General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Specification Differences Between Products

There are the following specification differences in the RA8M2 group products, depending on chip versions.

Table 1.1 Specification Differences Depending on Chip Versions

Chapter		Specification Differences	
		Chip version A	Chip version B
section 1, Overview	section 1.3. Part Numbering	Production identification code is 0	Production identification code is 1
section 7, Option-Setting Memory	section 7.2.11. FSBLCTRL0 : FSBL Control Register 0	Prohibit to set the FSBLEN [2:0] bits to 000b	The FSBLEN[2:0] bits can be set to 000b
section 9, Clock Generation Circuit	section 9.2.36. MOSCSCR : Main Clock Oscillator Standby Control Register	Prohibit to set the MOSCSOKP bit to 1	The MOSCSOKP bit can be set to 1
	section 9.2.37. HOCOSCR : High-Speed On-Chip Oscillator Standby Control Register	Prohibit to set the HOCOSOKP bit to 1	The HOCOSOKP bit can be set to 1
section 11, Low Power Mode	section 11.7. Voltage Scaling Control	During a DVFS transition (VSCR.VSCMTSF = 1), Don’t access to the CM85's TCM and CM85's cache. Before voltage scaling operation, disable the I-cache and D-cache by setting CCR.DC and CCR.IC to 0, and then deactivate them by setting MSCR.DCACTIVE and MSCR.ICACTIVE to 0	During a DVFS transition (VSCR.VSCMTSF = 1), there is no restriction on access to the CM85's TCM and CM85's cache
section 59, MRAM	section 59.5.43. MCUVER : MCU Version Register	Value after reset is 0x1	Value after reset is 0x2
section 62, Electrical Characteristics	section 62.2.2. I/O V_{IH}, V_{IL}	TCK/SWCLK 1.62V or above V_{IH} : Min = VCC × 0.7 V_{IL} : Max = VCC × 0.3	TCK/SWCLK 1.62V or above V_{IH} : Min = VCC × 0.8 V_{IL} : Max = VCC × 0.2 ΔV_T : Min = VCC × 0.05

Preface

1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document Type	Description
Microcontrollers	Data sheet	Features, overview, and electrical characteristics of the MCU
	User's Manual: Hardware	MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	User's Manual: Software	API reference and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE)
	User's Manual: Software	
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
0x1F	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h".
1234	Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

Example	Description
AAA.BBB.CCC	Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC).
AAA.BBB	A period separated a function module symbol (AAA) and register symbol (BBB).
BBB.DDD	A period separated a register symbol (BBB) and bit field symbol (DDD).
EEE[3:0]	Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0.

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Symbol	Name	Description
b	Binary Digit	Single 0 or 1
B	Byte	This unit is generally used for memory specification of the MCU and address space.
k	kilo-	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	Kilo-	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

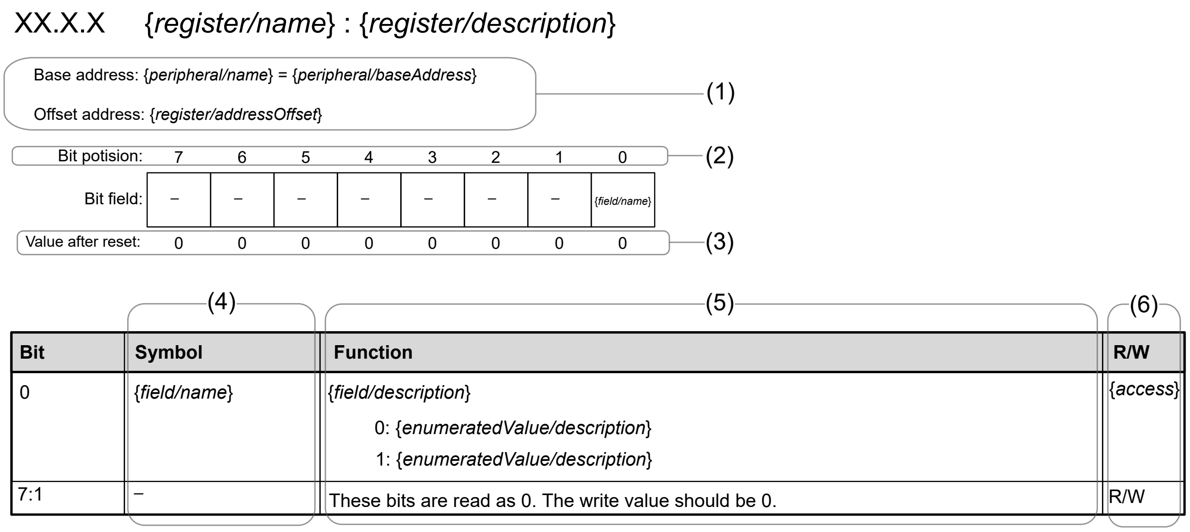
7. Special Terms

The following terms have special meanings.

Term	Description
NC	Not connected pin. This pin should be left floating unless specified otherwise.
Hi-Z	High impedance.
x	Don't care or undefined.

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.



(1) Function module symbol, register symbol, and address assignment

Function module symbol, *{peripheral/name}*, register symbol, *{register/name}*, and address assignment of this register are generally expressed. Base Address and Offset Address mean *{register/name}* : *{register/description}* of *{peripheral/name}* is assigned to address *{peripheral/baseAddress}* + *{register/addressOffset}*.

(2) Bit number

This number indicates the bit number. These bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

0: Indicates that the value is 0 after a reset.

1: Indicates that the value is 1 after a reset.

x: Indicates that the value is undefined after a reset.

(4) Symbol

{filed/name} indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field, *{field/description}*, and enumerated values.

(6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

R/W: The bit field is readable and writable.

R: The bit field is readable only. Writing to this bit field has no effect.

W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

Abbreviations used in this document are shown in the following table.

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ARC	Alleged RC
ATB	Advanced Trace Bus
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ETB	Embedded Trace Buffer
ETM	Embedded Trace Macrocell
FLL	Frequency Locked Loop
FPU	Floating Point Unit
HMI	Human Machine Interface
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NVIC	Nested Vector Interrupt Controller
OTP	One Time Programmable memory
PC	Program Counter
PFS	Port Function Select
PLL	Phase Locked Loop
POR	Power-on reset
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SHA	Secure Hash Algorithm
S/H	Sample and Hold
SP	Stack Pointer
SWD	Serial Wire Debug
SW-DP	Serial Wire-Debug Port
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter
VCO	Voltage Controlled Oscillator

Renesas RA8M2 Group

User's Manual

High-performance 1 GHz Arm® Cortex®-M85 core, 250 MHz Arm® Cortex®-M33 core, up to 1 MB code MRAM, and 2 MB SRAM with ECC. High-integration with Layer 3 Ethernet Switch Module, USB 2.0 High-Speed, CANFD, SDHI, I3C, Octal SPI, Decryption on-the-fly, and advanced analog. Integrated Renesas Security IP with cryptography accelerators, key management support, tamper detection and power analysis resistance in concert with Arm® TrustZone for integrated Secure element functionality.

Features

■ Arm® Cortex®-M85 Core

- Armv8.1-M architecture profile
- Armv8-M Security Extension
- Maximum operating frequency: 1 GHz
- Memory Protection Unit (Arm MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
  - Embeds two Systick timers: Secure and Non-secure instance
  - Driven by CPUCLK0 or MOCO divided by 8
- CoreSight™ ETM-M85

■ Arm® Cortex®-M33 core

- Armv8-M architecture profile
- Armv8-M Security Extension
- Maximum operating frequency: 250 MHz
- Memory Protection Unit (Arm MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
  - Embeds two Systick timers: Secure and Non-secure instance
  - Driven by CPUCLK1 or MOCO divided by 8
- CoreSight™ ETM-M33

■ Memory

- Up to 1-MB MRAM
- 2 MB SRAM including 256 KB of CM85 TCM and 128 KB of CM33 TCM
- Up to 8-MB Flash for SiP product

■ Connectivity

- Serial Communications Interface (SCI) × 10, up to 60 Mbps
- I^2C bus interface (IIC) × 3
- I^3C bus interface (I3C)
- Serial Peripheral Interface (SPI) × 2, up to 166 Mbps
- Octal Serial Peripheral Interface (OSPI) × 2, up to 333 MB/s
- USB 2.0 Full-Speed Module (USBFS)
- USB 2.0 High-Speed Module (USBHS)
- CAN with Flexible Data-rate (CANFD) × 2
- Layer 3 Ethernet Switch Module (ESWM)
  - 2 × Gigabit Ethernet
- SD/MMC Host Interface (SDHI) × 2
- Serial Sound Interface Enhanced (SSIE) × 2
- Pulse Density Modulation Interface (PDMIF)

■ Analog

- 16-bit A/D Converter (ADC16H) × 2, up to 23 channels
- 12-bit D/A Converter (DAC12) × 2
- High-Speed Analog Comparator (ACMPHS) × 4
- Temperature Sensor (TSN)

■ Timers

- General PWM Timer 32-bit (GPT32) with High Resolution × 4
  - 52 ps resolution in 300 MHz
- General PWM Timer 32-bit (GPT32) × 10
- Low Power Asynchronous General Purpose Timer (AGT) × 2
- Ultra-Low-Power Timer (ULPT) × 2

■ Security and Encryption

- Renesas Security IP (RSIP-E50D)
- Arm® TrustZone®
- Privileged control
- Device lifecyle management
- Secure boot
  - Immutable first stage boot loader in OTP
- Decryption on-the-fly (DOTF)
- Pin function
  - Up to three tamper-resistant pins
  - Secure pin multiplexing
- HUK zeroization

■ System and Power Management

- Low power modes
- Battery backup function (VBATT)
- Realtime Clock (RTC) with calendar and VBATT support
- Event Link Controller (ELC)
- Data Transfer Controller (DTC) × 2
- DMA Controller (DMAC) × 16
- Power-on reset
- Programable Voltage Detection (PVD) with voltage settings
- Watchdog Timer (WDT) × 2
- Independent Watchdog Timer (IWDT)

■ Human Machine Interface (HMI)

- Capture Engine Unit (CEU)

■ Multiple Clock Sources

- Main clock oscillator (MOSC) (8 to 48 MHz)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO) (16/18/20/32/48 MHz)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- PLL1/PLL2
- Clock out support

■ General-Purpose I/O Ports

- 5-V tolerance, open drain, input pull-up, switchable driving ability

■ Operating Voltage

- Standard product
  - VCC/VCC2: 1.62 to 3.63 V
- SiP product
  - VCC/VCC2: 1.62 to 3.63 V/1.70 to 2.00 V

■ Operating Junction Temperature and Packages

- Tj = 0 °C to +95 °C
  - 289-pin BGA (12 mm × 12 mm, 0.65 mm pitch)
  - 224-pin BGA (11 mm × 11 mm, 0.65 mm pitch)
  - 303-pin BGA (15 mm × 15 mm, 0.8 mm pitch)
  - 169-pin BGA (7 mm × 7 mm, 0.5 mm pitch)
- Tj = -40 °C to +105 °C
  - 289-pin BGA (12 mm × 12 mm, 0.65 mm pitch)
  - 224-pin BGA (11 mm × 11 mm, 0.65 mm pitch)
  - 303-pin BGA (15 mm × 15 mm, 0.8 mm pitch)
  - 169-pin BGA (7 mm × 7 mm, 0.5 mm pitch)
- Tj = -40 °C to +125 °C
  - 289-pin BGA (12 mm × 12 mm, 0.65 mm pitch)
  - 224-pin BGA (11 mm × 11 mm, 0.65 mm pitch)
  - 176-pin HLQFP (24 mm × 24 mm, 0.5 mm pitch)

1. Overview

The MCU integrates multiple series of software-compatible Arm®-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm® Cortex®-M85 core running up to 1 GHz and Arm® Cortex®-M33 core running up to 250 MHz with the following features:

- Up to 1 MB MRAM
- 2 MB SRAM (256 KB of CM85 TCM RAM, 128 KB CM33 TCM RAM, 1664 KB of user SRAM)
- Octal Serial Peripheral Interface (OSPI)
- Layer 3 Ethernet Switch Module (ESWM), USBFS, USBHS, SD/MMC Host Interface
- Analog peripherals
- Security and safety features

1.1 Function Outline

Table 1.1 Arm core

Feature	Functional description
Arm® Cortex®-M85 core	● Maximum operating frequency: up to 1 GHz ● Arm® Cortex®-M85 core – Revision: (r1p1-00rel0) – ARMv8.1-M architecture profile – Armv8-M Security Extension – Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008 Scalar half, single, and double-precision floating-point operation – M-profile Vector Extension (MVE) Integer, half-precision, and single-precision floating-point MVE (MVE-F) ● Arm® Memory Protection Unit (Arm MPU) – Protected Memory System Architecture (PMSAv8) – Secure MPU (MPU_S): 8 regions – Non-secure MPU (MPU_NS): 8 regions ● SysTick timer – Embeds two Systick timers: Secure instance (SysTick_S) and Non-secure instance (SysTick_NS) – Driven by CPUCLK0 or MOCO divided by 8 ● CoreSight™ ETM-M85
Arm® Cortex®-M33 core	● Maximum operating frequency: up to 250 MHz ● Arm® Cortex®-M33 core – Revision: (r0p4-00rel2) – ARMv8-M architecture profile – Armv8-M Security Extension – Armv8-DSP Extension – Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008 single-precision floating-point operation ● Arm® Memory Protection Unit (Arm MPU) – Protected Memory System Architecture (PMSAv8) – Secure MPU (MPU_S): 8 regions – Non-secure MPU (MPU_NS): 8 regions ● SysTick timer – Embeds two Systick timers: Secure instance (SysTick_S) and Non-secure instance (SysTick_NS) – Driven by CPUCLK1 or MOCO divided by 8 ● CoreSight™ ETM-M33

Table 1.2 Memory (1 of 2)

Feature	Functional description
Code MRAM	Maximum 1 MB of code MRAM. See section 59, MRAM.
Flash memory	System in package (SiP) maximum 8 MB serial flash memory. See section 44.4. SiP Product Configuration.

Table 1.2 Memory (2 of 2)

Feature	Functional description
Option-setting memory	The option-setting memory determines the state of the MCU after a reset. See section 7, Option-Setting Memory.
SRAM	On-chip high-speed SRAM with Error Correction Code (ECC). See section 58, SRAM.
OTP	On-chip OTP contains First Stage Bootloader (FSBL) General purpose 96-byte OTP

Table 1.3 System

Feature	Functional description
Operating modes	Three operating modes: ● Single-chip mode ● JTAG boot mode ● SCI/USB boot mode See section 4, Operating Modes.
Resets	This MCU provides the following 21 types of reset. See section 6, Resets.
Programmable Voltage Detection (PVD)	The Programmable Voltage Detection (PVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The PVD module consists of five separate voltage level detectors (PVD0, PVD1, PVD2, PVD4, PVD5). These PVDs measure the voltage level input to the VCC pin. PVD registers allow your application to configure detection of VCC changes at various voltage thresholds. See section 8, Programmable Voltage Detection (PVD).
Clocks	● Main clock oscillator (MOSC) ● Sub-clock oscillator (SOSC) ● High-speed on-chip oscillator (HOCO) ● Middle-speed on-chip oscillator (MOCO) ● Low-speed on-chip oscillator (LOCO) ● PLL1/PLL2 ● Clock out support See section 9, Clock Generation Circuit.
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See section 10, Clock Frequency Accuracy Measurement Circuit (CAC).
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), DMA Controller (DMAC) module and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts. See section 14, Interrupt Controller Unit (ICU).
Low power modes	Power consumption can be reduced in multiple ways, including setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, power gating control, selecting operating power control modes in normal operation, and transitioning to low power modes and processor low power modes. See section 11, Low Power Mode.
Battery backup function	A battery backup function is provided for partial powering by a battery. The battery-powered area includes the RTC, SOSC, backup register, tamper detection and VBATT_R voltage drop detection and switch between VCC and VBATT. See section 12, Battery Backup Function.
Register write protection	The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR_S and PRCR_NS). See section 13, Register Write Protection Function.
Memory Protection Unit (MPU)	All bus masters have Memory Protection Units (MPUs). See section 16, Memory Protection Unit (MPU).

Table 1.4 Event link

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention. See section 19, Event Link Controller (ELC).

Table 1.5 Direct memory access

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 18, Data Transfer Controller (DTC).
DMA Controller (DMAC)	The 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 17, DMA Controller (DMAC).

Table 1.6 External bus interface

Feature	Functional description
External buses	● CS area (ECBI): Connected to the external devices (external memory interface) ● SDRAM area (ECBI): Connected to the SDRAM (external memory interface) ● OSPI0 area (OSPI0BI): Connected to the OSPI0 (external device interface) ● OSPI1 area (OSPI1BI): Connected to the OSPI1 (external device interface)

Table 1.7 Timers (1 of 2)

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 14 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See section 22, General PWM Timer (GPT).
PWM Delay Generation Circuit (PDG)	The PWM Delay Generation circuit (PDG) has 4 channels delay circuits that can connect to the GPT. The PDG can control the rise and fall edge timing with which the PWM output for the GPT320 through the GPT323. See section 23, PWM Delay Generation Circuit (PDG).
Port Output Enable for GPT (POEG)	The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state See section 21, Port Output Enable for GPT (POEG).
Low Power Asynchronous General Purpose Timer (AGT)	The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register. See section 24, Low Power Asynchronous General Purpose Timer (AGT).
Ultra-Low-Power Timer (ULPT)	The Ultra-Low-Power Timer (ULPT) is a 32-bit timer which can be used for outputting pulses or counting external events. This 32-bit timer consists of reload registers and a down-counter. The reload registers and the down-counter are allocated to the same address and can be accessed through the ULPTCNT register. See section 25, Ultra-Low-Power Timer (ULPT)
Realtime Clock (RTC)	The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 26, Realtime Clock (RTC).
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. See section 27, Watchdog Timer (WDT).

Table 1.7 Timers (2 of 2)

Feature	Functional description
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) has a 14-bit down-counter, which resets the MCU by a reset output when the down-counter underflows. Alternatively, generation of an interrupt request when the counter underflows can be selected. This enables detection of a program runaway taking the refresh interval into account. The IWDT has two start modes: auto start mode, in which counting automatically starts after release from the reset state, and register start mode, in which counting is started by refreshing (writing to a specific register). See section 28, Independent Watchdog Timer (IWDT).

Table 1.8 Communication interfaces (1 of 2)

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communications Interface (SCI) × 10 channels have asynchronous and synchronous serial interfaces: ● Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA)) ● 8-bit clock synchronous interface ● Simple IIC (master-only) ● Simple SPI ● Smart card interface ● Manchester interface ● Simple LIN interface The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. All channels have FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. The maximum rate supported on this MCU. Refer to the electrical characteristics for the actual rate. See section 38, Serial Communications Interface (SCI).
I²C Bus interface (IIC)	The I²C Bus interface (IIC) has 3 channels. The IIC module conforms with and provides a subset of the NXP I²C (Inter-Integrated Circuit) bus interface functions. See section 39, I²C Bus Interface (IIC).
I3C Bus Interface (I3C)	The I3C Bus Interface (I3C) has 1 channel. The I3C module conform with and provide a subset of the NXP I²C (Inter-Integrated Circuit) bus interface functions and a subset of the MIPI I3C. See section 40, I3C Bus Interface (I3C).
Serial Peripheral Interface (SPI)	The Serial Peripheral Interface (SPI) provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices. The maximum rate supported on this MCU. Refer to the electrical characteristics for the actual rate. See section 43, Serial Peripheral Interface (SPI).
Control Area Network with Flexible Data-Rate Module (CANFD)	The CAN with Flexible Data-Rate (CANFD) module can handle classical CAN frames and CANFD frames complied with ISO 11898-1 standard. The module supports 4 transmit buffers per channel and 16 receive buffers per channel. See section 41, CAN with Flexible Data-rate (CANFD).
USB 2.0 Full-Speed module (USBFS)	The USB 2.0 Full-Speed module (USBFS) can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system. See section 36, USB 2.0 Full-Speed Module (USBFS).
USB 2.0 High-speed Module (USBHS)	The USB 2.0 High-Speed Module (USBHS) that operates as a host or a device controller compliant with the Universal Serial Bus (USB) Specification revision 2.0. The host controller supports USB 2.0 high-speed, full speed, and low-speed transfers, and the device controller supports USB 2.0 high-speed and full-speed transfers. The USBHS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification. The USBHS has FIFO buffer for data transfers, providing a maximum of 10 pipes. See section 37, USB 2.0 High-Speed Module (USBHS).

Table 1.8 Communication interfaces (2 of 2)

Feature	Functional description
Octal Serial Peripheral Interface (OSPI)	The Octal Serial Peripheral Interface (OSPI) is a memory controller that supports Expanded Serial Peripheral Interface (xSPI) (JEDEC Standard JESD251, JESD251-1 and JESD252). The OSPI supports 1-bit, 2-bit, 4-bit and 8-bit protocols. JESD251 specifies two interface profiles where profile 1.0 is Octal SPI and profile 2.0 is HyperBus^{TM} (HyperRAM^{TM} and HyperFlash^{TM}). OSPI supports QSPI protocol. See section 44, Octal Serial Peripheral Interface (OSPI).
Serial Sound Interface Enhanced (SSIE)	The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting I^2S/Monaural/TDM audio data over a serial bus. The SSIE supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 32-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission. See section 46, Serial Sound Interface Enhanced (SSIE).
SD/MMC Host Interface (SDHI)	The Secure Digital (SD) Card and Multi Media Card (MMC) Host Interface provides the functionality required to connect a variety of external memory cards to the MCU. The SDHI supports both 1- and 4-bit buses for connecting memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA). The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and supports high-speed SDR transfer modes. See section 47, SD/MMC Host Interface (SDHI).
Layer 3 Ethernet Switch Module (ESWM)	The Layer 3 Ethernet Switch Module (ESWM) consists of two channels of Gigabit Ethernet controller, an Ethernet switch with high level routing capability, and multi-protocol interface support. The Gigabit Ethernet controller conforms to the definition of the Ethernet MAC (Media Access Control) layer in the IEEE 802.3 standard. This can transmit and receive Ethernet (IEEE 802.3) frames by connecting with an external physical-layer LSI chip (PHY-LSI) which complies with the standard. The Ethernet switch allows autonomous frame routing within a same network interface protocol, or between different network interfaces protocols or optimized gateway applications. See section 29, Layer 3 Ethernet Switch Module (ESWM).
Pulse Density Modulation Interface (PDMIF)	PDM-IF has maximum three channels that are connectable with external microphone which outputs the pulse density modulated (PDM) signal. PDM-IF is connectable with up to three external microphones. PDM-IF can filter and convert 1-bit digital data streams that were pulse density modulated at a high sampling rate into 20-bit or 16-bit digital data at a lower sampling rate. See section 49, Pulse Density Modulation Interface (PDM-IF).

Table 1.9 Analog

Feature	Functional description
16-bit A/D Converter (ADC16H)	A 16-bit A/D Converter is provided. Up to 23 analog input channels are selectable. Temperature sensor output, and internal reference voltage and VBATT 1/6 voltage monitor are selectable for conversion. See section 53, 16-bit A/D Converter (ADC16H).
12-bit D/A Converter (DAC12)	A 12-bit D/A Converter (DAC12) is provided. See section 54, 12-Bit D/A Converter (DAC12).
Temperature Sensor (TSN)	The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC16H for conversion and can be further used by the end application. The sensor outputs an abnormal temperature detection signal to the reset control circuit and can be used to prevent the malfunction due to abnormal temperature. See section 55, Temperature Sensor (TSN).
High-Speed Analog Comparator (ACMPHS)	The High-Speed Analog Comparator (ACMPHS) can be used to compare an analog input voltage with a reference voltage and to provide a digital output based on the result of conversion. Both the analog input voltage and the reference voltage can be provided to the ACMPHS from internal sources (D/A converter output or internal reference voltage) and an external source. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion. See section 56, High-Speed Analog Comparator (ACMPHS).

Table 1.10 Human machine interfaces

Feature	Functional description
Capture Engine Unit (CEU)	The Capture Engine Unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. See section 60, Capture Engine Unit (CEU).

Table 1.11 Data processing

Feature	Functional description
Cyclic Redundancy Check (CRC) calculator	The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 48, Cyclic Redundancy Check (CRC).
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) compares, adds, and subtracts 32-bits data. When a selected condition applies, 32-bit data is compared and an interrupt can be generated. See section 57, Data Operation Circuit (DOC).

Table 1.12 Security

Feature	Functional description
Security function	• ARMv8-M TrustZone security • Privileged control • Device lifecycle management • Authentication Level (AL) • Key injection • Secure pin multiplexing • HUK zeroization • VBATT backup registers zeroization • Secure boot • Secure factory programming See section 51, Security Features.
Renesas Secure IP (RSIP-E50D)	• Symmetric cryptography: AES and ChaCha20-Poly1305 • Asymmetric cryptography: RSA and ECC • Message digest computation: HASH, HMAC • 128-bit true random number generation circuit • 256-bit Hardware Unique Key (HUK) • 128-bit unique ID • OEM boot loader version • Key data for the decryption on-the-fly (DOTF) • SPA/DPA Protections See section 52, Renesas Secure IP (RSIP-E50D).
Decryption on-the-fly (DOTF)	Decryption on-the-fly (DOTF) decrypts the encrypted content stored in the external memory in real-time. See section 45, Decryption On The Fly (DOTF).

1.2 Block Diagram

Figure 1.1 shows a block diagram of the MCU superset. Some individual devices within the group have a subset of the features.

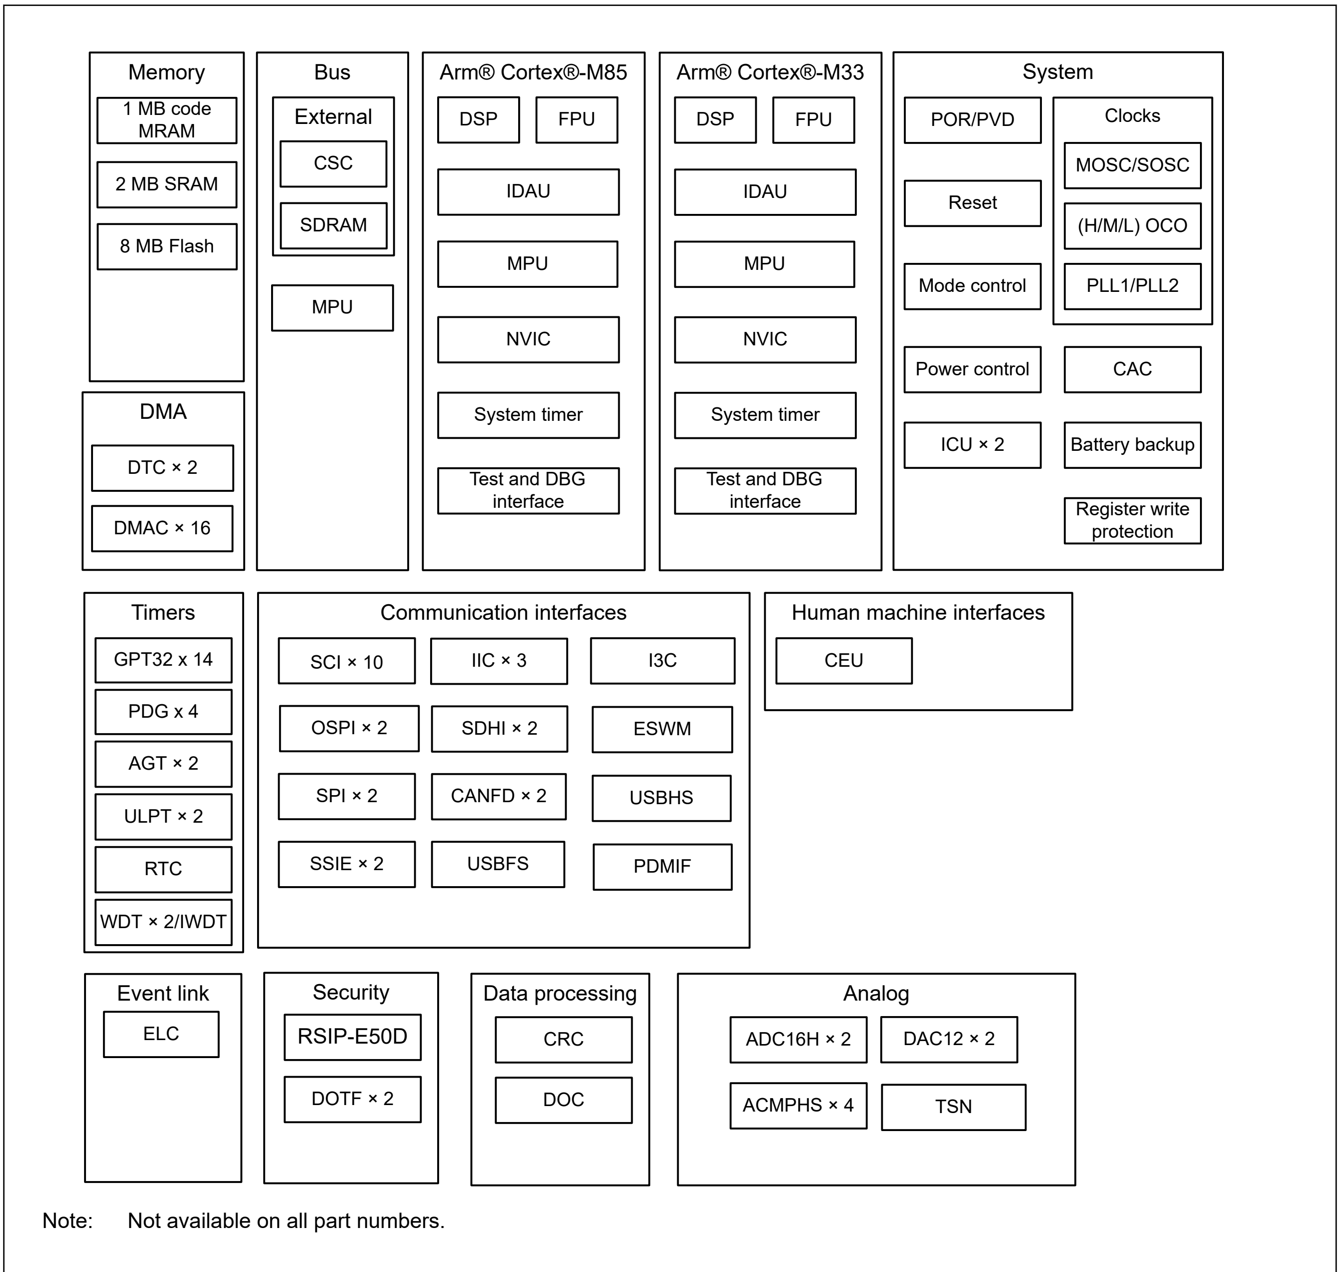

Figure 1.1 Block diagram

1.3 Part Numbering

Figure 1.2 shows the product part number information, including memory capacity and package type. Table 1.13 shows a list of products.

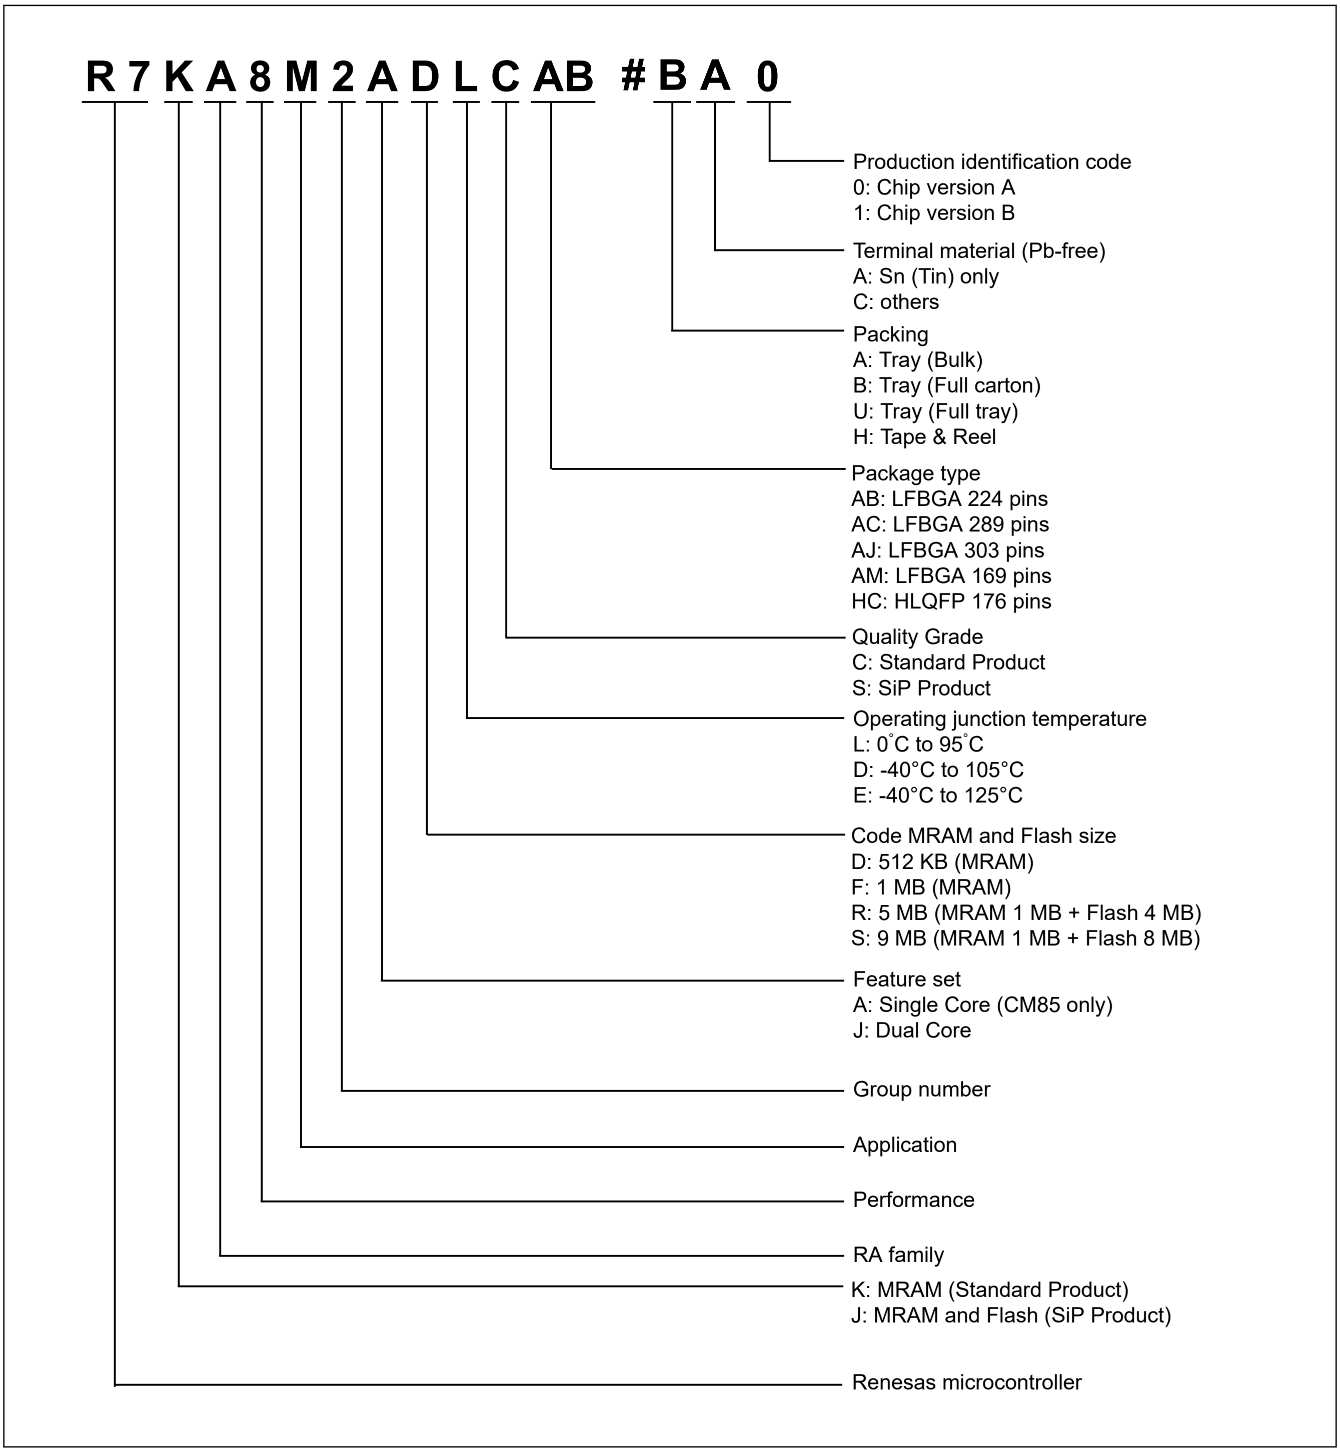

Figure 1.2 Part numbering scheme

Table 1.13 Product list

Product part number	Product group	CPU	Package code	Code MRAM	SRAM	Flash	Operating junction temperature

Note: The product name differs depending on the supported memory size. See section 1.3. Part Numbering.
Note: The maximum frequency varies by product group. See section 62.3.1. Frequency for details.
Note 1. Available pins depend on the Pin count, about details see section 1.7. Pin Lists.
Note 2. OSPI1 is connected to the serial Flash in the SiP product.
Note 3. OM_0_ECSINT1, OM_0_RSTO1 and OM_0_WP1 pins are not supported.
Note 4. Only SD1CLK_B, SD1CMD_B, SD1DAT0_B to SD1DAT3_B and SD1WP_B pins are supported.
Note 5. Only port 1 is supported.
Note 6. 16-bit interface is not supported.

1.5 Pin Functions

Table 1.15 Pin functions (1 of 7)

Function	Signal	I/O	Description
Power supply	VCC_01 to VCC_10, VCC2_11 to VCC2_15	Input	Power supply pin. Connect it to the system power supply. Connect this pin to the same numbered VSS_01 to VSS_15 by a 0.1-μF capacitor. The capacitor should be placed close to the pin. In the SiP product, connect VCC2_11 to VCC2_15 to the 1.8V system power supply.
	VCC2_16 to VCC2_19	Input	Dedicated power supply pin for the SiP product. Connect it to the 1.8V system power supply. Connect this pin to the same numbered VSS_16 to VSS_19 by a 0.1-μF capacitor. The capacitor should be placed close to the pin.
	VCC_DCDC	Input	Switching regulator power supply pin.
	VLO	I/O	Switching regulator pin.
	VCL0 to VCL11	Input	Connect this pin to the same numbered VSS0 to VSS11 pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VBATT	Input	Battery Backup power pin
	VSS_01 to VSS_15, VSS0 to VSS11, VSS_DCDC	Input	Ground pin. Connect it to the system power supply (0 V).
	VSS_16 to VSS_19, VSS	Input	Dedicated ground pin for the SiP product. Connect it to the system power supply (0 V).
	Vpp	Input	Power supply pin for serial Flash programming operation. See the ISSI serial Flash IS25WX064 datasheet for the details. If not used, the Vpp pin can be floated. Note that the deep power down current varies depending on the power supply status of the Vpp pin.
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOUT and XCIN.
	XCOUT	Output	
	EXCIN	Input	External sub-clock input
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
	PUP	Input	Connect to VCC2 through a resistor.
CAC	CACREF	Input	Measurement reference clock input pin
On-chip emulator	TMS	Input	On-chip emulator or boundary scan pins
	TDI	Input	
	TCK	Input	
	TDO	Output	
	TCLK	Output	Output clock for synchronization with the trace data
	TDATA0 to TDATA3	Output	Trace data output
	SWO	Output	Serial wire trace output pin
	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin

Table 1.15 Pin functions (2 of 7)

Function	Signal	I/O	Description
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQn	Input	Maskable interrupt request pins
	IRQn-DS	Input	Maskable interrupt request pins that can also be used in Deep Software Standby mode
External bus interface	EBCLK	Output	Outputs the external bus clock for external devices
	RD	Output	Strobe signal indicating that reading from the external bus interface space is in progress, active-low
	WR	Output	Strobe signal indicating that writing to the external bus interface space is in progress, in 1-write strobe mode, active-low
	WRn	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08, D23 to D16 or D31 to D24) is valid in writing to the external bus interface space, in byte strobe mode, active-low
	BCn	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08, D23 to D16 or D31 to D24) is valid in access to the external bus interface space, in 1-write strobe mode, active-low
	ALE	Output	Address latch signal when address/data multiplexed bus is selected
	WAIT	Input	Input pin for wait request signals in access to the external space, active-low
	CSn	Output	Select signals for CS areas, active-low
	A00 to A23	Output	Address bus
	D00 to D31	I/O	Data bus
	A00/D00 to A15/D15	I/O	Address/data multiplexed bus
SDRAM interface	SDCLK	Output	Outputs the SDRAM-dedicated clock
	CKE	Output	SDRAM clock enable signal
	SDCS	Output	SDRAM chip select signal, active low
	RAS	Output	SDRAM low address strobe signal, active low
	CAS	Output	SDRAM column address strobe signal, active low
	WE	Output	SDRAM write enable signal, active low
	DQMn	Output	SDRAM I/O data mask enable signal for DQ07 to DQ00, DQ15 to DQ08, DQ23 to DQ16 or DQ31 to DQ24
	A00 to A16	Output	Address bus
	DQ00 to DQ31	I/O	Data bus

Table 1.15 Pin functions (3 of 7)

Function	Signal	I/O	Description
GPT	GTETRGA, GTETRGB, GTETRGC, GTETRGD	Input	External trigger input pins
	GTIOCnA, GTIOCnB	I/O	Input capture, output compare, or PWM output pins
	GTADSM0, GTADSM1	Output	A/D conversion start request monitoring output pins
	GTCPPOn	Output	Toggle output synchronized with PWM period
	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W
	GTOUUP	Output	3-phase PWM output for BLDC motor control (positive U phase)
	GTOULO	Output	3-phase PWM output for BLDC motor control (negative U phase)
	GTOVUP	Output	3-phase PWM output for BLDC motor control (positive V phase)
	GTOVLO	Output	3-phase PWM output for BLDC motor control (negative V phase)
	GTOWUP	Output	3-phase PWM output for BLDC motor control (positive W phase)
	GTOWLO	Output	3-phase PWM output for BLDC motor control (negative W phase)
AGT	AGTEEn	Input	External event input enable signals
	AGTIOn	I/O	External event input and pulse output pins
	AGTOn	Output	Pulse output pins
	AGTOAn	Output	Output compare match A output pins
	AGTOBn	Output	Output compare match B output pins
ULPT	ULPTEEn	Input	External count control input
	ULPTEVIn	Input	External event input
	ULPTEEn-DS	Input	External count control input that can also be used in Deep Software Standby mode 1
	ULPTEVIn-DS	Input	External event input that can also be used in Deep Software Standby mode 1
	ULPTOn	Output	Pulse output
	ULPTOAn	Output	Output compare match A output
	ULPTOBn	Output	Output compare match B output
	ULPTOn-DS	Output	Pulse output that can also be used in Deep Software Standby mode 1
	ULPTOAn-DS	Output	Output compare match A output that can also be used in Deep Software Standby mode 1
	ULPTOBn-DS	Output	Output compare match B output that can also be used in Deep Software Standby mode 1
RTC	RTCOUT	Output	Output pin for 1-Hz or 64-Hz clock
	RTCICn	Input	Time capture event input pins

Table 1.15 Pin functions (4 of 7)

Function	Signal	I/O	Description
SCI	SCKn	I/O	Input/output pins for the clock (clock synchronous mode)
	RXDn	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXDn	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTSn_RTSn	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low.
	CTSn	Input	Input for the start of transmission.
	DEn	Output	Driver enable signal for RS-485
	SCLn	I/O	Input/output pins for the IIC clock (simple IIC mode)
	SDAn	I/O	Input/output pins for the IIC data (simple IIC mode)
	SCKn	I/O	Input/output pins for the clock (simple SPI mode)
	MISOn	I/O	Input/output pins for slave transmission of data (simple SPI mode)
	MOSIn	I/O	Input/output pins for master transmission of data (simple SPI mode)
	SSn	Input	Chip-select input pins (simple SPI mode), active-low
IIC	SCLn	I/O	Input/output pins for the clock
	SDAn	I/O	Input/output pins for data
I3C	I3C_SCL0	I/O	Input/output pins for the clock
	I3C_SDA0	I/O	Input/output pins for data
SPI	RSPCKA, RSPCKB	I/O	Clock input/output pin
	MOSIA, MOSIB	I/O	Input or output pins for data output from the master
	MISOA, MISOB	I/O	Input or output pins for data output from the slave
	SSLA0, SSLB0	I/O	Input or output pin for slave selection
	SSLA1 to SSLA3, SSLB1 to SSLB3	Output	Output pins for slave selection
CANFD	CRXn	Input	Receive data
	CTXn	Output	Transmit data
USBFS	VCC_USB	Input	Power supply pin
	VSS_USB	Input	Ground pin
	USB_DP	I/O	D+ pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus.
	USB_DM	I/O	D- pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_EXICEN	Output	Low-power control signal for external power supply (OTG) chip
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip
	USB_OVRCURA, USB_OVRCURB	Input	Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_OVRCURA-DS, USB_OVRCURB-DS	Input	Overcurrent pins for USBFS that can also be used in Deep Software Standby mode 1. Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_ID	Input	Connect the MicroAB connector ID input signal to this pin during operation in OTG mode

Table 1.15 Pin functions (5 of 7)

Function	Signal	I/O	Description
USBHS	VCC_USBHS	Input	Power supply pin
	VSS1_USBHS, VSS2_USBHS	Input	Ground pin
	AVCC_USBHS	Input	Analog power supply
	USBHS_RREF	I/O	Reference current source pin for the USBHS Must be connected to the VSS2_USBHS pin through a 2.2-kΩ (±1%) resistor.
	USBHS_DP	I/O	Input/output pin for the D+ data line of the USB bus
	USBHS_DM	I/O	Input/output pin for the D- data line of the USB bus
	USBHS_EXICEN	Output	Must be connected to the OTG power supply IC
	USBHS_ID	input	Must be connected to the OTG power supply IC
	USBHS_VBUSEN	Output	VBUS power supply enable pin for the USBHS
	USBHS_OVRCURA, USBHS_OVRCURB	Input	Overcurrent pin for the USBHS
	USBHS_OVRCURA-DS, USBHS_OVRCURB-DS	Input	Overcurrent pin for the USBHS that can also be used in Deep Software Standby mode 1.
	USBHS_VBUS	Input	USB cable connection monitor input pin
OSPI	OM_n_SCLK	Output	Clock output (OCTACLK divided by 2)
	OM_n_SCLKN	Output	Inverted clock output (OCTACLK divided by 2)
	OM_n_CSn	Output	Chip select signal for an OctaFlash device, active-low
	OM_n_DQS	I/O	Read data strobe/write data mask signal
	OM_n_SIOn	I/O	Data input/output
	OM_n_RESET	Output	Reset signal for both slave devices, active-low
	OM_n_ECSINT1	Input	Error Correction Status and Interrupt for slave1
	OM_n_RSTO1	Input	Slave reset status for slave1
	OM_n_WP1	Output	Write Protect for slave1, active-low
SSIE	SSIBCK0, SSIBCK1	I/O	SSIE serial bit clock pins
	SSILRCK0/SSIFS0, SSILRCK1/SSIFS1	I/O	LR clock/frame synchronization pins
	SSITXD0	Output	Serial data output pin
	SSIRXD0	Input	Serial data input pin
	SSIDATA1	I/O	Serial data input/output pins
	AUDIO_CLK	Input	External clock pin for audio (input oversampling clock)
SDHI/MMC	SDnCLK	Output	SD clock output pins
	SDnCMD	I/O	Command output pin and response input signal pins
	SDnDAT0 to SDnDAT7	I/O	SD and MMC data bus pins
	SDnCD	Input	SD card detection pins
	SDnWP	Input	SD write-protect signals

Table 1.15 Pin functions (6 of 7)

Function	Signal	I/O	Description
ESWM	ETn_GTX_CLK	Output	1000 Mb/s transmit clock
	ETn_TX_CLK	Input	100 Mb/s,10 Mb/s transmit clock
	ETn_RX_CLK	Input	Receive clock
	ETn_TX_EN	Output	Transmit enable
	ETn_TXD0 to ETn_TXD7	Output	Transmit data
	ETn_TX_ER	Output	Transmit coding error
	ETn_RX_DV	Input	Receive data valid
	ETn_RXD0 to ETn_RXD7	Input	Receive data
	ETn_RX_ER	Input	Receive error
	ETn_MDC	Output	Management data clock
	ETn_MDIO	I/O	Management data input/output
	RGMIIn_TXC	Output	Transmit clock
	RGMIIn_RXC	Input	Receive clock
	RGMIIn_TX_CTL	Output	Transmit control
	RGMIIn_TXD0 to RGMIIn_TXD3	Output	Transmit data
	RGMIIn_RX_CTL	Input	Receive control
	RGMIIn_RXD0 to RGMIIn_RXD3	Input	Receive data
	RMIIn_REF50CK	Input	Synchronous clock reference
	RMIIn_TX_EN	Output	Transmit enable
	RMIIn_TXD0 to RMIIn_TXD1	Output	Transmit data
	RMIIn_CRS_DV	Input	Carrier sense/Receive data valid
	RMIIn_RXD0 to RMIIn_RXD1	Input	Receive data
	RMIIn_RX_ER	Input	Receive error
	ETn_LINKSTA	Input	PHY Link Status
	ETn_INT	Input	PHY interrupt
	ETn_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received.
	GPTP_CAPTUREn	Input	Media clock capture input
	GPTP_MATCHn	Output	Media clock recovery output
	GPTP_PPSn	Output	PPS signal
	GPTP_PTPOUT0 to GPTP_PTPOUT3	Output	PTP Pulse generator signal
	ET_TAS_STA0 to ET_TAS_STA3	Output	TAS status monitor
	ETHPHYCLK	Output	Clock output for PHY
PDMIF	PDMCLK0 to PDMCLK2	Output	Clock output pin
	PDMDAT0 to PDMDAT2	Input	Data input pin

Table 1.15 Pin functions (7 of 7)

Function	Signal	I/O	Description
Analog power supply	AVCC0	Input	Analog voltage supply pin. This is used as the analog power supply for the respective modules.
	AVSS0	Input	Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin.
	VREFH	Input	Analog reference voltage supply pin for the ADC16H (unit 1) and D/A Converter. Connect this pin to AVCC0 when not using the ADC16H (unit 1) and D/A Converter.
	VREFL	Input	Analog reference ground pin for the ADC16H and D/A Converter. Connect this pin to AVSS0 when not using the ADC16H (unit 1) and D/A Converter.
	VREFH0	Input	Analog reference voltage supply pin for the ADC16H (unit 0). Connect this pin to AVCC0 when not using the ADC16H (unit 0).
	VREFL0	Input	Analog reference ground pin for the ADC16H. Connect this pin to AVSS0 when not using the ADC16H (unit 0).
ADC16H	ANxxx	Input	Input pins for the analog signals to be processed by the A/D converter.
	ADTRGm	Input	Input pins for the external trigger signals that start the A/D conversion, active-low.
	ADSTm	Output	AD conversion start
	ADmFLAG1	Output	AD conversion end
	ADSYNC	Output	Synchronization signal between units
DAC12	DAn	Output	Output pins for the analog signals processed by the D/A converter.
ACMPHS	VCOUT	Output	Comparator output pin
	IVREFn	Input	Reference voltage input pins for comparator
	IVCMPn	Input	Analog voltage input pins for comparator
I/O ports	Pmn	I/O	General-purpose input/output pins (m: port number, n: pin number)
	P200	Input	General-purpose input pin
CEU	VIO_D15 to VIO_D0	Input	CEU data bus pins
	VIO_CLK	Input	CEU clock pins
	VIO_VD	Input	CEU vertical sync pins
	VIO_HD	Input	CEU horizontal sync pins
	VIO_FLD	Input	Field signal pins

1.6 Pin Assignments

The following figures show the pin assignments from the top view.

U17	R15	N12	176	VCC_USB	—	—	—	—	—	—	—

Note: Several pin names have the added suffix of _A, _B, and _C. These suffixes have special conditions for electrical characteristics. See section 62, Electrical Characteristics for detail.

Note 1. There are two types for IIC function, one is a simple IIC by SCI and another is a dedicated IIC. This terminal is for a dedicated IIC.

Note: Several pin names have the added suffix of _A, _B, and _C. These suffixes have special conditions for electrical characteristics. See section 62, Electrical Characteristics for detail.

Note 1. There are two types for IIC function, one is a simple IIC by SCI and another is a dedicated IIC. This terminal is for a dedicated IIC.

2. CPU

The MCU is based on the Arm® Cortex-M85 Processor and Arm® Cortex®-M33 Processor.

2.1 Overview

2.1.1 CPU

(1) CPU0

- Arm® Cortex-M85
  - Revision: r1p1-00rel0
  - ARMv8.1-M architecture profile
  - Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008
    Scalar half, single, and double-precision floating-point operation.
    Interrupt notification when FPU exception occurs.
  - M-profile Vector Extension (MVE)
    Integer, half-precision, and single-precision floating-point MVE (MVE-F)
  - Armv8-M Security Extension
- Security Attribution Unit (SAU): 8 regions
- Implementation Defined Attribution Unit (IDAU)
- Memory Protection Unit (MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- System Timer (SysTick)
  Reference clock:
  - CPUCLK0
  - 1 MHz generated from on-chip oscillator (MOCO/8)

  Two system timers are implemented:
  - Secure instance (SysTick_S)
  - Non-secure instance (SysTick_NS)
- Low power modes
  - Sleep mode
  - Deep Sleep mode
- CPU individual reset
- Cache
  - Instruction cache: 16 KB with ECC
  - Data cache: 16 KB with ECC
- Tightly Coupled Memory (TCM)
  - ITCM: 128 KB (16 blocks × 8 KB) with ECC
  - DTCM: 128 KB (16 blocks × 8 KB) with ECC
- Nested Vectored Interrupt Controller (NVIC): 96 IRQs
- Programable MBIST Controller: Excluded
- Global exclusive monitor is not supported

See reference [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B), [2] ARM Limited., Arm(R) Cortex-M85 Processor Technical Reference Manual (ARM 101924) for the detail.

(2) CPU1

- Arm® Cortex®-M33 Processor
  - Revision: r0p4-00rel2
  - ARMv8-M architecture profile
  - Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008
    Single-precision floating-point operation.
    Interrupt notification when FPU exception occurs.
  - Armv8-M Security Extension (Can be disabled by OTP. CPU1 can only be selected as primary CPU if its Security Extension is enabled.)
  - Armv8-DSP Extension.
- Security Attribution Unit (SAU): 8 regions
- Implementation Defined Attribution Unit (IDAU)
- Memory Protection Unit (MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- System Timer (SysTick)
  Reference clock:
  - CPUCLK1
  - 1 MHz generated from on-chip oscillator (MOCO/8)

  Two system timers are implemented:
  - Secure instance (SysTick_S)
  - Non-secure instance (SysTick_NS)
- Low power modes
  - Sleep mode
  - Deep Sleep mode
- Cache
  - Code-bus Cache (C-Cache): 16 KB with ECC
  - System-bus Cache (S-Cache): 16 KB with ECC
- Tightly Coupled Memory (TCM)
  - CTCM: 64 KB with ECC
  - STCM: 64 KB with ECC
- Nested Vectored Interrupt Controller (NVIC): 96 IRQs
- Global exclusive monitor is not supported

See the following references for the detail:

- [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B)
- [9] ARM Limited., Arm(R) Cortex-M33 Processor Technical Reference Manual (ARM 100230).

2.1.2 Debug

(1) CPU0 Debug Components

- Arm® CoreSight™ ETM-M85
  - Revision: r1p1-00rel0
  - ARM ETM Architecture version 4.5
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace unit (DWT)
  - 8 Data Watchpoint and Trace (DWT) comparators, up to 2 data value comparison
- Breakpoint Unit (BPU)
  - 8 instruction comparators
- Cross Trigger Interface (CTI0)
- Arm® CoreSight™ Trace Port Interface Unit for Cortex-M85 (TPIU)
  - TPIU Formatter output: Excluded
  - Serial Wire Output (SWO)

(2) CPU1 Debug Components

- Arm® CoreSight™ ETM-M33
  - Revision: r0p2-00rel0
  - ARM ETM Architecture version 4.2
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace unit (DWT)
  - 4 Data Watchpoint and Trace (DWT) comparators
- Breakpoint Unit (BPU)
  - 8 instruction comparators
- Cross Trigger Interface (CTI1)
- Arm® CoreSight™ Trace Port Interface Unit for Cortex-M33 (TPIU)
  - TPIU Formatter output: Excluded
  - Serial Wire Output (SWO)

(3) Common Debug Components

- Debug Access Port (DAP)
  - CoreSight SoC-400 Access Port :
    - #0: AHB-AP0
    - #1: APB-AP
    - #2: AHB-AP1
  - JTAG Debug Port and Serial Wire Debug Port (SWJ-DP)
    Serial Wire protocol version 2 (Target instance is fixed value: 0000)
- Timestamp Generator (TSG)
  - CoreSight SoC-400 Timestamp Generator
  - Global Timestamp for ETM and ITM
  - Driven by ICLK
- Embedded Cross Trigger

- CoreSight SoC-400 Cross Trigger Interface (CTI)
- CoreSight SoC-400 Cross Trigger Matrix (CTM)

- Embedded Trace FIFO (ETF)
  - CoreSight™ Trace Memory Controller with ETF configuration
  - FIFO size: 8 KB
- Debug Register Module (DBGREG)
- On-Chip Debug Register Module (OCDREG)
- Authentication Method using JTAG/SWD: Challenge response
- Trace Output Selector: Select between CPU0 and CPU1 SWO trace output.
- CoreSight SoC-400 Trace Port Interface Unit (TPIU) up to 4 bits TPIU Formatter output.

See the following references for the detail:

- [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B)

- [9] ARM Limited., Arm(R) Cortex-M33 Processor Technical Reference Manual (ARM 100230).

2.2 Block Diagram

Figure 2.1 shows the block diagram of CPUs and CoreSight Debug subsystem (DBGSS).

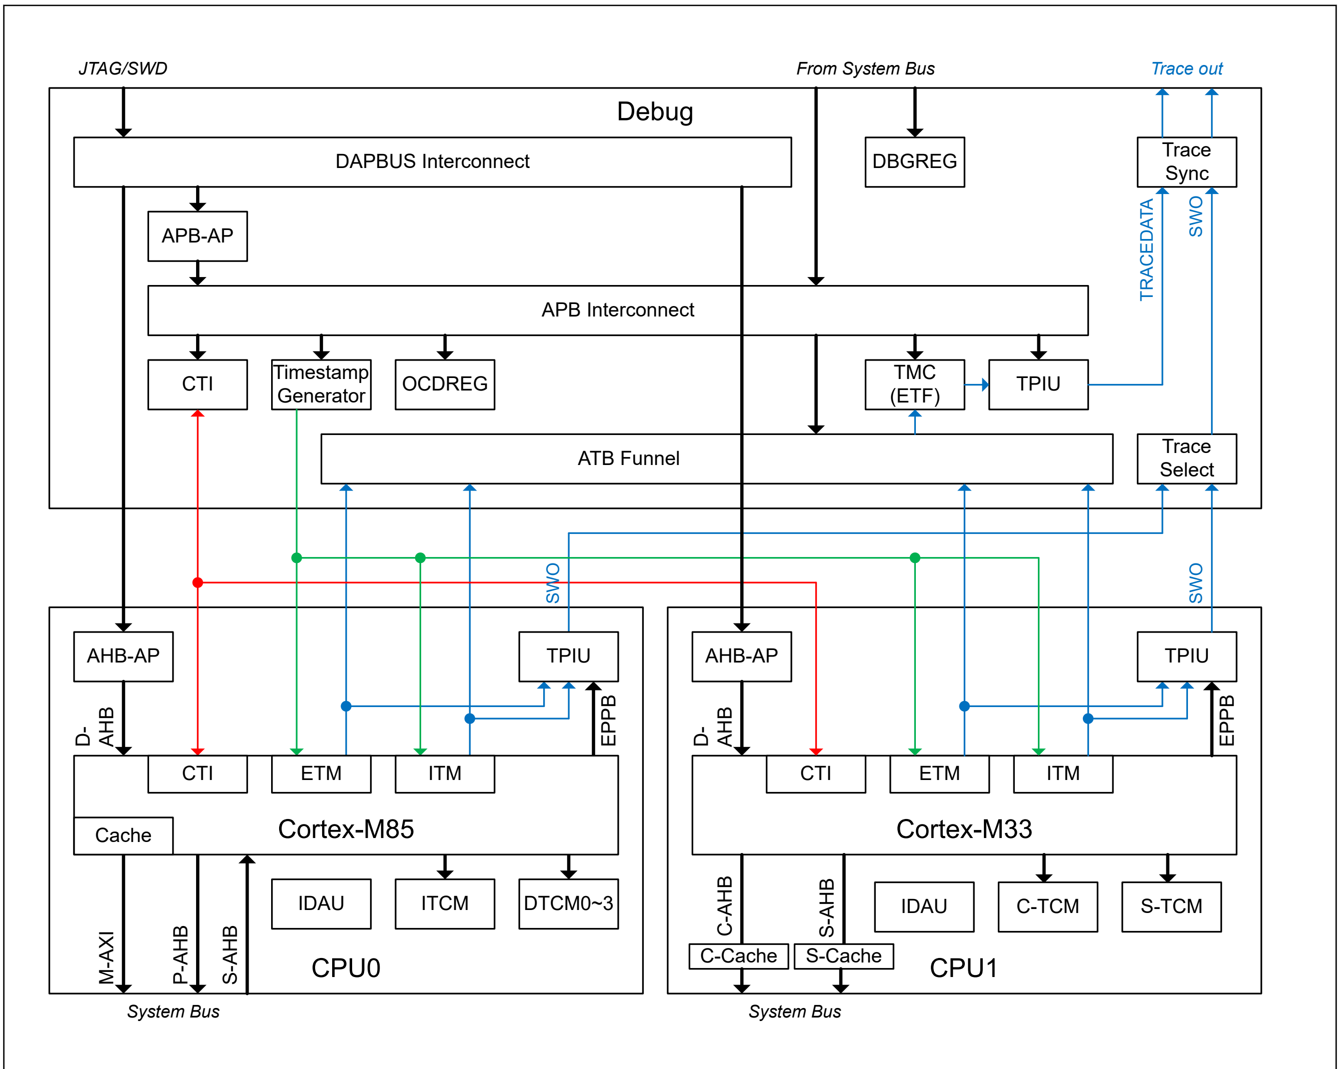

Figure 2.1 CPU and Debug block diagram

2.3 Implementation Options

Table 2.1 shows the implementation options related to CPU0 (Cortex-M85) and Table 2.2 shows the implementation options related to CPU1 (Cortex-M33).

Table 2.1 Implementation options related to CPU0 (1 of 2)

Option	Implementation
SAU	8 regions
IDAU	Included
MPU	MPU_S: 8 regions MPU_NS: 8 regions
MVE	Integer and half and single-precision floating-point MVE
FPU	Scalar half, single, and double-precision floating-point
Interrupts	96
Priority bits	4 bits (16 levels)
Sleep mode power-saving	Sleep mode, Deep Sleep mode
TCM	• ITCM : 128 KB (16 blocks × 8 KB) • DTCM : 128 KB (16 blocks × 8 KB) • ECC enable (determined by OFS1.INITECCEN) • ITCMCR.EN = 1 and DTCMCR.EN = 1, cannot be rewritten

Table 2.1 Implementation options related to CPU0 (2 of 2)

Option	Implementation
CACHE	● I-Cache: 16 KB ● D-Cache: 16 KB ● ECC enable (determined by OFS1.INITECCEN) ● Automatic invalidation is enabled During debug, the cache is controlled by CACHEDBGCR.L1RSTDIS.
P-AHB	512 MB, always enabled (PAHBCR.EN is always 1)
SysTick	Included two system timers: SysTick_S and SysTick_NS External reference clock with frequency = 1 MHz (MOCO/8) SYST_CALIB = 0x0000270F NOREF, bit[31] = 0: Reference clock is implemented SKEW, bit[30] = 0: TENMS calibration value is exact Bits[29:24] = 0x00: Reserved TENMS, bits[23:0] = 0x00270F: (0x270F + 1) x 1 [µs] = 10 [ms]
System reset request output	AIRCR.SYSRESETREQ bit causes the system reset
DWT	8 comparators
BPU	8 comparators
CTI	Included, CTI0 (for CPU0)
ITM	Included
ETM	Included
TPIU	Included ● TPIU Formatter output: Excluded ● Serial Wire Output (SWO)
Programmable MBIST Controller (PMC-100)	Excluded

Table 2.2 Implementation options related to CPU1 (1 of 2)

Option	Implementation
SAU	8 regions
IDAU	Included
MPU	MPU_S: 8 regions MPU_NS: 8 regions
SECEXT (Security Extension)	Supported. Can be enabled/disabled by setting OTP.
FPU	Single-precision floating-point
Interrupts	96
Priority bits	4 bits (16 levels)
Sleep mode power-saving	Sleep mode, Deep Sleep mode
SysTick	Included two system timers: SysTick_S and SysTick_NS External reference clock with frequency = 1 MHz (MOCO/8) SYST_CALIB = 0x0000270F NOREF, bit[31] = 0: Reference clock is implemented SKEW, bit[30] = 0: TENMS calibration value is exact Bit[29:24] = 0x00: Reserved TENMS, bits[23:0] = 0x00270F: (0x270F + 1) x 1 [µs] = 10 [ms]
System reset request output	AIRCR.SYSRESETREQ bit causes the system reset request output
DWT	4 comparators
BPU	8 comparators
CTI	Included (CTI1 for CPU1)
ITM	Included
ETM	Included

Table 2.2 Implementation options related to CPU1 (2 of 2)

Option	Implementation
TPIU	Included ● TPIU formatter output: Excluded ● Serial Wire Output (SWO)

Table 2.3 DBGSS implementation options

Option	Implementation
TSG	Included Driven by clock with frequency = ICLK
TMC (ETF configuration)	8 KB
DAP	SWJ-DP AHB-AP0 (for CPU0): AP0 APB-AP (for CoreSight SoC-400): AP1 AHB-AP1 (for CPU1): AP2
TPIU	Included ● Up to 32-bits TPIU formatter output

2.4 Trace Interface

A Trace Port Interface Unit (TPIU) and Serial Wire Output (SWO) provide trace output. Table 2.4 shows the MCU pins for the function. These pins are multiplexed with other functions.

Table 2.4 Trace function pins

Name	I/O	Function	When not in use
TCLK	Out	Trace clock	Open
TDATA0	Out	Trace data output	Open
TDATA1	Out	Trace data output	Open
TDATA2	Out	Trace data output	Open
TDATA3	Out	Trace data output	Open
SWO	Out	Serial Wire Output Mutiplexed with JTAG TDO pin	Open

2.5 JTAG/SWD Interface

Table 2.5 shows JTAG/SWD chip pins.

Table 2.5 JTAG/SWD pins

Name	I/O	Function	When not in use
TCK/SWCLK	In	JTAG Clock pin Serial Wire Data Clock pin	Pull-up
TMS/SWDIO	In-Out	JTAG TMS pin Serial Wire Data In-Out pin	Pull-up
TDI	In	JTAG TDI pin	Pull-up
TDO	Out	JTAG TDO pin Mutiplexed with Serial Wire Output	Open

2.6 Boot

The MCU supports Single-chip mode, Boot modes (JTAG, SCI/USB). For details of each mode, see section 4, Operating Modes.

2.6.1 Single-chip Mode

In this mode, CPUs execute user application code. However, when the First Stage Boot Loader (FSBL) execution is enabled, the primary CPU executes the FSBL code provided by Renesas before executing the user application code.

2.6.1.1 Boot CPU Selection

In the dual-core system, the primary CPU can be selected by the boot firmware command and booted first after a system reset release. By default, CPU0 is the primary CPU.

During the system reset release, the secondary CPU is in power gating state until it is activated by the primary CPU by writing to CPUnACTCSR register. Then depends on CPUnWAITCR.CPUWAIT, the secondary CPU may be in the wait state (CPUWAIT) or starts program execution. While in the wait state, code and data can be transferred to TCMs of the secondary CPU (when CPU0 is the secondary CPU, its activation status must be confirmed before code/data transferring or release of CPUWAIT). The primary CPU is not affected by CPUnWAITCR.CPUWAIT.

2.6.2 Initial Vector Table Base Address

In the MCU, the secure vector table base address of each CPU is determined according to the operating mode and whether it is the primary or secondary CPU as shown in Table 2.6, and the non-secure vector table base address is fixed at 0x0000_0000 for both CPUs except the case when CPU1 (CM33) with Security Extension is disabled, non-secure vector table base address is determined by CPUnINITVTOR value.

Table 2.6 Initial secure vector table base address in Single-chip mode

Operating mode	Primary CPU INITSVTOR	Secondary CPU INITSVTOR
Single-chip mode	0x0200_0000	CPUnINITVTOR

2.7 Sleep Modes for Low Power States

Each CPU supports two Sleep modes: Sleep mode and Deep Sleep mode.

2.7.1 Sleep Mode

2.7.1.1 Transition to Sleep Mode

When a WFI/WFE instruction or Sleep-on-exit function is executed while SCR.SLEEPDEEP bit is 0, the corresponding CPU enters Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the CPU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see section 14, Interrupt Controller Unit (ICU).

Table 2.7 shows the operation of IWDT when primary CPU enters Sleep mode.

Table 2.7 IWDT operation when primary CPU enters Sleep mode

IWDT operation	OFS0.IWDTSTRT	OFS0.IWDTSTPCTL*1	IWDTCSTPR.SLCSTP*2
Stop counting	0 (auto start mode)	1	—
Continue counting	0 (auto start mode)	0	—
Stop counting	1 (register start mode)	—	1
Continue counting	1 (register start mode)	—	0

Note 1. OFS0.IWDTSTPCTL controls IWDT stops/continues counting while IWDT is in auto start mode and the primary CPU is in Sleep mode.

Note 2. IWDTCSTPR.SLCSTP controls IWDT stops/continues counting while IWDT is in register start mode and the primary CPU is in Sleep mode.

Counting by IWDT stops when the primary CPU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops when the primary CPU is in Sleep mode).

Counting by IWDT continues when the primary CPU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop when the primary CPU is in Sleep mode).

Counting by the IWDT stops when the primary CPU enters Sleep mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 1 (IWDT stops when the primary CPU is in Sleep mode).

Counting by the IWDT continues when the primary CPU enters Sleep mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 0 (IWDT does not stop when the primary CPU is in Sleep mode).

The operation of WDT0/1 when CPU0/1 enters Sleep mode is shown in Table 2.8 and Table 2.9.

Table 2.8 WDT0 operation when CPU0 enters Sleep mode

WDT0 operation	OFS0.WDTSTRT0	OFS0.WDTSTPCTL0*1	WDT0.WDTCSTPR.SLCSTP*2
Stop counting	0 (auto start mode)	1	—
Continue counting	0 (auto start mode)	0	—
Stop counting	1 (register start mode)	—	1
Continue counting	1 (register start mode)	—	0

Note 1. OFS0.WDTSTPCTL0 controls WDT0 stops/continues counting while WDT0 is in auto start mode and the CPU0 is in Sleep mode.
Note 2. WDT0.WDTCSTPR.SLCSTP controls WDT0 stops/continues counting while WDT0 is in register start mode and the CPU0 is in Sleep mode.

Counting by WDT0 stops when CPU0 enters Sleep mode while the WDT0 is in auto start mode and the OFS0.WDTSTPCTL0 bit is 1 (WDT0 stops when CPU0 is in Sleep mode). Similarly, counting by WDT0 stops when CPU0 enters Sleep mode while the WDT0 is in register start mode and the SLCSTP bit in WDTCSTPR is 1 (WDT0 stops when CPU0 is in Sleep mode).

Counting by WDT0 continues when the CPU0 enters Sleep mode while the WDT0 is in auto start mode and the OFS0.WDTSTPCTL0 bit is 0 (WDT0 does not stop when CPU0 is in Sleep mode). Similarly, counting by WDT0 continues when CPU0 enters Sleep mode while the WDT0 is in register start mode and the SLCSTP bit in WDTCSTPR is 0 (WDT0 does not stop when CPU0 is in Sleep mode).

Table 2.9 WDT1 operation when CPU1 enters Sleep mode

WDT1 operation	OFS3.WDTSTRT1	OFS3.WDTSTPCTL1*1	WDT1.WDTCSTPR.SLCSTP*2
Stop counting	0 (auto start mode)	1	—
Continue counting	0 (auto start mode)	0	—
Stop counting	1 (register start mode)	—	1
Continue counting	1 (register start mode)	—	0

Note 1. OFS3.WDTSTPCTL1 controls WDT1 stops/continues counting while WDT1 is in auto start mode and the CPU1 is in Sleep mode.
Note 2. WDT1.WDTCSTPR.SLCSTP controls WDT1 stops/continues counting while WDT1 is in register start mode and the CPU1 is in Sleep mode.

Counting by WDT1 stops when CPU1 enters Sleep mode while the WDT1 is in auto start mode and the OFS3.WDTSTPCTL1 bit is 1 (WDT1 stops when CPU1 is in Sleep mode). Similarly, counting by WDT1 stops when CPU1 enters Sleep mode while the WDT1 is in register start mode and the SLCSTP bit in WDTCSTPR is 1 (WDT1 stops when CPU1 is in Sleep mode).

Counting by WDT1 continues when the CPU1 enters Sleep mode while the WDT1 is in auto start mode and the OFS3.WDTSTPCTL1 bit is 0 (WDT1 does not stop when CPU1 is in Sleep mode). Similarly, counting by WDT1 continues when CPU1 enters Sleep mode while the WDT1 is in register start mode and the SLCSTP bit in WDTCSTPR is 0 (WDT1 does not stop when CPU1 is in Sleep mode).

For details on WFI/WFE instruction and sleep-on-exit function to enter Sleep mode, see [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B).

2.7.1.2 Cancelling Sleep Mode

Sleep mode of each CPU is canceled by:

- An interrupt/event
- A reset:
  - RES pin reset
  - Power-on reset

- Voltage monitor 0 reset
- Overcurrent protection reset
- Core voltage monitor reset
- Independent watchdog timer reset
- CPUn (n = 0, 1) watchdog timer reset
- Voltage Monitor m reset (m = 1, 2 and 4, 5)
- Software reset
- CPUn (n = 0, 1) Lockup reset
- Common memory error reset
- Local memory n (n = 0, 1) error reset
- Bus error reset

The operations are as follows:

Canceling by an interrupt/event

- When an available interrupt request is generated, Sleep mode is canceled, and the CPUn (n = 0, 1) starts the interrupt handling.
- When the debugger writes 1 to MCUCTRL.EDBGRQn (n = 0, 1 for CPU0 and CPU1), Sleep mode is canceled, and the CPUn (n = 0, 1) enters Debug state[*1].
- When the CPUn (n = 0, 1) receives an event issued by an SEV instruction executed by another CPU and the transition to Sleep mode is caused by WFE instruction, Sleep mode is canceled, and the CPUn (n = 0, 1) executes the next instruction after WFE.

Canceling by RES pin reset

When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for a period specified in section 62, Electrical Characteristics. When the RES pin is driven high after the specified period, the primary CPU starts the reset exception handling.

Canceling by IWDT reset

Sleep mode is canceled by a system reset generated by an IWDT underflow and the primary CPU starts the reset exception handling. However, IWDT stops in Sleep mode and a system reset for canceling Sleep mode is not generated in the following conditions:

- OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
- OFS0.IWDTSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1

Canceling by WDT0 reset

Sleep mode is canceled by a system reset generated by a WDT0 underflow and the primary CPU starts the reset exception handling. However, WDT0 stops in Sleep mode even when counting in Normal mode and a system reset for canceling Sleep mode is not generated in the following conditions:

- OFS0.WDTSTRT0 = 0 (auto start mode) and OFS0.WDTSTPCTL0 = 1
- OFS0.WDTSTRT0 = 1 (register start mode) and WDT0.WDTCSTPR.SLCSTP = 1

Canceling by WDT1 reset

Sleep mode is canceled by a system reset generated by a WDT1 underflow and the primary CPU starts the reset exception handling. However, WDT1 stops in Sleep mode even when counting in Normal mode and a system reset for canceling Sleep mode is not generated in the following conditions:

- OFS3.WDTSTRT1 = 0 (auto start mode) and OFS3.WDTSTPCTL1 = 1
- OFS3.WDTSTRT1 = 1 (register start mode) and WDT1.WDTCSTPR.SLCSTP = 1

Canceling by other resets available in Sleep mode

Sleep mode is canceled by other resets and the Primary CPU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see section 14, Interrupt Controller Unit (ICU).

Note 1. CPU cannot enter Debug state if it is in Secure state while debugger is in Non-Secure state.

2.7.2 Deep Sleep Mode

2.7.2.1 Transition to Deep Sleep Mode

When a WFI instruction or sleep-on-exit function is executed while SCR.SLEEPDEEP is set to 1, the corresponding CPU enters Deep Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. However, accessing the TCM of CPU0 (when CPU0 is in Deep Sleep mode) is not available and SysTick also stops in this mode. Available resets or all interrupts in Deep Sleep mode cause the MCU to cancel Deep Sleep mode.

In Deep Sleep mode, the CPU is in power gating state (for CPU0, it depends on CPDLPSTATE setting).

IWDT and WDT0/1 operations in Deep Sleep mode is the same in Sleep mode.

2.7.2.2 Cancelling Deep Sleep Mode

Deep Sleep mode is canceled by:

- Interrupts shown in Table 14.5
- A reset:
  - RES pin reset
  - Power-on reset
  - Voltage monitor 0 reset
  - Overcurrent protection reset
  - Core voltage monitor reset
  - Independent watchdog timer reset
  - CPUn (n = 0, 1) watchdog timer reset
  - Voltage monitor m reset (m = 1, 2 and 4, 5)
  - Software reset
  - CPUn (n = 0, 1) lockup reset
  - Common memory error reset
  - Local memory n (n = 0, 1) error reset
  - Bus error reset

The operations are as follows:

Canceling by an interrupt

When an interrupt request is generated, Deep Sleep mode is canceled and the CPUn (n = 0, 1) starts the interrupt handling.

Canceling by RES pin reset

When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for a period specified in section 62, Electrical Characteristics. When the RES pin is driven high after the specified period, the CPUs starts the reset exception handling.

Canceling by IWDT reset

Deep Sleep mode is canceled by a system reset generated by an IWDT underflow and the primary CPU starts the reset exception handling. However, IWDT stops in Deep Sleep mode and a system reset for canceling Deep Sleep mode is not generated in the following conditions:

- OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
- OFS0.IWDTSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1

Canceling by WDT0 reset

Deep Sleep mode is canceled by a system reset generated by a WDT0 underflow and the primary CPU starts the reset exception handling. However, WDT0 stops in Deep Sleep mode even when counting in Normal mode and a system reset for canceling Deep Sleep mode is not generated in the following conditions:

- OFS0.WDTSTRT0 = 0 (auto start mode) and OFS0.WDTSTPCTL0 = 1
- OFS0.WDTSTRT0 = 1 (register start mode) and WDT0.WDTCSTPR.SLCSTP = 1

Canceling by WDT1 reset

Deep Sleep mode is canceled by a system reset generated by a WDT1 underflow and the primary CPU starts the reset exception handling. However, WDT1 stops in Deep Sleep mode even when counting in Normal mode and a system reset for canceling Deep Sleep mode is not generated in the following conditions:

- OFS3.WDTSTRT1 = 0 (auto start mode) and OFS3.WDTSTPCTL1 = 1
- OFS3.WDTSTRT1 = 1 (register start mode) and WDT1.WDTCSTPR.SLCSTP = 1

Canceling by other resets available in Deep Sleep mode

Deep Sleep mode is canceled by other resets and the primary CPU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see section 14, Interrupt Controller Unit (ICU).

2.8 Debug Function

The MCU provides ability to debug software by either external debug or self-hosted debug.

The external debug function is enabled by either JTAG/SWD or software programming. See section 2.8.1. External Debugger Connectivity, Authentication by JTAG/SWD and section 2.8.2. Debug Protection Mechanism by Software for details.

Self-hosted debug function can be enabled by software programming. See section 2.8.2. Debug Protection Mechanism by Software for details.

When debug function is enabled, operation of system can be affected. See section 2.8.3. Effect of Debug Function for details.

2.8.1 External Debugger Connectivity, Authentication by JTAG/SWD

In this MCU, three Protection Levels (PL) can be set:

- PL0 — Debug is not permitted
- PL1 — Non-secure debug is permitted
- PL2 — Secure debug is permitted.

When debug function is enabled by performing authentication using JTAG/SWD, three debug levels corresponding to three Authentication Level (AL) are available:

- AL0 — No debug functions are available
- AL1 — Only non-secure debug functions (both invasive and non-invasive debug) are enabled, and debugger can access only defined non-secure debug accessible regions
- AL2 — Non-secure and secure debug functions (both invasive and non-invasive debug) are enabled and accessible from the debugger.

Note: See reference [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B) for details about invasive, non-invasive, secure, and non-secure debug.

Authentication Level is determined as follows:

- When Device Life Cycle state (DLM state) is not OEM (LCK_BOOT, RMA_RET, RMA_REQ, RMA_ACK), AL is determined by DLM state. See Table 2.10.
- When Device Life Cycle state (DLM state) is equal to OEM, AL can be determined by PL set by user and authentication performed using JTAG/SWD. Authentication method of the MCU is the challenge response method with the authentication key installed by user.

The initial value of Authentication Level (AL) is determined by the value of the Protection Level (PL). See Table 2.10.

For the authentication sequence, see section 2.14.2.2. Connecting Sequence and JTAG/SWD Authentication.

In addition, using authentication key AL1 and AL2 can be prohibited by setting Protection LCKS and LCKNS, respectively. Setting LCKS and LCKNS can be performed by a boot firmware command.

Table 2.10 shows condition for authentication level that can be used for serial programmer.

Table 2.10 Condition for authentication level

Condition				Available authentication level
DLM state	PL	LCKS	LCKNS	
OEM	PL2	Don't care	Don't care	AL2 (default)
OEM	PL1	111	Don't care	AL1 (default) AL2 (authentication using AL2_KEY)
OEM	PL1	000 (using AL2_KEY prohibited)	Don't care	AL1 (default)
OEM	PL0	111	111	AL0 (default) AL1 (authentication using AL1_KEY) AL2 (authentication using AL2_KEY)
OEM	PL0	111	000 (using AL1_KEY prohibited)	AL0 (default) AL2 (authentication using AL2_KEY)
OEM	PL0	000 (using AL2_KEY prohibited)	111	AL0 (Default) AL1 (authentication using AL1_KEY)
OEM	PL0	000 (using AL2_KEY prohibited)	000 (using AL1_KEY prohibited)	AL0 (default)
LCK_BOOT	PL0	Don't care	Don't care	AL0 (default)
RMA_RET	PL0	Don't care	Don't care	AL0 (default)
RMA_REQ	PL0	Don't care	Don't care	AL0 (default)
RMA_ACK	PL2	Don't care	Don't care	AL2 (default)

Note: When debugging using SWJ-DP, set CDBGPWRUPREQ = 1.

Note: Debug connection from external emulator to CoreSight components using Debug APB is enabled as default setting, and as don't care for authentication mechanism result. However, this connection can be disabled by software programming. See DBGAUTH0.DEVICEEN for details.

Debug capability is not available while MCU is operating with the Boot mode or during the FSBL execution.

2.8.2 Debug Protection Mechanism by Software

In this mechanism, the challenge and response authentication procedure is not performed, instead software can be programmed to enable debug function of the MCU directly. In other words, debug function is controlled by software completely.

The debug function can be enabled by setting OFS1.SWDBG = 0 and one of the following bits:

- DBGAUTH0.NIDENn = 1: Non-invasive debug enable (n = 0,1 for CPU0 and CPU1)
- DBGAUTH0.DBGENn = 1: Invasive debug enable (n = 0,1 for CPU0 and CPU1)
- DAUTHCTRL.SPNIDENSEL = 1 and DAUTHCTRL.INTSPNIDEN = 1: Secure non-invasive debug enable. See [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B) for details.
- DAUTHCTRL.SPIDENSEL = 1 and DAUTHCTRL.INTSPIDEN = 1: Secure invasive debug enable. See [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B) for details.

Note: Authentication using software programming is not restricted by DLM state, PL, LCKS and LCKNS.

Note: Except DAUTHCTRL.INTSPNIDEN and DAUTHCTRL.INTSPIDEN overrides processor external secure invasive/ non-invasive debug authentication interface, when debug function enabled by authentication using JTAG/SWD, it cannot be disabled by software.

2.8.3 Effect of Debug Function

The debug function affects inside and outside of CPU. This section describes the effects excluding debug authentication.

2.8.3.1 Low Power Mode

All CoreSight debug components can store the register settings even when the CPU enters Deep Sleep mode, or when the MCU enters Software Standby or Deep Software Standby mode if SYOCDCR.DBGEN is 1 (see section 11, Low Power Mode) and any of the following condition is true:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN1 or DBGAUTH0.NIDEN1 is 1

However, AHB-APn (n = 0, 1 for AHB-AP0, AHB-AP1 of each CPU0, 1) cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components.

The MCU does not respond to On-Chip Debug (OCD), when OCD starts connecting to the MCU while it is in Software Standby mode or Deep Software Standby mode.

2.8.3.2 Reset/Interrupt

During debug when CPU enters debug state, the IWDT and corresponding WDTn (n = 0, 1) is stopped*1. During debug when CPU does not enter debug state and debug function is not AL0 or self-hosted debug is enabled, then some resets are restrained depend on DBGSTOPCR setting as WDT0, WDT1, IWDT*2. When PVDn (n! = 0), interrupt and reset depends on DBGSTOPCR whether CPU is in halting mode or not. Some access error is not generated by external debugger (DAP) access, see Table 2.11.

Table 2.11 Controlling of resets and interrupts generation in OCD mode

Reset/Interrupt name	Control in On-Chip Debug (OCD) mode	
	OCD break mode	OCD run mode
RES pin reset	Same as user mode	
Power-on reset	Same as user mode	
Independent watchdog timer reset/interrupt*2	Does not occur*1	Depends on DBGSTOPCR setting*2
Watchdog timer 0/1 reset/interrupt	Does not occur*1	Depends on DBGSTOPCR setting*2
CPU Lockup reset/interrupt	Does not occur	Same as user mode
Voltage monitor 0 reset	Same as user mode	
Voltage monitor 1 reset/interrupt	Depends on DBGSTOPCR setting*3	
Voltage monitor 2 reset/interrupt	Depends on DBGSTOPCR setting*3	
CPU0 Cache/TCM ECC error reset	Depends on DBGSTOPCR setting	
CPU1 Cache/TCM ECC error reset/interrupt	Cache: Depends on CAPOAD.OAD TCM: Depends on TCMCRC.OAD and TCMCRS.OAD	
MRAM ECC error reset/interrupt	Depends on DBGSTOPCR setting	
Cache/TCM ECC error BusFaults	Same as user mode*4	
SRAM ECC error reset/interrupt	Same as user mode*4	
Deep Software Standby reset	Same as user mode	
Software reset	Same as user mode	
Bus error reset/interrupt	Same as user mode*4	

Note 1. In OCD Break mode
IWDT always stops if any of the following condition is true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OSF1.SWDBG is 0, DBGAUTH0.DBGEN0 is 1, and CPU0 is the primary CPU
- OSF1.SWDBG is 0, DBGAUTH0.DBGEN1 is 1, and CPU1 is the primary CPU.

WDT0 always stops if any of the following condition is true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OSF1.SWDBG is 0 and DBGAUTH0.DBGEN0.

WDT1 always stops if any of the following condition is true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OSF1.SWDBG is 0 and DBGAUTH0.DBGEN1.

Note 2. In OCD run mode, IWDT and WDTn (n = 0, 1) operation depends on DBGSTOPCR setting if any of the following condition is true:
IWDT:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OSF1.SWDBG is 0, DBGAUTH0.DBGEN0 is 1, and CPU0 is the primary CPU
- OSF1.SWDBG is 0, DBGAUTH0.DBGEN1 is 1, and CPU1 is the primary CPU.

WDT0:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OSF1.SWDBG is 0 and DBGAUTH0.DBGEN0.

WDT1:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OSF1.SWDBG is 0 and DBGAUTH0.DBGEN1.

Note 3. Reset or interrupt masking depends on DBGSTOPCR setting.
Note 4. The system reset request or interrupt request is not generated when an error is detected for DAP access (applies to the Cache and TCM of CPU1).

2.8.3.3 First Stage Bootloader (FSBL)

During FSBL execution, debug is prohibited regardless of Authentication Level (AL).

2.8.4 Hot Plug-in Debug

Hot plug-in debugging is supported if challenge-response authentication is not required. Also, it is not supported in Software Standby and Deep Software Standby modes.

2.8.5 Unprivileged Debug

Unprivileged debug is supported only in CPU0 (Armv8.1-M).

2.9 Register Descriptions

2.9.1 CPU Control Registers

In addition to the internal registers of the CPU, the MCU also provides additional specific control and status registers that are considered as CPU control register.

Table 2.12 shows a list of CPU control registers.

Table 2.12 List of CPU control registers (1 of 2)

Name	Abbreviation	Address (Secure)	Address (Non-secure)	Access size	R/W
CPU Security Attribution Register	CPUSAR	0x4000_8170	0x5000_8170	32-bit	Read/Write
CPU0 Lockup Control Register	CPU0LCKUPCR	0x4000_F030	0x5000_F030	8-bit	Read/Write
CPU1 Lockup Control Register	CPU1LCKUPCR	0x4000_F034	0x5000_F034	8-bit	Read/Write
CPU0 Control Register Protection Register	CPU0CRPT	0x4000_F840	0x5000_F840	16-bit	Read/Write

Table 2.12 List of CPU control registers (2 of 2)

Name	Abbreviation	Address (Secure)	Address (Non-secure)	Access size	R/W
CPU1 Control Register Protection Register	CPU1CRPT	0x4000_F844	0x5000_F844	16-bit	Read/Write
CPU0 Function Lock Control Register	CPU0LOCKCR	0x4000_F400	—	8-bit	Read/Write
CPU1 Function Lock Control Register	CPU1LOCKCR	0x4000_F404	—	8-bit	Read/Write
CPU0 Non-secure Function Lock Control Register	CPU0LOCKCRNS	—	0x5000_F500	8-bit	Read/Write
CPU1 Non-secure Function Lock Control Register	CPU1LOCKCRNS	—	0x5000_F504	8-bit	Read/Write
CPU0 Initial Vector Base Address Register	CPU0INITVTOR	0x4000_F040	—	32-bit	Read/Write
CPU1 Initial Vector Base Address Register	CPU1INITVTOR	0x4000_F044	0x5000_F044	32-bit	Read/Write
CPU0 CPUWAIT Control Register	CPU0WAITCR	0x4000_F050	—	8-bit	Read/Write
CPU1 CPUWAIT Control Register	CPU1WAITCR	0x4000_F054	0x5000_F054	8-bit	Read/Write
CPU0 Activation Control and Status Register	CPU0ACTCSR	0x4000_F060	—	16-bit	Read/Write
CPU1 Activation Control and Status Register	CPU1ACTCSR	0x4000_F064	0x5000_F064	16-bit	Read/Write
CPU0 Local Memory Error Control Register	CPU0LMECR	0x4000_F070	0x5000_F070	8-bit	Read/Write
CPU Identification Register	CPUIDR	0x4000_F078	0x5000_F078	8-bit	Read
CPU0 Status Monitor Register	CPU0STATM	0x4000_F080	0x5000_F080	8-bit	Read
CPU1 Status Monitor Register	CPU1STATM	0x4000_F084	0x5000_F084	8-bit	Read
CPU SECEXT Monitor Register	SECEXTMON	0x4000_F090	—	8-bit	Read
Non-secure CPU Control Register	NSCPUCR	0x4000_F094	—	32-bit	Read/Write

2.9.1.1 CPUSAR : CPU Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x170

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUSA1	CPUSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPUSA0	CPU Security Attribution 0 (CPU0) 0: Secure 1: Non-secure	R/W
1	CPUSA1	CPU Security Attribution 1 (CPU1) 0: Secure 1: Non-secure	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

CPUSAn bit

Security attributes of registers for CPUn control. The target registers are as follow.

- CPU.CPUnLCKUPCR

- CPU.CPUnCRPT

CPUSA0 bit

The CPUSA0 bit controls the security attributes of the following registers.

- CPU0RSTCR
- CPU0LMECR

CPUSA1 bit

The CPUSA1 bit controls the security attributes of the following registers.

- CPU1INITVTOR
- CPU1WAITCR
- CPU1ACTCSR

2.9.1.2 CPUnLCKUPCR : CPUn Lockup Control Register (n = 0, 1)

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x030 + 0x004 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection of CPUn lockup 0: Non-maskable interrupt 1: System reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (CPUSAR.CPUSAn)
P-TYPE-2
n = 0, 1

When CPUn enters the lockup state, it can be selected to generate either a system reset or an interrupt by writing to CPUnLCKUPCR.OAD.

The CPUnLCKUPCR security attribution is controlled by CPUSAR.

Writing to CPUnLCKUPCR.OAD bit is protected by CPU Control Register Protection Register (CPUnCRPT).

2.9.1.3 CPUnCRPT : CPUn Control Register Protection Register (n = 0, 1)

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x840 + 0x004 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Writing to CPUnLCKUPCR register is available. 1: Writing to CPUnLCKUPCR register is not available. Read access is available.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
15:8	KEY[7:0]	The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.	W

Note: S-TYPE-3 (CPUSAR.CPUSAn)
P-TYPE-2
n = 0, 1

The CPUnCRPT.PROTECT bit enables writing to CPUnLCKUPCR, CPUnWAITCR, and CPUnLMECR registers (CPU1LMECR is not available).

The security attribution of CPUnCRPT is controlled by CPUSAR.

2.9.1.4 CPU0LOCKCR : CPU0 Function Lock Control Register

Base address: CPU_CTRL = 0x4000_F000

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	LCKDCAIC	LCKDTGU	LCKITGU	LCKSAU	LCKSMPU	LCKSVTAIR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCKSVTAIR	Disables writes to the following secure registers from software or from a debug agent that is connected to the processor. VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS	R/W*1
1	LCKSMPU	Disables writes to registers that are associated with the Secure MPU region from software or from a debug agent connected to the processor. MPU_CTRL, MPU_RNR, MPU_RBAR, MPU_RLAR, MPU_RBAR_An, MPU_RLAR_An	R/W*1
2	LCKSAU	This signal disables writes to registers that are associated with the SAU region from software or from a debug agent connected to the processor. SAU_CTRL, SAU_RNR, SAU_RBAR, SAU_RLAR	R/W*1
3	LCKITGU	Disables writes to registers that are associated with the ITCM interface security gating from software or from a debug agent connected to the processor. ITGUCTRL, ITGU_LUTn	R/W*1
4	LCKDTGU	Disables writes to registers that are associated with the DTCM interface security gating from software or from a debug agent connected to the processor. DTGUCTRL, DTGU_LUTn	R/W*1
5	LCKDCAIC	Disables access to the instruction cache direct cache access registers DCAICLR and DCAICRR	R/W*1
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6
P-TYPE-2
Note 1. Writing 0 is ignored.

The CPU0LOCKCR register controls some miscellaneous signals of CPU0.

Reset is the only clear condition.

2.9.1.5 CPU1LOCKCR : CPU1 Function Lock Control Register

Base address: CPU_CTRL = 0x4000_F000

Offset address: 0x404

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LCKSAU	LCKSMPU	LCKSVTAIR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCKSVTAIR	Disables writes to the following secure registers from software or from a debug agent that is connected to the processor. VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS	R/W*1
1	LCKSMPU	Disables writes to registers that are associated with the Secure MPU region from software or from a debug agent connected to the processor. MPU_CTRL, MPU_RNR, MPU_RBAR, MPU_RLAR, MPU_RBAR_An, MPU_RLAR_An	R/W*1
2	LCKSAU	This signal disables writes to registers that are associated with the SAU region from software or from a debug agent connected to the processor. SAU_CTRL, SAU_RNR, SAU_RBAR, SAU_RLAR	R/W*1
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6
P-TYPE-2
Note 1. Writing 0 is ignored.

The CPU1LOCKCR register controls some miscellaneous signals of CPU1.

Reset is the only clear condition.

2.9.1.6 CPUnLOCKCRNS : CPUn Non-secure Function Lock Control Register (n = 0, 1)

Base address: CPU_CTRL_NS = 0x5000_F000

Offset address: 0x500 + 0x004 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LCKN SMPU	LCKN SVTO R
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCKNSVTOR	Disables writes to the VTOR_NS register.	R/W*1
1	LCKNSMPU	Disables writes to registers that are associated with the Non-secure MPU region from software or from a debug agent connected to the processor. MPU_CTRL_NS, MPU_RNR_NS, MPU_RBAR_NS, MPU_RLAR_NS, MPU_RBAR_A_NSn, MPU_RLAR_A_NSn	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-7
P-TYPE-2
Note 1. Writing 0 is ignored.

The CPUnLOCKCRNS register controls some miscellaneous signals of CPUn.

Reset is the only clear condition.

2.9.1.7 CPUnINITVTOR : CPU Initial Vector Base Address Register (n = 0, 1)

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x040 + 0x004 × n

Bit position: 31 ... 0

Bit field: CPUINITVTOR[31:0]

Value after reset: 0 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CPUINITVTOR[31:0]	CPUn Initial Vector Base Address Writing to CPUINITVTOR[6:0] is discarded and read as 0.	R/W

Note: S-TYPE-6 (CPU0INITVTOR) / S-TYPE-3 (CPU1INITVTOR)
P-TYPE-2 (CPUnINITVTOR)

The CPUnINITVTOR register controls Vector Base Address bit field in the Secure/Non-secure Vector Table Offset.

2.9.1.8 CPUnWAITCR : CPUn CPUWAIT Control Register (n = 0, 1)

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x050 + 0x004 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CPUWAIT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPUWAIT	Writing 1 to stall the CPUn when it is out of reset. This bit is valid only when CPUn is the secondary CPU. 0: CPUn starts instruction execution out of reset 1: CPUn is forced into a quiescent state out of reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6 (CPU0WAITCR) / S-TYPE-3 (CPU1WAITCR)
P-TYPE-2 (CPUnWAITCR)

The CPUnWAITCR register controls the execution state of the secondary CPU when it is out of reset.

Writing to CPUnWAITCR.CPUWAIT bit is protected by CPU Control Register Protection Register (CPUnCRPT).

2.9.1.9 CPUnACTCSR : CPUn Activation Control and Status Register (n = 0, 1)

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x060 + 0x004 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								ACT	—	—	—	—	—	—	ACTREQ
Value after reset:	0	0	0	0	0	0	0	0	X	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ACTREQ	CPUn activation request This bit is read as 0. This bit is valid only when CPUn is the secondary CPU. 0: No effect 1: Request CPUn activation if ACT bit is 0	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	ACT	CPUn activation status 0: CPUn is in inactive state (power gating/reset state) 1: CPUn is in active state (out of reset)	R
15:8	KEY[7:0]	Key Code These bits control the write access to this register. To modify this register, write 0xA5 to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit. These bits are read as 0.	R/W

Note: The initial value of ACT bit is:
1: If CPUn is the primary CPU.
0: If CPUn is the secondary CPU.

Note: S-TYPE-6 (CPU0ACTCSR) / S-TYPE-3 (CPU1ACTCSR)
P-TYPE-2 (CPUnACTCSR)

The CPUnACTCSR register controls the activation of the secondary CPU after a system reset. It also indicates the activation status of CPUn.

2.9.1.10 CPU0LMECR : CPU0 Local Memory Error Control Register

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x070

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SYRSTEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SYRSTEN	System Reset Request Enable 0: Disables system reset request when multiple bits error occurs in data cache or TCM 1: Enables system reset request when multiple bits error occurs in data cache or TCM	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The CPU0LMECR register controls a system reset request when multiple bits error occurs in data cache or in TCM of CPU0.

Writing to CPU0LMECR.SYRSTEN bit is protected by CPU Control Register Protection Register (CPU0CRPT).

TCM must be initialized before setting CPU0LMECR.SYRSTEN bit because ECC error may occur if CPU0 and CPU1 issue a speculative access to the uninitialized TCM.

2.9.1.11 CPUIDR : CPU Identification Register

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x078

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CPUID
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPUID	CPU Identification 0: CPU0 1: CPU1	R
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-5

The CPUIDR register shows the ID of CPUn. This register is expected to be read by CPUn. The read value is undefined if read by a bus master other than CPUn.

2.9.1.12 CPU0STATM : CPU0 Status Monitor Register

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x080

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SAHBSTP	—	—	SLEEPDEEP	SLEEPING
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLEEPING	CPU0 Sleeping State 0: CPU0 is running 1: CPU0 is at Sleep mode	R
1	SLEEPDEEP	CPU0 SLEEPDEEP state Indicates that the processor is at a Deep Sleep mode.	R
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	SAHBSTP	CPU0 S-AHB Status Flag 0: CPU0 S-AHB is active 1: CPU0 S-AHB is stopped	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-5

The CPU0STATM register shows status of CPU0 related to Sleep, SleepDeep, and S-AHB Stop.

2.9.1.13 CPU1STATM : CPU1 Status Monitor Register

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x084

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SLEEPDEEP	SLEEPING
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLEEPING	CPU1 Sleeping State 0: CPU1 is running 1: CPU1 is at Sleep mode	R
1	SLEEPDEEP	CPU1 SLEEPDEEP state Indicates that the processor is at a Deep Sleep mode.	R
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-5

The CPU1STATM register shows status of CPU1 related to Sleep and SleepDeep.

2.9.1.14 SECEXTMON : CPU SECEXT Monitor Register

Base address: CPU_CTRL = 0x4000_F000

Offset address: 0x090

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SECEXT1	SECEXT0
Value after reset:	0	0	0	0	0	0	0/1	1

Bit	Symbol	Function	R/W
0	SECEXT0	CPU0 Security Extension CPU0 (Cortex-M85) always includes Security Extension. 0: CPU0 does not include Security Extension 1: CPU0 includes Security Extension	R
1	SECEXT1	CPU1 Security Extension 0: CPU1 does not include Security Extension 1: CPU1 includes Security Extension	R
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6
P-TYPE-2

The SECEXTMON register shows status of CPU0/1 related to Security Extension.

2.9.1.15 NSCPUCR : Non-secure CPU Control Register

Base address: CPU_CTRL = 0x4000_F000

Offset address: 0x094

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSTREQEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	RSTREQEN	System Reset Request Enable 0: System reset request caused by non-secure CPU without SECEXT is not allowed 1: System reset request caused by non-secure CPU without SECEXT is allowed	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6
P-TYPE-2

The NSCPUCR register manages the system reset request of the CPU which does not have Security Extension.

2.9.2 Address Spaces for External Debugger

The MCU debug system includes three CoreSight Access Ports (AP):

- AHB-APn, which is connected to the CPUn bus matrix, has the same accessibility to the system address space as CPUn (n = 0, 1)
- APB-AP, which has OCD address space, is connected to the CoreSight components and OCDREG registers.

Figure 2.2 shows a block diagram of the AP connection and address spaces.

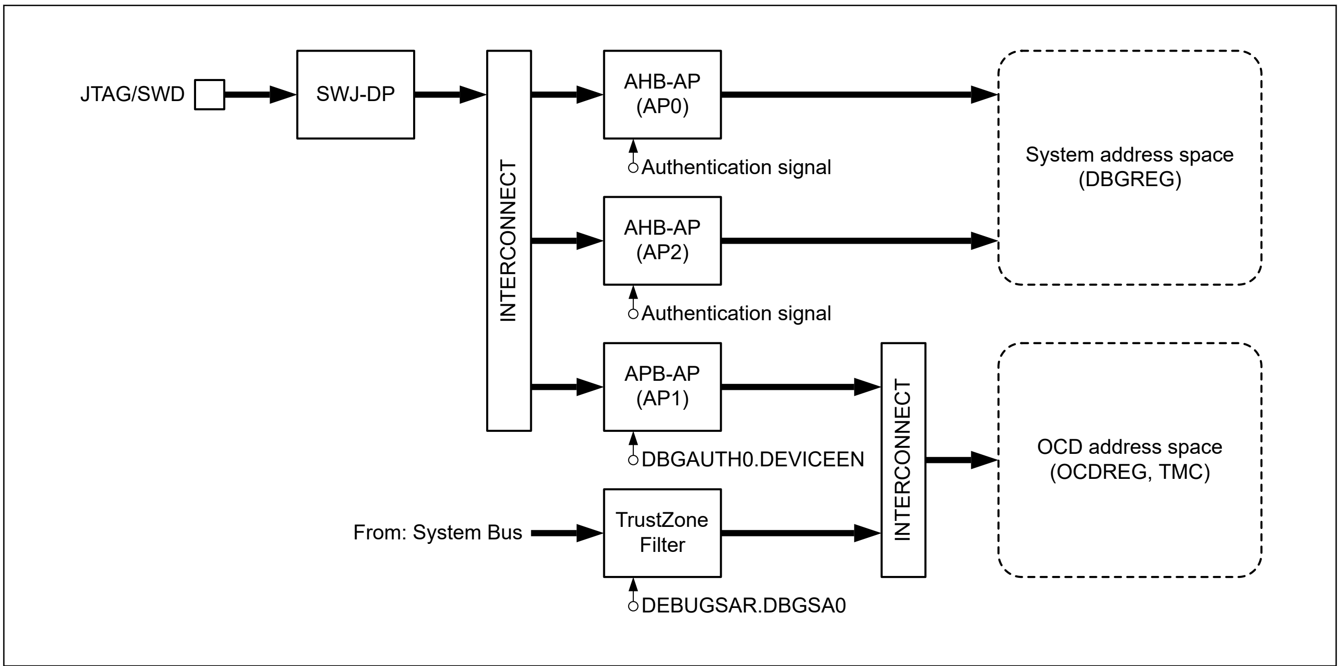

Figure 2.2 Block diagram of the AP connection and address spaces

For debugging purpose, there are two address spaces, DBGREG and OCDREG.

DBGREG is located in the system address space and can be accessed from either OCD emulator, CPUs or other bus masters in the MCU.

OCDREG is located in the OCD address space and can be accessed from either OCD emulator, CPUs or other bus masters in the MCU. See Table 2.15 for details.

2.9.3 CPU Peripheral

Each CPU core has its Private Peripheral Bus (PPB) which can be accessed only from that CPU and OCD emulator. CoreSight components are accessible from either CPUs or OCD emulator. Table 2.13 and Table 2.14 show dedicated Peripheral address of CPUn (n = 0, 1). Table 2.15 describes CoreSight component address.

Reserved area	0x4001_7000	0x4001_AFFF	—

Note: Do not access TPIU if trace clock is not supplied.
Note 1. The base address 0x4001_0000 is dedicated for CPU secure access.
The base address for CPU non-secure access is 0x5001_0000.
The base address for OCD emulator access is 0x8001_0000.
Do not access reserved area (secure: 0x4001_7000-0x4001_AFFF, non-secure: 0x5001_7000-0x5001_AFFF).
If reserved area is accessed, the access is not guaranteed.

2.9.4 ROM Table

There are five ROM Tables in the MCU:

- CPU0 processor ROM table
- CPU0 EPPB ROM table
- CPU1 processor ROM table
- CPU1 EPPB ROM table
- System ROM Table.

The CPUn EPPB ROM Table points to the TPIU component and processor ROM table inside each CPU. The EPPB ROM table does not point to or be pointed by the System ROM Table.

The Processor ROM Table contains the entries which hold a list of debug components implemented in CPUn (n = 0, 1). The System ROM Table contains the entries which hold a list of debug components implemented as CoreSight debug components of the MCU.

2.9.4.1 ROM Entries

ROM entries holds a list of CoreSight debug components in the system. OCD emulator can use the ROM entries to determine which components are implemented in the system.

The entries of debug components are described as follow:

- Table 2.16: System ROM entries
- Table 2.17: CPU0 EPPB ROM entries
- Table 2.18: CPU0 Processor ROM entries (see reference [2] ARM Limited., Arm(R) Cortex-M85 Processor Technical Reference Manual (ARM 101924))
- Table 2.19: CPU1 EPPB ROM entries
- Table 2.20: CPU1 Processor ROM entries (see reference [9] ARM Limited., Arm(R) Cortex-M33 Processor Technical Reference Manual (ARM 100230)).

Table 2.16 System ROM entries

#	Address*1	Access size	R/W	Value	Target module
0	0x4001_0000	32-bit	Read-only	0x00001003	OCDREG
1	0x4001_0004	32-bit	Read-only	0x00002003	CTI
2	0x4001_0008	32-bit	Read-only	0x00003003	Funnel
3	0x4001_000C	32-bit	Read-only	0x00004003	ETF
4	0x4001_0010	32-bit	Read-only	0x00005003	TSG
5	0x4001_0014	32-bit	Read-only	0x00006003	TPIU
6	0x4001_00148	32-bit	Read-only	0x00000000	End of entries

Note 1. The base address 0x4001_0000 is dedicated for secure access of CPUs. The base address for non-secure access of CPUs is 0x5001_0000. The base address for OCD emulator access is 0x8001_0000.

Table 2.17 CPU0 EPPB ROM entries

#	Address	Access size	R/W	Value	Target module
0	0xE00F_E000	32-bit	Read-only	0x00001003	CPU0 Processor ROM Table
1	0xE00F_E004	32-bit	Read-only	0xFFF42003	CPU0 TPIU
2	0xE00F_E008	32-bit	Read-only	0x00000000	End of entries

Note: The base address of CPU0 EPPB ROM Table is 0xE00F_E000.
Note: TPIU clock enable should be supplied before reading ROM table.

Table 2.18 CPU0 Processor ROM entries

#	Address	Access size	R/W	Value	Target module
0	0xE00F_F000	32-bit	Read-only	0xFFF0F003	SCS
1	0xE00F_F004	32-bit	Read-only	0xFFF02003	DWT
2	0xE00F_F008	32-bit	Read-only	0xFFF03003	BPU
3	0xE00F_F00C	32-bit	Read-only	0xFFF01003	ITM
5	0xE00F_F014	32-bit	Read-only	0xFFF42003	ETM
6	0xE00F_F018	32-bit	Read-only	0xFFF04003	PMU
7	0xE00F_F01C	32-bit	Read-only	0xFFF43003	CTI0
8	0xE00F_F020	32-bit	Read-only	0xFFF47002	PMC
9	0xE00F_F024	32-bit	Read-only	0x00000000	End of entries

Note: The base address of CPU0 Processor ROM Table is 0xE00F_F000.

Table 2.19 CPU1 EPPB ROM entries

#	Address	Access size	R/W	Value	Target module
0	0xE00F_E000	32-bit	Read-only	0x00001003	CPU1 Processor ROM Table
1	0xE00F_E004	32-bit	Read-only	0xFFF42003	CPU1 TPIU
2	0xE00F_E008	32-bit	Read-only	0x00000000	End of entries

Note: The base address of CPU1 EPPB ROM Table is 0xE00F_E000.
Note: TPIU clock enable should be supplied before reading ROM table.

Table 2.20 CPU1 Processor ROM entries

#	Address	Access size	R/W	Value	Target module
0	0xE00F_F000	32-bit	Read-only	0xFFF0F003	SCS
1	0xE00F_F004	32-bit	Read-only	0xFFF02003	DWT
2	0xE00F_F008	32-bit	Read-only	0xFFF03003	BPU
3	0xE00F_F00C	32-bit	Read-only	0xFFF01003	ITM
5	0xE00F_F014	32-bit	Read-only	0xFFF42003	ETM
6	0xE00F_F018	32-bit	Read-only	0xFFF43003	CTI1
7	0xE00F_F01C	32-bit	Read-only	0xFFF44002	MTB
8	0xE00F_F20	32-bit	Read-only	0x00000000	End of entries

Note: The base address of CPU1 Processor ROM Table is 0xE00F_F000.

2.9.4.2 CoreSight Component Registers

ROM Table has CoreSight Component registers defined in Arm® CoreSight™ Architecture.

Table 2.21 shows the registers of System ROM Table.

Table 2.22 shows CPU0 EPPB ROM Table.

Table 2.23 shows CPU0 Processor ROM Table. See reference [2] ARM Limited., Arm(R) Cortex-M85 Processor Technical Reference Manual (ARM 101924).

Table 2.24 shows CPU1 EPPB ROM Table.

Table 2.25 shows CPU1 Processor ROM Table. See reference [9] ARM Limited., Arm(R) Cortex-M33 Processor Technical Reference Manual (ARM 100230).

Table 2.21 Registers of System ROM Table (1 of 2)

Name	Address	Access size	R/W	Initial value
PID4	0x8001_0FD0	32-bit	Read-only	0x00000004

Table 2.21 Registers of System ROM Table (2 of 2)

Name	Address	Access size	R/W	Initial value

First Stage Boot Loader Status Register	FSBLSTAT	Port 0/2	0x4001_B200 0x5001_B200	32-bit	Read/Write

2.9.5.1 DEBUGSAR : Debug Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x180

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DBGSA0	Debug Security Attribution 0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

DBGSA0 bit (Debug Security Attribution 0)

Security attributes of registers for debug control. The target registers are as follow:

- DBGREG.DBGAUTH0
- The CoreSight registers connected to APB-AP and mapped to the system address space.

Note: This is not affected to the access from external by APB-AP.

2.9.5.2 DBGSTR : Debug Status Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	CDBGPWRUPACK	CDBGPWRUPREQ	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	x	x	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
27:0	—	These bits are read as 0.	R
28	CDBGPWRUPREQ	Debug power-up request 0: OCD is not requesting debug power-up 1: OCD is requesting debug power-up	R
29	CDBGPWRUPACK	Debug power-up acknowledge 0: Debug power-up request is not acknowledged 1: Debug power-up request is acknowledged	R
31:30	—	These bits are read as 0.	R

Note: S-TYPE-5
P-TYPE-2

The DBGSTR register is a status register to notify OCD status to programs. This register monitors the debug connecting state.

2.9.5.3 DBGSTOPCR : Debug Stop Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	DBGSTOP_CTERR1	DBGSTOP_CTERR0	—	DBGSTOP_NVMERR	—	—	—	—	—	—	—	—	DBGSTOP_PVD	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGSTOP_WDT1	DBGSTOP_WDT0	DBGSTOP_IWDT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
0	DBGSTOP_IWDT	Mask bit for IWDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and IWDT counter is stopped, regardless of this bit value. 0: Enable IWDT reset/interrupt 1: Mask IWDT reset/interrupt and stop IWDT counter	R/W

Bit	Symbol	Function	R/W
1	DBGSTOP_WDT0	Mask bit for WDT0 reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and WDT0 counter is stopped, regardless of this bit value. 0: Enable WDT0 reset/interrupt 1: Mask WDT0 reset/interrupt and stop WDT0 counter	R/W
2	DBGSTOP_WDT1	Mask bit for WDT1 reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and WDT1 counter is stopped, regardless of this bit value. 0: Enable WDT1 reset/interrupt 1: Mask WDT1 reset/interrupt and stop WDT1 counter	R/W
16:3	—	These bits are read as 0. The write value should be 0.	R/W
17	DBGSTOP_PVD	Mask bit for PVDn (n! = 0) reset/interrupt 0: Enable PVDn (n! = 0) reset/interrupt 1: Mask PVDn (n! = 0) reset/interrupt	R/W
25:18	—	These bits are read as 0. The write value should be 0.	R/W
26	DBGSTOP_NVMERR	Mask bit for MRAM ECC error reset/interrupt 0: Enable MRAM ECC error reset/interrupt 1: Mask MRAM ECC error reset/interrupt	R/W
27	—	This bit is read as 0. The write value should be 0.	R/W
28	DBGSTOP_CTERR0	Mask bit for Cache/TCM ECC error reset of CPU0 0: Enable Cache/TCM ECC error reset 1: Mask Cache/TCM ECC error reset	R/W
29	DBGSTOP_CTERR1	This bit is reserved. It can be R/W but has no effect.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-2

The DBGSTOPCR register specifies functional stop during debugging.

This register is valid only when any of the following conditions are true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1.SWDBG is 0, and DBGAUTH0.DBGEN0 is 1
- OFS1.SWDBG is 0, and DBGAUTH0.DBGEN1 is 1.

When none of the above conditions are true, the MCU ignores this register setting and regards all bits as 0.

2.9.5.4 DBGAUTH0 : Debug Authentication Control Register0

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SWDBG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEVICEEN
Value after reset:	OFS1.SWDBG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	NIDEN1	NIDEN0	—	—	DBGEN1	DBGEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DBGEN0[*1]	CPU0 invasive debug enable 0: Disabled 1: Enabled	R/W
1	DBGEN1[*1]	CPU1 invasive debug enable 0: Disabled 1: Enabled	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	NIDEN0	CPU0 non-invasive debug enable 0: Disabled 1: Enabled	R/W
5	NIDEN1	CPU1 non-invasive debug enable 0: Disabled 1: Enabled	R/W
15:6	—	These bits are read as 0. The write value should be 0.	R/W
16	DEVICEEN[*2]	APB-AP (AP1) authentication 0: Disabled 1: Enabled	R/W
30:17	—	These bits are read as 0. The write value should be 0.	R/W
31	SWDBG	Software control of debug function 0: Disabled 1: Enabled	R

Note: S-TYPE-3(DEBUGSAR.DBGSA0)
P-TYPE-2

Note: MCU behaves according to the setting of DBGSTOPCR, SYOCDCR, TRCKCR, TRACECTR, and MCUCTRL when DBGENn = 1 or NIDENn = 1 is TRUE or when CDBGPWRUPREQ = 1 and AL ≠ AL0 is TRUE (n = 0, 1).

Note 1. When AL2 or AL1, the MCU ignores this bit and regards as if it is set to 1.

Note 2. When AL2, the MCU ignores this bit and regards as if it is set to 1.

When software control of debug function (OFS1.SWDBG = 0) is enabled, non-secure invasive and non-invasive debug function of CPUn can be controlled by DBGENn and NIDENn bits of this register (n = 0, 1).

Access from APB-AP to the CoreSight components through Debug APB can be enabled by DEVICEEN bit of this register.

When OFS1.SWDBG is 1, the MCU ignores this register and regards it as if it is set to its initial value.

2.9.5.5 CACHEDBGCR : Cache Debug Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	L1RST DIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	L1RSTDIS	Disable L1 cache automatic invalidation of CPU0 0: Enable automatic invalidation of the L1 cache 1: Disable automatic invalidation of the L1 cache	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6
P-TYPE-2

Note: The setting of the register is valid only if any of the following conditions apply:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1.

The CACHEDBGCR register provides capability of control Disable L1 cache invalidation out of reset during debugging.

2.9.5.6 TRPORTCR : Trace Port Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x030

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWOSEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PORTSEL[1:0]		—	—	—	—	DRV[1:0]		—	OE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
0	OE	Data Out Enable bit indicates whether trace clock, trace data and SWO outputs are enabled or not. OE bit should be enabled before trace clock is enabled. 0: Output disabled 1: Output enabled	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
3:2	DRV[1:0]	Port drive capability control indicates trace port buffer speed. 0 0: Low 0 1: Middle 1 0: High-Speed high-drive 1 1: High	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
9:8	PORTSEL[1:0]	Port select. Only A port setting is supported. 0 0: A port 0 1: B port	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	SWOSEL	Select SWO between CPU0 and CPU1 0: SWO of CPU0 is selected (default) 1: SWO of CPU1 is selected	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-2

Note: The setting of the register is valid only when any of the following conditions applies:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN1 or DBGAUTH0.NIDEN1 is 1.

Trace data control when OE bit = 1.

Target CPU	Trace Protocol	TPIU_SPPR (CPU0)	TPIU_SPPR (CPU1)	SWOSEL
CPU0	SWO	01b or 10b	Don't care	0 (CPU0)
	Parallel	00b	Don't care	0 (CPU0)

Target CPU	Trace Protocol	TPIU_SPPR (CPU0)	TPIU_SPPR (CPU1)	SWOSEL
CPU1	SWO	Don't care	01b or 10b	1 (CPU1)
	Parallel	Don't care	00b	1 (CPU1)
CPU0 and CPU1	SWO	01b or 10b	01b or 10b	Select CPU output SWO
	Parallel	00b to CPU0 or CPU1		Select CPU when TPIU_SPPR = 00b

For more information about TPIU_SPPR register (CPU0: bit PProtocol, CPU1: bit TXMODE), see [1] ARM Limited., ARMv8-M Architecture Reference Manual (ARM DDI 0553B).

2.9.5.7 ALCTRL : Authentication Level Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	FAILCNT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	AL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	x*1	x*1	x*1	x*1	x*1	x*1	x*1	x*1

Note 1. Determined by PL value.

Bit	Symbol	Function	R/W
7:0	AL[7:0]	AL monitor Power-on reset initializes the AL to AL0. When the current device lifecycle is not OEM, AL is updated to the level corresponding to the device lifecycle. When the current device lifecycle is OEM: ● Without debugger connection: AL is updated to the same level as the PL ● With debugger connection: AL is updated to the same level as the PL only if PL is higher than AL The Renesas firmware updates the AL in Boot mode when the debug authentication is successful. The Renesas firmware updates the AL to a lower level in Boot mode regardless of authentication status. A debugger disconnection updates the AL to the same level as the PL. When FAILCNT[1:0] = 11, AL[7:0] stops updating (it is controlled by software). 0x00: AL0 0x05: AL1 0xA5: AL2	R/W
29:8	—	These bits are read as 0. The write value should be 0.	R/W
31:30	FAILCNT[1:0]	Number of times responding to incorrect response data 0 0: No responding to incorrect response data 0 1: First time of responding to incorrect response data 1 0: Second time of responding to incorrect response data 1 1: Third time of responding to incorrect response data	R/W

Note: S-TYPE-5
P-TYPE-5

Note:
- When CDBGPWRUPREQ changes from 1 to 0, the AL value is initialized to PL value
- Exiting from Boot mode when DBGPWRUPREQ = 0 also initializes the AL value
- Only accessible in Boot mode.

The ALCTRL register monitors the Authentication Level.

2.9.5.8 FSBLSTAT : First Stage Boot Loader Status Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x200

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	FSBLCLK[2:0]			—	—	—	—	—	—	RS	CS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS	FSBL completion status 0: FSBL is executing 1: FSBL execution is complete	R/W
1	RS	FSBL result status 0: FSBL failed 1: FSBL passed	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
10:8	FSBLCLK[2:0]	System clock frequency selection during FSBL execution The selection reflects the value of FSBLCTRL0.FSBLCLK[2:0]. FSBLCTRL0 specifications are described in section 7, Option-Setting Memory.	R
31:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-5

The FSBLSTAT register notifies FSBL completion to the debugger.

This register is initialized by a system reset and is accessible only while FSBL is executing.

2.9.5.9 TRPORTSZ : Trace Port Size Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x038

Bit position:	31 ... 0
Bit field:	PORTSIZE[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
31:0	PORTSIZE[31:0]	Indicates how many pins of TRACEDATA are available. Only set 1 bit to this register, all others must be 0. Writing value with more than 1 bit set can cause Unpredictable behavior. The value set to this register must be the same as the value setting for CoreSight TPIU.CPSR register. Writing different value can cause Unpredictable behavior. Bit N is set: N + 1 bit(s) of TRACEDATA is supported (N = 0 to 31).	R/W

Note: S-TYPE-5
P-TYPE-2

Note: The setting of the register is valid only if any of the following conditions apply:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1
- OFS1.SWDBG is 0 and DBGAUTH0.DBGEN1 or DBGAUTH0.NIDEN1 is 1.

The TRPORTSZ register controls how many pins of trace data are used.

2.9.5.10 DBGNVMCR : Debug Non-volatile Memory Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x050

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NVMWE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NVMWE	Non-volatile memory write enable 0: MRAM write is not allowed 1: MRAM write is allowed	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-2

Note: NVMWE is valid only when CPU is in halted state

2.9.5.11 CoreSight Component Registers

DBGREG has CoreSight Component registers defined in ARM® CoreSight™ Architecture. Table 2.27 shows a list of DBGREG CoreSight Component registers.

Table 2.27 CoreSight Component registers of DBGREG

Name	Address	Access size	R/W	Initial value
PID4	0x4001_BFD0	32-bit	Read-only	0x00000004
PID5	0x4001_BFD4	32-bit	Read-only	0x00000000
PID6	0x4001_BFD8	32-bit	Read-only	0x00000000
PID7	0x4001_BFDC	32-bit	Read-only	0x00000000
PID0	0x4001_BFE0	32-bit	Read-only	0x00000005
PID1	0x4001_BFE4	32-bit	Read-only	0x00000030
PID2	0x4001_BFE8	32-bit	Read-only	0x0000000A
PID3	0x4001_BFEC	32-bit	Read-only	0x00000000
CID0	0x4001_BFF0	32-bit	Read-only	0x0000000D
CID1	0x4001_BFF4	32-bit	Read-only	0x000000F0
CID2	0x4001_BFF8	32-bit	Read-only	0x00000005
CID3	0x4001_BFFC	32-bit	Read-only	0x000000B1

2.9.6 OCDREG

OCDREG is a register module provided for OCD (On-Chip Debug) Emulator functionalities. OCDREG is implemented as a CoreSight compliant component. Table 2.28 shows a list of OCDREG registers.

Note: Accesses to OCDREG from CPU and other bus masters is only permitted by privileged access, and one of the following conditions must be satisfied:

- Debugger is connected

- Self-hosted debug is enabled.

Accesses to OCDREG from external debug through APB-AP is permitted by either privileged access or unprivileged access.

Base address:

- CPU 0x4001_1000 (Secure), 0x5001_1000 (Non-Secure)
- OCD: 0x8001_1000

Table 2.28 OCDREG registers list

Name		DAP Port	OCD address	CPU address	Access size	R/W
MCU Status Register*1	MCUSTAT	Port 1	0x8000_0400	Cannot be accessed from CPU	32-bit	Read-only
MCU Error Status Register	MCUERRSTAT	Port 1	0x8001_1000	0x4001_1000 0x5001_1000	32-bit	Read-only
MCU Control Register	MCUCTRL	Port 1	0x8001_1004	0x4001_1004 0x5001_1004	32-bit	Read/Write
JTAG Boot Mode Entry Register	JBMDR	Port 1	0x8001_1100	0x4001_1100 0x5001_1100	32-bit	Read/Write
JTAG Boot Receive Data Register	JBRDR	Port 1	0x8001_1120	0x4001_1120 0x5001_1120	32-bit	Read/Write
JTAG Boot Transmit Data Register	JBTDR	Port 1	0x8001_1130	0x4001_1130 0x5001_1130	32-bit	Read/Write
JTAG Boot Status Register	JBSTR	Port 1	0x8001_1140	0x4001_1140 0x5001_1140	32-bit	Read/Write
JTAG Boot Interrupt Control Register	JBICR	Port 1	0x8001_1150	0x4001_1150 0x5001_1150	32-bit	Read/Write
First Stage Boot Loader Status Monitor Register	FSBLSTATM	Port 1	0x8001_1300	0x4001_1300 0x5001_1300	32-bit	Read-only

Note: Do not write to MCUCTRL using JTAG/SWD while the CPU is accessing MCUCTRL, JBMDR, JBRDR, JBTDR, and JBICR.
Do not write to JBMDR using JTAG/SWD except during RES pin reset.
Do not write to JBRDR using JTAG/SWD while the CPU is accessing MCUCTRL, JBMDR, JBRDR, JBTDR, and JBICR.
Do not write to JBTDR using JTAG/SWD.
Do not write to JBSTR using JTAG/SWD.
Do not write to JBICR using JTAG/SWD.

Note 1. See section 2.9.6.1. MCUSTAT : MCU Status Register.

2.9.6.1 MCUSTAT : MCU Status Register

Address: 0x8000_0400

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	AP[1:0]		—	—	—	—	—	—	—	DSTBY3	DSTBY2	DSTBY1	—	—	STBY2	—
Value after reset:	0	x	0	0	0	0	0	0	0	x	x	x	0	0	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	AL[1:0]		—	—	—	SECEXT	—	—	—	CPU1STOPCLK	CPU1SLEEP	CPU0STOPCLK	CPU0SLEEP	—
Value after reset:	1	0	0	0	0	0	0	1	0	0	0	x	x	x	x	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0.	R
1	CPU0SLEEP	Indicates CPU0 is in Sleep mode. 0: CPU0 is not in Sleep mode 1: CPU0 is in Sleep mode	R

Bit	Symbol	Function	R/W
2	CPU0STOPCLK	0: CPU0 clock is not stopped. It indicates that the CPU0 is in Normal or Sleep mode. 1: CPU0 clock is stopped. It indicates that the CPU0 is in Deep Sleep, Or the MCU is in Software Standby mode or Deep Software Standby power mode.	R
3	CPU1SLEEP	Indicates CPU1 is in Sleep mode. 0: CPU1 is not in Sleep mode 1: CPU1 is in Sleep mode	R
4	CPU1STOPCLK	0: CPU1 clock is not stopped. It indicates CPU1 is in Normal or Sleep mode. 1: CPU1 clock is stopped. It indicates CPU1 is in Deep Sleep, or the MCU is in Software Standby mode or Deep Software Standby power mode.	R
7:5	—	These bits are read as 0.	R
8	SECEXT	This bit is read as 1. 0: Secure debug is not supported 1: Secure debug is supported	R
11:9	—	These bits are read as 0.	R
13:12	AL[1:0]	Authentication Level monitor 0x0: AL0 0x1: AL1 0x3: AL2	R
14	—	This bit is read as 0.	R
15	—	This bit is read as 1.	R
16	—	The read value is undefined.	R
17	STBY2	Indicates the MCU is in Software Standby mode. 0: MCU is not in Software Standby mode 1: MCU is in Software Standby mode	R
19:18	—	These bits are read as 0.	R
20	DSTBY1	Indicates the MCU is in Deep Software Standby 1 mode. 0: MCU is not in Deep Software Standby 1 mode 1: MCU is in Deep Software Standby 1 mode	R
21	DSTBY2	Indicates the MCU is in Deep Software Standby 2 mode. 0: MCU is not in Deep Software Standby 2 mode 1: MCU is in Deep Software Standby 2 mode	R
22	DSTBY3	Indicates the MCU is in Deep Software Standby 3 mode. 0: MCU is not in Deep Software Standby 3 mode 1: MCU is in Deep Software Standby 3 mode	R
29:23	—	These bits are read as 0.	R
31:30	AP[1:0]	Indicates which access ports are available. An external host must check AP[1:0] and must not access AP that is unavailable because unavailable AP cannot respond. 0 0: AP0 and AP1 are available 0 1: AP0, AP1 and AP2 are available	R

Note: MCUSTAT register address is independent of OCDREG space. Only OCD emulator can access this register.

The MCUSTAT register indicates MCU status and authentication status. All bits in the register are monitoring bits so cannot be reset. The register has no security protection.

2.9.6.2 MCUERRSTAT : MCU Error Status Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ZERO
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ZERO	Zeroization status flag 0: Zeroization caused by tamper detection has not been performed 1: Zeroization caused by tamper detection has been performed	R
31:1	—	These bits are read as 0.	R

Note: S-TYPE-5
P-TYPE-2

The MCUERRSTAT register indicates the error status of the MCU caused by tamper attack. All bits in the register are monitoring bits so cannot be reset. The register has no security protection.

2.9.6.3 MCUCTRL : MCU Control Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUWAIT1	CPUWAIT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EDBGRQ1	EDBGRQ0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EDBGRQ0	External Debug Request for CPU0. Writing 1 to the bit causes CPU Halt or Debug Monitor exception request. 0: Not request debug event 1: Request debug event	R/W
1	EDBGRQ1	External Debug Request for CPU1. Writing 1 to the bit causes CPU Halt or Debug Monitor exception request. 0: Not request debug event 1: Request debug event	R/W
15:2	—	These bits are read as 0. The write value should be 0.	R/W
16	CPUWAIT0	CPU0 WAIT SETTING. Write 1 to assert CPUWAIT0, write 0 to deassert CPUWAIT0. 0: Clear CPUWAIT0 to low 1: Set CPUWAIT0 to high	R/W

Bit	Symbol	Function	R/W
17	CPUWAIT1	CPU1 WAIT SETTING. Write 1 to assert CPUWAIT1, write 0 to deassert CPUWAIT1. 0: Clear CPUWAIT1 to low 1: Set CPUWAIT1 to high	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

Note: This register is valid only when any of the following conditions are true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1.SWDBG is 0, and DBGAUTH0.DBGEN0 is 1
- OFS1.SWDBG is 0, and DBGAUTH0.DBGEN1 is 1.
  When none of the above conditions are true, the MCU ignores this register setting and regards all bits as 0.

Note: S-TYPE-5
P-TYPE-2

The MCUCTRL register provides external debugger ability to wake up system from low power state, and ability to enter debug state by external event.

2.9.6.4 Authentication Control Registers

Authentication registers accessible from the debugger are placed in OCDREG.

2.9.6.4.1 JBMDR : JTAG Boot Mode Entry Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	KEY							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	KEY	Mode entry key Pin reset releases after 0xA5 is set, then system enters the JTAG boot mode. MDSR.JBOTS = 1 when system transitions to JTAG boot mode. Setting this value does not have any effect when debugger is not connected.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-2

The JBMDR register sets command from the debugger.

This register is initialized by the debugger disconnection.

2.9.6.4.2 JBRDR : JTAG Boot Receive Data Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x120

Bit position:	31																															0
Bit field:	RDAT[31:0]																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	RDAT[31:0]	Received data register R/W is possible for both the external host and CPU, but the following usage is recommended: W: External host R: CPU (Boot Firmware) When JBSTR.RDF = 1, write is not possible and an error occurs.	R/W

Note: S-TYPE-5
P-TYPE-2

The JBRDR register is used for receiving data from the debugger.

2.9.6.4.3 JBTDR : JTAG Boot Transmit Data Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x130

Bit position:	31 … 0
Bit field:	TDAT[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	TDAT[31:0]	Transmitted data register R/W is possible for both the external host and CPU, but the following usage is recommended: W: CPU (Boot Firmware) R: External host When JBSTR.TDE = 1, read is not possible and an error occurs.	R/W

Note: S-TYPE-5
P-TYPE-2

The JBTDR register is used for transmitting data from the debugger.

2.9.6.4.4 JBSTR : JTAG Boot Status Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x140

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDE	RDF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	RDF	Receive buffer full [Set conditions] • Write access to JBRDR • Write 1 to JBSTR.RDF [Clear conditions] • Read access to JBRDR • Write 0 to JBSTR.RDF 0: No receiving data 1: There is receiving data	R/W

Bit	Symbol	Function	R/W
1	TDE	Transmit data empty [Set conditions] ● Read access to JBTDR ● Write 1 to JBSTR.TDE [Clear conditions] ● Write access to JBTDR ● Write 0 to JBSTR.TDE 0: There is data transmission 1: No data transmission	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-2

The JBSTR register is used for monitoring boot status.

2.9.6.4.5 JBICR : JTAG Boot Interrupt Control Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x150

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDFIE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RDFIE	Receive buffer full interrupt enabled. 0: Interrupt request disabled by RDF = 1 1: Enable interrupt request by RDF = 1	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5
P-TYPE-2

The JBICR register is used for controlling interrupt during JTAG boot.

2.9.6.4.6 FSBLSTATM : First Stage Boot Loader Status Monitor Register

Base address: CPU_OCD = 0x4001_1000
CPU_OCD_NS = 0x5001_1000

Offset address: 0x300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RS	CS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS	FSBL completion status 0: FSBL is not complete 1: FSBL is complete	R
1	RS	FSBL result status 0: FSBL failed 1: FSBL passed	R
31:2	—	These bits are read as 0.	R

Note: S-TYPE-5
P-TYPE-2

The FSBLSTATM register is mirror of the FSBLSTAT register.

2.9.6.5 CoreSight Component Registers

OCDREG has CoreSight Component registers defined in ARM® CoreSight™ Architecture. Table 2.29 shows a list of OCDREG CoreSight Component registers.

See reference [6] ARM Limited., Arm(R) CoreSight Architecture Specification (ARM IHI 0029D) for the detail of each register.

Table 2.29 CoreSight Component registers of OCDREG

Name	Address	Access size	R/W	Initial value
PID4	0x8001_1FD0	32-bit	Read-only	0x00000004
PID5	0x8001_1FD4	32-bit	Read-only	0x00000000
PID6	0x8001_1FD8	32-bit	Read-only	0x00000000
PID7	0x8001_1FDC	32-bit	Read-only	0x00000000
PID0	0x8001_1FE0	32-bit	Read-only	0x00000004
PID1	0x8001_1FE4	32-bit	Read-only	0x00000030
PID2	0x8001_1FE8	32-bit	Read-only	0x0000000A
PID3	0x8001_1FEC	32-bit	Read-only	0x00000000
CID0	0x8001_1FF0	32-bit	Read-only	0x0000000D
CID1	0x8001_1FF4	32-bit	Read-only	0x000000F0
CID2	0x8001_1FF8	32-bit	Read-only	0x00000005
CID3	0x8001_1FFC	32-bit	Read-only	0x000000B1

Note: S-TYPE-5
P-TYPE-2

2.10 CoreSight Cross Trigger Interface

Table 2.30 Cross Trigger Interface (1 of 2)

Number of CTI channel	CTITRIGIN		CTITRIGOUT	
CTI	0	ETF ACQCOMP	0	TPIU FLUSHIN
	1	ETF FULL	1	TPIU TRIGIN
	2	—	2	ETF FLUSHIN
	3	—	3	ETF TRIGIN
	4	—	4	—
	5	—	5	—
	6	—	6	—
	7	—	7	—

Table 2.30 Cross Trigger Interface (2 of 2)

Number of CTI channel	CTITRIGIN		CTITRIGOUT	
CTI0	0	Processor Halted	0	Processor debug request
	1	DWT Comparator Output 0	1	Processor Restart
	2	DWT Comparator Output 1	2	CTIIRQ[0] (Connected to ICU0)
	3	DWT Comparator Output 2	3	CTIIRQ[1] (Connected to ICU0)
	4	ETM Event Output 0	4	ETM Event Input 0
	5	ETM Event Output 1	5	ETM Event Input 1
	6	—	6	ETM Event Input 2
	7	—	7	ETM Event Input 3
CTI1	0	Processor Halted	0	Processor debug request
	1	DWT Comparator Output 0	1	Processor Restart
	2	DWT Comparator Output 1	2	CTIIRQ[0] (Connected to ICU1)
	3	DWT Comparator Output 2	3	CTIIRQ[1] (Connected to ICU1)
	4	ETM Event Output 0	4	ETM Event Input 0
	5	ETM Event Output 1	5	ETM Event Input 1
	6	—	6	ETM Event Input 2
	7	—	7	ETM Event Input 3

The MCU supports processor CTI0/CTI1 and CoreSight Common CTI which is implemented in Debug module. The ICU setting is necessary when CTIIRQ is used.

2.11 CoreSight ATB Funnel

There is one CoreSight ATB Funnel in the MCU. The funnel has four ATB slaves and one ATB master, and it is used to select the debug trace sources from ETMn and ITMn to ETF. Figure 2.3 shows the CoreSight ATB connection in the MCU (n = 0, 1).

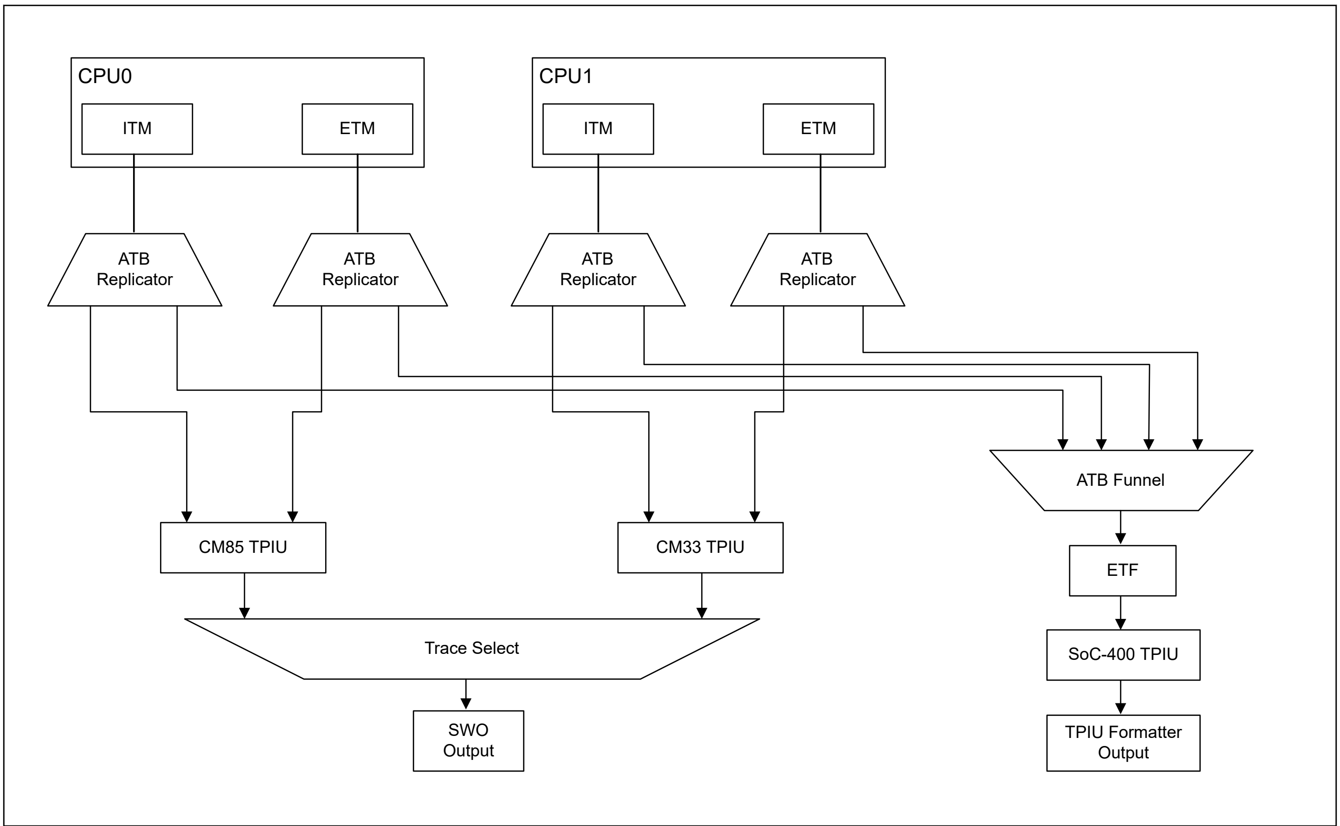

Figure 2.3 CoreSight ATB connection

Table 2.31 shows funnel ATB slave connection.

Table 2.31 ATB slave connection

ATB Slave No.	Connected Trace Source
#0	CPU0-ITM
#1	CPU0-ETM
#2	CPU1-ITM
#3	CPU1-ETM

See reference [4] ARM Limited., Arm(R) CoreSight SoC-400 Technical Reference Manual (ARM 0302-01 2nd release for r3p2) for the detail of ATB and Funnel.

2.12 SysTick System Timer

The MCU has two SysTick system timers for each CPUn (n = 0, 1), secure SysTick and non-secure SysTick.

The SysTick source is CPUCLKn or 1 MHz clock generated from the on-chip oscillator. When using 1 MHz clock generated from the on-chip oscillator for the SysTick source, the CPUCLKn frequency must be 2 MHz or higher (n = 0, 1).

2.13 CoreSight Timestamp Generator

The MCU has a CoreSight Timestamp Generator to provide timestamp to ITM and ETM for each CPUn (n = 0, 1).

The timestamp is generated by a 64-bit counter operating.

See reference [4] ARM Limited., Arm(R) CoreSight SoC-400 Technical Reference Manual (ARM 0302-01 2nd release for r3p2) for the detail.

2.14 OCD Emulator Connection

In this product, the MCU confirms access permission for MCU resources by checking current Authentication Level stored in OCDREG. There are two ways to control Authentication Level, through:

- JTAG/SWD. See Figure 2.4.
- Software. See Figure 2.5.

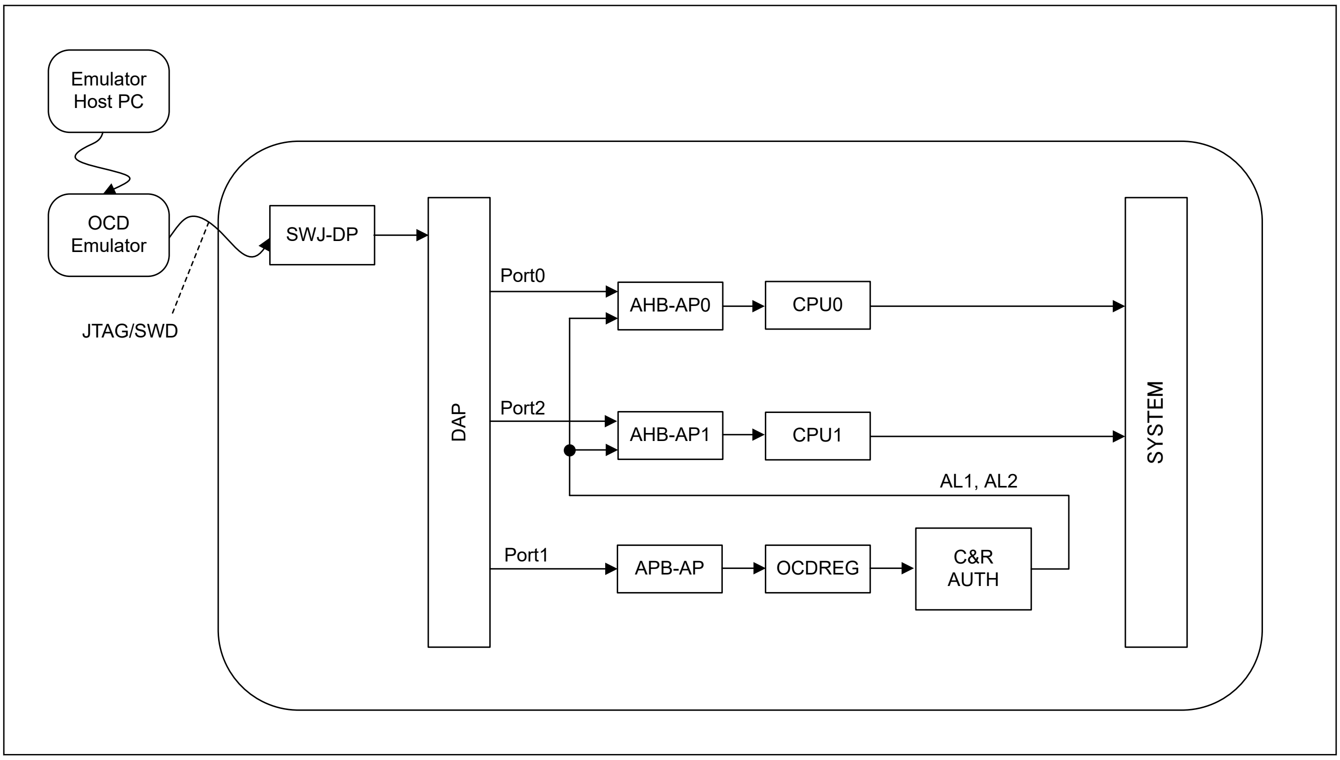

Figure 2.4 Using JTAG/SWD to control authentication level

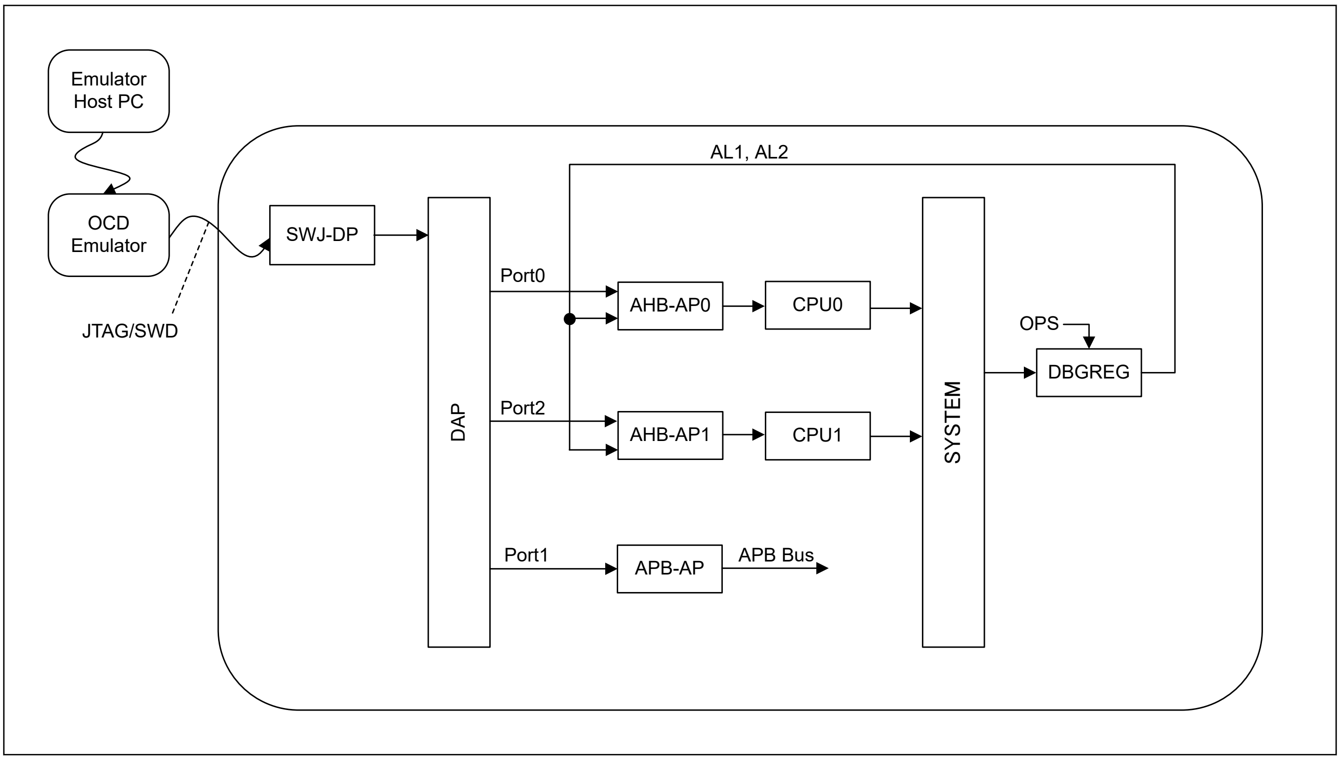

Figure 2.5 Using software to control authentication level

2.14.1 Restrictions in OCD Emulator Connecting

There are some restrictions regarding emulator access. This section describes the restrictions.

2.14.1.1 Starting Connection While in Low Power Mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal, Sleep mode or Deep Sleep mode. If the MCU is in Software Standby or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.14.1.2 Low Power Mode Change During Debugging

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-APn (n = 0, 1) is prohibited in Deep Sleep, Software Standby, Deep Software Standby mode. Only SWJ-DP, APB-AP and OCDREG can be accessed from OCD emulator in these modes. Table 2.32 shows the limitations.

Table 2.32 Limitations of SWJ-DP, APB-AP and OCDREG in low power mode

Current mode	Start OCD emulator connection	Change low power mode	Access AHB-APn (n = 0, 1) and system bus	Access APB-AP and OCDREG
Normal	Available	Available	Available	Available
Sleep	Available	Available	Available	Available
Deep Sleep	Available	Available	N/A	Available
Software Standby	N/A	Available	N/A	Available
Deep Software Standby	N/A	Available	N/A	Available

2.14.2 Connecting Sequence and JTAG/SWD Authentication

This section describes how to authenticate the MCU. section 2.14.2.1. JTAG/SWD Authentication Mechanism introduces which mechanism is used for authentication, and section 2.14.2.2. Connecting Sequence and JTAG/SWD Authentication provides steps for connecting sequence and authenticating the MCU using JTAG/SWD. See section 2.9.5. DBGREG and section 2.9.6. OCDREG for details about the registers control JTAG/SWD authentication.

2.14.2.1 JTAG/SWD Authentication Mechanism

The MCU supports challenge-response authentication using the boot firmware.

2.14.2.1.1 JTAG Boot Mode and Authentication Request

JTAG boot mode request is asserted if the debugger sets 0xA5 command to JBMDR while RES pin is asserted and MD pin is high when RES pin is deasserted. After entered JTAG boot mode, the debugger can issue authentication procedure by sending Authentication command to JBRDR register.

2.14.2.1.2 Auth Circuit

Auth circuit updates initial Authentication Level (AL) by Protection Level (PL).

When challenge-response authentication is complete, the authentication level is updated by the boot firmware

(1) Initial Authentication Level Update

Auth circuit updates initial authentication level by protection level.

Table 2.33 shows auth circuit update of initial authentication level.

Other than OEM, the initial authentication level is not dependent on the protection level.

Table 2.33 Auth circuit update of initial authentication level (1 of 2)

Input		Output
Lifecycle	Protection level	Authentication level
OEM	PL0	AL0
	PL1	AL1
	PL2	AL2
RMA_REQ	*	AL0

Table 2.33 Auth circuit update of initial authentication level (2 of 2)

Input		Output
Lifecycle	Protection level	Authentication level
RMA_ACK	*	AL2
RMA_RET	*	AL0
LCK_BOOT	*	AL0

(2) Authentication at Challenge-response Authentication

The boot firmware authenticates and writes authentication result to authentication control registers.

2.14.2.2 Connecting Sequence and JTAG/SWD Authentication

Challenge-response authentication

1. Assert RES pin by connecting the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus.
   In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register (CTRL/STAT), and then wait until CDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set boot mode request command (0xA5) to JBMDR and set MD pin to 1.
5. Negate RES pin.
6. Check MCUSTAT.AL:
   - If MCUSTAT.AL is higher than or equal to request AL, there is no need to authenticate. Go to step 11..
7. Set Authentication command to JBRDR.
8. Read challenge value from JBTDR.
9. Set the response data to JBRDR.
10. Read JBTDR and check MCUSTAT.AL.
    - If MCUSTAT.AL is not the same as the requested AL, authentication failed
    - If retry authentication: go to step 7..
11. Set up the AHB-APn to access the system address space. The AHB-APn is connected to DAP bus port 0, 2 (n = 0, 1).
12. Start accessing the CPU debug resources using the AHB-APn (n = 0, 1).

For CPU individual reset, FSBL is never executed.

For FSBL execution, IWDT and WDT0/1 function as the settings for OEM selected mode.

2.16 CM33 CACHE (C-Cache and S-Cache)

2.16.1 Overview

There are two types of caches:

- C-Cache on Cortex-M33 Code AHB interface (C-AHB)
- S-Cache on Cortex-M33 System AHB interface (S-AHB).

2.16.1.1 Specifications of Cache

Table 2.34 Specifications of cache

Item	C-Cache	S-Cache
Capacity	16 KB	16 KB
Way	4-way set associative	4-way set associative
Line size	256 bits	256 bits
Number of entry	128 entries/ways (4-way set associative)	128 entries/ways (4-way set associative)
Write way	Write-through/write-back Non write-allocate/write-allocate	Write-through/write-back Non write-allocate/write-allocate
Replace way	LRU	LRU
Error detection	ECC Data memory: SECDED Tag memory: SEDDED	ECC Data memory: SECDED Tag memory: SEDDED
Cache support area	0x0000_0000 – 0x1FFF_FFFF	0x2000_0000 – 0xDFFF_FFFF

Note: Transient, non-transient and shareability of memory attributes (set by Arm MPU) do not affect cache behavior.

2.16.1.2 Block Diagram

Figure 2.6 shows the block structure of cache.

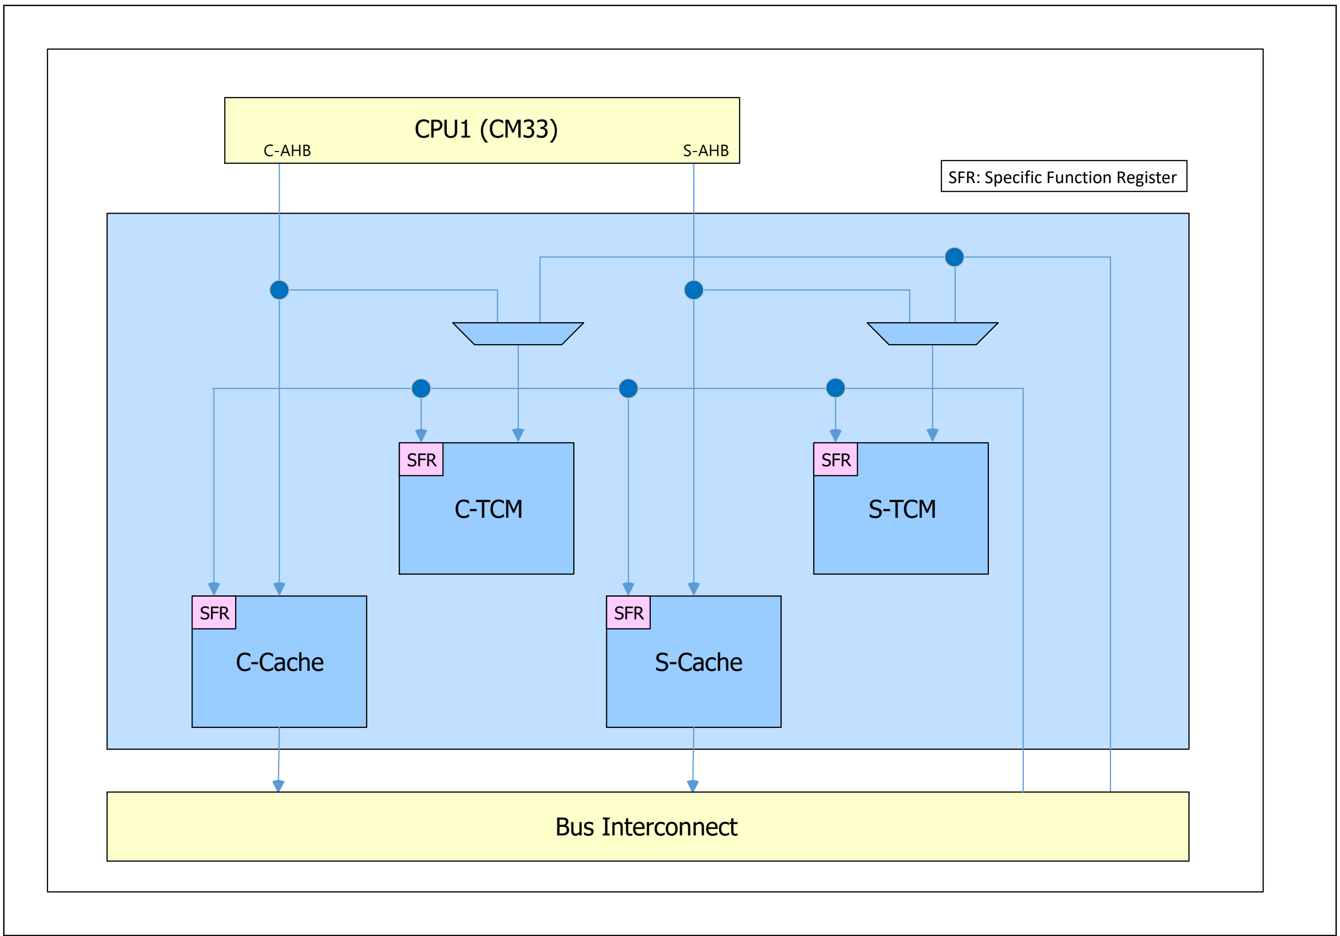

Figure 2.6 Cache block structure

Figure 2.7 shows the detailed cache structure.

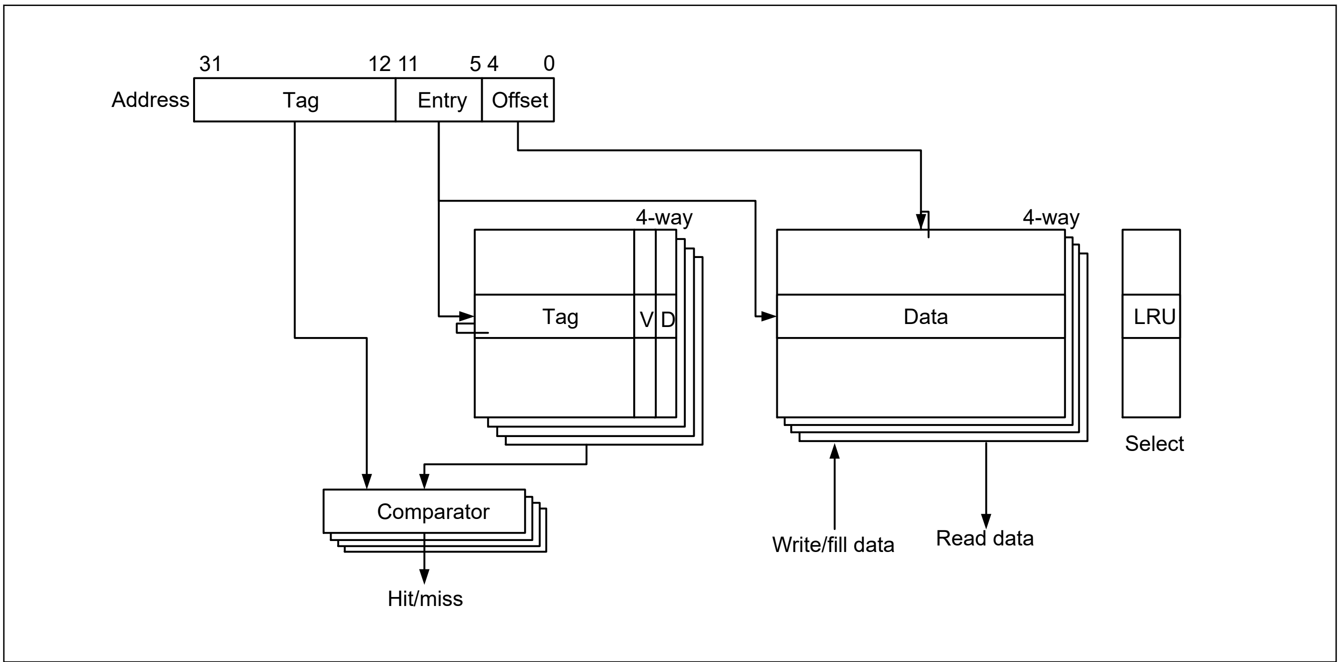

Figure 2.7 Detailed cache structure

Tag

Tag holds the cached address [31:12]. Tag also holds the ECC code for 32 bits with zero-extended address[31:12] and valid bit V.

Tag is cleared by the cache flush function.

V

V is a valid bit and exists in each cache line. It shows the validated data is stored in the cache line.

V bit is cleared by the cache flush function.

D

D is a dirty bit and exists in each cache line. It shows the validated data stored in the cache line is changed from the original value, and requires to be written back to bus.

Data

Data holds 256-bit data in each cache line.

LRU

LRU (Least Recently Used) is a way to replace each cache line.

Comparator

Comparator determines whether the data to be accessed is stored in the cache line.

If V is set and the address equals to the address stored in the tag, the cache determines the access is a hit. Otherwise, it is a miss. If there is an ECC error in the Hit tag memory line, it is treated as a miss.

2.16.2 Register List

Cache has registers which control the cache functions. Table 2.35 shows all the cache related registers.

Table 2.35 Register list

Register name	Symbol	Address (for secure/non-secure access)
Cache Security Attribution Register	CACHESAR	CPSCU_BASE + 0x500
C-Cache Control Register	CCACTL	CACHE_BASE + 0x000
C-Cache Flush Control Register	CCAFCT	CACHE_BASE + 0x004
C-Cache Write Attribute	CCAWTA	CACHE_BASE + 0x00C
C-Cache Error Detection Status	CCAEDST	CACHE_BASE + 0x010
C-Cache Test Access Address	CCATAA	CACHE_BASE + 0x014
C-Cache Test Access Data	CCATAD	CACHE_BASE + 0x018
S-Cache Control Register	SCACTL	CACHE_BASE + 0x040
S-Cache Flush Control Register	SCAFCT	CACHE_BASE + 0x044
S-Cache Write Attribute	SCAWTA	CACHE_BASE + 0x04C
S-Cache Error Detection Status	SCAEDST	CACHE_BASE + 0x050
S-Cache Test Access Address	SCATAA	CACHE_BASE + 0x054
S-Cache Test Access Data	SCATAD	CACHE_BASE + 0x058
Cache ECC Error Operation After Detection Register	CAPOAD	CACHE_BASE + 0x200
Cache Protection Register	CAPRCR	CACHE_BASE + 0x204

CPSCU_BASE (Base address of CPSCU) is 0x4000_8000 (Secure) or 0x5000_8000 (Non-secure).

CACHE_BASE (Base address of Cache) is 0x4001_C000 (Secure) or 0x5001_C000 (Non-secure).

2.16.3 Register Descriptions

2.16.3.1 CACHESAR : Cache Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x500

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	CACHEESA	—	CACHESA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CACHESA	Security attributes of registers for cache control 0: Secure 1: Non-Secure	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	CACHEESA	Security attributes of registers for cache error 0: Secure 1: Non-Secure	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-1
Privilege: P-TYPE-1
This register is write-protected by PRCR_S.PRC4.

Only Secure access can write to this register. Non-secure read access is allowed, non-secure write access is denied, and TrustZone access error is not generated.

CACHESA bit (Security attributes of registers for cache control)

Security attributes of registers for cache control. The target registers are as follows.

- CCACTL
- CCAWTA
- CCAEDST
- SCACTL
- SCAWTA
- SCAEDST

CACHEESA bit (Security attributes of registers for cache error)

Security attributes of registers for cache error. The target registers are as follows.

- CAPOAD
- CAPRCR

CACHESA and CACHEESA must be set to 0 when secure program/secure data is cacheable.

2.16.3.2 CCACTL : C-Cache Control Register

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	WB	FC	—	—	—	—	—	—	—	ENC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENC	C-cache enable bit Set C-Cache enable. 0: C-Cache disable 1: C-Cache enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	FC	C-Cache flush bit Set C-Cache line flush. 0: No action 1: C-Cache line flush (all lines invalidate)	R/W
9	WB	C-cache write-back Trigger to write back C-Cache. 0: No action 1: C-Cache write-back	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHESA)
Privilege: P-TYPE-2

ENC bit (C-cache enable bit)

The ENC bit controls the cache enable of C-Cache.

When C-Cache set to enable, whether it caches data or not depends on the access attribute setting for cacheable of CPU1.

FC bit (C-Cache flush bit)

The FC bit is an alias for CCAFCT.FC. See section 2.16.3.3. CCAFCT : C-Cache Flush Control Register for details.

WB bit (C-cache write-back)

The WB bit is an alias for CCAFCT.WB. See section 2.16.3.3. CCAFCT : C-Cache Flush Control Register for details.

2.16.3.3 CCAFCT : C-Cache Flush Control Register

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WB	FC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FC	C-Cache flush bit Set C-Cache line flush. 0: No action 1: C-Cache line flush (all lines invalidate)	R/W
1	WB	C-Cache write-back Trigger to write back C-Cache. 0: No action 1: C-Cache write-back	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-5
Privilege: P-TYPE-2

FC bit (C-Cache flush bit)

The FC bit controls the cache flush of C-Cache.

[Clearing condition]

- This bit is cleared automatically when a cache flush is completed.

[Setting condition]

- Writing 1 to this bit.

WB bit (C-Cache write-back)

The WB bit triggers a write-back of C-Cache.

[Clearing condition]

- This bit is cleared automatically when write back is completed.

[Setting condition]

- Writing 1 to this bit.

Note: Setting FC to 1 when CCAWTA.WT is 0 performs both write back and flush.

If flush or write back has already started (CCAFCT.FC = 1 or CCAFCT.WB = 1), CCAFCT and CCACTL cannot be written until CCAFCT.FC and CCAFCT.WB are cleared automatically, that is, the process completes.

Cache is disabled after reset.

Cache does not perform write back and flush cache memory automatically when cache is disabled or reset.

If there is a dirty line left in the cache while the cache is disabled, inconsistencies can occur between cache and memory.

To disable the cache, use the following procedure.

1. Write 0x0100 (if CCAWTA.WT = 1) or 0x0300 (if CCAWTA.WT = 0) to CCACTL.

2. Make sure that CCAFCT.FC and CCAFCT.WB are both 0.

To enable the cache after reset, use the following procedure.

1. Set CCAFCT.FC to 1 to flush cache memory.
2. Wait for the flush to complete until CCAFCT.FC is 0.
3. Set CCACTL.ENC to 1 to enable the cache.
4. Writing to CCACTL or CCAFCT after reset automatically flushes the cache.

To enable the cache after cache is disabled, use the following procedure.

1. Make sure CCAFCT.WB and CCAFCT.FC is 0, that is, the cache does not perform write back or flush.
2. Set CCACTL.ENC to 1 to enable the cache.

2.16.3.4 CCAWTA : C-Cache Write Attribute

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WA	WT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	WT	C-Cache write-through Setting the attribute of C-Cache for write-through or write-back. 0: Write-through or write-back depends on the cache attribute of the area 1: Always write-through mode	R/W
1	WA	C-Cache write-allocation Setting the attribute of C-Cache for write-allocation. 0: Always disable write-allocation 1: Write-allocation enable depends on the cache attribute of the area	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHESA)
Privilege: P-TYPE-2

WT bit (C-Cache write-through)

The WT bit specifies the write attribute of C-Cache for write-through or write-back.

C-Cache must be disabled (CCACTL.ENC = 0) when changing this bit value.

When WT is 0, the cache attribute is determined by the default memory map or MPU of the Cortex-M33 processor.

WA bit (C-Cache write-allocation)

The WA bit enables C-Cache write-allocation.

C-Cache must be disabled (CCACTL.ENC = 0) when changing this bit value.

2.16.3.5 CCAEDST : C-Cache Error Detection Status

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	EST2	ESTD	ESTC	ESD1	ESD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ESD0	C-Cache data error status 0 Indicates status of whether ECC 1-bit error was detected when reading C-Cache data memory. Write value must be 0. Writing 0 clears this status. 0: ECC 1-bit error was not detected 1: ECC 1-bit error was detected and corrected	R/W
1	ESD1	C-Cache data error status 1 Indicates status of whether ECC 2-bit error was detected when reading C-Cache data memory. Write value must be 0. Writing 0 clears this status. 0: ECC 2-bit error was not detected 1: ECC 2-bit error was detected	R/W
2	ESTC	C-Cache tag clean line invalidate status Indicates status of whether clean line was invalidated by ECC 1-bit error of C-Cache tag memory. Write value must be 0. Writing 0 clears this status. 0: Clean line was not invalidated 1: Clean line was invalidated	R/W
3	ESTD	C-Cache tag dirty line invalidate status Indicates status of whether dirty line was invalidated by ECC 1-bit error of C-Cache tag memory. Write value must be 0. Writing 0 clears this status. 0: Dirty line was not invalidated 1: Dirty line was invalidated	R/W
4	EST2	C-Cache tag 2-bit error status Indicates status of whether ECC 2-bit error was detected when reading C-Cache tag memory. Write value must be 0. Writing 0 clears this status. 0: ECC 2-bit error was not detected 1: ECC 2-bit error was detected	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHESA)
Privilege: P-TYPE-2

ESD0, ESD1 bit

These bits indicate the status of whether ECC errors were detected when reading C-Cache data memory.

Writing 0 clears this status. Resets other than Bus Error Reset or Memory Error Reset clear this status. If an error occurs and the status is cleared at the same time, the status is cleared, and the error is ignored.

ESTC, ESTD, EST2 bit

These bits indicate the status of whether uncorrectable ECC errors were detected when reading C-Cache tag memory.

ESTC : Invalidate clean line by ECC 1-bit error (correctable)

ESTD : invalidate dirty line by ECC 1-bit error (uncorrectable)

EST2 : Detect ECC 2-bit error (uncorrectable)

Writing 0 clears this status. If an error occurs and the status is cleared at the same time, the status is cleared, and the error is ignored.

If ESTD is 1, dirty line is invalidated without write back.

2.16.3.6 CCATAA : C-Cache Test Access Address

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	WAY[1:0]		—	—	—	—	—	—	RW	—	—	—	—	TARGET[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ENTRY[6:0]							OFFSET[2:0]			—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
4:2	OFFSET[2:0]	Address offset C-Cache test access address lower 3 bits [4:2] corresponds to upper 3 bits of 5-bit offset [4:0]. These bits are valid when cache data read/write and ECC code read/write.	R/W
11:5	ENTRY[6:0]	Address entry C-Cache test access address middle 7 bits [11:5] corresponds to entry.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
18:16	TARGET[2:0]	Access target These bits specify the C-Cache test access target. Access type is specified by bit RW[23]. 0 0 0: Cache data read or write 0 0 1: Data ECC code read or write 0 1 0: Tag, V, D read or write 0 1 1: LRU read or write 1 0 0: Tag ECC code read or write 1 0 1 - 1 1 1: Setting prohibited	R/W
22:19	—	These bits are read as 0. The write value should be 0.	R/W
23	RW	Read write This bit specifies whether C-Cache test access type is read or write. 0: Read 1: Write	R/W
29:24	—	These bits are read as 0. The write value should be 0.	R/W
31:30	WAY[1:0]	Address way C-Cache test access address higher 2 bits corresponds to way. These bits are valid when cache data/ecc code/tag read/write. These bits are invalid when LRU read/write.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

WAY[1:0], ENTRY[6:0], OFFSET[2:0] bit

These bits indicate the address for C-Cache test access.

WAY[1:0], ENTRY[6:0], OFFSET[2:0] are valid for ECC code/cache data read or write.

WAY[1:0], ENTRY[6:0] are valid, and OFFSET[2:0] is invalid for Tag and Tag ECC code read or write.

ENTRY[6:0] is valid and WAY[1:0], OFFSET[2:0] are invalid for LRU read or write.

TARGET[2:0] bits (Access target)

These bits specify the C-Cache test access target. The truth table is below.

RW bit (Read write)

The RW bit specifies whether C-Cache test access type is read or write. The truth table is below.

CCATAA.RW[23]	CCATAA.TARGET[18:16]	Command
0	000	Cache data read
1	000	Cache data write
0	001	Data ECC code read
1	001	Data ECC code write
0	010	Tag read
1	010	Tag write
0	011	LRU read
1	011	LRU write
0	100	Tag ECC code read
1	100	Tag ECC code write

Writing to CCATAA register triggers the test access. During test access writing, write to register CCATAD before writing to register CCATAA. During test access reading, read register CCATAD after writing to register CCATAA.

To perform read access, follow these steps:

1. Write to CCATAA with CCATAA.RW = 0.
2. Read CCATAA to check.
3. Read CCATAD.

To perform write access, follow these steps:

1. Write to CCATDA.
2. Write to CCATAA with CCATAA.RW = 1.

If CCATAD register is updated by the test access reading and the CCATAD register is written at the same time, CCATAD register update by the test access reading is ignored and CCATAD register is written.

2.16.3.7 CCATAD_DATA : C-Cache Test Access Data (DATA)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DATA[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DATA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	DATA[31:0]	C-Cache test access data These bits are valid when C-Cache test access cache data read/write (CCATAA[18:16] = 000).	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

DATA[31:0] bits

These bits indicate each data when C-Cache test access.

Which bits are valid depends on the type of C-Cache test access.

C-Cache test access should be done with C-Cache turned off (CCACTL.ENC = 0).

If CCATAD register is updated by the test access reading and the CCATAD register is written at the same time, CCATAD register update by the test access reading is ignored and CCATAD register is written.

2.16.3.8 CCATAD_ECC : C-Cache Test Access Data (ECC)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	ECC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	ECC[6:0]	C-Cache test access ECC code These bits are valid when C-Cache test access data ECC code of cache data read/write (CCATAA[18:16] = 001).	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

ECC[6:0] bits

The ECC[6:0] bits indicate each data when C-Cache test access.

Which bits are valid depends on the type of C-Cache test access.

C-Cache test access should be done with C-Cache turned off (CCACTL.ENC = 0).

If CCATAD register is updated by the test access reading and the CCATAD register is written at the same time, CCATAD register update by the test access reading is ignored and CCATAD register is written.

2.16.3.9 CCATAD_TAG : C-Cache Test Access Data (TAG)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	TAG[19:4]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TAG[3:0]				—	—	—	—	—	—	—	—	—	—	V	D
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D	C-Cache test access Dirty This bit is valid when C-Cache test access Tag, V, D read/write (CCATAA[18:16] = 010).	R/W
1	V	C-Cache test access Valid This bit is valid when C-Cache test access Tag, V, D read/write (CCATAA[18:16] = 010).	R/W
11:2	—	These bits are read as 0. The write value should be 0.	R/W
31:12	TAG[19:0]	C-Cache test access Tag data These bits are valid when C-Cache test access Tag, V, D read/write (CCATAA[18:16] = 010).	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

TAG[19:0], V, D bits

These bits indicate each data when C-Cache test access.

Which bits are valid depends on the type of C-Cache test access.

C-Cache test access should be done with C-Cache turned off (CCACTL.ENC = 0).

If CCATAD register is updated by the test access reading and the CCATAD register is written at the same time, CCATAD register update by the test access reading is ignored and CCATAD register is written.

2.16.3.10 CCATAD_LRU : C-Cache Test Access Data (LRU)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	LRU[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	LRU[4:0]	C-Cache test access LRU data These bits are valid when C-Cache test access LRU read/write (CCATAA[18:16] = 011).	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

LRU[4:0] bits

The LRU[4:0] bits indicate each data when C-Cache test access.

Which bits are valid depends on the type of C-Cache test access.

C-Cache test access should be done with C-Cache turned off (CCACTL.ENC = 0).

If CCATAD register is updated by the test access reading and the CCATAD register is written at the same time, CCATAD register update by the test access reading is ignored and CCATAD register is written.

2.16.3.11 CCATAD_TAGECC : C-Cache Test Access Data (TAGECC)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	TAG ECC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	TAG ECC[6:0]	C-Cache test access Tag ECC code These bits are valid when C-Cache test access Tag ECC code read/write (CCATAA[18:16] = 100).	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

TAG ECC[6:0] bits (C-Cache test access Tag ECC code)

These bits indicate each data when C-Cache test access.

Which bits are valid depends on the type of C-Cache test access.

C-Cache test access should be done with C-Cache turned off (CCACTL.ENC = 0).

If CCATAD register is updated by the test access reading and the CCATAD register is written at the same time, CCATAD register update by the test access reading is ignored and CCATAD register is written.

2.16.3.12 SCACTL : S-Cache Control Register

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	WB	FS	—	—	—	—	—	—	—	ENS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENS	S-Cache enable bit Set S-Cache enable. 0: S-Cache disable 1: S-Cache enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	FS	S-Cache flush bit Set S-Cache line flush. 0: No action 1: S-Cache line flush (all lines invalidate)	R/W
9	WB	S-Cache write-back Trigger to write back S-Cache. 0: No action 1: S-Cache write-back	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHESA)
Privilege: P-TYPE-2

ENS bit (S-Cache enable bit)

The ENS bit controls the cache enable of S-Cache.

When S-Cache set to enable, whether it caches the data or not depends on the access attribute setting of cacheable for CPU1.

FS bit (S-Cache flush bit)

The FS bit is an alias for SCAFCT.FS. See section 2.16.3.13. SCAFCT : S-Cache Flush Control Register for details.

WB bit (S-Cache write-back)

The WB bit is an alias for SCAFCT.WB. See section 2.16.3.13. SCAFCT : S-Cache Flush Control Register for details.

2.16.3.13 SCAFCT : S-Cache Flush Control Register

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x044

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WB	FS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FS	S-Cache flush bit Set S-Cache line flush. 0: No action 1: S-Cache line flush (all lines invalidate)	R/W
1	WB	S-Cache write-back Trigger to write back S-Cache. 0: No action 1: S-Cache write-back	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-5
Privilege: P-TYPE-2

FS bit (S-Cache flush bit)

The FS bit controls the cache flush of S-Cache.

[Clearing condition]

- This bit is cleared automatically when a cache flush is completed.

[Setting condition]

- Writing 1 to this bit.

WB bit (S-Cache write-back)

The WB bit triggers a write-back of S-Cache.

[Clearing condition]

- This bit is cleared automatically when write back is completed.

[Setting condition]

- Writing 1 to this bit.

Note: Setting FS to 1 when SCAWTA.WT is 0 performs both write back and flush.

If flush or write back has already started (SCAFCT.FS = 1 or SCAFCT.WB = 1), SCAFCT and SCACTL cannot be written until SCAFCT.FS and SCAFCT.WB are cleared automatically, that is, the process completes.

Cache is disabled after reset.

Cache does not write back and flush cache memory automatically when cache is disabled or reset.

If there is a dirty line left in the cache while cache is disabled, inconsistencies can occur between the cache and memory.

To disable the cache, use the following procedure.

1. Write 0x0100 (if SCAWTA.WT = 1) or 0x0300 (if SCAWTA.WT = 0) to SCACTL.

2. Make sure that SCAFCT.FC and SCAFCT.WB are both 0.

To enable the cache after reset, use the following procedure.

1. Set SCAFCT.FS to 1 to flush cache memory.
2. Wait for the flush to complete until SCAFCT.FS is 0.
3. Set SCACTL.ENS to 1 to enable the cache.
4. Writing to SCACTL or SCAFCT after reset automatically flushes the cache.

To enable the cache after cache is disabled, use the following procedure.

1. Make sure SCAFCT.WB and SCAFCT.FS is 0, that is, the cache does not perform write back or flush.
2. Set SCACTL.ENS to 1 to enable the cache.

2.16.3.14 SCAWTA : S-Cache Write Attribute

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x04C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WA	WT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	WT	S-Cache write-through Setting the attribute of S-Cache for write-through or write-back. 0: Write-through or write-back depends on the cache attribute of the area 1: Always write-through mode	R/W
1	WA	S-Cache write-allocation Setting the attribute of S-Cache write-allocation. 0: Always disable write-allocation 1: Write-allocation enable depends on the cache attribute of the area	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R

Note: Security: S-TYPE-3 (CACHESAR.CACHESA)
Privilege: P-TYPE-2

WT bit (S-Cache write-through)

The WT bit specifies the write attribute of S-Cache for write-through or write-back.

S-Cache must be disabled (SCACTL.ENS = 0) when changing this bit value.

When WT is 0, the cache attribute is determined by the default memory map or MPU of the Cortex-M33 processor.

WA bit (S-Cache write-allocation)

The WA bit enables S-Cache write-allocation.

S-Cache must be disabled (SCACTL.ENS = 0) when changing this bit value.

2.16.3.15 SCAEDST : S-Cache Error Detection Status

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x050

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	EST2	ESTD	ESTC	ESD1	ESD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ESD0	S-Cache data error status 0 Indicates status of whether ECC 1-bit error was detected when reading S-Cache data memory. Write value must be 0. Writing 0 clears this status. 0: ECC 1-bit error was not detected 1: ECC 1-bit error was detected, and corrected	R/W
1	ESD1	S-Cache data error status 1 Indicates status of whether ECC 2-bit error was detected when reading S-Cache data memory. Write value must be 0. Writing 0 clears this status. 0: ECC 2-bit error was not detected 1: ECC 2-bit error was detected	R/W
2	ESTC	S-Cache Tag clean line invalidate status Indicates status of whether clean line was invalidated by ECC 1-bit error of S-Cache tag memory. Write value must be 0. Writing 0 clears this status. 0: Clean line was not invalidated 1: Clean line was invalidated	R/W
3	ESTD	S-Cache Tag dirty line invalidate status Indicates status of whether dirty line was invalidated by ECC 1-bit error of S-Cache tag memory. Write value must be 0. Writing 0 clears this status. 0: Dirty line was not invalidated 1: Dirty line was invalidated	R/W
4	EST2	S-Cache Tag 2-bit error status Indicates status of whether ECC 2-bit error was detected when reading S-Cache tag memory. Write value must be 0. Writing 0 clears this status. 0: ECC 2-bit error was not detected 1: ECC 2-bit error was detected	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHESA)
Privilege: P-TYPE-2

ESD0, ESD1

These bits indicate the status of whether ECC errors were detected when reading S-Cache data memory.

Writing 0 clears this status. Resets other than Bus Error Reset or Memory Error Reset clear this status. If an error occurs and the status is cleared at the same time, the status is cleared, and the error is ignored.

ESTC, ESTD, EST2

These bits indicate the status of whether uncorrectable ECC error were detected when reading S-Cache tag memory.

ESTC : Invalidate clean line by ECC 1-bit error (correctable)

ESTD : Invalidate dirty line by ECC 1-bit error (uncorrectable)

EST2 : Detect ECC 2-bit error (uncorrectable)

Writing 0 clears this status. If an error occurs and the status is cleared at the same time, the status is cleared, and the error is ignored.

If ESTD is 1, dirty line is invalidated without write back.

2.16.3.16 SCATAA : S-Cache Test Access Address

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x054

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	WAY[1:0]		—	—	—	—	—	—	RW	—	—	—	—	TARGET[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ENTRY[6:0]							OFFSET[2:0]			—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
4:2	OFFSET[2:0]	Address offset S-Cache test access address lower 3-bit [4:2] corresponds to upper 3-bit of 5-bit offset [4:0]. These bits are valid when cache data read/write and ECC code read/write.	R/W
11:5	ENTRY[6:0]	Address entry S-Cache test access address middle 7-bit [11:5] corresponds to entry.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
18:16	TARGET[2:0]	Access target These bits specify the S-Cache test access target. Access type is specified by bit RW[23]. 0 0 0: Cache data read or write 0 0 1: Data ECC code read or write 0 1 0: Tag, V, D read or write 0 1 1: LRU read or write 1 0 0: Tag ECC code read or write 1 0 1 - 1 1 1: Setting prohibited	R/W
22:19	—	These bits are read as 0. The write value should be 0.	R/W
23	RW	Read write This bit specifies whether S-Cache test access type is read or write. 0: read 1: write	R/W
29:24	—	These bits are read as 0. The write value should be 0.	R/W
31:30	WAY[1:0]	Address way S-Cache test access address higher 2-bit corresponds to way. These bits are valid when cache data/ecc code/tag read/write. These bits are invalid when LRU read/write.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

WAY[1:0], ENTRY[6:0], OFFSET[2:0] bit

These bits indicate the address when S-Cache test access.

WAY[1:0], ENTRY[6:0], OFFSET[2:0] are valid for ECC code/cache data read or write.

WAY[1:0], ENTRY[6:0] are valid, and OFFSET[2:0] is invalid for TAG and TAG ECC code read or write.

ENTRY[6:0] is valid and WAY[1:0], OFFSET[2:0] are invalid for LRU read or write.

TARGET[2:0] bits

The TARGET[2:0] bits specify the S-Cache test access target. The truth table is below.

RW bit

The RW bit specifies whether S-Cache test access type is read or write. The truth table is below.

SCATAA.RW[23]	SCATAA.TARGET[18:16]	Command
0	000	Cache data read
1	000	Cache data write
0	001	Data ECC code read
1	001	Data ECC code write
0	010	Tag read
1	010	Tag write
0	011	LRU read
1	011	LRU write
0	100	Tag ECC code read
1	100	Tag ECC code write

Writing to SCATAA register triggers the test access. When the test access is writing, write to register SCATAD before writing to register SCATAA. When the test access is reading, read register SCATAD after writing to register SCATAA.

To perform read access, follow these steps:

1. Write to SCATAA with SCATAA.RW = 0.
2. Read SCATAA to check.
3. Read SCATAD.

To perform write access, follow these steps:

1. Write to SCATDA.
2. Write to SCATAA with SCATAA.RW = 1.

If SCATAD register is updated by the test access reading and the SCATAD register is written at the same time, SCATAD register update by the test access reading is ignored and SCATAD register is written.

2.16.3.17 SCATAD_DATA : S-Cache Test Access Data (DATA)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x058

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DATA[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DATA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	DATA[31:0]	S-Cache test access data These bits are valid when S-Cache test access cache data read/write (SCATAA[18:16] = 000).	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

DATA[31:0] bits

These bits indicate each data when S-Cache test access.

Which bits are valid depend on the type of S-Cache test access.

S-Cache test access should be done with S-Cache turned off (SCACTL.ENS = 0).

If SCATAD register is updated by the test access reading and the SCATAD register is written at the same time, SCATAD register update by the test access reading is ignored and SCATAD register is written.

2.16.3.18 SCATAD_ECC : S-Cache Test Access Data (ECC)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x058

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	ECC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	ECC[6:0]	S-Cache test access ECC code These bits are valid when S-Cache test access data ECC code of cache data read/write (SCATAA[18:16] = 001).	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

ECC[6:0] bits

These bits indicate each data when S-Cache test access.

Which bits are valid depend on the type of S-Cache test access.

S-Cache test access should be done with S-Cache turned off (SCACTL.ENS = 0).

If SCATAD register is updated by the test access reading and the SCATAD register is written at the same time, SCATAD register update by the test access reading is ignored and SCATAD register is written.

2.16.3.19 SCATAD_TAG : S-Cache Test Access Data (TAG)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x058

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	TAG[19:4]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TAG[3:0]				—	—	—	—	—	—	—	—	—	—	V	D
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	D	S-Cache test access Dirty This bit is valid when S-Cache test access Tag, V, D read/write (SCATAA[18:16] = 010).	R/W
1	V	S-Cache test access Valid This bit is valid when S-Cache test access Tag, V, D read/write (SCATAA[18:16] = 010).	R/W
11:2	—	These bits are read as 0. The write value should be 0.	R/W
31:12	TAG[19:0]	S-Cache test access Tag data These bits are valid when S-Cache test access Tag, V, D read/write (SCATAA[18:16] = 010).	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

TAG, V, D bits

These bits indicate each data when S-Cache test access.

Which bits are valid depend on the type of S-Cache test access.

S-Cache test access should be done with S-Cache turned off (SCACTL.ENS = 0).

If SCATAD register is updated by the test access reading and the SCATAD register is written at the same time, SCATAD register update by the test access reading is ignored and SCATAD register is written.

2.16.3.20 SCATAD_LRU : S-Cache Test Access Data (LRU)

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x058

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	LRU[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	LRU[4:0]	S-Cache test access LRU data These bits are valid when S-Cache test access LRU read/write (SCATAA[18:16] = 011).	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

LRU[4:0] bits

The LRU[4:0] bits indicate each data when S-Cache test access.

Which bits are valid depend on the type of S-Cache test access.

S-Cache test access should be done with S-Cache turned off (SCACTL.ENS = 0).

If SCATAD register is updated by the test access reading and the SCATAD register is written at the same time, SCATAD register update by the test access reading is ignored and SCATAD register is written.

2.16.3.21 SCATAD_TAGECC : S-Cache Test Access Data

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x058

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	TAGECC[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	TAGECC[6:0]	S-Cache test access Tag ECC code These bits are valid when S-Cache test access Tag ECC code read/write (CCATAA[18:16] = 100).	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note: It is necessary to write by word (32-bit) access. Half word/byte write access is prohibited.
Note: Security: S-TYPE-6
Privilege: P-TYPE-2

TAGECC[6:0] bits (S-Cache test access Tag ECC code)

The TAGECC[6:0] bits indicate each data when S-Cache test access.

Which bits are valid depend on the type of S-Cache test access.

S-Cache test access should be done with S-Cache turned off (SCACTL.ENC = 0).

If SCATAD register is updated by the test access reading and the SCATAD register is written at the same time, SCATAD register update by the test access reading is ignored and SCATAD register is written.

2.16.3.22 CAPOAD : Cache ECC Error Operation After Detection Register

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x200

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	E1STSEN	ECCMOD1	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection bit Selects the operation after error detection. 0: Interrupt 1: Reset	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	ECCMOD1	ECC enable Enable ECC (error correction code) on C-Cache and S-Cache. 0: Disable ECC 1: Enable ECC	R/W
4	E1STSEN	ECC correctable error information update enable Correctable ECC error is: ● 1-bit ECC error of Cache Data memory ● Clean line of Cache Tag memory was invalidated by ECC 1-bit error 0: Disable updating of correctable ECC error information 1: Enable updating of correctable ECC error information	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHEESA)
Privilege: P-TYPE-2

The CAPOAD register is write-protected by CAPRCR. Set CAPRCR.PRCR before writing to this register. Do not write to this register when the cache is enabled.

OAD bit (Operation after detection bit)

The OAD bit specifies the operation after ECC error detection.

ECCMOD1 bit (ECC enable)

The ECCMOD1 bit enables detecting and correcting error with ECC on C-Cache and S-Cache.

E1STSEN bit (ECC correctable error information update enable)

The E1STSEN bit enables or disables updating of the correctable ECC error status CCAEDST.ESD0/SCAEDST.ESD0/CCAEDST.ESTC/SCAEDST.ESTC.

When CAPOAD.E1STSEN = 0, even if a correctable ECC error occurs, the error status is not updated and no actions such as interrupt or reset are taken after an error is detected, regardless of the value of CAPOAD.OAD.

2.16.3.23 CAPRCR : Cache Protection Register

Base address: CACHE = 0x4001_C000
CACHE_NS = 0x5001_C000

Offset address: 0x204

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	KW[6:0]							PRCR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRCR	Register Write Control bit Set Register Write Control 0: Writing to the protected register is disabled 1: Writing to the protected register is enabled	R/W
7:1	KW[6:0]	Write Key Code bit These bits are used to enable or disable writing of the PRCR bit.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: Security: S-TYPE-3 (CACHESAR.CACHEESA)
Privilege: P-TYPE-2

PRCR bit (Register Write Control bit)

The PRCR bit controls the writing of the CAPOAD register.

When the PRCR bit is set to 1, writing to the CAPOAD register is enabled.

When writing to this bit, write 0x78 in KW[6:0] at the same time.

KW[6:0]bits (Write Key Code bit)

The KW[6:0] bits are used to enable or disable writing of the PRCR bit.

When writing to PRCR bit, write 0x78 in KW[6:0] at the same time.

When the value of KW[6:0] bits except 0x78 is written in, PRCR bit is not updated.

The KW[6:0] bits are always read as 0x00.

2.16.4 Operation

2.16.4.1 C-Cache/S-Cache

Figure 2.8 shows the function flow to access C-Cache/S-Cache from CPU.

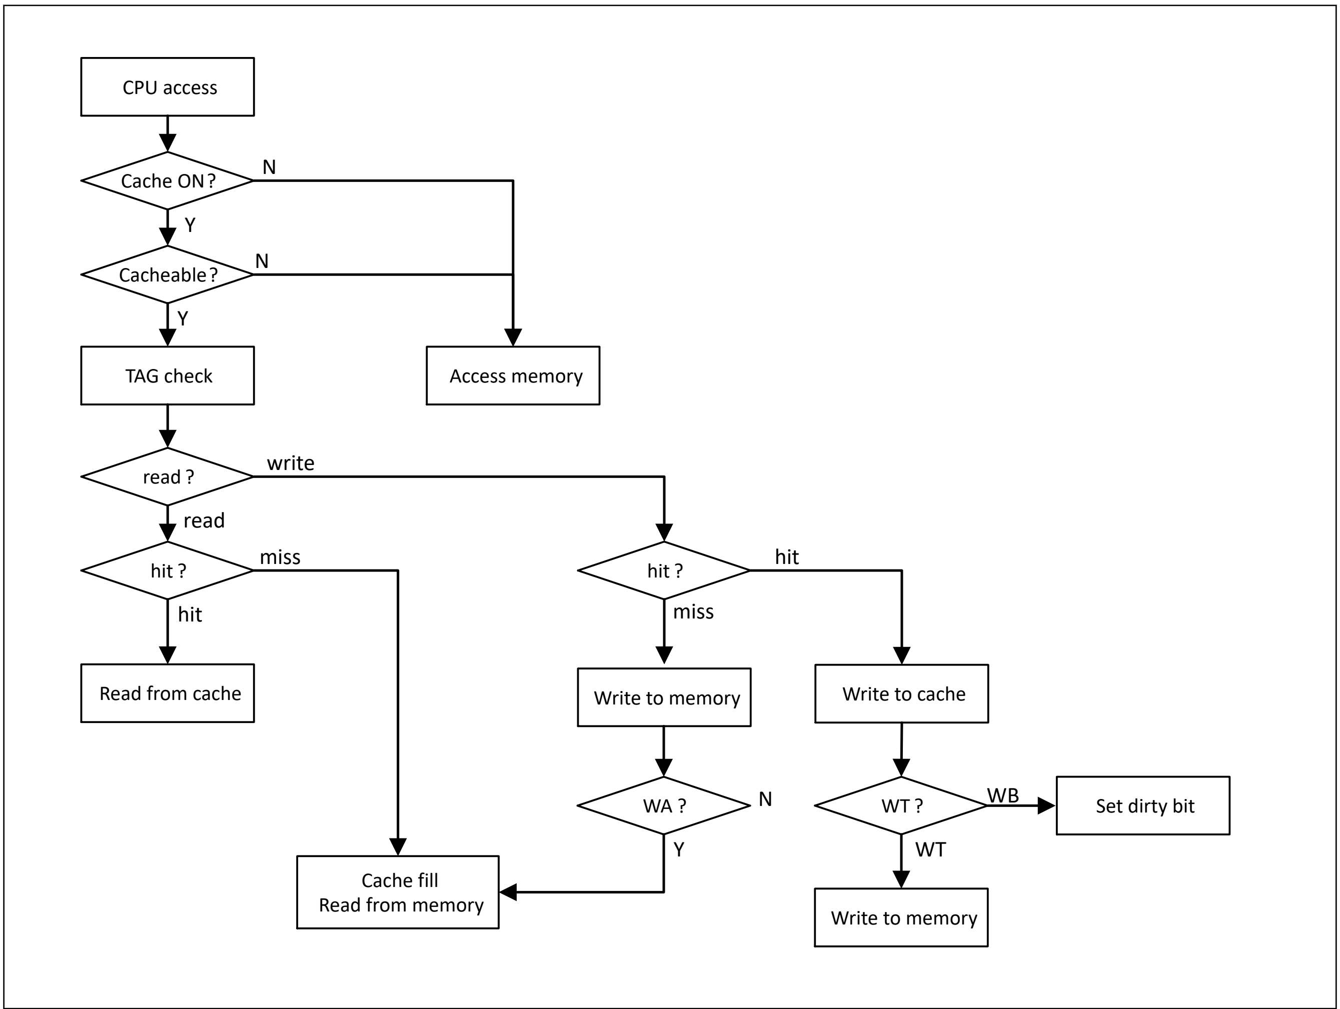

Figure 2.8 CPU access function flow of C-Cache/S-Cache

The cache function works when the cache is enabled (CCACTL.ENC = 1, SCACTL.ENS = 1) and cacheable access from the CPU. Cache checks the address from which the CPU access request and the one in the cache tag, and determines that the CPU access is a hit or miss.

- Read miss: Cache reads one cache line data from memory and stores it into the cache data. Then the cache returns the required data to the CPU.
- Read hit: Cache reads required data from the cache data and returns to the CPU. Then the access cycle is determined as a hit of zero-wait cycle.
- Write miss: Cache writes data to memory. When write-allocation is set (CCAWTA.WA = 1, SCAWTA.WA = 1) and the attribute of area is write-allocation, the cache fills a line from memory.
- Write hit: Cache writes the data to the cache. When write-through is set (CCAWTA.WT = 1, SCAWTA.WT = 1) or attribute of area is write-through, the cache writes the data to memory. However, when write-through is not set (CCAWTA.WT = 0, SCAWTA.WT = 0) and attribute of area is write-back, the cache sets the Dirty bit of the data in Tag.

2.16.4.2 Cache Flush

In order to flush the cache, set 1 to CCAFCT.FC and SCAFCT.FS bits. The Valid bit, Dirty bit and Tag data in Tag are then cleared. The Tag ECC code is initialized to the code generated by the value 0. Cache data is not cleared.

Note: If the same address is accessed with different cacheability (set by the Arm MPU), write back and flush the cache before any access after cacheability changes. If CCAWTA.WT and SCAWTA.WT are set to 1, no write back is required.

If the same address is accessed with different cacheability without write back and flush, the read/write data is undefined.

2.16.4.3 LRU and Replace

Cache uses LRU (Least Recently Used) mechanism as cache replacement algorithm. If a CPU access is determined as a hit or miss, the cache replaces the cache data which is not the last restored. The cache also marks as the latest data in LRU of the cache data. Therefore, even if cache line in cache ways are full, the cache can replace the cache data using LRU that shows the older cache.

2.16.4.4 ECC

2.16.4.4.1 Correction of ECC Errors of Cache Data Memory

Enabling and disabling of ECC error correction can be selected through the setting by the CAPOAD.ECCMOD1 bit. In the initial state, ECC error correction is disabled. The ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection Code).

When ECC function is enabled, 7-bit ECC is generated from 32-bit data, 32-bit data and 7-bit ECC code are written to the cache data memory. For reading, 32-bit data and 7-bit ECC code are read out from the cache data memory.

When ECC function is enabled, if a 1-bit error occurs, error correction is performed and the CCAEDST.ESD0 or SCAEDST.ESD0 bit is set to 1, if the CAPOAD.E1STSEN bit is 1. If a 2-bit error occurs, error detection is performed and the CCAEDST.ESD1 or SCAEDST.ESD1 bit is set to 1, though error correction is not performed.

When ECC error is detected in cache data, it only performs error correction and CCAEDST, SCAEDST setting. It does not invalidate the cache like Tag ECC error.

When ECC function is disabled, error correction or error detection is not performed even though 1-bit or 2-bit error occurs. So the CCAEDST.ESD0 bit, the CCAEDST.ESD1 bit, the SCAEDST.ESD0 bit and the SCAEDST.ESD1 bit are not updated.

2.16.4.4.2 ECC Errors of Cache Tag Memory

Enabling and disabling of Tag ECC error detection can be selected through the setting by the CAPOAD.ECCMOD1 bit (the same as cache data). The ECC check type is SED-DED (Single-Error Detection and Double-Error Detection Code).

When ECC function is enabled, 7-bit ECC code is generated from 32-bit data (upper bit of tag/V extended 0), tag data and 7-bit ECC code are written to the cache tag memory. For read, tag data and 7-bit ECC code are read out from the cache tag memory.

When ECC function is disabled, no error detection is performed even though 1-bit or 2-bit error occurs. So, the CCAEDST.ESTC bit, the CCAEDST.ESTD bit, the CCAEDST.EST2 bit, the SCAEDST.ESTC and the SCAEDST.ESTD bits, and the SCAEDST.EST2 bit are not updated.

If Tag ECC error is detected, the line is invalidated and treated as a miss. For clean line error, the cache can be recovered by cache refilling. However, for dirty line error, the system cannot be recovered because dirty data cannot write back.

2.16.4.4.3 ECC Error Interrupt Function

When ECC function is enabled, error checking is possible in the cache tag/data memory.

For a 2-bit error of the cache data, the CCAEDST.ESD1 bit or the SCAEDST.ESD1 bit is set to 1. For a 1-bit error of the cache data, the CCAEDST.ESD0 bit or the SCAEDST.ESD0 bit is set to 1 when CAPOAD.E1STSEN bit is 1.

For a 2-bit error of the cache tag, the CCAEDST.EST2 bit or the SCAEDST.EST2 bit is set to 1. For invalidate of the cache tag dirty line by ECC 1-bit error, the CCAEDST.ESTD bit or the SCAEDST.ESTD bit is set to 1.

For invalidate of the cache tag clean line by ECC 1-bit error, the CCAEDST.ESTC bit or the SCAEDST.ESTC bit is set to 1 when CAPOAD.E1STSEN bit is 1.

When the correctable error is to be masked, it is necessary to set the CAPOAD.E1STSEN bit to 0 to disable updating the following bits to 1.

- CCAEDST.ESD0
- CCAEDST
- ESTC
- SCAEDST.ESD0

- SCAEDST.ESTC

An ECC error is not generated while ECC function is disabled

ECC error may result request of a reset or an interrupt. When an ECC error occurs and when the CAPOAD.OAD bit is 1, a reset request is output. When it is 0, an interrupt request is output to the ICU.

ECC Error interrupt occurs when there is at least one error status in the CCAEDST register and the SCAEDST register is set to 1. ECC Error interrupt continues to occur until all error status in the CCAEDST register and SCAEDST register are cleared.

2.16.4.4.4 ECC Decoder Testing

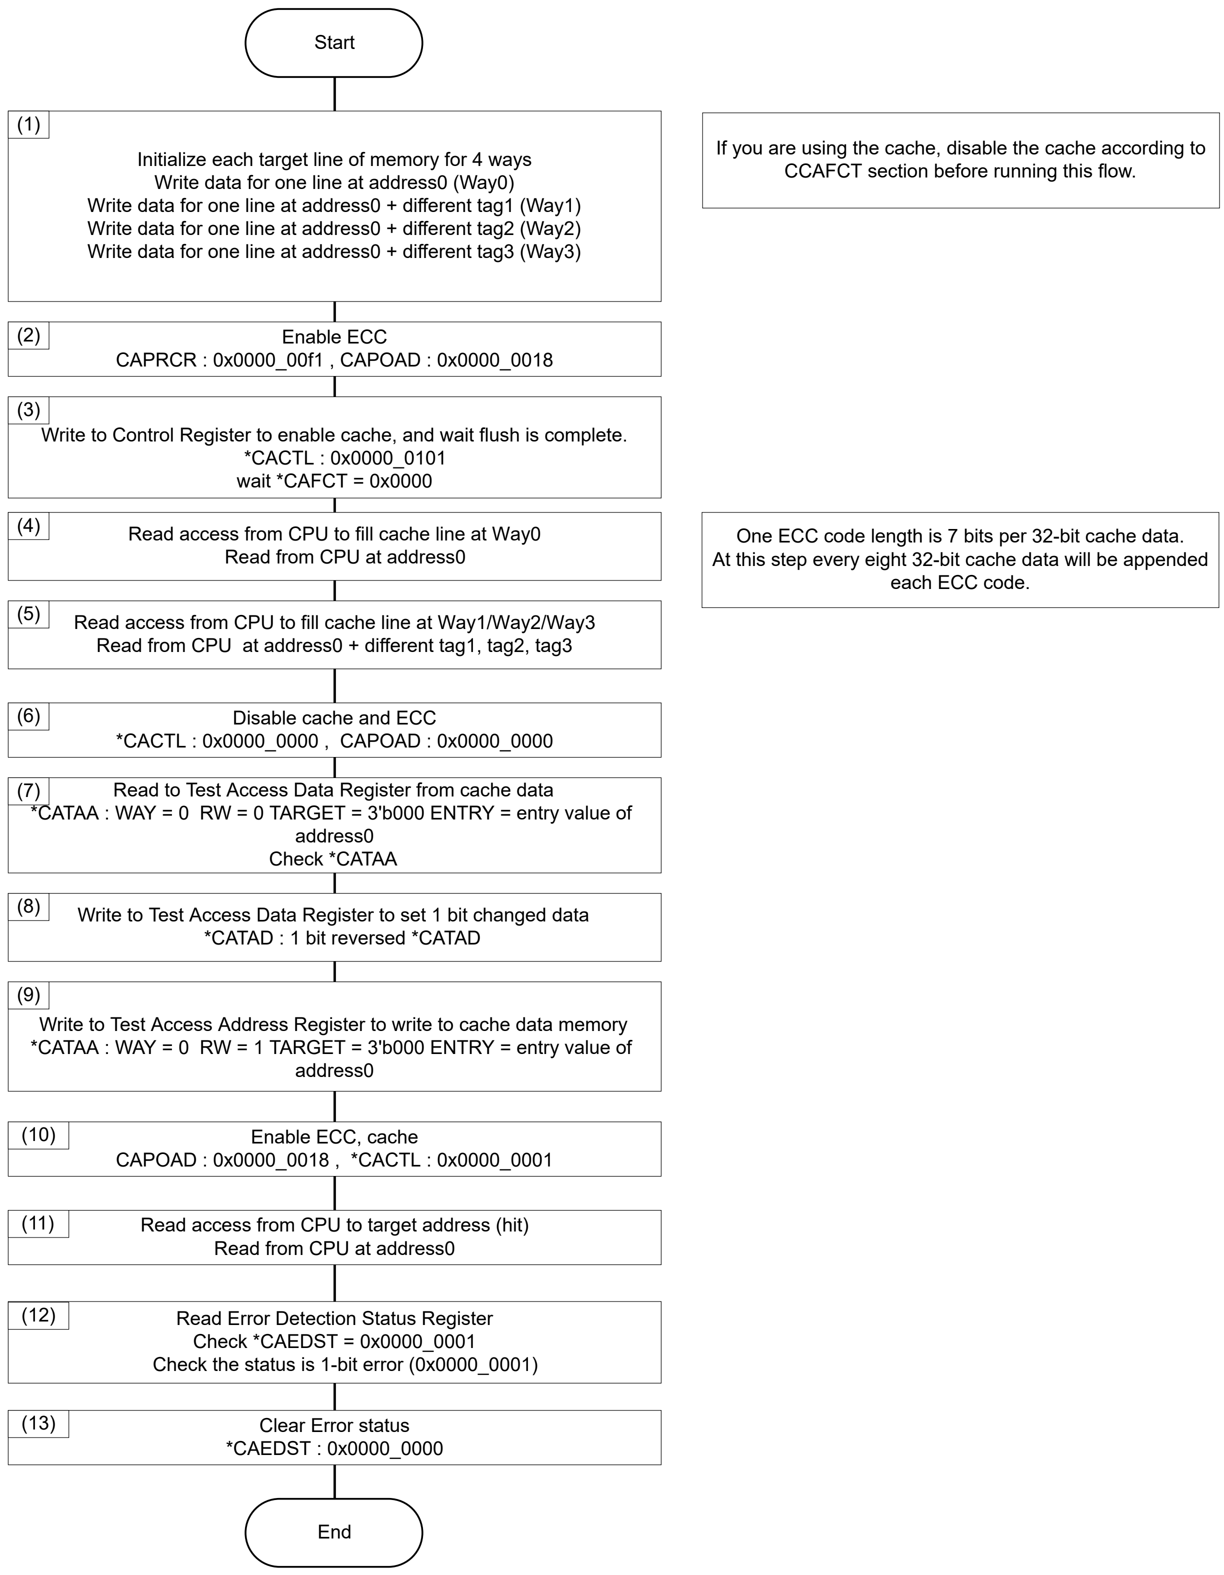
There are six ECC decoders in total, one for each way of the cache tag, and one each for the CPU read path and write-back path of cache data.

To test the ECC decoder in cache data, perform the flow of CPU read (section 2.16.4.4.4.1. ECC Decoder of CPU Read) and the flow of write-back (section 2.16.4.4.4.2. ECC Decoder of Write-back). To test the ECC decoder in cache tag, perform all of Way0 through Way3 of tag in the flow of CPU read (section 2.16.4.4.4.1. ECC Decoder of CPU Read).

Since the ECC decoder for cache data is shared between Way0 and Way3, it is possible to test the ECC decoder without testing both ways. For reference, both ways test are described.

2.16.4.4.4.1 ECC Decoder of CPU Read

Figure 2.9 shows the testing flow of cache ECC decoder for CPU reading from the cache or decoder of cache tag.



Note: If you are using the cache, disable the cache according to section 2.16.3.3. CCAFCT : C-Cache Flush Control Register before running this flow.

Figure 2.9 Test flow of cache ECC decoder for CPU reading from decoder of cache tag

Notes for each step in the operation flow are described as follows.

(1) To initialize the target line, write data at the address that offset value is from 0x00 to 0x1F.

To initialize data for Way1, write at address0 + different tag1 address.

Initialize data for Way2 and Way3 as well.

For example: address0 = 0x2100_0000

address0 + different tag1 = 0x2101_0000

address0 + different tag2 = 0x2102_0000

address0 + different tag3 = 0x2103_0000

(7)(9) The flow for these steps is about ECC decoder in Way0 of the cache data. For ECC decoders test except write-back ECC decoder (see section 2.16.4.4.4.2. ECC Decoder of Write-back), repeat steps (1) to (13) with the following item combination value written to *CATAA.

	*CATAA.TARGET
Data	000
Data ECC	001
Tag	010
Tag ECC	100

	*CATAA.WAY
Way0	00
Way1	01
Way2	10
Way3	11

Test all of Way0 through Way3 in TARGET = 3’b010 or 3’b100, because Tag ECC decoders are in each of all ways.

(8) To test 2-bit ECC error detection, write 2 bits reversed *CATAD.

(11) Read from CPU at address0 + different tag1 when testing Way1.

Read from CPU at address0 + different tag2 when testing Way2.

Read from CPU at address0 + different tag3 when testing Way3.

