Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD18)
Set CMD18 argument in SD_ARG and write 0x0000_0012 to SD_CMD. CMD18 is issued and the multiple block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be

halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data receive from SD card/MMC and data read
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_0A00 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data received from the SD card/MMC is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks that is set to SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000_0000.

f. Operation complete
When all-block data read and the CMD12 response received are completed, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to read the response. This is the end of multiple block read operation. In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

47.3.9 Multiple Block Write (SD/MMC Using Internal Timer)

Figure 47.14 shows an example flow of a multiple block write using internal timer.

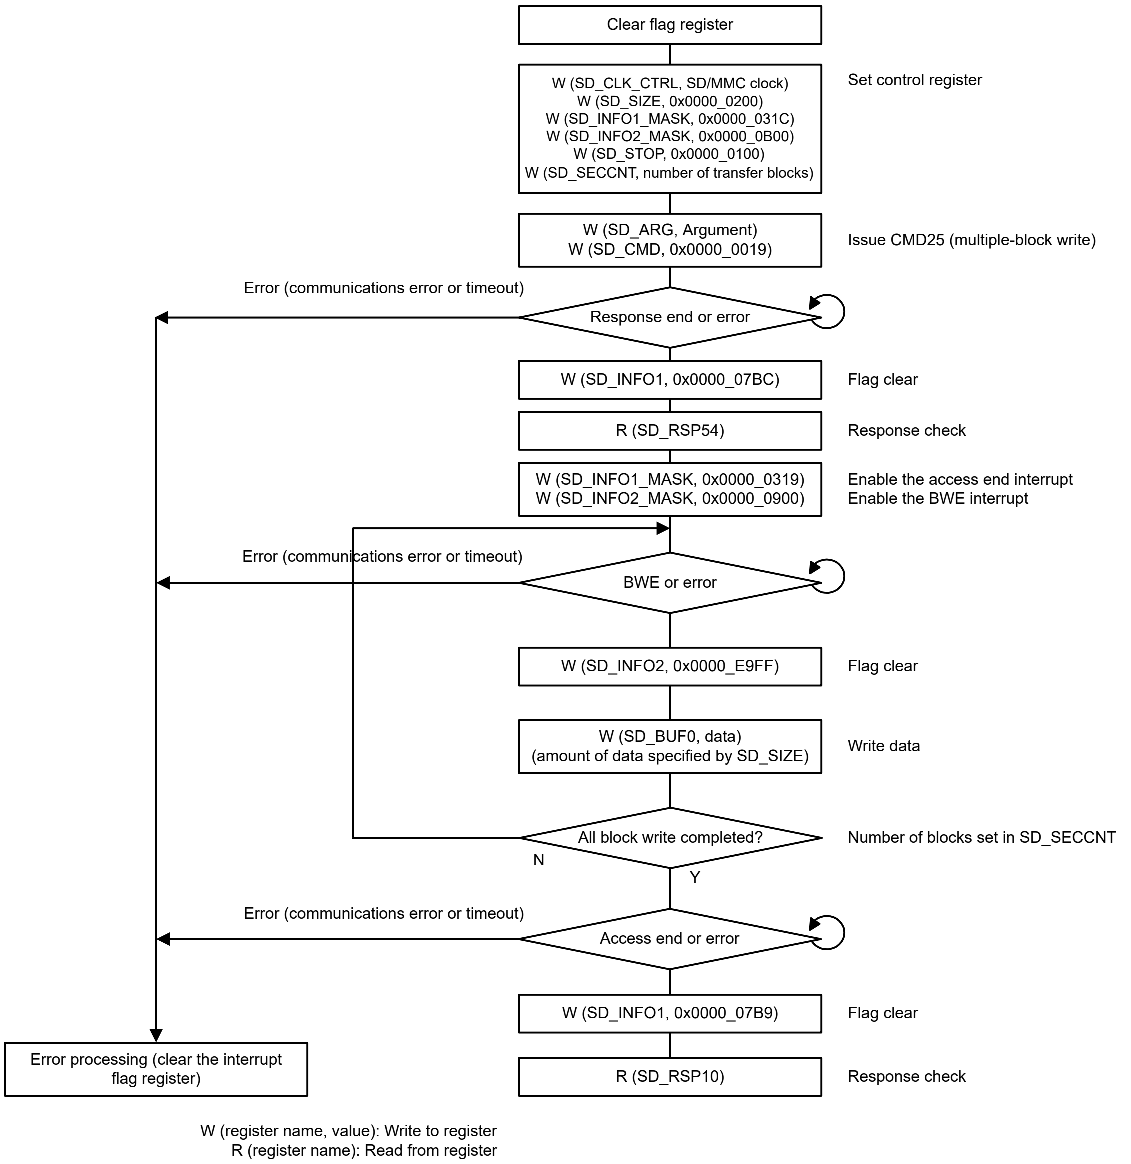

Figure 47.14 Example of multiple block write operation using internal timer

47.3.9.1 Multiple Block Write Operation Using Internal Timer

The operation of the multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD25)
Set CMD25 argument in SD_ARG and write 0x0000_0019 to SD_CMD. CMD25 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND bit (response end) in SD_INFO1 is set to 1 to generate an interrupt.

Clear the RSPEND bit to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to SD card/MMC
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_0900 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card/MMC. The CRC status and busy state are received from the SD card/MMC. This repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000_0000.

f. Operation complete
When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs.

47.3.10 Multiple Block Write (MMC Using External Timer)

Figure 47.15 shows an example flow of a multiple block write using an external timer.

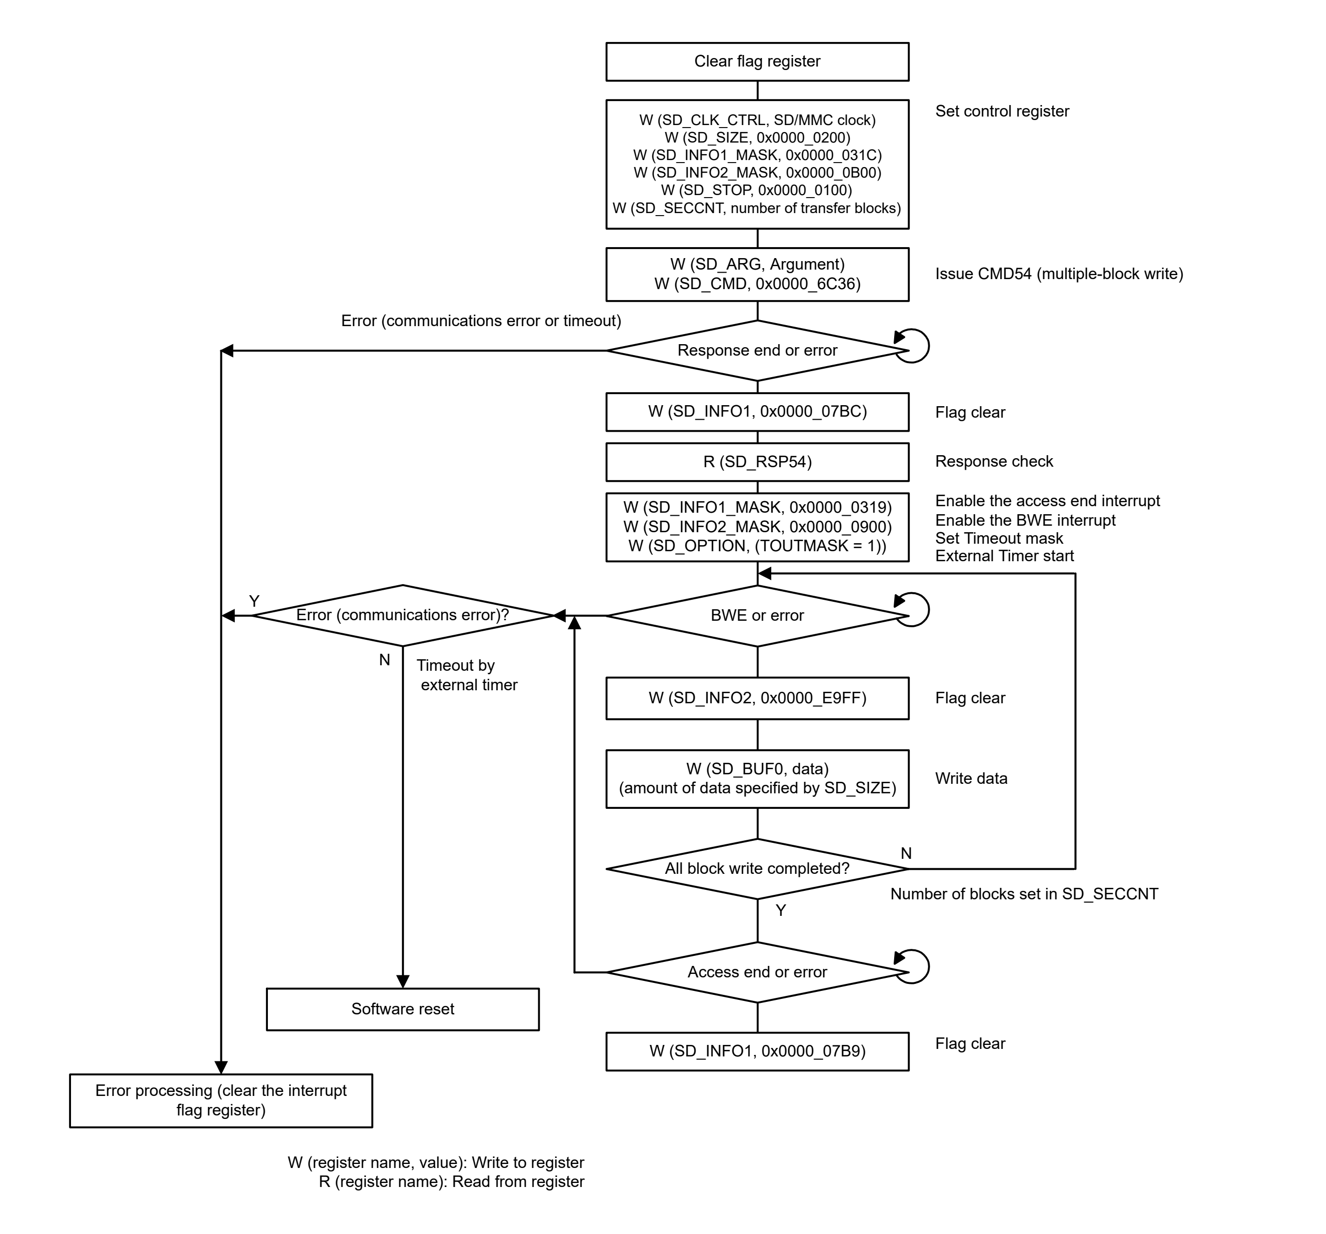

Figure 47.15 Example of multiple block write operation using external timer

47.3.10.1 Multiple Block Write Operation Using External Timer

The operation of the multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD54)
Set CMD54 Argument in SD_ARG and write 0x0000_6C36 to SD_CMD. CMD54 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND bit (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND bit to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued

and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to MMC
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt, write 0x0000_0900 to SD_INFO2_MASK to enable the BWE interrupt and set 1 to TOUTMASK of SD_OPTION to inactivate timeout. In addition, start external timer. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the MMC. The CRC status and busy state are received from the MMC. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD_BUF0 is in progress.

f. Operation complete
When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs when receiving response. Execute software reset if a timeout by external timer occurs when transmitting data.

47.3.11 IO_RW_DIRECT Command (SD: CMD52)

Figure 47.16 shows an example flow of an IO_DIRECT command (CMD52) operation.

47.4 Usage Notes

47.4.1 SD_BUF Illegal Write Access (SD/MMC)

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified in SD_SIZE must be written.

If the data exceeds the size specified in SD_SIZE is written, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 might not be transmitted and the SD_CLK_CTRLEN bit in SD_INFO2 is held at the value of 0. If this occurs, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SD_CLK_CTRLEN bit to 1.

However, this does not apply to the single byte or three bytes when the SD_SIZE setting is odd, or to the fraction of bytes when the SD_SIZE setting is even (the 2 bytes that are not in a 4-byte unit), because the portion of dummy data writing is regarded as excess data and ignored.

47.4.2 Block Number Constraint for Multiple Block Read (SD)

When performing a multiple block read of one or two blocks, depending on the timing with which the SD card response register is read, the response value might not be read properly. To prevent this, do one of the following:

1. When receiving one or two blocks of data, use single block reading.
2. Read the response to CMD18 from SD_RSP54.

47.4.2.1 Mechanism of Incorrect Reading

Figure 47.25 shows the processing flows of the SDHI (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation in Figure 47.25, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response might be read. This problem does not occur for multiple block reads of three or more blocks, because CMD12 is not issued until the block of data is read. The problem also does not occur for multiple block writes, because the CMD25 response is read before the block of data is sent.

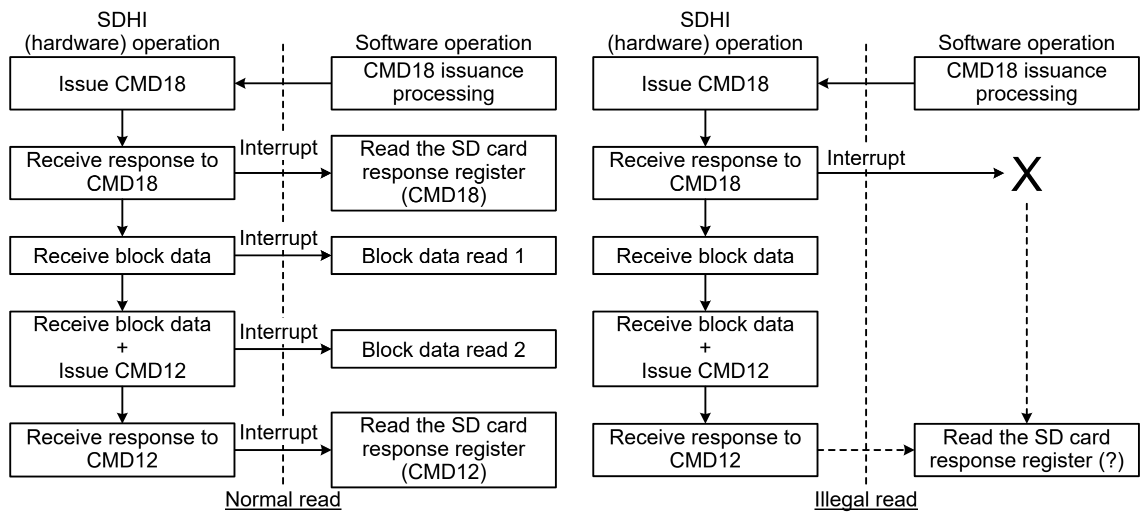

Figure 47.25 Multiple block read operation flow chart (two blocks)

47.4.3 Automatic Control of SD/MMC Clock Output (SD/MMC)

In the SD Card/MMC standard, 74 cycles of SD/MMC clock must be output before initialization of the card. For this reason, use automatic control of SD/MMC clock output after 74 cycles of SD/MMC clock are output. In addition, if automatic control of SD/MMC clock output was in use, SD/MMC clock output is stopped on completion of the sequence for a communications error or timeout. When state transitions within the SD card/MMC are necessary after completion of the sequence, release automatic control of SD/MMC clock output and restart supply of the SD/MMC clock to the SD card/MMC.

47.4.4 Control of the C52PUB Setting for Multiple Block Write (SD)

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write because of CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by using one of the following procedures, as appropriate:

(a) When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 because the issuing of CMD52 is completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

(b) When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2,…) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 because the issuing of CMD52 is completed, restart writing to SD_BUF by DMA transfer.

47.4.5 Notes on SD_CLK_CTRL Register Settings (SD/MMC)

When the SD_CLK_CTRLEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, you must check that the SD_CLK_CTRLEN bit in SD_INFO2 is 1.

47.4.6 Specification Limitations

1. The Suspend/Resume operation of the SDIO is not supported.
2. The SPI bus is not supported. (SD/MMC)
3. The shared bus and 8-bit SD bus of the embedded SDIO are not supported.
4. Stream transfer of MMC is not supported.
5. High Priority Interrupt (HPI) of MMC is not supported.
6. Boot Operation/Alternative Boot Operation of MMC is not supported.
7. Open-ended multiple block transfer of MMC is not supported.

47.4.7 STP Bit Setting During Multiple Block Read (SD/MMC)

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence might not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SD_CLK_CTRLEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence does not stop because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, you must leave the SEC bit in SD_STOP as 1.

47.4.8 Register Setting Notes

1. All registers in section 47.2. Register Descriptions are accessed in 32-bit access-only.
2. When setting registers, set them after the I/O Port Register setting.

47.4.9 Module-stop Function

SDHI operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The SDHI module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

47.4.10 Software Standby Mode

Before entering Software Standby mode, confirm the SD_INFO2.CBSY bit is 0.

48. Cyclic Redundancy Check (CRC)

48.1 Overview

The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer.

Table 48.1 lists the CRC calculator specifications and Figure 48.1 shows a block diagram.

Table 48.1 CRC calculator specifications

Item	Description	
Data size	8-bit	32-bit
Data for CRC calculation*1	CRC code generated for data in 8n-bit units (where n is a natural number)	CRC code generated for data in 32n-bit units (where n is a natural number)
CRC processor unit	Operation executed on 8 bits in parallel	Operation executed on 32 bits in parallel
CRC generating polynomial	One of three generating polynomials that is selectable: [8-bit CRC] • $X^8 + X^2 + X + 1$ (CRC-8) [16-bit CRC] • $X^{16} + X^{15} + X^2 + 1$ (CRC-16) • $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT)	One of two generating polynomials that is selectable: [32-bit CRC] • $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (CRC-32) • $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C)
CRC calculation switching	The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication	
Module-stop function	Module-stop state can be set to reduce power consumption	
CRC snoop	Monitor reads from and writes to a certain register address	
TrustZone Filter	Security and Privilege attribution can be set	

Note 1. This function cannot divide data used in CRC calculations. Write data in 8-bit or 32-bit units.

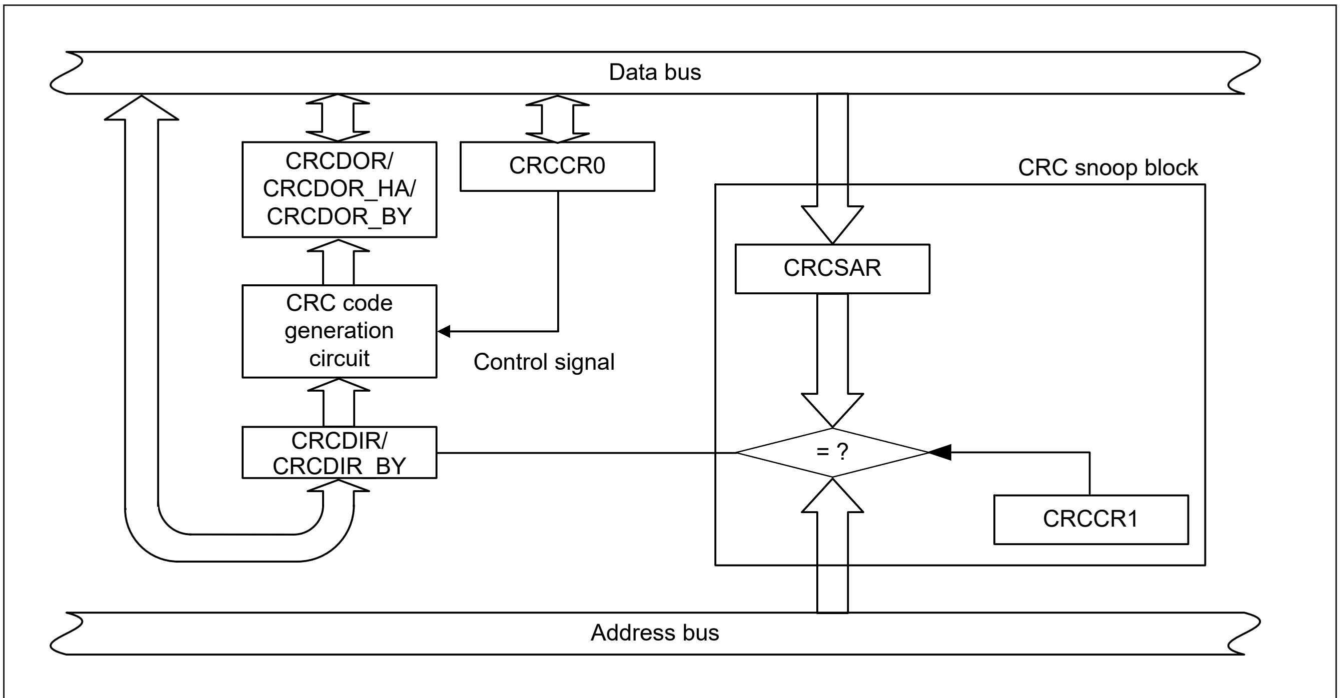

Figure 48.1 CRC calculator block diagram

48.2 Register Descriptions

48.2.1 CRCCR0 : CRC Control Register 0

Base address: CRC = 0x4031_0000
CRC_NS = 0x5031_0000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DORCLR	LMS	—	—	—	GPS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	GPS[2:0]	CRC Generating Polynomial Switching 0 0 1: 8-bit CRC-8 ($X^8 + X^2 + X + 1$) 0 1 0: 16-bit CRC-16 ($X^{16} + X^{15} + X^2 + 1$) 0 1 1: 16-bit CRC-CCITT ($X^{16} + X^{12} + X^5 + 1$) 1 0 0: 32-bit CRC-32 ($X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$) 1 0 1: 32-bit CRC-32C ($X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$) Others: No calculation is executed	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	LMS	CRC Calculation Switching 0: Generate CRC code for LSB-first communication 1: Generate CRC code for MSB-first communication	R/W
7	DORCLR	CRCDOR/CRCDOR_HA/CRCDOR_BY Register Clear 0: No effect 1: Clear the CRCDOR/CRCDOR_HA/CRCDOR_BY register	W

Note: S-TYPE3, P-TYPE3

GPS[2:0] bits (CRC Generating Polynomial Switching)

The GPS[2:0] bits select the CRC generating polynomial.

LMS bit (CRC Calculation Switching)

The LMS bit selects the bit order of generated CRC code. Transmit the lower byte of the CRC code first for LSB-first communication and the upper byte first for MSB-first communication. For details on transmitting and receiving CRC code, see section 48.3. Operation.

DORCLR bit (CRCDOR/CRCDOR_HA/CRCDOR_BY Register Clear)

Write 1 to the DORCLR bit to set the CRCDOR/CRCDOR_HA/CRCDOR_BY register to 0x00000000. This bit is read as 0. Only 1 can be written to it.

48.2.2 CRCCR1 : CRC Control Register 1

Base address: CRC = 0x4031_0000
CRC_NS = 0x5031_0000

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CRCSEN	CRCSWR	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	CRCSWR	Snoop-On-Write/Read Switch 0: Snoop-on-read 1: Snoop-on-write	R/W
7	CRCSEN	Snoop Enable 0: Disabled 1: Enabled	R/W

Note: S-TYPE3, P-TYPE3

CRCSWR bit (Snoop-On-Write/Read Switch)

The CRCSWR bit selects the direction of access in the CRC snoop function.

When this bit is set to 0 (initial value), the CRC snoop operation to read a specific register is enabled. Similarly, when this bit is set to 1, the CRC snoop operation to write a specific register is enabled.

CRCSEN bit (Snoop Enable)

When the CRCSEN bit is set to 1, the CRC snoop operation is enabled. When this bit is set to 0, the CRC snoop operation is disabled.

48.2.3 CRCDIR/CRCDIR_BY : CRC Data Input Register

Base address: CRC = 0x4031_0000
CRC_NS = 0x5031_0000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	CRC input data The CRCDIR register is a 32-bit read/write register to write data for CRC-32 or CRC-32C calculation. The CRCDIR_BY (CRCDIR[31:24]) is an 8-bit read/write register to write data for CRC-8, CRC-16, or CRC-CCITT calculation.	R/W

Note: S-TYPE3, P-TYPE3

48.2.4 CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register

Base address: CRC = 0x4031_0000
CRC_NS = 0x5031_0000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	CRC output data The CRCDOR register is a 32-bit read/write register for CRC-32 or CRC-32C calculation. The CRCDOR_HA (CRCDOR[31:16]) register is a 16-bit read/write register for CRC-16 or CRC-CCITT calculation. The CRCDOR_BY (CRCDOR[31:24]) register is an 8-bit read/write register for CRC-8 calculation. Because its initial value is 0x00000000, rewrite the CRCDOR/CRCDOR_HA/ CRCDOR_BY register to perform the calculations using a value other than the initial value. Data written to the CRCDIR/CRCDIR_BY register is CRC calculated and the result is stored in the CRCDOR/CRCDOR_HA/CRCDOR_BY register. If the CRC code is calculated following the transferred data and the result is 0x00000000, there is no CRC error.	R/W

Note: S-TYPE3, P-TYPE3

48.2.5 CRCSAR : Snoop Address Register

Base address: CRC = 0x4031_0000
CRC_NS = 0x5031_0000

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CRCSA[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	CRCSA[13:0]	Register Snoop Address These bits store the TDR or RDR address in the SCI module to snoop	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

CRCSA[13:0] bits (Register Snoop Address)

The CRCSA[13:0] bits specify the lower address 14 bits of the register monitored by the CRC snoop operation.

Only the following addresses can be used for the CRCSA[13:0] bits:

[Secure region address]

- 0x4035_8004: SCI0.TDR, 0x4035_8000: SCI0.RDR
- 0x4035_8104: SCI1.TDR, 0x4035_8100: SCI1.RDR
- 0x4035_8204: SCI2.TDR, 0x4035_8200: SCI2.RDR
- 0x4035_8304: SCI3.TDR, 0x4035_8300: SCI3.RDR
- 0x4035_8404: SCI4.TDR, 0x4035_8400: SCI4.RDR
- 0x4035_8504: SCI5.TDR, 0x4035_8500: SCI5.RDR
- 0x4035_8604: SCI6.TDR, 0x4035_8600: SCI6.RDR
- 0x4035_8704: SCI7.TDR, 0x4035_8700: SCI7.RDR
- 0x4035_8804: SCI8.TDR, 0x4035_8800: SCI8.RDR
- 0x4035_8904: SCI9.TDR, 0x4035_8900: SCI9.RDR

[Non-secure region address]

- 0x5035_8004: SCI0_NS.TDR, 0x5035_8000: SCI0_NS.RDR
- 0x5035_8104: SCI1_NS.TDR, 0x5035_8100: SCI1_NS.RDR
- 0x5035_8204: SCI2_NS.TDR, 0x5035_8200: SCI2_NS.RDR
- 0x5035_8304: SCI3_NS.TDR, 0x5035_8300: SCI3_NS.RDR
- 0x5035_8404: SCI4_NS.TDR, 0x5035_8400: SCI4_NS.RDR

- 0x5035_8504: SCI5_NS.TDR, 0x5035_8500: SCI5_NS.RDR
- 0x5035_8604: SCI6_NS.TDR, 0x5035_8600: SCI6_NS.RDR
- 0x5035_8704: SCI7_NS.TDR, 0x5035_8700: SCI7_NS.RDR
- 0x5035_8804: SCI8_NS.TDR, 0x5035_8800: SCI8_NS.RDR
- 0x5035_8904: SCI9_NS.TDR, 0x5035_8900: SCI9_NS.RDR

48.3 Operation

48.3.1 Basic Operation

The CRC calculator generates CRC codes for use in LSB-first or MSB-first transfer.

The following examples show CRC code generation for input data (0xF0) using the 16-bit CRC-CCITT generating polynomial ($X^{16} + X^{12} + X^5 + 1$). In these examples, the value of the CRC Data Output Register (CRCDOR_HA) is cleared before CRC calculation.

When an 8-bit CRC (with the polynomial $X^8 + X^2 + X + 1$) is in use, the valid bits of the CRC code are obtained in CRCDOR_BY. When a 32-bit CRC is in use, the valid bits of the CRC code are obtained in CRCDOR.

Figure 48.2 and Figure 48.3 show the LSB-first and MSB-first data transmission examples respectively. Figure 48.4 and Figure 48.5 show the LSB-first and MSB-first data reception examples.

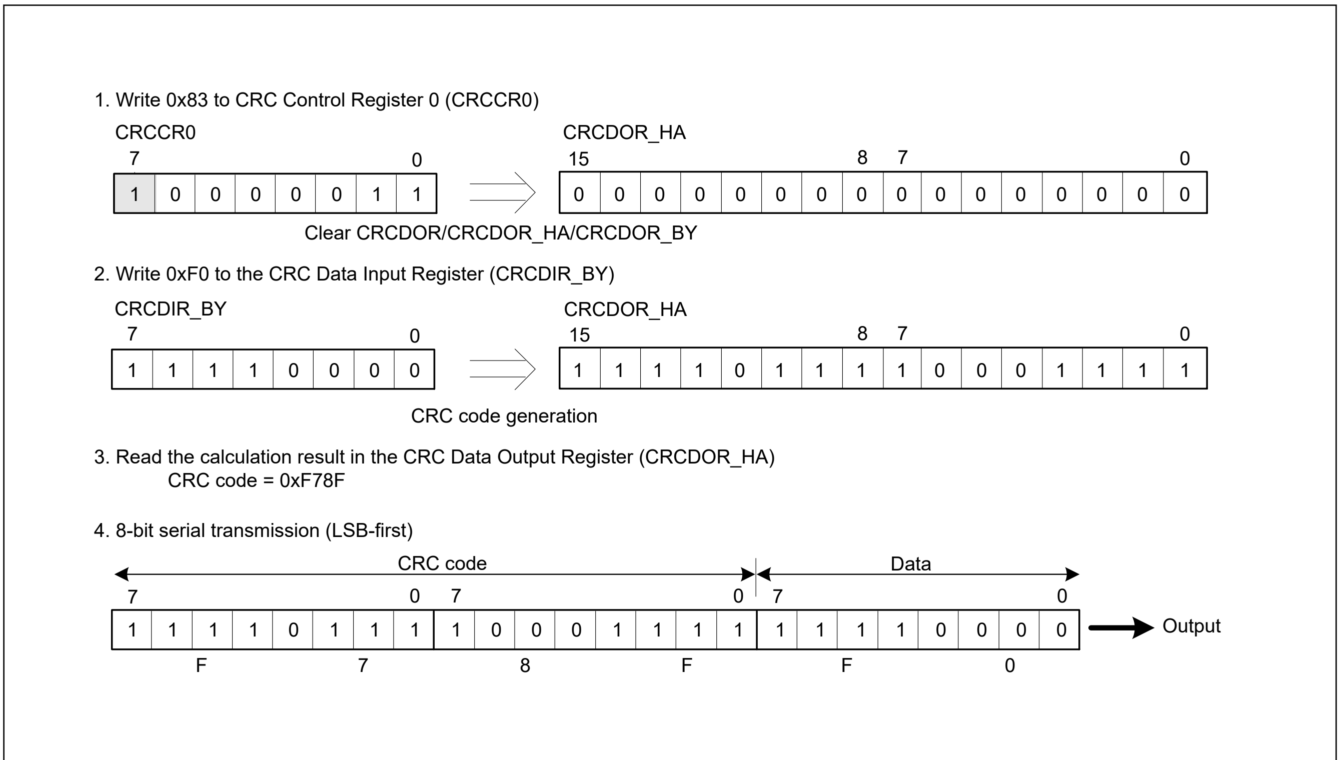

Figure 48.2 LSB-first data transmission

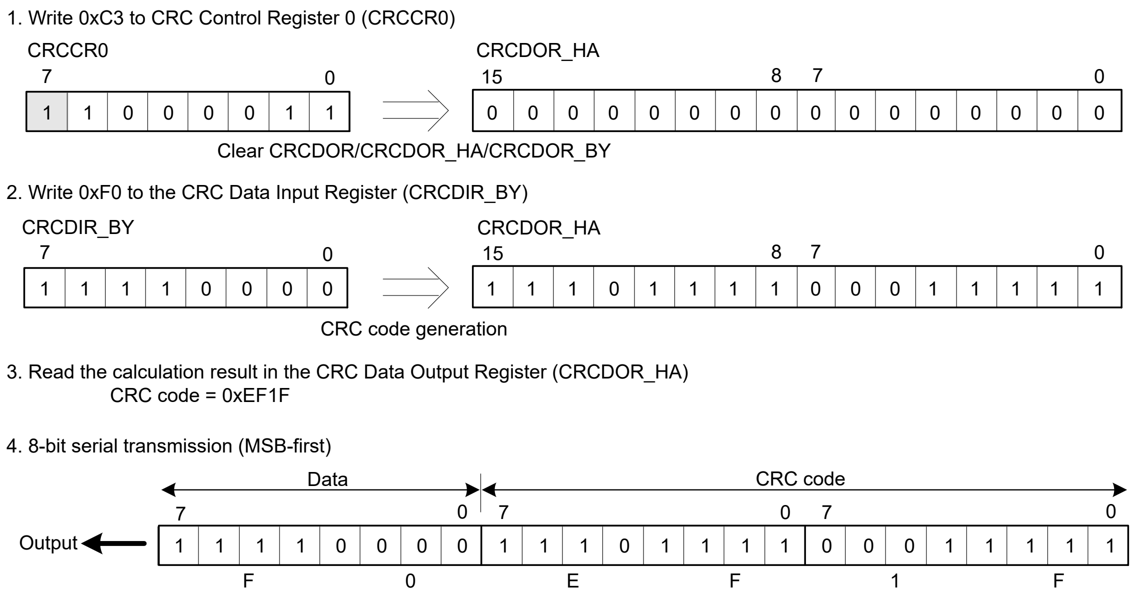

Figure 48.3 MSB-first data transmission

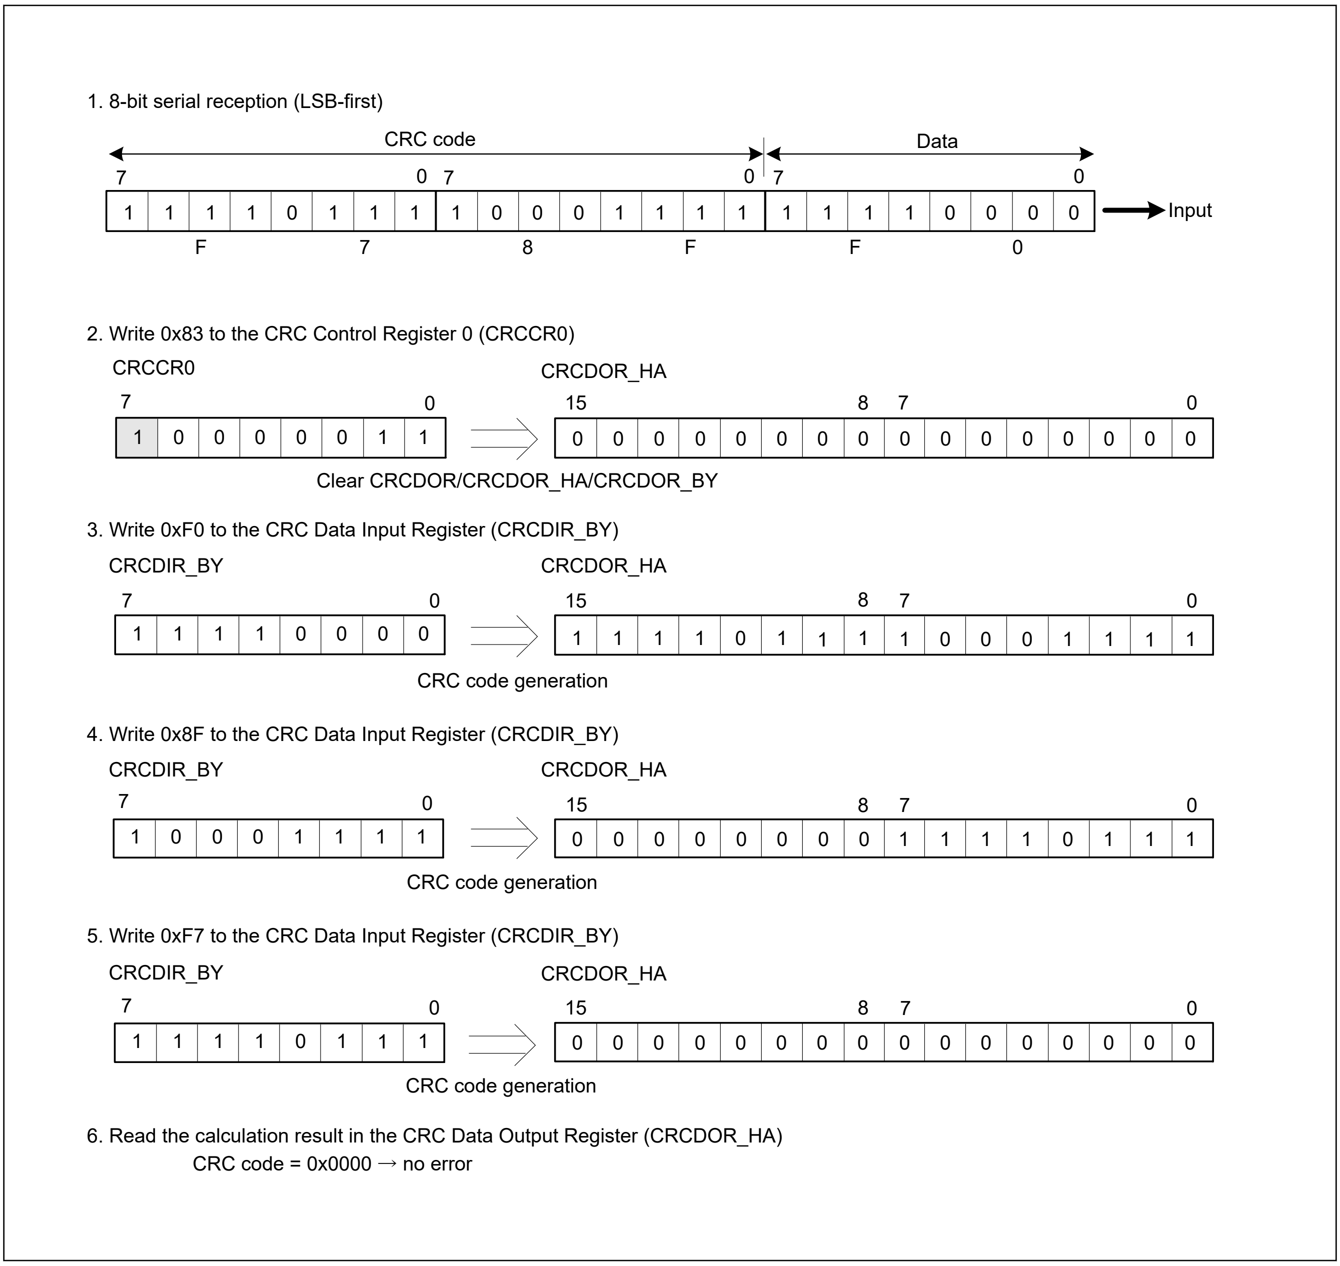

Figure 48.4 LSB-first data reception

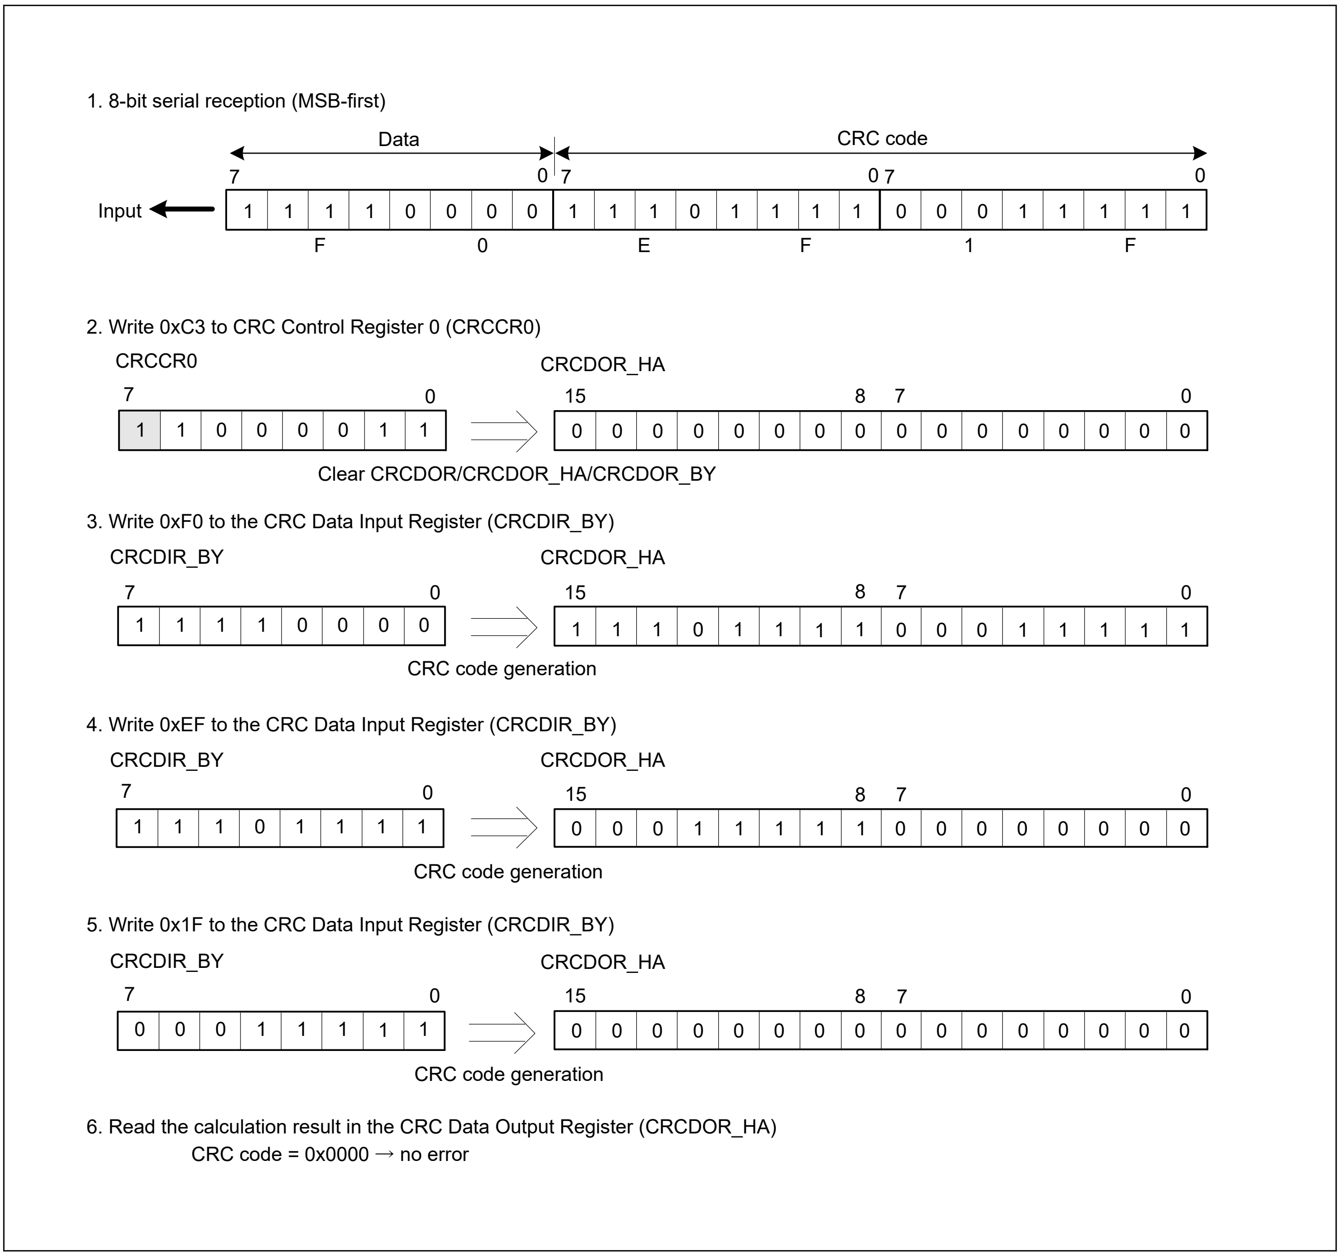

Figure 48.5 MSB-first data reception

48.3.2 CRC Snoop Function

The CRC snoop function monitors reads from and writes to a specific register and performs CRC calculation on the monitored data automatically. Because the CRC snoop function recognizes writes to and reads from a specific register address as a trigger to automatically perform CRC calculation, there is no need to write data to the CRCDIR register. All I/O registers specified in the section 48.2.5. CRCSAR : Snoop Address Register are subject to the CRC snoop. The CRC snoop is useful in monitoring writes to the SCIn.TDR (n = 0 to 9) register, and reads from the SCIn.RDR (n = 0 to 9) register.

To use this function, write the lower address 14 bits of a specific register to bits CRCSA[13] to CRCSA[0] in the CRCSAR register, and set CRCSEN bit in the CRCCR1 register to 1. Then, set the CRCSWR bit in the CRCCR1 register to 1 to enable snooping on writes to the target register, or set the CRCSWR bit in the CRCCR1 register to 0 to enable snooping on reads from the target register. It is possible that access to a target I/O register may be executed before the CRCSWR bit write completed. In this case, the data is not stored in the CRCDIR register. To avoid this issue, before accessing I/O register, read back the CRCSWR bit that was written to confirm that the write completed.

When both the CRCSEN and CRCSWR bits are set to 1, and data is written to a target register in a bus master module such as the CPU, DMAC, and DTC, the CRC calculator stores the data in the CRCDIR register and performs CRC calculation. Similarly, when the CRCSEN bit is set to 1, CRCSWR bit to 0, and data is read from a target register in a bus master module such as the CPU, DMAC, and DTC, the CRC calculator stores the data in the CRCDIR register and performs CRC calculations.

When the CRC code is generated by using CRC-8, CRC-16, and CRC-CCITT generating polynomial, the target register is accessed in 1 byte (8 bits). RDR_BY and TDRLL should be used to access RDR and TDR. Similarly, when the CRC code is generated by using CRC-32 and CRC-32C generating polynomial, the target register is accessed in 1 word (32 bits). Note that for RDR and TDR, CRC codes are generated that contain data other than RDAT and TDAT.

When CRC is marked as secure by PSARC.PSARC1 bit, the CRC snoop function is available for secure access to the specified I/O registers. When CRC is marked as non-secure by PSARC.PSARC1 bit, the CRC snoop function is available for non-secure access to the specified I/O registers.

48.4 Usage Notes

48.4.1 Settings for the Module-Stop State

The Module Stop Control Register C (MSTPCRC) can enable or disable CRC calculator operation. The CRC calculator is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

48.4.2 Note on Transmission

The transmission sequence for the CRC code differs based on whether the transmission is LSB-first or MSB-first. Figure 48.6 shows an LSB-first and MSB-first data transmission.

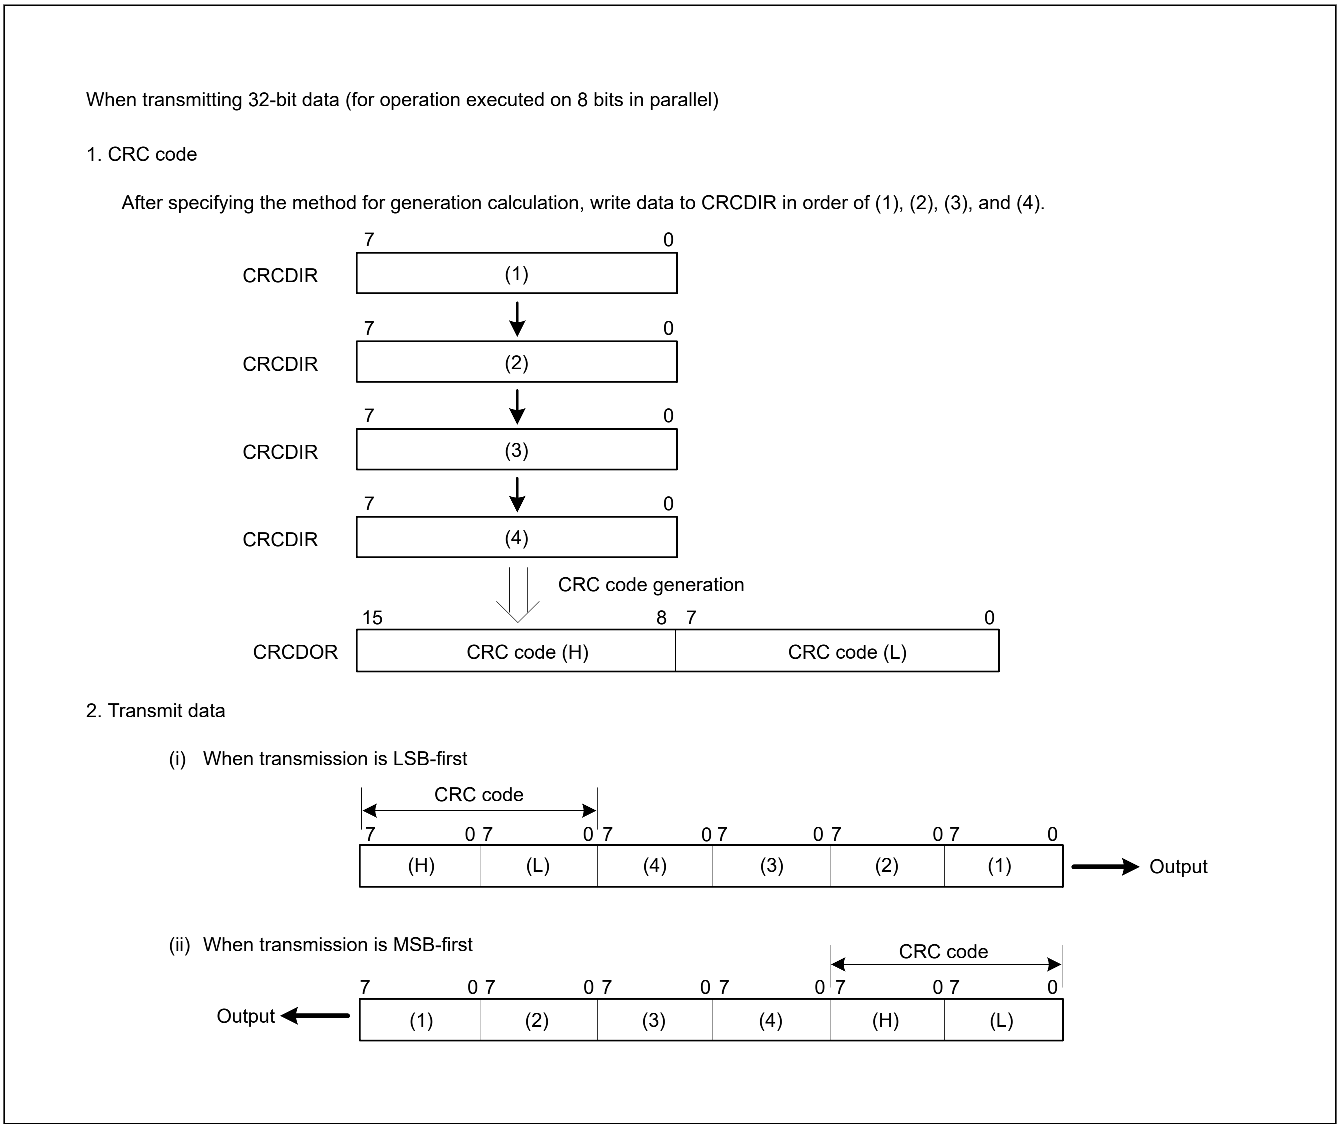

Figure 48.6 LSB-first and MSB-first data transmission

49. Pulse Density Modulation Interface (PDM-IF)

49.1 Overview

The Pulse Density Modulation Interface (PDM-IF) has maximum three channels that are connectable with external microphone which outputs the pulse density modulated signal. PDM-IF is connectable with up to three external microphones. PDM-IF can filter and convert 1-bit digital data streams that were pulse density modulated at a high sampling rate into 20-bit or 16-bit digital data at a lower sampling rate.

In this section, PCLK refers to PCLKB.

Table 49.1 lists the specifications of PDM-IF. Figure 49.1 shows the block diagrams of PDM-IF.

Table 49.1 PDM-IF specification

Item	Description
Number of channels	3 channels

Functions	• Capable of filtering 1-bit digital input data PDM_DATAn (n = 0 to 2) and converting them into 20-bit or 16-bit digital data. The bit order is little-endian.
	• IP supports stereo microphone (L/R sampling by rising/falling clock edge).
	• IP supports sound activity detector.
	• Each channel of IP includes programmable filters: 4th order sinc filter, high-pass filter (for suppression of DC bias), compensation filter (for sinc passband distortion), half-band decimation filter (for aliasing distortion).
	  – IP supports programmable and flexible decimation ratios.
	  – The sinc filter is selectable as first-, second-, third-, fourth-order.
	• IP supports DMA operation through APB.
	• Each channel of IP has an internal buffer.
	  – Buffer size as 32 stages at design time
	  – Capable of storing voice data during low power mode
	• Error detection functions can be used for debugging.

Interrupt sources	Maximum 7 sources 1. Data reception interrupt per channel (Maximum 3 interrupts) 2. Sound detection interrupt (shared between channels) 3. Error detection interrupt per channel (Maximum 3 interrupts)
Low power consumption function	• IP supports microphone low power configuration (slower clock). IP can switch to higher clock speed after sound detection recognized. • MCU can stop bus clock during low power mode.
Bus interface	• IP has an APB interface which is confirmed to APB4.
TrustZone filter	• Security and Privilege attribution can be set.

Each channel of PDM-IF consists of following blocks:

- Clock control: It generates PDMCLKn to microphone, and internal timing signal to sinc filter.
- Data input control: It receives PDMDATAn from microphone.
- Sinc filter: It converts the 1-bit digital data stream input from PDMDATAn to 34-bit signed data. And then the 34-bit signed data is clipped to 20-bit signed data.
- High-pass filter: It is a filter for suppression of DC bias.
- Compensation filter: It is a filter for sinc passband distortion.
- Low-pass (half-band decimation) filter: It is a filter for aliasing distortion.
- Moving average filter: It is a simple filter for noise reduction before sound detection.
- Sound detection: It generates the wakeup interrupt to recover from low power mode.
- Data buffer: It stores 20-bit or 16-bit data filtered by some filters.
- Short circuit detection: It detects the short circuit error which indicates consecutive 0’s or 1’s input from PDMDATAn.
- Overvoltage detection: It detects the overvoltage error.
- Error control: It generates error flags from other blocks.

The 1-bit digital data stream input from PDMDATAn pin (n = 0 to 2) is converted to 34-bit signed data by the sinc filter and then the data is clipped to 20-bit signed data. The 20-bit signed data is used for sound detection and data storing in buffer.

Sound detection block receives 20-bit signed data through high-pass filter block and moving average filter block. The block compares received data to the programmed thresholds and generates a wakeup interrupt in case that the data is above the upper threshold or below the lower threshold.

Data buffer block receives 20-bit signed data through high-pass filter, compensation filter, and low-pass filter. The block stores the 20-bit signed data or the clipped 16-bit signed data. And then the block sends the 20-bit signed data or 16-bit signed data to APB-IF once APB read access occurs.

Table 49.2 PDM I/O pins (n = 0 to 2)

Function	Pin name	I/O	Description
PDM-IF	PDMCLKn	Output	Output pins for clock
	PDMDATAn	Input	Input pins for data

Note: Some registers are mirroring together between base address symbol PDM_CTL and PDMn registers. See section 49.2.67. Mirroring Register.
Note 1. See section 49.4. Setting Flow.
Note 2. The register is not shown in the Setting flow, but it is allowed to use in the flow.

49.2.2 PDCSTRTR : Channel Software Start Trigger Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	STRTRG2	STRTRG1	STRTRG0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STRTRG0	Channel 0 Start Trigger 0: Do nothing 1: Start channel 0	W
1	STRTRG1	Channel 1 Start Trigger 0: Do nothing 1: Start channel 1	W
2	STRTRG2	Channel 2 Start Trigger 0: Do nothing 1: Start channel 2	W
31:3	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.3 PDCSTPTR : Channel Software Stop Trigger Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	STPTRG2	STPTRG1	STPTRG0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STPTRG0	Channel 0 Stop Trigger 0: Do nothing 1: Stop channel 0	W
1	STPTRG1	Channel 1 Stop Trigger 0: Do nothing 1: Stop channel 1	W
2	STPTRG2	Channel 2 Stop Trigger 0: Do nothing 1: Stop channel 2	W
31:3	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.4 PDCCHGTR : Channel Software Change Trigger Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	CHGTRG2	CHGTRG1	CHGTRG0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CHGTRG0	Channel 0 Change Trigger 0: Do nothing 1: Change clock (PDM_CLK0) setting	W
1	CHGTRG1	Channel 1 Change Trigger 0: Do nothing 1: Change clock (PDM_CLK1) setting	W
2	CHGTRG2	Channel 2 Change Trigger 0: Do nothing 1: Change clock (PDM_CLK2) setting	W
31:3	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.5 PDCICR : Channel Interrupt Control Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	IEDE2	IEDE1	IEDE0	—	—	—	—	—	IDRE2	IDRE1	IDRE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ISDE2	ISDE1	ISDE0	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	ISDE0	Channel 0 Sound Detection Interrupt Enable Bit 0: Do not allow PDM_SDET interrupt to be issued when the sound for channel 0 is detected 1: Allow PDM_SDET interrupt to be issued when the sound for channel 0 is detected	R/W
9	ISDE1	Channel 1 Sound Detection Interrupt Enable Bit 0: Do not allow PDM_SDET interrupt to be issued when the sound for channel 1 is detected 1: Allow PDM_SDET interrupt to be issued when the sound for channel 1 is detected	R/W
10	ISDE2	Channel 2 Sound Detection Interrupt Enable Bit 0: Do not allow PDM_SDET interrupt to be issued when the sound for channel 2 is detected 1: Allow PDM_SDET interrupt to be issued when the sound for channel 2 is detected	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
16	IDRE0	Channel 0 Data Reception Interrupt Enable Bit 0: Do not allow PDM_DAT0 interrupt to be issued 1: Allow PDM_DAT0 interrupt to be issued	R/W
17	IDRE1	Channel 1 Data Reception Interrupt Enable Bit 0: Do not allow PDM_DAT1 interrupt to be issued 1: Allow PDM_DAT1 interrupt to be issued	R/W
18	IDRE2	Channel 2 Data Reception Interrupt Enable Bit 0: Do not allow PDM_DAT2 interrupt to be issued 1: Allow PDM_DAT2 interrupt to be issued	R/W
23:19	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
24	IEDE0	Channel 0 Error Detection Interrupt Enable Bit 0: Do not allow PDM_ERR0 interrupt to be issued 1: Allow PDM_ERR0 interrupt to be issued	R/W
25	IEDE1	Channel 1 Error Detection Interrupt Enable Bit 0: Do not allow PDM_ERR1 interrupt to be issued 1: Allow PDM_ERR1 interrupt to be issued	R/W
26	IEDE2	Channel 2 Error Detection Interrupt Enable Bit 0: Do not allow PDM_ERR2 interrupt to be issued 1: Allow PDM_ERR2 interrupt to be issued	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

49.2.6 PDCSR : Channel Status Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	EDF2	EDF1	EDF0	—	—	—	—	—	DRF2	DRF1	DRF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SDF2	SDF1	SDF0	—	—	—	—	—	STATE 2	STATE 1	STATE 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STATE0	Channel 0 State 0: Channel 0 stop 1: Channel 0 in operation	R
1	STATE1	Channel 1 State 0: Channel 1 stop 1: Channel 1 in operation	R
2	STATE2	Channel 2 State 0: Channel 2 stop 1: Channel 2 in operation	R
7:3	—	These bits are read as 0.	R
8	SDF0	Channel 0 Sound Detection Flag 0: Indicates that the sound which exceeded the threshold is not detected 1: Indicates that the sound which exceeded the threshold is detected	R
9	SDF1	Channel 1 Sound Detection Flag 0: Indicates that the sound which exceeded the threshold is not detected 1: Indicates that the sound which exceeded the threshold is detected	R
10	SDF2	Channel 2 Sound Detection Flag 0: Indicates that the sound which exceeded the threshold is not detected 1: Indicates that the sound which exceeded the threshold is detected	R
15:11	—	These bits are read as 0.	R
16	DRF0	Channel 0 Data Reception Flag 0: Indicates that the number of data stored in buffer does not exceed the threshold 1: Indicates that the number of data stored in buffer exceeded the threshold	R
17	DRF1	Channel 1 Data Reception Flag 0: Indicates that the number of data stored in buffer does not exceed the threshold 1: Indicates that the number of data stored in buffer exceeded the threshold	R

Bit	Symbol	Function	R/W
18	DRF2	Channel 2 Data Reception Flag 0: Indicates that the number of data stored in buffer does not exceed the threshold 1: Indicates that the number of data stored in buffer exceeded the threshold	R
23:19	—	These bits are read as 0.	R
24	EDF0	Channel 0 Error Detection Flag 0: Indicates that errors are not detected. 1: Indicates that errors are detected. See section 49.2.17. PDSRCHn : Status Register Channel n (n = 0 to 2) for details.	R
25	EDF1	Channel 1 Error Detection Flag 0: Indicates that errors are not detected. 1: Indicates that errors are detected. See section 49.2.17. PDSRCHn : Status Register Channel n (n = 0 to 2) for details.	R
26	EDF2	Channel 2 Error Detection Flag 0: Indicates that errors are not detected. 1: Indicates that errors are detected. See section 49.2.17. PDSRCHn : Status Register Channel n (n = 0 to 2) for details.	R
31:27	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

STATEn: See section 49.3.2. Channel Start and Channel Stop for details.

[Condition to become 0]

- When 1 is written to PDCSTPTR.STPTRGn.

[Condition to become 1]

- When 1 is written to PDCSTRTR.STRTRGn.

SDFn: See section 49.3.6. Sound Detection for details.

[Condition to become 0]

- When writing 1 to a flag clear register bit (PDCSCR.SDFCn).

[Condition to become 1]

- When PDCSDCR.SDEn = 1 and a moving average filter result is higher than or equal to PDSDUTR.SDETU[19:0].
- When PDCSDCR.SDEn = 1 and a moving average filter result is lower than or equal to PDSDLTR.SDETL[19:0].

DRFn: See section 49.3.7. Data Buffer for details.

[Condition to become 0]

- When PDCDRCR.DATREn = 0 or PDDSR.DATNUM[7:0] is lower than a threshold.

[Condition to become 1]

- When PDCDRCR.DATREn = 1 and PDDSR.DATNUM[7:0] is higher than or equal to a threshold which is configured by PDDBCR.DATRITHR[2:0].

EDFn

[Condition to become 0]

- When all error flags are cleared by writing to section 49.2.18. PDSCRCHn : Status Clear Register Channel n (n = 0 to 2), this flag is also cleared.

[Condition to become 1]

- When any error occurs. See section 49.2.17. PDSRCHn : Status Register Channel n (n = 0 to 2) register for the kind of error.

49.2.7 PDCSCR : Channel Status Clear Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SDFC2	SDFC1	SDFC0	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	The write value should be 0.	W
8	SDFC0	Channel 0 Sound Detection Flag Clear 0: Do nothing 1: Clear PDCSR.SDF0	W
9	SDFC1	Channel 1 Sound Detection Flag Clear 0: Do nothing 1: Clear PDCSR.SDF1	W
10	SDFC2	Channel 2 Sound Detection Flag Clear 0: Do nothing 1: Clear PDCSR.SDF2	W
31:11	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.8 PDCSDCR : Channel Sound Detection Control Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SDE2	SDE1	SDE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SDE0	Channel 0 Sound Detection Enable Bit 0: Do not allow sound detection 1: Allow sound detection	R/W
1	SDE1	Channel 1 Sound Detection Enable Bit 0: Do not allow sound detection 1: Allow sound detection	R/W
2	SDE2	Channel 2 Sound Detection Enable Bit 0: Do not allow sound detection 1: Allow sound detection	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

49.2.9 PDCDRCR : Channel Data Read Control Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x24

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DATRE2	DATRE1	DATRE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DATRE0	Channel 0 Data Read Enable Bit 0: Do not allow reading data from data buffer 1: Allow reading data from data buffer	R/W
1	DATRE1	Channel 1 Data Read Enable Bit 0: Do not allow reading data from data buffer 1: Allow reading data from data buffer	R/W
2	DATRE2	Channel 2 Data Read Enable Bit 0: Do not allow reading data from data buffer 1: Allow reading data from data buffer	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

49.2.10 PDCDCR : Channel Data Clear Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DATC2	DATC1	DATC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DATC0	Channel 0 Data Clear 0: Do nothing 1: Clear data	W
1	DATC1	Channel 1 Data Clear 0: Do nothing 1: Clear data	W
2	DATC2	Channel 2 Data Clear 0: Do nothing 1: Clear data	W

Bit	Symbol	Function	R/W
31:3	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.11 PDVR : Version Register

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x80

Bit position:	31																				11											0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VER[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
11:0	VER[11:0]	PDM-IF version is shown.	R
31:12	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

49.2.12 PDSTRTRCHn : Software Start Trigger Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x100 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRTRG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STRTRG	Start Trigger 0: Do nothing 1: Start the channel	W
31:1	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.13 PDSTPTRCHn : Software Stop Trigger Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x104 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	ISDE	Sound Detection Interrupt Enable Bit 0: Do not allow PDM_SDET interrupt to be issued 1: Allow PDM_SDET interrupt to be issued	R/W
2	IDRE	Data Reception Interrupt Enable Bit 0: Do not allow PDM_DATn interrupt to be issued 1: Allow PDM_DATn interrupt to be issued	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
16	IEDE	Error Detection Interrupt Enable Bit 0: Do not allow PDM_ERRn interrupt to be issued 1: Allow PDM_ERRn interrupt to be issued	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

49.2.16 PDSDCRCHn : Status Detection Control Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x110 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	BFOWDE	—	—	—	—	—	—	—	—	OVUDE	OVLDE	SCDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SDE	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	SDE	Sound Detection Enable Bit 0: Do not allow sound detection 1: Allow sound detection	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W
16	SCDE	Short Circuit Detection Enable Bit 0: Do not allow detection of the PDM_DATAn pin short circuit 1: Allow detection of the PDM_DATAn pin short circuit	R/W

Bit	Symbol	Function	R/W
17	OVLDE	Overvoltage Lower Limit Exceeded Detection Enable Bit 0: Do not allow detection of data fallen lower limit 1: Allow detection of data fallen lower limit	R/W
18	OVUDE	Overvoltage Upper Limit Exceeded Detection Enable Bit 0: Do not allow detection of data exceeded upper limit 1: Allow detection of data exceeded upper limit	R/W
26:19	—	These bits are read as 0. The write value should be 0.	R/W
27	BFOWDE	Buffer Overwriting Detection Enable Bit 0: Do not allow detection of buffer overwriting 1: Allow detection of buffer overwriting	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

49.2.17 PDSRCHn : Status Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x114 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	BFOWDF	—	—	—	—	—	—	—	—	OVUDF	OVLDF	SCDF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DRF	SDF	STATE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	STATE	State 0: Channel stop 1: Channel in operation	R
1	SDF	Sound Detection Flag 0: Indicates that the sound which exceeded the threshold is not detected 1: Indicates that the sound which exceeded the threshold is detected	R
2	DRF	Data Reception Flag 0: Indicates that the number of data stored in buffer is lower than a threshold 1: Indicates that the number of data stored in buffer is higher than or equal to a threshold	R
15:3	—	These bits are read as 0.	R
16	SCDF	Short circuit detection flag. 0: Indicates that the PDM_DATAn pin short circuit is not detected. 1: Indicates that a short circuit on the PDM_DATAn pin has been detected.	R
17	OVLDF	Overvoltage Lower Limit Exceeded Detection Flag 0: Indicates that the data is not lower than the lower limit 1: Indicates that the data has fallen the lower limit	R
18	OVUDF	Overvoltage Upper Limit Exceeded Detection Flag 0: Indicates that the data has not exceeded the upper limit 1: Indicates that the data has exceeded the upper limit	R
26:19	—	These bits are read as 0.	R
27	BFOWDF	Buffer Overwriting Detection Flag 0: Indicates that buffer overwriting does not occur 1: Indicates that buffer overwriting occurs	R
31:28	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

STATE: For details, see section 49.3.2. Channel Start and Channel Stop.

[Condition to become 0]

- When 1 is written to PDSTPTR.STPTRG.

[Condition to become 1]

- When 1 is written to PDSTRTR.STRTRG.

SDF: For details, see section 49.3.6. Sound Detection.

[Condition to become 0]

- When writing 1 to the flag clear register bit (PDSCR.SDFC).

[Condition to become 1]

- When PDSDCR.SDE = 1 and a moving average filter result is PDSDUTR.SDETU[19:0] or higher.
- When PDSDCR.SDE = 1 and a moving average filter result is PDSDLTR.SDETL[19:0] or lower.

DRF: For details, see section 49.3.7. Data Buffer.

[Condition to become 0]

- When PDDRCR.DATRE = 0 or PDDSR.DATNUM[7:0] is lower than a threshold.

[Condition to become 1]

- When PDDRCR.DATRE = 1 and PDDSR.DATNUM[7:0] is higher than or equal to a threshold which is configured by PDDBCR.DATRITHR[2:0].

SCDF: For details, see section 49.3.8. Short-circuit Detection.

[Condition to become 0]

- When writing 1 to the flag clear register bit (PDSCR.SCDFC).

[Condition to become 1]

- When PDSDCR.SCDE = 1 and 1 is continuously input to the PDM_DATAn pin, exceeding the number of times set in PDSCTSR.SCDH[12:0].
- When PDSDCR.SCDE = 1 and 0 is continuously input to the PDM_DATAn pin, exceeding the number of times set in PDSCTSR.SCDL[12:0].

OVLDF: For details, see section 49.3.9. Overvoltage Detection.

[Condition to become 0]

- When writing 1 to the flag clear register bit (PDSCR.OVLDFC).

[Condition to become 1]

- When PDSDCR.OVLDE = 1 and a clipped sinc filter result is smaller than a lower limit (PDOVLTR.OVDL[19:0]).

OVUDF: For details, see section 49.3.9. Overvoltage Detection.

[Condition to become 0]

- When writing 1 to the flag clear register bit (PDSCR.OVUDFC).

[Condition to become 1]

- When PDSDCR.OVUDE = 1 and a clipped sinc filter result is larger than an upper limit (PDOVUTR.OVDU[19:0]).

BFOWDF: For details, see section 49.3.7. Data Buffer.

[Condition to become 0]

- When writing 1 to the flag clear register bit (PDSCR.BFOWDFC).

[Condition to become 1]

- When PDSDCR.BFOWDE = 1 and data buffer is full and data is written to buffer without reading.

49.2.18 PDSCRCHn : Status Clear Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x118 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:28	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

49.2.19 PDMDSRCHn : Mode Setting Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x120 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DBIS[3:0]				—	—	SDMAMD[1:0]		—	—	—	—	—	—	LFIS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CFIS[1:0]		—	—	HFIS[1:0]		—	SFMD[2:0]			—	—	—	INPSEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	INPSEL	Input Data Select 0: Rise-edge data of channel n. 1: Fall-edge data of channel n-1. When n = 0, fall-edge data of channel 2 is selected.	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
6:4	SFMD[2:0]	Sinc Filter Mode Setting 0 0 1: 1-order 0 1 0: 2-order 0 1 1: 3-order Others: 4-order (default)	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
9:8	HFIS[1:0]	High-pass Filter Input Shift Setting 0 0: No shift 0 1: 1-bit right shift 1 0: 2-bit right shift 1 1: 3-bit right shift	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	CFIS[1:0]	Compensation Filter Input Shift Setting 0 0: No shift 0 1: 1-bit right shift 1 0: 2-bit right shift 1 1: 3-bit right shift	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
17:16	LFIS[1:0]	Low-pass (half-band decimation) Filter Input Shift Setting 0 0: No shift 0 1: 1-bit right shift 1 0: 2-bit right shift 1 1: 3-bit right shift	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	SDMAMD[1:0]	Moving Average Mode for Sound Detection Data 0 0: 1-order (filter is skipped) (default) 0 1: 2-order 1 0: 4-order 1 1: User prohibition	R/W
27:26	—	These bits are read as 0. The write value should be 0.	R/W
31:28	DBIS[3:0]	Data Buffer Input Shift Setting S: signed bit 0x0: 20-bit mode, {1{S}, [18:0]} 0x1: 20-bit mode, {2{S}, [18:1]} 0x2: 20-bit mode, {3{S}, [18:2]} 0x3: 20-bit mode, {4{S}, [18:3]} 0x8: 16-bit mode, {S,D[18:4]} 0x9: 16-bit mode, {S,D[17:3]} 0xA: 16-bit mode, {S,D[16:2]} 0xB: 16-bit mode, {S,D[15:1]} 0xC: 16-bit mode, {S,D[14:0]} Others: Setting prohibited	R/W

Note: S-TYPE-3, P-TYPE-3

49.2.20 PDSFCRCHn : Sinc Filter Control Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x124 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SINCRNG[4:0]					SINCDEC[7:0]								—	—	—	—	—	—	—	—	—	—	—	—	CKDIV[3:0]			
Value after reset:	0	0	0	0	0	1	0	1	0	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CKDIV[3:0]	PDM_CLKn Dividend Ratio to Core Clock 0x0: 2 divisions (default) 0x1: 4 divisions 0x2: 6 divisions ⋮ 0xD: 28 divisions 0xE: 30 divisions 0xF: 32 divisions	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
23:16	SINCDEC[7:0]	Sinc Filter Decimation Ratio M indicates the decimation ratio. Setting less than M = 4 is prohibited. When the value is set, the sinc filter operation is not guaranteed. Set it to satisfy D × M > 12. If it is not satisfied, the operation of other filters is not guaranteed. (D: PDM_CLKn dividend ratio) Decimation ratio M is set as follows. M = SINCDEC + 1 0x00: M = 1 (prohibited) 0x01: M = 2 (prohibited) 0x02: M = 3 (prohibited) 0x03: M = 4 ⋮ 0x7C: M = 125 (default) ⋮ 0xFF: M = 256	R/W

Bit	Symbol	Function	R/W
28:24	SINCRNG[4:0]	Sinc Filter Output Valid Range When overflow occurs, 0x7FFFF is output. When underflow occurs, 0x80000 is output. S: Signed bit 0x00: {S, [32:14]} 0x01: {S, [31:13]} 0x02: {S, [30:12]} 0x03: {S, [29:11]} 0x04: {S, [28:10]} 0x05: {S, [27:9]} (default) 0x06: {S, [26:8]} 0x07: {S, [25:7]} 0x08: {S, [24:6]} 0x09: {S, [23:5]} 0x0A: {S, [22:4]} 0x0B: {S, [21:3]} 0x0C: {S, [20:2]} 0x0D: {S, [19:1]} 0x0E: {S, [18:0]} 0x0F: {S, [17:0], 0} 0x10: {S, [16:0], 00} 0x11: {S, [15:0], 000} 0x12: {S, [14:0], 0000} 0x13: {S, [13:0], 00000} 0x14: {S, [12:0], 000000} 0x15: {S, [11:0], 0000000} 0x16: {S, [10:0], 00000000} 0x17: {S, [9:0], 000000000} 0x18: {S, [8:0], 0000000000} 0x19: {S, [7:0], 00000000000} 0x1A: {S, [6:0], 000000000000} 0x1B: {S, [5:0], 0000000000000} 0x1C: {S, [4:0], 00000000000000} 0x1D: {S, [3:0], 000000000000000} 0x1E: {S, [2:0], 0000000000000000} 0x1F: {S, [1:0], 00000000000000000} (prohibited)	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

See Table 49.7 for the setting values of SINCDEC[7:0] and SINCRNG[4:0].

49.2.21 PDHFCS0RCHn : High-pass Filter Coefficient s(0) Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x128 + 0x100 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HFS[15:0]															
Value after reset*1:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	0	1	1	0	0	0	0	1

Bit	Symbol	Function	R/W
15:0	HFS[15:0]	High-pass Filter Coefficient s(0) 16-bit signed data (Fraction bit [13:0])	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. High-pass filter cut-off frequency = 100 Hz

49.2.22 PDHFCK1RCHn : High-pass Filter Coefficient k(1) Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x12C + 0x100 × n

Bit position:	31																15															0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HFK[15:0]															
Value after reset[*1]:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	1	0	0	0	0	0	1

Bit	Symbol	Function	R/W
15:0	HFK[15:0]	High-pass Filter Coefficient k(1) 16-bit signed data (Fraction bit [13:0])	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. High-pass filter cut-off frequency = 100 Hz

49.2.23 PDHFCH0RCHn : High-pass Filter Coefficient h(0) Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x130 + 0x100 × n

Bit position:	31																15															0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HFH[15:0]															
Value after reset[*1]:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	HFH[15:0]	High-pass Filter Coefficient h(0) 16-bit signed data (Fraction bit [13:0])	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. High-pass filter cut-off frequency = 100 Hz

49.2.24 PDHFCH1RCHn : High-pass Filter Coefficient h(1) Register Channel n (n = 0 to 2)

Base address: PDMIF = 0x4025_6000
PDMIF_NS = 0x5025_6000

Offset address: 0x134 + 0x100 × n

Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DATNUM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DATNUM[7:0]	Number of Data Stored in Buffer When PDDRCRCHn.DATRE = 0, 0 is read out. When PDDRCRCHn.DATRE = 1, the number of data stored in buffer is read out. For buffer size that is of 32 stages, the maximum value is 31.	R
31:8	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

49.2.67 Mirroring Register

The common registers except for the Version register have mirroring registers in each channel. PDCSR.EDFn is a register which ORs all the error flags of the mirroring registers in each channel.

Use the common registers for synchronous control between channels.

Table 49.4 Mirroring register

Common register		Mirroring register in each channel	
Register name	**Bit name**	**Register name**	**Bit name**
PDCSTRTR	STRTRGn	PDSTRTR	STRTRG
PDCSTPTR	STPTRGn	PDSTPTR	STPTRG
PDCCHGTR	CHGTRGn	PDCHGTR	CHGTRG
PDCICR	ISDEn	PDICR	ISDE
	IDREn		IDRE
	IEDEn		IEDE
PDCSR	STATEn	PDSR	STATE
	SDFn		SDF
	DRFn		DRF
PDCSCR	SDFCn	PDSCR	SDFC
PDCSDCR	SDEn	PDSDCR	SDE
PDCDRCR	DATREn	PDDRCR	DATRE
PDCDCR	DATCn	PDDCR	DATC

49.3 Operation

49.3.1 Clock Specification

The frequency-divided core clock is generated and output to PDM_CLKn.

Table 49.5 shows guaranteed clock frequency and clock mode in PDM-IF. PDM clock (PDMIFCLK) and PCLK are asynchronous.

Table 49.5 Guaranteed clock frequency and clock mode

PDMIFCLK	PCLK	PDM_CLKn		
Frequency (MHz)	Frequency (MHz)	Frequency (MHz)	Supported core clock Division ratio	Setting value (PDSFCR.CKDIV[3:0])
8	1 to 62.5*1	4	2	0x0
		2	4	0x1
		1.33	6	0x2
		1	8	0x3
		0.8	10	0x4
		0.67	12	0x5
		0.57	14	0x6
		0.5	16	0x7
		0.44	18	0x8
		0.4	20	0x9
		0.36	22	0xA
		0.33	24	0xB
		0.31	26	0xC
		0.29	28	0xD
		0.27	30	0xE
		0.25	32	0xF

Note 1. PDM-IF is possible to operate at PCLK below 1 MHz but the guaranteed frequency operation range is 1 to 62.5 MHz.

49.3.1.1 Output Sampling Frequency

PDM-IF output sampling frequency is shown by the following formula:

$F_{out} = F_{clk} / (M \times 2)$

- F_{out}: PDM-IF output sampling frequency
- F_{clk}: PDM_CLKn frequency (See Table 49.5)
- M: Sinc filter decimation ratio (PDSFCRCHn.SINCDEC[7:0] + 1)

49.3.2 Channel Start and Channel Stop

The channel start and the channel stop is controlled by the register of Table 49.6.

Set the channels to be synchronized to 1 at the same time by using the common registers.

Set the channel start according to section 49.4.1. Start Flow.

Set the channel stop according to section 49.4.2. Stop Flow.

Table 49.6 Channel start trigger and channel stop trigger

Category	Register bit name	
	Common register	Channel register
Channel start	PDCSTRTR.STRTRG0	PDSTRTRCH0.STRTRG
	PDCSTRTR.STRTRG1	PDSTRTRCH1.STRTRG
	PDCSTRTR.STRTRG2	PDSTRTRCH2.STRTRG
Channel stop	PDCSTPTR.STPTRG0	PDSTPTRCH0.STPTRG
	PDCSTPTR.STPTRG1	PDSTPTRCH1.STPTRG
	PDCSTPTR.STPTRG2	PDSTPTRCH2.STPTRG

49.3.3 PDM_CLKn Frequency Change

The external microphone transitions the power mode according to input clock frequency. PDM-IF enables to transition the power mode of the microphone by changing the operating frequency of PDM_CLKn which is output to the microphone when operating. The operating frequency of PDM_CLKn can be changed using PDSFCR.CKDIV[3:0] bits. When the frequency is changed, the decimation ratio of the sinc filter must also be changed. Set PDSRCRCHn.SINCDEC[7:0] so that the sampling frequency after the decimation can be 32 kHz*1. Furthermore, when the decimation ratio is changed, the output range of the sinc filter is also changed. Set PDSRCRCHn.SINCRNG[4:0] together in accordance with the output range. See Table 49.7 for details.

After changing the configuration of these registers, software must wait for the settling time of microphone and PDM-IF channel. See section 49.4.4. Low-power Mode Transition Flow and section 49.4.5. Normal Mode Transition Flow for details.

Note 1. In case that the sampling frequency is different from 32 kHz, the characteristics of filters after the sinc filter might change.

49.3.4 Filter

49.3.4.1 Data Clipping and Shifting between Filters

Voice sample data is clipped or shifted between filters. Figure 49.2 shows this operation.

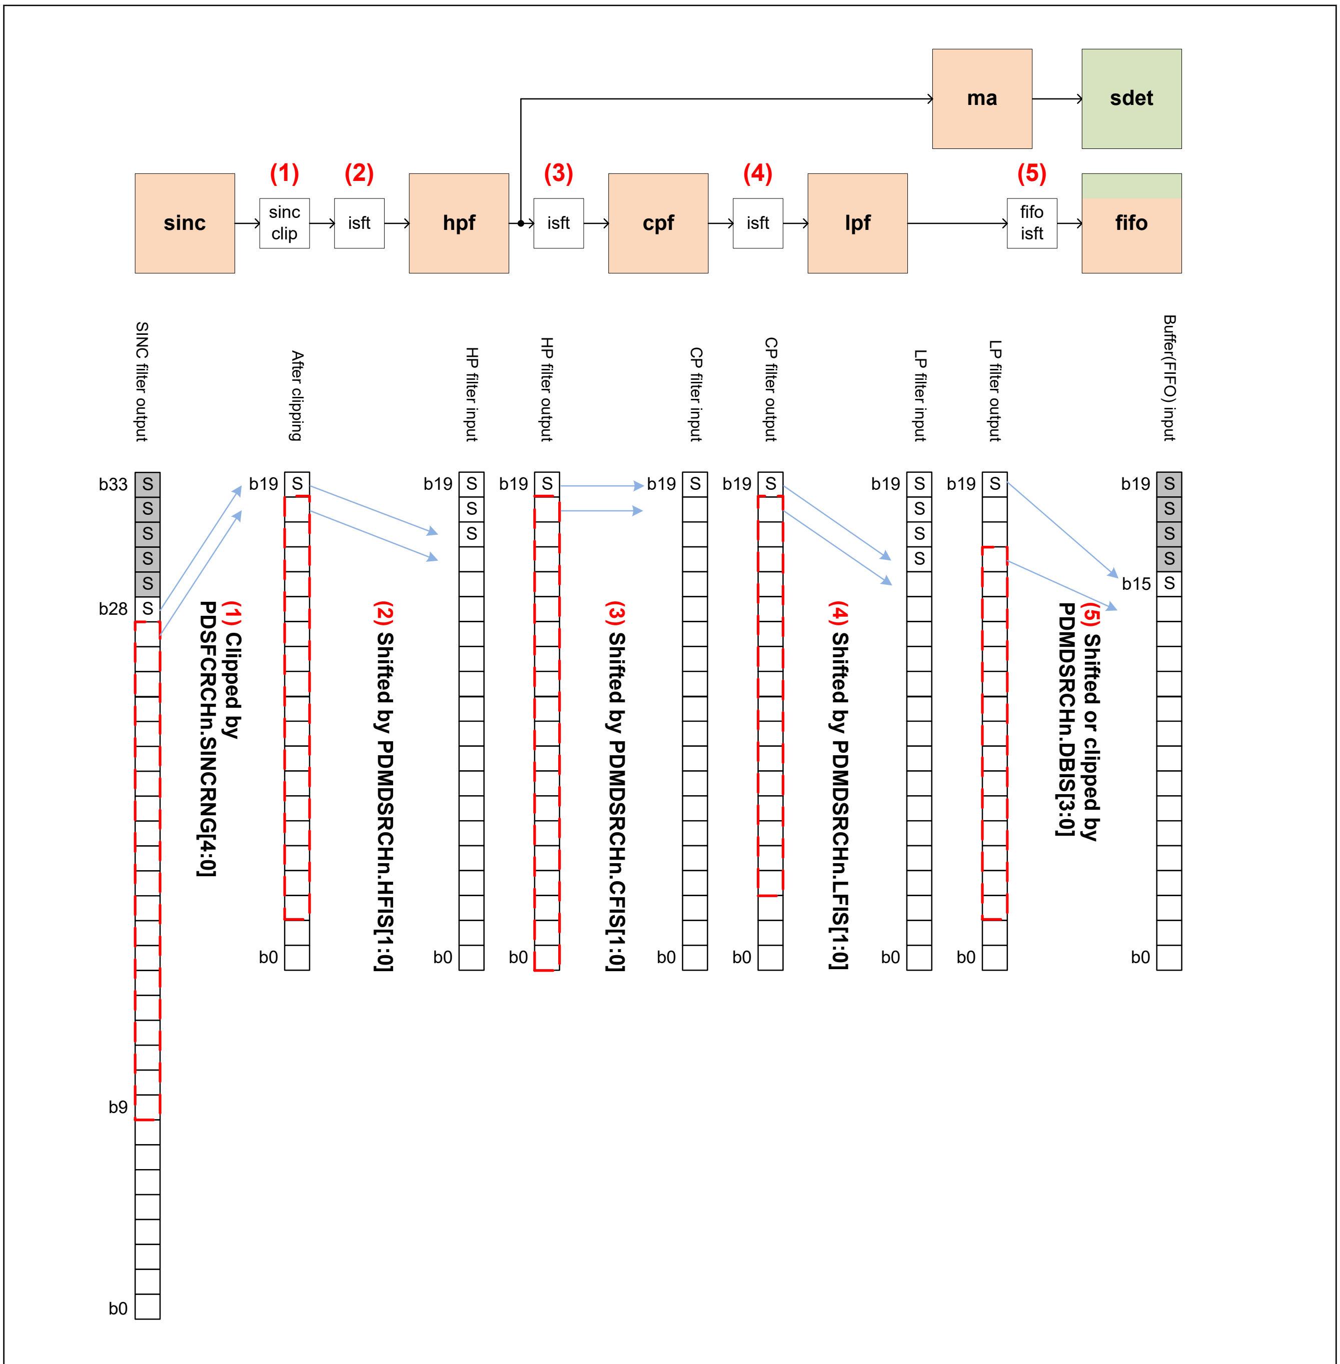

Figure 49.2 Data clipping and shifting between filters

(1) Sinc filter output clip

Table 49.7 lists the available settings of the sinc filter and data clipping.

It is controlled by PDSFCRCHn.SINCRNG[4:0].

It is prohibited to set other than those in Table 49.7.

Table 49.7 Sinc filter output clip (1 of 3)

PDMIFCLK (MHz)	Sinc filter order	PDMDSRCHn.SFMD[2:0]	PDM_CLK dividend ratio	PDSFCRCHn.CKDIV[3:0]	Sinc filter decimation ratio	PDSFCRCHn.SINCDEC[7:0]	Sinc filter output effective bits	Sinc filter output clipping (20 bits)	PDSFCRCHn. SINCRNG[4:0]	Resolution	PDM_CLKn frequency (MHz)	SINC filter output sampling frequency (kHz)	PDM-IF output sampling frequency (kHz)

			26	0xC	9	0x08	b4 to b0	b4 to b0, 000000000000000	11101	5	0.31	34.19	17.09
			28	0xD	9	0x08	b4 to b0	b4 to b0, 000000000000000	11101	5	0.29	31.75	15.87
			30	0xE	8	0x07	b4 to b0	b4 to b0, 000000000000000	11101	5	0.27	33.33	16.67
			32	0xF	8	0x07	b4 to b0	b4 to b0, 000000000000000	11101	5	0.25	31.25	15.63

An overflow or an underflow never occurs as long as the combinations which are shown in Table 49.7 are set to PDMDSRCHn.SFMD[2:0], PDSFCRCHn.CKDIV[3:0], PDSFCRCHn.SINCDEC[7:0] and PDSFCRCHn.SINCRNG[4:0]. However, when other combinations are set to them, the overflow or the underflow might occur. When the overflow occurs, 0x7FFFF is output. When the underflow occurs, 0x80000 is output. Use the overvoltage detection function if you want to know if the overflow or the underflow occurs.

(2) High-pass filter input shift

The clipped sinc filter output is right-shifted and input to the high-pass filter.

It is controlled by PDMDSRCHn.HFIS[1:0].

Table 49.8 High-pass filter input shift (1 of 2)

PDMDSR.HFIS[1:0]	Function	Shifted data*1
0x0	No shift	S, b18-b0
0x1	1-bit right-shift	S, S, b18-b1

Table 49.8 High-pass filter input shift (2 of 2)

PDMDSR.HFIS[1:0]	Function	Shifted data*1
0x2	2-bit right-shift	S, S, S, b18-b2
0x3	3-bit right-shift	S, S, S, S, b18-b3

Note 1. S: Signed bit (= bit 19)

(3) Compensation filter input shift

The high-pass filter output is right-shifted and input to the compensation filter.

It is controlled by PDMDSRCHn.CFIS[1:0].

Table 49.9 Compensation filter input shift

PDMDSR.CFIS[1:0]	Function	Shifted data*1
0x0	No shift	S, b18-b0
0x1	1-bit right-shift	S, S, b18-b1
0x2	2-bit right-shift	S, S, S, b18-b2
0x3	3-bit right-shift	S, S, S, S, b18-b3

Note 1. S: Signed bit (= bit 19)

(4) Low-pass filter input shift

The compensation filter output is right-shifted and input to the low-pass (half-band decimation) filter.

It is controlled by PDMDSRCHn.LFIS[1:0].

Table 49.10 Low-pass filter input shift

PDMDSR.LFIS[1:0]	Function	Shifted data*1
0x0	No shift	S, b18-b0
0x1	1-bit right-shift	S, S, b18-b1
0x2	2-bit right-shift	S, S, S, b18-b2
0x3	3-bit right-shift	S, S, S, S, b18-b3

Note 1. S: Signed bit (= bit 19)

(5) Buffer input shift or clip

The compensation filter output is right-shifted, or 16-bit data is clipped from the compensation filter output. The shifted or clipped data is then input to buffer.

It is controlled by PDMDSRCHn.DBIS[1:0].

Table 49.11 Buffer input shift or clip (1 of 2)

PDMDSRCHn.DBIS[3:0]	Function	Valid data width	Shifted or Clipped data*1
0000	No shift	20-bit	S, b18-b0
0001	1-bit right-shift	20-bit	S, S, b18-b1
0010	2-bit right-shift	20-bit	S, S, S, b18-b2
0011	3-bit right-shift	20-bit	S, S, S, S, b18-b3
1000	Signed bit and 18-4 is clipped	16-bit	S, b18-b4
1001	Signed bit and 17-3 is clipped*2	16-bit	S, b17-b3
1010	Signed bit and 16-2 is clipped*2	16-bit	S, b16-b2

Table 49.11 Buffer input shift or clip (2 of 2)

PDMDSRCHn.DBIS[3:0]	Function	Valid data width	Shifted or Clipped data*1
1011	Signed bit and 15-1 is clipped*2	16-bit	S, b15-b1
1100	Signed bit and 14-0 is clipped*2	16-bit	S, b14-b0

Note 1. S: Signed bit (= bit 19)
Note 2. When an overflow occurs, 0x7FFF is input to the buffer.
When an underflow occurs, 0x8000 is input to the buffer.

49.3.4.2 Sinc Filter

The operating clock of the sinc filter is PDMIFCLK. Sinc filter is operated using the 1-bit stream data latched with the rise-edge or fall-edge of PDM_CLKn. For details, see section 49.3.5. Data Input Control for Stereo Sound.

Figure 49.3 shows a sinc filter block diagram.

The differentiation stage is operated by decimation clock (the frequency is 1/M of PDM_CLKn). M is the decimation ratio and is set in the PDSFCRCHn.SINCDEC[7:0] bits. The filter result is output in register every decimation clock.

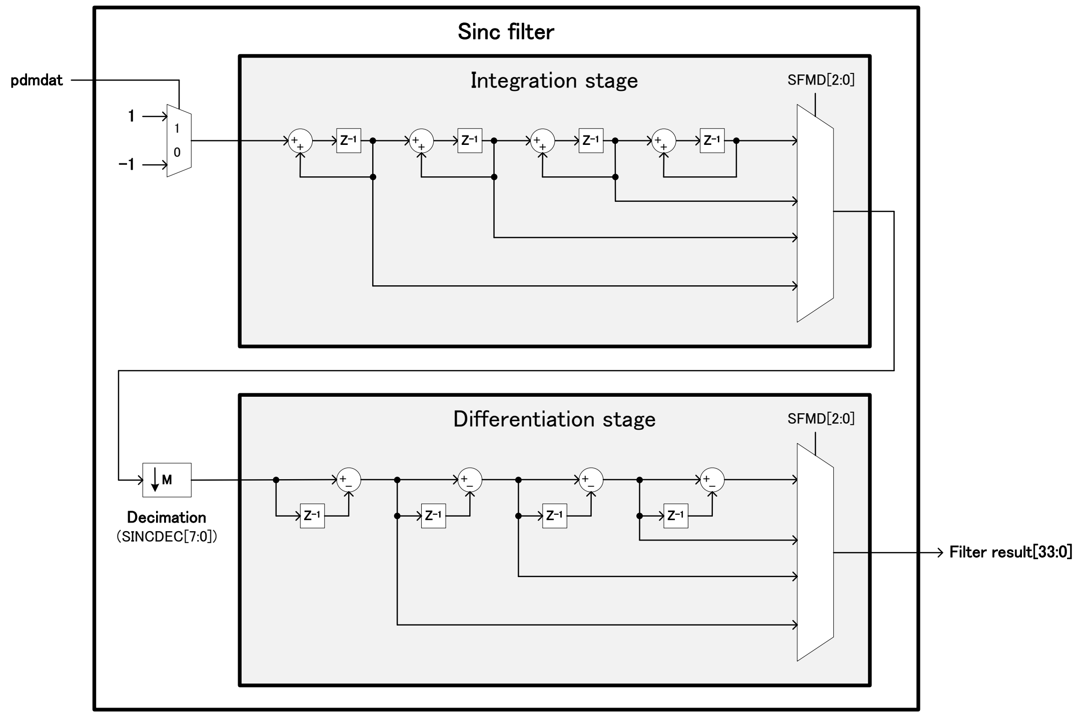

Figure 49.3 Sinc filter block diagram

49.3.4.3 High-pass Filter

The operating clock of the high-pass filter is PDMIFCLK. High-pass filter is operated using the result of the sinc filter.

Figure 49.4 shows a high-pass filter block diagram.

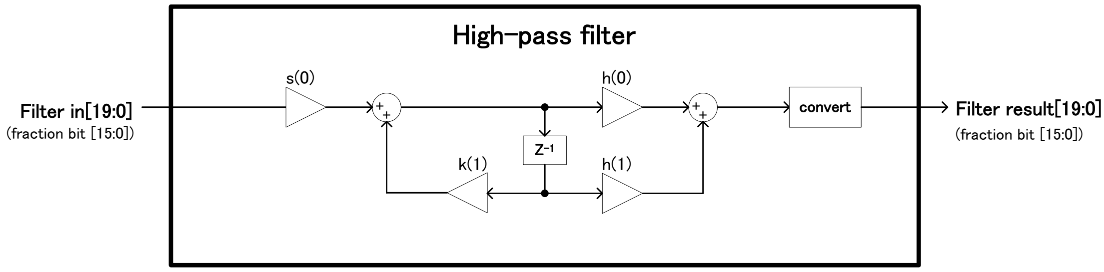

Figure 49.4 High-pass filter block diagram

Table 49.12 shows a high-pass filter specification.

Table 49.12 High-pass filter specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Coefficient	Bit width	Signed 16-bit (fraction 14-bit) For details, see section 49.2.21. PDHFCS0RCHn : High-pass Filter Coefficient s(0) Register Channel n (n = 0 to 2), section 49.2.22. PDHFCK1RCHn : High-pass Filter Coefficient k(1) Register Channel n (n = 0 to 2), and section 49.2.23. PDHFCH0RCHn : High-pass Filter Coefficient h(0) Register Channel n (n = 0 to 2).
Delay Z	Bit width	Signed 32-bit (fraction 18-bit)
Multiplier	Input A bit width	Signed 32-bit (fraction 18-bit)
	Input B bit width	Signed 16-bit (fraction 14-bit)
	Output bit width	Signed 47-bit (fraction 32-bit)
Adder	Input A bit width	Signed 32-bit (fraction 18-bit)
	Input B bit width	Signed 32-bit (fraction 18-bit)
	Output bit width	Signed 33-bit (fraction 18-bit)
Output conversion	Input bit width	Signed 32-bit (fraction 18-bit)
	Output bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at functional unit input or final output

49.3.4.4 Compensation Filter

The operating clock of the compensation filter is PDMIFCLK. Compensation filter is operated using the result of the high-pass filter.

Figure 49.5 shows a compensation filter block diagram.

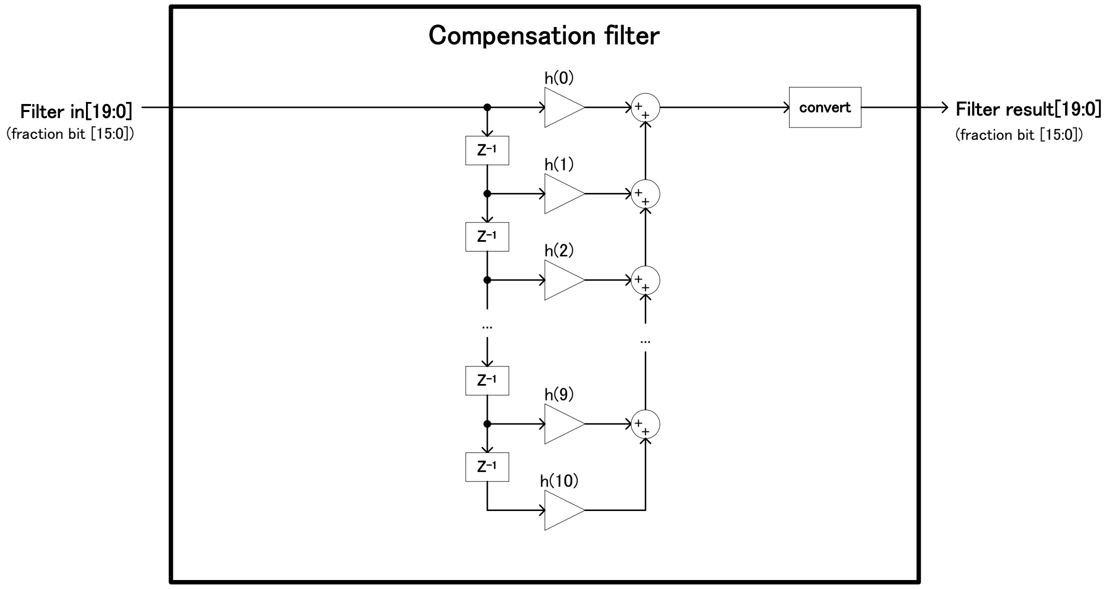

Figure 49.5 Compensation filter block diagram

Table 49.13 shows a compensation filter specification.

Table 49.13 Compensation filter specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Coefficient	Bit width	Signed 13-bit (fraction 11-bit) For details, see section 49.2.25. PDCFCH00RCHn : Compensation Filter Coefficient h(0) Register Channel n (n = 0 to 2).
Delay Z	Bit width	Signed 20-bit (fraction 16-bit)
Multiplier	Input A bit width	Signed 20-bit (fraction 16-bit)
	Input B bit width	Signed 13-bit (fraction 11-bit)
	Output bit width	Signed 32-bit (fraction 27-bit)
Adder	Input A bit width	Signed 22-bit (fraction 18-bit)
	Input B bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 23-bit (fraction 18-bit)
Output conversion	Input bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at functional unit input or final output

49.3.4.5 Low-pass (Half-band Decimation) Filter

The operating clock of the low-pass filter is PDMIFCLK. Low-pass filter is operated using the result of the compensation filter. Output data is decimated to a half of input data. As a result, output data frequency reduces to half of input frequency and the output data frequency is equal to the sample rate of data stored in FIFO.

Figure 49.6 shows a low-pass filter block diagram.

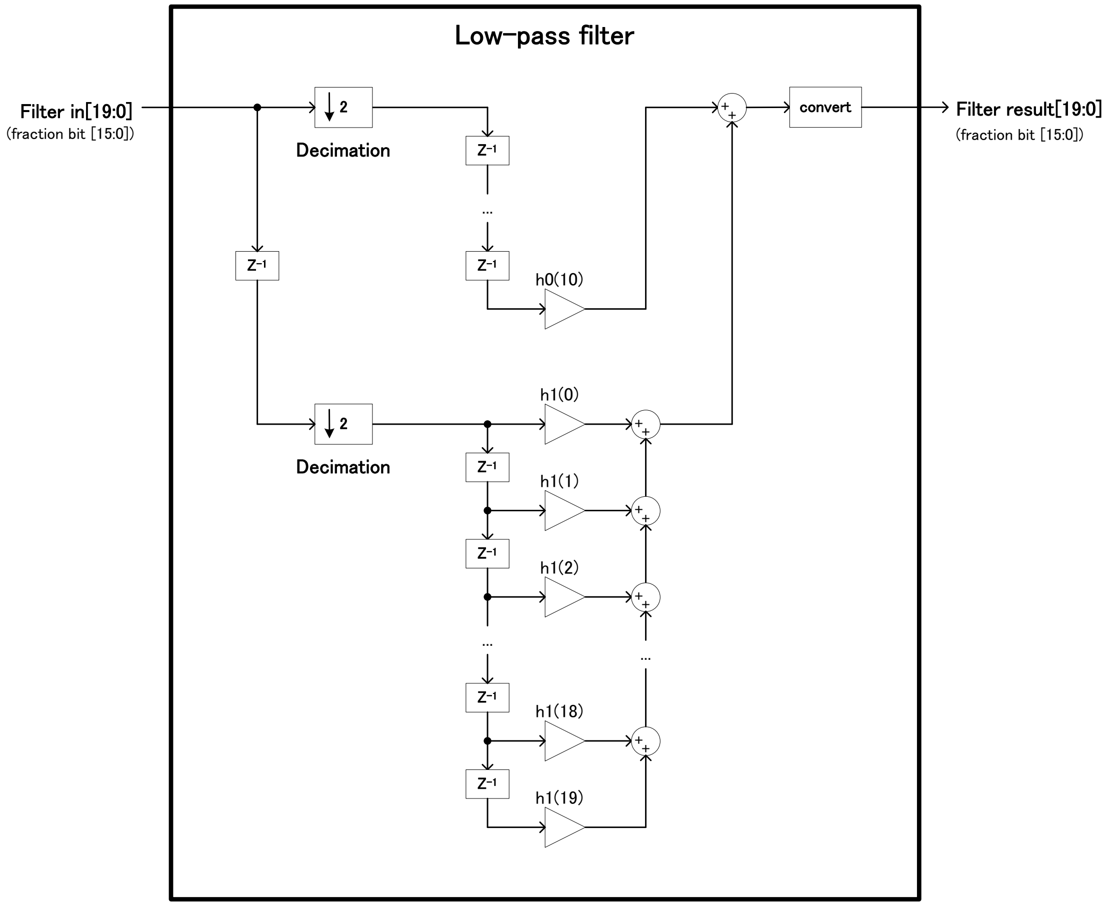

Figure 49.6 Low-pass filter block diagram

Table 49.14 shows a low-pass filter specification.

Table 49.14 Low-pass filter specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Coefficient	Bit width	Signed 13-bit (fraction 11-bit) For details, see section 49.2.25. PDCFCH00RCHn : Compensation Filter Coefficient h(0) Register Channel n (n = 0 to 2).
Delay Z	Bit width	Signed 20-bit (fraction 16-bit)
Multiplier	Input A bit width	Signed 20-bit (fraction 16-bit)
	Input B bit width	Signed 13-bit (fraction 11-bit)
	Output bit width	Signed 32-bit (fraction 27-bit)
Adder	Input A bit width	Signed 22-bit (fraction 18-bit)
	Input B bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 23-bit (fraction 18-bit)
Output conversion	Input bit width	Signed 22-bit (fraction 18-bit)
	Output bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at functional unit input or final output

49.3.4.6 Moving Average Filter

The operating clock of the moving average filter is PDMIFCLK. The moving average filter is operated using the result of the high-pass filter. The order of the moving average filter can be changed by the setting of the PDMDSRCHn.SDMAMD[1:0] bits.

Figure 49.7 shows a moving average filter block diagram.

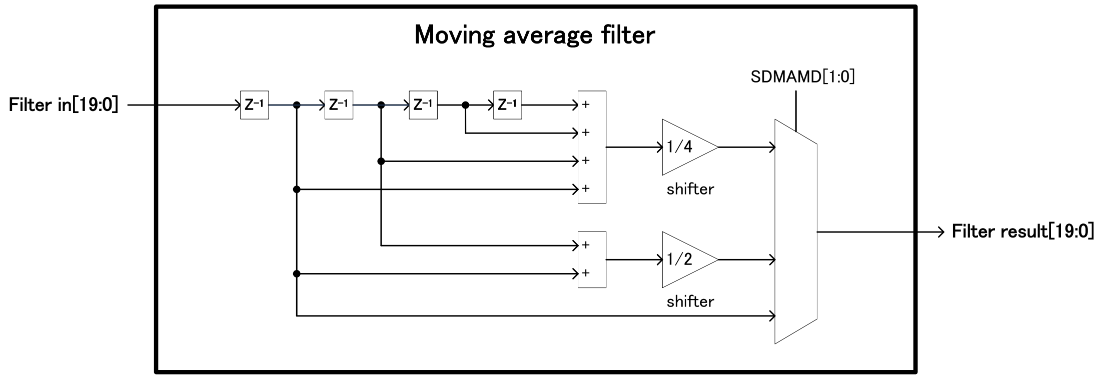

Figure 49.7 Moving average filter block diagram

Table 49.15 shows a moving average filter specification.

Table 49.15 Moving average filter specification

Function		Specification
Input	Bit width	Signed 20-bit (fraction 16-bit)
Output	Bit width	Signed 20-bit (fraction 16-bit)
Delay Z	Bit width	Signed 20-bit (fraction 16-bit)
Excessive fraction bits processing		Excessive fraction bits are rounded down at shifter

49.3.4.7 Settling Time of Channel Activation/Setting Change

Settling time of channel activation is the time after a start trigger PDCSTRTR.STRTRGn (or PDSTRTRCHn.STRTRG) is set before the filter result is stable and output. Settling time of channel setting change is the time after a change trigger PDCCHGTR.CHGTRGn (or PDCHGTRCHn.CHGTRG) is set before the filter result is stable and output. Figure 49.8 shows the settling time measurement point.

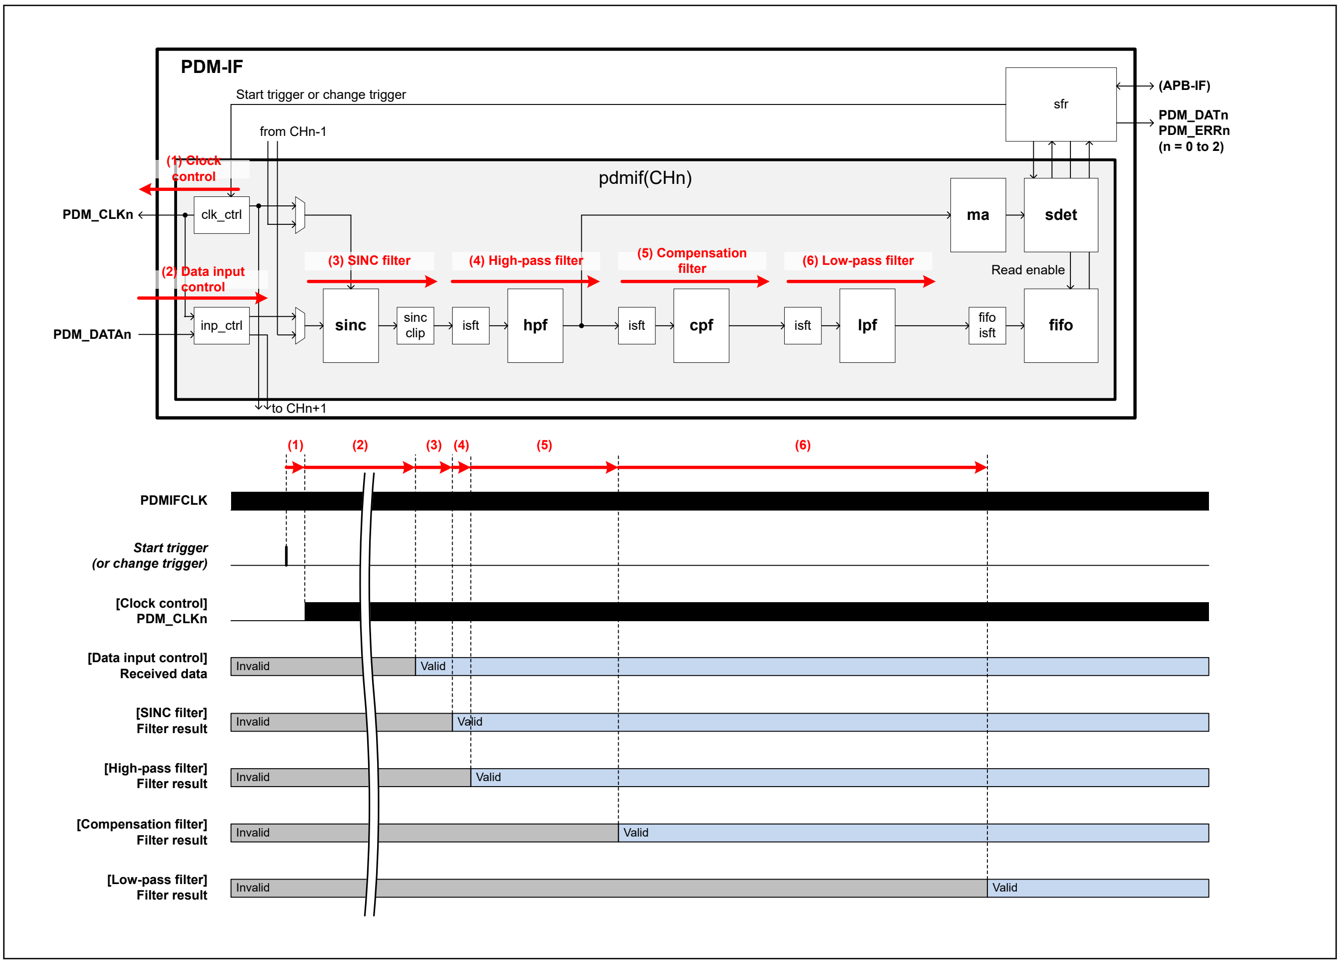

Figure 49.8 Settling time of channel activation

Settling time is calculated as Table 49.16.

Table 49.16 Settling time of channel activation/setting change

No	Function	Settling time	
		Channel activation	Channel setting change
(1)	Clock control	(4 + (D / 2)) × Cp	(3 + Do + (D / 2)) × Cp
(2)	Data input control	(D / 2) × Cp + (***Stable time for microphone***[*1])	
(3)	Sinc filter	(K × D × M) × Cp	
(4)	High-pass filter	(D × M + 5) × Cp	
(5)	Compensation filter	(10 × D × M + 12) × Cp	
(6)	Low-pass filter	(38 × D × M + 22) × Cp	

Note 1. Wakeup time from low power mode, switching time. For details, see datasheet of microphone.

Cp: PDMIFCLK period

D: PDM_CLKn’s dividend ratio

Do: PDM_CLKn’s dividend ratio (old setting)

K: Sinc filter order

M: Sinc filter decimation ratio

49.3.5 Data Input Control for Stereo Sound

The microphone which supports the stereo sound outputs the right sound synchronized with the rise-edge of PDM_CLKn and the left sound synchronized with the fall-edge of PDM_CLKn.

PDM-IF can process the right sound and the left sound using different channels.

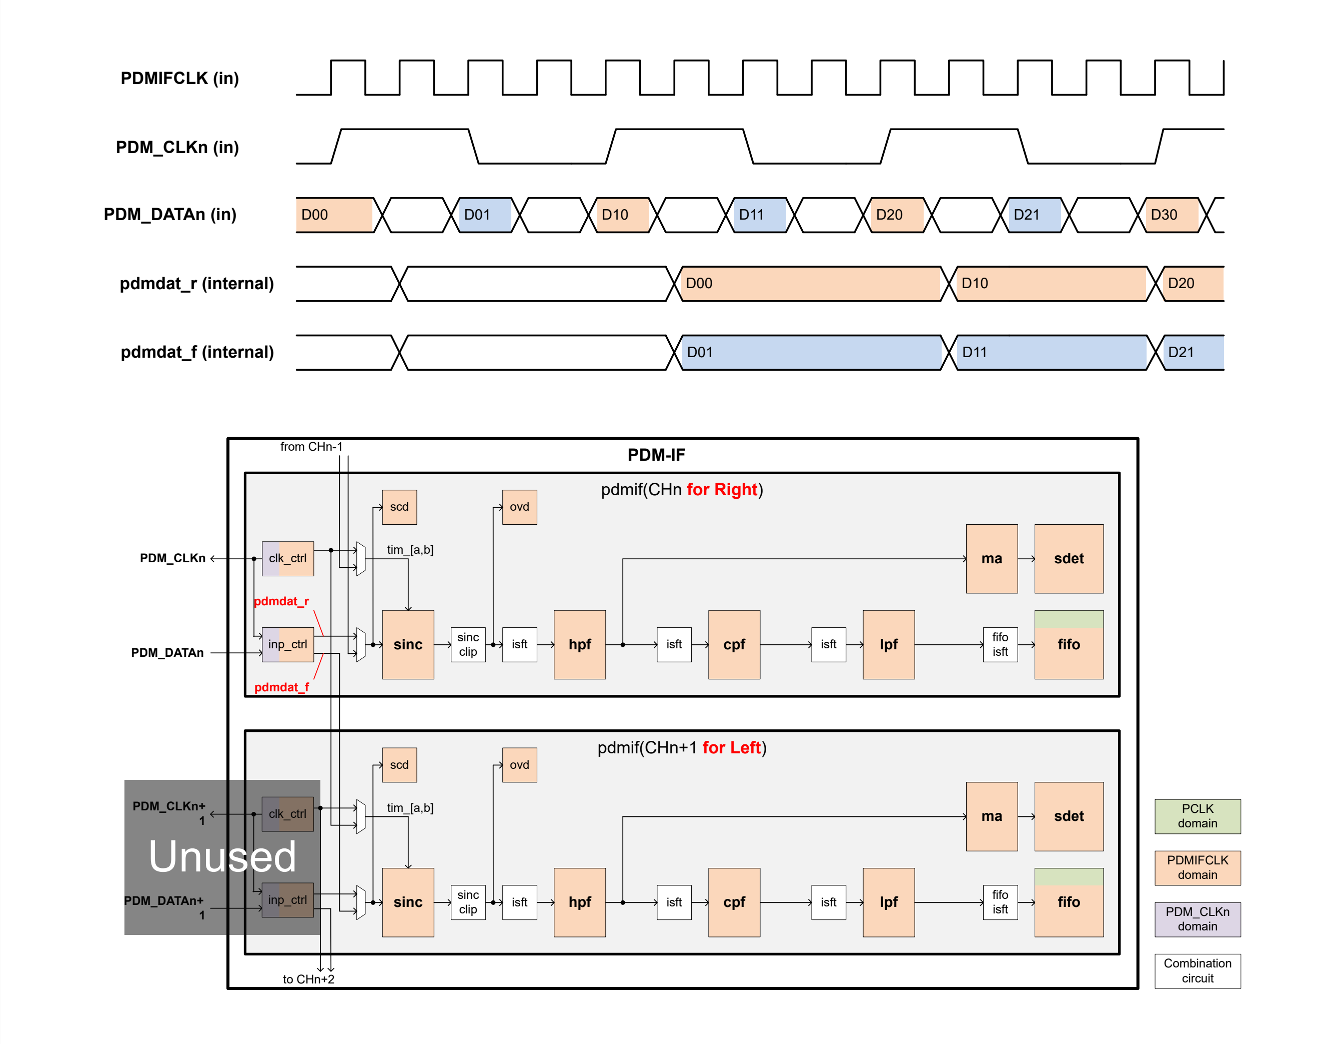

Figure 49.9 Data input control for stereo sound

Table 49.17 shows channel combinations of stereo sound processing.

Table 49.17 Channel combinations of stereo sound processing

Input	Data processing latched at rise-edge (right sound)	Data processing latched at fall-edge (left sound)
PDM_CLK0	Channel 0	Channel 1
PDM_DATA0		
PDM_CLK1	Channel 1	Channel 0
PDM_DATA1		

Table 49.18 shows an example of register settings for stereo sound processing using channel 0 and channel 1.

Table 49.18 Register settings for stereo sound processing (1 of 2)

Register	Bit	Channel 0 setting	Channel 1 setting
PDICRCHn	All bits	Channel unique settings	Channel unique settings
PDSDCRCHn	All bits	Channel unique settings	Channel unique settings

PDOVUTRCHn	All bits	Channel unique settings	Channel unique settings

49.3.6 Sound Detection

The operating clock of the sound detection function is PDMIFCLK. When PDSDCRCHn.SDE = 1, the function determines the sound detection using the moving average filter results.

A sound detection flag (PDSR.SDF) is set to 1 when the result is above the upper limit PDSDUTRCHn.SDETU[19:0]. The sound detection flag is also set to 1 when the result is below the lower limit PDSDLTRCHn.SDETL[19:0]. The sound detection flag is cleared to 0 when 1 is written to PDSCRCHn.SDFC.

Figure 49.10 shows the sound detection function.

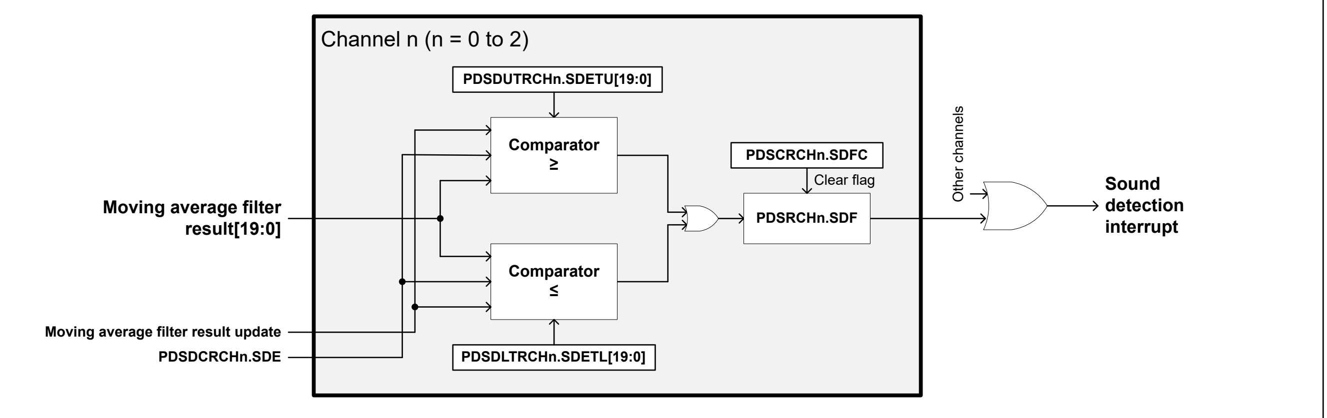

Figure 49.10 Sound detection function

49.3.7 Data Buffer

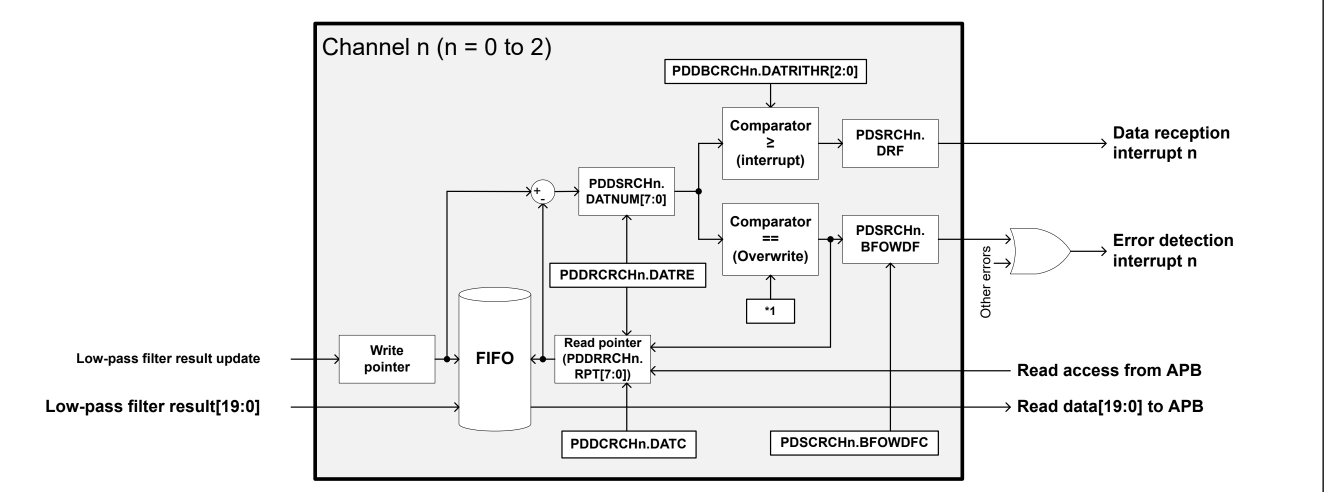
Data buffer writes sound data to FIFO synchronizing with PDMIFCLK and reads sound data from FIFO synchronizing with PCLK. Data buffer stores sound data in FIFO until it is read out.

While PDDRCRCHn.DATRE = 0 (hereinafter, DATRE), PDDSR.DATNUM[7:0] (hereinafter, DATNUM[7:0]) shows 0 and PDM-IF does not allow sound data to be read. After DATRE is changed from 0 to 1, DATNUM[7:0] shows the buffer size minus 2 and PDM-IF allows sound data to be read. While DATRE = 1, data buffer increments DATNUM[7:0] when data is written and decrements DATNUM[7:0] when data is read.

When DATNUM[7:0] is higher than or equal to a threshold which is configured by PDDBCRCHn.DATRITHR[2:0], a data reception flag PDSRCHn.DRF (hereinafter, DRF) is set to 1. When DATNUM[7:0] is lower than the threshold by reading data for instance, a data reception flag DRF is cleared to 0.

When DATNUM[7:0] is the buffer size minus 2 and data is written without reading, data buffer overwrites the oldest data with a new one and a buffer overwriting detection flag PDSRCHn.BFOWDF (hereinafter, BFOWDF) is set to 1. DATNUM[7:0] is then set to the buffer size minus 2 again after overwriting. However, data buffer overwrites but BFOWDF is not set after DATRE changes from 0 to 1 to before the first data is read.

Figure 49.11 shows the data buffer function.



Note 1. Buffer size - 1 (when buffer size is of 32 stages, this value is 31).

Figure 49.11 Data buffer function

49.3.8 Short-circuit Detection

When short-circuit detection enable (PDSDCRCHn.SCDE) is valid, the short-circuit detection can operate.

A dedicated 13-bit counter counts consecutive 0s or 1s input from pdmdat which is output by data input control block of channel n or channel n + 1.

When the number of consecutive 0s exceeds the value set in the PDSCTSRCHn.SCDL[12:0] register or the number of consecutive 1s exceeds the value set in the PDSCTSRCHn.SCDH[12:0] register, a short-circuit detection interrupt request is generated.

Figure 49.12 shows the configuration for the short-circuit detection function.

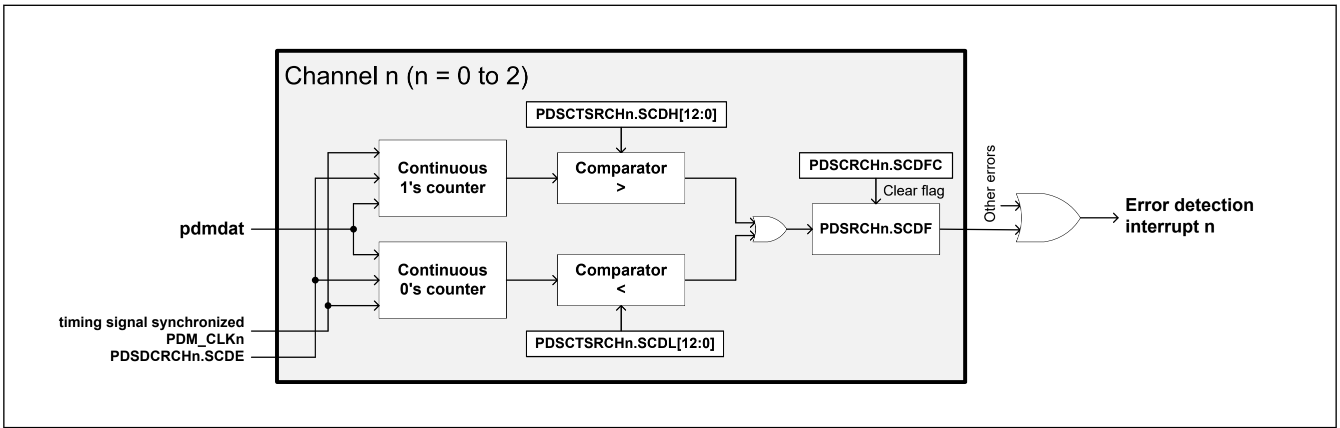


Figure 49.12 Short-circuit detection function

49.3.9 Overvoltage Detection

When the overvoltage upper limit detection enable (PDSDCRCHn.OVUDE) is valid, the overvoltage upper limit detection can operate. When the overvoltage lower limit detection enable (PDSDCRCHn.OVLDE) is valid, the overvoltage lower limit detection can operate.

The sound data is clipped as a 20-bit data from 34-bit data output from sinc filter by setting the PDSFCR.SINCRNG[4:0] bits. See Table 49.7 for detail.

An overvoltage upper limit detection flag is set to 1 when the clipped sound data is higher than PDOVUTRCHn.OVDU[19:0].

An overvoltage lower limit detection flag is set to 1 when the clipped sound data is lower than PDOVUTRCHn.OVDL[19:0].

Figure 49.13 shows the overvoltage detection function.

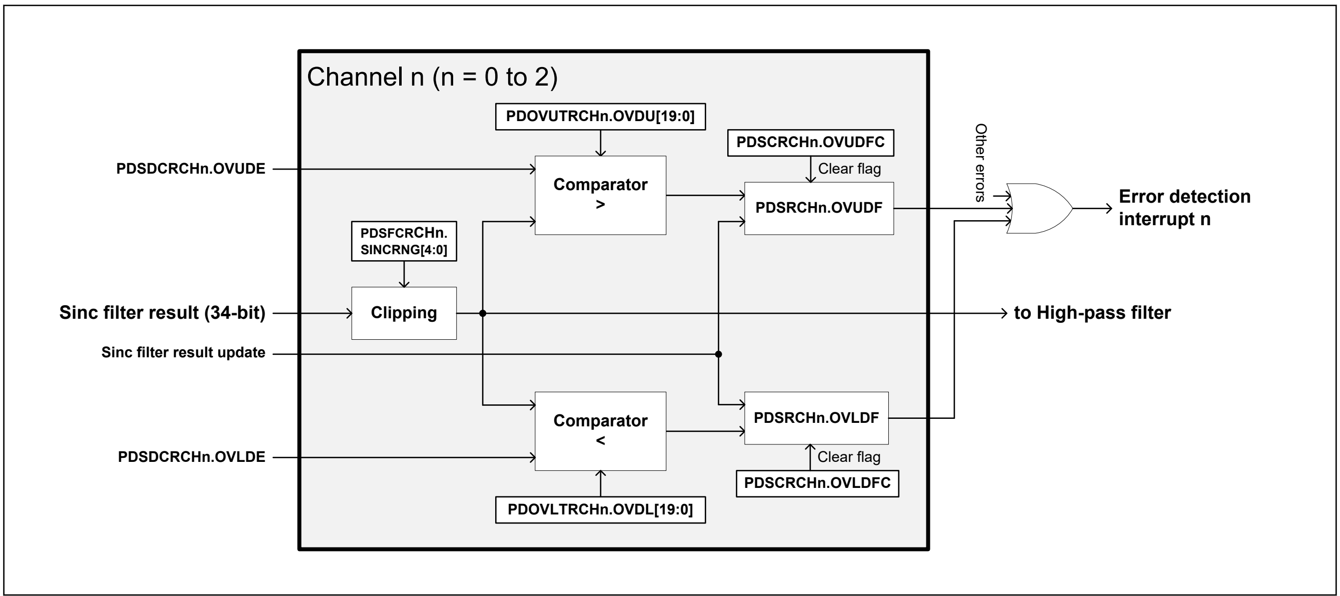

Figure 49.13 Overvoltage detection function

49.3.10 Error

Table 49.19 shows a PDM-IF error list.

Table 49.19 PDM-IF error list

No	Register name	Description	Comment	Function (Related section)
1	PDSRCHn.SCDF	Short circuit detection flag		section 49.3.8. Short-circuit Detection
2	PDSRCHn.OVLDF	Overvoltage lower limit detection flag		section 49.3.9. Overvoltage Detection
3	PDSRCHn.OVUDF	Overvoltage upper limit detection flag		section 49.3.9. Overvoltage Detection
4	PDSRCHn.BFOWDF	Buffer overwriting detection flag	For debugging	section 49.3.7. Data Buffer

No.4 errors are for debugging. Software must set registers and operate PDM-IF so that these errors do not occur. If any of these errors occurs, stop PDM-IF following section 49.4.2. Stop Flow and change the settings.

49.3.11 Interrupt Function

PDM-IF has the following interrupt function.

Table 49.20 PDM-IF interrupt list (1 of 2)

No	Signal name	Interrupt name	Number of signals	Pulse or Level	Related register bit name		Function (Related section)
					Common register	Channel register	
1	PDM_DATn (n = 0 to 2)	Data reception interrupt CHn	3	Level	PDCSR.DRFn	PDSRCHn.DRF	section 49.3.7. Data Buffer
2	PDM_SDET	Sound detection interrupt (3-channel status flags are ORed.)	1	Level	PDCSR.SDFn	PDSRCHn.SDF	section 49.3.6. Sound Detection

Table 49.20 PDM-IF interrupt list (2 of 2)

No	Signal name	Interrupt name	Number of signals	Pulse or Level	Related register bit name		Function (Related section)
					Common register	Channel register	
3	PDM_ERRn (n = 0 to 2)	Error detection interrupt CHn	3	Level	PDCSR.EDFn	PDSRCHn.SCDF	section 49.3.8. Short-circuit Detection
						PDSRCHn.OVLDF	section 49.3.9. Overvoltage Detection

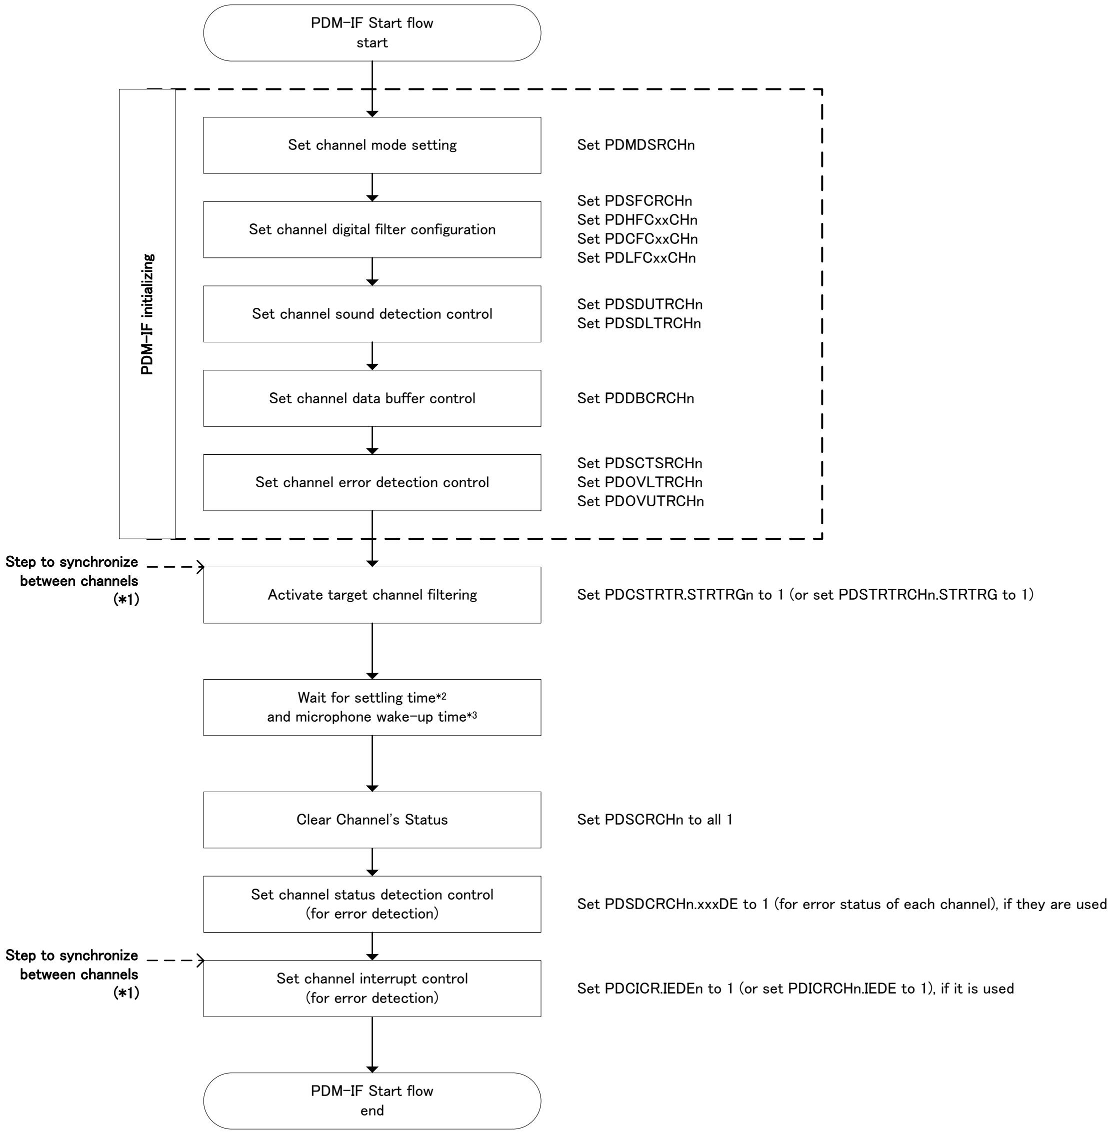
49.4.1 Start Flow

Figure 49.17 shows example of the start procedure of PDM-IF.

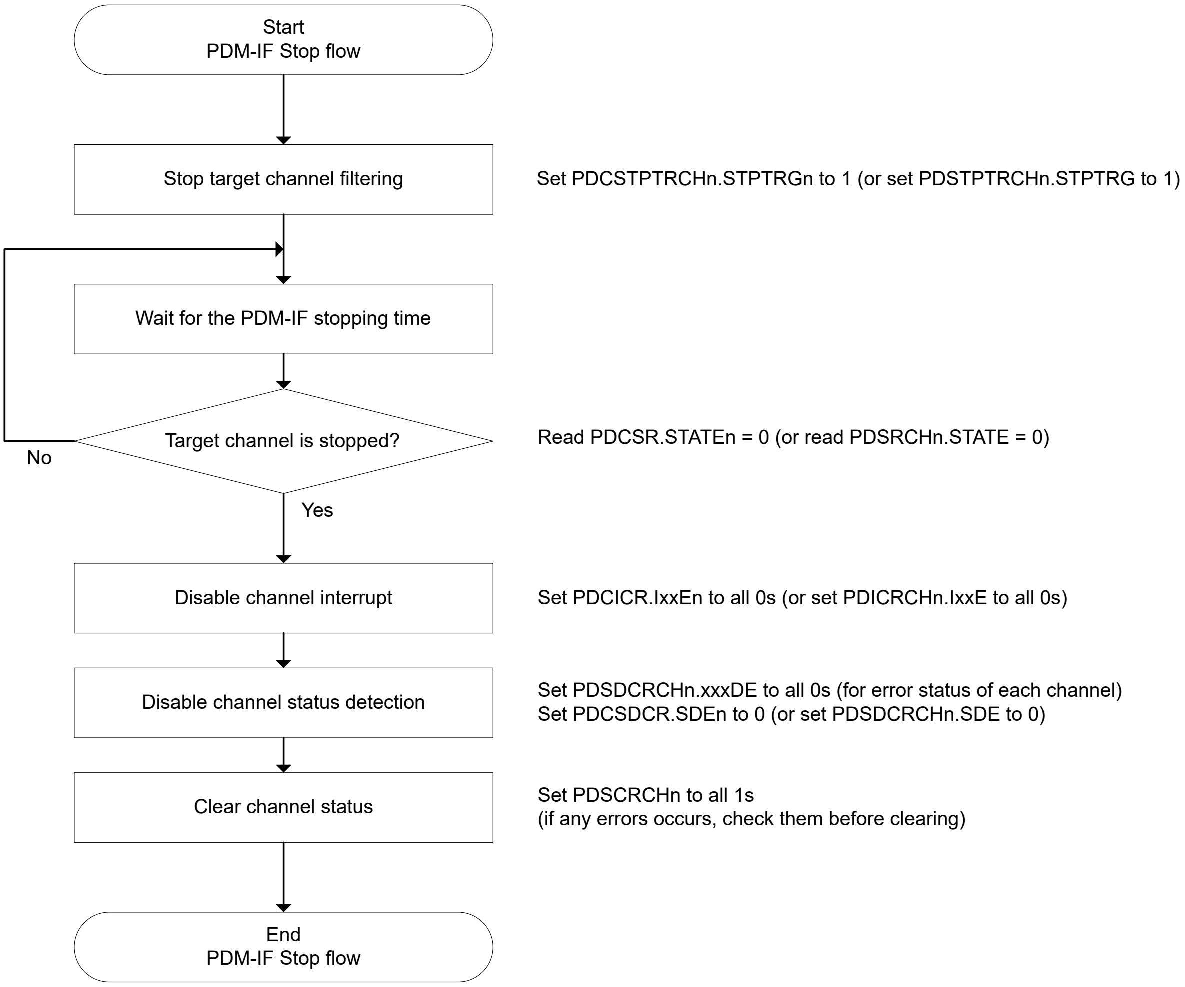


Note: xx or xxx refers to the register that matches the name pattern as similar part (ex: PDLFC) + different part (xx or xxx).
Note 1. If the channels are to be synchronized, complete the settings for each channels before this step.
Note 2. For details, see section 49.3.4.7. Settling Time of Channel Activation/Setting Change.
Note 3. Confirm the wake-up time from the connected microphone specifications.

Figure 49.17 PDM-IF start flow

49.4.2 Stop Flow

Figure 49.18 shows example of the stop procedure of PDM-IF.

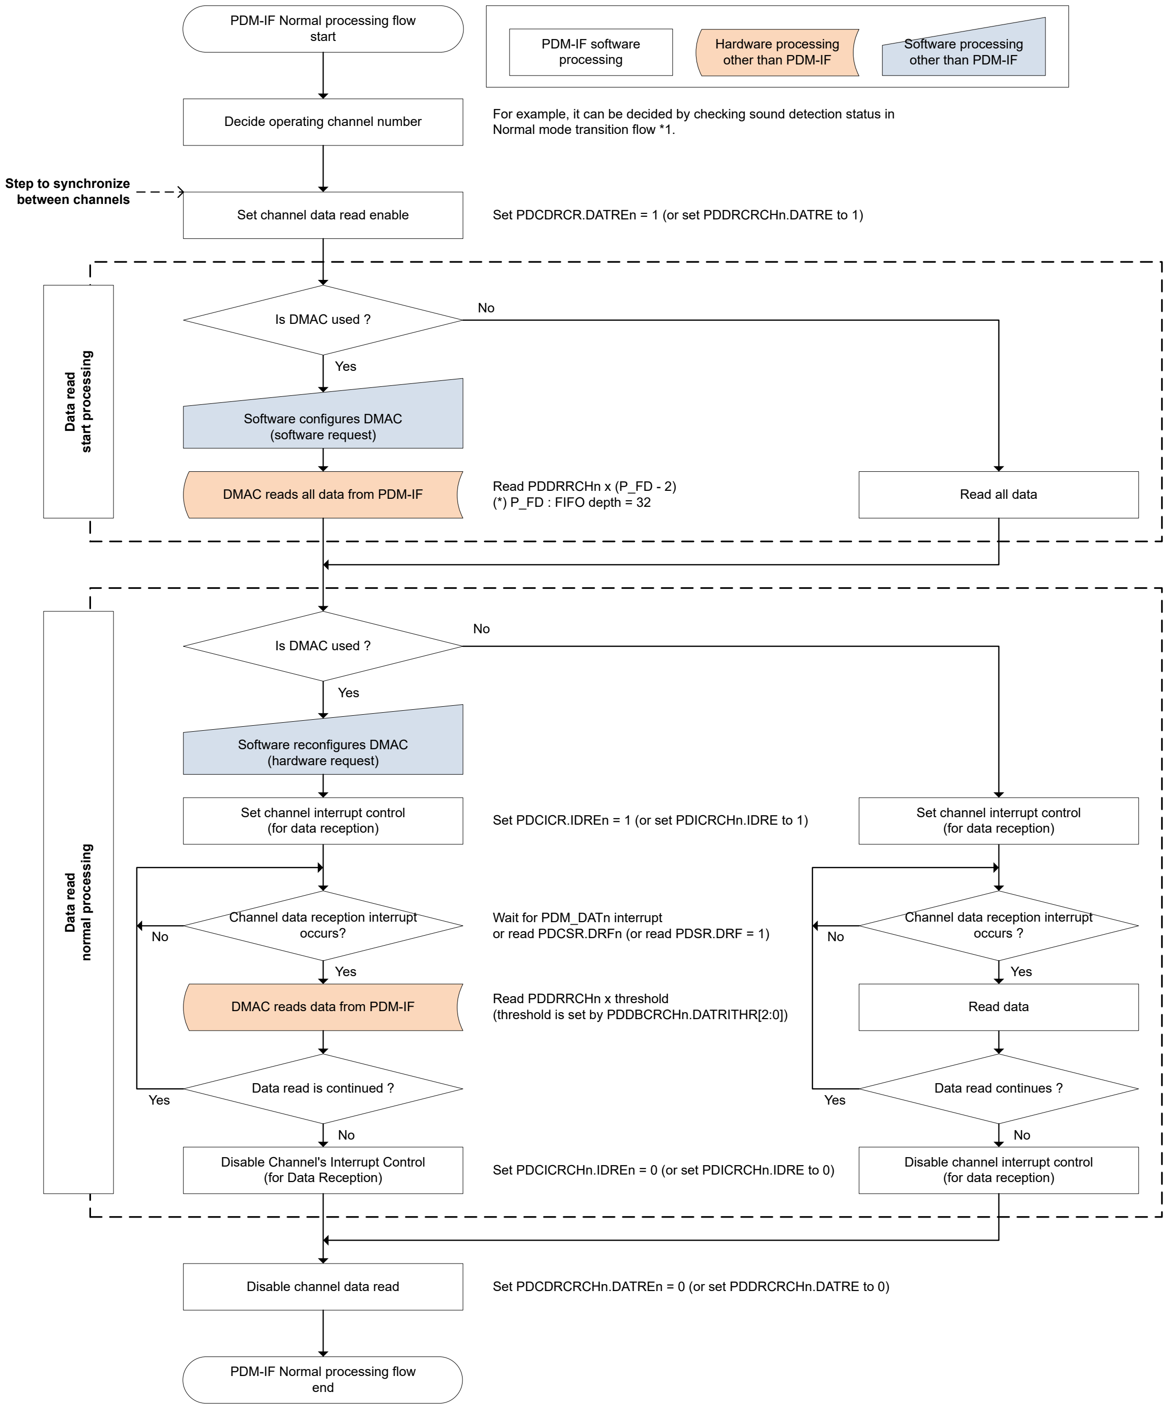


Note: xx or xxx refers to the register that matches the name pattern as different part (xx or xxx) + similar part (ex: DE).

Figure 49.18 PDM-IF stop flow

49.4.3 Normal Processing Flow

Figure 49.19 shows example of the normal processing procedure of PDM-IF.

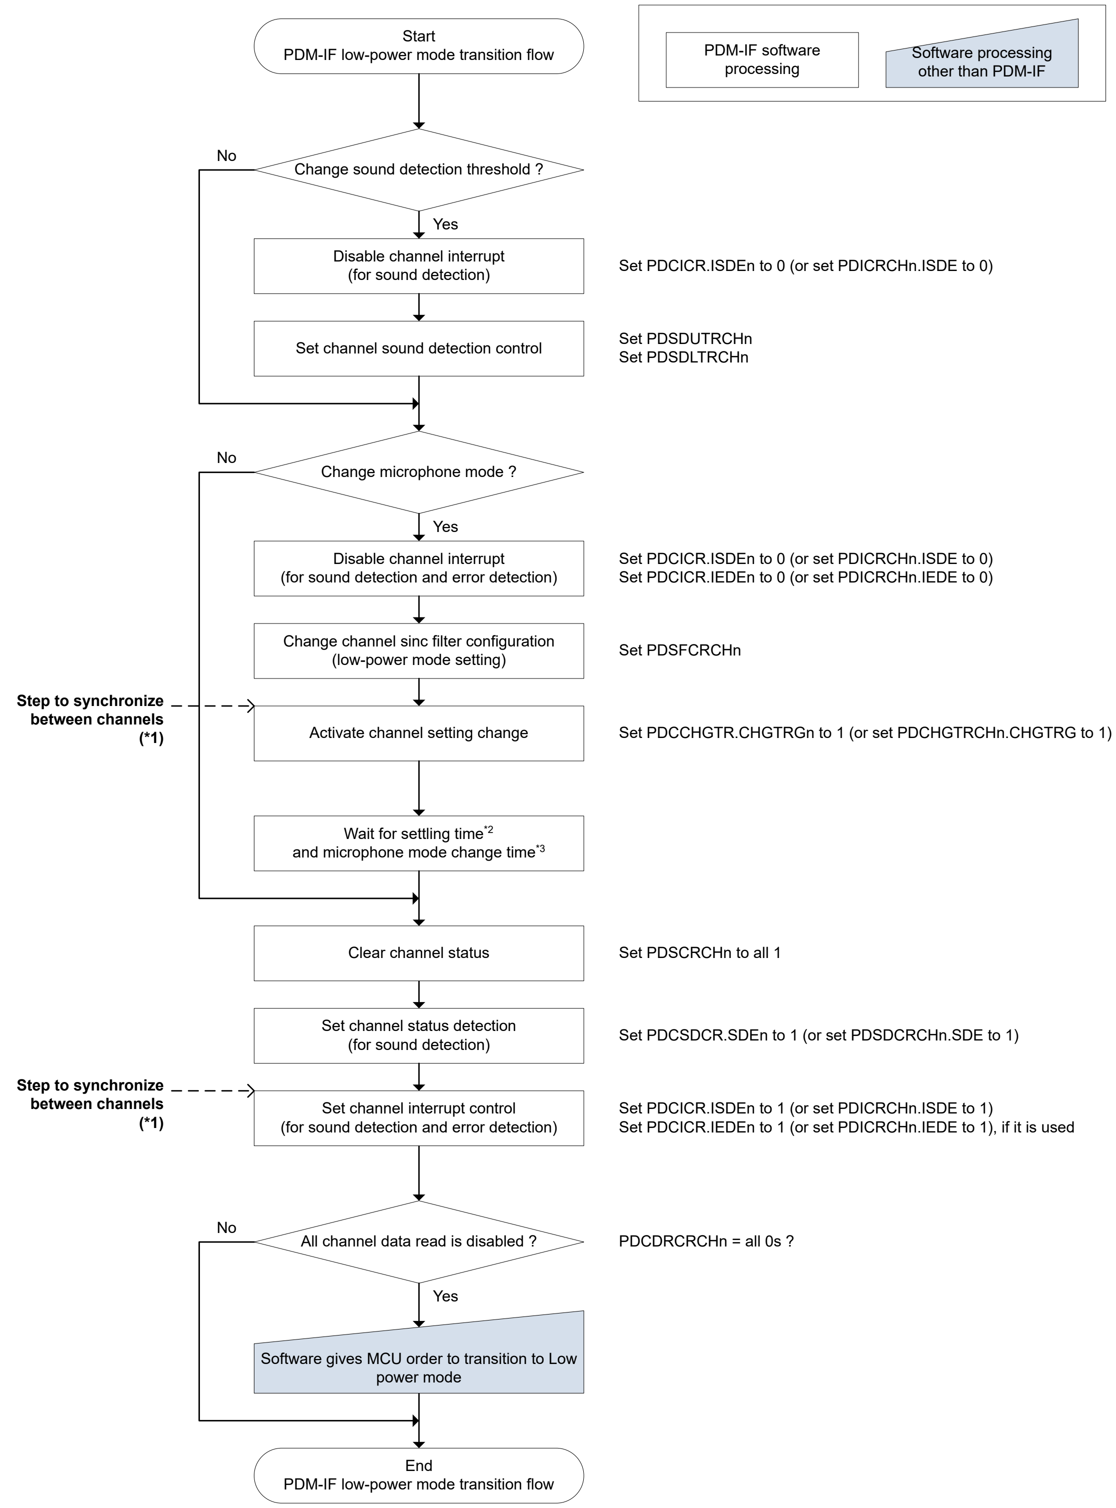


Note 1. For details, see Figure 49.21.

Figure 49.19 PDM-IF normal processing flow

49.4.4 Low-power Mode Transition Flow

Figure 49.20 shows example of the low-power mode transition procedure of PDM-IF.

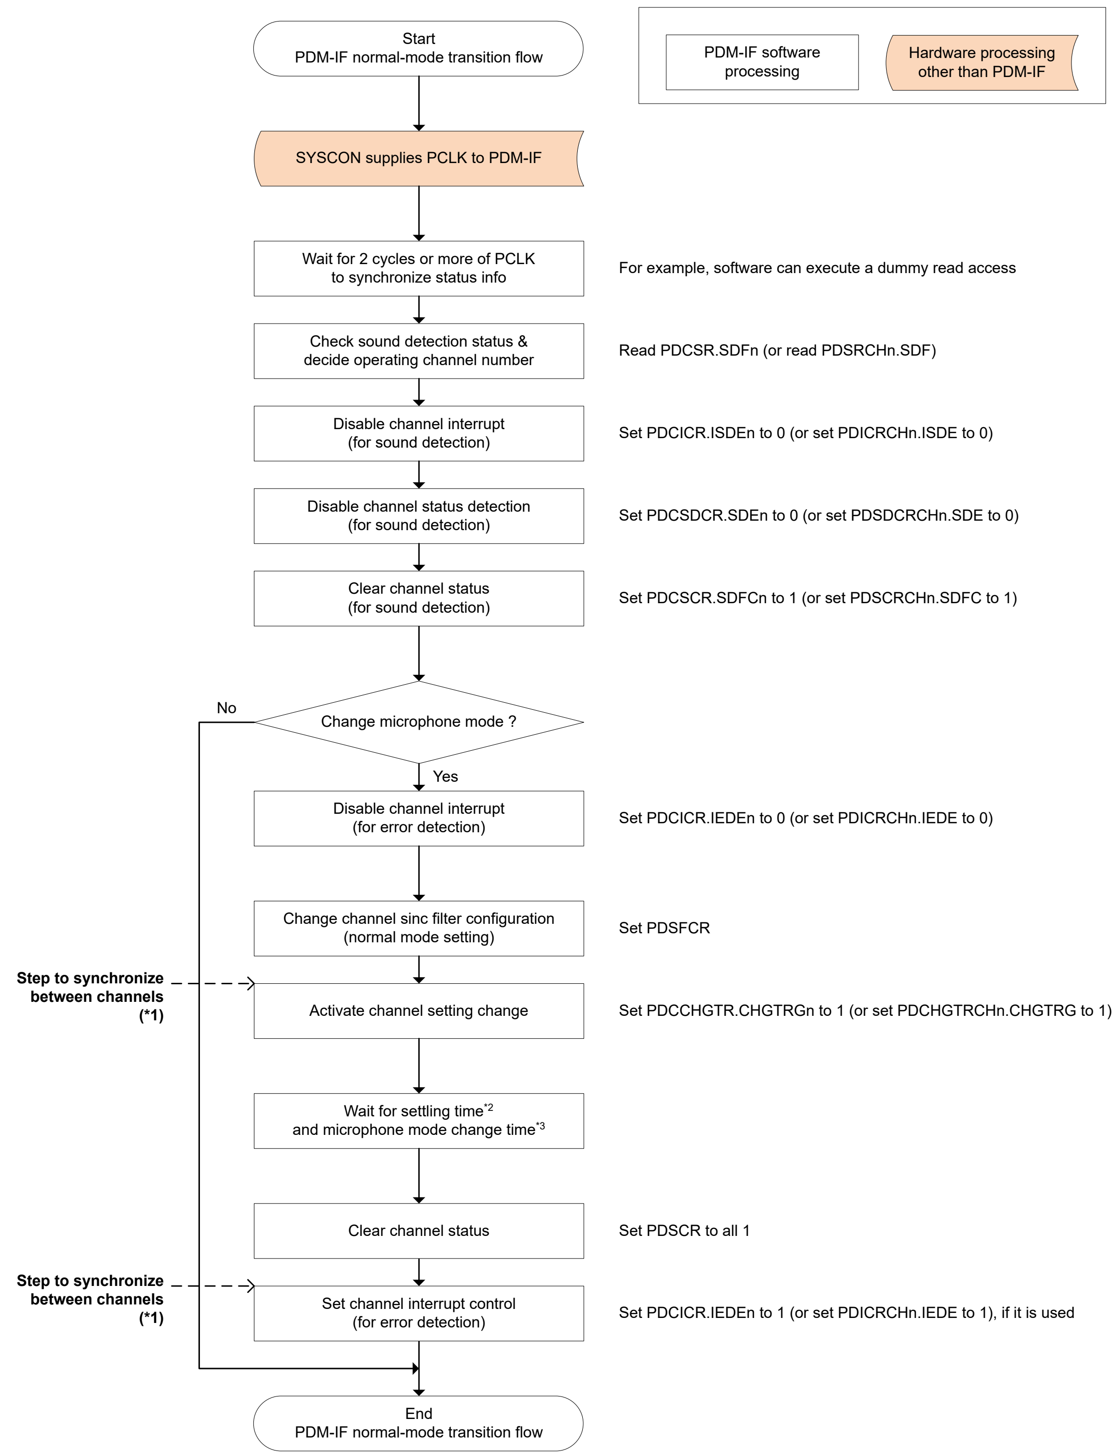


Note 1. If the channels are to be synchronized, complete the settings for each channel before this step.
Note 2. For details, see section 49.3.4.7. Settling Time of Channel Activation/Setting Change.
Note 3. Confirm the PDM microphone mode frequency and mode change time from the connected microphone specifications.

Figure 49.20 PDM-IF low-power mode transition flow

49.4.5 Normal Mode Transition Flow

Figure 49.21 shows example of normal-mode transition procedure of PDM-IF.



Note 1. If the channels are to be synchronized, complete the settings for each channel before this step.
Note 2. For details, see section 49.3.4.7. Settling Time of Channel Activation/Setting Change.
Note 3. Confirm the PDM microphone mode frequency and mode change time from the connected microphone specifications.

Figure 49.21 PDM-IF normal-mode transition flow

49.5 Usage Notes

49.5.1 Data Reception Interrupt Threshold Register Setting

A data reception interrupt PDM_DATn is issued as a level output. Therefore, if the number of samples in buffer still exceeds the data reception interrupt threshold set in PDDBCRCHn.DATRITHR[2:0] when data reading of DMA finishes, the interrupt controller might not detect the edge of PDM_DATn. The situation happens if data reading time exceeds sampling rate*1 × threshold. Set the appropriate threshold so that the interrupt controller can detect the interrupt.

In case the threshold cannot avoid the situation, read PDDBCRCHn.DATRITHR[2:0] and restart DMA by software after reading the data.

Note 1. Sampling rate: Time to spend to store a sample in buffer.

49.5.2 Frequency Characteristics of Filters with Default Settings

Figure 49.22 shows the frequency characteristics of the filters with the default settings for reference information.

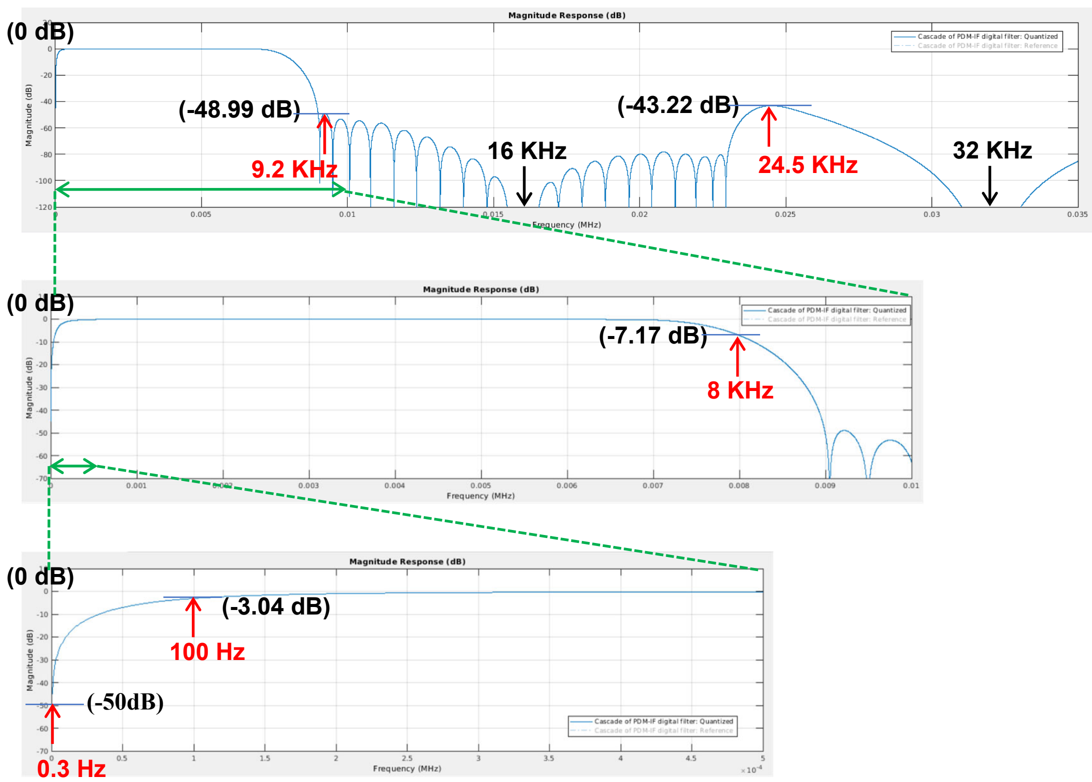


Figure 49.22 Frequency characteristics of filters with default settings

Table 49.21 Frequency characteristics of filters with default settings (1 of 2)

Frequency (Hz)		Magnitude (dB)
Cut-off frequency of LPF	24.5 kHz	-43.22
	…	…
	9.2 kHz	-48.99
	8 kHz	-7.17

Table 49.21 Frequency characteristics of filters with default settings (2 of 2)

Frequency (Hz)		Magnitude (dB)
Passband	7 kHz	-0.39
	6 kHz	-0.07
	…	…
	150 Hz	-1.63
	100 Hz	-3.04
Cut-off frequency of HPF	50 Hz	-7.02
	0.3 Hz	-50.00

50. Boundary Scan

50.1 Overview

The boundary scan function provides a serial I/O interface based on the JTAG (Joint Test Action Group), IEEE Std.1149.1, and IEEE Standard Test Access Port and Boundary Scan Architecture. Table 50.1 lists the boundary scan specifications, Figure 50.1 shows a block diagram, and Table 50.2 lists the I/O pins.

Table 50.1 Boundary scan specifications

Parameter	Specifications
Execution condition	Boundary scan must be executed when the RES pin is driven low.
Test modes	● BYPASS mode ● EXTEST mode ● SAMPLE/PRELOAD mode ● CLAMP mode ● HIGHZ mode ● IDCODE mode

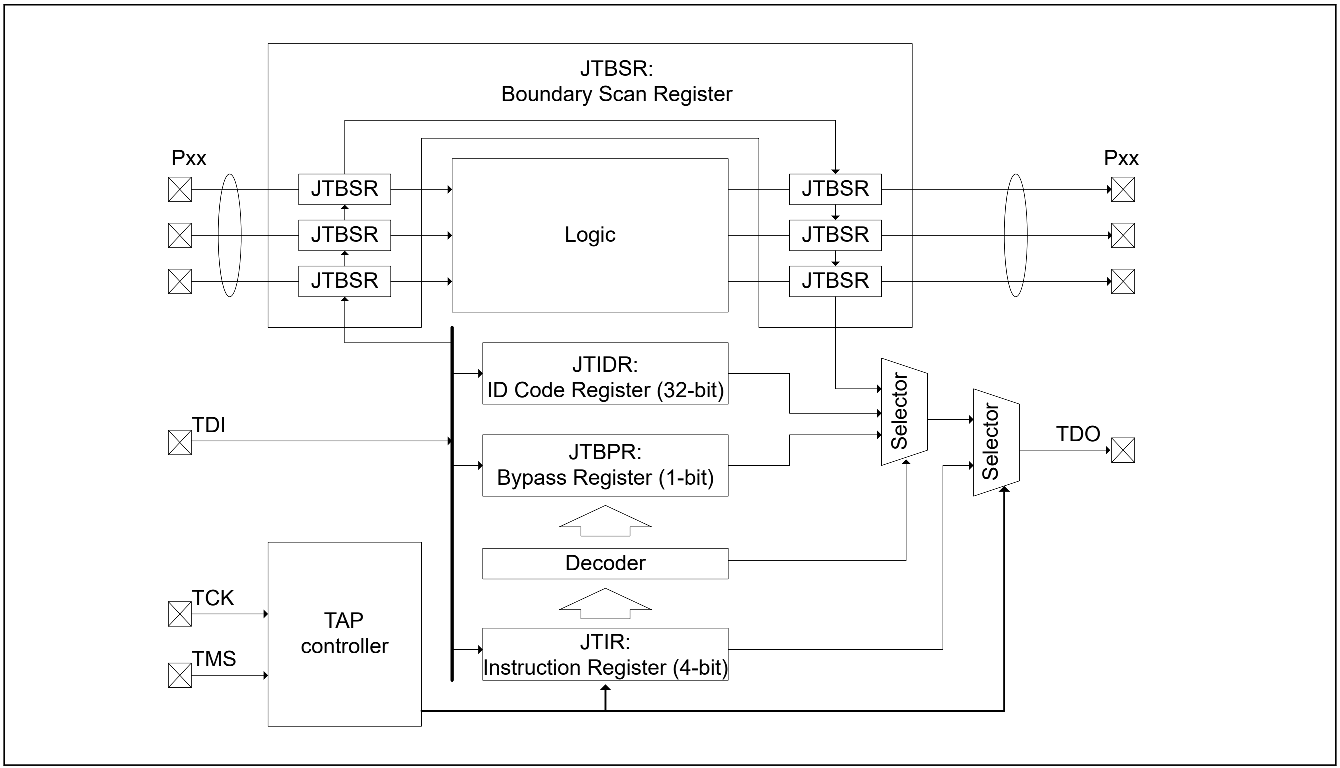

Figure 50.1 Boundary scan function block diagram

Table 50.2 Boundary scan I/O pins

Pin name	I/O	Description
TCK	Input	Test clock input pin Clock signal for boundary scan. The input clock duty cycle is 50% when the boundary scan function is used.
TMS	Input	Test mode select pin
TDI	Input	Test data input pin
TDO	Output	Test data output pin

Note: This device does not support the TRST pin for the JTAG interface.

50.2 Register Descriptions

Table 50.3 lists the boundary scan registers.

Table 50.3 Boundary scan registers

Register name	Symbol	Value after reset
Instruction Register	JTIR	0xE
ID Code Register	JTIDR	0x085D_A447
Bypass Register	JTBPR	Undefined
Boundary Scan Register	JTBSR	Undefined

Usage notes for the boundary scan registers:

- Instructions can be input to the Instruction Register (JTIR) through the TDI pin by serial transfer.
- The Bypass Register (JTBPR), which is a 1-bit register, is connected between the TDI and TDO pins in BYPASS mode.
- The Boundary Scan Register (JTBSR), which is configured according to the BSDL description, is connected between the TDI and TDO pins when test data is being shifted in.

Table 50.4 shows the availability of serial transfer for the registers.

Table 50.4 Serial transfer for registers

Register name	Serial input	Serial output
Instruction Register (JTIR)	Available	Available
ID Code Register (JTIDR)	Available	Available
Bypass Register (JTBPR)	Available	Available
Boundary Scan Register (JTBSR)	Available	Available

50.2.1 JTIR : Instruction Register

Bit position:	3	2	1	0
Bit field:	TS[3:0]			
Value after reset:	1	1	1	0

<table>
<tr><th>Bit</th><th>Symbol</th><th>Function</th><th>R/W</th></tr>
<tr><td>3:0</td><td>TS[3:0]</td><td>Test Bit Set
The command configuration for these bits
<table>
<tr><th>TS[3:0]</th><th>Instruction</th></tr>
<tr><td>0x0</td><td>EXTEST</td></tr>
<tr><td>0x1</td><td>SAMPLE/PRELOAD</td></tr>
<tr><td>0x3</td><td>IDCODE (Renesas code)</td></tr>
<tr><td>0x5</td><td>CLAMP</td></tr>
<tr><td>0x6</td><td>HIGHZ</td></tr>
<tr><td>0xF</td><td>BYPASS</td></tr>
<tr><td>Others</td><td>Reserved</td></tr>
</table></td><td>—</td></tr>
</table>

JTAG instructions can be transferred to the JTIR register by serial input from the TDI pin. The JTIR register is initialized when a power-on reset occurs, or when the TAP controller is in the Test-Logic-Reset state.

50.2.2 JTIDR : ID Code Register

Bit position: 31 … 0

Bit field: DID[31:0]

Value after reset: 0 0 0 0 1 0 0 0 0 1 0 1 1 1 0 1 1 0 1 0 0 1 0 0 0 1 0 0 0 1 1 1

Bit	Symbol	Function	R/W
31:0	DID[31:0]	Device ID These bits store the fixed value that indicates the device IDCODE (0x085D_A447).	—

The JTIDR register data is output from the TDO pin when the IDCODE instruction is executed. After a reset release, the DID[31:0] of JTIDR changes into the Arm® debug code. See the *Arm® CoreSight™ SoC-400 Technical Reference Manual* (ARM DDI 0480F).

50.2.3 JTBPR : Bypass Register

The JTBPR register is a 1-bit register and is connected between the TDI and TDO pins when the JTIR register is set to BYPASS mode. The JTBPR register cannot be read from or written to by the CPU.

50.2.4 JTBSR : Boundary Scan Register

The JTBSR register is a shift register for controlling the external input and output pins of this device, and is distributed across the pads. To apply the JTBSR register in boundary-scan testing, issue the EXTEST, SAMPLE/PRELOAD, CLAMP and HIGHZ instructions. The BSDL file describes the associations between the JTBSR register bits and the pins of this device. The value after reset is undefined.

50.3 Operation

During a reset, the JTAG ports, TCK, TMS, TDI and TDO are assigned as default pin functions. The TCK, TMS and TDI pins are pulled up by the pull-up resistors. Boundary scan testing can be executed after the setup time elapses when POR is negated and RES is driven low.

50.3.1 TAP Controller

Figure 50.2 shows the state transition diagram of the TAP controller. All transitions are controlled by the TMS signal.

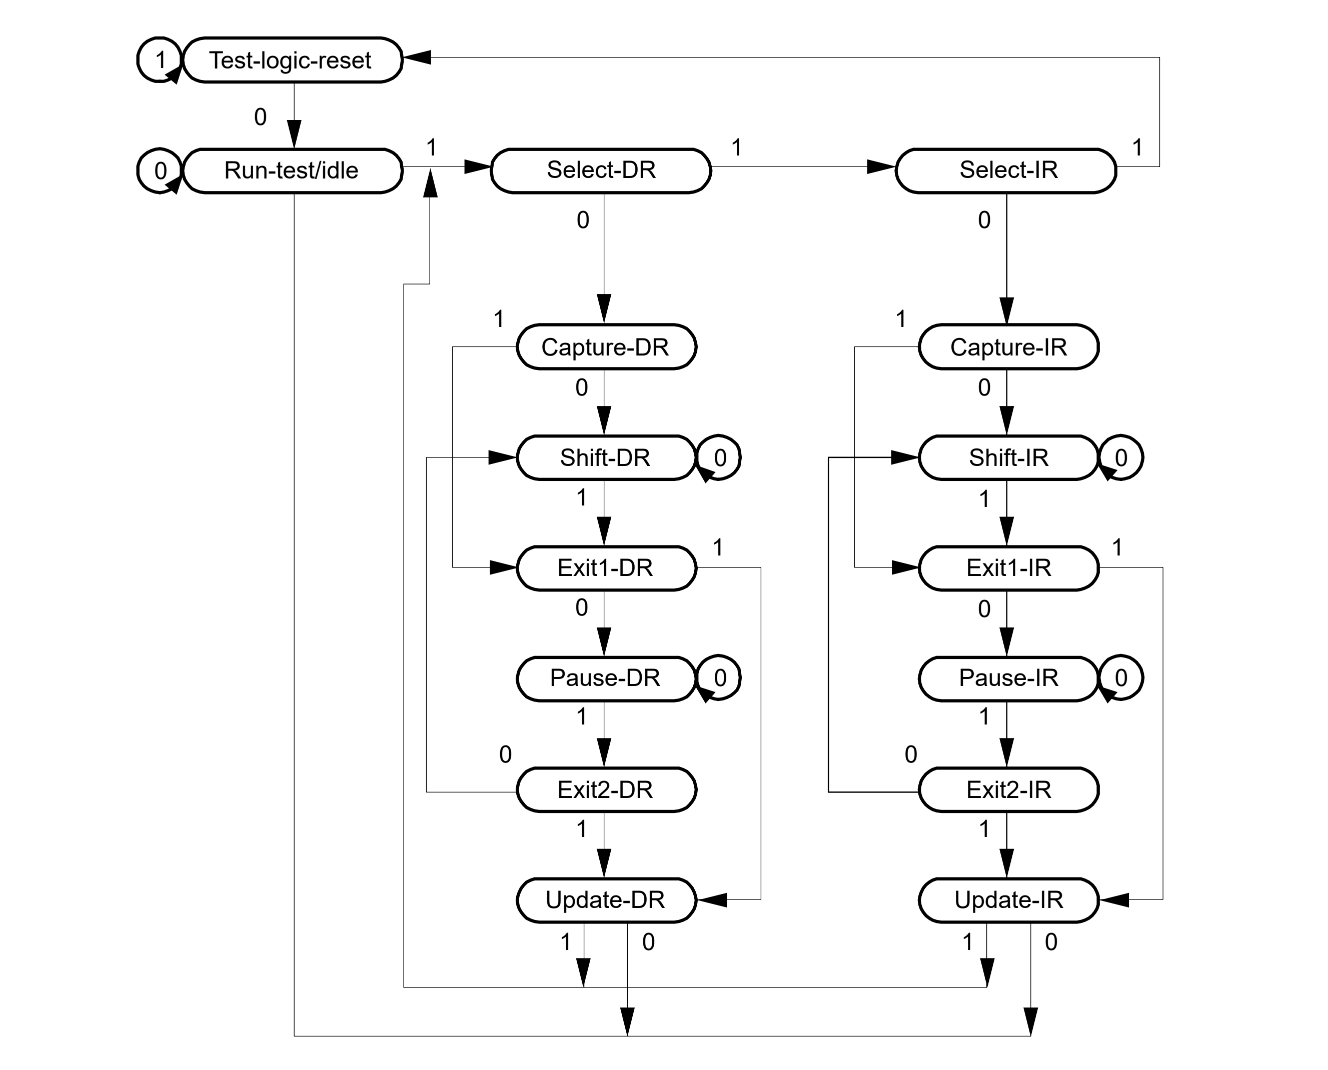

Figure 50.2 State transition diagram of TAP controller

50.3.2 Commands

(1) BYPASS

The BYPASS instruction drives the Bypass Register (JTBPR). This instruction shortens the shift path, facilitating the transfer of serial data to other LSIs on a printed circuit board at higher speeds. While this instruction is being executed, the test circuit has no effect on the system circuits.

The JTBPR register is connected between the TDI and TDO pins. Bypass operation is initiated from the Shift-DR operation. The TDO is low in the first clock cycle in the Shift-DR state. In the subsequent clock cycles, values input to the TDI pin are output from the TDO pin.

(2) EXTEST

The EXTEST instruction is used to test external circuits when this device is installed on the printed circuit board. If this instruction is executed, output pins are used to output test data (specified in the SAMPLE/PRELOAD instruction) from the Boundary Scan Register (JTBSR) to the other devices, and input pins are used to input the test result.

(3) SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input data from the internal circuits of this device to the JTBSR register, output data from the scan path, and reload the data to the scan path. While this instruction is executed, input signals are directly input to this device and output signals are also directly output to the external circuits. This device system circuit is not affected by this instruction.

In SAMPLE operation, the JTBSR register latches a snapshot of the data transferred from the input pins to the internal circuit or data transferred from the internal circuit to the output pins. The latched data is read from the scan path. The JTBSR register latches the data snapshot on the rising edge of the TCK pin in the Capture-DR state. The data snapshot is only transferred from the internal circuit to the output pins during a reset.

In PRELOAD operation, the initial value is written from the scan path to the parallel output latch of the JTBSR register prior to the EXTEST instruction execution. If EXTEST is executed without executing this PRELOAD operation, undefined values are output from the beginning to the end (transfer to the output latch) of the EXTEST sequence. (In the EXTEST instruction, output parallel latches are always output to the output pins.)

(4) IDCODE

When the IDCODE instruction is selected, the ID Code Register (JTIDR) value is output to the TDO pin in the Shift-DR state of the TAP controller. In this case, the JTIDR register value is output LSB-first. During this instruction execution, the test circuit does not affect the system circuit.

(5) CLAMP

When the CLAMP instruction is selected, output pins output the JTBSR register value that was specified in the SAMPLE/PRELOAD instruction in advance. While the CLAMP instruction is selected, the status of the JTBSR register is maintained regardless of the TAP controller state.

The JTBPR register is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

(6) HIGHZ

When the HIGHZ instruction is selected, all output pins enter high-impedance state. While the HIGHZ instruction is selected, the JTBSR register is maintained regardless of the state of the TAP controller.

The JTBPR register is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

50.4 Usage Notes

The boundary scan function is subject to the following constraints:

- The boundary scan must be executed when the RES pin is driven low
- Serial data input/output is in LSB order, as shown in Figure 50.3

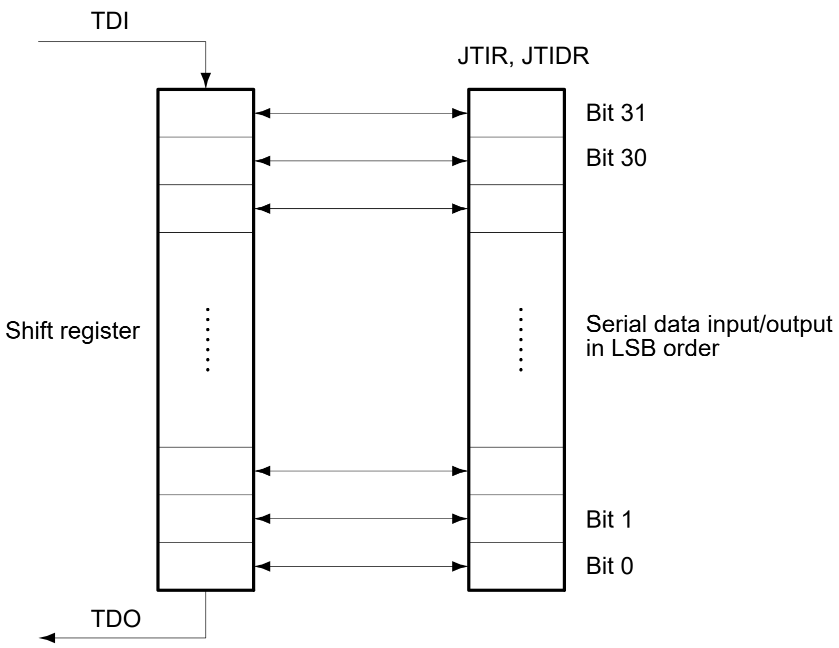

Figure 50.3 Serial data input/output

The following pins cannot be boundary-scanned for Standard Product and SiP Product:

- Power supply pins (VCC, VCC2, VCC_DCDC, VCL, VSS, VSS_DCDC, VBATT, AVCC0, AVSS0, VCC_USB, VSS_USB, VSS1_USBHS, VSS2_USBHS, VCC_USBHS, AVCC_USBHS, VSS1_USBHS, VSS2_USBHS)
- Analog reference pins (VREFH0, VREFL0, VREFH, VREFL)
- Clock pins (EXTAL, XTAL, XCIN, and XCOUT)
- Reset pin (RES)
- USBHS-dedicated pins (USBHS_DP, USBHS_DM, USBHS_RREF)
- USBFS pin (USB_DP, USB_DM)
- The boundary-scan pins (TCK, TMS, TDI, and TDO).
- The switching regulator pin (VLO)

The following pins cannot be boundary-scanned for SiP Product:

- SiP flash pins (OM_1_SCLK, OM_1_CS1, OM_1_DQS, OM_1_SIO7-0, OM1_RESET and OM_1_ECSINT1)

51. Security Features

51.1 Features

- Armv8-M TrustZone security
  - Implementation Defined Attribution Unit (IDAU) is implemented
  - Security Attribution Unit (SAU) is implemented
    - 8 regions
  - Master Security Attribution Unit (MSAU) is implemented (IDAU for master other than CPU)
  - Code MRAM
    - Up to 2 regions (secure/non-secure)
  - SiP flash (Only for SiP product)
    - Up to 2 regions (secure/non-secure)
  - CM33 TCM
    - Up to 2 regions (secure/non-secure) for C-TCM and S-TCM
  - SRAM
    - Up to 2 regions (secure/non-secure) per SRAM
  - VBATT backup registers
    - Up to 2 regions (secure/non-secure)
  - Peripheral
    - Security attributes can be set individually for each unit/channel
  - CSC*1
    - CSC region is defined as non-secure
  - SDRAM*1
    - SDRAM region is defined as non-secure
  - OPSI0*1
    - OPSI0 region is defined as non-secure
  - OPSI1*1 (only for Standard product)
    - OPSI1 region is defined as non-secure
- Privileged control
  - Access permissions for memory except VBATT backup register are controlled by MPU managed by the privileged code
  - Privilege attributes of VBATT backup register are controlled by the registers of each controller
  - Individual privileged or Unprivileged attribution for each peripheral.
- Device lifecycle management
- Three debug levels
  - AL2: Non-secure and secure debug functions are enabled and accessible from the debugger
  - AL1: Only non-secure debug functions is enabled, and the debugger can access only defined non-secure debug accessible regions
  - AL0: No debug functions are available.
- Key injection
- Secure factory programming
  - Supports image programming in ciphertext format in an untrusted factory

- Secure boot
  - Support up to four revocable Root of Trust (RoT) in OTP, which is the SHA-256 hash digest of the RoT public key.
  - Verify the integrity and authenticity of image to be programmed
  - Verify the integrity and authenticity of the executable image by the immutable (OTP) First Stage Bootloader (FSBL) prior to executing the image.
- Cryptographic accelerator
  - See section 52, Renesas Secure IP (RSIP-E50D).
- Secure pin multiplexing
  - All I/O port pins can be configured individually as secure or non-secure
  - Peripheral pin function is valid when the security attribute of peripheral and I/O port match. See section 20, I/O Ports.
- Decryption on the fly
  - Decryption on the fly (DOTF) decrypts the encrypted content stored in the external memory in real time. See section 45, Decryption On The Fly (DOTF).

Note 1. There is no TrustZone filter in the external RAM and external device area. Therefore, even if these regions are marked as secure in the SAU settings, non-secure masters except the CPU can access them.

51.2 Tamper Detection

The device is provided with I/O ports capable of detecting an external tamper attempt. In the case of a tamper event:

- Timestamping — The RTC can take a timestamp to log the event, and an interrupt can be generated. See section 26, Realtime Clock (RTC).
- Hardware Unique Key — Hardware Unique Key (HUK) is zeroized (set to zero) following detection of a tamper event. See section 59, MRAM.
- VBATT backup registers — VBATT backup registers are zeroized (set to zero) following detection of a tamper event. See section 12, Battery Backup Function.

51.3 Arm Security Features

51.3.1 Arm TrustZone Technology

Arm TrustZone technology divides the system and the application into secure and non-secure domains. A secure application can issue both secure and non-secure transactions, but a non-secure application can only issue non-secure transactions. Secure transactions can only access secure memory and resources, and non-secure transactions can only access non-secure memory and resources. Secure transactions can be issued only using secure region addresses and non-secure transactions can be issued only using non-secure region addresses. Figure 51.1shows the security attributes of transactions that can be issued by each master.

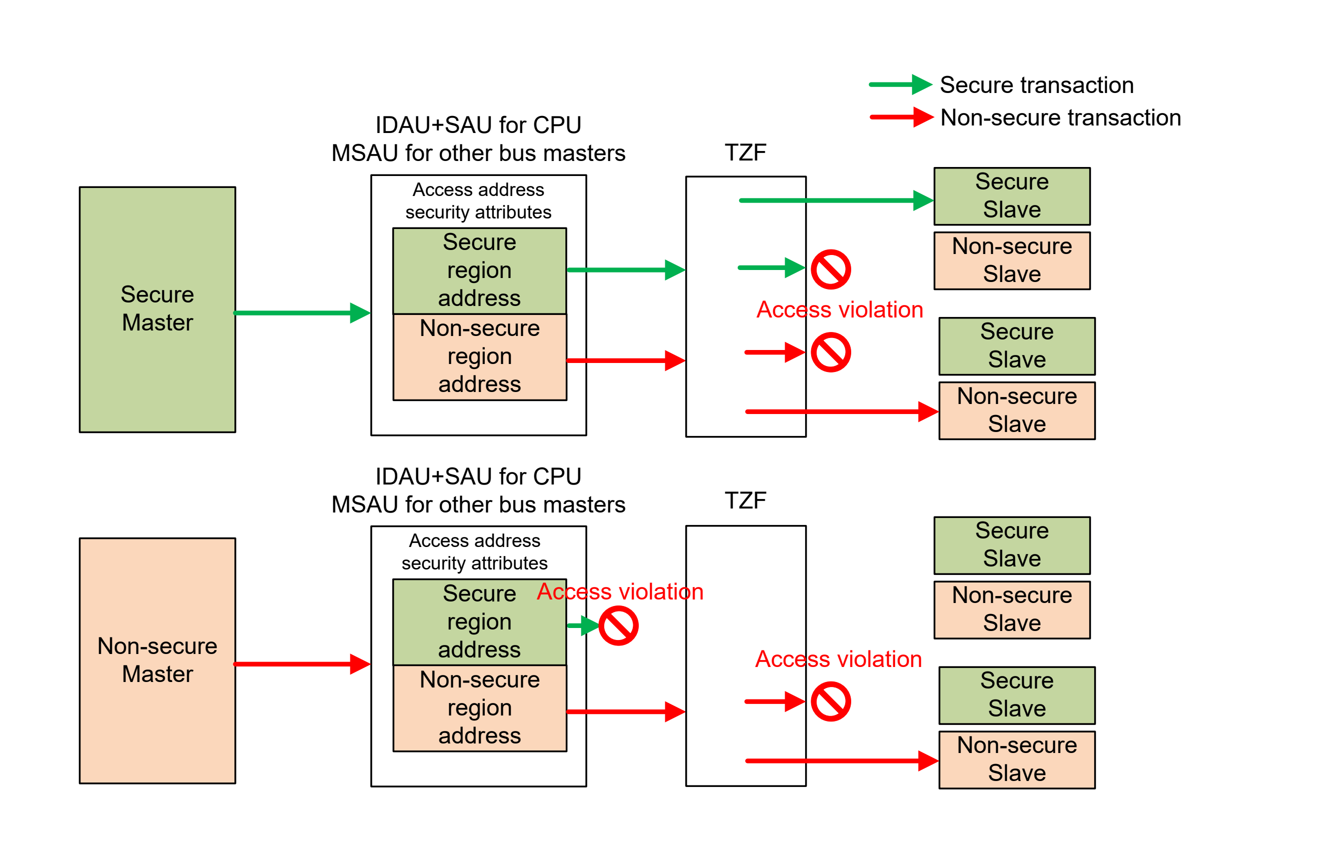

Figure 51.1 Transactions that can be issued by each master

For more details, see the *Arm® v8-M Architecture Reference Manual* and *Arm® Platform Security Architecture Trusted Base System Architecture for Arm®v6-M, Arm®v7-M and Arm®v8-M*.

