These bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes. That is, the interval between settings is any power of two. When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set. When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits. In repeat-block transfer mode, write 00000b in the DARA[4:0] bits. An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. Table 18.2 lists the settings and the corresponding extended repeat areas.

Note: When setting the extended repeat area, set the lowest bit or lower bits of DMDAR as follows according to the setting of DMTMD.SZ[1:0].
When DMTMD.SZ[1:0] = 01b (16 bits), set DMDAR[0] to 0b.

When DMTMD.SZ[1:0] = 10b (32 bits), set DMDAR[1:0] to 00b.
When DMTMD.SZ[1:0] = 11b (64 bits), set DMDAR[2:0] to 000b.

DADR Bit (Destination Address Update Setting after Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR register after reloading the value of DMDRR register. When this bit is set to 1, an index value ((DMDBSH – DMDBSL) × transfer data size) is added to DMDAR register after reloading the value of DMDRR register. When this bit is set to 0, DMDAR register only reloads DMDRR register. This behavior is described in Table 18.13. In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] Bits (Destination Address Update Mode Select)

These bits select the mode of updating the destination address. When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the destination address is incremented by 1, 2, 4, and 8, respectively. When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the destination address is decremented by 1, 2, 4, and 8, respectively. When offset addition is selected, the offset specified by the DMOFR register is added to the address.

SARA[4:0] Bits (Source Address Extended Repeat Area Setting)

These bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes. When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set. When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits. In repeat-block transfer mode, write 00000b in the SARA[4:0] bits. An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. Table 18.2 lists the settings and the corresponding extended repeat areas.

Note: When setting the extended repeat area, set the lowest bit or lower bits of DMSAR as follows according to the setting of DMTMD.SZ[1:0].
When DMTMD.SZ[1:0] = 01b (16 bits), set DMSAR[0] to 0b.
When DMTMD.SZ[1:0] = 10b (32 bits), set DMSAR[1:0] to 00b.
When DMTMD.SZ[1:0] = 11b (64 bits), set DMSAR[2:0] to 000b.

SADR Bit (Source Address Update Setting after Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR register after reloading the value of DMSRR register. When this bit is set to 1, an index value ((DMSBSH – DMSBSL) × transfer data size) is added to DMSAR register after reloading the value of DMSRR register. When this bit is set to 0, DMSAR register only reloads DMSRR register. This behavior is described in Table 18.12. In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] Bits (Source Address Update Mode Select)

These bits select the mode of updating the source address. When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the source address is incremented by 1, 2, 4, and 8, respectively. When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the source address is decremented by 1, 2, 4, and 8, respectively. When offset addition is selected, the offset specified by the DMOFR register is added to the address.

Table 18.2 Settings and Corresponding Extended Repeat Areas

SARA[4:0] or DARA[4:0]	Extended Repeat Area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 Kbyte specified as extended repeat area by the lower 10 bits of the address
01011b	2 Kbytes specified as extended repeat area by the lower 11 bits of the address
01100b	4 Kbytes specified as extended repeat area by the lower 12 bits of the address
01101b	8 Kbytes specified as extended repeat area by the lower 13 bits of the address
01110b	16 Kbytes specified as extended repeat area by the lower 14 bits of the address
01111b	32 Kbytes specified as extended repeat area by the lower 15 bits of the address
10000b	64 Kbytes specified as extended repeat area by the lower 16 bits of the address
10001b	128 Kbytes specified as extended repeat area by the lower 17 bits of the address
10010b	256 Kbytes specified as extended repeat area by the lower 18 bits of the address
10011b	512 Kbytes specified as extended repeat area by the lower 19 bits of the address
10100b	1 Mbyte specified as extended repeat area by the lower 20 bits of the address
10101b	2 Mbytes specified as extended repeat area by the lower 21 bits of the address
10110b	4 Mbytes specified as extended repeat area by the lower 22 bits of the address
10111b	8 Mbytes specified as extended repeat area by the lower 23 bits of the address
11000b	16 Mbytes specified as extended repeat area by the lower 24 bits of the address
11001b	32 Mbytes specified as extended repeat area by the lower 25 bits of the address
11010b	64 Mbytes specified as extended repeat area by the lower 26 bits of the address
11011b	128 Mbytes specified as extended repeat area by the lower 27 bits of the address
11100b to 11111b	Setting prohibited.

18.2.12 DMA Offset Register (DMOFR)

Address(es): DMAC0.DMOFR 8700 7018h, DMAC1.DMOFR 8700 7058h, DMAC2.DMOFR 8700 7098h, DMAC3.DMOFR 8700 70D8h, DMAC4.DMOFR 8700 7118h, DMAC5.DMOFR 8700 7158h, DMAC6.DMOFR 8700 7198h, DMAC7.DMOFR 8700 71D8h, DMAC0_NS.DMOFR 0700 7018h, DMAC1_NS.DMOFR 0700 7058h, DMAC2_NS.DMOFR 0700 7098h, DMAC3_NS.DMOFR 0700 70D8h, DMAC4_NS.DMOFR 0700 7118h, DMAC5_NS.DMOFR 0700 7158h, DMAC6_NS.DMOFR 0700 7198h, DMAC7_NS.DMOFR 0700 71D8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination.	0000 0000h to 00FF FFFFh (0 bytes to (16 M – 1) bytes) FF00 0000h to FFFF FFFFh (–16 Mbytes to –1 byte)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.

Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR register returns the extended value. In repeat-block transfer mode, the offset cannot be specified by DMOFR register when offset addition is selected, write 0000 0000h to DMOFR register.

18.2.13 DMA Transfer Enable Register (DMCNT)

Address(es): DMAC0.DMCNT 8700 701Ch, DMAC1.DMCNT 8700 705Ch, DMAC2.DMCNT 8700 709Ch, DMAC3.DMCNT 8700 70DCh, DMAC4.DMCNT 8700 711Ch, DMAC5.DMCNT 8700 715Ch, DMAC6.DMCNT 8700 719Ch, DMAC7.DMCNT 8700 71DCh, DMAC0_NS.DMCNT 0700 701Ch, DMAC1_NS.DMCNT 0700 705Ch, DMAC2_NS.DMCNT 0700 709Ch, DMAC3_NS.DMCNT 0700 70DCh, DMAC4_NS.DMCNT 0700 711Ch, DMAC5_NS.DMCNT 0700 715Ch, DMAC6_NS.DMCNT 0700 719Ch, DMAC7_NS.DMCNT 0700 71DCh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DTE	DMA Transfer Enable	0: Disables DMA transfer. 1: Enables DMA transfer.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DTE Bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel. If the DTE bit is cleared during DMA transfer, no transfer requests for the corresponding channel will be accepted after the transfer ends.

[Setting condition]

- 1 is written to this bit.

[Clearing conditions]

- 0 is written to this bit.
- The specified total volume of data transfer is completed.
- The DMA transfer is stopped by the repeat size end interrupt.
- The DMA transfer is stopped by the extended repeat area overflow interrupt.
- The DMA transfer is stopped due to the occurrence of an access error. For details, see section 18.5, Processing on DMA Transfer Error.

18.2.14 DMA Software Start Register (DMREQ)

Address(es): DMAC0.DMREQ 8700 701Dh, DMAC1.DMREQ 8700 705Dh, DMAC2.DMREQ 8700 709Dh, DMAC3.DMREQ 8700 70DDh, DMAC4.DMREQ 8700 711Dh, DMAC5.DMREQ 8700 715Dh, DMAC6.DMREQ 8700 719Dh, DMAC7.DMREQ 8700 71DDh, DMAC0_NS.DMREQ 0700 701Dh, DMAC1_NS.DMREQ 0700 705Dh, DMAC2_NS.DMREQ 0700 709Dh, DMAC3_NS.DMREQ 0700 70DDh, DMAC4_NS.DMREQ 0700 711Dh, DMAC5_NS.DMREQ 0700 715Dh, DMAC6_NS.DMREQ 0700 719Dh, DMAC7_NS.DMREQ 0700 71DDh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SWREQ	DMA Software Start	Writing 1 to this bit triggers the generation of a DMA transfer request, and DMA transfer is started in response to the request	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	CLRS	DMA Software Start Bit Auto Clear Setting	0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.

SWREQ Bit (DMA Software Start)

When 1 is written to this bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is set to 0 if the CLRS bit is set to 0. This bit is not set to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer. Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC trigger source is software). Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b. To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- 1 is written to this bit.

[Clearing conditions]

- The DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- The DMA transfer is stopped due to the occurrence of an access error. See section 18.5, Processing on DMA Transfer Error.
- 0 is written to this bit.

CLRS Bit (DMA Software Start Bit Auto Clear Setting)

This bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is set to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not set to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

18.2.15 DMA Status Register (DMSTS)

Address(es): DMAC0.DMSTS 8700 701Eh, DMAC1.DMSTS 8700 705Eh, DMAC2.DMSTS 8700 709Eh, DMAC3.DMSTS 8700 70DEh, DMAC4.DMSTS 8700 711Eh, DMAC5.DMSTS 8700 715Eh, DMAC6.DMSTS 8700 719Eh, DMAC7.DMSTS 8700 71DEh, DMAC0_NS.DMSTS 0700 701Eh, DMAC1_NS.DMSTS 0700 705Eh, DMAC2_NS.DMSTS 0700 709Eh, DMAC3_NS.DMSTS 0700 70DEh, DMAC4_NS.DMSTS 0700 711Eh, DMAC5_NS.DMSTS 0700 715Eh, DMAC6_NS.DMSTS 0700 719Eh, DMAC7_NS.DMSTS 0700 71DEh

	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	DTIF	—	—	—	ESIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ESIF	Transfer Escape End Interrupt Flag	0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated.	R/W*1
b3 to b1	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b4	DTIF	Transfer End Interrupt Flag	0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated.	R/W*1
b6, b5	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	ACT	DMA Active Flag	0: DMAC operation is suspended. 1: DMAC is operating.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. Only 0 can be written to clear the flag.

ESIF Flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- Transfer of each single-repeat size of data is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- Transfer of each single-block size of data is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- An extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- An extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- 0 is written to this bit.
- 1 is written to the DMCNT.DTE bit.

DTIF Flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- The specified number of unit-transfers is completed in normal transfer mode (the value of the DMCRAL[15:0] bits has become 0000h on completion of transfer).
- The specified number of repeat transfer operations is completed in repeat transfer mode (the value of the DMCRBL[15:0] bits has become 0000h on completion of transfer (DMTMD.TKP = 0), or the DMCRBL[15:0] bits reload the value of the DMCRBH[15:0] bits (DMTMD.TKP = 1)).

- The specified number of blocks has been transferred in block transfer mode (the value of the DMCRBL[15:0] bits has become 0000h on completion of transfer (DMTMD.TKP = 0), or the DMCRBL[15:0] bits have been reloaded with the value of the DMCRBH[15:0] bits (DMTMD.TKP = 1)).
- The specified number of blocks has been transferred in repeat-block transfer mode (the value of the DMCRBL[15:0] bits has become 0000h on completion of transfer (DMTMD.TKP = 0), or the DMCRBL[15:0] bits have been reloaded with the value of the DMCRBH[15:0] bits (DMTMD.TKP = 1)).

[Clearing conditions]

- 0 is written to this bit.
- 1 is written to the DMCNT.DTE bit.

ACT Flag (DMA Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- The DMAC starts data transfer.

[Clearing condition]

- The data transfer in response to one transfer request is completed.

18.2.16 DMAC Trigger Source Flag Control Register (DMCSL)

Address(es): DMAC0.DMCSL 8700 701Fh, DMAC1.DMCSL 8700 705Fh, DMAC2.DMCSL 8700 709Fh, DMAC3.DMCSL 8700 70DFh, DMAC4.DMCSL 8700 711Fh, DMAC5.DMCSL 8700 715Fh, DMAC6.DMCSL 8700 719Fh, DMAC7.DMCSL 8700 71DFh, DMAC0_NS.DMCSL 0700 701Fh, DMAC1_NS.DMCSL 0700 705Fh, DMAC2_NS.DMCSL 0700 709Fh, DMAC3_NS.DMCSL 0700 70DFh, DMAC4_NS.DMCSL 0700 711Fh, DMAC5_NS.DMCSL 0700 715Fh, DMAC6_NS.DMCSL 0700 719Fh, DMAC7_NS.DMCSL 0700 71DFh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DISEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DISEL	Interrupt Select	0: At the beginning of transfer, clear the interrupt status flag of the trigger source to 0. 1: At the end of transfer, the interrupt status flag of the trigger source issues an interrupt to the CPU.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.

DISEL Bit (Interrupt Select)

This bit selects whether the interrupt status flag of the trigger source is set to 0 or issues an interrupt request to the CPU, at the beginning of DMA transfer. When DMTMD.DCTG[1:0] = 00b (activation by software), the setting of the DISEL bit does not affect the operation.

18.2.17 DMA Source Buffer Size Register (DMSBS)

Address(es): DMAC0.DMSBS 8700 7028h, DMAC1.DMSBS 8700 7068h, DMAC2.DMSBS 8700 70A8h, DMAC3.DMSBS 8700 70E8h, DMAC4.DMSBS 8700 7128h, DMAC5.DMSBS 8700 7168h, DMAC6.DMSBS 8700 71A8h, DMAC7.DMSBS 8700 71E8h, DMAC0_NS.DMSBS 0700 7028h, DMAC1_NS.DMSBS 0700 7068h, DMAC2_NS.DMSBS 0700 70A8h, DMAC3_NS.DMSBS 0700 70E8h, DMAC4_NS.DMSBS 0700 7128h, DMAC5_NS.DMSBS 0700 7168h, DMAC6_NS.DMSBS 0700 71A8h, DMAC7_NS.DMSBS 0700 71E8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DMSBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DMSBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DMSBSL[15:0]	Lower Bits of Source Buffer Size	Functions as data transfer counter in repeat-block transfer mode	R/W
b31 to b16	DMSBSH[15:0]	Upper Bits of Source Buffer Size	Specifies the repeat-area size in repeat-block transfer mode	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.
Set the same value for the DMSBSH[15:0] and DMSBSL[15:0] bits in repeat-block transfer mode. Write 00000000h to the DMSBS register in normal, repeat and block transfer mode. The DMSBSH[15:0] bits specify buffer size and the DMSBSL[15:0] bits function as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by the DMSBSH[15:0] bits. When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting the DMSBSH[15:0] and DMSBSL[15:0] bits to 0000h is prohibited. When final data of one buffer size is transferred, the DMSBSL[15:0] bits reload value of the DMSBSH[15:0] bits. When address update mode is fixed address, this register is ignored. Table 18.3 lists the setting values of Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 18.3 Available Setting for DMSBS Register in Repeat-Block Transfer Mode

Source Address Update Mode (DMAMD.SM)	Transfer Data Size (DMTMD.SZ)	Available Setting for DMSBSH[15:0] and DMSBSL[15:0] Bits
Source address is fixed. (SM = 00b)	Don't care	0000h (DMSBS is not used)
Offset addition (SM = 01b)	8 bits (SZ = 00b)	0001h to FFFFh (1 to 65535)
	16 bits (SZ = 01b)	0001h to 7FFFh (1 to 32767)
	32 bits (SZ = 10b)	0001h to 3FFFh (1 to 16383)
	64 bits (SZ = 11b)	0001h to 1FFFh (1 to 8191)
Source address is incremented or decremented. (SM = 1xb)	Don't care	0000h (infinite) 0001h to FFFFh (1 to 65535)

18.2.18 DMA Destination Buffer Size Register (DMDBS)

Address(es): DMAC0.DMDBS 8700 702Ch, DMAC1.DMDBS 8700 706Ch, DMAC2.DMDBS 8700 70ACh, DMAC3.DMDBS 8700 70ECh, DMAC4.DMDBS 8700 712Ch, DMAC5.DMDBS 8700 716Ch, DMAC6.DMDBS 8700 71ACh, DMAC7.DMDBS 8700 71ECh, DMAC0_NS.DMDBS 0700 702Ch, DMAC1_NS.DMDBS 0700 706Ch, DMAC2_NS.DMDBS 0700 70ACh, DMAC3_NS.DMDBS 0700 70ECh, DMAC4_NS.DMDBS 0700 712Ch, DMAC5_NS.DMDBS 0700 716Ch, DMAC6_NS.DMDBS 0700 71ACh, DMAC7_NS.DMDBS 0700 71ECh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DMDBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DMDBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DMDBSL[15:0]	Lower Bits of Destination Buffer Size	Functions as data transfer counter in repeat-block transfer mode	R/W
b31 to b16	DMDBSH[15:0]	Upper Bits of Destination Buffer Size	Specifies the repeat-area size in repeat-block transfer mode	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.
Set the same value for the DMDBSH[15:0] and DMDBSL[15:0] bits in repeat-block transfer mode. Write 00000000h to the DMDBS register in normal, repeat and block transfer mode. The DMDBSH[15:0] bits specify buffer size and the DMDBSL[15:0] bits function as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by the DMDBSH[15:0] bits. When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting the DMDBSH[15:0] and DMDBSL[15:0] bits to 0000h is prohibited. When final data of one buffer size is transferred, the DMDBSL[15:0] bits reload value of the DMDBSH[15:0] bits. When address update mode is fixed address, this register is ignored. Table 18.4 lists the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 18.4 Available Setting for DMDBS Register in Repeat-Block Transfer Mode

Destination Address Update Mode (DMAMD.DM)	Transfer Data Size (DMTMD.SZ)	Available Setting for DMDBSH[15:0] and DMDBSL[15:0] Bits
Destination address is fixed. (DM = 00b)	Don't care	0000h (DMDBS is not used)
Offset addition (DM = 01b)	8 bits (SZ = 00b)	0001h to FFFFh (1 to 65535)
	16 bits (SZ = 01b)	0001h to 7FFFh (1 to 32767)
	32 bits (SZ = 10b)	0001h to 3FFFh (1 to 16383)
	64 bits (SZ = 11b)	0001h to 1FFFh (1 to 8191)
Destination address is incremented or decremented. (DM = 1xb)	Don't care	0000h (infinite) 0001h to FFFFh (1 to 65535)

18.2.19 DMA Bufferable Write Enable Register (DMBWR)

Address(es): DMAC0.DMBWR 8700 7030h, DMAC1.DMBWR 8700 7070h, DMAC2.DMBWR 8700 70B0h, DMAC3.DMBWR 8700 70F0h, DMAC4.DMBWR 8700 7130h, DMAC5.DMBWR 8700 7170h, DMAC6.DMBWR 8700 71B0h, DMAC7.DMBWR 8700 71F0h, DMAC0_NS.DMBWR 0700 7030h, DMAC1_NS.DMBWR 0700 7070h, DMAC2_NS.DMBWR 0700 70B0h, DMAC3_NS.DMBWR 0700 70F0h, DMAC4_NS.DMBWR 0700 7130h, DMAC5_NS.DMBWR 0700 7170h, DMAC6_NS.DMBWR 0700 71B0h, DMAC7_NS.DMBWR 0700 71F0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BWE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BWE	Bufferable Write Enable	0: Writing to bufferable areas bypasses the write buffers. 1: Writing to bufferable areas proceeds through the write buffers.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.

BWE Bit (Bufferable Write Enable)

This bit enables or disables buffered writing to bufferable areas. When the setting of this bit is 1 (enabling use of the buffers), even if the write access by the DMAC is completed, the actual write operation might not have been finished. The DMAC treats writing as complete once it has written to a write buffer, even though writing to the destination may not yet be finished. For details, see section 16.2.5.2, Bufferable Write and section 16.2.5.3, Notes on the Timing of Writing Completion. If an error occurs during writing to a slave that is capable of supporting buffered write operations, this is detected as a buffered write error, triggering an interrupt or reset. However, the DMA transfer does not stop at such times.

18.2.20 DMAC Module Start Register (DMAST)

Address(es): DMAC.DMAST 8700 7800h,
DMAC_NS.DMAST 0700 7800h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DMST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DMST	DMAC Module Start	0: DMAC module stop 1: DMAC module start	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DMST Bit (DMAC Module Start)

When this bit is set to 1, DMAC is ready to accept transfer requests for all channels. When 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) of multiple channels and then this bit is set to 1 (DMAC module start), the corresponding multiple channels can be placed in the transfer request acceptable state at the same time. When the DMST bit is set to 0 during DMA transfer, DMA transfer is suspended after completion of the current data transfer corresponding to a single transfer request. DMA transfer can be resumed by setting the DMST bit to 1 again.

[Setting condition]

- 1 is written to this bit.

[Clearing condition]

- 0 is written to this bit.