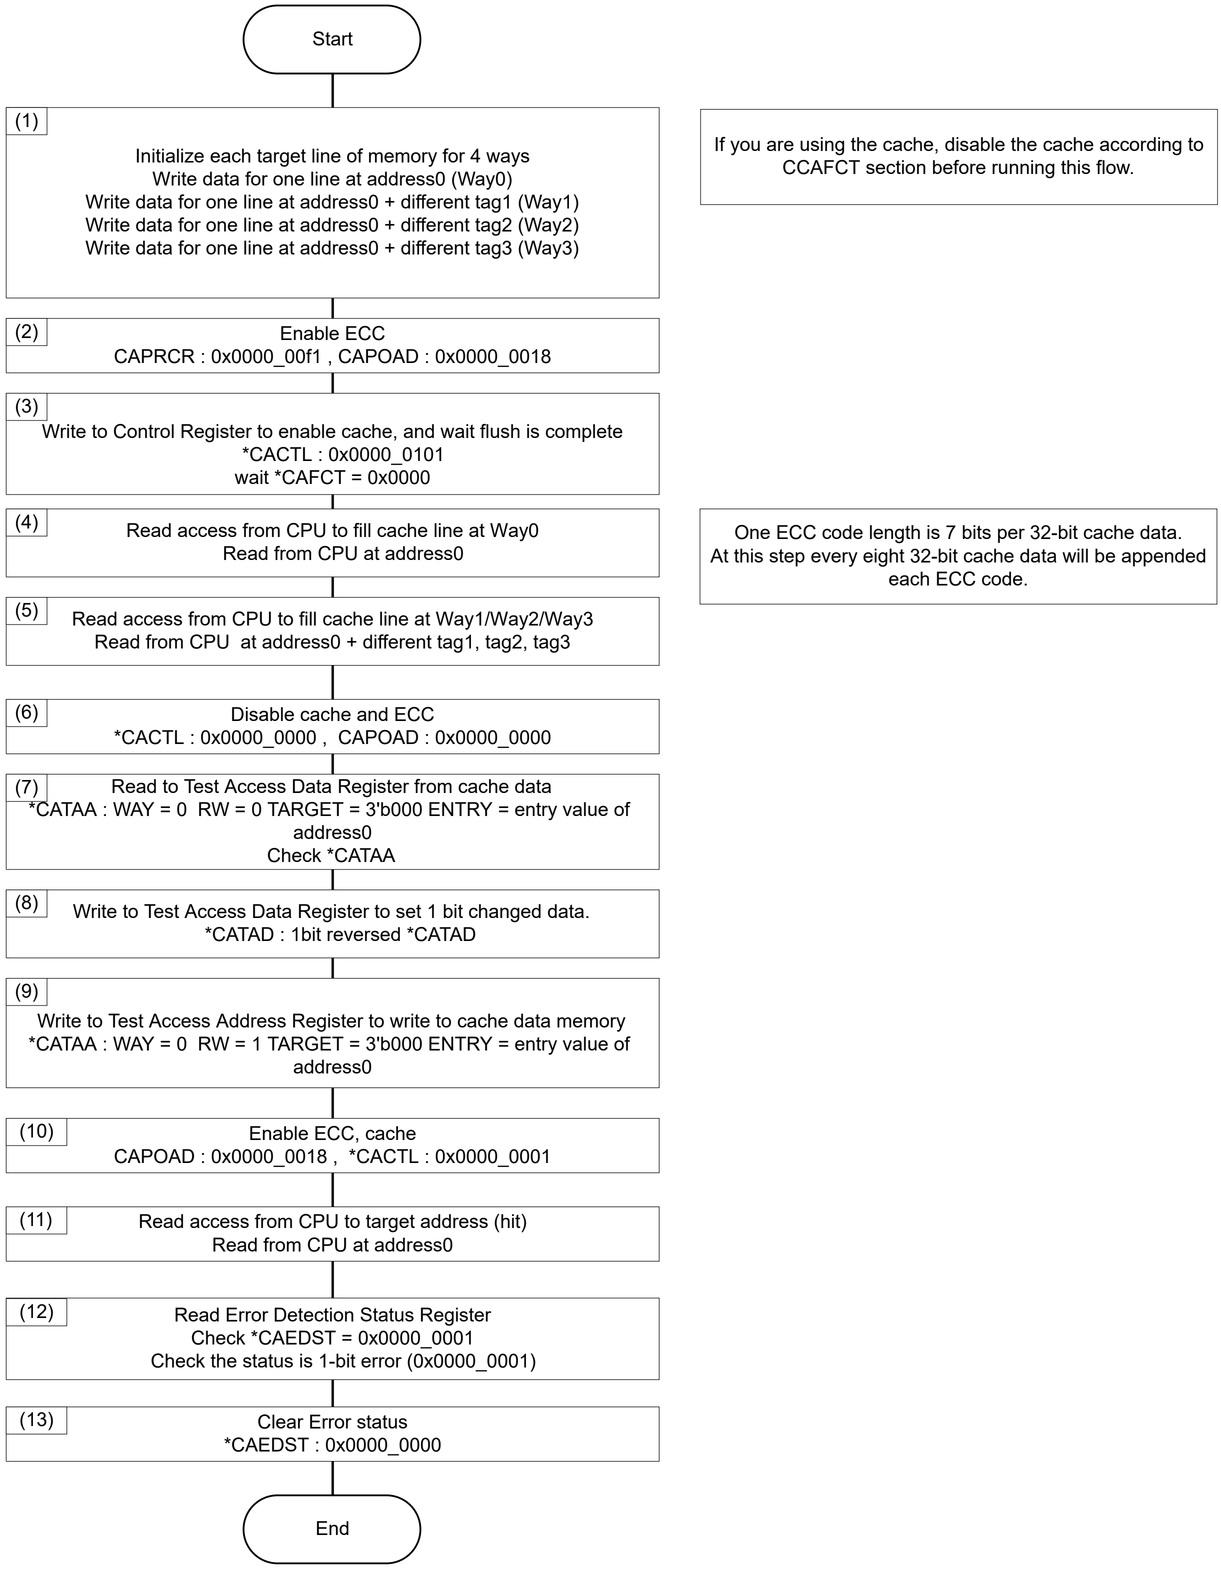
(12) To test 1-bit ECC error correction, check that the read value has been corrected.

Check *CAEDST is of the following value in each test.

Target	Error	Value of *CAEDST
Data	ECC 1-bit error	0x0000_0001
	ECC 2-bit error	0x0000_0002
Data ECC	ECC 1-bit error	0x0000_0001
	ECC 2-bit error	0x0000_0002
Tag	ECC 1-bit error	0x0000_0004 (in this flow, the cache line is clean)
	ECC 2-bit error	0x0000_0010
Tag ECC	ECC 1-bit error	0x0000_0004 (in this flow, the cache line is clean)
	ECC 2-bit error	0x0000_0010

2.16.4.4.4.2 ECC Decoder of Write-back

Figure 2.10 shows the testing flow of cache ECC decoder for write-back.



Note: If you are using the cache, disable the cache according to section 2.16.3.3. CCAFCT : C-Cache Flush Control Register before running this flow.

Figure 2.10 Test flow of cache ECC decoder for write-back

Notes for each step in the operation flow are described as follows.

(1) To initialize the target line, write data at the address that offset value is from 0x00 to 0x1F.

To initialize data for Way1, write at address0 + different tag1 address.

Initialize data for Way2 and Way3 as well.

For example: address0 = 0x2100_0000

address0 + different tag1 = 0x2101_0000

address0 + different tag2 = 0x2102_0000

address0 + different tag3 = 0x2103_0000

(7)(9) The flow for these steps is about ECC decoder in Way0 of the cache data. For decoder in write-back, repeat steps (1) to (15) with the following item combination value written to *CATAA.

	*CATAA.TARGET
Data	000
Data ECC	001

	*CATAA.WAY
Way0	00
Way1	01
Way2	10
Way3	11

(8) To test 2-bit ECC error detection, write 2 bits reversed *CATAD.

(10)(11) The flow for these steps is about ECC decoder in Way0 of the cache data. For decoder in path of other ways, repeat steps (1) to (15) with the following value of Way0 through Way3.

	Way0	Way1	Way2	Way3
*CATAA.WAY	00	01	10	11
*CATAD of (11)	0x0000_0014	0x0000_0009	0x0000_001E	0x0000_0013

(13) Different tag (not in cache) has a different tag address from each Way address in (1).

For example: address0 + different tag (not in cache) = 0x2110_0000

(14) To test 1-bit ECC error, check that the read value at address0 (write-back value) has been corrected.

To test 2-bit ECC error, check that the read value at address0 (write-back value) has not been corrected.

Check *CAEDST is of the following value.

Target	Error	*CAEDST
Data	ECC 1-bit error	0x0000_0001
	ECC 2-bit error	0x0000_0002
Data ECC	ECC 1-bit error	0x0000_0001
	ECC 2-bit error	0x0000_0002

2.16.4.4.5 Note of ECC

When switching to enable ECC, follow the procedure (section 2.16.3.3. CCAFCT : C-Cache Flush Control Register and section 2.16.3.13. SCAFCT : S-Cache Flush Control Register) to disable C-Cache and S-Cache before switching. Switching to enable ECC while the cache is enabled can cause ECC errors due to incorrect ECC code.

2.16.4.5 Bus Error

The correspondence to a bus error from a bus slave is shown in the section that follows:

- For cache off: Cache returns the bus error to the CPU.
- For non-cacheable access: Cache returns the bus error to the CPU.

- For cache fill: Cache returns the bus error to the CPU. The cache does not write the line contains error to cache memory.
- For write hit status: Cache cannot return the bus error to the CPU. The cache does not clear validation.
- For write miss status: Cache cannot return the bus error to the CPU.

2.16.5 Usage Notes

2.16.5.1 Coherency

The coherency between the cache and the external memory and internal SRAM must be guaranteed by software. To share memory between multiple bus masters (such as between multiple CPUs or between CPU and DMAC) in the cache support area, perform write back and flush the cache data as needed.

2.16.5.2 Cache Flush/WB Operation

When CPU1 operates Cache Flush/WB by *CAFCT/*CACTL, the CPU1 must check that Flush/WB completes (*CAFCT = 0, * denotes C-Cache, or S-Cache, that is, CCAFCT/CCACTL or SCAFCT/SCACTL).

Do not operate Flush/WB from a bus master other than CPU1.

When Cache Flush/WB operation is executed, the priority of Cache Flush/WB operation is higher than that of access from CPU1.

2.16.5.3 Restrictions Relating to Security Attribution of C-Cache and S-Cache

When using C-Cache and S-Cache, one of the following conditions must be observed:

- CPU1 should be used only in secure state.
- CPU1 should be used only in non-secure state. It is only possible if SECEXT (Security Extension) of CPU1 is disabled.
- C-Cache and S-Cache should be used only in non-secure program. In addition, all of the following conditions must be observed:
    1. Set the MPU so that all secure memory space used by the secure program is non-cacheable.
    2. When secure program accesses non-secure memory space, execute WB and Flush of the cache before accessing it.
    3. When using on-chip WDT instead of an external WDT, the on-chip WDT should be set as a secure attribution and also set to apply interrupt to CPU0 or reset when a WDT error occurs.

2.17 CM33 TCM (Tightly Coupled Memory)

2.17.1 Overview

The MCU provides an on-chip TCM (tightly coupled memory) with Error Correction Code (ECC).

2.17.1.1 Specifications of TCM

Table 2.36 Specifications of TCM

Item	C-TCM	S-TCM
Capacity	64 KB	64 KB
Error detection	ECC (SECDED)	ECC (SECDED)
Security	Secure region/Non-secure region	Secure region/Non-secure region

Table 2.37 Address map of TCM (1 of 2)

Address	Usage	Master	SA
0x0000_0000 to 0x0000_FFFF	C-TCM	CPU1 (CM33)	Secure
0x1000_0000 to 0x1000_FFFF	C-TCM	CPU1 (CM33)	Non-secure

Table 2.37 Address map of TCM (2 of 2)

Address	Usage	Master	SA
0x2000_0000 to 0x2000_FFFF	S-TCM	CPU1 (CM33)	Secure
0x2A00_0000 to 0x2A00_FFFF	C-TCM	Bus master (example, CPU0)	Secure
0x2A01_0000 to 0x2A01_FFFF	S-TCM	Bus master (example, CPU0)	Secure
0x3000_0000 to 0x3000_FFFF	S-TCM	CPU1 (CM33)	Non-secure
0x3A00_0000 to 0x3A00_FFFF	C-TCM	Bus master (example, CPU0)	Non-secure
0x3A01_0000 to 0x3A01_FFFF	S-TCM	Bus master (example, CPU0)	Non-secure

Each C-TCM or S-TCM memory is one entity which capacity is 64 KB can be accessed from different master through different address.

If the access of bus master conflicts with the access of CPU1, the bus interface of TCM returns a wait cycle to the bus. See section 2.17.4.4. Wait Cycle.

2.17.1.2 Block Diagram

Figure 2.11 shows the block structure of Cache and TCM.

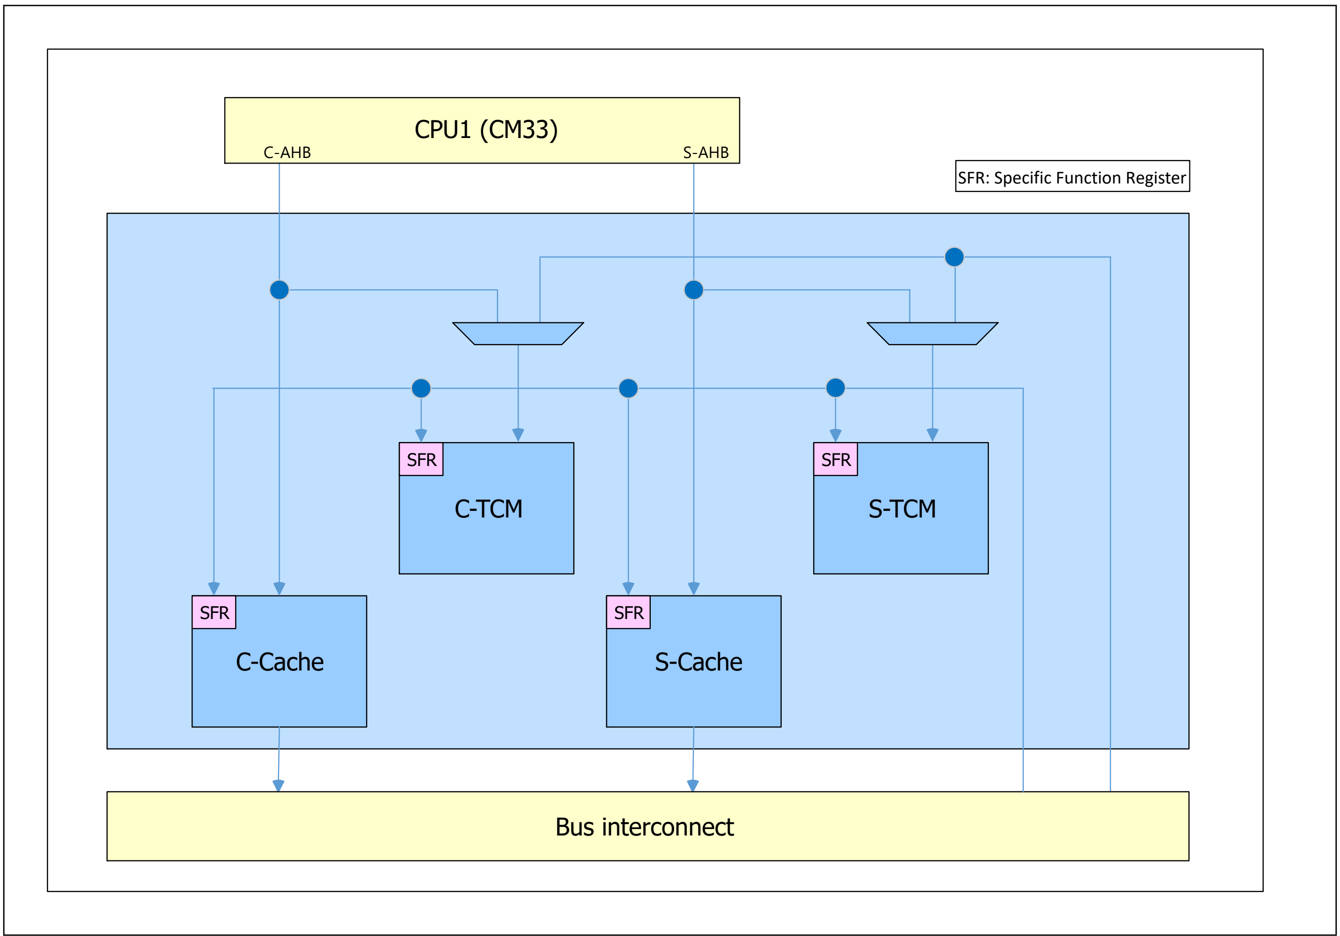


Figure 2.11 Block structure of Cache and TCM

2.17.2 Register List

TCM_BASE_S(Base address of TCM) is 0x4001_C800

TCM_BASE_NS(Base address of TCM) is 0x5001_C800

CPSCU_BASE_S (Base address of CPSCU) is 0x4000_8000.

CPSCU_BASE_NS (Base address of CPSCU) is 0x5000_8000.

Security Attribution Register (TCMSAR) is write protected by PRCR.PRCR4. TCMSAR controls the security attributes of all TCM registers. TCMPRCR_S and TCMPRCR_NS protects TCMCRn from secure and non-secure write accesses.

Table 2.38 Register list

Register name	Address (for secure access)		Address (for non-secure access)	
TCMSAR	CPSCU_BASE_S +	0x504	—	—
TCMSABARC TCMSABARS	CPSCU_BASE_S +	0x508 0x50C	—	—
TCMPRCR_S	TCM_BASE_S +	0x00	—	—
TCMPRCR_NS	—	—	TCM_BASE_NS +	0x04
TCMCRC TCMCRS	TCM_BASE_S +	0x10 0x14	TCM_BASE_NS +	0x10 0x14
TCMESR	TCM_BASE_S +	0x40	TCM_BASE_NS +	0x40
TCMESCLR	TCM_BASE_S +	0x48	TCM_BASE_NS +	0x48
TCMEARC0 TCMEARC1 TCMEARS0 TCMEARS1	TCM_BASE_S +	0x50 0x54 0x58 0x5C	TCM_BASE_NS +	0x50 0x54 0x58 0x5C

2.17.3 Register Descriptions

2.17.3.1 TCMSAR : TCM Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x504

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCMSA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCMSA	Security attributes of registers for TCM control 0: Secure 1: Non-Secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: This register is write-protected by PRCR_S.PRC4.

Security: S-TYPE-1

Privilege: P-TYPE-1

Only secure access can write to this register. Non-secure read access is allowed, non-secure write access is denied, TrustZone access error is not generated.

TCMSA bit (Security attributes of registers for TCM control)

Security attributes of registers for TCM control. The target registers are as follow.

- TCMCRx
- TCMESCLR

The TCMSA bit must be set to 0 when secure program/secure data is located at TCM.

2.17.3.2 TCMSABARx : TCM Security Attribute Boundary Address Register (x = C or S)

Base address: CPSCU = 0x4000_8000

Offset address: 0x508 or 0x50C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	TCMSABA		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TCMSABA			—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
12:0	—	These bits are read as 0. The write value should be 0.	R/W
18:13	TCMSABA	Boundary address between secure and non-secure (start address of non-secure region).	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note: This register is write-protected by PRCR_S.PRC4.

Security: S-TYPE-1

Privilege: P-TYPE-1

TCMSABARx specifies the boundary address between the secure and non-secure regions of each TCM. TCMSABARx indicates the start address of non-secure regions. TCMSABARx 32-bit value corresponds to the absolute address. When writing to TCMSABARx, the write value of bits [31:19] and bits [12:0] should be 0.

The region lower than the boundary address is marked as Secure, and the region higher than or equal to the boundary address is marked as Non-secure.

TCMSABARC

When the boundary address is 0x0000_0000, the whole C-TCM is marked as Non-secure.

When the boundary address is 0x0001_0000 or higher, the whole C-TCM is marked as Secure.

Since the initial boundary address is 0x0007_E000, the whole of C-TCM (64 KB) is marked as Secure after reset.

The boundary address setting affects not only the CPU1 address but also the bus master address (alias address).

Table 2.39 Address map of C-TCM

Address	Master	SA
0x0000_0000 to 0x0000_0000 + TCMSABARC - 0x1	CPU1 (CM33)	Secure
0x0000_0000 + TCMSABARC to 0x0000_FFFF	CPU1 (CM33)	Non-secure
0x1000_0000 to 0x1000_0000 + TCMSABARC - 0x1	CPU1 (CM33)	Secure
0x1000_0000 + TCMSABARC to 0x1000_FFFF	CPU1 (CM33)	Non-secure
0x2A00_0000 to 0x2A00_0000 + TCMSABARC - 0x1	Bus master	Secure
0x2A00_0000 + TCMSABARC to 0x2A00_FFFF	Bus master	Non-secure
0x3A00_0000 to 0x3A00_0000 + TCMSABARC - 0x1	Bus master	Secure
0x3A00_0000 + TCMSABARC to 0x3A00_FFFF	Bus master	Non-secure

TCMSABARS

When the boundary address is 0x0000_0000, the whole S-TCM is marked as Non-secure.

When the boundary address is 0x0001_0000 or higher, the whole S-TCM is marked as Secure.

Since the initial boundary address is 0x0007_E000, the whole of S-TCM (64 KB) is marked as Secure after reset.

The boundary address setting affects not only the CPU1 address but also the bus master address (alias address).

Table 2.40 Address map of S-TCM

Address	Master	SA
0x2000_0000 to 0x2000_0000 + TCMSABARS - 0x1	CPU1 (CM33)	Secure
0x2000_0000 + TCMSABARS to 0x2000_FFFF	CPU1 (CM33)	Non-secure
0x2A01_0000 to 0x2A01_0000 + TCMSABARS - 0x1	Bus master	Secure
0x2A01_0000 + TCMSABARS to 0x2A01_FFFF	Bus master	Non-secure
0x3000_0000 to 0x3000_0000 + TCMSABARS - 0x1	CPU1 (CM33)	Secure
0x3000_0000 + TCMSABARS to 0x3000_FFFF	CPU1 (CM33)	Non-secure
0x3A01_0000 to 0x3A01_0000 + TCMSABARS - 0x1	Bus master	Secure
0x3A01_0000 + TCMSABARS to 0x3A01_FFFF	Bus master	Non-secure

2.17.3.3 TCMPRCR_S : TCM Protection Control Register for Secure

Base address: TCM = 0x4001_C800

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KW[7:0]								—	—	—	—	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Register Write Control 0: Write registers are disabled 1: Write registers are enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KW[7:0]	Write Key Code Key code protection to the PR bit.	R/W

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

Security: S-TYPE-1

Privilege: P-TYPE-1

PR bit (Register Write Control)

The PR bit controls the write mode of the TCMCRx registers that are marked as Secure by TCMSAR register. When this bit is set to 1, writing to the TCMCRx marked as Secure is enabled.

KW[7:0] bits (Write Key Code)

The KW[7:0] bits enable or disable writes to the PR bit. When writing to the PR bit, write 0xA5 to the KW[7:0] bits simultaneously. When a value other than 0xA5 is written to KW[7:0], the PR bit is not updated. The KW[7:0] bits are always read as 0x00.

2.17.3.4 TCMPRCR_NS : TCM Protection Control Register for Non-Secure

Base address: TCM_NS = 0x5001_C800

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KW[7:0]								—	—	—	—	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Register Write Control 0: Write registers are disabled 1: Write registers are enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KW[7:0]	Write Key Code Key code protection to the PR bit.	R/W

Note: It is necessary to write by half word access.
Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

Security: S-TYPE-1

Privilege: P-TYPE-1

PR bit (Register Write Control)

The PR bit controls the write mode of the TCMCRx registers that are marked as Non-secure by TCMSAR register. When this bit is set to 1, writing to the TCMCRx marked as Non-secure is enabled.

KW[7:0] bits (Write Key Code)

The KW[7:0] bits enable or disable writes to the PR bit. When writing to the PR bit, write 0xA5 to the KW[7:0] bits simultaneously. When a value other than 0xA5 is written to KW[7:0], the PR bit is not updated. The KW[7:0] bits are always read as 0x00.

2.17.3.5 TCMCRx : TCM Control Register (x = C or S)

Base address: TCM = 0x4001_C800
TCM_NS = 0x5001_C800

Offset address: 0x10 or 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TSTBYP	—	—	E1STSEN	ECCMOD[1:0]		—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after ECC error detection 0: Interrupt 1: Reset	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
3:2	ECCMOD[1:0]	ECC Operating Mode Select 0 0: Disable ECC function 0 1: Setting prohibited 1 0: Enable ECC function without error checking 1 1: Enable ECC function with error checking	R/W
4	E1STSEN	ECC 1-Bit Error Information Update Enable 0: Disable updating of 1-bit ECC error information 1: Enable updating of 1-bit ECC error information	R/W

Bit	Symbol	Function	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TSTBYP	ECC Test Enable/ECC Bypass Select 0: Disable ECC bypass 1: Enable ECC bypass	R/W

Security: S-TYPE-3 (TCMSAR.TCMSA)

Privilege: P-TYPE-2

The protection register (TCMPRCR_S or TCMPRCR_NS) protects this register against writing. This register can be written only when the PR bit in the TCMPRCR_S or TCMPRCR_S register is 1.

Do not write to this register while access to TCM is in progress.

If CPU0 and CPU1 issue speculative access to an uninitialized TCM with ECC enabled, it may trigger an interrupt or reset. After enabling ECC function with error checking, initialize the TCM before setting the interrupt in the IELSRn register or setting the reset in the OAD bit.

OAD bit (Operation after ECC error detection)

The OAD bit selects whether to generate a reset or an interrupt when ECC error is detected.

ECCMOD[1:0] bits (ECC Operating Mode Select)

The ECCMOD[1:0] bits set the access mode to the ECC area.

E1STSEN bit (ECC 1-Bit Error Information Update Enable)

The E1STSEN bit enables or disables updating of the ECC 1-bit error status TCMESR.ERRC0, TCMESR.ERRS0.

When TCMCRx.E1STSEN = 0, the operation after error (such as NMI or reset) is not performed regardless of the value TCMCRx.OAD, even when ECC 1-bit error correction is done.

TSTBYP bit (ECC Test Enable/ECC Bypass Select)

The TSTBYP bit enables direct access to ECC code by bypassing the ECC function.

The ECC bypass function is used along with, setting the ECCMOD[1:0] bits in the same register to 00b.

The ECC code length is 7 bits for 32-bit data. When TSTBYP bit is 1, bits [6:0] of read data is ECC code, bits [31:7] of read data is undefined, bits [6:0] of write data are written to the ECC region of the address, bits [31:7] of write data are ignored.

For details about ECC test, see section 2.17.4.1. ECC Function.

2.17.3.6 TCMESR : TCM Error Status Register

Base address: TCM = 0x4001_C800
TCM_NS = 0x5001_C800

Offset address: 0x40

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	ERRS1	ERRS0	ERRC1	ERRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ERRC0	C-TCM 1-bit ECC Error Status 0: 1-bit ECC error has not occurred 1: 1-bit ECC error has occurred	R
1	ERRC1	C-TCM 2-bit ECC Error Status 0: 2-bit ECC error has not occurred 1: 2-bit ECC error has occurred	R

Bit	Symbol	Function	R/W
2	ERRS0	S-TCM 1-bit ECC Error Status 0: 1-bit ECC error has not occurred 1: 1-bit ECC error has occurred	R
3	ERRS1	S-TCM 2-bit ECC Error Status 0: 2-bit ECC error has not occurred 1: 2-bit ECC error has occurred	R
15:4	—	These bits are read as 0.	R

Note: This register is initialized after returning from Software Standby mode while the debugger is connected.

Security: S-TYPE-5

Privilege: P-TYPE-2

The TCMESR register is cleared by the corresponding bit in TCMESCLR register or resets other than Bus Error Reset and Memory Error Reset. Also during access from the debugger, the TCMESR register is not updated.

ERRx0 bit (x-TCM 1-bit ECC Error Status) (x = C or S)

The ERRx0 bit shows whether there is a 1-bit ECC error in x-TCM.

When ECC function with error checking is enabled (TCMCRx.ECCMOD = 2’b11) and, updating of the 1-bit error information is enabled (TCMCRx.E1STSEN = 1), the ERRx0 bit is set to 1 if a 1-bit error is detected. When ERRx0 bit is set to 1, a reset or an interrupt request is generated according to the TCMCRx.OAD.

ERRx1 bit (x-TCM 2-bit ECC Error Status) (x = C or S)

The ERRx1 bit shows whether there is a 2-bit ECC error in x-TCM.

When ECC function with error checking is enabled (TCMCRx.ECCMOD = 2’b11), the ERRx1 bit is set to 1 if a 2-bit error is detected.

When ERRx1 bit is set to 1, a reset or an interrupt request is generated according to the TCMCRx.OAD.

If the status is cleared and an error occurs at the same time, the error is ignored and the status is cleared.

2.17.3.7 TCMESCLR : TCM Error Status Clear Register

Base address: TCM = 0x4001_C800
TCM_NS = 0x5001_C800

Offset address: 0x48

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	CLRS1	CLRS0	CLRC1	CLRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLRC0	C-TCM 1-bit ECC Error Status Clear Writing to the CLRC0 clears TCMESR.ERRC0 and TCMEARC0.EAR. 1: Clear error	R/W*1
1	CLRC1	C-TCM 2-bit ECC Error Status Clear Writing to the CLRC1 clears TCMESR.ERRC1 and TCMEARC1.EAR. 1: Clear error	R/W*1
2	CLRS0	S-TCM 1-bit ECC Error Status Clear Writing to the CLRS0 clears TCMESR.ERRS0 and TCMEARS0.EAR. 1: Clear error	R/W*1
3	CLRS1	S-TCM 2-bit ECC Error Status Clear Writing to the CLRS1 clears TCMESR.ERRS1 and TCMEARS1.EAR. 1: Clear error	R/W*1
15:4	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only writing 1 is valid. Writing value is not retained, read value is 0.

Security: S-TYPE-3 (TCMSAR.TCMSA)

Privilege: P-TYPE-2

CLRx0 bit (x-TCM 1-bit ECC Error Status Clear) (x = C or S)

The CLRx0 bit can clear 1-bit ECC error status bit in the TCMESR.

TCMESR.ERRx0 can be cleared when writing 1 to CLRx0.

CLRx1 bit (x-TCM 2-bit ECC Error Status Clear) (x = C or S)

The CLRx1 bit can clear 2-bit ECC error status bit in the TCMESR.

TCMESR.ERRx1 can be cleared when writing 1 to CLRx1.

If the status is cleared and an error occurs at the same time, the error is ignored and the status is cleared.

2.17.3.8 TCMEARxm : TCM Error Address Register (x = C or S) (m = 0 to 1)

Base address: TCM = 0x4001_C800
TCM_NS = 0x5001_C800

Offset address: 0x50, 0x54, 0x58 or 0x5C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EAR[17:2]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EAR[17:2]														—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
17:2	EAR[17:2]	When an SRAM error occurs, an error address is stored.	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

Note: This register is initialized after returning from Software Standby mode while the debugger is connected.

Security: S-TYPE-5

Privilege: P-TYPE-2

This register is cleared by the corresponding bit in TCMESCLR register, or resets other than Bus Error Reset and Memory Error Reset. Also during access from the debugger, this register is not updated.

TCMEARx0 bits

This register stores the error address where 1-bit ECC error is detected. These bits hold the error address that occurred first. These bits are cleared by clearing 1-bit ECC error from TCMESCLR.CLRx0.

TCMEARx1 bits

This register stores the error address where 2-bit ECC error is detected. These bits hold the error address that occurred first. These bits are cleared by clearing 2-bit ECC error from TCMESCLR.CLRx1.

If the status is cleared and an error occurs at the same time, the error is ignored and the status is cleared.

2.17.4 Operation

2.17.4.1 ECC Function

2.17.4.1.1 Correction of ECC Errors

Enabling and disabling of ECC error correction can be selected through the setting by the TCMCRx.ECCMOD[1:0] bits. In the initial state, ECC error correction is disabled. The ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection Code).

When the ECC function is enabled, 7-bit ECC code is generated from 32-bit data. Writes to the TCM are 32-bit data and 7-bit ECC code. For reads, 32-bit data and 7-bit ECC code are read out from the TCM.

When ECC function with error checking is enabled, if a 1-bit error occurs, error correction is performed and the TCMESR.ERRx0 bit is set to 1, if the TCMCRx.E1STSEN bit is 1. If a 2-bit error occurs, error detection is performed and the TCMESR.ERRx1 bit is set to 1, although error correction is not performed.

When ECC function without error checking is enabled, if a 1-bit error occurs, error correction is performed but the TCMESR.ERRx0 bit is not updated even though the TCMCRx.E1STSEN bit is 1. If a 2-bit error occurs, error detection is performed but the TCMESR.ERRx1 bit is not updated, and error correction is not performed.

When the ECC function is disabled, neither error correction nor error detection is performed even though 1-bit or 2-bit error occurs. Therefore, the TCMESR.ERRx0 bit and the TCMESR.ERRx1 bit are not updated.

When updating the data after the occurrence of an error, the only support of 32-bit data writing. Since the TCM data is undefined after power on and release from Deep Software Standby mode, accessing the TCM when the ECC function is enabled and error checking is selected causes an ECC error to occur. Therefore, before using ECC function, initial writing with 32-bit data size, or initial writing with ECC function enabled and error checking disabled, to the area to be used in the TCM should be performed.

2.17.4.1.2 ECC Error Interrupt Function

When the ECC function with error checking is enabled, error checking is possible in the TCM. For a 2-bit error, the TCMESR.ERRx1 bit set to 1. For a 1-bit error, the TCMESR.ERRx0 bit set to 1 when TCMCRx.E1STSEN bit is 1.

When the ECC 1-bit error is to be masked, it is necessary to set the TCMCRx.E1STSEN bit to 0 to disable the setting of TCMESR.ERRx0 bit to 1. An ECC error is not generated while the ECC function is disabled or the ECC function without error checking is enabled.

An ECC error may result in a request for a reset or an interrupt. When an ECC error occurs and when the TCMCRx.OAD bit is 1, a reset request is output. When the TCMCRx.OAD bit is 0, an interrupt request is output to the ICU.

An ECC error interrupt occurs when an error status in the TCMESR register is set to 1. ECC error interrupt continues to occur until the error status in the TCMESR register is cleared.

2.17.4.1.3 ECC Decoder Testing

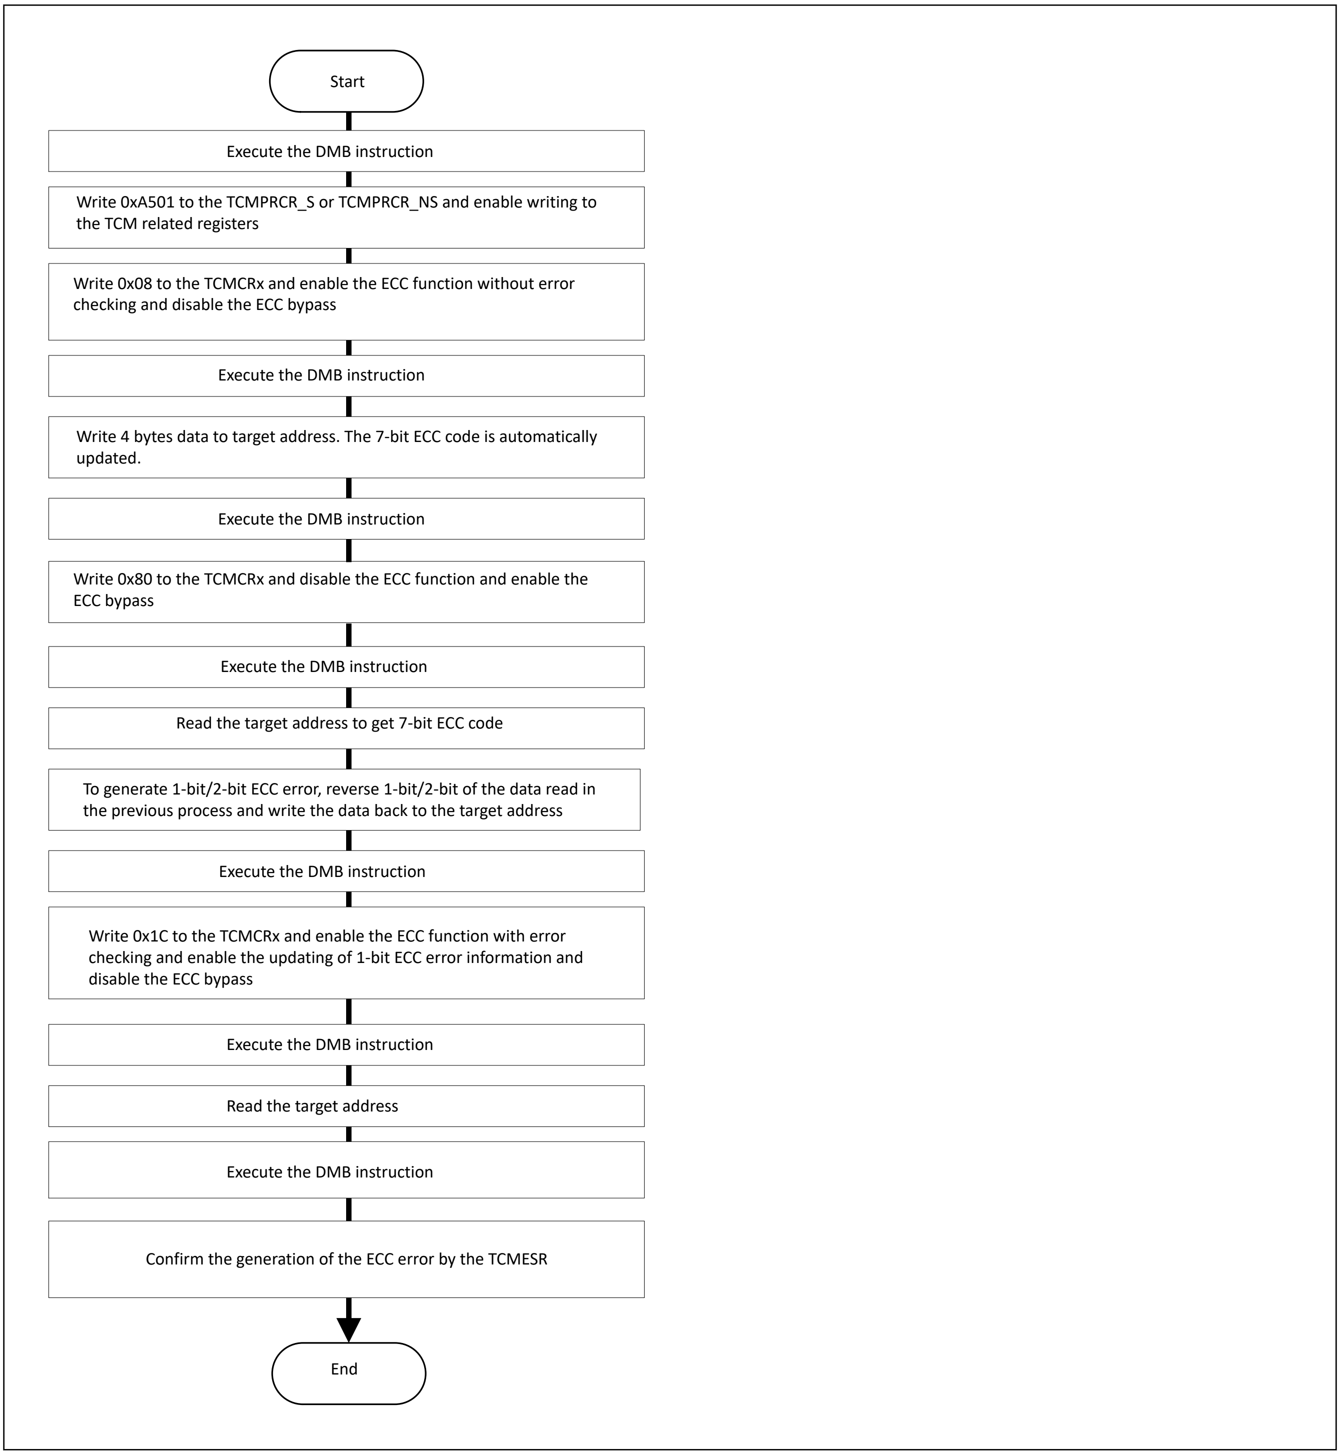

Figure 2.12 ECC decoder testing flowchart

2.17.4.2 TrustZone Filter Function

2.17.4.2.1 TrustZone Filter for TCM Registers

TCM registers can be protected with a Security Attribution (SA) from non-secure or secure transaction. When SA indicates that TCM registers are secure status, non-secure transaction cannot access them because TrustZone Filter detects an error and protects the access. When SA indicates that TCM registers are non-secure status, secure transaction cannot access them because TrustZone Filter detects an error and protects the access. SA for TCM registers is one to be used commonly among TCM registers.

For a failed access due to a TrustZone error, an error response is generated.

SA	Transaction	Write access	Read access
Secure	Secure	Permitted	Permitted
	Non-secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
Non-secure	Secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
	Non-secure	Permitted	Permitted

2.17.4.2.2 TrustZone Filter for TCM Memory Regions

C-TCM and S-TCM regions can divide into secure, non-secure independently. The access permissions for these regions are as follows.

SA	Transaction	Write access	Read access
Secure	Secure	Permitted	Permitted
	Non-secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
Non-secure	Secure	Protected (TrustZone Filter error)	Protected (TrustZone Filter error)
	Non-secure	Permitted	Permitted

A TrustZone Filter error for TCM memory, generates an error notification.

For details, see section 51, Security Features.

2.17.4.3 Interrupt Source

The TCM interrupt source includes an ECC error and a TrustZone Filter error.

ECC error can choose a reset request or an interrupt request by the TCMCRx.OAD bit.

The TCM interrupt occurs when an error status in the TCMESR register is set to 1. The TCM interrupt continues to occur until the error status in the TCMESR register is cleared.

When local memory error occurs (NMISR.LMST = 1 or RSTSR1.LM1RF = 1), read TCMESR and check the TCM interrupt source. When access is from the debugger, the error is detected and corrected, but no error status is set, and no reset request or interrupt request is output.

For more details on Debug mode, see section 2, CPU.

Table 2.41 TCM interrupt source

Name	Interrupt source	DTC activation	DMAC activation
ECCERR	ECC error (x-TCM with ECC)	Not possible	Not possible
TZFLT	TrustZone Filter error	Not possible	Not possible

2.17.4.4 Wait Cycle

For write access with ECC function enabled (TCMCRx.ECCMOD[1] = 1) and access size is other than 32-bit (for example, 8-bit or 16-bit), a wait cycle occurs.

If access of the bus master conflicts with access of CPU1, the bus interface of TCM returns a wait cycle to the bus master until CPU1 finishes the access, because CPU1 has priority.

If there is a security breach in CPU1 or access of the bus master to TCM, TCM responds by inserting a wait cycle with an AHB error. In other case, no wait cycle is required.

2.17.5 Usage Notes

2.17.5.1 Note on TCM Memory Cell Test

Because the TCM has a write buffer, if reading from the same address after writing, data in the write buffer may be read instead of the TCM memory cell. When reading data written for testing of the TCM memory cell, insert the write according to the following procedure to avoid reading from a write buffer.

1. Write data to the test target address.
2. Inside the same TCM, write to an address 4 or more away from the address in step 1.
3. Read the data from the address in step 1.

3. Inter-Processor Communication (IPC)

3.1 Overview

Inter-Processor Communication (IPC) supports hardware sharing and communication between two processors. IPC can generate interrupt events to support communication between each processor.

Several semaphore mechanisms are required to achieve mutually exclusive access between processors. To achieve this, IPC implements multiple locks. Application developers select to use separate or shared hardware semaphores between the two CPUs. A mechanism is also required for simple data communication between CPUs. For example, a FIFO that CPU0 uses for write-only data and CPU1 uses for read-only data. In addition, for mutual use, a FIFO is required with CPU1 as write-only data and CPU0 as read-only data. Table 3.1 lists the IPC specifications.

Table 3.1 IPC specifications

Item		Description
Semaphore	Lock information	• A total of 16 factors • Security attributes and privileged attributes are selected every 8 factors
Inter-Processor interrupt	Non-maskable	• IPC0: one factor, one non-maskable interrupt, security attributes and privileged attributes are selected. • IPC1: one factor, one non-maskable interrupt, security attributes and privileged attributes are selected.
	Maskable	• IPC00: 8 factors, one maskable interrupt, security attributes and privileged attributes are selected[*1] • IPC01: 8 factors, one maskable interrupt, security attributes and privileged attributes are selected[*1] • IPC10: 8 factors, one maskable interrupt, security attributes and privileged attributes are selected[*1] • IPC11: 8 factors, one maskable interrupt, security attributes and privileged attributes are selected[*1]
Message-FIFO	FIFO	• Message FIFO 00 (CPU1 -> CPU0), one maskable interrupt, security attributes and privileged attributes are selected[*1] • Message FIFO 01 (CPU1 -> CPU0), one maskable interrupt, security attributes and privileged attributes are selected[*1] • Message FIFO 10 (CPU0 -> CPU1), one maskable interrupt, security attributes and privileged attributes are selected[*1] • Message FIFO 11 (CPU0 -> CPU1), one maskable interrupt, security attributes and privileged attributes are selected[*1] • 4 FIFO stages • Transfer data size 32 bits
	Error information	• Write with FIFO FULL[*1] • Read with FIFO Empty[*1]

Note 1. The interrupts for IPC00, Message FIFO 00 and Error information are common. The same applies to others.

3.2 Register Descriptions

IPC_BASE (base address of IPC) is 0x4002_0000 (Secure) and 0x5002_0000 (Non-secure).

CPSCU_BASE (base address of CPSCU) is 0x4000_8000 (Secure) and 0x5000_8000 (Non-secure).

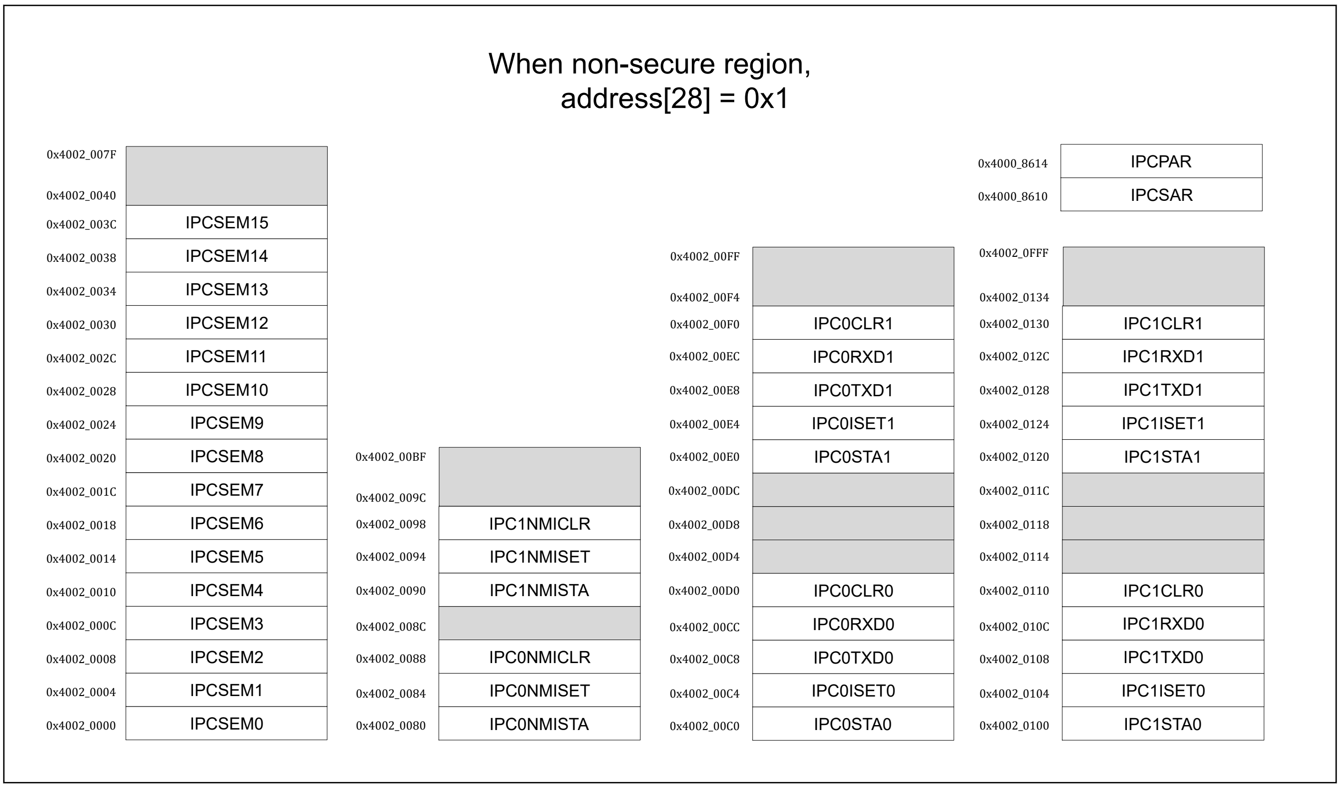

Figure 3.1 IPC register address map

Privileged attributes of registers. The target registers are as follow.

- IPC0STA0 register
- IPC0ISET0 register
- IPC0TXD0 register
- IPC0RXD0 register
- IPC0CLR0 register

PAIPCIR1 bit

Privileged attributes of registers. The target registers are as follow.

- IPC0STA1 register
- IPC0ISET1 register
- IPC0TXD1 register
- IPC0RXD1 register
- IPC0CLR1 register

PAIPCIR2 bit

Privileged attributes of registers. The target registers are as follow.

- IPC1STA0 register
- IPC1ISET0 register
- IPC1TXD0 register
- IPC1RXD0 register
- IPC1CLR0 register

PAIPCIR3 bit

Privileged attributes of registers. The target registers are as follow.

- IPC1STA1 register
- IPC1ISET1 register
- IPC1TXD1 register

- IPC1RXD1 register
- IPC1CLR1 register

3.2.3 IPCSEMn : Semaphore Register n (n = 0 to 15)

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x000 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LOCK
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LOCK	This bit indicates the shared resource is locked. Set condition : Reading this register. Clear condition : Writing 1 to this bit. 0: Unlocked 1: Locked	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: The LOCK bit is not set for reads with halfword access or byte access that do not include the b0.
Note: S-TYPE-3, P-TYPE-3

The IPC has the registers to perform semaphore for synchronization and exclusive control between CPU0 and CPU1. This register only indicates the status and does not have any hardware protection of shared memory. Thus, the exclusive control must be done by software that uses this register.

The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

LOCK bit (Shared resource is locked for Semaphore Control)

The LOCK bit of this register is used to achieve mutually exclusive access between processors. By using this bit, the application developer can select whether to use the hardware semaphore separately or in common between the two processors.

3.2.4 IPC0NMISTA : Inter-Processor0 NMI Request Status Register

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x080

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NMI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NMI	This bit indicates the status of interrupt request. 0: Not requesting interrupt 1: Requesting interrupt	R
31:1	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

The IPC0NMISTA register indicates that a non-maskable interrupt is issued from CPU0 to CPU1. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

NMI bit (NMI Request Set)

The NMI bit indicates an NMI interrupt request is issued from CPU0 to CPU1.

3.2.5 IPC0NMISET : Inter-Processor0 NMI Request Set Register

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SET
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SET	Writing 1 to the bit sets IPC0NMISTA.NMI.	W
31:1	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The IPC0NMISET register is used to issue a non-maskable interrupt from CPU0 to CPU1. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

SET bit (NMI Request Set)

When 1 is written, IPC0NMISTA.NMI is set to 1 and an NMI interrupt is issued to CPU0.

3.2.6 IPC0NMICLR : Inter-Processor0 NMI Request Clear Register

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x088

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLR	Writing 1 to this bit clears IPC0NMISTA.NMI.	W
31:1	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The IPC0NMICLR register is used for canceling non-maskable interrupt from CPU1 to CPU0. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

CLR bit (NMI Request Clear)

When 1 is written, IPC0NMISTA.NMI is clear to 0 and the NMI interrupt to CPU0 is canceled.

3.2.7 IPC1NMISTA : Inter-Processor1 NMI Request Status Register

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x090

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NMI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NMI	This bit indicates the status of interrupt request. 0: Not requesting interrupt 1: Requesting interrupt	R
31:1	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

The IPC1NMISTA register indicates that a non-maskable interrupt is issued from CPU0 to CPU1. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

NMI bit (NMI Request Status)

The NMI bit indicates an NMI interrupt request is issued from CPU0 to CPU1.

3.2.8 IPC1NMISET : Inter-Processor1 NMI Request Set Register

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x094

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SET
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SET	Writing 1 to this bit sets IPC1NMISTA.NMI.	W
31:1	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC1NMISET

register is used to issue a non-maskable interrupt from CPU0 to CPU1. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

SET bit (NMI Request Set)

When 1 is written, IPC1NMISTA.NMI is set to 1 and an NMI interrupt is issued to CPU1.

3.2.9 IPC1NMICLR : Inter-Processor1 NMI Request Clear Register

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x098

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CLR	Writing 1 to this bit clears IPC1NMISTA.NMI.	W
31:1	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC1NMICLR

register is used to cancel non-maskable interrupt from CPU0 to CPU1. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

CLR bit (NMI Request Clear)

When 1 is written, IPC1NMISTA.NMI is clear to 0 and the NMI interrupt to CPU1 is canceled.

3.2.10 IPC0STA0 : Inter-Processor0 Status Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FERR	RERR	—	—	—	—	—	—	FULL	RDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IRQ7	IRQ6	IRQ5	IRQ4	IRQ3	IRQ2	IRQ1	IRQ0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	IRQ7 to IRQ0	This bit indicates the status of interrupt request. 0: Not requesting interrupt 1: Requesting interrupt	R
15:8	—	These bits are read as 0. The write value should be 0.	R
16	RDY	This bit is set when FIFO is not empty. This bit is used for the interrupt request. 0: FIFO 00 data is not ready 1: FIFO 00 data is ready	R
17	FULL	0: FIFO 00 is not full 1: FIFO 00 is full	R
23:18	—	These bits are read as 0. The write value should be 0.	R
24	RERR	Indicates that the message FIFO 00 tried to read data despite being empty. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
25	FERR	Indicates that the message FIFO 00 tried to send more data even though it was full. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
31:26	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

This register indicates the status of the maskable interrupt IPC0IRQ0 from CPU1 to CPU0. When any of IRQn (n = 0 to 7), RDY, RERR, or FERR is 1, the IPC0IRQ0 interrupt is issued. Read this register in the interrupt handler to determine which interrupt has occurred. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

IRQn bit (Interrupt Request Status n (n = 0 to 7))

These bits indicate an interrupt to CPU0. Writing "1" to IPC0ISET0.SETn sets IRQn to "1". Writing "1" to IPC0CLR0.CLRn clears IRQn to "0". If any bit is "1", an IPC0IRQ0 interrupt request is issued.

RDY bit (Receive Data Ready)

When this bit is "1", it indicates that there is data received in the message FIFO 00 for CPU0. When the message FIFO is empty, this bit is "0". When this bit is "1", the IPC0IRQ0 interrupt request is issued.

FULL bit (FIFO Full)

The depth of message FIFO 00 is 4. When this bit is "1", it indicates that the message FIFO 00 is full.

RERR bit (RDY Error Status)

When reading IPC0RXD0 while the RDY bit is "0", this bit sets to "1". Writing "1" to the IPC0CLR0.RCLR bit clears this bit to "0". When this bit is "1", the IPC0IRQ0 interrupt request is issued.

FERR bit (FULL Error Status)

When writing to IPC0TXD0 while the FULL bit is "1", this bit sets to "1". Writing "1" to the IPC0CLR0.FCLR bit clears this bit to "0". When this bit is "1", the IPC0IRQ0 interrupt request is issued.

3.2.11 IPC0ISET0 : Inter-Processor0 IRQ Request Set Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SET7	SET6	SET5	SET4	SET3	SET2	SET1	SET0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SETn (n = 0 to 7)	Writing 1 to this bit sets IPC0STA0.IRQn	W
31:8	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC0ISET0

register is used to issue a maskable interrupt from CPU0 to CPU1. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

SETn bit (Interrupt Request Set n (n = 0 to 7))

When 1 is written, IPC0STA0.IRQn is set to 1 and a maskable interrupt to CPU0 is issued.

3.2.12 IPC0TXD0 : Inter-Processor0 FIFO Transfer Data Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0C8

Bit position: 31 … 0

Bit field: TXD[31:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	TXD[31:0]	Transmit data for the Message FIFO 00	W

Note: Only writing with a 32-bit data size is valid. Halfword or byte access is ignored.
Note: S-TYPE-3, P-TYPE-3

This is a register for writing data to message FIFO 00 from CPU1 to CPU0. Write to this register by CPU1. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

TXD[31:0] bits (Transmit data for the Message FIFO 00)

Writing to this register sets the transmit data in message FIFO 00 and the IPC0STA0.RDY bit becomes "1". If you write to this register while the IPC0STA0.FULL bit is "1", the write operation is ignored, and the IPC0STA0.FERR bit becomes "1".

3.2.13 IPC0RXD0 : Inter-Processor0 FIFO Receive Data Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0CC

Bit position:	31–0
Bit field:	RXD[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	RXD[31:0]	Received data from the message FIFO 00 Reading this register updates it with the next received data in the message FIFO 00.	R

Note: If a TRZ error occurs, the read is 0 and it does not update to the next data.
S-TYPE-3, P-TYPE-3

This register is for reading received data from the message FIFO 00 from CPU1 to CPU0. Read this register by CPU0. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

RXD[31:0] bits (Received data from the message FIFO 00)

If this register is read while the IPC0STA0.RDY bit is "0", the IPC0STA0.RERR bit is set to "1".

3.2.14 IPC0CLR0 : Inter-Processor0 Clear Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0D0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FCLR	RCLR	—	—	—	—	—	—	—	RST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CLR7	CLR6	CLR5	CLR4	CLR3	CLR2	CLR1	CLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CLRn (n = 0 to 7)	Writing 1 to this bit clears IPC0STA0.IRQn.	W
15:8	—	These bits are read as 0. The write value should be 0.	W
16	RST	Writing 1 resets Message FIFO 00.	W
23:17	—	These bits are read as 0. The write value should be 0.	W
24	RCLR	Writing 1 resets IPC0STA0.RERR.	W
25	FCLR	Writing 1 resets IPC0STA0. FERR.	W
31:26	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The

IPC0CLR0

register is used to cancel the maskable interrupt from CPU1 to CPU0. The register can then be used to cancel the FIFO transfer. It can also clear the Error flag that occurred in the FIFO. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

CLRn bits (Interrupt Request Clear n (n = 0 to 7))

When 1 is written, IPC0STA0.IRQn is clear to 0. All bits of IPC0STA0 are 0 and maskable interrupts to CPU0 are cancelled.

RST bit (FIFO Reset)

When 1 is written, the RST bit resets Message FIFO 00. The data stored in the FIFO becomes invalid and the following registers are cleared:

- IPC0STA0.FULL
- IPC0STA0.RDY

If there is no interrupt event other than the message FIFO, the interrupt request is canceled.

RCLR bit (Clear RDY Error Status 00)

The RCLR bit clears IPC0STA0.RERR.

FCLR bit (Clear FULL Error Status 00)

The FCLR bit clears IPC0STA0. FERR.

3.2.15 IPC0STA1 : Inter-Processor0 Status Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FERR	RERR	—	—	—	—	—	—	FULL	RDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IRQ7	IRQ6	IRQ5	IRQ4	IRQ3	IRQ2	IRQ1	IRQ0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	IRQn (n = 0 to 7)	This bit indicates the status of interrupt request. 0: Not requesting interrupt 1: Requesting interrupt	R
15:8	—	These bits are read as 0. The write value should be 0.	R
16	RDY	This bit is set when FIFO is not empty. This bit is used for the interrupt request. 0: FIFO 01 data is not ready 1: FIFO 01 data is ready	R
17	FULL	0: FIFO 01 is not full 1: FIFO 01 is full	R
23:18	—	These bits are read as 0. The write value should be 0.	R
24	RERR	Indicates that the message FIFO 01 tried to read data despite being empty. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R

Bit	Symbol	Function	R/W
25	FERR	Indicates that the message FIFO 01 tried to send more data even though it was full. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
31:26	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

This register indicates the status of the maskable interrupt IPC0IRQ1 from CPU1 to CPU0. When any of IRQn (n = 0 to 7), RDY, RERR, or FERR is '1', the IPC0IRQ1 interrupt is issued. Read this register in the interrupt handler to determine which interrupt has occurred. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

IRQn bit (Interrupt Request Status n (n = 0 to 7))

These bits indicate an interrupt to CPU0. Writing "1" to IPC0ISET1.SETn sets IRQn to "1". Writing "1" to IPC0CLR1.CLRn clears IRQn to "0". If any bit is "1", an IPC0IRQ1 interrupt request is issued.

RDY bit (Receive Data Ready)

When this bit is "1", it indicates that there is data received in the message FIFO 01 for CPU0. When the message FIFO is empty, this bit is "0". When this bit is "1", the IPC0IRQ1 interrupt request is issued.

FULL bit (FIFO Full)

The depth of message FIFO 01 is 4. When this bit is "1", it indicates that the message FIFO 01 is full.

RERR bit (RDY Error Status)

When reading IPC0RXD1 while the RDY bit is "0", this bit sets to "1". Writing "1" to the IPC0CLR1.RCLR bit clears this bit to "0". When this bit is "1", the IPC0IRQ1 interrupt request is issued.

FERR bit (FULL Error Status)

When writing to IPC0TXD1 while the FULL bit is "1", this bit sets to "1". Writing "1" to the IPC0CLR1.FCLR bit clears this bit to "0". When this bit is "1", the IPC0IRQ1 interrupt request is issued.

3.2.16 IPC0ISET1 : Inter-Processor0 IRQ Request Set Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0E4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SET7	SET6	SET5	SET4	SET3	SET2	SET1	SET0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SETn (n = 0 to 7)	Writing 1 to this bit sets IPC0STA1.IRQn.	W
31:8	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC0ISET1

register is used to issue a maskable interrupt from CPU1 to CPU0. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

SETn bit (Interrupt Request Set n (n = 0 to 7))

When 1 is written, IPC0STA1.IRQn is set to 1 and a maskable interrupt to CPU0 is issued.

3.2.17 IPC0TXD1 : Inter-Processor0 FIFO Transfer Data Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0E8

Bit position:	31–0
Bit field:	TXD[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	TXD[31:0]	Transmit data for the Message FIFO 01	W

Note: Only writing with a 32-bit data size is valid. Halfword or byte access is ignored.
Note: S-TYPE-3, P-TYPE-3

This is a register for writing data to message FIFO 01 from CPU1 to CPU0. Write to this register by CPU1. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

TXD[31:0] bits (Transmit data for the Message FIFO 01)

Writing to this register sets the transmit data in message FIFO 01 and the IPC0STA1.RDY bit becomes "1". If you write to this register while the IPC0STA1.FULL bit is "1", the write operation is ignored, and the IPC0STA1.FERR bit becomes "1".

3.2.18 IPC0RXD1 : Inter-Processor0 FIFO Receive Data Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0EC

Bit position:	31–0
Bit field:	RXD[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	RXD[31:0]	Received data from the message FIFO 01 Reading this register updates it with the next received data in the message FIFO 01.	R

Note: If a TRZ error occurs, the read is 0 and it does not update to the next data.
S-TYPE-3, P-TYPE-3

This register is for reading received data from the message FIFO 01 from CPU1 to CPU0. Read this register by CPU0. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

RXD[31:0] bits (Received data from the message FIFO 01)

If this register is read while the IPC0STA1.RDY bit is "0", the IPC0STA1.RERR bit is set to "1".

3.2.19 IPC0CLR1 : Inter-Processor0 Clear Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x0F0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FCLR	RCLR	—	—	—	—	—	—	—	RST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CLR7	CLR6	CLR5	CLR4	CLR3	CLR2	CLR1	CLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CLRn (n = 0 to 7)	Writing 1 to this bit clears IPC0STA1.IRQn.	W
15:8	—	These bits are read as 0. The write value should be 0.	W
16	RST	Writing 1, then resets Message FIFO 01.	W
23:17	—	These bits are read as 0. The write value should be 0.	W
24	RCLR	Writing 1 resets IPC0STA1.RERR.	W
25	FCLR	Writing 1 resets IPC0STA1. FERR.	W
31:26	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC0CLR1

register is used to cancel the maskable interrupt from CPU1 to CPU0. The register can then be used to cancel the FIFO transfer. This register can also clear the Error flag that occurred in the FIFO. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

CLRn bit (Interrupt Request Clear n (n = 0 to 7))

When 1 is written, IPC0STA1.IRQn is cleared to 0. All bits of IPC0STA1 are 0, and maskable interrupts to CPU0 are cancelled.

RST bit (FIFO Reset)

Writing 1 to the RST bit resets message FIFO 01. The data stored in the FIFO becomes invalid and the following registers are cleared:

- IPC0STA1.FULL
- IPC0STA1.RDY

If there is no interrupt event other than the message FIFO, the interrupt request is canceled.

RCLR bit (Clear RDY Error Status 01)

The RCLR bit clears IPC0STA1.RERR.

FCLR bit (Clear FULL Error Status 01)

The FCLR bit clears IPC0STA1. FERR.

3.2.20 IPC1STA0 : Inter-Processor1 Status Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FERR	RERR	—	—	—	—	—	—	FULL	RDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IRQ7	IRQ6	IRQ5	IRQ4	IRQ3	IRQ2	IRQ1	IRQ0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	IRQn (n = 0 to 7)	This bit indicates the status of interrupt request. 0: Not requesting interrupt 1: Requesting interrupt	R
15:8	—	These bits are read as 0. The write value should be 0.	R
16	RDY	This bit is set when FIFO is not empty. This bit is used for the interrupt request. 0: FIFO 10 data is not ready 1: FIFO 10 data is ready	R
17	FULL	0: FIFO 10 is not full 1: FIFO 10 is full	R
23:18	—	These bits are read as 0. The write value should be 0.	R
24	RERR	This bit indicates that the message FIFO 10 tried to read data despite being empty. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
25	FERR	This bit indicates that the message FIFO 10 tried to send more data even though it was full. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
31:26	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

This register indicates the status of the maskable interrupt IPC1IRQ0 from CPU0 to CPU1. When any of IRQn (n = 0 to 7), RDY, RERR, or FERR is '1', the IPC1IRQ0 interrupt is issued. Read this register in the interrupt handler to determine which interrupt has occurred. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

IRQn bit (Interrupt Request Status n (n = 0 to 7))

These bits indicate an interrupt to CPU1. Writing "1" to IPC1ISET0.SETn sets IRQn to "1". Writing "1" to IPC1CLR0.CLRn clears IRQn to "0". If any bit is "1", an IPC1IRQ0 interrupt request is issued.

RDY bit (Receive Data Ready)

When this bit is "1", it indicates that there is data received in the message FIFO 10 for CPU1. When the message FIFO is empty, this bit is "0". When this bit is "1", the IPC1IRQ0 interrupt request is issued.

FULL bit (FIFO Full)

The depth of message FIFO 10 is 4. When this bit is "1", it indicates that the message FIFO 10 is full.

RERR bit (RDY Error Status)

When reading IPC1RXD0 while the RDY bit is "0", this bit sets to "1". Writing "1" to the IPC1CLR0.RCLR bit clears this bit to "0". When this bit is "1", the IPC1IRQ0 interrupt request is issued.

FERR bit (FULL Error Status)

When writing to IPC1TXD0 while the FULL bit is "1", this bit sets to "1". Writing "1" to the IPC1CLR0.FCLR bit clears this bit to "0". When this bit is "1", the IPC1IRQ0 interrupt request is issued.

3.2.21 IPC1ISET0 : Inter-Processor1 IRQ Request Set Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SET7	SET6	SET5	SET4	SET3	SET2	SET1	SET0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SETn (n = 0 to 7)	Writing 1 to this bit sets IPC1STA0.IRQn.	W
31:8	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC1ISET0

register is used to issue a maskable interrupt from CPU0 to CPU1. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

SETn bit (Interrupt Request Set n (n = 0 to 7))

When 1 is written, IPC1STA0.IRQn is set to 1 and a maskable interrupt to CPU1 is issued.

3.2.22 IPC1TXD0 : Inter-Processor1 FIFO Transfer Data Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x108

Bit position:	31 … 0
Bit field:	TXD[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	TXD[31:0]	Transmit data for the Message FIFO 10	W

Note: Only writing with a 32-bit data size is valid. Halfword or byte access is ignored.
Note: S-TYPE-3, P-TYPE-3

This is a register for writing data to message FIFO 10 from CPU0 to CPU1. Write to this register by CPU0. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

TXD[31:0] bits (Transmit data for the Message FIFO 10)

Writing to this register sets the transmit data in message FIFO 10 and the IPC1STA0.RDY bit becomes "1". If you write to this register while the IPC1STA0.FULL bit is "1", the write operation is ignored, and the IPC1STA0.FERR bit becomes "1".

3.2.23 IPC1RXD0 : Inter-Processor1 FIFO Receive Data Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x10C

Bit position:	31 ... 0
Bit field:	RXD[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	RXD[31:0]	Received data from the message FIFO 10 Reading this register updates it with the next received data in the message FIFO 10.	R

Note: If a TRZ error occurs, the read is 0 and it does not update to the next data.
S-TYPE-3, P-TYPE-3

This register is for reading received data from the message FIFO 10 from CPU0 to CPU1. Read this register by CPU1. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

RXD[31:0] bits (Received data from the message FIFO 10)

If this register is read while the IPC1STA0.RDY bit is "0", the IPC1STA0.RERR bit is set to "1".

3.2.24 IPC1CLR0 : Inter-Processor1 Request Clear Register0

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FCLR	RCLR	—	—	—	—	—	—	—	RST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CLR7	CLR6	CLR5	CLR4	CLR3	CLR2	CLR1	CLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CLRn (n = 0 to 7)	Writing 1 to this bit clears IPC1STA0.IRQn.	W
15:8	—	These bits are read as 0. The write value should be 0.	W
16	RST	Writing 1 resets Message FIFO 10.	W
23:17	—	These bits are read as 0. The write value should be 0.	W
24	RCLR	Writing 1 resets IPC1STA0.RERR.	W
25	FCLR	Writing 1 resets IPC1STA0. FERR.	W
31:26	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC1CLR0

register is used to cancel the maskable interrupt from CPU0 to CPU1. The register can then be used to cancel the FIFO transfer. It can also clear the Error flag that occurred in the FIFO. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

CLRn bit (Interrupt Request Clear n (n = 0 to 7))

When 1 is written, IPC1STA0.IRQn is cleared to 0. All bits of IPC1STA0 are 0, and maskable interrupts to CPU1 are cancelled.

RST bit (FIFO Reset)

Writing 1 to the RST bit resets message FIFO 10. The data stored in the FIFO becomes invalid and the following registers are cleared:

- IPC1STA0.FULL
- IPC1STA0.RDY

If there is no interrupt event other than the message FIFO, the interrupt request is canceled.

RCLR bit (Clear RDY Error Status 10)

The RCLR bit clears IPC1STA0.RERR.

FCLR bit (Clear FULL Error Status 10)

The FCLR bit clears IPC1STA0. FERR.

3.2.25 IPC1STA1 : Inter-Processor1 Request Status Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x120

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FERR	RERR	—	—	—	—	—	—	FULL	RDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	IRQ7	IRQ6	IRQ5	IRQ4	IRQ3	IRQ2	IRQ1	IRQ0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	IRQn (n = 0 to 7)	This bit indicates the status of interrupt request. 0: Not requesting interrupt 1: Requesting interrupt	R
15:8	—	These bits are read as 0. The write value should be 0.	R
16	RDY	This bit is set when FIFO is not empty. This bit is used for the interrupt request. 0: FIFO 11 data is not ready 1: FIFO 11 data is ready	R
17	FULL	0: FIFO 11 is not full 1: FIFO 11 is full	R
23:18	—	These bits are read as 0. The write value should be 0.	R
24	RERR	Indicates that the message FIFO 11 tried to read data despite being empty. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
25	FERR	Indicates that the message FIFO 11 tried to send more data even though it was full. 0: Not Error. Not requesting interrupt. 1: Error. Requesting interrupt.	R
31:26	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-3, P-TYPE-3

This register indicates the status of the maskable interrupt IPC1IRQ1 from CPU0 to CPU1. When any of IRQn (n = 0 to 7), RDY, RERR, or FERR is '1', the IPC1IRQ1 interrupt is issued. Read this register in the interrupt handler to determine which interrupt has occurred. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

IRQn bit (Interrupt Request Status n (n = 0 to 7))

These bits indicate an interrupt to CPU1. Writing "1" to IPC1ISET1.SETn sets IRQn to "1". Writing "1" to IPC1CLR1.CLRn clears IRQn to "0". If any bit is "1", an IPC1IRQ1 interrupt request is issued.

RDY bit (Receive Data Ready)

When this bit is "1", it indicates that there is data received in the message FIFO 11 for CPU1. When the message FIFO is empty, this bit is "0". When this bit is "1", the IPC1IRQ1 interrupt request is issued.

FULL bit (FIFO Full)

The depth of message FIFO 11 is 4. When this bit is "1", it indicates that the message FIFO 11 is full.

RERR bit (RDY Error Status)

When reading IPC1RXD1 while the RDY bit is "0", this bit sets to "1". Writing "1" to the IPC1CLR1.RCLR bit clears this bit to "0". When this bit is "1", the IPC1IRQ1 interrupt request is issued.

FERR bit (FULL Error Status)

When writing to IPC1TXD1 while the FULL bit is "1", this bit sets to "1". Writing "1" to the IPC1CLR1.FCLR bit clears this bit to "0". When this bit is "1", the IPC1IRQ1 interrupt request is issued.

3.2.26 IPC1ISET1 : Inter-Processor1 IRQ Request Set Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x124

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SET7	SET6	SET5	SET4	SET3	SET2	SET1	SET0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SETn (n = 0 to 7)	Writing 1 to this bit sets IPC1STA1.IRQn.	W
31:8	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC1ISET1

register is used to issue a maskable interrupt from CPU0 to CPU1. The IRQ is assigned eight events, but there is only one interrupt event The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

SETn bit (Interrupt Request Set n (n = 0 to 7))

When 1 is written, IPC1STA1.IRQn is set to 1 and a maskable interrupt to CPU1 is issued.

3.2.27 IPC1TXD1 : Inter-Processor1 FIFO Transfer Data Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x128

Bit position:	31	...	0
Bit field:	TXD[31:0]		
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		

Bit	Symbol	Function	R/W
31:0	TXD[31:0]	Transmit data for the Message FIFO 11	W

Note: Only writing with a 32-bit data size is valid. Halfword or byte access is ignored.
Note: S-TYPE-3, P-TYPE-3

This is a register for writing data to message FIFO 11 from CPU0 to CPU1. Write to this register by CPU0. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

TXD[31:0] bits (Transmit data for the Message FIFO 11)

Writing to this register sets the transmit data in message FIFO 11 and the IPC1STA1.RDY bit becomes "1". If you write to this register while the IPC1STA1.FULL bit is "1", the write operation is ignored, and the IPC1STA1.FERR bit becomes "1".

3.2.28 IPC1RXD1 : Inter-Processor1 FIFO Receive Data Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x12C

Bit position:	31	...	0
Bit field:	RXD[31:0]		
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0		

Bit	Symbol	Function	R/W
31:0	RXD[31:0]	Received data from the message FIFO 11 Reading this register updates it with the next received data in the message FIFO 11.	R

Note: If a TRZ error occurs, the read is 0 and it does not update to the next data.
S-TYPE-3, P-TYPE-3

This register is for reading received data from the message FIFO 11 from CPU0 to CPU1. Read this register by CPU1. The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR.

RXD[31:0] bits (Received data from the message FIFO 11)

If this register is read while the IPC1STA1.RDY bit is "0", the IPC1STA1.RERR bit is set to "1".

3.2.29 IPC1CLR1 : Inter-Processor1 Clear Register1

Base address: IPC = 0x4002_0000
IPC_NS = 0x5002_0000

Offset address: 0x130

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	FCLR	RCLR	—	—	—	—	—	—	—	RST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CLR7	CLR6	CLR5	CLR4	CLR3	CLR2	CLR1	CLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CLRn (n = 0 to 7)	Writing 1 to this bit clears IPC0IRQSTA1.IRQn.	W
15:8	—	These bits are read as 0. The write value should be 0.	W
16	RST	Writing 1 resets message FIFO 11.	W
23:17	—	These bits are read as 0. The write value should be 0.	W
24	RCLR	Writing 1 resets IPC1STA1.RERR.	W
25	FCLR	Writing 1resets IPC1STA1. FERR.	W
31:26	—	These bits are read as 0. The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-3

The
IPC1CLR1

register is used to cancel the maskable interrupt from CPU0 to CPU1. The register can then be used to cancel the FIFO transfer. It can also clear the Error flag that occurred in the FIFO. The IRQ is assigned eight events, but there is only one interrupt event. The security of this register depends on IPCSAR. The privilege of this register depends on IPCPAR.

CLRn bit (Interrupt Request Clear n (n = 0 to 7))

When 1 is written, IPC1STA1.IRQn is cleared to 0. All bits of IPC1STA1 are 0, and maskable interrupts to CPU1 are cancelled.

RST bit (FIFO Reset)

Writing 1 resets the message FIFO 11. The data stored in the FIFO becomes invalid and the following registers are cleared:

- IPC1STA1.FULL
- IPC1STA1.RDY

If there is no interrupt event other than the message FIFO, the interrupt request is canceled.

RCLR bit (Clear RDY Error Status 11)

The RCLR bit clears IPC1STA1.RERR.

FCLR bit (Clear FULL Error Status 11)

The FCLR bit clears IPC1STA1. FERR.

3.3 Operation

3.3.1 Semaphore

The IPC has registers to perform semaphore for synchronization and exclusive control between CPU0 and CPU1.

Figure 3.2 shows the structure of the IPCSEM register used for semaphore control.

This register only indicates the status and does not have any hardware protection of shared memory. Thus, the exclusive control must be done by software that uses this register.

Security attributes and privileged attributes must be set in common for IPCSEM0 to IPCSEM7, and IPCSEM8 to IPCSEM15.

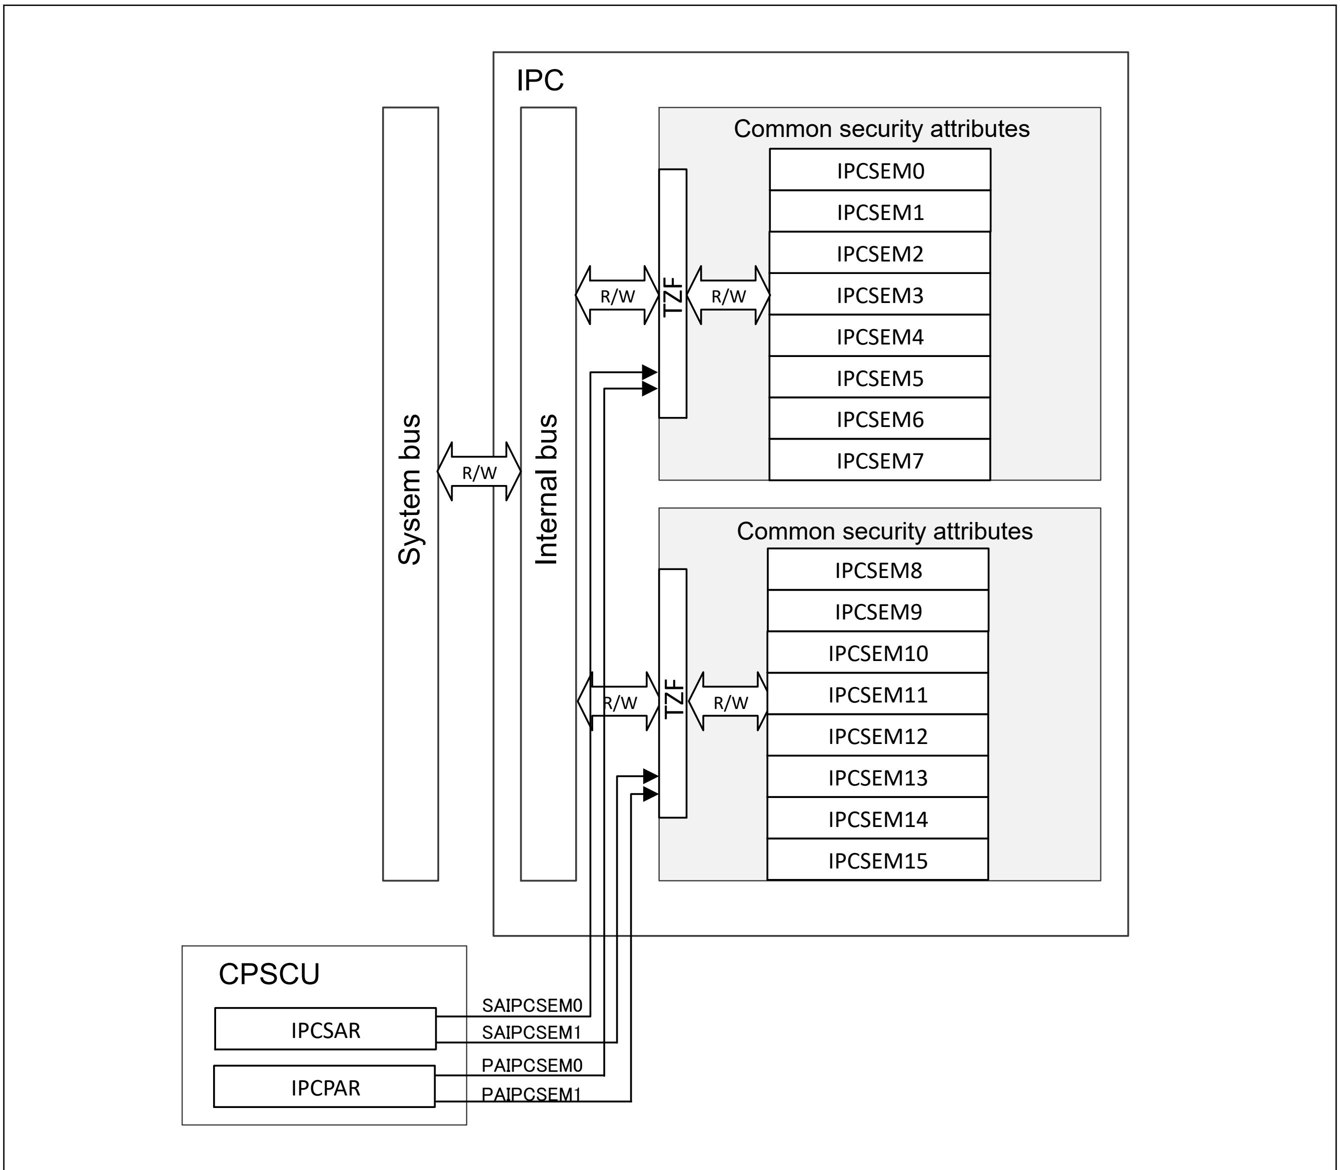

Figure 3.2 IPCSEM register

3.3.2 Inter-processor Non-maskable Interrupt

IPC supports the Inter-processor Non-maskable Interrupt feature between CPU0 and CPU1. Figure 3.3 shows the configuration diagram of the "Inter-processor Non-maskable Interrupt" function. IPC0NMI is the non-maskable interrupt from CPU1 to CPU0 and IPC1NMI is the one from CPU0 to CPU1. IPCiNMI (i = 0, 1) functions are controlled by IPCiNMISTA, IPCiNMISET, and IPCiNMICLR. The security attributes of these bits are controlled by IPCSAR and privileged attributes of these bits are controlled by IPCPAR.

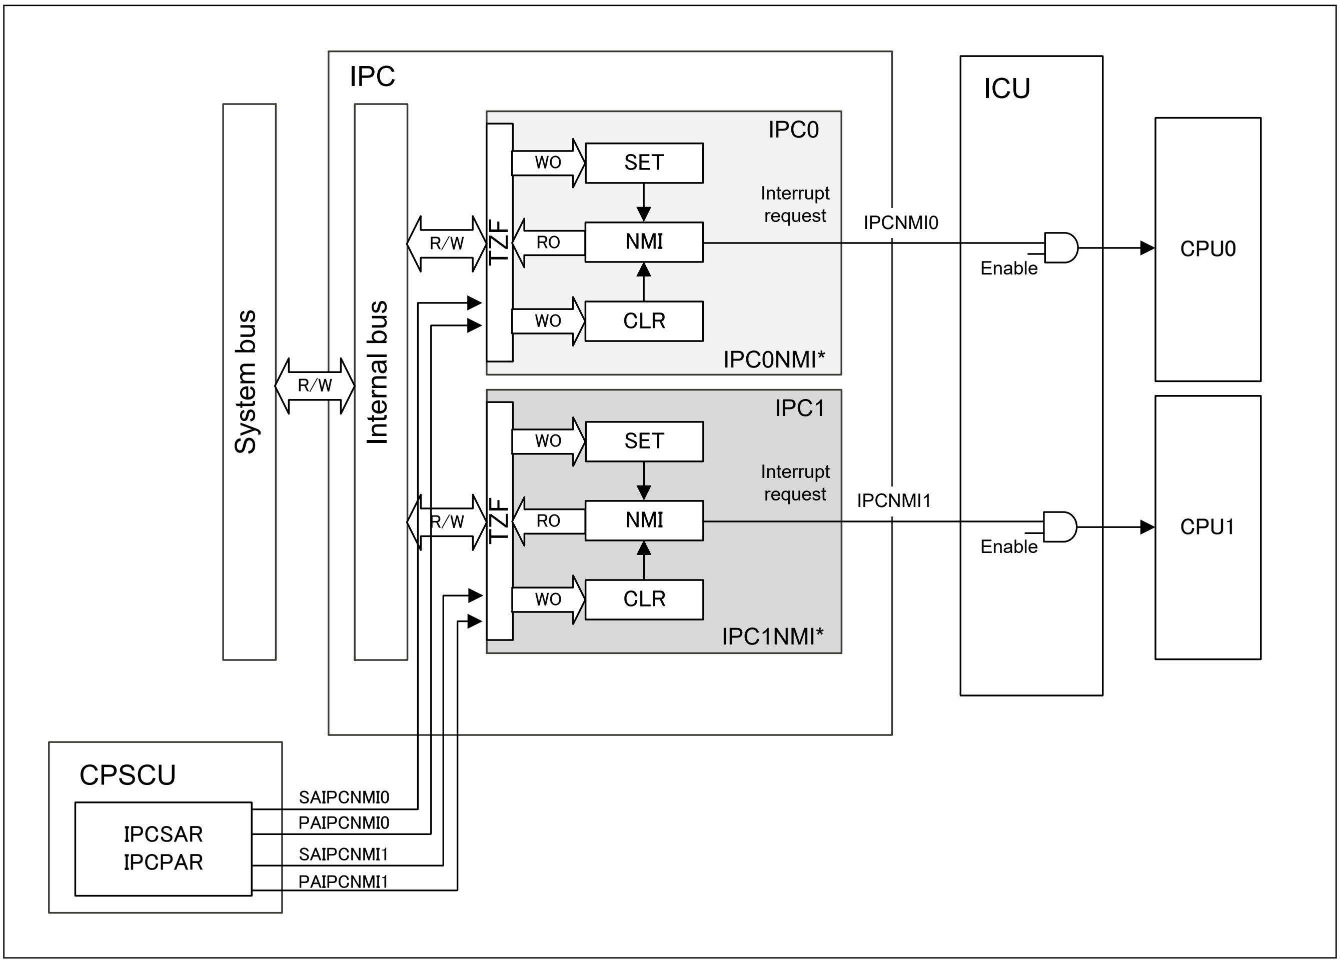

Figure 3.3 Inter-processor non-maskable interrupt

The CPU can only select either Secure or Non-secure for NMI. The IPC NMI security attribute must also be set accordingly. See section 14, Interrupt Controller Unit (ICU) for controls on mixing Secure and Non-secure NMIs. If the IPC does not use NMI interrupt, mask it in the ICU register.

3.3.3 Inter-processor Maskable Interrupt

IPC supports the Inter-processor Maskable Interrupt feature between CPU0 and CPU1. Figure 3.4 shows the configuration diagram of the "Inter-processor Maskable Interrupt" function. IPC0IRQj (j = 0, 1) is the maskable interrupt from CPU1 to CPU0 and IPC1IRQj (j = 0, 1) is the maskable interrupt from CPU0 to CPU1. IPCiIRQj (i = 0, 1), (j = 0, 1) are controlled by IPCiSTAj.IRQn, IPCiISETj.SETn, IPCiCLRj.CLRn (n = 0 to 7) respectively. The security attributes of the registers related to this function are controlled by IPCSAR, and the privileged attributes are controlled by IPCPAR. Security attributes and privileged attributes can be set for each IPCiIRQj (i = 0, 1), (j = 0, 1). Each IPCiIRQj has eight interrupt request sources, IPCiSTAj.IRQn (n = 0 to 7).

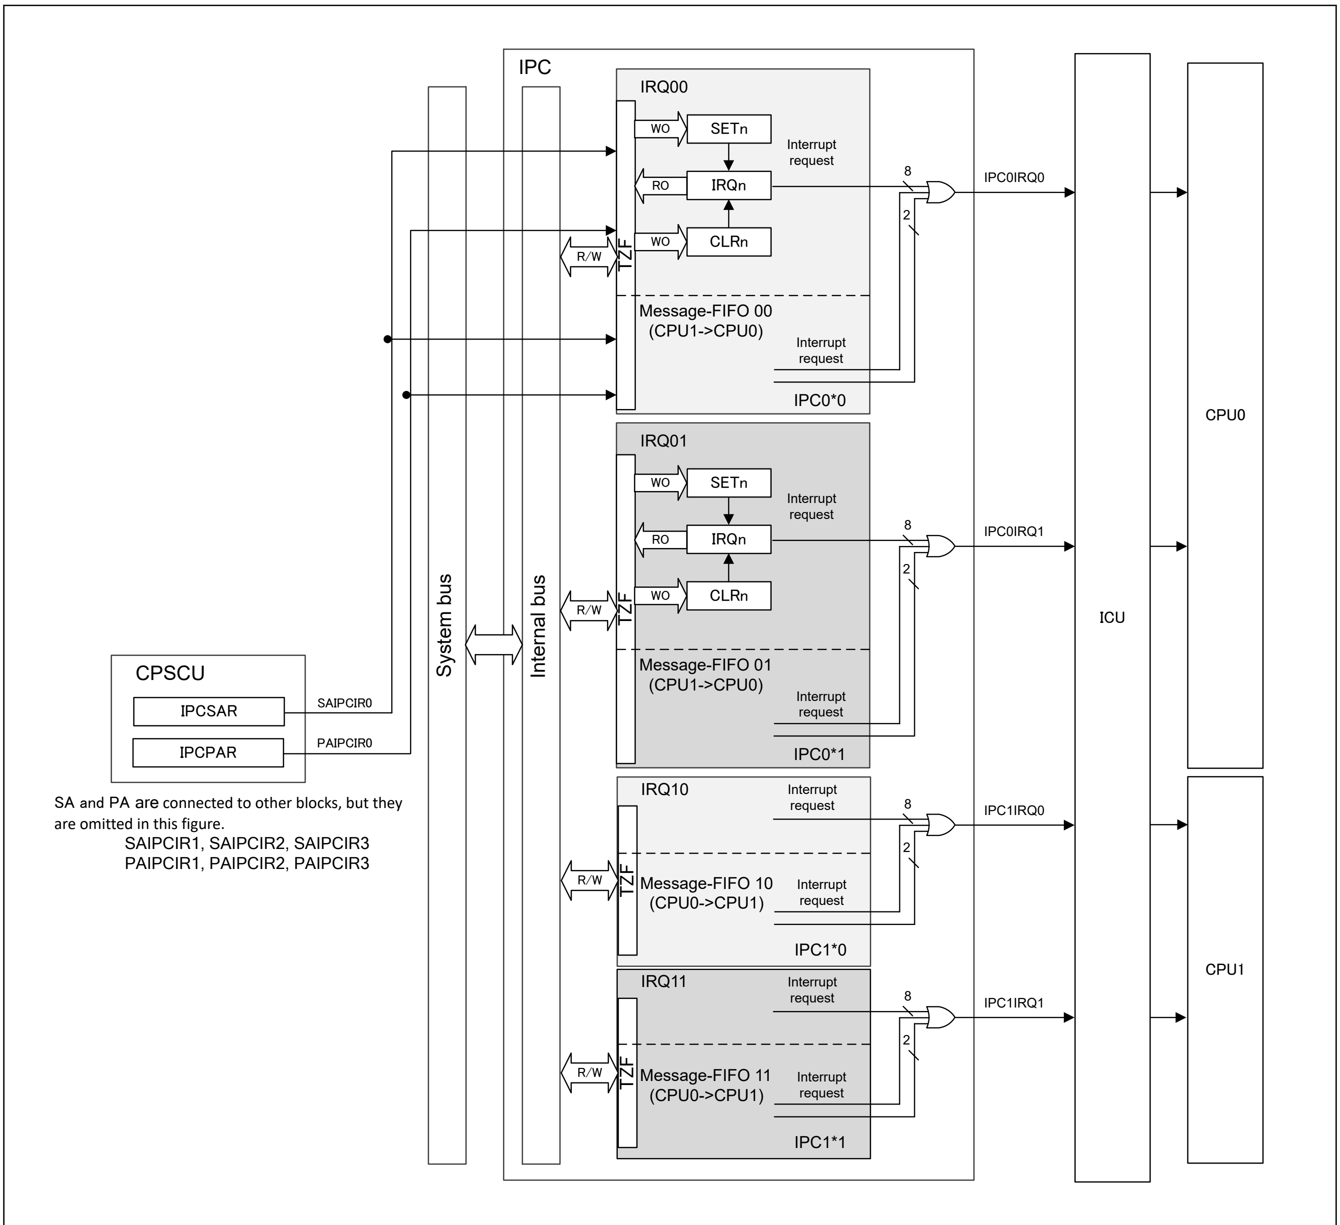

Figure 3.4 Inter-processor maskable interrupt

3.3.4 Exclusive Control Flow

Figure 3.5 shows an example of the exclusive access control flow when semaphore is executed between two CPUs.

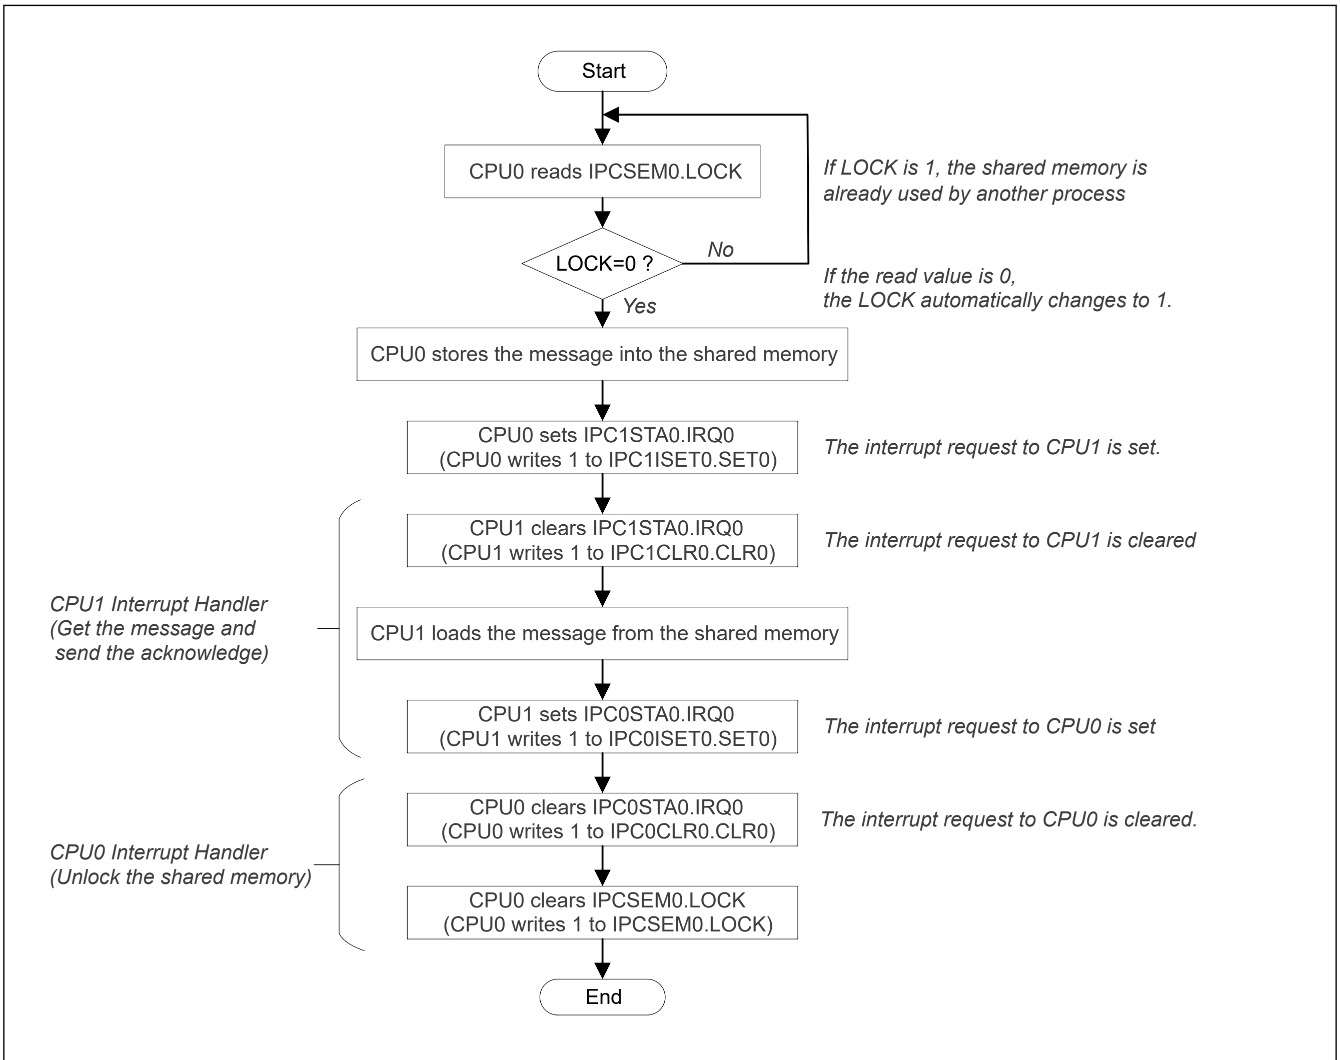

Figure 3.5 Example flow of CPU0 sending a message to CPU1

3.3.5 Message-FIFO

The IPC has four FIFOs. IPC00 and IPC01 are FIFOs that transmit data from CPU1 to CPU0, and IPC10 and IPC11 are FIFOs that transmit data from CPU0 to CPU1. Each FIFO issues the maskable interrupt IPCiIRQj (i = 0, 1), (j = 0, 1) as shown in the following figure. IPCiIRQj is issued when there is a request in the Message-FIFO (RDY = 1), when the Message-FIFO is full and you write to it (FERR = 1), or when the Message-FIFO is empty and you read from it (RERR = 1) in IRQij (i = 0, 1; j = 0, 1). The security attributes of this register are controlled by IPCSAR. The privileged attribute of this register is controlled by IPCPAR. Security attributes and privileged attributes can be set for each FIFO. Figure 3.6 shows an image diagram of the message-FIFOs.

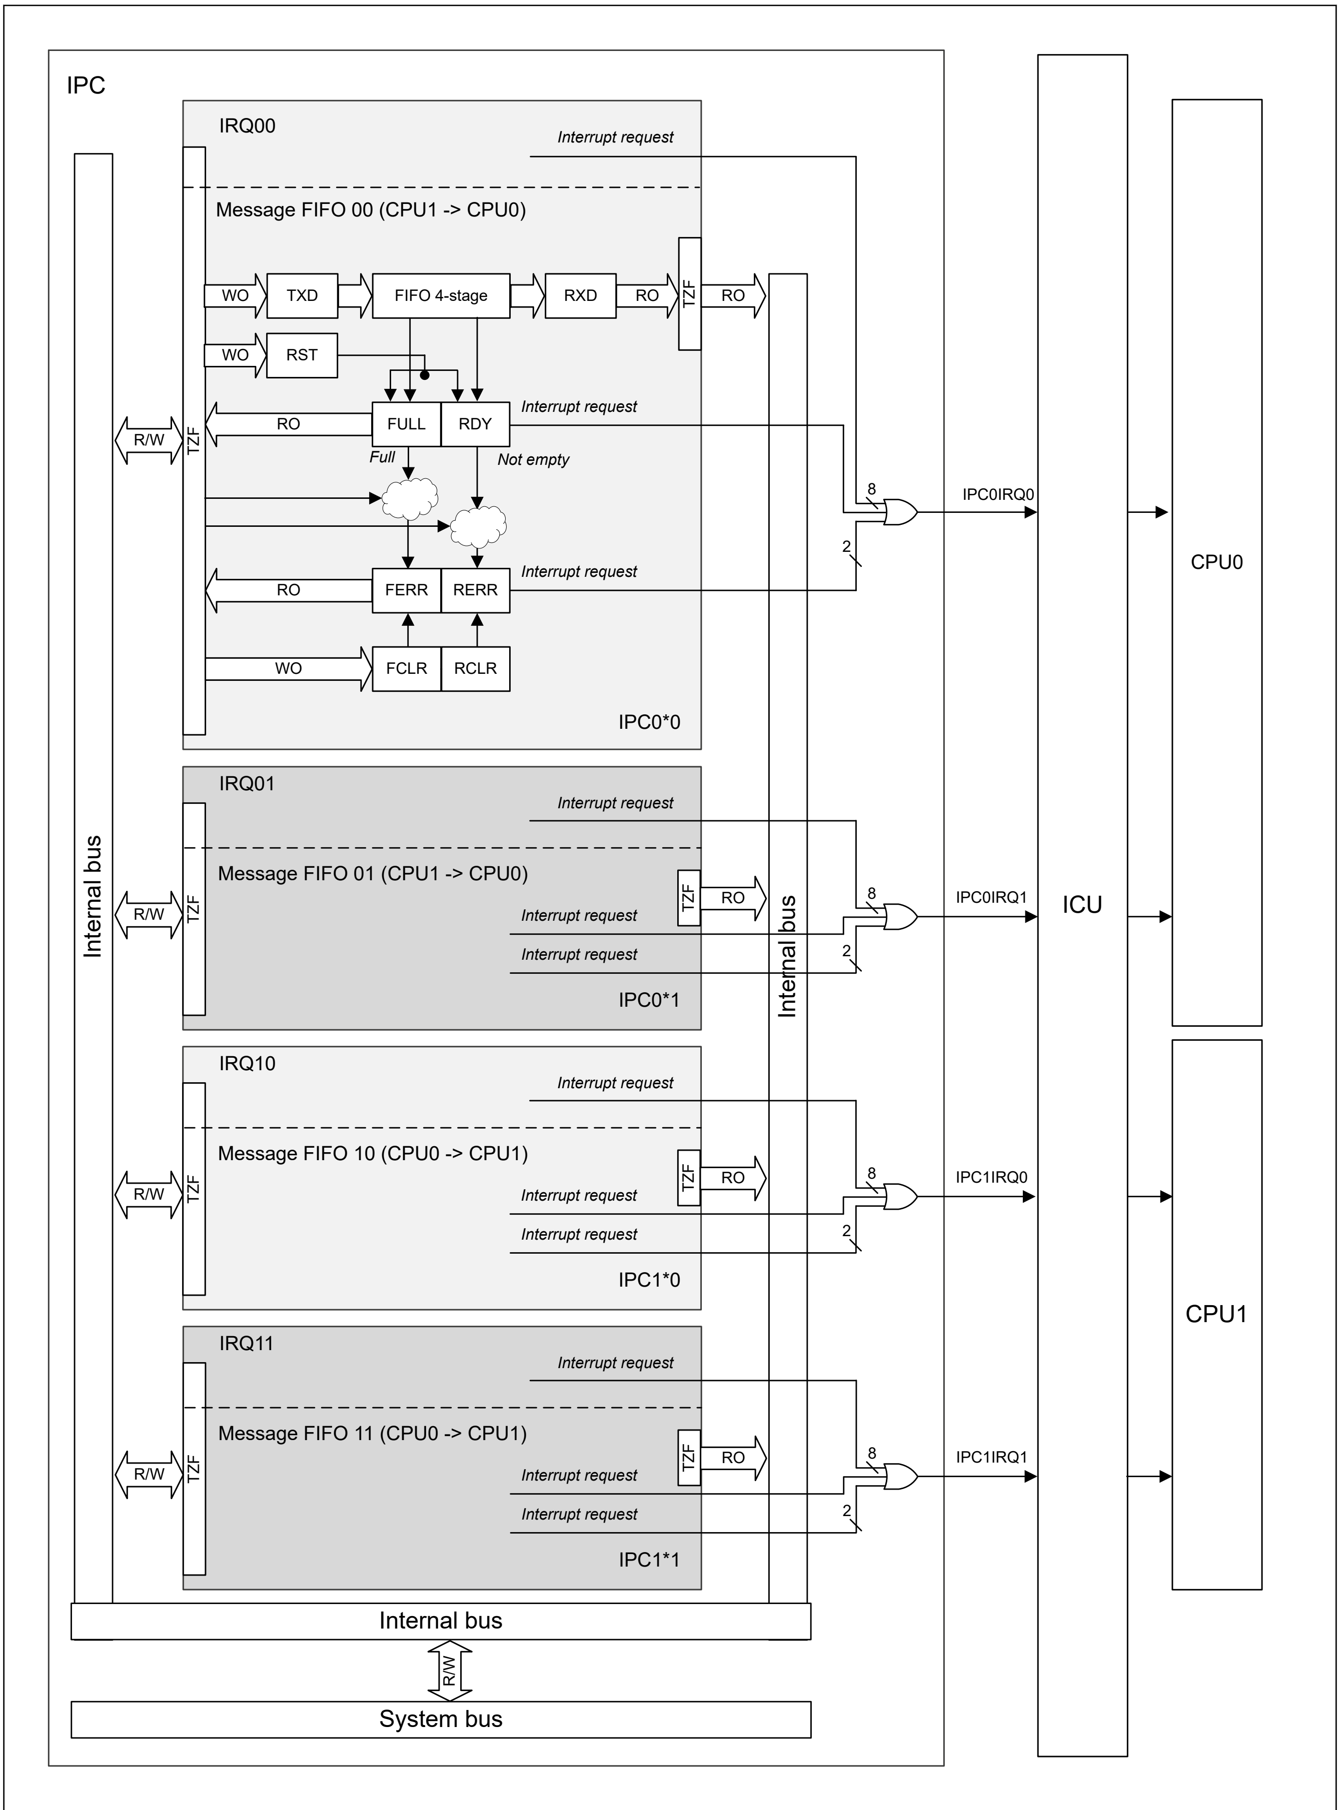

Figure 3.6 Inter-processor message FIFO

See Figure 3.4 for the security and privileged attributions.

Figure 3.7 shows an example of sending data from CPU1 to CPU0 using message FIFO 00.

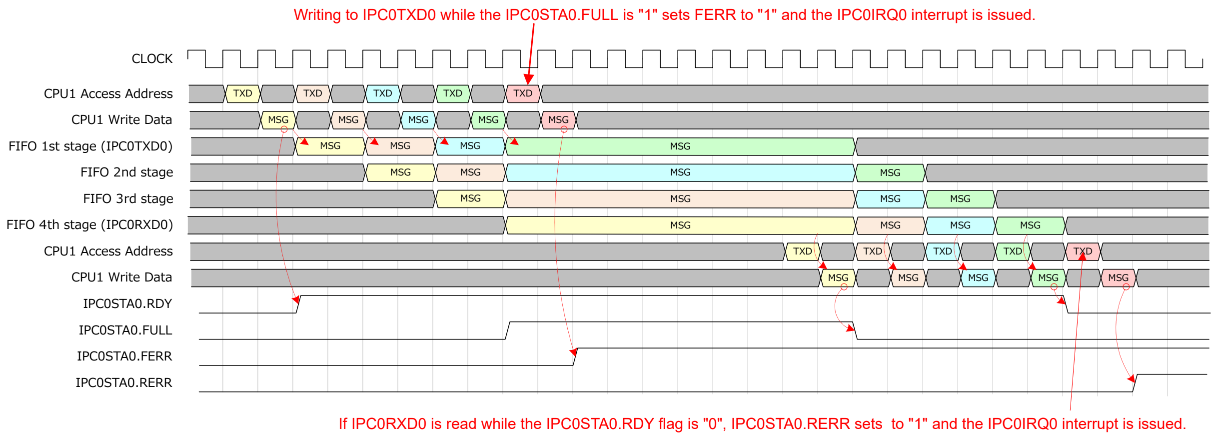

Figure 3.7 Inter-processor message FIFO timing

3.3.6 IPC Interrupt

CPU Sleep mode and CPU Deep Sleep mode can be canceled by the interrupts issued by IPC functions.

4. Operating Modes

4.1 Overview

Table 4.1 shows the selection of operating modes by the mode-setting pin(MD pin) and JTAG accessible command. For details, see section 4.3. Details of Operating Modes.

Table 4.1 Selection of operating modes by the mode-setting pin

Mode-setting pin (MD)	Operating mode	On-chip MRAM	External bus
1	Single chip mode/ JTAG Boot Mode	Enable	Disable
0	SCI / USB boot mode	Enable	Disable

4.2 Operating Mode Types and Selection

Table 4.1 show the relationship between levels on the mode-setting pins (MD) on release from the reset state and the operating mode selected at that time. For details on each of the operating modes, see section 4.3. Details of Operating Modes. Operation starts with the on-chip MRAM enabled and the external bus disabled, regardless of the mode in which operation started.

4.3 Details of Operating Modes

4.3.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs. When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip MRAM is enabled.

4.3.2 JTAG Boot Mode

In this mode, the on-chip MRAM programming routine (JTAG boot program), stored in a dedicated area within the MCU, is used. The on-chip MRAM, including code MRAM and extra MRAM, can be modified from outside the MCU by using the JTAG and SWD interface. CSW.DbgSwEnable bit in APB-AP Control/Status Word register must be 1 in this mode.

To enter this mode, it is necessary to input the request from the JTAG and SWD-I/F during RES-pin reset.

4.3.3 SCI Boot Mode

In this mode, the on-chip MRAM programming routine (SCI boot program), stored in a dedicated area within the MCU, is used. The on-chip MRAM, including the code MRAM and extra MRAM, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see section 59, MRAM. The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

4.3.4 USB Boot Mode

In this mode, the on-chip MRAM programming routine (USB boot program), stored in a dedicated area within the MCU, is used. The on-chip MRAM, including the code MRAM and extra MRAM, can be modified from outside the MCU by using the USB. For details, see section 59, MRAM. The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

4.4 Operating Modes Transitions

4.4.1 Operation Modes and the Relationship of Mode Transition

Figure 4.1 shows that the operation modes and the relationship of mode transition. Operating mode can be transitioned in the direction of the arrow at the figure.

JTAG Boot mode and SCI/USB Boot mode is not possible using POR.

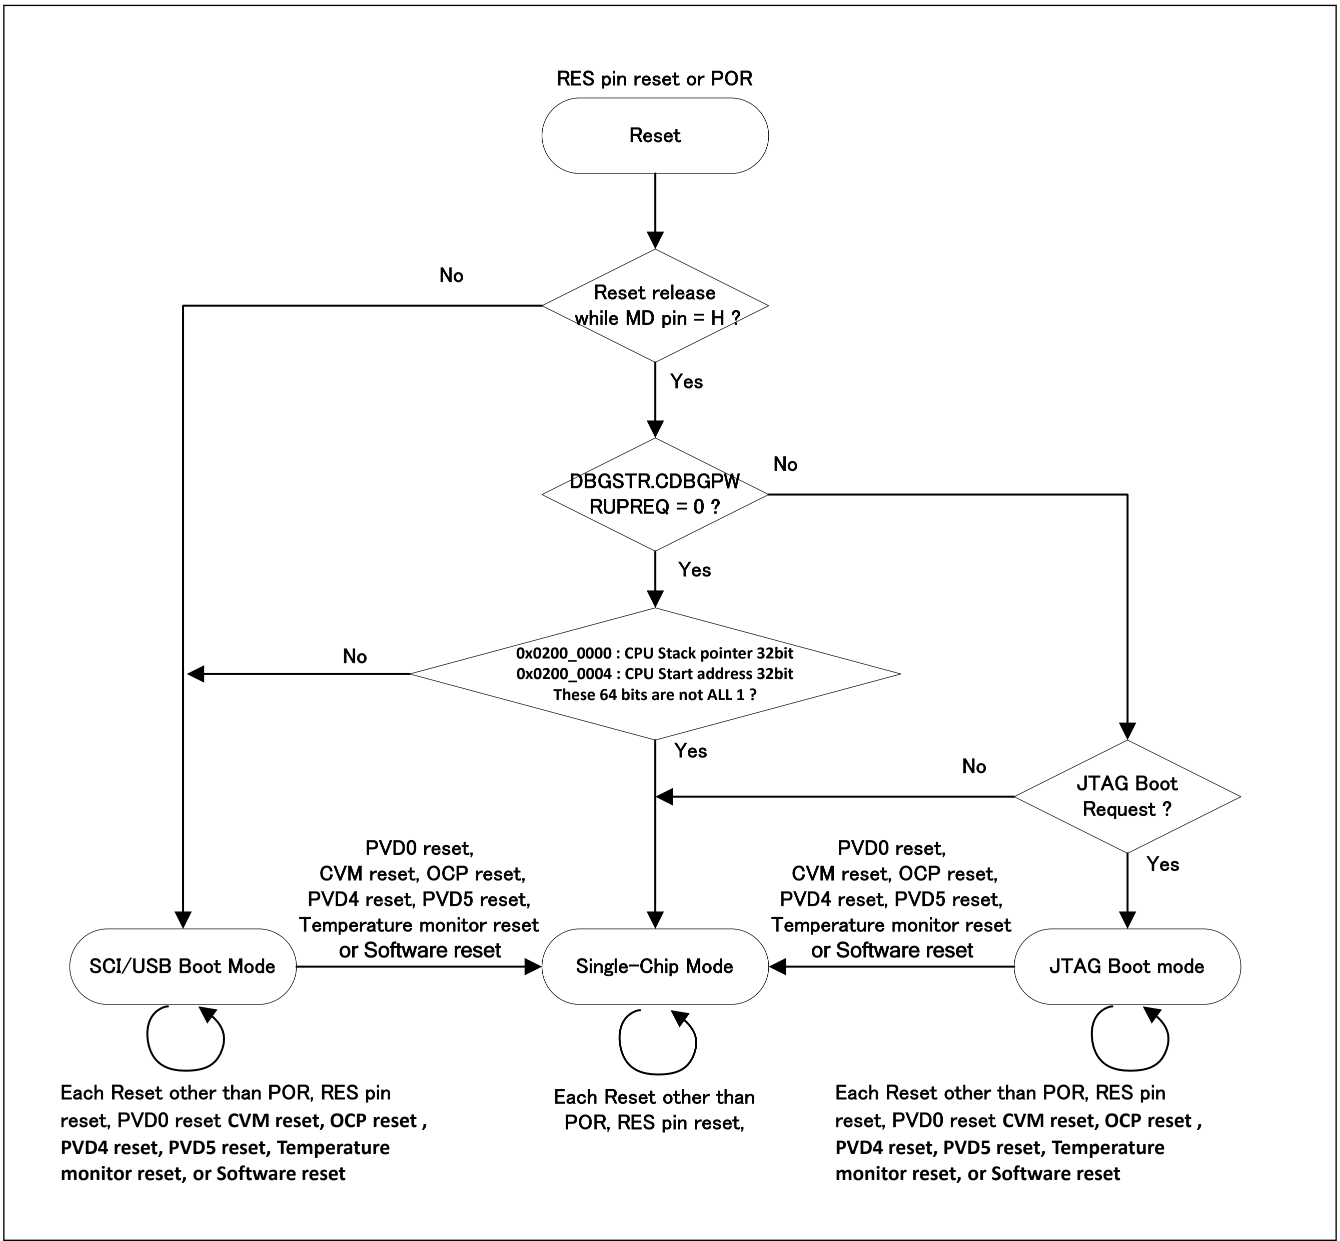

Figure 4.1 Operation modes and the relationship of mode transition

5. Address Space

5.1 Address Space

The MCU supports a 4 GB linear address space ranging from 0x0000_0000 to 0xFFFF_FFFF that can contain both program and data. In the address from 0x0000_0000 to 0x5FFF_FFFF, secure and non-secure region are isolated. Figure 5.1 and Figure 5.2 show the memory map example of 1 MB MRAM product.

Address	CPU0 (CM85)	CPU1 (CM33)	the others	IDAU/MSAU Security_Attribution
0xE010_0000 – 0xFFFF_FFFF	System for CM85	System for CM33	Reserved area*1	
0xE000_0000 – 0xE010_0000	Private Peripheral bus	Private Peripheral bus	Reserved area*1	
0xA000_0000 – 0xE000_0000	Reserved area*1			Non-secure
0x7000_0000 – 0xA000_0000	External address space (OSPI area)			Non-secure
0x6800_0000 – 0x7000_0000	External address space (SDRAM area)			Non-secure
0x6000_0000 – 0x6800_0000	External address space (CS area)			Non-secure
0x5050_0000 – 0x6000_0000	Reserved area*1			Non-secure
0x5000_0000 – 0x5050_0000	Peripheral IO registers			Non-secure
0x4050_0000 – 0x5000_0000	Reserved area*1			Secure
0x4000_0000 – 0x4050_0000	Peripheral IO registers			Secure
0x3A02_0000 – 0x4000_0000	Reserved area*1			Non-secure
0x3A01_0000 – 0x3A02_0000	CPU1-STCM alias*9	Reserved area*1	CPU1-STCM alias*9	Non-secure
0x3A00_0000 – 0x3A01_0000	CPU1-CTCM alias*8	Reserved area*1	CPU1-CTCM alias*8	Non-secure
0x3804_0000 – 0x3A00_0000	Reserved area*1			Non-secure
0x3802_0000 – 0x3804_0000	Reserved area*1	CPU0-DTCM alias*7		Non-secure
0x3800_0000 – 0x3802_0000	Reserved area*1	CPU0- ITCM alias*6		Non-secure
0x321D_4000 – 0x3800_0000	Reserved area*1			Non-secure
0x321A_0000 – 0x321D_4000	On-chip SRAM (SRAME)*10			Non-secure
0x3200_0000 – 0x321A_0000	On-chip SRAM			Non-secure
0x3002_0000 – 0x3200_0000	Reserved area*1			Non-secure
0x3001_0000 – 0x3002_0000	CPU0-DTCM*7	Reserved area*1	Reserved area*1	Non-secure
0x3000_0000 – 0x3001_0000		CPU1-STCM*9		Non-secure
0x2A02_0000 – 0x3000_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x2A01_0000 – 0x2A02_0000	CPU1-STCM alias*5	Reserved area*1	CPU1-STCM alias*5	Non-secure callable for CPU Secure for other bus masters
0x2A00_0000 – 0x2A01_0000	CPU1-CTCM alias*4	Reserved area*1	CPU1-CTCM alias*4	Non-secure callable for CPU Secure for other bus masters
0x2804_0000 – 0x2A00_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x2802_0000 – 0x2804_0000	Reserved area*1	CPU0-DTCM alias*3		Non-secure callable for CPU Secure for other bus masters
0x2800_0000 – 0x2802_0000	Reserved area*1	CPU0-ITCM alias*2		Non-secure callable for CPU Secure for other bus masters
0x221D_4000 – 0x2800_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x221A_0000 – 0x221D_4000	On-chip SRAM (SRAME)*10			Non-secure callable for CPU Secure for other bus masters
0x2200_0000 – 0x221A_0000	On-chip SRAM			Non-secure callable for CPU Secure for other bus masters
0x2002_0000 – 0x2200_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x2001_0000 – 0x2002_0000	CPU0-DTCM*3	Reserved area*1	Reserved area*1	Non-secure callable for CPU Secure for other bus masters
0x2000_0000 – 0x2001_0000		CPU1-STCM*5		Non-secure callable for CPU Secure for other bus masters
0x1880_0000 – 0x2000_0000	Reserved area*1			Non-secure
0x1800_0000 – 0x1880_0000	SiP-Flash area (OSPI1 CS1 area)			Non-secure
0x1300_0000 – 0x1800_0000	Reserved area*1			Non-secure
0x12E0_0000 – 0x1300_0000	Extra MRAM (option-setting memory)			Non-secure
0x12D0_0000 – 0x12E0_0000	Reserved area*1			Non-secure
0x12A0_0000 – 0x12D0_0000	Extra MRAM (option-setting memory)			Non-secure
0x1210_0000 – 0x12A0_0000	Reserved area*1			Non-secure
0x1200_0000 – 0x1210_0000	Code MRAM			Non-secure
0x1002_0000 – 0x1200_0000	Reserved area*1			Non-secure
0x1001_0000 – 0x1002_0000	CPU0-ITCM*6	Reserved area*1	Reserved area*1	Non-secure
0x1000_0000 – 0x1001_0000		CPU1-CTCM*8		Non-secure
0x0880_0000 – 0x1000_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x0800_0000 – 0x0880_0000	SiP-Flash area (OSPI1 CS1 area)			Non-secure callable for CPU Secure for other bus masters
0x0300_0000 – 0x0800_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x02E0_0000 – 0x0300_0000	Extra MRAM (option-setting memory)			Non-secure callable for CPU Secure for other bus masters
0x02D0_0000 – 0x02E0_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x02A0_0000 – 0x02D0_0000	Extra MRAM (option-setting memory)			Non-secure callable for CPU Secure for other bus masters
0x0210_0000 – 0x02A0_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x0200_0000 – 0x0210_0000	Code MRAM			Non-secure callable for CPU Secure for other bus masters
0x0002_0000 – 0x0200_0000	Reserved area*1			Non-secure callable for CPU Secure for other bus masters
0x0001_0000 – 0x0002_0000	CPU0- ITCM*2	Reserved area*1	Reserved area*1	Non-secure callable for CPU Secure for other bus masters
0x0000_0000 – 0x0001_0000		CPU1-CTCM*4		Non-secure callable for CPU Secure for other bus masters

Note: See Table 5.1. The capacity of the Code MRAM, On-chip SRAM differs depending on the product.
Note 1. Reserved areas should not be accessed.
Note 2. CPU0-ITCM for Secure has different addresses for CPU1 and other bus masters.
Note 3. CPU0-DTCM for Secure has different addresses for CPU1 and other bus masters.
Note 4. CPU1-CTCM for Secure has different addresses for CPU0 and other bus masters.
Note 5. CPU1-STCM for Secure has different addresses for CPU0 and other bus masters.
Note 6. CPU0-ITCM for Non-Secure has different addresses for CPU1 and other bus masters.
Note 7. CPU0-DTCM for Non-Secure has different addresses for CPU1 and other bus masters.
Note 8. CPU1-CTCM for Non-Secure has different addresses for CPU0 and other bus masters.
Note 9. CPU1-STCM for Non-Secure has different addresses for CPU0 and other bus masters.
Note 10. These areas are accessible only when SRAM ECC function is disabled.

Figure 5.2 1 MB MRAM product for Standard Product

Table 5.1 Capacity of the Code MRAM, SRAM and SiP-Flash

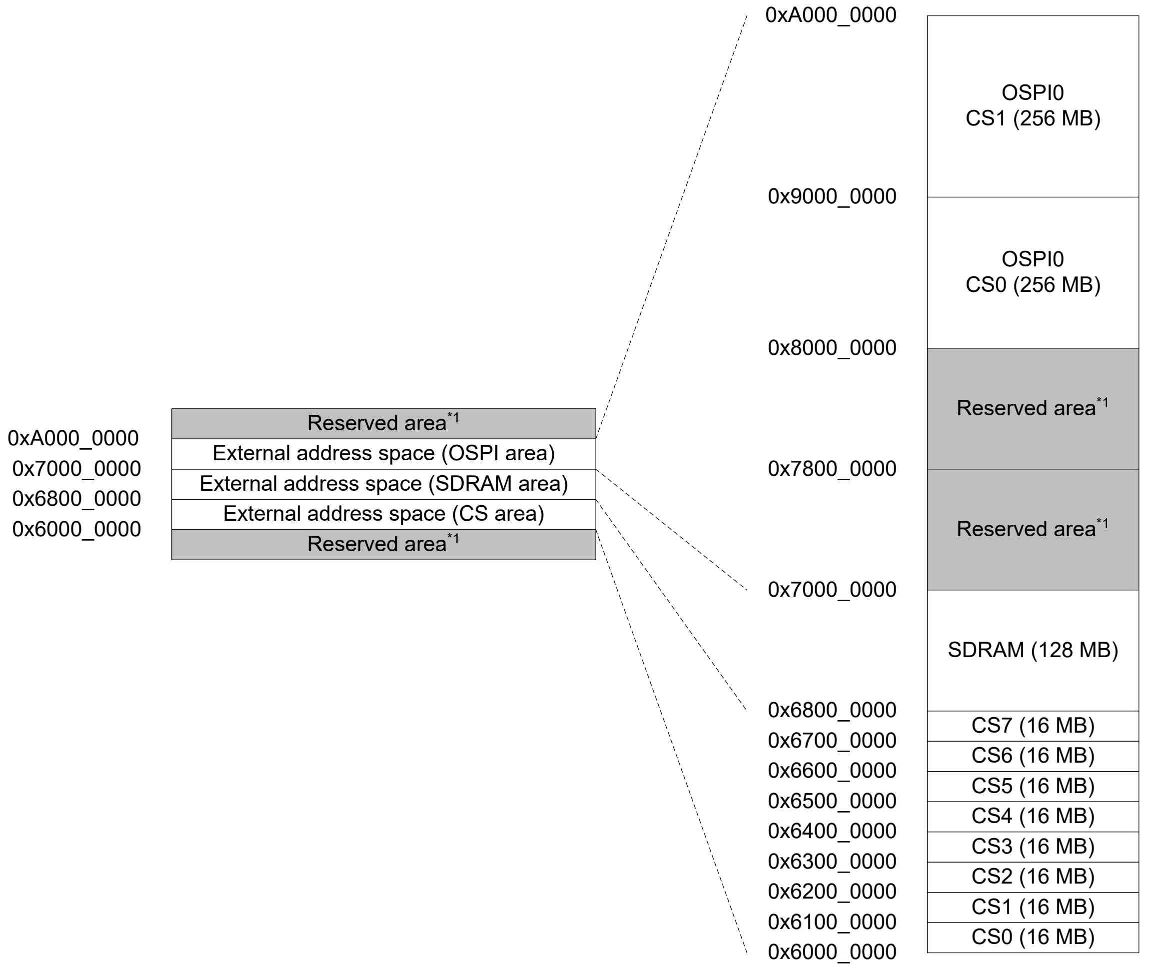
CPU	Code MRAM			On-chip SRAM			SiP-Flash		
	Capacity	Address		Capacity	Address		Capacity	Address	
		Secure alias	Non-Secure alias		Secure alias	Non-Secure alias		Secure alias	Non-Secure alias
Dual	1 MB	0x0200_0000 to 0x0210_0000	0x1200_0000 to 0x1210_0000	1.6 MB	0x2200_0000 to 0x221A_0000	0x3200_0000 to 0x321A_0000	4 MB	0x0800_0000 to 0x0840_0000	0x1800_0000 to 0x1840_0000
							8 MB	0x0800_0000 to 0x0880_0000	0x1800_0000 to 0x1880_0000
Single	1 MB	0x0200_0000 to 0x0210_0000	0x1200_0000 to 0x1210_0000	1.6 MB + 128 KB*1	0x2200_0000 to 0x221A_0000 0x2A00_0000 to 0x2A02_0000	0x3200_0000 to 0x321A_0000 0x3A00_0000 to 0x3A02_0000	—		
	512 KB	0x0200_0000 to 0x0208_0000	0x1200_0000 to 0x1208_0000						

Note 1. In single-core, C-TCM and S-TCM at addresses 0x2A00_0000 to 0x2A01_FFFFF can be used as SRAM. For details of TCM, see section 2, CPU.

5.2 External Address Space

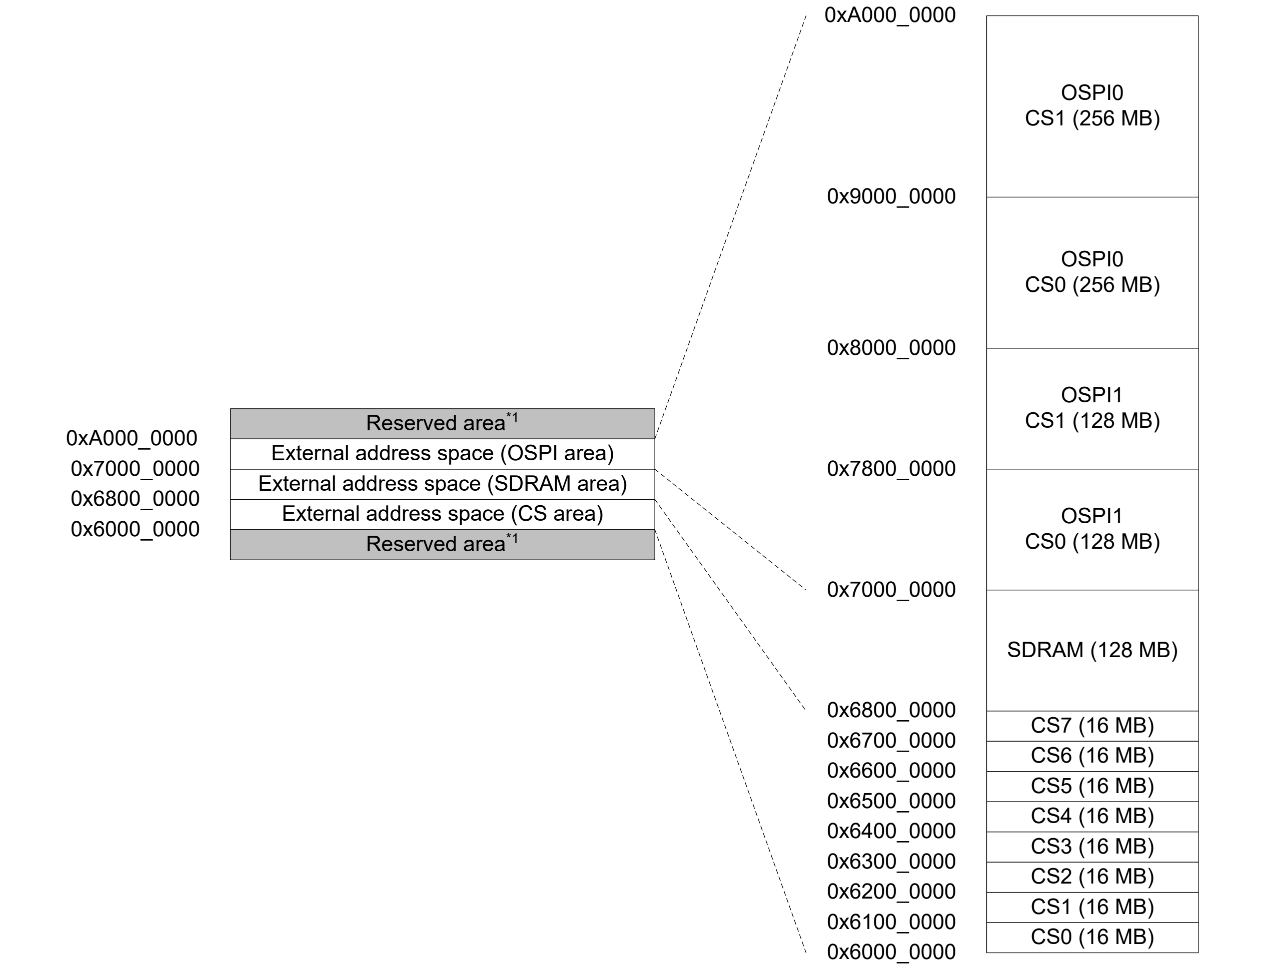
The external address space is divided into CS areas (CS0 to CS7), SDRAM area (SDCS), and OSPI areas (CS0 and CS1). The eight CS areas (CS0 to CS7) each correspond to the CSn signal output from a CSn (n = 0 to 7) pin. The two OSPI areas (CS0 and CS1) each correspond to the OM_CSn signal output from an OM_CSn (n = 0, 1) pin.

Figure 5.3 and Figure 5.4 show the address ranges associated with the individual CS areas (CS0 to CS7), SDRAM area (SDCS), and OSPI areas (CS0 and CS1).



Note 1. Reserved areas should not be accessed.

Figure 5.3 Detailed address map for CS area, SDRAM area, and OSPI area for SiP Product



Note 1. Reserved areas should not be accessed.

Figure 5.4 Detailed address map for CS area, SDRAM area, and OSPI area for Standard Product

5.3 Peripheral I/O Register Address Space

The peripheral I/O register address space is classified into two types. Figure 5.5 shows the address space types and Table 5.2 shows the address space types for each module.

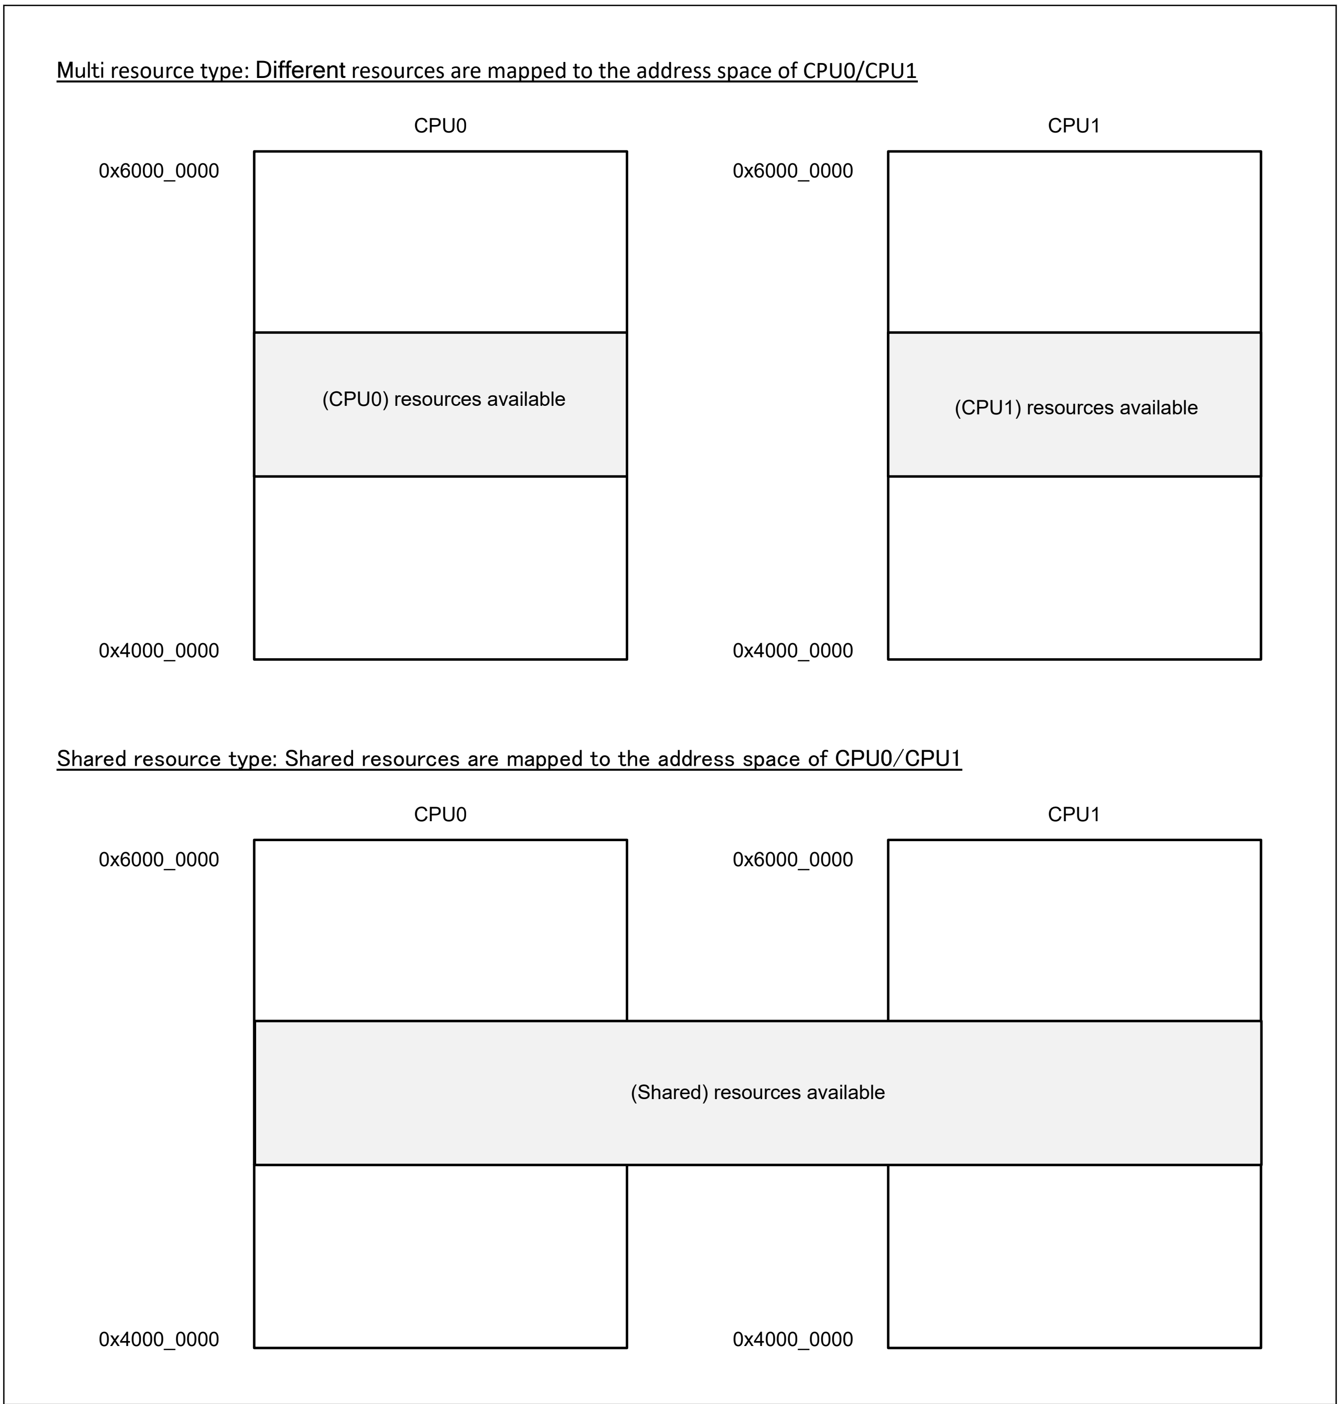


Figure 5.5 Address space types

Table 5.2 Address space types of each module (1 of 2)

Module name	Register name	Space type
ICU	NMIER, NMICLR, NMISR, WUPEN0, WUPEN1, DSLPWUPIRQENj, DELSRm, IELSRn	Multi resource type
	Other than the above	Shared resource types
DMAC	DMACCHSAR, DMACCHPAR, DMACSAR	Shared resource types
	Other than the above	Multi resource type
DTC	DTCSAR	Shared resource types
	Other than the above	Multi resource type

Table 5.2 Address space types of each module (2 of 2)

Module name	Register name	Space type
Others	All	Shared resource types

6. Resets

6.1 Overview

This MCU provides the following 21 types of reset.

It also has a function to control the reset generation by only secure program access.

System reset is all factors such that can initialize CPU core. All reset factors except VBATT_POR are system reset for this product.

On the other hand, CPU has a reset that initializes itself individually. The reset is not a system reset. See section 2, CPU.

Table 6.1 lists the reset names and sources.

Table 6.1 Reset names and sources

Reset Name		Source
System reset	RES Pin reset	Voltage input to the RES pin is driven low
	Power-on reset (POR)	VCC falls (voltage detection: V_{POR})*1
	Voltage Monitor 0 reset	VCC falls (voltage detection: V_{det0})*1
	Voltage Monitor 1 reset	VCC falls (voltage detection: V_{det1})*1 VCC rises (voltage detection: V_{det1})*1
	Voltage Monitor 2 reset	VCC falls (voltage detection: V_{det2})*1 VCC rises (voltage detection: V_{det2})*1
	Voltage Monitor 4 reset	VCC falls (voltage detection: V_{det4})*1 VCC rises (voltage detection: V_{det4})*1
	Voltage Monitor 5 reset	VCC falls (voltage detection: V_{det5})*1 VCC rises (voltage detection: V_{det5})*1
	Core Voltage Monitor reset	VDD falls (voltage detection: V_{det}_VDDL)*1 VDD rises (voltage detection: V_{det}_VDDH)*1
	Temperature Monitor reset	Detect temperature outside a certain range
	Independent Watchdog Timer reset	IWDT underflow or refresh error
	CPU0 Watchdog Timer reset	WDT underflow or refresh error for CPU0
	CPU1 Watchdog Timer reset	WDT underflow or refresh error for CPU1
	CPU0 Lockup reset	This reset is generated when CPU0 encounters lockup
	CPU1 Lockup reset	This reset is generated when CPU1 encounters lockup
	Bus Error reset	BUS error (MSAU error, MMPU error, Illegal address error, TZF error, Slave Bus error, Bufferable write error)
	Common Memory Error reset	RAM error (ECC error of SRAM)
	Local Memory 0 Error reset	RAM error (ECC error of CPU0 Cache or TCM)
	Local Memory 1 Error reset	RAM error (ECC error of CPU1 Cache or TCM)
	Deep Software Standby reset	Deep Software Standby mode is canceled by an interrupt
	Software reset	Register setting (use the software reset bit AIRCR.SYSRESETREQ)
VBATT_POR reset		VBATT_R falls (voltage detection: $V_{PORBATT}$)*1

Note 1. For details on the voltages to be monitored (V_{POR}, V_{det0}, V_{det1}, V_{det2}, V_{det4}, V_{det5}, V_{det}_VDDL, V_{det}_VDDH and $V_{PORBATT}$), see section 8, Programmable Voltage Detection (PVD), section 12, Battery Backup Function, and section 62, Electrical Characteristics.

The internal state and pins are initialized by a reset. Table 6.2 and Table 6.3 list the targets initialized by resets.

Table 6.2 Reset detect flags initialized by each reset source (1 of 4)

Flag to be initialized	Reset source: RES pin reset	Power-on reset	Voltage monitor 0 reset	Core voltage monitor reset	Voltage monitor 4 reset	Voltage monitor 5 reset	Temperature monitor reset	Independent watchdog timer reset	CPU0 watchdog timer reset	CPU1 watchdog timer reset	CPU0 lockup reset
Power-On Reset Detect Flag (RSTSR0.PORF)	✓	—	—	—	—	—	—	—	—	—	—
Voltage Monitor 0 Reset Detect Flag (RSTSR0.PVD0RF)	✓	✓	—	—	—	—	—	—	—	—	—
Core Voltage Monitor Reset Detect Flag (RSTSR3.CVMRF)	✓	✓	✓	—	—	—	—	—	—	—	—
Temperature Monitor Reset Detect Flag (RSTSR3.TEMPRF)	✓	✓	✓	—	—	—	—	—	—	—	—
Independent Watchdog Timer Reset Detect Flag (RSTSR1.IWDTRF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—
CPU0 Watchdog Timer Reset Detect Flag (RSTSR1.WDT0RF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—
CPU1 Watchdog Timer Reset Detect Flag (RSTSR1.WDT1RF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—
CPU0 Lockup Reset Detect Flag (RSTSR1.CLU0RF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—
CPU1 Lockup Reset Detect Flag (RSTSR1.CLU1RF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—
Voltage Monitor 1 Reset Detect Flag (RSTSR0.PVD1RF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—
Voltage Monitor 2 Reset Detect Flag (RSTSR0.PVD2RF)	✓	✓	✓	✓	✓	✓	✓	—	—	—	—

Other than the above		✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	—

Note: ✓ : Initialized
— : Not initialized

Note 1. RTC has Software reset for RTC. Some control bits are not initialized by all types of resets. For details on the target bits, see section 9, Clock Generation Circuit.

Note 2. Depend on setting of DPSBYCR.IOKEEP.

Note 3. After the debugger authentication passes, setting SYOCDCR.DBGEN to 1 does not initialize this register or the function. For details, see section 2, CPU.

Note 4. Cortex-M85 registers initialized on cold reset.

Note 5. Cortex-M33 registers initialized on cold reset.

Note 6. CoreSight SoC-400 TPIU registers, CoreSight SoC-400 ATB Funnel registers, CoreSight SoC-400 ATB Replicator registers, CoreSight SoC-400 CTI Replicator registers, CoreSight SoC-400 AHB-AP registers, CoreSight SoC-400 APB-AP registers, CoreSight SoC-400 Debug Port registers, CoreSight SoC-400 Timestamp Generator registers, CoreSight Trace Memory Controller registers.

The RTC is not initialized by any reset source. SOSC and LOCO can be selected as the clock sources of the RTC.

Table 6.4 and Table 6.5 show the states of SOSC and LOCO when a reset occurs.

Table 6.4 States of SOSC when a reset occurs

		Reset source	
		VBAT_POR reset	Other
SOSC	Enable or disable	Initialized to enable	Continue with the state that was selected before the reset occurred
	Drive capability	Initialized to standard drive capability	

Table 6.5 States of LOCO when a reset occurs

		Reset source	
		Power-on reset, Voltage-Monitor 0, 4, 5 reset, Core Voltage-Monitor reset, Temperature-Monitor reset and Deep software standby 2, 3 reset	Other
LOCO	Enable or disable	Initialized to enable	
	Oscillation accuracy*1	Initialized to accuracy before trimming by LOCOUTCR (accuracy: ± 15%)	Continue with the accuracy that was trimmed by LOCOUTCR

Note 1. If the LOCO that is trimmed by LOCOUTCR is selected as the RTC source clock, please be careful that LOCO oscillation accuracy will be initialized by Power-on reset, Voltage-Monitor 0, 4, 5 reset, Core Voltage-Monitor reset, Temperature-Monitor reset and Deep software standby 2, 3 reset.

When a reset is released, reset exception handling starts. For details on the reset exception handling, see section 6.3.14. Determination of Reset Generation Source.

Table 6.6 lists the pin related to the reset function.

Table 6.6 Pin related to reset

Pin name	I/O	Function
RES	Input	Reset pin

6.2 Register Descriptions

6.2.1 RSTSAR : Reset Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC3	NONSEC2	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: Reset Status Register 0 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: Reset Status Register 1 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: Reset Status Register 2 0: Secure 1: Non-secure	R/W
3	NONSEC3	Non-secure Attribute bit 3 Target register: Reset Status Register 3 0: Secure 1: Non-secure	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of RSTSR0.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of RSTSR1.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of RSTSR2.

NONSEC3 bit (Non-secure Attribute bit 3)

This bit controls the security attribute of RSTSR3.

6.2.2 RSTSR0 : Reset Status Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DPSR STF	PVD5 RF	PVD4 RF	—	PVD2 RF	PVD1 RF	PVD0 RF	PORF
Value after reset:	x[*1]	x[*1]	x[*1]	0	x[*1]	x[*1]	x[*1]	x[*1]

Bit	Symbol	Function	R/W
0	PORF	Power-On Reset Detect Flag 0: Power-on reset not detected 1: Power-on reset detected	R/W[*2]
1	PVD0RF	Voltage Monitor 0 Reset Detect Flag 0: Voltage monitor 0 reset not detected 1: Voltage monitor 0 reset detected	R/W[*2]
2	PVD1RF	Voltage Monitor 1 Reset Detect Flag 0: Voltage monitor 1 reset not detected 1: Voltage monitor 1 reset detected	R/W[*2]
3	PVD2RF	Voltage Monitor 2 Reset Detect Flag 0: Voltage monitor 2 reset not detected 1: Voltage monitor 2 reset detected	R/W[*2]
4	—	This bit is read as 0. The write value should be 0.	R/W
5	PVD4RF	Voltage Monitor 4 Reset Detect Flag 0: Voltage monitor 4 reset not detected 1: Voltage monitor 4 reset detected	R/W[*2]
6	PVD5RF	Voltage Monitor 5 Reset Detect Flag 0: Voltage monitor 5 reset not detected 1: Voltage monitor 5 reset detected	R/W[*2]

Bit	Symbol	Function	R/W
7	DPSRSTF	Deep Software Standby Reset Flag 0: Deep Software Standby Mode cancellation not requested by an interrupt or a reset*3. 1: Deep Software Standby Mode cancellation requested by an interrupt or a reset*3.	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.
Note 3. Independent watchdog timer reset, Voltage Monitor 1 reset, Voltage Monitor 2 reset.

PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 0 is written after 1 is read from PORF flag.

PVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The PVD0RF flag indicates that the voltage monitor 0 reset has occurred.

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from PVD0RF flag.

PVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The PVD1RF flag indicates that the voltage monitor 1 reset has occurred.

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from PVD1RF flag.

PVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The PVD2RF flag indicates that the voltage monitor 2 reset has occurred.

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from PVD2RF flag.

PVD4RF flag (Voltage Monitor 4 Reset Detect Flag)

The PVD4RF flag indicates that the voltage monitor 4 reset has occurred.

[Setting condition]

- When a voltage monitor 4 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from PVD4RF flag.

PVD5RF flag (Voltage Monitor 5 Reset Detect Flag)

The PVD5RF flag indicates that the voltage monitor 5 reset has occurred.

[Setting condition]

- When a voltage monitor 5 reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from PVD5RF flag.

DPSRSTF flag (Deep Software Standby Reset Flag)

The DPSRSTF flag indicates that Deep Software Standby Mode is canceled by an external or internal interrupt, and that an internal reset (Deep Software Standby reset) occurs when an exception from Deep Software Standby Mode occurs.

[Setting condition]

- When Deep Software Standby Mode is cancelled by an external or an internal interrupt. For details, see section 11, Low Power Mode.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from DPSRSTF flag.

6.2.3 RSTSR1 : Reset Status Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	LM1RF	CLU1RF	—	—	WDT1RF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	x*1	x*1	0	0	x*1	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	CMRF	—	—	—	BUSRF	—	—	—	—	LM0RF	CLU0RF	—	SWRF	WDT0RF	IWDTRF
Value after reset:	0	x*1	0	0	0	x*1	0	0	0	0	x*1	x*1	0	x*1	x*1	x*1

Bit	Symbol	Function	R/W
0	IWDTRF	Independent Watchdog Timer Reset Detect Flag 0: Independent watchdog timer reset not detected 1: Independent watchdog timer reset detected	R/W*2
1	WDT0RF	Watchdog Timer 0 Reset Detect Flag 0: Watchdog timer 0 reset not detected 1: Watchdog timer 0 reset detected	R/W*2
2	SWRF	Software Reset Detect Flag 0: Software reset not detected 1: Software reset detected	R/W*2
3	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
4	CLU0RF	CPU0 Lockup Reset Detect Flag 0: CPU0 lockup reset not detected 1: CPU0 lockup reset detected	R/W
5	LM0RF	Local memory 0 error Reset Detect Flag 0: Local memory 0 error reset not detected 1: Local memory 0 error reset detected	R/W*2
9:6	—	These bits are read as 0. The write value should be 0.	R/W
10	BUSRF	Bus Error Reset Detect Flag 0: Bus error reset not detected 1: Bus error reset detected	R/W*2
13:11	—	These bits are read as 0. The write value should be 0.	R/W
14	CMRF	Common Memory Error Reset Detect Flag 0: Common memory error reset not detected 1: Common memory error reset detected	R/W*2
16:15	—	These bits are read as 0. The write value should be 0.	R/W
17	WDT1RF	Watchdog Timer 1 Reset Detect Flag 0: Watchdog timer 1 reset not detected 1: Watchdog timer 1 reset detected	R/W*2
19:18	—	These bits are read as 0. The write value should be 0.	R/W
20	CLU1RF	CPU1 Lockup Reset Detect Flag 0: CPU1 lockup reset not detected 1: CPU1 lockup reset detected	R/W*2
21	LM1RF	Local memory 1 error Reset Detect Flag 0: Local memory 1 error reset not detected 1: Local memory 1 error reset detected	R/W*2
31:22	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an Independent watchdog timer reset occurred.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from IWDTRF flag.

WDT0RF flag (Watchdog Timer 0 Reset Detect Flag)

The WDT0RF flag indicates that a CPU0 watchdog timer reset occurred.

[Setting condition]

- When a CPU0 watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from WDT0RF flag.

SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a Software reset occurred.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from SWRF flag.

CLU0RF flag (CPU0 Lockup Reset Detect Flag)

The CLU0RF flag indicates that a CPU0 lockup reset occurred.

[Setting condition]

- When a CPU0 Lockup reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from CLU0RF flag.

LM0RF flag (Local memory 0 error Reset Detect Flag)

The LM0RF flag indicates that a Local memory 0 error reset (ECC error of CPU0 Cache or TCM) occurred.

[Setting condition]

- When a Local memory 0 error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from LM0RF flag.

BUSRF flag (Bus Error Reset Detect Flag)

The BUSRF flag indicates that BUS error reset (MSAU error, MMPU error, Illegal address error, TZF error, Slave Bus error, Bufferable write error) occurred.

[Setting condition]

- When a bus slave MPU error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs
- When 0 is written after 1 is read from BUSRF flag.

There are several causes for setting this reset flag.

If you want to identify the reset factor, see section 15, Buses.

CMRF flag (Common Memory Error Reset Detect Flag)

The CMRF flag indicates that a Common memory error reset (ECC error of SRAM) occurred.

[Setting condition]

- When a Common memory error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from CMRF flag.

There are several causes for setting this reset flag.

If you want to identify the reset factor, see section 58, SRAM.

WDT1RF flag (Watchdog Timer 1 Reset Detect Flag)

The WDT1RF flag indicates that a CPU1 watchdog timer reset occurred.

[Setting condition]

- When a CPU1 watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from WDT1RF flag.

CLU1RF flag (CPU1 Lockup Reset Detect Flag)

The CLU1RF flag indicates that a CPU1 lockup reset occurred.

[Setting condition]

- When a CPU1 lockup reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from CLU1RF flag.

LM1RF flag (Local memory 1 error Reset Detect Flag)

The LM1RF flag indicates that a Local memory 1 error reset (ECC error of CPU1 Cache or TCM) occurred.

[Setting condition]

- When a Local memory 1 error reset occurs.

[Clearing conditions]

- When a reset listed in Table 6.2 occurs.
- When 0 is written after 1 is read from LM1RF flag.

6.2.4 RSTSR2 : Reset Status Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA44

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CWSF
Value after reset:	0	0	0	0	0	0	0	x*1

Bit	Symbol	Function	R/W
0	CWSF	Cold/Warm Start Determination Flag 0: Cold start 1: Warm start	R/W*2
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software. Writing 0 to CWSF does not set it to 0.

[Clearing condition]

- When a reset listed in Table 6.2 occurs.

6.2.5 RSTSR3 : Reset Status Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA48

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TEMPRF	—	—	—	—	—	—	CVMRF
Value after reset:	x*1	0	0	0	0	0	0	x*1

Bit	Symbol	Function	R/W
0	CVMRF	Core Voltage Monitor Reset Detect Flag 0: Core voltage monitor reset not detected 1: Core voltage monitor reset detected	R/W*2
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	TEMPRF	Temperature Monitor Reset Detect Flag 0: Temperature monitor reset not detected 1: Temperature monitor reset detected	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

CVMRF flag (Core Voltage Monitor Reset Detect Flag)

The CVMRF indicates that Core voltage fell below V_{det}_VDDL.

The CVMRF indicates that Core voltage rised above V_{det}_VDDH.

[Setting condition]

- When a Core voltage monitor reset occurs.

[Clearing condition]

- When a reset listed in Table 6.3 occurs.
- When 0 is written after 1 is read from CVMRF flag.

TEMPRF flag (Temperature Monitor Reset Detect Flag)

The TEMPRF indicates that Temperature monitor reset has occurred.

[Setting condition]

- When a Temperature monitor reset occurs.

[Clearing condition]

- When a reset listed in Table 6.3 occurs.
- When 0 is written after 1 is read from TEMPRF flag.

6.2.6 SYRSTMSK0 : System Reset Mask Control Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BUSMASK	CMMASK	LM0MASK	CLU0MASK	—	SWMASK	WDT0MASK	IWDTMASK
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTMASK	Independent Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
1	WDT0MASK	CPU0 Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
2	SWMASK	Software Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	CLU0MASK	CPU0 Lockup Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
5	LM0MASK	Local Memory 0 Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
6	CMMASK	Common Memory Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7	BUSMASK	Bus Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK0 is a register that controls the occurrence of reset.

The IWDTMASK bit cannot be rewritten while the independent watchdog timer is operating. The WDT0MASK bit cannot be rewritten while the CPU0 watchdog timer is operating.

6.2.7 SYRSTMSK1 : System Reset Mask Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAD4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	LM1MASK	CLU1MASK	—	—	WDT1MASK	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	WDT1MASK	CPU1 Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W

Bit	Symbol	Function	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	CLU1MASK	CPU1 Lockup Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
5	LM1MASK	Local Memory 1 Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK1 is a register that controls the occurrence of reset.

6.2.8 SYRSTMSK2 : System Reset Mask Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAD8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PVD2 MASK	PVD1 MASK
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PVD1MASK	Voltage Monitor 1 Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
1	PVD2MASK	Voltage Monitor 2 Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK2 is a register that controls the occurrence of reset.

6.2.9 TEMPRCR : Temperature Monitor Reset Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xADC

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	TSNK EEP	CMPE N	TSNE N	TEMP REN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TEMPREN	Temperature Reset Enable 0: Temperature reset is disabled 1: Temperature reset is enabled	R/W
1	TSNEN	Temperature Sensor Enable 0: Temperature sensor is disabled 1: Temperature sensor is enabled	R/W

Bit	Symbol	Function	R/W
2	CMPEN	Comparator Enable 0: Comparator is disabled 1: Comparator is enabled	R/W
3	TSNKEEP	Temperature Sensor Latch Control 0: Temperature sensor latch is opened 1: Temperature sensor latch is closed	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

6.2.10 TEMPRLR : Temperature Monitor Reset Lock Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAE0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LOCK
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	LOCK	Temperature Monitor Reset Control Register Lock 0: Temperature monitor reset control register is unlocked 1: Temperature monitor reset control register is locked	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.
Note: This register accepts write accesses only twice. If you write to TEMPRLR 3 times or more, please reset it and re-write.

6.3 Operation

6.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time (t_{RESWT}) elapses. The CPU then starts the reset exception handling.

For details, see section 62, Electrical Characteristics.

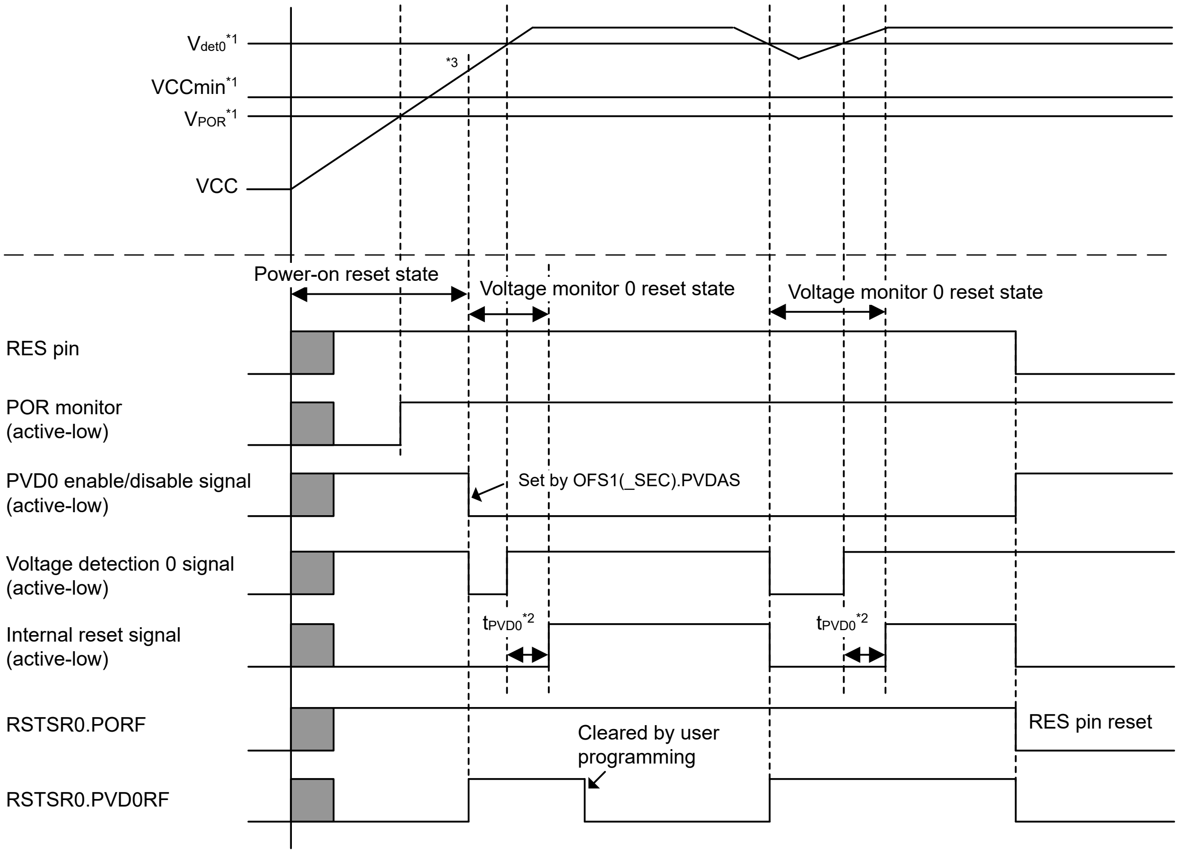
6.3.2 Power-On Reset

The power-on reset circuit generates this internal reset. If the RES pin is in a high-level state when power is supplied, a power-on reset is generated.

After VCC exceeds V_{POR} and the specified period (power-on reset time) elapses, the internal reset is canceled, and the CPU starts the reset exception handling. The power-on reset time is the stabilization period for the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset.

Figure 6.1 shows examples of operations during a power-on reset and voltage monitor 0 reset.



Note: For details on the electrical characteristics, see section 62, Electrical Characteristics.

Note 1. V_{det0} shows a voltage monitor 0 reset detection level, V_{POR} shows a power-on reset detection level, and VCCmin shows minimum guaranteed voltage of MCU.

Note 2. tPVD0 shows the reset time of Voltage Monitor 0.

Note 3. At power-on, VCC should rise to the minimum guaranteed voltage before the power-on reset is released.

Figure 6.1 Example of operations during a power-on reset and Voltage Monitor 0 Reset

6.3.3 Voltage Monitor Reset

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start bit (PVDAS) in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below V_{det0}, the RSTSR0.PVD0RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 0 reset. Clear the OFS1.PVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds V_{det0} and the voltage monitor 0 reset time (t_{PVD0}) elapses, the internal reset is canceled, and the CPU starts the reset exception handling. The V_{det0} voltage detection level can be changed by the setting in the VDSEL[1:0] bits in Option Function Select Register 1 (OFS1).

- Case of PVDiFCR.RHSEL = 0 and PVDjFCR.RHSEL = 0 (i = 1, 2, j = 4, 5)

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (PVD1CR0), the RSTSR0.PVD1RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 1 reset if VCC falls to or below V_{det1}.

Timing for release from the Voltage Monitor 1 reset state is selectable in the Voltage Monitor 1 Reset Negate Select bit (RN) in PVD1CR0. When the RN bit is 0 and VCC falls to or below Vdet1, the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time (tPVD1) elapses after VCC rises above V_{det1}. When the PVD1CR0.RN bit is 1 and VCC falls to or below Vdetm, the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time (tPVD1) elapses.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (PVD2CR0), the RSTSR0.PVD2RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 2 reset if VCC falls to or below V_{det2}.

Timing for release from the Voltage Monitor 2 reset state is selectable in the Voltage Monitor 2 Reset Negate Select bit (RN) in PVD2CR0. When the RN bit is 0 and VCC falls to or below V_{det2}, the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (tPVD2) elapses after VCC rises above V_{det2}. When the PVD2CR0.RN bit is 1 and VCC falls to or below Vdetm, the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (tPVD2) elapses.

When the Voltage Monitor 4 Reset Enable bit (RE) is set to 1 (enabling generation of a reset by the voltage detection circuit) in Voltage Monitor 4 Circuit Control Register 0 (PVD4CR0), the RSTSR0.PVD4RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 4 reset if VCC falls to or below V_{det4}.

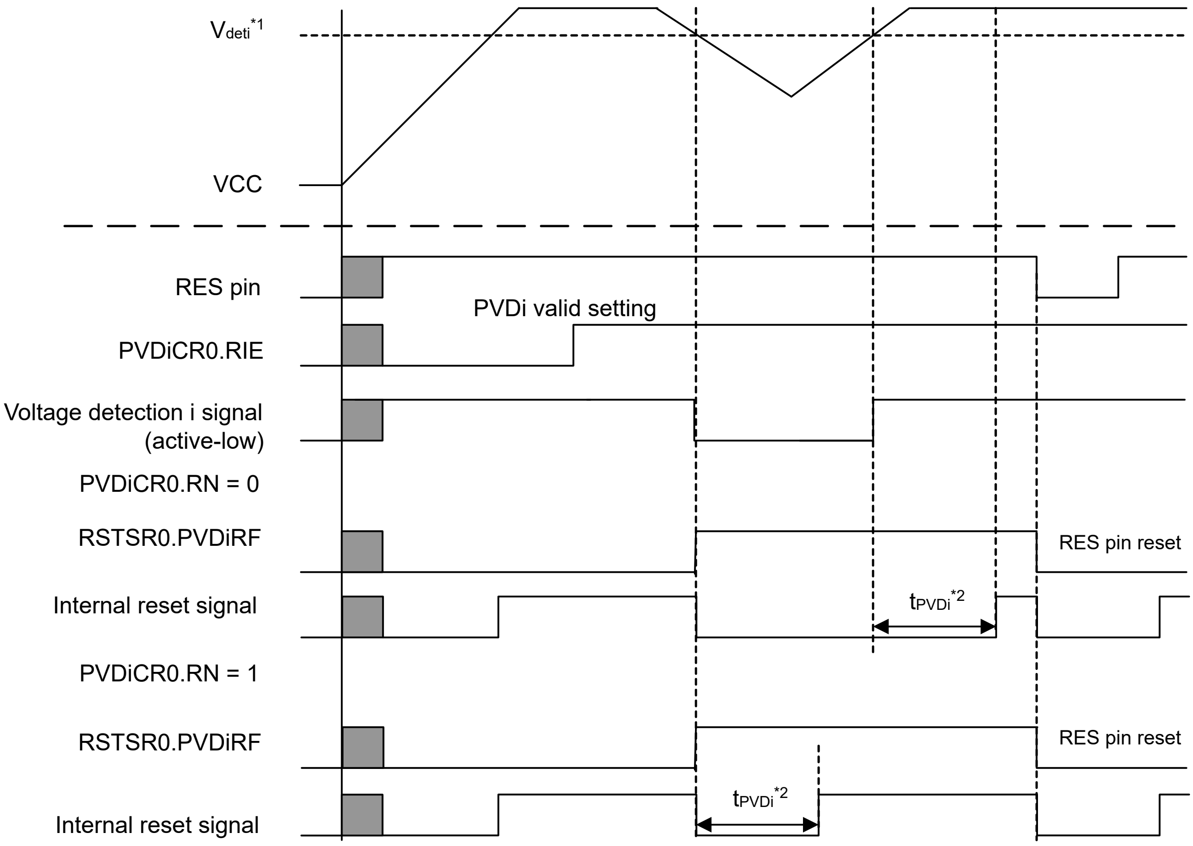
The CPU is then released from the internal reset state and starts reset exception handling when the PVD4 reset time (tPVD4) elapses after VCC rises above V_{det4}.

When the Voltage Monitor 5 Reset Enable bit (RE) is set to 1 (enabling generation of a reset by the voltage detection circuit) in Voltage Monitor 5 Circuit Control Register 0 (PVD5CR0), the RSTSR0.PVD5RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 5 reset if VCC falls to or below V_{det5}.

The CPU is then released from the internal reset state and starts reset exception handling when the PVD5 reset time (tPVD5) elapses after VCC rises above V_{det5}.

Figure 6.2 shows examples of operations during the voltage monitor 1 and 2 reset.

Figure 6.3 shows examples of operations during the voltage monitor 4 and 5 reset.

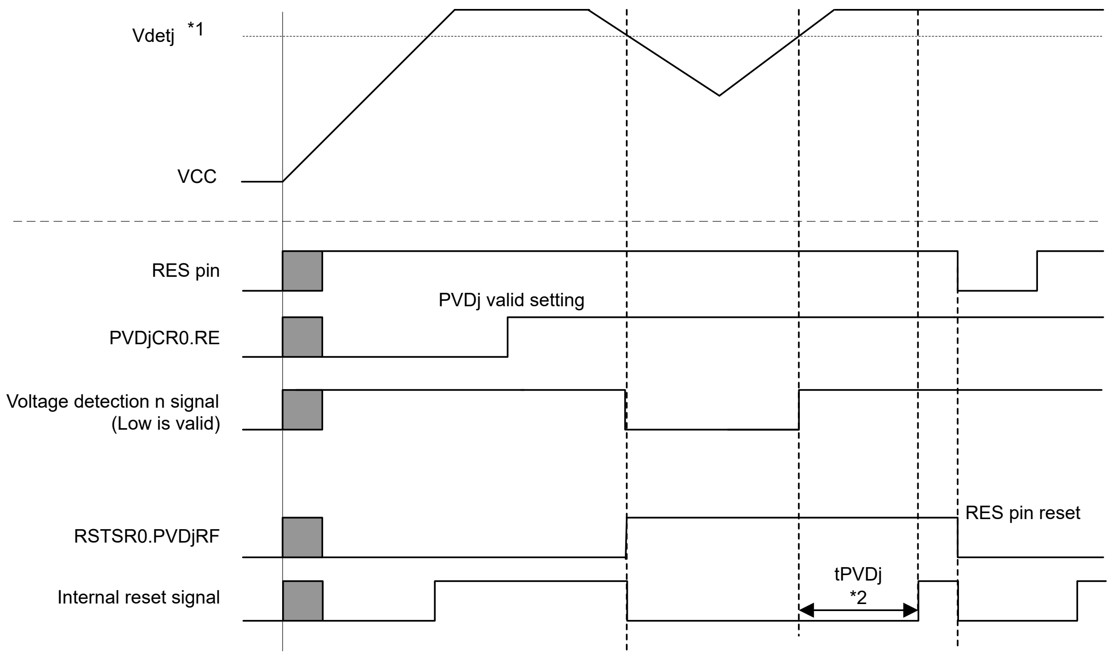


Note: For details on the electrical characteristics, see section 62, Electrical Characteristics.

Note 1. V_{deti} indicates the detection level of the voltage monitor i reset. (i = 1, 2)

Note 2. t_{PVDi} indicates the time for the voltage monitor i reset. (i = 1, 2)

Figure 6.2 Example of operations during voltage monitor i reset (i = 1, 2)



Note: For details on the electrical characteristics, see section 62, Electrical Characteristics.
Note 1. Vdetj shows a detection level of voltage monitor j reset. (j = 4, 5)
Note 2. tPVDj shows a time for voltage monitor j reset. (j = 4, 5)

Figure 6.3 Example of operations during voltage monitor j reset (j = 4, 5)

- Case of PVDiFCR.RHSEL = 1 and PVDjFCR.RHSEL = 1 (i = 1, 2, j = 4, 5)

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (PVD1CR0), the RSTSR0.PVD1RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 1 reset if VCC rises to or above V_{det1}.

The CPU is then released from the internal reset state and starts reset exception handling when the PVD1 reset time (tPVD1) elapses after VCC falls below V_{det1}.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (PVD2CR0), the RSTSR0.PVD2RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 2 reset if VCC rises to or above V_{det2}.

The CPU is then released from the internal reset state and starts reset exception handling when the PVD2 reset time (tPVD2) elapses after VCC falls below V_{det2}.

When the Voltage Monitor 4 Reset Enable bit (RE) is set to 1 (enabling generation of a reset by the voltage detection circuit) in Voltage Monitor 4 Circuit Control Register 0 (PVD4CR0), the RSTSR0.PVD4RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 4 reset if VCC rises to or above V_{det4}.

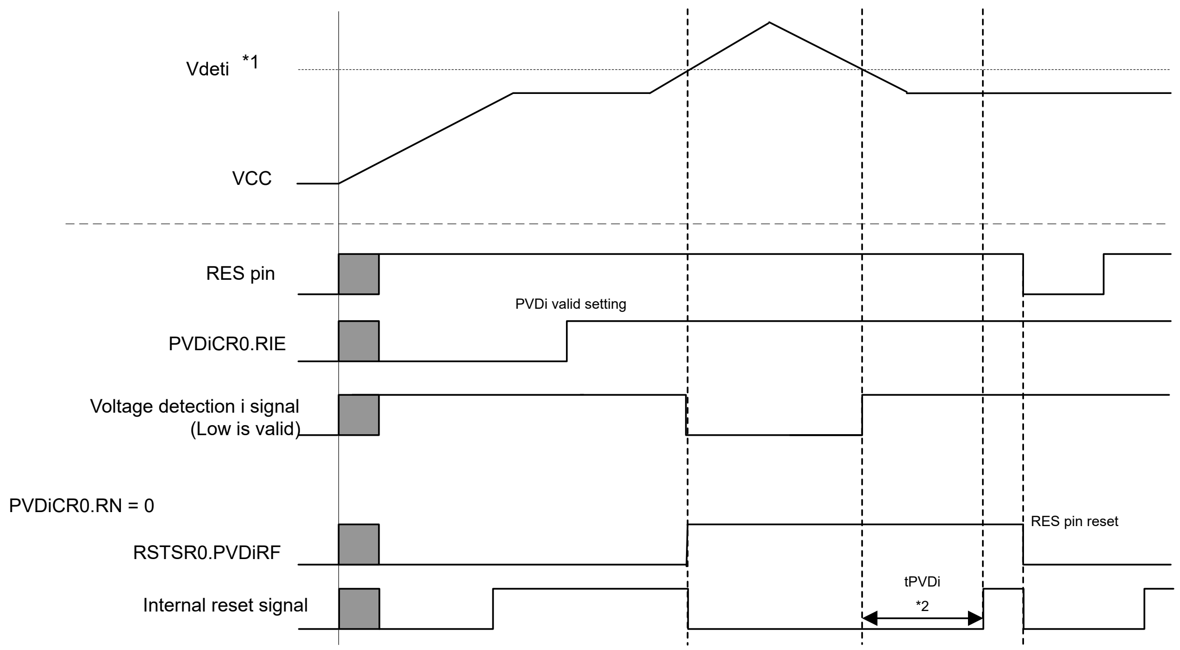
The CPU is then released from the internal reset state and starts reset exception handling when the PVD4 reset time (tPVD4) elapses after VCC falls below V_{det4}.

When the Voltage Monitor 5 Reset Enable bit (RE) is set to 1 (enabling generation of a reset by the voltage detection circuit) in Voltage Monitor 5 Circuit Control Register 0 (PVD5CR0), the RSTSR0.PVD5RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 5 reset if VCC rises to or above V_{det5}.

The CPU is then released from the internal reset state and starts reset exception handling when the PVD5 reset time (tPVD5) elapses after VCC falls below V_{det5}.

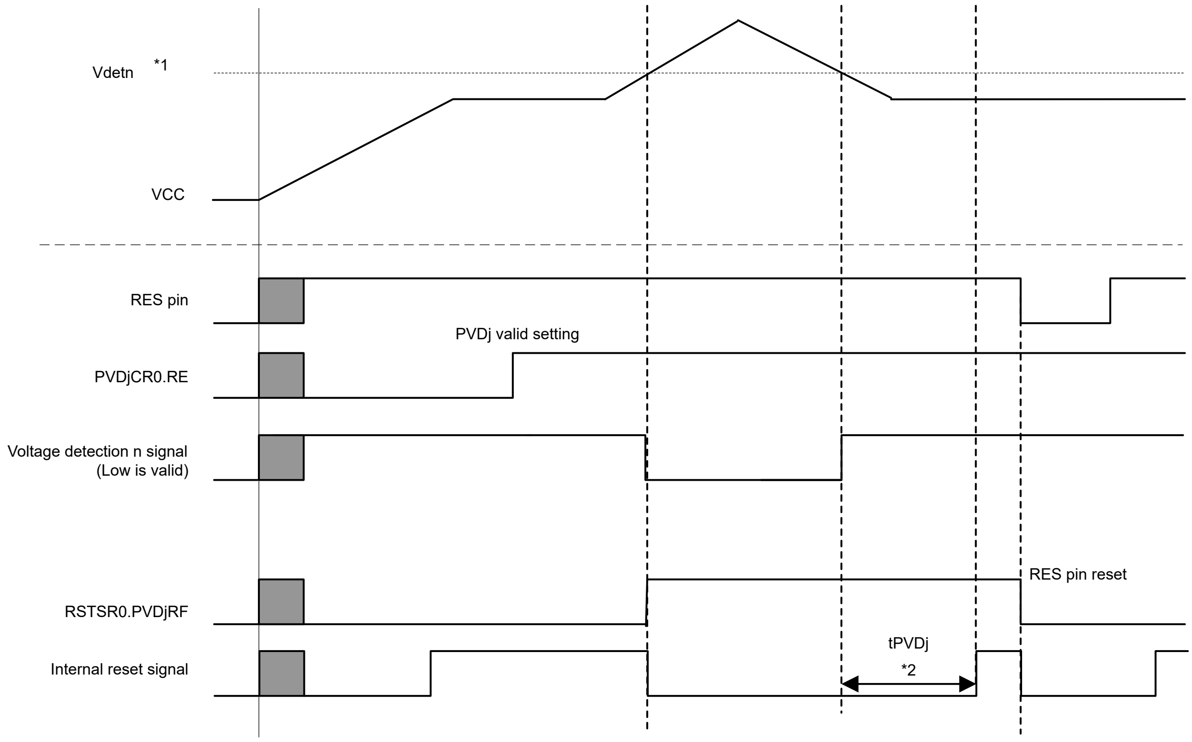
Figure 6.4 shows examples of operations during the voltage monitor 1 and 2 reset.

Figure 6.5 shows examples of operations during the voltage monitor 4 and 5 reset.



Note: For details on the electrical characteristics, see section 62, Electrical Characteristics.
Note 1. V_{deti} shows a detection level of voltage monitor i reset (i = 1 to 2).
Note 2. t_{PVDi} shows a time for voltage monitor i reset (i = 1 to 2).

Figure 6.4 Example of operations during voltage monitor i reset (i = 1, 2)



Note: For details on the electrical characteristics, see section 62, Electrical Characteristics.
Note 1. Vdetj shows a detection level of voltage monitor j reset. (j = 4, 5)
Note 2. tPVDj shows a time for voltage monitor j reset. (j = 4, 5)

Figure 6.5 Example of operations during voltage monitor j reset (j = 4, 5)

The Core Voltage Monitor reset is an internal reset generated by the Core Voltage monitor circuit.

If the Core Voltage Detection Circuit disable bit (CVMRDIS) in Option Function Select Register 0 (OFS2) is 0 (Core Voltage monitor reset is enabled after a reset) and VDD falls below V_{det}_VDDL or rises above V_{det}_VDDH, the RSTSR3.CVMRF flag is set to 1 and the Core Voltage detection circuit generates a Core Voltage monitor reset.

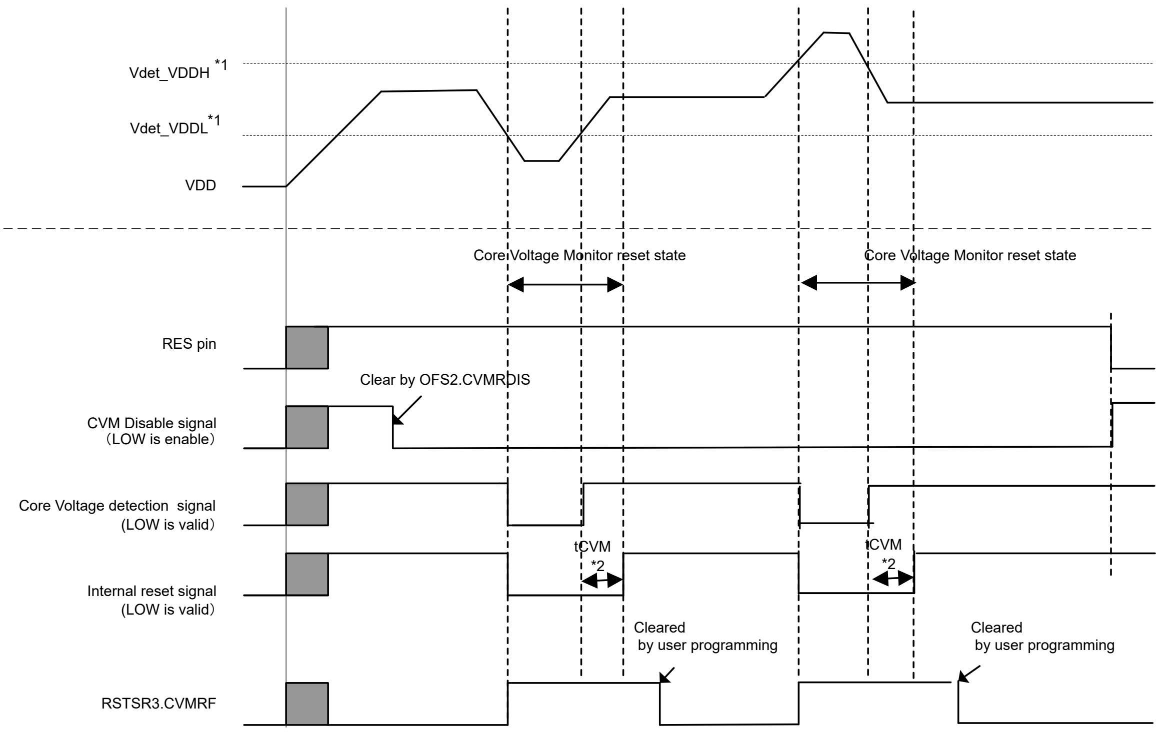
After VDD is between V_{det}_VDDL and V_{det}_VDDH and the Core Voltage monitor reset time (tCVM) elapses, the internal reset is canceled, and the CPU starts the reset exception handling.

The Core Voltage Monitor reset function does not work during DSTBY mode.

When RES pin reset is asserted while issuing CVM reset, the CVM reset is not negated.

When the Core Voltage Monitor reset occurs, the values of register and SRAM cannot be guaranteed due to the response time until the reset occurs.

Figure 6.6 shows examples of operations during the core voltage monitor reset.



Note 1. For details on the electrical characteristics, see section 62, Electrical Characteristics.
Note 2. tCVM shows the reset time of Core Voltage Monitor.

Figure 6.6 Operation Examples during Core Voltage Monitor Reset

6.3.4 Deep Software Standby Reset

These internal resets are generated when either of the Deep Software Standby mode are canceled by an associated interrupt.

The Deep Software Standby reset is canceled after t_{DSBY} (return time after Deep Software Standby mode cancellation) elapses. At the same time, Deep Software Standby mode is also canceled.

When t_{DSBYWT} (wait time after Deep Software Standby mode cancellation) elapses after Deep Software Standby mode has been canceled, the internal reset is canceled, and the CPU starts the reset exception handling.

For details of the Deep Software Standby reset, see section 11, Low Power Mode.

6.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDT). Output of the reset from the IWDT can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see section 28, Independent Watchdog Timer (IWDT).

6.3.6 CPU0/CPU1 Watchdog Timer Reset

The CPU0/CPU1 watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT0/1). Output of the reset from the WDT0/1 can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, the reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see section 27, Watchdog Timer (WDT).

6.3.7 CPU0/CPU1 Lockup Reset

The CPU0 lockup reset is an internal reset generated by Arm core. Output of the reset from Arm core can be selected by CPU0LCKUPCR.OAD.

When output of the CPU0 lockup reset is selected, CPU0 generated if Arm core is in the lockup state. When the internal reset time (tRESW2) elapses after the CPU0 lockup reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

Similarly, CPU1 has lockup reset. Output of the reset from Arm core can be selected by CPU1LCKUPCR.OAD.

For details on the CPU lockup reset, see section 2, CPU.

6.3.8 Software Reset

This internal reset is generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time (t_{RESW2}) elapses after the software reset is generated, the internal reset is canceled, and the CPU starts the reset exception handling. For dual CPU systems, SYSRESETREQ of CPU0 will always generate a software reset but CPU1 reset request can be gated off by setting a control register accessible by secure software running on CPU0.

6.3.9 Bus Error Reset

Bus error reset is an internal reset generated by buses.

It is an integrated reset generated by buses, and it consists of the following:

- Bus error reset (MSAU error, MMPU error, Illegal address error, Slave TrustZone Filter error, Slave Bus error, Bufferable write error)

Output of Bus error reset can be selected by MSAOAD.OAD or MMPUOAD.OAD or BUSOAD.ILERROAD or BUSOAD.SLERROAD or BUSOAD.BWERROAD.

When the internal reset time (t_{RESW2}) elapses after the Bus error reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Bus error reset, see section 15, Buses. Determination of reset generation source in Bus error reset is similar to determination of interrupt generation source, see section 14, Interrupt Controller Unit (ICU).

6.3.10 Common Memory Error Reset

Common memory error reset is an internal reset generated by SRAMs.

It is an integrated reset generated by SRAMs and consists of the following:

- SRAM error reset (ECC error)

Output of SRAM error reset can be selected by SRAMCRn.OAD.

When the internal reset time (tRESW2) elapses after the Common memory error reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Common memory error reset, see section 58, SRAM. Determination of reset generation source in Common memory error reset is similar to determination of interrupt generation source, see section 14, Interrupt Controller Unit (ICU).

6.3.11 Local Memory 0 / Local Memory 1 Error Reset

Local memory 0/ Local memory 1 error reset is an internal reset generated by SRAMs.

It is an integrated reset generated by SRAMs, and it consists of the following:

- Local Memory 0 error reset (ECC error of CPU0 Cache or TCM)
- Local Memory 1 error reset (ECC error of CPU1 Cache or TCM)

Output of Local Memory 1 error reset can be selected by CAPOAD.OAD and TCMCRC.OAD or TCMCRS.OAD.

When the internal reset time (tRESW2) elapses after the Local Memory 0/1 Error Reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Local Memory 0 and Local Memory 1 error reset, see section 2, CPU. For determination of reset generation source in Local Memory 0/Local Memory 1 Error Reset, it is similar to determination of interrupt generation source and see section 14, Interrupt Controller Unit (ICU).

6.3.12 Temperature Monitor Reset

Temperature monitor reset is an internal reset generated by temperature sensor (TSN). TSN detects ambient temperature on surrounding environment of MCU. If it is outside from the specified range, reset is issued.

The function of temperature monitor reset is enabled via specific procedure which is described in Figure 6.7.

When TSN is activated and reset function enabled, temperature monitoring is executed. Representative behavior of temperature monitor reset is shown in Figure 6.8 and Figure 6.9.

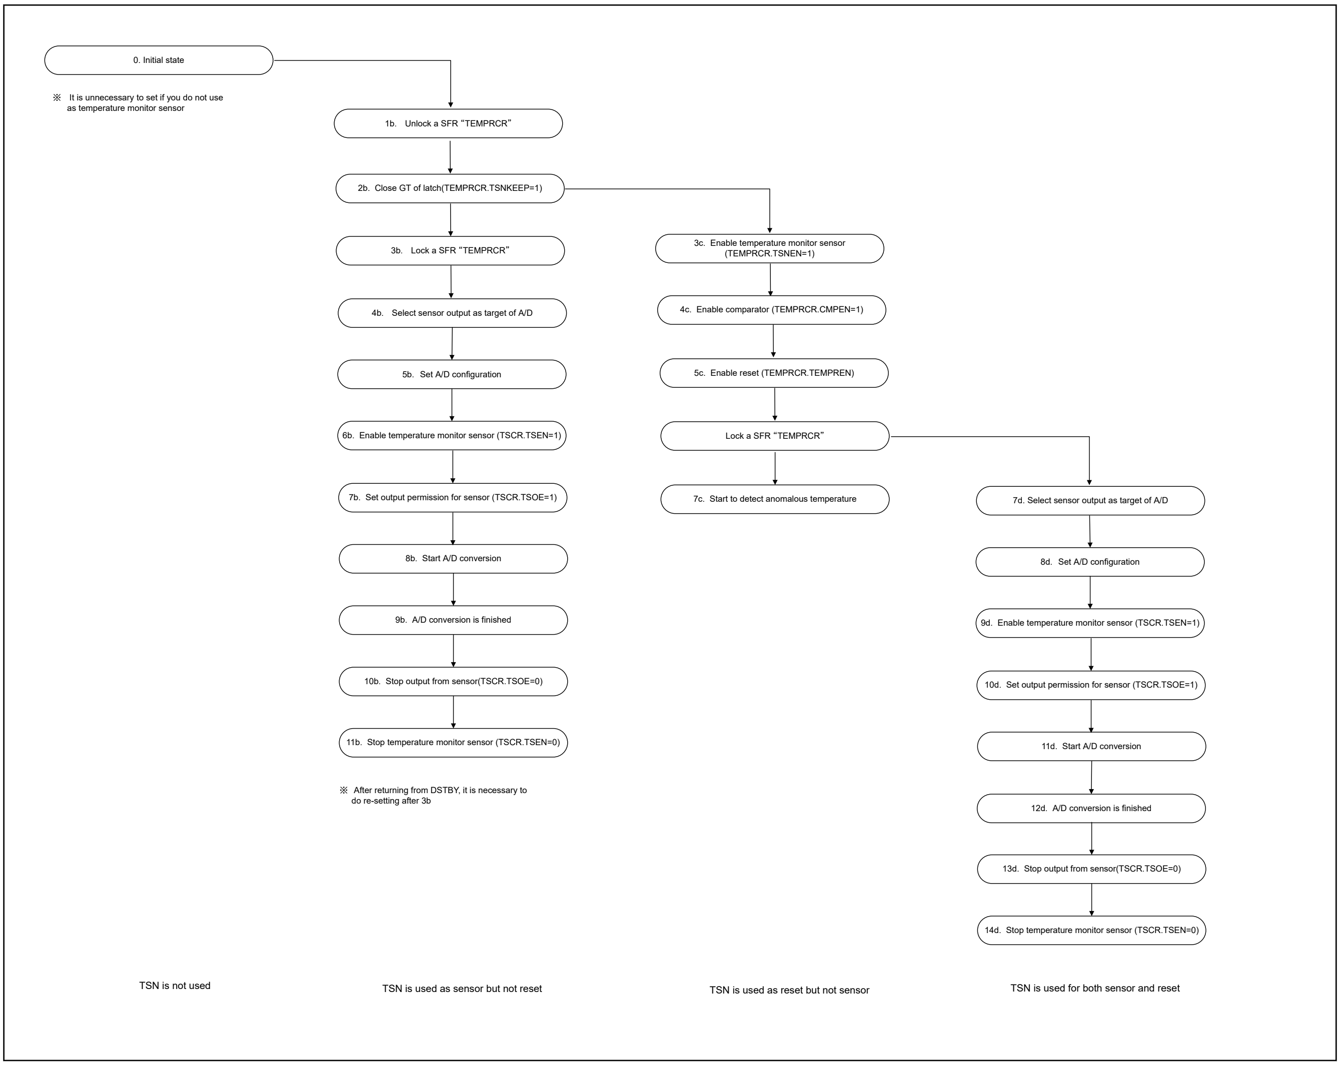


Figure 6.7 Setting procedure for temperature monitor sensor

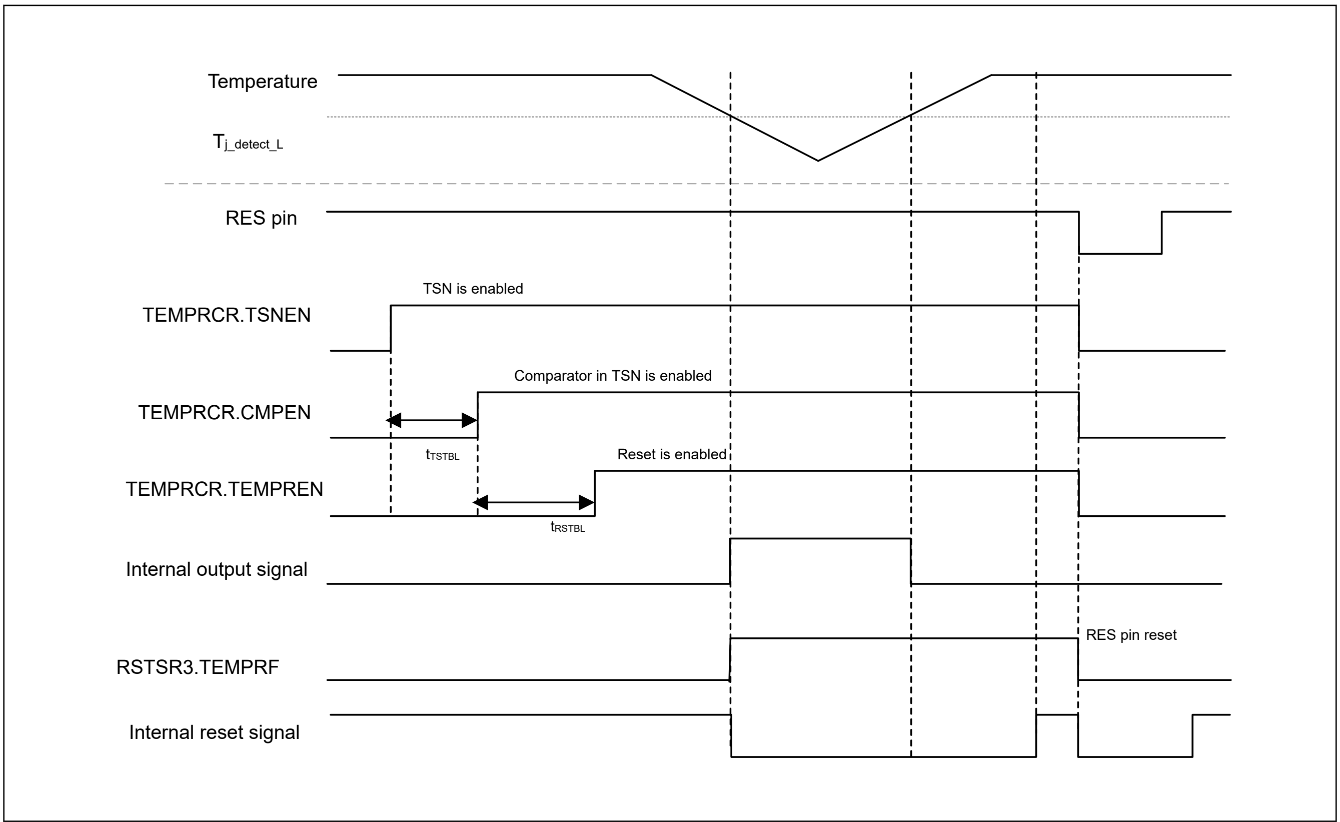

Figure 6.8 Example of temperature monitor reset operation (low detection)

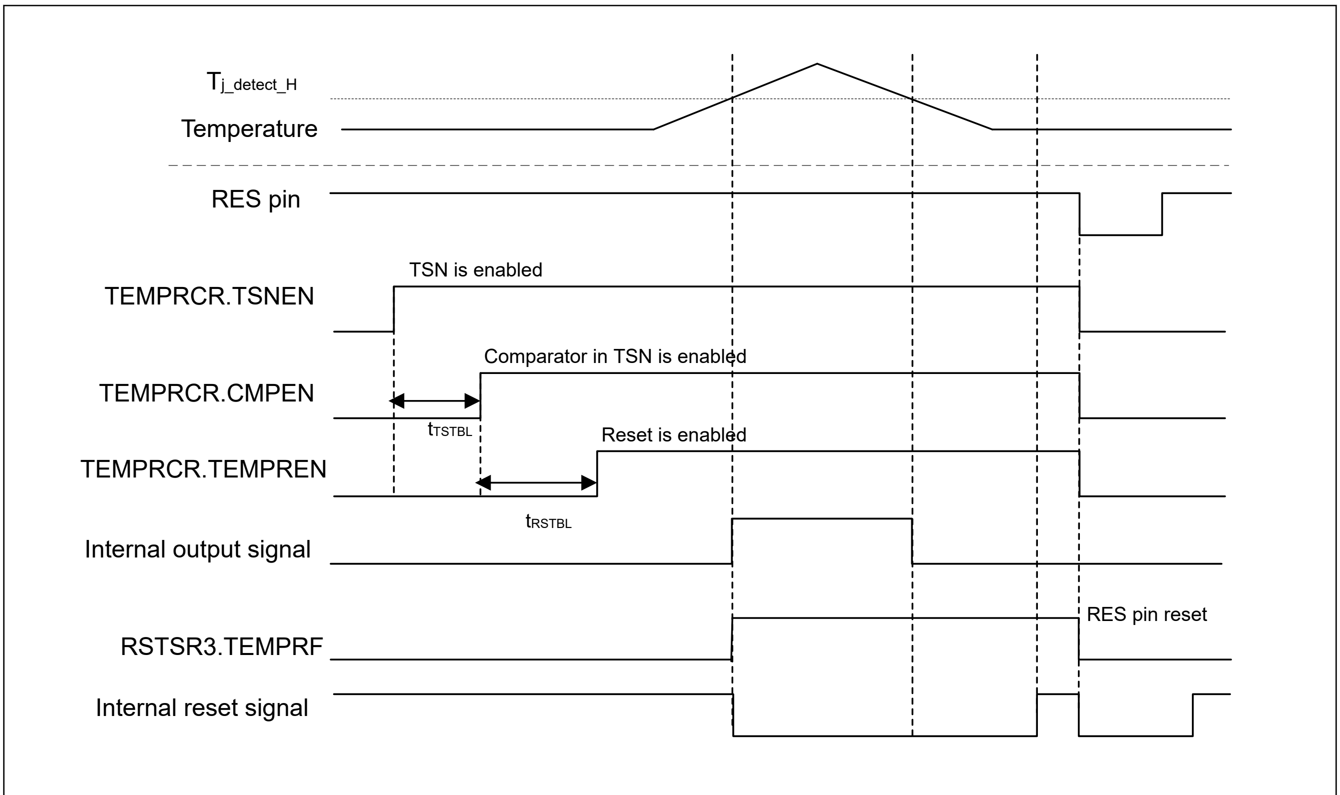

Figure 6.9 Example of temperature monitor reset operation (high detection)

6.3.13 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

Figure 6.10 shows an example of cold/warm start determination operation.

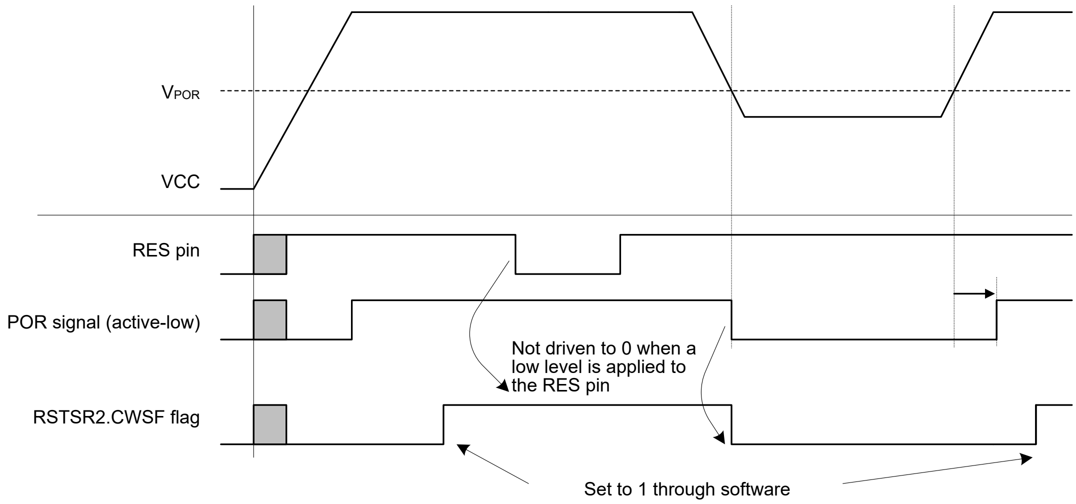

Figure 6.10 Example of cold/warm start determination operation

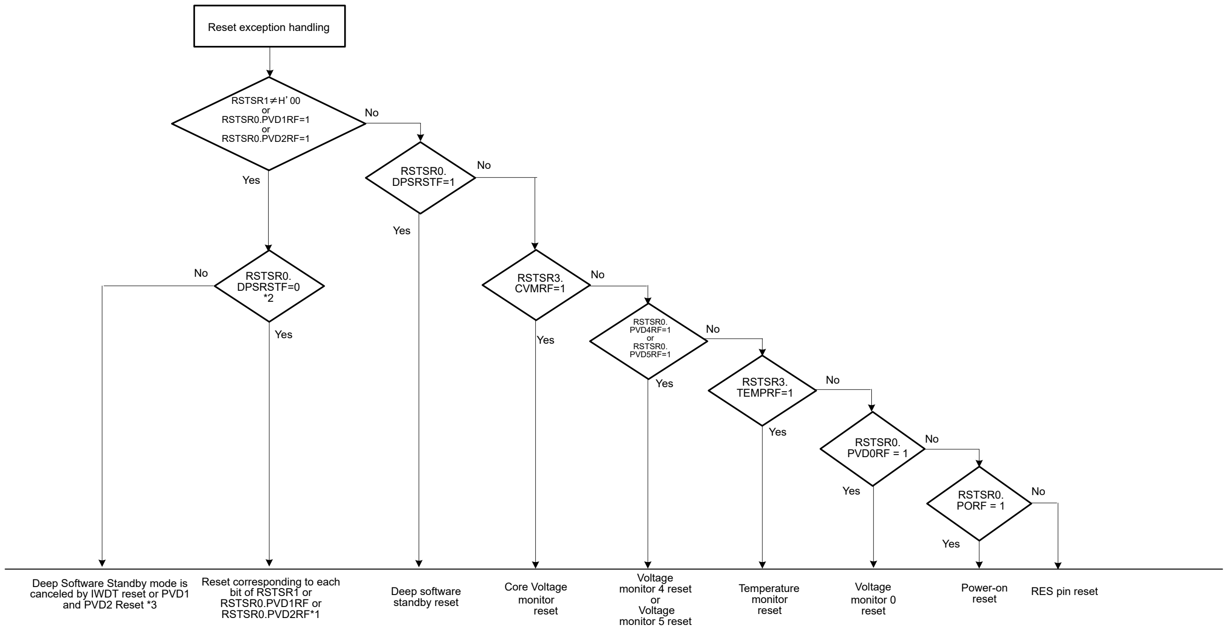
6.3.14 Determination of Reset Generation Source

Read RSTSR0, RSTSR1, and RSTSR3 to determine which reset executes the reset exception handling.

Figure 6.11 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after 1 is read.



Note 1. If a reset associated with each bit of RSTSR1, RSTSR0.PVD1RF, or RSTSR0.PVD2RF occurred at the same time, all occurrences of the reset flags are set to 1.

Note 2. After checking RSTSR1 ≠ 0x00, RSTSR0.PVD1RF = 1 or RSTSR0.PVD2RF = 1, check RSTSR0.DPSRSTF to determine whether it caused the cancellation of Deep Software Standby mode.

Note 3. The Reset Status registers (RSTSR0, RSTSR1, RSTSR2, and RSTSR3) should be cleared before the Deep Software Standby transition. If the reset flag has not been cleared, the return factor cannot be correctly identified.

Figure 6.11 Example of reset generation source determination flow

6.4 Reset Protection from Non-Secure Programs

The reset occurrence can be controlled. A reset is generated according to the setting of SYRSTMSK0, SYRSTMSK1 and SYRSTMSK2 that can only be accessed from a secure program.

The reset source that is set to disable is generated but is not propagated to the MCU. The reset flags of RSTSR0 and RSTSR1 bits are not set.

The resets that can be controlled are as follows:

- Independent watchdog timer reset
- CPU0/CPU1 Watchdog timer reset
- CPU0/CPU1 lockup reset
- Common memory error reset
- Local memory 0 error reset
- Local memory 1 error reset
- Bus error reset
- Voltage monitor 1 reset
- Voltage monitor 2 reset
- Software reset

7. Option-Setting Memory

7.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area or the OTP area of the extra MRAM memory.

Figure 7.1 shows the option-setting memory area. The option-setting memory area has Secure region and Non-secure region. Table 7.1 shows the programming condition of the option-setting memory area.

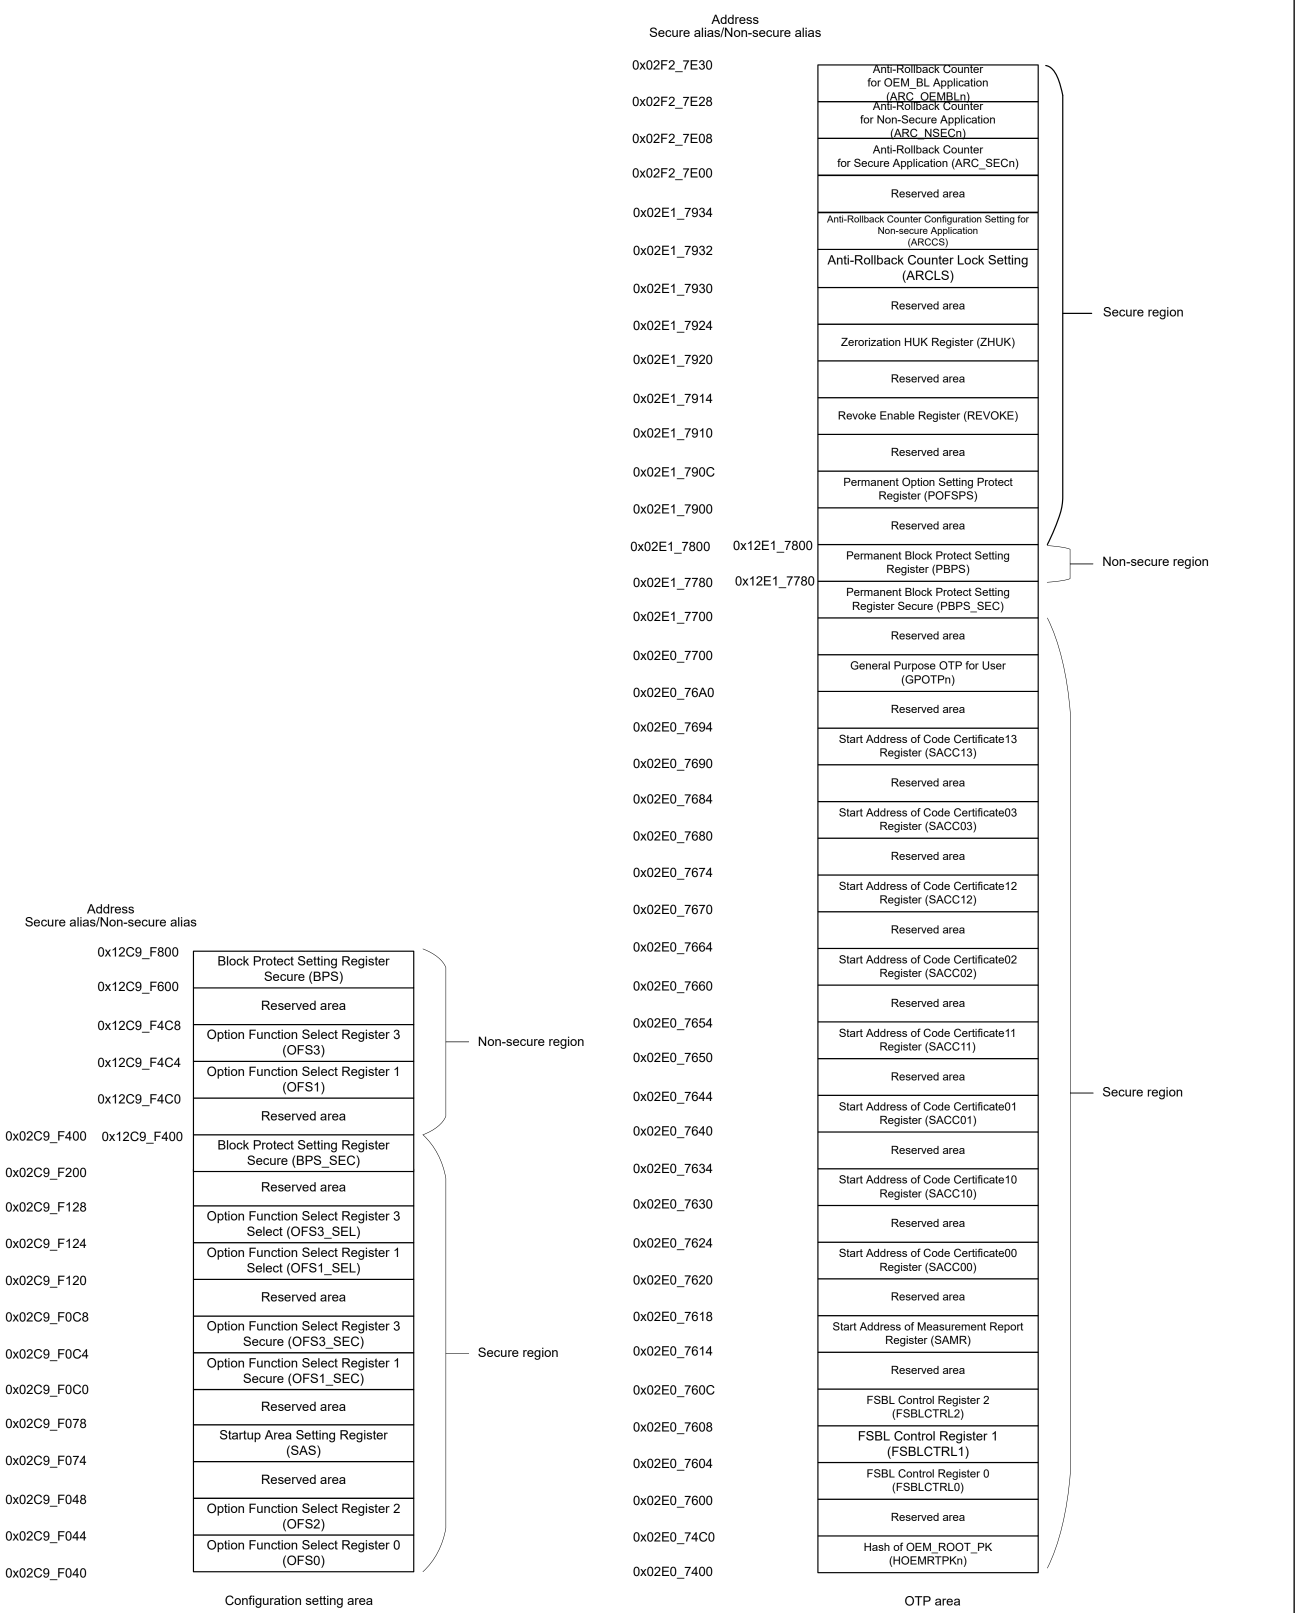


Figure 7.1 Option-setting memory area

Table 7.1 The programming condition of the option-setting memory area

	Self programming	Serial programming	Programming by the on-chip debugger
Secure region	Programming commands issued via Secure alias access.	Programming commands issued when the authentication level is AL2.	Programming commands issued when the authentication level is AL2.
Non-secure region	Programming commands issued via Non-secure alias access.	Programming commands issued when the authentication level is AL2 or AL1.	Programming commands issued when the authentication level is AL2 or AL1.

7.2 Register Descriptions

7.2.1 OFS0 : Option Function Select Register 0

Address: 0x02C9_F040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	WDT0STPCTL	—	WDT0RSTIRQS	WDT0RPSS[1:0]		WDT0RPES[1:0]		WDT0CKS[3:0]				WDT0TOPS[1:0]		WDT0STRT	—
Value after reset:	User setting[*1]															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	IWDTSTPCTL	—	IWDTRSTIRQS	IWDTRPSS[1:0]		IWDTRPES[1:0]		IWDTCKS[3:0]				IWDTTOPS[1:0]		IWDTSTRT	—
Value after reset:	User setting[*1]															

Bit	Symbol	Function	R/W
0	—	The program value is read from this bit.[*2]	R
1	IWDTSTRT	IWDT Start Mode Select 0: Automatically activate IWDT after a reset (auto start mode) 1: Stop IWDT after a reset (register start mode)	R
3:2	IWDTTOPS[1:0]	IWDT Timeout Period Select 0 0: 128 cycles (0x007F) 0 1: 512 cycles (0x01FF) 1 0: 1024 cycles (0x03FF) 1 1: 2048 cycles (0x07FF)	R
7:4	IWDTCKS[3:0]	IWDT-Dedicated Clock Frequency Division Ratio Select 0x0: × 1 0x2: × 1/16 0x3: × 1/32 0x4: × 1/64 0xF: × 1/128 0x5: × 1/256 Others: Reserved	R
9:8	IWDTRPES[1:0]	IWDT Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (no window end position setting)	R
11:10	IWDTRPSS[1:0]	IWDT Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (no window start position setting)	R
12	IWDTRSTIRQS	IWDT Reset Interrupt Request Select 0: Interrupt 1: Reset	R
13	—	The program value is read from this bit.[*2]	R

Bit	Symbol	Function	R/W
14	IWDTSTPCTL	IWDT Stop Control 0: Continue counting 1: Stop counting when primary CPU is in CPU Sleep mode or CPU Deep Sleep mode, or MCU is in Software Standby mode or Deep Software Standby mode 1	R
16:15	—	The program value is read from these bits.*2	R
17	WDT0STRT	WDT0 Start Mode Select 0: Automatically activate WDT0 after a reset (auto start mode) 1: Stop WDT0 after a reset (register start mode)	R
19:18	WDT0TOPS[1:0]	WDT0 Timeout Period Select 0 0: 1024 cycles (0x03FF) 0 1: 4096 cycles (0x0FFF) 1 0: 8192 cycles (0x1FFF) 1 1: 16384 cycles (0x3FFF)	R
23:20	WDT0CKS[3:0]	WDT0 Clock Frequency Division Ratio Select 0x1: PCLKB divided by 4 0x4: PCLKB divided by 64 0xF: PCLKB divided by 128 0x6: PCLKB divided by 512 0x7: PCLKB divided by 2048 0x8: PCLKB divided by 8192 Others: Reserved	R
25:24	WDT0RPES[1:0]	WDT0 Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (no window end position setting)	R
27:26	WDT0RPSS[1:0]	WDT0 Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (no window start position setting)	R
28	WDT0RSTIRQS	WDT0 Reset Interrupt Request Select 0: Interrupt 1: Reset	R
29	—	The program value is read from this bit.*2	R
30	WDT0STPCTL	WDT0 Stop Control 0: Continue counting 1: Stop counting when CPU0 is in CPU Sleep mode or CPU Deep Sleep mode	R
31	—	The program value is read from this bit.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state). When IWDT is activated in auto start mode, the OFS0 register setting for the IWDT is valid.

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The time it takes for the counter to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524,288 IWDT clock cycles.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see section 28, Independent Watchdog Timer (IWDT).

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode or Deep Software Standby mode1.

For details, see section 28, Independent Watchdog Timer (IWDT).

WDT0STRT bit (WDT0 Start Mode Select)

The WDT0STRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

WDT0TOPS[1:0] bits (WDT0 Timeout Period Select)

The WDT0TOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDT0CKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDT0CKS[3:0] and WDT0TOPS[1:0] bits.

For details, see section 27, Watchdog Timer (WDT).

WDT0CKS[3:0] bits (WDT0 Clock Frequency Division Ratio Select)

The WDT0CKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDT0TOPS[1:0] bits setting, the WDT counting period can be set from 4,096 to 134,217,728 PCLKB cycles.

For details, see section 27, Watchdog Timer (WDT).

WDT0RPES[1:0] bits (WDT0 Window End Position Select)

The WDT0RPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDT0RPSS[1:0] and WDT0RPES[1:0] bits vary with the setting of the WDT0TOPS[1:0] bits.

For details, see section 27, Watchdog Timer (WDT).

WDT0RPSS[1:0] bits (WDT0 Window Start Position Select)

The WDT0RPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see section 27, Watchdog Timer (WDT).