51.3.2 Privileged Control

Systems and applications are divided into privileged and unprivileged domains. The CPU can limit or exclude access to some resources by executing code in privileged or unprivileged mode. Privileged mode can access both privileged and unprivileged domains, but unprivileged mode can access only the unprivileged domain.

For more details, see the *Arm® v8-M Architecture Reference Manual* and *Arm® Platform Security Architecture Trusted Base System Architecture for Arm®v6-M, Arm®v7-M and Arm®v8-M* .

51.3.3 Security Attribution

The TrustZone for Armv8-M implementation consists of the Security Attribution Unit (SAU) and Implementation Defined Attribution Unit (IDAU). The 4GB memory space is partitioned into Secure (S) and Non-Secure (NS) memory regions. The Secure memory space is further divided into two types, Non-secure Callable (NSC) and Secure.

Note:
- S = Secure addresses are used for memory and peripherals that are only accessible by secure software or secure masters.
- NSC = A special type of secure location. This type of memory is the only type in which an Armv8-M processor permits to hold a Secure Gateway (SG) instruction that enables software to transition from Non-secure to Secure state.
- NS = Non-secure addresses are used for memory and peripherals accessible by all software running on the device.

51.3.3.1 Implementation Defined Attribution Unit (IDAU)

The IDAU defines the code, SRAM and peripheral region into the secure alias region and the non-secure alias region by the address bit [28]. The secure code region and secure SRAM region are assigned the NSC security attributes. The security map defined by IDAU is fixed in hardware and cannot be changed by software.

51.3.3.2 Master Security Attribution Unit (MSAU)

MSAU is IDAU that defines system-specific security address map for masters other than CPU. The MSAU defines secure and non-secure alias regions but does not define the Non-secure Callable (NSC) and region number. Masters other than the CPU can issue a security transaction using the secure alias address defined by MSAU. However, non-secure masters are prohibited from issuing secure transactions using an address in the secure alias region. Figure 51.2 shows the defined security map of IDAU and MSAU. The security map defined by MSAU is fixed in hardware and cannot be changed by software.

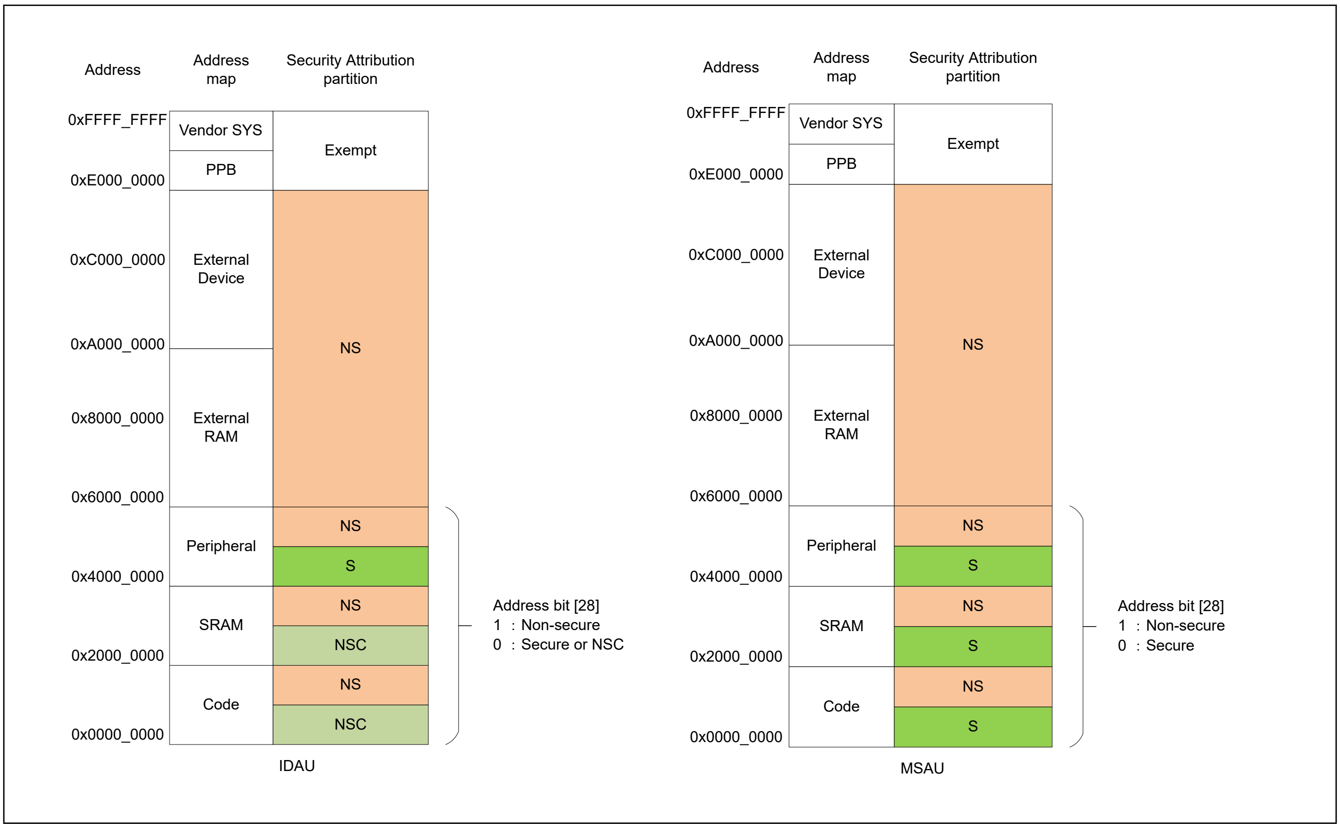

Figure 51.2 IDAU and MSAU defined security map

51.3.3.3 Secure Attribution Unit (SAU)

The SAU is a programmable unit that determines the security of an address. The SAU is programmable in the Secure state and has a programmers' model similar to the MPU. If an address maps to regions defined by both IDAU and SAU, the region of the highest security level is selected. Secure master can issue secure and non-secure transactions using the address of each security alias region. Non-secure master cannot issue secure transactions using the address of the secure alias region. Figure 51.3 shows the final determination of the address map security level.

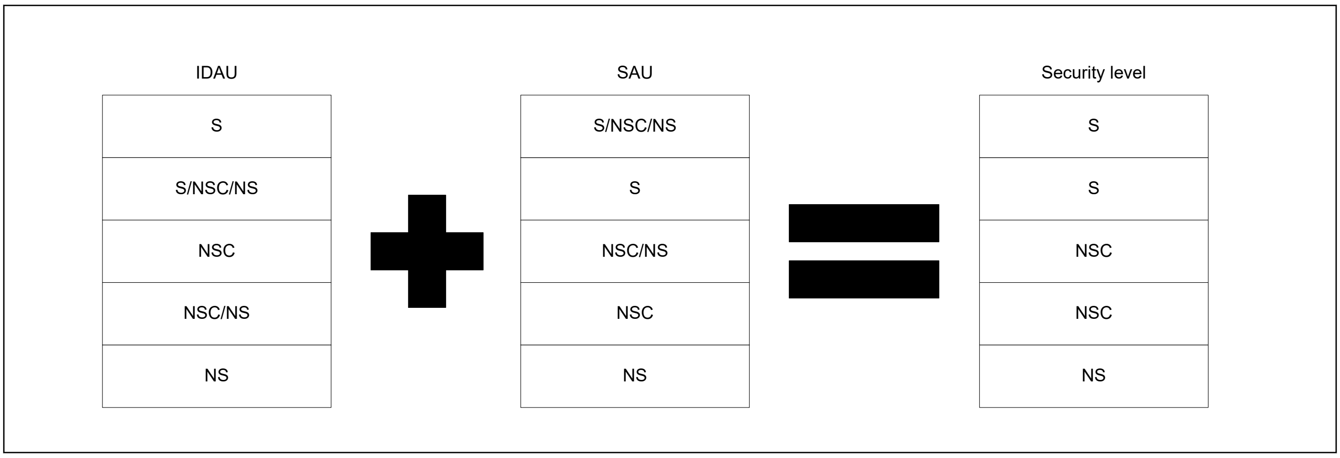

Figure 51.3 Final determination of address map security level

When using TrustZone to perform secure and non-secure region separation, SAU MUST be set according to the following.

The regions set as NS attribute in IDAU MUST be set to NS in the SAU as well. The regions set to NS attribute in IDAU are:

0x1000_0000 to 0x1FFF_FFFF (SAU Region 1 in Figure 51.4)

0x3000_0000 to 0x3FFF_FFFF (SAU Region 3 in Figure 51.4)

0x5000_0000 to 0xDFFF_FFFF (SAU Region 3 in Figure 51.4)

At least one NSC region MUST be created within any region defined as NSC by the IDAU. The regions set to NSC attribute by the IDAU are:

0x0000_0000 to 0x0FFF_FFFF (SAU Region 0 in Figure 51.4)

0x2000_0000 to 0x2FFF_FFFF (SAU Region 2 in Figure 51.4)

If you do not wish to define any isolation by means of using TrustZone, do not change SAU_CTRL.ALLNS = 0 and SAU_CTRL.ENABLE = 0 (initial value).

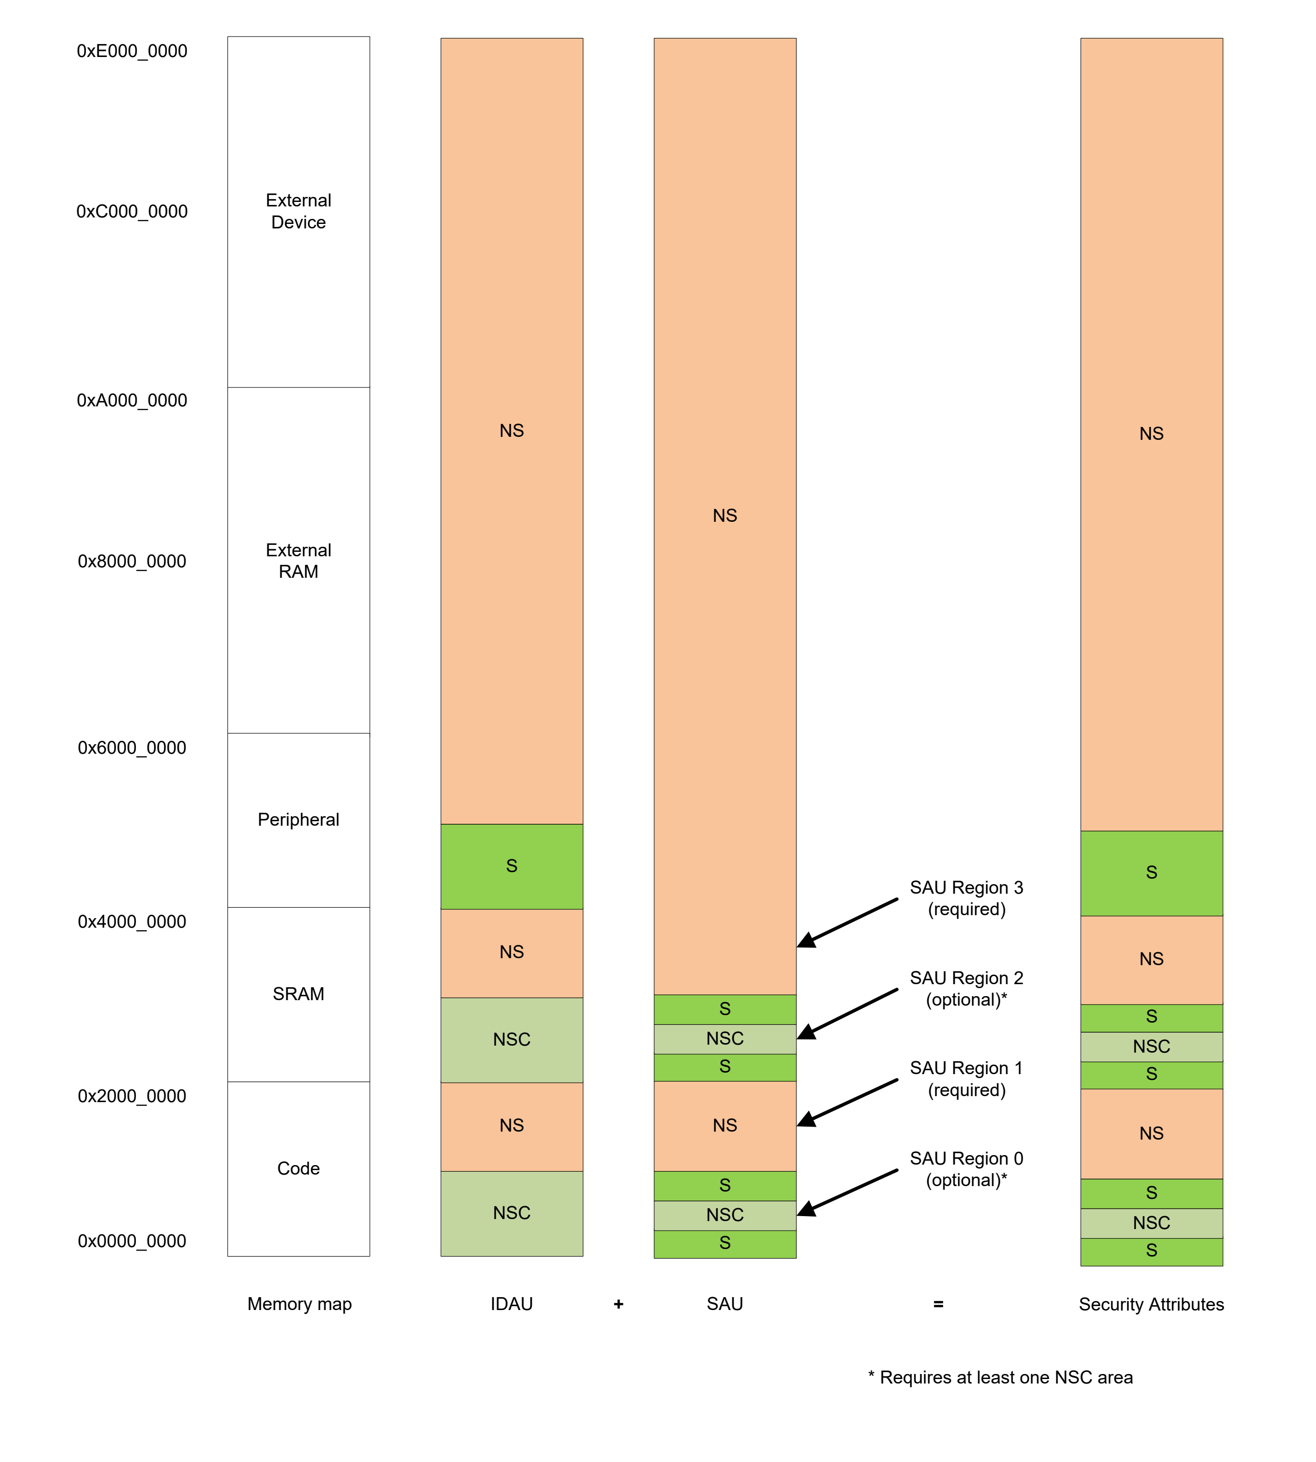

Figure 51.4 SAU settings and resulting security attributes

51.3.3.4 Region Number

The SAU and IDAU also define region numbers for each of the memory regions and security attributes. This region number is used by software to determine if a contiguous range of memory shares common security attributes. Figure 51.5 shows the defined region number of IDAU.

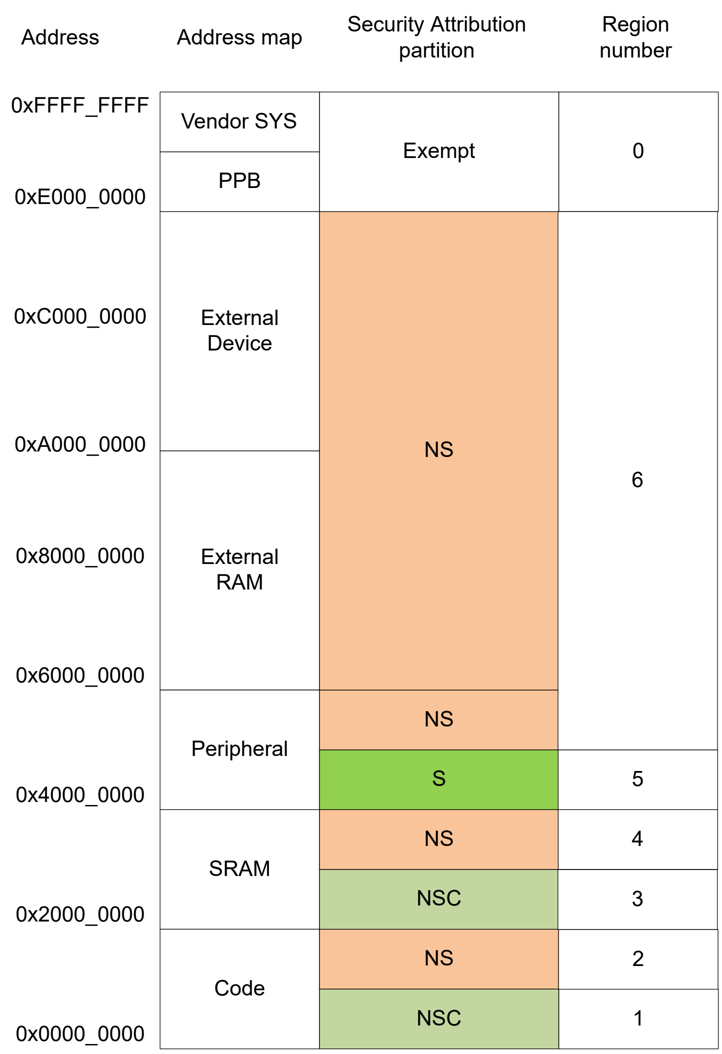

Figure 51.5 IDAU defined region numbers

51.3.3.5 Memory Security Attribution of TrustZone Filter

The memories are divided into S and NS regions. The memory security attribution of code MRAM and SiP flash (when equipped) is stored into nonvolatile memory by a boot firmware command when the device lifecycle is in the OEM state and the authentication level is AL2. These memory security attributions are applied before application execution. They cannot be updated by the application but are readable using CMSAMON or SFSAMON registers. The memory security attributions of CM33 TCM, SRAM and VBATT backup registers are set by a dedicated security attribution register writable only by secure access.

The code MRAM can be divided in up to two regions. The SiP flash can be divided in up to two regions. Programming or erasing of SiP flash should be managed by secure user to prevent non-secure user from programming or erasing the secure area. The CM33 TCM, SRAM and VBATT backup registers can be divided in up to two regions.. Figure 51.6 shows the memory mapping. Table 51.1 shows size of the memory region and Table 51.2 shows access permission of the memory region.

SRAM ECC region can be used as data region when ECC function is disabled. The security attribution of this region is set by the dedicated security attribute register. See section 58, SRAM for the details.

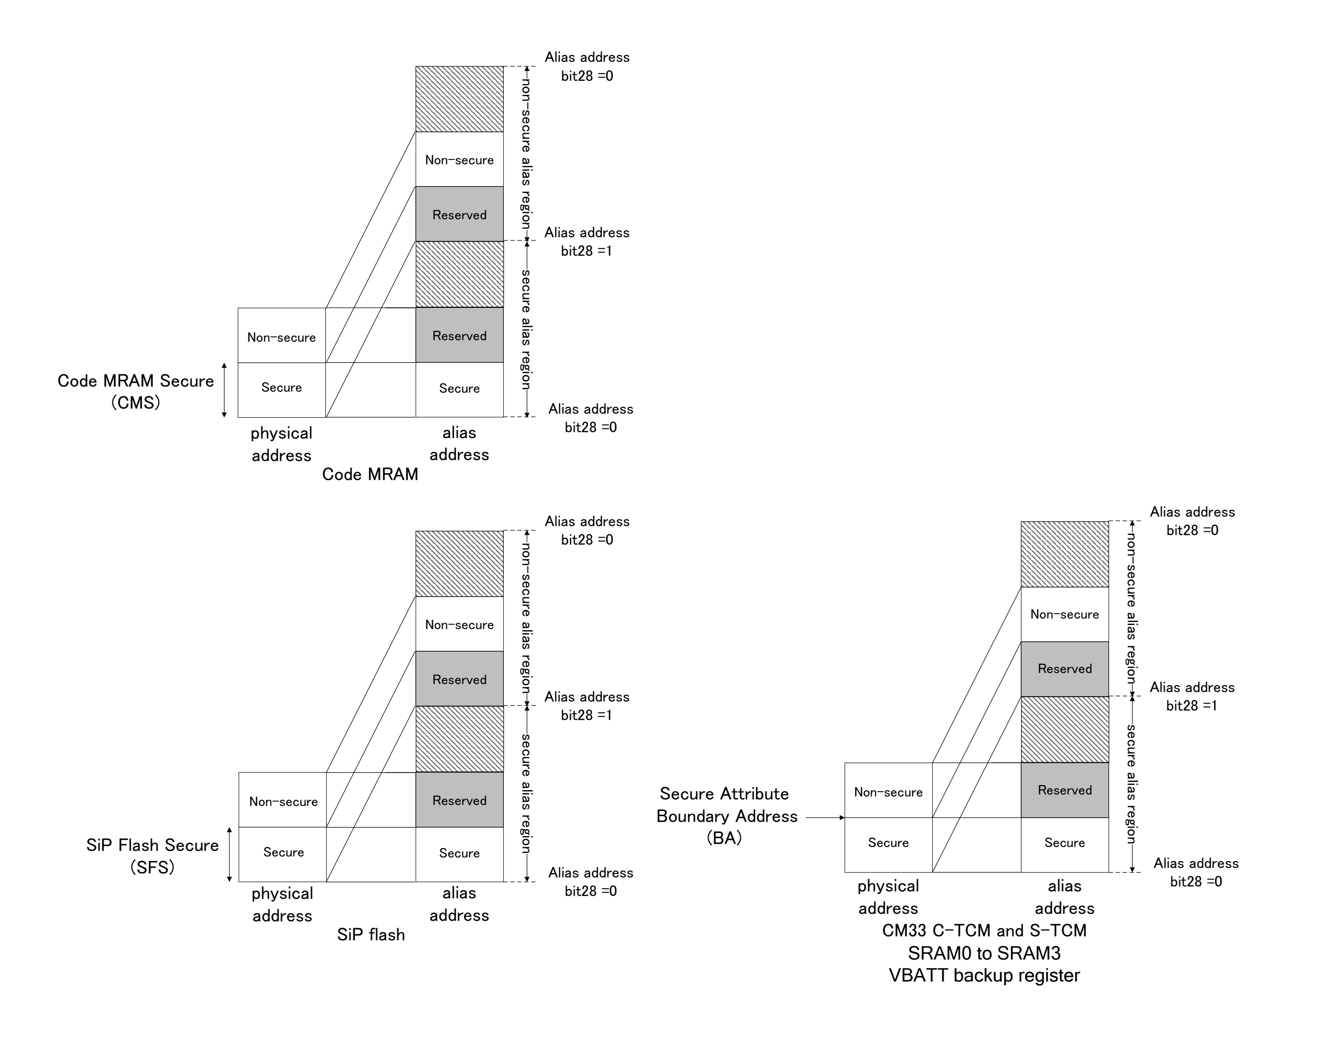

Figure 51.6 Memory mapping

Table 51.1 Size of memory region (1 of 2)

Memory region	Start address	Size
CM33 C-TCM secure	0x0000_0000*1	BA (8 KB)
CM33 C-TCM non-secure	0x1000_0000 + BA (8 KB)*1	C-TCM size - BA (8 KB)
Code MRAM secure	0x0200_0000	CMS size (32 KB)
Code MRAM non-secure	0x1200_0000 + CMS size (32 KB)	Code MRAM size - CMS size (32 KB)
SiP flash secure	0x0800_0000	SFS size (32 KB)
SiP flash non-secure	0x1800_0000 + SFS size (32 KB)	SiP flash size - SFS size (32 KB)
CM33 S-TCM secure	0x2000_0000*1	BA (8 KB)
CM33 S-TCM non-secure	0x3000_0000 + BA (8 KB)*1	S-TCM size - BA (8 KB)
SRAM0 secure	0x2200_0000	BA (8 KB)
SRAM0 non-secure	0x3200_0000 + BA (8 KB)	SRAM0 size - BA (8 KB)
SRAM1 secure	0x2208_0000	BA (8 KB)
SRAM1 non-secure	0x3208_0000 + BA (8 KB)	SRAM1 size - BA (8 KB)
SRAM2 secure	0x2210_0000	BA (8 KB)
SRAM2 non-secure	0x3210_0000 + BA (8 KB)	SRAM2 size - BA (8 KB)
SRAM3 secure	0x2218 0000	BA (8 KB)

Table 51.1 Size of memory region (2 of 2)

Memory region	Start address	Size
SRAM3 non-secure	0x3218 0000 + BA (8 KB)	SRAM3 size - BA (8KB)
VBATT backup register secure	0x4001_ED00	BA (32 bytes)
VBATT backup register non-secure	0x5001_ED00 + BA (32 bytes)	Backup register size - BA (32 bytes)

Note: The number in parentheses indicates the smallest unit that can be set by the user.
Note: BA is the setting value of the security attribution boundary address register for each memory region.
Note 1. Address of CPU1. For address of other bus masters, see Table 2.37.

Table 51.2 Access permission of the memory region

Memory region	Secure transaction	Non-secure transaction
Each memory region configured as S or NSC	Allowed	Write ignored/Read ignored TrustZone access error is generated
Each memory region configured as NS	Write ignored/Read ignored TrustZone access error is generated	Allowed

51.3.3.6 CPU Security Attribution

Cortex-M33 security extension can be disabled by the boot firmware command only when cortex-M33 is configured as the secondary CPU in dual core product. Disabling the Cortex-M33 security extension is a permanent setting.

51.3.3.7 Peripheral Security and Privilege Attribution of TrustZone Filter

Each peripheral can be configured as secure or non-secure and privileged or unprivileged. Peripherals are divided into two types.

Type1 peripheral has one security and privilege attribution and access to all registers is controlled by one security and privilege attribution. Type1 peripheral security and privilege attribution is set to the PSARx (x = B to E) and the PPARx (x = B to E) registers by the secure and privileged application.

Type2 peripheral has the security and the privilege attribution for each register or for each bit and access to each register or bit field is controlled according to these security and privilege attributions. Type2 peripheral security and privilege attribution is set to the Security Attribution register and the Privilege Attribution register in each module by the secure and privileged application. For details on the Security Attribution register and the Privilege Attribution register, see each section.

Table 51.3 shows the classification of peripheral type.

Table 51.3 Classification of peripheral type

Type1	Type2
SCI, SPI, OSPI, DOTF, USBHS, USBFS, IIC, I3C, RSIP-E50D, ESWM, CANFD, PDMIF, CEU, DOC, SDHI, SSIE, CRC, CAC, ACMPHS, TSN, ADC16H, DAC12, POEG, PDG, AGT, GPT, ULPT, RTC, IWDT, and WDT	System control (Resets, PVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function, Register Write Protection Function), MRAM controller, SRAM controller, CPU cache, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, and I/O ports

Table 51.4 shows the access permission of type1 peripherals. The access permission of type2 peripherals is different by peripherals. Each register description of type2 peripherals includes the note of S-TYPE and P-TYPE indicating the specification of the access permission. For details on S-TYPE and P-TYPE, see section Appendix 4, Notes for Register R/W.

Table 51.4 Access permission of type1 peripherals (1 of 2)

	Secure and Privileged access	Secure and Unprivileged access	Non-secure and Privileged access	Non-secure and Unprivileged access
Peripheral configured as Secure and Privileged	Allowed	Write ignored/Read ignored TrustZone Access error is generated	Write ignored/Read ignored TrustZone Access error is generated	Write ignored/Read ignored TrustZone Access error is generated
Peripheral configured as Secure and Unprivileged	Allowed	Allowed	Write ignored/Read ignored TrustZone Access error is generated	Write ignored/Read ignored TrustZone Access error is generated

Table 51.4 Access permission of type1 peripherals (2 of 2)

	Secure and Privileged access	Secure and Unprivileged access	Non-secure and Privileged access	Non-secure and Unprivileged access
Peripheral configured as Non-secure and Privileged	Write ignored/Read ignored TrustZone Access error is generated	Write ignored/Read ignored TrustZone Access error is generated	Allowed	Write ignored/Read ignored TrustZone Access error is generated
Peripheral configured as Non-secure and Unprivileged	Write ignored/Read ignored TrustZone Access error is generated	Write ignored/Read ignored TrustZone Access error is generated	Allowed	Allowed

51.3.4 TrustZone Access Error

Table 51.5 shows the behavior when TrustZone access error occurs. The behavior varies depending on the master.

Table 51.5 Behavior of TrustZone access error

DAP	CPU	DMAC/DTC	ESWM	CEU
• Only error response is returned*1	• IDAU/SAU detects SecureFault exception • TrustZone filter detects BusFault exception • Can issue IRQ or reset*2	• Stop transfer • Issue IRQ or reset*2 • Generate interrupt (DMAn_TRANSERR)	• Issue IRQ or reset*2 • Generate interrupt (ETHER_GWEI)*3	• Issue IRQ or reset*2

Note: This behavior is not applicable for bufferable write access. For more information on when a bufferable write access error is detected, see section 15, Buses.

Note 1. When a TrustZone access error occurs by a debugger access, exception, NMI, or reset does not occur. Only the error response is returned.

Note 2. The operation after error detection is selected by the BUSOAD.SLERROAD bit.

Note 3. AXI error status in GWEIS0.AES bit is set. The interrupt occurs when interrupt is enabled in GWEIE0.AEE bit.

51.4 Device Lifecycle Management

Device Lifecycle Management (DLM) identifies the current development/production/deployment phase of the device and controls the capabilities of the debug function, the serial programming interface, and Renesas test mode. Figure 51.7 shows the available device lifecycle states and Table 51.6 shows the lifecycle state definitions and capabilities in each state.

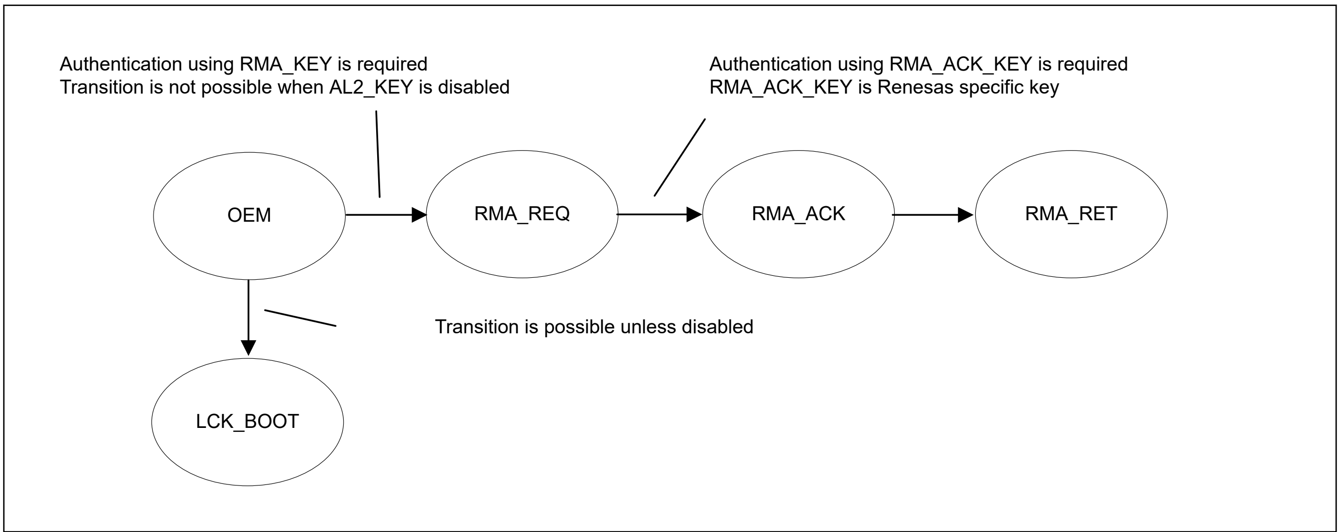

Figure 51.7 Device lifecycle states

Table 51.6 Lifecycle state definition and capabilities in each state

Lifecycle	Definition	Protection level	Debug function	Serial programming	Renesas test mode
OEM	"Original Equipment Manufacturer" The device is owned by the customer.	PL2 or PL1 or PL0	Depend on the authentication level		Not available
LCK_BOOT	"LoCKed BOOT interface" The debug interface and the serial programming interface are permanently disabled.	PL0	Not available	Not available	Not available
RMA_REQ	"Return Material Authorization REQuest" Request for RMA. The customer must send the device to Renesas in this state.	PL0	Not available	Available Cannot access code MRAM/SiP flash area	Not available
RMA_ACK	"Return Material Authorization ACKnowledged" Failure analysis in Renesas	PL2	Available in the secure and non-secure debug	Available Cannot access code MRAM/SiP flash area	Available
RMA_RET	"Return Material Authorization RETurn" The device is back to the customer. The device does not boot.	PL0	Not available	Not available	Not available

51.4.1 Changing the Lifecycle State

Use the boot firmware commands to change the device lifecycle state. See the boot firmware application note for details of the command. The lifecycle state cannot be updated by an application, but the current lifecycle state can be read through the DLMMON register.

As shown in Figure 51.7, each transition is one-way and the state cannot be regressed.

Transition from OEM to RMA_REQ requires key authentication using the RMA_KEY which must have been previously injected by the customer. The key length of the RMA_KEY is 128 bits. Inject the RMA_KEY as shown in section 51.5. Secure Key Injection. RMA_KEY can be injected in AL2.

The key authentication uses a challenge and response authentication or authentication using the MCU's unique ID. The response (challenge and response authentication) or the authentication code (using the MCU's unique ID) can be calculated as follows:

Response = AES-128 CMAC (RMA_KEY, 128-bit challenge)

Authentication code = AES-128 CMAC (RMA_KEY, 128-bit MCU unique ID)

The contents of the MRAM and SiP flash except permanently locked blocks or registers are erased when transitioning to RMA_REQ. The contents of the permanently locked blocks or registers can be read by Renesas at failure analysis. An MRAM block can be permanently locked by setting the PBPS/PBPS_SEC registers to permanently disable writing of the block. The option-setting memory can be permanently locked by the POFSPS register, permanently disabled writing of the register. Transition to RMA_REQ is not possible if the AL2_KEY is disabled. The MCU does not respond after changing the device lifecycle state to RMA_REQ. To continue to use boot firmware commands, you must enter boot mode again after a reset. See the *Boot Firmware Application Note* for details.

Transition from OEM to LCK_BOOT is possible unless that transition has been explicitly disabled. Use the parameter setting command in AL2 or AL1 to prohibit the transition to LCK_BOOT. The LCK_BOOT transition prohibition is a permanent setting and cannot be undone. The debug interface and serial programming interface are permanently disabled in LCK_BOOT.

51.4.2 Protection and Authentication Level

The protection level (PL) and the authentication level (AL) determine the availability of the debug function and the serial programming interface. PL and AL are fixed except in the OEM state. For PL and for AL, three levels can be set for each in the OEM state. AL indicates a temporary authentication status and is initialized to PL after an MCU power-on reset. Both PL and AL can be changed only by the boot firmware and cannot be changed by the application. Figure 51.8 shows the available Protection Level and Authentication Level states and transitions. Table 51.7 shows the availability of the debug function and the serial programming interface in each level.

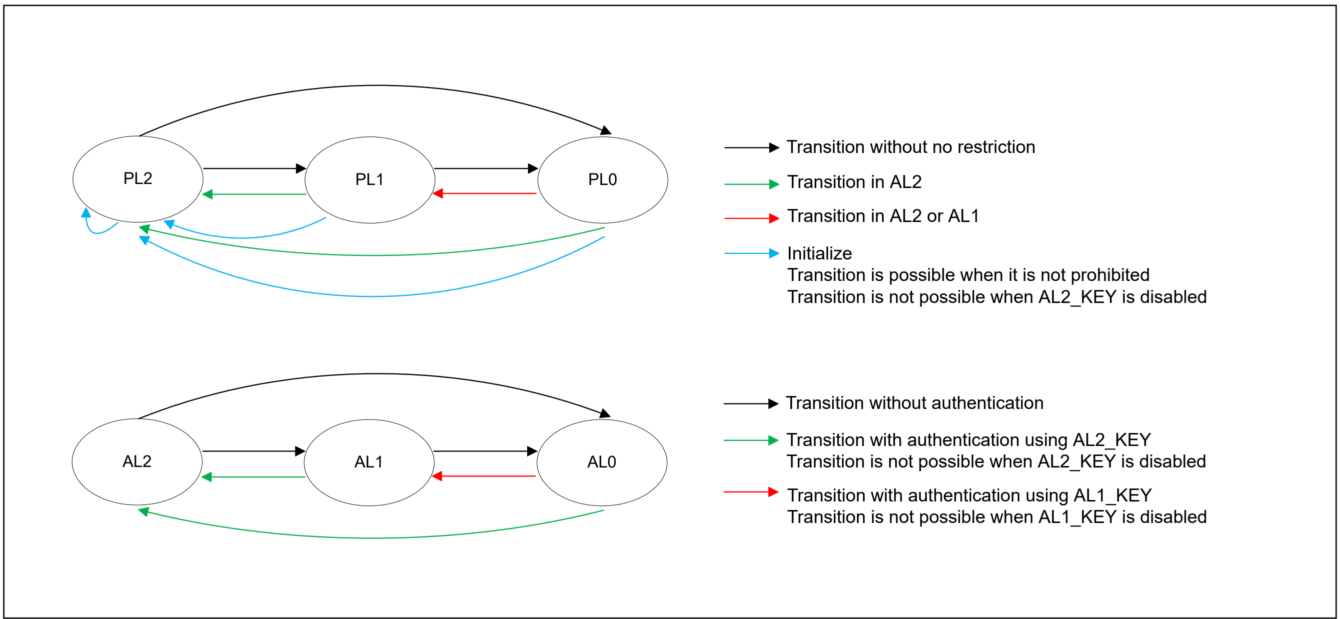

Figure 51.8 PL and AL states and transitions

Table 51.7 Availability of the debug function and the serial programming interface in each authentication level

AL	Debug function	Serial programming interface
AL2	Non-secure and Secure debug functions are enabled and accessible from the debugger	All functions are available
AL1	Only non-secure debug function is enabled, and debugger can access only defined non-secure debug accessible regions	Available but cannot program, erase, or read secure code MRAM or SiP flash area
AL0	No debug functions are available	Available but cannot access code MRAM or SiP flash area

Use the boot firmware commands to change PL and AL. See the boot firmware application note for details of the command.

Changing to a lower PL can be done with no restriction. Changing to a higher PL requires that the MCU be at that AL. For example, when the current AL is AL1, changing to PL1 is possible but changing to PL2 is impossible. PL can be reset by the Initialize command unless the command itself is disabled. After the Initialize command is executed, PL is set back to PL2 and the contents on the MRAM and SiP flash memory are erased. Initialize command does not execute when OTP area of option-setting memory is not blank. Initialize command can be disabled permanently in all AL states by parameter setting command to prevent memory erasure without authorization. Initialize command is disabled also when AL2_KEY is disabled. MCU does not respond after executing the Initialize command. To continue to use the serial programming commands, reenter the boot mode after a reset. See the *Boot Firmware Application Note* for the detail.

Changing to a lower AL can be done without authentication. Changing to a higher AL requires key authentication using AL2_KEY or AL1_KEY, as appropriate. These keys are 128-bit keys. Injection of AL2_KEY or AL1_KEY is performed as shown in section 51.5. Secure Key Injection. AL2_KEY can be injected in AL2, AL1_KEY can be injected in AL2 or AL1. The key authentication uses a challenge and response authentication. The response can be calculated as follows:

Response = AES-128 CMAC (KEY, 128 bits challenge)

AL2_KEY can be disabled permanently in AL2 with the parameter setting command.

AL1_KEY can be disabled permanently in AL2 or AL1 by parameter setting command.

51.4.3 Serial Programming

Whether a serial programmer can be connected and the range of memory that can be accessed depends on the device lifecycle state and AL as shown in Table 51.6 and Table 51.7. In addition, the accepted serial programming commands differ depending on the device lifecycle state and AL. See the *Boot Firmware Application Note* for details of the commands.

51.4.4 Device Lifecycle State and PL Change Example

The following section describes a typical device lifecycle state and PL change example.

- Secure developer
  - Set the memory security attribution of the code MRAM and SiP flash using the boot firmware command
  - Program and debug the secure application
  - If the AL2_KEY and RMA_KEY are required, inject them using the boot firmware commands
  - Inject application AES, ChaCha20-Poly1305, RSA, ECC, HMAC and EdDSA keys listed in Table 51.8 (if required)
  - Prepare the MCU for the non-secure developer
    - If the non-secure developer is not permitted to use the Initialize command, disable it using the boot firmware command.
    - If the AL2_KEY is not used and the non-secure developer is not permitted to use the Initialize function, disable the AL2_KEY using the boot firmware command.
    - Change the PL from PL2 to PL1 using the boot firmware command
- Non-secure developer
  - Program and debug the non-secure application.
  - If the AL1_KEY is required, inject it using the boot firmware command.
  - Inject application AES, ChaCha20-Poly1305, RSA, ECC, HMAC and EdDSA keys listed in Table 51.8 (if required)
  - Prepare the MCU for end-product deployment
    - Disable the Initialize command using the boot firmware command (if required)
    - If the AL1_KEY is not used, disable the AL1_KEY using the boot firmware command
    - Change the PL from PL1 to PL0 using the boot firmware command

51.4.5 Failure Analysis

If the customer requests failure analysis by Renesas, it is necessary to send the device after changing the device lifecycle state to RMA_REQ. If the device lifecycle state is not RMA_REQ, Renesas cannot perform the failure analysis. After failure analysis, Renesas changes the lifecycle to RMA_RET and returns the device to the customer.

Note: RMA_KEY is required to change the device lifecycle state to RMA_REQ or the MCU's Unique ID must be used as part of an authentication code. See section 51.4.1. Changing the Lifecycle State for details.

51.5 Secure Key Injection

To inject a user key into the MCU, perform the following steps.

Renesas provides the Security Key Management Tool, available on the Renesas website, to assist with key injection preparation.

1. Create a 256-bit installation key.
   This key is called the User Factory Programming Key (UFPK) and is used to wrap a user key
2. Get the wrapped version (W-UFPK) of the UFPK through the Renesas Key Wrapping Service.
3. Wrap the user key using the UFPK.
4. Send the W-UFPK and the wrapped user key to the MCU using a boot firmware command.
   The user key is unwrapped, wrapped with the MCU's hardware unique key, and stored in nonvolatile memory. DLM keys are stored in unmapped flash. Application keys are stored at the address specified with the key injection command.

Figure 51.9 shows an example of key injection and Table 51.8 shows the keys that can be injected.

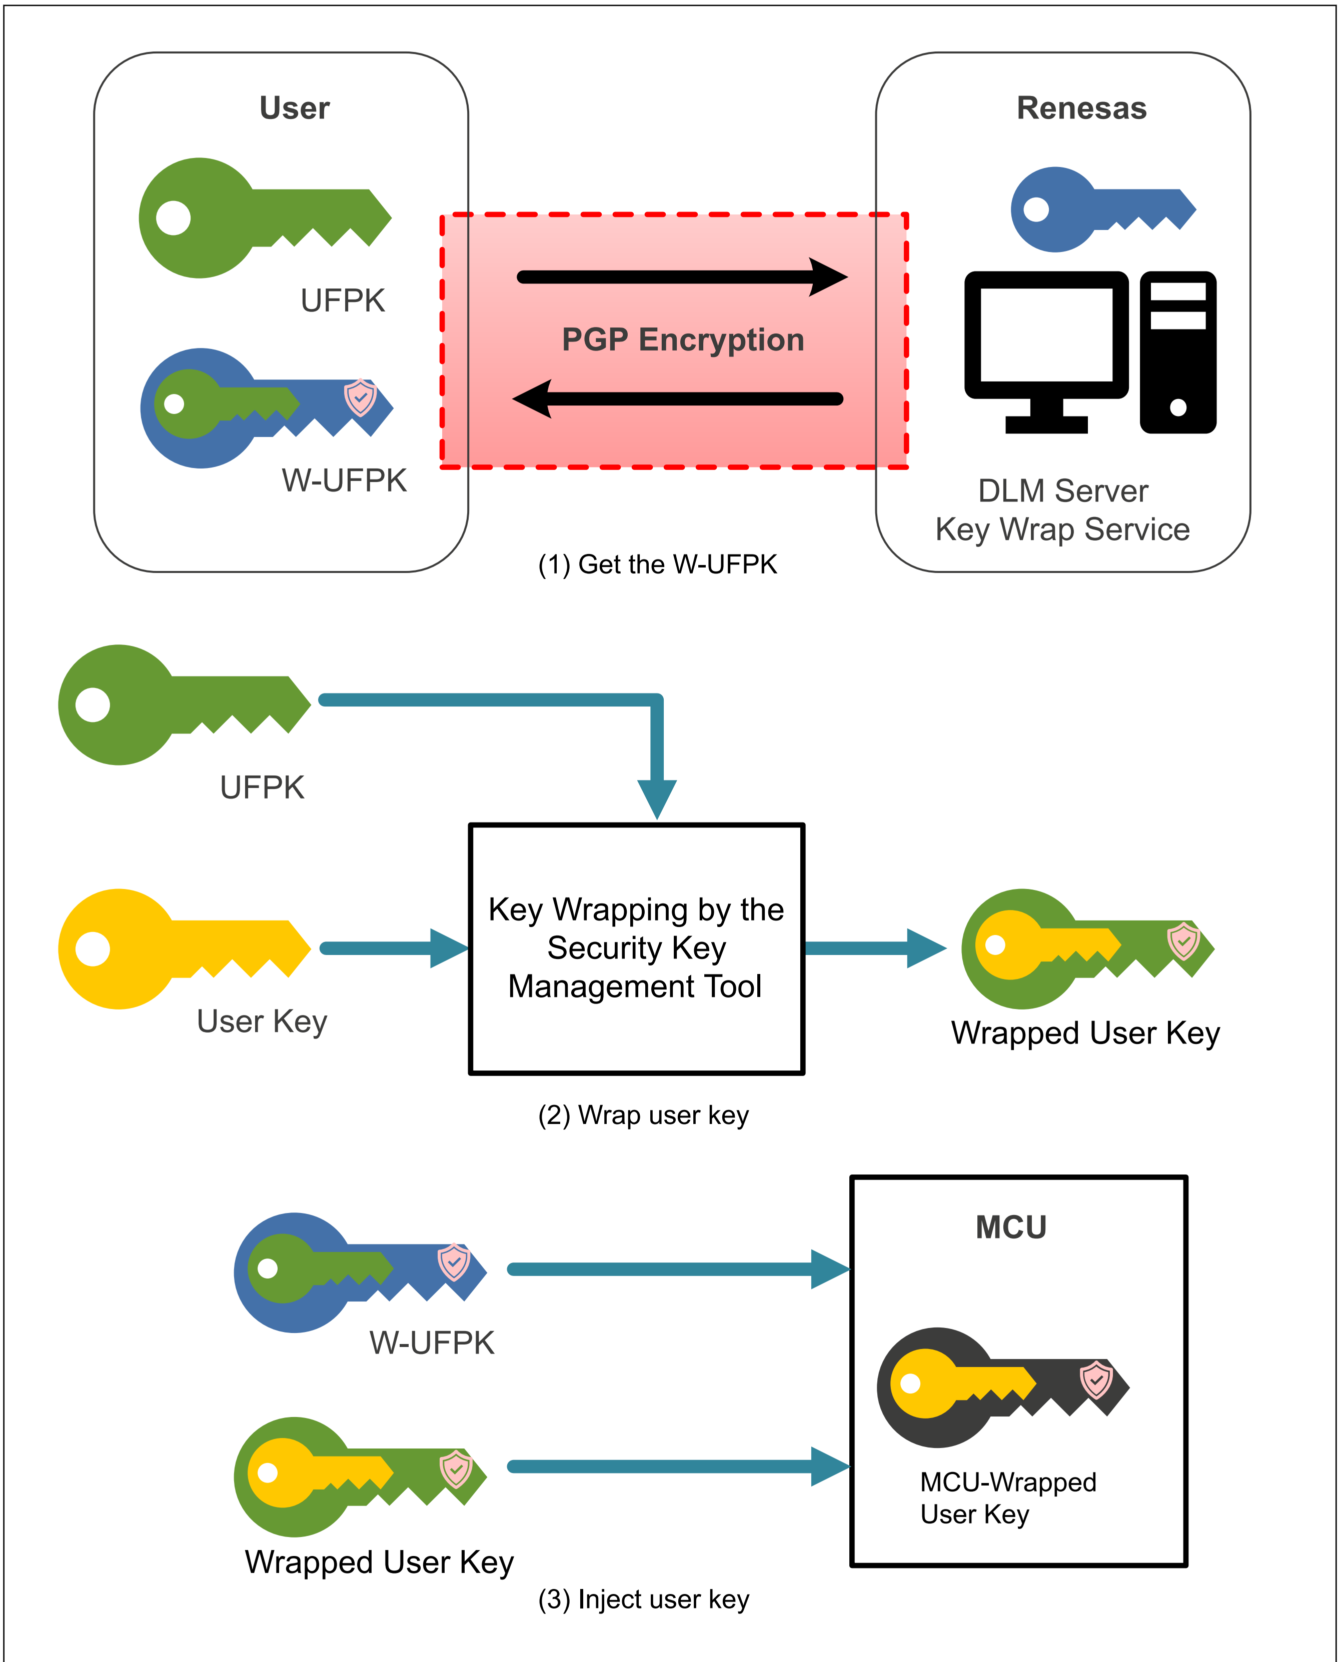

Figure 51.9 Key injection

Table 51.8 Keys that can be injected

DLM transition	AL transition	AES	ChaCha20-Poly-1305	RSA	ECC	HMAC	EdDSA	Secure boot	Other
RMA_KEY	AL2_KEY, AL1_KEY	AES-128, AES-192, AES-256, AES-XTS-128, AES-XTS-256	ChaCha20-Poly-1305	RSA-1024, RSA-2048, RSA-3072, RSA-4096 (Public and Private) RSA-2048 Public Key for TLS	ECC P-192, ECC P-224, ECC P-256, ECC P-384, ECC P-521 (Public and Private) ECC P256r1, ECC P384r1, ECC P512r1, ECC secp256k1 (Public and Private)	HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512, HMAC-SHA512/224, HMAC-SHA512/256, HMAC-SHA3-224, HMAC-SHA3-256, HMAC-SHA3-384, HMAC-SHA3-512	Ed25519 (Public and Private)	Up to 4 OEM_ROOT_PKs	Key-Update Key

51.6 Secure Factory Programming

In addition to secure key injection support for injecting user keys (DLM, debug authentication, application, and secure boot keys), the MCU supports the programming of a firmware image in ciphertext format to prevent assets from being leaked during production programming. This enables secure factory programming in a non-secure environment. Secure factory programming is supported by the boot firmware. The maximum capacity that can be programmed with the secure factory programming is almost 16 MB. See the security key management tool user's manual or the boot firmware application note for details of the capacity limitation. Figure 51.10 shows an example of secure factory programming of an encrypted firmware image. The customer wraps the Image Encryption Key with the UFPK and encrypts the image with the Image Encryption Key using AES128-CCM. When the customer sends the W-UFPK, the wrapped Image Encryption Key, and encrypted image to the MCU through the serial programming interface, the MCU decrypts and programs the firmware image.

To further support secure factory programming in a non-secure environment, the DLM state, Protection Level, and Authentication Keys can all be set via a single boot firmware command. Points to note about this boot firmware command include:

- Encrypted firmware programming can be performed only when the MCU is in the OEM state.
- This command changes the Protection Level of the MCU. The initial PL must be PL2. The final PL must be PL0.
- If the DLM state remains in the OEM state, AL2 key must be injected. AL1 key can optionally also be injected.
- The MCU can be transitioned to the LCK_BOOT state. In this case, AL keys cannot be injected.
- AL keys must be wrapped with the same UFPK as the Image Encryption Key.
- This command erases all code MRAM area except option-setting memory before programming encrypted firmware image. If there are any permanently locked blocks, this command cannot be executed.
- Prohibit to execute this command if the current register setting or write value to the registers related to startup area selection are other than the following:
  - SAS.BTFLG = 1b
- All option-setting memory values must be included in the encrypted firmware image, including those not changed from their default values. However, if the following areas are write-protected, the write data in these areas should not be included in the image. If included, this command terminates with an error.
  - Configuration setting area protected by POFSPS register.

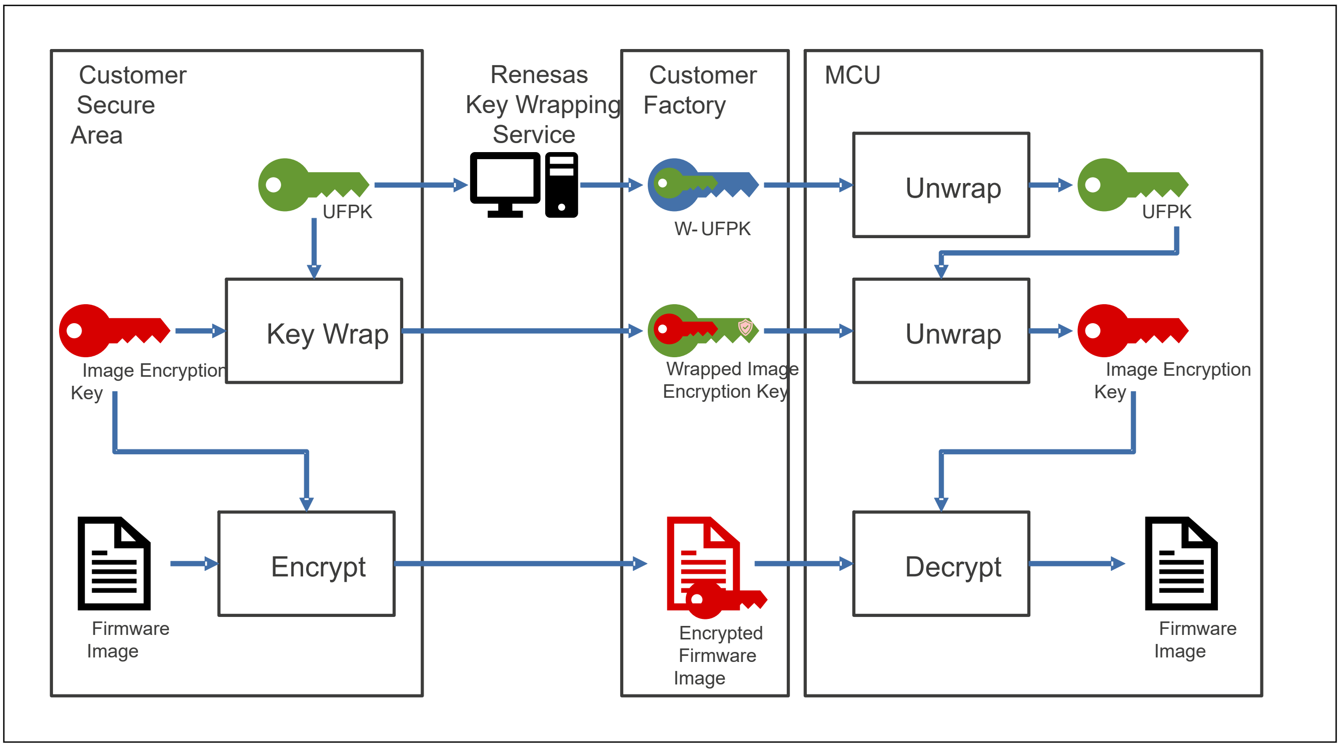

Figure 51.10 Secure factory encrypted image programming

51.7 Secure Boot

Secure boot verifies the integrity and authenticity of an OEM boot loader (called OEM_BL) starting at the beginning of application executable memory.

The OEM_BL is verified when it is initially programmed and prior to execution.

OEM_BL is verified when it is programmed using the boot firmware. Two certificates are used for validation. One is the key certificate, which is used to certify the OEM_BL verification key (called the OEM_BL_PK, the public part of the OEM_BL verification key pair). The key certificate is signed by the secret part of OEM_BL verification root key pair (called OEM_ROOT_SK). The public part of OEM_BL verification root key pair (called OEM_ROOT_PK) is registered with the MCU as the root of trust key using secure key injection as described in section 51.5. Secure Key Injection. The OEM_ROOT_SK and OEM_ROOT_PK are a 256-bit ECC (secp256r1 curve) key pair. The SHA2-256 hash of the OEM_ROOT_PK is stored during the secure key injection process. Up to four OEM_ROOT_PKs can be registered. These OEM_ROOT_PKs can be revoked if they are no longer needed. The validation process succeeds if the non-revoked first OEM_ROOT_PK with the biggest n value matches.

The other certificate for validation during programming is the code certificate, which is used to certify the OEM_BL. The code certificate is signed by the secret part of OEM_BL verification key pair (called OEM_BL_SK). After successful validation of the OEM_BL, the HMAC value of OEM_BL and the code certificate (called OEM_BL_digest) is generated and programmed to MRAM. HMAC SHA2-256 is used to generate the HMAC value. A derived key from the HUK is used as the HMAC key, so the HMAC value is unique in each MCU.

In single-chip mode, the immutable first stage boot loader (called FSBL) in the on-chip OTP is executed after reset when the FSBL is enabled in the FSBLCTRL0 register. When secure boot is selected in FSBLCTRL1 register, the FSBL generates the HMAC value of the OEM_BL and the code certificate, and compares it to the expected HMAC value. When the HMAC value is the same, the FSBL jumps to the OEM_BL. When CRC boot is selected in the FSBLCTRL1 register, the FSBL calculates the CRC of the OEM_BL and compares it to the expected CRC value, which is located in the code certificate. If the CRC values match, the FSBL jumps to the OEM_BL.

The code certificate must be programmed into MRAM, and its location in MRAM must be programmed into the SACC0n register or SACC1n register. The SACC0n register specifies the start address of the code certificate when BTFLG = 1. The SACC1n register specifies the start address of the code certificate when BTFLG = 0. Because SACC0n and SACC1n registers are OTP and cannot be erased, there are four areas each for updating the code certificate start address. FSBL reads the values in order from the register with the largest n value, and uses the first value that is not all 1 as the start address of the code certificate. Therefore, use registers in order from the smallest n value.

When measurement reporting is enabled in the FSBLCTRL1 register, the FSBL stores the measurement report to the SRAM address specified by the SAMR register. When reading the measurement report, disable the ECC function by setting SRAMCRn.ECCMOD[1:0] = 00b.

FSBL execution can be skipped after a software reset or deep software standby reset, as configured by the FSBLCTRL0 register.

If the generated HMAC or CRC value is different from the expected value, the high level is output to the port set by the FSBLCTRL2 register and the MCU goes to CPU Sleep mode.

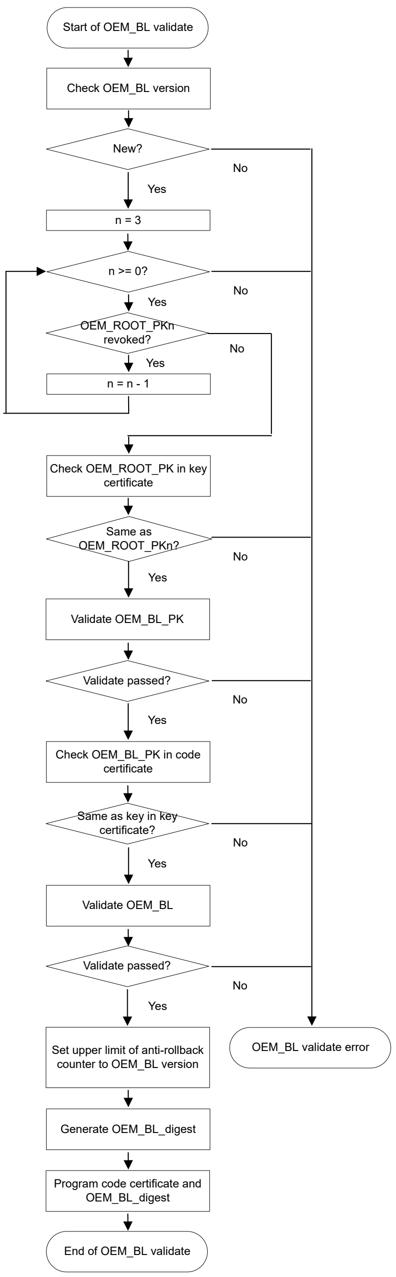

Figure 51.11 OEM_BL validation flow in serial programming mode

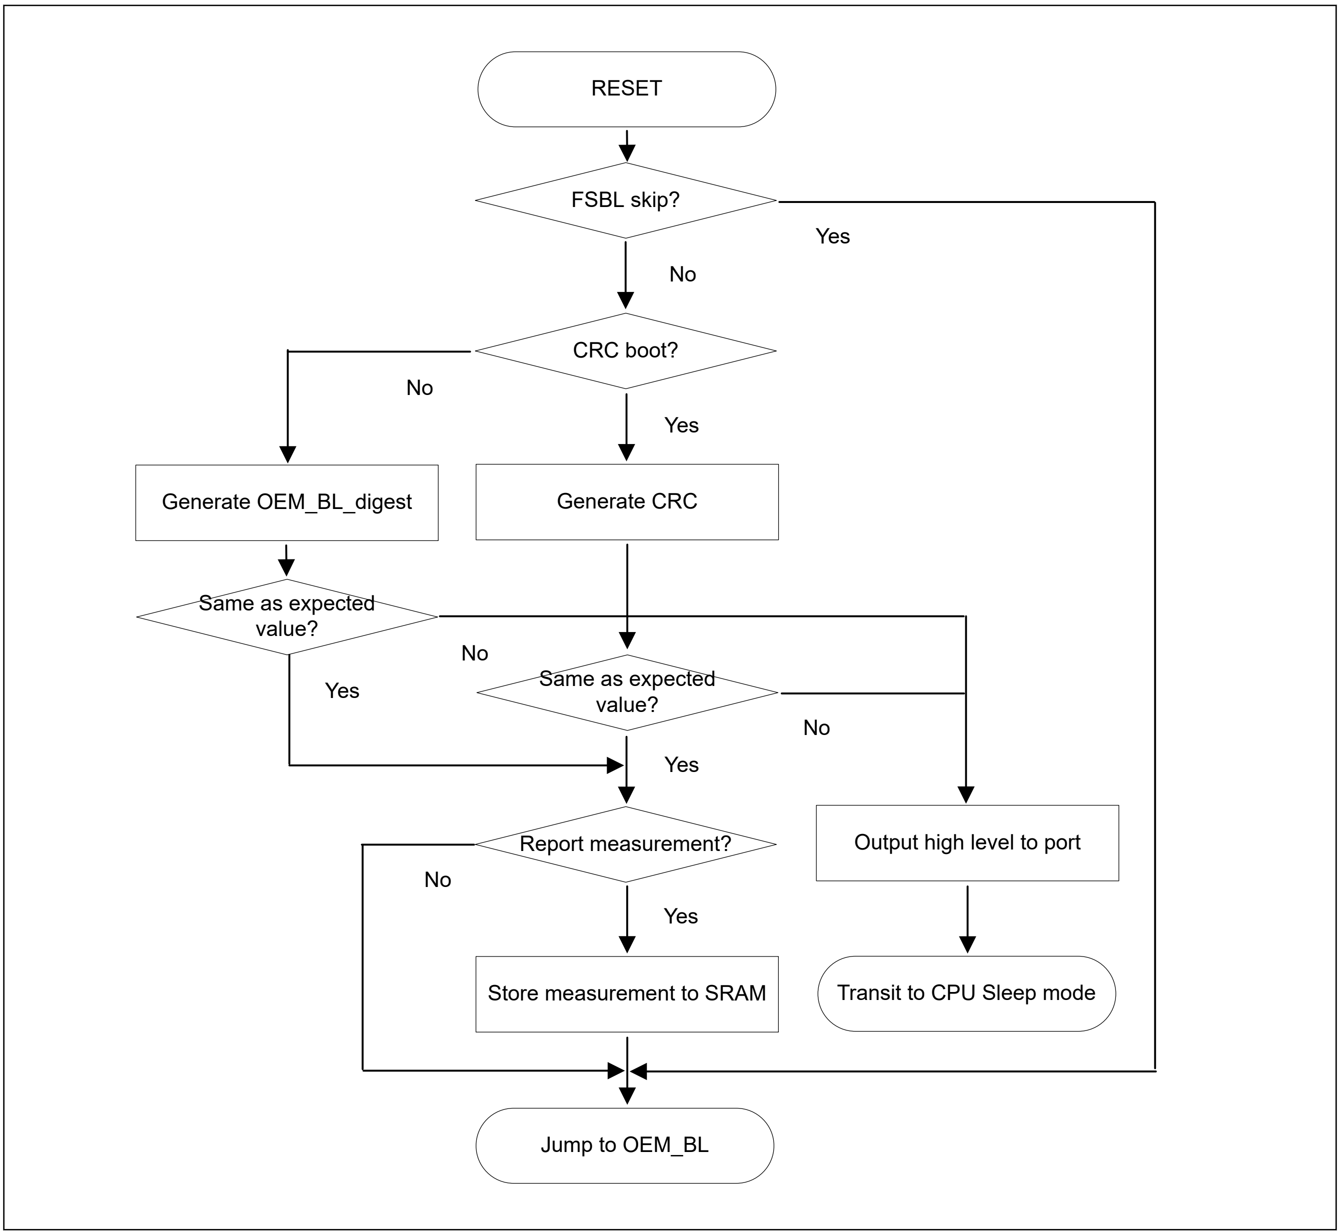

Figure 51.12 FSBL flow in single-chip mode

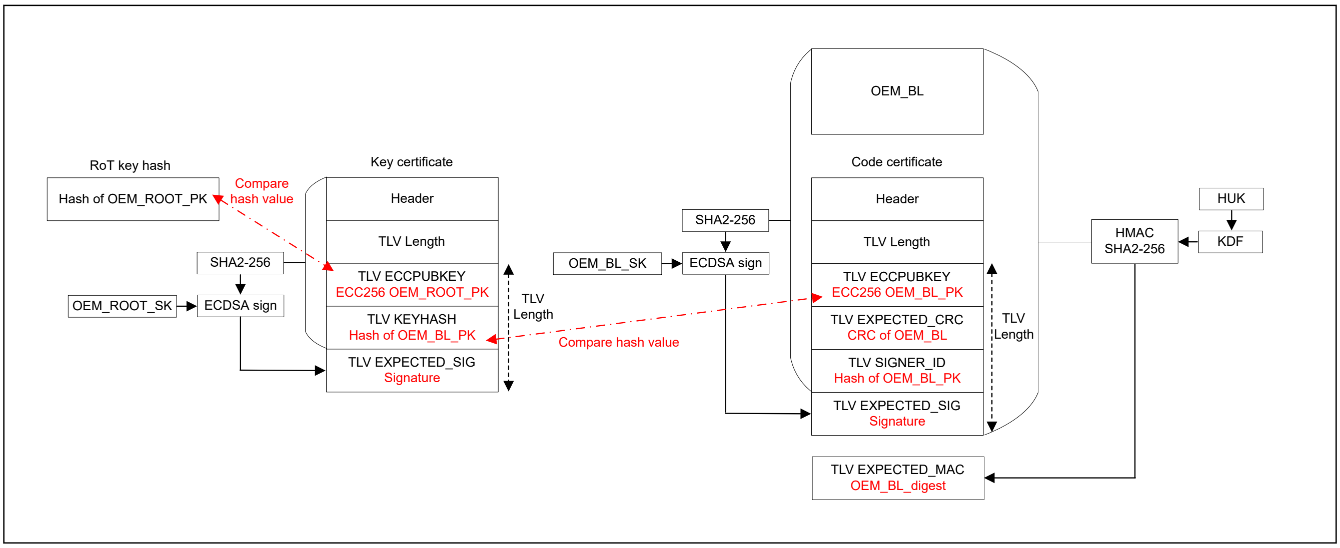

Figure 51.13 Validation structure and certificate format

Table 51.9 Detail of key certificate

Field		Size [byte]	Description
Header	Magic	4	Set to 0x6B657963
	Manifest version	4	Set to 0x00010000
	Flags	4	Reserved for future use
	Reserved	20	Reserved for future use
TLV Length		4	Length in bytes of TLV field
TLV ECCPUBKEY	Type & Length	4	Set to 0x00088010
	Value	64	ECC P-256 OEM_ROOT_PK
TLV KEYHASH	Type & Length	4	Set to 0x10144008
	Value	32	SHA2-256 hash value of OEM_BL_PK
TLV EXPECTED_SIG	Type & Length	4	Set to 0x20088410
	Value	64	Signature

Table 51.10 Detail of code certificate (1 of 2)

Field		Size [byte]	Description
Header	Magic	4	Set to 0x636F6463
	Manifest version	4	Set to 0x00010000
	Flags	4	Set to 0x00000000
	Load Addr	4	Set to 0x00000000
	Dest Addr	4	Set to 0x00000000
	Image size	4	Size in bytes of OEM_BL set in multiples of 16, minimum size is 64 bytes
	Image version	4	Version number of OEM_BL. Can be specified from 1 to 64
	Build number	4	Set to 0x00000000
TLV length		4	Length in bytes of TLV field
TLV ECCPUBKEY	Type & Length	4	Set to 0x01088010
	Value	64	ECC P-256 OEM_BL_PK
TLV EXPECTED_CRC	Type & Length	4	Set to 0x40000001
	Value	4	CRC32 of OEM_BL

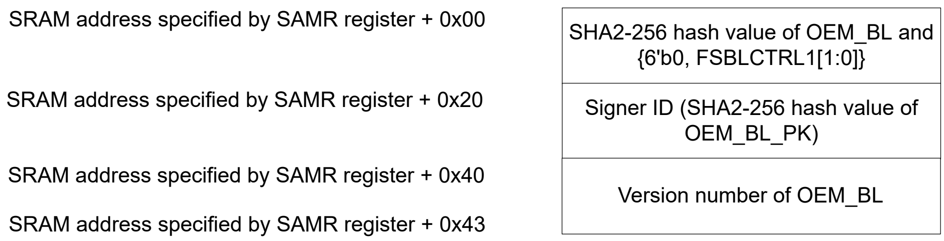
Table 51.10 Detail of code certificate (2 of 2)

Field		Size [byte]	Description
TLV SIGNER_ID	Type & Length	4	Set to 0x10144008
	Value	32	SHA2-256 hash value of OEM_BL_PK
TLV EXPECTED_SIG	Type & Length	4	Set to 0x25088410
	Value	64	Signature of [Code Certificate | OEM_BL], signed by the OEM_BL_SK When generating the signature, enter the code certificate and OEM_BL in the hash function in this order.

Table 51.11 Detail of OEM_BL_digest

Field		Size [byte]	Description
TLV EXPECTED_MAC	Type & Length	4	Fixed value 0x30184008
	Value	32	Unique OEM_BL_digest in each MCU

Note: OEM_BL_digest should be programmed in the area contiguous with the code certificate.

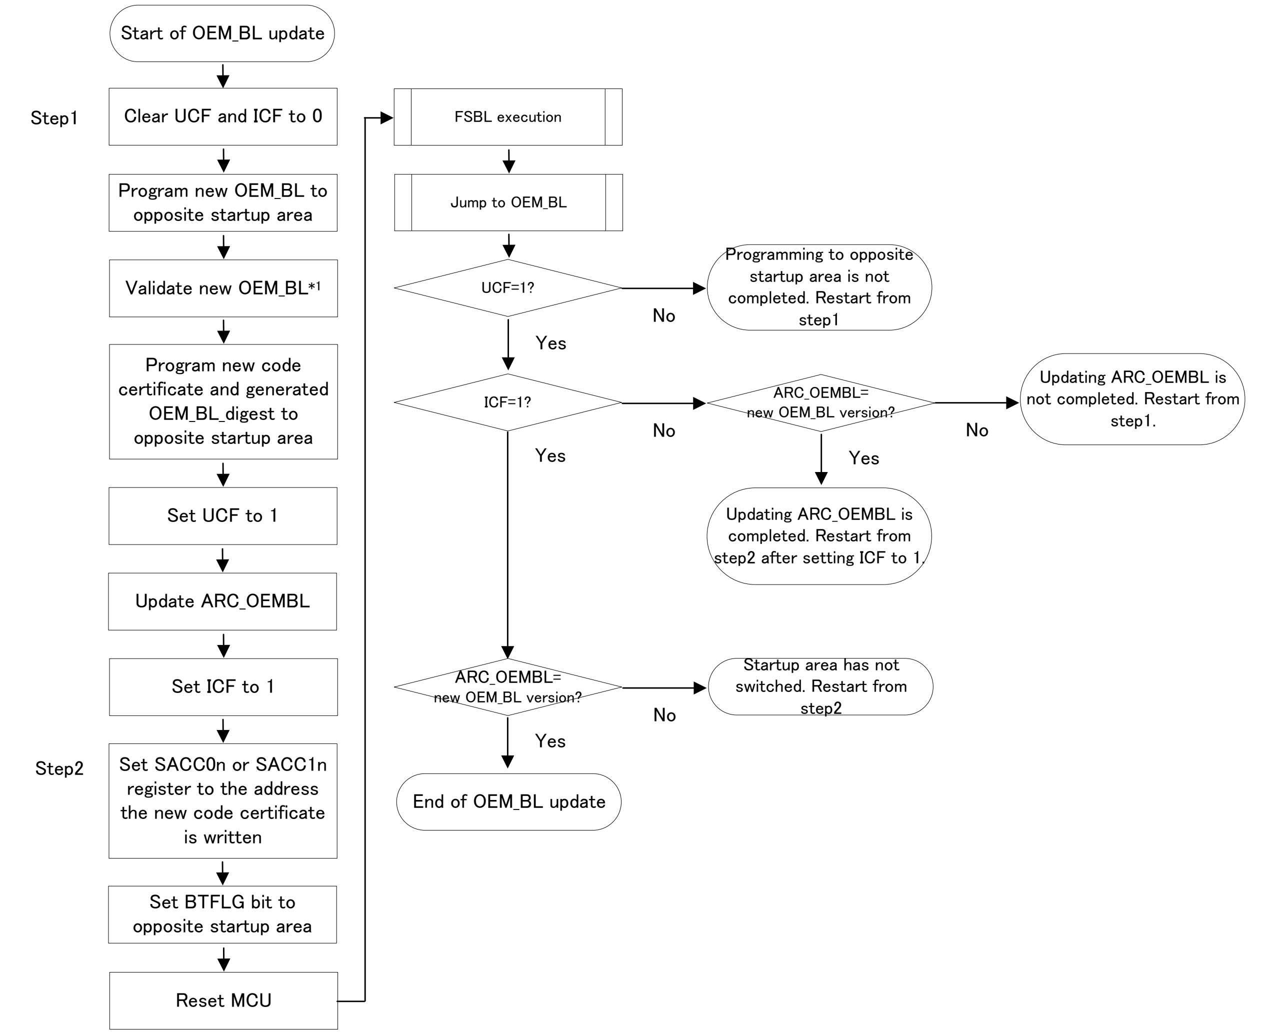


Note: OEM_BL and FSBLCTRL[7:0] are entered into the hash function in this order.

Figure 51.14 Format and location of the measurement report

OEM_BL can be updated by application code. In this case, the application code must validate the updated bootloader, generate the OEM_BL_digest, and store it immediately after the new code certificate, as per the flow described by Figure 51.11.Figure 51.15 show the OEM_BL update flow.

The implementation of the OEM_BL is user defined and application specific. However, it is recommended to implement status flags such as Update Complete Flag (UCF) and Increment Complete Flag (ICF) in the code MRAM as a countermeasure against update errors due to unexpected power failure. If an update error occurs, it can be recovered as shown in the following figures. If an update error occurs, the current OEM_BL is executed after FSBL execution. Note that the update error determination program is required for both the current OEM_BL and the new OEM_BL.



Note 1. Validate new OEM_BL the same way as Figure 51.11.

Figure 51.15 OEM_BL update flow

51.8 Register Description

51.8.1 PSARB : Peripheral Security Attribution Register B

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PSARB31	PSARB30	PSARB29	PSARB28	PSARB27	PSARB26	PSARB25	PSARB24	PSARB23	PSARB22	—	—	PSARB19	PSARB18	PSARB17	PSARB16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PSARB12	PSARB11	—	PSARB9	PSARB8	PSARB7	—	—	PSARB4	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	PSARB4	I3C Bus Interface Security Attribution Target module: I3C and the MSTPCRB.MSTPB4 bit 0: Secure 1: Non-secure	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	PSARB7	I2C Bus Interface 2 Security Attribution Target module: IIC2 and the MSTPCRB.MSTPB7 bit 0: Secure 1: NonSecure	R/W
8	PSARB8	I2C Bus Interface 1 Security Attribution Target module: IIC1 and the MSTPCRB.MSTPB8 bit 0: Secure 1: Non-secure	R/W
9	PSARB9	I2C Bus Interface 0 Security Attribution Target module: IIC0 and the MSTPCRB.MSTPB9 bit 0: Secure 1: Non-secure	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	PSARB11	Universal Serial Bus 2.0 FS Interface 0 Security Attribution Target module: USBFS0 and the MSTPCRB.MSTPB11 bit 0: Secure 1: Non-secure	R/W
12	PSARB12	Universal Serial Bus 2.0 HS Interface Security Attribution Target module: USBHS and the MSTPCRB.MSTPB12 bit 0: Secure 1: Non-secure	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
16	PSARB16	Octa Memory Controller 0 Security Attribution Target module: OSPI0 (+DOTF0) and the MSTPCRB.MSTPB16 bit 0: Secure 1: Non-secure	R/W
17	PSARB17	Octa Memory Controller 1 Security Attribution Target module: OSPI1 (+DOTF1) and the MSTPCRB.MSTPB17 bit 0: Secure 1: Non-secure	R/W
18	PSARB18	Serial Peripheral Interface 1 Security Attribution Target module: RSPI1 and the MSTPCRB.MSTPB18 bit 0: Secure 1: Non-secure	R/W
19	PSARB19	Serial Peripheral Interface 0 Security Attribution Target module: RSPI0 and the MSTPCRB.MSTPB19 bit 0: Secure 1: Non-secure	R/W
21:20	—	These bits are read as 0. The write value should be 0.	R/W
22	PSARB22	Serial Communication Interface 9 Security Attribution Target module: SCI9 and the MSTPCRB.MSTPB22 bit 0: Secure 1: Non-secure	R/W
23	PSARB23	Serial Communication Interface 8 Security Attribution Target module: SCI8 and the MSTPCRB.MSTPB23 bit 0: Secure 1: Non-secure	R/W
24	PSARB24	Serial Communication Interface 7 Security Attribution Target module: SCI7 and the MSTPCRB.MSTPB24 bit 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
25	PSARB25	Serial Communication Interface 6 Security Attribution Target module: SCI6 and the MSTPCRB.MSTPB25 bit 0: Secure 1: Non-secure	R/W
26	PSARB26	Serial Communication Interface 5 Security Attribution Target module: SCI5 and the MSTPCRB.MSTPB26 bit 0: Secure 1: Non-secure	R/W
27	PSARB27	Serial Communication Interface 4 Security Attribution Target module: SCI4 and the MSTPCRB.MSTPB27 bit 0: Secure 1: Non-secure	R/W
28	PSARB28	Serial Communication Interface 3 Security Attribution Target module: SCI3 and the MSTPCRB.MSTPB28 bit 0: Secure 1: Non-secure	R/W
29	PSARB29	Serial Communication Interface 2 Security Attribution Target module: SCI2 and the MSTPCRB.MSTPB29 bit 0: Secure 1: Non-secure	R/W
30	PSARB30	Serial Communication Interface 1 Security Attribution Target module: SCI1 and the MSTPCRB.MSTPB30 bit 0: Secure 1: Non-secure	R/W
31	PSARB31	Serial Communication Interface 0 Security Attribution Target module: SCI0 and the MSTPCRB.MSTPB31 bit 0: Secure 1: Non-secure	R/W

Note: Access category: S-TYPE-1, P-TYPE-1.

The PSARB register specifies the security attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.2 PSARC : Peripheral Security Attribution Register C

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PSARC31	PSARC30	—	PSARC28	PSARC27	PSARC26	—	PSARC24	—	—	—	—	—	—	—	PSARC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	PSARC13	PSARC12	PSARC11	—	—	PSARC8	PSARC7	—	—	—	—	—	PSARC1	PSARC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PSARC0	Clock Frequency Accuracy Measurement Circuit Security Attribution. Target module: CAC and the MSTPCRC.MSTPC0 bit 0: Secure 1: Non-secure	R/W
1	PSARC1	Cyclic Redundancy Check Calculator Security Attribution Target module: CRC and the MSTPCRC.MSTPC1 bit 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
6:2	—	These bits are read as 0. The write value should be 0.	R/W
7	PSARC7	Serial Sound Interface Enhanced (channel 1) Security Attribution Target module: SSIE1 and the MSTPCRC.MSTPC7 bit 0: Secure 1: Non-secure	R/W
8	PSARC8	Serial Sound Interface Enhanced (channel 0) Security Attribution Target module: SSIE0 and the MSTPCRC.MSTPC8 bit 0: Secure 1: Non-secure	R/W
10:9	—	These bits are read as 0. The write value should be 0.	R/W
11	PSARC11	Secure Digital Host IF 1 Security Attribution Target module: SDHI1 and the MSTPCRC.MSTPC11 bit 0: Secure 1: Non-secure	R/W
12	PSARC12	Secure Digital Host IF 0 Security Attribution Target module: SDHI0 and the MSTPCRC.MSTPC12 bit 0: Secure 1: Non-secure	R/W
13	PSARC13	Data Operation Circuit Security Attribution Target module: DOC and the MSTPCRC.MSTPC13 bit 0: Secure 1: Non-secure	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
16	PSARC16	CEU Security Attribution Target module: CEU and the MSTPCRC.MSTPC16 bit 0: Secure 1: Non-secure	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	PSARC24	Pulse Density Modulation Interface Security Attribution Target module: PDMIF and the MSTPCRC.MSTPC24 bit 0: Secure 1: Non-secure	R/W
25	—	This bit is read as 0. The write value should be 0.	R/W
26	PSARC26	Controller Area Network with Flexible Data-Rate 1 Security Attribution Target module: CANFD1 and the MSTPCRC.MSTPC26 bit 0: Secure 1: Non-secure	R/W
27	PSARC27	Controller Area Network with Flexible Data-Rate 0 Security Attribution Target module: CANFD0 and the MSTPCRC.MSTPC27 bit 0: Secure 1: Non-secure	R/W
28	PSARC28	Ether-PHY clock Security Attribution Target module: ETHPHYCLK and the MSTPCRC.MSTPC28 bit 0: Secure 1: Non-secure	R/W
29	—	This bit is read as 0. The write value should be 0.	R/W
30	PSARC30	Layer 3 Ethernet Switch Module Security Attribution Target module: ESWM and the MSTPCRC.MSTPC30 bit 0: Secure 1: Non-secure	R/W
31	PSARC31	RSIP-E50D Security Attribution Target module: RSIP-E50D and the MSTPCRC.MSTPC31 bit 0: Secure 1: Non-secure	R/W

Note: Access category: S-TYPE-1, P-TYPE-1.

The PSARC register specifies the security attribution for each module and the corresponding bit in Module Stop Control

Register.

51.8.3 PSARD : Peripheral Security Attribution Register D

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	PSARD28	PSARD27	PSARD26	PSARD25	—	—	PSARD22	PSARD21	PSARD20	PSARD19	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	PSARD4	Asynchronous General Purpose Timer 1 Security Attribution Target module: AGT1 and the MSTPCRD.MSTPD4 bit 0: Secure 1: Non-secure	R/W
5	PSARD5	Asynchronous General Purpose Timer 0 Security Attribution Target module: AGT0 and the MSTPCRD.MSTPD5 bit 0: Secure 1: Non-secure	R/W
6	PSARD6	PWM Delay Generation Circuit Security Attribution Target module: PDG and the MSTPCRD.MSTPD6 bit 0: Secure 1: Non-secure	R/W
10:7	—	These bits are read as 0. The write value should be 0.	R/W
11	PSARD11	Port Output Enable for GPT Group 3 Security Attribution Target module: PGI3 and the MSTPCRD.MSTPD11 bit 0: Secure 1: Non-secure	R/W
12	PSARD12	Port Output Enable for GPT Group 2 Security Attribution Target module: PGI2 and the MSTPCRD.MSTPD12 bit 0: Secure 1: Non-secure	R/W
13	PSARD13	Port Output Enable for GPT Group 1 Security Attribution Target module: PGI1 and the MSTPCRD.MSTPD13 bit 0: Secure 1: Non-secure	R/W
14	PSARD14	Port Output Enable for GPT Group 0 Security Attribution Target module: PGI0 and the MSTPCRD.MSTPD14 bit 0: Secure 1: Non-secure	R/W
18:15	—	These bits are read as 0. The write value should be 0.	R/W
19	PSARD19	12-Bit D/A Converter 1 Security Attribution Target module: DAC121 and the MSTPCRD.MSTPD19 bit 0: Secure 1: Non-secure	R/W
20	PSARD20	12-Bit D/A Converter 0 Security Attribution Target module: DAC120 and the MSTPCRD.MSTPD20 bit 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
21	PSARD21	16-Bit A/D Converter Security Attribution Target module: ADC16H and the MSTPCRD.MSTPD21 bit 0: Secure 1: Non-secure	R/W
22	PSARD22	Temperature Sensor Security Attribution Target module: TSN and the MSTPCRD.MSTPD22 bit 0: Secure 1: Non-secure	R/W
24:23	—	These bits are read as 0. The write value should be 0.	R/W
25	PSARD25	High speed analog Comparator 3 Security Attribution Target module: ACMPHS3 and the MSTPCRD.MSTPD25 bit 0: Secure 1: Non-secure	R/W
26	PSARD26	High speed analog Comparator 2 Security Attribution Target module: ACMPHS2 and the MSTPCRD.MSTPD26 bit 0: Secure 1: Non-secure	R/W
27	PSARD27	High Speed analog Comparator 1 Security Attribution Target module: ACMPHS1 and the MSTPCRD.MSTPD27 bit 0: Secure 1: Non-secure	R/W
28	PSARD28	High Speed Analog Comparator 0 Security Attribution Target module: ACMPHS0 and the MSTPCRD.MSTPD28 bit 0: Secure 1: Non-secure	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: Access category: S-TYPE-1, P-TYPE-1.

The PSARD register specifies the security attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.4 PSARE : Peripheral Security Attribution Register E

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PSARE31	PSARE30	PSARE29	PSARE28	PSARE27	—	—	—	—	—	PSARE21	PSARE20	PSARE19	PSARE18	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

18	PSARE18	General PWM Timer Channel 13 Security Attribution Target module: GPT13 and the MSTPCRE.MSTPE18 bit 0: Secure 1: Non-secure	R/W
19	PSARE19	General PWM Timer Channel 12 Security Attribution Target module: GPT12 and the MSTPCRE.MSTPE19 bit 0: Secure 1: Non-secure	R/W
20	PSARE20	General PWM Timer Channel 11 Security Attribution Target module: GPT11 and the MSTPCRE.MSTPE20 bit 0: Secure 1: Non-secure	R/W
21	PSARE21	General PWM Timer Channel 10 Security Attribution Target module: GPT10 and the MSTPCRE.MSTPE21 bit 0: Secure 1: Non-secure	R/W
26:22	—	These bits are read as 0. The write value should be 0.	R/W
27	PSARE27	General PWM Timer Channel 4 Security Attribution Target module: GPT4 and the MSTPCRE.MSTPE27 bit 0: Secure 1: Non-secure	R/W
28	PSARE28	General PWM Timer Channel 3 Security Attribution Target module: GPT3 and the MSTPCRE.MSTPE28 bit 0: Secure 1: Non-secure	R/W
29	PSARE29	General PWM Timer Channel 2 Security Attribution Target module: GPT2 and the MSTPCRE.MSTPE29 bit 0: Secure 1: Non-secure	R/W
30	PSARE30	General PWM Timer Channel 1 Security Attribution Target module: GPT1 and the MSTPCRE.MSTPE30 bit 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
31	PSARE31	General PWM Timer Channel 0 Security Attribution Target module: GPT0, GPT_OPS and the MSTPCRE.MSTPE31 bit 0: Secure 1: Non-secure	R/W

Note: Access category: S-TYPE-1, P-TYPE-1.

The PSARE register specifies the security attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.5 MSSAR : Module Stop Security Attribution Register

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSSAR31	—	—	—	—	—	—	—	MSSAR23	MSSAR22	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MSSAR3	MSSAR2	MSSAR1	MSSAR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MSSAR0	SRAM0 Clock Stop Security Attribution Target module: the MSTPCRA.MSTPA0 bit 0: Secure 1: Non-secure	R/W
1	MSSAR1	SRAM1 Clock Stop Security Attribution Target module: the MSTPCRA.MSTPA1 bit 0: Secure 1: Non-secure	R/W
2	MSSAR2	SRAM2 Clock Stop Security Attribution Target module: the MSTPCRA.MSTPA2 bit 0: Secure 1: Non-secure	R/W
3	MSSAR3	SRAM3 Clock Stop Security Attribution Target module: the MSTPCRA.MSTPA3 bit 0: Secure 1: Non-secure	R/W
21:4	—	These bits are read as 0. The write value should be 0.	R/W
22	MSSAR22	DMAC0/DTC0 Clock Stop Security Attribution Target module: the MSTPCRA.MSTPA22 bit 0: Secure 1: Non-secure	R/W
23	MSSAR23	DMAC1/DTC1 Clock Stop Security Attribution Target module: the MSTPCRA.MSTPA23 bit 0: Secure 1: Non-secure	R/W
30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	MSSAR31	ELC Clock Stop Security Attribution Target module: the MSTPCRC.MSTPC14 bit 0: Secure 1: Non-secure	R/W

Note: Access category: S-TYPE-1, P-TYPE-1.

The MSSAR register specifies the security attribution for the corresponding bit in Module Stop Control Register.

51.8.6 PPARB : Peripheral Privilege Attribution Register B

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x1C

31	PPARB31	Serial Communication Interface 0 Privilege Attribution Target module: SCI0 and the MSTPCRB.MSTPB31 bit 0: Privileged 1: Unprivileged	R/W

Note: Access category: S-TYPE-2, P-TYPE-1.

The PPARB register specifies the privilege attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.7 PPARC : Peripheral Privilege Attribution Register C

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PPARC31	PPARC30	—	PPARC28	PPARC27	PPARC26	—	PPARC24	—	—	—	—	—	—	—	PPARC16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	PPARC13	PPARC12	PPARC11	—	—	PPARC8	PPARC7	—	—	—	—	—	PPARC1	PPARC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	PPARC0	Clock Frequency Accuracy Measurement Circuit Privilege Attribution Target module: CAC and the MSTPCRC.MSTPC0 bit 0: Privileged 1: Unprivileged	R/W
1	PPARC1	Cyclic Redundancy Check Calculator Privilege Attribution Target module: CRC and the MSTPCRC.MSTPC1 bit 0: Privileged 1: Unprivileged	R/W
6:2	—	These bits are read as 1. The write value should be 1.	R/W
7	PPARC7	Serial Sound Interface Enhanced (Channel 1) Privilege Attribution Target module: SSIE1 and the MSTPCRC.MSTPC7 bit 0: Privileged 1: Unprivileged	R/W
8	PPARC8	Serial Sound Interface Enhanced (Channel 0) Privilege Attribution Target module: SSIE0 and the MSTPCRC.MSTPC8 bit 0: Privileged 1: Unprivileged	R/W
10:9	—	These bits are read as 1. The write value should be 1.	R/W
11	PPARC11	Secure Digital Host IF 1 Privilege Attribution Target module: SDHI1 and the MSTPCRC.MSTPC11 bit 0: Privileged 1: Unprivileged	R/W
12	PPARC12	Secure Digital Host IF 0 Privilege Attribution Target module: SDHI0 and the MSTPCRC.MSTPC12 bit 0: Privileged 1: Unprivileged	R/W
13	PPARC13	Data Operation Circuit Privilege Attribution Target module: DOC and the MSTPCRC.MSTPC13 bit 0: Privileged 1: Unprivileged	R/W
15:14	—	These bits are read as 1. The write value should be 1.	
16	PPARC16	CEU Privilege Attribution Target module: CEU and the MSTPCRC.MSTPC16 bit 0: Privileged 1: Unprivileged	R/W
23:17	—	These bits are read as 1. The write value should be 1.	R/W
24	PPARC24	Pulse Density Modulation Interface Privilege Attribution Target module: PDMIF and the MSTPCRC.MSTPC24 bit 0: Privileged 1: Unprivileged	R/W
25	—	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
26	PPARC26	Controller Area Network with Flexible Data-Rate 1 Privilege Attribution Target module: CANFD1 and the MSTPCRC.MSTPC26 bit 0: Privileged 1: Unprivileged	R/W
27	PPARC27	Controller Area Network with Flexible Data-Rate 0 Privilege Attribution Target module: CANFD0 and the MSTPCRC.MSTPC27 bit 0: Privileged 1: Unprivileged	R/W
28	PPARC28	Ether-PHY clock Privilege Attribution Target module: ETHPHYCLK and the MSTPCRC.MSTPC28 bit 0: Privileged 1: Unprivileged	R/W
29	—	This bit is read as 1. The write value should be 1.	R/W
30	PPARC30	Layer 3 Ethernet Switch Module Privilege Attribution Target module: ESWM and the MSTPCRC.MSTPC30 bit 0: Privileged 1: Unprivileged	R/W
31	PPARC31	RSIP-E50D Privilege Attribution Target module: RSIP-E50D and the MSTPCRC.MSTPC31 bit 0: Privileged 1: Unprivileged	R/W

Note: Access category: S-TYPE-2, P-TYPE-1.

The PPARC register specifies the privilege attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.8 PPARD : Peripheral Privilege Attribution Register D

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x24

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	PPARD28	PPARD27	PPARD26	PPARD25	—	—	PPARD22	PPARD21	PPARD20	PPARD19	—	—	—

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 1. The write value should be 1.	R/W
4	PPARD4	Asynchronous General Purpose Timer 1 Privilege Attribution Target module: AGT1 and the MSTPCRD.MSTPD4 bit 0: Privileged 1: Unprivileged	R/W
5	PPARD5	Asynchronous General Purpose Timer 0 Privilege Attribution Target module: AGT0 and the MSTPCRD.MSTPD5 bit 0: Privileged 1: Unprivileged	R/W
6	PPARD6	PWM Delay Generation Circuit Privilege Attribution Target module: PDG and the MSTPCRD.MSTPD6 bit 0: Privileged 1: Unprivileged	R/W
10:7	—	These bits are read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
11	PPARD11	Port Output Enable for GPT Group 3 Privilege Attribution Target module: PGI3 and the MSTPCRD.MSTPD11 bit 0: Privileged 1: Unprivileged	R/W
12	PPARD12	Port Output Enable for GPT Group 2 Privilege Attribution Target module: PGI2 and the MSTPCRD.MSTPD12 bit 0: Privileged 1: Unprivileged	R/W
13	PPARD13	Port Output Enable for GPT Group 1 Privilege Attribution Target module: PGI1 and the MSTPCRD.MSTPD13 bit 0: Privileged 1: Unprivileged	R/W
14	PPARD14	Port Output Enable for GPT Group 0 Privilege Attribution Target module: PGI0 and the MSTPCRD.MSTPD14 bit 0: Privileged 1: Unprivileged	R/W
18:15	—	These bits are read as 1. The write value should be 1.	R/W
19	PPARD19	12-Bit D/A Converter 1 Privilege Attribution Target module: DAC121 and the MSTPCRD.MSTPD19 bit 0: Privileged 1: Unprivileged	R/W
20	PPARD20	12-Bit D/A Converter 0 Privilege Attribution Target module: DAC120 and the MSTPCRD.MSTPD20 bit 0: Privileged 1: Unprivileged	R/W
21	PPARD21	16-Bit A/D Converter Privilege Attribution Target module: ADC16H and the MSTPCRD.MSTPD21 bit 0: Privileged 1: Unprivileged	R/W
22	PPARD22	Temperature Sensor Privilege Attribution Target module: TSN and the MSTPCRD.MSTPD22 bit 0: Privileged 1: Unprivileged	R/W
24:23	—	These bits are read as 1. The write value should be 1.	R/W
25	PPARD25	High speed analog Comparator 3 Privilege Attribution Target module: ACMPHS3 and the MSTPCRD.MSTPD25 bit 0: Privileged 1: Unprivileged	R/W
26	PPARD26	High speed analog Comparator 2 Privilege Attribution Target module: ACMPHS2 and the MSTPCRD.MSTPD26 bit 0: Privileged 1: Unprivileged	R/W
27	PPARD27	High speed analog Comparator 1 Privilege Attribution Target module: ACMPHS1 and the MSTPCRD.MSTPD27 bit 0: Privileged 1: Unprivileged	R/W
28	PPARD28	High speed analog Comparator 0 Privilege Attribution Target module: ACMPHS0 and the MSTPCRD.MSTPD28 bit 0: Privileged 1: Unprivileged	R/W
31:29	—	These bits are read as 1. The write value should be 1.	R/W

Note: Access category: S-TYPE-2, P-TYPE-1.

The PPARD register specifies the privilege attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.9 PPARE : Peripheral Privilege Attribution Register E

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PPARE31	PPARE30	PPARE29	PPARE28	PPARE27	—	—	—	—	—	PPARE21	PPARE20	PPARE19	PPARE18	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PPARE15	—	—	—	—	—	PPARE9	PPARE8	—	—	—	—	PPARE3	PPARE2	PPARE1	PPARE0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	PPARE0	WDT1 Privilege Attribution Target module: WDT1 0: Privileged 1: Unprivileged	R/W
1	PPARE1	WDT0 Privilege Attribution Target module: WDT0 0: Privileged 1: Unprivileged	R/W
2	PPARE2	IWDT Privilege Attribution Target module: IWDT 0: Privileged 1: Unprivileged	R/W
3	PPARE3	Real Time Clock Privilege Attribution Target module: RTC 0: Privileged 1: Unprivileged	R/W
7:4	—	These bits are read as 1. The write value should be 1.	R/W
8	PPARE8	ULPT1 Privilege Attribution Target module: ULPT1 and the MSTPCRE.MSTPE8 bit 0: Privileged 1: Unprivileged	R/W
9	PPARE9	ULPT0 Privilege Attribution Target module: ULPT0 and the MSTPCRE.MSTPE9 bit 0: Privileged 1: Unprivileged	R/W
14:10	—	These bits are read as 1. The write value should be 1.	R/W
15	PPARE15	GPT common Privilege Attribution Target module: GPT GTCLKCR register 0: Privileged 1: Unprivileged	R/W
17:16	—	These bits are read as 1. The write value should be 1.	R/W
18	PPARE18	General PWM Timer Channel 13 Privilege Attribution Target module: GPT13 and the MSTPCRE.MSTPE18 bit 0: Privileged 1: Unprivileged	R/W
19	PPARE19	General PWM Timer Channel 12 Privilege Attribution Target module: GPT12 and the MSTPCRE.MSTPE19 bit 0: Privileged 1: Unprivileged	R/W

Bit	Symbol	Function	R/W
20	PPARE20	General PWM Timer Channel 11 Privilege Attribution Target module: GPT11 and the MSTPCRE.MSTPE20 bit 0: Privileged 1: Unprivileged	R/W
21	PPARE21	General PWM Timer Channel 10 Privilege Attribution Target module: GPT10 and the MSTPCRE.MSTPE21 bit 0: Privileged 1: Unprivileged	R/W
26:22	—	These bits are read as 1. The write value should be 1.	R/W
27	PPARE27	General PWM Timer Channel 4 Privilege Attribution Target module: GPT4 and the MSTPCRE.MSTPE27 bit 0: Privileged 1: Unprivileged	R/W
28	PPARE28	General PWM Timer Channel 3 Privilege Attribution Target module: GPT3 and the MSTPCRE.MSTPE28 bit 0: Privileged 1: Unprivileged	R/W
29	PPARE29	General PWM Timer Channel 2 Privilege Attribution Target module: GPT2 and the MSTPCRE.MSTPE29 bit 0: Privileged 1: Unprivileged	R/W
30	PPARE30	General PWM Timer Channel 1 Privilege Attribution Target module: GPT1 and the MSTPCRE.MSTPE30 bit 0: Privileged 1: Unprivileged	R/W
31	PPARE31	General PWM Timer Channel 0 Privilege Attribution Target module: GPT0 and the MSTPCRE.MSTPE31 bit 0: Privileged 1: Unprivileged	R/W

Note: Access category: S-TYPE-2, P-TYPE-1.

The PPARE register specifies the privilege attribution for each module and the corresponding bit in Module Stop Control Register.

51.8.10 MSPAR : Module Stop Privilege Attribution Register

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSPAR31	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
30:0	—	These bits are read as 1. The write value should be 1.	R/W
31	MSPAR31	ELC Clock Stop Privilege Attribution Target module: the MSTPCRC.MSTPC14 bit 0: Privileged 1: Unprivileged	R/W

Note: Access category: S-TYPE-2, P-TYPE-1.

The MSPAR register specifies the privilege attribution for the corresponding bit in the Module Stop Control Register.

51.8.11 CMSAMON : Code MRAM Security Attribution Monitor Register

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x30

Bit position:	31								23								15															0
Bit field:	—	—	—	—	—	—	—	—	CMS[8:0]									—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	*1	*1	*1	*1	*1	*1	*1	*1	*1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as 0.	R
23:15	CMS[8:0]	Code MRAM Secure Area Indicate the area of secure region for code MRAM.	R
31:24	—	These bits are read as 0.	R

Note: Access category: S-TYPE-5, P-TYPE-5.
Note 1. The value in a blank product is 0x1FF. It is set to the value written by your application.

51.8.12 SFSAMON : SiP Flash Security Attribution Monitor Register

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x3C

Bit position:	31								23								15															0
Bit field:	—	—	—	—	—	—	—	—	SFS[8:0]									—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	*1	*1	*1	*1	*1	*1	*1	*1	*1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as 0.	R
23:15	SFS[8:0]	SiP Flash Secure Area Indicate the area of secure region for SiP flash.	R
31:24	—	These bits are read as 0.	R

Note: Access category: S-TYPE-5, P-TYPE-5.
Note 1. The value in a blank product is 0x1FF. It is set to the value written by your application.

51.8.13 DLMMON : Device Lifecycle Management State Monitor Register

Base address: PSCU = 0x4020_4000
PSCU_NS = 0x5020_4000

Offset address: 0x38

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	DLMMON[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1

Bit	Symbol	Function	R/W
3:0	DLMMON[3:0]	Device Lifecycle Management State Monitor Indicate DLM status value. 0x4: OEM 0x6: LCK_BOOT 0x7: RMA_REQ 0x8: RMA_ACK 0x9: RMA_RET Others: Reserved	R
31:4	—	These bits are read as 0.	R

Note: Access category: S-TYPE-5, P-TYPE-5.
Note 1. The value in a blank product is 0100b. These bits depend on DLM status.

51.8.14 MSAOAD : Master Security Attribution Operation After Detection Register

Base address: BUS = 0x4000_3000

Offset address: 0x1010

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection 0: IRQ 1: Reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code These bits enable or disable writing of the OAD bit.	W

Note: Access category: S-TYPE-6, P-TYPE-2.

OAD bit (Operation after detection)

The OAD bit specifies operation when the access violation is detected. When OAD = 0, error response is returned to the bus master, and IRQ request is generated if BUSIRQEN<Master Name>. EN bit is 1. Interrupts due to bus errors can be used as NMI if NMIER.BUSEN bit is 1. When OAD = 1, reset request is generated. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. If this value is not written to the KEY[7:0] bits, the OAD bit is not updated.

51.8.15 MSAPT : Master Security Attribution Protect Register

Base address: BUS = 0x4000_3000

Offset address: 0x1014

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MSAOAD register writing is possible. 1: MSAOAD register writing is protected. Read is possible.	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code These bits enable or disable writing of the PROTECT bit.	W

Note: Access category: S-TYPE-6, P-TYPE-2.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MSAPT.PROTECT controls the MSAOAD register.

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. If this value is not written to the KEY[7:0] bits, the PROTECT bit is not updated.

51.9 Usage Note

51.9.1 Security or Privilege Bit Write Timing

When writing a security or privilege attribution bit, confirm that writing is complete by reading the security or privilege register until it matches the value written. The protection is not effective until writing to the security or privilege register is complete.

52. Renesas Secure IP (RSIP-E50D)

52.1 Overview

This security engine consists of an isolated subsystem comprising an access management circuit, storage area, encryption/ decryption circuit, and random number generation circuit. In combination with the RSIP library, the security engine can prevent eavesdropping (to maintain confidentiality), falsification of information (to ensure integrity), and impersonation (to verify authenticity).

Because key information required for encryption and decryption is stored only in the security engine and all accesses from the outside can be blocked, the security engine enables building a more robust security system.

Table 52.1 lists the security engine specifications. Figure 52.1 shows the security engine block diagram.

Table 52.1 Security engine specifications (1 of 2)

Parameter	Specifications
Access control	Access management circuit ● In case of irregular access to the security engine due to a tampered program or CPU runaway, this circuit blocks all subsequent accesses and stops data output from the security engine. Interrupt RSIP_TADI is generated.
Symmetric cryptography	AES: Compliant with NIST FIPS PUB 197 ● Key length: 128, 192, or 256 bits ● Data block size: 128 bits ● AES supports the following block cipher mode: – ECB, CBC, CTR: Compliant with NIST SP 800-38A – CCM: Compliant with NIST SP 800-38C – GCM: Compliant with NIST SP 800-38D – XTS: Compliant with IEEE 1619-2007 ● AES supports the following authentication algorithms: – CMAC: Compliant with NIST SP 800-38B – GMAC: Compliant with NIST SP 800-38D ChaCha20-Poly1305: Compliant with RFC7539 ● Key length: 256 bits ● Block size: 512 bits ● Support the following algorithms: – ChaCha20 – ChaCha20-Poly1305
Random number generation	128-bit true random number generation circuit
Asymmetric cryptography	RSA ● Maximum number of operable bits: 4224 bits ● Supported key sizes: 1024 bits, 2048 bits, 3072 bits, and 4096 bits ● Signature generation, signature verification, public-key encryption, private-key decryption. ECC ● Maximum number of operable bits: 576 bits ● Support for curve – NIST P-192, P-224, P-256, P-384, and P-521 – Brain pool P256r1, P384r1, and P512r1 – Ed25519 – secp256k1 ● Signature generation, signature verification, key generation.
Message digest computation	HASH ● Block size: 512 bits (SHA-224, SHA-256) 1024 bits (SHA-512/224, SHA-512/256, SHA-384, SHA-512) 1152 bits (SHA3-224), 1088 bits (SHA3-256), 832 bits (SHA3-384), 576 bits (SHA3-512), 1344 bits (SHAKE128), 1088 bits (SHAKE256) ● Key size: 512 bits or less ● HASH supports the following secure hash algorithms: – SHA-224, SHA-256, SHA-512/224, SHA-512/256, SHA-384, and SHA-512: Compliant with FIPS PUB 180-4 – SHA3-224, SHA3-256, SHA3-384, SHA3-512, SHAKE128, and SHAKE256: Compliant with FIPS PUB 202 ● HASH supports the following message authentication algorithm: – HMAC: Compliant with FIPS PUB 198

Table 52.1 Security engine specifications (2 of 2)

Parameter	Specifications
Hardware Unique Key	● A read-only, 256-bit Hardware Unique Key (HUK) is exclusively accessible by the security engine access management circuit through a dedicated bus. ● Key derivation functions (KDFs) combine the Hardware Unique Key with the key generation information. The derived keys implement the key wrapping for user key secure storage. ● The HUK uniqueness prevents the illicit cloning and copying of keys to another MCU of the MCU group. ● The HUK itself is stored in wrapped (encrypted, non-plain) format in an isolated memory area. Therefore, it is protected from illicit access and copy.
Application Key Management	● Wrapped keys are only valid within the security engine.
Unique ID	● A read-only, 128-bit ID unique to an MCU (Unique ID) is accessible from the access management circuit. ● Key derivation functions (KDFs) combine the Unique ID with the key generation information. Such derived keys are used to unwrap the HUK within the security engine boundary.
OEM boot loader version	● The security engine outputs the current OEM boot loader version (OEM BL Ver.) after successful validation of a firmware update. ● MRAM sequencer supports Anti-Rollback Counter Protection using the OEM boot loader version, which can be validated using the security engine.
Decryption-on-the-fly	The security engine outputs the key data of the decryption-on-the-fly IP (DOTF) through a dedicated bus. The key can be set separately for DOTF0 and DOTF1.
Tamper Resistance	Countermeasures available for side-channel attacks, including SPA/DPA and timing attacks.
Module-stop function	Module-stop state can be set to reduce power consumption.
TrustZone Filter	Security and Privilege attribution can be set.

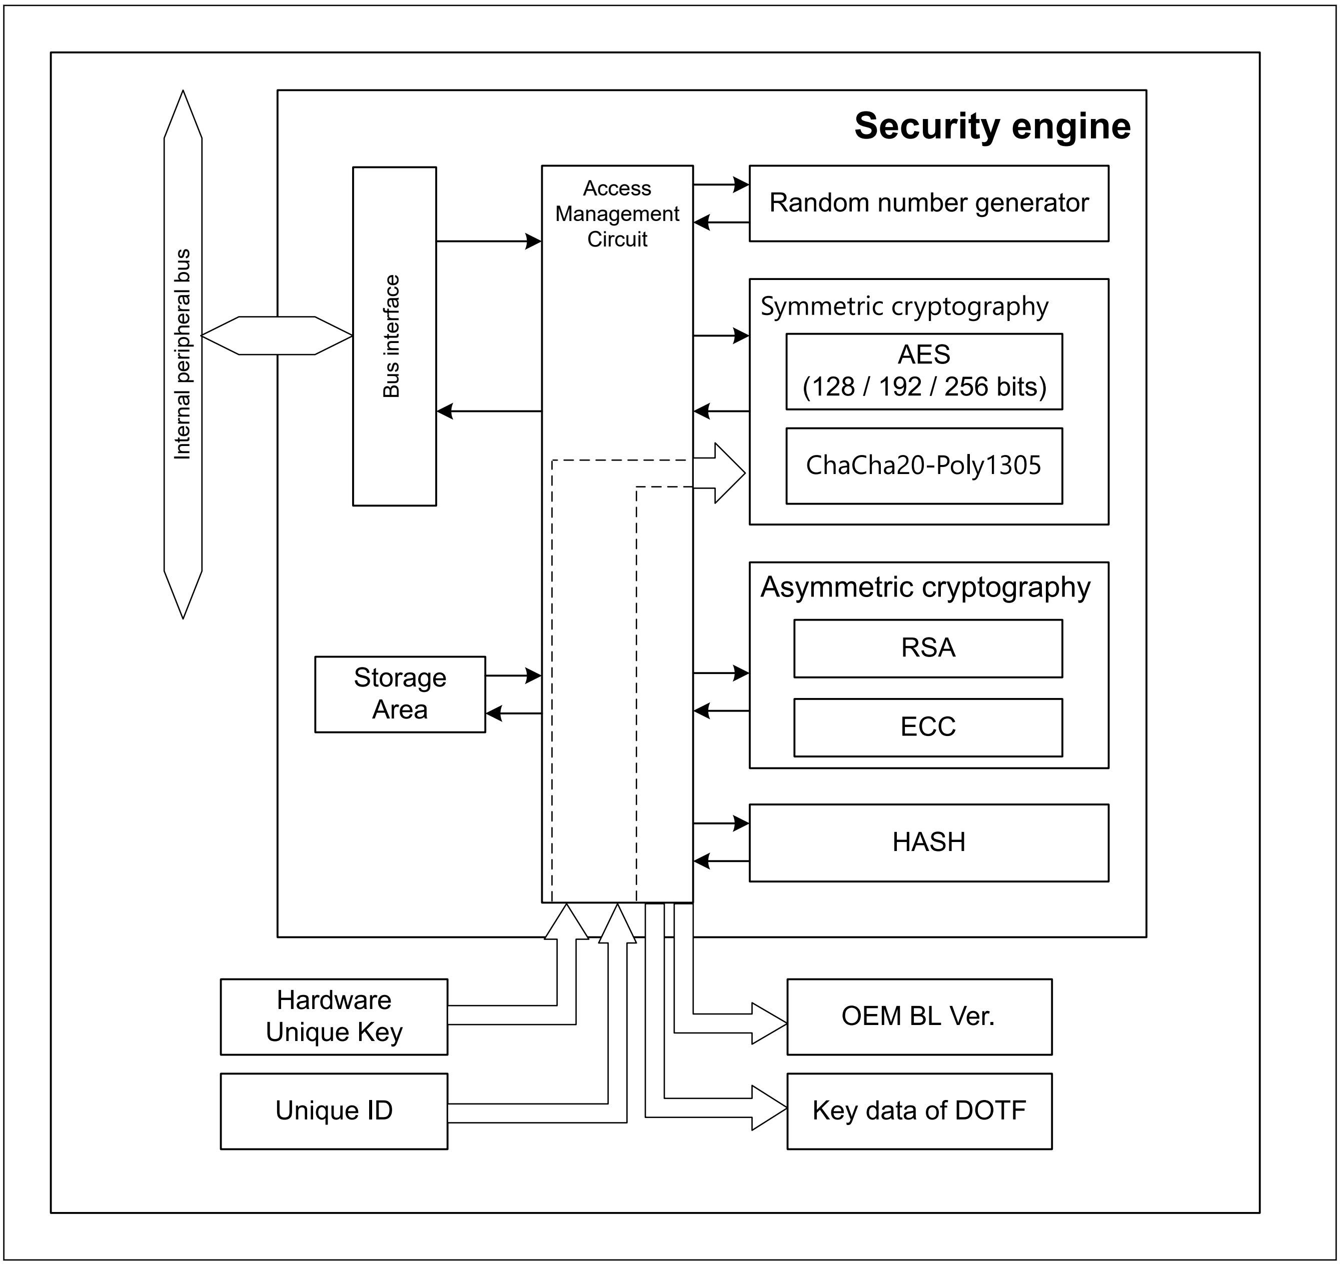

Figure 52.1 Security engine block diagram

52.2 Operation

52.2.1 Symmetric Cryptography

Figure 52.2 shows conceptual block diagram of the symmetric cryptography installed in the security engine.

The symmetric cryptography uses the input key information and converts the plaintext data to ciphertext or ciphertext data to plaintext through the hardware.

The encryption/decryption process can be completed without exposing the key data and the intermediate data of the process outside of the security engine. This process is performed by the encryption/decryption circuit and storage area of the security engine internally.

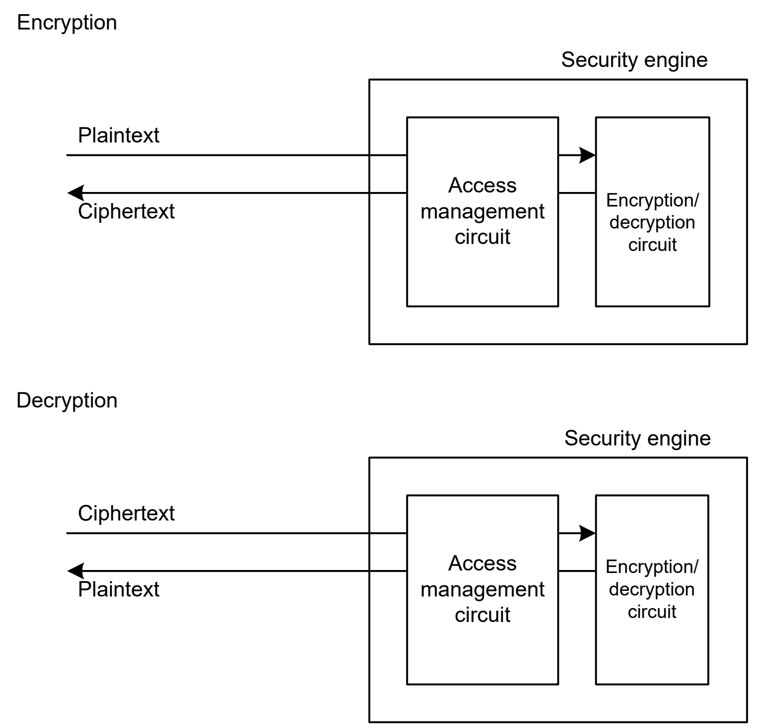

Figure 52.2 Conceptual diagram of the symmetric cryptography

52.2.2 Asymmetric Cryptography

Figure 52.3 shows conceptual block diagram of the asymmetric cryptography installed in the security engine.

The asymmetric cryptography uses the input key information and converts the plaintext data to ciphertext or ciphertext data to plaintext or generates/verifies the signature.

The encryption/decryption or signature generation/verification process can be completed without exposing the key data and the process's intermediate data outside of the security engine. This process is performed by the cryptographic circuit and storage area of the security engine internally.

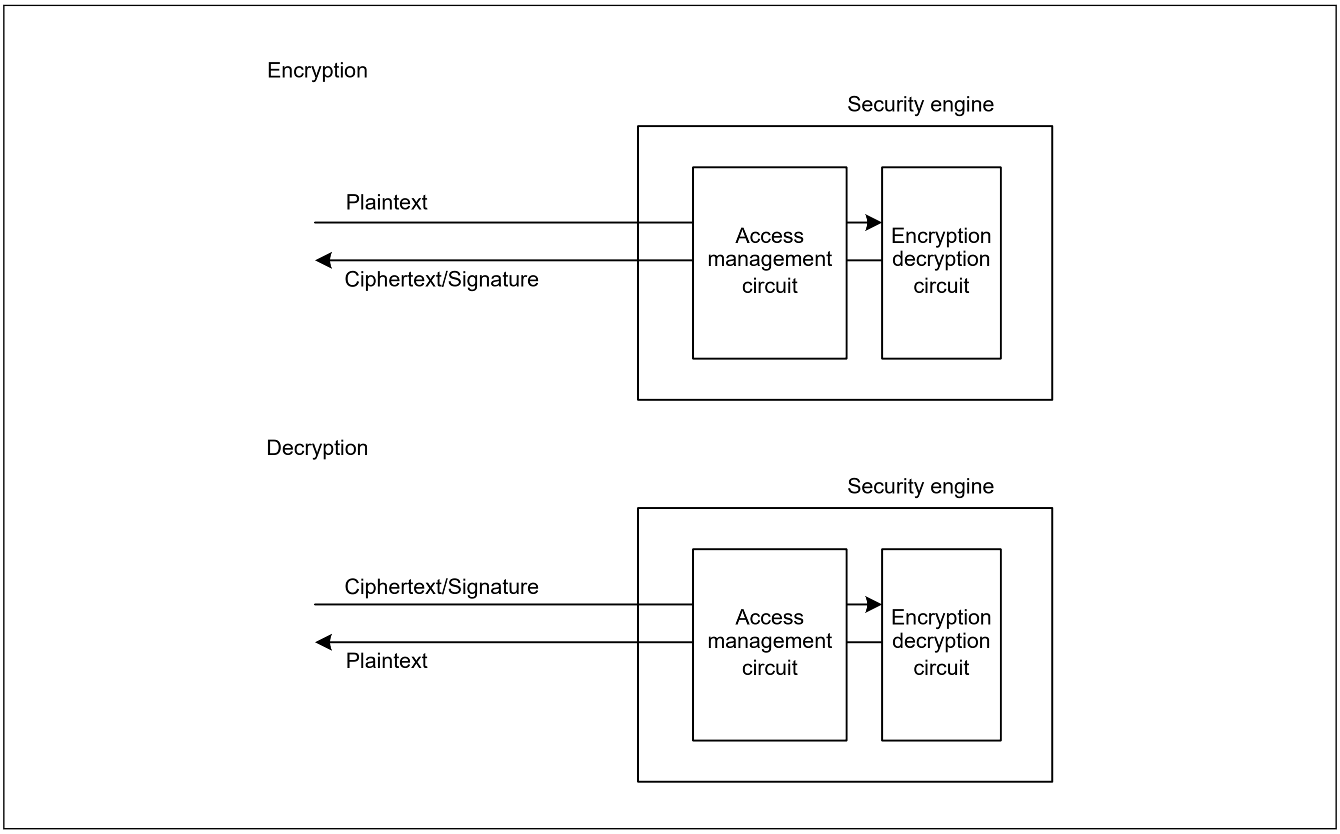

Figure 52.3 Conceptual diagram of the asymmetric cryptography

52.2.3 Hash Generator

Figure 52.4 shows conceptual block diagram of the hash generator installed in the security engine.

The hash generator generates uses the input key information (if required for the hash calculation) and generates the message digest or tag.

The calculation process can be completed without exposing any key data and the intermediate data of the process outside of the security engine. This process is performed by the hash circuit and storage area of the security engine internally.

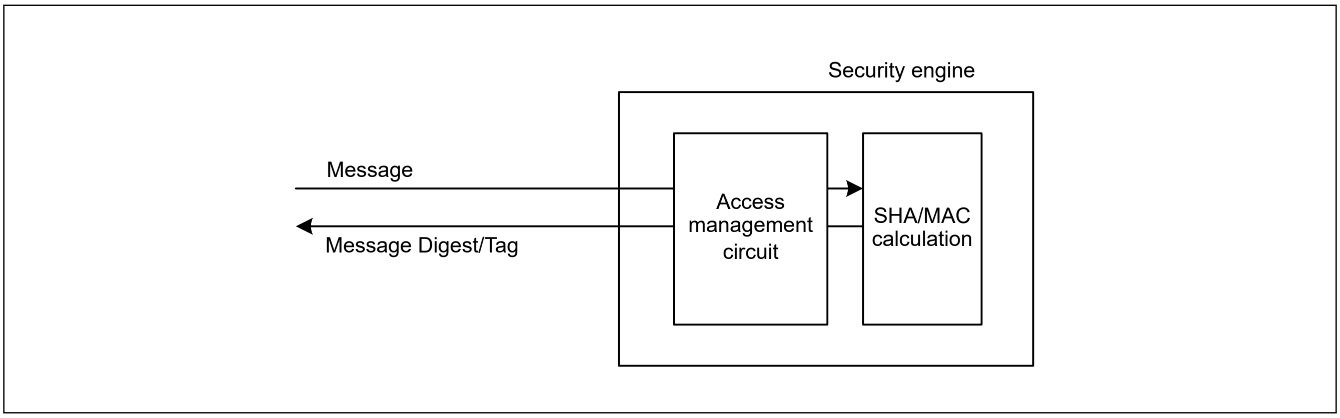

Figure 52.4 Conceptual diagram of the hash generator

52.2.4 Encryption and Decryption

Follow the procedure below to encrypt and decrypt the data:

1. Input the key information to the security engine.
2. Input the target data to the security engine. Plaintext data is converted to ciphertext and ciphertext data to plaintext.
3. Read the converted data.

The encryption/decryption circuit has input and output buffers, and can perform encryption/decryption in parallel with data input/output. Figure 52.5 shows the encryption engine timing.

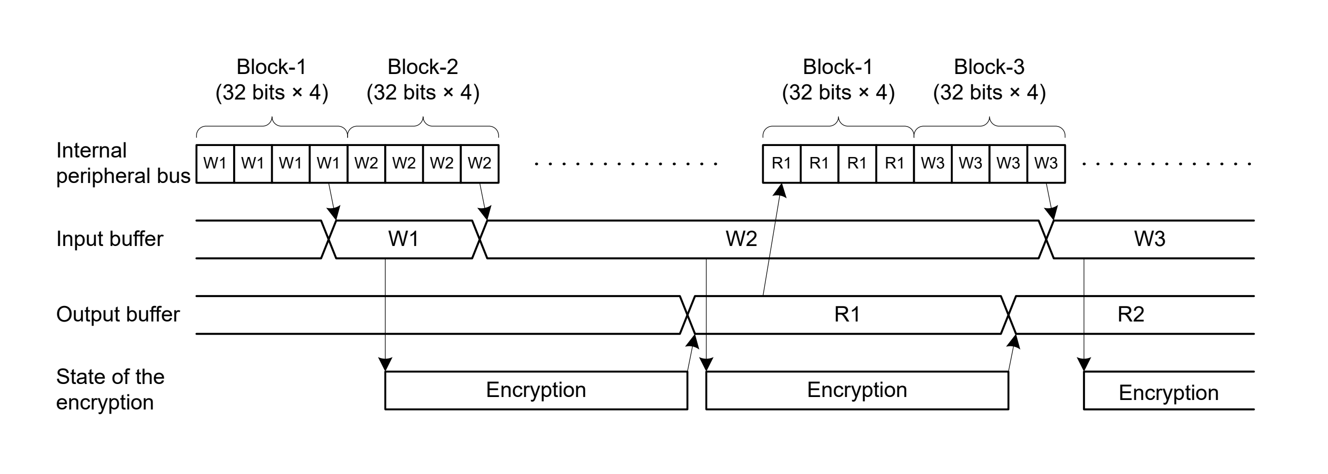

Figure 52.5 Encryption and decryption timing (AES)

52.3 Usage Notes

52.3.1 Software Standby Mode

When Software Standby mode is entered while the security engine is in process, proper processing cannot be resumed after cancelling Software Standby mode. Software Standby mode should therefore be entered while the security engine is not running.

52.3.2 Module-Stop Function Setting

The security engine operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The security engine module is initially stopped after reset. Releasing the module-stop state enables access to the registers.

52.3.3 SPA/DPA Protections

SPA/DPA protections can optionally be enabled for encryption/decryption processing.

52.3.4 Restrictions on Open Process

While open process of the API of security engine (R_RSIP_Open) is running, the following restriction applies:

- The CPUCLK0 frequency and the ICLK frequency must be the same.

53. 16-bit A/D Converter (ADC16H)

This is the ADC_B version of the ADC16H peripheral module. ADC_B is referred to as ADC16H in this chapter.

53.1 Overview

This MCU contains two units of Noise-Shaping SAR-type A/D converters (ADC16H) that is the hybrid architecture with features of SAR-type and Delta-Sigma modulation-type. The A/D converter unit 0 (ADC0) can select up to 15 channels of analog inputs. The A/D converter unit 1 (ADC1) can select up to 15 channels of analog inputs. The temperature sensor, internal reference voltage, VBATT 1/6 voltage monitor output, and D/A converters can be A/D-converted by A/D converter unit 0 or unit 1. A/D conversion data can be selected from 16-bit, 14-bit, 12-bit, and 10-bit length data formats.

The ADC16H has the following features:

- Resolution: Up to 16-bit
- Fast conversion: Up to 6.25 Msps (0.16 µs per channel) (when A/D conversion clock ADCLK = 50 MHz)
- Input channels: Up to 23 analog input channels
- Support single-ended input or differential inputs
- Self-calibration function
- Built-in channel-dedicated sample-and-hold circuit (S&H)

Table 53.1 shows the ADC16H specifications, Table 53.2 shows the correspondence between ADC16H functions and ADC16H operation mode, and Table 53.3 shows the ADC16H I/O pins.

Figure 53.1 shows the block diagram of ADC16H. Figure 53.2 shows the analog channel structure for A/D converter unit 0. Figure 53.3 shows the analog channel structure for A/D converter unit 1.

Table 53.5 shows the ADC16H channel configuration of the extended analog function.

Table 53.1 ADC16H specifications (1 of 3)

Item	Description
Number of units	Two units (unit 0 and unit 1)
Input channels	● Support single-ended input or differential inputs ● Up to 23 analog input channels – A/D converter unit 0: Up to 15 analog input channels at Single-ended input, 6 analog input channels (3 pairs) of which support Differential inputs. – A/D converter unit 1: Up to 15 analog input channels at Single-ended input, 6 analog input channels (3 pairs) of which support Differential inputs. – 7 analog input channels are shared by A/D converter unit 0 and unit 1
Extended analog function	Self-diagnosis, temperature sensor, internal reference voltage, D/A converter (DA0, DA1), VBATT 1/6 voltage monitor output
A/D conversion method	● Successive approximation register method in SAR mode ● Noise-Shaping Successive approximation register method in Oversampling mode and Hybrid mode
Resolution of A/D converter	● Up to 12-bits in SAR mode ● Up to 16-bits in Oversampling mode or Hybrid mode
Conversion time	0.16 µs per channel (when A/D conversion clock ADCLK = 50 MHz).
A/D conversion clock	The A/D conversion clock (ADCLK) can be set by selecting the clock source and the division ratio as follows: ● The clock source: the ADC clock ADCCLK*1, the peripheral module clock PCLKA*1, the GPT clock GPTCLK*1. ● The division ratio: 1/2/3/4/5 A/D conversion clock (ADCLK) can operate between 25 MHz at a minimum and 60 MHz at a maximum.
A/D conversion data	● A/D conversion results are stored in data register or FIFO. ● A/D conversion results are available in 16-, 14-, 12-, and 10-bit data formats.

Table 53.1 ADC16H specifications (2 of 3)

<table>
<tr><th>Item</th><th>Description</th></tr>
<tr><td>Operation mode</td><td>
• SAR mode
– A/D converter samples the signal source once, and convert by Successive Approximation Register method
– Fast A/D conversion
– Support up to 8 channels per one scan group
– Support single-ended input and differential input
• Oversampling mode
– A/D converter oversamples the signal source, and converts analog-to-digital by Noise Shaping Successive Approximation Register method
– High-accuracy A/D conversion
– Support up to 8 channels per one scan group
– Support single-ended input and differential input
• Hybrid mode
– A/D converter oversamples the signal source, and converts analog-to-digital by Noise Shaping Successive Approximation Register method
– High-accuracy A/D conversion
– High data rate in continuous scanning operation
– Support up to 4 channels per one scan group
– Support single-ended input and differential input
</td></tr>
<tr><td>Scan mode</td><td>
• Single scan mode
– Assign any selected analog input or analog channel of the extended analog function to any scan group, and convert the selected analog input only once per scan group for A/D conversion.
– By selecting the scan start conditions for each scan group individually, A/D conversion for each scan group can be started at different times.
• Continuous scan mode
– Assign any selected analog input or analog channel of the extended analog function to any scan group and repeat A/D conversion in scan group units.
• Background continuous scan mode
– Assign any selected analog input or analog channel of the extended analog function to any scan group and repeat A/D conversion in scan group units.
– The A/D conversion is performed in the background and, if the A/D conversion start trigger is entered, the A/D conversion data at that point is acquired.
• One-channel continuous scan mode
– Repeat A/D conversion of a single analog input or analog channel of an extended analog function.
– If the A/D conversion start trigger is entered, the channel to be converted can be switched.
– This conversion mode is suitable for use cases where a change to the A/D conversion channel is required according to an external factor.
• Fixed-channel continuous scan mode
– First scan a fixed number of fixed channels, then scan the non-fixed channels assigned to the scan group in sequence, and repeat these operations.
– Enabling adjustment of the A/D conversion frequency and A/D converts more channels than in normal Hybrid mode.
</td></tr>

Table 53.1 ADC16H specifications (3 of 3)

Item	Description
Functions	● Virtual Channel function (33 virtual channels) ● Scan Group function (up to 9 scan groups) ● Variable sampling time (select from 16 tables per virtual channel) ● Channel-dedicated sample-and-hold circuit (SH) (3 SH units for A/D converter unit 0, 3 SH units for A/D converter unit 1) ● Self-diagnosis function for A/D converter ● Selectable A/D-converted value addition mode or average mode ● Analog input disconnection detection assist function (discharge function/precharge function) ● Selectable the data format from 16- / 14- / 12- / 10-bit. ● Selectable the signed-data or the unsigned-data format ● Limiter Clip function (up to 8 tables) ● Compare Match function (up to 8 tables) ● Self-calibration function ● User's Gain adjustment function ● User's Offset adjustment function ● Built-in FIFO (8 stages per each scan group) ● Built-in digital filter (support only Oversampling mode and Hybrid mode) ● Multiple A/D converters unit-to-unit synchronous operation function
Interrupt sources	● A/D scan end interrupt – Generates the interrupt requests and the ELC events at the end of A/D scan operation for the scan group i (ADC_ADIi (i = 0 to 8)). The interrupt requests are independent for each scan group. ● FIFO data read request interrupt – Generates the interrupt requests when the number of vacant stages of FIFO for the scan group i becomes less than or equal to the specified value (ADC_FIFOREQi (i = 0 to 8)). The interrupt requests are independent for each scan group. ● FIFO data overflow interrupt – Generates the interrupt request when the overflow occurs in any of the FIFO for the scan groups 0 to 8 (ADC_FIFOOVF). ● Limiter clip interrupt – Generates the interrupt request when the limiter clip using the limiter tables 0 to 7 is occurred for A/D conversion results (ADC_LIMCLPI). ● Compare match interrupt – Generates the interrupt requests when the compare match using the compare match tables j are occurred for A/D conversion results (ADC_CMPIj (j = 0 to 3)). The interrupt requests are independent for each compare match table. ● Composite compare match interrupt – Generates the interrupt requests and the ELC events when the compare match of the composite condition using compare match tables 0 to 7 occurs (ADC_CCMPMm (m = 0, 1), ADC_CCMPUMm (m = 0, 1)). ● A/D converter error interrupt – Generates the interrupt requests when the operational error is detected in A/D converter Unit j (ADC_ERRj (j = 0, 1)). ● A/D conversion overflow interrupt – Generates the interrupt request when the A/D conversion result overflow is occurred (ADC_RESOVFj (j = 0, 1)). The interrupt requests are independent for A/D converter unit j. ● A/D converter calibration end interrupt – Generates the interrupt requests at the end of calibration operation of A/D converter unit j (ADC_CALENDj (j = 0, 1)).
ELC interface	● Trigger Input – Scan can be started by the trigger from the ELC. ● Event Generation – An event is generated at the end of each scan operation for the scan group 0 to 8. – An event is generated when Composite Compare Match is occurred.
Reference voltage	● Unit 0: – VREFH0 is the analog reference voltage. – VREFL0 is the analog reference ground. ● Unit 1: – VREFH is the analog reference voltage. – VREFL is the analog reference ground.
Module-stop function	Module-stop state can be set to reduce power consumption.*2

Note 1. For details, see section 9, Clock Generation Circuit.
Note 2. For details, see section 11, Low Power Mode.

Digital calculation	Digital filter function	—	—	✓*1	✓*1	✓*1	✓*1	✓*1	✓*1	✓*1
	User’s gain/ offset adjustment function	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Addition/average function	✓	✓	✓	✓	✓	✓	✓	✓	—
	Limiter clip function	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Compare match function	✓	✓	✓	✓	✓	✓	✓	✓	✓
FIFO function		✓	✓	✓	✓	✓	✓	✓	✓	✓

Note 1. Use of the digital filter function is required when in Oversampling mode and Hybrid mode.
Note 2. When using the channel-dedicated sample-and-hold circuit in group priority operation, it is available only for the highest priority scan group.
Note 3. Only fixed channels are supported when the number of fixed channels is set to 3 CH and all fixed channels are set to channel-dedicated sample-and-hold circuit. Non-fixed channels cannot use channel-dedicated sample-and-hold circuit.

Table 53.3 ADC16H I/O pins

Pin name	I/O	Function
AVCC0	Input	Analog block power supply pin for unit 0 and unit 1
AVSS0	Input	Analog block power supply ground pin for unit 0 and unit 1
VREFH0	Input	Analog reference voltage supply pin for unit 0
VREFL0	Input	Analog reference ground pin for unit 0
VREFH	Input	Analog reference voltage supply pin for unit 1
VREFL	Input	Analog reference ground pin for unit 1
AN000 to AN022	Input	Analog input pins
SHIN0P to SHIN2P, SHIN4P to SHIN6P	Input	Analog input pins for channel-dedicated sample-and-hold circuit ● For single-ended input: Connect to signal source ● For differential input: Functions as the non-inverting inputs (+) terminal for differential input
SHIN0N to SHIN2N, SHIN4N to SHIN6N	Input	Analog input pins for channel-dedicated sample-and-hold circuit ● For single-ended input: Connect to signal source ● For differential input: Functions as the inverting inputs (-) terminal for differential input
ADTRG0, ADTRG1	Input	External trigger input pin for starting A/D conversion, active-low.
ADST0, ADST1	Output	A/D conversion start
AD0FLAG1, AD1FLAG1	Output	A/D conversion end
ADSYNC	Output	Synchronization signal between units

117	Self-diagnosis S&H unit 5*2	—	—	—	✓
118	Self-diagnosis S&H unit 6*2	—	—	—	✓

Note 1. Do not perform A/D conversions of the same signal source from both A/D converter unit 0 and unit 1.
Note 2. The self-diagnosis function is only supported with differential input.

53.2 Register Descriptions

53.2.1 System

53.2.1.1 ADCLKENR : A/D Conversion Clock Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLKEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLKEN	ADCLK Operating Enable 0: Stop ADCLK 1: Supply ADCLK	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The ADCLKENR controls the supply of the A/D conversion clock (ADCLK).

53.2.1.2 ADCLKSR : A/D Conversion Clock Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLKSR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLKSR	ADCLK status 0: ADCLK is stopped 1: ADCLK is in supply	R
31:1	—	These bits are read as 0.	R

The ADCLKSR register indicates the supply status of the A/D conversion clock (ADCLK).

53.2.1.3 ADCLKCR : A/D Conversion Clock Control Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DIVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLKSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CLKSEL[1:0]	ADCLK Clock Source Select 0 0: ADC Clock (ADCCLK) 0 1: GPT Clock (GPTCLK) 1 0: Peripheral Module Clock A (PCLKA) 1 1: Setting prohibited	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W
18:16	DIVR[2:0]	Clock Division Ratio Select 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/3 0 1 1: 1/4 1 0 0: 1/5 Others: Setting prohibited	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

The ADCLKCR register selects the frequency of A/D conversion clock (ADCLK). The frequency of ADCLK should be set within the range specified in the section 62, Electrical Characteristics.

CLKSEL[1:0] bits (ADCLK Clock Source Select)

CLKSEL[1:0] bits select the clock source of A/D conversion clock (ADCLK).

DIVR[2:0] bits (Clock Division Ratio Select)

DIVR[2:0] bits select the division ratio for the clock source selected by CLKSEL[1:0] bits. The clock divided by the clock source selected by CLKSEL[1:0] bits at the ratio set by DIVR[2:0] bits becomes the A/D conversion operating clock (ADCLK).

53.2.1.4 ADSYCR : A/D Converter Synchronous Operation Control Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADSYDIS1	ADSYDIS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	ADSYCYC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1

Bit	Symbol	Function	R/W
7:0	ADSYCYC[7:0]	Synchronous Operation Period Cycle These bits should be set in the range from 5 to 255. The settings of 0 to 4 are prohibited.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
16	ADSYDIS0	ADC0 Synchronous Operation Select 0: Enable ADC0 synchronous operation 1: Disable ADC0 synchronous operation	R/W
17	ADSYDIS1	ADC1 Synchronous Operation Select 0: Enable ADC1 synchronous operation 1: Disable ADC1 synchronous operation	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The ADSYCR register controls the synchronous operation function.

ADSYCYC[7:0] bits (Synchronous Operation Period Cycle)

These bits are selected the synchronous operation period cycles.

These bits set in the range from 5 to 255 regardless of whether the synchronous operation function is used or not. The settings from 0 to 4 are prohibited.

ADSYDIS0 bit (ADC0 Synchronous Operation Select)

ADSYDIS0 bit selects enable/disable the synchronous operation of ADC0. If the synchronous operation is enabled, the ADC0 operates synchronously with other A/D converter that has synchronous operation enabled.

ADSYDIS1 bit (ADC1 Synchronous Operation Select)

ADSYDIS1 bit selects enables/disables to the synchronous operation of ADC1. If the synchronous operation is enabled, the ADC1 operates synchronously with other A/D converter that has synchronous operation enabled.

53.2.1.5 ADUSLPCR0 : A/D Converter Unit Sleep Control Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADUSLP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADUSLP	Sleep setting of A/D converter unit 0 0: Set A/D converter to Normal operation mode 1: Set A/D converter to Sleep operation mode	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

This register is used to control the A/D converter unit 0 Sleep mode.

53.2.1.6 ADUSLPCR1 : A/D Converter Unit Sleep Control Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADUSLP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADUSLP	Sleep setting of A/D converter unit 1 0: Set A/D converter to Normal operation mode 1: Set A/D converter to Sleep operation mode	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

This register is used to control the A/D converter unit 1 Sleep mode.

53.2.1.7 ADERINTCR : A/D Conversion Error Interrupt Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADEIE1	ADEIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADEIE0	ADC0 A/D Conversion Error Interrupt Enable 0: Disable A/D conversion error interrupt for ADC0 1: Enable A/D conversion error interrupt for ADC0	R/W
1	ADEIE1	ADC1 A/D Conversion Error Interrupt Enable 0: Disable A/D conversion error interrupt for ADC1 1: Enable A/D conversion error interrupt for ADC1	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The ADERINTCR register controls the enable/disable to the A/D conversion error interrupt.

53.2.1.8 ADOVFINTCR : A/D Conversion Overflow Interrupt Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x024

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADOVFIE1	ADOVFIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADOVFIE0	ADC0 A/D Conversion Overflow Interrupt Enable 0: Disable A/D conversion overflow interrupt for ADC0 1: Enable A/D conversion overflow interrupt for ADC0	R/W
1	ADOVFIE1	ADC1 A/D Conversion Overflow Interrupt Enable 0: Disable A/D conversion overflow interrupt for ADC1 1: Enable A/D conversion overflow interrupt for ADC1	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The ADOVFINTCR register controls the enable/disable to the A/D conversion overflow interrupt.

53.2.1.9 ADCALINTCR : Calibration Interrupt Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CALENDIE1	CALENDIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W
16	CALENDIE0	ADC0 Calibration End Interrupt Enable 0: Disable Calibration End Interrupt for ADC0 1: Enable Calibration End Interrupt for ADC0	R/W
17	CALENDIE1	ADC1 Calibration End Interrupt Enable 0: Disable Calibration End Interrupt for ADC1 1: Enable Calibration End Interrupt for ADC1	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The ADCALINTCR register controls the enable/disable to the Calibration End Interrupt.

53.2.1.10 ADMDR : A/D Converter Mode Selection Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADMD1[3:0]				—	—	—	—	ADMD0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ADMD0[3:0]	ADC0 Mode Selection 0x0: SAR mode – Single scan mode 0x1: SAR mode – Continuous scan mode 0x4: Oversampling mode – Single scan mode 0x5: Oversampling mode – Continuous scan mode 0x6: Oversampling mode – One-channel continuous scan mode 0x8: Hybrid mode – Single scan mode 0x9: Hybrid mode – Continuous scan mode 0xA: Hybrid mode – Background continuous scan mode 0xB: Hybrid mode – Fixed-channel continuous scan mode Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
11:8	ADMD1[3:0]	ADC1 Mode Selection 0x0: SAR mode – Single scan mode 0x1: SAR mode – Continuous scan mode 0x4: Oversampling mode – Single scan mode 0x5: Oversampling mode – Continuous scan mode 0x6: Oversampling mode – One-channel continuous scan mode 0x8: Hybrid mode – Single scan mode 0x9: Hybrid mode – Continuous scan mode 0xA: Hybrid mode – Background continuous scan mode 0xB: Hybrid mode – Fixed-channel continuous scan mode Others: Setting prohibited	R/W
31:12	—	These bits are read as 0. The write value should be 0.	R/W

The ADMDR register selects the operation mode and the scan mode for each A/D converter.

53.2.2 Scan Group

53.2.2.1 ADGSPCR : A/D Group Scan Priority Control Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x044

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	GRP1	LGRRS1	RSCN1	PGS1	—	—	—	—	GRP0	LGRRS0	RSCN0	PGS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PGS0	ADC0 Group Priority Control Setting 0: ADC0 operation is without group priority control 1: ADC0 operation is with group priority control in SAR mode. Setting prohibited when other than SAR mode.	R/W
1	RSCN0	ADC0 Group Priority Control Setting 2 0: Set when PGS0 is set to 0. 1: Set when PGS0 is set to 1.	R/W
2	LGRRS0	ADC0 Group Priority Control Setting 3 0: Set when PGS0 is set to 0. 1: Set when PGS0 is set to 1.	R/W
3	GRP0	ADC0 Group Priority Control Setting 4 0: Set the following case: ● When PGS0 is set to 0 ● When PGS0 is set to 1 and ADC0 is SAR mode – Single scan mode. 1: Set when PGS0 is set to 1 and ADC0 is SAR mode – Continuous scan mode.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	PGS1	ADC1 Group Priority Control Setting 0: ADC1 operation is without group priority control 1: ADC1 operation is with group priority control in SAR mode. Setting prohibited when other than SAR mode.	R/W
9	RSCN1	ADC1 Group Priority Control Setting 2 0: Set when PGS1 is set to 0. 1: Set when PGS1 is set to 1.	R/W

Bit	Symbol	Function	R/W
10	LGRRS1	ADC1 Group Priority Control Setting 3 0: Set when PGS1 is set to 0. 1: Set when PGS1 is set to 1.	R/W
11	GRP1	ADC1 Group Priority Control Setting 4 0: Set the following case: ● When PGS1 is set to 0 ● When PGS1 is set to 1 and ADC1 is SAR mode – Single scan mode. 1: Set when PGS1 is set to 1 and ADC1 is SAR mode – Continuous scan mode.	R/W
31:12	—	These bits are read as 0. The write value should be 0.	R/W

The ADGSPCR register controls the group priority operation to each A/D converter. For details on setting this register, see section 53.3.18. Group Priority Operation.

53.2.2.2 ADSGER : Scan Group Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x048

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SGRE8	SGRE7	SGRE6	SGRE5	SGRE4	SGRE3	SGRE2	SGRE1	SGRE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	SGRE0 to SGRE8	Scan Group n Enable The suffix number of each bit symbol corresponds to the scan group number n. 0: Disable the scan group n 1: Enable the scan group n	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The ADSGER register selects the enable/disable to each scan group.

SGREn bit (Scan Group n Enable) (n = 0 to 8)

The SGREn bit selects the enable/disable to the scan group n. When SGREn is set to 1, A/D conversion with the scan group n is available. When SGREn is set to 0, A/D conversion with the scan group n is not available, even if the trigger corresponding to the scan group n is input.

53.2.2.3 ADSGCR0 : Scan Group Control Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x04C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	SGADS3[1:0]		—	—	—	—	—	—	SGADS2[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SGADS1[1:0]		—	—	—	—	—	—	SGADS0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SGADS0[1:0]	Scan Group 0 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	SGADS1[1:0]	Scan Group 1 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	SGADS2[1:0]	Scan Group 2 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	SGADS3[1:0]	Scan Group 3 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSGCR0 register selects which A/D converter is used for each scan group.

53.2.2.4 ADSGCR1 : Scan Group Control Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x050

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	SGADS7[1:0]		—	—	—	—	—	—	SGADS6[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SGADS5[1:0]		—	—	—	—	—	—	SGADS4[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SGADS4[1:0]	Scan Group 4 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	SGADS5[1:0]	Scan Group 5 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	SGADS6[1:0]	Scan Group 6 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	SGADS7[1:0]	Scan Group 7 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSGCR1 register selects which A/D converter is used for each scan group.

53.2.2.5 ADSGCR2 : Scan Group Control Register 2

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x054

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGADS8[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SGADS8[1:0]	Scan Group 8 A/D Converter Selection 0 0: Select ADC0 0 1: Select ADC1 Others: Setting prohibited	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The ADSGCR2 register selects which A/D converter is used for each scan group.

53.2.2.6 ADINTCR : Scan End Interrupt Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x05C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ADIE8	ADIE7	ADIE6	ADIE5	ADIE4	ADIE3	ADIE2	ADIE1	ADIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	ADIE0 to ADIE8	Scan Group n Scan End Interrupt Enable The suffix number of each bit symbol corresponds to the scan group number n. 0: Disable scan end interrupt 1: Enable scan end interrupt	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The ADINTCR register enables/disables the scan end interrupt.

53.2.2.7 ADTRGEXTn : External Trigger Enable Register n (n = 0 to 8)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x0C0 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRGEXT1	TRGEXT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TRGEXT0	External Trigger Input 0 (ADTRG0) Enable 0: Disable ADTRG0 1: Enable ADTRG0	R/W
1	TRGEXT1	External Trigger Input 1 (ADTRG1) Enable 0: Disable ADTRG1 1: Enable ADTRG1	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGEXTn register enables/disables the External Trigger input 0 and 1 (ADTRG0 and ADTRG1) as the starting conditions for A/D conversion of scan group n.

53.2.2.8 ADTRGELCn : ELC Trigger Enable Register n (n = 0 to 8)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x0C4 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	TRGELC5	TRGELC4	TRGELC3	TRGELC2	TRGELC1	TRGELC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	TRGELC0 to TRGELC5	ELC Trigger m Enable The suffix number of each bit symbol corresponds to the ELC trigger number m. 0: Disable ELC Trigger m 1: Enable ELC Trigger m	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGELCn register enables/disables the ELC Trigger m as the starting conditions for A/D conversion of scan group n.

53.2.2.9 ADTRGGPTn : GPT Trigger Enable Register n (n = 0 to 8)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x0C8 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	TRGGPTB13	TRGGPTB12	TRGGPTB11	TRGGPTB10	TRGGPTB9	TRGGPTB8	TRGGPTB7	TRGGPTB6	TRGGPTB5	TRGGPTB4	TRGGPTB3	TRGGPTB2	TRGGPTB1	TRGGPTB0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TRGGPTA13	TRGGPTA12	TRGGPTA11	TRGGPTA10	TRGGPTA9	TRGGPTA8	TRGGPTA7	TRGGPTA6	TRGGPTA5	TRGGPTA4	TRGGPTA3	TRGGPTA2	TRGGPTA1	TRGGPTA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	TRGGPTA0 to TRGGPTA13	GPT channel m A/D Conversion Starting Request A Enable The suffix number of each bit symbol corresponds to the GPT channel number m. 0: Disable the A/D conversion stating request A from GPT channel m 1: Enable the A/D conversion stating request A from GPT channel m	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
29:16	TRGGPTB0 to TRGGPTB13	GPT channel m A/D Conversion Starting Request B Enable The suffix number of each bit symbol corresponds to the GPT channel number m. 0: Disable the A/D conversion stating request B from GPT channel m 1: Enable the A/D conversion stating request B from GPT channel m	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGGPTn register enables/disables the A/D conversion starting request A/B from GPT channel m as the starting conditions for A/D conversion of scan group n.

53.2.2.10 ADTRGENR : A/D Conversion Start Trigger Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	STTRGEN8	STTRGEN7	STTRGEN6	STTRGEN5	STTRGEN4	STTRGEN3	STTRGEN2	STTRGEN1	STTRGEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	STTRGEN0 to STTRGEN8	Scan Group n A/D Conversion Start Trigger Enable The suffix number of each bit symbol corresponds to the scan group number n. 0: Disable the A/D conversion start trigger 1: Enable the A/D conversion start trigger	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGENR register enables/disables the trigger from the peripheral modules for starting the A/D conversion of Scan group n. The triggers for each scan group are selected in the ADTRGEXTn, ADTRGELCn, and ADTRGGPTn registers.

STTRGENn bit (Scan Group n A/D Conversion Start Trigger Enable)

The STTRGENn bit selects whether the trigger inputs from the peripheral module, which are selected in the ADTRGEXTn, ADTRGELCn, and ADTRGGPTn registers, is used for the A/D conversion start condition.

When the STTRGENn bit is set to 1, the A/D conversion of scan group n can be started by trigger inputs from the peripheral module.

When the STTRGENn bit is set to 0, the A/D conversion of scan group n cannot be started by trigger inputs from the peripheral module. In this setting, the A/D conversion of scan group n can be only started by writing to the ADSYSTR or ADSTRn registers.

53.2.2.11 ADTRGDLR0 : A/D Conversion Start Trigger Delay Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x1C0

Bit position:	31								23							16									7							0
Bit field:	—	—	—	—	—	—	—	—	TRGDLY1[7:0]								—	—	—	—	—	—	—	—	TRGDLY0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TRGDLY0[7:0]	Scan Group 0 Trigger Input Delay Configuration	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	TRGDLY1[7:0]	Scan Group 1 Trigger Input Delay Configuration	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGDLR0 register controls the input delay added to the External trigger inputs, ELC triggers and GPT triggers which are the starting conditions for the A/D conversion of each scan group. The input delay value is given as the register setting value × the cycle of the A/D conversion clock (ADCLK).

53.2.2.12 ADTRGDLR1 : A/D Conversion Start Trigger Delay Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x1C4

Bit position:	31								23 16									7 0
Bit field:	—	—	—	—	—	—	—	—	TRGDLY3[7:0]	—	—	—	—	—	—	—	—	TRGDLY2[7:0]
Value after reset:	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	TRGDLY2[7:0]	Scan Group 2 Trigger Input Delay Configuration	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	TRGDLY3[7:0]	Scan Group 3 Trigger Input Delay Configuration	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGDLR1 register controls the input delay added to the External trigger inputs, ELC triggers and GPT triggers which are the starting conditions for the A/D conversion of each scan group. The input delay value is given as the register setting value × the cycle of the A/D conversion clock (ADCLK).

53.2.2.13 ADTRGDLR2 : A/D Conversion Start Trigger Delay Register 2

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x1C8

Bit position:	31								23 16									7 0
Bit field:	—	—	—	—	—	—	—	—	TRGDLY5[7:0]	—	—	—	—	—	—	—	—	TRGDLY4[7:0]
Value after reset:	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	TRGDLY4[7:0]	Scan Group 4 Trigger Input Delay Configuration	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	TRGDLY5[7:0]	Scan Group 5 Trigger Input Delay Configuration	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGDLR2 register controls the input delay added to the External trigger inputs, ELC triggers and GPT triggers which are the starting conditions for the A/D conversion of each scan group. The input delay value is given as the register setting value × the cycle of the A/D conversion clock (ADCLK).

53.2.2.14 ADTRGDLR3 : A/D Conversion Start Trigger Delay Register 3

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x1CC

Bit position:	31								23 16									7 0
Bit field:	—	—	—	—	—	—	—	—	TRGDLY7[7:0]	—	—	—	—	—	—	—	—	TRGDLY6[7:0]
Value after reset:	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	TRGDLY6[7:0]	Scan Group 6 Trigger Input Delay Configuration	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	TRGDLY7[7:0]	Scan Group 7 Trigger Input Delay Configuration	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGDLR3 register controls the input delay added to the External trigger inputs, ELC triggers and GPT triggers which are the starting conditions for the A/D conversion of each scan group. The input delay value is given as the register setting value × the cycle of the A/D conversion clock (ADCLK).

53.2.2.15 ADTRGDLR4 : A/D Conversion Start Trigger Delay Register 4

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x1D0

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRGDLY8[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TRGDLY8[7:0]	Scan Group 8 Trigger Input Delay Configuration	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The ADTRGDLR4 register controls the input delay added to the External trigger inputs, ELC triggers and GPT triggers which are the starting conditions for the A/D conversion of each scan group. The input delay value is given as the register setting value × the cycle of the A/D conversion clock (ADCLK).

53.2.2.16 ADSWNR0 : A/D conversion times per scan Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x060

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	SWNOFIX[2:0]			—	—	—	—	—	—	SWFIX[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	BCSSTSL[3:0]				—	—	—	—	—	SWNUM[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SWNUM[2:0]	Sweep Conversion Channel Number per scan Specifies the scan period of fixed channel scan mode. 0x0: 1 times 0x1: 2 times ⋮ 0x7: 8 times	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Function	R/W
11:8	BCSSTSL[3:0]	Blank Channel Sampling State Table Select Sampling state table selection bit for blank channel. Select the analog input sampling time setting table. The sampling state value of the selected table is used. 0x0: Select sampling state table 0 (ADSSTR0.SST0[9:0]) 0x1: Select sampling state table 1 (ADSSTR0.SST1[9:0]) 0x2: Select sampling state table 2 (ADSSTR1.SST2[9:0]) 0x3: Select sampling state table 3 (ADSSTR1.SST3[9:0]) ⋮ 0xF: Select sampling state table 15 (ADSSTR7.SST15[9:0])	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R
17:16	SWFIX[1:0]	Fixed channel Number Specifies the fixed channel number. 0x0: 1 fixed channel 0x1: 2 fixed channels 0x2: 3 fixed channels 0x3: Setting prohibited	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R
26:24	SWNOFIX[2:0]	Non-Fixed Channel Number Specifies the non-fixed channel number. 0x1: 1 channels Others: Setting prohibited	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R

The ADSWNR0 register sets the A/D conversion period for the fixed channel scan of A/D converter Unit 0.

SWNUM[2:0] bits (Sweep Conversion Channel Number per scan)

The SWNUM[2:0] bits specify the AD conversion cycle for fixed channel scan of A/D converter Unit 0.

The A/D conversion cycle is the value set by SWNUM[2:0] + 1.

BCSSTSL[3:0] bits (Blank Channel Sampling State Table Select)

The BCSSTSL[3:0] bits set the number of sampling states on blank channels that do not get the A/D conversion data.

SWFIX[1:0] bits (Fixed channel Number)

The SWFIX[1:0] bits set the number of fixed channels that are converted channels sweeping through each scan.

SWNOFIX[2:0] bits (Non-Fixed Channel Number)

The SWNOFIX[2:0] bits set the number of non-fixed channels that are converted while switching channels in each scan.

Note: This register is valid only when fixed channel continuous scan is set (ADMD0[3:0] = 0xB).

53.2.2.17 ADSWNR1 : A/D conversion times per scan Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x064

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	SWNOFIX[2:0]			—	—	—	—	—	—	SWFIX[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	BCSSTSL[3:0]				—	—	—	—	—	SWNUM[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SWNUM[2:0]	Sweep Conversion Channel Number per scan Specifies the scan period of fixed channel scan mode. 0x0: 1 times 0x1: 2 times : 0x7: 8 times	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R
11:8	BCSSTSL[3:0]	Blank Channel Sampling State Table Select Sampling state table selection bit for blank channel. Select the analog input sampling time setting table. The sampling state value of the selected table is used. 0x0: Select sampling state table 0 (ADSSTR0.SST0[9:0]) 0x1: Select sampling state table 1 (ADSSTR0.SST1[9:0]) 0x2: Select sampling state table 2 (ADSSTR1.SST2[9:0]) 0x3: Select sampling state table 3 (ADSSTR1.SST3[9:0]) : 0xF: Select sampling state table 15 (ADSSTR7.SST15[9:0])	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R
17:16	SWFIX[1:0]	Fixed channel Number Specifies the fixed channel number. 0x0: 1 fixed channel 0x1: 2 fixed channels 0x2: 3 fixed channels 0x3: Setting prohibited	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R
26:24	SWNOFIX[2:0]	Non-Fixed Channel Number Specifies the non-fixed channel number. 0x1: 1 channels Others: Setting prohibited	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R

The ADSWNR1 register sets the A/D conversion period for the fixed channel scan of A/D converter Unit 1.

SWNUM[2:0] bits (Sweep Conversion Channel Number per scan)

The SWNUM[2:0] bits specify the AD conversion cycle for fixed channel scan of A/D converter Unit 1.

The A/D conversion cycle is the value set by SWNUM[2:0] + 1.

BCSSTSL[3:0] bits (Blank Channel Sampling State Table Select)

The BCSSTSL[3:0] bits set the number of sampling states on blank channels that do not get the A/D conversion data.

SWFIX[1:0] bits (Fixed channel Number)

The SWFIX[1:0] bits set the number of fixed channels that are converted channels sweeping through each scan.

SWNOFIX[2:0] bits (Non-Fixed Channel Number)

The SWNOFIX[2:0] bits set the number of non-fixed channels that are converted while switching channels in each scan.

Note: This register is valid only when fixed channel continuous scan is set (ADMD1[3:0] = 0xB).

53.2.2.18 ADDECCR : One-channel Continuous Scan Mode Decimation Control Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x080

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DCIM1[4:0]					—	—	—	DCIM0[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	DCIM0[4:0]	One-channel continuous scan mode output decimation setting for A/D converter unit 0 0x0: No decimation 0x3: Output data once for every 4 conversions (thinned 3 times) 0x7: Output data once for every 8 conversions (thinned out 7 times) Others: Setting prohibited	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
12:8	DCIM1[4:0]	One-channel continuous scan mode output decimation setting for A/D converter unit 1 0x0: No decimation 0x3: Output data once for every 4 conversions (thinned 3 times) 0x7: Output data once for every 8 conversions (thinned out 7 times) Others: Setting prohibited	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

ADDECCR register controls the decimation of data output in the one-channel continuous scan mode.

53.2.2.19 ADACMDR : A/D Converter Accuracy Mode Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ADHACMD1	—	—	—	—	—	—	—	ADHACMD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADHACMD0	A/D converter unit 0 high accuracy mode setting 0: High accuracy mode of A/D converter is disabled 1: High accuracy mode of A/D converter is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	ADHACMD1	A/D converter unit 1 high accuracy mode setting 0: High accuracy mode of A/D converter is disabled 1: High accuracy mode of A/D converter is enabled	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The ADACMDR register controls the accuracy mode of the A/D converter.

ADHACMDx (x = 0, 1) bit (A/D Converter Accuracy Mode Setting Register)

The ADHACMDx (x = 0, 1) bit selects the accuracy mode of the A/D converter.

Setting this bit to 1 enables high accuracy mode of the A/D converter. Enabling the high accuracy mode provides higher accuracy A/D conversion results than when the high accuracy mode is disabled. For details on analog characteristics, see section 62, Electrical Characteristics.

When setting this bit to 1 (enable high accuracy mode), some register setting restrictions apply to this function. For details, see .

53.2.3 Virtual Channel

53.2.3.1 ADCHCRn : A/D Conversion Channel Configuration Register n (n = 0 to 32)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x600 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	SSTSEL[3:0]

Bit	Symbol	Function	R/W
15	AINMD	Analog Input mode selection[*1,*2] 0: Single-ended input 1: Differential input	R/W
19:16	SSTSEL[3:0]	Sampling State Table Selection 0x0: Select the sampling state table 0 0x1: Select the sampling state table 1 0x2: Select the sampling state table 2 0x3: Select the sampling state table 3 ⋮ 0xF: Select the sampling state table 15	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Select Differential input when self-diagnosis is selected.
Note 2. When using channel-dedicated sample-and-hold circuit, ADSHCRm.SHMDn (m = 0, 1, n = 0 to 2, 4 to 6) and corresponding ADCHCRn.AINMD (n = 0 to 32) setting must be matched.

The ADCHCRn register selects the Virtual channel configuration for A/D conversion.

SGSEL[4:0] bits (Scan Group Selection)

The SGSEL[4:0] bits select which scan group to assign the selected channel in CNVCS[6:0]. If SGSEL[4:0] is set to 0x00, the channel selected by CNVCS[6:0] is not available for A/D conversion. If SGSEL[4:0] is set to other than 0x00, the channel selected by CNVCS[6:0] is available for A/D conversion in the scan operation of the scan group corresponding to the setting value.

Up to 8 A/D conversion channels can be assigned per scan group in the SAR mode or Oversampling mode; Up to 4 A/D conversion channels can be assigned per scan group in the Hybrid mode. Do not assign more than specified number of A/D conversion channels per scan group.

CNVCS[6:0] bits (A/D Conversion Channel Selection)

The CNVCS[6:0] bits select the analog signal source for the A/D conversion. The CNVCS[6:0] bits should be set for the channel number corresponding to the Analog Input or the Extended Analog function. For A/D conversion of the analog signal source in Differential input mode, the CNVCS[6:0] bits should be set the even-numbered channel; When the odd-numbered channel is set in Differential input mode, A/D conversion is not guaranteed.

To A/D convert the channel selected by the CNVCS[6:0] bits, it should be assigned to one of the scan groups by the SGSEL[4:0] bits.

AINMD bits (Analog Input mode selection)

The AINMD bit selects the input method for A/D conversion of the analog signal source selected by the CNVCS[6:0] bits. When the AINMD bit is set to 0, A/D conversion is performed in single-ended input. When the AINMD bit is set to 1, A/D conversion is performed in differential input.

If the self-diagnosis channel is selected with the CNVCS[6:0] bits, a differential input should be selected.

SSTSEL[3:0] bits (Sampling State Table Selection)

The SSTSEL[3:0] bits select the sampling state table for A/D conversion of the analog signal source selected by the CNVCS[6:0] bits. The number of sampling states is the value set in the selected sampling state table.

53.2.3.2 ADDOPCRAn : A/D Conversion Data Operation Control A Register n (n = 0 to 32)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x604 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	OFSETSEL[3:0]				—	—	—	—	GAINSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DFSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	DFSEL[2:0]	Digital Filter Selection[*1 *2] 0x0: Not use the digital filter 0x1: Use the 1st digital filter 0x2: Use the 2nd digital filter 0x3: Use the 3rd digital filter 0x4: Use the 4th digital filter Others: Setting prohibited	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
19:16	GAINSEL[3:0]	User Gain Table Selection 0x0: Not use the User Gain Table 0x1: Use the User Gain Table 0 0x2: Use the User Gain Table 1 0x3: Use the User Gain Table 2 ⋮ 0x8: Use the User Gain Table 7 Others: Setting prohibited	R/W
23:20	—	These bits are read as 0. The write value should be 0.	R/W
27:24	OFSETSEL[3:0]	User Offset Table Selection 0x0: Not use the user offset table 0x1: Use the user offset table 0 0x2: Use the user offset table 1 0x3: Use the user offset table 2 ⋮ 0x8: Use the user offset table 7 Others: Setting prohibited	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Whenever A/D conversion is performed in Oversampling mode or Hybrid mode, the digital filter must be used.
Note 2. Whenever A/D conversion is performed in SAR mode, the digital filter must not be used.

The ADDOPCRAn register is one of the registers that selects the data calculation function for the A/D conversion data of virtual channel n.

DFSEL[2:0] bits (Digital Filter Selection)

The DFSEL[2:0] bits select the digital filter for inputting A/D converted data of virtual channel n. When 000b is set in the DFSEL[2:0] bits, the digital filter is not used. When 001b, 010b, 011b, or 100b is set in the DFSEL[2:0] bits, the digital filter corresponding to the setting of the DFSEL[2:0] bits is selected. The characteristics of the digital filters are specified by ADDFSRm (m = 0, 1) register.

For SAR mode, select 000b for the DFSEL[2:0] bits. For Oversampling mode or Hybrid mode, set the DFSEL[2:0] bits to 001b, 010b, 011b, or 100b.

GAINSEL[3:0] bits (User Gain Table Selection)

The GAINSEL[3:0] bits select the User Gain Table for adjusting the A/D conversion data of virtual channel n.

When the GAINSEL[3:0] bits are set to 0x0, no gain adjustment is performed. When the GAINSEL[3:0] bits are set to any of 0x1 to 0x8, the gain adjustment is performed according to the User Gain Table selected by the GAINSEL[3:0] bits.

OFSETSEL[3:0] bits (User Offset Table Selection)

The OFSETSEL[3:0] bits select the user offset table for adjusting the A/D conversion data of virtual channel n. When the OFSETSEL[3:0] bits are set to 0x0, no offset adjustment is performed. When the OFSETSEL[3:0] bits are set to any of 0x1 to 0x8, the offset adjustment is performed according to the User Offset Table selected by the OFSETSEL[3:0] bits.

53.2.3.3 ADDOPCRBn : A/D Conversion Data Operation Control B Register n (n = 0 to 32)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x608 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	CMPTBLE7	CMPTBLE6	CMPTBLE5	CMPTBLE4	CMPTBLE3	CMPTBLE2	CMPTBLE1	CMPTBLE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ADC[3:0]				—	—	—	—	—	—	AVEMD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	AVEMD[1:0]	Addition/Averaging Mode Selection 0 0: Not use Addition/Averaging mode 0 1: Addition mode 1 0: Averaging mode 1 1: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
11:8	ADC[3:0]	Addition/Averaging Times Selection 0x0: 1-time conversion (no addition, same as normal conversion) 0x1: 2-time conversion (1 addition) 0x3: 4-time conversion (3 additions) 0x4: 8-time conversion (7 additions) 0x5: 16-time conversion (15 additions) 0x6: 32-time conversion (31 additions) 0x7: 64-time conversion (63 additions) 0x8: 128-time conversion (127 additions) 0x9: 256-time conversion (255 additions) 0xA: 512-time conversion (511 additions) 0xB: 1024-time conversion (1023 additions) Others: Setting prohibited	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
23:16	CMPTBLE0 to CMPTBLE7	Compare Match Enable The suffix number of each bit symbol corresponds to the compare match table number m. 0: Disable the compare match with the compare match table m 1: Enable the compare match with the compare match table m	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The ADDOPCRBn register is one of the registers that selects the data calculation function for the A/D conversion data of virtual channel n.

AVEMD[1:0] bits (Addition/Averaging Mode Selection)

The AVEMD[1:0] bits select the addition mode or the averaging mode for the A/D conversion of virtual channel n. When the AVEMD[1:0] bits are set to 00b, the addition/averaging operation is not performed. When the AVEMD[1:0] bits are set to 01b or 10b, the addition/averaging operation is performed according to the setting value of the ADC[3:0] bits.

ADC[3:0] bits (Addition/Averaging Times Selection)

The ADC[3:0] bits select the number of times of addition/averaging for the A/D conversion of virtual channel n. If the addition mode or the averaging mode is selected in the AVEMD[1:0] bits, the A/D conversion is performed a number of times according to the setting value of the ADC[3:0] bits.

CMPTBLEm bits (Compare Match Enable) (m = 0 to 7)

The CMPTBLEm bits enable/disable the compare match with the compare match table m for the A/D conversion data of virtual channel n.

53.2.3.4 ADDOPCRCn : A/D Conversion Data Operation Control C Register n (n = 0 to 32)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x60C + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	SIGNSEL	—	—	ADPRC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	LIMTBLS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	LIMTBLS[3:0]	Limiter Clip Table Selection 0x0: Not use the Limiter Clip Table 0x1: Use the Limiter Clip Table 0 0x2: Use the Limiter Clip Table 1 0x3: Use the Limiter Clip Table 2 ⋮ 0x8: Use the Limiter Clip Table 7 Others: Setting prohibited	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
17:16	ADPRC[1:0]	A/D Conversion Data Format Selection 0 0: Store the A/D conversion result as 16-bit data format 0 1: Store the A/D conversion result as 14-bit data format 1 0: Store the A/D conversion result as 12-bit data format 1 1: Store the A/D conversion result as 10-bit data format	R/W
19:18	—	These bits are read as 0. The write value should be 0.	R/W
20	SIGNSEL	A/D Conversion Data Signed/Un-signed Selection 0: Signed data format 1: Un-signed data format	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

The ADDOPCRCn register is one of the registers that selects the data calculation function for the A/D conversion data of virtual channel n.

LIMTBLS[3:0] bits (Limiter Clip Table Selection)

The LIMTBLS[3:0] bits select the limiter clip table for clipping the A/D conversion data of virtual channel n. When the LIMTBLS[3:0] bits are set to 0x0, the A/D conversion data is not clipped. When the LIMTBLS[3:0] bits are set to any of 0x1 to 0x8, the A/D conversion data is clipped according to the limiter clip table selected by the LIMTBLS[3:0] bits.

ADPRC[1:0] bits (A/D Conversion Data Format Selection)

The ADPRC[1:0] bits select the data length of A/D conversion data. The A/D conversion data of virtual channel n is stored to the A/D Data Register or the FIFO with selected data length.

SIGNSEL bit (A/D Conversion Data Signed/Un-signed Selection)

The SIGNSEL bit selects the Signed/Unsigned data format of the A/D conversion data. The A/D conversion data of the virtual channel n is stored to the A/D Data Register or the FIFO with selected data format.

Select the Signed data format (SIGNSEL = 0) whenever the A/D conversion of the self-diagnosis channel is performed. Select the Unsigned data format (SIGNSEL = 1) whenever the A/D conversion in SAR mode, unless to convert the self-diagnosis channel, is performed. The signed data format or the unsigned data format is available for the A/D conversion in Oversampling mode or Hybrid mode unless converting to the self-diagnosis channel.

53.2.4 A/D Conversion Configuration

53.2.4.1 ADSGDCRn : Scan Group Diagnosis Function Control Register n (n = 0 to 8)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x200 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	ADNDIS[7:0]								—	—	ADDISN	ADDISP	—	—	—	ADDISEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DIAGVAL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	DIAGVAL[2:0]	Self-diagnosis Mode Selection 0 0 0: Set when any self-diagnosis channel is not included. Setting prohibited when any self-diagnosis channels are included. 1 0 0: Self-diagnosis mode 1 1 0 1: Self-diagnosis mode 2 1 1 0: Self-diagnosis mode 3 Others: Setting prohibited	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
16	ADDISEN	Disconnection Detection Assist Enable 0: Disable the disconnection detection assist function 1: Enable the disconnection detection assist function	R/W
19:17	—	These bits are read as 0. The write value should be 0.	R/W
20	ADDISP	Disconnection Detection Assist Mode Selection (for the even-numbered analog channel) 0: Discharge 1: Precharge	R/W
21	ADDISN	Disconnection Detection Assist Mode Selection (for the odd-numbered analog channel) 0: Discharge 1: Precharge	R/W

Bit	Symbol	Function	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
31:24	ADNDIS[7:0]	Disconnection Detection Assist Period 0x0: Setting prohibited when the disconnection detection assist function is enabled 0x1: Setting prohibited 0x2: Setting prohibited 0x3: Setting prohibited Others: The number of states for the discharge or precharge period. The number of states actually valid in the operation is the value of the register setting minus one.	R/W

The ADSGDCRn register controls the diagnosis function at the scanning operation of scan group n.

DIAGVAL[2:0] bits (Self-diagnosis Mode Selection)

The DIAGVAL[2:0] bits select the self-diagnosis mode for A/D converter.

The DIAGVAL[2:0] bits must be set to 000b when the scan group n does not include any virtual channels that selected the self-diagnosis channel. The DIAGVAL[2:0] bits must be set to 100b, 101b or 110b when the scan group n is including the virtual channel that selected the self-diagnosis channel.

ADDISEN bit (Disconnection Detection Assist Enable)

The ADDISEN bit enables/disables the disconnection detection assist function. When the ADDISEN bit is set to 0, the disconnection detection assist operation is not performed. When the ADDISEN bit is set to 1, the disconnection detection assist operation according to the setting of the ADDISP bit and the ADDISN bit is performed at the scanning operation of scan group n.

ADDISP bit / ADDISN bit (Disconnection Detection Assist Mode Selection)

The ADDISP bit and the ADDISN bit select the discharge/precharge operation for the disconnection detection.

The ADDISP bit selects the discharge/precharge operation for the even-numbered analog channel.

The ADDISN bit selects the discharge/precharge operation for the odd-numbered analog channel.

ADNDIS[7:0] bits (Disconnection Detection Assist Period)

The ADNDIS[7:0] bits select the discharge/precharge period. When the disconnection detection assist function is disabled (ADDISEN = 0), the ADNDIS[7:0] bits should be set to 0x0. When the disconnection detection assist function is enabled (ADDISEN = 1), the ADNDIS[7:0] bits should be set the value within 0x3 to 0xFF. The number of states actually valid in the operation is the value of the register setting minus one. For example, if ADNDIS[7:0] = 0x05 is set, the discharge/precharge period is 4 states.

53.2.4.2 ADSSTR0 : Sampling State Table Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x240

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SST1[9:0]										—	—	—	—	—	—	SST0[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
9:0	SST0[9:0]	Sampling State Table 0 These bits set the sampling time in the range from 2 to 1023 states.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	SST1[9:0]	Sampling State Table 1 These bits set the sampling time in the range from 2 to 1023 states.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSSTR0 register selects the sampling time at the A/D conversion that is using each sampling state table.

53.2.4.3 ADSSTR1 : Sampling State Table Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x244

Bit position:	31						25									16							9									0
Bit field:	—	—	—	—	—	—	SST3[9:0]										—	—	—	—	—	—	SST2[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
9:0	SST2[9:0]	Sampling State Table 2 These bits set the sampling time in the range from 2 to 1023 states.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	SST3[9:0]	Sampling State Table 3 These bits set the sampling time in the range from 2 to 1023 states.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSSTR1 register selects the sampling time at the A/D conversion that is using each sampling state table.

53.2.4.4 ADSSTR2 : Sampling State Table Register 2

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x248

Bit position:	31						25									16							9									0
Bit field:	—	—	—	—	—	—	SST5[9:0]										—	—	—	—	—	—	SST4[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
9:0	SST4[9:0]	Sampling State Table 4 These bits set the sampling time in the range from 2 to 1023 states.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	SST5[9:0]	Sampling State Table 5 These bits set the sampling time in the range from 2 to 1023 states.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSSTR2 register selects the sampling time at the A/D conversion that is using each sampling state table.

53.2.4.5 ADSSTR3 : Sampling State Table Register 3

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x24C

Bit position:	31						25									16							9									0
Bit field:	—	—	—	—	—	—	SST7[9:0]										—	—	—	—	—	—	SST6[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
9:0	SST6[9:0]	Sampling State Table 6 These bits set the sampling time in the range from 2 to 1023 states.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	SST7[9:0]	Sampling State Table 7 These bits set the sampling time in the range from 2 to 1023 states.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSSTR3 register selects the sampling time at the A/D conversion that is using each sampling state table.

53.2.4.6 ADSSTR4 : Sampling State Table Register 4

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x250

Bit position:	31	30	29	28	27	26	25–16	15	14	13	12	11	10	9–0
Bit field:	—	—	—	—	—	—	SST9[9:0]	—	—	—	—	—	—	SST8[9:0]

Bit	Symbol	Function	R/W
9:0	SST14[9:0]	Sampling State Table 14 These bits set the sampling time in the range from 2 to 1023 states.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
25:16	SST15[9:0]	Sampling State Table 15 These bits set the sampling time in the range from 2 to 1023 states.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADSSTR7 register selects the sampling time at the A/D conversion that is using each sampling state table.

53.2.4.10 ADCNVSTR : A/D Conversion State Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x260

Bit position:	31																		13					8			5					0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CST1[5:0]						—	—	CST0[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
5:0	CST0[5:0]	A/D Converter Unit 0 (ADC0) A/D successive approximation time configuration These bits set the successive approximation time in the range from 3 to 63 states.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
13:8	CST1[5:0]	A/D Converter Unit 1 (ADC1) A/D successive approximation time configuration These bits set the successive approximation time in the range from 3 to 63 states.	R/W
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The ADCNVSTR register specifies the A/D successive approximation time, which required by the A/D converter Unit 0 or Unit 1 to convert the sampled analog input to the digital value, in the number of cycles based on A/D conversion clock (ADCLK). The A/D successive approximation time does not include the sampling time of the analog input.

The A/D successive approximation time must be set to meet the value specified in section 62, Electrical Characteristics. If the successive approximation time is set to a value over the range specified for the electrical characteristics, the A/D conversion result is not guaranteed. In addition, the A/D successive approximation time for each A/D converter should be set to be the same. (Set the same value to CST0[5:0] bits and CST1[5:0] bits).

53.2.5 S&H and Others

53.2.5.1 ADSHCR0 : Channel-dedicated Sample-and-hold Circuit Control Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x280

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SHEN2	SHEN1	SHEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SHEN0	Channel-dedicated Sample-and-hold Circuit Unit 0 Select 0: Bypass the circuit unit 0 1: Use the circuit unit 0	R/W
1	SHEN1	Channel-dedicated Sample-and-hold Circuit Unit 1 Select 0: Bypass the circuit unit 1 1: Use the circuit unit 1	R/W
2	SHEN2	Channel-dedicated Sample-and-hold Circuit Unit 2 Select 0: Bypass the circuit unit 2 1: Use the circuit unit 2	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
16	SHMD0[*1]	Channel-dedicated Sample-and-hold Circuit Unit 0 Input Mode Select 0: Single-ended Input mode 1: Differential Input mode	R/W
17	SHMD1[*1]	Channel-dedicated Sample-and-hold Circuit Unit 1 Input Mode Select 0: Single-ended Input mode 1: Differential Input mode	R/W
18	SHMD2[*1]	Channel-dedicated Sample-and-hold Circuit Unit 2 Input Mode Select 0: Single-ended Input mode 1: Differential Input mode	R/W

Bit	Symbol	Function	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When using channel-dedicated sample-and-hold circuit, ADSHCRm.SHMDn (m = 0, 1, n = 0 to 2, 4 to 6) and corresponding ADCHCRn.AINMD (n = 0 to 32) setting must be matched.

The ADSHCR0 register controls the channel-dedicated sample-and-hold circuits (unit 0, unit 1 and unit 2) connected to the A/D converter unit 0 (ADC0).

SHENn bit (Channel-dedicated Sample-and-hold Circuit Bypass Select) (n = 0 to 2)

The SHENn bit selects whether to use or bypass the channel-dedicated sample-and-hold circuits unit n.

When the SHENn bit is set to 0, the channel-dedicated sample-and-hold circuits unit n is disabled. If A/D conversion of analog input channel which is connected to the channel-dedicated sample-and-hold circuit unit n is performed, the channel-dedicated sample-and-hold circuit is not used and is bypassed.

When the SHENn bit is set to 1, the channel-dedicated sample-and-hold circuits unit n is enabled. In this case, A/D conversion of analog input channel to which the channel-dedicated sample-and-hold circuit unit n is performed with the channel-dedicated sample-and-hold circuit used.

SHMDn bit (Channel-dedicated Sample-and-hold Circuit Input Mode Select) (n = 0 to 2)

The SHMDn bit selects the input mode of the channel-dedicated sample-and-hold circuits unit n.

When the SHMDn bit is set to 0, the channel-dedicated sample-and-hold circuits unit n is in Single-ended input mode.

When the SHMDn bit is set to 1, the channel-dedicated sample-and-hold circuits unit n is in Differential input mode.

53.2.5.2 ADSHCR1 : Channel-dedicated Sample-and-hold Circuit Control Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x28C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SHEN6	SHEN5	SHEN4
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SHEN4	Channel-dedicated Sample-and-hold Circuit Unit 4 Select 0: Bypass the circuit unit 4 1: Use the circuit unit 4	R/W
1	SHEN5	Channel-dedicated Sample-and-hold Circuit Unit 5 Select 0: Bypass the circuit unit 5 1: Use the circuit unit 5	R/W
2	SHEN6	Channel-dedicated Sample-and-hold Circuit Unit 6 Select 0: Bypass the circuit unit 6 1: Use the circuit unit 6	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
16	SHMD4*1	Channel-dedicated Sample-and-hold Circuit Unit 4 Input Mode Select 0: Single-ended Input mode 1: Differential Input mode	R/W
17	SHMD5*1	Channel-dedicated Sample-and-hold Circuit Unit 5 Input Mode Select 0: Single-ended Input mode 1: Differential Input mode	R/W

Bit	Symbol	Function	R/W
18	SHMD6[*1]	Channel-dedicated Sample-and-hold Circuit Unit 6 Input Mode Select 0: Single-ended Input mode 1: Differential Input mode	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When using channel-dedicated sample-and-hold circuit, ADSHCRm.SHMDn (m = 0, 1, n = 0 to 2, 4 to 6) and corresponding ADCHCRn.AINMD (n = 0 to 32) setting must be matched.

The ADSHCR1 register controls the channel-dedicated sample-and-hold circuits (unit 4, unit 5 and unit 6) connected to the A/D converter unit 1 (ADC1).

SHENn bit (Channel-dedicated Sample-and-hold Circuit Bypass Select) (n = 4 to 6)

The SHENn bit selects whether to use or bypass the channel-dedicated sample-and-hold circuits unit n.

When the SHENn bit is set to 0, the channel-dedicated sample-and-hold circuits unit n is disabled. If A/D conversion of analog input channel which is connected to the channel-dedicated sample-and-hold circuit unit n is performed, the channel-dedicated sample-and-hold circuit is not used and is bypassed.

When the SHENn bit is set to 1, the channel-dedicated sample-and-hold circuits unit n is enabled. In this case, A/D conversion of analog input channel to which the channel-dedicated sample-and-hold circuit unit n is performed with the channel-dedicated sample-and-hold circuit used.

SHMDn bit (Channel-dedicated Sample-and-hold Circuit Input Mode Select) (n = 4 to 6)

The SHMDn bit selects the input mode of the channel-dedicated sample-and-hold circuits unit n.

When the SHMDn bit is set to 0, the channel-dedicated sample-and-hold circuits unit n is in Single-ended input mode.

When the SHMDn bit is set to 1, the channel-dedicated sample-and-hold circuits unit n is in Differential input mode.

53.2.5.3 ADSHDCR0 : Channel-dedicated Sample-and-hold Circuit Diagnosis Control Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x284

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4	SH1DIS	A/D converter unit 1 channel-dedicated sample-and-hold circuit disconnection detection assist selection 0: Discharge 1: Precharge	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: For more details about restrictions, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

The ADSHDCR1 register controls settings of the diagnosis function for the channel-dedicated sample-and-hold circuits (unit 4, unit 5, unit 6) connected to the A/D converter unit 1 (ADC1).

53.2.5.5 ADSHSTR0 : Channel-dedicated Sample-and-hold Circuit State Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x288

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SHHST[2:0]			—	—	—	—	—	—	—	—	SHSST[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
7:0	SHSST[7:0]	Channel-dedicated Sample-and-hold Circuit Unit 0 to 2 Sampling Time Setting These bits set the sampling time in the range from 4 to 255 states.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
18:16	SHHST[2:0]	Channel-dedicated Sample-and-hold Circuit Unit 0 to 2 Hold Mode Switching Time Setting These bits set the hold mode switching time in the range from 2 to 7 states.	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

The ADSHSTR0 register specifies the sampling time and the hold mode switching time for the channel-dedicated sample-and-hold circuits (unit 0, unit 1, and unit 2) connected to the A/D converter unit 0 (ADC0). The value set in this register should be set to meet the value specified in section 62, Electrical Characteristics.

53.2.5.6 ADSHSTR1 : Channel-dedicated Sample-and-hold Circuit State Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x294

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SHHST[2:0]			—	—	—	—	—	—	—	—	SHSST[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
7:0	SHSST[7:0]	Channel-dedicated Sample-and-hold Circuit Unit 4 to 6 Sampling Time Setting These bits set the sampling time in the range from 4 to 255 states.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
18:16	SHHST[2:0]	Channel-dedicated Sample-and-hold Circuit Unit 4 to 6 Hold Mode Switching Time Setting These bits set the hold mode switching time in the range from 2 to 7 states.	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

The ADSHSTR1 register specifies the sampling time and the hold mode switching time for the channel-dedicated sample-and-hold circuits (unit 4, unit 5, and unit 6) connected to the A/D converter unit 1 (ADC1). The value set in this register should be set to meet the value specified in section 62, Electrical Characteristics.