18.2.21 DMAC Error Channel Register (DMECHR)

Address(es): DMAC.DMECHR 8700 7840h, DMAC_NS.DMECHR 0700 7840h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DMERRW	—	—	—	DMECHSAM	—	—	—	—	DMECH[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DMECH[3:0]	DMAC Error Channel Flag	Indicates the channel number causing the error 0000: Error occurred on channel 0 0001: Error occurred on channel 1 0010: Error occurred on channel 2 : : 0111: Error occurred on channel 7	R
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	DMECHSAM	DMAC Error Channel Security Attribution Monitor Flag	Indicates the security attribution of a channel causing the error 0: Secure channel 1: Non-secure channel	R
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	DMERRW	DMAC Error Access Read/Write Attribute Flag	Indicates the read/write attribute of the error access 0: Read access 1: Write access	R
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DMESTA	DMAC Error Status Flag	0: No DMA transfer error occurred 1: DMA transfer error occurred	R/W*1
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Writing to the DMESTA flag depends on the value of the DMECHSAM flag.

When reading this register, it can be accessed from both secure and non-secure access. When writing this register, it depends on the value of the DMECHR.DMECHSAM flag.

- When the value of the DMECHR.DMECHSAM flag is 1, it can be accessed from secure and non-secure access.
- When the value of the DMECHR.DMECHSAM flag is 0, it can be accessed from secure. An error is returned when write access is performed in a non-secure access.

This register is cleared by a reset. On debugging a program, select an interrupt instead of a reset in the corresponding bits of the registers listed in the interrupt/reset selection column of Table 18.20 in section 18.6.2, Transfer Error Interrupt.

DMECH[3:0] Flag (DMAC Error Channel Flag)

When a transfer error due to DMA transfer occurs, this flag stores the channel number of the DMAC that was violated. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- A DMA transfer error occurs while the DMESTA flag is 0.

[Clearing condition]

- 1 is written to the DMESTA flag.

DMECHSAM Flag (DMAC Error Channel Security Attribution Monitor Flag)

When a transfer error due to DMA transfer occurs, this flag indicates the security attribution of the violating DMAC channel. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- A DMA transfer error occurs while the DMESTA flag is 0.

[Clearing condition]

- 1 is written to DMESTA flag.

DMERRW Flag (DMAC Error Access Read/Write Attribute Flag)

Indicates the read/write attribute of the error access.

[Setting condition]

- A DMA transfer error occurs during write access to the on-chip memory or registers of other modules.

[Clearing condition]

- 1 is written to the DMESTA flag.

DMESTA Flag (DMAC Error Status Flag)

Indicates whether or not a DMA transfer error occurred. DMECH[3:0] bits, DMECHSAM bit, DMESTA flag are cleared by writing 1 to DMESTA flag. Writing 0 to DMESTA flag is ignored. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- A DMA transfer error occurs.

[Clearing condition]

- 1 is written to the DMESTA flag.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. When DMECHSAM = 0, it cannot be cleared in the non-secure state.

18.2.22 DMAC74 Interrupt Status Monitor Register (DMIST)

Address(es): DMAC.DMIST 8700 7804h,
DMAC_NS.DMIST 0700 7804h

	b7	b6	b5	b4	b3	b2	b1	b0
	DMIS7	DMIS6	DMIS5	DMIS4	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b4	DMIS4	DMAC4 Interrupt Status Flag	0: DMAC4 interrupt is not requested. 1: DMAC4 interrupt is requested.	R
b5	DMIS5	DMAC5 Interrupt Status Flag	0: DMAC5 interrupt is not requested. 1: DMAC5 interrupt is requested.	R
b6	DMIS6	DMAC6 Interrupt Status Flag	0: DMAC6 interrupt is not requested. 1: DMAC6 interrupt is requested.	R
b7	DMIS7	DMAC7 Interrupt Status Flag	0: DMAC7 interrupt is not requested. 1: DMAC7 interrupt is requested.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note: The security attribute depends on the setting of the DMACCHSAR.SADMAC4 bit.

DMISm Flag (DMACm Interrupt Status Flag) (m = 4 to 7)

This flag monitors the DMACm interrupt request. Writing to this flag will be ignored. While the DMACm.DMINT.DTIE bit is 1 and the DMACm.DMSTS.DTIF flag is 1, or the DMACm.DMINT.ESIE bit is 1 and the DMACm.DMSTS.ESIF flag is 1, the DMIST.DMISm flag is set to 1.

18.2.23 DMAC Control Register (DMCTL)

Address(es): DMAC.DMCTL 8700 7810h,
DMAC_NS.DMCTL 0700 7810h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	ERCH	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PR	Priority Control Select	0: Fixed priority 1: Round-robin	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	ERCH	Clear Channel Select	0: Target channel only 1: All channels	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Do not write to the register for a given channel while either the DMSTS.ACT flag is 1 (DMA transfer in progress) or the DMCNT.DTE bit is 1 (enabling DMA transfer) for the same channel.

PR Bit (Priority Control Select)

When the DMCTL.PR bit is set to 0, arbitration is performed in the fixed priority mode of channel 0 > channel 1 > channel 2 > channel 3 …> channel 7 (channel 0: highest priority) > DTC and DMA transfer is started. When the DMCTL.PR bit is set to 1, arbitration is performed in the round-robin mode and DMA transfer is started.

ERCH Bit (Clear Channel Select)

When the DMCTL.ERCH bit is set to 0, the ICU clears all bits of the target channel of DMRSRm register (m = 0 to 7) by the error response during transfer. DMRSRm register (m = 0 to 7) other than the target channel is not cleared. When the DMCTL.ERCH bit is set to 1, the ICU clears all bits of all channels of DMRSRm register (m = 0 to 7) by the error response during transfer.

18.3 Operation

18.3.1 Transfer Mode

(1) Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL[15:0] bits. When these bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting the DMCRB register is invalid in normal transfer mode. Except in free-running mode, a transfer end interrupt request can be generated after completion of the specified number of transfer operations. Table 18.5 lists the register update operation in normal transfer mode, and Figure 18.2 shows an operation example in normal transfer mode.

Table 18.5 Register Update Operation in Normal Transfer Mode

Register	Function	Update Operation after Completion of a Transfer by One Transfer Request
DMSAR	Transfer source address	Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/offset addition
DMCRA.DMCRAL[15:0]	Transfer counter	Decremented by one/not updated (in free-running function)
DMCRA.DMCRAH[9:0]	—	Not updated (Not used in normal transfer mode)
DMCRB	—	Not updated (Not used in normal transfer mode)

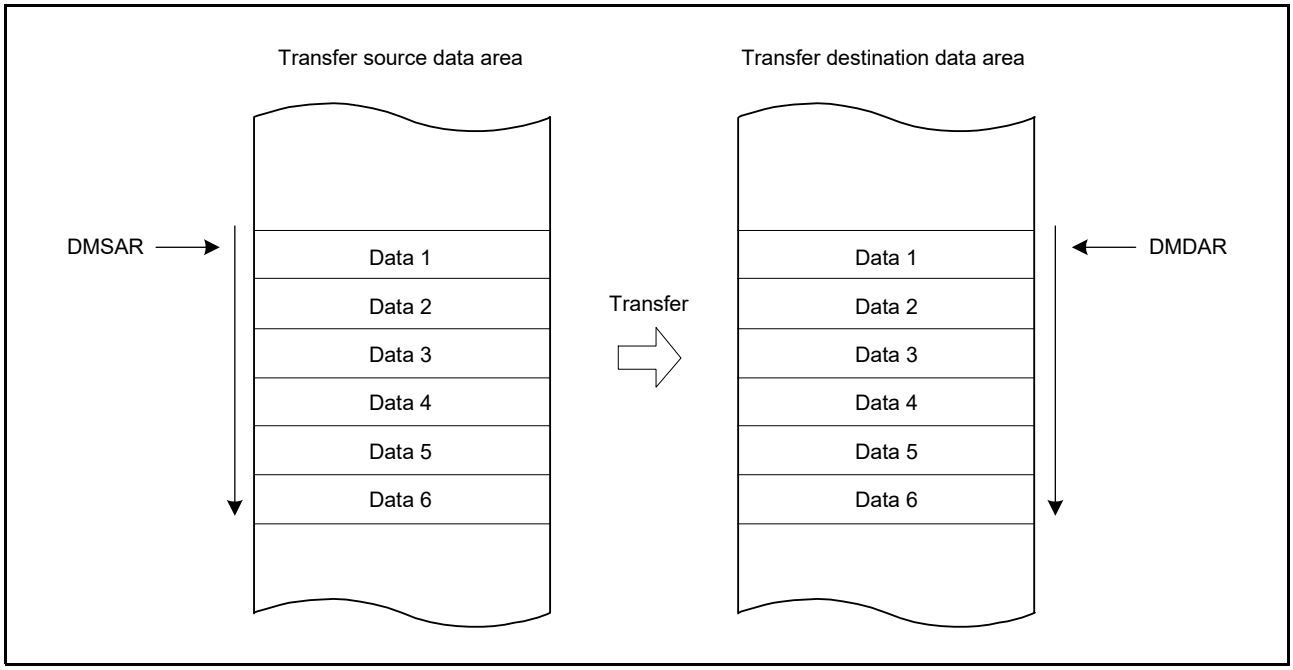

Figure 18.2 Operation Example in Normal Transfer Mode

(2) Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request. A maximum of 1K data can be set as a total repeat transfer size using the DMCRA register. A maximum of 64K can be set as the number of repeat transfer operations using the DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size. Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling. A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations. Table 18.6 lists the register update operation in repeat transfer mode, and Figure 18.3 shows an operation example in repeat transfer mode.

Table 18.6 Register Update Operation in Repeat Transfer Mode

Register	Function	Update Operation after Completion of a Transfer by One Transfer Request	
		When the DMCRA.DMCRAL[15:0] bits are not 1	When the DMCRA.DMCRAL[15:0] bits are 1 (Transfer of the Last Data in Repeat Size)
DMSAR	Transfer source address	Increment/decrement/fixed/ offset addition	• DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/ offset addition	• DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMCRA.DMCRAH [9:0]	Repeat size	Not updated	Not updated
DMCRA.DMCRAL [15:0]	Transfer counter	Decremented by one	DMCRA.DMCRAH[9:0]
DMCRB.DMCRBH [15:0]	Number of repeat transfer operations	Not updated	Not updated
DMCRB.DMCRBL [15:0]	Count of repeat transfer operations	Not updated	Decremented by one

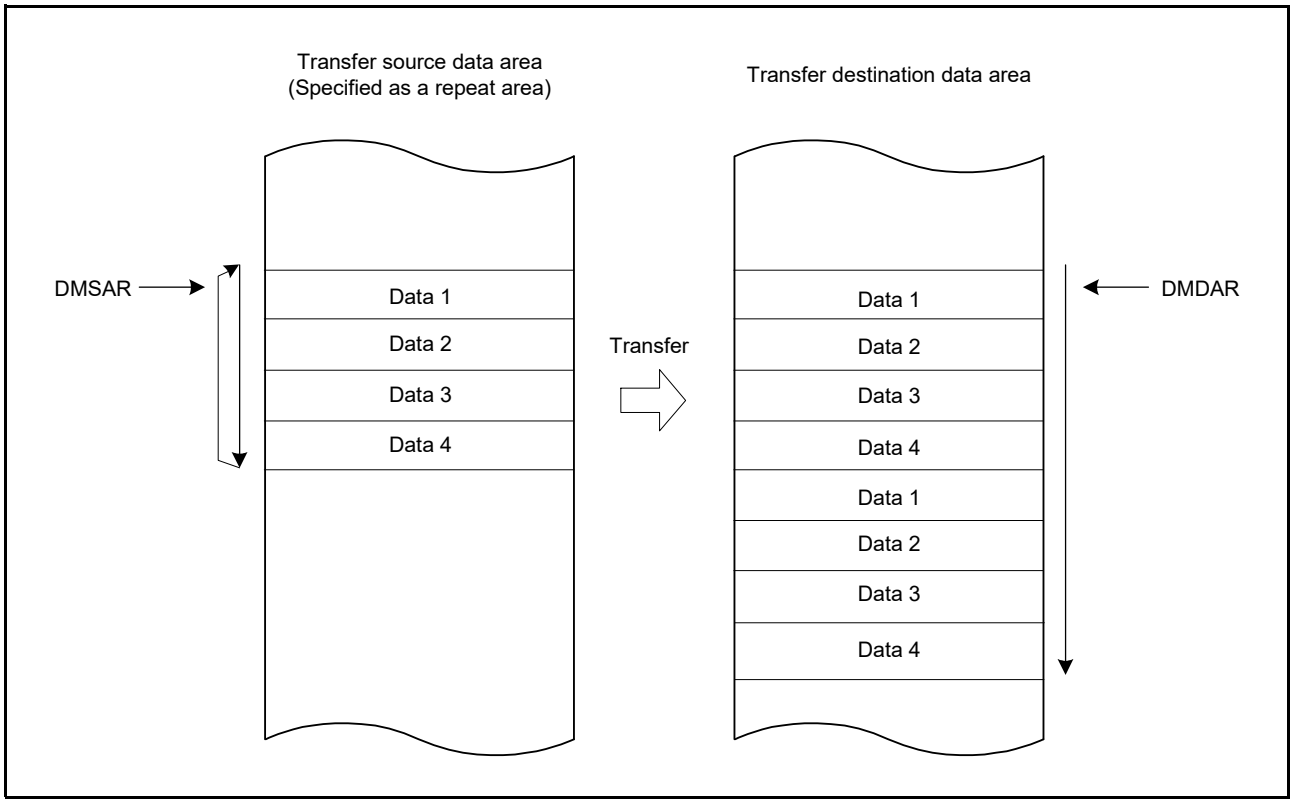

Figure 18.3 Operation Example in Repeat Transfer Mode

(3) Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request. A maximum of 1K data can be set as a total block transfer size using the DMCRA register. A maximum of 64K can be set as the number of block transfer operations using the DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size. Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling. Transfer end interrupt request can be generated after completion of the specified number of block transfer operations. Table 18.7 lists the register update operation in block transfer mode, and Figure 18.4 shows an operation example in block transfer mode.

Table 18.7 Register Update Operation in Block Transfer Mode

Register	Function	Update Operation after Completion of Single-Block Transfer by One Transfer Request
DMSAR	Transfer source address	• DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	• DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMCRA.DMCRAH[9:0]	Block size	Not updated
DMCRA.DMCRAL[15:0]	Transfer count	DMCRA.DMCRAH[9:0]
DMCRB.DMCRBH[15:0]	Number of block transfer operations	Not updated
DMCRB.DMCRBL[15:0]	Count of block transfer operations	Decremented by one

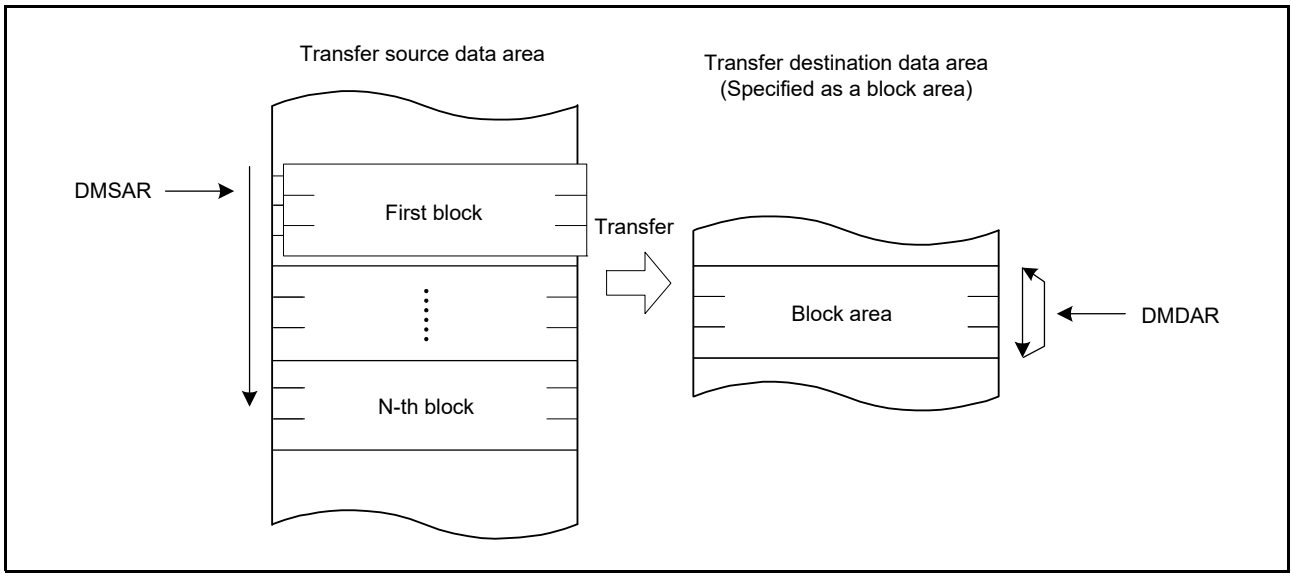

Figure 18.4 Operation Example in Block Transfer Mode

(4) Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.
Repeat function: Added function (ring buffer) to repeat specified address area.
Offset function: Multiple areas with offset can be specified within one block transfer.
The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer. Figure 18.5 shows an example of adding a repeat function to the transfer destination. Figure 18.6 shows repeat-block transfer with an offset to the transfer destination. In repeat-block transfer mode, a single block data is transferred by one transfer request. A maximum of 1K data can be set as a total block transfer size using DMCRA register. A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size. Generation of a transfer end interrupt request after completion of the specified number of block-transfer operations is selectable.

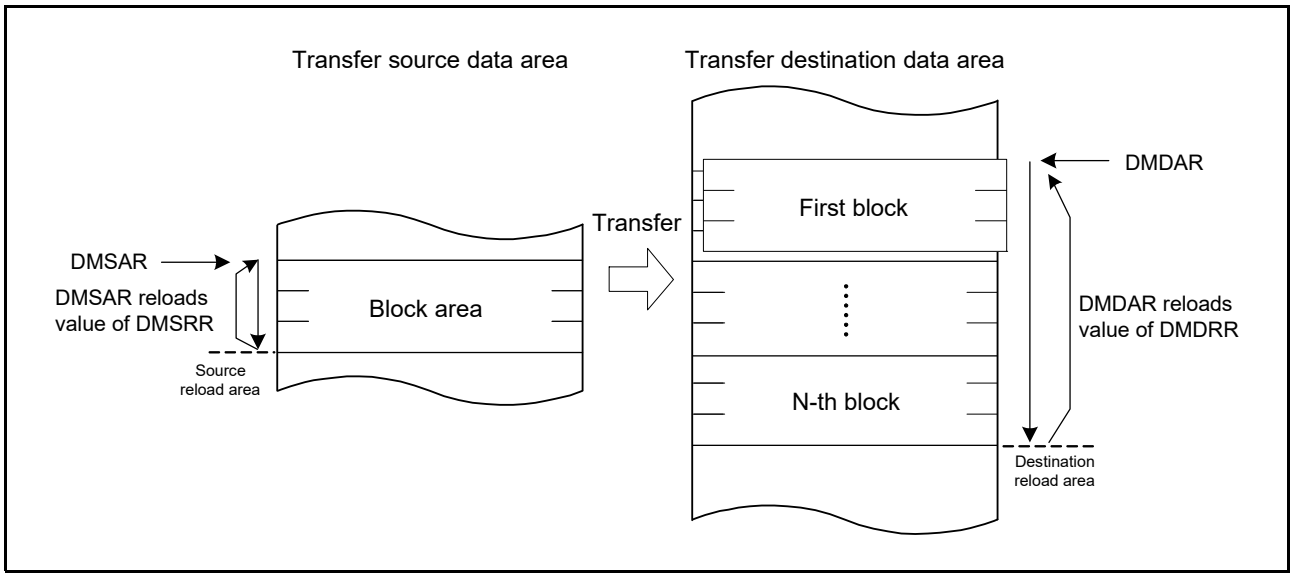

Figure 18.5 Operation Example in Repeat-Block Transfer Mode

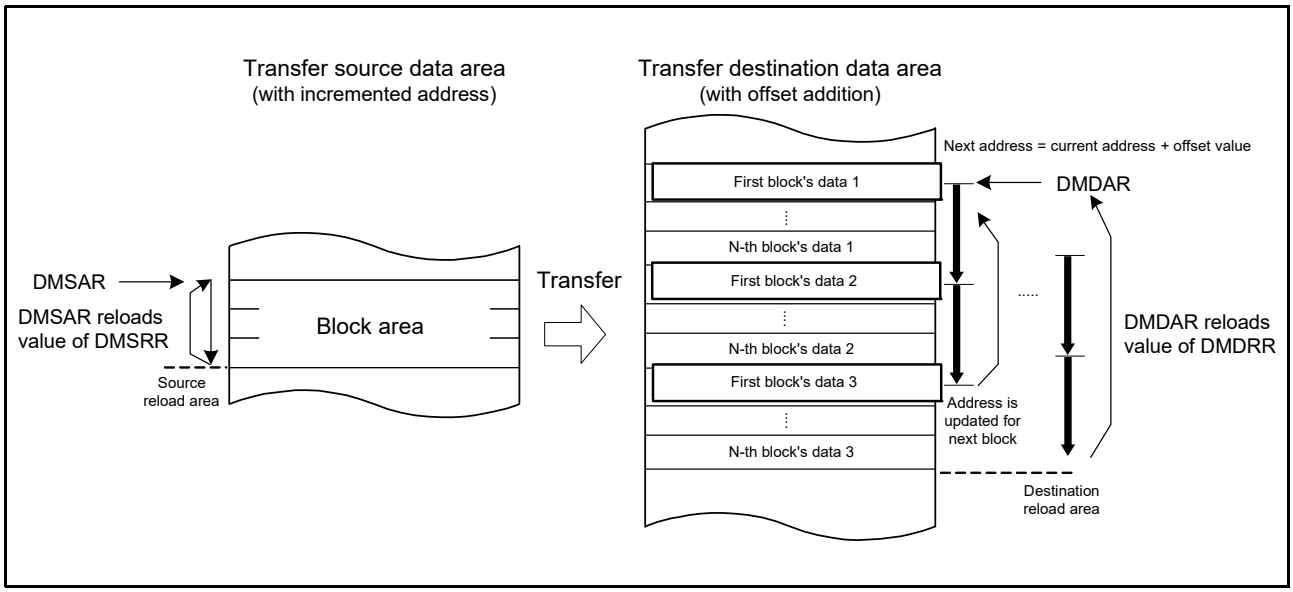

Figure 18.6 Operation Example in Repeat-Block Transfer Mode with Offset Addition

Table 18.8 to Table 18.13 list the register update operations in repeat-block transfer mode.