WDT0RSTIRQS bit (WDT0 Reset Interrupt Request Select)

The WDT0RSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see section 27, Watchdog Timer (WDT).

WDT0STPCTL bit (WDT0 Stop Control)

The WDT0STPCTL bit specifies whether to stop counting when CPU0 is in CPU Sleep mode or CPU Deep Sleep mode.

For details, see section 27, Watchdog Timer (WDT).

7.2.2 OFS2 : Option Function Select Register 2

Address: 0x02C9_F044

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting[*1]															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	EXVDDSEL[1:0]	EXVDDSEL[1:0]	—	—	CVMRDIS	DCDCEN
Value after reset:	User setting[*1]															

Bit	Symbol	Function	R/W
0	DCDCEN	DCDC enable 0: Disable DCDC 1: Enable DCDC	R
1	CVMRDIS	CVM reset disable 0: Enable CVM reset 1: Disable CVM reset	R
3:2	—	The program value is read from these bits.[*2]	R
5:4	EXVDDSEL[1:0]	External VDD voltage select for SRAM 1 0: 0.9V ± 10% Others: Setting prohibit	R
31:6	—	The program value is read from these bits.[*2]	R

Note 1. The value in a blank product is 0xFFFFFFEF. It is set to the value written by your application.
Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

DCDCEN bit (DCDC enable)

The DCDCEN bit selects whether the DCDC is enabled or disabled.

CVMRDIS bit (CVM reset disable)

The CVMRDIS bit selects whether the CVM reset is enabled or disabled.

EXVDDSEL[1:0] bits (External VDD voltage select for SRAM)

The EXVDDSEL[1:0] bit selects bits selects the voltage for SRAM in external VDD mode.

7.2.3 SAS : Startup Area Setting Register

Address: 0x02C9_F074

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	BTSIZE[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
14:0	—	The program value is read from these bits.*2	R
28:15	—	The program value is read from these bits.*2	R
30:29	BTSIZE[1:0]	Size of Start-Up Area select 0 0: Reserved 0 1 Start-Up area Size is set to 32KB 1 0 Start-Up area Size is set to 16KB 1 1: Start-Up area Size is set to 8KB	R
31	BTFLG	Startup Area Select Flag This bit specifies whether the address of the startup area is exchanged for the boot swap function or not. Example of 8KB startup area 0: First 8 KB area (0x0200_0000 to 0x0200_1FFF) and second 8 KB area (0x0200_2000 to 0x0200_3FFF) are exchanged. 1: First 8 KB area (0x0200_0000 to 0x0200_1FFF) and second 8 KB area (0x0200_2000 to 0x0200_3FFF) are not exchanged.	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

7.2.4 OFS1, OFS1_SEC : Option Function Select Register 1 for Non-Secure and Secure

Address: OFS1: 0x12C9_F4C0
OFS1_SEC: 0x02C9_F0C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	INITECCEN	SWDBG	—	—	—	—	—	—	—	—
Value after reset:	The value set by the user*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HOCOFRQ0[2:0]			HOCOEN	—	—	PVDLPSEL	—	PVDAS	VDSEL[2:0]		
Value after reset:	The value set by the user*1															

Bit	Symbol	Function	R/W
2:0	VDSEL[2:0]	Voltage Detection 0 Level Select 0 0 0: Select 2.85 V 0 0 1: Select 2.58 V 0 1 0: Select 2.15 V 0 1 1: Select 2.00 V 1 0 0: Select 1.90 V 1 0 1: Select 1.80 V 1 1 0: Select 1.67 V 1 1 1: Select 1.56 V*3	R

Bit	Symbol	Function	R/W
3	PVDAS	Voltage Detection 0 Circuit Start 0: Enable voltage monitor 0 reset after a reset 1: Disable voltage monitor 0 reset after a reset	R
4	—	The program value is read from this bit.*2	R
5	PVDLPSEL	Low Power Consumption Function of PVD0 Select at Deep Software standby mode 0: Enable low power consumption function by selecting PVD0 for the battery power supply switch control during DSTBY1 and DSTBY2. 1: Disable low power consumption function of PVD0 for the battery power supply switch control during DSTBY1 and DSTBY2.	R
7:6	—	The program value is read from these bits.*2	R
8	HOCOEN	HOCO Oscillation Enable 0: Enable HOCO oscillation after a reset 1: Disable HOCO oscillation after a reset	R
11:9	HOCOFRQ0[2:0]	HOCO Frequency Setting 0 0 0 0: 16 MHz 0 0 1: 18 MHz 0 1 0: 20 MHz 1 0 0: 32 MHz 1 1 1: 48 MHz Others: Reserved.	R
23:12	—	The program value is read from these bits.*2	R
24	SWDBG	Software Debug Control 0: Enable software debug control. The MCU behaves according to DBGCTRL0 and DBGCTRL1, and IWDT and WDT automatically stops when CPU is in the debug state. 1: Disable software debug control. The MCU ignores DBGCTRL0 and DBGCTRL1, and IWDT and WDT continue the operation even when CPU is in the debug state. However, when CDBGPWRUPREQ is 1 and AL is not AL0, IWDT and WDT automatically stops when CPU is in the debug state.	R
25	INITECCEN	Initial ECC Enable 0: Disable ECC function of TCM and CACHE of CPU0. 1: Enable ECC function of TCM and CACHE of CPU0.	R
31:26	—	The program value is read from these bits.*2	R

Note 1. The value of OFS1 and OFS1_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.
Note 3. Setting prohibited when VBATT function is enabled, OFS1(_SEC).PVDAS and PVDLPSEL bits are 0 and at least one of Deep Software Standby modes 1 and 2 is used.

OFS1 register is for Non-secure developer, and OFS1_SEC register is for Secure developer.

VDSEL[2:0] bits (Voltage Detection 0 Level Select)

The VDSEL[2:0] bits select the voltage detection level of the voltage detection 0 circuit.

PVDAS bits (Voltage Detection 0 Circuit Start)

The PVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

PVDLPSEL bits (Low Power Consumption Function of PVD0 Select at Deep Software standby mode)

The PVDLPSEL selects whether the low power consumption function of PVD0 for the battery power supply switch control is enabled or disabled during DSTBY1 and DSTBY2 mode.

When disable this function, the battery power supply switch is controlled by VCC voltage drop detection circuit dedicated for VBATT, the response time is faster instead of increasing current consumption. When enable this function, the battery power supply switch is controlled by PVD0, function, the current consumption is smaller instead of response time delay.

See section 62, Electrical Characteristics

HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, Set the OFS1(_SEC).HOCOFRQ0[2:0] bits to an optimum value.

Note: OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits when OFS1(_SEC).HOCOEN = 1.

HOCOFRQ0[2:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[2:0] bits specify the HOCO frequency after a reset as 16 to 48 MHz.

SWDBG bit (Software Debug Control)

The SWDBG bit selects whether software debug control is enabled or disabled.

INITECCEN bit (Initial ECC Enable)

The INITECCEN bit selects whether ECC function of TCM and CACHE of CPU0 is enabled or disabled.

When the INITECCEN bit is changed from 1 to 0, be sure to perform a power-on reset after the change.

7.2.5 OFS1_SEL : Option Function Select Register 1 for Security Attribution

Address: OFS1_SEL: 0x02C9_F120

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	INITECCEN	SWDBG	—	—	—	—	—	—	—	—
Value after reset:	The value set by the user*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HOCOFRQ0[2:0]			HOCOEN	—	—	PVDLPSEL	—	PVDAS	VDSEL[2:0]		
Value after reset:	The value set by the user*1															

Bit	Symbol	Function	R/W
2:0	VDSEL[2:0]	Security attributes of Voltage Detection 0 Level Select 0 0 0: Select OFS1_SEC.VDSEL0[2:0] 1 1 1: Select OFS1.VDSEL0[2:0] Others: Select Reserved.	R
3	PVDAS	Security attributes of Voltage Detection 0 Circuit Start 0: Select OFS1_SEC.PVDAS 1: Select OFS1.PVDAS	R
4	—	The program value is read from this bit.*2	R
5	PVDLPSEL	Security attributes of Low Power Consumption Function of PVD0 Select at Deep Software standby mode 0: Select OFS1_SEC.PVDLPSEL 1: Select OFS1.PVDLPSEL.	R
7:6	—	The program value is read from these bits.*2	R

23:12	—	The program value is read from these bits.*2	R
24	SWDBG	Security attributes of Software Debug Control 0: Select OFS1_SEC.SWDBG 1: Select OFS1.SWDBG	R
25	INITECCEN	Security attributes of Initial ECC Enable 0: Select OFS1_SEC.INITECCEN 1: Select OFS1.INITECCEN	R
31:26	—	The program value is read from these bits.*2	R

Note 1. The value of OFS1_SEL in a blank product is 0x00000000. It is set to the value written by your application

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 0.

The OFS1_SEL register selects the security attribute. Which security attribute is applied, OFS or OFS_SEC, is determined by the setting value of the corresponding bit in the OFS1_SEL register. For details, see section 7.3.3. Security Attribution of Extra MRAM Option-Setting Memory

7.2.6 OFS3, OFS3_SEC : Option Function Select Register 3

Address: OFS3: 0x12C9_F4C4
OFS3_SEC: 02C9_F0C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	WDT1STPCTL	—	WDT1RSTIRQS	WDT1RPSS[1:0]		WDT1RPES[1:0]		WDT1CKS[3:0]				WDT1TOPS[1:0]		WDT1STRT	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
16:0	—	The program value is read from these bits. *2	R
17	WDT1STRT	WDT1 Start Mode Select 0: Automatically activate WDT after a reset (auto start mode) 1: Stop WDT after a reset (register start mode).	R

23:20	WDT1CKS[3:0]	WDT1 Clock Frequency Division Ratio Select 0 0 0 1: PCLKB divided by 4 0 1 0 0: PCLKB divided by 64 1 1 1 1: PCLKB divided by 128 0 1 1 0: PCLKB divided by 512 0 1 1 1: PCLKB divided by 2048 1 0 0 0: PCLKB divided by 8192 Other settings are prohibited.	R

Bit	Symbol	Function	R/W
25:24	WDT1RPES[1:0]	WDT1 Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (No window end position setting)	R
27:26	WDT1RPSS[1:0]	WDT1 Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (No window start position setting)	R
28	WDT1RSTIRQS	WDT1 Reset Interrupt Request Select WDT Behavior Select 0: NMI 1: Reset	R
29	—	The program value is read from these bits. *2	R
30	WDT1STPCTL	WDT1 Stop Control 0: Continue counting 1: Stop counting when CPU1 is in CPU Sleep mode or CPU Deep Sleep mode	R
31	—	The program value is read from these bits. *2	R

Note 1. The value of OFS3 and OFS3_SEC in a blank product is 0xFFFFFFFF. The value of OFS3_SEL in factory shipment product is 0x00000000. It is set to the value written by your application.

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 0.

OFS3 register is for Non-secure developer, and OFS3_SEC register is for Secure developer. OFS3 register is for non-secure developer.

WDT1STRT bit (WDT1 Start Mode Select)

The WDT1STRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated state). When the WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

WDT1TOPS[1:0] bits (WDT1 Timeout Period Select)

The WDT1TOPS[1:0] bits select the timeout period, the time it takes for the down counter to underflow, as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDT1CKS[3:0] bits. The number of PCLKB cycles that the counter takes to underflow after a refresh operation is determined by the combination of the WDT1CKS[3:0] and WDT1TOPS[1:0] bits.

For details, see section 27, Watchdog Timer (WDT).

WDT1CKS[3:0] bits (WDT1 Clock Frequency Division Ratio Select)

The WDT1CKS[3:0] bits select the division ratio of the prescaler to divide the PCLKB frequency as 1/4, 1/64, 1/128, 1/512, 1/2048, or 1/8192. Using this setting combined with the WDT1TOPS[1:0] bit setting, the WDT counting period can be set from 4,096 to 134,217,728 PCLKB cycles.

For details, see section 27, Watchdog Timer (WDT).

WDT1RPES[1:0] bits (WDT1 Window End Position Select)

The WDT1RPES[1:0] bits select the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position. Otherwise, only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window, in the WDT1RPSS[1:0] and WDT1RPES[1:0] bits, vary with the setting of the WDT1TOPS[1:0] bits.

For details, see section 27, Watchdog Timer (WDT).

WDT1RPSS[1:0] bits (WDT1 Window Start Position Select)

The WDT1RPSS[1:0] bits select the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%.

The interval between the positions where the window starts and ends becomes the period in which a refresh is possible. However, refresh is not possible outside this period.

For details, see section 27, Watchdog Timer (WDT).

WDT1RSTIRQS bit (WDT1 Reset Interrupt Request Select)

The WDT1RSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The selected operation can be a watchdog timer reset, non-maskable interrupt request, or interrupt request.

For details, see section 27, Watchdog Timer (WDT).

WDT1STPCTL bit (WDT1 Stop Control)

The WDT1STPCTL bit specifies whether to stop counting when CPU1 is in CPU Sleep mode or CPU Deep Sleep mode. For details, see section 27, Watchdog Timer (WDT).

7.2.7 OFS3_SEL : Option Function Select Register 3 for Security

Address: OFS3_SEL: 02C9 F124h

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	WDT1STPCTL	—	WDT1RSTIRQS	WDT1RPSS[1:0]		WDT1RPES[1:0]		WDT1CKS[3:0]				WDT1TOPS[1:0]		WDT1STRT	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
16:0	—	The program value is read from these bits. *2	R
17	WDT1STRT	Security attributes of WDT1 Start Mode Select 0: Select OFS3_SEC.WDT1STRT 1: Select OFS3.WDT1STRT.	R
19:18	WDT1TOPS[1:0]	Security attributes of WDT1 Timeout Period Select 0 0: Select OFS3_SEC.WDT1TOPS[1:0] 1 1: Select OFS3.WDT1TOPS[1:0] Others: Setting prohibit	R
23:20	WDT1CKS[3:0]	Security attributes of WDT1 Clock Frequency Division Ration Select 0 0 0 0: Select OFS3_SEC.WDT1CKS[3:0] 1 1 1 1: Select OFS3.WDT1CKS[3:0 Others: Setting prohibit	R
25:24	WDT1RPES[1:0]	Security attributes of WDT1 Window End Position Select 0 0: Select OFS3_SEC.WDT1RPES[1:0] 1 1: Select OFS3.WDT1RPES[1:0] Others: Setting prohibit	R
27:26	WDT1RPSS[1:0]	Security attributes of WDT1 Window Start Position Select 0 0: Select OFS3_SEC.WDT1RPSS[1:0] 1 1: Select OFS3.WDT1RPSS[1:0] Others: Setting prohibit	R
28	WDT1RSTIRQS	Security attributes of WDT1 Reset Interrupt Request Select 0: Select OFS3_SEC.WDT1RSTIRQS 1: Select OFS3.WDT1RSTIRQS	R
29	—	The program value is read from these bits. *2	R

Bit	Symbol	Function	R/W
30	WDT1STPCTL	Security attributes of WDT1 Stop Control 0: Select OFS3_SEC.WDT1STPCTL 1: Select OFS3.WDT1STPCTL	R
31	—	The program value is read from these bits. *2	R

Note 1. The value of OFS3 and OFS3_SEC in a blank product is 0xFFFFFFFF. The value of OFS3_SEL in factory shipment product is 0x00000000. It is set to the value written by your application.

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 0.

The OFS3_SEL register selects the security attribute. Which security attribute is applied, OFS or OFS_SEC, is determined by the setting value of the corresponding bit in the OFS3_SEL register. For details, see section 59, MRAM

7.2.8 BPS, BPS_SEC : Block Protect Setting Register

Address:

BPS: 0x12C9_F600 + 0x04 × n (n = 0 to 127) (Non-secure)
BPS_SEC: 0x02C9_F200 + 0x04 × n (n = 0 to 127) (Secure)

Bit position:	31 … 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value of BPS and BPS_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

BPS_SEC register is for Secure developer, and BPS register is for Non-secure developer.

The BPS and BPS_SEC registers invalidate the writing to the code MRAM memory. When the bit of this register is set to 0, the writing to the corresponding block are invalid. For details, see section 59, MRAM.

7.2.9 PBPS, PBPS_SEC : Permanent Block Protect Setting Register

Address: PBPS: 0x12E1_7780 + 0x04 × n (n = 0 to 31) (Non-Secure)
PBPS_SEC: 0x02E1_7700 + 0x04 × n (n = 0 to 31) (Secure)

Bit position:	31 … 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value of PBPS and PBPS_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

PBPS_SEC register is for secure developer, and PBPS register is for non-secure developer. The PBPS and PBPS_SEC registers invalidate writes to bits of BPS and BPS_SEC. The bit of this register can be programmed 0 when corresponding bit of BPS and BPS_SEC is programmed to 0. When the bit of this register is programmed to 0, writing the corresponding bit of BPS and BPS_SEC register is invalid. Once the bit of this register is set to 0, it is impossible to change the bit to 1.

For details, see section 59, MRAM.

7.2.10 Permanent Option Function Select Protect Setting Register (POFSPS)

Address: 0x02E1_7900

Bit position:	31 … 0
Bit field:	POFSPS[31:0]
Value after reset:	User setting*1

Address: 0x02E1_7904

Bit position:	63–32
Bit field:	POFSPS[63:32]
Value after reset:	User setting*1

Address: 0x02E1_7908

Bit position:	95–80	79–64
Bit field:	Reserved bits	POFSPS[79:64]
Value after reset:	User setting*1	

Note 1. The value of POFSPS in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

The POFSPS register invalidate the programming and erasure to the option function select area. When the bit of this register is set to 0, the programming and erasure to the corresponding area is invalid. For details, see section 59, MRAM.

7.2.11 FSBLCTRL0 : FSBL Control Register 0

Address: 0x02E0_7600

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	FSBLCLK[2:0]			FSBLSKIPDS[2:0]			FSBLSKIPSW[2:0]			FSBLEN[2:0]		
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
2:0	FSBLEN[2:0]	FSBL Enable 0 0 0: Enable FSBL 1 1 1: Disable FSBL Others: Reserved	R
5:3	FSBLSKIPSW[2:0]	FSBL Skip Enable for Software Reset 0 0 0: Enable skip 1 1 1: Disable skip Others: Reserved	R
8:6	FSBLSKIPDS[2:0]	FSBL Skip Enable for Deep Software Standby Reset 0 0 0: Enable skip 1 1 1: Disable skip Others: Reserved	R
11:9	FSBLCLK[2:0]	Clock Frequency Selection during FSBL Execution See Table 7.2.	R
31:12	—	The program value is read from these bits.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

Table 7.2 The relationship between FSBLCLK setting and system clock frequency (1 of 2)

System clock	FSBLCLK[2:0] = 111b (VDD = VSCR_1 or voltage range 1)	FSBLCLK[2:0] = 110b (VDD = VSCR_1 or voltage range 1)	FSBLCLK[2:0] = 101b (VDD = VSCR_2 or voltage range 2)	FSBLCLK[2:0] = 100b (VDD = VSCR_2 or voltage range 2)
CPUCLK0	250 MHz	200 MHz	150 MHz	133 MHz

Table 7.2 The relationship between FSBLCLK setting and system clock frequency (2 of 2)

System clock	FSBLCLK[2:0] = 111b (VDD = VSCR_1 or voltage range 1)	FSBLCLK[2:0] = 110b (VDD = VSCR_1 or voltage range 1)	FSBLCLK[2:0] = 101b (VDD = VSCR_2 or voltage range 2)	FSBLCLK[2:0] = 100b (VDD = VSCR_2 or voltage range 2)
CPUCLK1	250 MHz	200 MHz	150 MHz	133 MHz
ICLK	250 MHz	200 MHz	150 MHz	133 MHz
MRICLK	250 MHz	200 MHz	150 MHz	133 MHz
MRPCLK	125 MHz	100 MHz	75 MHz	66 MHz
PCLKA	125 MHz	100 MHz	75 MHz	66 MHz
PCLKB	62.5 MHz	50 MHz	37.5 MHz	33 MHz

Note: Other FSBLCLK settings are prohibited.

7.2.12 FSBLCTRL1 : FSBL Control Register 1

Address: 0x02E0_7604

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSBLEXMD[1:0]	
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
1:0	FSBLEXMD[1:0]	FSBL Execution Mode 0 0: CRC boot and not report measurement 0 1: CRC boot and report measurement 1 0: Secure boot and not report measurement 1 1: Secure boot and report measurement	R
31:2	—	The program value is read from these bits.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

7.2.13 FSBLCTRL2 : FSBL Control Register 2

Address: 0x02E0_7608

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PORTGN[4:0]					PORTPN[3:0]			
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
3:0	PORTPN[3:0]	FSBL Error Notification Port Pin Number*2 0 0 0 0: PORTn00 0 0 0 1: PORTn01 ⋮ 1 1 1 1: PORTn15 (n = 0 to 9, A, B)	R
8:4	PORTGN[4:0]	FSBL Error Notification Port Group Name*2 0 0 0 0 0: PORT0m 0 0 0 0 1: PORT1m ⋮ 0 1 0 1 1: PORTBm Others: Reserved (m = 0 to 15)	R
31:9	—	The program value is read from these bits.*3	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. When non-existent pin is selected, FSBL error notification is not output.
Note 3. This register can only be programmed by MACI command. When programming, the set value should be 1.

FSBLCTRL2 register selects the port to output when an Error occurs during FSBL execution. The PORTGN bits select a group of ports, and the PORTPN bits select the pins of that group. It thereby determines the unique port.

7.2.14 SACC0n : Start Address of Code Certificate 0n (n = 0 to 3)

Address: SACC0n: 0x02E0_7620 + 0x20 × n (n = 0 to 3)

Bit position:	31 … 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

See section 51.7. Secure Boot for details.

7.2.15 SACC1n : Start Address of Code Certificate 1n (n= 0 to 3)

Address: SACC1n: 0x02E0_7630 + 0x20 × n (n = 0 to 3)

Bit position:	31 … 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

See section 51.7. Secure Boot for details.

7.2.16 SAMR : Start Address of Measurement Report

Address: 0x02E0_7614

Bit position:	31 … 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

The SAMR register specifies the starting address of measurement report. The measurement report is stored in the SRAM shown in . Specify the address of SRAM0 to SRAM3. In case SRAM0 is used for measurement report, do not specify the addresses from 0x22007780 to 0x22007BFF. When reading the measurement report, disable the ECC function by setting SRAMCRn.ECCMOD[1:0] = 00b. See section 51.7. Secure Boot for details.

7.2.17 REVOKE : REVOKE Enable

Address: 0x02E1_7910

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	REVOKE[3:0]			
Value after reset:	User setting*1															

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Bit	Symbol	Function	R/W
3:0	REVOKE[3:0]	Configuration setting for OEM_ROOT_KEY revoke xxx0b: OEM_ROOT_PK0 is revoked, and read data is masked to 0 xxx1b: OEM_ROOT_PK0 is enabled and can be read xx0xb: OEM_ROOT_PK1 is revoked, and read data is masked to 0 xx1xb: OEM_ROOT_PK1 is enabled and can be read x0xxb: OEM_ROOT_PK2 is revoked, and read data is masked to 0 x1xxb: OEM_ROOT_PK2 is enabled and can be read 0xxxb: OEM_ROOT_PK3 is revoked, and read data is masked to 0 1xxxb: OEM_ROOT_PK3 is enabled and can be read	R
31:4	—	The program value is read from this bit.*1	R

Note 1. This register can only be programmed by MACI command. When programming, the set value should be 1.

7.2.18 HOEMRTRKn : Hash of OEM_ROOT_PKn (n= 0 to 3)

Address: HOEMRTPK0: 0x02E0_7400 +0x4 × i (i = 0 to 11)
HOEMRTPK1: 0x02E0_7430 +0x4 × i (i = 0 to 11)
HOEMRTPK2: 0x02E0_7460 +0x4 × i (i = 0 to 11)
HOEMRTPK3: 0x02E0_7490 +0x4 × i (i = 0 to 11)

Bit position:	31 ... 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

This register can be programmed only by boot firmware.

7.2.19 ZHUK : Zeroization HUK Enable

Address: 0x02E1_7920

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	ZHUKEN3	ZHUKEN2	ZHUKEN1	ZHUKEN0
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
0	ZHUKEN0	Configuration setting for RTCIC0 0: W-HUK zeroization by RTCIC0 tamper event is enabled 1: W-HUK zeroization by RTCIC0 tamper event is disabled	R
1	ZHUKEN1	Configuration setting for RTCIC1 0: W-HUK zeroization by RTCIC1 tamper event is enabled 1: W-HUK zeroization by RTCIC1 tamper event is disabled	R
2	ZHUKEN2	Configuration setting for RTCIC2 0: W-HUK zeroization by RTCIC2 tamper event is enabled 1: W-HUK zeroization by RTCIC2 tamper event is disabled	R
3	ZHUKEN3	Configuration setting for MREZC register 0: W-HUK zeroization by MREZC is enabled 1: W-HUK zeroization by MREZC is disabled	R
31:4	—	The program value is read from this bit.*2	R

Note: When ZHUKEN3 bit is 0, set ZHUKENn (n = 0 to 2) bits setting same as VBTADCR3 (see section 12, Battery Backup Function). For example, when ZHUKENn (n = 0 to 2) is 101b, set VBTADCR3.VBATADZEn (n = 0 to 2) to 010b.

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

7.2.20 ARCLS : Anti-Rollback Counter Lock Setting

Address: 0x02E1_7930

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	ARCBL_LK	ARCNS_LK[3:0]				ARCS_LK
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
0	ARCS_LK	ARC_SEC Lock 0: ARC_SEC protection is enabled 1: ARC_SEC protection is disabled	R
4:1	ARCNS_LK[3:0]	ARC_NSEC Lock In case of 64 bits x 4 counter setting x x x 0: ARC_NSEC[63:0] protection is enabled x x 0 x: ARC_NSEC[127:64] protection is enabled x 0 x x: ARC_NSEC[191:128] protection is enabled 0 x x x : ARC_NSEC[255:192] protection is enabled 1 1 1 1: ARC_NSEC[255:0] protection is disabled Others Reserved. In case of 256 bits counter setting 0 0 0 0: ARC_NSEC[255:0] protection is enabled 1 1 1 1: ARC_NSEC[255:0] protection is enabled Others Reserved.	R

Bit	Symbol	Function	R/W
5	ARCBL_LK	ARC_OENBL Lock 0: ARC_OEMBL protection is enabled 1: ARC_OEMBL protection is disabled	R
15:6	—	The program value is read from these bits*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

Anti-rollback counter Lock bits setting are located in the OTP area. Anti-rollback counter Lock bits setting can be set to "0" by the "Program" command and cannot be changed from "0" to "1". When the lock bit is 0, the anti-rollback counter corresponding to each bit cannot be updated by the "Increment Counter" command.

7.2.21 ARCCS : Anti-Rollback Counter Configuration Setting for Non-secure Application

Address: 0x02E1_7932

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CNF_ARCNS [1:0]	
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
1:0	CNF_ARCNS[1:0]	Configuration setting for ARC_NSEC 0 0: ARC_NSEC configuration is 4 × 64 bits 0 1: ARC_NSEC configuration is 1 × 256 bits Others ARC_NSEC configuration is disabled	R
15:2	—	The program value is read from these bits*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by MACI command. When programming, the set value should be 1.

ARC_NSEC configuration setting is located in the OTP area. These bits specify two types of ARC_NSEC configuration: 4 × 64 bits or 1 × 256 bits. "Increment Counter" or "Read Counter" command cannot be issued to ARC_NSEC when counter configuration setting is disabled.

7.2.22 ARC_SECn : Anti-Rollback Counter for Secure Application n (n = 0, 1)

Address: 0x02F2 7E00 + 4 × n (n=0, 1)

Bit position:	31	0
Bit field:	ARC_SEC[32 × n + 31 : 32 × n]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	ARC_SEC[32 × n + 31 : 32 × n]	Anti-Rollback Counter for Secure Application The counter value is obtained by arranging the read values from the upper register (n = 1) to the lower register (n = 0).	R

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

7.2.23 ARC_NSECn : Anti-Rollback Counter for Non-secure Application n (n = 0 to 7)

Address: 0x02F2 7E08 + 4 × n (n = 0 to 7)

Bit position:	31	0
Bit field:	ARC_NSECn[32 × n + 31 : 32 × n]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	ARC_NSECn[32 × n + 31 : 32 × n]	Anti-Rollback Counter for Non-secure Application The counter value is obtained by arranging the read values from the upper register (n = 7) to the lower register (n = 0).	R

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

7.2.24 ARC_OEMBLn : Anti-Rollback Counter for OEMBL (n = 0, 1)

Address: 0x02F2 7E28 + 4 × n (n = 0, 1)

Bit position:	31	0
Bit field:	ARC_OEMBL[32 × n + 31 : 32 × n]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	ARC_OEMBL[32 × n + 31 : 32 × n]	Anti-Rollback Counter for OEM_BL Application The counter value is obtained by arranging the read values from the upper register (n = 1) to the lower register (n = 0).	R

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

7.2.25 GPOTPn : General Purpose OTP (n = 0 to 23)

Address: 02E0 76A0h + 4 x n (n = 0 to 23)

Bit position:	31	0
Bit field:	GPOTP[31:0]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	GPOTP[31:0]	General Purpose OTP This is an OTP area that can be used for general purpose. Secure user can write any value.	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

7.3 Setting Option-Setting Memory

7.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in Figure 7.1. The allocated data is used by FSBL or tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

7.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in section 7.3.1. Allocation of Data in Option-Setting Memory, alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

(1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The extra MRAM option-setting memory support background operations (BGO). When write the option-setting memory, the code MRAM can be read.

For details of the configuration setting command, see section 59, MRAM.

(2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in section 7.3.1. Allocation of Data in Option-Setting Memory, from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in section 7.3.1. Allocation of Data in Option-Setting Memory.

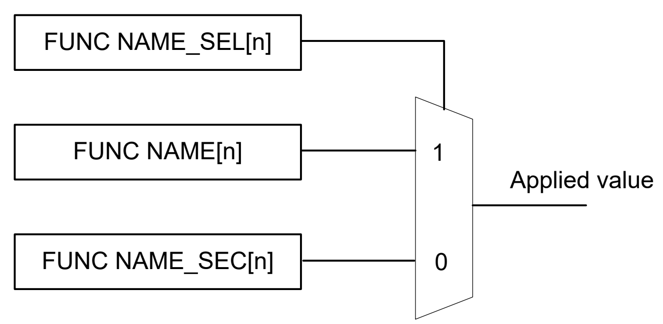
7.3.3 Security Attribution of Extra MRAM Option-Setting Memory

Some functionality has 3 registers for Non-secure (FUNC NAME), and Secure (FUNC NAME_SEC), and security attribution (FUNC NAME_SEL). Only Secure developer can set the registers for Secure and security attribution. As shown in Figure 7.2, when the bit of security attribution register is set to 0, the corresponding bit of Secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of Non-secure register is applied.

For example, if the Secure developer wants to configure PVD of OFS1 as Secure, HOCO of OFS1 as Non-secure, the Secure developer needs to set OFS1_SEL as follows.

OFS1_SEL = 0xFFFF_FFF0

By this setting, PVDAS and VDSEL[2:0] values of OFS1_SEC and HOCOFRQ0[2:0] and HOCOEN values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME_SEL) should be set to 0.



Note: FUNC_NAME is corresponded to OFS1 and OFS3.

Figure 7.2 Selection of applied value

Block protect setting (BPS or BPS_SEC) and permanent block protect setting (PBPS or PBPS_SEC) are selected by the code MRAM security attribution.

7.3.4 Timing of the Setting Value

For SAS, BPS, BPS_SEC, PBPS and PBPS_SEC registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

7.4 Usage Notes

7.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

- Security attribution region (0x02C9_F120 to 0x02C9_F1FF)
  When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 0 to all bits in reserved areas and all reserved bits. Operation is not guaranteed if 1 is written to these bits.
- Other region
  When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

7.4.2 FSBL Execution After System Reset

When FSBLCTRL0.FSBLEN bit is set to 000b, FSBL is always executed after system reset is released. However, setting FSBLCTRL0.FSBLSKIPSW or FSBLCTRL0.FSBLSKIPDS bit adds a condition to Skip FSBL. See Table 7.3.

Table 7.3 FSBL execution conditions

FSBLEN	FSBLSKIPSW	FSBLSKIPDS	FSBL execution after system reset
111b	*	*	Not executed
000b	111b	111b	Executed
000b	111b	000b	Deep Software Standby reset : Not executed Other reset than above : Executed
000b	000b	111b	Software reset : Not executed Other reset than above : Executed
000b	000b	000b	Software reset : Not executed Deep Software Standby reset : Not executed Other reset than above : Executed

When using the FSBL skip function, the reset status registers (RSTSR0, RSTSR1, and RSTSR3) should be cleared before the system reset is released.

Note: The FSBL will always run if at least one of the reset flags that allows the FSBL to run is set.

7.4.3 FSBL Skip Function

To skip FSBL execution after a software reset release, RSTSR0, RSTSR1, and RSTSR3 should be cleared before executing software reset. If any flags other than RSTSR1.SWRF is set, FSBL may be executed.

To skip FSBL execution after a Deep Software Standby Reset release, RSTSR0, RSTSR1, and RSTSR3 should be cleared before the transition to Deep Software Standby mode. If any flags other than RSTSR0.DPSRSTF is set, FSBL may be executed.

8. Programmable Voltage Detection (PVD)

8.1 Overview

The Programable Voltage Detection (PVD) module monitors the voltage level input to the VCC pin and the detection level can be selected using a software program. The PVD module consists of several separate voltage level detectors which measure the voltage level input to the VCC pin. PVD registers allow your application to configure detection of VCC change at various voltage thresholds.

Each voltage level detector has a voltage monitor associated with it. Voltage monitor registers are used to configure the PVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 8.1 lists the PVD specifications. Figure 8.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 8.2 and Figure 8.3 show a block diagram of the voltage monitor m/n interrupt and reset circuit (m = 1, 2, n = 4, 5).

The PVD module consists of low voltage detection (LVD) and High voltage detection (HVD). LVD detects that VCC is dropping below the voltage threshold. HVD detects that VCC is rising above the voltage threshold.

PVDn are implemented for security purposes. Compared to PVDm, the functions available are more limited. PVDn has a register lock function for security.

The voltage level detector for core voltage is implemented. It monitors the voltage level input to the VDD, and the detection level is pre-defined by hardware. The voltage level detector for core voltage has a voltage monitor circuit associated with it. The voltage monitor circuit for core voltage can assert the reset (Core Voltage Monitor Reset) when the core voltage crossed the threshold as under Vdet_VDDL and over Vdet_VDDH.

The function of Core Voltage Monitor Reset (CVMR) is enabled when OFS2.CVMRDIS = 0.

Table 8.1 PVD specifications (1 of 2)

Item		Programable voltage monitor 0	Programable voltage monitor m (m = 1, 2)	Programable voltage monitor n (n = 4, 5)
Voltage Monitoring	Monitored pin	VCC	VCC	VCC
	Detected Event	Voltage falls past V_{det0}	Voltage rises or falls past V_{detm}	Voltage rises or falls past V_{detn}
	Detection Voltage	Selectable from among 8 different levels by using OFS1.VDSEL0 [2:0] bits as V_{det0}	Selectable from among 16 different levels by using PVDmCMPCR.PVDLVL[4:0] bits as V_{detm}	Selectable from among 16 different levels by using PVDnCMPCR.PVDLVL[4:0] bits as V_{detn}
	Monitor Flag	None	PVDmSR.MON flag: Monitors whether voltage is higher or lower than V_{detm}	None
			PVDmSR.DET flag: V_{detm} passage detection	
Process on voltage detection	Reset	Voltage monitor 0 reset	Voltage monitor m reset	Voltage monitor n reset
		Reset when V_{det0} > VCC CPU restart after specified time with VCC > V_{det0}	Reset condition selectable: Reset when V_{detm} > VCC (LVD) or V_{detm} < VCC (HVD) CPU restart timing selectable: after specified time with LVD or HVD	Reset condition selectable: Reset when V_{detn} > VCC (LVD) or V_{detn} < VCC (HVD)
	Interrupt	No interrupt	Voltage monitor m interrupt	No interrupt
			Non-maskable interrupt or maskable interrupt selectable	
			Interrupt request issued in response to either or both LVD and HVD	
Digital filter	Enable/ Disable Switching	Digital filter function not available	Available	Available
	Sampling Time	—	1/s LOCO frequency × 2 (s: 2, 4, 8, 16)	1/s LOCO frequency × 2 (s: 2, 4, 8, 16)
Event linking		None	Available Output of event signals on detection of V_{detm} crossings	None

Table 8.1 PVD specifications (2 of 2)

Item	Programable voltage monitor 0	Programable voltage monitor m (m = 1, 2)	Programable voltage monitor n (n = 4, 5)
Register lock	None	None	PVDLR

Table 8.2 CVM specifications

Item		Core voltage monitor
Voltage Monitoring	Monitored pin	VDD
	Detected Event	Voltage falls past V_{det}_VDDL Voltage rises past V_{det}_VDDH
	Detection Voltage	Pre-defined level*1
Process on voltage detection	Reset	Core Voltage monitor reset*2
		Reset when V_{det}_VDDL > VDD or V_{det}_VDDH < VDD CPU restart after specified time with V_{det}_VDDL ≤ VDD ≤ V_{det}_VDDH

Note 1. It means V_{det}_VDDL and V_{det}_VDDH

Note 2. See the chapter of Reset about core voltage monitor reset.

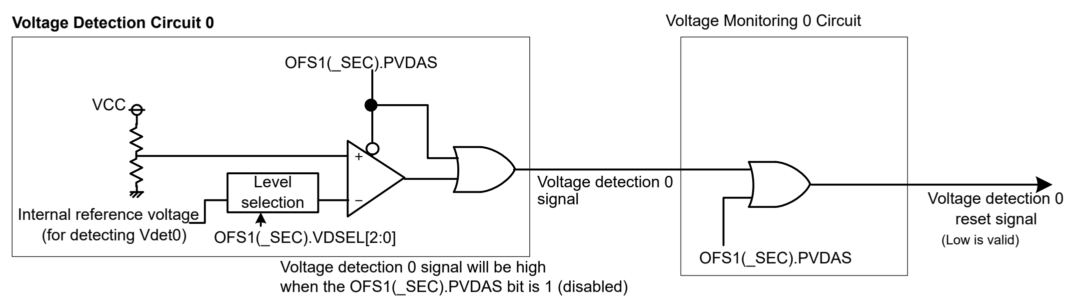


Figure 8.1 Block diagram of voltage monitor 0 reset circuit

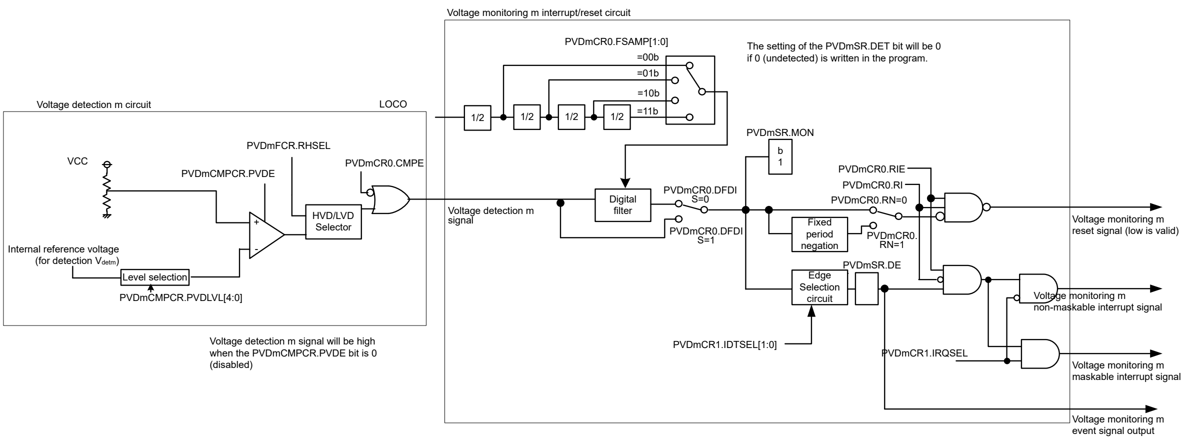

Figure 8.2 Block diagram of voltage monitor m interrupt/reset circuit (m = 1, 2. The m is integer).

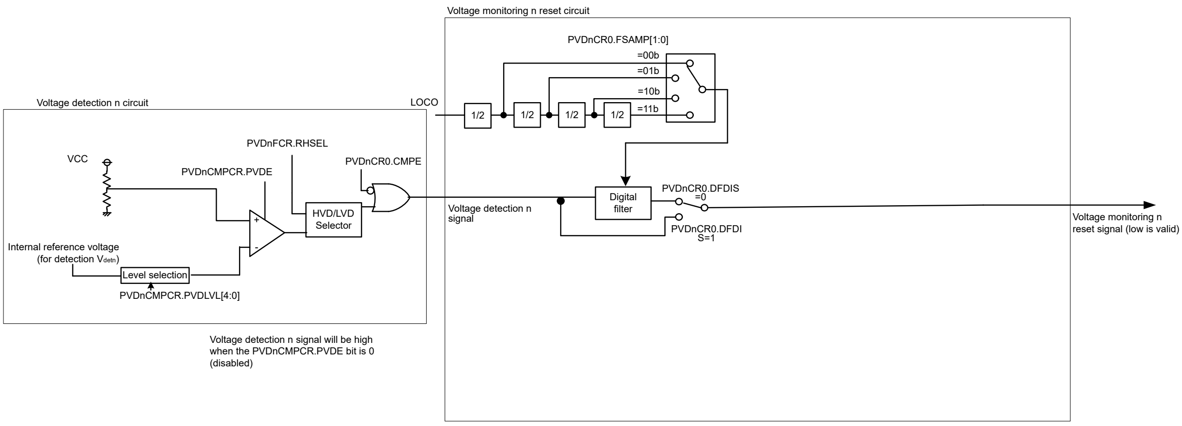

Figure 8.3 Block diagram of voltage monitor n reset circuit (n = 4, 5. The n is integer).

8.2 Register Descriptions

8.2.1 PVDSAR : Programable Voltage Detection Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3CC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non Secure Attribute bit 0 Target register: registers for PVD1 0: Secure 1: Non Secure	R/W
1	NONSEC1	Non Secure Attribute bit 1 Target register: registers for PVD2 0: Secure 1: Non Secure	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by PRCR register.

The PVDSAR register controls the secure attribute of PVD registers.

NONSEC0 bit (Non Secure Attribute bit 0)

This bit controls the security attribute of PVD1CMPCR, PVD1CR0, PVD1CR1, PVD1SR.

NONSEC1 bit (Non Secure Attribute bit 1)

This bit controls the security attribute of PVD2CMPCR,PVD2CR0, PVD2CR1, PVD2SR.

8.2.2 PVDmCMPCR : Voltage Monitor m Comparator Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA58 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PVDE	—	—	PVDLVL[4:0]				
Value after reset:	0	0	0	0	1	1	1	1

Bit	Symbol	Function	R/W
4:0	PVDLVL[4:0]	Detection Voltage m Level Select Settings other than the following are prohibited. These are standard voltage level during the fall of voltage. For details on standard voltage level during the rise of voltage, see section 62, Electrical Characteristics. 0x03: 3.86 V (Vdetm_3) 0x04: 3.14 V (Vdetm_4) 0x05: 3.10 V (Vdetm_5) 0x06: 3.08 V (Vdetm_6) 0x07: 2.85 V (Vdetm_7) 0x08: 2.83 V (Vdetm_8) 0x09: 2.80 V (Vdetm_9) 0x0A: 2.62V (Vdetm_10) 0x0B: 2.33V (Vdetm_11) 0x0C: 1.90V (Vdetm_12) 0x0D: 1.86V (Vdetm_13) 0x0E: 1.74V (Vdetm_14) 0x0F: 1.71V (Vdetm_15) Others: Setting prohibited	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	PVDE	Voltage Detection m Enable 0: Voltage detection m circuit disabled 1: Voltage detection m circuit enabled	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

PVDLVL[4:0] bits (Detection Voltage m Level Select)

The PVDmCMPCR.PVDLVL can be changed only if all the PVDmCMPCR.PVDE bits and all the PVDnCMPCR.PVDE bits are 0. All the voltage detection circuits should not be set at the same voltage detection level.

Do not change PVDmCMPCR.PVDLVL and PVDmCMPCR.PVDE at the same time.

PVDE bit (Voltage Detection m Enable)

When using voltage detection m interrupt/reset or the PVDmSR.MON bit, set the PVDmCMPCR.PVDE bit to 1. The voltage detection m circuit starts once td(E-A) passes after the PVDmCMPCR.PVDE bit value is changed from 0 to 1. When using the voltage detection m circuit in Deep Software Standby mode, do not transit to Deep Software Standby mode 3.

8.2.3 PVDnCMPCR : Voltage Monitor n Comparator Control Register (n = 4, 5)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA64+ 0x4 × (n - 4)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PVDE	—	—	PVDLVL[4:0]				
Value after reset:	0	0	0	0	1	1	1	1

Bit	Symbol	Function	R/W
4:0	PVDLVL[4:0]	Detection Voltage n Level Select Settings other than above are prohibited. (These are standard voltage level during fall of voltage. About standard voltage level during rise of voltage, refer to chapter of electrical characteristics.) 0 0 0 1 1 : 3.86V (Vdetn_3) 0 0 1 0 0 : 3.14V (Vdetn_4) 0 0 1 0 1 : 3.10V (Vdetn_5) 0 0 1 1 0 : 3.08V (Vdetn_6) 0 0 1 1 1 : 2.85V (Vdetn_7) 0 1 0 0 0 : 2.83V (Vdetn_8) 0 1 0 0 1 : 2.80V (Vdetn_9) 0 1 0 1 0 : 2.62V (Vdetn_10) 0 1 0 1 1 : 2.33V (Vdetn_11) 0 1 1 0 0 : 1.90V (Vdetn_12) 0 1 1 0 1 : 1.86V (Vdetn_13) 0 1 1 1 0 : 1.74V (Vdetn_14) 0 1 1 1 1 : 1.71V (Vdetn_15)	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	PVDE	Voltage Detection n Enable 0: Voltage detection n circuit disabled 1: Voltage detection n circuit enabled	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The PVDnCMPCR.PVDLVL can be changed only if all the PVDmCMPCR.PVDE bits and all the PVDnCMPCR.PVDE bits are 0. All the voltage detection circuits should not be set at the same voltage detection level.

Please do not change PVDnCMPCR.PVDLVL and PVDnCMPCR.PVDE at the same time.

PVDE bit (Voltage Detection n Enable)

When using voltage detection n interrupt/reset or the PVDnSR.MON bit, set the PVDnCMPCR.PVDE bit to 1. The voltage detection n circuit starts once td(E-A) passes after the PVDnCMPCR.PVDE bit value is changed from 0 to 1. When using the voltage detection n circuit in deep software standby mode, do not transit to deep software standby mode 3.

8.2.4 PVDmCR0 : Voltage Monitor m Circuit Control Register 0 (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA70 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RN	RI	FSAMP[1:0]		—	CMPE	DFDIS	RIE
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Function	R/W
0	RIE	Voltage Monitor m Interrupt/Reset Enable 0: Disable 1: Enable	R/W
1	DFDIS	Voltage monitor m Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter	R/W
2	CMPE	Voltage Monitor m Circuit Comparison Result Output Enable 0: Voltage monitor m circuit comparison result output disabled 1: Voltage monitor m circuit comparison result output enabled	R/W
3	—	The read value is undefined. The write value should be 1.	R/W
5:4	FSAMP[1:0]	Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency	R/W
6	RI	Voltage Monitor m Circuit Mode Select (1) case of PVDmFCR.RHSEL = 0 0: Voltage monitor m interrupt during V_{detm} passage 1: Voltage monitor m reset enabled when the voltage falls to and below V_{detm} (2) case of PVDmFCR.RHSEL = 1 0: Prohibited 1: Voltage monitoring m reset enabled when the voltage rises to and up V_{detm}	R/W
7	RN	Voltage Monitor m Reset Negate Select (1) case of PVDmFCR.RHSEL = 0 0: Negation follows a stabilization time (t_{PVDm}) after VCC > V_{detm} is detected. 1: Negation follows a stabilization time (t_{PVDm}) after assertion of the PVDm reset. (2) case of PVDmFCR.RHSEL = 1 0: Negation follows a stabilization time (t_{PVDm}) after VCC < V_{detm} is detected. 1: Prohibited	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor m Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor m interrupt/reset. Ensure that neither a voltage monitor m interrupt nor a voltage monitor m reset is generated during programming or erasure of the MRAM.

DFDIS bit (Voltage monitor m Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) if the DFDIS bit is 0 (enabling the digital filter circuit).Set the DFDIS bit to 1 (digital filter circuit disabled) when using voltage monitor m circuit in software standby mode or Deep Software Standby mode.

CMPE bit (Voltage Monitor m Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor m circuit comparison result output. Set the CMPE bit to 1 after the voltage detection m circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection m circuit, disable the voltage detection m circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the PVDmCR0.DFDIS bit is 1 (digital filter circuit disabled). The FSAMP[1:0] bits should not be vmodified when the PVDmCR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor m Circuit Mode Select)

When the PVDmCR0.RI bit is 1 (voltage monitor m reset selected), a transition to Deep Software Standby mode 2 or 3 cannot be made, instead a transition to Deep Software Standby mode 1 is made. To enter Deep Software Standby mode 2 or 3, set all the PVDmCR0.RI bits to 0 (voltage monitor m interrupt selected).

RN bit (Voltage Monitor m Reset Negate Select)

Case of PVDmFCR.RHSEL = 0

If the RN bit is set to 1 (negation follows a stabilization time after assertion of the PVDm reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Furthermore, if a transition to Software Standby mode or Deep Software Standby mode is to be made, the only possible value for the RN bit is 0 (negation follows a stabilization time after VCC > V_{detm} is detected). Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the PVDm reset signal) when this is the case.

Case of PVDmFCR.RHSEL = 1

Do not set the RN bit to 1.

8.2.5 PVDnCR0 : Voltage Monitor n Circuit Control Register 0 (n = 4, 5)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA7C + 0x4 × (n - 4)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	FSAMP[1:0]		—	CMPE	DFDIS	RE
Value after reset:	0	1	0	0	x	0	1	0

Bit	Symbol	Function	R/W
0	RE	Voltage Monitor n Reset Enable 0: Disabled 1: Enabled	R/W
1	DFDIS	Voltage Monitor n Digital Filter Disable Mode Select 0: Digital filter enabled 1: Digital filter disabled	R/W
2	CMPE	Voltage Monitor n Circuit Comparison Result Output Enable 0: Voltage monitor n circuit comparison result output disabled. 1: Voltage monitor n circuit comparison result output enabled.	R/W
3	—	The read value is undefined. The write value should be 1.	R/W
5:4	FSAMP[1:0]	Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency	R/W
6	—	This bit is read as 1. The write value should be 1.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RE bit (Voltage Monitor n Reset Enable)

RE bit decides whether to enable Voltage Monitor n Reset. When RE bit is 1, this function is activated. Ensure that a voltage Monitor n reset isn't generated during programming or erasure of the MRAM.

DFDIS bit (Voltage Monitor n Digital Filter Disable Mode Select)

Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) if the DFDIS bit is 0 (enabling the digital filter circuit).

Set the DFDIS bit to 1 (digital filter circuit disabled) when using voltage monitor n circuit in software standby mode or deep software standby mode.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be modified only when the PVDnCR0.DFDIS bit is 1 (digital filter circuit disabled). The FSAMP[1:0] bits should not be modified when the PVDnCR0.DFDIS bit is 0 (digital filter circuit enabled).

8.2.6 PVDmCR1 : Voltage Monitor m Circuit Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0E0 + 0x2 × (m-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	IRQSEL	IDTSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
1:0	IDTSEL[1:0]	Voltage Monitor m Interrupt Generation Condition Select (1) case of PVDmFCR.RHSEL = 0 0 0: When VCC ≥ V_{detm} (rise) is detected 0 1: When VCC < V_{detm} (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
2	IRQSEL	Voltage Monitor m Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt*1	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.
Note 1. When enabling maskable interrupts, do not change the value of the NMIER.PVDmEN bit on the ICU side from the reset state.

8.2.7 PVDmSR : Voltage Monitor m Circuit Status Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0E1 + 0x2 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	DET	Voltage Monitor m Voltage Change Detection Flag*1 (1) case of PVDmFCR.RHSEL = 0 0: Not detected 1: V_{detm} passage detection (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.*2	R/W
1	MON	Voltage Monitor 1 Signal Monitor Flag (1) case of PVDmFCR.RHSEL = 0 0: VCC ≤ V_{detm} 1: VCC > V_{detm} or MON is disabled (2) case of PVDmFCR.RHSEL = 1 0: VCC ≥ V_{detm} 1: VCC < V_{detm} or MON is disabled	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.
Note 2. DET is depended on PVDmCR1.IDETSEL[1:0].
PVDmCR1.IDETSEL[1:0] = 0 0: When VCC < Vdetm (fall) is detected, DET is set.

PVDmCR1.IDETSEL[1:0] = 0 1: When VCC ≥ Vdetm (rise) is detected, DET is set.
PVDmCR1.IDETSEL[1:0] = 1 0: When fall or rise are detected, DET is set.
PVDmCR1.IDETSEL[1:0] = 1 1: Settings prohibited

DET flag (Voltage Monitor m Voltage Change Detection Flag)

The DET flag is enabled when the PVDmCMPCR.PVDE bit is 1 (voltage detection m circuit enabled) and the PVDmCR0.CMPE bit is 1 (voltage monitor m circuit comparison result output enabled).

The DET flag should be set to 0 after PVDmCR0.RIE is set to 0 (disabled). PVDmCR0.RIE can be set to 1 (enabled) after a period of two or more cycles of PCLKB has elapsed.

Depending on the number of cycles of PCLKB defined for access to read an I/O register, two or more cycles than PCLKB may have to be secured as waiting time.

MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the PVDmCMPCR.PVDE bit is 1 (voltage detection m circuit enabled) and the PVDmCR0.CMPE bit is 1 (voltage monitor m circuit comparison result output enabled).

8.2.8 PVDmFCR : Voltage Monitor m Function Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB20 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RHSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RHSEL	Rise Hysteresis Select 0: Hysteresis level for VCC-fall detection is selected. 1: Hysteresis level for VCC-rise detection is selected.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

RHSEL bit (Rise Hysteresis Select)

When RHSEL = 0 for VCC-fall detection, the hysteresis level is set above the voltage detection level set by PVDLVL[4:0]. When RHSEL = 1 for VCC-rise detection, the hysteresis level is set under the voltage detection level set by PVDLVL[4:0]. See the chapter of electrical characteristics about the detail of hysteresis level of PVD.

When PVD reset generated by the VCC-fall detection is required, you should set RHSEL to 0.

When PVD reset generated by the VCC-rise detection is required, you should clear RHSEL to 1.

RHSEL must not be set to 1 when PVDmCR0.RI = 0.

RHSEL can be changed only if all the PVDmCMPCR.PVDE bits and all the PVDnCMPCR.PVDE bits are 0.

8.2.9 PVDnFCR : Voltage Monitor n Function Control Register (n = 4, 5)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB2C + 0x4 × (n - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RHSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RHSEL	Rise Hysteresis Select 0: Hysteresis level for VCC-fall detection is selected. 1: Hysteresis level for VCC-rise detection is selected.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

RHSEL bit (Rise Hysteresis Select)

When RHSEL = 0 for VCC-fall detection, the hysteresis level is set above the voltage detection level set by PVDLVL[4:0]. When RHSEL = 1 for VCC-rise detection, the hysteresis level is set under the voltage detection level set by PVDLVL[4:0] . See the chapter of electrical characteristics about the detail of hysteresis level of PVD.

When PVD reset generated by the VCC-fall detection is required, you should set RHSEL to 0.

When PVD reset generated by the VCC-rise detection is required, you should clear RHSEL to 1.

RHSEL can be changed only if all the PVDmCMPCR.PVDE bits and all the PVDnCMPCR.PVDE bits are 0.

8.2.10 PVDLR : Voltage Monitor Lock Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB34

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LOCK
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	LOCK	LOCK control 0: The control registers for PVD4 and PVD5 can be written. 1: The control registers for PVD4 and PVD5 can not be written.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

This register is initialized by POR, RES pin reset, Voltage Monitor 0 reset (PVD0 reset).

LOCK bit (LOCK control)

The initial value of LOCK bit is 1. When the LOCK bit is 1, the control registers for PVD4 and PVD5 can not be written. If the LOCK bit is written to 0 after the LOCK is initialized by the resets which can initialize the LOCK, the control registers for PVD4 and PVD5 can be written.

After that, if you write an arbitrary value to the LOCK, the LOCK bit is fixed to 1. Then the control registers for PVD4 and PVD5 can not be written.

Here, the control registers for PVD4 and PVD5 are PVD4CMPCR, PVD5CMPCR, PVD4CR0, PVD5CR0, PVD4FCR, PVD5FCR.

8.3 VCC Input Voltage Monitor

8.3.1 Monitoring V_{det0}

The comparison results from voltage monitor 0 are not available for reading.

8.3.2 Monitoring V_{detm}

After the settings are completed, results of comparison by voltage Monitor m can be monitored by using the PVDmSR.MON flag.

Table 8.3 Procedures to set up monitoring against V_{detm}

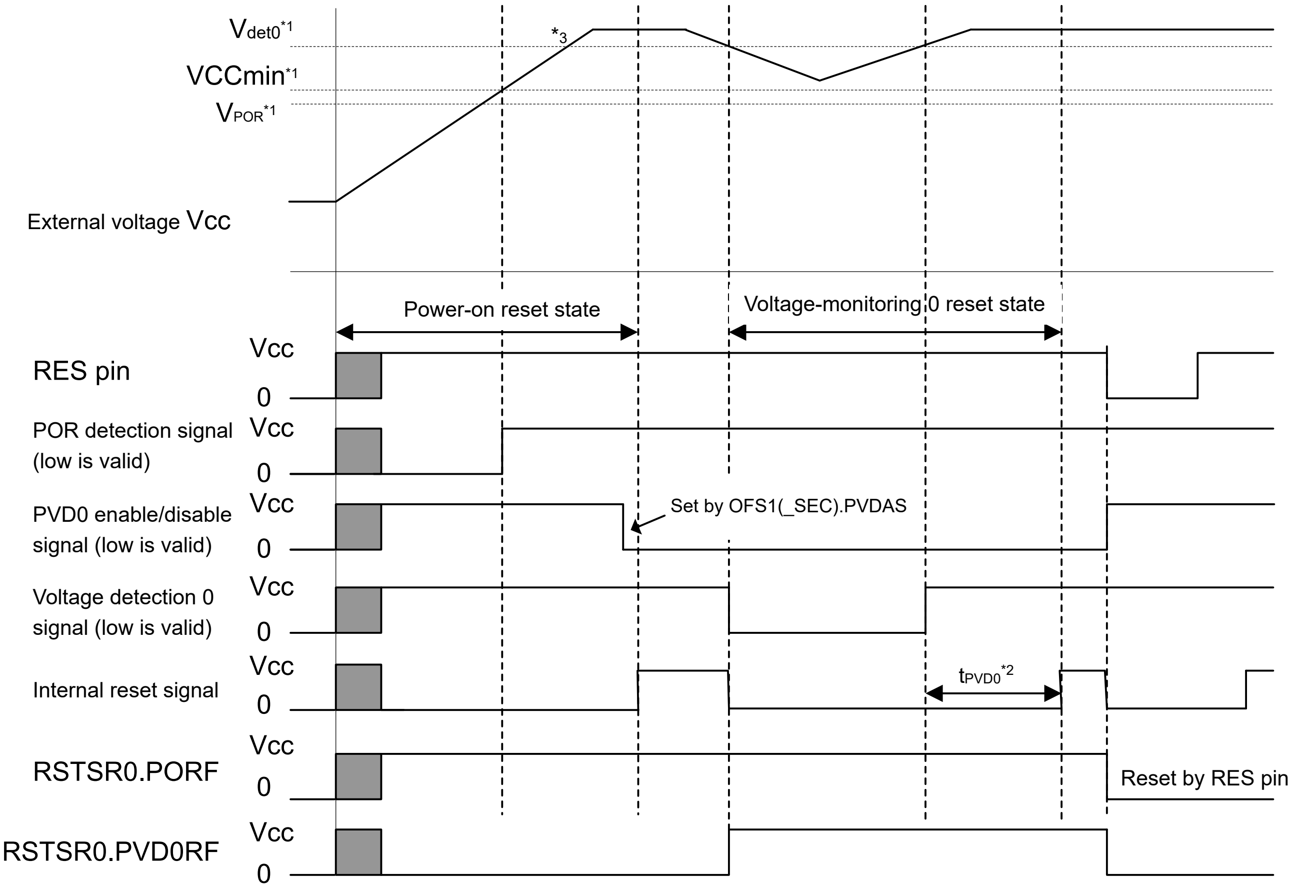
Step		Monitoring the comparison results from voltage monitor 1
Setting the voltage detection m circuit	1	Set PVDmCMPCR.PVDE = 0 to disable voltage detection m before writing to the PVDmCMPCR.PVDLVL [4:0] bits.
	2	Select the detection voltage in the PVDmCMPCR.PVDLVL[4:0] bits.
	3	Set PVDmCMPCR.PVDE = 1 to enable the voltage detection m circuit.
	4	Wait for at least $t_{d\ (E-A)}$ *1.
Setting the digital filter*2	5	Select the sampling clock for the digital filter in the PVDmCR0.FSAMP[1:0] bits.
	6	Set PVDmCR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least 2s + 3 cycles of the LOCO (where s = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by s).
Enabling output	8	Set PVDmCR0.CMPE = 1 to enable output of the comparison results from voltage monitor m.

Note 1. Steps 5 to 7 can be performed during the waiting time of step 4.
Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

8.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1(_SEC).PVDAS bit to 0. (enabling the voltage monitor 0 reset after a reset)

Figure 8.4 shows an example of operations for a voltage monitor 0 reset.



Note: For details of the electrical characteristics, see section 62, Electrical Characteristics.
Note 1. V_{POR} indicates the detection level for a power-on reset and V_{det0} indicates the detection level for a voltage monitor 0 reset and VCC_{min} shows minimum guaranteed voltage of MCU.
Note 2. t_{PVD0}: the period until the voltage monitor 0 reset is released.
Note 3. At the time the power-supply voltage rises, VCC must rise to at least the minimum guaranteed voltage before release from the POR reset state.

Figure 8.4 Example of voltage monitor 0 reset operation

8.5 Interrupt and Reset from Voltage Monitor m (m = 1, 2)

An interrupt or reset can be generated in response to the results of comparison by the voltage detection m circuit

Table 8.4 shows the procedures for setting bits related to the voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring operates. Table 8.5 shows the procedures for setting bits related to the voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops. Figure 8.5 shows an example of operations for a voltage monitor m interrupt. For the operation of the voltage monitor m reset, see Figure 6.2 in section 6, Resets.

Furthermore, if you intend to use the voltage Monitor m circuit in software standby or Deep Software Standby mode, make settings for the voltage Monitor m circuit according to the following procedures.

(1) Setting in Software Standby mode

- Disable the digital filter (PVDmCR0.DFDIS = 1).
- After VCC > V_{detm} is detected, negate the voltage monitor m reset signal (PVDmCR0.RN = 0) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (PVDmCR0.DFDIS = 1).
- Enable the voltage monitor m interrupt (PVDmCR0.RI = 0). If the voltage monitor m reset is enabled (PVDmCR0.RI = 1), a transition to Deep Software Standby mode 2 or 3 is not possible, and the transition will be to Deep Software Standby mode 1 instead.
- During Deep Software Standby mode 3, the voltage Monitor m circuit is stopped. If you intend to use the voltage Monitor m circuit in Deep Software Standby mode, do not transit to Deep Software Standby mode 3.

(3) Disabling at on-chip debug mode

- The function of the voltage Monitor m circuit is disabled by setting DBGSTOPCR.DBGSTOP_PVD at on-chip debug mode.

Table 8.4 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring operates (m = 1, 2)

Step		Voltage monitor m interrupt (voltage monitor m ELC event output)	Voltage monitor m reset
Setting up the voltage detection m circuit	1	Set PVDmCMPCR.PVDE = 0 (disable voltage detection m before writing to the PVDmCMPCR register.)	
	2	Select the detection voltage by setting the PVDmCMPCR.PVDLVL bits.	
	3	—	Select the type of the reset condition by setting the PVDmFCR.RHSEL bit.
	4	Set PVDmCMPCR.PVDE = 1 (enabling the voltage detection m circuit).	
	5	Wait for at least $t_{d\ (E\text{-}A)}$ *1.	
Setting the digital filter*2	6	Select the sampling clock for the digital filter by the setting PVDmCR0.FSAMP[1:0] bits.	
	7	Set PVDmCR0.DFDIS = 0 (enabling the digital filter).	
	8	Wait for at least 2s + 3 cycles of the LOCO (where s = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by s) *4.	
Setting up the voltage monitor m interrupt or reset	9	Set PVDmCR0.RI = 0 to select the voltage monitor m interrupt.	• Set PVDmCR0.RI = 1 (selecting the voltage monitor m reset). • Select the type of the reset negation by setting the PVDmCR0.RN bit.
	10	• Select the timing of interrupt requests by setting the PVDmCR1.IDTSEL[1:0] bits. • Select the type of interrupt by setting the PVDmCR1.IRQSEL bit.	—
Enabling output	11	Set PVDmSR.DET = 0.	
	12	Set PVDmCR0.RIE = 1 (enabling the voltage Monitor m interrupt or reset) *3.	
	13	Set PVDmCR0.CMPE = 1 (enabling output of the results of comparison by voltage monitor m).	

Note 1. Steps 6 to 12 can be performed during the wait time in step 5.
Note 2. Steps 6 to 8 are not required if the digital filter is not in use.
Note 3. Step 12 is not required if only the ELC event signal is to be output.
Note 4. Steps 9 to 12 can be performed during the waiting time of step 8.

Table 8.5 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops (m = 1, 2) (1 of 2)

Step		Voltage monitor m interrupt (voltage monitor m ELC event output), voltage monitor m reset
Stopping the enabling output	1	Set PVDmCR0.CMPE = 0 (disabling output of the results of comparison by voltage Monitor m).
	2	Wait for at least 2s + 3 cycles of the LOCO (where s = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by s) *1.
	3	Set PVDmCR0.RIE = 0 (disabling the voltage monitor m interrupt or reset)*3.
Stopping the digital filter	4	Set PVDmCMPCR.DFDIS = 1 (disabling the digital filter) *1 *2.

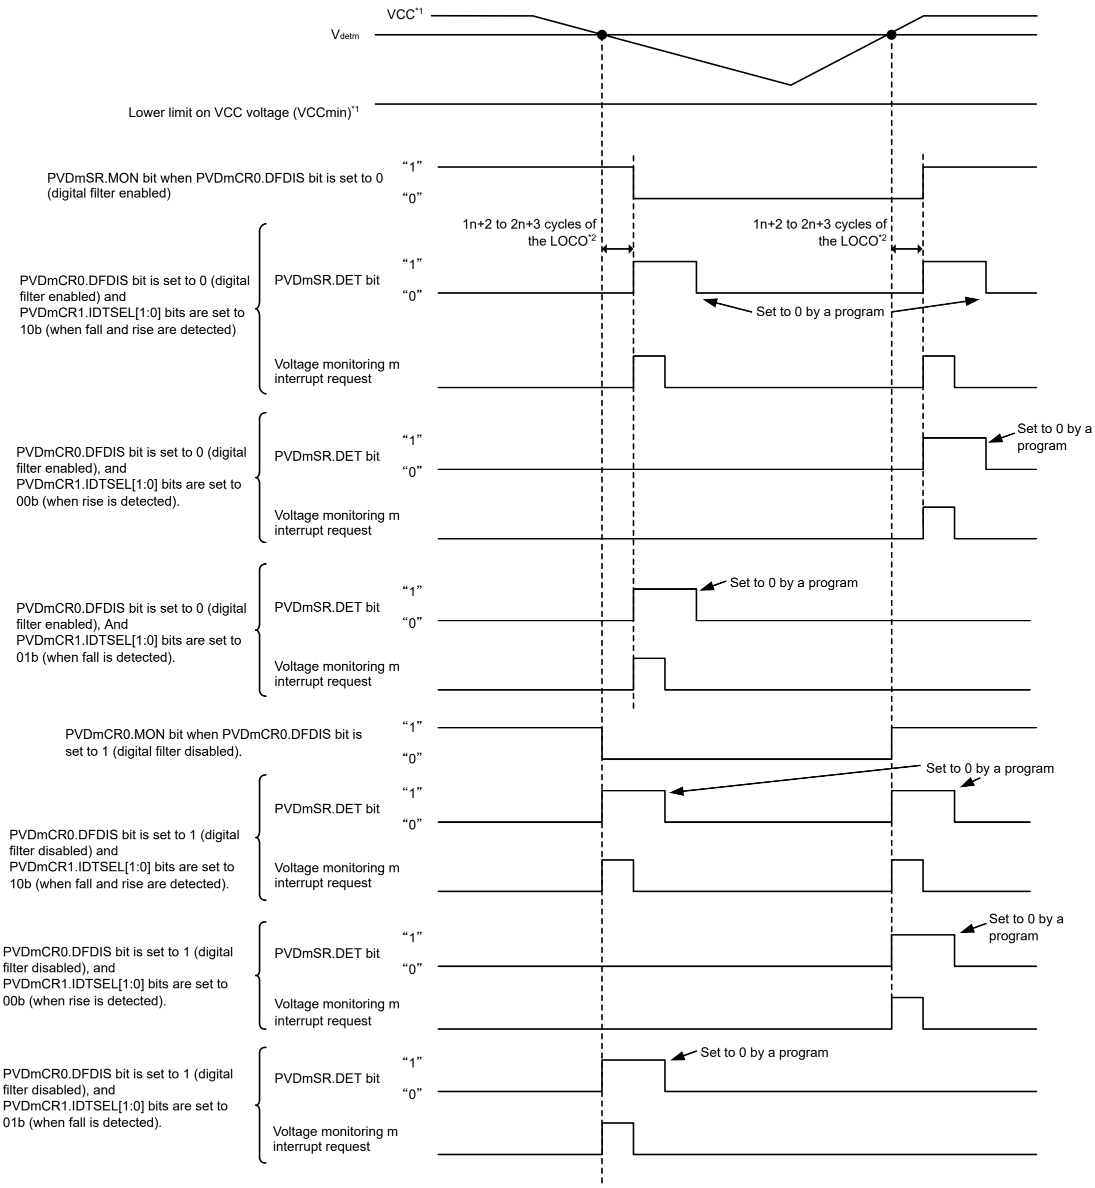
Table 8.5 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops (m = 1, 2) (2 of 2)

Step		Voltage monitor m interrupt (voltage monitor m ELC event output), voltage monitor m reset
Stopping the voltage detection m circuit	5	Set PVDmCMPCR.PVDE = 0 (disabling the voltage detection m circuit).

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.
Note 2. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least two cycles of the LOCO before re-enabling it.
Note 3. Step 3 is not required if only the ELC event signal is to be output.

If the voltage monitor m interrupt or voltage monitor m reset setting is to be made again after it has been used and stopped once, the following steps in the procedures for stopping and making the setting can be omitted according to the condition:

- Setting or stopping the voltage detection m circuit is not required if the setting for the voltage detection m circuit is not to be changed
- Setting or stopping the digital filter is not required if the setting for the digital filter is not to be changed
- Setting the voltage monitor m interrupt or reset is not required if the setting for the voltage monitor m interrupt or voltage monitor m reset is not to be changed.



Note 1. When the voltage monitor 0 reset is not in use, use at VCC ≥ VCCmin.
Note 2. Frequency of the sampling clock for the digital filter is the LOCO frequency divided by n.

Figure 8.5 Example of voltage monitor m interrupt operation (m = 1, 2)

8.6 Reset from Voltage Monitor n = 4, 5

A reset can be generated in response to the results of comparison by the voltage detection n circuit.

Table 6.6 lists the procedures for setting bits related to the voltage monitor n reset so that voltage monitoring operates. Table 6.7 shows the procedure for setting bits related to the voltage monitor n reset so that voltage monitoring stops. For the operation of the voltage monitor n reset, see section 6.3.3. Voltage Monitor Reset.

Furthermore, if you intend to use the voltage Monitor n circuit in software standby or deep software standby mode, make settings for the voltage Monitor n circuit according to the following procedures

1. Setting in software standby mode
   - Disable the digital filter (PVDnCR0.DFDIS = 1).

- After VCC > Vdetn is detected, negate the voltage Monitor n reset signal following a stabilization time.

2. Settings in deep software standby mode
   - Disable the digital filter (PVDnCR0.DFDIS = 1)
   - During deep software standby mode 3, the voltage Monitor n circuit is stopped. If you intend to use the voltage Monitor n circuit in deep software standby mode, do not transit to deep software standby mode 3.

Table 8.6 Procedures for setting bits related to the voltage monitor n reset so that voltage monitoring operates

Procedure	Step	Voltage Monitor n Reset
Setting the voltage detection n circuit	1	Set PVDnCMPCR.PVDE = 0 (disable voltage detection n before writing to PVD nCMPCR.PVDLVL)
	2	Select the detection voltage by setting the PVDnCMPCR.PVDLVL[4:0] bits.
	3	Select the type of the reset condition by setting the PVDnFCR.RHSEL bit.
	4	Set PVDnCMPCR.PVDE = 1 (enabling the voltage detection n circuit).
	5	Wait for at least td (E-A).*1
Setting the digital filter*2	6	Select the sampling clock for the digital filter by setting the PVDnCR0.FSAMP[1:0] bits.
	7	Set PVDnCR0.DFDIS = 0 (enabling the digital filter).
	8	Wait for at least 2s + 3 cycles of the LOCO (where s = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by s).*3
Enabling output	9	Set PVDnCR0.RE = 1 (enabling the voltage Monitor n reset).
	10	Set PVDnCR0.CMPE = 1 (enabling output of the results of comparison by voltage Monitor n).

Note 1. Steps 5 to 10 can be performed during the waiting time of step 4.
Note 2. Steps 5 to 8 are not required if the digital filter is not in use.
Note 3. Steps 9 can be performed during the waiting time of step 8.

Table 8.7 Procedures for setting bits related to the voltage monitor n reset so that voltage monitoring stops

Procedure	Step	Voltage Monitor n Reset
Settings to stop enabling of output	1	Set PVDnCR0.CMPE = 0 (disabling output of the results of comparison by voltage Monitor n).
	2	Wait for at least 2s + 3 cycles of the LOCO (where s = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by s).*1
	3	Set PVDnCR0.RIE = 0 (disabling the voltage Monitor n reset).
Stopping the digital filter	4	Set PVDnCR0.DFDIS = 1 (disabling the digital filter).*1*2
Stopping the voltage detection n circuit	5	Set PVDnCMPCR.PVDE = 0 (disabling the voltage detection n circuit).

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.
Note 2. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least two cycles of the LOCO before re-enabling it.

If the voltage Monitor n reset setting is to be made again after it has been used and stopped once, the following steps in the procedures for stopping and making the setting can be omitted according to the condition.

- Setting or stopping the voltage detection n circuit is not required if the setting for the voltage detection n circuit is not to be changed.
- Setting or stopping the digital filter is not required if the setting for the digital filter is not to be changed.
- Setting the voltage Monitor n interrupt or reset is not required if the setting for the voltage Monitor m interrupt or voltage Monitor n reset is not to be changed.

8.7 Event Link Controller (ELC) Output

The PVDm (m = 1, 2) can output the event signals to the Event Link Controller (ELC).

(1) V_{detm} passage detection event

The PVDm outputs the event signal when it is detected that the voltage has passed the V_{detm} voltage while both the voltage detection m circuit and the voltage monitor m circuit comparison result output are enabled.

When enabling the event link output function of the PVDm, be sure to specify settings to enable the PVDm before enabling the PVDm event link function of the ELC. To stop the event link output function of the PVDm, be sure to specify settings to stop the PVDm before disabling the PVDm event link function of the ELC.

8.7.1 Interrupt Handling and Event Linking

Each PVD has bits to separately enable or disable the voltage monitor m interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

On the contrary, as soon as an interrupt source is generated, the event link signal is output as the event signal to the other module through the ELC regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor m interrupts in Software Standby mode, Deep Software Standby mode 1, and Deep Software Standby mode 2. The event signals for the ELC in Software Standby mode, Deep Software Standby mode 1, and Deep Software Standby mode 2 are output as follows:

- When the event V_{detm} is detected in Software Standby mode, no event signals are generated for the ELC because no clock is presented in Software Standby mode. Because V_{detm} passage detection flag is preserved, when the supply of the clock is resumed after restoring from Software Standby mode, the event signals for the ELC is output according to the state of the V_{detm} passage detection flag.
- If event of passing V_{detm} is detected in Deep Software Standby mode, no event signal is generated for the ELC.

9. Clock Generation Circuit

9.1 Overview

The MCU provides a clock generation circuit. Table 9.1 and Table 9.2 list the clock generation circuit specifications. Figure 9.1 show a block diagram, and Table 9.3 lists the I/O pins.

Table 9.1 Clock generation circuit specifications for the clock sources (1 of 2)

Clock source	Description	Specification
Main clock oscillator (MOSC)	Resonator frequency	8 MHz to 48 MHz
	External clock input frequency	Up to 48 MHz
	Connectable resonator or additional circuit: ceramic resonator, crystal Connection pins: EXTAL, XTAL	Available
	Drive capability switching	Available
	Automatic Gain Control Function	Available
	Oscillation stop detection function	Available
Sub-clock oscillator (SOSC)	Resonator frequency	32.768 kHz
	Connectable resonator or additional circuit: crystal resonator Connection pin: XCIN, XCOUT	Available
	External clock input	Available
	Drive capability switching	Available
	Oscillation stop detection function	Available
PLL1 circuit PLL2 circuit	Input clock source	MOSC/HOCO
	Input pulse frequency division ratio	Selectable from 1/2/3
	Input clock frequency	8 MHz to 48 MHz
	Input clock frequency (After input frequency division)	8 MHz to 24 MHz
	Frequency multiplication ratio	Selectable from 40 to 300 (after the decimal point : 0/0.33/0.50/0.66)
	VCO frequency	960 MHz to 2400 MHz
	Number of output clocks	Output 3 different clocks
	Output pulse frequency division ratio	Number of output clocks Output 3 different clocks
	PLL Output clock P	60 to 1200 MHz (output division ratio : 2/3/4/6/8/16)
	PLL Output clock Q	106.6 to 1200 MHz (output division ratio : 1.5/2/3/4/5/6/8/9)
	PLL Output clock R	106.6 to 1200 MHz (output division ratio : 1.5/2/3/4/5/6/8/9)
High-speed on-chip oscillator (HOCO)	Oscillation frequency	16/18/20/32/48/ MHz
	FLL function	Available
	User trimming	Available
Middle-speed on-chip oscillator (MOCO)	Oscillation frequency	8 MHz
	User trimming	Available
Low-speed on-chip oscillator (LOCO)	Oscillation frequency	32.768 kHz
	User trimming	Available

Table 9.1 Clock generation circuit specifications for the clock sources (2 of 2)

Clock source	Description	Specification
External clock input for JTAG (TCK)	Input clock frequency	Up to 25 MHz
External clock input for SWD (SWCLK)	Input clock frequency	Up to 25 MHz

Table 9.2 Clock generation circuit specifications for the internal clocks (1 of 3)

Item	Clock source	Maximum Frequency of Clock Source	Clock supply	Specification
CPU0 clock (CPUCLK0)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	CPU0	Up to 1 GHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
CPU1 clock (CPUCLK1)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	CPU1	Up to 250 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
MRAM bus clock (MRICLK)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	Code MRAM, MRAM code bus	Up to 250 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
MRAM clock (MRPCLK)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	Extra MRAM, MRAM peripheral bus	Up to 125 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
System clock (ICLK)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	DMAC, DTC, SRAM, System BUS, I/O Ports, ICU	Up to 250 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
Debugger clock (DCLK)	ICLK	—	Debug Subsystem	Up to 250 MHz
Peripheral module clock A (PCLKA)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	High-speed peripheral bus (ESWM, , USBHS, SCI, I3C, CANFD, CNECC, SPI, CRC, DOC, ADC16H, RSIP-E50D, GPT, PDG, DOTF AES clock, CEU)	Up to 125 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
Peripheral module clock B (PCLKB)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	Low-speed peripheral bus (CAC, ELC, POEG, RTC, WDT, IWDT, AGT, ULPT, IIC, USBFS, SSIE, SDHI, TSN, ACMPHS, OSPI, DOTF bus clock, DAC12, PDMIF)	Up to 62.5 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
Peripheral module clock C (PCLKC)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	Not used	Up to 125 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
Peripheral module clock D (PCLKD)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	Peripheral module(GPT count clock, PDG)	Up to 250 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
Peripheral module clock E (PCLKE)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	Peripheral module (CANFDRAM)	Up to 250 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
External bus clock (BCLK)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	External bus	Up to 125 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64
EBCLK pin output (EBCLK)	BCLK or 1/2 BCLK or BCLKA or 1/2 BCLKA	—	EBCLK pin	BCLK: Up to 60 MHz Division ratio: 1 or 2 BCLKA: Up to 60 MHz Division ratio: 1 or 2
SDCLK pin output (SDCLK)	BCLK or BCLKA	—	SDCLK pin	BCLK: Up to 125 MHz BCLKA: Up to 133MHz
Trace clock (TRCLK)	MOSC/SOSC/HOCO/ MOCO/PLL1P	1 GHz	CPU-OCD	Up to 125 MHz Division ratio: 1/2/3/4/6/8/12/16/24/32/64/128/256
SCI clock (SCICLK)	MOSC/SOSC/HOCO/ MOCO/LOCO/PLL1P/ PLL1Q/PLL1R/PLL2P/ PLL2Q/PLL2R	480 MHz	SCI	Up to 120 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32

Table 9.2 Clock generation circuit specifications for the internal clocks (2 of 3)

Item	Clock source	Maximum Frequency of Clock Source	Clock supply	Specification
SPI clock (SPICLK)	MOSC/SOSC/HOCO/ MOCO/ LOCO/PLL1P/ PLL1Q/PLL1R/PLL2P/ PLL2Q/PLL2R	333 MHz	SPI	Up to 333.33 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
Octal-SPI clock (OCTACLK)	MOSC/SOSC/HOCO/ MOCO/ LOCO/PLL1P/ PLL1Q/PLL1R/PLL2P/ PLL2Q/PLL2R	333 MHz	Octal-SPI	Up to 333.33 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
Octal-SPI divide clock (OCTADIVCLK)	1/2 OCTACLK	—	Octal-SPI	Up to 166.67 MHz
CANFD core clock (CANFDCLK)	MOSC/SOSC/HOCO/ MOCO/ LOCO/PLL1P/ PLL1Q/PLL1R/PLL2P/ PLL2Q/PLL2R	480 MHz	CANFD	Up to 80 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
ADC clock (ADCCLK)	MOSC/SOSC/HOCO/ MOCO/LOCO/PLL1P/ PLL1Q/PLL1R/PLL2P/ PLL2Q/PLL2R	480 MHz	ADC16H	Up to 120 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
GPT clock (GPTCLK)	MOSC/HOCO/MOCO/ PLL1P/PLL1Q/PLL1R/ PLL2P/PLL2Q/PLL2R	600 MHz	GPT, PDG, ADC16H	Up to 300 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
USB clock (USBCLK)	MOSC/HOCO/MOCO/ PLL1P/ PLL1Q/PLL1R/ PLL2P/PLL2Q/PLL2R	480 MHz	USBFS, USBHS	48 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
USB clock (USB60CLK)	MOSC/HOCO/MOCO/ PLL1P/ PLL1Q/PLL1R/ PLL2P/PLL2Q/PLL2R	480 MHz	USBHS	60 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
I3C clock (I3CCLK)	MOCO/PLL1P/PLL1Q/ PLL1R/ PLL2P/PLL2Q/ PLL2R	800 MHz	I3C	Up to 200 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
Asynchronous external bus clock (BCLKA)	MOCO/PLL1P/PLL1Q/ PLL1R/PLL2P/ PLL2Q/ PLL2R	800 MHz	External bus	Up to 133 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
EtherSW clock (ESWCLK)	MOCO/PLL1P/PLL1Q/ PLL1R/PLL2P/ PLL2Q/ PLL2R	1 GHz	ESWM	Up to 250 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
EtherSW-PHY clock (ESWPHYCLK)	MOCO/PLL1P/PLL1Q/ PLL1R/PLL2P/ PLL2Q/ PLL2R	1 GHz	ESWM	500 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
Ether-PHY clock (ETHPHYCLK)	MOSC/MOCO/PLL1P/ PLL1Q/PLL1R/PLL2P/ PLL2Q/PLL2R	800 MHz	ETHPHYCLK pin	25/50 MHz Division ratio: 1/2/3/4/5/6/8/10/16/32
Clock/buzzer output (CLKOUT)	MOSC/SOSC/HOCO/ MOCO/LOCO	—	CLKOUT pin	Up to 60 MHz Division ratio: 1/2/4/8/16/32/64/128
MOSC clock for USBHS (USBMCLK)	MOSC	—	USBHS	12/20/24/48 MHz No division
CAN clock (CANMCLK)	MOSC	—	CANFD	8 MHz to 48 MHz No division
ULPT LOCO clock (ULPTLCLK)	LOCO	—	ULPT	32.768 kHz No division
ULPT Sub-clock (ULPTSCLK)	SOSC	—	ULPT	32.768 kHz No division
AGT LOCO clock (AGTLCLK)	LOCO	—	AGT	32.768 kHz No division
AGT Sub clock (AGTSCLK)	SOSC	—	AGT	32.768 kHz No division

Table 9.2 Clock generation circuit specifications for the internal clocks (3 of 3)

Item	Clock source	Maximum Frequency of Clock Source	Clock supply	Specification
PDMIF clock (PDMIFCLK)	MOCO	—	PDMIF	8 MHz No division
CAC Main clock (CACMCLK)	MOSC	—	CAC	Up to 48 MHz No division
CAC Sub clock (CACSCLK)	SOSC	—	CAC	32.768 kHz No division
CAC HOCO clock (CACHCLK)	HOCO	—	CAC	16/18/20/32/48 MHz No division
CAC MOCO clock (CACMOCLK)	MOCO	—	CAC	8 MHz No division
CAC LOCO clock (CACLCLK)	LOCO	—	CAC	32.768 kHz No division
RTC LOCO clock (RTCLCLK)	LOCO	—	RTC	32.768 kHz No division
RTC Sub clock (RTCSCLK)	SOCO	—	RTC	32.768 kHz No division
IWDT clock (IWDTCLK)	1/2 LOCO	—	IWDT	16.384 kHz No division
SysTick timer clock (SYSTICKCLK)	1/8 MOCO	—	SysTick timer	1 MHz No division
JTAG clock (JTAGTCK)	TCK	—	JTAG	Up to 25 MHz No division
Serial wire clock (SWCLK)	TCK	—	OCD	Up to 25 MHz No division
TCLK pin output (TCLK)	1/2 TRCLK	—	TCLK pin	Up to 60 MHz

Note: When selecting PLL as the clock source, set the PLL output frequency to 1 GHz or less.

Note: If the PLL reference clock source is HOCO, the PLL multiplication setting must be set within output frequency range of PLL in consideration of HOCO frequency (minimum/maximum).

Note: Restrictions on setting clock frequency: CPUCLK0 ≥ ICLK, CPUCLK1 ≥ ICLK, MRICLK ≥ ICLK, CPUCLK0 ≥ MRICLK, CPUCLK1 ≥ MRICLK, ICLK ≥ MRPCLK, ICLK ≥ PCLKA ≥ PCLKB, ICLK ≥ BCLK, GPTCLK > PCLKA, PCLKD ≥ PCLKA ≥ PCLKB
Restrictions on clock frequency ratio: (N: integer, and up to 64)
CPUCLK0 : ICLK = N : 1, CPUCLK1 : ICLK = N : 1, MRICLK : ICLK = N : 1, CPUCLK0 : MRICLK = N : 1, CPUCLK1 : MRICLK = N : 1, ICLK : MRPCLK = N : 1, ICLK : BCLK = N : 1, ICLK : PCLKA = N : 1, ICLK : PCLKB = N : 1, ICLK : PCLKC = N : 1 or 1 : N, ICLK : PCLKD = N : 1 or 1 : N, ICLK : PCLKE = N : 1 or 1 : N
When one clock selects 3, 6, 12, 24-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.
If the CAN-FD is used, clock frequency ratio is constrained to be PCLKA:PCLKE = 1:2.

Note: The multiplication of PLL1 and PLL2 should be set to be within the output frequency range of PLL1 and PLL2, taking the frequency of HOCO into consideration when not using the FLL function.

Note: Clocks have a permissible frequency range (See Table 9.2).
MRAM and SRAM also have a permissible operating frequency range in each wait cycle setting. (See section 58, SRAM, section 59, MRAM)
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency when not using FLL function. (See section 62, Electrical Characteristics).

Note: PLLCCR.PLSRCSEL bit must be set to 0 when CPUCLK0 is set to over 960 MHz.

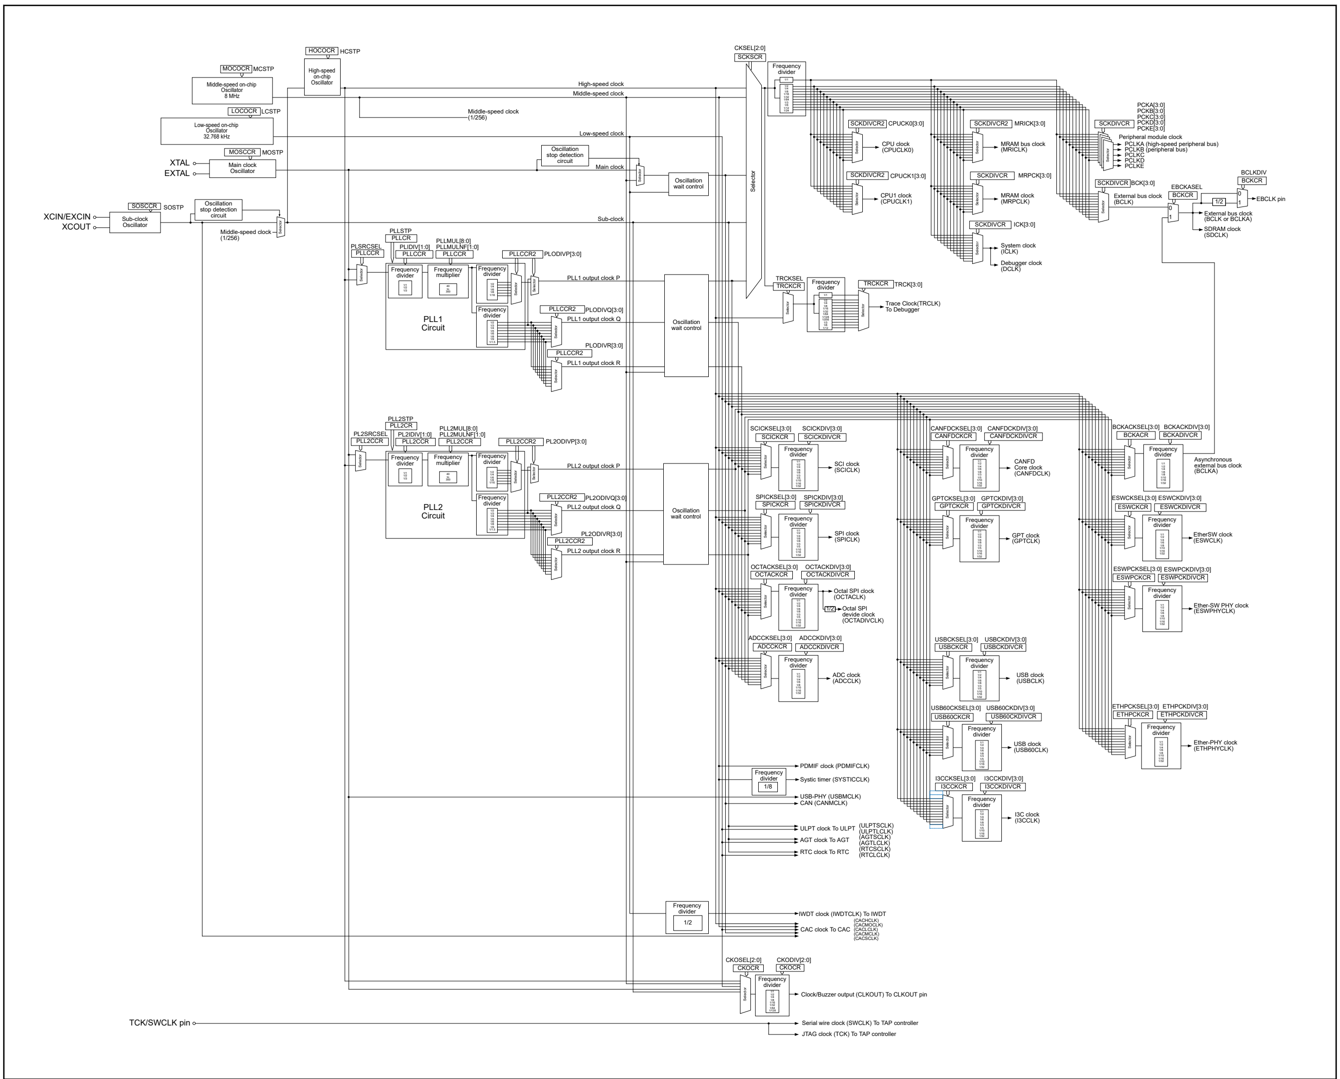


Figure 9.1 Clock generation circuit block diagram

Table 9.3 lists the input/output pins of the clock generation circuit.

Table 9.3 Input/Output Pins of Clock Generation Circuit

Pin name	I/O	Description
XTAL	Output	These pins are used to connect a ceramic resonator or crystal resonator. The EXTAL pin can also be used to input an external clock. For details, see section 9.3.2. External Clock Input.
EXTAL	Input	
XCIN/EXCIN	Input	These pins are used to connect a 32.768-kHz crystal resonator. The XCIN pin can also be used to input an external clock. For details, section 9.4.2. External Clock Input.
XCOUT	Output	
TCK/SWCLK	Input	This pin is used to input the clock for the JTAG/SWD
EBCLK	Output	This pin is used to supply external devices with the external bus clock (EBCLK)
SDCLK	Output	SDRAM clock (SDCLK) supply for external devices
CLKOUT	Output	This pin is used to output the CLKOUT/BUZZER clock
TRCLK	Output	TRACE clock output.

9.2 Register Descriptions

9.2.1 CGFSAR : Clock Generation Function Security Attribute Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	NONSEC28	NONSEC27	—	NONSEC25	NONSEC24	—	NONSEC22	NONSEC21	NONSEC20	NONSEC19	NONSEC18	NONSEC17	NONSEC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	NONSEC14	NONSEC13	NONSEC12	NONSEC11	NONSEC10	NONSEC09	NONSEC08	NONSEC07	NONSEC06	NONSEC05	NONSEC04	NONSEC03	NONSEC02	—	NONSEC00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC00	Non-secure Attribute bit 00 Target register: SCKDIVCR, SCKDIVCR2, SCKSCR Target factor: system clock control 0: Secure 1: Non-secure	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	NONSEC02	Non-secure Attribute bit 02 Target register: HOCOCR, HOCOCR2, FLLCR1, FLLCR2, HOCOUTCR, HOCOSCR, USBCKSELR Target factor: HOCO 0: Secure 1: Non-secure	R/W
3	NONSEC03	Non-secure Attribute bit 03 Target register: MOCOCR, MOCOUTCR, MOCOSCR Target factor: MOCO 0: Secure 1: Non-secure	R/W
4	NONSEC04	Non-secure Attribute bit 04 Target register: LOCOCR, LOCOUTCR Target factor: LOCO 0: Secure 1: Non-secure	R/W
5	NONSEC05	Non-secure Attribute bit 05 Target register: MOSCCR, MOSCWTCR, MOMCR, MOMCR2, MOSCSCR Target factor: MOSC 0: Secure 1: Non-secure	R/W
6	NONSEC06	Non-secure Attribute bit 06 Target register: OSTDCR, OSTDSR Target factor: oscillation stop detection control 0: Secure 1: Non-secure	R/W
7	NONSEC07	Non-secure Attribute bit 07 Target register: SOSCCR, SOMCR Target factor: SOSC 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
8	NONSEC08	Non-secure Attribute bit 08 Target register: PLLCCR, PLLCCR2, PLLCR Target factor: PLL 0: Secure 1: Non-secure	R/W
9	NONSEC09	Non-secure Attribute bit 09 Target register: PLL2CCR, PLL2CCR2, PLL2CR Target factor: PLL2 0: Secure 1: Non-secure	R/W
10	NONSEC10	Non-secure Attribute bit 10 Target register:SOSTDCR, SOSTDSR Target factor: Sub oscillation stop detection control 0: Secure 1: Non-secure	R/W
11	NONSEC11	Non-secure Attribute bit 11 Target register: CKOCR Target factor: CLKOUT control 0: Secure 1: Non-secure	R/W
12	NONSEC12	Non-secure Attribute bit 12 Target register: BCKCR, EBCKOCR Target factor: EBCLK 0: Secure 1: Non-secure	R/W
13	NONSEC13	Non-secure Attribute bit 13 Target register: SDCKOCR Target factor: SDCLK 0: Secure 1: Non-secure	R/W
14	NONSEC14	Non-secure Attribute bit 14 Target register: BCKADIVCR, BCKACR Target factor: BCLKA 0: Secure 1: Non-secure	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W
16	NONSEC16	Non-secure Attribute bit 16 Target register: USBCKDIVCR, USBCKCR Target factor: USBCLK 0: Secure 1: Non-secure	R/W
17	NONSEC17	Non-secure Attribute bit 17 Target register: OCTACKDIVCR, OCTACKCR Target factor: OCTACLK 0: Secure 1: Non-secure	R/W
18	NONSEC18	Non-secure Attribute bit 18 Target register: CANFDCKDIVCR, CANFDCKCR Target factor: CANFDCLK 0: Secure 1: Non-secure	R/W
19	NONSEC19	Non-secure Attribute bit 19 Target register: USB60CKDIVCR, USB60CKCR Target factor: USB60CLK 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
20	NONSEC20	Non-secure Attribute bit 20 Target register:I3CCKDIVCR, I3CCKCR Target factor: I3CCLK 0: Secure 1: Non-secure	R/W
21	NONSEC21	Non-secure Attribute bit 21 Target register: SCICKDIVCR, SCICKCR Target factor: SCICLK 0: Secure 1: Non-secure	R/W
22	NONSEC22	Non-secure Attribute bit 22 Target register: SPICKDIVCR, SPICKCR Target factor: SPICLK 0: Secure 1: Non-secure	R/W
23	—	This bit is read as 0. The write value should be 0.	R/W
24	NONSEC24	Non-secure Attribute bit 24 Target register: ADCCKDIVCR, ADCCKCR Target factor: ADCCLK 0: Secure 1: Non-secure	R/W
25	NONSEC25	Non-secure Attribute bit 25 Target register: GPTCKDIVCR, GPTCKCR Target factor: GPTCLK 0: Secure 1: Non-secure	R/W
26	—	This bit is read as 0. The write value should be 0.	R/W
27	NONSEC27	Non-secure Attribute bit 27 Target register: ESWCKDIVCR, ESWCKCR, ESWPCKDIVCR, ESWPCKCR Target factor: ESWCLK, ESWPHYCLK 0: Secure 1: Non-secure	R/W
28	NONSEC28	Non-secure Attribute bit 28 Target register: ETHPCKDIVCR, ETHPCKCR Target factor: ETHPHYCLK 0: Secure 1: Non-secure	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

CGFSAR register controls the secure attribute of Clock Generation Function registers.

NONSEC00 bit (Non-secure Attribute bit 00)

This bit controls the security attribute of SCKDIVCR, SCKDIVCR2, SCKSCR.

NONSEC02 bit (Non-secure Attribute bit 02)

This bit controls the security attribute of HOCOCR, HOCOCR2, FLLCR1, FLLCR2, HOCOUTCR, HOCOSCR, USBCKSELR.

NONSEC03 bit (Non-secure Attribute bit 03)

This bit controls the security attribute of MOCOCR, MOCOUTCR, MOCOSCR.

NONSEC04 bit (Non-secure Attribute bit 04)

This bit controls the security attribute of LOCOCR, LOCOUTCR.

NONSEC05 bit (Non-secure Attribute bit 05)

This bit controls the security attribute of MOSCCR, MOSCWTCR, MOMCR, MOMCR2, MOSCSCR.

NONSEC06 bit (Non-secure Attribute bit 06)

This bit controls the security attribute of OSTDCR, OSTDSR.

NONSEC07 bit (Non-secure Attribute bit 07)

This bit controls the security attribute of SOSCCR, SOMCR.

NONSEC08 bit (Non-secure Attribute bit 08)

This bit controls the security attribute of PLLCCR, PLLCCR2, PLLCR.

NONSEC09 bit (Non-secure Attribute bit 09)

This bit controls the security attribute of PLL2CCR, PLL2CCR2, PLL2CR.

NONSEC10 bit (Non-secure Attribute bit 10)

This bit controls the security attribute of SOSTDCR, SOSTDSR.

NONSEC11 bit (Non-secure Attribute bit 11)

This bit controls the security attribute of CKOCR.

NONSEC12 bit (Non-secure Attribute bit 12)

This bit controls the security attribute of BCKCR, EBCKOCR.

NONSEC13 bit (Non-secure Attribute bit 13)

This bit controls the security attribute of SDCKOCR.

NONSEC14 bit (Non-secure Attribute bit 14)

This bit controls the security attribute of BCKADIVCR, BCKACR.

NONSEC16 bit (Non-secure Attribute bit 16)

This bit controls the security attribute of USBCKDIVCR, USBCKCR.

NONSEC17 bit (Non-secure Attribute bit 17)

This bit controls the security attribute of OCTACKDIVCR, OCTACKCR.

NONSEC18 bit (Non-secure Attribute bit 18)

This bit controls the security attribute of CANFDCKDIVCR, CANFDCKCR.

NONSEC19 bit (Non-secure Attribute bit 19)

This bit controls the security attribute of USB60CKDIVCR, USB60CKCR.

NONSEC20 bit (Non-secure Attribute bit 20)

This bit controls the security attribute of I3CCKDIVCR, I3CCKCR.

NONSEC21 bit (Non-secure Attribute bit 21)

This bit controls the security attribute of SCICKDIVCR, SCICKCR.

NONSEC22 bit (Non-secure Attribute bit 22)

This bit controls the security attribute of SPICKDIVCR, SPICKCR.

NONSEC24 bit (Non-secure Attribute bit 24)

This bit controls the security attribute of ADCCKDIVCR, ADCCKCR.

NONSEC25 bit (Non-secure Attribute bit 25)

This bit controls the security attribute of GPTCKDIVCR, GPTCKCR.

NONSEC27 bit (Non-secure Attribute bit 27)

This bit controls the security attribute of ESWCKDIVCR, ESWCKCR, ESWPCKDIVCR, ESWPCKCR

NONSEC28 bit (Non-secure Attribute bit 28)

This bit controls the security attribute of ETHPCKDIVCR, ETHPCKCR.

9.2.2 SCKDIVCR : System Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

27:24	ICK[3:0]*1*2*3*4*5*6*7	System Clock (ICLK) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 1 0 1 1: × 1/24 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
31:28	MRPCK[3:0][*1*8]	MRAM Clock (MRPCLK) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 1 0 1 1: × 1/24 Others: Setting prohibited.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: When one clock selects 3, 6, 12, 24-divisions, the other clocks must not select 2, 4, 8, 16, 32, 64- divisions.
Note 1. The following relation is required between the frequencies of the system clock (ICLK) and the MRAM Clock (MRPCLK).
ICLK:MRPCLK = N:1 (N: integer)
Note 2. The following relation is required between the frequencies of the system clock (ICLK) and the external bus clock (BCLK).
ICLK:BCLK = N:1 (N: integer)
Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKA, PCLKB)
ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)
Note 4. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD, PCLKE):
ICLK:PCLKC, PCLKD PCLKE = N:1 or 1:N (N: integer)
Note 5. The following relation is required between the frequencies of the CPU0 clock (CPUCLK0) and the system clock (ICLK):
CPUCLK0:ICLK = N:1 (N: integer)
Note 6. The following relation is required between the frequencies of the CPU1 clock (CPUCLK1) and the system clock (ICLK):
CPUCLK1:ICLK = N:1 (N: integer)
Note 7. The following relation is required between the frequencies of the MRAM bus clock (MRICLK), the CPU0 clock (CPUCLK0), the CPU1 clock (CPUCLK1) and the system clock (ICLK):
MRICLK:ICLK = N:1 (N: integer)
CPUCLK0:MRICLK = N:1 (N: integer)
CPUCLK1:MRICLK = N:1 (N: integer)
Note 8. The frequency of the MRAM clock (MRPCLK) is limited to the MRE frequency notifications register (MREFREQ). See section 59, MRAM.

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE), MRAM Clock (MRPCLK), and external bus clock (BCLK).

9.2.3 SCKDIVCR2 : System Clock Division Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x024

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MRICK[3:0]				—				CPUCK1[3:0]				CPUCK0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CPUCK0[3:0]*1	CPU0 Clock (CPUCLK0) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 1 0 1 1: × 1/24 Others: Setting prohibited.	R/W
7:4	CPUCK1[3:0]*2*5	CPU1 Clock (CPUCLK1) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 1 0 1 1: × 1/24 Others: Setting prohibited.	R/W
11:8	—	Set these bits to the same value as MRICK[3:0]	R/W
15:12	MRICK[3:0]*3*4	MRAM bus Clock (MRICLK) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 1 0 1 1: × 1/24 Others: Setting prohibited.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: When one clock selects 3, 6, 12, 24-divisions, the other clocks must not select 2, 4, 8, 16, 32, 64- divisions.
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The following relation is required between the frequencies of the CPU0 clock (CPUCLK0) and the system clock (ICLK): CPUCLK0:ICLK = N:1 (N: integer)
Note 2. The following relation is required between the frequencies of the CPU1 clock (CPUCLK1) and the system clock (ICLK):CPUCLK1:ICLK = N:1 (N: integer)
Note 3. The following relation is required between the frequencies of the MRAM bus clock (MRICLK), the CPU0 clock (CPUCLK0), the CPU1 clock (CPUCLK1)and the system clock (ICLK):
MRICLK:ICLK = N:1 (N: integer)
CPUCLK0:MRICLK = N:1 (N: integer)
CPUCLK1:MRICLK = N:1 (N: integer)
Note 4. The frequency of the MRAM bus clock (MRICLK) is limited to the MRC frequency notifications register (MRCFREQ). See section 59, MRAM.
Note 5. Set the same value as MRICK[3:0] for single core product.

SCKDIVCR2 selects the frequencies of the CPU0 clock (CPUCLK0), the CPU1 clock (CPUCLK1) and the MRAM bus clock (MRICLK).

9.2.4 SYRACCR : System Register Access Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xCC

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BUSY
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSY	Access Ready monitor 0: Ready to read/write access 1: Writing in progress	R
7:1	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-5, P-TYPE-5
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SYRACCR register monitor that the target registers can be accessed.

The target registers are LOCOCR and LOCOUTCR.

BUSY bit (Access Ready monitor)

When SYRACCR.BUSY is 0, you can access the target registers.

Make sure that SYRACCR.BUSY is 0 before accessing the target registers.

When SYRACCR.BUSY is 1, the write access to one of the target registers is in progress. If SYRACCR.BUSY is 1, further writing to one of the target registers is ignored, and the read value from the target registers is not guaranteed.

9.2.5 SCKSCR : System Clock Source Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x026

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CKSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	CKSEL[2:0]	Clock Source Select 0 0 0: HOCO 0 0 1: MOCO (Value after reset) 0 1 0: Setting prohibited 0 1 1: Main clock oscillator (MOSC) 1 0 0: Sub-clock oscillator (SOSC) 1 0 1: PLL1 output clock P (PLL1P) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: S-TYPE-3, P-TYPE-2

The SCKSCR register selects the clock source for the system clock.

CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- CPU0 clock (CPUCLK0)
- CPU1 clock (CPUCLK1)
- MRAM bus clock (MRICLK)
- MRAM clock (MRPCLK)
- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE)
- External bus clock (BCLK)
- SDRAM clock (SDCLK)

The bits select from one of the following sources:

- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)
- Sub-clock oscillator (SOSC)
- PLL1 output clock P (PLL1P)

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

Check the operation state of clock sources in each product operating mode, and do not select the clock source to be stopped in SCKSCR. The clock sources should be switched when there are no occurring internal asynchronous interrupt. For details, see section 11, Low Power Mode.

9.2.6 PLLCCR : PLL Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0AC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLMUL[8]
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PLLMUL[7:0]								PLLMULNF[1:0]		—	PLSRCSEL	—		PLIDIV[1:0]	
Value after reset:	0	0	1	0	0	1	1	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PLIDIV[1:0]*1	PLL1 Input Frequency Division Ratio Select 0 0: 1/1 0 1: 1/2 1 0: 1/3 Others: Setting prohibited.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PLSRCSEL	PLL1 Clock Source Select 0: Main clock oscillator*3 1: HOCO*4	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7:6	PLLMULNF[1:0]*2	PLL1 Frequency Multiplication Fractional Factor Select 0 0: 0.00 (Value after reset) 0 1: 0.33 (1/3) 1 0: 0.66 (2/3) 1 1: 0.50 (1/2)	R/W
16:8	PLLMUL[8:0]*2	PLL1 Frequency Multiplication Factor Select 0x27: × 40 (Value after reset) 0x28: × 41 0x29: × 42 ⋮ 0x12A: × 299 0x12B: × 300 Others: Setting prohibited.	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PLIDIV[1:0] should be set so that the frequency of PLL1 input signal is within the range of section 9.1. Overview.

Note 2. PLLMUL[8:0] and PLLMULNF[1:0] should be set so that the frequency of PLL1 output signal is within the range of section 9.1. Overview.

Note 3. PLSRCSEL must be set to 0 when CPUCLK0 is set to over 960MHz.

Note 4. The FLL function must be enabled when using USBCLK.

The PLLCCR register sets the operation of the PLL1 circuit.

Writing to the PLLCCR is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL1 operates).

PLIDIV[1:0] bits (PLL1 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL1 clock source.

PLSRCSEL bit (PLL1 Clock Source Select)

This bit selects the clock source for the PLL1.

PLLMULNF[1:0] bits (PLL1 Frequency Multiplication Fractional Factor Select)

These bits select the fractional part of the frequency multiplication factor for the PLL1 circuit.

PLLMUL[8:0] bits (PLL1 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL1 circuit.

9.2.7 PLLCCR2 : PLL Clock Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x4C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—				PLODIVR[3:0]				PLODIVQ[3:0]				PLODIVP[3:0]			
Value after reset:	0	0	0	0	0	1	0	1	0	1	0	1	0	1	0	1

Bit	Symbol	Function	R/W
3:0	PLODIVP[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock P 0001: × 1/2 0010: × 1/3 0011: × 1/4 0101: × 1/6 (Value after reset) 0111: × 1/8 1111: × 1/16 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
7:4	PLODIVQ[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock Q 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 1001: × 1/1.5 Others: Setting prohibited.	R/W
11:8	PLODIVR[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock R 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 1001: × 1/1.5 Others: Setting prohibited.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. It must be set so that the frequency of PLL1 output signal is within the range listed in Table 9.1.

The PLLCCR2 register sets up the operation of the PLL1 circuit. Writing to the PLLCCR2 is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL1 operates).

Even if only one of the PLL1 output clock P, Q, or R is used, PLLCCR2 must be set so that the frequency of PLL1 output signal is within the range listed in Table 9.1.

PLODIVP[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock P)

These bits select the output frequency division ratio for PLL1 output clock P (PLL1P).

PLODIVQ[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock Q)

These bits select the output frequency division ratio for PLL1 output clock Q (PLL1Q).

PLODIVR[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock R)

These bits select the output frequency division ratio for PLL1 output clock R (PLL1R).

9.2.8 PLLCR : PLL Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x02A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLLSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLLSTP	PLL1 Stop Control 0: PLL1 is operating 1: PLL1 is stopped.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL1 circuit.

PLLSTP bit (PLL1 Stop Control)

This bit runs or stops the PLL1 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL1 by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL1, only use the PLL1 clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL1 operation. A fixed time is also required for oscillation to stop after stopping the PLL1 operation. Additionally, apply the following limitations when starting and stopping the PLL1 operation by the PLLSTP bit:

- After stopping the PLL1, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL1.
- Confirm that the PLL1 is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL1.
- Regardless of whether the PLL1 clock is selected as the system clock source, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL1.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL1, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL1 output clock P (PLL1P)).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL1 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL1 source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

9.2.9 PLL2CCR : PLL2 Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0C8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL2MUL[8]
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PLL2MUL[7:0]								PLL2MULNF[1:0]		—	PL2SRCSEL	—		PL2IDIV[1:0]	
Value after reset:	0	0	1	0	0	1	1	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PL2IDIV[1:0][*1]	PLL2 Input Frequency Division Ratio Select 0 0: 1/1 (Value after reset) 0 1: 1/2 1 0: 1/3 Others: Setting prohibited.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PL2SRCSEL	PLL2 Clock Source Select 0: Main clock oscillator 1: HOCO[*3]	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
7:6	PLL2MULNF[1:0][*2]	PLL2 Frequency Multiplication Fractional Factor Select 00: 0.00 (Value after reset) 01: 0.33 (1/3) 10: 0.66 (2/3) 11: 0.50 (1/2)	R/W

Bit	Symbol	Function	R/W
16:8	PLL2MUL[8:0]*2	PLL2 Frequency Multiplication Factor Select 0x27: × 40 (Value after reset) 0x28: × 41 0x29: × 42 ⋮ 0x12A: × 299 0x12B: × 300 Others: Setting prohibited.	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. PL2IDIV[1:0] should be set so that the frequency of PLL2 input signal is within the range of section 9.1. Overview.
Note 2. PLL2MUL[8:0] and PLL2MULNF[1:0] should be set so that the frequency of PLL2 output signal is within the range of section 9.1. Overview.
Note 3. The FLL function must be enabled when using USBCLK.

The PLL2CCR register sets the operation of the PLL2 circuit.

Writing to the PLL2CCR register is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

PL2IDIV[1:0] bits (PLL2 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL2 clock source.

PL2SRCSEL bit (PLL2 Clock Source Select)

This bit selects the clock source for the PLL2.

PLL2MULNF[1:0] bit (PLL2 Frequency Multiplication Fractional Factor Select)

These bits select the fractional part of the frequency multiplication factor for the PLL2 circuit.

PLL2MUL[8:0] bits (PLL2 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL2 circuit.

9.2.10 PLL2CCR2 : PLL2 Clock Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x4E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—				PL2ODIVR[3:0]				PL2ODIVQ[3:0]				PL2ODIVP[3:0]			
Value after reset:	0	0	0	0	0	1	0	1	0	1	0	1	0	1	0	1

Bit	Symbol	Function	R/W
3:0	PL2ODIVP[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock P 0001: × 1/2 0010: × 1/3 0011: × 1/4 0101: × 1/6 (Value after reset) 0111: × 1/8 1111: × 1/16 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
7:4	PL2ODIVQ[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock Q 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 1001: × 1/1.5 Others: Setting prohibited.	R/W
11:8	PL2ODIVR[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock R 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 1001: × 1/1.5 Others: Setting prohibited.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. It must be set so that the frequency of PLL2 output signal is within the range listed in Table 9.1.

The PLL2CCR2 register sets up the operation of the PLL2 circuit. Writing to the PLL2CCR2 is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

Even if only one of the PLL2 output clock P, Q, or R is used, PLL2CCR2 must be set so that the frequency of PLL2 output signal is within the range listed in Table 9.1.

PL2ODIVP[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock P)

These bits select the output frequency division ratio for PLL2 output clock P (PLL2P).

PL2ODIVQ[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock Q)

These bits select the output frequency division ratio for PLL2 output clock Q (PLL2Q).

PL2ODIVR[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock R)

These bits select the output frequency division ratio for PLL2 output clock R (PLL2R).

9.2.11 PLL2CR : PLL2 Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x04A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLL2STP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLL2STP	PLL2 Stop Control 0: PLL2 is operating 1: PLL2 is stopped.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLL2CR register controls the operation of the PLL2 circuit.

PLL2STP bit (PLL2 Stop Control)

This bit runs or stops the PLL2 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL2 by the PLL2CCR.PL2SRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLL2STP bit setting is changed to run the PLL2, only use the PLL2 clock after confirming that the OSCSF.PLL2SF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL2 operation. A fixed time is also required for oscillation to stop after stopping the PLL2 operation. Additionally, apply the following limitations when starting and stopping the PLL2 operation by the PLL2STP bit:

- After stopping the PLL2, confirm that the OSCSF.PLL2SF bit is 0 before restarting the PLL2.
- Confirm that the PLL2 is operating and that the OSCSF.PLL2SF bit is 1 before stopping the PLL2.
- Confirm that the OSCSF.PLL2SF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL2.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL2, confirm that the OSCSF.PLL2SF bit is cleared to 0 before executing a WFI instruction.

Confirm the following conditions before writing 0 to PLL2STP:

- When the PLL2 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When the PLL2 source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

9.2.12 BCKCR : External Bus Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x030

Bit position:	7	6	5	4	3	2	1	0
Bit field:	EBCK ASEL	—	—	—	—	—	—	BCLK DIV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCLKDIV	BCLK Pin Output Select 0: BCLK or BCLKA 1: BCLK/2 or BCLKA/2	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	EBCKASEL[*1]	External Bus Asynchronous Select 0: Synchronous (BCLK) 1: Asynchronous (BCLKA)	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. Before changing this bit, set BCKACR.BCKACKSREQ = 1 and then change the value while BCKACR.BCKACKSRDY = 1.

The BCKCR register controls the external bus clock.

This register must be selected with BCKACR. For detail, see section 9.2.62. BCKACR : Asynchronous External Bus Clock Control Register.

BCLKDIV bit (BCLK Pin Output Select)

This bit selects the clock signal for output from the BCLK pin.

Either the BCLK clock with the frequency selected by the BCK[2:0] bits in SCKDIVCR or the BCLK clock divided by 2 can be selected.

EBCKASEL bit (External Bus Asynchronous Select)

This bit selects the clock signal for External Bus, EBCLK and SDCLK.

9.2.13 MOSCCR : Main Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x032

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	MOSTP	Main Clock Oscillator Stop 0: Operate the main clock oscillator*1 1: Stop the main clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: S-TYPE-3, P-TYPE-2
Note 1. MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock source, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software standby after operating the main clock oscillator or Deep Software Standby mode.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P)
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL1 is operating)
- PLL2CCR.PL2SRCSEL = 0 (PLL2 source clock = MOSC) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

9.2.14 SOSCCR : Sub-Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	SOSTP	Sub-Clock Oscillator Stop 0: Operate the sub-clock oscillator*1 1: Stop the sub-clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

SOSTP bit (Sub-Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit to check that the value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

When selecting External clock input by SOMCR.SOSEL, set SOMCR.SOSEL to 1 and wait 50us, then set SOSTP to 0.

The following restrictions apply when starting and stopping the operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- After setting the SOSTP bit to 0, use the sub-clock only after the sub-clock oscillation stabilization time ($t_{SUBOSCWT}$) has elapsed.
- Regardless of whether the sub-clock oscillator is selected as the system clock, confirm that the sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

9.2.15 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCSTP	LOCO Stop 0: Operate the LOCO clock 1: Stop the LOCO clock	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: Make sure that SYRACCR.BUSY is 0 before accessing LOCOCR. When SYRACCR.BUSY is 1, the write access is ignored and the read value is not guaranteed.

The LOCOCR register controls the LOCO clock.

LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

When changing the value of the bit, only execute subsequent instructions after reading the bit and checking that its value has actually been updated.

9.2.16 HOCOCR : High-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x036

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HCSTP
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Function	R/W
0	HCSTP	HOCO Stop 0: Operate the HOCO clock *2 *3 1: Stop the HOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The HCSTP bit value after a reset is 0 when the OFS1(_SEC).HOCOEN bit is 0. It is 1 when the OFS1(_SEC).HOCOEN bit is 1.
Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1(_SEC).HOCOFRQ0[2:0] bit to an optimum value.
Note 3. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] even if OFS1(_SEC).HOCOFRQ0[2:0] is not appropriate value.

The HOCOCR register controls the HOCO clock.

HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1(_SEC).HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock, wait more than HOCO stop width time and confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock. See section 62, Electrical Characteristics for HOCO stop width time.
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock.
- Regardless of whether the HOCO clock is selected as the system clock source, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after setting HOCO operation with the HCSTP bit.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO).
- PLLCCR.PLSRCSEL = 1 (PLL1 source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P)
- PLLCCR.PLSRCSEL = 1 (PLL1 source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL1 is operating)
- PLL2CCR.PL2SRCSEL = 1 (PLL2 source clock = HOCO) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

9.2.17 HOCOCR2 : High-Speed On-Chip Oscillator Control Register2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x037

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	HCFRQ0[2:0]		
Value after reset:	0	0	0	0	0	0/1*1	0/1*1	0/1*1

Bit	Symbol	Function	R/W
2:0	HCFRQ0[2:0]	HOCO Frequency Setting 0 0 0 0: 16 MHz 0 0 1: 18 MHz 0 1 0: 20 MHz 1 0 0: 32 MHz 1 1 1: 48 MHz Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. Value after reset of the HCFRQ0[2:0] bits depend on OFS1(_SEC).HOCOFRQ0[2:0] bits.

The HOCOCR2 register controls the HOCO clock.

Writing to the HOCOCR2 is prohibited when the HOCOCR.HCSTP bit is 0 (the HOCO operates)

HCFRQ0[2:0] bits (HOCO Frequency Setting 0)

These bits select the frequency of HOCO.

9.2.18 MOCOCR : Middle-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x038

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MCSTP	MOCO Stop 0: MOCO clock is operating 1: MOCO clock is stopped	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOCOCR register controls the MOCO clock.

MCSTP bit (MOCO Stop)

This bit starts or stops the MOCO clock.

When changing the value of the bit, only execute subsequent instructions after reading the bit and checking that its value has actually been updated.

There are restrictions on MOCO operation conditions, MOCO stop conditions and the setting of the MCSTP bit. For details, see section 9.6. Middle Speed On-chip Oscillator (MOCO).

9.2.19 FLLCR1 : FLL Control Register1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x039

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FLLEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FLLEN	FLL Enable 0: FLL function is disabled 1: FLL function is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: HOCO must be stopped (HOCOCR.HCSTP = 1) before FLLCR1.FLLEN is modified.
Note: SOSC must be operating with stabilization while FLL is enabled (FLLCR1.FLLEN = 1).
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The FLLCR1 register controls the FLL function of the HOCO.

FLLEN bit (FLL Enable)

This bit enables or disables the FLL function of the HOCO.

If FLL is enabled, the frequency accuracy is guaranteed after FLL is stabilized. The FLL stabilization can be checked by the CAC frequency measurement, but it must be executed after HOCO stabilization.

In addition, you must disable FLL by setting the FLLEN bit to 0 before transitioning to Software Standby mode.

Table 9.4 show an example flow of the FLL setting for each case.

Table 9.4 FLL setting flow (1 of 2)

Step		Operation
After reset release/ Deep Software Standby cancellation	1	Start (After reset release / Deep Software Standby cancellation)
	2	FLL setting (FLLCR2.FLLCNTL)
	3	Enable FLL (FLLCR1.FLLEN = 1) Note: SOSC must be running with the oscillation stabilization.
	4	Enable HOCO (HOCOCR.HCSTP = 0)
	5	Wait for the FLL stabilization (t_{FLLWT})
	6	Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	7	End (HOCO can be used.)

Table 9.4 FLL setting flow (2 of 2)

Step		Operation
Software standby transition/ cancellation	1	Start (FLL is being used.)
	2	Stop HOCO (HOCOCR.HCSTP = 1) Note: If HOCO is used as the system clock or the PLL reference clock, these clock source must be changed to another clock before HOCO is stopped.
	3	Disable FLL (FLLCR1.FLLEN = 0)
	4	WFI instruction
	5	Software standby mode
	6	Software standby cancellation
	7	Enable FLL (FLLCR1.FLLEN = 1)
	8	Enable HOCO (HOCOCR.HCSTP = 0)
	9	Wait for the FLL stabilization (t_{FLLWT})
	10	Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	11	End (HOCO can be used.)

9.2.20 FLLCR2 : FLL Control Register2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	FLLCNTL[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
10:0	FLLCNTL[10:0]	FLL Multiplication Control When OFS1(_SEC).HOCOFRQ0[2:0] is 000b (16 MHz) or 100b (32 MHz), these bits must be set to 0x1E8. When OFS1(_SEC).HOCOFRQ0[2:0] is 001b (18 MHz), these bits must be set to 0x225. When OFS1(_SEC).HOCOFRQ0[2:0] is 010b (20 MHz), these bits must be set to 0x262. When OFS1(_SEC).HOCOFRQ0[2:0] is 111b (48 MHz), these bits must be set to 0x1E8. Settings other than above are prohibited.	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

The FLLCR2 register controls the FLL function of the HOCO.

FLLCNTL[10:0] bits (FLL Multiplication Control)

These bits select the multiplication ratio of the FLL reference clock.

These bits must be set before FLL is enabled (FLLCR1.FLLEN=1).

9.2.21 OSCSF : Oscillation Stabilization Flag Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PLL2SF	PLLSF	—	MOSCSF	—	—	HOCOSF
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Function	R/W
0	HOCOSF	HOCO Clock Oscillation Stabilization Flag 0: The HOCO clock is stopped or is not yet stable 1: The HOCO clock is stable, so is available for use as the system clock source	R
2:1	—	These bits are read as 0.	R
3	MOSCSF	Main Clock Oscillation Stabilization Flag 0: The main clock oscillator is stopped or is not yet stable*2 1: The main clock oscillator is stable, so is available for use as the system clock source	R
4	—	This bit is read as 0.	R
5	PLLSF	PLL1 Clock Oscillation Stabilization Flag 0: The PLL1 clock is stopped or is not yet stable. 1: The PLL1 clock is stable, so is available for use as the system clock source	R
6	PLL2SF	PLL2 Clock Oscillation Stabilization Flag 0: The PLL2 clock is stopped or is not yet stable. 1: The PLL2 clock is stable	R
7	—	This bit is read as 0.	R

Note: S-TYPE-5, P-TYPE-5

Note 1. The value after reset depends on the OFS1(_SEC).HOCOEN setting.
When OFS1(_SEC).HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.
When OFS1(_SEC).HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags that indicate the operating status of the oscillation stabilization wait circuit of each oscillator. After oscillation starts, these circuits generate a waiting time until the output clock of each oscillator stabilizes. The status of each oscillation stabilization wait flag set to 1 indicates that the clock supply is stable and can be used in related circuits.

HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1(_SEC).HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- After the HOCO clock stops and the HOCOCR.HCSTP bit is set to 0, HOCOSF is set to 1 after HOCO clock is stable to ±10% or less. If the HOCO clock is used at 1.5%, it must wait for wait time specified in the electrical characteristics. (For details, see section 62, Electrical Characteristics)
  The HOCO clock is supplied when HOCOCR.HCSTP bit is set to 0, regardless of the state of HOCOSF.

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

Note: Even if OFS1(_SEC).HOCOEN has been set to 0, confirm that the OSCSF.HOCOSF has been set to 1 before starting to use the HOCO clock.

Note: In debugging mode, even if HOCO is oscillating, this flag is masked to 0 for the user program debugging when all of following conditions are met simultaneously:

- The Trace Clock is operating enabled by setting TRCKCR.TRCKEN bit to 1.
- The Trace Clock source is selected HOCO for oscillation in debug mode by setting TRCKCR.TRCKSEL bit to 1.
- HOCOCR.HCSTP bit is set to 1.

MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of LOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

PLLSF flag (PLL1 Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the oscillation stabilization status for the PLL1.

[Setting condition]

- After the PLL1 stops and the PLLCR.PLLSTP bit is set to 0, supply of the PLL1 clock starts after PLL1 clock is stable.
  If oscillation by the PLL1 clock source selected in the PLLCCR.PLSRCSEL bit is not stable when the PLLSTP bit is set to 0, waiting for the PLL1 oscillation stabilization after the PLL1 clock source oscillation is stabilized.

[Clearing condition]

- When the PLL1 is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

PLL2SF flag (PLL2 Clock Oscillation Stabilization Flag)

This flag indicates the oscillation stabilization status for the PLL2.

[Setting condition]

- After the PLL2 stops and the PLL2CR.PLL2STP bit is set to 0, supply of the PLL2 clock starts after PLL2 clock is stable.
  If oscillation by the PLL2 clock source selected in the PLLCCR.PLSRCSEL is not stable when the PLL2STP bit is set to 0, waiting for the PLL2 oscillation stabilization after the oscillation of the PLL2 clock source is stabilized.

[Clearing condition]

- When the PLL2 is operating and then is deactivated because the PLL2CR.PLL2STP bit is set to 1.

9.2.22 OSCMONR : Oscillator Monitor Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x43

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LOCOMON	MOCOMON	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
1	MOCOMON	MOCO operation monitor 0: MOCO is set to operate. 1: MOCO is set to stop.	R
2	LOCOMON	LOCO operation monitor 0: LOCO is set to operate. 1: LOCO is set to stop.	R
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-5

This register is not controlled by CGFSAR register.

MOCOMON bit (MOCO operation monitor)

MOCOMON indicates the operation or stop setting status for MOCO.

[Clearing condition]

- When MOCO operating conditions are met. For details, see section 9.6.1. MOCO Operating Conditions.

[Setting condition]

- When MOCO stop conditions are met. For details, see section 9.6.2. MOCO Stop Conditions.

LOCOMON bit (LOCO operation monitor)

LOCOMON indicates the operation or stop setting status for LOCO.

[Clearing condition]

- When LOCO operating conditions are met. For details, see section 9.5.1. LOCO Operating Conditions.

[Setting condition]

- When LOCO stop conditions are met. For details, see section 9.5.2. LOCO Stop Conditions.

9.2.23 OSTDCR : Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x040

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OSTDE	—	—	—	—	—	—	OSTDIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDIE	Oscillation Stop Detection Interrupt Enable 0: Disable oscillation stop detection interrupt (do not notify the POEG) 1: Enable oscillation stop detection interrupt (notify the POEG)	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	OSTDE	Oscillation Stop Detection Function Enable 0: Disable oscillation stop detection function 1: Enable oscillation stop detection function	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The OSTDCR register controls main-clock oscillation stop detection function.

OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

9.2.24 OSTDSR : Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x041

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OSTDF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDF	Oscillation Stop Detection Flag 0: Main clock oscillation stop not detected 1: Main clock oscillation stop detected	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL1P)

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL1P.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are neither 011b (system clock source is MOSC) nor, 101b (system clock source is PLL1P) and PLLCCR.PLSRCSEL bit is not 0 (PLL1 source clock is MOSC).

9.2.25 SOSTDCR : Sub-clock Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SOST DE	—	—	—	—	—	—	SOST DIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SOSTDIE	Sub-clock Oscillation Stop Detection Interrupt Enable 0: The oscillation stop detection interrupt is disabled. 1: The oscillation stop detection interrupt is enabled.	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	SOSTDE	Sub-clock Oscillation Stop Detection Function Enable 0: Oscillation stop detection function is disabled. 1: Oscillation stop detection function is enabled.	R/W

Note: S-TYPE-3, P-TYPE-2

SOSTDCR Register controls Sub-clock oscillation-stop detection function.

This register is only initialized by VBATT_POR reset.

SOSTDIE bit (Sub-clock Oscillation Stop Detection Interrupt Enable)

This bit enables or disables the Sub-clock oscillation stop detection function interrupt.

If the Sub-clock oscillation stops detection flag in the Sub-clock oscillation stop detection status register (SOSTDSR.SOSTDF) requires clearing, clear the SOSTDF after the SOSTDIE bit is cleared to 0. Make sure SOSTDF is cleared before setting the SOSTDIE bit to 1 again.

SOSTDE bit (Sub-clock Oscillation Stop Detection Function Enable)

This bit enables or disables the sub-clock oscillation stop detection function.

When the SOSTDE bit is 1 (sub-clock oscillation stop detection function enabled), the MOCO stop bit (MOCOCR.MCSTP) is cleared to 0 and the MOCO operation is started. The MOCO cannot be stopped while the oscillation stop detection function is enabled except in deep software standby mode and VBAT mode. Writing 1 to the MOCOCR.MCSTP bit (MOCO stopped) is invalid.

When the sub-clock oscillation stops detection flag in the sub-clock oscillation stop detection status register (SOSTDSR.SOSTDF) is 1 (sub-clock oscillation stop detected), writing 0 to the SOSTDE bit is invalid.

To enable the sub-clock oscillation stop detection function, the SOSTDSR.SOSTDF flag must be cleared to 0 after setting the SOSTDCR.SOSTDE bit to 1. However, after setting the SOSTDCR.SOSTDE bit to 1, be sure to wait for the start-up time of the sub-clock oscillation stop detector (Tsosdup) before clearing the SOSTDSR.SOSTDF flag. For SOSTDSR, please see section 9.2.26. SOSTDSR : Sub-clock Oscillation Stop Detection Status Register.

Be sure to set the system clock to other clock sources than the sub-clock oscillator before enabling the sub-clock oscillation stop detection function.

9.2.26 SOSTDSR : Sub-clock Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC05

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SOST DF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SOSTDF	Sub-clock Oscillation Stop Detection Flag 0: The sub-clock oscillation stop has not been detected. 1: The sub-clock oscillation stop has been detected.	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit can only be set to 0.

SOSTDSR Register indicates status of the sub-clock oscillation stop detection.

This register is only initialized by VBATT_POR reset.

SOSTDF flag (Sub-clock Oscillation Stop Detection Flag)

This bit is a flag to indicate the sub-clock status. When the SOSTDF flag is 1, it indicates that the sub-clock oscillation stop has been detected.

Once the sub-clock oscillation stop is detected, the OSTDF bit is not cleared to 0 even though the sub-clock oscillation is restarted. The SOSTDF bit is cleared to 0 by reading 1 from the bit and then writing 0.

At least 3 PCLKB cycles of wait time is necessary between writing 0 to SOSTDF and reading SOSTDF as 0.

If the SOSTDF bit is cleared to 0 while the sub-clock oscillation is stopped, the SOSTDF bit is immediately set to 1.

SOSTDSR.SOSTDF cannot be cleared to 0 while the following conditions:

- SCKSCR.CKSEL[2:0] = 100 (System clock source = SOSC)

[Setting condition]

- The sub-clock oscillation is stopped with the SOSTDCR.SOSTDE being 1 (sub-clock oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are not 100b (System clock is SOSC).

9.2.27 MOSCWTCR : Main Clock Oscillator Wait Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0A2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTS[3:0]			
Value after reset:	0	0	0	0	0	1	0	1

Bit	Symbol	Function	R/W
3:0	MSTS[3:0]	Main Clock Oscillator Wait Time Setting 0x0: Wait time = 3 cycles (11.4 μs) 0x1: Wait time = 35 cycles (133.5 μs) 0x2: Wait time = 67 cycles (255.6 μs) 0x3: Wait time = 131 cycles (499.7 μs) 0x4: Wait time = 259 cycles (988.0 μs) 0x5: Wait time = 547 cycles (2086.6 μs) 0x6: Wait time = 1059 cycles (4039.8 μs) 0x7: Wait time = 2147 cycles (8190.2 μs) 0x8: Wait time = 4291 cycles (16368.9 μs) 0x9: Wait time = 8163 cycles (31139.4 μs) Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.

Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.

The wait time set in these bits is counted using: 1 cycle (μs) = $1/(f_{LOCO}[MHz] \times 8) = 1/(0.032768 \times 8) = 3.81$ (μs) (min.) The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCO.LCSTP bit. After the specified wait time elapses, supply of the main clock starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

9.2.28 MOMCR : Main Clock Oscillator Mode Oscillation Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	MOSEL	—	—	MODRV0[2:0]			—
Value after reset:	0	0	0	1	1	0	1	0

Bit	Symbol	Function	R/W
0	—	These bits are read as 0. The write value should be 0.	R/W
3:1	MODRV0[2:0]	Main Clock Oscillator Drive Capability 0 Switching 0 0 0: 8 MHz 0 1 1: 8MHz to 24MHz 1 0 1: 8MHz to 48MHz Others: Setting prohibited	R/W
4	—	This bit is read as 1. The write value should be 1.	R/W
5	—	These bits are read as 0. The write value should be 0.	R/W
6	MOSEL	Main Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the pin is set as a port.
Note: The MOSCCR.MOSTP bit must be 1 (MOSC is stopped) before changing this register.
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MODRV0[2:0] bit (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV0[2:0] bit switches the drive capability of the main clock oscillator. It is recommended to set 101b, other setting is possible to reduce current consumption. See section 62, Electrical Characteristics for current consumption.

MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

9.2.29 SOMCR : Sub-Clock Oscillator Mode Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SOSEL	—	—	—	—	SODRV[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SODRV[1:0]	Sub-Clock Oscillator Drive Capability Switching 0 0: Standard (12.5pf) 0 1: Lowpower mode 1 (9pf) 1 0: Lowpower mode 2 (7pf) 1 1: Lowpower mode 3 (4pf)	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	SOSEL	Sub-Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The SOMCR register must be modified when SOSCCR.SOSTP is 1 (SOSC is stopped).

This register is initialized by only VBATT_POR reset.

SODRV[1:0] bits (Sub-Clock Oscillator Drive Capability Switching)

The SODRV[1:0] bits switch the drive capability of the sub-clock oscillator.

SOSEL bit (Sub-Clock Oscillator Switching)

The SOSEL bit switches the source for the Sub-clock oscillator.

For details, see section 9.4. Sub-Clock Oscillator.

9.2.30 CKOCR : Clock Out Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CKOEN	CKODIV[2:0]			—	CKOSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	CKOSEL[2:0]	Clock Out Source Select 0 0 0: HOCO 0 0 1: MOCO (Value after reset) 0 1 0: LOCO 0 1 1: MOSC 1 0 0: SOSC Others: Setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6:4	CKODIV[2:0]	Clock Output Frequency Division Ratio 0 0 0: × 1/1 0 0 1: × 1/2 0 1 0: × 1/4 0 1 1: × 1/8 1 0 0: × 1/16 1 0 1: × 1/32 1 1 0: × 1/64 1 1 1: × 1/128	R/W
7	CKOEN	Clock Out Enable 0: Disable clock out 1: Enable clock out	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear this bit before entering Software Standby or Deep Software Standby mode if the selecting clock out source clock is stopped in that mode.

9.2.31 EBCKOCR : External Bus Clock Output Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x052

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EBCKOEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EBCKOEN	EBCLK Pin Output Control 0: EBCLK pin output is disabled (fixed high) 1: EBCLK pin output is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

9.2.32 SDCKOCR : SDRAM Clock Output Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x053

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SDCK OEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SDCKOEN	SDCLK Pin Output Control 0: SDCLK pin output is disabled. (Fixed high) 1: SDCLK pin output is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SDCKOEN bit (SDCLK Pin Output Control)

This bit selects controls the output of the SDCLK pin.

9.2.33 LOCOUTCR : LOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x402

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	LOCOUTRM[7:0]	LOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: Make sure that SYRACCR.BUSY is 0 before accessing LOCOUTCR. When SYRACCR.BUSY is 1, the write access is ignored and the read value is not guaranteed.
Note: MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range.
Note: After changing LOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

The LOCOUTCR register is added to the original LOCO trimming data.

Changing LOCOUTCR during RTC operation is prohibited.

9.2.34 MOCOUTCR : MOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x061

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	MOCOUTRM[7:0]	MOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range.
Note: After changing MOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

The MOCOUTCR register is added to the original MOCO trimming data.

9.2.35 HOCOUTCR : HOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x062

Bit position:	7	6	5	4	3	2	1	0
Bit field:	HOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	HOCOUTRM[7:0]	HOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range.
Note: After changing HOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.
Note: These bits must be 0x00 when FLL is enabled (FLLCR1.FLLEN = 1).

The HOCOUTCR register is added to the original HOCO trimming data.

9.2.36 MOSCSCR : Main Clock Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x07C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOSCSOKP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MOSCSOKP	Main Clock Oscillator Standby Oscillation Keep select 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOSCSCR must be changed while MOSCCR.MOSTP bit is 1 (MOSC is stopped).

MOSCSOKP bit (Main Clock Oscillator Standby Oscillation Keep select)

This bit controls that Main Clock Oscillator keeps oscillating in Software Standby mode.

If this bit is disabled and MOSCCR.MOSTP bit is 0 (MOSC is run), the Main Clock Oscillator stops in Software Standby mode.

If this bit is enabled and MOSCCR.MOSTP bit is 0 (MOSC is run), the Main Clock Oscillator will keep oscillating in Software Standby mode.

If MOSCCR.MOSTP bit is 1 (MOSC is stopped), the Main Clock Oscillator stops in Software Standby mode regardless of the setting of this bit.

9.2.37 HOCOSCR : High-Speed On-Chip Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x07D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HOCOSOKP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	HOCOSOKP	HOCO Standby Oscillation Keep select. 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

HOCOSOKP bit (HOCO Standby Oscillation Keep select.)

This bit controls that HOCO keeps oscillating in Software Standby mode.

If this bit is disabled and HOCOCR.HCSTP bit is 0 (HOCO is run), the HOCO stops in Software Standby mode.

If this bit is enabled and HOCOCR.HCSTP bit is 0 (HOCO is run), the HOCO will keep oscillating in Software Standby mode.

If HOCOCR.HCSTP bit is 1 (HOCO is stopped), the HOCO stops in Software Standby mode regardless of the setting of this bit.

9.2.38 MOCOSCR : Middle-Speed On-Chip Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x084

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOCO SOKP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MOCOSOKP	MOCO Standby Oscillation Keep select 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

MOCOSOKP bit (MOCO Standby Oscillation Keep select)

This bit controls that MOCO keeps oscillating in Software Standby mode.

If this bit is disabled and MOCOCR.MCSTP bit is 0 (MOCO is run), the MOCO stops in Software Standby mode.

If this bit is enabled and MOCOCR.MCSTP bit is 0 (MOCO is run), the MOCO will keep oscillating in Software Standby mode.

9.2.39 USBCKDIVCR : USB Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	USBCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	USBCKDIV[3:0]	USB Clock (USBCLK) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKDIVCR register controls the USB clock.

USBCKDIV[3:0] bits (USB Clock (USBCLK) Division Select)

These bits select the frequency of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRB.MSTPB11 = 1 and MSTPCRB.MSTPB12 = 1 before setting USBCKCR.USBCKSREQ = 1.

9.2.40 OCTACKDIVCR : Octal-SPI Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	OCTACKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	OCTACKDIV[3:0]	Octal-SPI Clock (OCTACLK) Division Select 0 0 0 0: 1/1 (Value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

OCTACKDIVCR controls the Octal-SPI clock.

OCTACKDIV[3:0] bits (Octal-SPI Clock (OCTACLK) Division Select)

These bits select the frequency of the Octal-SPI clock (OCTACLK) and must be modified when OCTACKCR.OCTACKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRB.MSTPB16 = 1 and MSTPCRB.MSTPB17 = 1 before setting OCTACKCR.OCTACKSREQ = 1.

9.2.41 CANFDCKDIVCR : CANFD Core Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CANFDCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CANFDCKDIV[3:0]	CANFD core clock (CANFDCLK) Division Select 0 0 0 0: 1/1 (Value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CANFDCKDIVCR controls the CANFD core clock.

CANFDCKDIV[3:0] bits (CANFD core clock (CANFDCLK) Division Select)

These bits select the frequency of the CANFD core clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRC.MSTPC26 = 1 and MSTPCRC.MSTPC27 = 1 before setting CANFDCKCR.CANFDCKSREQ = 1.

9.2.42 USB60CKDIVCR : USB60 Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	USB60CKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	USB60CKDIV[3:0]	USB clock (USB60CLK) Division Select 0 0 0 0: 1/1 (Value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

USB60CKDIVCR controls the USB clock.

USB60CKDIV[3:0] bits (USB clock (USB60CLK) Division Select)

These bits select the frequency of the USB clock USB60CKDIV and must be modified when USB60CKCR.USB60CKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRB.MSTPB12 = 1 before setting USB60CKCR.USB60CKSREQ = 1.

9.2.43 I3CCKDIVCR : I3C Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x070

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	I3CCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	I3CCKDIV[3:0]	I3C clock (I3CCLK) Division Select 0 0 0 0: 1/1 (Value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

I3CCKDIVCR controls the I3C clock.

I3CCKDIV[3:0] bits (I3C clock (I3CCLK) Division Select)

These bits select the frequency of the I3C clock (I3CCLK) and must be modified when I3CCKCR.I3CCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRB.MSTPB4 = 1 before setting I3CCKCR.I3CCKSREQ = 1.

9.2.44 USBCKCR : USB Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x074

Bit position:	7	6	5	4	3	2	1	0
Bit field:	USBCKSRDY	USBCKSREQ	—	—	USBCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	USBCKSEL[3:0]	USB Clock (USBCLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0011: Main clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6	USBCKSREQ	USB Clock (USBCLK) Switching Request 0: No request 1: Request switching.	R/W
7	USBCKSRDY	USB Clock (USBCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKCR register controls the USB clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of USBCKDIVCR.USBCKDIV[3:0] and USBCKSEL[3:0], use the following procedure:

1. Write 1 to MSTPCRB.MSTPB11 and MSTPCRB.MSTPB12 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two USBCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to USBCKSREQ.
4. Poll until USBCKSRDY is read as 1. While USBCKSRDY = 1, no clock is output to USBCLK.
5. Write to USBCKDIVCR.USBCKDIV[3:0] and USBCKSEL[3:0].
6. Write 0 to USBCKSREQ.
7. Poll until USBCKSRDY is read as 0.
8. When USBCKSRDY becomes 0, USBCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USBCKSREQ = 1 and USBCKSRDY = 0, or when USBCKSREQ = 0 and USBCKSRDY = 1.

USBCKSEL[3:0] bits (USB Clock (USBCLK) Source Select)

These bits select the clock source of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

USBCKSREQ bit (USB Clock (USBCLK) Switching Request)

This bit selects the USBCLK switching request.

USBCKSRDY flag (USB Clock (USBCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the USBCLK. When USBCKSRDY = 1, no clock is output to USBCLK.

9.2.45 OCTACKCR : Octal-SPI Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x075

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OCTACKSRDY	OCTACKSREQ	—	—	OCTACKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	OCTACKSEL[3:0]	Octal-SPI Clock (OCTACLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OCTACKSREQ	Octal-SPI Clock (OCTACLK) Switching Request 0: No request 1: Request switching.	R/W
7	OCTACKSRDY	Octal-SPI Clock (OCTACLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The OCTACKCR register controls the Octal-SPI clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output.

To change the set value of OCTACKDIVCR.OCTACKDIV[3:0] and OCTACKSEL[3:0], use the following procedure:

1. Write 1 to MSTPCRB.MSTPB16 and MSTPCRB.MSTPB17 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Confirm the reading value of both MSTPCRB.MSTPB16 and MSTPCRB.MSTPB17 is 1 only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to OCTACKSREQ.
4. Poll until OCTACKSRDY is read as 1. While OCTACKSRDY = 1, no clock is output to OCTACLK.
5. Write to OCTACKDIVCR.OCTACKDIV[3:0] and OCTACKSEL[3:0].
6. Write 0 to OCTACKSREQ.
7. Poll until OCTACKSRDY is read as 0.
8. When OCTACKSRDY becomes 0, OCTACLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when OCTACKSREQ = 1 and OCTACKSRDY = 0, or when OCTACKSREQ = 0 and OCTACKSRDY = 1.

OCTACKSEL[3:0] bits (Octal-SPI Clock (OCTACLK) Source Select)

These bits select the clock source of the Octal-SPI clock (OCTACLK) and must be modified when OCTACKCR.OCTACKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

OCTACKSREQ bit (Octal-SPI Clock (OCTACLK) Switching Request)

This bit selects the OCTACLK switching request.

OCTACKSRDY flag (Octal-SPI Clock (OCTACLK) Switching Ready state flag)

This flag indicates the state of switching ready for the OCTACLK. When OCTACKSRDY = 1, no clock is output to OCTACLK.

9.2.46 CANFDCKCR : CANFD Core Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x076

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CANF DCKS RDY	CANF DCKS REQ	—	—	CANFDCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	CANFDCKSEL[3:0]	CANFD Core Clock (CANFDCLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	CANFDCKSREQ	CANFD Core Clock (CANFDCLK) Switching Request 0: No request 1: Request switching	R/W
7	CANFDCKSRDY	CANFD Core Clock (CANFDCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The CANFDCKCR register controls the CANFD Core Clock (CANFDCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of CANFDCKDIVCR.CANFDCKDIV[3:0] and CANFDCKSEL[3:0], use the following procedure:

1. Write 1 to MSTPCRC.MSTPC26 and MSTPCRC.MSTPC27 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two CANFDCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to CANFDCKSREQ.
4. Poll until CANFDCKSRDY is read as 1. While CANFDCKSRDY = 1, no clock is output to CANFDCLK.
5. Write to CANFDCKDIVCR.CANFDCKDIV[3:0] and CANFDCKSEL[3:0].
6. Write 0 to CANFDCKSREQ.
7. Poll until CANFDCKSRDY is read as 0.
8. When CANFDCKSRDY becomes 0, CANFDCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when CANFDCKSREQ = 1 and CANFDCKSRDY = 0, or when CANFDCKSREQ = 0 and CANFDCKSRDY = 1.

CANFDCKSEL[3:0] bits (CANFD Core Clock (CANFDCLK) Source Select)

These bits select the clock source of the CANFD Core clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

CANFDCKSREQ bit (CANFD Core Clock (CANFDCLK) Switching Request)

This bit selects the CANFDCLK switching request.

CANFDCKSRDY flag (CANFD Core Clock (CANFDCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the CANFDCLK. When CANFDCKSRDY = 1, no clock is output to CANFDCLK.

9.2.47 USB60CKCR : USB60 Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x077

Bit position:	7	6	5	4	3	2	1	0
Bit field:	USB60 CKSR DY	USB60 CKSR EQ	—	—	USB60CKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	USB60CKSEL[3:0]	USB60 Clock (USB60CK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 1: Main clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	USB60CKSREQ	USB60 Clock (USB60CK) Switching Request 0: No request 1: Request switching	R/W
7	USB60CKSRDY	USB60 Clock (USB60CK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USB60CKCR register controls the USB60 Clock.

To change the set value of USB60CKDIVCR. USB60CKDIV[3:0] and USB60CKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to MSTPCRB.MSTPB12 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two USB60CLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to USB60CKSREQ.
4. Poll until USB60CKSRDYY is read as 1. While USB60CKSRDY = 1, no clock is output to USB60CLK.
5. Write to USB60CKDIVCR.USB60CKDIV[3:0] and USB60CKSEL[3:0].

6. Write 0 to USB60CKSREQ.
7. Poll until USB60CKSRDY is read as 0.
8. When USB60CKSRDY becomes 0, USB60CLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USB60CKSREQ = 1 and USB60CKSRDY = 0, or when USB60CKSREQ = 0 and USB60CKSRDY = 1.

USB60CKSEL[3:0] bits (USB60 Clock (USB60CK) Source Select)

These bits select the clock source of the USB Clock (USB60CLK) and must be modified when USB60CKCR.USB60CKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

USB60CKSREQ bit (USB60 Clock (USB60CK) Switching Request)

This bit selects the USB60CLK switching request.

USB60CKSRDY flag (USB60 Clock (USB60CK) Switching Ready state flag)

This flag indicates the state of switching ready for the USB60CLK. When USB60CKSRDY = 1, no clock is output to USB60CLK.

9.2.48 I3CCKCR : I3C Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x078

Bit position:	7	6	5	4	3	2	1	0
Bit field:	I3CCKSRDY	I3CCKSREQ	—	—	I3CCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	I3CCKSEL[3:0]	I3C Clock (I3CCLK) Source Select 0001: MOCO (value after reset) 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	I3CCKSREQ	I3C Clock (I3CCLK) Switching Request 0: No request 1: Request switching	R/W
7	I3CCKSRDY	I3C Clock (I3CCLK) Switching Ready state flag 0: Impossible to switch 1: Possible to switch	R

Note: S-TYPE-3, P-TYPE-2

I3CCKCR controls the I3C clock.

To change the set value of I3CCKDIVCR.I3CCKDIV[3:0] and I3CCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to MSTPCRB.MSTPB4 only when switching the division ratio setting from 1/n (n ≠ 1).

2. Wait for two I3CCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to I3CCKSREQ.
4. Polling until I3CCKSRDY is read as 1. While I3CCKSRDY = 1, no clock is output to I3CCLK.
5. Write the setting value to I3CCKDIVCR.I3CCKDIV[3:0] and I3CCKSEL[3:0].
6. Write 0 to I3CCKSREQ.
7. Polling until I3CCKSRDY is read as 0.
8. When I3CCKSRDY becomes 0, I3CCLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with I3CCKSREQ = 1 and I3CCKSRDY = 0, or I3CCKSREQ = 0 and I3CCKSRDY = 1.

I3CCKSEL[3:0] bits (I3C Clock (I3CCLK) Source Select)

These bits select the clock source of the I3C clock (I3CCLK) and must be modified when I3CCKCR.I3CCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

I3CCKSREQ bit (I3C Clock (I3CCLK) Switching Request)

This bit selects the I3CCLK switching request.

I3CCKSRDY bit (I3C Clock (I3CCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the I3CCLK.

While I3CCKSRDY = 1, no clock is output to I3CCLK.

9.2.49 SCICKDIVCR : SCI Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x054

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	SCICKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	SCICKDIV[3:0]	SCI clock (SCICLK) Division Select 0 0 0 0: 1/1 (Value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SCICKDIVCR controls the SCI clock.

SCICKDIV[3:0] bits (SCI clock (SCICLK) Division Select)

These bits select the frequency of the SCI clock (SCICLK) and must be modified when SCICKCR.SCICKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set all MSTPCRB.MSTPB22 to MSTPB31 = 1 before setting SCICKCR.SCICKSREQ = 1.

9.2.50 SPICKDIVCR : SPI Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x056

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	SPICKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	SPICKDIV[3:0]	SPI clock (SPICLK) Division Select 0 0 0 0: 1/1 (Value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3 0 1 1 0: 1/5 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SPICKDIVCR controls the SPI clock.

SPICKDIV[3:0] bits (SPI clock (SPICLK) Division Select)

These bits select the frequency of the SPI clock (SPICLK) and must be modified when SPICKCR.SPICKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRB.MSTPB18 = 1 and MSTPCRB.MSTPB19 = 1 before setting SPICKCR.SPICKSREQ = 1.

9.2.51 ADCCKDIVCR : ADC Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ADCCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ADCCKDIV[3:0]	ADC Clock (ADCCLK) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

ADCCKDIVCR controls the ADC clock.

ADCCKDIV[3:0] bits (ADC Clock (ADCCLK) Division Select)

These bits select the frequency of the ADC clock (ADCCLK).

These bits must change when ADCCKCR.ADCCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRD.MSTPD21 = 1 before setting ADCCKCR.ADCCKSREQ = 1.

9.2.52 GPTCKDIVCR : GPT Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	GPTCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	GPTCKDIV[3:0]	GPT Clock (GPTCLK) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 0 1: 1/3[*1] 0 1 1 0: 1/5[*1] 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. Do not set when GPT clock is used for ADC16H or PDG.

GPTCKDIVCR controls the GPT clock.

GPTCKDIV[3:0] bits (GPT Clock (GPTCLK) Division Select)

These bits select the frequency of the GPT clock (GPTCLK).

These bits must change when GPTCKCR.GPTCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set all MSTPCRE.MSTPE18 to MSTPE21 and MSTPE27 to MSTPE31 = 1 before setting GPTCKCR.GPTCKSREQ = 1.

9.2.53 SCICKCR : SCI Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x055

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SCICK SRDY	SCICK SREQ	—	—	SCICKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	SCICKSEL[3:0]	SCI Clock (SCICLK) Source Select 0000: HOCO 0001: MOCO (value after reset) 0010: LOCO 0011: Main clock oscillator 0100: Sub-clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	SCICKSREQ	SCI Clock (SCICLK) Switching Request 0: No request 1: Request switching	R/W
7	SCICKSRDY	SCI Clock (SCICLK) Switching Ready state flag 0: Impossible to switch 1: Possible to switch	R

Note: S-TYPE-3, P-TYPE-2

SCICKCR controls the SCI clock.

To change the set value of SCICKDIVCR.SCICKDIV[3:0] and SCICKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to all MSTPCRB.MSTPB22 to MSTPB31 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two SCICLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to SCICKSREQ.
4. Polling until SCICKSRDY is read as 1. While SCICKSRDY = 1, no clock is output to SCICLK.
5. Write the setting value to SCICKDIVCR.SCICKDIV[3:0] and SCICKSEL[3:0].
6. Write 0 to SCICKSREQ.
7. Polling until SCICKSRDY is read as 0.
8. When SCICKSRDY becomes 0, SCICLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with SCICKSREQ = 1 and SCICKSRDY = 0, or SCICKSREQ = 0 and SCICKSRDY = 1.

SCICKSEL[3:0] bits (SCI Clock (SCICLK) Source Select)

These bits select the clock source of the SCI clock (SCICLK) and must be modified when SCICKCR.SCICKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

SCICKSREQ bit (SCI Clock (SCICLK) Switching Request)

This bit selects the SCICLK switching request.

SCICKSRDY bit (SCI Clock (SCICLK) Switching Ready state flag)

This flag indicates the state of switching ready for the SCICLK.

While SCICKSRDY = 1, no clock is output to SCICLK.

9.2.54 SPICKCR : SPI Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x057

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPICK SRDY	SPICK SREQ	—	—	SPICKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	SPICKSEL[3:0]	SPI Clock (SPICLK) Source Select 0000: HOCO 0001: MOCO (value after reset) 0010: LOCO 0011: Main clock oscillator 0100: Sub-clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	SPICKSREQ	SPI Clock (SPICLK) Switching Request 0: No request 1: Request switching	R/W
7	SPICKSRDY	SPI clock (SPICLK) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R

Note: S-TYPE-3, P-TYPE-2

SPICKCR controls the SPI clock.

To change the set value of SPICKDIVCR.SPICKDIV[3:0] and SPICKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to MSTPCRB.MSTPB18 and MSTPCRB.MSTPB19 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two SPICLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to SPICKSREQ.
4. Polling until SPICKSRDY is read as 1. While SPICKSRDY = 1, no clock is output to SPICLK.
5. Write the setting value to SPICKDIVCR.SPICKDIV[3:0] and SPICKSEL[3:0].
6. Write 0 to SPICKSREQ.
7. Polling until SPICKSRDY is read as 0.

8. When SPICKSRDY becomes 0, SPICLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with SPICKSREQ = 1 and SPICKSRDY = 0, or SPICKSREQ = 0 and SPICKSRDY = 1.

SPICKSEL[3:0] bits (SPI Clock (SPICLK) Source Select)

These bits select the clock source of the SPI clock (SPICLK) and must be modified when SPICKCR.SPICKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

SPICKSREQ bit (SPI Clock (SPICLK) Switching Request)

This bit selects the SPICLK switching request.

SPICKSRDY bit (SPI clock (SPICLK) Switching Ready State Flag)

This flag indicates the state of switching ready for the SPICLK.

While SPICKSRDY = 1, no clock is output to SPICLK.

9.2.55 ADCCKCR : ADC Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ADCCKSRDY	ADCCKSREQ	—	—	ADCCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ADCCKSEL[3:0]	ADC Clock (ADCCLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	ADCCKSREQ	ADC Clock (ADCCLK) Switching Request 0: No request 1: Request switching	R/W
7	ADCCKSRDY	ADC Clock (ADCCLK) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit is read only.

ADCCKCR controls the ADCCLK.

To change the set value of ADCCKDIVCR.ADCCKDIV[3:0] and ADCCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to MSTPCRD.MSTPD21 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two ADCCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to ADCCKSREQ.
4. Polling until ADCCKSRDY is read as 1.
   While ADCCKSRDY = 1, no clock is output to the ADCCLK.
5. Write the setting value to ADCCKDIVCR.ADCCKDIV[3:0] and ADCCKSEL[3:0].
6. Write 0 to ADCCKSREQ.
7. Polling until ADCCKSRDY is read as 0.
   When ADCCKSRDY becomes 0, the ADCCLK starts outputting.
8. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with ADCCKSREQ = 1 and ADCCKSRDY = 0, or ADCCKSREQ = 0 and ADCCKSRDY = 1.

ADCCKSEL[3:0] bits (ADC Clock (ADCCLK) Source Select)

These bits select the clock source of the ADCCLK.

These bits must change when ADCCKCR.ADCCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

ADCCKSREQ bit (ADC Clock (ADCCLK) Switching Request)

This bit selects the ADCCLK switching request.

ADCCKSRDY flag (ADC Clock (ADCCLK) Switching Ready State Flag)

This flag indicates the state of switching ready for the ADCCLK.

While ADCCKSRDY = 1, no clock is output to the ADCCLK.

9.2.56 GPTCKCR : GPT Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	GPTCKSRDY	GPTCKSREQ	—	—	GPTCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	GPTCKSEL[3:0]	GPT Clock (GPTCLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (value after reset) 0 0 1 1: Main clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	GPTCKSREQ	GPT Clock (GPTCLK) Switching Request 0: No request 1: Request switching	R/W

Bit	Symbol	Function	R/W
7	GPTCKSRDY	GPT Clock (GPTCLK) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R/W*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit is read only.

GPTCKCR controls the GPTCLK.

To change the set value of GPTCKDIVCR.GPTCKDIV[3:0] and GPTCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to all MSTPCRE.MSTPE18 to MSTPE21 and MSTPE27 to MSTPE31 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two GPTCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to GPTCKSREQ.
4. Polling until GPTCKSRDY is read as 1.
   While GPTCKSRDY = 1, no clock is output to the GPTCLK.
5. Write the setting value to GPTCKDIVCR.GPTCKDIV[3:0] and GPTCKSEL[3:0].
6. Write 0 to GPTCKSREQ.
7. Polling until GPTCKSRDY is read as 0.
   When GPTCKSRDY becomes 0, the GPTCLK starts outputting.
8. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with GPTCKSREQ = 1 and GPTCKSRDY = 0, or GPTCKSREQ = 0 and GPTCKSRDY = 1.

GPTCKSEL[3:0] bits (GPT Clock (GPTCLK) Source Select)

These bits select the clock source of GPTCLK.

These bits must change when GPTCKCR.GPTCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

GPTCKSREQ bit (GPT Clock (GPTCLK) Switching Request)

This bit selects the GPTCLK switching request.

GPTCKSRDY flag (GPT Clock (GPTCLK) Switching Ready State Flag)

This flag indicates the state of switching ready for the GPTCLK.

While GPTCKSRDY = 1, no clock is output to the GPTCLK.

9.2.57 TRCKCR : Trace Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TRCKEN	—	—	TRCKSEL	TRCK[3:0]			
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
3:0	TRCK[3:0]	Trace Clock Operating Frequency Select 0000: 1/1 0001: 1/2 0010: 1/4 (value after reset) 0011: 1/8 0100: 1/16 0101: 1/32 0110: 1/64 0111: 1/128 1000: 1/256 1001: 1/3 1010: 1/6 1011: 1/12 Others: Setting prohibited	R/W
4	TRCKSEL	Trace Clock Source Select 0: System clock source (value after reset) 1: HOCO (oscillation in debug mode)	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TRCKEN	Trace Clock Operating Enable 0: Stop 1: Operation enable	R/W

Note: S-TYPE5, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: Trace clock must be enabled when accessing TPIU registers.

Trace Clock Control Register controls switching the trace clock.

This register is not controlled by CGFSAR register.

When changing the frequency of the Trace Clock, the trace clock must be stopped (TRCKCR.TRCKEN = 0).

TRCK[3:0] bit (Trace Clock Operating Frequency Select)

These bits select the frequency of the trace clock.

This bit must change when TRCKCR.TRCKEN = 0.

TRCKSEL bit (Trace Clock Source Select)

This bit selects the clock source of the trace clock. According to this bit, the trace clock is as follows:

[When this bit = 0]

- The system clock source is selected as the clock source for the trace clock.
  The system clock source is selected by SCKSCR.CKSEL[2:0] bits.
- The clock supply to the trace clock is selected of MOCO divided by 1 when in Software Standby mode or Deep Software Standby mode.

[When this bit = 1]

- The HOCO is selected as the clock source for the trace clock.
- If TRCKSEL is set to 1, HOCO is operated depending on the state of HOCOCR.HCSTP. However, OSCSF does not confirm that the swing is stable, so wait for the stable wait time.
- HOCO continues to oscillate and supply the trace clock even if in Software Standby mode or Deep Software Standby mode.

This bit must change when TRCKCR.TRCKEN = 0.

TRCKEN bit (Trace Clock Operating Enable)

This bit enables or disables the clock supply of the trace clock.

TRCK[3:0] bits and TRCKSEL bit must be set before changing this bit from 0 (stop) to 1 (enable).

When changing this bit from 1 (enable) to 0 (stop), the trace function must be disabled.

The trace clock is output with this bit set to 1 and under the following conditions:

- CDBGPWRUPREQ = 1 and AL ≠ AL0
- DBGCTRL0.REGEN = 1 and OFS1.SWDBG = 0.

9.2.58 BCKADIVCR : Asynchronous External Bus Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0D4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	BCKACKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	BCKACKDIV[3:0]	Asynchronous External Bus Clock (BCLKA) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

BCKADIVCR controls the asynchronous external bus clock.

BCKACKDIV[3:0] bits (Asynchronous External Bus Clock (BCLKA) Division Select)

These bits select the frequency of the asynchronous external bus clock (BCLKA).

These bits must change when BCKACR.BCKACKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set EBCKOCR.EBCKOEN = 0 and SDCKOCR.SDCKOEN = 0 before setting BCKACR.BCKACKSREQ = 1. In addition, set BCKCR.EBCKASEL = 0 to select the synchronous (BCLK) side before switching the division ratio.

9.2.59 ESWCKDIVCR : EtherSW Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0D5

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ESWCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ESWCKDIV[3:0]	EtherSW Clock (ESWCLK) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

ESWCKDIVCR controls the EtherSW clock.

ESWCKDIV[3:0] bits (EtherSW Clock (ESWCLK) Division Select)

These bits select the frequency of the EtherSW clock (ESWCLK).

These bits must change when ESWCKCR.ESWCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRC.MSTPC30 = 1 before setting ESWCKCR.ESWCKSREQ = 1.

9.2.60 ESWPCKDIVCR : EtherSW-PHY Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0D6

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ESWPCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ESWPCKDIV[3:0]	EtherSW-PHY Clock (ESWPHYCLK) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

ESWPCKDIVCR controls the EtherSW-PHY clock.

ESWPCKDIV[3:0] bits (EtherSW-PHY Clock (ESWPHYCLK) Division Select)

These bits select the frequency of the EtherSW-PHY clock (ESWPHYCLK).

These bits must change when ESWPCKCR.ESWPCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRC.MSTPC30 = 1 before setting ESWPCKCR.ESWPCKSREQ = 1.

9.2.61 ETHPCKDIVCR : Ether-PHY Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0D8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	ETHPCKDIV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ETHPCKDIV[3:0]	Ether-PHY Clock (ETHPHYCLK) Division Select 0 0 0 0: 1/1 (value after reset) 0 0 0 1: 1/2 0 0 1 0: 1/4 0 0 1 1: 1/6 0 1 0 0: 1/8 0 1 1 1: 1/10 1 0 0 0: 1/16 1 0 0 1: 1/32 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

ETHPCKDIVCR controls the Ether-PHY clock.

ETHPCKDIV[3:0] bits (Ether-PHY Clock (ETHPHYCLK) Division Select)

These bits select the frequency of the Ether-PHY clock (ETHPHYCLK).

These bits must change when ETHPCKCR.ETHPCKSRDY = 1.

When switching the division ratio setting from 1/n (n ≠ 1), set MSTPCRC.MSTPC28 = 1 before setting ETHPCKCR.ETHPCKSREQ = 1.

9.2.62 BCKACR : Asynchronous External Bus Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0DA

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BCKACKSRDY	BCKACKSREQ	—	—	BCKACKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	BCKACKSEL[3:0]	Asynchronous External Bus Clock (BCLKA) 0 0 0 1: MOCO (value after reset) 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	BCKACKSREQ	Asynchronous External Bus Clock (BCLKA) Switching Request 0: No request 1: Request switching	R/W

Bit	Symbol	Function	R/W
7	BCKACKSRDY	Asynchronous External Bus Clock (BCLKA) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit is read only.

BCKACR controls the BCLKA.

To change the set value of BCKADIVCR.BCKACKDIV[3:0] and BCKACKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 0 to EBCKOCR.EBCKOEN and SDCKOCR.SDCKOEN only when switching the division ratio setting from 1/n (n ≠ 1).
2. Write 1 to BCKACKSREQ.
3. Polling until BCKACKSRDY is read as 1.
   While BCKACKSRDY = 1, no clock is output to the BCLKA.
4. Write 0 to BCKCR.EBCKASEL only when switching the division ratio setting from 1/n (n ≠ 1).
5. Write the setting value to BCKCR.BCLKDIV, BCKCR.EBCKASEL, BCKADIVCR.BCKACKDIV[3:0] and BCKACKSEL[3:0].
6. Write 0 to BCKACKSREQ.
7. Polling until BCKACKSRDY is read as 0.
   When BCKACKSRDY becomes 0, the BCLKA starts outputting.
8. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with BCKACKSREQ = 1 and BCKACKSRDY = 0, or BCKACKSREQ = 0 and BCKACKSRDY = 1.

BCKACKSEL[3:0] bits (Asynchronous External Bus Clock (BCLKA))

These bits select the clock source of the BCLKA.

These bits must change when BCKACR.BCKACKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected

BCKACKSREQ bit (Asynchronous External Bus Clock (BCLKA) Switching Request)

This bit selects the BCLKA switching request.

BCKACKSRDY flag (Asynchronous External Bus Clock (BCLKA) Switching Ready State Flag)

This flag indicates the state of switching ready for the BCLKA.

While BCKACKSRDY = 1, no clock is output to the BCLKA.

9.2.63 ESWCKCR : EtherSW Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0DB

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ESWCKSRDY	ESWCKSREQ	—	—	ESWCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	ESWCKSEL[3:0]	EtherSW Clock (ESWCLK) Source Select 0 0 0 1: MOCO (value after reset) 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	ESWCKSREQ	EtherSW Clock (ESWCLK) Switching Request 0: No request 1: Request switching	R/W
7	ESWCKSRDY	EtherSW Clock (ESWCLK) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit is read only.

ESWCKCR controls the ESWCLK.

To change the set value of ESWCKDIVCR.ESWCKDIV[3:0] and ESWCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to MSTPCRC.MSTPC30 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two ESWCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to ESWCKSREQ.
4. Polling until ESWCKSRDY is read as 1.
   While ESWCKSRDY = 1, no clock is output to the ESWCLK.
5. Write the setting value to ESWCKDIVCR.ESWCKDIV[3:0] and ESWCKSEL[3:0].
6. Write 0 to ESWCKSREQ.
7. Polling until ESWCKSRDY is read as 0.
   When ESWCKSRDY becomes 0, the ESWCLK starts outputting.
8. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with ESWCKSREQ = 1 and ESWCKSRDY = 0, or ESWCKSREQ = 0 and ESWCKSRDY = 1.

ESWCKSEL[3:0] bits (EtherSW Clock (ESWCLK) Source Select)

These bits select the clock source of the ESWCLK.

These bits must change when ESWCKCR.ESWCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

ESWCKSREQ bit (EtherSW Clock (ESWCLK) Switching Request)

This bit selects the ESWCLK switching request.

ESWCKSRDY flag (EtherSW Clock (ESWCLK) Switching Ready State Flag)

This flag indicates the state of switching ready for the ESWCLK.

While ESWCKSRDY = 1, no clock is output to the ESWCLK.

9.2.64 ESWPCKCR : EtherSW-PHY Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0DC

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ESWPCKSRDY	ESWPCKSREQ	—	—	ESWPCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	ESWPCKSEL[3:0]	EtherSW-PHY Clock (ESWPHYCLK) Source Select 0 0 0 1: MOCO (value after reset) 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	ESWPCKSREQ	EtherSW-PHY Clock (ESWPHYCLK) Switching Request 0: No request 1: Request switching	R/W
7	ESWPCKSRDY	EtherSW-PHY Clock (ESWPHYCLK) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit is read only.

ESWPCKCR controls the ESWPHYCLK.

To change the set value of ESWPCKDIVCR.ESWPCKDIV[3:0] and ESWPCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure

1. Write 1 to MSTPCRC.MSTPC30 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two ESWPHYCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to ESWPCKSREQ.
4. Polling until ESWPCKSRDY is read as 1.
   While ESWPCKSRDY = 1, no clock is output to the ESWPHYCLK.
5. Write the setting value to ESWPCKDIVCR.ESWPCKDIV[3:0] and ESWPCKSEL[3:0].
6. Write 0 to ESWPCKSREQ.
7. Polling until ESWPCKSRDY is read as 0.
   When ESWPCKSRDY becomes 0, the ESWPHYCLK starts outputting.
8. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with ESWPCKSREQ = 1 and ESWPCKSRDY = 0, or ESWPCKSREQ = 0 and ESWPCKSRDY = 1.

ESWPCKSEL[3:0] bits (EtherSW-PHY Clock (ESWPHYCLK) Source Select)

These bits select the clock source of the ESWPHYCLK.

These bits must change when ESWPCKCR.ESWPCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

ESWPCKSREQ bit (EtherSW-PHY Clock (ESWPHYCLK) Switching Request)

This bit selects the ESWPHYCLK switching request.

ESWPCKSRDY flag (EtherSW-PHY Clock (ESWPHYCLK) Switching Ready State Flag)

This flag indicates the state of switching ready for the ESWPHYCLK.

While ESWPCKSRDY = 1, no clock is output to the ESWPHYCLK.

9.2.65 ETHPCKCR : Ether-PHY Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0DE

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ETHPCKSRDY	ETHPCKSREQ	—	—	ETHPCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	ETHPCKSEL[3:0]	Ether-PHY Clock (ETHPHYCLK) Source Select 0 0 0 1: MOCO (value after reset) 0 0 1 1: Main clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	ETHPCKSREQ	Ether-PHY Clock (ETHPHYCLK) Switching Request 0: No request 1: Request switching	R/W
7	ETHPCKSRDY	Ether-PHY Clock (ETHPHYCLK) Switching Ready State Flag 0: Impossible to switch 1: Possible to switch	R*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This bit is read only.

ETHPCKCR controls the ETHPHYCLK.

To change the set value of ETHPCKDIVCR.ETHPCKDIV[3:0] and ETHPCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure:

1. Write 1 to MSTPCRC.MSTPC28 only when switching the division ratio setting from 1/n (n ≠ 1).
2. Wait for two ETHPHYCLK only when switching the division ratio setting from 1/n (n ≠ 1).
3. Write 1 to ETHPCKSREQ.
4. Polling until ETHPCKSRDY is read as 1.
   While ETHPCKSRDY = 1, no clock is output to the ETHPHYCLK.
5. Write the setting value to ETHPCKDIVCR.ETHPCKDIV[3:0] and ETHPCKSEL[3:0].
6. Write 0 to ETHPCKSREQ.
7. Polling until ETHPCKSRDY is read as 0.

When ETHPCKSRDY becomes 0, the ETHPHYCLK starts outputting.

8. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with ETHPCKSREQ = 1 and ETHPCKSRDY = 0, or ETHPCKSREQ = 0 and ETHPCKSRDY = 1.

ETHPCKSEL[3:0] bits (Ether-PHY Clock (ETHPHYCLK) Source Select)

These bits select the clock source of the ETHPHYCLK.

These bits must change when ETHPCKCR.ETHPCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

ETHPCKSREQ bit (Ether-PHY Clock (ETHPHYCLK) Switching Request)

This bit selects the ETHPHYCLK switching request.

ETHPCKSRDY flag (Ether-PHY Clock (ETHPHYCLK) Switching Ready State Flag)

This flag indicates the state of switching ready for the ETHPHYCLK.

While ETHPCKSRDY = 1, no clock is output to the ETHPHYCLK.

9.2.66 USBCKSELR : USB Clock Selection Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0F0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	UCKSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	UCKSEL	USB Clock (USBCLK) Selection 0: Disable (value after reset) 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Rewrite the USBCKSELR register while the SYSCFG.SCKE bit is 0.

UCKSEL bit (USB Clock (USBCLK) Selection)

Set the UCKSEL bit depending on other register settings shown in Table 9.5.

The UCKSEL bit can only be set to 1 when USBFS is used as the device controller. Set the UCKSEL bit to 0 to use the host controller and the On-The-Go (OTG) function.

The HOCO user trimming function cannot be used when the UCKSEL bit is 1. Set the HOCOUTCR.HOCOUTRIM[7:0] bits to 0x00.

Table 9.5 UCKSEL bit setting

UCKSEL	USBCKCR.USBCKSEL[3:0]	FLLCR1.FLLEN
0	Other than 0000 (Other than HOCO)	—
	0000 (HOCO)	1 (FLL enabled)
1	0000 (HOCO)	0 (FLL disabled)

9.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

9.3.1 Connecting a Crystal Resonator

Figure 9.2 shows an example of connecting a crystal resonator. A damping resistor (Rd) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 9.1.

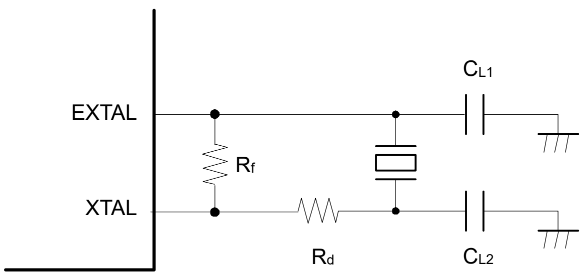

Figure 9.2 Example of crystal resonator connection

Figure 9.3 shows an equivalent circuit of the crystal resonator.

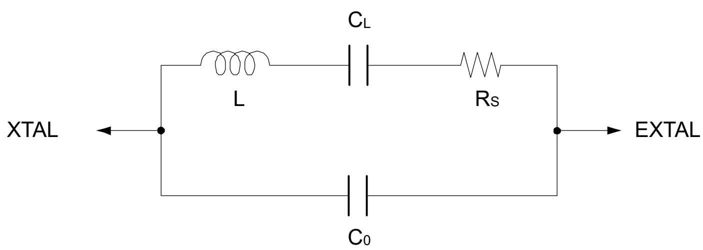

Figure 9.3 Equivalent circuit of the crystal resonator

9.3.2 External Clock Input

Figure 9.4 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

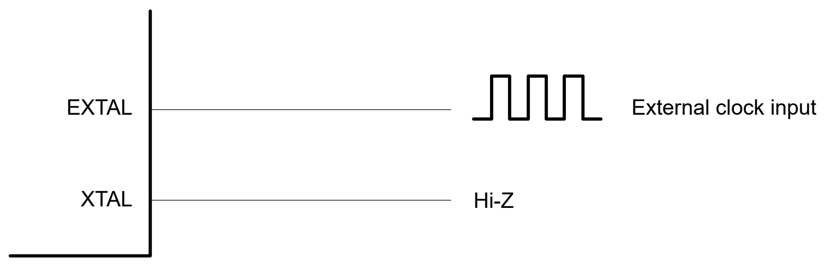

Figure 9.4 Equivalent circuit for external clock

9.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.

9.3.4 Note on Oscillation Keep in Software Standby Mode

By using the oscillation keep function of the Main Clock Oscillator in Software Standby mode, the Main Clock Oscillator stabilization wait time after canceling Software standby mode can be shortened.

If MCU enters Software Standby mode under the MOSCSCR.MOSCSOKP bit is set to enabled (MOSCSCR.MOSCSOKP bit is 1) and under the Main Clock Oscillator is operating, the Main Clock Oscillator will keep oscillating in Software Standby mode. When canceling Software Standby mode in this state, the Main clock can be used without the oscillator stabilization wait time.

If using this function, confirm that the setting value is written to the register before entering the Software standby mode.

However, even if this function is enabled, the clock supply to the system and peripheral modules during Software Standby mode is stopped.

9.4 Sub-Clock Oscillator

To supply the clock signal to the sub-clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

9.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in Figure 9.5. A damping resistor (Rd) can be added, if necessary. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the resonator manufacturer recommends the use of an external feedback resistor (Rf), insert an Rf between XCIN and XCOUT by following the instructions. When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in Table 9.1.

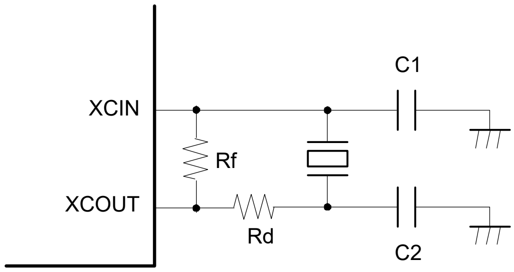

Figure 9.5 Connection example of 32.768-kHz crystal resonator

Figure 9.6 shows an equivalent circuit for the 32.768-kHz crystal resonator.

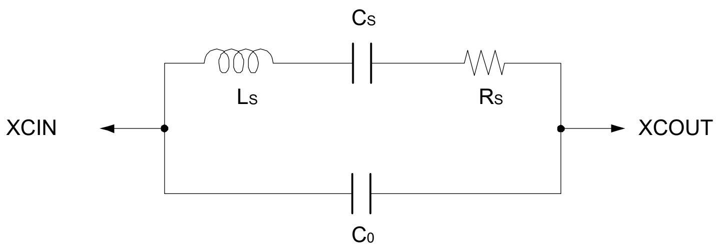

Figure 9.6 Equivalent circuit for the 32.768-kHz crystal resonator

9.4.2 External Clock Input

In the external clock input mode, clock is input from EXCIN pin.

9.5 Low Speed On-chip Oscillator (LOCO)

Low Speed On-chip Oscillator (LOCO) is the internal oscillator that supplies a low-speed clock.

9.5.1 LOCO Operating Conditions

There are restriction on LOCO operation setting. For detail, see section 9.5.3. Restrictions on LOCO Operation and Stopping

LOCO oscillates when any of the following conditions is met.*1

[LOCO operating conditions]

- When LOCO is set to operate in the LOCOCR register (LOCOCR.LCSTP bit is 0).
- When IWDT is set to the auto start mode. (OFS0.IWDTSTRT bit is 0)*2
- When IWDT is set to the register start mode (OFS0.IWDTSTRT bit is 1) and counting is started.*3
- \When waiting for the oscillation stabilization of the Main Clock Oscillator (while MOCOCR.MCSTP bit is 0 and OSCSF.MOSCSF bit is 0).*4

Note 1. LOCO stops at Deep Software Standby mode 2 or Deep Software Standby mode 3.
Note 2. When IWDT is set to the auto start mode, regardless of the setting of IWDTSTPCTL bit in OFS0 register, LOCO continues to oscillate.
Note 3. When IWDT is set to the register start mode, regardless of the setting of SLCSTP bit in IWDTCSTPR register, LOCO continues to oscillate once IWDT starts counting.
Note 4. Even if the Main Clock Oscillator is set to the external clock input mode, LOCO operates because the oscillation stabilization wait circuit operates when the Main Clock Oscillator starts operating.

9.5.2 LOCO Stop Conditions

There are restriction on LOCO stop setting. For detail, see section 9.5.3. Restrictions on LOCO Operation and Stopping.

There are two ways to top LOCO: stop by transition to Low Power mode or stop by LOCOCR register.

(A) LOCO stop conditions related to Low Power mode

LOCO stops when transitioning to the following Low Power mode

- Deep Software Standby mode 2
- Deep Software Standby mode 3

(B) LOCO stop conditions related to LOCOCR register

When LOCO is stopped using the LOCOCR register, even if the LCSTP bit set to stop (LOCOCR.LCSTP bit is 1), LOCO may not be stopped depending on the operating status of IWDT and oscillator.

LOCO can be stopped when all of the following conditions are met.

- LOCO is set to stop using the LOCOCR register (LOCOCR.LCSTP bit is 1)
- IWDT is not operating. (Include the case of stopping in CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, and Deep Software Standby mode 1 by setting the OFS0.IWDTSTPCTL bit or the IWDTCSTPR.SLCSTP bit.).
- Main Clock Oscillator is stopped or Main Clock oscillation is stable. (MOCOCR.MCSTP bit is 1 or OSCSF.MOSCSF bit is 1)

9.5.3 Restrictions on LOCO Operation and Stopping

After setting the LCSTP bit in LOCOCR to 0 to start the LOCO clock, only use the clock after the LOCO clock oscillation stabilization wait time (tLOCOWT) elapses. A fixed stabilization wait is required after setting the LOCO clock to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, read OSCMONR.LOCOMON, make sure LOCO is stopped, and then set the operation.
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode.
- When a transition to Software Standby mode or Deep Software Standby mode after setting LOCO to stop, read OSCMONR.LOCOMON, make sure LOCO is stopped, and executing the WFI instruction.

The LOCO clock is used to measure the oscillation stabilization wait time of the main clock oscillator. While the main clock oscillator is waiting for oscillation stabilization, the LOCO clock oscillates regardless of the LCSTP bit setting. At this time, it is necessary to prevent conflicts between the LOCO stop (or operation) by the LCSTP bit in LOCOCR and the LOCO clock oscillation for the Main clock Oscillator stabilization wait time (or LOCO clock stop after Main clock oscillation stabilization). Therefore, do not change the LOCOCR.LCSTP bit during the period from the 3 LOCO clock cycle before setting the start of main clock oscillator operation until the main clock oscillator stabilization can be confirmed with the oscillation stabilization flag in the OSCSF register.

When using IWDT in the register start mode (OFS0.IWDTSTRT bit is 1), set the LOCO to run (LOCOCR.LCSTP = 0) before IWDT count operation, and use IWDT after LOCO oscillation has stabilized. When IWDT is used in register start mode, do not change the LOCOCR.LCSTP bit during the period from the 3 LOCO clock cycles before IWDT count operation starts until the start of IWDT count operation can be confirmed.

When using the Digital filter or the Reset negate select for Voltage monitor m (m = 1 to 2) in Programmable Voltage Detection (PVDm), set the LOCO to run (LOCOCR.LCSTP = 0) before enabling PVDm and use PVDm after LOCO oscillation has stabilized.

9.6 Middle Speed On-chip Oscillator (MOCO)

Middle Speed On-chip Oscillator (MOCO) is the internal oscillator that supplies a middle-speed clock.

9.6.1 MOCO Operating Conditions

There are restriction on MOCO operation setting. For detail, see section 9.6.3. Restrictions on MOCO Operation and Stopping.

MOCO oscillates when any of the following conditions is met.

[MOCO operating conditions]

- When MOCO is set to operate in the LOCOCR register (MOCOCR.MCSTP = 0)
- When waiting for the HOCO oscillation stabilization (while OFS1.HOCOEN bit is 0 or HOCOCR.HCSTP bit is 0, and OSCSF.HOCOSF bit is 0).
- When waiting for the PLL1 oscillation stabilization (while PLLCR.PLLSTP bit is 0, and OSCSF.PLLSF bit is 0).
- When waiting for the PLL2 oscillation stabilization (while PLL2CR.PLL2STP bit is 0, and OSCSF.PLL2SF bit is 0).
- When MOSC oscillation stop detection function is set to enable.
- When SOSC oscillation stop detection function is set to enable.

Note: MOCO stops at Software Standby mode or Deep Software Standby mode.

9.6.2 MOCO Stop Conditions

There are restriction on MOCO stop setting. For detail, see section 9.6.3. Restrictions on MOCO Operation and Stopping.

There are two ways to top MOCO: stop by transition to Low Power mode or stop by MOCOCR register.

(A) MOCO stop conditions related to Low Power mode

MOCO stops when transitioning to the following Low Power mode.

- Software Standby mode (MOCOSCR.MOCOSOKP=0)
- Deep Software Standby mode

Note: When the On-Chip Debugger function is enabled, MOCO does not stop when transitioning to each standby mode.

(B) MOCO stop conditions related to MOCOCR register

When MOCO is stopped using the MOCOCR register, even if the MCSTP bit set to stop (MOCOCR.MCSTP bit is 1), MOCO may not be stopped depending on the operating status of the system.

MOCO can be stopped when all of the following conditions are met.

[MOCO stop conditions]

- MOCO is set to stop using the MOCOCR register (MOCOCR.MCSTP bit is 1)
- When HOCO is stopped or HOCO oscillation is stable. (OFS1(_SEC).HOCOEN bit is 1 and HOCOCR.HCSTP bit is 1, or OSCSF.HOCOSF bit is 1)
- PLL1 circuit is stopped or PLL1 oscillation is stable. (PLLCR.PLSTP bit is 1 or OSCSF.PLLSF bit is 1)
- PLL2 circuit is stopped or PLL2 oscillation is stable. (PLL2CR.PL2STP bit is 1 or OSCSF.PLL2SF bit is 1)

9.6.3 Restrictions on MOCO Operation and Stopping

After setting the MCSTP bit to 0 to start the MOCO clock, only use the clock after the MOCO clock oscillation stabilization time (tMOCOWT) elapses. A fixed stabilization wait is required after setting the MOCO clock to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation.

- After stopping the MOCO clock, read OSCMONR.MOCOMON, make sure MOCO is stopped, and then set the operation.
- Confirm that MOCO oscillation is stable before stopping the MOCO clock.
- Regardless of whether the MOCO clock is selected as the system clock source, confirm that MOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode. If MOCO is stopped, operate the MOCO.

- Regardless of whether the MOCO clock is selected as the system clock source, confirm that MOCO oscillation is stable before executing the wait instruction to place the CPU in the CPU Deep Sleep mode. If MOCO is stopped, operate the MOCO.
- Confirm that MOCO oscillation is stable before executing a Power Control for each power domain by Software. If MOCO is stopped, operate the MOCO.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).
- Oscillation stop detection is enabled (OSTDCR.OSTDE bit is 1).
- While waiting for the HOCO oscillation stabilization (OFS1.HOCOEN bit is 0 or HOCOCR.HCSTP bit is 0, and OSCSF.HOCOSF bit is 0)
- While waiting for the PLL1 oscillation stabilization (PLLCR.PLLSTP bit is 0, and OSCSF.PLLSF bit is 0)
- While waiting for the PLL2 oscillation stabilization (PLL2CR.PLL2STP bit is 0, and OSCSF.PLL2SF bit is 0)
- While executing a Power Control for each power domain by software (During the Power Gating Control)

The MOCO clock is used to measure the oscillation stabilization wait time of the HOCO/PLL1/PLL2 clock. While waiting for the HOCO/PLL1/PLL2 clock to stabilize, the MOCO clock oscillates regardless of the MOCOCR.MCSTP bit setting. At this time, it is necessary to prevent conflicts between the MOCO stop (or operation) by the MCSTP bit in MOCOCR and the MOCO clock oscillation for HOCO/PLL1/PLL2 clock oscillation stabilization wait time (or MOCO clock stop after HOCO/PLL1/PLL2 clock oscillation stabilization). Therefore, do not change the MOCOCR.MCSTP bit during the period from the 3 MOCO clock cycles before the start of HOCO/PLL1/PLL2 clock operation setting until the HOCO/PLL1/PLL2 clock oscillation stability can be confirmed by the HOCOSF/PLLSF/PLL2SF flag in the OSCSF register.

9.7 High Speed On-chip Oscillator (HOCO)

High Speed On-chip Oscillator (HOCO) is the internal oscillator that supplies a high-speed clock.

9.7.1 Frequency Locked Loop Function

HOCO supports the Frequency Locked Loop (FLL) function that corrects the frequency accuracy of the HOCO clock using the Sub-Clock Oscillator. When the FLL function is enabled, the frequency accuracy of the HOCO clock can be improved compared to when the FLL function is disabled.

When using the FLL function, the oscillation of the Sub-Clock Oscillator must be stable. In addition, the sub-clock oscillator must meet the frequency accuracy specified in section 62, Electrical Characteristics.

When enabling the FLL function and using HOCO, enable the FLL function in advance and enable HOCO (HOCOCR.HCTSP=0) after SOSC has stabilized.

Set FLLCR2.FLLCNTL[10:0] as follows for each HOCO frequency setting. And the HOCO clock reaches the desired frequency after tFLLWT after enabling HOCO.

Table 9.6 FLLCNTL setting for each HOCO frequency setting

FLLCR2.FLLCNTL[10:0]	OFS1(_SEC).HOCOFRQ0[2:0]	Target Frequency (FHOCO)
0x1E8	000b	16 MHz
0x225	001b	18 MHz
0x262	010b	20 MHz
0x1E8	100b	32 MHz
0x1E8	111b	48 MHz

9.7.2 Note on Oscillation Keep in Software Standby mode

By using the oscillation keep function of the HOCO in Software Standby mode, the HOCO oscillation stabilization wait time after canceling Software standby mode can be shortened.

To keep the HOCO oscillation in Software Standby mode, make the following settings:

- Enable the HOCO Standby Oscillation Keep function in the HOCOSCR register. (HOCOSCR.HOCOSOKP bit is set to 1)
- The setting of power control for HOCO in HOCOLDOCR.

If MCU enters Software Standby mode under the above settings and under the HOCO is operating, the HOCO will keep oscillating in Software Standby mode. When canceling Software Standby mode in this state, the HOCO clock can be used without the oscillator stabilization wait time.

If using this function, confirm that the setting value is written to the register before entering the Software standby mode.

However, even if this function is enabled, the clock supply to the system and peripheral modules during Software Standby mode is stopped.

9.7.3 Note on using as TRACE clock source

If HOCO is selected as Trace clock source with TRCKCRSEL bit on TRCKCR register, and then Trace clock function is enable (TRCKCR.TRCKEN=1), HOCO oscillates regardless of the value of HCSTP bit on HOCOCR register. In this situation, HOCO will continue to oscillate even if MCU is in Software Standby mode, Deep Software Standby mode, or Reset (except POR and PVD0) to keep supplying the clock to the TRACE module.

If HOCO is used as Trace clock source, Trace clock should be enabled with TRCKEN bit on TRCKCR register while HOCO is stopped (OFS1(_SEC).HOCOEN=1 and HOCOCR.HCSTP=1) or HOCO is oscillating and stable (OSCSF.HOCOSF=1).

9.8 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

Figure 9.7 shows the block diagram of PLL1 circuit, and Figure 9.8 shows the PLL2 circuit. PLL1 and PLL2 have the same circuit configuration. The PLL1 circuit is explained the following as an example.

The input clock source selection circuit selects the clock source input to the PLL.

The input clock divider circuit divides the input clock and generates the PLL reference clock.

The frequency control circuit controls the VCO clock to be generated from the PLL reference clock according to the frequency multiplier setting. The frequency multiplication ratio is determined by the combination of the PLLMUL bits and PLLMULNF bits. The PLLMUL bit determines the integer part of the multiplication ratio, and the PLLMULNF bit determines the fractional part of the multiplication ratio. For example, if the PLLMUL bit setting is 26 and the PLLMULNF bit setting is 0.33, the multiplication ratio is 26.33.

The PLL circuit has the 3 output clocks. The output clock divider circuit divides the VCO clock to generate each PLL clock output. The division ratio for generating each output clock can be set independently with the PLODIVP, PLODIVQ, and PLODIVR bits.

The PLL Input clock frequency, the PLL Reference clock frequency, the VCO clock frequency, and each Output clock frequency must be within the specified in section 62, Electrical Characteristics.

The PLL frequency setting can only be changed the PLL circuit is stopped. Do not change the PLL frequency setting when PLL stop control bit (PLLSTP) is 0.

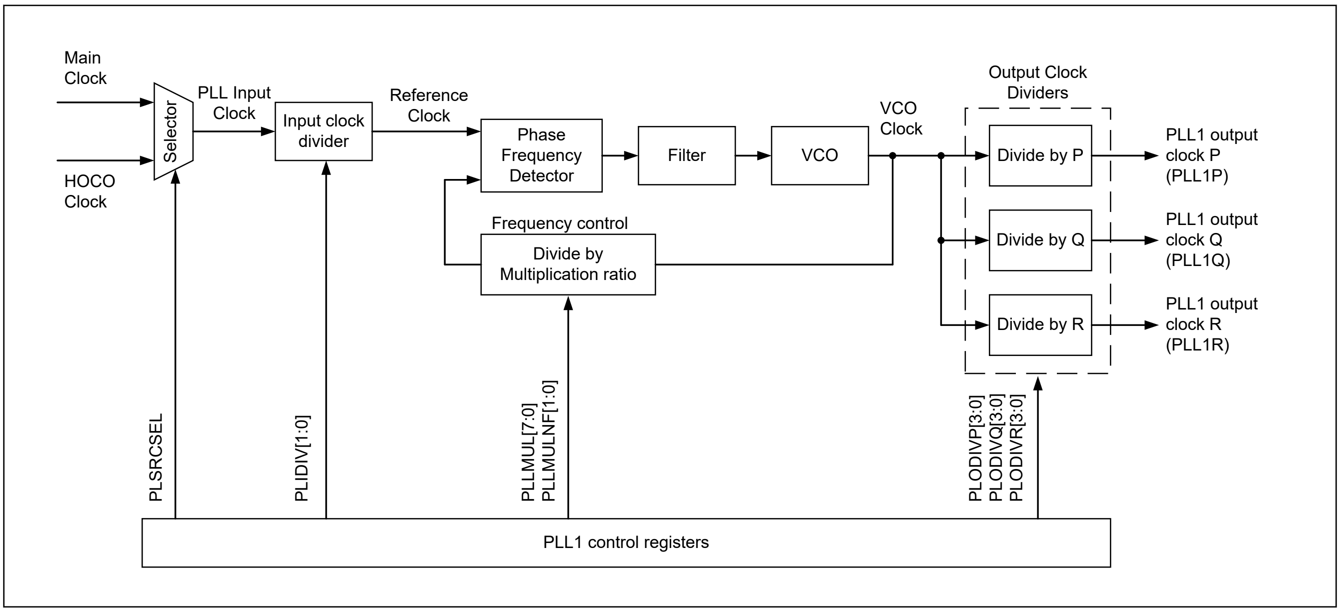

Figure 9.7 PLL1 block diagram

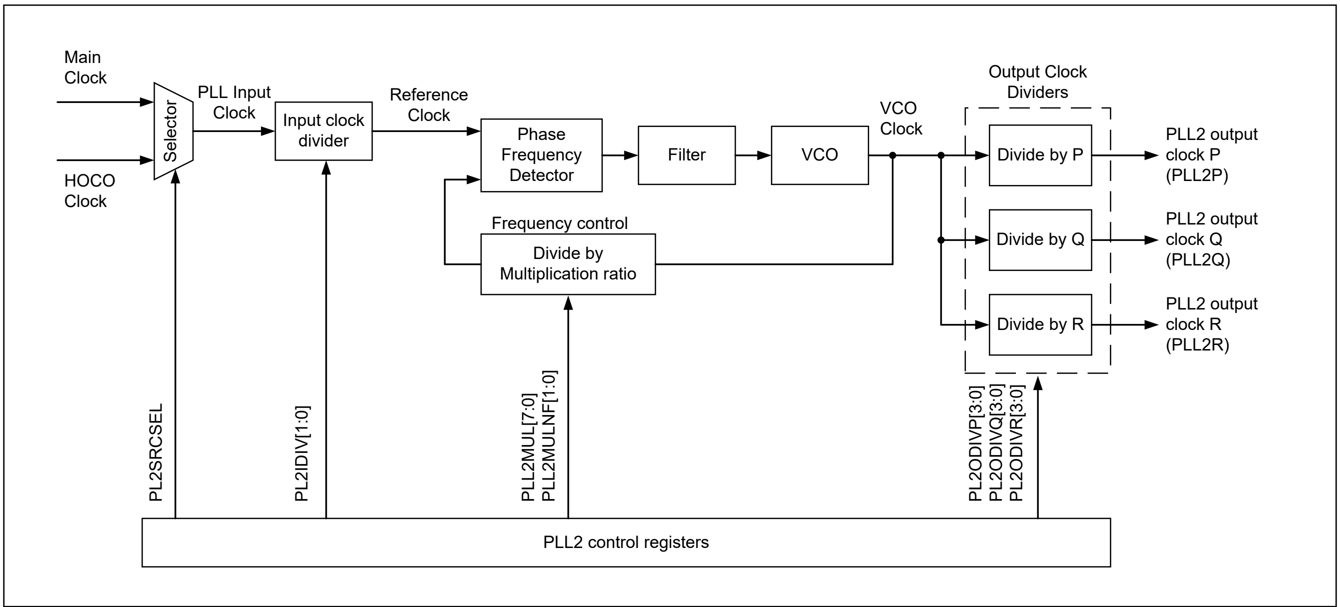

Figure 9.8 PLL2 block diagram

9.9 Oscillation Stop Detection Function

9.9.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock source switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P), PLL1 clock remains the system clock source. The frequency becomes free-running, and the setting in the SCKSCR.CKSEL[2:0] bits does not change.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to stop state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See section 62, Electrical Characteristics.

Switching between the main clock oscillator and the MOCO clock or between the PLL1 clock and PLL1 free-running clock is controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
  - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
  - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.
- When PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL1P):
  - When OSTDF changes 0 to 1, the clock source switches to the PLL1 free-running oscillation clock.
  - When OSTDF changes 1 to 0, the clock source switches back to PLL1.

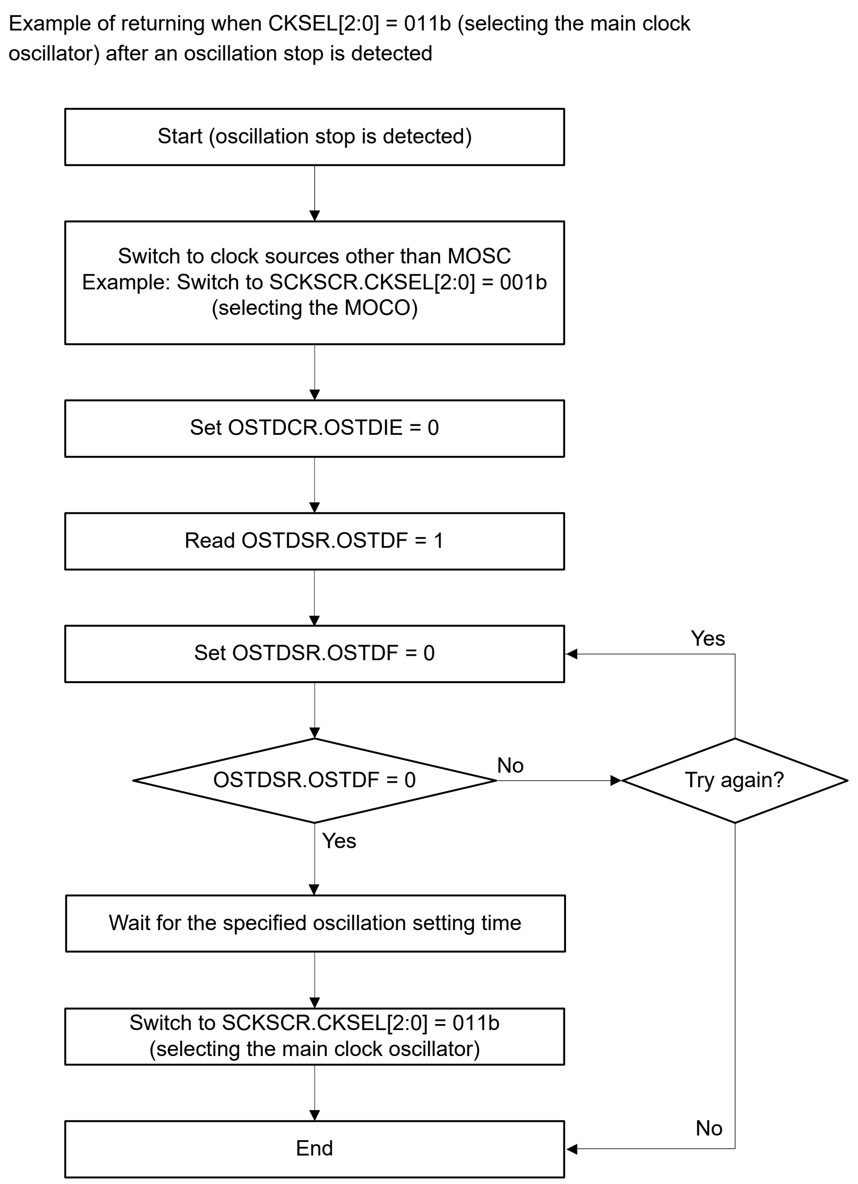
To switch the clock source to the main clock or PLL1 clock again after the oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the main clock or PLL1 clock and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, then set the CKSEL[2:0] bits to the main clock or PLL1 clock after the specified oscillation stabilization time elapses.

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause.

The oscillation stop detection function switches the following clocks to the MOCO clock (when the system clock source is MOSC) or the PLL1 free-running clock (when the system clock source is PLL1P) :

- All clocks that can be selected as the MOSC clock or PLL1 except CLKOUT, USBMCLK and CACMCLK.
- The system clock (ICLK) frequency during the MOCO (when the system clock source is MOSC) or PLL1 free-running (when the system clock source is PLL1P) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits (SCKDIVCR.ICK[3:0])



Note: On return from the oscillation-stopped state, the factor responsible for stopping the main clock oscillation circuit must be removed from the system to allow oscillation to resume.

Figure 9.9 Flow of recovery on detection of oscillator stop

9.9.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see section 14, Interrupt Controller Unit (ICU).

9.9.3 Sub-clock Oscillation Stop Detection and Operation after Detection

The sub-clock oscillation stop detection function is used to detect the sub-clock oscillator stop. When an oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC), the system clock source switches to the MOCO/256 clock.
  An oscillation stop detection interrupt request can be generated when an oscillation stop is detected.
  The sub-clock oscillation stop is detected when the input clock remains to be 0 or 1 for a certain period, for example, when a malfunction occurs in the sub-clock oscillator. See Electrical Characteristics.
  Switching between the sub-clock oscillator and the MOCO/256 clock is controlled by the Sub-clock Oscillation Stop Detection flag (SOSTDSR.SOSTDF).
  The SOSTDF flag controls the switched clock as the follows:
- SCKSCR.CKSEL[2:0] = 100b (System clock source = SOSC):
  - When SOSTDF changes from 0 to 1, the clock source switches to the MOCO/256 clock.
  - When SOSTDF changes from 1 to 0, the clock source switches to SOSC again.

To switch the clock source to the sub-clock oscillator again after the oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the sub-clock, and clear the SOSTDF flag to 0. Also, check that the SOSTDF flag is not 1, and then set the CKSEL[2:0] bits to the sub-clock oscillator after the specified oscillation stabilization time elapses.

After a VBAT_POR release, the sub-clock oscillator is stopped and the sub-clock oscillation stop detection function is disabled. To enable the sub-clock oscillation stop detection function, activate the sub-clock oscillator and write 1 to the Sub-clock Oscillation Stop Detection Function Enable bit (SOSTDCR.SOSTDE) after the specified oscillation stabilization time elapses.

After that, be sure to clear the Sub-clock Oscillation Stop Detection Flag (SOSTDSR.SOSTDF) to 0 after the start-up time of the sub-clock oscillation stop detector (Tsosdup) elapses.

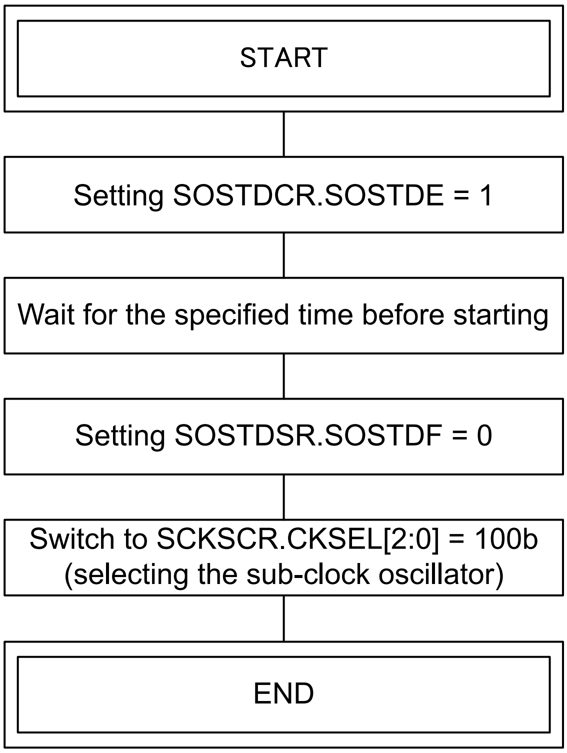
When selecting the sub-clock oscillator for the system clock, complete the above settings before switching.

The sub-clock oscillation stop detection function detects when the Sub-Clock Oscillator is stopped by an external cause.

The sub-clock oscillation stop detection function switches the following clocks to the MOCO/256 clock.

- All clocks that can be selected as the SOSC clock except CACSCLK.
- The system clock (ICLK) frequency during MOCO/256 operation is specified in the MOCO oscillation frequency and the division ratio set in the System Clock Select bits (SCKDIVCR.ICK[3:0]).

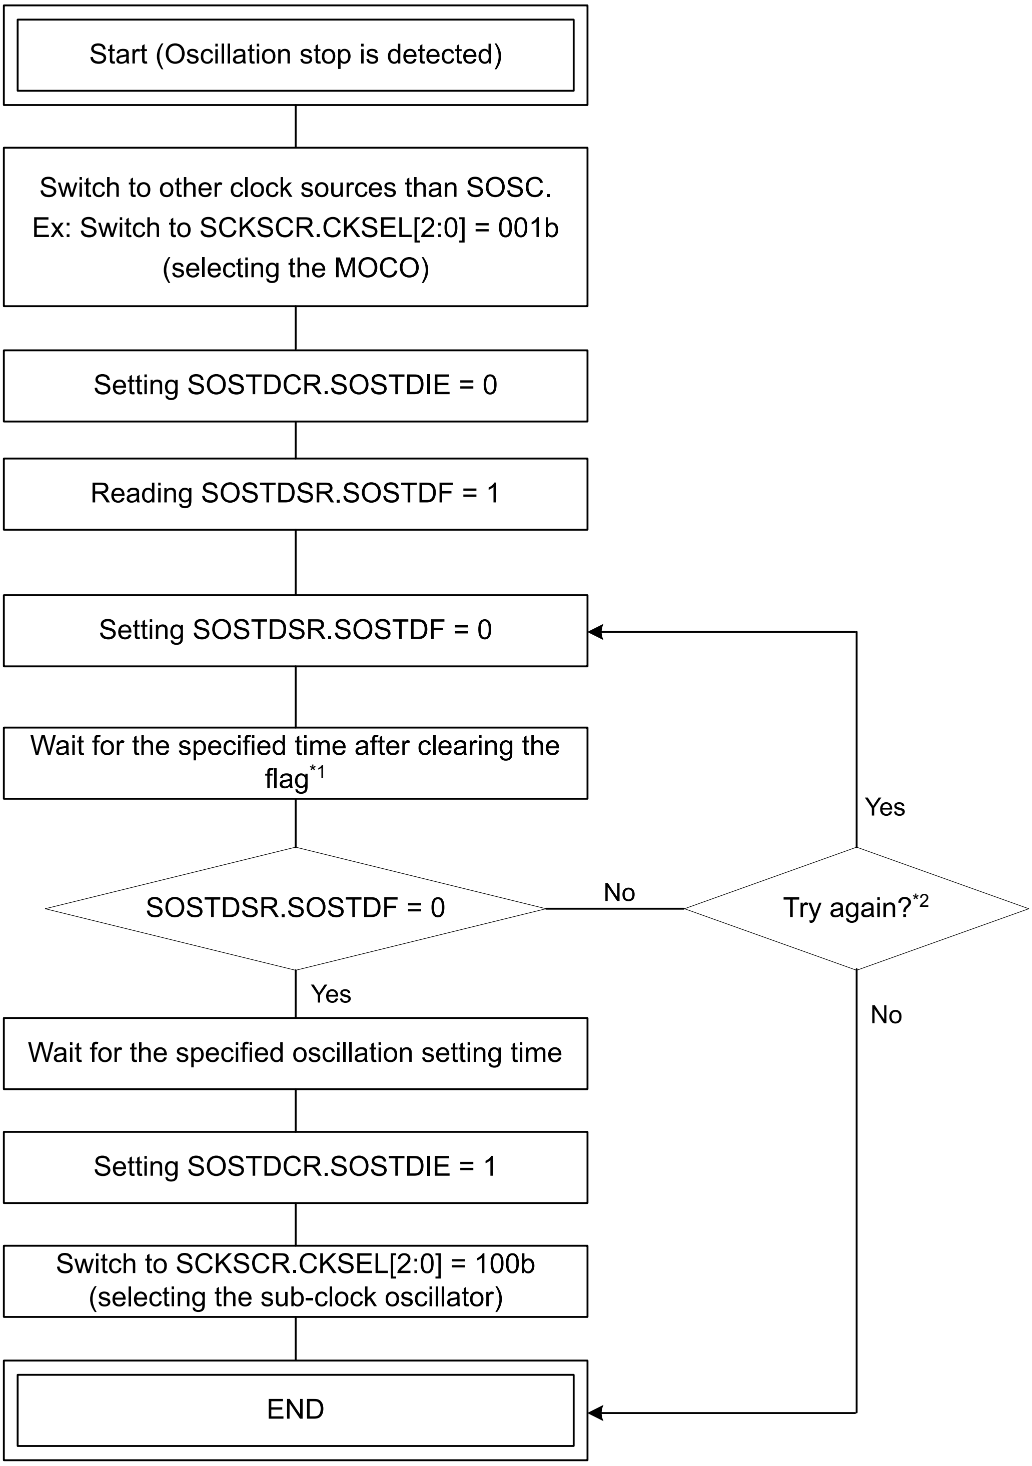
Example of activation of sub-clock oscillation stop detection function when CKSEL[2:0] = 100b (selecting the sub-clock oscillator)



Note: Set the system clock to the other clock sources than the sub-clock oscillator before executing this flow.

Figure 9.10 Flow of Activation of Sub Clock Oscillation Stop Detection Function

Example of re-returning when CKSEL[2:0]=100b (selecting the sub-clock oscillator) after an oscillation stop is detected.



Note: On return from the oscillation-stopped state, the factor responsible for stopping the sub-clock oscillation circuit must be removed on the user system to allow the return of oscillation.

Note 1. If the SOSTDSR.SOSTDF flag is cleared, wait at least 1.5 μs before reading the next SOSTDSR.SOSTDF flag.

Note 2. Retry at least once.