53.2.5.7 ADSHSBPCR : Channel-dedicated Sample-and-hold Circuit Single-ended Input Mode Bypass Control Register

19	—	This bit is read as 0. The write value should be 0.	R
20	SHSBN4	Channel-dedicated sample-and-hold circuit unit 4 single-ended input bypass selection (odd analog channel) Can be written only when the target channel-dedicated sample-and-hold circuit setting is ADSHCR1.SHEN4 = 0. 0: Use the sample-and-hold circuit 1: Bypass the sample-and-hold circuit	R/W

Bit	Symbol	Function	R/W
21	SHSBN5	Channel-dedicated sample-and-hold circuit unit 5 single-ended input bypass selection (odd analog channel) Can be written only when the target channel-dedicated sample-and-hold circuit setting is ADSHCR1.SHEN5 = 0. 0: Use the sample-and-hold circuit 1: Bypass the sample-and-hold circuit	R/W
22	SHSBN6	Channel-dedicated sample-and-hold circuit unit 6 single-ended input bypass selection (odd analog channel) Can be written only when the target channel-dedicated sample-and-hold circuit setting is ADSHCR1.SHEN6 = 0. 0: Use the sample-and-hold circuit 1: Bypass the sample-and-hold circuit	R/W
31:23	—	These bits are read as 0. The write value should be 0.	R/W

Note: Write access is permitted only when ADSHCRx.SHENn (x = 0, 1, n = 0, 1, 2, 4, 5, 6) of the target sample-and-hold circuit is set to 0. If ADSHCRx.SHENn is set to 1, writing 1 to this bit is ignored.

ADSHSBPCR register controls the channel-dedicated sample-and-hold circuit single-ended bypass mode.

SHSBPn (Channel-dedicated sample-and-hold circuit unit n single-end input bypass control for even-numbered channel) (n = 0 to 2, 4 to 6)

SHSBNn (Channel-dedicated sample-and-hold circuit unit n single-end input bypass control for odd-numbered channel) (n = 0 to 2, 4 to 6)

The SHSBPn bit and the SHSBNn bit control the analog input for A/D conversion when the channel-dedicated sample-and-hold circuit is enabled.

When the bit is set to 0, the analog output held by the channel-dedicated sample-and-hold circuit is A/D-converted.

When the bit is set to 1, the analog input of the channel-dedicated sample-and-hold circuit is A/D-converted. In this case, the analog output held by the channel-dedicated sample-and-hold circuit is ignored on the A/D conversion.

When the channel-dedicated sample-and-hold circuit is used in single-ended input mode, the analog input of unused channel of the channel-dedicated sample-and-hold circuit can be A/D-converted without going through the channel-dedicated sample-and-hold circuit.

53.2.5.8 ADSHDBPCR : Channel-dedicated Sample-and-hold Circuit Differential Input Mode Bypass Control Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

8	SHDBP8	Scan group 8 channel-dedicated sample-and-hold circuit differential input bypass select 0: Use the sample-and-hold circuit 1: Bypass the sample-and-hold circuit	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

ADSHDBPCR register controls the channel-dedicated sample-and-hold circuit differential input bypass mode.

SHDBPn (Channel-dedicated sample-and-hold circuit differential input bypass control for scan group n) (n = 0 to 8)

When the bit is set to 0, the analog output held by the channel-dedicated sample-and-hold circuit specified in the scan group is A/D-converted.

When the bit is set to 1, the analog input of the channel-dedicated sample-and-hold circuit specified in the scan group is A/D-converted. In this case, the analog output held by the channel-dedicated sample-and-hold circuit is ignored on the A/D conversion.

In the case that the disconnection detection assist function is needed when the channel-dedicated sample-and-hold circuits are used in differential input mode, the input mode must be changed to single-ended mode. However, if the input mode is changed to use the disconnection detection assist function built in the channel-dedicated sample-and-hold circuit, calibration of the channel-dedicated sample-and-hold circuit is required.

This function allows bypassing the channel-dedicated sample-and-hold circuits to use the disconnection detection assist function without recalibration of the channel-dedicated sample-and-hold circuits.

53.2.5.9 ADSHSDCR0 : Channel-dedicated Sample-and-hold Circuit Self-diagnosis Control Register 0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SHCSST0	Channel-dedicated sample-and-hold circuit constant sampling control bit for A/D converter unit 0 (ADC0) When SHCSST0 is enabled, channel-dedicated sample-and-hold circuit sampling starts. 0: Disable channel-dedicated sample-and-hold circuit constant sampling 1: Enable channel-dedicated sample-and-hold circuit constant sampling	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	SHCSST1	Channel-dedicated sample-and-hold circuit constant sampling control bit for A/D converter unit 1 (ADC1) When SHCSST1 is enabled, channel-dedicated sample-and-hold circuit sampling starts. 0: Disable channel-dedicated sample-and-hold circuit constant sampling 1: Enable channel-dedicated sample-and-hold circuit constant sampling	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: This register must be used after calibration.
Note: Using this register is prohibited when channel-dedicated sample-and-hold circuit is not used.
Note: For more details about restrictions, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

The ADSHCSCR register controls the constant sampling function of channel-dedicated sample-and-hold circuit.

53.2.5.12 ADREFCR : Internal Reference Voltage Monitor Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x320

Bit position:	31																															0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VDE	Internal Reference Voltage A/D Conversion Select 0: Disable A/D conversion of internal reference voltage 1: Enable A/D conversion of internal reference voltage	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The ADREFCR register controls the function of the internal reference voltage circuit. When the A/D conversion of the internal reference voltage is performed, the VDE bit must be set to 1.

53.2.6 Digital Filter

53.2.6.1 ADDFSRn : A/D Converter Digital Filter Selection Register n (n = 0, 1)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x340 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	DFSEL3[1:0]		—	—	—	—	—	—	DFSEL2[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DFSEL1[1:0]		—	—	—	—	—	—	DFSEL0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	DFSEL0[1:0]	A/D Converter Unit n the 1st Digital Filter Characteristic Selection 0 1: Sinc filter Others: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	DFSEL1[1:0]	A/D Converter Unit n the 2nd Digital Filter Characteristic Selection 0 1: Sinc filter Others: Setting prohibited	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	DFSEL2[1:0]	A/D Converter Unit n the 3rd Digital Filter Characteristic Selection 0 1: Sinc filter Others: Setting prohibited	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	DFSEL3[1:0]	A/D Converter Unit n the 4th Digital Filter Characteristic Selection 0 1: Sinc filter Others: Setting prohibited	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADDFSRn register selects the characteristics of the digital filter for the A/D converter unit n. The selection of the digital filter to be used at A/D conversion is specified by the ADDOPCRAm register (m = 0 to 32). If the digital filter function is used with prohibited values set to the ADDFSRn.DFSELx[1:0] (x = 0 to 3) bits, the A/D conversion characteristics and A/D conversion results are not guaranteed.

53.2.7 Self-calibration

53.2.7.1 ADCALSTCR : A/D Converter Self-calibration State Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x264

Bit position:	31										21					16							9									0
Bit field:	—	—	—	—	—	—	—	—	—	—	CALADCST[5:0]						—	—	—	—	—	—	CALADSST[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
9:0	CALADSST[9:0]	A/D Converter Self-calibration Sampling Time Configuration These bits set the sampling time in the range from 2 to 1023 states.	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
21:16	CALADCST[5:0]	A/D Converter Self-calibration Successive Approximation Time Configuration. These bits set the successive approximation time in the range from 3 to 63 states.	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

The ADCALSTCR register specifies the sampling and the A/D successive approximation times at the self-calibration operation for all A/D converter (ADC0, ADC1). The sampling time and successive approximation time should be set by the number of clock cycles based on the A/D conversion clock (ADCLK) to meet the values specified in section 62, Electrical Characteristics.

53.2.7.2 ADCALSHCR : Channel-dedicated Sample-and-hold Circuit Self-calibration State Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x2B0

Bit position: 31 18 16 7 0

Bit field: — — — — — — — — — — — — — CALSHHST[2:0] — — — — — — — — CALSHSST[7:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 0 0

Bit	Symbol	Function	R/W
7:0	CALSHSST[7:0]	Channel-dedicated Sample-and-hold Circuit Self-calibration Sampling Time Configuration These bits set the sampling time in the range from 4 to 255 states.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
18:16	CALSHHST[2:0]	Channel-dedicated Sample-and-hold Circuit Self-calibration Hold Mode Switching Time Configuration These bits set the hold mode switching time in the range from 2 to 7 states.	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

The ADCALSHCR register specifies the sampling time and the hold mode switching time at the self-calibration operation for all channel-dedicated sample-and-hold circuits (SH0 to SH2, SH4 to SH6). The sampling time and the hold mode switching time should be set by the number of clock cycles based on the A/D conversion clock (ADCLK) to meet the values specified in section 62, Electrical Characteristics.

53.2.7.3 ADUOFTRn : User Offset Table Register n (n = 0 to 7)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x360 + 0x04 × n

Bit position: 31 15 0

Bit field: — — — — — — — — — — — — — — — — UOFSET[15:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	UOFSET[15:0]	User Offset Table n 0x7FFF: + 32767 0x7FFE: + 32766 ⋮ 0x0002: + 2 0x0001: + 1 0x0000: 0 (without user offset) 0xFFFF: - 1 0xFFFE: - 2 ⋮ 0x8001: - 32767 0x8000: - 32768	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The ADUOFTRn register specifies the offset value in the User Offset Table n.

53.2.7.4 ADUGTRn : User Gain Table Register n (n = 0 to 7)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x380 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15–0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UGAIN[15:0]
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	UGAIN[15:0]	User Gain Table n These bits set the gain value to be multiplied by the A/D conversion result. UGAIN[15:14]: Integer part of gain UGAIN[13:0]: Fractional part of gain	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The ADUGTRn register specifies the gain value in the user gain table n.

53.2.8 Limiter Clip Function

53.2.8.1 ADLIMINTCR : Limiter Clip Interrupt Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x3A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LIMIE0 to LIMIE8	Limiter Clip Interrupt n Enable bit The suffix number of each bit symbol corresponds to the limiter clip interrupt number n. 0: Disable the limiter clip interrupt n 1: Enable the limiter clip interrupt n	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The ADLIMINTCR register enables/disables the limiter clip interrupt n.

53.2.8.2 ADLIMTRn : Limiter Clip Table Register n (n = 0 to 7)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x3A4 + 0x04 × n

Bit position:	31–16	15–0
Bit field:	LIMU[15:0]	LIML[15:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	LIML[15:0]	Limiter clip table n : Lower-side limit value	R/W
31:16	LIMU[15:0]	Limiter clip table n : Upper-side limit value	R/W

The ADLIMTRn register specifies the lower- and upper-side limit value of the limiter clip table n.

53.2.8.3 ADLIMGRSR : Limiter Clip Scan Group Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LIMGRF8	LIMGRF7	LIMGRF6	LIMGRF5	LIMGRF4	LIMGRF3	LIMGRF2	LIMGRF1	LIMGRF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LIMGRF0 to LIMGRF8	Scan Group n Limiter Clip Flag The suffix number of each bit symbol corresponds to the scan group number n. 0: Limiter clip for scan group n is not detected 1: Limiter clip for scan group n is detected	R
31:9	—	These bits are read as 0.	R

The ADLIMGRSR register indicates whether the limiter clip occurred in the scanning operation for scan group n. Each flag can be cleared in the ADLIMGRSCR.

53.2.8.4 ADLIMCHSR0 : Limiter Clip Channel Status Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	LIMCHF22	LIMCHF21	LIMCHF20	LIMCHF19	LIMCHF18	LIMCHF17	LIMCHF16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LIMCHF15	LIMCHF14	LIMCHF13	LIMCHF12	LIMCHF11	LIMCHF10	LIMCHF9	LIMCHF8	LIMCHF7	LIMCHF6	LIMCHF5	LIMCHF4	LIMCHF3	LIMCHF2	LIMCHF1	LIMCHF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
22:0	LIMCHF0 to LIMCHF22	Analog Channel n: Limiter Clip Flag The suffix number of each bit symbol corresponds to the analog channel number n. 0: Limiter clip is not detected 1: Limiter clip is detected	R
31:23	—	These bits are read as 0.	R

The ADLIMCHSR0 register indicates whether the limiter clip occurred when the A/D conversion for the analog channel n is performed. Each flag can be cleared in ADLIMCHSCR0.

53.2.8.5 ADLIMEXSR : Extended Analog Limiter Clip Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD38

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	LIMEXF22	LIMEXF21	LIMEXF20	—	LIMEXF18	LIMEXF17	LIMEXF16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LIMEXF9	LIMEXF8	—	LIMEXF6	LIMEXF5	LIMEXF4	—	—	LIMEXF1	LIMEXF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LIMEXF0	Self-diagnosis Channel for A/D unit 0: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
1	LIMEXF1	Temperature Sensor Channel for A/D unit 1: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
3:2	—	These bits are read as 0.	R
4	LIMEXF4	Temperature Sensor Channel: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
5	LIMEXF5	Internal Reference Voltage Channel: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R

Bit	Symbol	Function	R/W
6	LIMEXF6	VBATT 1/6 voltage monitor output Channel: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
7	—	This bit is read as 0.	R
8	LIMEXF8	D/A Converter 0 Channel: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
9	LIMEXF9	D/A Converter 1 Channel: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
15:10	—	These bits are read as 0.	R
16	LIMEXF16	Self-diagnosis Channel for Sample-and-hold circuit unit0: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
17	LIMEXF17	Self-diagnosis Channel for Sample-and-hold circuit unit1: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
18	LIMEXF18	Self-diagnosis Channel for Sample-and-hold circuit unit2: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
19	—	This bit is read as 0.	R
20	LIMEXF20	Self-diagnosis Channel for Sample-and-hold circuit unit4: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
21	LIMEXF21	Self-diagnosis Channel for Sample-and-hold circuit unit5: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
22	LIMEXF22	Self-diagnosis Channel for Sample-and-hold circuit unit6: Limiter Clip Flag 0: Limiter clip is not detected 1: Limiter clip is detected	R
31:23	—	These bits are read as 0.	R

The ADLIMEXSR register indicates whether the limiter clip occurred when the A/D conversion for the extended analog function is performed. Each flag can be cleared in the ADLIMEXSCR.

53.2.8.6 ADLIMGRSCR : Limiter Clip Scan Group Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD3C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LIMGRC8	LIMGRC7	LIMGRC6	LIMGRC5	LIMGRC4	LIMGRC3	LIMGRC2	LIMGRC1	LIMGRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LIMGRC0 to LIMGRC8	Scan Group n Limiter Clip Flag Clear The suffix number of each bit symbol corresponds to the scan group number n. 0: No effect 1: ADLIMGRSR.LIMGRFn is cleared	W
31:9	—	The write value should be 0.	W

The ADLIMGRSCR register clears the limiter clip flag for scan group n (ADLIMGRSR.LIMGRFn).

53.2.8.7 ADLIMCHSCR0 : Limiter Clip Channel Status Clear Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	LIMCHC22	LIMCHC21	LIMCHC20	LIMCHC19	LIMCHC18	LIMCHC17	LIMCHC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LIMCHC15	LIMCHC14	LIMCHC13	LIMCHC12	LIMCHC11	LIMCHC10	LIMCHC9	LIMCHC8	LIMCHC7	LIMCHC6	LIMCHC5	LIMCHC4	LIMCHC3	LIMCHC2	LIMCHC1	LIMCHC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
22:0	LIMCHC0 to LIMCHC22	Analog Channel n Limiter Clip Flag Clear bit The suffix number of each bit symbol corresponds to the analog channel number n. 0: No effect 1: ADLIMCHSR0.LIMCHFn is cleared	W
31:23	—	The write value should be 0.	W

The ADLIMCHSCR0 register clears the limiter clip flag for the analog channel n (ADLIMCHSR0.LIMCHFn).

53.2.8.8 ADLIMEXSCR : Extended Analog Limiter Clip Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD4C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	LIMEXC22	LIMEXC21	LIMEXC20	—	LIMEXC18	LIMEXC17	LIMEXC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LIMEXC9	LIMEXC8	—	LIMEXC6	LIMEXC5	LIMEXC4	—	—	LIMEXC1	LIMEXC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LIMEXC0	Self-diagnosis channel for A/D unit 0: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC0 is cleared	W
1	LIMEXC1	Self-diagnosis channel for A/D unit 1: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC1 is cleared	W

Bit	Symbol	Function	R/W
3:2	—	The write value should be 0.	W
4	LIMEXC4	Temperature sensor channel: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC4 is cleared	W
5	LIMEXC5	Internal reference voltage channel: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC5 is cleared	W
6	LIMEXC6	VBATT 1/6 voltage monitor output channel: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC6 is cleared	W
7	—	The write value should be 0.	W
8	LIMEXC8	D/A converter 0 channel: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC8 is cleared	W
9	LIMEXC9	D/A converter 1 channel: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC9 is cleared	W
15:10	—	The write value should be 0.	W
16	LIMEXC16	Self-diagnosis channel for sample-and-hold circuit unit 0: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC16 is cleared	W
17	LIMEXC17	Self-diagnosis channel for sample-and-hold circuit unit 1: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC17 is cleared	W
18	LIMEXC18	Self-diagnosis channel for sample-and-hold circuit unit 2: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC18 is cleared	W
19	—	The write value should be 0.	W
20	LIMEXC20	Self-diagnosis channel for sample-and-hold circuit unit 4: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC20 is cleared	W
21	LIMEXC21	Self-diagnosis channel for sample-and-hold circuit unit 5: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC21 is cleared	W
22	LIMEXC22	Self-diagnosis channel for sample-and-hold circuit unit 6: Limiter Clip Flag Clear 0: No effect 1: ADLIMEXSR.LIMEXC22 is cleared	W
31:23	—	The write value should be 0.	W

The ADLIMEXSCR register clears the limiter clip flag for the extended analog function.

53.2.9 Compare Match Function

53.2.9.1 ADCMPENR : Compare Match Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x400

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CMPEN7	CMPEN6	CMPEN5	CMPEN4	CMPEN3	CMPEN2	CMPEN1	CMPEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CMPEN0 to CMPEN7	Compare Match n Enable The suffix number of each bit symbol corresponds to the compare match number n. 0: Disable the compare match n 1: Enable the compare match n	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The ADCMPENR register enables/disables the compare match n.

53.2.9.2 ADCMPINTCR : Compare Match Interrupt Enable Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x404

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	CMPIE3	CMPIE2	CMPIE1	CMPIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CMPIE0 to CMPIE3	Compare Match Interrupt n Enable The suffix number of each bit symbol corresponds to the compare match interrupt number n. 0: Disable the compare match interrupt n 1: Enable the compare match interrupt n	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The ADCMPINTCR register enables/disables the compare match interrupt n.

53.2.9.3 ADCCMPCRn : Composite Compare Match Configuration Register n (n = 0, 1)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x408 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	CCMPTBL7	CCMPTBL6	CCMPTBL5	CCMPTBL4	CCMPTBL3	CCMPTBL2	CCMPTBL1	CCMPTBL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CCMPCND[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CCMPCND[1:0]	Composite Compare Match Condition Selection 0 0: Logical disjunction (OR) conditions Others: Setting prohibited	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W
23:16	CCMPTBL0 to CCMPTBL7	Composite Compare Match Condition Table Selection 0: Not use the compare match table m 1: Use the compare match table m	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The ADCCMPCRn register configures the conditions for the composite compare match interrupt n.

CCMPCND[1:0] bits (Composite Compare Match Condition Selection)

The CCMPCND[1:0] bits select the generating condition for the composite compare match interrupt n.

CCMPTBLm bits (Composite Compare Match Condition Table Selection) (m = 0 to 7)

The CCMPTBLm bits select whether to use or not to use the compare match table m as the generating conditions of the composite compare match interrupt.

53.2.9.4 ADCMPMDR0 : Compare Match Mode Selection Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x448

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	CMPMD3[1:0]		—	—	—	—	—	—	CMPMD2[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CMPMD1[1:0]		—	—	—	—	—	—	CMPMD0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CMPMD0[1:0]	Compare Match 0 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W

Bit	Symbol	Function	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	CMPMD1[1:0]	Compare Match 1 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	CMPMD2[1:0]	Compare Match 2 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	CMPMD3[1:0]	Compare Match 3 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADCMPMDR0 register selects the generating condition of each compare match event.

53.2.9.5 ADCMPMDR1 : Compare Match Mode Selection Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x44C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	CMPMD7[1:0]		—	—	—	—	—	—	CMPMD6[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CMPMD5[1:0]		—	—	—	—	—	—	CMPMD4[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CMPMD4[1:0]	Compare Match 4 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	CMPMD5[1:0]	Compare Match 5 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
17:16	CMPMD6[1:0]	Compare Match 6 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W

Bit	Symbol	Function	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
25:24	CMPMD7[1:0]	Compare Match 7 : Match Mode Selection 0 0: Generate the match event when high-side level or more 0 1: Generate the match event when low-side level or less 1 0: Generate the match event when high-side level or more, or low-side level or less 1 1: Generate the match event when low-side level or more and high-side level or less	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The ADCMPMDR1 register selects the generating condition of each compare match event.

53.2.9.6 ADCMPTBRn : Compare Match Table Register n (n = 0 to 7)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x458 + 0x04 × n

Bit position:	31–16	15–0
Bit field:	CMPTBH[15:0]	CMPTBL[15:0]
Value after reset:	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	CMPTBL[15:0]	Compare Match Table n : Low-side level Set CMPTBH > CMPTBL	R/W
31:16	CMPTBH[15:0]	Compare Match Table n : High-side level Set CMPTBH > CMPTBL	R/W

The ADCMPTBRn register specifies the low-side level and the high-side level for the compare match table n.

53.2.9.7 ADCMPTBSR : Compare Match Table Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CMPTBF7	CMPTBF6	CMPTBF5	CMPTBF4	CMPTBF3	CMPTBF2	CMPTBF1	CMPTBF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CMPTBF0 to CMPTBF7	Compare Match Table n Match Flag The suffix number of each bit symbol corresponds to the compare match table number n. 0: Match event with compare match table n is not detected 1: Match event with compare match table n is detected	R
31:8	—	These bits are read as 0.	R

The ADCMPTBSR register indicates whether the match event with the Compare Match Table n occurred during the A/D conversion. Each flag can be cleared in the ADCMPTBSCR.

53.2.9.8 ADCMPTBSCR : Compare Match Table Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CMPTBC7	CMPTBC6	CMPTBC5	CMPTBC4	CMPTBC3	CMPTBC2	CMPTBC1	CMPTBC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CMPTBC0 to CMPTBC7	Compare Match Table n: Match Flag Clear The suffix number of each bit symbol corresponds to the compare match table number n. 0: No effect 1: ADCMPTBSR.CMPTBFn is cleared	W
31:8	—	The write value should be 0.	W

The ADCMPTBSCR register clears the match flag for the compare match n (ADCMPTBSR.CMPTBFn).

53.2.9.9 ADCMPCHSR0 : Compare Match Channel Status Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	CMPCHF22	CMPCHF21	CMPCHF20	CMPCHF19	CMPCHF18	CMPCHF17	CMPCHF16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMPCHF15	CMPCHF14	CMPCHF13	CMPCHF12	CMPCHF11	CMPCHF10	CMPCHF9	CMPCHF8	CMPCHF7	CMPCHF6	CMPCHF5	CMPCHF4	CMPCHF3	CMPCHF2	CMPCHF1	CMPCHF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
22:0	CMPCHF0 to CMPCHF22	Analog Channel n: Compare Match Flag The suffix number of each bit symbol corresponds to the analog channel number n. 0: Compare match is not detected 1: Compare match is detected	R
31:23	—	These bits are read as 0.	R

The ADCMPCHSR0 register indicates whether the compare match event for the Analog Channel n is detected. Each flag can be cleared in ADCMPCHSCR0.

53.2.9.10 ADCMPEXSR : Extended Analog Compare Match Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	CMPEXF22	CMPEXF21	CMPEXF20	—	CMPEXF18	CMPEXF17	CMPEXF16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CMPEXF9	CMPEXF8	—	CMPEXF6	CMPEXF5	CMPEXF4	—	—	CMPEXF1	CMPEXF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CMPEXF0	Self-diagnosis channel for A/D unit 0: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
1	CMPEXF1	Self-diagnosis channel for A/D unit 1: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
3:2	—	These bits are read as 0.	R
4	CMPEXF4	Temperature sensor channel: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
5	CMPEXF5	Internal reference voltage channel: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
6	CMPEXF6	VBATT 1/6 voltage monitor output Channel: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
7	—	This bit is read as 0.	R
8	CMPEXF8	D/A converter 0 channel: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
9	CMPEXF9	D/A converter 1 channel: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
15:10	—	These bits are read as 0.	R
16	CMPEXF16	Self-diagnosis channel for sample-and-hold circuit unit 0: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
17	CMPEXF17	Self-diagnosis channel for sample-and-hold circuit unit 1: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
18	CMPEXF18	Self-diagnosis channel for sample-and-hold circuit unit 2: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
19	—	This bit is read as 0.	R
20	CMPEXF20	Self-diagnosis channel for sample-and-hold circuit unit 4: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R

Bit	Symbol	Function	R/W
21	CMPEXF21	Self-diagnosis channel for sample-and-hold circuit unit 5: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
22	CMPEXF22	Self-diagnosis channel for sample-and-hold circuit unit 6: Compare Match Flag 0: Compare match is not detected 1: Compare match is detected	R
31:23	—	These bits are read as 0.	R

The ADCMPEXSR register indicates whether the compare match event for the extended analog function channel is detected. Each flag can be cleared in ADCMPEXSCR.

53.2.9.11 ADCMPCHSCR0 : Compare Match Channel Status Clear Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD18

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	CMPCHC22	CMPCHC21	CMPCHC20	CMPCHC19	CMPCHC18	CMPCHC17	CMPCHC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMPCHC15	CMPCHC14	CMPCHC13	CMPCHC12	CMPCHC11	CMPCHC10	CMPCHC9	CMPCHC8	CMPCHC7	CMPCHC6	CMPCHC5	CMPCHC4	CMPCHC3	CMPCHC2	CMPCHC1	CMPCHC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
22:0	CMPCHC0 to CMPCHC22	Analog channel n: Compare Match Flag Clear bit The suffix number of each bit symbol corresponds to the analog channel number n. 0: No effect 1: ADCMPCHSR0.CMPCHFn is cleared	W
31:23	—	The write value should be 0.	W

The ADCMPCHSCR0 register clears the compare match flag for the Analog Channel n (ADCMPCHSR0.CMPCHFn).

53.2.9.12 ADCMPEXSCR : Extended Analog Compare Match Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD24

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	CMPEXC22	CMPEXC21	CMPEXC20	—	CMPEXC18	CMPEXC17	CMPEXC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CMPEXC9	CMPEXC8	—	CMPEXC6	CMPEXC5	CMPEXC4	—	—	CMPEXC1	CMPEXC0

Bit	Symbol	Function	R/W
0	CMPEXC0	Self-diagnosis channel for A/D unit 0: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF0 is cleared	W

Bit	Symbol	Function	R/W
1	CMPEXC1	Self-diagnosis channel for A/D unit 1: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF1 is cleared	W
3:2	—	The write value should be 0.	W
4	CMPEXC4	Temperature sensor channel: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF4 is cleared	W
5	CMPEXC5	Internal reference voltage channel: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF5 is cleared	W
6	CMPEXC6	VBATT 1/6 voltage monitor output channel: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF6 is cleared	W
7	—	The write value should be 0.	W
8	CMPEXC8	D/A converter 0 channel: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF8 is cleared	W
9	CMPEXC9	D/A converter 1 channel: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF9 is cleared	W
15:10	—	The write value should be 0.	W
16	CMPEXC16	Self-diagnosis channel for sample-and-hold circuit unit 0: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF16 is cleared	W
17	CMPEXC17	Self-diagnosis channel for sample-and-hold circuit unit 1: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF17 is cleared	W
18	CMPEXC18	Self-diagnosis channel for sample-and-hold circuit unit 2: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF18 is cleared	W
19	—	The write value should be 0.	W
20	CMPEXC20	Self-diagnosis channel for sample-and-hold circuit unit 4: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF20 is cleared	W
21	CMPEXC21	Self-diagnosis channel for sample-and-hold circuit unit 5: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF21 is cleared	W
22	CMPEXC22	Self-diagnosis channel for sample-and-hold circuit unit 6: Compare Match Flag Clear 0: No effect 1: ADCMPEXSR.CMPEXF22 is cleared	W
31:23	—	The write value should be 0.	W

The ADCMPEXSCR register clears the compare match flag for the Extended Analog Function Channel (ADCMPEXSR.CMPEXFn).

53.2.10 Start and Stop Control of A/D Conversion

53.2.10.1 ADCALSTR : A/D Converter Self-calibration Start Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ADCALST1[2:0]			—	—	—	—	—	ADCALST0[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	ADCALST0[2:0]*1	A/D Converter Unit 0 (ADC0) Self-calibration Start Control [Function of each bit] b0: Start bit of the internal circuit calibration b1: Start bit of the gain and offset calibration b2: Start bit of the channel-dedicated sample-and-hold circuit calibration [Write value] 0: No effect (not start the calibration) 1: Start the calibration	W
7:3	—	The write value should be 0.	W
10:8	ADCALST1[2:0]*1	A/D Converter Unit 1 (ADC1) Self-calibration Start Control [Function of each bit] b0: Start bit of the internal circuit calibration b1: Start bit of the gain and offset calibration b2: Start bit of the channel-dedicated sample-and-hold circuit calibration [Write value] 0: No effect (not start the calibration) 1: Start the calibration	W
31:11	—	The write value should be 0.	W

Note 1. To perform a calibration operation, write 1 to each of the calibration start bits simultaneously.

The ADCALSTR register controls the start of the self-calibration for each A/D converter.

ADCALSTm[2:0] bits (A/D converter Unit m (ADCm) Self-calibration Start Control bits) (m = 0, 1)

The ADCALSTm[2:0] bits control the start of the self-calibration operation of the A/D converter Unit m. When any bit of ADCALSTm[2:0] is set to 1, the self-calibration operation corresponding to each bit is started. When multiple bits of ADCALSTm[2:0] are set to 1 simultaneously, each self-calibration operation is performed in the order as following:

1. Internal circuit calibration
2. A/D converter gain/offset calibration
3. Channel-specific sample and hold circuit gain/offset calibration

Note: The self-calibration operation corresponding to the bits set to 0 in ADCALSTm[2:0] is skipped.

The ADCALSTm[2:0] bits must be written when all A/D converters are stopped (ADSR.ADACTm = 0 and ADSR.CALACTm = 0);

Writing to the ADCALSTm[2:0] bits are prohibited when A/D converters are operating.

53.2.10.2 ADSYSTR : A/D Conversion Synchronous Software Start Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ADSYST8	ADSYST7	ADSYST6	ADSYST5	ADSYST4	ADSYST3	ADSYST2	ADSYST1	ADSYST0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	ADSYST0 to ADSYST8	Scan Group n: A/D Conversion start The suffix number of each bit symbol corresponds to the scan group number n. 0: No effect 1: Start the A/D conversion of scan group n	W
31:9	—	The write value should be 0.	W

The ADSYSTR register controls the start of the A/D conversion of scan group n. This register is used to start the A/D conversions of several scan groups simultaneously by software.

ADSYSTn bit (Scan Group n: A/D Conversion start) (n = 0 to 8)

The ADSYSTn bit controls the start of the A/D conversion of scan group n. When the ADSYSTn bit is set to 1, the A/D conversion of scan group n is started. Setting 0 to the ADSYSTn bit has no effect on the operation. Set 1 simultaneously to the ADSYSTn bit of the scan group to start A/D conversion simultaneously.

53.2.10.3 ADSTRn : A/D Conversion Software Start Register n (n = 0 to 8)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC20 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADST	Scan Group n A/D Conversion Start 0: No effect 1: Start the A/D conversion of scan group n	W
31:1	—	The write value should be 0.	W

The ADSTRn register controls the start of the A/D conversion of scan group n. This register is used to start the A/D conversion of a scan group by software.

If A/D conversions of several scan groups are to be started simultaneously by software, the ADSYSTR register should be used.

ADST bit (Scan Group n A/D Conversion Start)

The ADST bit controls the start of the A/D conversion of scan group n. When the ADST bit is set to 1, the A/D conversion of the scan group n is started. Setting 0 to the ADST bit has no effect on the operation.

53.2.10.4 ADSTOPR : A/D Conversion Stop Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC60

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ADSTOP1	—	—	—	—	—	—	—	ADSTOP0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADSTOP0	A/D Converter Unit 0 Force Stop 0: No effect 1: Force stop the operation of A/D converter unit 0	W
7:1	—	The write value should be 0.	W
8	ADSTOP1	A/D Converter Unit 1 Force Stop 0: No effect 1: Force stop the operation of A/D converter unit 1	W
31:9	—	The write value should be 0.	W

The ADSTOPR register forces each A/D converter to stop the operation. When the A/D converter is stopped with this register, the A/D conversion results with that A/D converter are not guaranteed.

ADSTOP0 bit (A/D Converter Unit 0 Force Stop)

The ADSTOP0 bit forces the A/D converter unit 0 to stop the A/D conversion operation. Setting 0 to the ADSTOP0 bit has no effect on the operation. When the ADSTOP0 bit is set to 1, the A/D converter unit 0 is forced to stop the operation. If the A/D converter unit 0 is forced to stop, the A/D conversion results with the A/D converter unit 0 are not guaranteed.

ADSTOP1 bit (A/D Converter Unit 1 Force Stop)

The ADSTOP1 bit forces the A/D converter unit 1 to stop the A/D conversion operation. Setting 0 to the ADSTOP1 bit has no effect on the operation. When the ADSTOP1 bit is set to 1, the A/D converter unit 1 is forced to stop the operation. If the A/D converter unit 1 is forced to stop, the A/D conversion results with the A/D converter unit 1 are not guaranteed.

53.2.11 Status Registers

53.2.11.1 ADSR : A/D Conversion Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC80

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CALACT1	CALACT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADACT1	ADACT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADACT0	A/D Converter Unit 0 (ADC0) A/D Conversion Status 0: ADC0 is not in A/D conversion 1: ADC0 is in A/D conversion	R
1	ADACT1	A/D Converter Unit 1 (ADC1) A/D Conversion Status 0: ADC1 is not in A/D conversion 1: ADC1 is in A/D conversion	R
15:2	—	These bits are read as 0.	R
16	CALACT0	A/D Converter Unit 0 (ADC0) : Calibration Status 0: ADC0 is not in the calibration operation 1: ADC0 is in the calibration operation	R
17	CALACT1	A/D Converter Unit 1 (ADC1) : Calibration Status 0: ADC1 is not in the calibration operation 1: ADC1 is in the calibration operation	R
31:18	—	These bits are read as 0.	R

The ADSR register indicates the status for each A/D converter operation.

53.2.11.2 ADGRSR : Scan Group Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC84

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ACTGR8	ACTGR7	ACTGR6	ACTGR5	ACTGR4	ACTGR3	ACTGR2	ACTGR1	ACTGR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	ACTGR0 to ACTGR8*1	Scan Group n Status The suffix number of each bit symbol corresponds to the scan group number n. 0: Scan group n is idle 1: Scan group n is in the scanning operation	R

Bit	Symbol	Function	R/W
31:9	—	These bits are read as 0.	R

Note 1. In the group priority operation, if the scanning operation of a low priority group is interrupted, the ACTGRn bit of the corresponding scan group is set to 1.

The ADGRSR register indicates the operating status for each scan group.

53.2.11.3 ADSCANENDSR : Scan End Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD50

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SCENDF8	SCENDF7	SCENDF6	SCENDF5	SCENDF4	SCENDF3	SCENDF2	SCENDF1	SCENDF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	SCENDF0 to SCENDF8*1	Scan Group n Scan End Flag The suffix number of each bit symbol corresponds to the scan group number n. 0: Scan group n has not been scanned 1: End of scan for scan group n is detected	R
31:9	—	These bits are read as 0.	R

Note 1. If the A/D conversion operation is stopped with the ADSTOPR register, the SCENDFn bit of the scan group in which the scan operation was stopped is not changed. (It is not set to 1)

The ADSCANENDSR register indicates whether the scanning operation for each scan group has been done. Each flag can be cleared in ADSCANENDSCR register.

53.2.11.4 ADSCANENDSCR : Scan End Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xD54

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SCENDC8	SCENDC7	SCENDC6	SCENDC5	SCENDC4	SCENDC3	SCENDC2	SCENDC1	SCENDC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	SCENDC0 to SCENDC8	Scan Group n Scan End Flag Clear The suffix number of each bit symbol corresponds to the scan group number n. 0: No effect 1: ADSCANENDSR.SCENDFn is cleared	W
31:9	—	The write value should be 0.	W

The ADSCANENDSCR register clears the scan end flag for the scan group n.

53.2.11.5 ADERSR : A/D Conversion Error Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC88

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADERF1	ADERF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADERF0	A/D Converter Unit 0 (ADC0) Error Flag 0: Error is not detected 1: Error is detected	R
1	ADERF1	A/D Converter Unit 1 (ADC1) Error Flag 0: Error is not detected 1: Error is detected	R
31:2	—	These bits are read as 0.	R

The ADERSR register indicates whether the operating error has occurred in each A/D converter. Each flag can be cleared in ADERSCR register.

The A/D conversion data is not guaranteed in the A/D converter operation with an error detected.

53.2.11.6 ADERSCR : A/D Conversion Error Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC8C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADERCLR1	ADERCLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADERCLR0	A/D Converter Unit 0 Error Flag Clear 0: No effect 1: ADERSR.ADERF0 is cleared	W
1	ADERCLR1	A/D Converter Unit 1 Error Flag Clear 0: No effect 1: ADERSR.ADERF1 is cleared	W
31:2	—	The write value should be 0.	W

The ADERSCR register clears the error flag for A/D converter unit 0 or unit 1.

53.2.11.7 ADCALENDSR : A/D Converter Self-calibration End Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC98

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CALENDF1	CALENDF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CALENDF0	A/D Converter Unit 0 Calibration End flag 0: End of the calibration is not detected 1: End of the calibration is detected	R
1	CALENDF1	A/D Converter Unit 1 Calibration End flag 0: End of the calibration is not detected 1: End of the calibration is detected	R
31:2	—	These bits are read as 0.	R

The ADCALENDSR register indicates the end of the calibration operation for the A/D converter unit 0 or unit 1. Each flag can be cleared in ADCALENDSCR register.

53.2.11.8 ADCALENDSCR : A/D Converter Self-calibration End Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xC9C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CALENDC1	CALENDC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CALENDC0	A/D Converter Unit 0 Calibration End Flag Clear 0: No effect 1: ADCALENDSR.CALENDF0 is cleared	W
1	CALENDC1	A/D Converter Unit 1 Calibration End Flag Clear 0: No effect 1: ADCALENDSR.CALENDF1 is cleared	W
31:2	—	The write value should be 0.	W

The ADCALENDSCR register clears the Calibration End flag for the A/D converter unit 0 or unit 1.

53.2.11.9 ADOVFERSR : A/D Conversion Overflow Error Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCA0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADOVFEF1	ADOVFEF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADOVFEF0	A/D Converter Unit 0 (ADC0) Overflow Error Flag 0: ADC0 overflow error is not detected 1: ADC0 overflow error is detected	R
1	ADOVFEF1	A/D Converter Unit 1 (ADC1) Overflow Error Flag 0: ADC1 overflow error is not detected 1: ADC1 overflow error is detected	R
31:2	—	These bits are read as 0.	R

The ADOVFERSR register indicates whether the overflow error has occurred in an A/D conversion using A/D converter unit 0 or unit 1. Each flag can be cleared in ADOVFERSCR register.

53.2.11.10 ADOVFCHSR0 : A/D Conversion Overflow Channel Status Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCA4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	OVFCHF22	OVFCHF21	OVFCHF20	OVFCHF19	OVFCHF18	OVFCHF17	OVFCHF16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OVFCHF15	OVFCHF14	OVFCHF13	OVFCHF12	OVFCHF11	OVFCHF10	OVFCHF9	OVFCHF8	OVFCHF7	OVFCHF6	OVFCHF5	OVFCHF4	OVFCHF3	OVFCHF2	OVFCHF1	OVFCHF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
22:0	OVFCHF0 to OVFCHF22	Analog Channel n: Overflow Flag The suffix number of each bit symbol corresponds to the analog channel number n. 0: Overflow is not detected 1: Overflow is detected	R
31:23	—	These bits are read as 0.	R

The ADOVFCHSR0 register indicates whether the overflow has occurred in the A/D conversion of the analog channel n. Each flag can be cleared in ADOVFCHSCR0 register.

53.2.11.11 ADOVFEXSR : Extended Analog A/D Conversion Overflow Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCB0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	OVFEXF22	OVFEXF21	OVFEXF20	—	OVFEXF18	OVFEXF17	OVFEXF16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OVFEXF0	Self-diagnosis channel for A/D unit 0: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
1	OVFEXF1	Self-diagnosis channel for A/D unit 1: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
3:2	—	These bits are read as 0.	R
4	OVFEXF4	Temperature sensor channel: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
5	OVFEXF5	Internal reference voltage channel: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
6	OVFEXF6	VBATT 1/6 voltage monitor output channel: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
7	—	This bit is read as 0.	R
8	OVFEXF8	D/A converter 0 channel: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
9	OVFEXF9	D/A converter 1 channel: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
15:10	—	These bits are read as 0.	R
16	OVFEXF16	Self-diagnosis channel for sample-and-hold circuit unit 0: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
17	OVFEXF17	Self-diagnosis channel for sample-and-hold circuit unit 1: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
18	OVFEXF18	Self-diagnosis channel for sample-and-hold circuit unit 2: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
19	—	This bit is read as 0.	R
20	OVFEXF20	Self-diagnosis channel for sample-and-hold circuit unit 4: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R

Bit	Symbol	Function	R/W
21	OVFEXF21	Self-diagnosis channel for sample-and-hold circuit unit 5: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
22	OVFEXF22	Self-diagnosis channel for sample-and-hold circuit unit 6: Overflow Flag 0: Overflow is not detected 1: Overflow is detected	R
31:23	—	These bits are read as 0.	R

The ADOVFEXSR register indicates whether the overflow occurred when the A/D conversion for the extended analog function is performed. Each flag can be cleared in ADOVFEXSCR.

53.2.11.12 ADOVFERSCR : A/D Conversion Overflow Error Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCB4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADOVFEC1	ADOVFEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADOVFEC0	A/D Converter Unit 0 (ADC0) Overflow Error Flag Clear 0: No effect 1: ADOVFERSR.ADOVFEF0 is cleared	W
1	ADOVFEC1	A/D Converter Unit 1 (ADC1) Overflow Error Flag Clear 0: No effect 1: ADOVFERSR.ADOVFEF1 is cleared	W
31:2	—	The write value should be 0.	W

The ADOVFERSCR register clears the Overflow Error flag for the A/D converter unit 0 or unit 1.

53.2.11.13 ADOVFCHSCR0 : A/D Conversion Overflow Channel Status Clear Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCB8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	OVFCHC22	OVFCHC21	OVFCHC20	OVFCHC19	OVFCHC18	OVFCHC17	OVFCHC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

7	—	The write value should be 0.	W
8	OVFEXF8	D/A Converter 0 Channel: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF8 is cleared	W
9	OVFEXF9	D/A Converter 1 Channel: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF9 is cleared	W
15:10	—	The write value should be 0.	W
16	OVFEXF16	Self-diagnosis Channel for Sample-and-hold circuit unit0: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF16 is cleared	W

Bit	Symbol	Function	R/W
17	OVFEXF17	Self-diagnosis Channel for Sample-and-hold circuit unit1: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF17 is cleared	W
18	OVFEXC18	Self-diagnosis Channel for Sample-and-hold circuit unit2: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF18 is cleared	W
19	—	The write value should be 0.	W
20	OVFEXC20	Self-diagnosis Channel for Sample-and-hold circuit unit4: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF20 is cleared	W
21	OVFEXC21	Self-diagnosis Channel for Sample-and-hold circuit unit5: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF21 is cleared	W
22	OVFEXC22	Self-diagnosis Channel for Sample-and-hold circuit unit6: Compare Match Flag Clear 0: No effect 1: ADOVFEXSR.OVFEXF22 is cleared	W
31:23	—	The write value should be 0.	W

The ADOVFEXSCR register clears the overflow flag for the extended analog function channels.

53.2.12 FIFO

53.2.12.1 ADFIFOCR : FIFO Control Register

Base address: ADC_B = 0x4033_8000

Offset address: 0x4C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	FIFOCE8	FIFOCE7	FIFOCE6	FIFOCE5	FIFOCE4	FIFOCE3	FIFOCE2	FIFOCE1	FIFOCE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FIFOEN8	FIFOEN7	FIFOEN6	FIFOEN5	FIFOEN4	FIFOEN3	FIFOEN2	FIFOEN1	FIFOEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	FIFOEN0 to FIFOEN8	Scan Group n FIFO Enable The suffix number of each bit symbol corresponds to the scan group number n. 0: Disable scan group n FIFO function 1: Enable scan group n FIFO function	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
24:16	FIFOCE0 to FIFOCE8	Scan Group n FIFO clear enable at scan start/resume 0: Scan group n FIFO clear disable 1: Scan group n FIFO clear enable	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOCR register enables/disables the FIFO function of scan group n.

FIFOENn bit (Scan Group n FIFO Enable) (n = 0 to 8)

The FIFOENn bit enables or disables the FIFO function of scan group n. When the FIFOENn bit is set to 1, the FIFO function of scan group n is enabled, and the result of A/D conversion is stored to the FIFO. When the FIFOENn bit is set to 0, the FIFO function of scan group n is disabled.

The A/D conversion result can also be read from the A/D data or extended data registers.

FIFOCEn bit (Scan Group n FIFO clear enable at scan start/resume) (n = 0 to 8)

The FIFOCEn bit controls whether the scan group n FIFO clear function is enabled or disabled. When the FIFOCEn bit is set to 1, FIFO clear for scan group n is enabled and the FIFO is cleared when the scan group n scan starts/resumes. When the FIFOCEn bit is set to 0, FIFO clear for scan group n is disabled.

53.2.12.2 ADFIFOINTCR : FIFO Interrupt Control Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x4C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FIFOIE8	FIFOIE7	FIFOIE6	FIFOIE5	FIFOIE4	FIFOIE3	FIFOIE2	FIFOIE1	FIFOIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	FIFOIE0 to FIFOIE8	Scan Group n FIFO Interrupt Enable The suffix number of each bit symbol corresponds to the scan group number n. 0: Disable scan group n FIFO interrupt 1: Enable scan group n FIFO interrupt	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOINTCR register enables/disables the FIFO data read request interrupt and FIFO overflow interrupt for scan group n.

53.2.12.3 ADFIFOINTLR0 : FIFO Interrupt Generation Level Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x4C8

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV1[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOILV0[3:0]	Scan Group 0 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
19:16	FIFOILV1[3:0]	Scan Group 1 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOINTLR0 register specifies the generation timing of the FIFO data read request interrupt for the scan group 0 and 1.

53.2.12.4 ADFIFOINTLR1 : FIFO Interrupt Generation Level Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x4CC

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV3[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV2[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOILV2[3:0]	Scan Group 2 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
19:16	FIFOILV3[3:0]	Scan Group 3 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOINTLR1 register specifies the generation timing of the FIFO data read request interrupt for the scan group 2 and 3.

53.2.12.5 ADFIFOINTLR2 : FIFO Interrupt Generation Level Register 2

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x4D0

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV5[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV4[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOILV4[3:0]	Scan Group 4 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
19:16	FIFOILV5[3:0]	Scan Group 5 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOINTLR2 register specifies the generation timing of the FIFO data read request interrupt for the scan group 4 and 5.

53.2.12.6 ADFIFOINTLR3 : FIFO Interrupt Generation Level Register 3

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x4D4

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV7[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV6[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOILV6[3:0]	Scan Group 6 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
19:16	FIFOILV7[3:0]	Scan Group 7 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOINTLR3 register specifies the generation timing of the FIFO data read request interrupt for the scan group 6 and 7.

53.2.12.7 ADFIFOINTLR4 : FIFO Interrupt Generation Level Register 4

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x4D8

Bit position:	31																												3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFOILV8[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOILV8[3:0]	Scan Group 8 FIFO Interrupt Output Timing Setting These bits set the generation timing of FIFO interrupt. The FIFO data read request interrupt is generated when the number of vacant stages in FIFO becomes less than or equal to the value set by these bits. Set a value in the range from 0 to 7. Setting a value in the range from 8 to 15 is prohibited.	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The ADFIFOINTLR4 register specifies the generation timing of the FIFO data read request interrupt for the scan group 8.

53.2.12.8 ADFIFOSR0 : FIFO Status Register 0

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCD0

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOST1[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOST0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOST0[3:0]	Number of vacant stages in FIFO for Scan Group 0	R
15:4	—	These bits are read as 0.	R
19:16	FIFOST1[3:0]	Number of vacant stages in FIFO for Scan Group 1	R
31:20	—	These bits are read as 0.	R

The ADFIFOSR0 register indicates the number of vacant stages in FIFO for scan group 0 and 1.

53.2.12.9 ADFIFOSR1 : FIFO Status Register 1

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCD4

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOST3[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOST2[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOST2[3:0]	Number of vacant stages in FIFO for Scan Group 2	R
15:4	—	These bits are read as 0.	R
19:16	FIFOST3[3:0]	Number of vacant stages in FIFO for Scan Group 3	R
31:20	—	These bits are read as 0.	R

The ADFIFOSR1 register indicates the number of vacant stages in FIFO for scan group 2 and 3.

53.2.12.10 ADFIFOSR2 : FIFO Status Register 2

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCD8

Bit position:	31												19			16													3			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	FIFOST5[3:0]				—	—	—	—	—	—	—	—	—	—	—	—	FIFOST4[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
3:0	FIFOST4[3:0]	Number of vacant stages in FIFO for Scan Group 4	R
15:4	—	These bits are read as 0.	R
19:16	FIFOST5[3:0]	Number of vacant stages in FIFO for Scan Group 5	R

Bit	Symbol	Function	R/W
31:20	—	These bits are read as 0.	R

The ADFIFOSR2 register indicates the number of vacant stages in FIFO for scan group 4 and 5.

53.2.12.11 ADFIFOSR3 : FIFO Status Register 3

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCDC

Bit position:	31–20	19–16	15–4	3–0
Bit field:	— (each bit)	FIFOST7[3:0]	— (each bit)	FIFOST6[3:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0	1 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0	1 0 0 0

Bit	Symbol	Function	R/W
3:0	FIFOST6[3:0]	Number of vacant stages in FIFO for Scan Group 6	R
15:4	—	These bits are read as 0.	R
19:16	FIFOST7[3:0]	Number of vacant stages in FIFO for Scan Group 7	R
31:20	—	These bits are read as 0.	R

The ADFIFOSR3 register indicates the number of vacant stages in FIFO for scan group 6 and 7.

53.2.12.12 ADFIFOSR4 : FIFO Status Register 4

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCE0

Bit position:	31–4	3–0
Bit field:	— (each bit)	FIFOST8[3:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	1 0 0 0

Bit	Symbol	Function	R/W
3:0	FIFOST8[3:0]	Number of vacant stages in FIFO for Scan Group 8	R
31:4	—	These bits are read as 0.	R

The ADFIFOSR4 register indicates the number of vacant stages in FIFO for scan group 8.

53.2.12.13 ADFIFODCR : FIFO Data Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCF0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FIFODC8	FIFODC7	FIFODC6	FIFODC5	FIFODC4	FIFODC3	FIFODC2	FIFODC1	FIFODC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	FIFODC0 to FIFODC8	Scan Group n FIFO Data Clear The suffix number of each bit symbol corresponds to the scan group number n. 0: No effect 1: Clear the data of scan group n FIFO	W
31:9	—	The write value should be 0.	W

The ADFIFODCR register clears the data in FIFO for each scan group.

FIFODCn bit (Scan Group n FIFO Data Clear) (n = 0 to 8)

The FIFODCn bit clears the data in FIFO for scan group n. Writing 1 to the FIFODCn clears the data in the FIFO of scan group n. Writing 0 has no effect on the operation, and the data in FIFO is not cleared.

53.2.12.14 ADFIFOERSR : FIFO Error Status Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCF4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	FIFOFLF8	FIFOFLF7	FIFOFLF6	FIFOFLF5	FIFOFLF4	FIFOFLF3	FIFOFLF2	FIFOFLF1	FIFOFLF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FIFOOVF8	FIFOOVF7	FIFOOVF6	FIFOOVF5	FIFOOVF4	FIFOOVF3	FIFOOVF2	FIFOOVF1	FIFOOVF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	FIFOOVF0 to FIFOOVF8	Scan Group n FIFO Overflow Flag The suffix number of each bit symbol corresponds to the scan group number n. 0: No overflow 1: FIFO overflow is detected	R
15:9	—	These bits are read as 0.	R
24:16	FIFOFLF0 to FIFOFLF8	Scan Group n FIFO Data Read Request Flag The suffix number of each bit symbol corresponds to the scan group number n. 0: FIFO Data Read Request is not detected. 1: FIFO Data Read Request is detected.	R
31:25	—	These bits are read as 0.	R

The ADFIFOERSR register indicates the status of the FIFO. Each flag can be cleared in ADFIFOERSCR.

FIFOOVFn bit (Scan Group n FIFO Overflow Flag) (n = 0 to 8)

The FIFOOVFn bit indicates whether the overflow occurred in the FIFO of the scan group n.

When FIFOOVFn = 0, an overflow is not detected in the FIFO. When FIFOOVFn = 1, an overflow occurred in the FIFO and the A/D conversion result cannot be stored to the FIFO. FIFOOVFn can be cleared in ADFIFOERSCR.

FIFOFLFn bit (Scan Group n FIFO Data Read Request Flag) (n = 0 to 8)

The FIFOFLFn bit indicates whether a FIFO data read request in scan group n has been detected. The setting and clearing conditions of FIFOFLFn are shown as follows:

[Setting condition]

When the condition of ADFIFOSRm.FIFOSTn[3:0] ≤ ADFIFOINTLRm.FIFOILVn[3:0] is detected.

[Clearing condition]

When ADFIFOERSCR.FIFOFLCn is written to 1 under the condition of ADFIFOSRm.FIFOSTn[3:0] > ADFIFOINTLRm.FIFOILVn[3:0].

When the condition of ADFIFOSRm.FIFOSTn[3:0] > ADFIFOINTLRm.FIFOILVn[3:0] is occurred by the read access to ADFIFODRn register with DMAC or DTC.

Note: m = 0 to 4, n = 0 to 8

53.2.12.15 ADFIFOERSCR : FIFO Error Status Clear Register

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0xCF8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	FIFOFLC8	FIFOFLC7	FIFOFLC6	FIFOFLC5	FIFOFLC4	FIFOFLC3	FIFOFLC2	FIFOFLC1	FIFOFLC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FIFOOVFC8	FIFOOVFC7	FIFOOVFC6	FIFOOVFC5	FIFOOVFC4	FIFOOVFC3	FIFOOVFC2	FIFOOVFC1	FIFOOVFC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	FIFOOVFC0 to FIFOOVFC8	Scan Group n FIFO Overflow Flag Clear The suffix number of each bit symbol corresponds to the scan group number n. 0: No effect 1: ADFIFOERSR.FIFOOVFn is cleared	W
15:9	—	The write value should be 0.	W
24:16	FIFOFLC0 to FIFOFLC8	Scan Group n FIFO Data Read Request Flag Clear The suffix number of each bit symbol corresponds to the scan group number n. 0: No effect 1: ADFIFOERSR.FIFOFLFn is cleared	W
31:25	—	The write value should be 0.	W

ADFIFOERSCR clears the FIFO overflow flags and the FIFO data read request flags for scan group n.

53.2.13 Data Register

53.2.13.1 ADDRn : A/D Data Register n (n = 0 to 22)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x2000 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15–0
Bit field:	ERR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DATA[15:0]
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	DATA[15:0]	A/D conversion data	R
30:16	—	These bits are read as 0.	R
31	ERR	A/D conversion data error status 0: No error (the A/D conversion data is valid) 1: Error is detected (the A/D conversion data is not guaranteed)	R

The ADDRn registers are read-only registers to read A/D conversion results.

DATA[15:0] bits (A/D conversion data)

The DATA[15:0] bits indicate the data of the A/D conversion result for the analog input channel n.

The data format of the A/D conversion results is determined by the setting of the virtual channel m (m = 0 to 32) to which the analog input channel n is assigned.

ERR bit (A/D conversion data error status)

The ERR bit indicates the error status in the A/D conversion for the analog input channel n.

When ERR = 0, the A/D conversion data is valid. When ERR = 1, the A/D conversion data is invalid, and the accuracy of the A/D conversion data is not guaranteed.

53.2.13.2 ADEXDRn : A/D Extended Analog Data Register n (n = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x2180 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	ERR	—	—	—	—	DIAGSR[2:0]			—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DATA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DATA[15:0]	A/D conversion data	R
23:16	—	These bits are read as 0.	R
26:24	DIAGSR[2:0]*1	Self-diagnosis Status*1	R
30:27	—	These bits are read as 0.	R
31	ERR	A/D Conversion Error Status 0: No error (the A/D conversion data is valid) 1: Error is detected (the A/D conversion data is not guaranteed)	R

Note 1. The ADEXDRn (n = 0, 1, 16 to 18, 20 to 22) registers have the DIAGSR[2:0] bits. The DIAGSR[2:0] bits in the ADEXDRn (n = 4 to 6, 8, 9) registers are reserved bits.

The ADEXDRn registers are read-only registers to read A/D conversion results of the extended analog function. The ADEXDRn registers and the extended analog functions are as follows:

- ADEXDR0 : LIMEXF0 Self-diagnosis Channel for A/D unit0
- ADEXDR1 : LIMEXF1 Self-diagnosis Channel for A/D unit1
- ADEXDR4 : LIMEXF4 Temperature Sensor Channel
- ADEXDR5 : LIMEXF5 Internal Reference Voltage Channel
- ADEXDR6 : LIMEXF6 VBATT 1/6 voltage monitor output
- ADEXDR8 : LIMEXF8 D/A Converter 0 Channel
- ADEXDR9 : LIMEXF9 D/A Converter 1 Channel
- ADEXDR16 : LIMEXF16 Self-diagnosis Channel for Sample-and-hold circuit unit0
- ADEXDR17 : LIMEXF17 Self-diagnosis Channel for Sample-and-hold circuit unit1

DATA[15:0] bits (A/D conversion data)

The DATA[15:0] bits indicate the data of the A/D conversion result for the extended analog function channel. The data format of the A/D conversion results is determined by the setting of the virtual channel m (m = 0 to 36) to which the extended analog function channel is assigned.

DIAGSR[2:0] bits (Self-diagnosis Status)

The DIAGSR[2:0] bits indicate the voltage setting of the self-diagnosis channel.

The voltage setting value is selected among the setting values of the ADSGDCRm.DIAGVAL[2:0] bits (m = 0 to 8), ADSHSDCR0.SHDIAGm bits (m = 0 to 7) and ADSHSDCR1.SHDIAG8 bits according to the setting value of ADCHCRn.CNVCS[6:0].

The DIAGSR[2:0] bits are available in the ADEXDR0, ADEXDR1, ADEXDR16, ADEXDR17, ADEXDR18, ADEXDR20, ADEXDR21 and ADEXDR22 registers.

The DIAGSR[2:0] bits in ADEXDRn except above are reserved.

ERR bit (A/D Conversion Error Status)

The ERR bit indicates the error status in the A/D conversion for the extended analog functions.

When ERR = 0, the A/D conversion data is valid. When ERR = 1, the A/D conversion data is invalid, and the accuracy of the A/D conversion data is not guaranteed.

53.2.13.3 ADFIFODRn : FIFO Data Register n (n = 0 to 8)

Base address: ADC_B = 0x4033_8000
ADC_B_NS = 0x5033_8000

Offset address: 0x2200 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	ERR	CH[6:0]							—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DATA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DATA[15:0]	A/D Conversion Data	R
23:16	—	These bits are read as 0.	R
30:24	CH[6:0]	A/D Conversion Channel Number	R
31	ERR	A/D Conversion Data Error Status 0: No error (the A/D conversion data is valid) 1: Error is detected (the A/D conversion data is not guaranteed)	R

The ADFIFODRn register is used to read data stored in the FIFO of scan group n.

DATA[15:0] bits (A/D Conversion Data)

The DATA[15:0] bits are read-only bits that read the A/D conversion data stored in the scan group n FIFO.

CH[6:0] bits (A/D Conversion Channel Number)

The CH[6:0] bits indicate the channel number of the A/D conversion data that is read from the DATA[15:0] bits.

ERR bit (A/D Conversion Data Error Status)

The ERR bit indicates the error status in the A/D conversion data of the analog channel indicated by the CH[6:0] bits.

When ERR = 0, the A/D conversion data is valid. When ERR = 1, the A/D conversion data is invalid, and the accuracy of the A/D conversion data is not guaranteed.

53.3 Operation

53.3.1 A/D Conversion Clock

A/D conversion clock (ADCLK) is the operation clock of ADC. The A/D converters (ADC0 and ADC1) are operated and controlled by ADCLK as the basic clock. Figure 53.4 shows clock structure of ADC16H.

ADCLK is generated from the clock source and the division ratio selected in ADCLKCR register. The frequency of ADCLK should be set so that PCLKA ≥ ADCLK. Also, the frequency of ADCLK should be set so that it is within the guaranteed operating range specified in the electrical characteristics. For details, see section 62, Electrical Characteristics.

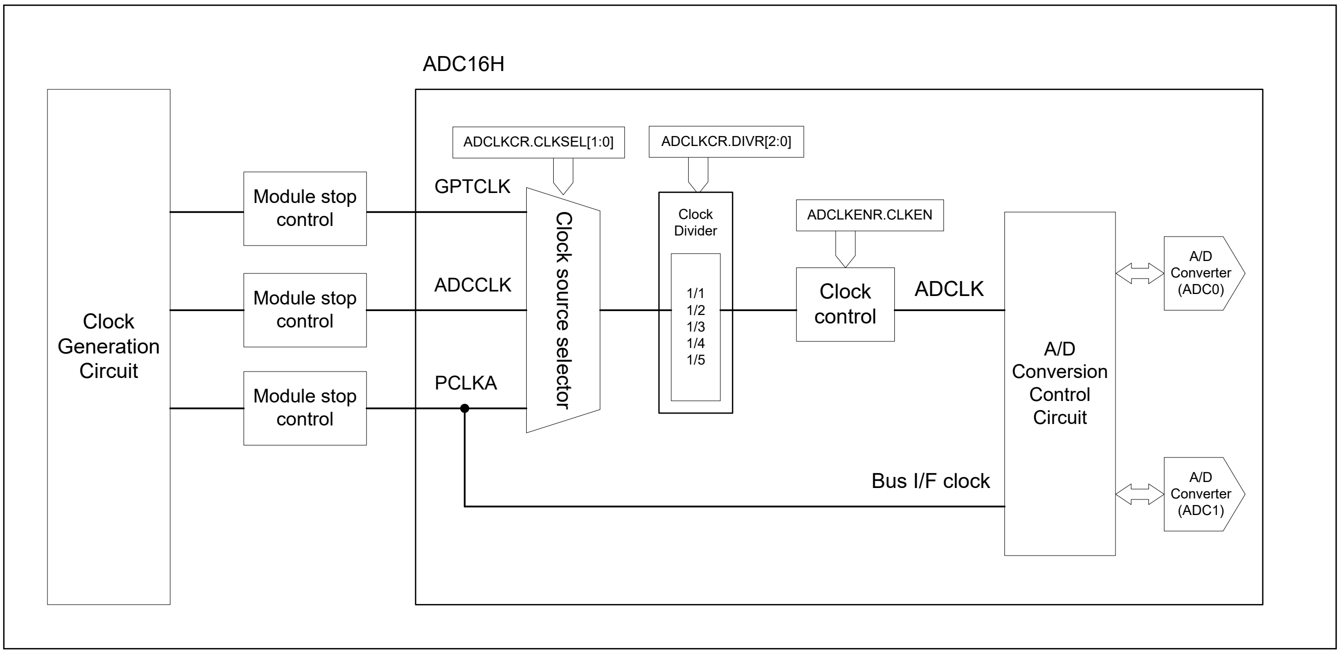

Figure 53.4 Clock structure

53.3.2 A/D Converter Operation Mode

53.3.2.1 SAR Mode

In SAR mode, A/D converter operates as a Nyquist type A/D converter. Analog channels are sampled one time and converted analog to digital by Successive Approximation Register (SAR) method. The features of SAR mode are shown in the following:

[Features of SAR mode]

- Fast conversion: A/D conversion data can be acquired with the shortest group delay.
- A/D conversion of up to 8 analog channels (virtual channels) is possible per scan group.
- Both single-ended input and differential input are supported (digital filter function is not supported)

For details about operation of A/D conversion in SAR mode, see section 53.3.7. Scanning Operation. For restrictions on SAR mode, see section 53.11.14. Restrictions on SAR Mode.

53.3.2.2 Oversampling Mode

In Oversampling mode, A/D converter operates as Oversampling-type A/D converter. Analog channels are oversampled and converted analog to digital by Noise Shaping Successive Approximation Register method (NS-SAR). The features of Oversampling mode are shown in the following:

[Features of Oversampling mode]

- High accuracy conversion: A/D conversion data can be acquired with Noise Shaping technology and Digital Filter function.*1
- A/D conversion of up to 8 analog channels (virtual channels) is possible per scan group.
- Both of single-ended input and differential input are supported.

Note 1. Digital Filter function must be used in Oversampling mode. It is prohibited to operate without digital filter function in Oversampling mode.

For details about operation of A/D conversion in Oversampling mode, see section 53.3.7. Scanning Operation. For restrictions on Oversampling mode, see section 53.11.15. Restrictions on Oversampling Mode.

53.3.2.3 Hybrid Mode

Hybrid mode has both features of SAR mode and Oversampling mode. In Hybrid mode, A/D converter operates as Oversampling-type A/D converter. Analog channels are oversampled and converted analog to digital by Noise Shaping Successive Approximation Register (NS-SAR) method. In the hybrid mode, while switching channels for each sampling, multiple analog channels are oversampled. The features of Hybrid mode are shown in the following:

[Features of Hybrid mode]

- High accuracy conversion: A/D conversion data can be acquired with Noise Shaping technology and Digital Filter function.*1
- Fast conversion: A/D conversion data can be acquired with the shortest group delay when in the Continuous scan mode and after initial delay time.
- A/D conversion of up to 4 analog channels (virtual channels) is possible per scan group.
- Both of single-ended input and differential input are supported.

Note 1. Digital Filter function must be used in Hybrid mode. It is prohibited to operate without digital filter function in Hybrid mode.

For details about operation of A/D conversion in Hybrid mode, see section 53.3.7. Scanning Operation. For restrictions on Hybrid mode, see section 53.11.16. Restrictions on Hybrid Mode.

53.3.3 Single-ended Input and Differential Input

ADC16H supports Single-ended input and Differential input. The selection of Single-ended input or Differential input is specified in ADCHCRn.AINMD (n = 0 to 32) bit. For the analog channels that support differential input, see Table 53.4 and Table 53.5.

Single-ended Input

In Single-ended input mode, the difference between the voltage of the analog channel (signal source) and the analog reference ground voltage (ADC0: VREFL0, ADC1: VREFL) is A/D-converted.

Differential Input

In Differential input mode, the even-numbered analog channel is used as the non-inverting input (+) (A_{INP}) and the odd-numbered analog channel is used as the inverting input (−) (A_{INN}), then the difference voltage between the non-inverting input (+) and the inverting input (−) ($A_{INP} - A_{INN}$) is A/D-converted.*1

For A/D conversion with Differential input mode, select the non-inverting input (+) channel*2 of the target of differential pair in ADCHCRn.CNVCS[6:0] (n = 0 to 32) bits, and select the Differential input mode in ADCHCRn.AINMD (n = 0 to 32) bit.

It is prohibited to perform A/D conversion for channels that do not support differential input with Differential input mode. In that case, A/D conversion result is not guaranteed.

Note 1. The differential input pair is a combination of channels with analog channel number 2i and 2i + 1 (i = 0, 1, 2, 3, ...), and they are named ANxxxP and ANxxxN (xxx = 000, 002, 004, ...). The combination of discontinuous analog channel numbers or the combination of analog channel numbers 2i − 1 and 2i cannot be used as a differential input pair.

Note 2. It is the even-numbered analog channel which is named as ANxxxP (xxx = 000, 002, 004, …).

53.3.4 Analog Channel

The analog channel is the source of the analog signal that is targeted for A/D conversion. The analog channels consist of the following elements:

- Analog input channels: A/D conversion channels for the analog input from MCU’s I/O pin as the signal source.
- Extended analog channels: A/D conversion channels for the source of the analog signal inside the MCU.

To perform A/D conversion for the analog channels, assignments to the virtual channel and scan group are required. For each element, refer to each item.

53.3.5 Virtual Channel

The virtual channel is a group of registers that stores the A/D conversion configurations for an analog channel. The virtual channels can be specified the configurations for A/D conversion such as the selection of the analog channels, the optional settings for A/D conversion, the data processing method of the A/D conversion data, the assignment to scan groups, and so on.

To perform the A/D conversion of the analog channel, the analog channel should be assigned to any of the virtual channels. Then that virtual channel should be assigned to one of the scan groups. See Figure 53.5 for the relationship between the analog channels and the virtual channels and scan groups. Figure 53.6 shows the A/D conversion order in Figure 53.5 settings.

The virtual channel can be assigned to only one scan group. If the same analog channel is to be converted within the different scan group, or the same analog channel is to be converted several times within the same scan group, assign the analog channel to several virtual channels. When performing the A/D conversion more than once using more than one virtual channel within the same scan group for the same analog channel, the FIFO function should be used in combination.

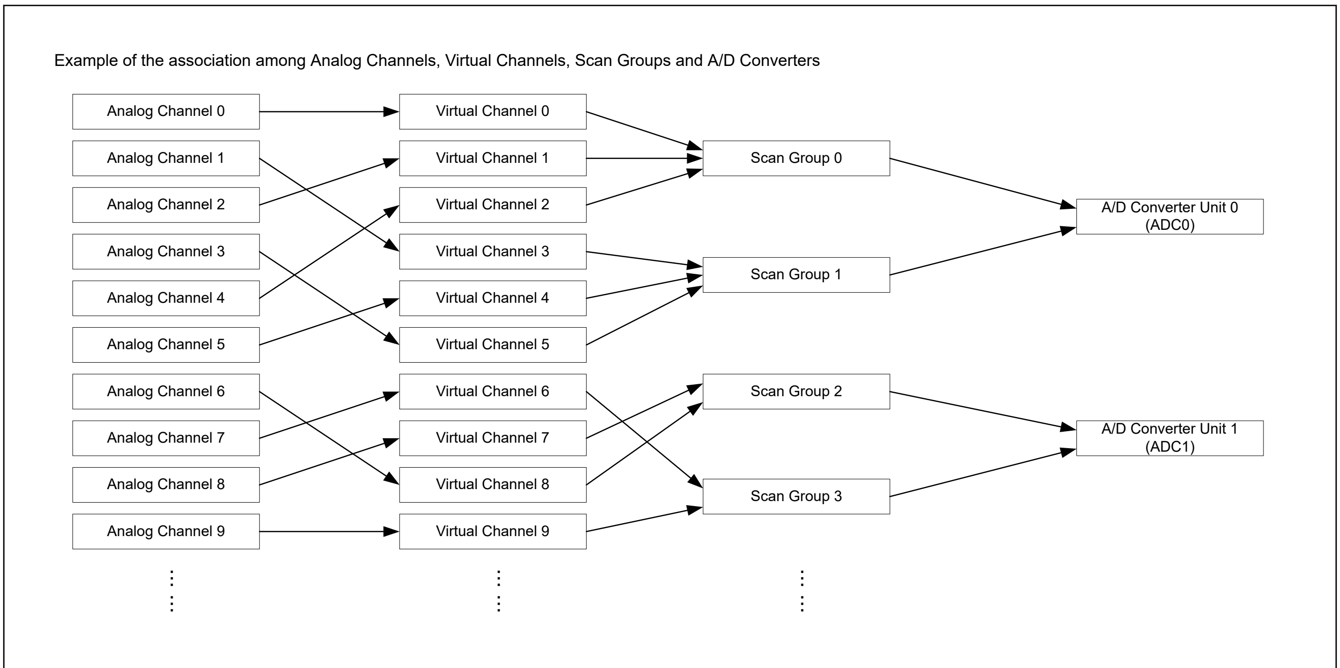

Figure 53.5 The concept of virtual channel

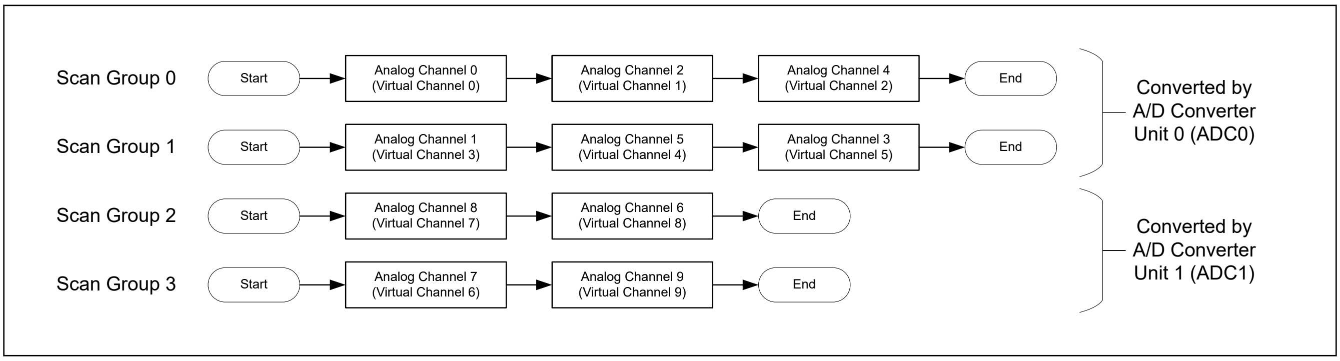

Figure 53.6 Example of A/D conversion order at the scanning operation

53.3.6 Scan Group

The scan group is a group of the analog channels that perform A/D conversion in a scanning operation. To perform the A/D conversion using the scan group, configure the following steps:

- Assign the analog channel for the A/D conversion to the virtual channel.
- Assign the virtual channel to the scan group.
- Assign the scan group to A/D converter.

See Figure 53.5 and Figure 53.6 for the relationship among the analog channels, the virtual channels, and the scan groups.

A single scan group can be assigned virtual channels in the following ranges, according to its operation mode.

- SAR mode: up to 8 virtual channels per scan group
- Oversampling mode: up to 8 virtual channels per scan group
- Hybrid mode: from 2 to 4 virtual channels per scan group

If more than the maximum number of virtual channels are allocated to one scan group, A/D conversion is performed on the 8th (SAR mode or Oversampling mode) or 4th (Hybrid mode) channels in ascending order of virtual channel numbers. Subsequent channels are not subject to A/D conversion.

Notes on the scan groups

The virtual channels assigned to one scan group should be assigned the analog channels that can be converted by the same A/D converter. If any analog channels cannot be converted by the specified A/D converter are included, the A/D conversion result of those channels are undefined.

In Hybrid mode, you must assign at least 2 virtual channels to a scan group. Operation is not guaranteed when any virtual channel is not assigned or only 1 virtual channel is assigned.

53.3.7 Scanning Operation

The scanning operation is the operation of sequential A/D conversion for the analog channels. The modes of the scanning operation are the followings:

- Single scan mode
  - In single scan mode, one scan group is scanned once for each A/D conversion start trigger input.
  - Each time an A/D conversion start trigger is input, A/D conversion is performed once for each analog channel assigned to that scan group.
- Continuous scan mode
  - The continuous scan mode repeats the scanning operation of one scan group.
  - When an A/D conversion start trigger is input, A/D conversion of each analog channel assigned to that scan group is repeated until A/D conversion stop processing is performed.
- Background continuous scan mode
  - The background continuous scan mode repeats the scanning operation of a single scanning group.

  - Scanning operation starts when the first A/D conversion start trigger is input.
  - A/D conversions of each analog channel assigned to that scan group are repeated until A/D conversion stop processing is performed. (Continuous scanning operation)
  - When an A/D conversion start trigger is input during continuous scanning operation, the A/D conversion data at that point is output. (Unless an A/D conversion start trigger is input, the A/D conversion data are not output and the values of the A/D data registers and FIFO data registers are not updated.)
- One-channel continuous scan mode
  - One-channel continuous scan mode repeats the scanning operation of one analog channel and can change conversion channel by a start trigger.
  - The first start trigger activates A/D conversion, and the same channel is continuously converted until the next start trigger is input.
  - Whenever an A/D conversion channel is switched by a start trigger, A/D conversion is suspended and resumed.
- Fixed-channel continuous scan mode
  - Fixed-channel continuous scan mode operates with a combination of fixed channels operating as Hybrid and non-fixed channels operating as SAR.
  - Scan a fixed number of fixed channels first, then scan one non-fixed channel assigned to the scan group. One non-fixed channel is switched in sequence with each scan. And repeat these operations.
  - A/D conversion data will not be output until conversion is completed according to the number of TAPs in the digital filter.

The scan modes supported by each operation mode are shown in Table 53.6.

Table 53.6 Scan mode and operation mode

Scan mode	Operation mode of A/D converter		
	SAR mode	Oversampling mode	Hybrid mode
Single scan mode	✓	✓	✓
Continuous scan mode	✓	✓	✓
Background continuous scan mode	—	—	✓
One-channel continuous scan mode	—	✓	—
Fixed-channel continuous scan mode	—	—	✓

Note: ✓: available, —: not available

The scanning operations are performed on a scan group basis. When the scanning operation is started, A/D conversion is performed for each analog channel based on the virtual channel setting. If the scanning operation starts for 2 or more scan group assigned to the same A/D converter at the same time, the scanning operation of the group with the lowest scan group number is performed.

The A/D conversion order of the analog channel in the scanning operation is the ascending order of the virtual channel numbers assigned to the scan group. The channels with the lowest virtual channel numbers are performed the A/D conversion at the forward end of the scan group. The channels with larger virtual channel numbers are performed the A/D conversion at the backward of the scan group.

See Figure 53.5 and Figure 53.6 for the relationship of the conversion order of the respective analog channel in the scanning operation.

The scanning operations in each operation mode are shown in the following.

53.3.7.1 SAR Mode – Single Scan Mode

Table 53.7 and Figure 53.7 show the operation example in SAR mode – Single scan mode.

Table 53.7 Example of the scanning operation in SAR mode – Single scan mode

Step	Operation
1	When a software trigger or a trigger from a peripheral module is input, the scanning operation of the scan group corresponding to the trigger is started.
2	Each time an A/D conversion of one analog channel is completed, A/D conversion result is stored to the data register (ADDRi (i = 0 to 22), ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)). If FIFO is used, the A/D conversion result is also stored to the FIFO data register (ADFIFODRk (k = 0 to 8)).
3	If the scan end interrupt is enabled, the scan end interrupt corresponding to that scan group is generated when the A/D conversion of all virtual channels assigned to that scan group is completed.
4	During the scanning operation, ADGRSR.ACTGRn (n = 0 to 8) bit corresponding to that scan group is set to 1. ADSR.ADACTm (m = 0, 1) bit corresponding to the A/D converter performing the A/D conversion is also set to 1. When scanning operation is complete, each bit is cleared to 0 and A/D converter enters the idle state.

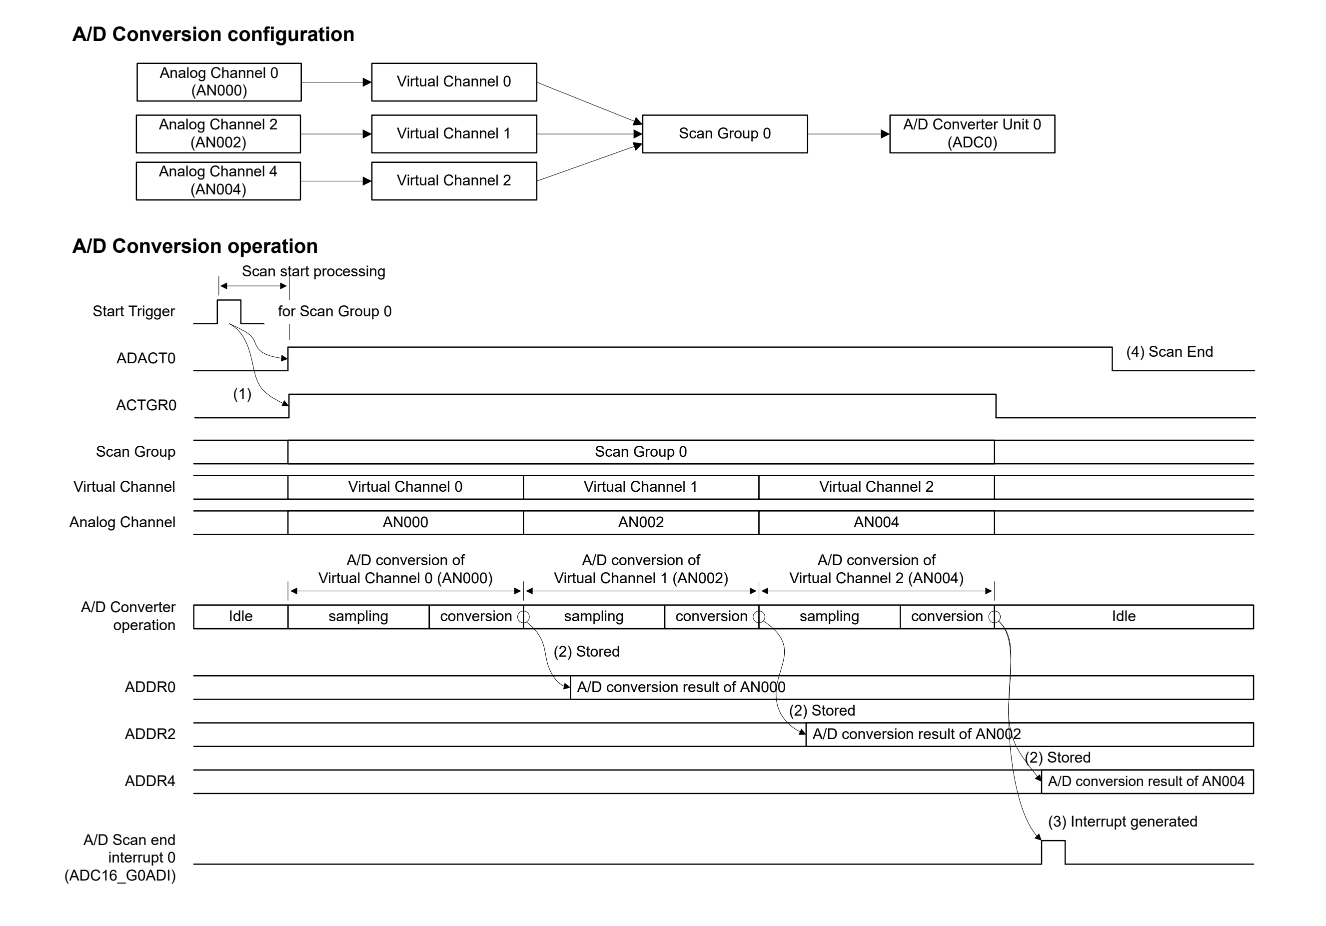

Figure 53.7 Example of the scanning operation in SAR mode – Single scan mode

53.3.7.2 SAR Mode – Continuous Scan Mode

Table 53.8 and Figure 53.8 show the operation example in SAR mode – Continuous scan mode.

Table 53.8 Example of the scanning operation in SAR mode – Continuous scan mode (1 of 2)

Step	Operation
1	When a software trigger or a trigger from a peripheral module is input, the scanning operation of the scan group corresponding to the trigger is started. When scanning operation starts, ADGRSR.ACTGRn (n = 0 to 8) corresponding to that scan group is set to 1. ADSR.ADACTm (m = 0, 1) bit corresponding to the A/D converter performing the A/D conversion is also set to 1.

Table 53.8 Example of the scanning operation in SAR mode – Continuous scan mode (2 of 2)

Step	Operation
2	Each time an A/D conversion of one analog channel is completed, A/D conversion result is stored to the data register (ADDRi (i = 0 to 22), ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)). If FIFO is used, the A/D conversion result is also stored to the FIFO data register (ADFIFODRk (k = 0 to 8)).
3	If the scan end interrupt is enabled, the scan end interrupt corresponding to that scan group is generated when the A/D conversion of all virtual channels assigned to that scan group is completed.
4	Until the A/D conversion stop process is performed, Step 2 to 3 are repeated, and the scanning operation continues. To stop the A/D conversion, you must follow to section 53.6.4. Force Stops the A/D Conversion Operation.

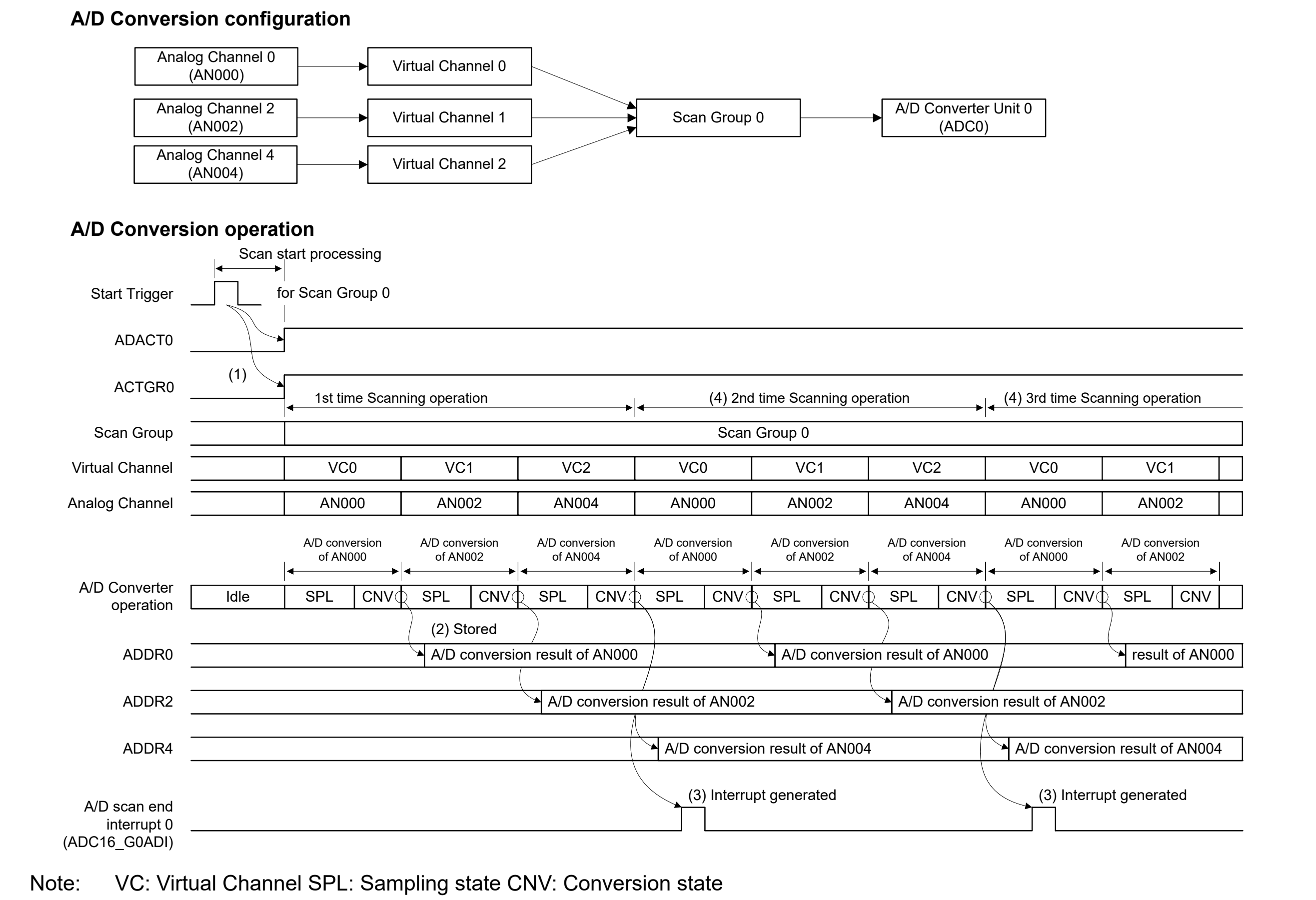

Figure 53.8 Example of scanning operation in SAR mode – Continuous scan mode

53.3.7.3 Oversampling Mode – Single Scan Mode

Table 53.9 and Figure 53.9 show the operation example in Oversampling mode – Single scan mode.

Table 53.9 Example of the scanning operation in Oversampling mode – Single scan mode (1 of 2)

Step	Operation
1	When a software trigger or a trigger from a peripheral module is input, the scanning operation of the scan group corresponding to the trigger is started.
2	Each analog channel is oversampled according to the number of TAPs in the digital filter and the number of A/D-converted value addition/averaging times. The oversampled data stored in the digital filter are discarded after the oversampling of each analog channel is completed.
3	A/D conversion data of each analog channel is output after oversampling. The A/D conversion data is stored in the data register (ADDRi (i = 0 to 22), ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)). If FIFO is used, A/D conversion data is also stored in FIFO data register (ADFIFODRk (k = 0 to 8)).

Table 53.9 Example of the scanning operation in Oversampling mode – Single scan mode (2 of 2)

Step	Operation
4	If the scan end interrupt is enabled, the scan end interrupt corresponding to that scan group is generated when the A/D conversion of all virtual channels assigned to that scan group is completed.
5	During the scanning operation, ADGRSR.ACTGRn (n = 0 to 8) bit corresponding to that scan group is set to 1. ADSR.ADACTm (m = 0, 1) bit corresponding to the A/D converter performing the A/D conversion is also set to 1. When scanning operation is complete, each bit is cleared to 0 and A/D converter enters the idle state.

When scanning operation starts, ADGRSR.ACTGRn (n = 0 to 8) corresponding to that scan group is set to 1. ADSR.ADACTm (m = 0, 1) bit corresponding to the A/D converter performing the A/D conversion is also set to 1.
2	In Hybrid mode, the scanning operation is performed while switching analog channels every time oversampling is performed.
3	After the oversampling corresponding to the number of TAPs of the digital filter and the number of A/D-converted value addition/averaging times is performed to each analog channel, A/D conversion data becomes in ready to be output. (The time taken for the oversampling required to obtain the first A/D conversion data is called the initial delay time. In the background continuous scan operation, A/D conversion data can be obtained after the initial delay time has elapsed from the start of the scanning operation.)
4	In scanning operation after the initial delay time has elapsed, each time oversampling is performed for an analog channel, the data in the digital filter is updated. The updated A/D conversion data for each analog channel can be output each one time oversampling or each multiple times oversampling corresponding to the number of A/D-converted value addition/averaging times is performed.
5	When an A/D conversion start trigger is input during background continuous scanning operation, the most recent A/D conversion data at that time is stored in the data register (ADDRi (i = 0 to 22), ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)). If FIFO function is set to enabled, A/D conversion data is also stored in the FIFO data register (ADFIFODRk (k = 0 to 8)).
6	If scan end interrupt is set to enable, scan end interrupt is generated.
7	Thereafter, until the A/D conversion stop process is performed, Background continuous scanning operation (Step 4) is repeated. And whenever the A/D conversion start trigger is input during Background continuous scanning operation, the A/D conversion data is output (Step 5 and Step 6). To stop A/D conversion, you must follow to section 53.6.4. Force Stops the A/D Conversion Operation.

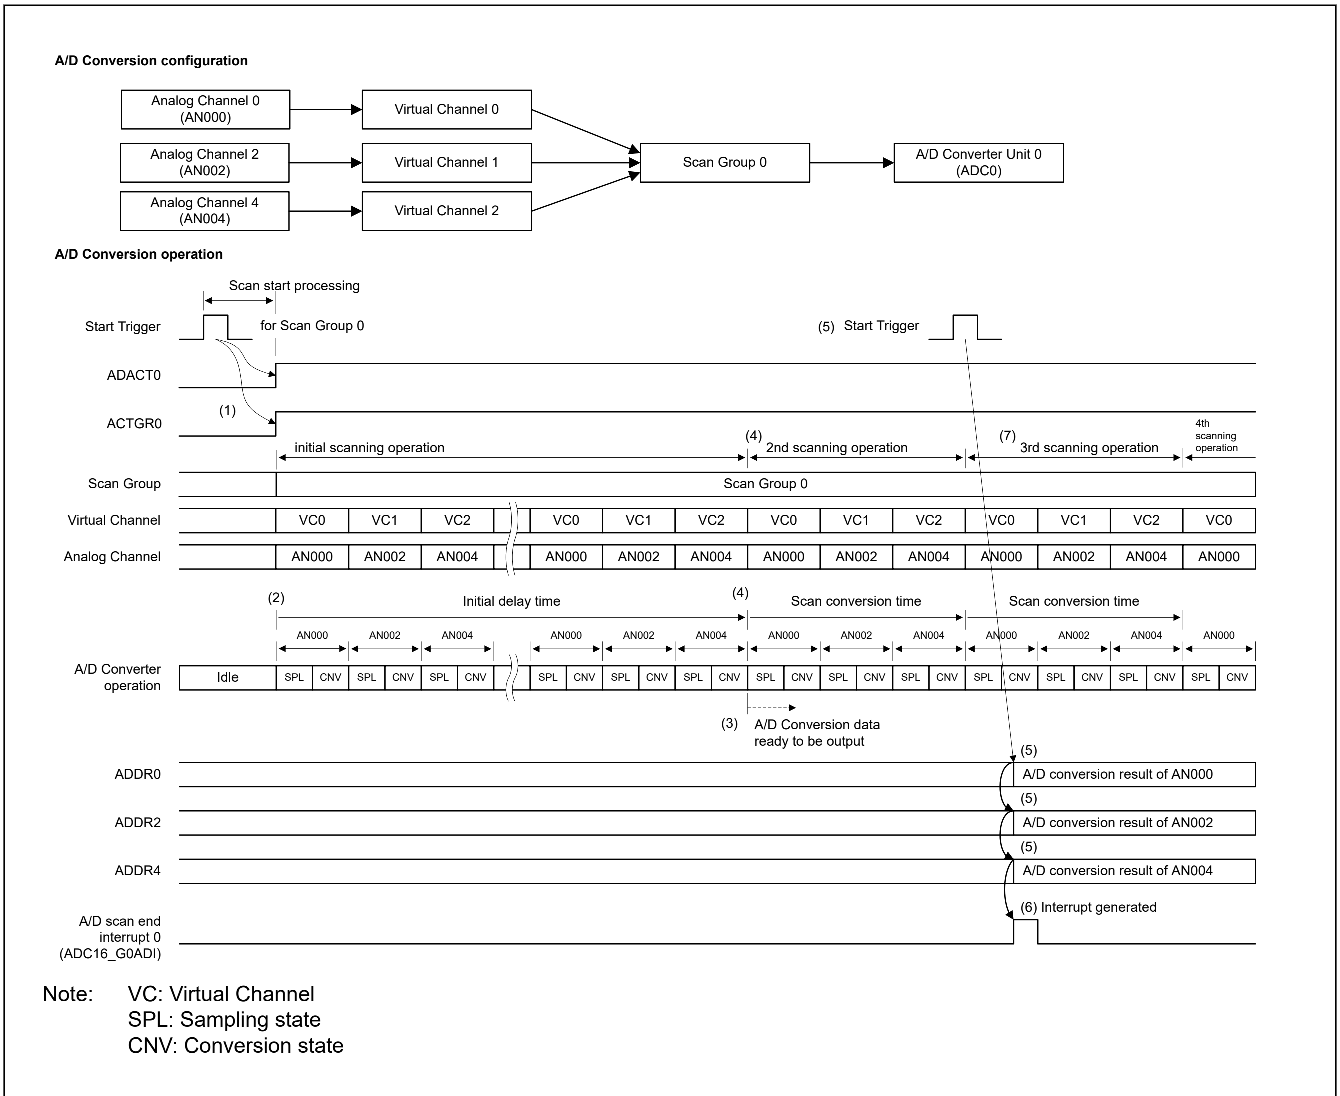

Figure 53.14 Example of scanning operation in Hybrid mode – Background continuous scan mode

53.3.7.9 Hybrid Mode – Fixed-channel Continuous Scan Mode

Table 53.15 and Figure 53.15 show the operation example in Hybrid mode – Fixed-channel continuous scan mode.

Table 53.15 Example of the scanning operation in Hybrid mode – Fixed-channel continuous scan mode (1 of 2)

Step	Operation
1	When a start trigger is input and the ADSR.ADACTm (m = 0, 1) bit becomes 1 (A/D conversion in progress), A/D conversion of the scan group selected by the ADSGCRm (m = 0, 1) register is started.
2	First, the fixed channels are converted for the number of channels set in the ADSWNRm.SWFIXm (m = 0, 1) bit.*1
3	After that, non-fixed channels are converted in ascending order of virtual channel numbers for the number of channels set in the ADSWNRm.SWNOFIXm (m = 0, 1) bits. The waveform example in fig uses 3 virtual channels and the conversion order is virtual channel 20 → virtual channel 21 → virtual channel 22.
4	When A/D conversion for one channel is completed, the A/D conversion result is stored in the A/D data register (ADDRi.DATA (i = 0 to 22), ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)) corresponding to the conversion target channel. If FIFO is used, the A/D conversion result is also stored to the FIFO data register (ADFIFODRk (k = 0 to 8)).

Table 53.15 Example of the scanning operation in Hybrid mode – Fixed-channel continuous scan mode (2 of 2)

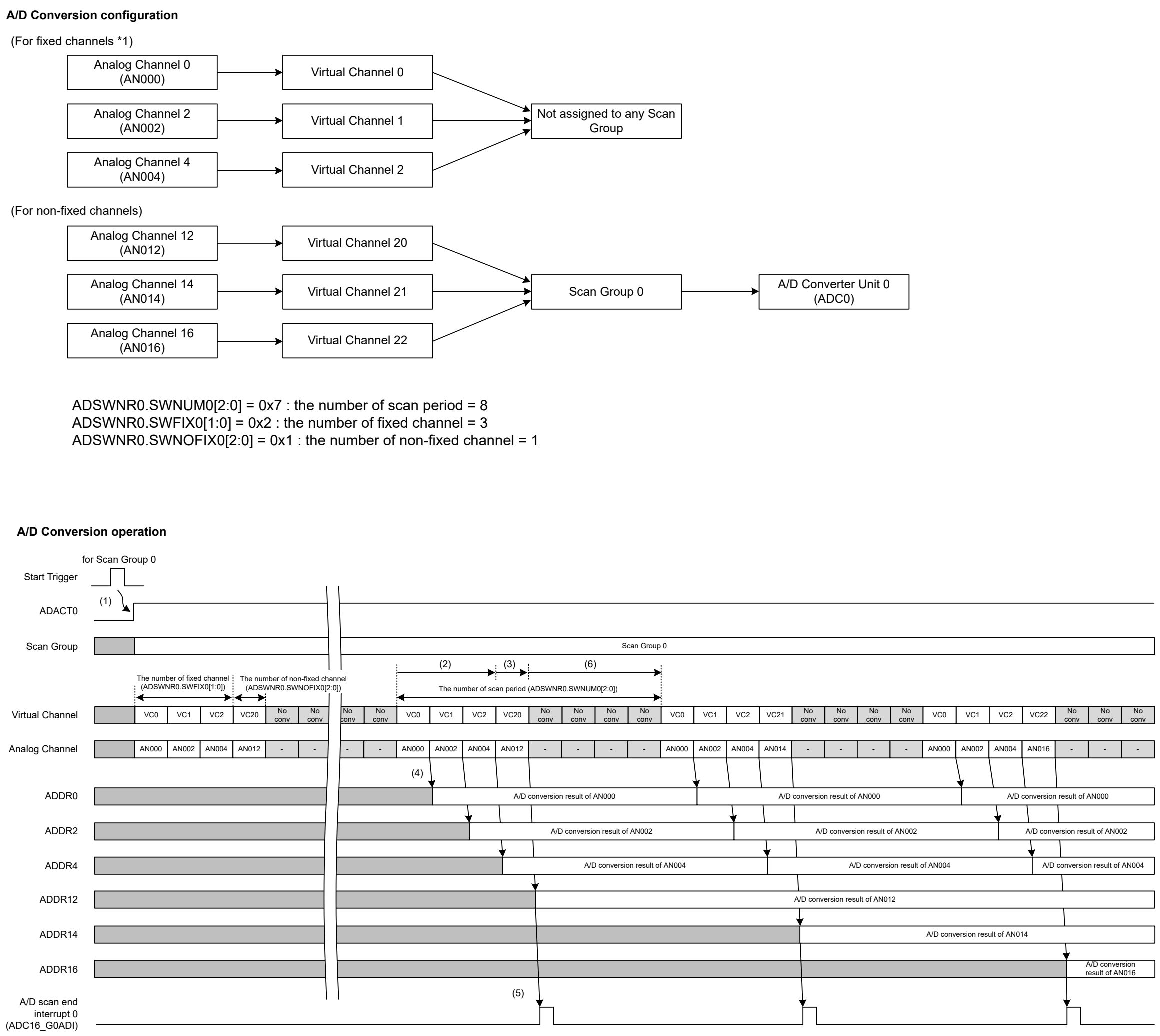
Step	Operation
5	When the A/D data register is updated during the scan cycle, a scan group n interrupt request is generated if the ADINTCR.ADIEn (n = 0 to 8) bit of each scan group in Scan End Interrupt Enable Register is set to 1 (enable scan group n interrupt by end of scan) after conversion of the asynchronous channel ends.
6	After the conversion of fixed channels and non-fixed channels is completed, the conversion time of idle cycles set in the ADSWNRm.BCSSTSLm (m = 0, 1) registers is counted until the end of the scan cycle set in ADSWNRm.SWNUMm (m = 0, 1).
7	After that, the A/D conversion operation, the result stored in the A/D conversion result register, the scan group n interrupt caused by the end of conversion of the non-fixed channel, and the count until the end of the scan cycle are repeated. Fixed channels repeat A/D conversion of the same channel, and non-fixed channels repeat A/D conversion up to the last channel assigned to the scan group, then return to the first channel.*2

Note: It is necessary to set so that the same filter is not selected between channels.

Note: When A/D conversion stop is set (ADSTOPR.ADSTOPm (m = 0, 1)), scan ends.

Note 1. Fixed channels in Fixed-channel continuous scan mode use the scan group and virtual channels determined for each unit. For details, see .

Note 2. If the scan period is set to less than the total number of conversions for fixed and non-fixed channels, conversion cycles beyond the scan period are not subject to A/D conversion.



Note 1. Fixed channels in Fixed channel continuous scan mode use the scan group and virtual channels determined for each unit. For details, see .

Figure 53.15 Example of scanning operation in Hybrid mode – Fixed-channel continuous scan mode

53.3.8 Self-calibration

ADC16H has a built-in self-calibration function. Self-calibration function is used to calibrate the variations of characteristics caused by the chip-by-chip variations. Self-calibration function has the following operations.

1. Internal Circuit Calibration
   - Adjusts the operation of A/D converter's internal circuitry.
2. Gain and Offset Calibration
   - Measure the A/D converter's Gain Error and Offset Error.
   - The calibration processing of the A/D conversion result based on the measured error data is performed after the A/D conversion.
     For details, see section 53.5.3.1. Gain Error and Offset Error Calibration.
   - This self-calibration should be performed after Internal-circuit self-calibration is completed.
3. Channel-dedicated sample-and-hold circuit Gain and Offset Calibration
   - Measure the Gain Error and the Offset Error when using the channel-dedicated sample-and-hold circuit.

- The calibration processing of the A/D conversion result based on the measured error data is performed after the A/D conversion.
  For details, see section 53.5.3.1. Gain Error and Offset Error Calibration.
- This self-calibration should be performed after A/D converter Gain/Offset self-calibration is completed.

53.3.8.1 Conditions Under Which Self-calibration is Required

The conditions under which self-calibration is required are shown in Table 53.16. Under the conditions shown in Table 53.16, self-calibration should be performed before using the A/D converter. If A/D converter is operating, stop all A/D converters and perform the self-calibration again. If the required self-calibration is not performed, the A/D conversion result is not guaranteed.

Table 53.16 List of conditions under which Self-calibration should be performed

Conditions under which self-calibration is required	Internal-circuit Calibration	Gain/Offset Calibration	Channel-dedicated sample-and-hold circuit Gain and Offset Calibration*1
After reset release	✓	✓	✓
After releasing the module stop	✓	✓	✓
When returning from Software Standby mode or Deep Software Standby mode	✓	✓	✓
When changed the ADCLK setting (When clock source or frequency is changed)	✓	✓	✓
When changed the operation mode or the scan mode of the A/D converter (When changed ADMDR.ADMDm bit (m = 0, 1))	✓	✓*2	✓
When changed A/D successive approximation time (When changed ADCNVSTR.CSTm bit (m = 0, 1))	✓	✓	✓
When changed the operation setting of the channel-dedicated sample-and-hold circuit *1	—	—	✓

Note: ✓: Self-calibration should be performed.
—: Self-calibration is not required.

Note 1. When any of ADSHCRm.SHENn bits are set to 1, or any of ADSHCRm.SHENn bits or any of ADSHCRm.SHMDn bits are changed, perform the channel-dedicated sample-and-hold circuits self-calibration (m = 0, 1, n = 0 to 2, 4 to 6). This is not required if the channel-dedicated sample-and-hold circuits are not used.

Note 2. When using fixed-channel continuous scan mode, also perform gain/offset calibration for SAR mode (single scan mode). The interval between performing calibration in SAR mode (single scan mode) and Hybrid mode should be as short as possible.

53.3.8.2 Self-calibration Procedure

Table 53.17 shows the self-calibration procedures.

Table 53.17 Procedure for self-calibration (1 of 2)

No.	Step	Description
1	Disable trigger input	Disables the trigger input from the peripheral module. (Write ADTRGENR.STTRGENn = 0)
2	Waiting for all A/D converters to stop	Check that all A/D converters are stopped. If A/D conversion is operating, wait until the A/D converter stops by either of the following: ● Wait until all A/D conversions are complete ● Force the A/D converter to stop the operation using the ADSTOPR register. For details on forced stopping of A/D conversion operation, see section 53.6.4. Force Stops the A/D Conversion Operation.
3	Setting the number of states for self-calibration	Set the number of states for the self-calibration of A/D converter to ADCALSTCR register. The values in ADCALSTCR register are commonly used for ADC0 and ADC1. Set the value to be set in ADCALSTCR register to satisfy the range defined in section 62, Electrical Characteristics.

Table 53.17 Procedure for self-calibration (2 of 2)

No.	Step	Description
4	Clearing the Error Status Flag	If error flags are detected, clear them before performing the self-calibration. (A/D converter error flag, A/D converter overflow flag, etc.)
5	Performing the self-calibration for ADC0	Performs the self-calibration for ADC0. ● Internal-circuit Calibration ● Gain/Offset Calibration After starting the self-calibration, wait until it is completed.
6	Performing the self-calibration for ADC1	Performs the self-calibration for ADC1 in the same as Step 5.
7	Setting the self-calibration of channel-dedicated sample-and-hold circuit *1	Make settings for self-calibration of channel-dedicated sample-and-hold circuit. Enable channel-dedicated sample-and-hold circuit. Sets the number of states for channel-dedicated sample-and-hold self-calibration (ADCALSTCR register *2 and ADCALSHCR register).
8	Performing channel-dedicated sample-and-hold circuit self-calibration for SH0 to SH2. *1	Performs the self-calibration for channel-dedicated sample-and-hold circuit (SH0 to SH2) connected to ADC0. ● Channel-dedicated sample-and-hold circuit Gain/Offset Calibration After starting self-calibration, wait until it is completed.
9	Performing channel-dedicated sample-and-hold circuit self-calibration for SH4 to SH6 *1	Performs the self-calibration for channel-dedicated sample-and-hold circuit (SH4 to SH6) connected to ADC1 in the same as Step 8.
10	Error Status Check *3	Check for errors in self-calibration. If no operating error occurs, self-calibration is complete.

Note: In order to increase the effectiveness of self-calibration, it is recommended to perform self-calibration for the A/D converters one by one.
Note 1. Not required if the channel-dedicated sample-and-hold circuits are not used.
Note 2. When the self-calibration is performed for the channel-dedicated sample-and-hold circuitry, the number of sampling states at the self-calibration of the A/D converter (ADCALSTCR.CALADSST[9:0] bits) may also need to be changed. Set the value that satisfies the electrical characteristics.
Note 3. If the A/D converter error is detected by the self-calibration, it may be set outside the operation guaranteed range specified in the electric characteristics. Check the operation setting.

53.3.8.3 Restrictions on Self-calibration

(1) Prohibition of the scanning operation during self-calibration

Do not start the scanning operation during self-calibration. When performing the scanning operation, start the scanning operation after self-calibration is completed. Operation is not guaranteed when the scanning operation is started during self-calibration.

(2) Prohibition of additional writes to the ADCALSTR register during self-calibration

After the self-calibration is started, writing to ADCALSTR register is prohibited until self-calibration is completed. Write to ADCALSTR register after self-calibration is completed. Operation is not guaranteed if this restriction is violated.

(3) Restrictions on self-calibration for channel-dedicated sample-and-hold circuit

To perform self-calibration for the channel-dedicated sample-and-hold circuit, set ADSHCRm.SHENn = 1 (m = 0, 1, n = 0 to 2, 4 to 6) for the sample-and-hold circuit channel to be used before performing self-calibration for the channel-dedicated sample-and-hold circuit.

(4) Restrictions on self-calibration

Self-calibration should be performed for the A/D converters one by one. During the self-calibration operation, the other A/D converters should be in idle (not in scan operation or self-calibration operation).

If this restriction is violated, the A/D conversion accuracy will be degraded due to noise during the self-calibration operation. In this case, the A/D converter characteristics are not guaranteed.

In addition, in order to enhance the effect of self-calibration, self-calibration operation should be performed under conditions with as little noise as possible.

(5) Restrictions on setting of the number of status for self-calibration

The number of states to be set in the ADCALSTCR and ADCALSHCR registers should be set to satisfy the values specified in the Electrical Characteristics. In addition, the number of states involved in self-calibration should be set to satisfy the following restrictions.

If these restrictions are violated, A/D conversion results are not guaranteed.

[Restrictions on setting of ADCALSTCR register]

- ADCALSTCR.CALADSST[9:0] bits
  - According to the type of self-calibration, set the values to satisfy those specified in the electrical characteristics.
  - If the setting value differs according to the type of self-calibration, change the register setting value for each self-calibration.
- ADCALSTCR.CALADCST[5:0] bits
  - Set the same value as ADCNVSTR.CSTm[5:0] (m = 0, 1) bits.
    (ADCALSTCR.CALADCST[5:0] = ADCNVSTR.CSTm[5:0])

[Restrictions on setting of ADCALSHCR register] (only when channel-dedicated sample-and-hold circuit is used)

- ADCALSHCR.CALSHSST[7:0] bits
  - Set the value equal to the value of the ADSHSTRm.SHSST[7:0] bits plus 1 (m = 0, 1).
    (ADCALSHCR.CALSHSST[7:0] = ADSHSTRm.SHSST[7:0] + 1)
  - If the setting values of ADSHSTR0.SHSST[7:0] and ADSHSTR1.SHSST[7:0] are different, change the register setting values of CALSHSST[7:0] for each self-calibration of ADC0 (SH0 to SH2) and ADC1 (SH4 to SH6).
- ADCALSHCR.CALSHHST[2:0] bits
  - Set the same value as ADSHSTRm.SHHST[2:0] (m = 0, 1) bits.

53.3.9 Analog Input Channel

For the correspondence between the analog input pins and the analog channel numbers, the A/D converters, and channel-dedicated sample-and-hold circuit, see Table 53.4.

53.3.10 Extended Analog Function

Extended analog function performs A/D conversion on the internal signal source of MCU. The available sources for extended analog function are as follows:

- Self-diagnosis voltage for A/D converters and channel-dedicated sample-and-hold circuits
- Internal reference voltage
- VBATT 1/6 voltage monitor output
- Temperature sensor
- D/A converter output (internal output path to ACMPHS)

53.3.11 Self-diagnosis Function for A/D Converters

The A/D converter has a built-in self-diagnosis function. The self-diagnosis function inputs the self-diagnosis voltage to the A/D converter and performs A/D conversion. The A/D conversion result of the self-diagnosis voltage can be used to confirm that the A/D converter is operating normally.

53.3.11.1 Self-diagnosis

The A/D converter has a built-in self-diagnosis function. The self-diagnosis function inputs the self-diagnosis voltage to the A/D converter and performs A/D conversion. The A/D conversion result of the self-diagnosis voltage can be used to confirm that the A/D converter is operating normally. Table 53.18 shows the operation mode in which the self-diagnostic function is available.

Table 53.18 List of operation mode for which the self-diagnostic function is available

Operation mode – Scan mode	Self-diagnosis function
SAR mode – Single scan mode	✓
SAR mode – Continuous scan mode	✓
Oversampling mode – Single scan mode	✓
Oversampling mode – Continuous scan mode	—
Oversampling mode – One-channel continuous scan mode	—
Hybrid mode – Single scan mode	✓
Hybrid mode – Continuous scan mode	—
Hybrid mode – Background continuous scan mode	—
Hybrid mode – Fixed-channel continuous scan mode	—

Note: ✓: Available, —: Not Available

The procedure for performing self-diagnosis of A/D converter is shown in the following.

1. Assign the self-diagnosis channel to one of the virtual channels and configure the virtual channel settings.
2. Assign the virtual channel that the self-diagnosis channel is selected to one of the scan groups.
3. Set the self-diagnosis voltage in DIAGVAL[2:0] bits of ADSGDCRn (n = 0 to 8) register corresponding to the scan group assigned in 2 above.
4. Start the scanning operation by inputting the A/D conversion start trigger. The self-diagnosis operation is executed at the A/D conversion of the self-diagnosis channel.

Table 53.19 lists the operation settings when the self-diagnosis function is used. When using the self-diagnosis function, follow the setting in Table 53.19. If self-diagnosis operation is performed with settings other than those shown in Table 53.19, the self-diagnosis result (A/D conversion result) is not guaranteed.

Table 53.19 List of operation setting and expected value for ADC0 self-diagnosis function

Self-diagnosis mode	Register setting value				Self-diagnosis operation
	ADSGDCRx	ADCHCRy		ADDOPCRCy	Expected value of A/D conversion data *1 *2 *3
	DIAGVAL[2:0]	CNVCS[6:0]	AINMD	SIGNSEL	
Self-diagnosis mode 1	100b	0x60	1	0	0x0000
Self-diagnosis mode 2	101b	0x60	1	0	0x8000
Self-diagnosis mode 3	110b	0x60	1	0	0x7FFF

Note: x = 0 to 8, y = 0 to 32
Note 1. The expected value is the ideal A/D converter result stored in ADEXDR0.DATA[15:0] or ADFIFODRx.DATA[15:0].
Note 2. The A/D conversion data is the value when 16-bit data format (ADDOPCRCy.ADPRC[1:0] = 00b) is selected.
Note 3. The A/D conversion result becomes (expected value + 1) or more when a positive accuracy error occurs in A/D conversion, and becomes (expected value - 1) or less when a negative accuracy error occurs.

Table 53.20 List of operation setting and expected value for ADC1 self-diagnosis function

Self-diagnosis mode	Register setting value				Self-diagnosis operation
	ADSGDCRx	ADCHCRy		ADDOPCRCy	Expected value of A/D conversion data *1 *3
	DIAGVAL[2:0]	CNVCS[6:0]	AINMD	SIGNSEL	
Self-diagnosis mode 1	100b	0x61	1	0	0x0000
Self-diagnosis mode 2	101b	0x61	1	0	0x8000
Self-diagnosis mode 3	110b	0x61	1	0	0x7FFF

Note: x = 0 to 8, y = 0 to 32
Note 1. The expected value is the ideal A/D converter result stored in ADEXDR1.DATA[15:0] or ADFIFODRx.DATA[15:0].
Note 2. The A/D conversion data is the value when 16-bit data format (ADDOPCRCy.ADPRC[1:0] = 00b) is selected.

Note 3. The A/D conversion result becomes (expected value + 1) or more when a positive accuracy error occurs in A/D conversion, and becomes (expected value - 1) or less when a negative accuracy error occurs.

Table 53.21 List of operation setting and expected value for ADC0 channel-dedicated sample-and-hold circuit self-diagnosis function

Self-diagnosis mode	Register setting value					Self-diagnosis operation
	ADSHSDCRw	ADCHCRy		ADSHCRw	ADDOPCRCy	Expected value of A/D conversion data *1 *2 *3
	SHDIAGx[2:0]	CNVCS[6:0]	AINMD	SHMDz	SIGNSEL	
S&H self-diagnosis mode 1	001b	SH0: 0x70 SH1: 0x71 SH2: 0x72	1	1	0	0x0000
S&H self-diagnosis mode 2	010b	SH0: 0x70 SH1: 0x71 SH2: 0x72	1	1	0	0x8000
S&H self-diagnosis mode 3	011b	SH0: 0x70 SH1: 0x71 SH2: 0x72	1	1	0	0x7FFF
S&H self-diagnosis mode 4	100b	SH0: 0x70 SH1: 0x71 SH2: 0x72	1	1	0	0x0000
S&H self-diagnosis mode 5	101b	SH0: 0x70 SH1: 0x71 SH2: 0x72	1	1	0	0x8000
S&H self-diagnosis mode 6	110b	SH0: 0x70 SH1: 0x71 SH2: 0x72	1	1	0	0x7FFF

Note: x = 0 to 8, y = 0 to 32, z = 0 to 2
Note 1. The expected value is the ideal A/D converter result stored in ADEXDRn.DATA[15:0] (n = 16,17,18) or ADFIFODRx.DATA[15:0].
Note 2. The A/D conversion data is the value when 16-bit data format (ADDOPCRCy.ADPRC[1:0] = 00b) is selected.
Note 3. The A/D conversion result becomes (expected value + 1) or more when a positive accuracy error occurs in A/D conversion, and becomes (expected value - 1) or less when a negative accuracy error occurs.

Table 53.22 List of operation setting and expected value for ADC1 channel-dedicated sample-and-hold circuit self-diagnosis function (1 of 2)

Self-diagnosis mode	Register setting value					Self-diagnosis operation
	ADSHSDCRw	ADCHCRy		ADSHCRw	ADDOPCRCy	Expected value of A/D conversion data *1 *2 *3
	SHDIAGx[2:0]	CNVCS[6:0]	AINMD	SHMDz	SIGNSEL

Table 53.22 List of operation setting and expected value for ADC1 channel-dedicated sample-and-hold circuit self-diagnosis function (2 of 2)

Self-diagnosis mode	Register setting value					Self-diagnosis operation
	ADSHSDCRw	ADCHCRy		ADSHCRw	ADDOPCRCy	Expected value of A/D conversion data *1 *2 *3
	SHDIAGx[2:0]	CNVCS[6:0]	AINMD	SHMDz	SIGNSEL	
S&H self-diagnosis mode 6	110b	SH4: 0x74 SH5: 0x75 SH6: 0x76	1	1	0	0x7FFF

Note: x = 0 to 8, y = 0 to 32, z = 4 to 6
Note 1. The expected value is the ideal A/D converter result stored in ADEXDRn.DATA[15:0] (n = 20,21, 22) or ADFIFODRx.DATA[15:0].
Note 2. The A/D conversion data is the value when 16-bit data format (ADDOPCRCy.ADPRC[1:0] = 00b) is selected.
Note 3. The A/D conversion result becomes (expected value + 1) or more when a positive accuracy error occurs in A/D conversion, and becomes (expected value - 1) or less when a negative accuracy error occurs.

53.3.11.2 Self-diagnosis Mode

(1) Self-diagnosis mode 1

In self-diagnosis mode 1, the non-inverting input (+) (A_{INP}) and inverting input (−) (A_{INN}) of A/D converter are input VREFL0 level (ADC0) or VREFL level (ADC1). Since the differential voltage is 0, the ideal value of the self-diagnosis result is 0x0000 (±0). The A/D conversion result becomes 0x0001 (+1) or more when a positive accuracy error occurs in A/D conversion, and becomes 0xFFFF (−1) or less when a negative accuracy error occurs.

(2) Self-diagnosis mode 2

In self-diagnosis mode 2, the non-inverting input (+) (A_{INP}) of A/D converter is input VREFL0 level (ADC0) or VREFL level (ADC1), and the inverting input (−) (A_{INN}) of A/D converter is input VREFH0 level (ADC0) or VREFH level (ADC1). Since the differential voltage is −VREFH0 (if VREFL0 = 0V) or −VREFH (if VREFL = 0V), the ideal value of the self-diagnosis result is 0x8000 (−32768). When an A/D conversion error occurs, the A/D conversion result of self-diagnosis is greater than 0x8000.

(3) Self-diagnosis mode 3

In self-diagnosis mode 3, the non-inverting input (+) (A_{INP}) of A/D converter is input VREFH0 level (ADC0) or VREFH level (ADC1), and the inverting input (−) (A_{INN}) of A/D converter is input VREFL0 level (ADC0) or VREFL level (ADC1). Since the differential voltage is +VREFH0 (if VREFL0 = 0V) or +VREFH (if VREFL = 0V), the ideal value of the self-diagnosis result is 0x7FFF (+32767). When an A/D conversion error occurs, the A/D conversion result of self-diagnosis is less than 0x7FFF.

53.3.11.3 Notes on Self-diagnosis Function

(1) Notes on the results of the self-diagnosis

The self-diagnostic result of A/D converter unit 0 can be read from the ADEXDR0 register. The self-diagnostic result of A/D converter unit 1 can be read from the ADEXDR1 register.

(2) Notes on data format during self-diagnosis

When self-diagnosis is performed, if a data format other than 16-bit length is set, an overflow occurs due to A/D conversion data rounding, and the A/D conversion data error is detected. To perform self-diagnosis, select the 16-bit data format.

53.3.12 Internal Reference Voltage

ADC16H can perform A/D conversion of Internal Reference Voltage. Internal Reference Voltage outputs a constant voltage that is independent of the power supply voltage (VCC, VSS, AVCC, AVSS, VREFH0, VREFL0, VREFH and VREFL). The monitoring of Internal Reference Voltage can be used to detect variations in the analog reference supply voltage (VREFH0, VREFL0, VREFH and VREFL), or abnormalities or faults in the system.

When performing A/D conversion of Internal Reference Voltage, it is required to set the Internal Reference Voltage Monitor Enable Register (ADREFCR) and assign the analog channel of Internal Reference Voltage to any of the virtual channels. See Table 53.5 for the correspondence between Internal Reference Voltage function and the analog channels. For the sampling time when A/D conversion of Internal Reference Voltage is performed, see section 62, Electrical Characteristics.

53.3.13 Temperature Sensor

ADC16H can perform A/D conversion of Temperature Sensor. The chip temperature can be estimated from the A/D conversion result of Temperature Sensor. For more details on Temperature Sensor, see section 55, Temperature Sensor (TSN).

When A/D conversion of Temperature Sensor is performed, Temperature Sensor should be configured and the analog channel of Temperature Sensor should be assigned to any of the virtual channels. See Table 53.5 for the correspondence between Temperature Sensor and analog channels. For the sampling time when A/D conversion of Temperature Sensor is performed, see section 62, Electrical Characteristics.

53.3.14 D/A Converter

ADC16H can perform A/D conversion of the voltage that the D/A converter is outputting to the internal module (ACMPHS). When the output of the D/A converter is used for the reference input voltage of High-Speed Analog Comparator (ACMPHS), this function can be used to monitor the output voltage of the D/A converter. For details of the D/A converter function, see section 54, 12-Bit D/A Converter (DAC12).

When A/D conversion is performed on the output of D/A converter (DA0 and DA1) (output to ACMPHS), the D/A converter should be configured and the analog channel of the D/A converter should be assigned to one of the virtual channels. For the sampling time when A/D conversion is performed on the D/A converter output voltage, see section 62, Electrical Characteristics.

53.3.15 VBATT 1/6 Voltage Monitor Output

ADC16H can perform A/D conversion of VBATT 1/6 voltage monitor output. VBATT 1/6 voltage monitor output is a function that can monitor the input voltage level to the VBATT pin at 1/6 level. For more details on VBATT voltage monitor function, see section 12, Battery Backup Function.

When A/D conversion of VBATT 1/6 voltage monitor output is performed, VBATT should be configured and the analog channel of VBATT 1/6 voltage monitor output should be assigned to any of the virtual channels. See Table 53.5 for the correspondence between VBATT 1/6 voltage monitor output and analog channels. For the sampling time when A/D conversion of VBATT 1/6 voltage monitor output is performed, see section 62, Electrical Characteristics.

53.3.16 Channel-dedicated Sample-and-hold Circuit

ADC16H has a built-in channel-dedicated sample-and-hold circuit. By using multiple channel-dedicated sample-and-hold circuits, it is possible to sample multiple analog inputs simultaneously.

The conditions under which channel-dedicated sample-and-hold circuit can be used are shown in Table 53.23.

Table 53.23 Operation mode in which channel-dedicated sample-and-hold circuits can be used

Operation mode	Channel-dedicated sample-and hold circuits
SAR mode – Single scan mode	✓*1
SAR mode – Continuous scan mode	—
Oversampling mode – Single scan mode	—
Oversampling mode – Continuous scan mode	—
Oversampling mode – One-channel continuous scan mode	—
Hybrid mode – Single scan mode	✓
Hybrid mode – Continuous scan mode	✓
Hybrid mode – Background continuous scan mode	✓
Hybrid mode – Fixed-channel continuous scan mode	✓ *2

Note: ✓: available, —: not available

Note 1. Constant Sampling Function is available.
Note 2. Only fixed channels are supported when fixed channels are set to 3ch and all fixed channels enable channel-dedicated sample-and-hold circuit. Non-fixed channels cannot use channel-dedicated sample-and-hold circuit.

53.3.16.1 Configuration of Channel-dedicated Sample-and-hold Circuit

(1) Configuration in Single-ended input mode

This subsection describes the internal configuration when using channel-dedicated sample-and-hold circuit with single-ended inputs.

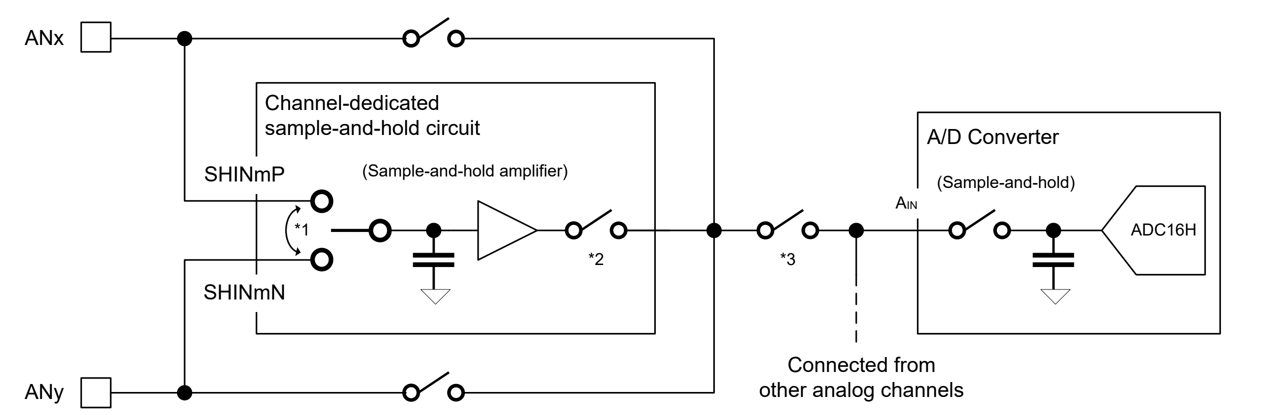
Figure 53.16 shows the configuration of channel-dedicated sample-and-hold circuit in Single-ended input mode.

Channel-dedicated sample-and-hold circuits are connected to two analog input channels.

In the case that one of the channels is used as an input for channel-dedicated sample-and-hold circuit and the other is assigned as an input for normal A/D conversion when the channel-dedicated sample-and-hold circuit is used in Single-ended input mode, one of the following methods can be used.

- Assign each input channel to a different scan group
- Use the function of ADSHSBPCR register for AD conversion in one scan group

For example, in the case of using the function of ADSHSBPCR register for AD conversion in one scan group, set 0 to ADSHSBPCR.SHSBP0 bit and set 1 to ADSHSBPCR.SHSBN0 bit when AN000 is used as an input channel of SH0 in Single-ended input mode and AN001 is used as an input channel of normal AD conversion.



Note m : The unit number of channel-dedicated sample-and-hold circuit
x : Even-numbered analog channel connected to the channel-dedicated sample-and-hold circuit
y : Odd-numbered analog channel connected to the channel-dedicated sample-and-hold circuit

Note 1. Turn on when the channel-dedicated sample-and-hold circuit is enabled and samples ANx or ANy channel.
Note 2. Turn on when the channel-dedicated sample-and-hold circuit is the holding state.
Note 3. Turn on when the A/D conversion (sampling state) of ANx, ANy or output of channel-dedicated sample-and-hold circuit.

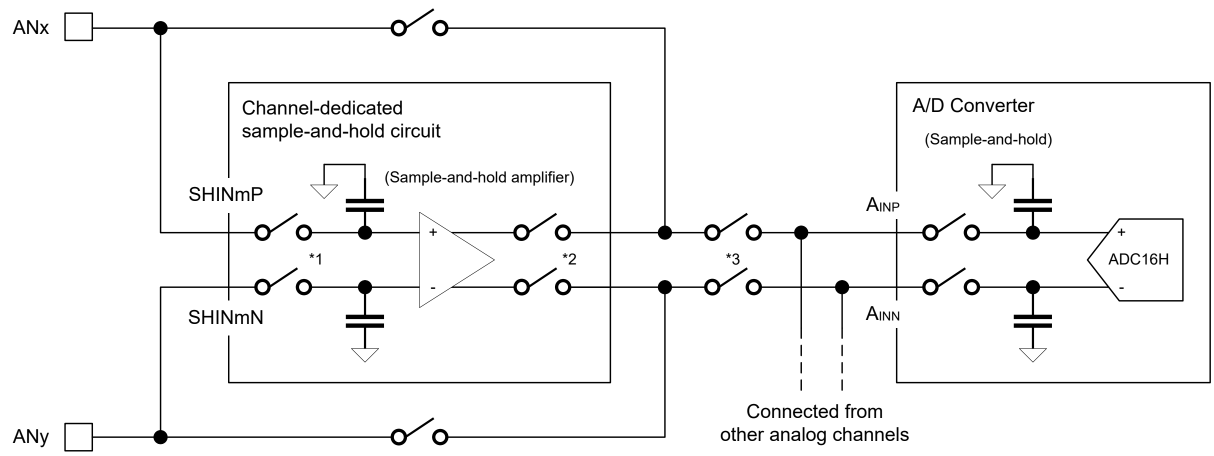
Figure 53.16 Internal configuration of channel-dedicated sample-and-hold circuit in Single-ended input mode

(2) Configuration in Differential input mode

This subsection describes the internal configuration when channel-dedicated sample-and-hold circuit is used with differential inputs.

Figure 53.17 shows the configuration of channel-dedicated sample-and-hold circuit in Differential input mode.

When channel-dedicated sample-and-hold circuit is operating in Differential input mode, the even analog channel is connected to the non-inverting input (+) (SHINmP) and the odd-numbered analog channel is connected to the inverting input (−) (SHINmN). Two analog inputs (differential input) are sampled and held in one scanning operation, and output to the A/D converter. The A/D conversion setting should be set to convert a differential input signal source. (ADCHCRn.AINMD = 1 (n = 0 to 32))



Note m : The unit number of channel-dedicated sample-and-hold circuit
x : Even-numbered analog channel connected to the channel-dedicated sample-and-hold circuit
y : Odd-numbered analog channel connected to the channel-dedicated sample-and-hold circuit

Note 1. Turn on when the channel-dedicated sample-and-hold circuit is enabled and samples ANx or ANy channel.
Note 2. Turn on when the channel-dedicated sample-and-hold circuit is the holding state.
Note 3. Turn on when the A/D conversion (sampling state) of ANx, ANy or output of channel-dedicated sample-and-hold circuit.

Figure 53.17 Internal configuration of channel-dedicated sample-and-hold circuit in Differential input mode

53.3.16.2 Operation in SAR Mode with Channel-dedicated Sample-and-hold Circuit

(1) Basic operation in SAR mode – Single scan mode (Single-ended input mode)

This section describes the basic operation of channel-dedicated sample-and-hold circuit in SAR mode. The configuration and behavior of example operations are shown in Table 53.24, Table 53.25 and Figure 53.18.

Table 53.24 Configuration of example operation for channel-dedicated sample-and-hold circuit in SAR mode – Single scan mode

Item	Configuration
A/D converter	Set ADC0 to SAR mode – Single scan mode
Channel-dedicated sample-and-hold circuit	Set SH0 to SH2 to enabled and Single-ended input mode. (AN000 to AN005 are subject to A/D conversion using channel-dedicated sample-and-hold circuit.)
Virtual channel*1	Assign AN000, AN002, AN004 and AN020 to virtual channel 0 to 3, and set to Single-ended input mode.
Scan group	Assign virtual channel 0 to 3 to scan group 0. Set scan group 0 to convert with ADC0.

Note 1. When channel-dedicated sample-and-hold circuit is used, there are restrictions on the setting of virtual channels. For more details, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

Table 53.25 Example operation of channel-dedicated sample-and-hold circuit in SAR mode – Single scan mode (1 of 2)

Step	Detail behavior of example operation
1	The scanning operation of scan group 0 starts when a trigger for scan group 0 is input.
2	Channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN000, AN002, AN004) and holds them.

Table 53.25 Example operation of channel-dedicated sample-and-hold circuit in SAR mode – Single scan mode (2 of 2)

Step	Detail behavior of example operation
3	A/D conversion is performed on the voltages held by each channel-dedicated sample-and-hold circuit and on other analog input channels (AN020).
4	When A/D conversion of each channel completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
5	If scan end interrupt in scan group 0 is set to enabled, a scan end interrupt occurs.

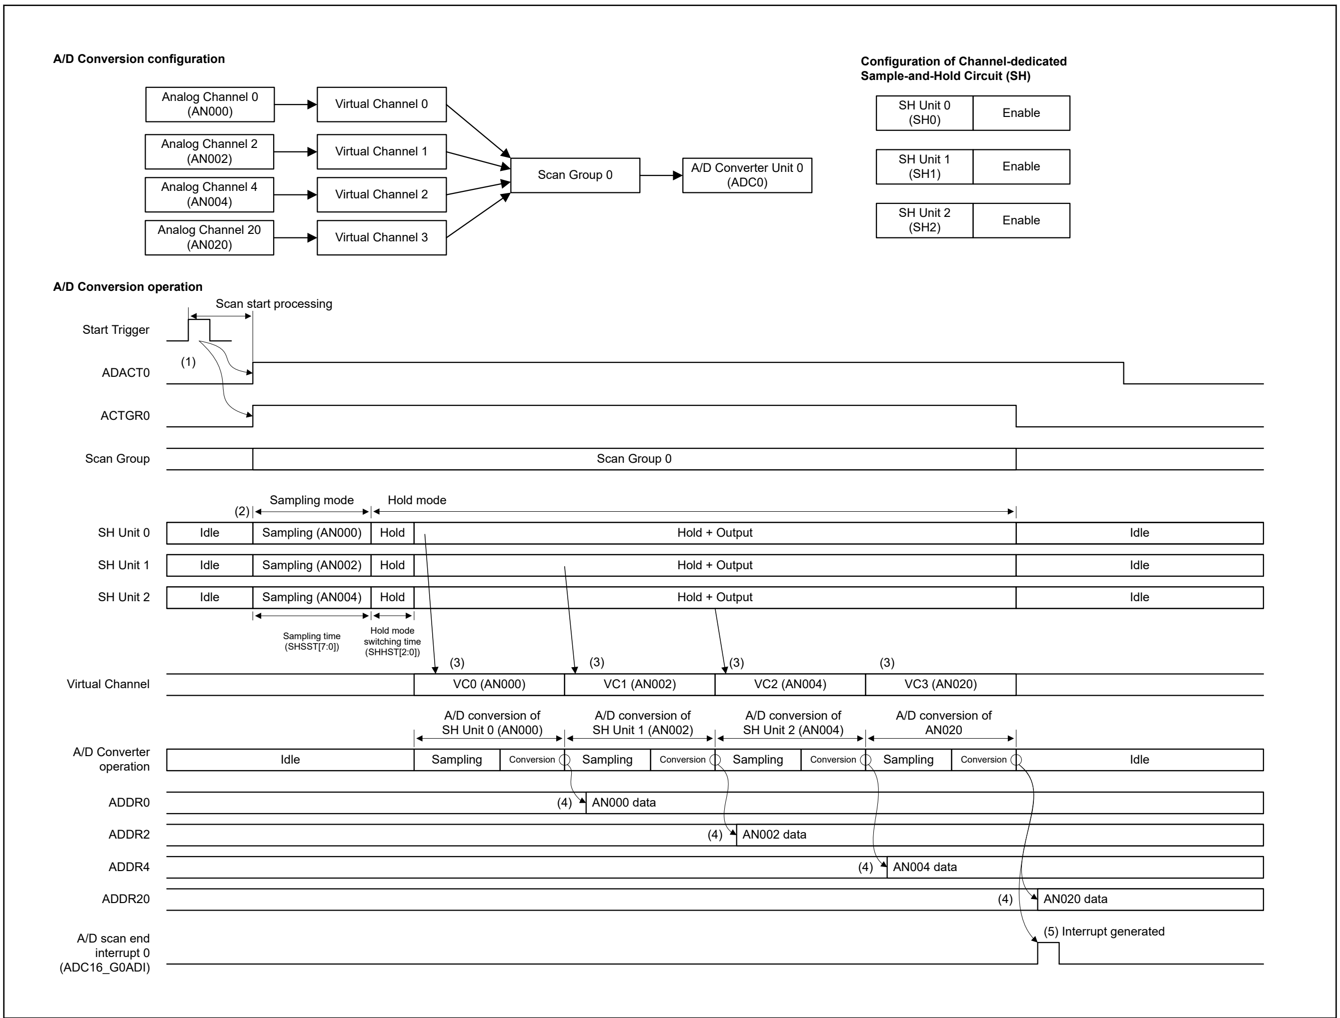


Figure 53.18 Basic operation of channel-dedicated sample-and-hold circuit in SAR mode

(2) Advanced operation in SAR mode - Single scan mode

This section describes the operation of A/D conversion that shares one channel-dedicated sample-and-hold circuit between two analog channels. The operation shown in this section is possible only when all of the following conditions are met.

[Operating Conditions]

- Operation mode: SAR mode – Single scan mode
- Input method: Single-ended input mode

The following shows an example of A/D conversions of even-numbered analog channels and odd-numbered analog channels using channel-dedicated sample-and-hold circuit in SAR mode – Single scan mode. The configuration example is shown in Table 53.26, and the operation detail is shown in Table 53.27 and Figure 53.19.

Table 53.26 Configuration example of advanced operation for channel-dedicated sample-and-hold circuit

Item	Configuration
A/D converter	Set ADC0 to SAR mode – Single scan mode
Channel-dedicated sample-and-hold circuit	Set SH0 to SH2 to enabled and Single-ended input mode. (AN000 to AN005 are subject to A/D conversion using channel-dedicated sample-and-hold circuit.)
Virtual channel*1	• Assign AN000, AN002 and AN004 to virtual channel 0 to 2, and set to single-ended input mode. • Assign AN001, AN003 and AN005 to virtual channel 3 to 5, and set to single-ended input mode.
Scan group	• Scan group 0: Assign AN000, AN002, AN004 (virtual channels 0 to 2). • Scan group 1: Assign AN001, AN003, AN005 (virtual channels 3 to 5). • Set scan group 0 and scan group 1 to convert with ADC0.

Note 1. When channel-dedicated sample-and-hold circuit is used, there are restrictions on the setting of virtual channels. For more details, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

Table 53.27 Example advanced operation of channel-dedicated sample-and-hold circuit

Step	Detail behavior of example operation
1	The scanning operation of scan group 0 starts when a trigger for scan group 0 is input.
2	Channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN000, AN002, AN004) and holds them.
3	A/D conversion is performed on the voltages held by channel-dedicated sample-and-hold circuit.
4	When A/D conversion of each channel in scan group 0 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
5	If scan end interrupt in scan group 0 is set to enabled, a scan end interrupt occurs.
6	After scanning of scan group 0 is completed, the scanning operation of scan group 1 starts when a trigger for scan group 1 is input.
7	Channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN001, AN003, AN05) and holds them.
8	A/D conversion is performed on the voltages held by channel-dedicated sample-and-hold circuit.
9	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
10	If scan end interrupt for scan group 1 is set to enabled, a scan end interrupt occurs.

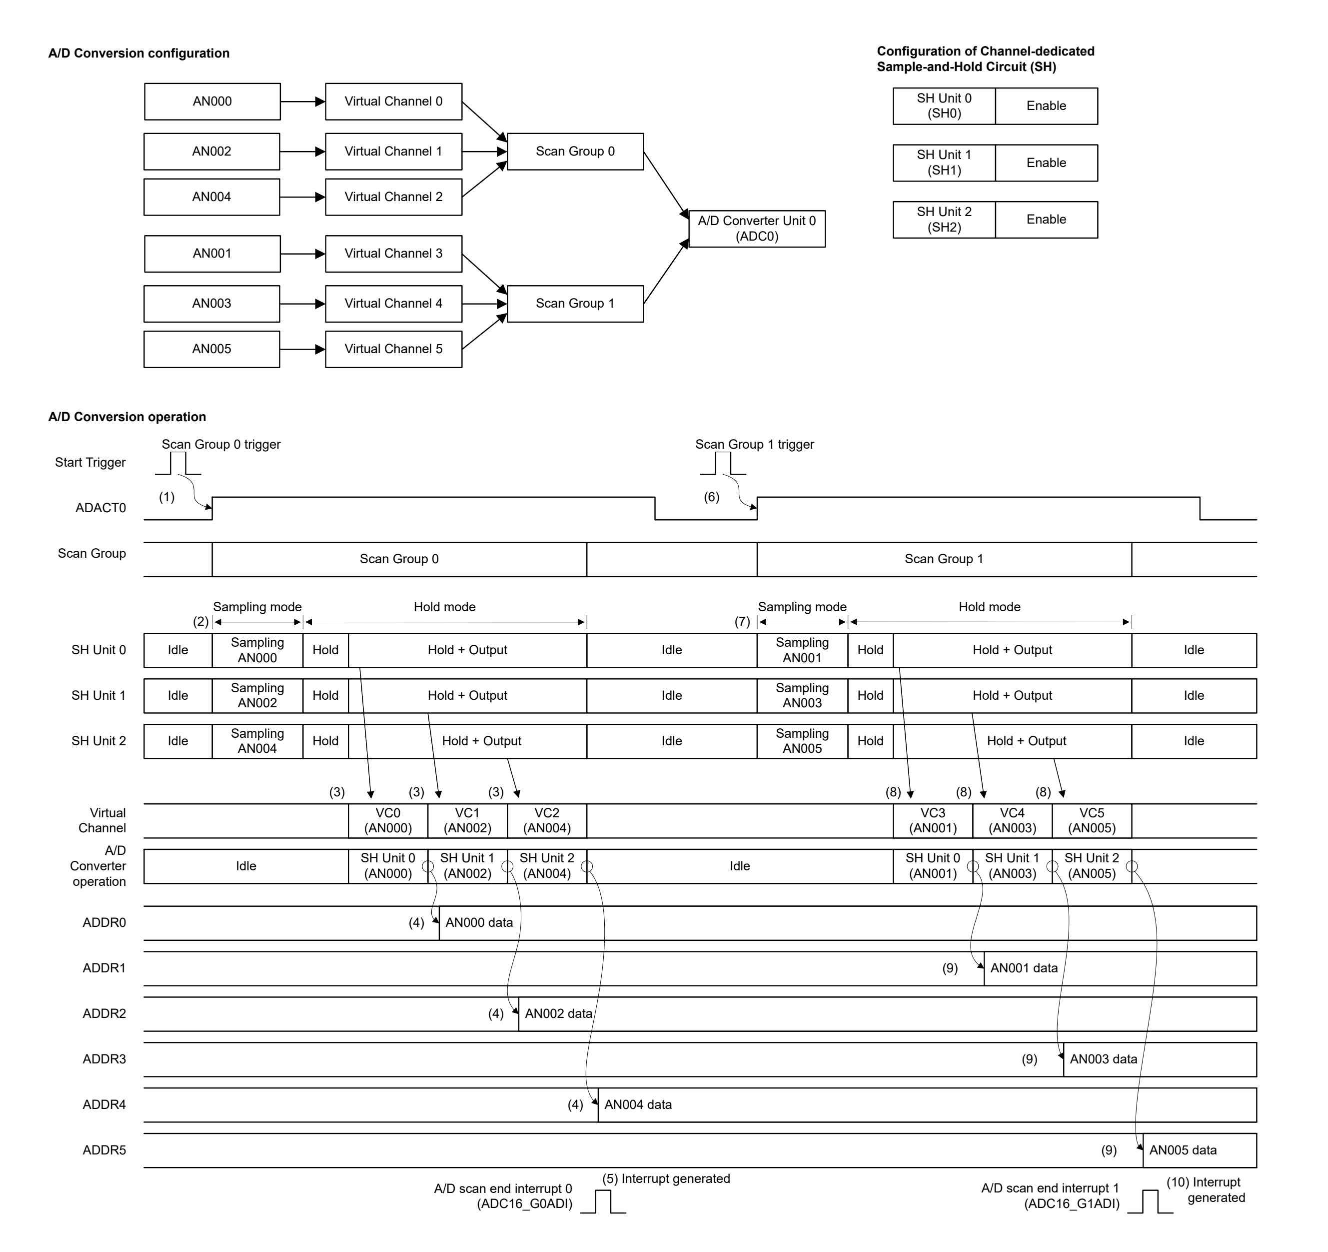

Figure 53.19 Example operation when channel-dedicated sample-and-hold circuit is shared with two analog channels in SAR mode

53.3.16.3 Operation in Hybrid Mode with Channel-dedicated Sample-and-hold Circuit

(1) Basic Operation in Hybrid Mode - Single Scan Mode

This section describes the basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Single scan mode. Since Differential input mode is supported in Hybrid mode, this example describes a case that channel-dedicated sample-and-hold circuits are set to Differential input mode. The configuration and behavior of example operation are shown in Table 53.28, Table 53.29 and Figure 53.20.

Table 53.28 Configuration of example operation for channel-dedicated sample-and-hold circuit in Hybrid mode – Single scan mode (1 of 2)

Item	Configuration
A/D converter	Set ADC0 to Hybrid mode – Single scan mode
Channel-dedicated sample-and-hold circuit	Set SH0 to SH2 to enabled and Differential input mode. (AN000 to AN005 are subject to A/D conversion using channel-dedicated sample-and-hold circuit.)

Table 53.28 Configuration of example operation for channel-dedicated sample-and-hold circuit in Hybrid mode – Single scan mode (2 of 2)

Item	Configuration
Virtual channel*1	• Assign AN000, AN002 and AN004 to virtual channel 0 to 2, and set to Differential input mode. (This will function AN000, AN002 and AN004 as the non-inverting inputs (+) of the differential input, and AN001, AN003, and AN005 as the inverting inputs (−) of the differential input.)
Scan group*1	• Assign virtual channel 0 to 2 to scan group 0. • Set scan group 0 to convert with ADC0.

Note 1. When channel-dedicated sample-and-hold circuit is used, there are restrictions on the setting of virtual channels. For more details, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

Table 53.29 Example operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Single scan mode

Step	Behavior
1	The scanning operation of scan group 0 starts when a trigger for scan group 0 is input.
2	Channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN000, AN002, AN004) and holds them.
3	The A/D converter performs oversampling once for each output of channel-dedicated sample-and-hold circuit (SH0 to SH2).
4	After one oversampling for each analog channel, channel-dedicated sample-and-hold circuit releases the held voltage and enters the idle state.
5	Step 2 to 4 is repeated until oversampling corresponding to the number of TAPs of the digital filter and the number of A/D-converted value addition/average times is performed for each analog channel.
6	A/D conversion data corresponding to each analog channel is output. The A/D conversion data is stored in the data register (ADDRi (i = 0, 2, 4)). If FIFO is used, A/D conversion data is also stored in FIFO data register (ADFIFODRk (k = 0 to 8)).
7	If the scan end interrupt is enabled, the scan end interrupt corresponding to that scan group is generated when the A/D conversion of all virtual channels assigned to that scan group is completed.
8	A/D converter and channel-dedicated sample-and-hold circuit enter the idle state when scanning operation is completed. The oversampling data in digital filter are discarded at the end of the scanning operation.

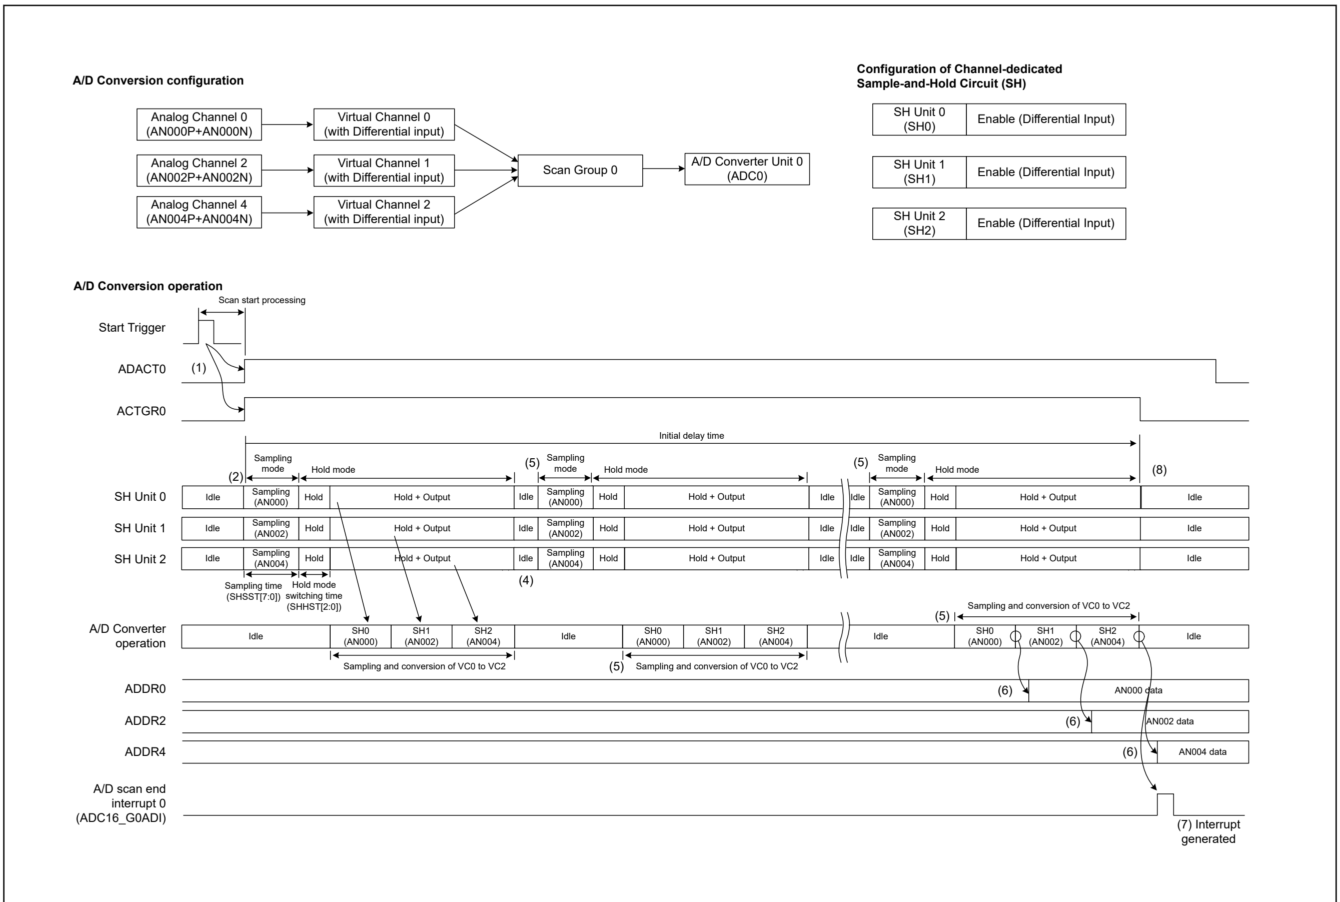

Figure 53.20 Basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Single scan mode

(2) Basic Operation in Hybrid Mode - Continuous Scan Mode

This section shows the basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Continuous scan mode. Since Differential input mode is supported in Hybrid mode, this example describes a case that channel-dedicated sample-and-hold circuits are set to Differential input mode. The configuration and behavior of example operation are shown in Table 53.30, Table 53.31 and Figure 53.21.

Table 53.30 Configuration of example operation for channel-dedicated sample-and-hold circuit in Hybrid mode – Continuous scan mode

Item	Configuration
A/D converter	Set ADC0 to Hybrid mode – Continuous scan mode
Channel-dedicated sample-and-hold circuit	Set SH0 to SH2 to enabled and Differential input mode. (AN000 to AN005 are subject to A/D conversion using channel-dedicated sample-and-hold circuit.)
Virtual channel[*1]	● Assign AN000, AN002 and AN004 to virtual channel 0 to 2, and set to Differential input mode. This treats AN000, AN002 and AN004 as the non-inverting inputs (+) of the differential input, and AN001, AN003, and AN005 as the inverting inputs (−) of the differential input.
Scan group[*1]	● Assign virtual channel 0 to 2 to scan group 0. ● Set scan group 0 to convert with ADC0.

Note 1. When channel-dedicated sample-and-hold circuit is used, there are restrictions on the setting of virtual channels. For more details, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

Table 53.31 Example operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Continuous scan mode (1 of 2)

Step	Behavior
1	The scanning operation of scan group 0 starts when a trigger for scan group 0 is input.

Table 53.31 Example operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Continuous scan mode (2 of 2)

Step	Behavior
2	Channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN000, AN002, AN004) and holds them.
3	The A/D converter performs oversampling once for each output of channel-dedicated sample-and-hold circuit (SH0 to SH2).
4	After one oversampling for each analog channel, channel-dedicated sample-and-hold circuit releases the held voltage and enters the idle state.
5	Step 2 to 4 is repeated until oversampling corresponding to the number of TAPs of the digital filter and the number of A/D-converted value addition/average times is performed for each analog channel.
6	A/D conversion data corresponding to each analog channel is output. The A/D conversion data is stored in the data register (ADDRi (i = 0, 2, 4)). If FIFO is used, A/D conversion data is also stored in FIFO data register (ADFIFODRk (k = 0 to 8)).
7	If the scan end interrupt is enabled, the scan end interrupt corresponding to that scan group is generated when the A/D conversion of all virtual channels assigned to that scan group is completed.
8	The second and subsequent rounds of scanning operations repeat the operation of Step 2 to 4, retaining the oversampling data stored in the digital filter. Each one time oversampling or each multiple times oversampling corresponding to the number of A/D-converted value addition/averaging times is performed for each analog channel, the next A/D conversion data is output. The A/D conversion data is stored in the data register (ADDRi (i = 0, 2, 4)). If FIFO is used, A/D conversion data is also stored in FIFO data register (ADFIFODRk (k = 0 to 8)).
9	If the scan end interrupt is enabled, the scan end interrupt corresponding to that scan group is generated when the A/D conversion of all virtual channels assigned to that scan group is completed.
10	Thereafter, until the forcibly stop process is performed, Step 8 to 9 are repeated, and the scanning operation continues. To perform the forcibly stop, follow to section 53.6.4. Force Stops the A/D Conversion Operation. If scanning operation is aborted by the forcibly stop process, A/D converter and channel-dedicated sample-and-hold circuit enter the idle state. The oversampling data in digital filter are discarded at the end of the scanning operation.

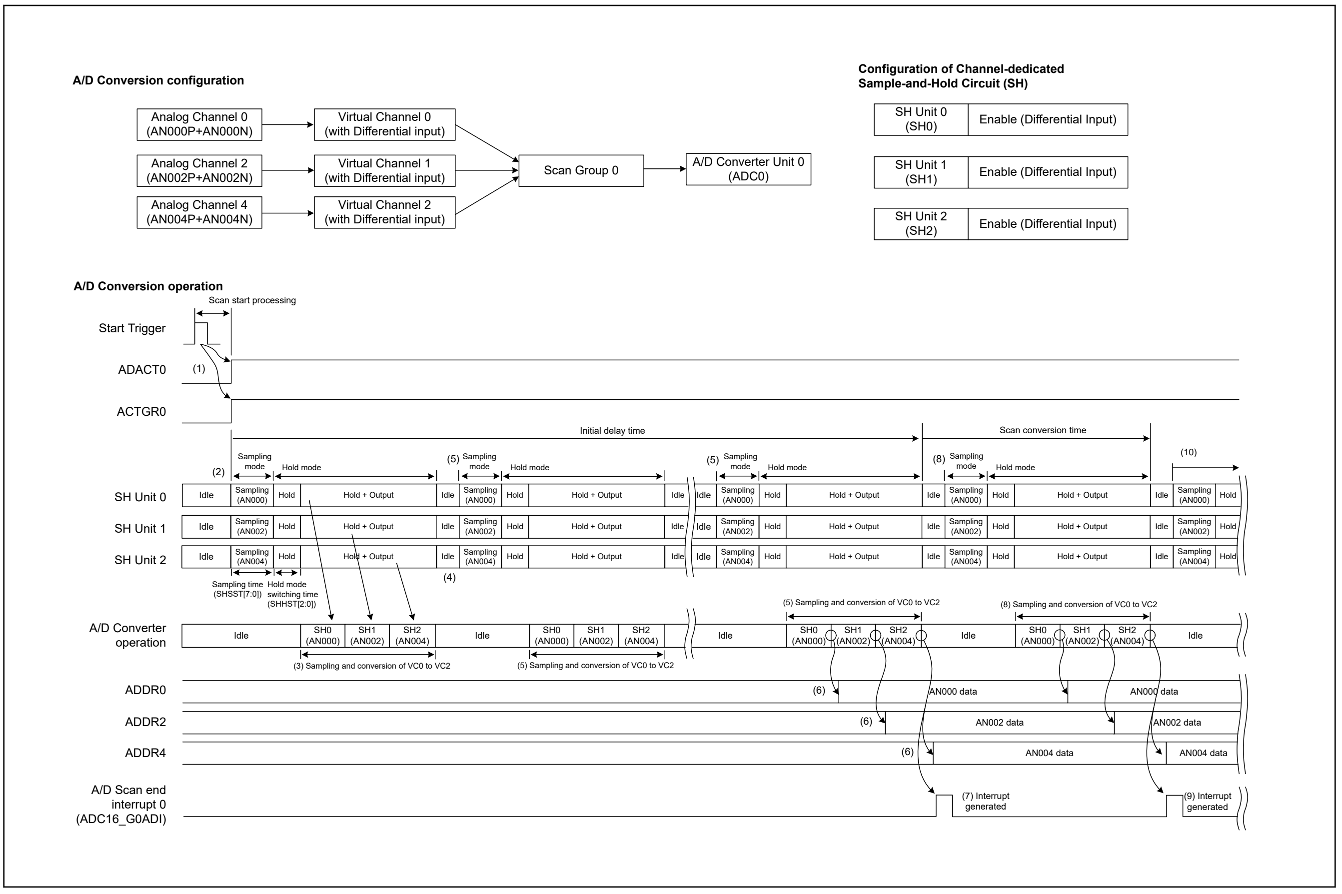

Figure 53.21 Basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Continuous scan mode

(3) Basic Operation in Hybrid Mode - Background Continuous Scan Mode

This section shows the basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Background continuous scan mode. Since Differential input mode is supported in Hybrid mode, this example describes a case that channel-dedicated sample-and-hold circuits are set to Differential input mode. The configuration and behavior of example operation are shown in Table 53.32, Table 53.33 and Figure 53.22.

Table 53.32 Configuration of example operation for channel-dedicated sample-and-hold circuit in Hybrid mode – Background continuous scan mode

Item	Configuration
A/D converter	Set ADC0 to Hybrid mode – Continuous scan mode
Channel-dedicated sample-and-hold circuit	Set SH0 to SH2 to enabled and Differential input mode. (AN000 to AN005 are subject to A/D conversion using channel-dedicated sample-and-hold circuit.)
Virtual channel*1	● Assign AN000, AN002 and AN004 to virtual channel 0 to 2, and set to Differential input mode. This treats AN000, AN002 and AN004 as the non-inverting inputs (+) of the differential input, and AN001, AN003, and AN005 as the inverting inputs (−) of the differential input.
Scan group*1	● Assign virtual channel 0 to 2 to scan group 0. ● Set scan group 0 to convert with ADC0.

Note 1. When channel-dedicated sample-and-hold circuit is used, there are restrictions on the setting of virtual channels. For more details, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

Table 53.33 Example operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Background continuous scan mode

Step	Behavior
1	The scanning operation of scan group 0 starts when a trigger for scan group 0 is input.
2	Channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN000, AN002, AN004) and holds them.
3	The A/D converter performs oversampling once for each output of channel-dedicated sample-and-hold circuit (SH0 to SH2).
4	After one oversampling for each analog channel, channel-dedicated sample-and-hold circuit releases the held voltage and enters the idle state.
5	Step 2 to 4 is repeated. After the oversampling corresponding to the number of TAPs of the digital filter and the number of A/D-converted value addition/averaging times is performed to each analog channel, first A/D conversion data becomes in ready to be output. Step 2 to 4 is repeated until oversampling corresponding to the number of TAPs of the digital filter and the number of A/D-converted value addition/average times is performed for each analog channel.
6	The second and subsequent rounds of scanning operations repeat the operation of Step 2 to 4, retaining the oversampling data stored in the digital filter. Each time oversampling is performed for each analog channel, the data in the digital filter is updated. Each one time oversampling or each multiple times oversampling corresponding to the number of A/D-converted value addition/averaging times is performed for each analog channel, the next A/D conversion data becomes in ready to be output.
7	When an A/D conversion start trigger is input during background continuous scanning operation, the most recent A/D conversion data at that time is stored in the data register (ADDRi (i = 0, 2, 4)). When FIFO function is set to enabled, A/D conversion data is also stored in the FIFO data register (ADFIFODRk (k = 0 to 8)). Also, if scan end interrupt is set to enable, scan end interrupt is generated. If FIFO interrupt is set to enable, FIFO data read request is generated when the condition for generating it is met.
8	Thereafter, until the forcibly stop process is performed, background continuous scanning operation (Step 6) is repeated. And whenever the A/D conversion start trigger is input during background continuous scanning operation, the A/D conversion data is output (Step 7). To perform the forcibly stop, follow to section 53.6.4. Force Stops the A/D Conversion Operation. If scanning operation is aborted by the forcibly stop process, A/D converter and channel-dedicated sample-and-hold circuit enter the idle state. The oversampling data in digital filter are discarded at the end of the scanning operation.

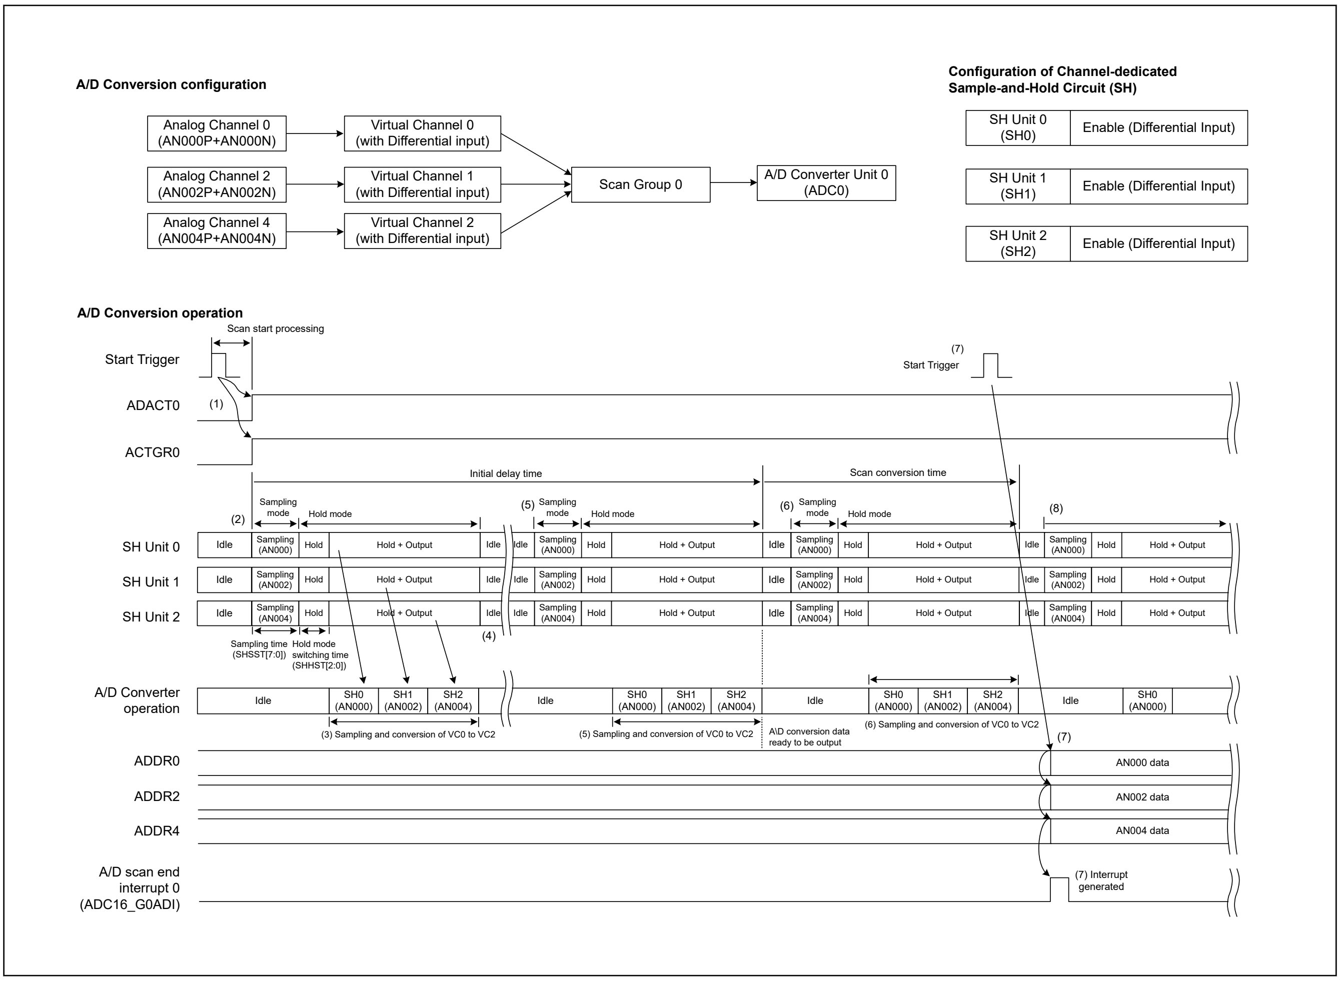

Figure 53.22 Basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Background continuous scan mode

(4) Basic Operation in Hybrid Mode - Fixed-channel Continuous Scan Mode

This section shows the basic operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Fixed-channel continuous scan mode. The configuration and behavior of example operation are shown in Table 53.34, Table 53.35. This mode is available only when the number of fixed channels is set to 3 and the fixed channels are used only for channel-dedicated sample-and-hold circuit.

Table 53.34 Configuration of example operation for channel-dedicated sample-and-hold circuit in Hybrid mode – Fixed-channel continuous scan mode

Item	Configuration
A/D converter	Set ADC0 to Hybrid mode – Fixed-channel continuous scan mode.
Channel-dedicated sample-and-hold circuit	Set SH0 to SH2 to enabled and Differential input mode. (AN000 to AN005 are subject to A/D conversion using channel-dedicated sample-and-hold circuit.)
Virtual channel*1	• Assign AN000, AN002 and AN004 to virtual channel 0 to 2, and set to Differential input mode. This treats AN000, AN002 and AN004 as the non-inverting inputs (+) of the differential input, and AN001, AN003, and AN005 as the inverting inputs (−) of the differential input.
Scan group*1	• Assign virtual channel 0 to 2 to scan group 0. • Set scan group 0 to convert with ADC0.

Note 1. When channel-dedicated sample-and-hold circuit is used, there are restrictions on the setting of virtual channels. For more details, see section 53.3.16.6. Restrictions on Channel-dedicated Sample-and-hold Circuit.

Table 53.35 Example operation of channel-dedicated sample-and-hold circuit in Hybrid mode – Fixed-channel continuous scan mode

Step	Behavior
1	When a start trigger is input and the ADSR.ADACTm (m = 0, 1) bit becomes 1 (A/D conversion in progress), A/D conversion of the scan group selected by the ADSGCRm (m = 0, 1) register is started.
2	Three fixed-channel channel-dedicated sample-and-hold circuit (SH0 to SH2) starts sampling the analog inputs (AN000, AN002, AN004) and holds them.
3	The A/D converter performs oversampling once for each output of channel-dedicated sample-and-hold circuit (SH0 to SH2).
4	One non-fixed channel is A/D converted in SAR mode. Non-fixed channels are converted from the virtual channels assigned to the relevant scan group in ascending order of channel number.
5	After performing A/D conversions for the three fixed channels and one non-fixed channel, channel-dedicated sample-and-hold circuit releases the held voltage and enters the idle state.
6	When A/D conversion for one channel is completed, the A/D conversion result is stored in the A/D data register (ADDRi.DATA (i = 0 to 22), ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)) corresponding to the conversion target channel. If FIFO is used, the A/D conversion result is also stored to the FIFO data register (ADFIFODRk (k = 0 to 8)).
7	If scan end interrupt is set to enable, scan end interrupt is generated.
8	The conversion time of idle cycles is counted until the end of the scan cycle.
9	Thereafter, until the A/D conversion stop process is performed, Background continuous scanning operation (Step 2 to 6) is repeated. For fixed channel scan, conversion of the same channel is repeated, and for non-fixed channel scan, conversion is repeated one channel at a time up to the last channel assigned to the scan group, and then back to the first channel. To stop A/D conversion, you must follow to section 53.6.4. Force Stops the A/D Conversion Operation.

53.3.16.4 Constant Sampling Function

Constant sampling is a function in which the channel-dedicated sample-and-hold circuit continues sampling before and after A/D conversion starts. This makes it possible to simultaneously sample multiple channels and acquire A/D conversion data at the same time.

Figure 53.23 shows the difference in A/D conversion operation when constant sampling is enabled (ADSHCSCR.SHCSSTm = 1 (x = 0, 1)) and when it is disabled (ADSHCSCR.SHCSSTm = 0 (x = 0, 1)).

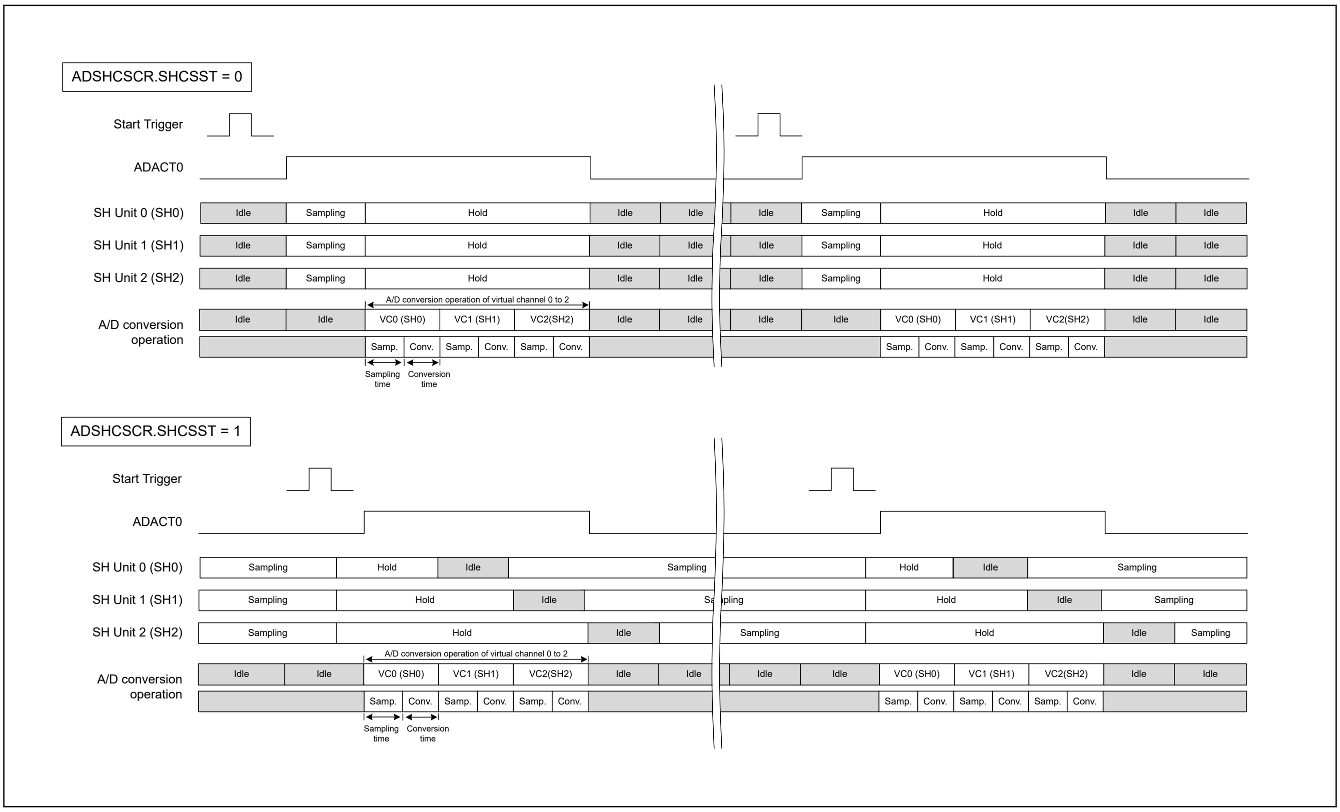

Figure 53.23 Difference between the function of channel-dedicated sample-and-hold circuit when using or not using constant sampling

53.3.16.5 Channel-dedicated Sample-and-hold Circuit Bypass Function

When channel-dedicated sample-and-hold (S&H) circuit is in differential input mode, the differential input bypass function allows disconnection detection with the disconnection detection assist function of A/D converter (single-ended input mode).

This function is intended to avoid the complex calibration procedure that occurs when the S&H switches from differential input mode to single-ended input mode, since the differential input bypass function is supported only in single-ended input mode.

When the ADSHDBPCR.SHDBPn (n = 0 to 8) bit is set to 1, the hold output of the S&H circuit is not selected for the AD conversion during the scan group. Instead, the input channel of the S&H circuit is selected for the AD conversion. The disconnection detection assist function can be executed in the scan group. For example, the following settings are possible in the order:

1. SH0 is enabled.
2. AN000 is assigned to scan group 0. The input mode is set to differential mode.
3. AN000 and AN001 are assigned to scan group 1. The input mode is set to single-ended mode and the disconnection detection assist function is enabled.
4. The ADSHDBPCR.SHDBP0 bit is set to 0 and the ADSHDBPCR.SHDBP1 bit is set to 1.

In the AD conversion of scan group 0, the sample-and-hold operation is performed with SH0, and the hold output is AD converted.

In the AD conversion of scan group 1, the disconnection detection assist function for the input channels of SH0, AN000 and AN001, is performed.

In this case, the SH0 setting is not changed and recalibration for SH0 is not required.

53.3.16.6 Restrictions on Channel-dedicated Sample-and-hold Circuit

When using channel-dedicated sample-and-hold circuit, observe the restrictions described in the sections that follow.

(1) Limitations on usage of channel-dedicated sample-and-hold circuit

Channel-dedicated sample-and-hold circuit is only available in the following:

- SAR mode – Single scan mode
- Hybrid mode – Single scan mode
- Hybrid mode – Continuous scan mode
- Hybrid mode – Background continuous scan mode
- Hybrid mode – Fixed channel continuous scan mode *1

In the operation mode other than above, channel-dedicated sample-and-hold circuit is prohibited.

In addition, the constant sampling function can only be used in SAR mode – Single scan mode.

The sampling time, hold mode switching time, and A/D sampling time of the channel-dedicated sample-and-hold circuit should be set as follows.

- 3.5 × (ADSHSTR0.SHHST[2:0] + ADSSTRx.SSTy[9:0]) ≥ ADSHSTR0.SHSST[7:0]

Note 1. Only fixed channels are supported when fixed channels are set to 3ch and all fixed channels enable channel-dedicated sample-and-hold circuit. Non-fixed channels cannot use channel-dedicated sample-and-hold circuit.

(2) Restrictions on self-calibration operation of channel-dedicated sample-and-hold circuit

Self-calibration operation is required when channel-dedicated sample-and-hold circuit is used. For more details on self-calibration procedures for channel-dedicated sample-and-hold circuit and the restrictions on it, see section 53.3.8. Self-calibration.

(3) Restrictions on assigning virtual channels and scan groups

For analog channels using channel-dedicated sample-and-hold circuit, assign them to virtual channels so that A/D conversion is performed at the front of the scan group. Specifically, assign an analog channel that uses channel-dedicated sample-and-hold circuit from the virtual channel that has the smallest virtual channel number among the virtual channels assigned to that scan group. (Assign the analog channels of channel-dedicated sample-and-hold circuit to the front virtual channels in ascending order of the virtual channel number.)

If this restriction is violated, the operation of channel-dedicated sample-and-hold circuit and A/D converter is not guaranteed.

(4) Prohibition of multiple assignments of channels using the same channel-dedicated sample-and-hold circuit in the same scan group

It is prohibited to assign more than one virtual channel that uses the same channel-dedicated sample-and-hold circuit to a single scan group. Specific restrictions are the followings:

[Restrictions]

- The virtual channel whose signal source is selected as the even-numbered analog channel connected to channel-dedicated sample-and-hold circuit and the virtual channel whose signal source is selected as the odd-numbered analog channel must not be assigned to the same scan group without using the bypass function.
- It is prohibited to assign the even-numbered analog channels or odd-numbered analog channels connected to channel-dedicated sample-and-hold circuit to multiple virtual channels, and assign them to the same scan group.

Operation is not guaranteed if this restriction is violated.

To avoid this restriction, assign virtual channels that use the same channel-dedicated sample-and-hold circuit to separate scan groups. This restriction can be avoided by preventing A/D conversion from occurring more than once for the same channel-dedicated sample-and-hold circuit during one scanning operation. For the example workaround for this restriction, see (2) Advanced operation in SAR mode - Single scan mode.

(5) Restriction on differential input bypass function

When a scan group is set as differential input bypass, all channel-dedicated sample-and-hold circuits including another scan group cannot be used for SH disconnection detection function and constant sampling function.

(6) Restrictions on group priority operation

Channel-dedicated sample-and-hold circuit is available only for the highest priority scan group in group priority operation.

(7) Restrictions on channel-dedicated sample-and-hold circuit (S&H) constant sampling function

- S&H constant sampling function is only available in SAR mode – Single scan mode. In the operation mode other than specified, S&H constant sampling function is prohibited.
- When using the S&H constant sampling function, the virtual channel settings of the channel that converts S&H, use the virtual channel number register corresponding to the S&H unit as shown in Table 53.36.

Table 53.36 Virtual channel number associated with sample-and-hold circuit unit

A/D converter unit	Channel-dedicated sample-and-hold circuit unit	Assigned virtual channel number
ADC0	S&H unit 0	Virtual Channel 0
	S&H unit 1	Virtual Channel 1
	S&H unit 2	Virtual Channel 2
ADC1	S&H unit 4	Virtual Channel 4
	S&H unit 5	Virtual Channel 5
	S&H unit 6	Virtual Channel 6

- When using the S&H constant sampling function, set the S&H sampling time (ADSHSTRm.SHSST[7:0](m = 0, 1)) according to the following rules:
  - When synchronization between units is disabled — ADSHSTRx.SHSSTx (x = 0 to 3) = 8’h4 (reset value)
  - When synchronization between units is enabled — The value for which the total time of S&H sampling time and S&H hold time (ADSHSTRm.SHSST[7:0] + ADSHSTRm.SHHST[2:0] (m = 0, 1)) is equal to the synchronization period.
- When S&H constant sampling function is enabled, it is prohibited to use any of the scan groups with S&H bypass input by setting the ADSHDBPCR register.
- When unit synchronization is enabled and S&H is used with constant sampling, set the synchronous period to 6 ADCLK or longer.
- Set S&H constant sampling (ADSHCSCR.SHCSSTm (m = 0, 1)) before starting A/D conversion after calibration.
- When S&H is used with constant sampling, the S&H sampling period is the period from the end of the S&H conversion to the start of the next S&H conversion. When you enter a conversion start trigger continuously, ensure that the trigger interval is sufficient to ensure the sampling period of S&H.

(8) Restrictions on channel-dedicated sample-and-hold circuit (S&H) disconnection detection assist function

- S&H disconnection detection assist function is only available in SAR mode – Single scan mode. In the operation mode other than specified, S&H disconnection detection assist function is prohibited.
- When S&H disconnection detection assist function is enabled, it is prohibited to use any of the scan groups with S&H bypass input by setting the ADSHDBPCR register.

(9) Restrictions on channel-dedicated sample-and-hold circuit (S&H) self-diagnosis function

- S&H self-diagnosis function is only available in SAR mode – Single scan mode. In the operation mode other than specified, S&H self-diagnosis function is prohibited.
- It is prohibited to set up normal conversion and S&H self-diagnostic channels of the same S&H unit in one scan group.

53.3.17 Disconnection Detection Assist Function

Disconnection detection assist function is the function that fixes the charges of the sampling capacitance of the A/D converter to a specified condition prior to starting A/D conversion. This function can be used to detect the wiring disconnection connected to analog input.

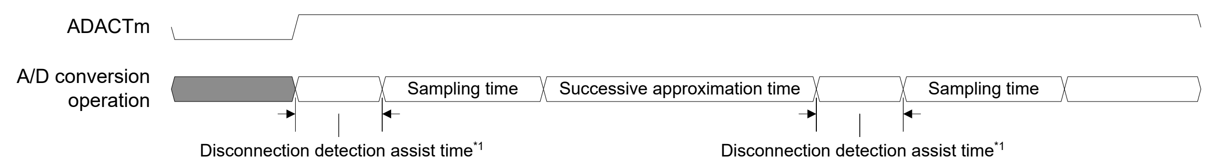
Table 53.37 shows the operation mode in which disconnection detection assist function is available. And when using disconnection detection assist function, it is recommended to enable the high accuracy mode by setting the ADACMDR.ADHACMDn (n = 0,1) bits to 1.

Table 53.37 List of operation mode for which disconnection detection assist function is available

Operation mode – Scan mode	When channel-dedicated sample-and-hold circuit is not used	When channel-dedicated sample-and-hold circuit is used
SAR mode – Single scan mode	✓	✓
SAR mode – Continuous scan mode	✓	—
Oversampling mode – Single scan mode	—	—
Oversampling mode – Continuous scan mode	—	—
Oversampling mode – One-channel continuous scan mode	—	—
Hybrid mode – Single scan mode	✓	—
Hybrid mode – Continuous scan mode	✓	—
Hybrid mode – Background continuous scan mode	—	—
Hybrid mode – Fixed-channel continuous scan mode	—	—

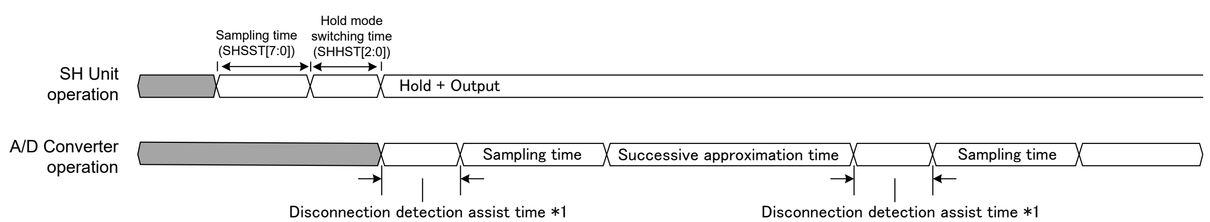
Note: ✓: available, —: not available

Figure 53.24 shows an example operation of A/D conversion when disconnection detection assist function is used, and Figure 53.25 shows an example operation of A/D conversion when disconnection detection assist function and channel-dedicated sample-and-hold circuit are used. Figure 53.26 shows an example of the disconnection detection when precharge is selected, and Figure 53.27 shows an example of the disconnection detection when discharge is selected.