Table 18.8 Register Update Operation Associated with Source Area in Repeat-Block Transfer Mode (Fixed Address DMAMD.SM[1:0] = 00b)

		Update operation after single data is transferred		
			DMCRA.DMCRAL[15:0] is 1 (single block is transferred)	
Register	Function	DMCRA.DMCRAL[15:0] is not 1	DMCRB.DMCRBL[15:0] is not 1	DMCRB.DMCRBL[15:0] is 1
DMSRR	Transfer source reload address	Not updated	Not updated	Not updated
DMSAR	Transfer source address	Not updated	Not updated	Not updated
DMCRA.DMCRAH [9:0]	Block size	Not updated	Not updated	Not updated
DMCRA.DMCRAL [15:0]	Block size count	Decremented by one	DMCRA.DMCRAH[9:0]	DMCRA.DMCRAH[9:0]
DMCRB.DMCRBH [15:0]	Number of block transfer operations	Not updated	Not updated	Not updated
DMCRB.DMCRBL [15:0]	Count of block transfer operations	Not updated	Decremented by one	DMTMD.TKP = 0 0 DMTMD.TKP = 1 DMCRB.DMCRBH[15:0]

Table 18.9 Register Update Operation Associated with Destination Area in Repeat-Block Transfer Mode (Fixed Address DMAMD.DM[1:0] = 00b)

		Update operation after single data is transferred		
			DMCRA.DMCRAL[15:0] is 1 (single block is transferred)	
Register	Function	DMCRA.DMCRAL[15:0] is not 1	DMCRB.DMCRBL[15:0] is not 1	DMCRB.DMCRBL[15:0] is 1
DMDRR	Transfer destination reload address	Not updated	Not updated	Not updated
DMDAR	Transfer destination address	Not updated	Not updated	Not updated
DMCRA.DMCRAH [9:0]	Block size	Not updated	Not updated	Not updated
DMCRA.DMCRAL [15:0]	Block size count	Decremented by one	DMCRA.DMCRAH[9:0]	DMCRA.DMCRAH[9:0]
DMCRB.DMCRBH [15:0]	Number of block transfer operations	Not updated	Not updated	Not updated
DMCRB.DMCRBL [15:0]	Count of block transfer operations	Not updated	Decremented by one	DMTMD.TKP = 0 0 DMTMD.TKP = 1 DMCRB.DMCRBH[15:0]

For more information about address update operation in repeat-block transfer mode, see section 18.3.5, Address-Update Function in Repeat-Block Transfer Mode.

18.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas. The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR). The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides. However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area. When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt due to an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is set to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt due to an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling. Figure 18.7 shows an example of the extended repeat area operation.

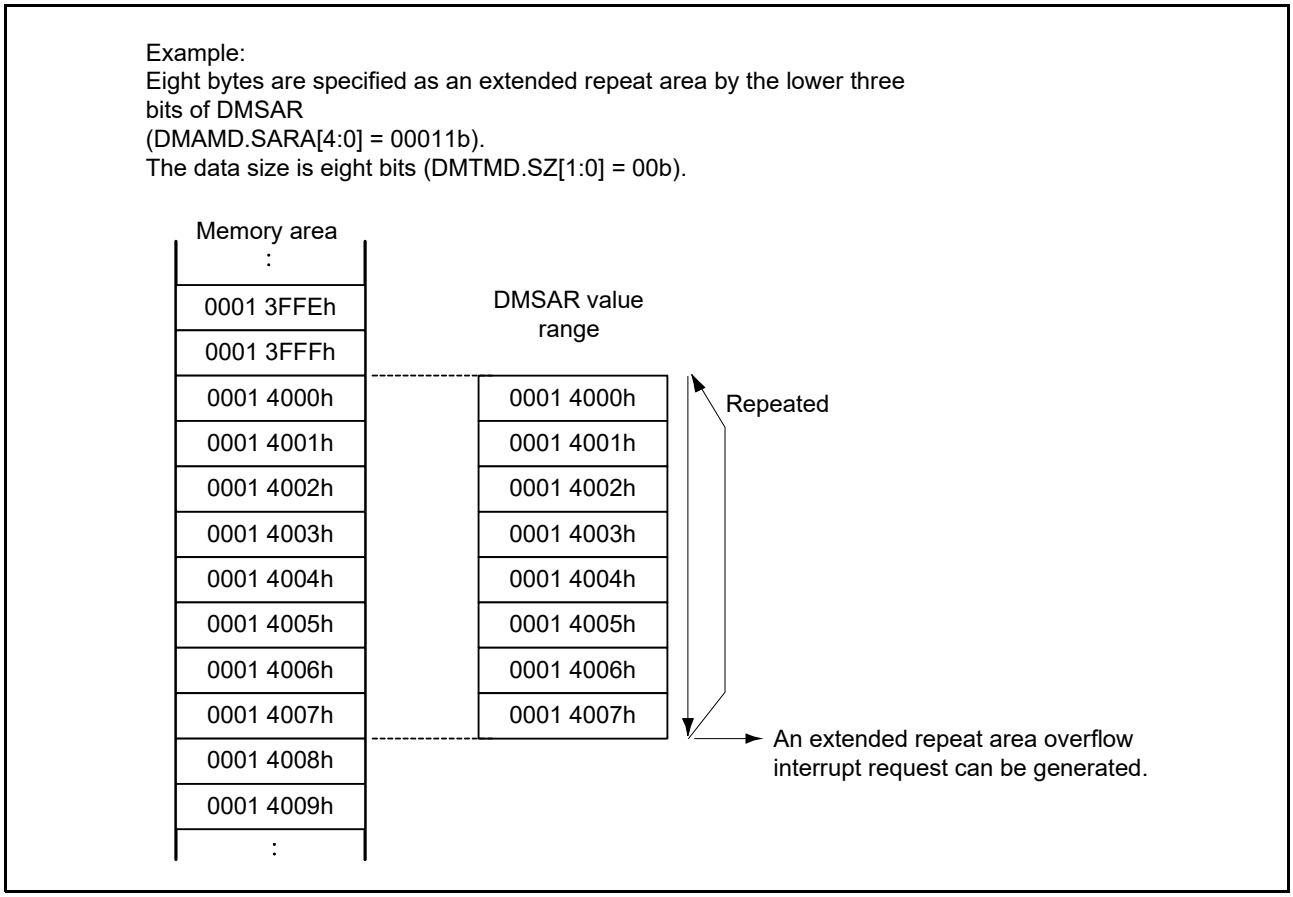

Figure 18.7 Example of Extended Repeat Area Operation

When an interrupt due to an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration. When a transfer is stopped by an interrupt due to an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt due to the overflow is suspended until transfer of the block is completed, and the transfer overruns. Figure 18.8 shows an example when the extended repeat area function is used in block transfer mode.

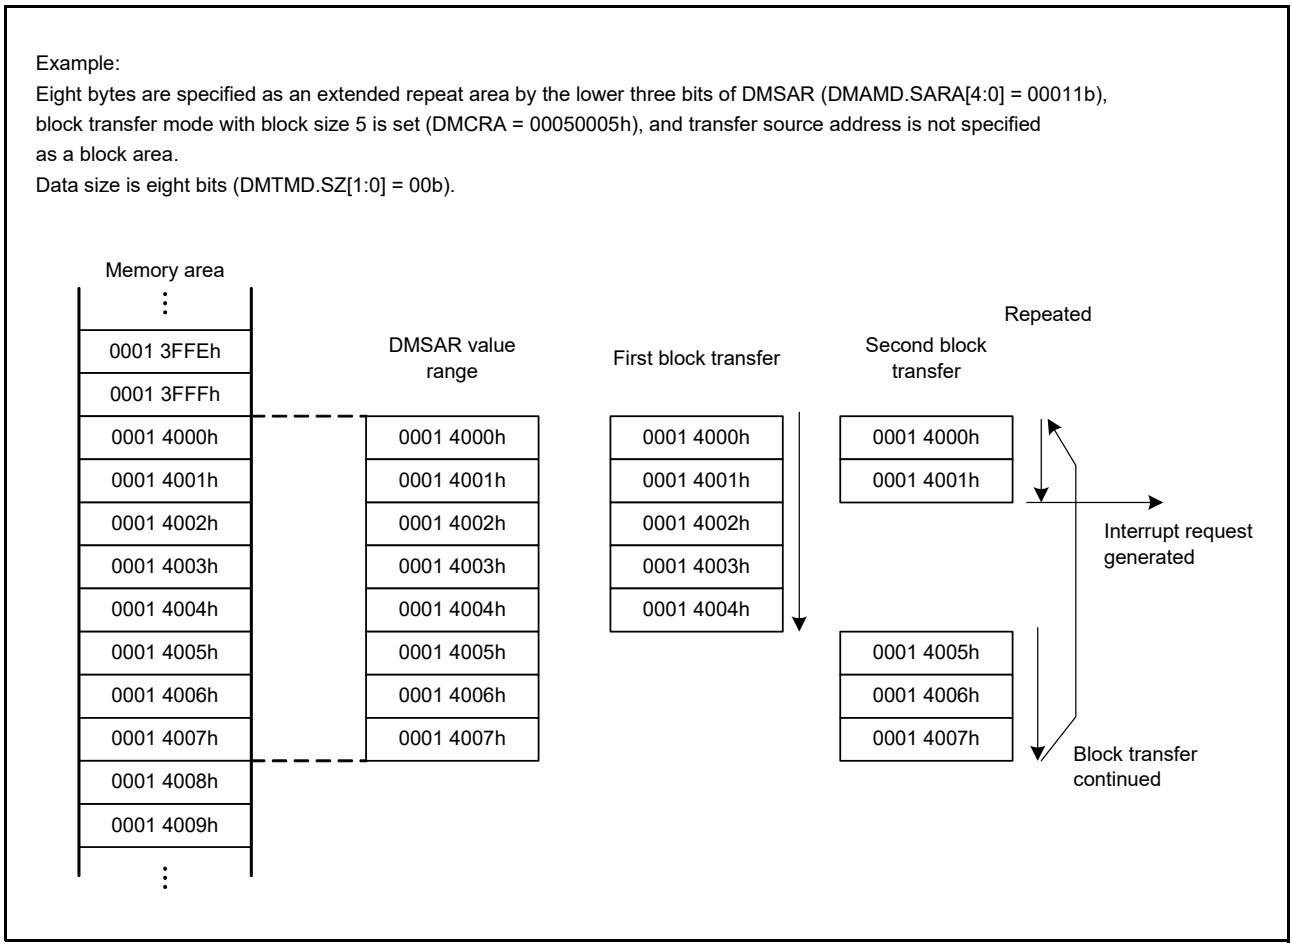

Figure 18.8 Example of Extended Repeat Area Function in Block Transfer Mode

18.3.3 Free-Running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

(1) In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL[15:0] bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped. For more information, see section 18.3.1, Transfer Mode.

(2) In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is set to 1, the transfer is not stopped by completion of specified total number of transfer operations and the value of the DMCRBH[9:0] bits is reloaded repeatedly. Figure 18.9 shows an example of block transfer operation without free-running function.

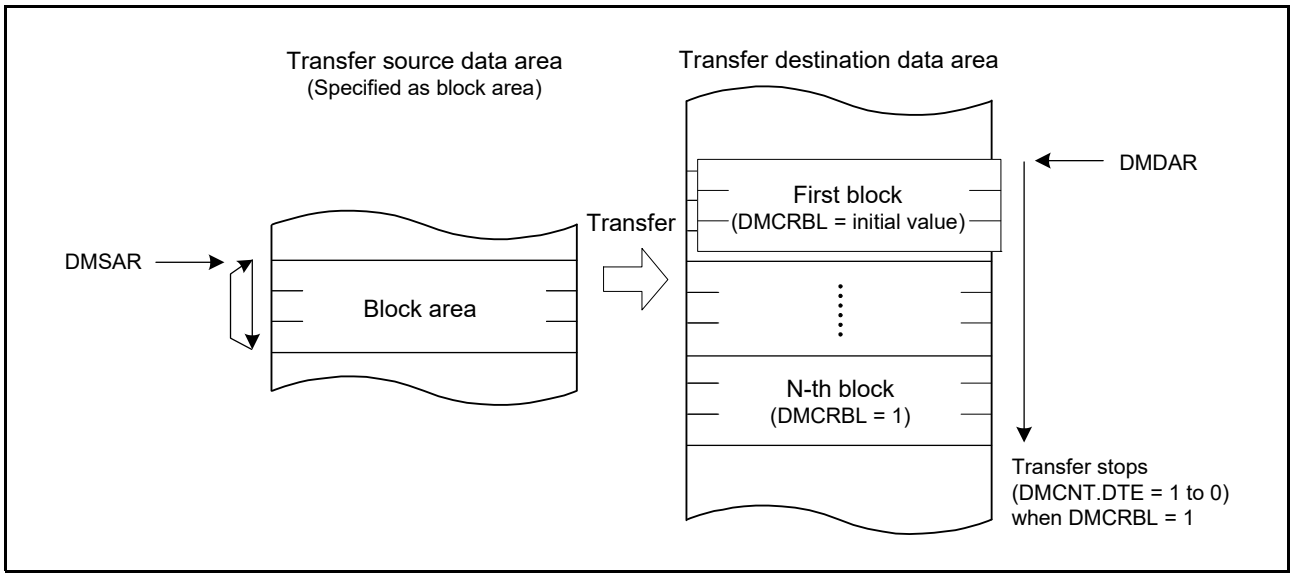

Figure 18.9 Operation in Block Transfer Mode with DMTMD.TKP = 0

Figure 18.10 shows an example of block transfer operation with free-running function.

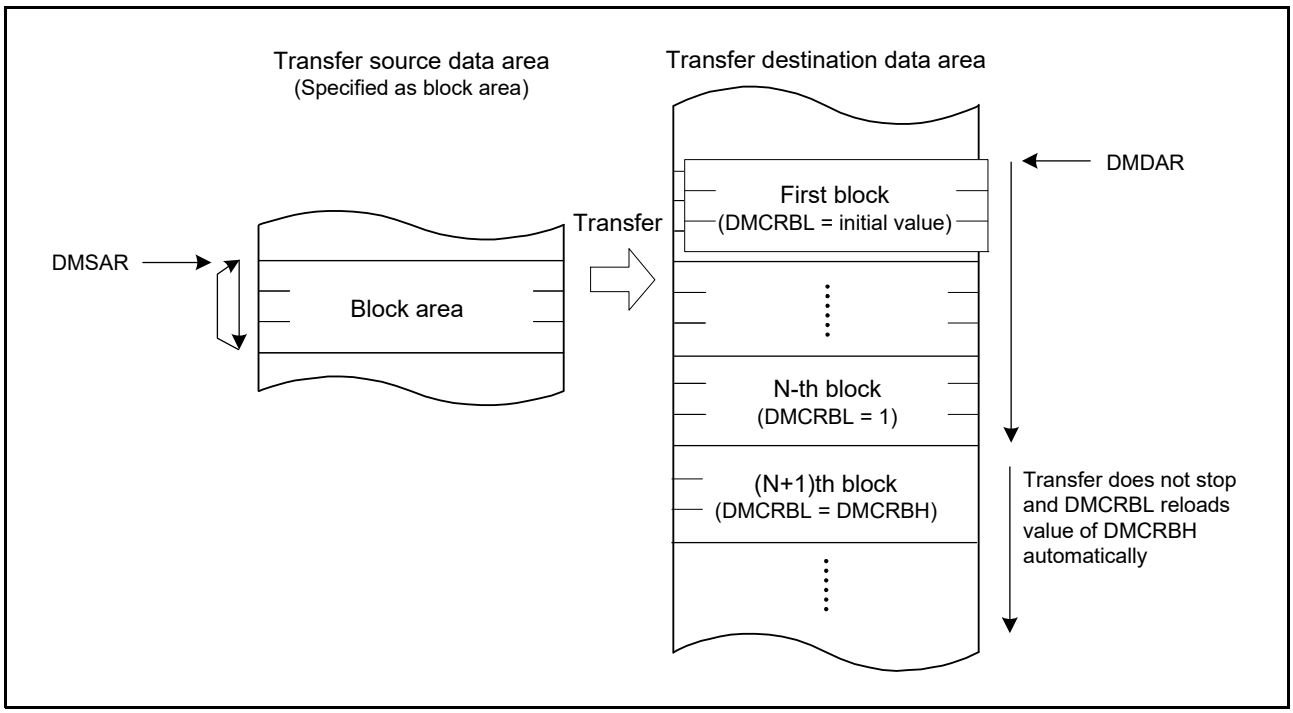

Figure 18.10 Operation in Block Transfer Mode with DMTMD.TKP = 1

18.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas. Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement. DMSBS or DMDBS register are used instead of DMOFR register in repeat-block transfer mode. For more information, see section (4), Repeat-Block Transfer Mode and section 18.3.5, Address-Update Function in Repeat-Block Transfer Mode. Table 18.14 lists the address update method in each address update mode.

Table 18.14 Address Update Method in Each Address Update Mode

Address Update Mode	Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for Address Update Modes	Address Update Method (for Different DMTMD.SZ[1:0] Settings)			
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b	SZ[1:0] = 11b
Address fixed	00b	Fixed			
Offset addition	01b	+DMOFR*1			
Increment	10b	+1	+2	+4	+8
Decrement	11b	–1	–2	–4	–8

Note 1. When setting a negative value in the DMA offset register, the value must be 2's complement. The 2's complement is obtained by the following formula.
2's complement of a negative offset value = ~ (offset) + 1 (~: Bit inversion)

(1) Basic Transfer Using Offset Addition

Figure 18.11 shows an example of address updating using offset addition.

