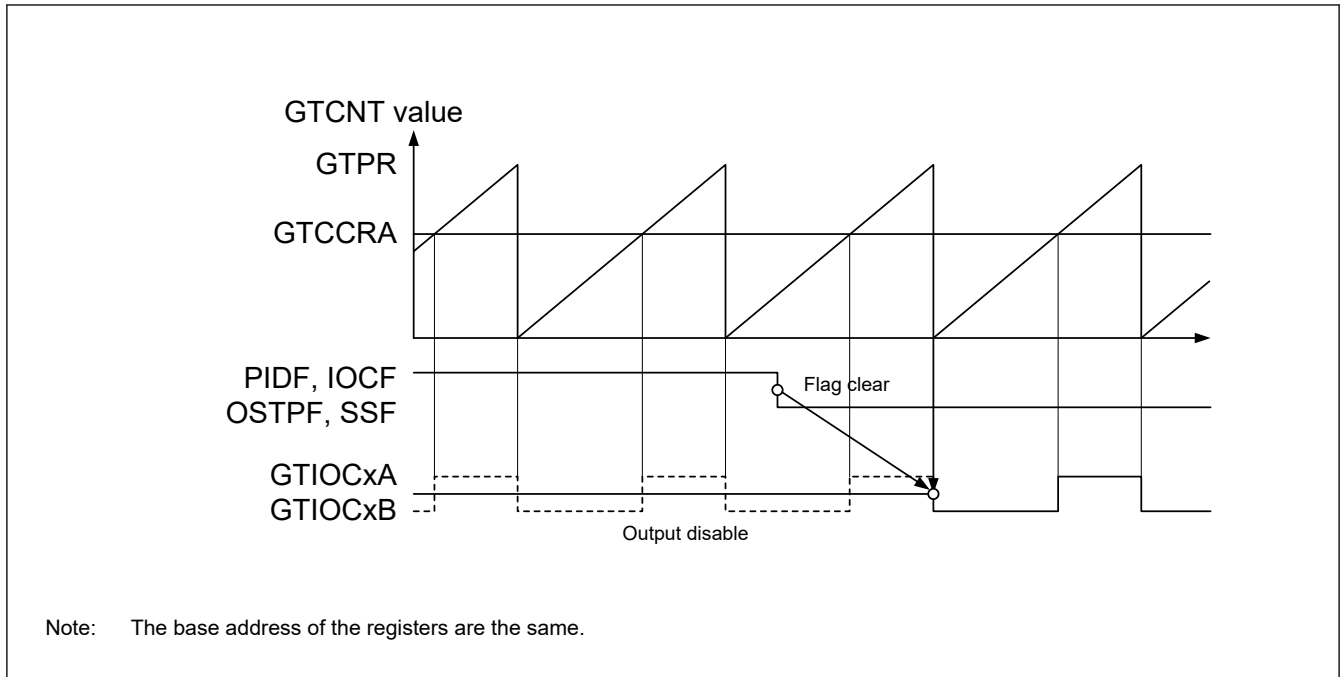

Writing 0 to the POEGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRn are not disabled and the POEGn.ST bit is not set to 0.

Writing 0 to the POEGn.IOCF flag is valid (the flag is cleared) only if all the GTST.OABHF and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when setting and releasing the flag occurs at the same time, the flag setting takes precedence.

[Figure 20.3](#) shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

**Figure 20.3 Output-disable release timing for GPT pin outputs**

## 20.4 Interrupt Sources

The POEG generates an interrupt request for the following factors:

- Output-disable control by the input level detection
- Output-disable request from the GPT

Table 20.3 lists the conditions for interrupt requests.

**Table 20.3 Interrupt sources and conditions**

| Interrupt source       | Symbol      | Associated flag | Trigger conditions                                            |
|------------------------|-------------|-----------------|---------------------------------------------------------------|
| POEG group A interrupt | POEG_GROUPA | POEGGA.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGA.PIDF     | An output-disable request from the GTETRGA pin occurred       |
| POEG group B interrupt | POEG_GROUPB | POEGGB.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGB.PIDF     | An output-disable request from the GTETRGB pin occurred       |
| POEG group C interrupt | POEG_GROUPC | POEGGC.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGC.PIDF     | An output-disable request from the GTETRGC pin occurred       |
| POEG group D interrupt | POEG_GROUPD | POEGGD.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGD.PIDF     | An output-disable request from the GTETRGD pin occurred       |

## 20.5 External Trigger Output to the GPT

The POEG outputs signals generated by filtering and level detection of GTETRGN pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture

For the POEGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGn.NFCS[1:0] and POEGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in section 20.3.1. Pin Input Level Detection Operation. The state after filtering can be monitored in POEGn.ST.

Figure 20.4 shows the output timing of an external trigger to the GPT.

Figure 20.4 Output timing of external trigger to the GPT

## 20.6 Usage Notes

### 20.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

### 20.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

## 21. General PWM Timer (GPT)

### 21.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with  $GPT32 \times 2$  channels and a 16-bit timer with  $GPT16 \times 2$  channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. The GPT can also be used as a general-purpose timer.

Table 21.1 lists the GPT specifications, Table 21.2 shows the GPT functions, and Figure 21.1 shows a block diagram.

**Table 21.1 GPT specifications**

| Item      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Note 1. GTETRGN connects to GPT through the POEG module. Therefore, to use the GPT function, supply the POEG clock by clearing the MSTPCRD.MSTPDn (n = 11 to 14) bit.

Note 2. See [section 21.5. Operations Linked by ELC](#).

Figure 21.1 GPT block diagram

Figure 21.2 shows an example using multiple GPTs.

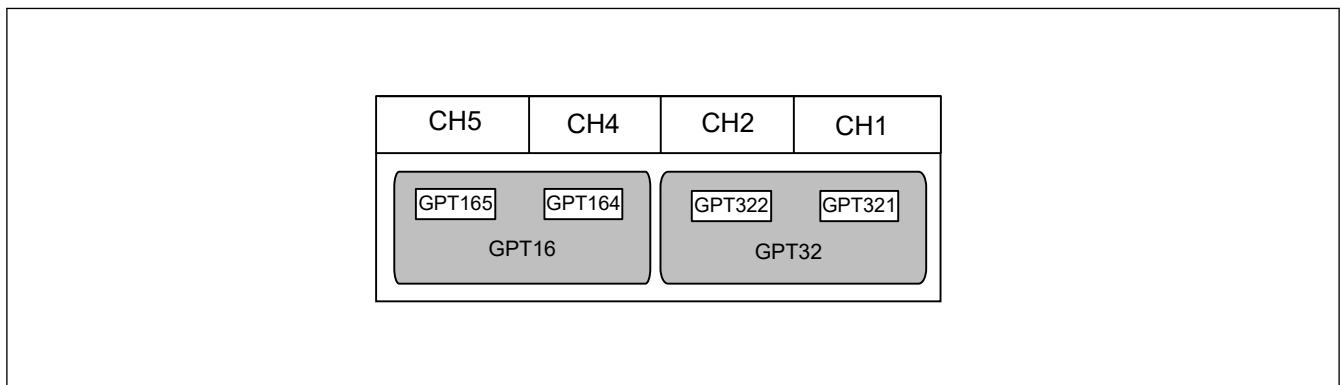

Figure 21.2 Association between GPT channels and module names

Table 21.3 lists the I/O pins.

Table 21.3 GPT I/O pins

| Channel | Pin name | I/O   | Function                                                                 |
|---------|----------|-------|--------------------------------------------------------------------------|
| Common  | GTETRGx  | Input | External trigger input pin x (input through the POEG)                    |
| GPT32n  | GTIOCnA  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|         | GTIOCnB  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |
| GPT16m  | GTIOCmA  | I/O   | GTCCRA register input capture input/output compare output/PWM output pin |
|         | GTIOCmB  | I/O   | GTCCRB register input capture input/output compare output/PWM output pin |

## 21.2 Register Descriptions

### 21.2.1 GTWP : General PWM Timer Write-Protection Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x00

| 4     | CMNWP      | Common Register Write Disabled<br>0: Write to the register is enabled<br>1: Write to the register is disabled                                        | R/W |
| 7:5   | —          | These bits are read as 0. The write value should be 0.                                                                                               | R/W |
| 15:8  | PRKEY[7:0] | GTWP Key Code<br>When 0xA5 is written to these bits, writing to the WP, STRWP, STPWP, CLRWP, and CMNWP bits are permitted. These bits are read as 0. | W   |
| 31:16 | —          | These bits are read as 0. The write value should be 0.                                                                                               | R/W |

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

#### WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

#### STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 1, 2, 4, 5) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT321.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPT322.GTSTR.CSTRT1 bit when its current setting is 0 causes the value to be updated, and the GPT321.GTCNT counter starts to run. When the setting of the GPT321.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPT322.GTSTR.CSTRT1 bit when its current setting is 0 leaves the bit with the value 0, and the GPT321.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

#### **STPWP bit (GTSTP.CSTOP Bit Write Disable)**

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 1, 2, 4, 5) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT321.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPT322.GTSTP.CSTOP1 bit when its current setting is 0 causes the value to be updated, and the GPT321.GTCNT counter is stopped. When the setting of the GPT321.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPT322.GTSTP.CSTOP1 bit when its current setting is 0 leaves the bit with the value 0, and the GPT321.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

#### **CLRWP bit (GTCLR.CCLR Bit Write Disable)**

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 1, 2, 4, 5) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT321.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPT322.GTCLR.CCLR1 bit when its current setting is 0 causes the value to be updated, and the GPT321.GTCNT counter is cleared. When the setting of the GPT321.GTWP.CLRWP bit is 1 (disabling writing), writing 1 to the GPT322.GTCLR.CCLR1 bit when its current setting is 0 leaves the bit with the value 0, and the GPT321.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

#### **CMNWP bit (Common Register Write Disabled)**

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 1, 2, 4, 5) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT321.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT322.GTSECSR.SECSEL1 bit causes the value of the GPT321.GTSECSR.SECSEL1 bit to be updated. In the same way, writing to the GPT322.GTSECR register updates the value of the GPT321.GTSECR register. When the setting of the GPT321.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPT322.GTSECSR.SECSEL1 bit does not cause the value of the GPT321.GTSECSR.SECSEL1 bit to be updated. In the same way, writing to the GPT322.GTSECR register does not update the value of the GPT321.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

**PRKEY[7:0] bits (GTWP Key Code)**

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

**21.2.2 GTSTR : General PWM Timer Software Start Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x04

Bit position: 31 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol              | Function                                                                                                                                | R/W |
|------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | CSTRT0 to CSTRT31*1 | Channel n GTCNT Count Start (n is the same as the bit position value)<br>0: GTCNT counter is not started<br>1: GTCNT counter is started | R/W |

Note 1. The bits that can be used vary depending on the product. The n in CSTRTn is the same as the GPT channel number. For this product, n is 1, 2, 4, 5.

The GTSTR starts the GTCNT counter operation for each channel n, where n = 1, 2, 4, 5.

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTR register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but cannot be written by non-secure access. For example, if GPT channel 1 is configured as secure and other GPTs are configured as non-secure, the CSTRT1 bit cannot be written by non-secure access to GPT322.GTSTR register, and the GTCNT counter operation status of GPT channel 1 is not changed. When the GTSTR register in GPT channel 2 is read by non-secure access in the same security configuration as the previous example, the GTCNT counter operation status of GPT channel 1 (CSTRT1 bit) can be read.

For the association between module names and channel numbers, see [Figure 21.2](#).

**CSTRTn bits (Channel n GTCNT Count Start (n = 1, 2, 4, 5))**

The CSTRTn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit (n = 1, 2, 4, 5) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

The bit corresponding to channel which security attribution is configured as secure can not be written by non-secure access. For example, if GPT channel 1 is configured as secure and other GPTs are configured as non-secure, the CCLR1 bit cannot be written by non-secure access to GTCLR register in GPT channel 2, and the GTCNT counter of GPT channel 1 is not cleared.

For the association between module names and channel numbers, see [Figure 21.2](#).

**CCLRn bits (Channel n GTCNT Count Clear (n = 1, 2, 4, 5))**

When the counting direction flag is set for decrement (GTST.TUCF flag = 0) with saw-wave mode selected in the GTCR.MD[2:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0x0000 0000 with other settings. These bits are read as 0.

**21.2.5 GTSSR : General PWM Timer Start Source Select Register**

Base address:  $GPT32n = 0x4016\_9000 + 0x0100 \times n$  (n = 1, 2)  
 $GPT16m = 0x4016\_9000 + 0x0100 \times m$  (m = 4, 5)

Offset address: 0x10

|                    |             |             |             |             |             |             |             |             |              |              |              |              |              |              |              |              |

| 30:24 | —      | These bits are read as 0. The write value should be 0.                                                                                          | R/W |
| 31    | CSTRT  | Software Source Counter Start Enable<br>0: Counter start disabled by the GTSTR register<br>1: Counter start enabled by the GTSTR register       | R/W |

The GTSSR sets the source to start the GTCNT counter.

Input from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### **SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)**

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

#### **SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)**

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

#### **SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)**

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

#### **SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)**

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

#### **SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)**

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

#### **SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)**

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

#### **SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)**

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

#### **SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)**

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

#### **SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)**

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### **SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)**

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### **SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)**

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### **SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)**

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)**

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)**

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)**

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)**

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**SSELCm bit (ELC\_GPTm Event Source Counter Start Enable) (m = A to H)**

The SSELCm bit enables or disables the GTCNT counter start at the ELC\_GPTm event input.

**CSTRT bit (Software Source Counter Start Enable)**

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

**21.2.6 GTPSR : General PWM Timer Stop Source Select Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x14

| 30:24 | —      | These bits are read as 0. The write value should be 0.                                                                                       | R/W |
| 31    | CSTOP  | Software Source Counter Stop Enable<br>0: Counter stop disabled by the GTSTP register<br>1: Counter stop enabled by the GTSTP register       | R/W |

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETR<sub>Gn</sub> (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### **PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)**

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

#### **PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)**

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

#### **PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)**

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

#### **PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)**

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

#### **PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)**

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

#### **PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)**

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

#### **PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)**

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

#### **PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)**

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

#### **PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)**

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)**

The PSCARBH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)**

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)**

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)**

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)**

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)**

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)**

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)**

The PSELCm bit enables or disables the GTCNT counter stop at the ELC\_GPTm event input.

**CSTOP bit (Software Source Counter Stop Enable)**

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

**21.2.7 GTCSR : General PWM Timer Clear Source Select Register**

The GTCSR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST=1) or stopped (GTCR.CST=0).

Inputs from GTETR<sub>Gn</sub> (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### **CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)**

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

#### **CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)**

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

#### **CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)**

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

#### **CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)**

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

#### **CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)**

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

**CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)**

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

**CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)**

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

**CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)**

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

**CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)**

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)**

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)**

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)**

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)**

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)**

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)**

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)**

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)**

The CSELCm bit enables or disables the GTCNT counter clear at the ELC\_GPTm event input.

**CCLR bit (Software Source Counter Clear Enable)**

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

## 21.2.8 GTUPSR : General PWM Timer Up Count Source Select Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0, 1)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x1C

| 31:24 | —       | These bits are read as 0. The write value should be 0.                                                                                                                                                                                                                      | R/W |

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETR<sub>n</sub> (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

**USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)**

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

**USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)**

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

**USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)**

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

**USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)**

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

**USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)**

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

**USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)**

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGC pin input.

**USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)**

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGD pin input.

**USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)**

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGD pin input.

**USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)**

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

**USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)**

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)**

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**USCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)**

The USCAFBH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)**

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)**

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

**USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)**

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

**USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)**

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

**USELCm bit (ELC\_GPTm Event Source Counter Count Up Enable) (m = A to H)**

The USELCm bit enables or disables the GTCNT counter count up at the ELC\_GPTm event input.

**21.2.9 GTDNSR : General PWM Timer Down Count Source Select Register**

| 31:24 | —      | These bits are read as 0. The write value should be 0.                                                                                                         | R/W |

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETR<sub>Gn</sub> (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### **DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

#### **DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

#### **DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

#### **DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

#### **DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

#### **DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

#### **DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

#### **DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

#### **DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)**

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

#### **DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)**

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### **DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)**

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)**

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)**

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)**

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

**DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)**

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)**

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**DSELCm bit (ELC\_GPTm Event Source Counter Count Down Enable) (m = A to H)**

The DSELCm bit enables or disables the GTCNT counter count down at the ELC\_GPTm event input.

**21.2.10 GTICASR : General PWM Timer Input Capture Source Select Register A**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x24

| 31:24 | —       | These bits are read as 0. The write value should be 0.                                                                                                                                                                                                                                  | R/W |

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETR<sub>Gn</sub> (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

#### **ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

#### **ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

#### **ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

#### **ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

#### **ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

#### **ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

**ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)**

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

**ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)**

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

**ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)**

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)**

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)**

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)**

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

**ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)**

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

**ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)**

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)**

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)**

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**ASELCm bit (ELC\_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)**

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC\_GPTm event input.

## 21.2.11 GTICBSR : General PWM Timer Input Capture Source Select Register B

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x28

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETR<sub>Gn</sub> (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

**BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

**BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

**BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

**BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

**BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

**BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

**BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

**BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

**BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)**

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

**BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)**

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)**

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)**

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)**

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)**

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)**

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)**

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**BSELCm bit (ELC\_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)**

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC\_GPTm event input.

**21.2.12 GTCR : General PWM Timer Control Register**

Base address:  $GPT32n = 0x4016\_9000 + 0x0100 \times n$  (n = 1, 2)  
 $GPT16m = 0x4016\_9000 + 0x0100 \times m$  (m = 4, 5)

Offset address: 0x2C

The GTCR controls GTCNT.

### CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input that are enabled by GTSSR for the starting counter source, occurs (n = 1, 2, 4, 5)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTPSR as the counter stop source, occurs (n = 1, 2, 4, 5)
- 0 is written by software directly.
- When the period count function is finished while the GTPC.ASTP bit is 1.

### MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. Only the MD[2] bit is valid at input capture. Counting in saw-wave mode is performed with 0 for the MD[2] bit, and counting in triangle-wave mode is performed with 1 for the MD[2] bit. The MD[2:0] bits must be set while the GTCNT operation is stopped. During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), set the MD[2:0] bits to the initial value (000b).

### TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped.

### 21.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x30

Note: n = 1, 2, 4, 5

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty of the GTIOCnA/GTIOCnB pin output.

The setting is invalid during the event count operation.

Count Direction:

- In saw-wave mode.  
When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).  
When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).  
When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.
- In triangle-wave mode.  
When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.  
When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

### UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

### UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

#### Output duty

- In saw-wave mode.  
When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).  
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).  
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.
- In triangle-wave mode.  
When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.  
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.  
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0 and the OADTY[1:0]/OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1 and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty of first cycle while count operation is stopped, these duty-cycle set during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

### OmDTY[1:0] bits (GTIOcNm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOcNm pin.

### OmDTYF bit (Forcible GTIOcNm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation.

**OmDTYR bit (GTIOCn Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)**

The OmDTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCn pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmDTYR bit is 1, the value after the period has elapsed due this compare match operation is target for the GTIOm[3:2] bits.

**21.2.14 GTIOR : General PWM Timer I/O Control Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x34

| 31:30 | NFCSB[1:0] | Noise Filter B Sampling Clock Select<br>0 0: PCLKD/1<br>0 1: PCLKD/4<br>1 0: PCLKD/16<br>1 1: PCLKD/64                                                                                                                                                                                                                            | R/W |

Note: n = 1, 2, 4, 5

The GTIOR sets the functions of the GTIOCnA and GTIOCnB pins. (n = 1, 2, 4, 5)

#### GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see [Table 21.4](#).

#### OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

#### OAHLD bit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLD bit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1:

- The output is retained when counting starts or stops.

#### OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

#### OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

**NFAEN bit (Noise Filter A Enable)**

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

**NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)**

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

**GTIOB[4:0] bits (GTIOCnB Pin Function Select)**

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see [Table 21.4](#).

**OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)**

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

**OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)**

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

**OBE bit (GTIOCnB Pin Output Enable)**

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

**OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)**

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

**NFBEN bit (Noise Filter B Enable)**

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

**NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)**

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

**Table 21.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits**

| GTIOA/GTIOB[4:0] bits |    |    |    |    | Function               |                              |                                                |

| 1                     | 1  | 1  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |

- Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and means a trough (GTCNT changes from 0 to 1) for triangle-wave mode.
- Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.
- Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

### 21.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

| 31    | —        | This bit is read as 0. The write value should be 0.                                                                                                                                                                                  | R/W |

The GTINTAD enables or disables interrupt requests and output disable requests.

#### GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable request from GPT to POEG and the group of output disable for GTIOCnA pin and GTIOCnB pin from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bit, with dead-time errors, simultaneous high output, and simultaneous low output factors following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

#### GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

#### GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

Note 1. Only 0 can be written to this bit. Do not write 1.

The GTST indicates the status of the GPT.

### TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

### TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

### TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

When GTCCRC performs buffer operation, GTCCRC does not perform compare match.

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

### TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

When GTCCRD performs buffer operation, GTCCRD does not perform compare match.

[Setting condition]

- $GTCNT = GTCCRD$ .

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$  (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$  (Triangle-wave PWM mode 3)
- $GTBER.CCRA[1:0] = 10b, 11b$  (GTCCRD performs buffer operation).

### TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

When GTCCRE performs buffer operation, GTCCRE does not perform compare match.

[Setting condition]

- $GTCNT = GTCCRE$ .

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$  (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$  (Triangle-wave PWM mode 3)
- $GTBER.CCRB[1:0] = 01b, 10b, 11b$  (GTCCRE performs buffer operation).

### TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

When GTCCRF performs buffer operation, GTCCRF does not perform compare match.

[Setting condition]

- $GTCNT = GTCCRF$ .

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$  (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$  (Triangle-wave PWM mode 3)
- $GTBER.CCRB[1:0] = 10b, 11b$  (GTCCRF performs buffer operation).

### TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to  $GTPR - 1$ ) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

**TCFPU flag (Underflow Flag)**

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

**TUCF flag (Count Direction Flag)**

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

**ODF flag (Output Disable Flag)**

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

**OABHF flag (Same Time Output Level High Flag)**

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

**OABLF flag (Same Time Output Level Low Flag)**

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

**PCF flag (Period Count Function Finish Flag)**

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

- 0 is written to this bit.

| 22    | CCRSWT    | GTCCRA and GTCCRB Forcible Buffer Operation<br>Writing 1 to this bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0. | W   |
| 31:23 | —         | These bits are read as 0. The write value should be 0.                                                                                                                                             | R/W |

The GTBER register provides settings for the buffer operation. Set the GTBER register while the GTCNT counter is stopped.

**BD0 bit (GTCCR Buffer Operation Disable)**

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCD.

**BD1 bit (GTPR Buffer Operation Disable)**

The BD1 bit disables the buffer operation using GTPR and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPD.

**CCRA[1:0] bits (GTCCRA Buffer Operation)**

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

**CCRB[1:0] bits (GTCCRB Buffer Operation)**

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

**PR[1:0] bits (GTPR Buffer Operation)**

The PR[1:0] bits set the buffer operation with GTPR and GTPBR combined.

**CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)**

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

**21.2.18 GTCNT : General PWM Timer Counter**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4, 5)

Offset address: 0x48

Bit position: 31 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol | Function                                                                                                                                                                                                                                                                                                                                                                 | R/W |
|------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a    | GTCNT is a 32-bit read/write counter for GPT32n (n = 1, 2). For GPT16m (m = 4, 5), GTCNT is a 16-bit register. GTCNT can only be written to after counting stops. For GPT16m (m = 4, 5), the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCNT must be set within the range of $0 \leq GTCNT \leq GTPR$ . | R/W |

### 21.2.19 GTCCRk : General PWM Timer Compare Capture Register k (k = A to F)

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)

| 0    | TDE    | Negative-Phase Waveform Setting<br>0: GTCCRB is set without using GTDVU<br>1: GTDVU is used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB | R/W |
| 31:1 | —      | These bits are read as 0. The write value should be 0.                                                                                                                                        | R/W |

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time. GPT has a dead time control function and the GTDVU register is used for setting dead time value.

#### TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU. When GTDVU is used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and the GTCCRB is not automatic setting.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB.

- Triangle waves:  
 Upper limit value: GTPR – 1  
 Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:  
 Upper limit value: GTPR  
 Lower limit value: 0.

| 31:26 | —             | These bits are read as 0. The write value should be 0.                                                                                                                                                                                                                                                                                                   | R/W |

Note 1. The signal before performing output disable control is selected.

Note 2. When channel's own GTIOCnA is selected, C is treated as "1".

Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

#### ICLFm[2:0] bit (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as "1".

#### ICLFSSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

### 21.2.25 GTPC : General PWM Timer Period Count Register

| 27:16 | PCNT[11:0] | Period Counter<br>Counter for the number of period                                                                | R/W |
| 31:28 | —          | These bits are read as 0. The write value should be 0.                                                            | R/W |

The GTPC register counts the number of period.

#### PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCE bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

#### ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bit is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at  $PCNT = 0$ , the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

#### PCNT[11:0] bit (Period Counter)

This counter counts the number of period.

When the PCEN bit is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In saw-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

### 21.2.26 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 1, 2)

| 9:8   | —       | These bits are read as 0. The write value should be 0.                                                                                  | R/W |
| 31:10 | —       | These bits are read as 0. The write value should be 0.                                                                                  | R/W |

The GTSECSR register selects an intended channel n (n = 1, 2, 4, 5) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but cannot be written by non-secure access. For example, if GPT channel 1 is configured as secure and other GPTs are configured as non-secure, the SECSEL1 bit cannot be written by non-secure access to GPT322.GTSECSR register, and the simultaneous control status of GPT channel 1 is not changed. When the GPT322.GTSECSR register is read by non-secure

access in the same security configuration as the previous example, the simultaneous control status of GPT channel 1 (SECSEL1 bit) can be read.

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

**SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 1, 2, 4, 5)**

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

**21.2.27 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register**

| 31:25 | —      | These bits are read as 0. The write value should be 0.                                                                                                                          | R/W |

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register. Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

The GTSECR register of channel which security attribution is configured as secure can not be written by non-secure access. For example, if GPTn is configured as secure and other GPTs are configured as non-secure, the GPTn.GTSECR register can

not be written by non-secure access to GPTn+1.GTSECR register even if the simultaneous control of GPTn is enabled, and the simultaneous control status of GPTn is not changed.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

#### **SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)**

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

#### **SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)**

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are enabled.

Simultaneous setting of SBDPE and SBDCD bits to 1 is prohibited.

#### **SBDCD bit (GTCCR Register Buffer Operation Simultaneous Disable)**

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

#### **SBDPD bit (GTPR Register Buffer Operation Simultaneous Disable)**

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are disabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

#### **SPCE bit (Period Count Function Simultaneous Enable)**

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

#### **SPCD bit (Period Count Function Simultaneous Disable)**

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

## 21.3 Operation

### 21.3.1 Basic Operation

Each channel has a 32-bit and 16-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOcNA or GTIOcNB can be changed (n = 1, 2, 4, 5). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

### 21.3.1.1 Counter operation

#### (1) Counter start and stop

The counter of each channel starts the count operation when GTCR.CST is set to 1, and stops counting when the bit is set to 0. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register
- Completion of the period count function while the GTPC.ASTP bit is 1

#### (2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1, and the overflow interrupt(GPTn\_OVF) is also generated. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 21.3 shows an example of a periodic count operation in up-counting by the count clock.

**Figure 21.3** Example of periodic count operation in up-counting by the count clock

Table 21.5 shows an example for setting periodic count operation in up-counting by the count clock.

**Table 21.5** Example for setting a periodic count operation in up-counting by the count clock

| No. | Step Name                     | Description                                                                                                                                                                         |
|-----|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode            | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.3, 000b (saw-wave PWM mode) is set.                                                                                 |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.3, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                 |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.3, 0x00000000 is set.                                                                                                      |
| 6   | Start count operation         | Set the GTCR.CST bit to 1 to start count operation.                                                                                                                                 |

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1, and the underflow interrupt(GPTn\_UDF) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 21.4 shows an example of periodic count operation in down-counting by the count clock.

Figure 21.4 Example of periodic count operation in down-counting by the count clock

Table 21.6 shows an example for setting periodic count operation in down-counting by the count clock.

Table 21.6 Example for setting periodic count operation in down-counting by count clock

| No. | Step Name                     | Description                                                                                                                                                                 |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode            | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 21.4, 000b (saw-wave PWM mode) is set.                                                                      |
| 2   | Set count direction           | Select the count direction with the GTUDDTYC register.<br>In Figure 21.4, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                        |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                         |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 21.4, the GTPR register value is set.                                                                              |
| 6   | Start count operation         | Set the GTCR.CST bit to 1 to start count operation.<br>In Figure 21.4, 1 is set in the CST bit.                                                                             |

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

If you are using a hardware source to count up, set the GTCR.CST bit to 1 to enable the counting operation. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.5 shows an example of an event count operation in up-counting by a hardware resource (the rising edge of GTETRGA pin input).

**Figure 21.5 Example of event count operation in up-counting using hardware sources**

Table 21.7 shows an example for setting event count operation in up-counting by a hardware source.

**Table 21.7 Example for setting an event count operation in up-counting using hardware sources**

| No. | Step Name                     | Description                                                      |
|-----|-------------------------------|------------------------------------------------------------------|
| 1   | Set count source              | Select the counting-up hardware source with the GTUPSR register. |
| 2   | Set cycle                     | Set the cycle in the GTPR register.                              |
| 3   | Set initial value for counter | Set the initial value in the GTCNT counter.                      |
| 4   | Start count operation         | Set the GTCR.CST bit to 1 to start count operation.              |

**(5) Event count operation in down-counting using hardware sources**

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.6 shows an example of an event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

**Figure 21.6 Example of event count operation in down-counting using hardware sources**

Table 21.8 shows an example for setting a periodic count operation in down-counting using a hardware resource.

**Table 21.8 Example for setting an event count operation in down-counting using hardware sources**

| No. | Step Name                     | Description                                                        |
|-----|-------------------------------|--------------------------------------------------------------------|
| 1   | Set count source              | Select the counting-down hardware source with the GTDNSR register. |
| 2   | Set cycle                     | Set the cycle in the GTPR register.                                |
| 3   | Set initial value for counter | Set the initial value in the GTCNT counter.                        |
| 4   | Start count operation         | Set the GTCR.CST bit to 1 to start count operation.                |

### (6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

When the count direction flag is set as decrement (GTST.TCUF flag = 0) in saw-wave mode selected with GTCR.MD[2:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw-waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with PCLKD. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

### 21.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCnA or GTIOCnB output pin (n = 1, 2, 4, 5). In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the cycle end which is determined by GTPR.

The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

#### (1) Low output and high output

Figure 21.7 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCnA pin by a GTCCRA compare match, and low is output from the GTIOCnB pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.

Figure 21.7 Example of low output and high output operation

Table 21.9 shows an example for setting low output and high output operation.

Table 21.9 Example for setting low output and high output operation (1 of 2)

| No. | Step Name                     | Description                                                                                                                                                                            |

| 1   | Set operating mode            | Set the operating mode with the GTCR.MD[2:0] bits.<br>In Figure 21.7, 000b (saw-wave PWM mode) is set.                                                                                 |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 21.7, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                   |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                    |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.                                                                                                                                            |

**Table 21.9 Example for setting low output and high output operation (2 of 2)**

| No. | Step Name                 | Description                                                                                                                                                            |
|-----|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6   | Set GTIOCnm pin function  | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In <a href="#">Figure 21.7</a> , GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b. |
| 7   | Enable GTIOCnm pin output | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.                                                                                  |
| 8   | Set compare match value   | Set compare match values in the GTCCRA and GTCCRB registers.                                                                                                           |
| 9   | Start count operation     | Set the GTCR.CST bit to 1 to start count operation.                                                                                                                    |

Note: n: 1, 2, 4, 5  
m: A, B

(2) Toggled output

[Figure 21.8](#) and [Figure 21.9](#) show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In [Figure 21.8](#), the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a GTCCRA compare match and GTIOCnB pin output by a GTCCRB compare match are toggled.

In [Figure 21.9](#), the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOCnA pin output level and a cycle end toggles the GTIOCnB pin output level.

**Figure 21.8 Example of toggled output operation (1)**

**Figure 21.9 Example of toggled output operation (2)**

Table 21.10 shows an example for setting toggled output operation.

**Table 21.10 Example for setting toggled output operation**

| No. | Step Name                     | Description                                                                                                                                                                                                            |

### 21.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 21.10 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOcNA input pin and to GTCCRB on the rising edge of the GTIOcNB input pin.

**Figure 21.10 Example of input capture operation**

Table 21.11 and Table 21.14 show the example for setting an input capture operation with count operation by the count clock.

**Table 21.11 Example for setting input capture operation**

| No. | Step Name                     | Description                                                                                                                                                                          |
|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode            | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.10, 000b (saw-wave PWM mode) is set.                                                                                 |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.10, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                 |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                  |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.                                                                                                                                          |
| 6   | Select input capture source   | Select the input capture source in the GTICASR and GTICBSR registers. In Figure 21.10, GTICASR = 0x00000F00, GTICBSR = 0x00003000.                                                   |
| 7   | Start count operation         | Set the GTCR.CST bit to 1 to start count operation.                                                                                                                                  |

### 21.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR and GTPBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF

#### 21.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR.

The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 1, 2, 4, 5).

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

Figure 21.11 to Figure 21.13 show examples of GTPR buffer operation and Table 21.12 shows an example for setting GTPR buffer operation.

Figure 21.11 Example of GTPR buffer operation with saw waves in up-counting

Figure 21.12 Example of GTPR buffer operation with saw waves in down-counting

Figure 21.13 Example of GTPR buffer operation with triangle waves

Table 21.12 Example for setting GTPR register buffer operation

| No. | Step Name                       | Description                                                                                                                                                                                                                                                                                             |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode              | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.11 and Figure 21.12, 000b (saw-wave PWM mode) is set, and in Figure 21.13, 100b (triangle-wave PWM mode 1) is set.                                                                                                                      |
| 2   | Set count direction             | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.11, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.12, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3   | Select count clock              | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                                                                                                                                    |
| 4   | Set cycle                       | Set the cycle in the GTPR register.                                                                                                                                                                                                                                                                     |
| 5   | Set initial value for counter   | Set the initial value in the GTCNT counter.                                                                                                                                                                                                                                                             |
| 6   | Set buffer operation            | Set buffer operation with the GTBER.PR[1:0] bits. In Figure 21.11, Figure 21.12, and Figure 21.13, PR[1:0] = 01b.                                                                                                                                                                                       |
| 7   | Set buffer value                | For buffer operation, set a value in one cycle after the current cycle in the GTPBR register.                                                                                                                                                                                                           |
| 8   | Start count operation           | Set the GTCR.CST bit to 1 to start count operation.                                                                                                                                                                                                                                                     |
| 9   | Set buffer value for each cycle | For buffer operation, set a value in one cycle after the current cycle in the GTPBR register.                                                                                                                                                                                                           |

### 21.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

#### (1) When GTCCRA or GTCCRB Functions as Output Compare Register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow  
Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear

In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in [section 21.3.2.1. GTPR Register Buffer Operation](#).

In triangle-wave mode, buffer transfer is not performed by the counter clear.

- Forcible buffer transfer

When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode.

Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

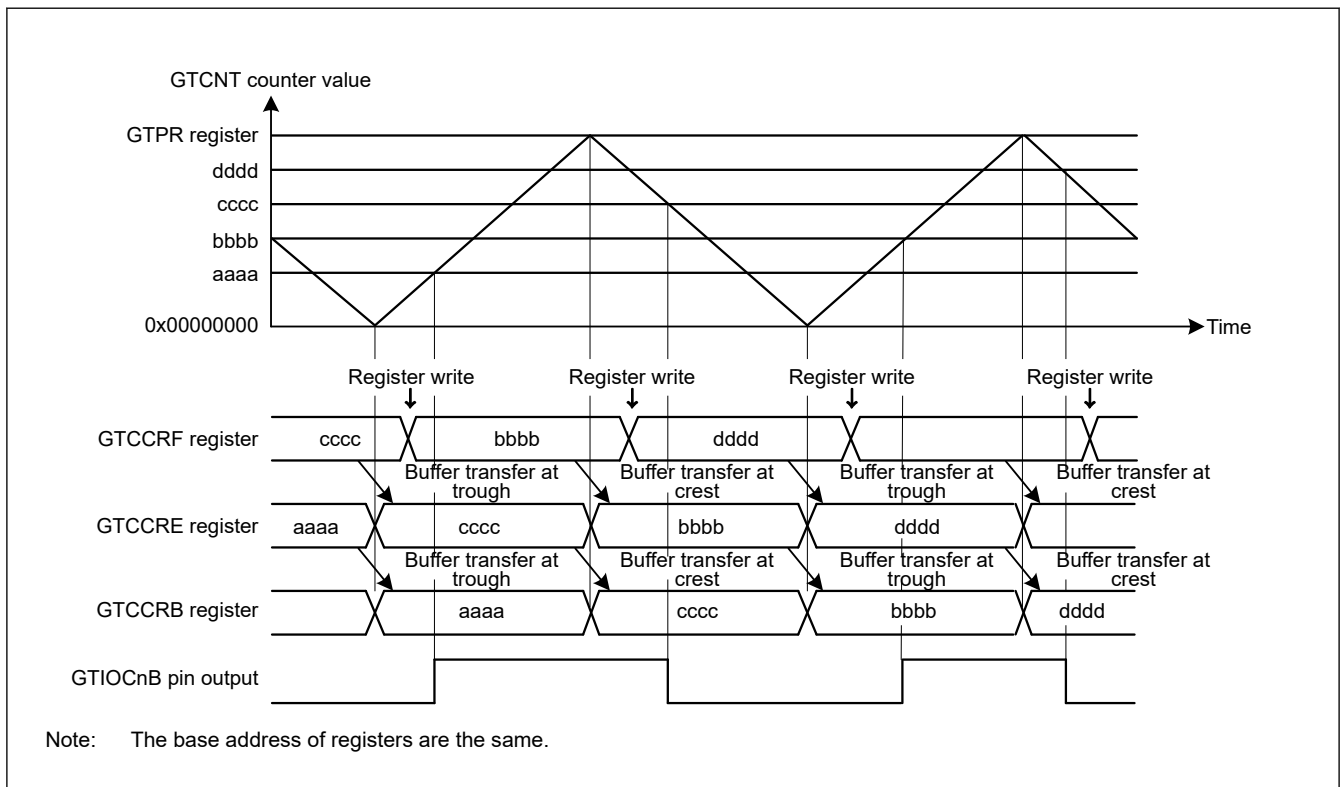

[Figure 21.14](#) to [Figure 21.16](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.13](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

**Figure 21.14** Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

**Figure 21.15** Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

**Figure 21.16** Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

**Table 21.13 Example for setting GTCCRA and GTCCRB buffer operation for output compare**

## (2) When GTCCRA or GTCCRB Functions as Input Capture Register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

[Figure 21.17](#) and [Figure 21.18](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.14](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

**Figure 21.17** Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOCnA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnA input

**Figure 21.18** Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOCnB input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnB input

**Table 21.14 Example for setting GTCCRA and GTCCRB buffer operation for input capture**

### 21.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCnA or GTIOCnB pin (n = 1, 2, 4, 5) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR and GTDVU, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

#### 21.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 1, 2, 4, 5) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

[Figure 21.19](#) shows an example of saw-wave PWM mode operation, and [Table 21.15](#) shows an example for setting saw-wave PWM mode.