Figure 9.11 Flow of Recovery from Detection of Sub Clock Oscillator Stop

9.9.4 Sub-clock Oscillation Stop Detection Interrupts

A sub-clock oscillation stop detection interrupt (SOSTD) is generated when the Sub-clock Oscillation Stop Detection flag (SOSTDSR.SOSTDF) is 1 and the Sub-clock Oscillation Stop Detection Interrupt Enable bit in the Sub-clock Oscillation Stop Detection Control Register (SOSTDCR.SOSTDIE) is 1 (enabled).

When the SOSTDSR.SOSTDF flag requires clearing, do so after clearing the Sub-clock Oscillation Stop Detection Interrupt Enable bit in the Sub-clock Oscillation Stop Detection Control Register (SOSTDCR.SOSTDIE). Make sure SOSTDF is cleared before setting the SOSTDIE bit to 1 again.

9.10 Internal Clock

Clock sources for the internal clock signals include:

- Main clock oscillator
- Sub-clock oscillator
- HOCO clock
- MOCO clock
- LOCO clock
- PLL1 clock (PLL1P, PLL1Q and PLL1R)
- PLL2 clock (PLL2P, PLL2Q and PLL2R)
- External clock input for JTAG
- External clock input for SWD

The following internal clocks are produced from these sources.

- Operating clock of the CPU0 : CPU0 clock (CPUCLK0)
- Operating clock of the CPU1 : CPU1 clock (CPUCLK1)
- Operating clock of the DMAC, DTC, SRAM, System Bus, I/O Port and ICU: System clock (ICLK)
- Operating clock of the Debug Subsystem : Debug clock (DCLK)
- Operating clock for MRAM code bus : MRAM code bus clock (MRICLK)
- Operating clocks of peripheral modules : Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD, and PCLKE)
- Operating clock for the MRAM peripheral bus : MRAM peripheral bus clock (MRPCLK)
- Clock for the external bus controller and external pin output: External bus clock (BCLK, EBCLK)
- Clock for the external bus controller and external pin output for the SDRAM : SDRAM clock (SDCLK)
- Clock for the trace function and external pin output : Trace clock (TRCLK)
- Operating clock for the SCI : SCI clock (SCICLK)
- Operating clock for the SPI : SPI clock (SPICLK)
- Operating clock for the Octal SPI : Octal-SPI clock (OCTACLK, OCTADIVCLK)
- Operating clock for the CANFD Core : CANFD Core clock (CANFDCLK)
- Operating clock for the USBFS and USBHS : USB clock (USBCLK)
- Operating clock for the USBHS : USB clock (USB60CLK)
- Operating clock for the ADC16H : ADC clock (ADCCLK)
- Operating clock for the GPT : GPT clock (GPTCLK)
- Operating clock for the I3C : I3C clock (I3CCLK)
- Clock for the external bus controller (Asynchronous) : External bus clock (BCLKA)
- Operating clock for the EtherSW : ESWM clock (ESWCLK)
- Operating clock for the EtherSW-PHY : ESWM clock (ESWPHYCLK)
- Operating clock for the ETHPHYCLK pin output : Ether-PHY clock (ETHPHYCLK)

- Clock for external pin output : Clock/Buzzer output (CLKOUT)
- Operating clock for the USBHS : MOSC clock for USBHS (USBMCLK)
- Operating clock for the CAN : CAN clock (CANMCLK)
- Operating clocks for the ULPT : ULPT LOCO clock (ULPTLCLK) and ULPT sub-clock (ULPTSCLK)
- Operating clock for the AGT : AGT LOCO clock (AGTLCLK) and AGT sub-clock (AGTSCLK)
- Operating clocks for the CAC : CAC clock (CACCLK)
- Operating clocks for the RTC : RTC LOCO clock (RTCLCLK) and RTC Sub-clock (RTCSCLK)
- Operating clock for the PDMIF : PDMIF clock (PDMIFCLK)
- Operating clock for the IWDT : IWDT clock (IWDTCLK)
- Operating clock for the SysTick timer : SysTick timer clock (SYSTICKCLK)
- Operating clock for the JTAG : JTAG clock (JTAGTCK)

For details on the registers used to set the frequencies of the internal clocks, see section 9.10.5. System Clock (ICLK) to section 9.10.34. JTAG Clock (JTAGTCK)

If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

9.10.1 CPU0 Clock (CPUCLK0)

The CPU0 clock (CPUCLK0) is the operating clock for the CPU0. Specify the frequency in the following bits:

- CPUCK0[3:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.2 CPU1 Clock (CPUCLK1)

The CPU1 clock, CPUCLK1, is the operating clock for the CPU1. Specify the frequency in the following bits:

- CPUCK1[3:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.3 MRAM Code Bus Clock (MRICLK)

The MRAM code bus clock, MRICLK, is the operating clock for the MRAM code bus interface. Specify the frequency in the following bits:

- MRICK[3:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.4 MRAM Peripheral Bus Clock (MRPCLK)

The MRAM peripheral bus clock, MRPCLK, is the operating clock for the MRAM peripheral bus interface. Specify the frequency in the following bits:

- MRPCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.5 System Clock (ICLK)

The system clock (ICLK) is the operating clock of the DMAC, DTC, SRAM, System Bus, I/O Port, and ICU. Specify the frequency in the following bits:

- ICK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0] and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See Figure 9.12 and Figure 9.13.

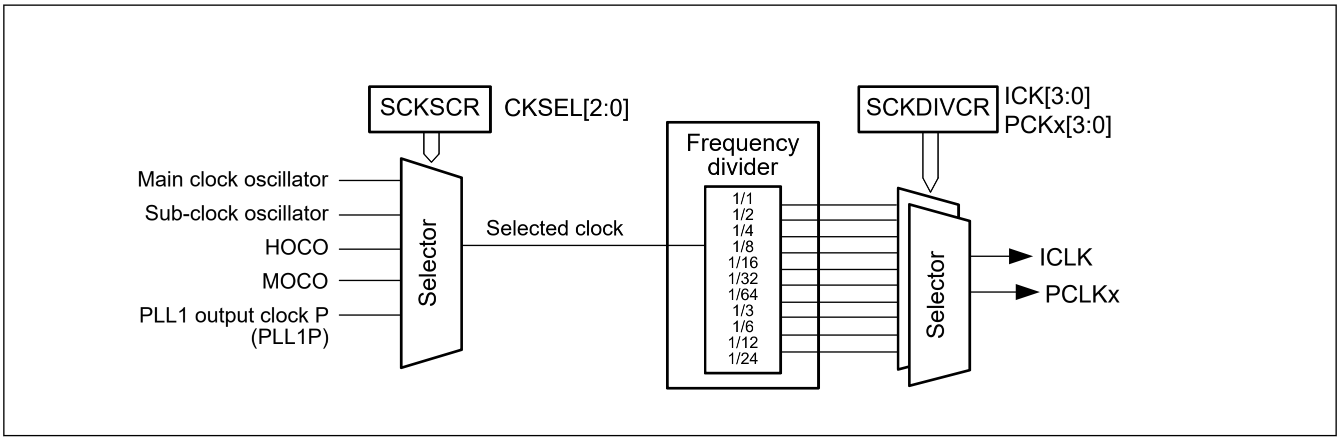


Figure 9.12 Block diagram of clock source selector

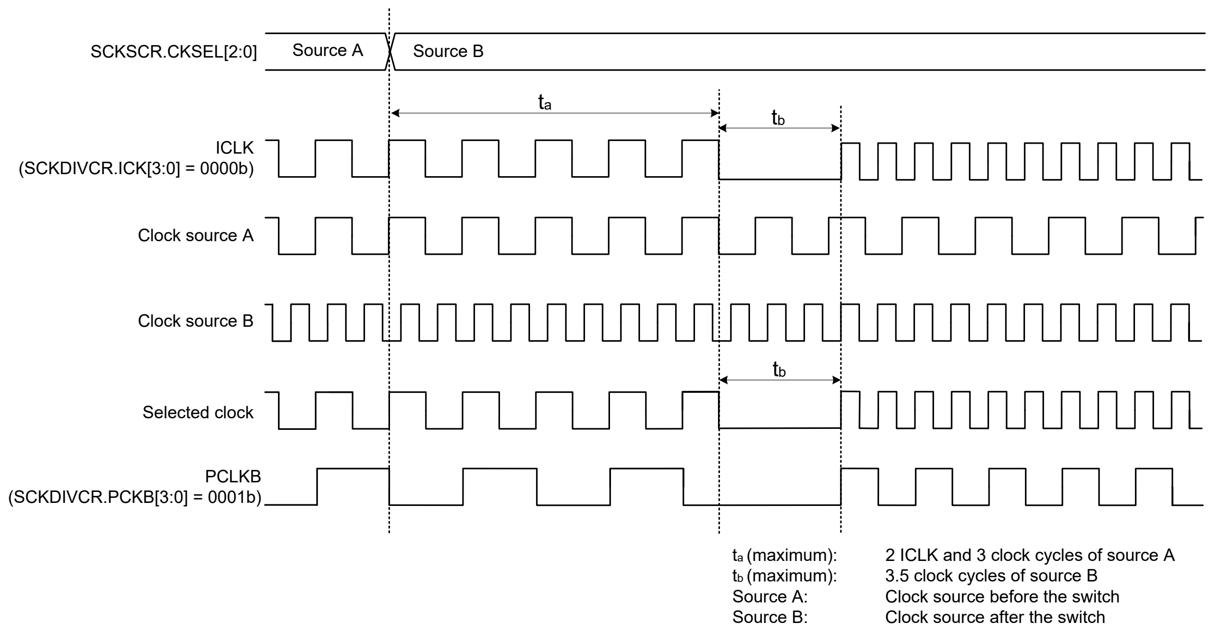

Figure 9.13 Timing of clock source switching

9.10.6 Debugger Clock (DCLK)

The Debugger clock (DCLK) is the operating clock for the Debug Subsystem. The frequency is same as ICLK.

9.10.7 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE)

The peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE) are the operating clocks for the peripheral modules.

The frequency of the given clock is specified in the following bits:

- PCKA[3:0], PCKB[3:0], PCKC[3:0], PCKD[3:0] and PCKE[3:0]bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0] and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See Figure 9.12 and Figure 9.13.

9.10.8 External Bus Clock (BCLK, EBCLK)

The external bus clock (BCLK) is an operating clock for the external bus controller. It is also output externally from the EBCLK pin for the external connection bus.

BCLK can be output from the EBCLK pin by setting the EBCKOCR.EBCKOEN bit to 1 and setting the PmnPFS.PSEL[4:0] to 01011b. Make sure that modification of the PmnPFS.PSEL[4:0] to 01011b must always be performed while the EBCKOCR.EBCKOEN bit is 0.

When the BCKCR.BCLKDIV bit is set to 1, the BCLK clock divided by 2 is output from the EBCLK pin.

Specify the frequency in the following bits:

- BCK[3:0] bits in SCKDIVCR

- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0] and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

A frequency higher than the system clock (ICLK) should not be set for the BCLK.

9.10.9 SDRAM Clock (SDCLK)

The SDRAM clock (SDCLK) is an operating clock for the external bus controller. It is output externally from the SDCLK pin for the SDRAM that is connected to the external bus. To output SDCLK on the SDCLK pin, set the SDCKOCR.SDCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b(enabling SDCLK output). Only change the value in the PmnPFS.PSEL[4:0] bits when the SDCKOCR.SDCKOEN bit is 0. Specify the frequency in the following bits:

- BCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0] and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

Do not set SDCLK to a frequency higher than that of the system clock (ICLK).

9.10.10 Trace Clock (TRCLK)

The trace clock (TRCLK) is the CPU tracing clock for the On-Chip Debugger function.

The TRCLK frequency is specified by the TRCK[3:0] bits and TRCKSEL bit in TRCKCR (The Trace Clock frequency division ratio and the Trace Clock Source select). When changing the frequency of the Trace Clock, the Trace Clock must be stopped (TRCKCR.TRCKEN = 0).

9.10.11 SCI Clock (SCICLK)

The SCI clock (SCICLK) is the operating clock for the SCI module.

Specify the frequency in the following bits:

- SCICKDIV[3:0] bits in SCICKDIVCR
- SCICKSEL[3:0] bits in SCICKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.12 SPI Clock (SPICLK)

The SPI clock (SPICLK) is the operating clock for the SPI module.

Specify the frequency in the following bits:

- SPICKDIV[3:0] bits in SPICKDIVCR
- SPICKSEL[3:0] bits in SPICKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.13 Octal-SPI Clock (OCTACLK, OCTADIVCLK)

The Octal-SPI clock (OCTACLK) is the operating clock for the Octal-SPI module.

Specify the frequency in the following bits:

- OCTACKDIV[3:0] bits in OCTACKDIVCR
- OCTACKSEL[3:0] bits in OCTACKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

OCTADIVCLK always outputs 2-division of OCTACLK.

9.10.14 CANFD Core Clock (CANFDCLK)

The CANFD Core clock (CANFDCLK) is the operating clock for the CANFD module.

Specify the frequency in the following bits:

- CANFDCKDIV[3:0] bits in CANFDCKDIVCR
- CANFDCKSEL[3:0] bits in CANFDCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.15 USB Clock (USBCLK)

The USB clock (USBCLK) is the operating clock for the USBFS and USBHS module.

A 48-MHz clock must be supplied when using the USBFS module or when using the USBHS module in CL-Only mode. USBCLK does not need to be supplied when not using USBHS module in CL-Only mode.

The USBCLK frequency is specified in the following bits:

- USBCKDIV[3:0] bits in USBCKDIVCR
- USBCKSEL[3:0] bits in USBCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0] and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.16 USB Clock (USB60CLK)

The USB clock (USB60CLK) is the operating clock for the USBHS module. A 60-MHz clock must be supplied when using the USBHS module in CL-Only mode. USB60CLK does not need to be supplied when not using USBHS in CL-Only mode.

Specify the frequency in the following bits:

- USB60CKDIV[3:0] bits in USB60CKDIVCR
- USB60CKSEL[3:0] bits in USB60CKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.17 MOSC Clock for USBHS (USBMCLK)

The MOSC clock for USBHS (USBMCLK) is the operating clock for the USBHS when not using the module in CL-Only mode. USBMCLK does not need to be supplied when using USBHS in CL-Only mode.

The USBMCLK frequency is 12 MHz or 20 MHz or 24 MHz or 48 MHz supplied from the main clock oscillator.

9.10.18 ADC Clock (ADCCLK)

The ADC clock, ADCCLK, is the operating clock for the ADC16H module. Specify the frequency in the following bits:

- ADCCKDIV[3:0] bits in ADCCKDIVCR
- ADCCKSEL[3:0] bits in ADCCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLLCCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.19 GPT Clock (GPTCLK)

The GPT clock, GPTCLK, is the operating clock for the GPT module. Specify the frequency in the following bits:

- GPTCKDIV[3:0] bits in GPTCKDIVCR
- GPTCKSEL[3:0] bits in GPTCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLLCCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.20 I3C Clock (I3CCLK)

The I3C clock (I3CCLK) is the operating clock for the I3C module.

Specify the frequency in the following bits:

- I3CCKDIV[3:0] bits in I3CCKDIVCR
- I3CCKSEL[3:0] bits in I3CCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.21 Asynchronous External Bus Clock (BCLKA)

The Asynchronous external bus clock, BCLKA, is the operating clock for the external bus controller. Specify the frequency in the following bits:

- BCKACKDIV[3:0] bits in BCKADIVCR
- BCKACKSEL[3:0] bits in BCKACR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLLCCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.22 EtherSW Clock (ESWCLK)

The EtherSW clock, ESWCLK, is the operating clock for the ESWM module. Specify the frequency in the following bits:

- ESWCKDIV[3:0] bits in ESWCKDIVCR
- ESWCKSEL[3:0] bits in ESWCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLLCCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.23 EtherSW-PHY Clock (ESWPHYCLK)

The EtherSW-PHY clock, ESWPHYCLK, is the operating clock for the ESWM module. Specify the frequency in the following bits:

- ESWPCKDIV[3:0] bits in ESWPCKDIVCR
- ESWPCKSEL[3:0] bits in ESWPCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLLCCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.24 Ether-PHY Clock (ETHPHYCLK)

The Ether-PHY clock, ETHPHYCLK, is the operating clock for the ETHPHYCLK pin output. Specify the frequency in the following bits:

- ETHPCKDIV[3:0] bits in ETHPCKDIVCR
- ETHPCKSEL[3:0] bits in ETHPCKCR
- PLLMUL[8:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[8:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLLCCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.25 CAN Clock (CANMCLK)

The CAN clock (CANMCLK) is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

9.10.26 ULPT Clock (ULPTLCLK, ULPTSCLK)

The ULPT clocks (ULPTLCLK and ULPTSCLK) are the operating clock for the ULPT module. ULPTLCLK is generated by the LOCO clock and ULPTSCLK is generated by the Sub-clock oscillator.

9.10.27 CAC Clock (CACCLK)

The CAC clock (CACCLK) is the operating clock for the CAC. CACCLK includes the following clocks:

- CAC Main clock (CACMCLK) is generated by the Main clock oscillator
- CAC Sub oscillator clock (CACSCLK) is generated by the Sub-clock oscillator
- CAC HOCO clock (CACHCLK) is generated by the HOCO clock
- CAC MOCO clock (CACMOCLK) is generated by the MOCO clock
- CAC LOCO clock (CACLCLK) is generated by the LOCO clock

9.10.28 RTC Clock (RTCSCLK, RTCLCLK)

The RTC clock (RTCSCLK, RTCLCLK) is the operating clock for the RTC.

RTCSCLK is generated by the sub-clock oscillator, and RTCLCLK is generated by the LOCO clock.

9.10.29 IWDT Clock (IWDTCLK)

The IWDT clock (IWDTCLK) is the operating clock for the IWDT.

IWDTCLK is internally generated by the LOCO clock which is always divided by 2.

9.10.30 AGT Clock (AGTSCLK, AGTLCLK)

The AGT clocks (AGTSCLK and AGTLCLK) are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator, and AGTLCLK is generated by the LOCO clock.

9.10.31 PDMIF Clock (PDMIFCLK)

The PDMIF clock, PDMIFCLK, are the operating clock for the PDMIF.

PDMIFCLK is generated by the MOCO clock.

9.10.32 SysTick Timer Clock (SYSTICKCLK)

The SysTick timer clock (SYSTICKCLK) is the operating clock for the SysTick timer. SYSTICKCLK is generated by the MOCO clock which is always divided by 8.

9.10.33 External Pin Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. The CLKOUT is output to the CLKOUT pin when the CKOCR.CKOEN bit is set to 1. Only change the value in the CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR
- HOCOFRQ0[2:0] bits in OFS1(_SEC)[*1]

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

9.10.34 JTAG Clock (JTAGTCK)

The JTAG clock (JTAGTCK) is the clock for the JTAG.

JTAGTCK is generated by the JTAG external clock (TCK).

9.11 Clock Setting

9.11.1 System Clock Setting

9.11.1.1 Initial System Clock Setting

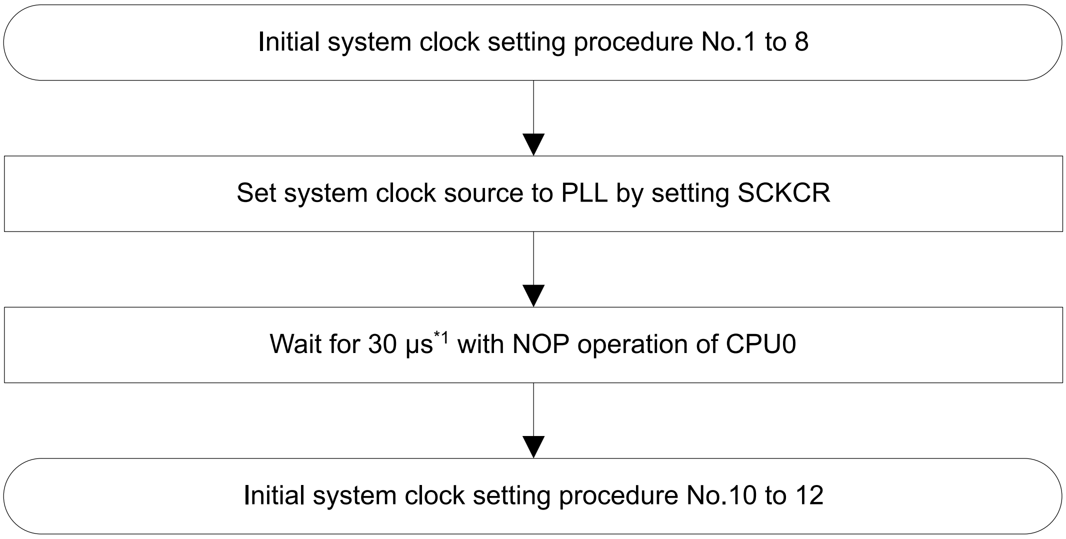
An example of the initial system clock setting procedure is shown in Table 9.7.

Table 9.7 Example of the initial system clock setting procedure after reset release/after Deep Software Standby cancellation

No.	Step	Description
1	Start	After reset release / Deep software standby cancellation (MOCO is selected as system clock source)
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 *1*2bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. *1 For details, see section 11, Low Power Mode.
4	Set a clock source to oscillate	Set a clock source that switches to the system clock source to oscillate.
5	Set MRAM and SRAM Wait Cycle	Set an appropriate access wait count for the MRAM and SRAM according to the frequency at which it operates after the system clock (ICLK), MRICLK and MRPCLK are set. For details, see section 59, MRAM and section 58, SRAM.
6	Set voltage scaling	Set an appropriate target voltage of VDD according to the frequency of each clocks after switching the system clock. For details, see section 11, Low Power Mode.
7	Set internal clock division ratio	Set the internal clock division ratio with SCKDIVCR and SCKDIVCR2 registers.
8	Set External Bus clock output / SDRAM clock output*3	Set the EBCLK pin output setting with BCKCR. Set the SDCLK pin output setting with SDCKOCR.
9	Switch the System Clock source	Switch the system clock source with SCKCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
10	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. *2
11	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 *1*2bit in PRCR register
12	End	System clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.
Note 3. Setting is not necessary if the External bus or SDRAM are not used.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.9. This additional procedure is shown in Figure 9.14. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 30 μs is in DCDC mode, 10 μs in External VDD mode.

Figure 9.14 Additional flow of initial system clock setting when PLL is used for the system clock source (assuming all module stop bits are initial value)

9.11.1.2 System Clock Setting for Faster Frequency

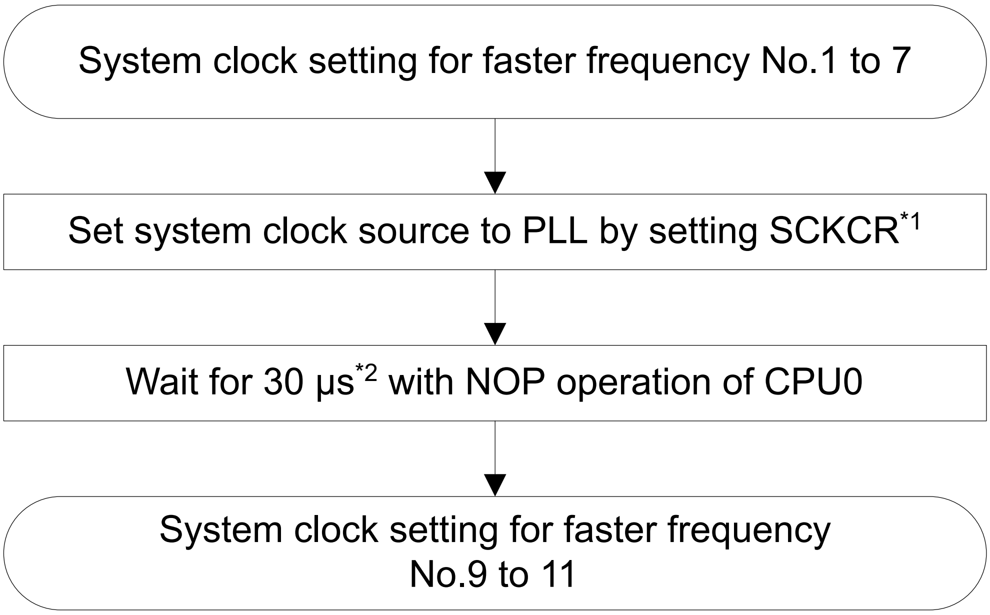
An example of setting procedure when changing the current system clock frequency to a faster frequency is shown in Table 9.8

Table 9.8 Example of setting procedure when changing the current system clock frequency to a faster frequency

No.	Step	Description
1	Start	
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1[*1*2] bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode[*1]	Change to High-Speed mode with OPCCR register.[*1] For details, see section 11, Low Power Mode.
4	Set a clock source to oscillate[*3]	Set a clock source that switches to the system clock source to oscillate.[*4]
5	Set MRAM and SRAM Wait Cycle	Set an appropriate access wait count for the MRAM and SRAM according to the frequency at which it operates after the system clock (ICLK), MRICLK and MRPCLK are set. For details, see section 59, MRAM and section 58, SRAM.
6	Set voltage scaling	Set an appropriate target voltage of VDD according to the frequency of each clocks after switching the system clock. For details, see section 11, Low Power Mode.
7	Set internal clock division ratio	Set the internal clock division ratio with SCKDIVCR and SCKDIVCR2 registers.
8	Switch the System Clock source[*3]	Switch the system clock source with SCKCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. [*2]
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1[*1*2] bit in PRCR register
11	End	System clock is changed to a Faster frequency.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.
Note 3. Setting is not necessary if the system clock source is not changed.
Note 4. To change the frequency of the PLL selected as the system clock source, it is necessary to change the system clock source to another clock source, stop the PLL, and then change the PLL setting.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.8. This additional procedure is shown in Figure 9.15. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. Do not set SCKCR when the PLL is already selected.
Note 2. 30 μs is in DCDC mode, 10 μs in External VDD mode.

Figure 9.15 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK0 to be faster frequency

9.11.1.3 System Clock Setting for Slower frequency

An example of setting procedure when changing the current system clock frequency to a slower frequency is shown in Table 9.9.

Table 9.9 Example of setting procedure when changing the current system clock frequency to a slower frequency (1 of 2)

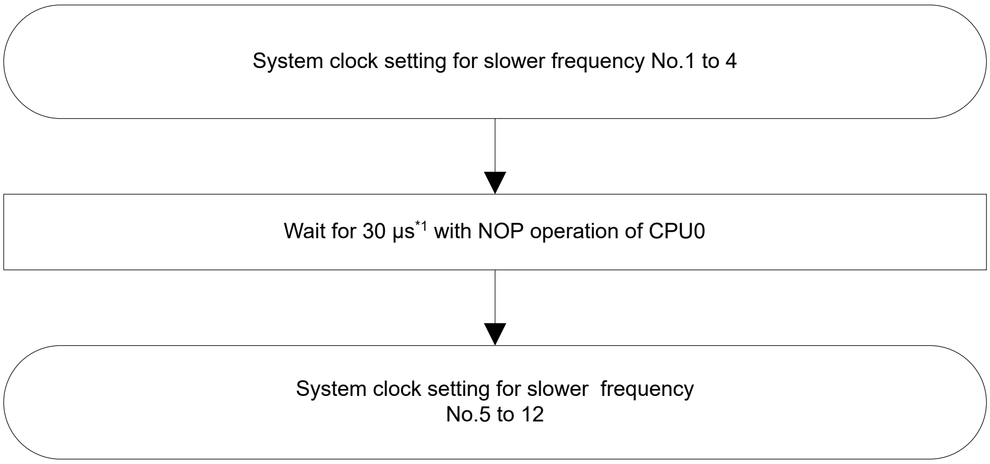
No.	Step	Description
1	Start	
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1*1*2 bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register.*1 For details, see section 11, Low Power Mode.
4	Set a clock source to oscillate*3	Set a clock source that switches to the system clock source to oscillate.*4
5	Set internal clock division ratio	Make the following settings so that the frequency does not exceed the electrical characteristics range when the system clock source is switched in the next step. ● Set the internal clock division ratio larger than the current division ratio. ● Set the internal clock division ratio so that the frequency after switching the system clock source is slower than the current frequency.*3
6	Switch the System Clock source*3	Switch the system clock source with SCKCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
7	Re-set internal clock division ratio	Re-set the internal clock division ratio with SCKDIVCR and SCKDIVCR2 registers according to the frequency after switching the system clock source.

Table 9.9 Example of setting procedure when changing the current system clock frequency to a slower frequency (2 of 2)

No.	Step	Description
8	Set voltage scaling	Set an appropriate target voltage of VDD according to the frequency of each clocks after switching the system clock. For details, see section 11, Low Power Mode.
9	Set MRAM and SRAM Wait Cycle	Set an appropriate access wait count for the MRAM and SRAM according to the frequency at which it operates after the system clock (ICLK), MRICLK and MRPCLK are set. For details, see section 59, MRAM and section 58, SRAM.
10	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. [*2]
11	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 [*1*2] bit in PRCR register
12	End	System clock is changed to a Slower frequency.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.
Note 3. Setting is not necessary if the system clock source is not changed.
Note 4. To change the frequency of the PLL selected as the system clock source, it is necessary to change the system clock source to another clock source, stop the PLL, and then change the PLL setting.

When the PLL1 is selected as the system clock source before switching the system clock source, additional procedure is required before procedure No.5. This additional procedure is shown in Figure 9.16. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 30 μs is in DCDC mode, 10 μs in External VDD mode.

Figure 9.16 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK0 to be slower frequency

9.11.2 Peripheral Module-dedicated Clock Setting

This section describes the setting procedure of the operating clock for the peripheral module. The target clocks are as follows : SCICLK, SPICLK, OCTACLK, CANFDCLK, USBCLK,USB60CLK, ADCCLK, GPTCLK, I3CCLK, BCLKA, ESWCLK, ESWPHYCLK and ETHPHYCLK.

9.11.2.1 Initial Peripheral Module-dedicated Clock Setting

An example of the initial clock setting procedure for peripheral module is shown in Table 9.10.

Table 9.10 Example of the setting procedure of the operating clock for peripheral module after reset release/after Deep Software Standby cancellation

No.	Step	Description
1	Start	After reset release / Deep software standby cancellation (MOCO is selected as system clock source)
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 *1*2bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. *1 For details, see section 11, Low Power Mode.
4	Set CKSREQ and wait for setting CKSRDY	Write 1 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 1 While CKSRDY is 1, the clock supply stops.
5	Set a clock source to oscillate	Set a clock source that switches to the peripheral module-dedicated clock source to oscillate.
6	Set the clock division ratio and switch the clock source	Write the setting value to CKDIV[3:0] in each CKDIVCR register. Write the setting value to CKSEL[3:0] in each CKCR register.
7	Clear CKSREQ and wait for clearing CKSRDY	Write 0 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 0. After CKSRDY is 0, the clock supply starts.
8	Cancel the Module Stop Control	Cancel the Module Stop Control in MSTPCRn register (n = A to E) and supply clock to peripheral module.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register.*2
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
11	End	Clock setting is completed. And then, set the peripheral modules.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.

9.11.2.2 Peripheral Module-dedicated Clock Source Changing

Table 9.11 shows an example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use.

Table 9.11 Example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use (1 of 2)

No.	Step	Description
1	Start	The operating clock for the peripheral module is being used.
2	Stop the peripheral module	Stop the operation of the peripheral module that the operating clock is to be changed.
3	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1*1*2bit in PRCR register
4	Change Operating Power Control Mode to High-Speed mode *1	Change to High-Speed mode with OPCCR register.*1 For details, see section 11, Low Power Mode.
5	Set CKSREQ and wait for setting CKSRDY	Write 1 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 1. While CKSRDY is 1, the clock supplying stops.
6	Set a clock source to oscillate	Set a clock source that switches to the peripheral module-dedicated clock source to oscillate.
7	Set the clock division ratio and switch the clock source	Write the setting value to CKDIV[3:0] in each CKDIVCR register. Write the setting value to CKSEL[3:0] in each CKCR register.
8	Clear CKSREQ and wait for clearing CKSRDY	Write 0 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 0. After CKSRDY is 0, the clock supplying starts.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. *2
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register

Table 9.11 Example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use (2 of 2)

No.	Step	Description
11	Restart the peripheral module	Change the peripheral module settings according to the operating clock after the settings are changed. After that, restart the operation of the peripheral module.
12	End	Clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.

9.11.2.3 Peripheral Module-dedicated Clock Division Ratio Changing

Table 9.12 shows an example of the setting change procedure when switching the division ratio of the operating clock for peripheral module in use.

Table 9.12 Example of the setting change procedure when switching the division ratio of the operating clock for peripheral module in use (without the clock source change)

No.	Step	Description
1	Start	The operating clock for the peripheral module is being used.
2	Stop the peripheral module	Stop the operation of the peripheral module that the operating clock is to be changed.
3	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 *1*2 bit in PRCR register
4	Change Operating Power Control Mode to High-Speed mode *1	Change to High-Speed mode with OPCCR register. *1 For details, see section 11, Low Power Mode.
5	Set the clock division ratio	Write the setting value to CKDIV[3:0] in each CKDIVCR register.
6	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register.*2
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
8	Restart the peripheral module	Change the peripheral module settings according to the operating clock after the settings are changed. After that, restart the operation of the peripheral module.
9	End	Clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.

9.11.3 Main Clock Oscillator Setting

Table 9.13 shows an example of the initial setting procedure for the Main Clock Oscillator.

Table 9.13 Example of the initial setting procedure for Main Clock Oscillator after reset release / after Deep Software Standby cancellation (1 of 2)

No.	Step	Description
1	Start	The Main Clock Oscillator is stopped after reset release / Deep software standby cancellation
2	Cancel Register Write Protection	Set 1 to PRC0 bit in PRCR register
3	Set the mode of Main Clock Oscillator	Set the following Main Clock Oscillator mode with MOMCR register ● Resonator or Clock input ● Drive Capability
4	Set the oscillation stabilization wait time	Set the Main Clock Oscillator Wait Time in MOSCWTCR register.
5	Set the oscillation keep in Software Standby mode	Set MOSCSCR register if Main Clock Oscillator keeps oscillation in Software Standby mode.
6	Set the Main Clock Oscillator to operate	Set the Main Clock Oscillator to start oscillating with the MOSCCR register.
7	Wait for Main Clock oscillation to stabilize	Polling until MOSCSF bit in OSCSF register is read as 1 (Oscillation is stable)

Table 9.13 Example of the initial setting procedure for Main Clock Oscillator after reset release / after Deep Software Standby cancellation (2 of 2)

No.	Step	Description
8	Apply Register Write Protection	Set 0 to PRC0 bit in PRCR register
9	End	The Main Clock Oscillator setting is completed. The Main Clock is available.

9.11.4 Sub-Clock Oscillator Setting

Table 9.14 shows an example of the initial setting procedure for the Sub-Clock Oscillator.

Table 9.14 Example of the initial setting procedure for Sub-Clock Oscillator after VBAT Power On Reset release

No.	Step	Description
1	Start	The Sub-Clock Oscillator is stopped after VBAT Power On Reset release.
2	Cancel Register Write Protection	Set 1 to PRC0 bit in PRCR register
3	Setting the mode of Sub-Clock Oscillator	Set the following Sub-Clock Oscillator mode with SOMCR register ● Resonator or Clock input ● Drive Capability
4	Set the Sub-Clock Oscillator to operate	Set the Sub-Clock Oscillator to start oscillating with the SOSCCR register.
5	Wait for Sub-Clock oscillation to stabilize	Wait for sub-clock oscillation stabilization time (tSUBOSCWT). For the sub-clock oscillation stabilization time, see section 62, Electrical Characteristics.
6	Apply Register Write Protection	Set 0 to PRC0 bit in PRCR register
7	End	The Sub-Clock Oscillator setting is completed. The Sub-Clock is available.

9.11.5 High-speed On Chip Oscillator Setting

9.11.5.1 HOCO Initial Clock Setting

Table 9.15 shows an example of the initial setting procedure for the HOCO.

Table 9.15 Example of the HOCO initial setting procedure after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1, without FLL)

No.	Step	Description
1	Start	The HOCO is stopped after reset release / Deep software standby cancellation when OFS1(_SEC).HOCOEN is 1.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Check the HOCO power supply*1	Check the following bit in the HOCOLDOCR register ● LDOSTP bit is 0 (LDO is enabled)
4	Set the HOCO frequency	Set the HOCO frequency with HOCOCR2 register
5	Set the oscillation keep in Software Standby mode	If HOCO keeps oscillation in Software Standby mode, set the following: ● HOCOSOKP bit in HOCOSCR register ● SKEEP bit in HOCOLDOCR register
6	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCR register.
7	Wait for HOCO clock oscillation to stabilize	Polling until HOCOSF bit in OSCSF register is read as 1 (Oscillation is stable)
8	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
9	End	HOCO clock setting is completed.HOCO Clock is available.

Note 1. When HOCOLDOCR.LDOSTP bit is 1, do not operate HOCO. If HOCOLDOCR.LDOSTP is switched from 1 to 0, waiting for the HOCO power supply to stabilize is required. See section 62, Electrical Characteristics on waiting time for the HOCO power supply to stabilize.

9.11.5.2 HOCO Setting with FLL Function

Table 9.16 shows an example of the initial setting procedure for HOCO with FLL function.

Table 9.17 shows the FLL function setting flow for the Software Standby mode transition and cancellation.

Table 9.16 Example of the HOCO setting procedure with FLL function after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1)

No.	Step	Description
1	Start	The HOCO is stopped after reset release / Deep software standby cancellation when OFS1(_SEC).HOCOEN is 1.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Check the HOCO power supply*1	Check the following bit in the HOCOLDOCR register. ● LDOSTP bit is 0 (LDO is enabled)
4	Set the HOCO frequency	Set the HOCO frequency with HOCOCR2 register
5	Set the FLL function to enable*2	Set the FLL Multiplication Control with FLLCR2 register. Set the FLL function to enable with FLLCR1 register.
6	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCR register.
7	Wait for HOCO clock oscillation to stabilize	Polling until HOCOSF bit in OSCSF register is read as 1 (Oscillation is stable)
8	Wait for FLL stabilization	Wait for FLL stabilization wait time (t_{FLLWT}), or wait until the HOCO clock is measured to confirm that the frequency accuracy is stable.
9	Check the HOCO stabilization	Check that HOCOSF bit in OSCSF register is read as 1
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
11	End	FLL setting is completed. HOCO Clock is available.

Note 1. When HOCOLDOCR.LDOSTP bit is 1, do not operate HOCO.
If HOCOLDOCR.LDOSTP is switched from 1 to 0, waiting for the HOCO power supply to stabilize is required. See section 62, Electrical Characteristics on waiting time for the HOCO power supply to stabilize.
Note 2. Sub-Clock Oscillator must be oscillating with the stabilization.

Table 9.17 FLL setting flow for Software Standby mode transition and cancellation

No.	Step	Description
1	Start	The HOCO is oscillating with FLL is enabled
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Stop HOCO*1	Set HOCO to stop with HOCOCR register.
4	Disable FLL	Set the FLL function to disable with FLLCR1 register.
5	WFI instruction*2	Transition to Software Standby mode with WFI instruction
6	Software Standby mode*2	MCU is in Software Standby mode
7	Cancellation Software Standby mode*2	Software Standby mode is cancelled
8	Set the FLL function to enable*3	Set the FLL Multiplication Control with FLLCR2 register. Set the FLL function to enable with FLLCR1 register.
9	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCR register.
10	Wait for FLL stabilization	Wait for FLL stabilization wait time (t_{FLLWT}), or wait until the HOCO clock is measured to confirm that the frequency accuracy is stable.
11	Check the HOCO stabilization	Check that HOCOSF bit in OSCSF register is read as 1.
12	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
13	End	HOCO Clock is available.

Note 1. If HOCO is used as the system clock source or the clock source of PLL, these clock source must be changed to another clock before HOCO is stopped.
Note 2. See section 11, Low Power Mode for detail of Software Standby mode.
Note 3. Sub-Clock Oscillator must be oscillating with the stabilization.

9.11.6 PLL Setting

9.11.6.1 PLL Initial Clock Setting

Table 9.18 shows an example of the initial setting procedure for the PLL.

Table 9.18 Example of the PLL initial setting procedure after reset release / after Deep Software Standby cancellation (PLL1 or PLL2)

No.	Step	Description
1	Start	The PLL1 is stopped after reset release / Deep software standby cancellation. The PLL2 is stopped after reset release / Deep software standby cancellation.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register.
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. For details, see section 11, Low Power Mode.
4	Check the PLL power supply*2	[PLL1] Check the following bit in the PLL1LDOCR register. ● LDOSTP bit is 0 (LDO is enabled). [PLL2] Check the following bit in the PLL2LDOCR register. ● LDOSTP bit is 0 (LDO is enabled).
5	Configure the PLL settings	[PLL1] Configure the following PLL1 settings in PLLCCR and PLLCCR2 registers. [PLL2] Configure the following PLL2 settings in PLL2CCR and PLL2CCR2 registers. [Setting Items] ● PLL input frequency division ratio ● PLL clock source ● Frequency Multiplication Factor ● Frequency Multiplication Fractional Factor ● PLL Output Frequency Division Ratio (P/Q/R)
6	Set PLL to operate	[PLL1] Set PLL1 to start oscillating with the PLLCR register. [PLL2] Set PLL2 to start oscillating with the PLL2CR register.
7	Wait for PLL clock oscillation to stabilize	[PLL1] Polling until PLLSF bit in OSCSF register is read as 1 (Oscillation is stable). [PLL2] Polling until PLL2SF bit in OSCSF register is read as 1 (Oscillation is stable).
8	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
9	End	PLL1 or PLL2 clock setting is completed. [PLL1] PLL1P, PLL1Q, PLL1R clocks are available. [PLL2] PLL2P, PLL2Q, PLL2R clocks are available.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. When PLL1LDOCR.LDOSTP bit is 1, do not operate PLL1.
If PLL1LDOCR.LDOSTP is switched from 1 to 0, waiting for the PLL1 power supply to stabilize is required. See section 62, Electrical Characteristics on waiting time for the PLL1 power supply to stabilize.
When PLL2LDOCR.LDOSTP bit is 1, do not operate PLL2.
If PLL2LDOCR.LDOSTP is switched from 1 to 0, waiting for the PLL2 power supply to stabilize is required. See section 62, Electrical Characteristics on waiting time for the PLL2 power supply to stabilize.

9.11.6.2 PLL Clock Setting Change

Table 9.19 shows an example of the initial setting procedure for the PLL.

Table 9.19 Example of the PLL setting change procedure (PLL1 or PLL2)

No.	Step	Description
1	Start	PLL1 is oscillating and the PLL1 clocks (PLL1P, PLL1Q, PLL1R) are being used. PLL2 is oscillating and the PLL2 clocks (PLL2P, PLL2Q, PLL2R) are being used.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register.
3	Stop PLL*1	[PLL1] Set PLL1 to stop with PLLCR register. [PLL2] Set PLL2 to stop with PLL2CR register.
4	Change the PLL settings	[PLL1] Configure the following PLL1 settings in PLLCCR and PLLCCR2 registers. [PLL2] Configure the following PLL2 settings in PLL2CCR and PLL2CCR2 registers. [Setting Items] ● PLL input frequency division ratio ● PLL clock source ● Frequency Multiplication Factor ● Frequency Multiplication Fractional Factor ● PLL Output Frequency Division Ratio (P/Q/R)
5	Set PLL to operate	[PLL1] Set PLL1 to start oscillating with the PLLCR register. [PLL2] Set PLL2 to start oscillating with the PLL2CR register.
6	Wait for PLL clock oscillation to stabilize	[PLL1] Polling until PLLSF bit in OSCSF register is read as 1 (Oscillation is stable). [PLL2] Polling until PLL2SF bit in OSCSF register is read as 1 (Oscillation is stable).
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register.
8	End	PLL1 or PLL2 clock setting change is completed. [PLL1] PLL1P, PLL1Q, PLL1R clocks are available. [PLL2] PLL2P, PLL2Q, PLL2R clocks are available.

Note 1. If PLL1P clock is used as the system clock source, the system clock source must be changed to another clock source before PLL1 is stopped.

9.12 Usage Notes

9.12.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR and SCKDIVCR2 register:

- CPU0 clock (CPUCLK0)
- CPU1 clock (CPUCLK1)
- MRAM code bus clock (MRICLK)
- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE)
- MRAM peripheral bus clock (MRPCLK)
- external bus clock (BCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See section 62, Electrical Characteristics.

- Each clock must be set according to Table 9.2.
- Do not change the clock frequency during external bus access. Furthermore, when access via the external bus is to start after a change to the clock frequency, only start access via the bus after confirming that the change to the frequencies has been completed.

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

9.12.2 Notes on Resonator

Because various resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in Figure 9.5. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

9.12.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in Figure 9.17 to prevent electromagnetic induction from interfering with correct oscillation. Figure 9.17 shows the case which the main clock oscillator is used. In case of sub-clock oscillator, it is also same as Figure 9.17.

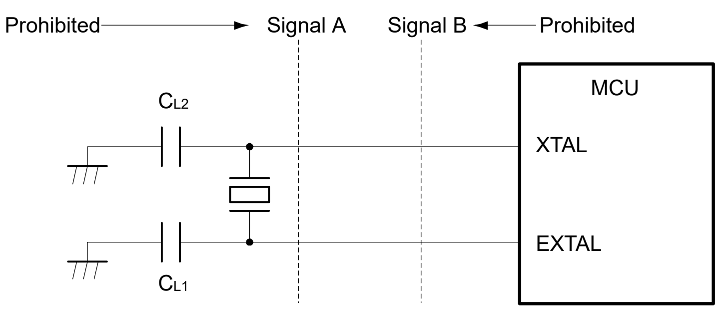


Figure 9.17 Signal routing in board design for oscillation circuit

9.12.4 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

When the sub-clock is not used, the XCIN and XCOUT pins can be used as general ports. When these pins are used as the general ports, the sub-clock must be stopped (SOSCCR.SOSTP bit should be set to 1).

9.12.5 Notes on Using Sub-Clock Oscillator

The output of the P212 (EXTAL), P213 (XTAL), P408 (for BGA-289pin) and P415 (for BGA-224pin) pins may affect the oscillation by the sub-clock oscillator.

If the sub-clock oscillator is used, implement board design so as not to affect the oscillation. Renesas strongly recommends setting the PmnPFS.DSCR[1:0] bits to 00b or 01b when using the P212 (EXTAL), P213 (XTAL), P408 (for BGA-289pin) and P415 (for BGA-224pin) as output pins and using the sub-clock oscillator.

In addition, when using the sub-clock oscillator in Low power mode drive capability (SOMCR.SODRV[1:0]= 01b, 10b and 11b), Renesas recommends setting the PmnPFS.DSCR[1:0] bits to 00b when using the P212 (EXTAL), P213 (XTAL), P408 (for BGA-289pin) and P415 (for BGA-224pin) as output pins and using the sub-clock oscillator.

9.12.6 Notes on Reset Conditions of SOSC and LOCO

RTC is not initialized by any reset source.

SOSC and LOCO can be selected as the clock source of RTC. The followings are the states of SOSC and LOCO when reset occurs.

Table 9.20 Reset Behavior of SOSC

Clock source	Item	Reset source	
		VBATT_POR reset	Other
SOSC	Enable or disable Drive capability	Initialized to enable	continue the state before the reset occurs

Table 9.21 Reset Behavior of LOCO

Clock source	Item	Reset source	
		Power-on reset/ Voltage-Monitoring 0, 4, 5 reset/ Core Voltage Monitor reset/ Deep software standby 2, 3 reset	Other
LOCO	Enable or disable	Initialized to enable	
	Oscillation accuracy*1	Initialized to accuracy before trimming by LOCOUTCR (accuracy : ±15 %)	Continue the accuracy that was trimmed by LOCOUTCR

Note 1. If the LOCO that is trimmed by LOCOUTCR is selected as the RTC source clock, please be careful that LOCO oscillation accuracy will be initialized by Power-on reset, Voltage-Monitor 0, 4, 5 reset, Core Voltage-Monitor reset and Deep software standby 2, 3 reset.

When a reset is canceled, a reset exception handling starts.

For details on the reset exception handling, see section 6, Resets

10. Clock Frequency Accuracy Measurement Circuit (CAC)

10.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

Table 10.1 lists the CAC specifications, Figure 10.1 shows the CAC block diagram, and Table 10.2 lists the CAC I/O pin.

Table 10.1 CAC specifications

Parameter	Specifications
Measurement target clocks	Frequency can be measured for: ● Main clock oscillator (CACMCLK) ● Sub-clock oscillator (CACSCLK) ● HOCO clock (CACHCLK) ● MOCO clock (CACMOCLK) ● LOCO clock (CACLCLK) ● Peripheral module clock B (PCLKB)
Measurement reference clocks	Frequency can be referenced to: ● External clock input to the CACREF pin ● Main clock oscillator (CACMCLK) ● Sub-clock oscillator (CACSCLK) ● HOCO clock (CACHCLK) ● MOCO clock (CACMOCLK) ● LOCO clock (CACLCLK) ● Peripheral module clock B (PCLKB)
Selectable function	Digital filter
Interrupt sources	● Measurement end ● Frequency error ● Overflow
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set

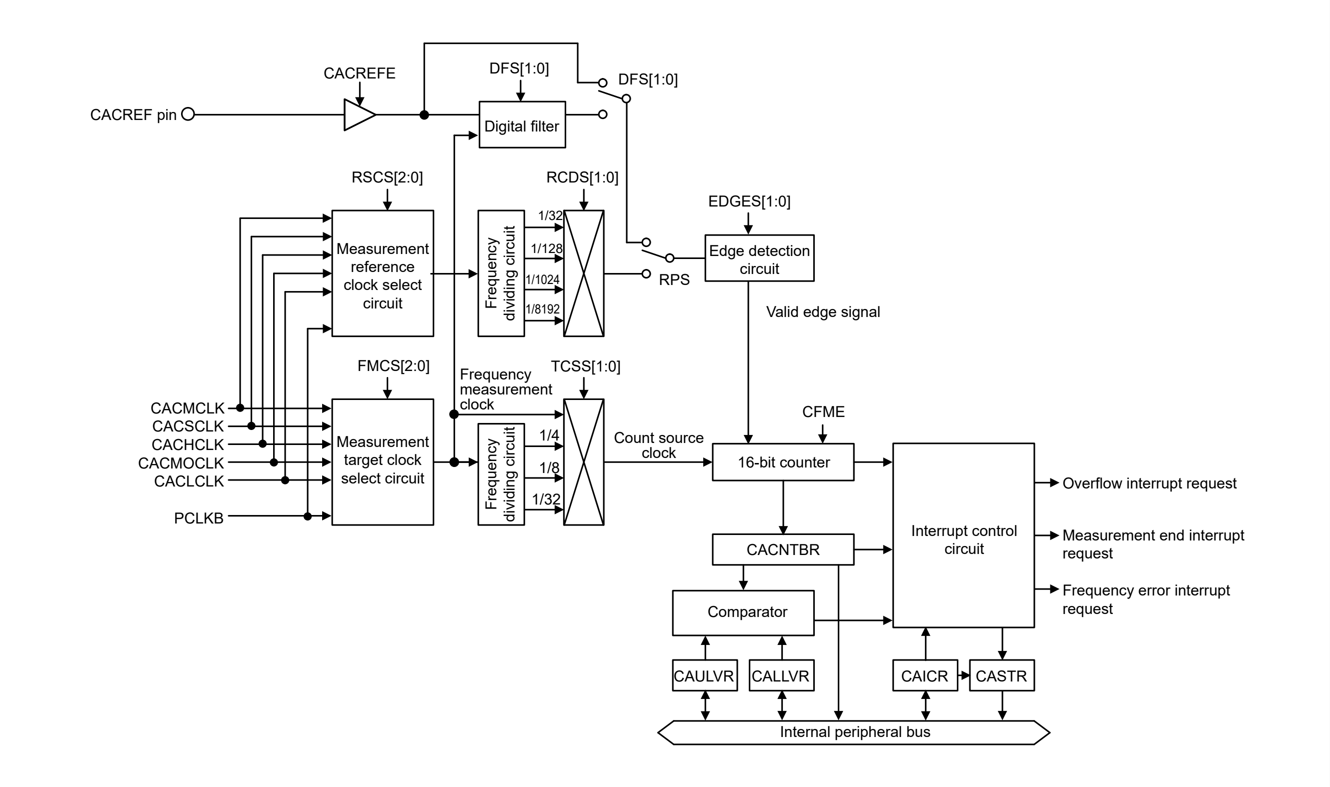

Figure 10.1 CAC block diagram

Table 10.2 CAC I/O pin

Function	Pin name	I/O	Description
CAC	CACREF	Input	Measurement reference clock input pin

10.2 Register Descriptions

10.2.1 CACR0 : CAC Control Register 0

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CFME
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CFME	Clock Frequency Measurement Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables clock frequency measurement. When this bit is rewritten, it takes some time for the change to be reflected in the internal circuit. If this bit is rewritten when the previous value has not been reflected in the internal circuit, the write is ignored. Read the bit to check if the rewrite has been reflected.

10.2.2 CACR1 : CAC Control Register 1

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	EDGES[1:0]		TCSS[1:0]		FMCS[2:0]			CACREFE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CACREFE	CACREF Pin Input Enable 0: Disable 1: Enable	R/W
3:1	FMCS[2:0]	Measurement Target Clock Select 0 0 0: Main clock oscillator (CACMCLK) 0 0 1: Sub-clock oscillator (CACSCLK) 0 1 0: HOCO clock (CACHCLK) 0 1 1: MOCO clock (CACMOCLK) 1 0 0: LOCO clock (CACLCLK) 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
5:4	TCSS[1:0]	Timer Count Clock Source Select 0 0: No division 0 1: × 1/4 clock 1 0: × 1/8 clock 1 1: × 1/32 clock	R/W
7:6	EDGES[1:0]	Valid Edge Select 0 0: Rising edge 0 1: Falling edge 1 0: Both rising and falling edges 1 1: Setting prohibited	R/W

Note: S-TYPE3, P-TYPE3
Note: Set the CACR1 register when the CACR0.CFME bit is 0.

CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

TCSS[1:0] bits (Timer Count Clock Source Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

10.2.3 CACR2 : CAC Control Register 2

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DFS[1:0]		RCDS[1:0]		RSCS[2:0]			RPS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RPS	Reference Signal Select 0: CACREF pin input 1: Internal clock (internally generated signal)	R/W
3:1	RSCS[2:0]	Measurement Reference Clock Select 0 0 0: Main clock oscillator (CACMCLK) 0 0 1: Sub-clock oscillator (CACSCLK) 0 1 0: HOCO clock (CACHCLK) 0 1 1: MOCO clock (CACMOCLK) 1 0 0: LOCO clock (CACLCLK) 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
5:4	RCDS[1:0]	Measurement Reference Clock Frequency Division Ratio Select 0 0: × 1/32 clock 0 1: × 1/128 clock 1 0: × 1/1024 clock 1 1: × 1/8192 clock	R/W
7:6	DFS[1:0]	Digital Filter Select 0 0: Disable digital filtering 0 1: Use sampling clock for the digital filter as the frequency measuring clock 1 0: Use sampling clock for the digital filter as the frequency measuring clock divided by 4 1 1: Use sampling clock for the digital filter as the frequency measuring clock divided by 16.	R/W

Note: S-TYPE3, P-TYPE3
Note: Set the CACR2 register when the CACR0.CFME bit is 0.

RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency-divisor of the reference clock for measurement when an internal reference clock is selected. When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

DFS[1:0] bits (Digital Filter Select)

The DFS[1:0] bits enable or disable the digital filter and selects its sampling clock.

10.2.4 CAICR : CAC Interrupt Control Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	OVFFCL	MENDFCL	FERRFCL	—	OVFIE	MENDIE	FERRIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FERRIE	Frequency Error Interrupt Request Enable 0: Disable 1: Enable	R/W
1	MENDIE	Measurement End Interrupt Request Enable 0: Disable 1: Enable	R/W
2	OVFIE	Overflow Interrupt Request Enable 0: Disable 1: Enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	FERRFCL	FERRF Clear 0: No effect 1: The CASTR.FERRF flag is cleared	W
5	MENDFCL	MENDF Clear 0: No effect 1: The CASTR.MENDF flag is cleared	W
6	OVFFCL	OVFF Clear 0: No effect 1: The CASTR.OVFF flag is cleared.	W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables or disables the frequency error interrupt request.

MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables or disables the measurement end interrupt request.

OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables or disables the overflow interrupt request.

FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

10.2.5 CASTR : CAC Status Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	OVFF	MENDF	FERRF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FERRF	Frequency Error Flag 0: Clock frequency is within the allowable range 1: Clock frequency has deviated beyond the allowable range (frequency error).	R
1	MENDF	Measurement End Flag 0: Measurement is in progress 1: Measurement ended	R
2	OVFF	Overflow Flag 0: Counter has not overflowed 1: Counter overflowed	R
7:3	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement ends.

[Clearing condition]

- 1 is written to the MENDFCL bit.

OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the CAICR.OVFFCL bit.

10.2.6 CAULVR : CAC Upper-Limit Value Setting Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x06

Bit position:	15															0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	The Upper Value of the Allowable Range The CAULVR register is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

Note: S-TYPE3, P-TYPE3

10.2.7 CALLVR : CAC Lower-Limit Value Setting Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x08

Bit position:	15															0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	The Lower Value of the Allowable Range The CALLVR register is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

Note: S-TYPE3, P-TYPE3

10.2.8 CACNTBR : CAC Counter Buffer Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x0A

Bit position:	15															0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	The Measurement Result The CACNTBR register is a 16-bit read-only register that stores the measurement result.	R

Note: S-TYPE3, P-TYPE3

10.3 Operation

10.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. Figure 10.2 shows an operating example of the CAC.

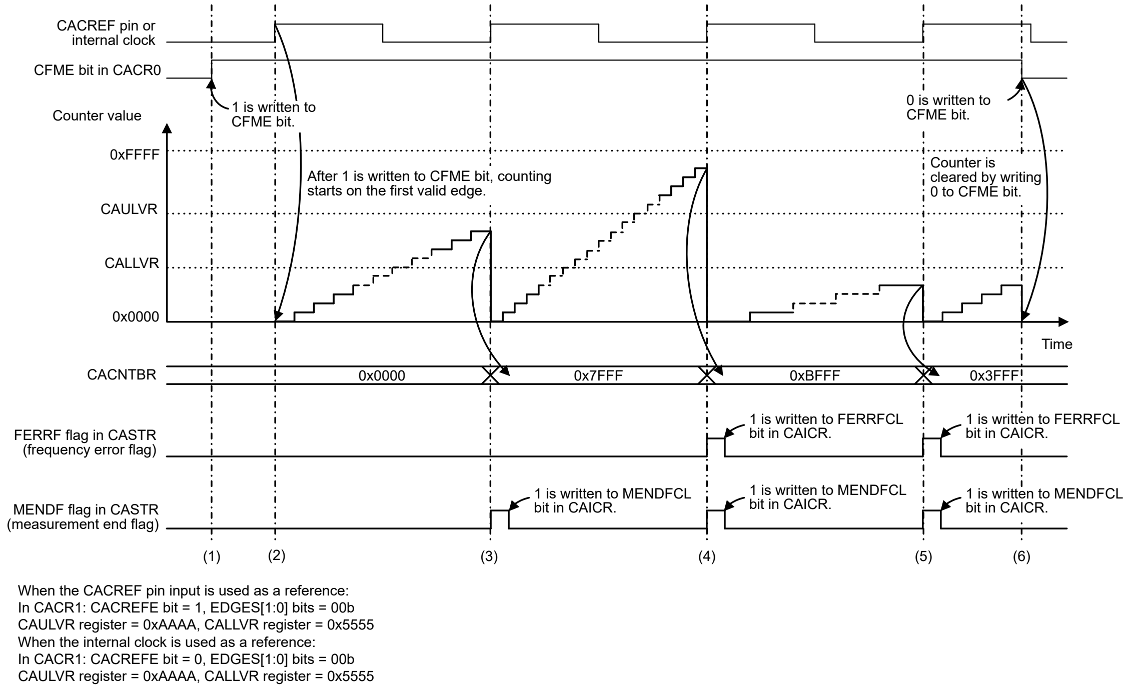

Figure 10.2 CAC operating example

The events in Figure 10.2 are:

1. When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
2. When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 10.2) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 10.2) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both CACNTBR ≤ CAULVR and CACNTBR ≥ CALLVR are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR > CAULVR, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR < CALLVR, the FERRF flag in CASTR is set to 1, because the clock frequency

is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.

6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

10.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

10.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. Table 10.3 provides information on the CAC interrupt requests.

Table 10.3 CAC interrupt requests

Interrupt request	Interrupt enable bit	Status flag	Interrupt sources
Frequency error interrupt	CAICR.FERRIE	CASTR.FERRF	The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR
Measurement end interrupt	CAICR.MENDIE	CASTR.MENDF	● Valid edge is input from the CACREF pin or internal clock ● Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit
Overflow interrupt	CAICR.OVFIE	CASTR.OVFF	Counter overflows

10.5 Usage Notes

10.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Mode.

11. Low Power Mode

11.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, EBCLK output control, SDCLK output control, stopping modules, power gating control, selecting operating power control modes, and transitions to low power modes.

Table 11.1 lists the specifications of functions to reduce power consumption. Table 11.2 to Table 11.4 lists the conditions to shift to low power modes, states of the CPU and peripheral modules, and the method for cancelling each mode. After a reset, the MCU enters the program execution state, but modules, except for the DMAC, DTC, and SRAM, do not operate.

Table 11.1 Specifications of the low-power mode functions

Parameter	Specification
Reducing power consumption by switching clock signals	The frequency division ratio can be selected independently for the system clock, peripheral module clock, external bus clock, and MRAM interface clock.*1
EBCLK output control	BCLK output or high-level output can be selected.
SDCLK output control	SDCLK output or high-level output can be selected.
Module-stop	Functions can be stopped independently for each peripheral module.
Power gating control	This function can be controlled the power state of the power domain. ● Control the turning On/OFF for the power domain ● Control the retention of specific circuits during power gating
Processor low power modes	● CPU Sleep mode ● CPU Deep Sleep mode
Low power modes	● Software Standby mode*2 ● Deep Software Standby mode1, 2, 3*2

Note 1. For details, see section 9, Clock Generation Circuit.
Note 2. This mode is not supported in external VDD mode.

Table 11.2 Operating state of processor low power mode (1 of 2)

Note: Selectable means that operating or not operating can be selected by setting the control registers before entering Processor Low Power Mode.
Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.
Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.
"—" means that the operation is not affected.

Note 1. In IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. Also, operating or stopping is selected by setting the IWDT.IWDTCSTPR.SLCSTP bit in IWDT register start mode.
In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Also, operating or stopping is selected by setting the WDT.WDTCSTPR.SLCSTP bit in WDT register start mode.

Note 2. This function is operating if debugger is connecting (DBGSTR.CDBGPWRUPREQ = 1 and SYOCDCR.DBGEN = 1) before entering this mode.

Note 3. This function is operating if debugger is connecting (DBGSTR.CDBGPWRUPREQ = 1 and SYOCDCR.DBGEN = 1) and TRCKCR.TRCKEN = 1 before entering this mode.

Note 4. If PDRAMSCR1.RKEEP0 bit is set to 0, the contents of the CPU0 TCM is not retained.

Note 5. Valid interrupt requests are any interrupt or exception that are not masked by the priority level of current exception and the priority level set by BASEPRI. In addition, if the interrupt request is based on IELSRn, the interrupt must be enabled by NVIC_ISERn.

I/O Ports	Retained*9	Retained*9		

Note: **Selectable** means that operating or not operating can be selected by setting the control registers before low power mode.
Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.
Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off. After canceling from each low power mode, the internal registers are initialized.

Note 1. In IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. Also, operating or stopping is selected by setting the IWDT.IWDTCSTPR.SLCSTP bit in IWDT register start mode.

Note 2. If IWDT is not used and LOCOCR.LCSTP = 0, LOCO is not stopped in Software Standby mode or Deep Software Standby mode 1.
If IWDT is used and IWDT Stop Control bit is 0 (OFS.IWDTSTPCTL = 0 or IWDT.IWDTCSTPR.SLCSTP = 0), LOCO is not stopped regardless the value of LOCOCR.LCSTP in Software Standby mode or Deep Software Standby mode 1.
If IWDT is used and IWDT Stop Control bit is 1 (OFS.IWDTSTPCTL = 1 or IWDT.IWDTCSTPR.SLCSTP = 1), LOCO is not stopped with LOCOCR.LCSTP = 0 in Software Standby mode or Deep Software Standby mode 1.
In other cases, LOCO is stopped in Software Standby mode or Deep Software Standby mode 1.

Note 3. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010 (LOCO) and 100 (SOSC).

Note 4. Only sub clock oscillator can be selected as the count source clock for RTC. When the RCR4.RCKSEL bit set to 1 (LOCO), the LPSCR must set to Deep Software Standby mode 1 before entering Deep Software Standby mode.

Note 5. AGT0 operation is possible when 100 (AGTLCLK) or 110 (AGTSCLK) is selected by the AGT0.AGTMR1.TCK[2:0] bits.
AGT1 operation is possible when 100 (AGTLCLK), 110 (AGTSCLK) or 101 (Underflow event signal from AGT0) is selected by the AGT1.AGTMR1.TCK[2:0] bits.

Note 6. Only IIC0 wakeup interrupt is available.

Note 7. When using PVD in Deep Software Standby mode, LPSCR must be set to DSTBY1 or DSTBY2 before entering Deep Software Standby mode.

Note 8. When the MCU enters Deep Software Standby mode 3, the PVD circuit stops.

Note 9. For the address bus and bus control signals (For SRAM: [A00 to A23, CS0 to CS7, RD, WR0 to WR3, WR, BC0 to BC3 and ALE], and for SDRAM: [A00 to A16, DQM0 to DQM3, SDCS, RAS, CAS, WE and CKE]), keeping the output state or changing to the high-impedance state can be selected by SBYCR.OPE bit.

Note 10. When MOSCSCR.MOSCSOKP = 1 while MOSC is oscillated, MOSC continues to oscillate in Software Standby mode.

Note 11. When HOCOSCR.HOCOSOKP = 1 while HOCO is oscillated, HOCO continues to oscillate in Software Standby mode.

Note 12. The function is depending on the setting value of the MOSCSCR.MOSCSOKP bit.

Note 13. If PDRAMSCR0.RKEEPn bit is set to 0, the contents of the target User SRAM is not retained.

Note 14. If PDRAMSCR1.RKEEPn bit is set to 0, the contents of the target TCM is not retained.

Note 15. This function is operating if debugger is connecting before entering this mode.

Note 16. This function is operating if debugger is connecting and TRCKCR.TRCKEN = 1 before entering this mode.
Note 17. When the MCU enters the Deep Software Standby mode 1 or 2 with that OFS1.PVDAS = 0 and OFS1.PVDLPSEL = 0, the battery power supply switch is controlled by the voltage monitor 0 which has lower power consumption than VCC voltage drop detection circuit dedicated for VBATT. When the MCU enters the Deep Software Standby mode 1 or 2 with that OFS1.PVDLPSEL = 1, the battery power supply switch is controlled by the VCC voltage drop detection circuit dedicated for VBATT. See section 12, Battery Backup Function and section 62, Electrical Characteristics for details.
Note 18. When the on-chip debugger function is valid, MOCO does not stop in this mode.
Note 19. Only VCOUT function is permitted. The VCOUT pin operates when ACMPHS uses no digital filter. For details on digital filter, see section 56, High-Speed Analog Comparator (ACMPHS).
Note 20. Only temperature monitor reset function can be operated.
Note 21. Only I3C wakeup interrupt is available.
Note 22. FIFO buffer is not retained.
Note 23. Write buffer is not retained.
Note 24. Valid interrupt requests are any interrupt or exception that are not masked by the priority level of current exception and the priority level set by BASEPRI. In addition, if the interrupt request is based on IELSRn, the interrupt must be enabled by NVIC_ISERn.

Table 11.4 Interrupt source for canceling Software Standby and Deep Software Standby modes

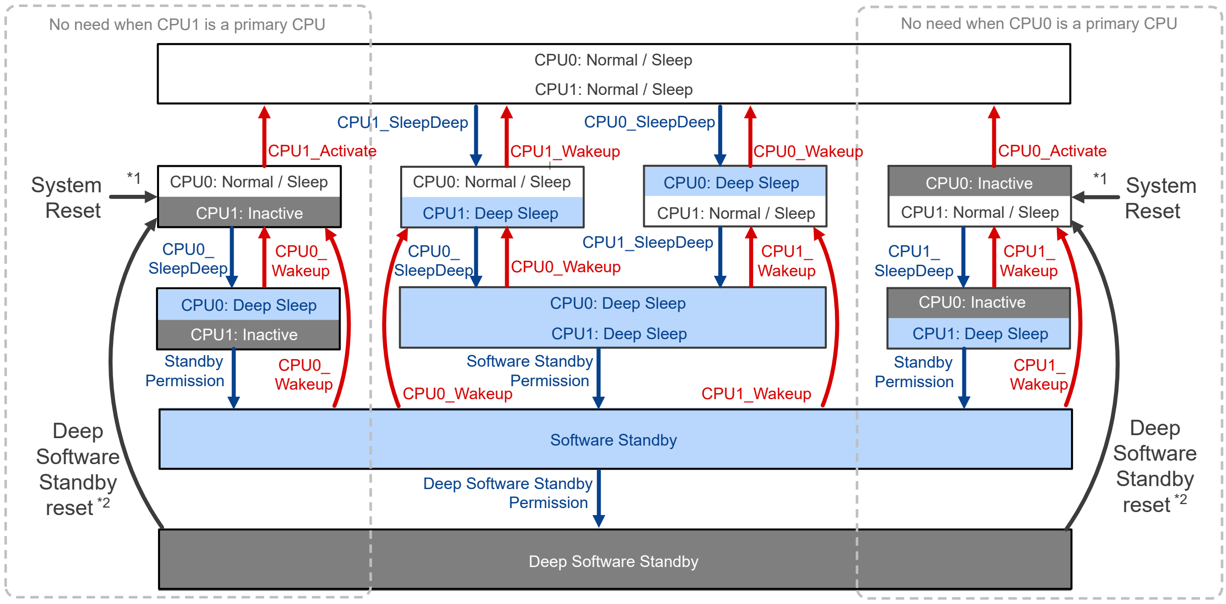
Figure 11.1 lists the low power mode transitions.

For detail, see section 11.6. Low Power Modes.



Note: When an interrupt that acts as a trigger for cancellation of CPU Sleep mode or CPU Deep Sleep mode is received during a transition to CPU Sleep mode or CPU Deep Sleep mode, the CPU that receives the interrupt does not transit to CPU Sleep mode or CPU Deep Sleep mode but go back to Normal mode. When an interrupt that acts as a trigger for cancellation of CPU Sleep mode or CPU Deep Sleep mode is received during a transition to Software Standby mode, the MCU does not transit to Software Standby mode but go back to the state before the transition. When entering to Deep Software Standby mode, if an interrupt occurs after the state has transitioned, after mode transition is completed, returning with Deep Software Standby reset.

Note: When the transition to Normal mode is done because of an interrupt from CPU Sleep mode, CPU Deep Sleep mode or Software Standby mode, the clock source is the same as before entering each low power modes.

Note: For interrupt sources for canceling CPU Sleep mode and CPU Deep Sleep mode, see section 2.7. Sleep Modes for Low Power States.

Note: For interrupt sources for canceling Software Standby mode and Deep Software Standby mode, see Table 11.4.

Note 1. The MOCO clock is the source of the operating clock following a transition from the reset state to Normal mode.

Note 2. When an available interrupt request is generated, an internal reset (Deep Software Standby reset) is generated over a fixed period. Canceling of Deep Software Standby mode accompanies release from the internal reset state, and then the primary CPU transitions to Normal mode and executes reset exception processing with the MOCO clock as the source of the operating clock. The secondary CPU becomes inactive.

Figure 11.1 Low power mode transitions

Note: S-TYPE-1, P-TYPE-1

The LPMSAR register controls the secure attribute of Low Power Mode registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of OPCCR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of LPSCR.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of SBYCR, SSCR1, SVSCR.

NONSEC4 bit (Non-secure Attribute bit 4)

This bit controls the security attribute of VSCR.

NONSEC8 bit (Non-secure Attribute bit 8)

This bit controls the security attribute of DPSBYCR.

NONSEC17 bit (Non-secure Attribute bit 17)

This bit controls the security attribute of HOCOLDOCR.

NONSEC18 bit (Non-secure Attribute bit 18)

This bit controls the security attribute of PLL1LDOCR.

NONSEC19 bit (Non-secure Attribute bit 19)

This bit controls the security attribute of PLL2LDOCR.

NONSEC21 bit (Non-secure Attribute bit 21)

This bit controls the security attribute of LVOCR and MWMCR.

11.2.2 PGCSAR : Power Gating Control Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3D8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	NONSEC7	NONSEC6	NONSEC5	NONSEC4	NONSEC3	—	—	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: PGSCR 0: Secure 1: Non-secure	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	NONSEC3	Non-secure Attribute bit 3 Target register: PSSTCR2 0: Secure 1: Non-secure	R/W
4	NONSEC4	Non-secure Attribute bit 4 Target register: PSSTCR3 0: Secure 1: Non-secure	R/W
5	NONSEC5	Non-secure Attribute bit 5 Target register: PSSTCR4 0: Secure 1: Non-secure	R/W
6	NONSEC6	Non-secure Attribute bit 6 Target register: PSSTCR5, PDCTRESWM 0: Secure 1: Non-secure	R/W
7	NONSEC7	Non-secure Attribute bit 7 Target register: CPUDSCR 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

The PGCSAR register controls the secure attribute of power gating registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of PGSCR.

NONSEC3 bit (Non-secure Attribute bit 3)

This bit controls the security attribute of PSSTCR2.

NONSEC4 bit (Non-secure Attribute bit 4)

This bit controls the security attribute of PSSTCR3.

NONSEC5 bit (Non-secure Attribute bit 5)

This bit controls the security attribute of PSSTCR4.

NONSEC6 bit (Non-secure Attribute bit 6)

This bit controls the security attribute of PSSTCR5, PDCTRESWM.

NONSEC7 bit (Non-secure Attribute bit 7)

This bit controls the security attribute of CPUDSCR.

11.2.3 DPFSAR : Deep Software Standby Interrupt Factor Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DPFSA31	DPFSA30	DPFSA29	—	DPFSA27	DPFSA26	DPFSA25	DPFSA24	—	—	—	DPFSA20	DPFSA19	DPFSA18	DPFSA17	DPFSA16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DPFSA								DPFSA							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DPFSA7 to DPFSA0	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7) Target register: DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 0 to 7) 0: Secure 1: Non-secure	R/W
15:8	DPFSA15 to DPFSA8	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15) Target register: DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 8 to 15) 0: Secure 1: Non-secure	R/W
16	DPFSA16	Deep Software Standby Interrupt Factor Security Attribute bit 16 Target register: DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 Target factor: PVD1 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
17	DPFSA17	Deep Software Standby Interrupt Factor Security Attribute bit 17 Target register: DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1 Target factor: PVD2 0: Secure 1: Non-secure	R/W
18	DPFSA18	Deep Software Standby Interrupt Factor Security Attribute bit 18 Target register: DPSIER2.b2, DPSIFR2.b2 Target factor: RTC Interval 0: Secure 1: Non-secure	R/W
19	DPFSA19	Deep Software Standby Interrupt Factor Security Attribute bit 19 Target register: DPSIER2.b3, DPSIFR2.b3 Target factor: RTC Alarm 0: Secure 1: Non-secure	R/W
20	DPFSA20	Deep Software Standby Interrupt Factor Security Attribute bit 20 Target register: DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4 Target factor: NMI Pin 0: Secure 1: Non-secure	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
24	DPFSA24	Deep Software Standby Interrupt Factor Security Attribute bit 24 Target register: DPSIER3.b0, DPSIFR3.b0 Target factor: USBFS Suspend/Resume 0: Secure 1: Non-secure	R/W
25	DPFSA25	Deep Software Standby Interrupt Factor Security Attribute bit 25 Target register: DPSIER3.b1, DPSIFR3.b1 Target factor: USBHS Suspend/Resume 0: Secure 1: Non-secure	R/W
26	DPFSA26	Deep Software Standby Interrupt Factor Security Attribute bit 26 Target register: DPSIER3.b2, DPSIFR3.b2 Target factor: ULPT0 0: Secure 1: Non-secure	R/W
27	DPFSA27	Deep Software Standby Interrupt Factor Security Attribute bit 27 Target register: DPSIER3.b3, DPSIFR3.b3 Target factor: ULPT1 0: Secure 1: Non-secure	R/W
28	—	This bit is read as 0. The write value should be 0.	R/W
29	DPFSA29	Deep Software Standby Interrupt Factor Security Attribute bit 29 Target register: DPSIER3.b5, DPSIFR3.b5 Target factor: IWDT Overflow 0: Secure 1: Non-secure	R/W
30	DPFSA30	Deep Software Standby Interrupt Factor Security Attribute bit 30 Target register: DPSIER3.b6, DPSIFR3.b6 Target factor: Sub-clock Oscillation stop detection 0: Secure 1: Non-secure	R/W
31	DPFSA31	Deep Software Standby Interrupt Factor Security Attribute bit 31 Target register: DPSIER3.b7, DPSIFR3.b7 Target factor: Tamper Detection 0: Secure 1: Non-secure	R/W

Note: S-TYPE-1, P-TYPE-1

The DPFSAR register controls the secure attribute of Deep Software Standby Interrupt Factor control registers.

DPFSA bits (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7))

This bit controls the security attribute of DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7).

Target factor is IRQn-DS Pin (n = 0 to 7).

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15))

This bit controls the security attribute of DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7).

Target factor is IRQn-DS Pin (n = 8 to 15).

DPFSA16 bit (Deep Software Standby Interrupt Factor Security Attribute bit 16)

This bit controls the security attribute of DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0.

Target factor is PVD1.

DPFSA17 bit (Deep Software Standby Interrupt Factor Security Attribute bit 17)

This bit controls the security attribute of DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1.

Target factor is PVD2.

DPFSA18 bit (Deep Software Standby Interrupt Factor Security Attribute bit 18)

This bit controls the security attribute of DPSIER2.b2, DPSIFR2.b2.

Target factor is RTC Interval.

DPFSA19 bit (Deep Software Standby Interrupt Factor Security Attribute bit 19)

This bit controls the security attribute of DPSIER2.b3, DPSIFR2.b3.

Target factor is RTC Alarm.

DPFSA20 bit (Deep Software Standby Interrupt Factor Security Attribute bit 20)

This bit controls the security attribute of DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4.

Target factor is NMI Pin.

DPFSA24 bit (Deep Software Standby Interrupt Factor Security Attribute bit 24)

This bit controls the security attribute of DPSIER3.b0, DPSIFR3.b0.

Target factor is USBFS Suspend/Resume.

DPFSA25 bit (Deep Software Standby Interrupt Factor Security Attribute bit 25)

This bit controls the security attribute of DPSIER3.b1, DPSIFR3.b1.

Target factor is USBHS Suspend/Resume.

DPFSA26 bit (Deep Software Standby Interrupt Factor Security Attribute bit 26)

This bit controls the security attribute of DPSIER3.b2, DPSIFR3.b2.

Target factor is ULPT0.

DPFSA27 bit (Deep Software Standby Interrupt Factor Security Attribute bit 27)

This bit controls the security attribute of DPSIER3.b3, DPSIFR3.b3.

Target factor is ULPT1.

DPFSA29 bit (Deep Software Standby Interrupt Factor Security Attribute bit 29)

This bit controls the security attribute of DPSIER3.b5, DPSIFR3.b5.

Target factor is IWDT Overflow.

DPFSA30 bit (Deep Software Standby Interrupt Factor Security Attribute bit 30)

This bit controls the security attribute of DPSIER3.b6, DPSIFR3.b6.

Target factor is Sub-clock Oscillation stop detection.

DPFSA31 bit (Deep Software Standby Interrupt Factor Security Attribute bit 31)

This bit controls the security attribute of DPSIER3.b7, DPSIFR3.b7.

Target factor is Tamper Detection.

11.2.4 DPFSAR1 : Deep Software Standby Interrupt Factor Security Attribution Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DPFSA[15:8]								DPFSA[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DPFSA7 to DPFSA0	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7) Target register: DPSIER4.bn, DPSIFR4.bn, DPSIEGR3.bn (n =0 to 7) Target factor: IRQn-DS Pin (n = 16 to 23) 0: Secure 1: Non-secure	R/W
15:8	DPFSA15 to DPFSA8	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15) Target register: DPSIER5.bn, DPSIFR5.bn, DPSIEGR4.bn (n = 0 to 7) Target factor: IRQn-DS Pin (n = 24 to 31) 0: Secure 1: Non-secure	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

The DPFSAR1 register controls the secure attribute of Deep Software Standby Interrupt Factor control registers.

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7))

This bit controls the security attribute of DPSIER4.bn, DPSIFR4.bn, DPSIEGR3.bn (n = 0 to 7).

Target factor is IRQn-DS Pin (n = 16 to 23).

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15))

This bit controls the security attribute of DPSIER5.bn, DPSIFR5.bn, DPSIEGR4.bn.

Target factor is IRQn-DS Pin (n = 24 to 31).

11.2.5 RSCSAR : RAM Standby Control Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSCSA[17:16]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RSCSA[12:0]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
12:0	RSCSA[12:0]	RAM Standby Control Security Attribute bit n (n =0 to 12) Target register: PDRAMSCR0.bn (n = 0 to 12) 0: Secure 1: Non-secure	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
17:16	RSCSA[17:16]	RAM Standby Control Security Attribute bit n (n = 16 to 17) Target register: PDRAMSCR1.bn (n = 0 to 1) 0: Secure 1: Non-secure	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

The RSCSAR register controls the secure attribute of RAM Standby Control registers.

RSCSA[12:0] bit (RAM Standby Control Security Attribute bit n (n =0 to 12))

This bit controls the security attribute of PDRAMSCR0.bn (n = 0 to 12).

RSCSA[17:16] bit (RAM Standby Control Security Attribute bit n (n = 16 to 17))

This bit controls the security attribute of PDRAMSCR1.bn (n = 0 to 1).

11.2.6 MSTPCRA : Module Stop Control Register A

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	MSTPA23	MSTPA22	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	0	0	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MSTPA3	MSTPA2	MSTPA1	MSTPA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0

Bit	Symbol	Function	R/W
0	MSTPA0	SRAM0 Module Stop*2 Target module: SRAM0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
1	MSTPA1	SRAM1 Module Stop*2 Target module: SRAM1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
2	MSTPA2	SRAM2 Module Stop*2 Target module: SRAM2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
3	MSTPA3	SRAM3 Module Stop*2 Target module: SRAM3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:4	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPA22	DMA Controller 0 and Data Transfer Controller 0 Module Stop*1 Target modules: DMAC0, DTC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
23	MSTPA23	DMA Controller 1 and Data Transfer Controller 1 Module Stop*1 Target module: DMAC1, DTC1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31:24	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-4, P-TYPE-2
Note 1. When rewriting the MSTPAi bit from 0 to 1, disable the DMAC and DTC before setting MSTPAi bit (i = 22, 23).
Note 2. When changing the value of this bit, only execute subsequent instructions after reading this bit to check that the value was updated.

11.2.7 MSTPCRB : Module Stop Control Register B

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTPB31	MSTPB30	MSTPB29	MSTPB28	MSTPB27	MSTPB26	MSTPB25	MSTPB24	MSTPB23	MSTPB22	—	—	MSTPB19	MSTPB18	MSTPB17	MSTPB16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MSTPB12	MSTPB11	—	MSTPB9	MSTPB8	MSTPB7	—	—	MSTPB4	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 1. The write value should be 1.	R/W
4	MSTPB4	I3C Bus Interface Module Stop*1 Target module: I3C 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
6:5	—	These bits are read as 1. The write value should be 1.	R/W
7	MSTPB7	IIC Bus Interface 2 Module Stop Target module: IIC2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
8	MSTPB8	IIC Bus Interface 1 Module Stop Target module: IIC1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
9	MSTPB9	IIC Bus Interface 0 Module Stop Target module: IIC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
10	—	This bit is read as 1. The write value should be 1.	R/W
11	MSTPB11	Universal Serial Bus 2.0 FS Interface 0 Module Stop*2 Target module: USBFS0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
12	MSTPB12	Universal Serial Bus 2.0 HS Interface Module Stop*2 Target module: USBHS 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
15:13	—	These bits are read as 1. The write value should be 1.	R/W
16	MSTPB16	Octal Serial Peripheral Interface 0 and Decryption On The Fly 0 Module Stop*3 Target module: OSPI0 and DOTF0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
17	MSTPB17	Octal Serial Peripheral Interface 1 and Decryption On The Fly 1 Module Stop*3 Target module: OSPI1 and DOTF1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
18	MSTPB18	Serial Peripheral Interface 1 Module Stop*4 Target module: SPI1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
19	MSTPB19	Serial Peripheral Interface 0 Module Stop*4 Target module: SPI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:20	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPB22	Serial Communication Interface 9 Module Stop*5 Target module: SCI9 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
23	MSTPB23	Serial Communication Interface 8 Module Stop*5 Target module: SCI8 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
24	MSTPB24	Serial Communication Interface 7 Module Stop*5 Target module: SCI7 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
25	MSTPB25	Serial Communication Interface 6 Module Stop*5 Target module: SCI6 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26	MSTPB26	Serial Communication Interface 5 Module Stop*5 Target module: SCI5 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
27	MSTPB27	Serial Communication Interface 4 Module Stop*5 Target module: SCI4 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPB28	Serial Communication Interface 3 Module Stop*5 Target module: SCI3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	MSTPB29	Serial Communication Interface 2 Module Stop*5 Target module: SCI2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30	MSTPB30	Serial Communication Interface 1 Module Stop*5 Target module: SCI1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	MSTPB31	Serial Communication Interface 0 Module Stop*5 Target module: SCI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4
Note 1. The MSTPB4 bit should be written after the I3C clock (I3CCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of I3CCLK following the change of MSTPB4.
Note 2. The MSTPB11 and MSTPB12 bits should be written after the USB clock (USBCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of USBCLK following the change of MSTPB11 and MSTPB12.
Note 3. The MSTPB16 and MSTPB17 bits should be written after the Octal-SPI clock (OCTACLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of OCTACLK following the change of MSTPB16 and MSTPB17. When changing the value of this bit, only execute subsequent instructions after reading this bit to check that the value was updated.
Note 4. The MSTPB18 and MSTPB19 bits should be written after the SPI clock (SPICLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of SPICLK following the change of MSTPB18 and MSTPB19.
Note 5. The MSTPBi bits should be written after the SCI clock (SCICLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of SCICLK following the change of MSTPBi (i = 22 to 31).

11.2.8 MSTPCRC : Module Stop Control Register C

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note: S-TYPE-4, P-TYPE-4

Note 1. The MSTPC0 bit should be written after the CAC clock is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of the CAC clock following the change of MSTPC0.

Note 2. The MSTPC24 bit should be written after the PDM clock (PDMCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of PDMCLK following the change of MSTPC24.

Note 3. The MSTPC26 and MSTPC27 bits should be written after the CANFD clock (CANFDCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of CANFDCLK following the change of MSTPC26 and MSTPC27.

Note 4. The MSTPC28 bit should be written after the Ether-PHY clock (ETHPHYCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of ETHPHYCLK following the change of MSTPC28.

Note 5. The MSTPC30 bit should be written after the EtherSW clock (ESWCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of ESWCLK following the change of MSTPC30.

11.2.9 MSTPCRD : Module Stop Control Register D

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

20	MSTPE20	General PWM Timer 11 Module Stop*2 Target module: GPT11 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21	MSTPE21	General PWM Timer 10 Module Stop*2 Target module: GPT10 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26:22	—	These bits are read as 1. The write value should be 1.	R/W
27	MSTPE27	General PWM Timer 4-9 Module Stop*2 Target module: GPT4-9 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPE28	General PWM Timer 3 Module Stop*2 Target module: GPT3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	MSTPE29	General PWM Timer 2 Module Stop*2 Target module: GPT2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
30	MSTPE30	General PWM Timer 1 Module Stop[*2] Target module: GPT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	MSTPE31	General PWM Timer 0 Module Stop[*2] Target module: GPT0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. When the count source is sub-clock oscillator or LOCO, ULPTn counting does not stop even if MSTPEi is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the ULPTn registers. (n = 1, 0) (i = 8, 9)

Note 2. The MSTPEi bits should be written after the GPT clock (GPTCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of GPTCLK following the change of MSTPEi (i = 18 to 21, 27 to 31).

11.2.11 OPCCR : Operating Power Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0A0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OPCMTSF	—	—	OPCM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OPCM[1:0]	Operating Power Control Mode Select 0 0: High-speed mode 0 1: Prohibited 1 0: Prohibited 1 1: Prohibited Settings other than above are prohibited.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	OPCMTSF	Operating Power Control Mode Transition Status Flag • Read 0: Transition completed 1: During transition • Write The write value should be 0.	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

OPCCR is used to reduce power consumption in Normal mode and Processor low power mode. Do not change from the initial value.

11.2.12 PGSCR: Power Gating Shift Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x104

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PGS
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PGS	Power gating shift timing Set the power gating start timing for each domain. Set this bit to 0 before transitioning to Software Standby mode or Deep Software Standby mode. 0: Power gating control for each domain is started partial at the same time 1: Power gating control for each domain is started serially	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

11.2.13 PSSTCRn : Power Switch Control Start Time Control Register n (n = 2 to 5)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x210 + 0x2 × n (n = 2 to 5)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PSST												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
12:0	PSST	Power switch control start time Set the power switch control start time when PGSCR.PGS = 0. Set 0x00B0 to this bit. Other setting is prohibited.	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

11.2.14 PDCTRESWM : ESWM Power Domain Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x118

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PDPGSF	PDCSF	—	—	—	—	—	PDDE
Value after reset:	1	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PDDE	Power control enable 0: Power on the target domain 1: Power off the target domain	R/W
5:1	—	These bits are read as 0. The write value should be 0.	R/W
6	PDCSF	Power control status flag 0: Power gating control is not executed (idle) 1: Power gating control is in progress	R
7	PDPGSF	Power gating status flag 0: Target domain is power on (not gating) 1: Target domain is power off (during Gating)	R

Note: S-TYPE-3, P-TYPE-2

The PDCTRESWM register controls power gating for ESWM power domain.

For restrictions on this register, not only in this section, see also section 11.5.1. Power Gating Control Using Power Domain Control Register.

PDDE bit (Power control enable)

The PDDE bit controls the power gating of the target domain. The PDDE bit should be set from 0 to 1, after confirmed that the PDCSF = 0 and PDPGSF = 0. On the other hand, the PDDE bit should be set from 1 to 0, after confirmed that the PDCSF = 0 and PDPGSF = 1.

PDCSF flag (Power control status flag)

The PDCSF flag indicates the power control status of the target domain.

PDPGSF flag (Power gating status flag)

The PDPGSF flag indicates whether the target domain is power gated.

11.2.15 PDRAMSCR0 : SRAM Power Domain Standby Control Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x140

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RKEEP12	RKEEP11	RKEEP10	RKEEP9	RKEEP8	RKEEP7	RKEEP6	RKEEP5	RKEEP4	RKEEP3	RKEEP2	RKEEP1	RKEEP0
Value after reset:	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
12:0	RKEEP[12:0]	RAM Retention 0: When entering the Software Standby mode, the contents of the target RAM are not kept. 1: When entering the Software Standby mode, the contents of the target RAM are kept.	R/W
14:13	—	These bits are read as 1. The write value should be 1.	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

The PDRAMSCR0 register controls the target memory in Software Standby mode.

RKEEPn bit (RAM Retention)

The RKEEPn (n = 0 to 12) bit controls whether to retain the contents of the target memory in software standby mode.

Table 11.5 shows the relationship between each bit and the target memory.

In addition, there are the following constraints regarding the setting of each bit.

RKEEP0 to RKEEP3

0000: When entering the Software Standby mode, the contents of the SRAM0 are not kept.

1111: When entering the Software Standby mode, the contents of the SRAM0 are kept.

Other than the above: Not supported

RKEEP4 to RKEEP7

0000: When entering the Software Standby mode, the contents of the SRAM1 are not kept.

1111: When entering the Software Standby mode, the contents of the SRAM1 are kept.

Other than the above: Not supported

RKEEP8 to RKEEP11

0000: When entering the Software Standby mode, the contents of the SRAM2 are not kept.

1111: When entering the Software Standby mode, the contents of the SRAM2 are kept.

Other than the above: Not supported

Table 11.5 Relationship between each bit and the target memory

PDRAM register bit	Target memory
PDRAM.b0	SRAM0: 0x2200_0000 to 0x2201_FFFF (Secure alias) 0x3200_0000 to 0x3201_FFFF (Non-secure alias) SRAM (CPU1 TCM)*1: 0x2A00_0000 to 0x2A01_FFFF (Secure alias) 0x3A00_0000 to 0x3A01_FFFF (Non-secure alias)
PDRAM.b1	SRAM0: 0x2202_0000 to 0x2203_FFFF (Secure alias) 0x3202_0000 to 0x3203_FFFF (Non-secure alias)
PDRAM.b2	SRAM0: 0x2204_0000 to 0x2205_FFFF (Secure alias) 0x3204_0000 to 0x3205_FFFF (Non-secure alias)
PDRAM.b3	SRAM0: 0x2206_0000 to 0x2207_FFFF (Secure alias) 0x3206_0000 to 0x3207_FFFF (Non-secure alias)
PDRAM.b4	SRAM1: 0x2208_0000 to 0x2209_FFFF (Secure alias) 0x3208_0000 to 0x3209_FFFF (Non-secure alias)
PDRAM.b5	SRAM1: 0x220A_0000 to 0x220B_FFFF (Secure alias) 0x320A_0000 to 0x320B_FFFF (Non-secure alias)
PDRAM.b6	SRAM1: 0x220C_0000 to 0x220D_FFFF (Secure alias) 0x320C_0000 to 0x320D_FFFF (Non-secure alias)
PDRAM.b7	SRAM1: 0x220E_0000 to 0x220F_FFFF (Secure alias) 0x320E_0000 to 0x320F_FFFF (Non-secure alias)
PDRAM.b8	SRAM2: 0x2210_0000 to 0x2211_FFFF (Secure alias) 0x3210_0000 to 0x3211_FFFF (Non-secure alias)
PDRAM.b9	SRAM2: 0x2212_0000 to 0x2213_FFFF (Secure alias) 0x3212_0000 to 0x3213_FFFF (Non-secure alias)
PDRAM.b10	SRAM2: 0x2214_0000 to 0x2215_FFFF (Secure alias) 0x3214_0000 to 0x3215_FFFF (Non-secure alias)
PDRAM.b11	SRAM2: 0x2216_0000 to 0x2217_FFFF (Secure alias) 0x3216_0000 to 0x3217_FFFF (Non-secure alias)
PDRAM.b12	SRAM3: 0x2218_0000 to 0x2219_FFFF (Secure alias) 0x3218_0000 to 0x3219_FFFF (Non-secure alias)

Note 1. SRAM (CPU1 TCM) is supported only for single core product.

11.2.16 PDRAMSCR1 : SRAM Power Domain Standby Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x142

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RKEEP1	RKEEP0
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	RKEEP0	RAM Retention 0: When entering the CPU0 Deep Sleep and Software Standby mode, the contents of the target RAM are not kept. 1: When entering the CPU0 Deep Sleep and Software Standby mode, the contents of the target RAM are kept.	R/W
1	RKEEP1*1	RAM Retention 0: When entering the Software Standby mode, the contents of the target RAM are not kept. 1: When entering the Software Standby mode, the contents of the target RAM are kept.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2
Note 1. RKEEP1 is valid only for a dual-core product.

The PDRAMSCR1 register controls the target memory in CPU0 Deep Sleep and Software Standby mode.

RKEEP0 bit (RAM Retention)

The RKEEP0 bit controls whether to retain the contents of the target memory in CPU0 Deep Sleep and software standby mode.

RKEEP1 bit (RAM Retention)

The RKEEP1 bit controls whether to retain the contents of the target memory in software standby mode.

Table 11.6 shows the relationship between each bit and the target memory.

Table 11.6 Relationship between each bit and the target memory

PDRAM register bit	Target memory
PDRAM.b0	CPU0 TCM
PDRAM.b1*1	CPU1 TCM

Note 1. Available only for a dual-core product.

11.2.17 SBYCR : Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x00C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	OPE	—	—	—	—	—	—
Value after reset:	0	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	OPE	Output Port Enable 0: In Software Standby mode or Deep Software Standby mode, Set the address bus and other bus control signal to the high-impedance state. 1: In Software Standby mode or Deep Software Standby mode, Address bus and other bus control signal retain the output state.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The SBYCR register controls the bus signal output in Software Standby mode and Deep Software Standby mode.

OPE bit (Output Port Enable)

The OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals (For SRAM: [A00 to A23, CS0 to CS7, RD, WR0 to WR3, WR, BC0 to BC3 and ALE], and for SDRAM: [A00 to A16, DQM0 to DQM3, SDCS, RAS, CAS, WE and CKE]) in Software Standby mode or Deep Software Standby mode.

11.2.18 SSCR1 : Software Standby Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA98

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	SS2LP[1:0]		—	SS2FR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SS2FR	Software Standby Fast Return 0: When returning from Software Standby mode, fast return function is disabled. 1: When returning from Software Standby mode, fast return function is enabled.	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
3:2	SS2LP[1:0]	Software Standby low power select 0 0: SS2LP_0 (default mode) 0 1: SS2LP_1 (Low power setting 1) Settings other than above are prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

SS2FR bit (Software Standby Fast Return)

When the SS2FR bit is 1, the recovery time from Software Standby mode is shorter. The setting of this bit is only valid when the SS2LP bit is 01b.

See section 62, Electrical Characteristics for details on the recovery time.

Note: It is recommended to set this bit to 1. Otherwise, it just increases the recovery time.

SS2LP[1:0] bits (Software Standby low power select)

When the SS2LP[1:0] bits are 01b, the power consumption of Software Standby mode is smaller but the recovery time from Software Standby mode is longer. See section 62, Electrical Characteristics for details on the power consumption and the recovery time.

11.2.19 LPSCR : Low Power State Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA90

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	LPMD[3:0]			
Value after reset:	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
3:0	LPMD[3:0]	Low power mode setting 0x0: System Active 0x4: Reserved*1 0x5: Software Standby mode 0x8: Deep Software Standby mode 1 0x9: Deep Software Standby mode 2 0xA: Deep Software Standby mode 3 Settings other than above are prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. Setting prohibited when transitioning to low power mode. Change the setting to a value other than 0x4 before transitioning to low power mode.

The LPSCR register controls the transition destination of low power mode.

LPSCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

LPMD[3:0] bits (Low power mode setting)

The LPMD[3:0] bits indicate the destination of low power mode. Actual low power mode transition is executed by WFI instruction in CPU.

The transition of Software Standby mode and Deep Software Standby mode does not occur unless the WFI instruction of each CPU is executed.

When the low power mode is canceled by an interrupt, The LPMD bit remains the value before transition. Writing 0 to this bit clears the bit itself.

While MENTRYR.MENTRY bit is 1, the setting to Software Standby and Deep software Standby mode is ineffective. Even if LPMD[3:0] is any of 0x5, 0x8 to 0xA, the MCU is keep to System active state on execution of a WFI instruction. See Table 11.8 for the detail.

While OFS0.IWDTSTPCTL bit is 0 (counting continues), the setting to Deep software Standby 2 and 3 mode is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction.

While IWDTCSTPR.SLCSTP is 0 (counting continues), the setting to Deep software Standby 2 and 3 mode is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction.

See Table 11.8 for the detail.

While the voltage monitor n (n = 1, 2) reset is enabled (PVDnCR0.RI = 1), the setting to Deep software Standby mode 2, 3 is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction. See Table 11.8 for the detail.

When at least PVDnCR0. RE (n = 4, 5) bit is 1 and all PVDnCR0.RI (n = 1, 2) bit are 0 and OFS0.IWDTSTPCTL is 1 and IWDTCSTPR.SLCSTP is 1, the setting to Deep software Standby mode 3 is ineffective. Even if LPMD is 0xA, the MCU enters Deep Software Standby 2 mode on execution of a WFI instruction. See Table 11.8 for the detail.

11.2.20 DPSBYCR : Deep Software Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	IOKEEP	—	—	DCSSMODE[1:0]		—	—
Value after reset:	0	0	0	1	0	1	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3:2	DCSSMODE[1:0]	DCDC soft start mode Set the wake-up time from the Deep Software Standby mode with DCDC. 0 0: Setting prohibited 0 1: 128 μs 1 0: 256 μs 1 1: 512 μs	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	IOKEEP	I/O Port Retention 0: When the Deep Software Standby mode is canceled, the I/O ports and D/A output are in the reset state 1: When the Deep Software Standby mode is canceled, the I/O ports and D/A output are in the same state as in the Deep Software Standby mode	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The DPSBYCR register controls the Deep Software Standby mode.

DPSBYCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DCSSMODE[1:0] bits (DCDC soft start mode)

The DCSSMODE[1:0] bits specify whether to shorten the time required to recover from the Deep Software Standby mode. For details, see section 62, Electrical Characteristics.

IOKEEP bit (I/O Port Retention)

In Deep Software Standby mode, I/O ports and D/A output keep the same states as in the Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports and D/A output or not when the Deep Software Standby mode is canceled.

11.2.21 DPSIER0 : Deep Software Standby Interrupt Enable Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7E	DIRQ6E	DIRQ5E	DIRQ4E	DIRQ3E	DIRQ2E	DIRQ1E	DIRQ0E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0E	IRQ0-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
1	DIRQ1E	IRQ1-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
2	DIRQ2E	IRQ2-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
3	DIRQ3E	IRQ3-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
4	DIRQ4E	IRQ4-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W

Bit	Symbol	Function	R/W
5	DIRQ5E	IRQ5-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
6	DIRQ6E	IRQ6-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W
7	DIRQ7E	IRQ7-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIER0 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

After the setting of DPSIER0 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR0 being set to 1. Therefore, DPSIFR0 should be cleared to 0 before entering Deep Software Standby mode.

See Table 11.4 to know the relation between this register and interrupt source for canceling Deep Software standby mode.

11.2.22 DPSIER1 : Deep Software Standby Interrupt Enable Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ15E	DIRQ14E	DIRQ13E	DIRQ12E	DIRQ11E	DIRQ10E	DIRQ9E	DIRQ8E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8E	IRQ8-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ9E	IRQ9-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ10E	IRQ10-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ11E	IRQ11-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DIRQ12E	IRQ12-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ13E	IRQ13-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ14E	IRQ14-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ15E	IRQ15-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIER1 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

After the setting of DPSIER1 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR1 being set to 1. Therefore, DPSIFR1 should be cleared to 0 before entering Deep Software Standby mode.

See Table 11.4 to know the relation between this register and interrupt source for canceling Deep Software standby mode.

11.2.23 DPSIER2 : Deep Software Standby Interrupt Enable Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIE	DRTCAIE	DRTCIIE	DPVD2IE	DPVD1IE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1IE	PVD1 Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DPVD2IE	PVD2 Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DRTCIIE	RTC Interval interrupt Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DRTCAIE	RTC Alarm interrupt Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DNMIE	NMI Pin Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W*1
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note 1. 1 can be written only once. Once 1 is written to this bit, subsequent write accesses are disabled.

DPSIER2 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

After the setting of DPSIER2 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR2 being set to 1. Therefore, DPSIFR2 should be cleared to 0 before entering Deep Software Standby mode.

See Table 11.4 to know the relation between this register and interrupt source for canceling Deep Software standby mode.

11.2.24 DPSIER3 : Deep Software Standby Interrupt Enable Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DVBATTADIE	DSOSTDIE	DIWDTIE	—	DULPT1IE	DULPT0IE	DUSBHSIE	DUSBFSIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFSIE	USBFS Suspend/Resume Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DUSBHSIE	USBHS Suspend/Resume Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DULPT0IE	ULPT0 Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DULPT1IE	ULPT1 Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	DIWDTIE	IWDT Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DSOSTDIE	Sub-clock Oscillation stop detection Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DVBATTADIE	VBATT Tamper Detection Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIER3 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

After the setting of DPSIER3 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR3 being set to 1. Therefore, DPSIFR3 should be cleared to 0 before entering Deep Software Standby mode.

See Table 11.4 to know the relation between this register and interrupt source for canceling Deep Software standby mode.

11.2.25 DPSIER4 : Deep Software Standby Interrupt Enable Register 4

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ23E	DIRQ22E	DIRQ21E	DIRQ20E	DIRQ19E	DIRQ18E	DIRQ17E	DIRQ16E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ16E	IRQ16-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ17E	IRQ17-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ18E	IRQ18-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ19E	IRQ19-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Bit	Symbol	Function	R/W
4	DIRQ20E	IRQ20-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ21E	IRQ21-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ22E	IRQ22-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ23E	IRQ23-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIER4 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

After the setting of DPSIER4 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR4 being set to 1. Therefore, DPSIFR4 should be cleared to 0 before entering Deep Software Standby mode.

See Table 11.4 to know the relation between this register and interrupt source for canceling Deep Software standby mode.

11.2.26 DPSIER5 : Deep Software Standby Interrupt Enable Register 5

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB44

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ31E	DIRQ30E	DIRQ29E	DIRQ28E	DIRQ27E	DIRQ26E	DIRQ25E	DIRQ24E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ24E	IRQ24-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ25E	IRQ25-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ26E	IRQ26-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ27E	IRQ27-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DIRQ28E	IRQ28-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ29E	IRQ29-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ30E	IRQ30-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ31E	IRQ31-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIER5 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

After the setting of DPSIER5 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR5 being set to 1. Therefore, DPSIFR5 should be cleared to 0 before entering Deep Software Standby mode.

See Table 11.4 to know the relation between this register and interrupt source for canceling Deep Software standby mode.

11.2.27 DPSIFR0 : Deep Software Standby Interrupt Flag Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA18

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7F	DIRQ6F	DIRQ5F	DIRQ4F	DIRQ3F	DIRQ2F	DIRQ1F	DIRQ0F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0F	IRQ0-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DIRQ1F	IRQ1-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DIRQ2F	IRQ2-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DIRQ3F	IRQ3-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	DIRQ4F	IRQ4-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
5	DIRQ5F	IRQ5-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
6	DIRQ6F	IRQ6-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DIRQ7F	IRQ7-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR0 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not even Deep Software Standby mode) or when the setting of DPSIER0 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR0 is cleared to 0x00.

To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least six PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0.

DPSIFR0 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR0 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

11.2.28 DPSIFR1 : Deep Software Standby Interrupt Flag Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA1C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ15F	DIRQ14F	DIRQ13F	DIRQ12F	DIRQ11F	DIRQ10F	DIRQ9F	DIRQ8F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8F	IRQ8-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DIRQ9F	IRQ9-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DIRQ10F	IRQ10-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DIRQ11F	IRQ11-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	DIRQ12F	IRQ12-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
5	DIRQ13F	IRQ13-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
6	DIRQ14F	IRQ14-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DIRQ15F	IRQ15-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR1 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not even Deep Software Standby mode) or when the setting of DPSIER1 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR1 is cleared to 0x00.

To clear DPSIFR1 to 0x00 after modifying DPSIER1, wait for at least six PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1.

DPSIFR1 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 8 to 15)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR1 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

11.2.29 DPSIFR2 : Deep Software Standby Interrupt Flag Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIF	DRTCAIF	DRTCIIF	DPVD2IF	DPVD1IF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1IF	PVD1 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W[*1]
1	DPVD2IF	PVD2 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W[*1]
2	DRTCIIF	RTC Interval Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W[*1]
3	DRTCAIF	RTC Alarm Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W[*1]
4	DNMIF	NMI Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W[*1]
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR2 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not even Deep Software Standby mode) or when the setting of DPSIER2 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR2 is cleared to 0x00.

To clear DPSIFR2 to 0x00 after modifying DPSIER2, wait for at least six PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2.

DPSIFR2 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DPVDmIF flag (PVDm Deep Software Standby Cancel Flag) (m = 1 to 2)

The DPVDmIF flag indicates that a cancel request by the voltage monitor m signal has been generated.

[Setting condition]

A cancel request is generated by the voltage monitor m signal that is selected in DPSIEGR2.

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTCIIF flag (RTC Interval Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC interval interrupt signal has been generated.

[Setting condition]

- A cancel request by the RTC interval interrupt signal is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DRTCAIF flag (RTC Alarm Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC alarm interrupt signal has been generated.

[Setting condition]

- A cancel request by the RTC alarm interrupt signal is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DNMIF flag (NMI Pin Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the NMI pin has been generated.

[Setting condition]

- A cancel request by the NMI pin specified by DPSIEGR2 is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

11.2.30 DPSIFR3 : Deep Software Standby Interrupt Flag Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DVBATTADIF	DSOSTDIF	DIWDTIF	—	DULPT1IF	DULPT0IF	DUSBHSIF	DUSBFSIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFSIF	USBFS Suspend/Resume Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DUSBHSIF	USBHS Suspend/Resume Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DULPT0IF	ULPT0 Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DULPT1IF	ULPT1 Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	—	This bit is read as 0. The write value should be 0.	R/W
5	DIWDTIF	IWDT Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Bit	Symbol	Function	R/W
6	DSOSTDIF	Sub-clock Oscillation stop detection Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DVBATTADIF	VBATT Tamper Detection Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when the corresponding cancel request is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not even Deep Software Standby mode) or when the setting of DPSIER3 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR3 is cleared to 0x00.

To clear DPSIFR3 to 0x00 after modifying DPSIER3, wait for at least six PCLKB cycles, read DPSIFR3, and then write 0 to DPSIFR3. Six or more PCLKB cycles can be secured, for example, by reading DPSIER3.

DPSIFR3 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DUSBFSIF flag (USBFS Suspend/Resume Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the USBFS suspend/resume has been generated.

The DUSBFSIF flag is a flag for USBFS.

[Setting condition]

- A cancel request by the USBFS suspend/resume is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DUSBHSIF flag (USBHS Suspend/Resume Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the USBHS suspend/resume has been generated.

The DUSBHSIF flag is a flag for USBHS.

[Setting condition]

- A cancel request by the USBHS suspend/resume is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DULPT0IF flag (ULPT0 Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the ULPT0 overflow has been generated.

[Setting condition]

- A cancel request by the ULPT0 is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DULPT1IF flag (ULPT1 Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the ULPT1 overflow has been generated.

[Setting condition]

- A cancel request by the ULPT1 is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DIWDTIF flag (IWDT Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the IWDT overflow has been generated.

[Setting condition]

- A cancel request by the IWDT is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DSOSTDIF flag (Sub-clock Oscillation stop detection Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the Sub-clock Oscillation stop detection has been generated.

[Setting condition]

- A cancel request by the SOSTD is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

DVBATTADIF flag (VBATT Tamper Detection Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the VBATT tamper detection has been generated.

[Setting condition]

- A cancel request by the VBATT tamper detection is generated.

[Clearing condition]

- Writing 0 to each bit after reading the bit as 1.

11.2.31 DPSIFR4 : Deep Software Standby Interrupt Flag Register 4

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB48

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ23F	DIRQ22F	DIRQ21F	DIRQ20F	DIRQ19F	DIRQ18F	DIRQ17F	DIRQ16F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ16F	IRQ16-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DIRQ17F	IRQ17-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DIRQ18F	IRQ18-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DIRQ19F	IRQ19-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	DIRQ20F	IRQ20-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Bit	Symbol	Function	R/W
5	DIRQ21F	IRQ21-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W
6	DIRQ22F	IRQ22-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DIRQ23F	IRQ23-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR3 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not even Deep Software Standby mode) or when the setting of DPSIER4 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR4 is cleared to 0x00.

To clear DPSIFR4 to 0x00 after modifying DPSIER4, wait for at least six PCLKB cycles, read DPSIFR4, and then write 0 to DPSIFR4. Six or more PCLKB cycles can be secured, for example, by reading DPSIER4.

DPSIFR4 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 16 to 23)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR3 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

11.2.32 DPSIFR5 : Deep Software Standby Interrupt Flag Register 5

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB4C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ31F	DIRQ30F	DIRQ29F	DIRQ28F	DIRQ27F	DIRQ26F	DIRQ25F	DIRQ24F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ24F	IRQ24-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DIRQ25F	IRQ25-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DIRQ26F	IRQ26-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DIRQ27F	IRQ27-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Bit	Symbol	Function	R/W
4	DIRQ28F	IRQ28-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
5	DIRQ29F	IRQ29-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
6	DIRQ30F	IRQ30-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DIRQ31F	IRQ31-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2

Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR4 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not even Deep Software Standby mode) or when the setting of DPSIER5 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR5 is cleared to 0x00.

To clear DPSIFR5 to 0x00 after modifying DPSIER5, wait for at least six PCLKB cycles, read DPSIFR5, and then write 0 to DPSIFR5. Six or more PCLKB cycles can be secured, for example, by reading DPSIER5.

DPSIFR5 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 24 to 31)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR4 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

11.2.33 DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 EG	DIRQ6 EG	DIRQ5 EG	DIRQ4 EG	DIRQ3 EG	DIRQ2 EG	DIRQ1 EG	DIRQ0 EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0EG	IRQ0-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ1EG	IRQ1-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
2	DIRQ2EG	IRQ2-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Bit	Symbol	Function	R/W
3	DIRQ3EG	IRQ3-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
4	DIRQ4EG	IRQ4-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ5EG	IRQ5-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ6EG	IRQ6-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ7EG	IRQ7-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIEGR0 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

11.2.34 DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA2C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ15EG	DIRQ14EG	DIRQ13EG	DIRQ12EG	DIRQ11EG	DIRQ10EG	DIRQ9EG	DIRQ8EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8EG	IRQ8-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ9EG	IRQ9-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
2	DIRQ10EG	IRQ10-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
3	DIRQ11EG	IRQ11-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
4	DIRQ12EG	IRQ12-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ13EG	IRQ13-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ14EG	IRQ14-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ15EG	IRQ15-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIEGR1 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

11.2.35 DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIEG	—	—	DPVD2EG	DPVD1EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1EG	PVD1 Edge Select 0: A cancel request is generated when VCC < Vdet1 (fall) is detected 1: A cancel request is generated when VCC ≥ Vdet1 (rise) is detected	R/W
1	DPVD2EG	PVD2 Edge Select 0: A cancel request is generated when VCC < Vdet2 (fall) is detected 1: A cancel request is generated when VCC ≥ Vdet2 (rise) is detected	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DNMIEG	NMI Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIEGR2 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

11.2.36 DPSIEGR3 : Deep Software Standby Interrupt Edge Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA34

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ23EG	DIRQ22EG	DIRQ21EG	DIRQ20EG	DIRQ19EG	DIRQ18EG	DIRQ17EG	DIRQ16EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ16EG	IRQ16-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ17EG	IRQ17-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
2	DIRQ18EG	IRQ18-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
3	DIRQ19EG	IRQ19-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Bit	Symbol	Function	R/W
4	DIRQ20EG	IRQ20-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ21EG	IRQ21-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ22EG	IRQ22-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ23EG	IRQ23-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIEGR3 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

11.2.37 DPSIEGR4 : Deep Software Standby Interrupt Edge Register 4

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ31EG	DIRQ30EG	DIRQ29EG	DIRQ28EG	DIRQ27EG	DIRQ26EG	DIRQ25EG	DIRQ24EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ24EG	IRQ24-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ25EG	IRQ25-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
2	DIRQ26EG	IRQ26-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
3	DIRQ27EG	IRQ27-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
4	DIRQ28EG	IRQ28-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ29EG	IRQ29-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ30EG	IRQ30-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ31EG	IRQ31-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: S-TYPE-4, P-TYPE-2

DPSIEGR4 is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 6, Resets.

11.2.38 SYOCDCR : System Control OCD Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA38

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DBGEN	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	—	The read value is undefined. The write value should be 0.	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	DBGEN	Debugger Enable bit 0: Disable on-chip debugger function 1: Enable on-chip debugger function*1	R/W

Note: S-TYPE-5 P-TYPE-2

Note 1. The value of DBGEN can be set by software. However, it is not until the debugger authentication passes that the on-chip debugger function is valid. That is, even if the DBGEN is 1, the on-chip debugger function is invalid unless the debugger authentication passes. For detail, see section 2, CPU.

This register is not controlled by any security attribute register (e.g. LPMSAR, DPFSAR).

SYOCDCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode.

DBGEN bit (Debugger Enable bit)

The DBGEN enables the on-chip debugger function.

[Setting condition]

- Power-on reset is generated
- Voltage Monitor 0 reset is generated.
- Core Voltage Monitor reset is generated.
- Writing 1 to the bit.

[Clearing condition]

- Writing 0 to the bit

11.2.39 PLL1LDOCR : PLL1-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: PLL1-LDO is enabled 1: PLL1-LDO is stopped	R/W

Bit	Symbol	Function	R/W
1	SKEEP	STBY Keep 0: PLL1-LDO is stopped during Software Standby mode. 1: PLL1-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

You can control the operation of the LDO dedicated for PLL1 (PLL1-LDO) by using this register.

LDOSTP bit (LDO Stop)

The PLL1-LDO state during Normal mode is controlled by this bit.

After setting 1 to this bit, do not set 0 to this bit for at least 1 µs. This bit can be set 0 to this bit only when 1 µs has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 25 µs for the power supply to stabilize.

Allow the power supply to stabilize before operating the PLL1.

SKEEP bit (STBY Keep)

The PLL1-LDO state during Software Standby mode is controlled by this bit. If the PLL1-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

11.2.40 PLL2LDOCR : PLL2-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: PLL2-LDO is enabled 1: PLL2-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: PLL2-LDO is stopped during Software Standby mode. 1: PLL2-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

You can control the operation of the LDO dedicated for PLL2 (PLL2-LDO) by using this register.

LDOSTP bit (LDO Stop)

The PLL2-LDO state during Normal mode is controlled by this bit.

After setting 1 to this bit, do not set 0 to this bit for at least 1 µs. This bit can be set 0 to this bit only when 1 µs has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 25 µs for the power supply to stabilize.

Allow the power supply to stabilize before operating the PLL2.

SKEEP bit (STBY Keep)

The PLL2-LDO state during Software Standby mode is controlled by this bit. If the PLL2-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

11.2.41 HOCOLDOCR : HOCO-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: HOCO-LDO is enabled 1: HOCO-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: HOCO-LDO is stopped during Software Standby mode. 1: HOCO-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

You can control the operation of the LDO dedicated for HOCO (HOCO-LDO) by using this register.

LDOSTP bit (LDO Stop)

The HOCO-LDO state during Normal mode is controlled by this bit.

After setting 1 to this bit, do not set 0 to this bit for at least 2 µs. This bit can be set 0 to this bit only when 2 µs has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 5 µs for the power supply to stabilize.

Allow the power supply to stabilize before operating the HOCO.

SKEEP bit (STBY Keep)

The HOCO-LDO state during Software Standby mode is controlled by this bit. If the HOCO-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

11.2.42 VSCR : Voltage Scaling Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x014

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	VSCMTSF	—	VSCM[2:0]		
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
2:0	VSCM[2:0]	Voltage Scaling Control Mode Bit Set the target voltage of VDD. 0 0 1: VSCR_1 0 1 0: VSCR_2 (default) Setting other than above are prohibited.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VSCMTSF	Voltage Scaling Control Mode Transition Status Flag ● Read 0: Transition completed 1: During transition ● Write The write value should be 0.	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VSCR register controls the voltage scaling operation.

VSCM[2:0] bits (Voltage Scaling Control Mode Bit)

The VSCM bits specify the target voltage of VDD for voltage scaling operation.

VSCMTSF flag (Voltage Scaling Control Mode Transition Status Flag)

The VSCMTSF flag indicates the voltage scaling transition state when the operating voltage scaling control is executed. When a write access is attempted to change the voltage scaling control mode, the VSCMTSF flag is set to 1. The flag becomes 0 after a transition to the voltage scaling control mode is completed. Make sure that the VSCMTSF flag is 0 (completed operating voltage scaling control mode transition) before the next processing.

11.2.43 SVSCR : SSTBY Voltage Scaling Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA9C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SVSCM[2:0]		
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
2:0	SVSCM[2:0]	SSTBY Voltage Scaling Control Mode Bit Set the target voltage of VDD in Software Standby mode. 0 0 1: SVSCR_1 0 1 0: SVSCR_2 (default) 0 1 1: SVSCR_3 1 0 0: SVSCR_4 1 0 1: SVSCR_5 Setting other than above are prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The SVSCR register controls the voltage scaling operation in Software Standby mode.

SVSCM[2:0] bits (SSTBY Voltage Scaling Control Mode Bit)

The SVSCM bits specify the target voltage of VDD for voltage scaling operation in Software Standby mode.

It is forbidden to set SVSCR_1 and SS2LP[1:0] = 01b and transition to Software Standby mode.

When SVSCR_3, SVSCR_4 or SVSCR_5 is set, the interrupt factor that cancels Software Standby mode is limited to NMI pin or IRQ pin.

11.2.44 CPUDSCR : CPU Deep Sleep Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x100

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PGD1	PGD0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PGD0	Power Gating Disable for CPU0 0: Power Gating Enable during CPU0 Deep Sleep (default) 1: Power Gating Disable during CPU0 Deep Sleep	R/W
1	PGD1	Power Gating Disable for CPU1 0: Power Gating Enable during CPU1 Deep Sleep (default) 1: Power Gating Disable during CPU1 Deep Sleep	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The CPUDSCR register controls the power gating during CPU deep sleep mode.

Each bit of CPUDSCR should be changed while the target CPU is operation.

When transitioning to Software Standby mode and Deep Software Standby mode, CPUDSCR.PGDn must be set to 0.

PGD0 bit (Power Gating Disable for CPU0)

The PGD0 bit specifies the power gating control of CPU0 power domain during CPU0 deep sleep mode.

PGD1 bit (Power Gating Disable for CPU1)

The PGD1 bit specifies the power gating control of CPU1 power domain during CPU1 deep sleep mode.

11.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR and SCKDIVCR2 registers are set.

For information on module and clock associations, see section 9.2.2. SCKDIVCR : System Clock Division Control Register and section 9.2.3. SCKDIVCR2 : System Clock Division Control Register 2.

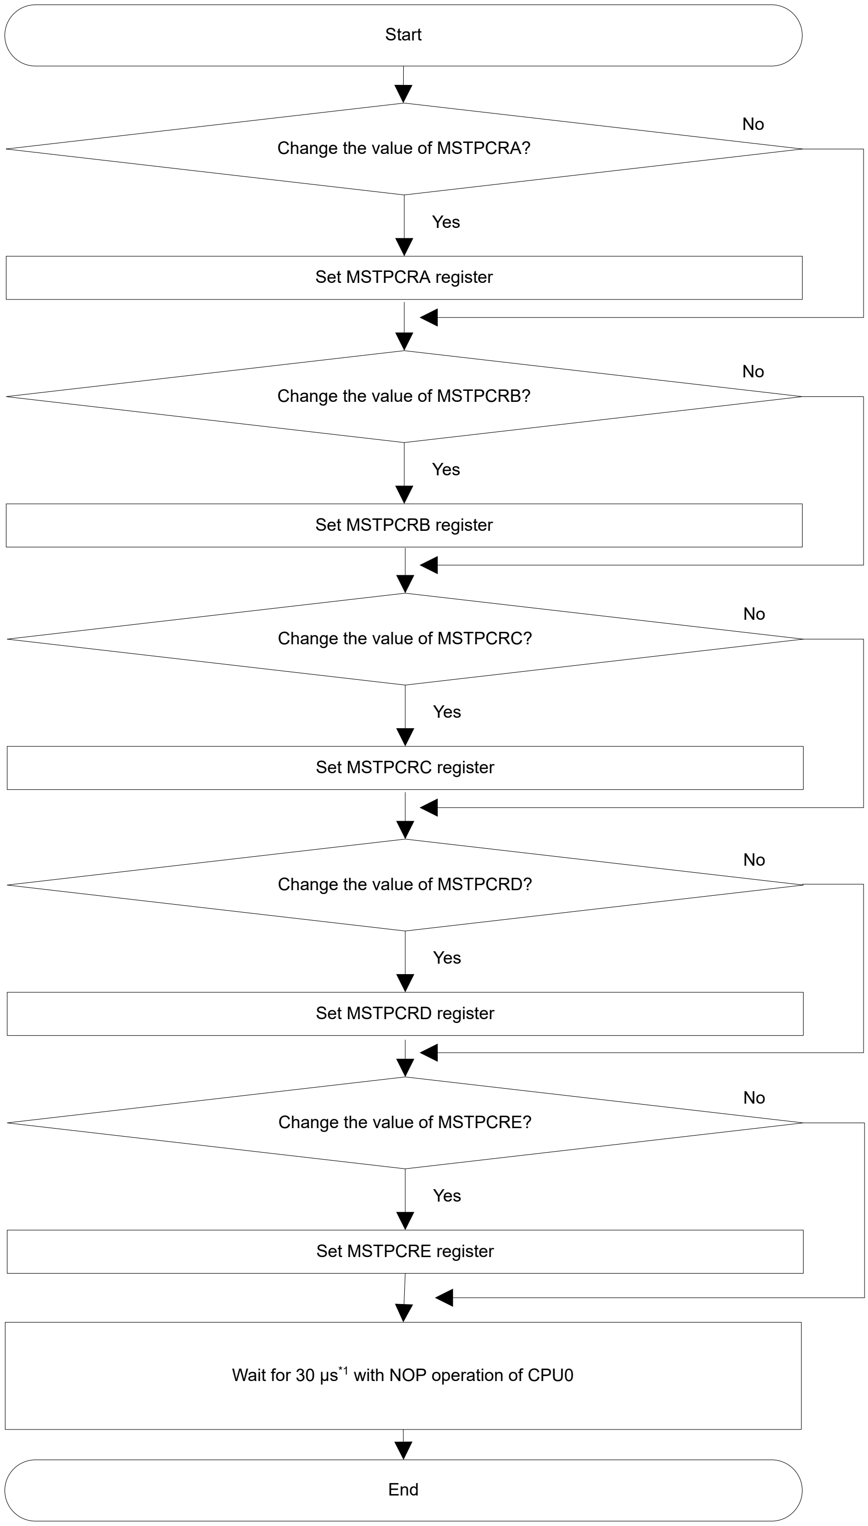
11.4 Module-Stop Function

The module-stop function can be set for each on-chip peripheral module.

When the MSTPmi bit (m = A to E, i = 31 to 0) in MSTPCRA to MSTPCRE is set to 1, the corresponding module stops operating and enters the module-stop state, but the CPU continues to operate independently. Clearing the MSTPmi bit to 0 cancels the module-stop state, allowing the module to restart operating at the end of the bus cycle. The internal states of modules are retained in the module-stop state.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn (n = 0 to 3) are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Otherwise, the read/write data nor the operation of the module is not guaranteed. Also, do not set 1 to the MSTPmi bit while the corresponding module is being accessed.

If the CPUCLK0 is faster than the ICLK maximum frequency in the electrical characteristics, after the MSTPmi bit is changed, a wait time should be provided according to the flow shown in Figure 11.2. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 30 µs in DCDC mode, 10 µs in External VDD mode

Figure 11.2 Setting flow of module stop control registers in case of CPUCLK0 is higher than the ICLK maximum frequency in electrical characteristics

11.5 Power Gating Control

The MCU supports the power gating function of the power domain.

User can individually control the power on/off of the divided power domains.

In the power gating state, the domain is powered off and the state is the same as SSTBY in Table 11.3.

11.5.1 Power Gating Control Using Power Domain Control Register

Table 11.7 shows the relationship PDCTR register and the target power domain.

When the PDCTR register is set, power gating control is executed. In addition, when using the power gating function, it should be set MOCOCR.MCSTP to 0 (MOCO is operated) in advance.

Make sure that the power domain control of the CPU and the power domain control by the PDCTRESWM do not conflict.

Table 11.7 Relationship between the PDCTR register and the target power domain

Control register				Target Power Domain name	Implemented IP name
Register name	PDDE	PDCSF	PDPGSF		
PDCTRESWM	Available	Available	Available	ESWM domain	ESWM

Examples of the procedures for power gating control:

1. Power OFF by PDCTRn.PDDE*1
   STEP1 : Confirm that the target domain is not performing the Power gating process
   - Check PDCTRn.PDCSF = 0

   STEP2 : Set the module stop control register to stop.
   - Write MSTPCR* = 1 (*: all register for target domain)

   STEP3 : Set PDCTRn.PDDE bit and start the power control.
   - Write PDCTRn.PDDE = 1

   STEP4 : Confirm that the power gating process is completed and the powered off
   - Check PDCTRn.PDCSF = 0 & PDCTRn.PDPGSF = 1
2. Power ON by PDCTRn.PDDE*1
   STEP1 : Confirm that the target domain is not performing the Power gating process
   - Check PDCTRn.PDCSF = 0

   STEP2 : Set PDCTRn.PDDE bit and start the power control.
   - Write PDCTRn.PDDE = 0

   STEP3 : Confirm that the power gating process is completed and the powered on
   - Check PDCTRn.PDCSF = 0 & PDCTRn.PDPGSF = 0

   STEP4 : Set the module stop control register to operate.
   - Write MSTPCR* = 0 (*: all register for target domain)

Note 1. When PDCTRn.PDCSF bit is “1” (during power gating control processing), PDCTRn register must not be changed.

11.6 Low Power Modes

11.6.1 CPU Sleep Mode and CPU Deep Sleep Mode

See section 2.7. Sleep Modes for Low Power States

11.6.2 Software Standby Mode

11.6.2.1 Entering Software Standby Mode

When WFI instructions of both CPUs are executed while LPSCR.LPMD bit is 0x5 and CPUn.SCR.SLEEPDEEP bit is 1, the MCU enters Software Standby mode depending on LPSCR.LPMD setting. When transitioning to Software Standby mode, CPUDSCR.PGDn must be set to 0. It must be set MOCOCR.MCSTP to 0 (MOCO is operated) before executed the WFI instruction to entry this mode. Take care that the transition is suspended during the configuration update transfer.

In Software Standby mode, the CPU, most of the on-chip peripheral functions and most of the oscillators stop*1. However, the contents of the CPU internal registers and RAM data, the states of on-chip peripheral functions and the I/O ports are retained. Software Standby mode allows significant reduction in power consumption because most of the oscillators stops*1. Table 11.3 shows the status of each on-chip peripheral functions and oscillators. In addition, Software Standby mode allows the internal regulator to transition into a low power state through SSCR1.SS2LP register. This further reduces power consumption. Available resets or interrupts in Software Standby mode make the MCU to return to Normal mode. See Table 11.4 for available interrupt sources for each mode. In case of using an interrupt to return to Normal mode, corresponding IELSRn register must be set before executing a WFI instruction. For the detail, see section 14, Interrupt Controller Unit (ICU).

Note 1. The state of the oscillators depends on the setting of the control register for each oscillator. For details, see section 9, Clock Generation Circuit.

The status of address bus and bus control signals in Software Standby mode can be selected by SBYCR.OPE bit. The SBYCR.OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals in Software Standby mode.

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction.

Counting by the IWDT stops when the MCU enters Software Standby mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep or Software Standby).

Counting by the IWDT continues when the MCU enters Software Standby mode while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep or Software Standby).

Counting by the IWDT stops when the MCU enters Software Standby mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 1 (IWDT stops in Sleep or Software Standby).

Counting by the IWDT continues when the MCU enters Software Standby mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 0 (IWDT does not stop in Sleep or Software Standby).

WDT stops counting when the MCU enters Software Standby mode because the PCLK stops.

Do not enter Software Standby mode while the MRAM is in programming procedure. In order to enter Software Standby mode, execute a WFI instruction after programming procedure completes.

In External VDD mode, do not enter Software Standby Mode.

Table 11.8 shows the setting of the related control bits and the modes to enter after executing WFI instruction.

Table 11.8 Setting of the bits what affect the mode after executing WFI instruction (1 of 2)

		Setting mode of LPSCR.LPMD bit and CPUn.SCR.SLEEPDEEP (n = 0, 1) bit			
		Software Standby (LPSCR.LPMD = 0x5, CPUn.SCR. SLEEPDEEP = 1)	Deep Software Standby 1 (LPSCR.LPMD = 0x8, CPUn.SCR. SLEEPDEEP = 1)	Deep Software Standby 2 (LPSCR.LPMD = 0x9, CPUn.SCR. SLEEPDEEP = 1)	Deep Software Standby 3 (LPSCR.LPMD = 0xA, CPUn.SCR. SLEEPDEEP = 1)
MENTRYR.MENTRY	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1	CPU Deep sleep mode	CPU Deep sleep mode	CPU Deep sleep mode	CPU Deep sleep mode
CPUDSCR.PGD0	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1	CPU Deep sleep mode	CPU Deep sleep mode	CPU Deep sleep mode	CPU Deep sleep mode

Table 11.8 Setting of the bits what affect the mode after executing WFI instruction (2 of 2)

		Setting mode of LPSCR.LPMD bit and CPUn.SCR.SLEEPDEEP (n = 0, 1) bit			
		Software Standby (LPSCR.LPMD = 0x5, CPUn.SCR. SLEEPDEEP = 1)	Deep Software Standby 1 (LPSCR.LPMD = 0x8, CPUn.SCR. SLEEPDEEP = 1)	Deep Software Standby 2 (LPSCR.LPMD = 0x9, CPUn.SCR. SLEEPDEEP = 1)	Deep Software Standby 3 (LPSCR.LPMD = 0xA, CPUn.SCR. SLEEPDEEP = 1)
CPUDSCR.PGD1	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1	CPU Deep sleep mode	CPU Deep sleep mode	CPU Deep sleep mode	CPU Deep sleep mode
OFS0.IWDTSTPCTL (auto-start mode)	0	Software Standby	Deep Software Standby 1	Deep Software Standby 1	Deep Software Standby 1
	1			Deep Software Standby 2	Deep Software Standby 3
IWDTCSTPR.SLCSTP (register start mode)	0	Software Standby	Deep Software Standby 1	Deep Software Standby 1	Deep Software Standby 1
	1			Deep Software Standby 2	Deep Software Standby 3
OFS2.CVMRDIS	0	Software Standby	Software Standby	Software Standby	Software Standby
	1		Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
PVD1CR0.RI	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1			Deep Software Standby 1	Deep Software Standby 1
PVD2CR0.RI	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1			Deep Software Standby 1	Deep Software Standby 1
PVD4CR0.RE	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1				Deep Software Standby 2*1
PVD5CR0.RE	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1				Deep Software Standby 2*1

Note 1. When at least PVDnCR0.RE (n = 4, 5) bit is 1 and all PVDnCR0.RI (n = 1, 2) bit are 0 and OFS0.IWDTSTPCTL is 1 and IWDTCSTPR.SLCSTP is 1, the transition is to Deep Software Standby mode 2 even if LPSCR is set to 0xA.

11.6.2.2 Canceling Software Standby Mode

Software Standby mode is canceled by an available interrupt shown in Table 11.4, RES pin reset, a power-on reset, a voltage monitor reset, a core voltage monitor reset, a reset caused by IWDT underflow or a temperature monitor reset.

The oscillators which were operating before the transition to Software Standby mode restarts. After the oscillation of all these oscillators has been stabilized, the MCU returns from Software Standby mode to Normal mode.

1. Canceling by an interrupt
   When an available interrupt request (for available interrupt, See Table 11.4) is generated, each oscillator which was operating before the transition to Software Standby mode restarts. After all these oscillators have been stabilized, the MCU returns from Software Standby mode to Normal mode and starts interrupt handling. When canceling the software standby mode by interrupt, each power domain returns to the same power state as the state before entering the software standby state.
2. Canceling by a RES pin reset

When RES pin is driven low, the MCU enters the reset state and oscillators, whose default status are operating, starts the oscillation. Make sure to keep RES pin low for the time period specified in section 62, Electrical Characteristics. When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

3. Canceling by a power-on reset
   Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.
4. Canceling by a voltage monitor reset
   Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.
5. Canceling by IWDT reset
   Software Standby mode is canceled by an internal reset generated by IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Software Standby mode and an internal reset for Canceling Software Standby mode is not generated in the following conditions:
   - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1 (auto-start mode)
   - IWDTCSTPR.SLCSTP = 1 (register start mode)
6. Canceling by a core voltage monitor reset
   Software Standby mode is canceled by a core voltage monitor reset (CVMR) and the MCU starts the reset exception handling.
7. Canceling by a temperature monitor reset
   Software Standby mode is canceled by a temperature monitor reset and the MCU starts the reset exception handling.

11.6.2.3 Example of Software Standby Mode Application

Figure 11.3 shows an example of entry to Software Standby mode by a falling edge of IRQn pin, and exit from Software Standby mode by a rising edge of IRQn pin.

In this example, an IRQn pin interrupt is accepted with IRQCRi.IRQMD[1:0] (i = 0 to 31) bits of the ICU are 00b (falling edge) in Normal mode, and then IRQCRi.IRQMD[1:0] (i = 0 to 31) bits are set to 01b (rising edge). Then, if MOCO is not operated, it must set MOCOCR.MCSTP to 0 (MOCO is operated). After that, LPSCR.LPMD bit is set to 0x5 and CPUn.SCR.SLEEPDEEP bit is set to 1, and then WFI instruction is executed. Thus, entry to Software Standby mode is completed. After that, exit from Software Standby mode is initiated by a rising edge of IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see section 14, Interrupt Controller Unit (ICU). The oscillation stabilization time in Figure 11.2 is specified in section 62, Electrical Characteristics.

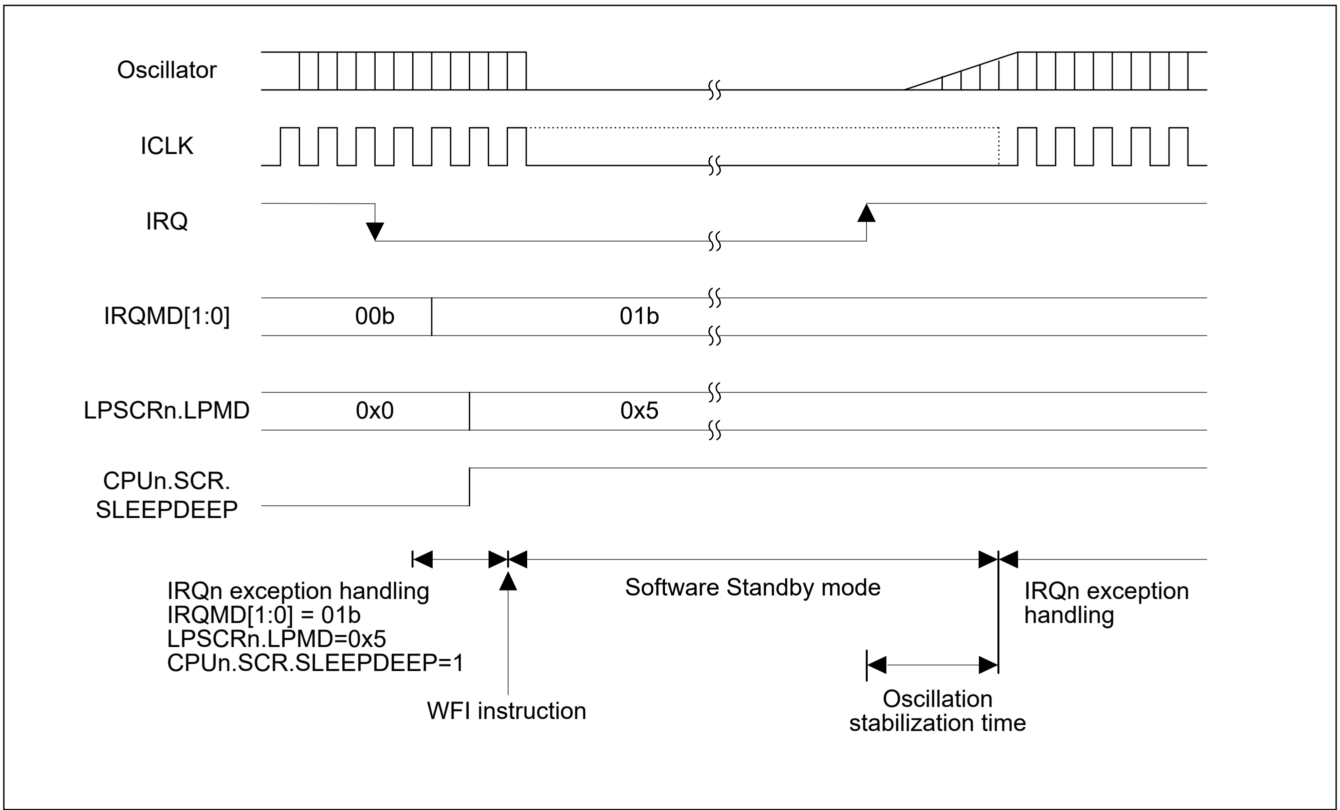


Figure 11.3 Example of Software Standby mode application

11.6.3 Deep Software Standby Mode

11.6.3.1 Transition to Deep Software Standby Mode

When WFI instructions of both CPUs are executed while LPSCR.LPMD bit is 0x8, 0x9, 0xA and CPUn.SCR.SLEEPDEEP bit is 1, the MCU enters Deep Software Standby mode 1 or 2 or 3 depending on LPSCR.LPMD setting. When transitioning to Deep Software Standby mode, CPUDSCR.PGDn must be set to 0. It should be set MOCOCR.MCSTP to 0 (MOCO is operated) before executed the WFI instruction to entry this mode. See Table 11.8 for the setting of the related control bits.

In these modes, the CPU, on-chip peripheral functions, SRAM, and oscillators are almost stopped as shown in Table 11.3. Furthermore, since the internal power supply to these inactive modules is stopped, power consumption is remarkably reduced. The contents of all the registers of the CPU and specific internal peripheral modules become undefined. Table 11.3 shows the status of each on-chip peripheral functions and oscillators.

In Deep Software Standby mode 1, when OFS1.PVDAS = 0 and OFS1.PVDLPSEL = 0, the battery power supply switch is controlled by the voltage monitor 0 which has lower power consumption than VCC voltage drop detection circuit dedicated for VBATT, so power consumption is further reduced at the case that VBATT function is enabled. In Deep Software Standby mode 2, the internal supply of power to the USB resume detecting unit and IWDT is cut off, reducing power consumption. When OFS1.PVDAS = 0 and OFS1.PVDLPSEL = 0, the battery power supply switch is controlled by the voltage monitor 0 which has lower power consumption than VCC voltage drop detection circuit dedicated for VBATT, so power consumption is further reduced at the case that VBATT function is enabled. In Deep Software Standby mode 3, the PVD is also stopped. For details, see section 62, Electrical Characteristics.

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction.

When the MCU enters Deep Software Standby mode 2 or 3 while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1, power supply to the IWDT-dedicated clock and the IWDT is cut off. Counting by the IWDT also stops.

When the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 0, the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby Mode 2 or 3, regardless of the setting in the LPSCR.LPMD bit.

When the IWDT is in register start mode and the IWDTCSTPR.SLCSTP is 0, the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby Mode 2 or 3, regardless of the setting in the LPSCR.LPMD.

Do not enter Deep Software Standby mode while the MRAM is in programming procedure. In order to enter Deep Software Standby mode, execute a WFI instruction after programming procedure completes.

In External VDD mode, do not enter Deep Software Standby Mode.

When PVDnCR0.RI (n = 1, 2) = 1 (selecting the voltage monitor n reset), the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD. The I/O port states are same as Software Standby mode.

When at least PVDnCR0. RE (n = 4, 5) bit is 1 and all PVDnCR0. RI (n = 1, 2) bit are 0 and OFS0.IWDTSTPCTL is 1 and IWDTCSTPR.SLCSTP is 1, the MCU enters Deep Software Standby mode 2 instead of Deep Software Standby mode 3, regardless of the setting in the LPSCR.LPMD. The I/O port states are same as Software Standby mode.

When the Core Voltage Detection Circuit is enabled (Core Voltage Monitor disable bit (CVMRDIS) in Option Function Select Register 0 (OFS2) is 0), the MCU enters Software Standby mode instead of Deep Software Standby Mode 1, 2 or 3, regardless of the setting in the LPSCR.LPMD bit.

11.6.3.2 Canceling Deep Software Standby Mode

Deep Software Standby mode is canceled by the interrupt shown in Table 11.4, RES pin reset, a power-on reset, a voltage monitor reset, a core voltage monitor reset, a reset caused by IWDT underflow or a temperature monitor reset.

(1) Canceling by an interrupt

Canceling by interrupts is controlled by DPSIERn (n = 0 to 5) and DPSIFRn (n = 0 to 5). When a Deep Software Standby Canceling interrupt is generated, the corresponding flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising edge or falling edge can be selected by DPSIEGRn (n = 0 to 4). The interrupts for which an edge can be selected are the NMI, IRQ0-DS to IRQ31-DS, voltage monitor n (n = 1, 2) interrupts. When a Deep Software Standby mode canceling request occurs, the internal power is supplied and MOCO starts oscillating, and then the internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is then supplied to the entire MCU and Deep Software Standby reset is canceled, and the MCU starts reset exception handling.

When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

(2) Canceling by RES pin reset

When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters the reset state. Make sure to keep RES pin low for the time period specified in section 62, Electrical Characteristics. When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

(3) Canceling by a power-on reset

Deep Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

(4) Canceling by a voltage monitor 0 reset

Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit and the MCU starts the reset exception handling.

(5) Canceling by a voltage monitor n reset (n = 1, 2, 4, 5)

Deep Software Standby mode 1 is canceled by a voltage monitor n reset (n = 1, 2, 4, 5)from the voltage detection circuit and the MCU starts the reset exception handling.

(6) Canceling by a IWDT reset

Deep Software Standby mode 1 is canceled by a IWDT reset (an internal reset generated by IWDT underflow) and the MCU starts the reset exception handling.

However, IWDT stops in Deep Software Standby mode 1 and a IWDT reset for Canceling Deep Software Standby mode 1 is not generated in the following conditions:

- OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1 (auto-start mode)
- IWDTCSTPR.SLCSTP = 1 (register start mode)

(7) Canceling by a temperature monitor reset

Deep Software Standby mode is canceled by a temperature monitor reset and the MCU starts the reset exception handling.

11.6.3.3 Pin States when Deep Software Standby Mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states as before transition to the Deep Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled. Upon cancellation of Deep Software Standby mode, the reset exception handling starts immediately.

Whether to initialize the I/O ports or to retain the I/O port states as before transition to the Deep Software Standby mode can be selected by the DPSBYCR.IOKEEP bit.

- When the DPSBYCR.IOKEEP bit = 0
  I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1

Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, I/O ports retain their states as before transition to the Deep Software Standby mode regardless of the MCU internal state. At this time, the I/O port states remain unchanged as before transition to the Deep Software Standby mode even if settings of I/O ports or peripheral modules are made. Then, the retained I/O port states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state.

The DPSBYCR.IOKEEP bit is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode.

11.6.3.4 Example of Deep Software Standby Mode Application

(1) Entering and exiting Deep Software Standby mode

Figure 11.4 shows an example where a transition to Deep Software Standby mode is made at the falling edge of the IRQn-DS pin, and exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] (i = 0 to 31) bits of the ICU set to 00b (falling edge). Then, after the DPSIEGRy.DIRQnEG (y = 0 or 1 or 4 or 5, n = 0 to 31) bit is set to 1 (rising edge) and the LPSCR.LPMD bit is set to 0x8 or 0x9 or 0xA and CPUn.SCR.SLEEPDEEP bit is set to 1, the WFI instruction is executed. Thus, a transition to Deep Software Standby mode is made. After that, exiting Deep Software Standby mode is made at the rising edge of the IRQ-DS pin.

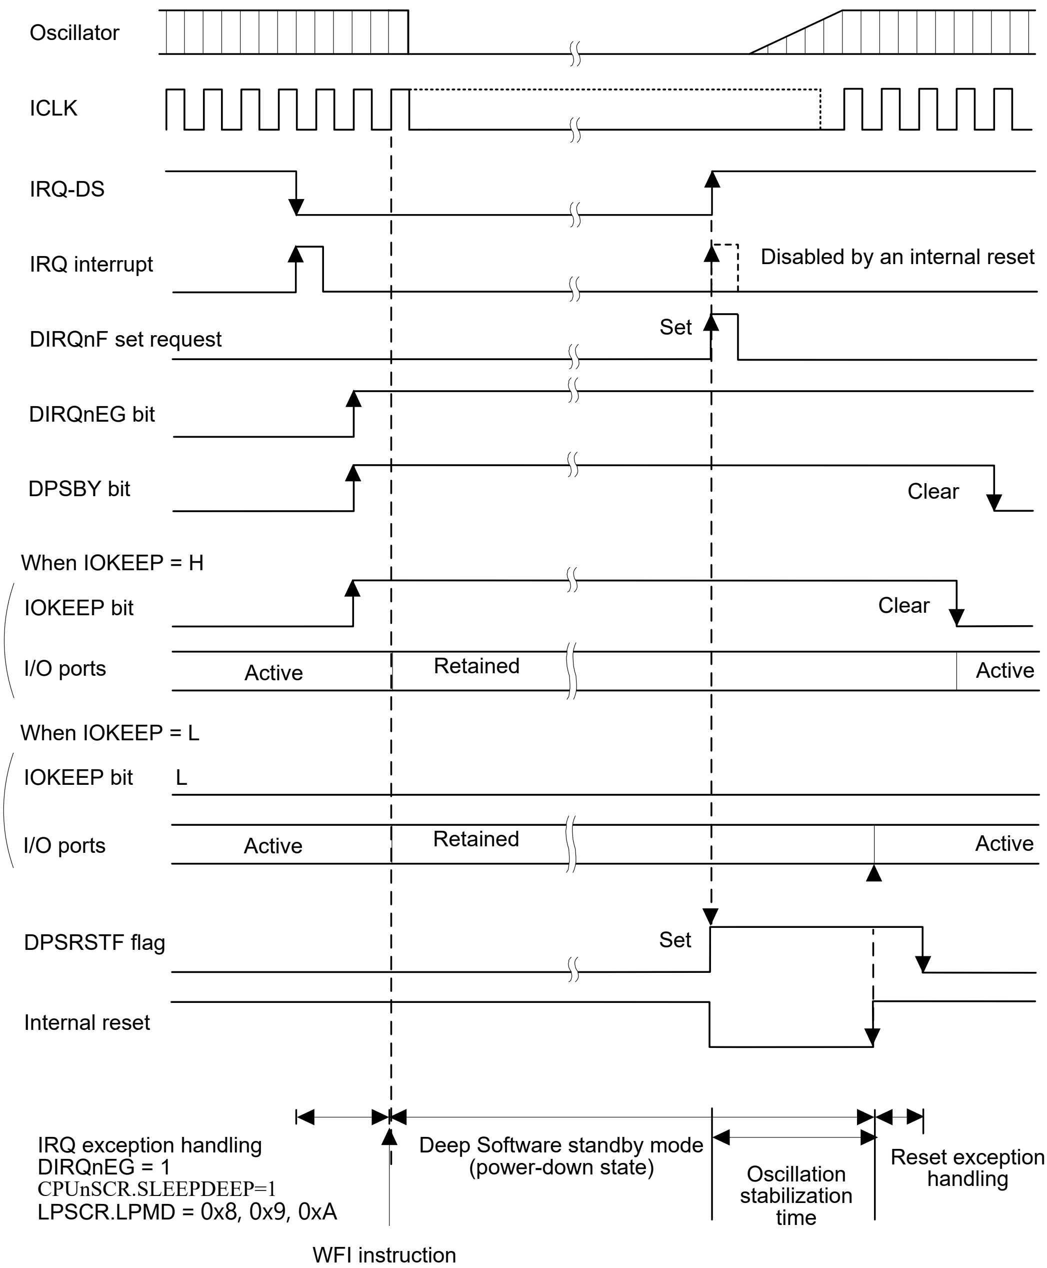

Figure 11.4 Example of Deep Software Standby mode application

11.6.3.5 Usage Flow for Deep Software Standby Mode

Figure 11.5 shows an example of a flowchart to use Deep Software Standby mode.

In this example, the RSTSR0.DPSRSTF flag of the reset function is read after the reset exception handling to determine whether a reset was generated by the RES pin or by the cancellation of Deep Software Standby mode.

In the case of a reset by the RES pin, a transition to Deep Software Standby mode is made after the required register settings have been made.

In the case of a reset by the cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is cleared to 0 after the I/O port settings have been made.

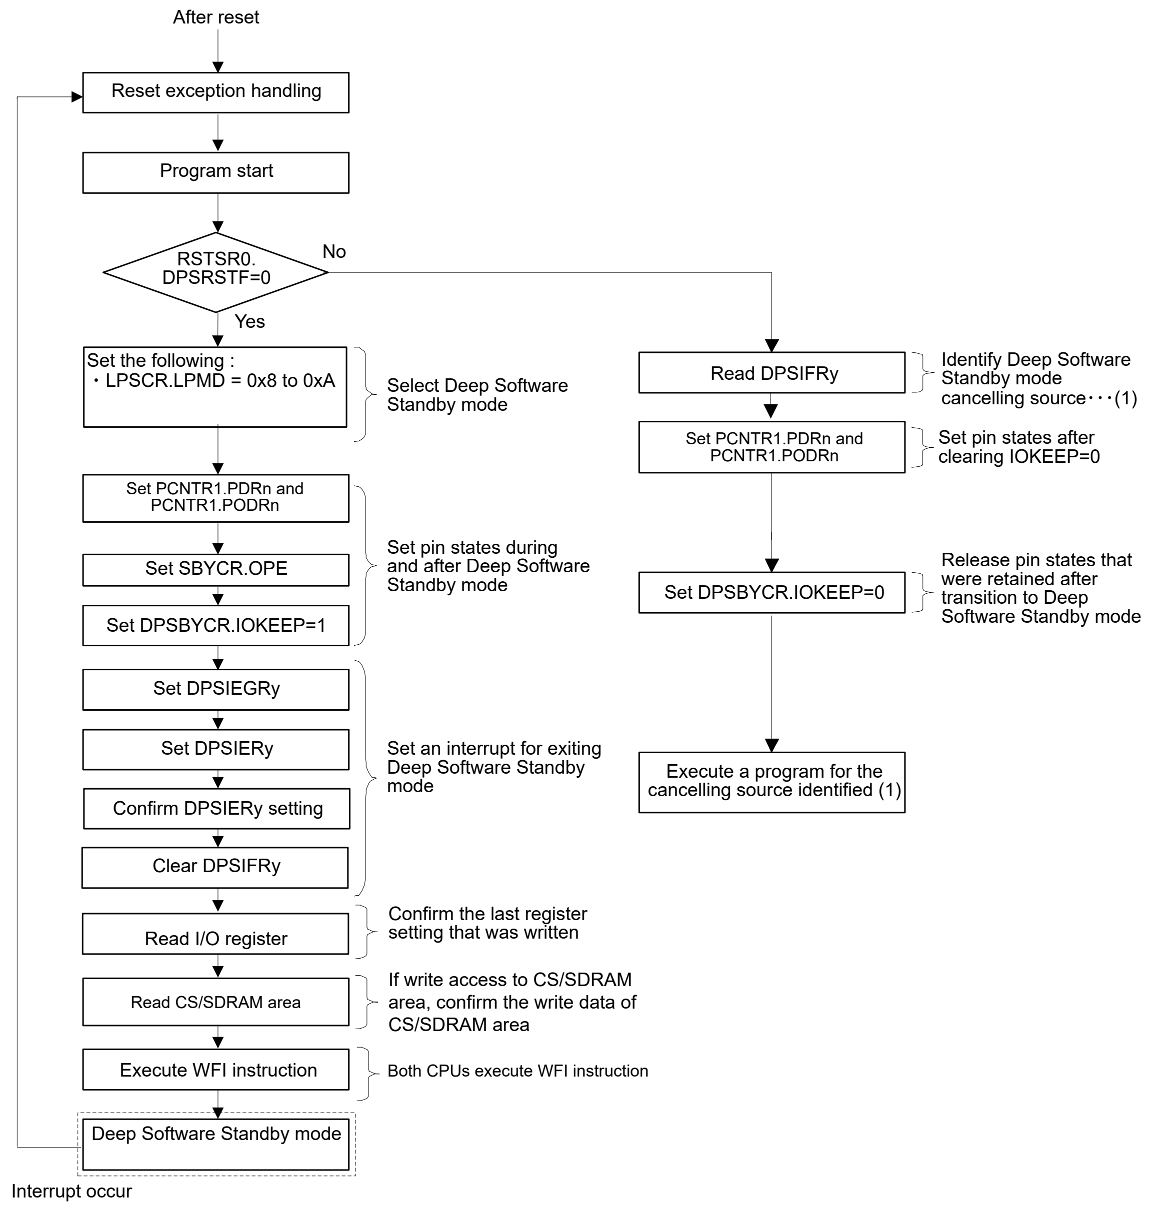

Figure 11.5 Example flowchart to use Deep Software Standby mode

11.7 Voltage Scaling Control

The MCU supports Voltage Scaling (DVFS) control for low power or high performance operation. CM85 TCM and CM85 cache cannot be used during the transition (VSCR.VSCMTSF = 1). Do not access CM85 TCM. Deactivate the CM85 cache or set the cache attribute of the entire address space to Non-cacheable. Figure 11.6 shows the transition of DVFS control.

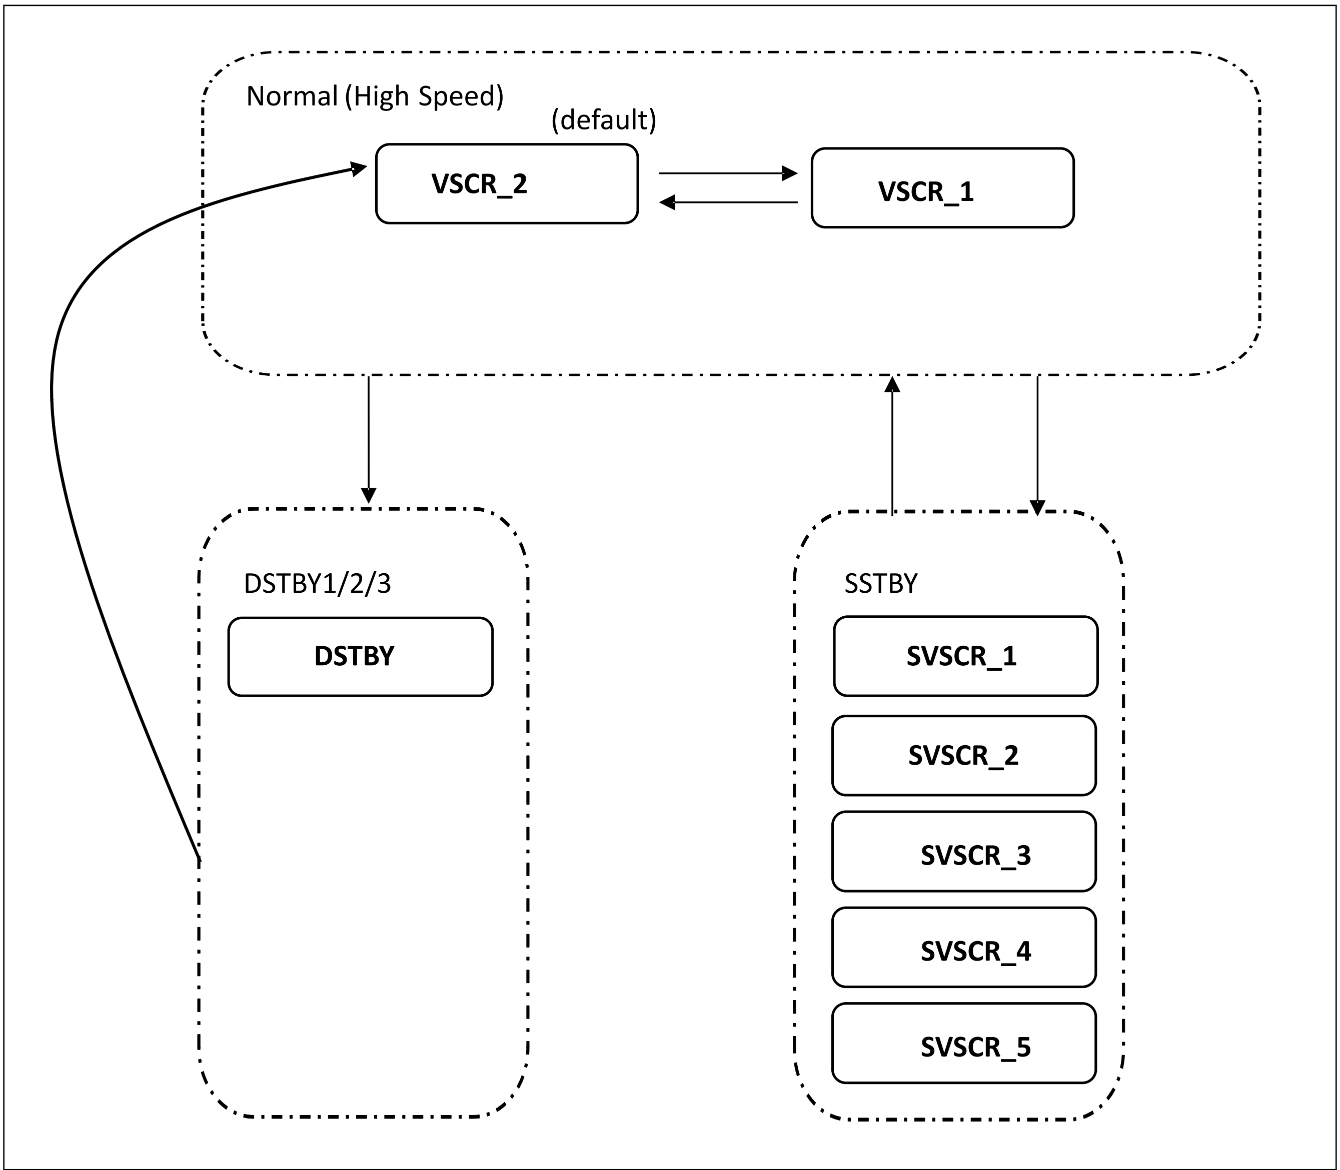

Figure 11.6 Voltage Scaling (DVFS) control for low power or high performance operation

<Normal Mode>

Make sure the operating condition (the frequency range) is always within the specified range before and after switching the VDD in Normal mode. Switch the voltage so that each clock does not exceed the maximum frequency shown in section 62, Electrical Characteristics.

The followings are examples of the procedures for switching the VDD

(1) Switching from VSCR_2 to VSCR_1

1. Set the VSCR.VSCM[2:0] bit to 0x1.
2. Confirm that VSCR.VSCMTSF flag is 0.
3. Set the SCKDIVCR and SCKDIVCR2 to the desired value.

(2) Switching from VSCR_1 to VSCR_2

1. Set the SCKDIVCR and SCKDIVCR2 to the desired value.
2. Set the VSCR.VSCM[2:0] bit to 0x2.
3. Confirm that VSCR.VSCMTSF flag is 0.

(3) In case it is necessary to change the PLL setting when changing the VDD

1. Change the clock source to other than PLL.
2. Stop the PLL.
3. Change the PLL setting.
4. Set the VSCR.VSCM[2:0] bit to the desired value.
5. Confirm that VSCR.VSCMTSF flag is 0.
6. Enable the PLL.
7. Wait the stabilization time for PLL.
8. Change the clock source to PLL.

< Software Standby mode>

- It is possible to transfer to Software Standby mode and to return from Software Standby mode with VSCR set to something other than default at Normal mode.
  In Software Standby mode, SVSCR setting is enabled. SVSCR must be set before transitioning to Software Standby mode.
  VSCR setting is retained during Software Standby mode and after returning from Software Standby mode.
- It is forbidden to set SVSCR_1 and SS2LP[1:0] = 01b and transition to Software Standby mode.

<Deep Software Standby mode 1/2/3>

- It is possible to transfer to Deep Software Standby mode 1/2/3 and to return from Deep Software Standby mode 1/2/3 with VSCR set to something other than default at Normal mode.
  VSCR is initialized when returning from Deep Software Standby mode 1/2/3.

11.8 Usage Notes

11.8.1 Register Access

(1) Do not write to the registers listed below in either of the following conditions:

<Registers>

- All registers with a peripheral name of SYSC.

<Conditions>

- OPCCR.OPCMTSF = 1 (during transition of operating power control mode)
- MENTRYR.MENTRY = 1 (Extra MRAM program mode)
- VSCR.VSCMTSF = 1 (during transition of operating power control mode)
- Time period from executing WFI instructions from both CPUs to returning to Normal mode

(2) Do not write to the registers listed below by DTC or DMAC.

<Registers>

- MSTPCRA
- MSTPCRB
- MSTPCRC
- MSTPCRD
- MSTPCRE

11.8.2 I/O Port States

I/O port states in Software Standby mode, Deep Software Standby mode are as same as before entering the modes. Therefore, the supply current is not reduced while output signals are held high.

11.8.3 Module-Stop State of DMAC and DTC

Before writing 1 to MSTPCRA.MSTPA22 or MSTPCRA.MSTPA23, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see section 17, DMA Controller (DMAC) and section 18, Data Transfer Controller (DTC).

11.8.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If setting module-stop bit while an interrupt request is generated, a CPU interrupt source or a DMAC or DTC startup source cannot be cleared. For this reason, make sure to disable the corresponding interrupts before setting the module-stop bits.

11.8.5 Input Buffer Control by DIRQnE Bit

Setting the DPSIERy.DIRQnE (y = 0 or 1 or 4 or 5, n = 0 to 31) bit to 1 enables the input buffer of the IRQ0-DS to IRQ31-DS pins. Note that, although inputs to these pins are sent to the DPSIFRy.DIRQnF (y = 0 or 1 or 4 or 5, n = 0 to 31) bits, they are not sent to the interrupt controller, peripheral modules, and I/O ports.

11.8.6 Transition to Low Power Modes

Do not enter low power modes (CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode) by executing a WFE instruction. It is possible to enter CPU Sleep mode by executing a WFE instruction. In that case, CPU Sleep mode is canceled by the SEV instruction executed by another CPU, or any available interrupt request.

11.8.7 Timing of WFI Instructions

It is possible for the WFI instruction to be executed before I/O register and CS area writes are complete, in which case operation may not be as intended. This can happen if the WFI is placed immediately after a write to a I/O register and CS area. To avoid this problem it is advisable to read back the register and CS area that was written to confirm that the write has completed.

11.8.8 Writing WDT/IWDT Registers by DMAC or DTC

Do not write registers in WDT or IWDT by DMAC or DTC while WDT or IWDT is stopped by entering processor low power mode.

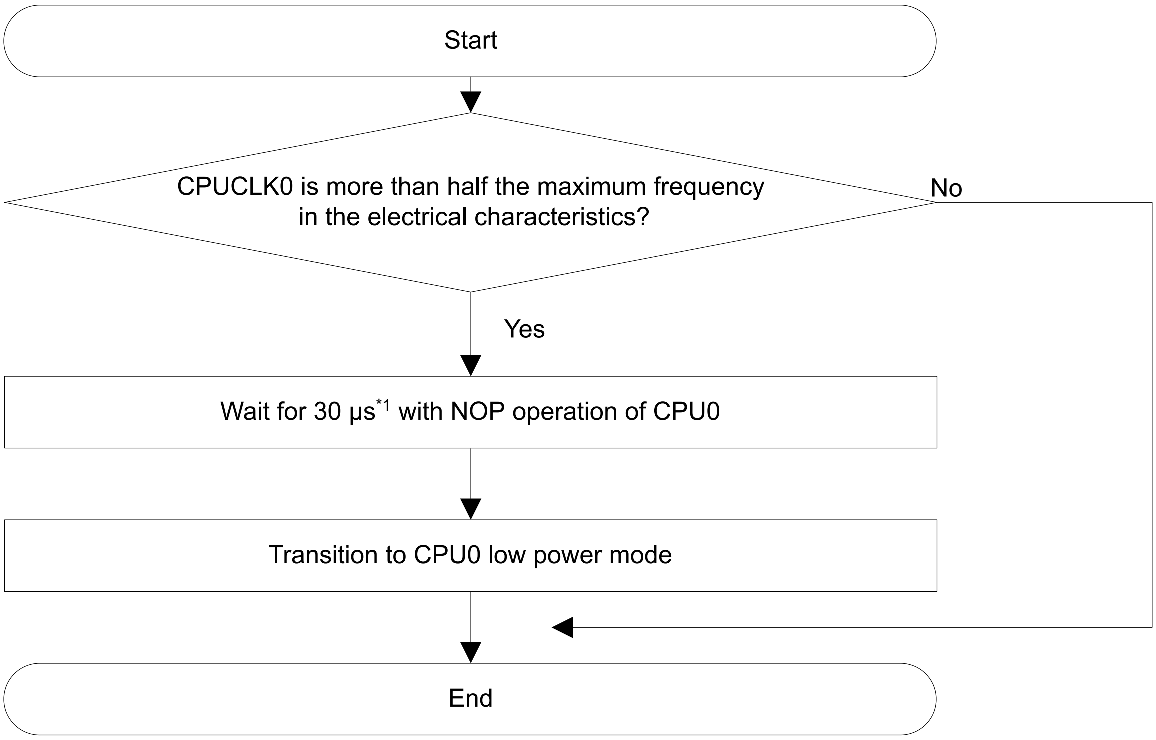
11.8.9 Module Stop Bit Write Timing

It is possible that the access to I/O register may be executed before the corresponding module stop bit write is completed. In this case, the access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module stop bit that was written to confirm that the write completed.

11.8.10 Notes on Transitioning to or Canceling Low Power State

Transitioning to/returning from the low power state requires procedures.

These flows are shown in Figure 11.7 to Figure 11.12. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 30 µs in DCDC mode, 10 µs in External VDD mode

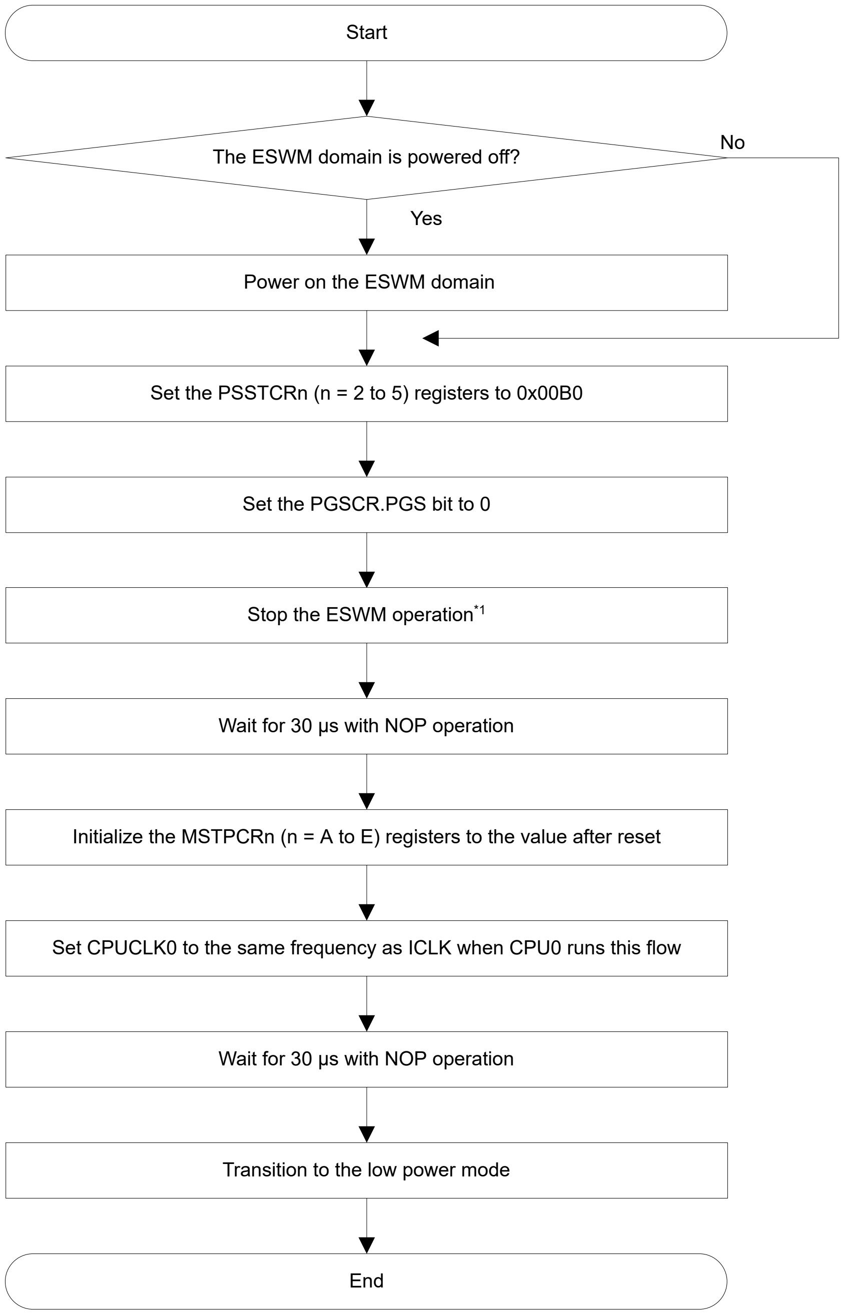
Figure 11.10 Additional flow for the return from CPU0 Deep Sleep mode with CPUDSCR.PGD0 bit is 0 (assuming that CPUCLK0 and ICLK are the same frequency when returning)



Note 1. See the Usage Notes in each chapter for how to stop the operation

Figure 11.11 Additional flow for the transition to Software Standby mode and Deep Software Standby mode 1/2/3

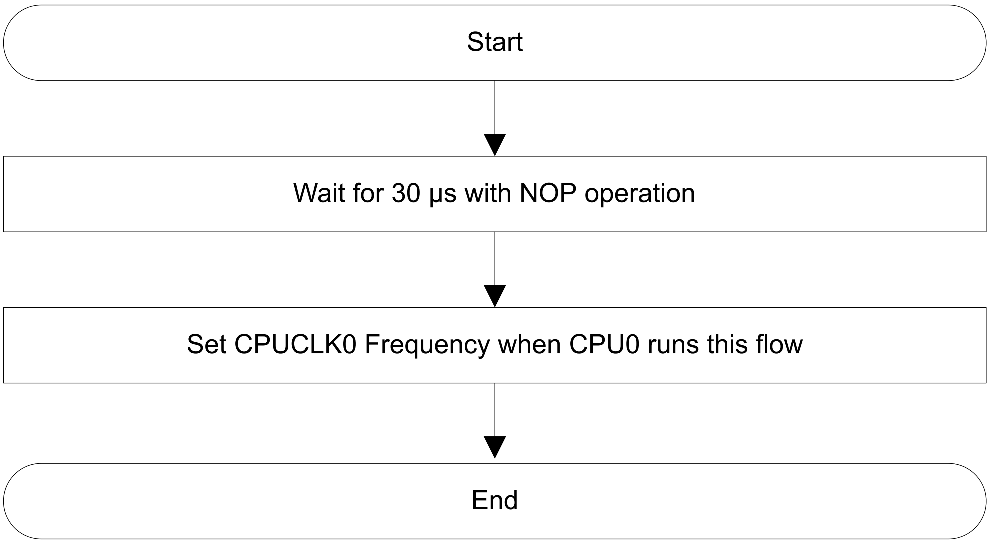


Figure 11.12 Additional flow for the return from Software Standby mode (assuming that CPUCLK0 and ICLK are the same frequency when returning)

11.8.11 Notes about the WFE instruction or Sleep-on-exit function

There are 3 ways to transition to low power modes, WFI instruction, WFE instruction and Sleep-on-exit. When WFE instruction or Sleep-on-exit is used for transition to low power modes, WFI instruction comments written in User’s Manual Hardware is applicable to WFE instruction or Sleep-on-exit.

12. Battery Backup Function

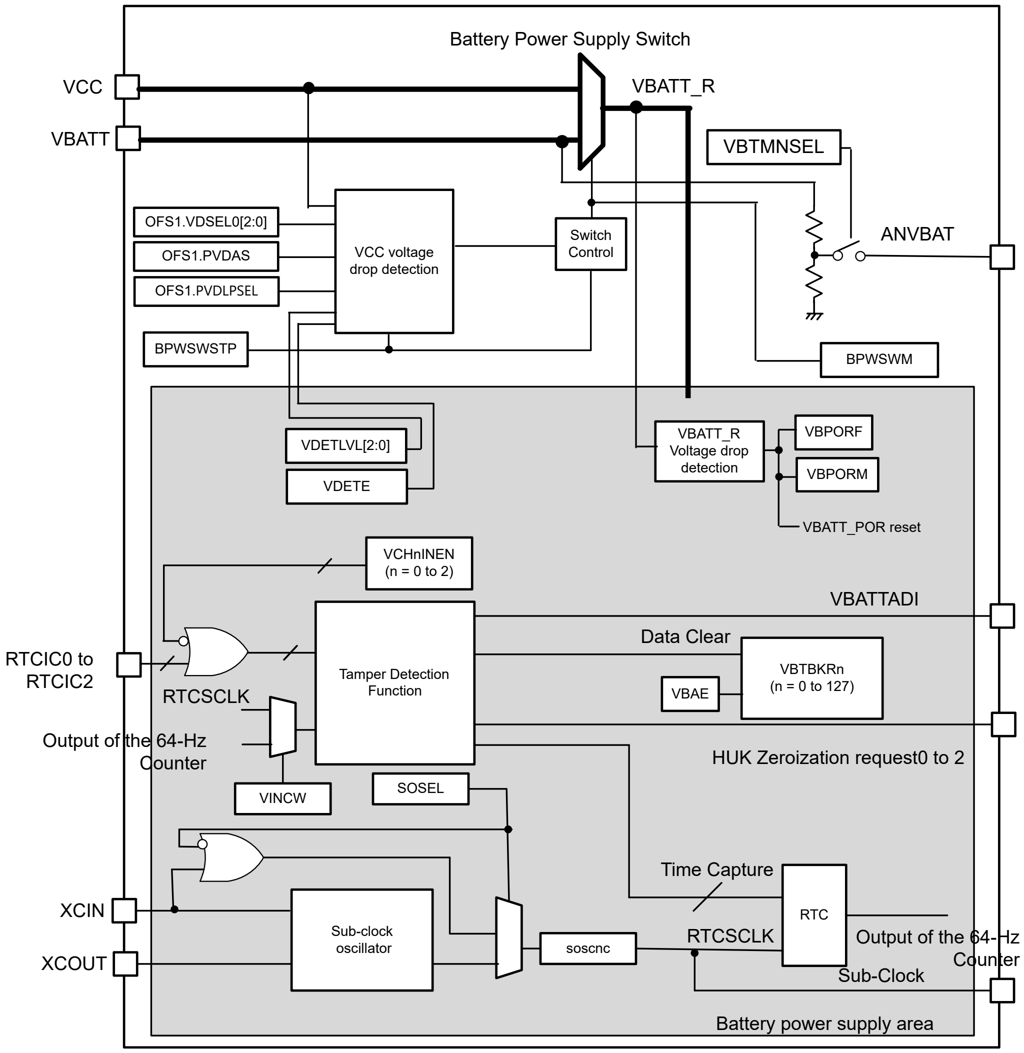
12.1 Overview

The MCU provides a battery backup function that maintains partial battery powering in the event of a power loss. Switching between VCC and VBATT, the battery-powered area includes RTC, SOSC, backup register, tamper detection and VBATT_R voltage drop detection. VBATT_R is the output voltage of the battery power supply switch. This is the power supply of the battery powered area.

During normal operation, the battery-powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

12.1.1 Battery Backup Function Block Diagram

Figure 12.1 shows the configuration of the battery backup function.



VBTMNSEL : VBATT Voltage Monitor Function Select Bit
VCHnINEN : VBATT CHn Input Enable bit (n = 0 to 2)
VDETLVL[2:0] : VDETBATT Level Select
VDETE : Voltage drop detection enable
BPWSWSTP : Battery Power Supply Switch Stop
VBPORF : VBATT_POR flag
BPWSWMON : Battery Power Supply Switch Status Monitor

VBTBKRn : VBATT Backup Register (n = 0 to 127)
VBAE : VBATT backup register access enable bit
OFS1 : Option Function Select Register 1
VDSEL0 : Voltage Detection 0 Level Select
PVDAS : Voltage Detection 0 Circuit Start
PVDLPSEL : PVD0 Select at Deep software standby mode
VINCW :VBATT Input Noise Canceler Width select
soscnc :Noise canceller for SOSC

Note: VCC : Main power supply pin
VBATT: Battery backup power supply pin
XCIN/XCOUT: SOSC input/output
RTCICn (n = 0 to 2): Input port for battery backup function

Figure 12.1 Battery backup function block diagram

12.1.2 Features of Battery Backup Function

The features include:

- Battery power supply switch
- VBATT_R voltage drop detection function
- Backup registers
- Time capture pin detection
- Tamper Detection function
- VBATT voltage monitor function

12.1.3 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

When VCC is lower than $V_{DETBATT}$, and VCC is higher than VBAT, the injected current connects from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

It is necessary to enable voltage monitor 0 resets to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

12.1.4 VBATT_R Voltage Drop Detection Function

VBATT_R voltage drop detection function supports the battery-powered area. This function monitors the VBATT_R voltage level. VBATT_R is the output voltage of the battery power supply switch. This voltage drop detection causes a VBATT_POR reset and initializes the battery-powered area. See details in each register description. The VBATT status register includes a flag to check for this voltage drop detections.

12.1.5 Backup Registers

The battery-powered area provides 128-byte backup registers. These registers retain data when VBATT is supplied and VCC is powered off. When tampering is detected, data of backup register can be cleared to 0x00.

12.1.6 Time Capture Function

The RTC detects RTCICn (n = 0 to 2) pin input level change. For more information, see section 26, Realtime Clock (RTC).

12.1.7 Tamper Detection Function

The tamper detection function detects the RTCICn (n = 0 to 2) pin input event. The input event is defined as a change of RTCICn (n = 0 to 2) pin input level. The tamper detection flag is set to 1 by the input event. When interrupt is enabled and flag is set to 1, tamper detection interrupt is generated. When backup registers clear is enabled and flag is set to 1, the data of backup registers is cleared. Time Capture Function can select this flag as the source of the time capture trigger.

When Tamper Detection Zeroization Enable is enabled and flag is set to 1, the HUK Zeroization request is outputted.

12.1.8 VBATT Voltage Monitor Function

VBATT voltage monitor function is to monitor the input voltage level to the VBATT pin. The voltage level can be monitored as analog signal. For more information, see section 53, 16-bit A/D Converter (ADC16H).

12.2 Register Descriptions

12.2.1 BBFSAR : Battery Backup Function Security Attribute Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3D0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	NONSEC6	NONSEC5	NONSEC4	NONSEC3	NONSEC2	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: VBATTMNSELR 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: VBTBER 0: Secure 1: Non-secure	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: VBTICTLR, VBTICTLR2, VBTIMONR 0: Secure 1: Non-secure	R/W
3	NONSEC3	Non-secure Attribute bit 3 Target register: VBTBPCR1, VBTBPCR2, VBTBPSR 0: Secure 1: Non-secure	R/W
4	NONSEC4	Non-secure Attribute bit 4 Target register: VBTADSR,VBTADCR1, VBTADCR2 0: Secure 1: Non-secure	R/W
5	NONSEC5	Non-secure Attribute bit 5 Target register: VBTADCR3 0: Secure 1: Non-secure	R/W
6	NONSEC6	Non-secure Attribute bit 6 Target register: VBTNCWCR 0: Secure 1: Non-secure	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by PRCR register.

The BBFSAR register controls the secure attribute of the battery backup function registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of VBATTMNSELR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of VBTBER.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of VBTICTLR, VBTICTLR2, and VBTIMONR.

NONSEC3 bit (Non-secure Attribute bit 3)

This bit controls the security attribute of VBTBPCR1 and VBTADCR2.

NONSEC4 bit (Non-secure Attribute bit 4)

This bit controls the security attribute of VBTADSR, VBTADCR1 and VBTADCR2.

NONSEC5 bit (Non-secure Attribute bit 5)

This bit controls the security attribute of VBTADCR3.

NONSEC6 bit (Non-secure Attribute bit 6)

This bit controls the security attribute of VBTNCWCR.

12.2.2 VBRSABAR : VBATT Backup Register Security Attribute Boundary Address Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3B0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SABA[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	SABA[15:0]	Boundary address between secure and non-secure	R/W

Note: S-TYPE-6, P-TYPE-2

VBRSABAR specify the boundary address between Secure and non-secure regions of VBATT Backup Register. This register specifies lower 16 bits of VBATT Backup Register address. Secure region is less than SABA. Non-secure region is SABA or higher. The boundary address can set in units of 32 bytes, so the value written from b4 to b0 should be 0. SABA has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Secure region : 0x4001_ED00 ≤ Address < 0x4001_0000 + SABA

Non-secure region : 0x4001_0000 + SABA ≤ Address

Note: The initial value specifies an address greater than the end address of VBATT Backup Register, so all area is Secure. If you specify all area of the VBATT Backup Register as Non-secure, specify the top address in the VBATT Backup Register area.

12.2.3 VBRPABARS : VBATT Backup Register Privilege Attribute Boundary Address Register for Secure Region

Base address: SYSC = 0x4001_E000

Offset address: 0x3B4

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PABAS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PABAS[15:0]	Privilege Attribute Boundary Address for Secure Region Boundary address between Privileged area and any-Privileged area in Secure	R/W

Note: S-TYPE-6, P-TYPE-2

VBRPABARS specify the boundary address between Privileged area and Any-Privileged area in Secure regions of VBATT Backup Register. This register further separates the Secure region of VBATT Backup Register set by VBRSABAR register into Privileged and Any-Privileged areas. This register specifies lower 16 bits of VBATT Backup Register address. Privileged area is less than PABAS. Any-Privileged area is PABAS or higher. The boundary address can set in units of 32byte, so the value written from b4 to b0 should be 0. PABAS has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Privileged area in Secure region : 0x4001_ED00 ≤ Address < 0x4001_0000 + PABAS
0x4001_ED00 ≤ Address < 0x4001_0000 + SABA

This area that satisfies both address conditions.

Any-Privileged area in Secure region : 0x4001_0000 + PABAS ≤ Address < 0x4001_0000 + SABA

Note: The initial value specifies before the top address of the VBATT Backup Register, so all the Secure region is Any-Privilege. In this case, the setting of this register is actually ignored.

If you specify Privileged for the entire VBATT Backup Register that you have set as the Secure region, specify VBRPABARS register to the 0xFFE0.

12.2.4 VBRPABARNS : VBATT Backup Register Privilege Attribute Boundary Address Register for Non-secure Region

Base address: SYSC_NS = 0x5001_E000

Offset address: 0x3B8

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PABANS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PABANS[15:0]	Privilege Attribute Boundary Address for Non-secure Region Boundary address between Privileged area and Any-Privileged area in Non-secure	R/W

Note: S-TYPE-7, P-TYPE-2

VBRPABARNS specify the boundary address between Privileged area and Any-Privileged area in Non-secure regions of VBATT Backup Register. This register further separates the Non-secure region of VBATT Backup Register set by VBRSABAR register into Privileged and Any-Privileged areas. This register specifies lower 16 bits of VBATT Backup Register address. Privileged area is less than PABANS. Any-Privileged area is PABANS or higher. The boundary address can set in units of 32byte, so the value written from b4 to b0 should be 0. PABANS has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Privileged area in Non-Secure region : 0x4001_0000 + SABA ≤ Address < 0x4001_0000 + PABANS

Any-Privileged area in Non-Secure region : 0x4001_0000 + PABANS ≤ Address
0x4001_0000 + SABA ≤ Address

This area that satisfies both address conditions.

Note: The initial value specifies before the top address of VBATT Backup Register, so all the Non-secure region is Any-Privilege. In this case, the setting of this register is actually ignored.

If you specify Privileged for the entire VBATT Backup Register that you have set as the Non-secure region, specify VBRPABARNS register to the 0xFFE0.

12.2.5 VBATTMNSELR : Battery Backup Voltage Monitor Function Select Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA84

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	VBTMNSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTMNSEL	VBATT Voltage Monitor Function Select Bit Select VBATT voltage monitor function 0: Disables VBATT voltage monitor function 1: Enables VBATT voltage monitor function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBATTMNSELR is the register which controls VBATT voltage monitor function.

This register is initialized by all reset sources except VBATT_POR reset.

VBTMNSEL bit (VBATT Voltage Monitor Function Select Bit)

Select VBATT low voltage monitor function. After setting this bit to 1, it is necessary to wait t_{MONWT} for the monitor level to stabilize.

Consumption current increases while VBTMNSEL = 1. So, after monitoring the VBATT voltage level, clear VBTMNSEL to 0 in order to reduce power consumption of VBATT power supply.

For more information on t_{MONWT}, see section 62, Electrical Characteristics.

12.2.6 VBTBER : VBATT Backup Enable Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	VBAE	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	VBAE	VBATT backup register access enable bit 0: Disable to access VBTBKR 1: Enable to access VBTBKR	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBAE bit is initialized by the power on reset of VCC or after transition to VBATT mode.

VBAE bit (VBATT backup register access enable bit)

You must write 1 to VBAE before accessing VBTBKR. And you must write 0 after finishing all access (Write or Read) to VBTBKR. If you do not write 0 to VBAE, the data of VBTBKR does not be kept at VBATT mode.

Also, while VBAE is set to 0, the value of VBTBKR can be retained even if the VDD power supply and VCC power supply are powered off.

(The value can be retained even if the Core Voltage Monitor reset and the Overcurrent protection reset occurs after setting VBAE to 0.)

To access VBTBKR, wait for at least 500 ns after writing 1 to VBAE, and then access VBTBKR.

Before entering the Deep Software Standby mode, you must write 0 to VBAE.

To enter the deep software standby mode, wait at least 250 ns after writing 0 to VBAE, and then enter the Deep Software Standby mode.

If you don't use VBTBKR, you should change VBAE to 0 in order to reduce power consumption of VBTBKR.

12.2.7 VBTBKRn : VBATT Backup Register (n = 0 to 127)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xD00 + 0x001 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	VBTBKRn[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	VBTBKRn[7:0]	VBATT Backup Register The value of this register is retained even in VBATT mode. This register is not initialized by any reset sources.	R/W

Note: S-TYPE-3, P-TYPE-3

VBTBKRn[7:0] bits (VBATT Backup Register)

The value of this register is retained even in VBATT mode.

You can use 32, 16 or 8-bit access instruction when accessing the VBTBKRn register. When accessing, please note that the byte order of the data stored in the VBTBKRn register is little endian.

The data of VBTBKRn register is cleared to 0x00 by VBATT_POR reset or tamper detection function.

12.2.8 VBTICTLR : VBATT Input Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VCH2INEN	VCH1INEN	VCH0INEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VCH0INEN	VBATT CH0 Input Enable 0: RTCIC0 input disable 1: RTCIC0 input enable	R/W
1	VCH1INEN	VBATT CH1 Input Enable 0: RTCIC1 input disable 1: RTCIC1 input enable	R/W
2	VCH2INEN	VBATT CH2 Input Enable 0: RTCIC2 input disable 1: RTCIC2 input enable	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBTICTLR is the register that can select RTCICn (n = 0 to 2) pin as input. This register is only initialized by VBATT_POR reset.

VCHnINEN bits (VBATT CHn Input Enable Bits) (n = 0 to 2)

The VCHnINEN bit enables the input direction on the RTCICn. A wait time of 50 µs is required for the operation to stabilize after the RTCICn pin input is enabled.

12.2.9 VBTICTLR2 : VBATT Input Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	VCH2 EG	VCH1 EG	VCH0 EG	—	VCH2 NCE	VCH1 NCE	VCH0 NCE
Value after reset:	0	1	1	1	0	0	0	0

Bit	Symbol	Function	R/W
0	VCH0NCE	VBATT CH0 Input Noise Canceler Enable 0: RTCIC0 pin input noise canceler disable 1: RTCIC0 pin input noise canceler enable	R/W
1	VCH1NCE	VBATT CH1 Input Noise Canceler Enable 0: RTCIC1 pin input noise canceler disable 1: RTCIC1 pin input noise canceler enable	R/W
2	VCH2NCE	VBATT CH2 Input Noise Canceler Enable 0: RTCIC2 pin input noise canceler disable 1: RTCIC2 pin input noise canceler enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VCH0EG	VBATT CH0 Input Edge Select 0: RTCIC0 pin input event is detected on falling edge 1: RTCIC0 pin input event is detected on rising edge	R/W
5	VCH1EG	VBATT CH1 Input Edge Select 0: RTCIC1 pin input event is detected on falling edge 1: RTCIC1 pin input event is detected on rising edge	R/W
6	VCH2EG	VBATT CH2 Input Edge Select 0: RTCIC2 pin input event is detected on falling edge 1: RTCIC2 pin input event is detected on rising edge	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBTICTLR2 is the register that can select RTCICn (n = 0 to 2) pin input mode. This register is only initialized by VBATT_POR reset.

VCHnNCE bits (VBATT CHn Input Noise Canceler Enable) (n = 0 to 2)

The VCHnNCEN bit enables the input noise canceler on the RTCICn (n = 0 to 2) pin input.

VCHnEG bits (VBATT CHn Input Edge Select) (n = 0 to 2)

The VCHnEG bit selects input event detection edge to set VBTADFn flag.

12.2.10 VBTIMONR : VBATT Input Monitor Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VCH2 MON	VCH1 MON	VCH0 MON
Value after reset:	0	0	0	0	0	x	x	x

Bit	Symbol	Function	R/W
0	VCH0MON	VBATT CH0 Input monitor 0: RTCIC0 pin input is low level 1: RTCIC0 pin input is high level.	R
1	VCH1MON	VBATT CH1 Input monitor 0: RTCIC1 pin input is low level 1: RTCIC1 pin input is high level	R
2	VCH2MON	VBATT CH2 Input monitor 0: RTCIC2 pin input is low level 1: RTCIC2 pin input is high level.	R
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBTIMONR is the register that can monitor RTCICn (n = 0 to 2) pin input level.

VCHnMON bits (VBATT CHn Monitor) (n = 0 to 2)

The VCHnMON bit indicates input level on the RTCICn (n = 0 to 2) pin.

12.2.11 VBTBPCR1 : VBATT Battery Power Supply Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA88

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BPWSWSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPWSWSTP	Battery Power Supply Switch Stop 0: Battery power supply switch enable 1: Battery power supply switch stop	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPCR1 register controls battery power supply switch. This register is initialized by all reset sources except Deep Software Standby reset and VBATT_POR reset.

BPWSWSTP bit (Battery Power Supply Switch Stop)

The BPWSWSTP bit can enable switching the backup module supply power source from VCC to VBATT when the voltage applied to the VCC pin drops.

When stop is selected, the battery backup module power supply is always from VCC. Set the VDETE bit to 0 after setting theBPWSWSTP bit to 1. The BPWSWSTP bit must not be set from 1 to 0 while the VDETE bit is 1. If this setting is made, the state of the backup power area cannot be guaranteed.

If the BPWSWSTP bit is changed from 1 to 0, set the value of the VBTBPCR2.VDETLVL before it.

After setting the BPWSWSTP value from 1 to 0, wait for t_{DETWT} then set it to the VBTBPCR2.VDETE bit is 1.

12.2.12 VBTBPCR2 : VBATT Battery Power Supply Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC45

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	VDETE	—	VDETLVL[2:0]		
Value after reset:	0	0	0	0	0	1	1	0

Bit	Symbol	Function	R/W
2:0	VDETLVL[2:0]	$V_{DETBATT}$ Level Select 0 0 0: 2.80 V 0 0 1: 2.53 V 0 1 0: 2.10 V 0 1 1: 1.95 V 1 0 0: 1.85 V 1 0 1: 1.75 V 1 1 0: setting prohibited 1 1 1: setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VDETE	Voltage drop detection enable 0: VCC Voltage drop detection disable 1: VCC Voltage drop detection enable	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPCR2 register controls battery power supply switch. This register is only initialized by VBATT_POR reset.

VDETLVL[2:0] bits ($V_{DETBATT}$ Level Select)

The VDETLVL[2:0] bits select $V_{DETBATT}$ level. When the voltage of the VCC pin drops below $V_{DETBATT}$, the power supply source switches from the VCC pin to the VBATT pin. The $V_{DETBATT}$ level should be below Voltage monitoring 0 level.

This MCU can reduce power consumption of the Deep Software Standby mode 1 or 2. When the MCU enters the Deep Software Standby mode 1 or 2 with that OFS1.PVDAS = 0 and OFS1.PVDLPSEL = 0, the battery power supply switch is controlled by the voltage monitor 0 which has lower power consumption than VCC voltage drop detection circuit dedicated for VBATT.

The VDETLVL[2:0] bits should change while the VDETE bit is 0. The VCC voltage detection function needs t_{DETWT} wait time for stabilization at the change of $V_{DETBATT}$ level. The VDETE bit should be set to 1 after this wait time.

For details on VDETLVL[2:0] bits, see section 12.3.2. VBATT Battery Power Supply Switch Usage.

VDETE bit (Voltage drop detection enable)

The VDETE bit enables the VCC voltage drop detection function for the battery power supply switch. The initial value of the VDETE bit is 0, at this time, the VCC voltage drop detection function for the battery power supply switch is disabled. If you use the battery power supply switch function, you must select $V_{DETBATT}$ level and enables the VCC voltage drop detection function.

For details on VDETE bit, see section 12.3.2. VBATT Battery Power Supply Switch Usage.

For more information on t_{DETWT}, see section 62, Electrical Characteristics.

12.2.13 VBTBPSR : VBATT Battery Power Supply Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC46

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BPWSWM	VBPORM	—	—	—	VBPORF
Value after reset:	0	0	x	x	0	0	0	x

Bit	Symbol	Function	R/W
0	VBPORF	VBATT_POR Flag 0: VBATT_R voltage drop is not detected 1: VBATT_R voltage drop is detected	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	VBPORM	VBATT_POR Monitor 0: VBATT_R voltage < $V_{PORBATT}$ 1: VBATT_R voltage > $V_{PORBATT}$	R
5	BPWSWM	Battery Power Supply Switch Status Monitor 0: VCC voltage < $V_{DETBATT}$ 1: VCC voltage > $V_{DETBATT}$	R
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPSR register indicate battery power supply status.

VBPORF flag (VBATT_POR Flag)

The VBPORF flag indicates that VBATT_R voltage drop was detected and VBATT_POR reset was asserted.

[Setting condition]

- When VBATT_R voltage drops below V_{PORBAT}.

[Clearing condition]

- When 0 is written.

VBPORM bit (VBATT_POR Monitor)

The VBPORM bit indicates comparison result between VBATT_R and V_{PORBAT}.

BPWSWM bit (Battery Power Supply Switch Status Monitor)

The BPWSWM bit indicates comparison result between VCC and $V_{DETBATT}$.

12.2.14 VBTADSR : VBATT Tamper Detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC48

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBTADF2	VBTADF1	VBTADF0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTADF0	VBATT Tamper Detection flag 0 0: RTCIC0 input edge is not detected 1: RTCIC0 input edge is detected	R/W
1	VBTADF1	VBATT Tamper Detection flag 1 0: RTCIC1 input edge is not detected 1: RTCIC1 input edge is detected	R/W
2	VBTADF2	VBATT Tamper Detection flag 2 0: RTCIC2 input edge is not detected 1: RTCIC2 input edge is detected	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADSR register indicate tamper detection function status. This register is only initialized by VBATT_POR reset.

VBTADFn flags (VBATT Tamper Detection flag n) (n = 0, 1, 2)

The VBTADFn (n = 0, 1, 2) flag indicates that RTCICn (n = 0, 1, 2) input edge is detected. The edge type of RTCICn (n = 0, 1, 2) input can be selected by VCHnEG (n = 0, 1, 2) bit.

[Setting condition]

- When RTCICn (n = 0, 1, 2) input edge is detected.

[Clearing conditions]

- When 0 is written after 1 is read from VBTADFn (n = 0, 1, 2) flag.

12.2.15 VBTADCR1 : VBATT Tamper Detection Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC49

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	VBTADCE2	VBTADCE1	VBTADCE0	—	VBTADIE2	VBTADIE1	VBTADIE0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTADIE0	VBATT Tamper Detection Interrupt Enable 0 0: Interrupt by VBTADF0 flag is disable 1: Interrupt by VBTADF0 flag is enable	R/W
1	VBTADIE1	VBATT Tamper Detection Interrupt Enable 1 0: Interrupt by VBTADF1 flag is disable 1: Interrupt by VBTADF1 flag is enable	R/W
2	VBTADIE2	VBATT Tamper Detection Interrupt Enable 2 0: Interrupt by VBTADF2 flag is disable 1: Interrupt by VBTADF2 flag is enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VBTADCE0	VBATT Tamper Detection Backup Register Clear Enable 0 0: Clear Backup Register by VBTADF0 flag is disable 1: Clear Backup Register by VBTADF0 flag is enable	R/W
5	VBTADCE1	VBATT Tamper Detection Backup Register Clear Enable 1 0: Clear Backup Register by VBTADF1 flag is disable 1: Clear Backup Register by VBTADF1 flag is enable	R/W
6	VBTADCE2	VBATT Tamper Detection Backup Register Clear Enable 2 0: Clear Backup Register by VBTADF2 flag is disable 1: Clear Backup Register by VBTADF2 flag is enable	R/W

Bit	Symbol	Function	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR1 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBTADIEn bits (VBATT Tamper Detection Interrupt Enable) (n = 0, 1, 2)

The VBTADIEn (n = 0, 1, 2) bit enables Tamper detection interrupt.

VBTADCEn bits (VBATT Tamper Detection Backup Register Clear Enable) (n = 0, 1, 2)

The VBTADCEn (n = 0, 1, 2) bit enables backup register clearing by tamper detection flag.

12.2.16 VBTADCR2 : VBATT Tamper Detection Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBRTCES2	VBRTCES1	VBRTCES0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBRTCES0	VBATT RTC Time Capture Event Source Select 0 0: RTCIC0 1: VBTADF0	R/W
1	VBRTCES1	VBATT RTC Time Capture Event Source Select 1 0: RTCIC1 1: VBTADF1	R/W
2	VBRTCES2	VBATT RTC Time Capture Event Source Select 2 0: RTCIC2 1: VBTADF2	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR2 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBRTCESn bits (VBATT RTC Time Capture Event Source Select) (n = 0, 1, 2)

The VBRTCESn (n = 0, 1, 2) bit selects RTC time capture event source.

When the noise cancellation function of the RTCIC pin input and the Sub-clock oscillation stop detection function are both enabled (VBTICTLR2.VCHnNCEN = 1 and SOSTDCR. SOSTDE = 1), set RTC Time Capture Event Source to VBTADFn (VBRTCESn = 1).

12.2.17 VBTADCR3 : VBATT Tamper Detection Control Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC54

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBTADZE2	VBTADZE1	VBTADZE0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTADZE0	VBATT Tamper Detection Zeroization Enable 0 0: Zeroing HUK request by VBTADF0 flag is disable 1: Zeroing HUK request by VBTADF0 flag is enable	R/W
1	VBTADZE1	VBATT Tamper Detection Zeroization Enable 1 0: Zeroing HUK request by VBTADF1 flag is disable 1: Zeroing HUK request by VBTADF1 flag is enable	R/W
2	VBTADZE2	VBATT Tamper Detection Zeroization Enable 2 0: Zeroing HUK request by VBTADF2 flag is disable 1: Zeroing HUK request by VBTADF2 flag is enable	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR3 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBTADZEn bit (VBATT Tamper Detection Zeroization Enable) (n = 0, 1, 2)

The VBTADZEn (n = 0, 1, 2) bit enables HUK Zeroization requests output by tamper detection flag.

12.2.18 VBTNCWCR : VBATT Noise Canceler Width Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VINCW[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	VINCW[2:0]	VBATT Input Noise Canceler Width select 0 0 0: 32.768 kHz 0 0 1: 64 Hz 0 1 0: 32 Hz 0 1 1: 16 Hz 1 0 0: 8 Hz 1 0 1: 4 Hz 1 1 0: 2 Hz 1 1 1: 1 Hz	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

This register is only initialized by VBATT_POR reset.

The VBTNCWCR bit selects noise cancellation width of Tamper input.

Denoising is done using the circuit shown in Figure 12.5. The setting is the frequency of the noise sampling clock.

When VBTNCWCR is set to a value other than 3'b000, start the RTC 64 Hz counter.

12.3 Operation

12.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the VBATT_R backup power area from the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DETBATT}$. When a drop of power supply from VCC pin is detected, backup power area enter the VBATT Mode. In the VBATT Mode, power supply is switched to VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DETBATT}$. This power supply change does not affect the VBATT_R backup power area function.

It is necessary to enable voltage monitor 0 reset to use the battery backup

The VBATT_R backup power area include following functions:

- RTC (including time capture detection, triggered by a change of the time capture pin input level)
- Sub-clock oscillator (including XCIN and XCOUT pins)
- The sub-clock oscillation stopping detection function
- VBATT Backup Register
- Tamper Detection Function
- VBATT Voltage Monitor Function

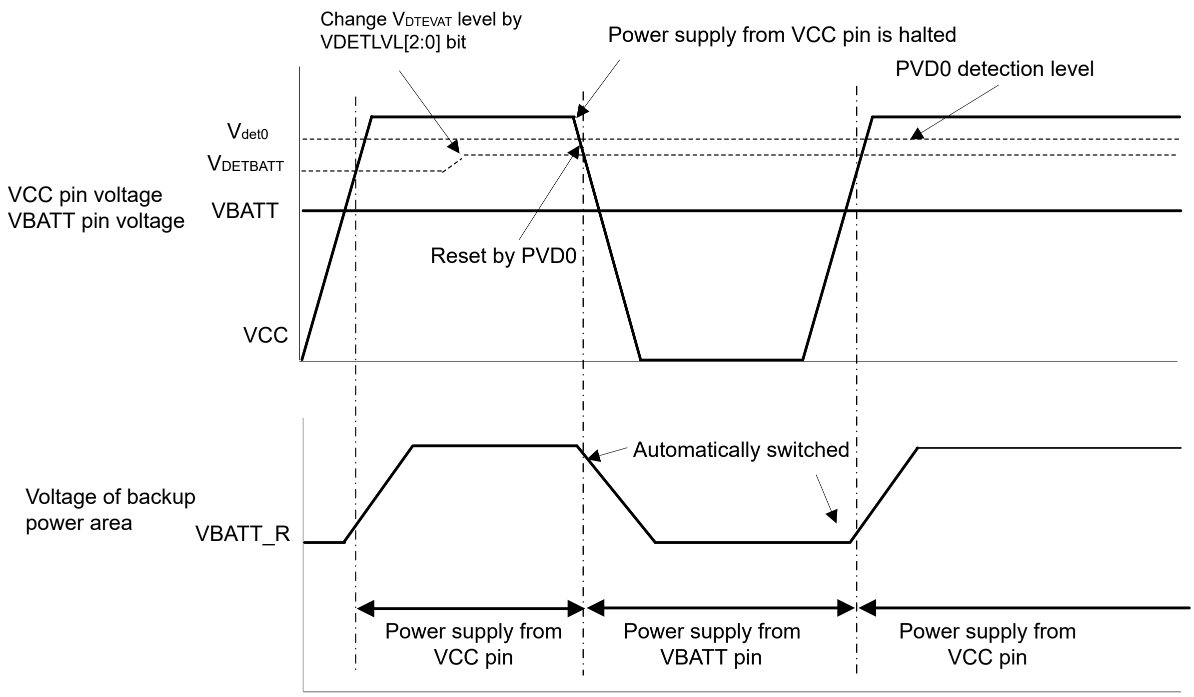
Table 12.1 shows the operating states in VBATT mode.

Table 12.1 Operating States in VBATT Mode

Operating state	VBATT Mode
Transition condition	Detection of VCC voltage drop
Canceling method other than reset	Detection of VCC voltage rise
State after cancellation by an interrupt	—
State after cancellation by a reset	—
Main clock oscillator	Stop
Sub-clock oscillator	Operating or not operating can be selected by SOSCCR.SOSTP bit. The status of the oscillator is same as before entering VBATT mode.
High-speed on-chip oscillator	Stop
Middle-speed on-chip oscillator	Stop
Low-speed on-chip oscillator	Stop
Sub-clock oscillation-stop detection function	Operating or not operating can be selected by SOSTDCR.SOSTDE bit. The status of the function is same as before entering VBATT mode.
PLL	Stop
PLL2	Stop
CPU	Stop (Undefined)
SRAM (ECC RAM included)	Stop (Undefined)
VBATT Backup Register	Stop (Retained or zeroized is selectable when Tamper input was detected.)
MRAM	Stop (Retained)
Realtime clock (RTC)	Selectable when selecting clock which is operating as the count source.
Programmable voltage detection circuit (PVD)	Stop
Power-on reset circuit	Stop
Other Peripheral modules	Stop (Undefined)
I/O ports	RTCICn ports (n = 0 to 2): Operating All ports not specified here: Undefined

Note: Stop (Retained) means that the contents of the internal registers are retained, but the operations are suspended.
Note: Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Figure 12.2 shows switching sequence of Battery backup function.



Note: For details, see section 62, Electrical Characteristics.

Note: $V_{DETBATT}$ indicates the threshold level of the power supply change between the VCC pin and the VBATT pin.

Figure 12.2 Switching sequence of Battery backup function.

12.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage being applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

The VCC voltage drop detection function for the battery power supply switch in "Figure 12.1" consists of two voltage drop detectors. One is a VCC drop detector for normal operation of the battery power supply switch that operates according to the settings of the VDTETLVL[2:0] bit and the VDETE bit. The other is voltage monitoring 0 to reduce power consumption during the Deep Software Standby mode 1 or 2.

In cold start, VDETE bit is initialized by VBATT_POR reset and the VCC voltage drop detection function for the battery power supply switch is disabled.

To use the battery power supply switch, the proper $V_{DETBATT}$ level must be selected by VDETLVL[2:0] bits and wait t_{DETWT} for stabilization. After wait, the VCC voltage drop detection function is enabled by VDETE bit. The battery power supply switch has a constraint that the $V_{DETBATT}$ level selected by VDETLVL[2:0] bits should be below Voltage monitoring 0 level.

When the MCU transitions to the Deep Software Standby mode 1 or 2 and the low power consumption function of voltage monitor 0 is enabled, the VCC drop detector for normal operation of the battery power supply switch is stopped to reduce power consumption. At this time, the power supply switch is controlled by the voltage monitor 0. This control by voltage monitor 0 continues until it returns from Deep Software Standby mode.

The battery backup function should be used after the voltage monitoring 0 reset is enabled (OFS1.PVDAS bit is 0).

If you don't use battery power supply switch. You must set BPWSWSTP bit to 1 and short the VCC and VBATT pins. When BPWSWSTP bit is 1, switch is stop, and power is always supplied from VCC pin.

12.3.3 VBATT_R Voltage Drop Detection Function Usage

This function enables to detect VBATT_R voltage drop. When VBATT_R voltage is drop and lower than $V_{PDR\ (BATR)}$, VBATT_POR reset is asserted. The VBPORF flag is set to 1 by VBATT_POR reset. If VBPORF flag is 1, RTC counter and register is invalid and Battery Backup Function registers are reset. You must initialize the functions included backup power area.

Figure 12.3 shows VBATT_R voltage drop detection function.

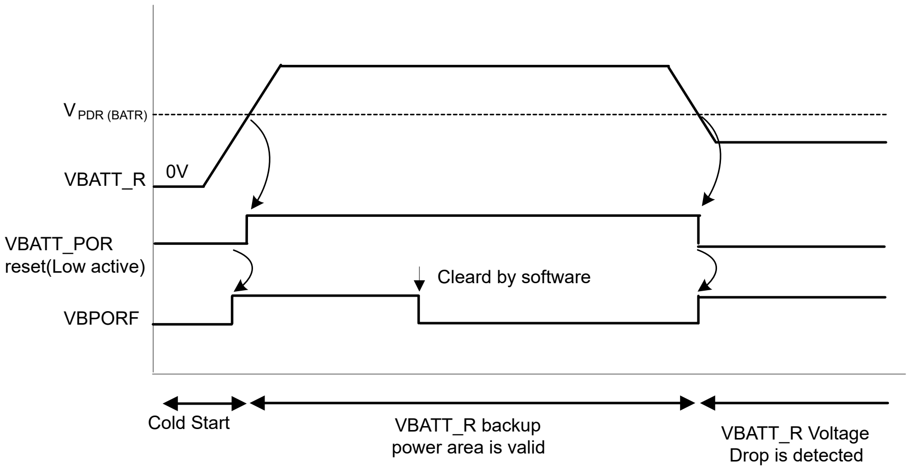


Figure 12.3 VBATT_R voltage drop detection function

12.3.4 VBATT Backup Register Usage

You can use 32, 16 or 8-bit access instruction when accessing the VBATT backup registers.

However, for example, when a 32-bit access instruction is executed, 8-bit read or write operation is executed with 4 consecutive times. When accessing, please note that the byte order of the data stored in the VBTBKR[n] (n = 0 to 127) register is little endian.

The data of VBATT backup register is cleared to 0x00 by VBATT_POR reset or tamper detection function.

The tamper detection function starts clearing operation of the VBATT backup register when the clear function is enabled and the tamper detection flag is set to 1. Do not cancel the clearing operation for 100 ns after starting. To cancel the clearing operation, disable the clear function or clear the tamper detection flag to 0. After canceling the clearing operation, do not access the VBATT backup register for 500 ns.

12.3.5 Tamper Detection Usage

The tamper detection function detects the RTCICn (n = 0 to 2) pin input event. The input event is defined as a change of RTCICn pin input level. The VBTADFn (n = 0 to 2) flag is set to 1 by the input event. When generate interrupt is enabled and the flag is set to 1, tamper detection interrupt is generated. When backup register clear function is enabled and flag is set to 1, the data of VBATT backup register is cleared. When Tamper Detection Zeroization Enable is enabled and flag is set to 1, the HUK Zeroization request is outputted. RTC time capture event source can select RTCICn pin input or the VBTADFn flag. If you need to synchronize time capture with a set of VBTADFn flags to 1, select the VBTADFn flag as the RTC time capture event source is recommended.

Figure 12.4 shows Tamper detection function.

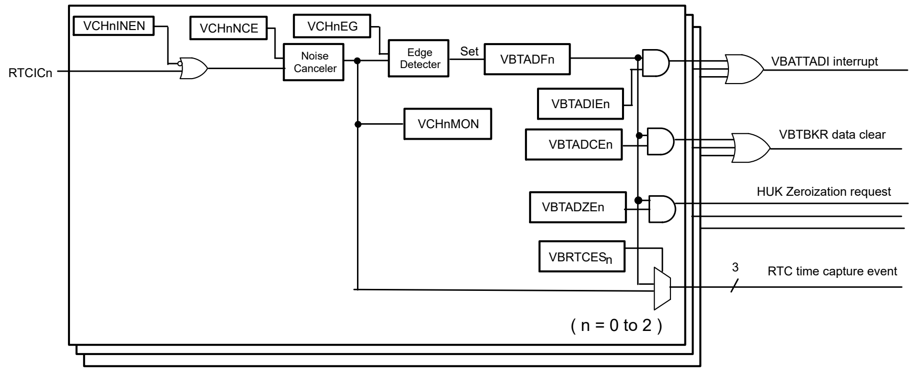

Figure 12.4 Tamper detection function

RTCICn pin inputs is enabled by the VCHnINEN (n = 0 to 2) bit. A wait time of 50us is required for the operation to stabilize after the RTCICn input is enabled.