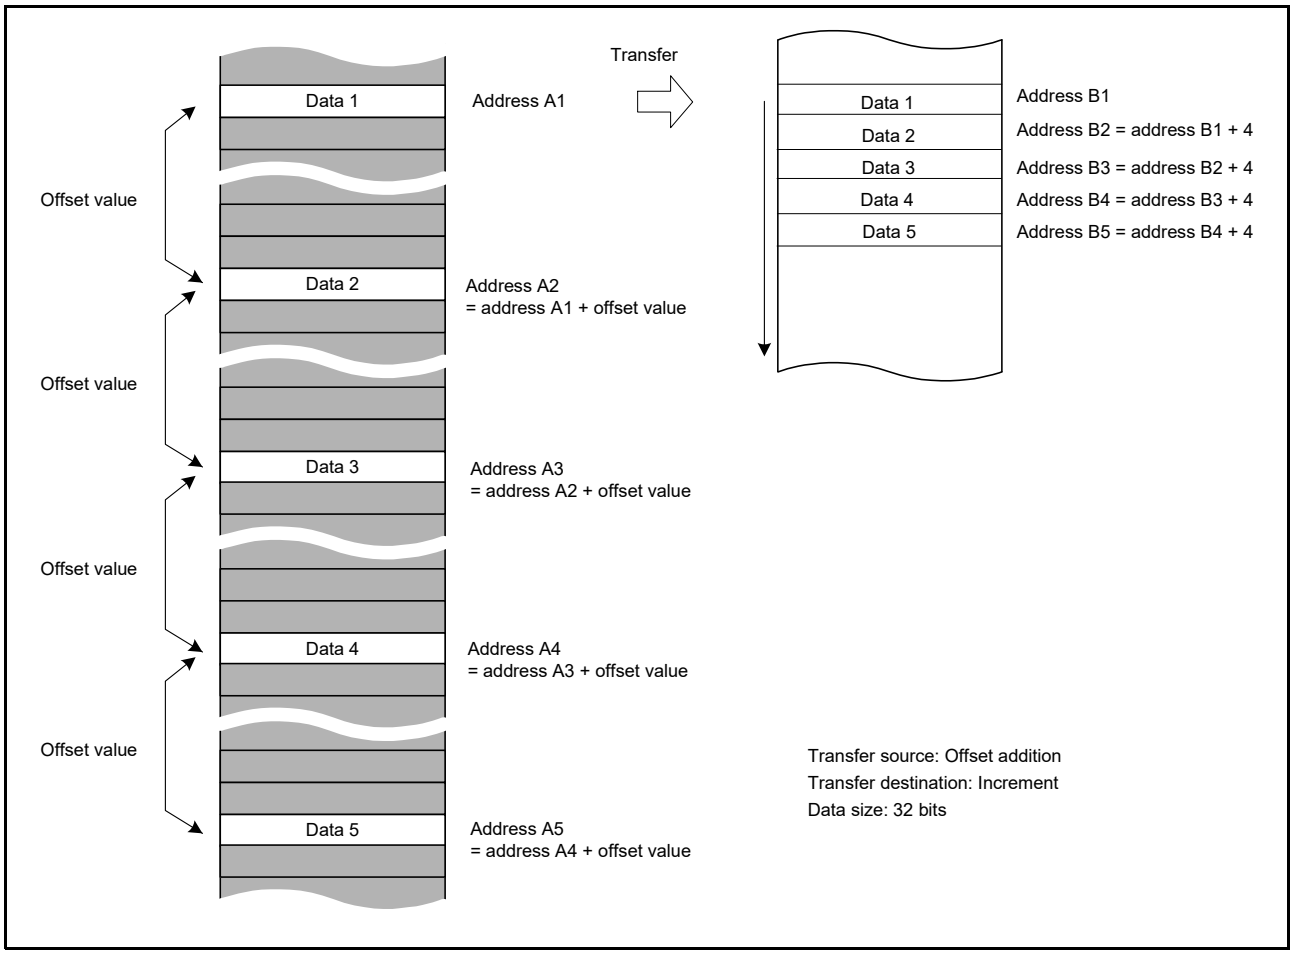

Figure 18.11 Example of Address Updating by Offset Addition

In Figure 18.11, the transfer data is 32 bits long, and offset addition and increment are set as the transfer source address update mode and transfer destination address update mode, respectively. The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

(2) Example of XY Conversion Using Offset Addition

Figure 18.12 shows the XY conversion using offset addition in repeat transfer mode. Settings are as follows:

- DMAMD.SM[1:0]: Source address update mode select: Offset addition
- DMAMD.DM[1:0]: Destination address update mode select: Destination address is incremented.
- DMTMD.SZ[1:0]: Data transfer size: 32 bits
- DMTMD.MD[1:0]: Transfer mode select: Repeat transfer
- DMTMD.DTS[1:0]: Repeat area select: The source is specified as the repeat area.
- DMOFR: Offset address: 10h
- DMCRA.DMCRAH[9:0]: Repeat size: 4h
- DMINT.RPTIE: The repeat size end interrupt is enabled.

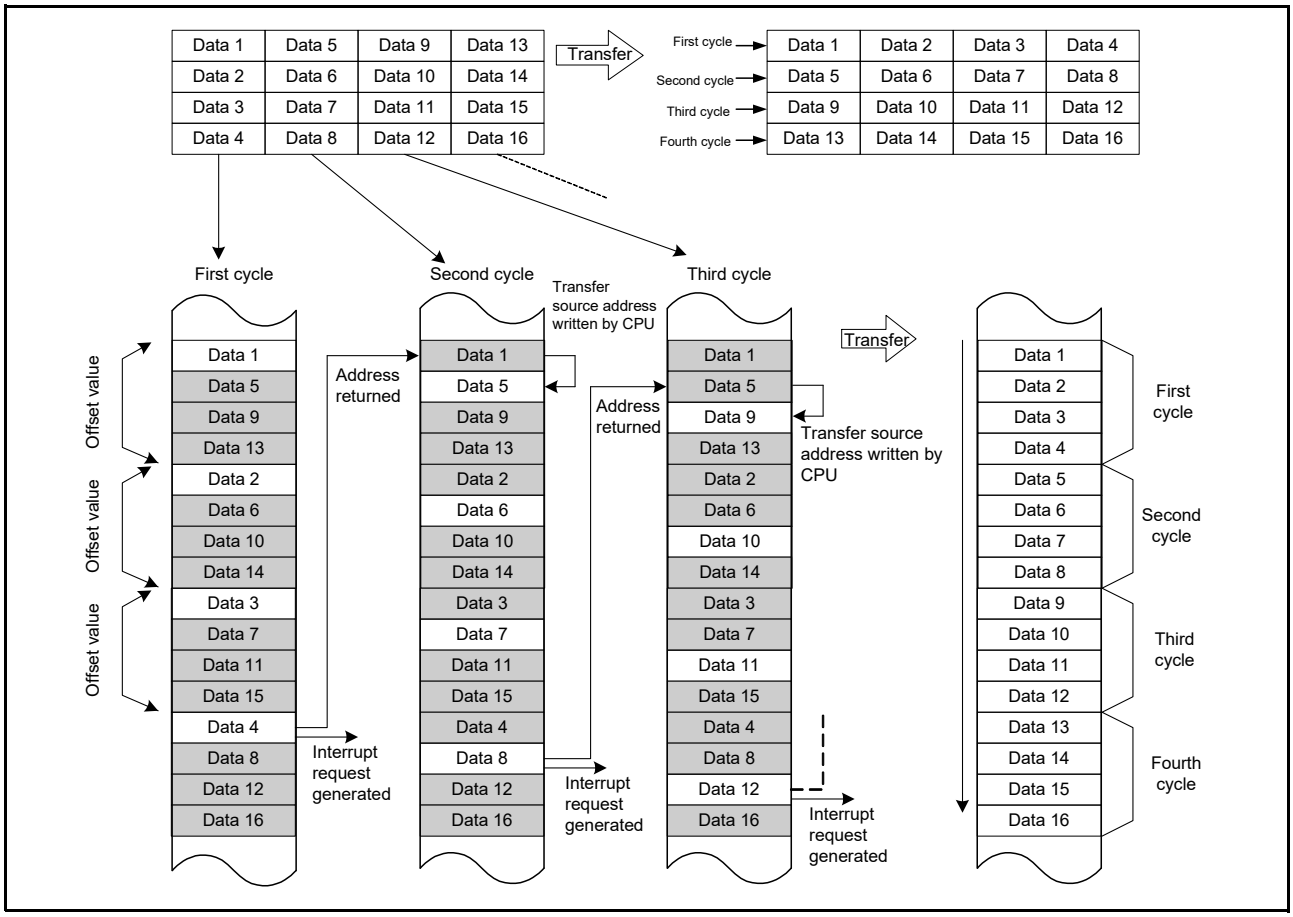

Figure 18.12 XY Conversion Operation Using Offset Addition in Repeat Transfer Mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to the destination continuous addresses. When data 4 is transferred, which means that the repeat size of transfers is completed, the transfer source address returns to the transfer start address (address of data 1 on the transfer source) and a repeat size end interrupt is requested. While this interrupt stops the transfer temporarily, perform the following.

- DMSAR register: Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- DMCNT register: Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 18.13 shows a flowchart of the XY conversion.

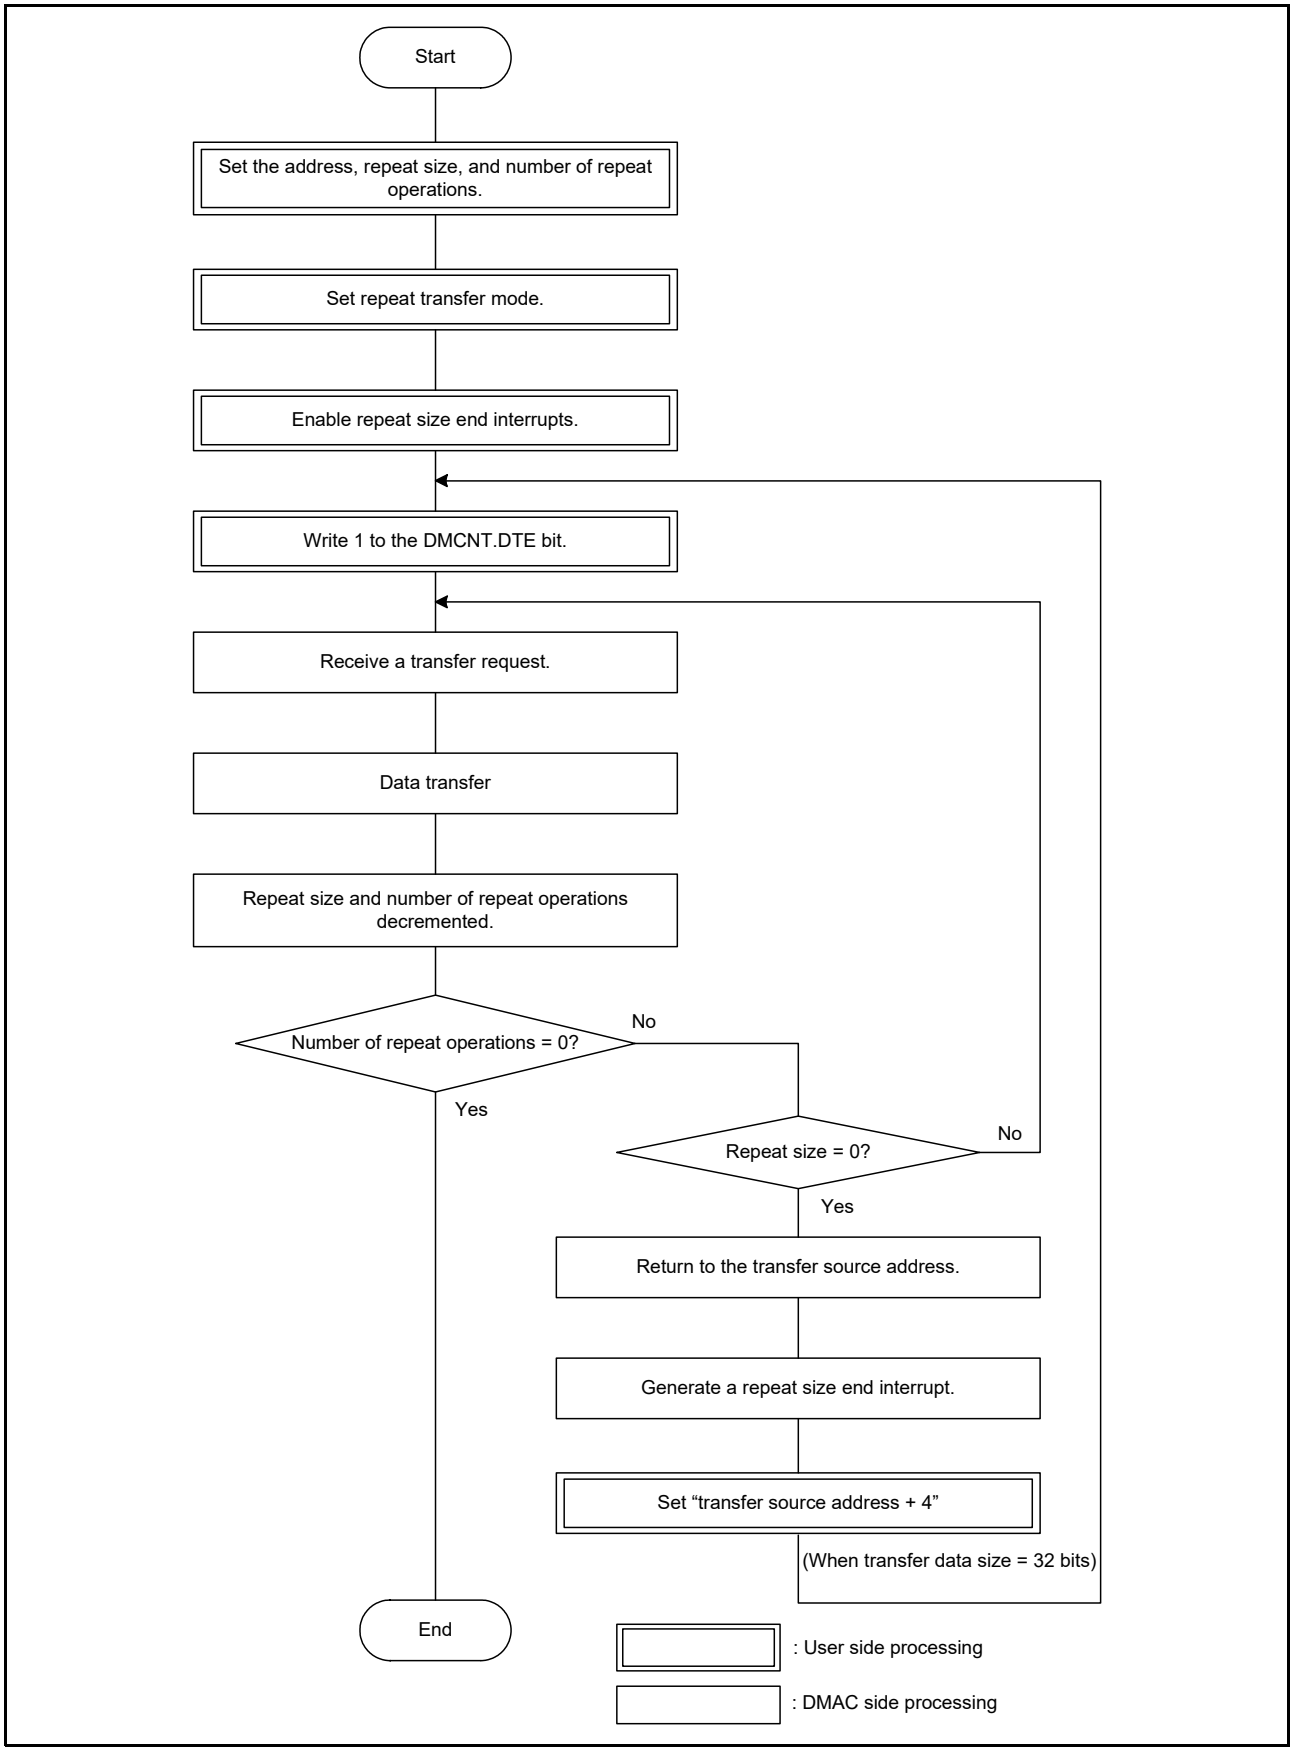

Figure 18.13 XY Conversion Flowchart Using Offset Addition in Repeat Transfer Mode

18.3.5 Address-Update Function in Repeat-Block Transfer Mode

The repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior in address updating differs from the behavior in the two other modes. This section describes the address-update function in the repeat-block transfer mode.

(1) Fixed Address Mode

When DMAMD.SM[1:0] bits is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] bits is set to 00b, the address update mode of the destination is fixed address. In fixed address, the address is not updated from the initial value of DMSAR and DMDAR registers. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request. Figure 18.14 shows address update in fixed address.

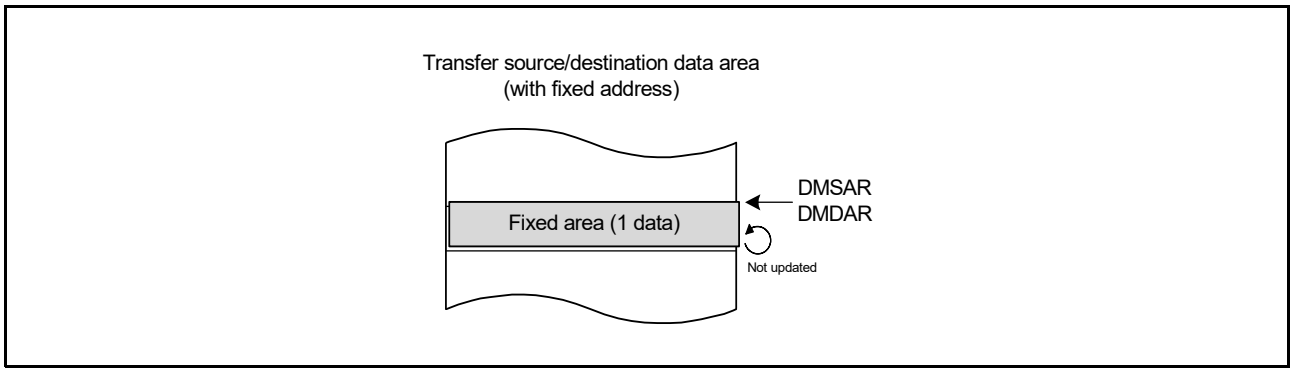

Figure 18.14 Address Update in Fixed Address

(2) Incremental and Decremental Address Mode

When DMAMD.SM[1:0] bits is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] bits is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] bits is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] bits is set to 11b, the address update mode of the destination is decremental address. In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0] bits. In these update modes DMSBS and DMDBS registers indicates a reload area. The unit of DMSBS and DMDBS registers is “number of data”. At the start of transfer, DMSBSL and DMDBSL registers, which is the lower 16 bits of DMSBS and DMDBS registers, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR registers reloads the value of DMSRR and DMDRR registers. Figure 18.15 shows address update in incremental address.

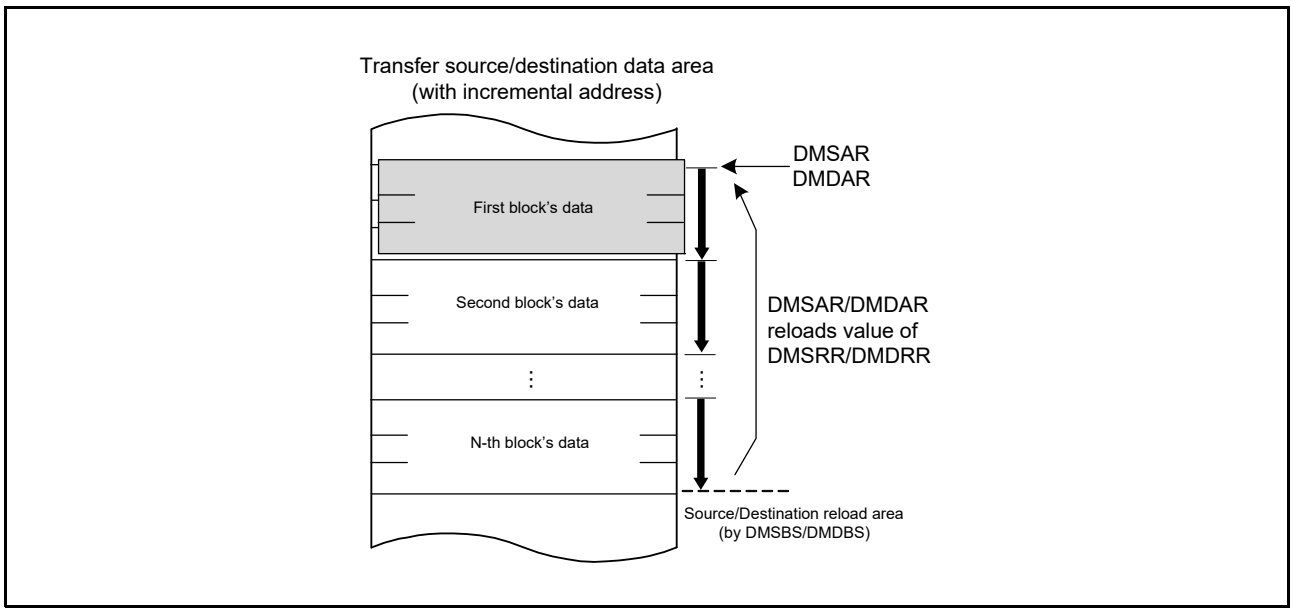

Figure 18.15 Address Update in Incremental Address

(3) Offset Addition Mode

When DMAMD.SM[1:0] bits is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] bits is set to 01b, the address update mode of the destination is offset addition. In offset addition, DMSBS and DMDBS registers indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS registers is the number of blocks. When the transfer starts, DMCRAL[15:0] bits operates as a down counter, DMSAR and DMDAR registers reloads the value of DMSRR and DMDRR registers every time one block is transferred. In addition, DMSBSL[15:0] and DMDBSL[15:0] bits, which is the lower 16 bits of DMSBS and DMDBS registers, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS registers value becomes 1, DMSAR and DMDAR registers reloads the value of DMSRR and DMDRR registers. When DMAMD.SADR and DMAMD.DADR registers is set to 0, offset addition operation of the same area is repeated. DMDAR register only reloads DMDRR register. Figure 18.16 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0.