**Figure 21.19** Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

**Table 21.15** Example for setting saw-wave PWM mode (1 of 2)

| No. | Step Name                     | Description                                                                                                                                                                                           |
|-----|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode            | Set the operating mode with the GTCR.MD[2:0] bits. In <a href="#">Figure 21.19</a> , 000b (saw-wave PWM mode) is set.                                                                                 |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register. In <a href="#">Figure 21.19</a> , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                                  |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                                   |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.                                                                                                                                                           |

### 21.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 1, 2, 4, 5) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.20 shows an example of saw-wave one-shot pulse mode operation, and Table 21.16 shows an example for setting saw-wave one-shot pulse mode.

**Figure 21.20** Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end

**Table 21.16 Example setting for saw-wave one-shot pulse mode**

### 21.3.3.3 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOcnA or GTIOcnB pin (n = 1, 2, 4, 5) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 21.21](#) shows an example of a triangle-wave PWM mode 1 operation, and [Table 21.17](#) shows an example for setting a triangle-wave PWM mode 1.

**Figure 21.21** Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB register compare match, and output retained at cycle end

#### 21.3.3.4 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCN<sub>A</sub> or GTIOCN<sub>B</sub> pin (n = 1, 2, 4, 5) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 21.22](#) shows an example of triangle-wave PWM mode 2 operation, and [Table 21.18](#) shows an example for setting triangle-wave PWM mode 2.

**Figure 21.22** Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOcNA pin and high output from the GTIOcNB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end

m: A, B

### 21.3.3.5 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 1, 2, 4, 5) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.23 shows an example of triangle-wave PWM mode 3 operation, and Table 21.19 shows an example for setting triangle-wave PWM mode 3.

**Figure 21.23 Example of triangle-wave PWM mode 3 operation with low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end**

### 21.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time value (GTDVU value) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time for the changing point of a negative waveform is set in the GTDVU register.

Writing to GTCCRB is prohibited when the automatic dead time setting function is used. Dead time setting beyond the cycle is also prohibited. Values for automatic dead time setting can be read from GTCCRB.

When a dead time error occurs, the compare match values for positive and negative waveforms are adjusted to generate the waveforms with the dead time as shown in [Table 21.20](#).

The adjusted value for the negative waveform is set for GTCCRB automatically.

The adjusted value for the positive waveform is used as internal signal and not set for GTCCRA.

In saw-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

The automatic dead time value setting to GTCCRB is performed at the next clock cycle count when registers that are used for calculating the automatic dead time value are updated. In triangle-wave mode, it also can be done at the next count clock from the current crest.

**Table 21.20 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs (1 of 2)**

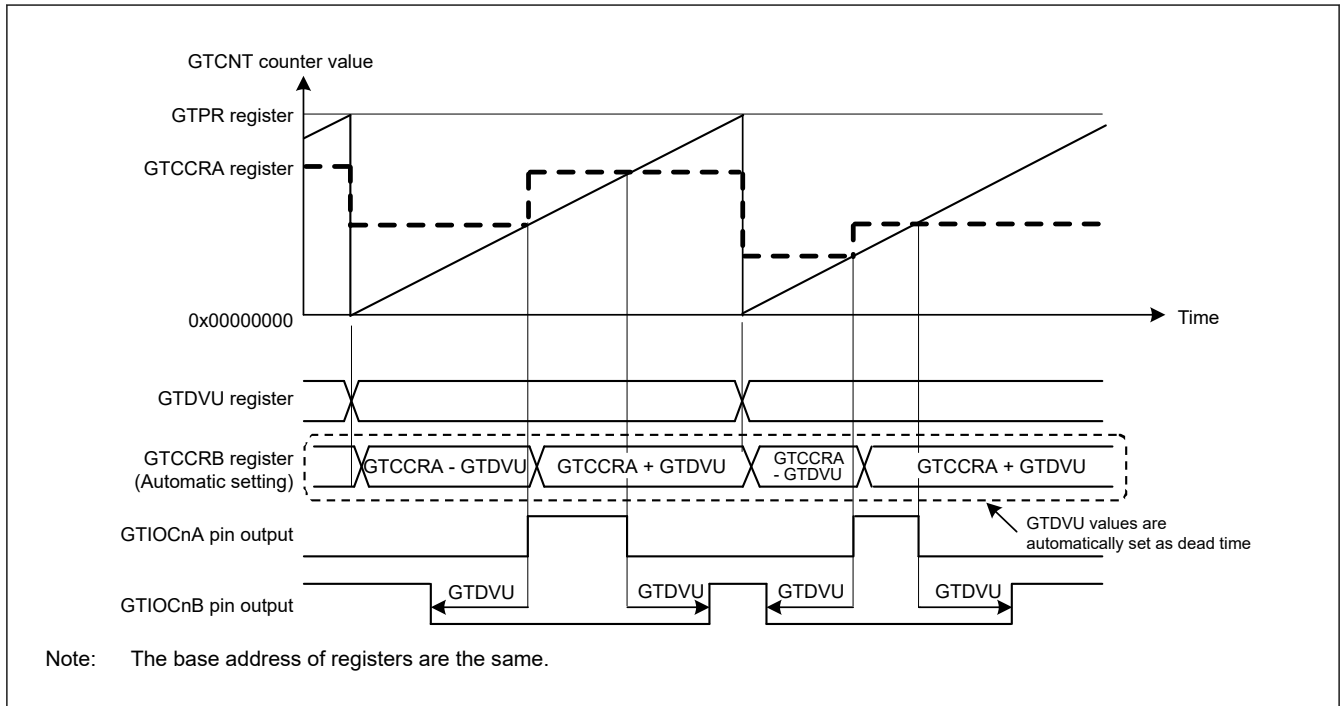

| Mode                              | Count Direction | Period      | Condition for Dead Time Error | Change Point of the Positive-Phase Waveform after Adjustment | Change Point of the Negative-Phase Waveform after Adjustment |
|-----------------------------------|-----------------|-------------|-------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|
| Sawtooth-wave one-shot pulse mode | Up-counting     | First half  | $GTCCRA - GTDVU < 0$          | GTDVU                                                        | 0                                                            |
|                                   |                 | Second half | $GTCCRA + GTDVU > GTPR$       | $GTPR - GTDVU$                                               | GTPR                                                         |
|                                   | Down-counting   | First half  | $GTCCRA + GTDVU > GTPR$       | $GTPR - GTDVU$                                               | GTPR                                                         |
|                                   |                 | Second half | $GTCCRA - GTDVU < 0$          | GTDVU                                                        | 0                                                            |

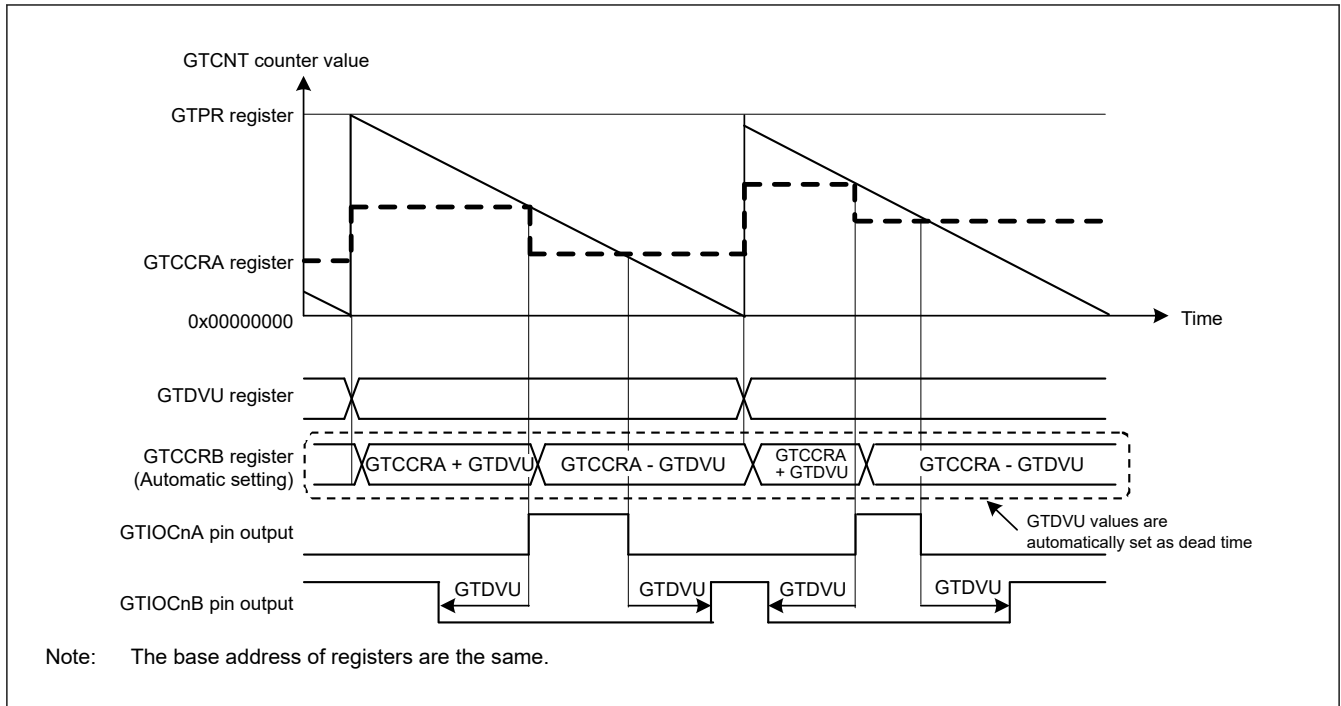

**Table 21.20 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs (2 of 2)**

| Mode                         | Count Direction | Period        | Condition for Dead Time Error | Change Point of the Positive-Phase Waveform after Adjustment | Change Point of the Negative-Phase Waveform after Adjustment |
|------------------------------|-----------------|---------------|-------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|
| Triangle-wave PWM mode 1/2/3 | Up-counting     | (First half)  | $GTCCRA - GTDVU \leq 0$       | $GTDTVU + 1$                                                 | 1                                                            |
|                              | Down-counting   | (Second half) | $GTCCRA - GTDVU < 0$          | $GTDTVU$                                                     | 0                                                            |

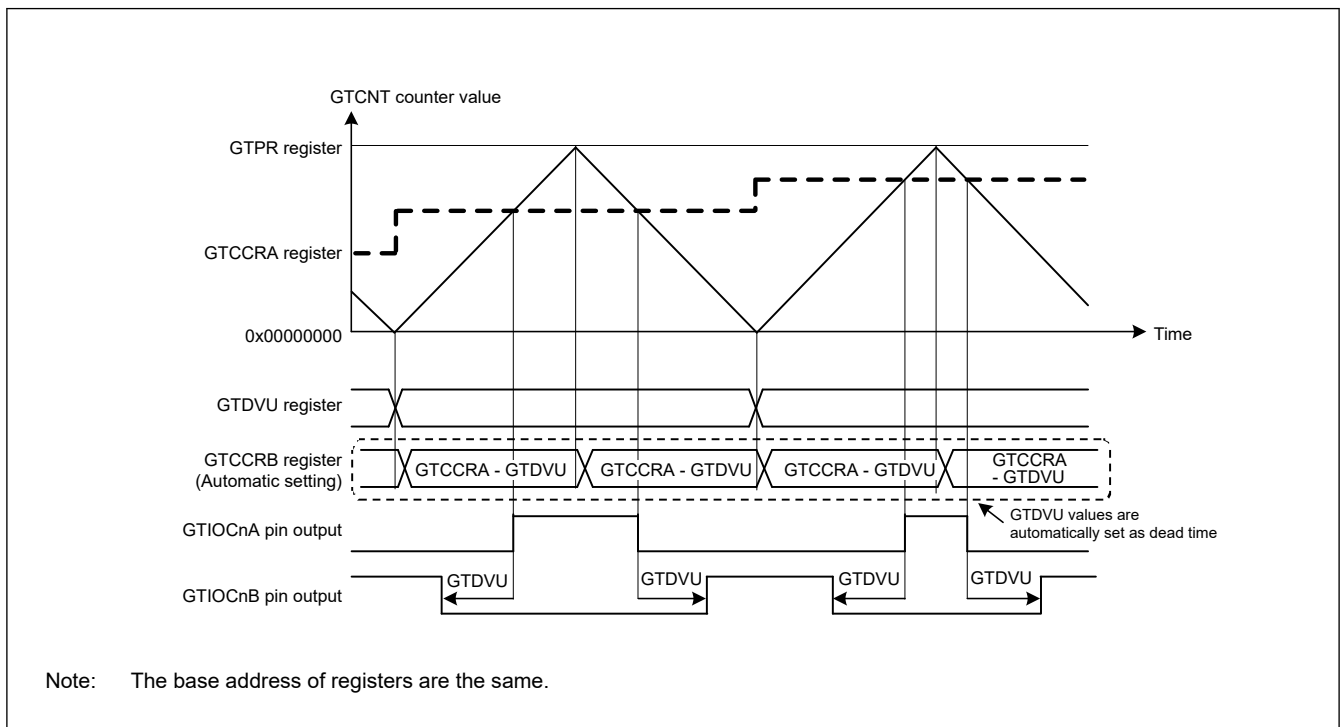

Figure 21.24 to Figure 21.27 show examples of automatic dead time setting function operation. Table 21.21 and Table 21.22 show the setting examples.

| 1   | Set operating mode                             | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.24 and Figure 21.25, 001b (saw-wave one-shot pulse mode) is set. In Figure 21.27, 110b (triangle-wave PWM mode 3) is set.                                                   |
| 2   | Set count direction                            | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.24, 01b is set after 11b is set in the GTUDDTYC[1:0] bits (up count). In Figure 21.25, 00b is set after 10b is set in the GTUDDTYC[1:0] bits (down count). |
| 3   | Select count clock                             | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                                                                        |
| 4   | Set cycle                                      | Set the cycle in the GTPR register.                                                                                                                                                                                                         |
| 5   | Set initial value for counter                  | Set the initial value in the GTCNT counter.                                                                                                                                                                                                 |
| 6   | Set GTIOCnm pin function                       | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.24, Figure 21.25, and Figure 21.27, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.                                                   |
| 7   | Enable GTIOCnm pin output                      | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.                                                                                                                                                       |
| 8   | Set buffer value for compare match             | Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers.                                                                                                                                        |
| 9   | Set forcible buffer transfer for compare match | Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly to the GTCCRA register.                                                                                                                                             |
| 10  | Set buffer value for compare match             | Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers.                                                                                                                                       |
| 11  | Set automatic dead time setting function       | Set the GTDTCR.TDE bit to 1 to enable the automatic dead time setting function.                                                                                                                                                             |
| 12  | Set dead time value                            | Set the dead time value in the GTDVU register.                                                                                                                                                                                              |
| 13  | Start count operation                          | Set the GTCR.CST bit to 1 to start count operation.                                                                                                                                                                                         |
| 14  | Set buffer value for each cycle                | For buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers.                                                                                                                 |

**Table 21.22 Example setting for automatic dead time setting function in triangle-wave PWM mode 1 or 2**

| No. | Step Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode                       | Set the operating mode with the GTCR.MD[2:0] bits. In <a href="#">Figure 21.26</a> , 100b (triangle-wave PWM mode 1) is set. In <a href="#">Figure 21.27</a> , 101b (triangle-wave PWM mode 2) is set.                                                                                                                                                                                                                                         |
| 2   | Select count clock                       | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                                                                                                                                                                                                                                                                           |
| 3   | Set cycle                                | Set the cycle in the GTPR register.                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4   | Set initial value for counter            | Set the initial value in the GTCNT counter.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 5   | Set GTIOCnm pin function                 | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In <a href="#">Figure 21.26</a> and <a href="#">Figure 21.27</a> , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.                                                                                                                                                                                                                                    |
| 6   | Enable GTIOCnm pin output                | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.                                                                                                                                                                                                                                                                                                                                                          |
| 7   | Set buffer operation for compare match   | Set buffer operation with the CCRA[1:0] bits in the GTBER register.                                                                                                                                                                                                                                                                                                                                                                            |
| 8   | Set compare match value                  | Set the GTIOCnA pin transition in the GTCCRA register.                                                                                                                                                                                                                                                                                                                                                                                         |
| 9   | Set buffer value for compare match       | For buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffer operation, also set the GTIOCnA pin transition in 2 cycles after the current cycle (in triangle-wave PWM mode 1) or 1 cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD registers. |
| 10  | Set automatic dead time setting function | Set the GTDTCR.TDE bit to 1 to enable the automatic dead time setting function.                                                                                                                                                                                                                                                                                                                                                                |
| 11  | Set dead time value                      | Set the dead time value in the GTDVU register.                                                                                                                                                                                                                                                                                                                                                                                                 |
| 12  | Start count operation                    | Set the GTCR.CST bit to 1 to start count operation.                                                                                                                                                                                                                                                                                                                                                                                            |
| 13  | Set buffer value for each cycle          | When the compare match register is used for buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC.                                                                                                                                                                                                   |

### 21.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value after the start of down-counting is reflected in the count cycle during down-counting.

[Figure 21.28](#) shows an example of count direction changing function operation.

**Figure 21.28 Example of a count direction changing function operation during buffer operation**

### 21.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCnA pin and the GTIOCnB pin (n = 1, 2, 4, 5) are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0% or 100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCnA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 21.23 shows the values of GTIOCnA and GTIOCnB pin output at cycle end.

**Table 21.23 Output values after releasing 0% or 100% duty setting (m = A, B)**

| GTIOR.GTIOm[3:2]                     | Compare match value at cycle end masked by 0% or 100% duty setting | GTUDDTYC.OmDTYR in duty 0% setting |   | GTUDDTYC.OmDTYR in duty 100% setting |   |

| 01<br>(low output at cycle end)      | —                                                                  | 0                                  | 0 | 0                                    | 0 |
| 10<br>(high output at cycle end)     | —                                                                  | 1                                  | 1 | 1                                    | 1 |
| 11<br>(output toggled at cycle end)  | 0                                                                  | 1                                  | 1 | 0                                    | 1 |
|                                      | 1                                                                  | 1                                  | 0 | 0                                    | 0 |

Figure 21.29 shows an example of output duty 0% and 100% function.

**Figure 21.29 Example of output duty 0% and 100% function**

### 21.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 1, 2, 4, 5).

### 21.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 21.30 shows an example of a count start operation by a hardware source. Table 21.24 shows the setting example.

**Figure 21.30 Example of count start operation by a hardware source started at the input of the signal from the ELC\_GPTA event**

**Table 21.24 Example setting for count start operation by a hardware source**

| No. | Step Name                     | Description                                                                                                                                                                             |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register.<br>In Figure 21.30, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                    |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                     |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 21.30, 0x00000000 is set.                                                                                                      |
| 6   | Set hardware count start      | Select a hardware source for starting count operation in the GTSSR register.<br>In Figure 21.30, GTSSR.SSELCA = 1                                                                       |
| 7   | Set hardware source operation | Set operation of the hardware source selected by the GTSSR register and start counting.<br>In Figure 21.30, the ELC_GPTA event input operation is set.                                  |

### 21.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 21.31 shows an example of a count stop operation by a hardware source. Table 21.25 shows the setting example. In this example, the count operation stops at the ELC\_GPTA event input and restarts at the ELC\_GPTB event input.

**Figure 21.31 Example of count stop operation by hardware source started by software, stopped at ELC\_GPTA input, and restarted at ELC\_GPTB input**

**Table 21.25 Example setting for count stop operation by a hardware source**

| No. | Step Name                     | Description                                                                                                                                                                                                     |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode            | Set the operating mode with GTCR.MD[2:0] bits.<br>In <a href="#">Figure 21.31</a> , 000b (saw-wave PWM mode) is set.                                                                                            |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register.<br>In <a href="#">Figure 21.31</a> , after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).                          |
| 3   | Select count clock            | Select the count clock with GTCR.TPCS[3:0].                                                                                                                                                                     |
| 4   | Set cycle                     | Set the cycle in GTPR.                                                                                                                                                                                          |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In <a href="#">Figure 21.31</a> , 0x00000000 is set.                                                                                                             |
| 6   | Set hardware count start      | Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In <a href="#">Figure 21.31</a> , GTSSR.SSELCB = 1.                                   |
| 7   | Set hardware count stop       | Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In <a href="#">Figure 21.31</a> , GTPSR.PSELCA = 1.                                     |
| 8   | Set hardware source operation | Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In <a href="#">Figure 21.31</a> , ELC_GPTA input operation and ELC_GPTB input operation are set. |

[Figure 21.32](#) shows an example of a count start/stop operation by a hardware source. [Table 21.26](#) shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

**Figure 21.32** Example of count start/stop operation by a hardware source started on the rising edge of GTETRGA pin input, and stopped on the falling edge of GTETRGA pin input

**Table 21.26** Example setting for count start/stop operation by a hardware source

| No. | Step Name                     | Description                                                                                                                                                                          |
|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Set operating mode            | Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.32, 000b (saw-wave PWM mode) is set.                                                                                 |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.32, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3   | Select count clock            | Select the count clock with the GTCR.TPCS[3:0] bits.                                                                                                                                 |
| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                  |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.32, 0x00000000 is set.                                                                                                      |
| 6   | Set hardware count start      | Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.32, GTSSR.SSGTRGAR = 1.                 |
| 7   | Set hardware count stop       | Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.32, GTPSR.PSGTRGAF = 1.                  |
| 8   | Set hardware source operation | Set operation of the hardware source selected in the GTSSR register or GTPSR register and start or stop counting. In Figure 21.32, the GTETRGA pin operation is set.                 |

### 21.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPTn\_OVF/GPTn\_UDF (n = 1, 2, 4, 5) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 21.33 and Figure 21.34 show examples of the GTCNT counter clearing operation by a hardware source. Table 21.27 shows the setting example. In this example, the GTCNT counter starts at the ELC\_GPTA input, and the counter stops and clears at the ELC\_GPTB input.

**Figure 21.33** Examples of count clearing operation by hardware source in saw wave up-counting, started at ELC\_GPTA input, and stopped/cleared at ELC\_GPTB input

**Figure 21.34** Examples of count clearing operation by hardware source in saw wave down-counting, started at ELC\_GPTA input, and stopped/cleared at ELC\_GPTB input

| 4   | Set cycle                     | Set the cycle in the GTPR register.                                                                                                                                                                                          |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 21.33, 0x00000000 is set. In Figure 21.34, the GTPR register value is set.                                                                                          |
| 6   | Set hardware count start      | Select a hardware source for starting count operation in the GTSSR register, and wait for count start by the hardware source. In Figure 21.33 and Figure 21.34, GTSSR.SSELCA = 1.                                            |
| 7   | Set hardware count stop       | Select a hardware source for stopping count operation in the GTPSR register, and wait for count stop by the hardware source. In Figure 21.33 and Figure 21.34, GTPSR.PSELCB = 1.                                             |
| 8   | Set hardware count clear      | Select a hardware source for clearing count operation in the GTCSR register, and wait for count clear by the hardware source. In Figure 21.33 and Figure 21.34, GTCSR.CSELCB = 1.                                            |
| 9   | Set hardware source operation | Set operation of the hardware source selected in the GTSSR register, GTPSR register or GTCSR register and start, stop or clear counting.<br>In Figure 21.33 and Figure 21.34, the ELC_GPTA input and ELC_GPTB input are set. |

The GPTn\_OVF/GPTn\_UDF (n = 1, 2, 4, 5) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 21.35 shows the relationship between the counter clearing by a hardware source and the GPTn\_OVF (n = 1, 2, 4, 5) interrupt.

**Figure 21.35 Relationship between counter clearing by hardware source and GPTn\_OVF (n = 1, 2, 4, 5) interrupt**

### 21.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

#### 21.3.8.1 Synchronized Operation by Software

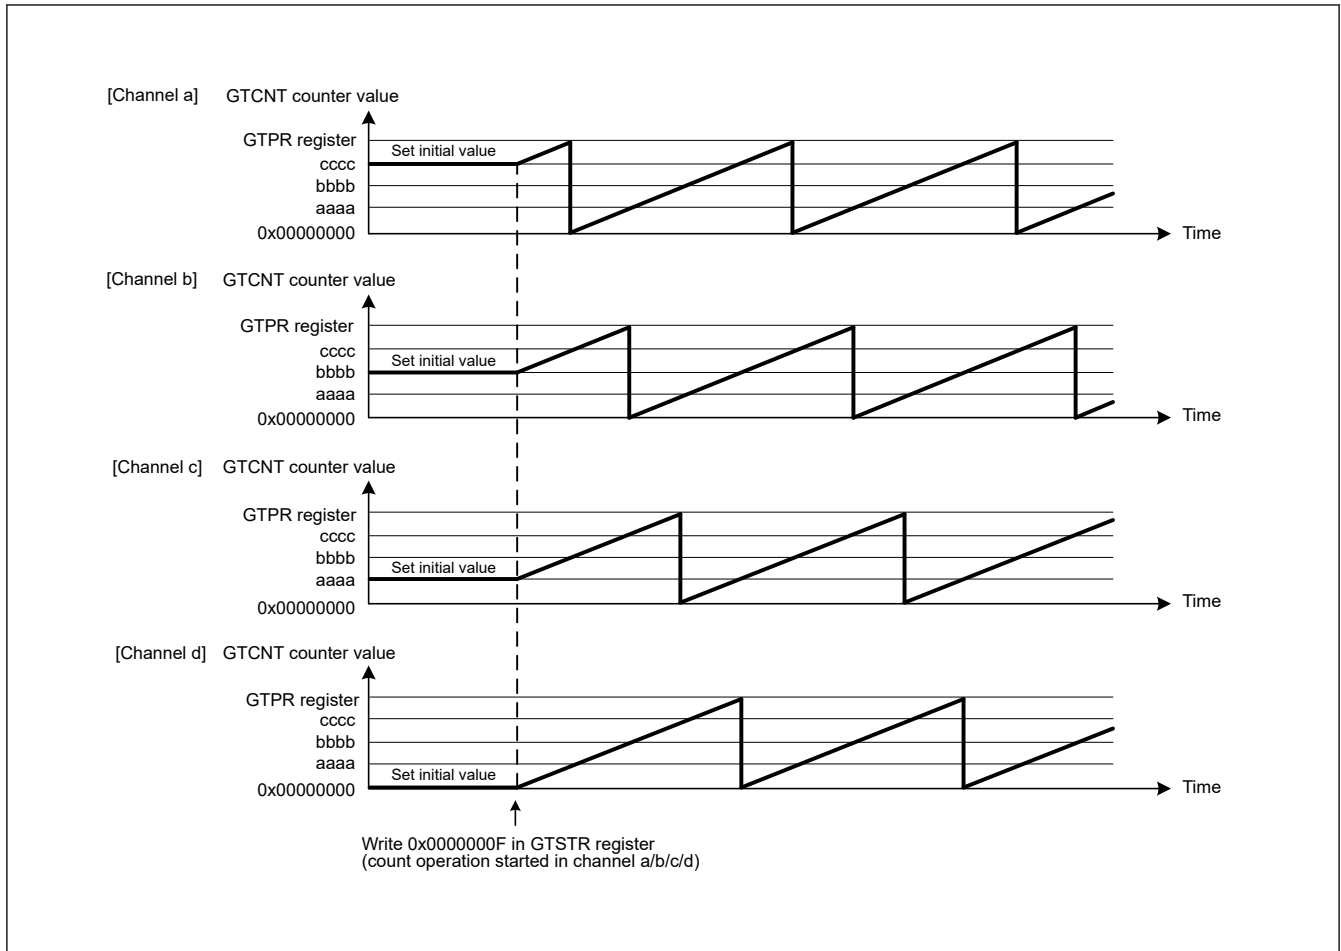

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Figure 21.36 shows an example of a simultaneous start, stop, and clear by software. Figure 21.37 shows an example of phase start operation by software.

**Figure 21.36** Example of a simultaneous start, stop, and clear by software with the same count cycle (GTPR register value)

**Figure 21.37** Example of software phase start with the same count cycle (GTPR register value)

### 21.3.8.2 Synchronized Operation by Hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by the following hardware sources. Hardware sources that can cause a synchronized operation are external trigger input and ELC event input. Synchronized operation through the GTIOCnA and GTIOCnB pin inputs is possible by setting an ELC event due to input capture as a hardware source (n = 1, 2, 4, 5).

Figure 21.38 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Table 21.28 shows the setting example.

**Figure 21.38 Example of a simultaneous start, stop, and clear by a hardware source with the same count cycle (GTPR register value)**

**Table 21.28 Example setting for simultaneous start by a hardware source (1 of 2)**

| No. | Step Name                     | Description                                                                                                                                                                             |

### 21.3.9 PWM Output Operation Examples

#### (1) Synchronized PWM output

The GPT outputs  $4 \times 2$  phases of linked PWM waveforms for a maximum of  $GPT \times 4$  channels.

[Figure 21.39](#) shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

**Figure 21.39 Example of synchronized PWM output**

(2) 3-phase saw-wave complementary PWM output

Figure 21.40 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOc<sub>n</sub>A pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOc<sub>n</sub>B pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

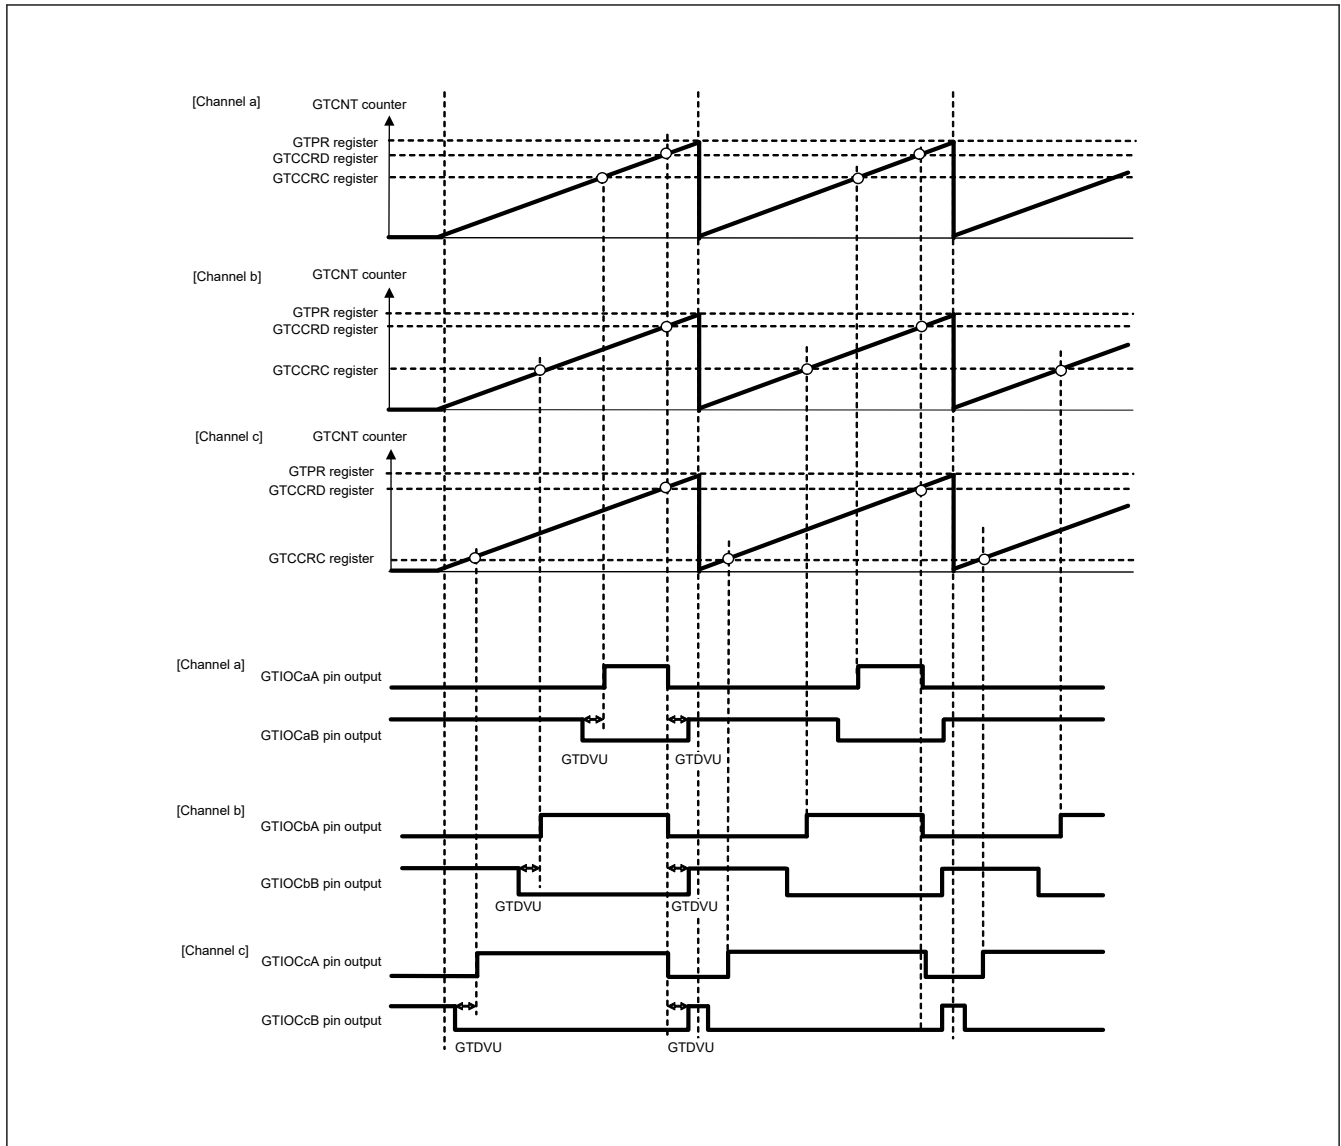

**Figure 21.40 Example of 3-phase saw-wave complementary PWM output**

(3) 3-phase saw-wave complementary PWM output with automatic dead time setting

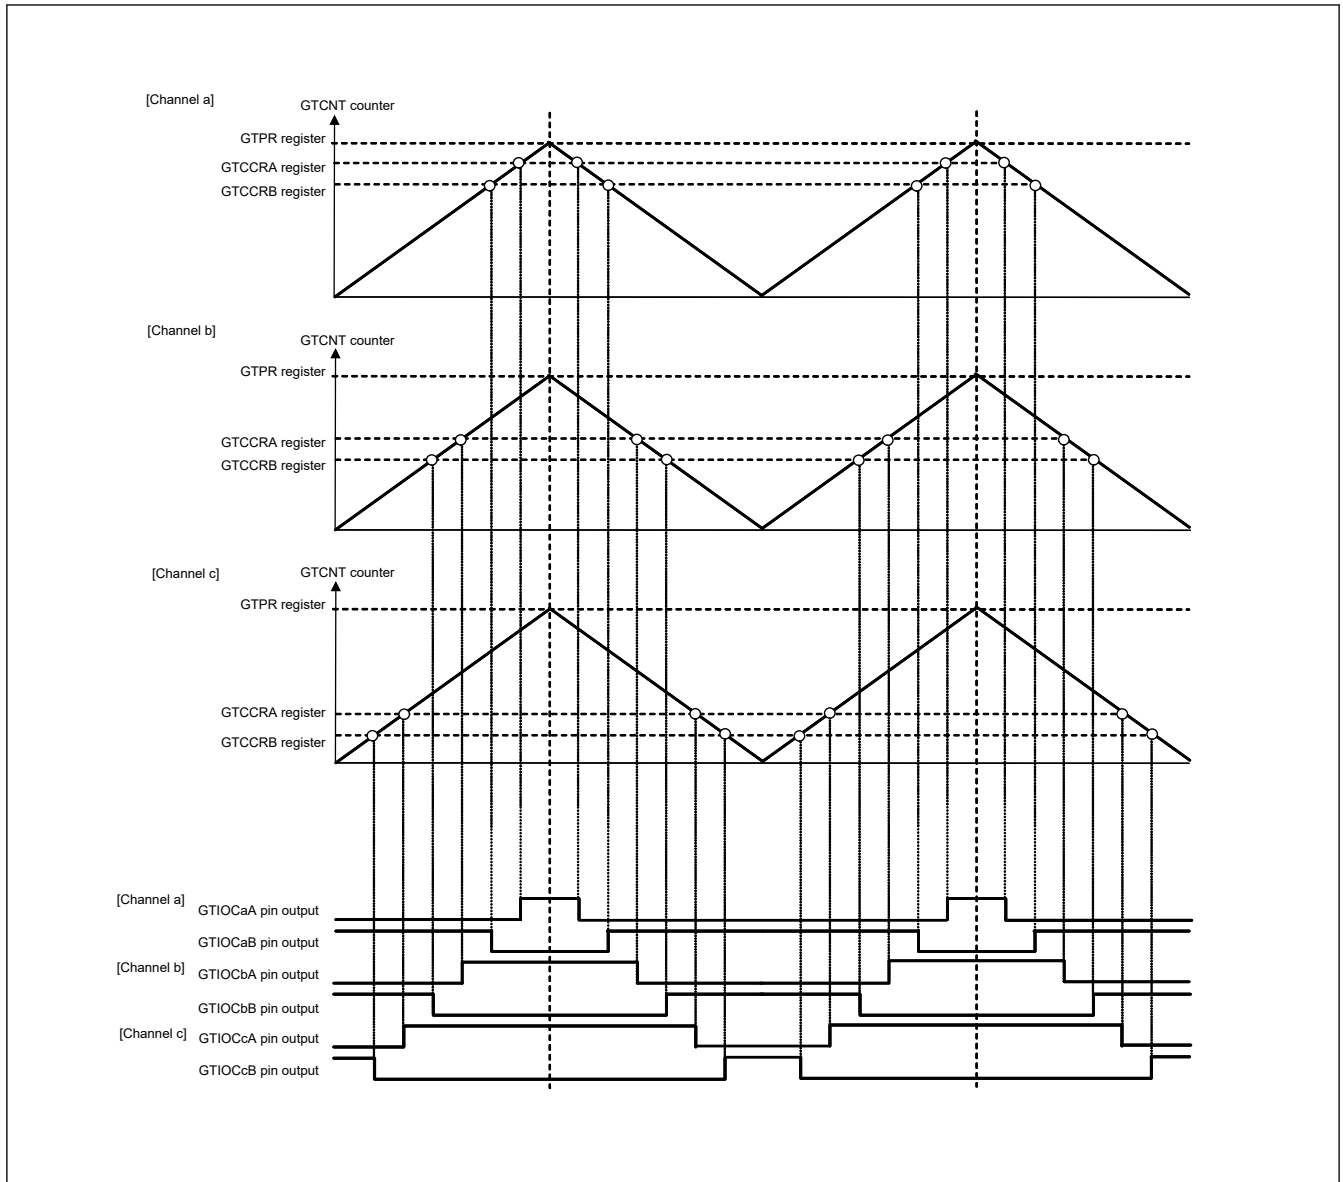

Figure 21.41 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOcNA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOcNB pin is set so that it outputs high as the initial value, toggles the output at a GTIOcNB compare match, and retains the output at the cycle end.