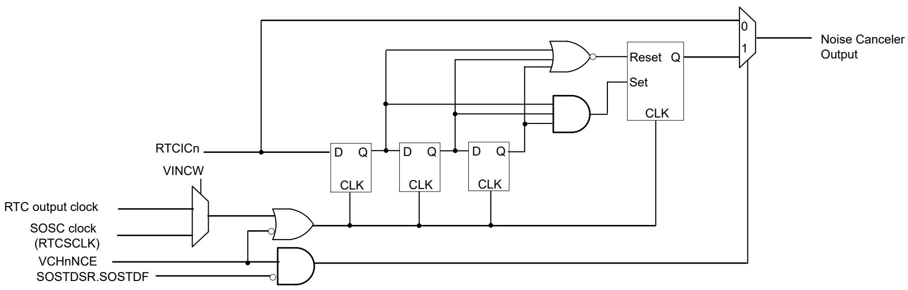
The VCHnNCE (n = 0 to 2) bit enables noise canceler. The noise canceler samples input signals at the Sub-Clock (RTCSCLK) or RTC output frequency and removes the pulses whose length is less than three sampling cycles.

The noise reduction sampling frequency can be selected in the VBTNCWCR.VINCW bit.

Figure 12.5 shows noise canceler circuit block diagram.

When changing the noise cancellation sampling frequency (changing the setting value of VBTNCWCR.VINCW bit), the VCHnNCE bit, VBTADCR1, VBTADCR2, and VBTADCR3 should be disabled.

The recommended initialization procedure is according to the flow example 3. For details, see section 12.3.7.4. Tamper Detection Function Initialization Setting Flow Example.



Note: n = 0 to 2

Figure 12.5 Noise canceler circuit block diagram

After enabling this noise canceler, a stabilization time of 5 clocks is required.

The VCHnEG (n = 0 to 2) bit enables to select Tamper detection edge. The edge detector operates asynchronously. When these control registers are changed, the VBTADFn flag may be set to 1 in a pseudo. The VBTADFn flag needs to be checked and clear to 0 after initialization of control registers. The VCHNnMON (n = 0 to 2) bit enables to monitor current input status. This bit also needs to be checked for inactive level after initialization of control registers.

The VBATTADI interrupt is asserted when 1 or more of 3 channels are flagged and interrupt is enabled.

The VBTBKRm(m = 0 to 127) register data is cleared to 00h when 1 or more of 3 channels are flagged and the VBATT backup register clear function is enabled.

12.3.6 VBATT Voltage Monitor Function Usage

You can monitor the input voltage level of VBATT pin. 1/6 of VBATT pin voltage level can be monitored as analog signal. After setting the VBTMNSEL bit to 1, it is necessary to wait t_{MONWT} for the monitor level to stabilize. For details on t_{MONWT}, see section 62, Electrical Characteristics.

Figure 12.6 shows VBATT voltage monitor function.

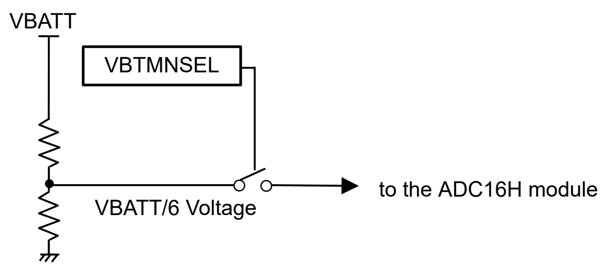


Figure 12.6 VBATT voltage monitor function

Note: For more information, see section 53, 16-bit A/D Converter (ADC16H).

Note: When VBTMNSEL bit is 1, VBAT power consumption is increased. It is recommended that VBTMNSEL bit sets to 1 only monitor timing.

12.3.7 Initial Settings Examples

12.3.7.1 Cold Start and Using the Power Supply Switch Flow Example

When turning on VCC pin and VBATT pin power for the first time, use the following flow to initialize.

1. Check VBPORM bit. If VBPORM flag is 0, wait until it changes to 1.
2. Clear VBPORF flag to 0.
3. Set the VDETLVL[2:0] bit to appropriate value. The $V_{DETBATT}$ level is Selected.
4. Wait t_{DETWT} for the VCC voltage detection function stabilization.
5. Set the VDETE bit to 1. The VCC voltage detection function is enabled.
6. Enable Sub-Clock Oscillator if needed.
7. Set Other Battery Backup Function and RTC registers.

For details on t_{DETWT}, see section 62, Electrical Characteristics.

For details on Sub-Clock Oscillator, see section 9, Clock Generation Circuit.

12.3.7.2 Warm Start and Using the Power Supply Switch Flow Example

The MCU transitions to VBATT mode when the power of the VCC pin is turned off while the power of the VBATT pin is on. In this section, warm start means when the power supply of the VCC pin is turned on in VBATT mode. When the MCU starts processing with a warm start, execute the following flow in order to check the VBATT_R voltage drop before executing other process.

1. Check VBPORM flag. If VBPORM flag is 0, wait until it changes to 1.
2. Check VBPORF flag. If VBPORF flag is 1, the VBATT_R voltage drop is detected. For details on re-initialize the backup power area, see section 12.3.7.1. Cold Start and Using the Power Supply Switch Flow Example. If not, it means that the VBATT_R voltage does not drop and the state of the backup power area is retained. So, you do not need to re-initialize the backup power area.

12.3.7.3 Not Using the Power Supply Switch Flow Example

When not using the power supply switch, VCC pin and VBATT pin should be shorted. In this case, the VBATT_POR reset cannot follow the power on reset of VCC and VBATT_R voltage drop may not be detected. So, initialize the backup power supply area with the following flow.

1. Set the BPWSWSTP bit to 1. The power supply switch is stopped.
2. Check VBPORM flag. If VBPORM flag is 1, wait until it changes to 0.
3. Clear the VDETE bit to 0. The VCC voltage drop detection function is stopped.
4. Clear the VDETLVL[2:0] bit to 110b. The initial value is selected.
5. Check VBPORF flag. When VBPORF flag is 1, clear it to 0.
6. Set the SOSTP bit to 1 regardless of its value. Stop Sub-Clock Oscillator.
7. Initialize the VBTICTLR register and SOMCR.SOSEL bit. Initialization is recommended because these registers are related to the control of the IO port.
8. Initialize Other Battery Backup Function registers if needed. Other Battery Backup Function registers are VBTICTLR2, VBTADSR, VBTADCR1, VBTADCR2, and VBTBKRn.
9. Enable Sub-Clock Oscillator if needed.
10. Set RTC registers.

For details on Sub-Clock Oscillator, see section 9, Clock Generation Circuit.

12.3.7.4 Tamper Detection Function Initialization Setting Flow Example

If using the tamper detection function, it is recommended to initialize according to the following flow example.

1. Set the VCHnINEN to appropriate value.
2. Wait 50us to stabilize after the RTCICn input.
3. Set the VBTNCWCR to appropriate value.
4. Set the VCHnNCE bit and the VCHnEG bit.
5. Wait 5 RTC-clocks to stabilize, if noise canceler is enabled.
6. Checking the VCHnMON bit indicates inactive is recommended. If it is active, it may not be possible to detect the tamper.
7. Initialize the invalid status of VBTADFn flag by clear to 0 after reading dummy read.
8. Set VBTADCR1, VBTADCR2,VBTADCR3 to enable interrupt, backup register clear, HUK Zeroization request output, and RTC time capture event.
9. Enables RTC time capture function if needed.

12.4 Interrupt Sources

The Battery Backup Function has two interrupt sources and are listed in Table 12.2.

Table 12.2 Battery Backup Function interrupt Sources

Symbol	Interrupt source	Interrupt flag	Interrupt conditions
VBATTADI	VBATT Tamper detection	VBTADF0	VBTADF0 = 1, VBTADIE0 = 1
		VBTADF1	VBTADF1 = 1, VBTADIE1 = 1
		VBTADF2	VBTADF2 = 1, VBTADIE2 = 1

12.5 Usage Notes

1. Operation of the sub-clock oscillator and RTC are not guaranteed when the voltage level on VBATT is lower than the guaranteed operation range. Initialize the RTC when the VBATT pin falls below the guaranteed operating voltage and then powers up again.
2. A reset generated while writing to registers described in this section might destroy the register value.

3. When VCC is higher than $V_{DETBATT\_m}$, the VCC pin and VBATT pin are separated. When VCC is lower than $V_{DETBATT}$ and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than VCC, current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
4. During RTC operation using the voltage from the VBATT pin and the I/O ports within the backup, the power supply area can only be used as time capture event input pins for the RTC.

13. Register Write Protection Function

13.1 Overview

The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR_S and PRCR_NS).

The two protected registers work on one secure set registers/bits and the other for non-secure set registers/bits. They are collectively mentioned as PRCR.

Table 13.1 lists the association between the PRCR bits and the use of registers to be protected.

The register information to which the PRCR bit is applied is provided in the description of each register.

Table 13.1 Association between PRCR bits and use of registers to be protected

PRCR bit	Register to be protected
PRC0	• Registers related to the clock generation circuit: SCKDIVCR, SCKDIVCR2, SCKSCR, PLLCCR, PLLCR, BCKCR, MOSCCR, HOCOCR, HOCOCR2, MOCOCR, FLLCR1, FLLCR2, CKOCR, OSTDCR, OSTDSR, SOSTDCR, SOSTDSR, PLL2CCR, PLL2CR, PLLCCR2, PLL2CCR2, EBCKOCR, SDCKOCR, SCICKDIVCR, SCICKCR, SPICKDIVCR, SPICKCR, ADCCKDIVCR, ADCCKCR, GPTCKDIVCR, GPTCKCR, BCKADIVCR, ESWCKDIVCR, ESWPCKDIVCR, ETHPCKDIVCR, BCKACR, ESWCKCR, ESWPCKCR, ETHPCKCR, MOCOUTCR, HOCOUTCR, USBCKDIVCR, OCTACKDIVCR, CANFDCKDIVCR, USB60CKDIVCR, I3CCKDIVCR, USBCKCR, OCTACKCR, CANFDCKCR, USB60CKCR, I3CCKCR, MOSCSCR, HOCOSCR, PLLSCR, PLL2SCR, MOCOSCR, MOSCWTCR, LOCOCR, LOCOUTCR, MOMCR, MOMCR2, SOSCCR, SOMCR, SYRACCR, USBCKSELR
PRC1	• Registers related to the low power modes: OPCCR, PGSCR, PSSTCR2, PSSTCR3, PSSTCR4, PSSTCR5, PDCTRESWM, PDRAMSCR0, PDRAMSCR1, SBYCR, SSCR1, LPSCR, DPSBYCR, DPSWCR, DPSIER0-5, DPSIFR0-5, DPSIEGR0-4, LDOSCR, PLL1LDOCR, PLL2LDOCR, HOCOLDOCR, LVOCR, VSCR, SVSCR, MLSMCR, CPUDSCR, MWMCR • Register related to the battery backup function: VBTBER, VBTICTLR, VBTBKRn (n = 0 to 127), VBTBPCR1, VBTBPCR2, VBTBPSR, VBTADSR, VBTADCR1, VBTADCR2, VBTICTLR2, VBTADCR3, VBTNCWCR
PRC3	• Registers related to the PVD: PVD1CMPCR, PVD2CMPCR, PVD4CMPCR, PVD5CMPCR, PVD1CR0, PVD2CR0, PVD4CR0, PVD5CR0, PVD1CR1, PVD1SR, PVD2CR1, PVD2SR, PVD1FCR, PVD2FCR, PVD4FCR, PVD5FCR, PVDLR, VBATTMNSELR
PRC4	• Registers related to the security and privilege setting registers: CGFSAR, RSTSAR, LPMSAR, PVDSAR, BBFSAR, DPFSAR, DPFSAR1, RSCSAR, PGCSAR, VBRSABAR, VBRPABARS, VBRPABARNS, CPUSAR, DEBUGSAR, CACHESAR, TCMSAR, TCMSABARC, TCMSABARS, IPCSAR, IPCPAR, ICUSARx (x = A, B, E to M), TEVTRCR, BUSSARx (x = A, B, C), BUSPARC, MMPUSARx (x = A, B), DMACCHSAR, DMACCHPAR, DMACSAR, DTCSAR, ELCSARx (x = A, B, C), ELCPARx (x = A, B, C), PmSAR (m = 0 to 9, A, B, C, D), PSARx (x = B, C, D, E), MSSAR, PPARBx (x = B, C, D, E), MSPAR, SRAMSABARn (n = 0 to 3), SRAMSAR, SRAMESAR, MSAR
PRC5	• Registers related to the reset control: SYRSTMSK0-2, TEMPRCR, TEMPRLR

13.2 Register Descriptions

The base address of SYSC is 0x4001_E000 (Secure) and 0x5001_E000 (Non-secure).

Table 13.2 lists the registers related to the register write protection function.

Table 13.2 Register list

Register name	Symbol	Value after reset	Address	Access size
Protect Register for Secure Register	PRCR_S	0x0000	0x4001_E3FA	16
Protect Register for Non-secure Register	PRCR_NS	0x0000	0x5001_E3FE	16

13.2.1 PRCR_S : Protect Register for Secure

Base address: SYSC = 0x4001_E000

Offset address: 0x3FA

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	PRC5	PRC4	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Write disabled 1: Write enabled	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Write disabled 1: Write enabled	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	PRC3	Enable writing to the registers related to the PVD 0: Write disabled 1: Write enabled	R/W
4	PRC4	Enables writing to the registers related to the security and privilege setting registers 0: Write disabled 1: Write enabled	R/W
5	PRC5	Enables writing to the registers related to the reset control 0: Write disabled 1: Write enabled	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control the write access to the PRCR_S register. To modify the PRCR_S register, write 0xA5 to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit.	W

Note: S-TYPE6, P-TYPE2

PRCR_S is used to protect registers that are always secure or configured as Secure.

PRC0 bit (Enable writing to the registers related to the clock generation circuit)

The PRC0 bit protects writing to the registers related to the clock generation circuit. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRC1 bit (Enable writing to the registers related to the low power modes, and the battery backup function)

The PRC1 bit protects writing to the registers related to the low power modes and the battery backup function. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRC3 bit (Enable writing to the registers related to the PVD)

The PRC3 bit protects writing to the registers related to the PVD. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRC4 bit (Enables writing to the registers related to the security and privilege setting registers)

The PRC4 bit protects writing to the registers related to the security and privilege setting registers. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR_S and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR_S after PRC4 change, and then write access the PRC4-controlled register.

PRC5 bit (Enables writing to the registers related to the reset control)

The PRC5 bit protects writing to the registers related to the reset control. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRKEY[7:0]bits (PRC Key Code)

The PRKEY[7:0] bits control permission and prohibition of writing to the PRCR_S register. To write PRCi bits of PRCR_S register, write 0xA5 to the PRKEY[7:0]. In case of writing other than 0xA5 to PRKEY[7:0], PRCi bits do not be changed even if writing to the PRCR_S register.

13.2.2 PRCR_NS : Protect Register for Non-Secure

Base address: SYSC_NS = 0x5001_E000

Offset address: 0x3FE

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	PRC4	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Write disabled 1: Write enabled	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Write disabled 1: Write enabled	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	PRC3	Enable writing to the registers related to the PVD 0: Write disabled 1: Write enabled	R/W
4	PRC4	Enables writing to the registers related to the privilege setting registers 0: Write disabled 1: Write enabled	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	PRC Key Code These bits control the write access to the PRCR_NS register. To modify the PRCR_NS register, write 0xA5 to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit.	W

Note: S-TYPE7, P-TYPE2

PRCR_NS is used to protect registers that are configured as Non-secure.

PRC0 bit (Enable writing to the registers related to the clock generation circuit)

The PRC0 bit protects writing to the registers related to the clock generation circuit. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRC1 bit (Enable writing to the registers related to the low power modes, and the battery backup function)

The PRC1 bit protects writing to the registers related to the low power modes and the battery backup function. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRC3 bit (Enable writing to the registers related to the PVD)

The PRC3 bit protects writing to the registers related to the PVD. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

PRC4 bit (Enables writing to the registers related to the privilege setting registers)

The PRC4 bit protects writing to the registers related to the privilege setting registers. Setting this bit to 1 enables writing to the corresponding registers. Setting this bit to 0 disables writing to the corresponding registers.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR_NS and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR_NS after PRC4 change, and then write access the PRC4-controlled register.

PRKEY[7:0]bits (PRC Key Code)

The PRKEY[7:0] bits control permission and prohibition of writing to the PRCR_NS register. To write PRCi bits of PRCR_NS register, write 0xA5 to the PRKEY[7:0]. In case of writing other than 0xA5 to PRKEY[7:0], PRCi bits do not be changed even if writing to the PRCR_NS register.

14. Interrupt Controller Unit (ICU)

14.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), DMA Controller (DMAC) module and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

Table 14.1 lists the ICU specifications, Figure 14.1 shows a block diagram, and Table 14.2 lists the I/O pins.

Table 14.1 ICU specifications (1 of 2)

Parameter		Description
Maskable interrupts	Peripheral function interrupts	Interrupts from peripheral modules Number of sources: 497 (a factor is chosen with an event list number 33 to 1023)
	External pin interrupts	● Interrupt detection on low level*4, falling edge, rising edge, rising and falling edges. One of these detection methods can be set for each source ● Digital filter function supported ● 32 sources, with interrupts from IRQi (i = 0 to 31) pins.
	CPU mutual interrupt	● IPC CPU mutual interrupt 0 (IPC_IRQ0) ● IPC CPU mutual interrupt 1 (IPC_IRQ1)
	Interrupt requests to CPU (NVIC)	96 interrupt requests are output to NVIC.
	DMAC control	● The DMAC can be activated using interrupt sources*1 ● The target interrupt source can be selected individually for every DMAC channels.
	DTC control	● The DTC can be activated using interrupt sources*1 ● The method for selecting an interrupt source is the same as that of the interrupt request to NVIC.
Non-maskable interrupts*2	NMI pin interrupt	● Interrupt from the NMI pin ● Interrupt detection on falling edge or rising edge ● Digital filter function supported
	Oscillation stop detection interrupt*3	Interrupt on detection of main oscillation is stopped
	Sub Oscillation stop detection interrupt*3	Interrupt on detection of sub oscillation is stopped
	WDT underflow/refresh error*3	Interrupt on an underflow of the down-counter or occurrence of a refresh error (CPU0, CPU1)
	IWDT underflow/refresh error*3	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	Voltage-monitor 1 interrupt*3	Voltage monitor interrupt of the voltage detection circuit 1 (PVD_PVD1)
	Voltage-monitor 2 interrupt*3	Voltage monitor interrupt of the voltage detection circuit 2 (PVD_PVD2)
	Common memory error interrupt	Common memory error means SRAM ECC error.
	Local memory error interrupt	Local memory error interrupt includes Cache and TCM ECC Error. (CPU1 only)
	Bus error Interrupt	Bus error interrupt includes MPU and TZF error
	Lockup error interrupt	Lockup error interrupt (CPU0, CPU1)
	CPU mutual Interrupt	IPC NMI CPU mutual interrupt (CPU0, CPU1)
	FPU Exception interrupt	FPU Exception interrupt (CPU0, CPU1)
	MRAM read error interrupt	● MRAM read error interrupt for MRC ● MRAM read error interrupt for MRE
Security	Secure	Some registers have Security Attribution.
	Privilege	Each register of the ICU can only be accessed with Privilege access.

Table 14.1 ICU specifications (2 of 2)

Parameter	Description
Return from low power mode	• CPU Sleep mode: Return is initiated by non-maskable interrupts or any other interrupt source. • CPU Deep Sleep mode: Return is initiated by non-maskable interrupts. Interrupt can be selected as WUPEN0, WUPEN1, DSLPWUPIRQENj register (j = 0 to 2). See section 14.2.4. ICUSARF : Interrupt Controller Unit Security Attribution Register F, section 14.2.9. ICUSARK : Interrupt Controller Unit Security Attribution Register K, section 14.2.10. ICUSARL : Interrupt Controller Unit Security Attribution Register L, section 14.2.11. TEVTRCR : Trusted Event Route Control Register, section 14.9.2. Return from CPU Deep Sleep Mode. • Software Standby mode: Return is initiated by non-maskable interrupts. Interrupt can be selected as WUPEN0, WUPEN1 register. See section 14.2.4. ICUSARF : Interrupt Controller Unit Security Attribution Register F, section 14.2.9. ICUSARK : Interrupt Controller Unit Security Attribution Register K, section 14.2.10. ICUSARL : Interrupt Controller Unit Security Attribution Register L, section 14.9.2. Return from CPU Deep Sleep Mode.

Note 1. For the DMAC and DTC activation sources, see Table 14.4.
Note 2. Non-maskable interrupts can be enabled only once after a reset release.
Note 3. These non-maskable interrupts can also be used as interrupts in general. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 to 2 interrupts, set the PVD1CR1.PVD1IRQSEL and PVD2CR1.PVD2IRQSEL bits to 1.
Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.

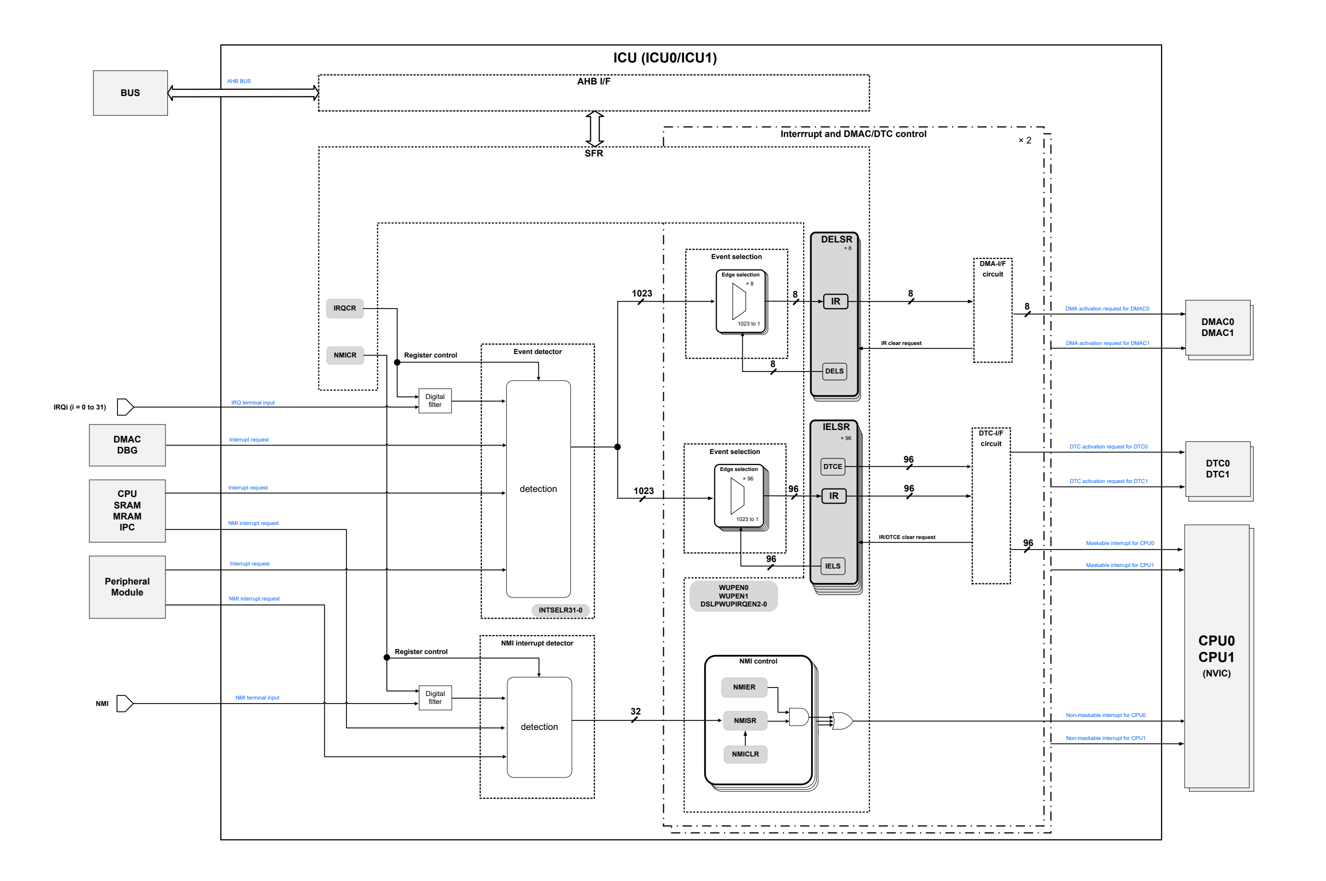

Figure 14.1 ICU block diagram

NMISR: Non-Maskable Interrupt Status Register

NMIER: Non-Maskable Interrupt Enable Register

NMICLR: Non-Maskable Interrupt Status Clear Register

NMICR: NMI Pin Interrupt Control Register

IRQCRi: IRQi Control Register (i = 0 to 31)

WUPEN0/1: Wake Up Interrupt Enable Register0/1

IELSRn: ICU Event Link Setting Register (n = 0 to 95)

DELSRm: DMAC Event Link Setting Register (m = 0 to 7)

IR: Interrupt Status Flag (IELSRn.IR, DELSRm.IR)

DTCE: DTC Activation Enable (IELSRn.DTCE)

DSLPWUPIRQENj: Deep Sleep Wake Up IRQ Enable Register (j = 0 to 2)

INTSELRp: Interrupt request select Register (p = 0 to 31)

Table 14.2 ICU I/O pins

Pin name	I/O	Description
NMI	Input	Non-maskable interrupt request pin
IRQi (i = 0 to IRQ31)	Input	External interrupt request pins

14.2 Register Descriptions

This section does not describe registers internal to Arm® NVIC.

For information on these registers, see the NVIC chapter of Arm® Processor Technical Reference Manual [1], [3].

ICU_BASE (base address of ICU) is 0x4000_C000(Secure) and 0x5000_C000(Non-secure)

COMMON_ICU_BASE (base address of COMMON_ICU) is 0x4000_6000(Secure) and 0x5000_6000(Non-secure)

CPSCU_BASE (base address of CPSCU) is 0x4000_8000(secure) and 0x5000_8000(non-secure).

The ICU0 and ICU1 registers have the same base address. ICU0 is dedicated to CPU0 and can only be accessed from CPU0. ICU1 is dedicated to CPU1 and can only be accessed from CPU1.

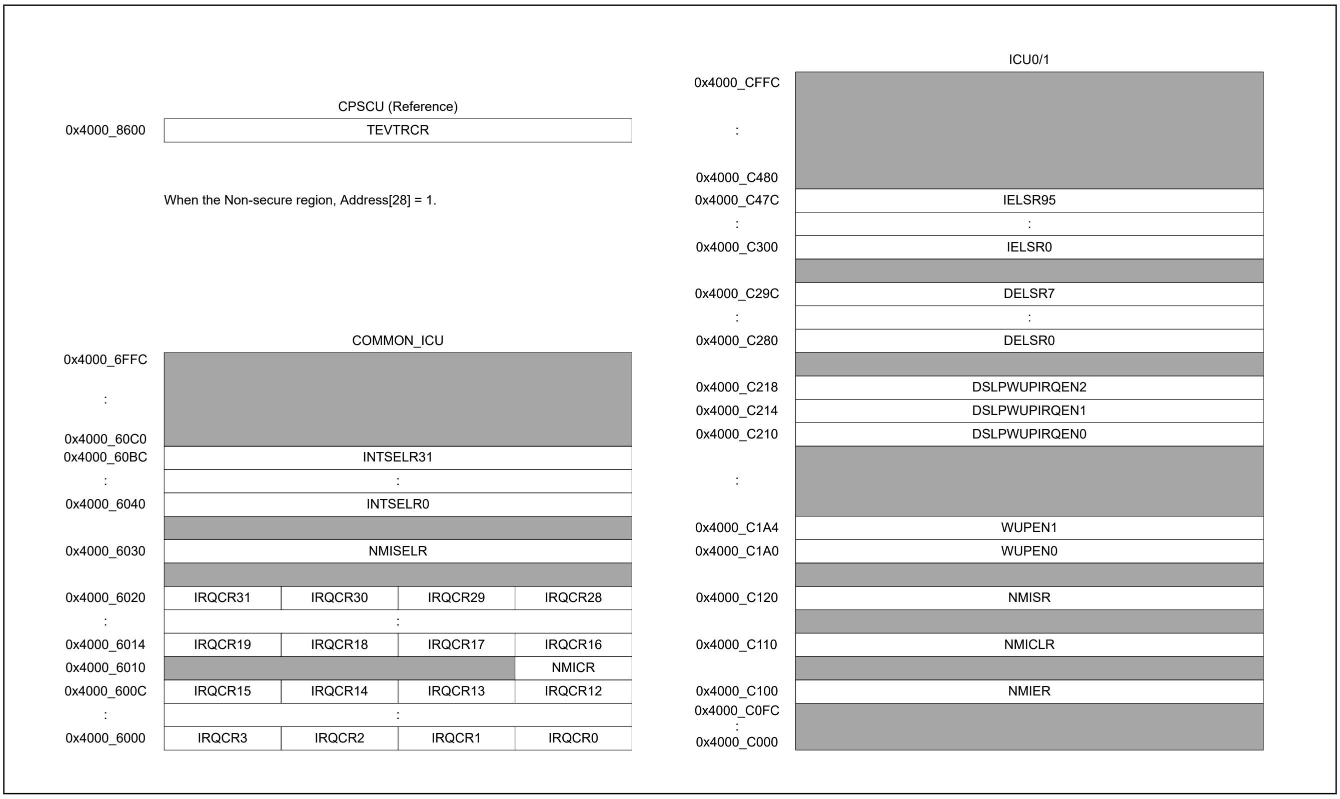

Figure 14.2 ICU Register Address Map

14.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIRQCR31	SAIRQCR30	SAIRQCR29	SAIRQCR28	SAIRQCR27	SAIRQCR26	SAIRQCR25	SAIRQCR24	SAIRQCR23	SAIRQCR22	SAIRQCR21	SAIRQCR20	SAIRQCR19	SAIRQCR18	SAIRQCR17	SAIRQCR16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIRQCR15	SAIRQCR14	SAIRQCR13	SAIRQCR12	SAIRQCR11	SAIRQCR10	SAIRQCR9	SAIRQCR8	SAIRQCR7	SAIRQCR6	SAIRQCR5	SAIRQCR4	SAIRQCR3	SAIRQCR2	SAIRQCR1	SAIRQCR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIRQCR31 to SAIRQCR0	Security attributes of registers for the IRQCR, WUPEN0, WUPEN1 registers 0: Secure 1: Non-Secure	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4.

SAIRQCRn (n = 0 to 31)

Security attributes of registers for IRQCRn, WUPEN0, WUPEN1 registers. The target registers are as follows:

- ICU.IRQCR0 to ICU.IRQCR31 registers
- ICU0.WUPEN0[15:0]
- ICU0.WUPEN1[31:16]
- ICU1.WUPEN0[15:0]
- ICU1.WUPEN1[31:16]

14.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SANMI1	SANMI0	SANMI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SANMI	Security attributes of the NMICR register 0: Secure 1: Non-Secure	R/W
1	SANMI0	Security attributes of the ICU0.NMISR, ICU0.NMIER, ICU0.NMICLR registers 0: Secure 1: Non-Secure	R/W

Bit	Symbol	Function	R/W
2	SANMI1	Security attributes of the ICU1.NMISR, ICU1.NMIER, ICU1.NMICLR registers 0: Secure 1: Non-Secure	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4.

SANMI bit (Security attributes of the NMICR register)

Security attributes of registers for non-maskable interrupt. The target register is as follows:

- NMICR

SANMI0 bit (Security attributes of the ICU0.NMISR, ICU0.NMIER, ICU0.NMICLR registers)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- ICU0. NMIER
- ICU0. NMICLR
- ICU0. NMISR

SANMI1 bit (Security attributes of the ICU1.NMISR, ICU1.NMIER, ICU1.NMICLR registers)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- ICU1. NMIER
- ICU1. NMICLR
- ICU1. NMISR

The AIRCR.BFHFNMINS (bit 13) value in Application Interrupt and Reset Control Register of ARM CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINS and the SANMI bit are different.

AIRCR.BFHFNMINS is secure and SANMI is non-secure. Polarity has the same meaning. Program these to match.

Note: Only one of Secure and Non-Secure can set security attribution for non-maskable interrupt related registers. If you programmed the Secure attribute as secure, it will always jump to the Secure interrupt handler. If you want to release any of the non-maskable interrupt sources to the non-secure user, prepare a function for executing a nonsecure program from the interrupt handler for Secure.

14.2.3 ICUSARE : Interrupt Controller Unit Security Attribution Register E

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x50

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIIC0WUP	SAAGT1CBWUP	SAAGT1CAWUP	SAAGT1UDWUP	SAUSBFS0WUP	SAUSBHSWUP	SARTCPRDWUP	SARTCALMWUP	—	—	—	SAVBATTWUP	SAPVD2WUP	SAPVD1WUP	—	SAIWDTWUP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
16	SAIWDTWUP	Security attributes of registers for WUPEN0.b16 0: Secure 1: Non-Secure	R/W
17	—	This bit is read as 0. The write value should be 0.	R/W
18	SAPVD1WUP	Security attributes of registers for WUPEN0.b18 0: Secure 1: Non-Secure	R/W
19	SAPVD2WUP	Security attributes of registers for WUPEN0.b19 0: Secure 1: Non-Secure	R/W
20	SAVBATTWUP	Security attributes of registers for WUPEN0.b20 0: Secure 1: Non-Secure	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
24	SARTCALMWUP	Security attributes of registers for WUPEN0.b24 0: Secure 1: Non-Secure	R/W
25	SARTCPRDWUP	Security attributes of registers for WUPEN0.b25 0: Secure 1: Non-Secure	R/W
26	SAUSBHSWUP	Security attributes of registers for WUPEN0.b26 0: Secure 1: Non-Secure	R/W
27	SAUSBFS0WUP	Security attributes of registers for WUPEN0.b27 0: Secure 1: Non-Secure	R/W
28	SAAGT1UDWUP	Security attributes of registers for WUPEN0.b28 0: Secure 1: Non-Secure	R/W
29	SAAGT1CAWUP	Security attributes of registers for WUPEN0.b29 0: Secure 1: Non-Secure	R/W
30	SAAGT1CBWUP	Security attributes of registers for WUPEN0.b30 0: Secure 1: Non-Secure	R/W
31	SAIIC0WUP	Security attributes of registers for WUPEN0.b31 0: Secure 1: Non-Secure	R/W

Note: S-TYPE1, P-TYPE1

Note: This register is write-protected by PRCR_S.PRC4.

14.2.4 ICUSARF : Interrupt Controller Unit Security Attribution Register F

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x54

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAPDMWUP	SAULP1BWUP	SAULP1AWUP	SAULP1UWUP	SAI3CWUP	SAULP0BWUP	SAULP0AWUP	SAULP0UWUP	SASOSCWUP	—	—	—	SACOMPHS0WUP	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	SACOMPHS0WUP	Security attributes of registers for WUPEN1.b3 0: Secure 1: Non-Secure	R/W
6:4	—	These bits are read as 0. The write value should be 0.	R/W
7	SASOSCWUP	Security attributes of registers for WUPEN1.b7 0: Secure 1: Non-Secure	R/W
8	SAULP0UWUP	Security attributes of registers for WUPEN1.b8 0: Secure 1: Non-Secure	R/W

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIELSR64 to SAIELSR95	Security attributes of registers for ICU1 event link setting2. 0: Secure 1: Non-Secure	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4.

SAIELSR (n = 64 to 95)

Security attributes of registers for ICU1 event link setting2. The target registers are as follows:

- ICU1.IELSR64 to IELSR95
- ICU1.DSLPWUPIRQEN2

The Secure Attribute managed within the ARM CPU NVIC must match the security attribution of ICU1.IELSRn (n = 64 to 95). NVIC internal registers are in NVIC_ITNS2[31:0]. Polarity has the same meaning. Program these to match.

14.2.11 TEVTRCR : Trusted Event Route Control Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x600

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	TEVTEICU1	TEVTEICU0	TEVTE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TEVTE	Trusted Event Route Control Register for ELC 0: Disable 1: Enable	R/W
1	TEVTEICU0	Trusted Event Route Control Register for ICU0 0: Disable 1: Enable	R/W
2	TEVTEICU1	Trusted Event Route Control Register for ICU1 0: Disable 1: Enable	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4

TEVTE bit (Trusted Event Route Control Register for ELC)

When TEVTE = 1, all ELS [9:0] bits of ELC.ELSRn (n = 0 to18) are allowed secure access write. Non-secure access write is protected.

- ELSRn.IELS[9:0] (n = 0 to 18)

TEVTEICU0 bit (Trusted Event Route Control Register for ICU0)

When TEVTEICU0 = 1, the IELS [9:0] bits of ICU0.IELSRn (n = 0 to 95), all DELS [9:0] bits of ICU0.DELSRm (m = 0 to 7) are allowed secure access write. Non-secure access write is protected. Additionally, when TEVTEICU0 = 1, if the Security Attribution of the target register (IELS [31:16] bits of ICU0.IELSRn (n = 0 to 95)) is non-secure, then secure access is not allowed. At this time, the upper level [31:16] cannot be read and write, but the response is OK, and no error occurs.

- ICU0.IELSRn.IELS[9:0] (n = 0 to 95)
- ICU0.DELSRm.DELS[9:0] (m = 0 to 7)

TEVTEICU1 bit (Trusted Event Route Control Register for ICU1)

When TEVTEICU1 = 1, the IELS [9:0] bits of ICU1.IELSRn (n = 0 to 95), the all DELS [9:0] bits of ICU1.DELSRm (m = 0 to 7) are allowed secure access write. Non-secure access write is protected. Additionally, when TEVTEICU1 = 1, if the Security Attribution of the target register (IELS [31:16] bits of ICU1.IELSRn (n = 0 to 95)) is non-secure, then secure access is not allowed. At this time, the upper level [31:16] cannot be read and write, but the response is OK, and no error occurs.

- ICU1.IELSRn.IELS[9:0] (n = 0 to 95)
- ICU1.DELSRm.DELS[9:0] (m = 0 to 7)

14.2.12 IRQCRi : IRQ Control Register (i = 0 to 31)

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x000 + 0x01 × i (i = 0 to 15)
0x004 + 0x01 × i (i = 16 to 31)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	FLTEN	—	FCLKSEL[1:0]		—	—	IRQMD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	IRQMD[1:0]	IRQi Detection Sense Select 0 0: Falling edge 0 1: Rising edge 1 0: Rising and falling edges 1 1: Low level	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	FCLKSEL[1:0]	IRQi Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	FLTEN	IRQi Digital Filter Enable 0: Digital filter is disabled 1: Digital filter is enabled.	R/W

Note: S-TYPE3, P-TYPE2

IRQCRi register changes must satisfy the following conditions:

1. For a CPU interrupt or DTC trigger:
   Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 95).
   The register value should be changed only when the value of the target IELSRn register is 0x0000.
2. For a DMAC trigger:
   Change the IRQCRi register value before setting the target DELSRm register (m = 0 to 7).
   The register value should be changed only when the value of the target DELSRm register is 0x0000.
3. For a wakeup enable signal:
   Change the IRQCRi register setting before setting the target WUPEN0.IRQWUPEN[n] (n = 0 to 15) or WUPEN1.IRQWUPEN[m] (m = 31 to 16). You can only change the register values when the target WUPEN0.IRQWUPEN[n] or WUPEN1.IRQWUPEN[m] is 0.

IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For setting method when using external pin interrupt, see section 14.5.7. External Pin Interrupts.

FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see section 14.5.6. Digital Filter.

FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see section 14.5.6. Digital Filter.

14.2.13 NMISR : Non-Maskable Interrupt Status Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x120

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	IPCST	—	MRERDST	MRCRDST	FPUEXCST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit field:	LUST	LMST	CMST	BUSST	—	—	—	—	NMIST	OSTST	SOSTST	—	PVD2ST	PVD1ST	WDTST	IWDTST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTST	IWDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
1	WDTST	WDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
2	PVD1ST	Voltage Monitor 1 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
3	PVD2ST	Voltage Monitor 2 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
4	—	These bits are read as 0.	R
5	SOSTST	Sub Oscillation Stop Detection Interrupt Status Flag 0: Interrupt not requested for sub oscillation stop 1: Interrupt requested for sub oscillation stop	R
6	OSTST	Main Clock Oscillation Stop Detection Interrupt Status Flag 0: Interrupt not requested for main clock oscillation stop 1: Interrupt requested for main clock oscillation stop	R

Bit	Symbol	Function	R/W
7	NMIST	NMI Pin Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
11:8	—	These bits are read as 0.	R
12	BUSST	Bus Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
13	CMST	Common Memory Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
14	LMST	Local Memory Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested.	R
15	LUST	LockUp Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
16	FPUEXCST	FPU Exception Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
17	MRCRDST	MRAM MRC read Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
18	MRERDST	MRAM MRE read Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
19	—	This bit is read as 0.	R
20	IPCST	IPC NMI CPU mutual Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
31:21	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE2

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored.

NMISR is set with a signal that is valid as a non-maskable interrupt supplied to CPU0/CPU1 by the setting judgment of NMIER. For details of the judgment by the NMIER setting, see section 14.8.2. Trusted Interrupt Management.

Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

IWDTST flag (IWDT Underflow/Refresh Error Interrupt Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit. The IWDT interrupt is only valid for primary CPU. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the IWDT underflow/refresh error interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

WDTST flag (WDT Underflow/Refresh Error Interrupt Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit. Accepts WDT interrupt for same CPUs. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the WDT underflow/refresh error interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

PVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The PVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.PVD1CLR bit. The voltage monitor 1 interrupt is valid only when bit 2 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the voltage monitor 1 interrupt is generated, and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.PVD1CLR bit.

PVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The PVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.PVD2CLR bit. The voltage monitor 2 interrupt is valid only when bit 3 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the voltage monitor 2 interrupt is generated, and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.PVD2CLR bit.

SOSTST flag (Sub Oscillation Stop Detection Interrupt Status Flag)

The SOSTST flag indicates a sub oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.SOSTCLR bit. The sub oscillation stop detection interrupt is valid only when bit 5 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the sub oscillation stops detection, interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.SOSTCLR bit.

OSTST flag (Main Clock Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates an oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit. The oscillation stop detection interrupt is valid only when bit 6 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the oscillation stops detection, interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

NMIST flag (NMI Pin Interrupt Status Flag)

The NMIST flag indicates a NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMICLR bit. The NMI pin interrupt is valid only when bit 7 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When an edge specified by the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMICLR bit.

BUSST flag (Bus Error Interrupt Status Flag)

The BUSST flag indicates a request for bus error interrupt as a NMI trigger. It is read-only and cleared by the NMICLR.BUSCLR bit. Bus error interrupt includes MPU and TZF error. The bus error interrupt is valid only when bit 12 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the bus error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.BUSCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.BUSCLR.

CMST flag (Common Memory Error Interrupt Status Flag)

The CMST flag indicates common memory error. It is read-only and cleared by the NMICLR.CMCLR bit.

Common memory error is SRAM ECC error. The common memory error interrupt is valid only when bit 13 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the common memory error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.CMCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.CMCLR.

LMST flag (Local Memory Error Interrupt Status Flag)

The LMST flag indicates local memory error. It is read-only and cleared by the NMICLR.LMCLR bit.

Local memory error includes CPU1 cache and TCM ECC error. The local memory error interrupt is valid only when bit 14 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the local memory error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.LMCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status will be set again even if this status is cleared, and an NMI request will be issued to the CPU. If the CPU returns from the NMI handler, the CPU will jump back to the NMI handler.

In the case of level detection, clear of the Status flag should follow the steps below.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.LUSTCLR.

LUST flag (LockUp Error Interrupt Status Flag)

The LUST flag indicates la lockup. It is read-only and cleared by the NMICLR. LUCLR bit. Accepts Lockup error interrupt for same CPUs. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the local memory error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.LMCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status will be set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU will jump back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.LUCLR.

FPUEXCST flag (FPU Exception Interrupt Status Flag)

The FPUEXCST flag indicates FPU Exception interrupt. It is read-only and cleared by the NMICLR.FPUEXCCLR bit. Accepts FPU Exception interrupt for same CPU. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the FPU Exception detection interrupt is generated

[Clearing condition]

When 1 is written to the NMICLR.FPUEXCCLR bit

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status will be set again even if this status is cleared, and an NMI request will be issued to the CPU. If the CPU returns from the NMI handler, the CPU will jump back to the NMI handler.

In the case of level detection, clear of the Status flag should follow the steps below.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.FPUEXCCLR.

MRCRDST flag (MRAM MRC read Error Interrupt Status Flag)

The MRCRDST flag indicates MRAM MRC read error interrupt. It is read-only and cleared by the NMICLR.MRCRDCLR bit. The MRAM MRC read error interrupt is valid only when bit 17 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the MRAM MRC read error detection interrupt is generated

[Clearing condition]

When 1 is written to the NMICLR.MRCRDSCLR bit

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status will be set again even if this status is cleared, and an NMI request will be issued to the CPU. If the CPU returns from the NMI handler, the CPU will jump back to the NMI handler.

In the case of level detection, clear of the Status flag should follow the steps below.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.MRCRDCLR.

MRERDST flag (MRAM MRE read Error Interrupt Status Flag)

The MRERDST flag indicates MRAM MRE read error interrupt. It is read-only and cleared by the NMICLR.MRERDCLR bit. The MRAM MRE read error interrupt is valid only when bit 18 of the NMIER register is set to "1" and supply to the target CPU is selected. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the MRAM MRE read error detection interrupt is generated

[Clearing condition]

When 1 is written to the NMICLR.MRERDCLR bit

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status will be set again even if this status is cleared, and an NMI request will be issued to the CPU. If the CPU returns from the NMI handler, the CPU will jump back to the NMI handler.

In the case of level detection, clear of the Status flag should follow the steps below.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.MRERDCLR.

IPCST flag (IPC NMI CPU mutual Interrupt Status Flag)

The IPCST flag indicates a request for IPC NMI CPU mutual interrupt as a NMI trigger. It is read-only and cleared by the NMICLR.IPCCLR bit. Accepts IPC interrupt for other CPUs. See section 14.8.2. Trusted Interrupt Management.

[Setting condition]

When the IPC NMI CPU mutual interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.IPCCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.IPCCLR.

14.2.14 NMIER : Non-Maskable Interrupt Enable Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	IPCEN	—	MRERDEN	MRCRDEN	FPUEXCEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

3	PVD2EN	Voltage monitor 2 Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
4	—	This bit is read as 0. The write value should be 0.	R/W
5	SOSTEN	Sub Oscillation Stop Detection Interrupt Enable 0: Disabled 1: Enabled	R/W
6	OSTEN	Oscillation Stop Detection Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
7	NMIEN	NMI Pin Interrupt Enable 0: Disabled 1: Enabled	R/W*1
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	BUSEN	Bus Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1
13	CMEN	Common Memory Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1
14	LMEN	Local Memory Error Interrupt Enable 0: Disabled 1: Enabled	R/W
15	LUEN	LockUp Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1
16	FPUEXCEN	FPU Exception Interrupt Enable 0: Disabled 1: Enabled	R/W
17	MRCRDEN	MRAM MRC read Error Interrupt Enable 0: Disabled 1: Enabled	R/W
18	MRERDEN	MRAM MRE read Error Interrupt Enable 0: Disabled 1: Enabled	R/W
19	—	This bit is read as 0. The write value should be 0.	R/W
20	IPCEN	IPC NMI CPU mutual Interrupt Enable 0: Disabled 1: Enabled	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE2
Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.
Note 2. Do not write 1 to this bit when the source is used as an interrupt signal.

For the NMIER bit, set only one of CPU0 and CPU1 to "1". Setting "1" to the NMIER bit of both CPU0 and CPU1 is prohibited.

IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupt as a NMI trigger. This bit is the enable bit to control the use of the IWDT underflow/refresh error interrupt as a Deep Sleep/Software Standby return factor.

WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupt as a NMI trigger. This bit is the enable bit to control the use of the WDT underflow/refresh error interrupt as a Deep Sleep return factor.

PVD1EN bit (Voltage monitor 1 Interrupt Enable)

The PVD1EN bit enables voltage monitor 1 interrupt as a NMI trigger.

PVD2EN bit (Voltage monitor 2 Interrupt Enable)

The PVD2EN bit enables voltage monitor 2 interrupt as a NMI trigger. This bit is the enable bit to control the use of the voltage monitor 2 interrupt as a Deep Sleep/Software Standby return factor.

SOSTEN bit (Sub Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as a NMI trigger. This bit is the enable bit to control the use of the sub oscillation stop detection interrupt as a Deep Sleep/Software Standby return factor.

OSTEN bit (Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as a NMI trigger. This bit is the enable bit to control the use of the main oscillation stop detection interrupt as a Deep Sleep/Software Standby return factor.

NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupt as a NMI trigger. This bit is the enable bit to control the use of the NMI pin interrupt as a Deep Sleep/Software Standby return factor.

BUSEN bit (Bus Error Interrupt Enable)

The BUSEN bit enables bus error interrupt as a NMI trigger. This bit is the enable bit to control the use of the bus error interrupt as a Deep Sleep return factor. Bus error includes MPU and TZF errors.

CMEN bit (Common Memory Error Interrupt Enable)

The CMEN bit enables common memory error interrupt as a NMI trigger. This bit is the enable bit to control the use of the bus error interrupt as a Deep Sleep return factor. Common memory error is SRAM ECC error.

LMEN bit (Local Memory Error Interrupt Enable)

LMEN bit enables local memory error interrupt as a NMI trigger. This bit is the enable bit to control the use of the local memory error interrupt as a Deep Sleep return factor. Local memory error interrupt includes Cache and TCM ECC Error.

LUEN bit (LockUp Error Interrupt Enable)

LUEN bit enables LockUp error interrupt as a NMI trigger.

FPUEXCEN bit (FPU Exception Interrupt Enable)

FPUEXCEN bit enables FPU Exception Interrupt as a NMI trigger.

MRCRDEN bit (MRAM MRC read Error Interrupt Enable)

MRCRDEN bit enables MRAM MRC read error Interrupt as a NMI trigger. This bit is the enable bit to control the use of the MRAM MRC read error interrupt as a Deep Sleep return factor.

MRERDEN bit (MRAM MRE read Error Interrupt Enable)

MRERDEN bit enables MRAM MRE read error Interrupt as a NMI trigger. This bit is the enable bit to control the use of the MRAM MRE read error interrupt as a Deep Sleep return factor.

IPCEN bit (IPC NMI CPU mutual Interrupt Enable)

IPCEN bit enables IPC NMI CPU mutual interrupt as a NMI trigger. This bit is the enable bit to control the use of the IPC NMI CPU mutual interrupt as a Deep Sleep return factor.

14.2.15 NMICLR : Non-Maskable Interrupt Status Clear Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	IPCCLR	—	MRERDCLR	MRCRDCLR	FPUEXCCLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUCLR	LMCLR	CMCLR	BUSCLR	—	—	—	—	NMICLR	OSTCLR	SOSTCLR	—	PVD2CLR	PVD1CLR	WDTCLR	IWDTCLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTCLR	IWDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.IWDTST flag	R/W*1
1	WDTCLR	WDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.WDTST flag	R/W*1
2	PVD1CLR	Voltage Monitor 1 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.PVD1ST flag	R/W*1
3	PVD2CLR	Voltage Monitor 2 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.PVD2ST flag.	R/W*1
4	—	This bit is read as 0. The write value should be 0.	R/W
5	SOSTCLR	Oscillation Stop Detection Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.OSTST flag	R/W*1
6	OSTCLR	Oscillation Stop Detection Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.OSTST flag	R/W*1
7	NMICLR	NMI Pin Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.NMIST flag	R/W*1
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	BUSCLR	Bus Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.BUSST flag	R/W*1
13	CMCLR	Common Memory Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.CMST flag	R/W*1
14	LMCLR	Local Memory Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LMST flag	R/W*1
15	LUCLR	LockUp Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LUST flag	R/W*1
16	FPUEXCCLR	FPU Exception Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.FPUEXCST flag	R/W*1

Bit	Symbol	Function	R/W
17	MRCRDCLR	MRAM MRC read Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.MRCRDST flag	R/W*1
18	MRERDCLR	MRAM MRE read Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.MRERDST flag	R/W*1
19	—	This bit is read as 0. The write value should be 0.	R/W
20	IPCCLR	IPC NMI CPU mutual Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.IPCST flag	R/W*1
31:21	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE2
Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the NMISR. Then the CPU will accidentally jump to the NMI handler again. To avoid this, be sure to read NMISR before exiting the NMI handler and make sure that NMISR is cleared before exiting the NMI handler.
Note 1. Only write 1 to this bit.

IWDTCLR bit (IWDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

WDTCLR bit (WDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

PVD1CLR bit (Voltage Monitor 1 Interrupt Status Flag Clear)

Writing 1 to the PVD1CLR bit clears the NMISR.PVD1ST flag. This bit is read as 0.

PVD2CLR bit (Voltage Monitor 2 Interrupt Status Flag Clear)

Writing 1 to the PVD2CLR bit clears the NMISR.PVD2ST flag. This bit is read as 0.

SOSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)

Writing 1 to the SOSTCLR bit clears the NMISR.SOSTST flag. This bit is read as 0.

OSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

NMICLR bit (NMI Pin Interrupt Status Flag Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

BUSCLR bit (Bus Error Interrupt Status Flag Clear)

Writing 1 to the BUSCLR bit clears the NMISR.BUSST flag. This bit is read as 0.

CMCLR bit (Common Memory Error Interrupt Status Flag Clear)

Writing 1 to the CMCLR bit clears the NMISR.CMST flag. This bit is read as 0.

LMCLR bits (Local Memory Error Interrupt Status Flag Clear)

Writing 1 to the LMCLR bit clears the NMISR.LMST flag. This bit is read as 0.

LUCLR bit (LockUp Error Interrupt Status Flag Clear)

Writing 1 to the LUCLR bit clears the NMISR.LUST flag. This bit is read as 0.

FPUEXCCLR bits (FPU Exception Interrupt Status Flag Clear)

Writing 1 to the FPUEXCCLR bit clears the NMISR.FPUEXCST flag. This bit is read as 0.

MRCRDCLR bits (MRAM MRC read Error Interrupt Status Flag Clear)

Writing 1 to the MRCRDCLR bit clears the NMISR.MRCRDST flag. This bit is read as 0.

MRERDCLR bits (MRAM MRE read Error Interrupt Status Flag Clear)

Writing 1 to the MRERDCLR bit clears the NMISR.MRERDST flag. This bit is read as 0

IPCCLR bits (IPC NMI CPU mutual Interrupt Status Flag Clear)

Writing 1 to the IPCCLR bit clears the NMISR.IPCST flag. This bit is read as 0.

14.2.16 NMICR : NMI Pin Interrupt Control Register

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	NFLTEN	—	NFCLKSEL[1:0]		—	—	—	NMIMD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NMIMD	NMI Detection Set 0: Falling edge 1: Rising edge	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	NFCLKSEL[1:0]	NMI Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	NFLTEN	NMI Digital Filter Enable 0: Disabled 1: Enabled	R/W

Note: S-TYPE3, P-TYPE2

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting the NMIER.NMIEN bit to 1.

NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see section 14.5.6. Digital Filter.

NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN bit is 1, and disabled when the NFLTEN bit is 0. The NMI pin level is sampled at the sampling clock cycle specified in NMIFLTC.NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see section 14.5.6. Digital Filter.

14.2.17 IELSRn : Interrupt Controller Unit Event Link Setting Register n (n = 0 to 95)

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x300 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DTCE	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	IELS[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	IELS[9:0]	ICU Event Link Select 0x00: Disable interrupts to the associated NVIC or DTC module Others: Event signal number to be linked. For details, see section 14.3.2. Event Number.	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	IR	Interrupt Status Flag 0: No interrupt request generated. 1: An interrupt request is generated.	R/W*2
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	DTCE	DTC Activation Enable 0: DTC activation is disabled. 1: DTC activation is enabled.	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The [15:0] bits in this register can only be accessed in halfword or word access. Byte access is ignored.
Note 2. Writing 1 to the IR flag is prohibited.

This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR).

If the security attribution is configured as secure,

- Secure access is allowed
- Non-secure write access is ignored and non-secure read access is read as 0. TrustZone access error is generated.

If the security attribution is configured as non-secure and the trusted event route is disabled:

- Secure write access is ignored and secure read access is read as 0. TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as non-secure and the trusted event route is enabled:

- Secure access to IELS bit is allowed
- Non-secure write access to IELS bit is ignored and non-secure read access is allowed
- Secure write access to other bits is ignored and secure read access to other bits is read as 0
- Non-secure access to other bits is allowed
- TrustZone access error is not generated

The IELSRn register selects the interrupt source used by the NVIC. For details, see Table 14.3. IELSRn, where n = 0 to 95, corresponds to the NVIC interrupt input source numbers 0 to 95.

IELS[9:0] bits (ICU Event Link Select)

The IELS[9:0] bits link an event signal to the associated NVIC or DTC module. For details, see section 14.3. Vector Table. All IELS[9:0] bits must be written at the same time.

[Setting condition]

When value is written to these bits.

[Clearing conditions]

When 0 is written to these bits.

When DTC transfer is stopped by the access error occurs. See section 18, Data Transfer Controller (DTC) unit chapter.

IR flag (Interrupt Status Flag)

The IR status flag indicates an individual interrupt request from the event specified in IELS[9:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- In the case of DTC.DISEL = 0. At the time other than the final transfer end in DTC transfer during DTCE = 1, IR flag repeat set and cleared by Hardware.
- In the case of DTC.DISEL = 1. For DTC transfers during DTCE = 1, the hardware does not clear the IR flag. Must be cleared by the CPU like No.1.

When DTC transfer except last transfer is completed (DTCE bit is changed from 1 to 0).

In the case of level detection, clear of the IR flag should follow the steps below.

1. Negate the level of an input factor.
2. Run the peripheral read access once and wait for 2 clock cycles of the associated peripheral module clock.
3. Clear the IR flag by writing 0.

Note: During DTCE = 1 writing 0 to IR register is prohibited.

Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the IR. Then the CPU will accidentally jump to the interrupt handler again. To avoid this, be sure to read this register before exiting the interrupt handler and make sure that IR is cleared before exiting the interrupt handler.

DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: The secure attribution managed within the Arm CPU NVIC must match the SA (Security Attribution) of IELSRn (n = 0 to 95).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn (n = 0 to 95) that is not the target is not cleared.

14.2.18 DELSRm : DMAC Event Link Setting Register m (m = 0 to 7)

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x280 + 0x4 × m

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	DELS[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	DELS[9:0]	DMAC Event Link Select 0x00: Disable interrupts to the associated DMAC module Others: Event signal number to be linked. For details, see section 14.3.2. Event Number.	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	IR	DMAC Activation Request Status flag 0: No DMAC activation request occurred 1: DMAC activation request occurred	R/W*2
31:17	—	These bits are read as 0. The write value should be 0.	R/W*1

Note: S-TYPE-3, P-TYPE-2
Note 1. This register must be accessed by halfword or word.
Note 2. Writing 1 to the IR flag is prohibited.

This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR).

If the security attribution is configured as Secure,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.

If the security attribution is configured as Non-secure and the trusted event route is disabled,

- Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as Non-secure and the trusted event route is enabled,

- Secure access to DELS bit is allowed.
- Non-secure write access to DELS bit is ignored and Non-secure read access to DELS bit is allowed.
- Secure write access to other bits is ignored and Secure read access to other bits is read as 0.
- Non-secure access to other bits is allowed.
- TrustZone access error is not generated.

DELS[9:0] bits (DMAC Event Link Select)

The DELS[9:0] bits link an event signal to the associated DMAC module. All DELS[9:0] bits must be written to simultaneously. Do not set the same event number in multiple DELSRm registers.

[Setting condition]

When value is written to these bits.

[Clearing conditions]

When 0 is written to these bits.

When DMA transfer is stopped by the access error occurs. See section 17, DMA Controller (DMAC) unit chapter.

IR flag (DMAC Activation Request Status flag)

This flag is a status flag for a DMAC activation request.

This flag is associated with the DELS[9:0] bits of this register.

[Setting condition]

When a DMAC activation request occurs from the associated peripheral module or IRQi pin.

[Clearing conditions]

When 0 is written to the flag.

When the DMA transfer is started after a DMAC activation request occurs.

When DMA transfer is stopped by the access error occurs. See section 17, DMA Controller (DMAC).

Note: IR flag is automatically cleared after completion of DMA transfer, so do not write "0" except in case of emergency, such as when an abort occurs. DMA transfer operation when "0" is written during DMA transfer cannot be guaranteed.

14.2.19 WUPEN0 : Wake Up Interrupt Enable Register 0

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x1A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31	RIIC0WUPEN	RIIC0 Address Match Interrupt Software Standby Mode Returns Enable bit 0: Software Standby Mode returns by IIC0 address match A interrupt is disabled 1: Software Standby Mode returns by IIC0 address match A interrupt is enabled	R/W

Note: S-TYPE4, P-TYPE2

Note: It is necessary to set to 1 the DSLPWUPIRQENj register bit corresponding to the IELSRn register that selects the factor that enabled the bit of this register.

Note 1. The security attribution of this register is set for each wakeup event. To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

IRQWUPEN15 bit to IRQWUPEN0 bit(Interrupt Software Standby Mode Returns Enable bits from IRQ15 to IRQ0)

The IRQWUPENn (n = 0 to 15) is the enable bit to control the use of the IRQn pin as a Software Standby mode return factor.

IWDTWUPEN bit (IWDT Interrupt Software Standby Mode Returns Enable bit)

The IWDTWUPEN is the enable bit to control the use of the IWDT interrupt as a Software Standby mode return factor.

PVD1WUPEN bit (PVD1 Interrupt Software Standby Mode Returns Enable bit)

The PVD1WUPEN is the enable bit to control the use of the PVD1 interrupt as a Software Standby mode return factor.

PVD2WUPEN bit (PVD2 Interrupt Software Standby Mode Returns Enable bit)

The PVD2WUPEN is the enable bit to control the use of the PVD2 interrupt as a Software Standby mode return factor.

VBATTWUPEN bits (VBATT Monitor Interrupt Software Standby Mode Returns Enable bit)

The VBATTWUPEN is the enable bit to control the use of the VBATT monitor interrupt as a Software Standby mode return factor.

RTCALMWUPEN bits (RTC Alarm Interrupt Software Standby Mode Returns Enable bit)

The RTCALMWUPEN is the enable bit to control the use of the RTC alarm interrupt as a Software Standby mode return factor.

RTCPRDWUPEN bits (RTC Period Interrupt Software Standby Mode Returns Enable bit)

The RTCPRDWUPEN is the enable bit to control the use of the RTC period interrupt as a Software Standby mode return factor.

USBHSWUPEN bits (USBHS Interrupt Software Standby Mode Returns Enable bit)

The USBHSWUPEN is the enable bit to control the use of the USBHS interrupt as a Software Standby mode return factor.

USBFS0WUPEN bits (USBFS Interrupt Software Standby Mode Returns Enable bit)

The USBFS0WUPEN is the enable bit to control the use of the USBFS interrupt as a Software Standby mode return factor.

AGT1UDWUPEN bits (AGT1 Underflow Interrupt Software Standby Mode Returns Enable bit)

The AGT1UDWUPEN is the enable bit to control the use of the AGT1 underflow interrupt as a Software Standby mode return factor.

AGT1CAWUPEN bits (AGT1 Compare Match A Interrupt Software Standby Mode Returns Enable bit)

The AGT1CAWUPEN is the enable bit to control the use of the AGT1 compare match A interrupt as a Software Standby mode return factor.

AGT1CBWUPEN bits (AGT1 Compare Match B Interrupt Software Standby Mode Returns Enable bit)

The AGT1CBWUPEN is the enable bit to control the use of the AGT1 compare match B interrupt as a Software Standby mode return factor.

RIIC0WUPEN bits (RIIC0 Address Match Interrupt Software Standby Mode Returns Enable bit)

The RIIC0WUPEN is the enable bit to control the use of the RIIC0 interrupt as a Software Standby mode return factor.

14.2.20 WUPEN1 : Wake Up Interrupt Enable Register 1

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x1A4

Note: S-TYPE4, P-TYPE2

Note: It is necessary to set to 1 the DSLPWUPIRQENj register bit corresponding to the IELSRn register that selects the factor that enabled the bit of this register.

Note: The security attribution of this register is set for each wakeup event. To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

COMPHS0WUPEN bit (Comparator-HS0 Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the Comparator-HS0 interrupt as a Software Standby return factor.

SOSCWUPEN bit (Sub Oscillation Stop Detection Interrupt Software Standby Returns Enable bit)

This bit is the enable bit to control the use of the Sub Oscillation Stop Detection Interrupt as a Software Standby return factor.

ULP0UWUPEN bit (ULPT0 Underflow Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Underflow interrupt as a Software Standby return factor.

ULP0AWUPEN bit (ULPT0 Compare Match A Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Compare match A interrupt as a Software Standby return factor.

ULP0BWUPEN bit (ULPT0 Compare Match B Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Compare match B interrupt as a Software Standby return factor

I3CWUPEN bit (I3C Wakeup Condition Detection Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the I3C wake up condition detection interrupt as a Software Standby return factor.

ULP1UWUPEN bit (ULPT1 Underflow Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Underflow interrupt as a Software Standby return factor.

ULP1AWUPEN bit (ULPT1 Compare Match A Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Compare match A interrupt as a Software Standby return factor.

ULP1BWUPEN bit (ULPT1 Compare Match B Interrupt Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Compare match B interrupt as a Software Standby return factor.

PDMWUPEN bit (PDMIF Sound Detection Interrupt Software Standby Returns Enable bit)

This bit is the enable bit to control the use of the PDMIF Sound Detection interrupt as a Software Standby return factor.

IRQWUPEN31 bit to IRQWUPEN16 bit(Interrupt Software Standby Returns Enable bits IRQ31 to IRQ16)

The IRQWUPEN31 is the enable bit to control the use of the IRQ31 pin as a Software Standby mode return factor.

The IRQWUPEN16 is the enable bit to control the use of the IRQ16 pin as a Software Standby mode return factor.

Bit position and IRQ terminal number correspond

14.2.21 DSLPWUPIRQENj : Deep Sleep Wake Up IRQ Enable Register (j = 0 to 2)

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x210 + 0x4 × j

Bit position:	31 … 0
Bit field:	IRQn (n = 32 × j + 31) to IRQn (n = 32 × j + 0)
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	IRQn	IRQ Deep Sleep Returns Enable bit n. (n = 32 × j + i (i = 0 to 31)) 0: Deep Sleep returns by IRQ event is disabled. 1: Deep Sleep returns by IRQ event is enabled.	R/W

Note: S-TYPE4, P-TYPE2

IRQ bits

This bit is the enable bit to control the use of the IRQ as a Deep Sleep return factor.

The IRQn (n = 32 × j + i (i = 0 to 31)) is selected in the IELSRn.IELS[9:0] bit (n = 0 to 95).

14.2.22 INTSELRp : Interrupt Request Select Register (p = 0 to 31)

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x40 + 0x4 × p

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	IS32p +31	IS32p +30	IS32p +29	IS32p +28	IS32p +27	IS32p +26	IS32p +25	IS32p +24	IS32p +23	IS32p +22	IS32p +21	IS32p +20	IS32p +19	IS32p +18	IS32p +17	IS32p +16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	IS32p +15	IS32p +14	IS32p +13	IS32p +12	IS32p +11	IS32p +10	IS32p +9	IS32p +8	IS32p +7	IS32p +6	IS32p +5	IS32p +4	IS32p +3	IS32p +2	IS32p +1	IS32p +0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	IS32p+31 to IS32p+0	This bit sets whether the interrupt requests and DTC requests are on the CPU0 side or the CPU1 side. 0: Selected as CPU0 factor 1: Selected as CPU1 factor	R/W[*1]

Note: S-TYPE-6, P-TYPE-2

Note 1. Bits in the following conditions are fixed to 0 because they are not assigned.

- INTSELR0.IS0 (bit0: event No.0) with no factor assigned.
- Invalid event number with no factor assigned.
  For more information, see Column M (Event Func. Assign) and Column Y (CPU Int. Maskable) in the Event List.
- Event number (event No.88,89,91,92,101) unique to CPU0/CPU1.
  (DBG CTI1-0 interrupts, IPC CPU mutual interrupt 0, IPC CPU mutual interrupt 1, FPU Exception.)

IS32p + (31 to 0) bits

For example, when IS1 = 0, the cause of Event No.1 is an interrupt for CPU0. Also, when IS2 = 1, the cause of Event No.2 is an interrupt for CPU1.

The relationship between the register and the event number is shown below.

- IS32p+31 to IS32p+0

p = 0 : selected event No.31 to No.0

p = 1 : selected event No.63 to No.32

p = 2 : selected event No.95 to No.64

p = 3 : selected event No.127 to No.96

p = 4 : selected event No.159 to No.128

p = 5 : selected event No.191 to No.160

⋮

p = 14 : selected event No.479 to No.448

p = 15 : selected event No. 511 to No.480

⋮

p = 30: selected event No.991 to No.960

p = 31 : selected event No.1023 to No.992

14.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see section 14.11. Reference.

14.3.1 Interrupt Vector Table

Table 14.3 describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

Table 14.3 Interrupt vector table (1 of 4)

Exception number	IRQ number	Vector offset	Source	Description
0	—	0x000	Arm	Initial stack pointer
1	—	0x004	Arm	Initial program counter (reset vector)
2	—	0x008	Arm	Non-Maskable Interrupt (NMI)
3	—	0x00C	Arm	HardFault
4	—	0x010	Arm	MemManage Fault
5	—	0x014	Arm	BusFault

14.3.2 Event Number

The following table lists heading details for Table 14.5, which describes each event number.

Table 14.4 Heading details for Event List

Heading	Description
Interrupt request source	Name of the source generating the interrupt request
Name	Name of the interrupt
Connect to NVIC	" ✓" indicates the interrupt can be used as a CPU interrupt
Invoke DTC	" ✓" indicates the interrupt can be used to request DTC activation
Invoke DMAC	"✓" indicates the interrupt can be used to request DMAC activation
Canceling CPU Deep Sleep	"✓" indicates the interrupt can be used to request a return from CPU Deep Sleep mode
Canceling Software Standby	" ✓" indicates the interrupt can be used to request a return from Software Standby mode
Canceling Deep Software Standby	"✓" indicates the interrupt can be used to request a return from Deep Software Standby mode

Note 1. Only supported when CMPCTL0.CSTEN = 1.
Note 2. Only the first edge detection is valid.
Note 3. Support only interrupt after DTC transfer.
Note 4. Only supported in Deep Software Standby mode 1 and Deep Software Standby mode 2.

Note 5. Only supported in Deep Software Standby mode 1.

14.4 Maskable Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation.

14.4.1 Interrupt Detection Selection

The interrupt controller unit selects an event source input from a peripheral function interrupt or an external terminal interrupt with IELSRn.IELS [9:0] (n = 0 to 95).

The accepted interrupt source sets the IELSRn. IR (n = 0 to 95) to 1 and sends an interrupt request to the NVIC.

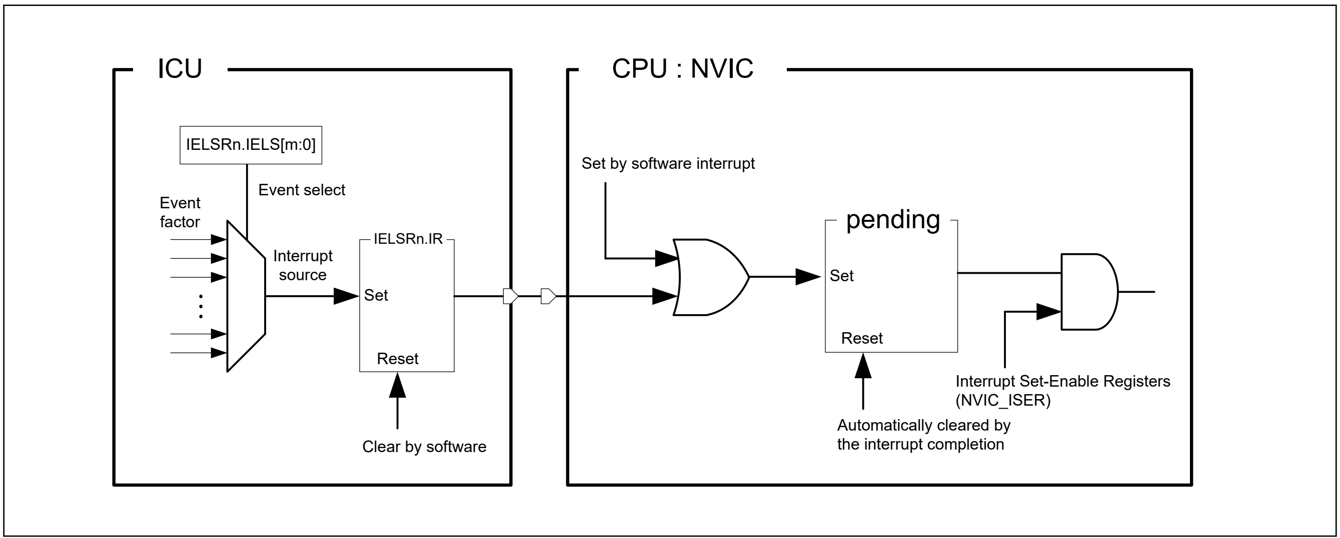

Figure 14.3 Interrupt path of the ICU and CPU : NVIC

14.4.2 Detecting Interrupts

External pin interrupt requests are detected by either the edge or level (falling edge, rising edge, rising and falling edges, or low level) of the interrupt signal. Set the IRQCRi.IRQMD[1:0] (i = 0 to 31) bits to select detection mode for the IRQi (i = 0 to 31) pins. For interrupt sources associated with peripheral modules, see section 14.3.2. Event Number.

14.5 Maskable Interrupt Setting Procedure

14.5.1 Operations During an Interrupt

- When an interrupt is generated: except for software interrupts:
  The IELSRn.IR (n = 0 to 95) flag and Interrupt Set Pending Register (NVIC_ISPRn) are set.
- When an interrupt is generated: software interrupts:
  Interrupt Set Pending Register (NVIC_ISPRn) are set.
- When an interrupt is complete:
  Clear the IELSRn.IR (n = 0 to 95) flag by software. The Interrupt Set Pending Register (NVIC_ISPRn) is automatically cleared.

Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the IR. Then the CPU will accidentally jump to the interrupt handler again. To avoid this, be sure to read IELSRn (n = 0 to 95) register before exiting the interrupt handler and make sure that IR is cleared before exiting the interrupt handler.

14.5.2 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC_ISER).
2. Set the IELSRn.IELS[9:0] (n = 0 to 95) bits as the interrupt source.
3. Specify the operation settings for the event source, such as Deep Sleep/Software Standby mode cancellation (WUPEN0, WUPEN1, DSLPWUPIRQENj (j = 0 to 2) register setting).

14.5.3 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as Deep Sleep/Software Standby mode cancellation (WUPEN0, WUPEN1, DSLPWUPIRQENj (j = 0 to 2) register setting).
2. Clear the interrupt source setting (IELSRn.IELS[9:0] (n = 0 to 95) = 0x00).
3. Clear the interrupt status flag (IELSRn.IR (n = 0 to 95) = 0).
4. Clear the interrupt Clear-Enable register (NVIC_ICER) and interrupt Clear-Pending register (NVIC_ICPR).

14.5.4 Polling for interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC_ICER).
2. Set the IELSRn.IELS[9:0] (n = 0 to 95) bits as the interrupt source.
3. Poll the interrupt Set-Pending register (NVIC_ISPR).

14.5.5 Selecting Interrupt Request Destinations

The interrupt output destination, CPU and DTC can be independently selected for each interrupt source.

The available destinations are fixed for each interrupt, as described in section 14.3.2. Event Number.

Use an interrupt request destination setting that is indicated by a “✓” in the event list (see section 14.3.2. Event Number).

If the CPU or DTC in one IELSRn (n = 0 to 95) register is selected, setting the same interrupt source in any other IELSRn (n = 0 to 95) register is prohibited.

Setting the same interrupt source for IELSRn (n = 0 to 95) and DELSRm is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi (i = 0 to 31) pin, you must set the IRQCRi.IRQMD[1:0] (i = 0 to 31) bits for that interrupt to select edge detection.

14.5.5.1 CPU Interrupt Request

When IELSRn.DTCE (n = 0 to 95) = 0, the event specified in the IELSRn (n = 0 to 95) register is output to the NVIC.

14.5.5.2 DTC Activation

When IELSRn.DTCE (n = 0 to 95) = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[9:0] (n = 0 to 95) bits to the target event and set the IELSRn.DTCE (n = 0 to 95) bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

An interrupt is generated by the same factor after DTC transmission is complete.

Table 14.6 shows operation when the DTC is the interrupt request destination.

Table 14.6 Operation at DTC activation

Interrupt request destination	DISEL*1	Remaining transfer operations	Operation per request	IR*2	DTCE after transfer
DTC*3	1	≠ 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	IELSRn.DTCE = 1
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	IELSRn.DTCE = 0 (IELSRn.DTCE bit is automatically cleared
	0	≠ 0	DTC transfer	Cleared at the start of DTC data transfer after reading DTC transfer data	IELSRn.DTCE = 1
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	IELSRn.DTCE = 0 (IELSRn.DTCE bit is automatically cleared)

Note 1. DTC.MRB.DISEL bit controls the interrupt generates timing from DTC to CPU.
Note 2. When the IELSRn.IR (n = 0 to 95) flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.
Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR (n = 0 to 95) flag clear timing, and the interrupt request destination after transfer. See Table 18.2 in section 18, Data Transfer Controller (DTC).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn (n = 0 to 95) that is not the target is not cleared.

14.5.5.3 DMAC Activation

Events specified in the DELSRm (m= 0 to 7) registers are output to the DMAC.

To set the interrupt source for DMAC, use the following procedure:

1. Set the DELSRm.DELS[9:0] (m= 0 to 7) bits to the event to activate the DMAC.
2. When using interrupts to CPU, set the IELSRn.IELS (n = 0 to 95) bit to factor of DMAC interrupt and IELSRn.DTCE (n = 0 to 95) bit to 0.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0] (m= 0 to 7)) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE (m= 0 to 7)) to 1.
5. Set the DMAC operation enable bit (DMAST.DMST) to 1.

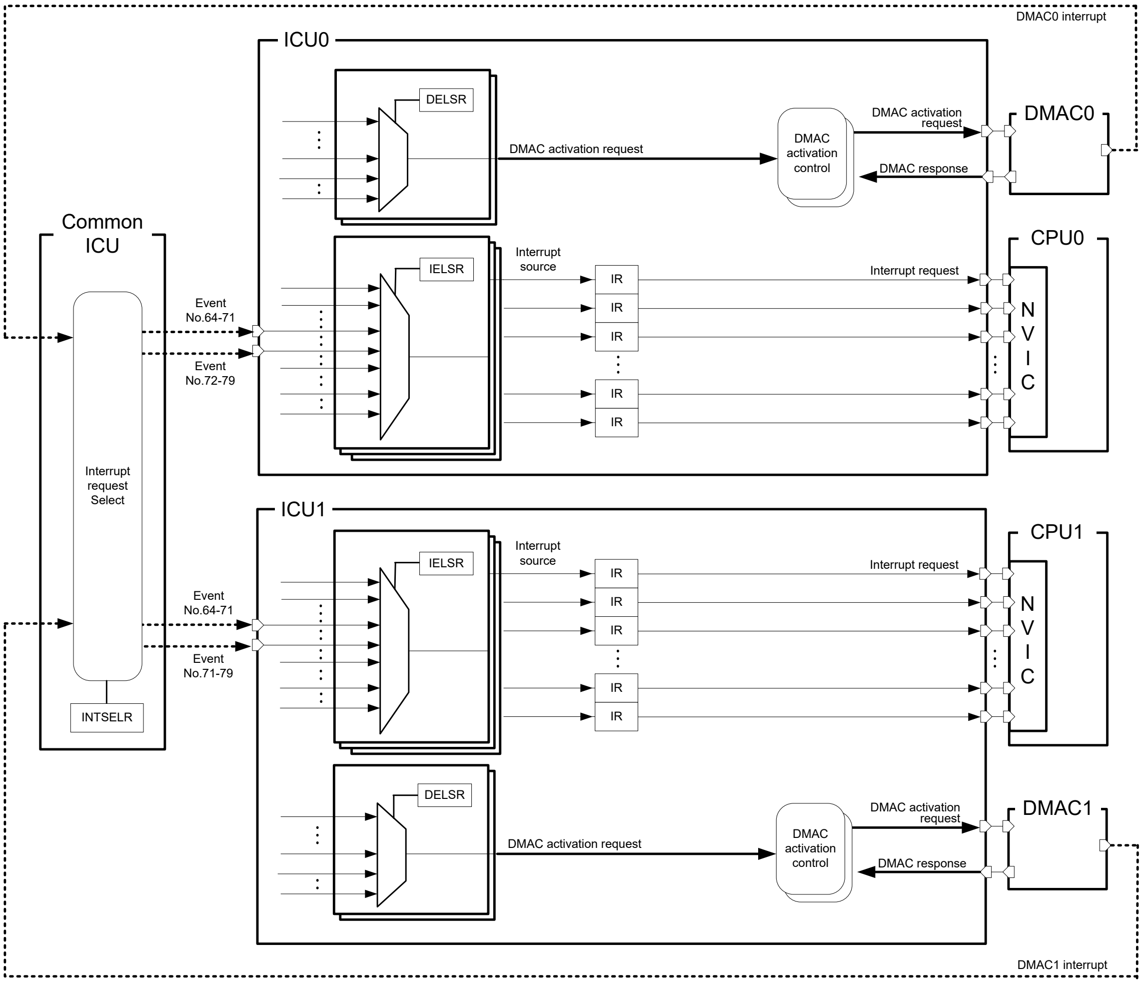

Figure 14.4 Course of the DMAC request trigger and interrupt

Note: If an error response occurs during DMAC transfer, the DMAC notifies the ICU that an error has occurred.
The ICU clears all bits of the target channel of DELSRm (m = 0 to 7). DELSRm (m = 0 to 7) that is not the target channel is not cleared.

14.5.6 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQi, (i = 0 to 31) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock, and removes any signal with a pulse width less than 3 sampling cycles.

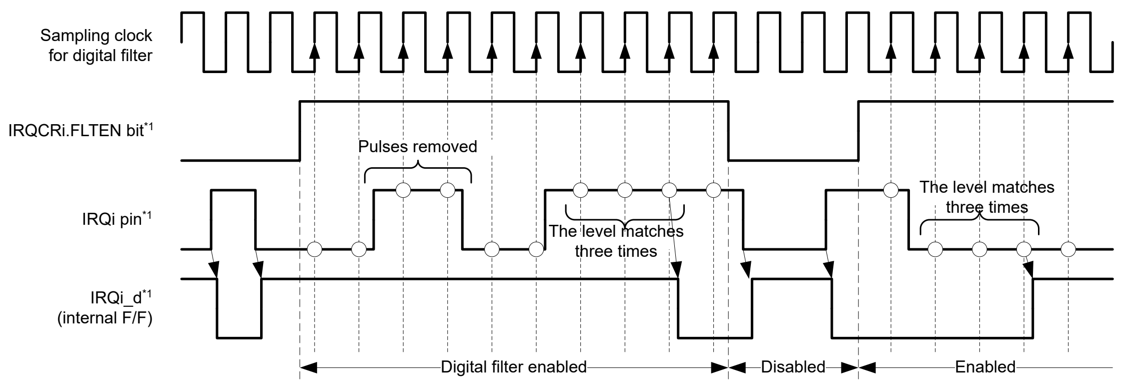
To use the digital filter for an IRQi pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCRi.FCLKSEL[1:0] bits (i = 0 to 31).
2. Set the IRQCRi.FLTEN bit (i = 0 to 31) to 1 (digital filter enabled).

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 14.5 shows an example of digital filter operation.



Operation example with IRQCRi.IRQMD[1:0] = 11b (low-level detection)

Note 1. i = 0 to 15

Figure 14.5 Digital filter operation example

During Software Standby mode, the digital filter is forcibly turned off by Hardware. After returning to normal mode from Software Standby mode, follow the values of IRQCRi.FLTEN (i = 0 to 31) and NMICR.NFLTEN. Once the filter is disabled, the event information sampled up to that point will be lost.

14.5.7 External Pin Interrupts

To use external pin interrupts:Configure I/O ports settings.

1. Clear the IRQCRi.FLTEN bit (i = 0 to 31) to 0 (digital filter disabled).
2. Specify or confirm the I/O port settings.
3. Set the IRQMD[1:0] the FCLKSEL[1:0] bits, and the FLTEN bit of the IRQCRi register (i = 0 to 31) register.
4. Select the IRQ pin as follows:
   - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS[9:0] (n = 0 to 95) bits and the IELSRn.DTCE (n = 0 to 95) bit to 0.
   - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS[9:0] (n = 0 to 95) bits and the IELSRn.DTCE (n = 0 to 95) bit to 1.
   - If the IRQ pin is to be used for DMAC activation, set the DMAC. DELSRm.DELS[9:0] (m = 0 to 7) bits.

14.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- Sub Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt (CPU0, CPU1)
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- Common memory error interrupt

- Local memory error interrupt (CPU1 only)
- Bus error interrupt
- Lockup error interrupt (CPU0, CPU1)
- IPC NMI CPU mutual interrupt (CPU0, CPU1)
- FPU Exception interrupt (CPU0, CPU1)
- MRAM MRC/MRE read error interrupt

Non-maskable interrupts can only be used with the CPU, not to activate the DTC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the NMISR. Then the CPU will accidentally jump to the NMI handler again. To avoid this, be sure to read NMISR before exiting the NMI handler and make sure that NMISR is cleared before exiting the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI cannot be disabled when enabled, except by a reset.

14.6.1 Correspondence to TrustZone-M by NMI

The NMI security is set by AIRCR.BFHFNMINS.

Although there is only one NMI per CPU, multiple factors can be set. This section describes the procedure for mixing Secure and Non-secure programs of NMI. When doing so, the NMI-related registers of the ICU are set to Secure.

Register related to Non-Maskable Interrupt :

- NMISR
- NMIER
- NMICLR
- NMICR

Figure 14.6 shows the flow.

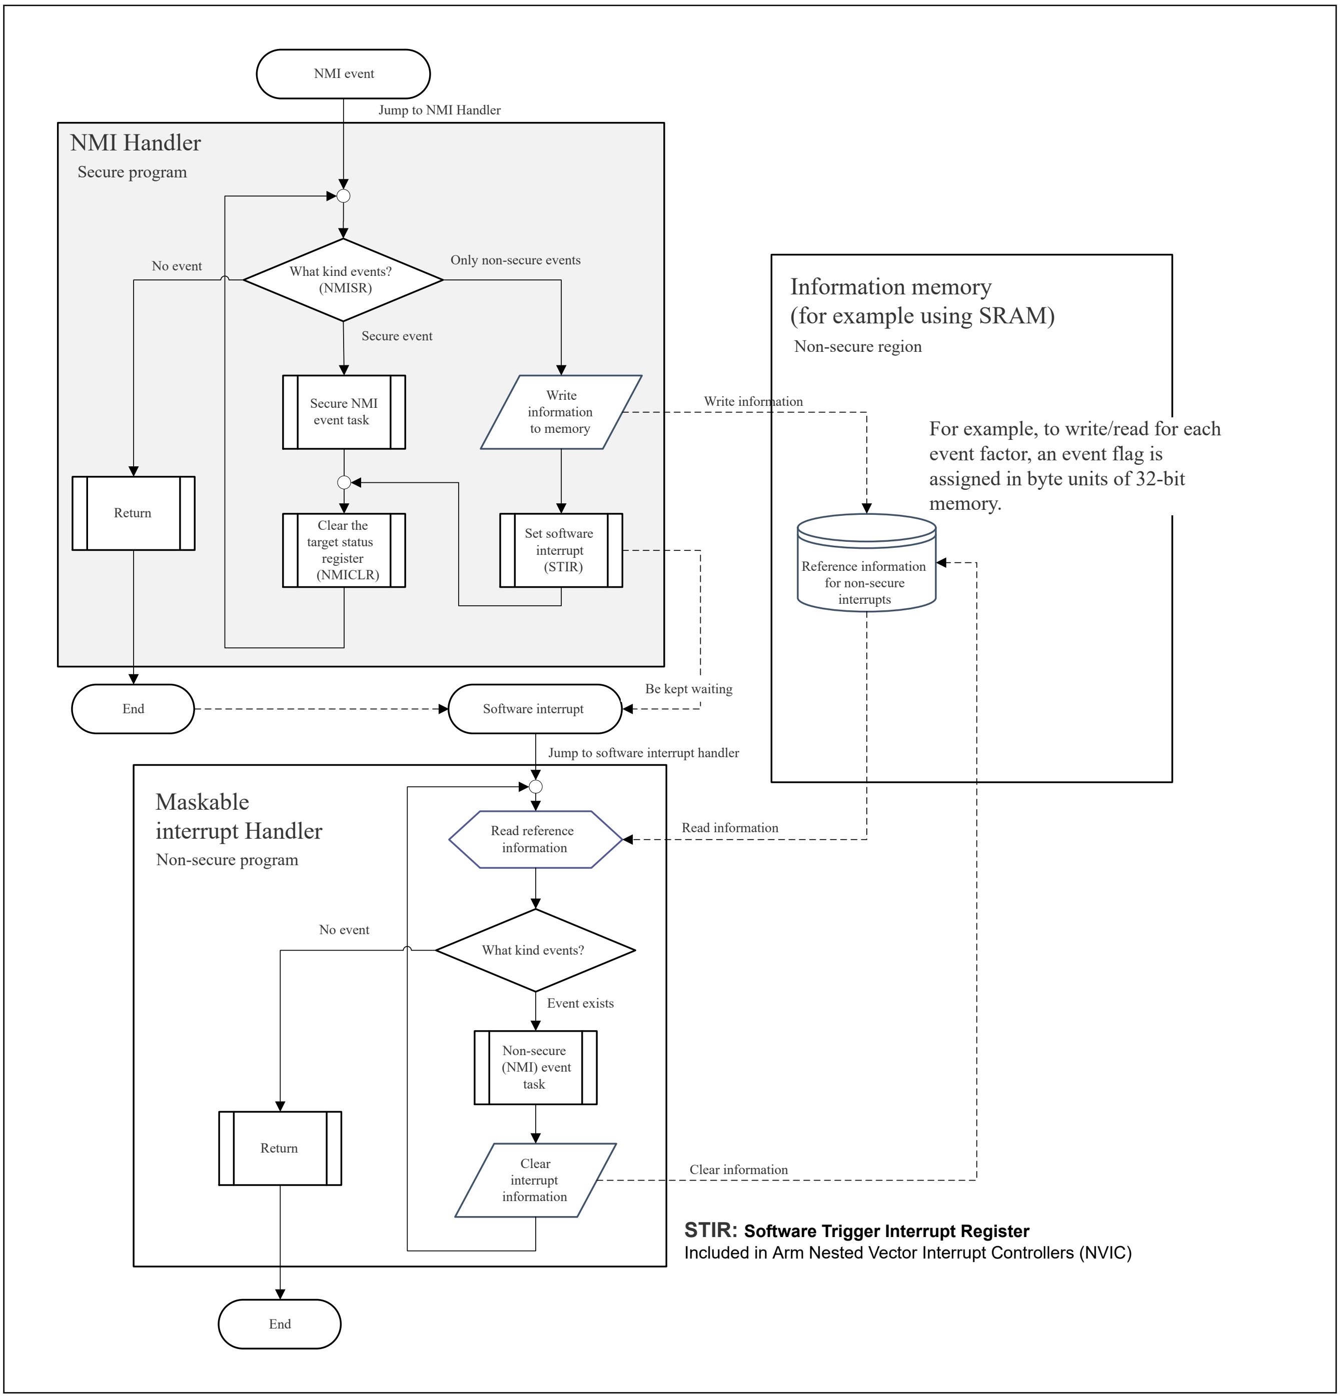


Figure 14.6 Correspondence to TrustZone-M by NMI

14.7 Inter-Processor Communication

The inter-processor communication has an interrupt function from CPU0 to CPU1 and an interrupt function from CPU1 to CPU0.

The following can be used as mutual interrupts between CPUs.

- IPC NMI CPU mutual interrupt (NMI bit20)
- IPC CPU mutual interrupt 0 (Event No.91)
- IPC CPU mutual interrupt 1 (Event No.92)

14.8 Security

14.8.1 Security Related to CPU Interrupt Inputs

Non-maskable interrupt

Arm® CPU NMI Secure is modified by AIRCR.BFHFNMINS and is managed by the software developer who manages Secure.

The following registers must follow the secure attribution set in AIRCR.BFHFNMINS.

- ICU.NMISR
- ICU.NMIER
- ICU.NMICLR

Therefore, the secure attribute set by ICUSARB must match the secure attribute set by AIRCR.BFHFNMINS.

Maskable interrupts

The secure of maskable interrupts are set in the Arm CPU NVIC internal registers (NVIC_ITNS0 to NVIC_ITNS15).

Which maskable interrupts are secured is controlled by the software developer who manages secure.

The following registers must follow the secure attribution set in NVIC_ITNS0 to NVIC_ITNS15.

- ICU.IELSRn (n = 0 to 95)

Therefore, the secure attribute set by ICUSARG, ICUSARH, and ICUSARI, ICUSARJ, ICUSARK, and ICUSARL must match the secure attribute set by NVIC_ITNS0 to NVIC_ITNS15.

14.8.2 Trusted Interrupt Management

The secure-interrupt should not be visible to non-secure-operation. Because there is a risk that vital information will be leaked to the attacker, the on-chip interrupt network can route any interrupt to secure or non-secure world. However, secure interrupt routing must be suppressed so that it can only be configured from a secure world.

When set TEVTRCR.TEVTEICU0/TEVTEICU1 = 1, secure program manages the selection of interrupt factors. It protects non-secure programs from using and monitoring secure interrupt factors without permission. Specifically, when TEVTRCR.TEVTEICU0/TEVTEICU1 = 1, the write permission of IELSR.IELS [9:0] is limited to the secure attribute, and the write by the non-secure attribute is ignored. TEVTRCR.TEVTEICU0/TEVTEICU1 protects only IELS [9:0], and the security attributes of IR and DTCE follow the settings of ICUSARG, ICUSARH, ICUSARI, ICUSARJ, ICUSARK, and ICUSARL. If TEVTRCR.TEVTEICU0/TEVTEICU1 = 1, it is necessary to set all IELS including non-secure interrupts in the secure program, or prepare a secure API to set IELS in response to the request from the non-secure program.

- Non-maskable interrupt
The non-maskable interrupt factor that can be used by CPU0 and CPU1 is determined by NMIER register.
The judgment conditions and priorities are as follows.
Condition 1: If the target bit of the NMIER register is set to only one of CPU0 and CPU1, it is supplied to the set CPU.
Condition 2: When both CPU0 and CPU1 set the target bit of the NMIER register, it is judged by the priority according to the primary/secondary of the CPU and the security level at the time of writing the NMIER register.
Priority (1) If the NMIER register on the primary CPU side is set with a secure write, the primary CPU has priority.
Priority (2) If the NMIER register on the secondary CPU side is set with a secure write, the secondary CPU has priority.
Priority (3) If the NMIER register is set with a non-secure write for both CPUs, the primary CPU has priority.
Example 1: When ICU0.NMIER.NMIEN=0, ICU1.NMIER.NMIEN= 1, supply to CPU1.
Example 2: When CPU0 is the primary CPU.
  - When both CPU0/CPU1 set the NMIER register with a secure write, it is supplied to CPU0.
  - When NMIER of CPU0 is set by non-secure write and NMIER of CPU1 is set by secure write, it is supplied to CPU1.
  - When the NMIER register is set with a non-secure write for both CPU0/CPU1, it is supplied to CPU0.

  The exception conditions are shown below.
Exception 1) Fixed to the primary CPU side, not selectable on the secondary CPU side.
  - bit0. IWDT underflow/refresh error interrupt

Exception 2) There is no distribution control between CPU0 and CPU1 due to individual CPU factors.

- bit1. WDT Underflow/Refresh Error Interrupt (Accepts for same CPUs).
- bit15. Lockup error interrupt (Accepts for same CPUs).
- bit16. FPU Exception interrupt (Accepts for same CPUs).
- bit20. IPC NMI CPU mutual interrupt (Controlled by IPC).

- Maskable interrupts
  The maskable interrupt factor that can be used by CPU0 and CPU1 is determined by INTSELRp register. (p = 0 to 31).
  The bit number of the INTSELRp register corresponds to the number of EventList.
  Setting the INTSELRp register to 0 will allow it to be used by CPU0, and setting 1 will allow it to be used by CPU1.
  However, the following factors can be used regardless of the setting value of the INTSELRp register.
  - Event No.88 DBG CTI0 interrupt (Accepts for same CPUs).
  - Event No.89 DBG CTI1 interrupt (Accepts for same CPUs).
  - Event No.91 IPC CPU mutual interrupt 0 (Controlled by IPC).
  - Event No.92 IPC CPU mutual interrupt 1 (Controlled by IPC).
  - Event No.101 FPU Exception interrupt (Accepts for same CPUs).

14.8.3 Trusted IELSR Setting Procedure

14.8.3.1 Case Where Secure Program Sets all IELSRs

Case where all settings are performed in the secure initial sequence.

Initial IELSR setting procedure after system reset release

1. Secure program sets interrupt request select (ICU.INTSELRp)
2. Secure program sets TEVTEICU0/TEVTEICU1 = 1
3. Secure program sets security attributes of all interrupts (NVIC_ITNS, Security Attribution of ICU.IELSRn.IELS)
4. Secure program selects all interrupt source (ICU.IELSRn.IELS)
5. Secure program allows secure interrupts (NVIC_ISER for secure interrupt)
6. Secure program jumps to non-secure program
7. Non-secure program allows non-secure interrupts (NVIC_ISER for non-secure interrupt)

14.8.3.2 Case Where Non-secure Program Sets IELSRn by Secure API

Case of setting upon receiving a request from a non-secure program.

Initial IELSR setting procedure after system reset release

1. Secure program sets interrupt request select (ICU.INTSELRp)
2. Secure program sets TEVTEICU0/TEVTEICU1 = 1
3. Secure program sets security attributes of all interrupts (NVIC_ITNS, Security Attribution of ICU.IELSRn.IELS)
4. Secure program selects secure interrupt source (ICU.IELSRn.IELS)
5. Secure program enables secure interrupt (NVIC_ISER for secure interrupt)
6. Secure program jumps to non-secure program
7. Non-secure program calls secure program (API call)
8. Secure program selects the cause of non-secure interrupt (ICU.IELSRn.IELS)
9. Secure program returns to non-secure program
10. Non-secure program allows non-secure interrupt (NVIC_ISER for non-secure interrupt)

14.8.3.3 IELSR Release Procedure When TEVTEICU0/TEVTEICU1 = 1

< When clearing interrupt settings of secure attribute by the secure program >

1. Clear the interrupt source setting (IELSRn.IELS = 0x00)
2. Clear the interrupt status flag (ICU.IELSRn.IR = 0)
3. Clear the Interrupt Clear Enable register (NVIC_ICPR)

<When clearing interrupt settings of non-secure attribute by the secure program >

1. Clear the interrupt source setting (IELSRn.IELS = 0x00)
2. Clear the interrupt status flag by using the non-secure alias address (IELSRn.IR = 0)
3. Clear the Interrupt Clear Enable register (NVIC_ICPR)

Secure can also rewrite NVIV_ICPRn_NS.

< When clearing interrupt settings of secure attribute by the non-secure program >

It cannot be canceled.

< When clearing interrupt settings of non-secure attribute by non-secure program>

1. Non-secure program calls secure program (API call)
2. Clear the interrupt source setting (IELSRn.IELS = 0x00)
3. Return from secure program to non-secure program
4. Clear the interrupt status flag (IELSRn.IR = 0)
5. Clear the Interrupt Clear Enable register (NVIC_ICPR)

14.9 Return from Low Power Modes

Table 14.5 lists the interrupt sources that can be used to exit Sleep, Deep Sleep or Software Standby mode. For more information, see section 11, Low Power Mode.

For recovery from Deep Software Standby mode, see chapter “Deep Software Standby Mode”.

Note: The return factor from low power mode must have a priority that the CPU can accept.

14.9.1 Return from CPU Sleep Mode

To return from CPU Sleep mode in response to an interrupt:

non-maskable interrupt

Use the NMIER register to enable the target interrupt request.

maskable interrupt

1. Select the CPU as the interrupt request destination.
2. Enable the interrupt in the NVIC.

14.9.2 Return from CPU Deep Sleep Mode

The MCU returns from CPU Deep Sleep mode using a non-maskable interrupt or a maskable interrupt. For the non-maskable interrupt factors exiting the Deep Sleep mode, see section 14.2.14. NMIER : Non-Maskable Interrupt Enable Register. For the maskable interrupt factors exiting the Deep Sleep mode, see section section 14.2.22. INTSELRp : Interrupt Request Select Register (p = 0 to 31).

To return from CPU Deep Sleep mode in response to an interrupt:

Non-maskable interrupt

Use the NMIER register to enable the target interrupt request.

Maskable interrupt

1. Select the interrupt source that enables return from CPU Deep Sleep mode.

2. Use the DSLPWUPIRQENj (j = 0 to 2) register to enable the target interrupt request.
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the IRQi (i = 0 to 31) pins that do not satisfy these conditions are not detected while the clock is stopped in CPU Deep Sleep mode. Similarly, it cannot detect a request for a non-maskable interrupt from a request source whose clock is stopped in CPU Deep Sleep mode. Therefore, those events cannot be used as return factors. For example, the CPU cannot return from software standby mode because the following NMI events do not occur.

- Lockup error interrupt (same CPU)
- FPU Exception interrupt (same CPU)

14.9.3 Return from Software Standby Mode

MCU goes to the Software Standby mode via CPU deep sleep state.

The MCU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For the non-maskable interrupt factors exiting the Software Standby mode, see section section 14.2.14. NMIER : Non-Maskable Interrupt Enable Register. For the maskable interrupt factors exiting the Software Standby mode, see section section 14.2.19. WUPEN0 : Wake Up Interrupt Enable Register 0, section 14.2.20. WUPEN1 : Wake Up Interrupt Enable Register 1, and section 14.2.22. INTSELRp : Interrupt Request Select Register (p = 0 to 31).

The maskable interrupt sources to exit the software standby mode are specified by the bits in WUPEN0 and WUPEN1. Additionally, the corresponding bits in DSLPWUPIRQENj (j = 0 to 2) need to be set to “1”.

However, if the mode is switched to S/W standby mode while the return factor in CPU Deep sleep mode is detected, the re-turn factor from deep sleep may cause the S/W standby mode to return to normal mode.

No event occurs from the function that stops in Software Standby mode. Therefore, those events cannot be used as return factors. For example, the CPU cannot return from Software Standby mode because the following NMI events do not occur.

- WDT underflow/refresh error (CPU0, CPU1)
- Common memory error interrupt
- Local memory error interrupt (CPU1 only)
- Bus error interrupt
- Lockup error interrupt (CPU0, CPU1)
- IPC NMI CPU mutual interrupt (CPU0, CPU1)
- FPU Exception interrupt (CPU0, CPU1)
- MRAM MRC/MRE read error interrupt

14.10 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

15. Buses

15.1 Overview

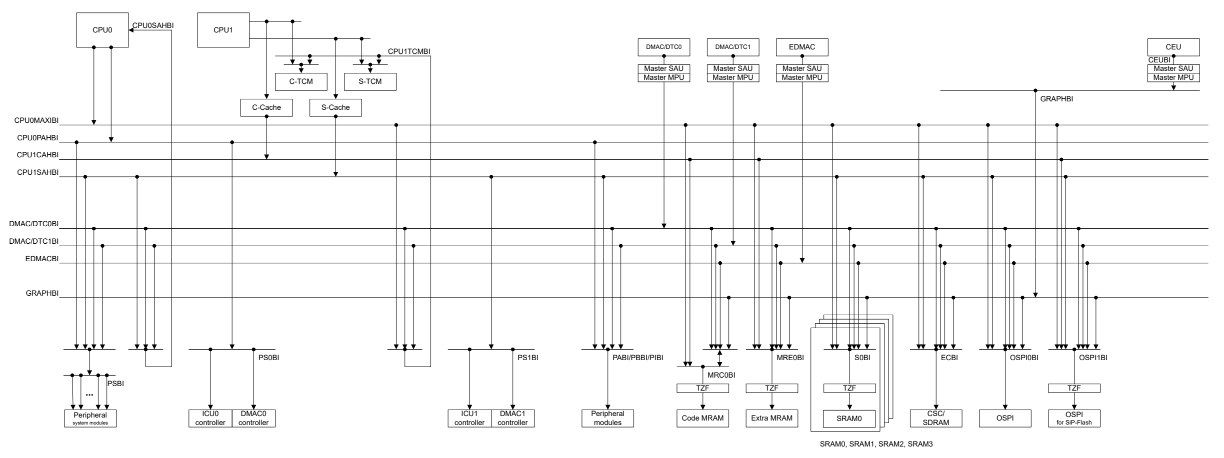
EDMAC in this chapter means the GWCA function of ESWM. Table 15.1 lists the bus masters and bus slaves, Figure 15.1 shows the system bus configuration, and Table 15.3 lists the addresses assigned for each bus.

Table 15.1 Bus specifications

Bus master/ slave name	Sync clock	Description
Classification: Bus masters		
CPU0MAXIBI (Arm® Cortex®-M85)	CPUCLK0	Connected to the CPU0 Master-AXI (M-AXI) Interface
CPU0PAHBI (Arm® Cortex®-M85)	CPUCLK0	Connected to the CPU0 Peripheral AHB (P-AHB) Interface
CPU1CAHBI (Arm® Cortex®-M33)	CPUCLK1	Connected to the CPU1 Instruction Cache for instructions and operands
CPU1SAHBI (Arm® Cortex®-M33)	CPUCLK1	Connected to the CPU1 Data Cache for system
DMAC/DTC0BI	ICLK	Connected to the DMAC/DTC0 Interface
DMAC/DTC1BI	ICLK	Connected to the DMAC/DTC1 Interface
EDMACBI	ICLK	Connected to the EDMAC Interface
CEUBI	PCLKA	Connected to the CEU Interface (Write Only)
Classification: Bus slaves		
MRC0BI	MRICLK	Connected to Code MRAM
MRE0BI	MRPCLK	Connected to Extra MRAM (Read Only)
CPU0SAHBI	ICLK	Connected to CPU0 S-AHB
CPU1TCMBI	CPUCLK1	Connected to CPU1 S-TCM and CPU1 C-TCM
S0BI	ICLK	Connected to SRAM0
S1BI	ICLK	Connected to SRAM1
S2BI	ICLK	Connected to SRAM2
S3BI	ICLK	Connected to SRAM3
ECBI	BCLK	Connected to the external devices (External Memory Interface)
OSPI0BI	ICLK	Connected to the OSPI (via DOTF) (External Memory Interface)
OSPI1BI	ICLK	Connected to the OSPI for SIP-Flash (External Memory Interface)
PBBI	PCLKB	Connected to peripheral modules synchronizes with PCLKB
PABI	PCLKA	Connected to peripheral modules synchronizes with PCLKA
PIBI	ICLK	Connected to peripheral modules synchronizes with ICLK
PS0BI	ICLK	Connected to ICU0 controller Connected to DMAC/DTC0 controller
PS1BI	ICLK	Connected to ICU1 controller Connected to DMAC/DTC1 controller
PSBI	CPUCLK1	Connected to peripheral system module. (CPU1-cache controller)
	ICLK	Connected to peripheral system modules. (MPU, CSC/SDRAM, SRAM, Debug component, Bus controller, common ICU controller, CPU controller, debug controller, IPC controller, and security attribution controller)
	MRPCLK	Connected to peripheral system module. (MRAM controller)
	PCLKB	Connected to peripheral system module. (system controller)

Note: CPU0MAXIBI: CPU0 M-AXI Bus Interface

CPU0PAHBI: CPU0 P-AHB Bus Interface
CPU1CAHBI: CPU1 C-AHB Bus Interface
CPU1SAHBI: CPU1 S-AHB Bus Interface
DMAC/DTC0BI: DMAC/DTC0 Bus Interface
DMAC/DTC1BI: DMAC/DTC1 Bus Interface
EDMACBI: EDMAC Bus Interface
CEUBI: CEU Bus Interface
MRC0BI: Code MRAM Bus Interface
MRE0BI: Extra MRAM Bus Interface
CPU0SAHBI: CPU0 S-AHB Interface (Bus Interface from Bus Masters except CPU0 to CPU0 ITCM and CPU0 DTCM)
CPU1TCMBI: Bus Interface from Bus Masters except CPU1 to CPU1 S-TCM and CPU1 C-TCM
S0BI: SRAM0 Bus Interface
S1BI: SRAM1 Bus Interface
S2BI: SRAM2 Bus Interface
S3BI: SRAM3 Bus Interface
ECBI: External memory CSC and SDRAM Bus Interface
OSPI0BI: External memory OSPI Bus Interface
OSPI1BI: External memory OSPI for SIP-Flash Bus Interface
PBBI: Peripheral synchronizes with PCLKB Bus Interface
PABI: Peripheral synchronizes with PCLKA Bus Interface
PIBI: Peripheral synchronizes with ICLK Bus Interface
PS0BI: ICU0, DMAC/DTC0 Controller Bus Interface
PS1BI: ICU1, DMAC/DTC1 Controller Bus Interface
PSBI: Peripheral System Bus Interface



Note: “TZF” is Slave TrustZone Filter.
Note: GRAPHBI is the bus interface that CEUBI is connected.

	0x4001_C000 to 0x4001_CFFF (Secure) 0x5001_C000 to 0x5001_CFFF (Non-secure)		CPU1 cache controller
	0x4001_E000 to 0x4001_EFFF (Secure) 0x5001_E000 to 0x5001_EFFF (Non-secure)		System controller
	0x4002_0000 to 0x4002_0FFF (Secure) 0x5002_0000 to 0x5002_0FFF (Non-secure)		IPC controller
	0x4012_0000 to 0x4013_FFFF (Secure) 0x5012_0000 to 0x5013_FFFF (Non-secure)		MRAM controller

Table 15.3 Addresses assigned for each slave (3 of 3)

Region	Address	Bus Interface	Area
	0x4020_0000 to 0x402F_FFFF (Secure) 0x5020_0000 to 0x502F_FFFF (Non-secure)	PBBI	Peripheral synchronizes with PCLKB
	0x4030_0000 to 0x403F_FFFF (Secure) 0x5030_0000 to 0x503F_FFFF (Non-secure)	PABI	Peripheral synchronizes with PCLKA
	0x4040_0000 to 0x404F_FFFF (Secure) 0x5040_0000 to 0x504F_FFFF (Non-secure)	PIBI	Peripheral synchronizes with ICLK
External RAM	0x6000_0000 to 0x6FFF_FFFF	ECBI	CSC/SDRAM (external bus)
	0x7000_0000 to 0x7FFF_FFFF	OSPI1BI*1	OSPI (via DOTF)
	0x8000_0000 to 0x9FFF_FFFF	OSPI0BI	OSPI (via DOTF)

Note 1. Products without SIP-FLASH can be accessed, but products with SIP-FLASH cannot.
Note 2. MRAM size 1 MB product is accessible, but MRAM size 512 KB product is not.

15.2 Description of Buses

15.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected. For details, see section 15.3.23. BUSSABT0<slave> : Bus Slave Arbitration Control Register 0 and section 15.3.24. BUSSABT1MRC0BI : Bus Slave Arbitration Control Register 1.

15.2.2 External Bus

The external bus controller arbitrates requests for bus access on the external address space from the CPU M-AXI bus, DMAC/DTC bus, EDMAC bus and CEU bus. See section 15.2.1. Arbitration for the priority and arbitration method of each master to the External bus.

The bus system provides an external space for the OSPI (OSPI0BI,OSPI1BI). See section 44, Octal Serial Peripheral Interface (OSPI).

Table 15.4 lists the external bus specifications and Table 15.5 lists the I/O pins.

The external bus controller transfers between the AXI master and the external bus over the FIFO.

In External address space access, the internal bus is released by capturing the bus access request with the FIFO before the access to the external bus is complete. This allows the internal bus to start the next bus access. However, if the FIFO is full and the next access is an external address space access, it will wait for the previous external bus operation to complete.

Figure 15.2 shows an example of operation when the FIFO function is in use. When this function is in use, if the next operation is peripheral module access after external device access, peripheral module access is executed in parallel without waiting for the completion of external device access.

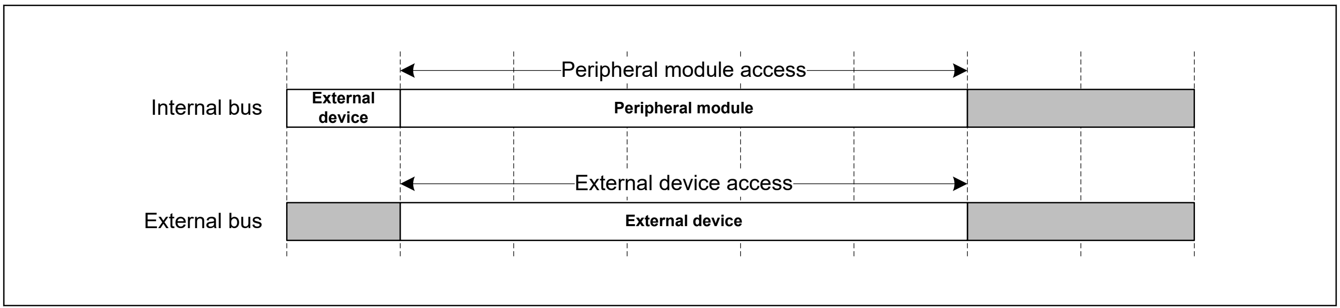

Figure 15.2 Example operation when the FIFO function is in use

Table 15.4 External bus specifications

Parameter	Specifications

External address space	• The external address space is divided into 8 CS areas (CS0 to CS7) and the SDRAM area (SDCS) for management.
	• Chip select signals can be output for each area.
	• The bus width can be set for each area.
	  – Separate bus: Selectable to 8-bit, 16-bit or 32-bit bus space
	  – Address/data multiplexed bus: Selectable to 8-bit or 16-bit bus space
	• Endian mode can be specified for each area.
	Big endian mode has the following restrictions. See section 15.2.5.1. Endianness Constraint for details.

CS area controller	• Recovery cycles can be inserted:
	  – Read recovery: Up to 15 cycles
	  – Write recovery: Up to 15 cycles
	• Cycle wait function: Wait for up to 31 cycles (for page access, up to 7 cycles)
	• Use wait control to set up:
	  – Assertion and negation timing of chip select signals (CS0 to CS7)
	  – Assertion timing of the read signal (RD) and write signals (WR0/WR and WR1)
	  – Timing of data output starts and ends
	• Write access modes:
	  – Single-write strobe mode and byte strobe mode
	Separate bus or address/data multiplexed bus can be set for each area.

SDRAM area controller	• Multiplexed output of row address and column address (8, 9, 10, or 11 bits) • Self-refresh and auto-refresh selectable • CAS latency can be specified from 1 to 3 cycles.
FIFO	FIFO number : 16 for Read Data and Write Data
Frequency	• The CS area controller (CSC) operates in synchronization with the external bus clock (BCLK)*1 • The frequency of the EBCLK pin output is the same as BCLK by default. Half of the BCLK cycles can be supplied by setting the EBCLK Pin Output Select bit, BCKCR.BCLKDIV, in the External Bus Clock Control Register. For more information, see section 9, Clock Generation Circuit. • The SDRAM area controller (SDRAMC) operates in synchronization with the SDRAM clock (SDCLK).

Note 1. BCLK and SDCLK must operate at the same frequency when the SDRAM is in use.

Table 15.5 External bus I/O pins (1 of 2)

Pin name	I/O	Related functions	Description
EBCLK, SDCLK*1	Output	CSC, SDRAMC	Clock output pin
A23 to A00*2	Output	CSC, SDRAMC	Address output pins
D31 to D00 DQ31 to DQ00	I/O	CSC, SDRAMC	D31 to D00 are CSC data input/output pins. DQ31 to DQ00 are SDRAMC data input/output pins. • D31 to D00, DQ31 to DQ00 pins are enabled when the 32-bit bus space is specified. • D15 to D00, DQ15 to DQ00 pins are enabled when the 16-bit bus space is specified. • D07 to D00, DQ07 to DQ00 pins are enabled when the 8-bit bus space is specified.
BC0	Output	CSC	• Strobe signal that indicates (when low) that D07 to D00 are valid during access to an external address space in single-write strobe mode, active-low. • When an 8-bit bus space is specified, this output pin is always held low regardless of the write access mode.
BC1	Output	CSC	• Strobe signal that indicates (when low) that D15 to D08 are valid during access to an external address space in single-write strobe mode, active-low. • This pin is not used when the 8-bit bus space is specified.
BC2	Output	CSC	• Strobe signal that indicates (when low) that D23 to D16 are valid during access to an external address space in single-write strobe mode, active-low. • This pin is not used when the 8- or 16-bit bus space is specified.
BC3	Output	CSC	• Strobe signal that indicates (when low) that D31 to D24 are valid during access to an external address space in single-write strobe mode, active-low. • This pin is not used when the 8- or 16-bit bus space is specified.
CS0*3	Output	CSC	Chip select signal for area 0 (CS0), active-low
CS1*3	Output	CSC	Chip select signal for area 1 (CS1), active-low

Table 15.5 External bus I/O pins (2 of 2)

Pin name	I/O	Related functions	Description
CS2*3	Output	CSC	Chip select signal for area 2 (CS2), active-low
CS3*3	Output	CSC	Chip select signal for area 3 (CS3), active-low
CS4	Output	CSC	Chip select signal for area 4 (CS4), active-low
CS5	Output	CSC	Chip select signal for area 5 (CS5), active-low
CS6	Output	CSC	Chip select signal for area 6 (CS6), active-low
CS7	Output	CSC	Chip select signal for area 7 (CS7), active-low
RD	Output	CSC	Strobe signal that indicates that a read from an external address space (CS0 to CS7) is in progress, active-low.
WR0/WR*4	Output	CSC	● WR0 signal is a strobe signal that indicates that a write to an external address space is in progress in byte strobe mode, and D07 to D00 are valid, active-low. ● WR signal is a strobe signal that indicates that a write to an external address space is in progress in single-write strobe mode, active-low. ● When an 8-bit bus space is specified, this output pin is held low during a write access regardless of the write access mode.
WR1	Output	CSC	● Strobe signal that indicates that D15 to D08 are valid during a write to an external address space in byte strobe mode, active-low. ● This signal is invalid in single-write strobe mode. ● This pin is not used when the 8-bit bus space is specified.
WR2	Output	CSC	● Strobe signal that indicates that D23 to D16 are valid during a write to an external address space in byte strobe mode, active-low. ● This signal is invalid in single-write strobe mode. ● This pin is not used when the 8- or 16-bit bus space is specified.
WR3	Output	CSC	● Strobe signal that indicates that D31 to D24 are valid during a write to an external address space in byte strobe mode, active-low. ● This signal is invalid in single-write strobe mode. ● This pin is not used when the 8- or 16-bit bus space is specified.
ALE	Output	CSC	Address latch signal when address/data multiplexed bus is selected.
WAIT	Input	CSC	Wait request signal used when accessing the external address space (CS0 to CS7), active-low
CKE	Output	SDRAMC	Clock enable signal
SDCS	Output	SDRAMC	Chip select signal, active-low
RAS	Output	SDRAMC	Row address strobe signal, active-low
CAS	Output	SDRAMC	Column address strobe signal, active-low
WE	Output	SDRAMC	Write enable signal, active-low
DQM0	Output	SDRAMC	I/O data mask enable signal for DQ07 to DQ00
DQM1	Output	SDRAMC	I/O data mask enable signal for DQ15 to DQ08
DQM2	Output	SDRAMC	I/O data mask enable signal for DQ23 to DQ16
DQM3	Output	SDRAMC	I/O data mask enable signal for DQ31 to DQ24

Note 1. The EBCLK and the SDCLK pin functions are shared by the CS area controller (CSC) and the SDRAM area controller (SDRAMC). When using the CSC and the SDRAMC simultaneously, the SDCLK pin function is valid.

Note 2. The A23 to A00 pin functions are shared by the CSC and the SDRAMC.
When using the CSC only:
The A00 and BC0 pin functions share the same pin, and either becomes valid according to the area, with the function being A00 in byte strobe mode and BC0 in single-write strobe mode. Setting the 8-bit external bus width is prohibited in single-write strobe mode.
When using the SDRAMC only:
The A15 to A00 pin functions are valid.
The A00 and DQM1 pin functions share the same pin, and either pin function becomes valid according to the external bus width. When selecting 8-bit bus width, the pin function is A00. When selecting 16-bit bus width, the pin function is DQM1.
When using the CSC and the SDRAMC simultaneously:
The A23 to A16 pin functions are valid for CSC. The A15 to A00 pin functions are shared by the CSC and the SDRAMC. In the SDRAMC functions, the A00 and the DQM1 pin functions work as described.
In the CSC functions, the A00 and the BC0 pin function works as described.

Note 3. The CS0 to CS3 (CSC) and SDRAMC pin functions share the same pin. When using the CSC and the SDRAMC simultaneously, the CS0 to CS3 pin functions are invalid.
Note 4. The WR0 signal and WR signal are identical. The WR0 signal is referred to as WR in single-write strobe mode.

15.2.3 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave interface. For example, if the CPU is fetching an instruction from Code Flash and an operand from MRAM, the DMAC can handle transfers between a peripheral module and the external memory interface at the same time.

Figure 15.3 shows an example of parallel operations. In this example, the CPU uses CPUMAXIBI to access MRC0BI. Furthermore, the DMAC/DTC simultaneously accesses the peripheral bus or the external bus during access to MRC0BI by the CPU.

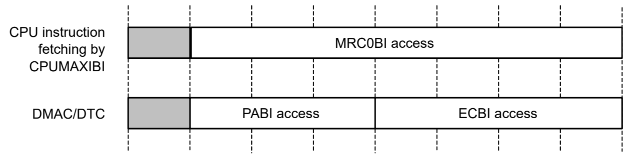

Figure 15.3 Example of parallel operations

15.2.4 Bus Settings

Set up the external bus with the following registers :

- Mode settings :
  CSn Mode Register (CSnMOD)
  CSn Wait Control Register 1 (CSnWCR1)
  CSn Wait Control Register 2 (CSnWCR2)
  CSn Control Register (CSnCR)
  CSn Recovery Cycle Setting Register (CSnREC)
  CS Recovery Cycle Insertion Enable Register (CSRECEN)
- I/O port assignments :
  PmnPFS.PMR = 1 and PmnPFS.PSEL[4:0] = 0x0B
- Frequency of the external bus clock (BCLK) and SDRAM clock (SDCLK) :
  SCKDIVCR register.

See section 20, I/O Ports, for information on PmnPFS and section Clock Generation Function for information on SCKDIVCR.

15.2.5 Restrictions

15.2.5.1 Endianness Constraint

Memory space must be little-endian to execute code of the Arm Cortex-M85 and Arm Cortex-M33core.

Big endian mode has the following restrictions.

- Only CPU0, CPU1, DMAC/DTC0 and DMAC/DTC1 can access to big endian area.
- The Arm Cortex-M85 core and Arm Cortex-M33 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.
- No unaligned access
- Accesses with different sizes to the same address are prohibited.
- 64-bit data access is not possible in the case of areas with big-endian setting.
- The memory type must be 'device memory'. (Sparse-write is prohibited)

- For changing the memory type, see reference [1].
- CPU0 (Cortex-M85 core) cannot access to big-endian area when using M-profile Vector Extension (MVE).

15.2.5.2 Bufferable Write Access

In the following bufferable write access, the write response comes from the midpoint of the bus, not from the endpoint of the write access.

1. CPU0 M-AXI accesses CPU1TCMBI.
2. CPU0 P-AHB accesses any area.
3. CPU1 C-AHB accesses any area.
4. CPU1 S-AHB accesses any area.
5. DMA accesses PABI, PBBI, PIBI, PSBI, CPU0SAHBI and CPU1TCMBI.

If an access violation occurs due to bufferable write access, an error response is not returned to the bus master, but an Interrupt request or Reset request is generated depending on the setting of the BUSOAD register. For more information, see section 15.7.2. Operations When a Bus Error Occurs.

15.2.5.3 Notes on Writing Completion Timing

For the following accesses, a write response is returned to the bus master before the write is completed, regardless of the bufferable attribute.

When writing to MRC0BI, the write response is returned from the write buffer for MRAM, not from the MRAM itself, regardless of the bufferable/non-bufferable setting.

In the write access to ECBI, the write response comes from the CSC/SDRAMC controller when the write access start s to CS/SDRAM regardless of whether it is bufferable or non-bufferable setting.

15.3 Register Descriptions

15.3.1 BUSSARA : Bus Security Attribution Register A

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSA0	Bus Security Attribution A0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSA0 bit (Bus Security Attribution A0)

Security attributes for arbitration control register. The target registers are as follows:

- BUSSABT0<slave>

<slave> = MRE0BI, S0BI, S1BI, S2BI, S3BI, ECBI, OSPI0BI, OSPI1BI, CPU0SAHBI, CPU1TCMBI, PBBI, PABI, PIBI, PSBI

- BUSSABT1MRC0BI

15.3.2 BUSSARB : Bus Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSB0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSB0	Bus Security Attribution B0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSB0 bit (Bus Security Attribution B0)

Security attributes of bus error related registers. The target registers are as follows:

- BUSERRCLR<Master Name>
- MBWERRCLR
- BUSOAD
- BUSOADPT
- BUSIRQEN<Master Name>

<Master Name>: CPU0/CPU1/DMAC0/DMAC1/EDMAC/CEU

15.3.3 BUSSARC : Bus Security Attribution Register C

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSC0	Bus Security Attribution C0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSC0 bit (Bus Security Attribution C0)

Security attributes of registers for bus (SDRAMC/CSC) Control. The target registers are as follows:

- BUS.CSnCR (n = 0 to 7)
- BUS.CSnREC (n = 0 to 7)
- BUS.CSRECEN
- BUS.CSnMOD (n = 0 to 7)
- BUS.CSnWCR1 (n = 0 to 7)
- BUS.CSnWCR2 (n = 0 to 7)
- BUS.SDCCR
- BUS.SDCMOD
- BUS.SDAMOD
- BUS.SDSELF
- BUS.SDRFCR
- BUS.SDRFEN
- BUS.SDICR
- BUS.SDIR
- BUS.SDADR
- BUS.SDTR
- BUS.SDMOD
- BUS.SDSR
- CPSCU.BUSPARC

15.3.4 BUSPARC : Bus Privileged Attribution Register C

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x114

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSPA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	BUSPA0	External bus controller privilege attribution 0: Privileged 1: Unprivileged	R/W

Bit	Symbol	Function	R/W
31:1	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1

BUSPA0 bit (External bus controller privilege attribution)

Privileged attributes of registers for Bus (SDRAMC/CSC) Control. The target registers are as follows:

- BUS.CSnCR (n = 0 to 7)
- BUS.CSnREC (n = 0 to 7)
- BUS.CSRECEN
- BUS.CSnMOD (n = 0 to 7)
- BUS.CSnWCR1 (n = 0 to 7)
- BUS.CSnWCR2 (n = 0 to 7)
- BUS.SDCCR
- BUS.SDCMOD
- BUS.SDAMOD
- BUS.SDSELF
- BUS.SDRFCR
- BUS.SDRFEN
- BUS.SDICR
- BUS.SDIR
- BUS.SDADR
- BUS.SDTR
- BUS.SDMOD
- BUS.SDSR

15.3.5 CSnCR : CSn Control Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x802 + 0x10 × n (n = 0 to 7)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MPXEN	—	—	—	EMODE	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0*1	0	0	0	0	0*1

Bit	Symbol	Function	R/W
0	EXENB	Operation Enable 0: Disable operation 1: Enable operation	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	BSIZE[1:0]	External Bus Width Select 0 0: 16-bit bus space 0 1: 32-bit bus space 1 0: 8-bit bus space Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	EMODE	Endian Mode 0: Little endian 1: Big endian	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W
12	MPXEN	Address/Data Multiplexed I/O Interface Select 0: Separate bus interface is selected for area n. 1: Address/data multiplexed I/O interface is selected for area n.	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. When n = 0, the value after reset is 1.

The BSIZE, EMODE, and MPXEN bits are not rewritable when the EXENB bit is set to 1. It is possible to rewrite at the same time as the EXENB bit.

Do not attempt to write the CSnCR register while the external bus is being accessed.

EXENB bit (Operation Enable)

The EXENB bit enables operation of the associated CS area. On MCU reset, operation is enabled (EXENB = 1) only for area 0. Operation in other areas is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When the CSC and SDRAMC are in use at the same time, EBCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (External Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

When the address/data multiplexed I/O interface is set with the MPXEN bit, it is prohibited to set it in 32-bit bus space, and the operation is not guaranteed when it is set.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the associated area. See section 15.2.5.1. Endianness Constraint for details.

MPXEN bit (Address/Data Multiplexed I/O Interface Select)

The MPXEN bit specifies separate bus interface or address/data multiplexed I/O interface of each area.

15.3.6 CSnREC : CSn Recovery Cycle Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x80A + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	WRCV[3:0]				—	—	—	—	RRCV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	RRCV[3:0]	Read Recovery 0 0 0 0: No recovery cycle is inserted. 0 0 0 1: 1 recovery cycle is inserted. 0 0 1 0: 2 recovery cycles are inserted. 0 0 1 1: 3 recovery cycles are inserted. 0 1 0 0: 4 recovery cycles are inserted. 0 1 0 1: 5 recovery cycles are inserted. 0 1 1 0: 6 recovery cycles are inserted. 0 1 1 1: 7 recovery cycles are inserted. 1 0 0 0: 8 recovery cycles are inserted. 1 0 0 1: 9 recovery cycles are inserted. 1 0 1 0: 10 recovery cycles are inserted. 1 0 1 1: 11 recovery cycles are inserted. 1 1 0 0: 12 recovery cycles are inserted. 1 1 0 1: 13 recovery cycles are inserted. 1 1 1 0: 14 recovery cycles are inserted. 1 1 1 1: 15 recovery cycles are inserted.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
11:8	WRCV[3:0]	Write Recovery 0 0 0 0: No recovery cycle is inserted. 0 0 0 1: 1 recovery cycle is inserted. 0 0 1 0: 2 recovery cycles are inserted. 0 0 1 1: 3 recovery cycles are inserted. 0 1 0 0: 4 recovery cycles are inserted. 0 1 0 1: 5 recovery cycles are inserted. 0 1 1 0: 6 recovery cycles are inserted. 0 1 1 1: 7 recovery cycles are inserted. 1 0 0 0: 8 recovery cycles are inserted. 1 0 0 1: 9 recovery cycles are inserted. 1 0 1 0: 10 recovery cycles are inserted. 1 0 1 1: 11 recovery cycles are inserted. 1 1 0 0: 12 recovery cycles are inserted. 1 1 0 1: 13 recovery cycles are inserted. 1 1 1 0: 14 recovery cycles are inserted. 1 1 1 1: 15 recovery cycles are inserted.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

When the CSnCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Do not attempt to write to the CSnREC register while the external bus is being accessed.

When the preceding bus access is from a separate bus, CSnREC is valid when the recovery cycle insertion is enabled in the Separate Bus Recovery Cycle Insertion Enable bit (RCVENi (i = 0 to 7)) in CSRECEN. When the preceding bus access is an address/data multiplexed bus access, CSnREC is valid when the recovery cycle insertion is enabled with the Multiplexed Bus Recovery Cycle Insertion Enable bit (RCVENMj (j = 0 to 7)) in CSRECEN. For more information, see section 15.5.4. Insertion of Recovery Cycles.

RRCV[3:0] bits (Read Recovery)

The RRCV[3:0] bits specify the number of recovery cycles inserted after a read access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000 is set, 1 to 15 recovery cycles are inserted when:

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.

WRCV[3:0] bits (Write Recovery)

The WRCV[3:0] bits specify the number of recovery cycles inserted after a write access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000 is set, 1 to 15 recovery cycles are inserted when:

- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

15.3.7 CSRECEN : CS Recovery Cycle Insertion Enable Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x880

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RCVENM7	RCVENM6	RCVENM5	RCVENM4	RCVENM3	RCVENM2	RCVENM1	RCVENM0	RCVEN7	RCVEN6	RCVEN5	RCVEN4	RCVEN3	RCVEN2	RCVEN1	RCVEN0
Value after reset:	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	RCVEN0	Separate Bus Recovery Cycle Insertion Enable 0 0: Disabled 1: Enabled	R/W
1	RCVEN1	Separate Bus Recovery Cycle Insertion Enable 1 0: Disabled 1: Enabled	R/W
2	RCVEN2	Separate Bus Recovery Cycle Insertion Enable 2 0: Disabled 1: Enabled	R/W
3	RCVEN3	Separate Bus Recovery Cycle Insertion Enable 3 0: Disabled 1: Enabled	R/W
4	RCVEN4	Separate Bus Recovery Cycle Insertion Enable 4 0: Disabled 1: Enabled	R/W
5	RCVEN5	Separate Bus Recovery Cycle Insertion Enable 5 0: Disabled 1: Enabled	R/W
6	RCVEN6	Separate Bus Recovery Cycle Insertion Enable 6 0: Disabled 1: Enabled	R/W
7	RCVEN7	Separate Bus Recovery Cycle Insertion Enable 7 0: Disabled 1: Enabled	R/W
8	RCVENM0	Multiplexed Bus Recovery Cycle Insertion Enable 0 0: Disabled 1: Enabled	R/W
9	RCVENM1	Multiplexed Bus Recovery Cycle Insertion Enable 1 0: Disabled 1: Enabled	R/W
10	RCVENM2	Multiplexed Bus Recovery Cycle Insertion Enable 2 0: Disabled 1: Enabled	R/W
11	RCVENM3	Multiplexed Bus Recovery Cycle Insertion Enable 3 0: Disabled 1: Enabled	R/W
12	RCVENM4	Multiplexed Bus Recovery Cycle Insertion Enable 4 0: Disabled 1: Enabled	R/W

Bit	Symbol	Function	R/W
13	RCVENM5	Multiplexed Bus Recovery Cycle Insertion Enable 5 0: Disabled 1: Enabled	R/W
14	RCVENM6	Multiplexed Bus Recovery Cycle Insertion Enable 6 0: Disabled 1: Enabled	R/W
15	RCVENM7	Multiplexed Bus Recovery Cycle Insertion Enable 7 0: Disabled 1: Enabled	R/W

Note: S-TYPE-3, P-TYPE-3

Writes are ignored if the CSnCR.EXENB bit is set to 1. Write CSRECEN only when all CSnCR.EXENB bits are “0”.

Do not attempt to write the CSRECEN register while the external bus is being accessed. For more information on insertion recovery cycles, see section 15.5.4. Insertion of Recovery Cycles.

RCVENi Bit (Separate Bus Recovery Cycle Insertion Enable i) (i = 0 to 7)

This bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

RCVENMj Bit (Multiplexed Bus Recovery Cycle Insertion Enable j) (j = 0 to 7)

This bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

Table 15.6 Access type associations with the RCVENn bits

Access type	External Address Space	Insertion of recovery cycles	Associated bits (Separate/ Multiplexed)
Read access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN0/RCVENM0
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN1/RCVENM1
Write access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN2/RCVENM2
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN3/RCVENM3
Read access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN4/RCVENM4
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN5/RCVENM5
Write access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN6/RCVENM6
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN7/RCVENM7

15.3.8 CSnMOD : CSn Mode Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x002 + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRMOD	—	—	—	—	—	PWENB	PRENB	—	—	—	—	EWENB	—	—	WRMOD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WRMOD	Write Access Mode Select 0: Byte strobe mode 1: Single-write strobe mode	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	EWENB	External Wait Enable 0: Disabled 1: Enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	PRENB	Page Read Access Enable 0: Disabled 1: Enabled	R/W
9	PWENB	Page Write Access Enable 0: Disabled 1: Enabled	R/W
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	PRMOD	Page Read Access Mode Select 0: Normal access compatible mode 1: External data read continuous assertion mode	R/W

Note: S-TYPE-3, P-TYPE-3

When the CSnCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Do not write to the CSnMOD register while access to the CSn area is in progress.

WRMOD bit (Write Access Mode Select)

The WRMOD bit selects the write access operating mode. Writing 0 selects byte strobe mode, in which data writes are controlled by the WRn signals (n = 0 to 3) associated with the respective byte positions. Writing 1 selects single-write strobe mode, in which data writes are controlled by the BCn (n = 0 to 3) and WR signals associated with the respective byte positions.

Note: Setting the external bus width to 8 bits is prohibited in single-write strobe mode.

Table 15.7 Control signals for write access mode

Mode	Pin name							
Write access mode	**WR3**	**WR2**	**WR1**	**WR0/WR**	**BC3**	**BC2**	**BC1**	**BC0**
Byte strobe mode	✓	✓	✓	✓ (WR0)	—	—	—	—
Single write strobe mode	—	—	—	✓ (WR)	✓	✓	✓	✓

✓ : Enabled, — : Disabled

EWENB bit (External Wait Enable)

The EWENB bit enables external waits. Writing 0 disables the WAIT signal. Writing 1 selects external wait and allows the WAIT signal to control the number of waits per cycle. In this state, wait cycles are inserted when the WAIT signal is low.

PRENB bit (Page Read Access Enable)

The PRENB bit enables page read accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PRENB should not be set to enable page read accesses. Page read accesses are not supported in the address/data multiplexed I/O interface.

PWENB bit (Page Write Access Enable)

The PWENB bit enables page write accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PWENB should not be set to enable page write accesses. Page write accesses are not supported in the address/data multiplexed I/O interface.

PRMOD bit (Page Read Access Mode Select)

The PRMOD bit selects the operating mode for page read accesses. Writing 0 selects normal access compatible mode, in which the RD signal is negated and an RD assert wait is inserted each time a unit of data is read. When there is no RD assert wait, the RD signal is negated only in the final transfer of the external bus access.

Writing 1 selects external data read continuous assertion mode, in which an RD assert wait is inserted and the RD signal is continuously asserted during the wait.

15.3.9 CSnWCR1 : CSn Wait Control Register 1 (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x004 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	CSRWAIT[4:0]					—	—	—	CSWWAIT[4:0]				
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CSPRWAIT[2:0]			—	—	—	—	—	CSPWWAIT[2:0]		
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
2:0	CSPWWAIT[2:0]	Page Write Cycle Wait Select*1 0 0 0: No wait is inserted. 0 0 1: Wait with a length of 1 clock cycle is inserted. 0 1 0: Wait with a length of 2 clock cycles is inserted. 0 1 1: Wait with a length of 3 clock cycles is inserted. 1 0 0: Wait with a length of 4 clock cycles is inserted. 1 0 1: Wait with a length of 5 clock cycles is inserted. 1 1 0: Wait with a length of 6 clock cycles is inserted. 1 1 1: Wait with a length of 7 clock cycles is inserted.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
28:24	CSRWAIT[4:0]	Normal Read Cycle Wait Select 0 0 0 0 0: No wait is inserted. 0 0 0 0 1: Wait with a length of 1 clock cycle is inserted. 0 0 0 1 0: Wait with a length of 2 clock cycles is inserted. 0 0 0 1 1: Wait with a length of 3 clock cycles is inserted. ⋮ 1 1 1 0 1: Wait with a length of 29 clock cycles is inserted. 1 1 1 1 0: Wait with a length of 30 clock cycles is inserted. 1 1 1 1 1: Wait with a length of 31 clock cycles is inserted.	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. The CSPWWAIT[2:0] value is only valid when the CSnMOD.PWENB bit is set to 1.
Note 2. The CSPRWAIT[2:0] value is only valid when the CSnMOD.PRENB bit is set to 1.

When the CSnCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Do not attempt to write to the CSnWCR1 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in (1) Constraints on using separate bus interface or (2) Constraints on using address/data multiplexed bus interface, according to the bus interface used.

CSPWWAIT[2:0] bits (Page Write Cycle Wait Select)

The CSPWWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page write cycle. The setting is enabled when the CSnMOD.PWENB bit is set to 1.

Note: The settings must satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

CSPRWAIT[2:0] bits (Page Read Cycle Wait Select)

The CSPRWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page read cycle. The setting is enabled when the CSnMOD.PRENB bit is set to 1.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

CSWWAIT[4:0] bits (Normal Write Cycle Wait Select)

The CSWWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal write cycle or page write cycle.

Note: The settings must satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

CSRWAIT[4:0] bits (Normal Read Cycle Wait Select)

The CSRWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal read cycle or page read cycle.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

15.3.10 CSnWCR2 : CSn Wait Control Register 2 (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x008 + 0x10 × n

R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

When the CSnCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Do not attempt to write to the CSnWCR2 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in (1) Constraints on using separate bus interface or (2) Constraints on using address/data multiplexed bus interface, according to the bus interface used.

CSROFF[2:0] bits (Read Access CS Extension Cycle Select)

The CSROFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (RD signal negated) until the CSn signal (n = 0 to 7) is negated in read access mode.

CSWOFF[2:0] bits (Write Access CS Extension Cycle Select)

The CSWOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 3) negated) until the CSn signal (n = 0 to 7) is negated in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

WDOFF[2:0] bits (Write Data Output Extension Cycle Select)

The WDOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 3) negated) until the write-data output is complete in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

AWAIT[1:0] bits (Address Cycle Wait Select)

AWAIT[1:0] bits specify the number of wait cycles to be inserted into an address output cycle with the address/data multiplexed I/O interface.

Note: CSnWCR2.CSON[2:0] value ≤ CSnWCR2.AWAIT[1:0] value.

For read access, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

For write access, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value and CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

RDON[2:0] bits (RD Assert Wait Select)

RDON[2:0] bits specify the number of wait cycles to be inserted before the RD signal is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

For page read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

WRON[2:0] bits (WR Assert Wait Select)

The WRON[2:0] bits specify the number of wait cycles to be inserted before the WRn signal (n = 0 to 3) is asserted.

Note: For normal write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

For page write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

WDON[2:0] bits (Write Data Output Wait Select)

The WDON[2:0] bits specify the number of wait cycles to be inserted before the write data is output.

Note: For normal write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

For page write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

CSON[2:0] bits (CS Assert Wait Select)

The CSON[2:0] bits specify the number of wait cycles to be inserted before the CSn signal (n = 0 to 7) is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

For page read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

For normal write access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

For page write access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.AWAIT[1:0] value.

15.3.11 SDCCR : SDC Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EXENB	Operation Enable 0: Disable 1: Enable	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	BSIZE[1:0]	SDRAM Bus Width Select 0 0: 16-bit bus space 0 1: 32-bit bus space 1 0: 8-bit bus space Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The BSIZE bits is not rewritable when the EXENB bit is set to 1. It is possible to rewrite at the same time as the EXENB bit.

EXENB bit (Operation Enable)

The EXENB bit enables the operation of the SDRAM address space. On reset, operation is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When CSC and SDRAMC are in use at the same time, EBCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (SDRAM Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

15.3.12 SDCMOD : SDC Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EMODE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EMODE	Endian Mode 0: Little endian 1: Big endian	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

When the SDCCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Writing to this register is possible only once after release from reset. The second and subsequent writes to this register are prohibited. SDRAM access operation is not guaranteed if more than one write access is attempted.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the SDRAM address space. See section 15.2.5.1. Endianness Constraint for details.

15.3.13 SDAMOD : SDRAM Access Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BE	Continuous Access Enable 0: Continuous access is disabled 1: Continuous access is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

When the SDCCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Set SDAMOD while the conditions listed in Table 15.31 are satisfied. The operation is not guaranteed if this register is set while these conditions are not satisfied.

BE bit (Continuous Access Enable)

This bit enables or disables continuous access to the SDRAM access space.

15.3.14 SDSELF : SDRAM Self-Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SFEN	SDRAM Self-Refresh Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the SDSELF register only when the conditions in Table 15.31 are satisfied. Otherwise, operation of SDRAM I/F function is not guaranteed.

SFEN bit (SDRAM Self-Refresh Enable)

The SFEN bit controls the self-refresh operation. Setting this bit to 1 initiates an auto-refresh cycle, after which self-refresh begins. Clearing this bit to 0 ends the self-refresh, and auto-refresh resumes. When the bit is set to 1, the write value takes effect when the self-refresh operation starts. When it is cleared to 0, if the self-refresh operation has already finished, the write value takes effect before the auto-refresh starts. If the self-refresh operation is in progress, the write value takes effect after the self-refresh is finished and before the auto-refresh is started.

15.3.15 SDRFCR : SDRAM Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC14

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	REFW[3:0]				RFC[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
11:0	RFC[11:0]	Auto-Refresh Request Interval Setting 0 0 0 0 0 0 0 0 0 0 0 0: Setting prohibited 0 0 0 0 0 0 0 0 0 0 0 1: 2 cycles 0 0 0 0 0 0 0 0 0 0 1 0: 3 cycles ⋮ 1 1 1 1 1 1 1 1 1 1 1 1: 4096 cycles	R/W
15:12	REFW[3:0]	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting 0 0 0 0: 1 cycle 0 0 0 1: 2 cycles 0 0 1 0: 3 cycles 0 0 1 1: 4 cycles 0 1 0 0: 5 cycles 0 1 0 1: 6 cycles 0 1 1 0: 7 cycles 0 1 1 1: 8 cycles 1 0 0 0: 9 cycles 1 0 0 1: 10 cycles 1 0 1 0: 11 cycles 1 0 1 1: 12 cycles 1 1 0 0: 13 cycles 1 1 0 1: 14 cycles 1 1 1 0: 15 cycles 1 1 1 1: 16 cycles	R/W

Note: S-TYPE-3, P-TYPE-3

RFC[11:0] bits (Auto-Refresh Request Interval Setting)

The RFC[11:0] bits specify the auto-refresh request interval. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If auto-refresh is enabled, the write value takes effect after the end of the auto-refresh cycles. The refresh counter uses SDCLK.

REFW[3:0] bits (Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting)

The REFW[3:0] bits specify the number of auto-refresh cycles and the number of self-refresh clearing cycles. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If an auto-refresh cycle is in progress, the value written to the bits while auto-refresh is enabled takes effect after the cycle completes.

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. This means they must sometimes wait until the access completes for the auto-refresh interval to be extended. Set the RFC[11:0] bits to an auto-refresh request interval value that meets the specifications of the SDRAM being used. Additionally, make sure to set the auto-refresh request interval to a duration longer than the auto-refresh cycle. The auto-refresh interval cannot be automatically adjusted when the frequency is changed during operation. In this case, perform a self-refresh operation and set the auto-refresh interval to an appropriate value for the frequency again.

15.3.15.1 Auto-refresh Request Interval and RFC Set Value

The SDRAMC (SDRAM area controller) includes a 12-bit refresh counter that generates auto-refresh requests at fixed intervals. Use the following equation to calculate the set value for the RFC[11:0] bits from the auto-refresh request interval:

RFC = (Auto-refresh request interval / SDCLK cycle) - 1

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. They must wait until the access completes. However, the counter value is updated regardless of whether or not the request was accepted. If two or more auto-refresh requests are generated while the SDRAM is being accessed, the second and subsequent requests are ignored.

15.3.16 SDRFEN : SDRAM Auto-Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC16

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RFEN	Auto-Refresh Operation Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

RFEN bit (Auto-Refresh Operation Enable)

The RFEN bit enables auto-refresh operation. When auto-refresh is required, set the RFEN bit to 1 before SDRAM access.

If the RFEN bit is set to 0 when auto-refresh is enabled, the RFEN bit becomes 0 after the auto-refresh cycle ends, and the auto-refresh operation stops. The interval at which refresh requests are generated is determined by the value in the Auto-Refresh Request Interval Setting bits (RFC[11:0]) in the SDRAM Refresh Control Register (SDRFCR).

15.3.17 SDICR : SDRAM Initialization Sequence Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	INIRQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	INIRQ	Initialization Sequence Start 0: Invalid 1: Start initialization sequence	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

INIRQ bit (Initialization Sequence Start)

Setting the INIRQ bit to 1 starts the SDRAM initialization sequence and automatically sets the Initialization Status bit (INIST) in the SDRAM Status Register (SDSR) to 1. The INIST bit clears automatically after the initialization sequence ends. The value written to the INIRQ bit is not retained.

Initialize the SDRAM according to the procedure in section 15.6.11.1. SDRAMC Access Procedure.

Note: Set the INIRQ bit to start the SDRAM initialization sequence only when the conditions in Table 15.31 are satisfied. Otherwise, operation is not guaranteed.

15.3.18 SDIR : SDRAM Initialization Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC24

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	PRC[2:0]			ARFC[3:0]				ARFI[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ARFI[3:0]	Initialization Auto-Refresh Interval 0 0 0 0: 3 cycles 0 0 0 1: 4 cycles 0 0 1 0: 5 cycles 0 0 1 1: 6 cycles 0 1 0 0: 7 cycles 0 1 0 1: 8 cycles 0 1 1 0: 9 cycles 0 1 1 1: 10 cycles 1 0 0 0: 11 cycles 1 0 0 1: 12 cycles 1 0 1 0: 13 cycles 1 0 1 1: 14 cycles 1 1 0 0: 15 cycles 1 1 0 1: 16 cycles 1 1 1 0: 17 cycles 1 1 1 1: 18 cycles	R/W
7:4	ARFC[3:0]	Initialization Auto-Refresh Count 0 0 0 0: Setting prohibited 0 0 0 1: 1 time 0 0 1 0: 2 times 0 0 1 1: 3 times 0 1 0 0: 4 times 0 1 0 1: 5 times 0 1 1 0: 6 times 0 1 1 1: 7 times 1 0 0 0: 8 times 1 0 0 1: 9 times 1 0 1 0: 10 times 1 0 1 1: 11 times 1 1 0 0: 12 times 1 1 0 1: 13 times 1 1 1 0: 14 times 1 1 1 1: 15 times	R/W

Bit	Symbol	Function	R/W
10:8	PRC[2:0]	Initialization Precharge Cycle Count 0 0 0: 3 cycles 0 0 1: 4 cycles 0 1 0: 5 cycles 0 1 1: 6 cycles 1 0 0: 7 cycles 1 0 1: 8 cycles 1 1 0: 9 cycles 1 1 1: 10 cycles	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

ARFI[3:0] bits (Initialization Auto-Refresh Interval)

The ARFI[3:0] bits specify the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.

ARFC[3:0] bits (Initialization Auto-Refresh Count)

The ARFC[3:0] bits specify the number of times auto-refresh is to be performed in the SDRAM initialization sequence.

PRC[2:0] bits (Initialization Precharge Cycle Count)

The PRC[2:0] bits specify the number of precharged cycles in the SDRAM initialization sequence.

Note: Implement settings that satisfy the specifications of the connected SDRAM before starting the initialization sequence.

15.3.19 SDADR : SDRAM Address Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MXC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	MXC[1:0]	Address Multiplex Select 0 0: 8-bit shift 0 1: 9-bit shift 1 0: 10-bit shift 1 1: 11-bit shift	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

When the SDCCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

Set SDADR only when the conditions in Table 15.31 are satisfied. Otherwise, operation is not guaranteed.

MXC[1:0] bits (Address Multiplex Select)

The MXC[1:0] bits select the size of the shift towards the lower half of the row address in row address/column address multiplexing. For details, see Table 15.36.

15.3.20 SDTR : SDRAM Timing Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	RAI[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RCD[1:0]		RP[2:0]			WR	—	—	—	—	—	CL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
2:0	CL[2:0]	SDRAMC Column Latency 0 0 0: Setting prohibited 0 0 1: 1 cycle 0 1 0: 2 cycles 0 1 1: 3 cycles Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	WR	Write Recovery Interval 0: 1 cycle 1: 2 cycles	R/W
11:9	RP[2:0]	Row Precharge Interval 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: 8 cycles	R/W
13:12	RCD[1:0]	Row Column Latency 0 0: 1 cycle 0 1: 2 cycles 1 0: 3 cycles 1 1: 4 cycles	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
18:16	RAI[2:0]	Row Active Interval 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: Setting prohibited	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

When the SDCCR.EXENB bit is set to 1, if a write access is made, the write is ignored.

The SDTR register specifies the timing for read and write accesses to the SDRAM. For more information, see section 15.6.11.3. Timing Register Settings and Access Timing.

Set the SDTR register only when the conditions in Table 15.31 are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

CL[2:0] bits (SDRAMC Column Latency)

The CL[2:0] bits specify the column latency of the SDRAM controller. This setting only affects the latency setting on the SDRAM controller side. To specify the column latency for externally connected SDRAM, use the SDRAM mode register (SDMOD).

WR bit (Write Recovery Interval)

The WR bit specifies the interval that must elapse between the SDRAM write command (WRIT) and deactivation (PRE).

RP[2:0] bits (Row Precharge Interval)

The RP[2:0] bits specify the minimum number of cycles that must elapse between the SDRAM deactivation command (PRE) and the next valid command.

RCD[1:0] bits (Row Column Latency)

The RCD[1:0] bits set the SDRAM row-column latency.

RAI[2:0] bits (Row Active Interval)

The RAI[2:0] bits specify the minimum interval that must elapse between the SDRAM row activation command (ACTV) and deactivation (PRE). The value specified in these bits must be less than or equal to the sum of the row column latency (RCD[1:0]) and column latency (CL[2:0]) settings.

15.3.21 SDMOD : SDRAM Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC48

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MR[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	MR[14:0]	Mode Register Setting Writing to these bits triggers a mode register set command	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The SDMOD register specifies the value to be written to the SDRAM mode register. Writing to SDMOD causes a mode register set command to be issued automatically to the SDRAM. Set SDMOD only when the conditions in Table 15.31 are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

MR[14:0] bits (Mode Register Setting)

Writing to the MR[14:0] bits causes a mode register set command to be issued to the SDRAM, and the setting in the MR[14:0] bits is output to the lower bits of the address. For more information, see section 15.6.9. Setting the Mode Register.

Write the mode register according to the procedure in section 15.6.11.1. SDRAMC Access Procedure.

Note: 1. Set a burst length of 1 for the SDRAM. Operation is not guaranteed with any other burst length setting.
2. The SDRAM column latency must match the setting in the SDRAMC Column Latency setting (CL[2:0]) in the SDRAM Timing Register (SDTR). Operation is not guaranteed if the latency settings do not agree.
3. Make sure the SRFST, INIST, and MRSST status bits in the SDRAM Status Register (SDSR) are all 0.

15.3.22 SDSR : SDRAM Status Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SRFST	INIST	—	—	MRSST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRSST	Mode Register Setting Status 0: Mode register setting not in progress 1: Mode register setting in progress	R
2:1	—	These bits are read as 0.	R
3	INIST	Initialization Status 0: Initialization sequence not in progress 1: Initialization sequence in progress	R
4	SRFST	Self-Refresh Transition/Recovery Status 0: Transition/recovery not in progress 1: Transition/recovery in progress	R
7:5	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

MRSST bit (Mode Register Setting Status)

When set to 1, the MRSST bit indicates that SDRAM mode register setting is in progress.

INIST bit (Initialization Status)

When set to 1, the INIST bit indicates that the SDRAM initialization sequence is in progress.

SRFST bit (Self-Refresh Transition/Recovery Status)

When set to 1, the SRFST bit indicates that a transition to or recovery from a self-refresh operation is in progress for the SDRAM. The in progress interval begins when the bits in Table 15.8 are written to and lasts until the associated commands are issued.

Note: Execution of a self-refresh, initialization sequence, or mode register setting can only be performed when all the status bits are 0. Do not rewrite the registers and bits in Table 15.8 when any of the SRFST, INIST, or MRSST status bits is set to 1.

Table 15.8 Registers and bits requiring status bit checking

Function	Register	Bits
Self-refresh	SDSELF	SFEN
Initialization sequence	SDICR	INIRQ
Mode register setting	SDMOD	MR[14:0]

15.3.23 BUSSABT0<slave> : Bus Slave Arbitration Control Register 0

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1208 (BUSSABT0MRE0BI), 0x1220 (BUSSABT0S0BI), 0x1228 (BUSSABT0S1BI), 0x1230 (BUSSABT0S2BI), 0x1238 (BUSSABT0S3BI), 0x1250 (BUSSABT0ECBI), 0x1258 (BUSSABT0OSPI0BI), 0x1260 (BUSSABT0OSPI1BI), 0x1268 (BUSSABT0CPU0SAHBI), 0x1270 (BUSSABT0CPU1TCMBI), 0x1278 (BUSSABT0PBBI), 0x1280 (BUSSABT0PABI), 0x1288 (BUSSABT0PIBI), 0x1290 (BUSSABT0PSBI)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ARBS	Arbitration Select for <slave> 0: Fixed priority 1: Round-robin	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

This register specifies the arbitration method for <slave> buses.

(<slave> = MRE0BI, S0BI, S1BI, S2BI, S3BI, ECBI, OSPI0BI, OSPI1BI, CPU0SAHBI, CPU1TCMBI, PBBI, PABI, PIBI, PSBI)

ARBS bit (Arbitration Select for <slave>)

The ARBS bit specifies the priority between bus masters connected to <slave>. For fixed priority, see Table 15.9. For round-robin, see Table 15.10.

Table 15.9 Bus priorities with fixed-priority arbitration (ARBS = 0)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT0MRE0BI	MRE0BI	GRAPH > EDMAC > DMAC/DTC0 > DMAC/DTC1 > CPU0MAXI > CPU1CAHB
BUSSABT0SnBI (n = 0 to 3) BUSSABT0ECBI BUSSABT0OSPI0BI	S0BI, S1BI, S2BI, S3BI ECBI OSPI0BI	GRAPH > EDMAC > DMAC/DTC0 > DMAC/DTC1 > CPU0MAXI > CPU1SAHB
BUSSABT0OSPI1BI	OSPI1BI	GRAPH > EDMAC > DMAC/DTC0 > DMAC/DTC1 > CPU0MAXI > CPU1SAHB > CPU1CAHB
BUSSABT0CPU0SAHBI	CPU0SAHBI	DMAC/DTC0 (R > W) > DMAC/DTC1 (R >W) > CPU1SAHB
BUSSABT0CPU1TCMBI	CPU1TCMBI	(DMAC/DTC0 (R > W) >DMAC/DTC1 (R > W)) > CPU0MAXI
BUSSABT0PBBI BUSSABT0PABI BUSSABT0PIBI BUSSABT0PSBI	PBBI PABI PIBI PSBI	DMAC/DTC0 (R > W) > DMAC/DTC1 (R > W) > CPU0PAHB > CPU1SAHB

Note 1. “>” represents left side has high priority.

Table 15.10 Bus priorities with round-robin arbitration (ARBS = 1) (1 of 2)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT0MRE0BI	MRE0BI	GRAPH ↔ EDMAC ↔ DMAC/DTC0 ↔ DMAC/DTC1 ↔ CPU0MAXI ↔ CPU1CAHB

Table 15.10 Bus priorities with round-robin arbitration (ARBS = 1) (2 of 2)

Bus Slave Arbitration Control Register	Slave interface	Priority order[*1]
BUSSABT0SnBI (n = 0 to 3) BUSSABT0ECBI BUSSABT0OSPI0BI	S0BI, S1BI, S2BI, S3BI ECBI OSPI0BI	GRAPH ↔ EDMAC ↔ DMAC/DTC0 ↔ DMAC/DTC1 ↔ CPU0MAXI ↔ CPU1SAHB
BUSSABT0OSPI1BI	OSPI1BI	GRAPH ↔ EDMAC ↔ DMAC/DTC0 ↔ DMAC/DTC1 ↔ CPU0MAXI ↔ CPU1SAHB ↔ CPU1CAHB
BUSSABT0CPU0SAHBI	CPU0SAHBI	DMAC/DTC0 ↔ DMAC/DTC1 ↔ CPU1SAHB
BUSSABT0CPU1TCMBI	CPU1TCMBI	(DMAC/DTC0 ↔ DMAC/DTC1) ↔ CPU0MAXI
BUSSABT0PBBI BUSSABT0PABI BUSSABT0PIBI BUSSABT0PSBI	PBBI PABI PIBI PSBI	DMAC/DTC0 ↔ DMAC/DTC1 ↔ CPU0PAHB ↔ CPU1SAHB

Note 1. "↔" represents round-robin.

15.3.24 BUSSABT1MRC0BI : Bus Slave Arbitration Control Register 1

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1200

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ARBS[1:0]	Arbitration Select 0 0: Fixed priority 0 1: Setting prohibited 1 0: Combination of round-robin and fixed priority 1 1: Round-robin	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

This register specifies the arbitration method for MRC0BI.

ARBS[1:0] bits (Arbitration Select)

The ARBS bits specify the priority between bus masters connected to Code MRAM. For the priority of each setting, see Table 15.11, Table 15.12 and Table 15.13.

Table 15.11 Bus priorities with fixed-priority arbitration (ARBS[1:0] = 00b)

Bus Slave Arbitration Control Register	Slave interface	Priority order[*1]
BUSSABT1MRC0BI	MRC0BI	EDMAC > DMAC/DTC0 > DMAC/DTC1 > CPU0MAXI > CPU1CAHB

Note 1. ">" represents left side has high priority.

Table 15.12 Bus priorities with combination of round-robin and fixed priority arbitration (ARBS[1:0] = 10b)

Bus Slave Arbitration Control Register	Slave interface	Priority order[*1]
BUSSABT1MRC0BI	MRC0BI	(EDMAC ↔ DMAC/DTC0 ↔ DMAC/DTC1) > CPU0MAXI > CPU1CAHB

Note 1. "↔" represents round-robin. ">" represents left side has high priority.

Table 15.13 Bus priorities with round-robin arbitration (ARBS[1:0] = 11b)

Bus Slave Arbitration Control Register	Slave interface	Priority order[*1]
BUSSABT1MRC0BI	MRC0BI	(EDMAC ↔ DMAC/DTC0 ↔ DMAC/DTC1) ↔ CPU0MAXI ↔ CPU1CAHB

Note 1. "↔" represents round-robin.

15.3.25 BUSERRSTAT<Master Name> : BUS Error Status Register

(Master Name: CPU0, CPU1, DMAC0, DMAC1, EDMAC, CEU)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A00 (BUSERRSTATCPU0), 0x1A10 (BUSERRSTATCPU1), 0x1A20 (BUSERRSTATDMAC0), 0x1A30 (BUSERRSTATDMAC1), 0x1A50 (BUSERRSTATEDMAC), 0x1AA0 (BUSERRSTATCEU)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MSERRSTAT	ILERRSTAT	MMERRSTAT	—	—	SLERRSTAT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLERRSTAT	Slave Bus Error Status 0: No error occurred 1: Error occurred	R
2:1	—	These bits are read as 0.	R
3	MMERRSTAT	Master MPU Error Status 0: No error occurred 1: Error occurred	R
4	ILERRSTAT	Illegal Address Access Error Status 0: No error occurred 1: Error occurred	R
5	MSERRSTAT	Master Security Attribution Unit Error Status 0: No error occurred 1: Error occurred	R
7:6	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is initialized after returning from Software Standby mode while the debugger is connected.

This register is cleared by reset other than Bus error reset, Common memory reset, and CPU local memory reset.

When the bus error occurred to plural at the same time, the STAT bit becomes effective only 1 by the following order of priority. The left side is high priority.

Master Security attribution unit Error > Slave bus Error, Slave TrustZone filter Error > Master-MPU Error> Illegal Address Access Error

After one of MSERRSTAT, ILERRSTAT, MMERRSTAT, and SLERRSTAT are set once, MSERRSTAT, ILERRSTAT, MMERRSTAT, and SLERRSTAT are not renewed.

SLERRSTAT bit (Slave Bus Error Status)

When slave error or TrustZone filter error occurs by bus, BUSERRSTAT.SLERRSTAT<Master Name>.SLERRSTAT is set to 1.

There is clearing conditions.

- Set BUSERRCLR<Master Name>.SLERRCLR to 1.

Slave error is an error that occurs on a slave such as Time-out.

The SLERRSTAT bit is not set when debugger violate.

For detail of slave error that occurs by bus, see section 15.7. Bus Error Monitoring Section.

MMERRSTAT bit (Master MPU Error Status)

When master mpu error occurs by bus, BUSERRSTAT<Master Name>.MMERRSTAT is set to 1.

There is clearing conditions.

- Set BUSERRCLR<Master Name>.MMERRCLR to 1.

For detail of master mpu error that occurs by bus, see section 16, Memory Protection Unit (MPU).

ILERRSTAT bit (Illegal Address Access Error Status)

When illegal address access error occurs by bus and write access to MRE0BI occurs, BUSERRSTAT<Master Name>.ILERRSTAT is set to 1.

There is clearing conditions.

- Set BUSERRCLR<Master Name>.ILLERRCLR to 1.

The ILERRSTAT bit is not set when debugger violate.

For detail of illegal address access error that occurs by bus, see section 15.7. Bus Error Monitoring Section.

MSERRSTAT bit (Master Security Attribution Unit Error Status)

When MSAU error occurs by bus, BUSERRSTAT<Master Name>.MSERRSTAT is set to 1.

There is clearing conditions.

- Set BUSERRCLR<Master Name>.MSERRCLR to 1.

For detail of MSAU error that occurs by bus, see section 15.7. Bus Error Monitoring Section.

Table 15.14 Associations between bus types and registers

n	Bus master type	Bus Error Status Register (0x1A00 + 0x10 × n)	Bus Error Clear Register (0x1A04 + 0x10 × n)	Bus Error IRQ Enable Register (0x1A08 + 0x10 × n)
0	CPU0	BUSERRSTATCPU0	BUSERRCLRCPU0	BUSIRQENCPU0
1	CPU1	BUSERRSTATCPU1	BUSERRCLRCPU1	BUSIRQENCPU1
2	DMAC/DTC0	BUSERRSTATDMAC0	BUSERRCLRDMAC0	BUSIRQENDMAC0
3	DMAC/DTC1	BUSERRSTATDMAC1	BUSERRCLRDMAC1	BUSIRQENDMAC1
5	EDMAC	BUSERRSTATEDMAC	BUSERRCLREDMAC	BUSIRQENEDMAC
10	CEU	BUSERRSTATCEU	BUSERRCLRCEU	BUSIRQENCEU

15.3.26 BUSERRCLR<Master Name> : BUS Error Clear Register

(Master Name: CPU0, CPU1, DMAC0, DMAC1, EDMAC, CEU)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A04 (BUSERRCLRCPU0), 0x1A14 (BUSERRCLRCPU1), 0x1A24 (BUSERRCLRDMAC0), 0x1A34 (BUSERRCLRDMAC1), 0x1A54 (BUSERRCLREDMAC), 0x1AA4 (BUSERRCLRCEU)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MSERRCLR	ILERRCLR	MMERRCLR	—	—	SLERRCLR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLERRCLR	Slave Bus Error Clear 0: No effect 1: Clear the BUSERRSTAT<Master Name>.SLERRSTAT flag	W
2:1	—	The write value should be 0.	W
3	MMERRCLR	Master MPU Error Clear 0: No effect 1: Clear the BUSERRSTAT<Master Name>.MMERRSTAT flag	W
4	ILERRCLR	Illegal Address Access Error Clear 0: No effect 1: Clear the BUSERRSTAT<Master Name>.ILERRSTAT flag	W
5	MSERRCLR	Master Security Attribution Unit Error Clear 0: No effect 1: Clear the BUSERRSTAT<Master Name>.MSERRSTAT flag	W
7:6	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-2

When writing 1 to BUSERRCLR<Master Name>, stop the bus access that causes an error in the corresponding bus master.

15.3.27 BUSOAD : BUS Operation After Detection Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BWERROAD	SLERROAD	ILERROAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ILERROAD	Illegal address access error operation after detection All bus master 0: Interrupt 1: Reset	R/W
1	SLERROAD	Slave bus error operation after detection All bus master 0: Interrupt 1: Reset	R/W
2	BWERROAD	Bufferable write error operation after detection All bus master 0: Interrupt 1: Reset	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: When an error occurs in speculative access issued by CPU0 and CPU1, interrupt or a system reset request may occur depending on the setting values of the OAD bit and BUSIRQEN<Master Name>.EN. In that case, it can be avoided by using Arm-MPU. See section 15.8. References[3] for the detail.

ILERROAD bit (Illegal address access error operation after detection)

The OAD bit specify operation when the illegal address access error is detected. When OAD bit is 0, error response is returned and if BUSIRQEN<Master Name>.EN = 1, and interrupt request is generated. When OAD bit is 1, error response is returned and reset request is generated.

SLERROAD bit (Slave bus error operation after detection)

The OAD bit specify operation when the slave bus error is detected. When OAD bit is 0, error response is returned and if BUSIRQEN<Master Name>.EN = 1, and interrupt request is generated. When OAD bit is 1, error response is returned and reset request is generated.

BWERROAD bit (Bufferable write error operation after detection)

The OAD bit specify operation when the bufferable write error is detected.

When OAD bit is 0, interrupt request is generated.

When OAD bit is 1, reset request is generated.

Interrupts due to bus errors (including bufferable errors) can also be used as NMI. See the section 14, Interrupt Controller Unit (ICU) NMIER register specifications for details.

15.3.28 BUSOADPT : BUS Operation After Detection Protect Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: BUSOAD register writing is possible. 1: BUSOAD register writing is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key code These bits enable or disable writes to the PROTECT bit.	W

Note: S-TYPE-3, P-TYPE-2

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

BUSOADPT.PROTECT controls the following registers:

- BUSOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

KEY[7:0] bits (Key code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.29 MBWERRSTAT : Master Bufferable Write Error Status Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1B00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MBWERR19	—	MBWERR17	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MBWERR9	MBWERR8	—	—	—	—	—	—	MBWERR1	MBWERR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MBWERR0	Master Bufferable Write Error 0: No bufferable write error in Master #0 1: Bufferable write error occurs in Master #0	R
1	MBWERR1	Master Bufferable Write Error 0: No bufferable write error in Master #1 1: Bufferable write error occurs in Master #1	R
7:2	—	These bits are read as 0.	R
8	MBWERR8	Master Bufferable Write Error 0: No bufferable write error in Master #8 1: Bufferable write error occurs in Master #8	R
9	MBWERR9	Master Bufferable Write Error 0: No bufferable write error in Master #9 1: Bufferable write error occurs in Master #9	R
16:10	—	These bits are read as 0.	R
17	MBWERR17	Master Bufferable Write Error 0: No bufferable write error in Master #17 1: Bufferable write error occurs in Master #17	R
18	—	This bit is read as 0.	R
19	MBWERR19	Master Bufferable Write Error 0: No bufferable write error in Master #19 1: Bufferable write error occurs in Master #19	R
31:20	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is initialized after returning from Software Standby mode while the debugger is connected.
Note: This register is cleared by reset other than Bus error reset, Common memory reset, and CPU local memory reset.

MBWERRn bit (Master Bufferable Write Error n)

When bufferable write access error occurs, MBWERRSTAT. MBWERRn is set to 1.

There are clearing conditions.

- Set MBWERRCLR. MBWECLRn to 1

If an error is detected on the slave side, the error flag of the master with the access path is set at the same time in addition to the flag of the master that issued the access.

Table 15.15 lists the registers associated with each bus master type.

Table 15.15 Associations between bus master types and bits

Bus master type	Master bufferable write error status bit	Master bufferable write error clear bit
CPU0	MBWERR0	MBWECLR0
CPU1	MBWERR1	MBWECLR1
DMAC/DTC0	MBWERR8	MBWECLR8
DMAC/DTC1	MBWERR9	MBWECLR9
EDMAC	MBWERR17	MBWECLR17
CEU	MBWERR19	MBWECLR19

15.3.30 MBWERRCLR : Master Bufferable Write Error Clear Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1B08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MBWECLR19	—	MBWECLR17	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MBWECLR9	MBWECLR8	—	—	—	—	—	—	MBWECLR1	MBWECLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MBWECLR0	Master Bufferable Write Error Clear 0: No effect 1: Clear the MBWERRSTAT.MBWERR0 flag	W
1	MBWECLR1	Master Bufferable Write Error Clear 0: No effect 1: Clear the MBWERRSTAT.MBWERR1 flag	W
7:2	—	The write value should be 0.	W
8	MBWECLR8	Master Bufferable Write Error Clear 0: No effect 1: Clear the MBWERRSTAT.MBWERR8 flag	W
9	MBWECLR9	Master Bufferable Write Error Clear 0: No effect 1: Clear the MBWERRSTAT.MBWERR9 flag	W
16:10	—	These bits are read as 0.	W
17	MBWECLR17	Master Bufferable Write Error Clear 0: No effect 1: Clear the MBWERRSTAT.MBWERR17 flag	W
18	—	The write value should be 0.	W
19	MBWECLR19	Master Bufferable Write Error Clear 0: No effect 1: Clear the MBWERRSTAT.MBWERR19 flag	W
31:20	—	The write value should be 0.	W

Note: S-TYPE-3, P-TYPE-2

15.3.31 BUSIRQEN<Master Name> : BUS Error Interrupt Enable Register

(Master Name: CPU0, CPU1, DMAC0, DMAC1, EDMAC, CEU)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A08 (BUSIRQENCPU0), 0x1A18 (BUSIRQENCPU1), 0x1A28 (BUSIRQENDMAC0), 0x1A38 (BUSIRQENDMAC1), 0x1A58 (BUSIRQENEDMAC), 0x1AA8 (BUSIRQENCEU)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EN	Interrupt enable after bus error detected Bus interrupt request permission setting to ICU when a bus error (except Master Bufferable Write Error) occurs. 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

When writing 1 to BUSIRQEN<Master Name>, stop the bus access that causes an error in the corresponding bus master.

EN bit (Interrupt enable after bus error detected)

To output a bus error interrupt request to the ICU due to an error, select the interrupt in the OAD setting corresponding to each error, and enable the interrupt request with this bit. The setting of this bit does not depend on the output a bus error interrupt request due to Master Bufferable Write Error.

15.4 Endian and Data Alignment

The external bus has a data alignment function to control which byte of the data bus (D31 to D24, D23 to D16, D15 to D08, D07 to D00) is used when accessing the external address space (the CS and SDRAM areas). Alignment is based on the bus specifications of the area to be accessed (8-bit, 16-bit, or 32-bit bus space), the data size, and the endian order.

15.4.1 Data Alignment Control for the CS Area

15.4.1.1 32-Bit Bus Space

When a 32-bit width is selected for a bus space by the BSIZE[1:0] bits in CSnCR, the address buses A23 to A2 are enabled to output address signals in units of 32 bits, and the address buses A1 and A0 are disabled (always output low).

When byte strobe mode is selected (the WRMOD bit = 0 in CSnMOD), the WR0 to WR3 pins are enabled. The BC0 to BC3 pins are not used.

When single-write strobe mode is selected (the WRMOD bit = 1 in CSnMOD), only the WR0 pin is enabled and always outputs the low level during write access, regardless of the data size. The WR1 to WR3 pins are invalid (always output high). The valid byte position is indicated by the BC0 to BC3 pins.

In 32-bit bus space, the valid positions of data external to the MCU and of control signals differ according to whether the endian is big or little.

Table 15.16 Data alignment (little-endian) in 32-bit bus space

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	WR3/BC3	WR2/BC2	WR1/BC1	WR0/BC0
						RD			
						Data bus			
						D31 D24	D23 D16	D15 D8	D7 D0
8 bits	4n	One	First	8 bits	4n				7 0
	4n + 1	One			4n			7 0	
	4n + 2	One	First	8 bits	4n		7 0		
	4n + 3	One			4n	7 0			
16 bits	4n	One	First	16 bits	4n			15 8	7 0
	4n + 2	One	First	16 bits	4n	15 8	7 0		
32 bits	4n	One	First	32 bits	4n	31 24	23 16	15 8	7 0
64 bits	4n	Two	First	32 bits	4n	31 24	23 16	15 8	7 0
			Second	32 bits	4n + 4	63 56	55 48	47 40	39 32

Table 15.17 Data alignment (big-endian) in 32-bit bus space

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	WR3/BC3	WR2/BC2	WR1/BC1	WR0/BC0
						RD			
						Data bus			
						D31 D24	D23 D16	D15 D8	D7 D0
8 bits	4n	One	First	8 bits	4n	7 0			
	4n + 1	One			4n		7 0		
	4n + 2	One	First	8 bits	4n			7 0	
	4n + 3	One			4n				7 0
16 bits	4n	One	First	16 bits	4n	15 8	7 0		
	4n + 2	One	First	16 bits	4n			15 8	7 0
32 bits	4n	One	First	32 bits	4n	31 24	23 16	15 8	7 0

15.4.1.2 16-Bit Bus Space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, address buses A23 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low).

When byte strobe mode is selected (WRMOD = 0 in CSnMOD), the WR0 and WR1 pins are enabled, and the WR2 and WR3 pins are disabled (fixed high). The BC0 to BC3 pins are not used.

When single-write strobe mode is selected (WRMOD = 1 in CSnMOD), only the WR0 pin is enabled, and it always outputs low during write access, regardless of the data size. The WR1 to WR3 pins are invalid (always outputs high). The valid byte position is indicated by the BC0 and BC1 pins.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Table 15.18 and Table 15.19.

Page access can occur for accesses to data in 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary and causes no change in the BC0 and BC1 signals. The conditions in which page access occurs are indicated by the letter (p) in Table 15.18 and Table 15.19.

Table 15.18 Data alignment (little-endian) in 16-bit bus space

							WR1/BC1	WR0/BC0
							RD	
							Data bus	
Data size	**Accessed address**	**Number of accesses**	**Bus cycle**	**Unit of data**	**Address**		**D15 D08**	**D07 D00**
8 bits	4n	One	First	8 bits	4n			7 0
	4n + 1	One	First	8 bits	4n		7 0	
	4n + 2	One	First	8 bits	4n + 2			7 0
	4n + 3	One	First	8 bits	4n + 2		7 0	
16 bits	4n	One	First	16 bits	4n		15 8	7 0
	4n+2	One	First	16 bits	4n + 2		15 8	7 0
32 bits	4n	Two	First	16 bits	4n		15 8	7 0
			Second	16 bits	4n + 2	(p)	31 24	23 16
64 bits	4n	Four	First	16 bits	4n		15 8	7 0
			Second	16 bits	4n + 2	(p)	31 24	23 16
			Third	16 bits	4n + 4		47 40	39 32
			Forth	16 bits	4n + 6	(p)	63 56	55 48

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

Table 15.19 Data alignment (big-endian) in 16-bit bus space

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		WR1/BC1 RD Data bus D15 … D08	WR0/BC0 RD Data bus D07 … D00
8 bits	4n	One	First	8 bits	4n		7 … 0	
	4n + 1	One	First	8 bits	4n			7 … 0
	4n + 2	One	First	8 bits	4n + 2		7 … 0	
	4n + 3	One	First	8 bits	4n + 2			7 … 0
16 bits	4n	One	First	16 bits	4n		15 … 8	7 … 0
	4n+2	One	First	16 bits	4n + 2		15 … 8	7 … 0
32 bits	4n	Two	First	16 bits	4n		31 … 24	23 … 16
			Second	16 bits	4n + 2	(p)	15 … 8	7 … 0

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

15.4.1.3 8-Bit Bus Space

When an 8-bit bus space is selected by the BSIZE[1:0] bits in CSnCR, the address buses A23 to A0 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0# pin is valid regardless of write access mode, and always outputs the low level during write access. The WR1# to WR3# pins and the BC0# to BC3# pins are not used.

Page access can occur in access to data in 16-, 32- or 64-bit units. Specifically, page access can occur when an access does not spread over a 32-bit boundary. The conditions in which page access occurs are indicated by the letter (p) in Table 15.20 and Table 15.21.

In 8-bit bus space, the valid positions of data external to the MCU are D7 to D0 and WR0# is used as the control signal, regardless of the endian mode.

Table 15.20 Data alignment (little-endian) in 8-bit bus space

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		Data bus (RD) WR1/BC1 D15 – D08	Data bus (RD) WR0/BC0 D07 – D00
8 bits	4n	One	First	8 bits	4n			7 0
	4n + 1	One	First	8 bits	4n + 1			7 0
	4n + 2	One	First	8 bits	4n + 2			7 0
	4n + 3	One	First	8 bits	4n + 3			7 0

			Second	8 bits	4n + 1	(p)		23 16
			Third	8 bits	4n + 2	(p)		15 8
			Fourth	8 bits	4n + 3	(p)		7 0

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

15.4.2 Data Alignment Control for the SDRAM Area

15.4.2.1 32-Bit Bus Space

When a 32-bit width is selected for a bus space by the BSIZE[1:0] bits in SDCCR, the address buses A26 to A02 are enabled to output address signals in units of 32 bits, and the address buses A01 and A00 are disabled (always output low). The valid byte position is indicated by DQM0 to DQM3 signals.

The external data is accessed using the D31 to D24, D23 to D16, D15 to D8, and D7 to D0 pins. Data can be accessed in either 8-bit, 16-bit, or 32-bit units at a time.

In 32-bit bus space, the valid positions of data external to the chip and of SDRAM control signals (DQM0 to DQM3) differ according to whether the endian is big or little. Table 15.22 and Table 15.23 show data alignment control when the endian is little and big, respectively.

When the SDAMOD.BE bit is set to 1, consecutive access may occur under the following conditions.

- When access to the same row address is accessed consecutively.
- Access with a data size of 64 bits that does not cross 64-bit address boundaries.

The conditions in which consecutive access occurs are indicated by the letter "(r1)" in Table 15.22 and Table 15.23.

Table 15.22 Data alignment (little-endian) in 32-bit bus space

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	DQM3	DQM2	DQM1	DQM0
						WE

						D31 D24	D23 D16	D15 D8	D7 D0
8 bits	4n	One	First	8 bits	4n (r1)	7 0			
	4n + 1	One			4n (r1)		7 0		
	4n + 2	One	First	8 bits	4n (r1)			7 0	
	4n + 3	One			4n (r1)				7 0

Table 15.23 Data alignment (big-endian) in 32-bit bus space (2 of 2)

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	DQM3	DQM2	DQM1	DQM0
						WE			
						Data bus			
						D31 … D24	D23 … D16	D15 … D8	D7 … D0
16 bits	4n	One	First	16 bits	4n (r1)	15 … 8	7 … 0		
	4n + 2	One	First	16 bits	4n (r1)			15 … 8	7 … 0
32 bits	4n	One	First	32 bits	4n (r1)	31 … 24	23 … 16	15 … 8	7 … 0

15.4.2.2 16-Bit Bus Space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low). The valid byte position is indicated by the DQM0 and DQM1 signals.

External data is accessed using the DQ15 to DQ08 and DQ07 to DQ00 pins and DQM0 and DQM1 control signals. Data can be accessed in either 8-bit or 16-bit units at a time.

When the SDAMOD.BE bit is set to 1, consecutive access may occur under the following conditions.

- When access to the same row address is accessed consecutively.
- Access with a data size of 32 bits
- Access with a data size of 64 bits that does not cross 64-bit address boundaries.
- Access with a data size of 64 bits that does not cross 32-bit address boundaries.
- The conditions in which consecutive access occurs are indicated by the letter "(r1)" in Table 15.24 and Table 15.25.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Table 15.24 and Table 15.25.

Table 15.24 Data alignment in 16-bit bus space with little-endian order for SDRAM area (1 of 2)

	4n + 1	One	First	8 bits	4n	(r1)			7	0
	4n + 2	One	First	8 bits	4n + 2	(r1)	7	0		
	4n + 3	One	First	8 bits	4n + 2	(r1)			7	0
16 bits	4n	One	First	16 bits	4n	(r1)	15	8	7	0
	4n+2	One	First	16 bits	4n + 2	(r1)	15	8	7	0
32 bits	4n	Two	First	16 bits	4n	(r1)	31	24	23	16
			Second	16 bits	4n + 2	(r1)	15	8	7	0

15.4.2.3 8-Bit Bus Space

When an 8-bit width is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A00 are enabled to output address signals in 8-bit units.

External data is accessed using the DQ07 to DQ00 pins and DQM0 control signal. Eight-bit data is accessed in single 8-bit access, 16-bit data with two 8-bit accesses, and 32-bit data with four 8-bit accesses.

When the SDAMOD.BE bit is set to 1, consecutive access may occur under the following conditions.

- When access to the same row address is accessed consecutively.
- Access with a data size of 16 / 32bit.
- Access with a data size of 64 bits that does not cross 64-bit address boundaries.
- Access with a data size of 64 bits that does not cross 32-bit address boundaries.

Table 15.26 and Table 15.27 show the case where continuous access occurs (r1).

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Table 15.26 and Table 15.27.

15.5 Operation of CS Area Controller

15.5.1 Separate Bus

This section describes the periods shown in the timing diagrams. The CS area controller (CSC) operates in synchronization with the external bus clock, BCLK. Operation cycles, such as wait cycles, specified in the CSC register, are counted on BCLK. In the following description, the frequencies of BCLK and EBCLK pin output are the same, unless otherwise noted. Access through the external bus starts at the same point as the output of a rising edge on the EBCLK pin. However, if the external bus clock, BCLK, and the output on the EBCLK pin are at different frequencies, the wait settings can cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See Figure 15.11 to Figure 15.15. If recovery cycles are inserted for bus access, the setting for the number of recovery cycles can also cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See Figure 15.33.

Tw1 to Twn (Clock Cycles of Wait for a Normal Read Cycle or Normal Write Cycle)

The period from Tw1 to Twn is the number of clock cycles from the start of access through the external bus clock to 1 cycle before the strobe signal is valid. The number of cycles is selectable from 0 to 31. Within this period, the timing of CSn, RD, and WRn assertion (driving the signals low) is determined by the respective wait settings. The wait periods are controlled by the following bits in the CSn Wait Control Register 2 (CSnWCR2).

- CS Assert Wait Select bits (CSON)
- RD Assert Wait Select bits (RDON)
- WR Assert Wait Select bits (WRON)
- Write-Data Output Wait Select bits (WDON)

The number of clock cycles for each of these wait periods is selectable as a value from 0 to 7, counted from the start of external bus access. The selectable number of cycles is also within the overall number of clock cycles required for waiting to read or write.

Tend (Clock Cycle where the Strobe Signal is Valid)

Tend is the next clock cycle after completion of the wait period for a normal cycle of read or write, or for a cycle of page read or page write. If the wait select bit for these cycles is 0, bus access starts on the clock cycle where the strobe signal is valid. The RD and WRn signals are negated in the next clock cycle. For a read access, the clock cycle where the strobe signal is valid is where the data to be read is sampled. If an external wait is enabled, the wait signal is sampled on the cycle where the strobe signal is valid. The bus cycle is extended if the wait signal is low. The bus cycle completes in the next clock cycle if the wait signal is high. Tend indicates the cycle where sampling of the wait signal starts.

After the first cycle where the strobe signal is valid during page access, second and subsequent page access operations (see Tpw1 to Tpwn (Page-Read Cycle Wait or Page-Write Cycle Wait)) start in the next cycle, except during write access with a setting other than 0 for write-data output extension clock cycles (see Tdw1 to Tdwn (Write-Data Output Extension Clock

Cycles)). If the setting for the RD or WR assertion wait is any value other than 0, the RD and WRn signals are negated in the next clock cycle. If the setting is 0, assertion continues. Additionally, the CSn signal continues to be asserted rather than negated.

Tn1 to Tnm (Clock Cycles of CS Extension)

For normal access, Tn1 to Tnm represent the clock cycles of the period following the cycle where the strobe signal is valid (Tend) up to negation of the CSn signal. For read or write access, the negation timing can be controlled by the read-access CS Extension Cycle Select bits (CSROFF) and the write-access CS Extension Cycle Select bits (CSWOFF) in the CSn Wait Control Register 2 (CSnWCR2). The number of cycles is counted from the cycle following the cycle where the strobe signal is valid.

For page access, Tn1 to Tnm represent the clock cycles of the period following the last cycle where the strobe signal is valid up to negation of the CSn signal.

For write access, setting the Write Data Output Extension Cycle Select bits (WDOFF) controls extension of the period where the address and output data is valid.

Tdw1 to Tdwn (Write-Data Output Extension Clock Cycles)

For write access, if the wait setting for the write-data output extension is any value other than 0, the specified clock cycles are inserted from the cycle following the cycle where the strobe signal is valid (Tend).

For normal access, this period is inserted within the clock cycle period for CS extension (Tn1 to Tnm).

For page access, this period is inserted within the clock cycle period where the strobe signal is valid and subsequent page accesses, or within the clock cycle period for the CS extension (Tn1 to Tnm). Valid address and data output are extended over this period, and the WRn signal is negated.

Tpw1 to Tpwn (Page-Read Cycle Wait or Page-Write Cycle Wait)

For the second and subsequent bus cycles during page access, the values for a page-read cycle wait or page-write cycle wait are used instead of the settings for a normal read or write cycle wait. The settings in the WR Assert Wait Select bits become enabled in the same way as for the first access. The RD assertion control operation depends on the page read access mode setting (the PRMOD bit in CSnMOD) as follows:

- CSnMOD.PRMOD = 0: A wait for RD assertion is inserted in the same way as for the first access, and the RD signal is negated
- CSnMOD.PRMOD = 1: Although a wait for RD assertion is inserted in the same way as for normal-access compatibility mode, the RD signal continues to be asserted over this period.

Tr1 to Trn (Recovery Cycles)

Recovery cycles can be inserted from the point where a bus cycle is complete (CSn signal negation). The number of recovery cycles can be controlled by setting the Read Recovery (RRCV) or Write Recovery (WRCV) bits in the CSn Recovery Cycle Register (CSnREC). Both numbers of recovery cycles are counted from the end of a bus cycle (CSn negation) and can be selected from 0 to 15 cycles. For more information, see section 15.5.4. Insertion of Recovery Cycles.

(1) Normal Access

When the PRENB and PWENB bits in CSnMOD are set to 0 to disable page read and page write access, all bus accesses take the form of normal read and write operations. Even when these bits are set to 1 to enable page read and page write access, bus access other than page access takes the form of normal read and write operations. Figure 15.4 to Figure 15.6 show the normal access operations.

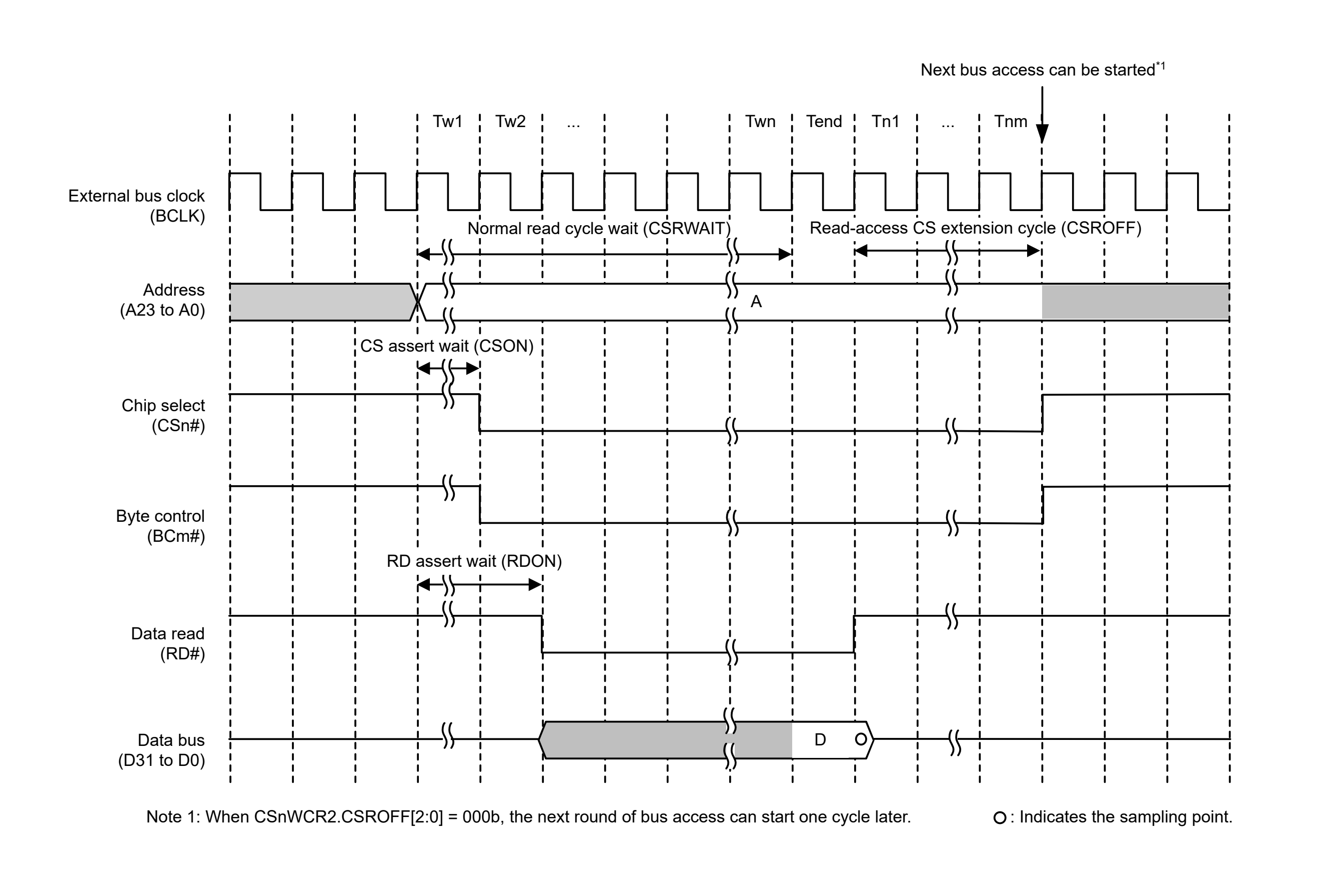

Figure 15.4 Bus timing for normal read operation (n = 0 to 7, m = 0 to 3)

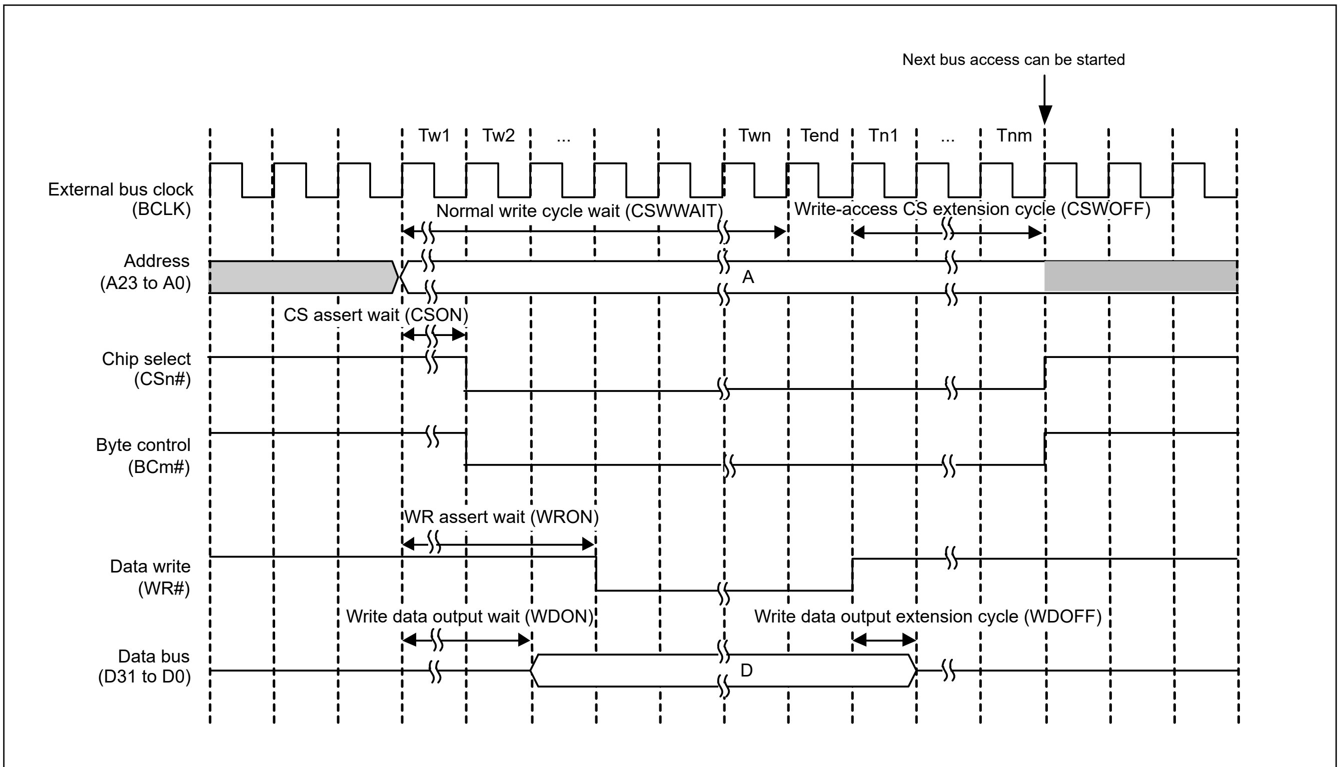

Figure 15.5 Bus timing for normal write operation in single-write strobe mode (n = 0 to 7, m = 0 to 3)

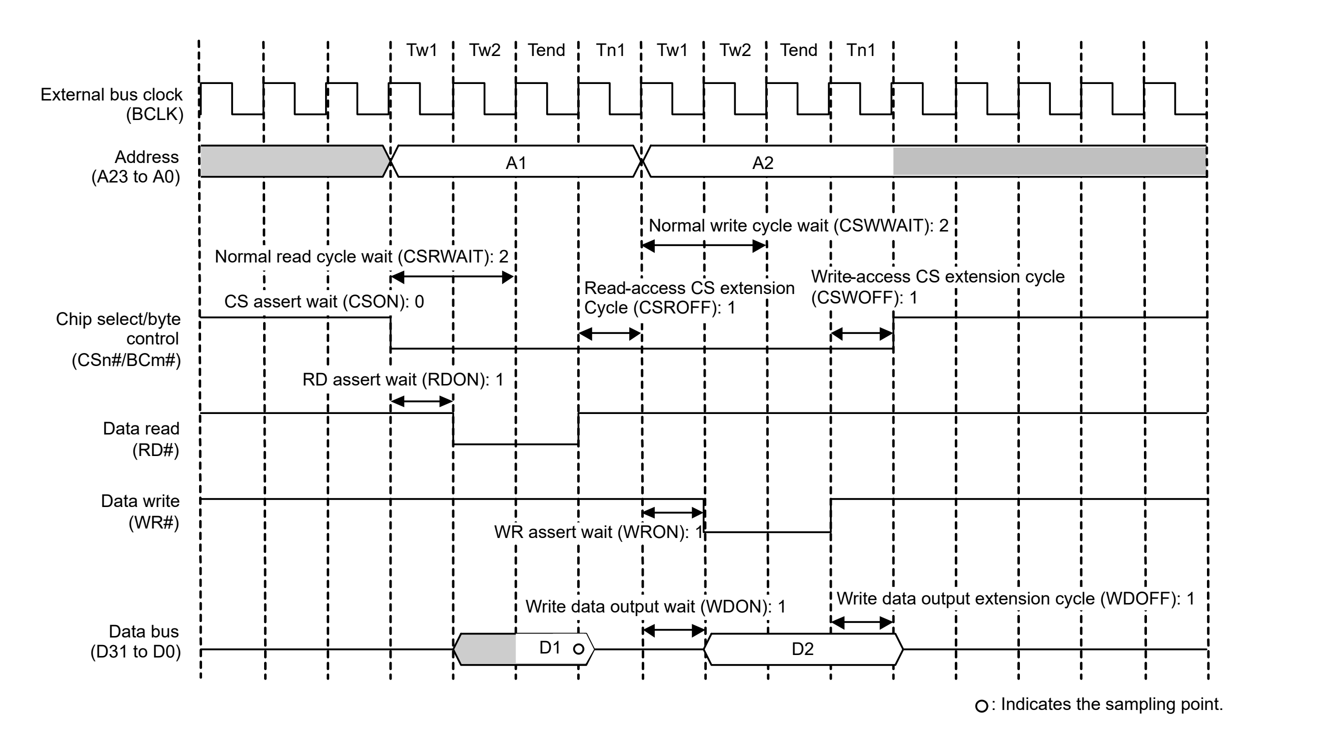

Figure 15.6 Example of normal access operation for read and write (n = 0 to 7, m = 0 to 3)

When two or more rounds of external bus access are required in response to a single request for transfer from a bus master, normal access operations are repeated. See Tw1 to Twn (Clock Cycles of Wait for a Normal Read Cycle or Normal Write Cycle) to Tdw1 to Tdwn (Write-Data Output Extension Clock Cycles). Figure 15.7 and Figure 15.8 show examples of operations when two rounds of bus access are generated in response to a single transfer request. If the recovery cycle insertion condition is satisfied, recovery cycles Tr1 to Trn (Recovery Cycles) are also inserted in the second and subsequent external bus accesses. See Figure 15.31.

The values in the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

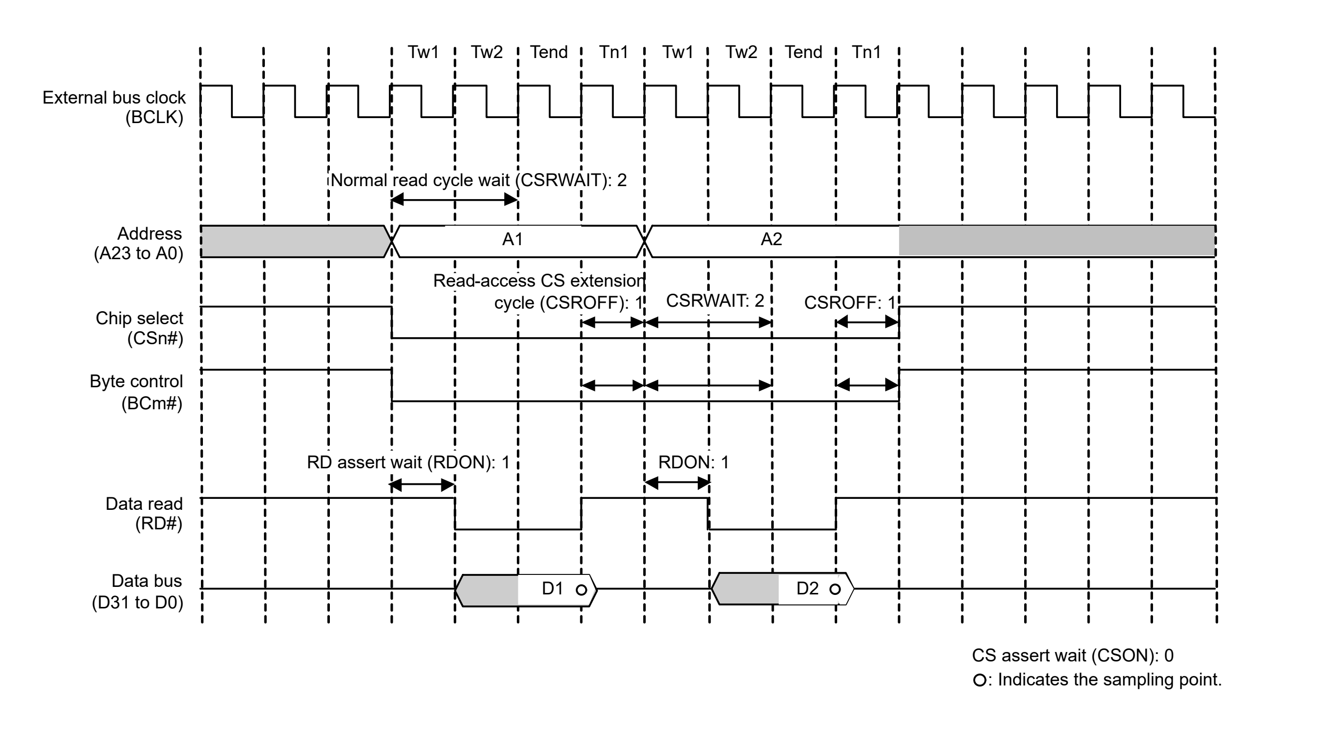

Figure 15.7 Example of normal read operation when two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0 to 3)

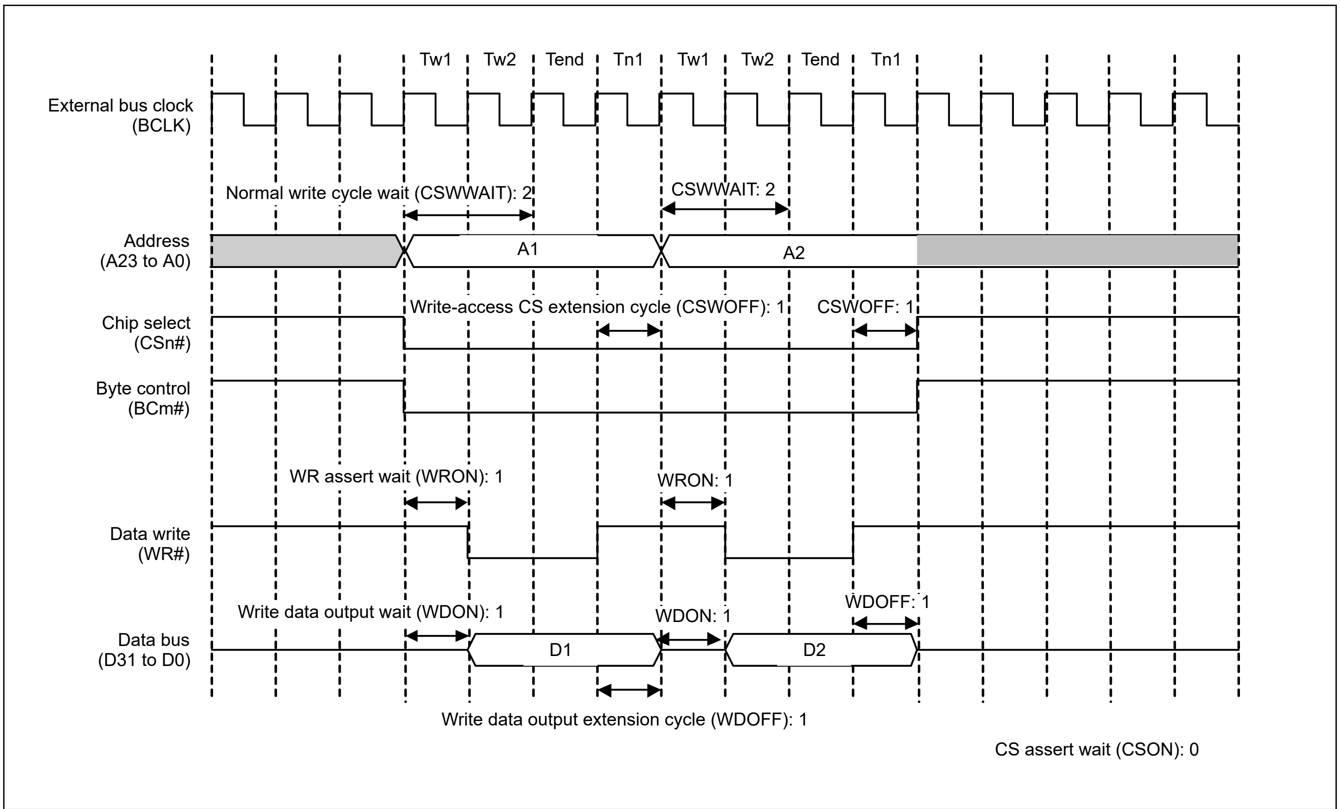

Figure 15.8 Example of normal write operation when two rounds of bus access are generated in response to a single transfer request in single-write strobe mode (n = 0 to 7, m = 0 to 3)

Figure 15.9 and Figure 15.10 show examples of normal read and write accesses to a 32-bit bus space in 16 bits.

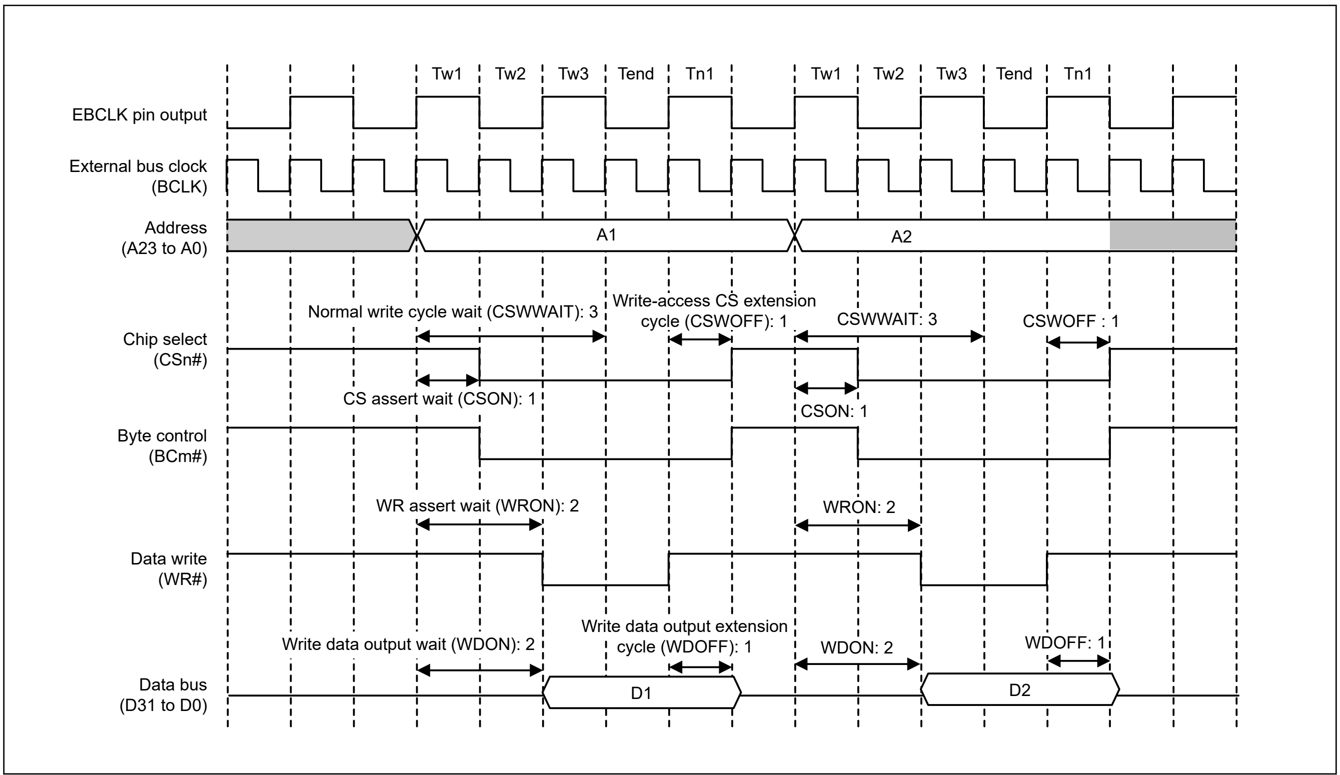

Figure 15.13 Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit (n = 0 to 7, m = 0 to 3)

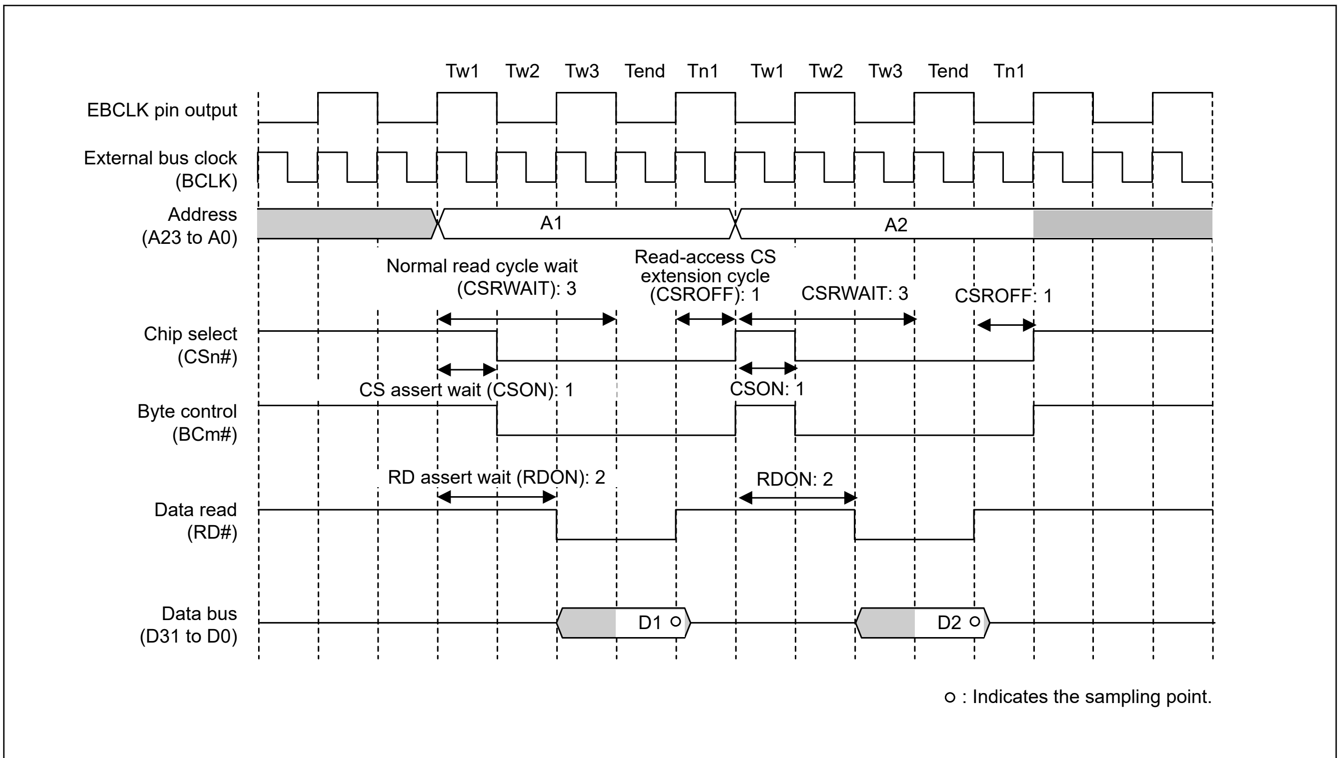

Figure 15.14 Example of normal read operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0 to 3)

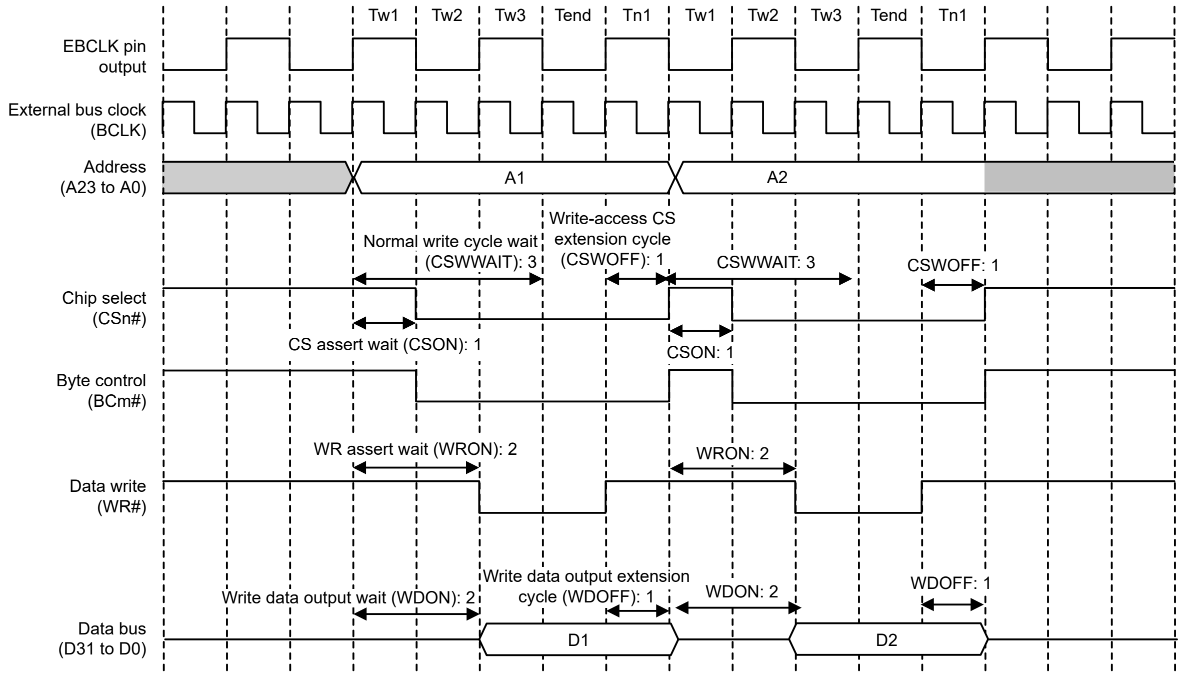

Figure 15.15 Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0 to 3)

(2) Page Access

When the PRENB and PWENB bits in CSnMOD are set to 1 to enable page read and page write access, the bus access for page access operations becomes page read and write. Page access can only occur when two or more rounds of external bus access are required for a single transfer request from the bus master. However, normal access is made when split accesses are not aligned or access extends across the 32-bit boundary. See Table 15.18 to Table 15.21 for the conditions under which page access occurs.