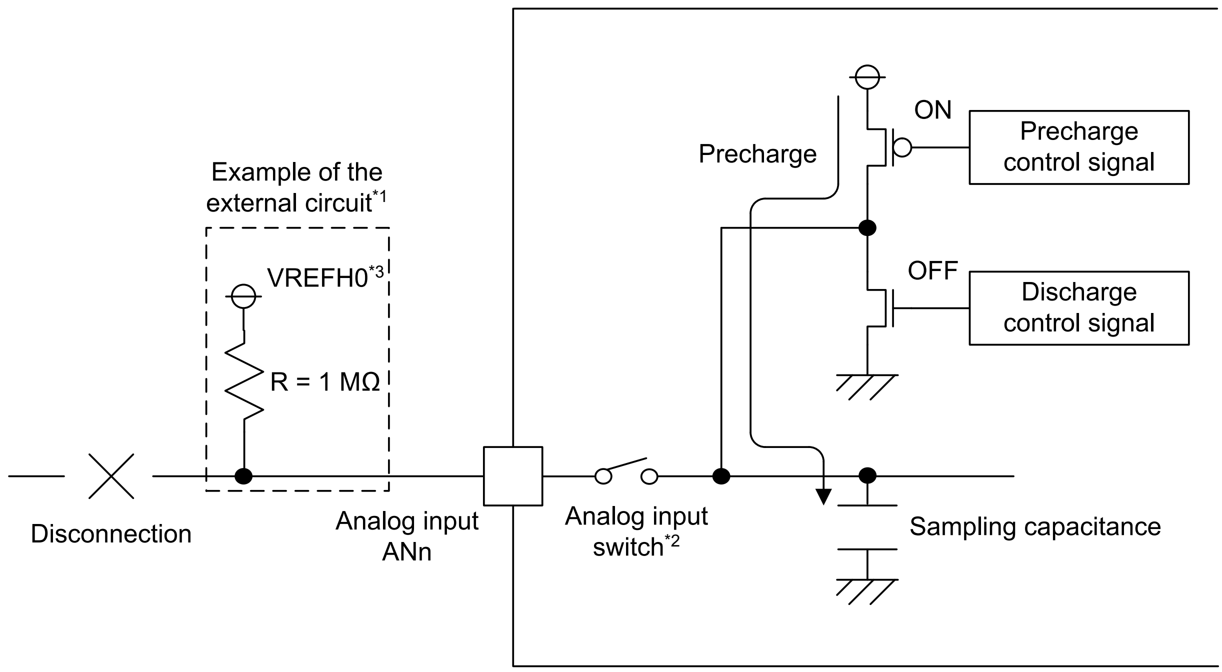
Note: m = 0, 1
Note 1. 3 to 254 cycles of ADCLK

Figure 53.24 Operation of A/D conversion when disconnection detection assist function is used



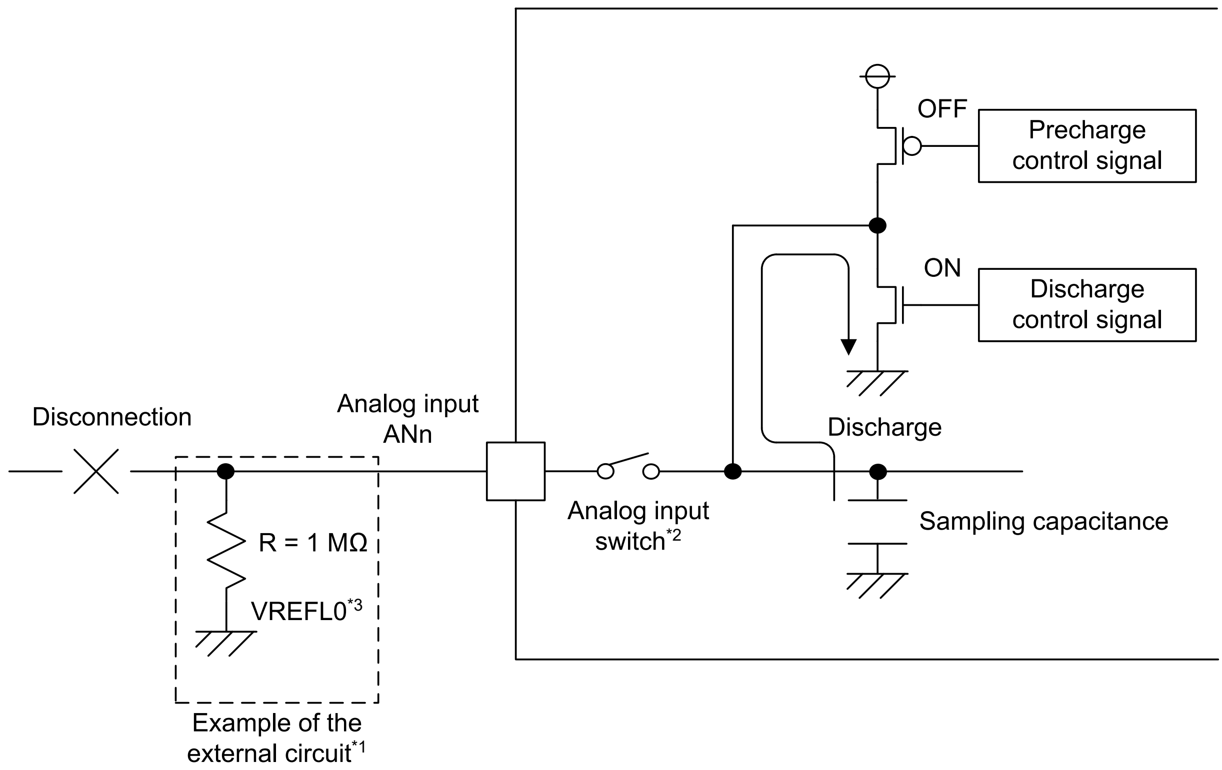
Note 1. 3 to 254 ADCLK cycles

Figure 53.25 Operation of A/D conversion when the disconnection detection assist function and channel-dedicated sample-and-hold circuit are used



Note 1. The converted result should be used after it is fully evaluated because the result data when disconnection occurs varies depending on the external circuit.
Note 2. Turn off when precharge, and turn on when sampling the Analog input ANn.
Note 3. Example is for ADC0; use VREFH for ADC1.

Figure 53.26 Example of disconnection detection when precharge is selected



Note: Connect the same reference ground as the ADC16H which is used.
Note 1. The converted result should be used after it is fully evaluated because the result data when disconnection occurs varies depending on the external circuit.
Note 2. Turn off when discharge and turn on when sampling the Analog input ANn.
Note 3. Example is for ADC0; use VREFL for ADC1.

Figure 53.27 Example of disconnection detection when discharge is selected

53.3.17.1 Restrictions on Disconnection Detection Assist Function

When using disconnection detection assist function, observe the following restrictions:

- Disconnection detection assist function is only available in the following modes:
  - SAR mode – Single scan mode
  - SAR mode – Continuous scan mode
  - Hybrid mode – Single scan mode
  - Hybrid mode – Continuous scan mode

  In the operation mode other than above, disconnection detection assist function is prohibited.
- Disconnection detection assist function with channel-dedicated sample-and-hold circuit is only available in the following modes:
  - SAR mode – Single scan mode

  In the operation mode other than above, disconnection detection assist function with channel-dedicated sample-and-hold circuit is prohibited.

53.3.18 Group Priority Operation

Group priority operation function is the function that performs the scanning operation (A/D conversion) for a scan group with a higher priority based on the priority of scan group.

The priority of scan groups is group 0 > group 1 > … > group n (n: the number of maximum scan group - 1).

Table 53.38 shows the conditions when group priority operation can be used and the corresponding register settings. Set the operation according to Table 53.38.

Table 53.38 Group priority operation usable conditions and corresponding register settings

Operating conditions		Group priority operation				
			Setting for ADGSPCR register [*1]			
Operation mode of A/D converter		Operation	PGSm	RSCNm	LGRRSm	GRPm
SAR mode	Single scan mode	✓	1	1	1	0
	Continuous scan mode	✓	1	1	1	1
Oversampling mode		—	0	0	0	0
Hybrid mode		—	0	0	0	0

Note: ✓: Available, —: Not Available (Prohibited)
m = 0, 1

Note 1. Settings other than the specified value are prohibited.

53.3.18.1 Group Priority Operation in SAR Mode – Single Scan Mode

In group priority operation in SAR mode – Single scan mode, the single scanning operation is performed according to the priority of scan group.

If an A/D conversion start trigger for the high priority group is input during a scanning operation of the low priority group, the scanning operation of the low priority group is interrupted, and the scanning operation of the high priority group is started. After the scanning operation of the high priority group is completed, the scanning operation of the low priority group is resumed.

When an A/D conversion start trigger of the low priority group during a scanning operation of the high priority group is input, the scanning operation of the low priority group is performed after the scanning operation of the high priority group is completed.

Example of the Group Priority Operation in SAR Mode – Single Scan Mode

Table 53.39 and Figure 53.28 show the example of group priority operation in SAR mode – Single scan mode when analog channel 0 (AN000) is assigned to scan group 0 (high priority) and analog channel 1 to 3 (AN001 to AN003) are assigned to scan group 1 (low priority).

Table 53.39 Example of the group priority operation in SAR mode – Single scan mode (2 groups)

Step	Operation
1	The scanning operation of scan group 1 starts when a trigger for scan group 1 is input.
2	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
3	If a trigger for scan group 0 is input during A/D conversion for scan group 1, the scanning operation of scan group 1 is suspended and the scanning operation of scan group 0 is started. [*1]
4	When A/D conversion of each channel in scan group 0 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
5	If a scan end interrupt for scan group 0 is enabled, a scan end interrupt occurs.
6	The scanning operation of scan group 1 is resumed after scanning of scan group 0 is completed. The scanning operation is resumed from the A/D conversion incomplete channel. [*1]
7	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
8	If a scan end interrupt for scan group 1 is enabled, a scan end interrupt occurs.
9	When all scanning operations are completed, ADSR.ADACTm (m = 0, 1) bits are cleared and the A/D converter enters the idle status.

Note 1. The timing of interruption and restart of scanning operation depends on the operating conditions. For details, see section 53.3.18.3. Restrictions on Group Priority Operation.

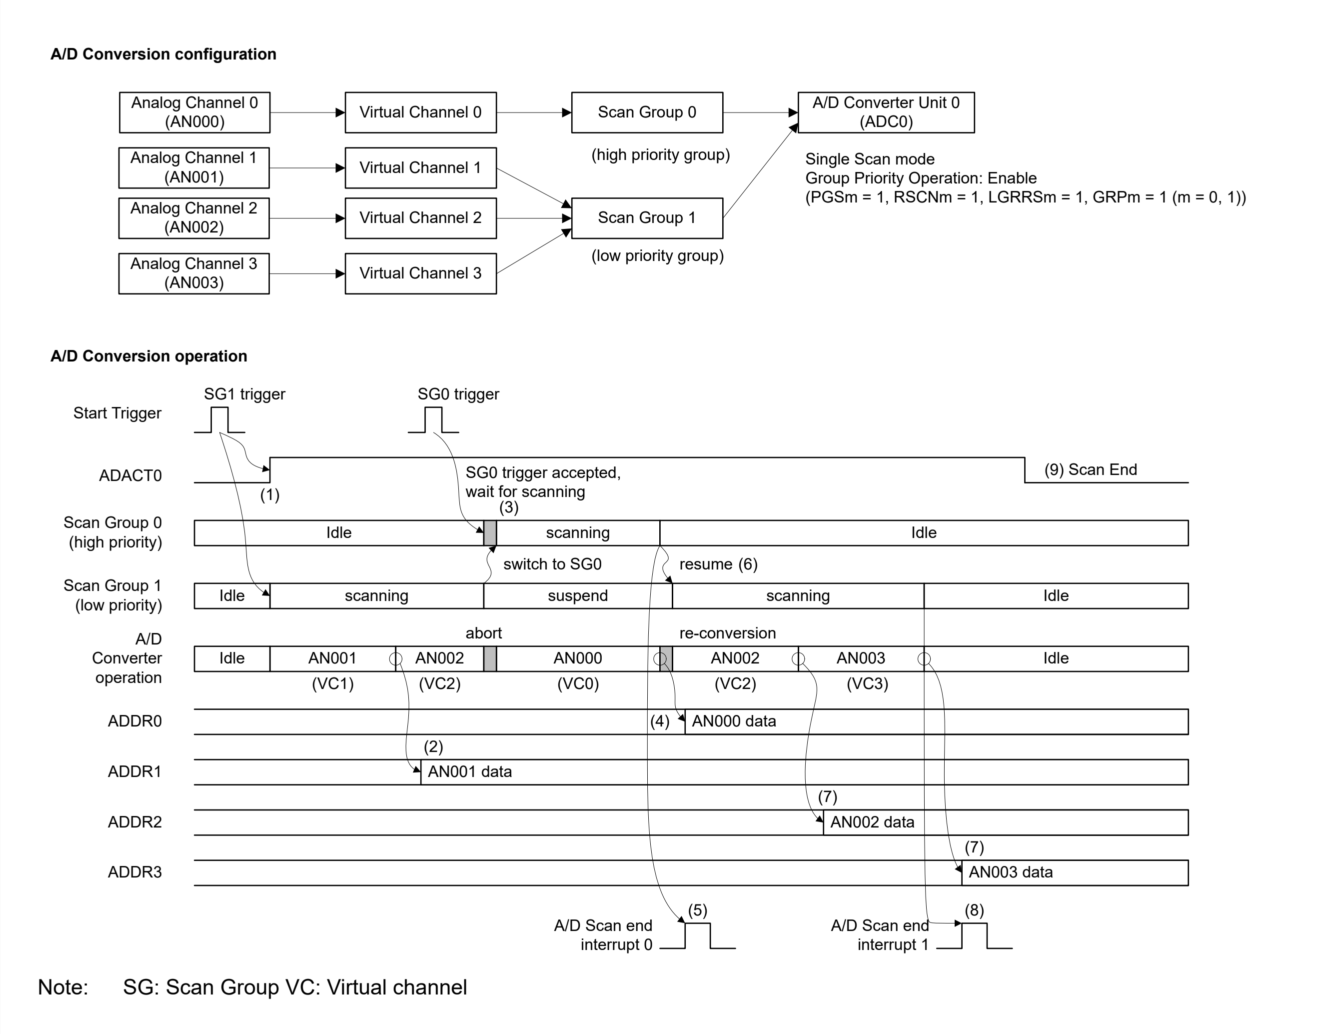


Figure 53.28 Example of group priority operation in SAR mode – Single scan mode (2 groups)

53.3.18.2 Group Priority Operation in SAR Mode – Continuous Scan Mode

In group priority operation in SAR mode – Continuous scan mode, the continuous scanning operation is performed for the scan group (continuous-scan group) in which scanning operation was first started. If an A/D conversion start trigger of another scan group (interrupt-scan group) is input during the continuous scanning operation of the continuous-scan group, the following operations are performed according to the priority of the interrupt-scan group.

1. Priority: When Interrupt-scan group (high) > Continuous-scan group (low)
   - The scanning operation of the continuous-scan group is interrupted, and the single scanning operation of the interrupt-scan group is started.
   - The continuous scanning operation of the continuous-scan group is restarted after the single scanning operation of the interrupt-scan group is completed.
2. Priority: When Continuous-scan group (high) > Interrupt-scan group (low)
   - This operation is prohibited. Operation is not guaranteed.

   In case 1. above, if an A/D conversion start trigger for another scan group (interrupt-scan group B) is input during the single scanning operation of the interrupt-scan group (interrupt-scan group A), the following operation is performed according to the priority of interrupt-scan group B.
3. Priority: When Interrupt-scan group B (high) > Interrupt-scan group A (middle) > Continuous-scan group (low)
   - The single scanning operation of interrupt-scan group A is suspended, and the single scanning operation of interrupt-scan group B is started.

- After the single scanning operation of interrupt-scan group B is completed, the single scanning operation of interrupt-scan group A is resumed.
- After the scanning operation of interrupt-scan group A is completed, the continuous scanning operation of the continuous-scan group is resumed.

4. Priority: When interrupt-scan group A (high) > interrupt-scan group B (medium) > continuous-scan group (low)
   - After the single scanning operation of interrupt-scan group A is completed, the single scanning operation of interrupt-scan group B is started.
   - After the single scanning operation of interrupt-scan group B is completed, the continuous scanning operation of the continuous-scan group is resumed.
5. Priority: When interrupt-scan group A (high) > continuous-scan group (medium) > interrupt-scan group B (low)
   - This operation is prohibited. Operation is not guaranteed.

Example operations are shown in the followings:

(1) Example of two-group priority operation in SAR mode – Continuous scan mode

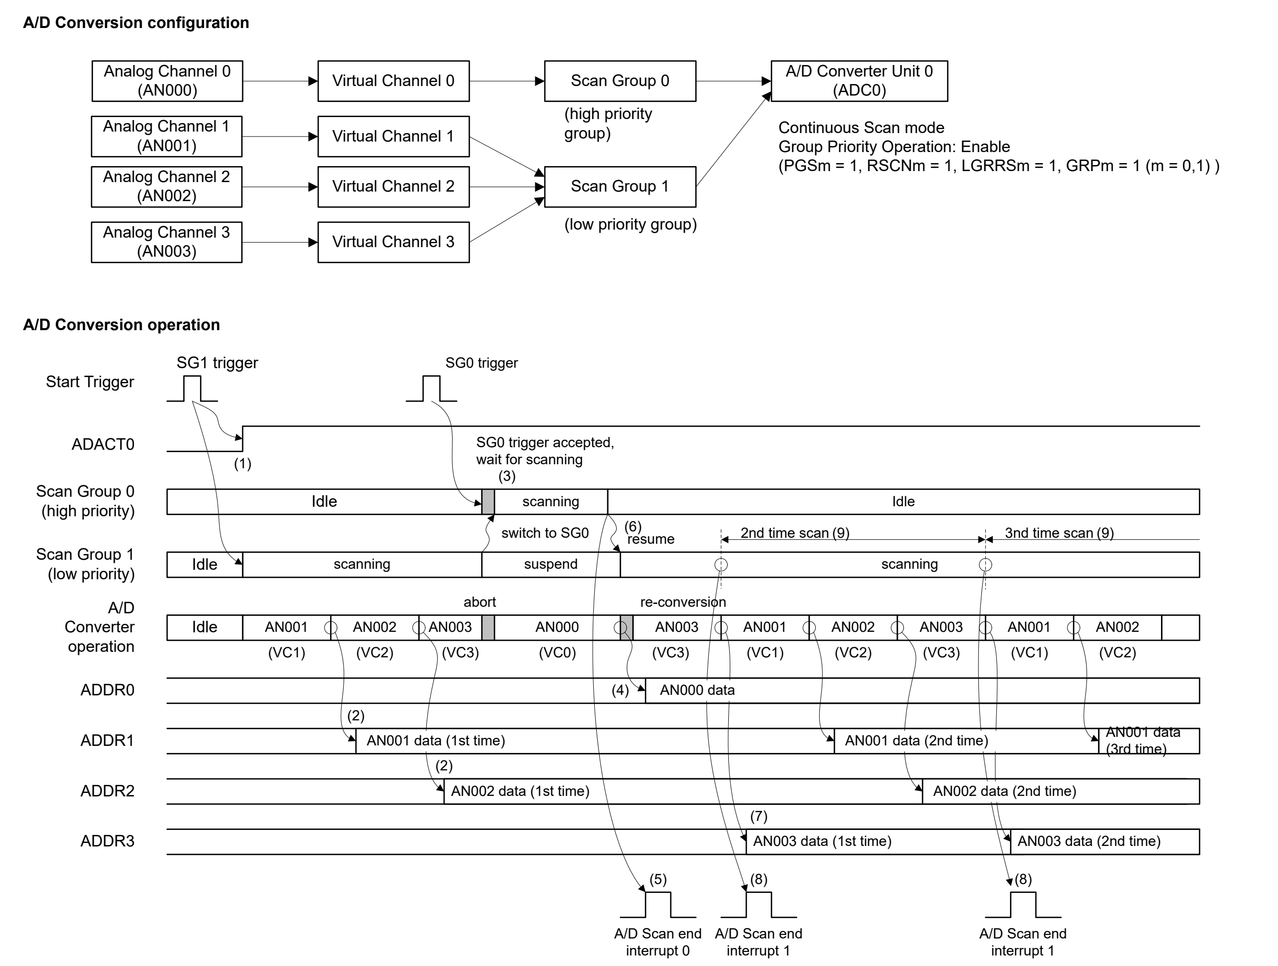
Table 53.40 and Figure 53.29 show the example of group priority operation in SAR mode – Continuous scan mode when analog channel 0 (AN000) is assigned to scan group 0 (high-priority group) and analog channel 1 to 3 (AN001 to AN003) is assigned to scan group 1 (low-priority group).

Table 53.40 Example of the group priority operation in SAR mode – Continuous scan mode (2 groups)

Step	Operation
1	The continuous scanning operation of scan group 1 (low priority group) is started by the trigger input of scan group 1.
2	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
3	If a trigger for scan group 0 is input during A/D conversion for scan group 1, the scanning operation of scan group 1 is suspended and scanning operation of scan group 0 is started. *1
4	When A/D conversion of each channel in scan group 0 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
5	If a scan end interrupt for scan group 0 is enabled, a scan end interrupt occurs.
6	The scanning operation of scan group 1 is resumed after scanning of scan group 0 is completed. The scanning operation is resumed from the A/D conversion incomplete channel. *1
7	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
8	If a scan end interrupt for scan group 1 is enabled, a scan end interrupt occurs.
9	Scan group 1 continues the continuous scanning operation. *2

Note 1. The timing of interruption and restart of scanning operation depends on the operating conditions. For details, see section 53.3.18.3. Restrictions on Group Priority Operation.

Note 2. To stop the continuous scanning operation, follow the procedures described in section 53.6.4. Force Stops the A/D Conversion Operation.



Note: SG: Scan Group VC: Virtual channel

Figure 53.29 Example of group priority operation in SAR mode – Continuous scan mode (2 groups)

(2) Example of three-groups priority operation in SAR mode – Continuous scan mode

Table 53.41 and Figure 53.30 show the example of group priority operation when analog channel 0 (AN000) is assigned to scan group 0 (high priority), analog channels 1 and 2 (AN001 and AN002) are assigned to scan group 1 (middle priority), and analog channel 3 to 5 (AN003 to AN005) are assigned to scan group 2 (low priority).

Table 53.41 Example of the group priority operation in SAR mode – Continuous scan mode (3 groups) (1 of 2)

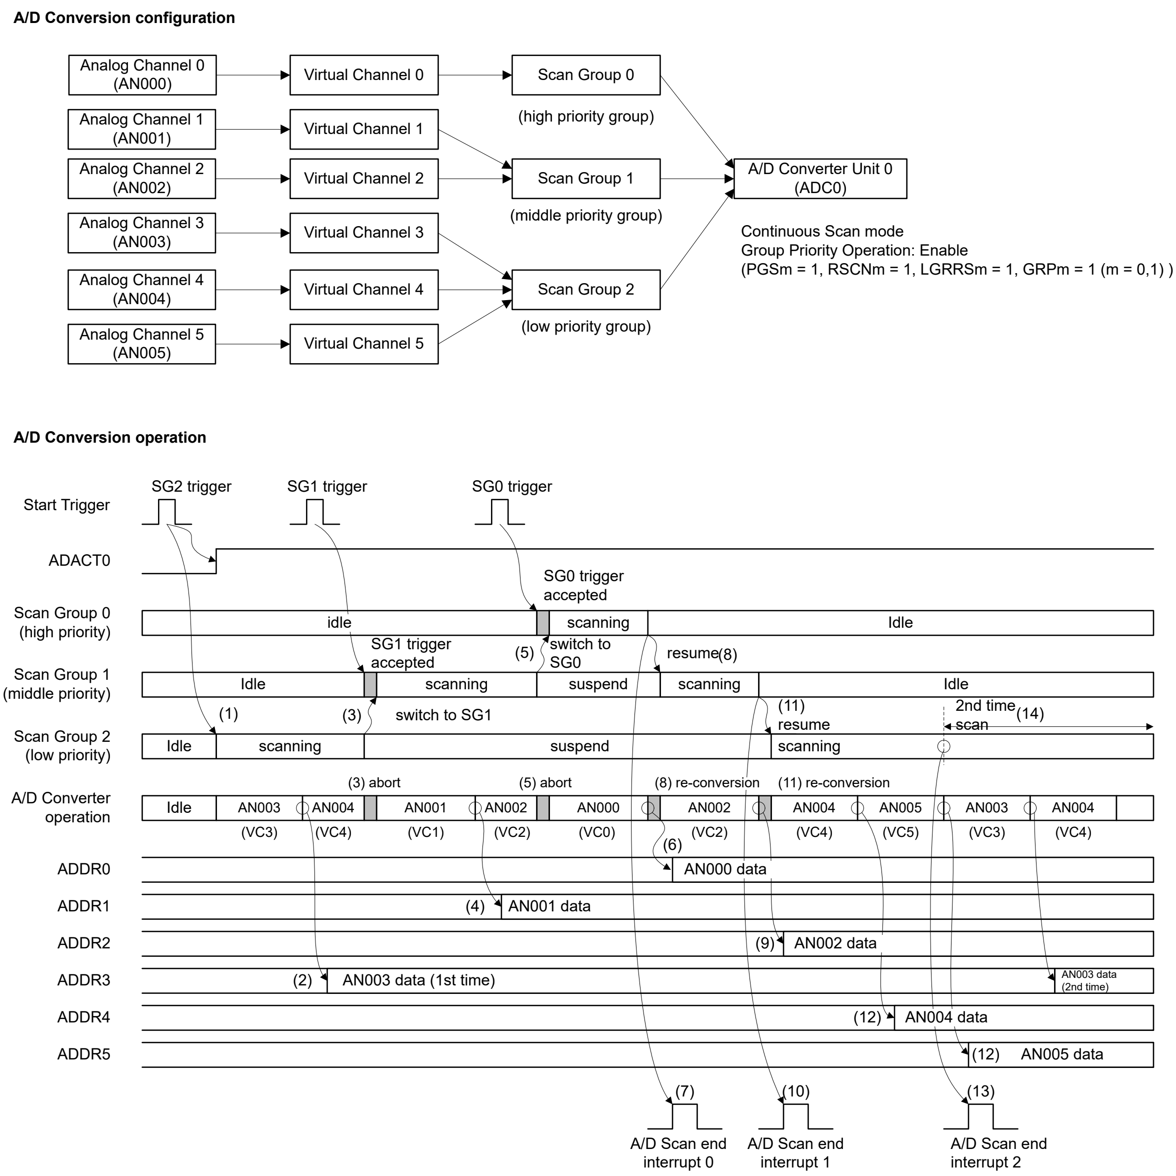
Step	Operation
1	The continuous scanning operation of scan group 2 is started by the trigger input of scan group 2.
2	When A/D conversion of each channel in scan group 2 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
3	If a trigger for scan group 1 is input during A/D conversion on scan group 2, the scanning operation of scan group 2 is suspended and the scanning operation of scan group 1 is started. *1
4	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
5	If a trigger for scan group 0 is input during A/D conversion for scan group 1, the scanning operation of scan group 1 is suspended and the scanning operation of scan group 0 is started. *1
6	When A/D conversion of each channel in scan group 0 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
7	If a scan end interrupt for scan group 0 is enabled, a scan end interrupt occurs.

Table 53.41 Example of the group priority operation in SAR mode – Continuous scan mode (3 groups) (2 of 2)

Step	Operation
8	The scanning operation of scan group 1 is resumed after scanning of scan group 0 is completed. The scanning operation is restarted from the A/D conversion incomplete channel. *1
9	When A/D conversion of each channel in scan group 1 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
10	If a scan end interrupt for scan group 1 is enabled, a scan end interrupt occurs.
11	Scan group 2 is resumed after scanning of scan group 1 is completed. The scanning operation is resumed from the A/D conversion incomplete channel. *1
12	When A/D conversion of each channel in scan group 2 completes, the A/D conversion result is stored in the corresponding A/D data register n (ADDRn).
13	If a scan end interrupt for scan group 2 is enabled, a scan end interrupt occurs.
14	Scan group 1 continues the continuous scanning operation. *2

Note 1. The timing of interruption and restart of scanning operation depends on the operating conditions. For details, see section 53.3.18.3. Restrictions on Group Priority Operation.

Note 2. To stop the continuous scanning operation, follow the procedures described in section 53.6.4. Force Stops the A/D Conversion Operation.



Note: SG: Scan Group VC: Virtual channel

Figure 53.30 Example of group priority operation in SAR mode – Continuous scan mode (3 groups)

53.3.18.3 Restrictions on Group Priority Operation

(1) Channel-dedicated sample-and-hold circuit restrictions

Channel-dedicated sample-and-hold circuit is available only for the highest priority scan group in group priority operation.

(2) Restrictions on the operation mode and operation setting of the A/D converter

Group priority operation is only available in SAR mode; Group priority operation is prohibited in Oversampling mode or Hybrid mode.

If these restrictions are violated, operation is not guaranteed.

(3) Restrictions on group priority operation in SAR mode – Continuous scan mode

In group priority operation in SAR mode – Continuous scan mode, do not input A/D conversion start triggers for scan groups that have a lower priority than the scan group that started continuous scanning operation. If this restriction is violated, the operation is not guaranteed.

(4) Restrictions on trigger input for the same scan group

Input the A/D conversion start triggers for the same scan group in group priority operation for the following periods.

[When synchronous operation is disabled (ADSYCR.ADSYDISm = 1)]

- 2 ADCLK + 2 PCLK cycles after the scan end flag is set *1

[When synchronous operation is enabled (ADSYCR.ADSYDISm = 0)]

- Synchronous operation period cycle × 2 after the scan end flag is set *1

Note: m = 0, 1

Note 1. ADSCANENDSR.SCENDFn = 1 (n = 0 to 8)

If A/D conversion start triggers are input without waiting for the above period, the A/D conversion start triggers may be lost. To accept A/D conversion start triggers reliably, input the trigger after the above period has elapsed.

(5) Restrictions on suspend and resume for scanning operation of low-priority groups

When an A/D conversion start trigger for the high priority group is input during scanning of the low priority group in group priority operation, the scanning operation of the low priority group is interrupted at the timing shown in the following:

[Scan interruption timing of low priority group]

- When synchronous operation is enabled
  - After the A/D conversion start trigger of the high-priority group is accepted, the scanning operation of the low-priority group is suspended after waiting until the next synchronous operation period timing.
- When synchronous operation is disabled
  - The scanning operation of the low-priority group is immediately suspended after the A/D conversion start trigger of the high-priority group is accepted.

If A/D conversion is being performed on channels for which A/D-converted value addition/averaging function is to be used at the timing of scan interruption of a low-priority group, the midway result of A/D-converted value addition/averaging value at that time is discarded. When the scanning operation of the low-priority group is resumed, A/D conversion starts over from the beginning of the number of times specified for A/D-converted value addition/averaging function.

If the scanning operation is suspended by group priority operation, ADGRSR.ACTGRn (n = 0 to 8) bit of the suspended scan group remains set to 1.

53.3.19 Synchronous Operation

Synchronous operation is the function that controls the operations of multiple A/D converters so that they are synchronized.

53.3.19.1 Synchronous Operation Examples

(1) Basic synchronous operation

The basic operation of synchronous operation is shown in the following. The configuration example is shown in Table 53.42, and the detail of operation is shown in Table 53.43 and Figure 53.31.

Table 53.42 Configuration example of basic synchronous operation (1 of 2)

Item	Configuration
A/D converter	• ADC0: Set to SAR mode – Single scan mode • ADC1: Set to SAR mode – Single scan mode
Virtual channel	• Virtual channel 0 to 2: Assign AN000 to AN002 and set to Single-ended input mode. • Virtual channel 6 to 8: Assign AN006 to AN008 and set to Single-ended input mode.

Table 53.42 Configuration example of basic synchronous operation (2 of 2)

Item	Configuration
Scan group	[Scan Group 0] ● Assign AN000 to AN002 (Virtual channel 0 to 2) ● Set to convert with ADC0 [Scan Group 1] ● Assign AN006 to AN008 (Virtual channel 6 to 8) ● Set to convert with ADC1

Table 53.43 Example of basic synchronous operation

Step	Detail behavior of example operation
1	When a trigger of scan group 0 is input, a wait is inserted until the A/D conversion synchronization timing.
2	At the timing of synchronous operation period, the trigger input of scan group 0 is accepted, and the scanning operation of scan group 0 (for ADC0) starts.
3	When a trigger of scan group 1 is input, a wait is inserted until the A/D conversion synchronization timing.
4	At the timing of synchronous operation period, the trigger input of scan group 1 is accepted, and the scanning operation of scan group 1 (for ADC1) starts.
5	During synchronous operation, the A/D converter starts the sampling operation in accordance with synchronous operation period.

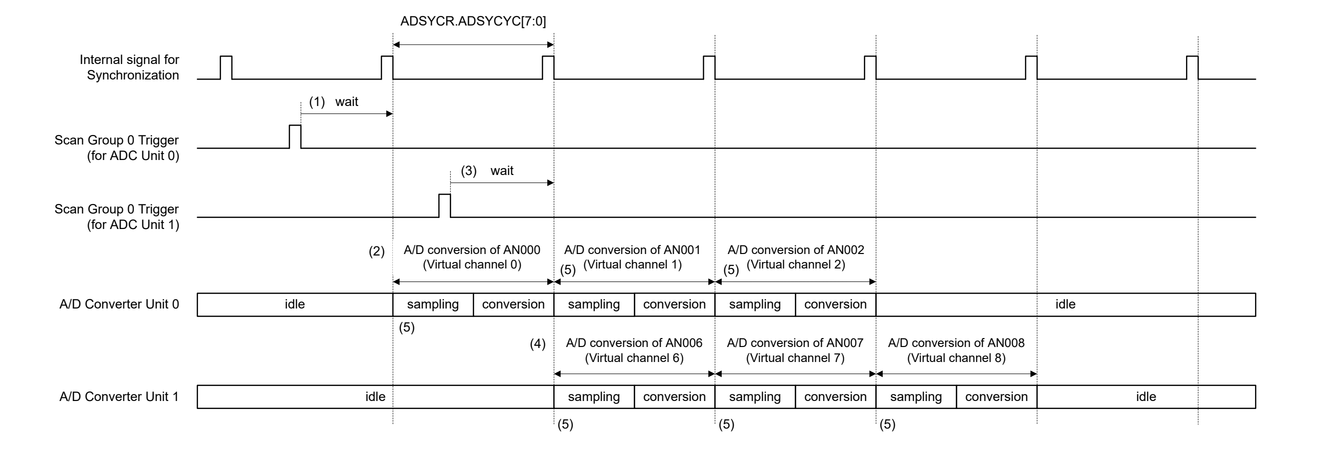


Figure 53.31 Example of synchronous operation in SAR mode – Single scan mode

(2) Synchronous operation using with channel-dedicated sample-and-hold circuit

An example of synchronous operation using with channel-dedicated sample-and-hold circuit is shown in the following. The configuration example is shown in Table 53.44, and the detail of operation is shown in Table 53.45 and Figure 53.32.

Table 53.44 Configuration example of basic synchronous operation (1 of 2)

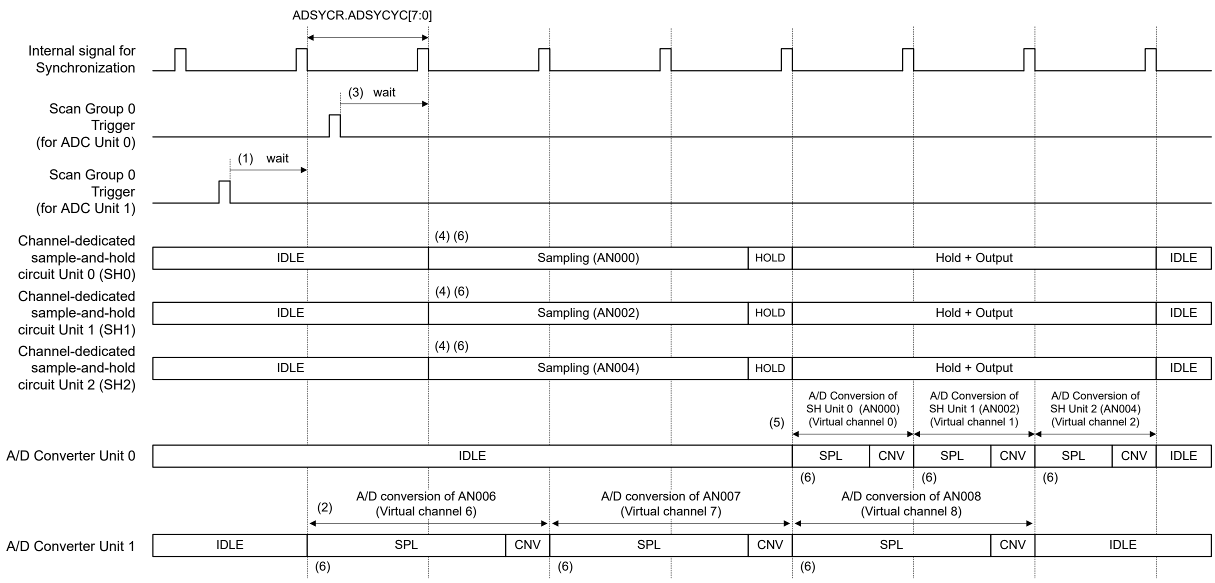
Item	Configuration
A/D converter	● ADC0: Set to SAR mode – Single scan mode ● ADC1: Set to SAR mode – Single scan mode
Channel-dedicated sample-and-hold circuit	● Set SH0 to SH2 to enabled and Single-ended input mode. ● Set SH4 to SH6 to enabled and Single-ended input mode.
Virtual channel	● Virtual channel 0 to 2: Assign AN000, AN002 and AN004, and set to Single-ended input mode. ● Virtual channel 6 to 8: Assign AN006, AN008 and AN010, and set to Single-ended input mode.

Table 53.44 Configuration example of basic synchronous operation (2 of 2)

Item	Configuration
Scan group	[Scan Group 0] ● Assign AN000, AN002 and AN004 (Virtual channel 0 to 2) ● Set to convert with ADC0 [Scan Group 1] ● Assign AN006, AN008 and AN010 (Virtual channel 6 to 8) ● Set to convert with ADC1

Table 53.45 Example of synchronous operation with channel-dedicated sample-and-hold circuit

Step	Detail behavior of example operation
1	When a trigger of scan group 1 is input, a wait is inserted until the A/D conversion synchronization timing.
2	At the timing of synchronous operation period, the trigger input of scan group 1 is accepted, and the scanning operation of scan group 1 (for ADC1) starts.
3	When a trigger of scan group 0 is input, a wait is inserted until the A/D conversion synchronization timing.
4	At the timing of synchronous operation period, the trigger input of scan group 0 is accepted, and the scanning operation of scan group 0 (for ADC0) starts. Channel-dedicated sample-and-hold circuit (SH0 to SH2) samples and holds the analog-channels of AN000/AN002/AN004 at the beginning of the scanning operation in scan group 0.
5	After the holding by channel-dedicated sample-and-hold circuit, A/D converter starts the samplings and the conversions.
6	During synchronous operation, channel-dedicated sample-and-hold circuit and A/D converter starts the sampling operation in accordance with synchronous operation period.



Note: SPL: Sampling state CNV: Conversion state

Figure 53.32 Example of synchronous operation using with channel-dedicated sample-and-hold circuit

53.3.19.2 Restrictions on Synchronous Operation

When synchronous operation is used, observe the following restrictions. If the following restrictions are violated, operations are not guaranteed.

1. Basic restrictions
    - Set the synchronous operation period to a value larger than successive approximation time of ADCm (m = 0, 1).
        - ADSYCR.ADSYCYC[7:0] ≥ ADCNVSTR.CSTm[5:0] + 1
          (m = 0, 1)

- Set so that the sum of the sampling times of the analog channels and successive approximation time of ADCm (m = 0, 1) is an integral multiple of the synchronous operation period.
  - ADSSTRx.SSTy[9:0] + ADCNVSTR.CSTm[5:0] = ADSYCR.ADSYCYC[7:0] × i
    (x = 0 to 7, y = 0 to 15, m = 0, 1, i: Any integer greater than or equal to 1 (i = 1, 2, 3…))
- Set the synchronous operation period to a value larger than successive approximation time at self-calibration.*1
  - ADSYCR.ADSYCYC[7:0] ≥ ADCALSTCR.CALADCST[5:0] + 1
- Set the sampling time and successive approximation time at self-calibration to be integral multiples of the synchronous operation period.*1
  - ADCALSTCR.CALADSST[9:0] + ADCALSTCR.CALADCST[5:0] = ADSYCR.ADSYCYC[7:0] × i
    (i: Any integer greater than or equal to 1 (i = 1, 2, 3…))

2. Restrictions when using channel-dedicated sample-and-hold circuit
   - Set the synchronous operation period to a value greater than the hold mode switching time of channel-dedicated sample-and-hold circuit.
     - ADSYCR.ADSYCYC[7:0] ≥ ADSHSTRm.SHHST[2:0] + 1
       (m = 0, 1)
   - Set the sum of channel-dedicated sample-and-hold circuit sampling time and the hold mode switching time to be an integral multiple of the synchronous operation period.
     - ADSHSTRm.SHSST[7:0] + ADSHSTRm.SHHST[2:0] = ADSYCR.ADSYCYC[7:0] × i
       (m = 0, 1, i: Any integer greater than or equal to 1 (i = 1, 2, 3…))
   - Set the hold mode switching time of channel-dedicated sample-and-hold circuit so that it is the same as successive approximation time of ADCm (m = 0, 1).
     - ADSHSTRm.SHHST[2:0] = ADCNVSTR.CSTm[5:0]
       (m = 0, 1)
   - Set the synchronous operation period to a value greater than the hold mode switching time in channel-dedicated sample-and-hold circuit's self-calibration operation.*1
     - ADSYCR.ADSYCYC[7:0] ≥ ADCALSHCR.CALSHHST[2:0] + 1
   - Set so that the sum of channel-dedicated sample-and-hold circuit sampling time and the hold mode switching time in self-calibration operation is an integral multiple of the synchronous operation period.*1
     - ADCALSHCR.CALSHSST[7:0] + ADCALSHCR.CALSHHST[2:0] = ADSYCR.ADSYCYC[7:0] × i
       (i: Any integer greater than or equal to 1 (i = 1, 2, 3…))
3. Restrictions when using disconnection detection assist function
   - Set Disconnection Detection Assist period so that it is the same as the synchronous operation period.
     - ADSGDCRn.ADNDIS[7:0] = ADSYCR.ADSYCYC[7:0]
       (n = 0 to 8)
4. Restriction when using high accuracy mode
   - Set so that the sum of the sampling times of the analog channels and successive approximation time of ADCm (m = 0, 1) is an even or equal multiple of the synchronous operation period.
     - ADSSTRx.SSTy[9:0] + ADCNVSTR.CSTm[5:0] = ADSYCR.ADSYCYC[7:0] × i
       (x = 0 to 7, y = 0 to 15, m = 0, 1, i: Any even number or equal to 1 (i = 1, 2, 4, 6…))

Note 1. In relation to this restriction, the restrictions on the settings of self-calibration should be satisfied at the same time. For restrictions on the setting of self-calibration, see section 53.3.8.3. Restrictions on Self-calibration.

53.4 A/D Conversion Monitor Signals

This section describes the internal operation of A/D conversion.

The A/D conversion monitor signals are output from pins that are configurable by the function of I/O ports.

The operating timing of A/D conversions can be checked by observing these signals with an oscilloscope.

The following A/D conversion monitor signals are available.

ADSYNC

ADSYNC is a reference signal of the synchronous operation of A/D conversion.

This signal indicates the synchronous timing of A/D conversion. When the synchronous operation function is enabled, the A/D converter operation is executed in synchronization with this signal. When the synchronous operation function is disabled, this signal is ignored. See section 53.3.19. Synchronous Operation for more details about synchronous operation of A/D conversion.

ADnFLAG1 (n = 0,1)

ADnFLAG1 indicates the period of the conversion of A/D converter unit n. While this signal is asserted, the A/D converter is performing the conversion operation.

ADSTn (n = 0,1)

ADSTn indicates the period of the scanning operation of A/D converter unit n. This signal is asserted during the execution of the A/D scanning operation.

Figure 53.33 shows the operation timing of each signal. See section 20, I/O Ports for information on how to select output signals.

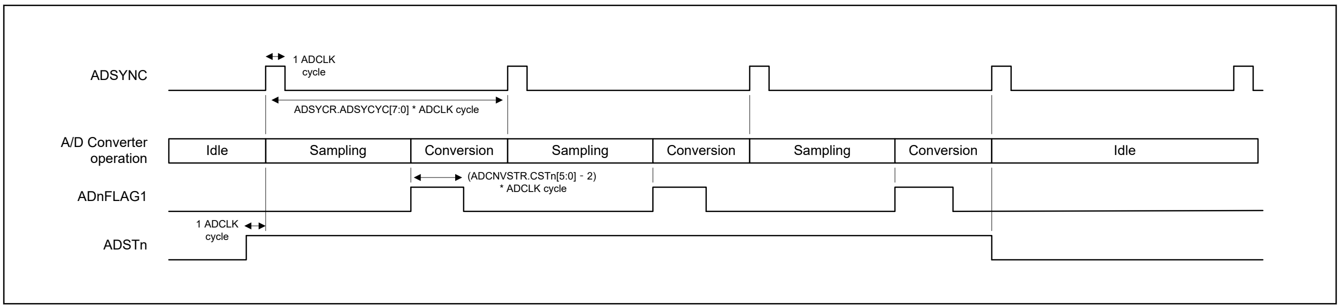


Figure 53.33 A/D conversion monitor signals

53.5 A/D Conversion Data

This section describes the internal processing for A/D conversion data. For details about the operation of A/D conversion, see section 53.3. Operation.

53.5.1 Internal Data Processing Flow

Figure 53.34 shows the internal processing-flow of A/D conversion data.

The A/D conversion data output from the A/D converter is temporarily stored in the data buffer. And then, various data processing is performed based on the register setting. If the function that corresponds to each data processing is not used, its data processing is skipped.

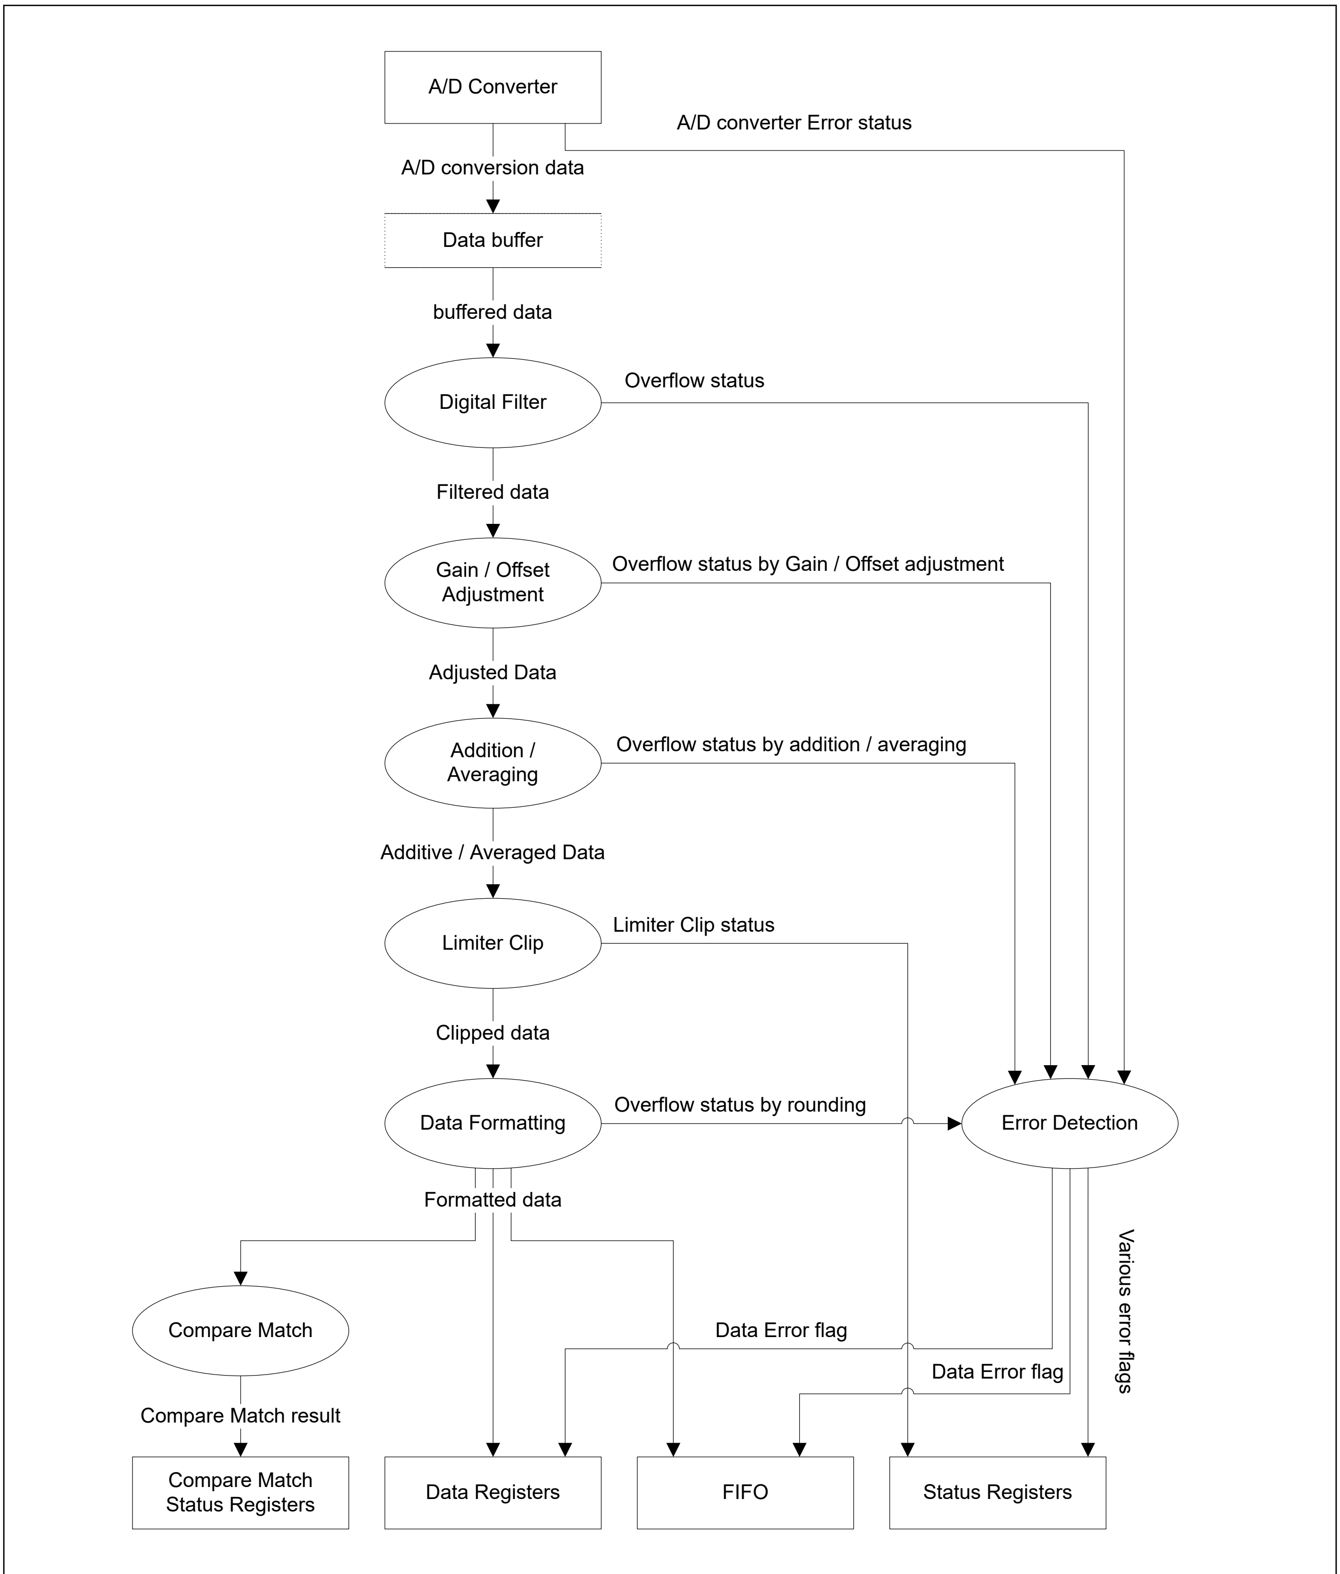

Figure 53.34 Internal data flow diagram of A/D conversion data

53.5.2 Digital Filter Function

ADC16H has 4 digital filters per 1 unit of A/D converter. High-precision A/D conversion results can be obtained by using a digital filter. The digital filter function must be used in Oversampling mode or Hybrid mode. The digital filter function in SAR mode is prohibited.

53.5.2.1 Configuration and Characteristics

The digital filter consists of a FIR type filter with 22 taps. The digital filter is set by ADDOPCRAn.DFSEL[2:0] (n = 0 to 32) and ADDFSRm (m = 0, 1) registers. The configuration of the digital filter is shown in Figure 53.35.

The type of the digital filter (FIR filter) can be selected from the following. For the characteristics of the digital filters, see section 62, Electrical Characteristics.

[List of digital filter characteristics]

- Sinc filter

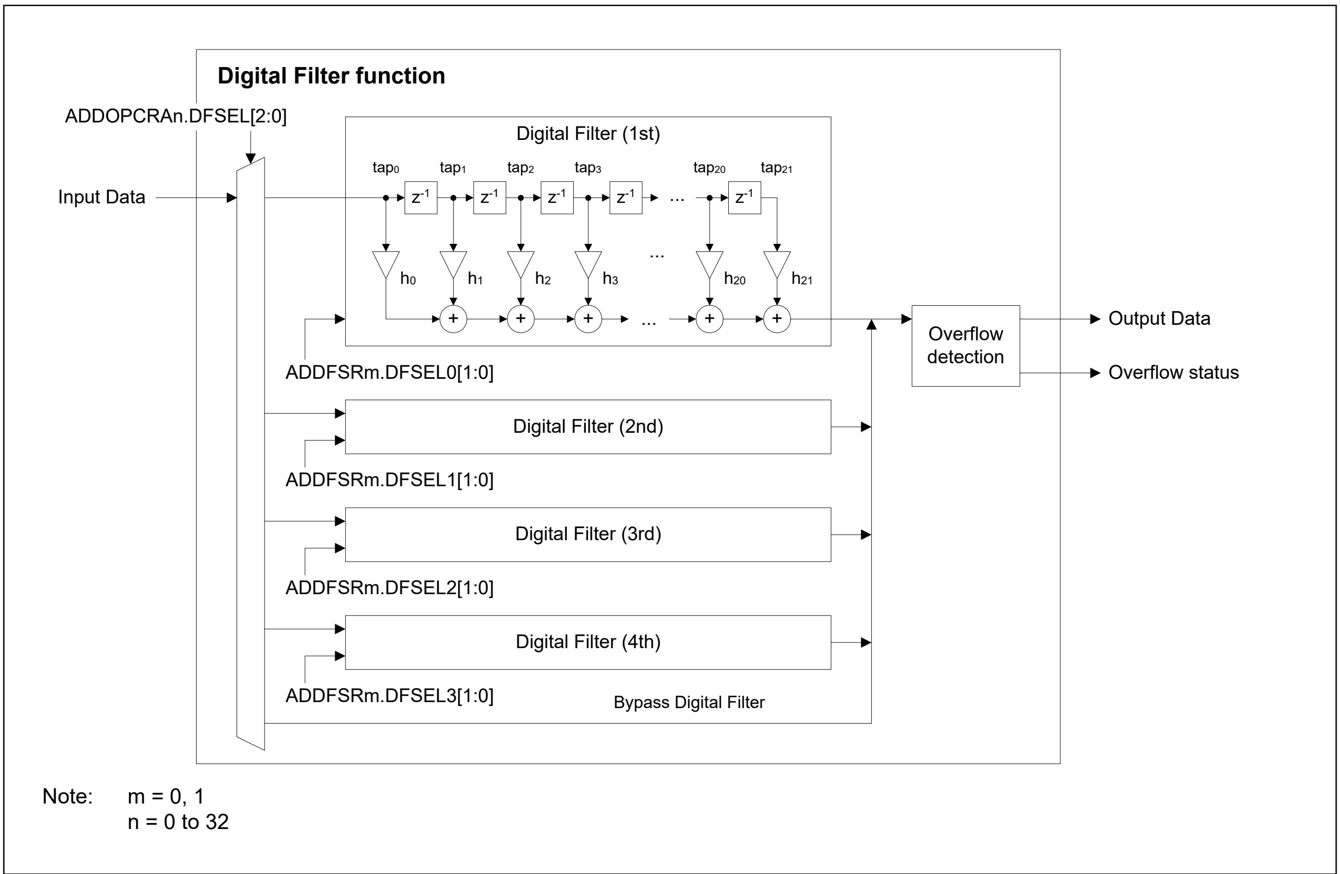

Figure 53.35 Block diagram of digital filter

53.5.2.2 Operation of Digital Filter Function

When the digital filter function is enabled, A/D conversion data is sequentially input to the digital filter. When all the taps in the digital filter are filled with data, the calculation result is output and sent to the next data processing.

The operation of the digital filters in Oversampling mode and Hybrid mode is shown in the followings.

(1) Digital filter operation in Oversampling mode

In Oversampling mode, oversampling (A/D conversion) is performed continuously for one analog channel. Each time oversampling is performed, A/D conversion data is sequentially input to the digital filter. When all the taps in the digital filter are filled with data, the calculation result is output and sent to the next data processing.

In Oversampling mode, the data of the taps in the digital filter is discarded when the A/D conversion data is output to the next data processing. However, when A/D-converted value addition/averaging function is used, the data of taps in the digital filter is kept until the data required to calculate the addition value or average value of the A/D converted value is collected. When the A/D-converted value addition/averaging value is calculated, the tap data in the digital filter is discarded.

(2) Digital filter operation in Hybrid mode

Hybrid mode can process oversampled data (A/D converted data) of up to four analog channels in parallel by using several digital filter circuits at the same time. Each time oversampling is performed, A/D conversion data is sequentially input to the digital filter. When all the taps in the digital filter are filled with data, the calculation result is output and sent to the next data processing.

In Hybrid mode – Single scan mode, taps in the digital filter are discarded at the end of scanning operation.

In Hybrid mode – Continuous scan mode, the data of the taps in the digital filter continues to be updated as long as the continuous scanning operation is continued. Therefore, after the data is filled in all taps in the digital filter, a new calculation result is output for each oversampling. When scanning operation is aborted due to a forced stop of A/D conversion, the data of taps in the filter is discarded.

The operation of the digital filter in Hybrid mode – Background continuous scan mode is the same as in Hybrid mode – Continuous scan mode. During the background continuous scanning operation, the digital filters and other data processing continue to take place in the background. When scanning operation is aborted due to a forced stop of A/D conversion, the data of taps in the filter is discarded.

53.5.3 Calibration and Adjustment

In this process, the following processing is performed for the results output from the A/D converter or for the data output from Digital Filter.

1. Calibrate Gain Error and Offset Error
2. Adjust User's Gain
3. Adjust User's Offset

For details on each process, refer to each item.

53.5.3.1 Gain Error and Offset Error Calibration

This process calibrates the A/D converter's Gain Error and Offset Error due to chip-by-chip characteristic variations.

Calibration for the A/D converter's Gain Error and Offset Error is performed by calculation based on error data measured inside the ADC16H by self-calibration operation.

Using gain error and offset error calibration when the input to the A/D converter is near the VREFH0 (unit 0) and VREFH (unit 1) upper limit or VREFL0 (unit 0) and VREFL (unit 1) lower limit, an overflow of A/D conversion data may occur.

53.5.3.2 User's Gain Adjustment

User's Gain adjusting function multiplies the A/D conversion data by an arbitrary coefficient value.

The coefficient value of User's Gain is set in ADUGTRn.UGAIN[15:0] (n = 0 to 7). User's Gain can be set for each virtual channel. The User's Gain Table to be used is selected in ADDOPCRAm.GAINSEL[3:0] (m = 0 to 32). The coefficient value of User's Gain is the sum of the gain corresponding to the bits that are set to 1 in ADUGTRn.UGAIN[15:0]. Table 53.46 shows the gain factors corresponding to the respective bit in ADUGTRn.UGAIN[15:0]. An example of setting User's Gain is shown in Table 53.47. Figure 53.36 and Figure 53.37 show the relationship between before adjustment (input) and after adjustment (output) to the A/D conversion result when User's Gain adjustment function is used.

The overflow of A/D conversion data may occur when User's Gain adjusting function is used.

Table 53.46 List of gains corresponding to each gain setting bit in User's Gain setting table register

UGAIN[15:8]	Gain value	UGAIN[7:0]	Gain value
b15	2^{1} = 2.0	b7	2^{-7} = 7.813E-03
b14	2^{0} = 1.0	b6	2^{-8} = 3.906E-03
b13	2^{-1} = 0.5	b5	2^{-9} = 1.953E-03
b12	2^{-2} = 0.25	b4	2^{-10} = 9.766E-04
b11	2^{-3} = 0.125	b3	2^{-11} = 4.883E-04
b10	2^{-4} = 0.0625	b2	2^{-12} = 2.441E-04
b9	2^{-5} = 0.03125	b1	2^{-13} = 1.221E-04
b8	2^{-6} = 1.563E-02	b0	2^{-14} = 6.104E-04

Table 53.47 Example of User's Gain Settings

ADUGTRn.UGAIN[15:0] (n = 0 to 7)	Gain value
0x0000	x0.0000

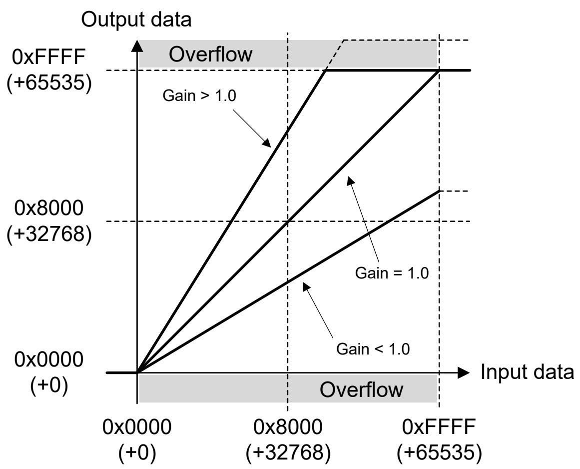

Figure 53.36 User's Gain Adjustment (16-bit data length format and Unsigned data format)

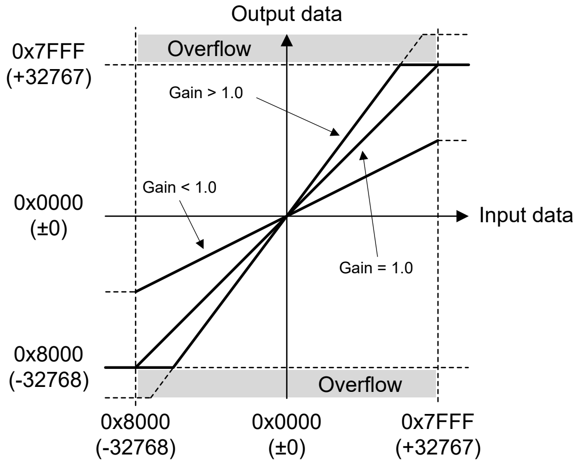

Figure 53.37 User's Gain Adjustment (16-bit data length format and Signed data format)

53.5.3.3 User's Offset Adjustment

User's Offset adjustment function adds or subtracts any constant value to or from the A/D conversion data.

The constant value of User's Offset is set in ADUOFTRn.UOFSET[15:0] (n = 0 to 7). User's Offset can be set for each virtual channel. User's Offset Table to be used is selected in ADDOPCRAm.OFSETSEL[3:0] (m = 0 to 32). Table 53.48 shows the relationship between the register setting value of User's Offset and the offset value. Figure 53.38 and Figure 53.39 show the relationship between before adjustment (input) and after adjustment (output) to the A/D conversion result when User's Offset adjustment function is used.

When User's Offset adjusting function is used, overflow of A/D conversion data may occur.

Table 53.48 Relationship between User's Offset register value and offset value

ADUOFTRn.UOFSET[15:0] (n = 0 to 7)	Offset value (16bit data length format)

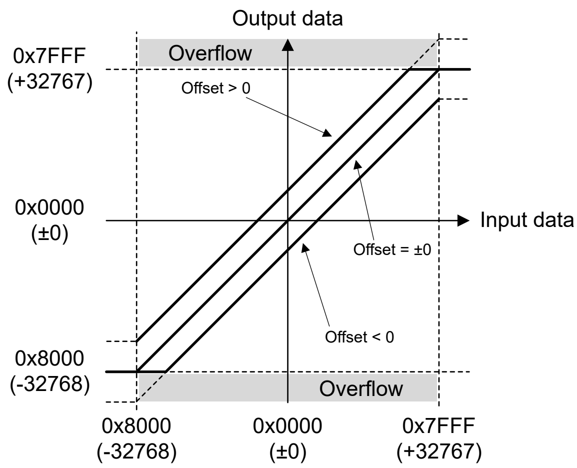

Figure 53.39 User's Offset Adjustment (16-bit data length format and Signed data format)

53.5.4 A/D-converted Value Addition/Averaging Function

A/D-converted value addition/averaging function is a function to calculate the sum value or average value of the result of A/D conversion of analog channels continuously for the specified number of times. A/D-converted value addition/averaging function can be configured for each virtual channel in ADDOPCRBn.AVEMD[1:0] bits and ADDOPCRBn.ADC[3:0] bits (n = 0 to 32).

A/D-converted value addition/averaging function inputs the output of the previous data processing. When the specified number of times of data is input, the added value or average value is calculated, and the result is output to the next data processing. When A/D-converted value addition/averaging function is used, the A/D converter repeats the A/D conversion until the data is collected for the number of times specified by the ADDOPCRBn.ADC[3:0] (n = 0 to 32) bits. One calculation result (total value or average value) is output every time the specified number of times of data is input to A/D-converted value addition/averaging. Figure 53.40 shows the operation of A/D-converted value addition/averaging function in SAR mode or Oversampling mode. Figure 53.41 shows the operation of A/D-converted value addition/averaging function in Hybrid mode.

When the A/D-converted value addition/averaging function is used, overflow of the A/D conversion data may occur. However, A/D conversion overflow may not be detected under certain conditions. For more information on A/D conversion overflow, see section 53.7.2. A/D Conversion Overflow.

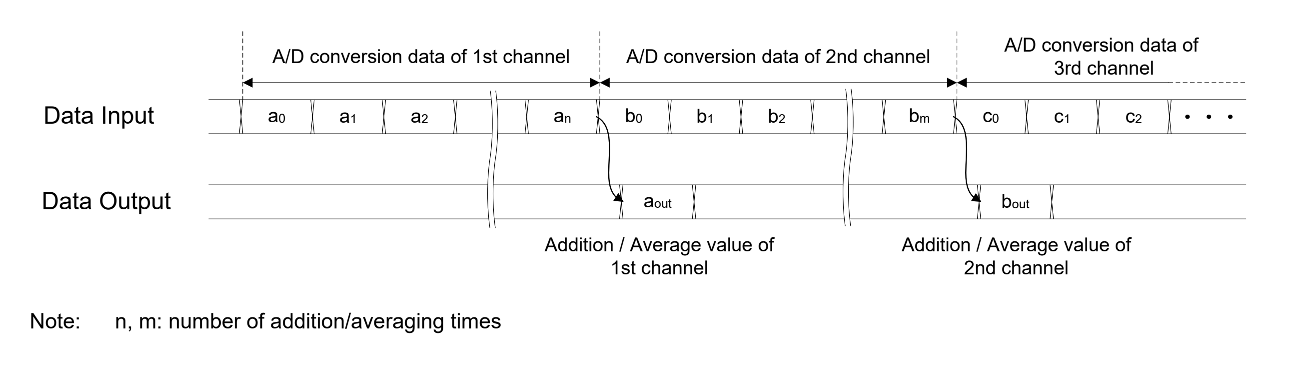

Figure 53.40 Example operation of A/D-converted value addition/averaging function (SAR mode or Oversampling mode)

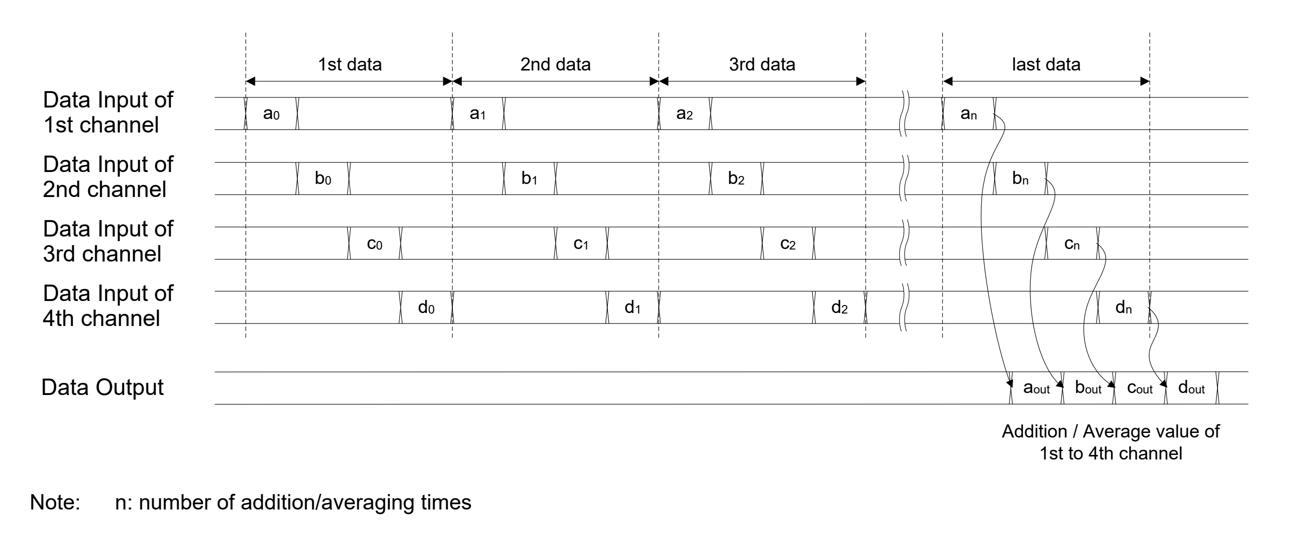

Figure 53.41 Example operation of A/D-converted value addition/averaging function (Hybrid mode)

53.5.5 Limiter Clip Function

Limiter Clip Function is the function to set the upper and lower limits of A/D conversion data. When the A/D conversion data exceeds the specified upper limit value, it is clipped to the upper limit value. If the A/D conversion data falls below the specified lower limit, it is clipped to the lower limit value. Figure 53.42 shows an example of Limiter Clip Function operation.

The upper and lower limits of Limiter Clip Function can be specified in ADLIMTRn.LIMU[15:0] (n = 0 to 7) and ADLIMTRn.LIML[15:0] (n = 0 to 7). The Limiter Clip Function can be selected use or not (enable or disable) for each virtual channel in ADDOPCRCm.LIMTBLS[3:0] (m = 0 to 32).

Limiter Clip Function is processed by 16-bit length. When 14-/12-/10-bit is selected as the data length of the A/D conversion data (when ADDOPCRCm.ADPRC[1:0] = 01b, 10b, or 11b (m = 0 to 32)), the rounding to the specified data length is performed after the clipping by Limiter Clip Function. For details, see section 53.5.6. Data Formatting Process.

The upper and lower limits of the limiter clip are treated as signed or unsigned depending on the setting of the sign selection bit (ADDOPCRCm.SIGNSEL (m = 0 to 32)) in the A/D conversion data.

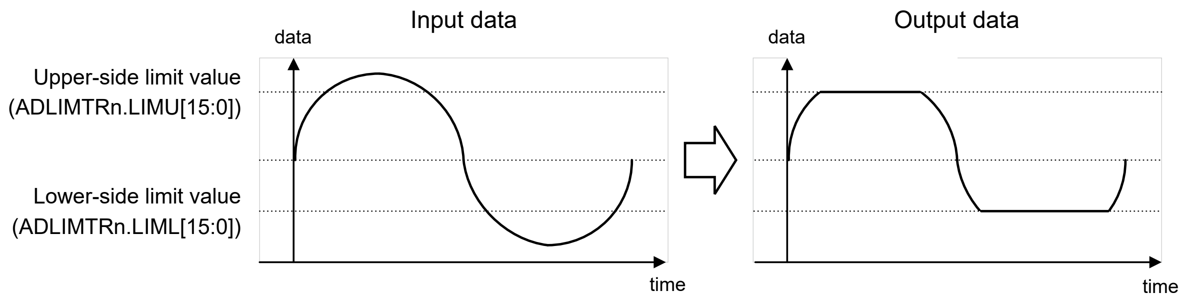
For Limiter Clip Function, the upper limit value should be greater than the lower limit value (ADLIMTRn.LIMU[15:0] > ADLIMTRn.LIML[15:0] (n = 0 to 7)). If the upper limit value is less than or equal to the lower limit value, the A/D conversion data always becomes 0x0000.

If a limiter clip occurs, the flags are set in the following status registers:

- ADLIMGRSR: The flag is set to the bit corresponding to the scan group where the limiter clip occurred.

- ADLIMCHSR0: If a limiter clip occurs during A/D conversion of an analog input channel, the flag is set to the corresponding bit.
- ADLIMEXSR: If a limiter clip occurs during A/D conversion of Extended Analog Function, the flag is set to the corresponding bit.

To clear the flags in the status registers, write 1 to the corresponding bit in ADLIMGRSCR, ADLIMCHSCR0, ADLIMEXSCR.



Note: n = 0 to 7

Figure 53.42 Example of limiter clip function operation

53.5.6 Data Formatting Process

In this process, the following formatting is performed on the A/D conversion data.

- Signed/Unsigned data processing
- Data Rounding process

The data formatted in this process is stored to DATA[15:0] bits of the A/D data register (ADDRi (i = 0 to 22)), the extended A/D data register (ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)), and the FIFO data register (ADFIFODRk (k = 0 to 8)) as the result of A/D conversion.

For details on the data format, see section 53.5.7. Data Format.

53.5.6.1 Signed/Unsigned Data Process

The A/D conversion data is formatted into Signed or Unsigned data format based on the setting of the ADDOPCRCn.SIGNSEL (n = 0 to 32) bits. Select the signed data format (SIGNSEL = 0) for Differential input mode and the unsigned format (SIGNSEL = 1) for Single-ended input mode.

53.5.6.2 Data Rounding Process

The A/D conversion data is processed as a fraction of the data length based on the setting of the ADDOPCRCn.ADPRC[1:0] (n = 0 to 32) bits. If 14-/12-/10-bit data format is selected (ADPRC[1:0] = 01b, 10b, 11b), the lower bits of the A/D conversion data will be rounding. (If the most significant bit of the digit to be cut off is 0, the digit is rounded down; if it is 1, the digit is rounded up.) If the 16-bit data format is selected (ADPRC[1:0] = 00b), the A/D conversion data is not rounded.

53.5.7 Data Format

This subsection describes the data format of the A/D conversion result stored to DATA[15:0] bits in A/D data register (ADDRi (i = 0 to 22)), Extended A/D data register (ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)), and FIFO data register (ADFIFODRk (k = 0 to 8)).

Note: The data format does not guarantee the resolution and accuracy of the A/D converter itself. See section 62, Electrical Characteristics for the characteristics of the A/D converter.

(1) 16-bits data length format

Table 53.49 shows the alignment of A/D conversion data on 16-bit data format. Figure 53.43 and Figure 53.44 show the data range for 16-bit data format.

For 16-bit data length signed data format, the differential input voltage is A/D-converted in the range of 0x8000 to 0x7FFF. This range corresponds to the voltage range of -VREFH0 to +VREFH0 for ADC0 or the voltage range of -VREFH to +VREFH for ADC1. In 16-bit data length unsigned data format, the single-ended input voltage is A/D-converted in the range of 0x0000 to 0xFFFF. This range corresponds to the voltage range of VREFL0 to VREFH0 for ADC0 or the voltage range of VREFL to VREFH for ADC1.

Table 53.49 Alignment of A/D conversion result data (16-bit data length)

Bit position:	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Note: This figure illustrates the case of the ideal A/D conversion characteristics.

Figure 53.44 Data range of A/D conversion result (16-bit data length, Unsigned data, Single-ended input)

(2) 14-bits data length format

Table 53.50 shows the alignment of A/D conversion data on 14-bit data format. Figure 53.45 and Figure 53.46 show the data range for 14-bit data format.

For 14-bit data length signed data format, the differential input voltage is A/D-converted in the range of 0x2000 to 0x1FFF as the range of -VREFH0 to +VREFH0 for ADC0 or the range of -VREFH to +VREFH for ADC1. In 14-bit data length unsigned data format, the single-ended input voltage is A/D-converted in the range of 0x0000 to 0x3FFF as the range of VREFL0 to VREFH0 for ADC0 or the range of VREFL to VREFH for ADC1.

For 14-bit data length, the upper 2 bits (bit15 to bit14) are always 0.

Table 53.50 Alignment of A/D conversion result data (14-bit data length)

Bit position:	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Note: This figure illustrates the case of the ideal A/D conversion characteristics.

Figure 53.46 Data range of A/D conversion result (14-bit data length, Unsigned data, Single-ended input)

(3) 12-bits data length format

Table 53.51 shows the alignment of A/D conversion data on 12-bit data format. Figure 53.47 and Figure 53.48 show the data range for 12-bit data format.

For 12-bit data length signed data format, the differential input voltage is A/D-converted in the range of 0x0800 to 0x07FF as the range of -VREFH0 to +VREFH0 for ADC0 or the range of -VREFH to +VREFH for ADC1. In 12-bit data length unsigned data format, the single-ended input voltage is A/D-converted in the range of 0x0000 to 0x0FFF as the range of VREFL0 to VREFH0 for ADC0 or the range of VREFL to VREFH for ADC1.

For 12-bit data length, the upper 4 bits (bit15 to bit12) are always 0.

Table 53.51 Alignment of A/D conversion result data (12-bit data length)

Bit position:	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Note: This figure illustrates the case of the ideal A/D conversion characteristics.

Figure 53.48 Data range of A/D conversion result (12-bit data length, Unsigned data, Single-ended input)

(4) 10-bits data length format

Table 53.52 shows the alignment of A/D conversion data on 10-bit data format. Figure 53.49 and Figure 53.50 show the data range for 10-bit data format.

For 10-bit data length signed data format, the differential input voltage is A/D-converted in the range of 0x0200 to 0x01FF as the range of -VREFH0 to +VREFH0 for ADC0 or the range of -VREFH to +VREFH for ADC1. In 10-bit data length unsigned data format, the single-ended input voltage is A/D-converted in the range of 0x0000 to 0x03FF as the range of VREFL0 to VREFH0 for ADC0 or the range of VREFL to VREFH for ADC1.

For 10-bit data length, the upper 6 bits (bit15 to bit10) are always 0.

Table 53.52 Alignment of A/D conversion result data (10-bit data length)

Bit position:	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Figure 53.50 Data range of A/D conversion result (10-bit data length, Unsigned data, Single-ended input)

53.5.8 Compare Match Function

53.5.8.1 Compare Match

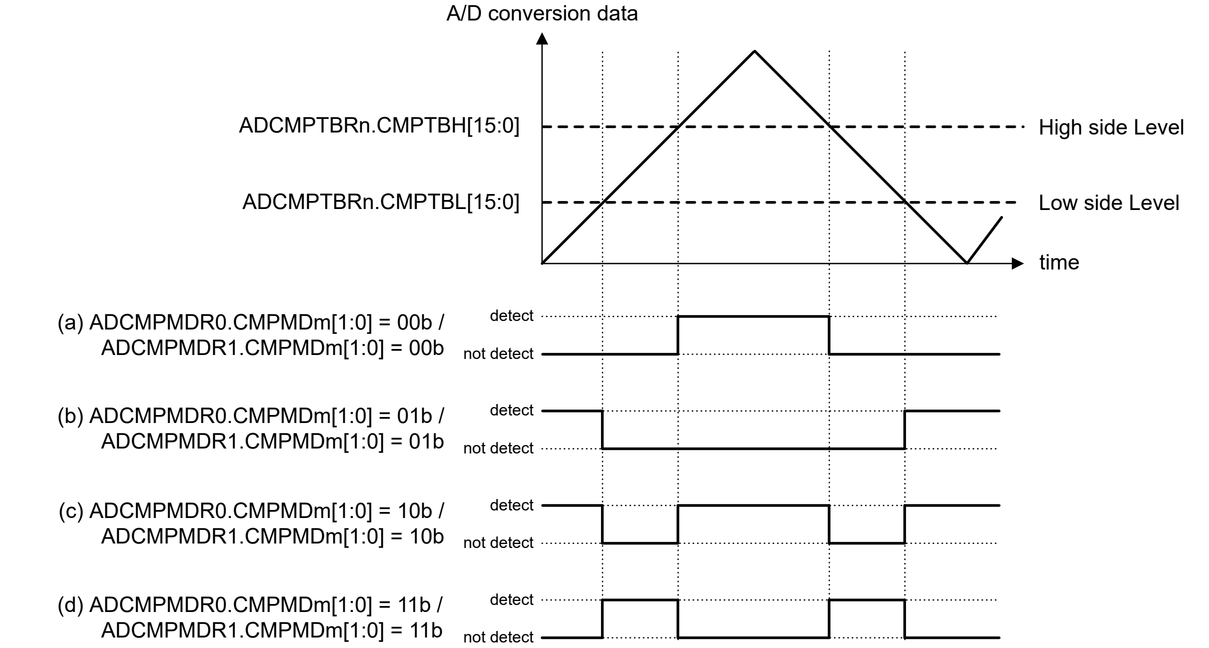
The compare match function compares the A/D conversion result with the reference value set in the compare match table register (ADCMPTBRn (n = 0 to 7)). The compare match function compares the A/D conversion data after the data formatting process.

(1) Compare match mode

The comparison mode for detecting the compare match is selected in ADCMPMDRm.CMPMDn[1:0] (m = 0, 1. n = 0 to 7). The comparison mode can be selected from the following four modes.

1. Compare match is detected when the A/D conversion value is greater than or equal to the specified upper limit value.
2. Compare match is detected when the A/D conversion value is less than or equal to the specified lower limit.
3. Compare match is detected when the A/D conversion value is greater than or equal to the specified upper limit value, or less than or equal to the lower limit value.
4. Compare match is detected when the A/D conversion value is within the specified upper and lower limit values (when the value is lower than or equal to the upper limit value and greater than or equal to the lower limit value).

Figure 53.51 shows an example of compare match detection.



Note: n = 0 to 7
m = 0 to 3 (ADCMPMDR0), m = 4 to 7 (ADCMPMDR1)

Figure 53.51 Compare match detection

(2) Compare match detection

To use the compare match function, enable the compare match table used in ADCMPENR register, and select the compare match table in ADDOPCRBn.CMPTBLEm (n = 0 to 32, m = 0 to 7) for each virtual channel.

When A/D conversion is performed on a virtual channel for which the compare match function is enabled, a compare match is judged based on the A/D conversion result of its channel.

When a compare match is detected, the flags are set in the following status registers:

- ADCMPTBSR: The flag is set to the bit corresponding to the compare match table used when a compare match is detected.
- ADCMPCHSR0: The flag is set to the bit corresponding to the analog input channel that detected the compare match.
- ADCMPEXSR: The flag is set to the bit corresponding to Extended Analog Function where a compare match is detected.

To clear the flag of each status register, write 1 to the corresponding bit of ADCMPTBSCR, ADCMPCHSCR0, ADCMPEXSCR.

If compare match interrupt is enabled in ADCMPINTCR register and a compare match using compare match table 0 to 3 is detected, the corresponding interrupt is generated.

53.5.8.2 Composite Compare Match

The composite compare match function generates interrupts and ELC events by combining the comparison results of multiple compare match tables. The combination and condition of the compare match table for the composite compare match function is set in ADCCMPCR0 or ADCCMPCR1.

Composite compare match interrupt is generated when a compare match is detected that matches the specified condition.

Figure 53.52 shows the relationship between composite compare match and compare match function. Table 53.53 shows the relationship between the composite compare match function and the control register.

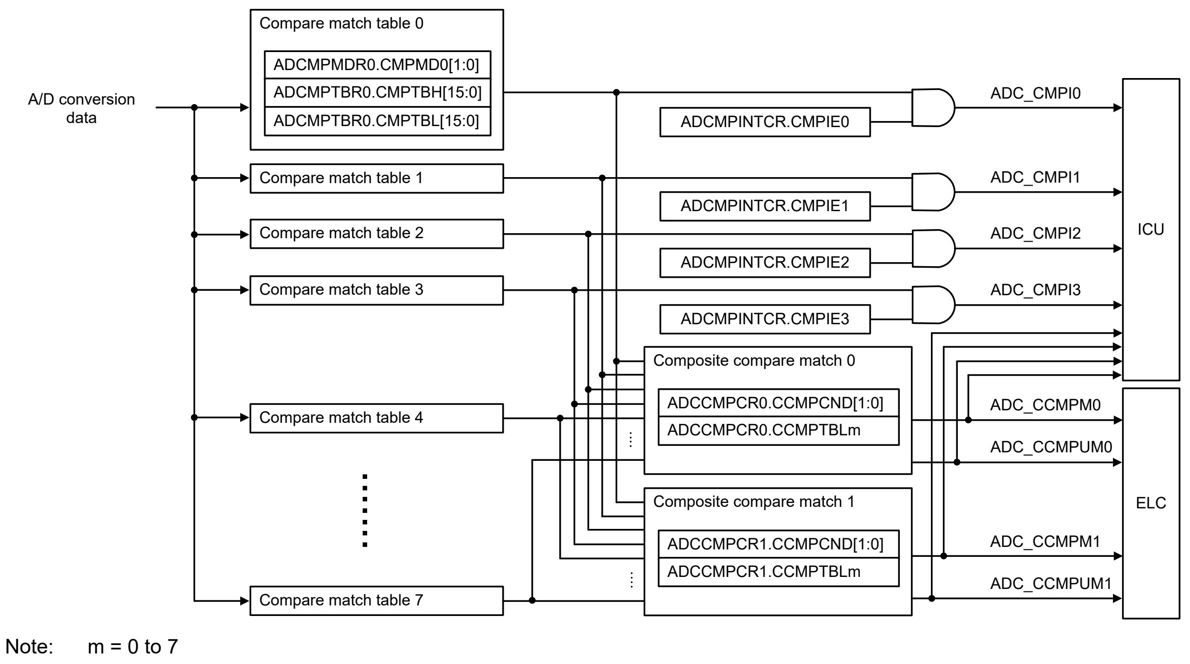


Figure 53.52 Relationship between composite compare match function and compare match function

Table 53.53 Composite compare match and control register

Function name	Enable composite compare function	Composite compare mode selection	Composite compare match interrupt
Composite compare match 0	ADCCMPCR0.CCMPTBLm (m = 0 to 7)	ADCCMPCR0.CCMPCND[1:0]	ADC_CCMPM0 ADC_CCMPUM0
Composite compare match 1	ADCCMPCR1.CCMPTBLm (m = 0 to 7)	ADCCMPCR1.CCMPCND[1:0]	ADC_CCMPM1 ADC_CCMPUM1

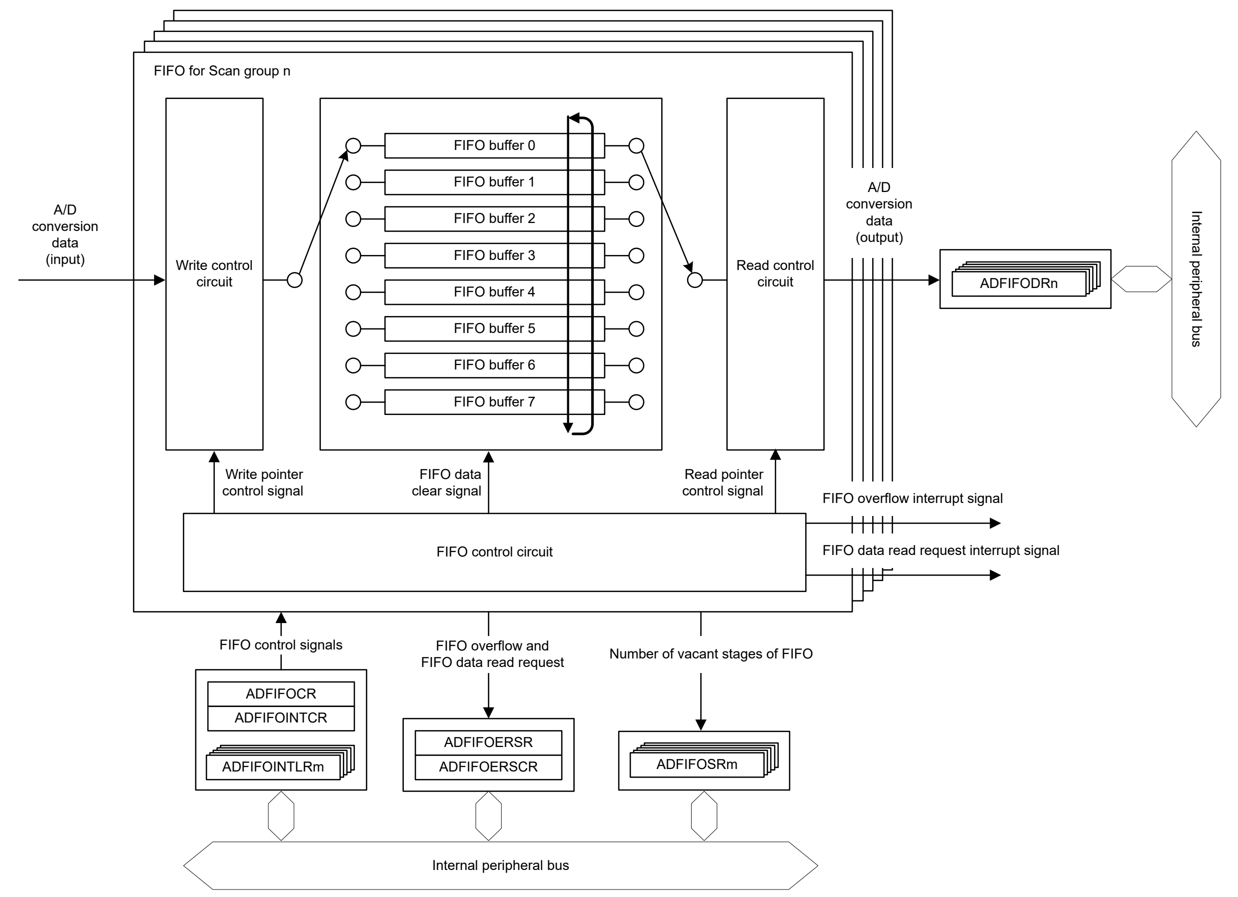
53.5.9 Data Registers

A/D data register (ADDRi (i = 0 to 22)) and Extended A/D data register (ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)) store the A/D conversion data of the analog channels corresponding to each register. These registers are updated (overwritten) when A/D conversion for the analog channel corresponding to each register is completed.

53.5.10 FIFO Function

FIFO consists of 8-stage registers and can hold up to 8 A/D conversion data. One FIFO is implemented for each scan group. The A/D conversion data stored in FIFO can be read from ADFIFODRn register (n = 0 to 8).

FIFO acts as a ring buffer. Writing and reading A/D conversion data to and from FIFO is controlled by the write pointer and read pointer inside FIFO. The block diagram of FIFO is shown in Figure 53.53.



Note: m = 0 to 4, n = 0 to 8

Figure 53.53 The block diagram of FIFO

53.5.10.1 Operation When Writing A/D Conversion Data to FIFO

The A/D conversion data is stored sequentially to the register pointed by the write pointer. When A/D conversion data is written to a register in FIFO, the write pointer is switched to the next register. At this time, the number of vacant stages (ADFIFOSRm.FIFOSTn[3:0] (m = 0 to 4, n = 0 to 8) bits) is decreased 1.

A FIFO overflow occurs when FIFO is full (ADFIFOSRm.FIFOSTn[3:0] bits are 0000b) and an additional A/D conversion data is written to FIFO. When a FIFO overflow occurs, the A/D conversion data is not written and the write pointer does not change.

53.5.10.2 Operation When Reading A/D Conversion Data from FIFO

When A/D conversion data is read from FIFO data register (ADFIFODRn (n = 0 to 8)), the data in the register pointed to by FIFO read pointer is read. When A/D conversion data is read from FIFO, the read pointer is switched to the next register. At this time, the number of vacant stages (ADFIFOSRm.FIFOSTn[3:0] (m = 0 to 4, n = 0 to 8) bits) is increased 1.

If FIFO is empty (ADFIFOSRm.FIFOSTn[3:0] bits are 1111b) and the reading from the FIFO is occurred, an invalid data is read. (If FIFO is read after a reset or after FIFO data is cleared, 0x00000000 is read. If data had been written to register in FIFO, the previous data is read.) The read pointer does not change in the read operation when FIFO is empty.

Read A/D conversion data from FIFO data register (ADFIFODRn) by 32-bit access. For details, see section 53.5.10.5. Usage Notes on FIFO.

53.5.10.3 FIFO Data Read Request and Overflow

When A/D conversion data is written to or read from FIFO, the write pointer or read pointer changes. Depending on the state of the write pointer and the read pointer, the number of vacant stages in FIFO is reflected in ADFIFOSRm.FIFOSTn[3:0] (m = 0 to 4, n = 0 to 8).

FIFO data read request flag is set (ADFIFOERSR.FIFOFLFn = 1 (n = 0 to 8)) when the number of vacant stages become less than or equal to the value specified in ADFIFOINTLRm.FIFOILVn[3:0] (m = 0 to 4, n = 0 to 8) bit. If a FIFO data read request occurs, FIFO data read request interrupt can be generated.

When FIFO is full (ADFIFOSRm.FIFOSTn[3:0] bits are 0000b) and additional A/D conversion data are written, FIFO overflow flag is set (ADFIFOERSR.FIFOOVFn = 1 (n = 0 to 8)). If a FIFO overflow occurs, FIFO data overflow interrupt can be generated.

53.5.10.4 Clearing FIFO Data

The data stored in the registers in FIFO can be cleared by writing to ADFIFODCR.FIFODCn (n = 0 to 8) bit. When writing 1 to ADFIFODCR.FIFODCn bit, the registers, read pointer, and write pointer in FIFO of the scan group corresponding to FIFODCn bit are initialized. Clearing FIFO data should be performed while A/D conversion is not being performed.

53.5.10.5 Usage Notes on FIFO

- Reading
  Reading the A/D conversion data from the FIFO data register (ADFIFODRn (n = 0 to 8)) should be performed with a single 32-bit access. Access to each bit of ADFIFODRn, 16-bit read access, and 8-bit read access are prohibited. If these restrictions are violated, the operation of FIFO is not guaranteed as the read pointer may not change normally, and correct data may not be able to read. Alternatively, the read pointer may advance unintentionally, and A/D conversion data may be lost.
- Rescanning
  When rescanning from the first channel by resuming the scan in group priority operation (ADGSPCR.PGSm = 1 (m = 0, 1), ADGSPCR.LGRPSm = 0 (m = 0, 1)), enable FIFO clear (ADFIFOCR.FIFOCEn = 1 (n = 0 to 8)) for scan groups other than the highest priority.
- Clearing
  When FIFO clear is enabled (ADFIFOCR.FIFOCEn = 1 (n = 0 to 8)), all data remaining in the FIFO at the start of scan or restart of a scan is cleared. Control the scan start timing so that the FIFO is not cleared before the necessary FIFO data is read.
  Note that the clearing FIFO data function by starting/resuming scanning is prohibited for other than SAR mode and group priority operation.

53.5.11 Data Output Decimation Function

In Oversampling mode — One-channel continuous scan mode, the output of conversion data can be decimated. The conversion data output interval can be set for each unit using ADDECCR.DCIMm (m = 0, 1). When conversion data output is decimated using this function, the interrupt output is decimated as well.

When this function is used in addition/average mode, the conversion data output interval is the period when the number of times the conversion data has been added or averaged and then subtracted by this function. In addition/average mode, the data to be subtracted by this function is the data before addition/averaging.

Figure 53.54 and Figure 53.55 show examples of operation when data is output every 4 times.

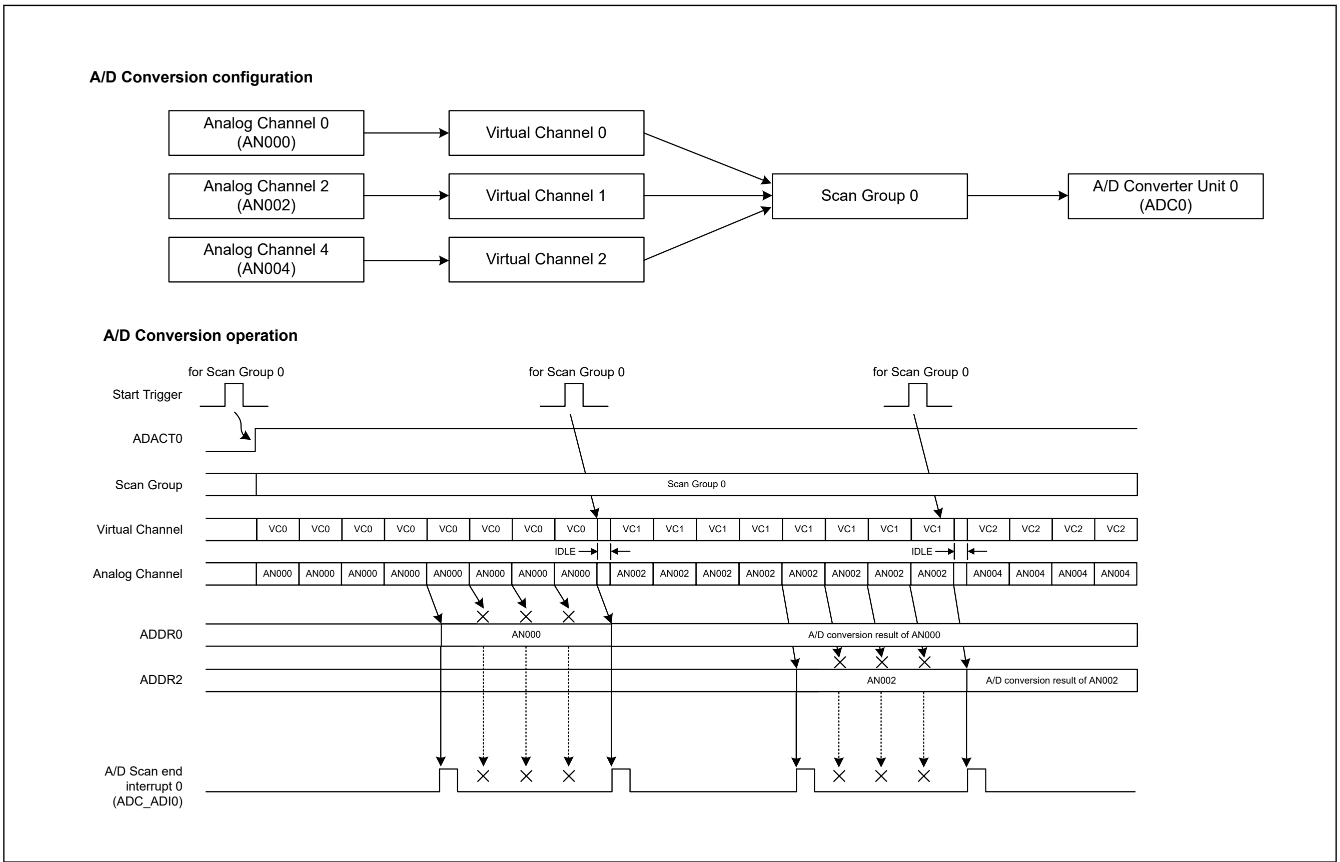


Figure 53.54 Example of data output decimation function (output every 4 times)

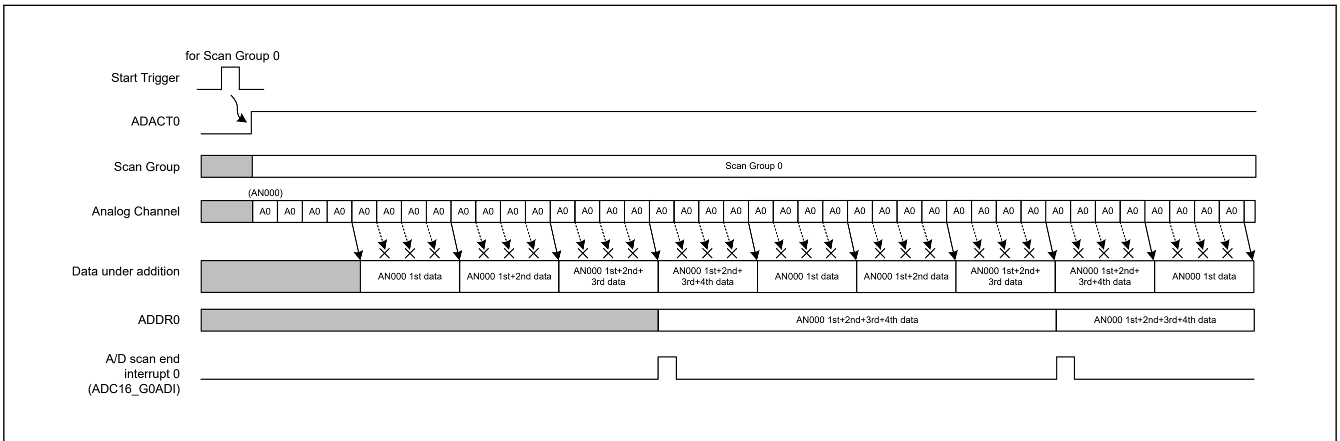

Figure 53.55 Example of data output decimation function (output every 4 times) when addition function is enabled (addition count is 4 times)

53.5.12 A/D Conversion Data Error Detection

The ERR bit in A/D data register (ADDRi (i = 0 to 22)), Extended A/D data register (ADEXDRj (j = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22)), and FIFO data register (ADFIFODRk (k = 0 to 8)) is a flag that indicates an A/D conversion data error. An A/D conversion data error indicates that an invalid A/D conversion data has been detected. If an A/D conversion data error occurs (ERR = 1), the A/D conversion data cannot be guaranteed.

A/D conversion data error is generated by the following factors.

- A/D converter error
- A/D conversion overflow

For more details about these errors, see section 53.7. Error Detection.

53.6 Start and Stop Control of A/D Conversion

53.6.1 Software Trigger

A/D conversion of scan group n can be started by writing 1 to ADSTRn.ADST (n = 0 to 8) bit or ADSYSTR.ADSYSTn (n = 0 to 8) bit.

ADSTRn.ADST bit is used to start A/D conversion individually for each scan group. ADSYSTR.ADSYSTn bit is used to start A/D conversion on the scan group assigned to ADC0 or ADC1 at the same time.

Except when group priority operation, writing to ADSTRn.ADST bit or ADSYSTR.ADSYSTn bit for the scan groups, which use A/D converter that is in A/D conversion, is ignored.

53.6.2 Peripheral Module Triggers

A/D conversion can be started by triggers from the peripheral modules listed in the followings.

- ELC Trigger
- GPT Trigger
- External Trigger (I/O port)

To perform A/D conversion by a trigger from a peripheral module, configure the trigger for each scan group and enable the trigger input from the peripheral module in ADTRGENR register.

53.6.2.1 ELC Trigger

A/D conversion can be started by an event (ELC event) from Event Link Controller. To start A/D conversion using an ELC event, configure the scan group using the ELC event in ADTRGELCn (n = 0 to 8) register and enable the A/D conversion start trigger in ADTRGENR register. Table 53.54 shows the correspondence between ADTRGELCn register and ELC event.

Table 53.54 Correspondence between ELC Trigger Enable Register and ELC Event

Resister bit	Event Name
ADTRGELCn.TRGELC0	ELC_AD00
ADTRGELCn.TRGELC1	ELC_AD01
ADTRGELCn.TRGELC2	ELC_AD02
ADTRGELCn.TRGELC3	ELC_AD10
ADTRGELCn.TRGELC4	ELC_AD11
ADTRGELCn.TRGELC5	ELC_AD12

Note: n = 0 to 8

53.6.2.2 GPT Trigger

A/D conversion can be started by an interrupt source from the general-purpose PWM Timer (GPT). To start A/D conversion using an interrupt source from the GPT, configure the scan group using the GPT interrupt source in ADTRGGPTn (n = 0 to 8) register and enable the A/D conversion start trigger in ADTRGENR register. Table 53.55 shows the correspondence between ADTRGGPTn register and GPT interrupt sources.

Table 53.55 Correspondence between GPT Trigger Enable Registers and GPT Interrupt Sources (1 of 2)

Resister bit	Event Name
ADTRGGPTn.TRGGPTA0	GPT0_ADTRGA
ADTRGGPTn.TRGGPTA1	GPT1_ADTRGA
ADTRGGPTn.TRGGPTA2	GPT2_ADTRGA
ADTRGGPTn.TRGGPTA3	GPT3_ADTRGA
ADTRGGPTn.TRGGPTA4	GPT4_ADTRGA
ADTRGGPTn.TRGGPTA5	GPT5_ADTRGA

Table 53.55 Correspondence between GPT Trigger Enable Registers and GPT Interrupt Sources (2 of 2)

Resister bit	Event Name
ADTRGGPTn.TRGGPTA6	GPT6_ADTRGA
ADTRGGPTn.TRGGPTA7	GPT7_ADTRGA
ADTRGGPTn.TRGGPTA8	GPT8_ADTRGA
ADTRGGPTn.TRGGPTA9	GPT9_ADTRGA
ADTRGGPTn.TRGGPTA10	GPT10_ADTRGA
ADTRGGPTn.TRGGPTA11	GPT11_ADTRGA
ADTRGGPTn.TRGGPTA12	GPT12_ADTRGA
ADTRGGPTn.TRGGPTA13	GPT13_ADTRGA
ADTRGGPTn.TRGGPTB0	GPT0_ADTRGB
ADTRGGPTn.TRGGPTB1	GPT1_ADTRGB
ADTRGGPTn.TRGGPTB2	GPT2_ADTRGB
ADTRGGPTn.TRGGPTB3	GPT3_ADTRGB
ADTRGGPTn.TRGGPTB4	GPT4_ADTRGB
ADTRGGPTn.TRGGPTB5	GPT5_ADTRGB
ADTRGGPTn.TRGGPTB6	GPT6_ADTRGB
ADTRGGPTn.TRGGPTB7	GPT7_ADTRGB
ADTRGGPTn.TRGGPTB8	GPT8_ADTRGB
ADTRGGPTn.TRGGPTB9	GPT9_ADTRGB
ADTRGGPTn.TRGGPTB10	GPT10_ADTRGB
ADTRGGPTn.TRGGPTB11	GPT11_ADTRGB
ADTRGGPTn.TRGGPTB12	GPT12_ADTRGB
ADTRGGPTn.TRGGPTB13	GPT13_ADTRGB

Note: n = 0 to 8

53.6.2.3 External Trigger

A/D conversion can be started by the input from the external trigger pin (ADTRG0 and ADTRG1). To start A/D conversion using an external trigger, configure the scan group using the external trigger in ADTRGEXTn (n = 0 to 8) register and enable the A/D conversion start trigger in ADTRGENR register.

External trigger is active low. Before setting to enable the external trigger (ADTRG0 and ADTRG1), you should input the High level to the external trigger pin.

53.6.3 Trigger Delay

The trigger delay function adds a delay to the A/D conversion start trigger in order to adjust the A/D conversion start timing for each scan group. This function adds a delay to the internal trigger for each scan group generated by accepting an external trigger, ELC trigger or GPT trigger. This function cannot be used to add a delay to a software trigger.

The delay value to be added to the internal trigger is set for each scan group in ADTRGDLRi (i = 0 to 4) register. The delay value to be added is the register setting value × A/D conversion clock (ADCLK) cycle.

53.6.4 Force Stops the A/D Conversion Operation

The scanning operation of the A/D converter can be forcibly stopped by writing 1 to ADSTOPR.ADSTOPm (m = 0, 1) bit during scanning operation. If the scanning operation is forcibly stopped, the A/D conversion data is not guaranteed.

53.6.4.1 Forced Stop Procedure

Table 53.56 shows the procedure for forced stop of A/D conversion operation. Observe Table 53.56 when performing the forced stop. If this procedure is violated, the A/D converter may not be able to stop and then it may not operate normally. In that case, a reset is required for recovery.

Table 53.56 Procedure for forced stop of A/D conversion operation

No.	Step Name	Description
1	Disable trigger input	Disables the trigger input from the peripheral module. Write ADTRGENR.STTRGENn = 0.
2	Waiting time	After setting the above Step 1, a wait time is required to safely stop the A/D converter. Proceed to the next processing after the specified waiting time has elapsed. For details on the wait time, see section 53.6.4.2. Waiting Time after Disabling Trigger Input for Forced Stop Processing.
3	Checking the A/D converter status	Check if the A/D converter is operating after the waiting time of the above Step 2 has elapsed. If the A/D converter is running (ADSR.ADACTm = 1), proceed to Step 4. If the A/D converter is stopped (ADSR.ADACTm = 0), no further processing is required (proceed to Step 6).
4	Forced stop of A/D converter	Forcibly stop the A/D converter by ADSTOPR register. Write ADSTOPR.ADSTOPm = 1.
5	Waiting for A/D converter to stop	Wait until the A/D converter stops. ADSR.ADACTm = 0.
6	End	Processing of forced stop is completed.

Note: m = 0, 1, n = 0 to 8
Do not write to ADSYSTR register or ADSTRn register while this forced stop procedure is in progress.

53.6.4.2 Waiting Time after Disabling Trigger Input for Forced Stop Processing

In the forced stop procedure shown in Table 53.56, after disabling the trigger input from the peripheral module, a wait time is required to perform the forced stop (Step 2 of Table 53.56). This wait time is the time that must be secured to perform a forced stop safely.

The wait time after disabling the trigger input for forced stop processing is calculated as follows.

[Waiting time after disabling trigger input in forced stop processing]

- When synchronous operation is enabled (ADSYCR.ADSYDISm = 0)
  - (ADTRGDLRi.TRGDLYn[7:0] setting value + ADSYCR.ADCSYCYC[7:0] setting value × 2) × t_{ADCLK}
- When synchronous operation is disabled (ADSYCR.ADSYDISm = 1)
  - (4 + ADTRGDLRi.TRGDLYn[7:0] setting value) × t_{ADCLK}

Note: i = 0 to 4, n = 0 to 8, m = 0, 1 t_{ADCLK}: ADCLK period

After the waiting time calculated by the above expressions has elapsed, proceed to the Step 3 in Table 53.56. There are two ways to generate the waiting time: (a) Use the timer function built into MCU. (b) Read the status register multiple times. If you choose (b), the number of register reads to generate the waiting time required is calculated by the following equation:

[Number of register reads to generate the waiting time]

N_{RD} = (Wait time after disabling trigger input ÷ (t_{PCLK} × N_{RDCYC})) + 1

N_{RD}: Number of register reads required to generate the trigger input disable wait time (truncate after the decimal point)

t_{PCLK}: The period of the Bus I/F clock (PCLKA)

N_{RDCYC}: Minimum number of register read access cycles (see section x, I/O Registers [DEADBEEF].)

53.7 Error Detection

53.7.1 A/D Converter Error

An A/D converter error is detected when an abnormal operation of the A/D converter occurs. If an A/D converter error is detected, the A/D conversion result is not guaranteed.

An A/D converter error occurs in the following cases:

[A/D Converter Error Generation Conditions]

- When A/D conversion is performed without self-calibration.
- When the operating frequency of ADCLK exceeds the guaranteed operating frequency range specified in the electric characteristics.
- When the successive approximation time of the A/D converter exceeds the guaranteed operating range specified in the electric characteristics.
- When an accidental abnormal operation occurs in the A/D converter due to external factors.

If an A/D converter error is detected, the flag is set in ADERSR.ADERFn (n = 0, 1) bit. To clear the A/D converter error flag, write 1 to the corresponding bit in ADERSCR register.

Notes on A/D Converter Error

The A/D converter error is an auxiliary function used to detect abnormal operation of the A/D converter. It does not guarantee the reliable detection of abnormal operation. Even under the A/D converter error occurrence conditions described above, an A/D converter error may not be detected depending on the individual chip differences and chip operating conditions.

53.7.2 A/D Conversion Overflow

A/D conversion overflow is detected when A/D conversion data exceeds the range that can be handled in the specified data format. If A/D conversion overflow occurs, the A/D conversion data becomes the upper or lower limit value of the specified data format. For the range that can be handled as A/D conversion data, see section 53.5.7. Data Format.

A/D conversion overflow is detected in the following cases:

- When the input to the A/D converter exceeds the range between VREFH0 to VREFL0 or VREFH to VREFL
  - Single-ended input: When the input to the A/D converter unit 0 exceeds VREFH0 or falls below VREFL0. When the input to the A/D converter unit 1 exceeds VREFH or falls below VREFL.
  - Differential input: When the differential input to the A/D converter unit 0 exceeds +VREFH0 or falls below −VREFH0. When the differential input to the A/D converter unit 1 exceeds +VREFH or falls below −VREFH.
- When overflow occurs by the internal processing (calculation) for the A/D conversion data shown in the following:
  - Gain error and Offset error calibration
  - User’s Gain/User’s Offset adjustment function
  - When using A/D-converted value addition function
  - Data formatting process

When an A/D conversion overflow is detected, the flag is set in the following status register:

- ADOVFERSR: The flag is set to the bit corresponding to the A/D converter that detected the A/D conversion overflow.
- ADOVFCHSR0: The flag is set to the bit corresponding to the analog input channel on which A/D conversion overflow is detected.
- ADOVFEXSR: The flag is set to the bit corresponding to the extended analog channel on which A/D conversion overflow is detected.

To clear the flags in the status registers, write 1 to the corresponding bit in ADOVFERSCR, ADOVFCHSCR0, ADOVFEXSCR.

53.7.3 FIFO Overflow

If A/D conversion data is written (added) to FIFO while FIFO is full, a FIFO overflow is detected. For more details about FIFO overflow, see section 53.5.10. FIFO Function.

53.8 Procedure for Setting up and Changing A/D Conversion

53.8.1 Initial Setup Procedure for A/D Conversion

Table 53.57 shows the initial setup procedure for A/D conversion.

Table 53.57 Initial setup procedure for A/D conversion

No.	Step	Description
1	Release module-stop	Release the module-stop bit for ADC16H in MSTPCR register.
2	I/O port configuration	Set ASEL bit of the pin used as analog input to 1.
3	Synchronous operation configuration	Set the synchronous operation function. The synchronous operation function is disabled at the initial value of the register after reset release. If the synchronous operation function is used, be sure to enable the synchronous operation function (ADSYCR.ADSYDISm = 0 (m = 0,1)).
4	ADCLK configuration	Set the clock source and division ratio for ADCLK.*1 Then, set ADCLKENR.CKEN bit to 1, and wait for ADCLK to supply (ADCLKSR.CLKSR = 1).
5	A/D conversion configuration	Configure the A/D conversion settings.
6	Wait for operation stabilization	Wait until the operating stabilization times specified in the Electrical Characteristics have elapsed.
7	Self-calibration	Self-calibration must be executed prior to starting A/D conversion. Set up for self-calibration and execute it. For details, see section 53.3.8. Self-calibration.
8	Trigger configuration	To start A/D conversion by a trigger from peripheral modules, configure the triggers for each scan group.
9	Start of A/D conversion	When a software trigger or a trigger from peripheral modules is input, A/D conversion (scanning operation) starts.

Note 1. When GPTCLK is selected, release the GPT module-stop state using the Module Stop Register E (MSTPCRE). For details, see section 11, Low Power Mode.

53.8.2 Procedure for Changing ADCLK Settings

Table 53.58 shows the procedure for changing ADCLK settings.

Table 53.58 Procedure for changing ADCLK settings (1 of 2)

No.	Step	Description
1	Disable trigger input	Disables the trigger input from the peripheral module. (Write ADTRGENR.STTRGENn = 0 (n = 0 to 8))
2	Stop A/D conversion	Check that all A/D converter is stopped. When A/D conversion is in progress, wait until all A/D conversion is completed or forcibly stop A/D conversion operation. For details about forcibly stop A/D conversion operation, see section 53.6.4. Force Stops the A/D Conversion Operation.
3	Stop ADCLK supplies	Set ADCLKENR.CKEN bit to 0. Then, wait for ADCLK to stop (ADCLKSR.CLKSR = 0).
4	Change ADCLK setting	Change the clock-source and the division ratio for ADCLK*1.
5	Started supplying ADCLK	Set ADCLKENR.CKEN bit to 1, and wait for ADCLK to supply (ADCLKSR.CLKSR = 1).

Table 53.58 Procedure for changing ADCLK settings (2 of 2)

No.	Step	Description
6	Change the A/D conversion configuration	Change the following settings according to the changed ADCLK frequency. ● Successive approximation time for A/D converter ● Number of sampling states for A/D conversion ● Number of sampling states and hold mode switching states for channel-dedicated sample-and-hold circuit *2 ● Number of states for self-calibration operation (A/D converter and channel-dedicated sample-and-hold circuit *2) ● Synchronous operation period *3 ● Disconnection detection assist period *4 If other settings related to A/D conversion are also to be changed, change them in this step.
7	Wait for operation stabilization	Wait until the operating stabilization times specified in the section 62, Electrical Characteristics have elapsed.
8	Self-calibration	Execute self-calibration operation prior to starting A/D conversion. For details, see section 53.3.8. Self-calibration.
9	Trigger configuration	To start A/D conversion by a trigger from peripheral modules, configure the triggers for each scan group.
10	Start of A/D conversion	When a software trigger or a trigger from peripheral modules is input, A/D conversion (scanning operation) starts.

Note 1. When GPTCLK is selected, release the GPT module stop state using the module stop register E (MSTPCRE). For details, see section 11, Low Power Mode.
Note 2. Setting is not required when channel-dedicated sample-and-hold circuit is not used.
Note 3. No change is required when synchronous operation setting is disabled (ADSYCR, ADSYDISm = 1 (m = 0, 1)).
Note 4. Setting is not required when disconnection detection assist function is not used.

53.8.3 Procedure for Changing the Settings of the A/D Converter

Table 53.59 shows the procedure for changing the A/D conversion configuration. If there is a change in ADCLK setting, follow the procedures in section 53.8.2. Procedure for Changing ADCLK Settings.

Table 53.59 Procedure for changing the settings of the A/D converter

No.	Step	Description
1	Disable trigger input	Disables the trigger input from the peripheral module. (Write ADTRGENR.STTRGENn = 0 (n = 0 to 8))
2	Stop A/D conversion	Check that all A/D converter is stopped. When A/D conversion is in progress, wait until all A/D conversion is completed or forcibly stop A/D conversion operation. For details about forcibly stop A/D conversion operation, see section 53.6.4. Force Stops the A/D Conversion Operation.
3	Change the A/D conversion configuration	Change the A/D conversion settings. (except the settings for ADCLK)
4	Wait for operation stabilization	Wait until the various operating stabilization times specified in the Electrical Characteristics have elapsed.
5	Self-calibration	Execute self-calibration operation prior to starting A/D conversion. For details, see section 53.3.8. Self-calibration.
6	Trigger configuration	To start A/D conversion by a trigger from peripheral modules, configure the triggers for each scan group.
7	Start of A/D conversion	When a software trigger or a trigger from peripheral modules is input, A/D conversion (scanning operation) starts.

53.9 Interrupt Sources and ELC Events

Table 53.60 lists ADC16H interrupt sources or ELC event requests.

For more details about interrupts, see section 14, Interrupt Controller Unit (ICU).

For more details about ELC events, see section 19, Event Link Controller (ELC).

Table 53.60 Interrupt sources (1 of 2)

Interrupt request or ELC event	Symbol	Description	Status flag
A/D converter error interrupt	ADC_ERR0	Generated when abnormal operation of ADC0 is detected.	ADERSR.ADERF0
	ADC_ERR1	Generated when abnormal operation of ADC1 is detected.	ADERSR.ADERF1
A/D converter self-calibration end interrupt	ADC_CALEND0	Generated when self-calibration operation of ADC0 is finished.	ADCALENDSR.CALENDF0
	ADC_CALEND1	Generated when self-calibration operation of ADC1 is finished.	ADCALENDSR.CALENDF1
A/D scan end interrupt	ADC_ADI0	Generated at the scan end of scan group 0	ADSCANENDSR.SCENDF0
	ADC_ADI1	Generated at the scan end of scan group 1	ADSCANENDSR.SCENDF1
	ADC_ADI2	Generated at the scan end of scan group 2	ADSCANENDSR.SCENDF2
	ADC_ADI3	Generated at the scan end of scan group 3	ADSCANENDSR.SCENDF3
	ADC_ADI4	Generated at the scan end of scan group 4	ADSCANENDSR.SCENDF4
	ADC_ADI5	Generated at the scan end of scan group 5	ADSCANENDSR.SCENDF5
	ADC_ADI6	Generated at the scan end of scan group 6	ADSCANENDSR.SCENDF6
	ADC_ADI7	Generated at the scan end of scan group 7	ADSCANENDSR.SCENDF7
	ADC_ADI8	Generated at the scan end of scan group 8	ADSCANENDSR.SCENDF8
Limiter clip interrupt	ADC_LIMCLPI	Generated when a limiter clip using limiter table 0 to 7 is detected for A/D conversion.	ADLIMGRSR.LIMGRFn ADLIMCHSR0.LIMCHFi ADLIMEXSR.LIMEXFj
A/D conversion overflow interrupt	ADC_RESOVF0	Generated when the overflow is detected in A/D conversion result with ADC0.	ADOVFERSR.ADOVFEF0 ADOVFCHSR0.OVFCHFi ADOVFEXSR.OVFEXFj
	ADC_RESOVF1	Generated when the overflow is detected in A/D conversion result with ADC1.	ADOVFERSR.ADOVFEF1 ADOVFCHSR0.OVFCHFi ADOVFEXSR.OVFEXFj
Compare match interrupt	ADC_CMPI0	Generated when a compare match with compare match table 0 is detected.	ADCMPTBSR.CMPTBF0
	ADC_CMPI1	Generated when a compare match with compare match table 1 is detected.	ADCMPTBSR.CMPTBF1
	ADC_CMPI2	Generated when a compare match with compare match table 2 is detected.	ADCMPTBSR.CMPTBF2
	ADC_CMPI3	Generated when a compare match with compare match table 3 is detected.	ADCMPTBSR.CMPTBF3
Composite compare match interrupt	ADC_CCMPM0 ADC_CCMPM1	Generated when a composite compare match with combined conditions using compare match table 0 to 7 is detected.	ADCMPTBSR.CMPTBF0 to ADCMPTBSR.CMPTBF8
	ADC_CCMPUM0 ADC_CCMPUM1	Generated when a composite compare match with combined conditions using compare match table 0 to 7 is not detected.	ADCMPTBSR.CMPTBF0 to ADCMPTBSR.CMPTBF8

Table 53.60 Interrupt sources (2 of 2)

Interrupt request or ELC event	Symbol	Description	Status flag
FIFO data read request interrupt	ADC_FIFOREQ0	Generated when the number of vacant stages in FIFO for scan group 0 become less than or equal to the specified value.	ADFIFOSR0.FIFOST0[3:0]
	ADC_FIFOREQ1	Generated when the number of vacant stages in FIFO for scan group 1 become less than or equal to the specified value.	ADFIFOSR0.FIFOST1[3:0]
	ADC_FIFOREQ2	Generated when the number of vacant stages in FIFO for scan group 2 become less than or equal to the specified value.	ADFIFOSR1.FIFOST2[3:0]
	ADC_FIFOREQ3	Generated when the number of vacant stages in FIFO for scan group 3 become less than or equal to the specified value.	ADFIFOSR1.FIFOST3[3:0]
	ADC_FIFOREQ4	Generated when the number of vacant stages in FIFO for scan group 4 become less than or equal to the specified value.	ADFIFOSR2.FIFOST4[3:0]
	ADC_FIFOREQ5	Generated when the number of vacant stages in FIFO for scan group 5 become less than or equal to the specified value.	ADFIFOSR2.FIFOST5[3:0]
	ADC_FIFOREQ6	Generated when the number of vacant stages in FIFO for scan group 6 become less than or equal to the specified value.	ADFIFOSR3.FIFOST6[3:0]
	ADC_FIFOREQ7	Generated when the number of vacant stages in FIFO for scan group 7 become less than or equal to the specified value.	ADFIFOSR3.FIFOST7[3:0]
	ADC_FIFOREQ8	Generated when the number of vacant stages in FIFO for scan group 8 become less than or equal to the specified value.	ADFIFOSR4.FIFOST8[3:0]
FIFO data overflow interrupt	ADC_FIFOOVF	Generated when FIFO overflow is detected in any of FIFO for scan group 0 to 8.	ADFIFOERSR.FIFOOVF0 to ADFIFOERSR.FIFOOVF8

Note: n = 0 to 8.
i = 0 to 28.
j = 0 to 2, 5 to 8.

(1) A/D converter error interrupt

A/D converter error interrupt can be generated when an A/D converter error is detected.

A/D converter error interrupt (ADC_ERRm (m = 0, 1)) is generated when ADERINTCR.ADEIEm (m = 0, 1) bit is 1 and ADERSR.ADERFm (m = 0, 1) bit is 1.

(2) A/D converter self-calibration end interrupt

A/D converter self-calibration end interrupt can be generated at the end of A/D converter self-calibration operation.

A/D converter self-calibration end interrupt (ADC_CALENDm (m = 0, 1)) is generated when ADCALINTCR.CALENDIEm (m = 0, 1) bit is 1 and ADCALENDSR.CALENDFm (m = 0, 1) bit is 1.

(3) A/D scan end interrupt

A/D scan end interrupt can be generated at the end of scanning operation of scan group n (n = 0 to 8).

A/D scan end interrupt for scan group 0 to 8 (ADC_ADI0 to ADC_ADI8) are generated when ADINTCR.ADIEn (n = 0 to 8) bit is set to 1 and ADSCANENDSR.SCENDFn (n = 0 to 8) bit is set to 1.

However, A/D scan end interrupt is not generated when A/D conversion operation (scanning operation) is forcibly stopped by ADSTOPR register.

(4) Limiter clip interrupt

Limiter clip interrupt (ADC_LIMCLPI) can be generated when a limiter clip with limiter table i (i = 0 to 7) is detected.

Limiter clip interrupt is generated when either ADLIMINTCR.LIMIEi (i = 0 to 8) bit is 1 and ADLIMGRSR.LIMGRFi (i = 0 to 8) bit is 1 is satisfied.

(5) A/D conversion overflow interrupt

A/D conversion overflow interrupt can be generated when A/D conversion overflow in the A/D conversion result using ADCm (m = 0, 1) is detected. For details about A/D conversion overflow, see section 53.7.2. A/D Conversion Overflow.

A/D conversion overflow interrupt (ADC_RESOVFm (m = 0, 1)) is generated when ADOVFINTCR.ADOVFIEm (m = 0, 1) bit is 1 and ADOVFERSR.ADOVFEFm (m = 0, 1) bit is 1.

(6) Compare match interrupt

Compare match interrupt can be generated when a compare match is detected.

Compare match interrupt (ADC_CMPIj (j = 0 to 3)) is generated when ADCMPINTCR.CMPIEj (j = 0 to 3) bit is 1 and ADCMPTBSR.CMPTBFj (j = 0 to 3) bit is 1.

There are no interrupts corresponding to the compare match tables 4 to 7.

(7) Composite compare match interrupt

Composite compare match interrupt (ADC_CCMPMk (k = 0, 1)) can be generated by combining the comparison results of two or more compare match tables. For details about composite compare match, see section 53.5.8.2. Composite Compare Match.

(8) FIFO data read request interrupt

FIFO data read request interrupt can be generated when the number of vacant stages in FIFO become less than or equal to the specified value.

FIFO data read request interrupt for scan group 0 to 8 (ADC_FIFOREQ0 to ADC_FIFOREQ8) are generated when ADFIFOINTCR.FIFOIEn (n = 0 to 8) is set to 1 and ADFIFOSRm.FIFOSTn[3:0] ≤ ADFIFOINTLRm.FIFOILVn[3:0] (m = 0 to 4, n = 0 to 8).

However, FIFO read request interrupt is not generated while the ADFIFOERSR.FIFOFLFn (n = 0 to 8) bit corresponding to its interrupt source is set to 1.

(9) FIFO data overflow interrupt

FIFO data overflow interrupt (ADC _FIFOOVF) can be generated when a FIFO overflow is detected in any of FIFO in scan groups 0 to 8.

FIFO data overflow interrupt is generated when ADFIFOINTCR.FIFOIEn (n = 0 to 8) bit is 1 and ADFIFOERSR.FIFOOVFn (n = 0 to 8) bit is 1.

53.10 Scan Conversion Time

53.10.1 Scan Start Processing Time

The processing time from the input of the A/D conversion start trigger to the start of the scanning operation is shown in Table 53.61 and Figure 53.56.

Table 53.61 Scan start processing time

Item		Symbol	Processing time
Peripheral module trigger input processing time*1		t_{D_TRG}	[When GPIO trigger is selected] ● 2 to 4 ADSRCCLK + (ADTRGDLRi.TRGDLYn[7:0] + (0 to 1)) × ADCLK [When other than above] 1 ADSRCCLK + (ADTRGDLRi.TRGDLYn[7:0] + (0 to 1)) × ADCLK
Software trigger input processing time		t_{D_SW}	[When ADCLK = PCLKA/1]*2 ● Number of access cycles to I/O registers*3 + (0 to 1 ADCLK) [Other than above] ● (Number of access cycles to I/O registers*3) + 1 PCLKA + (1 to 3 ADCLK)
Internal Trigger processing time		t_{D_ITRG}	[When synchronous operation is disabled] (ADSYCR.ADSYDISm = 1) ● 6 ADCLK [Idle start] ● 7 to 13 ADCLK [Suspend start]*4 [When synchronous operation is enabled] (ADSYCR.ADSYDISm = 0) ● 7 ADCLK [Idle start] ● (3+ADSYCR.ADSYCYC[7:0]) × ADCLK to (2+2×ADSYCR.ADSYCYC[7:0]) × ADCLK [Suspend start]*5
Wait Time for Synchronous Operation		t_{D_SYOP}	[When synchronous operation is disabled] (ADSYCR.ADSYDISm = 1) ● 0 [When synchronous operation is enabled] (ADSYCR.ADSYDISm = 0) ● 0 to ADSYCR.ADSYCYC[7:0] × ADCLK
Total scan start processing time	Started by Peripheral Module Trigger	t_{D_ADST}	$t_{D\_TRG} + t_{D\_ITRG} + t_{D\_SYOP}$
	Started by Software Trigger		$t_{D\_SW} + t_{D\_ITRG} + t_{D\_SYOP}$

Note: ADSRCCLK: Clock source of ADCLK
n = 0 to 8, m = 0, 1, i = 0 to 4

Note 1. It does not include the input delay time from the source of the peripheral module trigger to ADC16H.

Note 2. When ADCLKCR.CLKSEL[1:0] = 10b and ADCLKCR.DIVR[2:0] = 000b are set.

Note 3. It is the number of access cycles to ADSTRn register (n = 0 to 8) or ADSYSTR register. For more details about the number of access cycles for I/O registers, see section x, I/O Registers [DEADBEEF].

Note 4. When constant sampling is enabled, it is 7 to (6 + ADSHSTRm.SHSST[7:0]) × ADCLK. When constant sampling is enabled, by setting the sampling time setting of the channel-dedicated sample-and-hold circuit to ADSHSTRm.SHSST[7:0] = 0x4 (reset value), the effect of the ADSHSTRm.SHSST[7:0] setting on the conversion start time can be ignored.

Note 5. When constant sampling is enabled, (3+ADSYCR.ADSYCYC[7:0]) × ADCLK to (2+ADSHSTRm.SHSST[7:0] + ADSYCR.ADSYCYC[7:0]) × ADCLK. When constant sampling is enabled, by setting the sampling time setting of the channel-dedicated sample-and-hold circuit to ADSHSTRm.SHSST[7:0] = 0x4 (reset value), the effect of the ADSHSTRm.SHSST[7:0] setting on the conversion start time can be ignored.

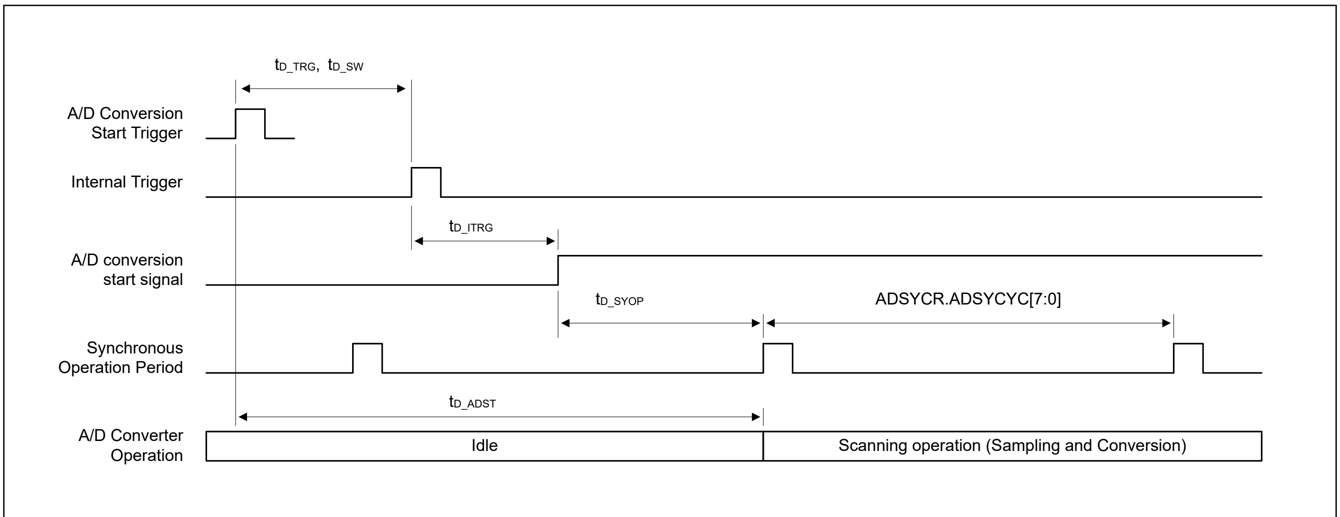

Figure 53.56 Scan start processing time

53.10.2 Conversion Processing Time

The various processing times in the conversion operation are shown in Table 53.62 and Figure 53.57 to Figure 53.61.

Table 53.62 A/D conversion processing time (1 of 2)

Item			Symbol	Processing Time
Channel-dedicated sample-and-hold processing time	Sampling time		t_{SH_SPL}	ADSHSTRm.SHSST[7:0] × ADCLK
	Hold mode switching time		t_{SH_HLD}	ADSHSTRm.SHHST[2:0] × ADCLK
	Sampling mode switching time (only when Hybrid mode)		t_{SH_D}	(ADSYCR.ADSYCYC[7:0] - 1) × ADCLK
Disconnection detection assist processing time			t_{DDA}	[When disconnection detection assist function is disabled] • 0 [When disconnection detection assist function is enabled] • ADSGDCRn.ADNDIS[7:0] × ADCLK
A/D conversion time	Sampling time		t_{AD_SPL}	ADSSTRp.SSTq[9:0] × ADCLK
	Successive approximation time		t_{AD_CNV}	ADCNVSTR.CSTm[5:0] × ADCLK
A/D conversion data processing time	SAR mode (Not using digital filter function)	When ADCLK = PCLKA/1 is set*1	t_{ADDP}	[When A/D-converted value addition/averaging function is not used] • 6 ADCLK + 2 PCLKA [When A/D-converted value addition/averaging function is used] • 7 ADCLK + 2 PCLKA
		Other than above		[When A/D-converted value addition/averaging function is not used] • 7 ADCLK + (5 to 6 PCLKA) [When A/D-converted value addition/averaging function is used] • 8 ADCLK + (5 to 6 PCLKA)
	Oversampling mode or Hybrid mode (Using with digital filter function)	When ADCLK = PCLKA/1 is set*1		[When A/D-converted value addition/averaging function is not used] • 8 ADCLK + 2 PCLKA [When A/D-converted value addition/averaging function is used] • 9 ADCLK + 2 PCLKA
		Other than above		[When A/D-converted value addition/averaging function is not used] • 9 ADCLK + 5 to 6 PCLKA [When A/D-converted value addition/averaging function is used] • 10 ADCLK + 5 to 6 PCLKA
Total A/D conversion time (SAR mode)*3	Channel conversion time*2		t_{ADCH_S}	$(t_{DDA} + t_{AD\_SPL} + t_{AD\_CNV}) \times N_{ADC} \times$ ADCLK
	Scan conversion time*4		t_{SCAN_S}	[When channel-dedicated sample-and-hold circuit is not used] • Σt_{ADCH_S} [When channel-dedicated sample-and-hold circuit is used] • $t_{SH\_SPL} + t_{SH\_HLD} + \Sigma t_{ADCH\_S}$
Total A/D conversion time (Oversampling mode)*3	Oversampling period		t_{OV_OS}	$(t_{DDA} + t_{AD\_SPL} + t_{AD\_CNV}) \times$ ADCLK
	Channel conversion time		t_{ADCH_O}	$(t_{DDA} + t_{AD\_SPL} + t_{AD\_CNV}) \times (N_{TAP} + N_{ADC}) \times$ ADCLK
	Scan conversion time*5		t_{SCAN_O}	Σt_{ADCH_O}

Table 53.62 A/D conversion processing time (2 of 2)

Item			Symbol	Processing Time
Total A/D conversion time (Hybrid mode)*3	Channel-dedicated sample-and-hold processing time in Hybrid mode		t_{HY_SH}	$t_{SH\_SPL} + t_{SH\_HLD} + t_{SH\_D}$
	Oversampling period		t_{HY_OS}	$(t_{DDA} + t_{AD\_SPL} + t_{AD\_CNV}) \times$ ADCLK
	Scan conversion time	Initial delay	t_{HY_ID}	[When channel-dedicated sample-and-hold circuit is not used] • $(N_{TAP} + N_{ADC}) \times \Sigma t_{HY\_OS}$*6 [When channel-dedicated sample-and-hold circuit is used] • $(t_{HY\_SH} \times (N_{ADC} + N_{TAP}) - t_{SH\_D}) + (N_{TAP} + N_{ADC}) \times \Sigma t_{HY\_OS}$*6
		After initial delay time	t_{SCAN_HY}	[When channel-dedicated sample-and-hold circuit is not used] • Σt_{HY_OS}*6 [When channel-dedicated sample-and-hold circuit is used] • $t_{HY\_SH} + \Sigma t_{HY\_OS}$*6

Note: n = 0 to 8, m = 0, 1, p = 0 to 7, q = 0 to 15
N_{ADC}: This value is the number of the times of the addition/averaging according to the setting value of ADDOPCRBx.ADC[3:0] (x = 0 to 32). If A/D-converted value addition/averaging function is not used, this value is 1.
N_{TAP}: This value is the number of TAP of the digital filter that selected in ADDOPCRAx.DFSEL[2:0] (x = 0 to 32) and ADDFSRm.DFSELy[1:0] (m = 0, 1, y = 0 to 4).
N_{SGCH}: This value is the number of the channels in the scan group.

Note 1. When ADCLKCR.CLKSEL[1:0] = 10b and ADCLKCR.DIVR[2:0] = 000b are set.

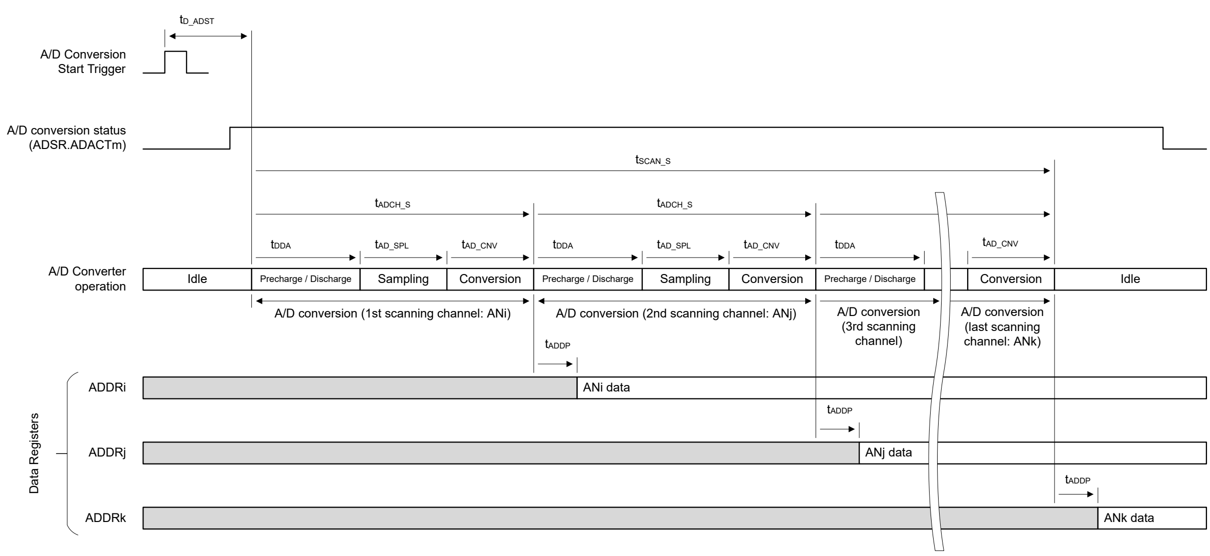
Note 2. It does not include the channel-dedicated sample-and-hold processing time.

Note 3. It does not include the A/D conversion data processing time.

Note 4. This is the sum of the channel conversion times (t_{ADCH_N}) that calculated from the conversion settings for each analog channel assigned to the scan group. If channel-dedicated sample-and-hold circuits are used, channel-dedicated sample-and-hold processing times (t_{SH_SPL} and t_{SH_HLD}) are also added.

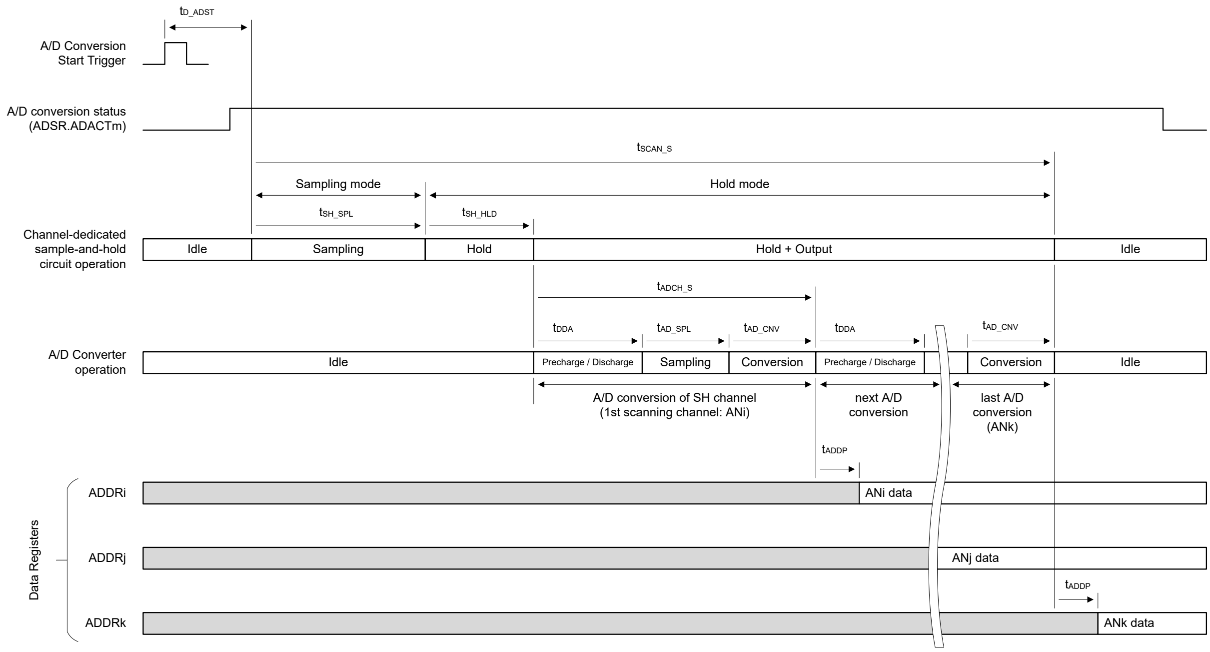
Note 5. This is the sum of the channel conversion times (t_{ADCH_O}) that calculated from the conversion settings for each analog channel assigned to the scan group.

Note 6. This is the sum of the oversampling period (t_{HY_OS}) that calculated from the conversion settings for each analog channel assigned to the scan group.



Note: i, j, k : Any analog channel number.
m = 0, 1

Figure 53.57 A/D conversion processing time (SAR mode)



Note: i, j, k : Any analog channel number.
m = 0, 1

Note: i, j, k : Any analog channel number.
m = 0, 1

Figure 53.61 A/D conversion processing time (Hybrid mode with channel-dedicated sample-and-hold circuit)

53.10.3 Scan End Processing Time

The scan end processing time and the forcibly stop processing time are shown in Table 53.63, Figure 53.62, Figure 53.63.

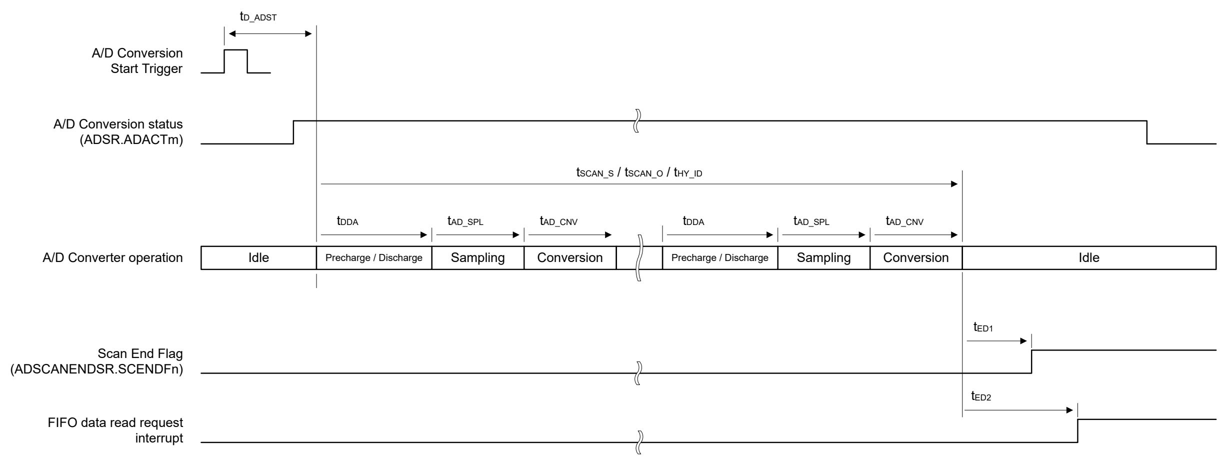
Table 53.63 Scan end processing time and forcibly stop processing time (1 of 2)

Item		Symbol	Processing Time
Scan end processing time	Until reflected in the status register*1	t_{ED1}	t_{ADDP}
	Until output the FIFO data read request interrupt	t_{ED2}	t_{ED1} + 2 PCLKA

Table 53.63 Scan end processing time and forcibly stop processing time (2 of 2)

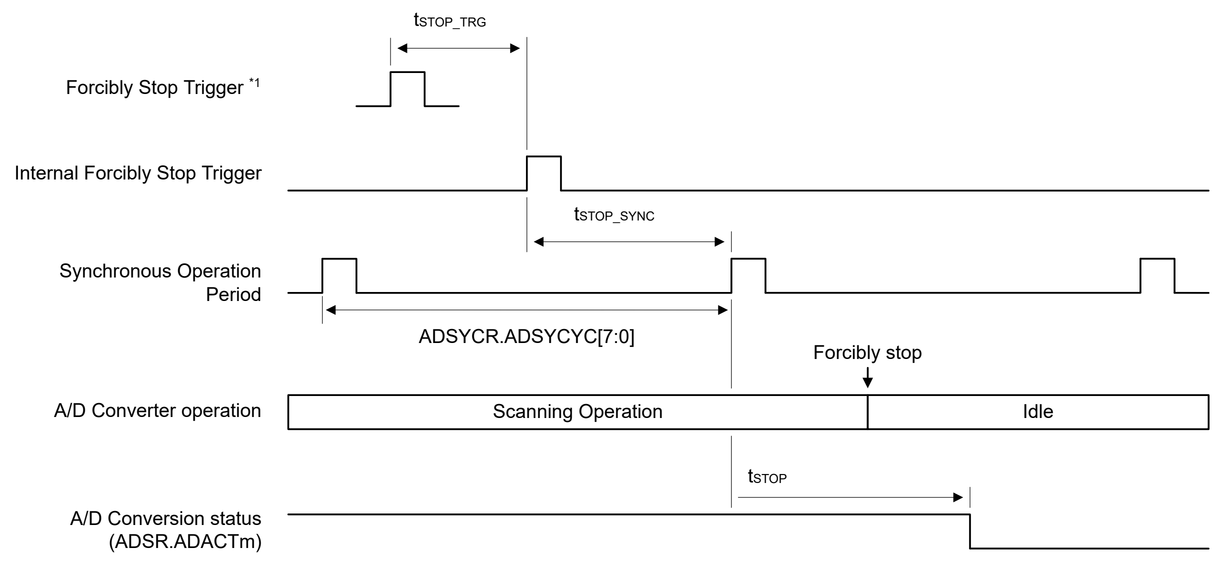
Item		Symbol	Processing Time
Forcibly Stop processing time	Forcibly stop trigger input processing time	t_{STOP_TRG}	[When ADCLK = PCLKA/1 is set]*2 ● Number of access cycles to I/O registers*3 + 1 PCLKA [Other than above] ● (Number of access cycles to I/O registers*3) + 1 PCLKA + (3 to 4 ADCLK)
	Wait time for synchronous operation	t_{STOP_SYNC}	[When synchronous operation is disabled] (ADSYCR.ADSYDISm = 1) ● 0 [When synchronous operation is enabled] (ADSYCR.ADSYDISm = 0) ● 0 to ADSYCR.ADSYCYC[7:0] × ADCLK
	Forcibly stop processing time	t_{STOP}	[When ADCLK = PCLKA/1 is set]*2 (ADSYCR.ADSYDISm = 1) ● 4 PCLKA (ADSYCR.ADSYDISm = 0) ● 3 PCLKA [Other than above] (ADSYCR.ADSYDISm = 1) ● 4 PCLKA + (2 to 3 PCLKA) (ADSYCR.ADSYDISm = 0) ● 3 PCLKA + (2 to 3 PCLKA)

Note: m = 0, 1
Note 1. This is the time it takes for ADSCANENDSR.SCENDFn = 1 (n = 0 to 8) or until an end-of-scan interrupt is generated.
Note 2. When ADCLKCR.CLKSEL[1:0] = 10b and ADCLKCR.DIVR[2:0] = 000b are set.
Note 3. It is the number of access cycles to ADSTOPR register. For more details about the number of access cycles for I/O registers, see section x, I/O Registers [DEADBEEF].



Note: n = 0 to 8, m = 0, 1

Figure 53.62 Scan end processing time (SAR/Oversampling/Hybrid mode – Single scan mode)



Note 1. It is generated by writing to ADSTOPR.ADSTOPm = 1. (m = 0, 1)

Figure 53.63 Forcibly stop processing time (SAR/Oversampling/Hybrid mode – Single scan mode)

53.11 Usage Notes

53.11.1 Prohibition of Changing the Operation Settings During A/D Conversion Operation

The registers related to the operation setting of the A/D converter should be set while all A/D converters are stopped (ADSR.ADACTm = 0 and ADSR.CALACTm = 0 (m = 0, 1)). Changing (writing) of registers except for those listed below is prohibited during A/D conversion. If the operation setting is changed during A/D conversion, operation is not guaranteed.

[Registers that can be written while the A/D converter is operating]

- Status clear registers
  - Status clear registers related to A/D converter operation (ADERSCR, ADCALENDSCR, ADSCANENDSCR)
  - A/D conversion overflow status clear registers (ADOVFERSCR, ADOVFCHSCR0, ADOVFEXSCR)
  - Limiter clip status clear register (ADLIMGRSCR, ADLIMCHSCR0, ADLIMEXSCR)
  - Compare match status clear register (ADCMPTBSCR, ADCMPCHSCR0, ADCMPEXSCR)
  - FIFO error status clear register (ADFIFOERSCR)
- Software trigger register (ADSYSTR, ADSTRn (n = 0 to 8))
- A/D converter stop register (ADSTOPR)
- A/D converter start trigger enable register (ADTRGENR) *1

Note 1. Writing during operation is only permitted for disabling the trigger input (ADTRGENR.STTRGENn = 0 (n = 0 to 8)) in order to stop the A/D conversion. To avoid unintended operation, do not change the trigger input to Enable (ADTRGENR.STTRGENn = 1) during operation.

53.11.2 Usage Notes on Forced Stop of A/D Conversion

If you want to forcibly stop the A/D conversion operation, follow the procedure in section 53.6.4. Force Stops the A/D Conversion Operation.

53.11.3 Usage Notes on A/D Data Registers

When A/D conversion is performed multiple times on the same analog channel, A/D data register ADDRn (n = 0 to 22) or A/D extended analog data register ADEXDRm (m = 0, 1, 4, 5, 6, 8, 9, 16, 17, 18, 20, 21, 22) corresponding to that analog channel is overwritten at the later A/D conversion.

If you intend to keep the data for each A/D conversion for the same analog channel, perform one of the following methods.

- Read out data from registers at each scanning operation
  - At the end of scanning each scan group, read out the A/D conversion data of the analog channel that was subject to A/D conversion from ADDRn or ADEXDRm.
  - This method is effective if A/D conversion of the same analog channel is not performed more than once in the same scan group, and A/D conversion data can be read from the registers before the next scanning operation.
- Use FIFO function to hold data for each A/D conversion
  - By using FIFO, multiple A/D conversion data for the same analog channel can be kept.
  - Read out the A/D conversion data before FIFO overflow.

53.11.4 Settings for the Module-stop Function

The Module Stop Control Register can enable or disable ADC16H operation. The ADC16H is initially stopped after a reset. The registers become accessible on release from the module-stop state.

See section 53.11.6. Restrictions on Entering and Releasing the Low-Power States in connection with this usage note.

53.11.5 Settings for the Software Standby Mode

Before entering Software Standby mode, stop ADC16H operation according to the procedures described in Figure 53.64 and Figure 53.65.

Note: For details on the wait time, see section 53.6.4.2. Waiting Time after Disabling Trigger Input for Forced Stop Processing.

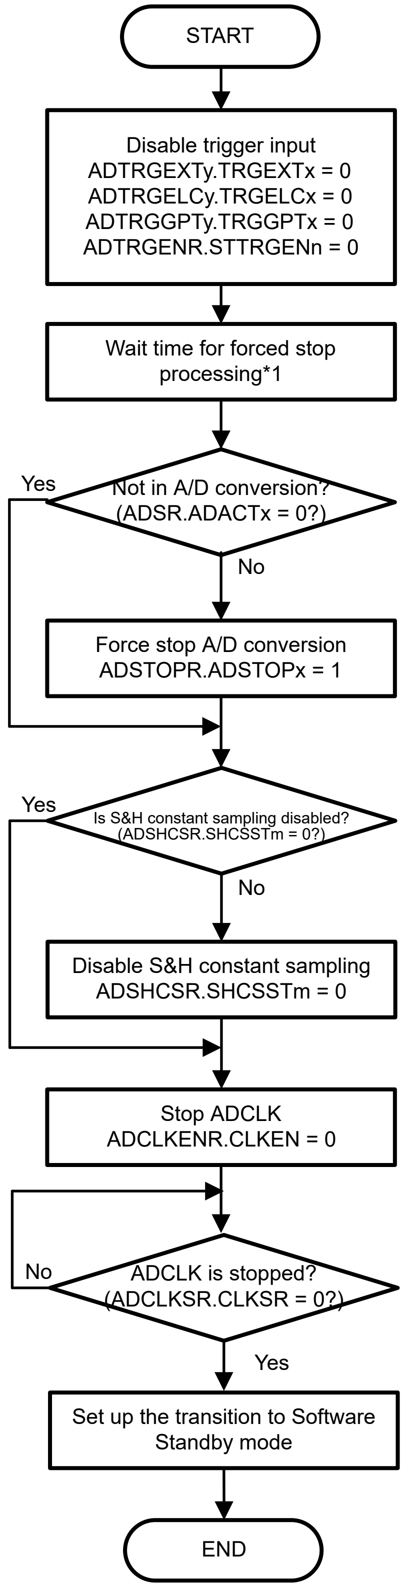


Figure 53.64 Example procedure for entering Software Standby mode

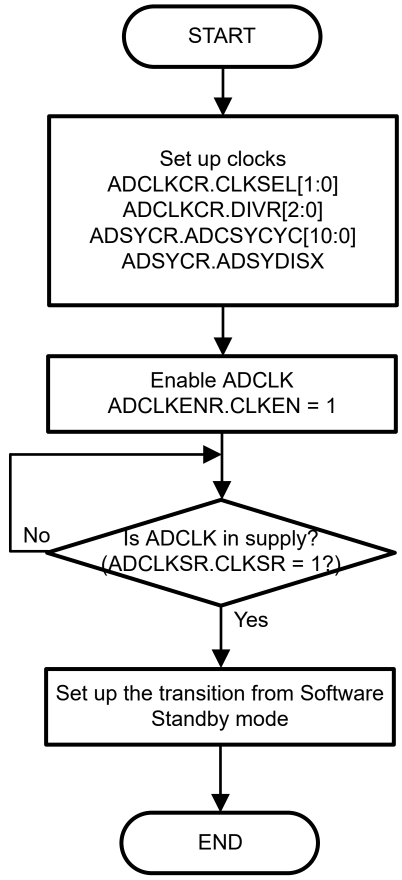

Figure 53.65 Example procedure for resuming Software Standby mode

53.11.6 Restrictions on Entering and Releasing the Low-Power States

Before entering the module-stop state or Software Standby mode, be sure to stop A/D conversion. In Addition, configure the A/D conversion not to start during the entering to the low power state.

To operate the A/D converter after the module-stop state or software standby mode is released, wait for the operation stabilization time specified in the Electrical Characteristics, execute self-calibration operation, and then start A/D conversion.

Also, when releasing the module-stop state again after entering to the module-stop state, make sure the shutdown time specified in the Electrical Characteristics has elapsed before releasing the module stop state.

Operations are not guaranteed if these restriction are violated.

53.11.7 Notes on Board Design

(1) Protection Circuit

To prevent the analog input pins from being destroyed by abnormal voltage such as excessive surge, take the following measures.

- Insert a capacitor between the power pin and the ground pin. The insertion points are below.
  - between AVCC0 and AVSS0
  - between VREFH0 and VREFL0
  - between VREFH and VREFL

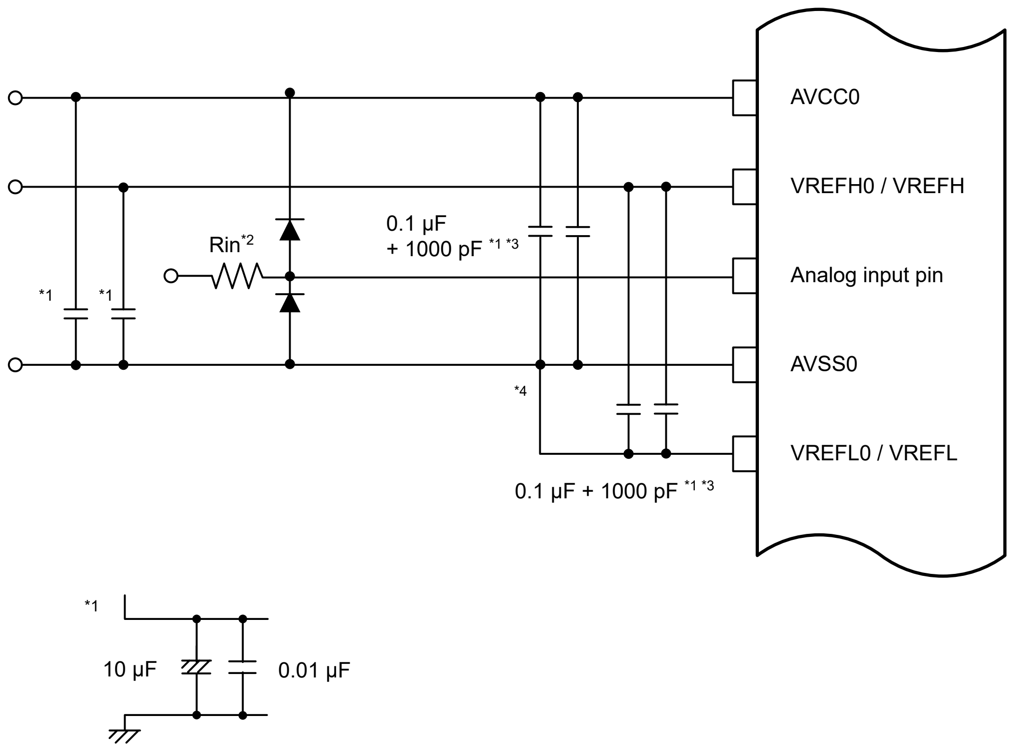
- Connect a protection circuit to protect the analog input pins.

An example of a protection circuit is shown in Figure 53.66.

(2) Board design to ensure A/D conversion accuracy

In order to ensure the accuracy of A/D conversion, design the board considering the following:

- Analog circuits and digital circuits should be separated from each other as far as possible.
- Analog circuit signal lines and digital circuit signal lines should not intersect or be placed near each other.
- The analog input, analog reference power supply (VREFH0, VREFH), analog reference ground (VREFL0, VREFL), and analog power supply (AVCC0) should be separated from digital circuits using the analog ground (AVSS0).
- The analog ground (AVSS0) should be connected to a stable digital ground (VSS) on the board (single-point ground plane connection).
- Place a capacitor for noise filters between analog power supply pin and the ground pin and between analog reference voltage supply pin and the ground pin close to the pin and connect them. Also, connect AVSS0, VREFL0 and VREFL pins to the analog ground on the board as close to the pins as possible. An example of connection is shown in Figure 53.66.



Note 1. The values shown here are for reference only.
The appropriate values depend on your board design, operating conditions, etc.
Note 2. Rin: Signal source impedance
Note 3. To ensure the better A/D conversion accuracy, these capacitors must be place as close as possible to the appropriate pins.
Note 4. Connect to the analog ground of the board at the position as close as possible to the capacitor for noise filtering that ensure the A/D conversion accuracy.

Figure 53.66 Example of protection circuit and noise prevention

53.11.8 Notes on Synchronous Operation

Synchronous operation function is disabled in the initial state after reset released. If using synchronous operation function, follow the restrictions described in section 53.3.19. Synchronous Operation.

53.11.9 Notes on Channel-dedicated Sample-and-hold Circuit

When using channel-dedicated sample-and-hold circuit, follow the restrictions. For details, see section 53.3.16. Channel-dedicated Sample-and-hold Circuit.

53.11.10 Restrictions on Analog Channel Shared Among Multiple A/D Converters (ADC16H) and High-Speed Analog Comparator (ACMPHS)

To avoid degradation of the accuracy of the A/D conversion result, A/D conversion of the same analog channel (same analog signal source) from both ADC0 and ADC1 is prohibited. Also, an analog source during A/D conversion should not be selected as an input for ACMPHS.

If this restriction is violated, the A/D conversion results are not guaranteed because the A/D conversion accuracy of the target analog channel may deteriorate significantly.

For the A/D conversion targets in Table 53.64, unit 0 and unit 1 cannot perform A/D conversion at the same time.

Table 53.64 A/D conversion targets that are mutually exclusive with each other

A/D conversion target	
Unit 0	Unit 1
AN016	
AN017	
AN018	
AN019	
AN020	
AN021	
AN022	
Temperature sensor	
Internal reference voltage	
VBATT 1/6 voltage monitor output	
D/A converter channel 0	
D/A converter channel 1	

The A/D conversion targets in Table 53.65 should not be selected as ACMPHS input during A/D conversion, because these pins are multiplexed with the ADC16H and ACMPHS.

Table 53.65 A/D conversion targets that are mutually exclusive with ACMPHS (1 of 2)

A/D conversion target

D/A converter channel 1	D/A converter channel 1	ACMPHS0 to ACMPHS3.IVCMP1

53.11.11 Notes on A/D Conversion Start Trigger

(1) Restrictions on A/D conversion start triggers for the same scan group

A/D conversion start triggers for the same scan group are not accepted until scanning operation of the scan group is completed, except Background continuous scan mode and One-channel continuous scan mode (in this case, A/D converter start triggers are ignored).

An A/D conversion trigger for the same scan group should be input after the scanning operation of its scan group is completed (ADSCANENDSR.SCENDFn = 1 (n = 0 to 8)) and after 6 PCLKA clock cycles or more have elapsed.

(2) Prohibition on calibration and A/D conversion

It is prohibited to start calibration and A/D conversion in the ADC unit during sleep operation. In addition, it is prohibited to set the ADC unit to Sleep mode during calibration and A/D conversion operations.

53.11.12 Notes on Self-calibration

Observe the restrictions on self-calibration function. For details, see section 53.3.8. Self-calibration.

53.11.13 Notes on Group Priority Operation

Observe the restrictions when using group priority operation. For details, see section 53.3.18. Group Priority Operation.

53.11.14 Restrictions on SAR Mode

(1) Notes on resolution and accuracy

In SAR mode, the A/D converter functions as a 12-bit A/D converter. Although the data output from the A/D converter is internally extended to 16-bit data length for calculation processing, even if 14-bit or 16-bit length data format is selected, the resolution and accuracy exceeding 12 bits are not guaranteed for that A/D conversion data. Select 14-bit or 16-bit length data format in SAR mode if you want to increase the computational resolution, such as when using A/D-converted value addition/averaging function or User’s Gain/User’s Offset function.

(2) Restrictions on digital filter function

The digital filter is prohibited in SAR mode. Operation is not guaranteed when the digital filter function is enabled.

53.11.15 Restrictions on Oversampling Mode

(1) Restrictions on digital filter configuration

In Oversampling mode, the use of the digital filter function is mandatory. If A/D conversion is performed without using the digital filter function, the A/D conversion characteristics are not guaranteed.

(2) Restrictions on trigger interval in One-channel continuous scan mode

In Oversampling mode – One-channel continuous scan mode, A/D conversion start trigger should be input after the following intervals.

[Required intervals for A/D conversion start trigger input]

- When trigger delay function is not used, or software trigger is used: 8 ADCLK or more
- When trigger delay function is used: (8 + (the setting value of ADTRGDLRm.TRGDLYn[7:0])) × ADCLK, or more

Note: m = 0 to 4, n = 0 to 8

If this restriction is violated, the A/D conversion start trigger is not accepted and is ignored.

53.11.16 Restrictions on Hybrid Mode

(1) Prohibition of scanning operation with only one channel

In Hybrid mode, be sure to assign two or more virtual channels to one scan group (up to 4 virtual channels). Scanning operation with only one virtual channel assigned to one scan group is prohibited. If this restriction is violated, operation is not guaranteed.

(2) Restrictions on virtual channel configuration

In Hybrid mode, do not assign the same analog channel to multiple virtual channels that are assigned to the same scan group. If this restriction is violated, A/D conversion result is not guaranteed.

(3) Restrictions on digital filter configuration

In Hybrid mode, the use of the digital filter function is mandatory. If A/D conversion in Hybrid mode is performed without using the digital filter function, the A/D conversion characteristics are not guaranteed.

In addition, since multiple digital filters are used simultaneously in Hybrid mode, the digital filters used for virtual channels in the same scan group must be set to be exclusive. The digital filters selected by the ADDOPCRAn.DFSEL[2:0] (n = 0 to 32) bits must be set to be exclusive among virtual channels in the same scan group. If the same digital filter is selected from multiple virtual channels in the same scan group, operation is not guaranteed.

(4) Restrictions on A/D-converted value addition/averaging function

When using A/D-converted value addition/averaging function in Hybrid mode, set the number of addition/averaging times for all virtual channels in the same scan group to be the same. If this restriction is violated, operation is not guaranteed.

(5) Restrictions on trigger interval in Background continuous scan mode

In Hybrid mode – Background continuous scan mode, A/D conversion start trigger should be input after the following interval or more.

[Required Interval for A/D Conversion Start Trigger Input]

- When trigger delay function is not used, or software trigger is used: 8 ADCLK, or more
- When trigger delay function is used: (8 + (the setting value of ADTRGDLRm.TRGDLYn[7:0])) × ADCLK, or more

Note: m = 0 to 4, n = 0 to 8

If this restriction is violated, the A/D conversion start trigger is not accepted and is ignored.

(6) Restrictions on Fixed-channel continuous scan mode

Observe the restrictions on Hybrid mode – Fixed-channel continuous scan mode.

- Fixed channels in Fixed-channel continuous scan mode use the scan group and virtual channels determined for each unit. See Table 53.66 for the scan group and virtual channels that can be assigned to fixed channels. The scan group setting for virtual channels that can be assigned to a fixed channel should be set to the no setting (ADCHCRn.SGSEL[4:0] = 0x00 (n = 0 to 32)).

Table 53.66 Virtual channel number of Fixed-channel continuous scan mode (1 of 2)

Unit	Unit 0	Unit 1
Scan group	Scan group 0	Scan group 1
1st Fixed channel	Virtual channel 0	Virtual channel 4
2nd Fixed channel	Virtual channel 1	Virtual channel 5

Table 53.66 Virtual channel number of Fixed-channel continuous scan mode (2 of 2)

Unit	Unit 0	Unit 1
3rd Fixed channel	Virtual channel 2	Virtual channel 6

- The scan period must be set to a number equal to or greater than the total number of conversions for fixed channels and non-fixed channels. If the scan period is set to less than the total number of conversions for fixed and non-fixed channels, conversion cycles beyond the scan period are not subject to A/D conversion.
- To prevent scan cycle variations due to non-fixed channels, set the same time for all virtual channel sampling states (ADSSTRx.SSTy[9:0]) used for non-fixed channels.
- Before starting scan in this mode, it is necessary to set ADMDR.ADMDm[3:0] = 0000 (m = 0, 1) and perform gain/offset calibration for SAR. The gain/offset correction coefficients for SAR are prepared separately from the correction coefficients for Hybrid that are calculated by the gain/offset calibration performed in this mode. These correction factors are used to correct the conversion results for fixed and non-fixed channels respectively.
- The use of fixed channels and non-fixed channels in fixed channel scanning in addition/average mode is prohibited.
- When using fixed-channel continuous scan mode, also perform gain/offset calibration for SAR mode (single scan mode).

For more details on Fixed-channel continuous mode, see section 53.3.7.9. Hybrid Mode – Fixed-channel Continuous Scan Mode.

(7) Restrictions on High Accuracy Mode

In Hybrid mode, enable High accuracy mode.

53.11.17 Restrictions on Composite Compare Match

The use of a common compare table for multi units is prohibited for composite compare match function. If selected, the composite condition MATCH interrupt is asserted when the condition is satisfied at any unit. When the condition is not satisfied for all units, the compound condition UNMATCH interrupt is asserted.

53.11.18 Restrictions on High Accuracy Mode Setting Register

When the High accuracy mode is used (ADACMDR.ADHACMDn (n = 0,1) = 1), observe the following setting restrictions.

- ADSSTRn.SSTm[9:0] ≥ ADCNVSTR.CSTn (n = 0, 1) [5:0] × 1.6
- ADSSTRn.SSTm[9:0] ≥ 10’h4
- ADSSTRn.SSTm[9:0] is set to a multiple of 2
- When synchronous operation is used, the synchronous operation period should be set as follows.
  - ADSYCR.ADSYCYC[7:0] × i = ADSSTRn.SSTm[9:0] + ADCNVSTR.CSTn[5:0]
    (i: Any even number or equal to 1 (i = 1, 2, 4, 6…))
- High accuracy mode can only be used with SAR mode or Hybrid mode. The scan modes supported by high accuracy mode are shown in Table 53.67.

Table 53.67 Scan modes supported by high accuracy mode

Operation mode of A/D converter	High accuracy mode	
	Disabled (ADACMDR.ADHACMDn = 0)	Enabled (ADACMDR.ADHACMDn = 1)
SAR mode	✓	✓
Oversampling mode	✓	—
Hybrid mode	—	✓

53.11.19 Restrictions on Measuring of VBATT Voltage Monitor Output

When measuring VBATT 1/6 voltage monitor output, perform two or more A/D conversions and ignore the first conversion result, or perform multiple A/D conversions and use the average of the conversion results.

53.11.20 Sampling Error and Sampling Time Estimation

This subsection describes how to estimate the sampling error and the sampling time.

The sampling time required in A/D conversion for externally input analog signal is determined by the charging time to the sampling capacitance in A/D converter. The simplified model of the circuit is shown in Figure 53.67.

The sampling time can be roughly estimated by the following equation.

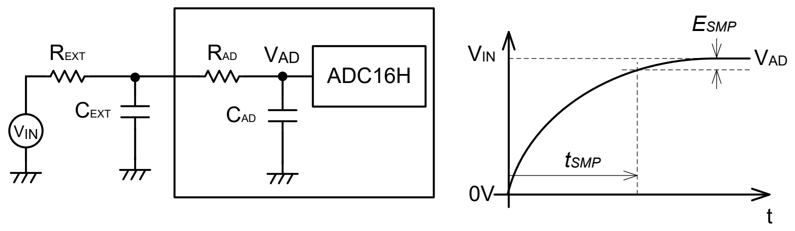

Figure 53.67 Simplified model of sample-and-hold circuit for A/D converter

You can estimate the sampling error (0 to 1, it is 1 when V_{IN}=VREFH0/VREFH). Set sampling time (t_{SMP}) so that sampling error (E_{SMP}) is within the expected range.

[Estimation Equation for Sampling Error]

$$E_{SMP}(t) = \frac{\dfrac{k_1 C_{AD}}{C_{EXT} + k_1 C_{AD}}}{1 - \dfrac{C_{EXT}}{C_{EXT} + k_1 C_{AD}} e^{\frac{-t_{SCAN} + t_{SMP}/k_2\left(1 - \frac{\tau_{EXT}}{\tau}\right)}{\tau_{EXT}}}} e^{\frac{-t_{SMP}/k_2}{\tau}}$$

$$\tau = R_{EXT}(C_{EXT} + k_1 C_{AD}) + R_{AD} k_1 C_{AD}$$

$$\tau_{EXT} = R_{EXT} C_{EXT}$$

E_{SMP}: Estimated sampling error

t_{SMP}: Sampling time

C_{EXT}: External capacitance (pin capacitance + PCB parasitic capacitance)

C_{AD}: Internal sampling capacitance

R_{EXT}: External input signal source Impedance

R_{AD}: Internal resistance

k_1,k_2: Correction coefficients according to operation mode

t_{SCAN}: Channel scan interval

Figure 53.68 shows definition of channel scan interval.

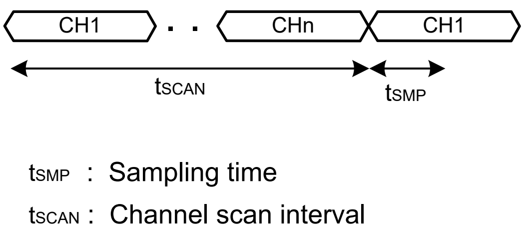

Figure 53.68 Definition of channel scan interval

Note: The typical values for each parameter are as follows.

These are reference value:

- Internal sampling capacitance (C_{AD}): 7 pF

Table 53.68 Reference values of k_1, k_2

Power	Scan mode	k_1		k_2
		High-speed channels (AN000 to AN011) Low-speed channels (AN016 to AN022)	Middle-speed channels (AN012 to AN015)	
AVCC: 2.7 to 3.63 V VCC: 2.7 to 3.63 V VREFH0/VREFH: 2.7 V to AVCC	SAR mode (Normal mode)	1.3	1.3	1.0
	SAR mode (High accuracy mode)	1.3	1.3	1.8
	Oversampling mode	1.0	1.0	1.0
	Hybrid mode	1.3	1.3	1.8
AVCC: 1.62 to 2.7 V VCC: 1.62 to 2.7 V VREFH0/VREFH: 1.62 V to AVCC	SAR mode (Normal mode)	1.2	1.3	1.0
	SAR mode (High accuracy mode)	1.2	1.3	1.8
	Oversampling mode	1.0	1.0	1.0
	Hybrid mode	1.2	1.3	1.8

Table 53.69 Reference values of RAD

Power	RAD (Ω)		
	High-speed channels (AN000 to AN011)	Middle-speed channels (AN012 to AN015)	Low-speed channels (AN016 to AN022)
AVCC: 2.7 to 3.63 V VCC: 2.7 to 3.63 V VREFH0/VREFH: 2.7 V to AVCC	700	2000	3000
	1500	3000	5000

[Usage Notes]

- Sampling time must be greater than or equal to the min value of the sampling time specified on section 62, Electrical Characteristics and restrictions in this chapter.
- The equation described in this subsection is simplified in view of general use case. It does not guarantee the accurate sampling error and sampling time. You should only use it to estimate the roughly sampling error and sampling time.

53.11.21 Port Settings When Using the ADC16H Input

When using the high-speed and middle-speed channels (AN000 to AN015), do not use PORT0 as digital output ports. Renesas recommends that you do not use the digital output that is also used as the AD analog input if low-speed channel (AN016 to AN022) is used. If the digital output that is also used as the AD analog input is used for output signals, perform A/D conversion several times, eliminate the maximum and minimum values, and obtain the average of the other results.

53.11.22 Notes on Simultaneous Operation with Other Modules

The following combinations may degrade the ADC accuracy depending on the specific timing of operation.

- All channels of ADC unit 1 when DAC12 is operated.
- All channels of ADC unit 0 and 1 when there is access to the external bus.
- Specific channels of ADC unit 0 and 1 when ACMPHS is operated. For details, see Table 53.65.

To mitigate deterioration, it is recommended to take following measures.

- Performing A/D conversion with average mode.
- For even better results, performing A/D conversion several times, eliminate the maximum and minimum values, and obtain the average of the other results.

54. 12-Bit D/A Converter (DAC12)

54.1 Overview

This is the DAC_B version of the DAC12 peripheral module. DAC_B is referred to as DAC12 in this chapter.

The MCU provides a 12-bit D/A Converter (DAC12). Table 54.1 lists the DAC12 specifications, Figure 54.1 shows a block diagram, and Table 54.2 lists the I/O pins.

Table 54.1 DAC12 specifications

Parameter	Specifications
Resolution	12 bits
Output channels	2 channels
Module-stop function	Module-stop state can be set to reduce power consumption
Event link function (input)	The DA0 and DA1 conversion can be started on input of an event signal
Destination of D/A output control function	Controls whether the output to the external pin or to the internal modules (ACMPHS and ADC16H) is used
TrustZone Filter	Security and Privilege attribution can be set

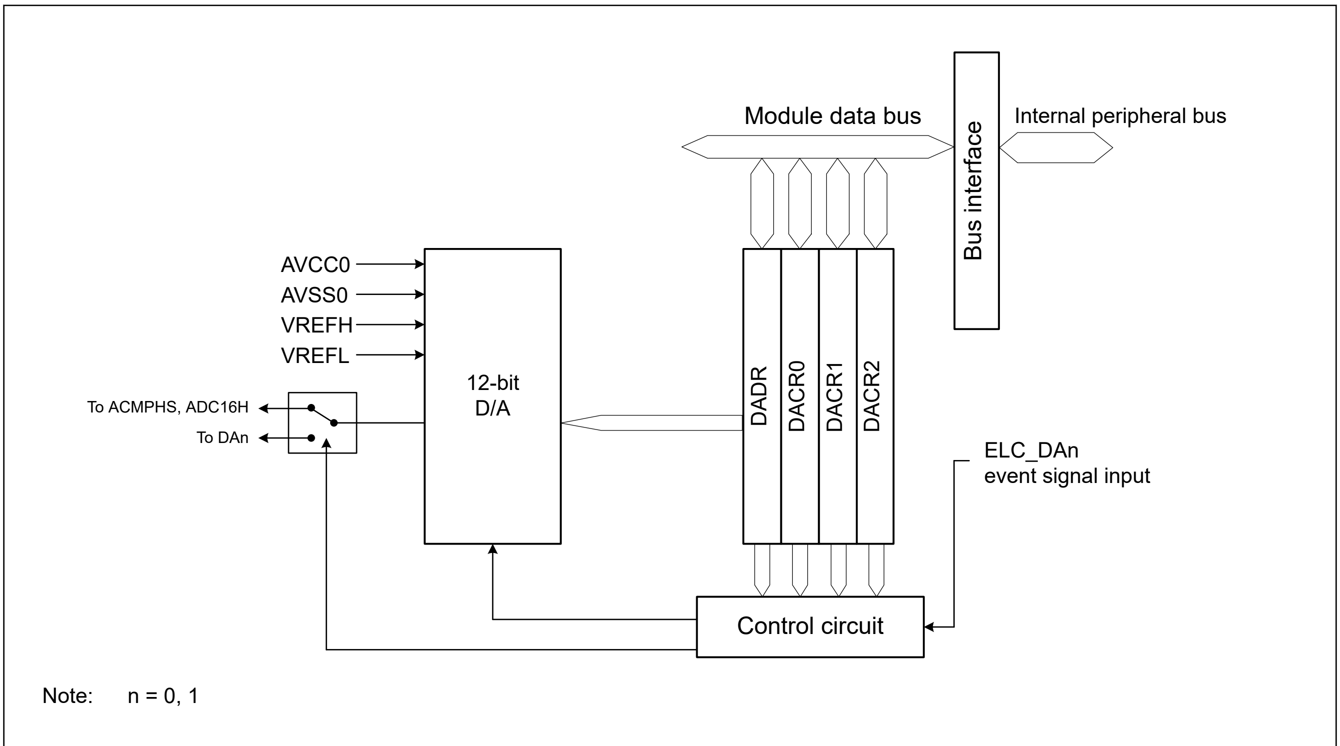

Figure 54.1 DAC12 block diagram

Table 54.2 lists the pin configuration of the DAC12.

Table 54.2 DAC12 I/O pins (1 of 2)

Pin name	I/O	Function
AVCC0	Input	• Analog power and analog reference top voltage supply pin for ADC16H and DAC12. • Connect to VCC when these modules are not used.
AVSS0	Input	• Analog ground and analog reference ground supply pin for ADC16H and DAC12. • Connect to VSS when these modules are not used.
VREFH	Input	Analog reference top voltage supply pin for the ADC16H (unit 1) and the DAC12
VREFL	Input	Analog reference ground pin for the ADC16H (unit 1) and the DAC12

Table 54.2 DAC12 I/O pins (2 of 2)

Pin name	I/O	Function
DA0	Output	Channel 0 output pin for the analog signals processed by the DAC12
DA1	Output	Channel 1 output pin for the analog signals processed by the DAC12

54.2 Register Descriptions

54.2.1 DADR : D/A Data Register

Base address: DACn_B = 0x4023_3000 + 0x0100 × n (n = 0, 1)
DACn_B_NS = 0x5023_3000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0000

Bit position:	15															0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: S-TYPE-3, P-TYPE-3

DADR register is 16-bit read/write registers that store data for D/A conversion. When an analog output is enabled, the values in DADR are converted and output to the analog output pins.

12-bit data can be formatted as left- or right-justified in the DACR1.DPSEL bit setting. In right-justified format (DACR1.DPSEL = 0), the lower 12 bits, [11:0], are valid. In left-justified format (DACR1.DPSEL = 1), the upper 12 bits, [15:4], are valid.

54.2.2 DACR0 : D/A Control 0 Register

Base address: DACn_B = 0x4023_3000 + 0x0100 × n (n = 0, 1)
DACn_B_NS = 0x5023_3000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DAOU TDIS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DAE*1	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DACE N
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DACEN	D/A Output Enable 0: Disable analog output of channel n (DAn) 1: Enable D/A conversion of channel n (DAn)	R/W
14:1	—	These bits are read as 0. The write value should be 0.	R/W
15	DAE*1	D/A Enable R/W 0: Control D/A conversion of channels 0 and 1 individually 1: Control D/A conversion of channels 0 and 1 collectively	R/W
30:16	—	These bits are read as 0. The write value should be 0.	R/W
31	DAOUTDIS	Analog Output Disables 0: The output to pin is enabled and the output to comparator is disabled 1: The output to pin is disabled and the output to comparator is enabled	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. This bit controls D/A conversion in combination with the DACR0.DACEN bit (n = 0, 1), which controls the output of the conversion results. For details, see Table 54.3.

Table 54.3 D/A conversion controls

DACR0.DAE of DAC120	DACR0.DAE of DAC121	DACR0.DACEN of DAC120	DACR0.DACEN of DAC121	Description
0	0	0	0	Disable D/A conversion and analog output pins (DA0, DA1)*1
0	0	1	0	● Enable D/A conversion of channel 0 and disable D/A conversion of channel 1 ● Enable analog output of channel 0 (DA0) and disable analog output of channel 1 (DA1)*1
0	0	0	1	● Disable D/A conversion of channel 0 and enable D/A conversion of channel 1 ● Disable analog output of channel 0 (DA0)*1 and enable analog output of channel 1 (DA1)
0	0	1	1	● Enable D/A conversion of channels 0 and 1 ● Enable analog output of channels 0 and 1 (DA0, DA1)
1*2	x	x	x	● Enable D/A conversion of channels 0 and 1 ● Collective enable analog output of channels 0 and 1 (DA0, DA1)
x	1*2	x	x	● Enable D/A conversion of channels 0 and 1 ● Collective enable analog output of channels 0 and 1 (DA0, DA1)

Note: x: Don't care
Note 1. When analog output is disabled, the analog output signal is placed in the Hi-Z state.
Note 2. When security attribution of DAC120 and DAC121 does not match, setting 1 to DAE bit has no effect on D/A conversion and analog output pins.

DACEN bit (D/A Output Enable)

The DACEN bit controls D/A conversion and analog output in combination with the DAE bit. For details, see Table 54.4.

When both the DACEN bit and DAE bit are 0, D/A conversion of channel n (n = 0, 1) is not processed, and no conversion result is output.

DAE bit (D/A Enable R/W)

The DAE bit controls D/A conversion and analog output in combination with the DACEN bit. For details, see Table 54.4.

DAOUTDIS bit (Analog Output Disables)

The DAOUTDIS bit controls the analog output destination of the DAC12. Set 0 to output to the pin or 1 to output to the comparator. It is not possible to output to both the pin and the comparator at the same time.

The event link function can be used to set the DACEN bit to 1. The DACR0.DACEN bit of DAC120 is set to 1 when the event specified in the ELSR12 register of the ELC (ELC_DA0 event) occurs, and output of the D/A conversion results starts. The DACR0.DACEN bit of DAC121 is set to 1 when the event specified in the ELSR13 register of the ELC (ELC_DA1 event) occurs, and output of the D/A conversion results starts.

Table 54.4 D/A conversion and analog output control

DACR0.DAE	DACR0.DACEN	DACR0.DAOUTDIS	Channel n operation	Analog external output of channel n*1	Analog internal output of channel n*2
0	0	x	Stop	Hi-Z	Hi-Z
	1	0	Run	D/A output	Hi-Z
		1	Run	Hi-Z	D/A output
1	x	0	Run	D/A output	Hi-Z
		1	Run	Hi-Z	D/A output

Note: x : Don't care
Note 1. Output to pin
Note 2. Output to ACMPHS and ADC16H

54.2.3 DACR1 : D/A Control 1 Register

Base address: DACn_B = 0x4023_3000 + 0x0100 × n (n = 0, 1)
DACn_B_NS = 0x5023_3000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPSEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W
16	DPSEL	DADR Format Select R/W 0: Right-justified format 1: Left-justified format	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

DPSEL bit (DADR Format Select R/W)

The DPSEL bit controls the data format of the DADR register.