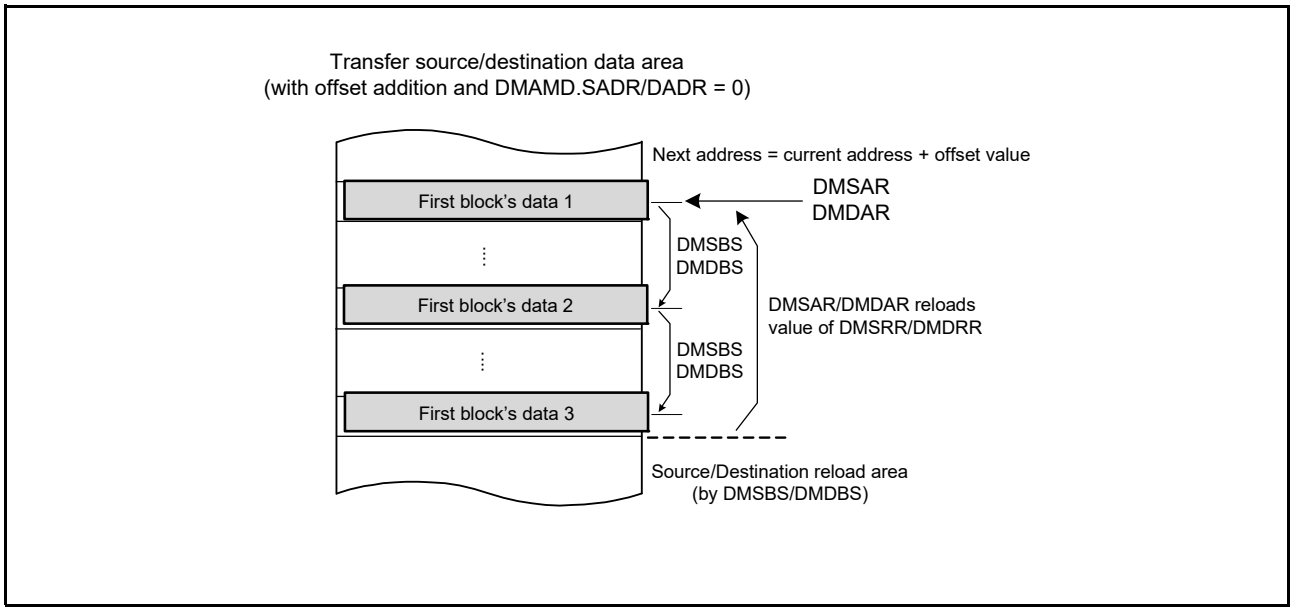

Figure 18.16 Address Update in Offset Addition with DMAMD.SADR and DMAMD.DADR = 0

When DMAMD.SADR and DMAMD.DADR bits is set to 1, the address is incremented by one data unit after DMSRR and DMDRR registers is reloaded by DMCRAL[15:0] = 1. In other words, an index value ((DMDBSH – DMDBSL) × transfer data size) is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 18.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1.

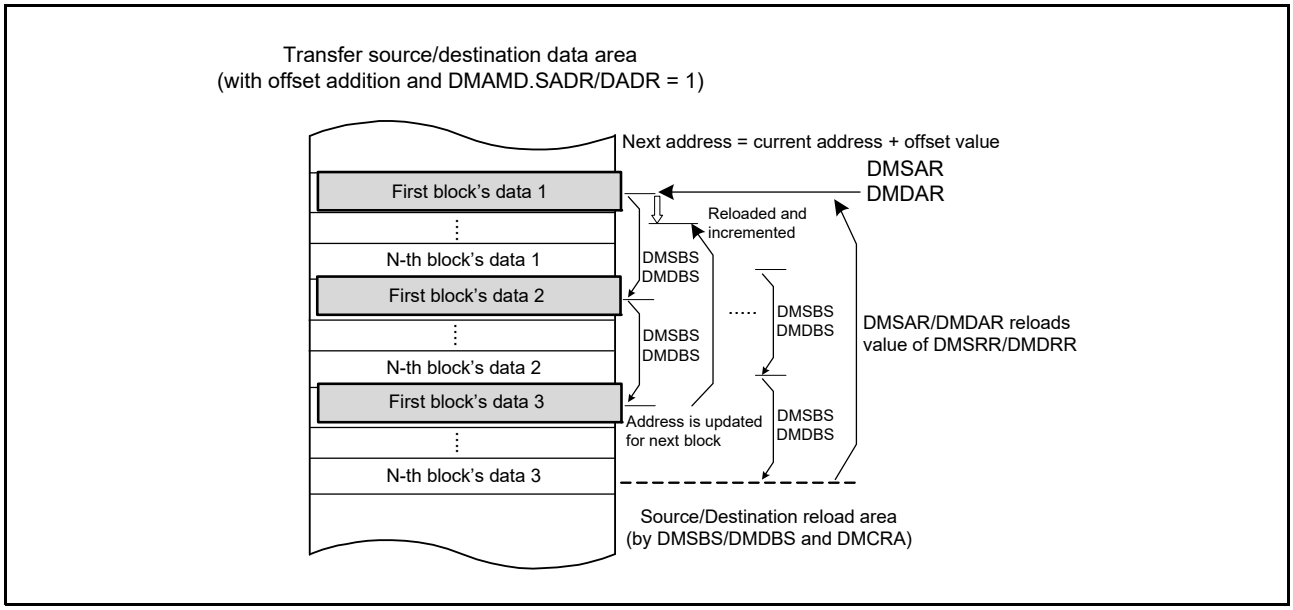

Figure 18.17 Address Update in Offset Addition with DMAMD.SADR and DMAMD.DADR = 1

18.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

(1) Use Case Example: Interval Address to Single Ring Buffer

Figure 18.18 shows an example of reading interval ADDRn registers (data register) of ADC module and storing it in single ring buffer. It transfers 2 data every 4 words per 1 request. The value of DMSAR register is incremented by 1 data per 1 request. The following settings enable this: The transfer source is offset addition, DMAMD.SADR = 1, the block size (DMCRA) is 2, and the transfer source offset (DMSBS) is 4. Table 18.15 lists a setting example.

Table 18.15 Setting Example: Interval Address to Single Ring Buffer

Register	Value	Description
DMSAR, DMSRR	8743 A000h	Initial source address
DMDAR, DMDRR	8200 0000h	Initial destination address
DMTMD.SZ[1:0]	10b	Data size is word
DMAMD.SADR	1	Source address update setting after reload: Add index after reloading
DMAMD.SM[1:0]	01b	Source update mode is offset addition
DMAMD.DM[1:0]	10b	Destination update mode is increment
DMCRAH[9:0], DMCRAL[15:0]	2	Transfer block size
DMSBSH[15:0], DMSBSL[15:0]	4	Source whole buffer size (unit is ‘blocks’) and Source access offset (unit is ‘data’)
DMDBSH[15:0], DMDBSL[15:0]	N × 2 (DMCRA)	Destination buffer size (unit is ‘data’)

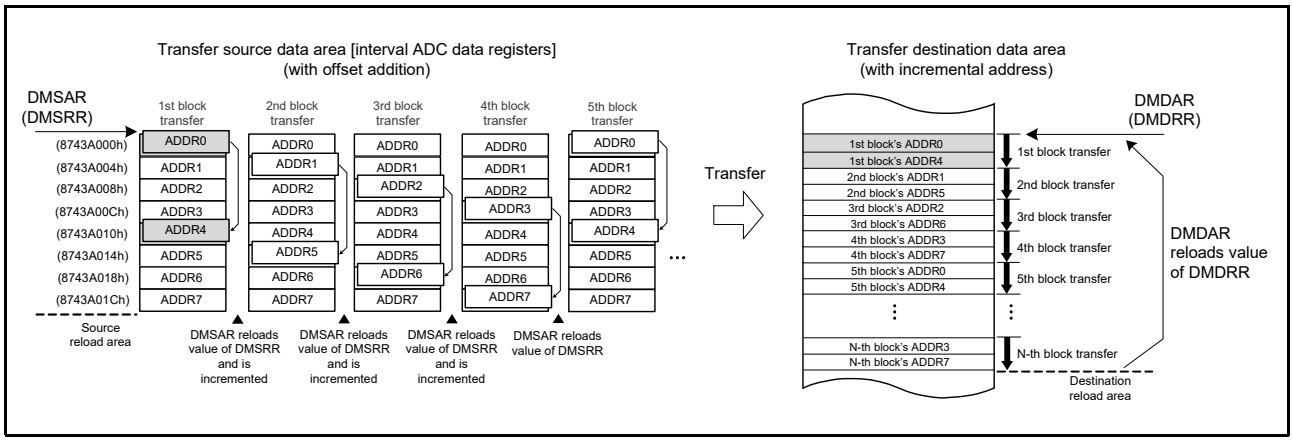

Figure 18.18 Use Case Example: Interval Address to Single Ring Buffer

(2) Use Case Example: Single Block to Multiple Ring Buffer

Figure 18.19 shows an example of storing the continuous ADDRn registers (data register) of ADC module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, a ring buffer in which only the second element (ADDR1) is arranged in transfer order is created at the destination. In the following case, a ring buffer of length N defined by DMDBS register is created. The number of data elements in the block is 3, which is defined by DMCRA register. Table 18.16 lists a setting example.

Table 18.16 Setting Example: Single Block to Multiple Ring Buffer

Register	Value	Description
DMSAR, DMSRR	8743 A000h	Initial source address
DMDAR, DMDRR	8200 0000h	Initial destination address
DMTMD.SZ[1:0]	10b	Data size is word
DMAMD.SADR	0	Source address update setting after reload: Only reloading
DMAMD.DADR	1	Destination address update setting after reload: Add index after reloading
DMAMD.SM[1:0]	10b	Source update mode is increment
DMAMD.DM[1:0]	10b	Destination update mode is increment
DMCRAH[9:0], DMCRAL[15:0]	3	Transfer block size
DMSBSH[15:0], DMSBSL[15:0]	3	Source buffer size (unit is ‘data’)
DMDBSH[15:0], DMDBSL[15:0]	N	Destination whole buffer size (unit is ‘blocks’) and Destination access offset (unit is ‘data’)

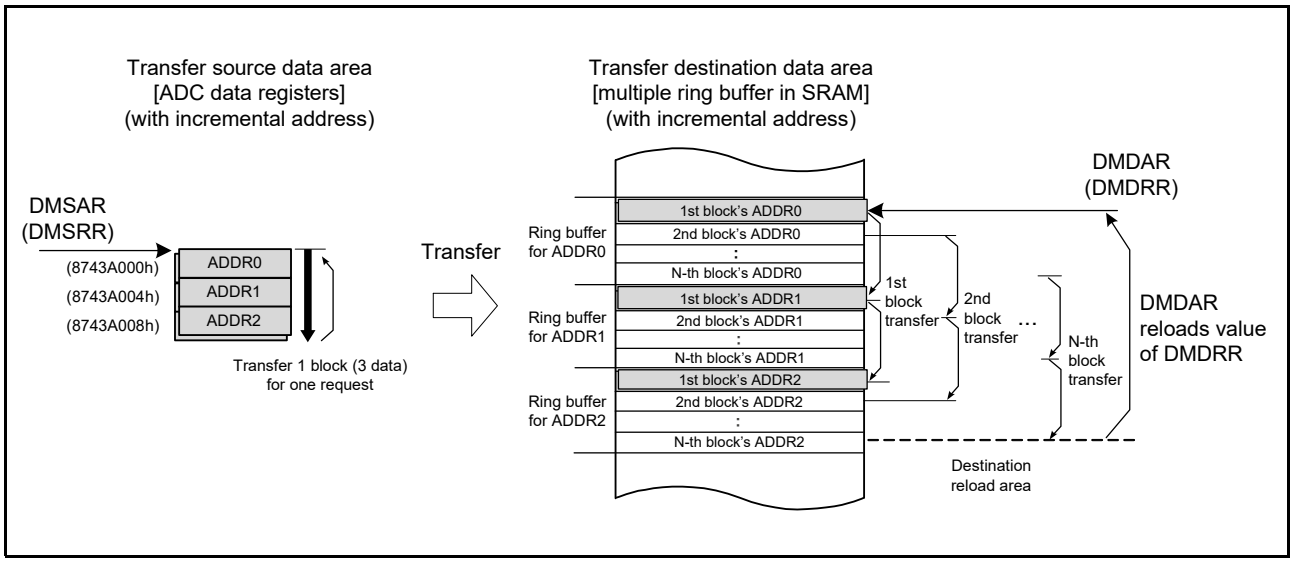

Figure 18.19 Use Case Example: Single Block to Multiple Ring Buffer

18.3.7 Trigger Sources

Software, the interrupt requests from the peripheral modules, and the external interrupt requests can be specified as the DMAC trigger sources. Setting the DMTMD.DCTG[1:0] bits selects the trigger source.

(1) Trigger by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request. When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

(2) Trigger by Interrupt Request

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC trigger sources. The trigger sources can be selected individually for each channel in the ICU.DMRSRm register (m = 0 to 7). To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set the ICU.DMRSRm register (m = 0 to 7) bits to the event number, and then clear the corresponding IR flag.
2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit to 1 (DMAC activation enabled).
5. Set the IERi.IENj bit to 0 so that the corresponding interrupt is enabled.

For interrupt requests specified as DMAC trigger sources, see Table 15.6, Interrupt Vector Table, Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

18.3.8 Operation Timing

Figure 18.20 and Figure 18.21 show DMAC operation timing examples.

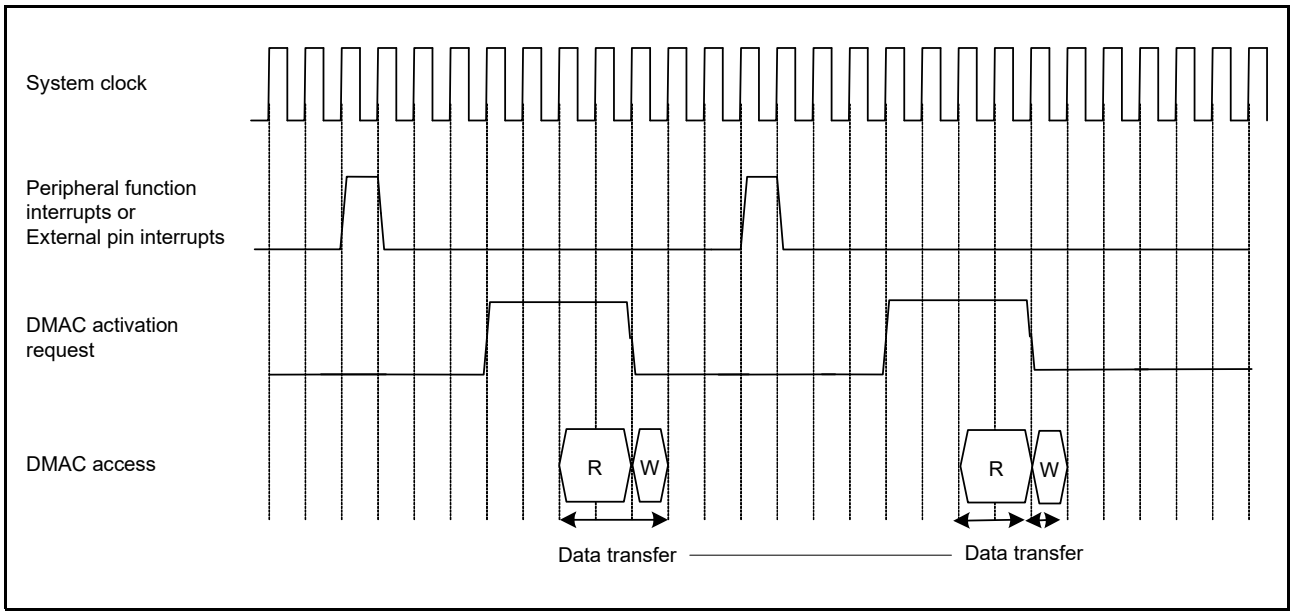

Figure 18.20 DMAC Operation Timing Example (1) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Normal Transfer Mode, Repeat Transfer Mode)

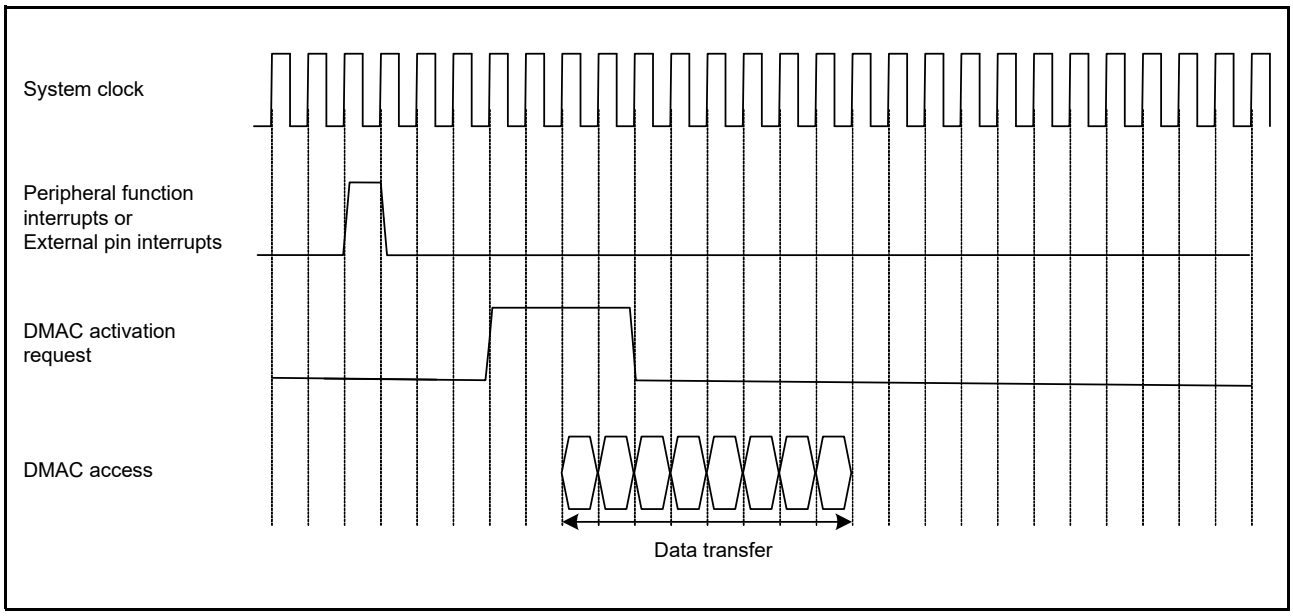

Figure 18.21 DMAC Operation Timing Example (2) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Block Transfer Mode, Block Size = 4)

18.3.9 Activating the DMAC

Table 18.17 lists the register setting procedure of normal, repeat and block transfer mode and Table 18.18 lists register setting procedure of repeat-block transfer mode.