**Figure 21.41 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting**

(4) 3-phase triangle-wave complementary PWM output

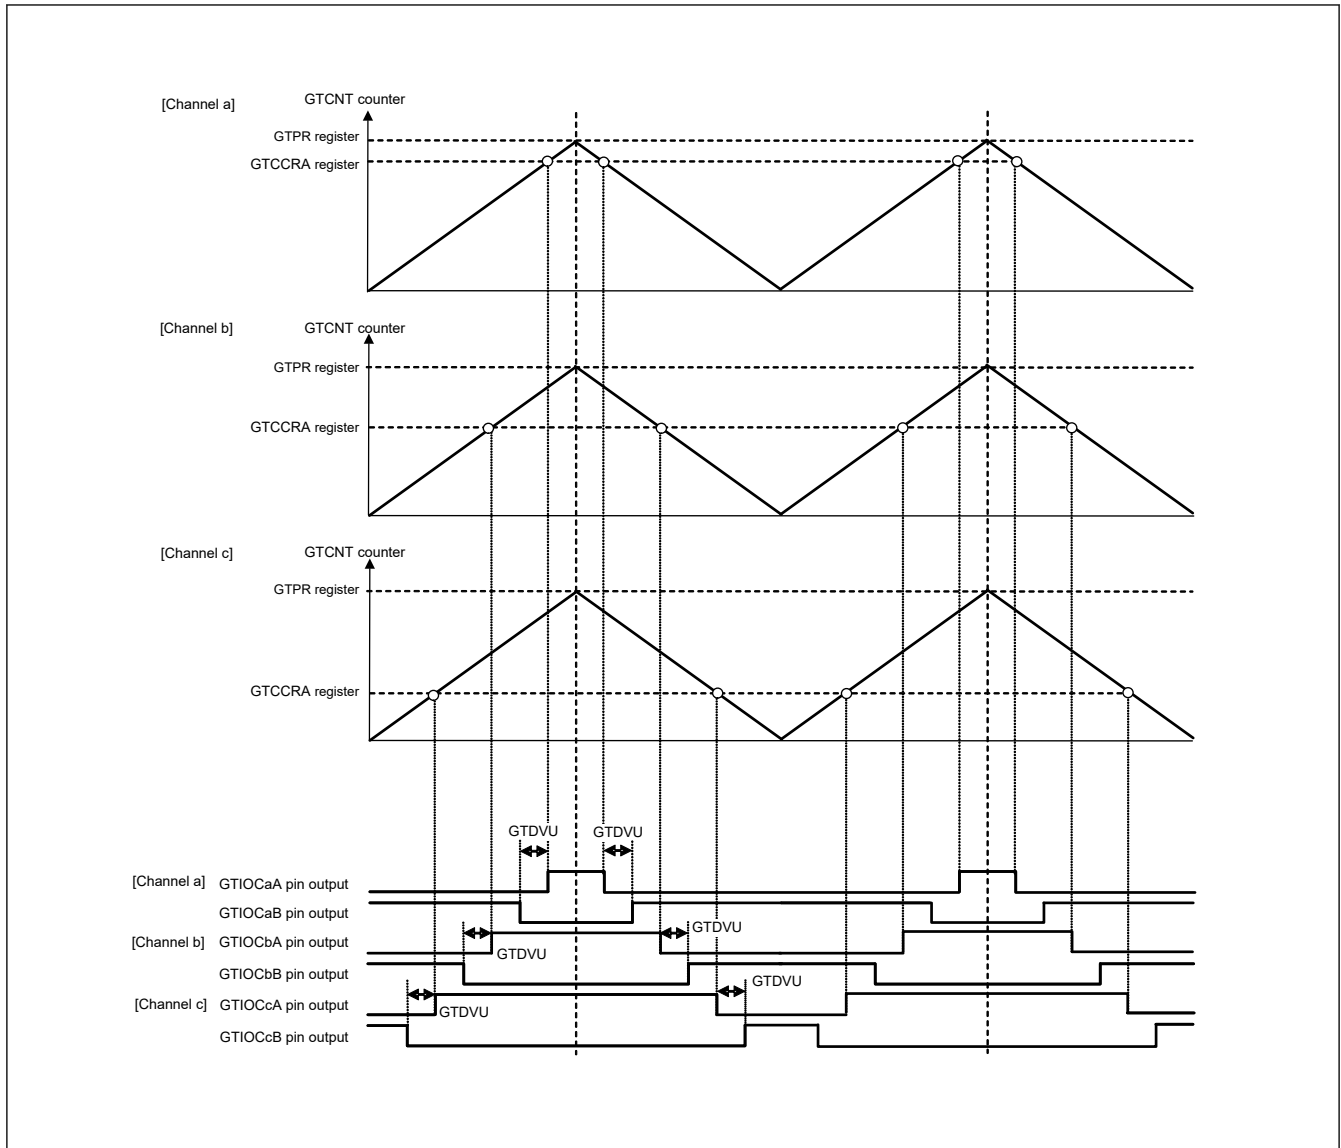

Figure 21.42 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 21.42 Example of 3-phase triangle-wave complementary PWM output**

(5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

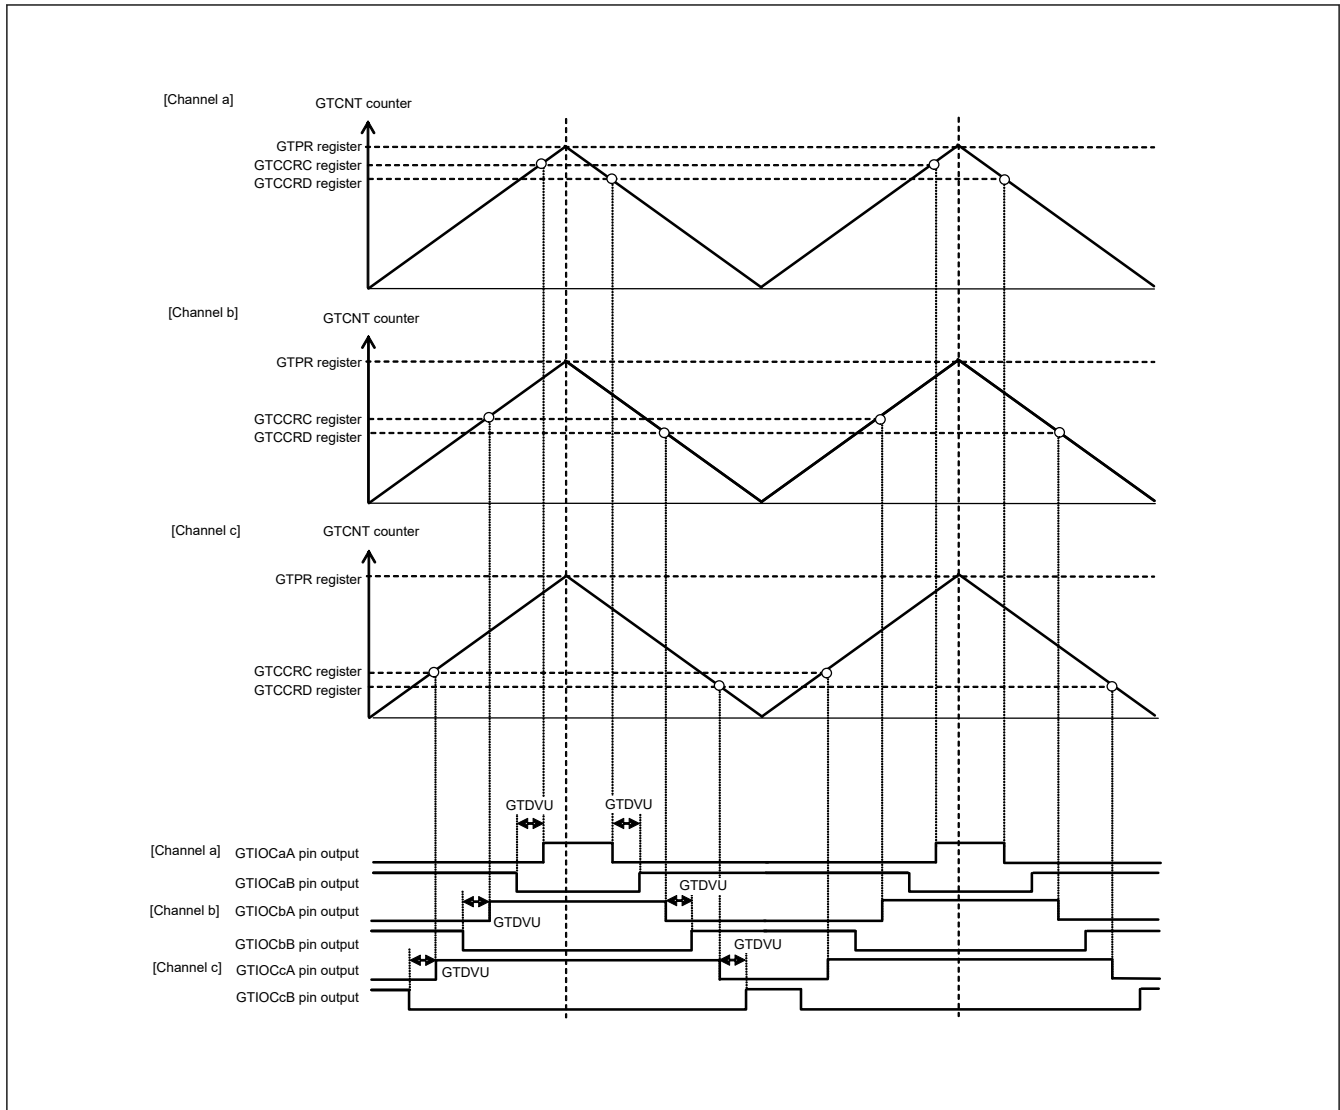

Figure 21.43 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 21.43 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting**

(6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 21.44 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOcNA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOcNB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

**Figure 21.44 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting**

### 21.3.10 Period Count Function

By setting the GTPC register, the end of period can be counted.

The number of period to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of period. When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped to finish the period count function. At that time, the GTST.PCF flag is set, and the period count function finish interrupt request GPTn\_PC is generated. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the period count function is finished.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the period count function for multiple channels.

Figure 21.45 and Figure 21.46 show examples of PWM cycle count function.

**Figure 21.45 Example of PWM cycle count function (saw-wave one-shot pulse mode)**

**Figure 21.46 Example of the timing of operations for PWM cycle count function (saw-wave one-shot pulse mode, up-counting)**

### 21.3.11 Phase Counting Function

The phase difference between the GTIOcNA and GTIOcNB pin ( $n = 1, 2, 4, 5$ ) inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOcNA and GTIOcNB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see [section 21.3.1.1. Counter operation](#).

[Figure 21.47](#) to [Figure 21.56](#) show an example of phase counting modes 1 to 5 operation when the GTIOcNA, GTIOcNB pins are used. [Table 21.29](#) to [Table 21.38](#) show conditions of up-counting or down-counting and list settings for the GTUPSR and GTDNSR registers which is corresponding to [Figure 21.47](#) to [Figure 21.56](#).

### 21.3.12 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

Figure 21.57 shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal ( $C = A$  or  $D = B$ ) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

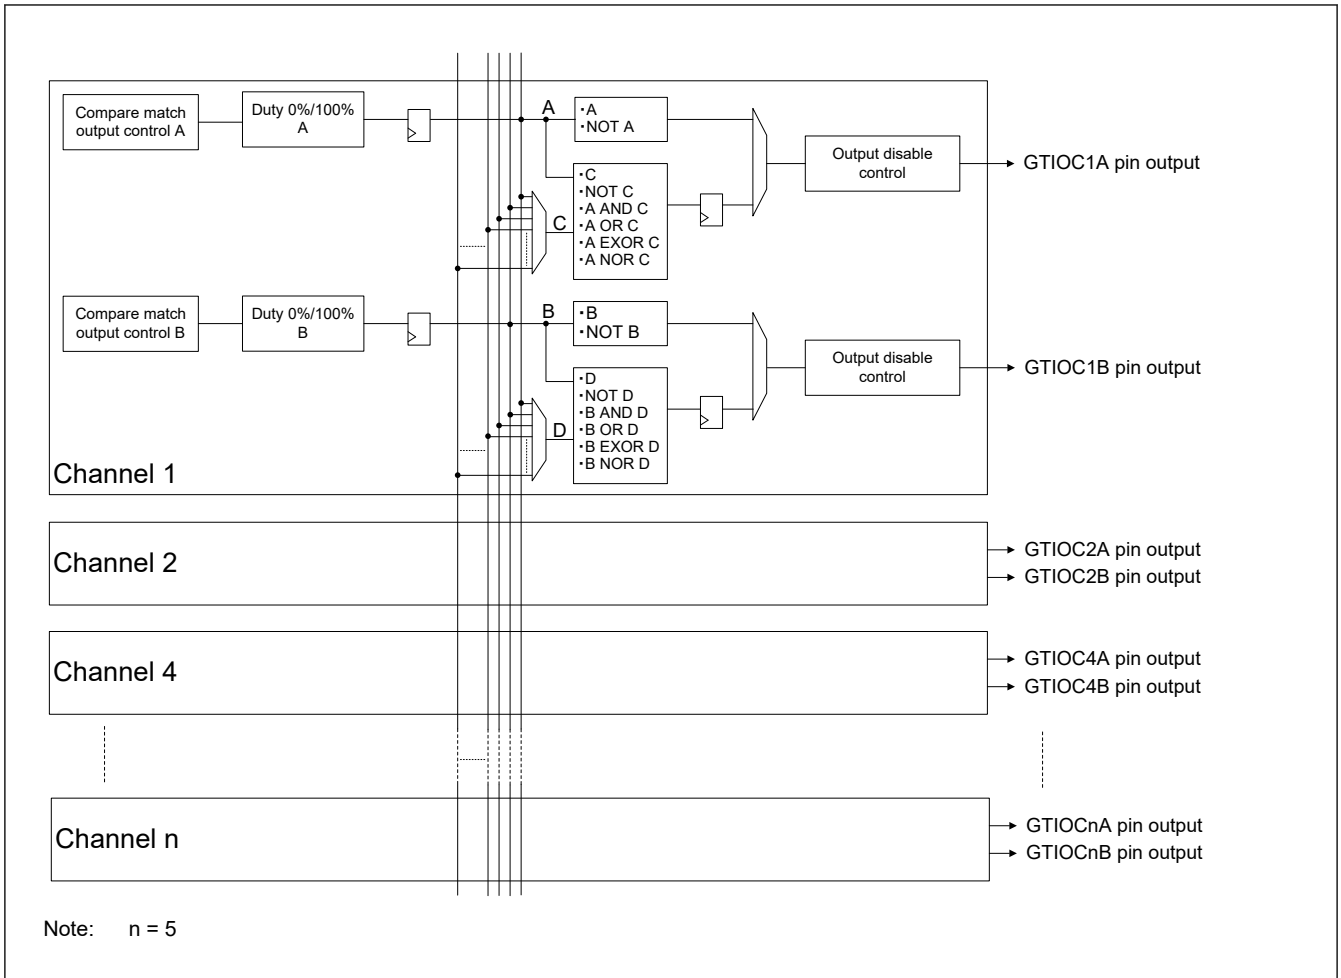

Figure 21.57 Block Diagram of Inter Channel Logical Operation

Figure 21.58 shows an example of inter channel logical operation.

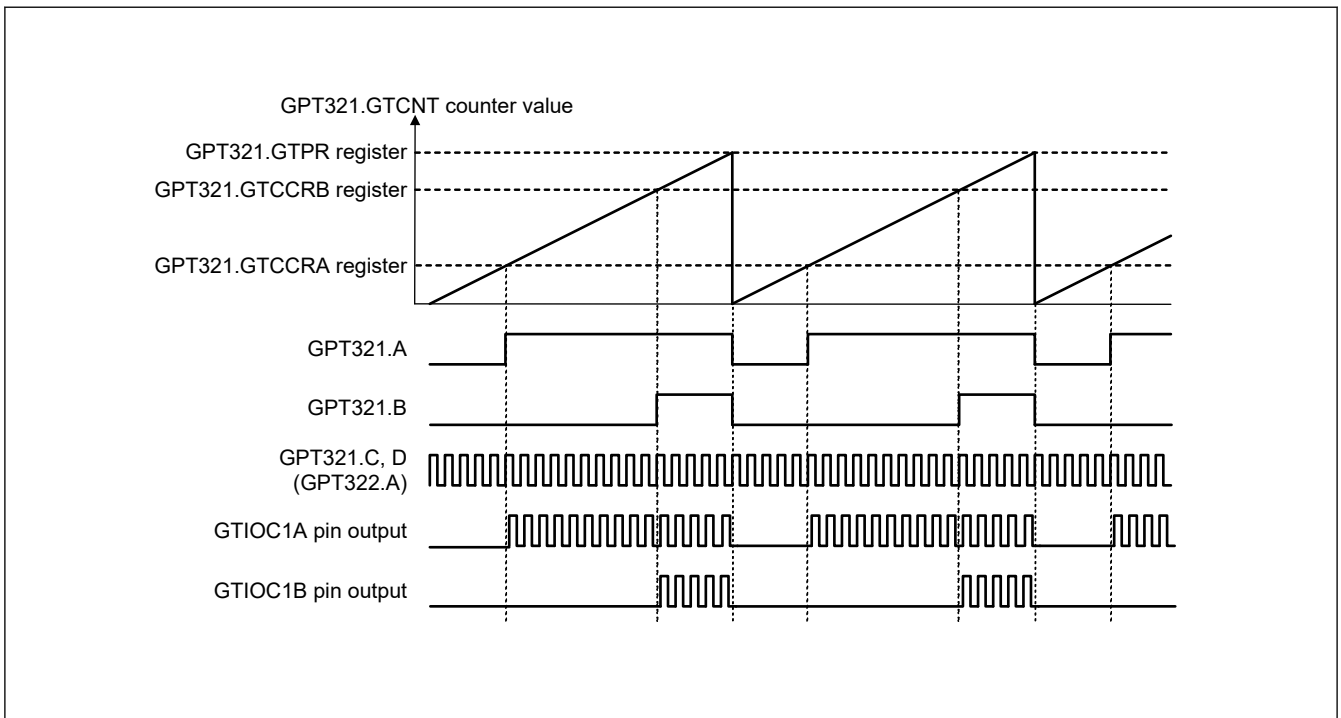

Figure 21.58 Example of Inter Channel Logical Operation

## 21.4 Interrupt Sources

### 21.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTCNT counter overflow (GTPR compare match)/underflow.
- period count function finish

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. The Interrupt Controller Unit can change the relative channel priorities. However, the priority within a channel is fixed. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

[Table 21.39](#) lists the GPT interrupt sources.

**Table 21.39** Interrupt sources

| Channel  | Name       | Interrupt source                                  | Interrupt flag  | DTC activation |
|----------|------------|---------------------------------------------------|-----------------|----------------|
| n = 1, 2 | GPTn_CCMPA | GPT32n.GTCCRA input capture/compare match         | GTST[0] (TCFA)  | Possible       |
|          | GPTn_CCMPB | GPT32n.GTCCRB input capture/compare match         | GTST[1] (TCFB)  | Possible       |
|          | GPTn_CMPC  | GPT32n.GTCCRC compare match                       | GTST[2] (TCFC)  | Possible       |
|          | GPTn_CMPD  | GPT32n.GTCCRD compare match                       | GTST[3] (TCFD)  | Possible       |
|          | GPTn_CMPE  | GPT32n.GTCCRE compare match                       | GTST[4] (TCFE)  | Possible       |
|          | GPTn_CMPF  | GPT32n.GTCCRF compare match                       | GTST[5] (TCFF)  | Possible       |
|          | GPTn_OVF   | GPT32n.GTCNT overflow (GPT32n.GTPR compare match) | GTST[6] (TCFPO) | Possible       |
|          | GPTn_UDF   | GPT32n.GTCNT underflow                            | GTST[7] (TCFPU) | Possible       |
|          | GPTn_PC    | Period count function finish (n = 1)              | GTST[31] (PCF)  | Possible       |
| n = 4, 5 | GPTn_CCMPA | GPT16n.GTCCRA input capture/compare match         | GTST[0] (TCFA)  | Possible       |
|          | GPTn_CCMPB | GPT16n.GTCCRB input capture/compare match         | GTST[1] (TCFB)  | Possible       |
|          | GPTn_CMPC  | GPT16n.GTCCRC compare match                       | GTST[2] (TCFC)  | Possible       |
|          | GPTn_CMPD  | GPT16n.GTCCRD compare match                       | GTST[3] (TCFD)  | Possible       |
|          | GPTn_CMPE  | GPT16n.GTCCRE compare match                       | GTST[4] (TCFE)  | Possible       |
|          | GPTn_CMPF  | GPT16n.GTCCRF compare match                       | GTST[5] (TCFF)  | Possible       |
|          | GPTn_OVF   | GPT16n.GTCNT overflow (GPT16n.GTPR compare match) | GTST[6] (TCFPO) | Possible       |
|          | GPTn_UDF   | GPT16n.GTCNT underflow                            | GTST[7] (TCFPU) | Possible       |
|          | GPTn_PC    | Period count function finish (n = 4 to 6)         | GTST[31] (PCF)  | Possible       |

#### (1) GPTn\_CCMPA interrupt (n = 1, 2, 4, 5)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

#### (2) GPTn\_CCMPB interrupt (n = 1, 2, 4, 5)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register

- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

### (3) GPTn\_CMPC interrupt (n = 1, 2, 4, 5)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

### (4) GPTn\_CMPD interrupt (n = 1, 2, 4, 5)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

### (5) GPTn\_CMPE interrupt (n = 1, 2, 4, 5)

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

### (6) GPTn\_CMPF interrupt (n = 1, 2, 4, 5)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

### (7) GPTn\_OVF interrupt (n = 1, 2, 4, 5)

An interrupt request is generated in the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)

- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

#### (8) GPTn\_UDF interrupt (n = 1, 2, 4, 5)

An interrupt request is generated in the following conditions.

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0 to 1)
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

About Interrupt signals and interrupt status flags, see [section 21.2.16. GTST : General PWM Timer Status Register](#).

#### (9) GPTn\_PC Interrupt (n = 1, 4, 5)

When the GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1, an interrupt request is generated at the end of cycle.

### 21.4.2 DMAC and DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#), [section 16, DMA Controller \(DMAC\)](#), and [section 17, Data Transfer Controller \(DTC\)](#).

## 21.5 Operations Linked by ELC

### 21.5.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The GPT has the following ELC event signals:

- Generation of compare match and input capture A interrupt (GPTn\_CCMPA)
- Generation of compare match and input capture B interrupt (GPTn\_CCMPB)
- Generation of compare match C interrupt (GPTn\_CMPC)
- Generation of compare match D interrupt (GPTn\_CMPD)
- Generation of compare match E interrupt (GPTn\_CMPE)
- Generation of compare match F interrupt (GPTn\_CMPF)
- Generation of overflow interrupt (GPTn\_OVF)
- Generation of underflow interrupt (GPTn\_UDF)
- Finish of period count function (GPTm\_PC)

Note: n = 1, 2, 4, 5

m = 1, 4, 5

### 21.5.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See [section 18, Event Link Controller \(ELC\)](#) for the connection between the ELC and the event signal input.

## 21.6 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 21.59 shows the timing of noise filtering.

**Figure 21.59** Timing of noise filtering

If noise filtering is enabled, the input capture operation or hall sensor input operation is performed on the edges of the noise filtered signal after a delay of (sampling interval  $\times$  2 + PCLKD) at the shortest. This is due to the noise filtering for the input capture input or hall sensor input.

## 21.7 Protection Function

### 21.7.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.

Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

### 21.7.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[1] and BD[0] bits settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write, by setting the BD[1] and BD[0] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

The BD[1] and BD[0] bits can be set on channel basis by writing directly to the GTBER register or it can be set to 0 simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 21.60 shows an example of operation for disabling buffer operation by writing to the GTBER register.

**Figure 21.60 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests**

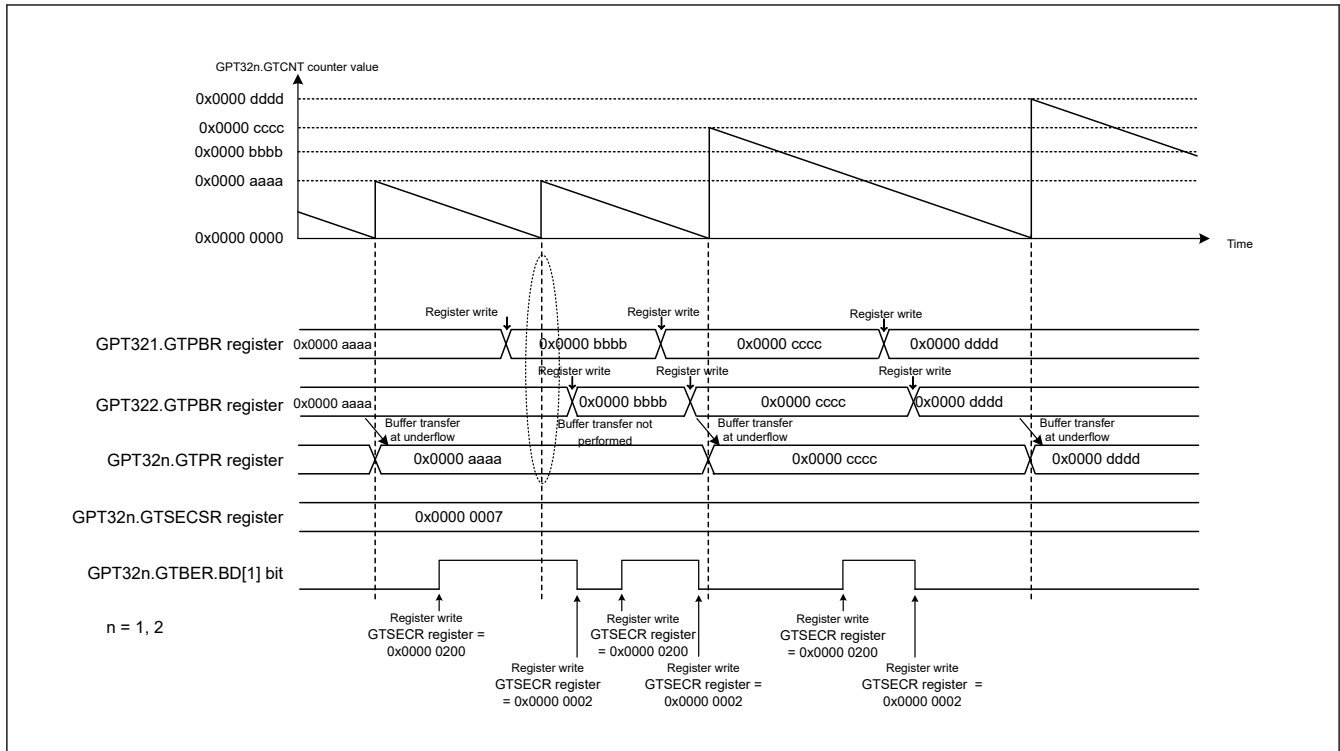

### 21.7.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting by the GTSECSR register  
Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register  
In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 21.61 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

**Figure 21.61 Example of Multiple Channel Operation for Disabling Buffer Operation (Saw Waves, Single Buffer Operation)**

### 21.7.3 GTIOCnm Pin Output Negate Control (n = 1, 2, 4, 5, m = A, B)

For protection from system failure, the output disable control that changes the GTIOCnm pin output value forcibly is provided for GTIOCnm pin output by the request of output disable from POEG. Output protection is required when the same output level being on the GTIOCnA and GTIOCnB pins is detected. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG performs the logical OR of the output disable request from each channel and the output disable request from the external input, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCnA pin and the GTIOCnB pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCnA pin and the GTIOR.OBDF[1:0] setting for the GTIOCnB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. It is after 3 PCLKD at shortest when the output disable condition is released after the output disable request becomes no longer satisfied. To reliably control output disabling, clear the flag of POEG for which the condition for the request to disable the output is no longer satisfied after 4 cycles of PCLKD.

When event count is performed or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCnA pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCnB pin).

Figure 21.62 shows an example of the GTIOCnm pin output disable control operation. (n = 1, 2, 4, 5, m = A, B)

**Figure 21.62** Example of GTIOcnm pin output disable control operation in saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable (n = 1, 2, 4, 5, m = A, B)

## 21.8 Initialization Method of Output Pins

### 21.8.1 Pin Settings After Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

Figure 21.63 Example of pin settings after reset

### 21.8.2 Pin Initialization Due to Error During Operation

If an error occurs during GPT operation, the following four types of pin control can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0, and the control bit associated with the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

If the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

## 21.9 Usage Notes

### 21.9.1 Module-Stop Function Setting

The Module Stop Control Register can enable or disable GPT operation. The GPT is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

### 21.9.2 GTCCRn Settings during Compare Match Operation (n = A to F)

#### (1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy all of the following conditions:

- $GTDVU < GTCCRA$
- $0 < GTCCRA < GTPR$

When the setting of  $GTCCRA = 0$  or  $GTCCRA \geq GTPR$  is made for the  $GTCCRA$  register during count operation, the output protection function is activated. However, if the following condition is not satisfied, the output protection function does not work normally:

- The value of the  $GTCCRA$  register at the start of counting is larger than 0 and less than  $GTPR$ .

For details, see [section 21.7.3. GTIOCnm Pin Output Negate Control \(n = 1, 2, 4, 5, m = A, B\)](#).

### (2) When automatic dead time setting is not made in triangle-wave PWM mode

The  $GTCCRA$  register must be set within the range of  $0 < GTCCRA < GTPR$ . If  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is satisfied. When  $GTCCRA > GTPR$ , no compare match occurs.

Similarly,  $GTCCRB$  must be set within the range of  $0 < GTCCRB < GTPR$ . If  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is satisfied. When  $GTCCRB > GTPR$ , no compare match occurs.

### (3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The  $GTCCRC$  and  $GTCCRD$  registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, the correct output waveforms with secured dead time may not be obtained.

- In up-counting:  $GTCCRC < GTCCRD$ ,  $GTCCRC > GTDVU$ ,  $GTCCRD < GTPR - GTDVU$
- In down-counting:  $GTCCRC > GTCCRD$ ,  $GTCCRC < GTPR - GTDVU$ ,  $GTCCRD > GTDVU$

### (4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The  $GTCCRC$  and  $GTCCRD$  registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting:  $0 < GTCCRC < GTCCRD < GTPR$
- In down-counting:  $GTPR > GTCCRC > GTCCRD > 0$

Similarly,  $GTCCRE$  and  $GTCCRF$  must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting:  $0 < GTCCRE < GTCCRF < GTPR$
- In down-counting:  $GTPR > GTCCRE > GTCCRF > 0$ .

### (5) In saw-wave PWM mode

The  $GTCCRA$  register must be set with the range of  $0 < GTCCRA < GTPR$ . If  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is satisfied. If  $GTCCRA > GTPR$  is set, no compare match occurs.

Similarly,  $GTCCRB$  must be set with the range of  $0 < GTCCRB < GTPR$ . If  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is satisfied. If  $GTCCRB > GTPR$  is set, no compare match occurs.

## 21.9.3 Setting Range for GTCNT Counter

The  $GTCNT$  counter register must be set with the range of  $0 \leq GTCNT \leq GTPR$ .

## 21.9.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the  $GTCNT$  counter by the  $GTCR.CST$  bit synchronizes the count clock that is selected in  $GTCR.TPCS[3:0]$ . When  $GTCR.CST$  is updated, the  $GTCNT$  counter starts/stops after a count clock that is selected in  $GTCR.TPCS[3:0]$ . Therefore, an event generated before the  $GTCNT$  counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after  $GTCR.CST$  is set to 0.

## 21.9.5 Priority Order of Each Event

### (1) GTCNT register

Table 21.40 shows a priority order of events updating the GTCNT register.

**Table 21.40 Priority order of sources updating GTCNT**

| Source updating GTCNT                                     | Priority order |
|-----------------------------------------------------------|----------------|
| Writing by CPU (writing to GTCNT/GTCLR)                   | High           |
| Clear by hardware sources set in GTCSR                    | ↑              |
| Count up or down by hardware sources set in GTUPSR/GTDNSR | ↑              |
| Count operation                                           | Low            |

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

### (2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

In case that stop by the period count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the period count function is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU (reading from GTCR/GTSTR/GTSTP registers), pre-update data is read.

### (3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

### (4) GTPR register

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

## 22. Low Power Asynchronous General Purpose Timer (AGT)

### 22.1 Overview

The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

Table 22.1 lists the AGT specifications, Figure 22.1 shows a block diagram, and Table 22.2 lists the I/O pins.

**Table 22.1 AGT specifications**

| Parameter                                   |                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operating modes                             | Timer mode                    | The count source is counted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                             | Pulse output mode             | The count source is counted and the output is inverted at each timer underflow                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                             | Event counter mode            | An external event is counted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Note 1. AGT<sub>n</sub> (n = 0, 2) cannot use underflow signal. AGT<sub>n</sub> (n = 1, 3) connects directly with the underflow event signal from the AGT<sub>n</sub> (n = 0, 2) timer.

Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

Note 3. For details, see section 10, Low Power Modes.

| Bit field:         |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 1  | 1  | 1  | 1  | 1  | 1  | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit  | Symbol | Function                                                               | R/W |
|------|--------|------------------------------------------------------------------------|-----|
| 15:0 | n/a    | 16-bit counter and reload register<br>Setting range : 0x0000 to 0xFFFF | R/W |

AGTn.AGT is a 16-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see [section 22.3.1. Reload Register and Counter Rewrite Operation](#).

When 1 is written to the TSTOP bit in the AGTCR register, AGT counter is forcibly stopped and set to 0xFFFF.

When the TCK[2:0] bits setting in the AGTMR1 register are a value other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0x0000, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts. The AGTOn, AGTIO pin output are toggled.

When the AGT register is set to 0x0000 in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts.

In addition, the AGTOn pin output is toggled even during a period other than the specified count period. When the AGT register is set to 0x0001 or more, a request signal is generated each time AGT underflows.

### 22.2.2 AGTCMA : AGT Compare Match A Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 3, 5)

Offset address: 0x02

|                    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 1  | 1  | 1  | 1  | 1  | 1  | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit  | Symbol | Function                                                                     | R/W |
|------|--------|------------------------------------------------------------------------------|-----|
| 15:0 | n/a    | 16-bit compare match A data is stored.*1<br>Setting range : 0x0000 to 0xFFFF | R/W |

Note 1. Set the AGTCMA register to 0xFFFF when compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see [section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

### 22.2.3 AGTCMB : AGT Compare Match B Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 3, 5)

Offset address: 0x04

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

|--|

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

| Bit  | Symbol | Function                                                                     | R/W |
|------|--------|------------------------------------------------------------------------------|-----|
| 15:0 | n/a    | 16-bit compare match B data is stored.*1<br>Setting range : 0x0000 to 0xFFFF | R/W |

Note 1. Set the AGTCMB register to 0xFFFF when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see [section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

### 22.2.4 AGTCR : AGT Control Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 3, 5)

Offset address: 0x08

Bit position: 7 6 5 4 3 2 1 0

|            |           |           |            |            |   |            |            |              |

| 3   | —      | This bit is read as 0. The write value should be 0.                                  | R/W     |
| 4   | TEDGF  | Active Edge Judgment Flag<br>0: No active edge received<br>1: Active edge received   | R/(W)*3 |
| 5   | TUNDF  | Underflow Flag<br>0: No underflow<br>1: Underflow                                    | R/(W)*3 |
| 6   | TCMAF  | Compare Match A Flag<br>0: No match<br>1: Match                                      | R/(W)*3 |
| 7   | TCMBF  | Compare Match B Flag<br>0: No match<br>1: Match                                      | R/(W)*3 |

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART bit and TCSTF flag are initialized at the same time. The pulse output level is also initialized. The read value is 0.

Note 2. For information on using the TSTART bit and TCSTF flag, see [section 22.4.1. Count Operation Start and Stop Control](#).

Note 3. Only 0 can be written to clear the flag.

**TSTART bit (AGT Count Start)**

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When the TSTART bit is set to 1 (count starts), the TCSTF flag is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF flag is set to 0 (count stops) in synchronization with the count source. For details, see [section 22.4.1. Count Operation Start and Stop Control](#).

**TCSTF flag (AGT Count Status Flag)**

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

**TSTOP bit (AGT Count Forced Stop)**

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

**TEDGF flag (Active Edge Judgment Flag)**

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input pin (AGTIO<sub>n</sub>) is complete in pulse width measurement mode
- When the set edge of the external input pin (AGTIO<sub>n</sub>) is input in pulse period measurement mode.

[Clearing condition]

- When 0 is written to this flag by software.

**TUNDF flag (Underflow Flag)**

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

**TCMAF flag (Compare Match A Flag)**

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

**TCMBF flag (Compare Match B Flag)**

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

## 22.2.5 AGTMR1 : AGT Mode Register 1

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to  $3, 5$ )

Offset address:  $0x09$

|               |   |          |   |   |            |           |   |   |
|---------------|---|----------|---|---|------------|-----------|---|---|
| Bit position: | 7 | 6        | 5 | 4 | 3          | 2         | 1 | 0 |

| 3   | TEDGPL    | Edge Polarity* <sup>4</sup><br>0: Single-edge<br>1: Both-edge                                                                                                                                                                                                                                                                                                                                         | R/W |
| 6:4 | TCK[2:0]  | Count Source* <sup>1</sup> * <sup>2</sup> * <sup>5</sup> * <sup>7</sup><br>0 0 0: PCLKB<br>0 0 1: PCLKB/8<br>0 1 1: PCLKB/2<br>1 0 0: Divided clock AGTLCLK specified by CKS[2:0] bits in the AGTMR2 register<br>1 0 1: Underflow event signal from AGTn ( $n = 0, 2$ )* <sup>6</sup><br>1 1 0: Divided clock AGTSCLK specified by CKS[2:0] bits in the AGTMR2 register<br>Others: Setting prohibited | R/W |
| 7   | —         | This bit is read as 0. The write value should be 0.                                                                                                                                                                                                                                                                                                                                                   | R/W |

Note: Write access to the AGTMR1 register initializes the output from the AGTOn, AGTIO<sub>n</sub>, AGTOAn, and AGTOB<sub>n</sub> pins. For details on the output level at initialization, see [section 22.2.7. AGTIOC : AGT I/O Control Register](#).

Note 1. When event counter mode is selected, the external input pin (AGTIO<sub>n</sub>) is selected as the count source regardless of the setting of TCK[2:0] bits.

Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 3. The operating mode can only be changed when the count is stopped while both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.