54.2.4 DACR2 : D/A Control 2 Register

Base address: DACn_B = 0x4023_3000 + 0x0100 × n (n = 0, 1)
DACn_B_NS = 0x5023_3000 + 0x0100 × n (n = 0, 1)

Offset address: 0x000C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OFSSEL	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	OFSSEL	DAC Operating Voltage Mode Selection 0: Normal voltage mode (VREFH ≥ 2.7 V) 1: Low voltage mode (VREFH < 2.7 V)	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

OFSSEL bit (DAC Operating Voltage Mode Selection)

The OFSSEL bit controls the optimization of the DAC output voltage according to the analog reference voltage VREFH. When the VREFH voltage is less than 2.7 V, set the OFSSEL bit to 1.

54.3 Operation

The DAC12 performs D/A conversion when the DACR0.DAE bit is 1 or the DACR0.DACEN bit is 1. The output destination of the D/A conversion result can be switched by the DACR0.DAOUTDIS bit value.

When the DACR0.DAOUTDIS bit is 0, the D/A conversion result is output to the DAn pin in the DAC output mode. When the DACR0.DAOUTDIS bit is 1, the D/A conversion result is output to the comparator in the comparator output mode.

The output value (reference) is expressed by the following formula:

$$\frac{\text{Setting in DADR}}{4096} \times \text{VREFH}$$

54.3.1 Configuration Update Transfer the Coefficient Value

Before using the DAC12, the coefficient value should be transferred from extra MRAM. See section 59.10. Configuration Update Transfer.

54.3.2 DAC Output Mode

This following example shows D/A conversion on channel n (n = 0, 1) in DAC output mode. Figure 54.2 shows the timing of this operation.

1. Set the DACR0.DAOUTDIS bit to 1.
2. Set the DACR1.DPSEL bit and the DACR2.OFSSEL bit as required. Set the D/A conversion initial data in the DADR register.
   If the DACR2.OFSSEL bit is set to 0, then set 0x0E0 to the DADR register, otherwise set 0x1F8 to the DADR register as an initial value of starting up D/A conversion.
3. After t_{SU} elapses from the DAOUTDIS bit setting, set the DACR0.DACEN bit or the DACR0.DAE bit to 1.
4. After t_{DISOUT} elapses, set the DACR0.DAOUTDIS bit to 0. The D/A conversion result of the initial value is output to the DAn pin after the time of $t_{DSLPUP2}$.
5. Set the data for D/A conversion to the DADR register.
6. After t_{DCONV2} elapses, the D/A conversion result is output to the DAn pin.

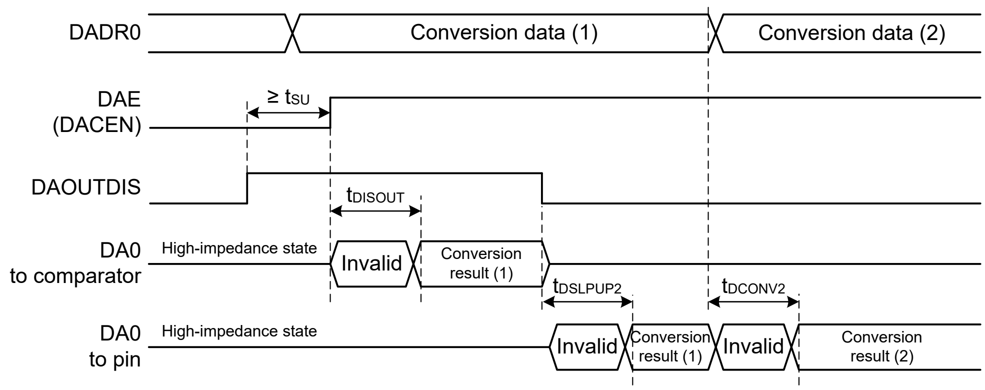

Figure 54.2 Example of DAC12 operation (DAC output mode)

54.3.3 Comparator Output Mode

This following example shows D/A conversion on channel n (n = 0, 1) in comparator output mode. Figure 54.3 shows the timing of this operation.

1. Set the DACR0.DAOUTDIS bit to 1.
2. Set the DACR1.DPSEL bit and the DACR2.OFSSEL bit as required. Set the D/A conversion initial data in the DADR register.
   If the DACR2.OFSSEL bit is set to 0, then set 0x0E0 to the DADR register, otherwise set 0x1F8 to the DADR register as an initial value of starting up D/A conversion.
3. After t_{SU} elapses from the DAOUTDIS bit setting, set the DACR0.DACEN bit or the DACR0.DAE bit to 1.

4. The D/A conversion result of the initial value is output to the comparator after the time of t_{DISOUT}.
5. Set the data for D/A conversion to the DADR register.
6. After t_{DCONV1} elapses, the D/A conversion result is output to the comparator.

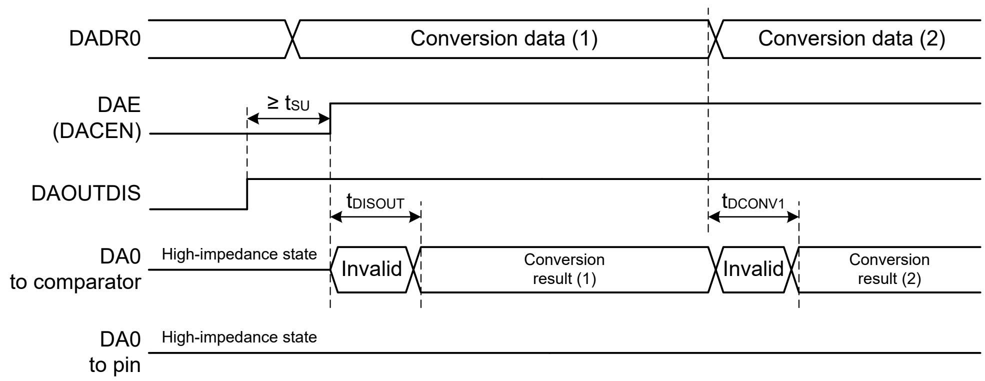

Figure 54.3 Example of DAC12 operation (comparator output mode)

54.4 Event Link Operation Setting Procedure

This section describes the procedures used in event link operation.

54.4.1 DA0 Event Link Operation Setting Procedure

To set up DA0 event link operation:

1. Set the DACR1.DPSEL bit to any value.
2. Set the DACR0.DACEN bit to 0.
3. Set the data for D/A conversion in the DADR.
4. Set the ELC_DA0 event signal to be linked to each peripheral module in the ELSR12 register.
5. Set the ELCR.ELCON bit to 1. This enables event link operation for all modules with the event link function selected.
6. Set the event output source module to activate the event link. After the event is output from the module, the DAC0DACR0.DACEN bit becomes 1, and D/A conversion starts on channel 0.
   The following time is required until the output value stabilizes.
   DAC output mode: 10.5µs
   Comparator output mode: 7µs
7. Set the ELSR12 register to 0x0000 to stop event link operation of DAC12 channel 0. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

54.4.2 DA1 Event Link Operation Setting Procedure

To set up DA1 event link operation:

1. Set the DACR1.DPSEL bit to any value.
2. Set the DACR0.DACEN bit to 0.
3. Set the data for D/A conversion in the DADR.
4. Set the ELC_DA1 event signal to be linked to each peripheral module in the ELSR13 register.
5. Set the ELCR.ELCON bit to 1. This enables the event link operation for all modules with the event link function selected.
6. Set the event output source module to activate the event link. After the event is output from the module, the DACR0.DACEN bit becomes 1, and D/A conversion starts on channel 1.

The following time is required until the output value stabilizes.
DAC output mode: 10.5µs
Comparator output mode: 7µs

7. Set the ELSR13 register to 0x0000 to stop event link operation of DAC12 channel 1. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

54.5 Analog Output Control by Security Attribution

Analog output to DA0/DA1 pin is controlled by the security attribution of Port and DAC12 as shown in Table 54.5.

Analog output to ACMPHS is not controlled by the security attribution.

Table 54.5 Analog output control by security attribution

Security Attribution			Analog Output	
DAC12 (PSARD)	**P014 (PmSAR (m = 0 to 9, A, B))**	**P015 (PmSAR (m = 0 to 9, A, B))**	**P014 pin output**	**P015 pin output**
0 (secure)	1 (non-secure)	1 (non-secure)	enable	enable
0 (secure)	1 (non-secure)	0 (secure)	enable	enable
0 (secure)	0 (secure)	1 (non-secure)	enable	enable
0 (secure)	0 (secure)	0 (secure)	enable	enable
1 (non-secure)	1 (non-secure)	1 (non-secure)	enable	enable
1 (non-secure)	1 (non-secure)	0 (secure)	enable	disable
1 (non-secure)	0 (secure)	1 (non-secure)	disable	enable
1 (non-secure)	0 (secure)	0 (secure)	disable	disable

54.6 Usage Notes on Event Link Operation

- When the event link function is used, set the DACR0.DAE bit to 0.
- When the event specified for the ELC_DA0 event signal is generated while writing to the DACR0.DACEN bit of DAC120 is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- When the event specified for the ELC_DA1 event signal is generated while writing to the DACR0.DACEN bit of DAC121 is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.

54.7 Usage Notes

54.7.1 Settings for the Module-Stop Function

DAC12 operation can be disabled or enabled using the Module Stop Control Register. The DAC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

54.7.2 DAC12 Operation in the Module-Stop State

When the MCU enters the module-stop state with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in the module-stop state, disable D/A conversion by setting the DACR0.DACEN and DACR0.DAE bits to 0.

54.7.3 DAC12 Operation in Software Standby Mode

When the MCU enters Software Standby mode with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in Software Standby mode, disable D/A conversion by setting the DACR0.DACEN and DACR0.DAE bits to 0.

54.7.4 Constraint on Entering Deep Software Standby Mode

When the MCU enters Deep Software Standby mode with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in Deep Software Standby mode, disable D/A conversion by setting the DACR0.DACEN and DACR0.DAE bits to 0.

55. Temperature Sensor (TSN)

55.1 Overview

The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC16H for conversion and can be further used by the end application.

Table 55.1 lists the TSN specifications, and Figure 55.1 shows a block diagram.

Table 55.1 TSN specifications

Item	Description
Temperature sensor voltage output	Temperature sensor outputs a voltage to the A/D converter
Module-stop function	Module-stop state can be set to reduce power consumption
Temperature sensor calibration data	Reference data measured for each chip at factory shipment is stored in a register
Temperature monitor reset source	The sensor outputs an abnormal temperature detection signal to the reset control circuit
TrustZone Filter	Security and Privilege attribution can be set

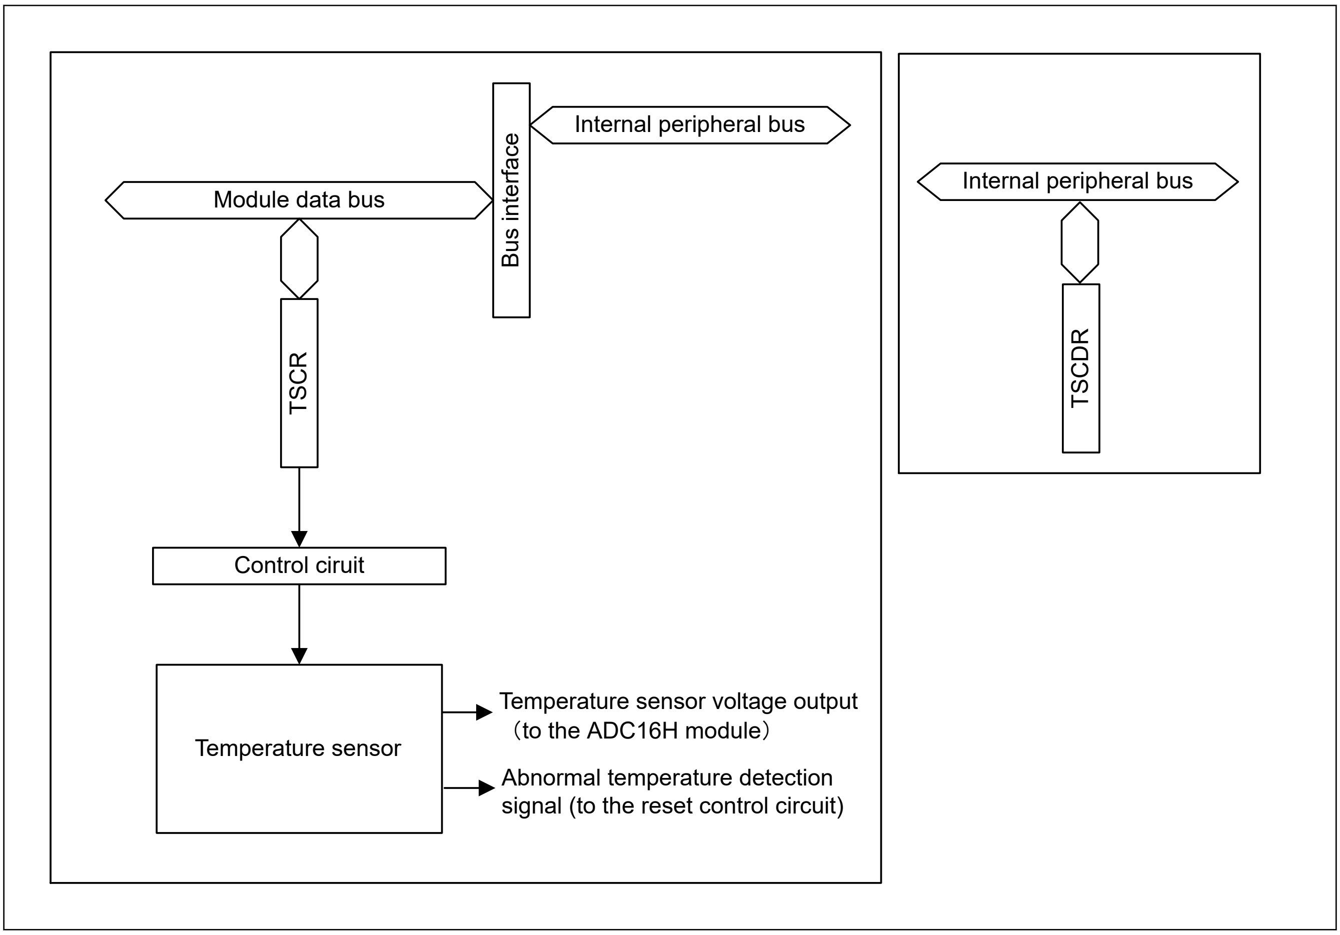

Figure 55.1 TSN block diagram

55.2 Register Descriptions

55.2.1 TSCR : Temperature Sensor Control Register

Base address: TSN = 0x4023_5000
TSN_NS = 0x5023_5000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TSEN	—	—	TSOE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	TSOE	Temperature Sensor Output Enable 0: Disable output from the temperature sensor to the ADC16H 1: Enable output from the temperature sensor to the ADC16H	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TSEN	Temperature Sensor Enable 0: Stop the temperature sensor 1: Start the temperature sensor	R/W

Note: S-TYPE3, P-TYPE3

The TSCR is a register which controls the temperature sensor. The timing constraints shown in Figure 55.3 apply to the settings of the TSCR register.

TSOE bit (Temperature Sensor Output Enable)

The TSOE bit enables or disables the temperature sensor output to ADC16H.

TSEN bit (Temperature Sensor Enable)

The TSEN bit starts or stops the temperature sensor.

55.2.2 TSCDR : Temperature Sensor Calibration Data Register

Base address: TSD = 0x02C1_EDA0
TSD_NS = 0x12C1_EDA0

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TSCD[15:0]															
Value after reset:	Chip-specific value															

Bit	Symbol	Function	R/W
15:0	TSCD[15:0]	Temperature Sensor Calibration Data Chip-specific value	R
31:16	—	These bits are read as 0.	R

Note: S-TYPE5, P-TYPE5

The TSCDR register stores temperature sensor calibration data measured for each chip at factory shipment.

Temperature sensor calibration data is the output voltage of the temperature sensor under the conditions Tj = 125±2 °C or 105±2 °C and AVCC0 = VREFH0 = 3.3 V converted to a digital value by the A/D converter. For details on the measurement temperature condition, see section 55.3.1. Preparation for Using the Temperature Sensor.

The TSCDR register is a read-only 32-bit register. Read from this register in 32-bit units.

Temperature sensor calibration data is stored in the lower 12 bits of the TSCDR register.

55.2.3 TSCDR2 : Temperature Sensor Calibration Data Register 2

Base address: TSD = 0x02C1_EDA0
TSD_NS = 0x12C1_EDA0

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TSCD[15:0]															
Value after reset:	Chip-specific value															

Bit	Symbol	Function	R/W
15:0	TSCD[15:0]	Temperature Sensor Calibration Data Chip-specific value	R
31:16	—	These bits are read as 0.	R

Note: S-TYPE5, P-TYPE5

The TSCDR2 register stores temperature sensor calibration data measured for each chip at factory shipment.

Temperature sensor calibration data is the output voltage of the temperature sensor under the conditions Tj = -40±2 °C and AVCC0 = VREFH0 = 3.3 V converted to a digital value by the A/D converter. For details on the measurement temperature condition, see section 55.3.1. Preparation for Using the Temperature Sensor.

The TSCDR2 register is a read-only 32-bit register. Read from this register in 32-bit units.

Temperature sensor calibration data is stored in the lower 12 bits of the TSCDR2 register.

55.3 Using the Temperature Sensor

The temperature sensor outputs a voltage that varies with the temperature. This voltage is converted to a digital value by the A/D converter. To obtain the die temperature, convert this value into the temperature.

55.3.1 Preparation for Using the Temperature Sensor

The ambient temperature (T) is proportional to the temperature sensor voltage output (Vs), so ambient temperature is calculated with the following formula:

T = (Vs - V1) / slope + T1

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor on temperature measurement (V)
- T1: Temperature experimentally measured at one point (°C)
- V1: Voltage output by the temperature sensor on measurement of T1 (V)
- T2: Temperature experimentally measured at a second point (°C)
- V2: Voltage output by the temperature sensor on measurement of T2 (V)
- Slope: Temperature gradient of the temperature sensor (V / °C), slope = (V2 - V1) / (T2 -T1)

Characteristics vary between sensors, so Renesas recommends measuring two different sample temperatures as follows:

1. Use the A/D converter to measure the voltage V1 output by the temperature sensor at temperature T1.
2. Again use the A/D converter to measure the voltage V2 output by the temperature sensor at a different temperature T2.
3. Obtain the temperature gradient (slope = (V2 - V1) / (T2 - T1)) from these results.
4. Subsequently, obtain temperatures by substituting the slope into the formula for the temperature characteristic (T = (Vs -V1) / slope + T1).

In order to make the temperature Ta and Tj as close as possible, perform the measurement with the power consumption of the MCU as low as possible.

If you are using the temperature gradient given in section 62, Electrical Characteristics, use the A/D converter to measure the voltage V1 output by the temperature sensor at temperature T1, then calculate the temperature characteristic using the following formula:

T = (Vs - V1) / slope + T1

Note: This method produces less accurate temperatures than measurement at two points.

In this MCU, the TSCDR register and TSCDR2 register store the temperature values of the temperature sensor measured under the condition Ta = Tj = 125±2 °C or 105±2 °C, -40±2 °C and AVCC0 = VREFH0 = 3.3 V. If you use this value as the sample measurement result at the first and second points, you can omit the preparation before using the temperature sensor.

In case of Tj Max = 125 °C*1, the TSCDR register and TSCDR2 register store the temperature values (CAL125 and CAL-40) of the temperature sensor measured under the condition Ta = Tj = 125±2 °C, -40±2 °C and AVCC0 = VREFH0 = 3.3 V.

V1 is calculated from CAL125 or CAL-40:

V1 = 3.3 × CAL125 or CAL-40 / 4096 [V] (for 12 bits accuracy)

Using this value, the measured temperature can be calculated according to the following formula:

T = (Vs - V1) / slope + 125 or -40 [°C]

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor when the temperature is measured (V)
- V1: Voltage output by the temperature sensor when Ta = Tj = 125 or -40°C and AVCC0 = VREFH0 = 3.3 V (V)
- Slope: Temperature gradient of the temperature sensor*2 / 1000 (V/°C)
  Slope also can be obtained by using TSCDR register or TSCDR2 register value as the sample measurement result at the second point.

In case of Tj Max = 95 °C or 105 °C*1, the TSCDR register and TSCDR2 register store the temperature values (CAL105 and CAL-40) of the temperature sensor measured under the condition Ta = Tj = 105±2 °C, -40±2 °C and AVCC0 = VREFH0 = 3.3 V. The TSCDR2 register stores the temperature value of the temperature sensor measured under the condition Ta = Tj = -40±2 °C and AVCC0 = VREFH0 = 3.3 V.

V1 is calculated from CAL105 or CAL-40.

V1 = 3.3 × CAL105 or CAL-40 / 4096 [V] (for 12 bits accuracy)

Using this value, the measured temperature can be calculated according to the following formula:

T = (Vs - V1) / slope + 105 or -40 [°C]

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor when the temperature is measured (V)
- V1: Voltage output by the temperature sensor when Ta = Tj = 105 or -40 °C and AVCC0 = VREFH0 = 3.3 V (V)
- Slope: Temperature gradient of the temperature sensor*2 / 1000 (V/°C)
  Slope also can be obtained by using TSCDR register or TSCDR2 register value as the sample measurement result at the second point.

Note 1. The upper limit of operating junction temperature is 95 °C, 105 °C or 125 °C, depending on the product. For details, see section 1.3. Part Numbering.
Note 2. See section 62, Electrical Characteristics.

55.3.2 Procedures for Measuring Temperature Sensor Using the Temperature Sensor with ADC16H

Figure 55.2 shows the procedure for using the TSN.

For details on the ADC16H setting procedures, see section 53, 16-bit A/D Converter (ADC16H). For details on the TEMPRCR register, see section 6, Resets.

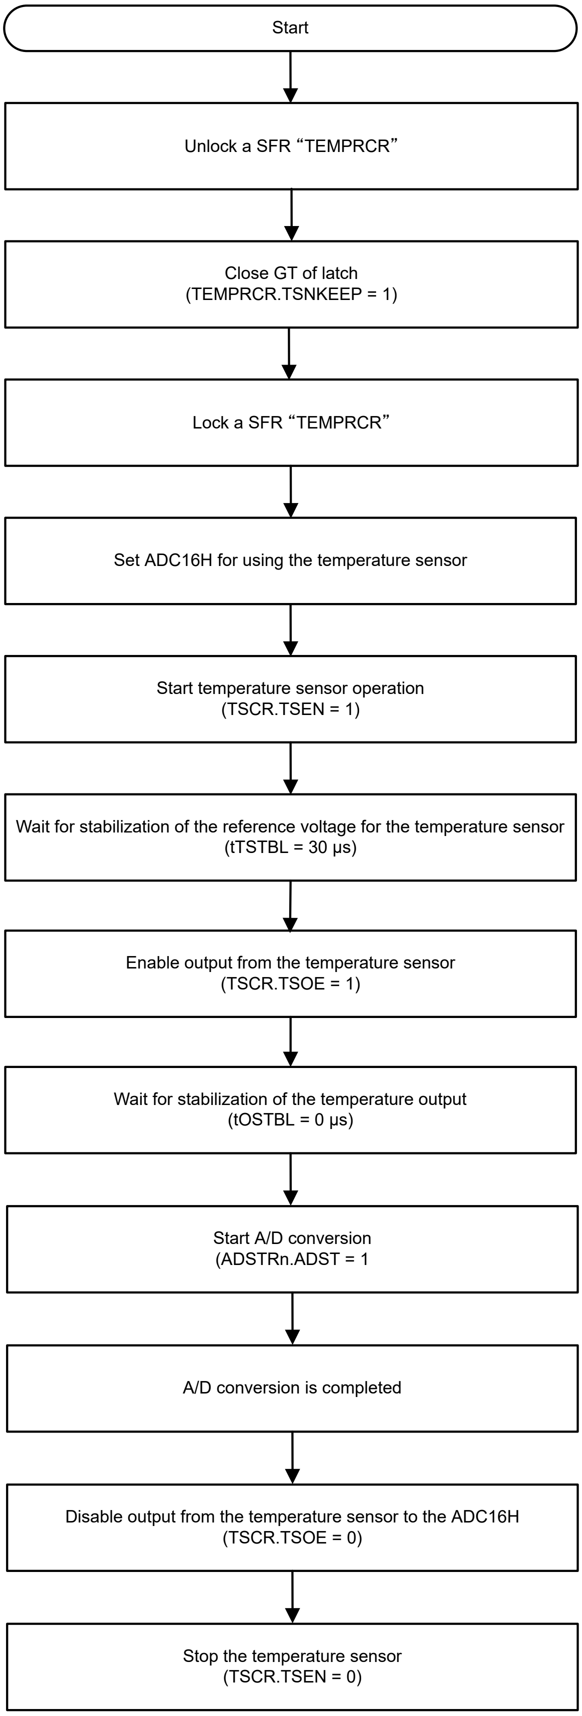

Figure 55.2 Procedure example for measuring temperature using TSN with ADC16H

Figure 55.3 shows the timing from the start of temperature sensor operation until the completion of A/D conversion when the ADC16H is in single scan mode (the conversion target is the temperature sensor output only). The times shown in the figure are described in Table 55.2.

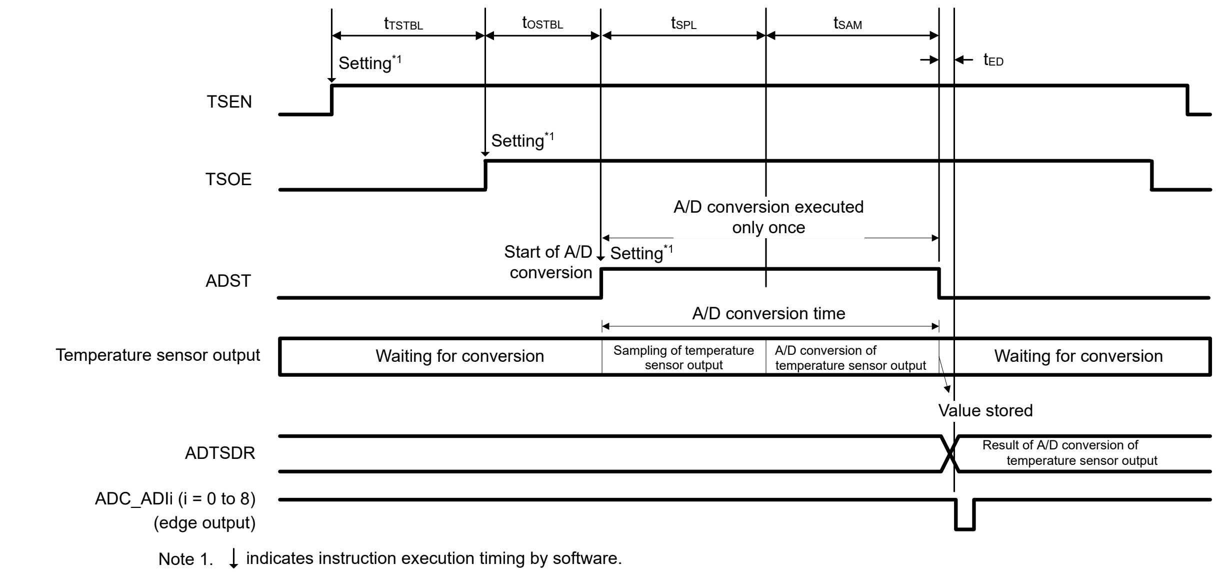

Figure 55.3 Timing from start of temperature sensor operation until completion of A/D conversion

Table 55.2 Time until completion of A/D conversion after start of temperature sensor operation

Parameter	Symbol	Time
Wait time for temperature sensor reference voltage stabilization	t_{TSTBL}	30 μs (min)
Wait time for temperature sensor output stabilization	t_{OSTBL}	0 μs (min)
Wait time for temperature sensor abnormal temperature detection signal stabilization	t_{RSTBL}	30 μs (min)
A/D converter input sampling time	t_{SPL}	ADSSTRn setting × ADCLK period
A/D conversion time	t_{SAM}	See Table XX.XX, Conversion times during scanning (in numbers of cycles of ADCLK and PCLKA) [DEADBEEF].
Scan conversion end delay	t_{ED}	

55.3.3 Procedures for Using the Temperature Monitor Reset

TSN can detect abnormal temperature and generate a signal to the reset circuit. If the temperature is outside the specified detection range*1, reset is issued. The function of temperature monitor reset is enabled using specific procedures that are described in Figure 55.4 and Figure 55.5.

For more information, see section 6.3.12. Temperature Monitor Reset.

Note 1. For details on the detection range of abnormal temperature, see section 62, Electrical Characteristics.

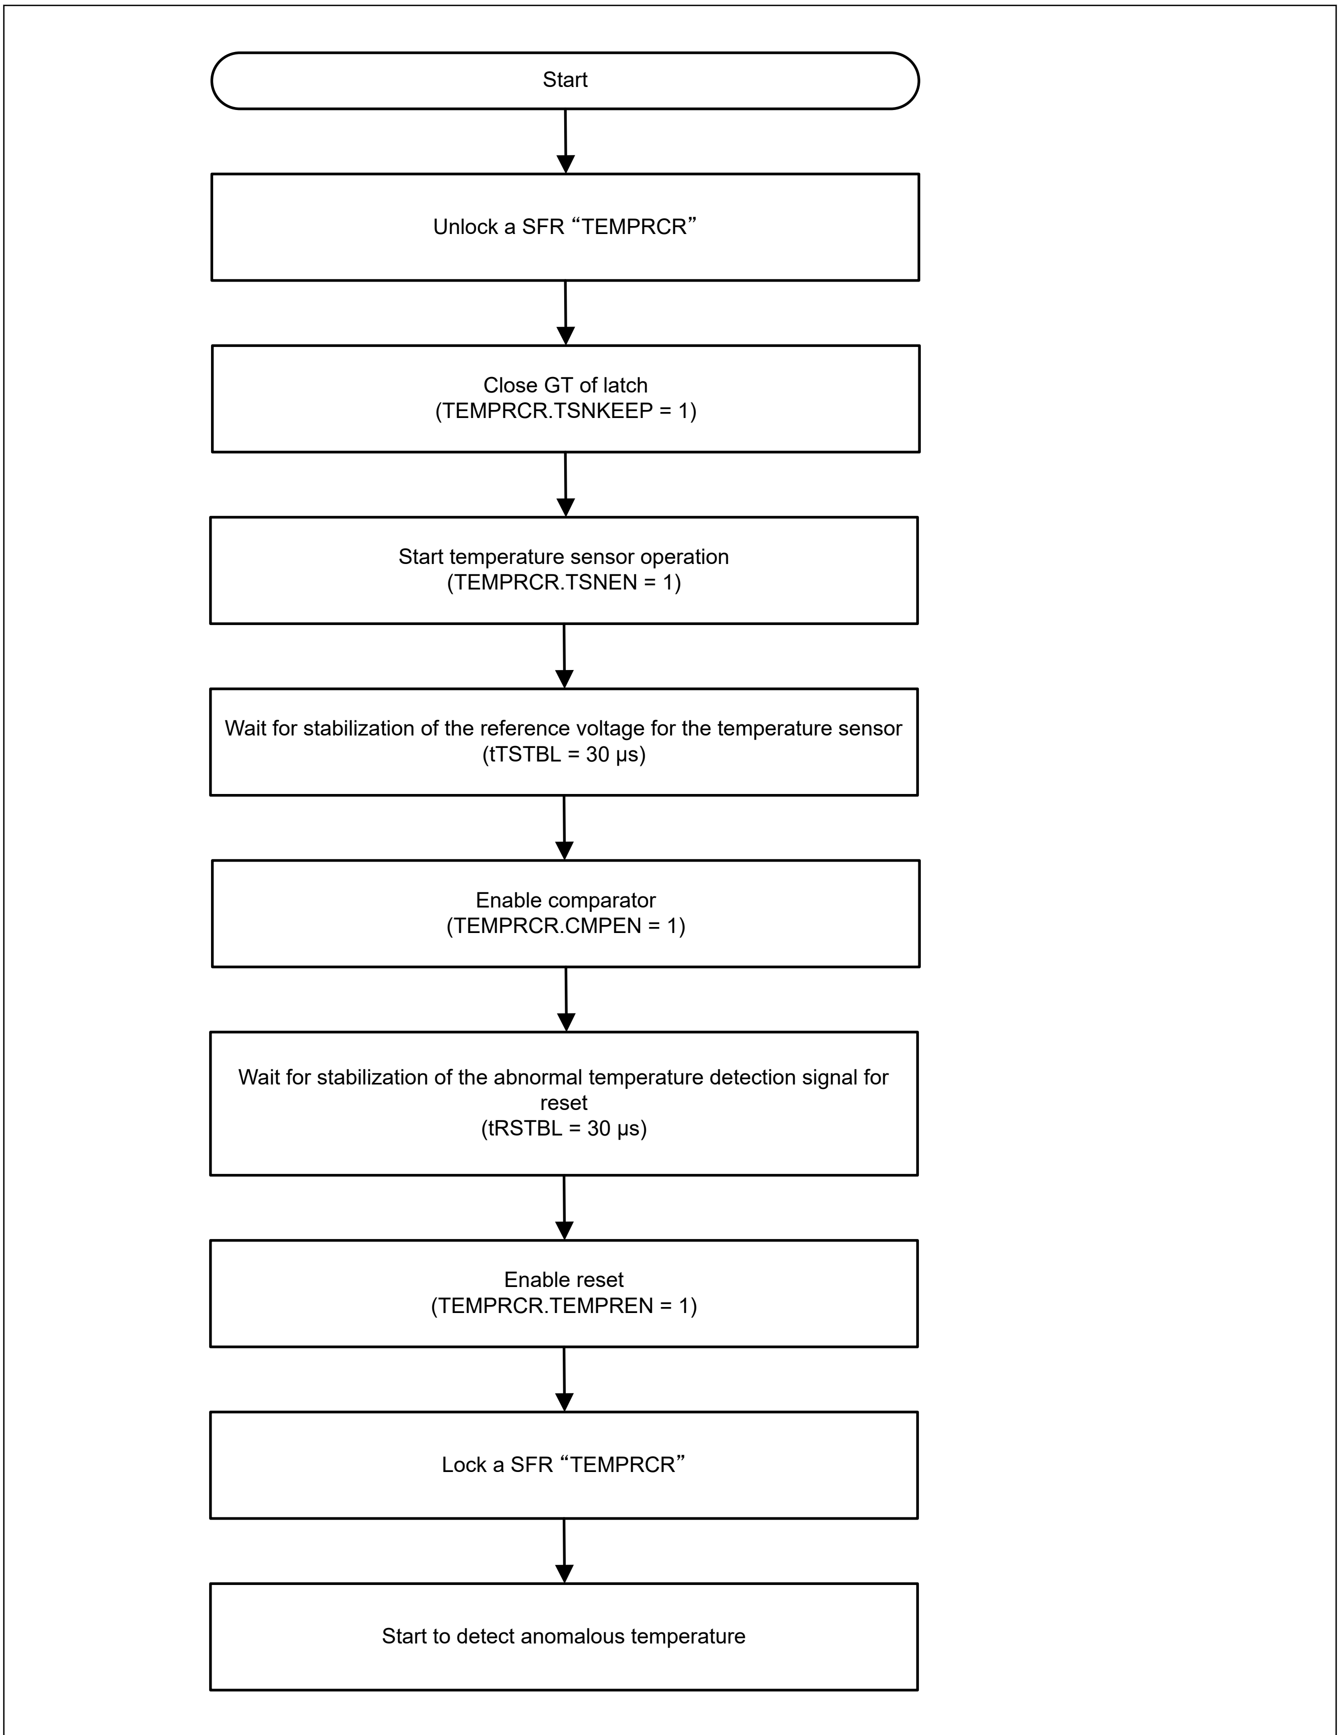

Figure 55.4 Procedure example for enabling temperature monitor reset but not measuring temperature with ADC16H

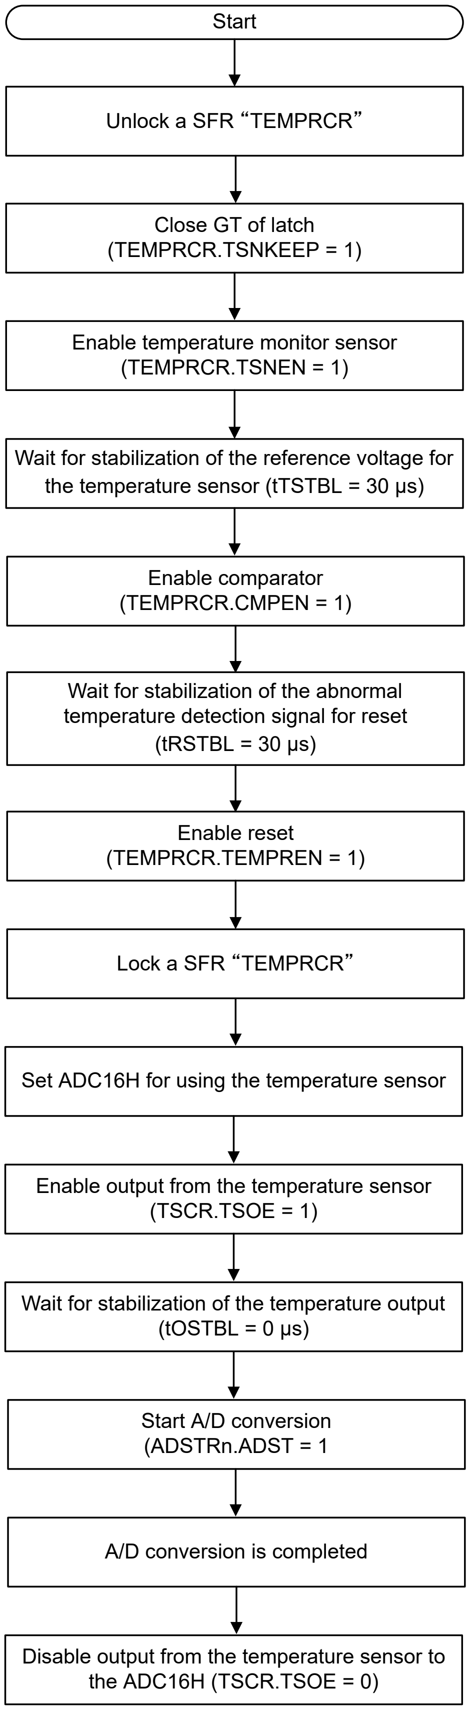

Figure 55.5 Procedure example for enabling temperature monitor reset and measuring temperature with ADC16H

55.4 Usage Notes

55.4.1 Settings for the Module-Stop Function

TSN operation can be disabled or enabled using the associated bit in Module Stop Control Register D (MSTPCRD). The TSN is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

55.4.2 Settings for the Software Standby Mode

Before entering Software Standby mode, set TSCR.TSOE bit to 0 after stopping A/D conversion, then set TSCR.TSEN bit to 0 to stop the TSN. Figure 55.6 shows the procedure for entering Software Standby mode and Figure 55.7 shows the procedure for returning from Software Standby mode.

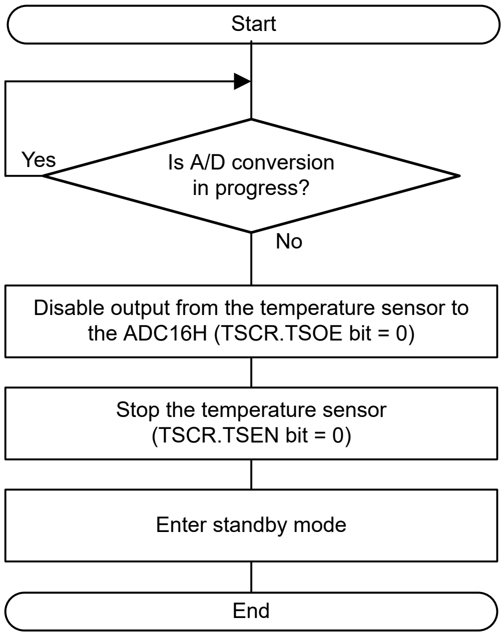

Figure 55.6 Example procedure for entering Software Standby mode

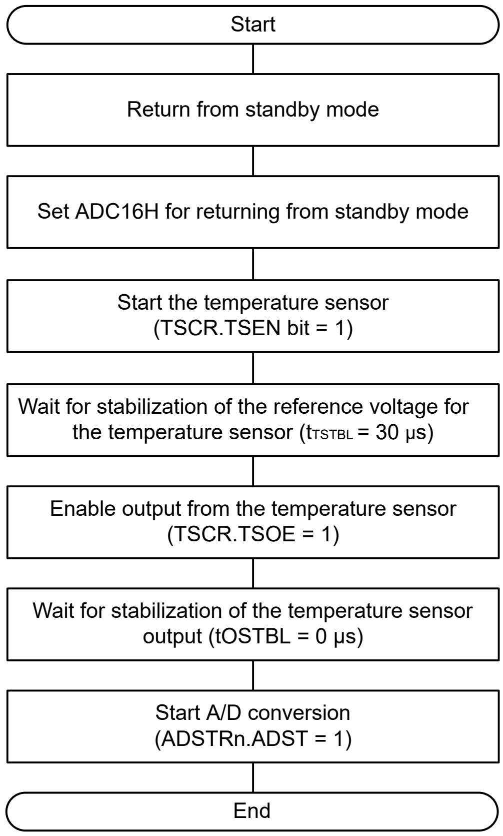

Figure 55.7 Example procedure for returning from Software Standby mode

56. High-Speed Analog Comparator (ACMPHS)

56.1 Overview

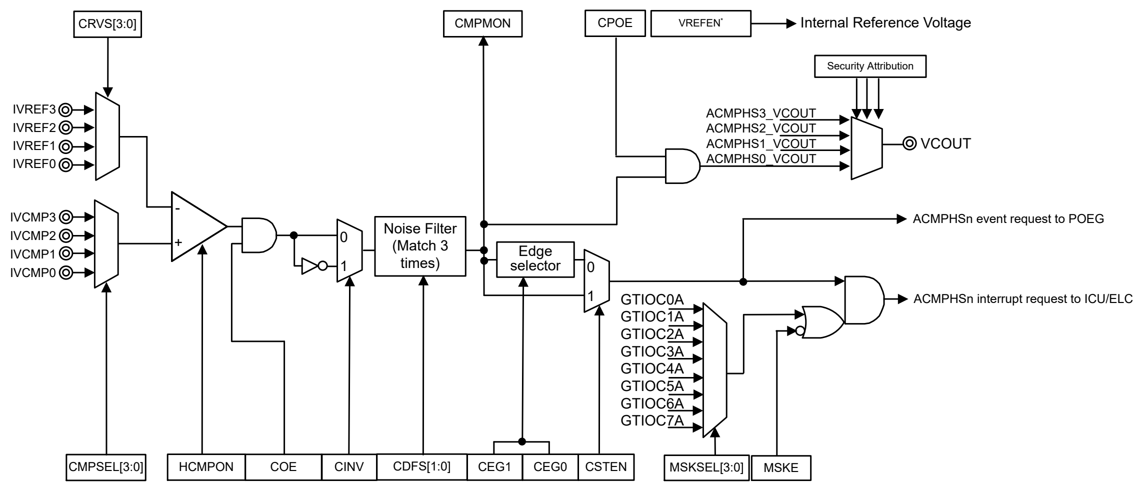
The High-Speed Analog Comparator (ACMPHS) can be used to compare an analog input voltage with a reference voltage and to provide a digital output based on the result of conversion. Both the analog input voltage and the reference voltage can be provided to the ACMPHS from internal sources (D/A converter output or internal reference voltage) and an external source. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion.

Table 56.1 lists the ACMPHS specifications, Figure 56.1 shows a block diagram, and Table 56.2 shows the input source configurations.

Table 56.1 ACMPHS specifications

Parameter	Specifications
Number of channels	4 channels: ACMPHSn (n = 0 to 3)
Analog input voltage	● Output from internal D/A converter ● Input from an external source (compatible with internal A/D converter input pin (one selectable))
Reference voltage	● Internal reference voltage (Vref) ● Output from internal D/A converter ● Input from an external source (compatible with internal A/D converter input pin (one selectable))
ACMPHS output	● Comparison result output to terminal PIN ● Generation of ELC event output ● Monitor output from register ● Generation of interrupt request output
Interrupt request signal	● Interrupt request generated on valid edge detection from comparison result (when CMPCTL.CSTEN = 0*1) ● Selectable to rising edge, falling edge, or both edges (when CMPCTL.CSTEN = 0*1) ● Rising edge only (when CMPCTL.CSTEN = 1*1)
Digital filter function	● Selectable to one of three sampling frequencies ● Not using the filter function is selectable
Module-stop function	Module-stop state can be set for each groups to reduce power consumption.
TrustZone Filter	Security and Privilege attribution can be set for each group

Note 1. Interrupt request signal selection restriction detail refers to section 56.5. ACMPHS Interrupts and section 56.6. ACMPHS Output to the Event Link Controller (ELC).



n = 0 to 3

CMPSEL[3:0] : bits in ACMPHSn.CMPSEL0 register
CRVS[3:0] : bits in ACMPHSn.CMPSEL1 register
CPOE, VREFEN : bits in ACMPHSn.CPIOC register
CMPMON : bits in ACMPHSn.CMPMON register
HCMPON, COE, CINV, CDFS[1:0], CEG1, CEG0, CSTEN : bits in ACMPHSn.CMPCTL register
MSKSEL[3:0] : bits in ACMPHSn.CMPSKCTL register
MSEK : bits in ACMPHSn.CMPINTCTL register

Note: VREFEN exists only in ACMPHS0.

Figure 56.1 ACMPHS block diagram

Table 56.2 Input source configuration of the ACMPHS

Comparator	Reference voltage input source				Analog voltage input source				Output pin
	IVREF3	IVREF2	IVREF1	IVREF0	IVCMP3	IVCMP2	IVCMP1	IVCMP0	
ACMPHS0	DA0	Vref	AN009	AN008	AN001	AN000	DA1	AN017	VCOUT[*1]
ACMPHS1	DA0	Vref	AN009	AN008	AN003	AN002	DA1	AN016	VCOUT[*1]
ACMPHS2	DA0	Vref	AN009	AN008	AN005	AN004	DA1	AN015	VCOUT[*1]
ACMPHS3	DA0	Vref	AN009	AN008	AN007	AN006	DA1	AN014	VCOUT[*1]

Note 1. ACMPHS0 to ACMPHS3 compare outputs are bundled with the VCOUT pin.

56.2 Register Descriptions

56.2.1 CMPCTL : Comparator Control Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x000

Bit position:	7	6	5	4	3	2	1	0
Bit field:	HCMPON	CDFS[1:0]		CEG[1:0]		CSTEN	COE	CINV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CINV	Comparator Output Polarity Selection[*1 *2] 0: Do not invert comparator output 1: Invert comparator output	R/W

Bit	Symbol	Function	R/W
1	COE	Comparator Output Enable 0: Disable comparator output (output signal is low level) 1: Enable comparator output	R/W
2	CSTEN	Interrupt Select*3 0: Output through the edge selector 1: Output directly	R/W
4:3	CEG[1:0]	Selection of Valid Edge (Edge Selector) 0 0: Do not detect edge 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges	R/W
6:5	CDFS[1:0]	Noise Filter Selection *1 *2 *3 *4 0 0: Do not use noise filter 0 1: Use noise filter sampling frequency of PCLKB/2^3 1 0: Use noise filter sampling frequency of PCLKB/2^4 1 1: Use noise filter sampling frequency of PCLKB/2^5	R/W
7	HCMPON	Comparator Operation Control*5 0: Stop operation (comparator outputs a low-level signal) 1: Enable operation (enables input to the comparator pins)	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Disable the ACMPHS output (COE = 0) before changing the CDFS[1:0] and CINV bits.

Note 2. If the CDFS[1:0] and CINV bits are changed, an ACMPHS interrupt request and an ELC event might be generated. Before changing these bits, set the ELSRn register to 0 (the ACMPHS output is not linked). After changing these bits, clear the IR flag in the IELSRn register to 0 to clear the interrupt status.

Note 3. Set the CSTEN bit to 1 and the CDFS[1:0] bits to 00b if the ACMPHS interrupt causes release of Software Standby mode. CSTEN is supported only by the ACMPHS0. ACMPHSn.CMPCTL.CTESN (n = 1 to 3) must be set to 0.

Note 4. If the CDFS[1:0] bits are changed from 00b (noise filter not used) to a value other than 00b (noise filter used), perform sampling four times and update the filter output, and then use the ACMPHS interrupt request or the ELC event.

Note 5. A stabilization wait time is required to permit ACMPHS operation after enabling it (HCMPON = 1). The operation stabilization wait time for ACMPHS modules 0 to 1 is 300 ns.

Note: Set this register before setting registers in the POEG when using comparator output as a POEG source.

The CMPCTL register controls the ACMPHS operation, enables or disables the ACMPHS output, selects the noise filter, selects the valid edge of the interrupt signal, and selects the interrupt.

56.2.2 CMPSEL0 : Comparator Input Select Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x004

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CMPSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CMPSEL[3:0]	Comparator Input Selection*1 *2 *3 0x00: Do not input 0x01: Select IVCMP0 0x02: Select IVCMP1 0x04: Select IVCMP2 0x08: Select IVCMP3 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Use the following procedure to change the CMPSEL[3:0] bits. Writing a value other than 0x00 while the value of the CMPSEL0 register is not 0x00 is invalid. Writing 1 to two or more bits is also invalid. In both cases, the previous value is retained.

To change the CMPSEL[3:0] bits:
1. Set the CMPCTL.COE bit to 0.
2. Set the CMPSEL0 register to 0x00.
3. Set a new value in the CMPSEL[3:0] bits, with 1 set in only one of the bits.
4. Wait for the input switching stabilization wait time (200 ns).
5. Set the CMPCTL.COE bit to 1.
6. Clear the IR flag in the IELSRn register to clear the interrupt status.

Note 2. For details, see Table 56.2.
Note 3. If ACMPHSn level detection signal is used as a POEG source, write access to these bits after the setting of any register in the POEG may generate a POEG source.

56.2.3 CMPSEL1 : Comparator Reference Voltage Select Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x008

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CRVS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CRVS[3:0]	Reference Voltage Selection*1*2*3*4 0x00: Do not input 0x01: Select IVREF0 0x02: Select IVREF1 0x04: Select IVREF2 0x08: Select IVREF3 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Use the following procedure to change the CRVS[3:0] bits. Writing a value other than 0x00 while the value of the CMPSEL1 register is not 0x00 is invalid. Writing 1 to two or more bits is also invalid. In both cases, the previous value is retained.
To change the CRVS[3:0] bits:
1. Set the CMPCTL.COE bit to 0.
2. Set the CMPSEL1 register to 0x00.
3. Set a new value to the CRVS[3:0] bits, with 1 set in only one of the bits.
4. Wait for the input switching stabilization wait time (200 ns)
5. Set the CMPCTL.COE bit to 1.
6. Clear the IR flag in the IELSRn register to clear the interrupt status.

Note 2. For details, see Table 56.2.
Note 3. When the on-chip D/A converter output voltage is used, set the D/A converter to generate comparator reference voltage before enabling comparator operation (CMPCTL.HCMPON = 1). For details on setting the D/A converter, see section 54, 12-Bit D/A Converter (DAC12).
Note 4. If ACMPHSn level detection signal is used as a POEG source, write access to these bits after the setting of any register in the POEG may generate a POEG source.

56.2.4 CMPMON : Comparator Output Monitor Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x00C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	COMPMON
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	COMPMON	Comparator Output Monitor*1 0: Comparator output is low 1: Comparator output is high	R
7:1	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

Note 1. When ACMPHS operation is enabled (CMPCTL.HCMPON = 1 and CMPCTL.COE = 1) but the noise filter is not in use (CDFS[1:0] = 00b), design the software so that the COMPMON bit is read twice and the values are only used after the two consecutive values match.

56.2.5 CPIOC : Comparator Output Control Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x010

Bit position:	7	6	5	4	3	2	1	0
Bit field:	VREFEN	—	—	—	—	—	—	CPOE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPOE	External Pin Output Enable Comparison result by the comparator is output to an external pin. 0: Output to the comparator external pin is disabled (the output signal is fixed to low) 1: Output to the comparator external pin is enabled	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	VREFEN	Internal Vref Enable*1 0: Disable internal Vref 1: Enable internal Vref	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. For ACMPHS modules 0 to 3, VREFEN exists only in ACMPHS0.CPIOC. When using the internal Vref in ACMPHSn.CMPCTL.CTESN (n = 0 to 3), set the VREFEN bit in ACMPHS0.CPIOC to 1. Bit [7] in ACMPHSn.CPIOC (n = 1 to 3) should be 0 regardless of whether or not the internal Vref is used.

56.2.6 CPINTCTL : Comparator Interrupt Control Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x040

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MSKE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MSKE	Comparator Interrupt Periodic Mask Enable 0: Disable interrupt masking (Default) 1: Enable interrupt masking by GPT output signal selected by CPMSKCTL.MSKSEL [2:0]	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

This register controls the interrupt to ICU/ELC, while the event to POEG (Port Output Enable) is not controlled by this register.

56.2.7 CPMSKCTL : Comparator Interrupt Mask Control Register

Base address: ACMPHSn = 0x4023_6000 + 0x0100 × n (n = 0 to 3)
ACMPHSn_NS = 0x5023_6000 + 0x0100 × n (n = 0 to 3)

Offset address: 0x044

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	MSKSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	MSKSEL[2:0]	Comparator Interrupt Periodic Mask Selection 0 0 0: Enable interrupt masking by GTIOC0A output signal 0 0 1: Enable interrupt masking by GTIOC1A output signal 0 1 0: Enable interrupt masking by GTIOC2A output signal 0 1 1: Enable interrupt masking by GTIOC3A output signal 1 0 0: Enable interrupt masking by GTIOC4A output signal 1 0 1: Enable interrupt masking by GTIOC5A output signal 1 1 0: Enable interrupt masking by GTIOC6A output signal 1 1 1: Enable interrupt masking by GTIOC7A output signal	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

This register controls the interrupt to ICU/ELC, while the event to POEG(Port Output Enable) is not controlled by this register.

56.3 Operation

The ACMPHS compares a reference voltage to an analog input voltage. Operation is not guaranteed when the values of registers are changed during ACMPHS operation. Table 56.3 shows the procedures for setting the registers associated with ACMPHS.

Table 56.3 Procedure for setting registers associated with ACMPHSn (n = 0 to 3) (1 of 2)

Step	Register	Bit	Setting
1	Associated MSTPCRD register	MSTPD28 to MSTPD27	0: Input clock supply.
2	Associated pin function control register (PFS)	ASEL	1: Select the function of pins IVREF and IVCMP.
3	ACMPHSn.CPIOC	VREFEN	1: When using the internal Vref.
4	Associated D/A convertor		When using the D/A convertor, select in the register.
5	CMPSEL0, CMPSEL1	CMPSEL[3:0] CRVS[3:0]	Select the ACMPHSn input, with 1 set in only one of the bits.
6	CMPCTL	CDFS[1:0], CEG[1:0], and CINV	Set up ACMPHSn control.
		HCMPON	1: Enable ACMPHSn operation.
7	CMPSKCTL	MSKCTL[2:0]	Select the interrupt mask source signal (from GPT)
8	CPINT	MSKE	1: Enable the interrupt mask function if needed
9	Waiting for the ACMPHS stabilization time (minimum 300 ns).		
10	CMPCTL	COE	1: Enable ACMPHSn output.
11	CPIOC	CPOE	Set the VCOUT output
	Associated pin function control register (PFS)	PSEL, PMR	Select the VCOUT port function.
12	IELSRn	IR, IELS[8:0]	When using an interrupt, select the interrupt status flag and the ICU event link.*1
13	ELSRn	ELS[8:0]	When using an ELC, select the event link*2.

Table 56.3 Procedure for setting registers associated with ACMPHSn (n = 0 to 3) (2 of 2)

Step	Register	Bit	Setting
14	Operation started		
15	CMPCTL	COE	0: When changing IVREF or IVCMP, to disable ACMPHSn output.
16	CMPSEL1	CRVS[3:0]	Change the CMPSEL1 bits as follows: 1. Set bits CMPSEL1 to 0000 0000b. 2. Set a new value to the CMPSEL1 bits, with 1 set in only one of the bits.
	CMPSEL0	CMPSEL[3:0]	Change the CMPSEL0 bits as follows: 1. Set bits CMPSEL0 to 0000 0000b. 2. Set a new value to the CMPSEL0 bits, with 1 set in only one of the bits.
17	Waiting for the ACMPHS switching stabilization time (minimum 200 ns).		
18	CMPCTL	COE	1: Enable ACMPHSn output.
19	Operation restarted		

Note 1. After ACMPHSn is set, an unnecessary interrupt might occur until operation becomes stable, so initialize the interrupt flag.
Note 2. After ACMPHSn is set, an unnecessary interrupt might occur until operation becomes stable, so initialize the event link select.

Figure 56.2 and Figure 56.3 show an example of ACMPHS operation. The VCOUT output becomes 1 when the analog input voltage is higher than the ACMPHS reference input voltage, and the VCOUT output becomes 0 when the analog input voltage is lower than the reference voltage. When the ACMPHS output changes, an interrupt request and an ELC event are output.

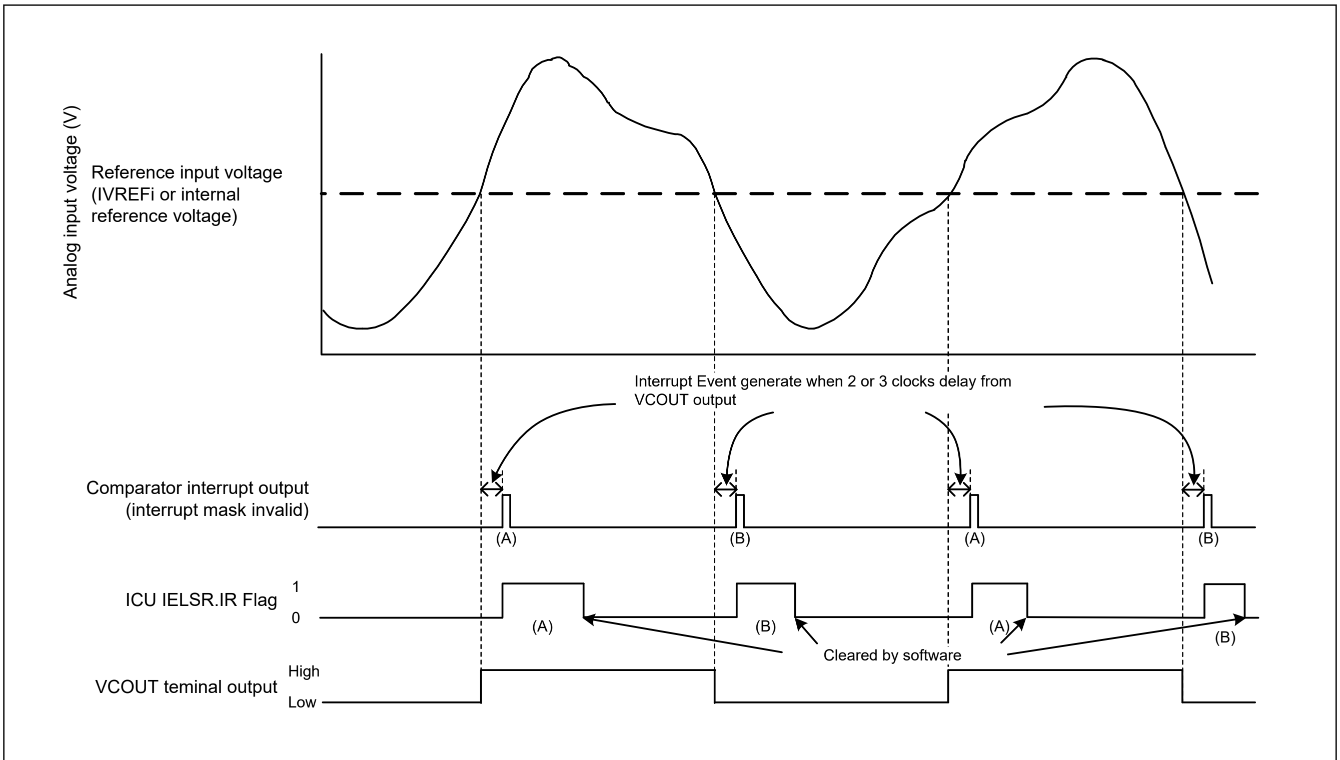


Figure 56.2 ACMPHS operation example (interrupt mask function invalid)

Figure 56.2 applies when CPOE = 1 (pin output enabled), CDFS[1:0] = 00b (filter not used), and CEG[1:0] = 11b (both-edge detection selected). When CINV = 0, CEG[1:0] = 01b (rising-edge detection selected for non-inversion output signal from the ACMPHS), the IELSR.IR flag changes as shown by (A) only. When CINV = 0, CEG[1:0] = 10b (falling-edge detection selected for non-inversion output signal from the ACMPHS), the IR flag changes as shown by (B) only. When CPOE = 1, VCOUT directly outputs.

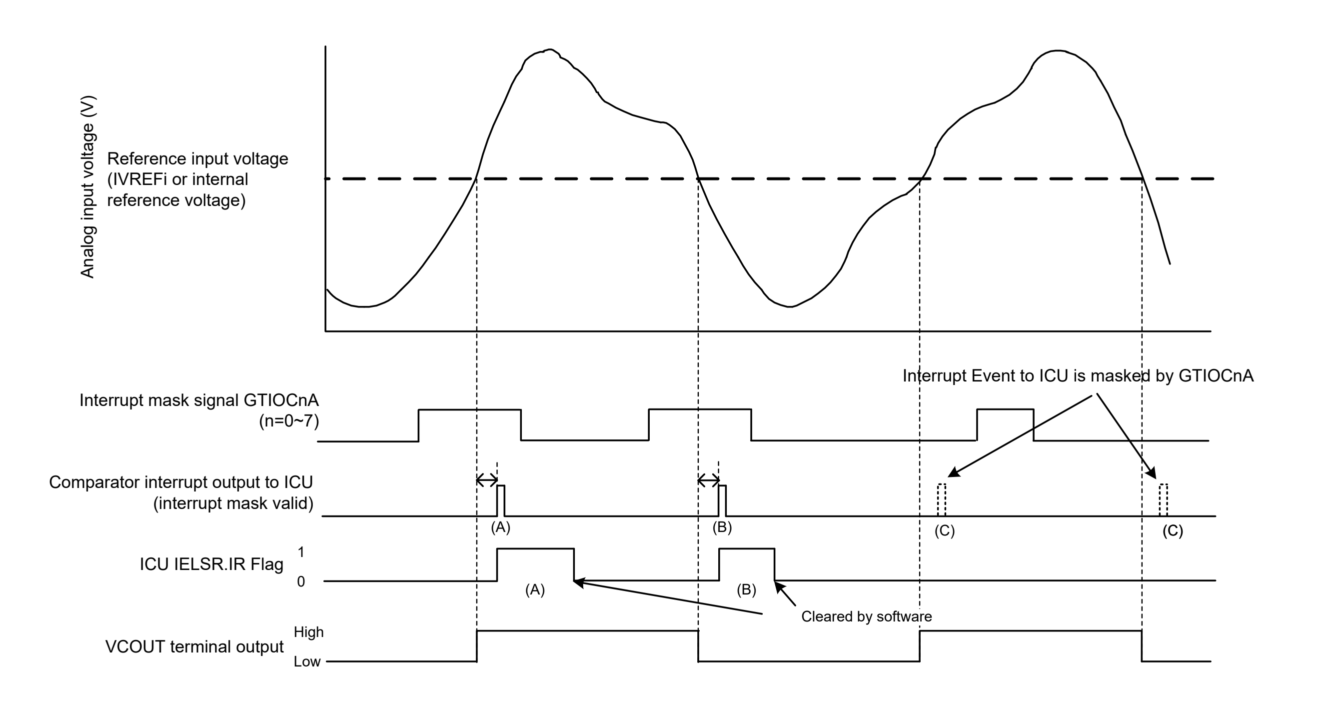

Figure 56.3 ACMPHS operation example (interrupt mask function valid)

Figure 56.3 applies when CPOE = 1 (pin output enabled), CDFS[1:0] = 00b (filter not used), CEG[1:0] = 11b (both-edge detection selected). When CINV = 0, CEG[1:0] = 01b (rising-edge detection selected for non-inversion output signal from the ACMPHS), the IELSR.IR flag changes as shown by (A) only. When CINV = 0, CEG[1:0] = 10b (falling-edge detection selected for non-inversion output signal from the ACMPHS), the IR flag changes as shown by (B) only.

When MSKE = 1 and MSKSEL[2:0] = 000b, the interrupt signal output to ICU is masked by GTIOC0A when GTIOC0A = low level as shown by (C), while it passes through when GTIOC0A = high level.

When CPOE = 1, VCOUT directly outputs, regardless of the MSKE setting.

56.4 Noise Filter

The ACMPHS contains a noise filter. The sampling clock can be selected in the CMPCTL.CDFS[1:0] bits. The comparator output signal is sampled every sampling clock, and if the same value is sampled three times, the noise filter output at the next sampling clock cycle is used as the ACMPHS output.

Figure 56.4 shows the configuration of the noise filter and edge detector, and Figure 56.5 shows an example of noise filter and interrupt operation.

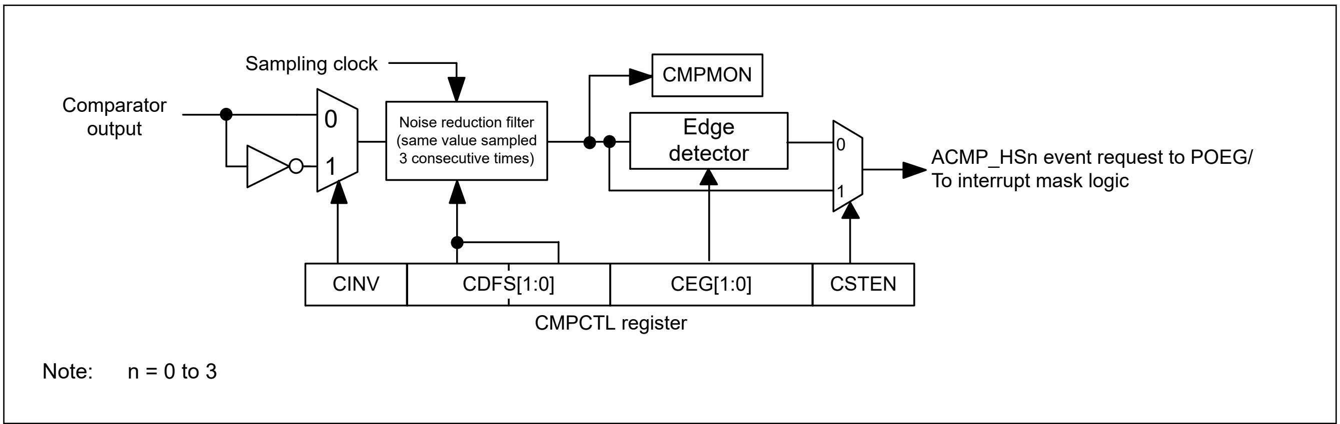

Figure 56.4 Noise filter and edge detection configuration

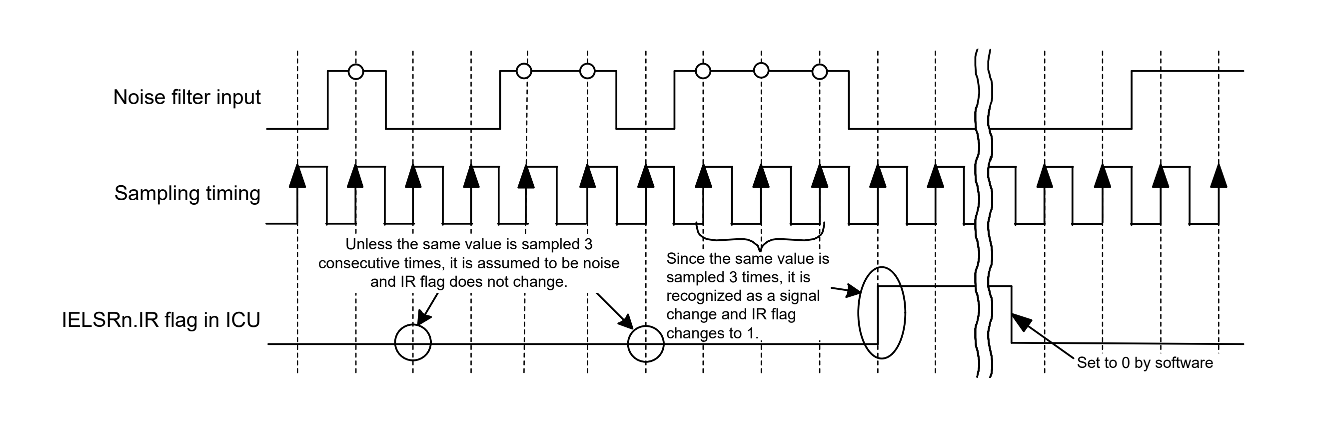

Figure 56.5 Noise filter and interrupt operation example

The operation example in Figure 56.5 applies when the CMPCTL.CDFS[1:0] bits are 01b, 10b, or 11b (noise filter used).

56.5 ACMPHS Interrupts

The ACMPHS generates four interrupt requests from sources ACMPHSn (n = 0 to 3). To use an ACMPHS interrupt, select it in the IELSR register in the Interrupt Controller Unit (ICU). Select the interrupt request in the CMPCTL.CSTEN bit either through the edge selector, or not.

Interrupt event to ICU/ELC can be masked by GPT output (GTIOCnA (n = 0 to 7)), it's controlled by CPINTCTL.MSKE bit and CPMSKCTL.MSKSEL[2:0] bits. Detail refer to Figure 56.3.

Event to POEG can't be masked by GPT output (GTIOCnA (n = 0 to 7)), it's not controlled by CPINTCTL.MSKE bit and CPMSKCTL.MSKSEL[2:0] bits.

When using the ACMPHS interrupt through the edge selector, set at least one of the CMPCTL.CEG[1:0] bits to 1 (to a value other than 00b for no edge selection). Set the CMPCTL.CSTEN bit to 0 (output through the edge selector) in Normal mode, CPU Sleep mode, and CPU Deep Sleep mode.

To use the ACMPHS interrupt in Software Standby mode, set the CMPCTL.CSTEN bit to 1 (direct output), set the CMPCTL.CDFS[1:0] bit to 00b (digital noise filter not used), and set CMPCTL.CINV as follows:

- When detecting compare result 0 to 1, set CMPCTL.CINV to 0 (comparator output not inverted)
- When detecting compare result 1 to 0, set CMPCTL.CINV to 1 (comparator output inverted).

An ACMPHS0 interrupt request can be used to release Software Standby mode. ACMPHS1, ACMPHS2, and ACMPHS3 cannot be used.

ACMPHSn (n = 0 to 3) cannot be used in Deep Software Standby mode.

For details on the register settings related to ACMPHS interrupt requests, see section 56.2.1. CMPCTL : Comparator Control Register, section 56.2.6. CPINTCTL : Comparator Interrupt Control Register and section 56.2.7. CPMSKCTL : Comparator Interrupt Mask Control Register.

56.6 ACMPHS Output to the Event Link Controller (ELC)

The ELC uses the ACMPHS interrupt request signal as an ELC event signal, enabling link operation for the preset module. To use the ACMPHS ELC event, select them in the ELSR register in the ELC. When using the ELC event request, set the CMPCTL.CSTEN bit to 0 (output through the edge selector). Also set at least one of the CMPCTL.CEG[1:0] bits to 1 (to a value other than 00b for no edge selection).

Interrupt event to ELC can be masked by GPT output (GTIOCnA (n = 0 to 7)), it's controlled by CPINTCTL.MSKE bit and CPMSKCTL.MSKSEL[2:0] bits.

56.7 ACMPHS Pin Output

The comparison result from the ACMPHS can be output to external pins. Use the CMPCTL.CINV and CPIOC.CPOE bits to set the output polarity (non-inverted or inverted output) and enable or disable output. To output the ACMPHS comparison result to the VCOUT output pin, set the associated port mn pin function control register (PmnPFS) in the I/O register.

Only when the security attribution of Port and ACMPHS match, the ACMPHS comparison result is output to the VCOUT pin as shown in the Table 56.4.

Table 56.4 The output condition of VCOUT pin by the security setting

PORT Security Attribution (PmSAR (m = 0 to 9, A, B))	ACMPHSn Security Attribution (PSARm (m = B to E))	VCOUT pin output source
0 (secure)	0 (secure)	ACMPHSn output enable
0 (secure)	1 (non-secure)	ACMPHSn output disable
1 (non-secure)	0 (secure)	ACMPHSn output disable
1 (non-secure)	1 (non-secure)	ACMPHSn output enable

Note: n = 0 to 3

56.8 Usage Notes

56.8.1 Settings for the Module-Stop Function

ACMPHS operation can be disabled or enabled using the Module Stop Control Register. The ACMPHS is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

56.8.2 Settings for the DAC12

ACMPHS is connected to the internal module output of the D/A converter. For details, see section 54, 12-Bit D/A Converter (DAC12).

56.8.3 Relationship with the ADC16H

Constraints apply on the simultaneous use of ACMPHS analog input and ADC16H analog input. For details, see section section 53.11.10. Restrictions on Analog Channel Shared Among Multiple A/D Converters (ADC16H) and High-Speed Analog Comparator (ACMPHS).

56.8.4 ACMPHS Operation in Module-Stop State

When the module-stop state is entered while ACMPHS is operating, analog circuits in the ACMPHS are not stopped and the analog power supply current is the same as that when ACMPHS is being used. If the analog power supply current needs to be reduced in the module-stop state, set the CMPCTL.HCMPON bit to 0 to stop the ACMPHS.

56.8.5 ACMPHS Operation in Software Standby Mode

When Software Standby mode is entered while ACMPHS is operating, analog circuits in the ACMPHS are not stopped and the analog power supply current is the same as that when ACMPHS is being used. If the analog power supply current needs to be reduced in Software Standby mode, set the CMPCTL.HCMPON bit to 0 to stop the ACMPHS.

56.8.6 Setting the D/A Converter for Generating Reference Voltage

Set the D/A converter to generate reference voltage and wait for the D/A converter output settling time before enabling the comparator. Similarly, before making any changes to the settings of the D/A converter, stop the comparator temporarily. After the changes are made, wait for the D/A converter output settling time before enabling the comparator.

57. Data Operation Circuit (DOC)

This is the DOC_B version of the DOC peripheral module.

DOC_B is referred to as DOC in this chapter.

57.1 Overview

The data operation circuit (DOC) is used to compare, add, and subtract 16 or 32-bit data. An interrupt can be generated when the following conditions apply.

- When the 16 or 32-bit compared values match the detection condition
- When the result of 16 or 32-bit data addition overflows
- When the result of 16 or 32-bit data subtraction underflows

Table 57.1 lists the data operation circuit specifications and Figure 57.1 shows a block diagram of the data operation circuit.

Table 57.1 DOC specifications

Item	Description
Data operation function	● 16 or 32-bit data comparison, comparison to detect data above or below thresholds, and window comparison ● 16 or 32-bit data addition, and subtraction
Module-stop function	The module-stop state can be set to reduce power consumption.
Interrupts	● The compared values match the detection condition ● The result of data addition is greater than 0xFFFF (DOCR.DOBW = 0) or 0xFFFF_FFFF (DOCR.DOBW = 1) ● The result of data subtraction is less than 0x0000 (DOCR.DOBW = 0) or 0x0000_0000 (DOCR.DOBW = 1)
Event link function (output)	● The result of data comparison is consistent with detection condition ● The result of data addition is greater than 0xFFFF (DOCR.DOBW = 0) or 0xFFFF_FFFF (DOCR.DOBW = 1) ● The result of data subtraction is less than 0x0000 (DOCR.DOBW = 0) or 0x0000_0000 (DOCR.DOBW = 1)
TrustZone Filter	Security and Privilege attribution can be set

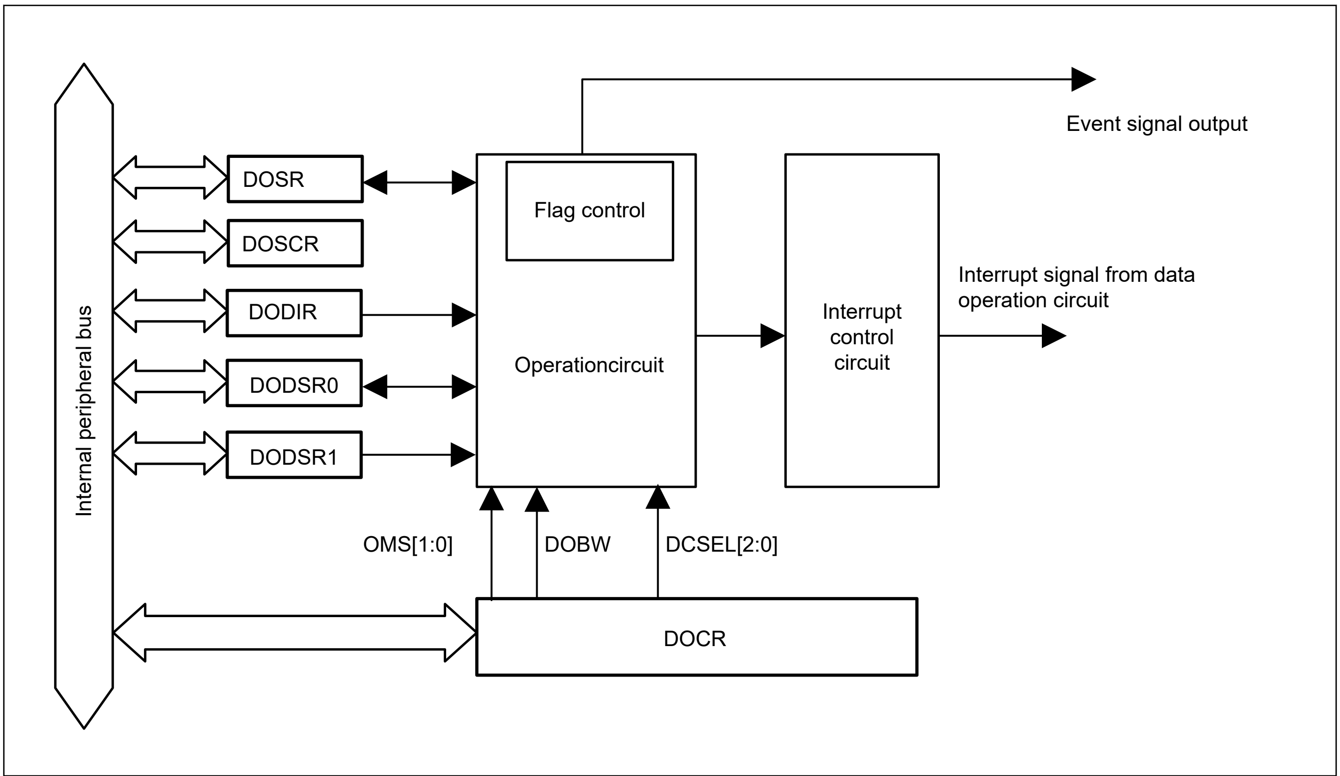

Figure 57.1 DOC block diagram

57.2 DOC Register Descriptions

57.2.1 DOCR : DOC Control Register

Base address: DOC_B = 0x4031_1000
DOC_B_NS = 0x5031_1000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	DCSEL[2:0]			DOBW	—	OMS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OMS[1:0]	Operating Mode Select 0 0: Data comparison mode 0 1: Data addition mode 1 0: Data subtraction mode 1 1: Setting prohibited	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	DOBW	Data Operation Bit Width Select 0: 16-bit 1: 32-bit	R/W
6:4	DCSEL[2:0]*1	Detection Condition Select 0 0 0: Mismatch (DODSR0 ≠ DODIR) 0 0 1: Match (DODSR0 = DODIR) 0 1 0: Lower (DODSR0 > DODIR) 0 1 1: Upper (DODSR0 < DODIR) 1 0 0: Inside window (DODSR0 < DODIR < DODSR1) 1 0 1: Outside window (DODIR < DODSR0, DODSR1 < DODIR) Others: Setting prohibited	R/W

Bit	Symbol	Function	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3
Note 1. Valid only when data comparison mode is selected.

The DOCR is a register which can set the operation mode of data operation circuit and interrupt enable/disable.

OMS[1:0] bits (Operating Mode Select)

These bits select the operating mode of the data operation circuit.

DOBW bit (Data Operation Bit Width Select)

This bit selects the bit width of data operation.

DCSEL[2:0] bits (Detection Condition Select)

These bits are valid only when data comparison mode is selected.

These bits select the condition for detection in data comparison mode.

57.2.2 DOSR : DOC Flag Status Register

Base address: DOC_B = 0x4031_1000
DOC_B_NS = 0x5031_1000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DOPCF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DOPCF	Data Operation Circuit Flag Indicates the result of an operation.	R
7:1	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

The DOSR register indicates the status of the data operation.

DOPCF flag (Data Operation Circuit Flag)

[Setting conditions]

- DOCR.OMS[1:0] bits = 00b (Data comparison mode): The compared value matches the detection condition selected by DOCR.DCSEL[2:0] bits
- DOCR.OMS[1:0] bits = 01b (Data addition mode): The result of data addition is greater than 0xFFFF (DOCR.DOBW = 0) or 0xFFFF_FFFF (DOCR.DOBW = 1)
- DOCR.OMS[1:0] bits = 10b (Data subtraction mode): The result of data subtraction is less than 0x0000 (DOCR.DOBW = 0) or 0x0000_0000 (DOCR.DOBW = 1)

[Clearing condition]

- Writing 1 to the DOSCR.DOPCFCL bit

57.2.3 DOSCR : DOC Flag Status Clear Register

Base address: DOC_B = 0x4031_1000
DOC_B_NS = 0x5031_1000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DOPCFCL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DOPCFCL	DOPCF Clear 0: Maintains the DOPCF flag state. 1: Clears the DOPCF flag.	W
7:1	—	The write value should be 0.	W

Note: S-TYPE3, P-TYPE3

The DOSCR is a register which can clear the status of data operation. This register is read as 0x00.

DOPCFCL bit (DOPCF Clear)

Setting this bit to 1 clears the DOPCF flag.

57.2.4 DODIR : DOC Data Input Register

Base address: DOC_B = 0x4031_1000
DOC_B_NS = 0x5031_1000

Offset address: 0x0C

Bit position: 31 ... 0

Bit field: (31:0)

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	It stores data used in the operations. Access the DODIR with the bit width of data operation selected by the DOCR.DOBW bit.	R/W

Note: S-TYPE3, P-TYPE3

57.2.5 DODSR0 : DOC Data Setting Register 0

Base address: DOC_B = 0x4031_1000
DOC_B_NS = 0x5031_1000

Offset address: 0x10

Bit position: 31 ... 0

Bit field: (31:0)

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	Access the DODSR0 with the bit width of data operation selected by the DOCR.DOBW bit. This register stores data for use as a reference in data comparison mode. When selecting window comparison (DOCR.DCSEL[2:0] = 100b, 101b), set a value less than DODSR1 (DODSR1 > DODSR0). This register also stores the results of operations in data addition and data subtraction modes.	R/W

Note: S-TYPE3, P-TYPE3

57.2.6 DODSR1 : DOC Data Setting Register 1

Base address: DOC_B = 0x4031_1000
DOC_B_NS = 0x5031_1000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Access the DODSR1 with the bit width of data operation selected by the DOCR.DOBW bit. This register stores data for use as a reference in data comparison mode. When selecting window comparison (DOCR.DCSEL[2:0] = 100b, 101b), set a value greater than DODSR0 (DODSR1 > DODSR0). This register is only used for window comparisons.	R/W

Note: S-TYPE3, P-TYPE3

57.3 Operation

57.3.1 Data Comparison Mode

Figure 57.2 to Figure 57.7 shows an example of the steps involved in data comparison mode operation by the data operation circuit.

The following is an example of operation when the bit width of data operation is 32-bit.

1. Writing 00b to the DOCR.OMS[1:0] bits selects data comparison mode, and setting the DOCR.DCSEL[2:0] to selects detection condition.
2. The 32-bit reference data is set in DODSR0 and DODSR1.*1
3. 32-bit data for comparison is written to DODIR.
4. If a value written to DODIR match the detection condition set by DOCR.DCSEL[2:0], the DOCR.DOPCF flag is set to 1 and an ELC event and a data operation circuit interrupt are generated.

Note: The comparison operation is executed only by writing to the DODIR

Note 1. The DODSR1 register setting is required only when window comparison is selected. Set a value greater than DODSR0 (DODSR1 > DODSR0).

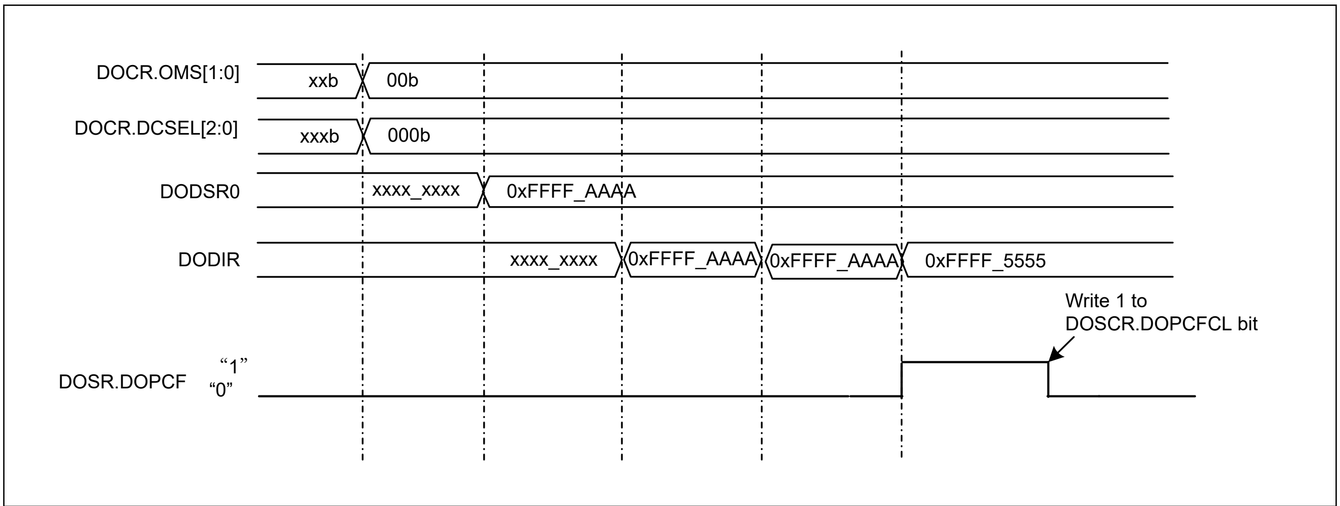

Figure 57.2 Example of Operation in Data Comparison Mode (Detection condition: Mismatch)

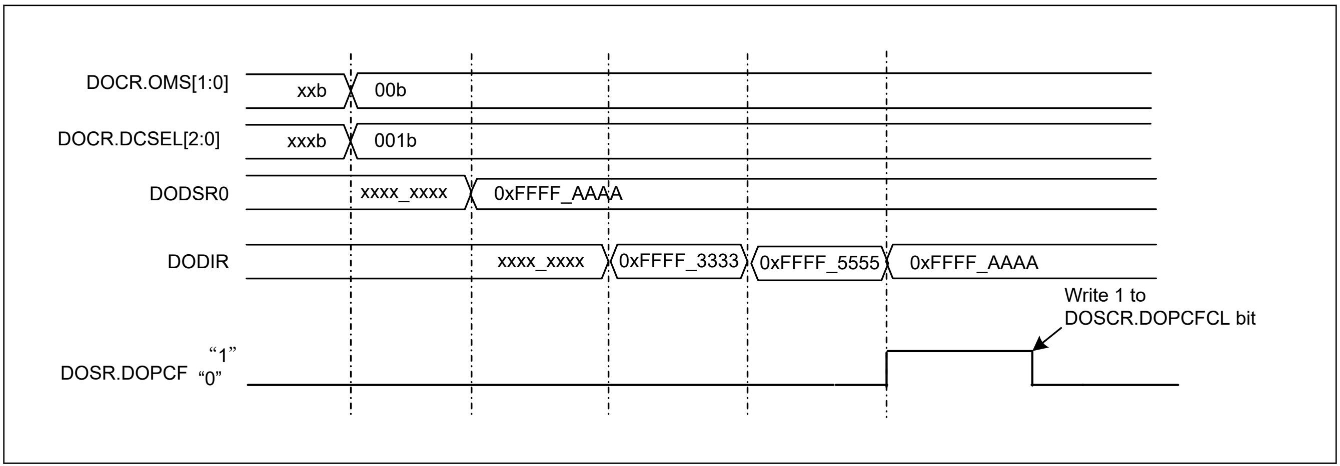

Figure 57.3 Example of Operation in Data Comparison Mode (Detection condition: Match)

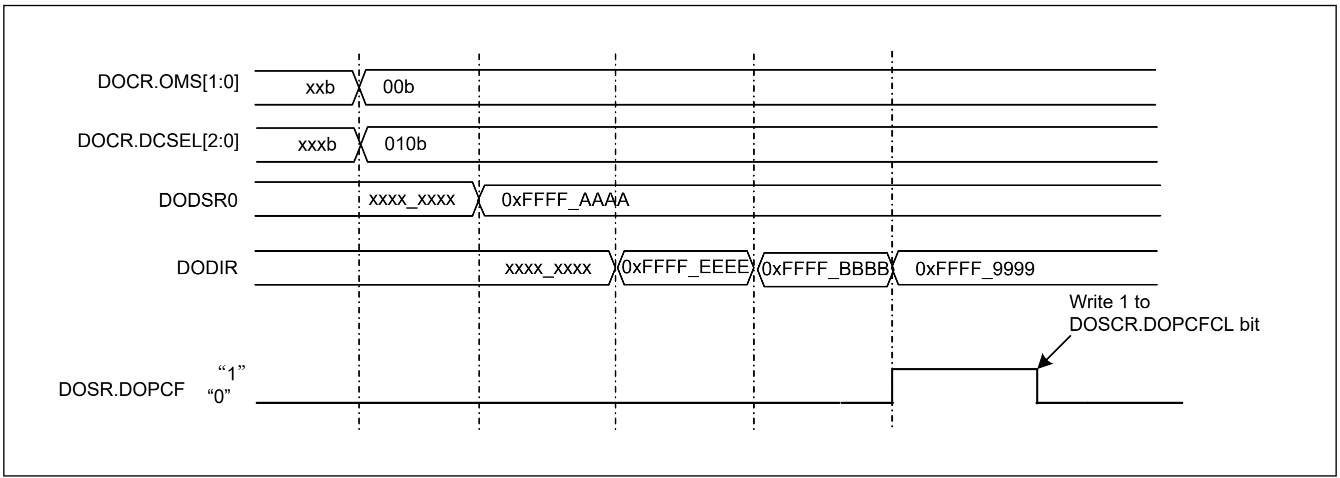

Figure 57.4 Example of Operation in Data Comparison Mode (Detection condition: Lower)

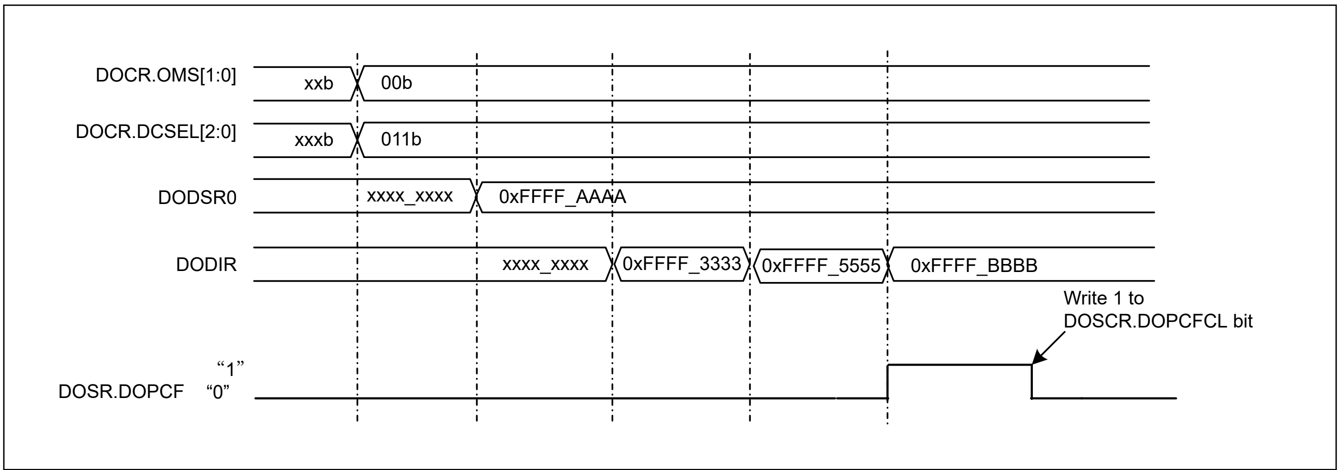

Figure 57.5 Example of Operation in Data Comparison Mode (Detection condition: Upper)

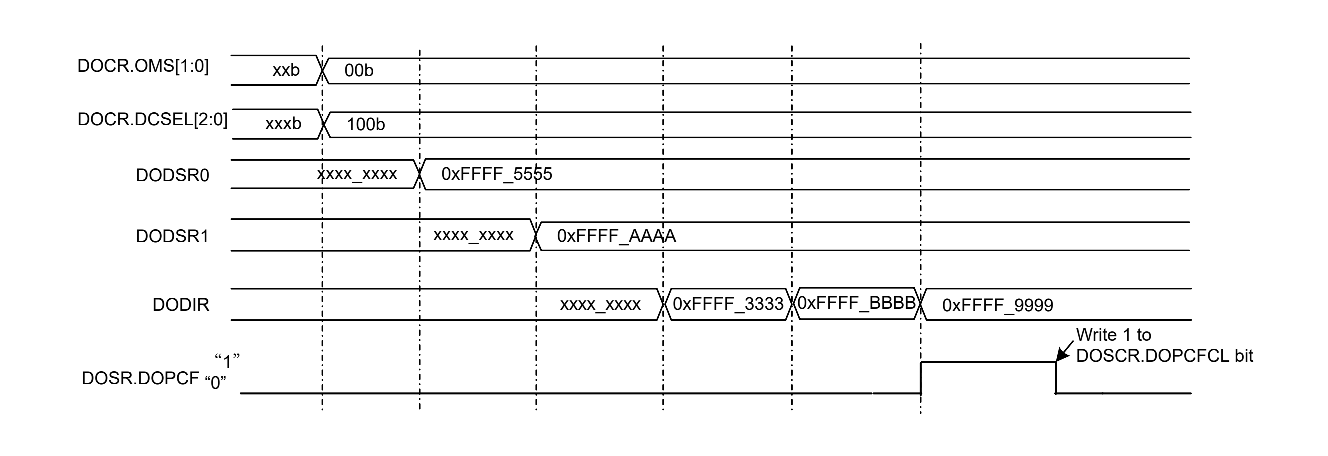

Figure 57.6 Example of Operation in Data Comparison Mode (Detection condition: Inside window)

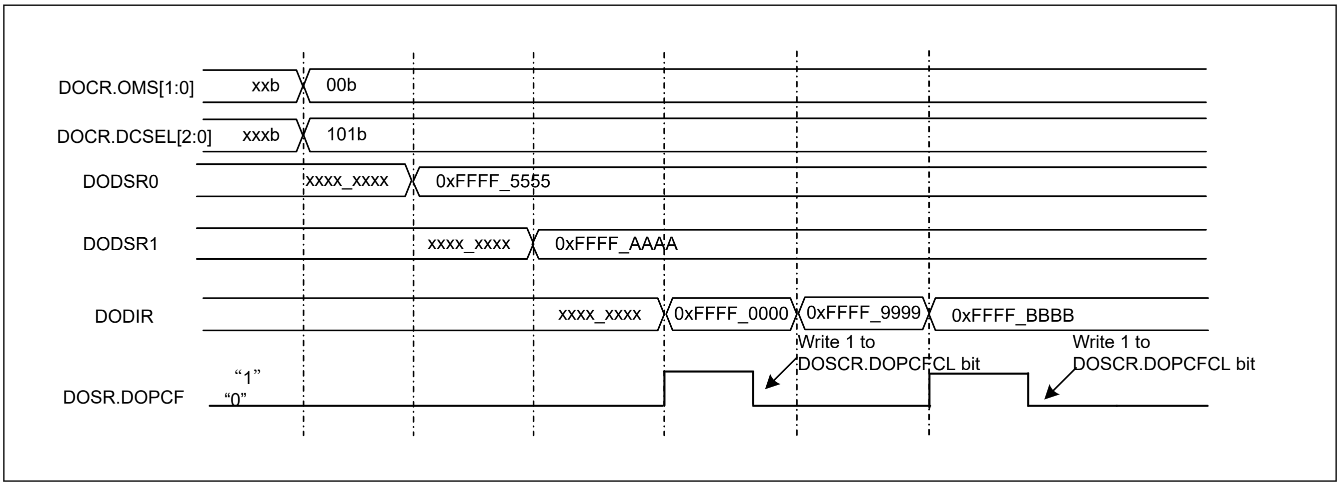

Figure 57.7 Example of Operation in Data Comparison Mode (Detection condition: Outside window)

57.3.2 Data Addition Mode

Figure 57.8 shows an example of the steps involved in data addition mode *1 operation by the data operation circuit.

The following is an example of operation when the bit width of data operation is 32-bit.

1. Writing 01b to the DOCR.OMS[1:0] bits selects data addition mode.
2. 32-bit data is set in the DODSR0 register as the initial value.
3. 32-bit data to be added is written to DODIR. The result of the operation is stored in DODSR0.
4. Writing of 32-bit data continues until all data for addition have been written to DODIR.
5. If the result of an operation is greater than 0xFFFF_FFFF, the DOSR.DOPCF flag is set to 1 and an ELC event and a data operation circuit interrupt are generated.

Note 1. Addition is executed only by writing to the DODIR.

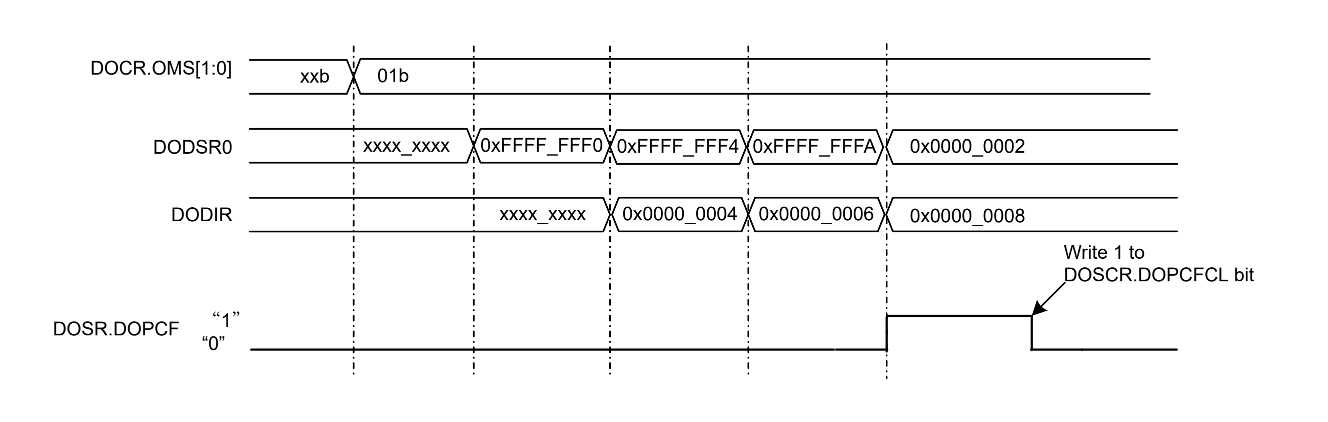

Figure 57.8 Example of Operation in Data Addition Mode

57.3.3 Data Subtraction Mode

Figure 57.9 shows an example of the steps involved in data subtraction mode [*1] operation by the data operation circuit.

The following is an example of operation when the bit width of data operation is 32-bit.

1. Writing 10b to the DOCR.OMS[1:0] bits selects data subtraction mode.
2. 32-bit data is set in the DODSR0 register as the initial value.
3. 32-bit data to be subtracted is written to DODIR. The result of the operation is stored in DODSR0.
4. Writing of 32-bit data continues until all data for subtraction have been written to DODIR.
5. If the result of an operation is less than 0x0000_0000, the DOSR.DOPCF flag is set to 1 and an ELC event and a data operation circuit interrupt are generated.

Note 1. Subtraction is executed only by writing to the DODIR.

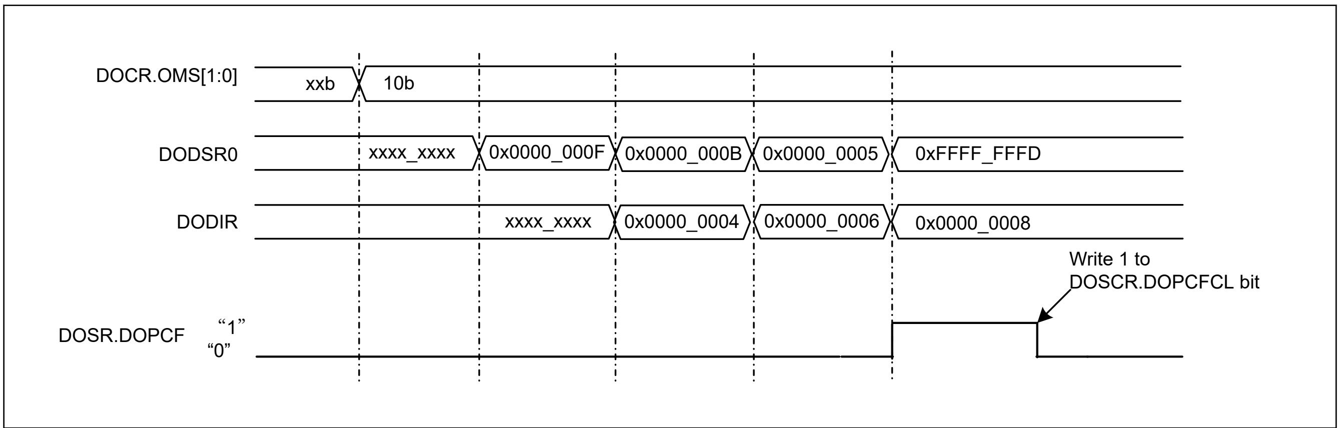

Figure 57.9 Example of Operation in Data Subtraction Mode

57.4 Interrupt Source

The data operation circuit generates the data operation circuit interrupt (DOC_DOPCI) as an interrupt request. When an interrupt source is generated, the data operation circuit flag corresponding to the interrupt is set to 1, and then interrupt request signal is generated. Table 57.2 describes the interrupt request.

Table 57.2 Interrupt request from DOC

Interrupt request	Status flag	Interrupt source
DOC interrupt	DOPCF	● The compared values match the detection condition. ● The result of data addition is greater than 0xFFFF (DOCR.DOBW = 0) or 0xFFFF_FFFF (DOCR.DOBW = 1). ● The result of data subtraction is less than 0x0000 (DOCR.DOBW = 0) or 0x0000_0000 (DOCR.DOBW = 1).

57.5 Event Link Output

The DOC outputs event signals for the event link controller (ELC) under the following conditions, and these can be used to initiate operations by other modules selected in advance.

- The compared values match the detection condition
- The data addition result is greater than 0xFFFF (DOCR.DOBW = 0) or 0xFFFF_FFFF (DOCR.DOBW = 1)
- The data subtraction result is less than 0x0000 (DOCR.DOBW = 0) or 0x0000_0000 (DOCR.DOBW = 1)

57.6 Interrupt Handling and Event Linking

The DOC has a bit to enable or disable interrupts. An interrupt request signal is output for the CPU when an interrupt source is generated while the corresponding enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal via the ELC when an interrupt source is generated, regardless of the setting of the corresponding interrupt enable bit.

57.7 Usage Notes

57.7.1 Settings for the Module-Stop State

The module Stop Control Register C (MSTPCRC) can enable or disable DOC operation. The DOC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

58. SRAM

58.1 Overview

The MCU provides an on-chip, high-density SRAM module with Error Correction Code (ECC).

In single-core, C-TCM and S-TCM at addresses 0x2A00_0000 to 0x2A01_FFFF can be used as SRAM.

See the section 2, CPU for details on TCM.

Table 58.1 SRAM specifications

Parameter		SRAM0	SRAM1	SRAM2	SRAM3
SRAM capacity		512 KB	512 KB	512 KB	128 KB
SRAM address	Secure alias	0x2200_0000 to 0x2207_FFFF	0x2208_0000 to 0x220F_FFFF	0x2210_0000 to 0x2217_FFFF	0x2218_0000 to 0x2219_FFFF
	Non-secure alias	0x3200_0000 to 0x3207_FFFF	0x3208_0000 to 0x320F_FFFF	0x3210_0000 to 0x3217_FFFF	0x3218_0000 to 0x3219_FFFF
ECC region*1	Secure alias	0x221A_0000 to 0x221A_FFFF	0x221B_0000 to 0x221B_FFFF	0x221C_0000 to 0x221C_FFFF	0x221D_0000 to 0x221D_3FFF
	Non-secure alias	0x321A_0000 to 0x321A_FFFF	0x321B_0000 to 0x321B_FFFF	0x321C_0000 to 0x321C_FFFF	0x321D_0000 to 0x321D_3FFF
Access		Wait states are not inserted into the access cycle by default. If the ICLK frequency is greater than half the maximum frequency in the electrical characteristics, a wait state is required. If the ICLK frequency is less than or equal half the maximum frequency in the electrical characteristics, a wait state is not required.			
Data retention function		Not available in Deep Software Standby mode			
Module-stop function		Module-stop state can be set to reduce power consumption			
Error checking		SEC-DED (Single-Error Correction and Double-Error Detection Code: 64-bit data with 8-bit ECC code)			
Security		TrustZone Filter is integrated for memory access and SFR access. Access to the memory space is controlled by setting the memory Security Attribution (SA). And access to I/O space (SFR) space is controlled by setting the register Security Attribution (SA). See section 58.3.5. TrustZone Filter Function.			

Note 1. When ECC function is disabled, it is used as a data region and can be accessed directly. When ECC function is enabled, direct access is disabled. When bypass is enabled, direct access to ECC bit is possible.

58.2 Register Descriptions

58.2.1 SRAMSABARn : SRAM Security Attribute Boundary Address Register (n = 0 to 3)

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x400 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Boundary address between secure and non-secure. (Offset of the start address of non-secure region)	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by the PRCR_S.PRC4 bit.

SRAMSABARn specify the offset of the boundary between the secure and non-secure regions of each SRAM. Write the absolute address to the SRAMSABARn. When writing to SRAMSABARn, writing from b31 to b21 is ignored and the value written from b12 to b0 should be 0.

The region lower than the boundary address is marked as “Secure”, and higher than or equal to the boundary address is marked as “Non-secure”.

The boundary address is as follows:

0x2200_0000 + SRAMSABARn (Secure alias)

0x3200_0000 + SRAMSABARn (Non-secure alias)

For SRAMSABAR0

When the offset of the boundary address is 0x0000_0000, whole SRAM0 is marked as Non-secure.

When the offset of the boundary address is 0x0008_0000 or large, whole SRAM0 is marked as Secure.

For SRAMSABAR1

When the offset of the boundary address is 0x0008_0000 or less, whole SRAM1 is marked as Non-secure.

When the offset of the boundary address is 0x0010_0000 or large, whole SRAM1 is marked as Secure.

For SRAMSABAR2

When the offset of the boundary address is 0x0010_0000 or less, whole SRAM2 is marked as Non-secure.

When the offset of the boundary address is 0x0018_0000 or large, whole SRAM2 is marked as Secure.

For SRAMSABAR3

When the offset of the boundary address is 0x0018_0000 or less, whole SRAM3 is marked as Non-secure.

When the offset of the boundary address is 0x001A_0000 or large, whole SRAM3 is marked as Secure.

58.2.2 SRAMSAR : SRAM Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SRAM WTSA	—	—	—	—	SRAM SA3	SRAM SA2	SRAM SA1	SRAM SA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRAMSA0	SRAM0 Register Security Attribution 0: Secure 1: Non-Secure	R/W
1	SRAMSA1	SRAM1 Register Security Attribution 0: Secure 1: Non-Secure	R/W
2	SRAMSA2	SRAM2 Register Security Attribution 0: Secure 1: Non-Secure	R/W
3	SRAMSA3	SRAM3 Register Security Attribution 0: Secure 1: Non-Secure	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	SRAMWTSA	SRAMWTSC Security Attribution 0: Secure 1: Non-Secure	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by the PRCR_S.PRC4 bit.

SRAMSA0 bit (SRAM0 Register Security Attribution)

Security attributes of SRAMCR0 registers. The target registers are as follows.

- SRAMCR0
- SRAMECCRGN0
- SRAMESCLR.CLR00, SRAMESCLR.CLR01

SRAMSA1 bit (SRAM1 Register Security Attribution)

Security attributes of SRAMCR1 registers. The target registers are as follows.

- SRAMCR1
- SRAMECCRGN1
- SRAMESCLR.CLR10, SRAMESCLR.CLR11

SRAMSA2 bit (SRAM2 Register Security Attribution)

Security attributes of SRAMCR2 registers. The target registers are as follows.

- SRAMCR2
- SRAMECCRGN2
- SRAMESCLR.CLR20, SRAMESCLR.CLR21

SRAMSA3 bit (SRAM3 Register Security Attribution)

Security attributes of SRAMCR3 registers. The target registers are as follows.

- SRAMCR3
- SRAMECCRGN3
- SRAMESCLR.CLR30, SRAMESCLR.CLR31

SRAMWTSA bit (SRAMWTSC Security Attribution)

Security attributes of SRAMWTSC.

58.2.3 SRAMESAR : SRAM ECC region Security Attribute Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x510

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRAM ESA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRAMESA	ECC region Security Attribution 0: Secure 1: Non-Secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by PRCR_S.PRC4.

SRAMESA bit (ECC region Security Attribution)

This bit indicates the security attribute of the ECC region of all SRAMs.

58.2.4 SRAMPRCR_S : SRAM Protection Control Register for Secure

Base address: SRAM = 0x4000_2000
Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KW[7:0]								—	—	—	—	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Register Write Control 0: Writing to registers are disabled 1: Writing to registers are enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KW[7:0]	Write Key Code Key code protection to the PR bit	W

Note: S-TYPE-6, P-TYPE-2
Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

PR bit (Register Write Control)

The PR bit controls the write mode of the SRAMWTSC, SRAMCRn, SRAMECCRGNn registers that are marked as “Secure” by SRAMSAR register. When this bit is set to 1, writing to the SRAMWTSC, SRAMCRn, SRAMECCRGNn marked as “Secure” is enabled.

While writing to this register it is necessary to write 0xA5 to the KW[7:0] bits simultaneously.

KW[7:0] bits (Write Key Code)

The KW[7:0] bits enable or disable writing to the PR bit. When you write to the PR bit, write 0xA5 to the KW[7:0] bits simultaneously. When a value other than 0xA5 is written to KW[7:0], the PR bit is not updated. The KW[7:0] bits are always read as 0x00.

58.2.5 SRAMPRCR_NS : SRAM Protection Control Register for Non-Secure

Base address: SRAM_NS = 0x5000_2000
Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KW[7:0]								—	—	—	—	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Register Write Control 0: Writing to registers are disabled 1: Writing to registers are enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KW[7:0]	Write Key Code Key code protection to the PR bit	W

Note: S-TYPE-7, P-TYPE-2
Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

PR bit (Register Write Control)

The PR bit controls the write mode of the SRAMWTSC, SRAMCRn, SRAMECCRGNn registers that are marked as “Non-secure” by SRAMSAR register. When this bit is set to 1, writing to the SRAMWTSC, SRAMCRn, SRAMECCRGNn marked as “Non-secure” is enabled.

While writing to this register it is necessary to write 0xA5 to the KW[7:0] bits simultaneously.

KW[7:0] bits (Write Key Code)

The KW[7:0] bits enable or disable writing to the PR bit. When you write to the PR bit, write 0xA5 to the KW[7:0] bits simultaneously. When a value other than 0xA5 is written to KW[7:0], the PR bit is not updated. The KW[7:0] bits are always read as 0x00.

58.2.6 SRAMWTSC : SRAM Wait State Control Register

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	WTEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WTEN	SRAM wait enable 0: Do not add wait state in the access cycle to SRAMs. 1: Add wait state in the access cycle to SRAMs.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (SRAMSAR.SRAMWTSA), P-TYPE-2
Note: SRAMWTSC is valid only for SRAM0, 1, 2, 3.
Note: The protection register (SRAMPRCR_S or SRAMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the SRAMPRCR_S or SRAMPRCR_NS register is 1.

WTEN bit (SRAM wait enable)

This bit sets the wait cycle insertion to the access cycle of SRAM. When it is set 1 to the WTEN bit, 1 wait cycle inserted to the read access cycle of SRAM. Also When the WTEN bit is 1, and access to the same region[*1] and the same mat[*2] is continuous, 1 wait cycle is inserted to the second access cycle. When ICLK frequency is greater than half the maximum frequency in the electrical characteristics, it is necessary to set 1 wait cycle in the WTEN bit.

Note 1. The region of SRAM is divided to 128KB units. The ECC region is not divided.
Note 2. The mat is divided to 0x0 to 0x7 and 0x8 to 0xF in the lower 4-bits of the address.

For example, in the case of SRAMn, the same region and the same mat is 8 areas of SRAM region, and 2 areas of ECC region in the figure below. If access 1 area continuously, 1 wait cycle is inserted. If ECC function is enabled or bypass is enabled, ECC region is accessed, so if access to the same mat continues, 1 wait cycle is inserted.

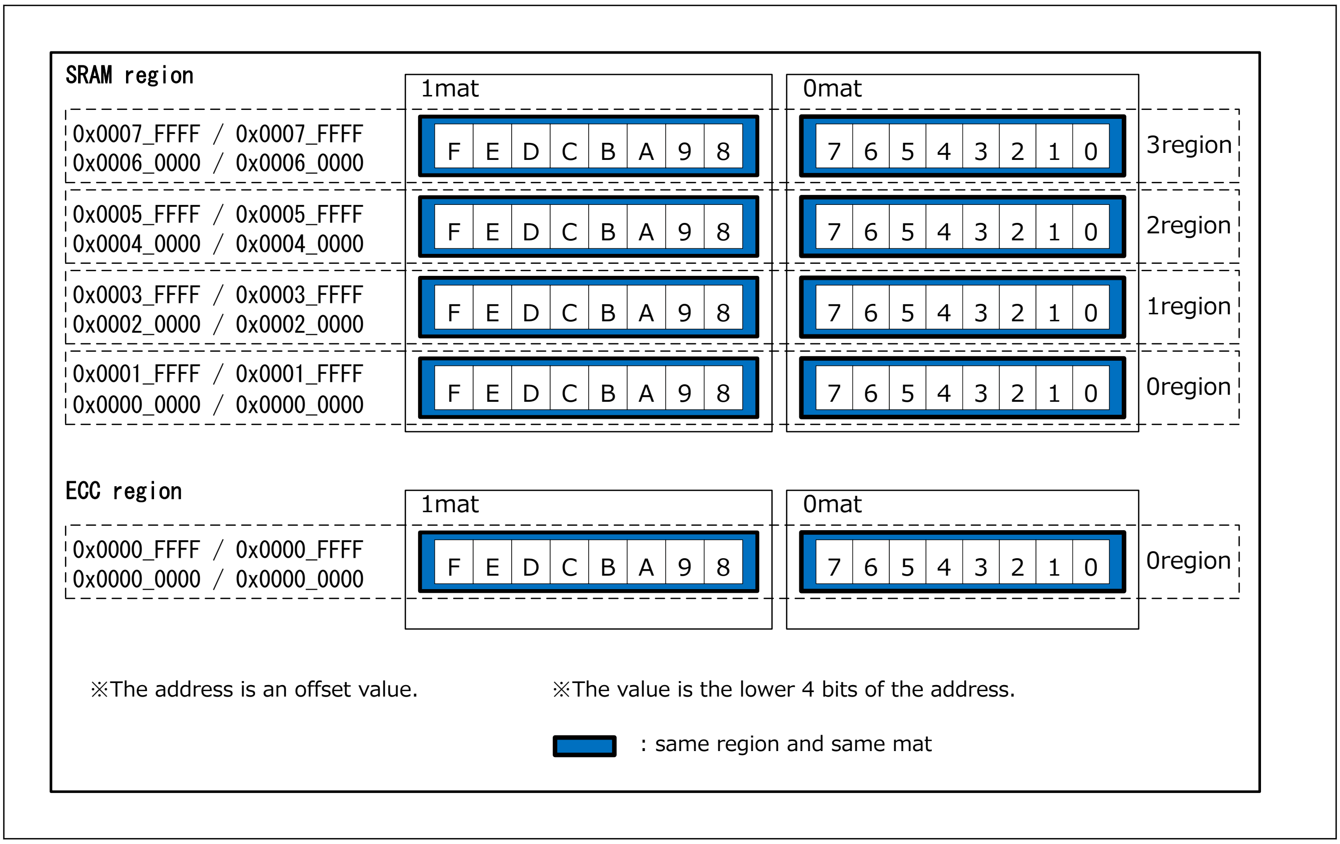

Figure 58.1 Mat configuration of each SRAMs

58.2.7 SRAMCRn : SRAM Control Register n For ECC RAM (n = 0 to 3)

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x10 + 0x04 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TSTBYP	—	—	E1STSEN	ECCMOD[1:0]		—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after error detection 0: Interrupt 1: Reset	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
3:2	ECCMOD[1:0]	ECC Operating Mode Select 0 0: Disable ECC function 0 1: Setting prohibited 1 0: Enable ECC function without error checking 1 1: Enable ECC function with error checking	R/W
4	E1STSEN	ECC 1-bit Error Update Enable 0: Disable updating of 1-bit ECC error 1: Enable updating of 1-bit ECC error	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TSTBYP	ECC Test Enable / ECC Bypass Select 0: Disable ECC bypass 1: Enable ECC bypass	R/W

Note: S-TYPE-3 (SRAMSAR.SRAMSA0), P-TYPE-2

Note: The protection register (SRAMPRCR_S or SRAMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the SRAMPRCR_S or SRAMPRCR_NS register is 1.

If CPU0 and CPU1 issue speculative access to an uninitialized SRAM with ECC enabled, it may trigger an interrupt or reset. After enabling ECC function with error checking, initialize the SRAM before setting the interrupt in the IELSRn register or setting the reset in the OAD bit.

OAD bit (Operation after error detection)

This bit selects a reset or non-maskable interrupt when an ECC error is detected.

ECCMOD[1:0] bits (ECC Operating Mode Select)

These bits set the access mode to the ECC operating.

E1STSEN bit (ECC 1-bit Error Update Enable)

This bit enables or disables updating of the ECC 1-bit error status bit in the SRAMESR, in response to a 1-bit error. This bit also functions as an interrupt or a reset mask.

TSTBYP bit (ECC Test Enable / ECC Bypass Select)

This bit enables direct access to ECC code by bypassing the ECC function. The ECC Bypass function is used along with setting the ECCMOD[1:0] bits in the same register to 00b.

For "64-bit data with 8-bit ECC code"

The ECC must be accessed the same address. The ECC code is assigned to the lower 8 bits. When writing the ECC code, the bits above the ECC bits are ignored. When reading the ECC code, the bits above the ECC bits are invalid.

Note: For details about ECC test, see section 58.3.4. ECC Decoder Testing.

58.2.8 SRAMECCRGN0 : SRAM ECC Region Control Register 0

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ECCRGN[2:0]		
Value after reset:	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
2:0	ECCRGN[2:0]	ECC target region select The ECC target region selected by this register can be controlled by SRAMCR0. 0 0 0: No ECC target region 0 0 1: 0x2200_0000–0x2201_FFFF 0x3200_0000–0x3201_FFFF (128 KB) 0 1 0: 0x2200_0000–0x2203_FFFF 0x3200_0000–0x3203_FFFF (256 KB) 0 1 1: 0x2200_0000–0x2205_FFFF 0x3200_0000–0x3205_FFFF (384 KB) 1 0 0: 0x2200_0000–0x2207_FFFF 0x3200_0000–0x3207_FFFF (512 KB) Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (SRAMSAR.SRAMSAn), P-TYPE-2

Note: The protection register (SRAMPRCR_S or SRAMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the SRAMPRCR_S or SRAMPRCR_NS register is 1.

ECCRGN[2:0] bits (ECC target region select)

These bits select ECC target region in SRAM0.

58.2.9 SRAMECCRGN1 : SRAM ECC Region Control Register 1

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x34

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ECCRGN[2:0]		
Value after reset:	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
2:0	ECCRGN[2:0]	ECC target region select The ECC target region selected by this register can be controlled by SRAMCR1. 0 0 0: No ECC target region 0 0 1: 0x2208_0000–0x2209_FFFF 0x3208_0000–0x3209_FFFF (128 KB) 0 1 0: 0x2208_0000–0x220B_FFFF 0x3208_0000–0x320B_FFFF (256 KB) 0 1 1: 0x2208_0000–0x220D_FFFF 0x3208_0000–0x320D_FFFF (384 KB) 1 0 0: 0x2208_0000–0x220F_FFFF 0x3208_0000–0x320F_FFFF (512 KB) Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (SRAMSAR.SRAMSAn), P-TYPE-2
Note: The protection register (SRAMPRCR_S or SRAMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the SRAMPRCR_S or SRAMPRCR_NS register is 1.

ECCRGN[2:0] bits (ECC target region select)

These bits select ECC target region in SRAM1.

58.2.10 SRAMECCRGN2 : SRAM ECC Region Control Register 2

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x38

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ECCRGN[2:0]		
Value after reset:	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
2:0	ECCRGN[2:0]	ECC target region select The ECC target region selected by this register can be controlled by SRAMCR2. 0 0 0: No ECC target region 0 0 1: 0x2210_0000–0x2211_FFFF 0x3210_0000–0x3211_FFFF (128 KB) 0 1 0: 0x2210_0000–0x2213_FFFF 0x3210_0000–0x3213_FFFF (256 KB) 0 1 1: 0x2210_0000–0x2215_FFFF 0x3210_0000–0x3215_FFFF (384 KB) 1 0 0: 0x2210_0000–0x2217_FFFF 0x3210_0000–0x3217_FFFF (512 KB) Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (SRAMSAR.SRAMSAn), P-TYPE-2
Note: The protection register (SRAMPRCR_S or SRAMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the SRAMPRCR_S or SRAMPRCR_NS register is 1.

ECCRGN[2:0] bits (ECC target region select)

These bits select ECC target region in SRAM2.

58.2.11 SRAMECCRGN3 : SRAM ECC Region Control Register 3

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x3C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ECCRGN[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	ECCRGN[2:0]	ECC target region select The ECC target region selected by this register can be controlled by SRAMCR3. 0 0 0: No ECC target region 0 0 1: 0x2218_0000–0x2219_FFFF 0x3218_0000–0x3219_FFFF (128 KB) Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (SRAMSAR.SRAMSAn), P-TYPE-2

Note: The protection register (SRAMPRCR_S or SRAMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the SRAMPRCR_S or SRAMPRCR_NS register is 1.

ECCRGN[2:0] bits (ECC target region select)

These bits select ECC target region in SRAM3.

58.2.12 SRAMESR : SRAM Error Status Register For ECC RAM

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x40

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	ERR31	ERR30	ERR21	ERR20	ERR11	ERR10	ERR01	ERR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ERR00	SRAM0 1-bit ECC Error Status 0: 1-bit ECC error has not occurred. 1: 1-bit ECC error has occurred.	R
1	ERR01	SRAM0 2-bit ECC Error Status 0: 2-bit ECC error has not occurred. 1: 2-bit ECC error has occurred.	R
2	ERR10	SRAM1 1-bit ECC Error Status 0: 1-bit ECC error has not occurred. 1: 1-bit ECC error has occurred.	R
3	ERR11	SRAM1 2-bit ECC Error Status 0: 2-bit ECC error has not occurred. 1: 2-bit ECC error has occurred.	R
4	ERR20	SRAM2 1-bit ECC Error Status 0: 1-bit ECC error has not occurred. 1: 1-bit ECC error has occurred.	R

Bit	Symbol	Function	R/W
5	ERR21	SRAM2 2-bit ECC Error Status 0: 2-bit ECC error has not occurred. 1: 2-bit ECC error has occurred.	R
6	ERR30	SRAM3 1-bit ECC Error Status 0: 1-bit ECC error has not occurred. 1: 1-bit ECC error has occurred.	R
7	ERR31	SRAM3 2-bit ECC Error Status 0: 2-bit ECC error has not occurred. 1: 2-bit ECC error has occurred.	R
15:8	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is initialized after returning from software standby mode while the debugger is connected.

This register is cleared by the corresponding bit in SRAMESCLR register or resets other than Bus Error Reset and Memory Error Reset. If error and clear occur at the same time, clear has priority. Also during accessing from debugger it is to stop updating register.

ERRn0 bit (SRAMn 1-bit ECC Error Status)

This bit shows whether there is a 1-bit ECC error in SRAMn.

When ECC function with error checking is enabled and, if the SRAMCRn.E1STSEN bit is 1, the ERRn0 bit is set to 1 if a 1-bit error is detected.

When ERRn0 bit is set to 1, outputs a reset or an interrupt request according to the SRAMCRn.OAD bit.

ERRn1 bit (SRAMn 2-bit ECC Error Status)

This bit shows whether there is a 2-bit ECC error in SRAMn.

When ECC function with error checking is enabled, the ERRn1 bit is set to 1 if a 2-bit error is detected.

When ERRn1 bit is set to 1, outputs a reset or an interrupt request according to the SRAMCRn.OAD bit.

58.2.13 SRAMESCLR : SRAM Error Status Clear Register For ECC RAM

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x48

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CLR31	CLR30	CLR21	CLR20	CLR11	CLR10	CLR01	CLR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLR00	SRAM0 1-bit ECC Error Status Clear Writing to the CLR00 clears SRAMESR.ERR00. 0: No effect 1: Clear 1-bit ECC error	W
1	CLR01	SRAM0 2-bit ECC Error Status Clear Writing to the CLR01 clears SRAMESR.ERR01. 0: No effect 1: Clear 2-bit ECC error.	W
2	CLR10	SRAM1 1-bit ECC Error Status Clear Writing to the CLR10 clears SRAMESR.ERR10. 0: No effect 1: Clear 1-bit ECC error.	W

Bit	Symbol	Function	R/W
3	CLR11	SRAM1 2-bit ECC Error Status Clear Writing to the CLR11 clears SRAMESR.ERR11. 0: No effect 1: Clear 2-bit ECC error.	W
4	CLR20	SRAM2 1-bit ECC Error Status Clear Writing to the CLR20 clears SRAMESR.ERR20. 0: No effect 1: Clear 1-bit ECC error.	W
5	CLR21	SRAM2 2-bit ECC Error Status Clear Writing to the CLR21 clears SRAMESR.ERR21. 0: No effect 1: Clear 2-bit ECC error.	W
6	CLR30	SRAM3 1-bit ECC Error Status Clear Writing to the CLR30 clears SRAMESR.ERR30. 0: No effect 1: Clear 1-bit ECC error.	W
7	CLR31	SRAM3 2-bit ECC Error Status Clear Writing to the CLR31 clears SRAMESR.ERR31. 0: No effect 1: Clear 2-bit ECC error.	W
15:8	—	The write value should be 0.	W

Note: S-TYPE-4 (SRAMSAR.SRAMSAn), P-TYPE-2

CLRn0 bit (SRAMn 1-bit ECC Error Status Clear)

This bit can clear 1-bit ECC error status bit in the SRAMESR. If error and clear occur at the same time, clear has priority.

SRAMESR.ERRn0 can be cleared, when writing 1 to CLRn0.

CLRn1 bit (SRAMn 2-bit ECC Error Status Clear)

This bit can clear 2-bit ECC error status bit in the SRAMESR. If error and clear occur at the same time, clear has priority.

SRAMESR.ERRn1 can be cleared, when writing 1 to CLRn1.

58.2.14 SRAMEARnm : SRAM Error Address Register nm For ECC RAM (n = 0 to 3, m = 0 to 1)

Base address: SRAM = 0x4000_2000
SRAM_NS = 0x5000_2000

Offset address: 0x50 + 0x10 × n + 0x04 × m

Bit position:	31 … 0
Bit field:	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	When an SRAM error occurs, it stores offset of an error address.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is initialized after returning from software standby mode while the debugger is connected.

This register is cleared by the corresponding bit in SRAMESCLR register, or resets other than Bus Error Reset and Memory Error Reset. If error and clear occur at the same time, clear has priority. Also during accessing from debugger it is to stop updating register.

The error address is as follows.

0x2200_0000 + SRAMEARnm (Secure alias)

0x3200_0000 + SRAMEARnm (Non-secure alias)

For SRAMEARn0

This register stores offset of the error address where 1-bit ECC error is detected. These bits hold offset of the error address that occurred first. These bits are cleared by clearing 1-bit ECC error from SRAMESCLR.

For SRAMEARn1

This register stores offset of the error address where 2-bit ECC error is detected. These bits hold offset of the error address that occurred first. These bits are cleared by clearing 2-bit ECC error from SRAMESCLR.

58.3 Operation

58.3.1 Module Stop Function

Power consumption can be reduced by setting module stop control register A (MSTPCRA) to stop supply of the clock signal to SRAM.

SRAMn (n = 0, 1, 2, 3) is controlled by SRAMn bit in MSTPCRA register and, in the case of 1, SRAMn becomes the clock stop state.

The SRAM is thus placed in the module-stop state by stopping supply of the clock signals. The SRAM operates after a reset.

SRAM is not accessible if it is in the module-stop state. A transition to the module-stop state should not be made while access to SRAM is in progress.

Access to the SRAM in the module-stop state is prohibited. If access is attempted, correct operation is not guaranteed.

For details on the MSTPCRA register, see section 11, Low Power Mode.

58.3.2 Correction of ECC Errors

Enabling and disabling of ECC error correction can be selected through the setting by ECCMOD[1:0] bits of SRAMCRn register. In the initial state, ECC error correction is disabled. The ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection Code).

When ECC function is enabled, 8-bit check bits are appended to 64-bit data for writing. For reading, 72-bit (data: 64 bits, check bits: 8 bits) data is read out from the SRAM (ECC area).

When ECC function with error checking are enabled, error correction is done if a 1-bit error occurs and the ERRn0 bit in the SRAMESR register is set to 1 if the E1STSEN bit in the SRAMCRn register is 1. If a 2-bit error occurs, error detection is done and the ERRn1 bit in the SRAMESR register is set to 1, though error correction is not performed.

When ECC function without error checking is enable, error correction is done if a 1-bit error occurs but ERRn0 bit in the SRAMESR register is not updated although E1STSEN bit in the SRAMCRn register is 1. If a 2-bit error occurs, this error is detected but the ERRn1 bit in the SRAMESR register is not updated, and error correction is not performed.

When ECC function is disable, neither error correction nor error detection is done although 1-bit or 2-bit error occur.

So ERRn0 and ERRn1 bits are not updated.

When updating all the data after the occurrence of an error, the only support of 64 bit data writing.

Since the SRAM data is undefined after power on and release from Deep Software Standby mode, accessing the SRAM when ECC function is enabled and error checking is selected causes an ECC error to occur. Therefore, before using ECC function, initial writing with ECC function enabled and 64-bit data size, or initial writing with ECC function enabled and the error checking disabled, to the area to be used in the SRAM should be done.

58.3.3 ECC Error Interrupt Function

When ECC function with error checking is enabled, error checking is possible in the SRAMn. In the case of a 2-bit error, the ERRn1 bit in the SRAMESR register set to 1. In the case of a 1-bit error, the ERRn0 bit in the SRAMESR register set to 1 when SRAMCRn.E1STSEN bit is 1.

When the ECC 1-bit error is to be masked, it is necessary to set the SRAMCRn.E1STSEN bit to 0 to disable updating to 1 of the SRAMESR.ERRn0 bit. An ECC error will not be generated while ECC function is disabled or ECC function without error checking is enabled.

ECC error may result in interrupt or reset. When ECC error occurs, When the SRAMCRn.OAD bit is 1, outputs a reset request. When it is 0, outputs a non-maskable interrupt request to the ICU.

ECC Error interrupt occurs when one flag in the SRAMESR register is set. ECC Error interrupt continues to occur until the SRAMESR register flag is cleared.

58.3.4 ECC Decoder Testing

Figure 58.2 shows the ECC decoder testing flowchart.

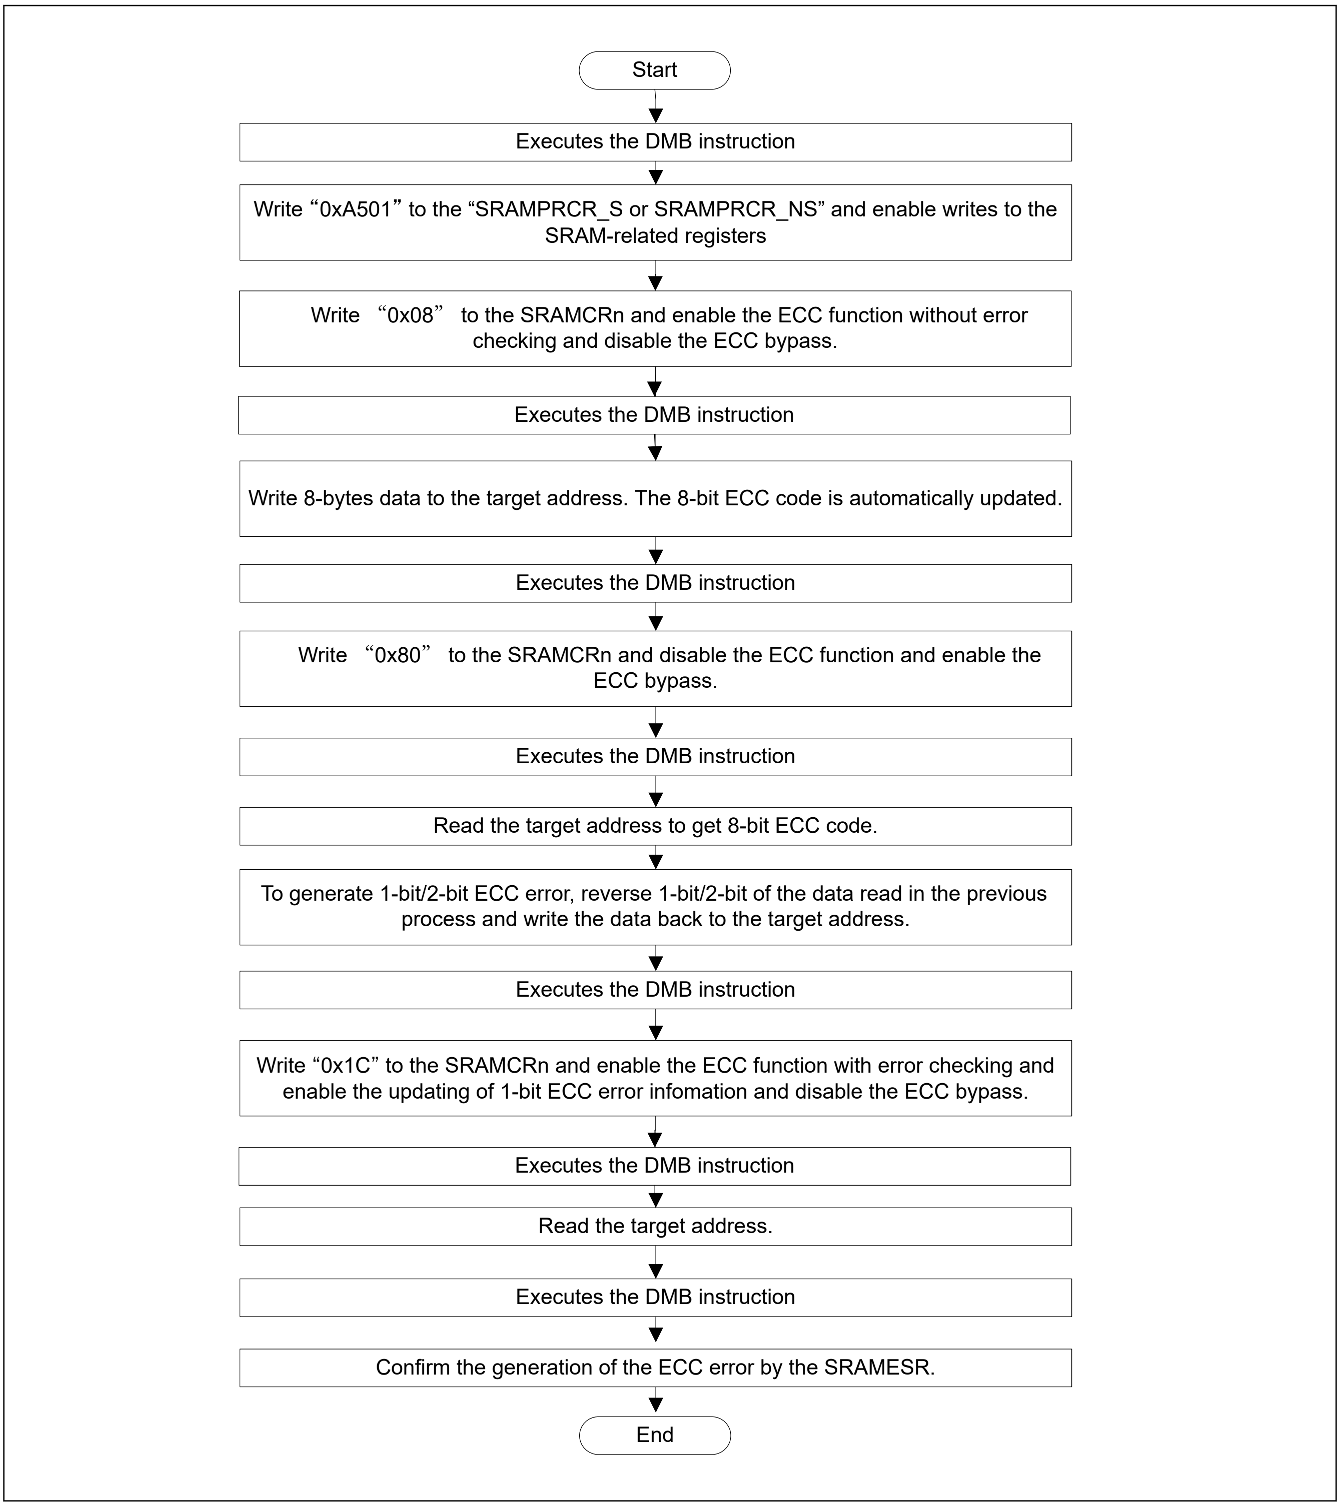

Figure 58.2 ECC decoder testing

58.3.5 TrustZone Filter Function

58.3.5.1 TrustZone Filter for SRAM Registers

SRAM registers can be protected with a Security Attribution (SA) from Non-secure or secure transaction. When SA indicates that SRAM registers are secure status, non-secure transaction can not access them because TrustZone Filter detects an error and protects the access. When SA indicates that SRAM registers are non-secure status, secure transaction can not access them because Trust Zone Filter detects an error and protects the access. SA for SRAM registers is just one to be used commonly among SRAM registers.

In the case of a failed access due to TrustZone error, error response is generated.

Table 58.2 Register protection

SA	Transaction	Write access	Read access
Secure	Secure	Permitted	Permitted
	Non-secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
Non-secure	Secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
	Non-secure	Permitted	Permitted

58.3.5.2 TrustZone Filter for SRAM Memory Regions

SRAM0, SRAM1, SRAM2, SRAM3 regions can divide into secure, non-secure independently. The access permissions for these regions are as below.

Table 58.3 Memory protection

SA	Transaction	Write access	Read access
Secure	Secure	Permitted	Permit
	Non-secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
Non-secure	Secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
	Non-secure	Permitted	Permitted

TrustZone Filter error for SRAM memory, generates an error notification.

58.3.6 Interrupt Source

The SRAM interrupt source includes an ECC error and TrustZone filter error. ECC error can choose interrupt or reset by the SRAMCRn.OAD bit. The SRAM interrupt occurs when one error status in the SRAMESR register is set to 1, the SRAM interrupt continues to occur until the SRAMESR register flag is cleared. When Common memory error occur (NMISR.CMST = 1 or RSTSR1.CMRF = 1), read SRAMESR and check SRAM interrupt source. When access is from the debugger, the error is detected and corrected, but no error flag is set, and no reset request and interrupt request is output.

Table 58.4 SRAM Interrupt Source

Name	Interrupt Source	DTC Activation	DMAC Activation
ECCERR	ECC error (SRAMs with ECC)	Not possible	Not possible
TZFLT	TrustZone filter error	Not possible	Not possible

58.3.7 Wait State

When ICLK frequency is greater than half the maximum frequency in the electrical characteristics do not set 0x00 in wait enable bit for the SRAMWTSC register, in order to insert a wait cycle.

When the wait is not inserted, the operation is not guaranteed.

When ICLK frequency is less than or equal half the maximum frequency in the electrical characteristics wait state is not required.

When the maximum ICLK frequency is 250MHz

- 250MHz ≥ ICLK > 125MHz = 1 wait
- 125MHz ≥ ICLK = No-wait

When the maximum ICLK frequency is 200MHz

- 200MHz ≥ ICLK > 100MHz = 1 wait
- 100MHz ≥ ICLK = No-wait

When the maximum ICLK frequency is 150MHz

- 150MHz ≥ ICLK > 75MHz = 1 wait
- 75MHz ≥ ICLK = No-wait

58.3.8 Access Cycle

The following shows the delay information of the access cycle.

- When ECC is enabled, writing less than 64 bits is 2 cycles slower than normal writing.
- Insert the wait cycle according to the setting of SRAMWTSC.WTEN. If SRAMWTSC.WTEN = 1, the read will be delayed by one cycle.

58.3.9 Access to the ECC Region

When ECC function is disabled, ECC region can be used as data region.

When ECC function is disabled, direct access is possible. When ECC function is enabled, direct access is disabled. When bypass is enabled, direct access to ECC bit is possible.

Bypass	ECC	Access region	SRAM region	ECC region	Note
enable	—	to SRAM region	—	✔	—
—	—	to ECC region	—	—	Access invalid
disable	enable	to SRAM region	✔	✔	—
—	—	to ECC region	—	—	Access invalid
—	disable	to SRAM region	✔	—	—
—	—	to ECC region	—	✔	—

Note: When using bypass, set SRAMCRn.ECCMOD[1:0] = 00b. See section 58.2.7. SRAMCRn : SRAM Control Register n For ECC RAM (n = 0 to 3).

58.4 Usage Note

58.4.1 Instruction Fetch from SRAM area

When using SRAM to operate a program, initialize the SRAM area so that the CPU can correctly prefetch data. ECC error might occur if the CPU prefetches from an area that is not initialized. Initialize the additional 12-byte area from the end address of the program with the 8-byte boundary. Renesas recommends using the NOP instruction for data initialization.

58.4.2 Notes on Using Error Checking of SRAM

Data in SRAM are undefined when the power is turned on. Therefore, ECC errors occur if the data are read before initialization. The SRAM are read in 8-byte (64-bit) units. Initialize them on 8-byte boundaries.

59. MRAM

This MCU incorporates code MRAM and option-setting memory. The code MRAM stores instructions and operands. For option-setting memory, see section 7, Option-Setting Memory.

59.1 Overview

Table 59.1 lists the specification of MRAM, and Figure 59.1 shows a block diagram of the MRAM-related modules.

For the I/O pins used in serial programing mode, see Table 59.39.

The CPSEQ (Code MRAM programming sequencer) controls programming of the code MRAM. EPSEQ (Extra MRAM programming sequencer) controls programming of extra MRAM which includes option-setting memory. The MACI (MRAM application command interface) controls EPSEQ according to the specified MACI commands.

For the configuration of the code MRAM, see section 59.2. Structure of Memory.

Table 59.1 Specifications of MRAM (1 of 2)

Item	Code MRAM	Option-setting memory in extra MRAM
Memory capacity	User area: 1 MB max	See section 7, Option-Setting Memory.
Read cycle	See section 59.5.2. MRCFREQ : Code MRAM Frequency Notifications Register	See section 59.5.3. MREFREQ : Extra MRAM Frequency Notifications Register
Programming method	Write page buffer	MACI command
Protection	Protects against erroneous rewriting of the MRAM	
Dual bank function	Not available	Not available
Block swap function	Not available	Not available
Background operations (BGOs)	• The code MRAM can be read while option-setting memory is being programmed • Option-setting memory can be read while the code MRAM is being programmed.	
Units of programming	1 to 32 bytes	16 bytes
MACI command	Not available	Program: 16 bytes Forced stop Status clear Configuration set: 16 bytes Increment counter: 1 bit Read counter: 8 bytes

Security function	• Protect against illicit tampering with or reading out of data in MRAM
	• OFS area protection
	• Startup area select setting protection
	  – BTFLG, BTSIZE, and MSUACR registers are protected by the FSPR bit.
	• Permanent block protect setting protection
	  – User area is permanently protected from programming operation by the permanent block protect function.
	• MRAM protection for TrustZone
	  – Protection for MRAM area (program)
	  – Protection for MRAM area (read)
	  – Protection for register
	• Extra MRAM program mode entry protection
	• Anti-rollback counter
	• HUK protection	

Safety function	Software protection • MACI command protection by MENTRYR register • User area protection by MRCPC0 and MRCPC1 registers • User area protection by the block protection setting. Error protection • Error is detected when unintended commands or prohibited settings occur. The MACI command is not accepted after an error detection. Boot area protection • The startup area select function allows the customer to safely update the startup program. The size of the startup area can be selected from 8 KB, 16 KB, or 32 KB. ECC support for double-bit error correction and triple-bit error detection.	

Table 59.1 Specifications of MRAM (2 of 2)

Item	Code MRAM	Option-setting memory in extra MRAM
Interrupt request	● MRAM_MRCRD (Code MRAM read error) Enabled by INTENBTC and INTENBDC bits. ● MRAM_MRERD (Extra MRAM read error) Enabled by INTENBTE and INTENBDE bits. ● MRAM_MRCPR (Code MRAM sequencer error) Enabled by MRCAEIE bits. ● MRAM_MREPR (Extra MRAM sequencer error) Enabled by CMDLKIEE and MREAEIE bits. ● MRAM_ENDOFPE (Extra MRAM sequencer ready (processing end)) Enabled by MRDYIE bit.	

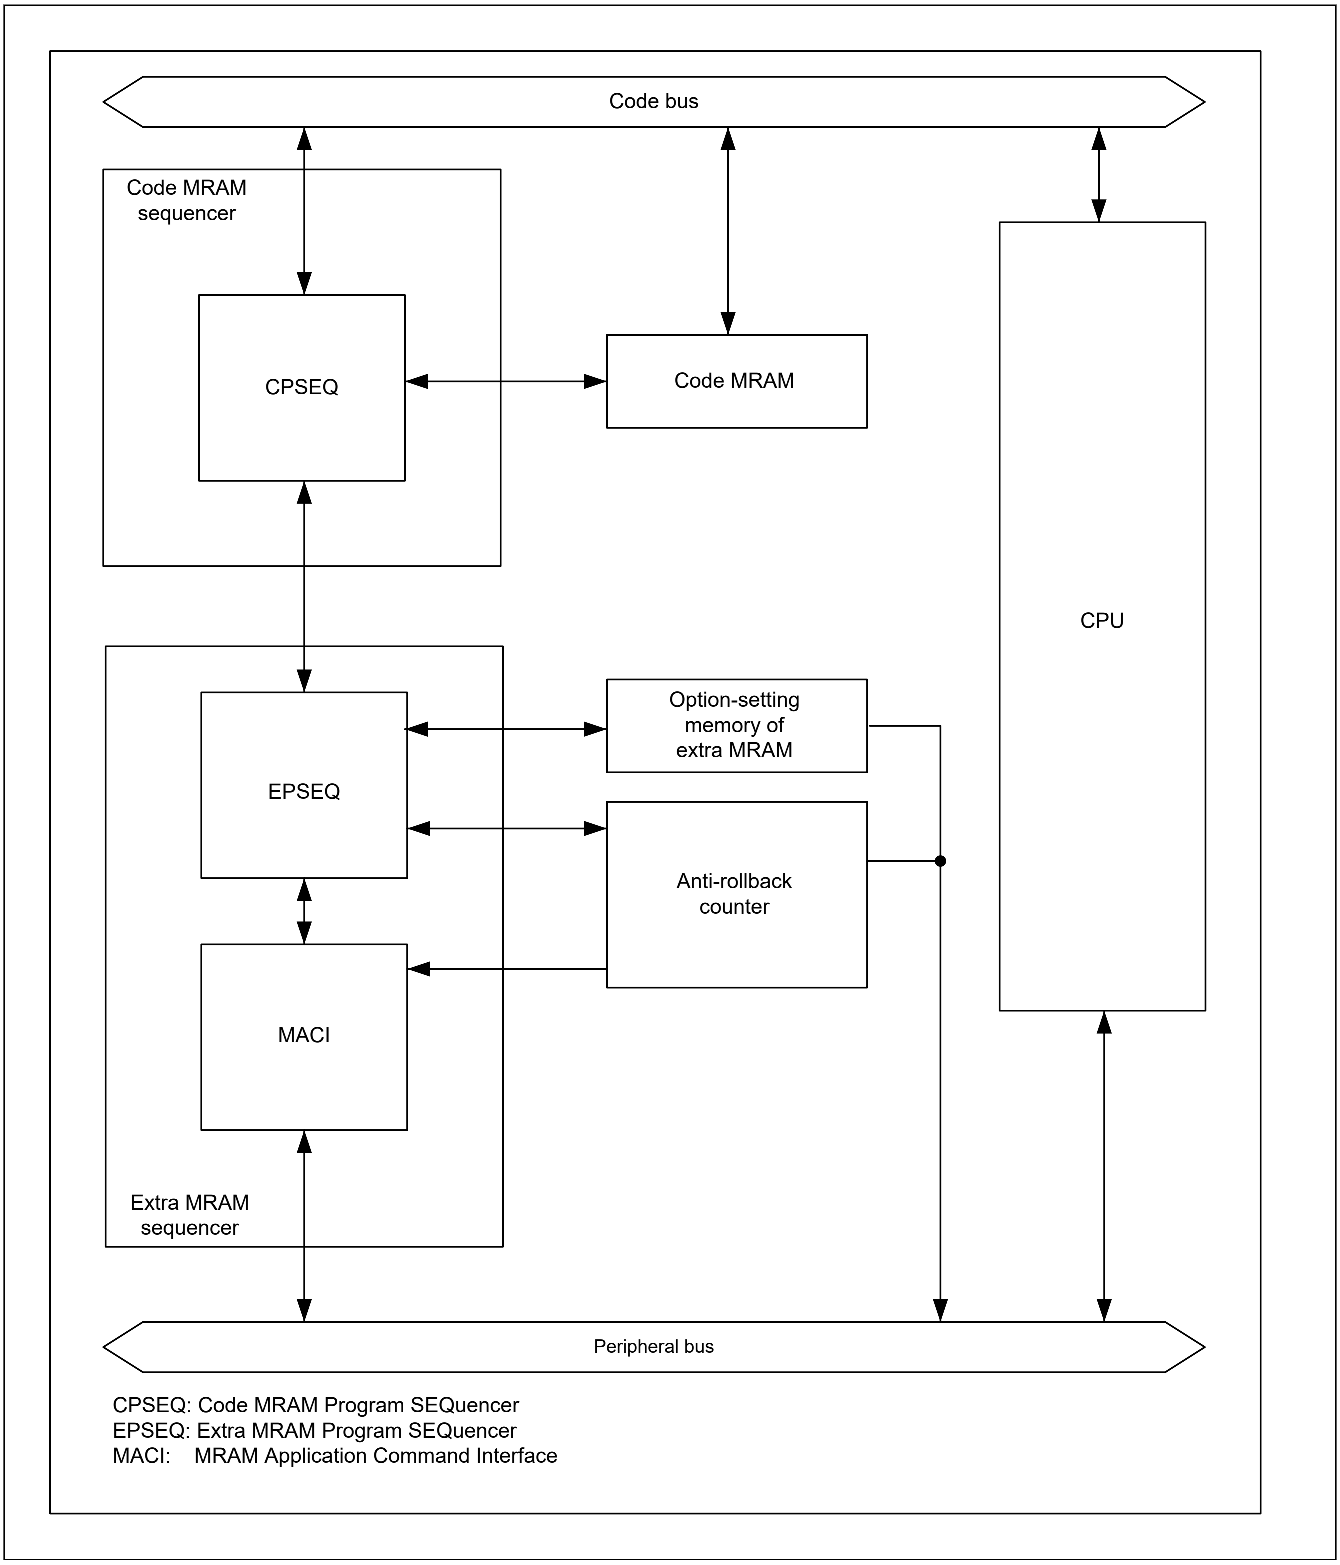

Figure 59.1 Block diagram of MRAM-related module

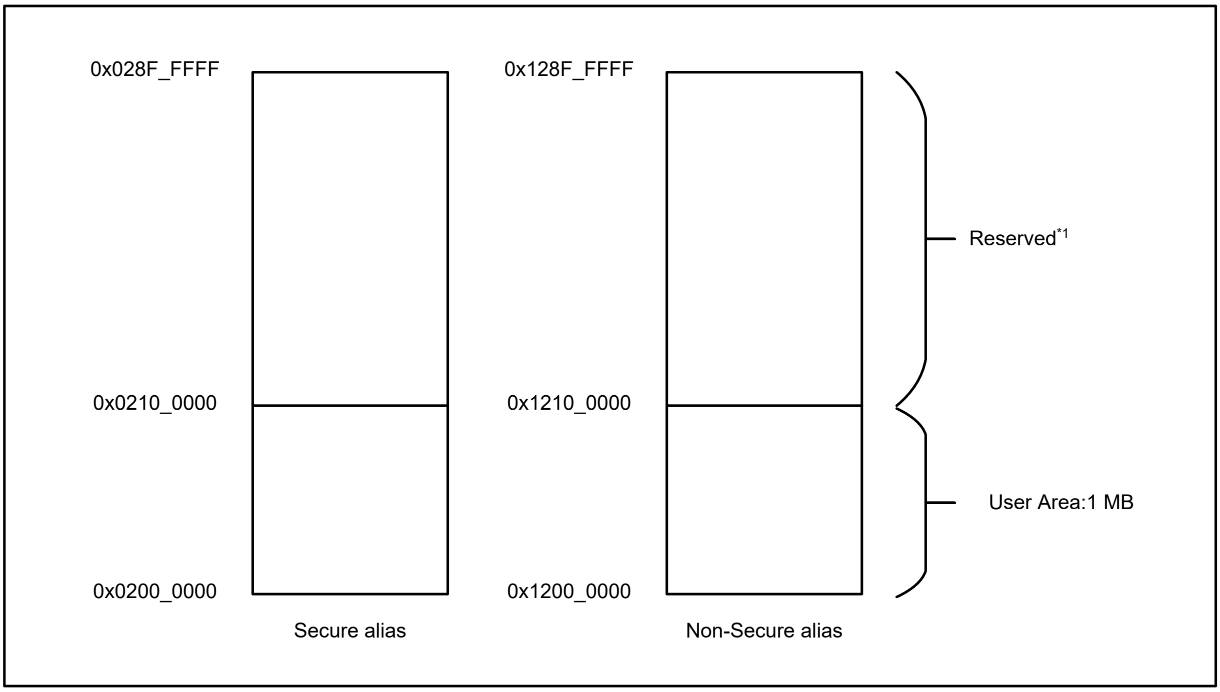
59.2 Structure of Memory

Figure 59.2 shows the memory map of the code MRAM.



Note 1. Bus error is generated.

Figure 59.2 Map of the code MRAM

Table 59.2 Read and programming address by product for the code MRAM

Product	Address
1 MB product	Secure alias: 0x0200_0000 to 0x020F_FFFF Non-Secure alias: 0x1200_0000 to 0x120F_FFFF

59.3 Address Space

Using the hardware interface with MRAM requires access to all registers of the hardware, which is for issuing MACI commands. The base address is shown in Table 59.3. Table 59.4 provides information about the hardware interface.

Table 59.3 Base address

Base address symbol	Address	Secure alias
BASE_MC	0x0200_0000 or 0x1200_0000	Secure or Non-Secure
BASE_MCS	0x0200_0000	Secure
BASE_MCN	0x1200_0000	Non-Secure
BASE_MR	0x4012_0000	Secure
	0x5012_0000	Non-Secure

Table 59.4 Information on the hardware interface area

Area	Address	Capacity
Area containing the various registers of the hardware	See section 59.5. Register Descriptions.	See section 59.5. Register Descriptions.
MACI command-issuing area	BASE_MR	4 bytes

For the address information of the extra MRAM, see section 5, Address Space.

59.4 MRAM Read and Program Function

59.4.1 Prefetch Buffer

Prefetch buffer speeds up CPU instruction fetches from bus master to code MRAM.

Table 59.5 Prefetch buffer overview

Function	Implementation
Target region	0x000_0000 to 0x00F_FFFF (1 MB)
Target bus master	CPU0 and CPU1 instruction fetch
Capacity	64 bytes/CPU
Associativity	Full associative
	256 bits per entry (256 bits aligned data), 2 entries
Access cycle	Hit: 0 wait Miss: See section 59.5.2. MRCFREQ : Code MRAM Frequency Notifications Register.

59.4.2 Programming Procedure

Program data for code MRAM is entered to the program buffer by bus access and is written to code MRAM in 32-bytes units. Renesas recommends the following to avoid system bus stall while processing code MRAM program.

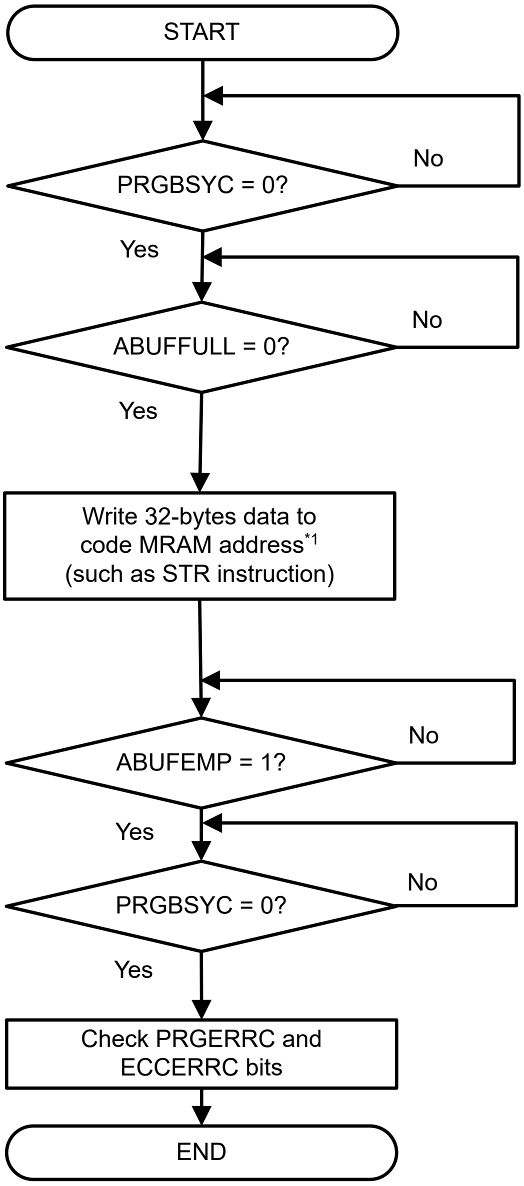
- Only one bus master can perform code MRAM write access
- Program data is 32 bytes or less in the same 32-bytes boundary.

The programming procedures of code MRAM are shown in Figure 59.3 and Figure 59.4. Before writing to code MRAM address, confirm that other program processing is not performed by PRGBSYC and ABUFFULL bits in the MRCPS register. The write data to the code MRAM address is stored in the 32-bytes program data buffer, and is programmed to the code MRAM in either of the following conditions.

- Program data buffer is full (Figure 59.3)
- Written code MRAM address is out of 32-bytes boundary from stored data in the program data buffer
- MRCFL bit in MRCFLR register is set to 1 (Figure 59.4).

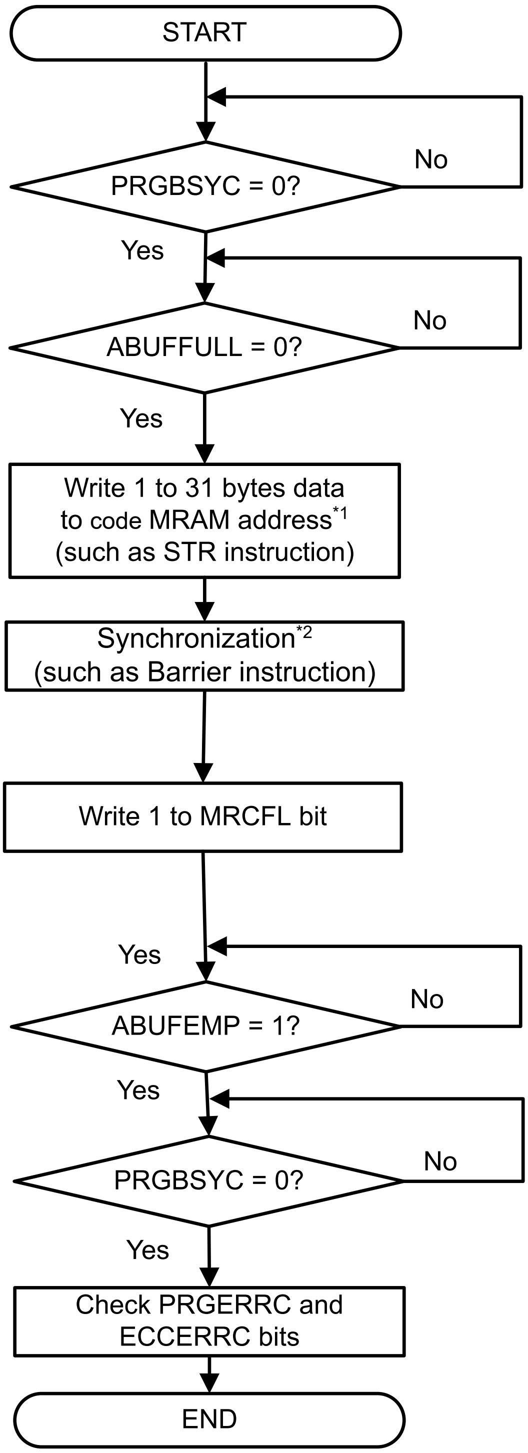
Program processing error status can be confirmed by the PRGERRC and ECCERRC bits in the MRCPS register.

See section 59.7. MACI Commands for programming procedure of extra MRAM.



Note 1. Program address starts from 32-bytes boundary and continuous address.

Figure 59.3 Code MRAM programming procedure (32-bytes programming)

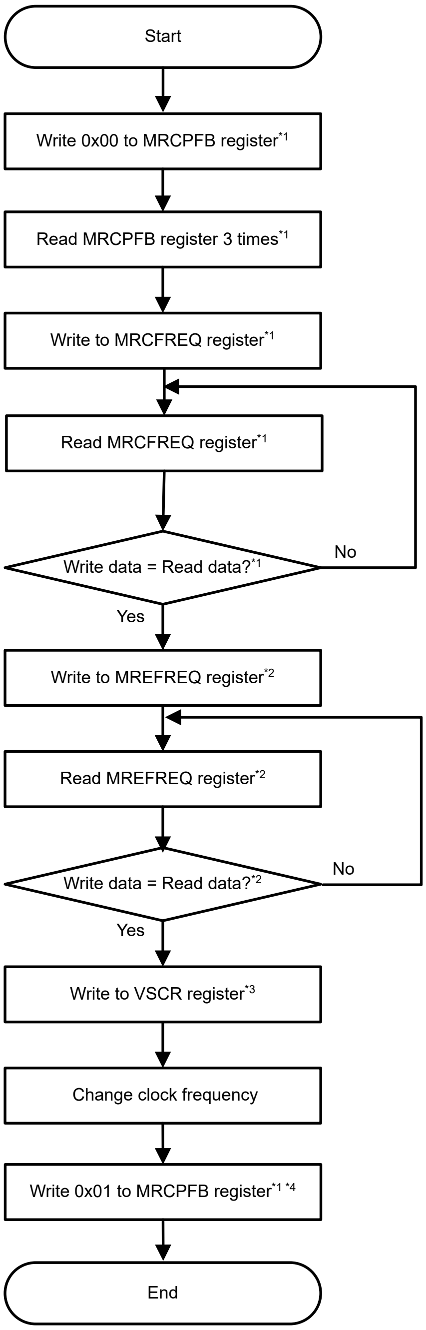


Note 1. Program address is continuous address.
Note 2. See section 59.14. Usage Notes for details.

Figure 59.4 Code MRAM programming procedure (smaller than 32-bytes programming)

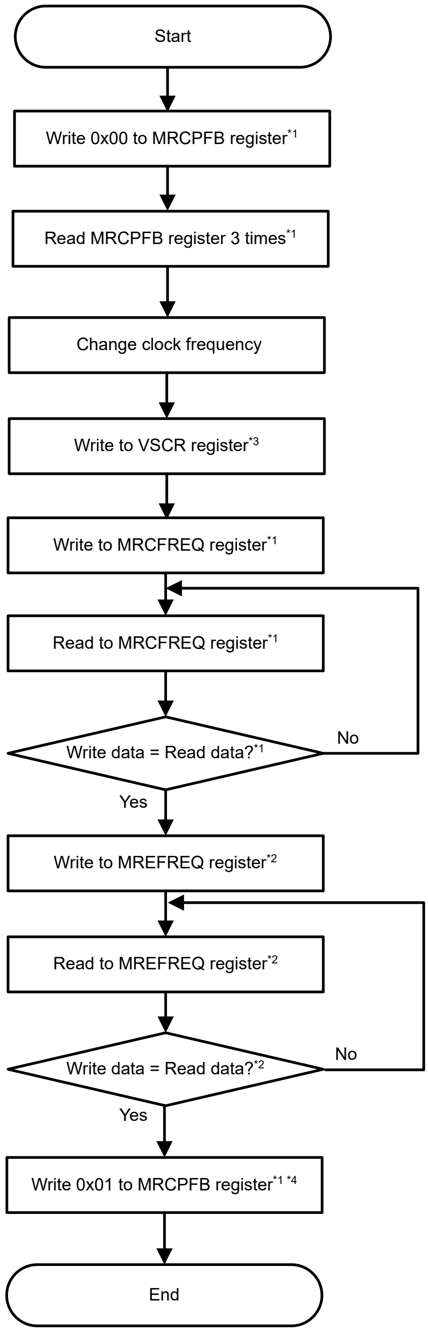
59.4.3 Frequency Change Procedure

The frequency setting is not reflected even if the register is written while programming or reading MRAM. To change the clock frequency, check that the register value is set to the write value before changing it. The frequency change procedures for code MRAM and extra MRAM are shown in Figure 59.5 and Figure 59.6.



Note 1. Only when changing MRCFREQ register.
Note 2. Only when changing MREFREQ register.
Note 3. Only when changing the voltage.
Note 4. When the value of MRCFREQ register is 0x65 or higher and prefetch buffer function is enabled to operate the device.

Figure 59.5 Frequency up procedure



Note 1. Only when changing MRCFREQ register.
Note 2. Only when changing MREFREQ register.
Note 3. Only when changing the voltage.
Note 4. When the value of MRCFREQ register is 0x65 or higher, and prefetch buffer function is enabled to operate the device.

Figure 59.6 Frequency down procedure

59.5 Register Descriptions

59.5.1 MRCPFB : Code MRAM Prefetch Buffer Enable Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x000

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MPFB EN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MPFBEN	Code MRAM Prefetch Buffer Enable 0: Prefetch buffer disable 1: Prefetch buffer enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

MPFBEN bit (Code MRAM Prefetch Buffer Enable)

This bit is used to enable or disable code MRAM prefetch buffer.

It is prohibited to enable prefetch buffer when the MRCFREQ register value is 0x064 or less.

59.5.2 MRCFREQ : Code MRAM Frequency Notifications Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MRCMHZ[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0

Bit	Symbol	Function	R/W
9:0	MRCMHZ[9:0]	Code MRAM Frequency Notifications These bits are used to set the operating frequency of the code MRAM. Set the MRICLK frequency. Number of read access waits to code MRAM. MRCMHZ[9:0] ≤ 0x064 (100 MHz): non wait access 0x064 (100 MHz) < MRCMHZ[9:0] ≤ 0x0C8 (200 MHz): 1 wait access 0x0C8 (200 MHz) < MRCMHZ[9:0] ≤ 0x0FA (250 MHz): 2 wait access Other setting is reserved.	R/W*1
23:10	—	These bits are read as 0. The write value should be 0.	R/W
31:24	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. Writing to these bits is only possible when 32 bits are written, and the value written to the KEY bits is 0x1E.
Note 2. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCFREQ register sets read and program frequency of code MRAM. For a faster clock frequency, set MRCMHZ[9:0] before changing the clock frequency. The ratio of code MRAM to extra MRAM frequency is limited to 5 or less. To slow down the clock frequency, set MRCMHZ[9:0] after changing the clock frequency. For information on the frequency setting, see section 59.4.3. Frequency Change Procedure.

MRCMHZ[9:0] bits (Code MRAM Frequency Notifications)

These bits specify the operating frequency of the code MRAM. Specifically, convert the frequency represented in MHz into a binary number and set it in these bits. If the operating frequency is 32.768 KHz or less, set the MCMHZ bits to 0x000.

Example:

Frequency is 249.9 MHz (MRCMHZ = 0x0FA)

Round up the first decimal place of 250 MHz to a whole number (= 250) and convert it into a binary number.

Frequency is 0.5 MHz (MRCMHZ = 0x001)

Round up the first decimal place of 0.5 MHz to a whole number (= 1) and convert it into a binary number.

Frequency is 32.768 kHz (MRCMHZ = 0x000)

KEY[7:0] bits (Key Code)

These bits control permission and prohibition of writing to the MCMHZ bits.

59.5.3 MREFREQ : Extra MRAM Frequency Notifications Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MREMHZ[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0

Bit	Symbol	Function	R/W
7:0	MREMHZ[7:0]	Extra MRAM Frequency Notifications These bits are used to set the operating frequency of the extra MRAM. Set the MRPCLK frequency. Number of read access waits to extra MRAM. MREMHZ[7:0] ≤ 0x64 (100 MHz): non wait access 0x64 (100 MHz) < MREMHZ[7:0] ≤ 0x7D (125 MHz): 1 wait access Other setting is reserved.	R/W*1
23:8	—	These bits are read as 0. The write value should be 0.	R/W
31:24	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. Writing to these bits is only possible when 32 bits are written, and the value written to the KEY bits is 0xE1.
Note 2. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

MREFREQ sets the read and program frequency of the extra MRAM. For a faster clock frequency, set MREMHZ[7:0] before changing the clock frequency. To slow down the clock frequency, set MREMHZ[7:0] after changing the clock frequency. For information on the frequency setting, see section 59.4.3. Frequency Change Procedure.

MREMHZ[7:0] bits (Extra MRAM Frequency Notifications)

These bits specify the operating frequency of the extra MRAM. Specifically, convert the frequency represented in MHz into a binary number and set it in these bits. If the operating frequency is 32.768 kHz or less, set the MREMHZ[7:0] bits to 0x000.

Example:

Frequency is 124.9 MHz (MREMHZ = 0x7D)

Round up the first decimal place of 124.9 MHz to a whole number (= 125) and convert it into a binary number.

Frequency is 0.5 MHz (MREMHZ = 0x001)

Round up the first decimal place of 0.5 MHz to a whole number (= 1) and convert it into a binary number.

Frequency is 32.768 kHz (MREMHZ = 0x000)

KEY[7:0] bits (Key Code)

These bits control permission and prohibition of writing to the MREMHZ[7:0] bits.

59.5.4 MRCDECC : Code MRAM ECC Decoder Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x010

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	ECCSELC	DECDISC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DECDISC	Code MRAM ECC Decoder Disable 0: ECC decoder enable 1: ECC decoder disable	R/W*1
1	ECCSELC	Code MRAM ECC Bits Select 0: ECC bits unselect 1: ECC bits select	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0x5A.
Note 2. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCDECC register is used to test the ECC decoder circuits for the code MRAM. For information on the test flow of the ECC decoder circuits, see section 59.9.4. Fault Correction and Detection.

DECDISC bit (Code MRAM ECC Decoder Disable)

This bit enables or disables the ECC decoder circuit in the code MRAM.

[Setting condition]

- 1 is written to while write enabling conditions are satisfied.

[Clearing condition]

- 0 is written to while write enabling conditions are satisfied.

ECCSELC bit (Code MRAM ECC Bits Select)

The ECC bits of code MRAM is output to the [144:128] bits and [16:0] bits of the read data when ECCSELC is set to 1. A value of 0 is output for the [255:145] and [127:17] bits of the read data. When a DEC error occurs, the corrected data is output. Read data is not guaranteed when a TED error is detected.

[Setting condition]

- 1 is written to while write enabling conditions are satisfied.

[Clearing condition]

- 0 is written to while write enabling conditions are satisfied.

KEY[7:0] bits (Key Code)

These bits control permission and prohibition of writing to the DECDISC and ECCSELC bits.

59.5.5 MRCRAEINT : Code MRAM Read Access Error Interrupt Enable Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x014

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	INTEN BTC	INTEN BDC
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	INTENBDC	Code MRAM DEC Error Interrupt Enable 0: Generation of an MRAM_MRCRD interrupt request is disabled when MRCRAES.DECERRC is set to 1 1: Generation of an MRAM_MRCRD interrupt request is enabled when MRCRAES.DECERRC is set to 1	R/W
1	INTENBTC	Code MRAM TED Error Interrupt Enable 0: Generation of an MRAM_MRCRD interrupt request is disabled when MRCRAES.TEDERRC is set to 1 1: Generation of an MRAM_MRCRD interrupt request is enabled when MRCRAES.TEDERRC is set to 1	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCRAEINT register enables or disables generation of a code MRAM read access error (MRAM_MRCRD) interrupt request.

INTENBDC bit (Code MRAM DEC Error Interrupt Enable)

This bit enables or disables generation of an MRAM_MRCRD interrupt request when a code MRAM read access violation occurs. This violation leads to the DECERRC bit in the MRCRAES register being set to 1.

INTENBTC bit (Code MRAM TED Error Interrupt Enable)

This bit enables or disables generation of an MRAM_MRCRD interrupt request when a code MRAM read access violation occurs. This violation leads to the TEDERRC bit in the MRCRAES register being set to 1.

59.5.6 MRCRAES : Code MRAM Read Access Error Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x018

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TEDE RRC	DECE RRC
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DECERRC	Code MRAM DEC Error Detected 0: DEC error undetected 1: DEC error detected	R/W*1
1	TEDERRC	Code MRAM TED Error Detected 0: TED error undetected 1: TED error detected	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. Only 0 can be written to clear the flag after 1 is read. These bits should be checked after 0 is written and rewritten to 0 if 1 is read.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

DECERRC bit (Code MRAM DEC Error Detected)

This bit indicates the result of a DEC error check for read data. When accessing reads from the debugger, DECERRC is not set to 1 even if a DEC error occurs. To resolve the DEC error, read 32 bytes of data from the address indicated by the MRCRDEA register and write it back to the same address.

[Setting condition]

- Error detected
  Error is detected to read data of bus masters (this bit is not set when error is detected to prefetched data).

[Clearing condition]

- 0 is written after reading 1 from this bit.

TEDERRC bit (Code MRAM TED Error Detected)

This bit indicates the result of a TED error check for read data. When accessing reads from the debugger, TEDERRC is not set to 1 even if a TED error occurs. To resolve the TED error, write 32 bytes of data to the address indicated by the MRCRTEA register.

[Setting condition]

- Error detected
  Error is detected to read data of bus masters (this bit is not set when error is detected to prefetched data).

[Clearing condition]

- 0 is written after reading 1 from this bit.

59.5.7 MRCRTEA : Code MRAM TED Error Address Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x01C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MRCRTEA[26:11]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRCRTEA[10:0]											—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	—	These bits are read as 0.	R
31:5	MRCRTEA[26:0]	Code MRAM Read Access TED Error Address Indicates the address when a TED error occurs.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCRTEA register stores the address when a TED error occurs in the code MRAM readout. The address of an ECC error is stored when the MRCRAES.TEDERRC bit is set to 1. MRCRTEA bits do not capture the error address when a TED error occurs until the MRCRAES.TEDERRC bit is cleared to 0.

MRCRTEA bits (Code MRAM Read Access TED Error Address)

[Setting condition]

- The TEDERRC bit in the MRCRAES register changes from 0 to 1.

59.5.8 MRCRDEA : Code MRAM DEC Error Address Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MRCRDEA[26:11]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRCRDEA[10:0]											—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	—	These bits are read as 0.	R
31:5	MRCRDEA[26:0]	Code MRAM Read Access DEC Error Address Indicates the address when a DEC error occurs.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCRDEA register stores the address when a DEC error occurs in the code MRAM readout. The address of an ECC error is stored when the MRCRAES.DECERRC bit is set to 1. MRCRDEA bits do not capture the error address when a DEC error occurs until the MRCRAES.DECERRC bit is cleared to 0.

MRCRDEA[26:0] bits (Code MRAM Read Access DEC Error Address)

[Setting condition]

- The DECERRC bit in the MRCRAES register changes from 0 to 1.

59.5.9 MRERAEINT : Extra MRAM Read Access Error Interrupt Enable Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x034

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	INTEN BTE	INTEN BDE
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	INTENBDE	Extra MRAM DEC Error Interrupt Enable 0: Generation of an MRAM_MRERD interrupt request is disabled when MERAES.DECERRE is set to 1 1: Generation of an MRAM_MRERD interrupt request is enabled when MERAES.DECERRE is set to 1	R/W
1	INTENBTE	Extra MRAM TED Error Interrupt Enable 0: Generation of an MRAM_MRERD interrupt request is disabled when MERAES.TEDERRE is set to 1 1: Generation of an MRAM_MRERD interrupt request is enabled when MERAES.TEDERRE is set to 1	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRERAEINT register enables or disables generation of an extra MRAM read access error (MRAM_MRERD) interrupt request.

INTENBDE bit (Extra MRAM DEC Error Interrupt Enable)

This bit enables or disables generation of an MRAM_MRERD interrupt request when an extra MRAM read access violation occurs. This violation leads to the DECERRE bit in the MRERAES register being set to 1.

INTENBTE bit (Extra MRAM TED Error Interrupt Enable)

This bit enables or disables generation of an MRAM_MRERD interrupt request when an extra MRAM read access violation occurs. This violation leads to the TEDERRE bit in the MRERAES register being set to 1.

59.5.10 MRERAES : Extra MRAM Read Access Error Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x038

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TEDERRE	DECERRE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DECERRE	Extra MRAM DEC Error Detected 0: DEC error undetected 1: DEC error detected	R/W*1
1	TEDERRE	Extra MRAM TED Error Detected 0: TED error undetected 1: TED error detected	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. Only 0 can be written to clear the flag after 1 is read. These bits should be checked after 0 is written and rewritten to 0 if 1 is read.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

DECERRE bit (Extra MRAM DEC Error Detected)

This bit indicates the result of a DEC error check for read data. When accessing reads from the debugger, DECERRE is not set to 1 even if a DEC error occurs. To resolve the DEC error, read 16 bytes of data from the address indicated by the MRERDEA register and write it back to the same address.

[Setting condition]

- Error detected
  Error is detected to read data of bus masters (this bit is not set when error is detected to prefetched data).

[Clearing condition]

- 0 is written after reading 1 from this bit.

TEDERRE bit (Extra MRAM TED Error Detected)

This bit indicates the result of a TED error check for read data. When accessing reads from the debugger, TEDERRE is not set to 1 even if a TED error occurs. To resolve the TED error, write 16 bytes of data to the address indicated by the MRERTEA register.

[Setting condition]

- Error detected
  Error is detected to read data of bus masters (this bit is not set when error is detected to prefetched data).

[Clearing condition]

- 0 is written after reading 1 from this bit.

59.5.11 MRERTEA : Extra MRAM TED Error Address Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x03C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MRERTEA[27:12]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRERTEA[11:0]												—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0.	R
31:4	MRERTEA[27:0]	Extra MRAM Read Access TED Error Address Indicates the address when a TED error occurs.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRERTEA register stores the address when a TED error occurs in the extra MRAM readout. The address of an ECC error is stored when the MRERAES.TEDERRE bit is set to 1. MRERTEA bits do not capture the error address when a TED error occurs until the MRERAES.TEDERRE bit is cleared to 0.

MRERTEA bits (Extra MRAM Read Access TED Error Address)

[Setting condition]

- The TEDERRE bit in the MRERAES register changes from 0 to 1.

59.5.12 MRERDEA : Extra MRAM DEC Error Address Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MRERDEA[27:12]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRERDEA[11:0]												—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0.	R
31:4	MRERDEA[27:0]	Extra MRAM Read Access DEC Error Address Indicates the address when a DEC error occurs.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRERDEA register stores the address when a DEC error occurs in the extra MRAM readout. The address of the ECC error is stored when the MRERAES.DECERRE bit is set to 1. The MRERDEA bits do not capture the error address when a DEC error occurs until the MRERAES.DECERRE bit is cleared to 0.

MRERDEA bits (Extra MRAM Read Access DEC Error Address)

[Setting condition]

- The DECERRE bit in the MRERAES register changes from 0 to 1.

59.5.13 MSAR : MRAM Security Attribution Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x100

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRCPSEQSA	MREPSEQSA	MRCPSA	—	MACITRSA	MACICMRSA	MACICMISA	—	—	—	—	MPFBENSA	MRCFREQSA	MRCECCSA	MREFREQSA	MREECCSA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MREECCSA	Extra MRAM ECC Register Security Attribution 0: Secure 1: Non-Secure	R/W
1	MREFREQSA	MREFREQ Register Security Attribution 0: Secure 1: Non-Secure	R/W
2	MRCECCSA	Code MRAM ECC Register Security Attribution 0: Secure 1: Non-Secure	R/W
3	MRCFREQSA	MRCFREQ Register Security Attribution 0: Secure 1: Non-Secure	R/W

Bit	Symbol	Function	R/W
4	MPFBENSA	MRCPFB Register Security Attribution 0: Secure 1: Non-Secure	R/W
8:5	—	These bits are read as 0. The write value should be 0.	R/W
9	MACICMISA	MACI command Issuing Security Attribution 0: Secure 1: Non-Secure	R/W
10	MACICMRSA	MACI Command Registers Security Attribution 0: Secure 1: Non-Secure	R/W
11	MACITRSA	MACI Transfer Security Attribution 0: Secure 1: Non-Secure	R/W
12	—	This bit is read as 0. The write value should be 0.	R/W
13	MRCPSA	Code MRAM Program Register Security Attribution 0: Secure 1: Non-Secure	R/W
14	MREPSEQSA	EPSEQ Area Register Security Attribution 0: Secure 1: Non-Secure	R/W
15	MRCPSEQSA	CPSEQ Area Register Security Attribution 0: Secure 1: Non-Secure	R/W

Note: S-TYPE-1, P-TYPE-1

Write access is invalid when PRCR_S.PRC4 = 0. For details, see section 13, Register Write Protection Function.

MREECCSA bit (Extra MRAM ECC Register Security Attribution)

This bit sets the security attribute of MREDECC, MRERAEINT, MRERAES, MRERTEA, and MRERDEA registers.

MREFREQSA bit (MREFREQ Register Security Attribution)

This bit sets the security attribute of the MREFREQ register.

MRCECCSA bit (Code MRAM ECC Register Security Attribution)

This bit sets the security attribute of MRCDECC, MRCRAEINT, MRCRAES, MRCRTEA, and MRCRDEA registers.

MRCFREQSA bit (MRCFREQ Register Security Attribution)

This bit sets the security attribute of the MRCFREQ register.

MPFBENSA bit (MRCPFB Register Security Attribution)

This bit sets the security attribute of the MCPFB register.

MACICMISA bit (MACI command Issuing Security Attribution)

This bit sets the security attribute of the MRAM access area.

MACICMRSA bit (MACI Command Registers Security Attribution)

This bit sets the security attribute of MASTAT, MREPAEINT, MRDYIE, MSADDR, MSTATR, MENTRYR, MSUINITR, MCMDR, and MSUASMON registers.

MACITRSA bit (MACI Transfer Security Attribution)

This bit sets the security attribute of MCTRCNTR, MCTRLSR, and MCTRSTATR registers.

MRCPSA bit (Code MRAM Program Register Security Attribution)

This bit sets the security attribute of MRCPC0, MRCBPROT0, MRCPS, MRCPEAINT, and MRCPEA registers.

MREPSEQSA bit (EPSEQ Area Register Security Attribution)

This bit sets the security attribute of MRPSC and MREEECC registers.

MRCPSEQSA bit (CPSEQ Area Register Security Attribution)

This bit sets the security attribute of the MRCEECC register.

59.5.14 MREZS : Extra MRAM Zeroization Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	WHUK EXE	WHUK ZF
Value after reset:	1	1	1	1	1	1	0	1/0*1

Bit	Symbol	Function	R/W
0	WHUKZF	W-HUK Zero Flag Status 0: W-HUK is zeroized 1: W-HUK is not zeroized	R
1	WHUKEXE	W-HUK Zeroization Executing Status 0: W-HUK zeroization is not executing 1: W-HUK zeroization is executing	R
7:2	—	These bits are read as 0.	R

Note: S-TYPE-6, P-TYPE-2
Note 1. The initial value is changed by the status of W-HUK.

WHUKZF bit (W-HUK Zero Flag Status)

See section 59.8.6. HUK Protection for the update conditions of WHUKZF.

[Setting condition]

- W-HUK zeroing not executed.

[Clearing conditions]

- After W-HUK zeroing is complete.

WHUKEXE bit (W-HUK Zeroization Executing Status)

[Setting condition]

- W-HUK zeroization is started.

[Clearing condition]

- W-HUK zeroization is finished.

59.5.15 MREZC : Extra MRAM Zeroization Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x404

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	WHUKZE[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	WHUKZE[2:0]	W-HUK Zeroization Execute 0XX, X0X, X X 0: W-HUK zeroization not executes 1 1 1: W-HUK zeroization executes	R/W*1*2
7:3	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note: S-TYPE-6, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0x3C.
Note 2. MREZC register cannot be written in the following conditions.

- When the W-HUK pseudo-zeroing operation in Table 59.31 has already been completed and pseudo-zeroing is to be started again by register writing without any system resets.
- If the operation of W-HUK zeroing in Table 59.31 has already been completed.