Table 18.17 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the DMAC trigger source.	To use peripheral function interrupts as DMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQn pin as the DMAC trigger source.	To use external pin interrupts as DMAC trigger sources.
3	Clear the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Disable the interrupt trigger for the DMAC
4	Clear the DMCNT.DTE bit to 0	Disable DMA transfer.
5	Set the interrupt source as a DMAC trigger source to the DMRSRm register by using the Interrupt Controller Unit	To use internal peripheral interrupts or external pin interrupts as DMAC trigger sources. Enable the interrupt bit for the trigger source. Set the DMAC trigger source.
6	Set the peripheral module as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source. Set the control register for the peripheral function.
7	Set the IRQn pin function by using the Interrupt Controller Unit.	To use external pin interrupt as a DMAC trigger source. Set the IRQn pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DARA[4:0] bits Set the DMAMD.SARA[4:0] bits	Set the Destination address update mode select bits Set the Source address update mode select bits Set the Destination address extended repeat area setting bits Set the Source address extended repeat area setting bits
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.DTS[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request source select bits Set the Data transfer size bits Set the Repeat area select bits Set the Transfer mode select bits Set the Transfer keeping bit
10	Set the DMSAR register Set the DMDAR register Set the DMCRA register	Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations.
11	Set the DMCRB register	To use block transfer mode or repeat transfer mode. Set the number of block transfer operations.
12	Set the DMOFR register	To use the address update function with offset. Set the offset value.
13	Set the DMINT.DTIE bit to 1	To use the transfer end interrupts. Enable the transfer end interrupts.
14	Set the DMINT.RPTIE bit Set the DMINT.SARIE bit Set the DMINT.DARIE bit Set the DMINT.ESIE bit to 1	To use the transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the transfer escape end interrupt.
15	Set the DMCNT.DTE bit to 1	Enable DMA transfer.
16	Set the DMAST.DMST bit to 1	Enable DMAC operation.*1 Common settings for DMAC
17	Set the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Enable the interrupt trigger for the DMAC
18	Start the peripheral function as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source
19	Enable the IRQn pin as a DMAC trigger source	To use external pin interrupt as a DMAC trigger source
20	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

m: DMAC channel (m = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

Table 18.18 Register Setting Procedure of Repeat-Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the DMAC trigger source.	To use peripheral function interrupts as DMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQn pin as the DMAC trigger source.	To use external pin interrupts as DMAC trigger sources.
3	Clear the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Disable the interrupt trigger for the DMAC
4	Clear the DMCNT.DTE bit to 0	Disable DMA transfer.
5	Set the interrupt source as a DMAC trigger source to the DMRSRm register by using the Interrupt Controller Unit	To use internal peripheral interrupts or external pin interrupts as DMA trigger sources. Enable the interrupt bit for the trigger source. Set the DMAC trigger source.
6	Set the peripheral module as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source. Set the control register for the peripheral function.
7	Set the IRQn pin function by using the Interrupt Controller Unit.	To use external pin interrupt as a DMAC trigger source. Set the IRQn pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DADR bit Set the DMAMD.SADR bit	Set the Destination address update mode select bits Set the Source address update mode select bits Set the Destination address update setting after reload bit Set the Source address update setting after reload bit
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request source select bits Set the Data transfer size bits Set the transfer mode to repeat-block transfer mode Set the Transfer keeping bit
10	Set the DMSAR register Set the DMDAR register Set the DMSRR register Set the DMDRR register Set the DMCRA register Set the DMCRB register	Set the transfer source start address Set the transfer destination start address Set the initial value of source start address Set the initial value of destination start address Set the number of transfer operations Set the number of block transfer operations
11	Set the DMSBS register Set the DMDBS register	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset Set the destination buffer size and access offset
12	Set the DMINT.DTIE bit to 1	To use the transfer end interrupts. Enable the transfer end interrupts.
13	Set the DMCNT.DTE bit to 1	Enable DMA transfer
14	Set the DMAST.DMST bit to 1	Enable DMAC operation.*1
15	Set the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Enable the interrupt trigger for the DMAC
16	Start the peripheral function as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source
17	Enable the IRQn pin as a DMAC trigger source	To use external pin interrupt as a DMAC trigger source
18	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

m: DMAC channel (m = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

18.3.10 Starting DMA Transfer

To enable the DMA transfer of DMACm (m = 0 to 7), set the DMCNT.DTE bit to 1 (DMA transfer enabled), and then set the DMAST.DMST bit to 1 (DMAC module start). Another transfer request cannot be accepted during the transfer of other DMAC channel or DTC. When the proceeding transfer is completed, channel arbitration is performed where a DMA transfer request of the highest priority channel is accepted and DMA transfer of the channel starts. When DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

18.3.11 Registers during DMA Transfer

The DMACm registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMCNT, and DMSTS.

(1) DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(2) DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(3) DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(4) DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(5) DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(6) DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(7) DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically set to 0 by the DMAC according to the DMA transfer state. The conditions for clearing this bit by the DMAC are as follows:

- The specified total volume of data transfer is completed.
- The DMA transfer is stopped by the repeat size end interrupt.
- The DMA transfer is stopped by the extended repeat area overflow interrupt.

- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for the DMCNT register). In this case, writing must be performed after the bit is set to 0.

(8) DMA Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACm is in the idle or active state. This flag is set to 1 when the DMACm starts data transfer, and is set to 0 when data transfer in response to one transfer request is completed. Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

(9) Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed. When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested. This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

(10) Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When both this flag and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested. This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling. Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

18.3.12 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests. When DMCTL.PR = 0, the channel priority is fixed as channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7 (channel 0: Highest) > DTC. When DMCTL.PR = 1, the DMAC determines the priority of channels at round-robin. When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

18.3.13 Channel Security

The security attribute can be set with CPSCU.DMACCHSAR.SADMACn bit for each DMAC channel.
When the CPSCU.DMACCHSAR.SADMACn bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.DMACCHSAR.SADMACn bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Do not change the CPSCU.DMACCHSAR register while DMA transfer.

18.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0.

18.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of the DMCRAL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of the DMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the DMTMD.TKP bit is set to 1 (free-running function), the DMSTS.DTIF flag is set to 1, but the DMCNT.DTE bit does not become 0.

(3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of the DMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the DMTMD.TKP bit is set to 1 (free-running function), the DMSTS.DTIF flag is set to 1, but the DMCNT.DTE bit does not become 0.

(4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of the DMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the DMTMD.TKP bit is set to 1 (free-running function), the DMSTS.DTIF flag is set to 1, but the DMCNT.DTE bit does not become 0.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

18.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of each single-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested, DMA transfer is terminated regardless of the value of the DMTMD.TKP bit, the DMCNT.DTE bit is set to 0, and the DMSTS.ESIF flag is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit. A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of each single-block size of data is completed. Repeat size end interrupt cannot be requested in repeat-block transfer mode. Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).
For the interrupt outputs, refer to Figure 18.22 and Figure 18.23.

18.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area address occurs while the source address extended repeat area is specified with the DMINT.SARIE bit set to 1 or the destination address extended repeat area is specified with the DMINT.DARIE bit set to 1, an interrupt due to an extended repeat area overflow is requested. When the interrupt is requested, DMA transfer is terminated regardless of the value of the DMTMD.TKP bit, the DMCNT.DTE bit is set to 0, and the DMSTS.ESIF flag is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Even if an interrupt due to an extended repeat area overflow is requested during a read cycle, the subsequent write cycle proceeds. In block transfer mode, even if an interrupt due to an extended repeat area overflow is requested during a single-block transfer, the remaining data in the block are transferred; transfer is terminated after a block transfer. An interrupt due to an extended repeat area overflow is not possible in repeat-block transfer mode. Before interrupt requests can be sent from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM). For the interrupt outputs, see Figure 18.22 and Figure 18.23.

18.5 Processing on DMA Transfer Error

If the DMBWR.BWE bit is 0 and an access error occurs during a DMA transfer, the DMAC will abort the transfer. The IR status flag for the vector number that caused the error and the DMCNT.DTE bit for the channel on which the error occurred are cleared. The DMA transfer setting registers are not written back. Information about the channel that caused the error is set in the DMECHR register. If there is then a transfer request from a source other than the one that started the DMA transfer that caused the error, arbitration will be re-established. For details on bus errors, see section 16.8, Bus Error Monitoring Section.

18.6 Interrupts

18.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request to the CPU or the DTC after transfer in response to one request is completed. The interrupt request is generated after the bus response to the final write of the DMA transfer. The timing of the bus response to a DMA write access depends on the setting of the DMBWR.BWE bit and transfer destination. For details, see section 18.2.19, DMA Bufferable Write Enable Register (DMBWR). In repeat-block transfer mode, do not enable escape transfer end interrupt. Table 18.19 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 18.22 shows the schematic logic diagram of interrupt outputs (DMAC0 to DMAC3). Figure 18.23 shows the schematic logic diagram of interrupt outputs (DMAC4 to DMAC7). Figure 18.24 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 18.19 Relation among Interrupt Sources, Interrupt Status Flags, and Interrupt Enable Bits

Interrupt Sources		Interrupt Enable Bits	Interrupt Status Flags	Request Output Enable Bits
Transfer end		—	DMSTS.DTIF	DMINT.DTIE
Escape transfer end	Repeat size end	DMINT.RPTIE	DMSTS.ESIF	DMINT.ESIE
	Source address extended repeat area overflow	DMINT.SARIE		
	Destination address extended repeat area overflow	DMINT.DARIE		

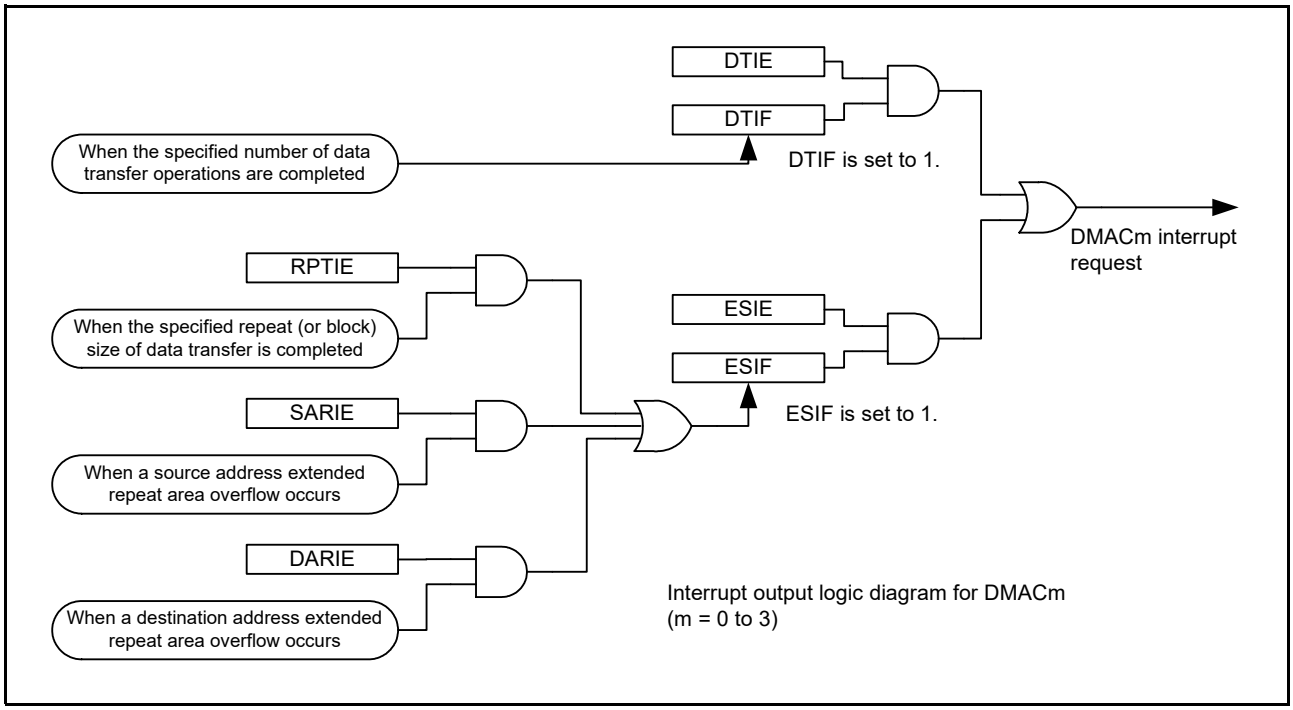

Figure 18.22 Schematic Logic Diagram of Interrupt Outputs (DMAC0 to DMAC3)

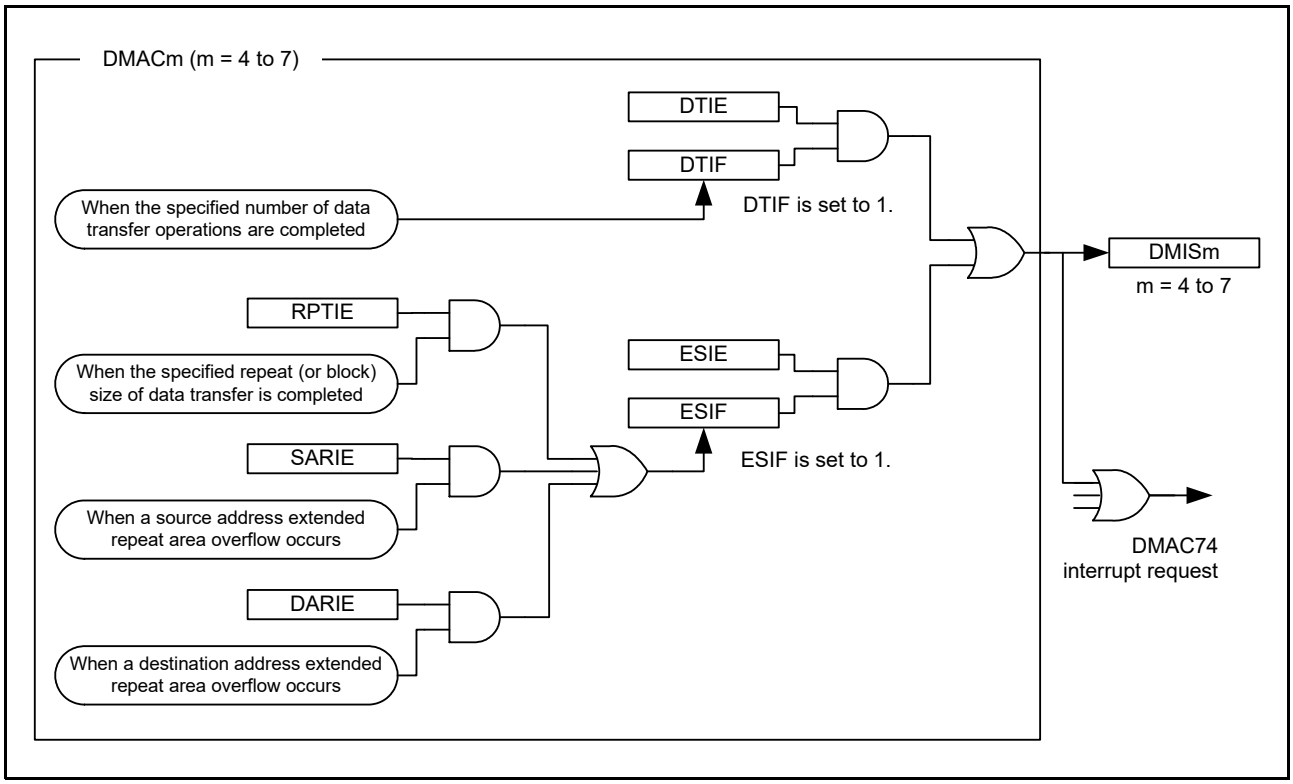

Figure 18.23 Schematic Logic Diagram of Interrupt Outputs (DMAC4 to DMAC7)

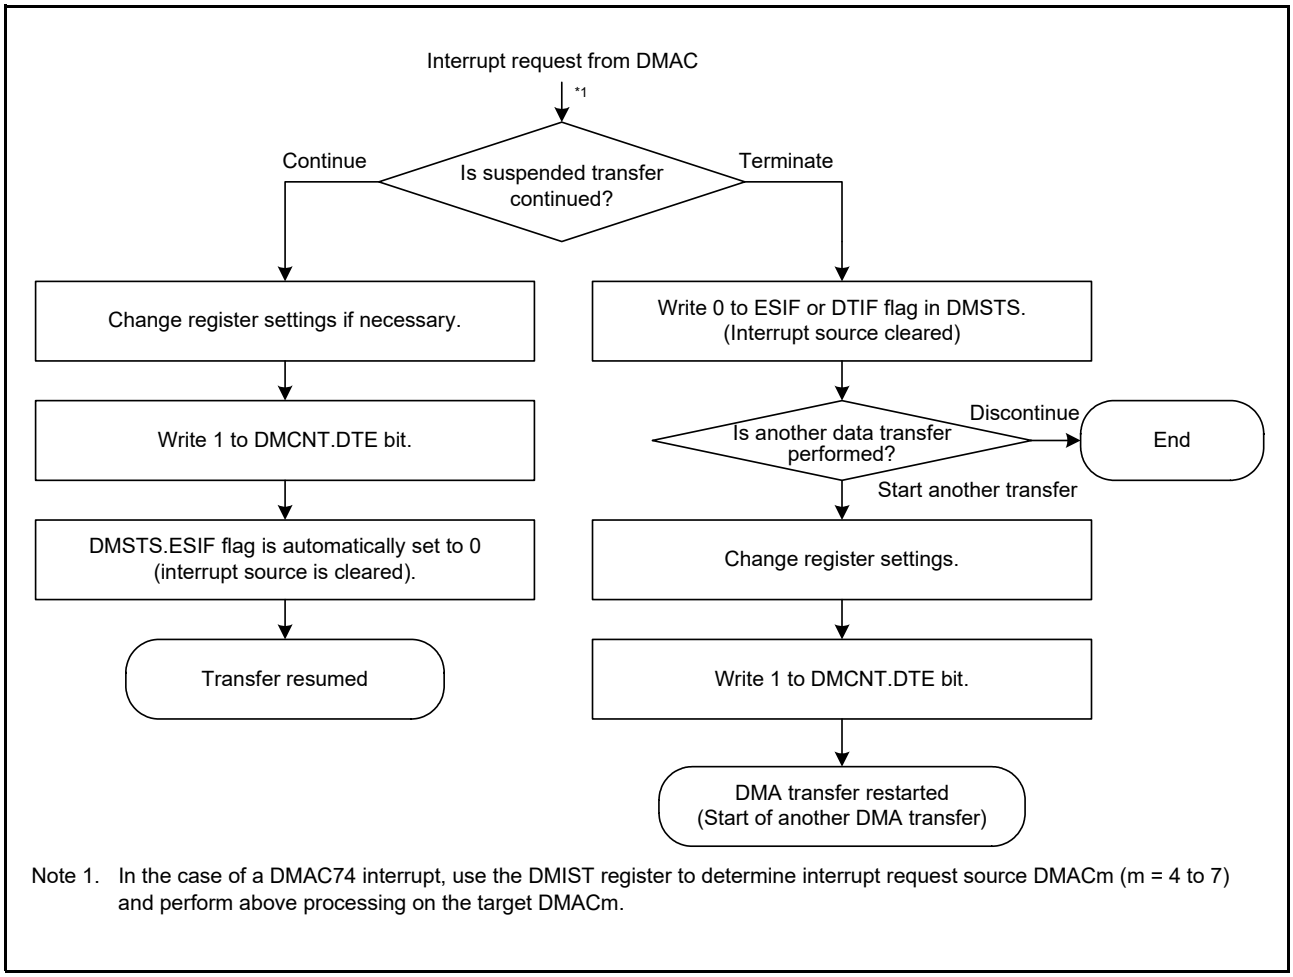

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases: (1) discontinuing or terminating DMA transfer and (2) continuing DMA transfer.

(1) When Discontinuing or Terminating DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACm remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

(2) When Continuing DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically set to 0 (interrupt source cleared), and DMA transfer is resumed.

Note 1. In the case of a DMAC74 interrupt, use the DMIST register to determine interrupt request source DMACm (m = 4 to 7) and perform above processing on the target DMACm.

Figure 18.24 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

18.6.2 Transfer Error Interrupt

A transfer error occurring during DMA transfer is detected as a bus error. For details, see section 16.8, Bus Error Monitoring Section.

Table 18.20 Interrupt and Error Information Due to DMA Transfer Error Cause

Transfer Error Factor	Interrupt/Reset Selection	NMI	Interrupt	Bus Error Status	Error Channel Information
MSAU Error	BUS.MSAOAD.OAD	ICU.NMISR.BUSST	ICU.IR16.IR	BUS.BUSERRSTATDMAC0.MSERRSTAT	DMECHR
Illegal Access Error	BUS.BUSOAD.ILERROAD			BUS.BUSERRSTATDMAC0.ILERRSTAT	
Slave Bus Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATDMAC0.SLERRSTAT	
Protect Zone Access Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATDMAC0.SLERRSTAT	

18.7 Event Link

Each DMAC channel outputs an event link request each time one data transfer is completed or, in block and repeat-block transfer mode, each time one block transfer is completed. The timing of the bus response from the DMA transfer destination depends on the transfer destination and bus configuration. For details, see section 16.2.5, Restrictions in section 16, Buses. Enabling or disabling buffered writing to bufferable areas in DMA transfers can be specified by the DMBWR register. For details, see section 18.2.19, DMA Bufferable Write Enable Register (DMBWR).