Note 4. The TEDGPL bit is enabled only in event counter mode.

Note 5. To run AGT in Software Standby mode, Snooze mode, or Deep Software Standby mode, select AGTLCLK or AGTSCLK (TCK[2:0] = 100b, 110b).

Note 6. AGTn ( $n = 0, 2$ ) cannot use underflow (setting prohibited). AGTn ( $n = 1, 3$ ) uses the AGTn ( $n = 0, 2$ ) underflow.

Note 7. Do not change the TCK[2:0] bits when the CKS[2:0] bits in the AGTMR2 register is not 000b. First, change the CKS[2:0] bits in the AGTMR2 register to 000b. Then change the TCK[2:0] bits and wait for one cycle of the count source.

## 22.2.6 AGTMR2 : AGT Mode Register 2

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to  $3, 5$ )

Offset address:  $0x0A$

|               |     |   |   |   |   |          |   |   |
|---------------|-----|---|---|---|---|----------|---|---|
| Bit position: | 7   | 6 | 5 | 4 | 3 | 2        | 1 | 0 |
| Bit field:    | LPM | — | — | — | — | CKS[2:0] |   |   |

Value after reset: 0 0 0 0 0 0 0 0 0

| Bit | Symbol   | Function                                                                                                                                                                                    | R/W |
|-----|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | CKS[2:0] | AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio*1 *2 *3<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 | R/W |
| 6:3 | —        | These bits are read as 0. The write value should be 0.                                                                                                                                      | R/W |
| 7   | LPM      | Low Power Mode<br>0: Normal mode<br>1: Low power mode                                                                                                                                       | R/W |

Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite the CKS[2:0] bits when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. When count source is AGTLCLK or AGTSCLK, the switch of CKS[2:0] bits is valid.

Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] bits are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] bits are set to 000b, and wait for 1 cycle of the count source.

### CKS[2:0] bit (AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio)

CKS[2:0] bits select the Count Source Clock Frequency Division Ratio for AGTLCLK or AGTSCLK.

### LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set this bit to 1 to operate in low power.

When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- When reading from the AGT register, read AGT register twice. Only the second reading of data is valid.
- When writing to the AGT, AGTCMA, AGTCMB, and AGTCR register, allow at least 2 cycles of the count source clock when writing to the register.
- When confirm the value written to the AGT, AGTCMA, AGTCMB, and AGTCR registers.
  - When the count operation is stopped; after writing data, it can be read in the next cycle.
  - When the count operation is operating; after writing data, it can be read 4 cycles after the count source clock.

Figure 22.2 shows the flow of how to write LPM bit

Figure 22.2 LPM how to write flow chart

### 22.2.7 AGTIOC : AGT I/O Control Register

| 7:6 | TIOGT[1:0] | Count Control <sup>*1 *2</sup><br>0 0: Event is always counted<br>0 1: Event is counted during polarity period specified for AGTEEn pin<br>Others: Setting prohibited                                                                                                                                                                                          | R/W |

Note 1. When AGTEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.

Note 2. TIOGT[1:0] bits are enabled only in event counter mode.

Note 3. When event counter mode operation is performed during Software Standby and Deep Software Standby mode, the digital filter function cannot be used.

#### TEDGSEL bit (I/O Polarity Switch)

The TEDGSEL bit switches the AGTOn pin output polarity and the AGTIO pin input/output edge and polarity.

In pulse output mode, it only controls polarity of the AGTOn pin output and AGTIO pin output. AGTOn pin output and AGTIO pin output are initialized when the AGTMR1 register is written or the TSTOP bit in the AGTCR register is written with 1.

### TOE bit (AGTOn pin Output Enable)

The TOE bit selects whether the AGTOn pin output is disabled or enabled.

### TIPF[1:0] bits (Input Filter)

The TIPF[1:0] bits specify the sampling frequency of the AGTIO pin input filter. When the input to the AGTIO pin is sampled and the values match three times in succession, the value is regarded as the input value.

### TIOGT[1:0] bits (Count Control)

The TIOGT[1:0] bits control the event count.

Note 1. You must set the Pin Function Select Register. See [section 19, I/O Ports](#).

The AGTIOSEL register sets the AGTIO pin when using the AGTIO pin in Deep Software Standby mode and Software Standby mode.

### SEL[1:0] bits (AGTIO pin Select)

The SEL[1:0] bits select the AGTIO pin function.

### TIES bit (AGTIO pin Input Enable)

The TIES bit enables or disables an external event input.

## 22.3 Operation

### 22.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (AGT compare match A/B register are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or the TCMEB bit is 1 (AGT compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

[Figure 22.3](#) and [Figure 22.4](#) show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

**Figure 22.3** Timing of rewrite operation with TSTART, TCMEA, and TCMEB bit value when AGT compare match A register and AGT compare match B register is invalid

**Figure 22.4** Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is valid

### 22.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and AGT compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and AGT compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 22.5 shows the timing of rewrite operation with TSTART bit value for compare register A. AGT Compare register B is of the same timing as AGT compare register A.

**Figure 22.5** Timing of rewrite operation with the TSTART bit value for AGT compare register A

### 22.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 22.6 shows the operation example in timer mode.

Figure 22.6 Operation example in timer mode

### 22.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and the output level of the AGTIO<sub>n</sub> and AGTON pins inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTIO<sub>n</sub> and AGTON pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTON pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 22.7 shows the operation example in pulse output mode.

Figure 22.7 Operation example in pulse output mode

### 22.3.5 Event Counter Mode

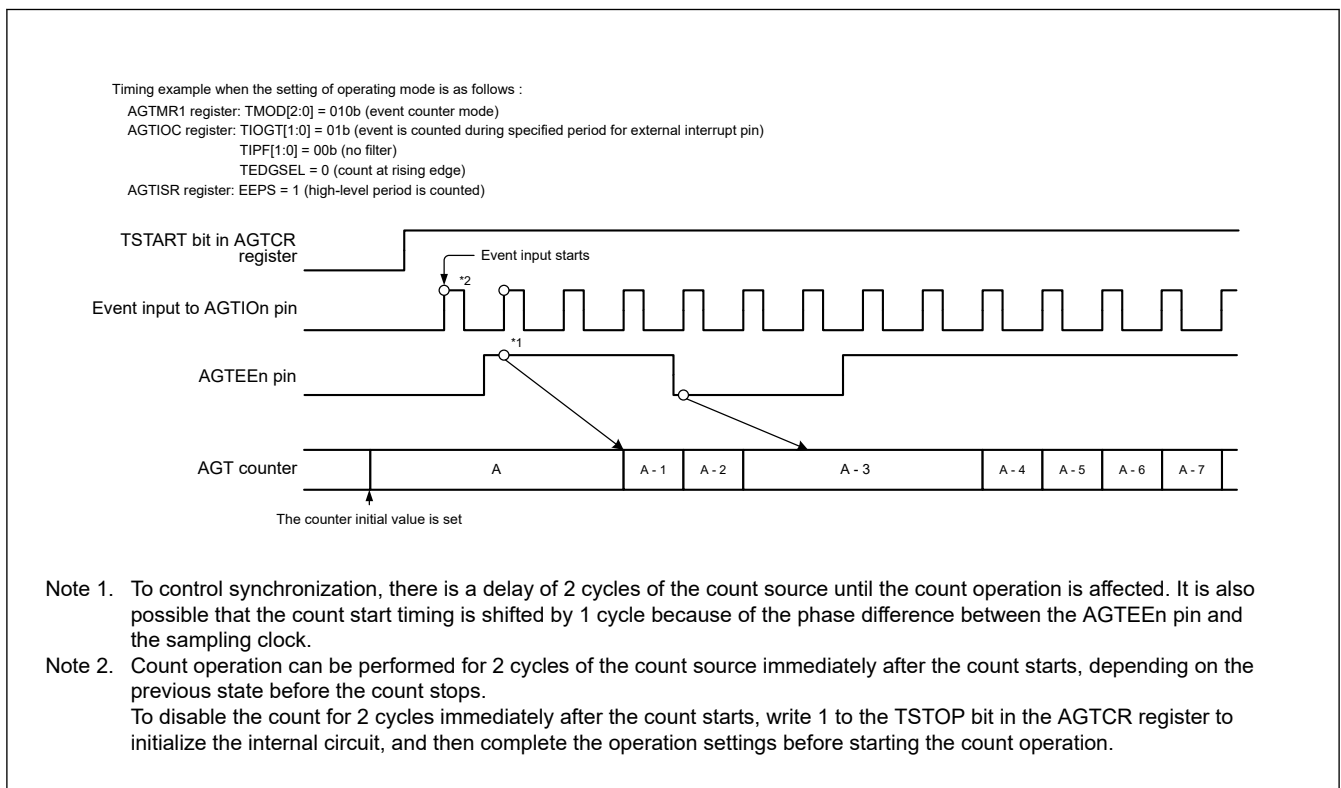

In event counter mode, the counter is decremented by an external event signal (count source) input to the AGTIO pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC register and AGTISR registers. In addition, the filter function for the AGTIO pin input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTOn pin can be toggled even in event counter mode.

Figure 22.8 shows the operation example in event counter mode.

**Figure 22.8 Operation example 1 in event counter mode**

Figure 22.9 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).

**Figure 22.9 Operation example 2 in event counter mode**

### 22.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTIO pin is measured. When the level specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the counter is decremented by the

count source selected with the TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTIO pin ends, the counter is stopped, the TEDGF flag in the AGTCR register is set to 1 (active edge received), and an interrupt request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF flag in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 22.10 shows the operation example in pulse width measurement mode.

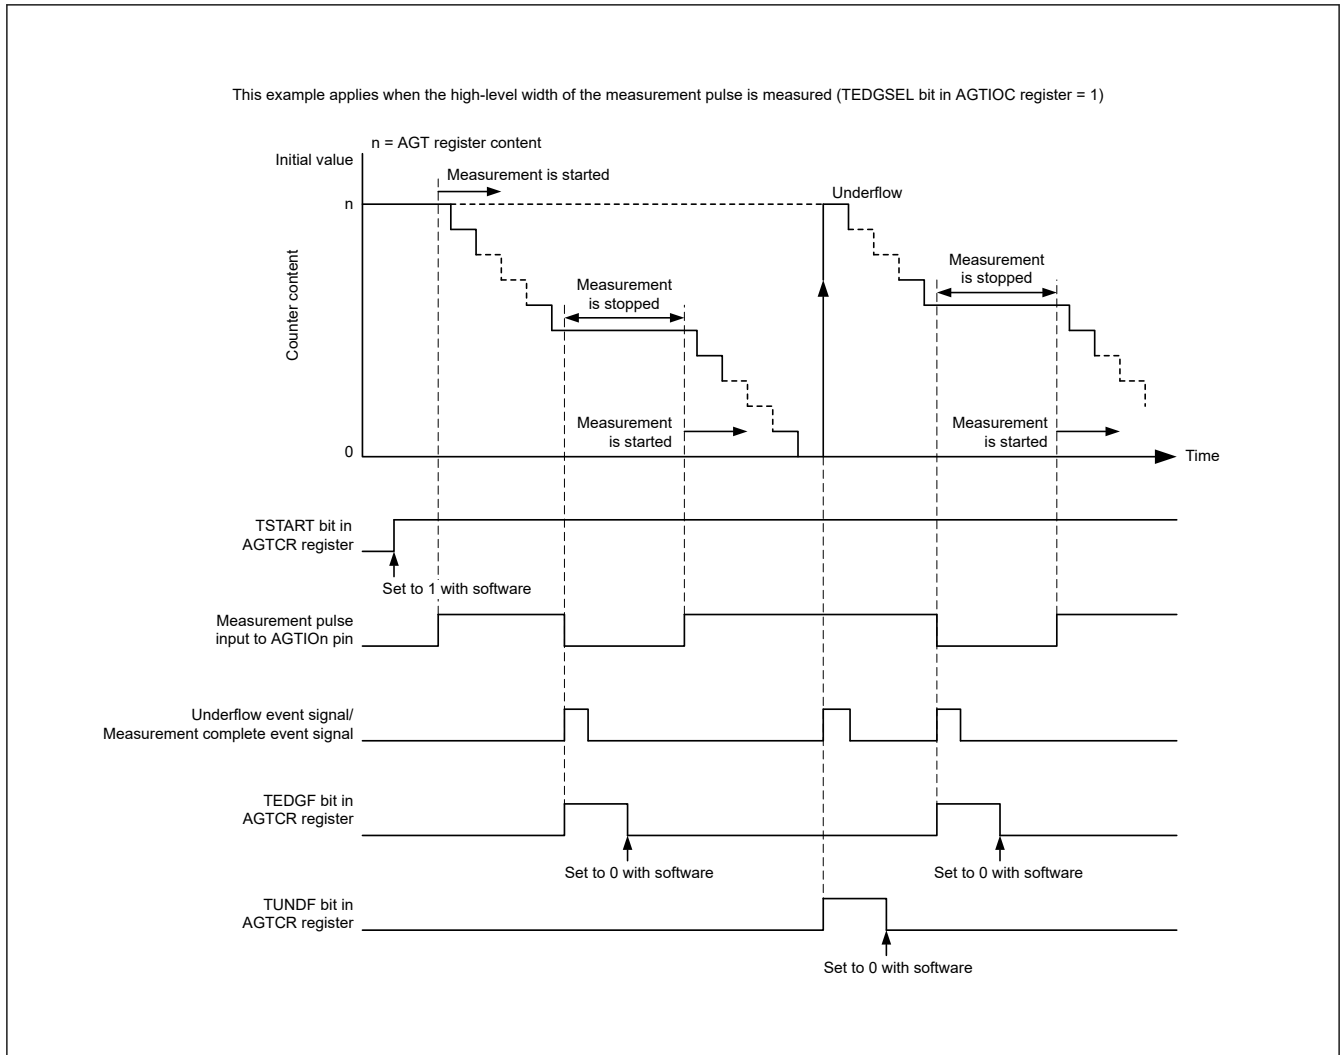

Figure 22.10 Operation example in pulse width measurement mode

### 22.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTIO pin is measured. The counter is decremented by the count source selected with TCK[2:0] bits in the AGTMR1 register. When a pulse with the period specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF flag in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see [section 22.4.6. How to Calculate Event Number, Pulse Width, and Pulse Period](#)) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF flag in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 22.11 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.

Figure 22.11 Operation example in pulse period measurement mode

### 22.3.8 Compare Match function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA or TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF flag in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When the compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. For details, see [section 22.3.1. Reload Register and Counter Rewrite Operation](#). In addition, the output level of the AGTOAn, AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

Figure 22.12 shows the operation example in compare match function.

Figure 22.12 Operation example in compare match function (TOPOLA = 0, TOPOLB = 0)

### 22.3.9 Output Settings for Each Mode

Table 22.5 to Table 22.8 list the states of pins AGTON, AGTION, AGTOAn, and AGTOBn pins in each mode.

Table 22.5 AGTON pin setting

| Operating mode | AGTIOC register |             | AGTON pin output |
|----------------|-----------------|-------------|------------------|
|                | TOE bit         | TEDGSEL bit |                  |
| All modes      | 1               | 1           | Inverted output  |
|                |                 | 0           | Normal output    |
|                | 0               | 0 or 1      | Output disabled  |

**Table 22.6 AGTIO<sub>n</sub> pin setting**

| Operating mode                | AGTIOC register |  |
|-------------------------------|-----------------|--|
|                               | TEDGSEL bit     |  |
| Timer mode                    | 0 or 1          |  |
| Pulse output mode             | 1               |  |
|                               | 0               |  |
| Event counter mode            | 0 or 1          |  |
| Pulse width measurement mode  |                 |  |
| Pulse period measurement mode |                 |  |

**Table 22.7 AGTOA<sub>n</sub> pin setting**

| Operating mode                | AGTCMSR register |            |
|-------------------------------|------------------|------------|
|                               | TOEA bit         | TOPOLA bit |
| Timer mode                    | 1                | 1          |
|                               |                  | 0          |
|                               | 0                | 0 or 1     |
| Pulse output mode             | 1                | 1          |
|                               |                  | 0          |
|                               | 0                | 0 or 1     |
| Event counter mode            | 1                | 1          |
|                               |                  | 0          |
|                               | 0                | 0 or 1     |
| Pulse width measurement mode  | 0                | 0          |
| Pulse period measurement mode |                  |            |

**Table 22.8 AGTOB<sub>n</sub> pin setting**

| Operating mode                | AGTCMSR register |            |
|-------------------------------|------------------|------------|
|                               | TOEB bit         | TOPOLB bit |
| Timer mode                    | 1                | 1          |
|                               |                  | 0          |
|                               | 0                | 0 or 1     |

|                               |                  | 0          |
|                               | 0                | 0 or 1     |
| Event counter mode            | 1                | 1          |
|                               |                  | 0          |
|                               | 0                | 0 or 1     |
| Pulse width measurement mode  | 0                | 0          |
| Pulse period measurement mode |                  |            |

### 22.3.10 Standby Mode

The AGT can operate in Software Standby and Deep Software Standby mode. Set it to Software Standby or Deep Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

[Table 22.9](#) and [Table 22.10](#) show the setting that can be used in Software Standby and Deep Software Standby mode.

**Table 22.9 Usable settings in Software Standby and Deep Software Standby mode (AGTn (n = 0, 2))**

| Operating mode                     | AGTMR1.TCK[2:0] | Operating clock                             | Resurgence factor of CPU |
|------------------------------------|-----------------|---------------------------------------------|--------------------------|
| Timer mode                         | 100b or 110b    | AGTLCLK or AGTSCLK                          | —                        |
| Pulse output mode                  | 100b or 110b    | AGTLCLK or AGTSCLK                          | —                        |
| Event counter mode <sup>*2*3</sup> | —               | AGTIO <sub>n</sub> (n = 0, 2) <sup>*1</sup> | —                        |
| Pulse width measurement mode       | 100b or 110b    | AGTLCLK or AGTSCLK                          | —                        |
| Pulse period measurement mode      | 100b or 110b    | AGTLCLK or AGTSCLK                          | —                        |

Note: —: invalid

Note 1. When using the AGTIO<sub>n</sub> pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 2. When AGTIOSEL.TIES = 0 and the external event input signal is disabled during Software Standby mode, stop the count operation before entering Software Standby mode. After returning from Software Standby mode, restart the count operation if necessary.

Note 3. When AGTIOSEL.SEL = 00b and AGTIO cannot be used as an AGTIO input pin during Deep Software Standby mode, stop the count operation before entering Deep Software Standby mode. After returning from Deep Software Standby mode, restart the count operation if necessary.

**Table 22.10 Usable settings in Software Standby and Deep Software Standby mode (AGTn (n = 1, 3, 5)<sup>\*3</sup>)**

| Operating mode                     | AGTMR1.TCK[2:0]                    | Operating clock                                                           | Resurgence factor of CPU                                                               |
|------------------------------------|------------------------------------|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Timer mode                         | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT <sub>n</sub> (n = 0, 2) underflow <sup>*6</sup> | <ul style="list-style-type: none"> <li>Underflow</li> <li>Compare match A/B</li> </ul> |
| Pulse output mode                  | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT <sub>n</sub> (n = 0, 2) underflow <sup>*6</sup> | <ul style="list-style-type: none"> <li>Underflow</li> <li>Compare match A/B</li> </ul> |
| Event counter mode <sup>*4*5</sup> | —                                  | AGTIO <sub>n</sub> (n = 1, 3, 5) <sup>*2</sup>                            | <ul style="list-style-type: none"> <li>Underflow</li> <li>Compare match A/B</li> </ul> |
| Pulse width measurement mode       | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT <sub>n</sub> (n = 0, 2) underflow <sup>*6</sup> | <ul style="list-style-type: none"> <li>Underflow</li> <li>Active edge</li> </ul>       |
| Pulse period measurement mode      | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGT <sub>n</sub> (n = 0, 2) underflow <sup>*6</sup> | <ul style="list-style-type: none"> <li>Underflow</li> <li>Active edge</li> </ul>       |

Note: —: invalid

Note: Release of Software Standby or Deep Software Standby mode is AGT1 or AGT3.

Note: Compare match A/B is resurgence factor of CPU from Software Standby mode.

Note 1. Only when AGT<sub>n</sub> (n = 0, 2) operates in [Table 22.9](#)

Note 2. When using the AGTIO<sub>n</sub> pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 3. AGT5 cannot operate in Deep Software Standby mode.

Note 4. When AGTIOSEL.TIES = 0 and the external event input signal is disabled during Software Standby mode, stop the count operation before entering Software Standby mode. After returning from Software Standby mode, restart the count operation if necessary.

Note 5. When AGTIOSEL.SEL = 00b and AGTIO cannot be used as an AGTIO input pin during Deep Software Standby mode, stop the count operation before entering Deep Software Standby mode. After returning from Deep Software Standby mode, restart the count operation if necessary.

Note 6. AGT5 cannot use AGT<sub>n</sub> (n = 0, 2) underflow for operating clock.

### 22.3.11 Interrupt Sources

The AGT<sub>n</sub> has three interrupt sources as listed in [Table 22.11](#).

**Table 22.11 AGT interrupt sources**

| Name                      | Interrupt source                                                                                                                                                                                                                                                                                                                          | DMAC/DTC activation |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| AGT <sub>n</sub> _AGTI    | <ul style="list-style-type: none"> <li>When the counter underflows</li> <li>When measurement of the active width of the external input pin (AGTIO<sub>n</sub>) is complete in pulse width measurement mode</li> <li>When the set edge of the external input pin (AGTIO<sub>n</sub>) is input in pulse period measurement mode.</li> </ul> | Possible            |
| AGT <sub>n</sub> _AGTCMAI | <ul style="list-style-type: none"> <li>When the values of AGT register and AGTCMA register match</li> </ul>                                                                                                                                                                                                                               | Possible            |
| AGT <sub>n</sub> _AGTCMBI | <ul style="list-style-type: none"> <li>When the values of AGT register and AGTCMB register match</li> </ul>                                                                                                                                                                                                                               | Possible            |

Note: Channel number (n = 0 to 3, 5)

### 22.3.12 Event Signal Output to ELC

The AGT uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGT outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see [section 18, Event Link Controller \(ELC\)](#).

## 22.4 Usage Notes

### 22.4.1 Count Operation Start and Stop Control

- When the operating mode (see [Table 22.1](#)) is set to other than the event counter mode, or the count source is set to other than AGTn underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.
- When the operating mode (see [Table 22.1](#)) is set to event counter mode, or the count source is set to AGT1 underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 2 PCLKB cycles. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 2 PCLKB cycles. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.

### 22.4.2 Access to Counter Register

When the TSTART bit and TCSTF flag in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

### 22.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR) can be changed only when the count is stopped with both the TSTART bit and TCSTF flag set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of TEDGF, TUNDF, TCMAF, and TCMBF flags are undefined. Before starting the count, write 0 to the following flags:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

### 22.4.4 Output pin setting

When using the AGTOn, AGTIOAn, AGTOAn, or AGTOBn as an output pin, set up the Operation and determine the initial output values. Then set an output mode in the port register.

When using the AGTIOAn as an input pin in pulse width measurement mode or pulse period measurement mode, set up the Operation and start count operation. Then start to enter external events from the AGTIOAn pin. Invalidate the first measurement and validate the second and later completed measurements.

### 22.4.5 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting TIPF[1:0] bits and when the TEDGSEL bit in the AGTIOC register changes.

### 22.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:  
Event number = initial value of counter [AGT register] - counter value of active event end
- In pulse width measurement mode, pulse width is expressed mathematically as follows:  
Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:  
Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1.

### 22.4.7 When Count is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

### 22.4.8 When Selecting AGTn (n = 0, 2) Underflow as the Count Source

Operate according to the following procedures described in this section when selecting the underflow event signal as the count source.

#### (1) Procedure for starting operation

1. Set AGT.
2. Start the count operation of AGTn (n = 1, 3).
3. Start the count operation of AGTn (n = 0, 2).

#### (2) Procedure for stopping operation

1. Stop the count operation of AGTn (n = 0, 2).
2. Stop the count operation of AGTn (n = 1, 3).
3. Stop the count source clock of AGTn (n = 1, 3) (write 000b in the AGTMR1.TCK[2:0] bits).

### 22.4.9 Module-stop function

AGT operation can be disabled or enabled using Module Stop Control Register D (MSTPCRD) and Module Stop Control Register E (MSTPCRE). The AGT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#)

### 22.4.10 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTIO<sub>n</sub>, AGTEE<sub>n</sub>, or both input as external event input, the clock source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

## 23. Realtime Clock (RTC)

### 23.1 Overview

The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.

The sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m. /p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

Table 23.1 lists the RTC specifications, Figure 23.1 shows a block diagram, and Table 23.2 lists the I/O pins.

**Table 23.1 RTC specifications**

| Parameter                    | Specifications                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| RTCICn (n = 0) | Input  | Time capture event input pins<br>RTCICn can be controlled by the VBTICTLR register. For more information, see <a href="#">section 11, Battery Backup Function</a> and <a href="#">section 19, I/O Ports</a> . |

## 23.2 Register Descriptions

Write or read from the RTC registers as described in [section 23.6.5. Notes on Writing to and Reading from Registers](#).

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power state during counting operations, for example, while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby mode, Deep Software Standby mode, or battery backup state immediately after setting any of these registers. For details, see [section 23.6.4. Transitions to Low Power Modes after Setting Registers](#).

### 23.2.1 R64CNT : 64-Hz Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x00

|                    |   |      |      |      |      |       |       |       |
|--------------------|---|------|------|------|------|-------|-------|-------|
| Bit position:      | 7 | 6    | 5    | 4    | 3    | 2     | 1     | 0     |
| Bit field:         | — | F1HZ | F2HZ | F4HZ | F8HZ | F16HZ | F32HZ | F64HZ |
| Value after reset: | 0 | x    | x    | x    | x    | x     | x     | x     |

| Bit | Symbol | Function                                                                  | R/W |
|-----|--------|---------------------------------------------------------------------------|-----|
| 0   | F64HZ  | 64-Hz Flag<br>This bit indicates the 64-Hz state of the sub-second digit. | R   |
| 1   | F32HZ  | 32-Hz Flag<br>This bit indicates the 32-Hz state of the sub-second digit. | R   |
| 2   | F16HZ  | 16-Hz Flag<br>This bit indicates the 16-Hz state of the sub-second digit. | R   |
| 3   | F8HZ   | 8-Hz Flag<br>This bit indicates the 8-Hz state of the sub-second digit.   | R   |
| 4   | F4HZ   | 4-Hz Flag<br>This bit indicates the 4-Hz state of the sub-second digit.   | R   |
| 5   | F2HZ   | 2-Hz Flag<br>This bit indicates the 2-Hz state of the sub-second digit.   | R   |
| 6   | F1HZ   | 1-Hz Flag<br>This bit indicates the 1-Hz state of the sub-second digit.   | R   |
| 7   | —      | This bit is read as 0.                                                    | R   |

The R64CNT counter is used in both calendar count mode and binary count mode. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 0x00 by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.2 RSECCNT : Second Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x02

|                    |   |            |   |   |           |   |   |   |
|--------------------|---|------------|---|---|-----------|---|---|---|
| Bit position:      | 7 | 6          | 5 | 4 | 3         | 2 | 1 | 0 |
| Bit field:         | — | SEC10[2:0] |   |   | SEC1[3:0] |   |   |   |
| Value after reset: | x | x          | x | x | x         | x | x | x |

| Bit | Symbol     | Function                                                                                                    | R/W |
|-----|------------|-------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | SEC1[3:0]  | 1-Second Count<br>Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place. | R/W |
| 6:4 | SEC10[2:0] | 10-Second Count<br>Counts from 0 to 5 for 60-second counting.                                               | R/W |
| 7   | —          | The read value is undefined. The write value should be 0.                                                   | R/W |

The RSECCNT counter sets and counts the BCD-coded second value. It counts the carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, you must stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.3 RMINCNT : Minute Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x04

|                    |   |   |            |   |   |           |   |   |
|--------------------|---|---|------------|---|---|-----------|---|---|
| Bit position:      | 7 | 6 | 5          | 4 | 3 | 2         | 1 | 0 |
| Bit field:         | — |   | MIN10[2:0] |   |   | MIN1[3:0] |   |   |
| Value after reset: | x | x | x          | x | x | x         | x | x |

| Bit | Symbol     | Function                                                                                                    | R/W |
|-----|------------|-------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | MIN1[3:0]  | 1-Minute Count<br>Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place. | R/W |
| 6:4 | MIN10[2:0] | 10-Minute Count<br>Counts from 0 to 5 for 60-minute counting.                                               | R/W |
| 7   | —          | The read value is undefined. The write value should be 0.                                                   | R/W |

The RMINCNT counter sets and counts the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.4 RHRCNT : Hour Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x06

|                    |   |    |           |   |          |   |   |   |
|--------------------|---|----|-----------|---|----------|---|---|---|
| Bit position:      | 7 | 6  | 5         | 4 | 3        | 2 | 1 | 0 |
| Bit field:         | — | PM | HR10[1:0] |   | HR1[3:0] |   |   |   |
| Value after reset: | x | x  | x         | x | x        | x | x | x |

| Bit | Symbol    | Function                                                                                                   | R/W |
|-----|-----------|------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | HR1[3:0]  | 1-Hour Count<br>Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place. | R/W |
| 5:4 | HR10[1:0] | 10-Hour Count<br>Counts from 0 to 2 once per carry from the ones place.                                    | R/W |
| 6   | PM        | AM/PM select for time counter setting.<br>0: AM<br>1: PM                                                   | R/W |
| 7   | —         | The read value is undefined. The write value should be 0.                                                  | R/W |

The RHRCNT counter sets and counts the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – from 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0.

Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x08

|                    |   |   |   |   |   |           |   |   |

| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2         | 1 | 0 |
| Bit field:         | — | — | — | — | — | DAYW[2:0] |   |   |
| Value after reset: | x | x | x | x | x | x         | x | x |

| Bit | Symbol    | Function                                                                                                                                                                         | R/W |
|-----|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | DAYW[2:0] | Day-of-Week Counting<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited | R/W |
| 7:3 | —         | The read values are undefined. The write value should be 0.                                                                                                                      | R/W |

The RWKCNT counter sets and counts in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x02 + 0x02 × n

|                    |           |   |   |   |   |   |   |   |
|--------------------|-----------|---|---|---|---|---|---|---|
| Bit position:      | 7         | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | BCNT[7:0] |   |   |   |   |   |   |   |
| Value after reset: | x         | x | x | x | x | x | x | x |

| Bit | Symbol    | Function       | R/W |
|-----|-----------|----------------|-----|
| 7:0 | BCNT[7:0] | Binary Counter | R/W |

BCNTn is a read/write 8-bit register to access BCNT[31:0] that is a 32-bit binary counter. BCNT3 is assigned to the BCNT[31:24] bits, BCNT2 is assigned to the BCNT[23:16] bits, BCNT1 is assigned to the BCNT[15:8] bits, and BCNT0 is assigned to the BCNT[7:0] bits. BCNTn performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.7 RDAYCNT : Day Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x0A

|                    |   |   |             |   |            |   |   |   |
|--------------------|---|---|-------------|---|------------|---|---|---|
| Bit position:      | 7 | 6 | 5           | 4 | 3          | 2 | 1 | 0 |
| Bit field:         | — | — | DATE10[1:0] |   | DATE1[3:0] |   |   |   |
| Value after reset: | 0 | 0 | x           | x | x          | x | x | x |

| Bit | Symbol      | Function                                                                                                 | R/W |
|-----|-------------|----------------------------------------------------------------------------------------------------------|-----|
| 3:0 | DATE1[3:0]  | 1-Day Count<br>Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place. | R/W |
| 5:4 | DATE10[1:0] | 10-Day Count<br>Counts from 0 to 3 once per carry from the ones place.                                   | R/W |
| 7:6 | —           | These bits are read as 0. The write value should be 0.                                                   | R/W |

The RDAYCNT counter is used in calendar count mode to set and count the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.8 RMONCNT : Month Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x0C

Bit position: 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 x x x x x

| Bit | Symbol    | Function                                                                                                     | R/W |
|-----|-----------|--------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | MON1[3:0] | 1-Month Count<br>Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place. | R/W |
| 4   | MON10     | 10-Month Count<br>Counts from 0 to 1 once per carry from the ones place.                                     | R/W |
| 7:5 | —         | These bits are read as 0. The write value should be 0.                                                       | R/W |

The RMONCNT counter is used in calendar count mode to set and count the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.9 RYRCNT : Year Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x0E

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0 x x x x x x x x

| Bit | Symbol   | Function                                                                                                   | R/W |
|-----|----------|------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | YR1[3:0] | 1-Year Count<br>Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place. | R/W |

| Bit  | Symbol    | Function                                                                                                                                           | R/W |
|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:4  | YR10[3:0] | 10-Year Count<br>Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place. | R/W |
| 15:8 | —         | These bits are read as 0. The write value should be 0.                                                                                             | R/W |

The RYRCNT counter is used in calendar count mode to set and count the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x10

Bit position: 7 6 5 4 3 2 1 0

|            |     |            |           |
|------------|-----|------------|-----------|
| Bit field: | ENB | SEC10[2:0] | SEC1[3:0] |
|------------|-----|------------|-----------|

Value after reset: x x x x x x x x

| Bit | Symbol     | Function                                                                                                                   | R/W |
|-----|------------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | SEC1[3:0]  | 1 Second<br>Value for the ones place of seconds.                                                                           | R/W |
| 6:4 | SEC10[2:0] | 10 Seconds<br>Value for the tens place of seconds.                                                                         | R/W |
| 7   | ENB        | ENB<br>0: Do not compare register value with RSECCNT counter value<br>1: Compare register value with RSECCNT counter value | R/W |

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x12

Value after reset:    x    x    x    x    x    x    x    x

| Bit | Symbol     | Function                                                                                                                   | R/W |
|-----|------------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | MIN1[3:0]  | 1 Minute<br>Value for the ones place of minutes.                                                                           | R/W |
| 6:4 | MIN10[2:0] | 10 Minutes<br>Value for the tens place of minutes.                                                                         | R/W |
| 7   | ENB        | ENB<br>0: Do not compare register value with RMINCNT counter value<br>1: Compare register value with RMINCNT counter value | R/W |

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x14

Value after reset:    x    x    x    x    x    x    x    x

| Bit | Symbol    | Function                                          | R/W |
|-----|-----------|---------------------------------------------------|-----|
| 3:0 | HR1[3:0]  | 1 Hour<br>Value for the ones place of hours.      | R/W |
| 5:4 | HR10[1:0] | 10 Hours<br>Value for the tens place of hours.    | R/W |
| 6   | PM        | AM/PM select for alarm setting.<br>0: AM<br>1: PM | R/W |

| Bit | Symbol | Function                                                                                                                 | R/W |
|-----|--------|--------------------------------------------------------------------------------------------------------------------------|-----|
| 7   | ENB    | ENB<br>0: Do not compare register value with RHRCNT counter value<br>1: Compare register value with RHRCNT counter value | R/W |

RHRAR is an alarm register associated with the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – From 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, you must set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 0x00 by an RTC software reset.

### 23.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x16

|               |     |   |   |   |   |           |   |   |
|---------------|-----|---|---|---|---|-----------|---|---|
| Bit position: | 7   | 6 | 5 | 4 | 3 | 2         | 1 | 0 |
| Bit field:    | ENB | — | — | — | — | DAYW[2:0] |   |   |

Value after reset: x x x x x x x x

| Bit | Symbol    | Function                                                                                                                                                                        | R/W |
|-----|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | DAYW[2:0] | Day-of-Week Setting<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited | R/W |
| 6:3 | —         | The read values are undefined. The write value should be 0.                                                                                                                     | R/W |
| 7   | ENB       | ENB<br>0: Do not compare register value with RWKCNT counter value<br>1: Compare register value with RWKCNT counter value                                                        | R/W |

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR

- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x10 + 0x02 × n

| Bit | Symbol | Function                                                 | R/W |
|-----|--------|----------------------------------------------------------|-----|
| 7:0 | BCNTAR | Alarm register associated with the 32-bit binary counter | R/W |

BCNTnAR is a read/write alarm register associated with the 32-bit binary counter. BCNT3AR is assigned to the BCNTAR[31:24] bits, BCNT2AR is assigned to the BCNTAR[23:16] bits, BCNT1AR is assigned to the BCNTAR[15:8] bits, and BCNT0AR is assigned to the BCNTAR[7:0]. This register is set to 0x00 by an RTC software reset.

### 23.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x18

| Bit | Symbol      | Function                                                                                                                   | R/W |
|-----|-------------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | DATE1[3:0]  | 1 Day<br>Value for the ones place of days.                                                                                 | R/W |
| 5:4 | DATE10[1:0] | 10 Days<br>Value for the tens place of days.                                                                               | R/W |
| 6   | —           | The read value is undefined. The write value should be 0.                                                                  | R/W |
| 7   | ENB         | ENB<br>0: Do not compare register value with RDAYCNT counter value<br>1: Compare register value with RDAYCNT counter value | R/W |

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR

- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1A

| Bit | Symbol    | Function                                                                                                                   | R/W |
|-----|-----------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | MON1[3:0] | 1 Month<br>Value for the ones place of months.                                                                             | R/W |
| 4   | MON10     | 10 Months<br>Value for the tens place of months.                                                                           | R/W |
| 6:5 | —         | The read values are undefined. The write value should be 0.                                                                | R/W |
| 7   | ENB       | ENB<br>0: Do not compare register value with RMONCNT counter value<br>1: Compare register value with RMONCNT counter value | R/W |

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1C

| Bit  | Symbol    | Function                                               | R/W |
|------|-----------|--------------------------------------------------------|-----|
| 3:0  | YR1[3:0]  | 1 Year<br>Value for the ones place of years.           | R/W |
| 7:4  | YR10[3:0] | 10 Years<br>Value for the tens place of years.         | R/W |
| 15:8 | —         | These bits are read as 0. The write value should be 0. | R/W |

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x0000 by an RTC software reset.