Figure 15.16 and Figure 15.17 show examples of page access operations.

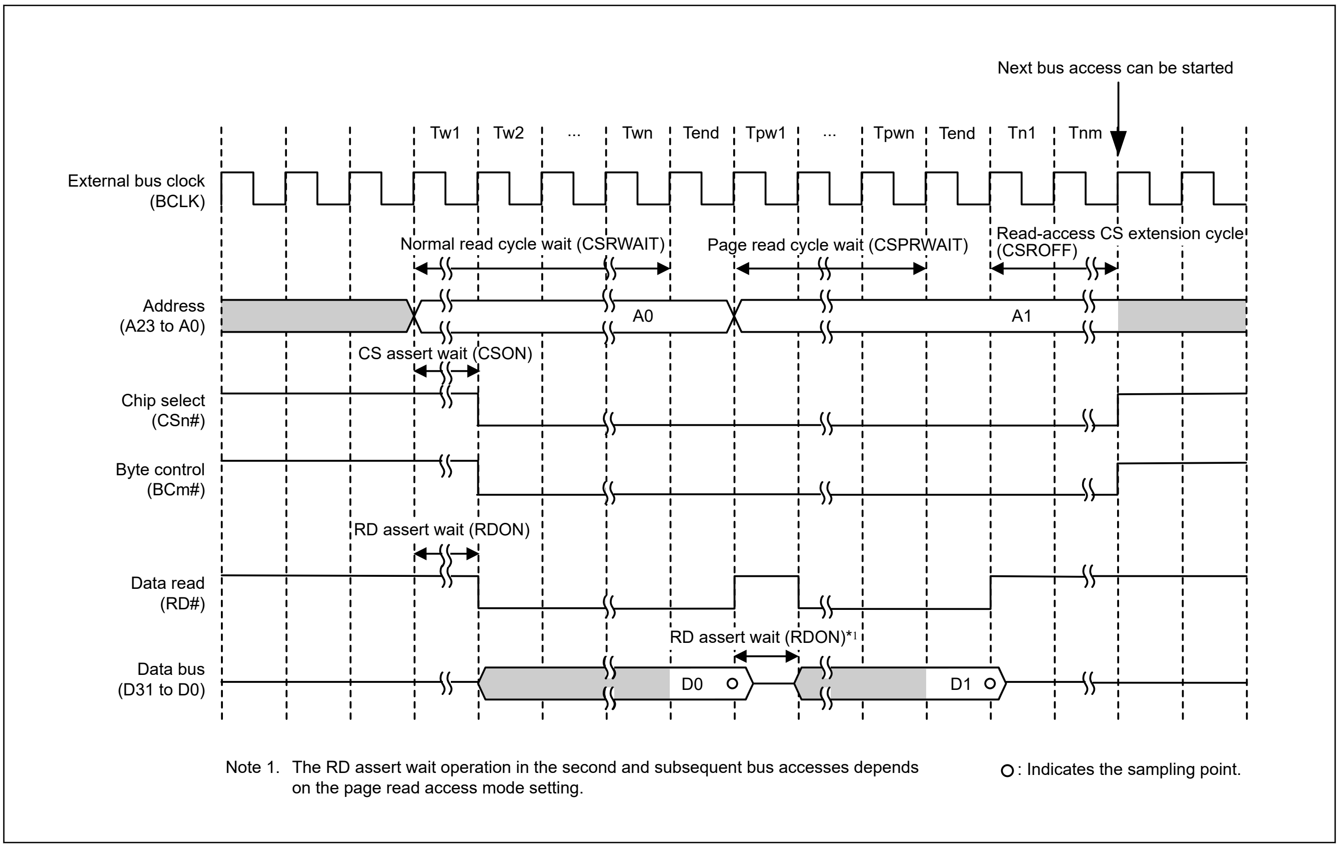

Figure 15.16 Page read access timing (n = 0 to 7, m = 0 to 3)

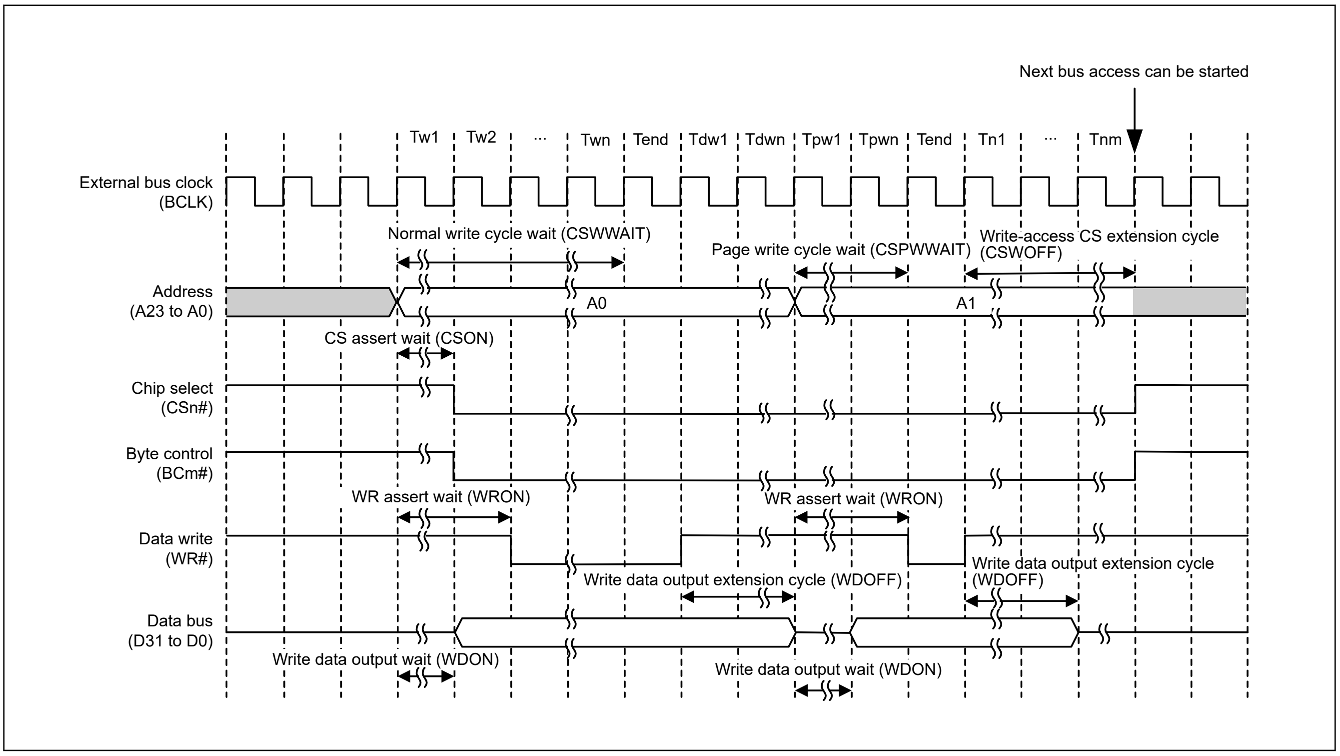

Figure 15.17 Page write access timing (n = 0 to 7, m = 0 to 3)

Figure 15.18 and Figure 15.19 show examples of operations for access to a 16-bit bus space in 32 bits. The values of the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

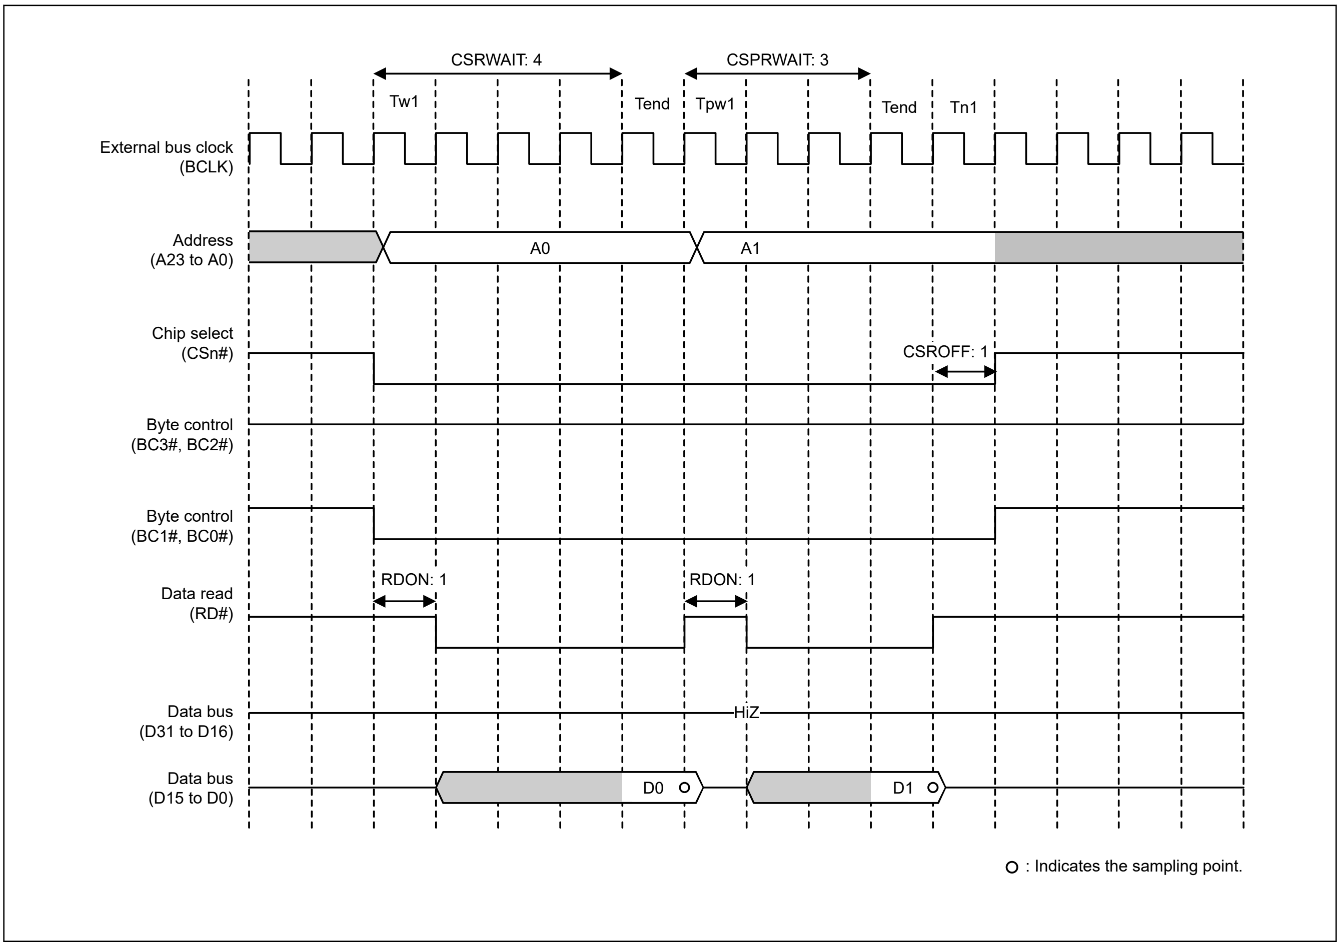

Figure 15.18 Example page read access operation when 16-bit bus space is accessed in 32 bits (n = 0 to 7)

Figure 15.20 and Figure 15.21 show examples of page access operations when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

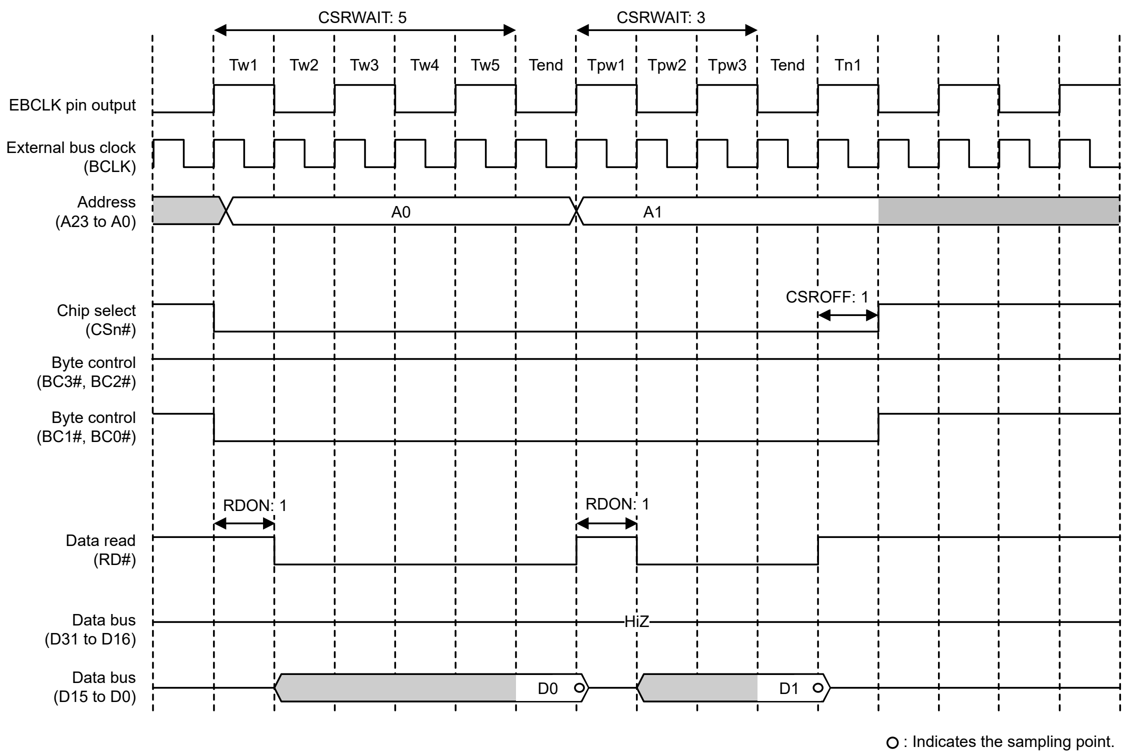

Figure 15.20 Example page read access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7)

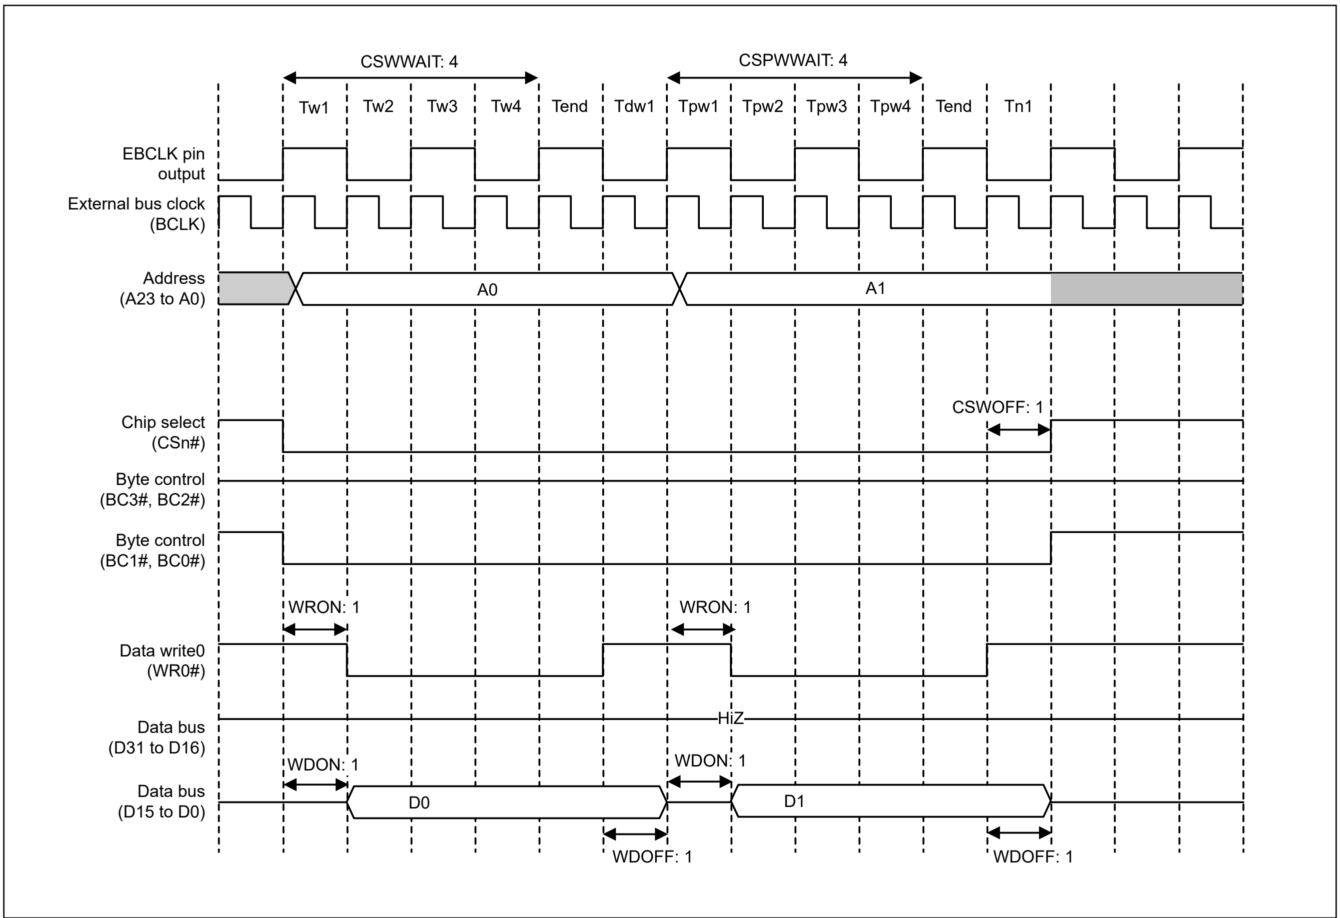

Figure 15.21 Example page write access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request, in single-write strobe mode (n = 0 to 7)

15.5.2 Address/Data Multiplexed Bus

When the address/data Multiplexed I/O Interface Select bit (MPXEN) in CSnCR is set to 1, addresses and data can be multiplexing input/output to/from the D15 to D00 pins in the corresponding area. Using this function enables direct connection of this MCU to peripherals of the MCU requiring address/data multiplexing. When 8-bit width is selected with the BSIZE[1:0] bits in CSnCR, D7 to D00 are multiplexed with A07 to A00. When 16-bit width is selected, D15 to D00 are multiplexed with A15 to A00. In the address/data multiplexed I/O space, accesses are controlled with the ALE, RD, WRn, and BCn signals.

Byte strobe mode or single-write strobe mode is selectable in the same way as for a separate bus. However, with regard to the BCn signals within the address cycle, the byte-control signal is output for the data being read or written.

During the address/data multiplexed I/O space access, after the number of wait cycles specified by the Address Cycle Wait Select bits (AWAIT[1:0]) in CSnWCR2 is inserted in the address output cycle, data access is performed.

Ta1 to Tan (Address Cycle Wait)

The period Ta1 to Tan is valid only when the address/data multiplexed I/O space is specified. This period is made up of the number of clock cycles between the start of external bus access and 1 cycle before the address latch (ALE) signal is negated. The number of cycles is selectable within the range from 0 to 3. Addresses are output until the next cycle of ALE signal negation (address cycle). The timing of ALE signal is the same as that of CS assertion. After the address cycle, a data cycle is started. CSnWCR1 and CSnWCR2 should be set so that an address cycle and a data cycle do not overlap.

Page access to the address/data multiplexed I/O space is invalid. When the PRENB or PWENB bit in CSnMOD is set to 1 to enable page-read or page-write access, these settings are ignored and normal read or write operation is performed.

Figure 15.22 to Figure 15.24 show examples of operations with the address/data multiplexed I/O interface

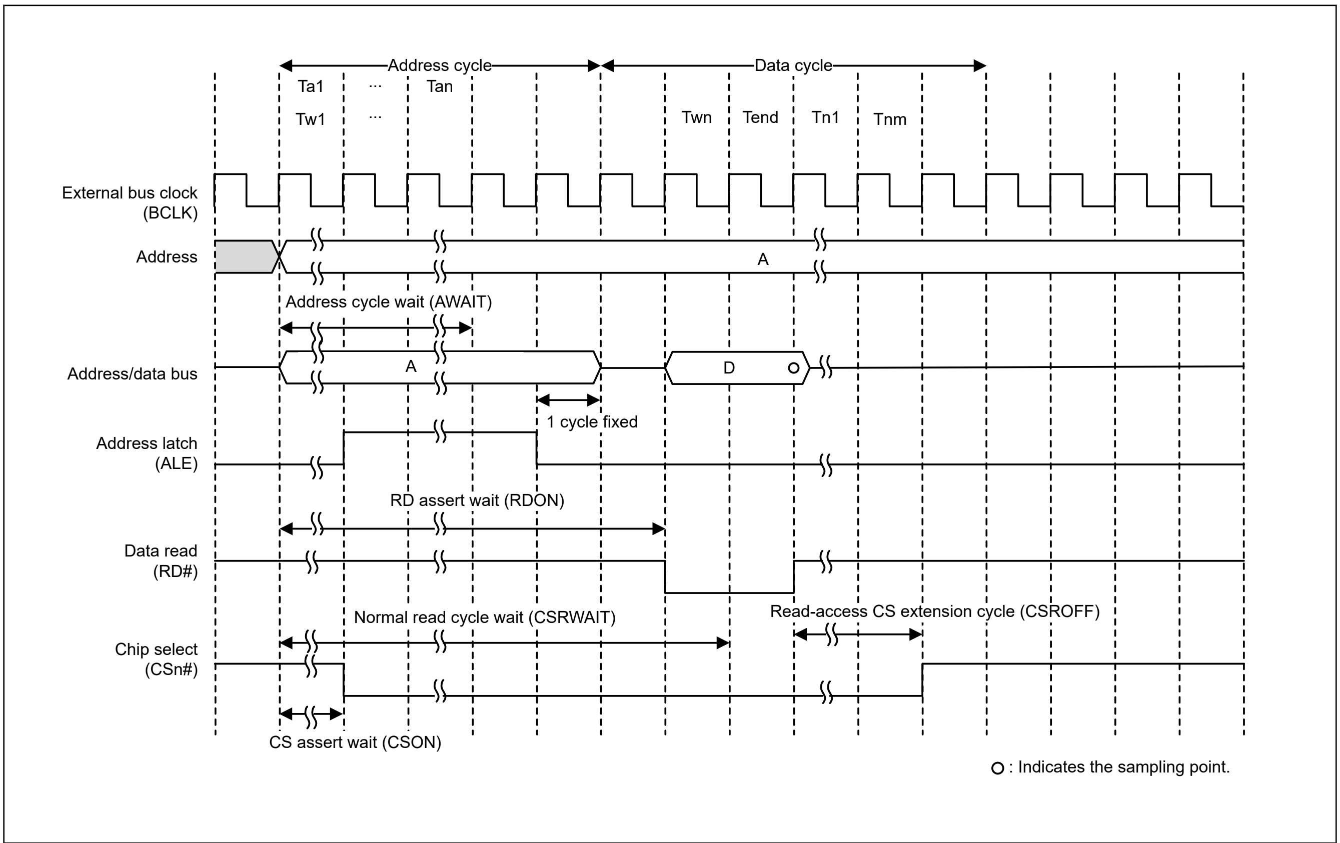

Figure 15.22 Example of read access operation with address/data multiplexed I/O interface (n = 0 to 7)

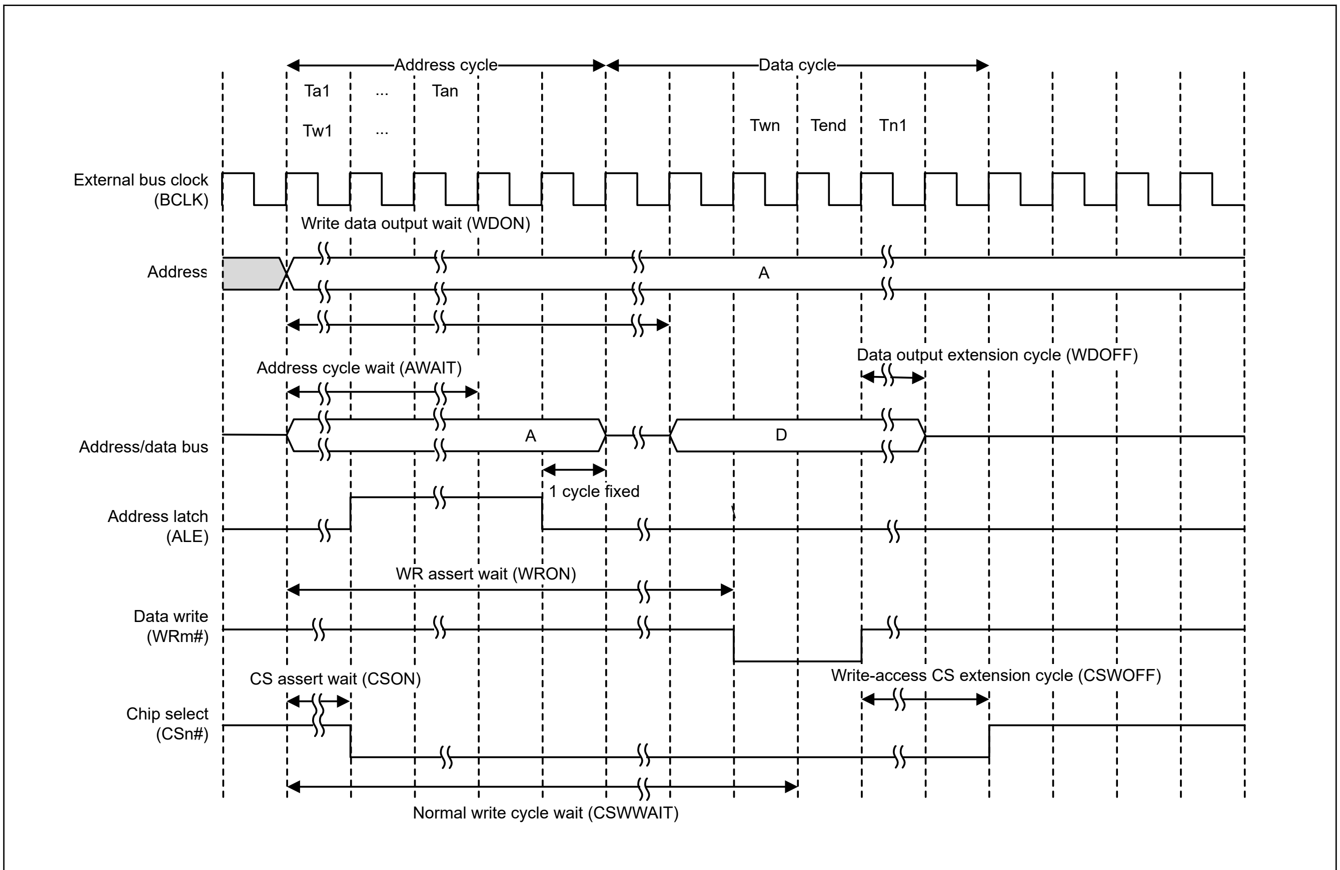

Figure 15.23 Example of write access operation with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

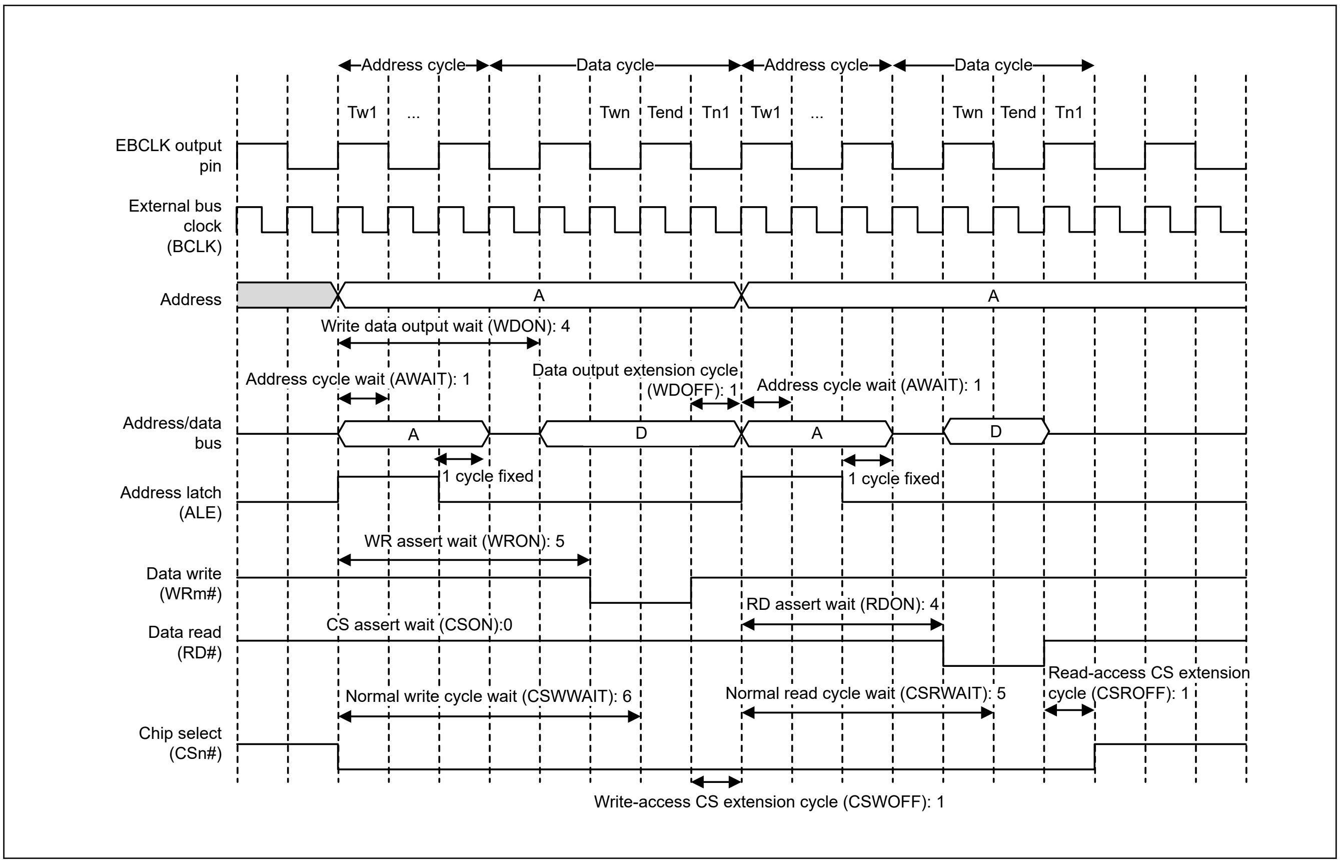

Figure 15.24 Example of bus timing with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

15.5.3 External Wait Function

Wait cycles can be extended by the WAIT signal beyond the length of the normal access cycle wait specified in the CSRWAIT[4:0] and CSWWAIT[4:0] bits in CSnWCR1, and the page access cycle wait specified in the CSPRWAIT[2:0] and CSPWWAIT[2:0] bits in CSnWCR1.

When external wait is enabled (EWENB = 1 in CSnMOD), wait cycles are inserted while the WAIT signal is held low. When external wait is disabled (EWENB = 0 in CSnMOD), the WAIT signal has no effect. All wait cycles specified in CSnWCR1 are inserted independently of the WAIT signal.

(1) Normal Access

Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in CSnWCR1. The bus cycle is extended while the WAIT signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT signal goes high.

(2) Page Access

The first access operation is the same as the normal access operation. Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in the CSnWCR1 register. The bus cycle is extended while the WAIT signal is held low. The wait cycle (Tend) ends at the next cycle after the WAIT signal goes high.

For the second and subsequent accesses, sampling of the WAIT signal begins on completion of the page access wait cycle (Tend). The page access wait cycle is extended while the WAIT signal is held low, and ends (Tend) at the next cycle after the WAIT signal goes high.

Figure 15.25 to Figure 15.28 show examples of external wait insertion timing with the separate bus interface.

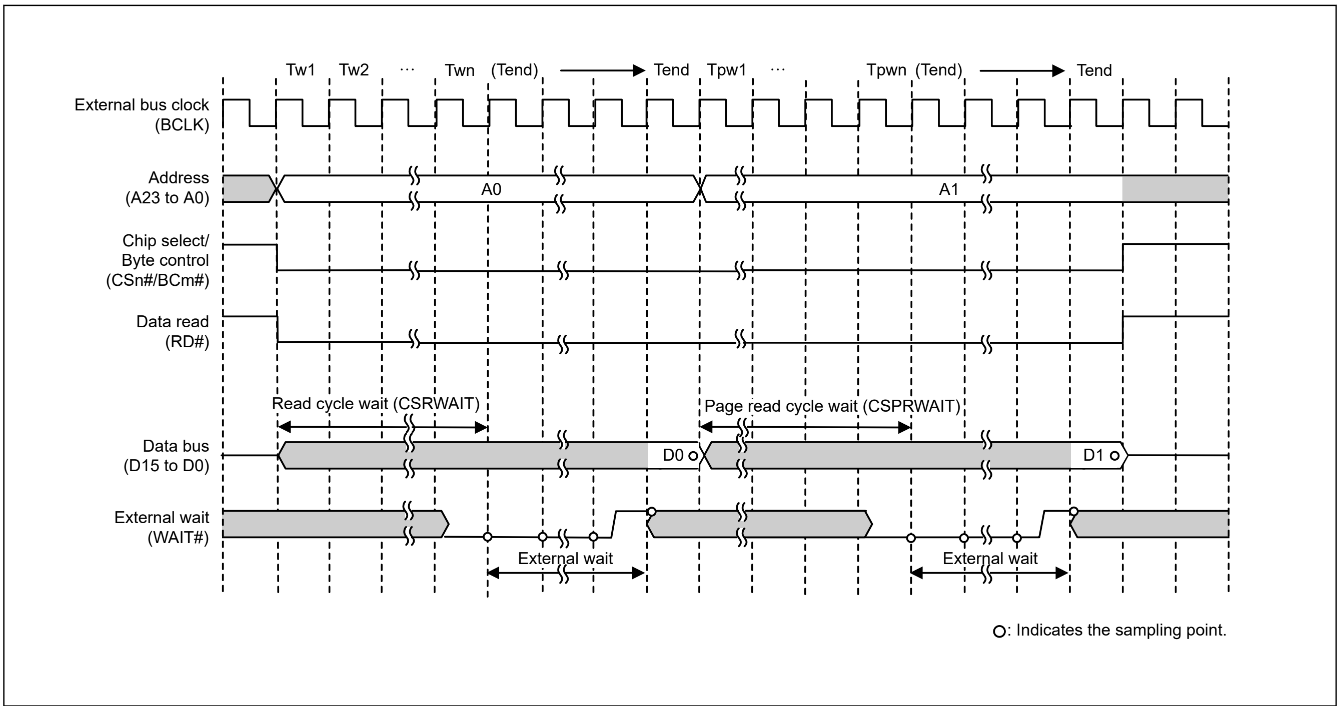

Figure 15.25 Example external wait timing for page read access to 16-bit bus space (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

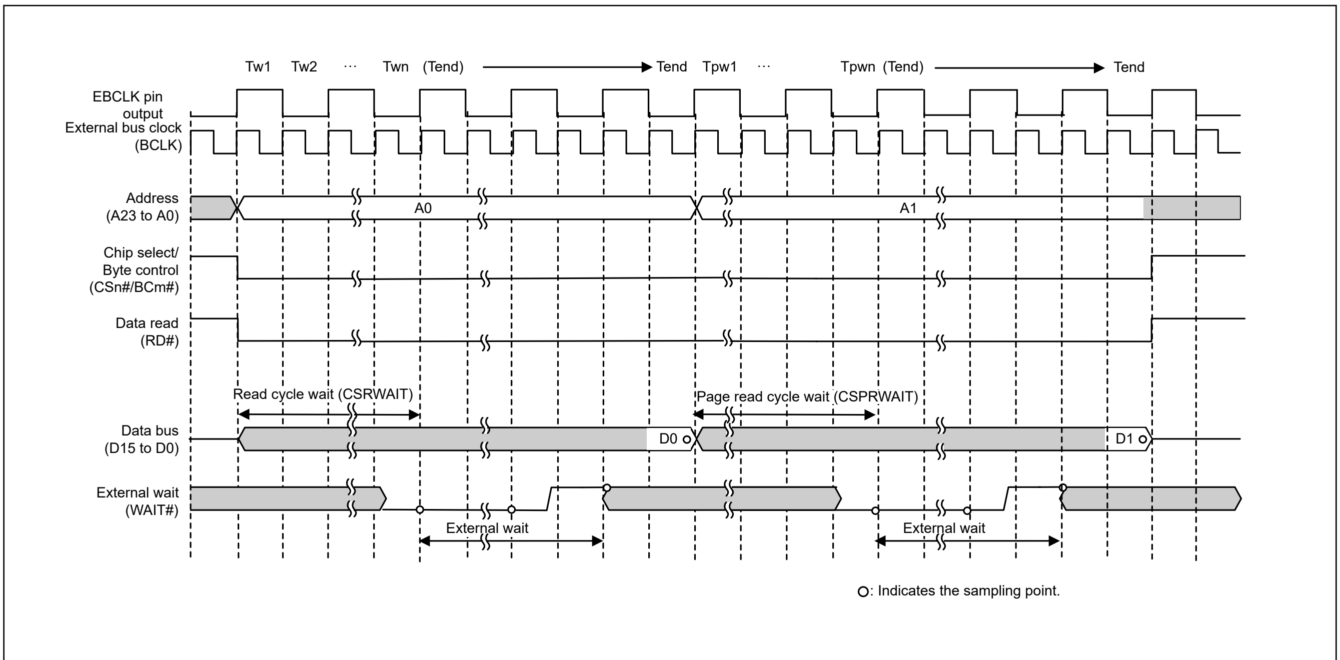

Figure 15.26 Example external wait timing for page read access to 16-bit bus space (when 1/2 BCLK is Selected with the EBCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

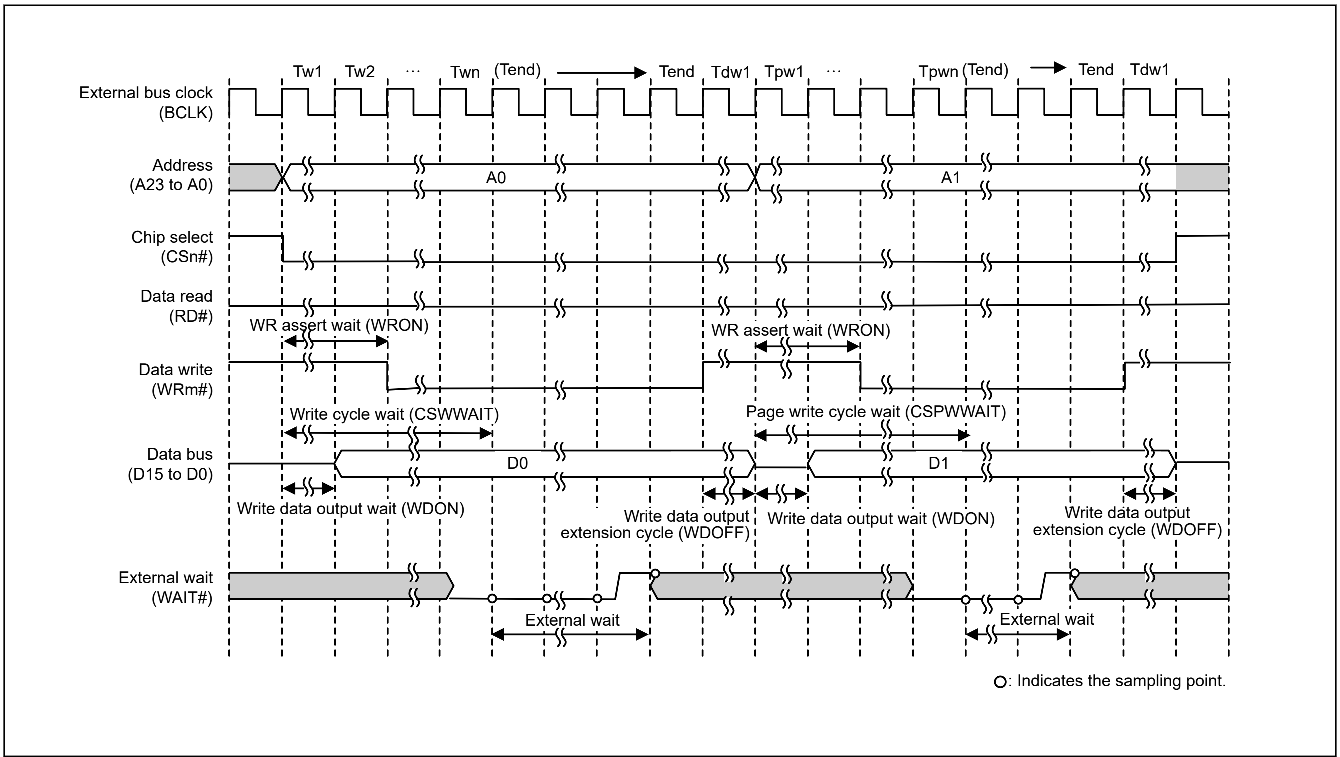

Figure 15.27 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

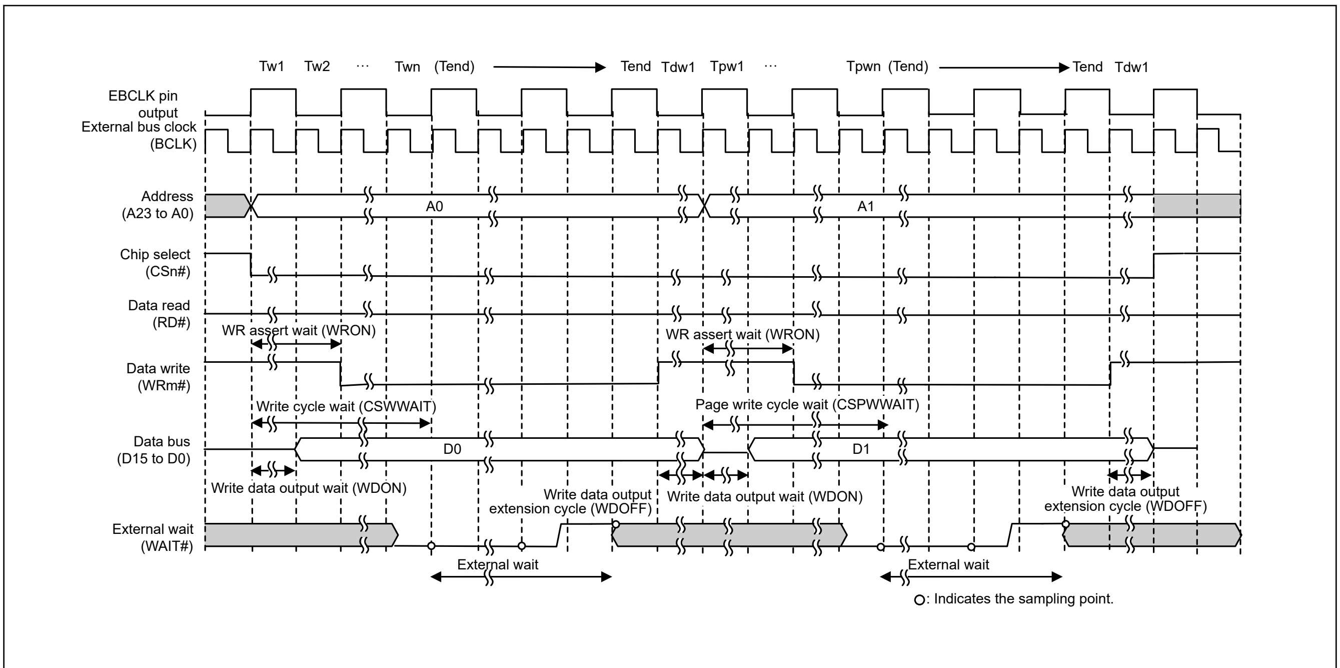

Figure 15.28 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/2 BCLK is selected with the EBCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

(3) Address/Data Multiplexed I/O Interface

In a data cycle with the address/data multiplexed I/O interface, programmed waits and pin waits using the WAIT pin can be inserted in the same way as that with the separate bus interface.

Address cycles are not affected by the wait control settings. Figure 15.29 shows an example of external wait insertion timing with the address/data multiplexed I/O interface.

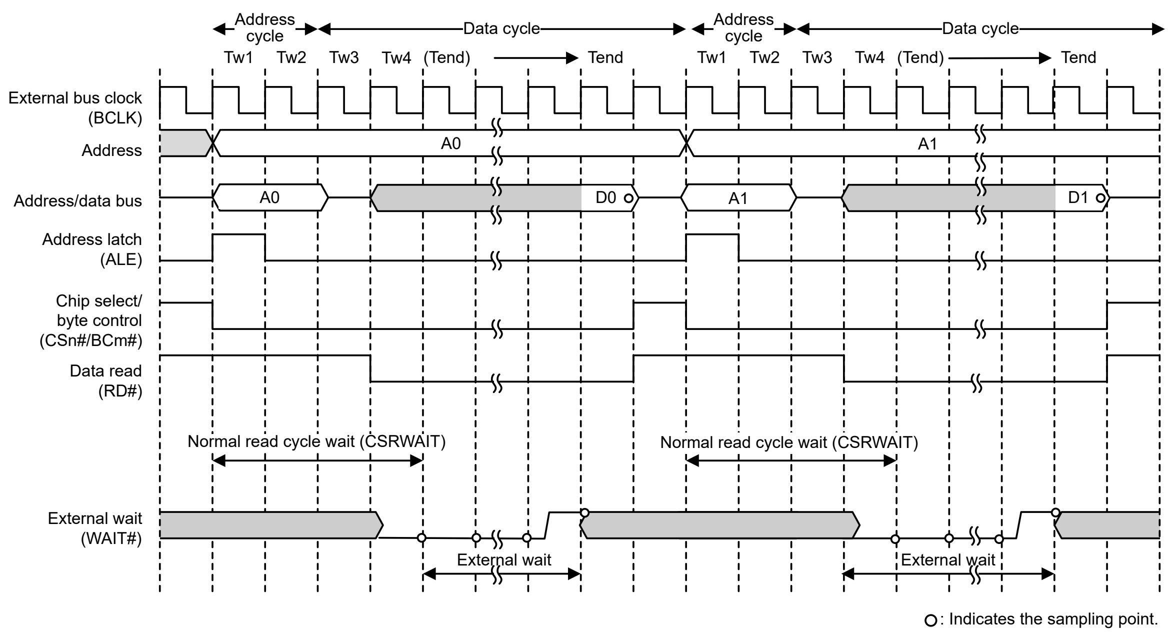

Figure 15.29 Example external wait insertion timing with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

15.5.4 Insertion of Recovery Cycles

Recovery cycles can be inserted between consecutive rounds of external bus access by setting the Recovery Cycle Insertion Enable bit in CSRECEN to 1.

The number of recovery cycles to be inserted after read cycles and write cycles can be independently set for each area using CSnREC. When the preceding bus cycle is a write access, the number of write recovery cycles must be set with the WRCV[3:0] bits for the associated area. When the preceding bus cycle is a read access, the number of read recovery cycles must be set with the RRCV[3:0] bits for the associated area. For example, when a CS1 read access occurs after a CS0 read access, the number of recovery cycles to be inserted between them is set in the RRCV[3:0] bits in CS0REC.

Recovery cycle insertion can be enabled or disabled with RCVENi (i = 0 to 7) in CSRECEN when the preceding bus access is a separate bus access, and with RCVENMj (j = 0 to 7) when the preceding bus access is an address/data multiplexed bus access.

Recovery cycles can be inserted on any of the following conditions:

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.
- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

The recovery cycle starts at the end of the preceding bus cycle, for example when the CSn signal (n = 0 to 7) is negated. A high-level period of the CSn signal is inserted for the specified recovery cycle period starting from this point.

In the fastest case, the CSn signal for the next round of bus access is asserted immediately after the end of the recovery cycles. Even if the next request for access to an external address space is generated during the recovery period, the next access over the external bus starts immediately after the end of the recovery cycles.

When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, recovery cycles are also inserted between these bus access cycles. However, when page read access is enabled (CSnMOD.PRENB = 1) or page write access is enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted except after the last bus access cycle of the transfer, even if the recovery cycle insertion condition is satisfied. See Figure 15.33.

Similarly, during normal access with page access enabled, recovery cycles are not inserted between bus access cycles but only after the last bus access cycle of the transfer. With the address/data multiplexed I/O interface, when the recovery cycle insertion condition is satisfied, recovery cycles are inserted between bus access cycles regardless of the page access enable setting.

Figure 15.30 to Figure 15.33 show examples of recovery cycle insertion with the separate bus interface.

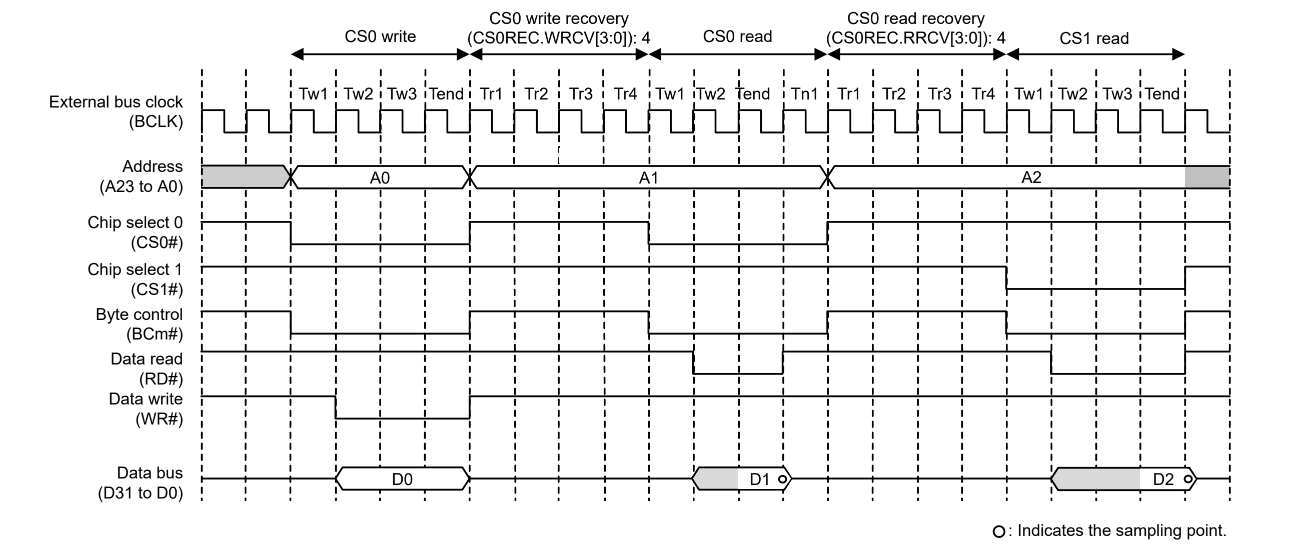

Figure 15.30 Example recovery cycle insertion with separate bus interface (m = 0 to 3)

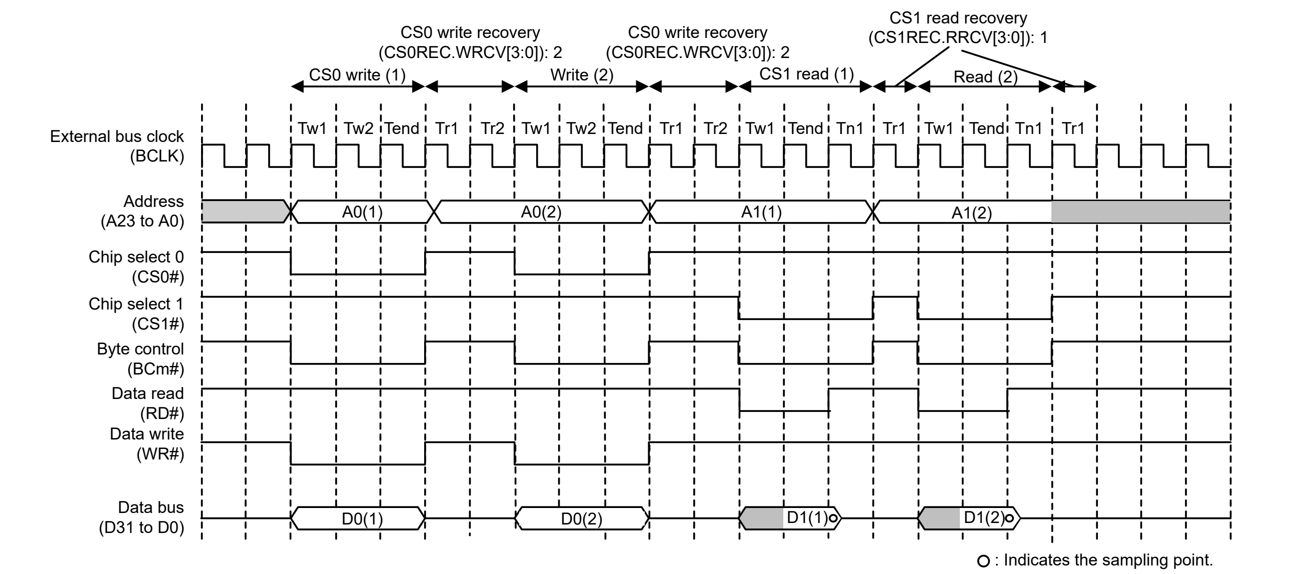

Figure 15.31 Example recovery cycle insertion when bus access is split, with separate bus interface and normal access (m = 0 to 3)

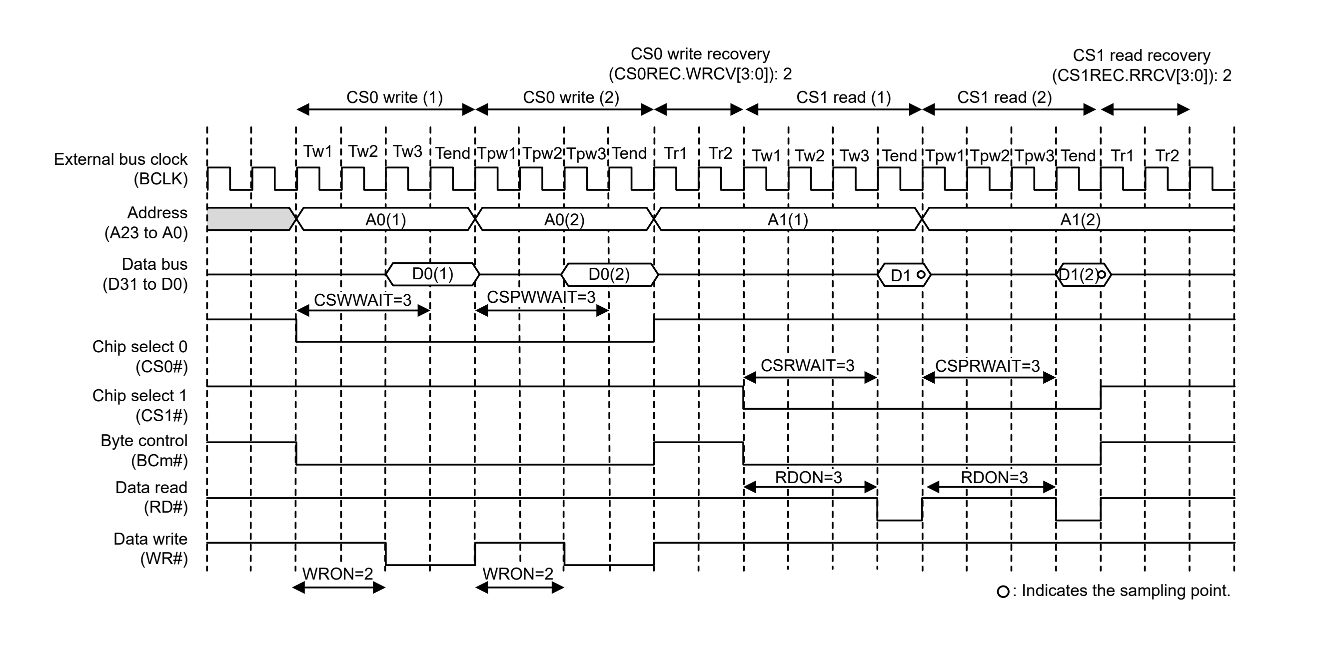

Figure 15.32 Example recovery cycle insertion when bus access is split, with separate bus interface and page access (m = 0 to 3)

Figure 15.33 shows an example operation when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

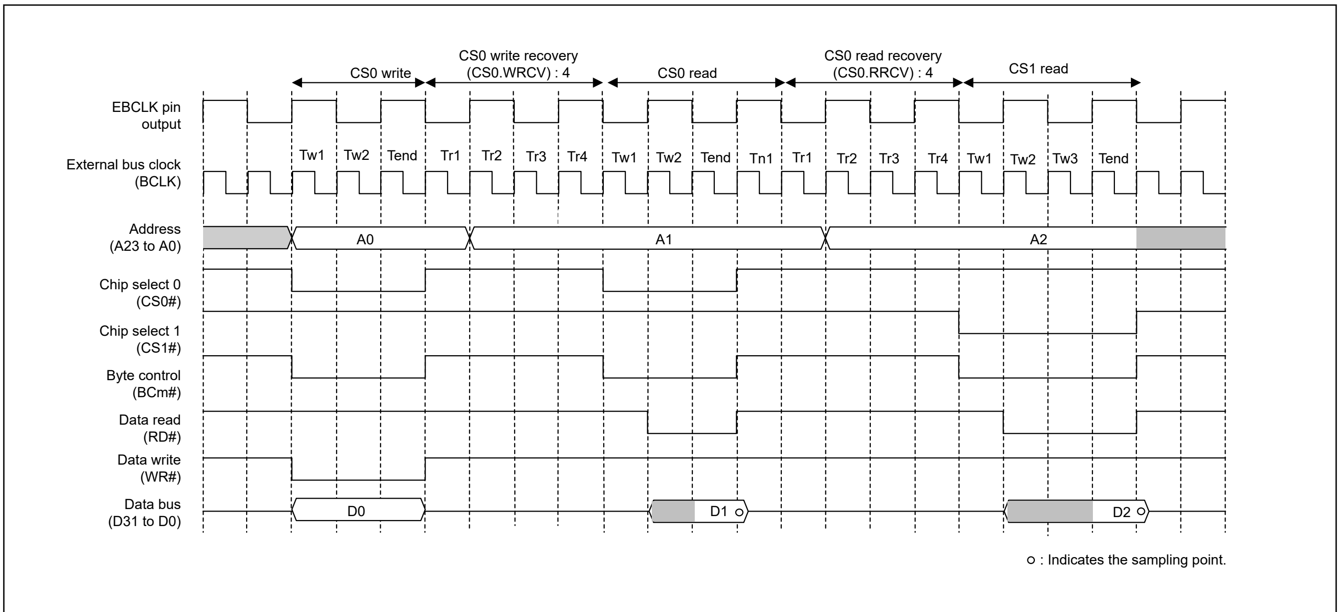

Figure 15.33 Example operation for recovery cycles when BCLK/2 is selected in the EBCLK Pin Output Select bit, with normal access through a separate bus interface (m = 0 to 3)

With the address/data multiplexed I/O interface, recovery cycles are inserted in the same way as that with the separate bus interface. Figure 15.34 and Figure 15.35 show examples of recovery cycle insertion with the address/data multiplexed I/O interface.

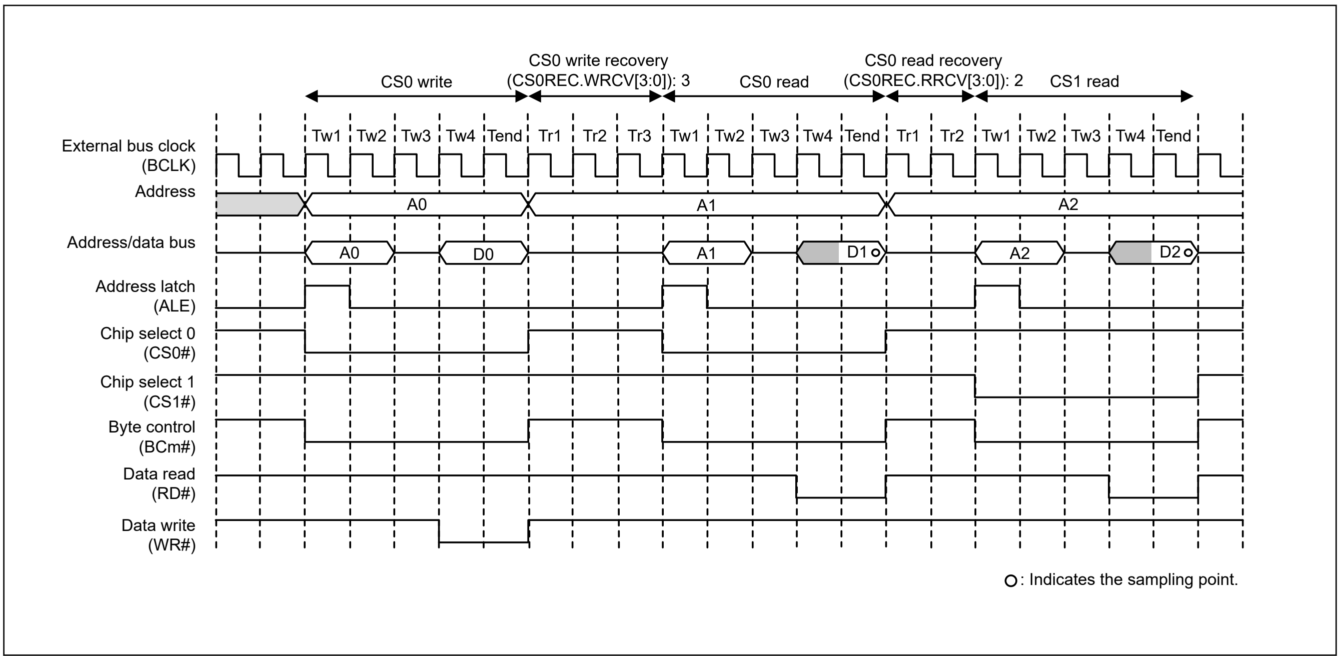

Figure 15.34 Example of recovery cycle insertion with address/data multiplexed I/O interface (m = 0, 1)

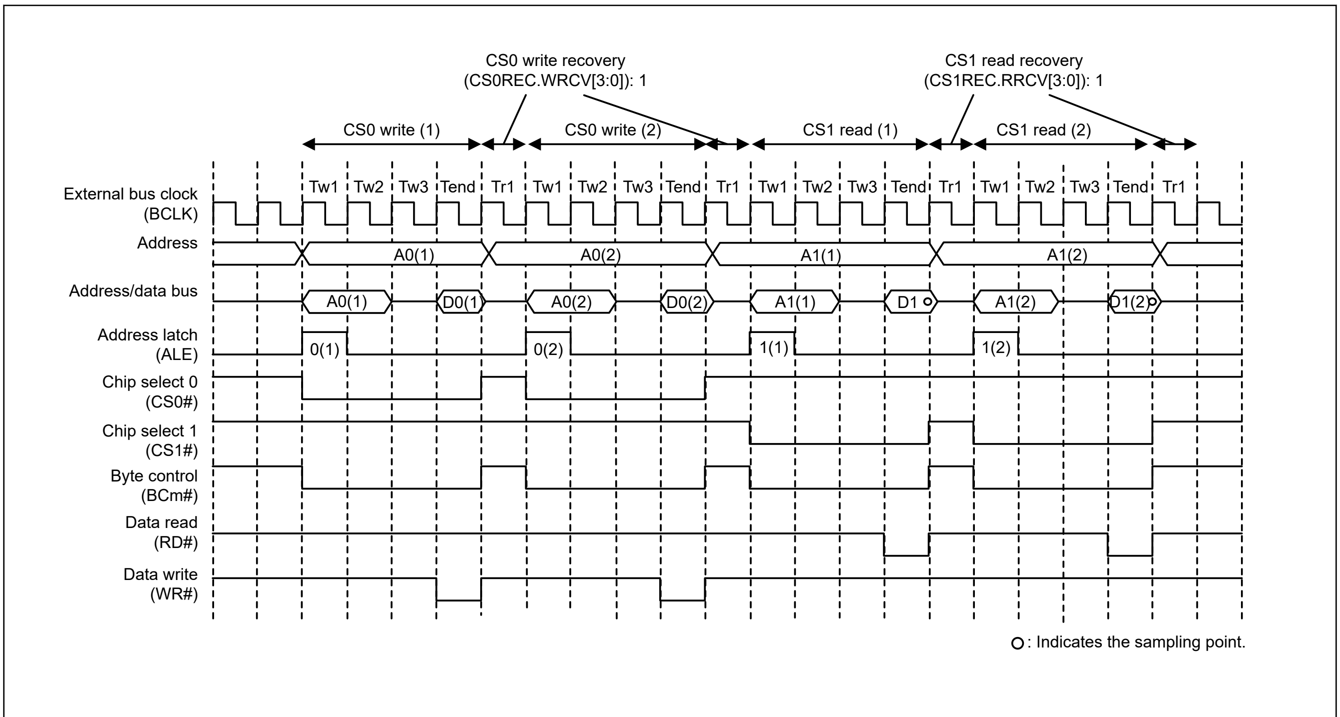

Figure 15.35 Example of recovery cycle insertion when a bus access is split with address/data multiplexed I/O interface (m = 0, 1)

15.5.5 No Access State

When no external address space is accessed, CSn, BCn, WRn, and RDn signals are high, ALE signal is low, and D31 to D00 are in the high-impedance state.

15.5.6 Limitations

(1) Constraints on using separate bus interface

Table 15.28 lists the constraints that apply to bits in the CSn Wait Control Register 1 (CSnWCR1) and CSn Wait Control Register 2 (CSnWCR2) when normal and page accesses occur.

Even if the Page Read Access Enable bit or Page Write Access Enable bit in the CSn Mode Register is set to enable (CSnMOD.PRENB = 1 or CSnMOD.PWENB = 1), the first page access or access that does not fall within the scope of a page access is a normal access operation. Because of this, constraints on normal access must be satisfied.

Table 15.28 Constraints on normal access and page access

Limitations at the time of normal access		Limitations at the time of page access	
Reading	**Writing**	**Reading**	**Writing**
CSON[2:0] ≤ CSRWAIT RDON[2:0] ≤ CSRWAIT CSON[2:0] ≤ RDON	1 ≤ WDON[2:0] CSON[2:0] ≤ CSWWAIT WRON[2:0] ≤ CSWWAIT WDON[2:0] ≤CSWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON	CSON[2:0] ≤ CSPRWAIT RDON[2:0] ≤ CSPRWAIT CSON[2:0] ≤ RDON	1 ≤ WDON[2:0] CSON[2:0] ≤ CSPWWAIT WRON[2:0] ≤ CSPWWAIT WDON[2:0] ≤ CSPWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON

Note: When 2 or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, with page read access enabled (CSnMOD.PRENB = 1) or page write access enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted between bus access cycles and are inserted only after the last bus access cycle of the transfer.

(2) Constraints on using address/data multiplexed bus interface

In the address/data multiplexed I/O space, page accesses are invalid. If a page access setting is specified, the setting is ignored and the normal read or write operation is performed. When the address/data multiplexed I/O interface is set, the BSIZE[1:0] bits in CSnCR should not be set to the 32-bit bus space. If set, the operation cannot be guaranteed.

Table 15.29 Constraints at the time of normal access

Reading	Writing
CSON[2:0] ≤ CSRWAIT RDON[2:0] ≤ CSRWAIT CSON[2:0] ≤ RDON AWAIT[1:0] + 2 ≤ RDON CSON[2:0] ≤ AWAIT	CSON[2:0] ≤ CSWWAIT WRON[2:0] ≤ CSWWAIT WDON[2:0] ≤ CSWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON AWAIT[1:0] + 2 ≤ WRON AWAIT[1:0] + 2 ≤ WDON CSON[2:0] ≤ AWAIT

(3) Constraint on pin multiplexing between the A00 and BC0 functions

Setting the single-write strobe mode is prohibited in the 8-bit bus space.

(4) Constraints when BCLK/2 is selected in the EBCLK Pin Output Select bit

When 1/2 cycle of BCLK is selected in the EBCLK Pin Output Select bit, the external bus access cycle starts on the rising edge of the EBCLK pin output. However, when 2 or more external bus access cycles are generated for a single transfer request from a bus master, the second or subsequent external bus access cycle can start on the falling edge of the EBCLK pin output, depending on the wait cycle settings. Set the registers appropriately for the specifications of connected devices.

(5) Instruction code constraints

You must fix the instruction code to little-endian order.

15.6 SDRAM Area Controller Operation

This section describes how the SDRAM area controller (SDRAMC) is enabled and the SDRAM bus width is set, followed by a description of the SDRAMC operations, including read, write, auto-refresh, self-refresh, initialization sequence, and mode register settings.

15.6.1 Enabling/Disabling SDRAM Access and Setting the SDRAM Bus Width

SDRAM access can be enabled or disabled using the SDC Control Register (SDCCR). The SDRAM bus width can also be set using SDCCR. The refresh operation is available even when the operation of the SDRAM address space is disabled, as long as self-refresh or auto-refresh is enabled.

15.6.2 No Access State

When no external address space is accessed, the SDCS, WE, RAS and CAS signals are high.

15.6.3 Insertion of Recovery Cycles

When access to the SDRAM area follows access to the CS area, data recovery cycles are inserted for the CS area controller (CSC). If the number of recovery cycles for the CSC is 0, the ACT command for the next SDRAM access is issued immediately after negation of CSn signal at the earliest. If the number of recovery cycles are not 0, the ACT command is issued 2 cycles after the specified recovery cycle period elapsed after negation of CSn signal at the earliest. Because no data conflicts can occur during access to the SDRAM area, there is no need to set data recovery cycles for the SDRAM (fixed to 0 cycle).

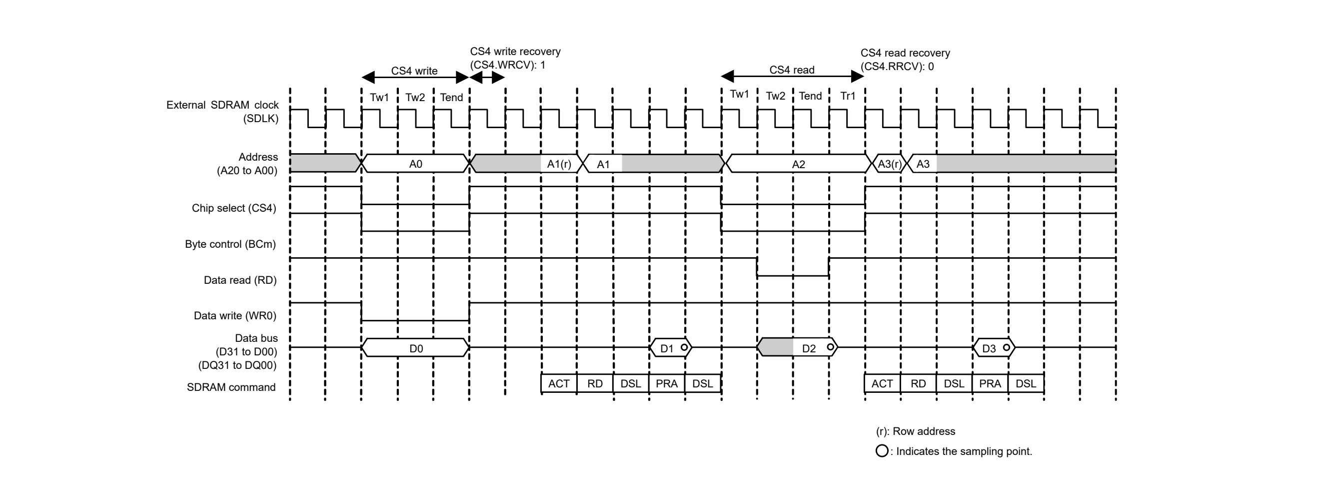

Figure 15.36 Example of recovery timing for SDRAM access

15.6.4 SDRAM Commands

To control the SDRAM, the SDRAMC issues a command for each bus cycle. Commands are defined by a combination of the SDCS, RAS, CAS, WE, CKE, and other signals. Table 15.30 lists the commands issued by the SDRAMC.

Table 15.30 SDRAMC commands

Name	Abbreviation	Command	SDCS	RAS	CAS	WE	CKE		BA1	BA0
							n-1	n		
DESL	DSL	Device deselect	H	x	x	x	H	x	x	x
ACTV	ACT	Bank active	L	L	H	H	H	x	V	V
READ	RD	Read	L	H	L	H	H	x	V	V
WRIT	WRI	Write	L	H	L	L	H	x	V	V
PRE	PRE	Precharge	L	L	H	L	H	x	V	V
PALL	PRA	All bank precharge	L	L	H	L	H	x	x	x
REF	RFA	Auto-refresh	L	L	L	H	H	x	x	x
MRS	MRS	Mode register set	L	L	L	L	H	x	L	L
SELF	RFS	Self-refresh entry	L	L	L	H	H	L	x	x
SELFX	RFX	Self-refresh end	H	x	x	x	L	H	x	x

Note: H = High level, L = Low level, V = Valid, x = Don't care.
n = Command issue cycle, n – 1 = 1 cycle before the command is issued.

15.6.5 Conditions for Setting the SDRAMC Registers

The SDRAMC registers must only be modified when all the conditions shown in Table 15.31 are satisfied.

Table 15.31 Conditions for register modification

Function or operation	Registers	Conditions
Self-refresh	SDSELF*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is enabled (SDRFEN.RFEN = 1)
Auto-refresh	SDRFCR	Self-refresh operation is disabled (SDSELF.SFEN = 0)
	SDRFEN	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Initialization sequence	SDIR*1	SDICR is not set yet, and the same conditions as for SDICR modification are satisfied
	SDICR*1	• Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Address register	SDADR	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Timing register	SDTR	• Self-refresh operation is in progress (SDSELF.SFEN = 1) or • SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Mode register	SDMOD*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Self-refresh operation is disabled (SDSELF.SFEN = 0)
Access Mode register	SDAMOD	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0)

Note 1. Before modifying this register, confirm that all the status bits in SDSR are 0.
Note 2. After writing 0 to the EXENB bit, confirm that it is cleared to 0.

15.6.6 Self-Refresh

Transition to or recovery from self-refresh mode is controlled with the SDRAM Self-Refresh Control Register (SDSELF). Immediately before the transition to self-refresh mode, an auto-refresh operation is performed. In self-refresh mode, the CKE signal is low. Immediately after recovery from self-refresh mode, the auto-refresh cycle starts.

Figure 15.37 and Figure 15.38 show timing examples of the transition to and recovery from self-refresh mode.

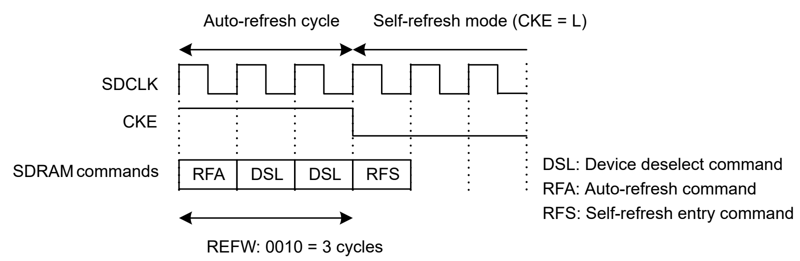

Figure 15.37 Example timing for transition to self-refresh mode when SDRFCR.REFW[3:0] = 0010 (3 cycles)

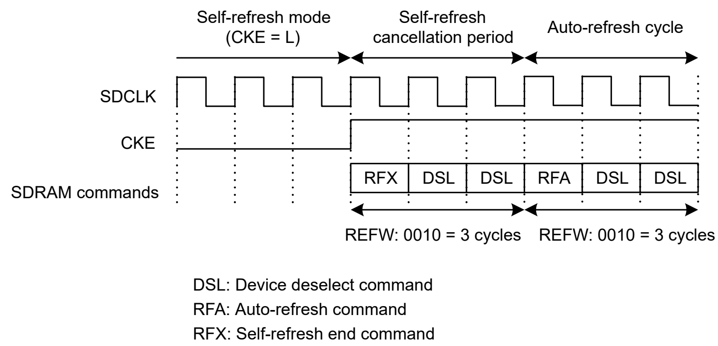

Figure 15.38 Example timing for recovery from self-refresh mode

(1) Self-refresh in Software Standby mode

When invoking self-refresh in Software Standby mode, first follow the procedure shown in section 15.6.11.2. Procedure for Transitioning to and Recovering from Self-refresh Mode. Next, set up the transition to Software Standby mode. In this mode, set the Output Port Enable bit (OPE) in the Standby Control Register (SBYCR) to 1 to hold the output state of the address bus and bus control signals.

After canceling Software Standby mode, follow the procedure shown in section 15.6.11.2. Procedure for Transitioning to and Recovering from Self-refresh Mode. For details on invoking and canceling Software Standby mode, see section 11, Low Power Mode.

(2) Self-refresh in Deep Software Standby mode

Deep Software Standby mode is invoked from within Software Standby mode. On this transition, the pin states remain unchanged. Therefore, invoking of self-refresh in Deep Software Standby mode can be handled the same as for Software Standby mode with one additional setting. You must also set the I/O Port Keep bit (IOKEEP) in the Deep Software Standby mode Control Register (DPSBYCR) to 1.

Because the SDRAMC is reset internally when Deep Software Standby mode is canceled, the SDRAM control registers must be set again. After canceling Software Standby mode, follow the procedure in this section to cancel self-refresh.

Figure 15.39 shows self-refresh timing in Deep Software Standby mode. For details on invoking and canceling Deep Software Standby mode, see section 11, Low Power Mode.

To cancel self-refresh mode:

1. Set DPSBYCR.IOKEEP to 1 to keep the CKE signal output low in Deep Software Standby mode.
2. Start the clock supply to the SDRAMC.
3. Set the SDRAM control registers (SDCMOD, SDADR, and SDTR) again. These registers were initialized by an internal reset on entering Deep Software Standby mode.
4. Enable an auto-refresh operation by setting SDRFEN.RFEN to 1.
5. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 1 to select self-refresh mode again.
6. Modify the port settings for the SDRAM interface.
7. Set SDCKOCR.SDCKOEN to 1 to start the clock supply to the SDRAM with the SDCLK pin.
8. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 0 to cancel self-refresh mode.

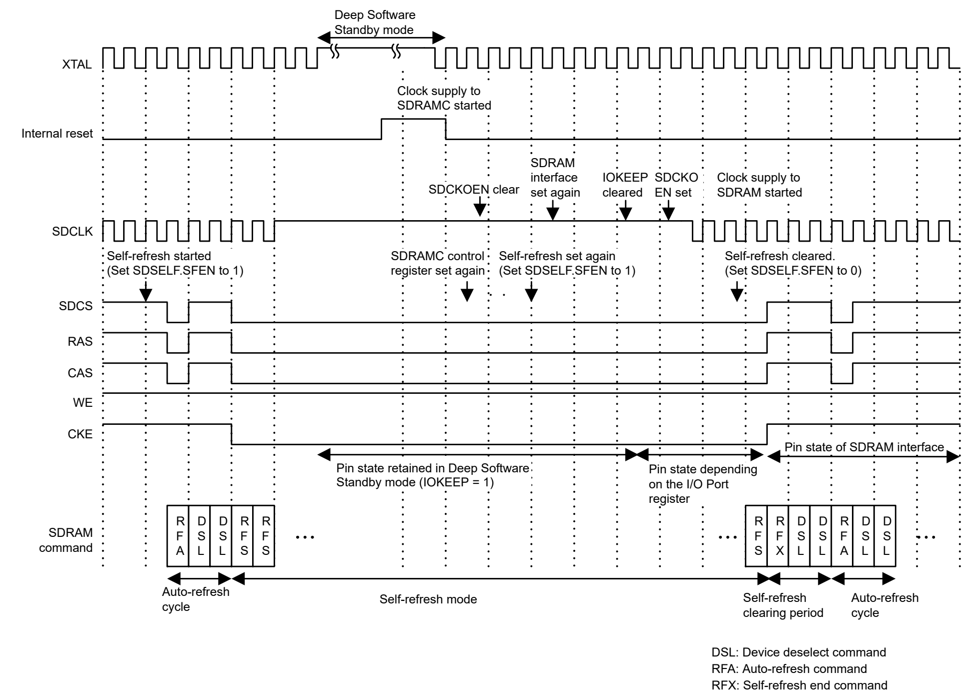

Figure 15.39 Example timing for self-refresh cycle in Deep Software Standby mode

15.6.7 Auto-Refresh

The auto-refresh cycle can be started by setting the Auto-Refresh Operation Enable bit (RFEN) in the SDRAM Auto-Refresh Control Register (SDRFEN) to 1. After the cycle starts, refresh requests are generated at fixed intervals determined by the refresh counter. However, because refresh requests are not accepted during read or write access, the auto-refresh cycle might be suspended.

If an SDRAM access and a refresh request are generated at the same time, the refresh request takes precedence. A CS area access and a refresh request can be made at the same if the SDCS, RAS, CAS, WE, and CKE signals, which are required for issuing the refresh command, are exclusively provided for SDRAM access.

The refresh counter is halted during a self-refresh operation. After recovery from the self-refresh mode, the auto-refresh cycle starts and the counter value is reset, resuming the counter operation.

Figure 15.40 shows a timing example of an auto-refresh cycle.

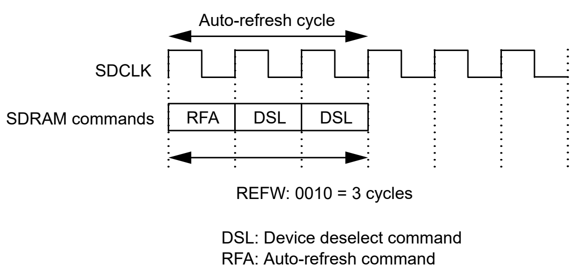

Figure 15.40 Example timing for auto-refresh cycle (1)

Figure 15.41 and Figure 15.42 show examples of operation when an auto-refresh request is generated during single access and continuous access, respectively.

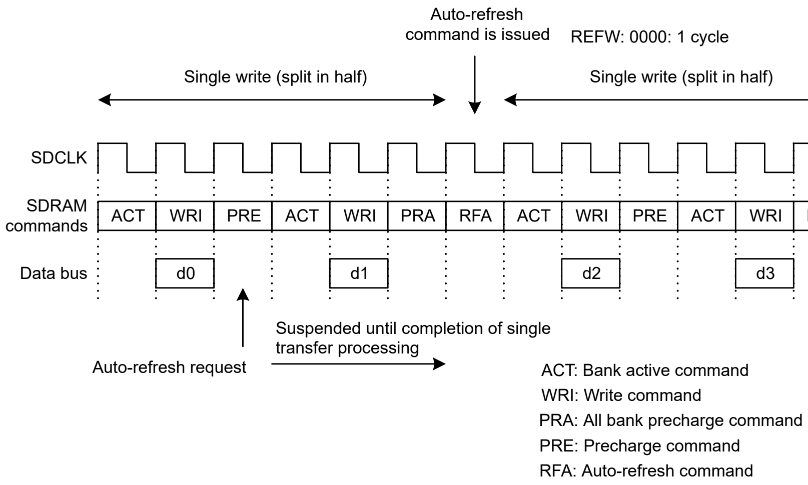

Figure 15.41 Example timing for auto-refresh cycle (2), when the auto-refresh request is made during single access

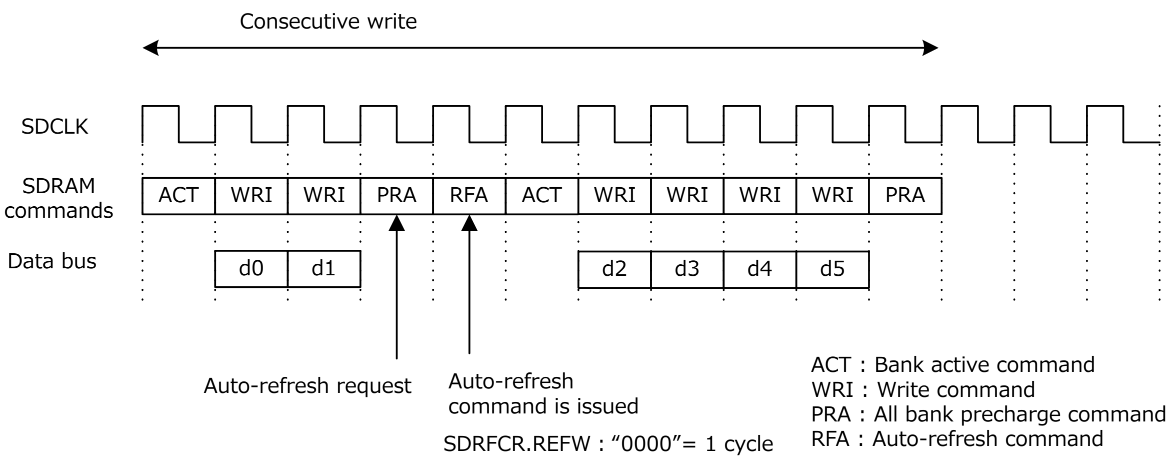

Figure 15.42 Example timing for auto-refresh Cycle (3) when auto-refresh request is made during continuous access

15.6.8 Initialization Sequencer

The SDRAMC has a sequencer to issue SDRAM initialization commands. After a reset, the initialization sequencer must be activated without fail. Operation is not guaranteed if the SDRAM is not initialized.

The SDRAM initialization sequencer issues an all-bank precharge command followed by auto-refresh commands n times, where n = 1 to 15. The SDRAM initialization sequence timing can be set using the SDRAM Initialization Register (SDIR). The SDRAM initialization sequence can be activated using the SDRAM Initialization Sequence Control Register (SDICR). These registers must be set only when the conditions listed in Table 15.31 are satisfied.

Figure 15.43 shows a timing example of the SDRAM initialization sequence. When the ARFC[3:0] bits in SDIR are set so that auto-refresh operation is performed two or more times, auto-refresh cycles are repeated in the initialization sequence accordingly.

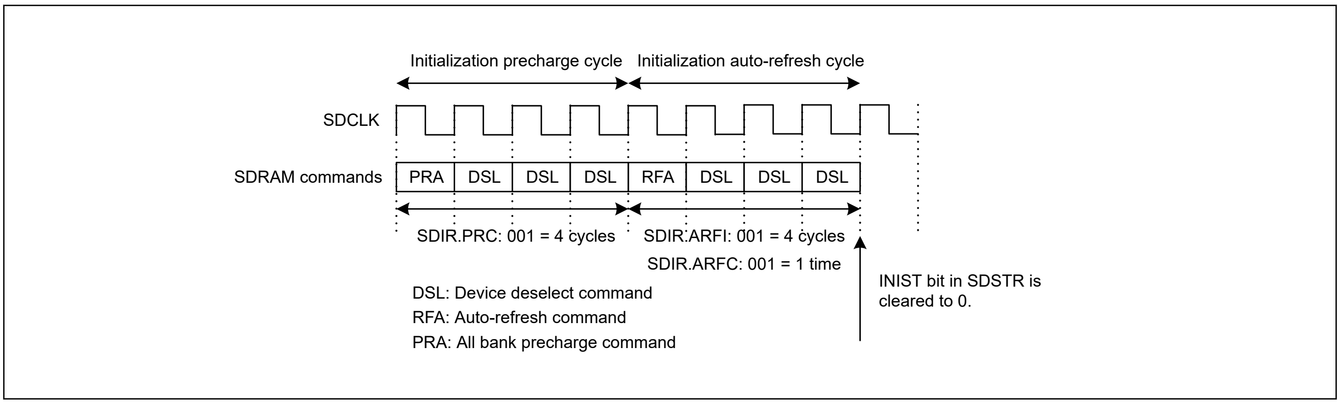

Figure 15.43 Example timing for SDRAM initialization sequence

15.6.9 Setting the Mode Register

Setting the SDRAM Mode Register (SDMOD) allows the mode register set command to be issued to the SDRAM and the value set in the MR[14:0] bits in SDMOD to be output to the lower bits of the address, specifically to A14 to A00 for 8-bit bus width, A15 to A01 for 16-bit bus width or A16 to A02 for 32-bit bus width. Before setting the mode register, set the SDRAM Bus Width Select bits in the SDC Control Register (SDCCR.BSIZE[1:0]) to determine the data bus width of the SDRAM.

Figure 15.44 shows the mode register setting timing.

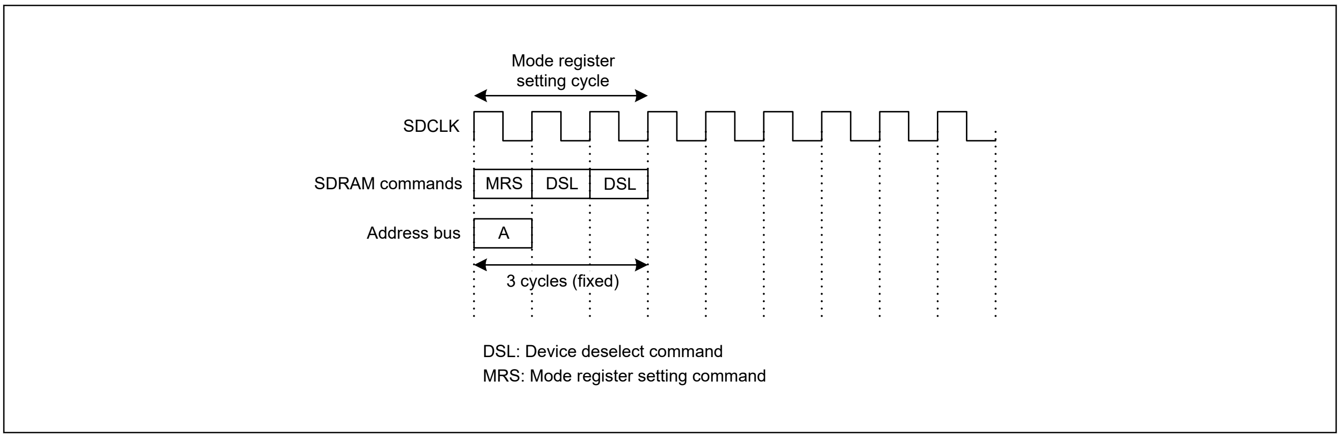

Figure 15.44 Mode register setting timing

15.6.10 Read/Write Access

There are two types of SDRAM read / write access:

- Single access
  The row address is output each time the data is accessed to access the data.
- Consecutive access
  When the same row address is accessed consecutively, after the row address is output, the data can be accessed at high speed simply by changing the column address.

When the continuous access enable bit (SDAMOD.BE) of the SDRAM access mode register is 1, consecutive access operation of SDRAM is enabled.

If the transfer from the bus master has a burst length of 2 or more and the transfer data size is less than or equal to the external bus width, consecutive access will occur.

(1) Single access

Figure 15.45 shows timing examples for single read and single write. The access timing changes depending on the setting of the SDRAM timing register (SDTR). For details, see section 15.6.11.3. Timing Register Settings and Access Timing.

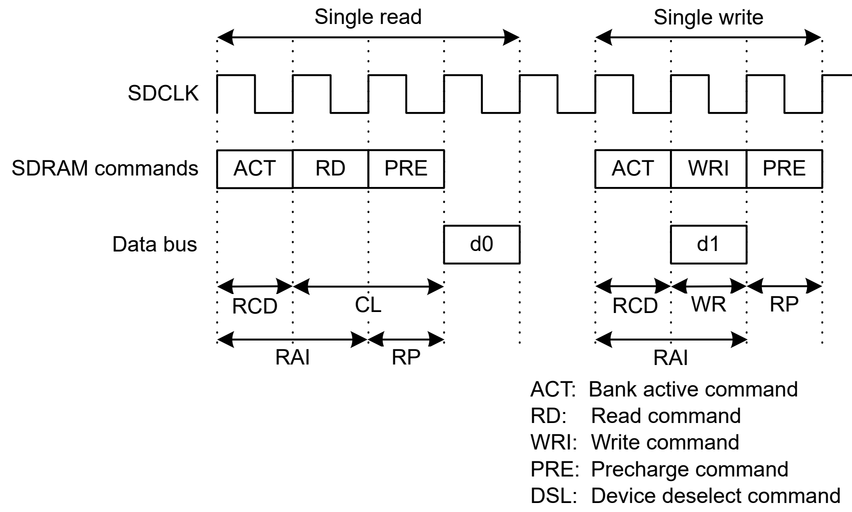

Figure 15.45 Example timing for single read/write

(2) Consecutive access

Figure 15.46 shows an example of the timing when performing consecutive read and continuous write of 4 data.

In addition, if the row address of SDRAM changes during transfer, the row is automatically deactivated and activated.

The access timing changes depending on the setting of the SDRAM timing register (SDTR). For details, see section 15.6.11.3. Timing Register Settings and Access Timing.

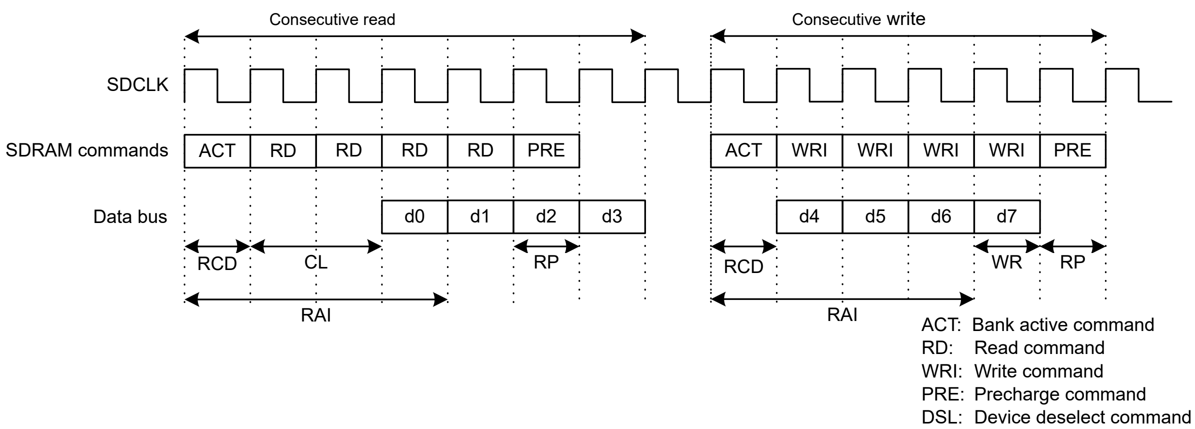

Figure 15.46 Example timing for Consecutive read/write

Figure 15.47 shows an example of the timing when the row address changes during consecutive writing.

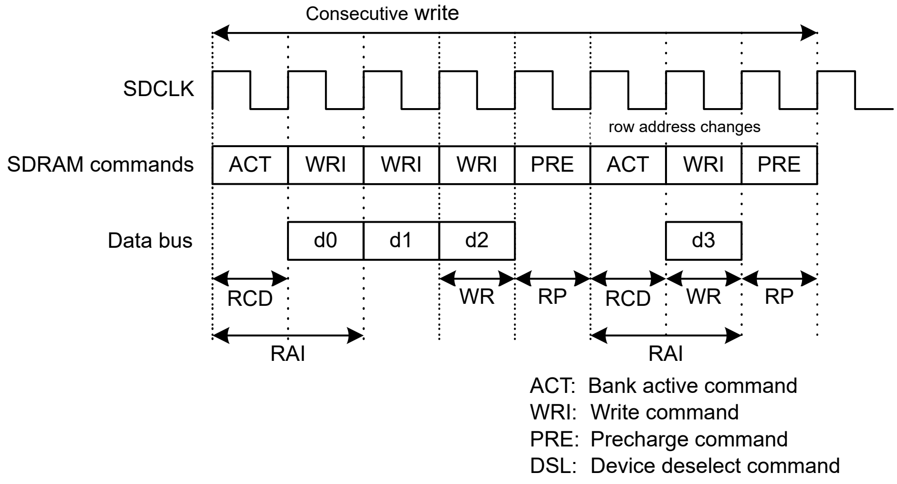

Figure 15.47 Example timing for Consecutive write when row address changes

Note: When consecutive burst write accesses are issued from bus masters to SDRAM area, a redundant write access may occurs if the following conditions are all satisfied, the last write access to SDRAM in the preceding burst access is repeated with the same address and the same write data.

- The preceding burst write and the following burst write have the same transfer size, and the transfer size is 8, 16, or 32 bits.
- The address of the subsequent burst write is the last address of the preceding burst write plus the transfer size.
- The burst length of the preceding burst write is 2 or more and that of the subsequent burst write is 1.

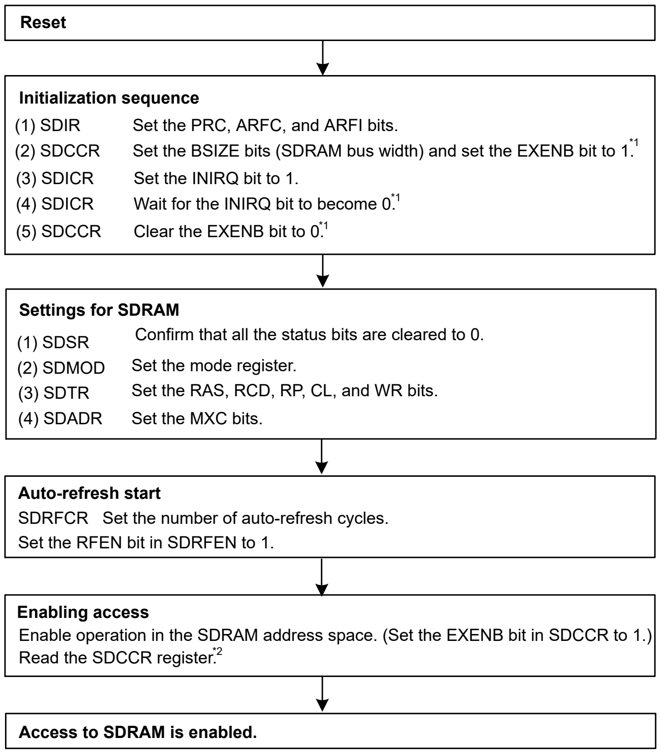
15.6.11 SDRAMC Setting Examples

This section describes the following:

- SDRAMC setting procedure
- Timing register setting examples
- Procedure for transitioning to and recovering from self-refresh mode.

15.6.11.1 SDRAMC Access Procedure

Figure 15.48 shows the SDRAMC setting procedure.



Note 1. If the SDRAM bus width is 16-bit, these two steps can be skipped.

Note 2. When setting with CPU0 (Cortex-M85 core), use a barrier instruction to prevent the SDCCR read access and external bus access from being reversed.

Figure 15.48 SDRAMC setting procedure

15.6.11.2 Procedure for Transitioning to and Recovering from Self-refresh Mode

Figure 15.49 shows the procedure for transitioning to and recovering from self-refresh mode.

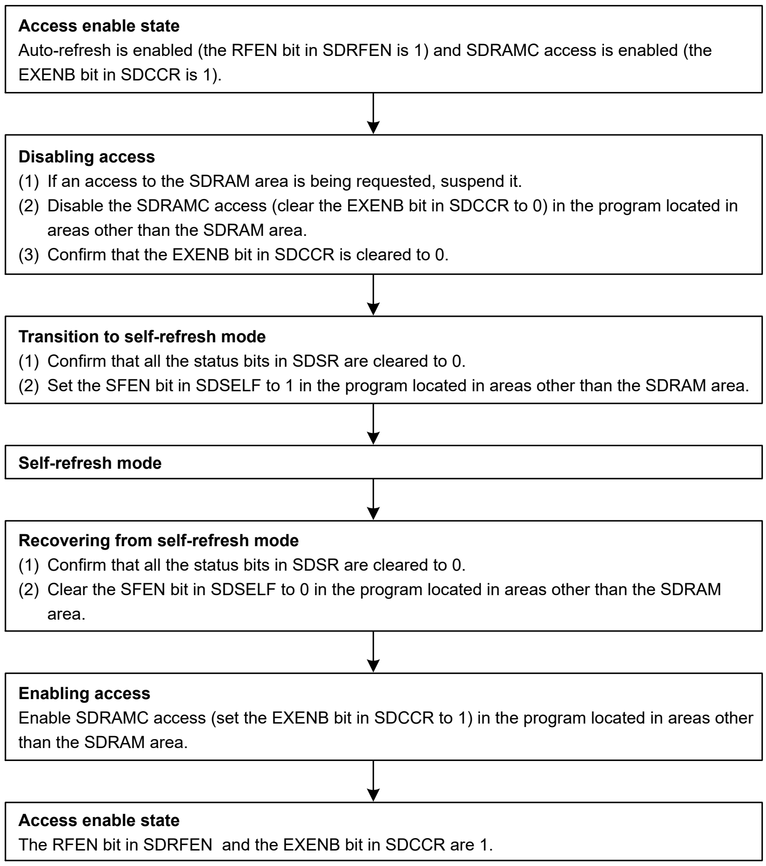


Figure 15.49 Procedure for transitioning to and recovering from self-refresh mode

Note: Self-refresh mode cannot be invoked during SDRAM access. SDRAM access must be disabled during both transition to and recovery from self-refresh mode. Follow the programming instructions shown in Figure 15.50.

Before transitioning to self-refresh mode, disable access to the SDRAM area.

During transition to self-refresh mode, self-refresh operation, and recovery from self-refresh mode, do not allow any operand access or instruction fetch, including prefetch to the SDRAM area, to be generated.

Figure 15.50 shows the procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode.

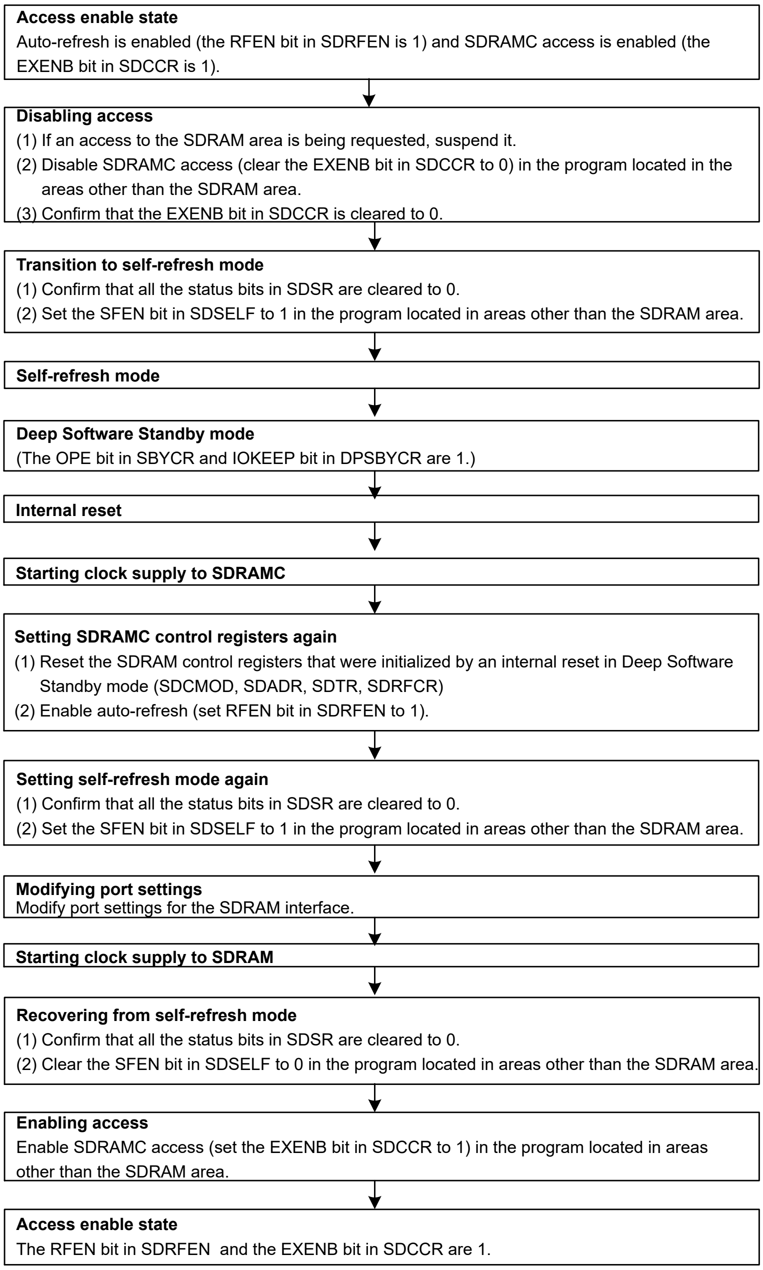

Figure 15.50 Procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode

15.6.11.3 Timing Register Settings and Access Timing

This section describes the relationship between read and write timing and the settings in the SDRAM Timing Register (SDTR).

(1) Single read timing examples

Figure 15.51 to Figure 15.55 show the relationship between single read timing and the SDTR register settings. Table 15.32 shows the correspondence between the figures and the SDTR register settings.

During read access, the next bus access is enabled at the earliest 2 cycles after the read data becomes valid. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the read data becomes valid, as shown in Figure 15.55.

Table 15.32 Correspondence between timing figures and STDR register settings for single read timing

Figure number	RAI[2:0] settings	Number of cycles	RCD[1:0] settings	Number of cycles	RP[2:0] settings	Number of cycles	CL[2:0] settings	Number of cycles

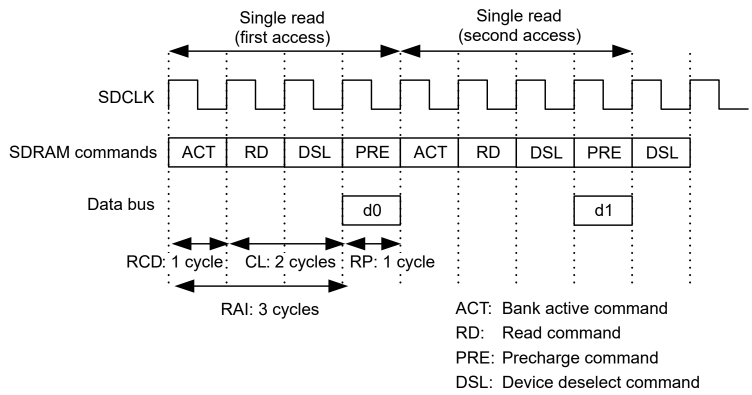

Figure 15.55 Example timing for single read (5), when two bus accesses occur for one transfer request

(2) Single write timing examples

Figure 15.56 to Figure 15.60 show the relationship between the single write timing and the SDTR register settings. Table 15.33 shows the association between the figures and the SDTR register settings. During write access, the next bus access is enabled at the earliest 2 cycles after a precharge command (PRE) is issued. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the PRE is issued, as shown in Figure 15.60.

Table 15.33 Association between timing figures and STDR register settings for single write timing

15.6.12 Address Multiplexing

In the SDRAM space, row and column addresses are multiplexed. The size of the shift in a row address must be specified in the Address Multiplex Select bits (SDADR.MXC[1:0]) in the SDRAM Address Register (SDADR). Additionally, in the SDRAM space, the address precharge-select command (Precharge-sel) is output to the upper bits of column addresses. Table 15.36 shows the relationship between the SDADR.MXC[1:0] settings and the shift amount.

Table 15.36 Address multiplexing (1 of 2)

MXC [1:0]	Shift amount	Data bus width	Address	Address pins external to the MCU																
				A16	A15	A14	A13	A12	A11	A10	A09	A08	A07	A06	A05	A04	A03	A02	A01	A00

15.6.14 Constraints

(1) Prohibition of access across areas of the address space

Access across multiple areas of the address space is prohibited with one access, and operation in that case is not guaranteed. Make sure that one word, longword access does not span two areas across the boundaries of each area of the address space.

(2) Low Power condition

In Software Standby and Deep Software Standby modes, auto-refresh operation is not available because the clock supply to the SDRAMC is stopped. To retain the data in the SDRAM when the SDRAM is externally connected, use the self-refresh function. For the procedure for transitioning to and recovering from self-refresh mode, see section 15.6.6. Self-Refresh.

(3) Setting the SDRAM Timing Register

Set the RAI[2:0] bits in the SDRAM Timing Register (SDTR) to a value less than or equal to the sum of the row column latency (SDTR.RCD[1:0]) and column latency (SDTR.CL[2:0]) settings. Operation is not guaranteed if this condition is not satisfied.

(4) Instruction code constraint

You must fix the instruction code to little-endian order.

See section 15.2.5.1. Endianness Constraint for details.

(5) Consecutive access mode

When SDAMOD.BE is "1" (continuous access enable), setting SDTR.CL = "1" is prohibited, and the operation is not guaranteed when SDTR.CL = "1" is set.

15.7 Bus Error Monitoring Section

This monitoring system monitors each individual area, and whenever it detects an error, it returns the error to the requesting master IP.

15.7.1 Bus Error Types

The following types of errors can occur on each bus:

- Master Security Attribution Unit error
- Bus master MPU error.
- Illegal address access.
- Slave TrustZone Filter error
- Bus error transmitted from each slave IP.

Table 15.46 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see section 16, Memory Protection Unit (MPU).

15.7.2 Operations When a Bus Error Occurs

15.7.2.1 Operations When a Bufferable Write Error Occurs

If an access violation occurs due to the bufferable write access an error response may not be returned to the bus master.

When a bufferable write access error that does not return an error response is detected, access is blocked and 1 is set in the bit corresponding to the error occurrence location of MBWERRSTAT. Furthermore, the bus error interrupt request or reset request is generated according to the setting of the BUSOAD.BWERROAD. Since MBWERRSTAT is held until reset other than Bus and Memory Error Reset or cleared by MBWERRCLR, they can be confirmed in the bus error interrupt handler.

A bufferable write access error can occur in the following cases.

1. CPU0 M-AXI accesses CPU1TCMBI and slave bus error or a slave TrustZone Filter error occurs.
2. CPU0 P-AHB accesses illegal address area.
3. CPU0 P-AHB accesses accessible area and slave bus error or a slave TrustZone Filter error occurs.
4. CPU1 C-AHB accesses illegal address area.
5. CPU1 C-AHB accesses accessible area and slave bus error or a slave TrustZone Filter error occurs.
6. CPU1 S-AHB accesses illegal address area.
7. CPU1 S-AHB accesses accessible area and slave bus error or a slave TrustZone Filter error occurs.
8. DMA accesses PABI, PBBI, PIBI, PSBI, CPU0SAHBI and CPU1TCMBI and slave bus error or a slave TrustZone Filter error occurs.

Table 15.43 Bus error notice method for Bufferable write access

OAD Setting	DAP	CPU0, CPU1	Other
BUSOAD.BWERROAD = 0	Interrupt	Interrupt	Interrupt
BUSOAD.BWERROAD = 1	Reset	Reset	Reset

The bus error interrupt request BUS_ERR can be assigned as Non-maskable interrupt request. See the ICU.NMIER register specification for details.

15.7.2.2 Operations When an Error except Bufferable Write Error Occurs

When a bus error occurs for an access other than the bufferable write, error access is blocked, and error operations determine by OAD setting and the bus master are performed. Table 15.44 shows OAD setting corresponding to each error. Table 15.45 shows how to notify when a bus error occurs.

- When OAD setting is interrupt.
  Error response is returned to the bus master.
  If BUSIRQEN<Master Name>.EN=1, the bus error interrupt BUS_ERR is generated.
  The bus error interrupt request BUS_ERR can also be used as Non-maskable interrupt request. See the ICU.NMIER register specifications for details.
- When OAD setting is Reset.
  Error response is returned to the bus master and reset request is generated.

Table 15.44 OAD setting corresponding to each error

Error type	OAD bit
MSAU Error	MSAOAD.OAD
MPU Error	MMPUOAD.OAD
Illegal Address Access Error	BUSOAD.ILERROAD
Slave Bus Error	BUSOAD.SLERROAD
Slave TrustZone Filter error	BUSOAD.SLERROAD

Table 15.45 Bus error notice method for Non-bufferable write access

OAD setting		DAP*1	CPUn (n = 0, 1)	DMAC/DTCn (n = 0, 1)	EDMAC	CEU
Interrupt	Bus	Error response only	BUS_ERR	BUS_ERR	BUS_ERR	BUS_ERR
	Bus Master		BusFault	DMAn_TRANSERR	ETHER_GWEI	—
Reset	Bus/Bus Master	Error response only	Reset	Reset	Reset	Reset

Note: DMAC/DTC0, DMAC/DTC1 and EDMAC can issue interrupt when it receives error response. This interrupt is output to ICU and transmitted from ICU to CPU.

Note 1. Only when the bus master is DAP, only an error response is returned regardless of the BUSOAD.OAD setting, and Interrupt and Reset requests are not generated.

Figure 15.67 shows the OAD setting flow after reset. During this register setting, stop the Bus Master.

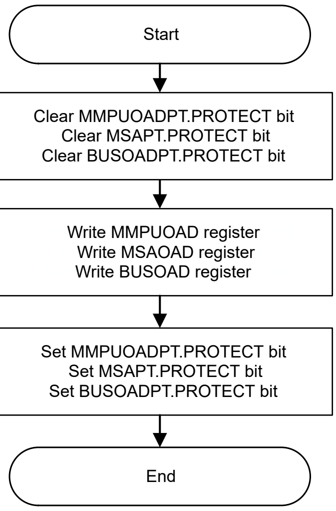

Figure 15.67 OAD setting flow after reset

For details of MMPUOADPT register and MMPUOAD register, see section 16, Memory Protection Unit (MPU).

For details of MSAPT register and MSAOAD register, see section 51, Security Features.

(1) Master Security Attribution Unit Error

The bus master of other than CPU and DAP has MSAU to block access to secure alias address from non-secure masters. The CPU does not have MSAU since it has IDAU and SAU. When MSAU Error is detected, an Error response is returned to the Master. At the same time, set 1 to MSERRSTAT bit of BUSERRSTAT<Master Name>. Furthermore, the bus error interrupt request or reset request is generated according to the setting of the MSAOAD.OAD and BUSIRQEN<Master Name>.EN. Since BUSERRSTAT<Master Name> is held until reset other than Bus error reset, Common memory reset, and CPU local memory reset Error Reset or cleared by BUSERRCLR<Master Name>, they can be confirmed in the bus error interrupt handler or after reset. The bus error interrupt is generated only at the first MSAU Error after reset or clearing BUSERRSTAT<Master Name>.MSERRSTAT bit by BUSERRCLR<Master Name>.

(2) Bus Master MPU Error

The bus master of other than CPU and DAP has Master-MPU for access control of the set address area. The CPU does not have Master-MPU since it has ARM MPU. When Master-MPU Error is detected, an Error response is returned to the Master. At the same time, set 1 to MMERRSTAT bit of BUSERRSTAT<Master Name>. Furthermore, the bus error interrupt request or reset request is generated according to the setting of the MMPUOAD.OAD and BUSIRQEN<Master Name>.EN. Since BUSERRSTAT<Master Name> is held until reset other than Bus error reset, Common memory reset, and CPU local memory reset Error Reset or cleared by BUSERRCLR<Master Name>, they can be confirmed in the bus error interrupt handler or after reset. The bus error interrupt is generated only at the first Master-MPU Error after reset or clearing BUSERRSTAT<Master Name>.MMERRSTAT bit by BUSERRCLR<Master Name>.

(3) Illegal Access Error

According to section 15.7.3. Conditions Leading to Illegal Address Access Errors, the illegal address access error occurs. When illegal address access error is detected, an Error response is returned to the Master. When a master other than DAP caused the illegal address access error, set 1 to ILERRSTAT bit of BUSERRSTAT<Master Name>. Furthermore, the bus error interrupt request or reset request is generated according to the setting of the BUSOAD.ILERROAD and BUSIRQEN<Master Name>.EN. Since BUSERRSTAT<Master Name> is held until reset other than Bus error reset, Common memory reset, and CPU local memory reset Error Reset or cleared by BUSERRCLR<Master Name>, they can be confirmed in the BusFault Handler or the bus error interrupt handler. The bus error interrupt is generated only at the first Illegal Error after reset or clearing BUSERRSTAT<Master Name>.ILERRSTAT bit by BUSERRCLR<Master Name>.

(4) Slave TrustZone Filter Error

When Slave TrustZone Filter Error is detected, an Error response is returned to the Master. When a master other than DAP caused Slave TrustZone Filter error, set 1 to SLERRSTAT bit of BUSERRSTAT<Master Name>. Furthermore, the bus error interrupt request or reset request is generated according to the setting of the BUSOAD.SLERROAD and BUSIRQEN<Master Name>.EN. Since BUSERRSTAT<Master Name> is held until reset other than Bus error reset, Common memory reset, and CPU local memory reset or cleared by BUSERRCLR<Master Name>, they can be confirmed in the bus error interrupt handler or after reset. The bus error interrupt is generated only at the first Slave TrustZone Filter Error after reset or clearing BUSERRSTAT<Master Name>.SLERRSTAT bit by BUSERRCLR<Master Name>.

(5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the Master. When a master other than DAP caused Slave Bus error, set 1 to SLERRSTAT bit of BUSERRSTAT<Master Name>. Furthermore, the bus error interrupt request or reset request is generated according to the setting of the BUSOAD.SLERROAD and BUSIRQEN<Master Name>.EN. Since BUSERRSTAT<Master Name> is held until reset other than Bus and Memory Error Reset or cleared by BUSERRCLR<Master Name>, they can be confirmed in the BusFault Handler or bus error interrupt handler. The bus error interrupt is generated only at the first Slave-Bus Error after reset or clearing BUSERRSTAT<Master Name>.SLERRSTAT bit by BUSERRCLR<Master Name>.

15.7.3 Conditions Leading to Illegal Address Access Errors

Illegal address access error by bus access occurs in the address space shown in Table 15.46.

Table 15.46 Conditions leading to illegal address access errors (1 of 4)

Address			MASTER bus							
							DMAC/DTC			GRAPHIC

0xA000_0000	0xFFFF_FFFF	Reserved	E	N/A	N/A	E	E	E	E	E

Note: "E" : A bus error is occurred.
"N/A" : Transfer does not occur.
"—" : A bus error has not occurred. Even if there is reserved area, a bus error has not occurred.
Do not access the reserved area in Code MRAM, Extra MRAM, SRAM0, SRAM1, SRAM2, and SRAM3. If accessed, a slave TrustZone Filter error may occur.

Note 1. The product with Code MRAM size of 512 KB is "E", others is "—".
Note 2. The product with Code MRAM size of 512 KB or 768 KB is "E", others is "—".
Note 3. The product without SIP-FLASH is "—", and the product with SIP-FLASH is "E".

15.7.4 Timeout

As for some peripheral module, a timeout error can occur in the module-stop function.

When there is no response from the slave for a certain time period, a timeout error is detected.

Timeout error is returned to the request master IP by Error response of the AHB-Lite protocol.

16. Memory Protection Unit (MPU)

16.1 Overview

EDMAC in this chapter refers to the GWCA function of ESWM.

All bus masters have Memory Protection Units (MPUs).

Table 16.1 lists the MPU specifications, and Table 16.2 shows the behavior on detection of each MPU error.

Table 16.1 MPU specifications

Classification	Module/Function	Specifications
Memory protection	Arm MPU	Memory protection function for the CPU: ● CPU0: Secure MPU 8 regions and Non-secure MPU 8 regions ● CPU1: Secure MPU 8 regions and Non-secure MPU 8 regions
	Bus master MPU	Memory protection function for each bus master except for the CPU: ● DMAC0 (DMAC/DTC0): 8 regions ● DMAC1 (DMAC/DTC1): 8 regions ● EDMAC (Ether-DMAC): 5 regions ● CEU: 2 regions

Table 16.2 Behavior on MPU error detection

MPU type	Access permissions setting	Boundary address setting minimum unit	Error response for the MPU error notification	Bus access at error detection	Hold the information of error access
Arm MPU	Read access Write access Execution	32 bytes	Supported*1	● Incorrectly write access ● Incorrectly read access	Hold in CPU
Bus master MPU	Read access Write access Privileged access (DMAC/DTC only)	DMAC0/1: 32 bytes EDMAC: 32 bytes CEU: 4 KB	Supported	● Write access ignored ● Read access is read as 0	Hold

Note 1. A privileged DAP request through the unprivileged debug extension mechanism is demoted to an unprivileged access and is subject to MPU checks. Both privileged and unprivileged requests are subject to MPU checks.

For information on error access for the Arm MPU, see section 16.4. References. For information on error access for other MPUs, see section 16.3.1. Register Descriptions and section 15.7. Bus Error Monitoring Section.

16.2 Arm MPU

The Arm MPU provides full support for:

- CPU0, 1: 8 secure regions and 8 non-secure regions
- Access permissions
- Export of memory attributes to the system

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see section 16.4. References.

16.3 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000_0000 to 0xFFFF_FFFF). The access control information can be set up to:

- 8 regions in DMAC0
- 8 regions in DMAC1
- 5 regions in EDMAC
- 2 regions in CEU

The bus master MPU monitors access to each region based on these settings.

If accesses violate the access permissions that are configured in the bus master MPU or crossing the boundaries of a valid MPU region with burst access, the bus master MPU returns an error response. For information on error access, see section 16.3.1. Register Descriptions and section 15.7.2. Operations When a Bus Error Occurs.

Table 16.3 lists the specifications of the bus master MPU.

Table 16.3 Bus master MPU specifications

Parameter	Description
Master groups	(Group name: Corresponding bus master) ● DMAC0: DMAC/DTC0 ● DMAC1: DMAC/DTC1 ● EDMAC: Ether-DMAC ● CEU: CEU
Protected regions	0x0000_0000 to 0xFFFF_FFFF
Number of regions	● DMAC0: 8 regions ● DMAC1: 8 regions ● EDMAC: 5 regions ● CEU: 2 regions
Address specification for individual regions	● Region start and end addresses are configurable
Enable or disable setting for memory protection in individual regions	● Settings enabled or disabled for the associated region
Access-control settings for individual regions	● Permission to read and write ● Permission to unprivileged access
Operation on error detection	● Reset or error response
Register protection	● Register can be protected from illegal writes

16.3.1 Register Descriptions

Register writes processing should be performed after stopping the corresponding master group bus access.

SA (Secure Attribution) is set in each register and the SA is used to determine whether the target register is a secure register or a non-secure register.

16.3.1.1 MMPUSARA : Master Memory Protection Unit Security Attribution Register A

15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	MMPUASA23 to MMPUASA16	MMPUAn Security Attribution (n = 16 to 23) 0: Secure 1: Non-secure	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

MMPUASA bits (MMPUAn Security Attribution (n = 0 to 7))

These bits specify security attributes of the Bus Master MPU Region Setting register for DMAC0. The target registers are as follows:

- MMPUSDMAC00n
- MMPUEDMAC00n
- MMPUACDMAC00n

MMPUASA bits (MMPUAn Security Attribution (n = 16 to 23))

These bits specify security attributes of the Bus Master MPU Region Setting register for DMAC1. The target registers are as follows:

- MMPUSDMAC10y (y = n − 16)
- MMPUEDMAC10y (y = n − 16)
- MMPUACDMAC10y (y = n − 16)

16.3.1.2 MMPUSARB : Master Memory Protection Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x134

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MMPU BSA8	—	—	—	—	—	—	MMPU BSA1	MMPU BSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MMPUBSA0	MMPUB0 Security Attribution 0: Secure 1: Non-secure	R/W
1	MMPUBSA1	MMPUB1 Security Attribution 0: Secure 1: Non-secure	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	MMPUBSA8	MMPUB8 Security Attribution 0: Secure 1: Non-secure	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

MMPUBSA0 bit (MMPUB0 Security Attribution)

This bit specifies the security attributes of the DMAC0 MPU Enable Setting register. The target registers are as follows:

- MMPUENDMAC0
- MMPUENPTDMAC0

MMPUBSA1 bit (MMPUB1 Security Attribution)

This bit specifies the security attributes of the DMAC1 MPU Enable Setting register. The target registers are as follows:

- MMPUENDMAC1
- MMPUENPTDMAC1

MMPUBSA8 bit (MMPUB8 Security Attribution)

This bit specifies the security attributes of the MPU Operation After Detection Setting register. The target registers are as follows:

- MMPUOAD
- MMPUOADPT

16.3.1.3 MMPUSDMACmn : MMPU Start Address Register for DMAC (m = 0, 1, n = 00 to 07)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0204 + 0x0010 × n (DMAC0n)
0x0404 + 0x0010 × n (DMAC1n)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_FFE0. Writing is ignored for bit 0 to bit 4. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSDMACmn (m = 0, 1, n = 00 to 07) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access are prohibited. When byte access and halfword access are executed, operation is not guaranteed.

Regions set by MMPUSDMACmn (m = 0, 1, n = 00 to 07), MMPUEDMACmn (m = 0, 1, n = 00 to 07) and MMPUACDMACmn (m = 0, 1, n = 00 to 07) registers, can be set for a secure access or a non-secure access with the MMPUSARA register. If the corresponding MMPUSARA.MMPUASAn (n = 0 to 7, 16 to 23) bit is set to 1, it is only possible to use that region with a non-secure access. On the other hand, if the corresponding MMPUSARA.MMPUASAn (n = 0 to 7, 16 to 23) bit is set to 0, it is only possible to use that region with a secure access.

16.3.1.4 MMPUSEDMACn : MMPU Start Address Register for EDMAC (n = 0 to 4)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0604 + 0x010 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for EDMAC Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_FFE0. Writing is ignored for bit 0 to bit 4. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSEDMACn (n = 0 to 4) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access are prohibited. When byte access and halfword access are executed, operation is not guaranteed.

16.3.1.5 MMPUSCEUn : MMPU Start Address Register for CEU (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0E04+ 0x010 × n

Bit position: 31 … 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x x x x 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for CEU Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_F000. Writing is ignored for bit 0 to bit 11. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSCEUn (n = 0, 1) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access are prohibited. When byte access and halfword access are executed, operation is not guaranteed.

16.3.1.6 MMPUEDMACmn : MMPU End Address Register for DMAC (m = 0, 1, n = 00 to 07)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0208 + 0x0010 × n (DMAC0n)
0x0408 + 0x0010 × n (DMAC1n)

Bit position: 31 … 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register Address where the region end, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_001F to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 4. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEDMACmn (m = 0, 1, n = 00 to 07) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access are prohibited. When byte access and halfword access are executed, operation is not guaranteed.

16.3.1.7 MMPUEEDMACn : MMPU End Address Register for EDMAC (n = 0 to 4)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0608 + 0x0010 × n

Bit position: 31 … 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for EDMAC Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_001F to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 4. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEEDMACn (n = 0 to 4) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access are prohibited. When byte access and halfword access are executed, operation is not guaranteed.

16.3.1.8 MMPUECEUn : MMPU End Address Register for CEU (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0E08 + 0x010 × n

Bit position: 31 … 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x x x x 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for CEU Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_0FFF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 11. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUECEUn (n = 0, 1) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access are prohibited. When byte access and halfword access are executed, operation is not guaranteed.

16.3.1.9 MMPUACDMACmn : MMPU Access Control Register for DMAC (m = 0, 1, n = 00 to 07)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0200 + 0x0010 × n (DMAC0n)
0x0400 + 0x0010 × n (DMAC1n)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	PP	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: DMAC region n unit is disabled 1: DMAC region n unit is enabled	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
3	PP	Privilege protection 0: Unprivileged access permission 1: Unprivileged access protection	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the DMACm region n (m = 0, 1, n = 00 to 07) unit.

When the ENABLE bit is set to 1, the RP bit, the WP bit and the PP bit are enabled for permit or protect access to the region that is set in MMPUSDMACmn (m = 0, 1, n = 00 to 07) and MMPUEDMACmn (m = 0, 1, n = 00 to 07).

When the ENABLE bit is set to 0, the access to DMACm region n (m = 0, 1, n = 00 to 07) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for DMACm region n (m = 0, 1, n = 00 to 07).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for DMACm region n (m = 0, 1, n = 00 to 07).

When the ENABLE bit is set to 1, the WP bit is available.

PP bit (Privilege protection)

The PP bit enables or disables unprivileged access protection for DMACm region n (m = 0, 1, n = 00 to 07).

When the ENABLE bit is set to 1, the PP bit is available.

16.3.1.10 MMPUACEDMACn : MMPU Access Control Register for EDMAC (n = 0 to 4)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0600 + 0x0010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: EDMAC region n unit is disabled. 1: EDMAC region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the EDMAC region n (n = 0 to 4) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSEDMACn (n = 0 to 4) and MMPUEEDMACn (n = 0 to 4).

When the ENABLE bit is set to 0, the access to EDMAC region n (n = 0 to 4) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for EDMAC region n (n = 0 to 4).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for EDMAC region n (n = 0 to 4).

When the ENABLE bit is set to 1, the WP bit is available.

16.3.1.11 MMPUACCEUn : MMPU Access Control Register for CEU (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0E00 + 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: CEU region n unit is disabled 1: CEU region n unit is enabled	R/W

Bit	Symbol	Function	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the CEU region n (n = 0, 1) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSCEUn (n = 0, 1) and MMPUECEUn (n = 0, 1).

When the ENABLE bit is set to 0, the access to CEU region n (n = 0, 1) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for CEU region n (n = 0, 1).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for CEU region n (n = 0, 1).

When the ENABLE bit is set to 1, the WP bit is available.

16.3.1.12 MMPUENDMACm : MMPU Enable Register for DMAC (m = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0100 (DMAC0n)
0x0300 (DMAC1n)

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of DMAC Enable 0: Bus master MPU of DMAC is disabled 1: Bus master MPU of DMAC is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of DMAC Enable)

The ENABLE bit enables or disables the bus master MPU function for DMACm (m = 0, 1).

When the ENABLE bit is set to 1, MMPUACDMACmn (m = 0, 1, n = 00 to 07) is available.

When the ENABLE bit is set to 0, MMPUACDMACmn (m = 0, 1, n = 00 to 07) is unavailable including permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.13 MMPUENEDMAC : MMPU Enable Register for EDMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0500

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of EDMAC Enable 0: Bus master MPU of EDMAC is disabled 1: Bus master MPU of EDMAC is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of EDMAC Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACEDMACn (n = 0 to 3) is available.

When the ENABLE bit is set to 0, MMPUACEDMACn (n = 0 to 3) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.14 MMPUENCEU : MMPU Enable Register for CEU

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0D00

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of CEU Enable 0: Bus master MPU of CEU is disabled 1: Bus master MPU of CEU is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of CEU Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACCEUn (n = 0, 1) is available.

When the ENABLE bit is set to 0, MMPUACCEUn (n = 0, 1) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.15 MMPUENPTDMACm : MMPU Enable Protect Register for DMAC m (m = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0104 (DMAC0n)
0x0304 (DMAC1n)

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENDMACm register write is possible. 1: MMPUENDMACm register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENDMACm (m = 0, 1) register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.16 MMPUENPTEDMAC : MMPU Enable Protect Register for EDMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0504

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENEDMAC register write is possible. 1: MMPUENEDMAC register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENEDMAC register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.17 MMPUENPTCEU : MMPU Enable Protect Register for CEU

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0D04

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENCEU register write is possible. 1: MMPUENCEU register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENCEU register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.18 MMPURPTDMACm : MMPU Regions Protect Register for DMAC Non-secure m (m = 0, 1)

Base address: RMPU_NS = 0x5000_0000

Offset address: 0x0108 (DMAC0n)
0x0308 (DMAC1n)

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DMAC write is possible. 1: Bus master MPU register for DMAC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-7
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTDMACm.PROTECT (m =0, 1) controls the following registers:

- MMPUSDMACmn (m =0, 1, n = 00 to 07) of non-secure
- MMPUEDMACmn (m =0, 1, n = 00 to 07) of non-secure
- MMPUACDMACmn (m =0, 1, n = 00 to 07) of non-secure

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.19 MMPURPTDMAC_SECm : MMPU Regions Protect Register for DMAC Secure m (m = 0, 1)

Base address: RMPU = 0x4000_0000

Offset address: 0x010C (DMAC0n)
0x030C (DMAC1n)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DMAC Secure write is possible. 1: Bus master MPU register for DMAC Secure write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-6
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTDMAC_SECm.PROTECT (m = 0, 1) controls the following registers:

- MMPUSDMACmn (m = 0, 1, n = 00 to 07) of secure
- MMPUEDMACmn (m = 0, 1, n = 00 to 07) of secure
- MMPUACDMACmn (m = 0, 1, n = 00 to 07) of secure

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.20 MMPURPTEDMAC : MMPU Regions Protect Register for EDMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0508

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for EDMAC write is possible. 1: Bus master MPU register for EDMAC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTEDMAC.PROTECT controls the following registers:

- MMPUSEDMACn (n = 0 to 4)
- MMPUEEDMACn (n = 0 to 4)
- MMPUACEDMACn (n = 0 to 4)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.21 MMPURPTCEU : MMPU Regions Protect Register for CEU

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0D08

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for CEU write is possible. 1: Bus master MPU register for CEU write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTCEU.PROTECT controls the following registers:

- MMPUSCEUn (n = 0, 1)
- MMPUECEUn (n = 0, 1)
- MMPUACCEUn (n = 0, 1)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.1.22 MMPUOAD : MMPU Operation After Detection Register

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0000

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection 0: IRQ 1: Reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the OAD bit.	R/W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

OAD bit (Operation after detection)

The OAD bit specifies operation when the access violation is detected.

When OAD bit is 0, error response is returned to the bus master, and if BUSIRQEN<Master Name>.EN = 1, IRQ request is generated. For details, see section 15.3.31. BUSIRQEN<Master Name> : BUS Error Interrupt Enable Register . Interrupts due to bus errors can also be used as NMI. For details, see the specifications of the ICU.NMIER register.

When OAD bit is 1, reset request is generated.

When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated. The KEY[7:0] bits always read as 0x00.

16.3.1.23 MMPUOADPT : MMPU Operation After Detection Protect Register

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUOAD register writing is possible. 1: MMPUOAD register writing is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code These bits enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access as byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPUOAD.PROTECT controls the following registers:

- MMPUOAD

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

16.3.2 Operation

16.3.2.1 Memory Protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If accesses violate the access permissions that are configured in bus master MPU, the bus master MPU generates a memory protection error.

Bus master MPU has master groups of DMAC0, DMAC1, EDMAC and CEU. The memory protection function checks the address of the bus for a unified master group, and blocks illegal access of the master group to the protected region by bus master MPU.

The region setting registers of the bus master MPU for DMAC can be set for secure master and non-secure master using the MMPUSARA register. The MPU region setting with MMPUSARA.MMPUASAn = 0 applies only to access from the secure master, and the MPU region setting with MMPUSARA.MMPUASAn = 1 applies only to access from the non-secure master. Figure 16.1 shows an example of access authorization for the secure master and non-secure master when both secure and non-secure MPU settings are configured.

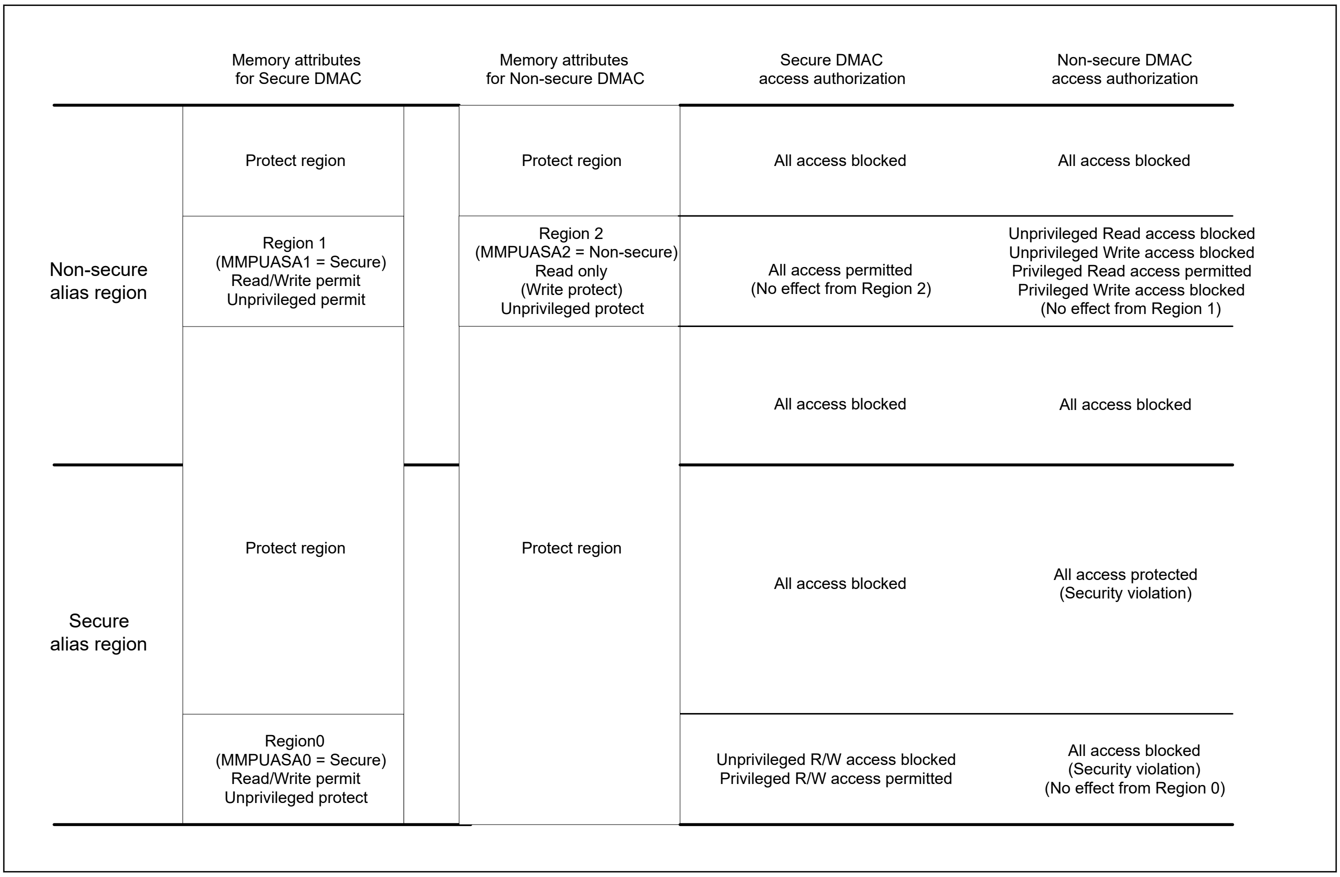

Figure 16.1 Example of access authority when both secure and non-secure regions of MPUs are set

Bus master MPU permit of all regions after reset. If MMPUENXXXX.ENABLE is 1 and there is no MPU region setting for the corresponding bus master, all regions are protected. (XXXX = Master Group name)

Figure 16.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

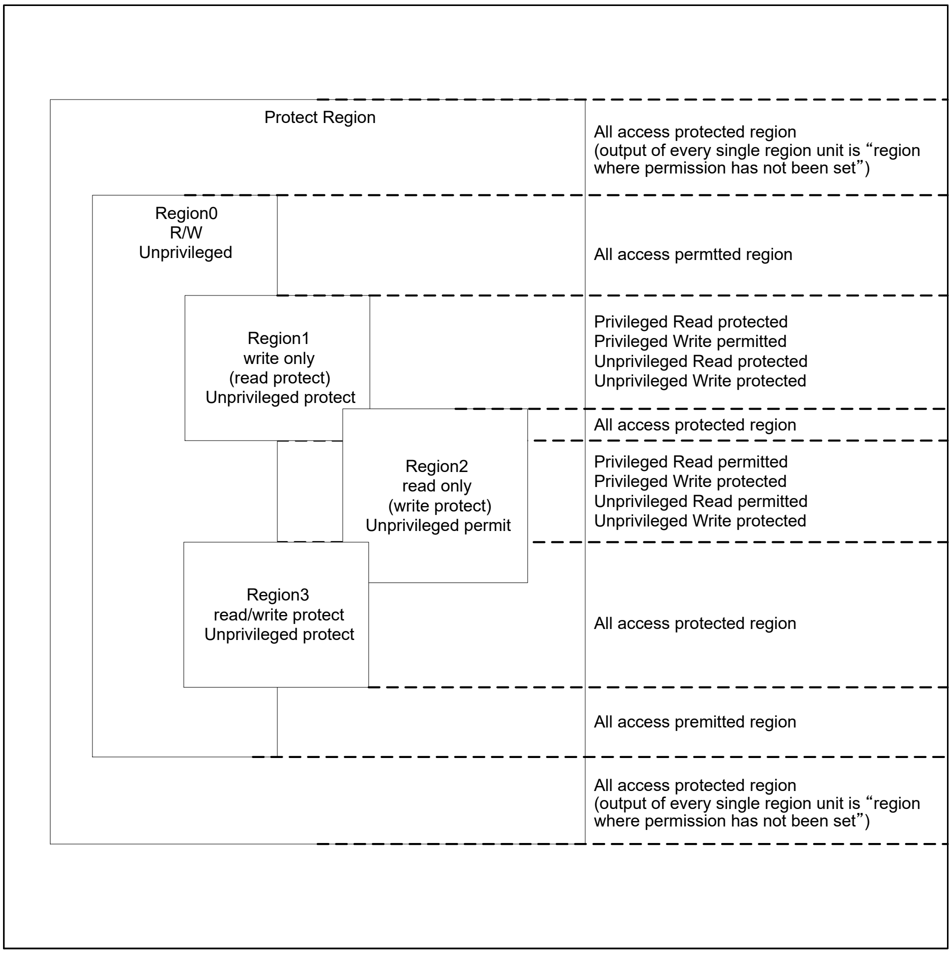

Figure 16.2 Access permission or protection by overlap of the bus master MPU regions

Figure 16.3 shows the register setting flow after reset. During this register setting, stop the bus master except the CPU.

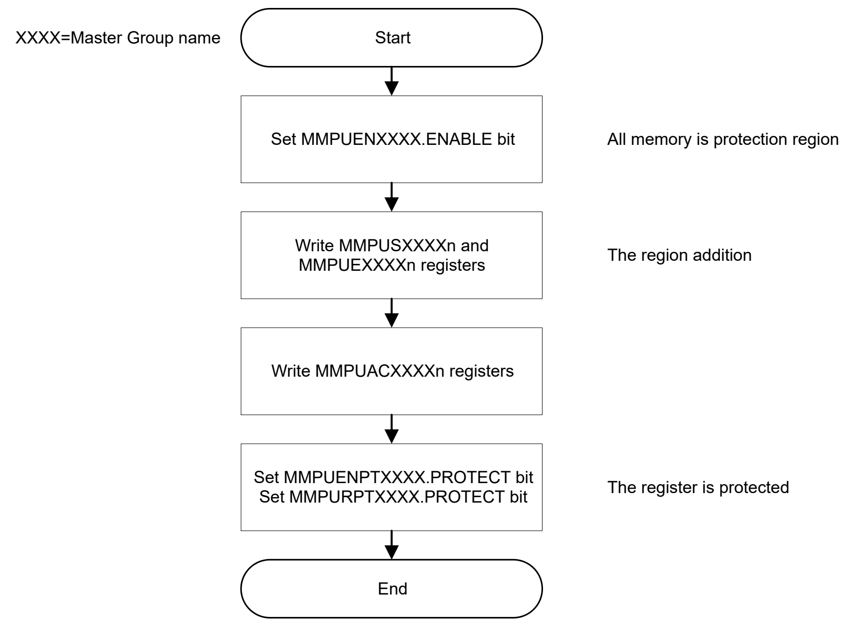

Figure 16.3 Register setting flow after reset

Figure 16.4 shows the register setting flow for adding regions. During this register setting, stop the master except the CPU.

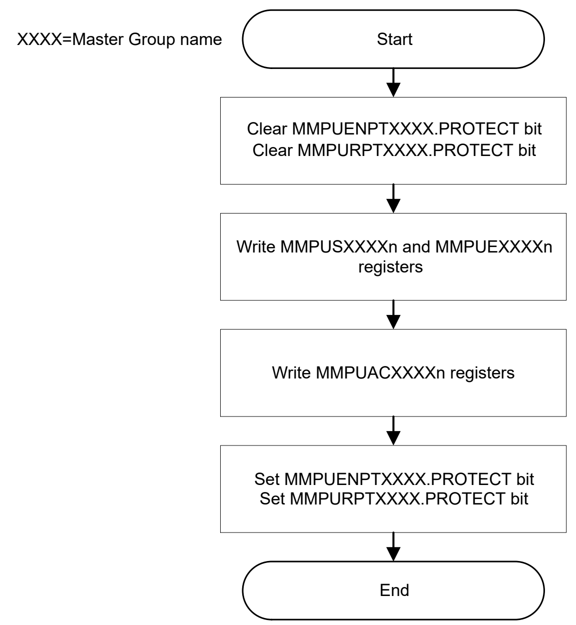

Figure 16.4 Register setting flow for region addition

16.3.2.2 Protecting the Registers

Registers related to the bus master MPU can be protected with the PROTECT bit as shown in Table 16.4.

Table 16.4 PROTECT bit and protect target registers (1 of 2)

PROTECT bit	Protect target registers
MMPUENPTDMACm.PROTECT	MMPUENDMACm (m = 0, 1)

Table 16.4 PROTECT bit and protect target registers (2 of 2)

PROTECT bit	Protect target registers
MMPUENPTEDMAC.PROTECT	MMPUENEDMAC
MMPUENPTCEU.PROTECT	MMPUENCEU
MMPURPTDMACm.PROTECT	The following registers set to Non-secure by MMPUSARA.MMPUASAn (n = 0 to 7, 16 to 23). MMPUSDMACmk (m = 0, 1, k = 00 to 07) MMPUEDMACmk (m = 0, 1, k = 00 to 07) MMPUACDMACmk (m = 0, 1, k = 00 to 07)
MMPURPTDMACm_SEC.PROTECT	The following registers set to Secure by MMPUSARA.MMPUASAn (n = 0 to 7, 16 to 23). MMPUSDMACmk (m = 0, 1, k = 00 to 07) MMPUEDMACmk (m = 0, 1, k = 00 to 07) MMPUACDMACmk (m = 0, 1, k = 00 to 07)
MMPURPTEDMAC.PROTECT	MMPUSEDMACn (n = 0 to 4) MMPUEEDMACn (n = 0 to 4) MMPUACEDMACn (n = 0 to 4)
MMPURPTCEU.PROTECT	MMPUSCEUn (n = 0, 1) MMPUECEUn (n = 0, 1) MMPUACCEUn (n = 0, 1)
MMPUOADPT.PROTECT	MMPUOAD.OAD

16.3.2.3 Memory Protection Error

If access to a protected region is detected, the bus master MPU generates an error. Set the MMPUOAD bit to select whether the error is reported as an IRQ or a reset.

For details of bus master MPU error, see section 15, Buses.

The IRQ status is indicated in ICU.IELSRn.IR. For details, see section 14, Interrupt Controller Unit (ICU). The reset status is indicated in SYSC.RSTSR1.BUSRF. For details, see section 6, Resets. Interrupts due to bus errors can also be used as NMI. For details of the specifications, see section 14.2.14. NMIER : Non-Maskable Interrupt Enable Register.

17. DMA Controller (DMAC)

17.1 Overview

The 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 17.1 lists the DMAC specifications, and Figure 17.1 shows a block diagram of the DMAC.

Table 17.1 DMAC specifications (1 of 2)

Item		DMAC0 (for CPU0)	DMAC1 (for CPU1)
Number of channels		8 channels (DMAC0n (n = 0 to 7))	8 channels (DMAC1n (n = 0 to 7))
Transfer space		4 GB (0x00000000 to 0xFFFFFFFF excluding reserved areas)	
Maximum transfer volume		64 M data (Maximum number of transfers in block transfer mode: 1,024 data × 65,536 blocks)	
DMAC activation source		Selectable for each channel: ● Software trigger ● Interrupt requests from peripheral modules or trigger input from external interrupt input pins.*1	
Channel priority		Selectable from fixed priority or round-robin ● channel 0 > channel 1 > channel 2 > channel 3 … > channel 7 > DTC (channel 0: Highest) ● Round-robin	
Transfer data	Single data	Bit length: 8, 16, 32, 64 bits	
	Block size	Number of data: 1 to 1,024	
Transfer mode	Normal transfer mode	● One data transfer by one DMA transfer request ● Free running function (setting in which total number of data transfers is not specified) settable	
	Repeat transfer mode	● One data transfer by one DMA transfer request ● Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. ● Maximum settable repeat size: 1,024 ● Selectable free running function	
	Repeat-block transfer mode	● One block data transfer by one DMA transfer request ● Maximum settable block size: 1,024 ● Block transfer can be repeated ● Maximum settable repeat size: 64K ● Selectable free running function	
	Block transfer mode	● One block data transfer by one DMA transfer request ● Maximum settable block size: 1,024 data ● Selectable free running function	
Selective functions	Extended repeat area function	● Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed ● Area of 2 bytes to 128 MB separately settable as extended repeat area for transfer source and destination	
Processing on DMAC transfer error		● When DMAC transfer error occurs, the channel on which the error occurred is stopped. ● DMAC Event link setting register (DELSRn (n =0 to 7)) in the ICU is cleared. Clearing targets are selectable for each channel or all channels.	
Interrupt DMACmn_INT (m = 0, 1, n = 0 to 7)	Transfer end interrupt	Generated on completion of transferring data volume specified by the transfer counter.	
	Transfer escape end interrupt	● Generated when the repeat size of data transfer is completed. ● Generated when the source address extended repeat area overflows. ● Generated when the destination address extended repeat area overflows.	
Interrupt DMAm_TRANSERR (m = 0, 1)	Error response detection interrupt	● Generated when the DMAC transfer error occurs	

Table 17.1 DMAC specifications (2 of 2)

Item	DMAC0 (for CPU0)	DMAC1 (for CPU1)
Event link activation (DMACmn_INT (m = 0, 1, n = 0 to 7))	Generated after each data transfer (for block transfer, after each block is transferred).	
Module-stop function	Module-stop state can be set to reduce power consumption.	
TrustZone Filter	Security and Privilege can be set for each channel.	

Note: Security attribution Register of DMAC channel is described in ICU.ICUSARC

Note 1. For details on DMAC activation sources, see Table 14.5 in section 14, Interrupt Controller Unit (ICU).

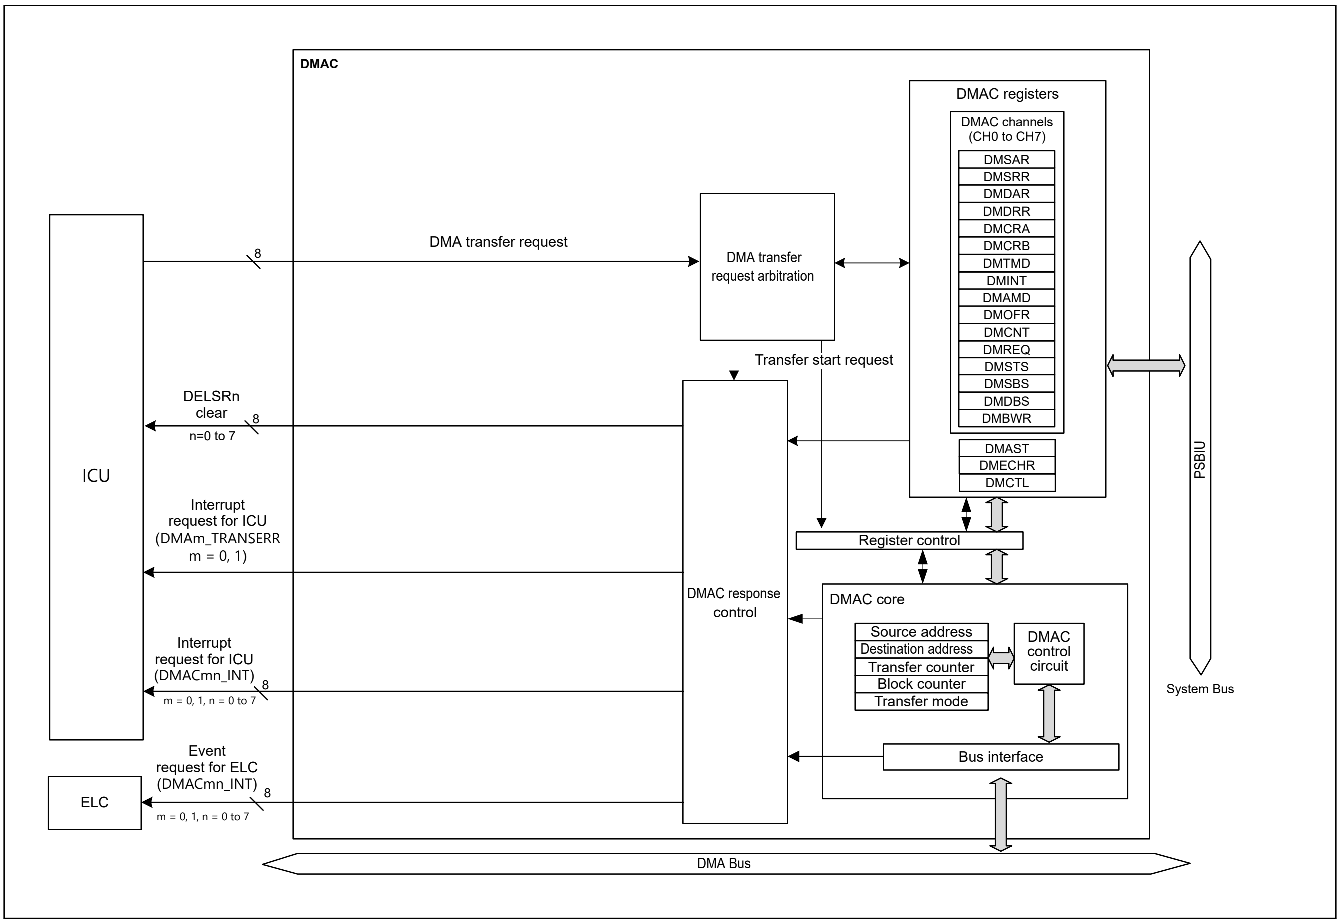

Figure 17.1 DMAC block diagram

17.2 Register Descriptions

The DMAC0 and DMAC1 registers have the same base address. DMAC0 is dedicated to CPU0 and can only be accessed from CPU0. DMAC1 is dedicated to CPU1 and can only be accessed from CPU1.

17.2.1 DMACCHSAR : DMA Channel Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x1A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	SADMAC107	SADMAC106	SADMAC105	SADMAC104	SADMAC103	SADMAC102	SADMAC101	SADMAC100
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SADMAC007	SADMAC006	SADMAC005	SADMAC004	SADMAC003	SADMAC002	SADMAC001	SADMAC000
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SADMAC007 to SADMAC000	Security attributes of output and registers for DMAC0 channel 0: Secure 1: Non-secure	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	SADMAC107 to SADMAC100	Security attributes of output and registers for DMAC1 channel 0: Secure 1: Non-secure	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

SADMAC00n (n = 0 to 7)

Security attributes registers for DMAC0 channel.

This bit determines the security attribute of the output as the master for each DMAC0 channel.

The controlled channel of DMAC0 registers are shown below. For details, see section 17.3.13. Channel Security.

- CPSCU.DMACCHPAR.PADMAC00n
- ICU0.DELSR channel n
- DMAC0.DMSAR channel n
- DMAC0.DMSRR channel n
- DMAC0.DMDAR channel n
- DMAC0.DMDRR channel n
- DMAC0.DMCRA channel n
- DMAC0.DMCRB channel n
- DMAC0.DMTMD channel n
- DMAC0.DMINT channel n
- DMAC0.DMAMD channel n
- DMAC0.DMOFR channel n
- DMAC0.DMCNT channel n
- DMAC0.DMREQ channel n
- DMAC0.DMSTS channel n
- DMAC0.DMSBS channel n
- DMAC0.DMDBS channel n
- DMAC0.DMBWR channel n

SADMAC10n (n = 0 to 7)

Security attributes registers for DMAC1 channel.

This bit determines the security attribute of the output as the master for each DMAC1 channel.

The controlled channel of DMAC1 registers are shown below. For details, see section 17.3.13. Channel Security.

- CPSCU.DMACCHPAR.PADMAC10n
- ICU1.DELSR channel n
- DMAC1.DMSAR channel n
- DMAC1.DMSRR channel n
- DMAC1.DMDAR channel n
- DMAC1.DMDRR channel n
- DMAC1.DMCRA channel n
- DMAC1.DMCRB channel n
- DMAC1.DMTMD channel n
- DMAC1.DMINT channel n
- DMAC1.DMAMD channel n
- DMAC1.DMOFR channel n
- DMAC1.DMCNT channel n
- DMAC1.DMREQ channel n
- DMAC1.DMSTS channel n
- DMAC1.DMSBS channel n
- DMAC1.DMDBS channel n
- DMAC1.DMBWR channel n

17.2.2 DMACCHPAR : DMA Channel Privilege Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x1F0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	PADMAC107	PADMAC106	PADMAC105	PADMAC104	PADMAC103	PADMAC102	PADMAC101	PADMAC100
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	PADMAC007	PADMAC006	PADMAC005	PADMAC004	PADMAC003	PADMAC002	PADMAC001	PADMAC000
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	PADMAC007 to PADMAC000	Privilege attributes of outputs and registers for DMAC0 channel 0: Privileged. 1: Unprivileged.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	PADMAC107 to PADMAC100	Privilege attributes of outputs and registers for DMAC1 channel 0: Privileged. 1: Unprivileged.	R/W
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-2, P-TYPE-1

PADMAC00n (n = 0 to 7)

Privilege attributes of output and registers for DMAC0 channel.

This bit determines the Privilege attribute of the output as the master for each DMAC0 channel. It also determines the privileged attributes of DMAC0 registers for each channel. For details, see section 17.3.14. Channel Privilege.

The controlled the channel of DMAC0 registers are shown below.

- DMAC0.DMSAR channel n
- DMAC0.DMSRR channel n
- DMAC0.DMDAR channel n
- DMAC0.DMDRR channel n
- DMAC0.DMCRA channel n
- DMAC0.DMCRB channel n
- DMAC0.DMTMD channel n
- DMAC0.DMINT channel n
- DMAC0.DMAMD channel n
- DMAC0.DMOFR channel n
- DMAC0.DMCNT channel n
- DMAC0.DMREQ channel n
- DMAC0.DMSTS channel n
- DMAC0.DMSBS channel n
- DMAC0.DMDBS channel n
- DMAC0.DMBWR channel n

PADMAC10n (n = 0 to 7)

Privilege attributes of output and registers for DMAC1 channel.

This bit determines the Privilege attribute of the output as the master for each DMAC1 channel. It also determines the privileged attributes of DMAC1 registers for each channel. For details, see section 17.3.14. Channel Privilege.

The controlled the channel of DMAC1 registers are shown below.

- DMAC1.DMSAR channel n
- DMAC1.DMSRR channel n
- DMAC1.DMDAR channel n
- DMAC1.DMDRR channel n
- DMAC1.DMCRA channel n
- DMAC1.DMCRB channel n
- DMAC1.DMTMD channel n
- DMAC1.DMINT channel n
- DMAC1.DMAMD channel n
- DMAC1.DMOFR channel n
- DMAC1.DMCNT channel n
- DMAC1.DMREQ channel n
- DMAC1.DMSTS channel n
- DMAC1.DMSBS channel n
- DMAC1.DMDBS channel n
- DMAC1.DMBWR channel n

17.2.3 DMACSAR : DMAC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x34

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMASTSA1
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMASTSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DMASTSA0	DMAC0 DMAST Security Attribution 0: Secure 1: Non-secure	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W
16	DMASTSA1	DMAC1 DMAST Security Attribution 0: Secure 1: Non-secure	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

For DMAC, security attribution is set for each channel. However, this register only sets the DMAST register security attribution.

DMASTSA0 bit (DMAC0 DMAST Security Attribution)

This bit specifies security attribution of the registers for DMAC0.DMAST and DMAC0.DMCTL. Do not write to the DMASTSA0 bit while DMAC0 transfer is enabled or a bus master is writing to the DMAC0 registers.

DMASTSA1 bit (DMAC1 DMAST Security Attribution)

This bit specifies security attribution of the registers for DMAC1.DMAST and DMAC1.DMCTL. Do not write to the DMASTSA1 bit while DMAC1 transfer is enabled or a bus master is writing to the DMAC1 registers.

17.2.4 DMSAR : DMA Source Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x00

Bit position:	31–0
Bit field:	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer source start address Setting range is 0x00000000 to 0xFFFFFFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMSAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bit.

17.2.5 DMSRR : DMA Source Reload Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x20

Bit position:	31																														0
Bit field:																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer source reload address 0x0000 0000 to 0xFFFF FFFF (4 GB)	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMSRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DMSRR is used to store the start address of the buffer size set in DMSBS during repeat-blcok transfer mode. In repeat-block transfer mode, DMSAR reloads value of DMSRR after specified transfer finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMSRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bit.

17.2.6 DMDAR : DMA Destination Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x04

Bit position:	31																														0
Bit field:																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer destination start address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

17.2.7 DMDRR : DMA Destination Reload Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x24

Bit position:	31																														0
Bit field:																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer destination reload address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DMDRR is used to store the start address of the buffer size set in DMDBS during repeat-blcok transfer mode. In repeat-block transfer mode, DMDAR reloads the value of DMDRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMDRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

17.2.8 DMCRA : DMA Transfer Count Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	DMCRAH[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMCRAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMCRAL[15:0]	Lower bits of transfer count Specifies the number of transfer operations.	R/W
25:16	DMCRAH[9:0]	Upper bits of transfer count Specifies the number of transfer operations.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMCRA while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Set the same value for DMCRAH and DMCRAL in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode, block transfer mode, and repeat-block transfer mode.

(1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

(2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat-block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

17.2.9 DMCRB : DMA Block Transfer Count Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMCRBH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMCRBL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMCRBL[15:0]	Functions as a number of block, repeat or repeat-block transfer counter. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536)	R/W
31:16	DMCRBH[15:0]	Specifies the number of block, repeat or repeat-block transfer operations. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536)	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMCRB while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Set the same value for DMCRBH and DMCRBL in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH specifies the number of block, repeat and repeat-block transfer operations, and DMCRBL functions as a 16-bit the number of block counter in block, repeat, and repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0x0001, 65535 when it is 0xFFFF, and 65536 when it is 0x0000.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and the final data of one repeat size or one block size is transferred, DMCRBL reloads the value of DMCRBH automatically.

17.2.10 DMTMD : DMA Transfer Mode Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MD[1:0]		DTS[1:0]		—	TKP	SZ[1:0]		—	—	—	—	—	—	DCTG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	DCTG[1:0]	Transfer Request Source Select 0 0: Software request 0 1: Hardware request*1 1 0: Setting prohibited 1 1: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	SZ[1:0]	Transfer Data Size Select 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: 64 bits	R/W
10	TKP	Transfer Keeping 0: Transfer is stopped by completion of specified total number of transfer operations. 1: Transfer is not stopped by completion of specified total number of transfer operations (free-running).	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
13:12	DTS[1:0]	Repeat Area Select 0 0: The destination is specified as the repeat area or block area. 0 1: The source is specified as the repeat area or block area. 1 0: The repeat area or block area is not specified. 1 1: Setting prohibited.	R/W
15:14	MD[1:0]	Transfer Mode Select 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Repeat-block transfer	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. To select the DMAC activation source, use the ICU.DELSRn registers. For details on DMAC activation sources, see Table 14.5 in section 14, Interrupt Controller Unit (ICU).

Set DMTMD while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DTS[1:0] bits (Repeat Area Select)

DTS[1:0] select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

TKP bit (Transfer Keeping)

TKP selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

17.2.11 DMINT : DMA Interrupt Setting Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x13

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DTIE	ESIE	RPTIE	SARIE	DARIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DARIE	Destination Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the destination address. 1: Enables an interrupt request for an extended repeat area overflow on the destination address.	R/W
1	SARIE	Source Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the source address. 1: Enables an interrupt request for an extended repeat area overflow on the source address.	R/W
2	RPTIE	Repeat Size End Interrupt Enable 0: Disables the repeat size end interrupt request. 1: Enables the repeat size end interrupt request.	R/W
3	ESIE	Transfer Escape End Interrupt Enable 0: Disables the transfer escape end interrupt request. 1: Enables the transfer escape end interrupt request.	R/W
4	DTIE	Transfer End Interrupt Enable 0: Disables the transfer end interrupt request. 1: Enables the transfer end interrupt request.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMINT while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

Do not set this bit to 1 in repeat-block transfer mode.

SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

Do not set this bit to 1 in repeat-block transfer mode.

RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

Do not set this bit to 1 in repeat-block transfer mode.

ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

17.2.12 DMAMD : DMA Address Mode Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x14

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SM[1:0]		SADR	SARA[4:0]					DM[1:0]		DADR	DARA[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	DARA[4:0]	Destination Address Extended Repeat Area Specifies the extended repeat area on the destination address. For details on the settings, see Table 17.2.	R/W
5	DADR	Destination Address Update Select After Reload 0: Only reloading. 1: Add index after reloading.	R/W
7:6	DM[1:0]	Destination Address Update Mode 0 0: Destination address is fixed. 0 1: Offset addition. 1 0: Destination address is incremented. 1 1: Destination address is decremented.	R/W
12:8	SARA[4:0]	Source Address Extended Repeat Area Specifies the extended repeat area on the source address. For details on the settings, see Table 17.2.	R/W
13	SADR	Source Address Update Select After Reload 0: Only reloading. 1: Add index after reloading.	R/W

Bit	Symbol	Function	R/W
15:14	SM[1:0]	Source Address Update Mode 0 0: Source address is fixed. 0 1: Offset addition. 1 0: Source address is incremented. 1 1: Source address is decremented.	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMAMD while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

DARA[4:0] bits (Destination Address Extended Repeat Area)

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 MB.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. Table 17.2 lists the settings and the corresponding extended repeat areas.

DADR bits (Destination Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in Table 17.13.

In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, or 11b, the destination address is incremented by 1, 2, 4, or 8 respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, or 11b, the destination address is decremented by 1, 2, 4, or 8 respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 MB.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. Table 17.2 lists the settings and the corresponding extended repeat areas.

SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value ((DMSBSH-DMSBSL) × DataSize) is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in Table 17.12.

In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, or 11b, the source address is incremented by 1, 2, 4, or 8 respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, or 11b, the source address is decremented by 1, 2, 4, or 8 respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

Table 17.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas

SARA[4:0] or DARA[4:0] settings	Extended repeat area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 KB specified as extended repeat area by the lower 10 bits of the address
01011b	2 KB specified as extended repeat area by the lower 11 bits of the address
01100b	4 KB specified as extended repeat area by the lower 12 bits of the address
01101b	8 KB specified as extended repeat area by the lower 13 bits of the address
01110b	16 KB specified as extended repeat area by the lower 14 bits of the address
01111b	32 KB specified as extended repeat area by the lower 15 bits of the address
10000b	64 KB specified as extended repeat area by the lower 16 bits of the address
10001b	128 KB specified as extended repeat area by the lower 17 bits of the address
10010b	256 KB specified as extended repeat area by the lower 18 bits of the address
10011b	512 KB specified as extended repeat area by the lower 19 bits of the address
10100b	1 MB specified as extended repeat area by the lower 20 bits of the address
10101b	2 MB specified as extended repeat area by the lower 21 bits of the address
10110b	4 MB specified as extended repeat area by the lower 22 bits of the address
10111b	8 MB specified as extended repeat area by the lower 23 bits of the address
11000b	16 MB specified as extended repeat area by the lower 24 bits of the address
11001b	32 MB specified as extended repeat area by the lower 25 bits of the address
11010b	64 MB specified as extended repeat area by the lower 26 bits of the address
11011b	128 MB specified as extended repeat area by the lower 27 bits of the address
11100b to 11111b	Setting prohibited.

17.2.13 DMOFR : DMA Offset Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x18

Bit position: 31 ... 0

Bit field: (31:0)

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination. 0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes) 0xFF000000 to 0xFFFFFFFF (–16 MB to –1 byte)	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMOFR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).

Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

17.2.14 DMCNT : DMA Transfer Enable Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DTE	DMA Transfer Enable 0: Disables DMA transfer. 1: Enables DMA transfer.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

DTE bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped by the access error occurs. See section 17.5. Processing on DMA Transfer Error.

If the DTE of the corresponding channel is set to 0 during DMA transfer, no new transfer requests will be accepted after the transfer ends.

17.2.15 DMREQ : DMA Software Start Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SWREQ	DMA Software Start 0: DMA transfer is not requested. 1: DMA transfer is requested.	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	CLRS	DMA Software Start Bit Auto Clear Select 0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

When DMA transfer is stopped by the access error occurs. See section 17.5. Processing on DMA Transfer Error

CLRS bit (DMA Software Start Bit Auto Clear Select)

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

17.2.16 DMSTS : DMA Status Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ACT	—	—	DTIF	—	—	—	ESIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ESIF	Transfer Escape End Interrupt Flag 0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated.	R/W*1
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	DTIF	Transfer End Interrupt Flag 0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated.	R/W*1
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	ACT	DMAC Active Flag 0: DMAC is in the idle state. 1: DMAC is operating.	R

Note: S-TYPE-3, P-TYPE-3

Note 1. Only 0 can be written to clear the flag.

ESIF flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- When 1-block data transfer is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- When an extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

DTIF flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer).
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).
- When the specified number of blocks have been transferred in block transfer mode and repeat-block transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

ACT flag (DMAC Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation.

[Clearing condition]

- When data transfer in response to one transfer request is completed.

17.2.17 DMSBS : DMA Source Buffer Size Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMSBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMSBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMSBSL[15:0]	Functions as data transfer counter in repeat-block transfer mode See Table 17.3 for available settings.	R/W
31:16	DMSBSH[15:0]	Specifies the repeat-area size in repeat-block transfer mode See Table 17.3 for available settings.	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMSBS while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Set the same value for DMSBSH and DMSBSL in repeat-block transfer mode. Write 0x00000000 to DMSBS in normal, repeat and block transfer mode.

DMSBSH specifies buffer size and DMSBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH and DMSBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMSBSL reloads value of DMSBSH. When address update mode is fixed address, this register is ignored. Table 17.3 shows the setting values of DMA Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 17.3 Available setting for DMSBS register in repeat-block transfer mode (1 of 2)

Source address update mode (DMAMD.SM)	Transfer data size (DMTMD.SZ)	Available setting for DMSBSH and DMSBSL bits
Source address is fixed (SM = 00b)	Don't care	0x0000 (DMSBS is not used)

Table 17.3 Available setting for DMSBS register in repeat-block transfer mode (2 of 2)

Source address update mode (DMAMD.SM)	Transfer data size (DMTMD.SZ)	Available setting for DMSBSH and DMSBSL bits
Offset addition (SM = 01b)	8 bits (SZ = 00b)	0x0001 to 0xFFFF (1 to 65535)
	16 bits (SZ = 01b)	0x0001 to 0x7FFF (1 to 32767)
	32 bits (SZ = 10b)	0x0001 to 0x3FFF (1 to 16383)
	64 bits (SZ = 11b)	0x0001 to 0x1FFF (1 to 8191)
Source address is incremented or decremented (SM = 1xb)	Don't care	0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535)

In normal, repeat and block transfer mode, DMSBS is not used. The setting is invalid.

17.2.18 DMDBS : DMA Destination Buffer Size Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMDBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMDBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMDBSL[15:0]	Functions as data transfer counter in repeat-block transfer mode. See Table 17.4 for available settings.	R/W
31:16	DMDBSH[15:0]	Specifies the repeat-area size in repeat-block transfer mode. See Table 17.4 for available settings.	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDBS while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Set the same value for DMDBSH and DMDBSL in repeat-block transfer mode. Write 0x00000000 to DMDBS in normal, repeat and block transfer mode.

DMDBSH specifies buffer size and DMDBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by DMDBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMDBSH and DMDBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMDBSL reloads value of DMDBSH. When address update mode is fixed address, this register is ignored. Table 17.4 shows the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 17.4 Available setting for DMDBS register in repeat-block transfer mode (1 of 2)

Destination address update mode (DMAMD.DM)	Transfer data size (DMTMD.SZ)	Available setting for DMDBSH and DMDBSL bits
Destination address is fixed (DM = 00b)	Don't care	0x0000 (DMDBS is not used)

Table 17.4 Available setting for DMDBS register in repeat-block transfer mode (2 of 2)

Destination address update mode (DMAMD.DM)	Transfer data size (DMTMD.SZ)	Available setting for DMDBSH and DMDBSL bits
Offset addition (DM = 01b)	8 bits (SZ = 00b)	0x0001 to 0xFFFF (1 to 65535)
	16 bits (SZ = 01b)	0x0001 to 0x7FFF (1 to 32767)
	32 bits (SZ = 10b)	0x0001 to 0x3FFF (1 to 16383)
	64 bits (SZ = 11b)	0x0001 to 0x1FFF (1 to 8191)
Destination address is incremented or decremented (DM = 1xb)	Don't care	0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535)

In normal, repeat and block transfer mode, DMDBS is not used. The setting is invalid.

17.2.19 DMBWR : DMA Bufferable Write Enable Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BWE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BWE	Bufferable Write Enable 0: Disables Bufferable Write 1: Enables Bufferable Write	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMBWR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

BWE bit (Bufferable Write Enable)

BWE bit indicates bufferable write is either enabled or disabled.

If this bit is 1, even if the write access as DMAC is completed, the actual slave write may not have ended.

When this bit is 1, it requests an early response by writing write data to the temporary buffer if possible to the slave. Therefore, even if write access as DMAC is completed, the actual slave write may not be finished. If an error occurs during write access to the target slave, the error may not be detected and the transfer may not be automatically stopped. In such cases, the error response detection interrupt DMAm_TRANSERR (m = 0, 1) will not occur.

See section 15.7.2. Operations When a Bus Error Occurs for slave groups that support bufferable writes and slave groups for which error response detection interrupts cannot be generated.

Some individual slave modules also support bufferable writes, so Refer to the respective module chapters.

[Setting condition]

- When 1 is written to this bit

[Clearing conditions]

- When 0 is written to this bit

17.2.20 DMAST : DMA Module Activation Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DMST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DMST	DMAC Operation Enable 0: DMAC activation is disabled. 1: DMAC activation is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE2

DMST bit (DMAC Operation Enable)

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

17.2.21 DMECHR : DMAC Error Channel Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DMECHSAM	—	—	—	—	DMECH[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	DMECH[3:0]	DMAC Error Channel Indicates the channel number causing the error 0000: Error occurred on channel 0 0001: Error occurred on channel 1 0010: Error occurred on channel 2 ⋮ ⋮ 0111: Error occurred on channel 7	R
7:4	—	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Function	R/W
8	DMECHSAM	DMAC Error Channel Security Attribution Monitor Indicates the security attribution of a channel causing the error 0: secure channel 1: non-secure channel	R
15:9	—	These bits are read as 0. The write value should be 0.	R
16	DMESTA	DMAC Error Status 0: No DMA transfer error occurred 1: DMA transfer error occurred	R/W *1
31:17	—	These bits are read as 0. The write value should be 0.	R

Note: P-TYPE-2
Note 1. Writing to DMESTA depends on the value of DMECHSAM.

When reading this register, it can be accessed from both secure and non-secure access.

When writing this register, it depends on DMECHR.DMESA.

- When DMESA = 1, it can be accessed from secure and non-secure access.
- When DMESA = 0, it can be accessed from secure. An error is returned when write access is performed in a non-secure access.

This register is cleared by a reset caused by a transfer error. Please select interrupt DMAm_TRANSERR (m = 0, 1) in BUS.OADCFG.OAD when you want to debug the program.

DMECH[3:0] bits (DMAC Error Channel)

When a transfer error due to DMA transfer occurs, it stores the channel of DMAC that was violated.

When reset was selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMECHSAM bit (DMAC Error Channel Security Attribution Monitor)

When a transfer error due to DMA transfer occurs, it indicates the security attribution of the violating DMAC channel.

When reset was selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMESTA bit (DMAC Error Status)

Indicates whether or not a DMA transfer error occurred.

DMECH[3:0], DMECHSAM, DMESTA are cleared by writing 1 to DMESTA. Writing 0 to DMESTA is ignored.

When reset was selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. DMECHSAM = 0, it cannot be cleared in the non-secure state.

17.2.22 DMCTL : DMAC Control Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	ERCH	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PR	Priority Control Select 0: Fixed priority mode 1: Round-robin mode	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	ERCH	Clear Channel Select 0: Target channel only 1: All channels	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Set DMCTL while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

PR bit (Priority Control Select)

When DMCTL.PR = 0, arbitration is performed in the fixed priority mode of channel 0 > channel 1 > channel 2 > channel 3 …> channel 7 > DTC (channel 0: highest priority) and DMA transfer is started.

When DMCTL.PR = 1, arbitration is performed in the round-robin mode and DMA transfer is started.

ERCH bit (Clear Channel Select)

When DMCTL.ERCH = 0, the ICU clears all bits of the target channel of DELSRn (n = 0 to 7) by the error response during transfer. DELSRn (n = 0 to 7) other than the target channel is not cleared.

When DMCTL.ERCH = 1, the ICU clears all bits of all channels of DELSRn (n = 0 to 7) by the error response during transfer.

17.3 Operation

17.3.1 Transfer Mode

17.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting DMCRB register is invalid in normal transfer mode. Except in free-running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 17.5 summarizes the register update operation in normal transfer mode, and Figure 17.2 shows the operation in normal transfer mode.

Table 17.5 Register update operation in normal transfer mode

Register	Function	Update operation after completion of a transfer by one transfer request
DMSAR	Transfer source address	Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/offset addition
DMCRAL	Transfer count	Decremented by one/not updated (in free running function)
DMCRAH	—	Not updated (Not used in normal transfer mode)
DMCRB	—	Not updated (Not used in normal transfer mode)

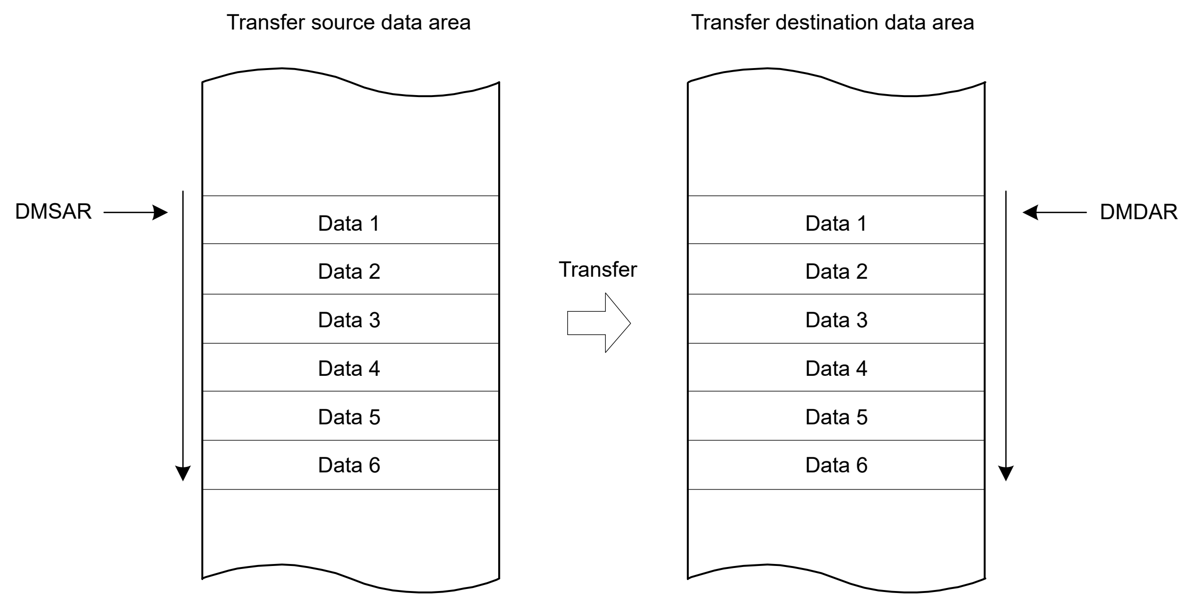

Figure 17.2 Operation in normal transfer mode

17.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRA register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

Table 17.6 summarizes the register update operation in repeat transfer mode, and Figure 17.3 shows the operation in repeat transfer mode.

Table 17.6 Register update operation in repeat transfer mode

Register	Function	Update operation after completion of a transfer by one transfer request	
		When DMCRAL register is not 1	When DMCRAL register is 1 (Transfer of the last data in repeat size)
DMSAR	Transfer source address	Increment/decrement/fixed/offset addition	• DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/offset addition	• DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMCRAH	Repeat size	Not updated	Not updated
DMCRAL	Transfer count	Decremented by one	DMCRAH
DMCRBH	Number of repeat transfer operations	Not updated	Not updated
DMCRBL	Count of repeat transfer operations	Not updated	Decremented by one

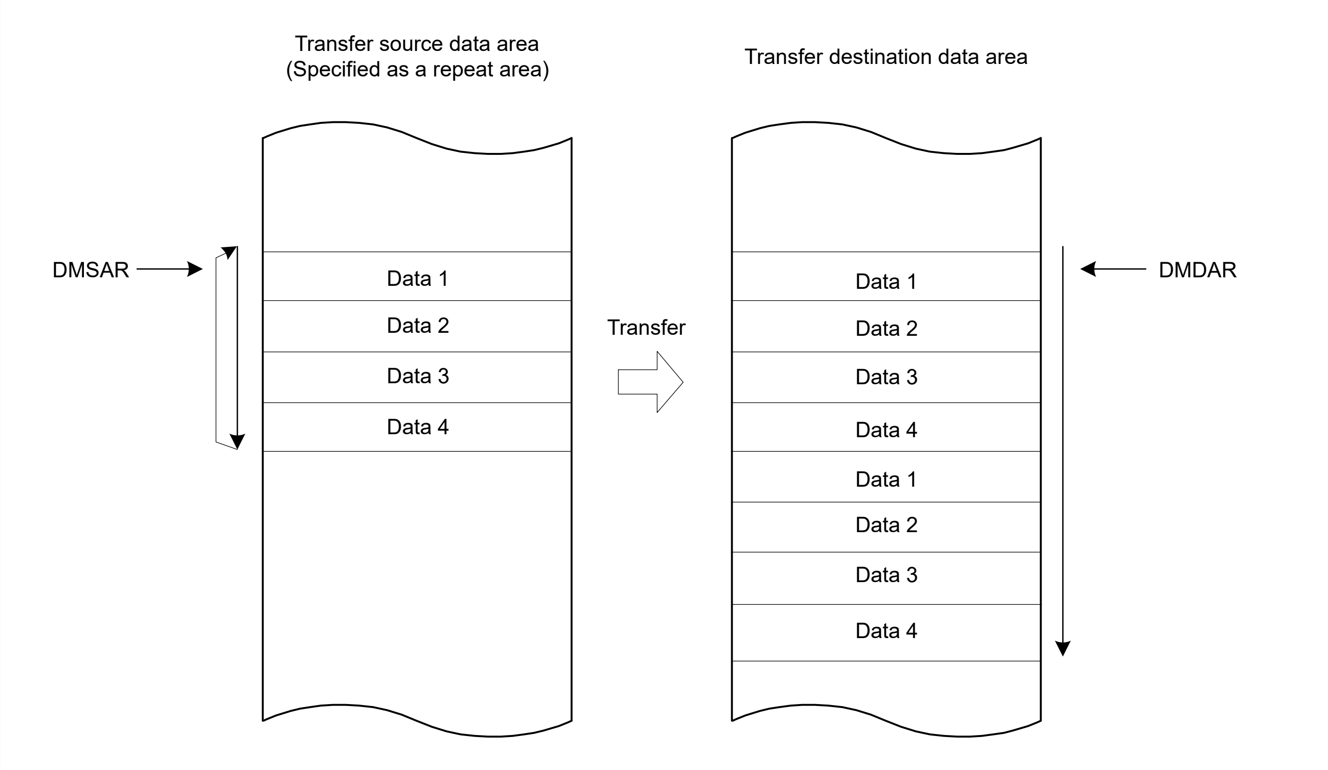

Figure 17.3 Operation in repeat transfer mode

17.3.1.3 Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA register.

A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

Table 17.7 summarizes the register update operation in block transfer mode, and Figure 17.4 shows the operation in block transfer mode.

Table 17.7 Register update operation in block transfer mode

Register	Function	Update operation after completion of single-block transfer by one transfer request
DMSAR	Transfer source address	• DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	• DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMCRAH	Block size	Not updated
DMCRAL	Transfer count	DMCRAH
DMCRBH	Number of block transfer operations	Not updated
DMCRBL	Count of block transfer operations	Decremented by one

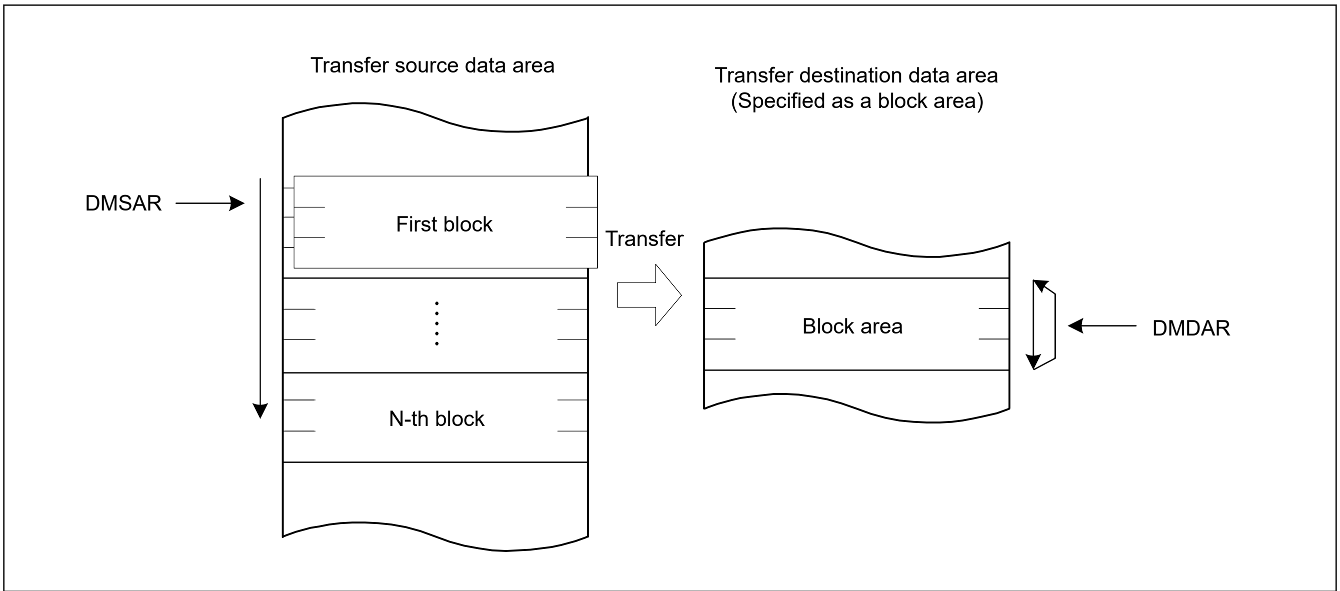

Figure 17.4 Operation in block transfer mode

17.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 17.5 shows an example of adding a repeat function to the transfer destination.

Figure 17.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

A transfer end interrupt request can be generated after completion of the specified number of repeat-block transfer operations.

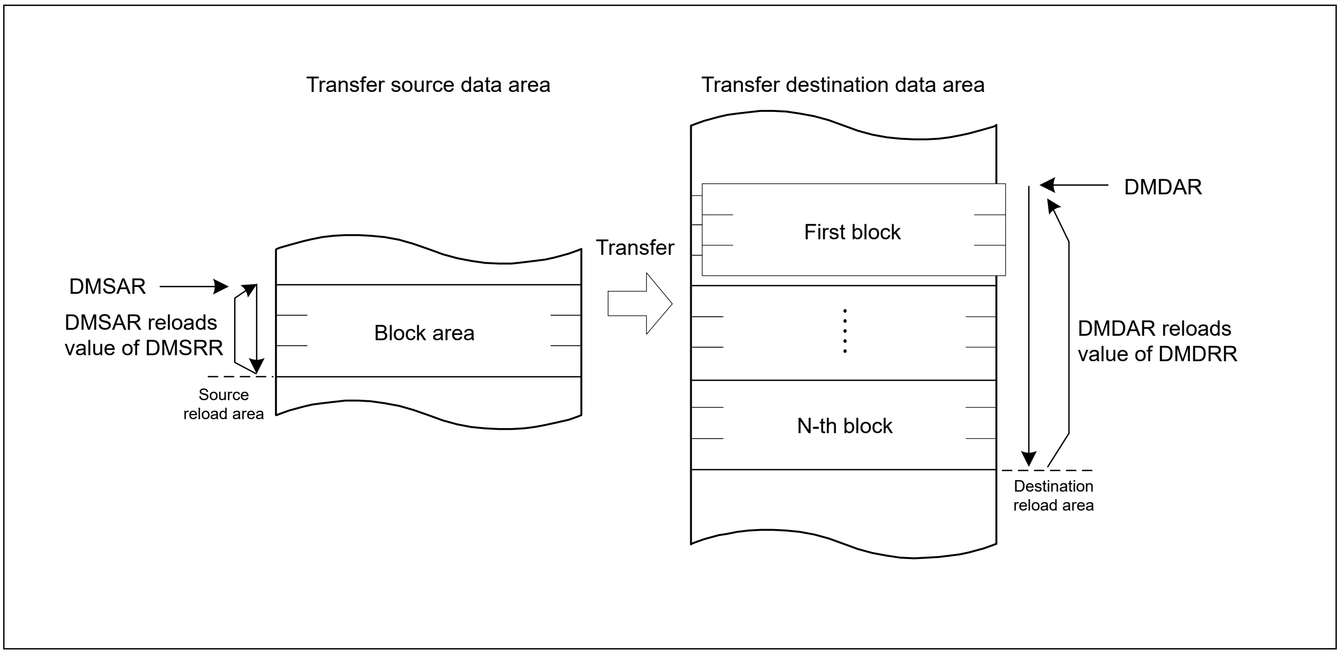

Figure 17.5 Operation in repeat-block transfer mode

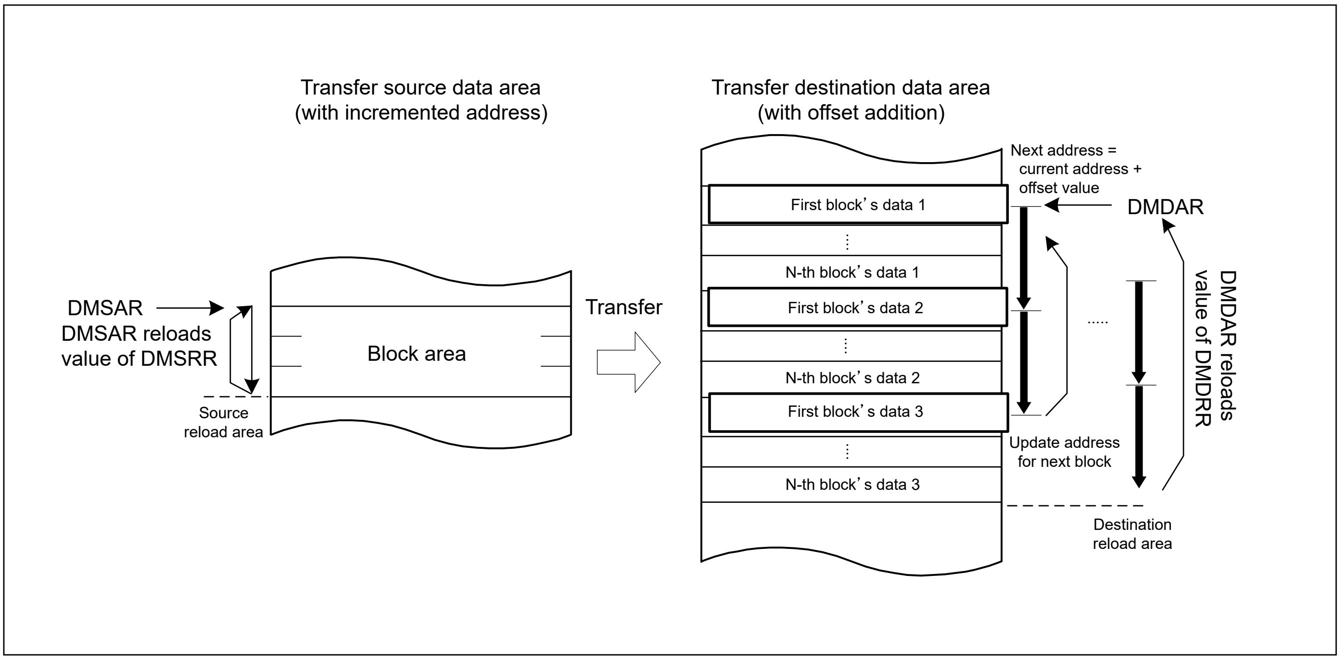

Figure 17.6 Operation in repeat-block transfer mode with offset addition

Table 17.8 to Table 17.13 summarize the register update operations in repeat-block transfer mode.

For more information about address update function in repeat-block transfer mode, see section 17.3.5. Address Update Function in Repeat-Block Transfer Mode.

17.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 17.7 shows an example of the extended repeat area operation.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b). The data size is eight bits (DMTMD.SZ[1:0] = 00b).

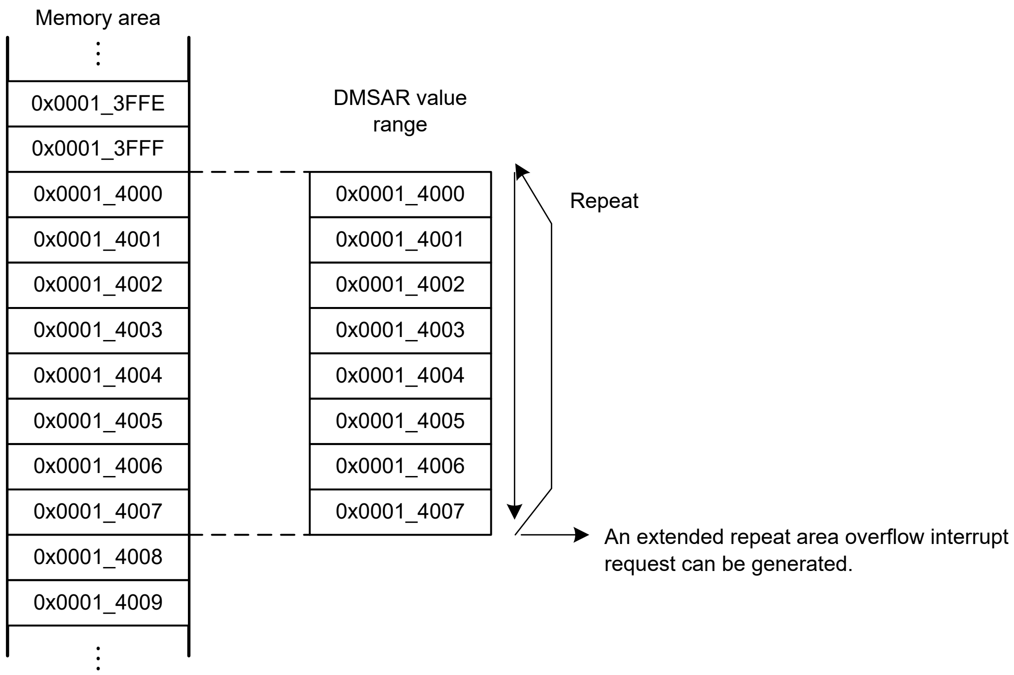

Figure 17.7 Example of extended repeat area operation

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 17.8 shows an example when the extended repeat area function is used in block transfer mode.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b), block transfer mode with block size 5 is set (DMCRA = 0x0005_0005), and transfer source address is not specified as a block area. Data size is eight bits (DMTMD.SZ[1:0] bits = 00b).

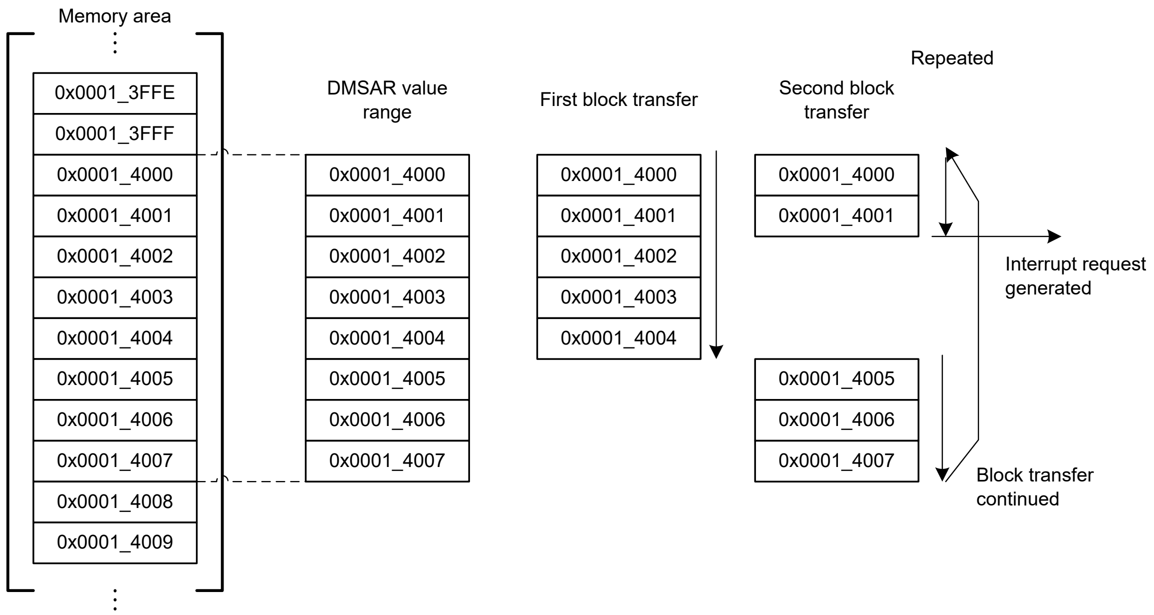

Figure 17.8 Example of extended repeat area function in block transfer mode

17.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

17.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see section 17.3.1.1. Normal Transfer Mode.

17.3.3.2 In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

Figure 17.9 show an example of block transfer operation without free-running function.

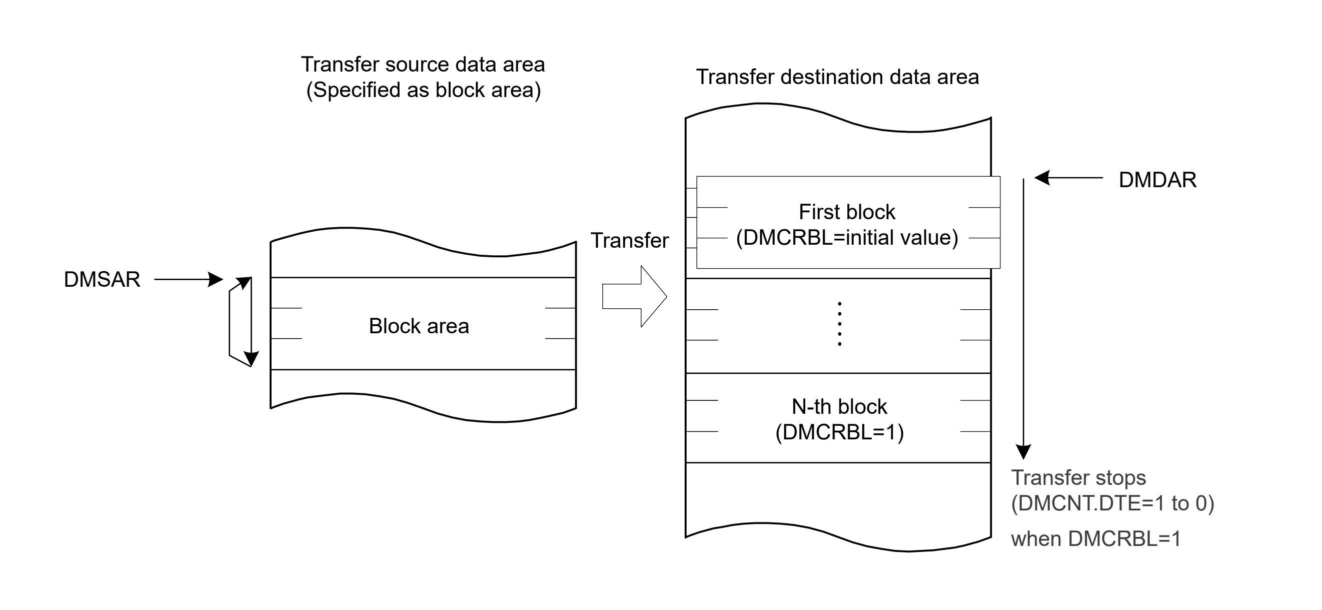

Figure 17.9 Operation in block transfer mode when DMTMD.TKP bit is set to 0

Figure 17.10 show an example of block transfer operation with free-running function.

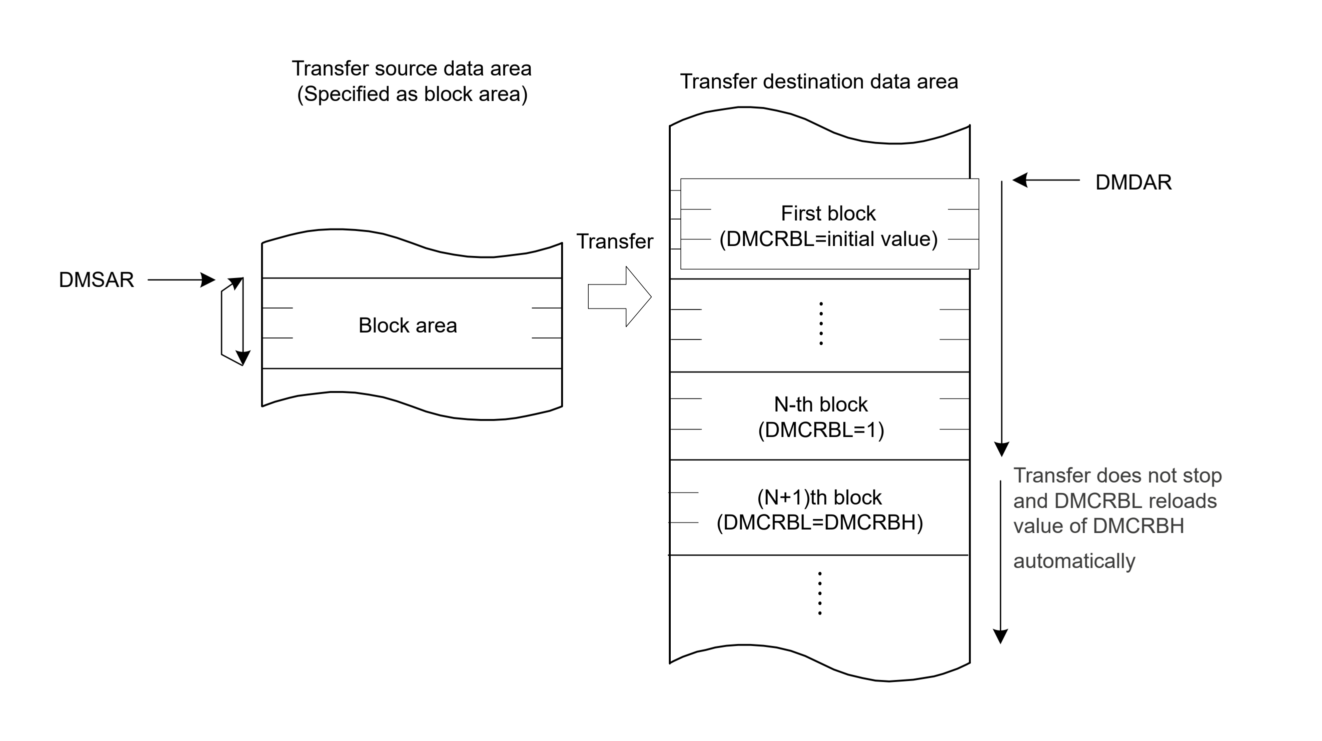

Figure 17.10 Operation in block transfer mode when DMTMD.TKP bit is set to 1

17.3.4 Address Update Function Using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2’s complement.

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information section 17.3.1.4. Repeat-Block Transfer Mode

Table 17.14 shows the address update method in each address update mode.

Table 17.14 Address update method in each address update mode

Address update mode	Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for address update modes	Address update method (for different SZ[1:0] settings in DMTMD)			
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b	SZ[1:0] = 11b
Address fixed	00b	Fixed			
Offset addition	01b	+DMOFR*1			
Increment	10b	+1	+2	+4	+8
Decrement	11b	–1	–2	–4	–8

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:
two's complement of a negative offset value = ~ (offset) + 1 (~ = bit inversion)

17.3.4.1 Basic Transfer Using Offset Addition

Figure 17.11 shows an example of address updating using offset addition.

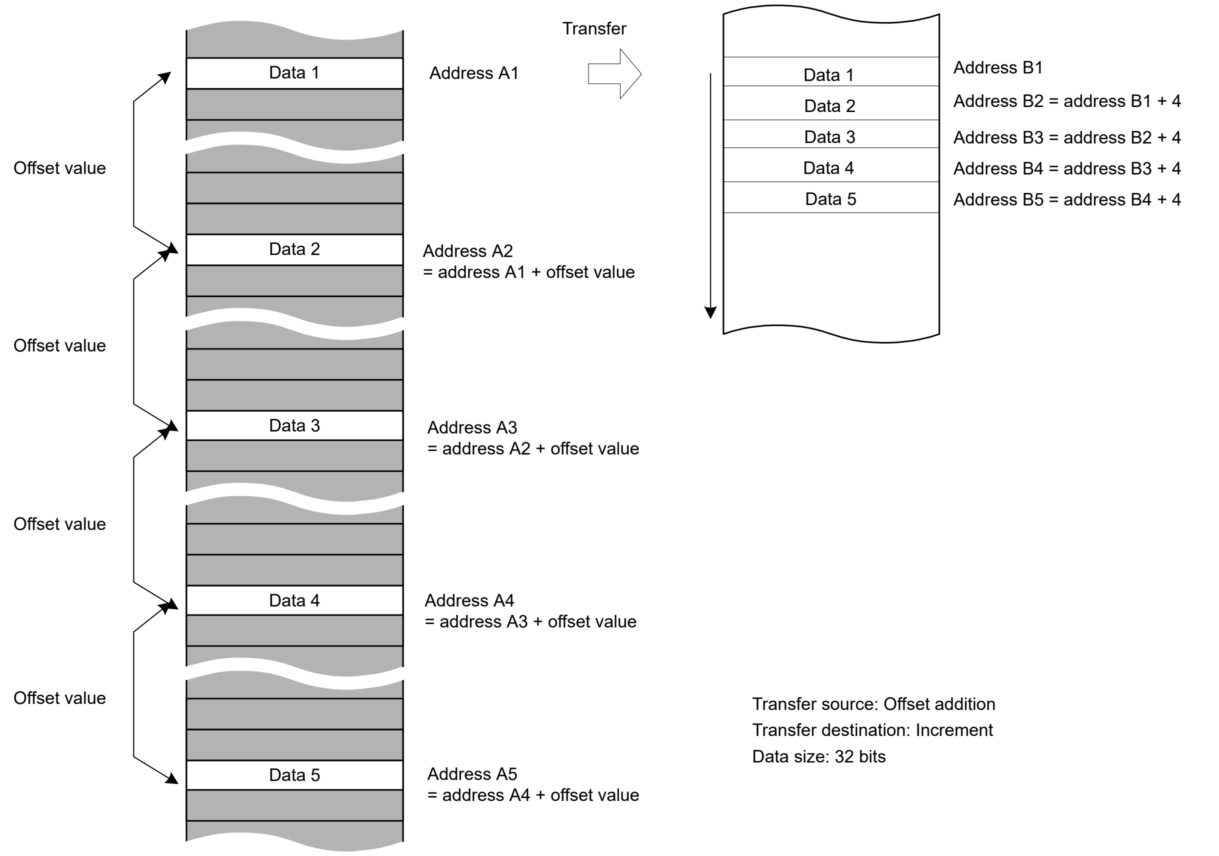

Figure 17.11 Example of address updating by offset addition

Figure 17.11 shows the setting of the following.

- The transfer data is 32 bits long.
- Offset addition is set as the transfer source address update mode.

- Increment is set as the transfer destination address update mode.

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

17.3.4.2 Example of XY Conversion Using Offset Addition

Figure 17.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition.
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits.
- DMTMD.MD — Transfer mode select: Repeat transfer.
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10.
- DMCRA — Repeat size: 0x4.
- DMINT.RPTIE — The repeat size end interrupt is enabled.

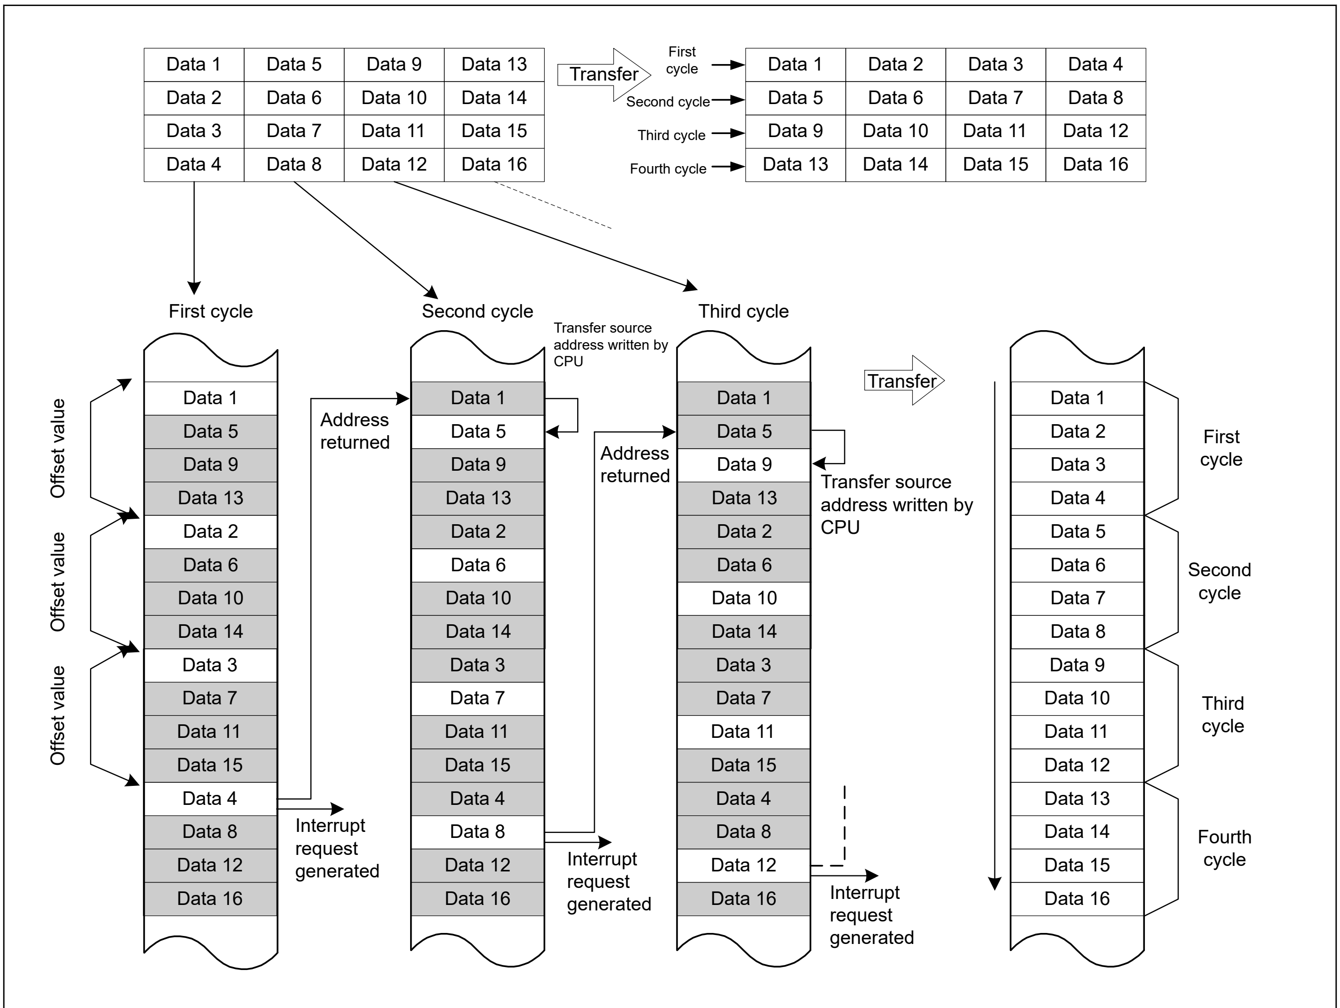

Figure 17.12 XY conversion operation using offset addition in repeat transfer mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5
(with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 17.13 shows a flowchart of the XY conversion.