Note 3. Written values are not retained by these bits (always reads 0x00).

The MREZC register is used to trigger zeroization of W-HUK by secure software.

WHUKZE[2:0] bits (W-HUK Zeroization Execute)

0 cannot be written to these bits.

[Setting condition]

- 1 is written to while write enabling conditions are satisfied.

[Clearing condition]

- After W-HUK zeroing is complete.

59.5.16 MASTAT : Extra MRAM Access Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2010

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CMDLK	MREAE	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	MREAE	Extra MRAM Access Violation Flag 0: No extra MRAM access violation has occurred 1: An extra MRAM access violation has occurred	R/W*1
4	CMDLK	Command Lock Flag 0: The MRAM sequencer is not in the command-locked state 1: The MRAM sequencer is in the command-locked state	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. Only 0 can be written to clear the flag after 1 is read.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MASTAT register indicates whether an extra MRAM access violation has occurred. If any of the CMDLK and MREAE flags is set to 1, the extra MRAM sequencer enters the command-locked state (see section 59.9.2. Error Protection). To release it from the command-locked state, the Status Clear or Forced Stop command must be issued to the extra MRAM sequencer.

MREAE flag (Extra MRAM Access Violation Flag)

This flag indicates whether an extra MRAM access violation occurred. When this flag is set to 1, the ILGLERR bit in the MSTATR register is set to 1, placing the extra MRAM sequencer in the command-locked state.

[Setting conditions]

In general, commands are issued in extra MRAM program mode as follows.

- The setting of the MSADDR register is a reserved portion of the extra MRAM area.
- The Configuration Set command is issued while the setting of the MSADDR register is out of BASE_MC + 0x00C9 F020 to BASE_MC + 0x00C9 F0A0 and BASE_MC + 0x00C9 F0C0 to BASE_MC + 0x00C9 F7FF.
- MACI command is issued to extra MRAM with the wrong security attribution.

[Clearing conditions]

- When 0 is written to this flag after 1 is set
- When the extra MRAM sequencer starts to process the Status Clear or Forced Stop command.

CMDLK flag (Command Lock Flag)

This flag indicates that the extra MRAM sequencer is in the command-locked state.

[Setting condition]

- The extra MRAM sequencer detects an error and enters the command-locked state.

[Clearing condition]

- When an extra MRAM sequencer starts to process the Status Clear or Forced Stop command.

59.5.17 MPAEINT : Extra MRAM Access Error Interrupt Enable Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2014

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CMDLKIE	MREAEIE	—	—	—
Value after reset:	0	0	0	1	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	MREAEIE	Extra MRAM Access Violation Interrupt Enable 0: Generation of an MRAM_MREPR interrupt request is disabled when MASTAT.MREAE is set to 1 1: Generation of an MRAM_MREPR interrupt request is enabled when MASTAT.MREAE is set to 1	R/W
4	CMDLKIE	Command Lock Interrupt Enable 0: Generation of an MRAM_MREPR interrupt request is disabled when MASTAT.CMDLK is set to 1 1: Generation of an MRAM_MREPR interrupt request is enabled when MASTAT.CMDLK is set to 1	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MPAEINT register enables or disables generation of an extra MRAM access error (MRAM_MREPR) interrupt request.

MREAEIE bit (Extra MRAM Access Violation Interrupt Enable)

This bit enables or disables generation of an MRAM_MREPR interrupt request when an extra MRAM access violation occurs. This violation leads to the MREAE bit in the MASTAT register being set to 1.

CMDLKIE bit (Command Lock Interrupt Enable)

This bit enables or disables generation of an MRAM_MREPR interrupt request when an extra MRAM sequencer enters the command-locked state. This violation leads to the CMDLK bit in the MASTAT register being set to 1.

59.5.18 MRDYIE : Extra MRAM Ready Interrupt Enable Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2018

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MRDYIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRDYIE	Extra MRAM Ready Interrupt Enable 0: Generation of an MRAM_ENDOFPE interrupt request is disabled 1: Generation of an MRAM_ENDOFPE interrupt request is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRDYIE register enables or disables generation of an extra MRAM ready (MRAM_ENDOFPE) interrupt.

MRDYIE bit (Extra MRAM Ready Interrupt Enable)

This bit is used to enable or disable generation of an MRAM_ENDOFPE interrupt request when the MRDY bit in the MSTATR register is changed from 0 to 1. This change occurs on completion of processing by the extra MRAM sequencer of Program and Configuration set command.

59.5.19 MSADDR : MACI Command Start Address Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2030

Bit position:	31 … 0
Bit field:	MSADDR[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	MSADDR[31:0]	Start Address for MACI Command Processing [Command]: [Address boundary] Program (extra MRAM): 16 bytes Configuration set (extra MRAM): 16 bytes	R/W*1

Note: S-TYPE-3, P-TYPE-2

Note 1. These bits can be written when the MRDY bit in the MSTATR register is 1. Writing to these bits are ignored when the MRDY bit is 0. Bits [3:0] are read-only.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MSADDR register specifies the address where the target area for command processing starts when the MACI command for Program or Configuration set is issued.

The MSADDR value is initialized when the SUINIT bit in the MSUINITR register is set to 1. It is also initialized by a reset.

MSADDR[31:0] bits (Start Address for MACI Command Processing)

These bits specify the start address for MACI command processing. Bits [31:29] and bits [27:25] are ignored in MACI command processing for extra MRAM. Bit [28] is used for the security alias for extra MRAM sequencer command. When bit [28] is 0, the extra MRAM sequencer can update the secure region with secure access. When bit [28] is 1, the extra MRAM sequencer can update the non-security region with secure and non-secure access. Bits corresponding to address bits of lower order than the corresponding boundary listed above are also ignored.

See the User's Manual for information on the addresses of the extra MRAM.

See Table 59.15 and Table 59.16 for information on the addresses of Program and Configuration set commands.

59.5.20 MCNTSELR : MRAM Counter Select Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2048

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CNTSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CNTSEL[2:0]	Counter select 0 0 0: Anti-rollback counter is not selected. 0 0 1: ARC_SEC is selected. Counter size is 64 bits. 0 1 0: ARC_OEMBL is selected. Counter size is 64 bits. 0 1 1: Anti-rollback counter is not selected. 1 x x: ARC_NSEC is selected. Counter configuration is 64 or 256 bits. See Table 59.6, Table 59.7, and Table 59.8 for details of the counter select condition.	R/W*1
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

Note 1. This bit can be written when MSTATR.MRDY = 1. Writing to this bit is ignored when MSTATR.MRDY = 0.

CNTSEL[2:0] bits (Counter select)

The MCNTSELR register specifies 3 types of anti-rollback counter (ARC_SEC, ARC_NSEC or ARC_OEMBL) in Increment Counter or Read Counter command.

The MCNTSELR value is initialized when the SUINIT bit in MSUINITR is set to 1.

[Setting condition]

- This register is written to in 8-bit access while MSTATR.MRDY = 1.

[Clearing condition]

- This register is written to in 8-bit access while MSTATR.MRDY = 1.

Before using the ARC_NSEC counter, it is necessary to set whether the counter is to be used with 4 lines × 64 bits or 1 line × 256 bits using the program command. The bits to be set are CNF_ARCNS0 and CNF_ARCNS1. If the CNF_ARCNS1 bit is set to 1, the ARC_NSEC counter cannot be used. Once the counter type is decided, it cannot be changed.

Table 59.6 Select condition of ARC_NSEC (64 bits) in increment/read counter command

MCNTSELR[2:0]	Target counter	Counter configuration
100b	ARC_NSEC[63:0]	Counter number is 4. Counter size is 64 bit.
101b	ARC_NSEC[127:64]	
110b	ARC_NSEC[191:128]	
111b	ARC_NSEC[255:192]	

Table 59.7 Select condition of ARC_NSEC (256 bits) in increment counter command

MCNTSELR[2:0]	Target counter	Counter configuration
100b	ARC_NSEC[255:0]	Counter number is 1. Counter size is 256 bit.
101b		
110b		
111b		

Table 59.8 Select condition of ARC_NSEC (256 bits) in read counter command

MCNTSELR[2:0]	Target counter	Counter configuration
100b	ARC_NSEC[63:0]	Counter number is 1. Counter size is 256 bit.
101b	ARC_NSEC[127:64]	
110b	ARC_NSEC[191:128]	
111b	ARC_NSEC[255:192]	

59.5.21 MCNTDTRn : MRAM Counter Data Register (n = 0, 1)

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x204C + 0x04 × n

Bit position:	31 ... 0
Bit field:	CNTRDAT[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CNTRDAT[31:0]	Counter Read Data Reading data of 32 bits (LSB side of counter values) is output to MCNTDTR0. Reading data of 32 bits (MSB side of counter values) is output to MCNTDTR1.	R

Note: S-TYPE-6, P-TYPE-2

The MCNTDTR0 and MCNTDTR1 registers indicate anti-rollback counter values (64 bits) that read by the Read Counter command.

CNTRDAT[31:0] bits (Counter Read Data)

[Setting condition]

- MACI has accepted Read Counter command.

[Clearing condition]

- MACI has accepted the extra MRAM sequencer command except for the Read Counter command
- The extra MRAM sequencer enters the command-locked state
- W-HUK zeroization started.

59.5.22 MCTRCNTR : MRAM Configuration Update Transfer Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2060

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	Key[7:0]								—	—	—	—	—	—	—	TRTRG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TRTRG	Transfer Start Trigger 0: Configuration update transfer processing does not start 1: Configuration update transfer processing starts	R/W[*1 *2 *3]
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	Key[7:0]	Key code These bits enable or disable TRTRG bit modification. Data written to these bits are not stored.	R/W[*1]

Note: S-TYPE-3, P-TYPE-2
Note 1. Written data is not stored in these bits.
Note 2. This bit can be written when MCTRSTATR register is 0x00. Writing to this bit is ignored when MCTRSTATR register is other than 0x00 or when W-HUK zeroing is in progress.
Note 3. Writing to this bit is enabled only when this register is accessed in 16-bit size and 0x45 is written to the Key[7:0] bits.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MCTRCNTR register specifies the start trigger and setting information in the configuration update transfer processing.

TRTRG bit (Transfer Start Trigger)

Starts the configuration update transfer processing.

[Setting condition]

- 1 is written to the TRTRG bit while write enabling conditions are satisfied.

59.5.23 MCTRLSR : MRAM Configuration Update Transfer List Select Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2064

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRLIST[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TRLIST[2:0]	Configuration Update Transfer List 0 0 1: Transfer list 1 is selected Others: Transfer list 1 is not selected	R/W[*1]
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit can be written when the TRBUSY bit in the MCTRSTATR register is 0. Writing to this bit when TRBUSY = 1 is ignored.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MCTRLSR register specifies the target transfer list in the configuration update transfer.

TRLIST[2:0] bits (Configuration Update Transfer List)

Transfer list 1 includes the coefficient value for DAC12.

[Setting condition]

- 1 is written to the TRLIST[2:0] bits while write enabling conditions are satisfied.

[Clearing condition]

- 0 is written to the TRLIST[2:0] bits while write enabling conditions are satisfied.

59.5.24 MCTRSTATR : MRAM Configuration Update Transfer Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x206C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TRMD	—	TRBUSY
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TRBUSY	Transfer Busy Status 0: Configuration update transfer is not processing 1: Configuration update transfer is processing	R
1	—	This bit is read as 0.	R
2	TRMD	Transfer Mode Setting Status 0: MENTRYR register is a data transferable setting 1: MENTRYR register is not a data transferable setting	R
7:3	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

TRBUSY bit (Transfer Busy Status)

Indicates status of the configuration update transfer processing.

[Setting condition]

- 1 is written to the TRTRG bit while write enabling conditions are satisfied.

[Clearing condition]

- The configuration update transfer processing is finished.

TRMD bit (Transfer Mode Setting Status)

Indicates the MENTRYR register setting that the configuration update transfer can be started.

[Setting condition]

- MENTRYR is 0x0080.

[Clearing condition]

- MENTRYR is 0x0000.

59.5.25 MSTATR : Extra MRAM Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2080

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	ILGCOMERR	—	SECERR	OTERR	TZFERR	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRDY	ILGLERR	—	PRGERR	—	—	—	—	—	—	CFGSETERR	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	—	These bits are read as 0.	R
5	CFGSETERR	Configuration Set Error Flag 0: Configuration set has been completed successfully 1: An error has occurred during configuration set	R
11:6	—	These bits are read as 0.	R
12	PRGERR	Programming Error Flag 0: Programming has been completed successfully 1: An error has occurred during programming	R
13	—	These bits are read as 0.	R
14	ILGLERR	Illegal Command Error Flag 0: The extra MRAM sequencer has not detected an illegal MACI command or illegal extra MRAM access 1: The extra MRAM sequencer has detected an illegal MACI command or illegal extra MRAM access	R
15	MRDY	Extra MRAM Ready Flag 0: Program, Configuration set, Increment Counter, or Read Counter command processing is in progress 1: None of the above is in progress	R
18:16	—	These bits are read as 0.	R
19	TZFERR	TrustZone Filter Error 0: A TrustZone filter error has not been detected 1: A TrustZone filter error has been detected	R
20	OTERR	Other Error 0: An error has not been detected 1: An error has been detected	R
21	SECERR	Security Error 0: A write protection error against MSUASMON.FSPR bit has not been detected 1: A write protection error against MSUASMON.FSPR bit has been detected	R
22	—	This bit is read as 0.	R
23	ILGCOMERR	Illegal Command Error 0: An illegal MACI command error has not been detected 1: An illegal MACI command error has been detected	R
31:24	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MSTATR register indicates the state of the extra MRAM sequencer.

CFGSETERR flag (Configuration Set Error Flag)

This flag indicates the result of an extra MRAM configuration setting. If this flag is 1, the extra MRAM sequencer is in the command-locked state.

[Setting condition]

- A TED error occurs when an extra MRAM sequencer reads data not to update from the configuration area during configuration setting.

[Clearing condition]

- The extra MRAM sequencer starts processing of the Status Clear or Forced Stop command.

PRGERR flag (Programming Error Flag)

This flag indicates the result of an extra MRAM programming. If this flag is 1, the extra MRAM sequencer is in the command-locked state.

[Setting condition]

- An error occurs during programming.

[Clearing condition]

- The extra MRAM sequencer starts processing of the Status Clear or Forced Stop command.

ILGLERR flag (Illegal Command Error Flag)

This flag indicates that the extra MRAM sequencer has detected an illegal MACI command or extra MRAM access. If this flag is 1, the extra MRAM sequencer is in the command-locked state.

[Setting Conditions] (See section 59.9.2. Error Protection)

- The extra MRAM sequencer has detected an illegal command
- The extra MRAM sequencer has detected illegal extra MRAM access.

[Clearing condition]

- The extra MRAM sequencer starts processing of the Status Clear or Forced Stop command.

MRDY flag (Extra MRAM Ready Flag)

This flag indicates the command processing state of the extra MRAM sequencer.

[Setting conditions]

- The extra MRAM sequencer completes command processing
- The extra MRAM sequencer has received the Forced Stop command and ended command processing
- W-HUK zeroing in processing.

[Clearing conditions]

- The extra MRAM sequencer has received the MACI command
- For Program and Configuration Set commands, the first write access to the MACI command-issuing area
- For other commands, the last write access to the MACI command issuing area.

TZFERR bit (TrustZone Filter Error)

This bit indicates a TrustZone protection error in the MACI command.

See Table 59.36. When this bit is 1, the extra MRAM sequencer enters the command-locked state.

[Setting condition]

- An error has been detected.

[Clearing condition]

- Status Clear or Forced Stop command processing is completed.

OTERR bit (Other Error)

This bit indicates that an MACI command has been issued when the condition of accepting commands is not satisfied.

See Table 59.36. When this bit is 1, the extra MRAM sequencer enters the command-locked state.

[Setting condition]

- An error has been detected.

[Clearing condition]

- Status Clear or Forced Stop command processing is completed.

SECERR bit (Security Error)

This bit indicates that the write protection by the MSUASMON.FSPR bit is violated.

See Table 59.36. When this bit is 1, the extra MRAM sequencer enters the command-locked state.

[Setting condition]

- An error has been detected.

[Clearing condition]

- Status Clear or Forced Stop command processing is completed.

ILGCOMERR bit (Illegal Command Error)

This bit indicates that the extra MRAM sequencer has detected an illegal MACI command.

See Table 59.36. When this bit is 1, the extra MRAM sequencer enters the command-locked state.

[Setting condition]

- An error has been detected.

[Clearing condition]

- Status Clear or Forced Stop command processing is completed.

59.5.26 MENTRYR : Extra MRAM Program Mode Entry Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2084

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								MENTRY	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	MENTRY	Extra MRAM Program Mode Entry 0: Extra MRAM is in read mode 1: Extra MRAM is in program mode	R/W[*1][*2][*3]
15:8	KEY[7:0]	Key Code	R/W[*4]

Note: S-TYPE-3, P-TYPE-2
Note 1. These bits can be written when the MRDY bit in the MSTATR register is 1. Writing to these bits are ignored when the MRDY bit is 0.
Note 2. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0xAA.
Note 3. The MENTRY bit cannot be set to 1 during configuration update, and the MENTRYR register cannot be written to during W-HUK zeroing.
Note 4. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MENTRYR register is used to specify the extra MRAM program mode. To specify an extra MRAM program mode so that the extra MRAM sequencer can receive MACI commands, set the MENTRY bit to 1 to place the extra MRAM sequencer in program mode.

The MENTRYR register is initialized when the SUINIT bit in MSUINITR is set to 1. It is also initialized by a reset.

MENTRY bit (Extra MRAM Program Mode Entry)

This bit specifies the extra MRAM program mode.

[Setting condition]

- Write 1 to the MENTRY bit while writing to MENTRYR is enabled and MENTRYR is 0x00.

[Clearing conditions]

- Write 8 bits to MENTRYR while the MRDY bit is 1
- A value other than 0xAA is specified in the KEY[7:0] bits and 16 bits are written to MENTRYR while the MRDY bit is 1
- Write 0 to the MENTRY bit while writing to MENTRYR is enabled

- Write to MENTRYR while writing is enabled and its value is other than 0x00.

KEY[7:0] bits (Key Code)

These bits control permission and prohibition of writing to the MENTRY bit.

59.5.27 MSUINITR : Extra MRAM Sequencer Setup Initialization Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x208C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	SUINIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SUINIT	Setup Initialization 0: The MSADDR, MENTRYR, and MCNTSELR extra MRAM sequencer setup registers keep their current values 1: The MSADDR, MENTRYR, and MCNTSELR extra MRAM sequencer setup registers are initialized	R/W*1 *2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit can be written when the MRDY bit in the MSTATR register is 1. Writing to this bit is ignored when the MRDY bit is 0.
Note 2. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0x2D.
Note 3. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MSUINITR register is used for initialization of the extra MRAM sequencer setup.

SUINIT bit (Setup Initialization)

This bit initializes the following extra MRAM sequencer setup registers.

- MSADDR
- MENTRYR
- MCNTSELR

KEY[7:0] bits (Key Code)

These bits control permission and prohibition of writing to the SUINIT bit.

59.5.28 MCMDR : MACI Command Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x20A0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMDR[7:0]								PCMDR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PCMDR[7:0]	Pre-command Flag The command just before the latest command is stored.	R

Bit	Symbol	Function	R/W
15:8	CMDR[7:0]	Command Flag The latest command is stored.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MCMDR register records the two most recent commands accepted by the extra MRAM sequencer.

PCMDR[7:0] flags (Pre-command Flag)

These flags indicate the command received immediately before the latest command received by the extra MRAM sequencer.

CMDR[7:0] flags (Command Flag)

These flags indicate the latest command received by the extra MRAM sequencer.

Table 59.9 States of MCMDR after receiving commands

Command	CMDR	PCMDR
Program	0xE8	Previous Command
Status Clear	0x50	Previous Command
Forced Stop	0xB3	Previous Command
Configuration set	0x40	Previous Command
Increment Counter	0xD0	0x35
Read Counter	0xD0	0x39

59.5.29 MSUASMON : MRAM Startup Area Select Monitor Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x20DC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	BTSIZE[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1/0	1/0	1/0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FSPR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1/0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as 0.	R
15	FSPR	Protection flag of programming to set boot flag and startup area control 0: Protected state 1: Non-protected state	R
28:16	—	These bits are read as 0.	R
30:29	BTSIZE[1:0]	Size of startup area select for boot swap 0 0: Reserved 0 1: Startup area size is set to 32 KB 1 0: Startup area size is set to 16 KB 1 1: Startup area size is set to 8 KB	R
31	BTFLG	Flag of startup area select for boot swap 0: The startup area is the alternate block (block 1) 1: The startup area is the default block (block 0)	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

FSPR flag (Protection flag of programming to set boot flag and startup area control)

This flag indicates the protection state against the Configuration Set command for the BTFLG bit, BTSIZE[1:0] bits, and the MSUACR register.

In response to a reset or Program command, the MACI transfers data from the extra MRAM to this register. The data corresponding to the FSPR flag is POFSPS[13] bit. See section 59.8.1. Permanent OFS Protect Setting for details.

BTSIZE[1:0] bits (Size of startup area select for boot swap)

These bits indicate the size of the startup area.

In response to a reset or Configuration Set command, the MACI transfers data from the extra MRAM to this register.

BTFLG flag (Flag of startup area select for boot swap)

This flag indicates whether the address of the startup area is exchanged for the boot swap function or not.

In response to a reset or Configuration Set command, the MACI transfers data from the extra MRAM to this register.

59.5.30 MSUACR : MRAM Startup Area Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x20E8

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	SAS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SAS[1:0]	Startup Area Select 0 X: Startup area is selected by BTFLG bit 1 0: Startup area is temporarily switched to the default area 1 1: Startup area is temporarily switched to the alternate area	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-6, P-TYPE-2

Note 1. The following described the write condition of this bit (these conditions are required at the same time).
1. The access size to this register is 16 bits.
2. The value of KEY [7:0] is 0x66.
3. The FSPR bit is 1.

Note 2. Written values are not retained by these bits (always reads 0x00).

The MSUACR register sets the startup area for the boot swap function.

SAS[1:0] bits (Startup Area Select)

These bits are used to select the startup area. Three methods are capable for changing the startup area.

KEY[7:0] bits (Key Code)

These bits control permission and prohibition of writing to the SAS[1:0] bits.

59.5.31 MRPSC : MRAM Program Speed Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x2800

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MHSPEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MHSPEN	MRAM High-Speed Program Mode Enable 0: Normal program mode 1: High-speed program mode	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

MHSPEN bit (MRAM High-Speed Program Mode Enable)

This bit enables or disables high-speed program mode of the code MRAM or extra MRAM. After setting this bit to 1 and programming the code MRAM or extra MRAM, the mode is changed to high-speed program mode. To change to normal program mode, set this bit to 0, read the MRPSC register once, and program or read the MRAM. See section 59.6.2. MRAM High-speed Program Mode for details of mode changing.

59.5.32 MRCPC0 : Code MRAM Program Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	MRCPNEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRCPNEN	Code MRAM Program Enable for Non-secure 0: Code MRAM non-secure aliases are not programmable 1: Code MRAM non-secure aliases are programmable	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0x86.
Note 2. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

MRCPNEN bit (Code MRAM Program Enable for Non-secure)

The MRCPNEN bit enables programming of non-secure alias.

Setting the NVMWE bit in the DBGNVMCR register to 1 allows programming to a non-secure alias that is not protected by the block protection of code MRAM, regardless of the value of MRCPNEN.

59.5.33 MRCPC1 : Code MRAM Program Control Register for Secure

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	MRCPSEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRCPSEN	Code MRAM Program Enable for Secure 0: Code MRAM secure aliases are not programmable 1: Code MRAM secure aliases are programmable	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-6, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0x68.
Note 2. Written values are not retained by these bits (always reads 0x00).

MRCPSEN bit (Code MRAM Program Enable for Secure)

The MRCPSEN bit enables programming of secure alias.

Setting the NVMWE bit in the DBGNVMCR register to 1 allows programming to a secure alias that is not protected by the block protection of the code MRAM, regardless of the value of MRCPSEN.

59.5.34 MRCBPROT0 : Code MRAM Block Protection Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3008

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	BPCN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPCN0	Code MRAM Block Protection Cancel for Non-secure 0: Code MRAM block protection is enabled 1: Code MRAM block protection is disabled	R/W*1 *2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note: S-TYPE-3, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0x78.
Note 2. Writing to this bit is ignored when the MRCPNEN bit in the MRCPC0 register is 0x0.
Note 3. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCBPROT0 register is used to disable block protect function for non-secure. When the block protect setting is locked by permanent block setting, it cannot be disabled by this register.

BPCN0 bit (Code MRAM Block Protection Cancel for Non-secure)

This bit disables block protect for non-secure function.

[Setting condition]

- 1 is written to BPCN0 while the write enabling conditions are satisfied.

[Clearing conditions]

One of the following conditions is satisfied.

- 0 is written to BPCN0 while the write enabling conditions are satisfied
- 0 is written to the MRCPC0.MRCPNEN bit.

59.5.35 MRCBPROT1 : Code MRAM Block Protection Register for Secure

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x300C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	BPCN1
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPCN1	Code MRAM Block Protection Cancel for Secure 0: Code MRAM block protection is enabled 1: Code MRAM block protection is disabled	R/W*1 *2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note: S-TYPE-6, P-TYPE-2

Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0xB1.

Note 2. Writing to this bit is ignored when the MRCPSEN bit in the MRCPC1 register is 0x0.

Note 3. Written values are not retained by these bits (always reads 0x00).

The MRCBPROT1 register is used to disable block protect function for secure. When the block protect setting is locked by permanent block setting, it cannot be disabled by this register.

BPCN1 bit (Code MRAM Block Protection Cancel for Secure)

This bit disables block protect for secure function.

[Setting condition]

- 1 is written to BPCN1 while the write enabling conditions are satisfied.

[Clearing conditions]

One of the following conditions is satisfied.

- 0 is written to BPCN1 while the write enabling conditions are satisfied
- 0 is written to the MRCPC1.MRCPSEN bit.

59.5.36 MRCPS : Code MRAM Program Status Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3010

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PRGBSYC	ABUFFULL	ABUFEMP	—	—	—	ECCERRC	PRGERRC
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRGERRC	Programming Error 0: Programming has been completed successfully 1: An error has occurred during programming	R/W*1

Bit	Symbol	Function	R/W
1	ECCERRC	ECC Error 0: Programming has been completed successfully 1: An error has occurred during programming	R/W*1
4:2	—	These bits are read as 0. The write value should be 0.	R/W
5	ABUFEMP	Address Buffer Empty 0: Address buffer is not empty, and code MRAM write data can flush 1: Address buffer is empty, and code MRAM write data cannot flush	R
6	ABUFFULL	Address Buffer Full 0: Address buffer is not full, and code MRAM write transaction is acceptable 1: Address buffer is full, and code MRAM write transaction is not acceptable	R
7	PRGBSYC	Code MRAM Program Busy 0: Code MRAM is not in program status 1: Code MRAM is in program status	R

Note: S-TYPE-3, P-TYPE-2

Note 1. Only 0 can be written to clear the flag after 1 is read. These bits should be checked after 0 is written and rewritten to 0 if 1 is read.

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCPS register indicates the code MRAM program status.

PRGERRC bit (Programming Error)

This bit indicates the result of code MRAM programming.

This bit can only be clear. Setting it is ignored.

When the DBGSTOPNVMER bit in the DBGSTOPCR register is set to 1, the PRGERRCbit is not set to 1 even if a program error occurs.

[Setting condition]

- An error has occurred during programming and the ECCERRC bit is 0.

[Clearing condition]

- 0 is written after reading 1 from this bit.

ECCERRC bit (ECC Error)

This bit indicates the occurrence of an uncorrectable error when programming data from the code bus is less than 32 bytes. Programming data to the code MRAM is generated from data in the target address and data from the code bus. If a TED error occurs when reading data from the target address, programming data to the code MRAM cannot be correctly generated if the data from the code bus is less than 32 bytes. To perform programming to an address with ECCERRC set to 1, all 32 bytes data must be input from the code bus.

This bit can only be clear. Setting it is ignored.

When the DBGSTOPNVMER bit in the DBGSTOPCR register is set to 1, the ECCERRC bit is not set to 1 even if an ECC error occurs.

[Setting condition]

- Uncorrectable error occurred when programming data from the code bus is less than 32 bytes and the PRGERRC bit is 0.

[Clearing condition]

- 0 is written after reading 1 from this bit.

ABUFEMP bit (Address Buffer Empty)

If the address buffer for the code MRAM programming is empty, the ABUFEMP bit is set to 1. When the ABUFEMP bit is 1, data in the program data buffer cannot be flushed because the MRCFL bit in the MRCFLR register cannot be written.

ABUFFULL bit (Address Buffer Full)

If the address buffer for the code MRAM programing is full, the ABUFFULL bit is set to 1. When the ABUFFULL bit is 1, a new write transaction cannot be accepted until the code MRAM programing starts or finishes.

PRGBSYC bit (Code MRAM Program Busy)

If CPSEQ executes the code MRAM programming processing, the PRGBSYC bit is set to 1. When the PRGBSYC bit is 1, a new read transaction to the code MRAM cannot be accepted until the code MRAM programming finishes.

59.5.37 MRCPAEINT : Code MRAM Program Access Error Interrupt Enable Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3014

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MRCAEIE	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	MRCAEIE	Code MRAM Program Access Error Interrupt Enable 0: Generation of an MRAM_MRCPR interrupt request is disabled when the ECCERRC or PRGERRC bits are 1 1: Generation of an MRAM_MRCPR interrupt request is enabled when the ECCERRC or PRGERRC bits are 1	R/W

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCPAEINT register enables or disables generation of a code MRAM program error (MRAM_MRCPR) interrupt request.

MRCAEIE bit (Code MRAM Program Access Error Interrupt Enable)

The MRCAEIE bit enables or disables MRAM_MRCPR interrupt request when a code MRAM program access error occurs and the ECCERRC or PRGERRC bits in MRCPS becomes 1.

59.5.38 MRCPEA : Code MRAM Program Error Address Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MCPEA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MCPEA[10:0]											—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	—	These bits are read as 0.	R
31:5	MCPEA[26:0]	Code MRAM Program Error Address Indicates the address when a program error occurs.	R

Note: S-TYPE-3, P-TYPE-2

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

The MRCPEA register stores the error address when a program or ECC error occurs.

MCPEA[26:0] bits (Code MRAM Program Error Address)

[Setting condition]

- When a program or ECC error occurs while the ECCERRC bit is 0 and the PROGERRC bit is 0, the error address is stored in the MRCPEA register.

59.5.39 MRCFLR : Code MRAM Flush Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3030

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	MRCFL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRCFL	Flush Write Data Buffer for Code MRAM 0: Not execute to flush program data buffer 1: Execute to flush program data buffer	R/W*1 *2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note: S-TYPE-5, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0xC3.
Note 2. When the ABUFEMP bit in the MRCPS register is 1, it is not possible to write 1 to this bit.
Note 3. Written values are not retained by these bits (always reads 0x00).

The MRCFLR register is used for programming data less than 32 bytes.

MRCFL bit (Flush Write Data Buffer for Code MRAM)

This bit is used for starting code MRAM programming operation.

[Setting condition]

- 1 is written to while write enabling conditions are satisfied.

[Clearing condition]

- When the ABUFEMP bit in the MRCPS register is set to 1.

59.5.40 MRCEECC : Code MRAM ECC Encoder Control Register

Base address: MRAM = 0x4013_C000
MRAM_NS = 0x5013_C000

Offset address: 0x3804

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ECCBYPC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECCBYPC	Code MRAM ECC Encoder Outputs Bypass Enable 0: ECC encoder output is programmed to the ECC bits of the code MRAM 1: Bits [144:128] and bits [16:0] of written data are programmed to the ECC bits of the code MRAM	R/W*1

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. Writing to these bits is only possible when 16 bits are written, and the value written to the KEY bits is 0xCD.
Note 2. Written values are not retained by these bits (always reads 0x00).

Associated SA: MSAR register. See section 59.5.13. MSAR : MRAM Security Attribution Register.

ECCBYPC bit (Code MRAM ECC Encoder Outputs Bypass Enable)

The ECCBYPC bit is used to test the ECC decoder circuits for the code MRAM. For information on the test flow of the ECC decoder circuits, see section 59.9.4. Fault Correction and Detection.

59.5.41 UIDRn : Unique ID Registers n (n = 0 to 3)

Address: 0x02F0_7B00 + 4 × n

Bit position:	31	0
Bit field:	UID	
Value after reset:	Unique value for each chip	

Bit	Symbol	Function	R/W
31:0	UID	Unique ID	R

Note: S-TYPE-5, P-TYPE-5

The UIDRn is a read-only register that stores a 16-byte ID code (unique ID) for identifying the individual MCU. The UIDRn register should be read in 32-bit units. When reading by the signature request command of the serial programming interface, data is read in order from the data with the large address. That is, the data in 0x02F0_7B0F is read first, and in 0x02F0_7B00 is read last.

59.5.42 PNRn : Part Numbering Register n (n = 0 to 3)

Address: 0x02C1_EC38 + 4 × n

Bit position:	31	0
Bit field:	PNR	
Value after reset:	Unique value for each chip	

Bit	Symbol	Function	R/W
31:0	PNR	Part Number	R

Note: S-TYPE-5, P-TYPE-5

The PNRn is a read-only register that stores a 16-byte part numbering. The PNRn register should be read in 32-bit units. Each byte corresponds to the ASCII code representation of the product part number as detailed in Table 1.13. The first character (R, 0x52 in ASCII code) of the part number is stored in the byte with the smallest address (0x02C1_EC38). When reading by the signature request command of the serial programming interface, the data is read in order from the data with the small address. That is, the data in 0x02C1_EC38 is read first, and in 0x02C1_EC47 is read last.

59.5.43 MCUVER : MCU Version Register

Address: 0x02C1_EC48

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MCUVE							
Value after reset:	Values depend on the chip							

Bit	Symbol	Function	R/W
7:0	MCUVE	MCU Version	R

Note: S-TYPE-5, P-TYPE-5

The MCUVER is a read-only register that stores the MCU version. The MCUVER register should be read in 8-bit units.

59.5.44 MWMCR : OTP Write Mode Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAB4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MWM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	MWM[1:0]	OTP Write Mode [1:0] 0 0: OTP normal speed write mode 0 1: OTP high speed write mode 0 1 0: OTP high speed write mode 1 1 1: Prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The MWMCR register controls the OTP write mode when writing data to OTP.

MWM[1:0] bits (OTP Write Mode [1:0])

1. MWM[1:0] = 00: OTP is set to OTP normal speed write mode.
   You can set MWM[1:0] to 00 when 1.62 V ≦ VCC ≦ 3.63 V.
   Refer to the write period of OTP normal speed write mode to section 62, Electrical Characteristics.
2. MWM[1:0] = 01: OTP is set to OTP high speed write mode 0.
   You can set MWM[1:0] to 01 when 2.5 V ≦ VCC ≦ 3.63 V.
   Refer to the write period of OTP high speed write mode 0 to section 62, Electrical Characteristics.
3. MWM[1:0] = 10: OTP is set to OTP high speed write mode 1.
   You can set MWM[1:0] to 10 when 3.0 V ≦ VCC ≦ 3.63 V.
   Refer to the write period of OTP high speed write mode 1 to section 62, Electrical Characteristics.
   While writing OTP in high speed mode 1:
   - Make CPUCLK0 and ICLK frequencies the same
   - Stop ESWM operation
   - Do not call Open process in the API of security engine.

59.6 Operating Mode

59.6.1 MRAM Read/Program Mode

Code MRAM and extra MRAM have modes for reading and programming as shown in Figure 59.7.

Transition from code MRAM read mode to code MRAM program mode is initiated by a software request generated by either of following conditions.

Programming of code MRAM starts automatically after transition to code MRAM program mode. When programming of code MRAM is completed, mode is transit from code MRAM program mode to code MRAM read mode automatically.

- Program data buffer is full
- Written code MRAM address is out of 32 bytes boundary from stored data in a program data buffer
- The MRCFL bit in the MRCFLR register is set to 1.

Transitions between extra MRAM read mode and extra MRAM program mode are initiated by changing the value of the MENTRYR register or by W-HUK zeroization. See section 59.8.6. HUK Protection. MRAM is in extra MRAM read mode when the MENTRYR register is 0x0000 and W-HUK zeroization is not executing. MRAM is in extra MRAM program mode in other cases. Programming of extra MRAM can be started using the MACI command in extra MRAM program mode or by starting W-HUK zeroization.

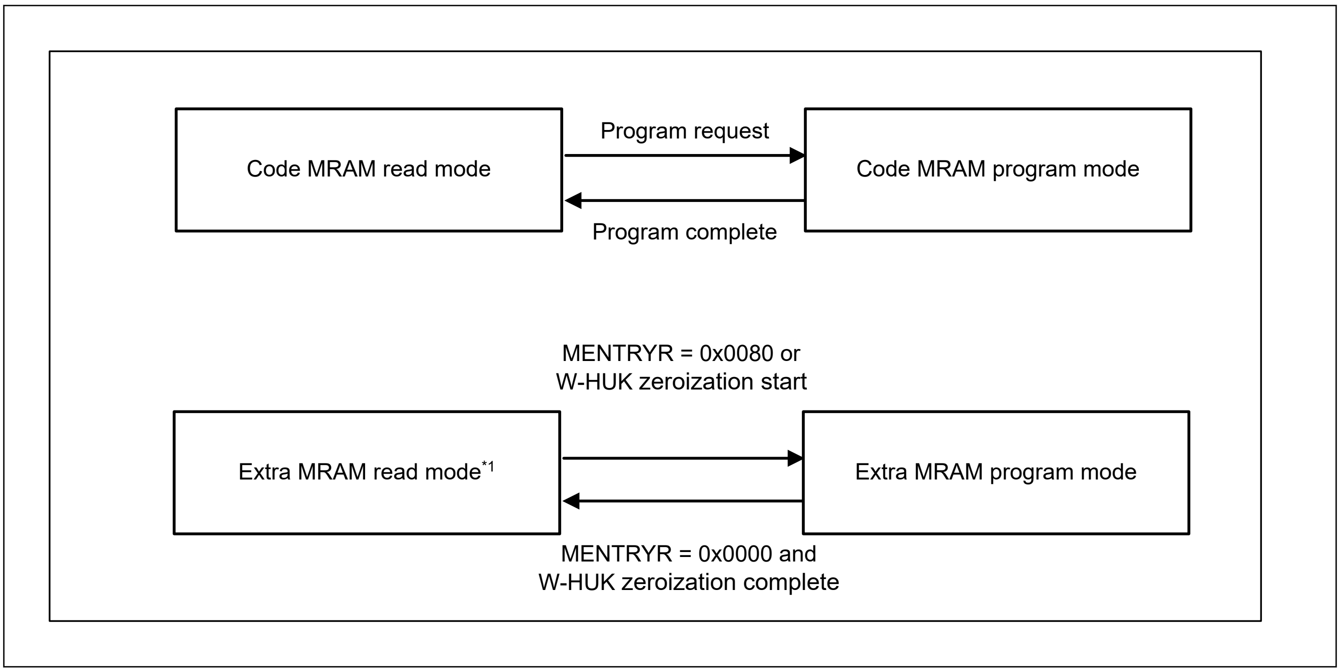


Figure 59.7 MRAM read/program mode transition

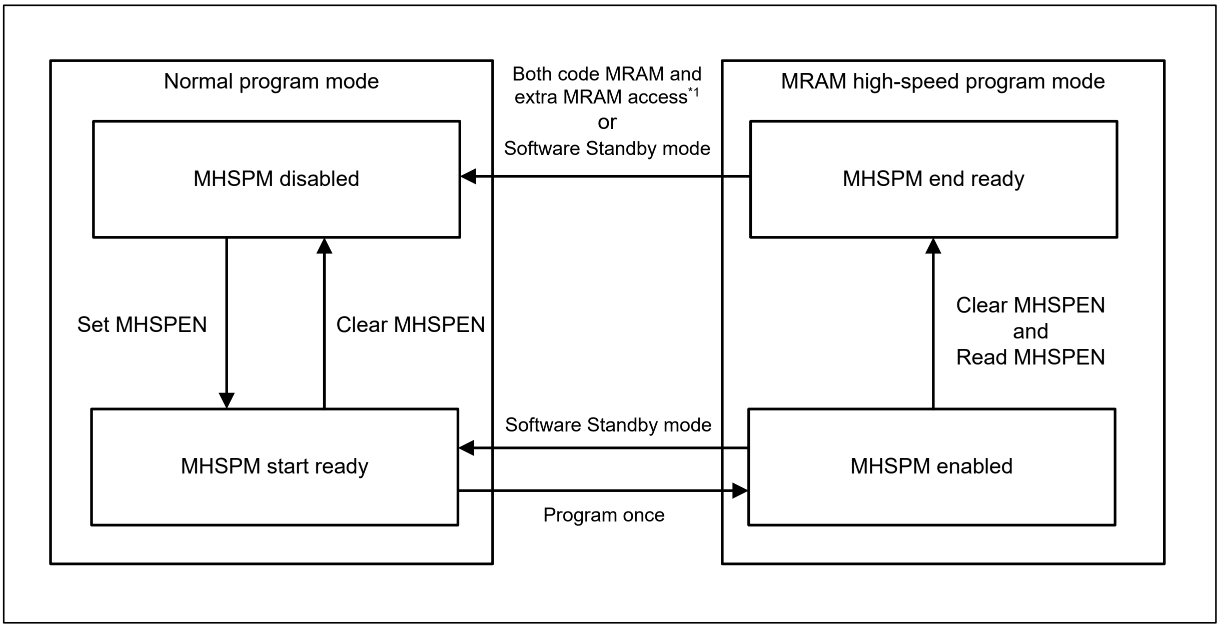
59.6.2 MRAM High-speed Program Mode

MRAM has normal program mode and high-speed program mode as shown in Figure 59.8, and the same mode setting is applied for both code MRAM program mode and extra program mode.

After setting the MHSPEN bit of the MRPSC register to 1 in MHSPM disabled status in normal program mode, the status changes to MHSPM start ready. When code MRAM or extra MRAM is programmed in MHSPM start ready status once, MRAM program mode changes to MHSPM enabled status in high-speed program mode.

To return to normal program mode from MHSPM enabled status, set the MHSPEN bit to 0, read the MHSPEN bit once, and transition into MHSPM end ready status at first. When both code MRAM and extra MRAM are accessed in MHSPM end ready status, MRAM program mode changes to MHSPM disabled status in normal program mode.

When the MCU transitions to Software Standby mode, the MRAM program mode changes to normal program mode while retaining the MHSPEN bit. If the MHSPEN bit is set to 1, programming the code MRAM or extra MRAM once after returning from Software Standby mode changes the MRAM program mode to high-speed program mode.



Note 1. Code MRAM access: Read, Program, W-HUK zeroization
Extra MRAM access: Read, Program, W-HUK zeroization, Forced stop

Figure 59.8 High-speed program mode transition

59.6.3 Debugger Support Functions

Precondition of functions

For non-secure debugging, the debugger can read and program to the Code MRAM area with non-secure attributes. Registers set to the secure attribute cannot be read and written by non-secure access. It is assumed that the MRCFREQ register and MREFREQ register are set to the appropriate values in user software when user software is running. For the debugger download, or break setting is enabled before user software startup, the chip startup frequency must be set to the initial register values of MRCFREQ and MREFREQ registers.

Program function

Code MRAM can be programmed by setting the NVMWE bit in the DBGNVMCR register to 1 without setting the MRCPC0 and MRCPC1 registers. However, it cannot be programmed in areas protected by block protection. If the block protection needs to be cleared, execute the Configuration program command in serial programing mode to do so. To avoid interfering with the operation of the debugger, when the DBGSTOPNVMER bit in the DBGSTOPCR register is set to 1, it masks the setting of the ECCERRC and PRGERRC bits in the MRCPS register, which is an error notification register during code MRAM programming. If the error bits were already set before the DBGSTOPNVMER bit is set, the value is held until the register is cleared.

Debugging by the debugger targets the code and data areas, so errors in the program caused by MACI commands other than in the data area of the extra MRAM are not masked.

Read function

The TEDERRC and DECERRC bits of the MRCRAES register and the TEDERRC and DECERRC bits of the MRERAES register are not set if an ECC error occurs during access from the debugger. DBGSTOPNVMER bit is not used for masking ECC error in reading from the debugger.

59.7 MACI Commands

59.7.1 Programmable Area with MACI Commands

Table 59.10 shows the MRAM and OTP areas in extra MRAM that can be programmed with the MACI command. These areas store setting data for security, safety, and system configuration. Each bit (both data and ECC) in the OTP area can only be programmed once from 1 to 0. There are two types of OTP areas with ECC and without ECC as shown in Table 59.10. A unit of 16-bytes data can be programmed only once to the OTP area with ECC. Reprogramming of different data cannot be retried because some bits of ECC may need to change from 0 to 1. Reliability of OTP area without ECC is secured by redundant data configuration. A unit of 16-bytes data can be programmed multiple times to OTP area without ECC when there is no bit changing from 0 to 1.

Table 59.10 Programmable area with MACI commands

Address (Offset address: BASE_MC)	Area name	Memory type	ECC
0x00C9_F020 to 0x00C9_F0AF	Configuration	MRAM	Use
0x00C9_F0C0 to 0x00C9_F7FF	Configuration	MRAM	Use
0x00E0_7400 to 0x00E0_74BF	Hash of OEM_ROOT_PKn (n = 0 to 3)	OTP	Use
0x00E0_7600 to 0x00E0_760F	FSBL setting	OTP	Use
0x00E0_7610 to 0x00E0_769F	Start address of measurement report Start address of Code Certificate	OTP	Use
0x00E0_76A0 to 0x00E0_76FF	General purpose OTP	OTP	Use
0x00E1_7700 to 0x00E1_777F	Permanent Block Protect Setting for Secure	OTP	Do not use
0x00E1_7780 to 0x00E1_77FF	Permanent Block Protect Setting	OTP	Do not use
0x00E1_7900 to 0x00E1_790F	OFS Permanent Lock Setting	OTP	Do not use
0x00E1_7910 to 0x00E1_791F	REVOKE	OTP	Do not use
0x00E1_7920 to 0x00E1_792F	Zeroization HUK in OTP Enable	OTP	Do not use
0x00E1_7930 to 0x00E1_793F	Anti-Rollback Counter Setting	OTP	Do not use
0x00E1_7950 to 0x00E1_79FF	Reserved	OTP	Do not use
—	Anti-Rollback Counter	OTP	Do not use

59.7.2 List of MACI Commands

Table 59.11 List of MACI commands

MACI command	Function
Program	This command is used to program extra MRAM area except for the configuration area. The program unit is 16 bytes.
Status Clear	This command initializes the ILGLERR, PRGERR, ILGCOMERR, SECERR, OTERR, TZFERR, and CFGPRGERR bits in the MSTATR register and the CMDLK and MREAE bits in the MASTAT register, including the extra MRAM sequencer released from command-locked state.
Forced Stop	This command forcibly stops processing of MACI commands and initializes the MSTATR and MASTAT register.
Configuration set	This command is used to program configuration area for setting security function and safety function Units of setting are 16 bytes.
Increment Counter (Secure access only)	The anti-rollback counter value can be incremented. The target counter is selected by MCNTSELR register. Update data unit is 1 bit.
Read Counter (Secure access only)	The anti-rollback counter value can be read. The target counter is selected by the MCNTSELR register. Reading data is output to MCNTDATAR0 and MCNTDATAR1 registers. Read unit is 64 bits.

The MACI commands are issued by writing to the MACI command-issuing area (see Table 59.4). When write access as shown in Table 59.12 proceeds in the specified state, the extra MRAM sequencer executes the processing corresponding to the given command (see section 59.7.3. Relationship Between the Extra MRAM Sequencer State and MACI Commands).

Table 59.12 MACI command formats

MACI commands	Number of write access	Write data to the MACI command-issuing area			
		1st access	2nd access	3rd to (N+2)th access	(N+3)th access
Program 16-byte programming: N = 8	N + 3	0xE8	0x08 (= N)	WD_1 to WD_N	0xD0
Status Clear	1	0x50	—	—	—
Forced Stop	1	0xB3	—	—	—
Configuration set N = 8 (16 Bytes)	N + 3	0x40	0x08 (= N)	WD_1 to WDn	0xD0
Increment Counter	2	0x35	0xD0	—	—
Read Counter	2	0x39	0xD0	—	—

Note: WDN (N = 1, 2,…): Nth 16-bit data to be programmed.

The extra MRAM sequencer clears the MSTATR.MRDY bit to 0 at the start of processing of a command other than the Status Clear command. The extra MRAM sequencer also sets this bit to 1 on completion of command processing.

If the setting of the MRDYIE.MRDYIE bit is 1, MRAM_ENDOFPE interrupt is generated when the MSTATR.MRDY bit is set to 1.

59.7.3 Relationship Between the Extra MRAM Sequencer State and MACI Commands

The MACI commands are accepted according to the mode/state of the extra MRAM sequencer. MACI commands should be issued after the transition to the extra MRAM program mode and checking the state of the extra MRAM sequencer. Use the MSTATR and MASTAT registers to check the state of the extra MRAM sequencer. In addition, the occurrence of errors in general can be checked by reading the CMDLK bit in the MASTAT register. Its value is the logical OR of the ILGLERR, ILGCOMERR, SECERR, OTERR, TZFERR, PRGERR, and CFGPRGERR bits in the MSTATR register. Table 59.13 lists the available commands in each operating mode.

Table 59.13 Operating mode and available commands

Operation mode	MENTRYR	Available commands
Extra MRAM read mode	0x0000	None
Extra MRAM program mode (W-HUK zeroization is not executed)	0x0080	Program Status Clear Forced Stop Configuration Set Increment Counter Read Counter
Extra MRAM program mode (W-HUK zeroization is executed)	0x0000/0x0080*1	None

Note 1. MRAM is in extra MRAM program mode when W-HUK zeroization is executed regardless of MENTRYR value. See section 59.6.1. MRAM Read/Program Mode.

Table 59.14 shows the state of the extra MRAM sequencer and acceptable MACI commands. An appropriate mode is assumed to have been set before the commands are executed.

Table 59.14 Acceptable MACI commands and the state of the extra MRAM sequencer

	Program, Configuration set, Increment Counter, Read Counter, Forced Stop command processing	Command-locked state (MRDY = 1)	Command-locked state (MRDY = 0)	W-HUK zeroization is executed	Other state
MRDY bit	0	1	0	0/1	1
CMDLK bit	0	1	1	0/1	0
Program	X	X	X	X	O
Status Clear	X	O	X	X	O
Forced Stop	O	O	O	X	O
Configuration set	X	X	X	X	O
Increment Counter	X	X	X	X	O
Read Counter	X	X	X	X	O

Remarks:

O: Acceptable

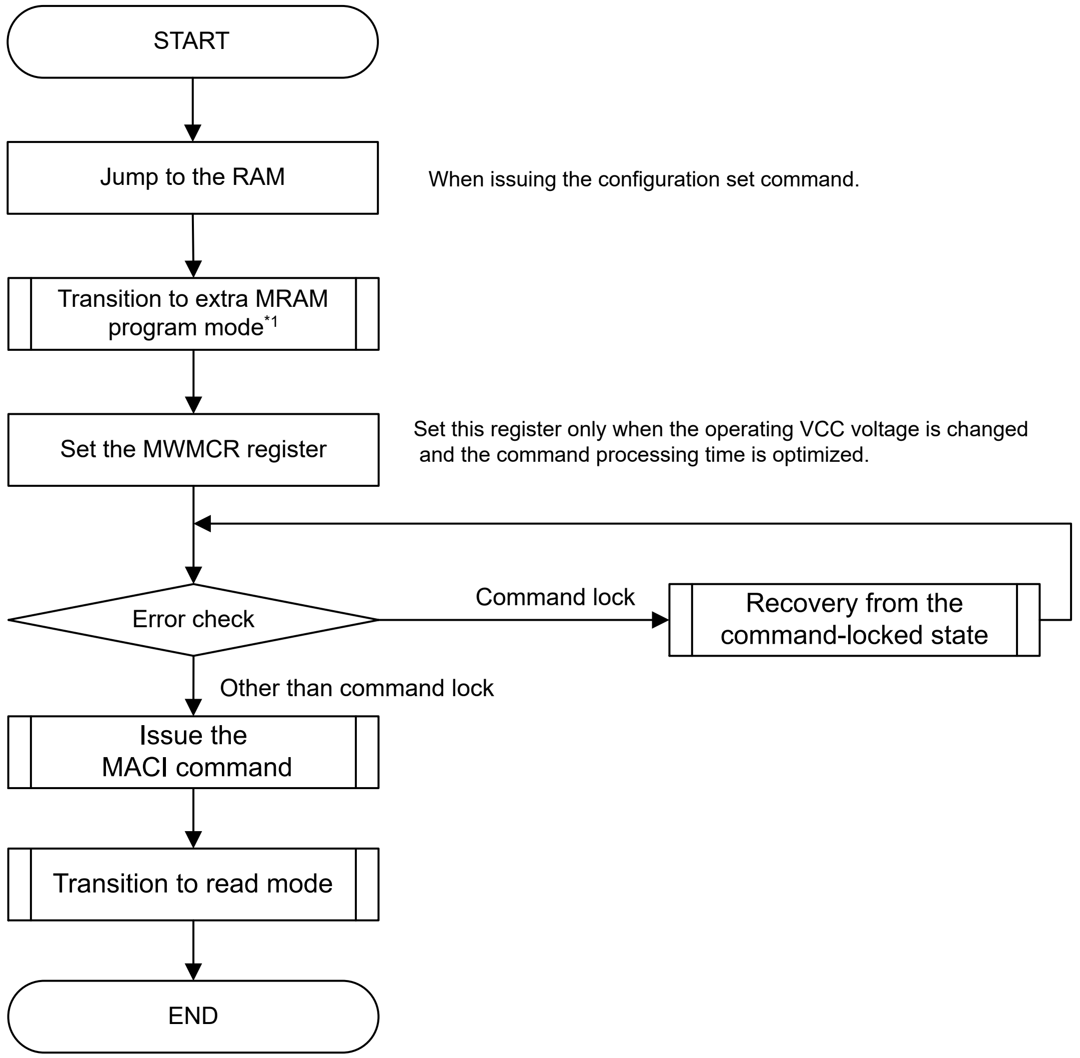
X: Not acceptable (places the sequencer in the command-locked state)

59.7.4 Usage of MACI Commands

This section gives an overview of the usage of MACI commands.

59.7.4.1 Overview of Command Usage in Extra MRAM Program Mode

Figure 59.9 shows an overview of MACI command usage in extra MRAM program mode. See Table 59.13 for the available commands in extra MRAM program mode.



Note 1. See section 59.7.4.2. Transition to Extra MRAM Program Mode.

Figure 59.9 Overview of command usage in extra MRAM program mode

59.7.4.2 Transition to Extra MRAM Program Mode

To issue the MACI commands for the extra MRAM, a transition to extra MRAM program mode is required. To cause the transition to extra MRAM program mode, set the MENTRY bit in the MENTRYR register to 1.

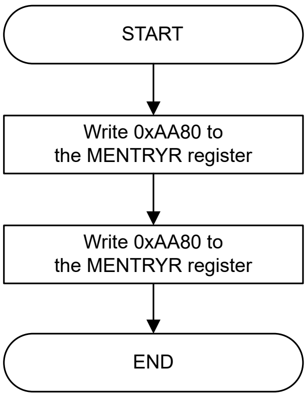


Figure 59.10 Procedure for transition to extra MRAM program mode

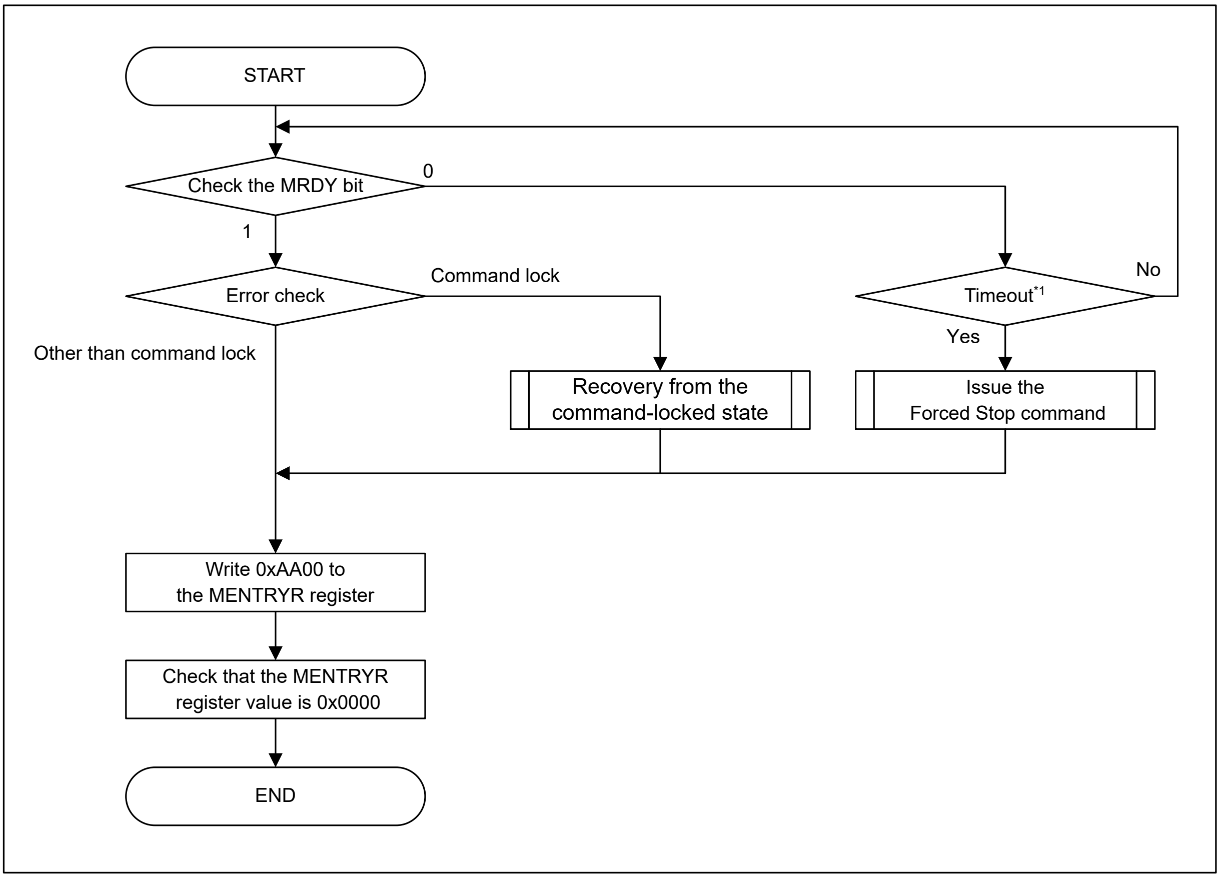
59.7.4.3 Transition to Read Mode

To read the extra MRAM, the MRDY bit in the MSTATR register must be set to 1 or a transition to read mode is required. To cause a transition to read mode, set the MENTRYR register to 0x0000. The transition to read mode should be made while processing by the extra MRAM sequencer is completed and the operation is in a state other than command-locked.



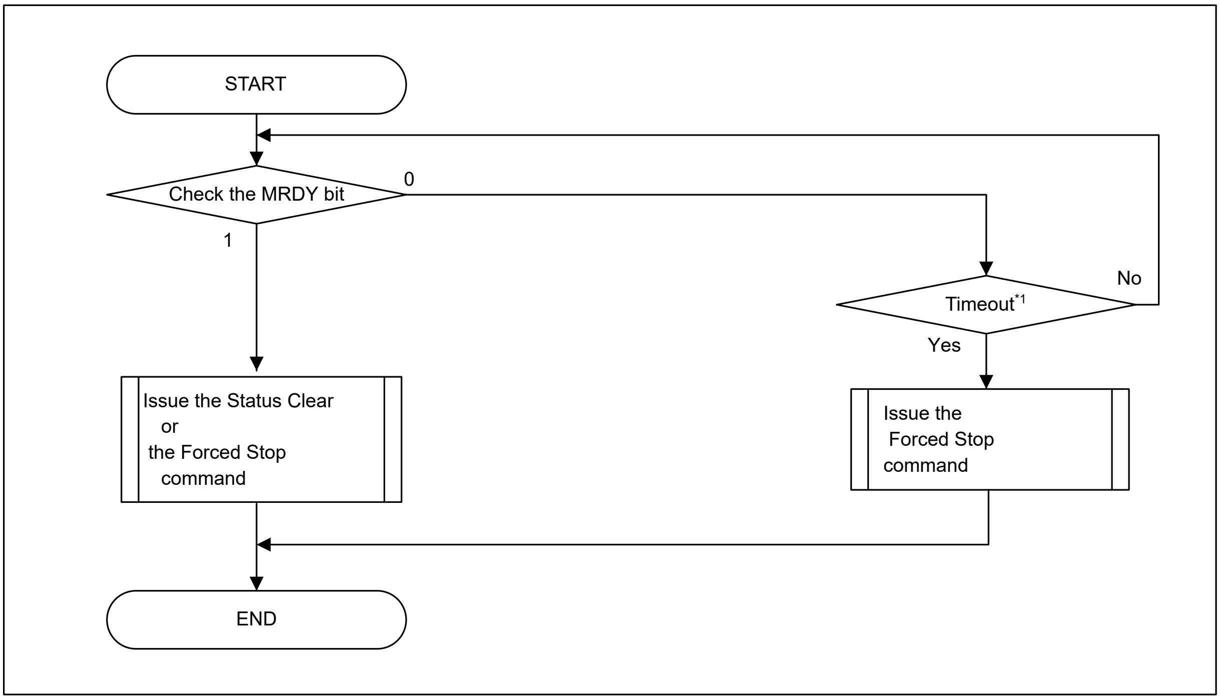
Note 1. Judgment of the timeout is based on 1.1 times the maximum time for processing of the MACI command that is in progress. For details of the updating time, see section 62, Electrical Characteristics.

Figure 59.11 Procedure for transition to read mode

59.7.4.4 Recovery from the Command-Locked State

When the extra MRAM sequencer enters the command-locked state, MACI commands cannot be accepted. To release the sequencer from the command-locked state, use the Status Clear command, Forced Stop command.

If processing is not completed in time beyond the maximum programming/erasure time specified in the electrical characteristics, this can be considered a timeout, and the extra MRAM sequencer should be stopped by the Forced Stop command.



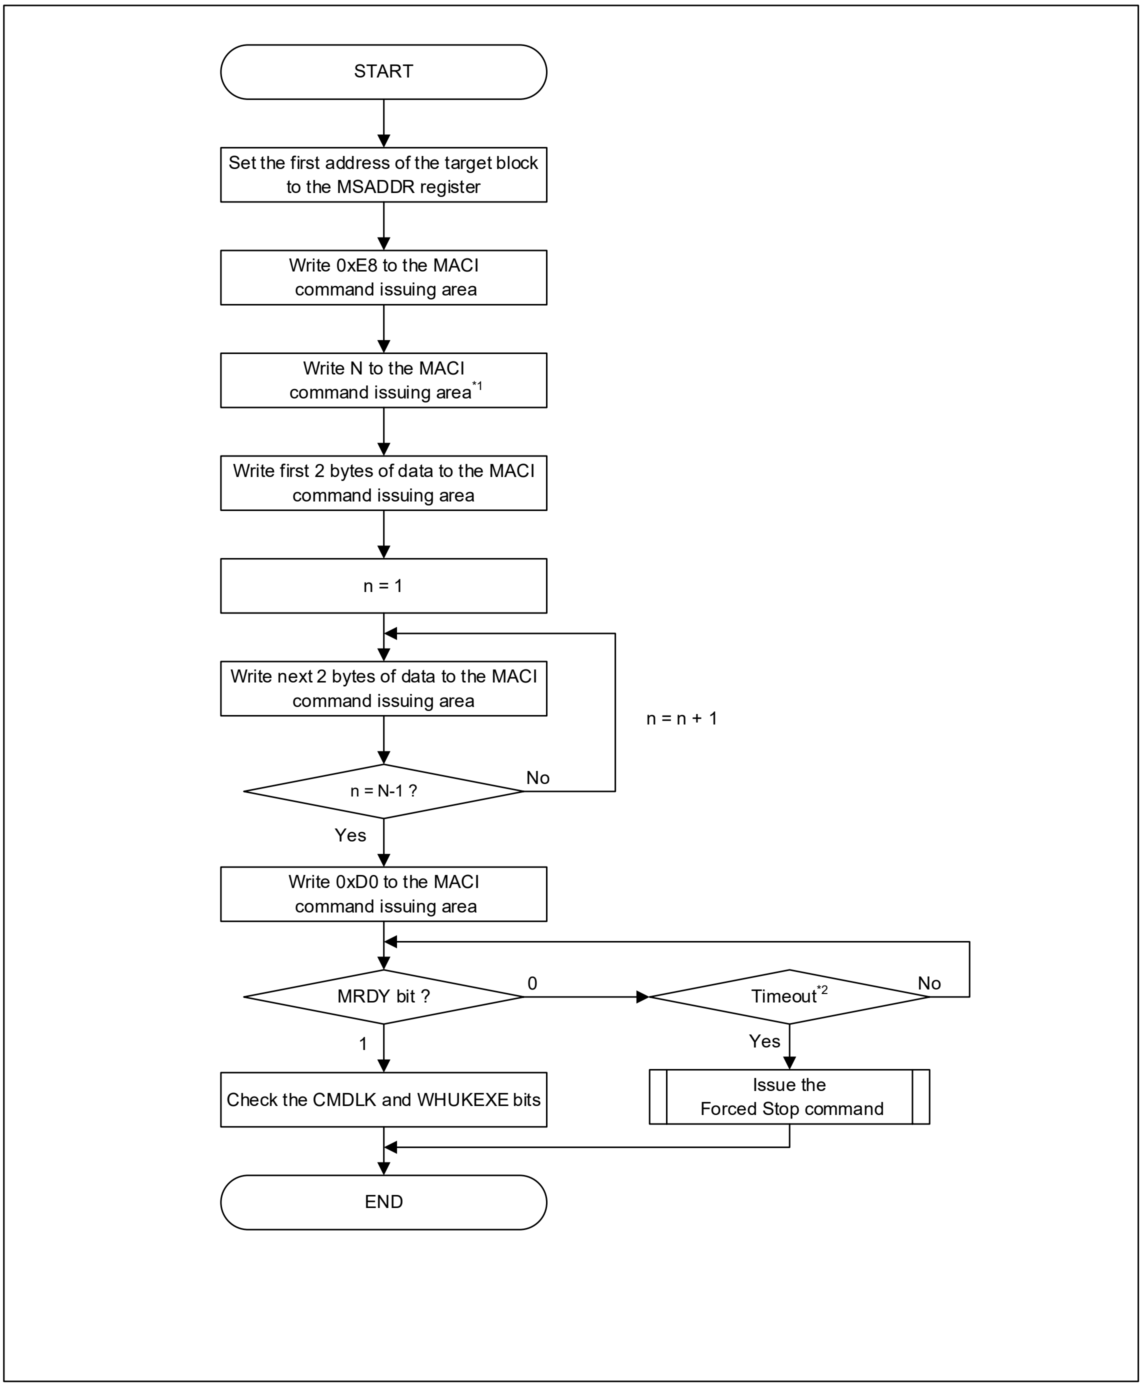
Note 1. Judgment of the timeout is based on 1.1 times the maximum time for processing of the MACI command that is in progress. For details of the updating time, see section 62, Electrical Characteristics.

Figure 59.12 Recovery from the command-locked state

59.7.4.5 Program Command

The Program command is used for programming to the Extra MRAM area, excluding the configuration area. Before issuing the Program command, set the first address of the target block in the MSADDR register.

Writing 0xD0 to the MACI command issuing area at the final access of the MACI command issuing starts the program command processing.



Note 1. N
0x08: 16-bytes programming

Note 2. Judgment of the timeout is based on 1.1 times the maximum time of programming. For details of the updating time, see section 62, Electrical Characteristics.

Figure 59.13 Usage of the Program command

The correspondence between the possible target data and the address value set in the MSADDR register is shown in Table 59.15. For details on the MSADDR register, see section 59.5.19. MSADDR : MACI Command Start Address Register.

Table 59.15 Address used by Program command

Address	MSADDR register value	Setting data	Timing when the setting is enabled
BASE_MC + 0x00E0_7600	BASE_MCS + 0x00E0_7600	FSBL setting	At a reset
BASE_MC + 0x00E0_7610	BASE_MCS + 0x00E0_7610 to BASE_MCS + 0x00E0_7690	Start address of measurement report Start address of code certificate	—
BASE_MC + 0x00E0_76A0	BASE_MCS + 0x00E0_76A0 to BASE_MCS + 0x00E0_76F0	General purpose OTP	—
BASE_MC + 0x00E1_7700	BASE_MCS + 0x00E1_7700 to BASE_MCS + 0x00E1_7770	Permanent Block Protect Setting for Secure (PBPS_SEC)*1	When a reset or command is executed
BASE_MC + 0x00E1_7780	BASE_MCN + 0x00E1_7780 to BASE_MCN + 0x00E1_77F0	Permanent Block Protect Setting (PBPS)*2	When a reset or command is executed
BASE_MC + 0x00E1_7900	BASE_MCS + 0x00E1_7900	Permanent OFS Protect Setting (POFSPS)	When a reset or command is executed
BASE_MC + 0x00E1_7910	BASE_MCS + 0x00E1_7910	REVOKE	When a reset or command is executed
BASE_MC + 0x00E1_7920	BASE_MCS + 0x00E1_7920	Zeroization HUK Enable	When a reset or command is executed
BASE_MC + 0x00E1_7930	BASE_MCS + 0x00E1_7930	Anti-rollback Counter Setting	—
BASE_MC + 0x00E1_7950	BASE_MCS + 0x00E1_7950 to BASE_MCS + 0x00E1_79F0	Reserved	—

Note 1. The PBPS_SEC[n] bit can be programmed to 0 when the BPS_SEC[4n], BPS_SEC[4n + 1], BPS_SEC[4n + 2], and BPS_SEC[4n + 3] bits are all 0.
Note 2. The PBPS[n] bit can be programmed to 0 when the BPS[4n], BPS[4n + 1], BPS[4n + 2], and BPS[4n + 3] bits are all 0.

59.7.4.6 Status Clear Command

The Status Clear command is used to clear the command-locked state (see section 59.7.4.4. Recovery from the Command-Locked State). To clear the ILGLERR, ILGCOMERR, SECERR, OTERR, PRGERR, TZFERR, and CFGPRGERR bits in the MSTATR register in the command-locked state, the Status Clear command is available.

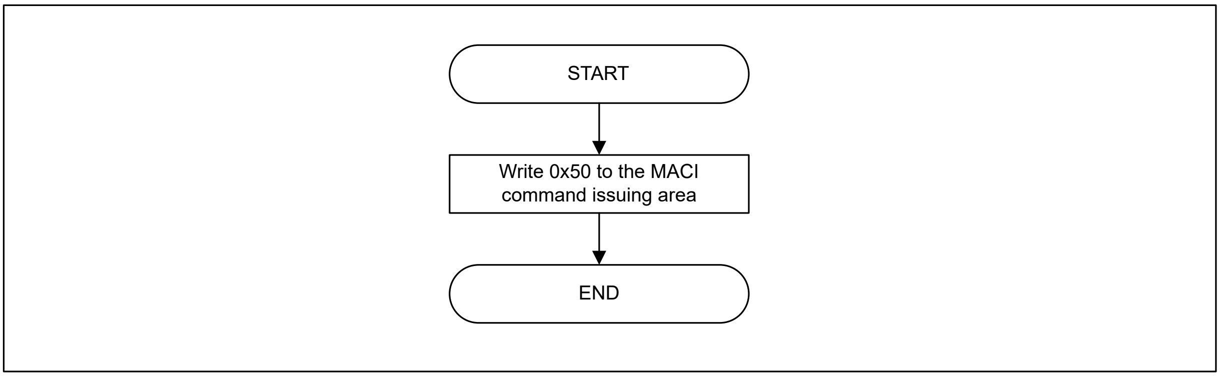


Figure 59.14 Usage of the Status Clear command

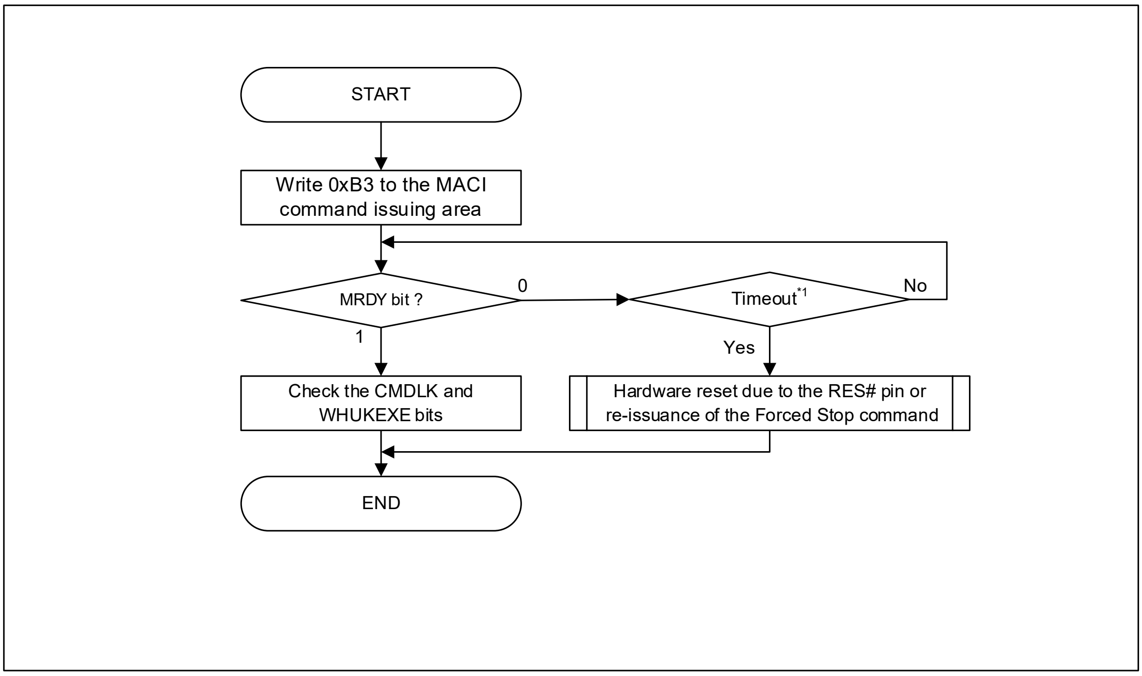
59.7.4.7 Forced Stop Command

The Forced Stop command forcibly ends command processing by the extra MRAM sequencer. Although this command halts command processing, values from the programming that was in progress are not guaranteed. Furthermore, resumption of processing is not possible. Processing of programming that was halted by the Forced Stop command is also defined as one from the perspective of programming endurance.

Executing the Forced Stop command also initializes part of the MACI, the whole extra MRAM sequencer, the MSTATR register, and the MASTAT register. Accordingly, this command can be used in the procedure for recovery from the command-locked state and in processing in response to a timeout of the extra MRAM sequencer (see section 59.7.4.4. Recovery from the Command-Locked State).

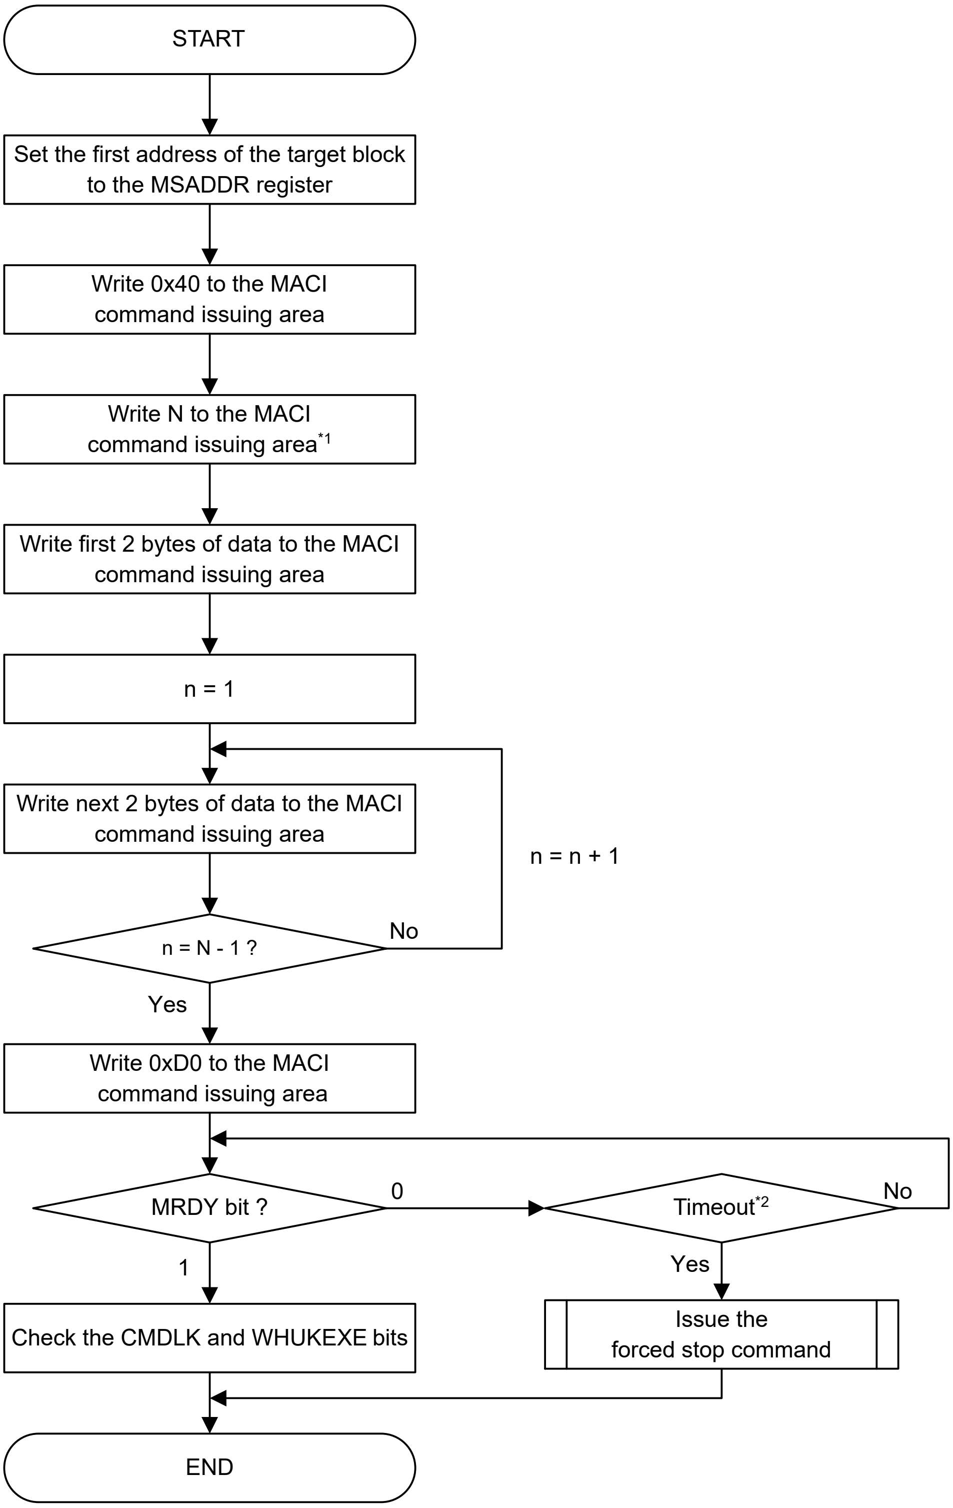


Note 1. Judgment of the timeout is based on 1.1 times the maximum time of the Forced Stop command latency. For details of the updating time, see section 62, Electrical Characteristics.

Figure 59.15 Usage of the Forced Stop command

59.7.4.8 Configuration Set Command

The Configuration Set command is used for security function and safety function. Before issuing the Configuration Set command, set the specified address (shown in Table 59.16) in the MSADDR register. Writing 0xD0 to the MACI command issuing area in the final access (for issuing the MACI command) starts MACI processing of the Configuration Set command.



Note 1. N
0x08: 16-bytes programming
Note 2. Judgment of the timeout is based on 1.1 times the maximum time of the command.
See the Electrical Characteristics of the User's Manual about those time.

Figure 59.16 Usage of the Configuration Set command

The correspondence between the possible target data for configuration setting and the address value set in the MSADDR register is shown in Table 59.16. For details on the MSADDR register, see section 59.5.19. MSADDR : MACI Command Start Address Register.

Table 59.16 Address used by the Configuration Set command

Address	MSADDR register value	Setting data	Operation of additional writing		Timing when the setting is enabled
			POFSPS.POFSPS [13] bit is 1	POFSPS.POFSPS [13] bit is 0	
BASE_MC + 0x00C9_F040	BASE_MCS + 0x00C9_F040	Option Function Select Register 0 (OFS0)	Writable*1	Writable*1	At a reset
BASE_MC + 0x00C9_F044	BASE_MCS + 0x00C9_F040	Option Function Select Register 2 (OFS2)	Writable*1	Writable*1	At a reset
BASE_MC + 0x00C9_F074	BASE_MCS + 0x00C9_F070	Startup Area Setting Register (SAS)	Writable*1	Not writable*1*2	When a reset or command is executed
BASE_MC + 0x00C9_F0C0	BASE_MCS + 0x00C9_F0C0	Option Function Select Register 1 Secure (OFS1_SEC)	Writable*1	Writable*1	At a reset
BASE_MC + 0x00C9_F0C4	BASE_MCS + 0x00C9_F0C0	Option Function Select Register 3 Secure (OFS3_SEC)	Writable*1	Writable*1	At a reset
BASE_MC + 0x00C9_F120	BASE_MCS + 0x00C9_F120	Option Function Select Register 1 Secure (OFS1_SEL)	Writable*1	Writable*1	At a reset
BASE_MC + 0x00C9_F124	BASE_MCS + 0x00C9_F120	Option Function Select Register 3 Secure (OFS3_SEL)	Writable*1	Writable*1	At a reset
BASE_MC + 0x00C9_F200	BASE_MCS + 0x00C9_F200 BASE_MCS + 0x00C9_F210 BASE_MCS + 0x00C9_F220 BASE_MCS + 0x00C9_F230	Block Protect Setting Register Secure (BPS_SEC)	Writable*3	Writable*3	When a reset or command is executed
BASE_MC + 0x00C9_F4C0	BASE_MCN + 0x00C9_F4C0	Option Function Select Register 1 (OFS1)	Writable	Writable	At a reset
BASE_MC + 0x00C9_F4C4	BASE_MCN + 0x00C9_F4C0	Option Function Select Register 3 (OFS3)	Writable	Writable	At a reset
BASE_MC + 0x00C9_F600	BASE_MCN + 0x00C9_F600 BASE_MCN + 0x00C9_F610 BASE_MCN + 0x00C9_F620 BASE_MCN + 0x00C9_F630	Block Protect Setting Register (BPS)	Writable*4	Writable*4	When a reset or command is executed

Note 1. This area can be protected by the POFSPS.POFSPS bit. If the POFSPS.POFSPS bit corresponding to the update area is 0, it cannot be updated by the Configuration Set command.

Note 2. The POFSPS.POFSPS[13] bit cannot be restored to 1 using the Program command once it is set to 0. Therefore, setting the startup area select flags and startup size select flags again becomes impossible. When the Configuration Set command is issued to the address of BASE_MCS + 0x00C9 F074, the command is locked. Exercise extra caution when handling the POFSPS.POFSPS[13] bit.

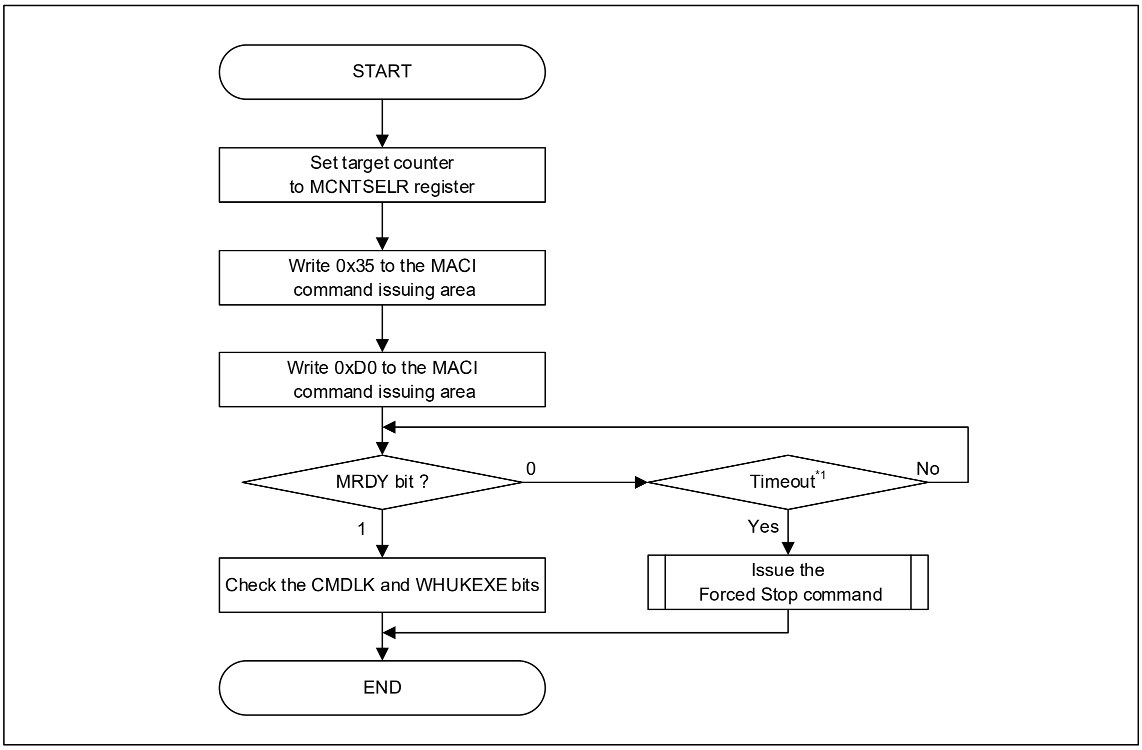
Note 3. Once the PBPS_SEC[n] bit is set to 0, the BPS_SEC[4n], BPS_SEC[4n + 1], BPS_SEC[4n + 2], and BPS_SEC[4n + 3] bits cannot be restored to 1 using the Configuration Set command.

Note 4. Once the PBPS[n] bit is set to 0, the BPS[4n], BPS[4n + 1], BPS[4n + 2], and BPS[4n + 3] bits cannot be restored to 1 using the Configuration Set command.

59.7.4.9 Increment Counter Command

The Increment Counter command is used for security function and safety function, and for updating three types of anti-rollback counter (ARC_SEC, ARC_NSEC, and ARC_OEMBL). The counter update is executed for increment processing and not for decrement processing.

Writing 0xD0 at the 2nd write access of the extra MRAM sequencer command triggers MACI to start the Increment Counter command processing. Completion of command processing can be confirmed by the MRDY bit of the MSTATR register.



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of the command.
See the Electrical Characteristics of the User's Manual about those time.

Figure 59.17 Usage of the Increment Counter command

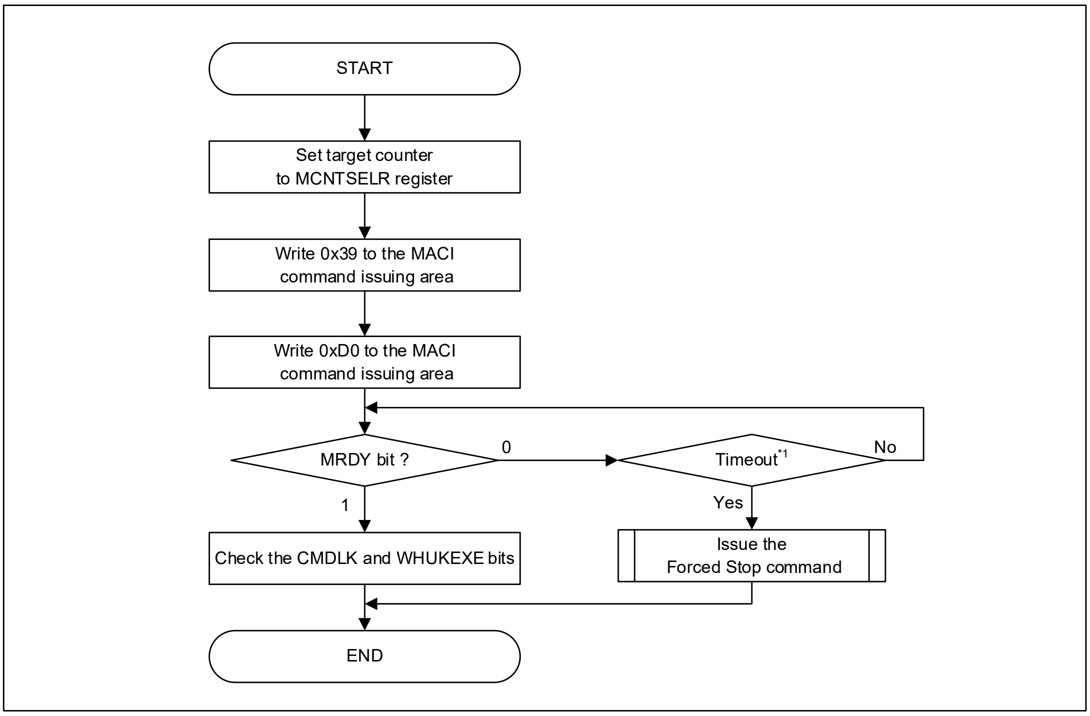
The anti-rollback counter value is not increased by the following conditions using the Increment Counter command.

- The target counter is protected by ARCSEC_LK, ARCNSEC_LK0 to 3, or ARCOEMBL_LK.
- The previous command is not the Read Counter command against ARC_OEMBL when the target counter is ARC_OEMBL.
- The update value of ARC_OEMBL is equal to or higher than the OEM boot loader version (OEM BL Ver.) output from the security engine.
- The target counter value is maximum (error does not occur).
- The target counter is ARC_NSEC when CNF_ARCNSEC0 to 1 is an invalid setting.

59.7.4.10 Read Counter Command

The Read Counter command is used for security function and safety function, and for reading three types of anti-rollback counter (ARC_SEC, ARC_NSEC, and ARC_OEMBL). The extra MRAM sequencer reads 64-bits data, and stores to MCNTDATAR0 and MCNTDATAR1 registers.

Writing 0xD0 at the 2nd write access of the extra MRAM sequencer command triggers MACI to start the Read Counter command processing. Completion of command processing can be confirmed by the MRDY bit of the MSTATR register.



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of the command.
See the Electrical Characteristics of the User's Manual about those time.

Figure 59.18 Usage of the Read Counter command

59.8 Security Function

The extra MRAM sequencer supports the following security functions in a security-enabled product:

- Permanent OFS protect setting
- Security flag for startup area and startup size
- Permanent block protect setting
- MRAM protection for TrustZone
- Extra MRAM configuration area protection
- Anti-rollback counter
- HUK protection
- OEM_ROOT_KEY protection.

59.8.1 Permanent OFS Protect Setting

OFS area in the configuration area can be permanent protected by POFSPS bits in the OTP area as shown in Table 59.17.
See the User's Manual: Section xx, Option-Setting Memory.

Table 59.17 Protection condition of OFS area in configuration area (1 of 2)

Protect address	MSADDR register value	Protection size	Protect bit	Remarks
BASE_MC + 0x00C9_F040	BASE_MCS + 0x00C9_F040	4 Bytes	POFSPS[0]	—
BASE_MC + 0x00C9_F044	BASE_MCS + 0x00C9_F040	4 Bytes	POFSPS[1]	—

Table 59.17 Protection condition of OFS area in configuration area (2 of 2)

Protect address	MSADDR register value	Protection size	Protect bit	Remarks
BASE_MC + 0x00C9_F048	BASE_MCS + 0x00C9_F040	4 Bytes	POFSPS[2]	—

BASE_MC + 0x00C9_F174	BASE_MCS + 0x00C9_F170	4 Bytes	POFSPS[77]	—
BASE_MC + 0x00C9_F178	BASE_MCS + 0x00C9_F170	4 Bytes	POFSPS[78]	—
BASE_MC + 0x00C9_F17C	BASE_MCS + 0x00C9_F170	4 Bytes	POFSPS[79]	—

59.8.2 Security Flag for Startup Area and Startup Size Select

The security flag (POFSPS.POFSPS[13]) for the startup area and startup size are located in the OTP area as the section 59.7.4.5. Program Command. The POFSPS[13] bit can be monitored as the FSPR bit in the MSUASMON register.

When the POFSPS[13] bit is 0, issuing the Configuration set command to change the BTFLG and BTSIZE bits causes the command-locked state. Also, when the POFSPS[13] bit is 0, it is not possible to write the startup area select bits (SAS[1:0]) in the MSUACR register. The POFSPS[13] bit provides the protection. See section 7, Option-Setting Memory.

59.8.3 Permanent Block Protect Setting

The permanent block protect setting is the clear protection for block protection setting. User area cannot be permanently updated by the MACI command when the permanent block protect setting is enabled. See section 59.9.1.2. Protection by Block Protect Setting in details of the block protect setting.

The block protect setting and the permanent block protect setting have the write/clear protection against the Configuration set command and Program command for each other. The extra MRAM sequencer does not detect an error when the Program command is issued to the write/clear protected settings.

Figure 59.19, Table 59.18, Table 59.19, Table 59.20, Table 59.21 and Table 59.22 show the write/clear protection against the block protect setting (BPS[4n]), (BPS[4n+1]), (BPS[4n+2]), (BPS[4n+3]) and the permanent protect setting (PBPS[n]). Figure 59.20, Table 59.23, Table 59.24, Table 59.25, Table 59.26 and Table 59.27 show the write/clear protection against the block protect setting for secure (BPS_SEC[4n]), (BPS_SEC[4n+1]), (BPS_SEC[4n+2]), (BPS_SEC[4n+3]) and permanent protect setting for secure (PBPS_SEC[n]).

Effective permanent block protect setting (PBPS or PBPS_SEC) depends on Code MRAM boundary setting.

For details of permanent block protect setting (PBPS or PBPS_SEC), see the User’s Manual: Section xx, Option-Setting Memory.

59.8.4 MRAM Protection for TrustZone

The MRAM protection for TrustZone is only available for the security-enabled product.

MRAM has the following four types of protect function against non-secure access to support the TrustZone specification for MRAM. Descriptions of this section are focused on extra MRAM sequencer operation.

- Protection for code MRAM area (program)
- Protection for extra MRAM area (program)
- Protection for MRAM area (read)
- Protection for register

59.8.4.1 Protection for Code MRAM Area (Program)

This function protects code MRAM from bus access such as CPU, DMAC. For details of protection, see section 51, Security Features.

59.8.4.2 Protection for Extra MRAM Area (Program)

This function protects secure area of extra MRAM from MRAM sequencer command of non-secure developer. The condition of protection depends on extra MRAM sequencer command, access attribution, and product specification.

See Table 59.28 for details of protection for extra MRAM area (program).

Extra MRAM area only allows privileged access.

Table 59.28 Protection for extra MRAM area (program)

MACI command		Target area		Issuing MACI command by non-secure access	Issuing MACI command by secure access
Program	Extra MRAM	MRAM and OTP area (Non-secure area)	Secure alias*1	X	X
			Non-secure alias*2	O	O
		MRAM and OTP area (Secure area)	Secure alias*1	X	O
			Non-secure alias*2	X	X
Configuration Set	Extra MRAM	Configuration area (Non-secure area)	Secure alias*1	X	X
			Non-secure alias*2	O	O
		Configuration area (Secure area)	Secure alias*1	X	O
			Non-secure alias*2	X	X
Increment Counter Read Counter	Extra MRAM	Anti-rollback counter area (Secure area only)	—	X	O

Note 1. The secure alias is determined when the address of MSADDR[28] is 0.
Note 2. The non-secure alias is determined when the address of MSADDR[28] is 1.

Remarks:

O: MACI command operation is not prohibited.

X: MACI command operation is prohibited.

Error occurs when the area is selected, and MACI command is executed.

The Configuration area has two types of secure region mapping for security-enabled product and security-disabled product. See Figure 59.21 for details of non-secure/secure region of configuration area.

The extra MRAM sequencer determines that the target area is a secure region from the MSADDR register setting and product information.

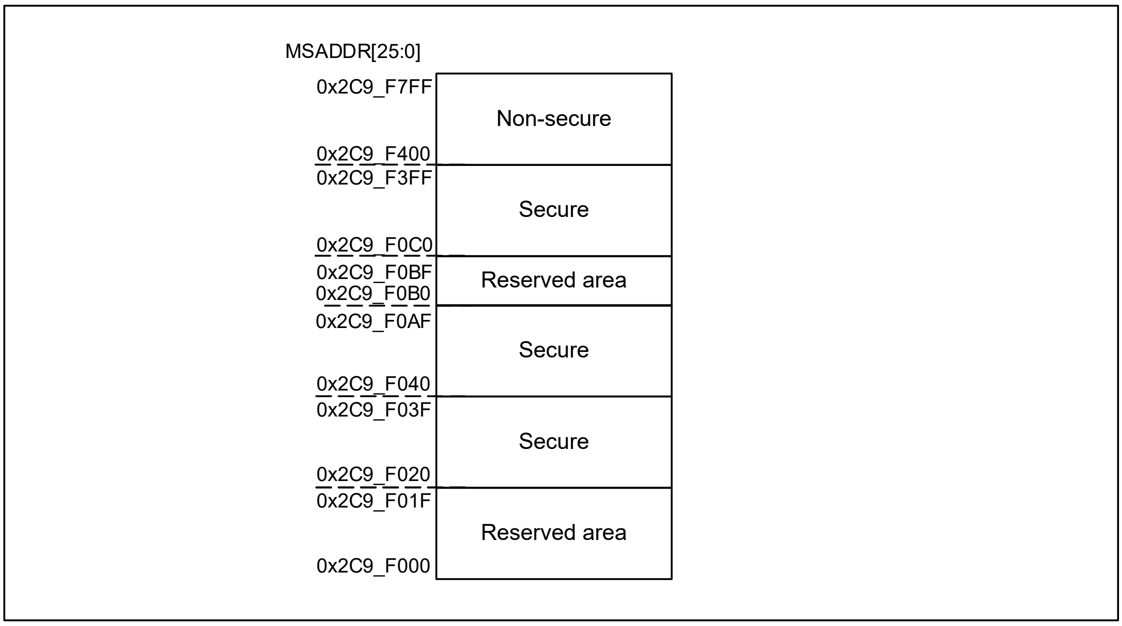

Figure 59.21 Secure/non-secure region in configuration area

59.8.4.3 Protection for MRAM Area (Read)

This function protects code MRAM and extra MRAM from bus access (such as CPU, DMAC). For details of protection, see the User's Manual: Section xx, Security Features.

59.8.4.4 Protection for Register

The MRAM registers have the write access protection against the non-secure access. See Table 59.29 for details of the protected MRAM registers. MRAM registers can be accessed with privileges.

Table 59.29 Protected MRAM registers for TrustZone (1 of 2)

Protection target registers	Secure attribute setting	Remarks
MRCEECC	SA register setting (MSAR.MRBCPSA)	See section 59.5.40. MRCEECC : Code MRAM ECC Encoder Control Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MRPSC and MREEECC	SA register setting (MSAR.MRBEPSA)	See section 59.5.31. MRPSC : MRAM Program Speed Control Register and MREEECC : Extra MRAM ECC Encoder Control Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MRCPC0, MRCBPROT0, MRCPS, MRCPEAINT, and MRCPEA	SA register setting (MSAR.MRCPSA)	See section 59.5.32. MRCPC0 : Code MRAM Program Control Register, section 59.5.34. MRCBPROT0 : Code MRAM Block Protection Register, section 59.5.36. MRCPS : Code MRAM Program Status Register, section 59.5.37. MRCPAEINT : Code MRAM Program Access Error Interrupt Enable Register and section 59.5.38. MRCPEA : Code MRAM Program Error Address Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MSAR	Always Secure	See section 59.5.13. MSAR : MRAM Security Attribution Register.

Table 59.29 Protected MRAM registers for TrustZone (2 of 2)

Protection target registers	Secure attribute setting	Remarks
MCTRCNTR, MCTRLSR, and MCTRSTATR	SA register setting (MSAR.MACITRSA)	See section 59.5.22. MCTRCNTR : MRAM Configuration Update Transfer Control Register, section 59.5.23. MCTRLSR : MRAM Configuration Update Transfer List Select Register and section 59.5.24. MCTRSTATR : MRAM Configuration Update Transfer Status Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MRAM access area	SA register setting (MSAR.MACICOMISA)	For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MACI*1	SA register setting (MSAR.MACICOMRSA)	For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MRCPFB	SA register setting (MSAR.MPFBENSA)	See section 59.5.1. MRCPFB : Code MRAM Prefetch Buffer Enable Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MRCFREQ	SA register setting (MSAR.MRCFREQSA)	See section 59.5.2. MRCFREQ : Code MRAM Frequency Notifications Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MRCDECC, MRCRAEINT, MRCRAES, MRCRTEA, and MRCRDEA	SA register setting (MSAR.MRCECCSA)	See section 59.5.4. MRCDECC : Code MRAM ECC Decoder Control Register, section 59.5.5. MRCRAEINT : Code MRAM Read Access Error Interrupt Enable Register, section 59.5.6. MRCRAES : Code MRAM Read Access Error Status Register, section 59.5.7. MRCRTEA : Code MRAM TED Error Address Register, and section 59.5.8. MRCRDEA : Code MRAM DEC Error Address Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MREFREQ	SA register setting (MSAR.MREFREQSA)	See section 59.5.3. MREFREQ : Extra MRAM Frequency Notifications Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MREDECC, MRERAEINT, MRERAES, MRERTEA, and MRERDEA	SA register setting (MSAR.MREECCSA)	See MREDECC : Extra MRAM ECC Decoder Control Register, section 59.5.9. MRERAEINT : Extra MRAM Read Access Error Interrupt Enable Register, section 59.5.10. MRERAES : Extra MRAM Read Access Error Status Register, section 59.5.11. MRERTEA : Extra MRAM TED Error Address Register, and section 59.5.12. MRERDEA : Extra MRAM DEC Error Address Register. For details of MSAR register, see section 59.5.13. MSAR : MRAM Security Attribution Register.
MREZS, MREZC, MCNTSELR, MCNTDATAR0 to 1, MRCPC1, MRCBPROT1, and MSUACR	Always Secure	See section 59.5.14. MREZS : Extra MRAM Zeroization Status Register, section 59.5.15. MREZC : Extra MRAM Zeroization Control Register, section 59.5.20. MCNTSELR : MRAM Counter Select Register, section 59.5.21. MCNTDTRn : MRAM Counter Data Register (n = 0, 1), section 59.5.33. MRCPC1 : Code MRAM Program Control Register for Secure, section 59.5.35. MRCBPROT1 : Code MRAM Block Protection Register for Secure, and section 59.5.30. MSUACR : MRAM Startup Area Control Register.

Note 1. The target MACI registers are MASTAT, MPAEINT, MRDYIE, MSADDR, MSTATR, MENTRYR, MSUINITR, MCMDR, and MSUASMON.

59.8.5 Anti-Rollback Counter

The anti-rollback counter cannot be decremented and is used in the firmware update. Only secure applications are available. Anti-rollback counter shifts one bit to the left with the Increment Counter command from the initial value of 0. The least significant bit (bit 0) is set to 1. When the anti-rollback counter is of maximum value, the extra MRAM sequencer does not change the counter by the Increment Counter command (error does not occur).

There are three commands that control the counters. See section 59.7.4.9. Increment Counter Command and section 59.7.4.10. Read Counter Command for details.

Figure 59.22 shows anti-rollback counter increment image when increment counter command is issued.

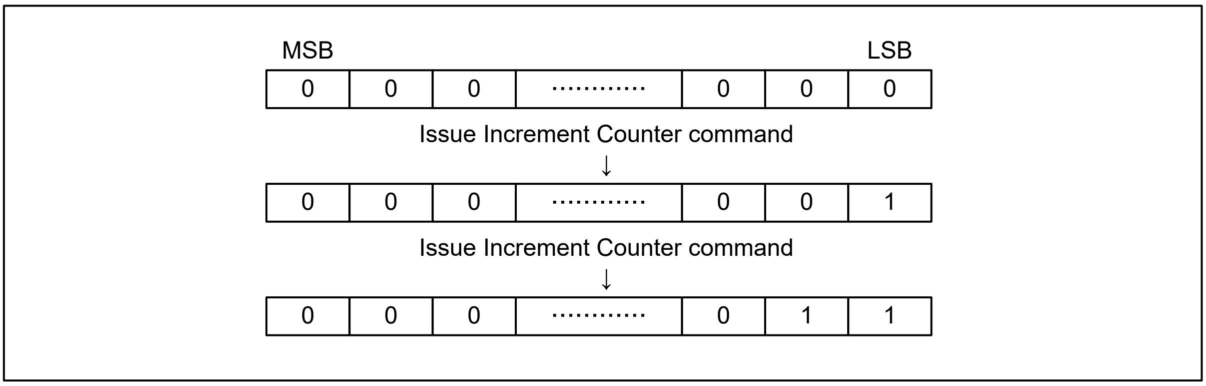

Figure 59.22 Increment image of anti-rollback counter

Anti-rollback counter has three types of counters (ARC_SEC, ARC_NSEC, and ARC_OEMBL) and lock bit (ARCSEC_LK, ARCNSEC_LK0 to 3, and ARCOEMBL_LK) for protection of each counter.

ARC_NSEC can be configured as 1 × 256 or 4 × 64 bits by the configuration area setting (CNF_ARCNS1 and CNF_ARCNS0) and cannot be updated in invalid setting.

ARC_OEMBL is protected by the security engine and cannot be updated until the update validation of the OEM boot loader is successful. After successful validation, ARC_OEMBL can be updated to the current OEM boot loader version (OEM BL Ver.) output by the security engine. ARC_OEMBL cannot be updated to a value that exceeds the OEM boot loader version (OEM BL Ver.).

59.8.6 HUK Protection

Zeroization of W-HUK is triggered when one of ZHUKEN[3:0] bits (zeroization enable bit) is 0 and anti-tamper is detected or 0x07 is set to WHUKWE[2:0] bits in MREZC register. Zeroing W-HUK disables the generation of HUK. Table 59.30 shows the combinations of enable bits and request signals. If a zeroing request is received during code MRAM or extra MRAM program, the executing program is forcibly terminated, and the zeroing process is started. If a code MRAM program request is received during zeroing, the code MRAM program is started after zeroing is completed. MACI commands are not accepted during zeroing. During W-HUK zeroing, all MACI commands are not accepted and extra MRAM cannot be read.

Table 59.30 Combinations of request signals and enable bits (1 of 2)

Zeroization request signal				Zeroization enable bit				Function
WHUKZE [2:0]	RTCIC			ZHUKEN				
	2	1	0	3	2	1	0	
0x7	—	—	—	0	—	—	—	O
0x7	—	—	—	1	—	—	—	Oe
Except 0x7	—	—	—	—	—	—	—	X
—	1	—	—	—	0	—	—	O
—	1	—	—	—	1	—	—	Oe
—	0	—	—	—	—	—	—	X
—	—	1	—	—	—	0	—	O
—	—	1	—	—	—	1	—	Oe
—	—	0	—	—	—	—	—	X
—	—	—	1	—	—	—	0	O
—	—	—	1	—	—	—	1	Oe

Table 59.30 Combinations of request signals and enable bits (2 of 2)

Zeroization request signal				Zeroization enable bit				Function
WHUKZE [2:0]	RTCIC			ZHUKEN				
	2	1	0	3	2	1	0	
—	—	—	0	—	—	—	—	X

Remarks:

O: W-HUK zeroing

Oe: W-HUK Pseudo-zeroing

X: Zeroization of W-HUK does not execute

—: Don't care

Table 59.31 shows differences of W-HUK pseudo-zeroing and W-HUK zeroing described in Table 59.30. If the zeroization enable bit is 1 and tamper is detected, the MREZS.WHUKZF bit is set to 0 to complete zeroing without physically zeroing W-HUK (W-HUK pseudo-zeroing).

Pseudo means the zeroization tamper event has happened, but the W-HUK zeroization response/action was not enabled and therefore not physically executed. The flag of zeroized W-HUK in the MREZS register is set, but because it is a pseudo tamper, it is restored at the next power cycle. W-HUK usage is disabled until the next power cycle. If the zeroization enable bit is 0 and a tamper is detected, physical zeroization of W-HUK is performed and the Zeroized Monitor register is set to 0 (W-HUK zeroing). When the zeroization function is enabled and after a tamper or software trigger, it is permanent (not pseudo). The flag of zeroized W-HUK in the MREZS register is cleared (set to 0 and remain at 0 permanently). See section 12.1.7. Tamper Detection Function for details of the tamper detection.

Table 59.31 Internal state at the time of zeroing request

Table 59.30 function	Operation name	Zeroization enable bits	W-HUK	Zeroized monitor register (MREZS)
Oe	W-HUK Pseudo-zeroing	Disable(1)	Not zeroed	Clear
O	W-HUK zeroing	Enable(0)	Zeroed	Clear flag after zeroization finished

59.8.7 OEM ROOT KEY Protection

OEM_ROOT_PKn can be revoked by the REVOKE setting in Option-Setting Memory. See section 51, Security Features for details of how OEM_ROOT_PKs are used when updating OEM_BL.

59.9 Protection Function

59.9.1 Software Protection

Software protection function disables MRAM programming operation according to register and configuration area settings.

59.9.1.1 Code MRAM Program Protection

When the MRCPC0 register is set to 0x0000, programming of non-secure aliases in code MRAM is prohibited. When the MRCPC1 register is set to 0x0000, programming of secure aliases in code MRAM is prohibited. Code MRAM program protection has a higher priority than block protection and cannot be canceled by MRCBPROT0 or MRCBPROT1 register.

59.9.1.2 Protection by Block Protect Setting

Each block in the user area has the block protect setting (BPS or BPS_SEC). When the MRCBPROT0 or MRCBPROT1 register is 0x0000 and the block protect bit is 0, program access to the non-secure user area of code MRAM is prohibited. When the MRCBPROT1 register is 0x0000 and the block protect bit is 0, program access to the secure user area of code MRAM is prohibited. To program the sector whose block protect bit is 0, set MRCBPROT0 or MRCBPROT1 register to 0x0001.

The block protect setting can be locked by the permanent block protect setting (PBPS or PBPS_SEC). When the permanent block protect setting and the block protect setting are 0, program access cannot be performed.

Effective block protect setting (BPS or BPS_SEC) and permanent block protect setting (PBPS or PBPS_SEC) depends on code MRAM boundary setting.

See section 59.8.3. Permanent Block Protect Setting for details of the permanent block protect setting and block protect setting.

See section 59.5.34. MRCBPROT0 : Code MRAM Block Protection Register and section 59.5.35. MRCBPROT1 : Code MRAM Block Protection Register for Secure details of the MRCBPROT0 and MRCBPROT1 registers.

For details of block protect setting (BPS or BPS_SEC), permanent block protect setting (PBPS or PBPS_SEC), and code MRAM boundary setting, see the User’s Manual: Section xx, Option-Setting Memory.

Table 59.32 to Table 59.35 show the relation of user area and the block protect setting in each function setting.

- BPS[0] to BPS[n] or BPS_SEC[0] to BPS_SEC[n] are assigned to the block of user area (for example, address is BASE_MC + 0x0000 0000 to the last block address).
- BPS[0]/BPS_SEC[0] and BPS[1]/BPS_SEC[1] are assigned to the block of user area depending on the startup area select setting (SAS.BTFLG bit) and startup area size select setting (SAS.BTSIZE bits). See section 59.9.3. Startup Program Protection for details.

Table 59.32 to Table 59.35 show example of the block protect setting.

Table 59.32 Example of block protect setting when SAS.BTFLG is 1 and all sizes

Address (offset address: BASE_MC)	Block size	Block protect setting	User area block number	Remarks
The last block address	2 KB	BPS[n] or BPS_SEC[n]	Block n	
⋮	⋮	⋮	⋮	
0x0000 3800 to 0x0000 3FFF	2 KB	BPS[7] or BPS_SEC[7]	Block 7	
0x0000 3000 to 0x0000 37FF	2 KB	BPS[6] or BPS_SEC[6]	Block 6	
0x0000 2800 to 0x0000 2FFF	2 KB	BPS[5] or BPS_SEC[5]	Block 5	
0x0000 2000 to 0x0000 27FF	2 KB	BPS[4] or BPS_SEC[4]	Block 4	
0x0000 1800 to 0x0000 1FFF	2 KB	BPS[3] or BPS_SEC[3]	Block 3	
0x0000 1000 to 0x0000 17FF	2 KB	BPS[2] or BPS_SEC[2]	Block 2	
0x0000 0800 to 0x0000 0FFF	2 KB	BPS[1] or BPS_SEC[1]	Block 1	
0x0000 0000 to 0x0000 07FF	2 KB	BPS[0] or BPS_SEC[0]	Block 0	

Table 59.33 Example of block protect setting when SAS.BTFLG is 0 and SAS.BTSIZE is 11 (1 of 2)

Address (offset address: BASE_MC)	Block size	Block protect setting	User area block number	Remarks
The last block address	2 KB	BPS[n] or BPS_SEC[n]	Block n	—
⋮	⋮	⋮	⋮	—
0x0000 4000 to 0x0000 47FF	2 KB	BPS[8] or BPS_SEC[8]	Block 8	—
0x0000 3800 to 0x0000 3FFF	2 KB	BPS[7] or BPS_SEC[7]	Block 3	Swap block 3 and block 7 in this startup area select setting

59.9.2 Error Protection

Error protection detects the issuing of illegal MACI commands, illegal access, and extra MRAM sequencer malfunction. MACI command acceptance is disabled (command-locked state) in response to the detection of these errors. The extra MRAM cannot be programmed while the extra MRAM sequencer is in the command-locked state. For release from the command-locked state, issue the Status Clear or Forced Stop command. The Status Clear command can only be used while the MRDY bit in the MSTATR register is 1. The Forced Stop command can be used regardless of the value of the MRDY bit. While the CMDLKIE bit in the MPAEINT register is 1, an extra MRAM access error (MRAM_MREPR) interrupt is generated if the extra MRAM sequencer enters the command-locked state (the CMDLK bit in the MASTAT register is set to 1).

If the extra MRAM sequencer enters the command-locked state in response to a command, the extra MRAM sequencer continues the processing for programming. If a command is issued in the command-locked state, the ILGLERR bit becomes 1 and the other bits retain the values set due to previous error detection.

Table 59.36 shows error protection types and status bit values after error detection.

Table 59.36 Error protection type (1 of 2)

Error type	Description	ILGCOMERR	SECERR	OTERR	TZFERR	ILGLERR	PRGERR	CFGPRG	MREAE*1
Illegal command error	An undefined size has been specified in the first cycle of command (not byte write)	1	0	0	0	1	0	0	0
	An undefined code is written in the first access of the MACI command	1	0	0	0	1	0	0	0
	The value specified in the last access of the multiple access MACI command is not 0xD0	1	0	0	0	1	0	0	0
	The value (N) specified in the second write access of the MACI command in the Program command or Configuration Set command is wrong	1	0	0	0	1	0	0	0
	Increment Counter or Read Counter command has been issued with an inconsistent MCNTSELR[2:0] setting. (Include CNF_ARCNS[1:0] setting is the mismatch).	1	0	0	0	1	0	0	0
	The MACI command not acceptable in each mode has been issued (see Table 59.13)	1	0	0	0	1	0	0	0
	The MACI command has been issued when command acceptance conditions are not satisfied (see Table 59.14)	0/1	0/1	0/1	0	1	0/1	0/1	0/1
	Increment Counter command has been issued against the anti-rollback area protected by lock bit setting	1	0	0	0	1	0	0	0
	Increment Counter command against ARC_OEMBL is issued when the OEM boot loader version (OEM BL Ver.) output from the security engine is the same or smaller than the ARC_OEMBL value (see section 59.8.5. Anti-Rollback Counter)	1	0	0	0	1	0	0	0
	Increment Counter command against ARC_OEMBL is issued when the previous command is not the Read Counter command against ARC_OEMBL (see section 59.8.5. Anti-Rollback Counter)	1	0	0	0	1	0	0	0
	A command has been issued against extra MRAM sequencer command illegal status (see Table 59.11)	0/1	0/1	0/1	0	1	0/1	0/1	0/1
Program error	An error occurs during programming (when the OTP area data changes from 0 to 1 or verifies the error)	0	0	0	0	0	1	0	0
Configuration set error	An error has occurred during the configuration set	0	0	0	0	0	0	1	0
Access error	Program command has been issued to reserved area in extra MRAM program mode	0/1	0	0	0	1	0	0	1
	Configuration Set command has been issued to reserved configuration area in program mode	0/1	0	0	0	1	0	0	1
	Program command or Configuration Set command has been issued to the TrustZone protection area in extra MRAM program mode	0/1	0	0	1	1	0	0	1
	Configuration Set command has been issued to the operation mode protection area in extra MRAM program mode	0/1	0	0	0	1	0	0	1

Table 59.36 Error protection type (2 of 2)

Error type	Description	ILGCOMERR	SECERR	OTERR	TZFERR	ILGLERR	PRGERR	CFGPRG	MREAE*1
Security error	Configuration Set command for the BTFLG bit setting has been issued when the FSPR bit is 0 (see section 59.7.4.8. Configuration Set Command)	0	1	0	0	1	0	0	0
Others	The MACI command issuing area has been accessed in read mode	0	0	1	0	1	0	0	0
	The MACI command issuing area has been read in program mode	0	0	1	0	1	0	0	0

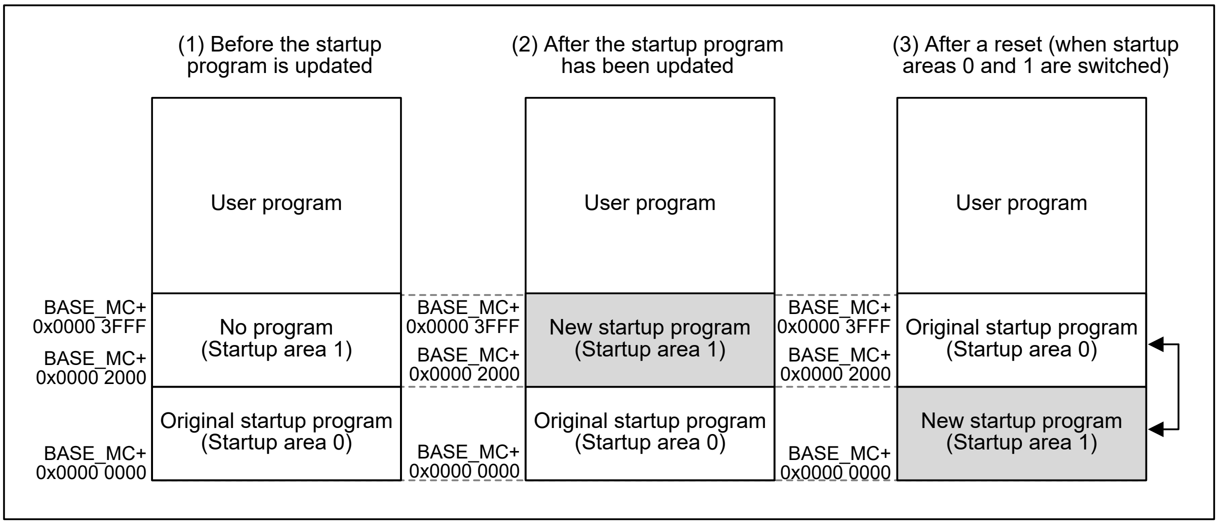
Note 1. MREAE value depends on the MSADDR setting.

59.9.3 Startup Program Protection

Protection of the startup program is for protection of the program to be started after a reset (the startup program). This function provides a way to safely update the startup program when rewriting is suspended during a reset.

The startup area is 8 KB, 16 KB, or 32 KB in size and is assigned to the user area in the code MRAM. The size of the startup area can be changed by the BTSIZE bit. When resizing the startup area, be careful not to destroy the software in use. This function uses the values of the SAS.BTFLG bit, the SAS.BTSIZE bits, and the MSUACR.SAS[1:0] bits to change the area where the startup program is stored in block units (see Figure 59.23 to Figure 59.26).

In protection of the startup program, the state of the selection of the startup area can be fixed by the POFSPS.POFSPS[13] bit. However, the POFSPS.POFSPS[13] bit is not restored to 1 once the flag is set to 0. Exercise extra caution when handling the POFSPS.POFSPS[13] bit.



Note: The addresses are used for reading, programming, and erasure. Startup area 0 is erased when the Block Erase command is issued for the address BASE_CF + 0x0000_0000 with the allocation shown under (3).

1. Before the startup program is updated
   When SAS.BTFLG = 1 and MSUACR.SAS[1:0] = 0xb, the address range from BASE_MC + 0x0000_2000 to BASE_MC + 0x0000_3FFF is selected as startup area 1 and the address range from BASE_MC + 0x0000_0000 to BASE_MC + 0x0000_1FFF is selected as startup area 0.
2. After the startup program has been updated
   A new startup program can be written to startup area 1. At this time, startup area 0 still contains the previous startup program, so rewriting by starting up from startup area 0 remains possible if rewriting to the startup area 1 fails.
3. After a reset (when startup areas 0 and 1 are switched)
   When rewriting startup area 1 is successfully completed, switch the assignment of startup areas 0 and 1 by rewriting the startup area selection bit (the SAS.BTFLG bit) with the Configuration Set command. Afterwards, the program is started up from startup area 1 after a reset.

Figure 59.23 Concept of protection of the startup program

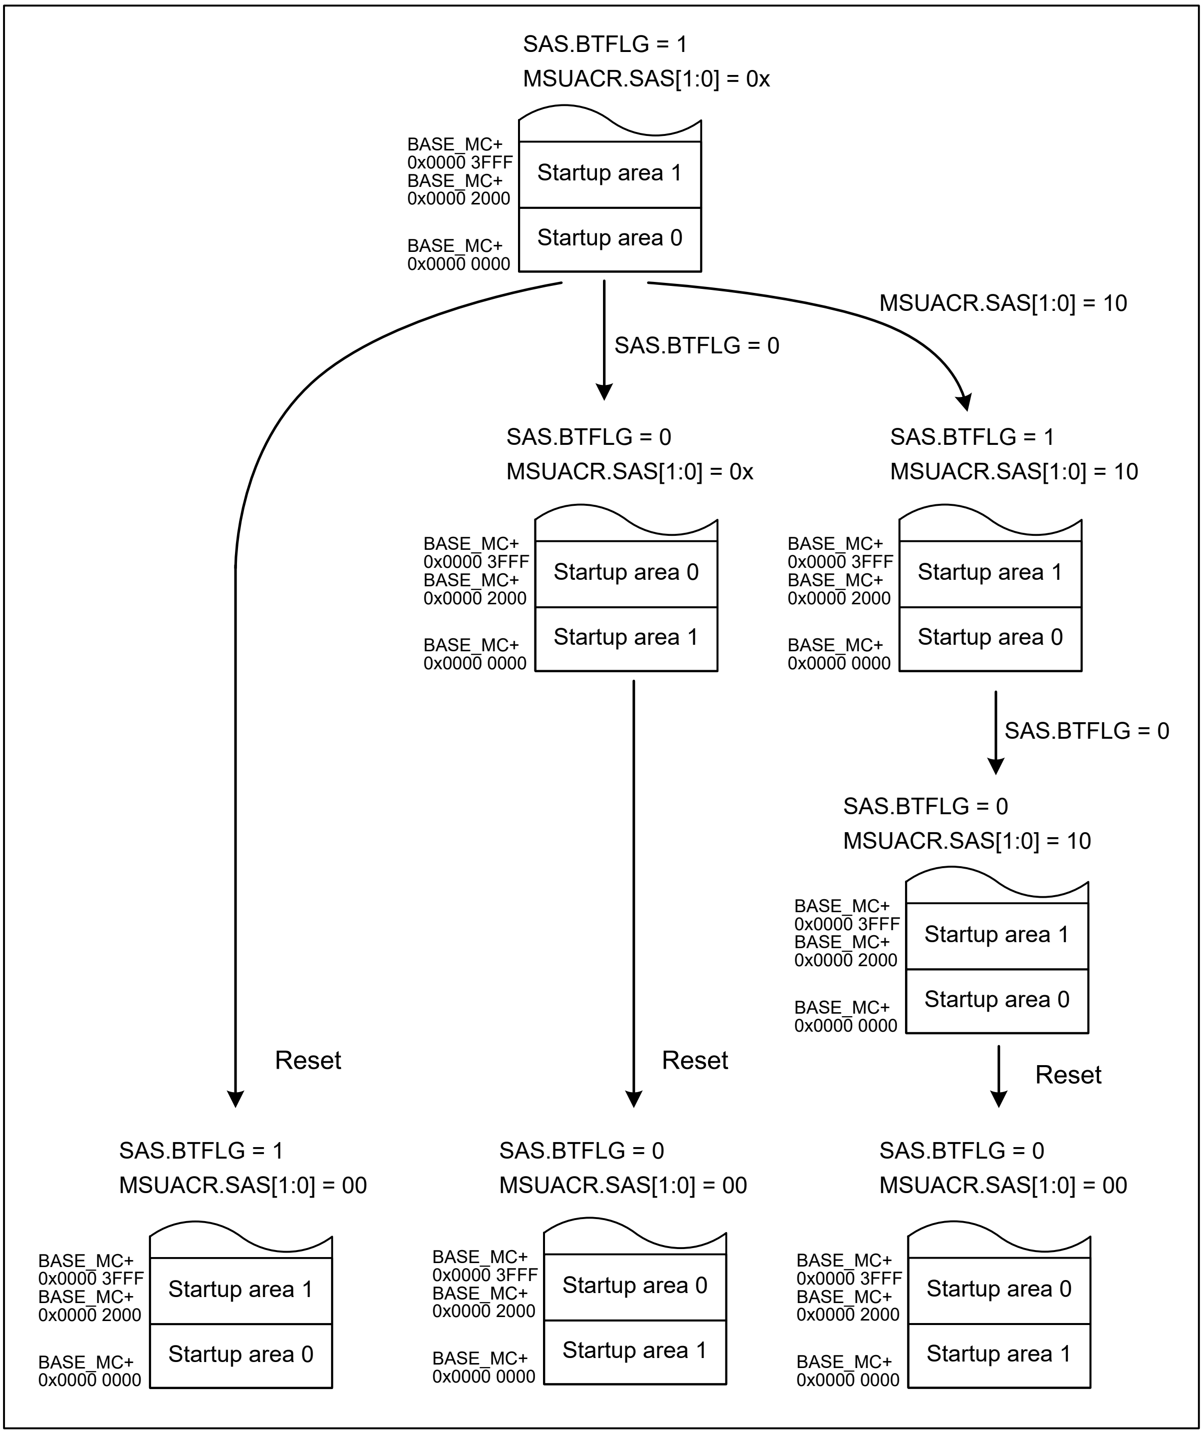


Figure 59.24 Example 1 of transitions for startup program protection settings

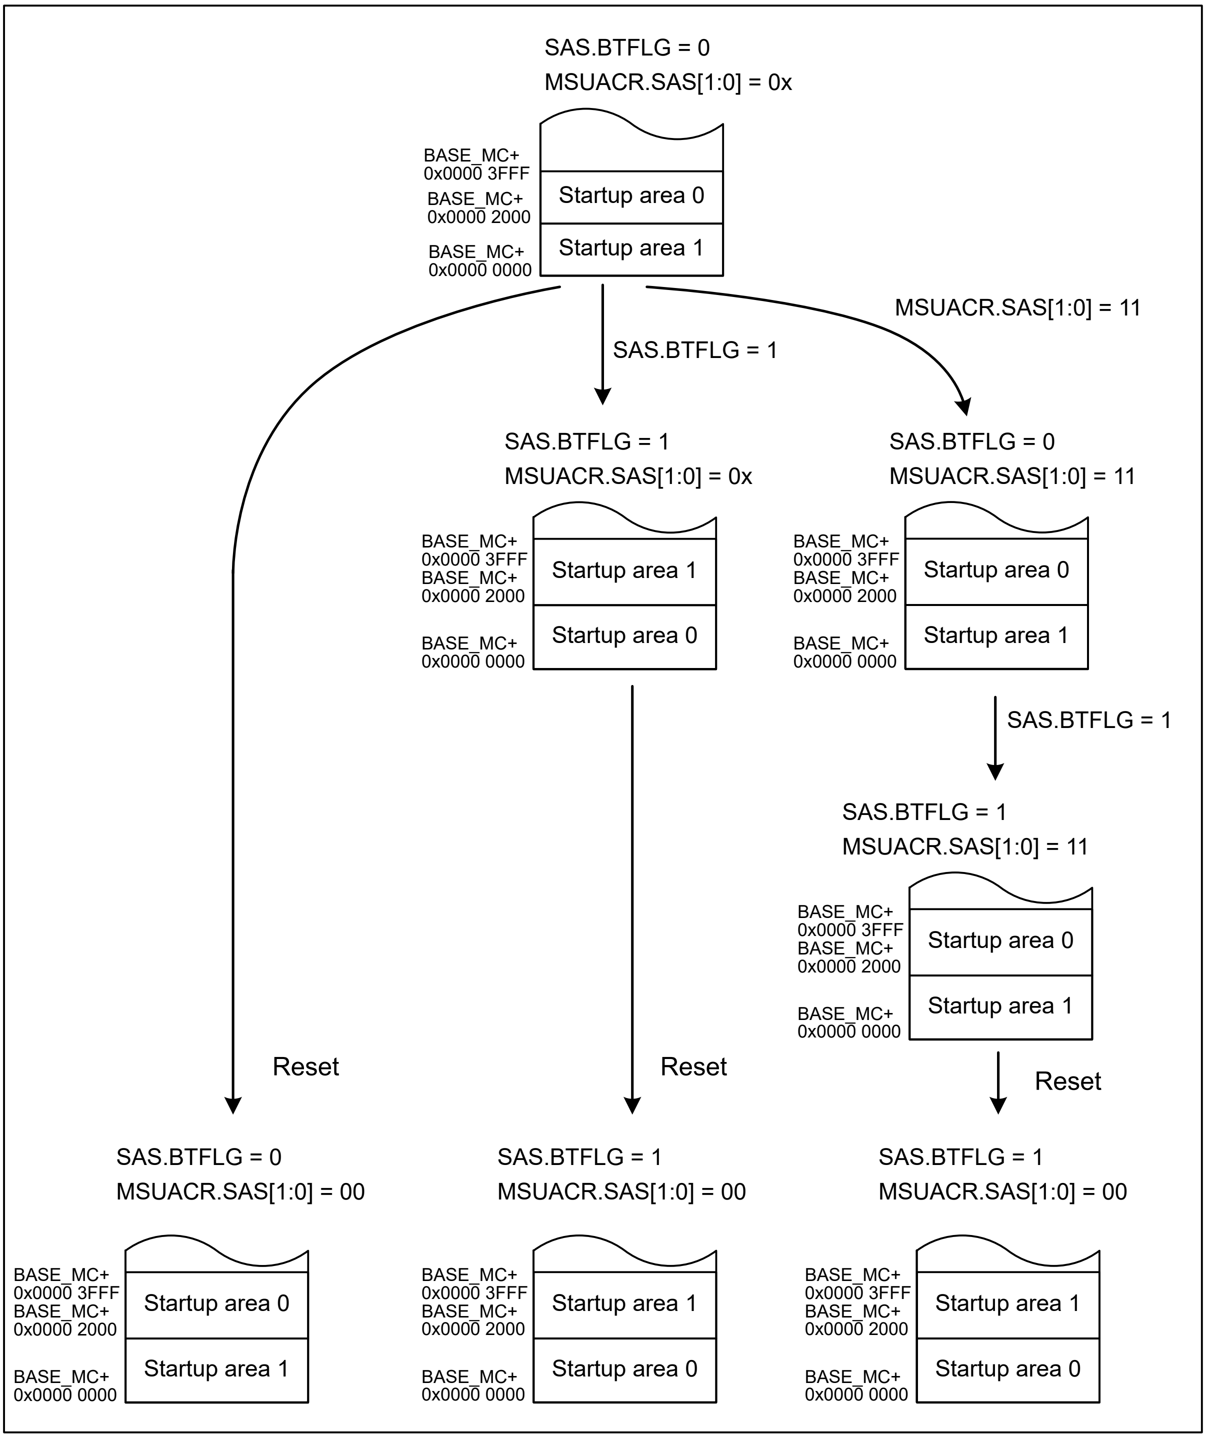

Figure 59.25 Example 2 of transitions for startup program protection settings

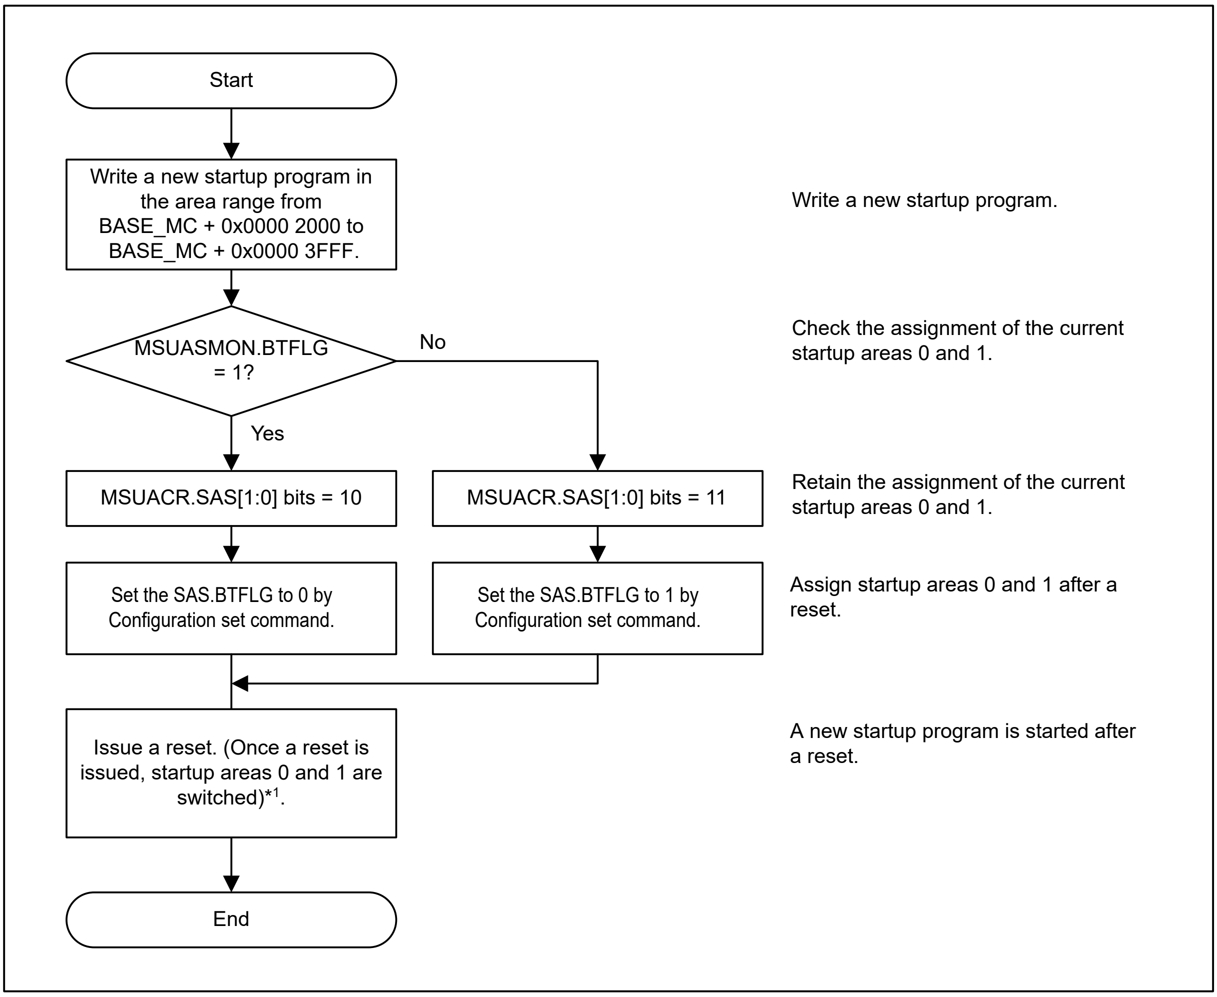

Figure 59.26 Concept of protection of the startup program

59.9.4 Fault Correction and Detection

MRAM systems are equipped with ECC circuitry to correct and detect errors. DEC-TED (double-bit error correction and triple-bit error detection) ECC corrects errors in 128-bit data units. Code MRAM uses two ECC circuits for 256-bit readout, and extra MRAM uses one ECC circuit for 128-bit readout.

If there is a DEC error in the code MRAM reading, error correction is performed and the MRCRAES.DECERRC bit is set to 1. If there is a TED error, the MRCRAES.TEDERRC bit is set to 1, but error correction is not possible. When an error is detected, the error address is stored in the MRCRDEA register for DEC error and in the MRCRTEA register for TED error. If a DEC error occurs, read the data at the error address, and write back. If a TED error occurs, update all 32 bytes of data and overwrite with the correct data.

If there is a DEC error in the extra MRAM reading, error correction is performed and the MRERAES.DECERRE bit is set to 1. If there is a TED error, the MRERAES.TEDERRE bit is set to 1, but error correction is not possible. When an error is detected, the error address is stored in the MRERDEA register for DEC errors and in the MRERTEA register for TED errors. If a DEC error occurs, read the data at the error address, and write back. If a TED error occurs, update all 32 bytes of data and overwrite with the correct data.

59.9.4.1 Test Method for ECC Circuits

The ECC circuit can be tested by setting the program data and ECC data to desired values. A block diagram of the ECC test circuit is shown in Figure 59.27.

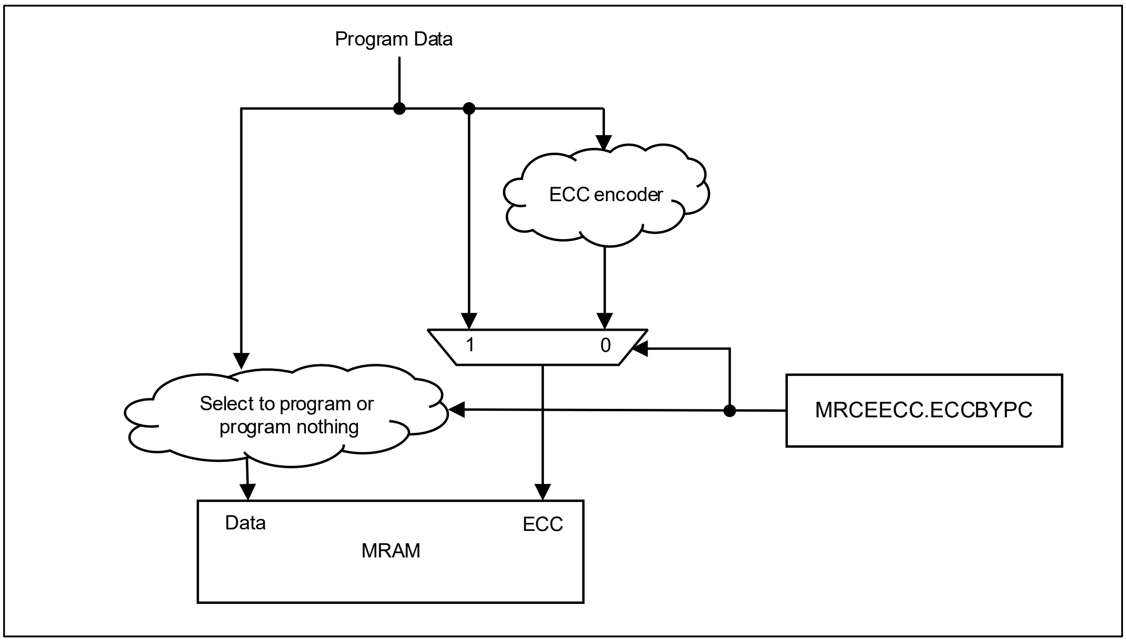

Figure 59.27 Block diagram of the ECC test circuit

Table 59.37 Changes in data allocation depending on the value of MRCEECC.ECCBYPC

MRCEECC.ECCBYPC	Code MRAM	
	Data[255:0]	ECC[33:0]
0	Program data[255:0]	ECC code generated from program data[127:0]
1	Program nothing	{Program data[144:128], Program data[16:0]}

Figure 59.28 shows the ECC decoder test flow of the code MRAM. The code MRAM has two ECC decoders and ECC errors are merged, so when testing the ECC decoder, test the ECC decoder circuits individually.

[Notation of Figure 59.28]

Note 1. To eliminate ECC errors in instruction fetching.

Note 2. If you get an error, try the test again at a different address.

Note 3. Invert the bits of the code according to the error condition you want to check (1 to 3)

Replace the bits shown in Table 59.37 with the code you created and write to the same address as DATA.

Note 4. See Table 59.38.

Table 59.38 Check results

Check results	Expected value		
	1-bit invert	2-bit invert	3-bit invert
MRCRAES.DECERRC	0	1	0
MRCRAES.TEDERRC	0	0	1

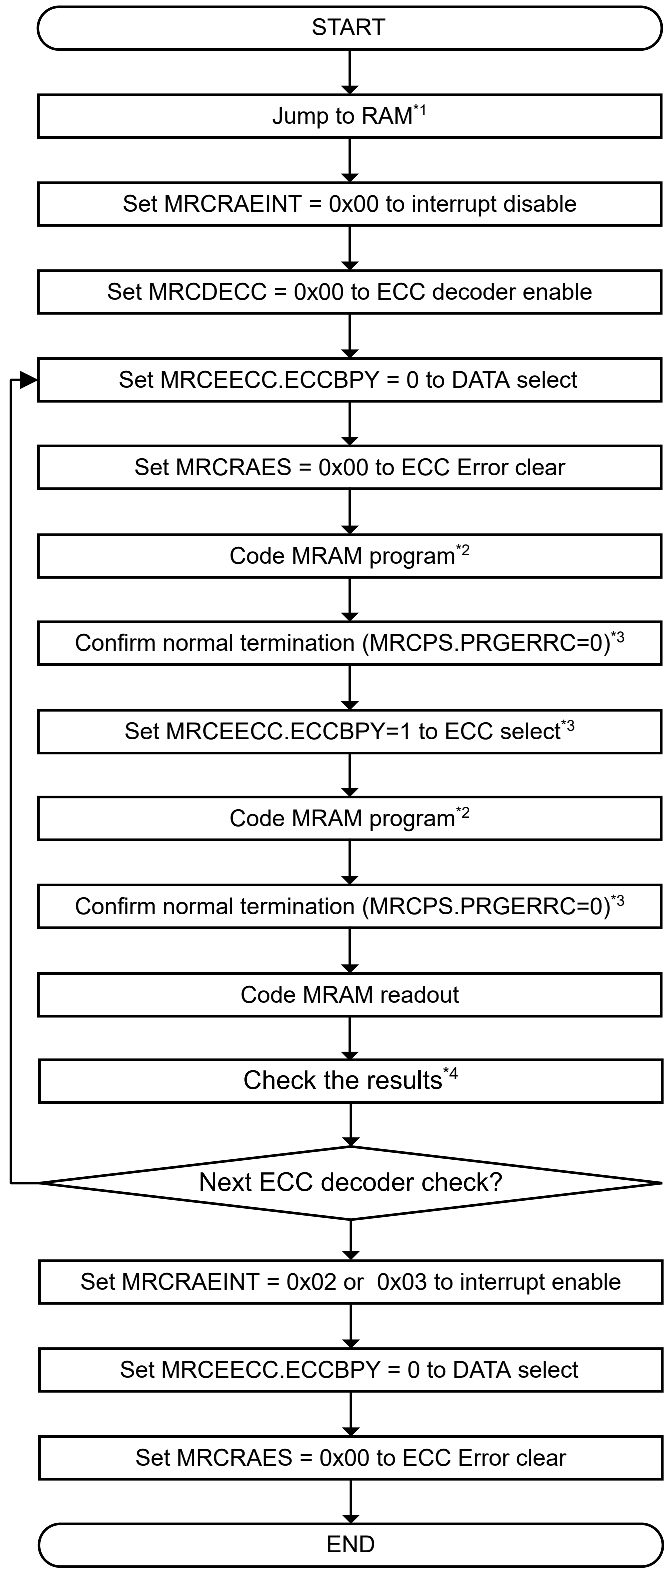

Figure 59.28 Code MRAM ECC decoder test flow

59.10 Configuration Update Transfer

After Program or Configuration Set command operation, the system status can be updated by configuration update transfer without system reset. MACI automatically determines a valid area and executes multidata transfer with the MCTRLSR register setting. With the TRTRG bit in MCTRCNTR written as 1 in the read mode (MENTRYR is 0x0000 and the WHUKEXE bit in MREZS register is 0), MACI transfers data from extra MRAM. MCTRSTATR register can monitor the processing status of configuration update transfer. Extra MRAM cannot be read during configuration data transfer.

Figure 59.29 shows configuration update transfer usage.

If the WHUKEXE bit in the MREZS register is set to 1 in the configuration update transfer flow, the configuration update transfer must be reexecuted after the W-HUK zeroing is finished.

See section 59.5.22. MCTRCNTR : MRAM Configuration Update Transfer Control Register, section 59.5.23. MCTRLSR : MRAM Configuration Update Transfer List Select Register, and section 59.5.24. MCTRSTATR : MRAM Configuration Update Transfer Status Register for details of the associated registers specifications (MCTRCNTR, MCTRLSR, and MCTRSTATR registers).

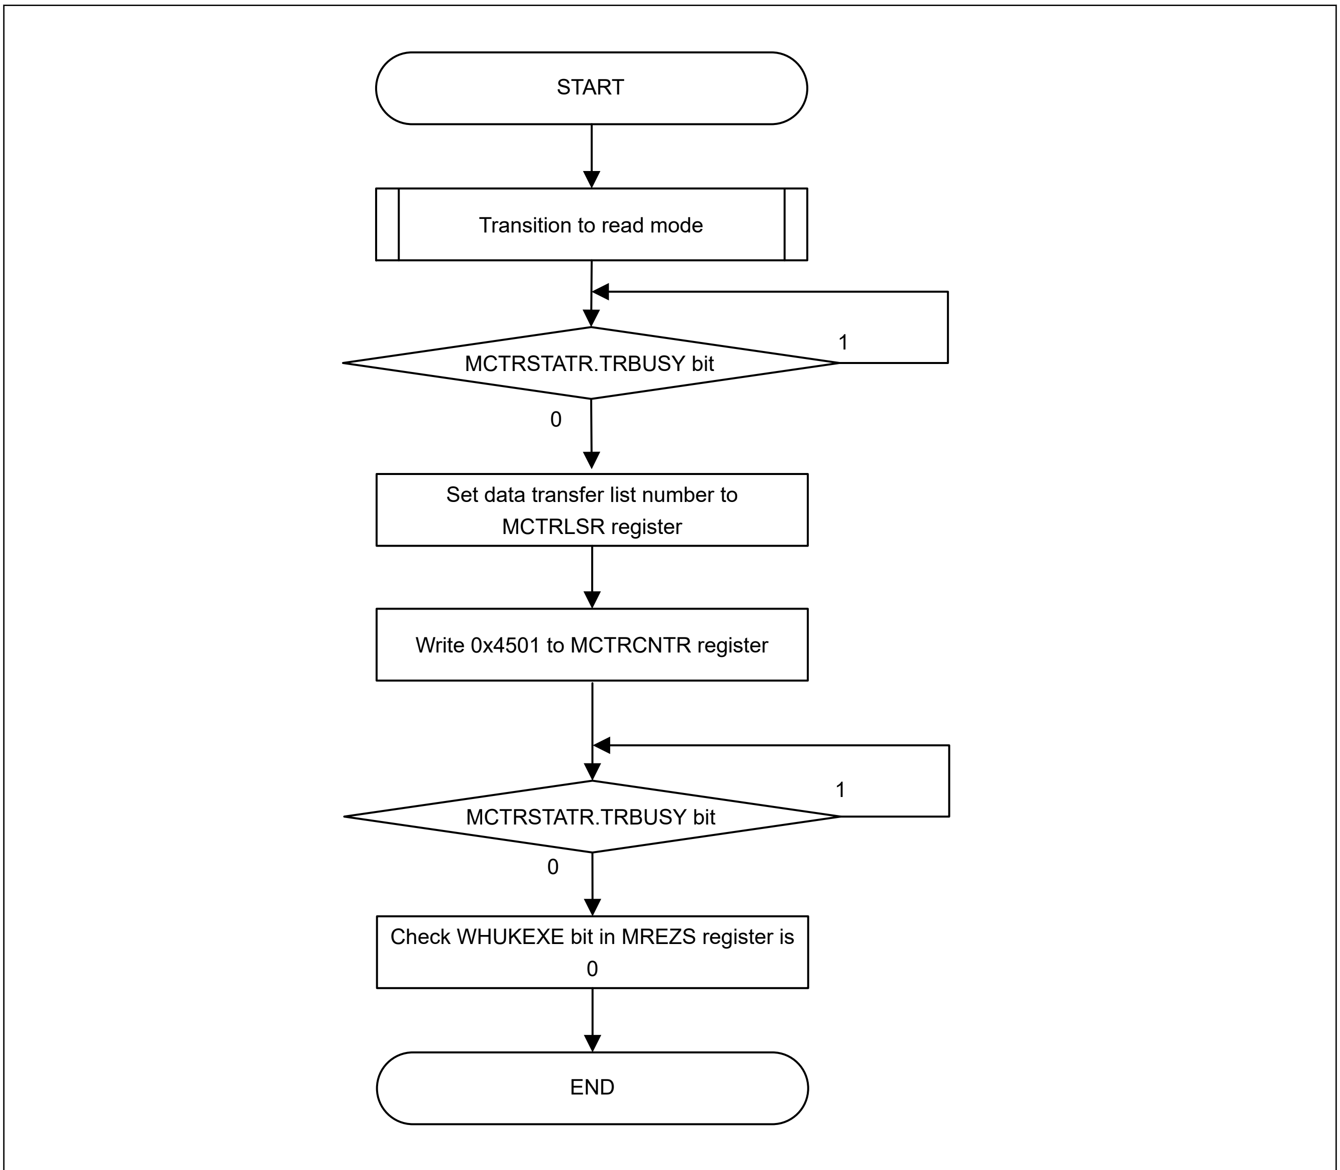

Figure 59.29 Configuration update transfer usage

59.11 Boot Mode

There are two serial programming modes:

- The boot mode (for the SCI interface) with SCI9
- The boot mode (for the USB interface) with USBFS.

Table 59.39 lists the I/O pins used in boot mode. Table 59.40 lists the available communication interface used in the boot mode.

Table 59.39 I/O pins used in boot mode

Pin name	I/O	Mode to be used	Use
MD	Input	Boot mode (for the SCI interface) Boot mode (for the USB interface)	Selection of operating mode
P208/RXD9	Input	Boot mode (for the SCI interface)	For host communication (to receive data through SCI)
P209/TXD9	Output		For host communication (to transmit data through SCI)
USB_DP, USB_DM	I/O	Boot mode (for the USB interface)	Data input/output of USB
USB_VBUS	Input		Detection of connection and disconnection of USB cables

Table 59.40 Available communication interface used in boot mode

Main clock oscillator or external clock is connected	Yes	No	No
Sub-clock oscillator is connected*1	Yes or No	Yes	No
Available interface	SCI or USB	SCI or USB	SCI
Tool connection time*2	Up to 1 second	Up to 2 seconds	Up to 3 seconds

Note 1. The drive capability of the sub-clock oscillator is set to standard by the SOMCR.SODRV bit. If you use the crystal that corresponds to the low drive capability on your board, the crystal may not oscillate in the boot mode.
Note 2. See the boot firmware manual for detail of the connection time.

59.11.1 Boot Mode (for the SCI Interface)

In boot mode (for the SCI interface), the host sends control commands and data for programming, and the MRAM is programmed accordingly. An on-chip SCI handles transfer between the host and this MCU in asynchronous mode. Tools for transmission of control commands and the data for programming must be prepared in the host.

When this MCU is activated in boot mode (for the SCI interface), the program on the dedicated area of the MCU is executed. The boot program automatically adjusts the bit rate of the SCI and controls programming/erasure by receiving control commands from the host.

Figure 59.30 shows the system configuration for operations in boot mode (for the SCI interface).

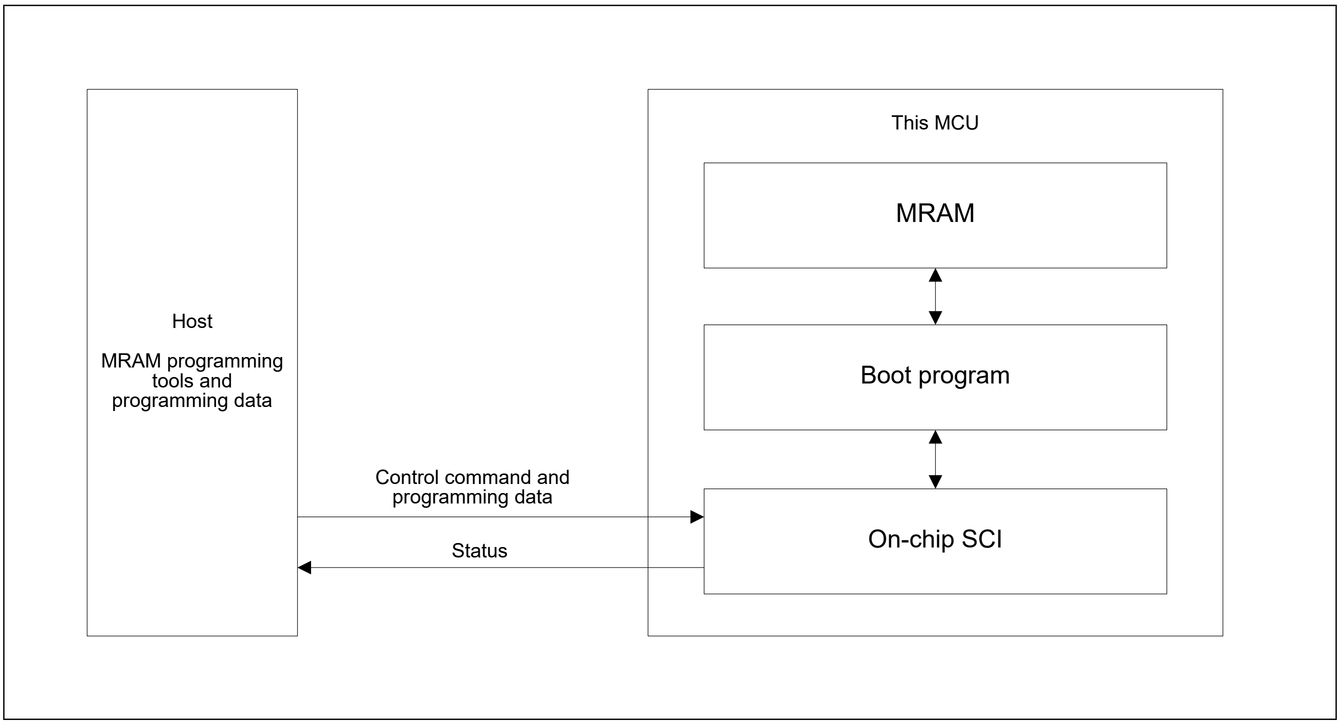

Figure 59.30 System configuration for operations in boot mode (for the SCI interface)

59.11.2 Boot Mode (for the USB Interface)

In boot mode (with the USB interface), the MRAM can be programmed by sending control commands and program data from the host. An on-chip USB is used for communications between the host and this MCU. The host requires tools for sending control commands and data for programming. Figure 59.31 shows the configuration of a system for use in boot mode (for the USB interface). The USB cable must be connected on reset release.

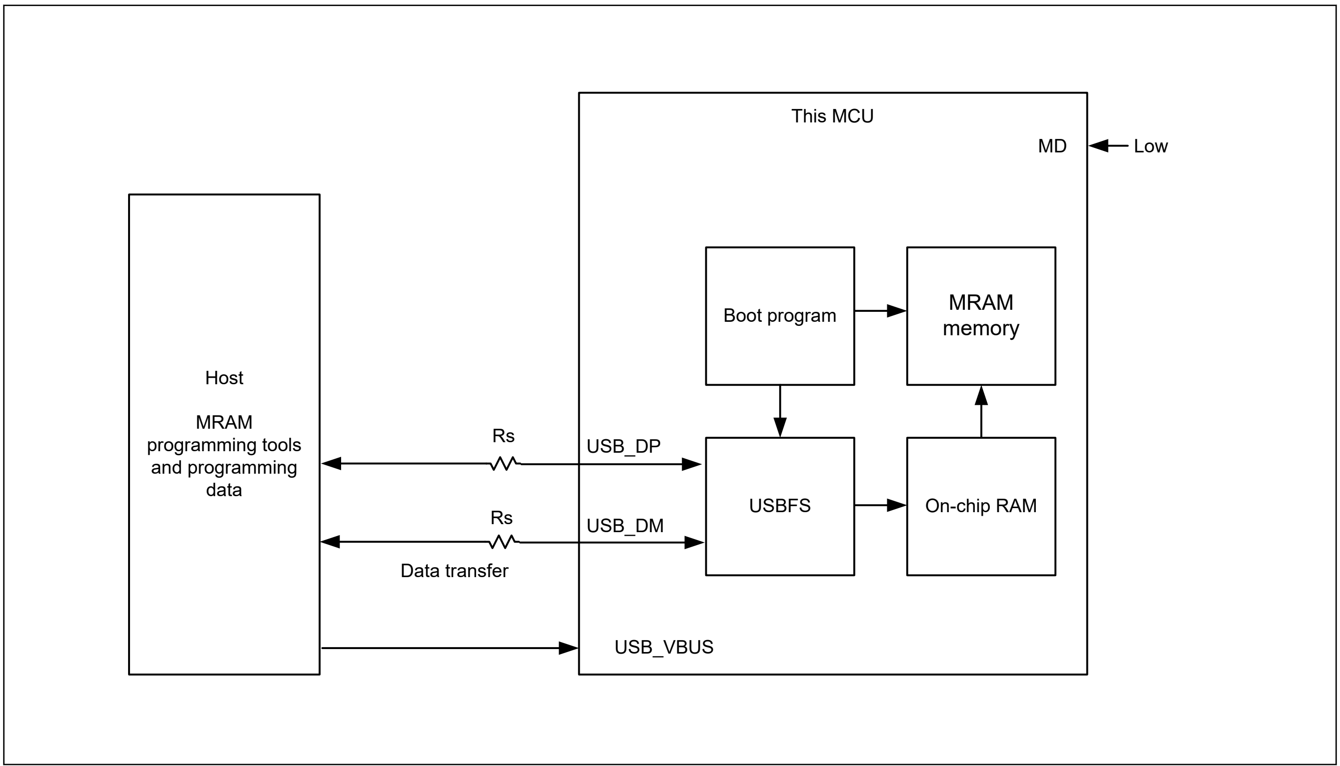

Figure 59.31 System configuration in boot mode (for the USB interface)

59.12 Using the Serial Programmer for Rewriting

A serial programmer can be used to rewrite MRAM in boot mode.

(1) Serial Programming

This MCU is mounted on the system board at the time of serial programming. Providing a connector to the board enables rewriting of this MCU by the serial programmer to proceed.

59.12.1 Environments for Serial Programming

The recommended environments for rewriting the MRAM of the MCU with data are described in Figure 59.32.

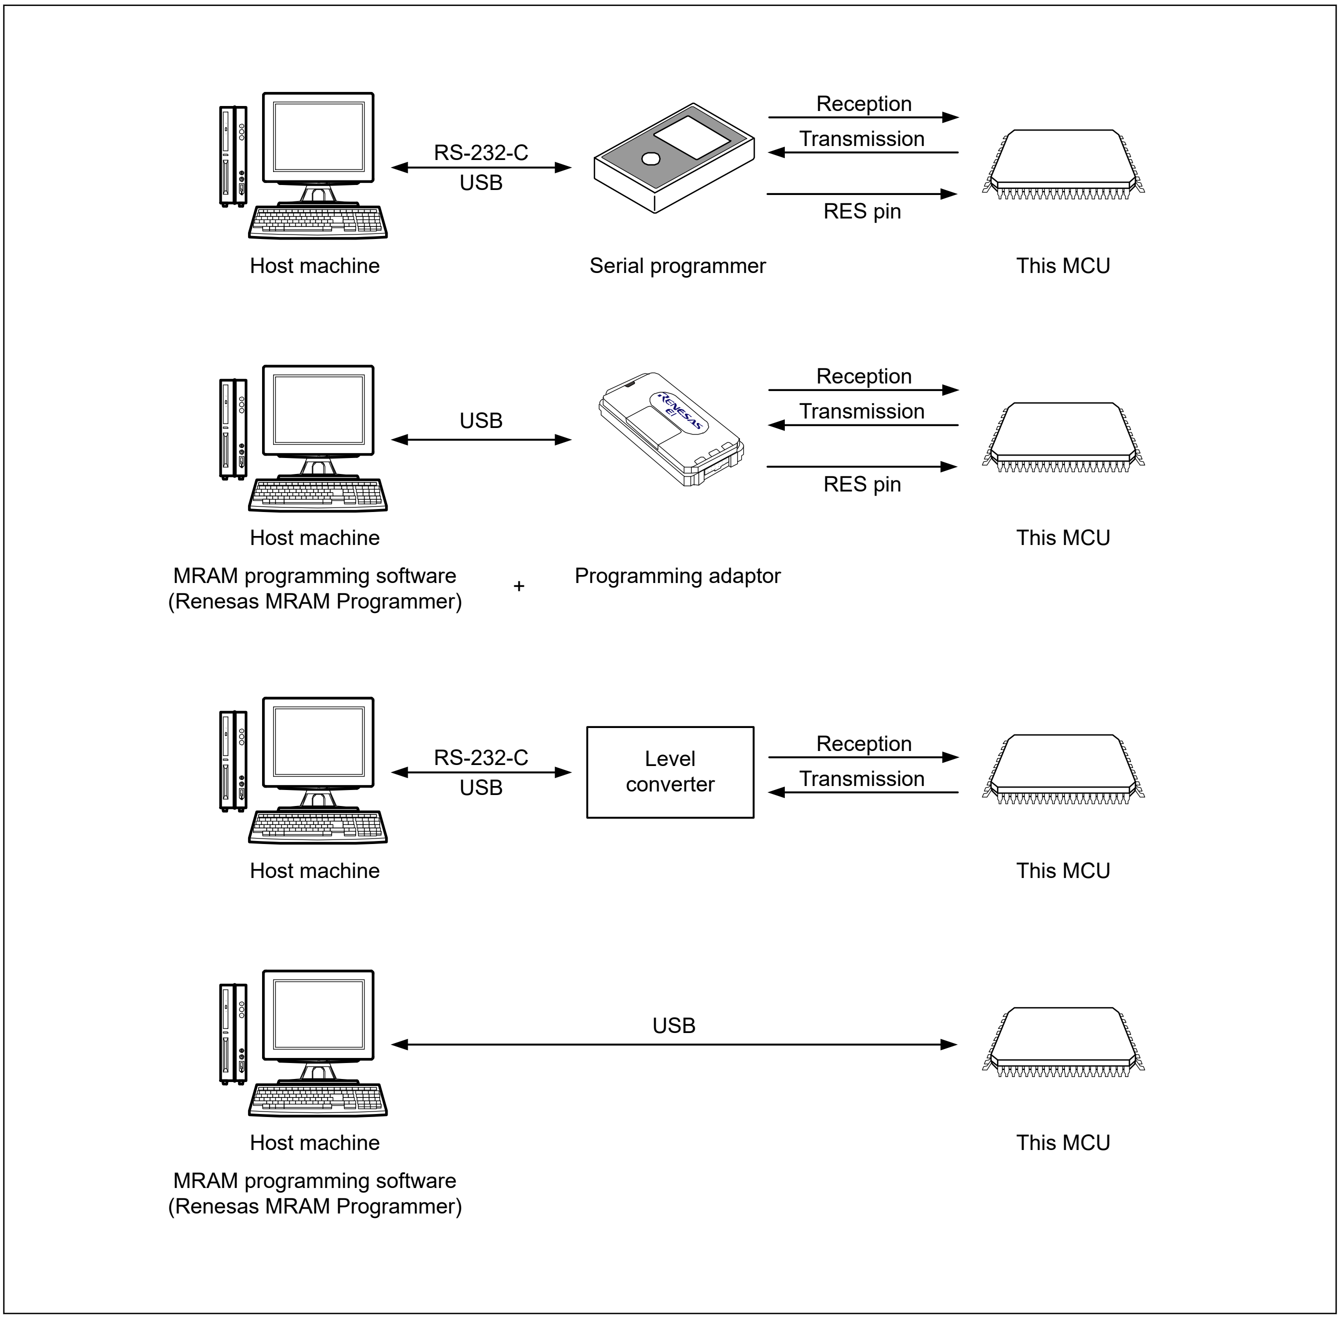

Figure 59.32 Environments for rewriting the MRAM

59.13 Programming Through Self-Programming

59.13.1 Overview

This MCU supports programming of the MRAM by the user program itself. The write page buffer or the MACI commands can be used with user programs for writing to the MRAM. This allows upgrading of user programs and rewriting of constant data fields.

The program for rewriting must be transferred to the internal RAM or external memory in advance when the BGO is not available or when rewriting the option-setting memory.

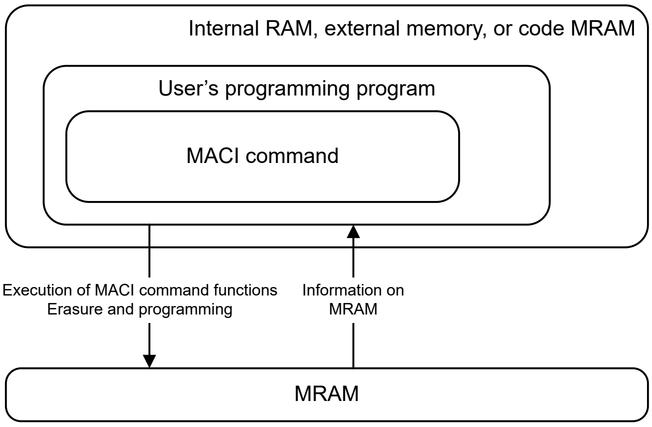

Figure 59.33 Schematic view of self-programming

For comprehensive information on the self-programming, see section 59.7. MACI Commands.

59.13.2 Parallel Accessibility

Parallel read and program accesses are possible in conditions shown in Table 59.41.

Read while program (Background operation: BGO) is possible between different MRAM banks. Parallel read to different MRAM banks is possible. Only one MRAM bank can be programmed at the same time. W-HUK zeroing has the highest priority among all MRAM programming requests. See section 59.8.6. HUK Protection.

Programming the code MRAM and the Extra MRAM cannot be executed at the same time, so they are arbitrated. The program executed later is forced to wait until the program executed first is completed. If the program for the code MRAM is started while MSTATR.MRDY = 0, the program will start after MSTATR.MRDY = 1. And if the program for the extra MRAM (issue the Program, Configuration set, or Increment Counter command) is started while MRCPS.PRGBSYC = 1, the program will start after MRCPS.PRGBSYC = 0. Therefore, in this case, the program time is the sum of the code and the extra MRAM program time.

There is also arbitration between read and program operations for the same MRAM macro, and they cannot be executed simultaneously. The values listed in the MRAM characteristics are for independent operation time without arbitration.

Table 59.41 Parallel accessibility

		Code MRAM		Extra MRAM	
		Read	Program	Read	Program
Code MRAM	Read	X	X	O*1	O
	Program	X	X	O	X
Extra MRAM	Read	O*1	O	X	X
	Program	O	X	X	X

Note: O: Executable
X: Not executable

Note 1. Bus masters cannot read extra MRAM during configuration update transfer. See section 59.10. Configuration Update Transfer.

59.13.3 Reading MRAM

Special settings are not required to read MRAM after release from the reset state. Data can simply be read out through access to addresses in the MRAM.

When reading MRAM that has not yet been programmed (that is, in the nonprogrammed state), all bits are read as 1.

59.14 Usage Notes

(1) Area Where Programming was Interrupted by W-HUK Zeroing

The data stored in the area where programming was suspended due to zeroing of the W-HUK is undefined. To prevent malfunctions due to reading undefined data, care should be taken not to fetch instructions or read data from the area where writing has been suspended.

(2) Actions Prohibited During Programming

- Do not reduce the power to less than the operating voltage.

(3) Prohibition of Additional Programming

An OTP area that uses ECC cannot be programmed twice with different data.

(4) Resets During Programming

For a reset due to the signal on the RES# pin during programming of the MRAM, wait for at least t_{RESW} (see section 62, Electrical Characteristics) of the reset input period once the operating voltage is within the range stipulated in the electrical characteristics, then release the device from the reset state.

(5) Allocation of Vectors for Interrupts and Other Exceptions During Programming

Generation of an interrupt or other exception during programming may lead to fetching of the vector from the code MRAM. The vectors cannot be read from code MRAM until the program is finished. Code MRAM requires t_{PMC} (see section 62, Electrical Characteristics) to program. Under conditions where BGO cannot be used, set the address of the vector to an address that is not in the code MRAM. Alternatively, make sure that no handling of interrupts or exceptions proceeds during programming.

(6) Synchronization of Code MRAM Program Completion and Subsequent Instruction Generation

When the CPU writes to code MRAM, there is a time lag from execution of MRAM programming by code MRAM program sequencer. For a barrier instruction that requires memory access completion, appropriate processing for synchronization is required to execute subsequent instructions. The processing for synchronization is shown as follows:

1. Code MRAM programming (for example, STR instruction).
2. Barrier instruction (for example, DMB instruction).
3. Flush the code MRAM programming data (see Figure 59.2).
4. Synchronization (wait for the flushing process to finish).
5. Subsequent instruction.

If it is necessary to avoid CPU stall in Step 4., completion of code MRAM programming should be checked by the PRGBSYC bit in the MRCPS register instead of dummy reading in Step 3..

(7) Constraints During Programming of MRAM

Frequency change, transition to software standby, and transition to deep standby are prohibited while MRAM is being programmed.

(8) Emulator Connection

Renesas provides the emulator which supports both debugging using SWD or JTAG communication and serial programming using SCI communication.

Table 59.42 shows the pinout of 10-pin or 20-pin socket pinouts when using this emulator. The pinout of SWD and JTAG is ARM standard, and MD, TXD, RXD pins are added for the serial programming using SCI communication.

Table 59.42 Pin assignment for emulator

Pin No.	SWD	JTAG	Serial programming using SCI
1	VCC	VCC	VCC
2	P210/SWDIO	P210/TMS	NC
4	P211/SWCLK	P211/TCK	P201/MD
6	P209/SWO	P209/TDO	P209/TXD9
8	P208	P208/TDI	P208/RXD9
9	GNDdetect	GNDdetect	GNDdetect
10	nRESET	nRESET	nRESET
12	P308/TCLK	P308/TCLK	NC
14	P307/TDATA[0]	P307/TDATA[0]	NC
16	P306/TDATA[1]	P306/TDATA[1]	NC
18	P305/TDATA[2]	P305/TDATA[2]	NC
20	P304/TDATA[3]	P304/TDATA[3]	NC
3, 5, 15, 17, 19	GND	GND	GND
7	NC	NC	NC
11, 13	NC	NC	NC

60. Capture Engine Unit (CEU)

60.1 Overview

The Capture Engine Unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, for example, JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple thinning in which the chrominance component (CbCr) of the evennumbered lines is thinned.

The functional overview of the CEU is shown in Table 60.1 and the main functions and their details are shown in Table 60.2.

Table 60.1 Functional overview of CEU (1 of 2)

Classification	Item	Function	Description	Note
Connectable camera	Size*1	5 megapixels	2,560 pixels × 1,920 lines	Image capture mode or data synchronous fetch mode Horizontal : 8-pixel units Vertical : 4-line units Data enable fetch mode 32-byte units The range of the image size that can be input is as follows. Horizontal: 2,560 pixels to 128 pixels Vertical: 1,920 pixels lines to 96 lines
		3 megapixels	2,048 pixels × 1,536 lines	
		2 megapixels	1,632 pixels × 1,224 lines	
		UXGA	1,600 pixels × 1,200 lines	
		SXGA (1)	1,280 pixels × 1,024 lines	
		SXGA (2)	1,280 pixels × 960 lines	
		WXGA	1,280 pixels × 768 lines	
		XGA	1,024 pixels × 768 lines	
		SVGA	800 pixels × 600 lines	
		WVGA	800 pixels × 480 lines	
		VGA	640 pixels × 480 lines	
		CIF	352 pixels × 288 lines	
		WQVGA	480 pixels × 240 lines	
		QVGA	320 pixels × 240 lines, 240 pixels × 320 lines	
		QCIF	176 pixels × 144 lines	
		QQVGA	160 pixels × 120 lines	
		Sub-QCIF	128 pixels × 96 lines	
	Input format	YCbCr422 8 bits	Cb_0, Y_0, Cr_0, Y_1…	Supports clock ratio of 1:1
			Cr_0, Y_0, Cb_0, Y_1…	
			Y_0, Cb_0, Y_1, Cr_0…	
			Y_0, Cr_0, Y_1, Cb_0…	
		YCbCr422 16 bits	{Y_0, Cb_0}, {Y_1, Cr_0}, …	
			{Y_0, Cr_0}, {Y_1, Cb_0}, …	
		Binary data	Specified amount to be fetched on edges of the sync signal	Written sequentially
			Data is fetched with the horizontal sync signal as an enable signal	
	Horizontal and vertical sync signal polarities	Arbitrary	High-active and low-active	
	Capture start location	Arbitrary	Can be specified in camera input clock units	Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units
	Number of captured pixels	Arbitrary	Can be specified in 8-pixel units horizontally and in 4-line units vertically	
	Interlace	Both-field capture	Stored as a field image	Capture: 2-VD (vertical sync signal) units
			Stored as a frame image	
		One-field capture	Top field or bottom field can be specified	Capture: 1-VD units
Memory write	Output format	YCbCr422 YCbCr420	YCbCr420 is realized by simple thinning	

Table 60.1 Functional overview of CEU (2 of 2)

Classification	Item	Function	Description	Note
Filter function	No scaling or scale-down	Scale-down of captured display	Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA)	
	Low-pass filter		Removal of high-frequency components	Only in the horizontal direction
Module-stop function	Module-stop state can be set to reduce power consumption.			
TrustZone Filter	Security and Privilege attribution can be set.			

Note 1. The range of the image size that can be input depends on the AC characteristics and the frame rate of the connected device, and the transfer speed to the destination RAM.

Table 60.2 Main functions of CEU and their details

Main function	Detailed description
Image data fetch	• Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. • Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. • Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.
Filter processing	Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.
Format conversion	Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple thinning in which the chrominance component (CbCr) of the even-numbered lines is thinned.

Figure 60.1 shows a block diagram of the CEU.

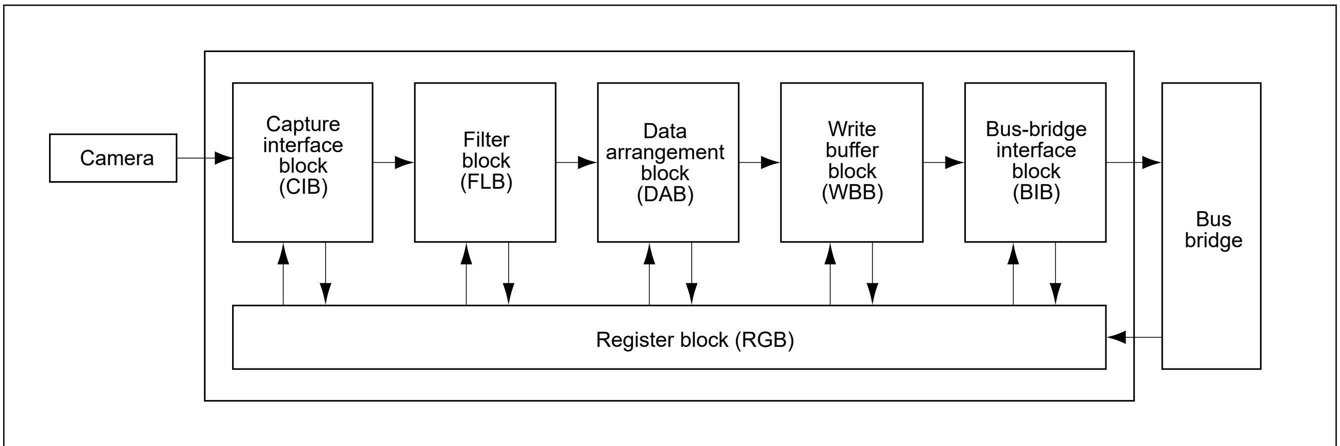

Figure 60.1 Block diagram of CEU

The pin configuration of the CEU is shown in Table 60.3.

Table 60.3 Pin configuration of CEU (1 of 2)

Pin name	Function	I/O	Description
VIO_D15 to VIO_D0*1	CEU data bus	Input	Camera image data input to the CEU
VIO_CLK	CEU clock	Input	Camera clock input to the CEU
VIO_VD	CEU vertical sync	Input	Camera vertical sync signal input to the CEU

Table 60.3 Pin configuration of CEU (2 of 2)

Pin name	Function	I/O	Description
VIO_HD	CEU horizontal sync	Input	Camera horizontal sync signal input to the CEU
VIO_FLD*2	Field signal	Input	Field identification signal to the CEU

Note 1. When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D15 to VIO_D0 are used.
Note 2. The VIO_FLD pin is valid only in interlace input mode (CAIFR.IFS=1).

60.2 Register Descriptions

The register configuration of the CEU is shown in Table 60.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 60.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 60.4 Register configuration of CEU (1 of 2)

Register name	Abbr.	R/W	Addresses			Access size
			Address (Plane A)	Address (Plane B)	Mirror Address

CEU Bufferable Write Enable Register	CBWER	R/W	0x4034_80A0	—	—	32

Note: The address shown in this table are Secure region. The address corresponding to the Non-secure region is when b28 of address is set to 1.

Note 1. After changing the setting of a register (CAMCR or CMCYR) that is determined by the external module characteristics, do not start capture until at least 10 external input clock cycles have elapsed.

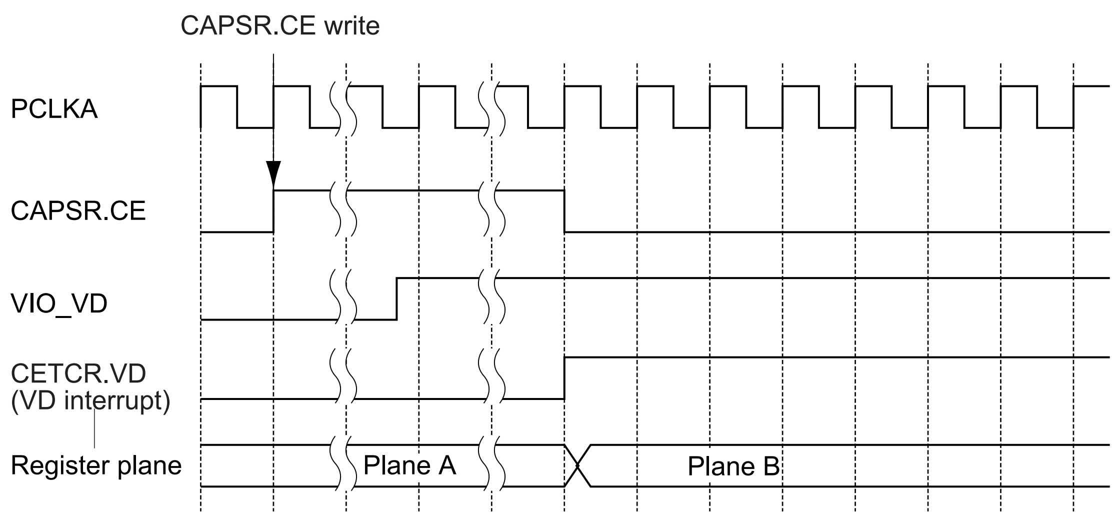

Figure 60.2 Register plane switching timing (VD polarity is high-active in data enable fetch mode)

60.2.1 CAPSR : Capture Start Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPKIL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CE	Capture enable ● Single-capture This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 60.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted. As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0. The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode. Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR. ● Continuous capture When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 60.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed. Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame. 0: Stops capturing 1: Starts capturing	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W
16	CPKIL	Software reset of capturing Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When CPKIL = 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CSTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 60.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CAPSR captures data input to the CEU from an external module.

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 60.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

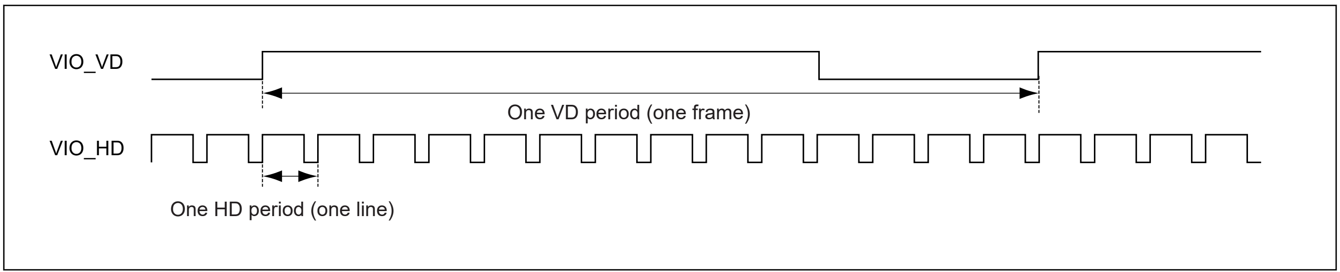

Figure 60.3 Frame timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 60.4 shows the timing of one field (when both the VD and HD polarities are high-active).

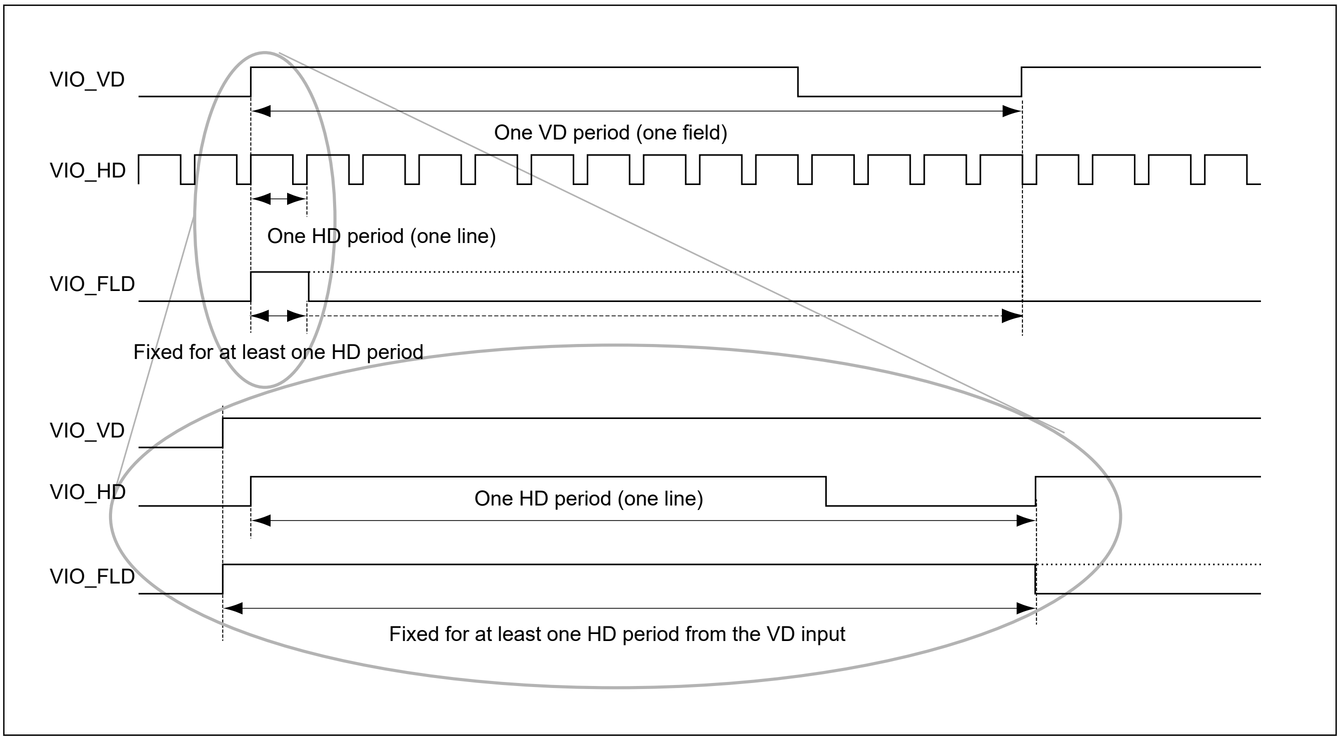

Figure 60.4 One field timing

In data enable fetch, one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 60.5 shows the timing of one frame for data enable fetch.