For details on the event link function, see section 21, Event Link Controller (ELC).

18.8 Low-Power Consumption Function

Before transition to the module-stop state, software standby mode, or deep software standby mode, set the DMAST.DMST bit to 0 (the DMAC suspended), and then perform the following.

(1) Module-Stop Function

Writing 1 to the module-stop setting bit (transition to the module-stop state) enables the module-stop function of the DMAC. If DMA transfer is in progress at the time a 1 is written to the module-stop setting bit, the transition to the module-stop state proceeds after DMA transfer has ended. While the module-stop setting bit is 1, accessing the DMAC registers are prohibited. Writing 0 to the module-stop setting bit releases the DMAC from the module-stop state.

(2) Software Standby and Deep Software Standby Modes

Make settings in accord with the procedure under section 11.6.2.1, Transitioning to Software Standby Mode or section 11.6.3.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption. If DMA transfer operations are in progress at the time the WAIT instruction is executed, the transition to software standby or deep software standby follows the completion of DMA transfer.

(3) Note on Low-Power Consumption Function

For the WAIT instruction and the register setting procedure, see section 11.8.6, Timing of the WAIT Instruction in section 11, Low Power Consumption. To perform DMA transfer after returning from low-power consumption mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in software standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination in accordance with the settings described in section 15.7.3, Selecting Interrupt Request Destination in section 15, Interrupt Controller (ICUM), and then execute the WAIT instruction.

18.9 Usage Notes

18.9.1 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

18.9.2 Setting of DMAC Trigger Select Register of the Interrupt Controller (ICU.DMRSRm)

The DMAC trigger select register (ICU.DMRSRm) should be set while the DMA transfer enable bit (DMCNT.DTE) is 0 (DMA transfer is disabled). Moreover, the DTC transfer request enable register (ICU.DTCERn) that corresponds to the same vector number that has been set by the ICU.DMRSRm register should not be set to 1. For details on the ICU.DTCERn and ICU.DMRSRm registers, see section 15, Interrupt Controller (ICUM).

18.9.3 Suspending or Restarting DMA Transfer

To suspend a DMA transfer request, write 0 to the interrupt enable bit for the trigger source (ICU.IERi.IENj bit). To restart the DMA transfer, write 1 to the ICU.IERi.IENj bit with the setting shown in section 18.3.9, Activating the DMAC.

19. EXDMA Controller (EXDMACAa)

This MCU incorporates a 2-channel direct memory access controller (EXDMAC) designed exclusively for external bus transfer. The EXDMAC is a module to transfer data without the CPU. When a DMA transfer request is generated, the EXDMAC transfers data stored at the transfer source address to the transfer destination address.

19.1 Overview

Table 19.1 lists the specifications of the EXDMAC, and Figure 19.1 shows a block diagram of the EXDMAC.

Table 19.1 Specifications of EXDMAC

Item		Description EXDMAC
Number of channels		2 (EXDMACn (n = 0, 1))
Transfer space		SRAM0/SRAM1 (Secure: 8200 0000h to 8217 FFFFh, Non-secure: 0200 0000h to 0217 FFFFh) CS0 to CS7/SDRAM (7000 0000h to 7FFF FFFFh) xSPI0/xSPI1 (2000 0000h to 5FFF FFFFh)
Maximum transfer volume		64M data (Maximum number of transfers in block transfer mode: 1024 data × 65536 blocks)
EXDMAC trigger source		• Trigger source selectable for each channel Software trigger Interrupt requests from peripheral modules*1 or trigger input to external interrupt input pins
Channel priority		Selectable from fixed priority or round-robin • Fixed priority: Channel 0 > channel 1 (channel 0: Highest) • Round-robin
Transfer data	Single data	Bit length: 8, 16, 32, 64 bits
	Block size	Number of data: 1 to 1024
Transfer mode	Normal transfer mode	• One data transfer by one DMA transfer request • Free running mode (setting in which total number of data transfers is not specified) settable
	Repeat transfer mode	• One data transfer by one DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. • Maximum settable repeat size: 1024 • Selectable free running function
	Block transfer mode	• One block data transfer by one DMA transfer request • Maximum settable block size: 1024 data • Selectable free running function
	Repeat-block transfer mode	• One block data transfer by one DMA transfer request • Maximum settable block size: 1024 data • Block transfer can be repeated • Maximum settable repeat size: 64K • Selectable free running function
Selective functions	Extended repeat area function	• Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed • Area of 2 bytes to 128 Mbytes separately settable as extended repeat area for transfer source and destination
Processing on DMA transfer error		• When DMA transfer error occurs, the transfer that caused the error is stopped • For clearing requests to the registers for trigger source in the ICU, clearing targets are selectable for each channel or all channels.
CPU interrupt source (EXDMACnI)	Transfer end interrupt	Generated on completion of transferring data volume specified by the transfer counter.
	Transfer escape end interrupt	• Generated when the repeat size of data transfer is completed. • Generated when the source address extended repeat area overflows. • Generated when the destination address extended repeat area overflows.
Power consumption reduction function		Module-stop state can be set.
Protect Zone Filter		Security can be set for each channel.

Note 1. For details on EXDMAC trigger sources, see Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

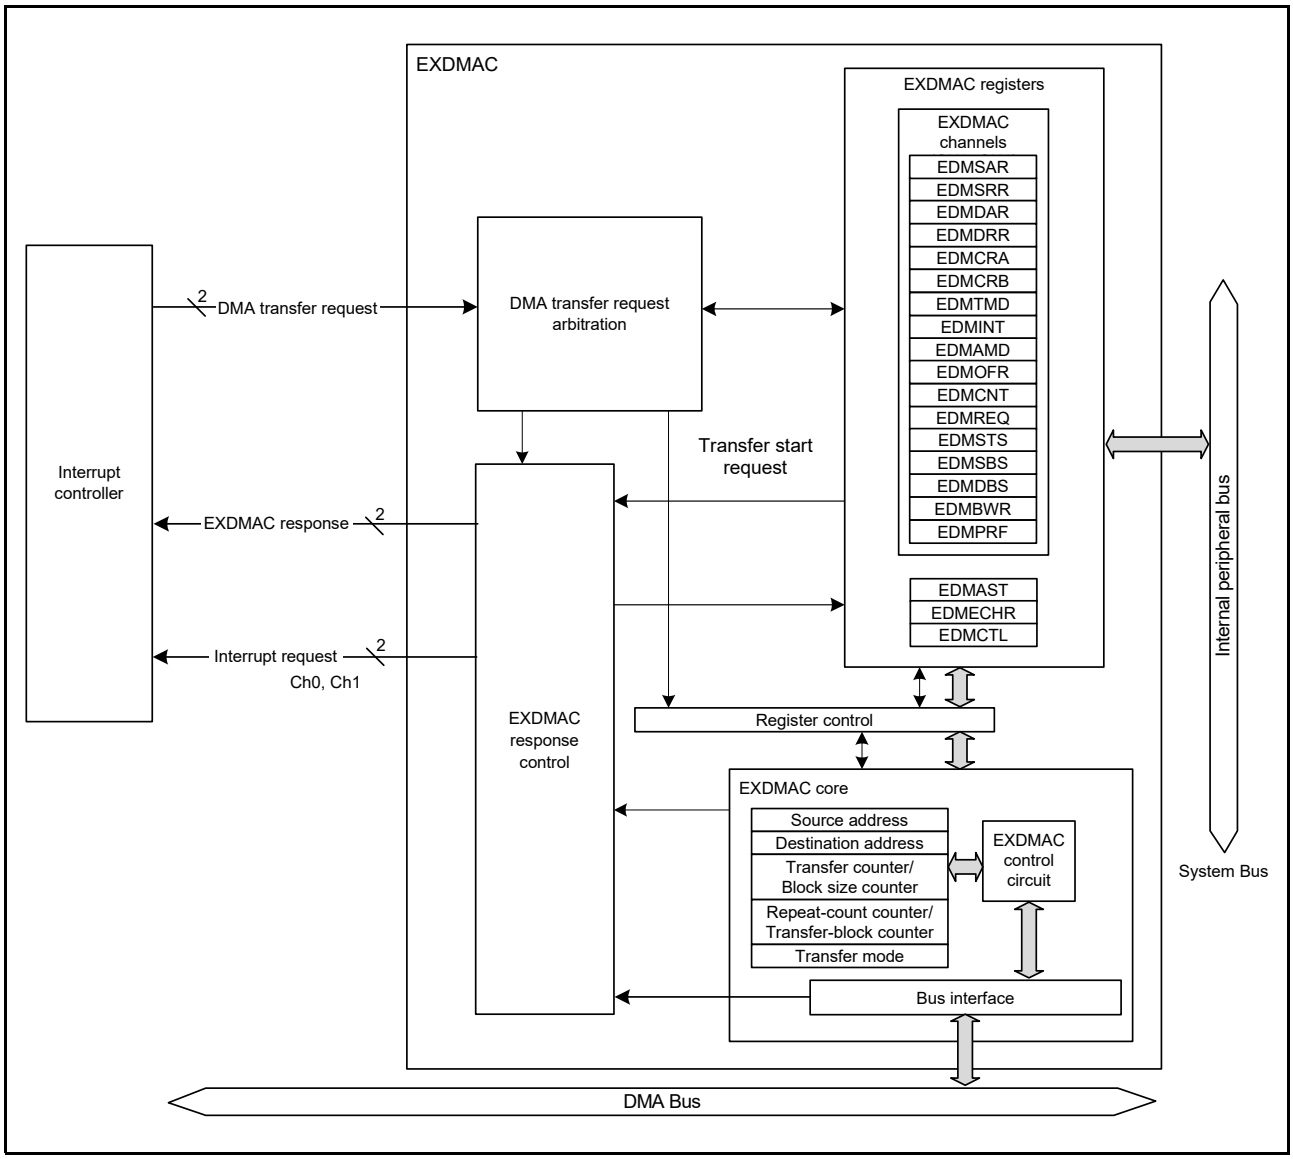

Figure 19.1 Block Diagram of EXDMAC

19.2 Register Descriptions

Security attribution can be set for each register and is used to determine whether the target register is a secure register or a non-secure register. The attribution can be set by the EXDMACCHSAR, EXDMACSAR registers.

19.2.1 EXDMAC Channel Security Attribution Register (EXDMACCHSAR)

Address(es): CPSCU.EXDMACCHSAR 8701 819Ch, CPSCU_NS.EXDMACCHSAR 0701 819Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADMACX1	SADMACX0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SADMACX0	Security Attributes of Output and Registers for EXDMAC Channel 0 Select	0: Secure 1: Non-secure	R/W
b1	SADMACX1	Security Attributes of Output and Registers for EXDMAC Channel 1 Select	0: Secure 1: Non-secure	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

SADMACXn Bits (Security Attributes of Output and Registers for EXDMAC Channel n Select) (n = 0, 1)

Each bit specifies the security attribute of the register for a EXDMAC channel n. For details, see section 19.3.12, Channel Security. The target registers are ICU.SELEXDRn (n = 0, 1), EDMSAR, EDMSRR, EDMDAR, EDMDRR, EDMCRA, EDMCRB, EDMTMD, EDMINT, EDMAMD, EDMOFR, EDMCNT, EDMREQ, EDMSTS, EDMSBS, EDMDBS, EDMBWR, and EDMPRF.

19.2.2 EXDMAC Controller Security Attribution Register (EXDMACSAR)

Address(es): CPSCU.EXDMACSAR 8701 8038h, CPSCU_NS.EXDMACSAR 0701 8038h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAXSTSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DMAXSTSA0	EXDMA EDMAST Security Attribution Setting 0	0: Secure 1: Non-secure	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

For EXDMAC, security attribution is set for each channel. However, security attribution of the EDMAST and EDMCTL registers is set by this register.

DMAXSTSA0 Bit (EXDMA EDMAST Security Attribution Setting 0)

The DMAXSTSA0 bit specifies security attribution of the EDMAST and EDMCTL registers.

19.2.3 EXDMA Source Address Register (EDMSAR)

Address(es): EXDMAC0.EDMSAR 8701 A000h, EXDMAC1.EDMSAR 8701 A040h,
EXDMAC0_NS.EDMSAR 0701 A000h, EXDMAC1_NS.EDMSAR 0701 A040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer source start address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the EDMSAR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0).

19.2.4 EXDMA Source Reload Address Register (EDMSRR)

Address(es): EXDMAC0.EDMSRR 8701 A020h, EXDMAC1.EDMSRR 8701 A060h,
EXDMAC0_NS.EDMSRR 0701 A020h, EXDMAC1_NS.EDMSRR 0701 A060h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer source reload address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

EDMSRR register is used to specify the DMA transfer source start and reload addresses in repeat-block transfer mode. Set EDMSRR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0). Set the same value to EDMSRR register as that of EDMSAR register. For details on the repeat-block transfer mode operation, see section (4), Repeat-Block Transfer Mode. In normal transfer mode, repeat transfer mode and block transfer mode, EDMSRR register is not used. The setting is invalid.

19.2.5 EXDMA Destination Address Register (EDMDAR)

Address(es): EXDMAC0.EDMDAR 8701 A004h, EXDMAC1.EDMDAR 8701 A044h, EXDMAC0_NS.EDMDAR 0701 A004h, EXDMAC1_NS.EDMDAR 0701 A044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer destination start address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the EDMDAR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0).

19.2.6 EXDMA Destination Reload Address Register (EDMDRR)

Address(es): EXDMAC0.EDMDRR 8701 A024h, EXDMAC1.EDMDRR 8701 A064h, EXDMAC0_NS.EDMDRR 0701 A024h, EXDMAC1_NS.EDMDRR 0701 A064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer destination reload address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

EDMDRR register is used to specify the DMA transfer destination start and reload addresses in repeat-block transfer mode. Set EDMDRR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0). Set the same value to EDMDRR register as that of EDMDAR register. For details on the repeat-block transfer mode operation, see section (4), Repeat-Block Transfer Mode. In normal transfer mode, repeat transfer mode and block transfer mode, EDMDRR register is not used. The setting is invalid.

19.2.7 EXDMA Transfer Count Register (EDMCRA)

Address(es): EXDMAC0.EDMCRA 8701 A008h, EXDMAC1.EDMCRA 8701 A048h,
EXDMAC0_NS.EDMCRA 0701 A008h, EXDMAC1_NS.EDMCRA 0701 A048h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	EDMCRAH[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDMCRAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMCRAL[15:0]	Lower Bits of Transfer Count	Specifies the number of transfer operations	R/W
b25 to b16	EDMCRAH[9:0]	Upper Bits of Transfer Count		R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note: Set the same value for EDMCRAH[9:0] and EDMCRAL[15:0] bits in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode and block transfer mode.

(1) Normal Transfer Mode (EDMTMD.MD[1:0] Bits = 00b)

The EDMCRAL[15:0] bits function as a 16-bit transfer counter. The number of transfer operations is one when the setting is 0001h, and 65535 when it is FFFFh. The value is decremented by one each time data is transferred. When the setting is 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function). Free running function is not selected by EDMTMD.TKP bit in normal transfer mode. The EDMCRAH[9:0] bits are not used in normal transfer mode. Write 000h to the EDMCRAH[9:0] bits.

(2) Repeat Transfer Mode (EDMTMD.MD[1:0] Bits = 01b)

The EDMCRAH[9:0] bits hold the repeat size and the EDMCRAL[15:0] bits function as a 10-bit transfer counter. The number of transfer operations is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In repeat transfer mode, a value in the range of 000h to 3FFh can be set for the EDMCRAH[9:0] and EDMCRAL[15:0] bits. Setting bits 15 to 10 in the EDMCRAL[15:0] bits is invalid. Write 0 to these bits. The value in the EDMCRAL[15:0] bits is decremented by one each time data is transferred until it reaches 000h, at which the value in the EDMCRAH[9:0] bits is loaded into the EDMCRAL[15:0] bits.

(3) Block Transfer Mode (EDMTMD.MD[1:0] Bits = 10b)

The EDMCRAH[9:0] bits hold the block size and the EDMCRAL[15:0] bits function as a 10-bit block size counter. The block size is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In block transfer mode, a value in the range of 000h to 3FFh can be set for the EDMCRAH[9:0] and EDMCRAL[15:0] bits. Setting bits 15 to 10 in the EDMCRAL[15:0] bits is invalid. Write 0 to these bits. The value in the EDMCRAL[15:0] bits is decremented by one each time data is transferred until it reaches 000h, at which the value in the EDMCRAH[9:0] bits is loaded into the EDMCRAL[15:0] bits.

(4) Repeat-Block Transfer Mode (EDMTMD.MD[1:0] Bits = 11b)

The EDMCRAH[9:0] bits hold the block size and the EDMCRAL[15:0] bits function as a 10-bit block size counter. The block size is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In repeat-block transfer

mode, a value in the range of 000h to 3FFh can be set for the EDMCRAH[9:0] and EDMCRAL[15:0] bits. Setting bits 15 to 10 in the EDMCRAL[15:0] bits is invalid. Write 0 to these bits. The value in the EDMCRAL[15:0] bits is decremented by one each time data is transferred until it reaches 000h, at which the value in the EDMCRAH[9:0] bits is loaded into the EDMCRAL[15:0] bits.

19.2.8 EXDMA Block Transfer Count Register (EDMCRB)

Address(es): EXDMAC0.EDMCRB 8701 A00Ch, EXDMAC1.EDMCRB 8701 A04Ch, EXDMAC0_NS.EDMCRB 0701 A00Ch, EXDMAC1_NS.EDMCRB 0701 A04Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EDMCRBH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDMCRBL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMCRBL[15:0]	Lower Bits of Block Transfer Count	Counts the number of block, repeat or repeat-block transfer operations	R/W
b31 to b16	EDMCRBH[15:0]	Upper Bits of Block Transfer Count		R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the same value for EDMCRBH[15:0] and EDMCRBL[15:0] bits in repeat transfer mode, block transfer mode, and repeat-block transfer mode. EDMCRBH[15:0] and EDMCRBL[15:0] bits specifies and counts, respectively, the number of transfer operations in block, repeat, and repeat-block transfer mode. The number of transfer operations is one when the setting is 0001h, 65535 when it is FFFFh, and 65536 when it is 0000h. In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred. In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final block data is transferred. In normal transfer mode, do not use the EDMCRB register because the setting is invalid. When EDMTMD.TKP bit is 1 and the final data of one repeat size or one block size is transferred, EDMCRBL[15:0] bits are reloaded with the value of EDMCRBH[15:0] bits automatically.

19.2.9 EXDMA Transfer Mode Register (EDMTMD)

Address(es): EXDMAC0.EDMTMD 8701 A010h, EXDMAC1.EDMTMD 8701 A050h, EXDMAC0_NS.EDMTMD 0701 A010h, EXDMAC1_NS.EDMTMD 0701 A050h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MD[1:0]		DTS[1:0]		—	TKP	SZ[1:0]		—	—	—	—	—	—	DCTG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	DCTG[1:0]	Transfer Request Source Select	b1 b0 0 0: Software 0 1: Interrupts*1 from peripheral modules or external interrupt input pins 1 0: Setting prohibited 1 1: Setting prohibited	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	SZ[1:0]	Data Transfer Size	b9 b8 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: 64 bits	R/W
b10	TKP	Transfer Keeping	0: Transfer is stopped by completion of specified total number of transfer operations. 1: Transfer is not stopped by completion of specified total number of transfer operations (free-running).	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b13, b12	DTS[1:0]	Repeat Area Select	b13 b12 0 0: The destination is specified as the repeat area or block area. 0 1: The source is specified as the repeat area or block area. 1 0: The repeat area or block area is not specified. 1 1: Setting prohibited	R/W
b15, b14	MD[1:0]	Transfer Mode Select	b15 b14 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Repeat-block transfer	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. EXDMAC trigger source is selected using the ICU.SELEXDRn registers. For details on EXDMAC trigger sources, see Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

DTS[1:0] Bits (Repeat Area Select)

DTS[1:0] bits select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

TKP Bit (Transfer Keeping)

TKP bit selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

19.2.10 EXDMA Interrupt Setting Register (EDMINT)

Address(es): EXDMAC0.EDMINT 8701 A013h, EXDMAC1.EDMINT 8701 A053h, EXDMAC0_NS.EDMINT 0701 A013h, EXDMAC1_NS.EDMINT 0701 A053h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DTIE	ESIE	RPTIE	SARIE	DARIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DARIE	Destination Address Extended Repeat Area Overflow Interrupt Enable	0: Disables an interrupt request for an extended repeat area overflow on the destination address 1: Enables an interrupt request for an extended repeat area overflow on the destination address	R/W
b1	SARIE	Source Address Extended Repeat Area Overflow Interrupt Enable	0: Disables an interrupt request for an extended repeat area overflow on the source address 1: Enables an interrupt request for an extended repeat area overflow on the source address	R/W
b2	RPTIE	Repeat Size End Interrupt Enable	0: Disables the repeat size end interrupt request. 1: Enables the repeat size end interrupt request.	R/W
b3	ESIE	Transfer Escape End Interrupt Enable	0: Disables the transfer escape end interrupt request. 1: Enables the transfer escape end interrupt request.	R/W
b4	DTIE	Transfer End Interrupt Enable	0: Disables the transfer end interrupt request. 1: Enables the transfer end interrupt request.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DARIE Bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while this bit is set to 1, the EDMCNT.DTE bit is set to 0. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that an interrupt due to an extended repeat area overflow on the destination address is requested. When block transfer mode is used with the extended repeat area function, an interrupt is requested when transfer of each single-block size of data is completed. When you set 1 in the EDMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped. When the extended repeat area is not specified for the destination address, this bit is ignored. When you use repeat-block transfer mode, do not set this bit to 1.