### 23.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1E

Bit position: 7 6 5 4 3 2 1 0

|            |     |   |   |   |   |   |   |
|------------|-----|---|---|---|---|---|---|
| Bit field: | ENB | — | — | — | — | — | — |
|------------|-----|---|---|---|---|---|---|

Value after reset: x x x x x x x x

| Bit | Symbol | Function                                                                                                                         | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------------------------|-----|
| 6:0 | —      | The read values are undefined. The write value should be 0.                                                                      | R/W |
| 7   | ENB    | ENB<br>0: Do not compare register value with the RYRCNT counter value<br>1: Compare register value with the RYRCNT counter value | R/W |

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0, 1) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x18 + 0x02 × n

Bit position: 7 6 5 4 3 2 1 0

|            |          |  |  |  |  |  |  |
|------------|----------|--|--|--|--|--|--|
| Bit field: | ENB[7:0] |  |  |  |  |  |  |
|------------|----------|--|--|--|--|--|--|

Value after reset: x x x x x x x x

| Bit | Symbol   | Function                                                           | R/W |
|-----|----------|--------------------------------------------------------------------|-----|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |

BCNTnAER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.20 BCNT2AER : Binary Counter 2 Alarm Enable Register (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1C

|                    |    |    |    |    |    |    |   |          |   |   |   |   |   |   |   |   |
|--------------------|----|----|----|----|----|----|---|----------|---|---|---|---|---|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8        | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | —  |    |    |    |    |    |   | ENB[7:0] |   |   |   |   |   |   |   |   |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0        | x | x | x | x | x | x | x | x |

| Bit  | Symbol   | Function                                                           | R/W |
|------|----------|--------------------------------------------------------------------|-----|
| 7:0  | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |
| 15:8 | —        | These bits are read as 0. The write value should be 0.             | R/W |

BCNT2AER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.21 BCNT3AER : Binary Counter 3 Alarm Enable Register (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1E

|                    |          |   |   |   |   |   |   |   |
|--------------------|----------|---|---|---|---|---|---|---|
| Bit position:      | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | ENB[7:0] |   |   |   |   |   |   |   |
| Value after reset: | x        | x | x | x | x | x | x | x |

| Bit | Symbol   | Function                                                           | R/W |
|-----|----------|--------------------------------------------------------------------|-----|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |

BCNT3AER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.22 RCR1 : RTC Control Register 1

Base address: RTC = 0x4008\_3000

Offset address: 0x22

|                    |          |   |   |   |       |     |     |     |
|--------------------|----------|---|---|---|-------|-----|-----|-----|
| Bit position:      | 7        | 6 | 5 | 4 | 3     | 2   | 1   | 0   |
| Bit field:         | PES[3:0] |   |   |   | RTCOS | PIE | CIE | AIE |

| 1   | CIE      | Carry Interrupt Enable<br>0: Disable carry interrupt requests<br>1: Enable carry interrupt requests                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | R/W |
| 2   | PIE      | Periodic Interrupt Enable<br>0: Disable periodic interrupt requests<br>1: Enable periodic interrupt requests                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | R/W |
| 3   | RTCOS    | RTCOUT Output Select<br>0: Outputs 1 Hz on RTCOUT<br>1: Outputs 64 Hz RTCOUT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | R/W |
| 7:4 | PES[3:0] | Periodic Interrupt Select<br>0x6: Generate periodic interrupt every 1/256 second*1<br>0x7: Generate periodic interrupt every 1/128 second<br>0x8: Generate periodic interrupt every 1/64 second<br>0x9: Generate periodic interrupt every 1/32 second<br>0xA: Generate periodic interrupt every 1/16 second<br>0xB: Generate periodic interrupt every 1/8 second<br>0xC: Generate periodic interrupt every 1/4 second<br>0xD: Generate periodic interrupt every 1/2 second<br>0xE: Generate periodic interrupt every 1 second<br>0xF: Generate periodic interrupt every 2 seconds<br>Others: Do not generate periodic interrupts | R/W |

Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0x6, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

#### AIE bit (Alarm Interrupt Enable)

The AIE bit enables or disables alarm interrupt requests.

If the times indicated in the counters and alarm settings match in Deep Software Standby mode, the MCU returns from Deep Software Standby mode regardless of the AIE bit value.

#### CIE bit (Carry Interrupt Enable)

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

#### PIE bit (Periodic Interrupt Enable)

The PIE bit enables or disabled a periodic interrupt.

If the periods indicated in the counters and PES[3:0] settings match in Deep Software Standby mode, the MCU returns from Deep Software Standby mode regardless of the PIE bit value.

**RTCOS bit (RTCOE Output Select)**

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (RCR2.START = 0) and the RTCOUT output is disabled (RCR2.RTCOE = 0). When RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

**PES[3:0] bits (Periodic Interrupt Select)**

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

**23.2.23 RCR2 : RTC Control Register 2 (in Calendar Count Mode)**

Base address: RTC = 0x4008\_3000

Offset address: 0x24

Note 1. R64CNT, RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, RYRAREN, RADJ, RTCCRn, RSECCPn, RMINCPn, RHRCPn, RDAYCPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See [section 23.6.5. Notes on Writing to and Reading from Registers](#) for notes on register writing/reading.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

### **START bit (Start)**

The START bit stops or restarts the prescaler or time counter operation. This bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

### **RESET bit (RTC Software Reset)**

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

### **ADJ30 bit (30-Second Adjustment)**

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of less than 30 seconds is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment completes. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

### **RTCOE bit (RTCOUT Output Enable)**

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

### **AADJE bit (Automatic Adjustment Enable)**

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

### **AADJP bit (Automatic Adjustment Period Select)**

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

### **HR24 bit (Hours Mode)**

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

### **CNTMD bit (Count Mode Select)**

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#).

### 23.2.24 RCR2 : RTC Control Register 2 (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x24

|                    |           |   |           |           |           |   |           |       |

| 5   | AADJP  | Automatic Adjustment Period Select* <sup>2,3</sup><br>0: Add or subtract RADJ.ADJ [5:0] bits from prescaler count value every 32 seconds<br>1: Add or subtract RADJ.ADJ [5:0] bits from prescaler count value every 8 seconds.                                                                                          | R/W |
| 6   | —      | The read value is undefined. The write value should be 0.                                                                                                                                                                                                                                                               | R/W |
| 7   | CNTMD  | Count Mode Select* <sup>4</sup><br>0: Calendar count mode<br>1: Binary count mode                                                                                                                                                                                                                                       | R/W |

Note 1. R64CNT, BCNTnAR, BCNTnAER, RADJ, RTCCRn, BCNTnCPm, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See [section 23.6.5. Notes on Writing to and Reading from Registers](#) for notes on register writing/reading.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

RCR2 in the binary count mode is a register related to the automatic correction function, RTCOUT output enable, RTC software reset, and count mode control.

#### START bit (Start)

The START bit stops or restarts the prescaler or counter (clock) operation. This bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

#### RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

#### RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

**AADJE bit (Automatic Adjustment Enable)**

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

**AADJP bit (Automatic Adjustment Period Select)**

The AADJP bit selects the automatic-adjustment period.

Correction period can be selected from 32 second units or 8 second units in binary count mode.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

**CNTMD bit (Count Mode Select)**

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#) .

**23.2.25 RCR4 : RTC Control Register 4**

Base address: RTC = 0x4008\_3000

Offset address: 0x28

| Bit | Symbol | Function                                                                          | R/W |
|-----|--------|-----------------------------------------------------------------------------------|-----|
| 0   | RCKSEL | Count Source Select<br>0: Sub-clock oscillator is selected<br>1: LOCO is selected | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.                            | R/W |

The RCR4 register is used in both calendar count mode and binary count mode.

**RCKSEL bit (Count Source Select )**

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The RCKSEL bit is only used in normal operation mode. When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

For details on count source setting, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#) and [section 23.3.2. Clock and Count Mode Setting Procedure](#). The count source must be selected only once before specifying the initial settings of the RTC registers at power on.

**23.2.26 RFRL : Frequency Register L**

Base address: RTC = 0x4008\_3000

Offset address: 0x2C

| Bit  | Symbol    | Function                                                                         | R/W |
|------|-----------|----------------------------------------------------------------------------------|-----|
| 15:0 | RFC[15:0] | Frequency Comparison Value<br>Write 0x00FF to this register when using the LOCO. | R/W |

RFRL is a register for controlling the prescaler when LOCO is selected.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

A value from 0x0007 through 0x01FF can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock is  $\geq$  LOCO.

Calculation method of frequency comparison value:

$$RFC[15:0] = (\text{LOCO clock frequency}) / 128 - 1$$

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 0x00FF.

### 23.2.27 RFRH : Frequency Register H

Base address: RTC = 0x4008\_3000

Offset address: 0x2A

| Bit  | Symbol | Function                                                        | R/W |
|------|--------|-----------------------------------------------------------------|-----|
| 0    | RFC16  | Write 0 before writing to the RFRL register after a cold start. | R/W |
| 15:1 | —      | These bits are read as 0. The write value should be 0.          | R/W |

Before writing to RFRHL.RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

### 23.2.28 RADJ : Time Error Adjustment Register

Base address: RTC = 0x4008\_3000

Offset address: 0x2E

| Bit | Symbol     | Function                                                                                                                                                                                                         | R/W |
|-----|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 5:0 | ADJ[5:0]   | Adjustment Value<br>These bits specify the adjustment value from the prescaler.                                                                                                                                  | R/W |
| 7:6 | PMADJ[1:0] | Plus-Minus<br>0 0: Do not perform adjustment.<br>0 1: Adjustment is performed by the addition to the prescaler<br>1 0: Adjustment is performed by the subtraction from the prescaler<br>1 1: Setting prohibited. | R/W |

The RADJ register is used in both calendar count mode and binary count mode. Adjustment is performed by the addition to or subtraction from the prescaler or 64-Hz counter. If the Automatic Adjustment Enable (RCR2.AADJE) bit is 0, adjustment

is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the Automatic Adjustment Period Select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with more processing. This register is set to 0x00 by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

### ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value (number of sub-clock cycles) from the prescaler.

### PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

## 23.2.29 RTCCR0 : Time Capture Control Register 0

Base address: RTC = 0x4008\_3000

Offset address: 0x40

|                    |      |   |           |   |      |           |   |   |
|--------------------|------|---|-----------|---|------|-----------|---|---|
| Bit position:      | 7    | 6 | 5         | 4 | 3    | 2         | 1 | 0 |
| Bit field:         | TCEN | — | TCNF[1:0] | — | TCST | TCCT[1:0] |   |   |
| Value after reset: | x    | 0 | x         | x | 0    | x         | x | x |

| Bit | Symbol    | Function                                                                                                                                                                                            | R/W |
|-----|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | TCCT[1:0] | Time Capture Control<br>0 0: Do not detect events<br>0 1: Detect rising edge<br>1 0: Detect falling edge<br>1 1: Detect both edges                                                                  | R/W |
| 2   | TCST      | Time Capture Status<br>0: No event detected<br>1: Event detected*1                                                                                                                                  | R/W |
| 3   | —         | This bit is read as 0. The write value should be 0.                                                                                                                                                 | R/W |
| 5:4 | TCNF[1:0] | Time Capture Noise Filter Control<br>0 0: Turn noise filter off<br>0 1: Setting prohibited<br>1 0: Turn noise filter on (count source)<br>1 1: Turn noise filter on (count source by divided by 32) | R/W |
| 6   | —         | These bits are read as 0. The write value should be 0.                                                                                                                                              | R/W |
| 7   | TCEN      | Time Capture Event Input Pin Enable<br>0: Disable the RTCICn pin as the time capture event input pin<br>1: Enable the RTCICn pin as the time capture event input pin                                | R/W |

Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCR0 register is used both in calendar count mode and in binary count mode. RTCCR0 controls the RTCIC0 pin.

RTCCR0 is updated in synchronization with the count source. When RTCCR0 is modified, check that all the bits except the TCST bit are updated before continuing with additional processing. This register is cleared to 0x00 by an RTC software reset. When RTCIC0 is used as the time capture pin, VBTICTLR.VCHnIEN (n = 0) must be set to 1.

### TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pin, RTCIC0. The detection edge is selectable. The TCCT[1:0] bits must be set while the VBTICTLR.VCHnIEN bit is 1.

**TCST bit (Time Capture Status)**

The TCST bit indicates that an event on the time capture event input pin, RTCIC0, was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

The event is detected only during count operation (RCR2.START bit = 1). Before reading the capture register, make sure that this bit is set to 1.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with additional processing.

**TCNF[1:0] bits (Time Capture Noise Filter Control)**

The TCNF[1:0] bits control the noise filter of the time capture event input pin (RTCIC0).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for 3 cycles of the specified sampling period, then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the VBTICTLR.VCHnIEN bit is 1.

**TCEN bit (Time Capture Event Input Pin Enable)**

The TCEN bit enables or disables the time capture event input pin, RTCIC0. When the functions of the time capture event input pins are multiplexed, set VBTICTLR first. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

Before setting this bit to 1, be sure to set the count source setting bit (RCR4.RCKSEL), RTC time capture event enable bit (RCPE.RTCEN), port control setting bits (PmnPFS.PDR, and PmnPFS.PMR). For details on the port control setting bits (PmnPFS.PDR and PmnPFS.PMR), see [section 19, I/O Ports](#).

**23.2.30 RSECCP0 : Second Capture Register 0 (in Calendar Count Mode)**

Base address: RTC = 0x4008\_3000

Offset address: 0x52

|                    |   |   |            |   |   |           |   |   |
|--------------------|---|---|------------|---|---|-----------|---|---|
| Bit position:      | 7 | 6 | 5          | 4 | 3 | 2         | 1 | 0 |
| Bit field:         | — |   | SEC10[2:0] |   |   | SEC1[3:0] |   |   |
| Value after reset: | x | x | x          | x | x | x         | x | x |

| Bit | Symbol     | Function                                                          | R/W |
|-----|------------|-------------------------------------------------------------------|-----|
| 3:0 | SEC1[3:0]  | 1-Second Capture<br>Capture value for the ones place of seconds.  | R   |
| 6:4 | SEC10[2:0] | 10-Second Capture<br>Capture value for the tens place of seconds. | R   |
| 7   | —          | The read value is undefined.                                      | R   |

RSECCP0 is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0 pin is stored in the RSECCP0 register, respectively. This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

### 23.2.31 RMINCP0 : Minute Capture Register 0 (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x54

|                    |   |   |            |   |           |   |   |   |
|--------------------|---|---|------------|---|-----------|---|---|---|
| Bit position:      | 7 | 6 | 5          | 4 | 3         | 2 | 1 | 0 |
| Bit field:         | — |   | MIN10[2:0] |   | MIN1[3:0] |   |   |   |
| Value after reset: | x | x | x          | x | x         | x | x | x |

| Bit | Symbol     | Function                                                          | R/W |
|-----|------------|-------------------------------------------------------------------|-----|
| 3:0 | MIN1[3:0]  | 1-Minute Capture<br>Capture value for the ones place of minutes.  | R   |
| 6:4 | MIN10[2:0] | 10-Minute Capture<br>Capture value for the tens place of minutes. | R   |
| 7   | —          | The read value is undefined.                                      | R   |

RMINCP0 is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0 pin is stored in the RMINCP0 register, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

### 23.2.32 RHRCPO : Hour Capture Register 0 (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x56

|                    |   |    |           |   |          |   |   |   |
|--------------------|---|----|-----------|---|----------|---|---|---|
| Bit position:      | 7 | 6  | 5         | 4 | 3        | 2 | 1 | 0 |
| Bit field:         | — | PM | HR10[1:0] |   | HR1[3:0] |   |   |   |
| Value after reset: | x | x  | x         | x | x        | x | x | x |

| Bit | Symbol    | Function                                                     | R/W |
|-----|-----------|--------------------------------------------------------------|-----|
| 3:0 | HR1[3:0]  | 1-Hour Capture<br>Capture value for the ones place of hours  | R   |
| 5:4 | HR10[1:0] | 10-Hour Capture<br>Capture value for the tens place of hours | R   |
| 6   | PM        | PM<br>0: AM<br>1: PM                                         | R   |
| 7   | —         | The read value is undefined.                                 | R   |

RHRCPO is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0 pin is stored in theRHRCPO register, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

### 23.2.33 RDAYCP0 : Date Capture Register 0 (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x5A

|               |   |   |             |            |   |   |   |   |
|---------------|---|---|-------------|------------|---|---|---|---|
| Bit position: | 7 | 6 | 5           | 4          | 3 | 2 | 1 | 0 |
| Bit field:    | — | — | DATE10[1:0] | DATE1[3:0] |   |   |   |   |

Value after reset: x x x x x x x x

| Bit | Symbol      | Function                                                    | R/W |
|-----|-------------|-------------------------------------------------------------|-----|
| 3:0 | DATE1[3:0]  | 1-Day Capture<br>Capture value for the ones place of days.  | R   |
| 5:4 | DATE10[1:0] | 10-Day Capture<br>Capture value for the tens place of days. | R   |
| 7:6 | —           | The read value is undefined.                                | R   |

RDAYCP0 is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0 pin is stored in the RDAYCP0 register, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

### 23.2.34 RMONCP0 : Month Capture Register 0 (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x5C

|               |   |   |   |           |           |   |   |   |
|---------------|---|---|---|-----------|-----------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4         | 3         | 2 | 1 | 0 |
| Bit field:    | — | — | — | MON1<br>0 | MON1[3:0] |   |   |   |

Value after reset: 0 0 0 x x x x x

| Bit | Symbol    | Function                                                        | R/W |
|-----|-----------|-----------------------------------------------------------------|-----|
| 3:0 | MON1[3:0] | 1-Month Capture<br>Capture value for the ones place of months.  | R   |
| 4   | MON10     | 10-Month Capture<br>Capture value for the tens place of months. | R   |
| 7:5 | —         | These bits are read as 0.                                       | R   |

RMONCP0 is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0 pin is stored in the RMONCP0 register, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

### 23.2.35 BCNTnCP0 : BCNTn Capture Register 0 (n= 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x52 (BCNT0CP0)  
 0x54 (BCNT1CP0)  
 0x56 (BCNT2CP0)  
 0x5A (BCNT3CP0)

BCNTnCP0 is a read-only register that captures the BCNTn value when a time capture event is detected. BCNT3CP0 is assigned to the BCNTCP0[31:24] bits, BCNT2CP0 is assigned to the BCNTCP0[23:16] bits, BCNT1CP0 is assigned to the BCNTCP0[15:8] bits and BCNT0CP0 is assigned to the BCNTCP0[7:0] bits. The event detection times detected by the RTCIC0 pin is stored in the BCNTnCP0 register, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

## 23.3 Operation

### 23.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, perform the initial settings for the clock, count mode, time error adjustment, time, alarm, interrupts, and time capture.

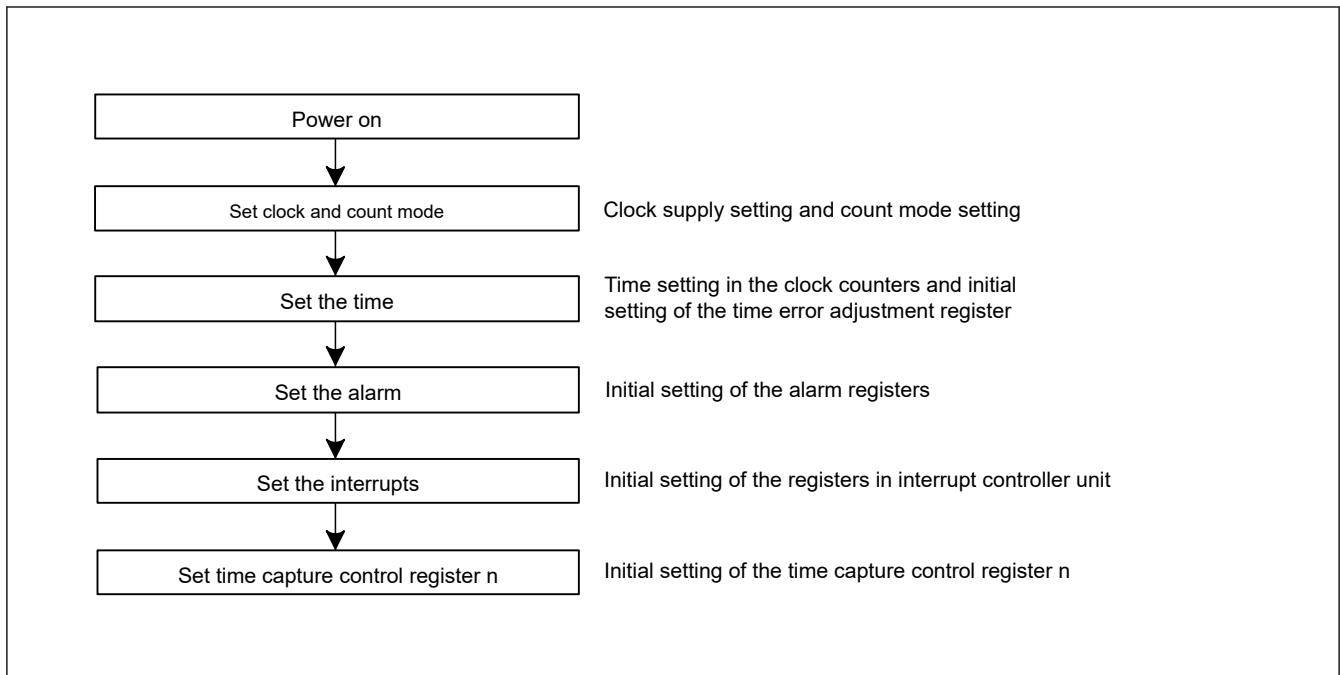

Figure 23.2 Outline of initial settings after a power on

### 23.3.2 Clock and Count Mode Setting Procedure

Figure 23.3 shows how to set the clock and the count mode.

**Figure 23.3 Clock and count mode setting procedure**

### 23.3.3 Setting the Time

Figure 23.4 shows how to set the time.

**Figure 23.4** Setting the time

### 23.3.4 30-Second Adjustment

Figure 23.5 shows how to execute a 30-second adjustment.

**Figure 23.5** 30-second adjustment

### 23.3.5 Reading 64-Hz Counter and Time

[Figure 23.6](#) shows how to read a 64-Hz counter and time.

Figure 23.6 Reading time

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 23.6, and the procedure using carry interrupts is shown in (b). To keep the program simple, method (a) should be used in most cases.

### 23.3.6 Alarm Function

Figure 23.7 shows how to use the alarm function.

**Figure 23.7 Using the alarm function**

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the Alarm Enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the Alarm Enable register.\*1

For any of the ENB[31:0] bits that are set to 1, the bits in the corresponding positions in the binary counter (BCNT[31:0]) are compared with the values of the corresponding bits in the binary alarm registers\*1. When all such bits match, the IR flag associated with the RTC\_ALM interrupt is set to 1 and the corresponding bits in the Interrupt Set-Pending/Clear-Pending Registers are set to 1. Alarm detection can be confirmed by reading the Interrupt Set-Pending Register associated with the RTC\_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC\_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR flag associated with the RTC\_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC\_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC\_ALM interrupt to clear it.

When the counter and the alarm time match in a low power state, the MCU returns from the low power state.

Note 1. For any bits in the ENB bits that are set to 1, the values in the corresponding positions in the alarm registers from the following registers are compared with the corresponding bits of the counted values.

Counter registers: RSECCNT, RMINCNT, RHRCNT, RWKCNT, RDAYCNT, RMONCNT, RYRCNT

Alarm registers: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAREN

### 23.3.7 Procedure for Disabling Alarm Interrupt

Figure 23.8 shows the procedure for disabling the enabled alarm interrupt request.

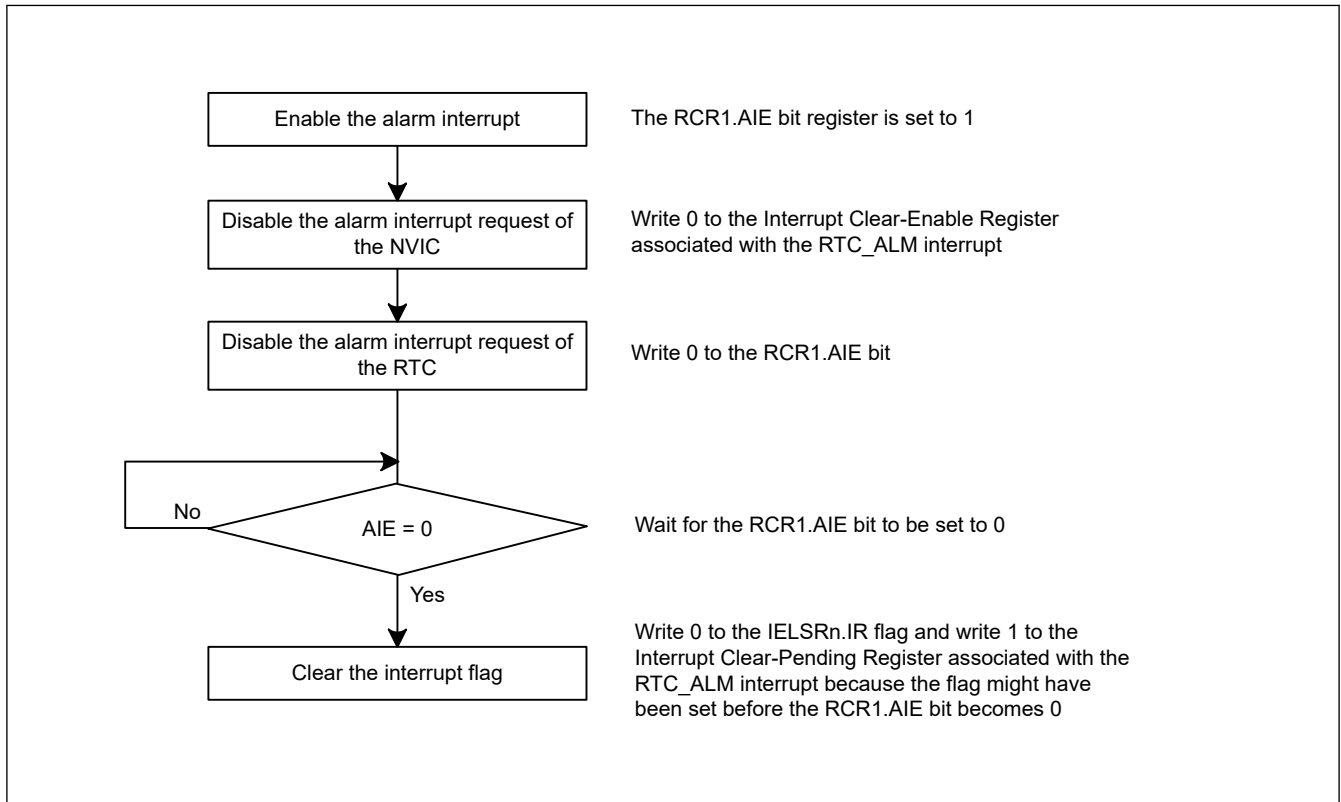

Figure 23.8 Procedure for disabling alarm interrupt request

### 23.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

#### 23.3.8.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

**(1) Example 1: Sub-clock oscillator running at 32.769 kHz****Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (0x3C)

**(2) Example 2: Sub-clock oscillator running at 32.766 kHz****Adjustment procedure**

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32766 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs slow by 2 clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 20 (0x14)

**(3) Example 3: Sub-clock oscillator running at 32.764 kHz****Adjustment procedure**

When the sub-clock oscillator is running at 32.764 kHz, 1 second elapses on 32764 clock cycles. Because the RTC operates for 32768 clock cycles as 1 second, the clock is delayed for 4 clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by advancing the clock 32 clock cycles every 8 seconds.

**Register settings when RCR2.CNTMD = 1:**

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (0x20)

**23.3.8.2 Adjustment by Software**

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register on execution of a write instruction to the RADJ register.

**(1) Example 1: Sub-clock oscillator running at 32.769 kHz****Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 1 clock cycle per second, so adjustment can take the form of setting the clock back by 1 cycle every second.

**Register settings**

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (0x01)  
This is written to the RADJ register once per 1-second interrupt.

### 23.3.8.3 Procedure to Change the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
3. Use the RCR2.AADJP bit to select the period of adjustment.
4. In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
3. Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the wanted time. After that, the time is adjusted every time a value is written to the RADJ register.

### 23.3.8.4 Procedure to Stop Adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

### 23.3.9 Capturing the time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin in calendar count mode or binary count mode .

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the RTCCRn.TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Set VBTICTLR.VCHnIEN (n = 0 to 2) to 1 to enable the RTCICn input. Operation when the noise filter is off is shown in [Figure 23.9](#) and operation when the noise filter is on is shown in [Figure 23.10](#).

Figure 23.9 Timing of a time capture operation with the noise filter off

Figure 23.10 Timing of a time capture operation with the noise filter on

## 23.4 Interrupt Sources

The RTC has three interrupt sources, as listed in [Table 23.3](#).

Table 23.3 RTC interrupt sources

| Name    | Interrupt source   |
|---------|--------------------|
| RTC_ALM | Alarm interrupt    |
| RTC_PRD | Periodic interrupt |
| RTC_CUP | Carry interrupt    |

### (1) Alarm interrupt (RTC\_ALM)

This interrupt is generated based on the comparison result between the alarm registers and RTC counters. For details, see [section 23.3.6. Alarm Function](#).

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR flag and the interrupt Set-Pending Register associated with the RTC\_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not 1 again until there is another match or the values of the alarm registers are modified again.

Figure 23.11 Timing for the alarm interrupt (RTC\_ALM)

(2) Periodic interrupt (RTC\_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected in the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC\_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

Figure 23.12 shows the timing of the carry interrupt (RTC\_CUP).

Figure 23.12 Timing for the carry interrupt (RTC\_CUP)

23.5 Event Link Output

The RTC generates periodic event output (RTC\_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

**Note:** If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

### 23.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output to the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

**Note:** Although alarm and periodic interrupts can still be output during Software Standby or Deep Software Standby mode, the periodic event signals for the ELC are not output.

## 23.6 Usage Notes

### 23.6.1 Register Writing during Counting

The following registers should not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL

The counter should be stopped before writing to any of these registers.

### 23.6.2 Use of Periodic Interrupts

Figure 23.13 shows the procedure for using periodic interrupts.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits.

In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.

**Figure 23.13** Using the periodic interrupt function

### 23.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

### 23.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode, Deep Software Standby mode, or battery backup state) during a write to an RTC register might corrupt the value of the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

### 23.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when fourth read operations are performed after writing.
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after returning from a reset or a period in Software Standby mode, Deep Software Standby mode, or battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock have elapsed.

### 23.6.6 Changing the Count Mode

When changing the count mode (calendar count mode/binary count mode), set the RCR2.START bit to 0, stop the counting operation, then start it again from the initial setting. For details on the initial setting, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#).

### 23.6.7 Initialization Procedure When the RTC Is Not to Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in [Figure 23.14](#).

Alternatively, when the sub-clock oscillator is not used as the system clock or realtime clock, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see [section 8, Clock Generation Circuit](#).

**Figure 23.14** Initialization procedure

### 23.6.8 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. If the RTC periodical interrupt or RTC periodical event output was generated at this time, the interrupt or event is invalid.

## 24. Watchdog Timer (WDT)

### 24.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 24.1 lists the WDT specifications and Figure 24.1 shows a block diagram.

**Table 24.1 WDT specifications**

| Parameter                                | Specifications                                                                                                                                                                                                                                                                                                                                  |

| TrustZone Filter                         | Security attribution can be set                                                                                                                                                                                                                                                                                                                 |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB)  $\geq 4 \times$  (the frequency of the count clock source after division).

Figure 24.1 WDT block diagram

## 24.2 Register Descriptions

### 24.2.1 WDTRR : WDT Refresh Register

Base address: WDT = 0x4008\_3400

Offset address: 0x00

Bit position: 7 0

Value after reset: 1 1 1 1 1 1 1 1

| Bit | Symbol | Function                                                                              | R/W |
|-----|--------|---------------------------------------------------------------------------------------|-----|
| 7:0 | n/a    | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register. | R/W |

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then writing 0xFF to WDTRR register (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected by setting the WDT Timeout Period Select bits (OFS0.WDTPPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected by setting the Timeout Period Select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see [section 24.3.3. Refresh Operation](#).

## 24.2.2 WDTCR : WDT Control Register

Base address: WDT = 0x4008\_3400

Offset address: 0x02

|                    |    |    |           |    |    |           |          |   |   |   |   |           |   |   |   |   |

| 13:12 | RPSS[1:0] | Window Start Position Select<br>0 0: 25%<br>0 1: 50%<br>1 0: 75%<br>1 1: 100% (do not specify window start position).                                                | R/W |
| 15:14 | —         | These bits are read as 0. The write value should be 0.                                                                                                               | R/W |

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply to writing to the WDTCR register. For details, see [section 24.3.2. Controlling Writing to the WDTCR, WDTSCR, and WDTCSR Registers](#).

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made in the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

### TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

[Table 24.2](#) lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

**Table 24.2** Timeout period settings

| CKS[3:0] bits | TOPS[1:0] bits | Clock division ratio | Timeout period (number of cycles) | PCLKB clock cycles |
|---------------|----------------|----------------------|-----------------------------------|--------------------|
| 0x1           | 00b            | PCLKB/4              | 1024                              | 4096               |
|               | 01b            |                      | 4096                              | 16384              |
|               | 10b            |                      | 8192                              | 32768              |
|               | 11b            |                      | 16384                             | 65536              |
| 0x4           | 00b            | PCLKB/64             | 1024                              | 65536              |
|               | 01b            |                      | 4096                              | 262144             |
|               | 10b            |                      | 8192                              | 524288             |
|               | 11b            |                      | 16384                             | 1048576            |
| 0xF           | 00b            | PCLKB/128            | 1024                              | 131072             |
|               | 01b            |                      | 4096                              | 524288             |
|               | 10b            |                      | 8192                              | 1048576            |
|               | 11b            |                      | 16384                             | 2097152            |
| 0x6           | 00b            | PCLKB/512            | 1024                              | 524288             |
|               | 01b            |                      | 4096                              | 2097152            |
|               | 10b            |                      | 8192                              | 4194304            |
|               | 11b            |                      | 16384                             | 8388608            |
| 0x7           | 00b            | PCLKB/2048           | 1024                              | 2097152            |
|               | 01b            |                      | 4096                              | 8388608            |
|               | 10b            |                      | 8192                              | 16777216           |
|               | 11b            |                      | 16384                             | 33554432           |
| 0x8           | 00b            | PCLKB/8192           | 1024                              | 8388608            |
|               | 01b            |                      | 4096                              | 33554432           |
|               | 10b            |                      | 8192                              | 67108864           |
|               | 11b            |                      | 16384                             | 134217728          |

**CKS[3:0] bits (Clock Division Ratio Select)**

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4096 and 134217728 PCLKB clock cycles.

**RPES[1:0] bits (Window End Position Select)**

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

**RPSS[1:0] bits (Window Start Position Select)**

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

Table 24.3 lists the counter values for the window start and end positions, and Figure 24.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

**Table 24.3 Relationship between the timeout period and window start and end counter values**

| TOPS[1:0] | Timeout period |               | Window start and end counter value |        |        |        |
|-----------|----------------|---------------|------------------------------------|--------|--------|--------|
|           | Cycles         | Counter value | 100%                               | 75%    | 50%    | 25%    |
| 00b       | 1024           | 0x03FF        | 0x03FF                             | 0x02FF | 0x01FF | 0x00FF |
| 01b       | 4096           | 0x0FFF        | 0x0FFF                             | 0x0BFF | 0x07FF | 0x03FF |
| 10b       | 8192           | 0x1FFF        | 0x1FFF                             | 0x17FF | 0x0FFF | 0x07FF |
| 11b       | 16384          | 0x3FFF        | 0x3FFF                             | 0x2FFF | 0x1FFF | 0x0FFF |

**Figure 24.2 RPSS[1:0] and RPES[1:0] bits setting and refresh-permitted period**

### 24.2.3 WDTSR : WDT Status Register

Base address: WDT = 0x4008\_3400

Offset address: 0x04

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

|            |           |           |              |  |  |  |  |  |  |  |  |  |  |  |  |
|------------|-----------|-----------|--------------|--|--|--|--|--|--|--|--|--|--|--|--|
| Bit field: | REFE<br>F | UNDF<br>F | CNTVAL[13:0] |  |  |  |  |  |  |  |  |  |  |  |  |
|------------|-----------|-----------|--------------|--|--|--|--|--|--|--|--|--|--|--|--|

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol       | Function                                                            | R/W              |
|------|--------------|---------------------------------------------------------------------|------------------|
| 13:0 | CNTVAL[13:0] | Down-Counter Value<br>Value counted by the down-counter             | R                |
| 14   | UNDF         | Underflow Flag<br>0: No underflow occurred<br>1: Underflow occurred | R/W <sup>1</sup> |

| Bit | Symbol | Function                                                                        | R/W              |
|-----|--------|---------------------------------------------------------------------------------|------------------|
| 15  | REFEF  | Refresh Error Flag<br>0: No refresh error occurred<br>1: Refresh error occurred | R/W <sup>1</sup> |

Note 1. Only 0 can be written to clear the flag.

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

### CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

### UNDFE flag (Underflow Flag)

Read the UNDFE flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFE flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

### REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

## 24.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT = 0x4008\_3400

Offset address: 0x06

|                    |             |   |   |   |   |   |   |   |
|--------------------|-------------|---|---|---|---|---|---|---|
| Bit position:      | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | RSTIR<br>QS | — | — | — | — | — | — | — |
| Value after reset: | 1           | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function                                               | R/W |
|-----|--------|--------------------------------------------------------|-----|
| 6:0 | —      | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol  | Function                                           | R/W |
|-----|---------|----------------------------------------------------|-----|
| 7   | RSTIRQS | WDT Behavior Selection<br>0: Interrupt<br>1: Reset | R/W |

The WDTRCR register controls reset output by a WDT down-counter underflow or interrupt request output.

Some constraints apply to writing to the WDTRCR register. For details, see [section 24.3.2. Controlling Writing to the WDTCR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTRCR register can also be made for the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

### 24.2.5 WDTCSNPR : WDT Count Stop Control Register

Base address: WDT = 0x4008\_3400

Offset address: 0x08

|               |            |   |   |   |   |   |   |   |
|---------------|------------|---|---|---|---|---|---|---|
| Bit position: | 7          | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | SLCS<br>TP | — | — | — | — | — | — | — |

Value after reset: 1 0 0 0 0 0 0 0 0

| Bit | Symbol | Function                                                                                            | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------|-----|
| 6:0 | —      | These bits are read as 0. The write value should be 0.                                              | R/W |
| 7   | SLCSTP | Sleep-Mode Count Stop Control<br>0: Disable count stop<br>1: Stop count on transition to Sleep mode | R/W |

The WDTCSNPR register controls whether to stop the WDT counter in Sleep mode. Some constraints apply to writing to the WDTCSNPR register. For details, see [section 24.3.2. Controlling Writing to the WDTCR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTCSNPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSNPR register can also be made for the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

#### SLCSTP bit (Sleep-Mode Count Stop Control)

The SLCSTP bit selects whether to stop counting on transition to Sleep mode.

### 24.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

## 24.3 Operation

### 24.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting starts with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state according to the settings in the Option Function Select register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the WDTRR register after the respective registers are set after a release from the reset state.

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register.

When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are disabled while the settings in the OFS0 register are enabled.