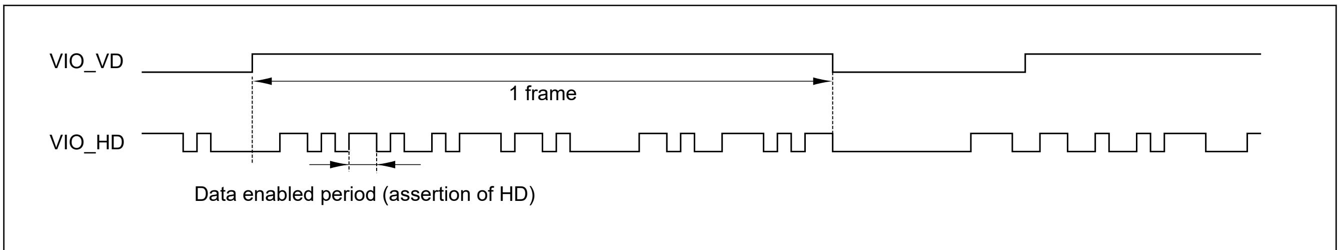

Figure 60.5 Frame timing (data enable fetch)

60.2.2 CAPCR : Capture Control Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	FDRP[7:0]								—	—	MTCM[1:0]		—	—	—	CTNCP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W
16	CTNCP	Continuous capture When capturing is started with this bit set to 1, capturing continues until the CE bit in CAPSR is cleared to 0 or a software reset is initiated by the CPKIL bit in CAPSR (see Figure 60.8). Continuous capture must be set before capturing is started. This bit is modified only after 0 is written to the CE bit to stop capturing. If this bit is modified during capturing, correct operation cannot be guaranteed. In data fetch mode, clear this bit to 0. 0: One-frame capture when CAPSR.CE = 1 1: Continuous capture until CAPSR.CE = 0	R/W
19:17	—	These bits are read as 0. The write value should be 0.	R/W
21:20	MTCM[1:0]	Specify the unit for transferring data to a bus bridge module. The efficiency of writing image data can be improved by continuously accessing the addresses. To improve the write efficiency, set these bits to 11. The setting of these bits appear to be unchanged from the outside. 0 0: Image capture: Y data and C data are transferred in 32-byte units Data fetch : Data is transferred in 32-byte units 0 1: Image capture: Y data and C data are transferred in 64-byte units Data fetch : Data is transferred in 64-byte 1 0: Image capture: Y data and C data are transferred in 128-byte units Data fetch : Data is transferred in 128-byte 1 1: Image capture: Y data and C data are transferred in 256-byte units Data fetch : Data is transferred in 256-byte	R/W
23:22	—	These bits are read as 0. The write value should be 0.	R/W
31:24	FDRP[7:0]	Set the frame drop interval in continuous-frame capture. When these bits are cleared to 0, frame drop is not performed, and all frames are captured. Figure 60.9 shows the value set in these bits and the timing of captured frames. The frame drop interval unit differs according to the capture setting. Table 60.5 shows the relationship between the capture setting and frame drop interval unit. The image of the frame drop timing for each capture setting when these bits are set to 2 is shown in Figure 60.10. In both-field capture, capturing is performed continuously for 2-VD periods, regardless of whether the second field is the top field or bottom field. In addition, in both-field capture, the frame drop counter is incremented when the first field has been identified as the top field or bottom field, regardless of whether the second field is the top field or bottom field. When 0 is written to the CE bit in CAPSR, capturing terminates after the current frame has been captured for a capture frame. However, for a drop frame, capturing is forcibly terminated in the CEU so no capture end interrupt (CPE bit in CETCR) is output. While CAPSR.CE = 1, do not change the setting of these bits. Note: Do not change the setting of these bits during continuous capture operations. To change the setting of these bits, stop continuous capture (CAPSR.CE = 0), clear the CTNCP bit (continuous capture) in CAPCR to 0, and then restart continuous capture. Continuous capture is performed during the period of CAPSR.CE = 1 shown in Figure 60.9.	R/W

Note: S-TYPE-3, P-TYPE-3

CAPCR sets continuous-frame capture and the frame drop intervals.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to 1.

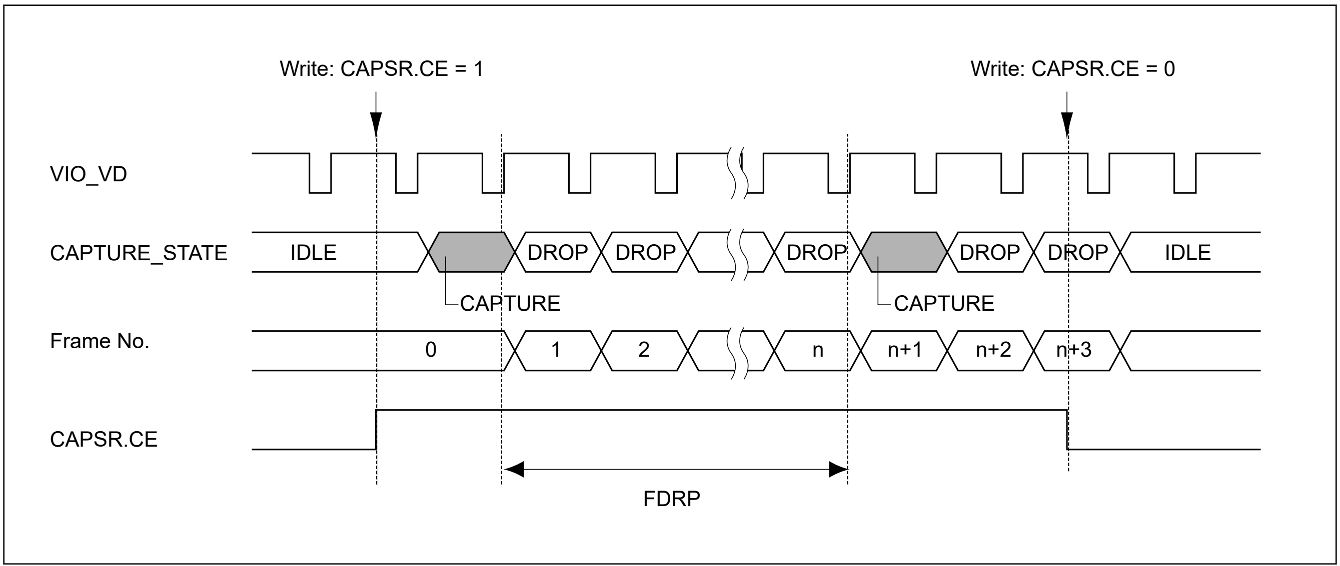

Figure 60.9 Setting of FDRP bits and frame drop timing

Table 60.5 Relationship between capture setting and frame drop interval unit

Input Mode	Captured Image	First Captured Image	Frame Drop Interval Unit	Capture Setting
Progressive	Frame	Frame immediately after capture start	Frame	A
Interlace	Both-field (2-VD capture)	Field immediately after capture start	2 fields (first capture field count)	B
				C
		Top field	2 fields (top-field count)	D
		Bottom field	2 fields (bottom-field count)	E
	One-field (1-VD capture)	Field immediately after capture start	First capture field	F
				G
		Top field	Top field	H
		Bottom field	Bottom field	I

Bit field:	—	—	—	DTIF	—	—	DTARY[1:0]		—	—	JPG[1:0]		—	—	VDPOL	HDPOL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	HDPOL	Sets the polarity for detection of the horizontal sync signal (HD) input from an external module. Figure 60.16 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, set this bit to 0. 0: Horizontal sync signal (HD) from an external module is detected as high active 1: Horizontal sync signal (HD) from an external module is detected as low active	R/W
1	VDPOL	Sets the polarity for detection of the vertical sync signal (VD) input from an external module. Figure 60.14 and Figure 60.15 show the relationship between the VD, HD and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, this bit is not used and the sense for detection is always active high. 0: Vertical sync signal (VD) from an external module is detected as high active 1: Vertical sync signal (VD) from an external module is detected as low active	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
5:4	JPG[1:0]	These bits select the fetched data type. 0 0: Image capture mode (input data are separated into the luminance component data (Y) and the chrominance component data (CbCr) for output to the memory) 0 1: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 1 0: Data enable fetch mode (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input) 1 1: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
9:8	DTARY[1:0]	Set the input order of the luminance component and chrominance component. The order in which Y and CbCr are input from an external module differs among modules. The CEU supports the input orders shown in Figure 60.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. 0 0: 8-bit interface: Image input data is fetched in the order of Cb_0, Y_0, Cr_0, and Y_1 16-bit interface: Image input data is fetched in the order of {Cb_0, Y_0} and {Cr_0, Y_1} 0 1: 8-bit interface: Image input data is fetched in the order of Cr_0, Y_0, Cb_0, and Y_1 16-bit interface: Image input data is fetched in the order of {Cr_0, Y_0} and {Cb_0, Y_1} 1 0: 8-bit interface: Image input data is fetched in the order of Y_0, Cb_0, Y_1, and Cr_0 16-bit interface: Image input data is fetched in the order of {Y_0, Cb_0} and {Y_1, Cr_0} 1 1: 8-bit interface: Image input data is fetched in the order of Y_0, Cr_0, Y_1, and Cb_0 16-bit interface: Image input data is fetched in the order of {Y_0, Cr_0} and {Y_1, Cb_0}	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	DTIF	Sets the digital image input pins from which data is to be captured. 0: Data input to 8-bit digital image input pins is captured 1: Data input to 16-bit digital image input pins is captured	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
16	FLDPOL	Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field.	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	DSEL	Sets the edge for fetching the image data (D15 to D0) from an external module. 0: D15 to D0 are fetched at the rising edge of the camera clock. 1: D15 to D0 are fetched at the falling edge of the camera clock.	R/W
25	FLDSEL	Sets the edge for capturing FLD from an external module. 0: FLD is captured at the rising edge of the camera clock. 1: FLD is captured at the falling edge of the camera clock.	R/W
26	HDSEL	Sets the edge for capturing HD from an external module. 0: HD is captured at the rising edge of the camera clock. 1: HD is captured at the falling edge of the camera clock.	R/W
27	VDSEL	Sets the edge for capturing VD from an external module. 0: VD is captured at the rising edge of the camera clock. 1: VD is captured at the falling edge of the camera clock.	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between the rising edge or falling edge of the camera clock for signal capture or data fetch operation
- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits or 16 bits)

- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to 0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to 1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

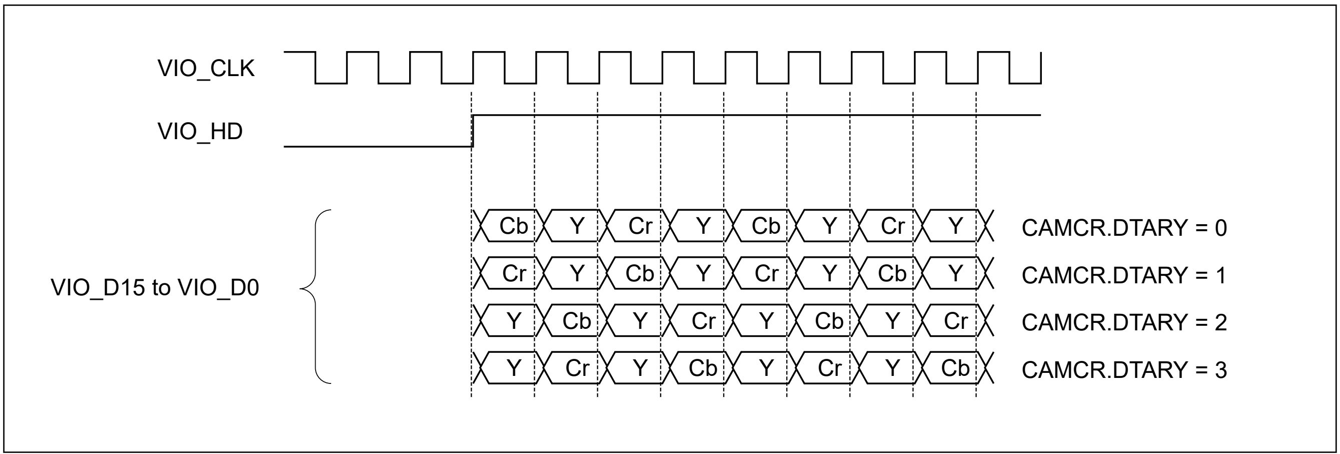

Figure 60.11 Input order of image data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled.

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.

This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.

Figure 60.12 and Figure 60.13 show the interface timing in data enable fetch mode.

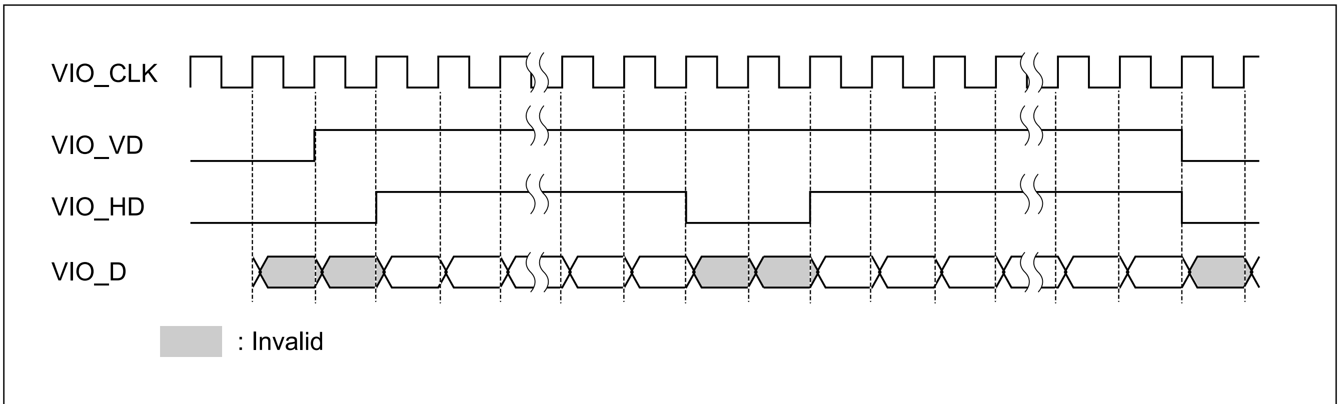

Figure 60.12 Data enable fetch timing (HD asserted (high) while VD is high)

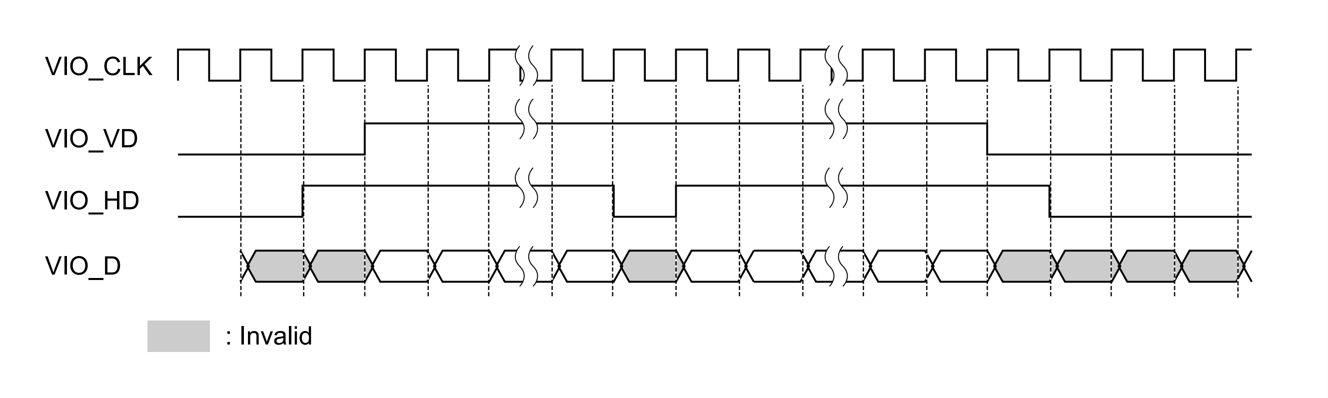

Figure 60.13 Data enable fetch timing (HD asserted (high) when VD is not high)

In data enable fetch mode, this module generates a VD interrupt in response to detection of the active level of VD. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time.

Figure 60.14 to Figure 60.16 show the relationships between the VIO_VD signal and the VD interrupt, the VIO_VD and VIO_HD signals and the VD interrupt, and the VIO_HD signal and the HD interrupt.

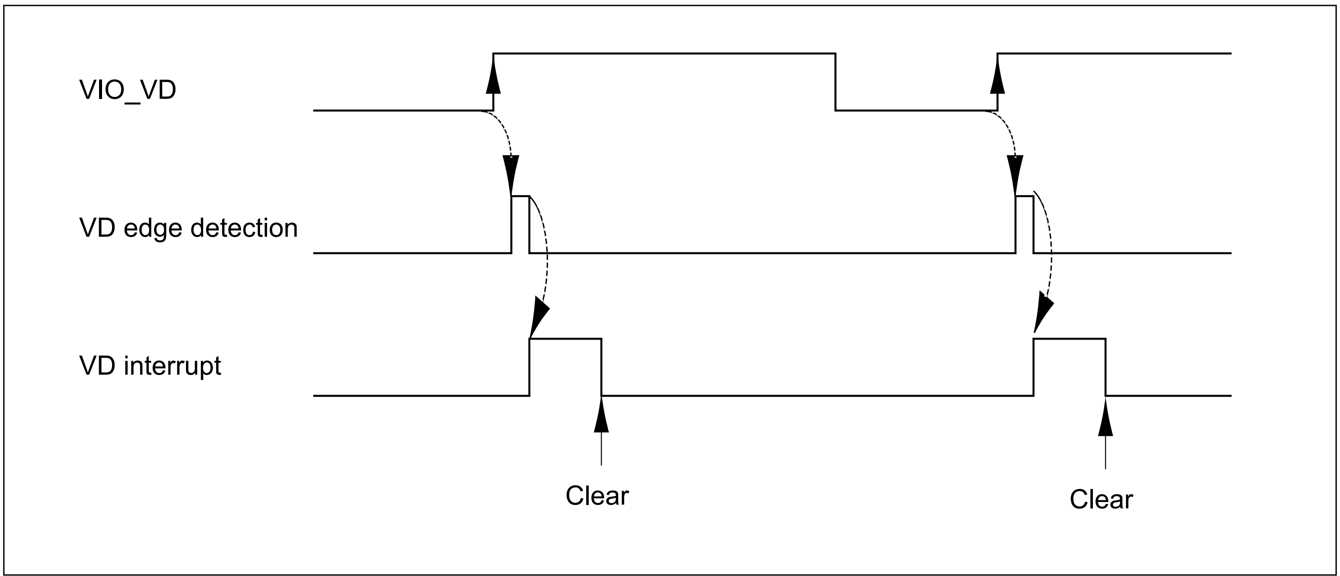

Figure 60.14 Relationship between VIO_VD and VD interrupt when VD is high-active (in data enable fetch mode)

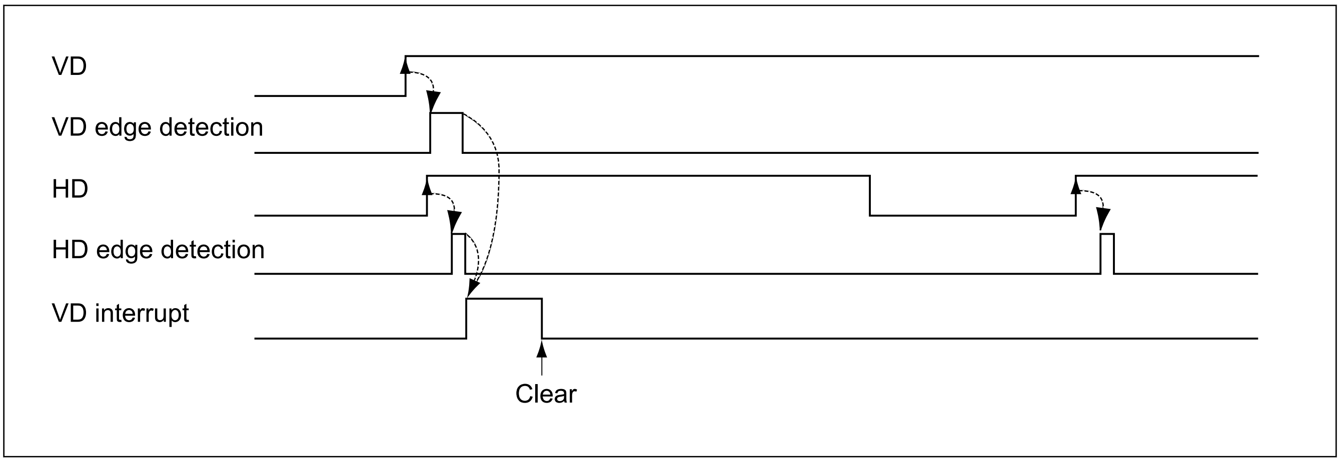

Figure 60.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are high-active (in Image capture mode or data synchronous fetch mode)

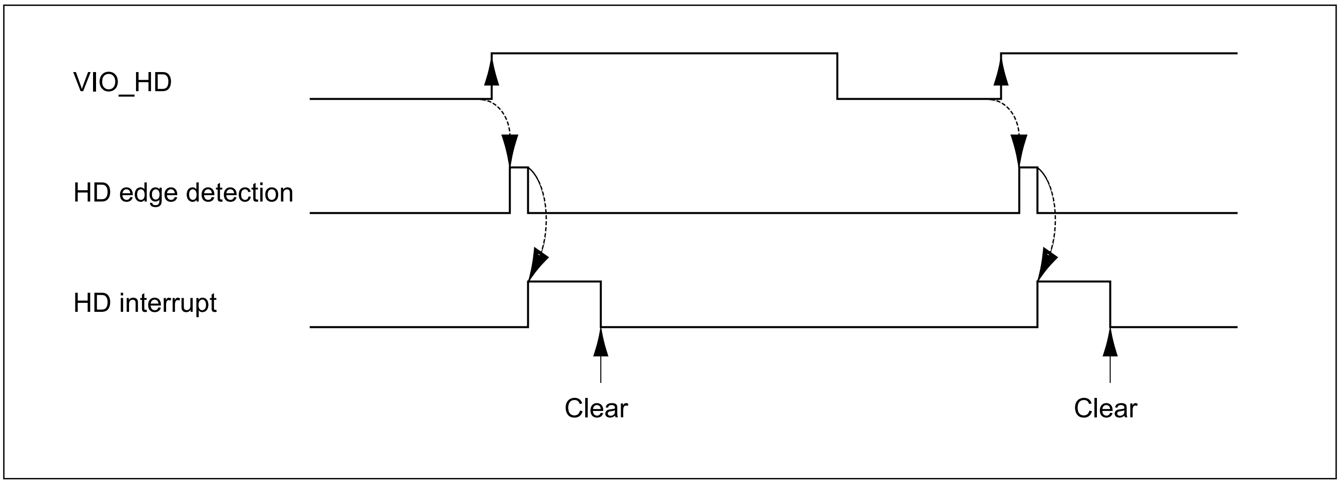

Figure 60.16 Relationship between VIO_HD and HD interrupt when HD is high-active

60.2.4 CMCYR : Capture Interface Cycle Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Bit position:	31	30	29 to 16	15	14	13 to 0
Bit field:	—	—	VCYL[13:0]	—	—	HCYL[13:0]
Value after reset:	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
13:0	HCYL[13:0]	Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
29:16	VCYL[13:0]	Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CMCYR is used to detect an illegal VD and an illegal HD. For HD, the number of cycles from a rising edge of HD to the next rising edge is set (falling edges when low-active is selected for HD). For VD, the number of HD inputs from a rising edge of VD to the next rising edge is set (falling edges when low-active is selected for VD).

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to 1.

Set 0 in all bits of this register, during data enable fetch mode.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

60.2.5 CAMOR, CAMOR_x : Capture Interface Offset Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0010 (CAMOR)
0x1010 (CAMOR_B)
0x2010 (CAMOR_M)

Bit position: 31 27 16 12 0

Bit field:	—	—	—	—	VOFST[11:0]	—	—	—	HOFST[12:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
12:0	HOFST[12:0]	Specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 60.19). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 60.20). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR).	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
27:16	VOFST[11:0]	Specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 60.17). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 60.18).	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. In data synchronous fetch mode, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

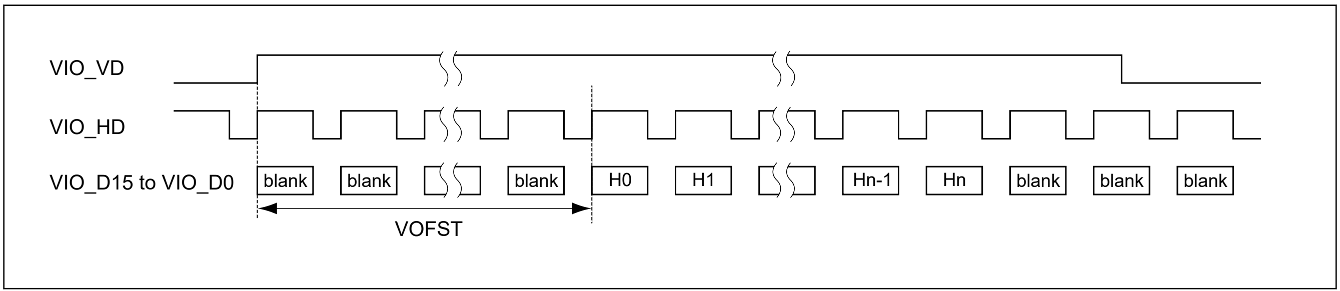

Figure 60.17 Vertical offset

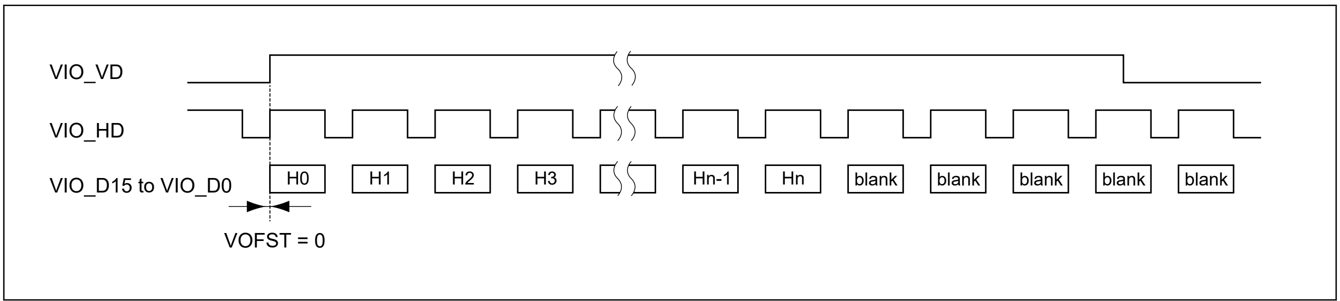

Figure 60.18 Timing when VD is data enable signal

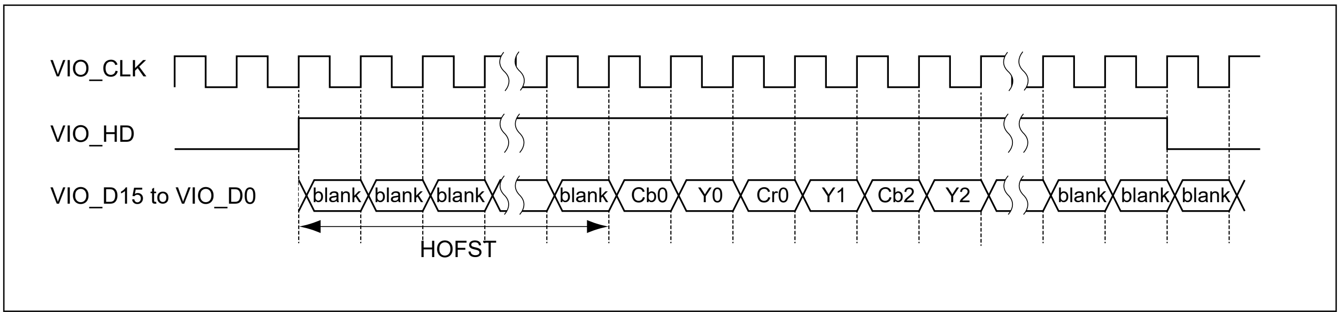

Figure 60.19 Horizontal offset

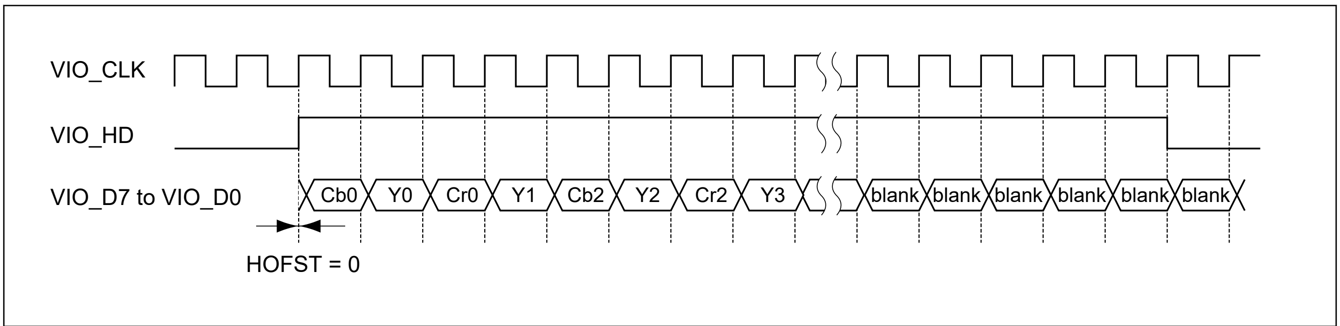

Figure 60.20 Timing when HD is data enable signal (8-bit interface)

60.2.6 CAPWR, CAPWR_x : Capture Interface Width Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0014 (CAPWR)
0x1014 (CAPWR_B)
0x2014 (CAPWR_M)

Bit position:	31	30	29	28	27–16	15	14	13	12–0
Bit field:	—	—	—	—	VWDTH[11:0]	—	—	—	HWDTH[12:0]
Value after reset:	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
12:0	HWDTH[12:0]	Specify the horizontal capture period. Specify the number of cycles to be captured from the location specified by the HOFST bits. Figure 60.22 shows the timing when the horizontal blanking period is 0. The CEU captures for only the number of cycles specified by these bits in the horizontal direction. Make a similar setting for data synchronous fetch. The maximum value to be set is as follows: ● 8-bit interface Image capture (16-cycle units) : 5,120 cycles (2,560 pixels) Data synchronous fetch (8-cycle units) : 2,560 cycles (2,560 bytes) ● 16-bit interface Image capture (8-cycle units) : 2,560 cycles (2,560 pixels) Data synchronous fetch (4-cycle units) : 1,280 cycles (2,560 bytes) The lower 2 bits should be written 0. Note: In data synchronous fetch mode, set CFSZR and CDWDR according to the values set in this register. For details, see the descriptions on CFSZR and CDWDR.	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
27:16	VWDTH[11:0]	Specify the vertical capture period (4-HD units). Specify the number of lines (HD count) to be captured from the location specified by the VOFST bits in CAMOR. Figure 60.21 shows the timing when the vertical blanking period is 0. The CEU captures only the number of lines (HD count) specified by these bits in the vertical direction. Make a setting in the same way to obtain data synchronization. The maximum value to be set is 1,920 HD (5 megapixels). The value of writing are ignored on the lower 2 bits, so write 0 to the lower 2 bits.	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CAPWR sets the fetch (capture) cycle width when capturing images.

The cycle width unit differs according to the interface and the data type to be captured. For each setting unit, see Table 60.6.

This register is not used, during data enable fetch mode.

Table 60.6 Unit for setting fetch (capture) cycle width

	Vertical Direction		Horizontal Direction	
Interface	Image Capture	Data Synchronous Fetch	Image Capture	Data Synchronous Fetch
8-bit interface	4 HD	4 HD	16 cycles	8 cycles
16-bit interface	4 HD	4 HD	8 cycles	4 cycles

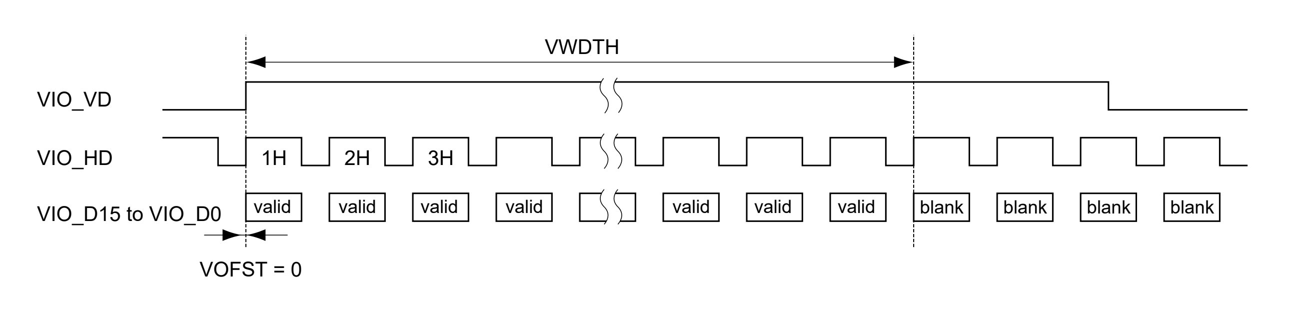

Figure 60.21 Vertical capture timing

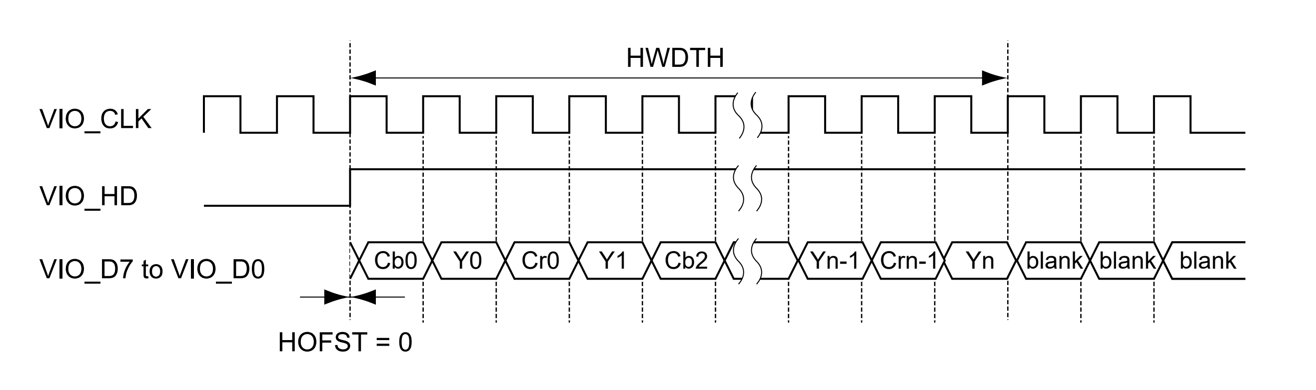

Figure 60.22 Horizontal capture timing (image capture with 8-bit interface)

60.2.7 CAIFR : Capture Interface Input Format Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	IFS	—	—	—	CIM	—	—	FCI[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	FCI[1:0]	Set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 0 0: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 0 1: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 1 0: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 1 1: Setting prohibited	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
4	CIM	Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD)	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
8	IFS	Sets the input mode for capturing images. 0: Progressive 1: Interlace	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), the image from which capturing starts (top field or bottom field), etc. CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to 1.

The items set by CAIFR are listed in Table 60.7.

Table 60.7 CAIFR Setting Items

Input Mode	IFS Bit	Captured Image	CIM Bit	Image to Start Capture	FCI Bits
Progressive	0	Frame	0	Frame immediately after activation	00
Interlace	1	Both-field (2-VD capture)	0	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11
		One-field (1-VD capture)	1	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and an oneframe capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 60.23 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

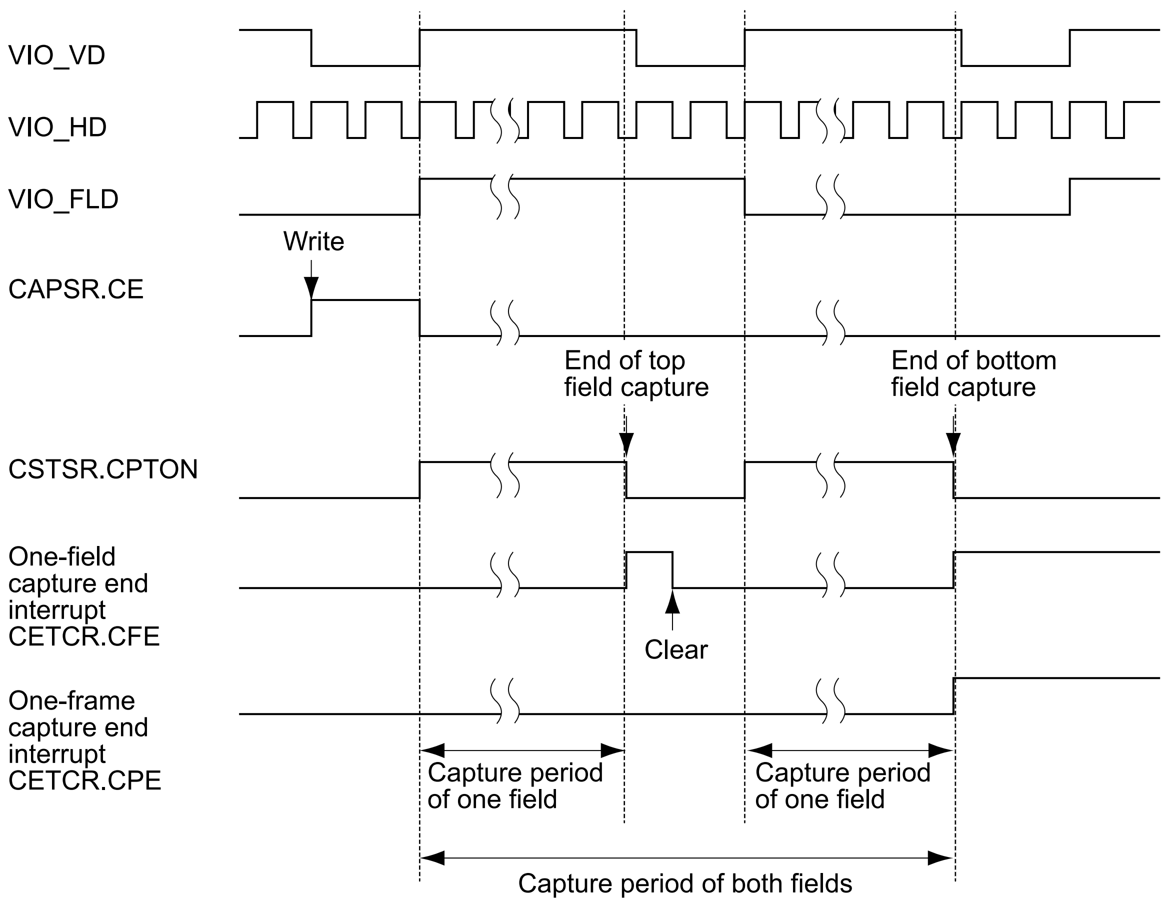

Figure 60.23 One-frame capture end interrupt and one-field capture end interrupt in both-field image capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 60.24). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCR (Figure 60.25).

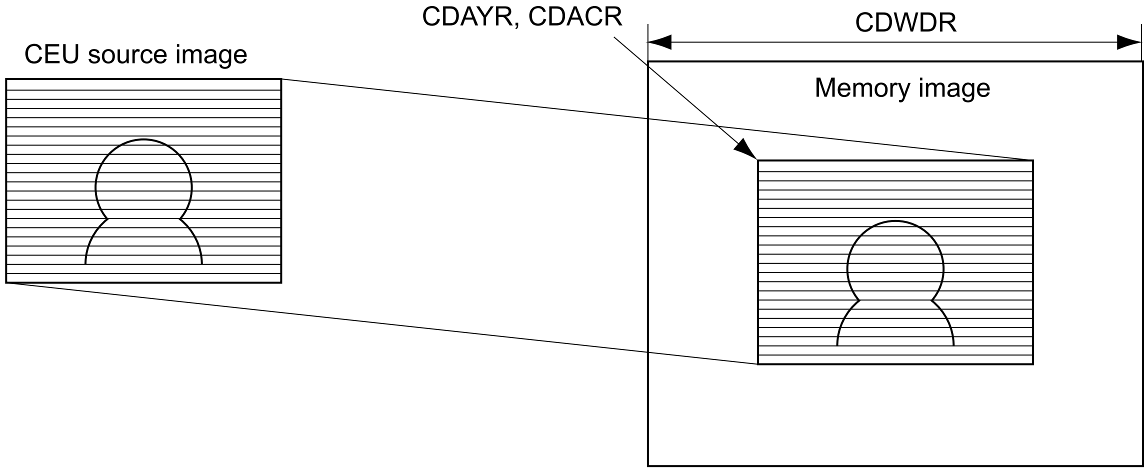

Figure 60.24 Image of storing captured frame image or captured one-field image in memory

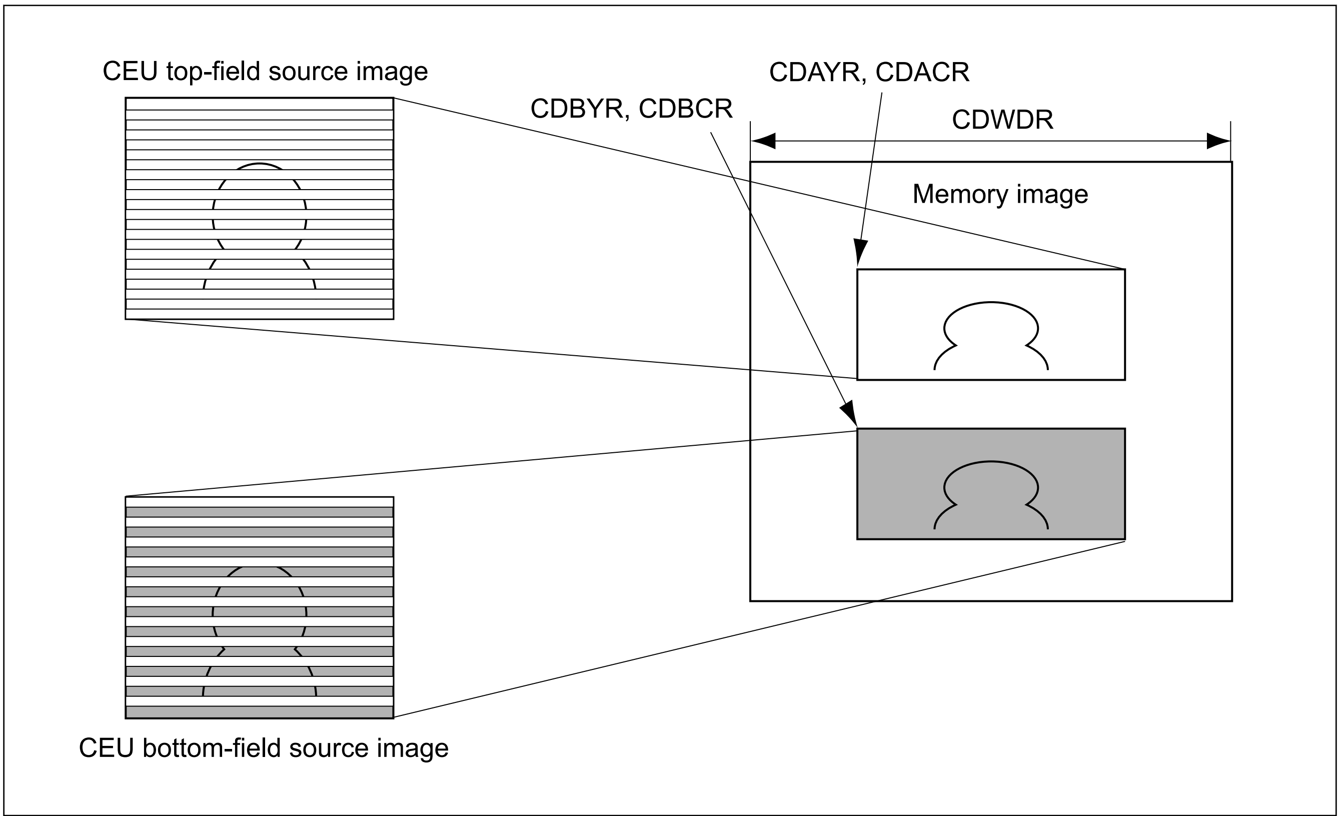

Figure 60.25 Image of storing captured both-field images in memory

If the FCI bits are set to 00b for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 60.26). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 60.27).

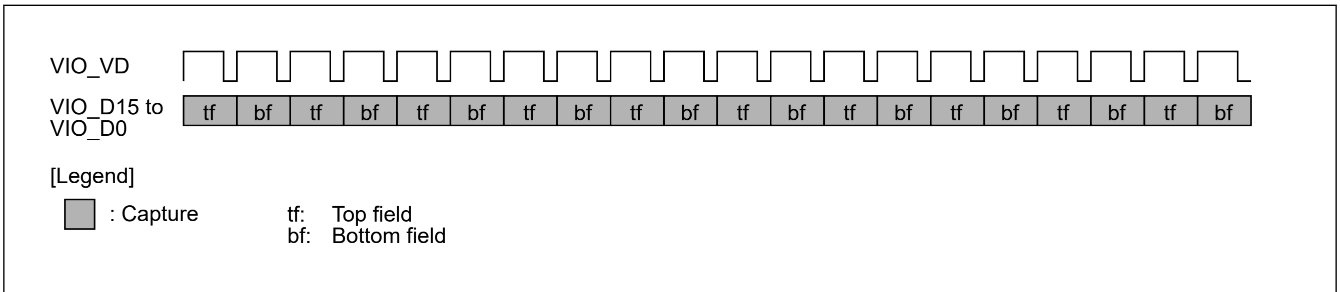

Figure 60.26 Continuous both-field capture in interlace mode (Image Immediately after Activation is Top Field (FCI[1:0] = 00b))

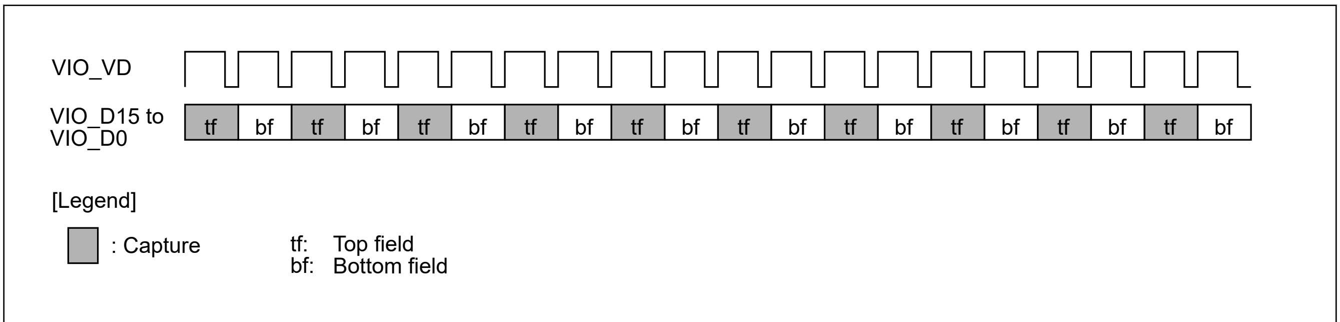

Figure 60.27 Continuous one-field capture in interlace mode (Image Immediately after Activation is Top Field (FCI[1:0] = 00b))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS = 1)

Capture image: Both-field (CIM = 0)

Image to start capture: Any setting other than the prohibited setting (FCI[1:0] = as desired)

Figure 60.28 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 60.28. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 60.28 at CDWDR/2 is shown in Figure 60.29. Setting the registers to form the image in Figure 60.28 enables an interlace image to be stored as a frame image in the memory as shown in Figure 60.29.

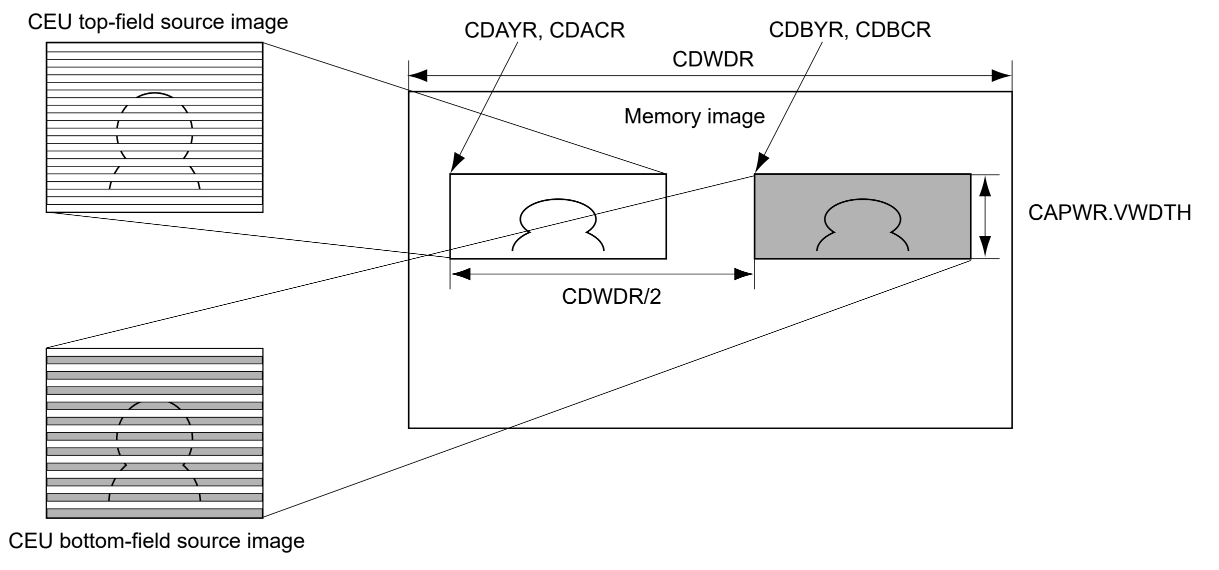

Figure 60.28 Image of storing captured both-fields of interlace input in memory

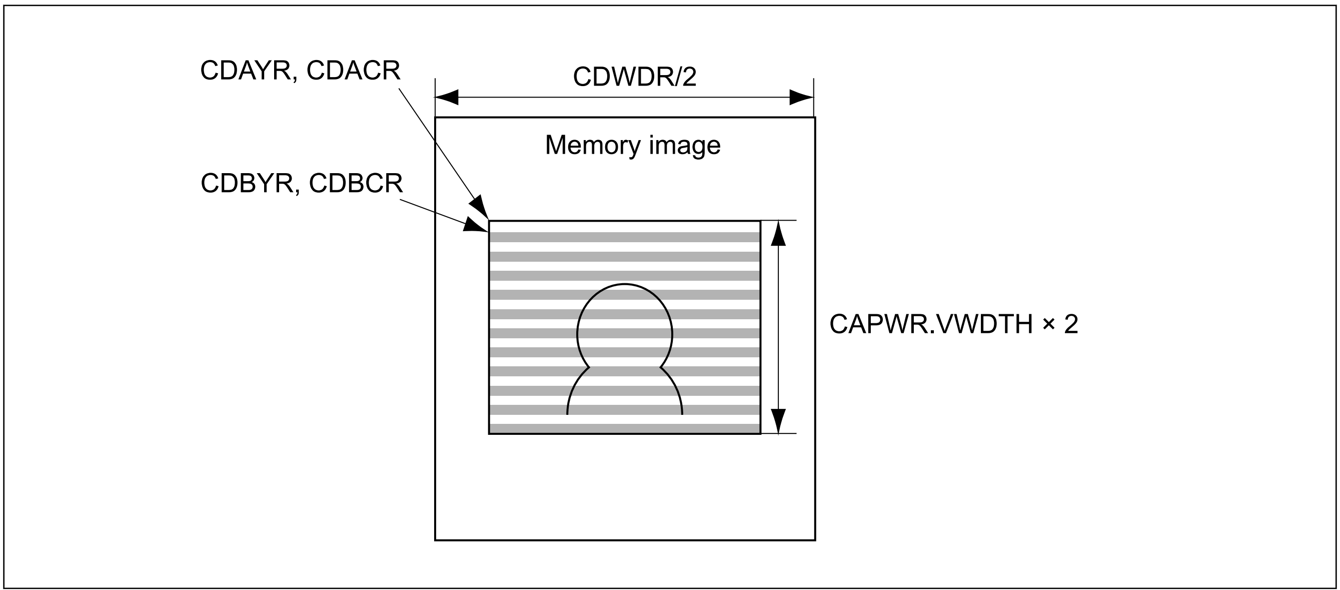

Figure 60.29 Image of storing Interlace input as frame image in memory

60.2.8 CRCNTR : CEU Register Control Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0028

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	RVS	—	—	RS	RC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RC	Specifies switching of the register plane used by the CEU in synchronization with VD. If the register plane is not switched, the register plane specified by the RS bit is used. 0: Uses the specified register plane in synchronization with VD 1: Switches the register plane in synchronization with VD	R/W
1	RS	Specifies which register plane is used by the CEU in synchronization with VD. The setting of this bit is valid only when RC = 0. 0: Uses plane A of the register 1: Uses plane B of the register	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	RVS	Sets the timing to switch the register plane in both-field capture. The setting of this bit is valid only when RC = 1 in both-field capture. 0: Switches the register plane every 2 VD 1: Switches the register plane every 1 VD	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

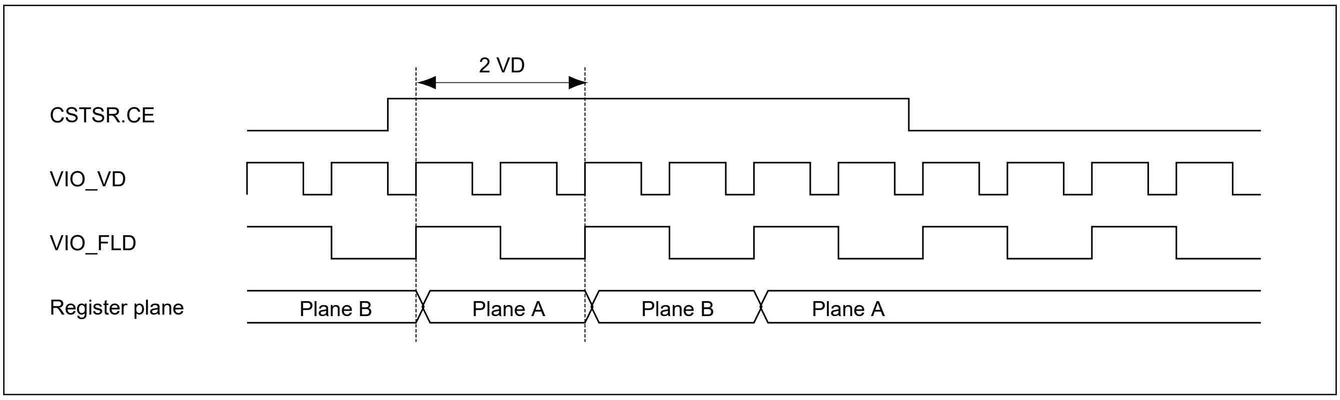

Figure 60.30 Timing for register plane switching when RVS = 0

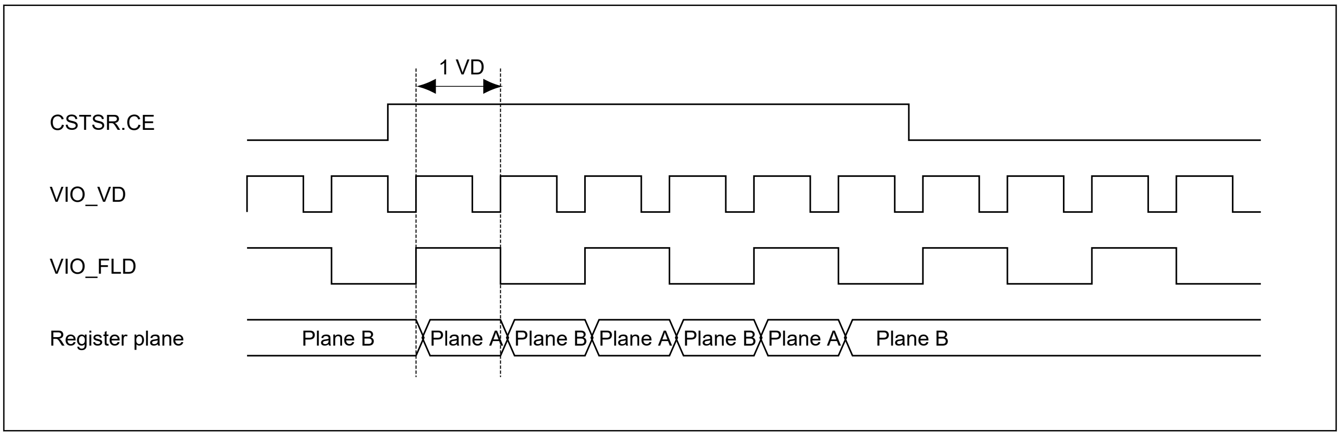

Figure 60.31 Timing for register plane switching when RVS = 1

60.2.9 CRCMPR : CEU Register Forcible Control Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x002C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RA	Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (CRCNTR.RC = 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to 1.

60.2.10 CFLCR, CFLCR_x : Capture Filter Control Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0030 (CFLCR)
0x1030 (CFLCR_B)
0x2030 (CFLCR_M)

Bit position:	31–28	27–16	15–12	11–0
Bit field:	VMANT[3:0]	VFRAC[11:0]	HMANT[3:0]	HFRAC[11:0]
Value after reset:	0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
11:0	HFRAC[11:0]	Fraction Part of Horizontal Scale-Down Factor The specifiable range is 0x000 to 0xFF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits. The value of writing are ignored on the lower 3 bits, so write 0 to the lower 3 bits.	R/W
15:12	HMANT[3:0]	Mantissa Part of Horizontal Scale-Down Factor The specifiable range is 0x0 to 0xF. When 0x0 is set for the HMANT bits and 0x000 is set for the HFRAC bits, the scale-down filter is not used.	R/W
27:16	VFRAC[11:0]	Fraction Part of Vertical Scale-Down Factor The specifiable range is 0x000 to 0xFF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits. The value of writing are ignored on the lower 3 bits, so write 0 to the lower 3 bits.	R/W
31:28	VMANT[3:0]	Mantissa Part of Vertical Scale-Down Factor The specifiable range is 0x0 to 0xF. When 0x0 is set for the VMANT bits and 0x000 is set for the VFRAC bits, the scale-down filter is not used.	R/W

Note: S-TYPE-3, P-TYPE-3

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

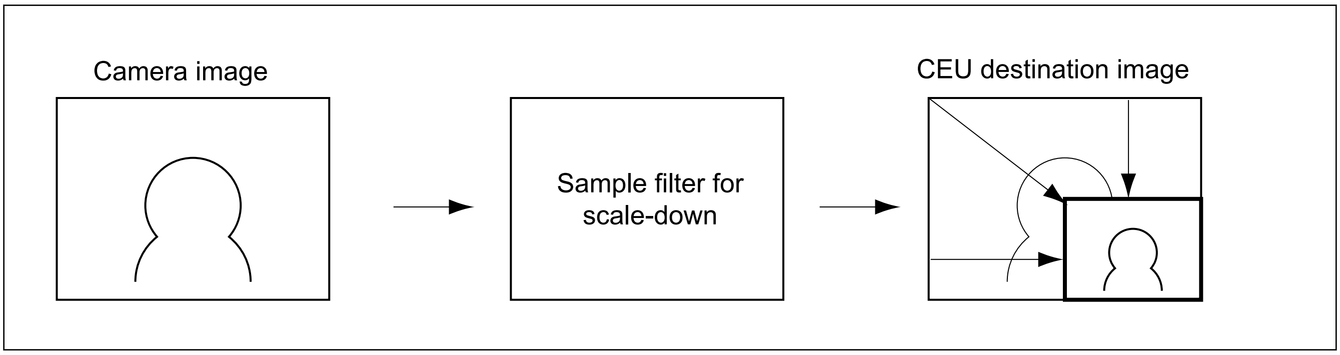

Figure 60.32 Scale-down of captured image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = \mathrm{MANT} \times 4096 + \mathrm{FRAC}$$ …Formula 1

$$\mathrm{SCL\ (scaling\ factor)} = \frac{4096}{\alpha}$$ …Formula 2

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x, the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$\mathrm{MANT} = \left\lfloor \frac{1}{\mathrm{SCL}} \right\rfloor, \mathrm{FRAC} = \left\lfloor 512 \times \left(\frac{1}{\mathrm{SCL}} - \mathrm{MANT} \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($\mathrm{SIZE_D}$) can be calculated using the input image size S_{in} (8-bit interface: half of the CAPWR setting, 16-bit interface: CAPWR setting) in the following formula.

$$\mathrm{SIZE}_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{\mathrm{MANT_{pre}}} \right\rfloor - 1 \right) \times \frac{\mathrm{MANT_{pre}} \times 4096}{\alpha} \right\rfloor$$ …Formula 3

$$\begin{bmatrix} \mathrm{MANT_{pre}} = 1 \rightarrow (0 \leq \mathrm{MANT} < 2) \\ \mathrm{MANT_{pre}} = 2 \rightarrow (2 \leq \mathrm{MANT} < 4) \\ \mathrm{MANT_{pre}} = 4 \rightarrow (4 \leq \mathrm{MANT} < 8) \\ \mathrm{MANT_{pre}} = 8 \rightarrow (8 \leq \mathrm{MANT}) \end{bmatrix}$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

SCL = 480/640 = 3/4, and the preliminary settings of MANT = 1, MANTpre = 1, and FRAC = 0x550 are made. Substituting these in the following formula results in an output pixel count of 479.

$$\mathrm{SIZE}_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{\mathrm{MANT_{pre}}} \right\rfloor - 1 \right) \times \frac{\mathrm{MANT_{pre}} \times 4096}{\alpha} \right\rfloor$$ …Formula 3

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of 0x548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as MANT = 1 and FRAC = 0x548.

Table 60.8 Setting examples for each scale-down filter factor

Scale-down factor	FRAC		MANT	Input pixel count	Output pixel count	Clipping size (CFSZR)
	Decimal	Hexadecimal				
7/8	576	0x240	1	640	560	560
3/4	1352	0x548	1	640	480	480
5/8	2448	0x990	1	640	400	400
1/2	0	0x0	2	640	320	320
3/8	2728	0xAA8	2	640	240	240
1/3	0.0	0x0	3	640	213	212
1/4	0.0	0x0	4	640	160	160
1/5	0.0	0x0	5	640	128	128
1/6	0.0	0x0	6	640	107	104
1/7	0.0	0x0	7	640	91	88
1/8	0.0	0x0	8	640	80	80
1/16	4088	0xFF8	15	640	40	40

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

60.2.11 CFSZR, CFSZR_x : Capture Filter Size Clip Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0034 (CFSZR)
0x1034 (CFSZR_B)
0x2034 (CFSZR_M)

Bit position:	31	30	29	28	27–16	15	14	13	12	11–0
Bit field:	—	—	—	—	VFCLP[11:0]	—	—	—	—	HFCLP[11:0]
Value after reset:	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
11:0	HFCLP[11:0]	Specify the horizontal clipping value of the filter output size (8-pixel units). The lower 3 bits should be written 0.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
27:16	VFCLP[11:0]	Specify the vertical clipping value of the filter output size (4-pixel units). The value of writing are ignored on the lower 2 bits, so write 0 to the lower 2 bits.	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

This register is not used, during data enable fetch mode.

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 60.33. The clipping size must be specified vertically in 4-pixel units and horizontally in 8-pixel units.

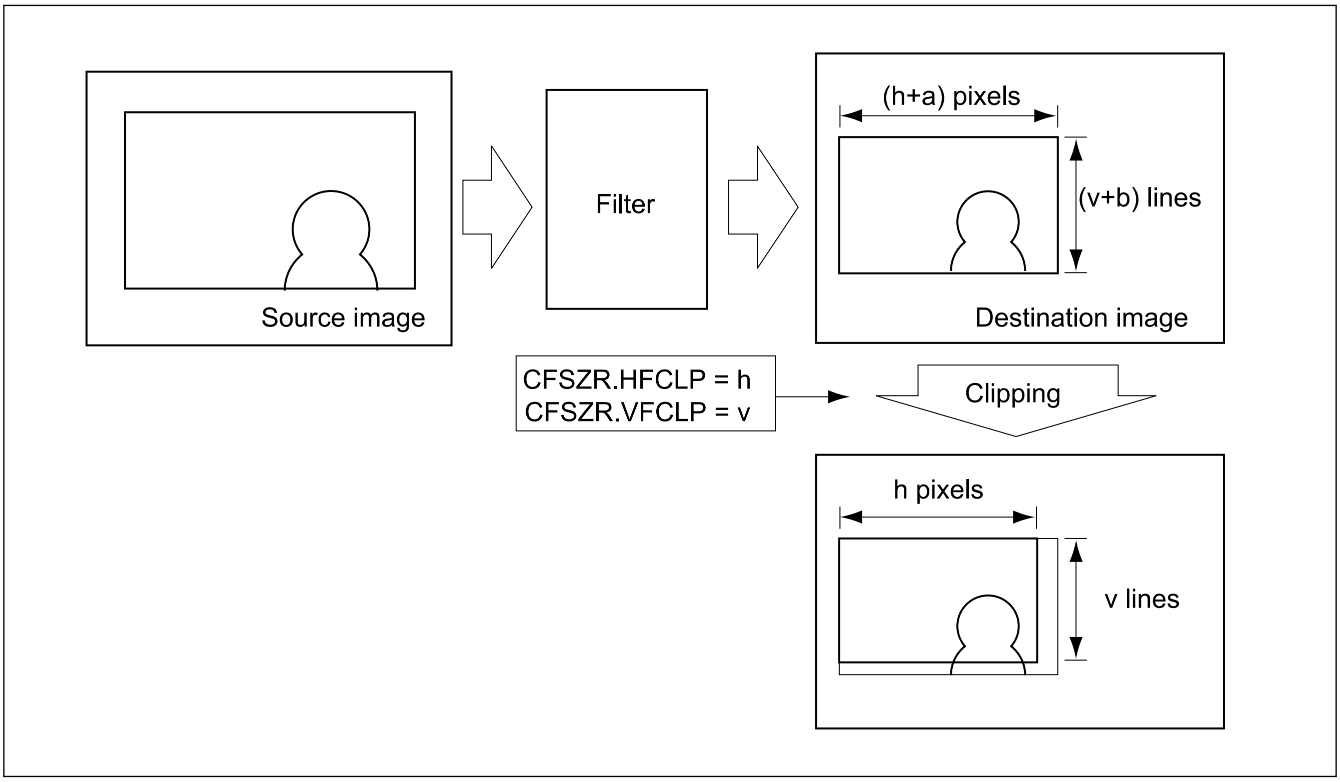

Figure 60.33 Clipping of image output from filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.

- 8-bit interface:
  VFCLP = CAPWR.VWDTH
  HFCLP = CAPWR.HWDTH/2
- 16-bit interface:
  VFCLP = CAPWR.VWDTH
  HFCLP = CAPWR.HWDTH

60.2.12 CDWDR, CDWDR_x : Capture Destination Width Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0038 (CDWDR)
0x1038 (CDWDR_B)
0x2038 (CDWDR_M)

Bit position:	31																			12												0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CHDW[12:0]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
12:0	CHDW[12:0]	Specify the horizontal image size in the memory area where the captured image is to be stored (8-byte units). The image data captured by the CEU is stored in the memory. In data synchronous fetch mode, set as follows: 8-bit interface: CHDW = CAPWR.HWDTH 16-bit interface: CHDW = CAPWR.HWDTH × 2 The lower 3 bits should be written 0.	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 8-byte units (8-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

60.2.13 CDAYR, CDAYR_x : Capture Data Address Y Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x003C (CDAYR)
0x103C (CDAYR_B)
0x203C (CDAYR_M)

Bit position:	31	0
Bit field:	CAYR[31:0]	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0

Bit	Symbol	Function	R/W
31:0	CAYR[31:0]	Capture Data Address Y ● Frame image capture: These bits set the address for storing the luminance component data of the captured data (8-pixel units). ● One-field image capture: These bits set the address for storing the luminance component data of the captured data (8-pixel units). ● Both-field image capture: These bits set the address for storing the luminance component data of the captured top-field data (8-pixel units). ● Data fetch: These bits set the address for storing data (8-byte units). ● Data enable fetch bundle write: These bits set the address for storing data (32-byte units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDAYR specifies the address where the luminance component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the luminance component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the luminance component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units.

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 60.34.

- Frame image capture: Set the address of the starting point of the memory area where the luminance component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the luminance component of the captured image is to be stored.

- Both-field image capture: Set the address of the starting point of the memory area where the luminance component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:
  End address = CDAYR + number of fetched bytes
- Data enable fetch bundle write: Set the address in 32-byte units.

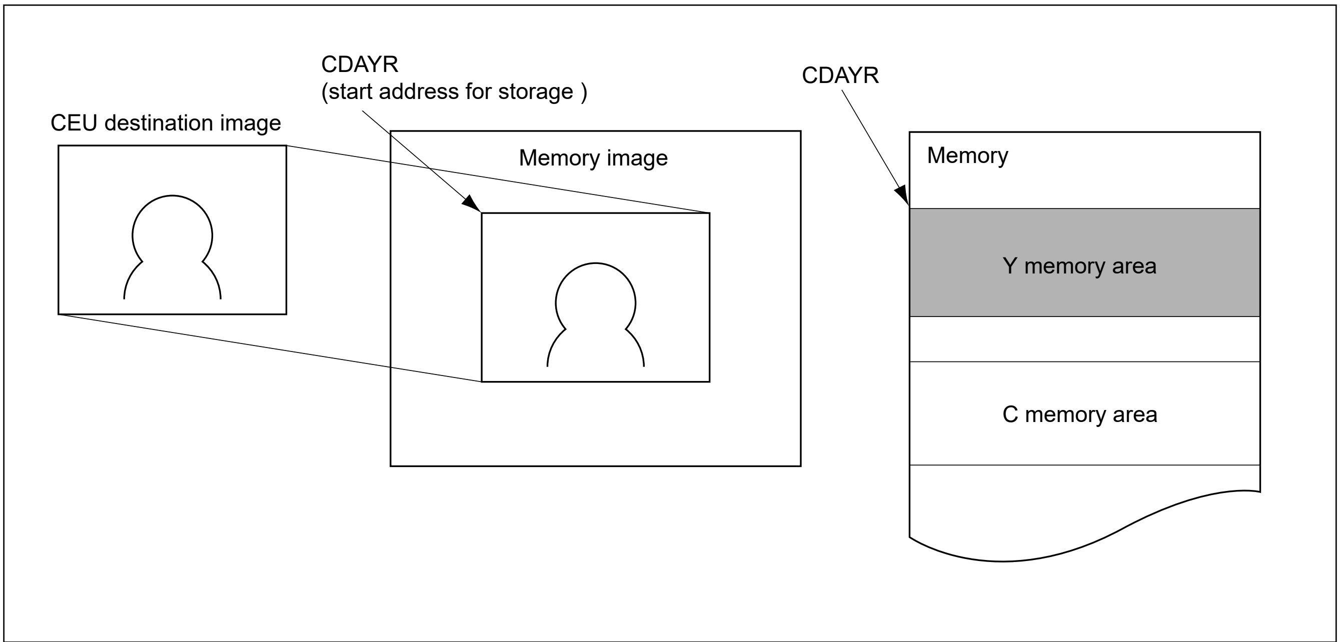

Figure 60.34 Relationship between captured image and luminance component memory area

60.2.14 CDACR, CDACR_x : Capture Data Address C Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0040 (CDACR)
0x1040 (CDACR_B)
0x2040 (CDACR_M)

Bit position:	31 … 0
Bit field:	CACR[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CACR[31:0]	Capture Data Address C ● Frame image capture: These bits set the address for storing the chrominance component data of the captured data (8-pixel units). ● One-field image capture: These bits set the address for storing the chrominance component data of the captured data (8-pixel units). ● Both-field image capture: These bits set the address for storing the chrominance component data of the captured top-field data (8-pixel units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDACR specifies the address where the chrominance component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or onefield image capture, set the start address of the memory area where the chrominance component of the captured data is to be stored by

CDACR. In both-field image capture, set the start address of the memory area where the chrominance component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units.

Set the address of the starting point of the memory area where the chrominance component of the captured image is to be stored in this register, as shown in Figure 60.35. The chrominance component has an output data format like that in Figure 60.36, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the chrominance component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the chrominance component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the chrominance component of the captured top-field image is to be stored.

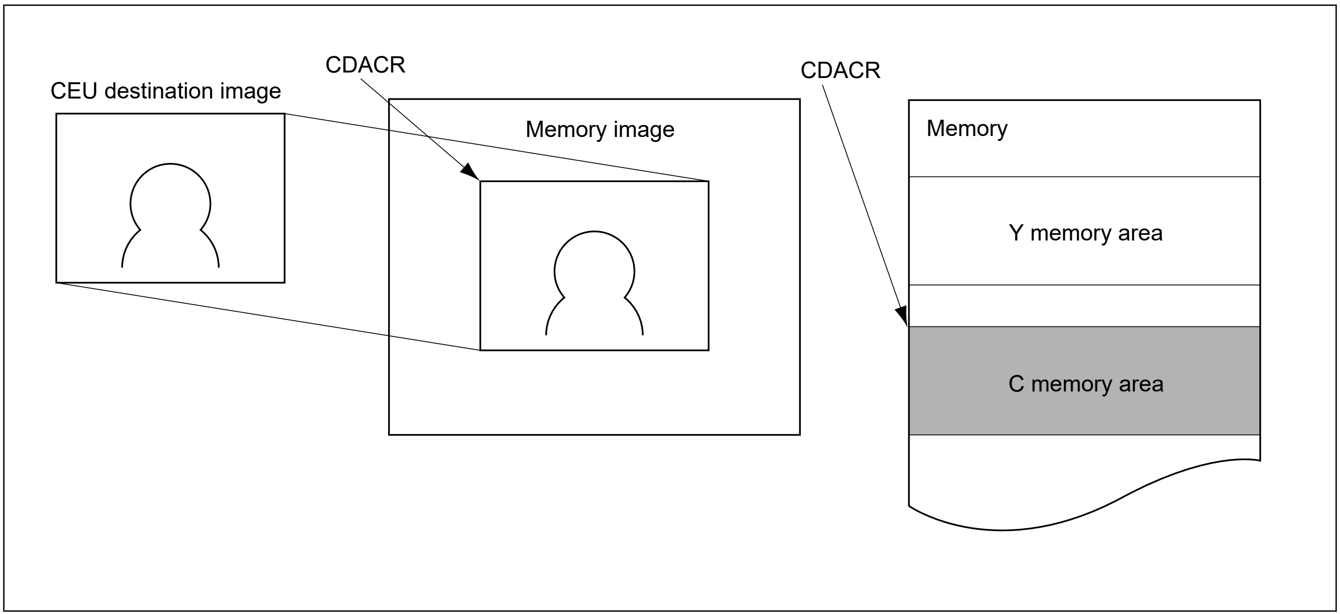

Figure 60.35 Relationship between captured image and chrominance component memory area

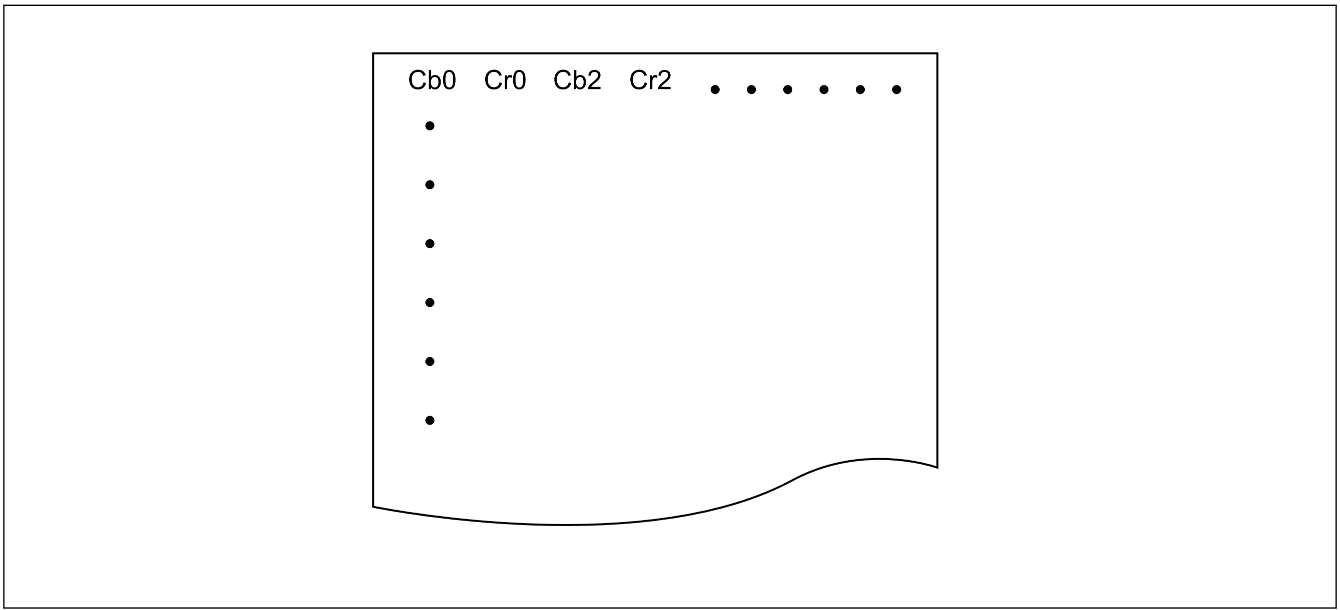

Figure 60.36 Image of storing chrominance components in memory

60.2.15 CDBYR, CDBYR_x : Capture Data Bottom-Field Address Y Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0044 (CDBYR)
0x1044 (CDBYR_B)
0x2044 (CDBYR_M)

Bit position:	31 ... 0
Bit field:	CBYR[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CBYR[31:0]	Set the address for storing the luminance component data of the captured bottom-field data (8-pixel units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDBYR specifies the address where the luminance component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the luminance component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units.

Set the address of the starting point of the memory area where the luminance component of the captured bottom-field image is to be stored in this register, as shown in Figure 60.37.

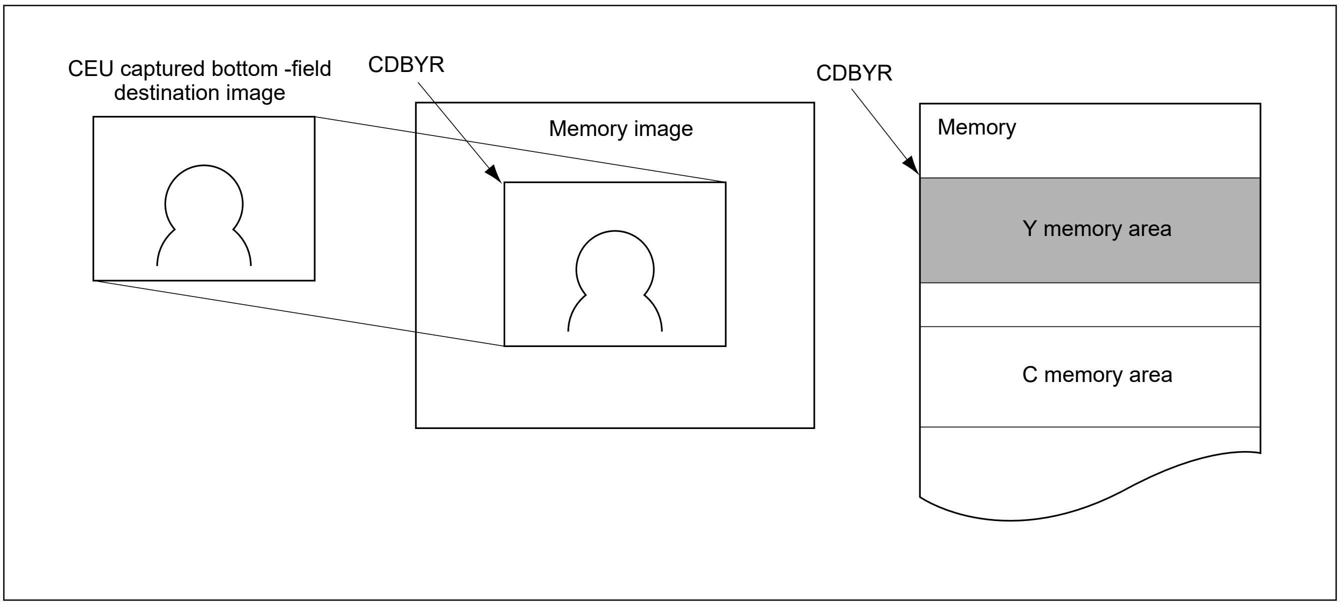

Figure 60.37 Relationship between captured bottom-field image and luminance component memory area

60.2.16 CDBCR, CDBCR_x : Capture Data Bottom-Field Address C Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0048 (CDBCR)
0x1048 (CDBCR_B)
0x2048 (CDBCR_M)

Bit position:	31 … 0
Bit field:	CBCR[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CBCR[31:0]	Set the address for storing the chrominance component data of the captured bottom-field data (8-pixel units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDBCR specifies the address where the chrominance component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the chrominance component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units.

Set the address of the starting point of the memory area where the chrominance component of the captured bottom-field image is to be stored in this register, as shown in Figure 60.38. The chrominance component has an output data format like that in Figure 60.39, and is saved in the memory in this format.

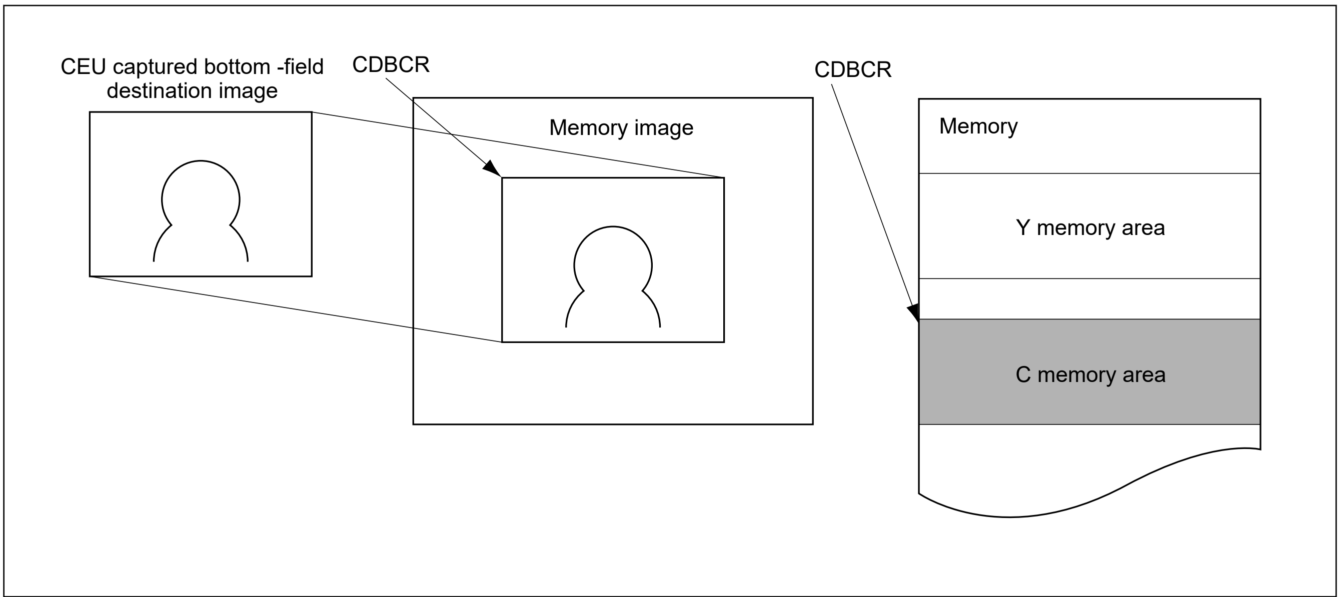

Figure 60.38 Relationship between captured bottom-field image and chrominance component memory area

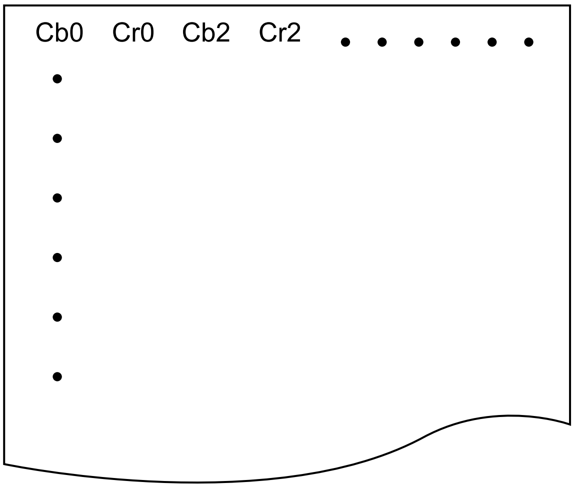

Figure 60.39 Image of storing chrominance components in memory

60.2.17 CBDSR, CBDSR_x : Capture Bundle Destination Size Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x004C (CBDSR)
0x104C (CBDSR_B)
0x204C (CBDSR_M)

Bit position:	31	30	29	28	27	26	25	24	23	22 ... 0
Bit field:	—	—	—	—	—	—	—	—	—	CBVS[22:0]
Value after reset:	0	0	0	0	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
22:0	CBVS[22:0]	Select the number of lines or number of bytes for output to the memory in a bundle write. Image capture and data synchronous fetch: Number of lines for output to the memory in a bundle write. Unit: 8 lines, min.: 8 lines, max.: 1,920 lines (0x780) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 bytes (0x600000) The value of writing are ignored on the lower 3 bits, so write 0 to the lower 3 bits.	R/W
31:23	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CBDSR sets the size of output to memory in a bundle write. The number of output lines should be specified for image capture or data synchronous fetch. The number of bytes should be specified for data enable fetch.

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when CDOCR.CBE = 1. When CDOCR.CBE = 1 and this register cleared to 0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 1,920 (0x780). Only bits CBVS[11:3] are valid.

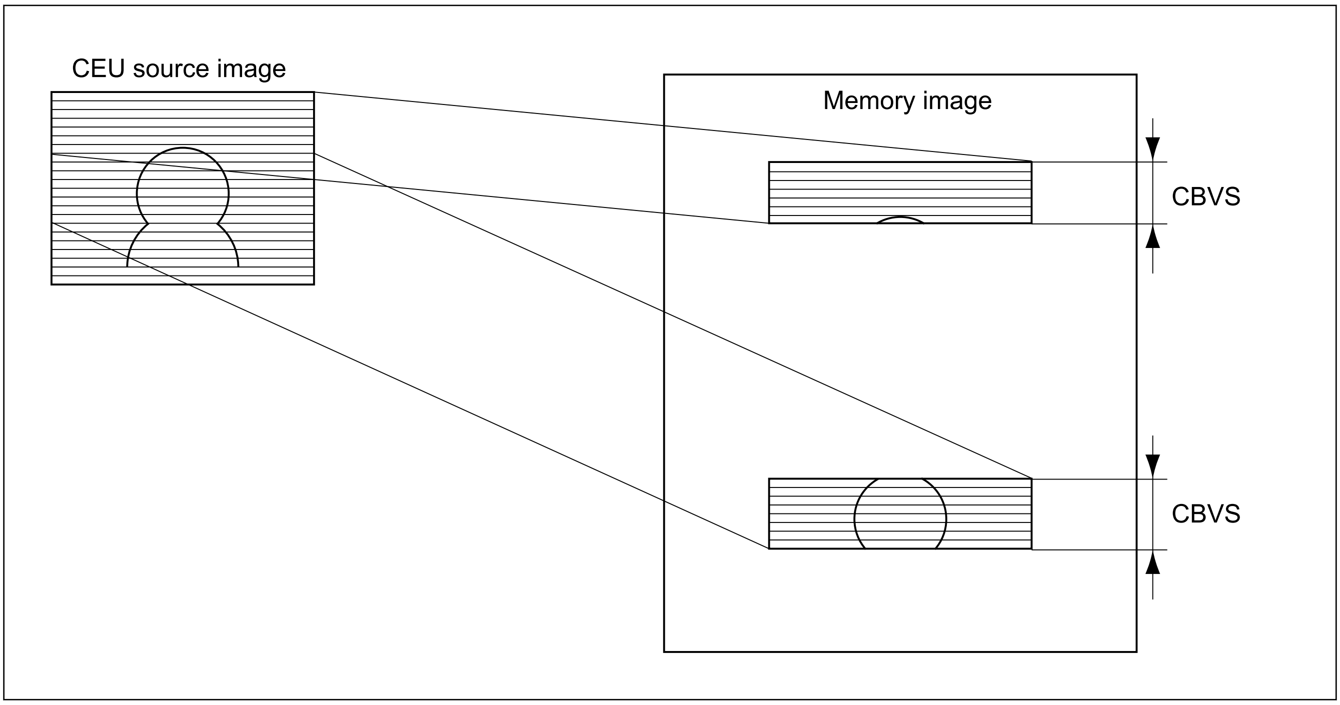

Figure 60.40 Image of storing captured image in memory by bundle write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when CDOCR.CBE = 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

60.2.18 CFWCR : Firewall Operation Control Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x005C

Bit position:	31 … 5	4	3	2	1	0
Bit field:	FWV[26:0]	—	—	—	—	FWE
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1 0 0 0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FWE	Firewall Operation With the setting of FWE = 1, when a write address exceeds the value set with FWV, the address is retained and an interrupt source FWF is set. After this, the address is not incremented and data is overwritten on the upper limit address. 0: Firewall is not activated. 1: Firewall is activated.	R/W
4:1	—	These bits are read as 0. The write value should be 0.	R/W
31:5	FWV[26:0]	Specify the upper limit of a write address. Specify the upper 27 bits of the 32-bit address. The upper limit of an address is FWV[26:0]<<5 + 0x1F.	R/W

Note: S-TYPE-3, P-TYPE-3

CFWCR specifies the upper limit of a write address in data enable fetch. When the VD input from an external module dose not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

60.2.19 CLFCR, CLFCR_x : Capture Low-Pass Filter Control Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0060 (CLFCR)
0x1060 (CLFCR_B)
0x2060 (CLFCR_M)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LPF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LPF	Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction)	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to 0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

60.2.20 CDOCR, CDOCR_x : Capture Data Output Control Register (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0064 (CDOCR)
0x1064 (CDOCR_B)
0x2064 (CDOCR_M)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CBE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	CDS	—	COLS	COWS	COBS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	COBS	Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units	R/W
1	COWS	Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units	R/W
2	COLS	Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units	R/W

Bit	Symbol	Function	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	CDS	Sets the image format when outputting the image data captured in the YCbCr422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr422 format to the YCbCr420 format before outputting data to the memory 1: Outputs data in the YCbCr422 format to the memory without conversion	R/W
15:5	—	These bits are read as 0. The write value should be 0.	R/W
16	CBE	Controls the number of lines of captured data to be written to the memory. ● Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 60.41). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished. ● Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. ● Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. Table 60.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 60.42 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 60.43 shows the timing of write end interrupts in data enable fetch. 0: Normal write 1: Bundle write	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDOCR sets the format for outputting captured data to the memory. In data fetch mode, set the CDS bit to 1.

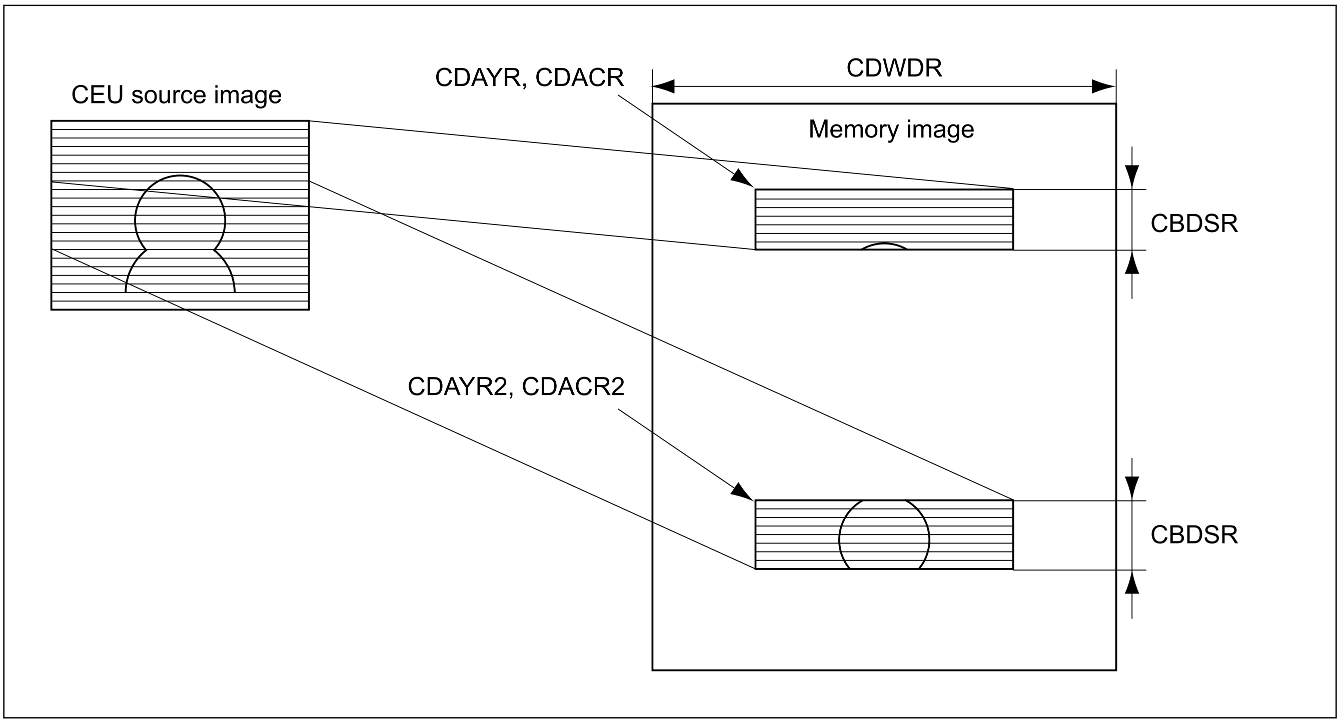

Figure 60.41 Image of bundle write to memory

Table 60.9 Correspondence between address setting registers and write end interrupt sources

Address setting registers	Bundle write end interrupt source
CDAYR, CDACR	CPBE1 bit in CETCR
CDAYR2, CDACR2	CPBE2 bit in CETCR
CDBYR, CDBCR	CPBE3 bit in CETCR
CDBYR2, CDBCR2	CPBE4 bit in CETCR

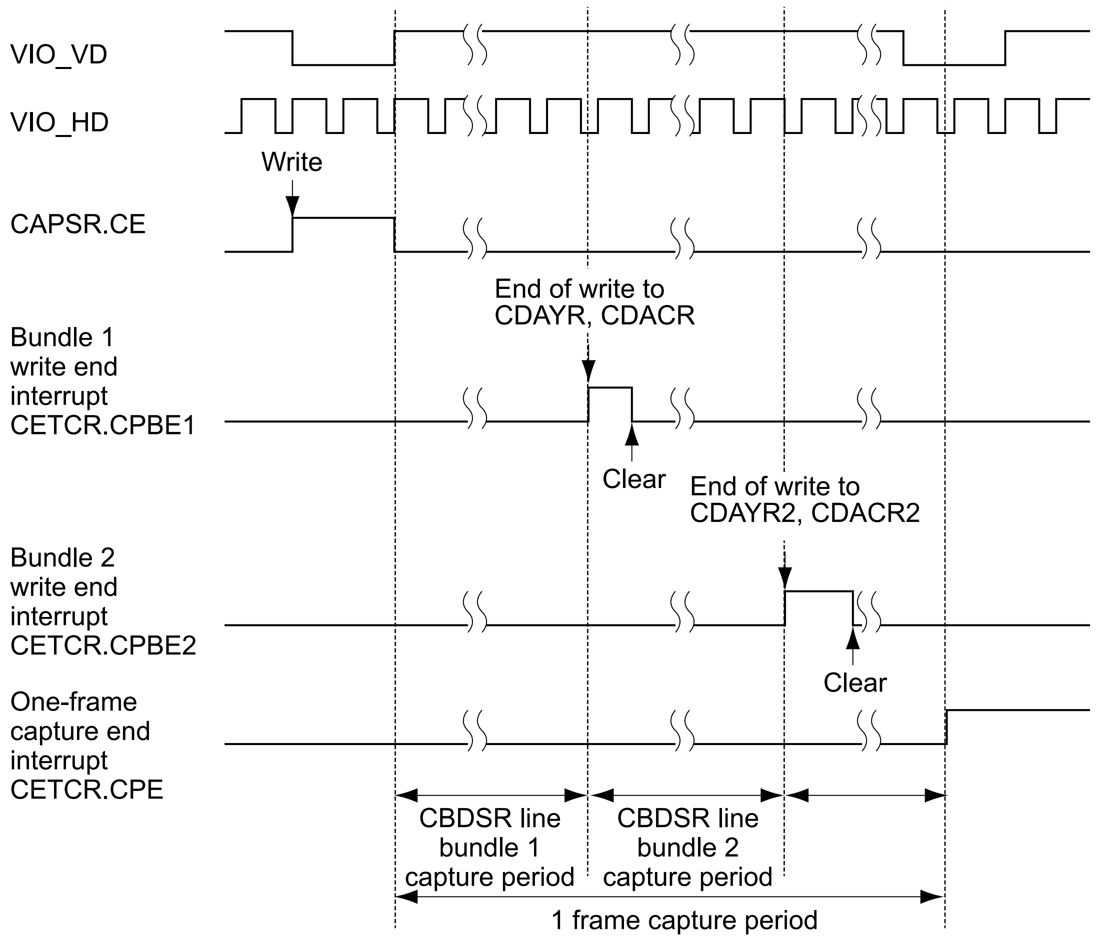

Figure 60.42 Timing of write end interrupts (Image capture, data synchronous fetch)

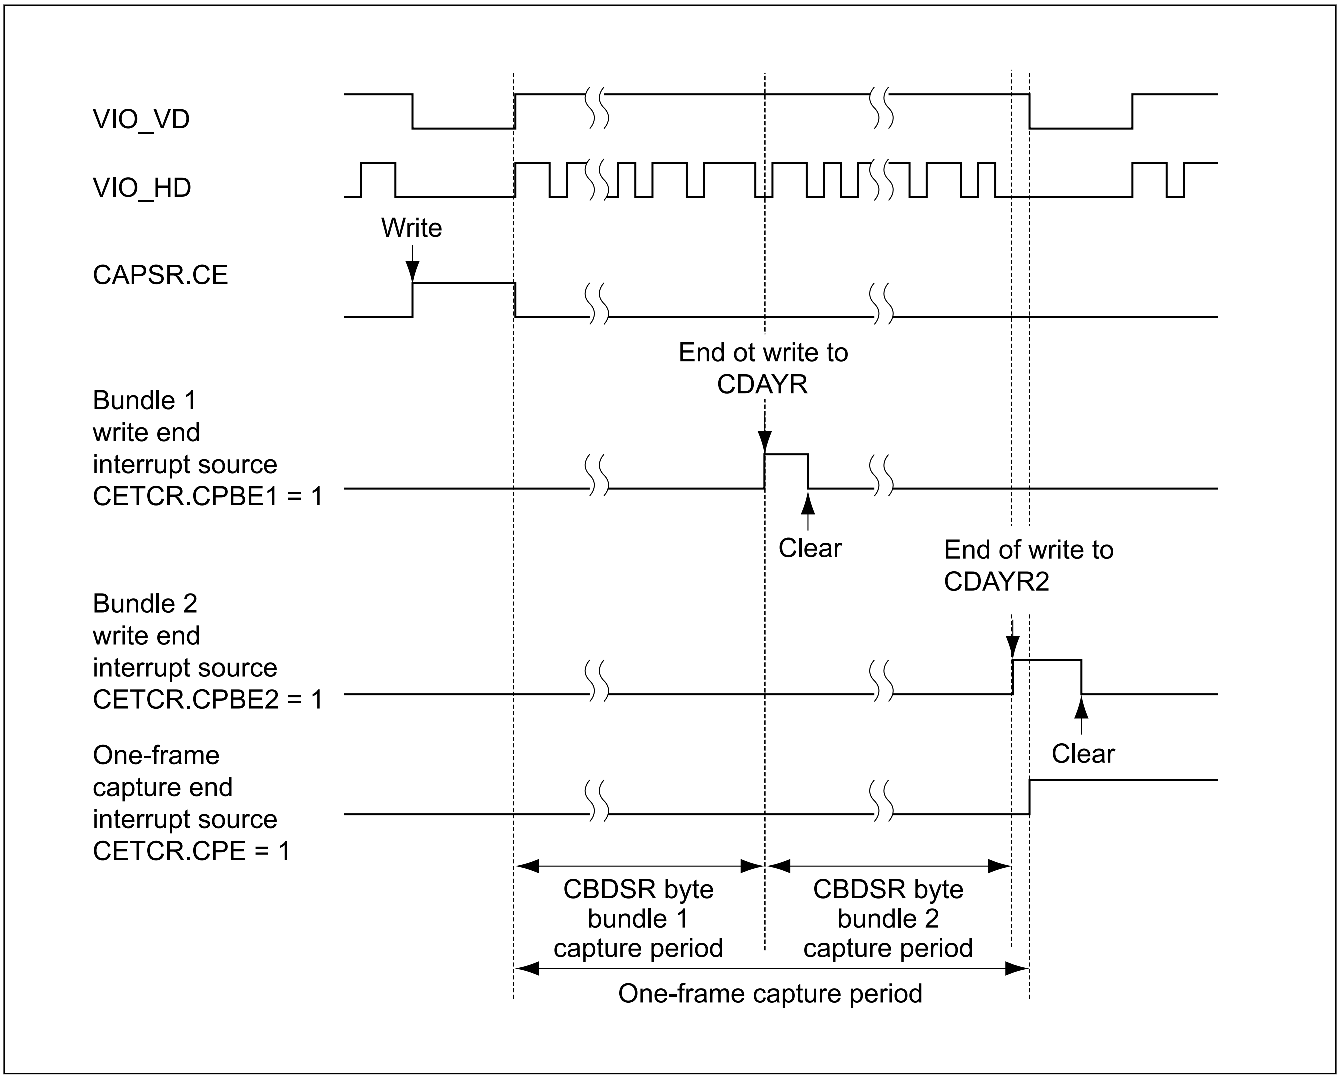

Figure 60.43 Timing of write end interrupts (data enable fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 60.44. To enable data swapping, set the corresponding control bit to 1.

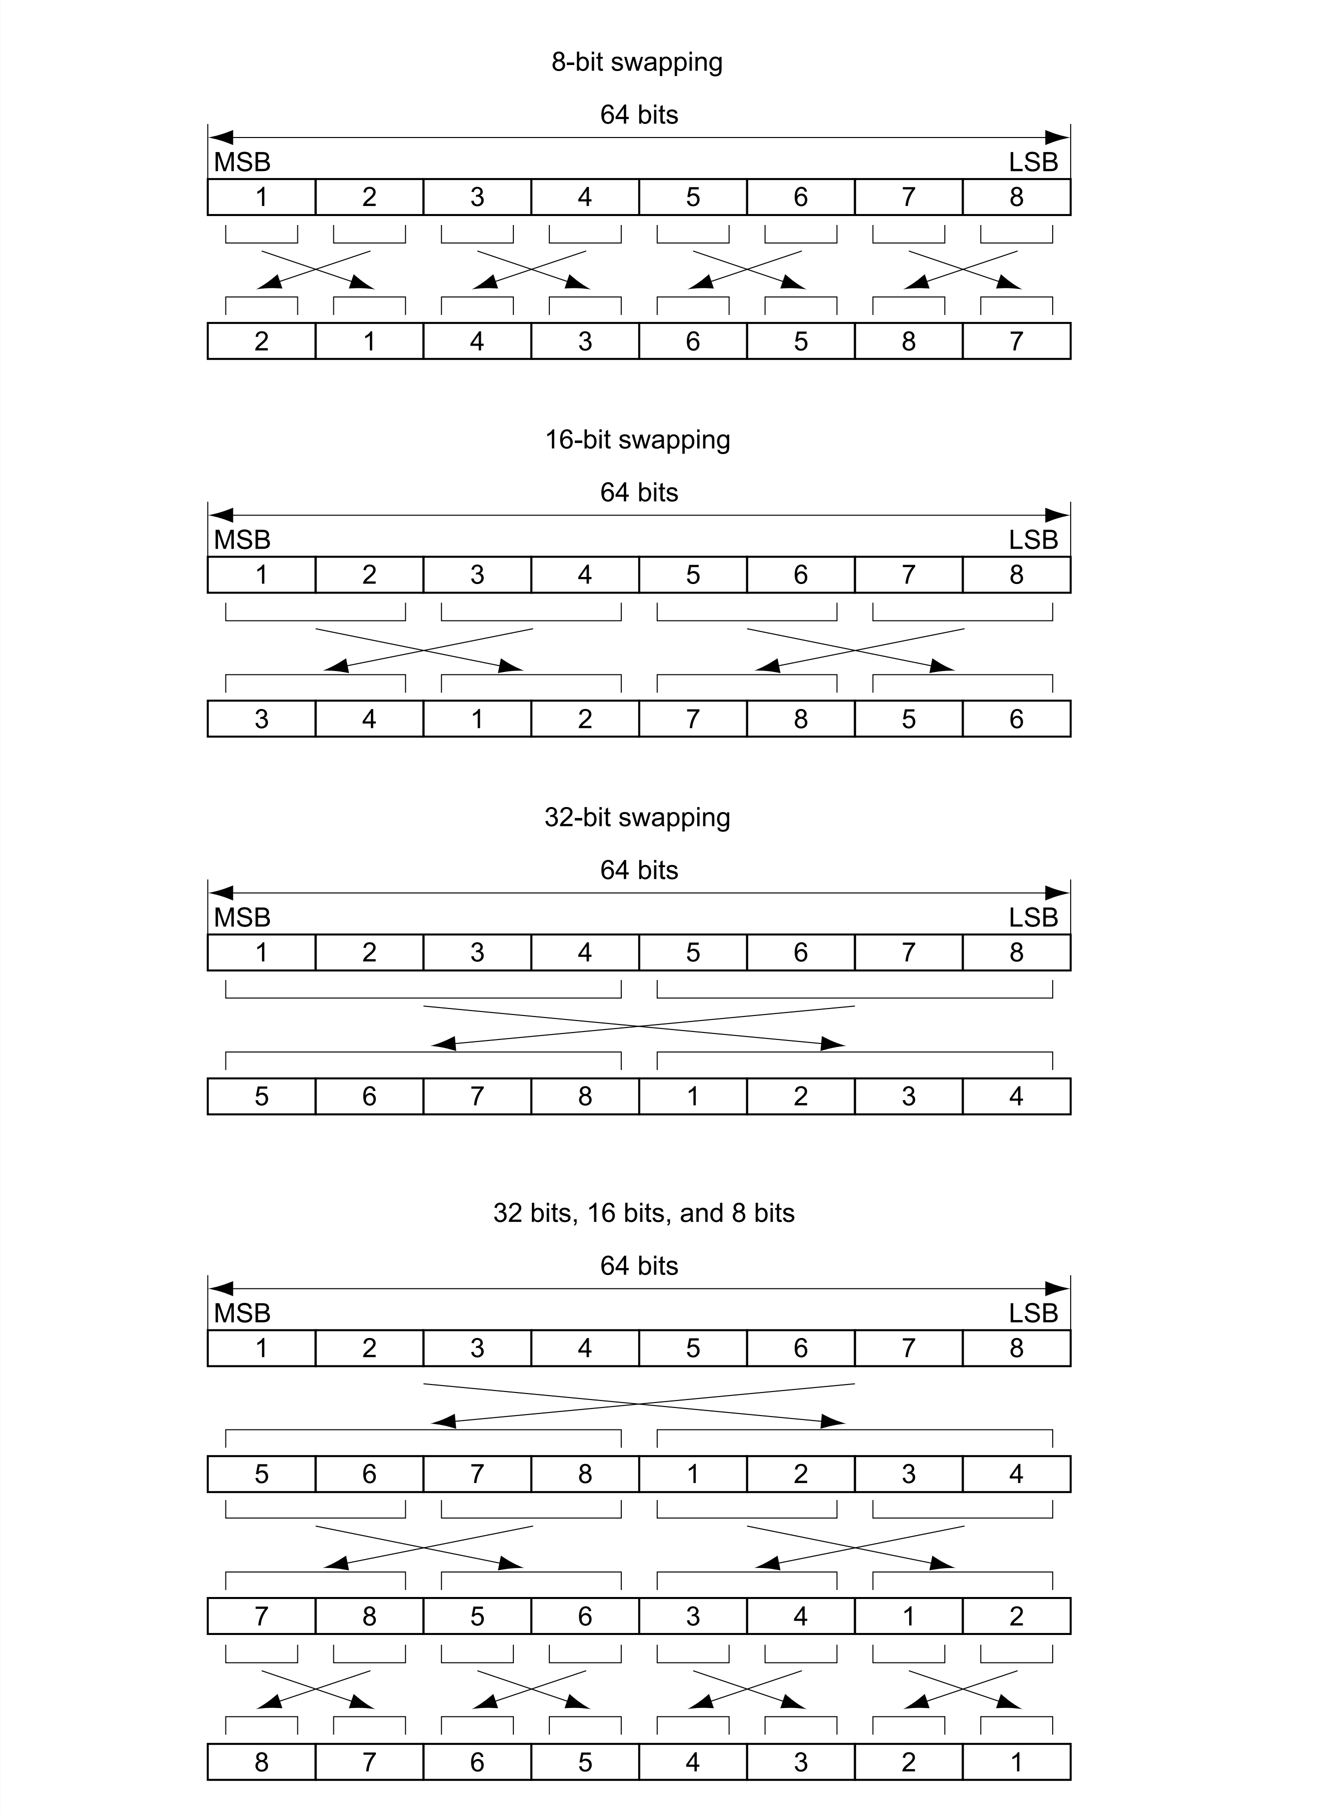

Figure 60.44 Data swapping by data aligner

60.2.21 CEIER : Capture Event Interrupt Enable Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0070

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	CPBE4IE	CPBE4 Interrupt Enable 0: Disables a CPBE4 interrupt 1: Enables a CPBE4 interrupt	R/W
16	CDTOFIE	CDTOF Interrupt Enable 0: Disables a CDTOF interrupt 1: Enables a CDTOF interrupt	R/W
17	IGHSIE	IGHS Interrupt Enable 0: Disables an IGHS interrupt 1: Enables an IGHS interrupt	R/W
18	IGVSIE	IGVS Interrupt Enable 0: Disables an IGVS interrupt 1: Enables an IGVS interrupt	R/W

Bit	Symbol	Function	R/W
19	—	This bit is read as 0. The write value should be 0.	R/W
20	VBPIE	VBP Interrupt Enable 0: Disables a VBP interrupt 1: Enables a VBP interrupt	R/W
22:21	—	These bits are read as 0. The write value should be 0.	R/W
23	FWFIE	FWF Interrupt Enable 0: Disables a FWF interrupt 1: Enables a FWF interrupt	R/W
24	NHDIE	Non-HD Interrupt Enable Disable this interrupt (NHDIE = 0) for data enable fetch. 0: Disables a non-HD interrupt 1: Enables a non-HD interrupt	R/W
25	NVDIE	Non-VD Interrupt Enable Disable this interrupt (NVDIE = 0) for data enable fetch. 0: Disables a non-VD interrupt 1: Enables a non-VD interrupt	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CEIER enables or disables interrupts of the event flag register that generates CEU interrupts.

60.2.22 CETCR : Capture Event Flag Clear Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0074

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	NVD	NHD	FWF	—	—	VBP	—	IGVS	IGHS	CDTOF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CPBE4	CPBE3	CPBE2	CPBE1	—	—	VD	HD	—	—	—	IGRW	—	—	CFE	CPE
Value after reset:	0	0	0	0	0	0	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPE	An interrupt indicating that capturing of one frame from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input. This interrupt indicates that capturing of one frame has finished. This bit is set to 1 when the image of the size set in CAPWR is captured and the last data transfer to the bus finished (see Figure 60.46).	R/W
1	CFE	An interrupt indicating that capturing of one field from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input (see Figure 60.45). This interrupt occurs only in both-field capture mode.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	IGRW	An interrupt indicating that during capturing, access was attempted to a register to which writing during operation is prohibited. Among the CEU registers, writing during capturing is prohibited for some registers. Table 60.10 shows which registers can/cannot be written to during capturing. This bit is set to 1 when a register to which writing during capturing is prohibited has been written to.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	HD	An interrupt indicating that HD (horizontal sync signal) was input from an external module. This bit is set to 1 when an HD input from an external module is detected. Immediately after the HDPOL bit in CAMCR is modified, a pseudo HD is input and this bit is set to 1. The HD interrupt after the HDPOL bit is modified should be ignored.	R/W
9	VD	An interrupt indicating that VD (vertical sync signal) was input from an external module. In data enable fetch mode, this bit is set to 1 when a VD input from an external module is detected. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD from an external module. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time. Immediately after the VDPOL bit in CAMCR is modified, a pseudo VD is input and this bit is set to 1. The VD interrupt after the VDPOL bit is modified should be ignored.	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	CPBE1	An interrupt indicating that writing to CDAYR and CDACR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).	R/W
13	CPBE2	An interrupt indicating that writing to CDAYR2 and CDACR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).	R/W
14	CPBE3	An interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).	R/W
15	CPBE4	An interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).	R/W
16	CDTOF	An interrupt indicating that data overflowed in the CRAM of the write buffer Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.	R/W
17	IGHS	An interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.	R/W
18	IGVS	An interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.	R/W
19	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
20	VBP	An interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch). The conditions for a VBP interrupt to occur are as follows: ● Condition 1 VD is input when there is captured data within the CEU ● Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.	R/W
22:21	—	These bits are read as 0. The write value should be 0.	R/W
23	FWF	The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1.	R/W
24	NHD	An interrupt indicating that no HD was input. The timing for a non-HD interrupt to occur differs depending on the bit width of the digital image input pins. 8-bit digital image input pins: Occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. 16-bit digital image input pins: Occurs when the 12-bit internal counter that is incremented every four cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,380 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch.	R/W
25	NVD	An interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt (CEU_CEUI) is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write 0xFFFFFFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.
- VD and HD bits immediately after system reset or Software Standby mode is entered.
- VD and HD bits after the polarities of the capture interface sync signals are changed.

60.2.23 CSTSR : Capture Status Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x007C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	CRST	—	—	—	—	—	—	—	CPFLD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPTON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPTON	Indicates that the CEU is operating. This bit retains 1 during the period that starts from the internal VD at capture start and ends when a one-frame capture end interrupt occurs. Figure 60.47 shows the CEU operating period.	R
15:1	—	These bits are read as 0.	R
16	CPFLD	Indicates which field is being captured. 0: Bottom field is being captured 1: Top field is being captured	R
23:17	—	These bits are read as 0.	R
24	CRST	Indicates which register plane is currently used. 0: Plane A of the register is being used 1: Plane B of the register is being used	R
31:25	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

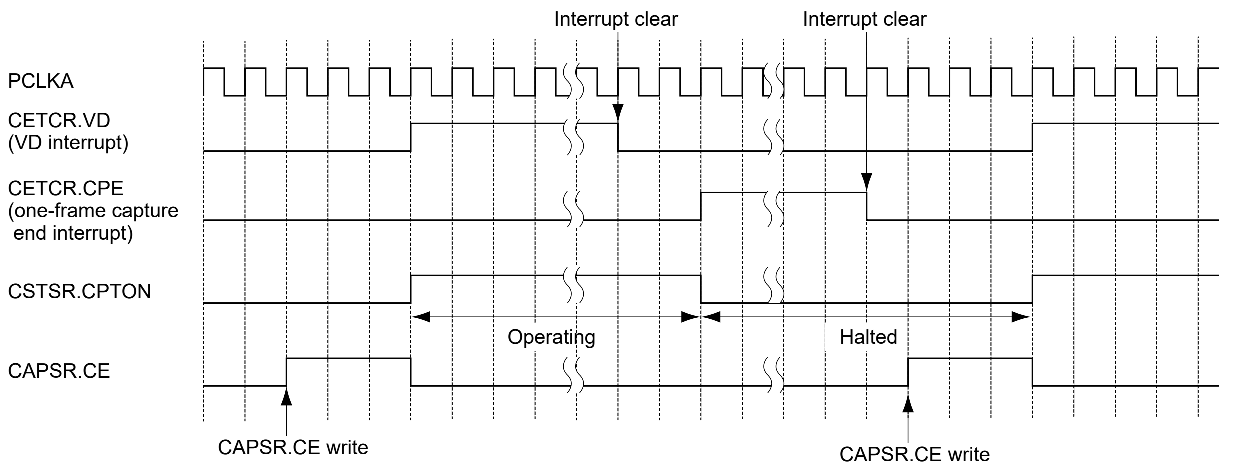

Figure 60.47 Operating status during capturing

60.2.24 CDSSR : Capture Data Size Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CDSS[31:0]																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CDSS[31:0]	Indicate the size of data written to the memory in data enable fetch. In a bundle write, size of data written to the selected address at the end of one-frame capture is indicated. In a bundle write, as soon as the number of bytes specified by CBDSR is transferred to the bus, address to which data is written is switched. Therefore, if one-frame capture is completed at the same time as a bundle write is completed, this register indicates 0x00000000. Figure 60.48 and Figure 60.49 show the overall timing of the CDSSR operation in a bundle write.	R

Note: S-TYPE-3, P-TYPE-3

CDSSR indicates the size of data written to the memory in data enable fetch. As this register indicates a correct value at the end of capture, confirm this register when capture is completed.

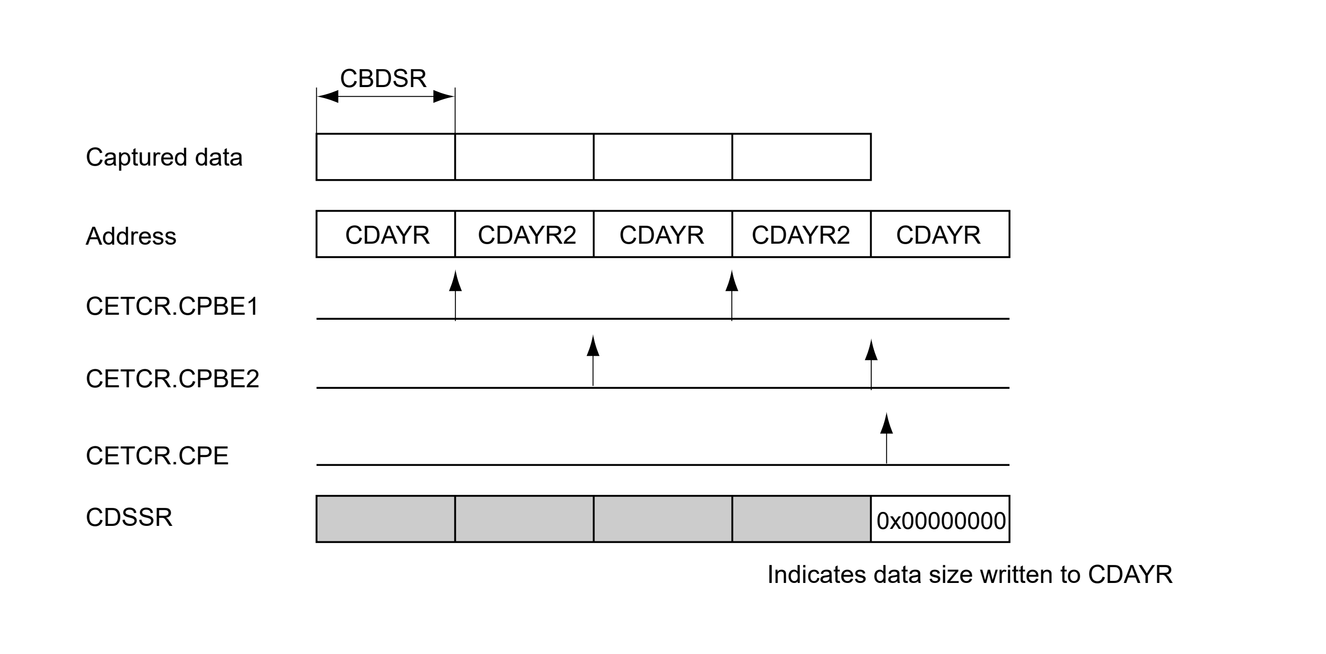

Figure 60.48 Overall timing of CDSSR operation in bundle write (when bundle write end and capture end coincide)

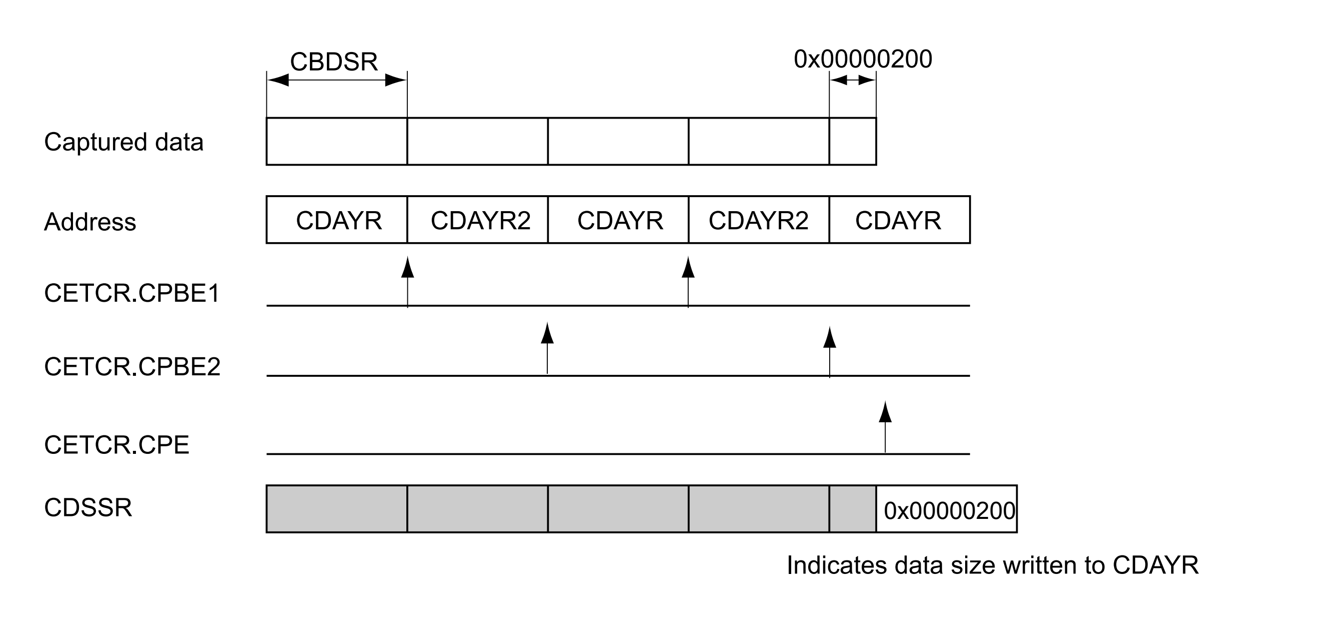

Figure 60.49 Overall timing of CDSSR operation in bundle write (when bundle write end and capture end do not coincide)

60.2.25 CDAYR2, CDAYR2_x : Capture Data Address Y Register 2 (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0090 (CDAYR2)
0x1090 (CDAYR2_B)
0x2090 (CDAYR2_M)

Bit position:	31 … 0
Bit field:	CAYR2[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CAYR2[31:0]	Capture Data Address Y Frame image capture: These bits set the address for storing the luminance component data of the captured data (8-pixel units). ● One-field image capture: These bits set the address for storing the luminance component data of the captured data (8-pixel units). ● Both-field image capture: These bits set the address for storing the luminance component data of the captured top-field data (8-pixel units). ● Data synchronous fetch: These bits set the address for storing data (8-byte units). ● Data enable fetch: These bits set the address for storing data (32-byte units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDAYR2 specifies the address for the luminance component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the luminance component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the luminance component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the luminance component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units.

Set the address of the starting point of the memory area where the luminance component of the captured image is to be stored in this register, as shown in Figure 60.50.

- Frame image capture: Set the address of the starting point of the memory area where the luminance component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the luminance component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the luminance component of the captured top-field image is to be stored.
- Data synchronous fetch: Set the address of the starting point of the memory area where the captured data is to be stored.
- Data enable fetch: Set the address of the starting point of the memory area where the captured data is to be stored in 32-byte units.

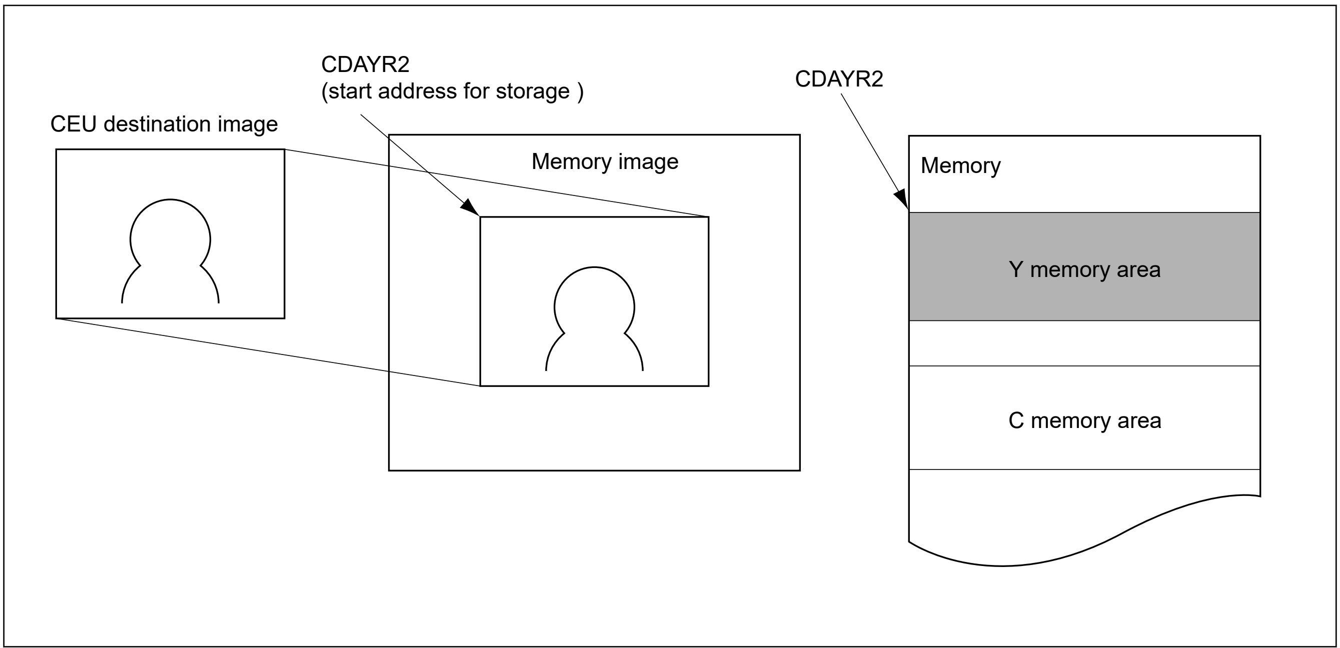

Figure 60.50 Relationship between captured image and luminance component memory area

60.2.26 CDACR2, CDACR2_x : Capture Data Address C Register 2 (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0094 (CDACR2)
0x1094 (CDACR2_B)
0x2094 (CDACR2_M)

Bit position:	31 … 0
Bit field:	CACR2[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CACR2[31:0]	Capture Data Address C ● Frame image capture: These bits set the address for storing the chrominance component data of the captured data (8-pixel units). ● One-field image capture: These bits set the address for storing the chrominance component data of the captured data (8-pixel units). ● Both-field image capture: These bits set the address for storing the chrominance component data of the captured top-field data (8-pixel units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDACR2 specifies the address for the chrominance component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the chrominance component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the chrominance component of the captured data is to be stored by CDACR2. In bothfield image capture, set the start address of the memory area where the chrominance component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units.

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 60.51.

- Frame image capture: Set the address of the starting point of the memory area where the chrominance component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the chrominance component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the chrominance component of the captured top-field image is to be stored.

The chrominance component has an output data format as shown in Figure 60.52, and is saved in the memory in this format.

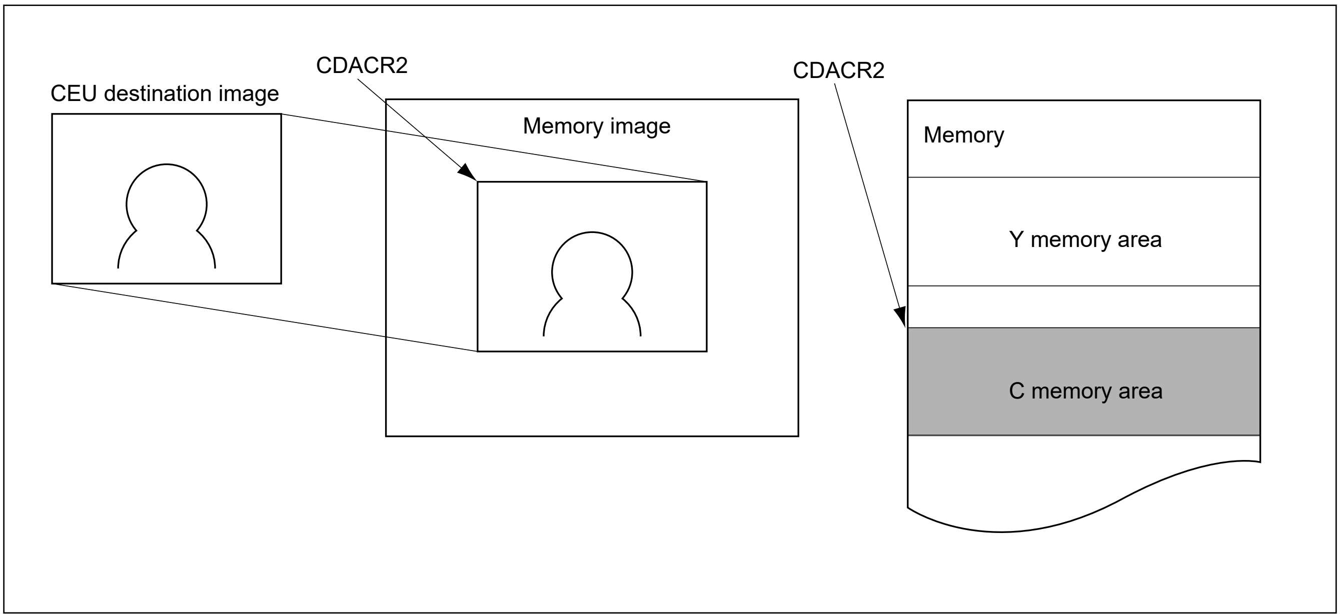

Figure 60.51 Relationship between captured image and chrominance component memory area

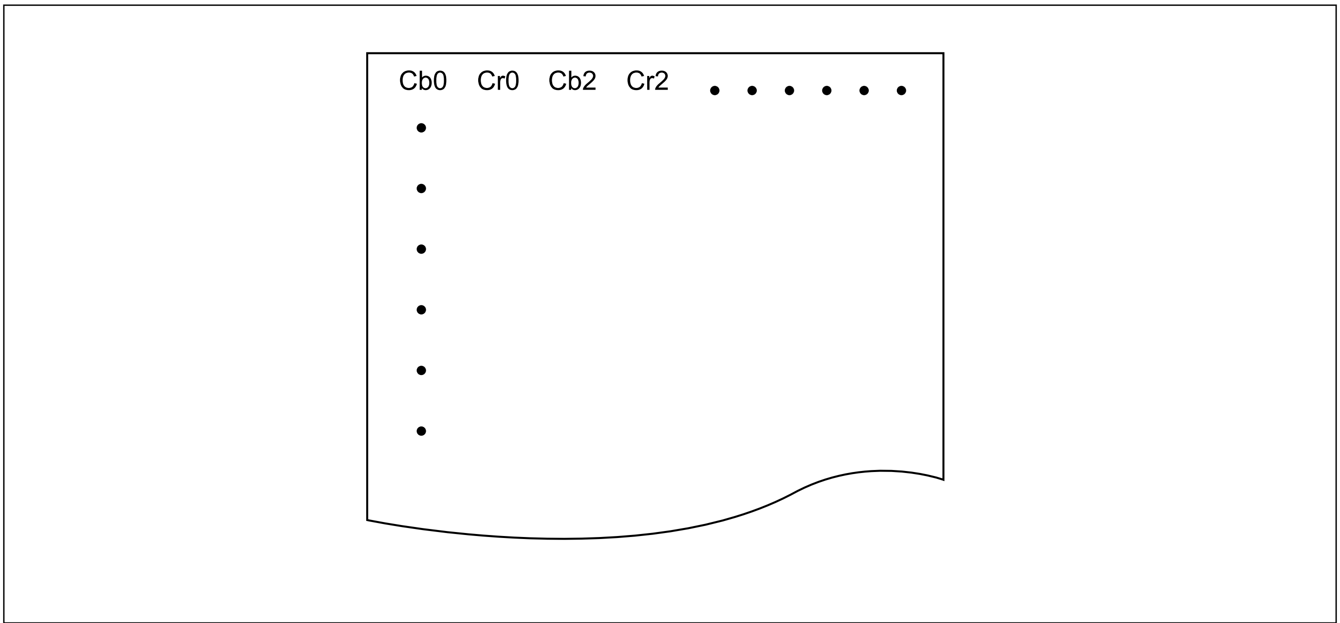

Figure 60.52 Image of storing chrominance components in memory

60.2.27 CDBYR2, CDBYR2_x : Capture Data Bottom-Field Address Y Register 2 (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x0098 (CDBYR2)
0x1098 (CDBYR2_B)
0x2098 (CDBYR2_M)

Bit position:	31 ... 0
Bit field:	CBYR2[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CBYR2[31:0]	Set the address for storing the luminance component data of the captured bottom-field data (8-pixel units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDBYR2 specifies the address for the luminance component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the luminance component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the luminance component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units.

In this register, set the address of the starting point of the memory area where the luminance component of the captured bottomfield image is to be stored in a bundle write, as shown in Figure 60.53.

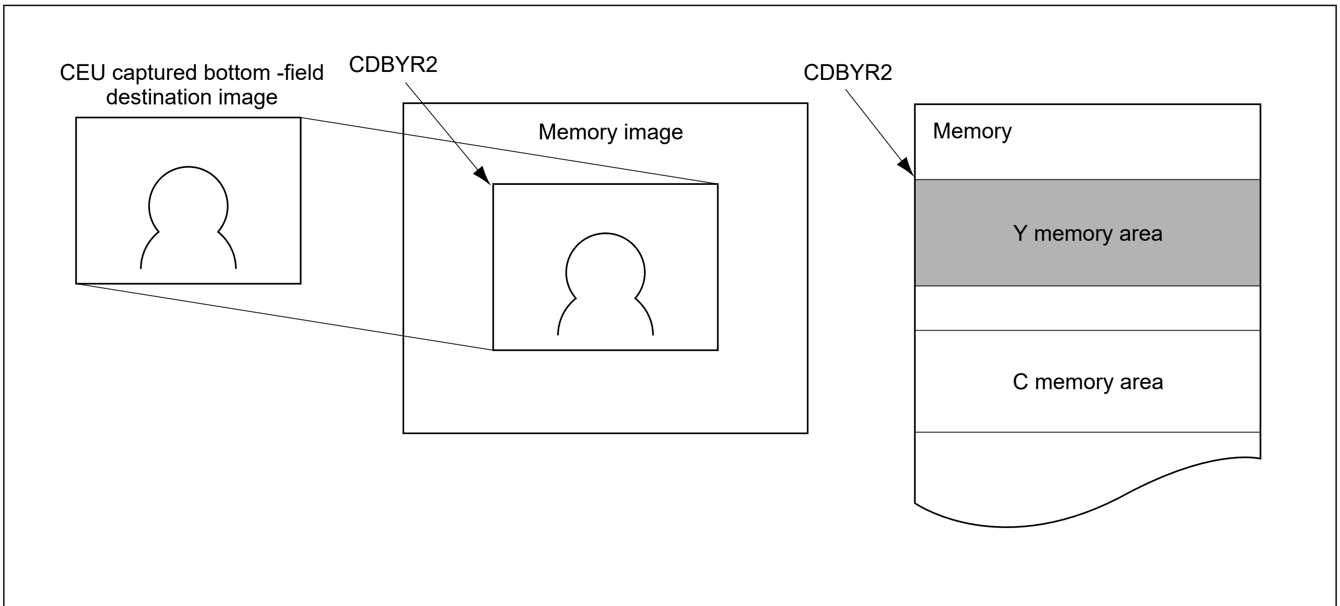

Figure 60.53 Relationship between captured bottom-field image and luminance component memory area

60.2.28 CDBCR2, CDBCR2_x : Capture Data Bottom-Field Address C Register 2 (x = B, M)

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x009C (CDBCR2)
0x109C (CDBCR2_B)
0x209C (CDBCR2_M)

Bit position:	31 – 0
Bit field:	CBCR2[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CBCR2[31:0]	Set the address for storing the chrominance component data of the captured bottom-field data (8-pixel units). The lower 3 bits should be written 0.	R/W

Note: S-TYPE-3, P-TYPE-3

CDBCR2 specifies the address for the chrominance component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the chrominance component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the chrominance component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units.

In this register, set the address of the starting point of the memory area where the chrominance component of the captured bottomfield image is to be stored in a bundle write, as shown in Figure 60.54. The chrominance component has an output data format as shown in Figure 60.55, and is saved in the memory in this format.

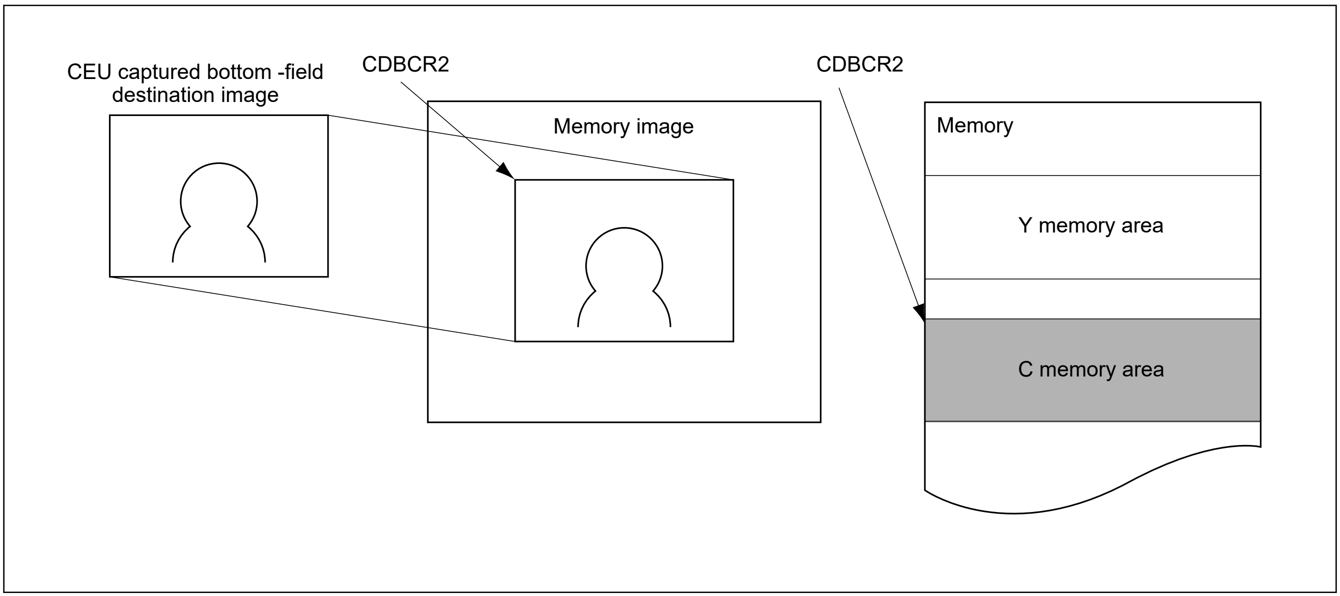

Figure 60.54 Relationship between captured bottom-field image and chrominance component memory area

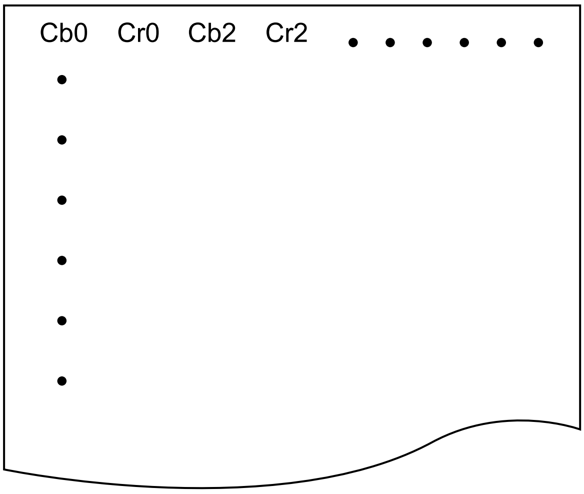

Figure 60.55 Image of storing chrominance components in memory

60.2.29 CBWER : CEU Bufferable Write Enable Register

Base address: CEU = 0x4034_8000
CEU_NS = 0x5034_8000

Offset address: 0x00A0

Bit position:	31																															0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BWE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BWE	Bufferable Write Enable 0: Disables Bufferable Write 1: Enables Bufferable Write	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

BWE bit (Bufferable Write Enable)

BWE bit indicates bufferable write is either enabled or disabled.

Note that if this bit is 1, even if the write access as CEU is completed, the actual slave write may not have ended.

Note: When this bit is 1, it requests an early response by writing write data to the temporary buffer if possible to the slave. Therefore, even if write access as CEU is completed, the actual slave write may not be finished. For details on slave groups that support bufferable writes, see section 15.7.2. Operations When a Bus Error Occurs and respective module sections.

60.3 Usage Notes

60.3.1 Settings for the Module-Stop Function

CEU operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The CEU is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

60.3.2 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock (VIO_CLK) should have a frequency at most the same as the CEU operating clock (PCLKA) frequency, with jitter on both sides included.

$$PCLKA \geq VIO\_CLK$$

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input

60.3.3 Restrictions on Input/Output Functions

Table 60.11 lists the restrictions regarding the CEU input/output functions.

Table 60.11 Restrictions on CEU Input/Output Functions

Item	Restrictions
External module interface	The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating (PCLKA), with jitter on both sides included.
	Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure.
	The capture horizontal size in image capture must be specified as follows: 8-bit interface: 16-cycle units 16-bit interface: 8-cycle units
	The capture horizontal size in data fetch must be specified as follows: 8-bit interface: 8-cycle units 16-bit interface: 4-cycle units
	The capture vertical size must be specified in 4-line units.
	The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock for 8-bit digital image input pins, or 16,379 cycles of external input clock for 16-bit digital image input pins.
	The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines.
	The minimum number of captured pixels should be sub-QCIF (128 × 96).
	The maximum number of captured pixels should be 5 megapixels (2,560 × 1,920).
	The capture size in data enable fetch must be controlled by VD and HD in 4-byte units. The range of the capture size in data enable fetch that can be input is as follows. Maximum: 6 MB (2,048 × 1,536 × 2) Minimum: 16 bytes
Memory output	The output address must be specified in 32-bit units.
	The horizontal size of the destination image (memory) must be specified in 8-pixel units.
	The number of horizontal output pixels (= horizontal clipping size) must be specified in 8-pixel units.
	The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units.
	In data enable fetch bundle write, the output address must be specified in 32-byte units.
Internal processing	The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter.

61. Internal Voltage Regulator

61.1 Overview

The MCU supports two power supply providing for core voltage (VDD):

- Switching regulator (DCDC)
- External power supply from external power device (External VDD)

Table 61.1 shows the specifications of internal voltage regulator.

DCDC or External VDD is selected with the OFS setting.

- When OFS2.DCDCEN is 1, DCDC is selected (DCDC mode)
- When OFS2.DCDCEN is 0, External VDD is selected (External VDD mode)

Table 61.1 Power supply selection

OFS setting (OFS2.DCDCEN)	Power mode
1	DCDC mode
0	External VDD mode

Note: External VDD mode is not supported for products in the HLQFP package.

61.2 Operation

61.2.1 DCDC Mode

Table 61.2 lists the DCDC mode pin settings, and Figure 61.1 shows the DCDC mode settings.

In DCDC mode, VDD is supplied from VCL through VLO output and an external inductor and capacitor.

Table 61.2 DCDC mode pin settings

Pins	Setting descriptions
All VCC_n and VCC2_n pins	• Connect each pin to the system power supply. • Connect each pin to the same numbered VSS_n through a 0.1-μF multilayer ceramic capacitor. Place the capacitor close to the pin.
VCC_DCDC pins	• Connect the pin to the system power supply. • Connect the pin to VSS_DCDC through a 22-μF and 0.1-μF multilayer ceramic capacitor in parallel. Place the capacitor close to the pin.
VCLn pins	• Connect each pin to the same numbered VSSn through a 0.22-μF multilayer ceramic capacitor. Place the capacitor close to the pin. • Connect each pin to an external inductor and capacitor. Place the inductor and capacitor close to the pin. See Figure 61.1.
All VLO pins	Connect each pin to an external inductor and capacitor. Place the 2.2-μH inductor and 47-μF capacitor close to the pin. This capacitor must be grounded to VSS_DCDC

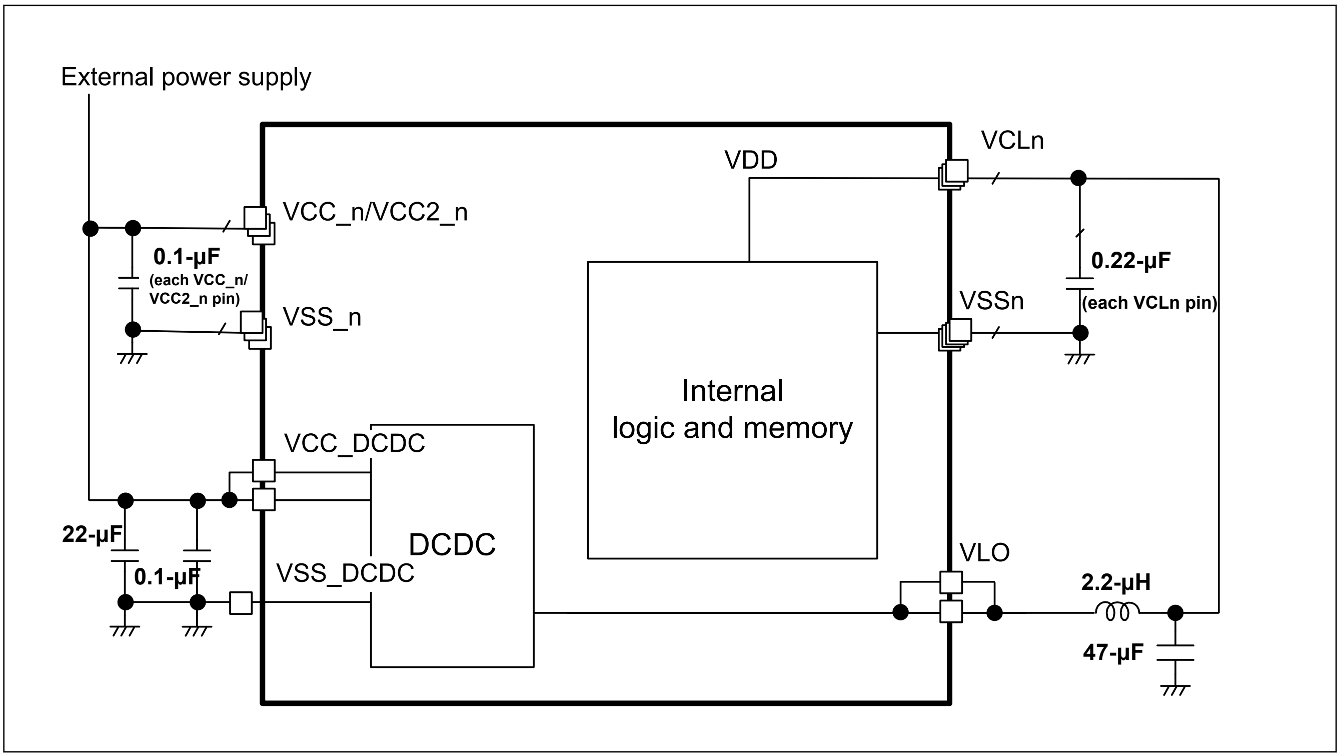

Figure 61.1 DCDC mode setting

61.2.2 External VDD Mode

Table 61.3 lists the External VDD mode pin settings, and Figure 61.2 shows the External VDD mode settings.

VDD is supplied from VCL pins.

Note: Software Standby mode, Deep Software Standby mode 1, 2, 3, Battery Backup Function and Voltage Scaling Control are not supported in this mode.

Table 61.3 Setting descriptions for External VDD mode

Pins	Setting descriptions
All VCC_n and VCC2_n pins	• Connect each pin to the system power supply device for VCC. • Connect each pin to the same numbered VSS_n through a 0.1-μF multilayer ceramic capacitor. Place the capacitor close to the pin.
VCC_DCDC pins	• Connect the pin to VSS_DCDC through 0.1-μF multilayer ceramic capacitor. Place the capacitor close to the pin.
VCLn pins	• Connect each pin to the system power supply device for VDD. • Connect each pin to the same numbered VSSn through a 0.22-μF multilayer ceramic capacitor. Place the capacitor close to the pin.
All VLO pins	Keep pin open

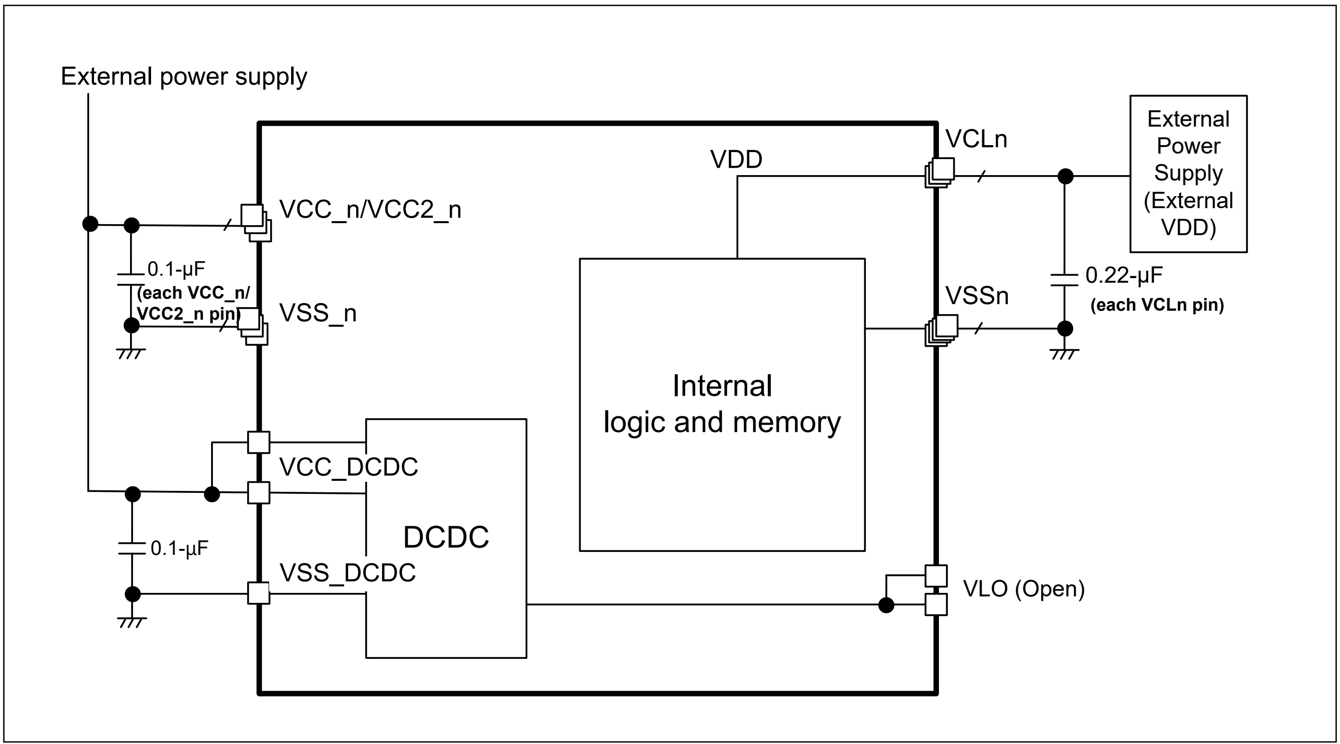

Figure 61.2 External VDD mode setting

61.3 Usage Notes

In DCDC mode, to minimize power loss and maximize efficiency, Renesas recommends using a 2.2-µH inductor with a DC resistance of 100 mΩ or less. Short VCC_n and VCC_DCDC.

In external VDD mode, the voltage of VDD should always be below the voltage of VCC including the power-on and power-off sequence. For details, see section 62, Electrical Characteristics.

62. Electrical Characteristics

Unless otherwise specified, minimum and maximum values are guaranteed by either design simulation, characterization results or test in production.

Supported peripheral functions and pins differ from one product name to another.

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

- VCC = VCC_DCDC = VBATT = 1.62 to 3.63 V
- VCC2 = 1.62 to 3.63 V for Standard Product
- VCC2 = 1.70 to 2.00 V for SiP Product
- AVCC0 = 1.62 to 3.63 V
- VCC_USB = VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
- VREFH0/VREFH = 1.62 V to AVCC0
- VSS = VSS_DCDC = AVSS0 = VREFL0/VREFL = VSS_USB = VSS1_USBHS = VSS2_USBHS = 0 V
- VCC voltage is lower than 2.7 V : LVOCR.LVO0E = 1, otherwise LVOCR.LVO0E = 0
- VCC2 voltage is lower than 2.7 V : LVOCR.LVO1E = 1, otherwise LVOCR.LVO1E = 0
- $T_j = T_{opj}$
  When not specified otherwise, typical values are measured at room temperature of 25 °C and VCC = VCC_DCDC = VCC_USB = VBATT = VCC_USBHS = AVCC_USBHS = AVCC0 = VREFH0 = VREFH = 3.3V

Figure 62.1 shows the timing conditions.

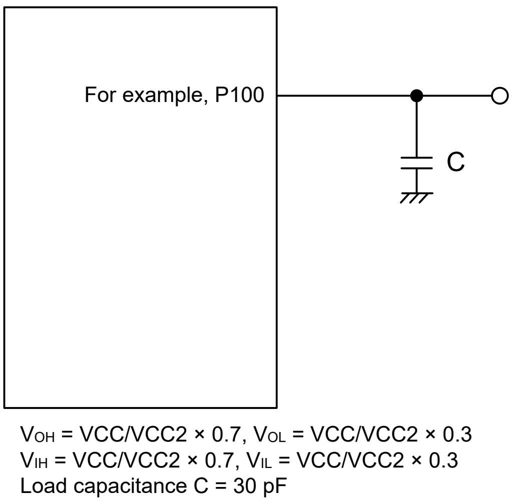

Figure 62.1 Input or output timing measurement conditions

The recommended measurement conditions for the timing specification of each peripheral provided are for the best peripheral operation. Make sure to adjust the driving abilities of each pin to meet your conditions.

62.1 Absolute Maximum Ratings

Table 62.1 Absolute maximum ratings (1 of 2)

Parameter	Symbol		Value	Unit
Power supply voltage	VCC, VCC_DCDC*2		−0.3 to +4.0	V
	VCC2	Standard Product	−0.3 to +4.0	V
		SiP Product	−0.3 to +2.5	V

Table 62.1 Absolute maximum ratings (2 of 2)

Parameter	Symbol	Value	Unit
External power supply voltage [*6]	VCL	−0.3 to +1.2	V
VBATT power supply voltage	VBATT	−0.3 to +4.0	V
Input voltage (except for 5 V-tolerant ports [*1])	V_{in}	−0.3 to VCC + 0.3, −0.3 to VCC2 + 0.3, −0.3 to VCC_USB + 0.3 or −0.3 to VBATT_R + 0.3	V
Input voltage (5 V-tolerant ports [*1])	V_{in}	−0.3 to + VCC + 4.0 (max. 5.8) or −0.3 to + VCC2 + 4.0 (max. 5.8)	V
Reference power supply voltage	VREFH/VREFH0	−0.3 to AVCC0 + 0.3	V
USBFS power supply voltage	VCC_USB	−0.3 to +4.0	V
USBHS power supply voltage	VCC_USBHS	−0.3 to +4.0	V
USBHS analog power supply voltage	AVCC_USBHS	−0.3 to +4.0	V
Analog power supply voltage	AVCC0	−0.3 to +4.0	V
Analog input voltage	V_{AN}	−0.3 to AVCC0 + 0.3	V
Operating junction temperature [*3 *4 *5]	T_{opj}	0 to 95 or −40 to +105 or −40 to +125	°C
Storage temperature	T_{stg}	−55 to +125	°C

Note 1. Ports P204, P205, P303, P407 to P413, P511, P512, P514, P515 and P708 to P715 are 5 V tolerant.
Note 2. Connect VCC_DCDC to VCC.
Note 3. See section 62.2.1. Tj/Ta Definition.
Note 4. Contact a Renesas Electronics sales office for information on derating operation when Tj = +95 °C to +125 °C. Derating is the systematic reduction of load for improved reliability.
Note 5. The lower and upper limit of operating junction temperature depend on the product. For details, see section 1.3. Part Numbering.
Note 6. External VDD mode does not support in HLQFP package.

Caution: Permanent damage to the MCU might result if absolute maximum ratings are exceeded.

Table 62.2 Recommended operating conditions

Parameter	Symbol			Min	Typ	Max	Unit
Power supply voltages	VCC, VCC_DCDC	Other than the following		1.62	—	3.63	V
		When ESWM is used		2.30	—	3.63	V
		When SDRAM is used		3.00	—	3.63	V
	VCC2	Standard Product	Other than the following	1.62	—	3.63	V
			When 32bit SDRAM is used	3.00	—	3.63	V
		SiP Product		1.70	—	2.00	V
	VCL	When external VDD is used*2*3	voltage range 1	0.92	—	0.99	V
			voltage range 2	0.87	—	0.99	V
		When DCDC is used (High-speed mode)	VSCR_1	—	0.95	—	V
			VSCR_2	—	0.925	—	V
		When DCDC is used (Software Standby mode)	SVSCR_1	—	0.95	—	V
			SVSCR_2	—	0.925	—	V
			SVSCR_3	—	0.825	—	V
			SVSCR_4	—	0.765	—	V
			SVSCR_5	—	0.715	—	V
	VSS, VSS_DCDC			—	0	—	V
USB power supply voltages	VCC_USB, VCC_USBHS, AVCC_USBHS	When USB is not used		1.62	—	3.63	V
		When USB is used		3.00	—	3.60	V
	VSS_USB, VSS1_USBHS, VSS2_USBHS			—	0	—	V
VBATT power supply voltage	VBATT			1.62	—	3.63	V
Analog power supply voltages	AVCC0*1		Other than the following	1.62	—	3.63	V
			When Channel dedicated sample-and-hold circuit is used	2.70	—	3.63	V
	AVSS0			—	0	—	V

Note 1. When the A/D converter, the D/A converter and the High-Speed Analog Comparator are not in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.

Note 2. VCL voltage must never be higher than VCC voltage.

Note 3. External VDD mode does not support in HLQFP package.

62.2 DC Characteristics

62.2.1 Tj/Ta Definition

Table 62.3 DC characteristics

Parameter	Symbol	Typ	Max	Unit	Test conditions
Permissible operating junction temperature	T_j	—	125*1	°C	High-speed mode

Note: Make sure that $T_j = T_a + \theta_{ja} \times$ total power consumption (W), where total power consumption = $(VCC - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + (I_{CC}max + I_{CC\_DCDC}max) \times VCC$.

Note: Minimum Ambient Temperature (Ta) is -40℃ or 0℃, depending on the product. For details, see section 1.3. Part Numbering.

Note 1. The upper limit of operating junction temperature is 95°C, 105°C or 125°C, depending on the product. For details, see section 1.3. Part Numbering.

62.2.2 I/O V_{IH}, V_{IL}

Table 62.4 I/O V_{IH}, V_{IL} except for Schmitt trigger input pins (1 of 2)

Parameter		VCC/VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit

Note 1. RES and peripheral function pins associated with P303, P407 to P413, P511, P512, P514, P515, P708 to P715 (total 21 pins).
Note 2. P204 and P205 (total 2 pins)
Note 3. All input pins except for the peripheral function pins already described in the table. There is an item for each power supply voltage for each port. Refer to the IO chapter for the power supply of the port.
Note 4. P303, P407 to P413, P511, P512, P514, P515, P708 to P715 (total 20 pins).
Note 5. All input pins except for the ports already described in the table. There is an item for each power supply voltage for each port. Refer to the IO chapter for the power supply of the port.
Note 6. When VCC or VCC2 is less than 1.62 V, the input voltage of 5 V-tolerant ports should be less than 3.6 V, otherwise breakdown may occur because 5 V-tolerant ports are electrically controlled so as not to violate the break down voltage.

62.2.3 I/O I_{OH}, I_{OL}

Table 62.6 I/O I_{OH}, I_{OL} (1 of 5)

Parameter			VCC/VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit
Permissible output current (average value per pin)	Ports P000 to P015, P201	—	—	I_{OH}	—	—	−2.0	mA
				I_{OL}	—	—	2.0	mA
	Ports P204, P205, P303, P407 to P413, P511, P512, P514, P515, P708 to P715, PA15 (total 23 pins)	Low drive*1	—	I_{OH}	—	—	−2.0	mA
				I_{OL}	—	—	2.0	mA
		Middle drive*2	—	I_{OH}	—	—	−4.0	mA
				I_{OL}	—	—	4.0	mA
		High drive*3	—	I_{OH}	—	—	−16	mA
				I_{OL}	—	—	20.0	mA
		High-speed high drive*4	—	I_{OH}	—	—	−20	mA
				I_{OL}	—	—	20.0	mA
	Other output pins*5	Low drive*1	—	I_{OH}	—	—	−2.0	mA
				I_{OL}	—	—	2.0	mA
		Middle drive*2	—	I_{OH}	—	—	−4.0	mA
				I_{OL}	—	—	4.0	mA
		High drive*3	—	I_{OH}	—	—	−16	mA
				I_{OL}	—	—	16.0	mA
		High-speed high drive*4	—	I_{OH}	—	—	−20	mA
				I_{OL}	—	—	20.0	mA
Permissible output current (max value per pin)	Ports P000 to P015, P201	—	—	I_{OH}	—	—	−4.0	mA
				I_{OL}	—	—	4.0	mA
	Ports P204, P205, P303, P407 to P413, P511, P512, P514, P515, P708 to P715, PA15 (total 23 pins)	Low drive*1	—	I_{OH}	—	—	−4.0	mA
				I_{OL}	—	—	4.0	mA
		Middle drive*2	—	I_{OH}	—	—	−8.0	mA
				I_{OL}	—	—	8.0	mA
		High drive*3	—	I_{OH}	—	—	−32	mA
				I_{OL}	—	—	40.0	mA
		High-speed high drive*4	—	I_{OH}	—	—	−40	mA
				I_{OL}	—	—	40.0	mA
	Other output pins*5	Low drive*1	—	I_{OH}	—	—	−4.0	mA
				I_{OL}	—	—	4.0	mA
		Middle drive*2	—	I_{OH}	—	—	−8.0	mA
				I_{OL}	—	—	8.0	mA
		High drive*3	—	I_{OH}	—	—	−32	mA
				I_{OL}	—	—	32.0	mA
		High-speed high drive*4	—	I_{OH}	—	—	−40	mA
				I_{OL}	—	—	40.0	mA

Table 62.6 I/O I_{OH}, I_{OL} (2 of 5)

Parameter				VCC/VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit
Permissible output current (maxvalue of total of all pins)	Maximum of all output pins	VCC I/O	Ports P411 to P415, P511 to P515, P708 to P715, P805 to P807 (total 21 pins)	1.62 V or above	$\Sigma I_{OH\ (max)}$	—	—	−40	mA
			Ports P212, P213, P400 to P410 (total 13 pins)	1.62 V or above		—	—	−40	
			Ports P700 to P707, PB00 to PB04 (total 13 pins)	1.62 V or above		—	—	−40	
			Ports PB05 to PB07, PD06, PD07 (total 5 pins)	1.62 V or above		—	—	−40	
			Ports P207, PD01 to PD05 (total 6 pins)	1.62 V or above		—	—	−40	
			Ports P904, P910 to P913 (total 5 pins)	1.62 V or above		—	—	−40	
			Ports P206, P304 to P312, P902, P903, P905 to P909 (total 17 pins)	1.62 V or above		—	—	−40	
			Ports P108 to P115, P201, P208 to P211, P300 to P303, P609, P914, P915, PA11 (total 21 pins)	1.62 V or above		—	—	−40	
			Ports P610 to P615, P813, PA04 to PA10, PA12 to PA15 (total 18 pins)	1.62 V or above		—	—	−40	
			Ports P503 to P510, P608, PA00 to PA03, PC11 to PC15, PD00 (total 19 pins)	1.62 V or above		—	—	−40	

Table 62.6 I/O I_{OH}, I_{OL} (3 of 5)

Parameter				VCC/VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit
Permissible output current (maxvalue of total of all pins)	Maximum of all output pins	VCC2 I/O	Ports PC00 to PC10 (total 11 pins)	1.62 V or above	$\Sigma I_{OH\ (max)}$	—	—	−40	mA
			Ports P204, P205, P600 to P607 (total 10 pins)	1.62 V or above		—	—	−40	
			Ports P202, P203, P313 to P315, P900, P901 (total 7 pins)	1.62 V or above		—	—	−40	
			Ports P100 to P107, P800, P801 (total 10 pins)	1.62 V or above		—	—	−40	
			Ports P500 to P502, P802 to P804, P808 to P812 (total 11 pins)	1.62 V or above		—	—	−40	
		AVCC0 I/O		1.62 V or above		—	—	-33	
		VCC_USB I/O		1.62 V or above		—	—	-33	

Table 62.6 I/O I_{OH}, I_{OL} (4 of 5)

Parameter				VCC/VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit
Permissible output current (maxvalue of total of all pins)	Maximum of all output pins	VCC and VCC2 I/O	Ports P411 to P415, P511 to P515, P708 to P715, P805 to P807 (total 21 pins)	1.62 V or above	$\Sigma I_{OL\ (max)}$	—	—	40	mA
			Ports P212, P213, P400 to P410 (total 13 pins)	1.62 V or above		—	—	40

Table 62.6 I/O I_{OH}, I_{OL} (5 of 5)

Parameter				VCC/VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit
Permissible output current (maxvalue of total of all pins)	Maximum of all output pins	VCC and VCC2 I/O	Ports P202, P203, P313 to P315, P900, P901 (total 7 pins)	1.62 V or above	$\Sigma I_{OL\ (max)}$	—	—	40	mA
			Ports P100 to P107, P800, P801 (total 10 pins)	1.62 V or above		—	—	40	
			Ports P500 to P502, P802 to P804, P808 to P812 (total 11 pins)	1.62 V or above		—	—	40	
		AVCC0 I/O		1.62 V or above		—	—	33	
		VCC_USB I/O		1.62 V or above		—	—	33	

Note 1. This is the value when low driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability except for P400 and P401 is retained in Deep Software Standby mode.
Note 2. This is the value when middle driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability except for P400 and P401 is retained in Deep Software Standby mode.
Note 3. This is the value when high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability except for P400 and P401 is retained in Deep Software Standby mode.
Note 4. This is the value when high-speed high driving ability is selected in the Port Drive Capability in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 5. Except for P200, P214 and P215, which is an input port.

Caution: To protect the reliability of the MCU, the output current values should not exceed the values in this table. The average output current indicates the average value of current measured during 100 µs.

62.2.4 I/O V_{OH}, V_{OL}, and Other Characteristics

Table 62.7 I/O V_{OH}, V_{OL}, and other characteristics (1 of 3)

Parameter		VCC/ VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit	Test conditions
Output voltage	IIC	2.70 V or above	V_{OL}	—	—	0.4	V	I_{OL} = 3.0 mA
			V_{OL}	—	—	0.6		I_{OL} = 6.0 mA
		1.62 V to 1.95 V	V_{OL}	—	—	VCC × 0.2		I_{OL} = 2.0 mA

			V_{OL}	—	—	0.5		I_{OL} = 1.0 mA

Table 62.7 I/O V_{OH}, V_{OL}, and other characteristics (3 of 3)

Parameter		VCC/ VCC2/ AVCC0/ VCC_USB	Symbol	Min	Typ	Max	Unit	Test conditions
Input leakage current	RES	1.62 V or above	$\|I_{in}\|$	—	—	5	μA	V_{in} = 0 V V_{in} = 5.5 V
	Port P200, P214, P215	1.62 V or above		—	—	1		V_{in} = 0 V V_{in} = VCC
Three-state leakage current (off state)	5 V-tolerant ports	1.62 V or above	$\|I_{TSI}\|$	—	—	5	μA	V_{in} = 0 V V_{in} = 5.5 V
	Other ports (except for port P200, P214, P215)	1.62 V or above		—	—	1		V_{in} = 0 V V_{in} = VCC, VCC2, AVCC0, VCC_USB
Input pull-up MOS current	Ports P0 to PD	2.70 V or above	I_p	−300	—	−10	μA	VCC, VCC2, AVCC0, VCC_USB = 2.7 to 3.63 V V_{in} = 0 V
		1.62 V or above		−300	—	−5		VCC, VCC2, AVCC0, VCC_USB = 1.62 to 3.63 V V_{in} = 0 V
Pull-up current serving as the SCL current source	I3C*3	3.00 to 3.63 V	I_{cs}	3	—	12	mA	VCC = 3.0 to 3.63 V V_{in} = 0.3 × VCC to 0.7 × VCC
		1.65 to 1.95 V						VCC = 1.65 to 1.95 V V_{in} = 0.3 × VCC to 0.7 × VCC
Input capacitance	Ports P014, P015	—	C_{in}	—	—	16	pF	Vbias = 0 V Vamp = 20 mV f = 1 MHz Ta = 25°C
	Ports P814/ USB_DP, P815/ USB_DM	—		—	—	12		
	Ports P400, P401, P409, P410, P511, P512, P708, P709, USBHS_DP, USBHS_DM	—		—	—	10		
	Other input pins	—		—	—	8		

Note 1. SCL0_A, SDA0_A, SCL1_A, SDA1_A, SCL2_A, SDA2_A (total 6 pins).
Note 2. This is the value when high speed high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 3. I3C_SCL0 (1 pin). This is the value when IIC high speed mode is selected.
Note 4. This is the value when high speed high driving ability is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: SDA0_B, SCL0_B, SDA1_B, SCL1_B, SDA2_B, SCL2_B.

62.2.5 Operating and Standby Current

Current value of SiP Flash memory is not included in this section, refer to the datasheet of IS25WX064.

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.
Note 2. Measured with clocks supplied to the peripheral functions and peripherals being operated. This does not include the BGO operation.
Note 3. I_{DD} depends on f (CPUCLK0 and ICLK) as follows. The ICLK items in the formula include CPU1 current.
I_{DD} Typ. = 0.25 × fCPUCLK0 + 0.77 × fICLK + 21 (unit : mA, fCPUCLK0 and fICLK are MHz)
I_{DD} Max.(VSCR_1, 95℃) = 0.22 × fCPUCLK0 + 0.80 × fICLK + 477 (unit : mA, fCPUCLK0 and fICLK are MHz)
I_{DD} Max.(VSCR_1, 105℃) = 0.22 × fCPUCLK0 + 0.80 × fICLK + 553 (unit : mA, fCPUCLK0 and fICLK are MHz)
I_{DD} Max.(VSCR_1, 125℃) = 0.22 × fCPUCLK0 + 0.80 × fICLK + 709 (unit : mA, fCPUCLK0 and fICLK are MHz)
I_{DD} Max.(VSCR_2, 95℃) = 0.22 × fCPUCLK0 + 0.93 × fICLK + 464 (unit : mA, fCPUCLK0 and fICLK are MHz)
I_{DD} Max.(VSCR_2, 105℃) = 0.22 × fCPUCLK0 + 0.93 × fICLK + 537 (unit : mA, fCPUCLK0 and fICLK are MHz)
I_{DD} Max.(VSCR_2, 125℃) = 0.22 × fCPUCLK0 + 0.93 × fICLK + 691 (unit : mA, fCPUCLK0 and fICLK are MHz)
Note 4. Typical DCDC efficiency and the voltage of the test conditions are applied.
Note 5. Do not let actual consumption current during operation exceed the current value described here.
Note 6. The power consumption is calculated as Power = VCC × I_{cc} + VCC_DCDC × I_{cc_DCDC}.

Table 62.9 Current of high-speed mode, maximum condition (MVE and peripheral operation) (External VDD mode)

The more practical I_{CC_DCDC} value can be obtained with the following formula.

I_{CC_DCDC} = (I_{DD} × VCL) / (VCC_DCDC × efficiency)

Where: VCL and VCC are the voltage of VCL pin and VCC pin respectively, and efficiency is shown in the following figures.

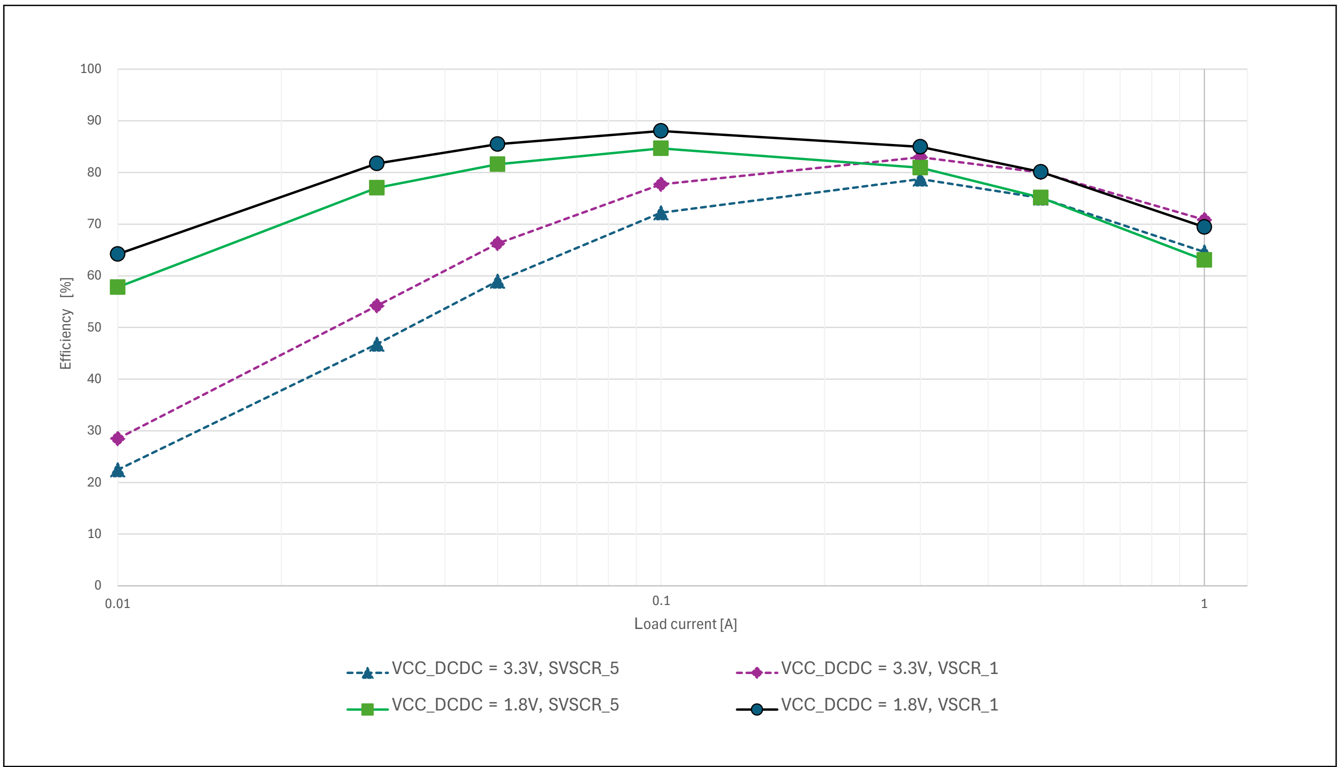

Figure 62.19 Typical DCDC efficiency (%) vs load current (A) in High-speed mode and Software Standby mode (SSCR1.SS2LP = SS2LP_1), Tj = 25 °C

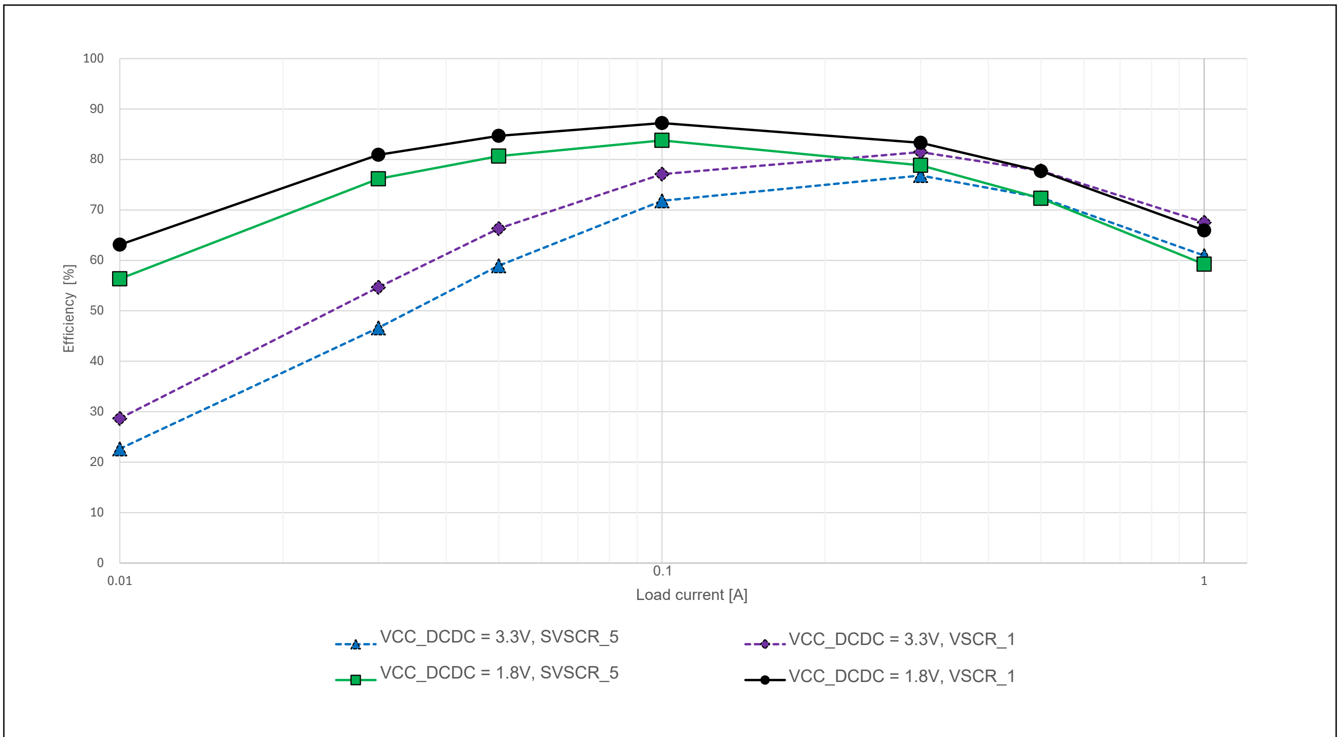

Figure 62.20 Typical DCDC efficiency (%) vs load current (A) in High-speed mode and Software Standby mode (SSCR1.SS2LP = SS2LP_0), Tj = 125 °C

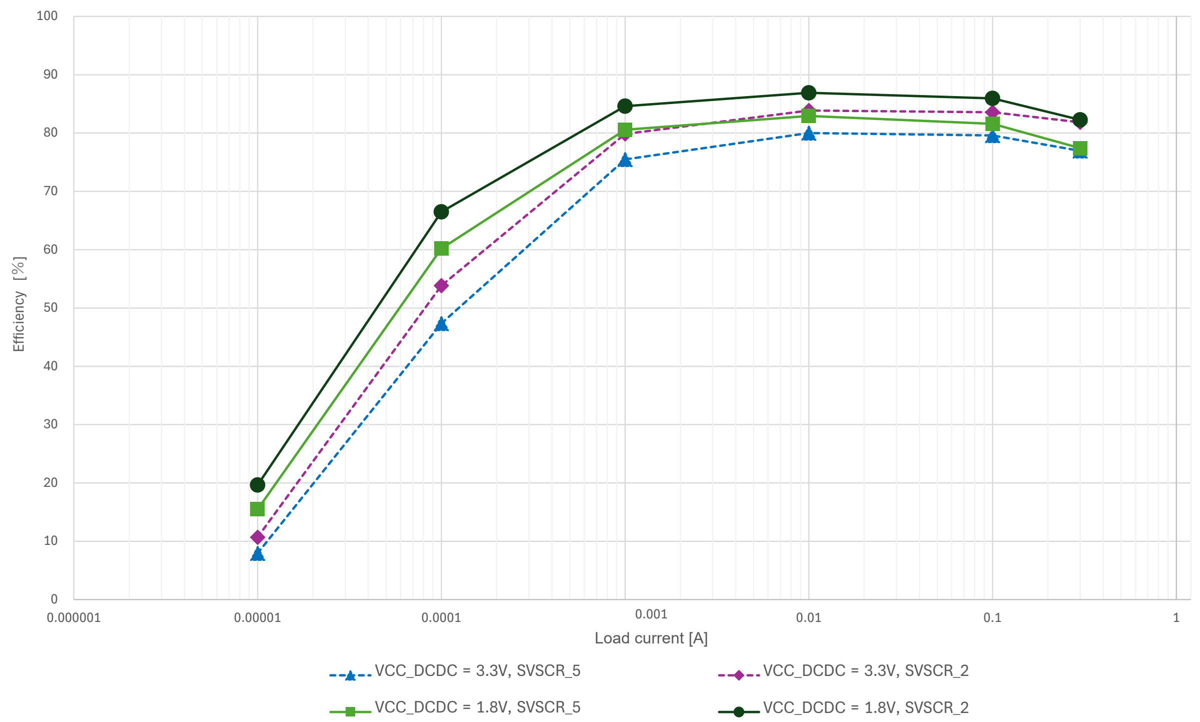

Figure 62.21 Typical DCDC efficiency (%) vs load current (A) in Software Standby mode (SSCR1.SS2LP = SS2LP_1), Tj = 25 °C

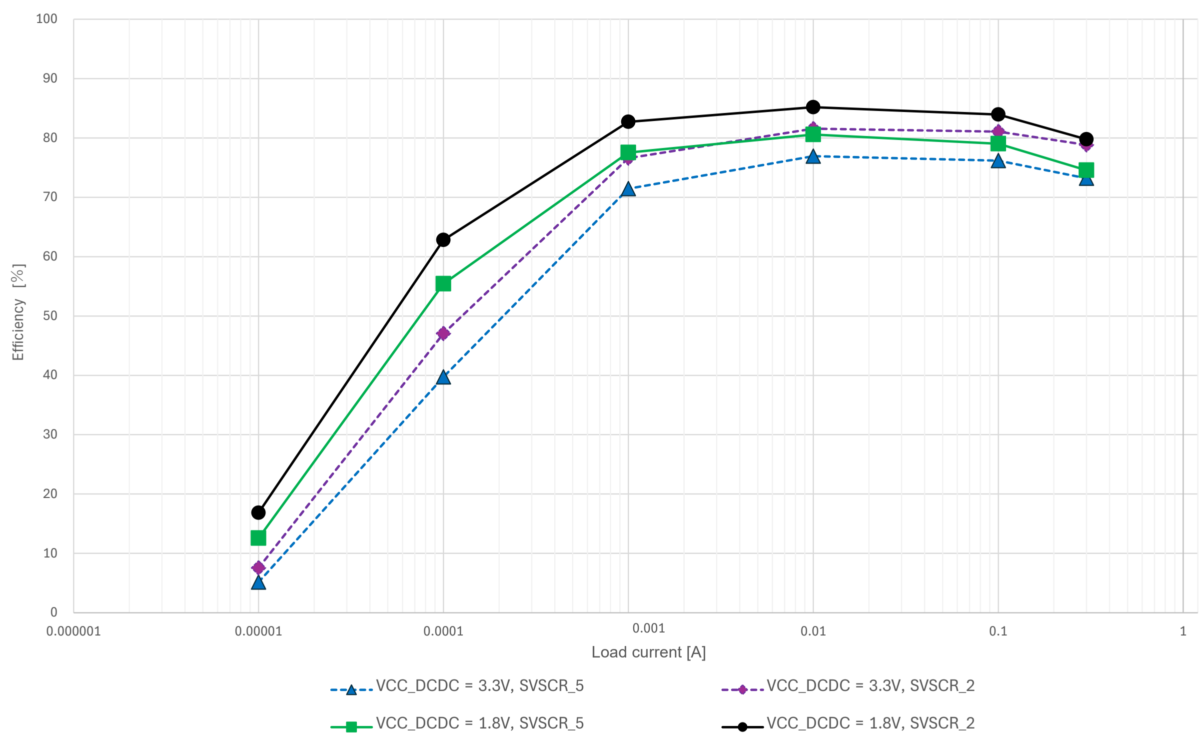

Figure 62.22 Typical DCDC efficiency (%) vs load current (A) in Software Standby mode (SSCR1.SS2LP = SS2LP_1), Tj = 125 °C

62.2.6 VCC Rise and Fall Gradient and Ripple Frequency

Table 62.40 VCC rise and fall gradient characteristics at power on/off

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
VCC rising gradient at power on*1		SrVCC	0.0084	—	20	ms/V	—
VCC falling gradient at power off	VBATT function is disabled*1	SfVCC1	0.0084	—	—	ms/V	—
	VBATT function is enabled.	SfVCC2	1.0000	—	—		—

Note 1. In case the VCC voltage crosses V_{POR1}

Table 62.41 VCC ripple frequency and gradient characteristics during operation

The ripple voltage must meet the allowable ripple frequency $f_{r(VCC)}$ within the range between the VCC upper limit (3.63 V) and lower limit (1.62 V). When the VCC change exceeds VCC ±10%, the allowable voltage change rising and falling gradient dt/dVCC must be met.

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Allowable ripple frequency	$f_{r(VCC)}$	—	—	10	kHz	Figure 62.23 $V_{r(VCC)} \le VCC \times 0.2$
		—	—	1	MHz	Figure 62.23 $V_{r(VCC)} \le VCC \times 0.08$
		—	—	10	MHz	Figure 62.23 $V_{r(VCC)} \le VCC \times 0.06$
Allowable voltage change rising and falling gradient	dt/dVCC*1	1.0	—	—	ms/V	When VCC change exceeds VCC ±10%

Note 1. In case the VCC voltage does not cross $_{VPOR1}$.