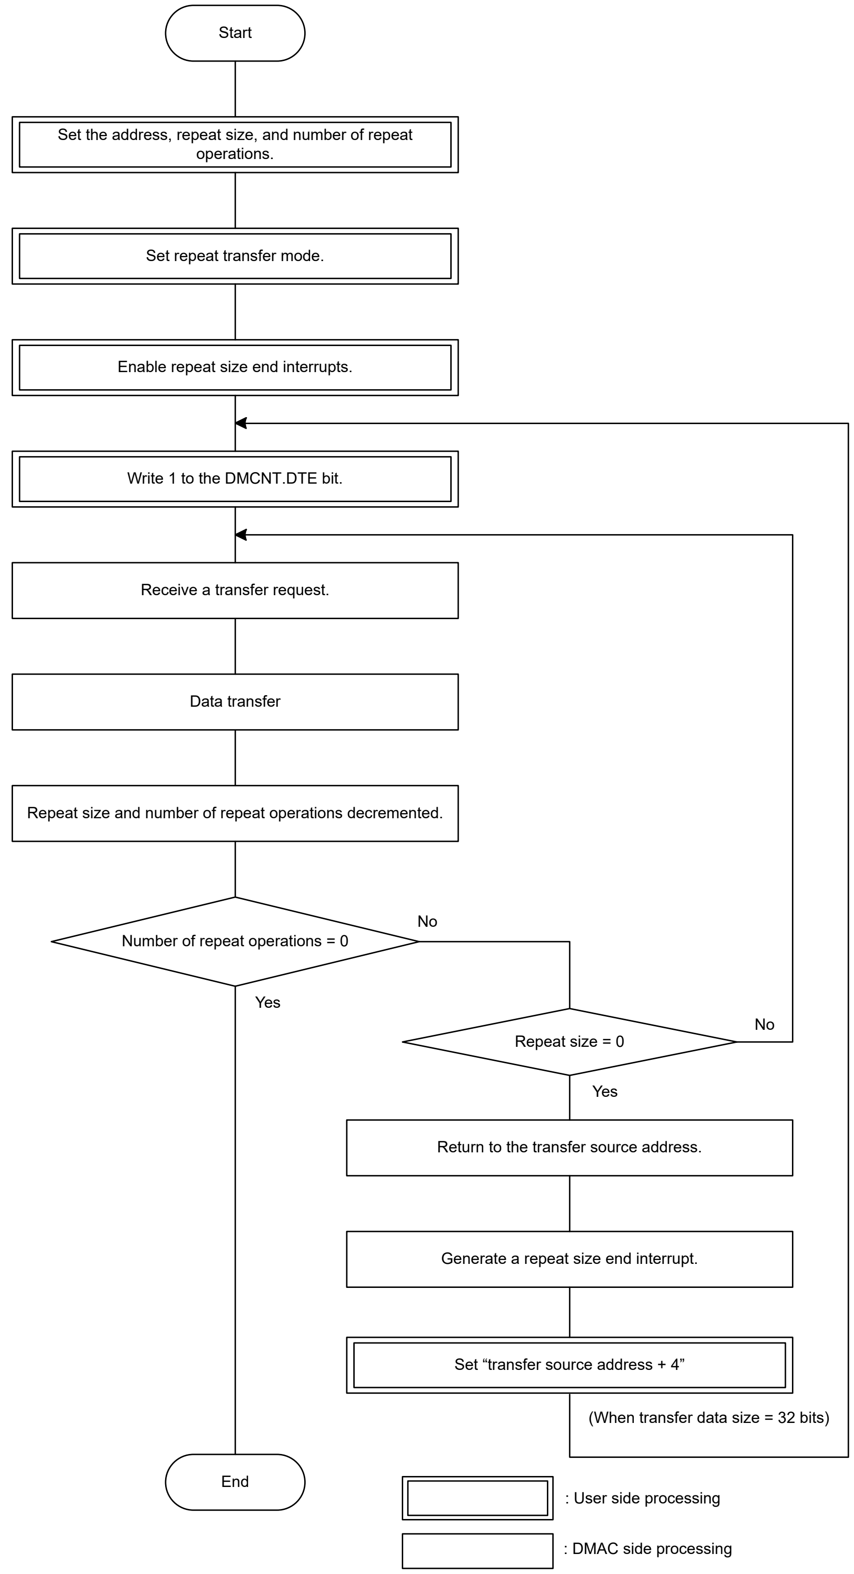

Figure 17.13 XY conversion flowchart using offset addition in repeat transfer mode

17.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

17.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 17.14 shows address update in fixed address.

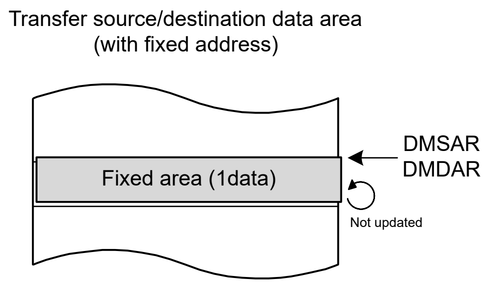

Figure 17.14 Address update in fixed address

17.3.5.2 Incremental and Decremental Address Mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 17.15 shows address update in incremental address.

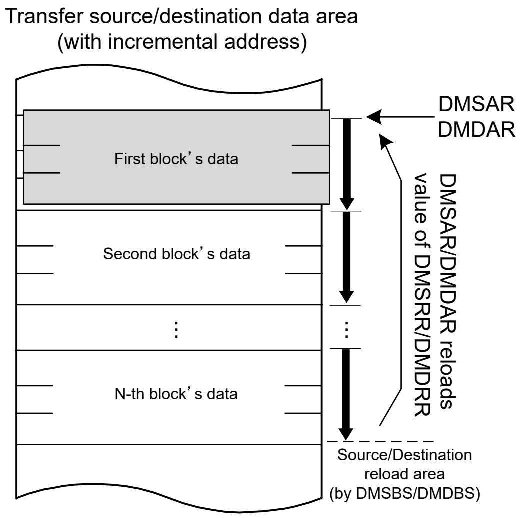

Figure 17.15 Address update in incremental address

17.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. Figure 17.16 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

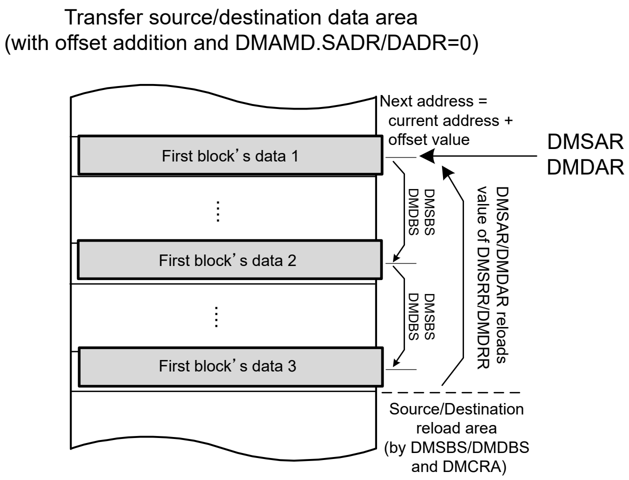

Figure 17.16 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRAL=1. In other words, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 17.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

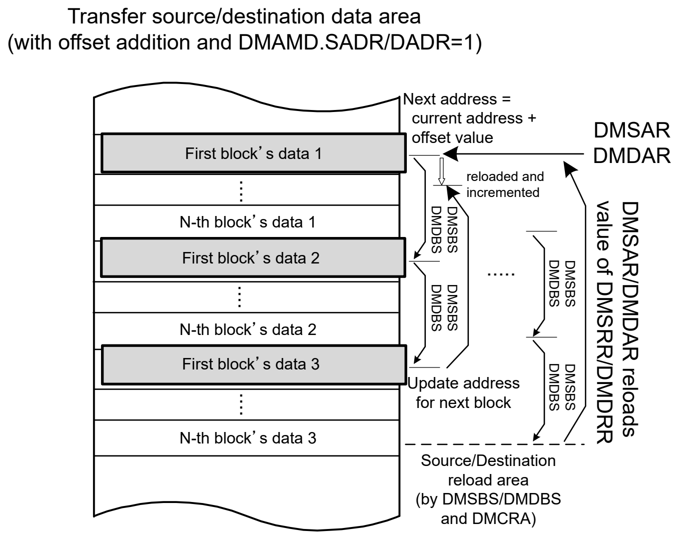

Figure 17.17 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1

17.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

17.3.6.1 Interval Address to Single Ring Buffer

Figure 17.18 shows an example of reading interval ADDRn registers (data register) of ADC16H module and storing it in single ring buffer. It transfers 2 data every 4 halfwords per 1 request. The block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 17.15 shows setting of this example.

Table 17.15 Setting of use case: from interval address to single ring buffer

Register	Value	Description
DMSAR, DMSRR	0x4033_A000	Initial source address
DMDAR, DMDRR	0x2200_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.SADR	0	DMSAR only reloads DMSRR
DMAMD.SM[1:0]	01b	Source update mode is offset addition
DMAMD.DM[1:0]	10b	Destination update mode is incremental address
DMCRAH, DMCRAL	2	Transfer block size
DMSBSH, DMSBSL	8	Source access offset (unit is 'data')
DMDBSH, DMDBSL	N × 2 (DMCRA)	Destination buffer size (unit is 'data')

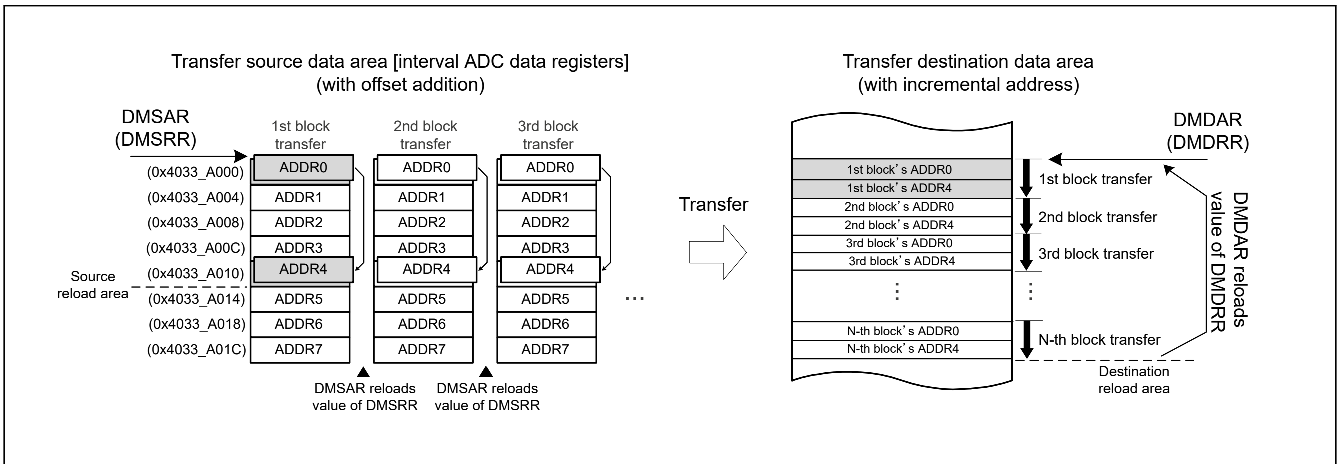

Figure 17.18 Example of use case: from interval address to single ring buffer

17.3.6.2 Single Block to Multi Ring Buffer

Figure 17.19 shows an example of storing the continuous ADDRn registers (data register) of ADC16H module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 17.16 shows setting of this example.

Table 17.16 Setting of use case: from single block to multi ring buffer (1 of 2)

Register	Value	Description
DMSAR, DMSRR	0x4033_A000	Initial source address
DMDAR, DMDRR	0x2200_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.DADR	1	Incremental destination address after reloading
DMAMD.SM[1:0]	01b	Source update mode is offset addition
DMAMD.DM[1:0]	01b	Destination update mode is offset addition

Table 17.16 Setting of use case: from single block to multi ring buffer (2 of 2)

Register	Value	Description
DMCRAH, DMCRAL	3	Transfer block size
DMSBSH, DMSBSL	2	Source buffer size (unit is ‘data’)
DMDBSH, DMDBSL	N	Destination whole buffer size (unit is ‘blocks’) and Destination access offset (unit is ‘data’)

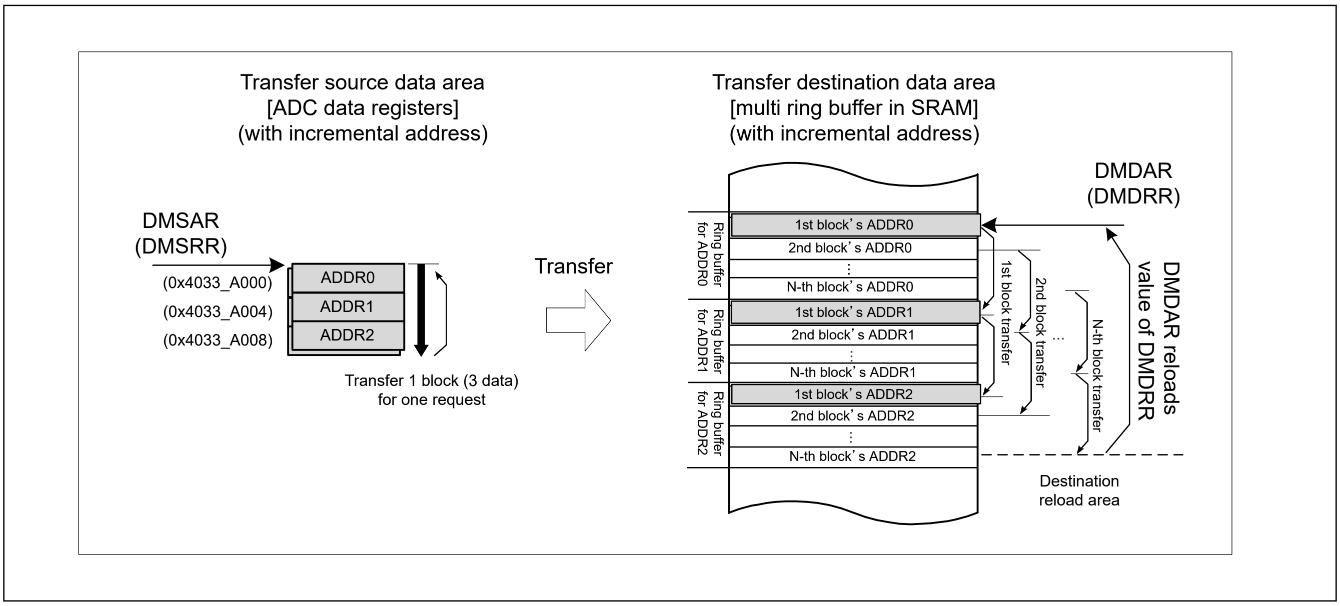

Figure 17.19 Example of use case: from single block to multi ring buffer

17.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

17.3.7.1 DMAC Activation by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

17.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in the ICU.DELSRn.DELS[9:0] (n = 0 to 7) bits.

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set the ICU.DELSRn.DELS[9:0] (n = 0 to 7) bits to the event number (select the DMAC event link).

2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled)

For interrupt requests specified as DMAC activation sources, see Table 14.3 in section 14, Interrupt Controller Unit (ICU).

17.3.8 Operation Timing

The following timing charts show the minimum number of execution cycles.

Figure 17.20 and Figure 17.21 show DMAC operation timing examples.

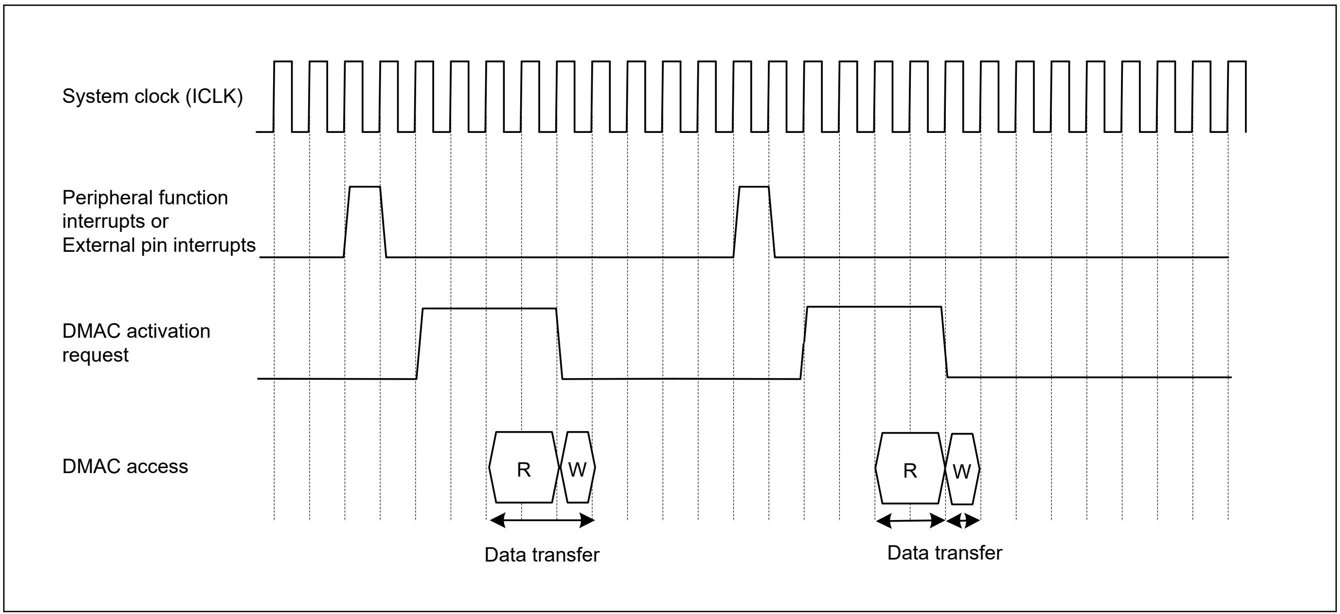

Figure 17.20 DMAC operation timing example 1 with DMAC activation by Interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode

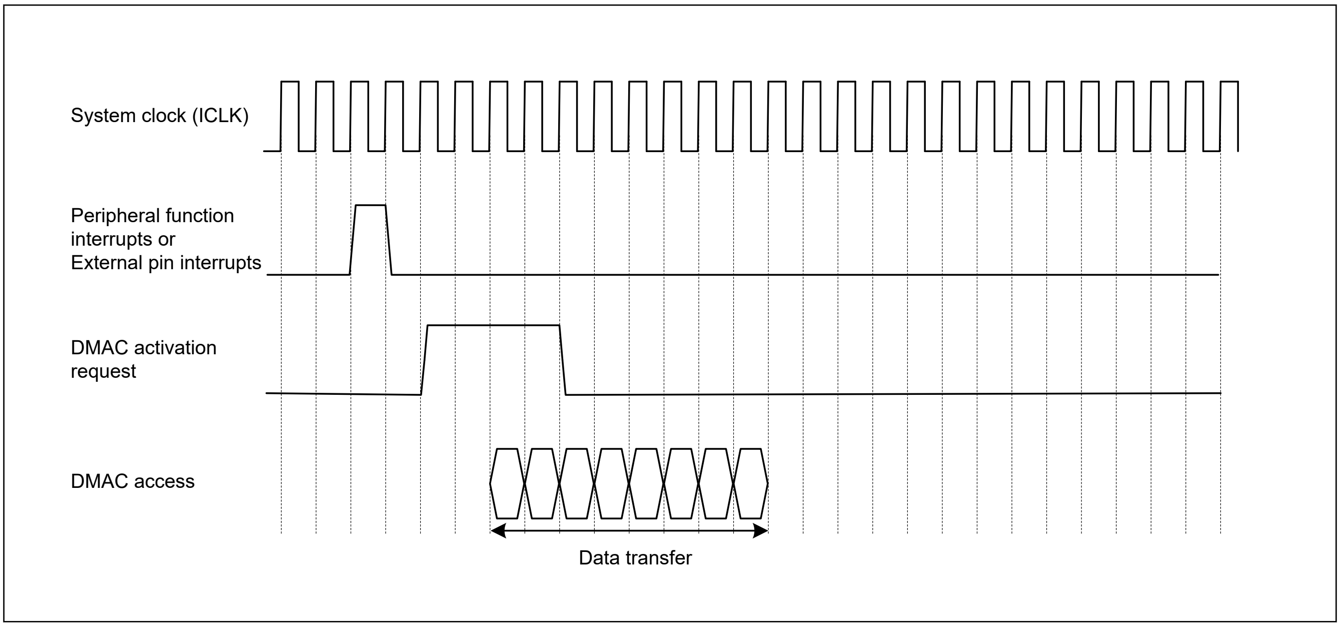

Figure 17.21 DMAC operation timing example 2 with DMAC activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4

17.3.9 Activating the DMAC

Table 17.17 shows the register setting procedure of normal, repeat and block transfer mode and Table 17.18 shows register setting procedure of repeat-block transfer mode.

Table 17.17 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the DMAC request source.	To use peripheral function interrupts as DMAC activation sources. Disable the control register for the peripheral function.
2	Disable the IRQn pin as the DMAC request source.	To use external pin interrupts as DMAC activation sources.
3	Set the ICU.DELSRn.DELS[9:0] bits to 0x00.	Disable the DMAC request.
4	Clear the DMCNT.DTE bit to 0	Disable DMA transfer.
5	Set the interrupt request as a DMAC request source in the DELSRn register by using the ICU.	To use internal peripheral interrupts or external pin interrupts as DMAC activation sources. Enable the interrupt bit for the activation source. Set the DMAC activation source.
6	Set the peripheral module as a DMAC request source	To use peripheral function interrupt as a DMAC activation source. Set the control register for the peripheral function without starting it.
7	Set the IRQn pin function by using the ICU.	To use external pin interrupt as a DMAC activation source. Set the IRQn pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DARA[4:0] bits Set the DMAMD.SARA[4:0] bits	Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address extended repeat area bits Set the Transfer source address extended repeat area bits
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.DTS[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request select bits Set the Data transfer size bits Set the Repeat area select bits Set the Transfer mode select bits Set the transfer keeping select bit
10	Set the DMSAR register Set the DMDAR register Set the DMCRA register	Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations.
11	Set the DMCRB register	To use block transfer mode or repeat transfer mode. Set the number of block transfer operations.
12	Set the DMOFR register	To use the address update function with offset. Set the offset value.
13	Set the DMINT.DTIE bit to 1	To use the DMA transfer end interrupts. Enable DMAC transfer end interrupts.
14	Set the DMINT.RPTIE bit Set the DMINT.SARIE bit Set the DMINT.DARIE bit Set the DMINT.ESIE bit to 1	To use the DMA transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the DMA transfer escape end interrupt.
15	Set the DMCNT.DTE bit to 1	Enable DMA transfer.
16	Set the DMAST.DMST bit to 1	Enable DMAC operation. *1 Common settings for DMAC
17	Start the peripheral function as a DMAC request source	To use peripheral function interrupt as a DMAC activation source
18	Enable the IRQn pin as a DMAC request source	To use external pin interrupt as a DMAC activation source
19	End of initial settings	For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

Table 17.18 Register Setting Procedure of Repeat-Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the DMAC request source.	To use peripheral function interrupts as DMA activation sources. Disable the control register for the peripheral function.
2	Disable the IRQ pin as the DMAC request source.	To use external pin interrupts as DMA activation sources.
3	Set the ICU.DELSRn.DELS[9:0] bits to 0x00.	Disable the DMAC request.
4	Clear the DMCNT.DTE bit to 0	Disable DMAC transfer.
5	Set the interrupt request as a DMAC request source in the DELSRn register by using the ICU.	To use internal peripheral interrupts or external pin interrupts as DMA activation sources. Enable the interrupt bit for the activation source. Set the DMAC activation source.
6	Set the peripheral module as a DMAC request source	To use peripheral function interrupt as a DMA activation source. Set the control register for the peripheral function without starting it.
7	Set the IRQ pin function by using the Interrupt Controller Unit.	To use external pin interrupt as a DMA activation source. Set the IRQ pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DADR bit Set the DMAMD.SADR bit	Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address update select after reload Set the Transfer source address update select after reload
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request select bits Set the Data transfer size bits Set the Transfer mode to repeat-block transfer mode Set the transfer keeping select bit
10	Set the DMSAR register Set the DMDAR register Set the DMSRR register Set the DMDRR register Set the DMCRA register Set the DMCRB register	Set the transfer source start address Set the transfer destination start address Set the initial value of source start address Set the initial value of destination start address Set the number of transfer operations Set the number of block transfer operations
11	Set the DMSBS register Set the DMDBS register	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset Set the destination buffer size and access offset
12	Set the DMINT.DTIE bit to 1	To use DMA transfer end interrupts. Enable DMAC transfer end interrupts.
13	Set the DMCNT.DTE bit to 1	Enable DMAC transfer
14	Set the DMAST.DMST bit to 1	Enable DMAC operation. *1
15	Start the peripheral function as a DMAC request source	To use peripheral function interrupt as a DMA activation source
16	Enable the IRQ pin as a DMAC request source	To use external pin interrupt as a DMA activation source
17	End of initial settings	For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

17.3.10 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

17.3.11 Registers During DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see Table 17.5 to Table 17.13.

DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see Table 17.5 to Table 17.13.

DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 17.5 to Table 17.13.

DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 17.5 to Table 17.13.

DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 17.8 to Table 17.13.

DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 17.8 to Table 17.13.

DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

DMAC Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see section 14, Interrupt Controller Unit (ICU).

17.3.12 Channel Priority

When multiple DMA transfer requests and a DTC transfer request are present, the DMAC and DTC determine the priority of channels that have DMA transfer requests and a DTC transfer request.

- When DMCTL.PR = 0, the channel priority is fixed as follows: channel 0 > channel 1 > channel 2 > channel 3 … > channel 7 > DTC (channel 0: Highest).

When DMCTL.PR = 1, the DMAC and DTC determine the priority of channels at round-robin.

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

17.3.13 Channel Security

The secure attribute can be set with CPSCU.DMACCHSAR.SADMACm0n (m = 0, 1, n = 0 to 7) for each DMAC channel.

When the CPSCU.DMACCHSAR.SADMACm0n bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.DMACCHSAR.SADMACm0n bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Refer to the Security chapter and BUS chapter for areas accessible to secure and non-secure masters.

Do not change to the CPSCU.DMACCHSAR while DMA transfer.

17.3.14 Channel Privilege

The privileged attribute can be set with CPSCU.DMACCHPAR.PADMACm0n (m = 0, 1, n = 0 to 7) for each DMAC channel n.

When the CPSCU.DMACCHPAR.PADMACm0n bit is 0.

- When the corresponding channel transfers, it behaves as a privileged master.
- The registers of channel are protected from an unprivileged access.

When the CPSCU.DMACCHPAR.PADMACm0n bit is 1.

- The transfer of DMAC channel is unprivileged access for both read and write.
- The registers of channel are unprivileged attributes.

Do not change to the CPSCU.DMACCHPAR while DMA transfer.

17.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see section 14, Interrupt Controller Unit (ICU).

17.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRAL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

17.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 14, Interrupt Controller Unit (ICU).

17.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 14, Interrupt Controller Unit (ICU).

17.5 Processing on DMA Transfer Error

DMA transfer error occurs with MSAU error, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, ICU.DELSRn of the corresponding channel is cleared. Write back to each register is not performed. The information of the channel that caused the error is set in DMECHR.

17.6 Interrupts

17.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request DMACmn_INT (m = 0, 1, n = 0 to 7) to the CPU or the DTC after transfer in response to one request is completed.

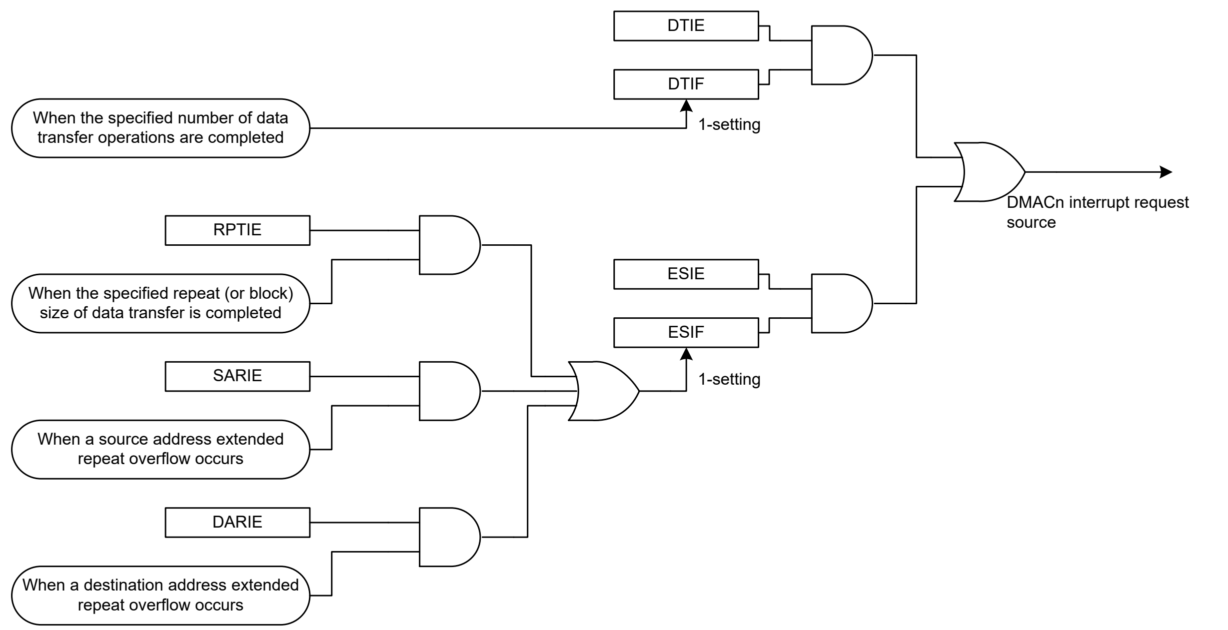
The interrupt request is generated after the bus response to the final write of the DMA transfer. The timing of the bus response to a DMA write access depends on the DMBWR.BWE and transfer destination. For details, see section 17.9.1. Bus Response to DMA Write Access.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

Table 17.19 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 17.22 shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). Figure 17.23 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 17.19 Relation among interrupt sources, interrupt status flags, and interrupt enable bits

Interrupt sources		Interrupt enable bits	Interrupt status flags	Request output enable bits
Transfer end		—	DMSTS.DTIF	DMINT.DTIE
Escape transfer end	Repeat size end	DMINT.RPTIE	DMSTS.ESIF	DMINT.ESIE
	Source address extended repeat area overflow	DMINT.SARIE		
	Destination address extended repeat area overflow	DMINT.DARIE		



Note: n = 0 to 7

Figure 17.22 Schematic logic diagram of interrupt output source (DMACn)

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

17.6.1.1 When Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

17.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

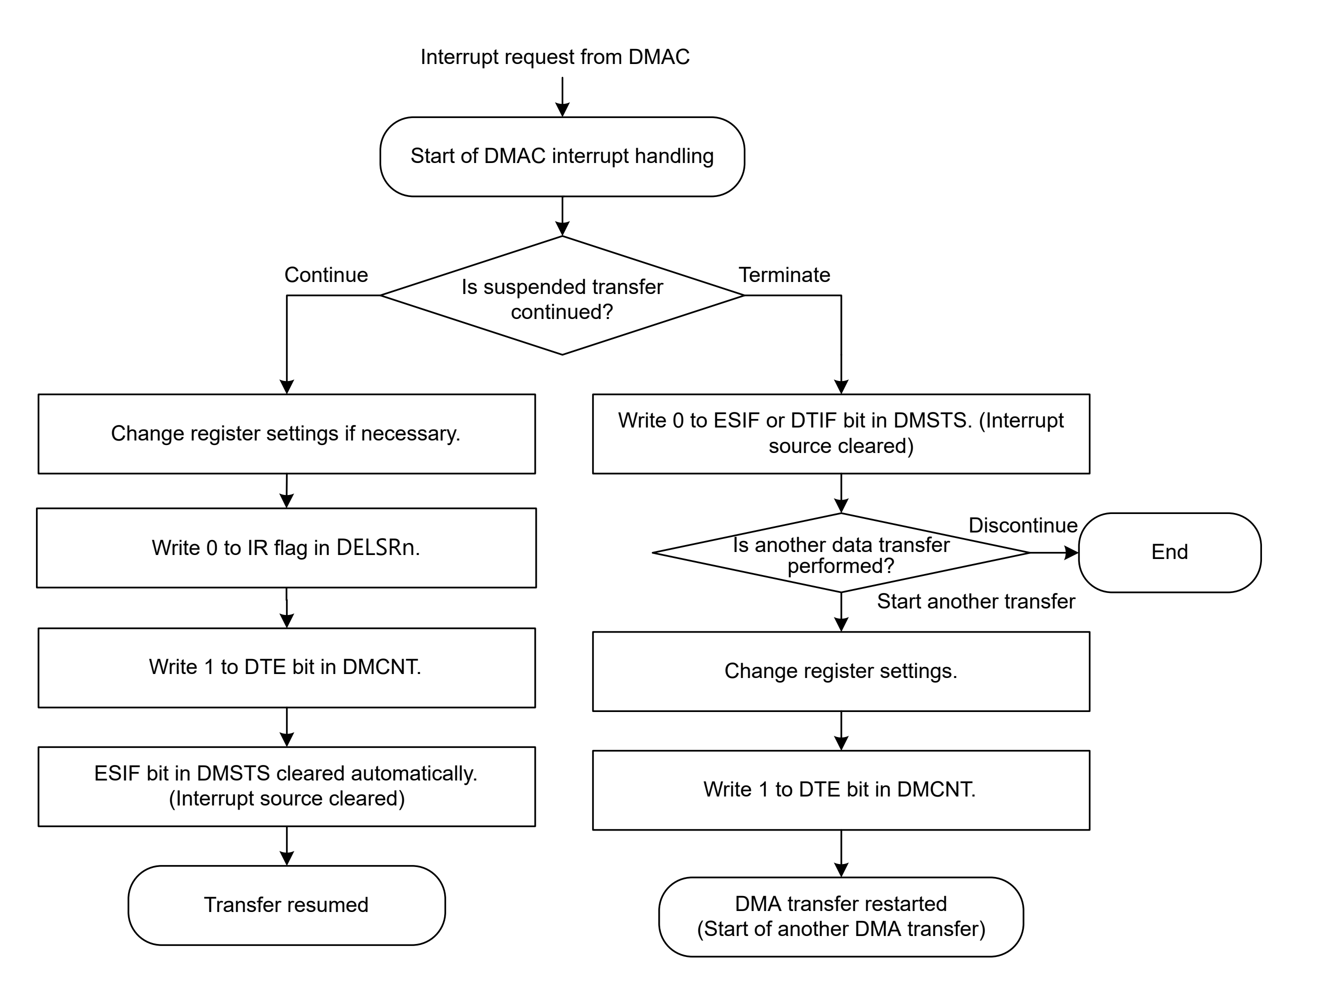


Figure 17.23 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

17.6.2 Transfer Error Interrupt

Error response detection interrupt request DMAm_TRANSERR (m = 0, 1) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer.

The types of interrupts that occur when a DMAC transfer error occurs are listed in the Table 17.20. The Table 17.20 also shows error information stored when a transfer error occurs.

Table 17.20 Interrupt and error information due to DMAC transfer error cause

Transfer error factor	NMI/RESET*1 Request	Interrupt Request	Bus Error Status	Error Channel Information
MSAU Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.MESRRSTAT	DMAC. DMECHR
Master MPU Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.MMERRSTAT	DMAC. DMECHR
Illegal Access Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.ILERRSTAT	DMAC. DMECHR
Slave Bus Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.SLERRSTAT	DMAC. DMECHR
TrustZone Filter error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.SLERRSTAT	DMAC. DMECHR

Note 1. If ICU.NMIER.BUSEN is enabled with DMAm_TRANSERR set in ICU.IELSR, NMI and an interrupt will occur due to a transfer error caused by DMA. Only NMI can be generated by not setting DMAm_TRANSERR to ICU.IELSR.

17.7 Event Link

Each DMAC channel outputs an event link request each time one data transfer is completed in normal transfer mode or repeat transfer mode, and each time one block transfer is completed in block transfer mode or repeat-block transfer mode.

The event link request DMACmn_INT (m = 0, 1, n = 0 to 7) is generated when the bus responds to the last destination access of DMA transfer.

The timing of the bus response to a DMA write access depends on the DMBWR.BWE and transfer destination. For details, see section 17.9.1. Bus Response to DMA Write Access.

For details, see section 19, Event Link Controller (ELC).

17.8 Low-Power Consumption Function

Before entering the module-stop state, Software Standby mode or Deep Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended) and use the settings in the sections that follow.

(1) Module-stop function

Setting the module-stop bit to 1 stops the DMAC corresponding to that module-stop bit.

If the module-stop bit is set to 1 while DMAC transfers data, the DMAC corresponding to that bit becomes the module-stop state after completing it.

When the module-stop bit is 1, access to the register of the DMAC corresponding to that module-stop bit is prohibited.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in section 11.6.2.1. Entering Software Standby Mode, or in section 11.6.3.1. Transition to Deep Software Standby Mode .

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

(3) Notes on low power consumption function

For information on the WFI instruction and register settings, see section 11.8.7. Timing of WFI Instructions.

To perform a DMA transfer after returning from a low power mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in section 14.4.1. Interrupt Detection Selection, and then execute the WFI instruction.

17.9 Usage Notes

17.9.1 Bus Response to DMA Write Access

The timing of the bus response to a DMA write access depends on the DMBWR.BWE setting and the destination of the transfer. When DMBWR.BWE is "1", the bus response is returned from the intermediate point described in section 15.2.5.2. Bufferable Write Access in the bus chapter. Also, when writing to an access destination described in section 15.2.5.3. Notes on Writing Completion Timing in the bus chapter, a bus response is returned before the write is completed.

17.9.2 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- ICU.DELSR
- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR

- DMSBS
- DMDBS
- DMSRR
- DMDRR
- DMBWR
- ICUSARC
- DMACSAR
- DMCTL

17.9.3 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 5, Address Space.

17.9.4 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn)

The DMAC event link setting register (ICU.DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE) that corresponds to the same event number that has been set by the ICU.DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE, see section 14, Interrupt Controller Unit (ICU).

17.9.5 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x000 to the DMAC Event Link select bits (ICU.DELSRn.DELS[9:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[9:0] bits following the settings shown in section 17.3.9. Activating the DMAC.

17.9.6 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the ICU.DELSRn.DELS[9:0] bits to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with the following steps:

1. Set the DMCNT.DTE bit to 0.
2. Set the ICU.DELSRn.IR flag to 0.

18. Data Transfer Controller (DTC)

18.1 Overview

A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.

Table 18.1 lists the DTC specifications and Figure 18.1 shows DTC block diagram.

Table 18.1 DTC specifications

Item	DTC0 (for CPU0)/DTC1 (for CPU1)
Transfer modes	● Normal transfer mode A single activation leads to a single data transfer. ● Repeat transfer mode A single activation leads to a single data transfer. The transfer address returns to the start address after the number of data transfers reaches the specified repeat size. The maximum number of repeat transfers is 256 and the maximum data transfer size is 256 × 64 bits (2048 bytes). ● Block transfer mode A single activation leads to a transfer of a single block. The maximum block size is 256 × 64 bits = 2048 bytes.
Transfer channel	● Channel transfer corresponding to the interrupt source is possible (transferred by a DTC activation request from the ICU). ● Multiple data units can be transferred on a single activation source (chain transfer). ● Chain transfers are selectable to either execute when the counter is 0 or always execute.
Transfer space	● 4 GB area from 0x0000_0000 to 0xFFFF_FFFF excluding reserved areas.
Data transfer units	● Single data unit: 1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits), 1 doubleword (64 bits). ● Single block size: 1 to 256 data units.
CPU interrupt source	● An interrupt request can be generated to the CPU on a DTC activation interrupt ● An interrupt request can be generated to the CPU after a single data transfer ● An interrupt request can be generated to the CPU after a data transfer of a specified volume.
Processing on DTC transfer error	● When the DTC transfer error occurs, it stops the transfer that caused the error ● Request to clear the register for activation request of DTC error number to ICU
Error response detection interrupt	Generated when the DTC transfer error occurs
Event link function	Generated after one data transfer (for block, after one block transfer)
Read skip	Read of transfer information can be skipped
Write-back skip	When the transfer source or destination address is specified as fixed, a write-back of transfer information can be skipped
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security attribution and privilege attribution can be set for each activation source.

Note: Security attribution Register of DTC is described in ICU.ICUSARG, ICU.ICUSARH, ICU.ICUSARI, ICU.ICUSARJ, ICU.ICUSARK and ICU.ICUSARL

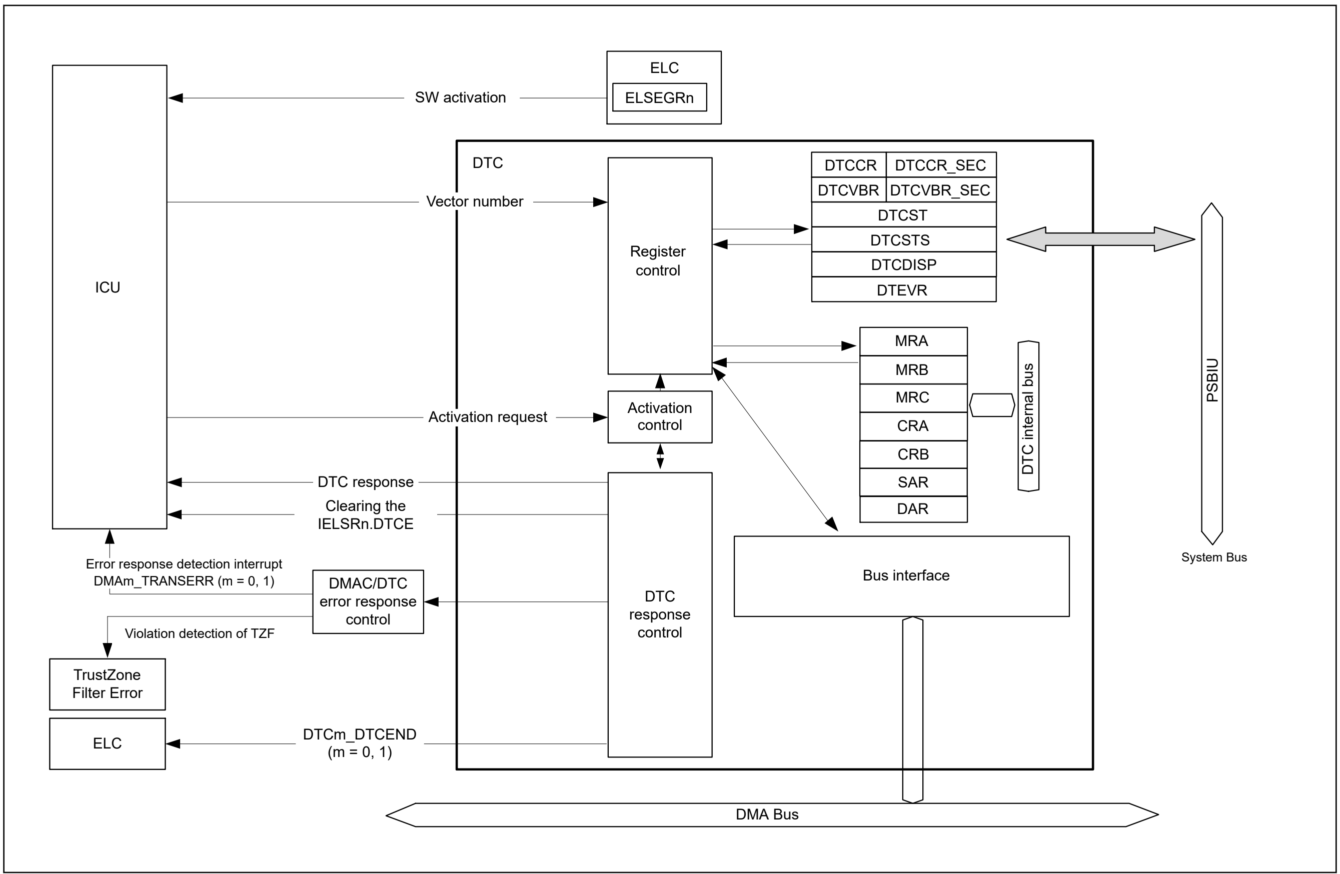

Figure 18.1 DTC block diagram

See section 14.1. Overview in section 14, Interrupt Controller Unit (ICU) for the connections between the DTC and NVIC in the CPU.

18.2 Register Descriptions

MRA, MRB, MRC, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

The DTC0 and DTC1 registers have the same base address. DTC0 is dedicated to CPU0 and can only be accessed from CPU0. DTC1 is dedicated to CPU1 and can only be accessed from CPU1.

18.2.1 DTCSAR : DTC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x30

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTCSTSA1
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTCSTSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DTCSTSA0	DTC0 Security Attribution 0: Secure 1: Non-secure	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W
16	DTCSTSA1	DTC1 Security Attribution 0: Secure 1: Non-secure	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

This register sets the DTCST and DTCSTS security attribution.

DTCSTSA0 bit (DTC0 Security Attribution)

This bit specifies security attribution of registers for DTC0.DTCST and DTC0.DTCSTS.

Do not write to the DTCSTSA0 bit while DTC0 transfer is enabled or a bus master is writing to the DTC0 registers.

DTCSTSA1 bit (DTC1 Security Attribution)

This bit specifies security attribution of registers for DTC1.DTCST and DTC1.DTCSTS.

Do not write to the DTCSTSA1 bit while DTC1 transfer is enabled or a bus master is writing to the DTC1 registers.

18.2.2 MRA : DTC Mode Register A

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x03 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MD[1:0]		SZ[1:0]		SM[1:0]		—	WBDIS
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
0	WBDIS	Write Back Disable 0: Write back to the DTC transfer information at the end of DTC data transfer. 1: Do not write back to the DTC transfer information at the end of DTC data transfer.	—
1	—	The read value is undefined. The write value should be 0.	—
3:2	SM[1:0]	Transfer Source Address Addressing Mode 0 0: Address in the SAR register is fixed (write-back to SAR is skipped.) 0 1: Address in the SAR register is fixed (write-back to SAR is skipped.) 1 0: SAR value is incremented after data transfer: +1 when SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b +8 when SZ[1:0] = 11b 1 1: SAR value is decremented after data transfer: -1 when SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b -8 when SZ[1:0] = 11b	—
5:4	SZ[1:0]	DTC Data Transfer Size 0 0: Byte (8-bit) transfer 0 1: Halfword (16-bit) transfer 1 0: Word (32-bit) transfer 1 1: Doubleword (64-bit) transfer	—

Bit	Symbol	Function	R/W
7:6	MD[1:0]	DTC Transfer Mode Select 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited	—

The MRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x03) and DTC transfers it automatically to and from the MRA register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.

WBDIS bit (Write Back Disable)

This bit selects whether to write back the transfer information at the end of data transfer.

When the WBDIS bit is 0, the updated DTC transfer information is written back.

When the WBDIS bit is 1, the transfer information is not written back even if the address is set to be incremented after transfer, and the same data transfer is performed for each start request. Since the transfer information is not written back, you can put the DTC transfer information in ROM. When the WBDIS bit is 1, the following operations are performed for each transfer mode.

When setting the MRC.DISPE bit to 1, also set the WBDIS bit to 1 (do not write back). If there is at least one transfer information with the WBDIS bit set to 1, set DTCCR.RRS to 0 (do not perform read skip). When used in secure state, access DTCCR_SEC.RRS instead of DTCCR.RRS.

(1) Normal transfer mode and repeat transfer mode

One startup factor transfers 1 byte, 1 halfword, 1 word, and 1 doubleword. The transfer address and the number of transfers are not updated, and the same transfer is repeated for each transfer request. Even if the number of transfers is 1, ICU.DTCERn.DTCE will not be cleared and DTC transfer will continue due to the next activation factor.

(2) Block transfer mode

One block is transferred by one activation factor. The transfer address and block transfer count are not updated, and the same block transfer is repeated for each transfer request. Even if the number of block transfers is 1, ICU.DTCERn.DTCE does not clear to 0 and continues DTC transfer due to the next activation factor.

18.2.3 MRB : DTC Mode Register B

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x02 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CHNE	CHNS	DISEL	DTS	DM[1:0]		—	—
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
1:0	—	The read values are undefined. The write value should be 0.	—

Bit	Symbol	Function	R/W
3:2	DM[1:0]	Transfer Destination Address Addressing Mode 0 0: Address in the DAR register is fixed (write-back to DAR is skipped) 0 1: Address in the DAR register is fixed (write-back to DAR is skipped) 1 0: DAR value is incremented after data transfer: +1 when MRA.SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b +8 when SZ[1:0] = 11b 1 1: DAR value is decremented after data transfer: -1 when MRA.SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b -8 when SZ[1:0] = 11b	—
4	DTS	DTC Transfer Mode Select 0: Select transfer destination as repeat or block area. 1: Select transfer source as repeat or block area.	—
5	DISEL	DTC Interrupt Select 0: Generate an interrupt request to the CPU when specified data transfer is complete. 1: Generate an interrupt request to the CPU each time DTC data transfer is performed.	—
6	CHNS	DTC Chain Transfer Select 0: Chain transfer is continuous. 1: Chain transfer occurs only when the transfer counter changes from 1 to 0 or 1 to CRAH.	—
7	CHNE	DTC Chain Transfer Enable 0: Chain transfer is disabled. 1: Chain transfer is enabled.	—

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x02) and DTC transfers it automatically to and from the MRB register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.

DM[1:0] bits (Transfer Destination Address Addressing Mode)

The DM[1:0] bits are to fix the address of the DAR register or specify increment / decrement of the DAR register after transfer.

DTS bit (DTC Transfer Mode Select)

The DTS bit specifies whether the transfer source or destination is the repeat or block area in repeat or block transfer mode.

DISEL bit (DTC Interrupt Select)

The DISEL bit specifies the condition for generating an interrupt request to the CPU.

CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see Table 18.3.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected by the CHNS bit. For details on chain transfer, see section 18.4.6. Chain Transfer.

Note: When the chain transfer settings are CHNE = 1 and CHNS = 0, the transfer count according to the transfer settings will be -1 for each transfer request. Therefore, the transfer count for each transfer information must match.

18.2.4 MRC : DTC Mode Register C

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x01 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DISPE
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
0	DISPE	Displacement Added 0: Do not add the displacement value to the forwarding source address. 1: Add the displacement value to the forwarding source address.	—
7:1	—	The read values are undefined. The write value should be 0.	—

The MRC register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x01) and DTC transfers it automatically to and from the MRC register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table

DISPE bit (Displacement Added)

The DISPE bit specifies whether to use the value of SAR + DTCDISP as the forwarding address. When setting the DISPE bit to 1, be sure to set the MRA.WBDIS bit to 1 (do not write back) and the DTCCR.RRS bit to 0 (do not perform read skip). When used in secure state, access DTCCR_SEC.RRS instead of DTCCR.RRS.

18.2.5 SAR : DTC Transfer Source Register

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x04 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position: 31 ... 0

Bit field: (empty)

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x

The SAR sets the transfer source start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x04) and DTC transfers it automatically to and from the SAR register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b, and bit[2], bit[1], and bit[0] must be 0 when MRA.SZ[1:0] = 11b.

18.2.6 DAR : DTC Transfer Destination Register

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x08 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position: 31 ... 0

Bit field: (empty)

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x

The DAR sets the transfer destination start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x08) and DTC transfers it automatically to and from the DAR register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b, and bit[2], bit[1], and bit[0] must be 0 when MRA.SZ[1:0] = 11b.

18.2.7 CRA : DTC Transfer Count Register A

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x0E + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
7:0	CRAL	Transfer Counter A Lower Register Specify the transfer count.	—
15:8	CRAH	Transfer Counter A Upper Register Specify the transfer count.	—

Note: The function depends on the transfer mode.
Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode.

CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.

(1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, the CRA register functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

(3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

18.2.8 CRB : DTC Transfer Count Register B

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x0C + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used, and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See section 18.3.1. Allocating Transfer Information and DTC Vector Table.

18.2.9 DTCCR : DTC Control Register

Base address: DTC0_NS = 0x5000_AC00

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	RRS	DTC Transfer Information Read Skip Enable for Non-secure 0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE7, P-TYPE2

RRS bit (DTC Transfer Information Read Skip Enable for Non-secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

Set the RRS bit to 0 when there is at least one transfer with the MRA.WBDIS bit set to 1.

If you want to set the MRC.DISPE bit to 1, you need to set the MRA.WBDIS bit to 1.

For information on the function of the RRS bit and how to set it, see section 18.4.1. Transfer Information Read Skip Function.

18.2.10 DTCCR_SEC : DTC Control Register for Secure Region

Base address: DTC0 = 0x4000_AC00

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	RRS	DTC Transfer Information Read Skip Enable for Secure 0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE6, P-TYPE2

RRS bit (DTC Transfer Information Read Skip Enable for Secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

18.2.11 DTCVBR : DTC Vector Base Register

Base address: DTC0_NS = 0x5000_AC00

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	DTC Vector Base Address for Non-secure region Set the DTC vector base address for non-secure region. The lower 10 bits should be 0.	R/W

Note: S-TYPE7, P-TYPE2

The DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1 KB units.

For information on the function of the RRS bit and how to set it, see section 18.4.1. Transfer Information Read Skip Function.

18.2.12 DTCVBR_SEC : DTC Vector Base Register for Secure Region

Base address: DTC0 = 0x4000_AC00

Offset address: 0x14

Bit position:	31 … 0
Bit field:	
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	n/a	DTC Vector Base Address for Secure region Set the DTC vector base address for secure region. The lower 10 bits should be 0.	R/W

Note: S-TYPE6, P-TYPE2

The DTCVBR_SEC sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

18.2.13 DTCST : DTC Module Start Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DTCST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DTCST	DTC Module Start 0: DTC module stopped 1: DTC module started	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE2

DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode
- Deep Software Standby mode

For details on these transitions, see section 18.10. Low Power Consumption Function and section 11, Low Power Mode.

18.2.14 DTCSTS : DTC Status Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x0E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ACT	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	VECN[7:0]	DTC-Activating Vector Number Monitoring These bits indicate the vector number for the activation source when a DTC transfer is in progress. The value is only valid if a DTC transfer is in progress (ACT flag is 1).	R
14:8	—	These bits are read as 0.	R
15	ACT	DTC Active Flag 0: DTC transfer operation is not in progress. 1: DTC transfer operation is in progress.	R

Note: S-TYPE3, P-TYPE2

VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

18.2.15 DTCDISP : DTC Address Displacement Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x18

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DTCDISP[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DTCDISP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	DTCDISP[31:0]	DTC Address Displacement Displacement value to be added to the DTC forwarding source address.	R/W

Note: S-TYPE-7, P-TYPE-2

The DTCDISP register specifies the displacement value to be added to the DTC forwarding source address. If the MRC.DISPE bit is 1, the value of SAR + DTCDISP is used as the transfer source address.

18.2.16 DTEVR : DTC Error Vector Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DTEVSAM	DTEV[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DTEV[7:0]	DTC Error Vector Number These bits represent error vector of the DTC.	R
8	DTEVSAM	DTC Error Vector Number SA Monitor Indicates the SA of vector number causing the error. 0: Secure vector number 1: Non-secure vector number	R
15:9	—	These bits are read as 0. The write value should be 0.	R
16	DTESTA	DTC Error Status Flag 0: No DTC transfer error occurred 1: DTC transfer error occurred	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R

Note: P-TYPE2 See below for access by security attribution.
Note: Writing to DTESTA depends on the value of DTEVSAM

When reading this register, it can be accessed from both secure and non-secure access.

When writing this register, it depends on DTEVR.DTEVSAM.

- When DTEVSAM = 1, it can be accessed from Secure and Non-secure access.
- When DTEVSAM = 0, it can be accessed from Secure. An error is returned when write access is performed in a Non-secure access.

This register is cleared by a reset caused by a transfer error. Please select interrupt DMAm_TRANSERR (m = 0, 1) in BUS.BUSOAD and TZF.MSAOAD when you want to debug the program.

DTEV[7:0] bit (DTC Error Vector Number)

When a transfer error due to DTC transfer occurs, it stores the channel of DTC that was violated.

[Setting condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

DTEVSAM bit (DTC Error Vector Number SA Monitor)

When a transfer error due to DTC transfer occurs, it indicates the SA of the violating DTC vector number.

[Setting condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition].

- When 1 is written to DTEVR.DTESTA.

DTESTA bit (DTC Error Status Flag)

Indicates whether or not a DTC transfer error occurred.

DTEV, DTEVSAM, DTESTA are cleared by writing 1 to DTESTA.

Writing 0 to DTESTA is ignored.

[Setting condition]

- When the DTC transfer error occurs.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

18.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output *n* number set in ICU.IELSRn is defined as the interrupt vector number. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number n is selected in ICU.IELSRn.IELS[9:0] (n = 0 to 95), as listed in section 14.3.2. Event Number. For activation by software, see section 19.2.2. ELSEGRn : Event Link Software Event Generation Register n (n = 0 to 3).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until the transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, the highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU.
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer.
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

18.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

The DTC has a vector table for secure DTC activation requests and a vector table for non-secure DTC activation requests. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the Non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR_SEC which is the Secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. However, if the MRA.WBDIS bit is set to 1 (no write back), it can also be placed in the ROM area. The start address of the transfer information n with vector number n must be 4n added to the base address in the vector table. Each transfer information start address must be a multiple of 16.

When setting the DTC transfer attribution for the privilege access or unprivileged access, allocating the vector table and transfer information as follows. The vector table should be located in the privileged area. Transfer information with the privileged attribution is located in the privileged area. Transfer information with the unprivileged attribution is located in any privileged area. Privileged area is set by MMPU (see section 16, Memory Protection Unit (MPU)). Privileged and non-privileged access settings are located at bit 0 of the address corresponding to each vector number in the vector table.

Figure 18.2 shows the relationship between the DTC vector table and transfer information.

Figure 18.3 shows the bit arrangement in the vector table.

Figure 18.4 shows the allocation of transfer information in the SRAM area.

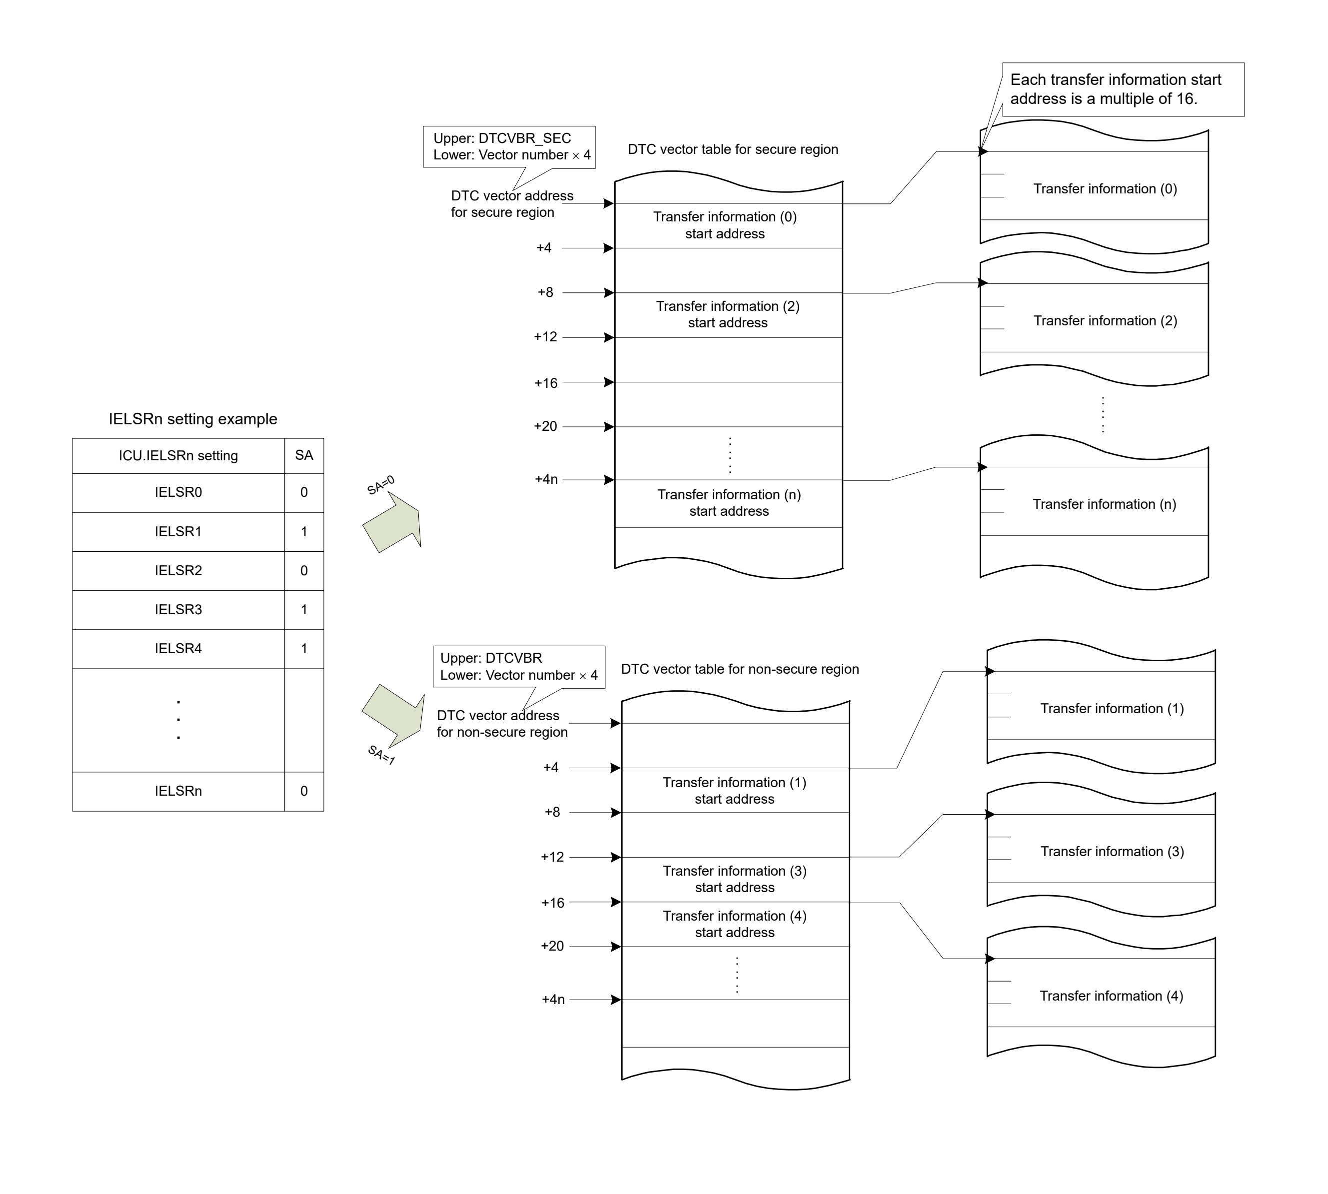

Figure 18.2 DTC vector table and transfer information

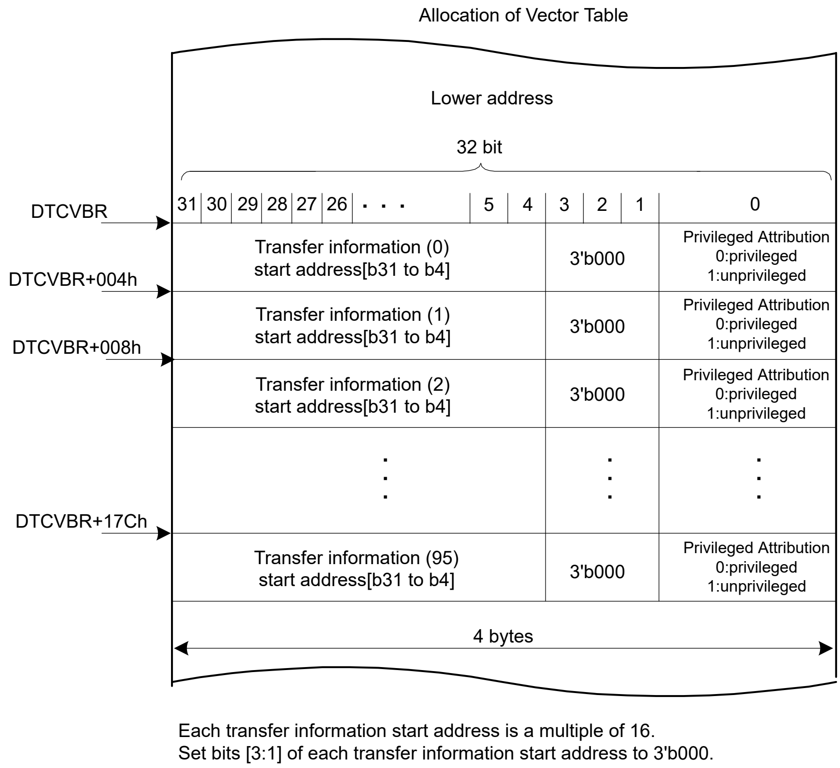

Figure 18.3 Bit arrangement in the vector table

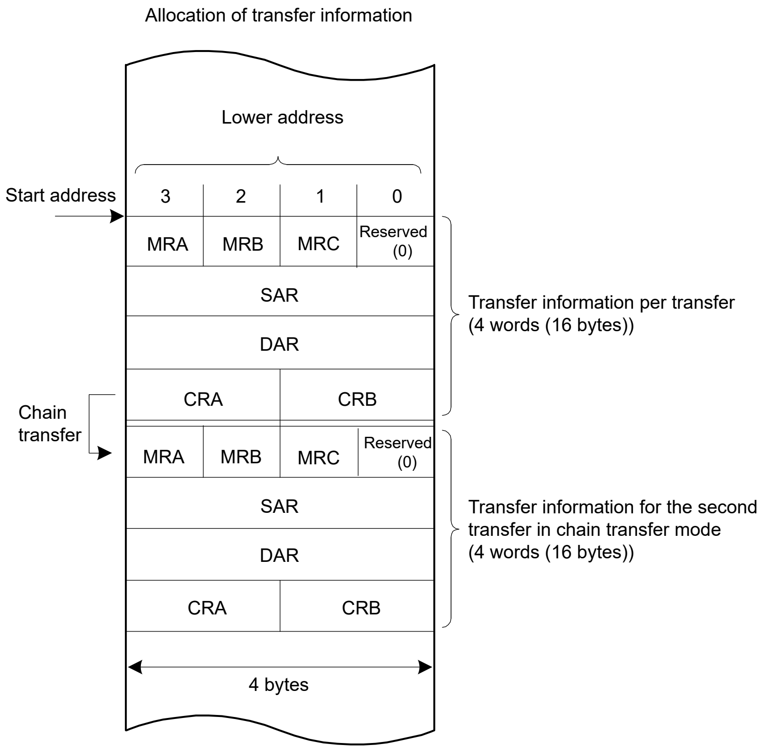

Figure 18.4 Allocation of transfer information in the SRAM area

18.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 18.2 describes the DTC transfer modes.

Table 18.2 DTC transfer modes (1 of 2)

Transfer mode	Data size transferred on single transfer request	Increment or decrement of memory address	Settable transfer count
Normal transfer mode	1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits), or 1 doubleword (64 bits).	Incremented or decremented by 1, 2, 4, or 8 or address-fixed	1 to 65536
Repeat transfer mode*1	1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits), or 1 doubleword (64 bits).	Incremented or decremented by 1, 2, 4, or 8 or address-fixed	1 to 256*3

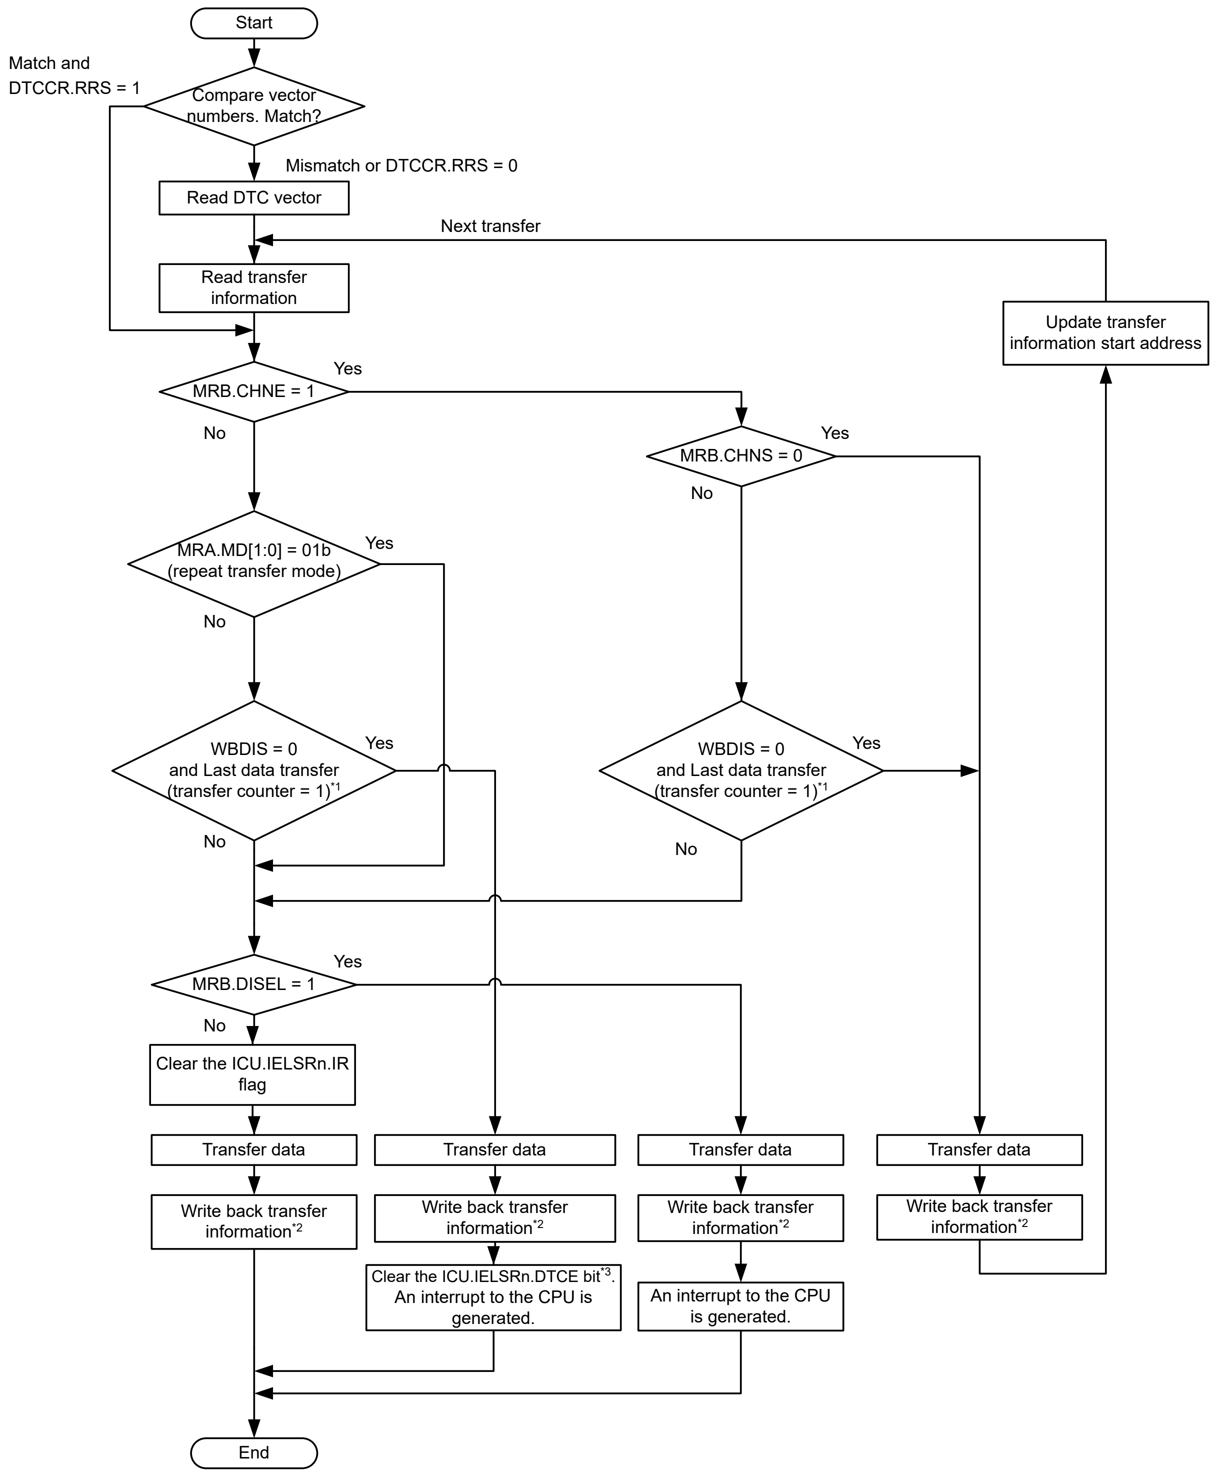
Table 18.2 DTC transfer modes (2 of 2)

Transfer mode	Data size transferred on single transfer request	Increment or decrement of memory address	Settable transfer count
Block transfer mode*2	Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), 1 to 256 words (4 to 1024 bytes), or 1 to 256 doublewords (8 to 2048 bytes)).	Incremented or decremented by 1, 2, 4, or 8 or address-fixed	1 to 65536

Note 1. Set the transfer source or transfer destination as the repeat area.
Note 2. Set the transfer source or transfer destination as the block area.
Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 18.5 shows the operation flow of the DTC. Table 18.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.



Note 1. Counter value before starting data transfer.
Note 2. Write back is skipped when the WBDIS bit is 1.
Note 3. The DTCE bit is not cleared when the WBDIS bit is 1.

Figure 18.5 DTC operation flow

Table 18.3 Chain transfer conditions

First transfer				Second transfer[*3]				DTC transfer
CHNE bit	CHNS bit	DISEL bit	Transfer counter[*1 *2]	CHNE bit	CHNS bit	DISEL bit	Transfer counter[*1 *2]	
0	—	0	Other than (1 → 0)	—	—	—	—	Ends after the first transfer
0	—	0	(1 → 0)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU
0	—	1	—	—	—	—	—	
1	0	—	—	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	0	Other than (1 → *)	—	—	—	—	Ends after the first transfer
1	1	—	(1 → *)	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	1	Other than (1 → *)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU

Note 1. The transfer counter used depends on the transfer modes as follows:
Normal transfer mode — CRA register
Repeat transfer mode — CRAL register
Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:
1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → *) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

18.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. Figure 18.13 shows an example when reading the transfer information is skipped.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

If there is at least one transfer information with the MRA.WBDIS bit set to 1, the transfer information read skip function cannot be used. Set the DTCCR.RRS bit to 0 (do not perform read skip). When used in secure state, access DTCCR_SEC.RRS instead of DTCCR.RRS.

18.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. Table 18.4 lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

When the MRA.WBDIS bit is 1, all transfer information (SAR, DAR, CRA, CRB) is not written back. Since the transfer information in memory is not updated, DTC data transfer can be performed without copying the transfer information from ROM to RAM. Also, by omitting writeback, the time required for post-processing of data transfer can be shortened.

Table 18.4 Transfer information write-back skip conditions and applicable registers

MRA.SM[1:0] bits		MRB.DM[1:0] bits		SAR register	DAR register
b3	b2	b3	b2		
0	0	0	0	Skip	Skip
0	0	0	1		
0	1	0	0		
0	1	0	1		
0	0	1	0	Skip	Write-back
0	0	1	1		
0	1	1	0		
0	1	1	1		
1	0	0	0	Write-back	Skip
1	0	0	1		
1	1	0	0		
1	1	0	1		
1	0	1	0	Write-back	Write-back
1	0	1	1		
1	1	1	0		
1	1	1	1		

18.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bits), 1-halfword (16 bits), 1-word (32 bits), or 1-doubleword (64 bits) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

Table 18.5 lists register functions in normal transfer mode, and Figure 18.6 shows the memory map of normal transfer mode.

Table 18.5 Register functions in normal transfer mode

Register	Description	Value written back by writing transfer information*2
SAR	Transfer source address	Increment, decrement, or fixed*1
DAR	Transfer destination address	Increment, decrement, fixed*1
CRA	Transfer counter A	CRA - 1
CRB	Transfer counter B	Not updated

Note 1. Write-back operation is skipped in address-fixed mode.
Note 2. Write-back is skipped when MRA.WBDIS = 1.

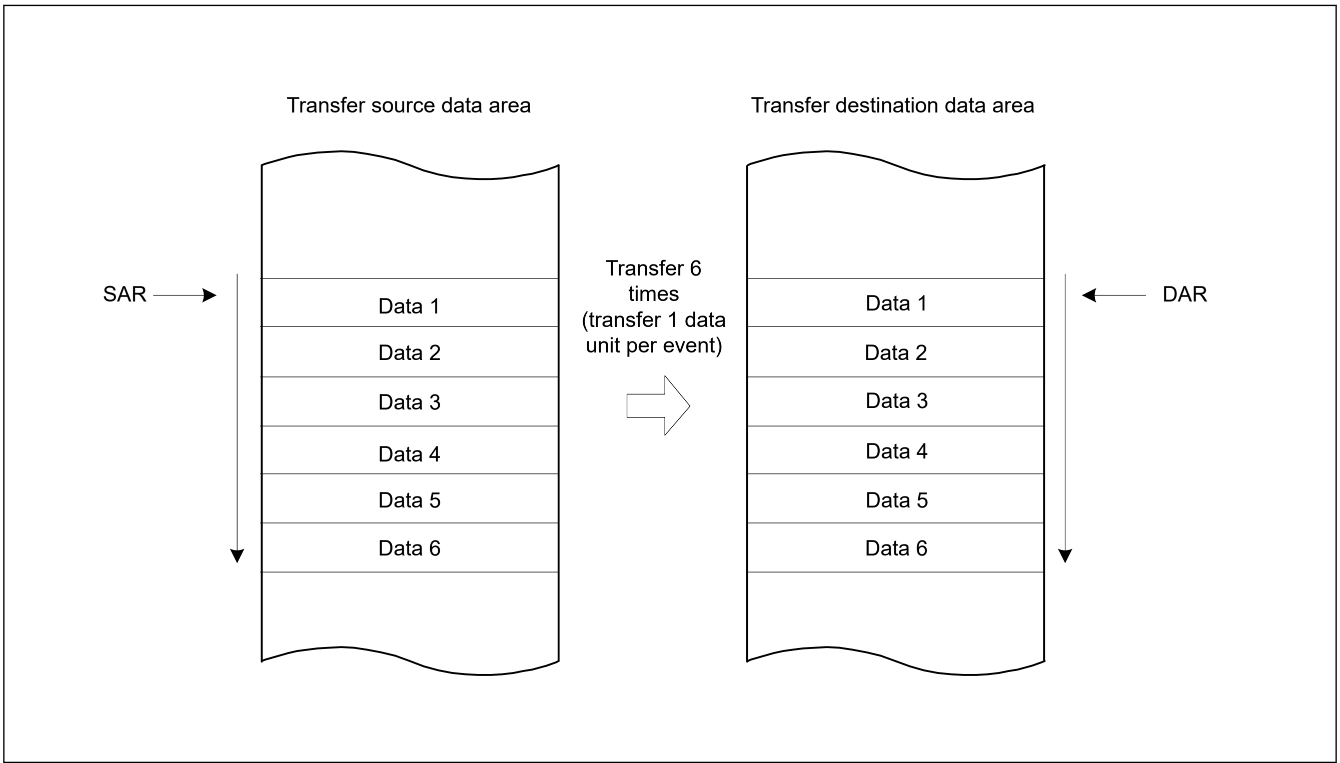


Figure 18.6 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0x0006)

18.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8 bits), 1-halfword (16 bits), 1-word (32 bits), or 1-doubleword (64 bits) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

Table 18.6 lists the register functions in repeat transfer mode, and Figure 18.7 shows the memory map of repeat transfer mode.

Table 18.6 Register functions in repeat transfer mode

Register	Description	Value written back by writing transfer information[*2]	
		When CRAL is not 1	When CRAL is 1
SAR	Transfer source address	Increment, decrement, fixed[*1]	• When the MRB.DTS bit is 0 Increment, decrement, or fixed[*1] • When the MRB.DTS bit is 1 SAR register initial value
DAR	Transfer destination address	Increment, decrement, or fixed[*1]	• When the MRB.DTS bit is 0 DAR register initial value • When the MRB.DTS bit is 1 Increment, decrement, or fixed[*1]
CRAH	Retains transfer counter	CRAH	CRAH
CRAL	Transfer counter A	CRAL - 1	CRAH
CRB	Transfer counter B	Not updated	Not updated

Note 1. Write-back is skipped in address-fixed mode.
Note 2. Write-back is skipped when MRA.WBDIS = 1.

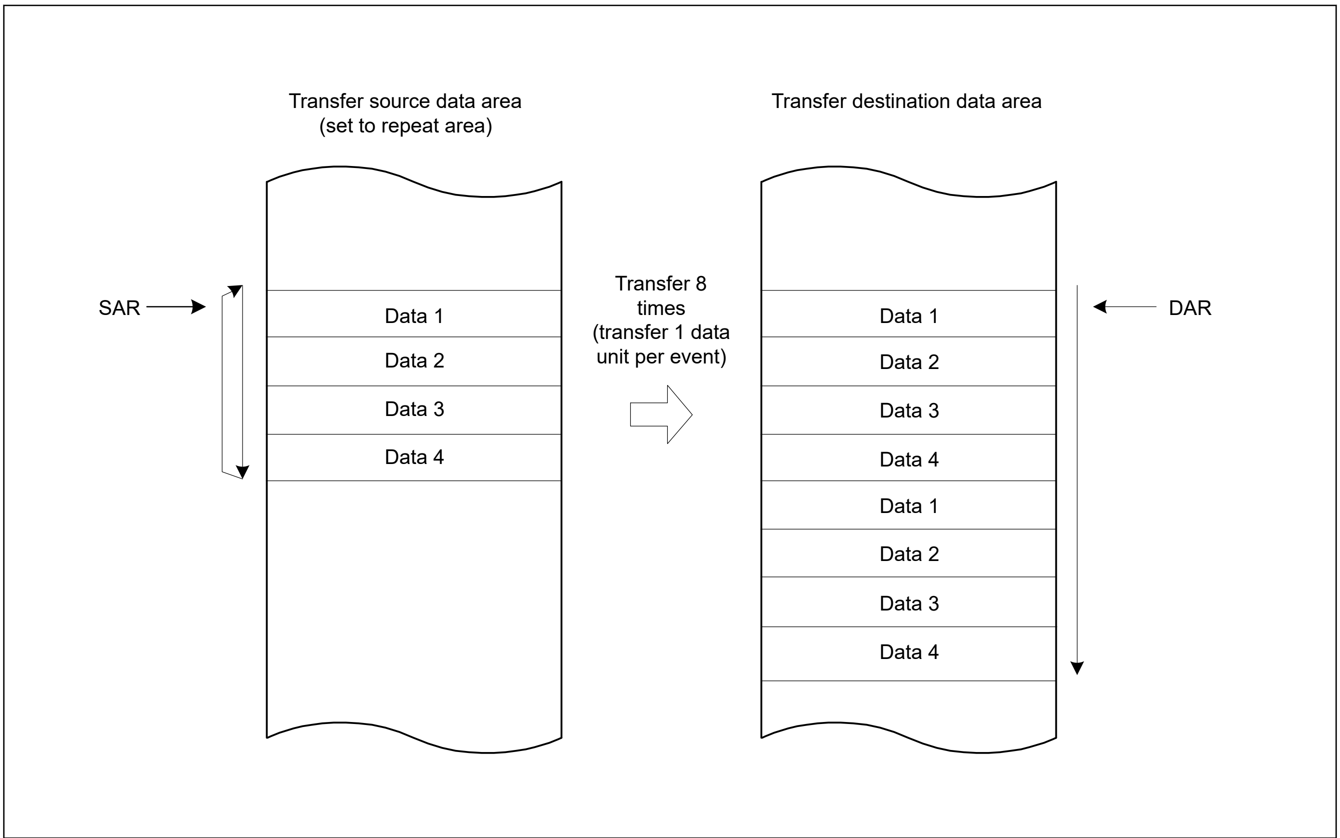

Figure 18.7 Memory map of repeat transfer mode when transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 0x04)

18.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), 1 to 256 words (4 to 1024 bytes), or 1 to 256 doublewords (8 to 2048 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 18.7 lists the register functions in block transfer mode, and Figure 18.8 shows the memory map for block transfer mode.

Table 18.7 Register functions in block transfer mode

Register	Description	Value written back by writing transfer information*2
SAR	Transfer source address	• When MRB.DTS bit is 0 Increment, decrement, or fixed*1 • When MRB.DTS bit is 1 SAR register initial value.
DAR	Transfer destination address	• When MRB.DTS bit is 0 DAR register initial value • When MRB.DTS bit is 1 Increment, decrement, or fixed*1.
CRAH	Holds block size	CRAH
CRAL	Block size counter	CRAH
CRB	Block transfer counter	CRB - 1

Note 1. Write-back is skipped in address-fixed mode.

Note 2. Write-back is skipped when MRA.WBDIS = 1.

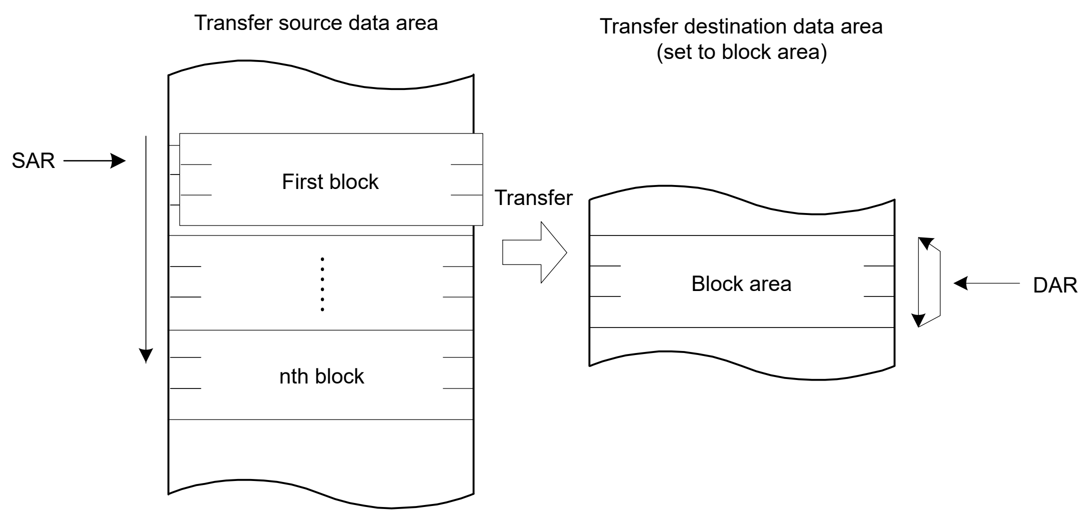

Figure 18.8 Memory map of block transfer mode

18.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, MRB, and MRC registers can be set independently of each other to define the data transfer. Figure 18.9 shows a chain transfer operation.

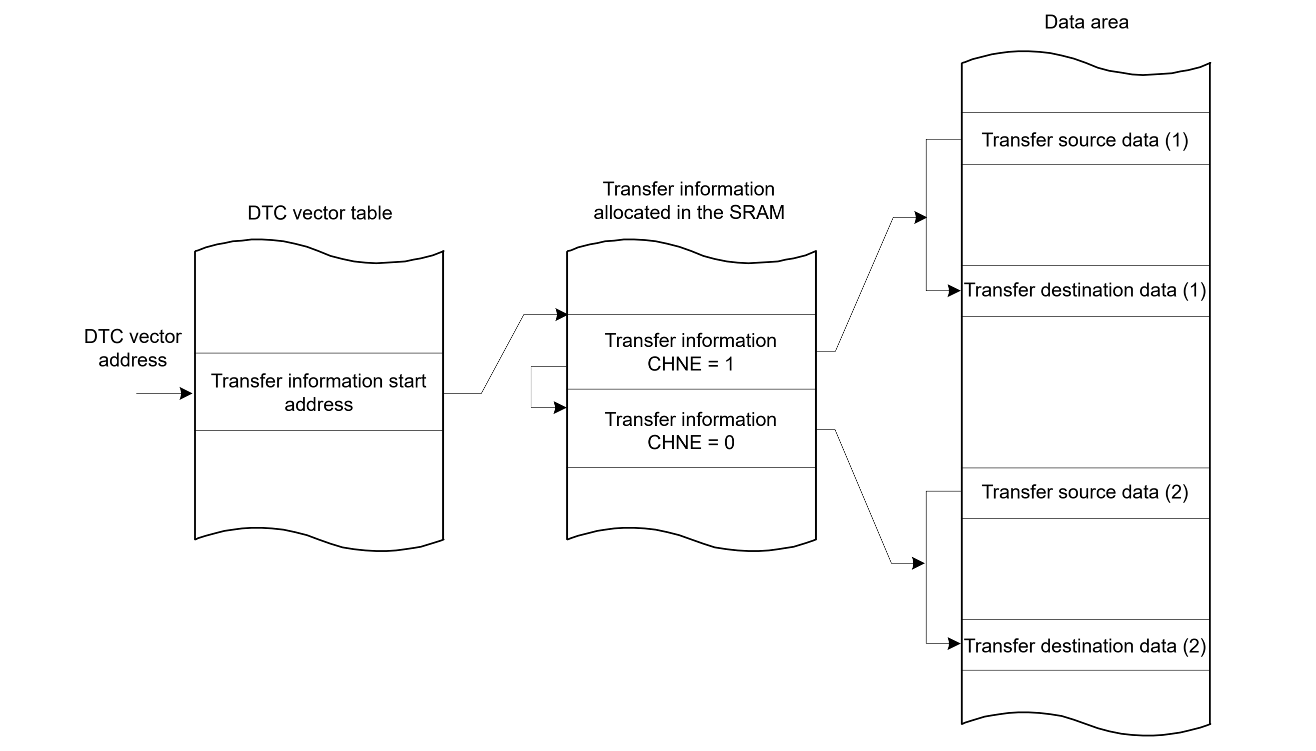

Figure 18.9 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see Table 18.3.

18.4.7 Operation Timing

Figure 18.10 to Figure 18.13 are timing diagrams that show the minimum number of execution cycles.

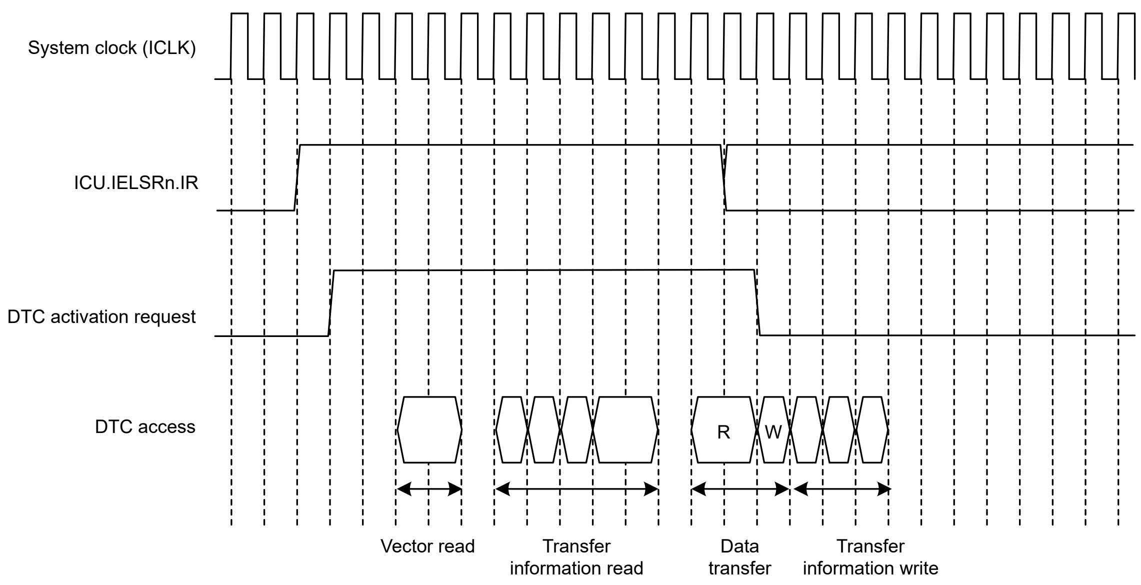

Figure 18.10 Example 1 of DTC operation timing in normal transfer and repeat transfer modes

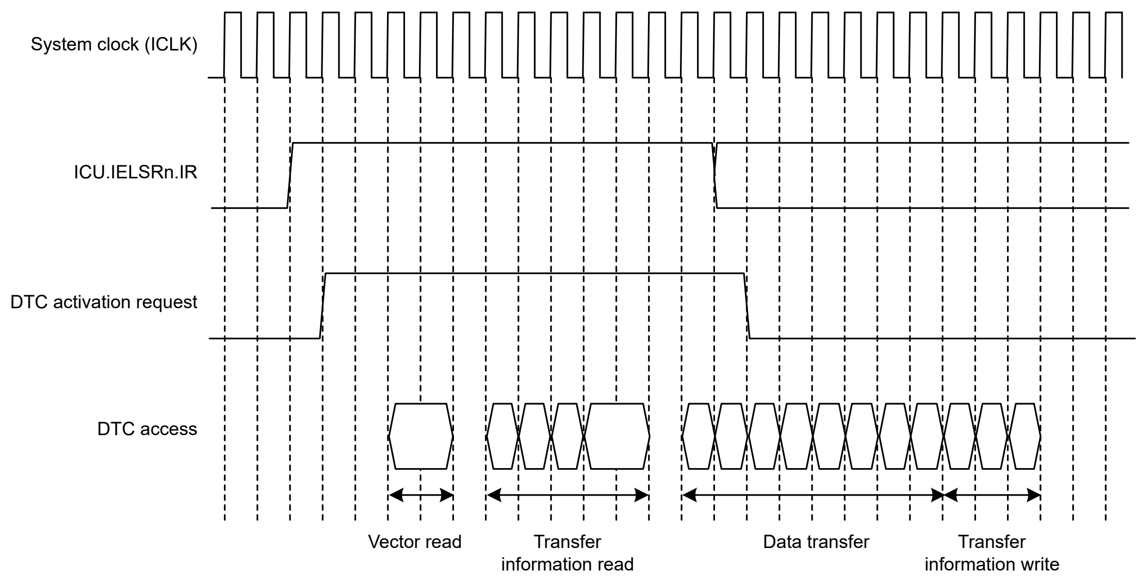

Figure 18.11 Example 2 of DTC operation timing in block transfer mode when the block size = 4

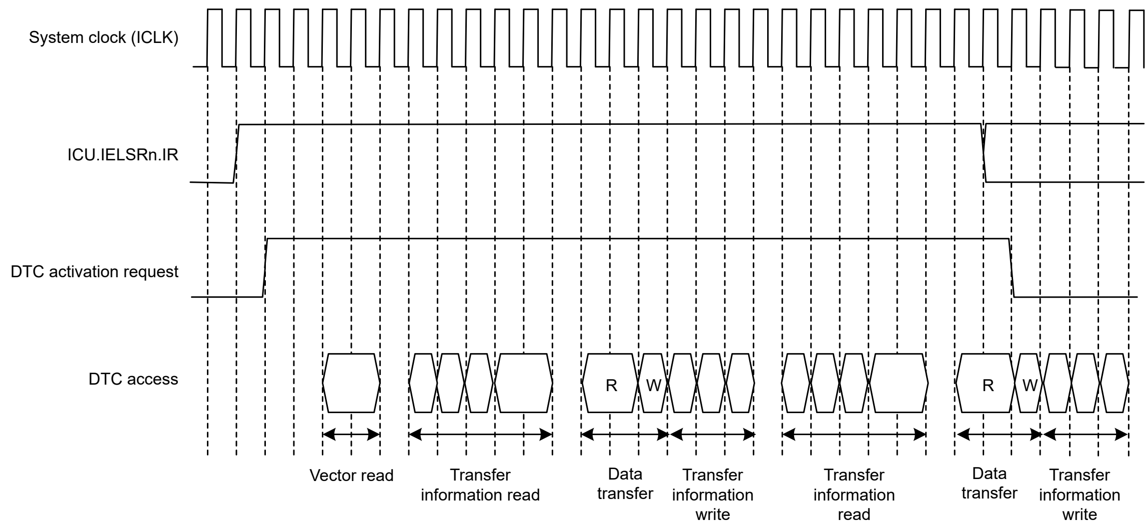
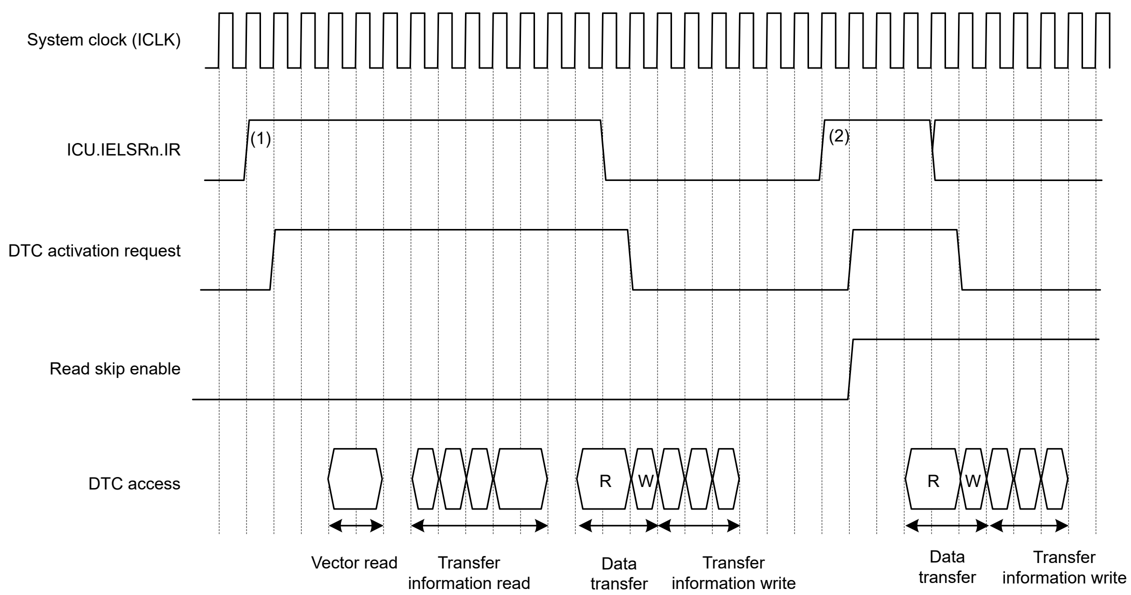


Note: n = Vector number

Figure 18.12 Example 3 of DTC operation timing for chain transfer



Note: n = Vector number
Note: When activation sources (vector numbers) of (1) and (2) are the same and the RRS = 1, the transfer information read for request (2) is skipped.

Figure 18.13 Example of operation when a transfer information read is skipped with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

18.4.8 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSRn (n = 0 to 95) register of ICU are controlled by SAIELSRn bit of ICUSARx (x = G, H, I, J, K or L) registers in CPSCU. For details on the CPSCU.ICUSARx registers, see section 14, Interrupt Controller Unit (ICU).

When the CPSCU.ICUSARx.SAIELSRn bit is 0

- IELSRn register have security attribute
- The vector number of DTC activated by the interrupt request set in IELS behaves as a secure master.

When the CPSCU.ICUSARx.SAIELSRn bit is 1

- IELSRn register have non-security attribute
- The vector number of DTC activated by the interrupt request set in IELS behaves as a non-secure master.

For areas accessible to secure or non-secure masters, See section 15, Buses, and section 51, Security Features.

18.4.9 Vector Privilege

The privileged attribute of transfer access of DTC vector n is controlled bit0 in vector table.

If bit0 corresponding to each vector number in the vector table is set to 0, DTC transfer is privileged access.

If bit0 is set to 1, DTC transfers are unprivileged access.

Refer to for vector table and transfer information.

18.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). When used in secure state, access DTCVBR_SEC instead of DTCVBR. Set the ICU.IELSRn.IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in Table 18.8 to set the DTC.

Table 18.8 DTC setting procedure

No.	Step Name	Description
1	Set the DTCCR.RRS bit to 0	Set the DTCCR.RRS bit to 0 to reset the transfer information read skip flag. After that, the transfer information read is not skipped while the DTC is activated. Be sure to specify this setting when the transfer information is updated.
2	Set transfer information (MRA, MRB, MRC, SAR, DAR, CRA, and CRB)	Allocate transfer information (MRA, MRB, MRC, SAR, DAR, CRA, and CRB) in the data area. To set transfer information, see section 18.2. Register Descriptions. To allocate transfer information, see section 18.3.1. Allocating Transfer Information and DTC Vector Table.
3	Set transfer information start addresses in the DTC vector table	Set the transfer information start addresses in the DTC vector table. To set the DTC vector table, see section 18.3.1. Allocating Transfer Information and DTC Vector Table.
4	Set the DTCCR.RRS bit to 1	Set the DTCCR.RRS bit to 1 to enable skipping of the second and subsequent transfer information read cycles for continuous DTC activation from the same interrupt source. The RRS bit can be set to 1, but if this is set during DTC transfer, it becomes valid from the next transfer. Leave the value of the RRS bit as 0 if the value of the MRA.WBDIS bit or the MRC.DISPE bit in any transfer information is 1.
5	Set the ICU.IELSRn.DTCE bit to 1. Set the ICU.IELSRn.IELS[8:0] as interrupt source. The interrupt should be enabled in the NVIC.	Set the ICU.IELSRn.DTCE bit to 1. Set ICU.IELSRn.IELS[8:0] as interrupt sources that trigger DTC. The interrupt must be enabled in the NVIC. See section 14.3.2. Event Number in section 14, Interrupt Controller Unit (ICU).
6	Set the enable bit for an activation source interrupt	Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources.
7	Set the DTCST.DTCST bit to 1	Set the DTC Module Start bit (DTCST.DTCST) to 1.

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.
Note: When DTCSAR.DTCSTSA = 0 is set and DTC is used in both the Secure and the Non-secure state, DTCST.DTCST bit must be written in the Secure state.
Note: When used in secure state for step 1 and step 4, access DTCCR_SEC.RRS instead of DTCCR.RRS.

18.6 Examples of DTC Usage

18.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

(1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

(2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[9:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

(4) SCI settings

Enable the SCIn_RXI (n = 0 to 9) interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

(5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

18.6.2 Chain Transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPT32n.GTCCRC register (n = 0 to 13). For the second of the chain transfers, normal transfer mode is specified for transfer to the GPT32n.GTCCRE register (n = 0 to 13). For the third of the chain transfers, normal transfer mode is specified for transfer to the GPT32n.GTPBR register (n = 0 to 13). This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT320.GTPR register as an activating source for the DTC.

(1) First transfer information set

Set up transfer to the GPT320.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.

5. Set the DAR register to the address of the GPT320.GTCCRC register.
6. Set the CRA register to the size of the data table.

(2) Second transfer information set

Set up for transfer to the GPT320.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRE register.
6. Set the CRA register to the size of the data table.

(3) Third transfer information set

Set up transfer to the GPT320.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and end chain transfer (MRB.CHNE = 0, MRB.CHNS = 0, MRB.DISEL = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTPBR register.
6. Set the CRA register to the size of the data table.

(4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT320.GTPBR immediately after the transfer control information for use in the GPT320.GTCCRC and GPT320.GTCCRE registers.

(5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT320.GTCCRC and GPT320.GTCCRE registers starts.

(6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT320 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[9:0] bits and specify the GPT320 counter overflow.
3. Set the DTCST.DTCST bit to 1.

(7) GPT settings

1. Set the GPT320.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT320.GTCCRA and GPT320.GTCCRB registers and the next PWM timer compare values in the GPT320.GTCCRC and GPT320.GTCCRE registers.
3. Set the default PWM timer period values in the GPT320.GTPR register and the next PWM timer period values in the GPT320.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

(8) GPT activation

Set the GPT320.GTSTR.CSTRT bits to 1 to start the GPT320.GTCNT counter.

(9) DTC transfer

Each time a GPT320 counter overflow is generated with the GPT320.GTPR register, the next PWM timer compare values are transferred to the GPT320.GTCCRC and GPT320.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT320.GTPBR register.

(10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT320 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

18.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. Figure 18.14 shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
   (a) Transfer source address = fixed.
   (b) CRA register = 0x0200 (512) times.
   (c) MRB.CHNE bit = 1 (chain transfer is enabled).
   (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
   (e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.
3. For the second data transfer:
   (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
   (b) Specify the CRA register in the first transfer information area for the transfer destination.
   (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
   (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
   (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   (f) CRA register = 0x0101 (The transfer count is 1).
4. For the third data transfer:
   (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
   (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
   (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
   (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to

0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.

7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

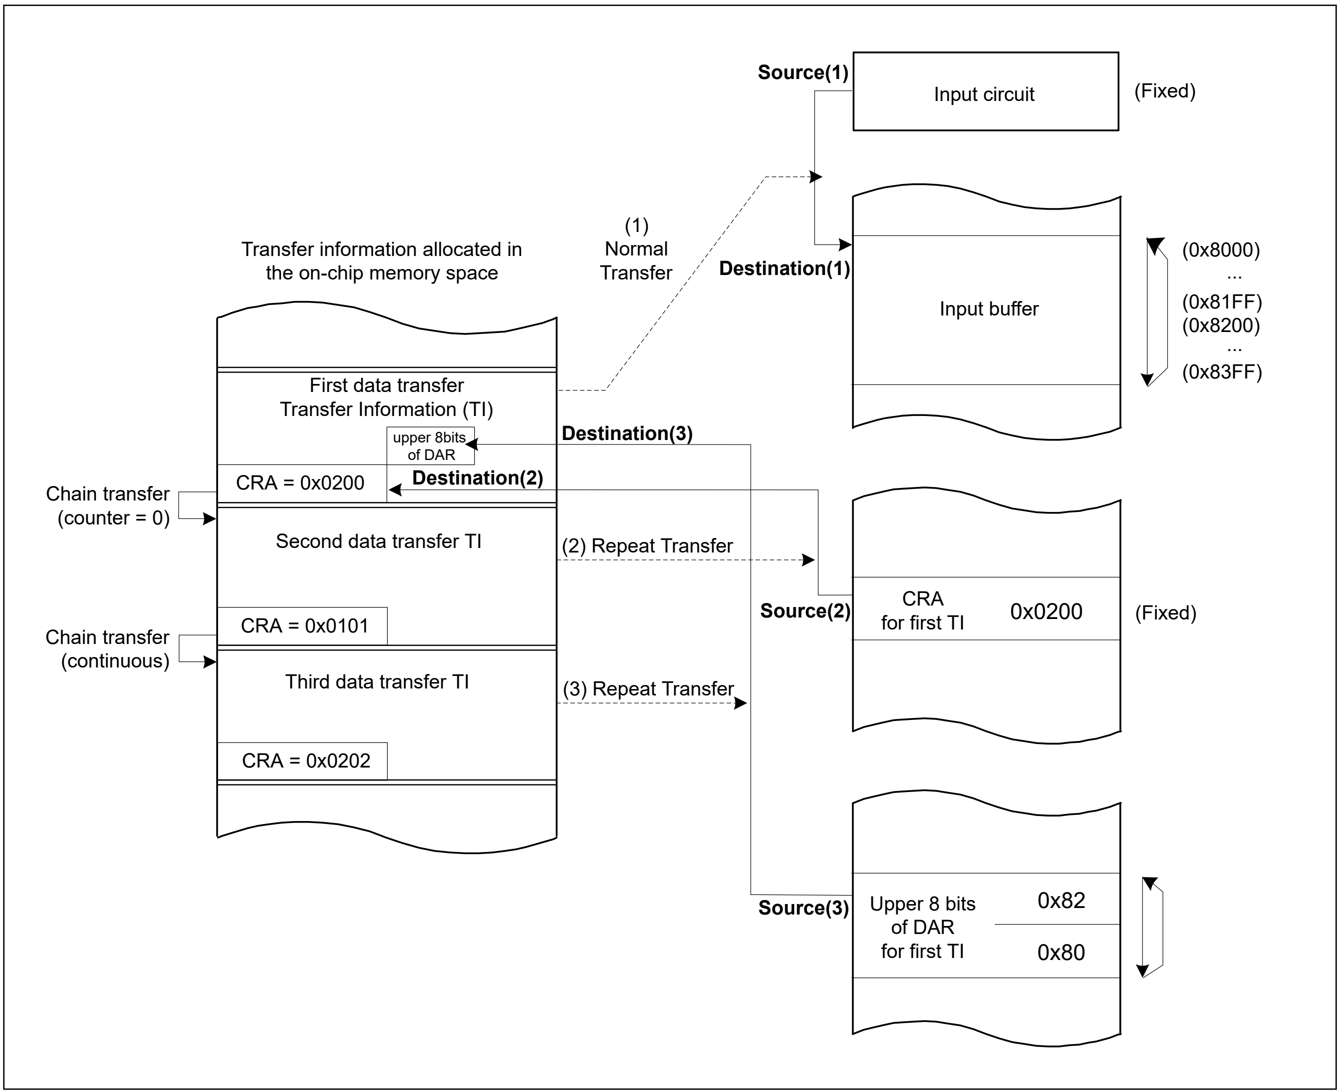


Figure 18.14 Chain transfer when counter = 0

18.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. DTC is stopped only for the vector number that caused the error.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Write back to SRAM is not performed.

After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is.

18.8 Interrupt

18.8.1 Interrupt Request of Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[9:0] bits. See section 14, Interrupt Controller Unit (ICU). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

18.8.2 Interrupt Request of Transfer Error

The error response detection interrupt request DMAm_TRANSERR (m = 0, 1) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer.

The types of interrupts that occur when the DTC transfer error occurs are listed in Table 18.9. The Table 18.9 also shows error information stored when a transfer error occurs.

Table 18.9 Interrupt and error information due to DTC transfer error cause

Transfer error factor	NMI/RESET*1 Request	Interrupt Request	Bus Error Status	Error Channel Information
MSAU Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.MESRRSTAT	DTC.DTEVR
Master MPU Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.MMERRSTAT	DTC.DTEVR
Illegal Access Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.ILERRSTAT	DTC.DTEVR
Slave Bus Error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.SLERRSTAT	DTC.DTEVR
TrustZone Filter error	ICU.NMISR.BUSST	DMAm_TRANSERR*1	BUS.BUSERRSTATDMACm.SLERRSTAT	DTC.DTEVR

Note 1. If ICU.NMIER.BUSEN is enabled with DMA0_TRANSERR set in ICU.IELSR, NMI and an interrupt will occur due to a transfer error caused by DMA. Only NMI can be generated by not setting DMAm_TRANSERR to ICU.IELSR.

18.9 Event Link

The DTC can produce an event link request on completion of one transfer request. The event link request is generated when the bus responds to the last destination access of DTC transfer. The timing of the bus response to DTC write access depends on the bus configuration and transfer destination. For details on bus responses, see section 15.2.5. Restrictions. Note that all DTC transfers are non-bufferable.

18.10 Low Power Consumption Function

Before transitioning to the module-stop state, Software Standby mode or Deep Software Standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections.

(1) Module-stop function

Setting the module-stop bit to 1 stops the DTC corresponding to that module-stop bit.

If the module-stop bit is set to 1 while DTC transfers data, the DTC corresponding to that bit becomes the module-stop state after completing it.

When the module-stop bit is 1, access to the register of the DTC corresponding to that module-stop bit is prohibited.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in section 11.6.2.1. Entering Software Standby Mode or section 11.6.3.1. Transition to Deep Software Standby Mode.

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode follows the completion of the DTC transfer.

(3) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see section 11, Low Power Mode.

To perform a DTC transfer after returning from a low power mode.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in section 14.4.1. Interrupt Detection Selection, then execute the WFI instruction.

18.11 Usage Notes

18.11.1 Transfer Information Start Address

You must set multiples of 16 for the transfer information start addresses in the vector table.

18.11.2 Arrangement of Transfer Information

When allocating the transfer information to the memory, arrange it as shown in Figure 18.15.

For example, when writing CRA and CRB setting data in 16 bits, write the CRB setting data to the lower address 0 and the CRA setting data to the lower address 2. When writing in 32 bits, place the CRA setting data on the 32-bit MSB side and the CRB setting data on the LSB side, and write them to the lower address 0.

Also, arrange the transfer information so that it does not straddle the 4KB boundary.

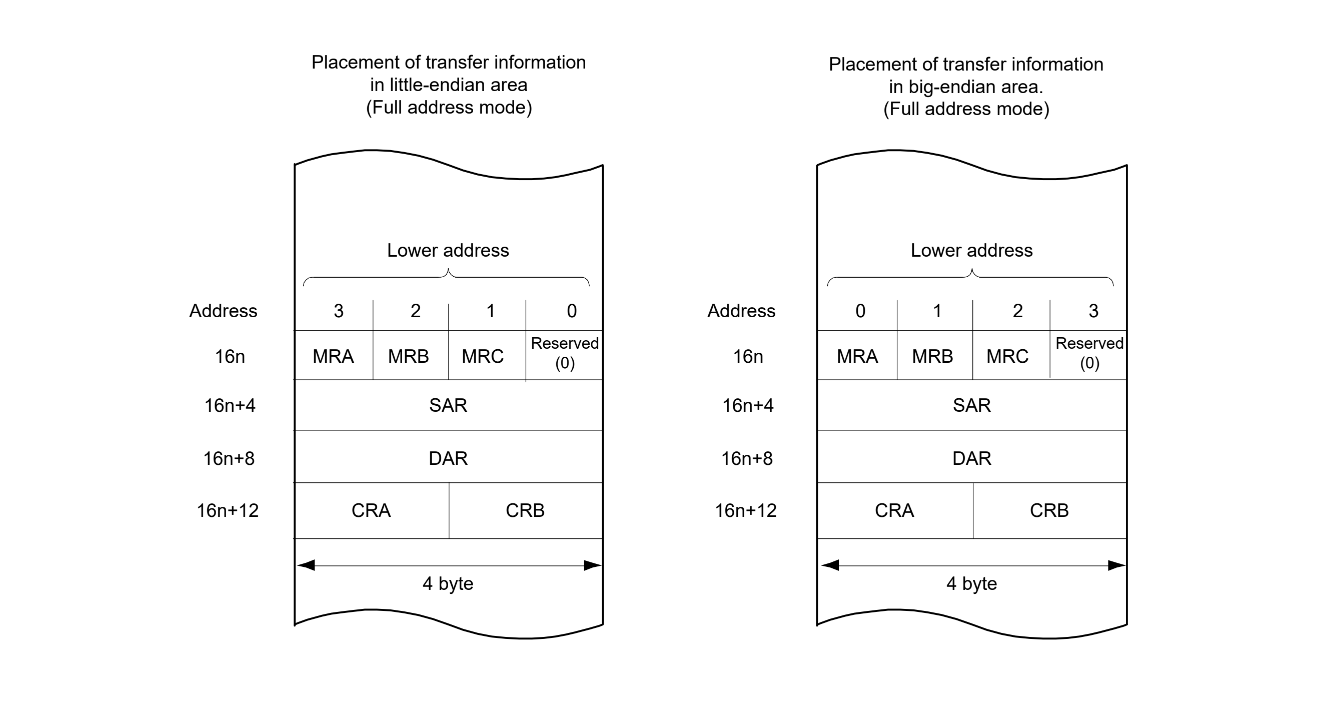

Figure 18.15 Arrangement of transfer information

18.11.3 Bus Response to DTC Write Access

The timing of the bus response to DTC write access depends on the transfer destination.

When writing to an access destination described in section 15.2.5.3. Notes on Writing Completion Timing, a bus response is returned before the write operation is completed.

19. Event Link Controller (ELC)

19.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

Table 19.1 lists the ELC specifications, and Figure 19.1 shows a block diagram.

Table 19.1 ELC specifications

Item	Description
Event link function	322 types of event signals can be directly connected to modules. The ELC generates the ELC event signal, and events that activate the DTC.
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set for each registers

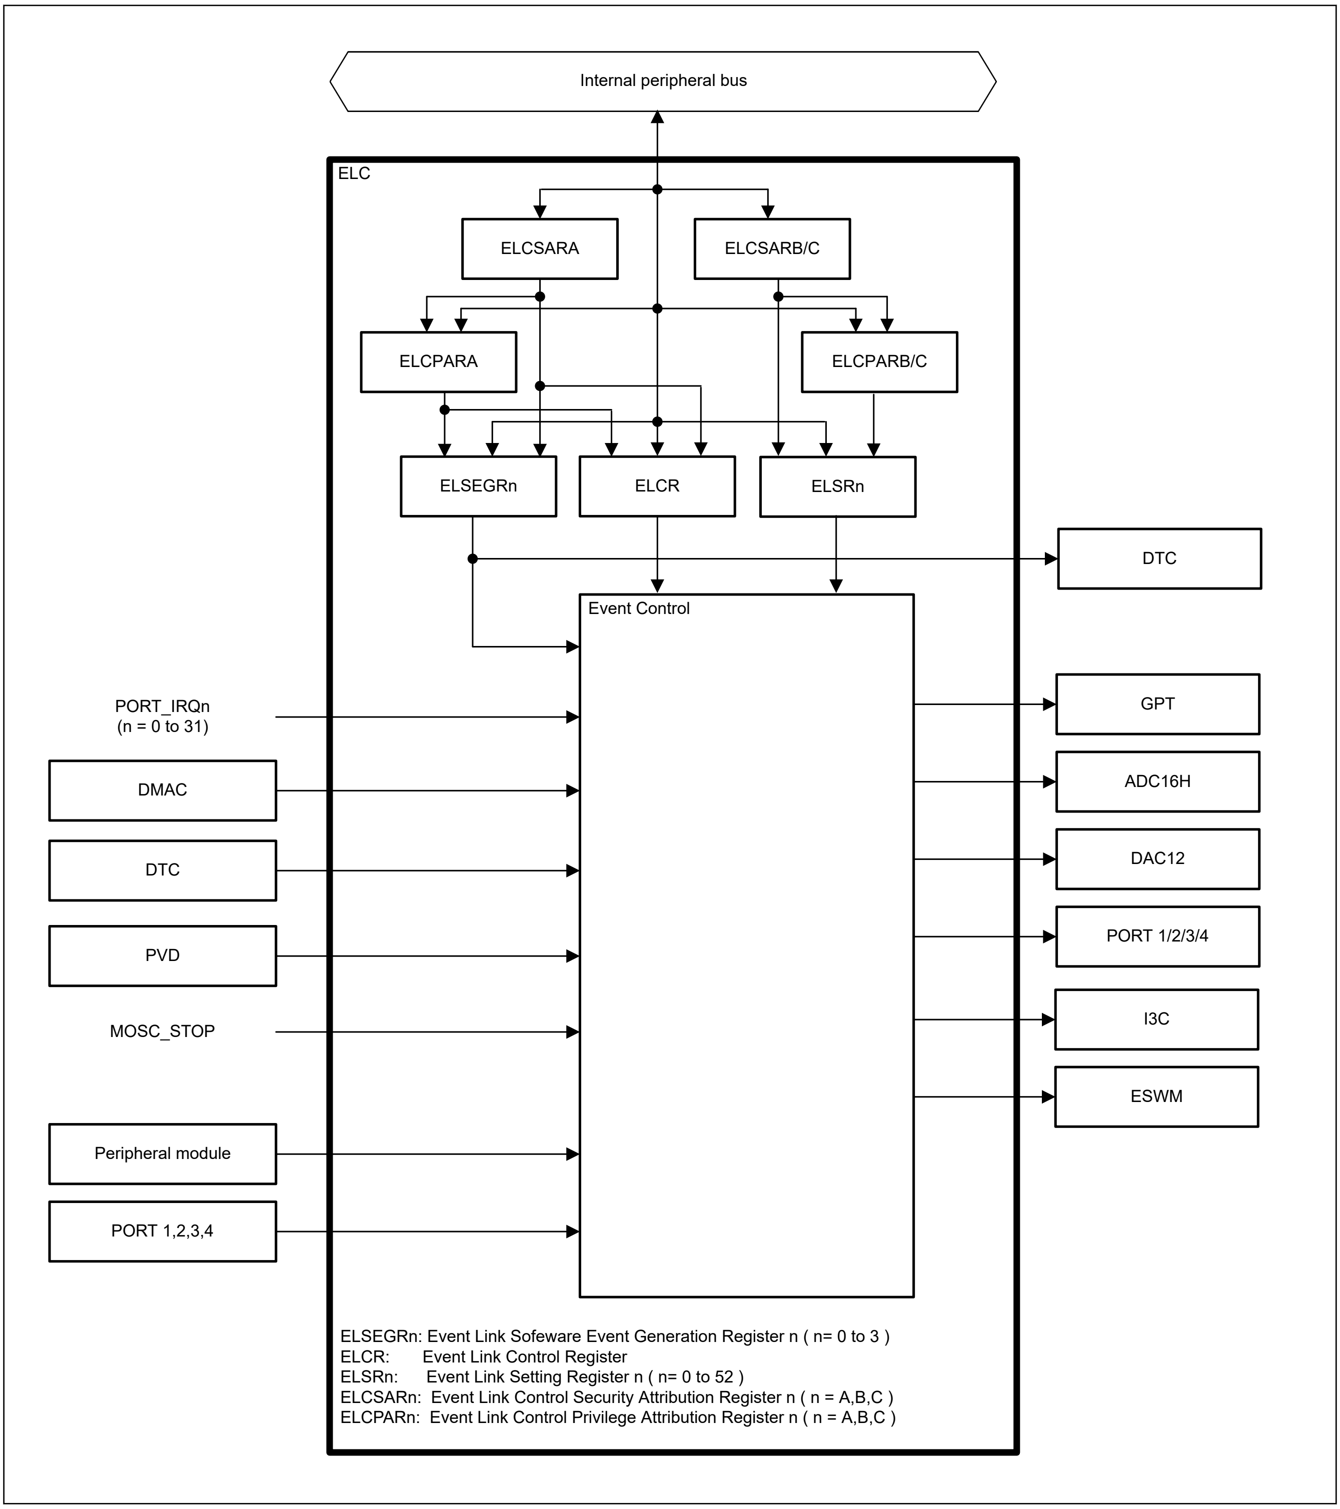

Figure 19.1 ELC block diagram

19.2 Register Descriptions

19.2.1 ELCR : Event Link Controller Register

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x000

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ELCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	ELCON	All Event Link Enable 0: ELC function is disabled. 1: ELC function is enabled.	R/W

Note: S-TYPE-3, P-TYPE-3

The ELCR register controls the ELC operation.

19.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0 to 3)

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x004 + 0x004 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SEG	Software Event Generation 0: Normal operation 1: Software event is generated.	W
5:1	—	These bits are read as 0. The write value should be 0.	R/W
6	WE	SEG Bit Write Enable 0: Write to SEG bit disabled. 1: Write to SEG bit enabled.	R/W
7	WI	ELSEGR Register Write Disable 0: Write to ELSEGR register enabled. 1: Write to ELSEGR register disabled.	W

Note: S-TYPE-3, P-TYPE-3

SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

19.2.3 ELSRn:Event Link Setting Register n (n = 0 to 52)

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x020 + 0x004 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ELS[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	ELS[9:0]	Event Link Select 0x000: Event output disabled for the associated peripheral module 0x001: Number setting for the event signal to be linked ⋮ 0x1F8: Number setting for the event signal to be linked Others: Settings prohibited	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: P-TYPE-3

Note: This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR). If the security attribution is configured as Secure,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.

If the security attribution is configured as Non-secure and the trusted event route is disabled,

- Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as Non-secure and the trusted event route is enabled,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is allowed.
- TrustZone access error is not generated.

The ELSRn register specifies an event signal to be linked to each peripheral module. Table 19.2 shows the association between the ELSRn register and the peripheral modules. Table 19.3 shows the association between the event signal names set in the ELSRn register and the signal numbers.

Table 19.2 Association between the ELSRn registers and peripheral functions (1 of 2)

Register name	Peripheral function (module)	Event name
ELSR0	GPT (A)	ELC_GPTA
ELSR1	GPT (B)	ELC_GPTB
ELSR2	GPT (C)	ELC_GPTC
ELSR3	GPT (D)	ELC_GPTD
ELSR4	GPT (E)	ELC_GPTE
ELSR5	GPT (F)	ELC_GPTF
ELSR6	GPT (G)	ELC_GPTG
ELSR7	GPT (H)	ELC_GPTH

Table 19.2 Association between the ELSRn registers and peripheral functions (2 of 2)

Register name	Peripheral function (module)	Event name
ELSR12	DAC12 channel 0	ELC_DA0
ELSR13	DAC12 channel 1	ELC_DA1
ELSR14	PORT1	ELC_PORT1
ELSR15	PORT2	ELC_PORT2

Bit	Symbol	Function	R/W
0	ELCR	Event Link Controller Register Privilege Attribution Target register: ELCR 0: Privileged 1: Unprivileged	R/W
1	ELSEGR0	Event Link Software Event Generation Register 0 Privilege Attribution Target register: ELSEGR0 0: Privileged 1: Unprivileged	R/W
2	ELSEGR1	Event Link Software Event Generation Register 1 Privilege Attribution Target register: ELSEGR1 0: Privileged 1: Unprivileged	R/W

Bit	Symbol	Function	R/W
3	ELSEGR2	Event Link Software Event Generation Register 2 Privilege Attribution Target register: ELSEGR2 0: Privileged 1: Unprivileged	R/W
4	ELSEGR3	Event Link Software Event Generation Register 3 Privilege Attribution Target register: ELSEGR3 0: Privileged 1: Unprivileged	R/W
31:5	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1
Note: This register is write-protected by PRCR_S and PRCR_NS register.

This register specifies the privilege attribution for the Register ELCR, ELSEGR0, ELSEGR1, ELSEGR2, and ELSEGR3 registers.

19.2.8 ELCPARB : Event Link Controller Privilege Attribution Register B

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x114

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	ELSR[31:30]		—	—	ELSR[27:19]									—	ELSR[17:16]	
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ELSR[15:12]				—	—	—	—	ELSR[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	ELSR7 to ELSR0	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 0 to 7) 0: Privileged 1: Unprivileged	R/W
11:8	—	These bits are read as 1. The write value should be 1.	R/W
17:12	ELSR17 to ELSR12	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 12 to 17) 0: Privileged 1: Unprivileged	R/W
18	—	This bit is read as 1. The write value should be 1.	R/W
27:19	ELSR27 to ELSR19	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 19 to 27) 0: Privileged 1: Unprivileged	R/W
29:28	—	These bits are read as 1. The write value should be 1.	R/W
31:30	ELSR31 to ELSR30	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 30, 31) 0: Privileged 1: Unprivileged	R/W

Note: S-TYPE-2, P-TYPE-1
Note: This register is write-protected by PRCR_S and PRCR_NS register.

This register specifies the privilege attribution for the Register ELSRn (n = 0 to 7, 12 to 17, 19 to 27, 30, 31) registers.

19.2.9 ELCPARC : Event Link Controller Privilege Attribution Register C

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x118

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	ELSR[52:48]				
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ELSR[47:32]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
20:0	ELSR[52:32]	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 32 to 52) 0: Privileged 1: Unprivileged	R/W
31:21	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1
Note: This register is write-protected by PRCR_S and PRCR_NS register.

This register specifies the privilege attribution for the Register ELSRn (n = 32 to 52) registers.

19.3 Operation

19.3.1 Relation Between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

19.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 19.4 lists the operations of modules when an event occurs.

Table 19.4 Module operations when event occurs (1 of 2)

Module	Operations when event is input
GPT	• Start counting • Stop counting • Clear counting • Up counting • Down counting • Input capture
DAC12	Start D/A conversion
I/O Ports	• Change pin output based on the EORR (reset) or EOSR (set) • Latch pin state to EIDR • The following ports can be used for the ELC: PORT 1 PORT 2 PORT 3 PORT 4
I3C	Start operation
ADC16H	Start A/D conversion

Table 19.4 Module operations when event occurs (2 of 2)

Module	Operations when event is input
DTC	Start DTC data transfer
ESWM	Media clock capture event occurs

19.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[9:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[9:0] bits associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the PVD is to be used, set the ELC after setting the PVD. To disable the PVD, do so after setting 0x00 to the associated ELSRn register.

19.4 Usage Notes

19.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

19.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (CPU Deep Sleep mode, Software Standby mode or Deep Software Standby mode). For more information, seeTable 19.3 and section 11, Low Power Mode.

19.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see Table 19.3 and section 11, Low Power Mode.

19.4.4 ELC Delay Time

In Figure 19.2, module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. Table 19.5 shows the ELC delay time.

Table 19.6 shows the clock domain of each module A. Table 19.7 shows the clock domain of each module B.

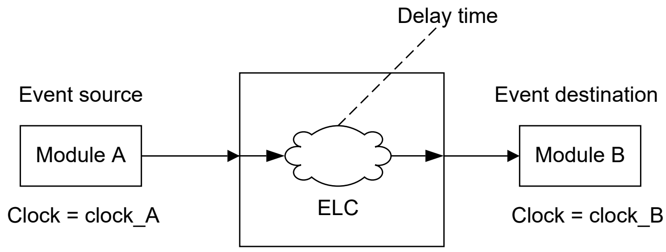

Figure 19.2 ELC delay time

Table 19.5 ELC delay time

Clock domain	Clock frequency	ELC delay time
clock_A = clock_B	clock_A = clock_B	0 cycle
clock_A ≠ clock_B	clock_A = clock_B	1 cycle to 2 cycles
	clock_A > clock_B	1 cycle to 2 cycles of clock_B
	clock_A < clock_B	1 cycle to 2 cycles of clock_A
clock_A ≠ clock_B	clock_A = clock_B*2	0 cycle
(Asynchronous)*1	—	5 cycles of clock_A + 4 cycles of clock_B

Note 1. When GPTCLK is selected as the GPT count clock, use this formula.
When ADC16H is destination and ADCCLK or GPTCLK is selected as the A/D conversion clock, use this formula.
Note 2. In case GPTCLK is selected as the GPT count clock, ADC conversion clock.

Table 19.6 Clock domain of each module A

Module A	Clock domain of clock_A
SCI, SPI, I3C, ADC16H, DOC, ESWM	PCLKA
Port, DMAC, PVD1, PVD2, MOSC, ULPT, AGT, IWDT, WDT, IIC, ACMPHS, ELC, I/O Ports	PCLKB
GPT	GPTCLK or PCLKD

Table 19.7 Clock domain of each module B

Module B	Clock domain of clock_B
I3C, ESWM	PCLKA
I/O Ports, DAC12	PCLKB
GPT	GPTCLK or PCLKD
ADC16H	ADCLK, GPTCLK, or PCLKA

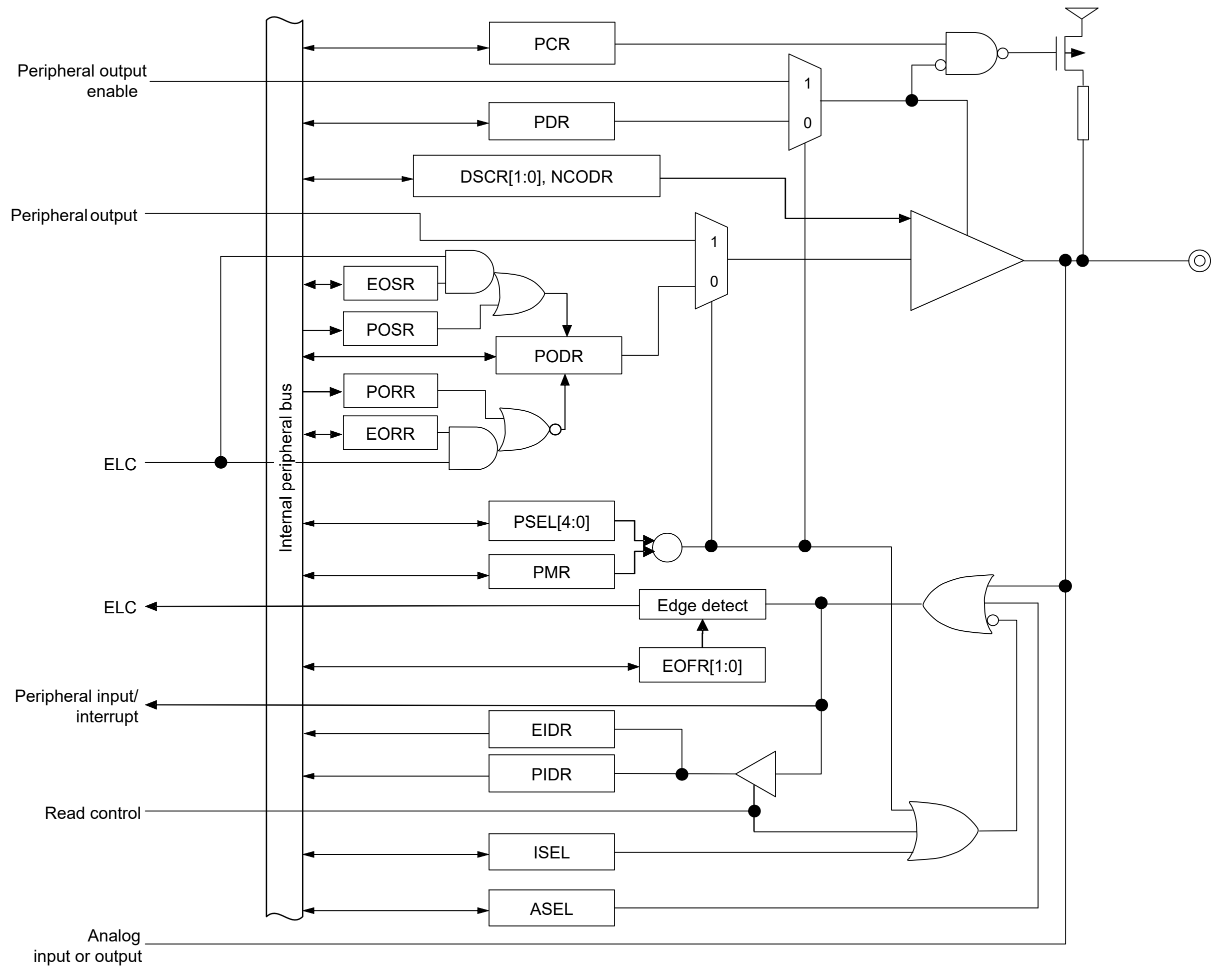
20. I/O Ports

20.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC or bus control pins.

All pins except P209 (as TDO of JTAG ports) operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 20.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 20.1 lists the I/O port specifications by package, and Table 20.2 lists the port functions.



Note: This figure shows a basic port configuration. The configuration differs depending on the ports.

Figure 20.1 Connection diagram for I/O port registers

Table 20.1 I/O port specifications (1 of 2)

Port	Package 289, 303 pins	Number of Pins	Package 224 pins	Number of Pins	Package 176 pins	Number of Pins	Package 169 pins	Number of Pins

20.2 Register Descriptions

20.2.1 PCNTR1/PODR/PDR : Port Control Register 1

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B, C, D)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B, C, D)

Offset address: 0x000 (PCNTR1/PDR)
0x002 (PODR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PODR15	PODR14	PODR13	PODR12	PODR11	PODR10	PODR09	PODR08	PODR07	PODR06	PODR05	PODR04	PODR03	PODR02	PODR01	PODR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PDR15	PDR14	PDR13	PDR12	PDR11	PDR10	PDR09	PDR08	PDR07	PDR06	PDR05	PDR04	PDR03	PDR02	PDR01	PDR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PDR15 to PDR00	Pmn Direction 0: Input (functions as an input pin) 1: Output (functions as an output pin)	R/W
31:16	PODR15 to PODR00	Pmn Output Data 0: Low output 1: High output	R/W

Note: S-TYPE-4, P-TYPE-5
Note: m = 0 to 9, A, B, C, D, n = 00 to 15

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See Table 20.2. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

For BGA169 package, set the direction of reserved pins to output. See section 20.5.9. Handling of Reserved Pins for BGA169 Package for details.

PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See Table 20.2. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

20.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B, C, D)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B, C, D)

Offset address: 0x004 (PCNTR2/PIDR)
0x006 (EIDR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EIDR15	EIDR14	EIDR13	EIDR12	EIDR11	EIDR10	EIDR09	EIDR08	EIDR07	EIDR06	EIDR05	EIDR04	EIDR03	EIDR02	EIDR01	EIDR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PIDR15	PIDR14	PIDR13	PIDR12	PIDR11	PIDR10	PIDR09	PIDR08	PIDR07	PIDR06	PIDR05	PIDR04	PIDR03	PIDR02	PIDR01	PIDR00
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	PIDR15 to PIDR00	Pmn State 0: Low level 1: High level	R
31:16	EIDR15 to EIDR00 [*2]	Port Event Input Data[*1] When an ELC_PORTx signal occurs 0: Low input 1: High input	R

Note: S-TYPE-4, P-TYPE-5
Note: m = 0 to 9, A, B, C, D, n = 00 to 15
Note 1. x = 1, 2, 3 or 4 for EIDR only
Note 2. Supported by ports 1, 2, 3 or 4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 specifies the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

PIDRn bits (Pmn State)

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- RTC Time Capture input and tamper detection (RTCIC)
- Analog function (ASEL = 1)
- I3C bus interface (I3C_SCL0, I3C_SDA0)
- JTAG/SWD interface (TCK/SWCLK, TMS/SWDIO, TDI, TDO)
- Trace interface (TCLK, TDATAn (n = 0 to 3), SWO)

EIDRn bits (Port Event Input Data)

The EIDRn bits latch a pin state when an ELC_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

20.2.3 PCNTR3/PORR/POSR : Port Control Register 3

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B, C, D)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B, C, D)

Offset address: 0x008 (PCNTR3/POSR)
0x00A (PORR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PORR 15	PORR 14	PORR 13	PORR 12	PORR 11	PORR 10	PORR 09	PORR 08	PORR 07	PORR 06	PORR 05	PORR 04	PORR 03	PORR 02	PORR 01	PORR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	POSR 15	POSR 14	POSR 13	POSR 12	POSR 11	POSR 10	POSR 09	POSR 08	POSR 07	POSR 06	POSR 05	POSR 04	POSR 03	POSR 02	POSR 01	POSR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W

31:16	PORR15 to PORR00	Pmn Output Reset 0: No effect on output 1: Low output	W

Note: S-TYPE-4, P-TYPE-5
Note: m = 0 to 9, A, B, C, D, n = 00 to 15

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSRn (bits [15:0] in PCNTR3) and the PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

POSRn bits (Pmn Output Set)

POSR changes PODR when set by a software write. For example, for P100, when PORT1.PCNTR3.POSR00 = 1, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSRn bits are reserved. See Table 20.2.

PORRn bits (Pmn Output Reset)

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PCNTR3.PORR00 = 1, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORRn bits are reserved. See Table 20.2.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.
Note: PORRn and POSRn should not be set at the same time.

20.2.4 PCNTR4/EORR/EOSR : Port Control Register 4

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 1 to 4)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 1 to 4)

Offset address: 0x00C (PCNTR4/EOSR)
0x00E (EORR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EORR 15	EORR 14	EORR 13	EORR 12	EORR 11	EORR 10	EORR 09	EORR 08	EORR 07	EORR 06	EORR 05	EORR 04	EORR 03	EORR 02	EORR 01	EORR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EOSR 15	EOSR 14	EOSR 13	EOSR 12	EOSR 11	EOSR 10	EOSR 09	EOSR 08	EOSR 07	EOSR 06	EOSR 05	EOSR 04	EOSR 03	EOSR 02	EOSR 01	EOSR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	EOSR15 to EOSR00	Pmn Event Output Set When an ELC_PORTx signal occurs 0: No effect on output 1: High output	R/W
31:16	EORR15 to EORR0	Pmn Event Output Reset When an ELC_PORTx signal occurs 0: No effect on output 1: Low output	R/W

Note: S-TYPE-4, P-TYPE-5
Note: m = 1 to 4, n = 00 to 15, x = 1 to 4

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

EOSRn bits (Pmn Event Output Set)

EOSR changes PODR when set because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EOSRn bits are reserved. See Table 20.2.

EORRn bits (Pmn Event Output Reset)

EORR changes PODR when reset because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EORR00 = 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EORRn bits are reserved. See Table 20.2.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

20.2.5 PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, C, D, n = 00 to 15)

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x000 + 0x040 × m + 0x004 × n (PmnPFS/PmnPFS_HA/PmnPFS_BY)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3	—	This bit is read as 0. The write value should be 0.	R/W
4	PCR	Pull-up Control 0: Disable input pull-up 1: Enable input pull-up	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	NCODR	N-Channel Open-Drain Control 0: CMOS output 1: NMOS open-drain output	R/W
9:7	—	These bits are read as 0. The write value should be 0.	R/W
11:10	DSCR[1:0]	Port Drive Capability 0 0: Low drive 0 1: Middle drive 1 0: High speed high drive 1 1: High drive	R/W
13:12	EOFR[1:0]	Event on Falling/Event on Rising*2 0 0: Don't care 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges	R/W
14	ISEL	IRQ Input Enable 0: Not used as an IRQn input pin 1: Used as an IRQn input pin	R/W
15	ASEL	Analog Input Enable 0: Not used as an analog pin 1: Used as an analog pin	R/W
16	PMR	Port Mode Control 0: Used as a general I/O pin 1: Used as an I/O port for peripheral functions	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
28:24	PSEL[4:0]	Peripheral Select These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter.	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. The initial value of P201, P208, P209. P210, P211, P814 and P815 is not 0x0000_0000. P201 is 0x0000_0010, P208 is 0x0001_0010, P209 is 0x0001_0400, P210 is 0x0001_0410, P211 is 0x0001_0010, P814 is 0x1301_0000 and P815 is 0x1301_0000.

Note 2. Supported by PORTn (n = 1 to 4).

Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see Table 20.1

PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

PCR bit (Pull-up Control)

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

NCODR bit (N-Channel Open-Drain Control)

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

DSCR[1:0] bits (Port Drive Capability)

The DSCR[1:0] bits switch the drive capacity of the port. If the drive capacity of a pin is fixed, the associated bit is a read/write bit, but the drive capacity cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

EOFR[1:0] bits (Event on Falling/Event on Rising)

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

ISEL bit (IRQ Input Enable)

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

ASEL bit (Analog Input Enable)

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register for Non-secure (PWPR_NS). Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

PMR bit (Port Mode Control)

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

PSEL[4:0] bits (Peripheral Select)

The PSEL[4:0] bits assign the peripheral function.

20.2.6 PWPR_NS : Write-Protect Register for Non-secure

Base address: PFS_NS = 0x5040_0800

Offset address: 0x50C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	PFSWE	PmnPFS Register Write Enable 0: Writing to the PmnPFS register is disabled 1: Writing to the PmnPFS register is enabled	R/W
7	B0WI	PFSWE Bit Write Disable 0: Writing to the PFSWE bit is enabled 1: Writing to the PFSWE bit is disabled	R/W

Note: S-TYPE-7, P-TYPE-2
Note: The access to this register is not controlled by any security attribution register.

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

20.2.7 PFENET : Ethernet Control Register

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x500

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	ETHIOMD1	ETHIOMD0	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	ETHIOMD0	Ethernet I/O Mode Setting ch0 0: GMII mode (ESWM channel 0) 1: MII mode (ESWM channel 0)	R/W
5	ETHIOMD1	Ethernet I/O Mode Setting ch1 0: GMII mode (ESWM channel 1) 1: MII mode (ESWM channel 1)	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: The access to the ETHIOMD0/1 bit is controlled by the PSARC.PSARC30 bit and PPARC.PPARC30 bit.

ETHIOMD0/ETHIOMD1 bit (Ethernet I/O Mode Setting ch0 and Ethernet I/O Mode Setting ch1)

When the transmit data output ports of ESWM are used as GMII/RGMII ports, the drive capability can be set by the ETHIOMDn bit and DSCR[1:0] bit. The details of the setting are given by the following table:

Interface type	PSEL[4:0]	ETHIOMDn	VCC voltage [V]	DSCR [1:0]	Drive capability
MII only	0x16	1b	3.6-2.7	01b	Middle drive
MII/GMII		0b	3.6-3.0	01b	RGMII/3.3 V
			2.7-2.3	11b	RGMII/2.5 V
RMII	0x17	—	3.6-2.7	11b	High drive
RGMII	0x18		3.6-3.0	01b	RGMII/3.3 V
			2.7-2.3	11b	RGMII/2.5 V

If the settings of the ETHIOMDn bit and DSCR[1:0] bit other than those in the above table are performed, the electrical characteristics cannot be guaranteed.

20.2.8 PWPR_S : Write-Protect Register for Secure

Base address: PFS = 0x4040_0800

Offset address: 0x514

Bit position:	7	6	5	4	3	2	1	0
Bit field:	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	PFSWE	PmnPFS Register Write Enable 0: Disable writes to the PmnPFS register 1: Enable writes to the PmnPFS register	R/W
7	B0WI	PFSWE Bit Write Disable 0: Enable writes the PFSWE bit 1: Disable writes to the PFSWE bit	R/W

Note: S-TYPE-6, P-TYPE-2

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register of the IO port pin set as secure by the PmSAR register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

20.2.9 PmSAR : Port Security Attribution Register (m = 0 to 9, A, B, C, D)

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x530 + 0x004 × m

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PMNSA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PMNSA[15:0]	Pmn Security Attribution Target I/O port pin : Pmn 0: Secure 1: Non-secure	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by PRCR register.
Note: m = 0 to 9, A, B, C, D, n = 00 to 15

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of each port, the registers are accessed only in 16-bit units.

PMNSA[15:0] bits (Pmn Security Attribution)

The PmnSA bit specifies the Security Attribution of Pmn.

20.2.10 LVOCR : Low Voltage Operation Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAB0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LVO1E	LVO0E
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	LVO0E	Low Voltage Operation 0 Enable 0: Disable 1: Enable	R/W
1	LVO1E	Low Voltage Operation 1 Enable 0: Disable 1: Enable	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Low voltage operation control register controls the IO when VCC/VCC2 is lower than 2.7V.

LVO0E bit (Low Voltage Operation 0 Enable)

When VCC is lower than 2.7V, set the LVO0E bit to 1.

LVO1E bit (Low Voltage Operation 1 Enable)

When VCC2 is lower than 2.7V, set the LVO1E bit to 1.

20.3 Operation

20.3.1 General I/O Ports

All pins except P208 to P211, P814 and P815 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see section 20.2. Register Descriptions.

Each port has the following bits:

- Port Security Attribution register (PmSAR) (m = 0 to 9, A, B, C, D), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states
- Event Input Data bit (EIDRn), which indicates the pin state when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Port Output Set bit (POSRn), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.

20.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins
- I/O configuration: CMOS output or NMOS open-drain output, pull-up control, and drive capacity
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR[1:0]: Drive capacity control bit that selects the drive capacity
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see section 20.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, C, D, n = 00 to 15).

20.3.3 Port Group Function for ELC

In the MCU, PORT1 to PORT4 are assigned for the ELC port group function.

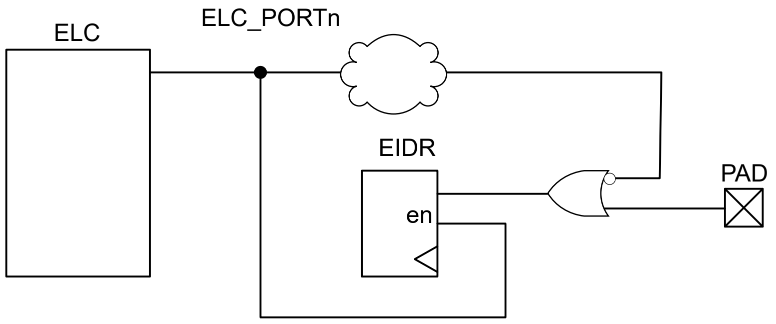
20.3.3.1 Behavior When ELC_PORTn (n = 1, 2, 3 or 4) is Input from ELC

The MCU supports the two functions described in this section when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC.

(1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins is read into the EIDR bit. See Figure 20.2

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.



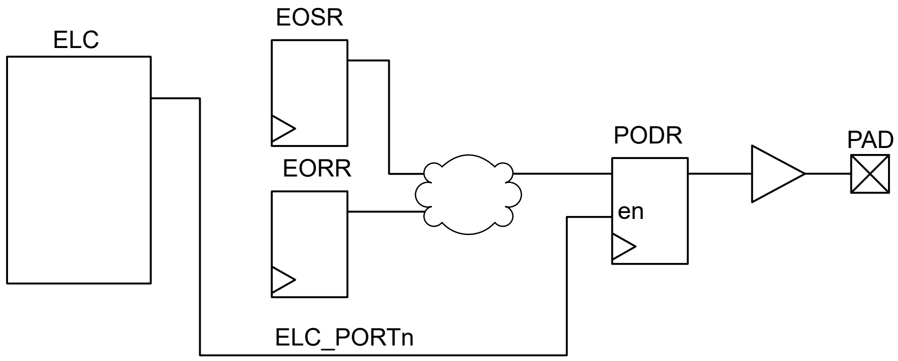
Note: n = 1, 2, 3 or 4

Figure 20.2 Event ports input data

(2) Output from PODR by EOSR and EORR

When an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.
- If EORR is set to 1, when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.



Note: n = 1, 2, 3 or 4

Figure 20.3 Event ports output data

20.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see section 20.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, C, D, n = 00 to 15). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port 1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Port n (n = 2 to 4) is also the same as Port 1. See Figure 20.4.

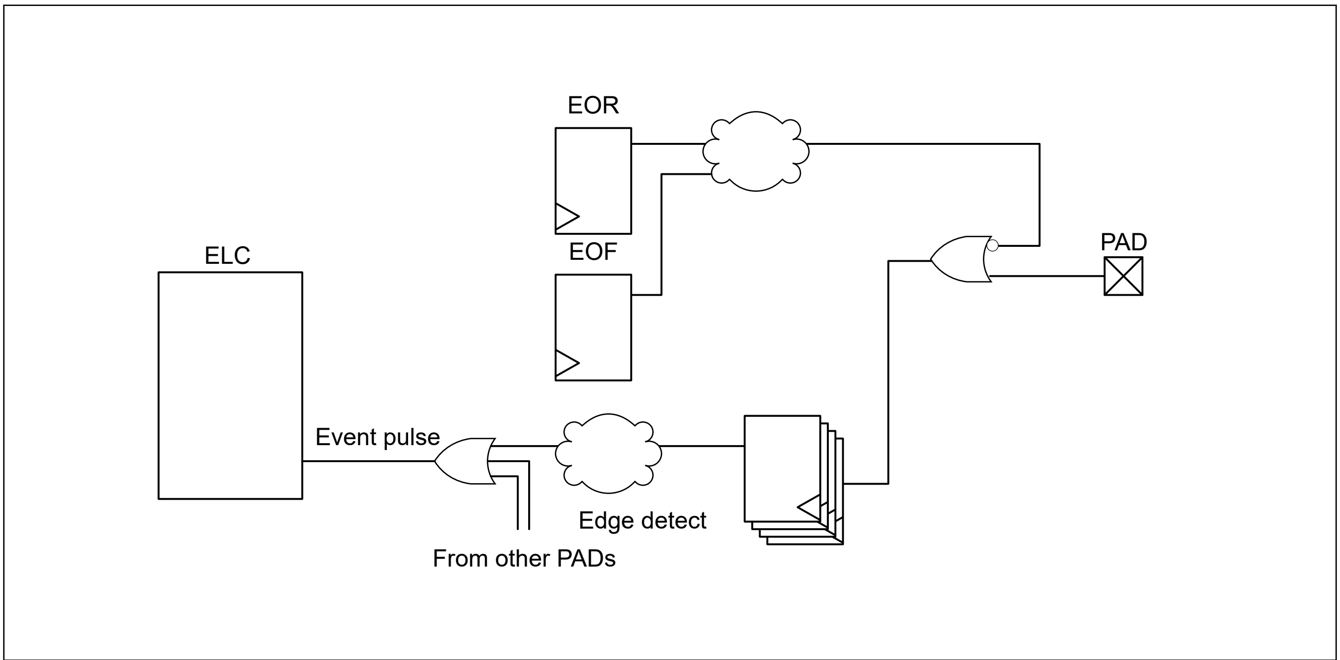


Figure 20.4 Generation of event pulse

20.4 Handling of Unused Pins

Table 20.3 shows how to handle unused pins.

Table 20.3 Handling of unused pins (1 of 2)

Pin name	Description
MD	Use as a mode selection pin
RES	Connect to VCC through a resistor
USB_DP, USB_DM	• Preconditions: – VCC_USB: Connect to VCC – VSS_USB: Connect to VSS – Set the module-stop state for USBFS (MSTPCRB.MSTPB11 = 1) • Processing details: – When both P814PFS.PMR and P815PFS.PMR bits are set to 1, keep these pins open. – When P814PFS.PMR or P815PFS.PMR bit is set to 0, configure it in the same way as P814, P815.
P200/NMI	Connect to VCC through a resistor
EXTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as Other ports.
XTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as Other ports.
XCIN/EXCIN	When the sub clock oscillator is not used, set the SOSCCR.SOSTP bit to 1 and set the SOMCR.SOSEL bit to 0 (general port P215). When this pin is not used as port P215, configure it in the same way as P214, P215.

Table 20.3 Handling of unused pins (2 of 2)

Pin name	Description
XCOUT	When the sub clock oscillator is not used, set the SOSCCR.SOSTP bit to 1 (general port P214). When the external clock is input to the EXCIN pin, the XCOUT pin functions as P214. When this pin is not used as port P214, configure it in the same way as P214, P215.
P000 to P015	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 through a resistor or to AVSS0 through a resistor *1 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
P100 to P107, P202 to P205, P313 to P315, P500 to P502, P600 to P607, P800 to P804, P808 to P812, P900, P901, PC00 to PC10	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC2 through a resistor or to VSS through a resistor *1 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
P214, P215	Connect to VSS through a resister
P814, P815	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC_USB through a resistor or to VSS through a resistor *1 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
Other ports	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC through a resistor or to VSS through a resistor *1 *2 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1 *3
USBHS_DP, USBHS_DM, USBHS_RREF	• Preconditions: – AVCC_USBHS = VCC_USBHS: Connect to VCC – VSS1_USBHS = VSS2_USBHS: Connect to VSS – Set the module-stop state for USBHS (MSTPCRB.MSTPB12 = 1) • Processing details: – USBHS_DP, USBHS_DM, and USBHS_RREF: Open
VREFH0, VREFH	Connect to AVCC0
VREFL0, VREFL	Connect to AVSS0
VLO	Keep pin open*4
VBATT	Connect to VCC

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.
Note 2. P208, P210 and P211 are recommended for pull up VCC through a resistor, because these pins are input pull-up enabled from the initial value (PmnPFS.PCR = 1).
Note 3. P209 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.
Note 4. For more information, see section 61, Internal Voltage Regulator

20.5 Usage Notes

20.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR_NS register. This enables writing to the PFSWE bit in the PWPR_NS register.*1
2. Set 1 to the PFSWE bit in the PWPR_NS register. This enables writing to the PmnPFS register.*1
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR_NS register. This disables writing to the PmnPFS register.*1
7. Set 1 to the B0WI bit in the PWPR_NS register. This disables writing to the PFSWE bit in the PWPR_NS register.*1

Note 1. When the security attribution of Pmn is set to 0, set the PWPR_S register to write to the PmnPFS register.

20.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = 1 to 4)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see section 19, Event Link Controller (ELC).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

20.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODRn is set.
6. Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

20.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDRn) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

20.5.5 I/O Buffer Specification

The P402, P403, and P404 can be used as the RTC input, tamper detection and other peripheral functions. Table 20.4 lists the P402, P403, P404 specifications.

Table 20.4 P402, P403, P404 specifications

I/O port	RTC and tamper detection			Other peripheral	
	RTC and tamper detection input enable register	RTC	Tamper detection	Other peripheral enable register	ADC16H, GPT, CAC, ESWM, CANFD, SCI, SSIE, SDHI and interrupt
P402	VBTICTLR.VCH0INEN	RTCIC0	RTCIC0	P402PFS.PSEL and PMR	For details, see section 20.6. Peripheral Select Settings for Each Product.
P403	VBTICTLR.VCH1INEN	RTCIC1	RTCIC1	P403PFS.PSEL and PMR	
P404	VBTICTLR.VCH2INEN	RTCIC2	RTCIC2	P404PFS.PSEL and PMR	

These RTC inputs and tamper detection are controlled by the VBTICTLR register and this register has the highest priority for selecting the functions.

P402, P403, and P404 can be used as IRQn-DS (n = 4, 14, 15) whether RTC inputs and tamper detection are selected or not. When using these interrupts, set the interrupt procedure after setting the VBTICTLR register. See section 12.2.8. VBTICTLR : VBATT Input Control Register.

See Figure 20.5.

The VBTICTLR register is only initialized by VBATT_POR reset. Therefore, when not using the RTC inputs and tamper detection, the associated bit of VBTICTLR register must be set to 0 after except VBATT_POR reset.

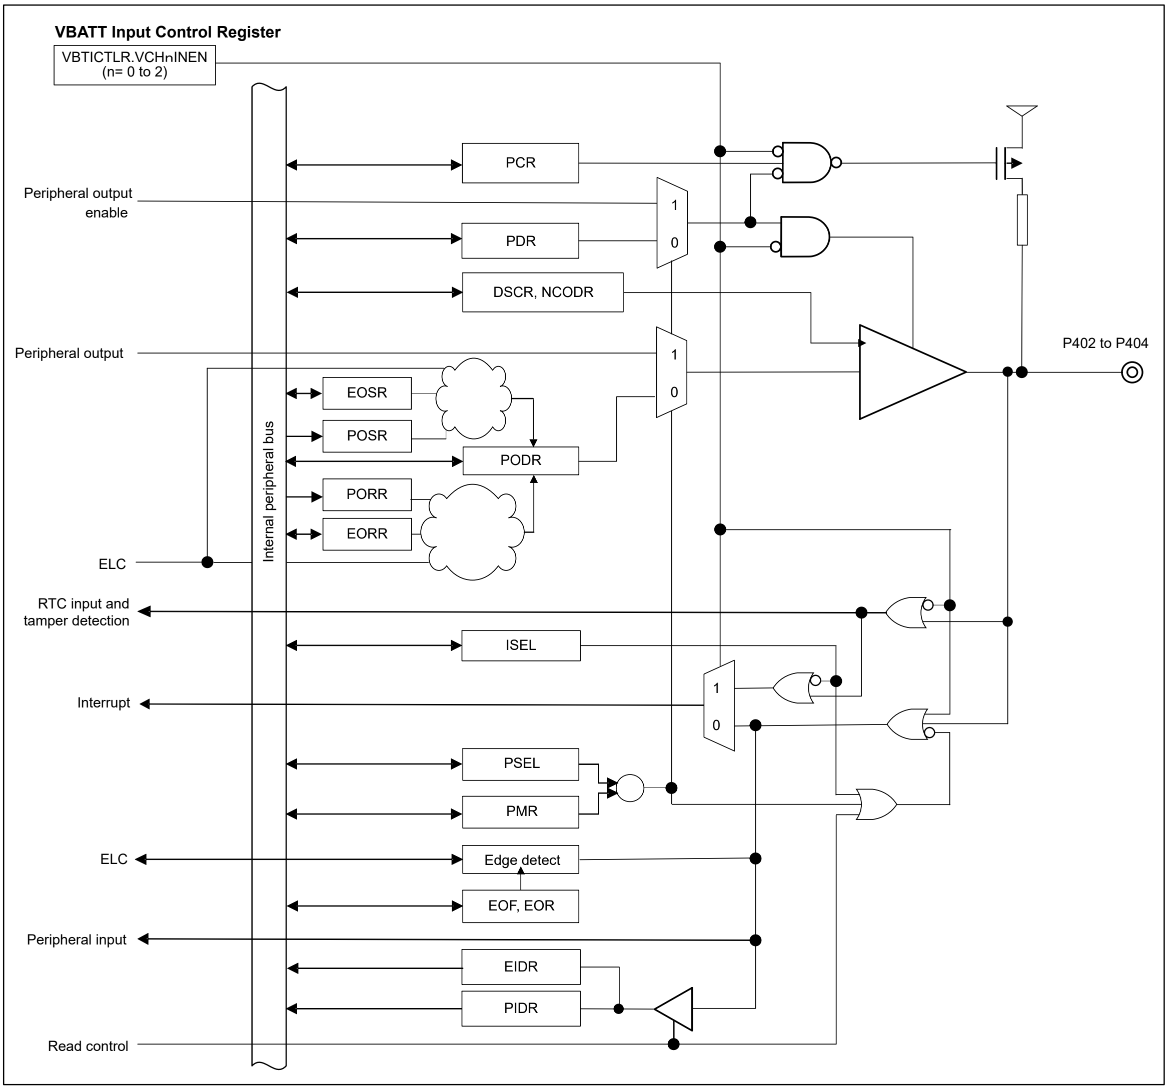

Figure 20.5 P402, P403, P404 diagram

20.5.6 Selecting Pins USB_DP and USB_DM

Pins USB_DP and USB_DM are shared with pins P814 and P815, respectively. Pins USB_DP and P814 can be set with the PFS.P814PFS.PMR bit, and pins USB_DM and P815 can be set with the PFS.P815PFS.PMR bit. Table 20.5 shows setting values of bits PFS.P814PFS.PMR and PFS.P815PFS.PMR with each selected pin.

Table 20.5 Selecting the USB/PORT pins

PMR Bits Settings		Pins Selected	
P814PFS.PMR bit	P815PFS.PMR bit	P814/USB_DP Pin	P815/USB_DM Pin
0	0	P814	P815
0	1	P814	P815
1	0	P814	P815
1	1	USB_DP	USB_DM

Note: When using P814/USB_DP and P815/USB_DM as GPIO pins (P814 and P815), use the USB related registers with their initial values.

Note: When using P814/USB_DP and P815/USB_DM as USB pins (USB_DP and USB_DM), use the GPIO related registers for P814 and P815 with their initial values.
Note: When using P814/USB_DP and P815/USB_DM as GPIO pins or USB pins, set these pins only once after a reset.

20.5.7 Pull-up/Pull-down Setting for P814 and P815 at USBFS/GPIO Function

When the GPIO function of P814 and P815 is used, the Pull-up/Pull-down function of USBFS register affects to P814 and P815. Therefore, before using GPIO function, the pull-up and pull-down control of USBFS needs to be disabled. The control register is SYSCFG.DPRPU and SYSCFG.DRPD bits.

20.5.8 Notes on using P215 and P214

Table 20.6 shows the pin selection and notes for P215 and P214.

Table 20.6 Pin selection and notes for P215 and P214

No.	P215	P214	Description
1	XCIN	XCOUT	Permitted*3
2	EXCIN*1	General purpose input*1	Permitted*4
3	EXCIN*1	Unused*2	Permitted*4
4	General purpose input*1	General purpose input*1	Permitted*5
5	General purpose input*1	Unused*2	Permitted*5
6	Unused*2	General purpose input*1	Permitted*6
7	Unused*2	Unused*2	Permitted*6

Note 1. Do not input a voltage higher than VCC to this pin when VCC > $V_{DETBATT}$.
Do not input a voltage higher than V_{BATT} to this pin when VCC ≤ $V_{DETBATT}$.
Note 2. Unused pin should be connected to VSS through a resister.
Note 3. Set the SOMCR.SOSEL bit to 0 and set SOSCCR.SOSTP bit to 0
Note 4. Set the SOMCR.SOSEL bit to 1 and set SOSCCR.SOSTP bit to 0
Note 5. Set the SOMCR.SOSEL bit to 0 and set SOSCCR.SOSTP bit to 1
Note 6. Set the SOSCCR.SOSTP bit to 1.

20.5.9 Handling of Reserved Pins for BGA169 Package

Table 20.7 shows how to handle reserved pins for BGA169 package.

Table 20.7 Handling of reserved pins for BGA169 package

Pin name	Description
P010, P011, P012, P013, P105, P108, P109, P110, P111, P202, P203, P204, P205, P207, P303, P304, P305, P308, P309, P313, P314, P315, P406, P411, P412, P413, P503, P504, P505, P506, P507, P508, P600, P601, P604, P605, P606, P607, P608, P611, P704, P705, P706, P707, P710, P711, P712, P713, P714, P715, P807, P810, P811, P812, P813, P900, P901, P902, P903, P904, P910, P911, P912, P913, P914, P915, PA01, PA06, PA07, PA15, PB00, PB01, PB02, PB03, PB04, PB05, PB06, PB07, PB08, PB09, PB10, PB11, PB12, PB13, PB14, PC00, PC01, PC02, PC03, PC04, PC05, PC06, PC07, PC08, PC09, PC10, PC12, PC15, PD00, PD01, PD02, PD03, PD04, PD05, PD06, PD07	Set direction to output (PCNTR1.PDRn = 1)

20.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added _A, _B, or _C suffixes. When assigning IIC, SPI, SSIE, and SDHI functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

1. In Pmn pin function select register(PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
2. Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
3. The single function should not be assigned to the multiple pins by PmnPFS register. When the GPT1, GPT5, SCI3, IIC0 or SPI0 are configured as secure and these pin function is being assigned to the pin which security attribution is set as secure by the PmSAR register, the write access to the PSEL bits for setting same function as secure pin in other pins is ignored when the security attribution of that pin is non-secure. For example, if the PSARE.PSARE30 bit is 0 (GPT1 is secure) and the P209PFS.PSEL bits is 00011b (pin function is GTIOC1A) and the P2SAR.P209SA bit is 0 (P209 is secure), the write 00011b to the P405PFS.PSEL bits is ignored when the P4SAR.P405SA bit is 1 (P405 is non-secure).
4. The PORT0, PORT5 and PORT8 have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1

Table 20.8 Register settings for input/output pin function (PORT0)

Note 1. Recommend using pins that have a letter appended to their names, for instance “_A”, “_B”, or “_C” to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t_{GTISK}).

Note 1. Recommend using pins that have a letter appended to their names, for instance “_A”, “_B”, or “_C” to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t_{GTISK}).

Note 3. The driver strength of this port is controlled by PmnPFS.DSCR[1:0] bits. Set the PmnPFS.DSCR[1:0] bits to Low Drive (00b).

Note 4. When using NMI pin interrupt, Port related registers setting are not required.

Note 5. To use this pin function, select the CoreSight TPIU.SPPR.PProtocol bits to SWO and set the TRPORTCR.OE bit to 1. The drive strength of this pin function is controlled by TRPORTCR.DRV[1:0] bits.

Note 1. Recommend using pins that have a letter appended to their names, for instance "_A", "_B", or "_C" to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t_{GTISK}).

21. Port Output Enable for GPT (POEG)

21.1 Overview

The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETRGn (n = A to D) pins
- Output-disable request from the GPT
- Comparator interrupt request detection
- Oscillation stop detection of the clock generation circuit
- Register settings

The GTETRGn (n = A to D) pins can be used as GPT external trigger input pins.

Table 21.1 lists the POEG specifications, Figure 21.1 shows a block diagram, and Table 21.2 lists the input pins.

Table 21.1 POEG specifications

Parameter	Specifications
Output-disable control through input level detection	The GPT output pins can be disabled when a GTETRGn rising edge or high level is sampled after polarity and filter selection.
Output-disable request from the GPT	When the GTIOCxA pin and the GTIOCxB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCxA and GTIOCxB pins are output-disabled.
Output-disable control through the comparator (ACMPHS) interrupt request detection	The GPT output pins can be disabled when an interrupt request is generated by a change in the output results of any of the comparators.
Output-disable control through oscillation stop detection	The GPT output pins can be disabled when oscillation of the clock generation circuit stops.
Output-disable control by software (registers)	The GPT output pins can be disabled by modifying the register settings.
Interrupt	Interrupts can be generated by detecting the input level of external trigger input pins (GTETRGn pins). Interrupts can be generated when all GPT or ACMPHS output pins are driven to an active level simultaneously.
External trigger output to the GPT	The GTETRGn signals can be output to the GPT after polarity and filter selection. (count start, count stop, count clear, up-count, down-count, or input capture function)
Noise filtering	For input from the GTETRGn pins, PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be selected as the noise filtering clock. (Filtering is performed by sampling the input signals three times using the selected clock.) Positive or negative polarity can be selected for any of the GTETRGn input pins. Signal state after polarity and filter selection can be monitored.
Module-stop function	Module-stop state can be set for each group to reduce power consumption.
TrustZone Filter	Security and Privilege attribution can be set for each group.

Note: n = A to D, x = 0 to 13

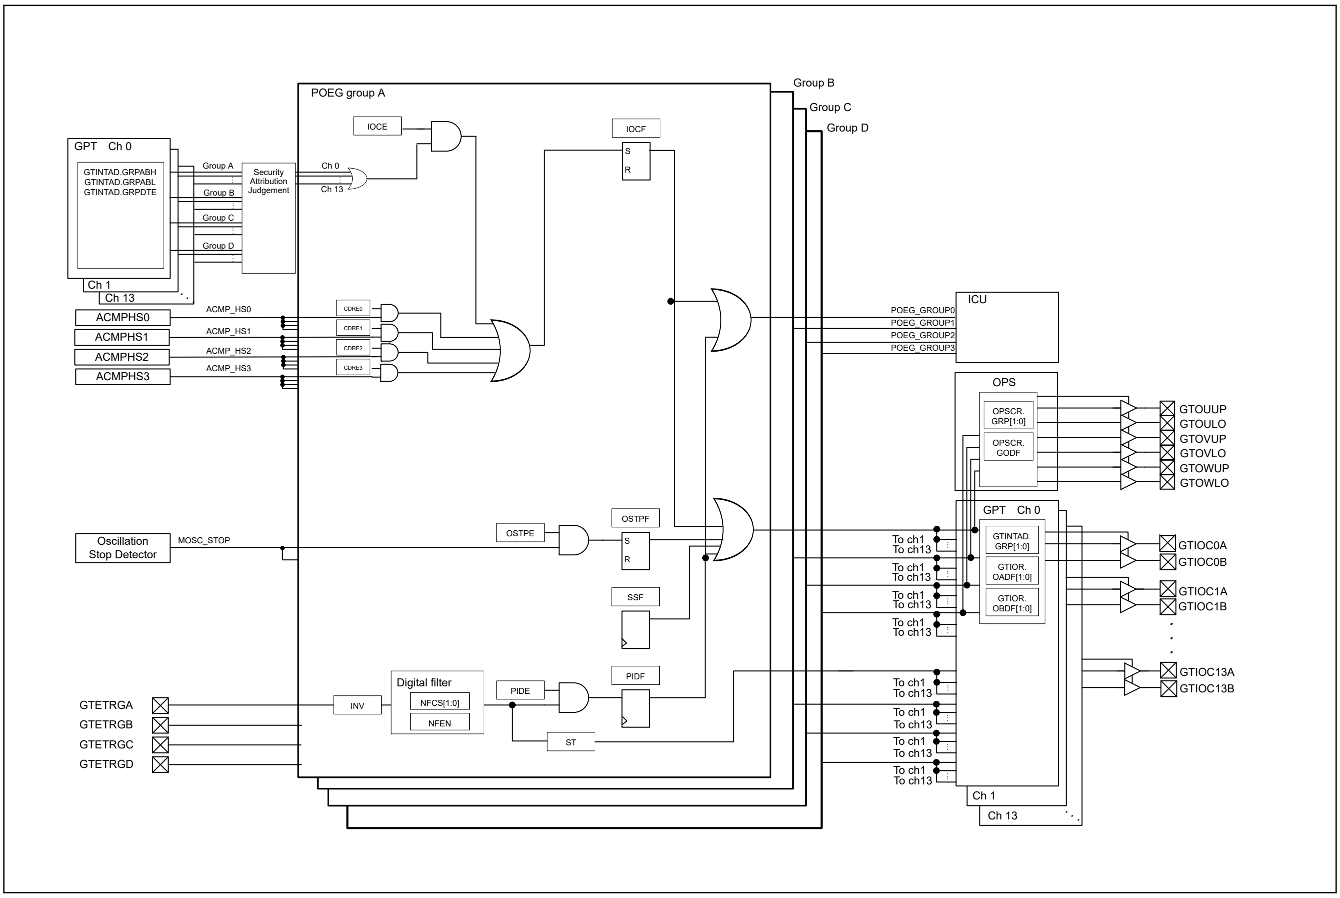

Figure 21.1 POEG block diagram

Table 21.2 POEG input pins

Pin name	I/O	Description
GTETRGA	Input	GPT output pin output-disable request signal or GPT external trigger input pin A
GTETRGB	Input	GPT output pin output-disable request signal or GPT external trigger input pin B
GTETRGC	Input	GPT output pin output-disable request signal or GPT external trigger input pin C
GTETRGD	Input	GPT output pin output-disable request signal or GPT external trigger input pin D

21.2 Register Descriptions

29	NFEN	Noise Filter Enable 0: Disable noise filtering 1: Enable noise filtering	R/W
31:30	NFCS[1:0]	Noise Filter Clock Select 0 0: Sample GTETRGn pin input level three times every PCLKB 0 1: Sample GTETRGn pin input level three times every PCLKB/8 1 0: Sample GTETRGn pin input level three times every PCLKB/32 1 1: Sample GTETRGn pin input level three times every PCLKB/128	R/W

Note: S-TYPE3, P-TYPE3
Note 1. Only 0 can be written to clear the flag.
Note 2. Can be modified only once after a reset.

The POEGGn (n = A to D) registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT.

In the descriptions, POEGGn represents the POEGGn (n = A to D) registers.

21.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the 3-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETRGn pins
  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.
- Output-disable request from the GPT
  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1 if the disable request is enabled by GTINTAD.
  The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].

  Note: The disable request is valid only when the security attributions of GPT and POEG are same. The disable request from GPT with a security attribution different from the security attribution of POEG is invalidated by the security attribution judgment.
- Comparator (ACMPHS) interrupt request detection
  Comparator interrupt detection is activated when any of the POEGGn.CDREi (i = 0 to 3) is 1. When the associated comparator interrupt is generated, the GPT output pins are disabled. POEGGn.IOCF indicates the detection status.
- Oscillation stop detection for the clock generation circuit
  While POEGGn.OSTPE is 1, the halt status of the main clock oscillator is detected and the POEGGn. OSTPF flag is set to 1.
- SSF bit setting
  When POEGGn.SSF is set to 1, the GPT and PWM output are disabled.

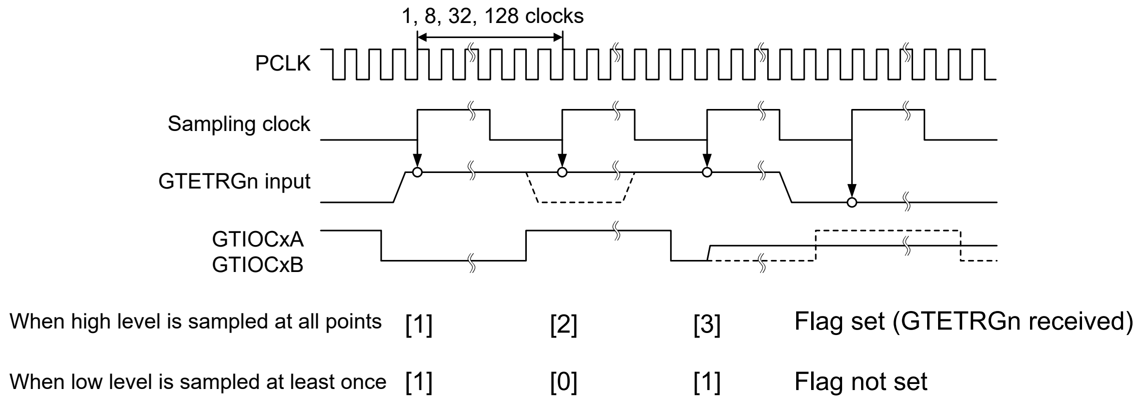
The output-disable state is controlled in the GPT module. The output-disable of the GTIOCxA and GTIOCxB pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPTx. The output-disable of the 3-phase PWM output for BLDC motor control pins is set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT_OPS.

21.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGn pins, the GPT output pins are output-disabled.

21.3.1.1 Digital Filter

Figure 21.2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0], the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETRGn pins are ignored.



Note: PCLK = PCLKB
Note: Each channel output can be set in the GPT setting. Low level sampling can be set in the POEGGn.INV setting.

Figure 21.2 Example of digital filter operation

21.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOC Pin Output Negate Control in section 22, General PWM Timer (GPT).

21.3.3 Comparator Interrupt Detection

If POEGGn.CDREi (i = 0 to 3) is 1 when an associated comparator interrupt request is generated, the GPT output pins are output-disabled for each group. The status flag is POEGGn.IOCF which is shared with GPT output-disable detection.

21.3.4 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

21.3.5 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGGn.SSF.

21.3.6 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following flags:

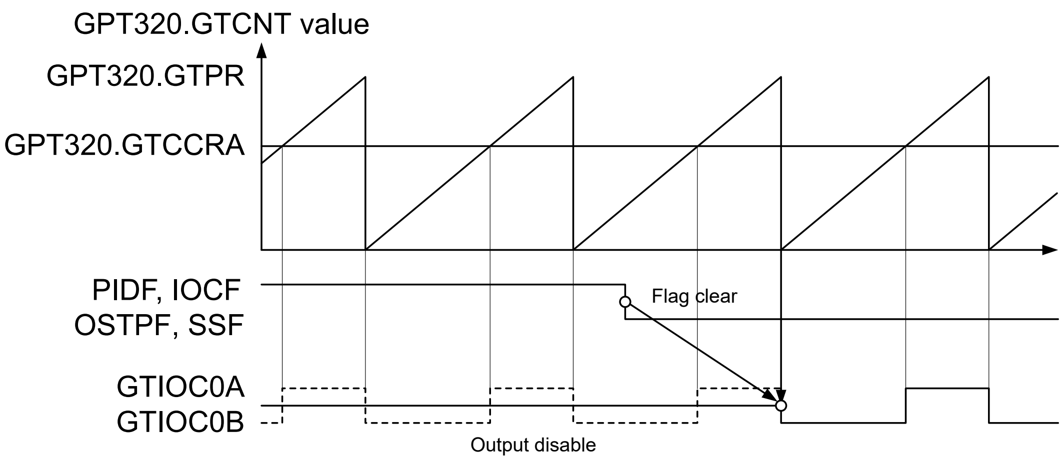
- POEGGn.PIDF
- POEGGn.IOCF
- POEGGn.OSTPF
- POEGGn.SSF

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.OABHF and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

Figure 21.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.



Note: The base address of the registers are the same.

Figure 21.3 Output-disable release timing for GPT pin outputs

21.4 Interrupt Sources

The POEG generates an interrupt request for the following factors:

- Output-disable control by the input level detection
- Output-disable request from the GPT or the comparator (ACMPHS) interrupt request detection

Table 21.3 lists the conditions for interrupt requests.

Table 21.3 Interrupt sources and conditions

Interrupt source	Symbol	Associated flag	Trigger conditions
POEG group A interrupt	POEG_GROUPA	POEGGA.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGA.PIDF	An output-disable request from the GTETRGA pin occurred
POEG group B interrupt	POEG_GROUPB	POEGGB.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGB.PIDF	An output-disable request from the GTETRGB pin occurred
POEG group C interrupt	POEG_GROUPC	POEGGC.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGC.PIDF	An output-disable request from the GTETRGC pin occurred
POEG group D interrupt	POEG_GROUPD	POEGGD.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGD.PIDF	An output-disable request from the GTETRGD pin occurred

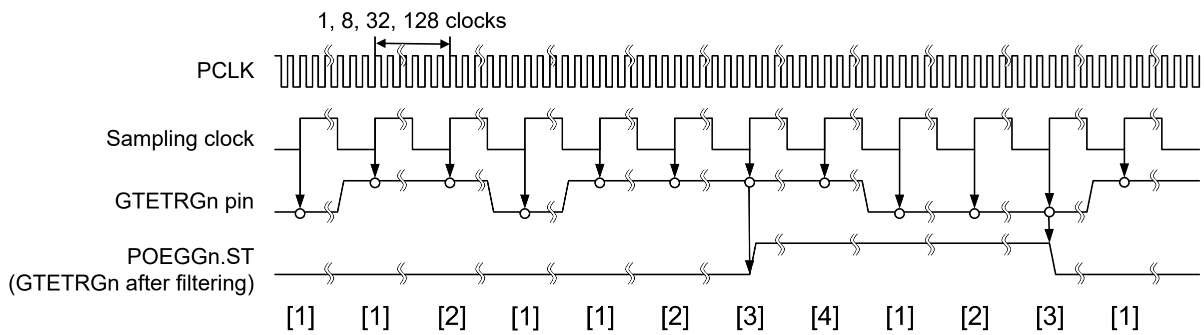
21.5 External Trigger Output to the GPT

The POEG outputs signals generated by filtering and level detection of GTETRGn pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0], that value is output. Set the control registers the same as for the input level detection operation described in section 21.3.1. Pin Input Level Detection Operation The state after filtering can be monitored in POEGGn.ST.

Figure 21.4 shows the output timing of an external trigger to the GPT.



Note: PCLK = PCLKB
Note: Each channel output can be set in the GPT settings. Polarity can be reversed in POEGGn.INV.

Figure 21.4 Output timing of external trigger to the GPT

21.6 Usage Notes

21.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

21.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

22. General PWM Timer (GPT)

22.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 14 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.

This GPT provides the high resolution PWM waveform generation function for the channel 0 to 3, the A/D conversion start request function, the asymmetric automatic dead time setting function, and the enhanced interrupt skipping function. In addition, it is enhanced with the external pulse width measuring function for the channel 0 to 3, the additional PWM modes for the channel 4 to 9, the extended buffer transfer function, the GTCPPO pin output function, and the inter-channel cooperation function.

Table 22.1 lists the GPT specifications, Table 22.2 shows the GPT functions, and Figure 22.1 shows a block diagram.

Table 22.1 GPT specifications

Item	Description
Functions	● 32 bits × 14 channels (GPT32n (n = 0 to 13)) ● Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter ● Clock sources independently selectable for each channel ● Two input/output pins per channel ● Two output compare/input capture registers per channel ● For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use ● In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms ● Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow ● Generation of dead times in PWM operation ● Generation of high accuracy duty in the vicinity of duty 0% and 100% PWM waveform ● In output compare operation, setting compare register is immediately used to generate PWM waveform with dead times ● Synchronous starting, stopping and clearing counters for arbitrary channels ● Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 8 ELC events ● Count start, count stop, count clear, up-count, down-count, or input capture operation in response to the status of two input pins ● Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 4 external triggers ● Output pin disable function by dead time error and detected short-circuits between output pins ● A/D conversion start request generation function ● PWM waveform for controlling brushless DC motors can be generated ● Compare match A to F event, overflow/underflow event, and input UVW edge event can be output to the ELC ● Enables the noise filter for input capture and input UVW ● Period count function ● External pulse width measuring function ● Logical operation between the channel output ● Synchronous counter clearing/counter setting/input capture among channels ● Bus clock: PCLKA, Core clock: GTCLK*1 ● Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64) (when using synchronous clock), PCLKA ≤ GTCLK (when using asynchronous clock GTIOCnA/B input/output pin polarity reversal function)

Note 1. GPT core clock (GTCLK) is PCLKD when synchronous clock is selected, and GPTCLK when asynchronous clock is selected. See Figure 22.3.

Table 22.2 GPT functions (1 of 2)

Parameter		Description
Count clock		GTCLK GTCLK/2 GTCLK/4 GTCLK/8 GTCLK/16 GTCLK/32 GTCLK/64 GTCLK/128 GTCLK/256 GTCLK/512 GTCLK/1024 GTETRGA, GTETRGB, GTETRGC, GTETRGD

Cycle setting buffer register		GTPBR GTPDBR
I/O pins		GTIOCnA GTIOCnB (n = 0 to 13)
External trigger input pin*1		GTETRGA GTETRGB GTETRGC GTETRGD
Counter clear sources		GTPR register compare match Input capture Input pin status ELC event input GTETRGn (n = A to D) pin input GTCCR register compare match (GPT32n (n = 4 to 9)) Other channel's counter clear sources (GPT32n (n = 4 to 9))
Period count function		Available (GPT32n (n = 0 to 3, 10 to 13))
Compare match output	Low output	Available
	High output	Available
	Toggle output	Available
Input capture function		Available
Automatic addition of dead time		Available
PWM mode		Available
High accuracy PWM waveform		Available (GPT32n (n = DEADBEEF))
Phase count function		Available
External pulse width measuring function		Available
Buffer operation		Double buffer Simultaneous operation disable control for multiple channels Buffer operation by counter clearing/compare match
One-shot operation		Available
DMAC/DTC activation		All the interrupt sources
A/D conversion start request		Compare match of GTADTRA or GTADTRB register
Brushless DC motor control function		Available

Table 22.2 GPT functions (2 of 2)

Parameter	Description
Interrupt sources	11 sources ● GTCCRA compare match/input capture(GPTn_CCMPA) ● GTCCRB compare match/input capture(GPTn_CCMPB) ● GTCCRC compare match(GPTn_CMPC) ● GTCCRD compare match(GPTn_CMPD) ● GTCCRE compare match(GPTn_CMPE) ● GTCCRF compare match(GPTn_CMPF) ● GTCNT overflow (GTPR compare match) (GPTn_OVF) ● GTCNT underflow (GPTn_UDF) ● GTPC count stop(GPTx_PC) (x = 0 to 3)
Interrupt skipping function	● Skipping of interrupts of GTCNT counter overflow (GTPR register compare match) (GPTn_OVF) and GTCNT counter underflow (GPTn_UDF) (interlocked with other interrupts and A/D conversion start requests) ● Skipping of GTADTRA and GTADTRB register compare match (GPT32y (y = 4 to 9)) ● Buffer operation skipping function
Event linking (ELC) function	Available*2
Noise filtering function	Available
Logical operation between the channel output	Available
Synchronous counter clearing/counter setting/input capture	Available (GPT32n (n = 4 to 9))
TrustZone Filter	Security and Privilege attribution can be set for each UNIT.*3

Note:

Note 1. GTETRGn connects to GPT through the POEG module. Therefore, to use the GPT function, supply the POEG clock by clearing the MSTPCRD.MSTPDn (n = 11 to 14) bit.

Note 2. See section 22.6. Operations Linked by ELC.

Note 3. UNIT0 to UNIT3 is CH0 to CH3.
UNIT4 is CH4 to CH9.
UNIT5 to 8 is CH10 to CH13.

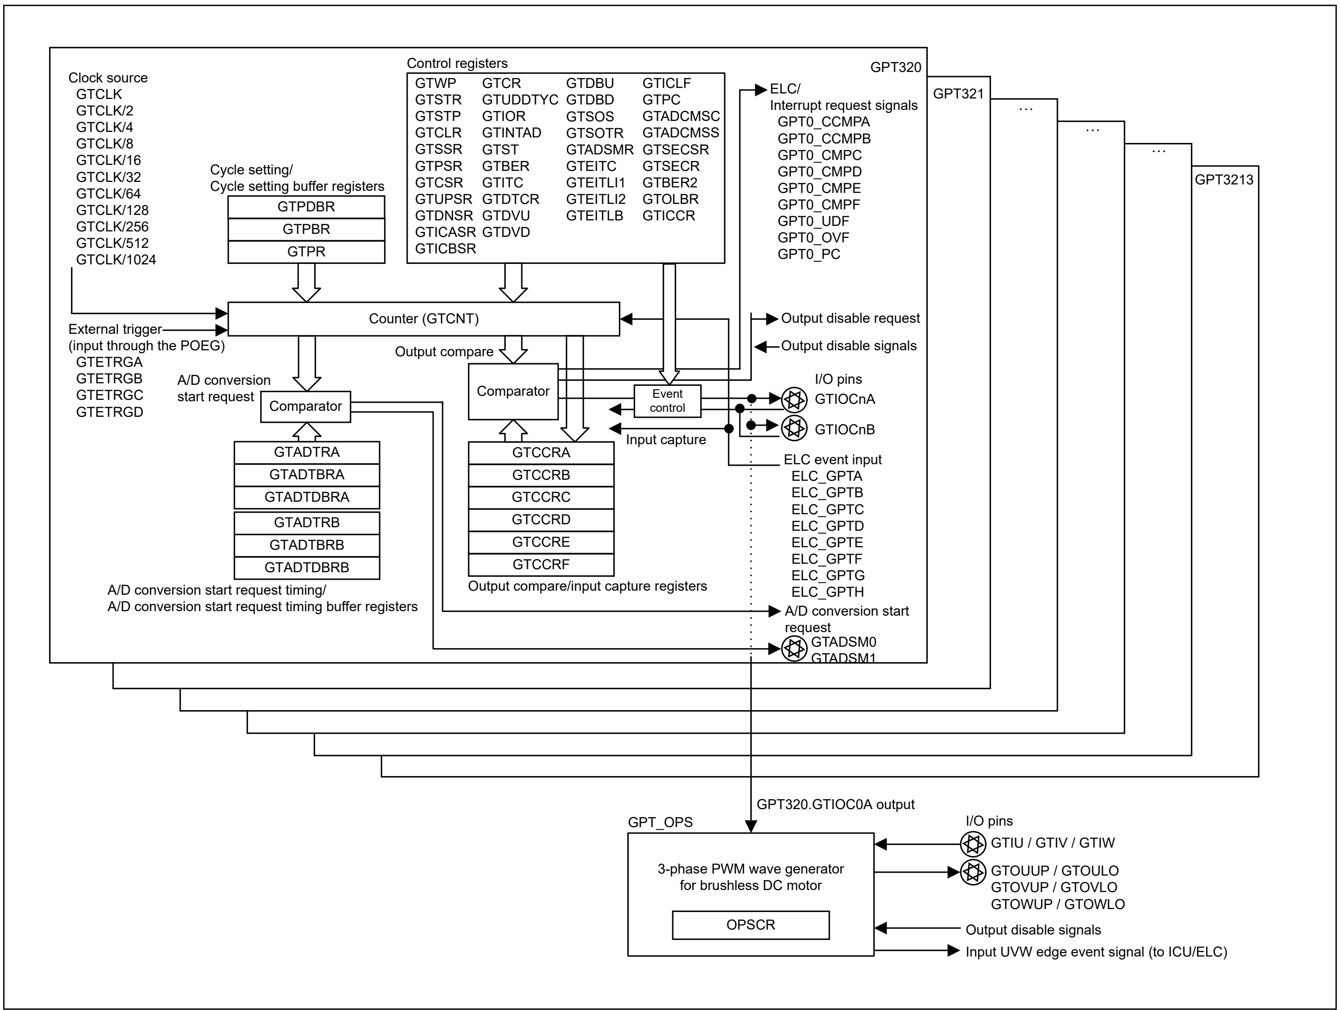

Figure 22.1 GPT block diagram (Saw-wave PWM mode 1, Saw-wave one-shot pulse mode, Triangle-wave PWM mode1,2,3)

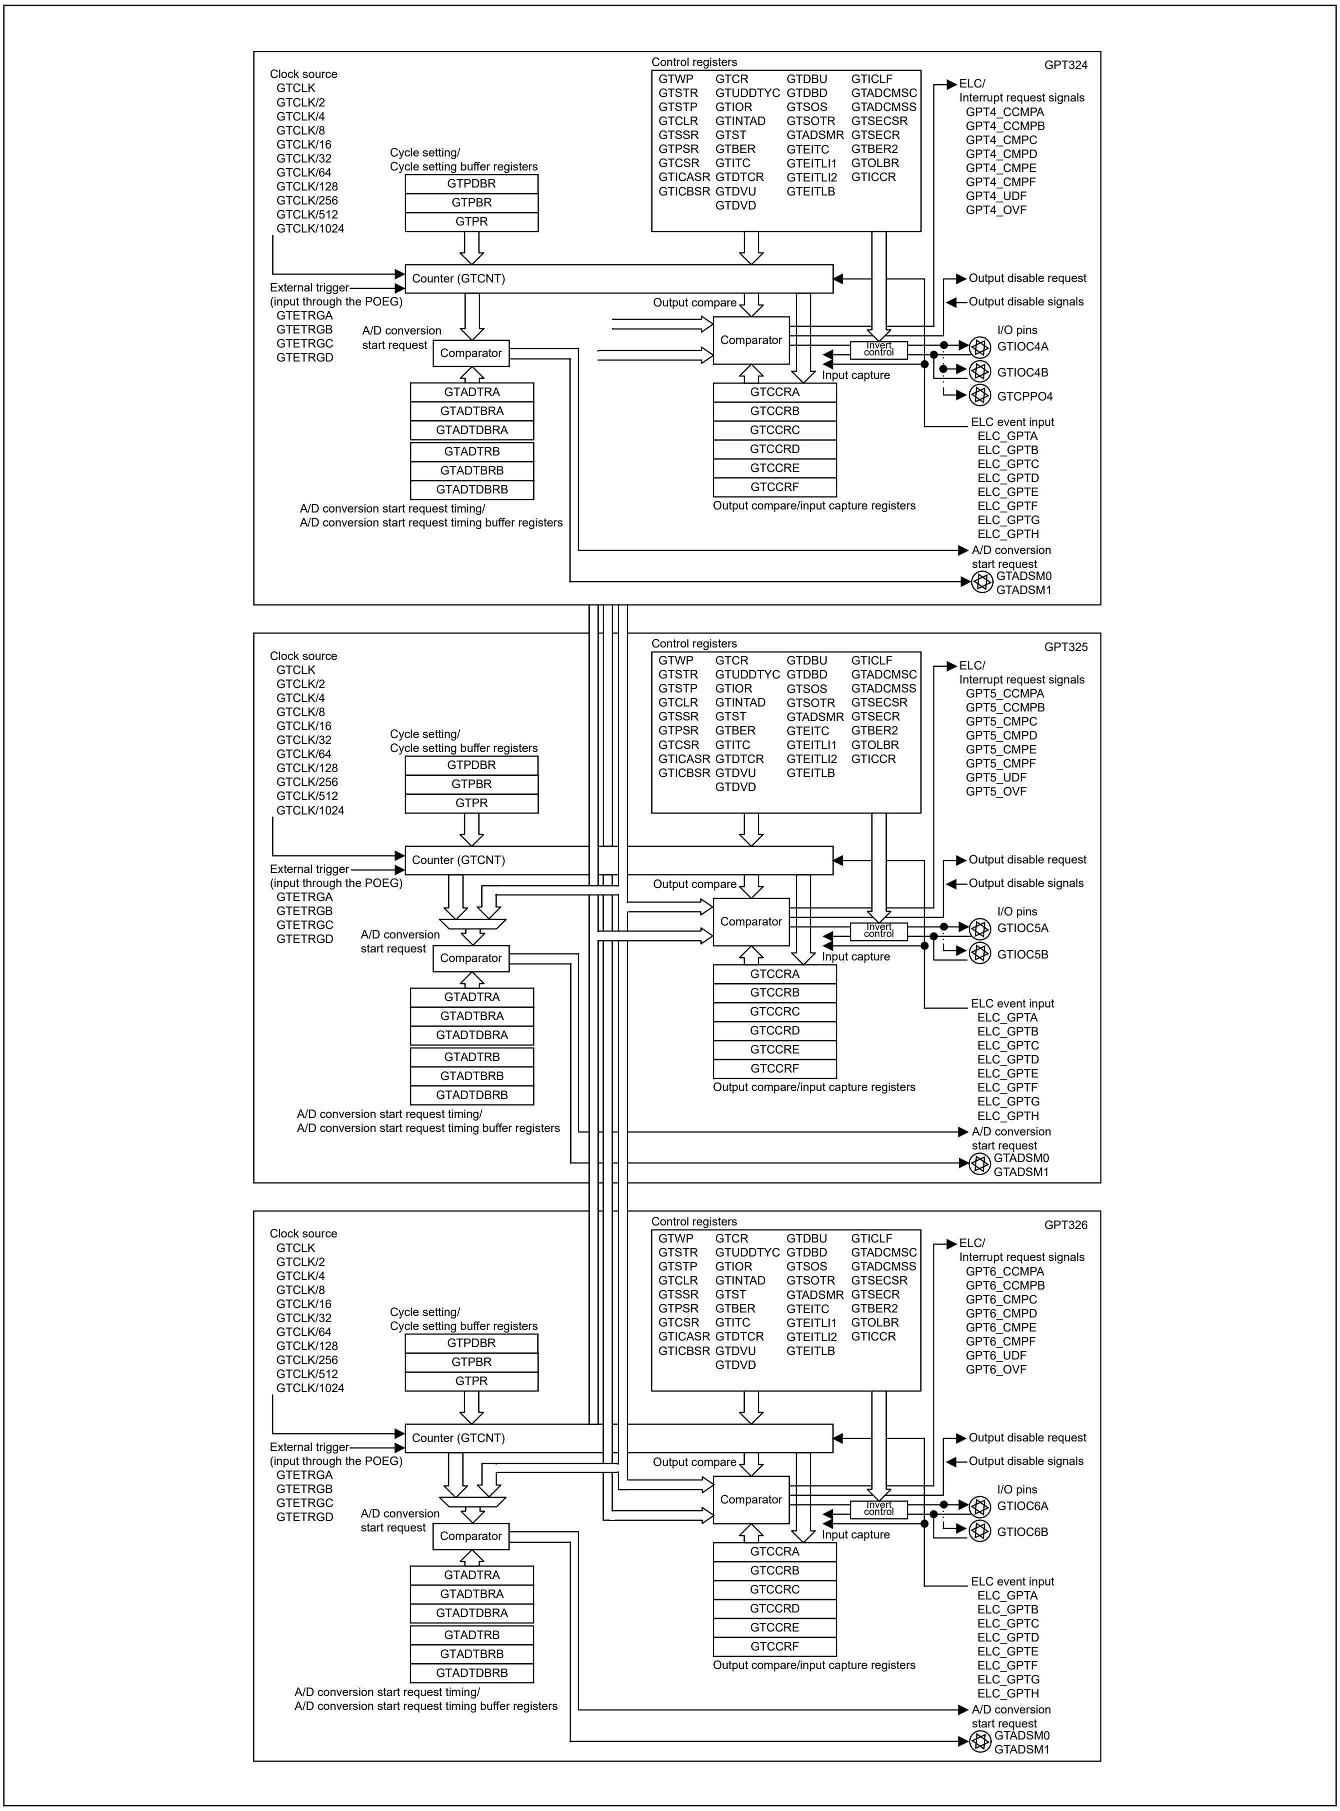

Figure 22.2 GPT block diagram (Saw-wave PWM mode 1, 2, Saw-wave one-shot pulse mode, Triangle-wave PWM mode1,2,3, Complementary PWM mode 1, 2, 3, 4)

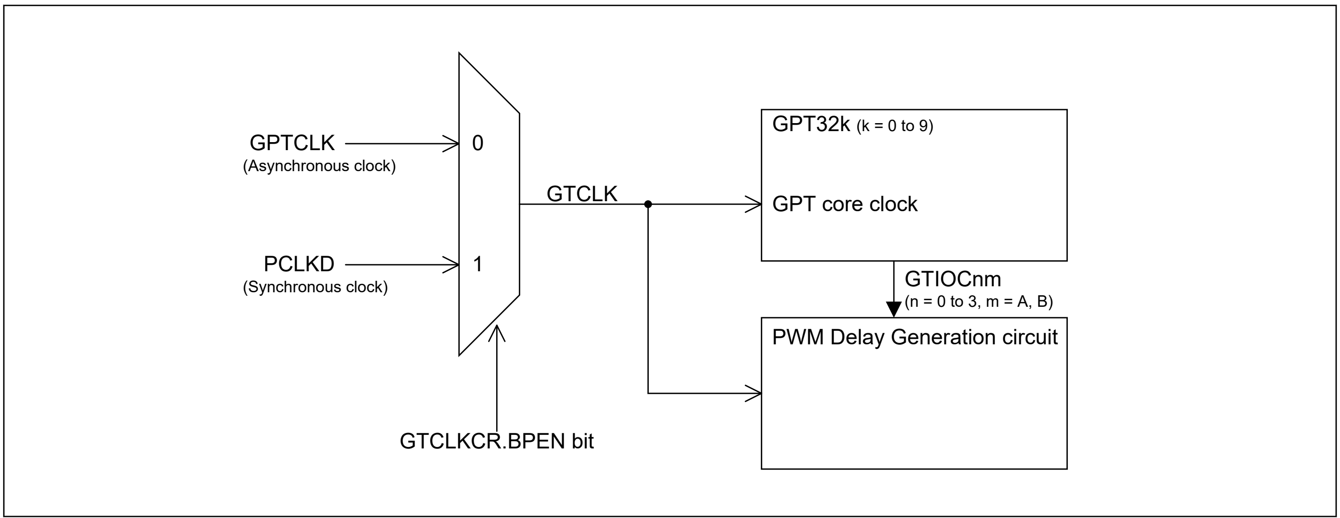

Figure 22.3 GPT core clock selection diagram

In this specification, three consecutive channels to configure complementary PWM mode is defined as complementary PWM mode channel group. The lowest position channel of complementary PWM mode channel group is defined as master channel. The second channel is defined as slave channel 1. The highest position channel is defined as slave channel 2.

Figure 22.4 shows an example using multiple GPTs.

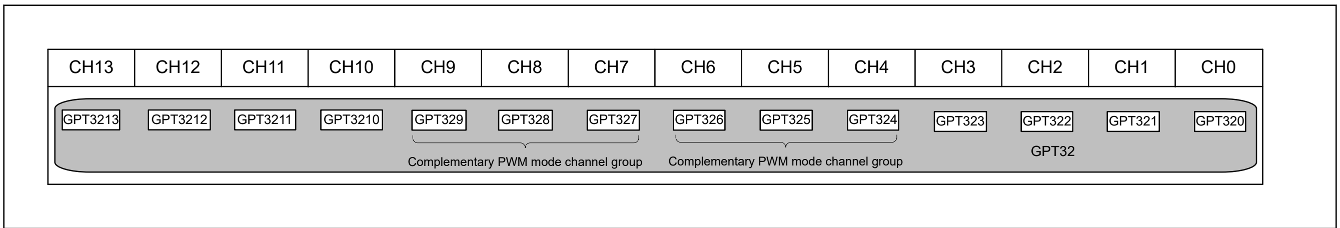

Figure 22.4 Association between GPT channels and module names

Table 22.3 lists the I/O pins.

Table 22.3 GPT I/O pins

Channel	Pin name	I/O	Function
Common	GTETRGx	Input	External trigger input pin x (input through the POEG)
	GTADSM0	Output	A/D conversion start request monitor 0 output pin
	GTADSM1	Output	A/D conversion start request monitor 1 output pin
GPT32n	GTIOCnA	I/O	GTCCRA register input capture input/output compare output/PWM output pin
	GTIOCnB	I/O	GTCCRB register input capture input/output compare output/PWM output pin
	GTCPPOk	Output	Toggle output synchronized with PWM period
GPT_OPS	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W

22.2 Register Descriptions

22.2.1 GTWP : General PWM Timer Write-Protection Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	CMNWP	CLRWP	STPWP	STRWP	WP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WP	Register Write Disable 0: Write to the register enabled 1: Write to the register disabled	R/W
1	STRWP	GTSTR.CSTRT Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
2	STPWP	GTSTP.CSTOP Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
3	CLRWP	GTCLR.CCLR Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
4	CMNWP	Common Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	GTWP Key Code When 0xA5 is written to these bits, writing to the WP, STRWP, STPWP, CLRWP, and CMNWP bits are permitted. These bits are read as 0.	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC, GTADCMSC, GTADCMSS, GTBER2, GTOLBR, GTICCR.

STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 0 to 13) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter starts to run. When the setting of the GPT320.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 13) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is stopped. When the setting of the GPT320.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 13) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is cleared. When the setting of the GPT320.GTWP.CLRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

CMNWP bit (Common Register Write Disabled)

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 0 to 13) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT320.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit causes the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register updates the value of the GPT320.GTSECR register. When the setting of the GPT320.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit does not cause the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register does not update the value of the GPT320.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

PRKEY[7:0] bit (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

22.2.2 GTSTR : General PWM Timer Software Start Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x04

Bit position:	31																														0
Bit field:	CSTRT31 to CSTRT0																														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CSTRT0 to CSTRT31*1	Channel n GTCNT Count Start (n is the same as the bit position value) 0: GTCNT counter is not started 1: GTCNT counter is started	R/W

Note 1. The bits that can be used vary depending on the product. The n in CSTRTn is the same as the GPT channel number. For this product, n is 0 to 13.

The GTSTR starts the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTR register.

In complementary PWM mode, writing to the CSTRTn bit of master channel is only valid. The bit on slave channels reflects the bit value of master channel.

For the association between module names and channel numbers, see Figure 22.4.

CSTRTn bits (Channel n GTCNT Count Start (n = 0 to 13))

The CSTRTn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit (n = 0 to 13) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

22.2.3 GTSTP : General PWM Timer Software Stop Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x08

Bit position:	31 to 0
Bit field:	CSTOP31 to CSTOP0
Value after reset:	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	CSTOP0 to CSTOP31*1	Channel n GTCNT Count Stop (n is the same as the bit position value) 0: GTCNT counter is not stopped 1: GTCNT counter stopped	R/W

Note 1. The bits that can be used vary depending on the product. The n in CSTOPn is the same as the GPT channel number. For this product, n is 0 to 13.

The GTSTP stops the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTP register.

In complementary PWM mode, writing to the CSTOPn bit of master channel is only valid. The bit on slave channels reflects the bit value of master channel.

For the association between module names and channel numbers, see Figure 22.4.

CSTOPn bits (Channel n GTCNT Count Stop (n = 0 to 13))

The CSTOPn bits stop channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOPn bit (n = 0 to 13) has no effect unless the GTPSR.CSTOP bit is set to 1. The read data shows the counter status of each channel (invert of GTCR.CST bit). A value of 0 means the counter is running and 1 means the counter is stopped.

22.2.4 GTCLR : General PWM Timer Software Clear Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x0C

Bit position:	31 to 0
Bit field:	CCLR31 to CCLR0
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	CCLR0 to CCLR31*1	Channel n GTCNT Count Clear (n : the same as bit position value) 0: GTCNT counter is not cleared 1: GTCNT counter is cleared	W

Note 1. The bits that can be used vary depending on the product. The n of CCLRn is the same as the GPT channel number. For this product, n is 0 to 13.

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter.

In complementary PWM mode, writing to the CCLRn bit of master channel is only valid. The bit on slave channels reflects the bit value of master channel.

For the association between module names and channel numbers, see Figure 22.4.

CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 13))

When the counting direction flag is set for decrement (GTST.TUCF flag = 0) with saw-wave mode selected in the GTCR.MD[2:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0x0000 0000 with other settings. These bits are read as 0.

22.2.5 GTSSR : General PWM Timer Start Source Select Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CSTRT	—	—	—	—	—	—	—	SSELCH	SSELCG	SSELCF	SSELCE	SSELCD	SSELCC	SSELCB	SSELCA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SSCBFAH	SSCBFAL	SSCBRAH	SSCBRAL	SSCAFBH	SSCAFBL	SSCARBH	SSCARBL	SSGTRGDF	SSGTRGDR	SSGTRGCF	SSGTRGCR	SSGTRGBF	SSGTRGBR	SSGTRGAF	SSGTRGAR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SSGTRGAR	GTETRGA Pin Rising Input Source Counter Start Enable 0: Counter start disabled on the rising edge of GTETRGA input 1: Counter start enabled on the rising edge of GTETRGA input	R/W*1
1	SSGTRGAF	GTETRGA Pin Falling Input Source Counter Start Enable 0: Counter start disabled on the falling edge of GTETRGA input 1: Counter start enabled on the falling edge of GTETRGA input	R/W*1
2	SSGTRGBR	GTETRGB Pin Rising Input Source Counter Start Enable 0: Counter start disabled on the rising edge of GTETRGB input 1: Counter start enabled on the rising edge of GTETRGB input	R/W*1
3	SSGTRGBF	GTETRGB Pin Falling Input Source Counter Start Enable 0: Counter start disabled on the falling edge of GTETRGB input 1: Counter start enabled on the falling edge of GTETRGB input	R/W*1
4	SSGTRGCR	GTETRGC Pin Rising Input Source Counter Start Enable 0: Counter start disabled on the rising edge of GTETRGC input 1: Counter start enabled on the rising edge of GTETRGC input	R/W*1
5	SSGTRGCF	GTETRGC Pin Falling Input Source Counter Start Enable 0: Counter start disabled on the falling edge of GTETRGC input 1: Counter start enabled on the falling edge of GTETRGC input	R/W*1
6	SSGTRGDR	GTETRGD Pin Rising Input Source Counter Start Enable 0: Counter start disabled on the rising edge of GTETRGD input 1: Counter start enabled on the rising edge of GTETRGD input	R/W*1
7	SSGTRGDF	GTETRGD Pin Falling Input Source Counter Start Enable 0: Counter start disabled on the falling edge of GTETRGD input 1: Counter start enabled on the falling edge of GTETRGD input	R/W*1
8	SSCARBL	GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable 0: Counter start disabled on the rising edge of GTIOCnA input when GTIOCnB input is 0 1: Counter start enabled on the rising edge of GTIOCnA input when GTIOCnB input is 0	R/W
9	SSCARBH	GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable 0: Counter start disabled on the rising edge of GTIOCnA input when GTIOCnB input is 1 1: Counter start enabled on the rising edge of GTIOCnA input when GTIOCnB input is 1	R/W

Bit	Symbol	Function	R/W
10	SSCAFBL	GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable 0: Counter start disabled on the falling edge of GTIOCnA input when GTIOCnB input is 0 1: Counter start enabled on the falling edge of GTIOCnA input when GTIOCnB input is 0	R/W
11	SSCAFBH	GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable 0: Counter start disabled on the falling edge of GTIOCnA input when GTIOCnB input is 1 1: Counter start enabled on the falling edge of GTIOCnA input when GTIOCnB input is 1	R/W
12	SSCBRAL	GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable 0: Counter start disabled on the rising edge of GTIOCnB input when GTIOCnA input is 0 1: Counter start enabled on the rising edge of GTIOCnB input when GTIOCnA input is 0	R/W
13	SSCBRAH	GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable 0: Counter start disabled on the rising edge of GTIOCnB input when GTIOCnA input is 1 1: Counter start enabled on the rising edge of GTIOCnB input when GTIOCnA input is 1	R/W
14	SSCBFAL	GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable 0: Counter start disabled on the falling edge of GTIOCnB input when GTIOCnA input is 0 1: Counter start enabled on the falling edge of GTIOCnB input when GTIOCnA input is 0	R/W
15	SSCBFAH	GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable 0: Counter start disabled on the falling edge of GTIOCnB input when GTIOCnA input is 1 1: Counter start enabled on the falling edge of GTIOCnB input when GTIOCnA input is 1	R/W
16	SSELCA	ELC_GPTA Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTA input 1: Counter start enabled at the ELC_GPTA input	R/W*1
17	SSELCB	ELC_GPTB Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTB input 1: Counter start enabled at the ELC_GPTB input	R/W*1
18	SSELCC	ELC_GPTC Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTC input 1: Counter start enabled at the ELC_GPTC input	R/W*1
19	SSELCD	ELC_GPTD Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTD input 1: Counter start enabled at the ELC_GPTD input	R/W*1
20	SSELCE	ELC_GPTE Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTE input 1: Counter start enabled at the ELC_GPTE input	R/W*1
21	SSELCF	ELC_GPTF Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTF input 1: Counter start enabled at the ELC_GPTF input	R/W*1
22	SSELCG	ELC_GPTG Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTG input 1: Counter start enabled at the ELC_GPTG input	R/W*1
23	SSELCH	ELC_GPTH Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTH input 1: Counter start enabled at the ELC_GPTH input	R/W*1
30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CSTRT	Software Source Counter Start Enable 0: Counter start disabled by the GTSTR register 1: Counter start enabled by the GTSTR register	R/W*1

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTSSR sets the source to start the GTCNT counter.

Input from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

SSELCm bit (ELC_GPTm Event Source Counter Start Enable) (m = A to H)

The SSELCm bit enables or disables the GTCNT counter start at the ELC_GPTm event input.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

22.2.6 GTPSR : General PWM Timer Stop Source Select Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Bit	Symbol	Function	R/W
20	PSELCE	ELC_GPTE Event Source Counter Stop Enable 0: Counter stop disabled at the ELC_GPTE input 1: Counter stop enabled at the ELC_GPTE input	R/W*1
21	PSELCF	ELC_GPTF Event Source Counter Stop Enable 0: Counter stop disabled at the ELC_GPTF input 1: Counter stop enabled at the ELC_GPTF input	R/W*1
22	PSELCG	ELC_GPTG Event Source Counter Stop Enable 0: Counter stop disabled at the ELC_GPTG input 1: Counter stop enabled at the ELC_GPTG input	R/W*1
23	PSELCH	ELC_GPTH Event Source Counter Stop Enable 0: Counter stop disabled at the ELC_GPTH input 1: Counter stop enabled at the ELC_GPTH input	R/W*1
30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CSTOP	Software Source Counter Stop Enable 0: Counter stop disabled by the GTSTP register 1: Counter stop enabled by the GTSTP register	R/W*1

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables the GTCNT counter stop at the ELC_GPTm event input.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

22.2.7 GTCSR : General PWM Timer Clear Source Select Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x18

30:28	—	These bits are read as 0. The write value should be 0.	R/W
31	CCLR	Software Source Counter Clear Enable 0: Counter clear disabled by the GTCLR register 1: Counter clear enabled by the GTCLR register	R/W*1

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTCSR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST=1) or stopped (GTCR.CST=0).

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables the GTCNT counter clear at the ELC_GPTm event input.

CSCMSC[2:0] bit (Compare Match/Input Capture/Synchronous counter clearing Source Counter Clear Enable*2)

Select enable or disable for the counter clear of the GTCNT counter by compare match/input capture/synchronous counter clearing group.