When the register start mode is selected, the setting for the OFS0 register is disabled while the settings for the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

### 24.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected, the OFS0 register setting is invalid, and the WDT control register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

After the reset state is released, set the following:

- Clock division ratio in the WDTCR register
- Window start and end positions in the WDTCR register
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to Sleep mode in the WDTCSSTPR register

The WDT refresh register (WDTRR) refreshes the down counter. As a result, the downcount starts at the value set by the timeout period selection bit (WDTCR.TOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt request/interrupt request as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs the reset signal or a non-maskable interrupt request/interrupt request (WDT\_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). The interrupt enabled for operating the NMI can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 24.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- WDT reset interrupt request selection (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

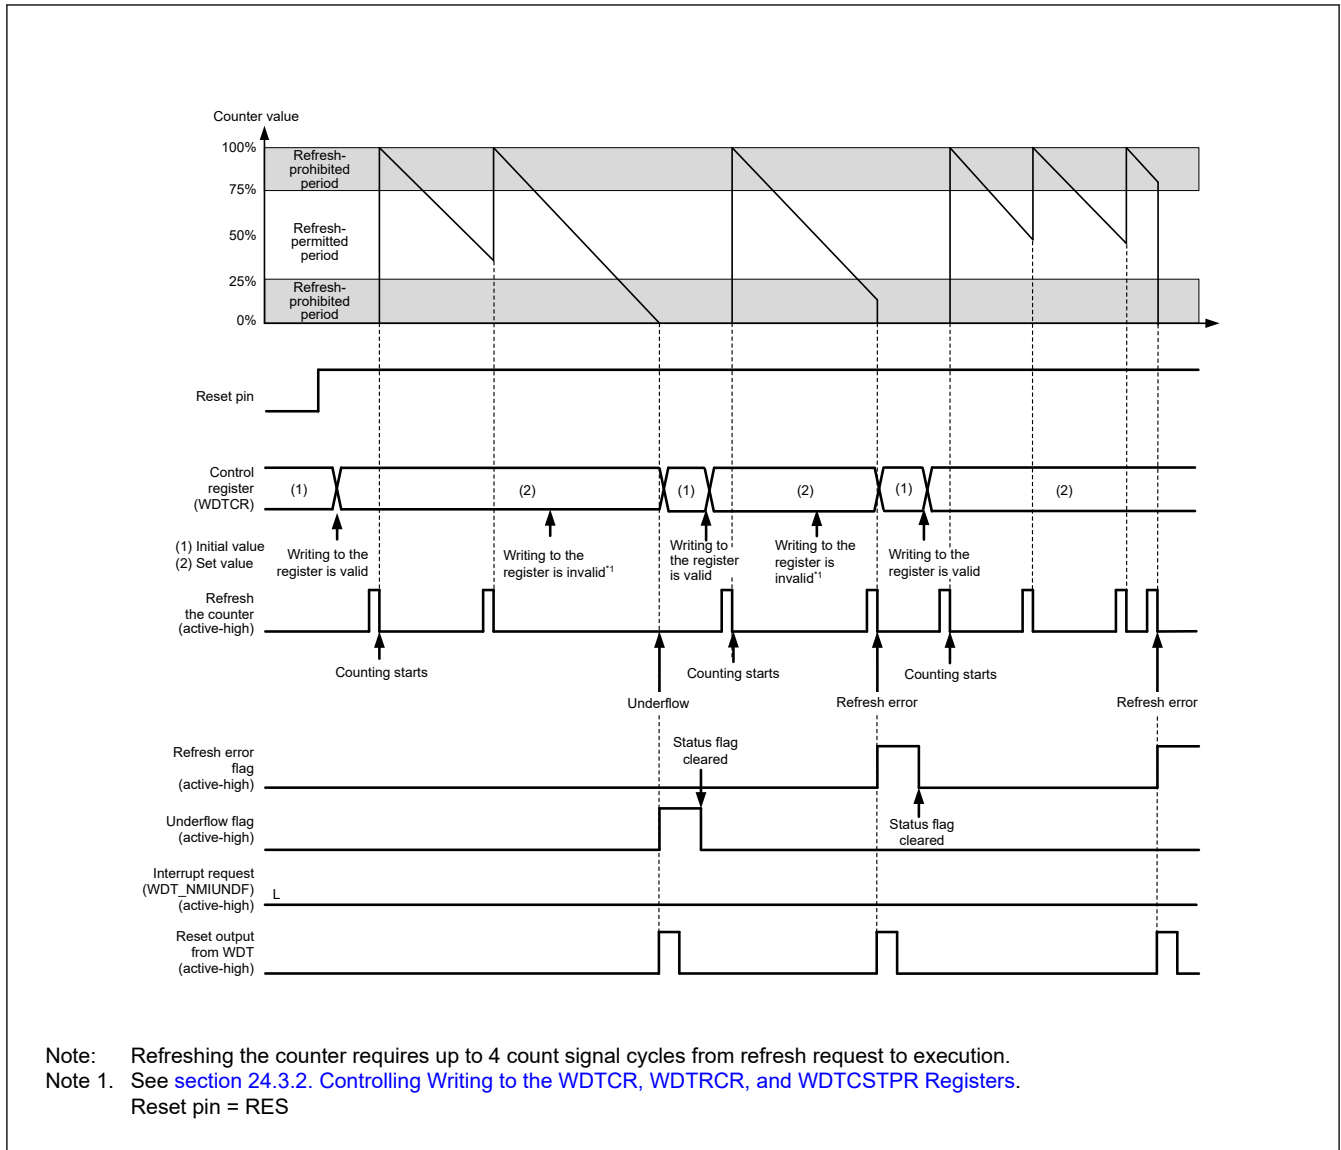

Figure 24.3 Operation example in register start mode

### 24.3.1.2 Auto start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected, the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control during transition to Sleep mode

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt

request/interrupt request (WDT\_NMIUNDF) as long as the counting continues. However, if the down-counter underflows because refreshing of the down-counter is not possible due to a runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or non-maskable interrupt request/interrupt request (WDT\_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected by setting the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 24.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- WDT behavior selection: interrupt (OFS0.WDTRSTIRQS = 0)
- Non-maskable Interrupt: WDT Underflow/Refresh Error Interrupt Enabled (NMIER.WDTEN = 1)
- The window start position is 75% (OFS0.WDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDTRPES[1:0] = 10b)

Figure 24.4 Operation example in auto start mode

### 24.3.2 Controlling Writing to the WDTCR, WDTRCR, and WDTCSSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSSTPR) is possible once each between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or writing to the WDTCR, WDTRCR, or WDTCSSTPR register, the protection signal in the WDT becomes 1 to protect the WDTCR, WDTRCR, and WDTCSSTPR registers against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 24.5 shows control waveforms produced in response to writing to the WDTCR register.

Figure 24.5 Control waveforms produced in response to writing to the WDTCR register

### 24.3.3 Refresh Operation

The down-counter is refreshed and starts counting operation on a write of the values 0x00 and then 0xFF to the WDT Refresh Register (WDTRR). If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on a write of 0x00 and then 0xFF to the WDTRR register.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the 0xFF write. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 ((n-1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from WDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing 0xFF to WDTRR 4 count cycles before the down-counter underflows.

Figure 24.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.

Figure 24.6 WDT refresh operation waveforms when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

Note: When setting the refresh time, consider the oscillation accuracy of the clock sources of the PCLKB and WDTCLK. Set values which ensure that refreshing is possible even when the frequency varies in the range of error of the oscillation accuracy.

### 24.3.4 Status Flags

The refresh error (WDTSR.REFEEF) and underflow (WDTSR.UNDFE) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEEF and WDTSR.UNDFE flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see [section 24.2.3. WDTSR : WDT Status Register](#).

### 24.3.5 Reset Output

When the Reset Interrupt Select bit (WDTSCR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up again and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

### 24.3.6 Interrupt Sources

When the Reset Interrupt Select bit (WDTSCR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start mode, an interrupt (WDT\_NMIUNDF) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

**Table 24.4 WDT interrupt source**

| Name        | Interrupt source                                                                                | Interrupt to CPU | Start DMAC or DTC |
|-------------|-------------------------------------------------------------------------------------------------|------------------|-------------------|
| WDT_NMIUNDF | <ul style="list-style-type: none"> <li>Down-counter underflow</li> <li>Refresh error</li> </ul> | Possible         | Not possible      |

### 24.3.7 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

Figure 24.7 shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.

**Figure 24.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOP5[1:0] = 01b**

### 24.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers

Table 24.5 lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. For details on the Option Function Select Register 0 (OFS0), see section 6.2.1. [OFS0 : Option Function Select Register 0](#).

**Table 24.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers**

| Control target                           | Function                         | OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0 | WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1 |
|------------------------------------------|----------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------|
| Down-counter                             | Timeout period selection         | OFS0.WDTPS[1:0]                                             | WDTCR.TOP5[1:0]                                                 |
|                                          | Clock division ratio selection   | OFS0.WDTCKS[3:0]                                            | WDTCR.CKS[3:0]                                                  |
|                                          | Window start position selection  | OFS0.WDTRPSS[1:0]                                           | WDTCR.RPSS[1:0]                                                 |
|                                          | Window end position selection    | OFS0.WDTRPES[1:0]                                           | WDTCR.RPES[1:0]                                                 |
| Reset output or interrupt request output | Select a reset interrupt request | OFS0.WDTRSTIRQS                                             | WDTCR.RSTIRQS                                                   |
| Count stop                               | Sleep mode count stop control    | OFS0.WDTSTPCTL                                              | WDTCSR.SLCSTP                                                   |

## 24.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow and refresh error. An event signal is output regardless of the settings of the WDTRCR.RSTIRQS bit in register start mode or the OFS0.WDTRSTIRQS bit in auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDF) is 1. For details, see [section 18, Event Link Controller \(ELC\)](#).

## 24.5 Usage Notes

### 24.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x53 to ICU Event Link Setting Register n (ICU.IELSRn) is prohibited when WDT reset interrupt request selection resets (OFS0.WDTRSTIRQS = 0 or WDTRCR.RSTIRQS = 0) or when enabling event link operation (IELSRn.ELS[8:0] = 0x53).

## 25. Independent Watchdog Timer (IWDT)

### 25.1 Overview

The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT in the following respects:

- The divided IWDT-dedicated clock (IWDTCLK) is used as the count source (not affected by PCLKB)
- IWDT does not support register start mode

Table 25.1 lists the IWDT specifications and Figure 25.1 shows a block diagram.

**Table 25.1 IWDT specifications**

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB)  $\geq 4 \times$  (the frequency of the count clock source after division).

The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

Figure 25.1 IWDT block diagram

## 25.2 Register Descriptions

### 25.2.1 IWDTRR : IWDT Refresh Register

Base address: IWDT = 0x4008\_3200

Offset address: 0x00

Bit position: 7 0

Bit field:

Value after reset: 1 1 1 1 1 1 1 1

| Bit | Symbol | Function                                                                             | R/W |
|-----|--------|--------------------------------------------------------------------------------------|-----|
| 7:0 | n/a    | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register | R/W |

The IWDTRR register refreshes the down-counter of the IWDT. The down-counter of the IWDT is refreshed by writing 0x00 and then writing 0xFF to IWDTRR (refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]) in the Option Function Select Register 0 (OFS0).

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see [section 25.3.2. Refresh Operation](#).

## 25.2.2 IWDTSR : IWDT Status Register

Base address: IWDT = 0x4008\_3200

Offset address: 0x04

| Bit  | Symbol       | Function                                                                        | R/W              |
|------|--------------|---------------------------------------------------------------------------------|------------------|
| 13:0 | CNTVAL[13:0] | Down-counter Value<br>Value counted by the down-counter                         | R                |
| 14   | UNDF         | Underflow Flag<br>0: No underflow occurred<br>1: Underflow occurred             | R/W <sup>1</sup> |
| 15   | REFEF        | Refresh Error Flag<br>0: No refresh error occurred<br>1: Refresh error occurred | R/W <sup>1</sup> |

Note 1. Only 0 can be written to clear the flag.

The IWDTSR register indicates the counter value of the down-counter and whether an underflow or refresh error occurred in the down-counter.

### CNTVAL[13:0] bits (Down-counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

### UNDF flag (Underflow Flag)

Read the UNDF flag to confirm whether an underflow occurred in the down-counter. The value 1 indicates that the down-counter underflowed. Write 0 to the UNDF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCLK cycles after an underflow. N is specified in the IWDTCKS[3:0] bits as follows:

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCKS[3:0] = 0x5, N = 256.

### REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred. This indicates that a refresh operation was performed during a prohibited period. The value 1 indicates that a refresh error occurred. Write 0 to the REFEF flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCLK cycles following a refresh error. N is specified in the IWDTCKS[3:0] bits as follows:

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCKS[3:0] = 0x5, N = 256.

### 25.2.3 OFS0 : Option Function Select Register 0

For information on the Option Function Select Register 0 (OFS0), see [section 6.2.1. OFS0 : Option Function Select Register 0](#).

#### IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits select the timeout period, that is, the period until the down-counter underflows, from 128, 512, 1024, or 2048 cycles, taking the divided clock specified in the IWDTCKS[3:0] bits as 1 cycle.

After the down-counter is refreshed, the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits determines the number of IWDTCLK cycles until the counter underflows.

[Table 25.2](#) lists the relationship between the IWDTCKS[3:0] and IWDTTOPS[1:0] bit settings, the timeout period, and the number of IWDTCLK cycles.

**Table 25.2** Timeout period settings

| IWDTCKS[3:0] bits |    |    |    | IWDTTOPS[1:0] bits |    | Clock division ratio | Timeout period (number of cycles) | IWDTCLK cycles |
|-------------------|----|----|----|--------------------|----|----------------------|-----------------------------------|----------------|
| b7                | b6 | b5 | b4 | b3                 | b2 |                      |                                   |                |
| 0                 | 0  | 0  | 0  | 0                  | 0  | IWDTCLK              | 128                               | 128            |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 512            |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 1024           |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 2048           |
| 0                 | 0  | 1  | 0  | 0                  | 0  | IWDTCLK/16           | 128                               | 2048           |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 8192           |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 16384          |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 32768          |
| 0                 | 0  | 1  | 1  | 0                  | 0  | IWDTCLK/32           | 128                               | 4096           |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 16384          |

#### IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the IWDT-dedicated clock (IWDTCLK) divided by 1, 16, 32, 64, 128, and 256. Combined with the IWDTTOPS[1:0] bit setting, the IWDT can be configured to a count period between 128 and 524,288 IWDTCLK cycles.

**IWDRPES[1:0] bits (IWDT Window End Position Select)**

The IWDRPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

**IWDRPSS[1:0] bits (IWDT Window Start Position Select)**

The IWDRPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

Table 25.3 lists the counter values for the window start and end positions, and Figure 25.2 shows the refresh-permitted period set in the IWDRPSS[1:0], IWDRPES[1:0], and IWDTTOPS[1:0] bits.

**Table 25.3 Relationship between the timeout period and window start and end counter values**

| IWDTTOPS[1:0] bits |    | Timeout period |               | Window start and end counter value |        |        |        |
|--------------------|----|----------------|---------------|------------------------------------|--------|--------|--------|
| b3                 | b2 | Cycles         | Counter value | 100%                               | 75%    | 50%    | 25%    |
| 0                  | 0  | 128            | 0x007F        | 0x007F                             | 0x005F | 0x003F | 0x001F |
| 0                  | 1  | 512            | 0x01FF        | 0x01FF                             | 0x017F | 0x00FF | 0x007F |
| 1                  | 0  | 1024           | 0x03FF        | 0x03FF                             | 0x02FF | 0x01FF | 0x00FF |
| 1                  | 1  | 2048           | 0x07FF        | 0x07FF                             | 0x05FF | 0x03FF | 0x01FF |

**Figure 25.2 IWDRPSS[1:0] and IWDRPES[1:0] bit settings and refresh-permitted period**

**IWDRSTIRQS bit (IWDT Reset Interrupt Request Select)**

The IWDRSTIRQS bit specifies the behavior when an underflow or a refresh error occurs. Setting 1 selects reset output. Setting 0 selects interrupt.

### IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit selects whether to stop counting on transition to Sleep, Snooze, or Software Standby mode.

## 25.3 Operation

### 25.3.1 Auto Start Mode

When the IWDT Start Mode Select bit (OFS0.IWDTSTRT) in the Option Function Select Register 0 is 0, auto start mode is selected, otherwise the IWDT is disabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio (OFS0.IWDTCKS[3:0])
- Window start and end positions (OFS0.IWDRPSS[1:0], OFS0.IWDRPES[1:0])
- Timeout period (OFS0.IWDTTOPS[1:0])
- Reset output or interrupt request (OFS0.IWDRSTIRQS)

When the reset state is released, the counter automatically starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]).

After that, as long as the program continues normal operation and the counter is refreshed within the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The IWDT does not output the reset signal as long as this procedure continues. However, if the counter underflows because the program crashed or because a refresh error occurred when an attempt is made to refresh outside the refresh-permitted period, the IWDT asserts the reset signal or non-maskable interrupt request/interrupt request (IWDT\_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle, the value of the timeout period is set in the down-counter and counting starts. The reset output or interrupt request output can be selected with the IWDT Reset Interrupt Request Select bit (OFS0.IWDRSTIRQS). The interrupt enabled for operating the NMI can be selected with the IWDT Underflow/Refresh Error Interrupt Enable bit (NMIER.IWDTEN).

Figure 25.3 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- IWDT behavior selection: interrupt (OFS0.IWDRSTIRQS = 0)
- Non-maskable Interrupt: IWDT Underflow/Refresh Error Interrupt Enabled (NMIER.IWDTEN = 1)
- The window start position is 75% (OFS0.IWDRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDRPES[1:0] = 10b).

Figure 25.3 Operation example in auto start mode

### 25.3.2 Refresh Operation

The down-counter is refreshed and operation starts (counting is started by refreshing) by writing the values 0x00 and then 0xFF to the IWDT Refresh Register (IWDTRR). If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on a write of 0x00 and then 0xFF to the IWDTRR.

When writes are made in the order of 0x00 (first time) → 0x00 (second time), and if 0xFF is written after that, the writing order 0x00 → 0xFF is satisfied. Writing 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF is valid, and the refresh is performed correctly. Even when the first value written before 0x00 is not 0x00, correct refreshing is performed as long as the operation contains the write sequence of 0x00 → 0xFF.

Correct refreshing is also performed regardless of whether a register other than IWDTRR is accessed or IWDTRR is read between writing 0x00 and writing 0xFF to IWDTRR. Writes to refresh the counter must be made within the refresh-permitted period. Whether writing is done within the refresh-permitted period is determined when 0xFF is written. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid to refresh the counter]

- 0x00 → 0xFF
- 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from IWDTRR → 0xFF.

[Example write sequences that are not valid to refresh the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)

- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF.

After 0xFF is written to the IWDTRR register, refreshing the counter requires up to 4 cycles of the signal for counting (the IWDT-Dedicated Clock Frequency Division Ratio Select bits (OFS0.IWDTCKS[3:0]) to determine how many cycles of the IWDT-dedicated clock (IWDTCLK) make up 1 cycle for counting. To meet this requirement, writing 0xFF to the IWDTRR must be completed 4 count cycles before the end of the refresh-permitted period or a down-counter underflow. The value of the counter can be checked with the counter bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 0x1FFF, even if 0x00 is written to IWDTRR before 0x1FFF is reached at (0x2002, for example), refreshing occurs if 0xFF is written to IWDTRR after the value of the IWDTSR.CNTVAL[13:0] bits reaches 0x1FFF
- When the window end position is set to 0x1FFF, refreshing occurs if 0x2003 (4 count cycles before 0x1FFF) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to IWDTRR
- When the refresh-permitted period continues until count 0x0000, refreshing can be performed immediately before an underflow. In this case, if 0x0003 (4 count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to IWDTRR, no underflow occurs and refreshing is performed.

Figure 25.4 shows the IWDT refresh-operation waveforms when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

Figure 25.4 IWDT refresh operation waveforms when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b

### 25.3.3 Status Flags

The refresh error (IWDTSR.REFEF) and underflow (IWDTSR.UNDF) flags retain the source of the interrupt request from the IWDT. Therefore, after a release from the interrupt request generation, read the IWDTSR.REFEF and UNDF flags to check for the interrupt source. For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the time of the next interrupt request from the IWDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see [section 25.2.2. IWDTSR : IWDT Status Register](#).

### 25.3.4 Reset Output

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1, a reset signal is output when an underflow in the counter or a refresh error occurs. Counting down automatically starts after the reset output.

### 25.3.5 Interrupt Sources

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0, an interrupt (IWDT\_NMIUNDF) signal occurs when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

**Table 25.4 IWDT interrupt source**

| Name         | Interrupt source                                                                                | Interrupt to CPU | Start DMAC or DTC |
|--------------|-------------------------------------------------------------------------------------------------|------------------|-------------------|
| IWDT_NMIUNDF | <ul style="list-style-type: none"> <li>Down-counter underflow</li> <li>Refresh error</li> </ul> | Possible         | Not possible      |

### 25.3.6 Reading the Down-Counter Value

As the counter is a IWDT-dedicated clock (IWDTCLK), the counter value cannot be read directly. The IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (IWDTSR.CNTVAL[13:0]) of the IWDT Status Register. Check these bits to obtain the counter value indirectly.

Reading the counter value requires multiple PCLKB clock cycles (up to 4 clock cycles), and the read counter value might differ from the actual counter value by a value of one count.

[Figure 25.5](#) shows the processing for reading the IWDT counter value when  $PCLKB > IWDTCLK$  and the clock division ratio is  $IWDTCLK$ .

**Figure 25.5 Processing for reading IWDT counter value when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b**

## 25.4 Output to the Event Link Controller (ELC)

The IWDT is capable of link operation for a specified module when the interrupt request signal is used as an event signal by the event link controller (ELC). The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting of the OFS0.IWDRSTIRQS bit. An event signal can also be output at generation of the next interrupt source while the Refresh Error flag (IWDTSR.REFEF) or Underflow flag (IWDTSR.UNDF) is 1. For details, see [section 18, Event Link Controller \(ELC\)](#).

## 25.5 Usage Notes

### 25.5.1 Refresh Operations

While configuring the refresh time, consider variations in the range of errors given the accuracy of PCLKB and IWDTCLK. Set values that ensure refreshing is possible.

### 25.5.2 Clock Division Ratio Setting

Satisfy the frequency of the peripheral module clock ( $PCLKB \geq 4 \times$  (the frequency of the count clock source after division)).

### 25.5.3 Constraints on the ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x52 to ICU Event Link Setting Register n (IELSRn.IELS[8:0]) is prohibited when enabling the IWDT reset assertion (OFS0.IWDRSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x52).

## 26. USB 2.0 Full-Speed Module (USBFS)

### 26.1 Overview

The USB 2.0 Full-Speed module (USBFS) operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all the transfer types defined in the USB 2.0 specification.

The USBFS has FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 26.1 lists the USBFS specifications, Figure 26.1 shows a block diagram, and Table 26.2 lists the I/O pins.

**Table 26.1 USBFS specifications**

| Parameter                | Specifications                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

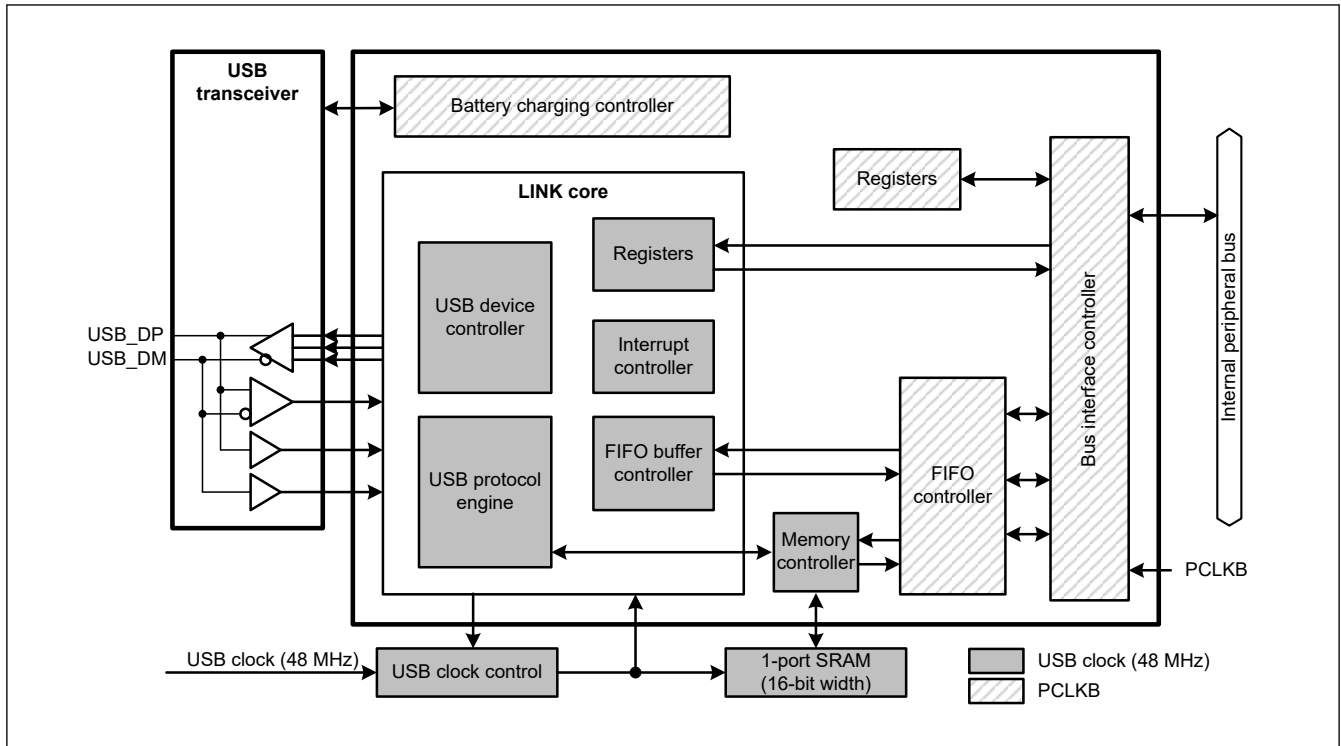

Figure 26.1 USBFS block diagram

Table 26.2 USBFS pin configuration

| Function | Pin name    | I/O    | Description                                                                                                                                                                                                       |
|----------|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USBFS    | USB_DP      | I/O    | D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus.                                                                                                             |
|          | USB_DM      | I/O    | D- I/O pin of the USB on-chip transceiver. This pin should be connected to the D- pin of the USB bus.                                                                                                             |
|          | USB_VBUS    | Input  | USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller. |
|          | USB_VBUSEN  | Output | VBUS (5 V) supply enable signal for external power supply chip.                                                                                                                                                   |
|          | USB_OVRCURA | Input  | External overcurrent detection signals should be connected to these pins.                                                                                                                                         |
|          | VCC_USB     | Input  | Power supply pins.                                                                                                                                                                                                |
|          | VSS_USB     | Input  | Ground pins.                                                                                                                                                                                                      |

## 26.2 Register Descriptions

### 26.2.1 SYSCFG : System Configuration Control Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x000

|               |    |    |    |    |    |      |   |   |   |      |      |           |   |   |   |      |
|---------------|----|----|----|----|----|------|---|---|---|------|------|-----------|---|---|---|------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10   | 9 | 8 | 7 | 6    | 5    | 4         | 3 | 2 | 1 | 0    |
| Bit field:    | —  | —  | —  | —  | —  | SCKE | — | — | — | DCFM | DRPD | DPRP<br>U | — | — | — | USBE |

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function                                          | R/W |
|-----|--------|---------------------------------------------------|-----|
| 0   | USBE   | USBFS Operation Enable<br>0: Disable<br>1: Enable | R/W |

| Bit   | Symbol | Function                                                                                     | R/W |
|-------|--------|----------------------------------------------------------------------------------------------|-----|
| 2:1   | —      | These bits are read as 0. The write value should be 0.                                       | R/W |
| 3     | —      | This bit is read as 0. The write value should be 0.                                          | R/W |
| 4     | DPRPU  | D+ Line Resistor Control<br>0: Disable line pull-up<br>1: Enable line pull-up                | R/W |
| 5     | DRPD   | D+/D– Line Resistor Control<br>0: Disable line pull-down<br>1: Enable line pull-down         | R/W |
| 6     | DCFM   | Controller Function Select<br>0: Select device controller<br>1: Select host controller       | R/W |
| 7     | —      | This bit is read as 0. The write value should be 0.                                          | R/W |
| 9:8   | —      | These bits are read as 0. The write value should be 0.                                       | R/W |
| 10    | SCKE   | USB Clock Enable<br>0: Stop clock supply to the USBFS<br>1: Enable clock supply to the USBFS | R/W |
| 15:11 | —      | These bits are read as 0. The write value should be 0.                                       | R/W |

Note: After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

### USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in [Table 26.3](#). Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] flags chattering, and confirming that the USB bus state is stable.

**Table 26.3 Registers initialized by writing 0 to the SYSCFG.USBE bit**

| Selected function | Register | Bit                                  | Remarks                                  |
|-------------------|----------|--------------------------------------|------------------------------------------|
| Device controller | SYSSTS0  | LNST[1:0]                            | Value is saved in host controller mode   |
|                   | DVSTCTR0 | RHST[2:0]                            | —                                        |
|                   | INTSTS0  | DVSQ[2:0]                            | Value is saved in host controller mode   |
|                   | USBADDR  | USBADDR[6:0]                         | Value is saved in host controller mode   |
|                   | USBREQ   | BREQUEST[7:0],<br>BMREQUESTTYPE[7:0] | Value is saved in host controller mode   |
|                   | USBVAL   | WVALUE[15:0]                         | Value is saved in host controller mode   |
|                   | USBINDX  | WINDEX[15:0]                         | Value is saved in host controller mode   |
|                   | USBLENG  | WLENTUH[15:0]                        | Value is saved in host controller mode   |
| Host controller   | DVSTCTR0 | RHST[2:0]                            | —                                        |
|                   | FRMNUM   | FRNM[10:0]                           | Value is saved in device controller mode |

### DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

### DRPD bit (D+/D– Line Resistor Control)

The DRPD bit enables or disables pulling down D+ and D– lines in host controller mode.

Set this bit to 1 in host controller mode and to 0 in device controller mode.

**DCFM bit (Controller Function Select)**

The DCFM bit selects the host or device function of the USBFS.

Only change this bit when the DPRPU and DRPD bits are both 0.

**SCKE bit (USB Clock Enable)**

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS.

When this bit is 0, only SYSCFG is permitted to be read from and written to; the other registers related to the USB should not be read from or written to.

**26.2.2 SYSSTS0 : System Configuration Status Register 0**

Base address: USBFS = 0x4009\_0000

Offset address: 0x004

|                    |        |    |    |    |    |    |   |   |   |       |       |   |   |   |           |   |

| 15   | OVCMON    | External USB_OVRCURA Input Pin Monitor<br>OVCMON indicates the USB_OVRCURA pin status.                                | R   |

Note: The value of the OVCMON bit depends on the status of the USB\_OVRCURA pin.

**LNST[1:0] bits (USB Data Line Status Monitor)**

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D-. For details, see [Table 26.4](#).

In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling pull-down of the lines (SYSCFG.DRPD bit = 1).

**Table 26.4 Status of the USB data bus lines (D+ and D-)**

| LNST[1:0] bits | During full-speed operation | During low-speed operation |
|----------------|-----------------------------|----------------------------|
| 00b            | SE0                         | SE0                        |
| 01b            | J-State                     | K-State                    |
| 10b            | K-State                     | J-State                    |
| 11b            | SE1                         | SE1                        |

**SOFEA bit (Active Monitor When the Host Controller Is Selected)**

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting to the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

**HTACT bit (USB Host Sequencer Status Monitor)**

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in the suspended state or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

**OVCMON bits (External USB\_OVRCURA Input Pin Monitor)**

The OVCMON bits indicate the status of the overcurrent signals from an external power supply IC.

**26.2.3 DVSTCTR0 : Device State Control Register 0**

Base address: USBFS = 0x4009\_0000

Offset address: 0x008

| Bit   | Symbol | Function                                               | R/W |
|-------|--------|--------------------------------------------------------|-----|
| 15:12 | —      | These bits are read as 0. The write value should be 0. | R/W |

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

### RHST[2:0] bits (USB Bus Reset Status)

RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0] bits update to a new value.

In device controller mode, if the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

### UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)
- An EOFERR interrupt is detected during communication (when UACT = 1)

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

### RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1 and in the USB Suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is cleared to 0 by software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the Suspend state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

### USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is cleared to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT = 1) or during resume processing (RESUME = 1) prevents the USBFS from starting USB bus reset processing until both the UACT and RESUME bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

### RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 μs) from a downstream peripheral device, and performs resume processing, driving the K-state. When the RWUPE bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port.

Do not stop the internal clock when the RWUPE bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

### WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the Suspend state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the Suspend state ( $INTSTS0.DVSQ[2:0] = 1xxb$ ) and the USB host enables the remote wakeup signal. Do not stop the internal clock while this bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

### 26.2.4 CFIFO/CFIFOL : CFIFO Port Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x014

| Bit  | Symbol                      | Function                                                                                                              | R/W |
|------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | FIFOPORT[15:0] <sup>1</sup> | FIFO Port<br>Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits | R/W |

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND) in the associated port selection register. See [Table 26.5](#) and [Table 26.6](#).

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIFO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

**FIFOPORT[15:0] bits (FIFO Port)**

When the FIFOPORT[15:0] bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See [Table 26.5](#) and [Table 26.6](#).

**Table 26.5 Endian operation in 16-bit access**

| CFIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---------------------|-------------|------------|
| 0                   | N + 1 data  | N + 0 data |
| 1                   | N + 0 data  | N + 1 data |

**Table 26.6 Endian operation in 8-bit access**

| CFIFOSEL.BIGEND bit | Bits [15:8]         | Bits [7:0] |

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol           | Function                                                                                                              | R/W |
|------|------------------|-----------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | FIFOPORT[15:0]*1 | FIFO Port<br>Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits | R/W |

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port selection register. See [Table 26.7](#) and [Table 26.8](#).

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU

- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

**FIFOPORT[15:0] bits (FIFO Port)**

When the FIFOPORT bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See [Table 26.7](#) and [Table 26.8](#).

| 15    | RCNT   | Read Count Mode<br>0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from the CFIFO. In double buffer mode, the DTLN[8:0] value is cleared when all data is read from only a single plane.<br>1: The DTLN[8:0] bits are decremented each time the receive data is read from the CFIFO. | R/W             |

Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

### CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

### ISEL bit (CFIFO Port Access Direction When DCP Is Selected)

After writing a new value to the ISEL bit with the DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set the ISEL and CURPIPE[3:0] bits simultaneously.

### MBW bit (CFIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all of the data is read.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

### REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

### 26.2.7 DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)

| 15  | RCNT         | Read Count Mode<br>0: Clear DTLN[8:0] bits in (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) when all receive data is read from DnFIFO (after read of a single plane in double buffer mode)<br>1: Decrement DTLN[8:0] bits each time receive data is read from DnFIFO | R/W |

The same pipe must not be specified in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected. The pipe number must not be changed while DMA or DTC transfer is enabled.

#### CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

### MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

### DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

### DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO port control register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

### REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

### RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the D0FIFOCTL.DTLN bit and D1FIFOCTL.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

### DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit ( $n = 0, 1$ ), as follows:

- RCNT = 0

The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

### FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

### BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

### BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

### 26.2.9 DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)

Base address: USBFS = 0x4009\_0000

Offset address: 0x02A + 0x4 × n

| Bit  | Symbol    | Function                                                                                                                                                                                                              | R/W              |

| 14   | BCLR      | CPU Buffer Clear<br>0: No operation<br>1: Clear FIFO buffer on the CPU side                                                                                                                                           | R/W <sup>1</sup> |
| 15   | BVAL      | Buffer Memory Valid Flag<br>0: Invalid (writing 0 has no effect)<br>1: Writing ended                                                                                                                                  | R/W              |

Note 1. Only 0 can be read.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

### DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all the received data from a single FIFO buffer plane.

While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all the data is read from the latter plane.

**FRDY bit (FIFO Port Ready)**

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

**BCLR bit (CPU Buffer Clear)**

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

**BVAL flag (Buffer Memory Valid Flag)**

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

| 15  | VBSE   | VBUS Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request                                 | R/W |

Note 1. The RSME, DVSE, and CTRE bits can only be set to 1 in device controller mode. Do not set these bits to 1 in host controller mode.

When a status flag in the INTSTS0 register sets to 1 and the associated interrupt request enable bit setting in the INTENB0 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB0 register setting, the status flag in the INTSTS0 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB0 register is switched from 0 to 1 while the associated status flag in the INTSTS0 register is set to 1, a USBFS interrupt is requested.

### 26.2.11 INTENB1 : Interrupt Enable Register 1

| 10:7 | —       | These bits are read as 0. The write value should be 0.                                                   | R/W |
| 11   | ATTCHE  | Connection Detection Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request     | R/W |
| 12   | DTCHE   | Disconnection Detection Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request  | R/W |
| 13   | —       | This bit is read as 0. The write value should be 0.                                                      | R/W |
| 14   | BCHGE   | USB Bus Change Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request           | R/W |
| 15   | OVRCRE  | Overcurrent Input Change Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |

Note: The bits in INTENB1 can only be set to 1 in host controller mode. Do not set these bits to 1 in device controller mode.

INTENB1 specifies the interrupt masks in host controller mode and for the setup transaction.

When a status flag in the INTSTS1 register sets to 1 and the associated interrupt request enable bit setting in the INTENB1 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB1 register setting, the status flag in the INTSTS1 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB1 register is switched from 0 to 1 while the associated status flag in the INTSTS1 register is set to 1, a USBFS interrupt is requested.

Do not enable interrupts in device controller mode.

### 26.2.12 BRDYENB : BRDY Interrupt Enable Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x036

|                    |    |    |    |    |    |    |                    |                    |                    |                    |                    |                    |                    |                    |                    |                    |

| 8     | PIPE8BRDYE | BRDY Interrupt Enable for Pipe 8<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 9     | PIPE9BRDYE | BRDY Interrupt Enable for Pipe 9<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15:10 | —          | This bit is read as 0. The write value should be 0.                                             | R/W |

The BRDYENB register enables or disables the INTSTS0.BRDY bit to be set to 1 when a BRDY interrupt is detected for each pipe.

When a status flag in the BRDYSTS register sets to 1 and the associated PIPE<sub>n</sub>BRDYE bit (n = 0 to 9) setting in the BRDYENB register is 1, the INTSTS0.BRDY flag sets to 1. In this case, if the BRDYE bit in INTENB0 is 1, the USBFS generates a BRDY interrupt request. While at least one PIPE<sub>n</sub>BRDY bit indicates 1, the USB generates the BRDY interrupt request when the associated interrupt request enable bit in the BRDYENB register is changed from 0 to 1 by software.

### 26.2.13 NRDYENB : NRDY Interrupt Enable Register

Base address: USBFS = 0x4009\_0000

| 9     | PIPE9NRDYE | NRDY Interrupt Enable for Pipe 9<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15:10 | —          | This bit is read as 0. The write value should be 0.                                             | R/W |

The NRDYENB register enables or disables the INTSTS0.NRDY bit to be set to 1 when a NRDY interrupt is detected for each pipe.

When a status flag in the NRDYSTS register sets to 1 and the associated PIPE<sub>n</sub>NRDYE (n = 0 to 9) bit setting in the NRDYENB register is 1, the INTSTS0.NRDY flag sets to 1. In this case, if the NRDYE bit in INTENB0 is 1, the USBFS generates a NRDY interrupt request. While at least one PIPE<sub>n</sub>NRDY bit indicates 1, the USBFS generates the NRDY interrupt request when the associated interrupt request enable bit in the NRDYENB register is changed from 0 to 1 by software.