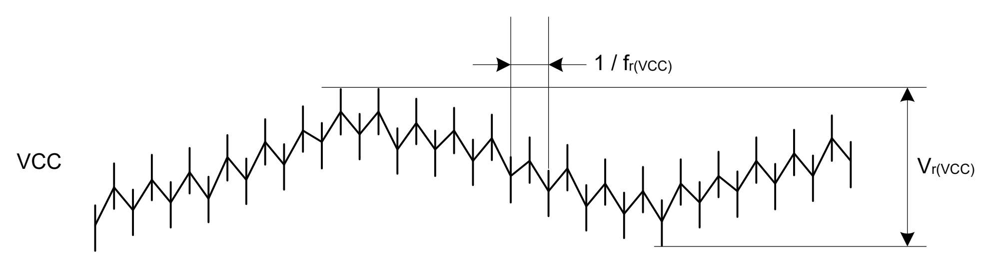

Figure 62.23 Ripple waveform

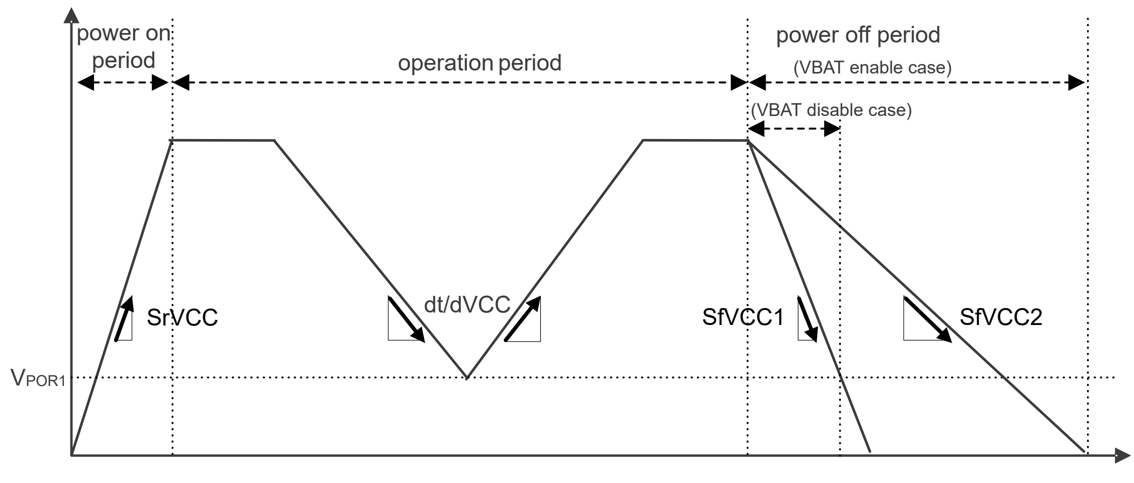

Figure 62.24 VCC rising and falling waveform

62.2.7 Power Supply Rise Gradient

Table 62.42 VCC_USB rise gradient characteristics at power on

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
VCC_USB rising gradient at power on	SrVCC_USB	8.4	—	—	μs/V	—

Table 62.43 VCC_USBHS and AVCC_USBHS rise gradient characteristics at power on

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
VCC_USBHS (=AVCC_USBHS) rising gradient at power on	SrVCC_USBHS	8.4	—	—	μs/V	—

62.2.8 Thermal Characteristics

Maximum value of junction temperature (Tj) must not exceed the value of section 62.2.1. Tj/Ta Definition.

Tj is calculated by either of the following equations.

- Tj = Ta + θja × Total power consumption
- Tj = Tt + Ψjt × Total power consumption
  - Tj : Junction Temperature (°C)
  - Ta : Ambient Temperature (°C)
  - Tt : Top Center Case Temperature (°C)
  - θja : Thermal Resistance of "Junction"-to-"Ambient" (°C/W)
  - Ψjt : Thermal Resistance of "Junction"-to-"Top Center Case" (°C/W)
- Total power consumption = Voltage × (Leakage current + Dynamic current)
- Leakage current of IO = Σ (I_{OL} × V_{OL}) /Voltage + Σ (|I_{OH}| × |VCC – V_{OH}|) /Voltage
- Dynamic current of IO = Σ IO (C_{in} + C_{load}) × IO switching frequency × Voltage
  - C_{in}: Input capacitance
  - C_{load}: Output capacitance

Regarding θja and Ψjt, see Table 62.44.

Table 62.44 Thermal Resistance

Parameter	Package	Symbol	Value*1	Unit	Test conditions
Thermal Resistance	176-pin HLQFP (PLQP0176K?-A)	θja	15	°C/W	JESD 51-2 and 51-7 compliant
	224-pin BGA (PLBG0224J?-A)		21		JESD 51-2 and 51-9 compliant
	289-pin BGA (PLBG0289J?-A)		20		
	303-pin BGA (PLBG0303G?-A)		17		
	176-pin HLQFP (PLQP0176K?-A)	Ψjt	0.3	°C/W	JESD 51-2 and 51-7 compliant
	224-pin BGA (PLBG0224J?-A)		0.3		JESD 51-2 and 51-9 compliant
	289-pin BGA (PLBG0289J?-A)		0.3		
	303-pin BGA (PLBG0303G?-A)		0.5		

Note 1. The values are reference values when the 4-layer board is used. Thermal resistance depends on the number of layers or size of the board. For details, see the JEDEC standards.

62.2.8.1 Calculation Guide of Maximum Current

Table 62.45 Power consumption of each unit (DCDC mode) (1 of 3)

Dynamic current/ Leakage current	MCU Domain	Category	Item	Symbol	Frequency [MHz]	Current [μA/MHz]	Current [mA]	Condition
Leakage current	Analog	Regulator and Leak*1	Tj = 95°C	I_{CC}	—	—	2.51	—

Table 62.47 Outline of operation for each unit (1 of 2)

Peripheral	Outline of operation
RTC	RTC is operating with LOCO.
GPT	Operating modes is set to saw-wave PWM mode. GPT is operating with PCLKD
POEG	Only clear module stop bit.
PDG	PDG is applying delay of 1/128 times GTCLK period.
AGT	AGT is operating with PCLKB.
ULPT	ULPT is operating with LOCO.
WDT	WDT is operating with PCLKB.
IWDT	IWDT is operating with IWDTCLK.

Table 62.47 Outline of operation for each unit (2 of 2)

Peripheral	Outline of operation
ESWM	Communication mode is set to 1 Gbps, MAC Loop back. gPTP timer is enabled. ESWM is operating continuous transmission and reception on two ports simultaneously.
USBFS	Transfer types are set to bulk transfer. USBFS is operating using Full-speed transfer (12 Mbps).
USBHS	Transfer types are set to bulk transfer. USBHS is operating using High-speed transfer.
SCI	SCI is transmitting data in clock synchronous mode.
IIC	Communication format is set to I2C-bus format. IIC is transmitting data in master mode.
I3C	Communication format is set to I3C SDR format. I3C is transmitting data in master mode (12.5MHz).
CANFD	CANFD is transmitting and receiving data in self-test mode 1.
SPI	SPI mode is set to SPI operation (4-wire method). SPI master/slave mode is set to master mode. SPI is transmitting 32-bit width data.
OSPI	OSPI is issuing memory write command to HyperRAM.
SSIE	Communication mode is set to Master. System word length is set to 32 bits. Data word length is set to 20 bits. SSIE is transmitting data using I2S format.
SDHI	Transfer bus mode is set to 8-bit wide bus mode. SDHI is issuing CMD24 (single-block write).
PDMIF	PDMIF is detecting sound activity for 3 channels.
ADC16H	Resolution is set to 16-bit accuracy. Conversion Data Operation Control B Register is set to 16 times average mode. ADC is converting the analog input in continuous scan mode. ADC is operating with ADCCLK.
DAC12	DAC12 is outputting the conversion result while updating the value of data register.
TSN	TSN is operating.
ACMPHS	ACMPHS is operating.
CEU	CEU is capturing data and transferring to the SRAM.
ELC	Only clear module stop bit.
RSIP-E50D	RSIP is doing self-test operation.
DOTF	DOTF is doing decryption with AES.
CRC	CRC is generating CRC code using 32-bit CRC32-C polynomial.
DOC	DOC is operating in data comparison mode.
CAC	Measurement target clocks is set to PCLKB. Measurement reference clocks is set to PCLKB. CAC is measuring the clock frequency accuracy.
DMAC	Bit length of transfer data is set to 32 bits. Transfer mode is set to block transfer mode. DMAC is transferring data from SRAM0 to SRAM0.
DTC	Bit length of transfer data is set to 32 bits. Transfer mode is set to block transfer mode. DTC is transferring data from SRAM0 to SRAM0.

62.2.8.2 Example of Tj Calculation

Assumption :

- Package 289-pin BGA : θja = 20 °C/W
- Ta = 65 °C
- $I_{CC} + I_{CC\_DCDC}$ = 320 mA
- VCC = 3.5 V (VCC = VCC2 = AVCC0 = AVCC_USBHS = VCC_USB = VCC_USBHS)
- I_{OH} = 1 mA, V_{OH} = VCC – 0.5 V, 12 Outputs
- I_{OL} = 20 mA, V_{OL} = 1.0 V, 8 Outputs
- I_{OL} = 1 mA, V_{OL} = 0.5 V, 12 Outputs

- C_{in} = 8 pF, 32 pins, Input frequency = 10 MHz
- C_{load} = 30 pF, 32 pins, Output frequency = 10 MHz

Static current of IO = Σ (VOL × IOL) / Voltage + Σ ((VCC - VOH) × IOH) / Voltage

= (20 mA × 1 V) × 8 / 3.5 V + (1 mA × 0.5 V) × 12 / 3.5 V + ((VCC - (VCC - 0.5 V)) × 1 mA) × 12 / 3.5 V

= 45.7 mA + 1.71 mA + 1.71 mA

= 49.1 mA

Dynamic current of IO = Σ IO (Cin + Cload) × IO switching frequency × Voltage

= ((8 pF × 32) × 10 MHz + (30 pF × 32) × 10 MHz) × 3.5 V

= 42.6 mA

Total power consumption = Voltage × (Static current + Dynamic current)

= (320 mA × 3.5 V) + (49.1 mA + 42.6 mA) × 3.5 V

= 1441 mW (1.441 W)

Tj = Ta + θja × Total power consumption

= 65 °C + 20 °C/W × 1.441W

= 93.82 °C

62.3 AC Characteristics

62.3.1 Frequency

HOCO clock oscillation stabilization wait time*2		t_{HOCOWT}	—	—	15.0	µs	—
HOCO stop width time		$t_{HOCOSTP}$	1	—	—	µs	Figure 62.31
HOCO period jitter		—	-3	—	3	ps	—
FLL stabilization wait time (Standard Product)		t_{FLLWT}	—	—	1.92	ms	—
FLL stabilization wait time (SiP Product)		t_{FLLWT}	—	—	2.15	ms	—
PLL1/PLL2 clock frequency		f_{PLL}	60	—	1200	MHz	—
PLL1/PLL2 clock oscillation stabilization wait time		t_{PLLWT}	—	—	50	µs	Figure 62.29
PLL1/PLL2 period jitter		—	—	±52	—	ps	—

Table 62.49 Clock timing except for sub-clock oscillator (3 of 3)

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
PLL1/PLL2 long term jitter	—	—	±300	—	ps	Term: 1 µs, 10 µs

Note 1. When setting up the main clock oscillator, ask the oscillator manufacturer for an oscillation evaluation, and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended value.
After changing the setting in the MOSCCR.MOSTP bit to start main clock operation, read the OSCSF.MOSCSF flag to confirm that it is 1, and then start using the main clock oscillator.

Note 2. This is the time from release from reset state until the HOCO oscillation frequency (f_{HOCO}) reaches the range for guaranteed operation.

Table 62.50 Clock timing for the sub-clock oscillator

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Sub-clock frequency	f_{SUB}	—	32.768	—	kHz	—
Sub-clock oscillation stabilization wait time	$t_{SUBOSCWT}$	—	—	—*1	s	Figure 62.30

Note 1. When setting up the sub-clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time.
After changing the setting in the SOSCCR.SOSTP bit to start sub-clock operation, only start using the sub-clock oscillator after the sub-clock oscillation stabilization time elapses with an adequate margin. A value that is two times the value shown is recommended.

Note 1. When the frequency of the crystal is 48 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 1.
Note 2. When the frequency of PLL1P is 1 GHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 16.
Note 3. When the frequency of the external clock is 48 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 1.
Note 4. When the frequency of PLL1P is 1 GHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 16.
Note 5. The Sub-clock oscillator frequency is 32.768 kHz and the greatest value of the internal clock division setting is 1.
Note 6. The HOCO frequency is 20 MHz and the greatest value of the internal clock division setting is 1.
Note 7. The PLL frequency is 1 GHz and the greatest value of the internal clock division setting is 16.
Note 8. The MOCO frequency is 8 MHz and the greatest value of the internal clock division setting is 1.
Note 9. For details, see SSCR1.SS2FR bit in the section 11, Low Power Mode.
Note 10. The recovery time can be calculated with the equation of t_{Common} + max(t_{OSCSTB}, t_{PG1}, t_{PGCK}) + max(t_{PG2}, t_{LPW}). And they can be determined with the following values and equations. For n, the greatest value is selected from among the internal clock(CPUCLK0, CPUCLK1, NPUCLK, ICLK, MRICLK, MRPCLK, PCLKm, FCLK, BCLK and EBCLK) division settings (m = A to E). t_{OSCSTB} in the table below means the time when each oscillator is active. When multiple oscillators are active, t_{OSCSTB} is determined by the longest t_{OSCSTB} among the active oscillators.
Note 11. The ICLK frequency is 250 MHz. This recovery time corresponds to t_{PG2}.
Note 12. When Ccyc is 27. See Table 62.54.

Table 62.53 Each element of recovery time

Mode	Wakeup time	Oscillation keep	Fast return function	Typ						Max						Unit
				t_{Common}	t_{OSCSTB}*1	t_{PG1}	t_{PGCK}	t_{PG2}	t_{LPW}	t_{Common}	t_{OSCSTB}*1	t_{PG1}	t_{PGCK}	t_{PG2}	t_{LPW}

62.3.6 Bus Timing

Table 62.56 Bus timing (1 of 3)

Condition 1: When using the CS area controller (CSC).
VCC = VCC_DCDC = VBATT = 1.62 V to 3.6 V, VCC2 = 1.62 V to 3.63 V
BCLK = 8 to 120 MHz, BCLKA = 8 to 120 MHz, EBCLK = 8 to 60 MHz (When VCC = VCC_USB = VBATT = 2.70 to 3.63 V)
BCLK = BCLKA = 8 to 60 MHz, EBCLK = 8 to 30 MHz (When VCC = VCC_USB = VBATT = 1.62 to 3.63 V)
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 30 pF
EBCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 2: When using the SDRAM area controller (SDRAMC).
BCLK = SDCLK = 8 to 125 MHz, BCLKA = SDCLK = 8 to 133 MHz
VCC = VCC_DCDC = VBATT = 3.0 to 3.63 V, VCC2 = 1.62 V to 3.63V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
SDCLK: High-speed high drive output is selected in the port drive capability bit in the PmnPFS register.
Others: High drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 3: When using the SDRAM area controller (SDRAMC) and CS area controller (CSC) simultaneously.
BCLK = SDCLK = 8 to 66 MHz, BCLKA = SDCLK = 8 to 66 MHz
VCC = VCC_DCDC = VBATT = 3.0 to 3.63 V, VCC2 = 1.62 V to 3.63V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
EBCLK/SDCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

Table 62.56 Bus timing (2 of 3)

Condition 1: When using the CS area controller (CSC).
VCC = VCC_DCDC = VBATT = 1.62 V to 3.6 V, VCC2 = 1.62 V to 3.63 V
BCLK = 8 to 120 MHz, BCLKA = 8 to 120 MHz, EBCLK = 8 to 60 MHz (When VCC = VCC_USB = VBATT = 2.70 to 3.63 V)
BCLK = BCLKA = 8 to 60 MHz, EBCLK = 8 to 30 MHz (When VCC = VCC_USB = VBATT = 1.62 to 3.63 V)
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 30 pF
EBCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 2: When using the SDRAM area controller (SDRAMC).
BCLK = SDCLK = 8 to 125 MHz, BCLKA = SDCLK = 8 to 133 MHz
VCC = VCC_DCDC = VBATT = 3.0 to 3.63 V, VCC2 = 1.62 V to 3.63V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
SDCLK: High-speed high drive output is selected in the port drive capability bit in the PmnPFS register.
Others: High drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 3: When using the SDRAM area controller (SDRAMC) and CS area controller (CSC) simultaneously.
BCLK = SDCLK = 8 to 66 MHz, BCLKA = SDCLK = 8 to 66 MHz
VCC = VCC_DCDC = VBATT = 3.0 to 3.63 V, VCC2 = 1.62 V to 3.63V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
EBCLK/SDCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

Parameter	Condition	VCC/VCC2	Symbol	Min	Max	Unit	Test conditions
Write data hold time	Condition1	2.70 V or above	t_{WDH}	1.0	—	ns	Figure 62.38 to Figure 62.44
		1.62 V or above		1.0	—	ns	
	Condition3	3.0 V or above		1.0	10.8	ns	
WAIT setup time	Condition1	2.70 V or above	t_{WTS}	12.5	—	ns	
		1.62 V or above		20.5	—	ns	
	Condition3	3.0 V or above		10.8	—	ns	
WAIT hold time	Condition1	2.70 V or above	t_{WTH}	0	—	ns	
		1.62 V or above		0	—	ns	
	Condition3	3.0 V or above		0	—	ns	

Table 62.56 Bus timing (3 of 3)

Condition 1: When using the CS area controller (CSC).
VCC = VCC_DCDC = VBATT = 1.62 V to 3.6 V, VCC2 = 1.62 V to 3.63 V
BCLK = 8 to 120 MHz, BCLKA = 8 to 120 MHz, EBCLK = 8 to 60 MHz (When VCC = VCC_USB = VBATT = 2.70 to 3.63 V)
BCLK = BCLKA = 8 to 60 MHz, EBCLK = 8 to 30 MHz (When VCC = VCC_USB = VBATT = 1.62 to 3.63 V)
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 30 pF
EBCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 2: When using the SDRAM area controller (SDRAMC).
BCLK = SDCLK = 8 to 125 MHz, BCLKA = SDCLK = 8 to 133 MHz
VCC = VCC_DCDC = VBATT = 3.0 to 3.63 V, VCC2 = 1.62 V to 3.63V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
SDCLK: High-speed high drive output is selected in the port drive capability bit in the PmnPFS register.
Others: High drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 3: When using the SDRAM area controller (SDRAMC) and CS area controller (CSC) simultaneously.
BCLK = SDCLK = 8 to 66 MHz, BCLKA = SDCLK = 8 to 66 MHz
VCC = VCC_DCDC = VBATT = 3.0 to 3.63 V, VCC2 = 1.62 V to 3.63V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
EBCLK/SDCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

62.3.7 I/O Ports, POEG, GPT, AGT, ULPT and ADC Trigger Timing

Table 62.57 I/O ports, POEG, GPT, AGT, ULPT and ADC trigger timing (1 of 4)

GPT32 Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.
If GPT pins are specified across the VCC I/O and VCC2 I/O, characteristics below is guaranteed only when VCC = VCC2.
AGT Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	Min	Max	Unit	Test conditions
I/O ports	Input data pulse width	t_{PRW}	5.5	—	t_{Icyc}	Figure 62.52
	EXCIN input frequency	t_{EXCIN}	—	36	kHz	
	RTCICn (n = 0 to 2) input pulse width	t_{RTCICW}	13.89	—	μs	Figure 62.53

Table 62.57 I/O ports, POEG, GPT, AGT, ULPT and ADC trigger timing (2 of 4)

GPT32 Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.
If GPT pins are specified across the VCC I/O and VCC2 I/O, characteristics below is guaranteed only when VCC = VCC2.
AGT Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.

Parameter			Symbol	Min	Max	Unit	Test conditions
POEG	POEG input trigger pulse width		t_{POEW}	3	—	t_{Pcyc}	Figure 62.54
	Output disable time	Input level detection of the GTETRGn pin (via flag)	t_{POEGDI}	—	2 PCLKB + 0.34	μs	Figure 62.55 When the digital noise filter is not in use (POEGGn.NFEN = 0 (n = A to D))
		Detection of the output stopping signal from GPT (deadtime error, simultaneous high output, or simultaneous low output)	t_{POEGDE}	—	0.5	μs	Figure 62.56
		Edge detection signal from a comparator	t_{POEGDC}	—	3 PCLKB + 0.5	μs	Figure 62.57 The time is that when the noise filter for ACMPHS is not in use (CMPCTL.CDFS [1:0] = 00b) and excludes the time for detection by ACMPHS.
		Register setting	t_{POEGDS}	—	0.3	μs	Figure 62.58 Time for access to the register is not included.
		Oscillation stop detection	$t_{POEGDOS}$	—	1.3	μs	Figure 62.59
		Level detection signal from a comparator	$t_{POEGDDC}$	—	0.5	μs	Figure 62.60 The time is that when the noise filter for ACMPHS is not in use (CMPCTL.CDFS [1:0] = 00b) and excludes the time for detection by ACMPHS.

		1.62 V or above		12	—		
	ULPTO, ULPTOA, ULPTOB output cycle	2.70 V or above	t_{ULCYC2}	64	—	μs	
		1.62 V or above		64	—		
ADC	ADC trigger input pulse width	2.70 V or above	t_{TRGW}	1.5	—	t_{ADcyc}	Figure 62.67
		1.62 V or above		3.0	—		

Note: t_{Icyc}: ICLK cycle, t_{Pcyc}: PCLKB cycle, t_{PDcyc}: GTCLK cycle, $t_{ULPTLCLK}$: ULPTLCLK cycle, t_{ADcyc}: ADCLK cycle.
Note 1. For Cycle and Time, the longer time characteristics are applied.
Note 2. Constraints on input cycle:
When not switching the source clock: $t_{Pcyc} \times 2 < t_{ACYC}$ should be satisfied.
When switching the source clock: $t_{Pcyc} \times 6 < t_{ACYC}$ should be satisfied.
Note 3. Constraints on input cycle:
ULPTEVI: $t_{Pcyc} \times 2 < t_{ULCYC}$ should be satisfied.
ULPTEE: $t_{ULPTLCLK} \times 2 < t_{ULCYC}$ should be satisfied.

	Slave		1.62 V or above					

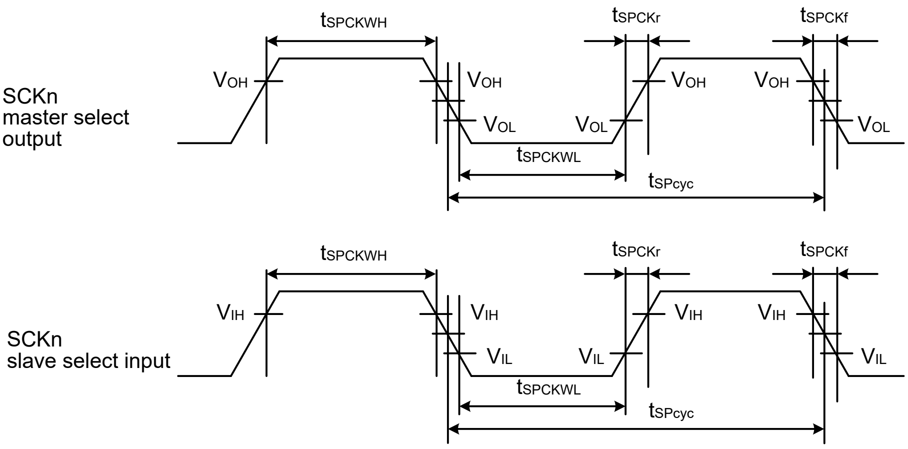
Table 62.61 SCI timing (Clock synchronous mode) (2 of 2)

Condition 1: VCC/VCC2 = 2.70 V or above
High drive output is selected in the Port Drive Capability bit in the PmnPFS register.
If SCI pins are specified across the VCC I/O and VCC2 I/O, characteristics below is guaranteed only when VCC = VCC2.
Condition 2: VCC/VCC2 = 1.62 V or above
Following pins have high-speed high-drive output selected in the Port Drive Capability bit in the PmnPFS register: SCK1_A, SCK1_C, SCK3_A, SCK4_A, SCK4_B, SCK4_C and SCK6_B
Other pins have high drive output is selected in the Port Drive Capability bit in the PmnPFS register.
If SCI pins are specified across the VCC I/O and VCC2 I/O, characteristics below is guaranteed only when VCC=VCC2.

Parameter		High Speed/ Default	VCC/VCC2	Symbol	Min	Max	Unit	Note
SCK clock rise and fall time	Output	—	2.70 V or above	t_{SCKr}, t_{SCKf}	—	3.3	ns	
			1.62 V or above		—	6.6		
	Input	—	1.62 V or above		—	0.1*3	t_{Scyc}	
Data input setup time	Master	High Speed*1	2.70 V or above	t_{SU}	2.6	—	ns	
			1.62 V or above		2.6	—		
		Default*2	2.70 V or above		2.8	—		
			1.62 V or above		2.8	—		
	Slave	Default*2	2.70 V or above		3.3	—		
			1.62 V or above		5.3	—		
Data input hold time	Master	High Speed*1	2.70 V or above	t_H	7.5	—	ns	
			1.62 V or above		9.5	—		
		Default*2	2.70 V or above		7.5	—		
			1.62 V or above		9.5	—		
	Slave	Default*2	2.70 V or above		3.0	—		
			1.62 V or above		5.0	—		
Data output delay	Master	High Speed*1	2.70 V or above	t_{OD}	—	5	ns	
			1.62 V or above		—	5		
		Default*2	2.70 V or above		—	7.3		
			1.62 V or above		—	7.3		
	Slave	High Speed*1	2.70 V or above		—	12.5		
			1.62 V or above		—	20.5		
		Default*2	2.70 V or above		—	18.5		
			1.62 V or above		—	26.5		
Data rise and fall time	Output	—	2.70 V or above	t_{Dr}, t_{Df}	—	3.3	ns	
			1.62 V or above		—	6.6		
	Input	—	1.62 V or above		—	1	μs	

Note: t_{Tcyc}: TCLK cycle.
Note 1. Must use pins that have a letter appended to their name, for instance _A, _B, _C, to indicate group membership. SCI0, SCI1, SCI2, SCI3 and SCI9 are instance _A, SCI4 and SCI5 are instance _B, SCI6, SCI7 and SCI8 are instance _C.
Note 2. All pins of group membership can be used.
Note 3. 1 μs at the longest



V_{OH} = 0.7 × VCC or 0.7 × VCC2, V_{OL} = 0.3 × VCC or 0.3 × VCC2,
V_{IH} = 0.7 × VCC or 0.7 × VCC2, V_{IL} = 0.3 × VCC or 0.3 × VCC2

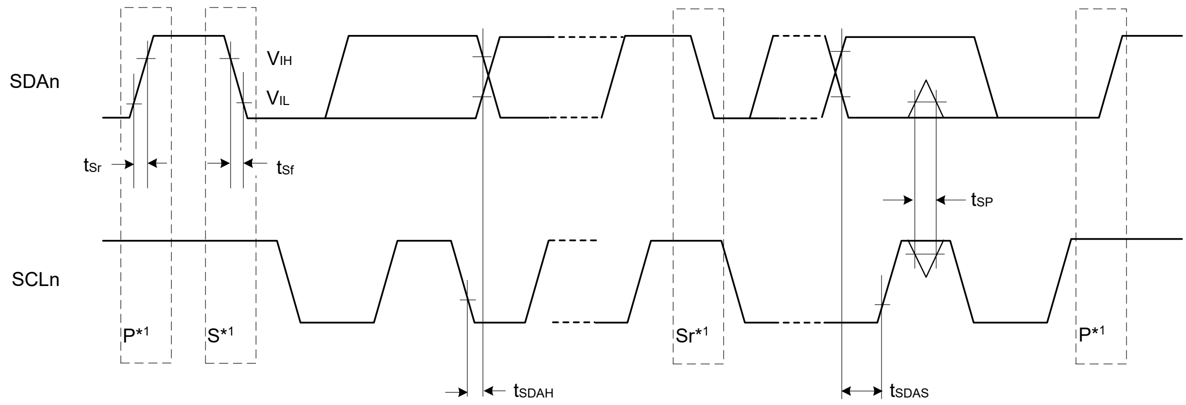
Table 62.62 SCI timing (Simple IIC mode)

Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.
VCC/VCC2 : 1.62 V or above
If SCI pins are specified across the VCC I/O and VCC2 I/O, characteristics below is guaranteed only when VCC = VCC2.

Parameter		Symbol	Min	Max	Unit	Note
Simple IIC (Standard mode)	SCL, SDA input rise time	t_{Sr}	—	1000	ns	
	SCL, SDA input fall time	t_{Sf}	—	300	ns	
	SCL, SDA input spike pulse removal time	t_{SP}	0	4 × t_{Tcyc}	ns	
	Data input setup time	t_{SDAS}	250	—	ns	
	Data input hold time	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b*1	—	400	pF	
Simple IIC (Fast mode)	SCL, SDA input rise time	t_{Sr}	—	300	ns	
	SCL, SDA input fall time	t_{Sf}	—	300	ns	
	SCL, SDA input spike pulse removal time	t_{SP}	0	4 × t_{Tcyc}	ns	
	Data input setup time	t_{SDAS}	100	—	ns	
	Data input hold time	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b*1	—	400	pF	

Note: t_{Tcyc}: TCLK cycle.
Note 1. C_b indicates the total capacity of the bus line.



Test conditions:
V_{IH} = VCC × 0.7 or VCC2 × 0.7
V_{IL} = VCC × 0.3 or VCC2 × 0.3
V_{OL} = 0.6 V, I_{OL} = 6 mA

Note: n = 0 to 4, 9
Note 1. S, P, and Sr indicate the following conditions:
S: Start condition
P: Stop condition
Sr: Restart condition

	SCL, SDA capacitive load	C_b	2.70 V or above	—	400	pF	
			1.62 to 1.95 V				

Table 62.65 IIC timing (1) (2 of 2)

Conditions:

1. Middle drive output is selected when VCC is 2.70 V or above, High drive output is selected when VCC is 1.62 to 1.95 V in the port drive capability bit in the PmnPFS register for the following pins: SDA0_B, SCL0_B, SDA1_B, SCL1_B, SDA2_B, SCL2_B
2. The following pins do not require setting: SCL0_A, SDA0_A. SCL1_A, SDA1_A. SCL2_A, SDA2_A
3. Use pins that have a letter appended to their names, for instance "_A" or "_B", to indicate group membership.

For the IIC interface, the AC portion of the electrical characteristics is measured for each group.

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
IIC (Fast mode) ICFER.FMPE = 0	SCL input cycle time	t_{SCL}	2.70 V or above	6 (12) × t_{IICcyc} + 600	—	ns	Figure 62.88
			1.62 to 1.95 V				
	SCL input high pulse width	t_{SCLH}	2.70 V or above	3 (6) × t_{IICcyc} + 300	—	ns	
			1.62 to 1.95 V				
	SCL input low pulse width	t_{SCLL}	2.70 V or above	3 (6) × t_{IICcyc} + 300	—	ns	
			1.62 to 1.95 V				
	SCL, SDA rise time	t_{Sr}	2.70 V or above	20	300	ns	
			1.62 to 1.95 V				
	SCL, SDA fall time	t_{Sf}	2.70 V or above	20 × (external pullup voltage/5.5 V)*1	300	ns	
			1.62 to 1.95 V				
	SCL, SDA input spike pulse removal time	t_{SP}	2.70 V or above	0	1 (4) × t_{IICcyc}	ns	
			1.62 to 1.95 V				
	SDA input bus free time when wakeup function is disabled	t_{BUF}	2.70 V or above	3 (6) × t_{IICcyc} + 300	—	ns	
			1.62 to 1.95 V				
	SDA input bus free time when wakeup function is enabled	t_{BUF}	2.70 V or above	3 (6) × t_{IICcyc} + 4 × t_{Pcyc} + 300	—	ns	
			1.62 to 1.95 V				
	START condition input hold time when wakeup function is disabled	t_{STAH}	2.70 V or above	t_{IICcyc} + 300	—	ns	
			1.62 to 1.95 V				
	START condition input hold time when wakeup function is enabled	t_{STAH}	2.70 V or above	1 (5) × t_{IICcyc} + t_{Pcyc} + 300	—	ns	
			1.62 to 1.95 V				
	Repeated START condition input setup time	t_{STAS}	2.70 V or above	300	—	ns	
			1.62 to 1.95 V				
	STOP condition input setup time	t_{STOS}	2.70 V or above	300	—	ns	
			1.62 to 1.95 V				
	Data input setup time	t_{SDAS}	2.70 V or above	t_{IICcyc} + 50	—	ns	
			1.62 to 1.95 V				
	Data input hold time	t_{SDAH}	2.70 V or above	0	—	ns	
			1.62 to 1.95 V				
	SCL, SDA capacitive load	C_b	2.70 V or above	—	400	pF	
			1.62 to 1.95 V				

Note: t_{IICcyc}: IIC internal reference clock (IICφ) cycle, t_{Pcyc}: PCLKB cycle.
Note: Values in parentheses apply when ICMR3.NF[1:0] is set to 11b while the digital filter is enabled with ICFER.NFE set to 1.
Note: Must use pins that have a letter appended to their name, for instance "_A", "_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.
Note 1. Only supported for SCL0_A, SDA0_A, SCL1_A, SDA1_A, SCL2_A, and SDA2_A.

Table 62.66 IIC timing (2)

Setting of the SCL0_A, SDA0_A, SCL1_A, SDA1_A. SCL2_A, SDA2_A pins are not required with the port drive capability bit in the PmnPFS register.

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
IIC (Fast-mode+) ICFER.FMPE = 1	SCL input cycle time	t_{SCL}	2.70 V or above	6 (12) × t_{IICcyc} + 240	—	ns	Figure 62.88
			1.62 to 1.95V				
	SCL input high pulse width	t_{SCLH}	2.70 V or above	3 (6) × t_{IICcyc} + 120	—	ns

			1.62 to 1.95V				
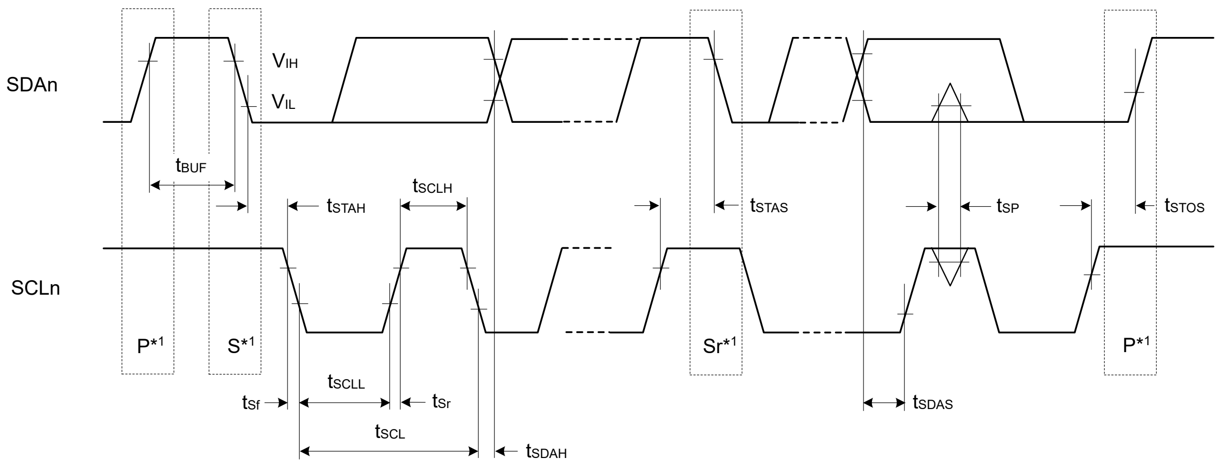
	Data input hold time	t_{SDAH}	2.70 V or above	0	—	ns	
			1.62 to 1.95V				
	SCL, SDA capacitive load	C_b*1	2.70 V or above	—	550	pF	
			1.62 to 1.95V				

Note: t_{IICcyc}: IIC internal reference clock (IICφ) cycle, tPcyc: PCLKB cycle.

Note: Values in parentheses apply when ICMR3.NF[1:0] is set to 11b while the digital filter is enabled with ICFER.NFE set to 1.
Note 1. Cb indicates the total capacity of the bus line.



Note 1. S, P, and Sr indicate the following conditions:
S: Start condition
P: Stop condition
Sr: Restart condition

Figure 62.88 I2C bus interface input/output timing

62.3.13 I3C Timing

Table 62.67 IIC timing (1)-1

Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	VCC	Min	Max	Unit
IIC (Standard mode, SMBus) BFCTL.FMPE = 0	SCL input cycle time	t_{SCL}	2.70 V or above, 1.65 to 1.95 V	10 (18) × t_{I3Ccyc} + 1300	—	ns
	SCL input high pulse width	t_{SCLH}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 300	—	ns
	SCL input low pulse width	t_{SCLL}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 300	—	ns
	SCL, SDA rise time	t_{Sr}	2.70 V or above, 1.65 to 1.95 V	—	1000	ns
	SCL, SDA fall time	t_{Sf}	2.70 V or above, 1.65 to 1.95 V	—	300	ns
	SCL, SDA input spike pulse removal time	t_{SP}	2.70 V or above, 1.65 to 1.95 V	0	1 (4) × t_{I3Ccyc}	ns
	SDA input bus free time when wakeup function is disabled	t_{BUF}	2.70 V or above, 1.65 to 1.95 V	5(9) × t_{I3Ccyc} + 300	—	ns
	SDA input bus free time when wakeup function is enabled	t_{BUF}	2.70 V or above, 1.65 to 1.95 V	5(9) × t_{I3Ccyc} + 4 × t_{Tcyc} + 300	—	ns
	START condition input hold time when wakeup function is disabled	t_{STAH}	2.70 V or above, 1.65 to 1.95 V	t_{I3Ccyc} + 300	—	ns
	START condition input hold time when wakeup function is enabled	t_{STAH}	2.70 V or above, 1.65 to 1.95 V	1(5) × t_{I3Ccyc} + t_{Tcyc} + 300	—	ns
	Repeated START condition input setup time	t_{STAS}	2.70 V or above, 1.65 to 1.95 V	1000	—	ns
	STOP condition input setup time	t_{STOS}	2.70 V or above, 1.65 to 1.95 V	1000	—	ns
	Data input setup time	t_{SDAS}	2.70 V or above, 1.65 to 1.95 V	t_{I3Ccyc} + 50	—	ns
	Data input hold time	t_{SDAH}	2.70 V or above, 1.65 to 1.95 V	0	—	ns
	SCL, SDA capacitive load	C_b*1	2.70 V or above, 1.65 to 1.95 V	—	400	pF

Note: t_{I3Ccyc}: I3C internal reference clock (I3Cφ) cycle, t_{Tcyc}: TCLK cycle.

Note: Values in parentheses apply when INCTL.DNFS[3:0] is set to 0011b while the digital filter is enabled with INCTL.DNFE set to 1.

Note 1. C_b indicates the total capacity of the bus line.

Table 62.68 IIC timing (1)-2

Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	VCC	Min	Max	Unit
IIC (Fast-mode)	SCL input cycle time	t_{SCL}	2.70 V or above, 1.65 to 1.95 V	10 (18) × t_{I3Ccyc} + 600	—	ns
	SCL input high pulse width	t_{SCLH}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 300	—	ns
	SCL input low pulse width	t_{SCLL}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 300	—	ns
	SCL, SDA rise time	t_{Sr}	2.70 V or above, 1.65 to 1.95 V	20	300	ns
	SCL, SDA fall time	t_{Sf}	2.70 V or above, 1.65 to 1.95 V	20 × (external pull-up voltage/3.6 V)	300	ns
	SCL, SDA input spike pulse removal time	t_{SP}	2.70 V or above, 1.65 to 1.95 V	0	1 (4) × t_{I3Ccyc}	ns
	SDA input bus free time when wakeup function is disabled	t_{BUF}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 300	—	ns
	SDA input bus free time when wakeup function is enabled		2.70 V or above, 1.65 to 1.95 V	5(9) × t_{I3Ccyc} + 4 × t_{Tcyc} + 300	—	ns
	START condition input hold time when wakeup function is disabled	t_{STAH}	2.70 V or above, 1.65 to 1.95 V	t_{I3Ccyc} + 300	—	ns
	START condition input hold time when wakeup function is enabled		2.70 V or above, 1.65 to 1.95 V	1(5) × t_{I3Ccyc} + t_{Tcyc} + 300	—	ns
	Repeated START condition input setup time	t_{STAS}	2.70 V or above, 1.65 to 1.95 V	300	—	ns
	STOP condition input setup time	t_{STOS}	2.70 V or above, 1.65 to 1.95 V	300	—	ns
	Data input setup time	t_{SDAS}	2.70 V or above, 1.65 to 1.95 V	t_{I3Ccyc} + 50	—	ns
	Data input hold time	t_{SDAH}	2.70 V or above, 1.65 to 1.95 V	0	—	ns
	SCL, SDA capacitive load	C_b*1	2.70 V or above, 1.65 to 1.95 V	—	400	pF

Note: t_{I3Ccyc}: I3C internal reference clock (I3Cφ) cycle, t_{Tcyc}: TCLK cycle.

Note: Values in parentheses apply when INCTL.DNFS[3:0] is set to 0011b while the digital filter is enabled with INCTL.DNFE set to 1.

Note 1. C_b indicates the total capacity of the bus line.

Table 62.69 IIC timing (1)-3

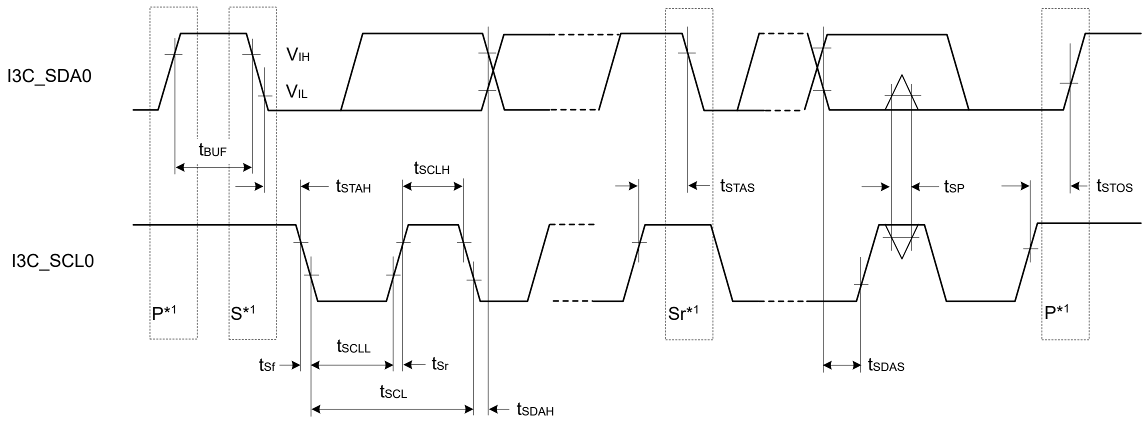
Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	VCC	Min	Max	Unit
IIC (Fast-mode +) BFCTL.FMPE = 1	SCL input cycle time	t_{SCL}	2.70 V or above, 1.65 to 1.95 V	10 (18) × t_{I3Ccyc} + 240	—	ns
	SCL input high pulse width	t_{SCLH}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 120	—	ns
	SCL input low pulse width	t_{SCLL}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 120	—	ns
	SCL, SDA rise time	t_{Sr}	2.70 V or above, 1.65 to 1.95 V	—	120	ns
	SCL, SDA fall time	t_{Sf}	2.70 V or above, 1.65 to 1.95 V	20 × (external pull-up voltage/3.3V)	120	ns
	SCL, SDA input spike pulse removal time	t_{SP}	2.70 V or above, 1.65 to 1.95 V	0	1 (4) × t_{I3Ccyc}	ns
	SDA input bus free time when wakeup function is disabled	t_{BUF}	2.70 V or above, 1.65 to 1.95 V	5 (9) × t_{I3Ccyc} + 120	—	ns
	SDA input bus free time when wakeup function is enabled			5(9) × t_{I3Ccyc} + 4 × t_{Tcyc} + 120		ns
	START condition input hold time when wakeup function is disabled	t_{STAH}	2.70 V or above, 1.65 to 1.95 V	t_{I3Ccyc} + 120	—	ns
	START condition input hold time when wakeup function is enabled			1(5) × t_{I3Ccyc} + t_{Tcyc} + 120		ns
	Restart condition input setup time	t_{STAS}	2.70 V or above, 1.65 to 1.95 V	120	—	ns
	Stop condition input setup time	t_{STOS}	2.70 V or above, 1.65 to 1.95 V	120	—	ns
	Data input setup time	t_{SDAS}	2.70 V or above, 1.65 to 1.95 V	t_{I3Ccyc} + 30	—	ns
	Data input hold time	t_{SDAH}	2.70 V or above, 1.65 to 1.95 V	0	—	ns
	SCL, SDA capacitive load	C_b*1	2.70 V or above, 1.65 to 1.95 V	—	550	pF

Note: t_{I3Ccyc}: I3C internal reference clock (I3Cφ) cycle, t_{Tcyc}: TCLK cycle.

Note: Values in parentheses apply when INCTL.DNFS[3:0] is set to 0011b while the digital filter is enabled with INCTL.DNFE set to 1.

Note 1. C_b indicates the total capacity of the bus line.



Test conditions:
V_{IH} = VCC × 0.7, V_{IL} = VCC × 0.3
V_{OL} = 0.6 V, I_{OL} = 6 mA (BFCTL.FMPE = 0)
V_{OL} = 0.4 V, I_{OL} = 15 mA (BFCTL.FMPE = 1)

Note 1. S, P, and Sr indicate the following conditions:
S: Start condition
P: Stop condition
Sr: Restart condition

Figure 62.89 I²C bus interface input/output timing

Table 62.70 IIC timing (2)

Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter			Symbol	VCC	Min	Max	Unit
IIC (Hs-mode) BFCTL.HSME = 1	SCL input cycle time		t_{SCL}	3.00 V or above	46 (48) × t_{I3Ccyc}	—	ns
				1.65 to 1.95 V	46 (48) × t_{I3Ccyc}	—	
	SCL input high pulse width	Cb = 400 pF	t_{SCLH}	3.00 V or above	29 (30) × t_{I3Ccyc}	—	ns
				1.65 to 1.95 V	29 (30) × t_{I3Ccyc}	—	
		Cb = 100 pF		3.00 V or above	13 (14) × t_{I3Ccyc}	—	
				1.65 to 1.95 V	13 (14) × t_{I3Ccyc}	—	
	SCL input low pulse width	Cb = 400 pF	t_{SCLL}	3.00 V or above	69 (70) × t_{I3Ccyc}	—	ns
				1.65 to 1.95 V	69 (70) × t_{I3Ccyc}	—	
		Cb = 100 pF		3.00 V or above	33 (34) × t_{I3Ccyc}	—	
				1.65 to 1.95 V	33 (34) × t_{I3Ccyc}	—

				1.65 to 1.95 V	—	80	
		Cb = 100 pF		3.00 V or above	—	40	
				1.65 to 1.95 V	—	40	
	SDA rise time	Cb = 400 pF	t_{SrDA}	3.00 V or above	—	160	ns
				1.65 to 1.95 V	—	160	
		Cb = 100 pF		3.00 V or above	—	80	
				1.65 to 1.95 V	—	80	
	SCL fall time	Cb = 400 pF	t_{SfCL}	3.00 V or above	—	80	ns
				1.65 to 1.95 V	—	80	
		Cb = 100 pF		3.00 V or above	—	40	
				1.65 to 1.95 V	—	40	
	SDA fall time	Cb = 400 pF	t_{SfDA}	3.00 V or above	—	160	ns
				1.65 to 1.95 V	—	160	
		Cb = 100 pF		3.00 V or above	—	80	
				1.65 to 1.95 V	—	80	
	SCL, SDA input spike pulse removal time		t_{SP}	3.00 V or above	0	1 (1) × t_{I3Ccyc}	ns
				1.65 to 1.95 V	0	1 (1) × t_{I3Ccyc}	
	Repeated START condition input setup time		t_{STAS}	3.00 V or above	40	—	ns
				1.65 to 1.95 V	40	—	
	STOP condition input setup time		t_{STOS}	3.00 V or above	40	—	ns
				1.65 to 1.95 V	40	—	
	Data input setup time		t_{SDAS}	3.00 V or above	10	—	ns
				1.65 to 1.95 V	10	—	
	Data input hold time	Cb = 400 pF	t_{SDAH}	3.00 V or above	0	150	ns
				1.65 to 1.95 V	0	150	
		Cb = 100 pF		3.00 V or above	0	70	
				1.65 to 1.95 V	0	70	
	SCL, SDA capacitive load		C_b*1	3.00 V or above	—	400	pF
				1.65 to 1.95 V	—	400	

Note: t_{I3Ccyc}: I3C internal reference clock (I3Cφ) cycle.
Note: Values in parentheses apply when INCTL.DNFS[3:0] is set to 0011b while the digital filter is enabled with INCTL.DNFE set to 1.
Note 1. C_b indicates the total capacity of the bus line.

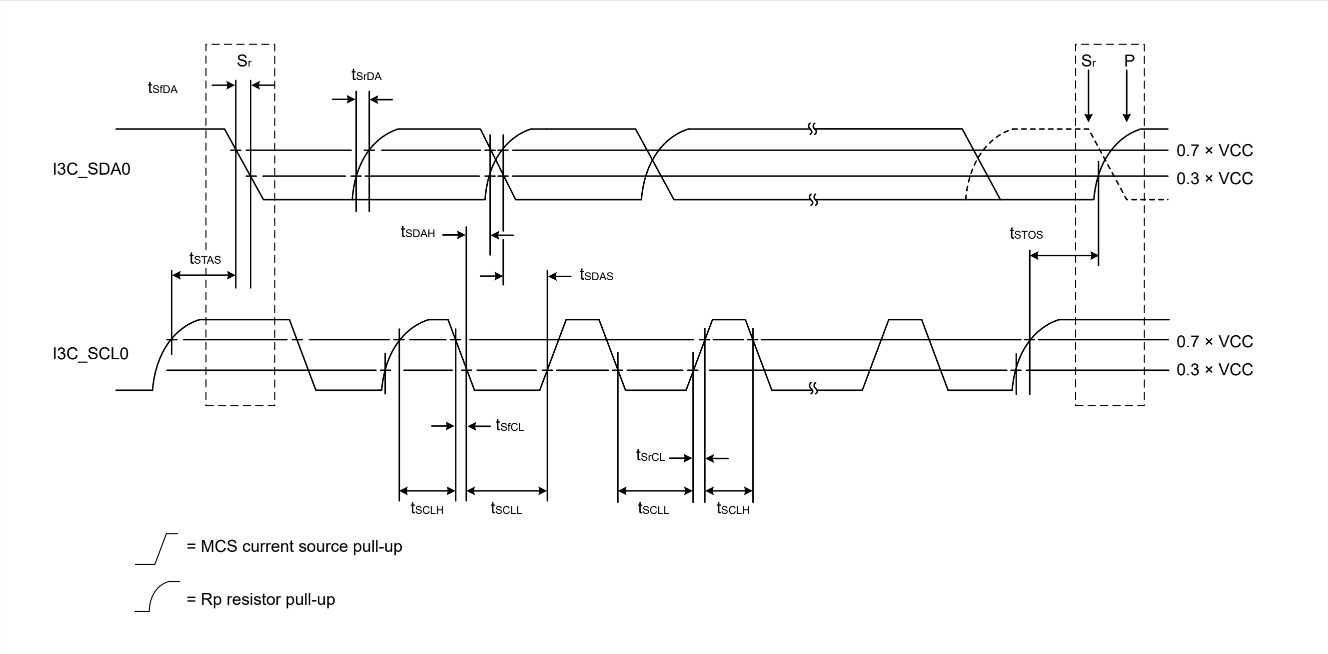

Figure 62.90 **I2C bus interface input/output timing (Hs-mode)**

Table 62.71 I3C timing (Open Drain Timing Parameters)

Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
I3C Open Drain Timing Parameters	SCL Clock Low Period	t_{LOW_OD} *1 *2	3.00 V or above	200	—	ns	Figure 62.93
			1.65 to 1.95 V	200	—		
		$t_{DIG\_OD\_L}$	3.00 V or above	$t_{LOW\_ODmin} + t_{fDA\_ODmin}$	—	ns	Figure 62.93
			1.65 to 1.95 V	$t_{LOW\_ODmin} + t_{fDA\_ODmin}$	—		
	SCL Clock High Period	t_{HIGH} *3 *4	3.00 V or above	—	41	ns	Figure 62.91
			1.65 to 1.95 V	—	41		
		t_{DIG_H}	3.00 V or above	—	$t_{HIGH} + t_{CF}$	ns	Figure 62.91
			1.65 to 1.95 V	—	$t_{HIGH} + t_{CF}$		
	SDA Signal Fall Time	t_{fDA_OD}	3.00 V or above	t_{CF}	12	ns	Figure 62.93
			1.65 to 1.95 V	t_{CF}	12		
	SDA Data Setup Time Open Drain Mode	t_{SU_OD} *1	3.00 V or above	12	—	ns	Figure 62.92
			1.65 to 1.95 V	18	—		
	Clock After START (S) Condition	t_{CAS} *5 *6	3.00 V or above	38.4 nano	For ENAS0: 1 μ	seconds	Figure 62.93
					For ENAS1: 100 μ		
					For ENAS2: 2 milli		
					For ENAS3: 50 milli		
			1.65 to 1.95 V	38.4 nano	For ENAS0: 1 μ		
					For ENAS1: 100 μ		
					For ENAS2: 2 milli		
					For ENAS3: 50 milli		
	Clock Before STOP (P) Condition	t_{CBP}	3.00 V or above	t_{CASmin} / 2	—	seconds	Figure 62.94
			1.65 to 1.95 V	t_{CASmin} / 2	—		
	Current Master to Secondary Master Overlap time during handoff	$t_{MMOverlap}$	3.00 V or above	$t_{DIG\_OD\_Lmin}$	—	ns	Figure 62.100
			1.65 to 1.95 V	$t_{DIG\_OD\_Lmin}$	—		
	Bus Available Condition	t_{AVAL} *7	3.00 V or above	1	—	μs	—
			1.65 to 1.95 V	1	—		
	Bus Idle Condition	t_{IDLE}	3.00 V or above	1	—	ms	—
			1.65 to 1.95 V	1	—		
	Time Internal Where New Master Not Driving SDA Low	t_{MMLock}	3.00 V or above	$t_{AVALmin}$	—	μs	Figure 62.100
			1.65 to 1.95 V	$t_{AVALmin}$	—		

Note 1. This is approximately equal to $t_{LOWmin} + t_{DS\_ODmin} + t_{rDA\_ODtyp} + t_{SU\_Odmin}$.

Note 2. The Master may use a shorter Low period if it knows that this is safe, i.e., that SDA is already above VIH

Note 3. Based on t_{SPIKE}, rise and fall times, and interconnect

Note 4. This maximum High period may be exceeded when the signals can be safely seen by Legacy I^{2}C Devices, and/or in consideration of the interconnect (e.g., a short Bus).
As a product specification, if this Max value cannot be guaranteed, change this Max value and specify that it cannot be used in the Mixed Bus.

Note 5. On a Legacy Bus where I^2C Devices need to see Start
Note 6. Slaves that do not support the optional ENTASx CCCs shall use the t_{CAS} Max value shown for ENTAS3
Note 7. On a Mixed Bus with Fm Legacy I^2C Devices, t_{AVAL} is 300 ns shorter than the Fm Bus Free Condition time (t_{BUF})

Table 62.72 I3C timing (Push-Pull Timing Parameters for SDR and HDR-DDR Modes)

Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter			Symbol	VCC	Min	Max	Unit	Test conditions
I3C Push-Pull Timing Parameters for SDR and HDR-DDR Modes	SCL Clock Frequency		f_{SCL}*1	3.00 V or above	0.01	12.5	MHz	—
				1.65 to 1.95 V	0.01	12.5		
	SCL Clock Low Period		t_{LOW}	3.00 V or above	27	—	ns	Figure 62.91
				1.65 to 1.95 V	32	—		
			t_{DIG_L}*2 *4	3.00 V or above	35	—	ns	Figure 62.91
				1.65 to 1.95 V	40	—		
	SCL Clock High Period for Mixed Bus		t_{HIGH_MIXED}	3.00 V or above	24	—	ns	Figure 62.91
				1.65 to 1.95 V	27	—		
			$t_{DIG\_H\_MIXED}$*2 *3	3.00 V or above	32	45	ns	Figure 62.91
				1.65 to 1.95 V	35	45		
	SCL Clock High Period		t_{HIGH}	3.00 V or above	24	—	ns	Figure 62.91
				1.65 to 1.95 V	27	—		
			t_{DIG_H}*2	3.00 V or above	32	—	ns	Figure 62.91
				1.65 to 1.95 V	35	—		
	Clock in to Data Out for Slave		t_{SCO}	3.00 V or above	—	12	ns	Figure 62.96
				1.65 to 1.95 V	—	12		
	SCL Clock Rise Time		t_{CR}	3.00 V or above	—	150 × 1 / f_{SCL} (capped at 60)	ns	Figure 62.91
				1.65 to 1.95 V	—	150 × 1 / f_{SCL} (capped at 60)		
	SCL Clock Fall Time		t_{CF}	3.00 V or above	—	150 × 1 / f_{SCL} (capped at 60)	ns	Figure 62.91
				1.65 to 1.95 V	—	150 × 1 / f_{SCL} (capped at 60)		
	SDA Signal Data Hold in Push-Pull Mode	Master	t_{HD_PP}*4*5	3.00 V or above	t_{CR} + 3 and t_{CF} + 3	—	—	Figure 62.95
				1.65 to 1.95 V	t_{CR} + 3 and t_{CF} + 3	—		
		Slave	t_{HD_PP}*5	3.00 V or above	0	—	—	Figure 62.95
				1.65 to 1.95 V	0	—		
	SDA Signal Data Setup in Push-Pull Mode		t_{SU_PP}	3.00 V or above	12	N/A	ns	Figure 62.97
				1.65 to 1.95 V	18	N/A		
	Clock After Repeated START (Sr)		t_{CASr}	3.00 V or above	t_{CASmin}	N/A	ns	Figure 62.99
				1.65 to 1.95 V	t_{CASmin}	N/A		
	Clock Before Repeated START (Sr)		t_{CBSr}	3.00 V or above	t_{CASmin} / 2	N/A	ns	Figure 62.99
				1.65 to 1.95 V	t_{CASmin} / 2	N/A		
	Capacitive Load per Bus Line (SDA/SCL)		C_b	3.00 V or above	—	50	pF	—
				1.65 to 1.95 V	—	50		

Note 1. $f_{SCL} = 1 / (t_{DIG\_L} + t_{DIG\_H})$
Note 2. t_{DIG_L} and t_{DIG_H} are the clock Low and High periods as seen at the receiver end of the I3C Bus using V_{IL} and V_{IH}.
Note 3. When communicating with an I3C Device on a mixed Bus, the $t_{DIG\_H\_MIXED}$ period must be constrained in order to make sure that I^2C Devices do not interpret I3C signaling as valid I^2C signaling.
Note 4. As both edges are used, the hold time needs to be satisfied for the respective edges; i.e., t_{CF} + 3 for falling edge clocks, and t_{CR} + 3 for rising edge clocks.
Note 5. In SDR Mode the Hold time parameter is referred to as t_{HD_SDR}, and in DDR Mode it is referred to as t_{HD_DDR}.

Table 62.73 I3C timing (Push-Pull Timing Parameters for HDR-TSP and HDR-TSL Modes)

Setting of the I3C_SCL0, I3C_SDA0 pins are not required with the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
I3C Push-Pull Timing Parameters for HDR-TSP and HDR-TSL Modes	Edge-to-Edge Period	t_{EDGE} *1 *2	3.00 V or above	t_{DIG_H}	—	ns	Figure 62.101
			1.65 to 1.95 V	t_{DIG_H}	—		
	Allowed Difference Between Signals for ‘Simultaneous’ Change	t_{SKEW}	3.00 V or above	—	11	ns	
			1.65 to 1.95 V	—	11		
	Stable Condition Between Symbols	t_{EYE}	3.00 V or above	12	—	ns	
			1.65 to 1.95 V	12	—		
	Time Between Successive Symbols	t_{SYMBOL}	3.00 V or above	$t_{EDGE\ Min}$	—	ns	
			1.65 to 1.95 V	$t_{EDGE\ Min}$	—		
	Symbol Clock	t_{CLOCK}	3.00 V or above	1 / f_{SCL} (Max)	—	—	
			1.65 to 1.95 V	1 / f_{SCL} (Max)	—		

Note 1. Edges occur at the rate of 1 / (t_{EDGE} × 2)
Note 2. In a Mixed Bus, HDR-TSL shall respect the maximum $t_{DIG\_H\_MIXED}$ shown in Figure 62.94.

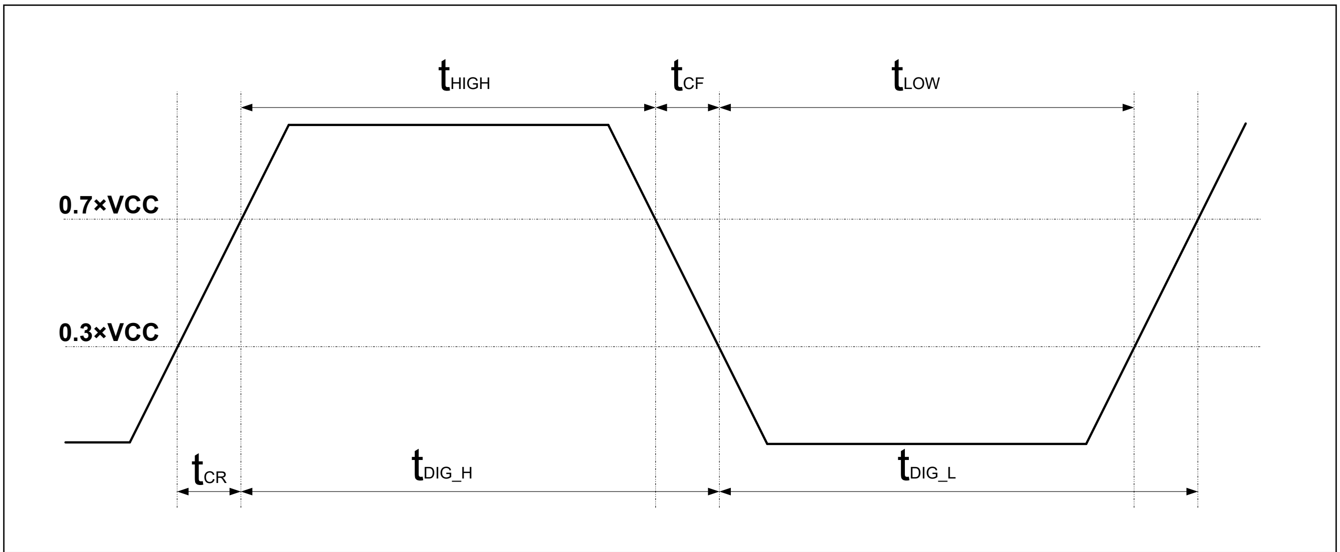

Figure 62.91 t_{DIG_H} and t_{DIG_L}

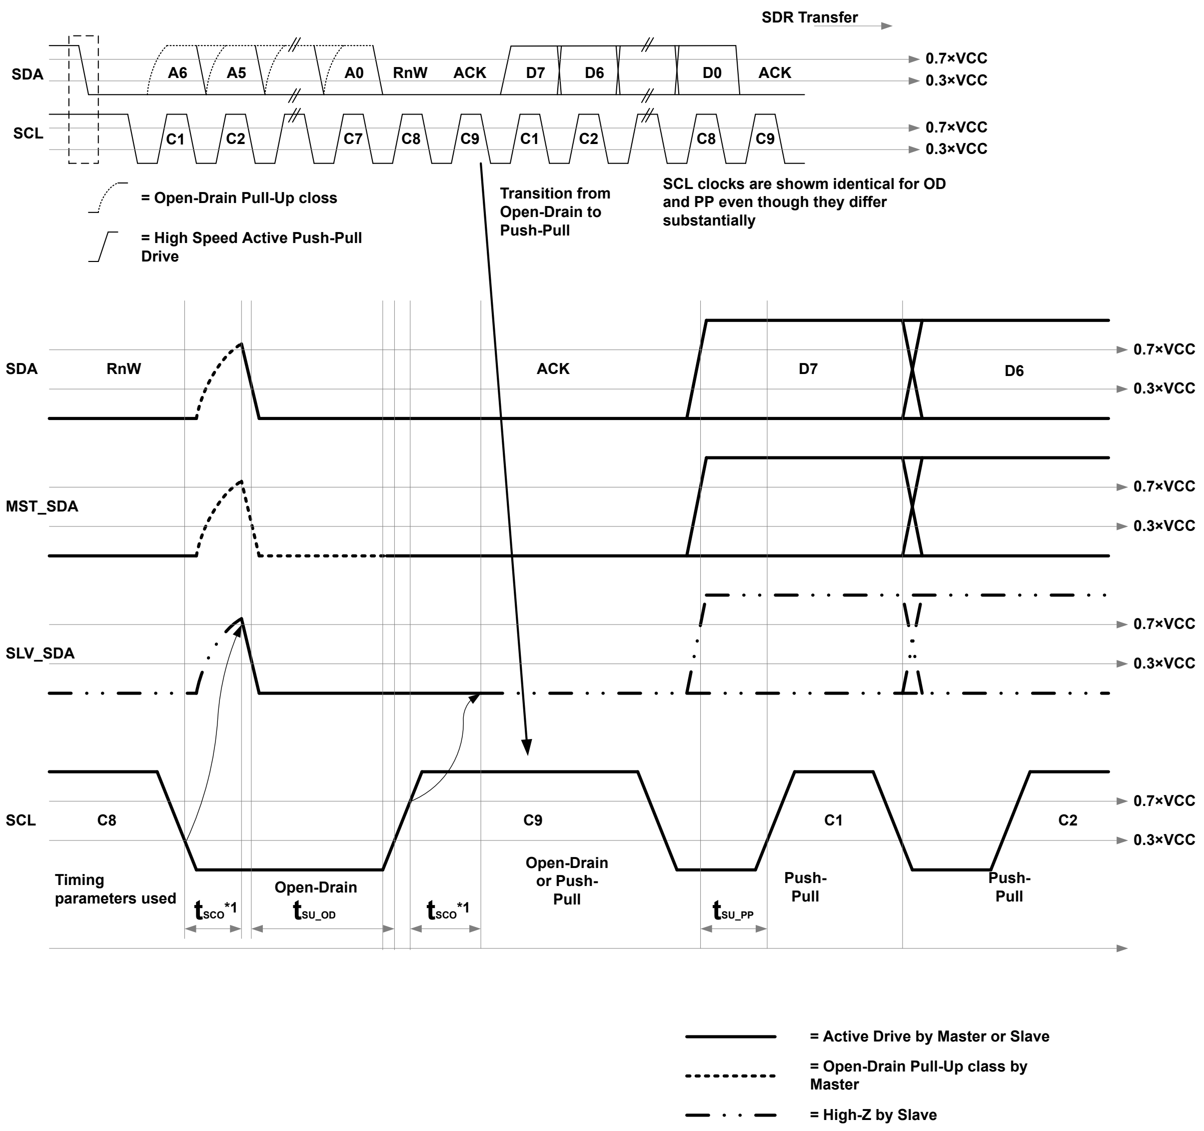

Note: Open-Drain: Master releases SDA after a suitable delay from SCL edges
Push-Pull: Master drives SDA after a suitable delay from SCL edges

Note 1. t_{SCO} is depicted for informative purposes only

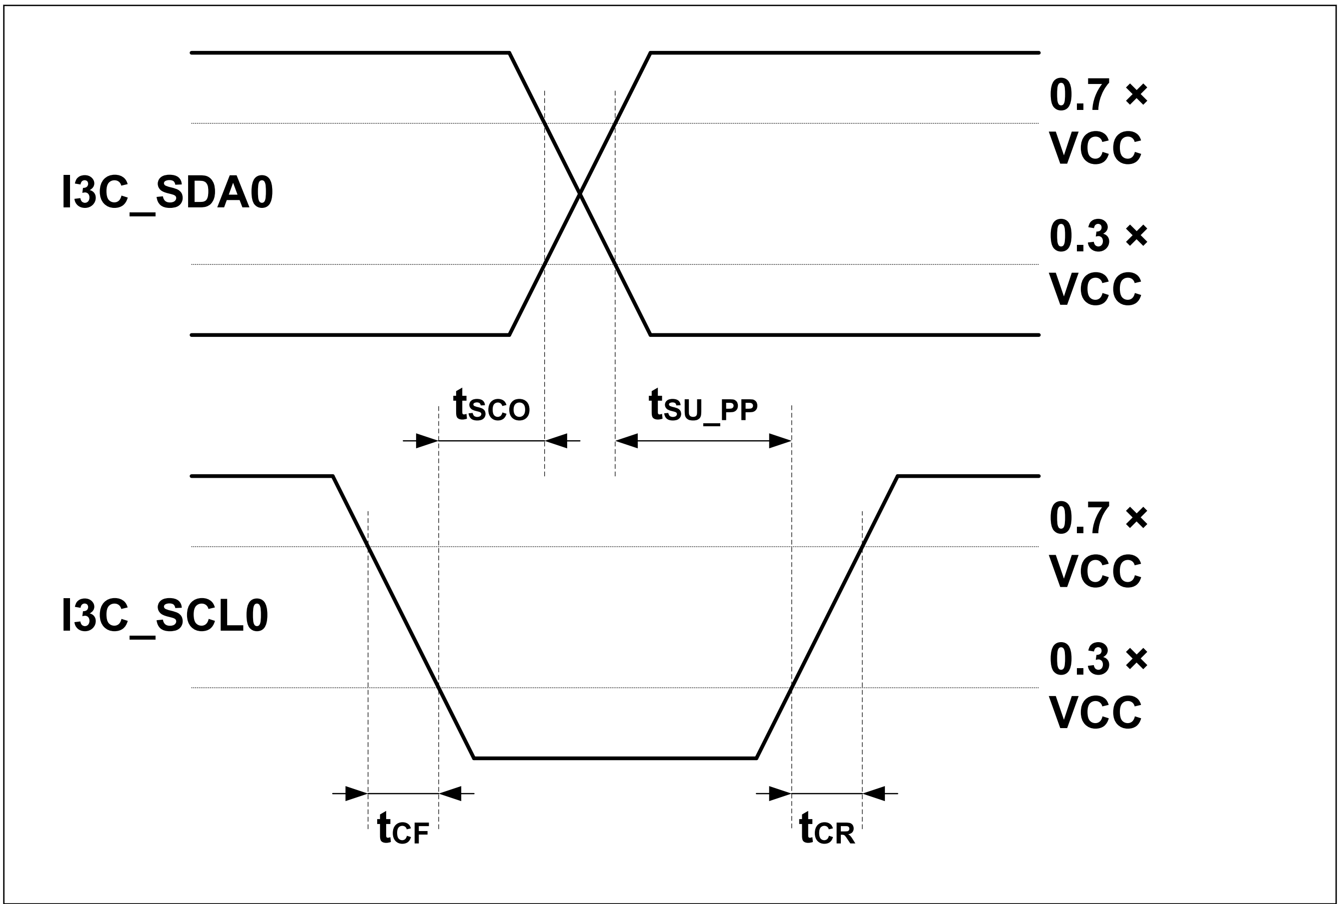

Figure 62.96 I3C Slave Out Timing

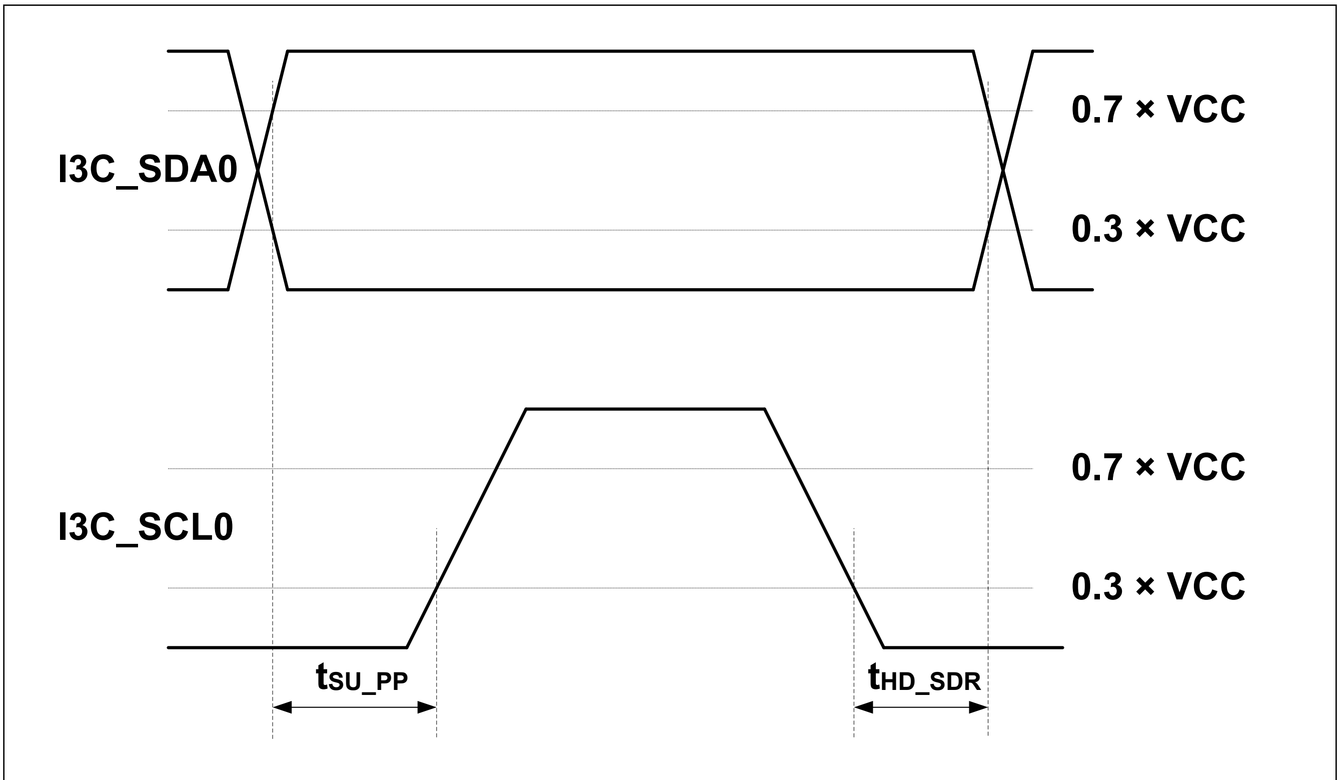

Figure 62.97 Master SDR Timing

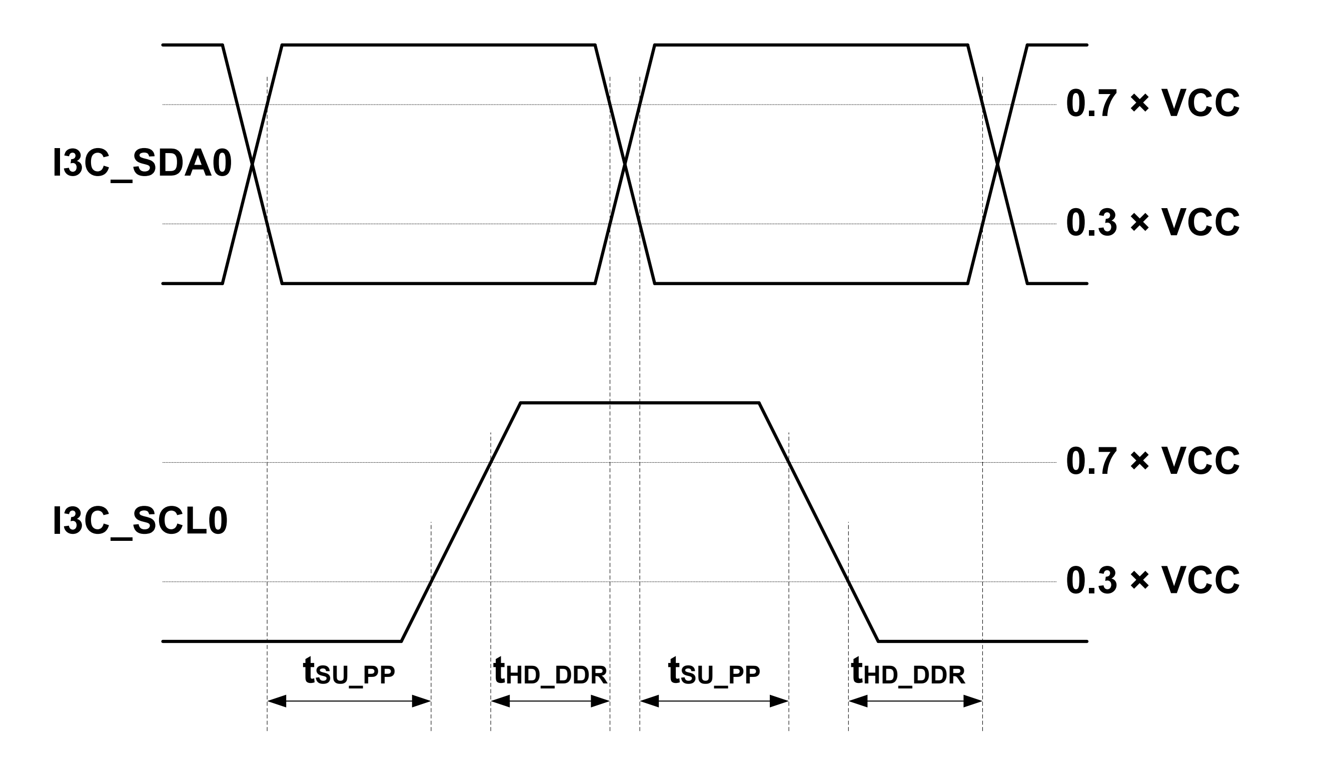

Figure 62.98 Master DDR Timing

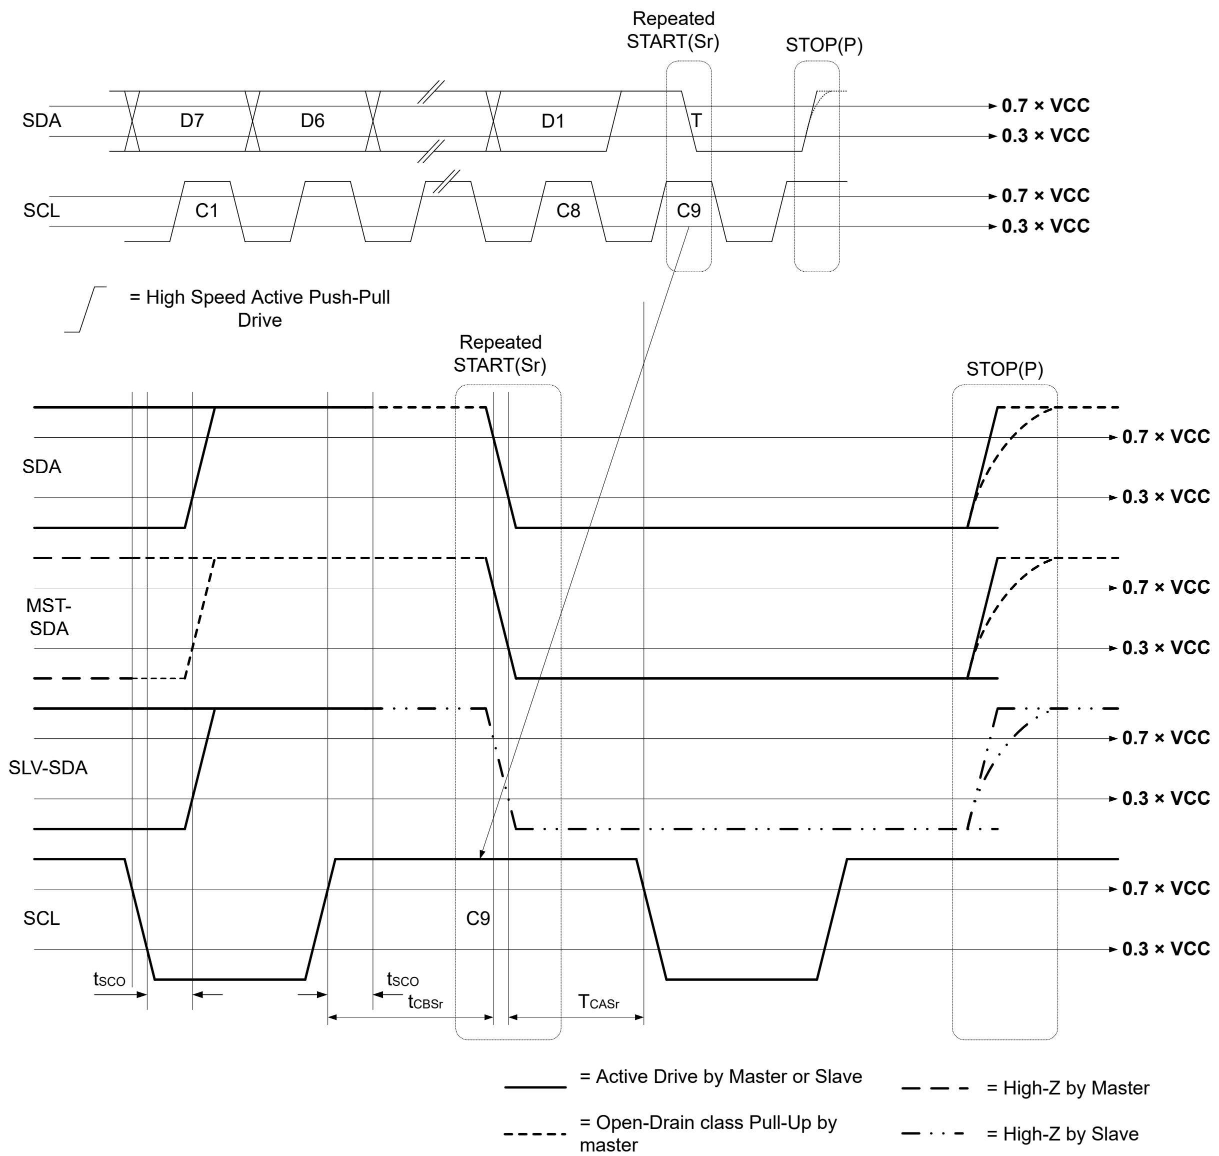

Note: Sr immediately followed by P is illegal for I2C devices, however many devices are not adversely affected by it. The condition is not illegal for I3C devices.

Figure 62.99 T-Bit When Master Ends Read with Repeated START and STOP

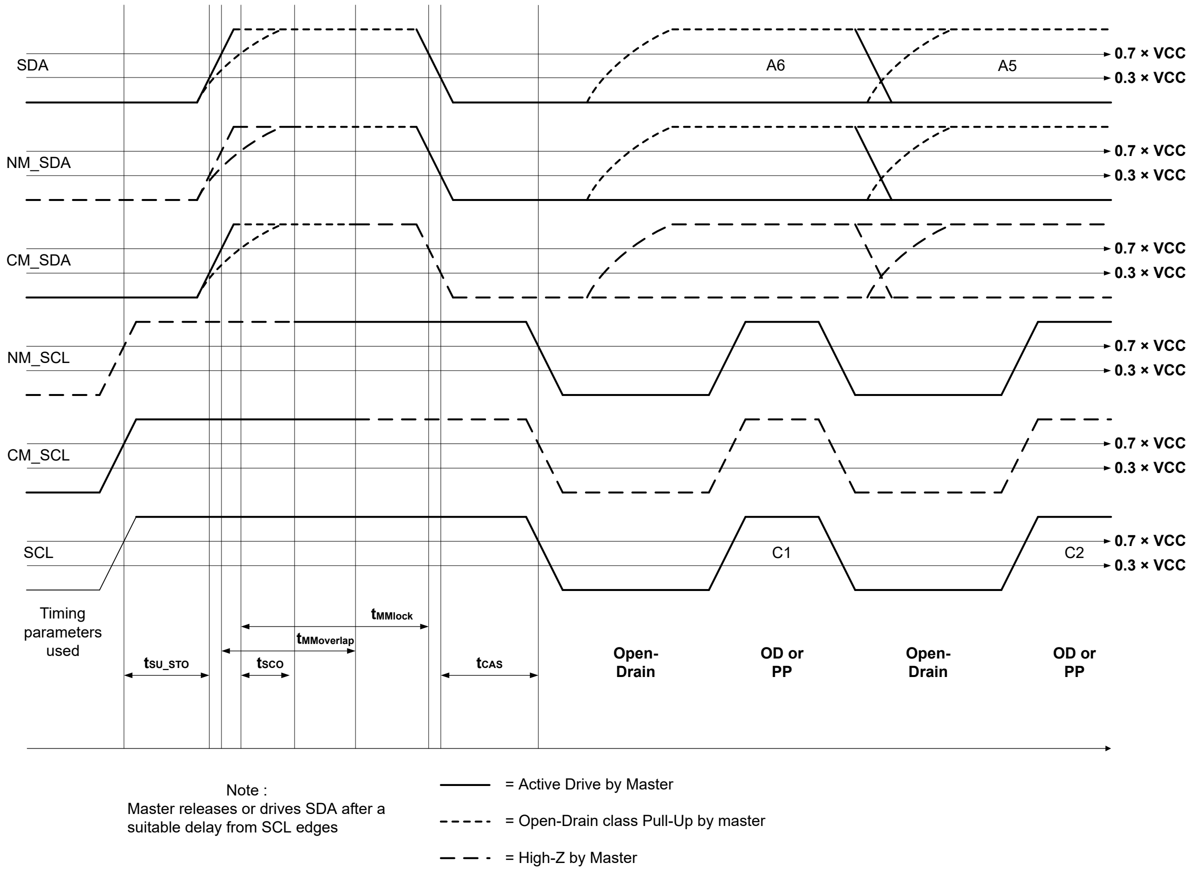

Figure 62.100 Master to Master Bus Handoff

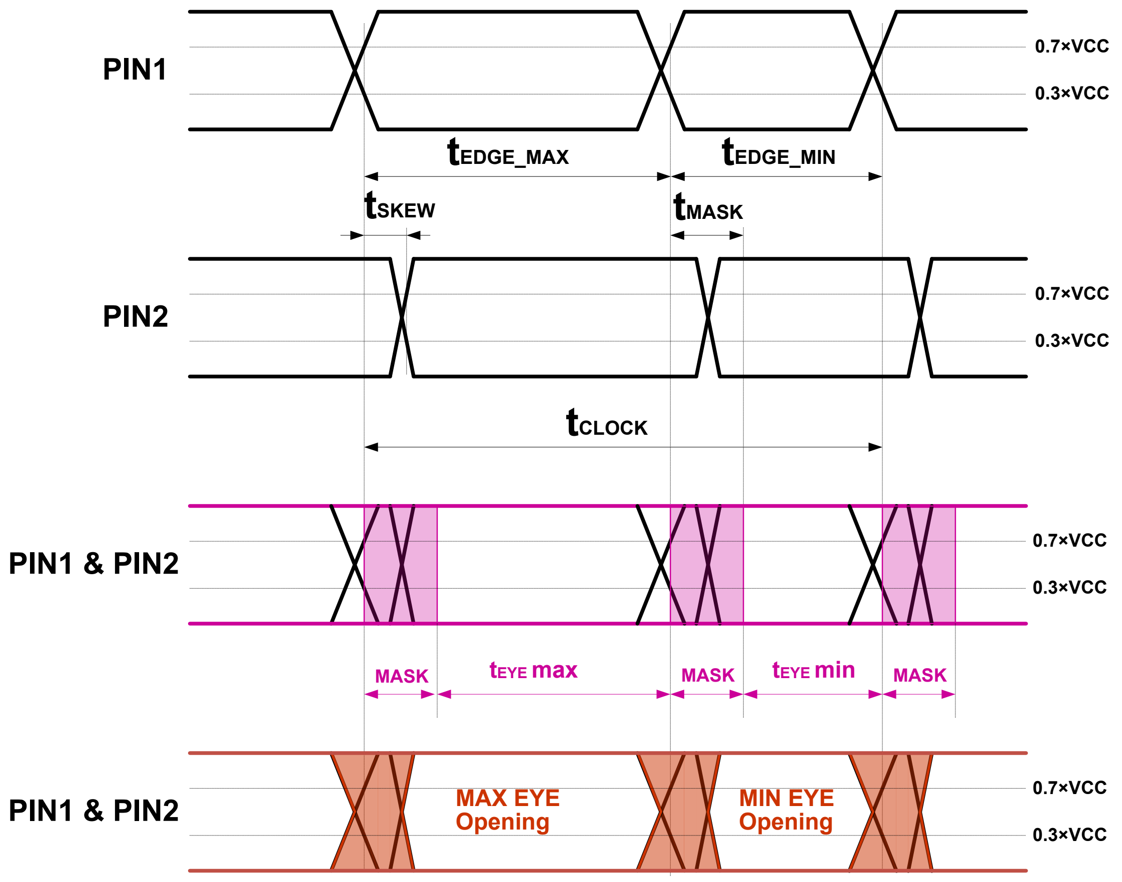

Design Conditions

1. The The differences of load magnitude and drive strength between the SDA and SCL lines result in different slopes, as shown
2. MASK period ≧ MAX t_{SKEW} + MAX rise/fall time between 0.3 × V_{DD} and 0.7 × V_{DD}, respectively, decreased by the time crossing the hysteresis window.

Simplifying Assumptions

1. t_{SKEW} is the same for both edges
2. Base CLOCK (e.g. 12.5MHz) is asymmetrical
3. Falling edges are equal rising edges
4. The MASK is shown as starting, from the last possible moment, whereas in reality it could be shifted left (towards the start point) delayed by the hysteresis window

Figure 62.101 Ternary Protocol Timing

62.3.14 SSIE Timing

Table 62.74 SSIE timing

(1) High drive output is selected with the Port Drive Capability bit in the PmnPFS register.
(2) Use pins that have a letter appended to their names, for instance "_A", "_B" or "_C" to indicate group membership. For the SSIE interface, the AC portion of the electrical characteristics is measured for each group.

Parameter			Symbol	VCC	Min.	Max.	Unit	Comments
SSIBCK	Cycle	Master	t_O	2.70V or above	80	—	ns	Figure 62.102
				1.62V or above	80	—		
		Slave	t_I	2.70V or above	80	—	ns	
				1.62V or above	80	—		
	High level/ low level	Master	t_{HC}/t_{LC}	2.70V or above	0.35	—	t_O	
				1.62V or above	0.35	—		
		Slave		2.70V or above	0.35	—	t_I	
				1.62V or above	0.35	—		
	Rising time/ falling time	Master	t_{RC}/t_{FC}	2.70V or above	—	0.15	t_O / t_I	
				1.62V or above	—	0.15		
		Slave		2.70V or above	—	0.15	t_O / t_I	
				1.62V or above	—	0.15		
SSILRCK/ SSIFS, SSITXD0, SSIRXD0, SSIDATA1	Input set up time	Master	t_{SR}	2.70V or above	12	—	ns	Figure 62.104, Figure 62.105
				1.62V or above	20	—		
		Slave		2.70V or above	12	—	ns	
				1.62V or above	12	—		
	Input hold time	Master	t_{HR}	2.70V or above	8	—	ns	
				1.62V or above	8	—		
		Slave		2.70V or above	15	—	ns	
				1.62V or above	15	—		
	Output delay time	Master	t_{DTR}	2.70V or above	−10	5	ns	
				1.62V or above	−10	7		
		Slave		2.70V or above	0	20	ns	
				1.62V or above	0	25		
	Output delay time from SSILRCK/ SSIFS change	Slave	t_{DTRW}	2.70V or above	—	20	ns	Figure 62.106*1
				1.62V or above	—	25		
GTIOC2A, AUDIO_CLK	Cycle		t_{EXcyc}	2.70V or above	20	—	ns	Figure 62.103
				1.62V or above	40	—		
	High level/ low level		t_{EXL}/t_{EXH}	2.70V or above	0.4	—	t_{EXcyc}	
				1.62V or above	0.4	—		
	Rising time/falling time		t_{EXf}/t_{EXr}	2.70V or above	—	0.1*2	t_{EXcyc}	
				1.62V or above	—	0.1*2		

Note 1. For slave-mode transmission, SSIE has a path, through which the signal input from the SSILRCK/SSIFS pin is used to generate transmit data, and the transmit data is logically output to the SSITXD0 or SSIDATA1 pin.
Note 2. 1μs at the longest.

Table 62.75 SD/MMC Host Interface signal timing

Conditions:
High-speed high drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins:
SD0CLK_A, SD0CLK_B, SD0CLK_C, SD1CLK_A, SD1CLK_B
For other pins, high drive output is selected in the Port Drive Capability bit in the PmnPFS register.
Clock duty ratio is 50%.

Parameter	Symbol	VCC/VCC2	Min	Max	Unit	Test conditions
SDCLK clock cycle	t_{SDCYC}	2.70 V or above	20	—	ns	Figure 62.107
		1.70 to1.95 V*1	20	—		
		1.70 to1.95 V	40	—		
SDCLK clock high pulse width	t_{SDWH}	2.70 V or above	6.5	—	ns	
		1.70 to1.95 V*1	6.5	—		
		1.70 to1.95 V	13.0	—		
SDCLK clock low pulse width	t_{SDWL}	2.70 V or above	6.5	—	ns	
		1.70 to1.95 V*1	6.5	—		
		1.70 to1.95 V	13.0	—		
SDCLK clock rise time	t_{SDLH}	2.70 V or above	—	3	ns	
		1.70 to1.95 V*1	—	4		
		1.70 to1.95 V	—	8		
SDCLK clock fall time	t_{SDHL}	2.70 V or above	—	3	ns	
		1.70 to1.95 V*1	—	4		
		1.70 to1.95 V	—	8		
SDCMD/SDDAT output data delay	t_{SDODLY}	2.70 V or above	–7.0	4.0	ns	
		1.70 to1.95 V*1	–7.0	7.0		
		1.70 to1.95 V	–15.0	15.0		
SDCMD/SDDAT input data setup	t_{SDIS}	2.70 V or above	4.5	—	ns	
		1.70 to1.95 V*1	4.5	—		
		1.70 to1.95 V	20.0	—		
SDCMD/SDDAT input data hold	t_{SDIH}	2.70 V or above	1.5	—	ns	
		1.70 to1.95 V	1.5	—		

Note: Must use pins that have a letter appended to their name, for instance "_A", "_B", to indicate group membership. For the SD/MMC Host interface, the AC portion of the electrical characteristics is measured for each group.
Note: If SD1DAT4_A to SD1DAT7_A are used, characteristics above is guaranteed only when VCC = VCC2.
Note 1. Only supported for Ch0 group B ("SD0*_B") and Ch1 group A ("SD1*_A")

62.3.16 CEU Timing

Table 62.76 Capture Engine Unit Signal Timing

Parameter	Symbol	VCC	Min	Max	Unit	Test conditions
Vertical sync (VIO_VD) setup time (Camera clock rising)	t_{VVDS}	2.70 V or above	2.0	—	ns	Figure 62.108 Figure 62.109
		1.62 V or above	4.5	—		
Vertical sync (VIO_VD) setup time (Camera clock falling)	t_{VVDS}	2.70 V or above	2.5	—	ns	
		1.62 V or above	4.5	—		
Vertical sync (VIO_VD) hold time	t_{VVDH}	2.70 V or above	3.5	—	ns	
		1.62 V or above	5.5	—		
Horizontal sync (VIO_HD) setup time (Camera clock rising)	t_{VHDS}	2.70 V or above	2.0	—	ns	
		1.62 V or above	4.5	—		
Horizontal sync (VIO_HD) setup time (Camera clock falling)	t_{VHDS}	2.70 V or above	2.5	—	ns	
		1.62 V or above	4.5	—		
Horizontal sync (VIO_HD) hold time	t_{VHDH}	2.70 V or above	3.5	—	ns	
		1.62 V or above	5.5	—		
Capture image data (VIO_D) setup time (Camera clock rising)	t_{VDTS}	2.70 V or above	2.0	—	ns	
		1.62 V or above	4.5	—		
Capture image data (VIO_D) setup time (Camera clock falling)	t_{VDTS}	2.70 V or above	2.5	—	ns	
		1.62 V or above	4.5	—		
Capture image data (VIO_D) hold time	t_{VDTH}	2.70 V or above	3.5	—	ns	
		1.62 V or above	5.5	—		
Camera clock cycle	t_{VCYC}	2.70 V or above	11.5	—	ns	
		1.62 V or above	23.0	—		
Camera clock high level width	t_{VHW}	2.70 V or above	$0.4 \times t_{VCYC}$	—	ns	
		1.62 V or above	$0.4 \times t_{VCYC}$	—		
Camera clock low level width	t_{VLW}	2.70 V or above	$0.4 \times t_{VCYC}$	—	ns	
		1.62 V or above	$0.4 \times t_{VCYC}$	—		
Field identification signal (VIO_FLD) setup time (Camera clock rising)	t_{VFDS}	2.70 V or above	2.0	—	ns	
		1.62 V or above	4.5	—		
Field identification signal (VIO_FLD) setup time (Camera clock falling)	t_{VFDS}	2.70 V or above	2.5	—	ns	
		1.62 V or above	4.5	—		
Field identification signal (VIO_FLD) hold time	t_{VFDH}	2.70 V or above	3.5	—	ns	
		1.62 V or above	5.5	—

62.3.17 CANFD Timing

Table 62.77 CANFD interface timing

Conditions: Low drive output is selected when VCC is 2.70V or above. Middle drive output is selected when VCC is 1.62V or above.

Parameter	Symbol	VCC/VCC2	Min	Max	Unit	Test conditions
Internal delay time	t_{node}	2.70 V or above	—	50	ns	Figure 62.110
		1.62 V or above	—	50		
Transmission rate		2.70 V or above	—	8	Mbps	
		1.62 V or above	—	8		

Note: Internal delay time (t_{node}) = Internal transfer delay time (t_{output}) + Internal receive delay time (t_{input})

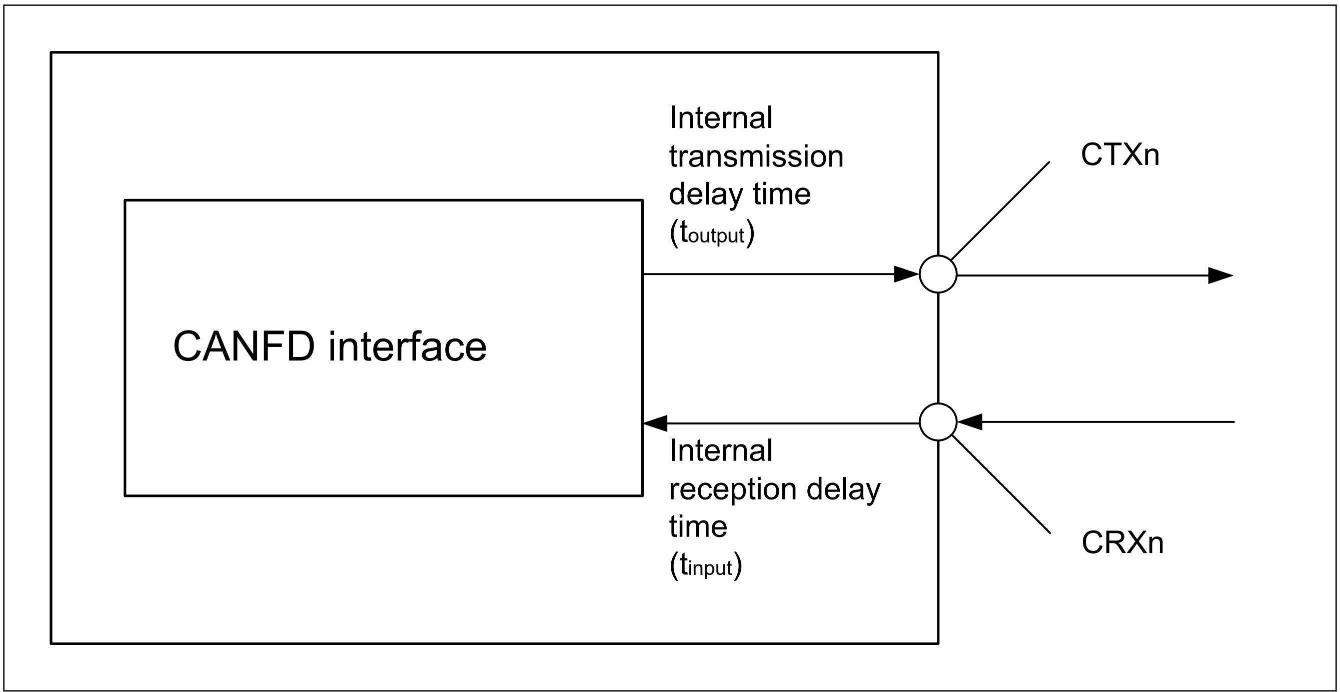

Figure 62.110 CANFD interface condition

62.3.18 PDG Timing

Table 62.78 PDG Timing

Parameter	Min	Typ	Max	Unit	Test conditions
Operation frequency	80	—	300	MHz	—
Resolution	—	48.8	—	ps	GTDLYCR.FRANGE [1:0] = 00 and GPTCLK = 160 MHz
	—	52.1	—	ps	GTDLYCR.FRANGE [1:0] = 01 and GPTCLK = 300 MHz
DNL[*1]	—	±2.0	—	LSB	—

Note 1. This value normalizes the differences between lines in 1-LSB resolution.

62.3.19 ESWM Timing

Table 62.79 ESWM timing (RMII)

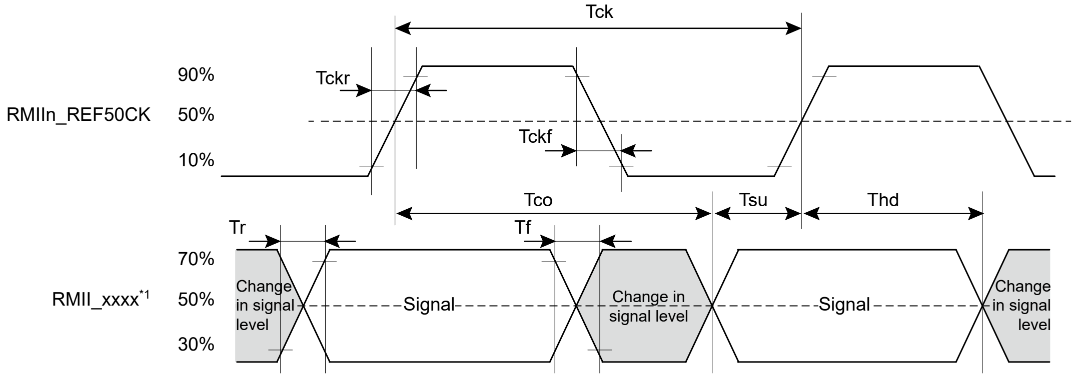
Conditions:

1. Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: ETn_MDC, ETn_MDIO.
2. The drive capacity selection and voltage range for pins other than ETn_MDC, ETn_MDIO.

- RMII use: High drive select, VCC = 2.7 to 3.6

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
ESWM (RMII)	RMIIn_REF50CK cycle time	Tck	2.70V or above	20	—	ns	Figure 62.112
	RMIIn_REF50CK frequency, typical 50 MHz	—		—	50 + 100 ppm	MHz	
	RMIIn_REF50CK duty	—		35	65	%	
	RMIIn_REF50CK rise/fall time	Tckr/ckf		0.5	3.5	ns	
	RMIIn_xxxx*1 output delay	Tco		2.5	12	ns	
	RMIIn_xxxx*2 setup time	Tsu		3	—	ns	
	RMIIn_xxxx*2 hold time	Thd		1	—	ns	
	RMIIn_xxxx*1 *2 rise/fall time	Tr/Tf		0.5	4	ns	

Note 1. RMIIn_TX_EN, RMIIn_TXD1, RMIIn_TXD0.
Note 2. RMIIn_CRS_DV, RMIIn_RXD1, RMIIn_RXD0, RMIIn_RX_ER.



Note 1. RMIIn_TX_EN, RMIIn_TXD1, RMIIn_TXD0, RMIIn_CRS_DV, RMIIn_RXD1, RMIIn_RXD0, RMIIn_RX_ER

Figure 62.112 RMIIn_REF50CK and RMII signal timing

Table 62.80 ESWM timing (MII)

Conditions:

1. Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: ETn_MDC, ETn_MDIO.
2. The drive capacity selection and voltage range for pins other than ETn_MDC, ETn_MDIO.

- MII use only: Middle drive select, VCC = 2.7 to 3.6
- GMII and MII use: RGMII 2.50 V drive select, VCC = 2.3 to 2.7
- GMII and MII use: RGMII 3.30 V drive select, VCC = 3.0 to 3.6

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
ESWM (MII)	ETn_TX_CLK cycle time	t_{Tcyc}	2.30 V or above	40	—	ns	—
	ETn_TX_EN output delay	t_{TENd}		1	20	ns	Figure 62.113
	ETn_ETXD0 to ETn_ETXD3 output delay	t_{MTDd}		1	20	ns	
	ETn_RX_CLK cycle time	t_{TRcyc}		40	—	ns	—
	ETn_RX_DV setup time	t_{RDVs}		10	—	ns	Figure 62.114
	ETn_RX_DV hold time	t_{RDVh}		10	—	ns	
	ETn_ERXD0 to ETn_ERXD3 setup time	t_{MRDs}		10	—	ns	
	ETn_ERXD0 to ETn_ERXD3 hold time	t_{MRDh}		10	—	ns	
	ETn_RX_ER setup time	t_{RERs}		10	—	ns	
	ETn_RX_ER hold time	t_{RESh}		10	—	ns	

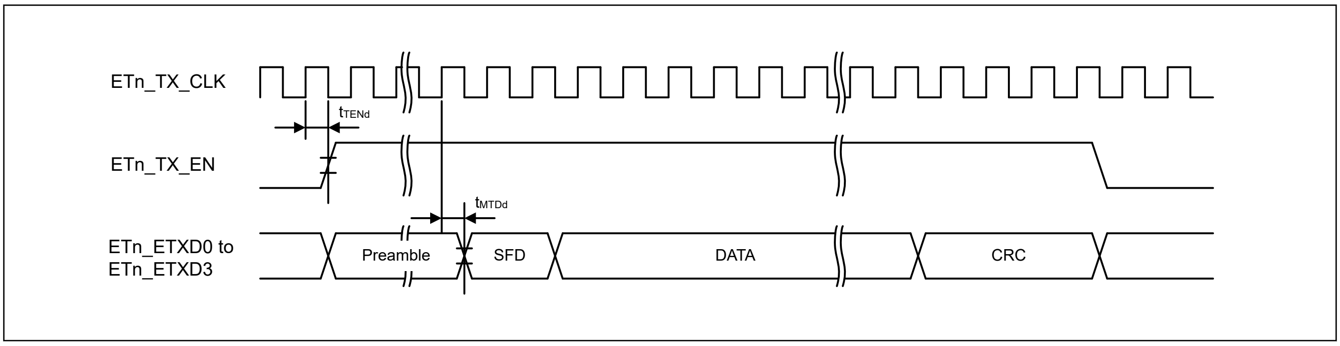


Figure 62.113 MII transmission timing in normal operation

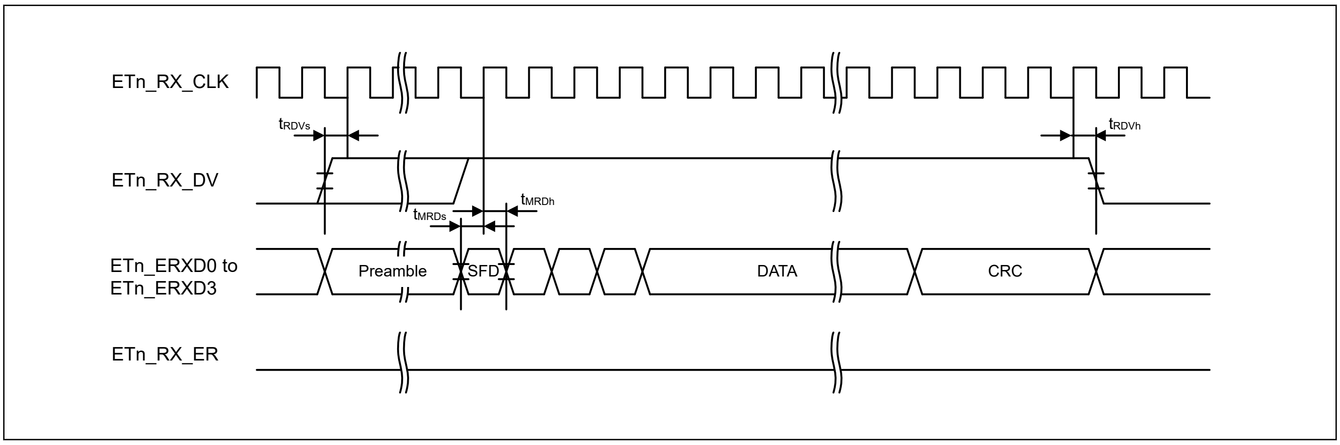

Figure 62.114 MII reception timing in normal operation

Table 62.81 ESWM timing (GMII)

Conditions:

1. Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: ETn_MDC, ETn_MDIO.
2. The drive capacity selection and voltage range for pins other than ETn_MDC, ETn_MDIO.

- GMII use at 2.5 V: RGMII 2.50V drive select, VCC = 2.3 to 2.7
- GMII use at 3.3 V: RGMII 3.30V drive select, VCC = 3.0 to 3.6

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
ESWM (GMII)	ETn_GTX_CLK Frequency	t_{FREQ}	2.30 V to 3.60 V	125 - 100 ppm	125 + 100 ppm	MHz	Figure 62.115 Figure 62.116
	ETn_GTX_CLK Period	t_{PERIOD}		7.5	8.5	ns	
	ETn_RX_CLK Period	t_{PERIOD}		7.5	—	ns	
	ETn_GTX_CLK, ETn_RX_CLK Time High	t_{HIGH}		2.5	—	ns	
	ETn_GTX_CLK, ETn_RX_CLK Time Low	t_{LOW}		2.5	—	ns	
	ETn_GTX_CLK, ETn_RX_CLK Rise Time	t_R		—	1	ns	
	ETn_GTX_CLK, ETn_RX_CLK Fall Time	t_F		—	1	ns	
	Magnitude of ETn_GTX_CLK, ETn_RX_CLK Slew Rate (rising)*1	—		0.6	—	V/ns	
	Magnitude of ETn_GTX_CLK, ETn_RX_CLK Slew Rate (falling)*1	—		0.6	—	V/ns	
	ETn_TXD, ETn_TX_EN, ETn_TX_ER Setup to ↑ETn_GTX_CLK and ETn_RXD, ETn_RX_DV, ETn_RX_ER Setup to ↑ ETn_RX_CLK	t_{SETUP}		2.5	—	ns	
	ETn_TXD, ETn_TX_EN, ETn_TX_ER Hold from ↑ ETn_GTX_CLK and ETn_RXD, ETn_RX_DV, ETn_RX_ER Hold from ↑ ETn_RX_CLK	t_{HOLD}		0.5	—	ns	
	ETn_TXD, ETn_TX_EN, ETn_TX_ER Setup to ↑ ETn_GTX_CLK and ETn_RXD, ETn_RX_DV, ETn_RX_ER Setup to ↑ ETn_RX_CLK	t_{SETUP}(RCVR)		2	—	ns	
	TXD, TX_EN, TX_ER, ETn_TX_ER Hold from ↑ GTX_CLK and RXD, RX_DV, RX_ER Hold from ↑ RX_CLK	t_{HOLD}(RCVR)		0	—	ns	

Note 1. Clock Skew rate is the instantaneous rate of change of the clock potential with respect to time (dV/dt), not an average value over the entire rise or fall time interval. Conformance with this specification guarantees that the clock signals will rise and fall monotonically through the switching region.

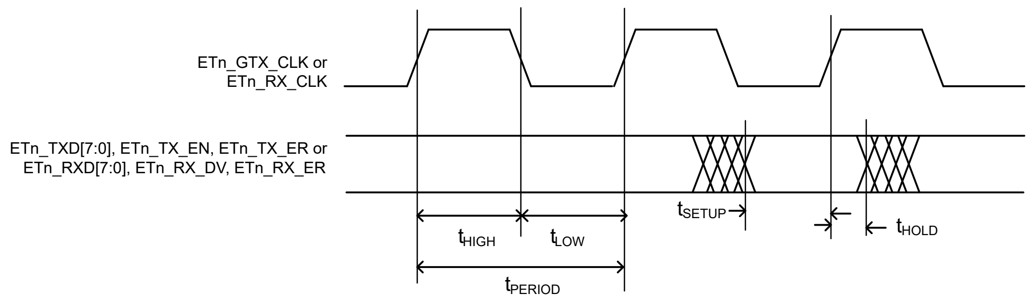

Figure 62.115 GMII timing

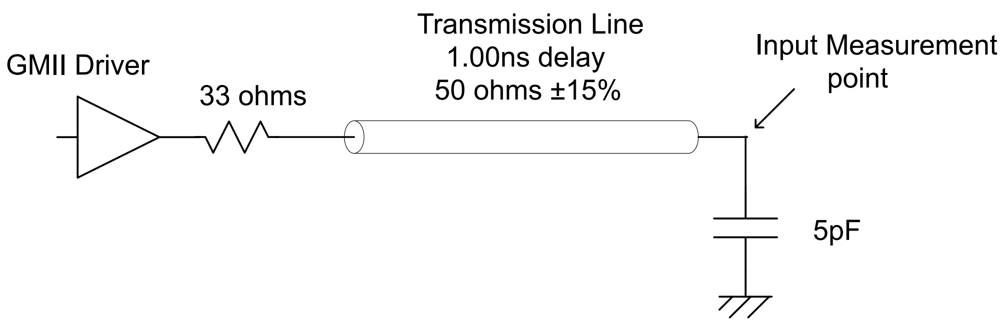

Figure 62.116 GMII output timing measurement conditions

Table 62.82 ESWM timing (RGMII)

Conditions:

1. Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: ETn_MDC, ETn_MDIO.
2. The drive capacity selection and voltage range for pins other than ETn_MDC, ETn_MDIO.

- RGMII use at 2.5 V: RGMII 2.50V drive select, VCC = 2.3 to 2.7
- RGMII use at 3.3 V: RGMII 3.30V drive select, VCC = 3.0 to 3.6

Parameter		Symbol	VCC	Min	Max	Unit	Test conditions
ESWM (RGMII)	Data to Clock output Skew (at Transmitter)*1	T_{skewT}	2.30 V to 3.60 V	−500	500	ps	Figure 62.117 Figure 62.118 Figure 62.119
	Data to Clock input Skew (at Receiver)*1	T_{skewR}		1	2.6	ns	
	Data to Clock output Setup (at Transmitter-integrated delay)	T_{setupT}		1.2	—	ns	
	Clock to Data output Hold (at Transmitter–integrated delay)	T_{holdT}		1.2	—	ns	
	Data to Clock input Setup (at Receiver–integrated delay)	T_{setupR}		1	—	ns	
	Data to Clock input Hold (at Receiver–integrated delay)	T_{holdR}		1	—	ns	
	Clock Cycle Duration*2	T_{cyc}		7.2	8.8	ns	
	Duty Cycle for Gigabit*3	Duty_G		45	55	%	
	Duty Cycle for 10/100T*3	Duty_T		40	60	%	
	Rise / Fall Time (20-80%)	T_r / T_f		—	0.75	ns	

Note 1. This implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5ns and less than 2.0ns will be added to the associated clock signal.
Note 2. For 10Mbps and 100Mbps, Tcyc will scale to 400ns+-40ns and 40ns+-4ns respectively.
Note 3. Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three Tcyc of the lowest speed transitioned between.

	Differential input voltage*2	Unit 0	AN000 to AN005	-VREFH0	—	+VREFH0	V	—
		Unit 1	AN006 to AN011	-VREFH	—	+VREFH	V	—

Note: t_{ADcyc}: ADCLK cycle

Note: t_{Cmp}: Successive approximation time

Note 1. If t_{Cmp} is greater than 100ns, the A/D sampling time should be greater than the following equation.

$1 \times t_{ADcyc} + 1.6 \times t_{Cmp}$

Note 2. Differential input voltage is (A_{INP} - A_{INN}).

A/D Converter Unit 0:

- A_{INP} is input voltage of A_{Nx}, and VREFL0 ≤ A_{INP} ≤ VREFH0.
- A_{INN} is input voltage of A_{Ny}, and VREFL0 ≤ A_{INN} ≤ VREFH0.

A/D Converter Unit 1:

- A_{INP} is input voltage of A_{Nx}, and VREFL ≤ A_{INP} ≤ VREFH.
- A_{INN} is input voltage of A_{Ny}, and VREFL ≤ A_{INN} ≤ VREFH.

					INL integral nonlinearity error	—	±1.5	±2	LSB	—
			High-speed channels (AN000 to AN005) (AN006 to AN011)	With channel dedicated sample and hold circuits	Conversion time*2	1.72	—	—	μs	• ADCLK: 50 MHz • Sampling time of channel-dedicated sample-and-hold circuits: 63 ADCLK • Hold mode switching time of channel-dedicated sample-and-hold circuits: 2 ADCLK • Sampling time: 16 ADCLK • Successive approximation time: 5 ADCLK • Signal source impedance: 50 Ω or less
					Offset error	—	±1.5	±6.75	LSB	—
					Full-scale error	—	±1.5	±6.75	LSB	—
					Absolute accuracy	—	±3.5	±9	LSB	—
					DNL differential nonlinearity error *3	—	±1	-1 to +1.5	LSB	—
					INL integral nonlinearity error	—	±2.5	±3.5	LSB	—

Note: These specification values are applicable when only one ADC16H is operating, DAC12 and ACMPHS are not operating, and there is no access to the external bus during A/D conversion.
If other ADC unit, DAC12, or ACMPHS is operating or bus access occurs during A/D conversion, values might not fall within the indicated ranges.
The use of ports 0 as digital outputs is not allowed when the ADC16H is used.
The characteristics apply when AVCC0, AVSS0, VREFH0, VREFH, VREFL0, VREFL, and ADC16H input voltage is stable.

Note 1. Without channel dedicated sample and hold circuits; The conversion time is the sum of the sampling time and the successive approximation time. Each of the above state is indicated for the test conditions.

Note 2. With channel-dedicated sample-and-hold circuits; The conversion time is the sum of the sampling time of channel-dedicated sample-and-hold circuits, the hold mode switching time, the sampling time and the successive approximation time. Each of the above state is indicated for the test conditions.

Note 3. DNL is measured using the Histogram Method, so the lower limit value is -1.

SAR mode	Differential input	Normal mode	High-speed channels (AN000 to AN005) (AN006 to AN011)	Without channel dedicated sample and hold circuits	Absolute accuracy	—	±4.5	±6	LSB	—
SAR mode	Differential input	Normal mode	High-speed channels (AN000 to AN005) (AN006 to AN011)	Without channel dedicated sample and hold circuits	DNL differential nonlinearity error *2	—	±0.75	±1	LSB	—
SAR mode	Differential input	Normal mode	High-speed channels (AN000 to AN005) (AN006 to AN011)	Without channel dedicated sample and hold circuits	INL integral nonlinearity error	—	±1.5	±2	LSB	—

Table 62.96 A/D conversion characteristics (SAR mode : External VDD mode) (4 of 4)

Conditions: AVCC: 1.62 to 2.7 V, VCC: 1.62 to 2.7 V, VREFH0/VREFH: 1.62 V to AVCC

Parameter						Min	Typ	Max	Unit	Test conditions
SAR mode	Differential input	High accuracy mode	High-speed channels (AN000 to AN005) (AN006 to AN011)	Without channel dedicated sample and hold circuits	Conversion time*1	1	—	—	μs	• ADCLK: 50 MHz • Sampling time: 40 ADCLK • Successive approximation time: 10 ADCLK • Signal source impedance: 50 Ω or less
					Offset error	—	±1	±2.5	LSB	—
					Full-scale error	—	±1	±2.5	LSB	—
					Absolute accuracy	—	±3.5	±4.5	LSB	—
					DNL differential nonlinearity error *2	—	±0.75	±1	LSB	—
					INL integral nonlinearity error	—	±1.5	±2	LSB	—

Note: These specification values are applicable when only one ADC16H is operating, DAC12 and ACMPHS are not operating, and there is no access to the external bus during A/D conversion.
If other ADC unit, DAC12, or ACMPHS is operating or bus access occurs during A/D conversion, values might not fall within the indicated ranges.
The use of ports 0 as digital outputs is not allowed when the ADC16H is used.
The characteristics apply when AVCC0, AVSS0, VREFH0, VREFH, VREFL0, VREFL, and ADC16H input voltage is stable.

Note 1. Without channel dedicated sample and hold circuits; The conversion time is the sum of the sampling time and the successive approximation time. Each of the above state is indicated for the test conditions.

Note 2. DNL is measured using the Histogram Method, so the lower limit value is -1.

Table 62.97 A/D conversion characteristics (Oversampling mode and Hybrid mode) (1)

Parameter				Min	Typ	Max	Unit	Test conditions
Oversampling mode and Hybrid mode	Resolution			—	—	16	bit	—
	Oversampling period	Oversampling mode		0.16	—	—	μs	• ADCLK: 50 MHz • Sampling time: 3 ADCLK • Successive approximation time: 5 ADCLK • Without disconnection detection assist function • Signal source impedance: 50 Ω or less
		Hybrid mode*2		0.18	—	—	μs	• ADCLK: 50 MHz • Sampling time: 8 ADCLK • Successive approximation time: 5 ADCLK • Without disconnection detection assist function • Signal source impedance: 50 Ω or less
	Digital filter characteristics*1	Sinc filter	Initial delay	—	22	—	/Fos	—
			Group delay	—	11	—		—
			Normalized Cutoff Frequency	—	0.033	—	Fin/Fos	—

Note: Fos is oversampling frequency.
When in Hybrid mode, Fos is 1/ (the sum of the oversampling periods of each analog channel assigned to the scan group).

Note 1. See Figure 62.135.

Note 2. Value per channel.

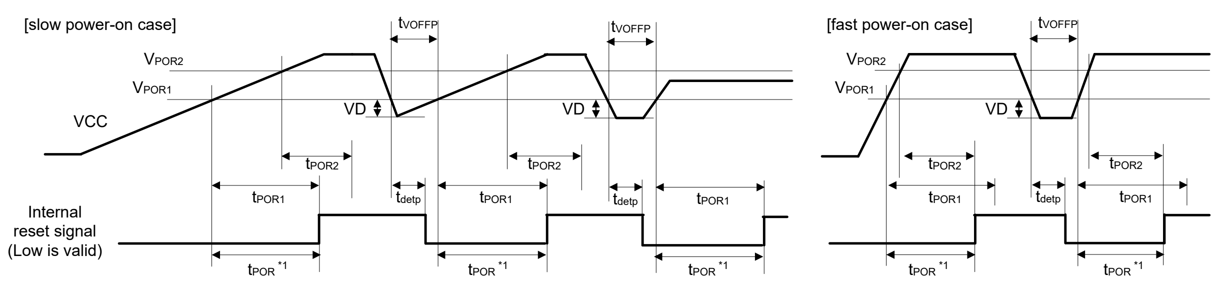
Table 62.110 Power-on reset circuit and voltage detection circuit characteristics (2 of 2)

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
Internal reset time*1	Power-on reset time	t_{POR1}	—	—	6.7	ms	Figure 62.139
		t_{POR2}	—	—	1.6		
	PVD0 reset time	t_{PVD0}	—	—	*1		Figure 62.139
	PVD1 reset time	t_{PVD1}	—	—	*1		Figure 62.140
	PVD2 reset time	t_{PVD2}	—	—	*1		
	PVD4 reset time	t_{PVD4}	—	—	*1		
	PVD5 reset time	t_{PVD5}	—	—	*1		
Minimum VCC downtime (POR)*2	50mV < VD	t_{VOFFP}	900	—	—	μs	Figure 62.139
	VD ≤ 50mV		2000	—	—		
Minimum VCC downtime (PVD)*2	PVD0	t_{VOFF}	25	—	—	μs	Figure 62.140
	PVD1, PVD2, PVD4, PVD5		25	—	—		
Response delay time (POR)	50mV < VD	t_{detp}	—	—	900	μs	Figure 62.139
	VD ≤ 50mV		—	—	2000		
Response delay time (PVD)	PVD0	t_{det}	—	—	25	μs	Figure 62.140, Figure 62.141
	PVD1, PVD2, PVD4, PVD5		—	—	25		
PVDn operation stabilization time (after PVD is enabled) (n = 1, 2, 4, 5)		$T_{d\ (E-A)}$	—	—	20	μs	Figure 62.141

Note 1. The maximum value of t_{PVD0}, t_{PVD1}, t_{PVD2}, t_{PVD4}, t_{PVD5} are equal to t_{DSBY} because the internal reset time is maximized when returning from Deep Software Standby mode.

Note 2. The minimum VCC downtime indicates the time when VCC is below the minimum value of voltage detection levels V_{POR1}, V_{det0}, V_{det1}, V_{det2}, V_{det4} and V_{det5} for the POR / PVD.



Note 1. t_{POR} is determined by the earlier point in time when the t_{POR1} has passed after crossing V_{POR1} or when the t_{POR2} has passed after crossing V_{POR2}.

	$V_{DETBATT\_3}$	1.885	1.950	2.015		
	$V_{DETBATT\_4}$	1.790	1.850	1.910		
	$V_{DETBATT\_5}$	1.690	1.750	1.810		
VCC drop detection stabilization wait time*2	t_{DETWT}	—	—	20	µs	—
Lower-limit VBATT voltage for power supply switching caused by VCC voltage drop	V_{BATTSW}	1.8	—	—	V	Figure 62.147
VCC-off period for starting power supply switching*1 (OFS1.PVDAS and PVDLPSEL are 0 in Deep Software Standby mode 1, 2)	$t_{VOFFBATT}$	25	—	—	µs	
VCC-off period for starting power supply switching*1 (Other than above)		25	—	—		

Table 62.114 Battery backup function characteristics (2 of 2)

Conditions: VCC = VCC_DCDC = VCC_USB = 1.62 to 3.63 V, VBATT = 1.62 to 3.63 V

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Backup domain power-down detection level	$V_{PDR\ (BATR)}$	1.43	1.47	1.52	V	Figure 62.148
Time delay in assertion of the reset signal for the backup domain*3	$t_{p\ (PDRL)}$	—	—	2000	µs	
Time delay in negation of the reset signal for the backup domain	$t_{p\ (PDRH)}$	—	—	3000		
VBATT monitor operation stabilization time (after VBATTMNSELR.VBTMNSEL is changed to 1)	t_{MONWT}	—	—	4.2	µs	—
VBATT voltage monitor level	$V_{MONBATT}$	—	VBATT / 6	—	V	—
VBATT current increase (when VBATTMNSELR.VBTTMNSEL is 1 compared to the case that VBATTMNSELR.VBTTMNSEL is 0)	$I_{VBATTSELB}$	—	1.35	2.00	µA	—
VCC current increase (when VBATTMNSELR.VBTTMNSEL is 1 compared to the case that VBATTMNSELR.VBTTMNSEL is 0)	$I_{VBATTSELC}$	—	15	25	µA	—

Note 1. The VCC-off period for starting power supply switching indicates the period in which VCC is below the minimum value of the voltage level for switching to battery backup ($V_{DETBATT}$).
In addition, this period indicates the time tVOFFP when VCC is below the minimum value of voltage detection levels V_{POR1}.

Note 2. Stable time when VBTBPCR2.VDETLVL is changed or VBTBPCR1. BPWSWSTP is changed from 1 to 0.

Note 3. When the VBATT_R recovers within this period, the backup domain reset signal may not be generated.

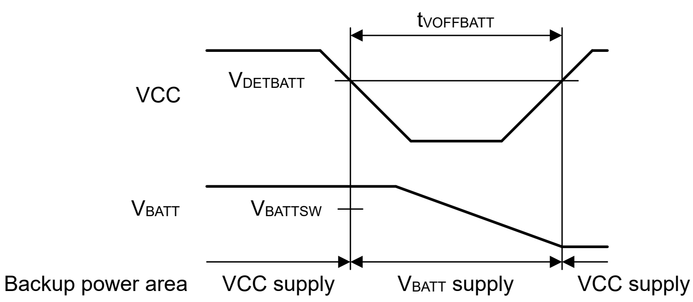

Figure 62.147 Battery backup function characteristics

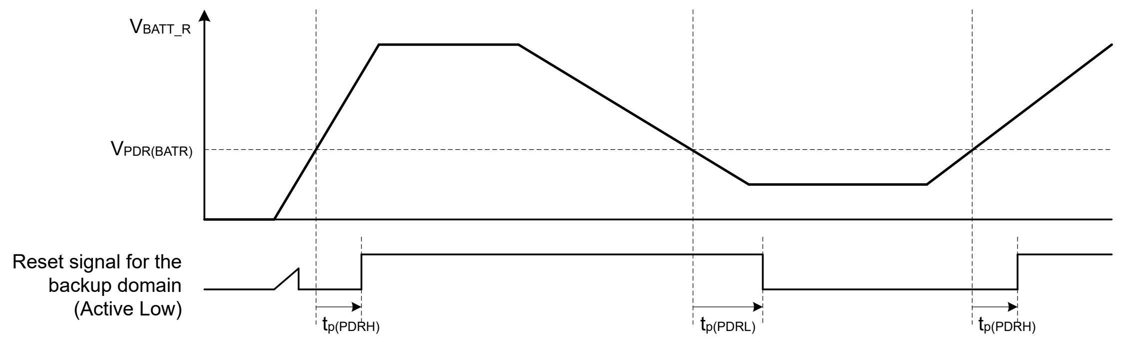

Figure 62.148 Backup domain reset characteristics

62.14 ACMPHS Characteristics

Table 62.115 ACMPHS

Parameter			Symbol	Min	Typ	Max	Unit	Test conditions
Reference voltage range			VREF	0	—	AVCC0	V	—
Input voltage range	ACMPHS0, 1	IVCMP1 to IVCMP3	VI	0	—	AVCC0	V	—
		IVCMP0		0	—	AVCC0		VCC ≥ AVCC0
				0	—	VCC		VCC < AVCC0
	ACMPHS2, 3			0	—	AVCC0		—
Output delay*1			Td	—	50	100	ns	VI = VREF ± 100mV
Internal reference voltage			Vref	0.77	0.8	0.84	V	—

Note 1. This value is the internal propagation delay.

62.15 MRAM Characteristics

62.15.1 Code MRAM Characteristics

Table 62.116 Code MRAM Characteristics (1 of 2)

Parameter		Symbol	MRICLK = 250 MHz			MRICLK = 200 MHz			MRICLK = 150 MHz			MRICLK = 133 MHz			Unit	Test conditions
			Min	Typ *4	Max	Min	Typ *4	Max	Min	Typ *4	Max	Min	Typ *4	Max		
Programming time of 32-byte*7 *8	Normal program mode (MRPSC.MHSPEN = 0)	t_{PMC}	—	6.7 *5 *6	83.3 *6	—	6.74 *5 *6	83.6 *6	—	6.92 *5 *6	85.6 *6	—	7.09 *5 *6	87.3 *6	μs	—
	High speed program mode (MRPSC.MHSPEN = 1)	t_{PMC}	—	4.7 *5 *6	81.3 *6	—	4.74 *5 *6	81.6 *6	—	4.92 *5 *6	83.6 *6	—	5.09 *5 *6	85.3 *6	μs	—

Table 62.116 Code MRAM Characteristics (2 of 2)

Parameter	Symbol	MRICLK = 250 MHz			MRICLK = 200 MHz			MRICLK = 150 MHz			MRICLK = 133 MHz			Unit	Test conditions
		Min	Typ *4	Max	Min	Typ *4	Max	Min	Typ *4	Max	Min	Typ *4	Max		
Reprogramming cycle*9	N_{PC}	100000 *1	—	—	100000 *1	—	—	100000 *1	—	—	100000 *1	—	—	Times	—
Data hold time*2	t_{DRP}	10*2 *3	—	—	10*2 *3	—	—	10*2 *3	—	—	10*2 *3	—	—	Years	Tj = +125°C

Note 1. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.
Note 2. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.
Note 3. This result is obtained from reliability testing.
Note 4. The reference value at VCC = 3.3 V and room temperature.
Note 5. Perform rewrite 50% of bits at Typ. condition.
Note 6. If MRPCLK < 125MHz, add the time of MRPCLK 1cycle to the Program time.
Note 7. To calculate the updating time at other frequencies, using approximate formula below listed.
If MRPCLK < 125MHz, add 1/FMRPCLK [us] to the formula. (F_{MRICLK}: frequency of MRICLK [MHz], F_{MRPCLK}: frequency of MRPCLK [MHz])
t_{PMC} (Typ) = 137.8/F_{MRICLK} + 6.452 [μs], t_{PMC} (Max) = 1879/F_{MRICLK} + 78.75 [μs] for normal program mode.
t_{PMC} (Typ) = 137.8/F_{MRICLK} + 4.452 [μs], t_{PMC} (Max) = 1879/F_{MRICLK} + 76.75 [μs] for high speed program mode.
Note 8. Read and program operations for the code MRAM cannot be executed simultaneously. This value is for independent program operation without arbitration between read and program.
Note 9. The reprogramming cycle is the number of programming per 32-byte code MRAM address space. Programming the same data to the same address also increases the reprogramming cycle count by one. For a reprogramming cycle of n times (n = 100,000), programming can be performed n times for every 32-byte code MRAM address space.

62.15.2 Option Setting Memory (configuration area) Characteristics

Table 62.117 Option Setting Memory (configuration area) characteristics

Parameter		Symbol	MRPCLK = 125 MHz			MRPCLK = 100 MHz			MRPCLK = 75 MHz			MRPCLK = 66 MHz			Unit	Test conditions
			Min	Typ *4	Max	Min	Typ *4	Max	Min	Typ *4	Max	Min	Typ *4	Max		
Command time for configuration set*5 *7	Normal program mode (MRPSC.MHSPEN = 0)	t_{PCFG}	—	0.356	8.19 *6	—	0.356	8.3 *6	—	0.372	8.83 *6	—	0.399	9.42 *6	ms	—
	High speed program mode (MRPSC.MHSPEN = 1)		—	0.0665	7.85 *6	—	0.0725	7.96 *6	—	0.0882	8.5 *6	—	0.0978	9.06 *6	ms	—
Update cycle*8		N_{CUPC}	100000 *1	—	—	100000 *1	—	—	100000 *1	—	—	100000 *1	—	—	Times	—
Data hold time*2		t_{DRP}	10*2 *3	—	—	10*2 *3	—	—	10*2 *3	—	—	10*2 *3	—	—	Years	Tj = +125°C

Note 1. This is the minimum number of times to guarantee all the characteristics after update. The guaranteed range is from 1 to the minimum value.
Note 2. This indicates the minimum value of the characteristic when update is performed within the specified range.
Note 3. This result is obtained from reliability testing.
Note 4. The reference value at VCC = 3.3 V and room temperature.
Note 5. To calculate the updating time at other frequencies, using approximate formula below listed. (F_{MRPCLK}: frequency of MRPCLK [MHz])

t_{PCFG} (Typ) = 6.146/F_{MRPCLK} + 0.3133 [msec], t_{PCFG} (Max) = 266.5/F_{MRPCLK} + 6.331 [msec] for normal program mode.
t_{PCFG} (Typ) = 5.184/F_{MRPCLK} + 0.02754 [msec], t_{PCFG} (Max) = 267.5/F_{MRPCLK} + 6.025 [msec] for high speed program mode.

Note 6. Values in this table are calculated based on the times of 5-times programming (16 bytes). Timeout values of Figure 59.16 is about 1.1 times of the maximum value (t_{PCFG} + t_{PMC} + Read time (MRPCLK 40cycle)).

Note 7. Read and program operations for the extra MRAM cannot be executed simultaneously. This value is for independent program operation without arbitration between read and program.

Note 8. The update cycle is the number of a configuration set command that can be issued configuration area. Programming the same data to the same address also increases the update cycle count by one.

62.15.3 Option Setting Memory (OTP area with ECC) Characteristics

Table 62.118 Option setting memory (OTP area with ECC) characteristics

Parameter		Symbol	MRPCLK = 125 MHz			MRPCLK = 100 MHz			MRPCLK = 75 MHz			MRPCLK = 66 MHz			Unit	Test conditions
			Min	Typ *1	Max	Min	Typ *1	Max	Min	Typ *1	Max	Min	Typ *1	Max		
Programming time of 16-byte*4 *5	Normal speed write mode (MWMCR.MWM[1:0] = 00)	t_{OTPE}	—	8.05 *2	113 *3	—	8.05 *2	113 *3	—	8.05 *2	113 *3	—	8.05 *2	113 *3	ms	—
	High speed write mode 0 (MWMCR.MWM[1:0] = 01)		—	4.03 *2	56.7 *3	—	4.03 *2	56.7 *3	—	4.03 *2	56.7 *3	—	4.03 *2	56.7 *3	ms	—
	High speed write mode 1 (MWMCR.MWM[1:0] = 10)		—	0.229*2	3.14 *3	—	0.229*2	3.14 *3	—	0.229*2	3.14 *3	—	0.229*2	3.14 *3	ms	—

Note 1. The reference value at VCC = 3.3 V and room temperature.

Note 2. Perform rewrite 50% of bits at Typ. condition.

Note 3. Timeout values of Figure 59.13 is about 1.1 times of the maximum value. (t_{OTPE} + t_{PMC} + Read time (MRPCLK 40cycle)).

Note 4. To calculate the updating time at other frequencies, using approximate formula below listed. (F_{MRPCLK}: frequency of MRPCLK [MHz])
t_{OTPE} (Typ) = 0.5065/F_{MRPCLK} + 8.123 [ms], t_{OTPE} (Max) = 4.433/F_{MRPCLK} + 114.1 [ms] for normal speed mode.
t_{OTPE} (Typ) = 0.3389/F_{MRPCLK} + 4.067 [ms], t_{OTPE} (Max) = 2.428/F_{MRPCLK} + 57.08 [ms] for high speed mode 0.
t_{OTPE} (Typ) = 0.1458/F_{MRPCLK} + 0.2312 [ms], t_{OTPE} (Max) = 0.3904/F_{MRPCLK} + 3.166 [ms] for high speed mode 1.

Note 5. Read and program operations for the extra MRAM cannot be executed simultaneously. This value is for independent program operation without arbitration between read and program.

62.15.4 Option Setting Memory (OTP area without ECC) Characteristics

Table 62.119 Option Setting Memory (OTP area without ECC) Characteristics

Parameter		Symbol	MRPCLK = 125 MHz			MRPCLK = 100 MHz			MRPCLK = 75 MHz			MRPCLK = 66 MHz			Unit	Test conditions
			Min	Typ *1	Max	Min	Typ *1	Max	Min	Typ *1	Max	Min	Typ *1	Max		
Programming time of 16-byte*4 *5	Normal speed write mode (MWMCR.MWM[1:0] = 00)	t_{OTPENE}	—	14.1 *2	200 *3	—	14.1 *2	200 *3	—	14.1 *2	200 *3	—	14.1 *2	200 *3	ms	—
	High speed write mode 0 (MWMCR.MWM[1:0] = 01)		—	7.07 *2	100 *3	—	7.07 *2	100 *3	—	7.07 *2	100 *3	—	7.07 *2	100 *3	ms	—
	High speed write mode 1 (MWMCR.MWM[1:0] = 10)		—	0.458 *2	6.28 *3	—	0.458 *2	6.28 *3	—	0.458 *2	6.28 *3	—	0.458 *2	6.28 *3	ms	—

Note 1. The reference value at VCC = 3.3 V and room temperature.
Note 2. Perform rewrite 50% of bits at Typ. condition.
Note 3. Timeout values of Figure 59.13 is about 1.1 times of the maximum value. (t_{OTPENE} + t_{PMC} + Read time (MRPCLK 40cycle)).
Note 4. To calculate the updating time at other frequencies, using approximate formula below listed. (F_{MRPCLK}: frequency of MRPCLK [MHz])
t_{OTPENE} (Typ) = 0.8486/F_{MRPCLK} + 14.25 [ms], t_{OTPENE} (Max) = 7.711/F_{MRPCLK} + 201.5 [ms] for normal speed mode.
t_{OTPENE} (Typ) = 0.5479/F_{MRPCLK} + 7.133 [ms], t_{OTPENE} (Max) = 4.148/F_{MRPCLK} + 100.8 [ms] for high speed mode 0.
t_{OTPENE} (Typ) = 0.2571/F_{MRPCLK} + 0.4627 [ms], t_{OTPENE} (Max) = 0.7401/F_{MRPCLK} + 6.333 [ms] for high speed mode 1.
Note 5. Read and program operations for the extra MRAM cannot be executed simultaneously. This value is for independent program operation without arbitration between read and program.

62.15.5 MACI Command Characteristics

Table 62.120 MACI command Characteristics

Parameter	Symbol	MRPCLK = 125 MHz			MRPCLK = 100 MHz			MRPCLK = 75 MHz			MRPCLK = 66 MHz			Unit	Test conditions
		Min	Typ *1	Max	Min	Typ *1	Max	Min	Typ *1	Max	Min	Typ *1	Max		
Command time for forced stop command*2	t_{FS}	—	—	3.35 *3	—	—	3.38 *3	—	—	3.47 *3	—	—	3.7 *3	μs	—
Command time for increment counter*2	t_{INCC}	—	0.252	1.61 *4	—	0.252	1.61 *4	—	0.252	1.61 *4	—	0.252	1.61 *4	ms	—
Command time for read counter*2	t_{RDC}	—	—	0.156*5	—	—	0.182*5	—	—	0.243*5	—	—	0.276*5	μs	—

Note 1. The reference value at VCC = 3.3 V and room temperature.
Note 2. To calculate the updating time at other frequencies, using approximate formula below listed. (F_{MRPCLK}: frequency of MRPCLK [MHz])
t_{FS} (Max) = 38.62/F_{MRPCLK} + 3.155 [us]
t_{INCC} (Typ) = 0.3348/F_{MRPCLK} + 0.2533 [msec], t_{INCC} (Max) = 0.8698/F_{MRPCLK} + 1.62 [msec]

t_{RDC} (Max) = 19.13/F_{MRPCLK} + 0.004099 [usec]

Note 3. Timeout values of Figure 59.15 is about 1.1 times of the maximum value. (t_{FS} + Read time (MRPCLK 40cycle)).

Note 4. Values in this table are calculated based on the times of 2-time programming (32 bytes). Timeout values of Figure 59.17 is about 1.1 times of the maximum value (t_{INCC} + t_{PMC} + Read time (MRPCLK 40cycle)).

Note 5. Counter read time is 100 cycles at MRPCLK. Timeout values of Figure 59.18 is about 1.1 times of the maximum value (t_{RDC} + Read time (MRPCLK 40cycle)).

62.15.6 Zeroizing of W-HUK

Table 62.121 Zeroizing of W-HUK Characteristics

Parameter	Symbol	MRPCLK = 125 MHz			MRPCLK = 100 MHz			MRPCLK = 75 MHz			MRPCLK = 66 MHz			Unit	Test conditions
		Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	Min	Typ	Max		
Acton time of Zeroing of W-HUK*1	t_{ZWH}	—	—	793	—	—	793	—	—	793	—	—	793	ms	—

Note 1. To calculate the updating time at other frequencies, using approximate formula below listed. (FMRPCLK: frequency of MRPCLK [MHz])
t_{ZWH} (Max) = 34.52/FMRPCLK + 799 [μs]

62.15.7 MRAM Magnetic Field Immunity Characteristics

Table 62.122 MRAM Magnetic field Immunity Characteristics

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
Operation	Write state	G_{max_wr}	—	—	200	Gauss	—
	Read state	G_{max_rd}	—	—	200	Gauss	—
	No access state	G_{max_noac}	—	—	500	Gauss	—
Storage		G_{max_stg}	—	—	500	Gauss	The applied temperature is T_{stg}.

62.16 Boundary Scan

Table 62.123 Boundary scan characteristics (1 of 2)

Parameter	VCC	Symbol	Min	Typ	Max	Unit	Test conditions
TCK clock cycle time	1.62 V or above	t_{TCKcyc}	100	—	—	ns	Figure 62.149
TCK clock high pulse width	1.62 V or above	t_{TCKH}	0.45	—	—	t_{TCKcyc}

Function	Pin function	Reset	Software Standby mode (SSTBY)		Deep Software Standby mode 1, 2, 3 (DSTBY1, 2, 3)		After Deep Software Standby mode is canceled (return to startup mode)	
			OPE = 0	OPE = 1	DSTBY1	DSTBY2/ DSTBY3	IOKEEP = 0	IOKEEP = 1*1
P400/P401	Other than function IRQ5-DS	Hi-Z	Keep-O*2		Hi-Z		Hi-Z	
PDMIF	PDMCLKn	Hi-Z	PDMCLKn output		Keep		Hi-Z	Keep
	PDMDATAn	Hi-Z	Keep-O*6		Keep		Hi-Z	Keep
Others	—	Hi-Z	Keep-O		Keep		Hi-Z	Keep

Note: Hi-Z: High-impedance
Keep-O: Output pins retain their previous values. Input pins go to high-impedance.
Keep-I: Pin states are retained the same as during periods in Normal mode.
Keep: Pin states are retained the same as during periods in Software Standby mode.
Note 1. Retains the I/O port state until the DPSBYCR.IOKEEP bit is cleared to 0.
Note 2. Input is enabled if the pin is specified as the Software Standby canceling source while it is used as an external interrupt pin.
Note 3. Input is enabled if the pin is specified as the Deep Software Standby canceling source.
Note 4. Input is enabled while the pin is used as an input pin.
Note 5. For host operation, set the USBHS.SYSCFG.DRPD bit to 1 to enable the USBHS_DP and USBHS_DM pull-down resistors.
For device operation, set the USBHS.SYSCFG.DPRPU bit to 1 to enable the DP pull-up resistor.
Note 6. Input is enabled if the PDMIF sound detection interrupt is specified as the Software Standby canceling source.

Appendix 2. Package Dimensions

Information on the latest version of the package dimensions or mountings is displayed in “Packages” on the Renesas Electronics Corporation website.

Appendix 3. I/O Registers

This appendix describes I/O register address and access cycles by function.

3.1 Peripheral Base Addresses

This section provides the base addresses for peripherals described in this manual. Table A3.1 shows the name, description, and the base address of each peripheral.

Table A3.1 Peripheral base address (1 of 4)

Description	Name of secure registers	Base address of secure registers in secure alias region	Name of non-secure registers	Base address of non-secure registers in non-secure alias region
Renesas Memory Protection Unit	RMPU	0x4000_0000	RMPU_NS	0x5000_0000
SRAM Control	SRAM	0x4000_2000	SRAM_NS	0x5000_2000
BUS Control	BUS	0x4000_3000	BUS_NS	0x5000_3000
Common Interrupt Controller	ICU_COMMON	0x4000_6000	ICU_COMMON_NS	0x5000_6000
CPU System Security Control Unit	CPSCU	0x4000_8000	CPSCU_NS	0x5000_8000
Direct Memory Access Controller 00	DMAC00	0x4000_A000	DMAC00_NS	0x5000_A000
Direct Memory Access Controller 01	DMAC01	0x4000_A040	DMAC01_NS	0x5000_A040
Direct Memory Access Controller 02	DMAC02	0x4000_A080	DMAC02_NS	0x5000_A080
Direct Memory Access Controller 03	DMAC03	0x4000_A0C0	DMAC03_NS	0x5000_A0C0
Direct Memory Access Controller 04	DMAC04	0x4000_A100	DMAC04_NS	0x5000_A100
Direct Memory Access Controller 05	DMAC05	0x4000_A140	DMAC05_NS	0x5000_A140

Note: Name = Peripheral name
Description = Peripheral functionality
Base address = Lowest reserved address or address used by the peripheral

3.2 Access Cycles

This section provides access cycle information for the I/O registers described in this manual.

- Registers are grouped by associated module.
- The number of access cycles indicates the number of cycles based on the specified reference clock.
- In the internal I/O area, reserved addresses that are not allocated to registers must not be accessed, otherwise operations cannot be guaranteed.
- The number of I/O access cycles depends on bus cycles of the internal peripheral bus, divided clock synchronization cycles, and wait cycles of each module. Divided clock synchronization cycles differ depending on the frequency ratio between ICLK and PCLK.
- When the frequency of ICLK is equal to that of PCLK, the number of divided clock synchronization cycles is always constant.
- When the frequency of ICLK is greater than that of PCLK, at least 1 PCLK cycle is added to the number of divided clock synchronization cycles.
- The number of write access cycles indicates the number of cycles obtained by non-bufferable write access.

Note: This applies to the number of cycles when access from the CPU does not conflict with the instruction fetching to the external memory or bus access from other bus masters such as DTC or DMAC.

Table A3.2 Access cycles (1 of 3)

Peripheral base address symbol	Address[*1]		Number of access cycles					Related function
			ICLK = PCLK		ICLK > PCLK[*2]		Cycle unit	
	From	To	Read	Write	Read	Write		
RMPU, SRAM, BUS, ICU_COMMON, CPSCU, DMAC0n, DMA0, DTC0, ICU, CPU_CTRL, CPU_OCD, CPU_DBG	0x4000_0000	0x4001_BFFF	3	2	3	2	ICLK	Renesas Memory Protection Unit, SRAM Control, BUS Control, Common Interrupt Controller, CPU System Security Control Unit, Direct memory access controller 0 n, DMAC Module Activation 0, Data Transfer Controller 0, Interrupt Controller, CPU Control Registers, On-Chip Debug, Debug Function

Table A3.2 Access cycles (3 of 3)

Peripheral base address symbol	Address*1		Number of access cycles					
			ICLK = MRPCLK		ICLK > MRPCLK*2		Cycle unit	Related function
	From	To	Read	Write	Read	Write		
MRAM	0x4013_0000	0x4013_FFFF	4	3	2 to 4	1 to 3	MRPCLK	MRAM control

Note 1. This table only shows secure address. Access cycle of the non-secure address is the same as its secure address.
Note 2. If the number of PCLK or MRPCLK cycles is non-integer (for example 1.5), the minimum value is without the decimal point, and the maximum value is rounded up to the decimal point. For example, 1.5 to 2. 5 is 1 to 3.
Note 3. BWAIT is the number of waits (not cycles) described in the USBHS.BUSWAIT register.

Appendix 4. Notes for Register R/W

- A secure bus master issues a secure access using an address marked as secure by IDAU/SAU or MSAU
- A secure bus master issues a non-secure access using an address marked as non-secure by IDAU/SAU or MSAU
- A non-secure bus master issues a non-secure access using an address marked as non-secure by IDAU/SAU or MSAU.

Table A4.1 Type of register notes (S-TYPE)

TYPE	UM description
S-TYPE-1	Only Secure access can write to this register. Read access is always allowed. Non-secure write access is ignored, but TrustZone access error is not generated.
S-TYPE-2	Read access is always allowed If the security attribution is configured as Secure: ● Secure write access is allowed ● Non-secure write access is ignored, but TrustZone access error is not generated.
	If the security attribution is configured as Non-secure: ● Secure write access is ignored, but TrustZone access error is not generated ● Non-secure access is allowed.
S-TYPE-3	If the security attribution is configured as Secure: ● Secure access is allowed ● Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.
	If the security attribution is configured as Non-secure: ● Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated ● Non-secure access is allowed.
S-TYPE-4	If the security attribution is configured as Secure: ● Secure access is allowed ● Non-secure write access is ignored and Non-secure read access is read as 0, but TrustZone access error is not generated.
	If the security attribution is configured as Non-secure: ● Secure write access is ignored and Secure read access is read as 0, but TrustZone access error is not generated ● Non-secure access is allowed.
S-TYPE-5	Access is always allowed.
S-TYPE-6	Secure access is allowed. Non-secure write access is ignored, and Non-secure read access is read as 0, TrustZone access error is generated.
S-TYPE-7	Secure write access is ignored, and Secure read access is read as 0, TrustZone access error is generated. Non-secure access is allowed.

Note: A non-secure bus master does NOT issue any access using an address marked as secure by IDAU/SAU or MSAU.

Table A4.2 Type of register notes (P-TYPE)

TYPE	UM description
P-TYPE-1	Privileged write access is allowed. Read access is always allowed. Unprivileged write access is ignored, but TrustZone access error is not generated.
P-TYPE-2	Privileged access is allowed. Unprivileged write access is ignored, and Unprivileged read access is read as 0, TrustZone access error is generated.
P-TYPE-3	If the privilege attribution is configured as Privileged: ● Privileged access is allowed ● Unprivileged write access is ignored and Unprivileged read access is read as 0, TrustZone access error is generated.
	If the privilege attribution is configured as Unprivilege: ● Privileged access and Unprivileged access are allowed.
P-TYPE-4	If the privilege attribution is configured as Privileged: ● Privileged access is allowed ● Unprivileged write access is ignored and Unprivileged read access is read as 0, TrustZone access error is not generated.
	If the privilege attribution is configured as Unprivilege: ● Privileged access and Unprivileged access are allowed.
P-TYPE-5	Access is always allowed.

Appendix 5. Peripheral Variant

Table A5.1 shows the correspondence between the module name used in this manual and the peripheral variant.

Table A5.1 Module name vs peripheral variant

Module name	Peripheral variant
SCI	SCI_B
SPI	SPI_B
OSPI	OSPI_B
ADC16H	ADC_B
DAC12	DAC_B
DOC	DOC_B

Revision History

Revision 1.00— February 14, 2025

First edition, issued

Revision 1.10 — May 16, 2025

1. Overview:
- Updated Figure 1.2 Part numbering scheme.

2. CPU:
- Updated Table 2.6 Initial secure vector table base address in Single-chip mode.
- Updated 2.8.1 External Debugger Connectivity, Authentication by JTAG/SWD.
- Updated Table 2.10 Condition for authentication level.
- Updated 2.9.1.7 CPUnINITVTOR : CPU Initial Vector Base Address Register (n = 0, 1)

3. Inter-Processor Communication:
- Updated 3.2.10 IPC0STA0 : Inter-Processor0 Status Register0.
- Updated 3.2.12 IPC0TXD0 : Inter-Processor0 FIFO Transfer Data Register0 and 3.2.13 IPC0RXD0 : Inter-Processor0 FIFO Receive Data Register0.
- Updated 3.2.15 IPC0STA1 : Inter-Processor0 Status Register1.
- Updated 3.2.17 IPC0TXD1 : Inter-Processor0 FIFO Transfer Data Register1 and 3.2.18 IPC0RXD1 : Inter-Processor0 FIFO Receive Data Register1.
- Updated 3.2.20 IPC1STA0 : Inter-Processor1 Status Register0.
- Updated 3.2.22 IPC1TXD0 : Inter-Processor1 FIFO Transfer Data Register0 and 3.2.23 IPC1RXD0 : Inter-Processor1 FIFO Receive Data Register0.
- Updated 3.2.25 IPC1STA1 : Inter-Processor1 Request Status Register1.
- Updated 3.2.27 IPC1TXD1 : Inter-Processor1 FIFO Transfer Data Register1 and 3.2.28 IPC1RXD1 : Inter-Processor1 FIFO Receive Data Register1.
- Updated 3.3.2 Inter-Processor Non-maskable Interrupt.
- Updated Figure 3.3 Inter-Processor non-maskable interrupt.
- Updated 3.3.4 Exclusive Control Flow.
- Updated Figure 3.6 Inter-processor message FIFO.
- Updated Figure 3.7 Inter-processor message FIFO timing.

6. Resets:
- Updated Table 6.3 Module-related registers initialized by each reset source.

7. Option-Setting Memory:
- Updated 7.2.4 OFS1, OFS1_SEC : Option Function Select Register 1 for Non-Secure and Secure.
- Updated 7.2.16 SAMR : Start Address of Measurement Report.

Revision 1.10 — May 16, 2025

9. Clock Generation Circuit:
- Updated 9.2.1 CGFSAR : Clock Generation Function Security Attribute Register.
- Updated 9.2.16 HOCOCR : High-Speed On-Chip Oscillator Control Register.
- Added HOCOCR2 : High-Speed On-Chip Oscillator Control Register2.
- Updated 9.2.19 FLLCR2 : FLL Control Register2.
- Updated 9.2.33 LOCOUTCR : LOCO User Trimming Control Register and 9.2.34 MOCOUTCR : MOCO User Trimming Control Register.
- Updated 9.2.38 USBCKDIVCR : USB Clock Division Control Register, 9.2.39 OCTACKDIVCR : Octal-SPI Clock Division Control Register, 9.2.40 CANFDCKDIVCR : CANFD Core Clock Division Control Register, 9.2.41 USB60CKDIVCR : USB60 Clock Division Control Register, 9.2.42 I3CCKDIVCR : I3C Clock Division Control Register, 9.2.43 USBCKCR : USB Clock Control Register, 9.2.44 OCTACKCR : Octal-SPI Clock Control Register, 9.2.45 CANFDCKCR : CANFD Core Clock Control Register, 9.2.46 USB60CKCR : USB60 Clock Control Register, 9.2.47 I3CCKCR : I3C Clock Control Register, 9.2.48 SCICKDIVCR : SCI Clock Division Control Register, 9.2.49 SPICKDIVCR : SPI Clock Division Control Register, 9.2.50 ADCCKDIVCR : ADC Clock Division Control Register, 9.2.51 GPTCKDIVCR : GPT Clock Division Control Register, 9.2.52 SCICKCR : SCI Clock Control Register, 9.2.53 SPICKCR : SPI Clock Control Register, 9.2.54 ADCCKCR : ADC Clock Control Register, and 9.2.55 GPTCKCR : GPT Clock Control Register.
- Updated 9.2.58 ESWCKDIVCR : EtherSW Clock Division Control Register, 9.2.59 ESWPCKDIVCR : EtherSW-PHY Clock Division Control Register, and 9.2.60 ETHPCKDIVCR : Ether-PHY Clock Division Control Register.
- Updated 9.2.62 ESWCKCR : EtherSW Clock Control Register, 9.2.63 ESWPCKCR : EtherSW-PHY Clock Control Register, and 9.2.64 ETHPCKCR : Ether-PHY Clock Control Register.
- Updated 9.10.1 CPU0 Clock (CPUCLK0), 9.10.2 CPU1 Clock (CPUCLK1), 9.10.3 MRAM Code Bus Clock (MRICLK), 9.10.4 MRAM Peripheral Bus Clock (MRPCLK), and 9.10.5 System Clock (ICLK).
- Updated 9.10.7 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE), 9.10.8 External Bus Clock (BCLK, EBCLK), and 9.10.9 SDRAM Clock (SDCLK).
- Updated 9.10.11 SCI Clock (SCICLK), 9.10.12 SPI Clock (SPICLK), 9.10.13 Octal-SPI Clock (OCTACLK, OCTADIVCLK), 9.10.14 CANFD Core Clock (CANFDCLK), 9.10.15 USB Clock (USBCLK), and 9.10.16 USB Clock (USB60CLK).
- Updated 9.10.18 ADC Clock (ADCCLK), 9.10.19 GPT Clock (GPTCLK), 9.10.20 I3C Clock (I3CCLK), 9.10.21 Asynchronous External Bus Clock (BCLKA), 9.10.22 EtherSW Clock (ESWCLK), 9.10.23 EtherSW-PHY Clock (ESWPHYCLK), and 9.10.24 Ether-PHY Clock (ETHPHYCLK).
- Updated 9.10.33 External Pin Output Clock (CLKOUT).
- Updated Table 9.14 Example of the HOCO initial setting procedure after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1, without FLL).
- Updated Table 9.15 Example of the HOCO setting procedure with FLL function after reset release / after Deep Software Standby cancellation (OFS9.HOCOEN = 1).

11. Low Power Modes:
- Updated Table 11.2 Operating state of processor low power mode.
- Updated Table 11.3 Operating state of each low power mode.
- Updated 11.2.20 DPSBYCR : Deep Software Standby Control Register.
- Updated 11.8.6 Transition to Low Power Modes.

13. Register Write Protection Function:
- Updated Table 13.1 Association between PRCR bits and use of registers to be protected.

14. Interrupt Controller Unit:
- Updated 14.2.12 IRQCRi : IRQ Control Register (i = 0 to 31).
- Updated 14.2.19 WUPEN0 : Wake Up Interrupt Enable Register 0 and 14.2.20 WUPEN1 : Wake Up interrupt enable register 1.
- Updated Table 14.5 Event List.
- Updated 14.9.2 Return from CPU Deep Sleep Mode and 14.9.3 Return from Software Standby Mode.

15. Buses:
- Modified the figure title in Figure 15.23 Example of write access operation with address/data multiplexed I/O interface.
- Modified the figure title in Figure 15.24 Example of bus timing with address/data multiplexed I/O interface.
- Added the Access Mode register to Table 15.33 Conditions for register modification.

17. DMA Controller:
- Added the new explanation to 17.3.1.4 Repeat-Block Transfer Mode.

18. Data Transfer Controller:
- Modified Figure 18.1 DTC block diagram.

20. I/O Ports:
- Modified Table 20.9 Register settings for input/output pin function (PORT2).

21. Port Output Enable for GPT:
- Modified Figure 21.1 POEG block diagram.

29. Layer 3 Ethernet Switch Module:
- Modified Table 29.1 ESWM specifications.
- Modified 29.2.2.6 TPEMIMC6t : Error and Monitoring Interrupt Mapping Configuration Register 6t.
- Modified 29.2.2.7 TPEMIMC7t : Error and Monitoring Interrupt Mapping Configuration Register 7t.

Revision 1.10 — May 16, 2025

30. Ethernet Message Forwarding Engine:
- Modified bit symbol suffix.
- Updated 30.3.1.5.2 FWLTHHC : L3 Hash Configuration Register.
- Updated 30.3.1.6.2 FWMACHC : MAC Hash Configuration Register.
- Updated 30.3.1.10.13 FWSEQNRC : Sequence Number Reset Configuration Register.

31. Ethernet Common Agent:
- Updated 31.3.1.4 RCDC : Clock Disable Configuration Register.
- Updated 31.3.2.3 CABPPFLCi : Buffer Pointer Pause Frame Level i Configuration Register, 31.3.2.4 CABPPWMLCi : Port i Buffer Pool Watermark Level Configuration Register (i = 0 to 2), 31.3.2.5 CABPPPFLCij : Port i Buffer Pointer Pause Frame Level j Configuration Register (i = 0 to 2) (j = 0, 1), and 31.3.2.6 CABPULCi : Port i Buffer Pointer Utilization Level Configuration Register i (i = 0 to 2).
- Updated 31.3.2.11 CABPMCPMi : Port i Buffer Pointer Maximum Count Monitoring Register (i = 0 to 2).
- Updated 31.5.1.1 IPV-based Watermark.
- Updated 31.5.1.3 Per-port Level-based Watermark i (i = 0 to 3).
- Updated 31.5.2.2 Per-port Pause Function i (i = 0 to 3).
- Updated 31.5.3 Per-port Memory Allocation Function.
- Updated 31.5.3.2 Reduced Memory Setting 1 (Recommended Setting) and 31.5.3.3 Reduced Memory Setting 2 (Recommended Setting).

32. Ethernet Agent:
- Modified 32.3.2.4 EATDQAC : TX Descriptor Queue Arbitration Configuration Register.
- Modified 32.3.2.9 EATDQMLMq : Transmission Descriptor Queue q Max Level Monitoring Register.
- Modified 32.3.4.2 EACC : CBS Configuration Register.
- Modified 32.3.4.5 EACOEM : CBS Oper Enable Monitoring Register.
- Modified 32.3.4.6 EACOIVMq : CBS Oper Increment Value Monitoring Register q.
- Modified 32.3.4.7 EACOULMq : CBS Oper Upper Limit Monitoring Register q.
- Modified 32.3.5.3 EATASENCi : TAS Entry Number Configuration Register i.
- Modified 32.3.5.4 EATASCTENC : TAS Cut-Through Entry Number Configuration Register.
- Modified 32.3.5.5 EATASENMi : TAS Entry Number Monitoring Register i.
- Modified 32.3.7.1.1 EAEIS0 : Error Interrupt Status Register 0.
- Modified 32.3.7.1.4 EAEIS1 : Error Interrupt Status Register 1.
- Modified 32.3.7.1.7 EAEIS2 : Error Interrupt Status Register 2.
- Modified Figure 32.9 CBS q setting flow.
- Modified Figure 32.10 CBS q disabling flow.
- Modified Table 32.5 Descriptor store ETHA/GWCA register association.
- Modified 32.5.1.3 Frame Size Check.
- Modified 32.5.1.5 CBS (Credit-based shaper) [802.1Qav].
- Modified 32.5.1.5.1 CBS Setting.
- Modified 32.5.1.6 TAS (Time Aware Shaper) [802.1Qbv].
- Modified Figure 32.19 TAS behavior when its schedule starts in the future.
- Modified Figure 32.20 TAS behavior when its schedule should have started in the past.
- Modified Figure 32.22 TAS behavior when its schedule reconfiguration should have happened in the past.
- Modified Figure 32.25 TAS recovery during gPTP offset correction.
- Modified 32.5.1.7.2 Preemption.

33. Ethernet MAC:
- Modified 33.4.1.7 MTPFC2 : Transmission Pause or PFC Frame Configuration Register 2.
- Modified Table 33.6 Reception error list.
- Modified 33.4.3.2 MEIE : Error Interrupt Enable Register.
- Modified 33.4.3.3 MEID : Error Interrupt Disable Register.
- Modified Figure 33.6 Initialization flow.
- Modified Figure 33.18 PFC frame format.
- Modified 33.6.2.2.1 Transmission of PFC frame.
- Modified 33.6.2.2.2 Reception of PFC frame.
- Modified Figure 33.22 Reception of PAUSE frame.
- Modified 33.6.3.1 Timestamp capture.
- Modified Figure 33.26 Example configuration of PTP message filter.

34. Ethernet CPU Agent:
- Modified bit symbol suffix.

35. Ethernet Generic PTP Timer:
- Modified 35.3.2.2 PTPTMDC : Timer Disable Configuration Register.
- Modified 35.6.3.6 POTPERnU : Period Setting Register nU (n = 0 to 3).

44. Octal Serial Peripheral Interface:
- Updated Table 44.8 Error list (n = 0, 1).
- Added 44.5.8 Block Protect for SiP Product.

49. Pulse Density Modulation Interface:
- Updated Table 49.2 PDM I/O pins (n = 0 to 2).
- Updated Table 49.20 PDM-IF interrupt list.

Revision 1.10 — May 16, 2025

51. Security Features:
- Updated Figure 51.14 Format and location of the measurement report.

52. Renesas Secure IP:
- Updated Table 52.1 Security engine specifications.

53. 16-bit A/D Converter:
- Updated 53.11.20 Sampling Error and Sampling Time Estimation.
- Updated 53.11.22 Notes on simultaneous operation with other modules.

54. 12-Bit D/A Converter:
- Updated base address.
- Updated 54.1 Overview.

61. Internal Voltage Regulator:
- Updated 61.2.2 External VDD Mode.

62. Electrical Characteristics:
- Updated 62.Electrical Characteristics.
- Updated 62.1 Absolute Maximum Ratings.
- Updated 62.2.5 Operating and Standby Current.
- Updated 62.3.10 SPI Timing.
- Updated 62.3.11 OSPI Timing.
- Updated 62.6 ADC Characteristics.
- Added 62.11 External VDD timing Characteristics.

Appendix:
- Updated Figure A2.3 HLQFP 176-pin in Appendix 2.
- Updated Table A5.1 Module name vs peripheral variant in Appendix 5.

Revision 1.20 — Jul 31, 2025

Specification Differences Between Products:
- Updated Table 1.1 Specification Differences Depending on Chip Versions

1. Overview:
- Updated Table 1.8 Communication interfaces
- Updated Table 1.15 Pin functions
- Updated Table 1.16 Pin list for the Standard product
- Updated Table 1.17 Pin list for the SiP product

2. CPU:
- Updated Table 2.26 DBGREG registers

9. Clock Generation Circuit:
- Updated 9.2.25 SOSTDCR : Sub-clock Oscillation Stop Detection Control Register
- Updated 9.9.3 Sub-clock Oscillation Stop Detection and Operation after Detection

11. Low Power Modes:
- Updated 11.7 Voltage Scaling Control

14. Interrupt Controller Unit:
- Modified offset address of 14.2.12 IRQCRi : IRQ Control Register (i = 0 to 31)
- Updated 14.2.13 NMISR : Non-Maskable Interrupt Status Register
- Updated 14.2.14 NMIER : Non-Maskable Interrupt Enable Register
- Updated 14.2.15 NMICLR : Non-Maskable Interrupt Status Clear Register
- Updated 14.2.16 NMICR : NMI Pin Interrupt Control Register
- Updated 14.2.17 IELSRn : Interrupt Controller Unit Event Link Setting Register n (n = 0 to 95)
- Updated 14.2.18 DELSRm : DMAC Event Link Setting Register m (m = 0 to 7)
- Updated 14.2.19 WUPEN0 : Wake Up Interrupt Enable Register 0
- Updated 14.2.20 WUPEN1 : Wake Up Interrupt Enable Register 1
- Updated 14.2.21 DSLPWUPIRQENj : Deep Sleep Wake Up IRQ Enable Register (j = 0 to 2)
- Updated Table 14.5 Event List

15. Buses:
- Updated Table 15.3 Addresses assigned for each slave

19. Event Link Controller:
- Updated Table 19.3 Association between event signal names set in ELSRn.ELS[9:0] bits and signal numbers

20. I/O Ports:
- Updated Table 20.8 Register settings for input/output pin function (PORT1)
- Updated Table 20.11 Register settings for input/output pin function (PORT4)
- Updated Table 20.14 Register settings for input/output pin function (PORT7)
- Updated Table 20.15 Register settings for input/output pin function (PORT8)

Revision 1.20 — Jul 31, 2025

22. General PWM Timer:
- Updated Table 22.2 GPT functions
- Updated Table 22.71 Interrupt sources
- Updated 22.5 A/D Conversion Start Request
- Updated Figure 22.151 Example of A/D Conversion Start Request Timing Operation
- Updated 22.6.1 Event Signal Output to ELC
- Updated Figure 22.172 Example of A/D Conversion Start Request Event Interval

29. Layer 3 Ethernet Switch Module:
- Deleted 29.2.2.1 TPEMIMC0 : Error and Monitoring Interrupt Mapping Configuration Register 0
- Updated Table 29.13 Interrupt and event output

32. Ethernet Agent:
- Updated 32.3.5.3 EATASENCi : TAS Entry Number Configuration Register i (i = 0 to 7)
- Updated 32.3.5.5 EATASENMi : TAS Entry Number Monitoring Register i (i = 0 to 7)

33. Ethernet MAC:
- Updated Figure 33.6 Initialization flow

35. Ethernet Generic PTP Timer:
- Updated Figure 35.1 GPTP block diagram
- Modified offset address of 35.6.3.4 POTSTRnM : Pulse Output Start Time Setting Register nM (n = 0 to 3)
- Modified offset address of 35.6.3.5 POTSTRnL : Pulse Output Start Time Setting Register nL (n = 0 to 3)
- Modified offset address of 35.6.3.6 POTPERnU : Period Setting Register nU (n = 0 to 3)
- Modified offset address of 35.6.3.7 POTPERnM : Period Setting Register nM (n = 0 to 3)
- Modified offset address of 35.6.3.8 POTPERnL : Period Setting Register nL (n = 0 to 3)
- Modified offset address of 35.6.3.9 POTPWRn : Pulse Width Setting Register n (n = 0 to 3)
- Modified offset address of 35.6.3.10 POTCPRnU : Time Capture Register nU (n = 0 to 3)
- Modified offset address of 35.6.3.11 POTCPRnM : Time Capture Register nM (n = 0 to 3)
- Modified offset address of 35.6.3.12 POTCPRnL : Time Capture Register nL (n = 0 to 3)

37. USB 2.0 High-Speed Module:
- Updated 37.2.34 PIPECFG : Pipe Configuration Register
- Modified offset address of 37.2.38 PIPEnCTR : Pipe n Control Register (n = 1 to 9)

40. I3C Bus Interface:
- Modified offset address of 40.2.64 SDATBASn : Slave Device Address Table Basic Register n (n = 0 to 2)

41. CAN with Flexible Data-rate:
- Modified base address of CANFDn_NS

59. MRAM:
- Updated Figure 59.5 Frequency up procedure

62. Electrical Characteristics:
- Updated Table 62.16 Current of high-speed mode, maximum data processing, CPU0 Deep Sleep, CPU1 active, peripheral clock ON (DCDC mode)
- Updated Table 62.18 Current of high-speed mode, maximum data processing (MVE operation), peripheral clock OFF (DCDC mode)
- Updated Table 62.19 Current of high-speed mode, maximum data processing (MVE operation), peripheral clock OFF (External VDD mode)
- Updated Table 62.20 Current of high-speed mode, maximum data processing (MVE operation), CPU0 active, CPU1 Deep Sleep, peripheral clock OFF (DCDC mode)
- Updated Table 62.21 Current of high-speed mode, maximum data processing (MVE operation), CPU0 active, CPU1 Deep Sleep, peripheral clock OFF (External VDD mode)
- Updated Table 62.22 Current of high-speed mode, maximum data processing, CPU0 Deep Sleep, CPU1 active, peripheral clock OFF (DCDC mode)
- Updated Table 62.23 Current of high-speed mode, maximum data processing, CPU0 Deep Sleep, CPU1 active, peripheral clock OFF (External VDD mode)
- Updated Table 62.24 Current of high-speed mode, CPU Sleep mode (DCDC mode)
- Updated Table 62.26 Current of high-speed mode, CPU0 Sleep, CPU1 Deep Sleep (DCDC mode)
- Updated Table 62.28 Current of high-speed mode, CPU0 Deep Sleep, CPU1 Sleep (DCDC mode)
- Updated Table 62.30 Current of high-speed mode, CPU Deep Sleep mode (DCDC mode)

Revision 1.30 — Feb 27, 2026

1. Overview:
- Updated Figure 1.2 Part numbering scheme
- Updated Table 1.13 Product list
- Updated Table 1.14 Function Comparison
- Updated Table 1.15 Pin functions
- Added Figure 1.5 Pin assignment for BGA 169-pin
- Updated Figure 1.6 Pin assignment for BGA 303-pin
- Updated Table 1.16 Pin list for the Standard product
- Updated Table 1.17 Pin list for the SiP product

2. CPU:
- Updated Table 2.11 Controlling of resets and interrupts generation in OCD mode
- Updated 2.17.3.5 TCMCRx : TCM Control Register (x = C or S)

5. Address Space:
- Updated Figure 5.2 1 MB MRAM product for Standard Product
- Added 5.3 Peripheral I/O Register Address Space

6. Resets:
- Updated Table 6.3 Module-related registers initialized by each reset source

7. Option-Setting Memory:
- Updated 7.1 Overview
- Updated Table 7.2 The relationship between FSBLCLK setting and system clock frequency
- Updated 7.2.18 HOEMRTRKn : Hash of OEM_ROOT_PKn (n= 0 to 3)
- Updated 7.2.20 ARCLS : Anti-Rollback Counter Lock Setting
- Updated 7.2.21 ARCCS : Anti-Rollback Counter Configuration Setting for Non-secure Application
- Updated 7.2.22 ARC_SECn : Anti-Rollback Counter for Secure Application n (n = 0, 1)
- Updated 7.2.23 ARC_NSECn : Anti-Rollback Counter for Non-secure Application n (n = 0 to 7)
- Updated 7.2.24 ARC_OEMBLn : Anti-Rollback Counter for OEMBL (n = 0, 1)
- Updated 7.2.25 GPOTPn : General Purpose OTP (n = 0 to 23)

9. Clock Generation Circuit:
- Updated 9.2.1 CGFSAR : Clock Generation Function Security Attribute Register
- Updated 9.2.25 SOSTDCR : Sub-clock Oscillation Stop Detection Control Register
- Added 9.2.66 USBCKSELR : USB Clock Selection Register
- Updated 9.9.3 Sub-clock Oscillation Stop Detection and Operation after Detection
- Updated Figure 9.11 Flow of Recovery from Detection of Sub Clock Oscillator Stop
- Updated Table 9.7 Example of the initial system clock setting procedure after reset release/after Deep Software Standby cancellation
- Updated Figure 9.14 Additional flow of initial system clock setting when PLL is used for the system clock source (assuming all module stop bits are initial value)
- Updated Table 9.8 Example of setting procedure when changing the current system clock frequency to a faster frequency
- Updated Figure 9.15 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK0 to be faster frequency
- Updated Table 9.9 Example of setting procedure when changing the current system clock frequency to a slower frequency
- Updated Figure 9.16 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK0 to be slower frequency

10. Clock Frequency Accuracy Measurement Circuit:
- Updated Figure 10.1 CAC block diagram

11. Low Power Modes:
- Updated Table 11.2 Operating state of processor low power mode
- Updated Table 11.3 Operating state of each low power mode
- Updated Figure 11.1 Low power mode transitions
- Updated Table 11.8 Setting of the bits what affect the mode after executing WFI instruction
- Updated 11.6.2.2 Canceling Software Standby Mode
- Updated 11.6.3.2 Canceling Deep Software Standby Mode
- Added 11.8.11 Notes about the WFE instruction or Sleep-on-exit function

13. Register Write Protection:
- Updated Table 13.1 Association between PRCR bits and use of registers to be protected

14. Interrupt Controller Unit:
- Updated Figure 14.2 ICU Register Address Map
- Updated Table 14.5 Event List

15. Buses:
- Updated Figure 15.1 System bus connection
- Updated Table 15.3 Addresses assigned for each slave
- Updated 15.3.1 BUSSARA : Bus Security Attribution Register A

Revision 1.30 — Feb 27, 2026

17. DMA Controller:
- Updated Table 17.1 DMAC specifications
- Updated 17.2 Register Descriptions

18. Data Transfer Controller:
- Updated Table 18.1 DTC specifications
- Updated 18.2 Register Descriptions

19. Event Link Controller:
- Updated Table 19.3 Association between event signal names set in ELSRn.ELS[9:0] bits and signal numbers

20. I/O Ports:
- Updated Table 20.1 I/O port specifications
- Updated 20.2.1 PCNTR1/PODR/PDR : Port Control Register 1
- Added Table 20.7 Handling of reserved pins for BGA169 package
- Updated Table 20.8 Register settings for input/output pin function (PORT0)
- Updated Table 20.9 Register settings for input/output pin function (PORT1)
- Updated Table 20.10 Register settings for input/output pin function (PORT2)
- Updated Table 20.11 Register settings for input/output pin function (PORT3)
- Updated Table 20.12 Register settings for input/output pin function (PORT4)
- Updated Table 20.13 Register settings for input/output pin function (PORT5)
- Updated Table 20.14 Register settings for input/output pin function (PORT6)
- Updated Table 20.15 Register settings for input/output pin function (PORT7)
- Updated Table 20.16 Register settings for input/output pin function (PORT8)
- Updated Table 20.17 Register settings for input/output pin function (PORT9)
- Updated Table 20.18 Register settings for input/output pin function (PORTA)
- Updated Table 20.19 Register settings for input/output pin function (PORTB)
- Updated Table 20.20 Register settings for input/output pin function (PORTC)
- Updated Table 20.21 Register settings for input/output pin function (PORTD)

24. Low Power Asynchronous General Purpose Timer:
- Updated Table 24.1 AGT specifications

25. Ultra-Low-Power Timer:
- Updated Table 25.1 ULPT specifications

27. Watchdog Timer:
- Updated Figure 27.1 WDT block diagram
- Updated 27.2.3 WDTSR : WDT Status Register

28. Independent Watchdog Timer:
- Updated Table 28.1 IWDT specifications
- Updated Figure 28.1 IWDT block diagram
- Updated 28.2.3 IWDTSR : IWDT Status Register
- Updated Figure 28.3 Operation example in register start mode
- Updated 28.3.3 Refresh Operation
- Added 28.5.2 Restriction on reading the counter value after returning from Deep Software Standby mode 1

29. Layer 3 Ethernet Switch Module:
- Updated 29.2.2.1 TPEMIMC1 : Error and Monitoring Interrupt Mapping Configuration Register 1
- Updated 29.2.2.2 TPEMIMC2 : Error and Monitoring Interrupt Mapping Configuration Register 2
- Updated 29.2.2.3 TPEMIMC3 : Error and Monitoring Interrupt Mapping Configuration Register 3
- Updated 29.2.2.4 TPEMIMC4 : Error and Monitoring Interrupt Mapping Configuration Register 4
- Updated 29.2.2.5 TPEMIMC6t : Error and Monitoring Interrupt Mapping Configuration Register 6t (t = 0 to 1)
- Updated 29.2.2.6 TPEMIMC7t : Error and Monitoring Interrupt Mapping Configuration Register 7t (t = 0 to 63)
- Updated 29.4.2 Precautions

30. Ethernet Message Forwarding Engine:
- Updated 30.3.1.6.30 FWVLANTEC : VLAN Table Entry Configuration Register

35. Ethernet Generic PTP Timer:
- Updated 35.3.2.3 PTPTIVCt : Timer t Increment Value Configuration Register (t = 0, 1)

37. USB 2.0 High-Speed Module:
- Updated 37.2.32 DCPCTR : DCP Control Register
- Updated 37.2.51 DPUSR2R : Deep Software Standby USB Suspend/Resume Interrupt Register

38. Serial Communications Interface:
- Updated 38.2.2 RDR/RDR_BY : Receive Data Register
- Updated 38.2.3 TDR/TDRLL/TDRLH : Transmit Data Register

Revision 1.30 — Feb 27, 2026

40. I3C Bus Interface:
- Updated 40.2.1 PRTS : Protocol Selection Register
- Updated Figure 40.140 Example of I2C initialization flowchart (single buffer transfer)
- Updated Figure 40.141 Example of each initialization flowchart for I3C master mode and slave mode
- Added 40.7.4 Notes on rewriting PRTS.PRTMD bit

41. CAN with Flexible Data-rate:
- Updated 41.2.43 CFDTMIEC : TX Message Buffer Interrupt Enable Configuration Register

44. Octal Serial Peripheral Interface:
- Updated 44.2.1.4 CMCFG0CSn : OSPI Command Map Configuration Register 0 CSn (n = 0, 1)
- Updated 44.2.1.7 LIOCFGCSn : OSPI Link I/O Configuration Register CSn (n = 0, 1)
- Added 44.2.2.22 RACTL : OSPI Register Access Control Register
- Added 44.2.2.23 MER : OSPI Map End Replace Register
- Updated 44.4 SiP Product Configuration
- Updated Figure 44.32 Connection between the MCU and the SiP Flash memory
- Updated Table 44.11 Data write possibility for each bus master
- Added 44.5.9 Constraint on OTP area for SiP Product

45. Decryption On The Fly:
- Updated 45.3.1 CONVAREAST : DOTF Conversion Area Start Address Register
- Updated 45.3.2 CONVAREAD : DOTF Conversion Area End Address Register

46. Serial Sound Interface Enhanced:
- Updated 46.2.1 SSICR : Control Register

48. Cyclic Redundancy Check:
- Updated 48.3.2 CRC Snoop Function

49. Pulse Density Modulation Interface:
- Updated Table 49.1 PDM-IF specification
- Updated 49.2.17 PDSRCHn : Status Register Channel n (n = 0 to 2)
- Updated Table 49.5 Guaranteed clock frequency and clock mode
- Added 49.3.1.1 Output Sampling Frequency
- Updated Table 49.7 Sinc filter output clip

54. 12-Bit D/A Converter:
- Updated Table 54.4 D/A conversion and analog output control
- Updated 54.4.1 DA0 Event Link Operation Setting Procedure
- Updated 54.4.2 DA1 Event Link Operation Setting Procedure

58. SRAM:
- Updated 58.2.7 SRAMCRn : SRAM Control Register n For ECC RAM (n = 0 to 3)
- Updated 58.3.7 Wait State

59. MRAM:
- Updated Table 59.1 Specifications of MRAM
- Updated 59.5.2 MRCFREQ : Code MRAM Frequency Notifications Register
- Updated 59.5.3 MREFREQ : Extra MRAM Frequency Notifications Register
- Updated 59.5.6 MRCRAES : Code MRAM Read Access Error Status Register
- Updated 59.5.9 MRERAEINT : Extra MRAM Read Access Error Interrupt Enable Register
- Updated 59.5.10 MRERAES : Extra MRAM Read Access Error Status Register
- Updated Figure 59.9 Overview of command usage in extra MRAM program mode
- Updated Table 59.16 Address used by the Configuration Set command
- Updated 59.7.4.9 Increment Counter Command
- Updated Table 59.36 Error protection type
- Updated 59.13.2 Parallel Accessibility

Revision 1.30 — Feb 27, 2026

62. Electrical Characteristics:

- Updated Table 62.2 Recommended operating conditions
- Updated Table 62.34 Coremark and normal mode current, CPU0 Deep Sleep, CPU1 active. (DCDC mode and External VDD mode)
- Added Table 62.42 VCC_USB rise gradient characteristics at power on
- Added Table 62.43 VCC_USBHS and AVCC_USBHS rise gradient characteristics at power on
- Updated Table 62.44 Thermal Resistance
- Updated Table 62.45 Power consumption of each unit (DCDC mode)
- Updated Table 62.46 Power consumption of each unit (External VDD mode)
- Updated Table 62.49 Clock timing except for sub-clock oscillator
- Updated Table 62.51 Reset timing
- Updated Table 62.52 Timing of recovery from low power modes
- Updated Table 62.63 SPI timing
- Updated Table 62.64 OSPI timing
- Updated Figure 62.85 DDR transmit/receive timing (4S-4D-4D, 8D-8D-8D)
- Updated Table 62.78 PDG Timing
- Updated Table 62.107 TSN characteristics
- Updated Table 62.109 Sub-clock oscillation stop detection circuit characteristics
- Added Figure 62.137 Sub-clock Oscillation Stop Detector start-up time
- Updated Table 62.110 Power-on reset circuit and voltage detection circuit characteristics
- Updated Figure 62.139 Power-on reset timing
- Updated Figure 62.140 Voltage detection circuit timing (Vdet0)
- Updated Figure 62.141 Voltage detection circuit timing (Vdetn) (n = 1, 2, 4, 5)
- Updated 62.15 MRAM Characteristics
- Updated Table 62.116 Code MRAM Characteristics
- Updated 62.15.2 Option Setting Memory (Configuration area) Characteristics
- Updated Table 62.120 MACI command Characteristics

Appendix:

- Updated Appendix 1. Port States in Each Processing Mode
- Added Figure A2.3 BGA 303-pin
- Updated Table A3.2 Access cycles