Since the compare match by the register that is performing the buffer operation (including the wave mode specific case) does not occur, the counter clear enable setting that makes the target register of the buffer operation the compare match factor is invalid.

In complementary PWM mode, the counter clear enable setting for compare match of the GTCCRB register, GTCCRE register, and GTCCRF register is invalid even when the buffer operation is not performed.

CP1CCE bit (Complementary PWM mode1 Crest Source Counter Clear Enable)

Select enable or disable for the counter clear at the crest of complementary PWM mode 1.

To enable this bit, do not set 1 to the PSYE bit of the GTIOR register.

It is valid only for the master channel in complementary PWM mode. The master channel setting also clears the GTCNT counter of the slave channel in complementary PWM mode.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

31:28	—	These bits are read as 0. The write value should be 0.	R/W

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGD pin input.

USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

USCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USELCm bit (ELC_GPTm Event Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables the GTCNT counter count up at the ELC_GPTm event input.

USILVL[3:0] bit (External Input Level Source Count-Up Enable)

Select enable or disable for the count-up of the GTCNT counter by the GTIOCnA pin input level, GTIOCnB pin input level, and GTETRGA/GTETRGB/GTETRGC/GTETRGD input level.

31:28	—	These bits are read as 0. The write value should be 0.	R/W

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

DSELCm bit (ELC_GPTm Event Source Counter Count Down Enable) (m = A to H)

The DSELCm bit enables or disables the GTCNT counter count down at the ELC_GPTm event input.

DSILVL[3:0] bit (External Input Level Source Count-Down Enable)

Select enable or disable for the count-down of the GTCNT counter by the GTIOCnA pin input level, GTIOCnB pin input level, and GTETRGA/GTETRGB/GTETRGC/GTETRGD input level.

31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is only available in GPT324 to GPT329.

In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASELCm bit (ELC_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC_GPTm event input.

ASOC bit (Other channel Source GTCCRA Input Capture Enable)

Select enable or disable for an input capture to the GTCCRA register by other channel factor.

Input capture of other channel factors is not subject to input capture factors to other channels set by the ICAFA and ICBFA bits of the GTICCR register.

24	BSOC	Other channel Source GTCCRB Input Capture Enable*1 0: Disables GTCCRB input capture by other channel factor 1: Enables GTCCRB input capture by other channel factor	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSELCm bit (ELC_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC_GPTm event input.

BSOC bit (Other channel Source GTCCRB Input Capture Enable)

Select enable or disable for an input capture to the GTCCRB register by other channel factor.

Input capture of other channel factors is not subject to input capture factors to other channels set by the ICAFB and ICBFB bits of the GTICCR register.

22.2.12 GTCR : General PWM Timer Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)

31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

Note 3. MD[3] bit is only available in GPT324 to GPT329. GPT320 to GPT323 and GPT3210 to GPT3213 only support Saw-wave PWM mode and Triangle-wave PWM mode except Saw-wave PWM mode 2.

The GTCR controls GTCNT.

Access in 8 bit unit to GTCR is prohibited.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input that are enabled by GTSSR for the starting counter source, occurs (n = 0 to 13)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTPSR as the counter stop source, occurs (n = 0 to 13)
- 0 is written by software directly.
- When the period count function is finished while the GTPC.ASTP bit is (n = 0 to 3, 10 to 13).

AINV bit (GTIOCnA input/output pin polarity reversal control)

This bit selects GTIOCnA input/output pin polarity reversal control.

BINV bit (GTIOCnB input/output pin polarity reversal control)

This bit selects GTIOCnB input/output pin polarity reversal control.

ICDS bit (Input Capture Operation Select During Count Stop)

This bit selects input capture operation during count stop, when the input capture function is selected.

SCGTIOC bit (GTIOC input Source Synchronous Clear Enable)

Select enable or disable the use of the counter clear by GTIOCnA/GTIOCnB input pin selected by the GTCSR register as the counter clear factor for other channels.

SSCGRP[1:0] bits (Synchronous Set/Clear Group Select)

Select the channel group of synchronous set/clear.

In complementary PWM mode, slave channels are also controlled by setting the SSCGRP[1:0] bits of the master channel.

CPSCD bit (Complementary PWM Mode Synchronous Clear Disable)

Select disable or enable of counter clear when synchronous clear from other channel occurs except section of trough in complementary PWM mode.

The slave channel is also controlled by setting the CPSCD bit of the master channel.

SSCEN bit (Synchronous Set/Clear Enable)

Select disable or enable of Synchronous set/clear.

In complementary PWM mode, slave channels are also controlled by setting the SSCEN bits of the master channel.

MD[3:0] bits (Mode Select)

These bits select the GPT operating mode.

In complementary PWM mode, slave channels are also controlled by setting the MD bits of the master channel.

Only the MD[3:2] bit (MD[2] for GPT320 to GPT323) is valid at input capture. Counting in saw-wave mode is performed with 00 for the MD[3:2] bit (0 for the MD[2] of GPT320 to GPT323), and counting in triangle-wave mode is performed with 01 for the MD[3:2] bit (1 for MD[2] of GPT320 to GPT323), and counting in complementary PWM mode is performed with 1 for the MD[3].

The MD bits must be set while the GTCNT operation is stopped.

During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), setting of the MD bits are ignored, where counting in saw-wave or triangle-wave or complementary PWM modes is not performed. Instead, up-counting or down-counting by a source set by the GTUPSR and GTDNSR registers is performed.

TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped.

CKEG[1:0] bits (Clock Edge Select)

When GTETRG input is selected by TPCS[3:0] bits, select the edge of GTETRG input used as the clock of GTCNT counter.

Set the CKEG[1:0] bits only when the GTCNT counter operation is stopped.

22.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x30

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

19	OADTYR	GTIOCnA Output Value Selecting after Releasing 0%/100% Duty Setting 0: The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from the 0 or 100% duty-cycle setting. 1: The function selected by the GTIOA[3:2] bits is applied to the compare match output value which is masked after release from the 0 or 100% duty-cycle setting.	R/W
23:20	—	These bits are read as 0. The write value should be 0.	R/W
25:24	OBDTY[1:0]	GTIOCnB Output Duty Setting 0 0: GTIOCnB pin duty depends on the compare match 0 1: GTIOCnB pin duty depends on the compare match 1 0: GTIOCnB pin duty 0% 1 1: GTIOCnB pin duty 100%	R/W
26	OBDTYF	Forcible GTIOCnB Output Duty Setting 0: Not forcibly set 1: Forcibly set	R/W
27	OBDTYR	GTIOCnB Output Value Selecting after Releasing 0%/100% Duty Setting 0: The function selected by the GTIOB[3:2] bits is applied to the output value when the duty cycle is set after release from the 0 or 100% duty-cycle setting. 1: The function selected by the GTIOB[3:2] bits is applied to the compare match output value which is masked after release from the 0 or 100% duty-cycle setting.	R/W
28	OABDTYT	GTIOCnA, B pin output 0%/100% duty setting reflection timing setting 0: The output duty-cycle setting changed at an underflow is reflected. 1: The output duty-cycle setting changed at an underflow and at the top of triangle-wave is reflected. The setting value "1" is invalid except the triangle-wave PWM mode.	R/W

Bit	Symbol	Function	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty of the GTIOCnA/GTIOCnB pin output.

The setting is invalid during the event count operation, Saw-wave PWM mode 2, Complementary PWM mode.

Count Direction:

- In saw-wave mode.
  When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
  When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
  When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.
- In triangle-wave mode.
  When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.
  When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty

- In saw-wave mode.
  When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.
- In triangle-wave mode.
  When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0 and the OADTY[1:0]/OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1 and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty of first cycle while count operation is stopped, these duty-cycle set during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

OmDTY[1:0] bits (GTIOCnm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCnm pin.

OmDTYF bit (Forcible GTIOCnm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation.

OmDTYR bit (GTIOCnm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCnm pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmDTYR bit is 1, the value after the period has elapsed due this compare match operation is target for the GTIOm[3:2] bits.

OABDTYT Bit (GTIOCnm pin output 0%/100% duty setting reflection timing setting) (n = 0 − (value of P_NUMCHALL − 1), m = A, B)

Select the reflection timing of the 0%/100% duty setting for the GTIOCnm pin in triangle-wave mode.

If the OABDTYT bit is 0, the output duty setting set in the GTUDDTYC.OADTY[1:0] and OBDTY[1:0] bits is reflected when an underflow occurs.

If the OABDTYT bit is “1”, the output duty setting set in the GTUDDTYC.OADTY[1:0] and OBDTY[1:0] bits is reflected when underflow occurs and at the top of the triangle-wave.

22.2.14 GTIOR : General PWM Timer I/O Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)

26:25	OBDF[1:0]	GTIOCnB Pin Disable Value Setting 0 0: None of the below options are specified 0 1: GTIOCnB pin is set to Hi-Z in response to controlling the output negation 1 0: GTIOCnB pin is set to 0 in response to controlling the output negation 1 1: GTIOCnB pin is set to 1 in response to controlling the output negation	R/W
27	OBEOCD*1	GTCCRB Compare Match Cycle End Output Invalidate 0: When Saw-wave PWM mode 1, validate GTIOB[3:2] setting When Saw-wave PWM mode 2, validate GTIOA[3:2] setting 1: When Saw-wave PWM mode 1, invalidate GTIOB[3:2] setting (GTIOCnB pin output is retained) When Saw-wave PWM mode 2, invalidate GTIOA[3:2] setting (GTIOCnA pin output is retained)	R/W
28	—	This bit is read as 0. The write value should be 0.	R/W
29	NFBEN	Noise Filter B Enable 0: The noise filter for the GTIOCnB pin is disabled 1: The noise filter for the GTIOCnB pin is enabled	R/W
31:30	NFCSB[1:0]	Noise Filter B Sampling Clock Select 0 0: GTCLK/1 0 1: GTCLK/4 1 0: GTCLK/16 1 1: GTCLK/64	R/W

Note 1. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTIOR sets the functions of the GTIOCnA, GTIOCnB and GTCPPOm pins. (n = 0 to 13, m = 0 to 13)

GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see Table 22.4 and Table 22.5.

CPSCIR bit (Complementary PWM Mode Initial Output at Synchronous Clear Disable)

Select the output waveform when synchronous clear occurs in complementary PWM mode.

The initial output is disabled by this function only when synchronous clear occurs in the trough section in complementary PWM mode. If a synchronous clear occurs at any other time, the initial value set by the GTIOA[4]/GTIOB[4] bits is output regardless of the CPSCIR bit setting. In addition, the initial value set by the GTIOA[4]/GTIOB[4] bits is output even when the synchronous clear occurs in the trough section immediately after the count starts.

OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

OAHLD bit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLD bit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1:

- The output is retained when counting starts or stops.

OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

OAEOCD bit (GTCCRA Compare Match Cycle End Output Invalidate)

If the cycle end matches the GTCCRA compare match timing in Saw-wave PWM mode 1 and 2, select invalid/valid of the setting of GTIOA[3:2] bits. When 1 (disabled) is set, the GTIOCnA pin holds the output when the cycle end and the GTCCRA compare match timing match.

PSYE bit (PWM Synchronous output Enable)

This bit set Enable/disable of output signal from GTCPPOm pin synchronized with the PWM cycle that toggles at the crest/trough/GTCNT counter clear of complementary PWM mode and Triangle-wave mode or the end of the cycle of the Saw-wave mode.

The initial output of the GTCPPOn output pin is Low, and the count start results in High.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see Table 22.4 and Table 22.5.

In Saw-wave PWM mode 2, only the GTIOB[1:0] bits are valid, and the GTIOCnA pin output is selected instead of the GTIOCnB pin by the GTCCRB register compare match.

OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

OBE bit (GTIOCnB Pin Output Enable)

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

OBEOCD bit (GTCCRB Compare Match Cycle End Output Invalidate)

If the cycle end matches the GTCCRB compare match timing in Saw-wave PWM mode 1 and 2, select invalid/valid of the GTIOB[3:2] bits setting in saw-wave PWM mode 1 or the GTIOA[3:2] bit setting in saw-wave PWM mode 2. When 1 (disabled) is set, the GTIOCnB pin in saw-wave PWM mode 1 or the GTIOCnA pin in saw-wave PWM mode 2 holds the output when the cycle end and the GTCCRB compare match timing match.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

Table 22.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits (Saw-wave mode, Triangle-wave mode)

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4*4	b3, b2*1 *2 *3 *4	b1, b0*2
0	0	0	0	0	Initial output is low	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	0	0	0	Initial output is high	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and means a trough (GTCNT changes from 0 to 1) for triangle-wave mode.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, if the OAEOCD and OBEOCD bits are set to 0 and the end of cycle output is enabled, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

Note 4. In Saw-wave PWM mode 2, GTIOB[4:2] bits is invalid. Since only GTIOCnA pins are output pins, set GTIOA[4] bit for initial output. Set GTIOA[3:2] bits for output at the end of a cycle.

Table 22.5 Settings of GTIOA[4:0] and GTIOB[4:0] bits (Complementary PWM mode)

GTIOA/GTIOB[4:0] bits*1 *2 *3					Function		
					Initial output, Active level	Up count Compare Match output	Down count Compare Match output
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	1	1	0	Initial output is Low. Active level is High.	Low output	High output
0	1	0	0	1		High output	Low output
1	0	1	1	0	Initial output is High. Active level is Low.	Low output	High output
1	1	0	0	1		High output	Low output

Note 1. In complementary PWM mode, the only values that can be set in the GTIOA[4:0] bits are 01001b, and 10110b. Setting other values is prohibited.

Note 2. In complementary PWM mode, the only values that can be set in the GTIOB[4:0] bits are 00110b, and 11001b. Setting other values is prohibited.

Note 3. In complementary PWM mode, setting GTIOB[4:0] bits does not use compare match of GTCCRB register. The combination of counter and register that is the target of compare match depends on the operation period of complementary PWM mode. For details, see section 22.3.3.7. Complementary PWM mode 1, 2, 3.

22.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

31	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTINTAD enables or disables interrupt requests, A/D conversion start request, and output disable requests.

SCFA bit (GTCCRA Register Compare Match/Input Capture Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRA register compare match/input capture as a clear factor for other channels.

SCFB bit (GTCCRB Register Compare Match/Input Capture Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRB register compare match/input capture as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFC bit (GTCCRC Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRC register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFD bit (GTCCRD Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRD register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFE bit (GTCCRE Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRE register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFF bit (GTCCRF Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRF register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFPO bit (Overflow Source Synchronous Clear Enable)

This bit enables or disables use of overflow as a clear factor for other channels.

In complementary PWM mode, it is valid only for the master channel.

SCFPU bit (Underflow Source Synchronous Clear Enable)

This bit enables or disables use of underflow as a clear factor for other channels.

In complementary PWM mode, it is valid only for the master channel.

ADTRAUEN bit (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter up-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRADEN bit (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter down-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBUEN bit (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter up-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBDEN bit (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter down-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable request from GPT to POEG and the group of output disable for GTIOCnA pin and GTIOCnB pin from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bit, with dead-time errors, simultaneous high output, and simultaneous low output factors following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

This bit enables or disables the output disable request by a dead time error.

The dead time error output disable request is not generated during the event count operation.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

22.2.16 GTST : General PWM Timer Status Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x3C

19	ADTRBDF	GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag 0: No GTADTRB register compare match has occurred in down-counting. 1: A GTADTRB register compare match has occurred in down-counting.	R/W*1
23:20	—	These bits are read as 0. The write value should be 0.	R/W
24	ODF	Output Disable Flag 0: No output disable request is generated 1: An output disable request is generated	R
27:25	—	These bits are read as 0. The write value should be 0.	R/W
28	DTEF	Dead Time Error Flag 0: No dead time error has occurred. 1: A dead time error has occurred.	R
29	OABHF	Same Time Output Level High Flag 0: No simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred. 1: A simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred.	R
30	OABLF	Same Time Output Level Low Flag 0: No simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred. 1: A simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred.	R
31	PCF*2	Period Count Function Finish Flag 0: No period count function finish has occurred 1: A period count function finish has occurred	R/W*1

Note 1. Only 0 can be written to this bit. Do not write 1.
When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.

Note 2. This bit is only available in GPT320 to GPT322 and GPT3210 to GPT3213.
In GPT324 to GPT329, this bit is read as 0. The write value should be 0.

The GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

When GTCCRC performs buffer operation, GTCCRC does not perform compare match.

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

When GTCCRD performs buffer operation, GTCCRD does not perform compare match.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

When GTCCRE performs buffer operation, GTCCRE does not perform compare match.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

When GTCCRF performs buffer operation, GTCCRF does not perform compare match.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

ITCNT[2:0] flag (GPTn_OVF/GPTn_UDF Interrupt Skipping Count Counter)

When the GPTn_OVF/GPTn_UDF interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter is incremented by 1 every time the GPTn_OVF/GPTn_UDF interrupt source which is selected in GTITC.IVTC[1:0] is generated.

These bits are operated independently of the extended interrupt skipping by the GTEITC register.

[Clearing conditions]

- The GPTn_OVF/GPTn_UDF interrupt skipping function is not used (the GTITC.IVTT[2:0] bits are 000b when the IVTC[1:0] bits are 00b).
- The GPTn_OVF/GPTn_UDF interrupt skipping count matches the specified count (the ITCNT[2:0] bits match the skipping count specified by the IVTT[2:0] bits).
- When the count operation is stopped

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

ADTRAUF flag (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in up-counting.

[Clearing condition]

- 0 is written to the ADTRAUF flag.

ADTRADF flag (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in down-counting.

[Clearing condition]

- 0 is written to the ADTRADF flag.

ADTRBUF flag (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in up-counting.

[Clearing condition]

- 0 is written to the ADTRBUF flag.

ADTRBDF flag (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in down-counting.

[Clearing condition]

- 0 is written to the ADTRBDF flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

This flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the count period.

This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is back within the period.

This flag can only be read from. (Writing 0 to clear the flag is not allowed.)

When the output disable request by the DTEF flag is enabled (when GTINTAD.GRPDTE bit is 1), the DTEF flag is output as the output disable request to the POEG. The GPT does not have a dead time error interrupt. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- When a change point of the waveform after the automatic setting of dead time has exceeded the count period (in the following cases).
  - Up-counting in triangle-wave mode:
    GTCCRA register – GTDVU register ≤ 0
  - Down-counting in triangle-wave mode:
    GTCCRA register – GTDVD register < 0
  - Up-counting in saw-wave one-shot pulse mode:
    GTCCRA register – GTDVU register < 0, or
    GTCCRA register + GTDVD register > GTPR register
  - Down-counting in saw-wave one-shot pulse mode:
    GTCCRA register + GTDVU register > GTPR register, or
    GTCCRA register - GTDVD register < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the count period.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

PCF flag (Period Count Function Finish Flag)

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

- 0 is written to this bit.

22.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

In saw-wave mode, no transfer. 0 1: In triangle wave or complementary PWM mode, transfer at crest. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 0: In triangle wave or complementary PWM mode, transfer at trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 1: In triangle wave or complementary PWM mode, transfer at both crest and trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing.	R/W
26	ADTDA	GTADTRA Register Double Buffer Operation 0: Single buffer operation (GTADTBRA → GTADTRA) 1: Double buffer operation (GTADTDBRA → GTADTBRA → GTADTRA)	R/W
27	—	This bit is read as 0. The write value should be 0.	R/W
29:28	ADTTB[1:0]	GTADTRB Register Buffer Transfer Timing Select 0 0: In triangle wave or complementary PWM mode, no transfer. In saw-wave mode, no transfer. 0 1: In triangle wave or complementary PWM mode, transfer at crest. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 0: In triangle wave or complementary PWM mode, transfer at trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 1: In triangle wave or complementary PWM mode, transfer at both crest and trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing.	R/W
30	ADTDB	GTADTRB Register Double Buffer Operation 0: Single buffer operation (GTADTBRB → GTADTRB) 1: Double buffer operation (GTADTDBRB → GTADTBRB → GTADTRB)	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTBER register provides settings for the buffer operation. Set the GTBER register except the BDx (x = 0 to 3) bits while the GTCNT counter is stopped.

BD0 bit (GTCCR Buffer Operation Disable)

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation in Saw-wave one-shot pulse mode or Triangle-wave PWM mode. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

In complementary PWM mode, it is valid only for the buffer operation of GTCCRC register and GTCCRE register. The buffer operation of GTCCRA registers cannot be disabled. Buffer operation of GTCCRE register and GTCCRF register is enabled/disabled by CP3DB bit of GTBER2 register. No buffer transfer to GTCCRB is performed in complementary PWM mode.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCD.

When the DBRTECm (m = A, B) bit is 1, setting the BD0 bit to 1 while the mode of operation is saw-wave one-shot pulse mode or triangle-wave PWM mode 3 results in transfer from the intermediate buffer to the GTCCRm register.

BD1 bit (GTPR Buffer Operation Disable)

The BD1 bit disables the buffer operation using GTPR, GTPDBR, and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPD.

In complementary PWM mode, the slave channel is also controlled by setting the BD1 bit of the master channel.

BD2 bit (GTADTRA/GTADTRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTADTRA, GTADTBRA, and GTADTDBRA registers together and buffer operation using the GTADTRB, GTADTBRB, and GTADTDBRB registers together.

The setting is invalid during the event count operation, and the buffer operation using the GTADTRA and GTADTRB registers is not performed.

A value for the BD2 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDAE or SBDAD bit in the GTSECR register.

BD3 bit (GTDVU/GTDVD Registers Buffer Operation Disable)

In Saw-wave PWM mode 1, Saw-wave one-shot pulse mode or Triangle-wave PWM mode, this bit disables buffer operation using the GTDVU and GTDBU registers together and buffer operation using the GTDVD and GTDBD registers together.

Even though the BD3 bit is set to 0, buffer operation in the GTDVD register is not performed if the GTDTCR.TDFER bit is set to 1. Instead, the value in the GTDVU register is set automatically.

In Saw-wave PWM mode 2 or complementary PWM mode, this bit is invalid and GTDVU and GTDVD registers don't perform buffer operation.

The setting is invalid during the event count operation, and the buffer operation using the GTDVU and GTDVD registers is not performed.

A value for the BD3 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDDE or SBDDD bit in the GTSECR register.

DBRTECm bits (GTCCRm Register Double Buffer Repeat Operation Enable) (m = A, B)

This setting enables the operation to repeat a transfer to the GTCCRm register from the intermediate buffer by cycle during the buffer transfer disable period when performing the double buffer operation using the GTCCRm register.

It is valid in saw-wave one-shot pulse mode and triangle-wave PWM mode 3.

The disabling period of buffer transfer indicates the period that buffer transfer is stopped by setting of the BD0 bit (CPU writing or simultaneous buffer operation control by the GTSECSR register) and the period for buffer transfer extended skipping (except the case for skipping by counting both crests and troughs) by the GTEITLB register.

When the DBRTECm bit is 1, writing by the CPU to the GTCCRm register sets the same value in temporary register x (x = C, E). The value of the GTCCRx (x = C, E) register is also transferred to the temporary register x (x = C, E) by forcible buffer transfer.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough), or complementary PWM mode.

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough), or complementary PWM mode.

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set the buffer operation with GTPR, GTPDBR, and GTPBR combined.

The setting is invalid in complementary PWM mode. Buffer operation unique to complementary PWM mode is performed regardless of the setting value of the PR[1:0] bits.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

The setting is invalid in complementary PWM mode.

ADTTA[1:0] bits (GTADTRA Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRA, GTADTBRA, and GTADTDBRA registers.

The setting is invalid during the event count operation.

ADTDA bit (GTADTRA Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.

The setting is invalid during the event count operation.

ADTTB[1:0] bits (GTADTRB Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRB, GTADTBRB, and GTADTDBRB registers.

The setting is invalid during the event count operation.

ADTDB bit (GTADTRB Register Double Buffer Operation)

These bits set buffer operation with the GTADTRB, GTADTBRB, and GTADTDBRB registers combined.

The setting is invalid during the event count operation.

22.2.18 GTITC : General PWM Timer Interrupt and A/D Conversion Start Request Skipping Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)

13	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
14	ADTBL	GTADTRB Register A/D Conversion Start Request Link 0: Not linked with GPTn_OVF/GPTn_UDF interrupt skipping function. 1: Linked with GPTn_OVF/GPTn_UDF interrupt skipping function.	R/W
31:15	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Saw-wave PWM mode 2 is not the target of this function.

The GTITC register sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (GPTn_OVF) and underflow interrupt (GPTn_UDF) and also sets whether to link the other interrupts and A/D conversion start requests with the GPTn_OVF/GPTn_UDF interrupt skipping function. Note the output disable request to POEG cannot be linked with the GPTn_OVF/GPTn_UDF interrupt skipping function. Additionally, if the interrupt skipping function is performed, the change in the status flag is also skipped.

The setting is invalid during the event count operation.

The setting is operated independently of the extended interrupt skipping by the GTEITC register.

ITLA bit (GTCCRA Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRA compare match/input capture interrupt (GPTn_CCMPA) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLB bit (GTCCRB Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRB compare match/input capture interrupt (GPTn_CCMPB) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLC bit (GTCCRC Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRC compare match interrupt (GPTn_CMPC) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLD bit (GTCCRD Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRD compare match interrupt (GPTn_CMPD) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLE bit (GTCCRE Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRE compare match interrupt (GPTn_CMPE) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLF bit (GTCCRF Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRF compare match interrupt (GPTn_CMPF) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

IVTC[1:0] bit (GPTn_OVF/GPTn_UDF Interrupt Skipping Function Select)

These bits set the skipping function for the GTPR compare match (GTCNT counter overflow) interrupt (GPTn_OVF) and GTCNT counter underflow interrupt (GPTn_UDF).

IVTT[2:0] bit (GPTn_OVF/GPTn_UDF Interrupt Skipping Count Select)

These bits set the skipping count for the GTPR compare match (GTCNT counter overflow) interrupt (GPTn_OVF) and GTCNT counter underflow interrupt (GPTn_UDF).

When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA Register A/D Conversion Start Request Link)

This bit specifies whether to link the GTADTRA A/D conversion start request, which is generated in response to a compare match with the GTCNT counter and the GTADTRA register, with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ADTBL bit (GTADTRB Register A/D Conversion Start Request Link)

This bit specifies whether to link the GTADTRB A/D conversion start request, which is generated in response to a compare match with the GTCNT counter and the GTADTRB register, with the GPTn_OVF/GPTn_UDF interrupt skipping function.

22.2.19 GTCNT : General PWM Timer Counter

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x48

Bit position:	31 … 0
Bit field:	GTCNT[31:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
31:0	GTCNT[31:0]	GTCNT is a 32-bit read/write counter for GPT32n (n = 0 to 13). GTCNT can only be written to after counting stops. Access in 8-bit or 16-bit units to the GTCNT counter is prohibited, and it should be accessed in 32-bit units. In saw waves or triangle waves, GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR.	R/W

22.2.20 GTCCRk : General PWM Timer Compare Capture Register k (k = A to F)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x4C (GTCCRA)
0x50 (GTCCRB)
0x54 (GTCCRC)
0x58 (GTCCRE)
0x5C (GTCCRD)
0x60 (GTCCRF)

Bit position:	31 … 0
Bit field:	GTCCRk[31:0]
Value after reset:	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTCCRk[31:0]	GTCCRk registers are read/write registers. Access in 8-bit or 16-bit units to the GTCCRk register is prohibited, and it should be accessed in 32-bit units. GTCCRA and GTCCRB are registers used for both output compare and input capture. GTCCRC and GTCCRE are compare match registers, and can also function as buffer registers for GTCCRA and GTCCRB. GTCCRD and GTCCRF are compare match registers, and can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).	R/W

22.2.21 GTPR : General PWM Timer Cycle Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x64

Bit position:	31 … 0
Bit field:	GTPR[31:0]
Value after reset:	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTPR[31:0]	GTPR is a read/write register that sets the maximum count value of GTCNT. Access in 8-bit or 16-bit units to the GTPR register is prohibited, and it should be accessed in 32-bit units. The setting is invalid in the Saw-wave PWM mode 2. For Saw waves except the Saw-wave PWM mode 2, the value of (GTPR + 1) is the cycle. For triangle waves or complementary PWM mode, the value of (GTPR value × 2) is the cycle. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.	R/W

22.2.22 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x68

Bit position: 31 … 0

Bit field: GTPBR[31:0]

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTPBR[31:0]	GTPBR is a read/write register that functions as a buffer register for GTPR. Access in 8-bit or 16-bit units to the GTPBR register is prohibited, and it should be accessed in 32-bit units. The setting is invalid in Saw-wave PWM mode 2. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.	R/W

22.2.23 GTPDBR : General PWM Timer Cycle Setting Double-Buffer Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x6C

Bit position: 31 … 0

Bit field: GTPDBR[31:0]

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTPDBR[31:0]	The buffer register for the GTPBR register (double buffer register for the GTPR register) Access in 8-bit or 16-bit units to the GTPDBR register is prohibited, and it should be accessed in 32-bit units. The setting is invalid in Saw-wave PWM mode 2. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.	R/W

22.2.24 GTADTRk : A/D Conversion Start Request Timing Register k (k = A, B)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x70 (GTADTRA)
0x7C (GTADTRB)

Bit position: 31 … 0

Bit field: GTADTRk[31:0]

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTADTRk[31:0]	Set the timing of A/D conversion start request generation Access in 8-bit or 16-bit units to the GTADTRk register is prohibited, and it should be accessed in 32-bit units. When the GTADTRk register value matches the GTCNT counter value, an A/D conversion start request is generated. In complementary PWM mode, A/D conversion start request is generated when the GTCNT counter of the master channel matches this register.	R/W

22.2.25 GTADTBRk : A/D Conversion Start Request Timing Buffer Register k (k = A, B)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x74 (GTADTBRA)
0x80 (GTADTBRB)

Bit position: 31 … 0

Bit field: GTADTBRk[31:0]

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTADTBRk[31:0]	The buffer registers for the GTADTRk register Access in 8-bit or 16-bit units to the GTADTBRk register is prohibited, and it should be accessed in 32-bit units.	R/W

22.2.26 GTADTDBRk : A/D Conversion Start Request Timing Double-Buffer Register k (k = A, B)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x78 (GTADTDBRA)
0x84 (GTADTDBRB)

Bit position: 31 … 0

Bit field: GTADTDBRk[31:0]

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTADTDBRk[31:0]	The buffer registers for the GTADTBRk register (double buffer registers for the GTADTRk register) Access in 8-bit or 16-bit units to the GTADTDBRk register is prohibited, and it should be accessed in 32-bit units.	R/W

22.2.27 GTDTCR : General PWM Timer Dead Time Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x88

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TDFER	—	—	TDBDE	TDBUE	—	—	—	TDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TDE	Negative-Phase Waveform Setting 0: GTCCRB is set without using GTDVU and GTDVD 1: GTDVU and GTDVD are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	TDBUE	GTDVU Register Buffer Operation Enable 0: GTDVU register buffer operation is disabled 1: GTDVU register buffer operation is enabled	R/W
5	TDBDE	GTDVD Register Buffer Operation Enable 0: GTDVD register buffer operation is disabled 1: GTDVD register buffer operation is enabled	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	TDFER	GTDVD Register Setting 0: GTDVU and GTDVD registers are set separately. 1: The value written to GTDVU register is automatically set to GTDVD register.	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time. GPT has a dead time control function and GTDVU and GTDVD registers are used for setting dead time value.

This register is invalid in Saw-wave PWM mode 2 or complementary PWM mode.

The setting is invalid during the event count operation.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and the GTCCRB is not automatic setting.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB, and GTST.DTEF flag becomes 1. However, if the obtained GTCCRB value exceeds the upper limit in triangle-wave PWM mode, DTEF flag becomes 0.

- Triangle waves:
  Upper limit value: GTPR − 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:
  Upper limit value: GTPR
  Lower limit value: 0.

TDBUE bit (GTDVU Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVU and GTDBU registers combined.

The timing of buffer transfer is at troughs in triangle-wave mode, and at overflows or underflows in saw-wave mode.

TDBDE bit (GTDVD Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVD and GTDBD registers combined.

The buffer transfer timing is the trough in triangle-wave mode, and at an overflow or underflow in saw-wave mode.

When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER bit (GTDVD Register Setting)

This bit sets whether or not the value written to the GTDVU register is also set to the GTDVD register automatically.

22.2.28 GTDVk : General PWM Timer Dead Time Value Register k (k = U, D)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x8C (GTDVU)
0x90 (GTDVD)

Bit position:	31 … 0
Bit field:	GTDVk[31:0]
Value after reset:	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTDVk[31:0]	GTDVk is a read/write register that sets the dead time for generating PWM waveforms with dead time. Access in 8-bit or 16-bit units to the GTDVk register is prohibited, and it should be accessed in 32-bit units. The setting is invalid in Saw-wave PWM mode 2. In complementary PWM mode, the GTDVD register is invalid and the GTDVU register is used as the dead time value during both up-counting and down-counting. No matter which GTDVU register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time. In Triangle-waves, The GTDVU register is used for up-counting. The GTDVD register is used for down-counting. In the case of a saw-waves, the GTDVU register controls the front dead time and the GTDVD register controls the rear dead time, regardless of whether the count is up or down. Setting a GTDVk value greater than or equal to GTPR is prohibited. In complementary PWM mode, set the GTDVU register to meet the following conditions: ● GTDVU > 0 ● GTDVU < GTPR/2 ● GTDVU + GTPR ≤ 0xffffffff When using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When GTDVk is used, writing to GTCCRB is prohibited. Other than complementary PWM mode, when this register is set to 0, waveforms without dead time are output. When the GTDTCR.TDFER bit is 1, the writing to the GTDVD register has no effect. At this time, when the GTDVD register is read, the value for the GTDVU register is read. While GPT is running, changing the GTDVk values is prohibited. To change GTDVk to a new value, stop the GPT with the CST bit in the GTCR register.	R/W

22.2.29 GTDBk: General PWM Timer Dead Time Buffer Register k (k = U, D)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x94 (GTDBU)
0x98 (GTDBD)

Bit position:	31–0
Bit field:	GTDBk[31:0]
Value after reset:	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	GTDBk[31:0]	The buffer register for the GTDVk register Access in 8-bit or 16-bit units to the GTDBk register is prohibited, and it should be accessed in 32-bit units.	R/W

22.2.30 GTSOS : General PWM Timer Output Protection Function Status Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0x9C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SOS[1:0]	Output Protection Function Status 0 0: Normal operation 0 1: Protected state (GTCCRA = 0 is set during transfer at trough or crest) 1 0: Protected state (GTCCRA ≥ GTPR is set during transfer at trough) 1 1: Protected state (GTCCRA ≥ GTPR is set during transfer at crest)	R
7:2	—	These bits are read as 0.	R
9:8	—	The read value is undefined.	R
31:10	—	These bits are read as 0.	R

The GTSOS register is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

SOS[1:0] bit (Output Protection Function Status)

This bit indicates the status of the output protection function in triangle-wave PWM mode. For details of the output protection function, see section 22.8.4. Output Protection Function for GTIOCnm Pin Output (n = 0 to 13; m = A, B).

22.2.31 GTSOTR : General PWM Timer Output Protection Function Temporary Release Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xA0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SOTR	Output Protection Function Temporary Release 0: Protected state is not released 1: Protected state is released	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The GTSOTR register temporarily releases the protected state of GTIOCnB pin output (n = 0 to 13) when output protection has been set.

The protected state can be released only for the case of GTSOS.SOS[1:0] bits are 10b (protected state in which GTCCRA register ≥ GTPR register has occurred during transfer at trough). The protected state cannot be released for any other case.

SOTR bit (Output Protection Function Temporary Release)

This bit sets whether to temporarily release the protected state of the GTIOCnB pin output in an output protected state.

After the SOTR bit has been set to 1, the output protection function is canceled from the first trough. After the SOTR bit has been set to 0, output protection is resumed from the first trough.

22.2.32 GTADSMR : General PWM Timer A/D Conversion Start Request Signal Monitoring Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xA4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	ADSMEN1	—	—	—	—	—	—	ADSMS1[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ADSMEN0	—	—	—	—	—	—	ADSMS0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ADSMS0[1:0]	A/D Conversion Start Request Signal Monitor 0 Selection 0 0: A/D conversion start request signal generated by the GTADTRA register during up-counting. 0 1: A/D conversion start request signal generated by the GTADTRA register during down-counting. 1 0: A/D conversion start request signal generated by the GTADTRB register during up-counting. 1 1: A/D conversion start request signal generated by the GTADTRB register during down-counting.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	ADSMEN0	A/D Conversion Start Request Signal Monitor 0 Output Enabling 0: Output of A/D conversion start request signal monitor 0 is disabled. 1: Output of A/D conversion start request signal monitor 0 is enabled.	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
17:16	ADSMS1[1:0]	A/D Conversion Start Request Signal Monitor 1 Selection 0 0: A/D conversion start request signal generated by the GTADTRA register during up-counting. 0 1: A/D conversion start request signal generated by the GTADTRA register during down-counting. 1 0: A/D conversion start request signal generated by the GTADTRB register during up-counting. 1 1: A/D conversion start request signal generated by the GTADTRB register during down-counting.	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
24	ADSMEN1	A/D Conversion Start Request Signal Monitor 1 Output Enabling 0: Output of A/D conversion start request signal monitor 1 is disabled. 1: Output of A/D conversion start request signal monitor 1 is enabled.	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

The GTADSMR register is used to control monitors for the A/D conversion start request signal that is synchronized with a frame period.

ADSMSk[1:0] bits (A/D Conversion Start Request Signal Monitor k Selection) (k = 0, 1)

These bits are used to select A/D conversion start request signal synchronized with a frame period which is monitored by the GTASMk pin.

In triangle-wave PWM mode or complementary PWM mode, the following settings are prohibited:

- Set ADSMSk[1:0] bit to 00b (A/D conversion start request during up-counting) when GTADTRA = 0
- Set ADSMSk[1:0] bit to 10b (A/D conversion start request during up-counting) when GTADTRB = 0
- Set ADSMSk[1:0] bit to 01b (A/D conversion start request during down-counting) when GTADTRA = GTPR
- Set ADSMSk[1:0] bit to 11b (A/D conversion start request during down-counting) when GTADTRB = GTPR

ADSMENk bit (A/D Conversion Start Request Signal Monitor k Output Enabling) (k = 0, 1)

This bit enables or disables the monitor output to the GTADSMk pin.

When the output is disabled, the GTADSMk pin goes to the low level.

When the bit is 1, the signal on the GTADSMk pin goes to the high level on assertion of the signal to request to the start of A/D conversion selected by the ADSMSk[1:0] bits and returns to the low level at the end of the current cycle of the timer for the channel that generated the given signal to request the start of A/D conversion. When the counter stops, the value when the counter stopped is retained for output. Set the ADSMENk bit to 0 to output the low level.

When a signal to request the start of A/D conversion is generated at the end of a timer period, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next period.

When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT.

22.2.33 GTEITC : General PWM Timer Extended Interrupt Skipping Counter Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xA8

19:18	—	These bits are read as 0. The write value should be 0.	R/W
23:20	EIVTT2[3:0]	Extended Interrupt Skipping 2 Skipping Count Setting Skipping count for the extended interrupt skipping 2	R/W
27:24	EITCNT2IV[3:0]	Extended Interrupt Skipping Counter 2 Initial Value	R/W*1
31:28	EITCNT2[3:0]	Extended Interrupt Skipping Counter 2	R

Note 1. The EITCNT2IV[3:0] bits are only writable when the value other than 00b is written to the EIVTC2[1:0] bits that have been 00b.

GTEITC register sets the extended interrupt skipping function to skip the interrupts, A/D conversion start requests, and buffer transfers independently by counting at overflow and underflow in the GTCNT counter.

The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.

The setting is invalid during the event count operation.

Access in 8-bit units to GTEITC is prohibited.

EIVTCk[1:0] bits (Extended Interrupt Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the extended interrupt skipping counter k.

Setting only with these bits does not skip the interrupts, A/D conversion start requests, and buffer transfers. Skipping function for the interrupt, A/D conversion start request, and buffer transfer, all of which are a target of skipping, is set individually with the GTEITLI1, GTEITLI2, and GTEITLB registers.

EIVTTk[3:0] bits (Extended Interrupt Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the EIVTCk[1:0] bits to the next generation of the count source.

When the count source is generated while the EIVTTk[3:0] bits match the EITCNTk[3:0] bits, the EITCNTk[3:0] bits are cleared.

When these bits are 0x0, skipping is not performed.

EITCNT1[3:0] bits (Extended Interrupt Skipping Counter 1)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the EIVTT1[3:0] bits.

Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.

[Clearing conditions]

- 00b is written to the EIVTC1[1:0] bits.
- 0x0 is written to the EIVTT1[3:0] bits.
- A count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated when the extended interrupt skipping 1 skipping count set by the EIVTT1[3:0] bits match the value for the EITCNT1[3:0]

EITCNT2IV[3:0] bit (Extended Interrupt Skipping Counter 2 Initial Value)

These bits are the value of the initial value for the extended interrupt skipping counter 2.

Writing to the EITCNT2IV[3:0] is performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the EITCNT2[3:0] bits are set not to count (EIVTC2[1:0] bits are 00b). When the EITCNT2IV[3:0] bits are written, the value written to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits simultaneously.

The writing to the EITCNT2IV[3:0] bits are ignored when the EITCNT2[3:0] bits are set to count (EIVTC2[1:0] bits are other than 00b) or perform the setting of not to count (00b is written to the EIVTC2[1:0] bits).

The EITCNT2IV[3:0] bits are not reset by the writing 00b to the EIVTC2[1:0] bits.

EITCNT2[3:0] bit (Extended Interrupt Skipping Counter 2)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the EIVTT2[3:0] bits.

Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.

Setting of the initial value for the EITCNT2[3:0] bits are performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the extended interrupt skipping counter 2 is set as not to count (EIVTC2[1:0] bits are 00b).

When the initial value is set, the written value to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits as the initial value.

[Clearing condition]

- 00b is written to the EIVTC2[1:0] bits.
- 0x0 is written to the EIVTT2[3:0] bits.
- The value other than 00b is written to the EIVTC2[1:0] bits and the 0x0 is written to the EITCNT2IV[3:0] bits simultaneously while 00b is set to the EIVTC2[1:0] bits.
- A count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the EIVTT2[3:0] bits match the value for the EITCNT2[3:0].

22.2.34 GTEITLI1 : General PWM Timer Extended Interrupt Skipping Setting Register 1

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

31	—	This bit is read as 0. The write value should be 0.	R/W

The GTEITLI1 register sets the extended skipping function for interrupts such as compare match/input capture, overflow and underflow.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.

The setting is invalid during the event count operation.

EITLm[2:0] bits (GTCCRm Register Compare Match/Input Capture Interrupt Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip the compare match/input capture interrupt (GPTn_CCMPm) in the GTCCRm register. See Table 22.6.

EITLx[2:0] bits (GTCCRx Register Compare Match Interrupt Extended Skipping Function Select) (x = C, D, E, F)

These bits select the extended interrupt skipping function to skip the compare match interrupt (GPTn_CMPx) in the GTCCRx register. See Table 22.6.

EITLV[2:0] bit (Overflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at overflow(GPTn_OVF). See Table 22.6.

EITLU[2:0] bit (Underflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at underflow (GPTn_UDF). See Table 22.6.

Table 22.6 Setting the Function select for the GTEITLI1

EITLy[2:0]	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An interrupt is output in the period of the EITCNT1[3:0] bits = 0)
0 1 0	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An interrupt is output in the period of the EITCNT2[3:0] bits = 0)
0 1 1	Skip an interrupt in the period the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An interrupt is output in the period of the EITCNT1[3:0] bits = 0 and the EITCNT2[3:0] bits = 0)
1 0 0	Setting prohibited
1 0 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An interrupt is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits)
1 1 0	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An interrupt is output in the period of the EITCNT2[3:0] bits = the EIVTT2[3:0] bits)
1 1 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An interrupt is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits and the EITCNT2 [3:0] bits = the EIVTT2[3:0] bits)

Note:
- y = A, B, C, D, E, F, V, U
- When the intended skipping counter is set as not to count (the EIVTCk[1:0] bits = 00b or the EIVTTk[3:0] bits = 0x0), skipping is not performed.(k = 1, 2)
- When the EITLy[2:0] bits are set to 011b or 111b, and when one of the skipping counter 1 or 2 is set as not to count, skipping is not performed.

22.2.35 GTEITLI2 : General PWM Timer Extended Interrupt Skipping Setting Register 2

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xB0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	EADTBL[2:0]			—	EADTAL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	EADTAL[2:0]	GTADTRA Register A/D Conversion Start Request Extended Skipping Function Select See Table 22.7.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	EADTBL[2:0]	GTADTRB Register A/D Conversion Start Request Extended Skipping Function Select See Table 22.7.	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

The GTEITLI2 register sets the extended skipping function for A/D conversion start requests.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.

The setting is invalid during the event count operation.

EADTmL[2:0] bits (GTADTRm Register A/D Conversion Start Request Extended Skipping Function Select) (m = A, B)

These bits select the extended skipping function to skip A/D conversion start requests for the compare match in the GTADTRm register. See Table 22.7.

Table 22.7 Setting the Function Select for the GTEITLI2 Register

EADTmL[2:0]	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = 0)
0 1 0	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An A/D conversion start request is output in the period of the EITCNT2[3:0] bits = 0)
0 1 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = 0 and the EITCNT2[3:0] bits = 0)
1 0 0	Setting prohibited
1 0 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits)
1 1 0	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of the EITCNT2[3:0] bits = the EIVTT2[3:0] bits)
1 1 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits and the EITCNT2[3:0] bits = the EIVTT2[3:0] bits)

Note:
- m = A, B
- When the intended skipping counter is set as not to count (the EIVTCk[1:0] bits = 00b or the EIVTTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
- When the EADTmL[2:0] bits are set to 011b or 111b, and when one of the skipping counter 1 or 2 is set as not to count, skipping is not performed.

22.2.36 GTEITLB : General PWM Timer Extended Buffer Transfer Skipping Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xB4

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	EBTLPR[2:0]			—	EBTLCB[2:0]			—	EBTLCA[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	EBTLCA[2:0]	GTCCRA Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	EBTLCB[2:0]	GTCCRB Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
10:8	EBTLPR[2:0]	GTPR Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W*1
15:11	—	These bits are read as 0. The write value should be 0.	R/W
18:16	EBTLADA[2:0]	GTADTRA Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W
19	—	This bit is read as 0. The write value should be 0.	R/W
22:20	EBTLADB[2:0]	GTADTRB Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W
23	—	This bit is read as 0. The write value should be 0.	R/W
26:24	EBTLDVU[2:0]	GTDVU Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W
27	—	This bit is read as 0. The write value should be 0.	R/W
30:28	EBTLDVD[2:0]	GTDVD Register Buffer Transfer Extended Skipping Function Select See Table 22.8.	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTEITLB register sets the extended skipping function for buffer transfers.

Setting only this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently of the interrupt skipping by the GTITC register.

The buffer transfer from the GTOLBR register to the GTIOR.GTIOA[4:0], GTIOB[4:0] bits is not target of the extended buffer transfer skipping function.

The setting is invalid during the event count operation.

EBTLCA[2:0] bit (GTCCRA Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRA, GTCCRC, GTCCRD registers and a temporary register A) in the GTCCRA register. See Table 22.8.

An extended skipping of buffer transfers in the GTCCRA register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRA register should be performed in the condition of not performing the extended buffer transfer skipping.

The buffer transfer between the GTCCRC, GTCCRE, and GTCCRA in complementary PWM mode cannot be skipped.

EBTLCB[2:0] bit (GTCCRB Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRB, GTCCRE, GTCCRF registers and a temporary register B) in the GTCCRB register. See Table 22.8.

An extended skipping of buffer transfers in the GTCCRB register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRB register should be performed in the condition of not performing the extended buffer transfer skipping.

EBTLPR[2:0] bit (GTPR Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTPR, GTPBR, and GTPDBR registers) in the GTPR register. See Table 22.8.

If the buffer transfer of GTPR is skipped in complementary PWM mode, GTEITC setting of slave channel should be matched to the master channel so that the buffer transfer timing of the slave channel matches the master channel.

EBTLADm[2:0] bits (GTADTRm Register Buffer Transfer Extended Skipping Function Select) (m = A, B)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTADTRm, GTADTBRm, and GTADTDBRm registers) in the GTADTRm register. See Table 22.8.

EBTLDVm[2:0] bits (GTDVm Register Buffer Transfer Extended Skipping Function Select) (m = U, D)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers between the GTDVm and GTDBm registers) in the GTDVm register. See Table 22.8.

Table 22.8 Setting the Function Select for the GTEITLB Register

EBTLx[2:0] bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than 0 (Buffer is transferred in the period of the EITCNT1[3:0] bits = 0)
0 1 0	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than 0 (Buffer is transferred in the period of the EITCNT2[3:0] bits = 0)
0 1 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (Buffer is transferred in the period of the EITCNT1[3:0] bits = 0 and the EITCNT2[3:0] bits = 0)
1 0 0	Setting prohibited
1 0 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (Buffer is transferred in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits)
1 1 0	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (Buffer is transferred in the period of the EITCNT2[3:0] bits = the EIVTT2[3:0] bits)
1 1 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (Buffer is transferred in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits and the EITCNT2[3:0] bits = the EIVTT2[3:0] bits)

Note:
- x = CA, CB, PR, ADA, ADB, DVU, DVD
- When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
- When the EBTLx[2:0] bits are set to 011b or 111b, and when one of the skipping counter 1 or 2 is set as not to count, skipping is not performed.

22.2.37 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)

Bit	Symbol	Function	R/W
25:20	ICLFSELD[5:0]	Inter Channel Signal D Select*1*3 0x00: GTIOC0A 0x01: GTIOC0B 0x02: GTIOC1A 0x03: GTIOC1B 0x04: GTIOC2A 0x05: GTIOC2B 0x06: GTIOC3A 0x07: GTIOC3B ⋮ ⋮ 0x3E: GTIOC31A 0x3F: GTIOC31B	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The signal before performing output disable control is selected.
Note 2. When channel's own GTIOCnA is selected, C is treated as "1".
Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

ICLFm[2:0] bit (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with GTCLK. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 GTCLK is selected, the output enable signal is also delayed with 1 GTCLK and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as "1".

ICLFSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

22.2.38 GTPC : General PWM Timer Period Count Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 3, 10 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xBC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	PCNT[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ASTP	—	—	—	—	—	—	—	PCEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PCEN	Period Count Function Enable 0: Period count function is disabled 1: Period count function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	ASTP	Automatic Stop Function Enable 0: Automatic stop function is disabled 1: Automatic stop function is enabled	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
27:16	PCNT[11:0]	Period Counter Counter for the number of period	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

The GTPC register counts the number of period.

PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bis is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

PCNT[11:0] bit (Period Counter)

This counter counts the number of period.

When the PCEN bis is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In saw-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode or complementary PWM mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

22.2.39 GTADCMSC : General PWM Timer A/D Conversion Start Request Compare Match Skipping Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

19:18	—	These bits are read as 0. The write value should be 0.	R/W
23:20	ADCMST2[3:0]	A/D Conversion Start Request Compare Match Skipping 2 Skipping Count Setting Skipping count for the A/D conversion start request compare match skipping 2	R/W
27:24	ADCMSCNT2IV[3:0]	A/D Conversion Start Request Compare Match Skipping Counter 2 Initial Value	R/W*2
31:28	ADCMSCNT2[3:0]	A/D Conversion Start Request Compare Match Skipping Counter 2	R

Note 1. Writing is possible only when the ADCMSC1[1:0] bits are 00b and a value other than 00b is written to the ADCMSC1[1:0] bits.
Note 2. Writing is possible only when the ADCMSC2[1:0] bits are 00b and a value other than 00b is written to the ADCMSC2[1:0] bits.

The GTADCMSC register is a register that controls the skipping counter of the A/D conversion start request compare match skipping function that counts compare matches of GTADTRA register and GTADTRB register, and skipping A/D conversion start request and buffer transfer independently.

This register setting is operated independently of the interrupt skipping by the GTITC register or GTEITC register.

Access in 8-bit units to GTADCMSC is prohibited.

ADCMSCk[1:0] bits (A/D Conversion Start Request Compare Match Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the A/D conversion start request compare match skipping counter k.

Setting only with these bits does not skip the A/D conversion start requests and buffer transfers. Skipping function for the A/D conversion start request and buffer transfer which are a target of skipping is set individually with the GTADCMSS register.

ADCMSTk[3:0] bits (A/D Conversion Start Request Compare Match Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the ADCMSCk[1:0] bits to the next generation of the count source.

When the count source is generated while the ADCMSTk[3:0] bits match the ADCMSCNTk[3:0] bits, the ADCMSCNTk[3:0] bits are cleared.

When these bits are 0x0, skipping is not performed.

ADCMSCNTkIV[3:0] bits (A/D Conversion Start Request Compare Match Skipping Counter k Initial Value) (k = 1, 2)

These bits are the value of the initial value for the A/D conversion start request compare match skipping counter k.

Writing to the ADCMSCNTkIV[3:0] is performed only when the writing value to the ADCMSCk[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the ADCMSCNTk[3:0] bits are set not to count (ADCMSCk[1:0] bits are 00b). When the ADCMSCNTkIV[3:0] bits are written, the value written to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits simultaneously.

The writing to the ADCMSCNTkIV[3:0] bits are ignored when the ADCMSCNTk[3:0] bits are set to count (ADCMSCk[1:0] bits are other than 00b) or perform the setting of not to count (00b is written to the ADCMSCk[1:0] bits).

The ADCMSCNTkIV[3:0] bits are not reset by the writing 00b to the ADCMSCk[1:0] bits.

ADCMSCNTk[3:0] bits (A/D Conversion Start Request Compare Match Skipping Counter k) (k=1,2)

The counting is incremented by 1 every time a count source selected by the ADCMSCk[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the ADCMSTk[3:0] bits.

Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.

Setting of the initial value for the ADCMSCNTk[3:0] bits are performed only when the writing value to the ADCMSCk[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the A/D conversion start request compare match skipping counter k is set as not to count (ADCMSCk[1:0] bits are 00b).

When the initial value is set, the written value to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits as the initial value.

[Clearing condition]

- 00b is written to the ADCMSCk[1:0] bits.
- 0x0 is written to the ADCMSTk[3:0] bits.
- The value other than 00b is written to the ADCMSCk[1:0] bits and the 0x0 is written to the ADCMSCNTkIV[3:0] bits simultaneously while 00b is set to the ADCMSCk[1:0] bits.
- A count source selected by the ADCMSCk[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the ADCMSTk[3:0] bits match the value for the ADCMSCNTk[3:0].

22.2.40 GTADCMSS : General PWM Timer A/D Conversion Start Request Compare Match Skipping Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)

The GTADCMSS register is a register that selects the A/D conversion start request compare match skipping function or the GTADTRm (m = A, B) register buffer transfer by A/D conversion start request compare match skipping function.

Setting only with this register does not perform skipping. The GTADCMSC register should be set so that a corresponding A/D conversion start request compare match skipping counter operates the counting.

This register setting is operated independently of the interrupt skipping by the GTITC register or GTEITC register.

ADCMSmL[2:0] bits (GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select) (m = A, B)

These bits select the A/D conversion start request compare match skipping function of the GTADTRm (m = A, B) register.Table 22.9.

ADCMBSm[2:0] bits (GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select) (m = A, B)

These bits select the GTADTRm (m = A, B) register buffer transfer by A/D conversion start request compare match skipping function which skips the buffer transfer of GTADTRm (m = A, B) register (Transfer between GTADTRm register, GTADTBRm register, GTADTDBRm register). See Table 22.10.

Table 22.9 Setting of the GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select bit (m = A, B)

ADCMSmL[2:0]	Function
0 0 0	Do not perform an A/D conversion start request compare match skipping
0 0 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0 (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0)
0 1 0	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0 (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = 0)
0 1 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0 (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0 and the ADCMSCNT2[3:0] bits = 0)
1 0 0	Setting prohibited
1 0 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits)
1 1 0	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)
1 1 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)

Note:
- m = A, B
- When the intended skipping counter is set as not to count (the ADCMSCk[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
- When the ADCMSmL[2:0] bits are set to 011b or 111b, and when one of the skipping counters is set as not to count, skipping is not performed.

Table 22.10 Setting of the GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select bit (m = A, B)

ADCMBSm[2:0]	Function
0 0 0	Do not perform an GTADTRm register buffer transfer by A/D conversion start request compare match skipping
0 0 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0)
0 1 0	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = 0)
0 1 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0 and the ADCMSCNT2[3:0] bits = 0)
1 0 0	Setting prohibited
1 0 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits)
1 1 0	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)
1 1 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (A Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)

Note:
- m = A, B
- When the intended skipping counter is set as not to count (the ADCMSCk[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
- When the ADCMSmL[2:0] bits are set to 011b or 111b, and when one of the skipping counters is set as not to count, skipping is not performed.

31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSECSR register selects an intended channel n (n = 0 to 13) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is 0.

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 13)

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

22.2.42 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xD4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	SSCD	SPCD	—	—	—	—	—	—	SSCE	SPCE

23:18	—	These bits are read as 0. The write value should be 0.	R/W
24	SPCD	Period Count Function Simultaneous Disable*2 0: Disable simultaneous disabling period count function 1: Disable period count function simultaneously	R/W

Bit	Symbol	Function	R/W
25	SSCD	Synchronous Set/Clear Simultaneous Disable*3 0: Disable simultaneous disabling synchronous set/clear 1: Disable synchronous set/clear simultaneously	R/W*1
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.
Note 2. This bit is only available in GPT320 to GPT323 and GPT3210 to GPT3213.
In GPT324 to GPT329, this bit is read as 0. The write value should be 0.
Note 3. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is 0.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPDBR, and GTPBR registers are enabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAE bit (GTADTR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are enabled.

Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDDE bit (GTDV Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are enabled.

Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SBDCD bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPD bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPDBR, and GTPBR registers are disabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAD bit (GTADTR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are disabled.

Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDDD bit (GTDV Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are disabled.

Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SPCE bit (Period Count Function Simultaneous Enable)

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCE bit (Synchronous Set/Clear Simultaneous Enable)

When 1 is written to this bit, 1 is simultaneously set to GTCR.SSCEN bit in the channels set to 1 by the GTSECSR register and Enable synchronous set/clear function.

Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

SPCD bit (Period Count Function Simultaneous Disable)

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCD bit (Synchronous Set/Clear Simultaneous Disable)

When 1 is written to this bit, 0 is simultaneously set to GTCR.SSCEN bit in the channels set to 1 by the GTSECSR register and Disable synchronous set/clear function.

Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

22.2.43 GTBER2 : General PWM Timer Buffer Enable Register 2

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)

31:30	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323 and GPT3210 to GPT3213, this bit is read as 0. The write value should be 0.

The GTBER2 register makes settings for buffer operation.

Set the CP3DB bit and OLTTm[1:0] (m = A, B) bits when the GTCNT counter is stopped.

CCTCA bit (Counter Clear Source GTCCRA Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTCCRA, GTCCRC, and GTCCRD registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTCA bit is 0, buffer transfer is not performed by counter clear.

If there is a conflict with the CMTCA bit setting, the CCTCA bit setting has priority.

The setting is invalid during the event count operation.

CCTCB bit (Counter Clear Source GTCCRB Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTCCRB, GTCCRE, and GTCCRF registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTCB bit is 0, buffer transfer is not performed by counter clear.

If there is a conflict with the CMTCB bit setting, the CCTCB bit setting has priority.

The setting is invalid during the event count operation.

CCTPR bit (Counter Clear Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTPR, GTPBR, and GTPDBR registers together.

This bit is effective when the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTPR bit is 0, buffer transfer is not performed by counter clear.

The setting is invalid during the event count operation.

CCTADm bit (Counter Clear Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by counter clear using the GTADTRm, GTADTBRm and GTADTDBRm registers together.

This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the ADTTm[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTADm bit is 0, buffer transfer is not performed by counter clear.

If there is a conflict with the CMTADm bit setting, the CCTADm bit setting has priority.

The setting is invalid during the event count operation.

CCTDV bit (Counter Clear Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTDVU and GTDBU or GTDVD and GTDBD registers together.

This bit is effective when the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTDV bit is 0, buffer transfer is not performed by counter clear.

The setting is invalid during the event count operation.

CMTCA[1:0] bit (Compare Match Source GTCCRA Register Buffer Transfer Enable)

This bit enables buffer transfer by compare match of GTCCRA using the GTCCRA, GTCCRC, and GTCCRD registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

If there is a conflict with the CCTCA bit setting, the CCTCA bit setting has priority.

The setting is invalid during the event count operation.

CMTCB[1:0] bit (Compare Match Source GTCCRB Register Buffer Transfer Enable)

This bit enables buffer transfer by compare match of GTCCRB using the GTCCRB, GTCCRE, and GTCCRF registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

If there is a conflict with the CCTCB bit setting, the CCTCB bit setting has priority.

The setting is invalid during the event count operation.

CMTADm bit (Compare Match Source GTADTRm Register Buffer Transfer Enable) (m = A, B)

This bit enables buffer transfer by compare match of GTADTRm using the GTADTRm, GTADTBRm and GTADTDBRm registers together.

This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the ADTTm[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

If there is a conflict with the CCTADm bit setting, the CCTADm bit setting has priority.

The setting is invalid during the event count operation.

CPTCA bit (Overflow/Underflow Source GTCCRA Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTCCRA, GTCCRC, and GTCCRD registers together.

This bit is effective when the CCTCA bit is 0 (GTCCRA register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTCB bit (Overflow/Underflow Source GTCCRB Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTCCRB, GTCCRE and GTCCRF registers together.

This bit is effective when the CCTCB bit is 0 (GTCCRB register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTPR bit (Overflow/Underflow Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTPR, GTPBR, and GTPDBR registers together.

This bit is effective when the CCTPR bit is 0 (GTPR register buffer transfer by counter clear is enabled), the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTADm bit (Overflow/Underflow Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTADTRm, GTADTBRm and GTADTDBRm registers together.

This bit is effective when the CCTADm bit is 0 (GTADTRm register buffer transfer by counter clear is enabled), the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the ADTTm[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTDV bit (Overflow/Underflow Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTDVU and GTDBU or GTDVD and GTDBD registers together.

This bit is effective when the CCTDV bit is 0 (GTDVU/GTDVD register buffer transfer by counter clear is enabled), the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CP3DB bit (Complementary PWM mode 3,4 Double Buffer select)

This bit enables buffer transfer using the GTCCRA, GTCCRE and GTCCRF registers together in complementary PWM mode 3,4.

CPBTD bit (Complementary PWM mode Buffer Transfer Disable)

This bit disables buffer transfer from temporary register (temporary register A and temporary register P) to the GTCCRC and GTPBR registers during timer counting in complementary PWM mode 1, 2 and 3. When CP3DB bit is 1, the buffer transfer from temporary register B to GTCCRE register is also disabled. The setting is invalid in complementary PWM mode 4.

OLTTm[1:0] bits (GTIOCnA Output Level Buffer Transfer Timing Select) (m = A, B)

This bit set the timing of buffer transfer from GTOLBR.GTIOmB[4:0] bits to GTIOR.GTIOm[4:0] bits.

22.2.44 GTOLBR : General PWM Timer Output Level Buffer Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 13)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 13)

Offset address: 0xE4

20:16	GTIOBB[4:0]	GTIOB buffer bits	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

The GTOLBR register is a buffer register for the GTIOR.GTIOA[4:0] bits and GTIOR.GTIOB[4:0] bits.

GTIOmB[4:0] bits (GTIOm buffer bits) (m = A, B)

These bits are buffer bits of GTIOR.GTIOm[4:0] bits.

These bits are transferred to the GTIOR.GTIOm[4:0] bits at the transfer timing selected by the GTBER2.OLTTm[1:0] (m = A, B) bits.

22.2.45 GTICCR : General PWM Timer Inter Channel Cooperation Input Capture Control Register

29:25	—	These bits are read as 0. The write value should be 0.	R/W
31:30	ICBGRP[1:0]	GTCCRB Input Capture Group Select 0 0: Select group A 0 1: Select group B 1 0: Select group C 1 1: Select group D	R/W

The GTICCR register is a register that controls input capture by inter channel cooperation.

For channels that perform input capture by inter channel cooperation, the forwarding enable bit of the input capture source corresponding to the GTCCRA register or GTCCRB register where the input capture occurs is invalid.

ICAFm bit (Forwarding GTCCRm register Compare Match/Input Capture to Other Channel GTCCRA Input Capture Source Enable) (m = A, B)

Enables/disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRA register.

ICAFx bit (Forwarding GTCCRx register Compare Match to Other Channel GTCCRA Input Capture Source Enable) (x = C, D, E, F)

Enables/disables the use of compare match of GTCCRx register as the input capture source of other channel's GTCCRA register.

ICAFPO bit (Forwarding Overflow to Other Channel GTCCRA Input Capture Source Enable)

Enable/disable to use the overflow of saw-waves, the crest of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICAFPU bit (Forwarding Underflow to Other Channel GTCCRA Input Capture Source Enable)

Enable/disable to use the underflow of saw-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICACLK bit (Forwarding Count Clock to Other Channel GTCCRA Input Capture Source Enable)

Enable/disable to use count clock as the input capture source of other channel's GTCCRA register.

ICAGRP[1:0] bit (GTCCRA Input Capture Group Select)

Select the group of input capture by inter channel cooperation for GTCCRA register.

For channels that accept input capture of the GTCCRA register due to input capture sources from other channels, set the GTICASR.ASOC bit to 1 and select the group of inter channel cooperation with the ICAGRP[1:0] bits.

ICBFm bit (Forwarding GTCCRm register Compare Match/Input Capture to Other Channel GTCCRB Input Capture Source Enable) (m = A, B)

Enables/disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRB register.

ICBFx bit (Forwarding GTCCRx register Compare Match to Other Channel GTCCRB Input Capture Source Enable) (x = C, D, E, F)

Enables/disables the use of compare match of GTCCRx register as the input capture source of other channel's GTCCRB register.

ICBFPO bit (Forwarding Overflow to Other Channel GTCCRB Input Capture Source Enable)

Enable/disable to use the overflow of saw-waves, the crest of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRB register.

ICBFPU bit (Forwarding Underflow to Other Channel GTCCRB Input Capture Source Enable)

Enable/disable to use the underflow of saw-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRB register.

ICBCLK bit (Forwarding Count Clock to Other Channel GTCCRB Input Capture Source Enable)

Enable/disable to use count clock as the input capture source of other channel's GTCCRB register.

ICBGRP[1:0] bit (GTCCRB Input Capture Group Select)

Select the group of input capture by inter channel cooperation for GTCCRB register.

For channels that accept input capture of the GTCCRB register due to input capture sources from other channels, set the GTICBSR.BSOC bit to 1 and select the group of inter channel cooperation with the ICBGRP[1:0] bits.

22.2.46 OPSCR : Output Phase Switching Control Register

Base address: GPT_OPS = 0x4032_3F00
GPT_OPS_NS = 0x5032_3F00

28:27	—	These bits are read as 0. The write value should be 0.	R/W
29	NFEN	External Input Noise Filter Enable 0: Do not use a noise filter on the external input 1: Use a noise filter on the external input	R/W
31:30	NFCS[1:0]	External Input Noise Filter Clock Selection Noise filter sampling clock setting of the external input. 0 0: GTCLK/1 0 1: GTCLK/4 1 0: GTCLK/16 1 1: GTCLK/64	R/W

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

UF , VF , WF bits (Input Phase Soft Setting)

The UF , VF , WF bits set the input phase from the software settings. When OPSCR.FB bit is 1, these bits are valid. The set value of the UF /VF /WF takes the place of the U/V/W external input.

U, V, W bits (Input Phase Monitor)

When the OPSCR.FB bit is 0, external inputs that are synchronized by GTCLK are monitored by these bits. When the OPSCR.FB bit is 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF , OPSCR.VF , and OPSCR.WF bits.

EN bit (Output Phase Enable)

The EN bit controls the output enable signal of output phase (positive phase/negative phase).

When the OPSCR.EN bit is 1, the signal waveform is output.

When the OPSCR.EN bit is 0, first set OPSCR.FB, OPSCR.UF /VF /WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP[1:0], OPSCR.GODF, OPSCR.NFEN, OPSCR.NFCS. Then, set the EN bit to 1. The EN bit should be set when output disable request does not occur from POEG. Also when OPSCR.GODF is 1 and the signal value selected in the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0. Even if 1 is written by software, the EN bit remains at 0.

For the return, after clearing the Output Disable Request by software, set the EN bit to 1.

Priority order of the EN bit is as follows (when the conflict occurs).

When writing 1 by software and clearing to 0 by the Output Disable Request conflict for the EN bit, clearing to 0 by the Output Disable Request is enabled.

FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

P bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output or PWM signal output for the positive-phase output (GTOUUP, GTOVUP and GTOWUP pins).

N bit (Negative-Phase Output (N) Control)

The N bit selects one of the level signal output or PWM signal output for the negative-phase output (GTOULO, GTOVLO and GTOWLO pins).

INV bit (Output Phase Invert Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

RV bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the GTCLK or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit).

When OPSCR.ALIGN bit is 0, input phase is aligned to GTCLK.

Note: When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

When OPSCR.ALIGN bit is 1, input phase is aligned with the falling edge of PWM.

GRP[1:0] bit (Output Disabled Source Selection)

The GRP[1:0] bit selects the output disable source.

The GRP bits should be set when GODF bit is 0. If GRP bits select a POEG except for the connected groups, the status of output pin never change to disable.

GODF bit (Group Output Disable Function)

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

When OPSCR.GODF bit is 0, this bit is ignored.

The GODF bit should be set when output disable request does not occur from POEG.

NFEN bit (External Input Noise Filter Enable)

The NFEN bit selects the noise filter for external input. When OPSCR.NFEN bit is 0, a noise filter for the external input is not used.

Note: Set this bit during the EN bit is 0 to avoid generation of unintentional internal edge caused by switching this bit.

NFCS[1:0] bits (External Input Noise Filter Clock Selection)

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit is 1, noise filter sampling clock setting of the external input is enabled.

1. Set the NFCS[1:0].
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

22.2.47 GTCLKCR : General PWM Timer Clock Control Register

Base address: GPT_GTCLK = 0x4032_3F10
GPT_GTCLK_NS = 0x5032_3F10

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BPEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPEN	Synchronization Circuit Bypass Enable 0: In case of using Bus Clock and GPT Core Clock asynchronously 1: In case of using Bus Clock and GPT Core Clock synchronously	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

The GTCLKCR register is a register that controls the clock.

Set first of initial setting after resetting.

If MSTPCRE.MSTPE31 bit is 0, changing this register is prohibited.

BPEN bit (Synchronization Circuit Bypass Enable)

Enable or disable the synchronization bypass function between the bus clock (PCLKA) and GPT core clock (GTCLK).

Set 0 when using an asynchronous clock (GPTCLK) or 1 when using a synchronous clock (PCLKD) as the core clock.

22.3 Operation

22.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR or GTCCRm (m = A to F) controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOCnA or GTIOCnB can be changed (n = 0 to 13). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

22.3.1.1 Counter Operation

(1) Counter start and stop

The counter of each channel starts the count operation when GTCR.CST is set to 1, and stops counting when the bit is set to 0. The GTCR.CST bit value is changed by the following sources:

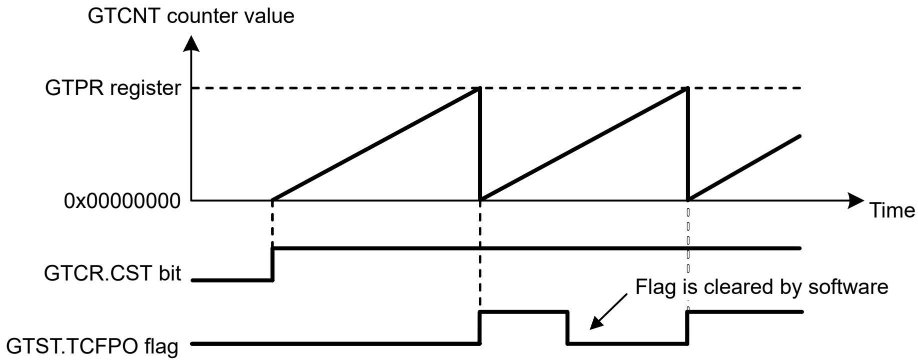
- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register

- Completion of the period count function while the GTPC.ASTP bit is 1

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow) or the GTCCRm (m = A to F) value selected by the GTCSR.CSCMSC[2:0] bits to 0 in Saw-wave PWM mode 2, the overflow interrupt(GPTn_OVF) is also generated. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 22.5 shows an example of a periodic count operation in up-counting by the count clock.



Note: The base address of registers are the same.

Figure 22.5 Example of periodic count operation in up-counting by the count clock

Table 22.11 shows an example for setting periodic count operation in up-counting by the count clock.

Table 22.11 Example for setting a periodic count operation in up-counting by the count clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.5, 000b or 0000b (saw-wave PWM mode 1) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.5, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 22.5, 0x00000000 is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1, and the underflow interrupt(GPTn_UDF) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 22.6 shows an example of periodic count operation in down-counting by the count clock.

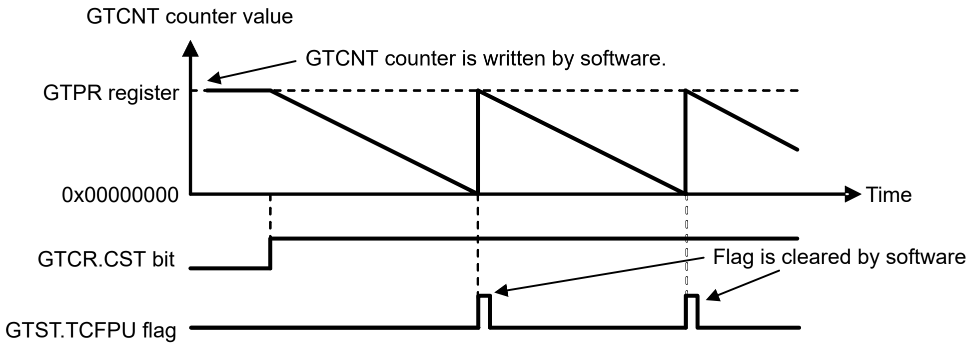


Figure 22.6 Example of periodic count operation in down-counting by the count clock

Table 22.12 shows an example for setting periodic count operation in down-counting by the count clock.

Table 22.12 Example for setting periodic count operation in down-counting by count clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.6, 000b or 0000b (saw-wave PWM mode 1) is set.
2	Set count direction	Select the count direction with the GTUDDTYC register. In Figure 22.6, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 22.6, the GTPR register value is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation. In Figure 22.6, 1 is set in the CST bit.

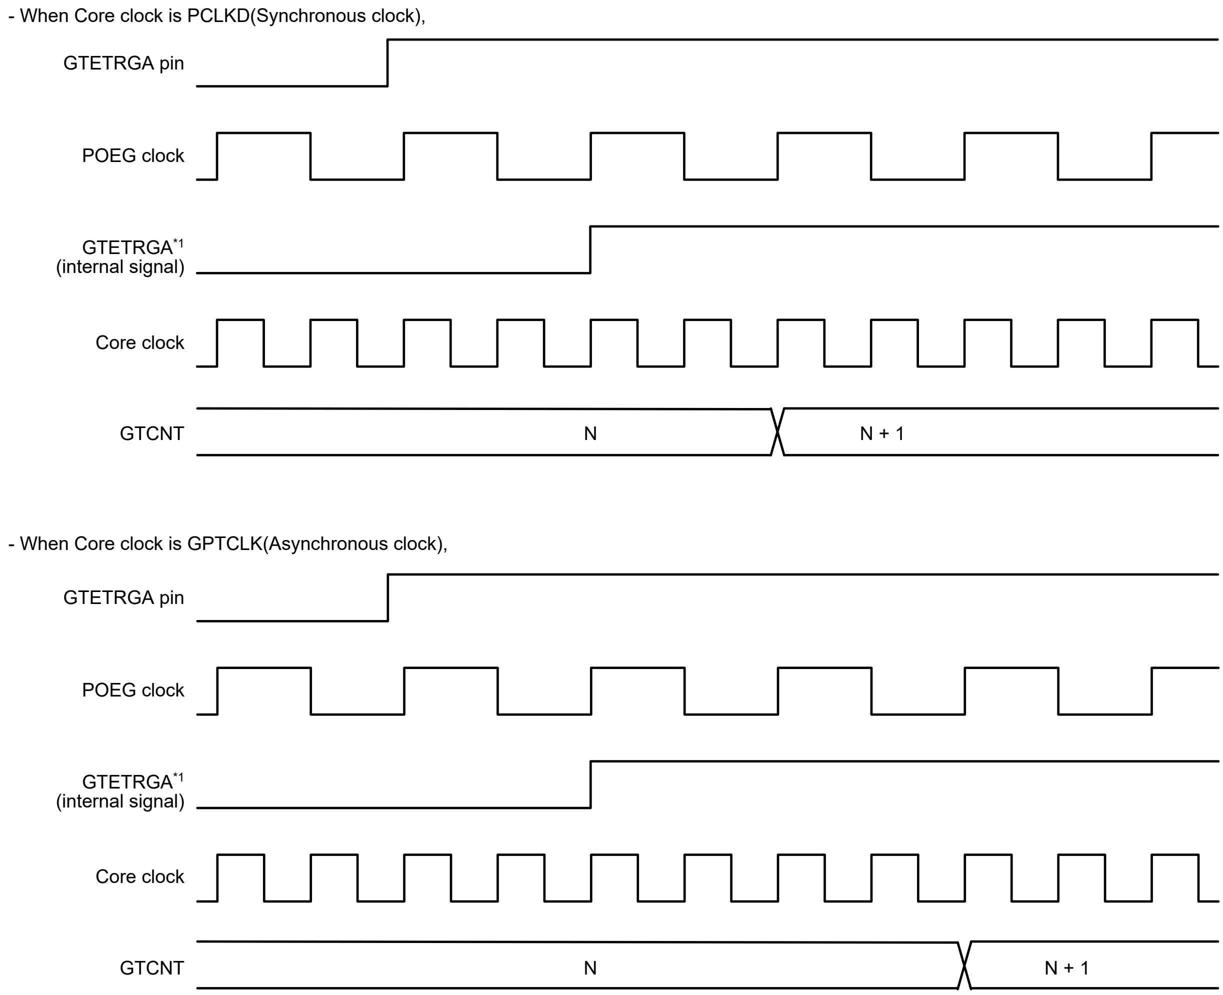
(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

If you are using a hardware source to count up, set the GTCR.CST bit to 1 to enable the counting operation. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 GTCLK delay after GTCR.CST is set to 1.

Figure 22.7 shows an example of an event count operation in up-counting by a hardware resource (the rising edge of GTETRGA pin input).



Note: POEG clock: PCLKB

Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

Figure 22.7 Example of event count operation in up-counting using hardware sources

Figure 22.8 shows an example of event count operation by ELC_GPTA event input.

This is an example of event count operation of GPT321.GTCNT counter. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

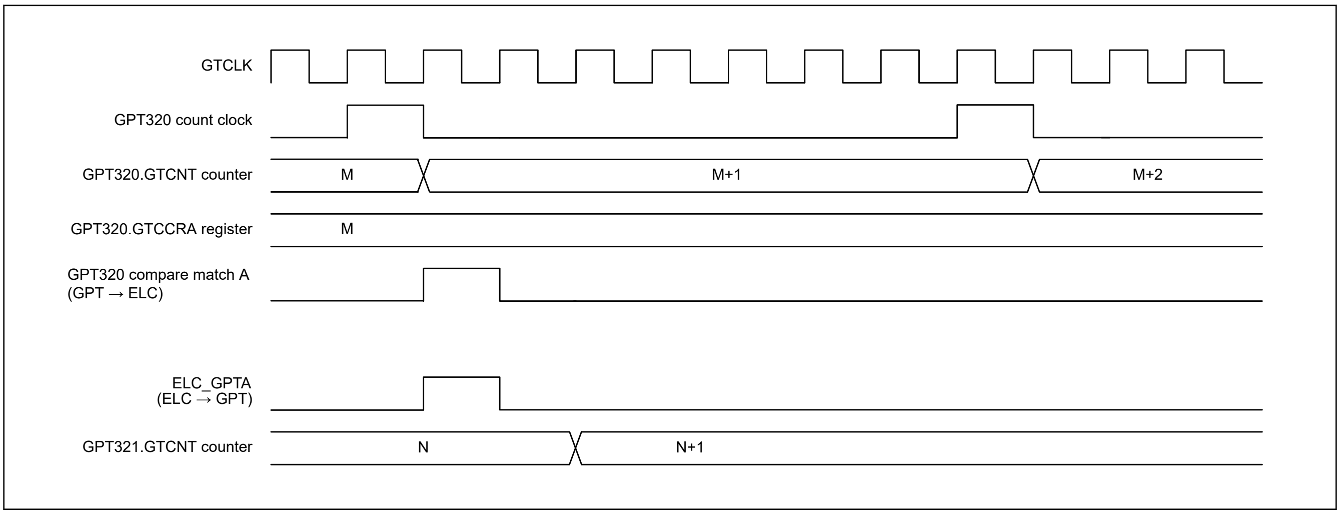


Figure 22.8 Example of Event Count Operation (Up-Counting the Number of Event Signals Input from ELC_GPTA)

Table 22.13 shows an example for setting event count operation in up-counting by a hardware source.

Table 22.13 Example for setting an event count operation in up-counting using hardware sources

No.	Step Name	Description
1	Set count source	Select the counting-up hardware source with the GTUPSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

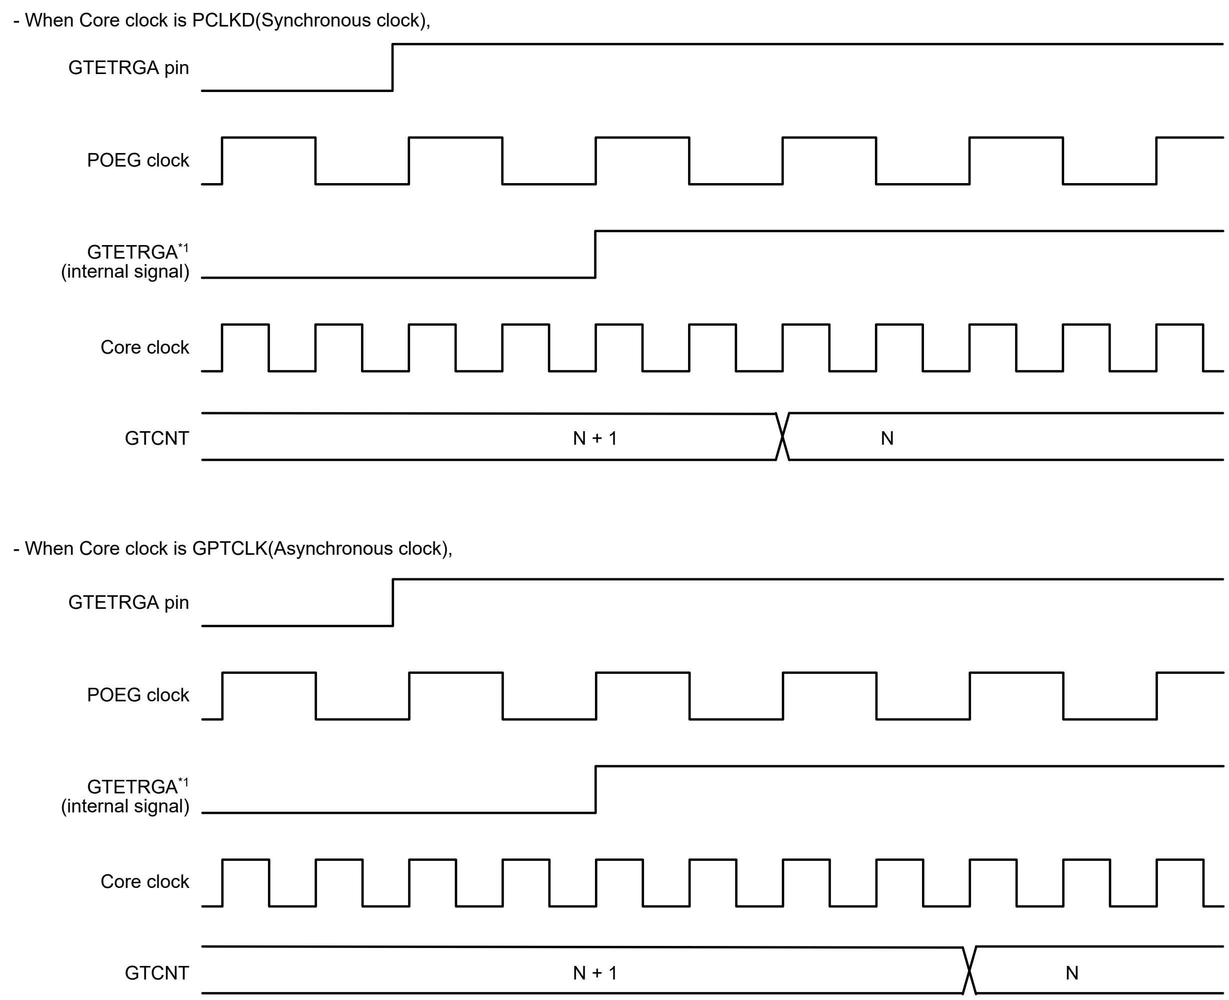
(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 GTCLK delay after GTCR.CST is set to 1.

Figure 22.9 shows an example of a event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).



Note: POEG clock: PCLKB

Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

Figure 22.9 Example of event count operation in down-counting using hardware sources

Table 22.14 shows an example for setting a periodic count operation in down-counting using a hardware resource.

Table 22.14 Example for setting an event count operation in down-counting using hardware sources

No.	Step Name	Description
1	Set count source	Select the counting-down hardware source with the GTDNSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Write access during counting (when CST = 1) is disabled. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

When the count direction flag is set as decrement (GTST.TCUF flag = 0) in saw-wave mode (Except saw-wave PWM mode 2) selected with GTCR.MD[2:0] bits or GTCR.MD[3:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw-waves mode (except saw-wave PWM mode 2) and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with GTCLK. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

22.3.1.2 Waveform Output by Compare Match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCnA or GTIOCnB output pin (n = 0 to 13). In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the cycle end which is determined by GTPR or GTCCRm selected as a counter clear source by the GTCSR.CSCMSC[2:0] bits in saw-wave PWM mode 2 (n = 0 to 13, m = A to F).

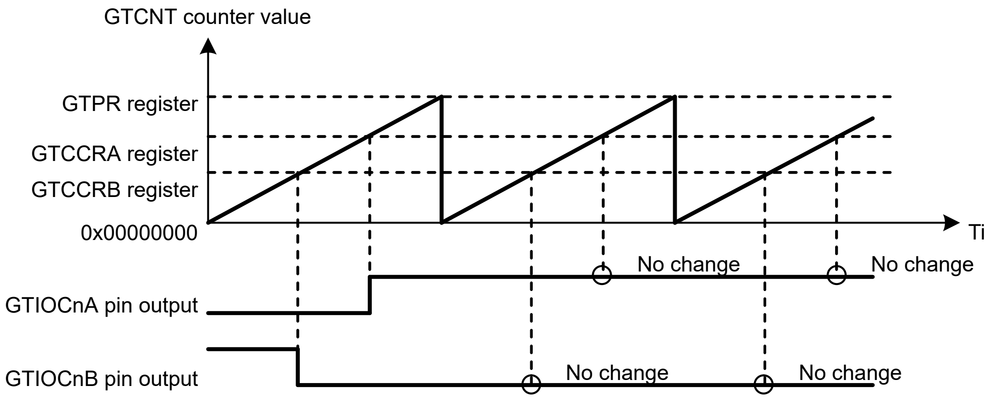
The cycle end is:

- For saw waves (except saw-wave PWM mode 2) in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves (except saw-wave PWM mode 2) in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw-wave PWM mode 2 and GTCCRm register (m = A to F) selected as a counter clear source by the GTCSR.CSCMSC[2:0] bits – When the GTCNT counter value changes from the GTCCRm register value to 0x0000 0000
- For saw waves – when the GTCNT counter is cleared
- For triangle waves or complementary PWM mode – when the GTCNT changes from 0 to 1 (trough).

(1) Low output and high output

Figure 22.10 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCnA pin by a GTCCRA compare match, and low is output from the GTIOCnB pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is low, high output at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is high, low output at compare match, output retained at cycle end

Note: The base address of registers are the same.

Figure 22.10 Example of low output and high output operation

Table 22.15 shows an example for setting low output and high output operation.

Table 22.15 Example for setting low output and high output operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.10, 000b or 0000b (saw-wave PWM mode 1) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.10, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.10, GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b.
7	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value*1	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Note: n: 0 to 13
m: A, B

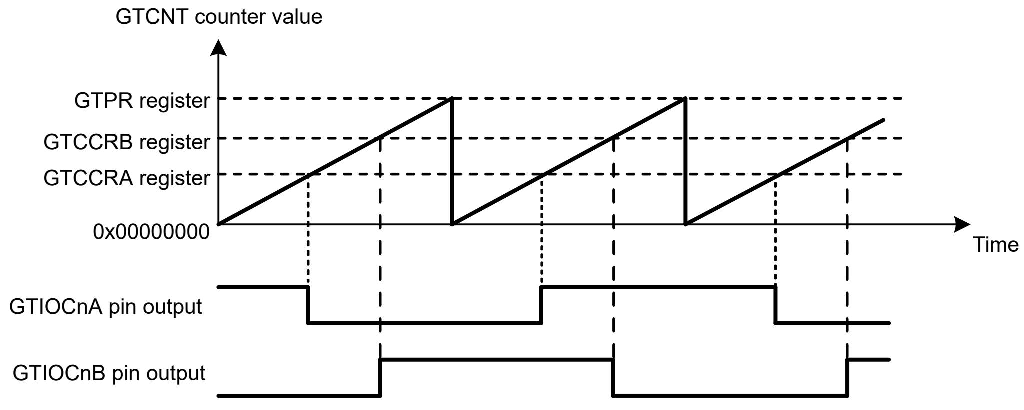
Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

(2) Toggled output

Figure 22.11 and Figure 22.12 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In Figure 22.11, the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a GTCCRA compare match and GTIOCnB pin output by a GTCCRB compare match are toggled.

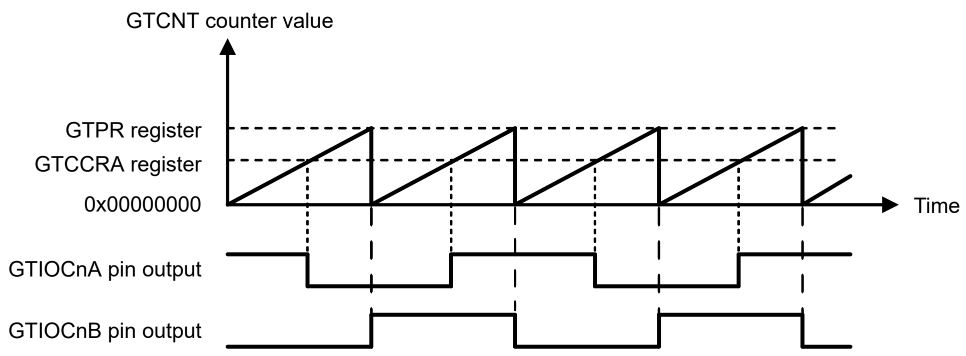
In Figure 22.12, the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOCnA pin output level and a cycle end toggles the GTIOCnB pin output level.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at cycle end

Note: The base address of registers are the same.

Figure 22.11 Example of toggled output operation (1)



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at cycle end

Note: The base address of registers are the same.

Figure 22.12 Example of toggled output operation (2)

Table 22.16 shows an example for setting toggled output operation.

Table 22.16 Example for setting toggled output operation (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.11 and Figure 22.12, 000b or 0000b (saw-wave PWM mode 1) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.11 and Figure 22.12, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.

Table 22.16 Example for setting toggled output operation (2 of 2)

No.	Step Name	Description
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.11, GTIOA[4:0] = 10011b, GTIOB[4:0] = 00011b, and in Figure 22.12, GTIOA[4:0] = 10011b, GTIOB[4:0] = 01100b.
7	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value*1	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Note: n: 0 to 13
m: A, B

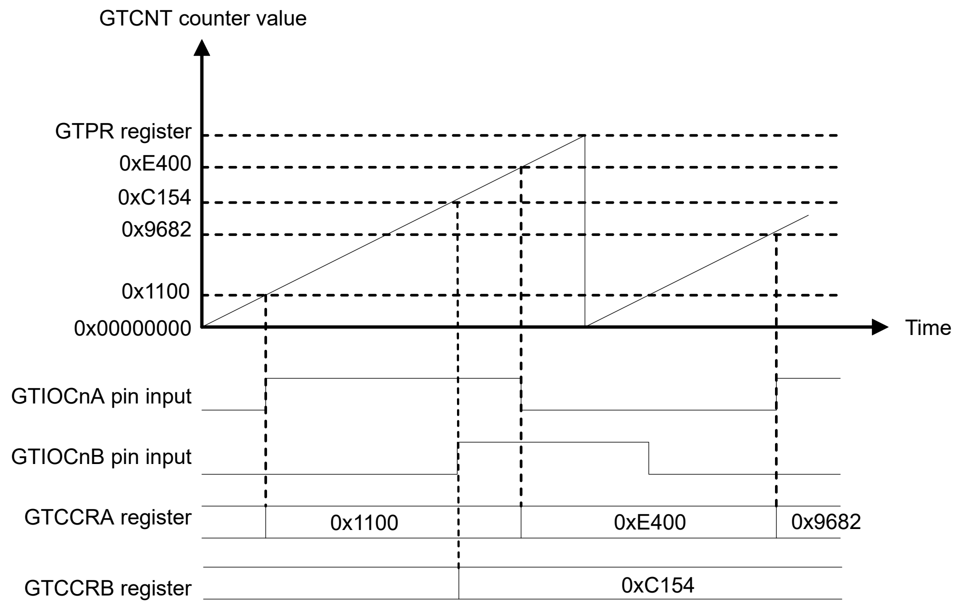
Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

22.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR. In complementary PWM mode, GTCCRA and GTCCRB registers do not function as input capture registers.

Figure 22.13 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOCnA input pin and to GTCCRB on the rising edge of the GTIOCnB input pin.



Note: The base address of registers are the same.
Note: [Setting examples]
GTICASR setting: input capture at both edges
GTICBSR setting: input capture at the rising edge

Figure 22.13 Example of input capture operation

Table 22.17 and Table 22.21 show the example for setting an input capture operation with count operation by the count clock.

Table 22.17 Example for setting input capture operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.13, 000b or 0000b (saw-wave PWM mode 1) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.13, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select the input capture source in the GTICASR and GTICBSR registers. In Figure 22.13, GTICASR = 0x00000F00, GTICBSR = 0x00003000. In GPT324 to GPT329 when input capture by other channel sources is used, set the GTICmSR.mSOC bit (m = A or B) to 1 and allow input capture by other channel sources, and select the group that cooperates with other channel sources by the GTICCR register.
7	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Figure 22.14 shows an example of the timing of input capture operation in response to ELC_GPTA event input.

This is an example of capture of the counter value by the GPT321.GTCCRA register in response to an input signal. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

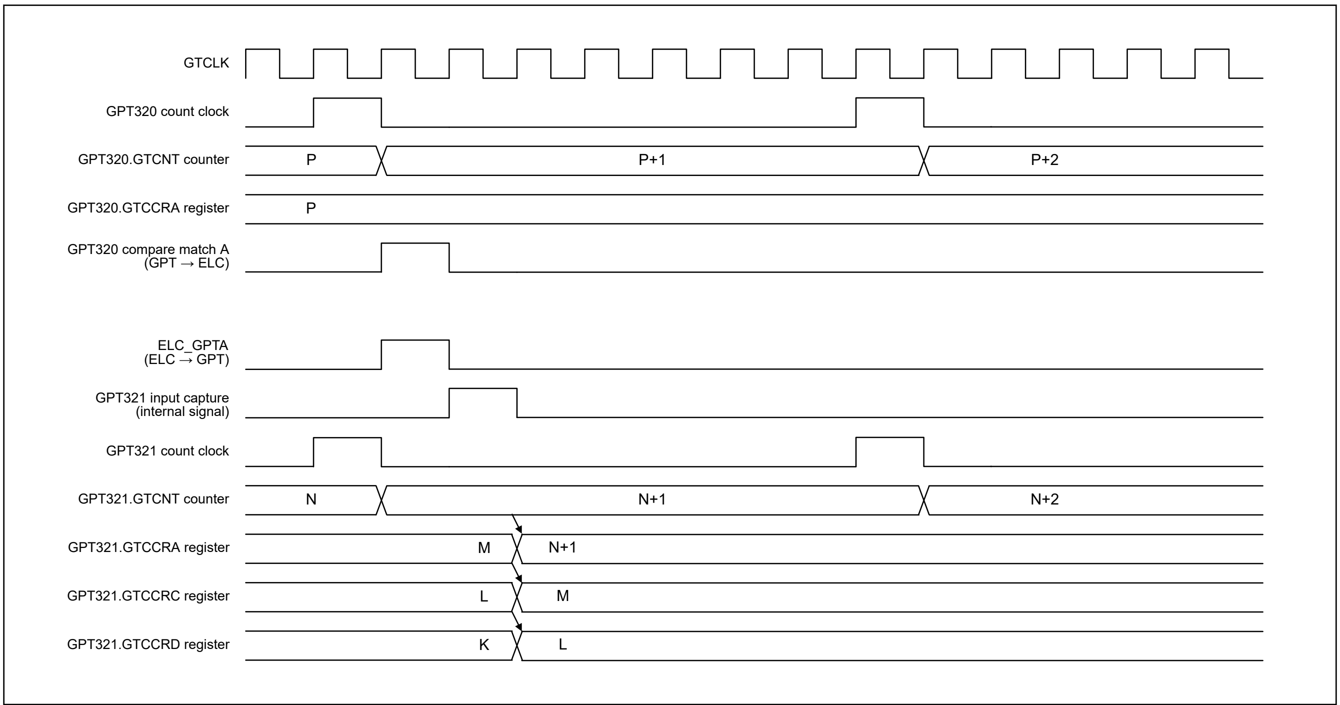


Figure 22.14 Example of the Timing of Input Capture Operation in Response to ELC_GPTA Event Input

Figure 22.15 shows an example of the timing of input capture operation in response to count clock from other channel.

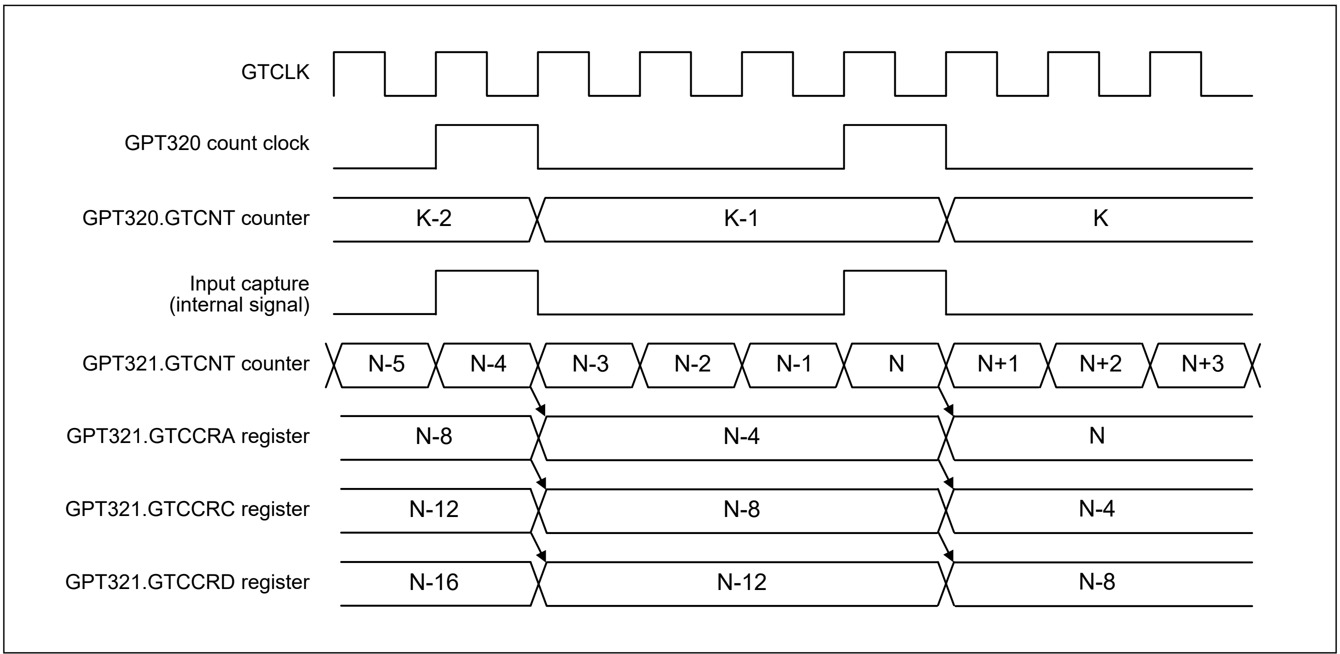

Figure 22.15 Example of the Timing of Input Capture Operation in Response to Count Clock from Other Channel

22.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB

The following buffer operation is enabled by setting GTDTCR:

- GTDVU and GTDBU
- GTDVD and GTDBD

The following buffer operation is enabled by setting GTBER2:

- GTCCRA, GTCCRE, and GTCCRF (in complementary PWM mode 3, 4)
- GTOLBR.GTIOAB[4:0] bits and GTIOR.GTIOA[4:0] bits
- GTOLBR.GTIOBB[4:0] bits and GTIOR.GTIOB[4:0] bits

22.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR.

GTPDBR register can function as a buffer register for the GTPBR register (double-buffer register for the GTPR register).

In complementary PWM mode, the buffer transfer from the GTPDBR register to temporary register P is performed only in the master channel (GPT32n). The temporary register P is transferred to each GTPBR register of master channel, slave channel 1 (GPT32n+1), and slave channel 2 (GPT32n+2). Transfer from the GTPBR register to the GTPR register is made concurrently in three channels. Therefore, the same value is stored in the same register of the three channels. The GTPR register of the master channel represents the GTCNT counter's (GTCNTn) period of the master channel. In the slave channels, periods are controlled using the GTPR register value and the GTDVU register value.

The setting is invalid in the Saw-wave PWM mode 2.

The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 0 to 13).

In the case of saw waves, the buffer transfer by clearing counter can be prohibited by GTBER2.CCTPR bit.

Table 22.18 shows the buffer transfer timing in the complementary PWM mode.

Table 22.18 GTPR Buffer Transfer Timing in Complementary PWM Mode

	Complementary PWM mode 1	Complementary PWM mode 2	Complementary PWM mode 3, 4
GTPDBR ↓ Temporary register P	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)
Temporary register P ↓ GTPBR	(1) When data is transferred to temporary register P during up-counting middle section: After one GTCLK cycle from data transfer to temporary register P (2) When data is transferred to temporary register P during a section other than up-counting middle section: At the end of trough section	(1) When data is transferred to temporary register P during down-counting middle section: After one GTCLK cycle from data transfer to temporary register P (2) When data is transferred to temporary register P during a section other than down-counting middle section: At the end of crest section	(1) When data is transferred to temporary register P during middle section: After one GTCLK cycle from data transfer to temporary register P (2) When data is transferred to temporary register P during a section other than middle section: At the end of crest/ trough sections
GTPBR ↓ GTPR	At the end of crest section At the end of crest section Synchronous Counter clear in up counting middle section and crest section (Including counter clear by setting GTCSR.CP1CCE)	At the end of trough section Counter clear in down counting middle section and trough section	At the end of crest section At the end of trough section Counter clear

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

To set the GTPR register to function as double buffer, set the GTBER.PR[1:0] bits to 10b or 11b. For single buffer operation, set 01b. Not to function as buffer, set 00b.

In complementary PWM mode, complementary PWM mode-specific buffer operation is performed regardless of the GTBER.PR[1:0] bit setting.

Figure 22.16 to Figure 22.21 show examples of GTPR buffer operation and Table 22.19 shows an example for setting GTPR buffer operation. For details of operation settings in complementary PWM mode, see section 22.3.3.7. Complementary PWM mode 1, 2, 3.

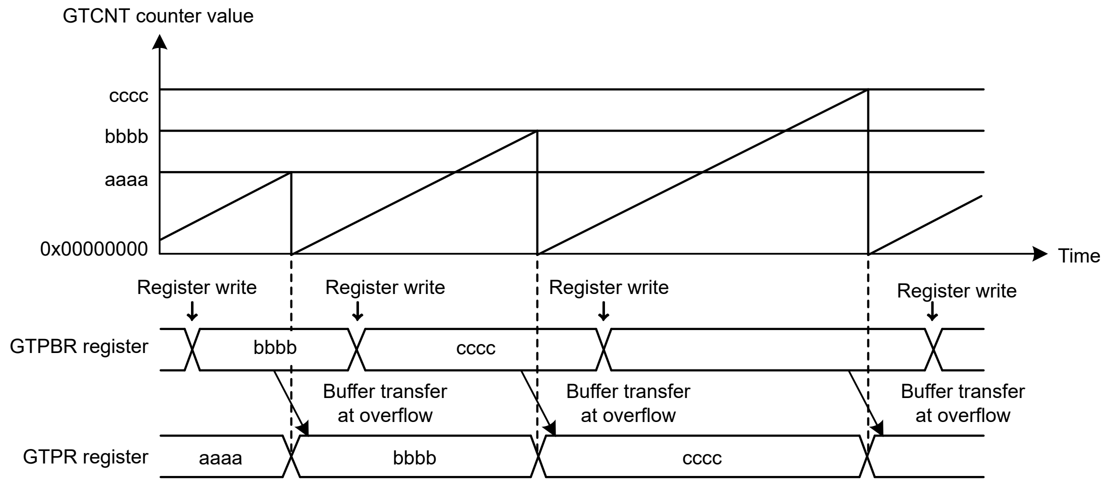

Figure 22.16 Example of GTPR buffer operation with saw waves in up-counting

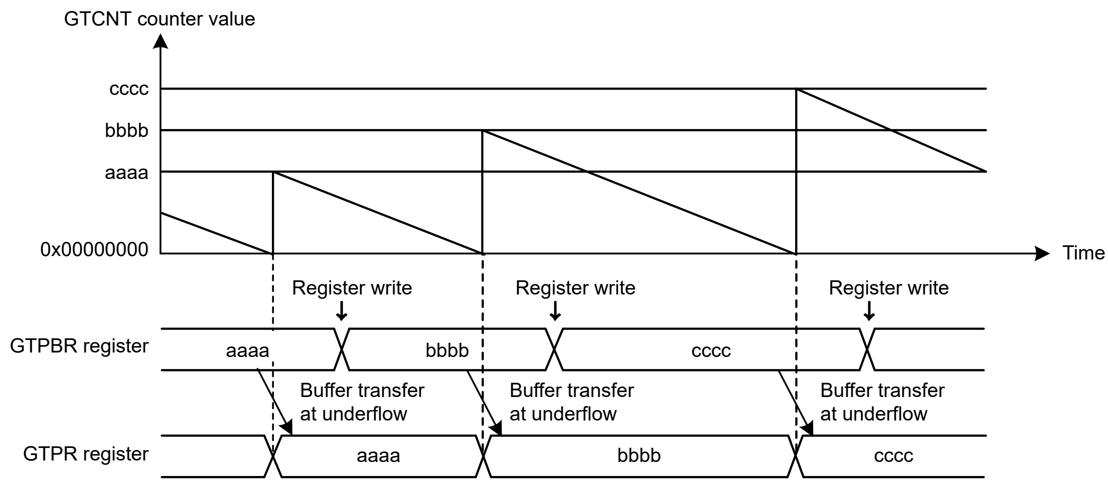

Figure 22.17 Example of GTPR buffer operation with saw waves in down-counting

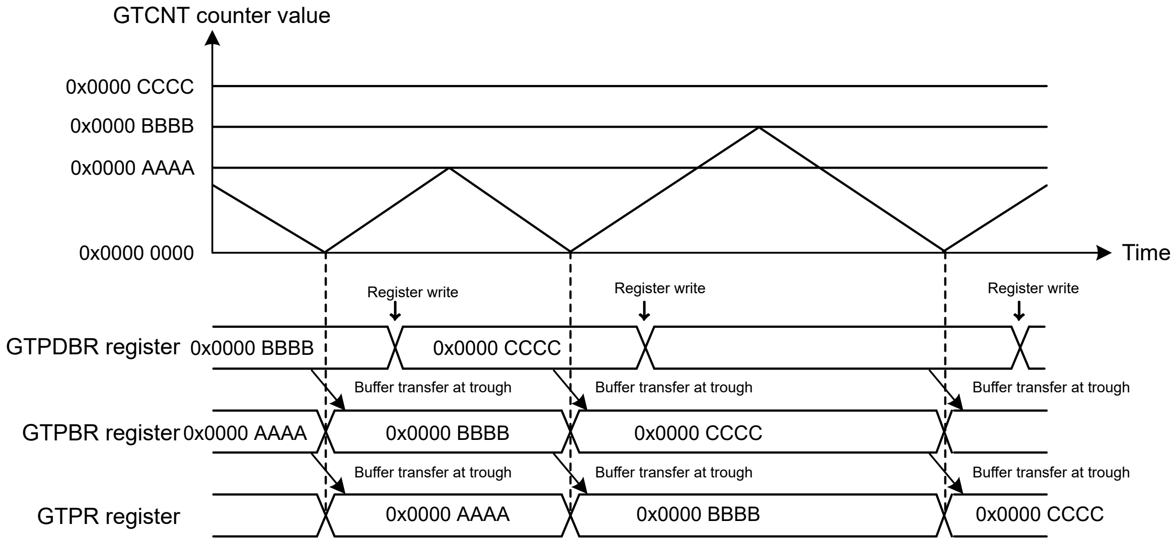

Figure 22.18 Example of GTPR double buffer operation with triangle waves

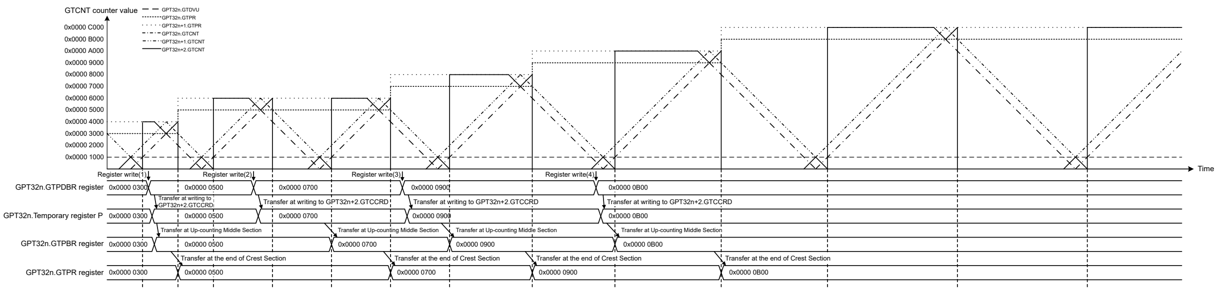

Figure 22.19 Example of GTPR double buffer operation with complementary PWM mode 1

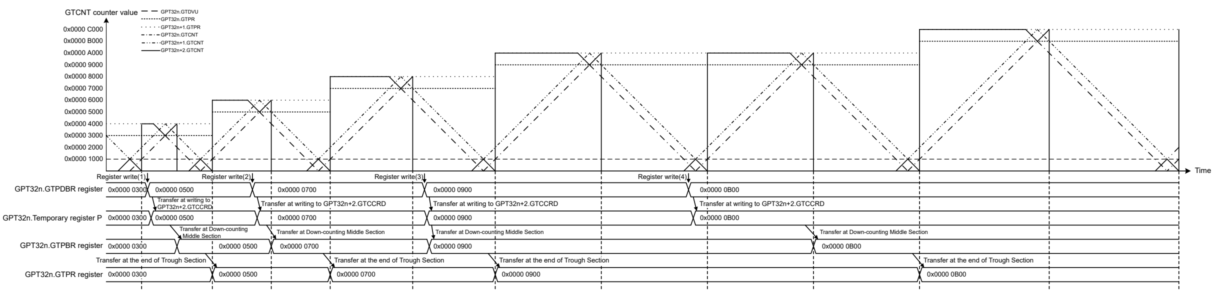

Figure 22.20 Example of GTPR double buffer operation with complementary PWM mode 2

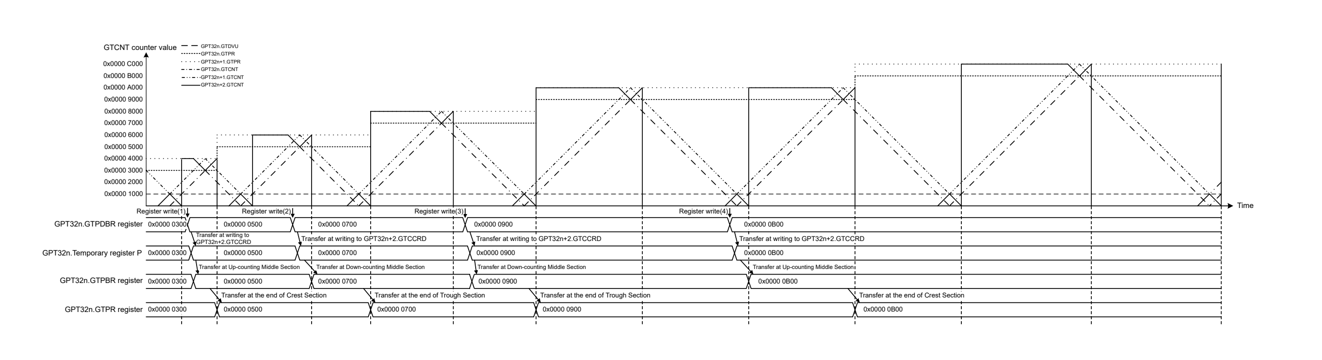

Figure 22.21 Example of GTPR double buffer operation with complementary PWM mode 3, 4

Table 22.19 Example for setting GTPR register buffer operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.16 and Figure 22.17, 000b or 0000b (saw-wave PWM mode 1) is set, and in Figure 22.18, 100b or 0100b (triangle-wave PWM mode 1) is set. In Figure 22.19 to Figure 22.21, 11xxb (complementary PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.16, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 22.17, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the GTBER.PR[1:0] bits. In Figure 22.16 and Figure 22.17, PR[1:0] = 01b. In Figure 22.18, PR[1:0] = 1xb. In Figure 22.19 to Figure 22.21, no PR[1:0] bits setting required.
7	Set buffer value	For buffer operation, set a value in one cycle after the current cycle in the GTPBR register. For double buffer operation, also set a value of the period for the cycle after the next cycle in the GTPDBR register.
8	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
9	Set buffer value for each cycle	For buffer operation, set a value in one cycle after the current cycle in the GTPBR register. For double buffer operation, also set a value of the period for the cycle after the next cycle in the GTPDBR register. In complementary PWM mode 1 (crest transfer), when the GTPDBR register is set in the up-counting trough or middle section, a value of the period for the next cycle is set. In other sections, a value of the period for the cycle after the next cycle is set. In complementary PWM mode 2 (trough transfer), when the GTPDBR register is set in the up-counting sect ion or the down-counting crest or middle sections, a value of the period for the next cycle is set. In other sections, a value of the period for the cycle after the next cycle is set. In complementary PWM mode 3 or 4 (crest/trough immediate transfer), when the GTPDBR register is set in a section other than the down-counting trough section, a value of the period for the next cycle is set. In the down-counting trough section, a value of the period for the cycle after the next cycle is set.

22.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, complementary PWM mode, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits.

(1) When GTCCRA or GTCCRB Functions as Output Compare Register

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, complementary PWM mode, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits. For details, see section 22.3.3. PWM Output Operating Mode. Other than the specified PWM output operation mode, buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
  Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in section 22.3.2.1. GTPR Register Buffer Operation.
  In saw-wave, the buffer transfer of GTCCRm register by counter clearing is possible to be disabled with GTBER2.CCTCm bit (m = A, B).
  In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Buffer transfer by compare match
  In saw-wave, the buffer transfer by the compare match of GTCCRm register enabled by GTBER2.CMTCm (m = A, B) bit is performed.
- Forcible buffer transfer
  When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally, buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1 in saw-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffers to the GTCCRm (m = A, B) registers is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or buffer transfer extended skipping function (function for repeated double-buffer operation while buffer transfer is disabled). For details, see section 22.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 22.22 to Figure 22.25 show examples of GTCCRA and GTCCRB buffer operation and Table 22.20 shows an example for setting GTCCRA and GTCCRB buffer operation.

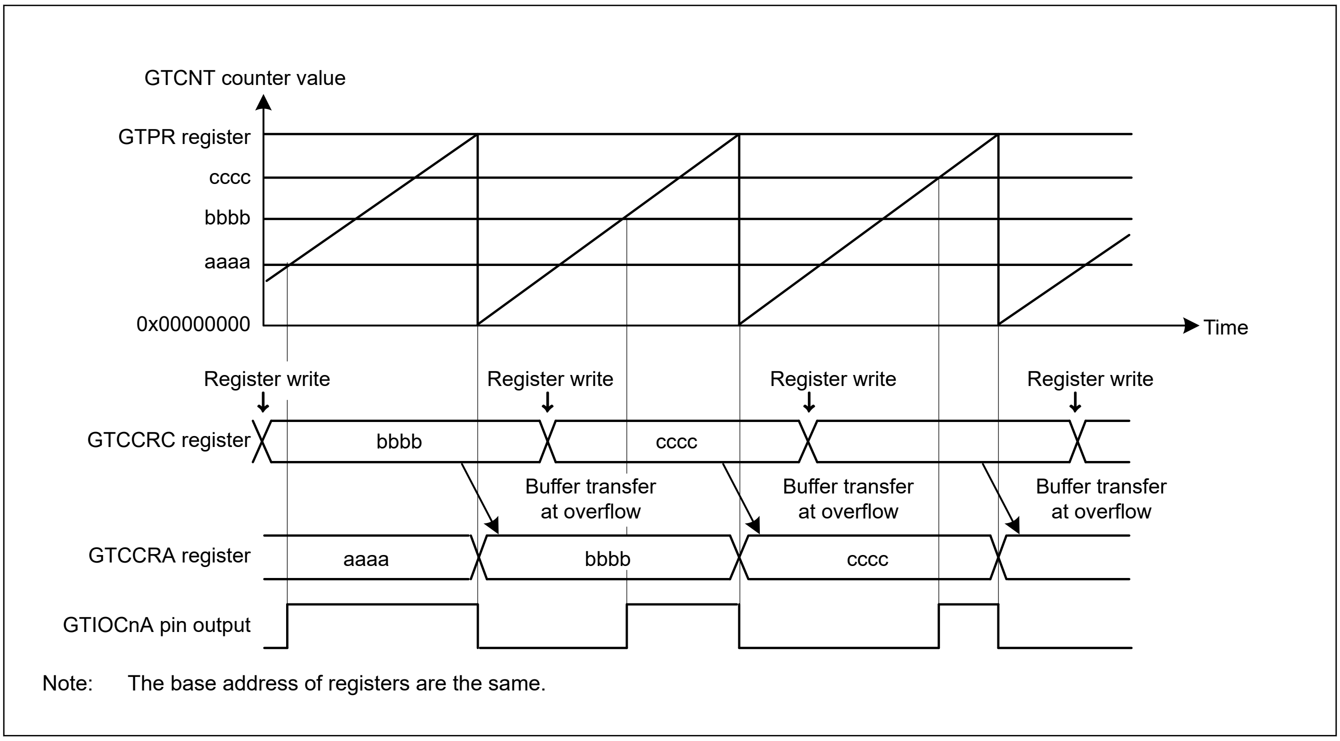

Figure 22.22 Example of GTCCRA and GTCCRB buffer operation with output compare, Saw-wave PWM mode 1 in up- counting, high output at GTCCRA compare match, and low output at cycle end

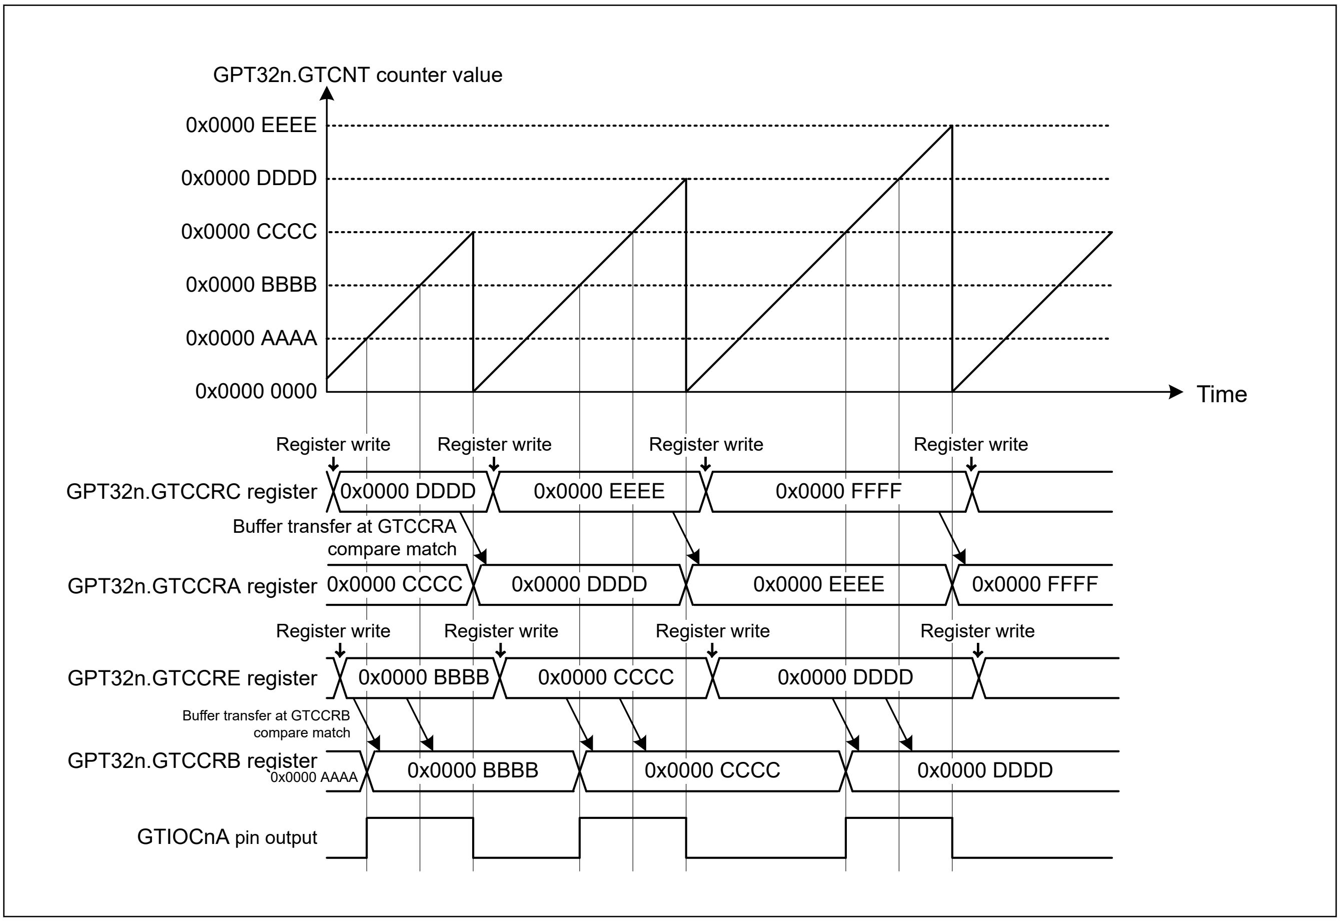

Figure 22.23 Example of GTCCRA and GTCCRB Registers Buffer Operation (Output Compare, Saw-Wave PWM Mode 2, Buffer Transfer at GTCCRA Register Compare Match, Counter Clearing, Low Output, Buffer Transfer at GTCCRB Register Compare Match, High Output) (n = 4 to 9)

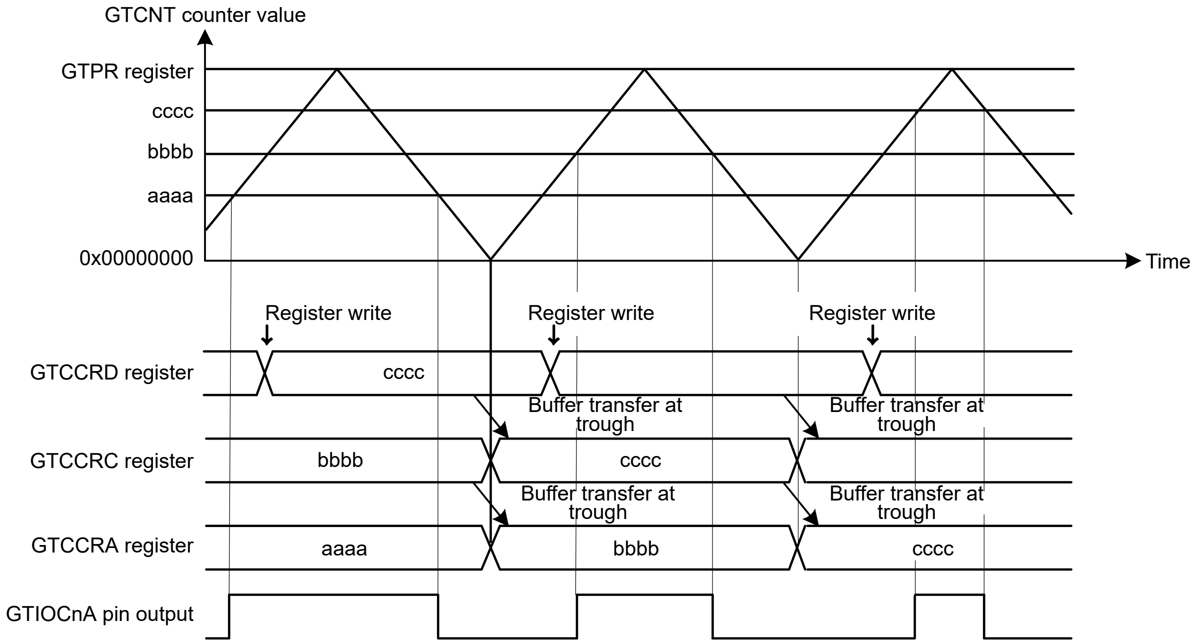
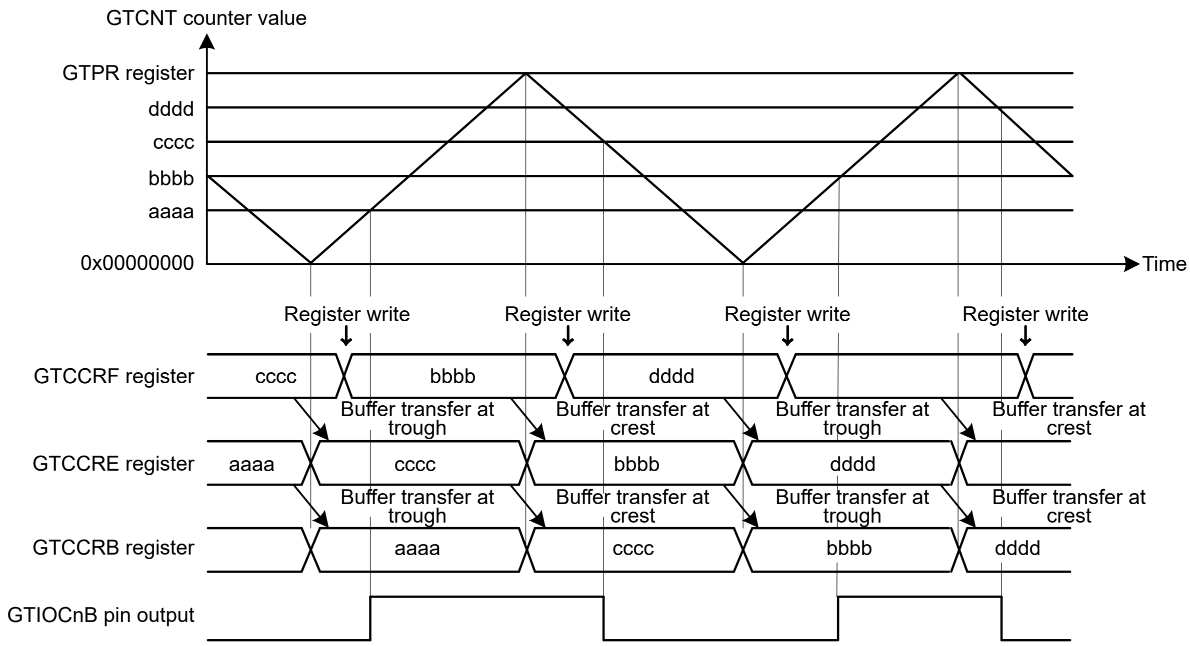


Note: The base address of registers are the same.

Figure 22.24 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end



Note: The base address of registers are the same.

Figure 22.25 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

Table 22.20 Example for setting GTCCRA and GTCCRB buffer operation for output compare

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.22, 000b or 0000b (saw-wave PWM mode 1) is set, in Figure 22.23, 0010b (saw-wave PWM mode 2) is set, in Figure 22.24, 100b or 0100b (triangle-wave PWM mode 1) is set, and in Figure 22.25, 101b or 0101b (triangle-wave PWM mode 2) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.22, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.22, GTIOA[4:0] = 00110b, in Figure 22.23, GTIOA[4:0] = 00101b and GTIOB[1:0] = 10b, in Figure 22.24, GTIOA[4:0] = 00011b, and in Figure 22.25, GTIOB[4:0] = 00011b.
7	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 22.22, CCRA[1:0] = 01b, in Figure 22.23, CCRA[1:0] = 01b and CCRB[1:0] = 01b, in Figure 22.24, CCRA[1:0] = 1xb, and in Figure 22.25, CCRB[1:0] = 1xb.
9	Set compare match value*1	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

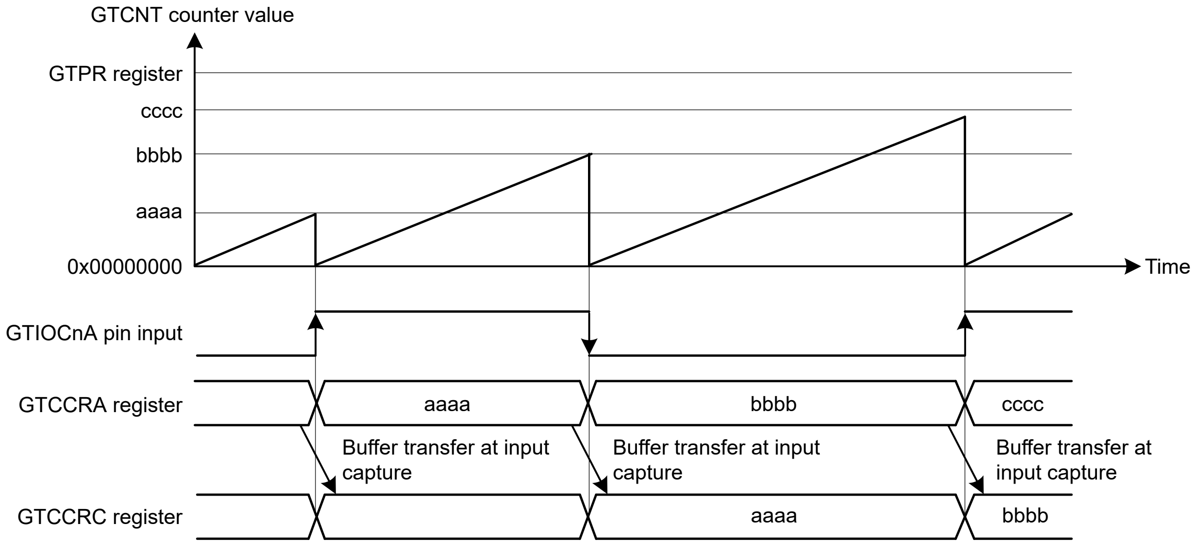
Note: n: 0 to 13
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

(2) When GTCCRA or GTCCRB Functions as Input Capture Register

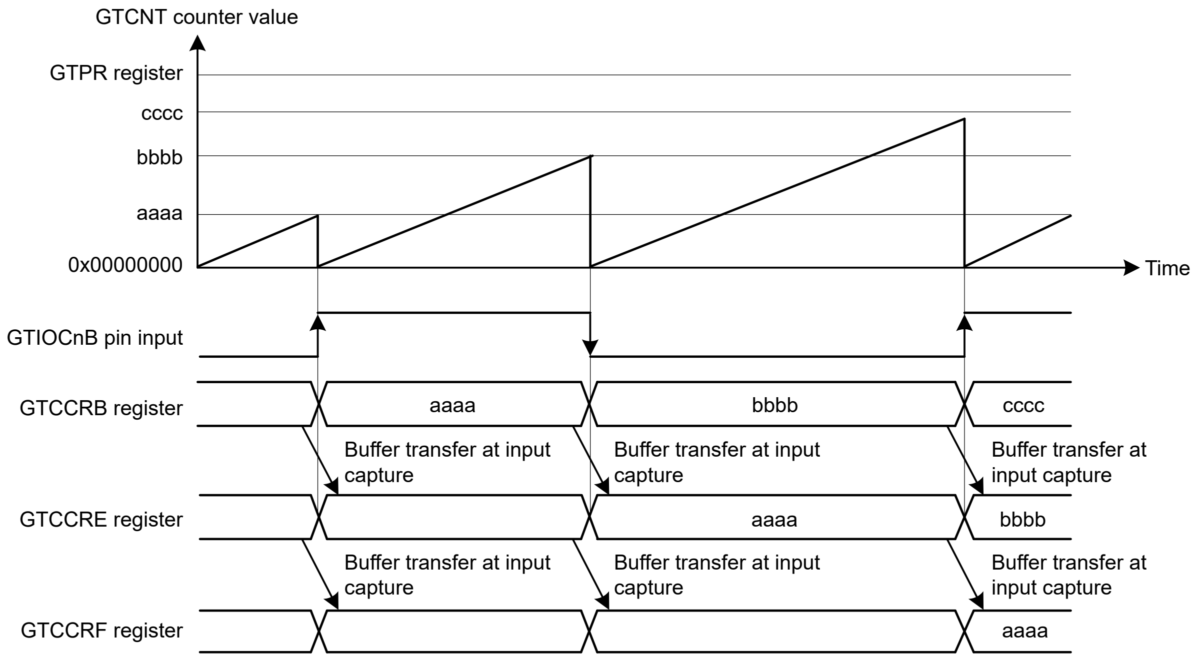
When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 22.26 and Figure 22.27 show examples of GTCCRA and GTCCRB buffer operation and Table 22.21 shows an example for setting GTCCRA and GTCCRB buffer operation.



Note: The base address of registers are the same.

Figure 22.26 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOCnA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnA input



Note: The base address of registers are the same.

Figure 22.27 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOCnB input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnB input

Table 22.21 Example for setting GTCCRA and GTCCRB buffer operation for input capture

No.	Step Name	Description
1	Set operating mode and counter clear sources	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits and count clear source with the GTCSR register. In Figure 22.26, MD[2:0] = 000b or MD[3:0] = 0000b (saw-wave PWM mode 1) and GTCSR = 0x00000F00, and in Figure 22.27, MD[2:0] = 000b or MD[3:0] = 0000b (saw-wave PWM mode 1) and GTCSR = 0x0000F000.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.26, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select input capture source in the GTICASR register and GTICBSR register. In Figure 22.26, GTICASR = 0x00000F00, and in Figure 22.27, GTICBSR = 0x0000F000. In GPT324 to GPT329 to perform input capture with sources of other channels, select a group that performs inter-channel cooperation by the GTICCR.ICmGRP bit (m = A or B). For the output-side channel of the input capture sources, set the GTICCR register to enables the input capture sources to output to other channels. For input-side channels, set the GTIOmSR.mSOC bit (m = A or B) to 1 to enable input capture with sources of other channels.
7	Set buffer operation	Set buffer operation with the CCRA and CCRB bits in the GTBER register. In Figure 22.26, CCRA[1:0] = 01b, and in Figure 22.27, CCRB[1:0] = 1xb.
8	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

22.3.2.3 Buffer Operation for GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To set the GTADTRA or GTADTRB register to function as a double buffer, set the GTBER.ADTDA or ADTDB bit to 1. For single buffer operation, set 0. Not to function as buffer, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b.

The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in saw-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to 11b for both crest and trough in triangle-wave mode or complementary PWM mode.

In saw-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to value other than 00b and in count operation, the buffer transfer, by similar counter clearing sources in section 22.3.2.1. GTPR Register Buffer Operation, is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).

In complementary PWM mode, the buffer transfer is performed after one GTCLK cycle from GTCCRD register write of slave channel 2.

In saw-wave mode, the buffer transfer of GTADTRm register by counter clearing can be disabled by GTBER2.CCTADm (m = A, B) bit setting.

In saw-wave mode, the buffer transfer of GTADTRm register by its own compare match can be enabled by the GTBER2.CMTADm (m = A, B) bit setting.

Figure 22.28 to Figure 22.32 show examples of buffer operation of the GTADTRA and GTADTRB registers, and Table 22.22 shows an example for setting buffer operation of the GTADTRA and GTADTRB registers.

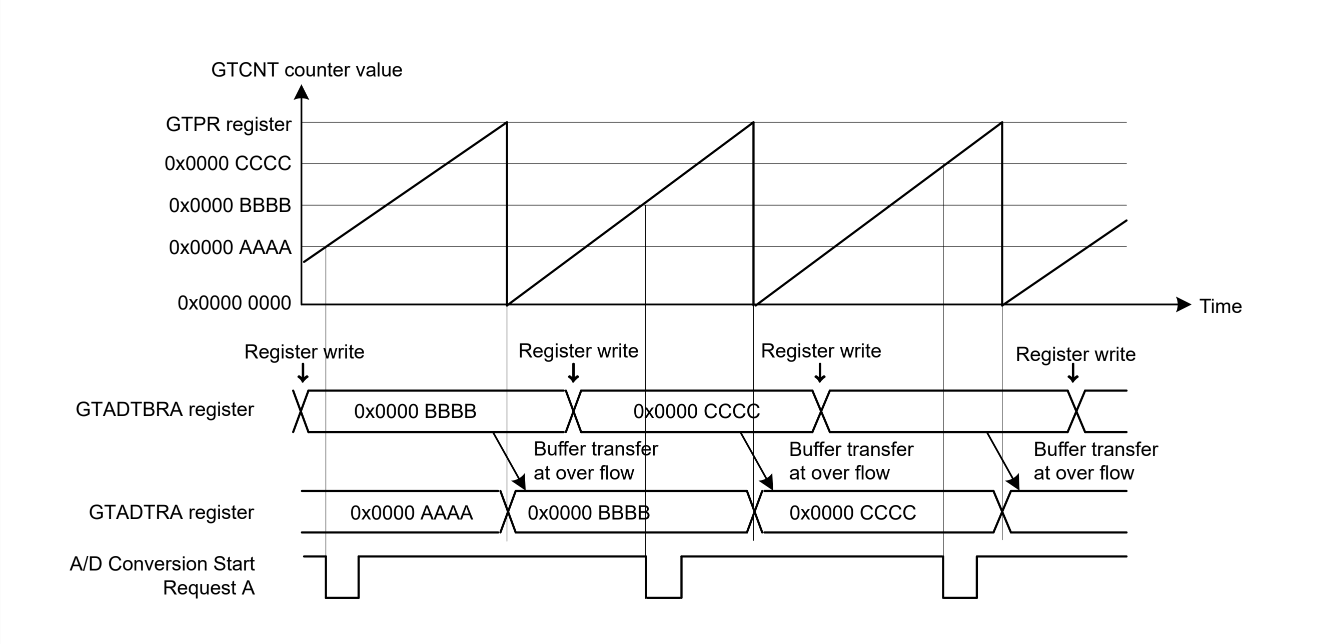


Figure 22.28 Example of Buffer Operation of the GTADTRA and GTADTRB Registers (Saw Waves in Up-Counting, A/D Conversion Start Request Generated by Up-Counting)

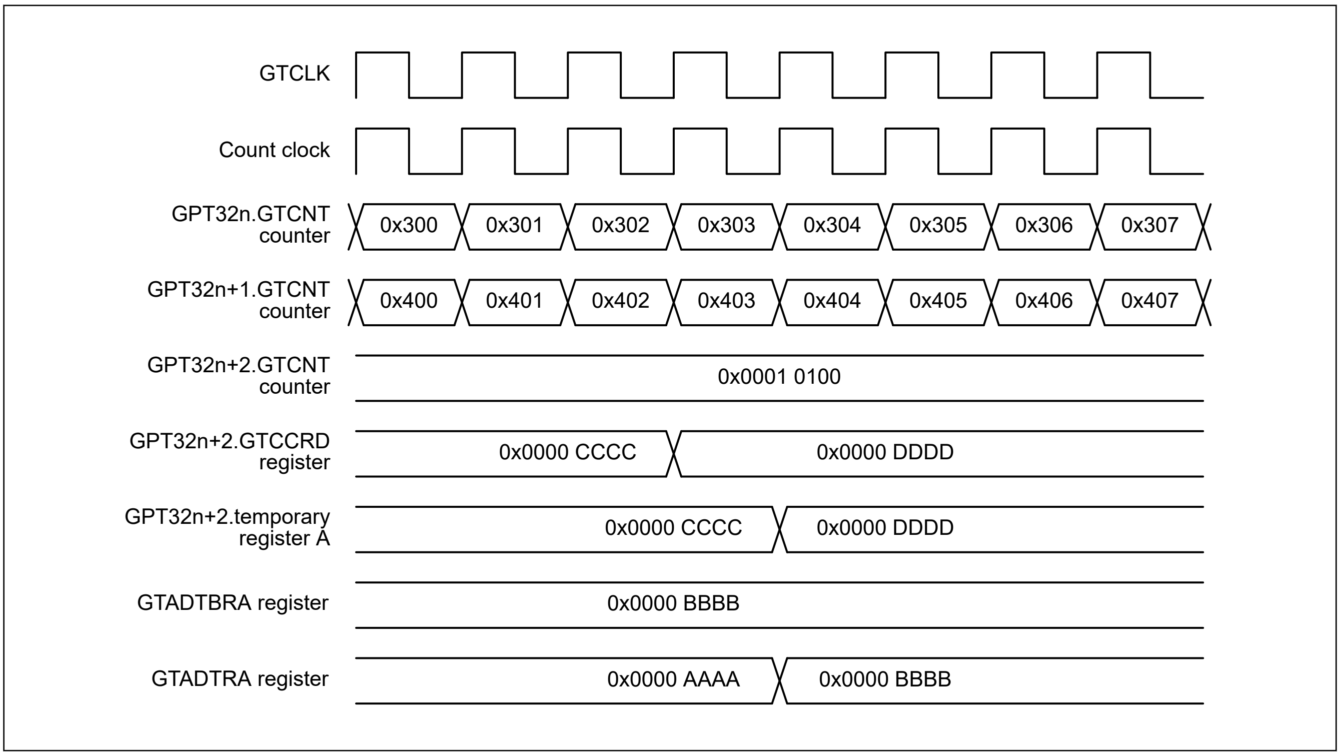

Figure 22.32 Example of Buffer Operation of the GTADTRA and GTADTRB Registers at the GTCCRD Register of Slave Channel 2 Updating in Complementary PWM Mode

Table 22.22 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. (In Figure 22.28 and Figure 22.29, 000b or 0000b (saw-wave PWM mode 1) is set, in Figure 22.30 and Figure 22.31, 100b, 101b, 110b, 0100b, 0101b, or 0110b (triangle-wave PWM mode) is set.)
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. (In Figure 22.28 and Figure 22.29, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).)
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode 2, set the cycle in the GTPR register. In the saw-wave PWM mode 2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in GTBER register. To perform buffer transfer at a compare match of the ADTRAm (m = A, B) register, set the GTBER2.CMTADm bit to 1. (In Figure 22.28, ADTTA[1:0] bits = 01b, 10b, or 11b and ADTDA bit = 0, in Figure 22.29, CMTADA bit = 1, in Figure 22.30, ADTTA[1:0] bits = 10b and ADTDA bit = 1, and in Figure 22.31, ADTTB [1:0] bits = 11b and ADTDB bit = 1.)
7	Set compare match value	Set the A/D conversion start request point in the GTADTRA and GTADTRB registers.
8	Set buffer value	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

Table 22.22 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (2 of 2)

No.	Step Name	Description
9	Enable A/D conversion start request	Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. (In Figure 22.28 and Figure 22.29, ADTRAUEN bit = 1, in Figure 22.30, ADTRADEN bit = 1, and in Figure 22.31, ADTRBUEN bit = 1 and ADTRBDEN bit = 1.)
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value of each cycle	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

22.3.2.4 Buffer operation for GTIOA and GTIOB

The GTOLBR.GTIOAB[4:0] bits can function as the buffer register of the GTIOR.GTIOA[4:0] bits and the GTOLBR.GTIOBB[4:0] bits can function as the buffer register of the GTIOR.GTIOB[4:0] bits.

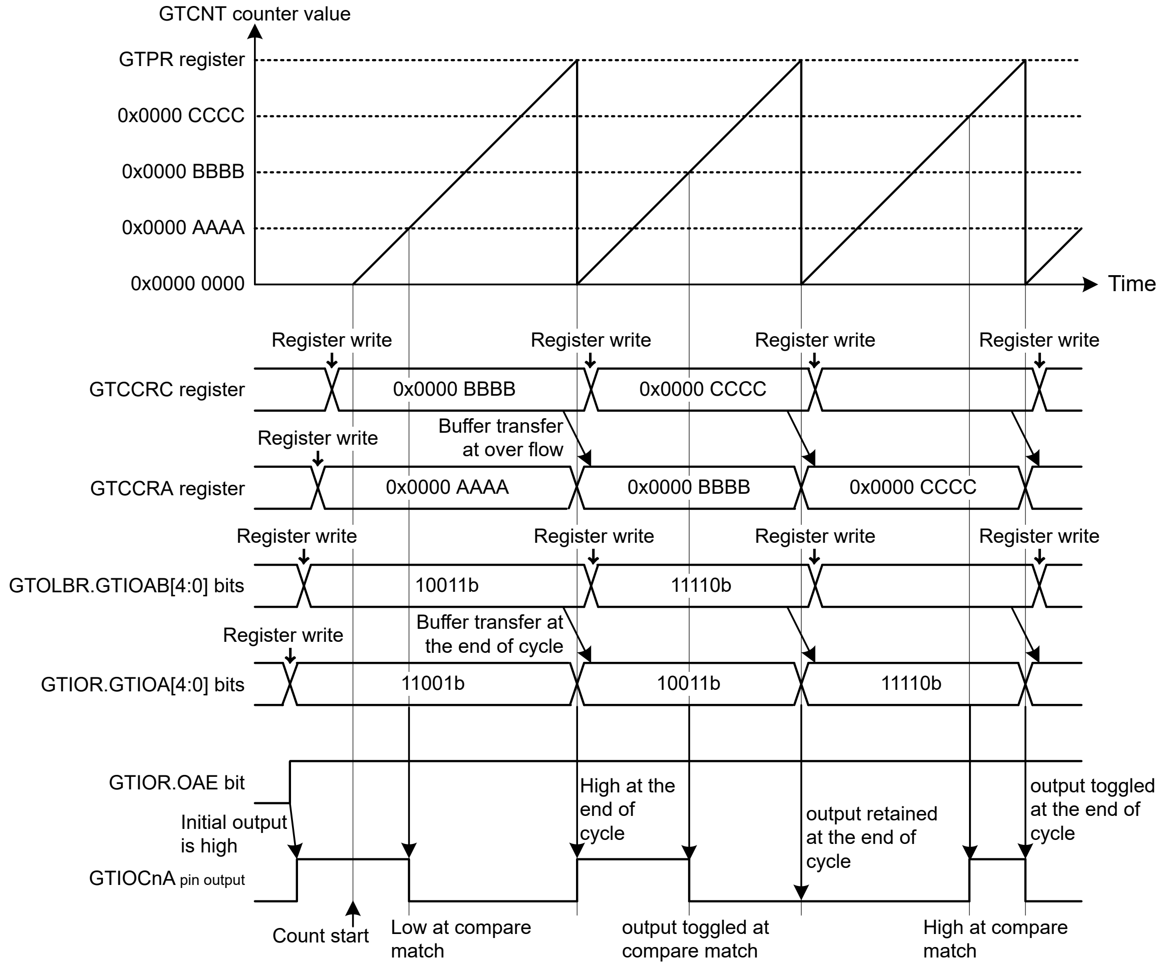
Buffer transfer timing can be set with the GTBER2.OLTTm[1:0] bits (m = A, B). It can be selected from the end of cycle or GTCCR register compare match (in saw-wave mode), from crest, trough, or both crest and trough (in triangle-wave mode and complementary PWM mode). In the case that the GTBER2.OLTTm[1:0] bits are 00b, buffer transfer is not performed.

In complementary PWM mode, the setting to convert GTIOA and GTIOB by buffer transfer during the dead time of complementary PWM is prohibited.

Therefore, when changing GTIOA and GTIOB by buffer transfer, it is necessary to set the crest and trough timings not to overlap with the dead time and change GTOLBR.GTIOAB and GTOLBR.GTIOBB.

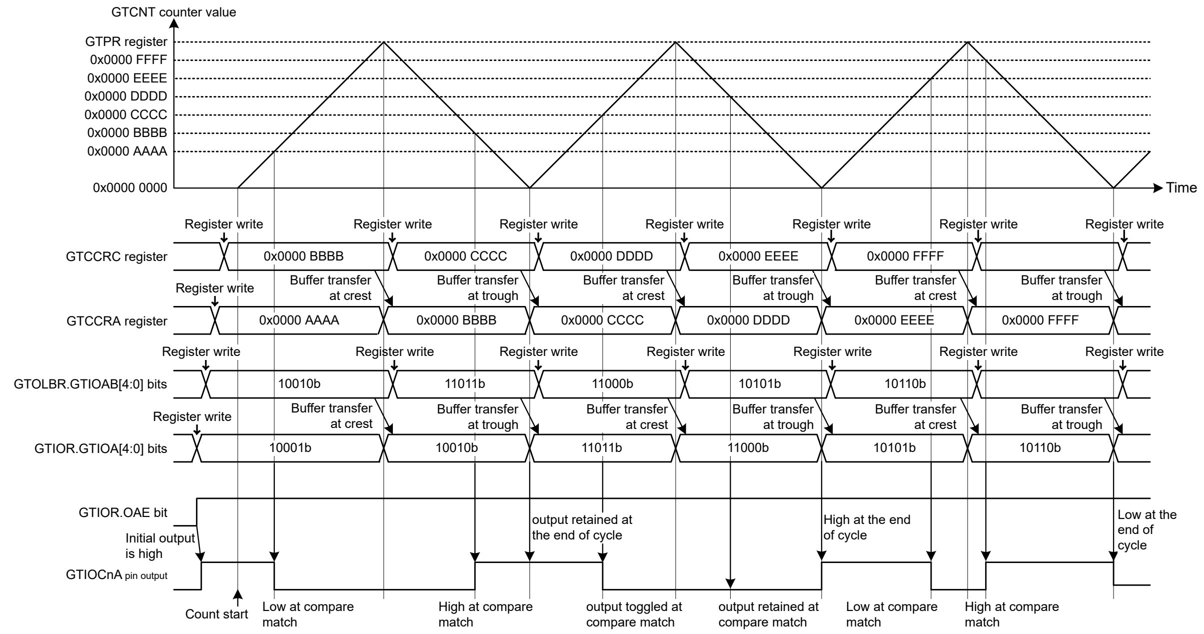
When the buffer transfer timing is crest, set the GTCCRm (m = A, C, E) register to satisfy GTCCRm < GTPR. And when the buffer transfer timing is trough, set the GTCCRm register to satisfy GTDVU < GTCCRm.

Figure 22.33 to Figure 22.35 show examples of buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits. Table 22.23 shows an example for setting buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits.



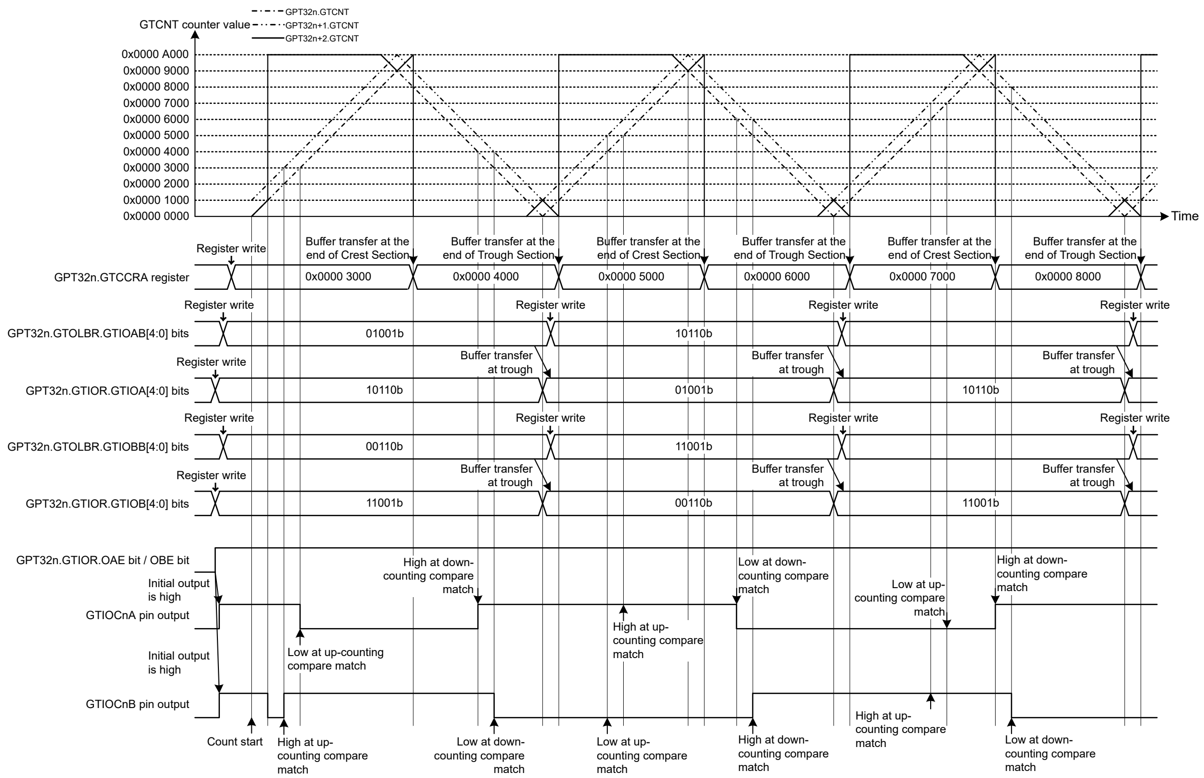
Note: Initial output is synchronized to the count clock.

Figure 22.33 Example of Buffer Operation of the GTIOA and GTIOB Bits (Up-Counting in Saw-Wave PWM Mode 1, Buffer Transfer at the End of Cycle)



Note: Initial output is synchronized to the count clock.

Figure 22.34 Example of Buffer Operation of the GTIOA and GTIOB Bits (Triangle-Wave PWM Mode 2, Buffer Transfer at Crests and Troughs)



Note: Initial output is synchronized to the count clock.

Figure 22.35 Example of Buffer Operation of the GTIOA and GTIOB Bits (Complementary PWM Mode 3, Buffer Transfer at Troughs)

Table 22.23 Example for Setting Buffer Operation of the GTIOA and GTIOB

No.	Step Name	Description
1	Set operating mode	Set the operating mode with GTCR.MD[3:0]. (In Figure 22.33, 0000b (saw-wave PWM mode 1) is set, in Figure 22.34, 0101b (triangle-wave PWM mode 2) is set, in Figure 22.35, 1110b (complementary PWM mode 3) is set.)
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. (In Figure 22.33, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).)
3	Select count clock	Select the count clock with GTCR.TPCS[3:0] bits.
4	Set cycle	Other than the saw-wave PWM mode 2, Set the cycle in GTPR. In the saw-wave PWM mode 2, Select the counter clear source compare match register GTCCRx (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In Figure 22.33, GTIOA[4:0] = 11001b, in Figure 22.34, GTIOA[4:0] = 10001b, in Figure 22.35, GTIOA[4:0] = 10110b and GTIOB[4:0] = 11001b.)
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with OAE and OBE in GTIOR.
8	Set buffer operation	Set buffer operation with OLTTm[1:0] bits in GTBER2 register. (In Figure 22.33, 01b is set in OLTTA[1:0], in Figure 22.34, 11b is set in OLTTA[1:0], in Figure 22.35, 10b is set in OLTTA[1:0] and 10b is set in OLTTB[1:0].)
9	Set buffer value	For buffer operation, set the GTIOCnm pin function in one cycle after the current cycle (in saw-wave mode and in triangle-wave/complementary PWM mode with buffer transfer at crest or trough) or half cycle after the current cycle (in triangle-wave/complementary PWM mode with buffer transfer at crest and trough) in the GTOLBR register.
10	Start count operation	Set GTCR.CST to 1 to start count operation.
11	Set buffer value of each cycle	For buffer operation, set the GTIOCnm pin function in one cycle after the current cycle (in saw-wave mode and in triangle-wave/complementary PWM mode with buffer transfer at crest or trough) or half cycle after the current cycle (in triangle-wave/complementary PWM mode with buffer transfer at crest and trough) in the GTOLBR register.

Note: n = 4 to 9
m = A, B

22.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCnA or GTIOCnB pin (n = 0 to 13) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

In complementary PWM mode, it is possible to output PWM waveforms (positive phase, negative phase) with dead time that guarantees the linearity of the PWM output pulse width near 0% and 100% duty.

In saw-wave mode other than saw-wave PWM mode 2, or triangle-wave mode, or the master channel of complementary PWM mode, the signal synchronized with the PWM cycle can be output from the GTCPPOn output terminal by setting the GTIOR.PSYE bit to 1. The GTCPPOn output is toggled at the end of cycle in saw-wave mode or at the timing of crest / trough / GTCNT counter clearing in triangle-wave mode or complementary PWM mode. The initial output of GTCPPOn is low, and it becomes high when the count starts.

22.3.3.1 Saw-Wave PWM Mode 1

In saw-wave PWM mode 1, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

When 0 is set in the GTIOR.OxEOCD (x = A, B) bit and the timing of the end of cycle and the timing of GTCCRx register compare match are the same time, the output pin performs along the PWM output setting for the end of cycle set by the GTIOR.GTIOx[3:2] bit.

When 1 is set in the GTIOR.OxEOCD bit, GTIOCnx output is retained.

Figure 22.36 shows an example of saw-wave PWM mode 1 operation, and Table 22.24 shows an example for setting saw-wave PWM mode 1.

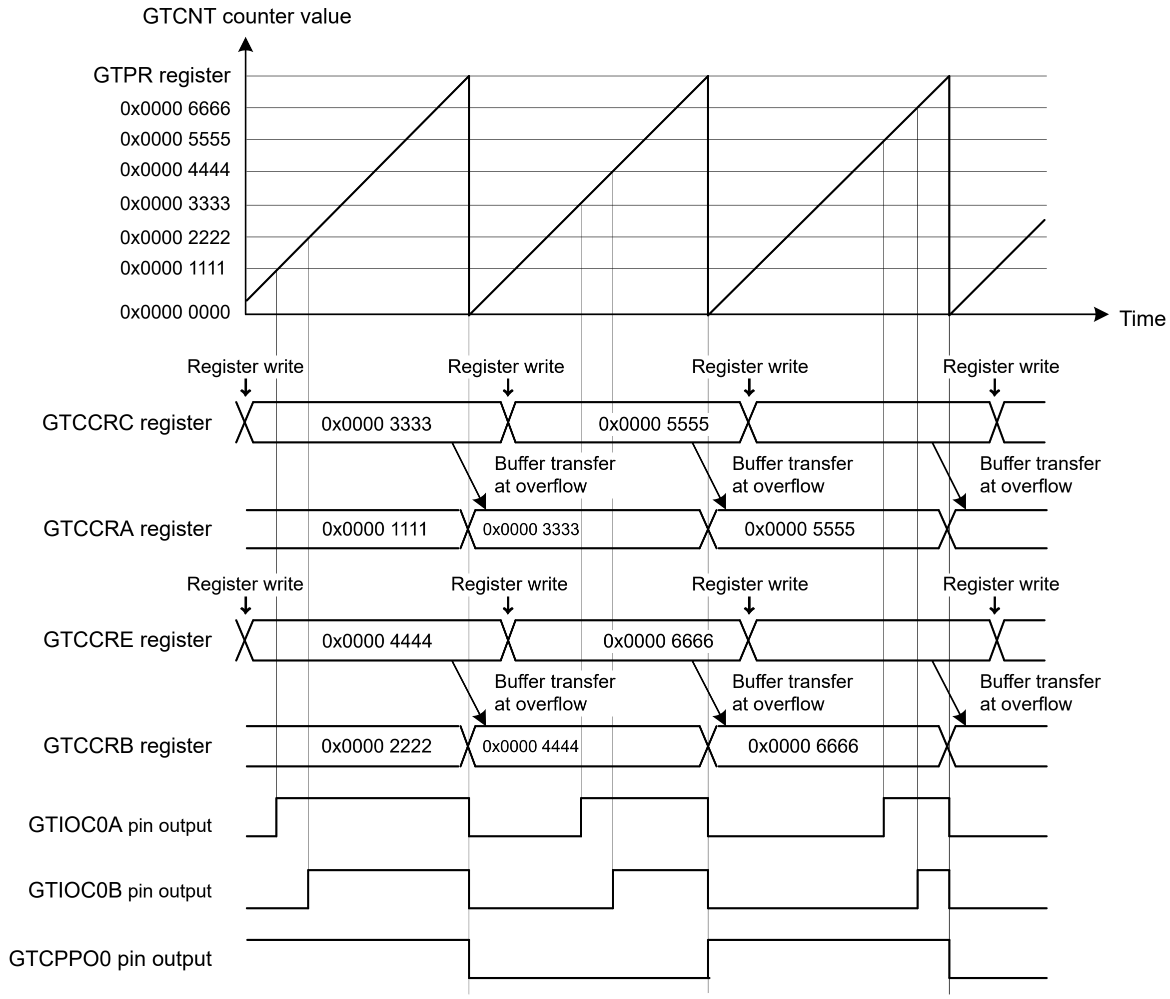


Figure 22.36 Example of saw-wave PWM mode 1 operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, low output at cycle end, and GTIOR.PSYE = 1

Table 22.24 Example for setting saw-wave PWM mode 1 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.36, 000b (saw-wave PWM mode 1) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.36, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.36, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b.
7	Enable GTCPPOn pin output	Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register.

Table 22.24 Example for setting saw-wave PWM mode 1 (2 of 2)

No.	Step Name	Description
8	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
9	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 22.36, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
10	Set compare match value*1	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.
11	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
12	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
13	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 13
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

22.3.3.2 Saw-Wave PWM Mode 2

The saw-wave PWM mode 2 is a mode in which the GTCNT counter is operated as a saw wave by up-counting without using the GTPR register, and the PWM waveform is output by the compare match of the GTCCRA and GTCCRB registers. The pin output level can be selected from low output, high output, or toggle output separately for a compare match according to the GTIOR register setting.

The GTIOCnA pin is used as an output pin. Use the GTIOR.GTIOB[1:0] bits for setting the GTIOCnA pin output at a compare match of the GTCCRB register.

When a counter clear occurs due to the GTCNT counter clearing source selected in the GTCSR register, this is handled at the end of cycle and PWM output operation at the end of the cycle selected with the GTIOR.GTIOA[3:2] bits is performed. If a counter clear (at the end of cycle) conflicts with a PWM output change due to a GTCCRx (x = A, B) register compare match, PWM output operation is performed at the end of cycle (in the case of the GTIOR.OxEOCD bit = 0) or the PWM output is retained (in the case of GTIOR.OxEOCD bit = 1).

Figure 22.37 to Figure 22.39 shows an example of saw-wave PWM mode 2 operation. Table 22.25 shows an example for setting saw-wave PWM mode 2.

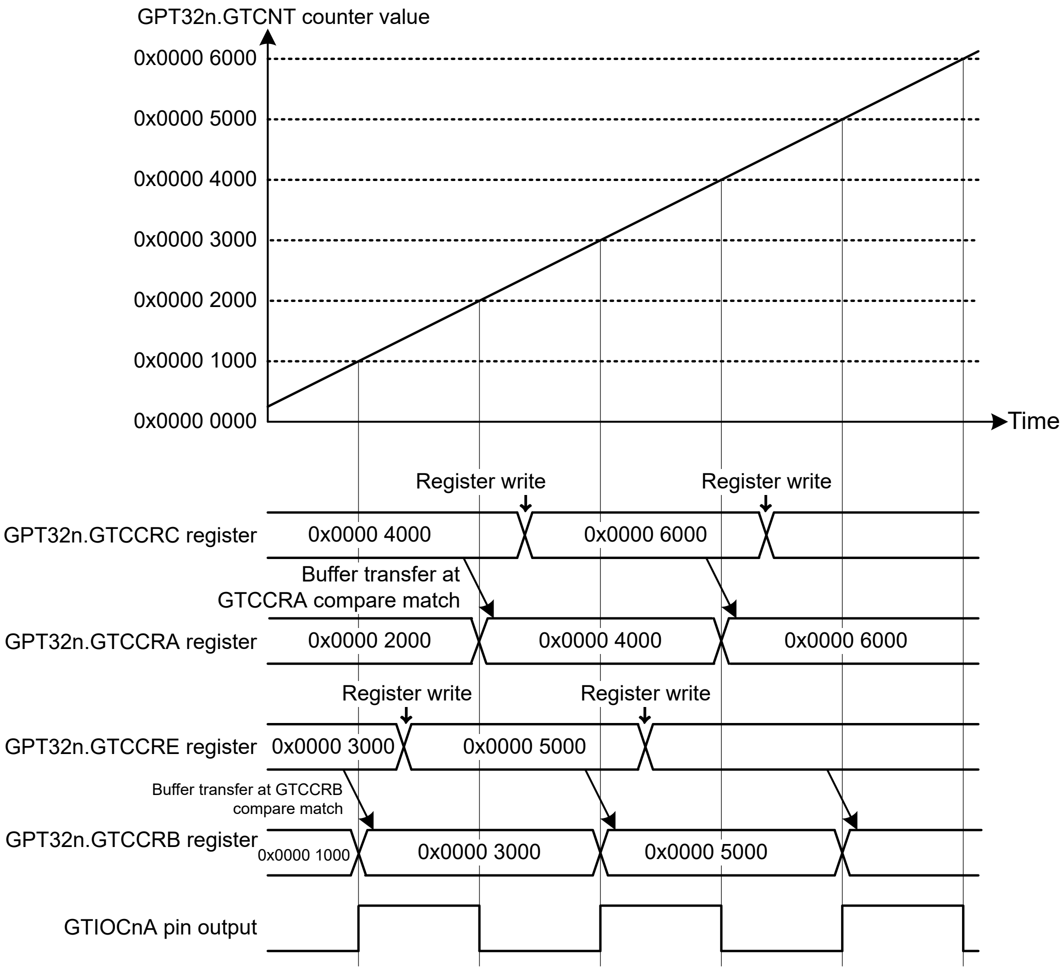

Figure 22.37 Example of Saw-Wave PWM Mode 2 Operation (Low Output at GTCCRA Register Compare Match, High Output at GTCCRB Register Compare Match, Single Buffer Operation, No Clear Setting) (n = 4 to 9)

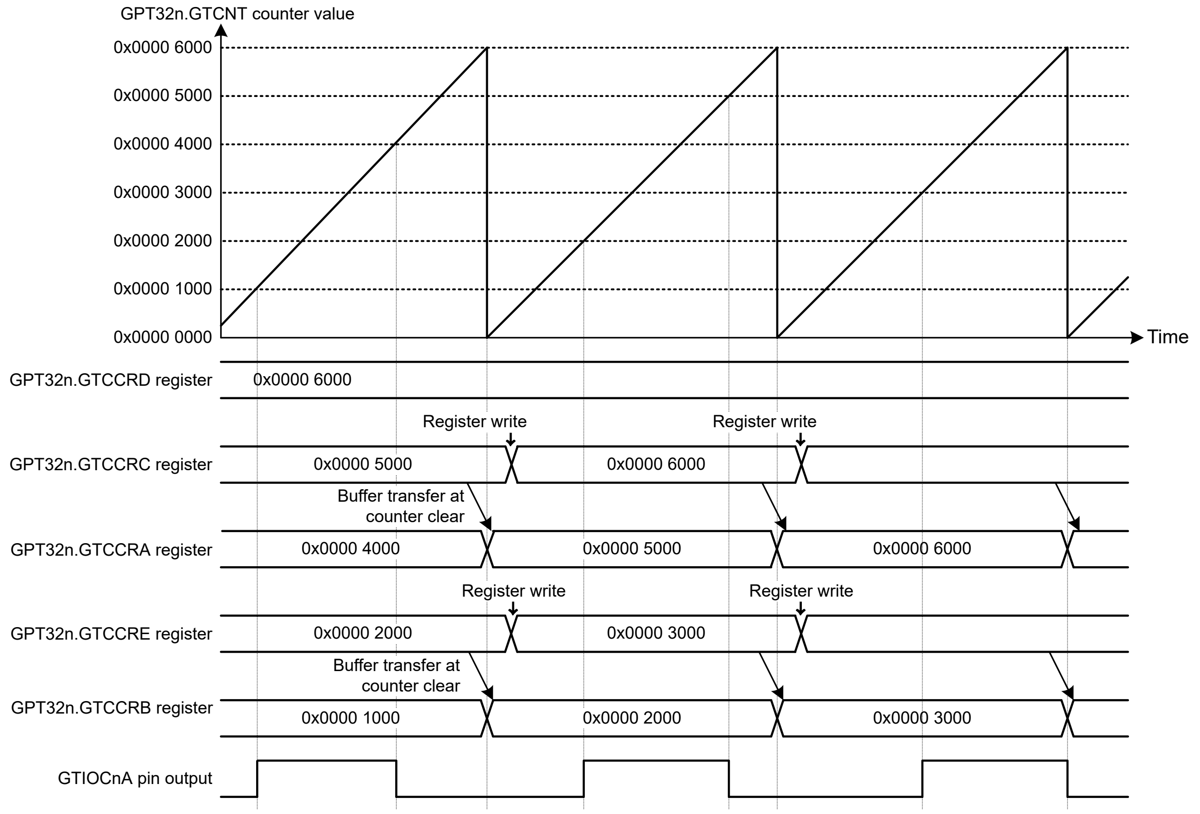

Figure 22.38 Example of Saw-Wave PWM Mode 2 Operation (Low Output at GTCCRA Register Compare Match, High Output at GTCCRB Register Compare Match, Low Output at the End of Cycle, Single Buffer Operation, Cleared at GTCCRD Register Compare Match, GTIOR.OAEOCD Bit = 0) (n = 4 to 9)

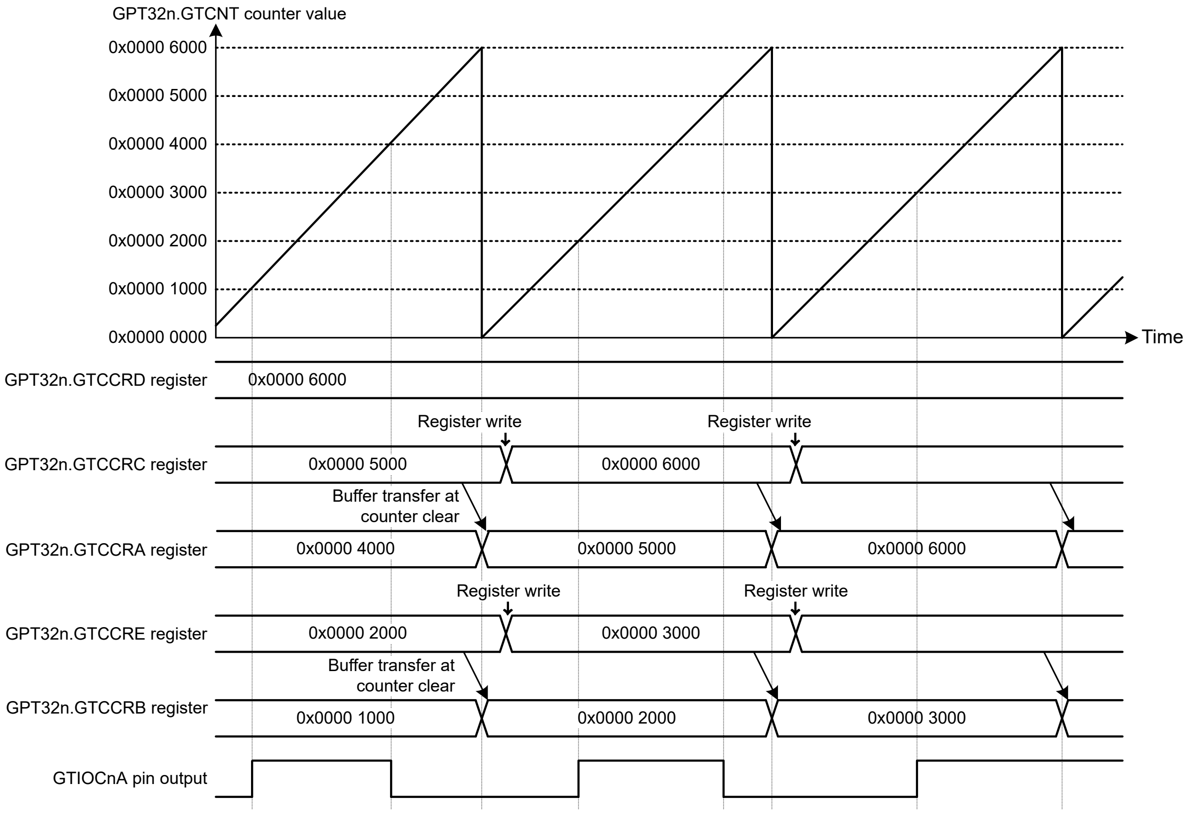

Figure 22.39 Example of Saw-Wave PWM Mode 2 Operation (Low Output at GTCCRA Register Compare Match, High Output at GTCCRB Register Compare Match, Low Output at the End of Cycle, Single Buffer Operation, Cleared at GTCCRD Register Compare Match, GTIOR.OAEOCD Bit =1) (n = 4 to 9)

Table 22.25 Example for Setting Saw-wave PWM mode 2

No.	Step Name	Description
1	Set operating mode	Set the operating mode with GTCR.MD[3:0]. (In Figure 22.37 to Figure 22.39, 0010b (saw-wave PWM mode 2) is set.)
2	Select count clock	Select the count clock with GTCR.TPCS[3:0] bits.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Set GTIOCnA pin function	Set the GTIOCnA pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In Figure 22.37 to Figure 22.39, GTIOA[4:0] = 00001b and GTIOB[1:0] = 10b.)
5	Enable GTIOCnA pin output*1	Set to enable the GTIOCnA pin output with OAE in GTIOR.
6	Set buffer operation	Set buffer operation with CCRA[1:0] and CCRB[1:0] bits in GTBER (In Figure 22.37 to Figure 22.39, CCRA[1:0] = 01b and CCRB[1:0] = 01b.)
7	Set compare match value*1	Set the GTIOCnA pin changing point in GTCCRA and GTCCRB.
8	Set buffer value	For buffer operation, set the GTCCRA register value and the GTCCRB register value which used in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTCCRA register value and the GTCCRB register value which used in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
9	Start count operation	Set GTCR.CST to 1 to start count operation.
10	Set buffer value of each cycle	For buffer operation, set the GTCCRA register value and the GTCCRB register value which used in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTCCRA register value and the GTCCRB register value which used in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 4 to 9
Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnA pin output enable and setting for a compare match value.

22.3.3.3 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

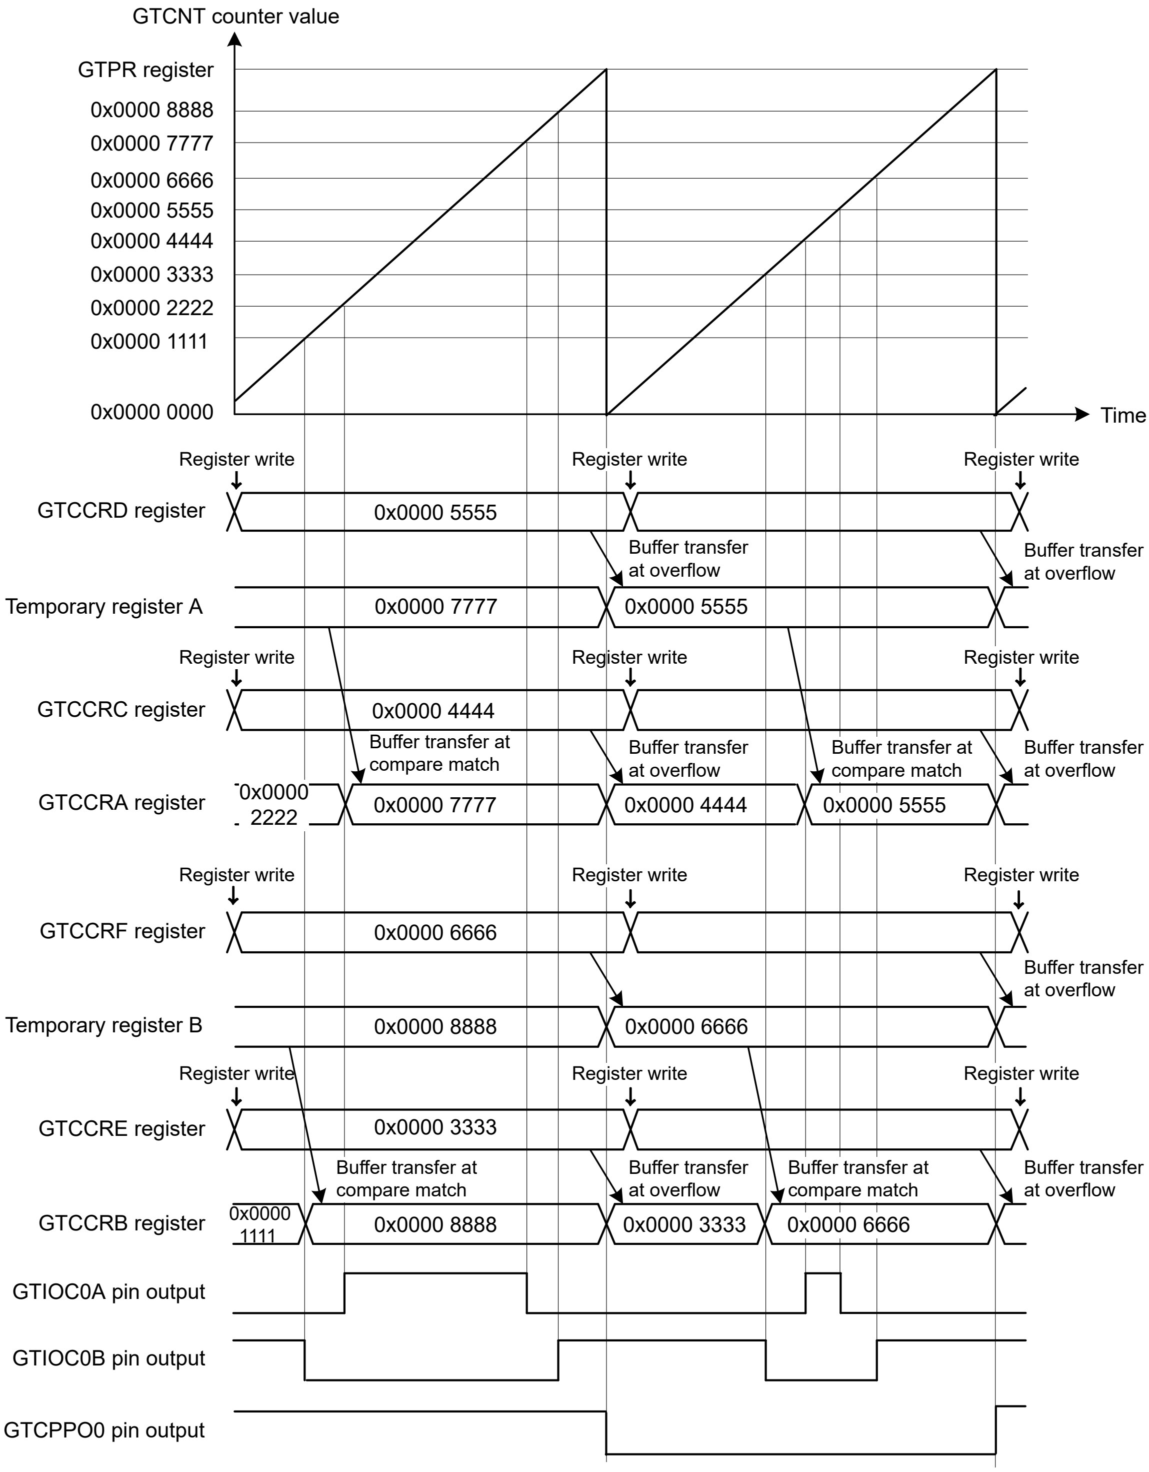
Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm register is repeated on a cyclic basis with using the temporary register x (x = C, E) and temporary register m which operate as intermediate buffers for the GTCCRx and GTCCRm registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, see section 22.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 22.40 shows an example of saw-wave one-shot pulse mode operation, and Table 22.26 shows an example for setting saw-wave one-shot pulse mode.



Note: The base address of registers are the same.

Figure 22.40 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 22.26 Example setting for saw-wave one-shot pulse mode

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.40, 001b (saw-wave one-shot pulse mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 22.40, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.40, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
7	Enable GTCPPOn pin output	Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register.
8	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
9	Set compare match value*1	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
10	Set forcible buffer transfer*1	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly.
11	Set buffer value	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
12	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
13	Set buffer value for each cycle	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

Note: n: 0 to 13
m: A, B

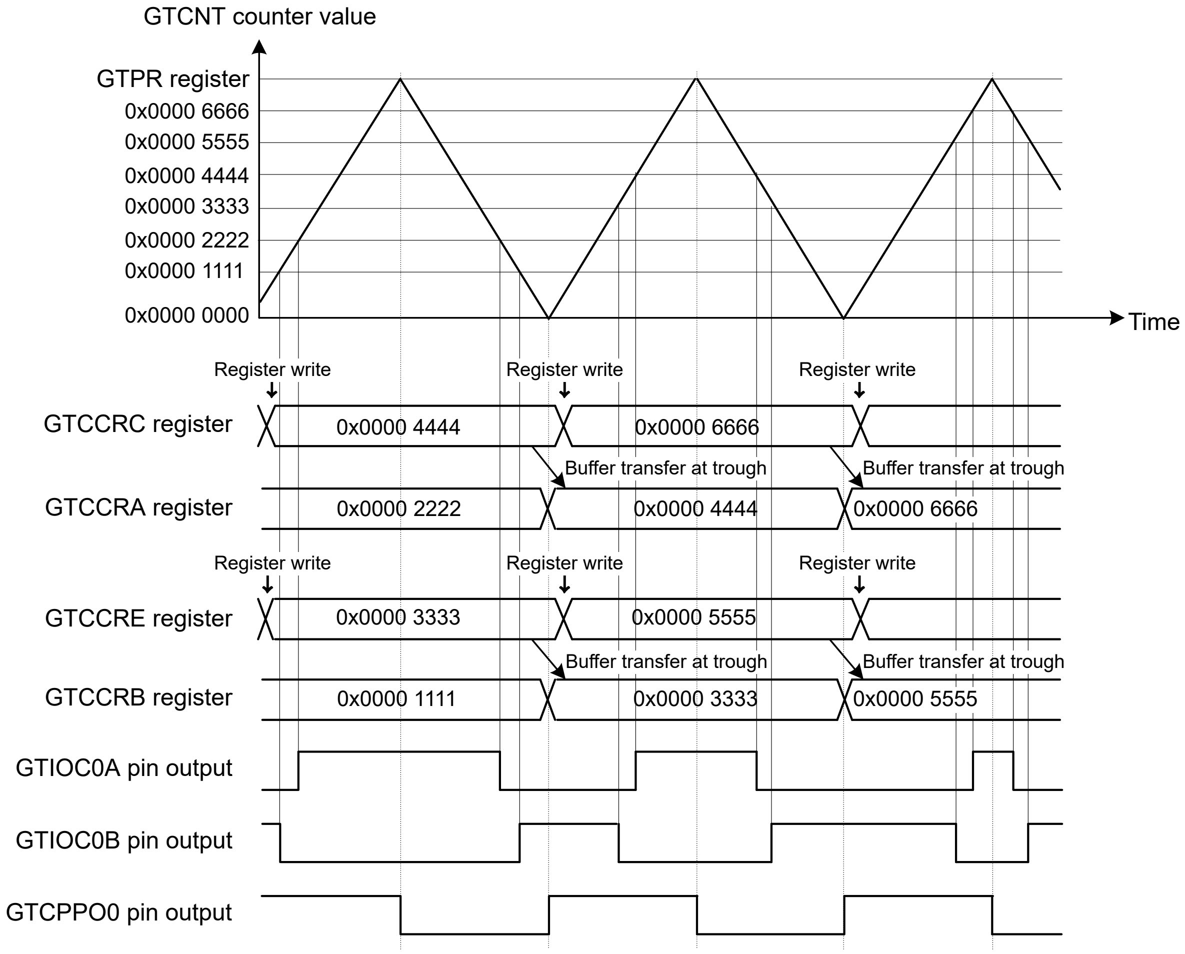
Note 1. When using PWM Delay Generation circuit, change the order of Enable GTIOCnm pin output and Set compare match value + Set forcible buffer transfer.

22.3.3.4 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 22.41 shows an example of a triangle-wave PWM mode 1 operation, and Table 22.27 shows an example for setting a triangle-wave PWM mode 1.



Note: The base address of registers are the same.

Figure 22.41 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB register compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 22.27 Example setting for triangle-wave PWM mode 1 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.41, 100b (triangle-wave PWM mode 1) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.41, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTCPPOn pin output	Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register.
7	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 22.41, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
9	Set compare match value*1	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.

Table 22.27 Example setting for triangle-wave PWM mode 1 (2 of 2)

No.	Step Name	Description
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 13
m: A, B

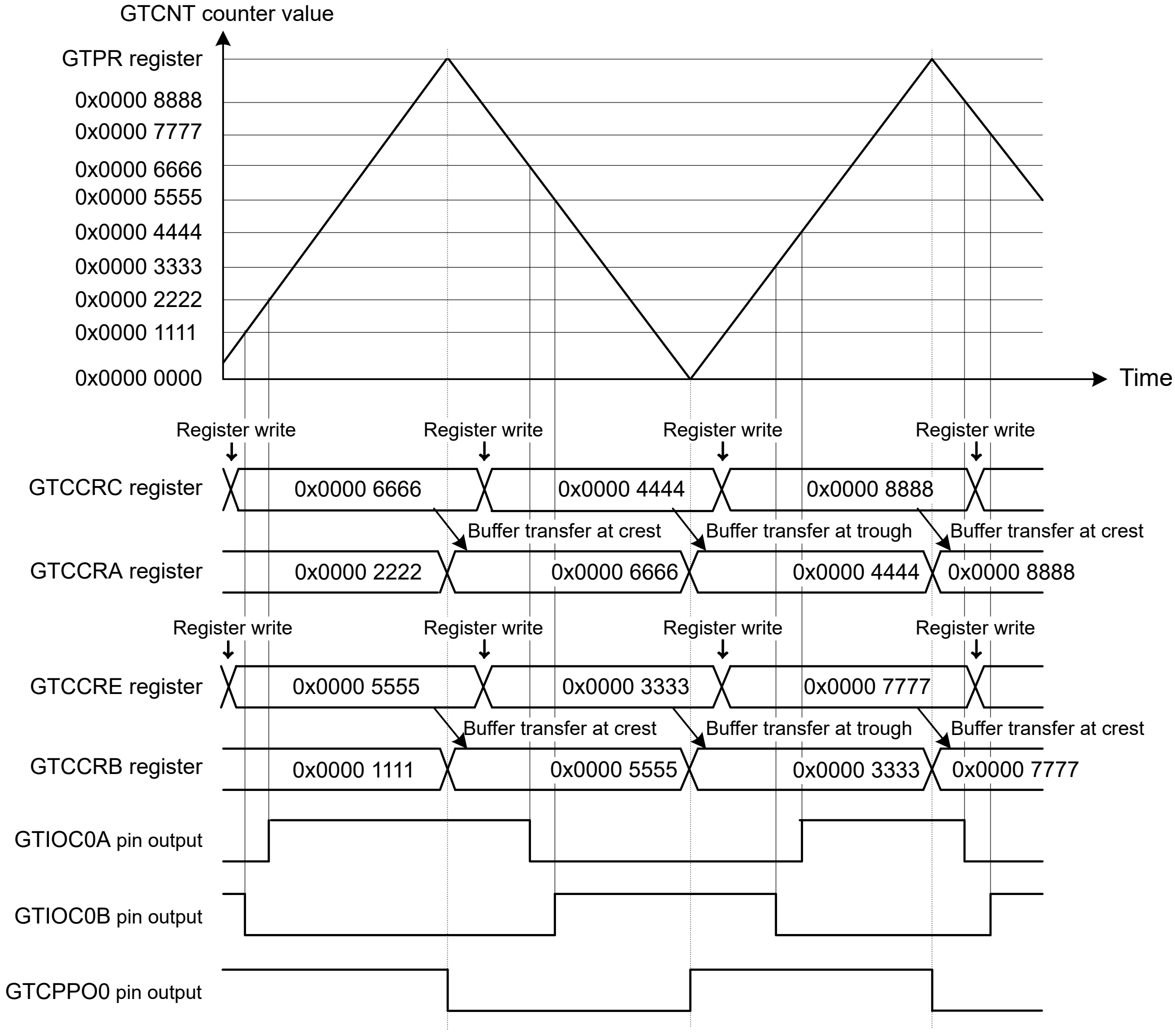
Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

22.3.3.5 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 22.42 shows an example of triangle-wave PWM mode 2 operation, and Table 22.28 shows an example for setting triangle-wave PWM mode 2.



Note: The base address of registers are the same.

Figure 22.42 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 22.28 Example for setting triangle-wave PWM mode 2 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.42, 101b (triangle-wave PWM mode 2) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.42, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTCPPOn pin output	Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register.
7	Enable GTIOCnm pin output[*1]	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 22.42, CCRA[1:0] = 01b and CCRB[1:0] = 01b.

Table 22.28 Example for setting triangle-wave PWM mode 2 (2 of 2)

No.	Step Name	Description
9	Set compare match value[*1]	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each half cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 13
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

22.3.3.6 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

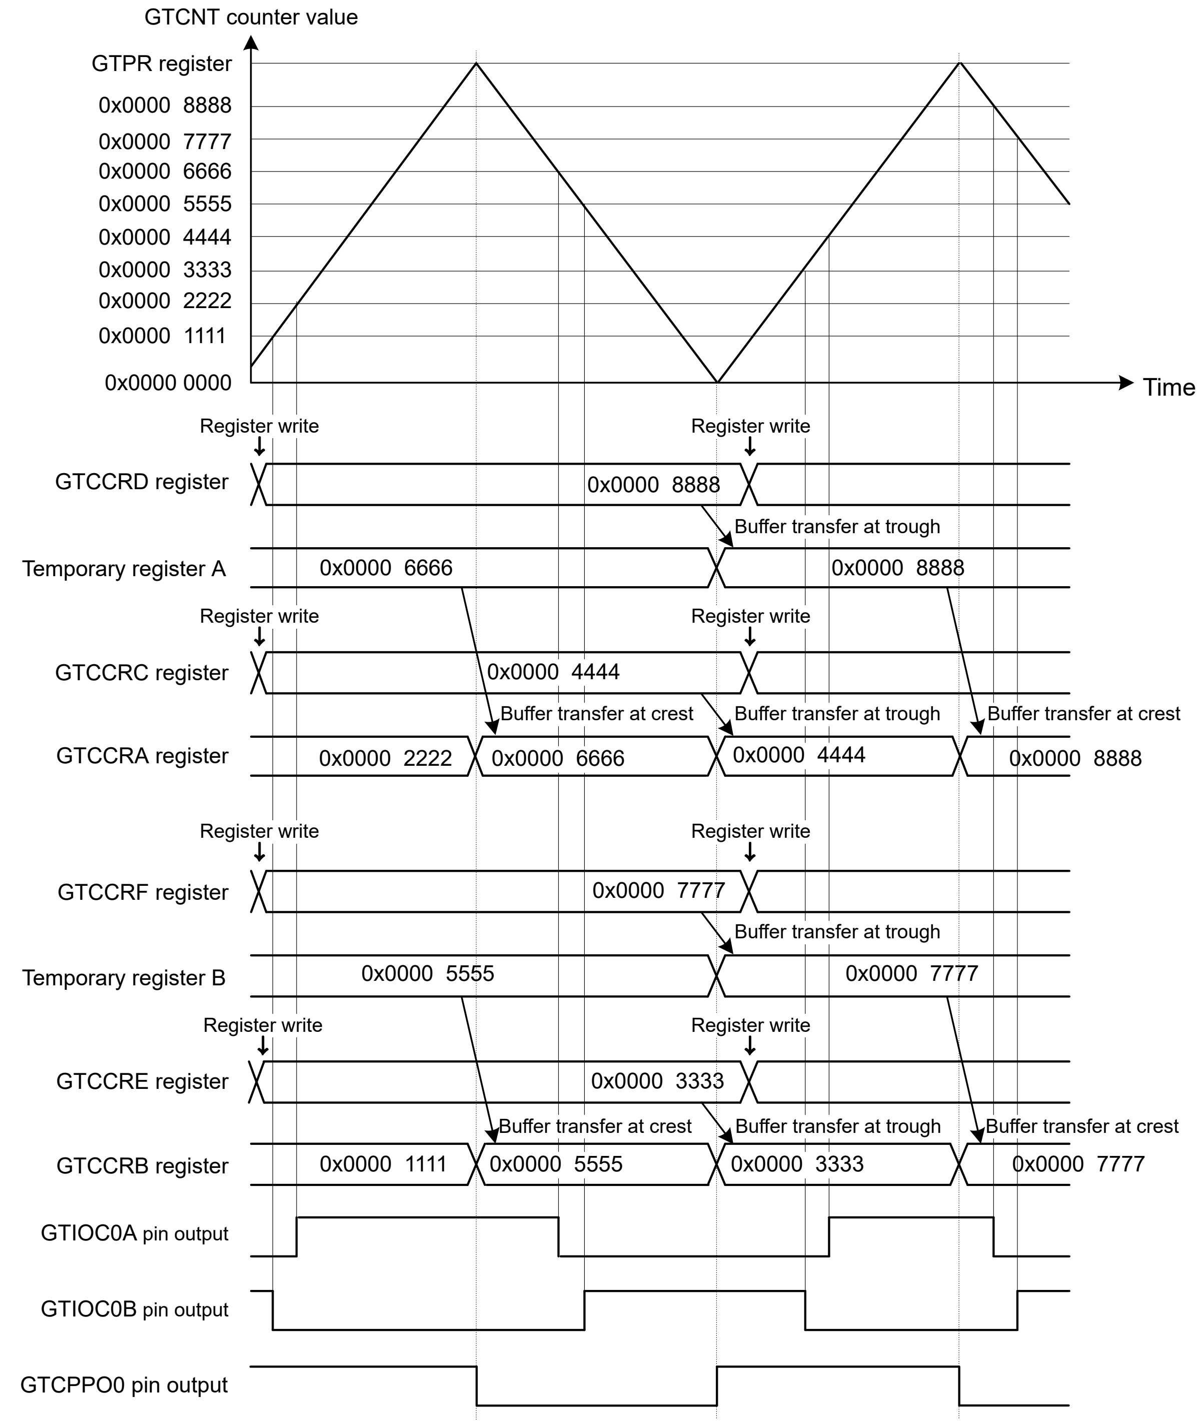
The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 22.43 shows an example of triangle-wave PWM mode 3 operation, and Table 22.29 shows an example for setting triangle-wave PWM mode 3.



Note: The base address of registers are the same.

Figure 22.43 Example of triangle-wave PWM mode 3 operation with low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 22.29 Example setting for triangle-wave PWM mode 3 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 22.43, 110b (triangle-wave PWM mode 3) is set.

Table 22.29 Example setting for triangle-wave PWM mode 3 (2 of 2)

No.	Step Name	Description
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 22.43, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTCPPOn pin output	Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register.
7	Enable GTIOCnm pin output*1	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value*1	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
9	Set forcible buffer transfer*1	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly.
10	Set buffer value	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

Note: n: 0 to 13
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of Enable GTIOCnm pin output and Set compare match value + Set forcible buffer transfer.

22.3.3.7 Complementary PWM mode 1, 2, 3

In complementary PWM mode, a three-phase PWM waveform with dead time that ensures the linearity in the vicinity of duty 0% and 100% can be output using the GTCNT counter of consecutive three channels. There are four modes depending on differences in buffer operation: (1) complementary PWM mode 1 (transfer at crests), (2) complementary PWM mode 2 (transfer at troughs), (3) complementary PWM mode 3 (transfer at crests and troughs), and (4) complementary PWM mode 4 (immediate transfer).

Figure 22.44 shows the block diagram in complementary PWM modes 1 to 3.

Among consecutive three channels, the lowest channel is referred to as master channel, and the adjacent upper two channels are referred to as slave channel 1 (lower) and slave channel 2 (upper).

The GTCNT counter of each channel performs individual count operation under the cycle operation by the master channel. In each channel, compare match with the GTCCRA register is performed selecting one of the three GTCNT counters in each operation section, and a positive-phase waveform and a negative-phase waveform are output from the GTIOCn+iA pin (i = 0, 1, 2) and the GTIOCn+iB pin respectively with a non-overlapping section of the dead time value set in the GTDVU register of the master channel.

The GTCCRA register performs buffer operation by the GTCCRC register, temporary register A, and GTCCRD register. In complementary PMW mode 3, setting the GTBER2.CP3DB bit to 1 also enables buffer operation of the GTCCRA register by the GTCCRE register, temporary register B, and GTCCRF register, allowing double buffer operation.

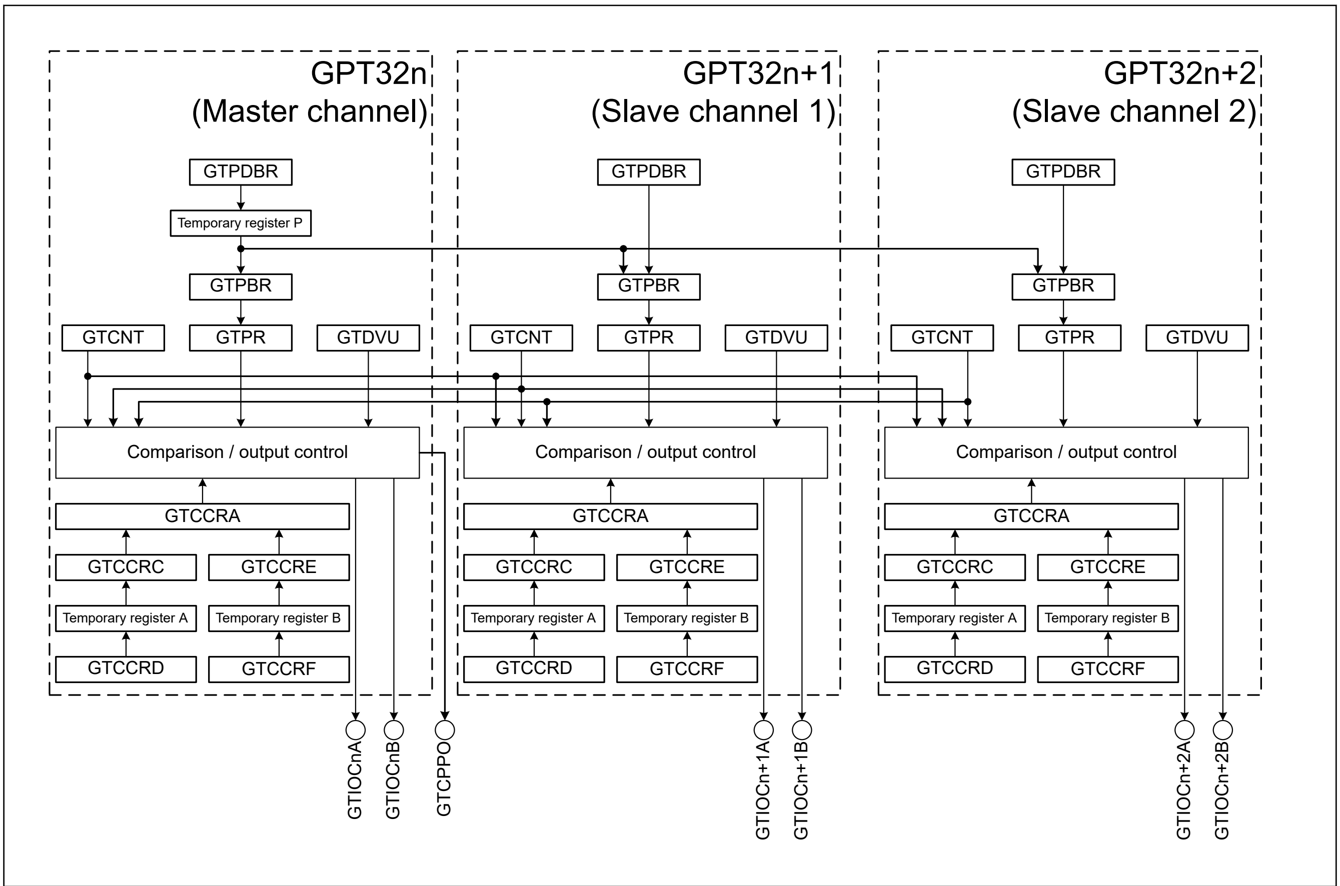


Figure 22.44 Block Diagram in Complementary PWM Mode 1, 2, 3 (n = 4, 7)

The GPT32n.GTCNT counter performs count operation for triangle waves using the GPT32n.GTPR register as a cycle register. A section where the GPT32n.GTCNT counter value is not larger than the dead time value is referred to as trough section.

The GPT32n+1.GTCNT counter performs count operation with the value (GPT32n.GTCNT counter value + dead time value set in the GPT32n.GTDVU register). A section where the GPT32n+1.GTCNT counter value is larger than the GPT32n.GTPR register value is referred to as crest section.

Crest section and trough section are classified into up-counting crest section, down-counting crest section, up-counting trough section, and down-counting trough section according to counting direction. A section between trough section and crest section is referred to as up-counting middle section or down-counting middle section according to counting direction. A section equivalent to the up-counting trough section after starting count operation is referred to as initial output section where operation differs partially from other up-counting trough sections.

The GPT32n+2.GTCNT counter functions as a counter to ensure the linearity in the vicinity of duty 0% and 100%. In a crest section, this counter performs count operation for a triangle wave (up-counting after down-counting) with the value (GPT32n.GTPR register value + dead time value) as an initial value and the GPT32n.GTPR register value as a trough. This counter is cleared to 0 at the end of the crest section, and then stops counting until the next trough section. In a trough section, this counter performs count operation for a triangle wave with an initial value of 0 and dead time value as a crest. This counter becomes the value (GPT32n.GTPR register value + dead time value) at the end of the trough section, and then stops counting until the next crest section. In the initial output section, however, this counter counts up with an initial value of 0 until the dead time value, and then becomes the value (GPT32n.GTPR register value + dead time value).

If the counter stops and then restarts in complementary PWM mode, the counter of each channel returns to the initial value after starting count operation, and then starts counting from the initial output section.

Table 22.30 and Table 22.31 shows count operation (counting direction/counting range) in each section. In these tables, registers with no channel identification indicate that the same value is stored in them of the master channel, slave channel 1, and slave channel 2.

Table 22.30 Count Operation in Complementary PWM Mode

Counter	Initial Value	Initial Output Section (After Start)	Up-Counting Middle Section	Up-Counting Crest Section	Down-Counting Crest Section
GPT32n.GTCNT	0	Up-counting 0 to GTDVU	Up-counting GTDVU+1 to GTPR-GTDVU	Up-counting GTPR-GTDVU+1 to GTPR	Down-counting GTPR-1 to GTPR-GTDVU
GPT32n+1.GTCNT	GTDVU	Up-counting GTDVU to GTDVU×2	Up-counting GTDVU×2+1 to GTPR	Up-counting GTPR+1 to GTPR+GTDVU	Down-counting GTPR+GTDVU-1 to GTPR
GPT32n+2.GTCNT	0	Up-counting 0 to GTDVU	Stop GTPR+GTDVU	Down-counting GTPR+GTDVU-1 to GTPR	Up-counting GTPR+1 to GTPR+GTDVU

Table 22.31 Count Operation in Complementary PWM Mode

Counter	Down-Counting Middle Section	Down-Counting Trough Section	Up-Counting Trough Section
GPT32n.GTCNT	Down-counting GTPR-GTDVU-1 to GTDVU	Down-counting GTDVU-1 to 0	Up-counting 1 to GTDVU
GPT32n+1.GTCNT	Down-counting GTPR-1 to GTDVU×2	Down-counting GTDVU×2-1 to GTDVU	Up-counting GTDVU+1 to GTDVU×2
GPT32n+2.GTCNT	Stop 0	Up-counting 1 to GTDVU	Down-counting GTDVU-1 to 0

In complementary PWM mode, the GTCCRA register performs unusual buffer operation.

Data transfers from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B are performed at the same time in three channels by writing a value to the GTCCRD register of the GPT32n+2 channel.

Data transfers from the temporary register A and temporary register B to the GTCCRC and GTCCRE registers vary depending on the transfer timing to the temporary register A and temporary register B. Data transfers from the GTCCRC and GTCCRE registers to the GTCCRA register are performed according to each complementary PWM mode name (crest transfer, trough transfer, and crest/trough transfer).

Buffer operation of the GTPR register in complementary PWM mode is described in section 22.3.2.1. GTPR Register Buffer Operation. Do not perform buffer operation for the GTDVU register in complementary PWM mode.

Table 22.32 shows buffer transfer timing during single buffer operation in complementary PWM modes 1 to 3. Table 22.33 shows buffer transfer timing during double buffer operation in complementary PWM mode 3.

Table 22.32 Single Buffer Transfer Timing in Complementary PWM Mode 1, 2, 3

Buffer Transfer	Complementary PWM Mode 1	Complementary PWM Mode 2	Complementary PWM Mode 3 (Single Buffer)
GTCCRD ↓ Temporary register A	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)
Temporary register A ↓ GTCCRC	(1) When data is transferred to temporary register A in up-counting middle section After one GTCLK cycle from transfer to temporary register A (2) When data is transferred to temporary register A in a section other than up-counting middle section At the end of trough section	(1) When data is transferred to temporary register A in down-counting middle section After one GTCLK cycle from transfer to temporary register A (2) When data is transferred to temporary register A in a section other than down-counting middle section At the end of crest section	(1) When data is transferred to temporary register A in middle section After one GTCLK cycle from transfer to temporary register A (2) When data is transferred to temporary register A in a section other than middle section At the end of crest and trough sections
GTCCRC ↓ GTCCRA	At the end of crest section Counter clear in up-counting middle section and crest section	At the end of trough section (excluding initial output section) Counter clear in down-counting middle section and trough section	At the end of crest section At the end of trough section (excluding initial output section) Counter clear

Table 22.33 Double Buffer Transfer Timing in Complementary PWM Mode 3

Transfer from GTCCRD to GTCCRA		Transfer from GTCCRF to GTCCRA	
Buffer Transfer	**Transfer Timing**	**Buffer Transfer**	**Transfer Timing**
GTCCRD ↓ Temporary register A	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)	GTCCRF ↓ Temporary register B	After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2)
Temporary register A ↓ GTCCRC	(1) When data is transferred to temporary register A in middle section After one GTCLK cycle from transfer to temporary register A (2) When data is transferred to temporary register A in a section other than middle section At the end of crest and trough sections	Temporary register B ↓ GTCCRE	(1) When data is transferred to temporary register B in middle section After one GTCLK cycle from transfer to temporary register B (2) When data is transferred to temporary register B in a section other than middle section At the end of crest and trough sections
GTCCRC ↓ GTCCRA	At the end of crest section Counter clear	GTCCRE ↓ GTCCRA	At the end of trough section (excluding initial output section)

An output level change in the positive-phase waveform from the GTIOCn+iA pin (i = 0, 1, 2) and the negative-phase waveform from the GTIOCn+iB pin occurs at a compare match in combination of counters and registers determined for each operation section. In middle sections, the positive-phase waveform output level changes at a compare match of the GPT32n.GTCNT counter and the GTCCRA register, and the negative-phase waveform output level changes at a compare match between the GPT32n+1.GTCNT counter and the GTCCRA register. In crest and trough sections, compare match operation is performed using the GPT32n+2.GTCNT counter, GTCCRC register, and GTCCRE register to ensure the linearity in the vicinity of duty 0% and 100%.

In the case that the compare match value equals to or larger than the GPT32n.GTPR register value, the duty becomes 0% (positive-phase waveform OFF, negative-phase waveform ON). In the case that the compare match value is 0, the duty becomes 100% (positive-phase waveform ON, negative-phase waveform OFF).

Table 22.34 lists combinations of counters and registers used for compare match operation to generate a positive-phase waveform and a negative-phase waveform in each operation section.

Table 22.34 Combinations of Counters and Registers for Compare Match Operation in Complementary PWM Mode

	Up-Counting Middle Section	Up-Counting Crest Section	Down-Counting Crest Section	Down-Counting Middle Section	Down-Counting Trough Section	Up-Counting Trough Section
Negative-phase OFF	GPT32n+1.GTCNT	GPT32n+1.GTCNT	—	GPT32n+2.GTCNT*1	GPT32n+2.GTCNT	GPT32n+1.GTCNT
	GTCCRA	GTCCRA	—	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)
Positive-phase ON	GPT32n.GTCNT	GPT32n.GTCNT	GPT32n+2.GTCNT	—	GPT32n.GTCNT*1	GPT32n.GTCNT
	GTCCRA	GTCCRA	GTCCRA	—	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)
Positive-phase OFF	GPT32n+2.GTCNT*1	GPT32n+2.GTCNT	GPT32n.GTCNT	GPT32n.GTCNT	GPT32n.GTCNT	—
	GTCCRC	GTCCRC	GTCCRC	GTCCRA	GTCCRA	—
Negative-phase ON	—	GPT32n+1.GTCNT*1	GPT32n+1.GTCNT	GPT32n+1.GTCNT	GPT32n+1.GTCNT	GPT32n+2.GTCNT
	—	GTCCRC	GTCCRC	GTCCRA	GTCCRA	GTCCRA

Note 1. Compare match is performed only at the time of final count in the target section, but is not performed at count values other than the final count.

In the case of normal complementary PWM mode waveform, a PWM waveform change occurs in the order of negative-phase OFF → positive-phase ON → positive-phase OFF → negative-phase ON. However, this order may vary depending on operation section and register values. In this case, OFF takes precedence in trough sections and ON takes precedence in crest sections (for negative-phase waveforms), and ON takes precedence in trough sections and OFF takes precedence in crest sections (for positive-phase waveforms). A lower-priority compare match that occurs at the same time or after a higher-priority compare match is ignored.

In the initial output section, the initial output set in the GTIOR register is retained. In the case that the GTCCRA register value is larger than the GTDVU register value at the end of the initial output section, negative phase is enabled. In the case that the GTCCRA register value is not larger than the GTDVU register value, positive phase is enabled.

As operation examples of normal complementary PWM mode waveform where compare match operation occurs in the middle section, Figure 22.45 and Figure 22.46 show complementary PWM mode 1, Figure 22.47 and Figure 22.48 show complementary PWM mode 2, Figure 22.49 and Figure 22.50 show single buffer complementary PWM mode 3, and Figure 22.51 and Figure 22.52 show double buffer complementary PWM mode 3.

Figure 22.53 to Figure 22.64 show complementary PWM mode waveforms where compare match operation occurs in crest sections and trough sections and differences due to compare match occurrence order.

Figure 22.65 and Figure 22.66 show examples of initial output operation according to the GTCCRA register value.

Table 22.35 shows an example for setting complementary PWM modes 1 to 3.

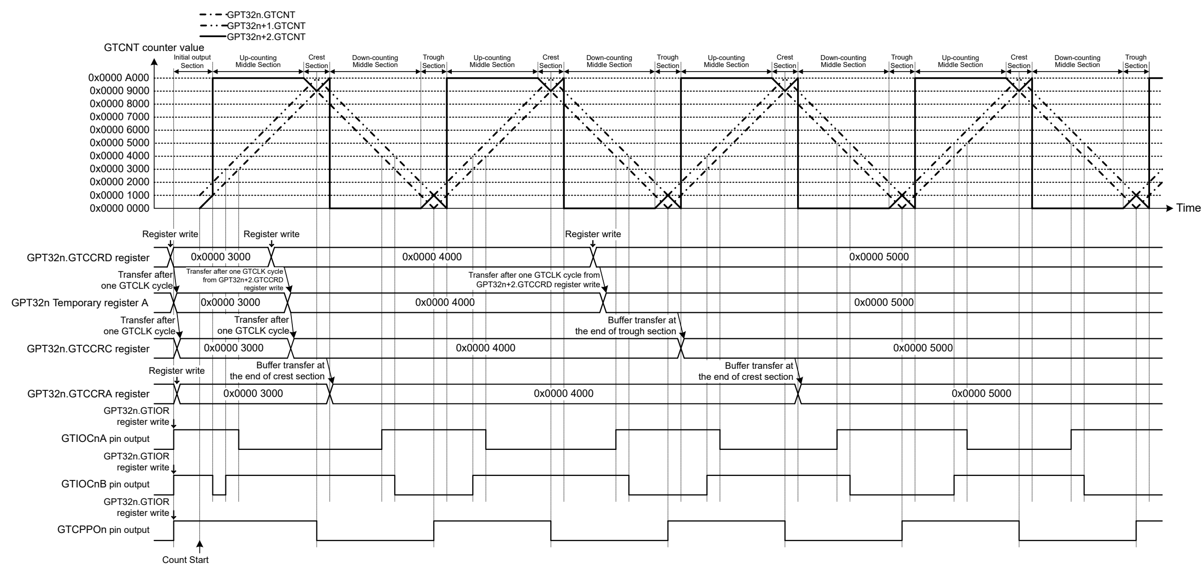

Figure 22.45 Example of Complementary PWM Mode 1 Operation (GTIOCnA pin = High / GTIOCnB pin = High as initial output, GTIOCnA pin = Low / GTIOCnB pin = High at GTCCRA register compare match during up-counting, GTIOCnA pin = High / GTIOCnB pin = Low at GTCCRA register compare match during down-counting, the dead time value is 0x0000 1000 and updating GTCCRD register in middle section) (n = 4, 7)