### 26.2.14 BEMPENB : BEMP Interrupt Enable Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x03A

|                    |    |    |    |    |    |    |                    |                    |                    |                    |                    |                    |                    |                    |                    |                    |

| Bit   | Symbol     | Function                                                                                        | R/W |
|-------|------------|-------------------------------------------------------------------------------------------------|-----|
| 6     | PIPE6BEMPE | BEMP Interrupt Enable for Pipe 6<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 7     | PIPE7BEMPE | BEMP Interrupt Enable for Pipe 7<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 8     | PIPE8BEMPE | BEMP Interrupt Enable for Pipe 8<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 9     | PIPE9BEMPE | BEMP Interrupt Enable for Pipe 9<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 15:10 | —          | This bit is read as 0. The write value should be 0.                                             | R/W |

The BEMPENB register enables or disables the INTSTS0.BEMP bit to be set to 1 when a BEMP interrupt is detected for each pipe.

When a status flag in the BEMPSTS register sets to 1 and the associated PIPE<sub>n</sub>BEMPE (n = 0 to 9) bit setting in the BEMPENB register is 1, the INTSTS0.BEMP flag sets to 1. In this case, if the BEMPE bit in INTENB0 is 1, the USBFS generates a BEMP interrupt request. While at least one PIPE<sub>n</sub>BEMP bit indicates 1, the USBFS generates the BEMP interrupt request when the associated interrupt request enable bit in the BEMPENB register is changed from 0 to 1 by software.

### 26.2.15 SOFCFG : SOF Output Configuration Register

| 15:9 | —        | These bits are read as 0. The write value should be 0.                                                                                                                            | R/W |

Note 1. Confirm that the EDGESTS flag is 0 before stopping the clock supply to the USBFS.

#### EDGESTS bit (Edge Interrupt Output Status Monitor)

The EDGESTS bit indicates 1 during the edge processing of an edge interrupt output signal. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

#### BRDYM bit (BRDY Interrupt Status Clear Timing)

The BRDYM bit specifies how the BRDY interrupt status flags for the pipes are cleared.

**TRNENSEL bit (Transaction-Enabled Time Select)**

When the USB port is in use for full- or low-speed communications, the TRNENSEL bit specifies the timing with which the USBFS issues tokens in a frame (transaction-enabled time).

Set this bit to 1 when a low-speed device is connected. The bit is only valid in host controller mode. Set this bit to 0 in device controller mode.

**26.2.16 INTSTS0 : Interrupt Status Register 0**

| Bit | Symbol | Function                                                                                                                | R/W               |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------|-------------------|
| 14  | RESM   | Resume Interrupt Status* <sup>2</sup> * <sup>3</sup><br>0: No resume interrupt occurred<br>1: Resume interrupt occurred | R/W* <sup>1</sup> |
| 15  | VBINT  | VBUS Interrupt Status* <sup>3</sup><br>0: No VBUS interrupt occurred<br>1: VBUS interrupt occurred                      | R/W* <sup>1</sup> |

Note: The value of the DVST bit is 0 when the MCU is reset and 1 after a USB bus reset.

Note: The value of the VBST bit is 1 when the USB\_VBUS pin is high and 0 when the USB\_VBUS pin is low.

Note: The value of the DVSQ[2:0] bits is 000b when the MCU is reset and 001b after a USB bus reset.

Note 1. To clear the VBINT, RESM, SOFR, DVST, CTRT, or VALID bits, write 0 only to the bits to be cleared. Write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. The status of the RESM, DVST, and CTRT bits are changed only in device controller mode. Set the associated interrupt enable bits to 0 (disabled) in host controller mode.

Note 3. The USBFS detects a change in the status indicated in the VBINT and RESM bits even while the clock supply is stopped (SYSCFG.SCKE bit = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply before clearing the status by software.

### CTSQ[2:0] bits (Control Transfer Stage)

In host controller mode, the read value of the CTSQ[2:0] bits is invalid.

### VALID bit (USB Request Reception)

In host controller mode, the read value of the VALID bit is invalid.

### DVSQ[2:0] bits (Device State)

The DVSQ[2:0] bits are initialized by a USB bus reset. In host controller mode, the read value is invalid.

### BRDY flag (Buffer Ready Interrupt Status)

The BRDY flag indicates the BRDY interrupt status.

The USBFS sets the BRDY bit to 1 when it detects a BRDY interrupt status (PIPE<sub>n</sub>BRDY = 1, n = 0 to 9) on at least one pipe for which BRDY interrupts are enabled (BRDYENB.PIPE<sub>n</sub>BRDYE = 1).

For the conditions that cause the PIPE<sub>n</sub>BRDY status to be asserted, see [section 26.3.3.1. BRDY interrupt](#).

The USBFS sets the BRDY bit to 0 when the software writes 0 to all of the PIPE<sub>n</sub>BRDY bits associated with the PIPE<sub>n</sub>BRDYE bits that are set to 1. Writing 0 to the BRDY flag in the software does not clear the flag.

### NRDY flag (Buffer Not Ready Interrupt Status)

The NRDY flag indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPE<sub>n</sub>NRDY = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (NRDYENB.PIPE<sub>n</sub>NRDYE = 1).

For the conditions that cause the PIPE<sub>n</sub>NRDY status to be asserted, see [section 26.3.3.2. NRDY interrupt](#).

The USBFS sets the NRDY bit to 0 when the software writes 0 to all of the PIPE<sub>n</sub>NRDY bits associated with the PIPE<sub>n</sub>NRDYE bits that are set to 1. Writing 0 to the NRDY flag in the software does not clear the flag.

### BEMP flag (Buffer Empty Interrupt Status)

The BEMP flag indicates the BEMP interrupt status.

The USBFS sets the BEMP bit to 1 when it detects a BEMP interrupt status (PIPE<sub>n</sub>BEMP = 1, n = 0 to 9) on at least one pipe for which BEMP interrupts are enabled (BEMPENB.PIPE<sub>n</sub>BEMPE = 1).

For the conditions that cause the PIPE<sub>n</sub>BEMP status to be asserted, see [section 26.3.3.3. BEMP interrupt](#).

The USBFS sets the BEMP bit to 0 when the software writes 0 to all of the PIPE<sub>n</sub>BEMP bits associated with the PIPE<sub>n</sub>BEMPE bits that are set to 1. Writing 0 to the BEMP flag in the software does not clear the flag.

### CTRT flag (Control Transfer Stage Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the CTSQ[2:0] bits and sets the CTRT flag to 1 on detecting a transition in the control transfer stage. When a control transfer stage transition interrupt occurs, clear the CTRT flag before the USBFS detects the next control transfer stage transition.

Values read from the CTRT flag in host controller mode are invalid.

### DVST flag (Device State Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the DVSQ[2:0] bits and sets the DVST flag to 1 on detecting a change in the device state. When a device state transition interrupt occurs, clear the DVST flag before the USBFS detects the next device state transition.

Values read from the DVST flag in host controller mode are invalid.

### SOFR flag (Frame Number Refresh Interrupt Status)

In host controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number when the DVSTCTR0.UACT bit is set to 1 by software. A SOFR interrupt is detected every 1 ms.

In device controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number. A frame number refresh interrupt is detected every 1 ms.

The USBFS can detect an SOFR interrupt through the internal interpolation function even when a corrupted SOF packet is received from the USB host.

### RESM flag (Resume Interrupt Status)

In device controller mode, the USBFS sets the RESM flag to 1 on detecting the falling edge of the signal on the USB\_DP pin in the Suspend state (DVSQ[2:0] = 1xxb). Values read from the RESM flag in host controller mode are invalid.

### VBINT flag (VBUS Interrupt Status)

The USBFS sets the VBINT flag to 1 on detecting a level change (high to low or low to high) in the USB\_VBUS pin input value. The USBFS sets the VBSTS flag to indicate the USB\_VBUS pin input value. When a VBUS interrupt occurs, eliminate transient elements by reading the VBSTS flag at least three times through software processing and check that the values read are the same.

|-----|--------|---------------------------------------------------------------------------------------------------------------------------|------------------|
| 12  | DTCH   | USB Disconnection Detection Interrupt Status<br>0: No DTCH interrupt occurred<br>1: DTCH interrupt occurred               | R/W <sup>3</sup> |
| 13  | —      | This bit is read as 0. The write value should be 0.                                                                       | R/W              |
| 14  | BCHG   | USB Bus Change Interrupt Status <sup>4</sup><br>0: No BCHG interrupt occurred<br>1: BCHG interrupt occurred               | R/W <sup>3</sup> |
| 15  | OVRRCR | Overcurrent Input Change Interrupt Status <sup>4</sup><br>0: No OVRRCR interrupt occurred<br>1: OVRRCR interrupt occurred | R/W <sup>3</sup> |

Note 1. The USBFS detects a change in the status in the PDDDETINT, OVRRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status through software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

Note 2. To clear the bits in the INTSTS1 register, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 3. To clear the bits in INTSTS1, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 4. The USBFS detects a change in the status in the OVRRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status through the software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

INTSTS1 is used to confirm the status of each interrupt in host controller mode. Only enable the status change interrupts indicated in the bits in INTSTS1 in host controller mode.

#### **PDDDETINT flag (PDDDET Detection Interrupt Status Flag)**

The USBFS sets the PDDDETINT flag to 1 on detecting a level change (high to low or low to high) in the PDDDET pin input value. When the PDDDETINT interrupt is generated, perform debouncing by reading the BCCTRL1.PDDDETSTS flag at least three times through software processing and checking that the values read are the same.

#### **SACK flag (Setup Transaction Normal Response Interrupt Status)**

The SACK flag indicates the status of the setup transaction normal response interrupt in host controller mode.

The USBFS detects the SACK interrupt and sets this flag to 1 when an ACK response is returned from a peripheral device during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

Values read from the SACK flag in device controller mode are invalid.

#### **SIGN flag (Setup Transaction Error Interrupt Status)**

The SIGN flag indicates the status of setup transaction error interrupts in host controller mode.

The USBFS detects the SIGN interrupt and sets this flag to 1 when an ACK response is not returned from a peripheral device three consecutive times during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions:

- Timeout is detected by the USBFS when the peripheral device has returned no response
- A corrupted ACK packet is received
- A handshake other than ACK (NAK, NYET, or STALL) is received

Values read from the SIGN flag in device controller mode are invalid.

#### **EOFERR flag (EOF Error Detection Interrupt Status)**

The EOFERR flag indicates the status of EOF error detection interrupts in host controller mode.

The USBFS detects the EOFERR interrupt and sets this flag to 1 on detecting that communication did not complete at the EOF2 timing defined in the USB 2.0 specification. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

After detecting the EOFERR interrupt, the USBFS controls the hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt was detected to 0
- Puts the port in which the EOFERR interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and re-enumerate the USB port.

Values read from the EOFERR flag in device controller mode are invalid.

#### **ATTCH flag (ATTCH Interrupt Status)**

The ATTCH flag indicates the status of USB attach detection interrupts in host controller mode.

The USBFS detects the ATTCH interrupt and sets this flag to 1 on detecting a J- or K-state on the full- or low-speed signal level for 2.5  $\mu$ s. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the ATTCH interrupt on any of the following conditions.

- K-state, SE0, or SE1 changes to J-state, and J-state continues for 2.5  $\mu$ s
- J-state, SE0, or SE1 changes to K-state, and K-state continues for 2.5  $\mu$ s

Values read from the ATTCH flag in device controller mode are invalid.

#### **DTCH flag (USB Disconnection Detection Interrupt Status)**

The DTCH flag indicates the status of USB disconnection detection interrupts in host controller mode.

The USBFS detects the DTCH interrupt and sets this flag to 1 on detecting a USB bus detach event. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects bus detach events based on the USB 2.0 specification.

After detecting the DTCH interrupt, the USBFS controls hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt was detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and transition to a wait state for connecting to the USB port (waiting for ATTCH interrupt generation).

Values read from the DTCH flag in device controller mode are invalid.

#### **BCHG flag (USB Bus Change Interrupt Status)**

The BCHG flag indicates the status of USB bus change interrupts in host controller mode.

The USBFS detects the BCHG interrupt and sets this flag to 1 when a change in the full- or low-speed signal level occurs on the USB port. This includes any change from J-state, K-state, or SE0 to J-state, K-state, or SE0. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS sets the LNST[1:0] flags to indicate the input state of the USB port. When a BCHG interrupt occurs, eliminate transient elements by repeat reading the LNST[1:0] flags by software until the same value is read at least three times.

Change in the USB bus state can be detected while the internal clock is stopped.

Values read from the BCHG flag in device controller mode are invalid.

#### **OVRCCR flag (Overcurrent Input Change Interrupt Status)**

The OVRCCR flag indicates the status of USB\_OVRCURA input pin change interrupts.

The USBFS detects the OVRCCR interrupt and sets this flag to 1 when a change (high to low or low to high) occurs in at least one of the input values to the USB\_OVRCURA pins. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

### 26.2.18 BRDYSTS : BRDY Interrupt Status Register

| 15:10 | —         | These bits are read as 0. The write value should be 0.                                          | R/W              |

Note 1. To clear the status indicated in the bits in BEMPSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

### 26.2.21 FRMNUM : Frame Number Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x04C

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

|            |      |      |   |   |   |            |  |  |  |  |  |  |  |  |  |
|------------|------|------|---|---|---|------------|--|--|--|--|--|--|--|--|--|
| Bit field: | OVRN | CRCE | — | — | — | FRNM[10:0] |  |  |  |  |  |  |  |  |  |
|------------|------|------|---|---|---|------------|--|--|--|--|--|--|--|--|--|

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit   | Symbol     | Function                                                                       | R/W              |
|-------|------------|--------------------------------------------------------------------------------|------------------|
| 10:0  | FRNM[10:0] | Frame Number<br>Latest frame number.                                           | R                |
| 13:11 | —          | These bits are read as 0. The write value should be 0.                         | R/W              |
| 14    | CRCE       | Receive Data Error<br>0: No error occurred<br>1: Error occurred                | R/W <sup>1</sup> |
| 15    | OVRN       | Overrun/Underrun Detection Status<br>0: No error occurred<br>1: Error occurred | R/W <sup>1</sup> |

Note 1. To clear the status, write 0 only to the bits to be cleared. Write 1 to the other bits.

#### FRNM[10:0] flags (Frame Number)

The USBFS sets the FRNM[10:0] flags to indicate the latest frame number, which is updated every 1 ms, when an SOF packet is issued or received.

#### CRCE flag (Receive Data Error)

The CRCE flag sets to 1 when a CRC error or bit stuffing error occurs during isochronous transfer. On detecting a CRC error in host controller mode, the USBFS generates an internal NRDY interrupt.

To clear the CRCE flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

### OVRN flag (Overrun/Underrun Detection Status)

The OVRN flag sets to 1 when an overrun or underrun error occurs during isochronous transfer. To clear the flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

In host controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the time to issue an OUT token comes before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the time to issue an IN token comes when no FIFO buffer planes are empty

In device controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the IN token is received before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the OUT token is received when no FIFO buffer planes are empty

### 26.2.22 DVCHGR : Device State Change Register

| 15:12 | —             | These bits are read as 0. The write value should be 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | R/W |

**USBADDR[6:0] bits (USB Address)**

In device controller mode, the USBADDR[6:0] flags indicate the USB address received when the USBFS processed a SetAddress request successfully. The USBFS sets the USBADDR[6:0] bits to 0x00 on detecting a USB bus reset.

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1. On recovering from a USB power shut-off, the operation can resume from the USB address set before the software shut-off.

In host controller mode, the USBADDR[6:0] bits are invalid.

**STSRECOV[3:0] bits (Status Recovery)**

Use the STSRECOV[3:0] bits to resume the state of the internal sequencer on recovering from USB power shut-off. For details, see [section 26.3.1.5. Release from Deep Software Standby mode because of USB suspend/resume interrupts.](#)

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1.

**26.2.24 USBREQ : USB Request Type Register**

Base address: USBFS = 0x4009\_0000

Offset address: 0x054

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol             | Function                                        | R/W              |
|------|--------------------|-------------------------------------------------|------------------|
| 7:0  | BMREQUESTTYPE[7:0] | Request Type<br>USB request bmRequestType value | R/W <sup>1</sup> |
| 15:8 | BREQUEST[7:0]      | Request<br>USB request bRequest value           | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBREQ stores setup requests for control transfers.

In device controller mode, the USBREQ stores the received bRequest and bmRequestType values. In host controller mode, it sets to the bRequest and bmRequestType values to be transmitted.

USBREQ is initialized by a USB bus reset.

**BMREQUESTTYPE[7:0] bits (Request Type)**

The BMREQUESTTYPE[7:0] bits hold the bmRequestType value of USB requests.

- In host controller mode:  
Set these bits to the value of the USB request data in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:  
These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

**BREQUEST[7:0] bits (Request)**

The BREQUEST[7:0] bits store bRequest value of the USB request.

- In host controller mode:  
Set these bits to the value of the USB request data in setup transmission transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:  
These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

**26.2.25 USBVAL : USB Request Value Register**

Base address: USBFS = 0x4009\_0000

Offset address: 0x056

| Bit  | Symbol       | Function                          | R/W              |
|------|--------------|-----------------------------------|------------------|
| 15:0 | WVALUE[15:0] | Value<br>USB request wValue value | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

In device controller mode, USBVAL stores the received wValue value. In host controller mode, it sets to the wValue value to be transmitted is set.

USBVAL is initialized by a USB bus reset.

**WVALUE[15:0] bits (Value)**

The WVALUE[15:0] bits store wValue value of the USB request.

- In host controller mode:  
Set these bits to the value of the wValue field in USB requests of transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:  
These bits indicate the wValue value of USB requests in reception setup transactions. Writing to the bits has no effect.

## 26.2.26 USBINDX : USB Request Index Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x058

| Bit  | Symbol       | Function                          | R/W              |
|------|--------------|-----------------------------------|------------------|
| 15:0 | WINDEX[15:0] | Index<br>USB request wIndex value | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBINDX stores setup requests for control transfers.

In device controller mode, it stores the received wIndex value. In host controller mode, it sets to the wIndex value to be transmitted.

USBINDX is initialized by a USB bus reset.

### WINDEX[15:0] bits (Index)

The WINDEX[15:0] bits hold the wIndex value of a USB request.

- In host controller mode:
 

Set these bits to the wIndex value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
 

These bits indicate the wIndex value in USB requests received in reception setup transactions. Writing to the bits has no effect.

## 26.2.27 USBLENG : USB Request Length Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x05A

| Bit  | Symbol        | Function                            | R/W              |
|------|---------------|-------------------------------------|------------------|
| 15:0 | WLENTUH[15:0] | Length<br>USB request wLength value | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBLENG stores setup requests for control transfers.

In device controller mode, the value of wLength that is received is stored. In host controller mode, the value of wLength to be transmitted is set.

USBLENG is initialized by a USB bus reset.

### WLENTUH[15:0] bits (Length)

The WLENTUH[15:0]bits hold the wLength value of a USB request.

- In host controller mode:

Set these bits to the wLength value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

These bits indicate the wLength value in USB requests received in reception setup transactions. Writing to the bits has no effect.

### 26.2.28 DCPCFG : DCP Configuration Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x05C

|                    |    |    |    |    |    |    |   |   |            |   |   |     |   |   |   |   |
|--------------------|----|----|----|----|----|----|---|---|------------|---|---|-----|---|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7          | 6 | 5 | 4   | 3 | 2 | 1 | 0 |
| Bit field:         | —  | —  | —  | —  | —  | —  | — | — | SHTN<br>AK | — | — | DIR | — | — | — | — |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0          | 0 | 0 | 0   | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function                                                                                                           | R/W |
|------|--------|--------------------------------------------------------------------------------------------------------------------|-----|
| 3:0  | —      | These bits are read as 0. The write value should be 0.                                                             | R/W |
| 4    | DIR    | Transfer Direction*1<br>0: Data receiving direction<br>1: Data transmitting direction                              | R/W |
| 6:5  | —      | These bits are read as 0. The write value should be 0.                                                             | R/W |
| 7    | SHTNAK | Pipe Disabled at End of Transfer*1<br>0: Keep pipe open after transfer ends<br>1: Disable pipe after transfer ends | R/W |
| 15:8 | —      | These bits are read as 0. The write value should be 0.                                                             | R/W |

Note 1. Only set this bit while the PID is NAK. Before setting this bit, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

#### DIR bit (Transfer Direction)

In host controller mode, the DIR bit sets the transfer direction of the data stage and status stage for control transfers. In device controller mode, set the DIR bit to 0.

#### SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change PID to NAK on transfer end when the selected pipe is receiving. It is only valid when the selected pipe is receiving.

When the SHTNAK bit is 1, the USBFS changes the DCPCTR.PID[1:0] bits for the DCP to NAK on determining that a transfer has ended. The USBFS determines transfer end on the following condition:

- A short packet, including a zero-length packet, is successfully received.

### 26.2.29 DCPMAXP : DCP Maximum Packet Size Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x05E

|                    |             |    |    |    |    |    |   |   |   |           |   |   |   |   |   |   |
|--------------------|-------------|----|----|----|----|----|---|---|---|-----------|---|---|---|---|---|---|
| Bit position:      | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6         | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | DEVSEL[3:0] |    |    |    | —  | —  | — | — | — | MXPS[6:0] |   |   |   |   |   |   |
| Value after reset: | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 1         | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol      | Function                                                                                                                                                                                      | R/W |
|-------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 6:0   | MXPS[6:0]   | Maximum Packet Size <sup>*1</sup><br>Maximum data payload specification (maximum packet size) for the DCP                                                                                     | R/W |
| 11:7  | —           | These bits are read as 0. The write value should be 0.                                                                                                                                        | R/W |
| 15:12 | DEVSEL[3:0] | Device Select <sup>*2</sup><br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>Others: Setting prohibited | R/W |

Note 1. Only set the MXPS[6:0] bits while PID is NAK. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary. After the MXPS[6:0] bits are set and the DCP is set to the CURPIPE[3:0] bits in a port select register, clear the buffer by setting the BCLR bit in the port control register to 1.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK and the DCPCTR.SUREQ bit is 0. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### MXPS[6:0] bits (Maximum Packet Size)

The MXPS[6:0] bits specify the maximum data payload (maximum packet size) for the DCP. The initial value is 0x40 (64 bytes). Set the bits to a USB 2.0-compliant value. Do not write to the FIFO buffer or set PID = BUF while MXPS[6:0] is set to 0.

### DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target peripheral device for a control transfer. Set up the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

## 26.2.30 DCPCTR : DCP Control Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x060

Note 1. This bit is read as 0.

Note 2. Only set the SQSET and SQCLR bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### PID[1:0] bits (Response PID)

The PID[1:0] bits control the USB response type during control transfers.

In host controller mode, to change the PID[1:0] setting from NAK to BUF:

- When the transmitting direction is set:
  - a. Write all of the transmit data to the FIFO buffer while the DVSTCTR0.UACT bit is 1 and PID is NAK.
  - b. Set PID[1:0] bits to 01b (BUF).  
The USBFS then executes the OUT transaction.
- When the receiving direction is set:
  - a. Check that the FIFO buffer is empty (or empty the buffer) while the DVSTCTR0.UACT bit is 1 and PID is NAK.
  - b. Set PID[1:0] bits to 01b (BUF).  
The USBFS then executes the IN transaction.

The USBFS changes the PID[1:0] setting as follows:

- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets the PID[1:0] to STALL (11b)
- When a reception error, such as a CRC error, is detected three times consecutively, the USBFS sets the PID[1:0] bits to NAK (00b)
- On receiving the STALL handshake, the USBFS sets PID[1:0] to STALL (11b)

In device controller mode, the USBFS changes the PID[1:0] setting as follows:

- On receiving a setup packet, the USBFS sets PID[1:0] to NAK (00b). The USBFS then sets the INTSTS0.VALID flag to 1, and the PID[1:0] setting cannot be changed until the software clears the VALID flag to 0.

- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets PID[1:0] to STALL (11b)
- On detecting a control transfer sequence error, the USBFS sets PID[1:0] to STALL (1xb)
- On detecting a USB bus reset, the USBFS sets PID[1:0] to NAK

The USBFS does not check the PID[1:0] setting while processing a SET\_ADDRESS request.

The PID[1:0] bits are initialized by a USB bus reset.

### CCPL bit (Control Transfer End Enable)

In device controller mode, setting the CCPL bit to 1 enables the status stage of the control transfer to be completed. When the bit is set to 1 by software while the associated PID[1:0] bits are set to BUF, the USBFS completes the control transfer status stage.

During control read transfers, the USBFS transmits the ACK handshake in response to the OUT transaction from the USB host. During control write or no-data control transfers, it transmits the zero-length packet in response to the IN transaction from the USB host. On detecting a SET\_ADDRESS request, the USBFS operates in auto response mode from the setup stage up to status stage completion regardless of the CCPL bit setting.

The USBFS changes the CCPL bit from 1 to 0 on receiving a new setup packet. The software cannot write 1 to the bit while the INTSTS0.VALID bit is 1. The bit is initialized by a USB bus reset.

In host controller mode, always write 0 to the CCPL bit.

### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether DCP is used for the transaction when USBFS changes the PID[1:0] bits from BUF to NAK. The USBFS changes the PBUSY bit from 0 to 1 on start of a USB transaction for the selected pipe. It changes the PBUSY bit from 1 to 0 on completion of one transaction.

After PID is set to NAK by software, the value in the PBUSY bit indicates whether changes to pipe settings can proceed.

For details, see [section 26.3.4.1. Pipe control register switching procedures](#).

### SQMON bit (Sequence Toggle Bit Monitor)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

The USBFS toggles the bit on normal completion of the transaction. It does not toggle the bit, however, when a DATAPID mismatch occurs during a transfer in the receiving direction.

In device controller mode, the USBFS sets the SQMON bit to 1 (specifies DATA1 as the expected value) on successful reception of the setup packet.

In device controller mode, the USBFS does not reference this bit during IN or OUT transactions at the status stage, and it does not toggle the bit on normal completion.

### SQSET bit (Sequence Toggle Bit Set)

The SQSET bit specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

### SQCLR bit (Sequence Toggle Bit Clear)

The SQCLR bit specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer. It is read as 0.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

### SUREQCLR bit (SUREQ Bit Clear)

In host controller mode, setting the SUREQCLR bit to 1 clears the SUREQ bit to 0. The bit is read as 0.

If transfer stops while the SUREQ bit is set to 1 in a setup transaction, set the SUREQCLR bit to 1 by software. This is not necessary at the end of a normal setup transaction, because the USBFS automatically clears the SUREQ bit to 0.

Only control the SUREQ bit through the SUREQCLR bit while the DVSTCTR0.UACT bit is 0. When UACT is 0, communication is halted or no transfer is occurring because a bus disconnection was detected.

In device controller mode, always write 0 to this bit.

**SUREQ bit (Setup Token Transmission)**

In host controller mode, setting the SUREQ bit to 1 triggers the USBFS to transmit the setup packet. After completing the setup transaction process, the USBFS generates either the SACK or SIGN interrupt and clears the SUREQ bit to 0. The USBFS also clears the SUREQ bit to 0 when the software sets the SUREQCLR bit to 1.

Before setting the SUREQ bit to 1, set the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, and USBLENG appropriately to transmit the target USB request in the setup transaction. Also check that the PID[1:0] bits for the DCP are set to NAK. After setting the SUREQ bit to 1, do not change the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, or USBLENG until the setup transaction is complete (SUREQ bit = 1). Write 1 to the SUREQ bit only when transmitting the setup token. Otherwise, write 0.

In device controller mode, always write 0 to this bit.

**BSTS flag (Buffer Status)**

The BSTS flag indicates the status of access to the DCP FIFO buffer. The meaning of this flag varies as follows depending on the CFIFOSEL.ISEL setting:

- When ISEL = 0, the bit indicates whether receive data can be read from the buffer
- When ISEL = 1, the bit indicates whether transmit data can be written to the buffer

**26.2.31 PIPESEL : Pipe Window Select Register**

| 15:4 | —            | These bits are read as 0. The write value should be 0.                                                                                                                                                           | R/W |

Set pipes 1 to 9 using the PIPESEL, PIPECFG, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN registers (n = 1 to 9).

After selecting the pipe in the PIPESEL register, pipe functions must be set in the associated PIPECFG, PIPEMAXP, and PIPEPERI registers. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set independently of the pipe selection in this register.

**PIPESEL[3:0] bits (Pipe Window Select)**

The PIPESEL[3:0] bits select the pipe number associated with the PIPECFG, PIPEMAXP, and PIPEPERI registers used for data writing and reading. Selecting a pipe number in the PIPESEL[3:0] bits allows writing to and reading from PIPECFG, PIPEMAXP, and PIPEPERI associated with the selected pipe number.

When PIPESEL[3:0] = 0000b, 0 is read from all the bits in PIPECFG, PIPEMAXP, and PIPEPERI. Writing to these bits has no effect.

Note 1. Only set the TYPE[1:0], SHTNAK, and EPNUM[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the BFRE, DBLB, and DIR bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. To change the BFRE, DBLB, or DIR bits after completing USB communication on the selected pipe, in addition to the constraints described in Note 2, write 1 and 0 to the PIPEnCTR.ACLRM bit continuously through the software and clear the FIFO buffer assigned to the pipe.

PIPECFG specifies the transfer type, FIFO buffer access direction, and endpoint numbers for pipes 1 to 9. It also selects single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

### EPNUM[3:0] bits (Endpoint Number)

The EPNUM[3:0] bits specify the endpoint number for the selected pipe. Setting 0000b indicates the pipe not used.

Set these bits so that the combination of the DIR and EPNUM[3:0] settings is different from those for other pipes. The EPNUM[3:0] bits can be set to 0000b for all pipes.

**DIR bit (Transfer Direction)**

The DIR bit specifies the transfer direction for the selected pipe.

When the software sets this bit to 0, the USBFS uses the selected pipe for receiving. When the software sets this bit to 1, the USBFS uses the selected pipe for transmitting.

**SHTNAK bit (Pipe Disabled at End of Transfer)**

The SHTNAK bit specifies whether to change the PIPEnCTR.PID[1:0] bits to 00b (NAK) at the end of transfer when the selected pipe is set in the receiving direction. The bit is valid for pipes 1 to 5 in the receiving direction.

When the software sets this bit to 1 for a receiving pipe, the USBFS changes the associated PIPEnCTR.PID[1:0] bits to 00b (NAK) on determining the transfer end. The USBFS determines that the transfer has ended on the following conditions:

- A short packet data (including a zero-length packet) was successfully received
- The transaction counter is used and the number of packets specified for the transaction counter are successfully received

**DBLB bit (Double Buffer Mode)**

The DBLB bit selects either single or double buffer mode for the FIFO buffer used by the selected pipe. The bit is valid for pipes 1 to 5.

**BFRE bit (BRDY Interrupt Operation Specification)**

The BFRE bit specifies the BRDY interrupt generation timing from the USBFS to the CPU for the selected pipe.

When the software sets the BFRE bit to 1 and the selected pipe is in the receiving direction, the USBFS detects the transfer completion and generates the BRDY interrupt on reading the packet.

When a BRDY interrupt is generated with this setting, the software must write 1 to the BCLR bit in the port control register. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to the BCLR bit.

When the BFRE bit is set to 1 by software and the selected pipe is in the transmitting direction, the USBFS does not generate the BRDY interrupt. For details, see [section 26.3.3.1. BRDY interrupt](#).

**TYPE[1:0] bits (Transfer Type)**

The TYPE[1:0] bits specify the transfer type for the pipe selected in the PIPESEL.PIPESEL[3:0] bits. Before setting PID to BUF and starting USB communication on the selected pipe, set the TYPE[1:0] bits to a value other than 00b.

**26.2.33 PIPEMAXP : Pipe Maximum Packet Size Register**

| Bit   | Symbol      | Function                                                                                                                                                                                      | R/W |
|-------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:12 | DEVSEL[3:0] | Device Select <sup>*2</sup><br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>Others: Setting prohibited | R/W |

- Note: The value of the MXPS[8:0] bits is 0x000 when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 0x040 when a pipe is selected.
- Note 1. Only set the MXPS[8:0] bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.
- Note 2. Only set the DEVSEL[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEMAXP specifies the maximum packet size for pipes 1 to 9.

### MXPS[8:0] bits (Maximum Packet Size)

The MXPS[8:0] bits specify the maximum data payload (maximum packet size) for the selected pipe.

Set these bits to the appropriate value for each transfer type based on the USB 2.0 specification. When MXPS[8:0] = 0, do not write to the FIFO buffer or set PID to BUF. These writes have no effect.

### DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target device for USB communication. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0x2, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0x0.

| 11:3  | —                       | These bits are read as 0. The write value should be 0.                                                                                              | R/W |
| 12    | IFIS                    | Isochronous IN Buffer Flush<br>0: Do not flush buffer<br>1: Flush buffer                                                                            | R/W |
| 15:13 | —                       | These bits are read as 0. The write value should be 0.                                                                                              | R/W |

- Note 1. Only set the IITV[2:0] bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEPERI selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfers, and sets the interval error detection interval for pipes 1 to 9.

**IITV[2:0] bits (Interval Error Detection Interval)**

To change the IITV[2:0] bits to another value after they are set and USB communication is performed, set the PIPEnCTR.PID[1:0] bits to 00b (NAK) and then set the PIPEnCTR.ACLRM bit to 1 to initialize the interval timer.

The IITV[2:0] bits are not provided for pipes 3 to 5. Write 000b to bit positions of the IITV[2:0] bits associated with pipes 3 to 5.

**IFIS bit (Isochronous IN Buffer Flush)**

The IFIS bit specifies whether to flush the buffer when the pipe selected in the PIPESEL.PIPESEL[3:0] bits is used for isochronous IN transfers.

In device controller mode when the selected pipe is for isochronous IN transfers, the USBFS automatically clears the FIFO buffer if the USBFS fails to receive the IN token from the USB host within the interval set in the IITV[2:0] bits in terms of frames.

When double buffering is specified (PIPECFG.DBLB = 1), the USBFS only clears the data in the previously used plane.

The USBFS clears the FIFO buffer on receiving the SOF packet immediately after the frame in which the USBFS expected to receive the IN token. Even if the SOF packet is corrupted, the FIFO buffer is cleared at the time the SOF packet is expected to be received by using the internal interpolation function.

When the host controller function is selected, set this bit to 0.

Set this bit to 0 when the selected pipe is not for isochronous transfer.

**26.2.35 PIPEnCTR : PIPEn Control Registers (n = 1 to 5)**

Note 1. Only 0 can be read.

Note 2. Only set the ATREPM bit or write 1 to the SQCLR or SQSETbit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSYbit through the software is not necessary.

Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bit, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEnCTR can be set for any pipe selection in the PIPESEL register.

### PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction on the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. [Table 26.9](#) and [Table 26.10](#) show the basic operations of the USBFS (when there are no errors in the communication packets) based on the PID[1:0] bit setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to NAK on recognizing completion of the transfer when the selected pipe is in the receiving direction and the PIPECFG.SHTNAK bit for the selected pipe is set to 1 by software
- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify the response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

**Table 26.9 Operation of the USBFS based on the PID[1:0] setting in host controller mode (1 of 2)**

| PID[1:0] value | Transfer type                  | Transfer direction (DIR bit)   | USBFS operation       |
|----------------|--------------------------------|--------------------------------|-----------------------|
| 00b (NAK)      | Does not depend on the setting | Does not depend on the setting | Does not issue tokens |

**Table 26.9 Operation of the USBFS based on the PID[1:0] setting in host controller mode (2 of 2)**

| PID[1:0] value             | Transfer type                  | Transfer direction (DIR bit)   | USBFS operation                                                                                                                                                                                                                                                                                        |

|                            | Isochronous                    | Does not depend on the setting | Issues tokens regardless of the status of the FIFO buffer associated with the selected pipe.                                                                                                                                                                                                           |
| 10b (STALL) or 11b (STALL) | Does not depend on the setting | Does not depend on the setting | Does not issue tokens.                                                                                                                                                                                                                                                                                 |

**Table 26.10 Operation of the USBFS based on the PID[1:0] setting in device controller mode**

| PID[1:0] value             | Transfer type     | Transfer direction (DIR bit)     | USBFS operation                                                                                                                                                         |
|----------------------------|-------------------|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00b (NAK)                  | Bulk or interrupt | Does not depend on the setting   | Returns NAK in response to the token from the USB host                                                                                                                  |
|                            | Isochronous       | Does not depend on the setting   | Returns nothing in response to the token from the USB host                                                                                                              |
| 01b (BUF)                  | Bulk              | Receiving direction (DIR = 0)    | Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception                |
|                            | Interrupt         | Receiving direction (DIR = 0)    | Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception                |
|                            | Bulk or interrupt | Transmitting direction (DIR = 1) | Transmits data in response to the token from the USB host if the FIFO buffer associated with the selected pipe is ready for transmission. Otherwise, returns NAK.       |
|                            | Isochronous       | Receiving direction (DIR = 0)    | Receives data in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception. Otherwise, discards the data. |
|                            | Isochronous       | Transmitting direction (DIR = 1) | Transmits data in response to the token from the USB host if the associated FIFO buffer is ready for transmission. Otherwise, transmits a zero-length packet.           |
| 10b (STALL) or 11b (STALL) | Bulk or interrupt | Does not depend on the setting   | Returns STALL in response to the token from the USB host                                                                                                                |
|                            | Isochronous       | Does not depend on the setting   | Returns nothing in response to the token from the USB host                                                                                                              |

**PBUSY bit (Pipe Busy)**

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible. For details, see [section 26.3.4.1. Pipe control register switching procedures](#).

**SQMON bit (Sequence Toggle Bit Confirmation)**

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

When the selected pipe is not the isochronous transfer type, the USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON flag when a DATA-PID mismatch occurs during transfer in the receiving direction.

**SQSET bit (Sequence Toggle Bit Set)**

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS clears the SQSET bit to 0.

**SQCLR bit (Sequence Toggle Bit Clear)**

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS clears the SQCLR bit to 0.

**ACLRM bit (Auto Buffer Clear Mode)**

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 26.11 shows the data cleared by writing 1 and 0 to the ACLRM bit continuously and the cases in which this processing is required.

**Table 26.11 Data cleared by the USBFS when ACLRM = 1**

| Number | Data cleared by setting the ACLRM bit                                                               | Situations requiring data clear                          |
|--------|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| 1      | All data in the FIFO buffer allocated to the selected pipe (two FIFO buffers in double buffer mode) | When initializing the selected pipe                      |
| 2      | Interval count value when the selected pipe is the isochronous transfer type                        | When resetting the interval count value                  |
| 3      | Internal flags related to the PIPECFG.BFRE bit                                                      | When changing the PIPECFG.BFRE setting                   |
| 4      | FIFO buffer toggle control                                                                          | When changing the PIPECFG.DBLB setting                   |
| 5      | Internal flags related to the transaction count                                                     | When forcing the transaction count function to terminate |

**ATREPM bit (Auto Response Mode)**

The ATREPM bit enables or disables auto response mode for the selected pipe.

This bit can be set to 1 in device controller mode when the selected pipe is the bulk transfer type. When the bit is set to 1, the USBFS responds to the token from the USB host as follows:

- When the selected pipe is set for bulk IN transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 1):
  - a. When the ATREPM bit = 1 and PID = BUF, the USBFS transmits a zero-length packet in response to the IN token.
  - b. The USBFS updates the sequence toggle bit (DATA-PID) each time the USBFS receives ACK from the USB host. In a single transaction, the IN token is received, a zero-length packet is transmitted, and then ACK is received. The USBFS does not generate the BRDY or BEMP interrupt.
- When the selected pipe is set for bulk OUT transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 0):
 

When the ATREPM bit = 1 and PID = BUF, the USBFS returns NAK in response to the OUT token and generates an NRDY interrupt.

For USB communication in auto response mode, set the ATREPM bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the selected pipe uses isochronous transfer, always set this bit to 0.

In host controller mode, always set the ATREPM bit to 0.

**INBUFM bit (Transmit Buffer Monitor)**

The INBUFM bit indicates the FIFO buffer status for the selected pipe in the transmitting direction.

When the selected pipe is set in the transmitting direction (PIPECFG.DIR = 1), the USBFS sets this bit to 1 when the CPU or DMA/DTC completes writing data to at least one FIFO buffer plane.

The USBFS sets this bit to 0 when the USBFS completes transmission of the data from the FIFO buffer plane to which all the data is written. In double buffer mode (PIPECFG.DBLB = 1), the USBFS sets the INBUFM bit to 0 when the USBFS completes transmission of the data from the two FIFO buffer planes before the CPU or DMA/DTC completes writing data to one FIFO buffer plane.

The INBUFM bit indicates the same value as the BSTS bit when the selected pipe is in the receiving direction (PIPECFG.DIR = 0).

### BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 26.12.

**Table 26.12** BSTS bit operation

| DIR value | BFRE value | DCLRM value | BSTS bit function                                                                                                                                                                   |
|-----------|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0         | 0          | 0           | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read                                                                            |
|           |            | 1           | Setting prohibited                                                                                                                                                                  |
|           | 1          | 0           | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 when the software sets the BCLR bit in the port control register to 1 after the data read is complete |
|           |            | 1           | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read                                                                            |
| 1         | 0          | 0           | Sets to 1 when transmit data can be written to the FIFO buffer, and clears to 0 on completion of data write                                                                         |
|           |            | 1           | Setting prohibited                                                                                                                                                                  |
|           | 1          | 0           | Setting prohibited                                                                                                                                                                  |
|           |            | 1           | Setting prohibited                                                                                                                                                                  |

| 15    | BSTS   | Buffer Status<br>0: Buffer access disabled<br>1: Buffer access enabled        | R   |

Note 1. Only write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

### PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction of the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. [Table 26.9](#) and [Table 26.10](#) show the basic operation (when there are no errors in the transmitted and received packets) of the USBFS depending on the PID[1:0] setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the selected pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify each response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible.

### SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

The USBFS toggles the SQMON bit on successful completion of the transaction. However, the USBFS does not toggle the SQMON bit when a DATA-PID mismatch occurs during transfer in the receiving direction.

### SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS sets the SQSET bit to 0.

### SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS sets the SQCLR bit to 0.

### ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 26.13 shows the data cleared by writing 1 and 0 continuously to the ACLRM bit and the cases in which this processing is required.

**Table 26.13 Data cleared by the USBFS when ACLRM = 1**

| Number | Data cleared by setting the ACLRM bit                                        | Situations requiring data clear                          |
|--------|------------------------------------------------------------------------------|----------------------------------------------------------|
| 1      | All data in the FIFO buffer allocated to the selected pipe                   | When initializing the selected pipe                      |
| 2      | Interval count value when the selected pipe is the isochronous transfer type | When resetting the interval count value                  |
| 3      | Internal flags related to the PIPECFG.BFRE bit                               | When changing the PIPECFG.BFRE setting                   |
| 4      | Internal flags related to the transaction count                              | When forcing the transaction count function to terminate |

### BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 26.12.

## 26.2.37 PIPE<sub>n</sub>TRE : PIPE<sub>n</sub> Transaction Counter Enable Register (n = 1 to 5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x090 + 0x4 × (n - 1)

|                    |    |    |    |    |    |    |           |           |   |   |   |   |   |   |   |   |
|--------------------|----|----|----|----|----|----|-----------|-----------|---|---|---|---|---|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9         | 8         | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | —  | —  | —  | —  | —  | —  | TREN<br>B | TRCL<br>R | — | — | — | — | — | — | — | — |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0         | 0         | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol | Function                                                                                      | R/W |
|-------|--------|-----------------------------------------------------------------------------------------------|-----|
| 7:0   | —      | These bits are read as 0. The write value should be 0.                                        | R/W |
| 8     | TRCLR  | Transaction Counter Clear<br>0: Invalid (writing 0 has no effect)<br>1: Clear counter value   | R/W |
| 9     | TRENB  | Transaction Counter Enable<br>0: Disable transaction counter<br>1: Enable transaction counter | R/W |
| 15:10 | —      | These bits are read as 0. The write value should be 0.                                        | R/W |

Note: Set each bit in PIPE<sub>n</sub>TRE while PID is NAK. Before setting these bits after changing the PIPE<sub>n</sub>CTR.PID[1:0] bits for the selected pipe from BUF to NAK, check that the PIPE<sub>n</sub>CTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### TRCLR bit (Transaction Counter Clear)

When the TRCLR bit sets to 1, the USBFS clears the value of the transaction counter associated with the selected pipe and then sets the TRCLR bit to 0.

### TRENB bit (Transaction Counter Enable)

The TRENB bit enables or disables the transaction counter.

For receiving pipes, setting the TRENB bit to 1 after setting the total number of the packets to be received in the PIPEnTRN.TRNCNT[15:0] bits through the software allows the USBFS to control hardware on having received the number of packets equal to the TRNCNT[15:0] setting, as follows:

- When the PIPECFG.SHTNAK bit is 1, the USBFS changes the PID bits to NAK for the associated pipe on having received the number of packets equal to the TRNCNT[15:0] setting
- When the PIPECFG.BFRE bit is 1, the USBFS asserts the BRDY interrupt on having received the number of packets equal to the TRNCNT[15:0] setting and then reading the last received data

For transmitting pipes, set the TRENB bit to 0.

When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT[15:0] bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.

### 26.2.38 PIPEnTRN : PIPEn Transaction Counter Register (n = 1 to 5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x092 + 0x4 × (n - 1)

| Bit  | Symbol       | Function                                                                                                                                                                                                                                                                                                                        | R/W |
|------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | TRNCNT[15:0] | Transaction Counter<br>When written to, this bit specifies the total packets (number of transactions) to be received by the selected pipe.<br>When read from, when PIPEnTRE.TRENB is 0, this bit indicates the specified number of transactions.<br>When PIPEnTRE.TRENB is 1, this bit indicates the current transaction count. | R/W |

The PIPEnTRN registers retain their settings during a USB bus reset.

#### TRNCNT[15:0] bits (Transaction Counter)

The USBFS increments the value of the TRNCNT[15:0] bits by 1 when all the following conditions are satisfied on receiving the packet:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value ≠ current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

The USBFS clears the value of the TRNCNT[15:0] bits to 0 when any of the following conditions are satisfied:

All the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value = current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The USBFS received a short packet

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The PIPEnTRE.TRCLR bit was set to 1 by software

For transmitting pipes, set the TRNCNT[15:0] bits to 0. When the transaction counter is not used, set the TRNCNT[15:0] bits to 0.

Setting the number of transactions to be transferred to the TRNCNT[15:0] bits is only enabled when the PIPEnTRE.TRENB bit is 0. To set the number of transactions to be transferred, set the TRCLR bit to 1 to clear the current counter value before setting the PIPEnTRE.TRENB bit to 1.

### 26.2.39 BCCTRL1 : Battery Charging Control Register 1

| 31:10 | —         | These bits are read as 0. The write value should be 0.                                                              | R/W |

#### RPDME bit (D- Line Pull-down Control)

In device controller operation, set this bit to 1 to perform Data Contact Detect. In the Battery Charging Specification Revision 1.2, there are two methods to handle Data Contact Detect; the method realized by software wait and the method to contact the data line by hardware. The RPDME bit adopts the latter method. When RPDME = 1, the USBFS controls D- line pull-down.

**IDPSRCE bit (D+ Line IDPSRC Output Control)**

In device controller operation, set this bit to 1 to perform Data Contact Detect. In the Battery Charging Specification Revision 1.2, there are two methods to handle Data Contact Detect; the method realized by software wait and the method to contact the data line by hardware. The IDPSRCE bit adopts the latter method. When IDPSRCE = 1, the USBFS enables the IDP\_SRC circuit

**VDMSRCE bit (D- Line VDMSRC (0.6 V) Output Control)**

In host controller operation, during Primary Detection, this bit controls VDMSRC (0.6 V) output from the USB\_DM pin.  
In device controller operation, during Secondary Detection, this bit controls VDMSRC (0.6 V) output from the USB\_DM pin.

**VDPSRCE bit (D+ Line VDPSRC (0.6 V) Output Control)**

In device controller operation, if Primary Detection is executed, this bit controls VDPSRC (0.6 V) output from the USB\_DP pin.

**PDDETE bit (D+ Line 0.6 V Input Detection Control)**

When the PDDETE bit is set to 1, the following states can be detected.

In host controller operation, during Primary Detection, VDPSRC (0.6 V) is input to the USB\_DP pin from a peripheral device.

In device controller operation, during Secondary Detection, VDPSRC (0.6 V) output from the USBFS to the USB\_DM pin is input to the USB\_DP pin via the host.

**CHGDETE bit (D- Line 0.6 V Input Detection Control)**

In device controller operation, the following can be detected when the CHGDETE bit is set to 1.

During Primary Detection, VDMSRC (0.6 V) is input to the USB\_DM pin from the host.

During Primary Detection, VDPSRC (0.6 V) output from the USBFS to the USB\_DP pin is input to the USB\_DM pin via the USB host.

**PDDETSTS flag (D+ Line 0.6 V Input Detection Status Flag)**

The PDDETSTS flag is enabled when the PDDETE bit is 1. The PDDETSTS flag becomes 1 under the following conditions.

In host controller operation, during Primary Detection, VDPSRC (0.6V) is input to the USB\_DP pin from a peripheral device.

In device controller operation, during Secondary Detection, the VDMSRC (0.6V) output from the USBFS to the USB\_DM pin is input to the USB\_DP pin via the host.

**CHGDETSTS flag (D- Line 0.6 V Input Detection Status Flag)**

In device controller operation, this flag is enabled when the CHGDETE bit is 1. The CHGDETSTS flag becomes 1 under the following conditions.

During Primary Detection, VDMSRC (0.6V) is input to the USB\_DM pin from the USB host.

During Primary Detection, the VDPSRC (0.6V) output from the USBFS to the USB\_DP pin is input to the USB\_DM pin via the USB host.

## 26.2.40 BCCTRL2 : Battery Charging Control Register 2

Base address: USBFS = 0x4009\_0000

Offset address: 0x0B4

| 5:0  | —           | These bits are read as 0. The write value should be 0.                                                                                   | R/W |
| 7:6  | USBSPD[1:0] | Transfer Speed of Communication Target Device<br>0 0: Do not use DEVADDn<br>0 1: Low-speed<br>1 0: Full-speed<br>1 1: Setting prohibited | R/W |
| 15:8 | —           | These bits are read as 0. The write value should be 0.                                                                                   | R/W |

The DEVADDn register specifies the transfer speed of the peripheral device that is the communication target for pipes 0 to 9.

In host controller mode, set all DEVADDn bits before starting communication to any pipes. Only change the bits in DEVADDn when no valid pipes are using the bit settings. A valid pipe is defined as one that satisfies both of the following conditions:

- The target device of the DEVADDn register is selected in the DEVSEL[3:0] bits
- The PID[1:0] bits are set to BUF for the selected pipe, or the selected pipe is the DCP with the DCPCTR.SUREQ bit set to 1

In device controller mode, set all bits in this register to 0.

### USBSPD[1:0] bits (Transfer Speed of Communication Target Device)

The USBSPD[1:0] bits specify the USB transfer speed of the target peripheral device. Set these bits to 10b when a full-speed device is connected through the hub. In host controller mode, the USBFS generates packets based on the USBSPD[1:0] setting. In device controller mode, set these bits to 00b.

#### 26.2.42 PHYSECTRL : PHY Single-ended Receiver Control Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x0F4

|                    |                                                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |      |       |  |  |   |

| 22    | —       | The read value is undefined. The write value should be 0.                                                                                                               | R/W |
| 23    | DVBST0  | USB VBUS Input<br>Indicates VBUS input signal on the USBFS side                                                                                                         | R   |
| 31:24 | —       | These bits are read as 0. The write value should be 0.                                                                                                                  | R/W |

Note 1. Use this bit during operation in Deep Software Standby mode. For details, see [section 26.3.1.5. Release from Deep Software Standby mode because of USB suspend/resume interrupts.](#)

### SRPC0 bit (USB Single-ended Receiver Control)

The SRPC0 bit controls the D+ and D- inputs of the USB transceiver. In host controller mode, set this bit to 1. In device controller mode, set this bit to 0 when disconnected, set to 1 when suspended. This bit is only valid when the FIXPHY0 bit is 1.

### FIXPHY0 bit (USB Transceiver Output Fix)

The FIXPHY0 bit keeps the outputs of the USB transceiver disabled.

## 26.2.44 DPUSR1R : Deep Software Standby USB Suspend/Resume Interrupt Register

#### DPINTE0 bit (USB DP Interrupt Enable/Clear)

The DPINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DP input of the USBFS. Writing 0 to this bit while the DPINT0 bit is 1 sets the DPINT0 bit to 0.

#### DMINTE0 bit (USB DM Interrupt Enable/Clear)

The DMINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DM input of the USBFS. Writing 0 to this bit while the DMINT0 bit is 1 clears the DMINT0 bit to 0.

#### DOVRCRAE0 bit (USB OVRCURA Interrupt Enable/Clear)

The DOVRCRAE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the OVRCURA input of the USBFS. Writing 0 to this bit while the DOVRCRA0 bit is 1 clears the DOVRCRA0 bit to 0.

#### DVBSE0 bit (USB VBUS Interrupt Enable/Clear)

The DVBSE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the VBUS input of the USBFS. Writing 0 to this bit while the DVBINT0 bit is 1 clears the DVBINT0 bit to 0.

#### DPINT0 bit (USB DP Interrupt Source Recovery)

The DPINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DP input of the USBFS. This recovery is only enabled when the DPINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

**DMINT0 bit (USB DM Interrupt Source Recovery)**

The DMINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DM input of the USBFS. This recovery is only enabled when the DMINTE0 bit is 1. Writing 0 to the DMINTE0 bit while this bit is 1 clears this bit to 0.

**DOVRCRA0 bit (USB OVRCURA Interrupt Source Recovery)**

The DOVRCRA0 bit indicates that the system has returned from Deep Software Standby mode because of the OVRCURA input of the USBFS. This recovery is only enabled when the DOVRCRAE0 bit is 1. Writing 0 to the DOVRCRAE0 bit while this bit is 1 clears this bit to 0.

**DVBINT0 bit (USB VBUS Interrupt Source Recovery)**

The DVBINT0 bit indicates that the system has returned from Deep Software Standby mode because of the VBUS input of the USBFS. This recovery is only enabled when the DVBSE0 bit is 1. Writing 0 to the DVBSE0 bit while this bit is 1 clears this bit to 0.

**26.3 Operation****26.3.1 System Control**

This section describes register settings required for initializing the USBFS and controlling power consumption.

**26.3.1.1 Setting data to the USBFS registers**

Setting the SYSCFG.USBE bit to 1 after starting the clock supply (SYSCFG.SCKE bit = 1) enables and starts USBFS operation.

**26.3.1.2 Selecting the controller function**

The USBFS can operate as either a host or device controller.

Use the SYSCFG.DCFM bit to select one of these USBFS functions. The DCFM bit must be changed in the initial settings immediately after a reset or in the D+ pull-up-disabled state (SYSCFG.DPRPU bit = 0) and D+ and D- pull-down-disabled state (SYSCFG.DRPD bit = 0).

**26.3.1.3 Controlling the USB data bus using resistors**

The USBFS provides pull-up and pull-down resistors for the D+ and D- lines. Pull these lines up or down by setting the SYSCFG.DPRPU and DRPD bits.

In device controller mode, confirm that connection to the USB host is made, and then set the SYSCFG.DPRPU bit to 1 and pull up the D+ line (in full-speed communication).

When the SYSCFG.DPRPU bit is set to 0 during communication with a PC, the USBFS disables the pull-up resistor of the USB data line, thereby notifying the USB host of disconnection.

In host controller mode, set the SYSCFG.DRPD bit to 1 to pull down the D+ and D- lines.

**Table 26.14 USB data bus resistor control**

| SYSCFG register settings |           | USB data bus control |           | Function                                            |
|--------------------------|-----------|----------------------|-----------|-----------------------------------------------------|
| DRPD bit                 | DPRPU bit | D-                   | D+        |                                                     |
| 0                        | 0         | Open                 | Open      | When resistors not used                             |
| 0                        | 1         | Open                 | Pull-up   | When operating as a device controller at full-speed |
| 1                        | 0         | Pull-down            | Pull-down | When operating as a host controller                 |
| 1                        | 1         | —                    | —         | Setting prohibited                                  |

**26.3.1.4 Example external connection circuits**

The USBFS controls the pull-up resistor of the D+ line and the pull-down resistor of D+ and D- lines. Select pull-up and pull-down for the lines in the SYSCFG.DPRPU and SYSCFG.DRPD bits. In device controller mode, the pull-up resistor of

USB data line is disabled if SYSCFG.DPRPU bit is set to 0 while communicating with the USB host. The USBFS can use this to notify the USB host of a device disconnect.

Figure 26.2 shows an example host connection.

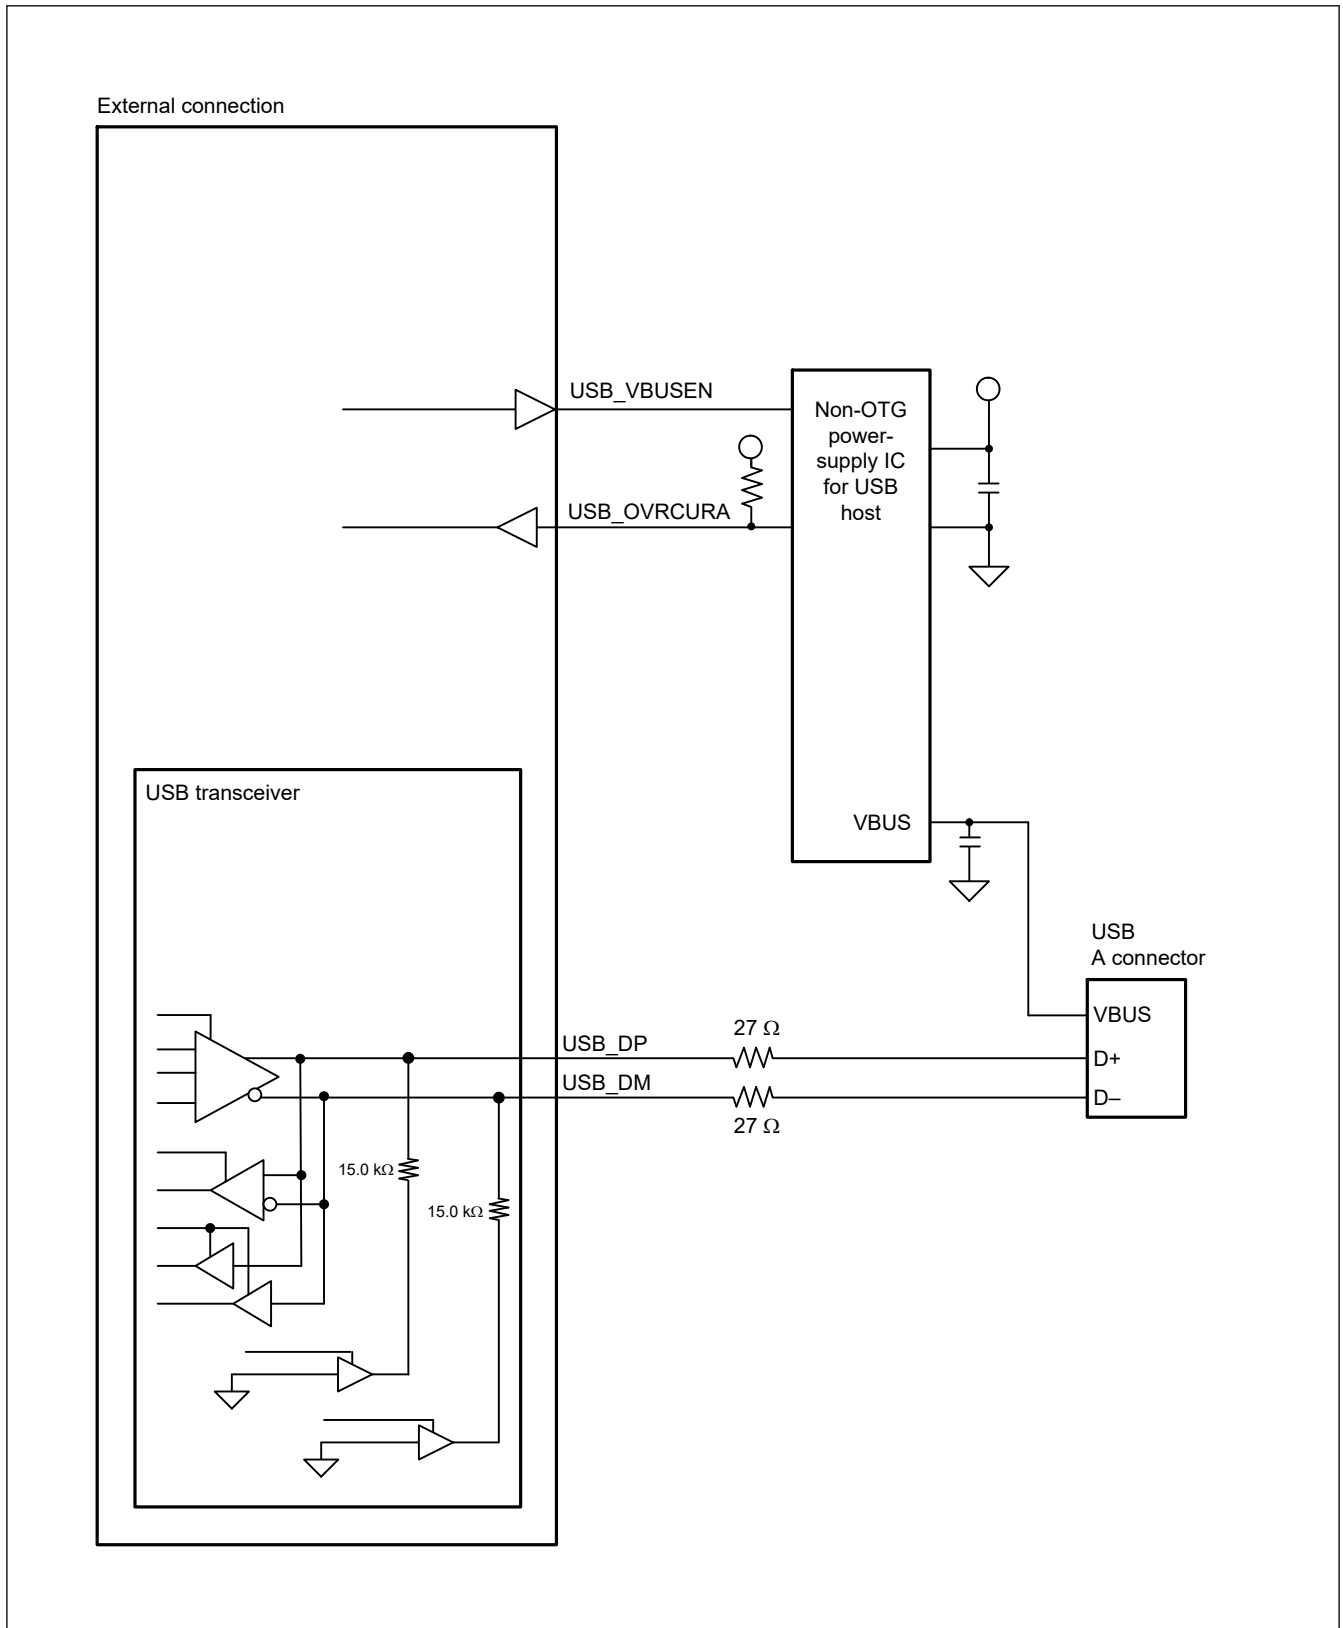

Figure 26.2 Example host connection

Figure 26.3 shows an example device connection in a bus-powered system.

**Figure 26.3 Example device connection in a bus-powered state**

Figure 26.4 shows an example of functional connection of the USB connector with Battery Charging Rev 1.2 supported.

**Figure 26.4 Example of functional connection with Battery Charging Rev 1.2 supported**

The examples of external circuits given in this section are simplified circuits, and their operation in every system is not guaranteed.

### 26.3.1.5 Release from Deep Software Standby mode because of USB suspend/resume interrupts

Deep Software Standby mode can be canceled by a USB suspend/resume interrupt. USB suspend/resume interrupts are detected by the USB resume detecting unit, which controls and monitors the USB I/O pins to detect the interrupts.

Figure 26.5 shows a schematic diagram of the connection between the USB resume detecting unit and the USB I/O pins.

Figure 26.5 Connection between the USB resume detecting unit and the USB I/O pins

Table 26.15 shows the USB suspend and resume interrupt sources and their associated I/O pins.

Table 26.15 USB suspend and resume interrupt sources and their associated I/O pins

| USB operating mode | Source                | Pin name       |
|--------------------|-----------------------|----------------|
| Device             | Resume                | USB_DP         |
| Host               | Attach or detach      | USB_DP, USB_DM |
| Device             | Attach or detach      | USB_VBUS       |
| Host               | Overcurrent detection | USB_OVRCURA    |

### 26.3.2 Interrupts

Table 26.16 lists the interrupt sources in the USBFS. When an interrupt generation condition is satisfied and the interrupt output is enabled using the associated interrupt enable register, a USBFS interrupt request is issued to the Interrupt Controller Unit (ICU) and an USBFS interrupt is generated.

Table 26.16 Interrupt sources (1 of 2)

| Bit to be set to 1 | Name                                             | Interrupt source                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Applicable controller function | Status flag        |

### 26.3.3 Interrupt Descriptions

#### 26.3.3.1 BRDY interrupt

The BRDY interrupt is generated in both host and device controller modes. This section describes the conditions in which the USBFS sets the associated bit in BRDYSTS to 1. Under these conditions, the USBFS generates a BRDY interrupt if the software has set the bit in BRDYENB associated with the given pipe to 1 and the INTENB0.BRDYE bit to 1.

The conditions for generating and clearing the BRDY interrupt depend on the SOFCFG.BRDYM and PIPECFG.BFRE settings for each pipe as follows:

##### (1) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, the USBFS generates an internal BRDY interrupt request trigger and sets the BRDYSTS.PIPE<sub>n</sub>BRDY bit associated with the selected pipe to 1.

##### For transmitting pipes

- When the DIR bit is changed from 0 to 1 by software
- When packet transmission is complete for a pipe while write-access from the CPU to the FIFO buffer for the pipe is disabled (when the BSTS bit is read as 0)
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode
- No request trigger is generated until completion of writing data to the currently-written FIFO buffer even if transmission to the other FIFO buffer is complete
- When the hardware flushes the buffer of the pipe for isochronous transfers
- When 1 is written to the PIPE<sub>n</sub>CTR.ACLRM bit, which causes the FIFO buffer to transition from the write-disabled to write-enabled state

No request trigger is generated for the DCP, that is, during data transmission for control transfers.

##### For receiving pipes

- When packet reception is successfully complete, enabling the FIFO buffer to be read while read-access from the CPU to the FIFO buffer for the given pipe is disabled (when the BSTS bit is read as 0). No request trigger is generated for transactions in which a DATA-PID mismatch has occurred.
- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode. No request trigger is generated until completion of reading data from the currently-read FIFO buffer, even if reception by the other FIFO buffer is complete.

In device controller mode, the BRDY interrupt is not generated in the status stage of control transfers. The PIPEBRDY interrupt status of the selected pipe can be set to 0 by writing 0 to the associated PIPE<sub>n</sub>BRDY bit through software. In this case, the other PIPEBRDY bit should be set to 1.

Clear the BRDY status before accessing the FIFO buffer.

## (2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1

With these settings, the USBFS generates a BRDY interrupt on completion of reading all data for a single transfer using the receiving pipe, and sets the bit in BRDYSTS associated with the pipe to 1.

On any of the following conditions, the USBFS determines that the last data for a single transfer was received.

- When a short packet including a zero-length packet is received
- When the PIPE<sub>n</sub> transaction counter register (PIPE<sub>n</sub>TRN) is used and the number of packets specified in the PIPE<sub>n</sub>TRN.TRNCNT[15:0] bits are completely received

When the data is completely read after any of these conditions is satisfied, the USBFS determines that all data for a single transfer is completely read.

When a zero-length packet is received while the FIFO buffer is empty, the USBFS determines that all data for a single transfer is completely read when the FRDY bit in the FIFO port control register is 1 and the DTLN[8:0] bits are 0. In this case, to start the next transfer, write 1 to the BCLR bit in the associated port control register through the software. With these settings, the USBFS does not detect a BRDY interrupt for the transmitting pipe.

The PIPEBRDY interrupt status of a pipe can be set to 0 by writing 0 to the associated BRDYSTS.PIPE<sub>n</sub>BRDY bit through the software. In this case, 1s must be written to the PIPEBRDY bits for the other pipes.

In this mode, do not change the PIPECFG.BFRE bit setting until all data for a single transfer is processed. When it is necessary to change the PIPECFG.BFRE bit before completion of processing, all FIFO buffers for the pipe must be cleared using the PIPE<sub>n</sub>CTR.ACLR bit.

## (3) When SOFCFG.BRDYM = 1 and PIPECFG.BFRE = 0

With these settings, the BRDYSTS.PIPE<sub>n</sub>BRDY values are linked to the BSTS bit setting for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by the USB depending on the FIFO buffer status.

### For transmitting pipes

The BRDY interrupt status bits are set to 1 when the FIFO buffer is ready for write access, and are set to 0 when it is not ready. The BRDY interrupt is not generated for the DCP in the transmitting direction even when it is ready for write access.

### For receiving pipes

The BRDY interrupt status bits set to 1 when the FIFO buffer is ready for read access, and set to 0 when all data is read (not ready for read access).

When a zero-length packet is received while the FIFO buffer is empty, the associated bit is set to 1 and the BRDY interrupt is continuously generated until the software writes 1 to BCLR. With this setting, the PIPE<sub>n</sub>BRDY bit cannot be set to 0 by software.

When the SOFCFG.BRDYM bit is set to 1, set the PIPECFG.BFRE bit for all pipes to 0.

[Figure 26.10](#) shows the timing of BRDY interrupt generation.

**Figure 26.10 Timing of BRDY interrupt generation**

The condition for clearing the INTSTS0.BRDY bit depends on the SOFCFG.BRDYM bit setting, as shown in [Table 26.18](#).

**Table 26.18 Conditions for clearing the BRDY bit**

| BRDYM bit | Condition for clearing BRDY bit                                                        |
|-----------|----------------------------------------------------------------------------------------|
| 0         | The USBFS clears the BRDY bit to 0 when all bits in BRDYSTS are set to 0 by software.  |
| 1         | The USBFS clears the BRDY bit to 0 when the BSTS bits for all pipes have cleared to 0. |

### 26.3.3.2 NRDY interrupt

On generating an internal NRDY interrupt request for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated PIPEnNRDY bit in NRDYSTS to 1. If the associated bit in NRDYENB is set to 1 by software, the USBFS sets the INTSTS0.NRDY bit to 1 and generates a USBFS interrupt.

This section describes the conditions in which the USBFS generates the internal NRDY interrupt request for a given pipe. The internal NRDY interrupt request is not generated during setup transaction execution in host controller mode. During setup transactions in host controller mode, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer in device controller mode.

### (1) In host controller mode

#### For transmitting pipes

On any of the following conditions, the USBFS detects an NRDY interrupt:

- For isochronous transfer pipes, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS transmits a zero-length packet following the OUT token and sets the associated NRDYSTS.PIPEnNRDY bit and the FRMNUM.OVRN bit to 1.
- During communications other than setup transactions on pipes not used for isochronous transfers, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device)
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the PID[1:0] setting for the associated pipe to STALL (11b).

#### For receiving pipes

- For isochronous transfer pipes, when the time to issue an IN token comes but there is no space available in the FIFO buffer. In this case, the USBFS discards the received data for the IN token and sets the PIPEnNRDY bit associated with the pipe and the OVRN bit to 1. When a packet error is detected in the received data for the IN token, the USBFS also sets the FRMNUM.CRCE bit to 1.
- For non-isochronous transfer pipes, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device for the IN token issued by the USBFS (when timeout is detected before detection of the DATA packet from the peripheral device)
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- For isochronous transfer pipes, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1. The PID[1:0] setting for the pipe is not changed.
- For isochronous transfer pipes, when a CRC error or a bit stuffing error is detected in the received data packet. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe and the CRCE bit to 1.
- When the STALL handshake is received. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1 and changes the PID[1:0] setting for the associated pipe to STALL.

### (2) In device controller mode

#### For transmitting pipes

- When an IN token is received while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS generates a NRDY interrupt request on reception of the IN token and sets the NRDYSTS.PIPEnNRDY bit to 1. For an isochronous transfer pipe in which an interrupt is generated, the USBFS transmits a zero-length packet and sets the FRMNUM.OVRN bit to 1.

#### For receiving pipes

- When an OUT token is received but there is no space available in the FIFO buffer. For an isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request on reception of the OUT token and sets the PIPEnNRDY bit to 1 and OVRN bit to 1. For a non-isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token is received, and sets the PIPEnNRDY bit to 1. The NRDY interrupt request is not generated during retransmission

because of a DATA-PID mismatch. In addition, the NRDY interrupt request is not generated if an error occurs in the DATA packet.

- For isochronous transfer pipes, when a token is not received successfully within an interval frame. In this case, the USBFS generates an NRDY interrupt request when the SOF is received, and sets the PIPEnNRDY bit to 1.

Figure 26.11 shows the timing of NRDY interrupt generation in device controller mode.

### 26.3.3.3 BEMP interrupt

On detecting a BEMP interrupt for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated BEMPSTS.PIPEnBEMP bit to 1. If the associated bit in BEMPENB is set to 1 by software, the USBFS sets the INTSTS0.BEMP bit to 1 and generates a USBFS interrupt. This section describes the conditions in which the USBFS generates an internal BEMP interrupt request.

#### (1) For transmitting pipes

When the FIFO buffer of the associated pipe is empty on completion of transmission, including zero-length packet transmission, and in single buffer mode, an internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for a non-DCP pipe. The internal BEMP interrupt request is not generated in any of the following conditions:

- When the CPU or DMA/DTC has already started writing data to the FIFO buffer of the CPU on completion of transmitting data from one FIFO buffer in double buffer mode
- When the buffer is cleared (emptied) by setting the PIPEnCTR.ACLRM or the BCLR bit to 1 in the port control register
- When an IN transfer (zero-length packet transmission) is performed during the control transfer status stage in device controller mode

(2) For receiving pipes

When a successfully-received data packet size exceeds the specified maximum packet size. In this case, the USBFS generates a BEMP interrupt request, sets the associated BEMPSTS.PIPEnBEMP bit to 1, discards the received data, and changes the associated PID[1:0] setting for the pipe to STALL (11b). The USBFS returns no response in host controller mode, and returns STALL response in device controller mode.

The internal BEMP interrupt request is not generated in any of the following conditions:

- When a CRC error or a bit stuffing error is detected in the received data
- When a setup transaction is being performed:
  - Writing 0 to the BEMPSTS.PIPEnBEMP bit clears the status
  - Writing 1 to the BEMPSTS.PIPEnBEMP bit has no effect

Figure 26.12 shows the timing of BEMP interrupt generation in device controller mode.

26.3.3.4 Device state transition interrupt (device controller mode)

Figure 26.13 shows a diagram of the USBFS device state transitions. The USBFS controls device states and generates device state transition interrupts. However, recovery from the Suspend state (resume signal detection) is detected by means of the resume interrupt. Device state transition interrupts can be enabled or disabled independently in INTENB0. Devices whose states have changed can be checked in the INTSTS0.DVSQ[2:0] bits.

When a transition is made to the default state, a device state transition interrupt is generated after a USB bus reset is detected.

The USBFS controls device states, and device state transition interrupts can be generated, only in device controller mode.

Figure 26.13 Device state transitions

### 26.3.3.5 Control transfer stage transition interrupt (device controller mode)

Figure 26.14 shows a diagram of the control transfer stage transitions of the USBFS. The USBFS controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled independently in INTENB0. Transfer stages that have transitioned can be checked in the INTSTS0.CTSQ[2:0] bits.

Control transfer stage transition interrupts are generated only in device controller mode. This section describes control transfer sequence errors. If an error occurs, the DCPCTR.PID[1:0] bits are set to 1xb (STALL response).

(1) Control read transfer errors

- An OUT token is received but no data is transferred in response to the IN token at the data stage
- An IN token is received at the status stage
- A data packet with DATAPID = DATA0 is received at the status stage

(2) Control write transfer errors

- An IN token is received but no ACK is returned in response to the OUT token at the data stage
- A data packet with DATAPID = DATA0 is received as the first data packet at the data stage
- An OUT token is received at the status stage

(3) Control write no data transfer errors

- An OUT token is received at the status stage

At the control write transfer data stage, if the receive data length exceeds the wLength value of the USB request, it is not recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (INTSTS0.CTRT = 1), the CTSQ[2:0] = 110b value is saved until the CTRT bit is set to 0, clearing the interrupt status. While CTSQ[2:0] = 110b is being saved, no CTRT interrupt for ending the setup stage is generated, even if a new USB request is received. The USBFS saves the setup stage completion status, and it generates a CTRT interrupt after the interrupt status is cleared by software.

Figure 26.14 Control transfer stage transitions

26.3.3.6 Frame update interrupt

In host controller mode, an interrupt is generated when the frame number is updated.

In device controller mode, an SOFR interrupt is generated when the frame number is updated. The USBFS updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation.

### 26.3.3.7 VBUS interrupt

When the USB\_VBUS pin level changes, a VBUS interrupt is generated. The level of the USB\_VBUS pin can be checked with the INTSTS0.VBSTS bit. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. If the system is activated with the host controller connected, the first VBUS interrupt is not generated, because there is no change in the USB\_VBUS pin level.

### 26.3.3.8 Resume interrupt