SARIE Bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while this bit is set to 1, the EDMCNT.DTE bit is set to 0. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that an interrupt due to an extended repeat area overflow on the source address is requested. When block transfer mode is used with the extended repeat area function, an interrupt is requested when transfer of each single-block size of data is completed. When you set 1 in the EDMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped. When the extended repeat area is not specified for the source address, this bit is ignored. When you use repeat-block transfer mode, do not set this bit to 1.

RPTIE Bit (Repeat Size End Interrupt Enable)

When this bit is set to 1 in repeat transfer mode, the EDMCNT.DTE bit is set to 0 when transfer of each single-repeat size of data is completed. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the EDMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified). When this bit is set to 1 in block transfer mode, the EDMCNT.DTE bit is set to 0 when transfer of each single-block size of data is completed in the same way as repeat transfer mode. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the EDMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified). When you use repeat-block transfer mode, do not set this bit to 1.

ESIE Bit (Transfer Escape End Interrupt Enable)

This bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and interrupt requests for extended repeat area overflows on the source and destination addresses) that are generated during DMA transfer. The transfer escape end interrupt is generated when the EDMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by setting this bit or the EDMSTS.ESIF flag to 0.

DTIE Bit (Transfer End Interrupt Enable)

This bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers. The transfer end interrupt is generated when the EDMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by setting this bit or the EDMSTS.DTIF flag to 0.

19.2.11 EXDMA Address Mode Register (EDMAMD)

Address(es): EXDMAC0.EDMAMD 8701 A014h, EXDMAC1.EDMAMD 8701 A054h,
EXDMAC0_NS.EDMAMD 0701 A014h, EXDMAC1_NS.EDMAMD 0701 A054h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SM[1:0]		SADR	SARA[4:0]					DM[1:0]		DADR	DARA[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	DARA[4:0]	Destination Address Extended Repeat Area Setting	Specifies the extended repeat area on the destination address. For details on the settings, see Table 19.2.	R/W
b5	DADR	Destination Address Update Setting after Reload	0: Only reloading. 1: Add index after reloading.	R/W
b7, b6	DM[1:0]	Destination Address Update Mode Select	b7 b6 0 0: Destination address is fixed. 0 1: Offset addition 1 0: Destination address is incremented. 1 1: Destination address is decremented.	R/W
b12 to b8	SARA[4:0]	Source Address Extended Repeat Area Setting	Specifies the extended repeat area on the source address. For details on the settings, see Table 19.2.	R/W
b13	SADR	Source Address Update Setting after Reload	0: Only reloading. 1: Add index after reloading.	R/W
b15, b14	SM[1:0]	Source Address Update Mode Select	b15 b14 0 0: Source address is fixed. 0 1: Offset addition 1 0: Source address is incremented. 1 1: Source address is decremented.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DARA[4:0] Bits (Destination Address Extended Repeat Area Setting)

These bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes. That is, the interval between settings is any power of two. When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set. When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when EDMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits. In repeat-block transfer mode, write 00000b in the DARA[4:0] bits. An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the EDMINT.DARIE bit set to 1. Table 19.2 lists the settings and the corresponding extended repeat areas.

Note: When setting the extended repeat area, set the lowest bit or lower bits of EDMDAR as follows according to the setting of EDMTMD.SZ[1:0].
When EDMTMD.SZ[1:0] = 01b (16 bits), set EDMDAR[0] to 0b.
When EDMTMD.SZ[1:0] = 10b (32 bits), set EDMDAR[1:0] to 00b.
When EDMTMD.SZ[1:0] = 11b (64 bits), set EDMDAR[2:0] to 000b.

DADR Bit (Destination Address Update Setting after Reload)

In repeat-block transfer mode, this bit specifies the behavior of EDMDAR register after reloading the value of EDMDRR

register. When this bit is set to 1, an index value ((EDMDBSH – EDMDBSL) × transfer data size) is added to EDMDAR register after reloading the value of EDMDRR register. When this bit is set to 0, EDMDAR register only reloads EDMDRR register. This behavior is described in Table 19.13. In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] Bits (Destination Address Update Mode Select)

These bits select the mode of updating the destination address. When increment is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the destination address is incremented by 1, 2, 4, and 8, respectively. When decrement is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the destination address is decremented by 1, 2, 4, and 8, respectively. When offset addition is selected, the offset specified by the EDMOFR register is added to the address.

SARA[4:0] Bits (Source Address Extended Repeat Area Setting)

These bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes. When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set. When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when EDMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits. In repeat-block transfer mode, write 00000b in the SARA[4:0] bits. An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the EDMINT.SARIE bit set to 1. Table 19.2 lists the settings and the corresponding extended repeat areas.

Note: When setting the extended repeat area, set the lowest bit or lower bits of EDMSAR as follows according to the setting of EDMTMD.SZ[1:0].
When EDMTMD.SZ[1:0] = 01b (16 bits), set EDMSAR[0] to 0b.
When EDMTMD.SZ[1:0] = 10b (32 bits), set EDMSAR[1:0] to 00b.
When EDMTMD.SZ[1:0] = 11b (64 bits), set EDMSAR[2:0] to 000b.

SADR Bit (Source Address Update Setting after Reload)

In repeat-block transfer mode, this bit specifies the behavior of EDMSAR after reloading the value of EDMSRR. When this bit is set to 1, an index value ((EDMSBSH – EDMSBSL) × transfer data size) is added to EDMSAR after reloading the value of EDMSRR. When this bit is set to 0, EDMSAR only reloads EDMSRR. This behavior is described in Table 19.12. In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] Bits (Source Address Update Mode Select)

These bits select the mode of updating the source address. When increment is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the source address is incremented by 1, 2, 4, and 8, respectively. When decrement is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the source address is decremented by 1, 2, 4, and 8, respectively. When offset addition is selected, the offset specified by the EDMOFR register is added to the address.

Table 19.2 Settings and Corresponding Extended Repeat Areas

SARA[4:0] or DARA[4:0]	Extended Repeat Area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 Kbyte specified as extended repeat area by the lower 10 bits of the address
01011b	2 Kbytes specified as extended repeat area by the lower 11 bits of the address
01100b	4 Kbytes specified as extended repeat area by the lower 12 bits of the address
01101b	8 Kbytes specified as extended repeat area by the lower 13 bits of the address
01110b	16 Kbytes specified as extended repeat area by the lower 14 bits of the address
01111b	32 Kbytes specified as extended repeat area by the lower 15 bits of the address
10000b	64 Kbytes specified as extended repeat area by the lower 16 bits of the address
10001b	128 Kbytes specified as extended repeat area by the lower 17 bits of the address
10010b	256 Kbytes specified as extended repeat area by the lower 18 bits of the address
10011b	512 Kbytes specified as extended repeat area by the lower 19 bits of the address
10100b	1 Mbyte specified as extended repeat area by the lower 20 bits of the address
10101b	2 Mbytes specified as extended repeat area by the lower 21 bits of the address
10110b	4 Mbytes specified as extended repeat area by the lower 22 bits of the address
10111b	8 Mbytes specified as extended repeat area by the lower 23 bits of the address
11000b	16 Mbytes specified as extended repeat area by the lower 24 bits of the address
11001b	32 Mbytes specified as extended repeat area by the lower 25 bits of the address
11010b	64 Mbytes specified as extended repeat area by the lower 26 bits of the address
11011b	128 Mbytes specified as extended repeat area by the lower 27 bits of the address
11100b to 11111b	Setting prohibited.

19.2.12 EXDMA Offset Register (EDMOFR)

Address(es): EXDMAC0.EDMOFR 8701 A018h, EXDMAC1.EDMOFR 8701 A058h,
EXDMAC0_NS.EDMOFR 0701 A018h, EXDMAC1_NS.EDMOFR 0701 A058h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination.	0000 0000h to 00FF FFFFh (0 bytes to (16 M – 1) bytes) FF00 0000h to FFFF FFFFh (–16 Mbytes to –1 byte)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Write to this register while the EXDMAC operation is stopped (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0) (not during data transfer). Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading EDMOFR register returns the extended value. In repeat-block transfer mode, the offset cannot be specified by EDMOFR when offset addition is selected, write 0000 0000h to EDMOFR register.

19.2.13 EXDMA Transfer Enable Register (EDMCNT)

Address(es): EXDMAC0.EDMCNT 8701 A01Ch, EXDMAC1.EDMCNT 8701 A05Ch, EXDMAC0_NS.EDMCNT 0701 A01Ch, EXDMAC1_NS.EDMCNT 0701 A05Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DTE	DMA Transfer Enable	0: Disables DMA transfer. 1: Enables DMA transfer.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DTE Bit (DMA Transfer Enable)

When the EDMAST.DMST bit is set to 1 (EXDMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel. If the DTE bit is cleared during DMA transfer, no transfer requests for the corresponding channel will be accepted after the transfer ends.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped due to the occurrence of an access error. See section 19.5, Processing on DMA Transfer Error.

19.2.14 EXDMA Software Start Register (EDMREQ)

Address(es): EXDMAC0.EDMREQ 8701 A01Dh, EXDMAC1.EDMREQ 8701 A05Dh, EXDMAC0_NS.EDMREQ 0701 A01Dh, EXDMAC1_NS.EDMREQ 0701 A05Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SWREQ	DMA Software Start	Writing 1 to this bit triggers the generation of a DMA transfer request, and DMA transfer is started in response to the request	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	CLRS	DMA Software Start Bit Auto Clear Setting	0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

SWREQ Bit (DMA Software Start)

When 1 is written to this bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is set to 0 if the CLRS bit is set to 0. This bit is not set to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer. Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the EDMTMD.DCTG[1:0] bits are set to 00b (EXDMAC trigger source is software). Setting this bit is invalid when the EDMTMD.DCTG[1:0] bits are set to a value other than 00b. To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When DMA transfer is stopped due to the occurrence of an access error. See section 19.5, Processing on DMA Transfer Error.
- When 0 is written to this bit.

CLRS Bit (DMA Software Start Bit Auto Clear Setting)

This bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is set to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not set to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

19.2.15 EXDMA Status Register (EDMSTS)

Address(es): EXDMAC0.EDMSTS 8701 A01Eh, EXDMAC1.EDMSTS 8701 A05Eh, EXDMAC0_NS.EDMSTS 0701 A01Eh, EXDMAC1_NS.EDMSTS 0701 A05Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	DTIF	—	—	—	ESIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ESIF	Transfer Escape End Interrupt Flag	0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated.	R/W*1
b3 to b1	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b4	DTIF	Transfer End Interrupt Flag	0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated.	R/W*1
b6, b5	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	ACT	EXDMA Active Flag	0: EXDMAC operation is suspended. 1: EXDMAC is operating.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.
Note 1. Only 0 can be written to clear the flag.

ESIF Flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.
[Setting conditions]

- Transfer of each single-repeat size of data is completed in repeat transfer mode with the EDMINT.RPTIE bit set to 1.
- Transfer of each single-block size of data is completed in block transfer mode with the EDMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the EDMINT.SARIE bit is set to 1 and the EDMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address)
- When an extended repeat area overflow on the destination address occurs while the EDMINT.DARIE bit is set to 1 and the EDMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address)

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the EDMCNT.DTE bit.

DTIF Flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.
[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of the EDMCRAL[15:0] bits has become 0000h on completion of transfer)
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of the EDMCRBL[15:0] bits has become 0000h on completion of transfer (EDMTMD.TKP = 0), or the EDMCRBL[15:0] bits have been reloaded with the value of the EDMCRBH[15:0] bits (EDMTMD.TKP = 1))
- When the specified number of blocks has been transferred in block transfer mode (the value of the

EDMCRBL[15:0] bits has become 0000h on completion of transfer (EDMTMD.TKP = 0), or the EDMCRBL[15:0] bits have been reloaded with the value of the EDMCRBH[15:0] bits (EDMTMD.TKP = 1))

- When the specified number of blocks has been transferred in repeat-block transfer mode (the value of the EDMCRBL[15:0] bits has become 0000h on completion of transfer (EDMTMD.TKP = 0), or the EDMCRBL[15:0] bits have been reloaded with the value of the EDMCRBH[15:0] bits (EDMTMD.TKP = 1))

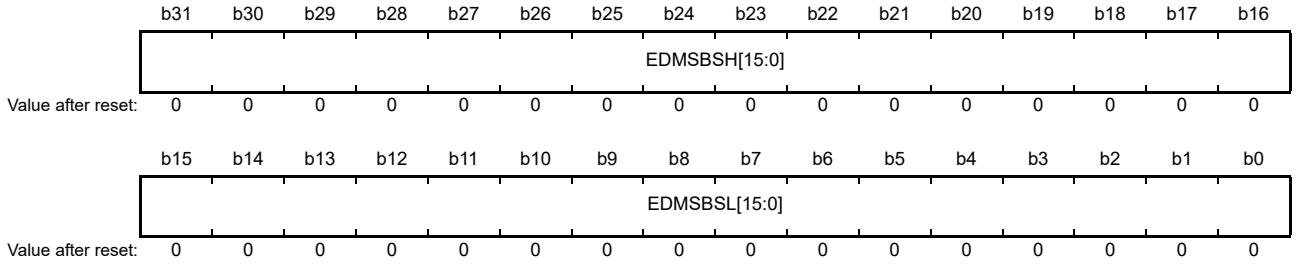
[Clearing conditions]

- When 0 is written to this bit
- When 1 is written to the EDMCNT.DTE bit

ACT Flag (EXDMA Active Flag)

This flag indicates whether the EXDMAC is in the idle or active state.

[Setting condition]



- When the EXDMAC starts data transfer operation

[Clearing condition]

- When data transfer in response to one transfer request is completed

19.2.16 EXDMA Source Buffer Size Register (EDMSBS)

Address(es): EXDMAC0.EDMSBS 8701 A028h, EXDMAC1.EDMSBS 8701 A068h,
EXDMAC0_NS.EDMSBS 0701 A028h, EXDMAC1_NS.EDMSBS 0701 A068h

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMSBSL[15:0]	Lower Bits of Source Buffer Size	Functions as data transfer counter in repeat-block transfer mode	R/W
b31 to b16	EDMSBSH[15:0]	Upper Bits of Source Buffer Size	Specifies the repeat-area size in repeat-block transfer mode	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the same value for the EDMSBSH[15:0] and EDMSBSL[15:0] bits in repeat-block transfer mode. Write 00000000h to the EDMSBS register in normal, repeat and block transfer mode. The EDMSBSH[15:0] bits specify buffer size and the EDMSBSL[15:0] bits function as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by the EDMSBSH[15:0] bits. When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting the EDMSBSH[15:0] and EDMSBSL[15:0] bits to 0000h is prohibited. When final data of one buffer size is transferred, the EDMSBSL[15:0] bits are reloaded with the value of the EDMSBSH[15:0] bits. When address update mode is fixed address, this register is ignored. Table 19.3 lists the setting values of Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 19.3 Available Setting for EDMSBS Register in Repeat-Block Transfer Mode

Source Address Update Mode (EDMAMD.SM)	Transfer Data Size (EDMTMD.SZ)	Available Setting for EDMSBSH[15:0] and EDMSBSL[15:0] Bits
Source address is fixed. (SM = 00b)	Don't care	0000h (EDMSBS is not used)
Offset addition (SM = 01b)	8 bits (SZ = 00b)	0001h to FFFFh (1 to 65535)
	16 bits (SZ = 01b)	0001h to 7FFFh (1 to 32767)
	32 bits (SZ = 10b)	0001h to 3FFFh (1 to 16383)
Source address is incremented or decremented. (SM = 1xb)	Don't care	0000h (infinite) 0001h to FFFFh (1 to 65535)

19.2.17 EXDMA Destination Buffer Size Register (EDMDBS)

Address(es): EXDMAC0.EDMDBS 8701 A02Ch, EXDMAC1.EDMDBS 8701 A06Ch,
EXDMAC0_NS.EDMDBS 0701 A02Ch, EXDMAC1_NS.EDMDBS 0701 A06Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EDMDBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDMDBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMDBSL[15:0]	Lower Bits of Destination Buffer Size	Functions as data transfer counter in repeat-block transfer mode	R/W
b31 to b16	EDMDBSH[15:0]	Upper Bits of Destination Buffer Size	Specifies the repeat-area size in repeat-block transfer mode	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the same value for the EDMDBSH[15:0] and EDMDBSL[15:0] bits in repeat-block transfer mode. Write 00000000h to the EDMDBS register in normal, repeat and block transfer mode. The EDMDBSH[15:0] bits specify buffer size and the EDMDBSL[15:0] bits function as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by the EDMDBSH[15:0] bits. When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting the EDMDBSH[15:0] and EDMDBSL[15:0] bits to 0000h is prohibited. When final data of one buffer size is transferred, the EDMDBSL[15:0] bits are reloaded with the value of the EDMDBSH[15:0] bits. When address update mode is fixed address, this register is ignored. Table 19.4 lists the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 19.4 Available Setting for EDMDBS Register in Repeat-Block Transfer Mode

Destination Address Update Mode (EDMAMD.DM)	Transfer Data Size (EDMTMD.SZ)	Available Setting for EDMDBSH[15:0] and EDMDBSL[15:0] Bits
Destination address is fixed. (DM = 00b)	Don't care	0000h (EDMDBS is not used)
Offset addition (DM = 01b)	8 bits (SZ = 00b)	0001h to FFFFh (1 to 65535)
	16 bits (SZ = 01b)	0001h to 7FFFh (1 to 32767)
	32 bits (SZ = 10b)	0001h to 3FFFh (1 to 16383)
Destination address is incremented or decremented. (DM = 1xb)	Don't care	0000h (infinite) 0001h to FFFFh (1 to 65535)

19.2.18 EXDMA Bufferable Write Enable Register (EDMBWR)

Address(es): EXDMAC0.EDMBWR 8701 A030h, EXDMAC1.EDMBWR 8701 A070h,
EXDMAC0_NS.EDMBWR 0701 A030h, EXDMAC1_NS.EDMBWR 0701 A070h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BWE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BWE	Bufferable Write Enable	0: Disables bufferable write 1: Enables bufferable write	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

BWE Bit (Bufferable Write Enable)

This bit specifies enabling or disabling of bufferable writing. If this bit is 1, even if the write access as the EXDMAC is completed, the actual slave writing may not have ended. When an error occurs during writing to a bufferable area (area in which a buffer is interposed during writing) of a slave device, the detected error is referred to as a “bufferable write error”. DMA transfer is not terminated at this time. For details, see section 19.8.1, Bus Response to DMA Write Access.

19.2.19 EXDMAC Module Start Register (EDMAST)

Address(es): EXDMAC.EDMAST 8701 A800h,
EXDMAC_NS.EDMAST 0701 A800h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DMST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DMST	EXDMAC Module Start	0: EXDMAC module stop 1: EXDMAC module start	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DMST Bit (EXDMAC Module Start)

When this bit is set to 1, EXDMAC is ready to accept transfer requests for all channels. When 1 is written to the EDMCNT.DTE bit (DMA transfer is enabled) of multiple channels and then this bit is set to 1 (EXDMAC module start), the corresponding multiple channels can be placed in the transfer request acceptable state at the same time. When the DMST bit is set to 0 during DMA transfer, DMA transfer is suspended after completion of the current data transfer corresponding to a single transfer request. DMA transfer can be resumed by setting the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit

[Clearing condition]

- When 0 is written to this bit

19.2.20 EXDMAC Error Channel Register (EDMECHR)

Address(es): EXDMAC.EDMECHR 8701 A840h, EXDMAC_NS.EDMECHR 0701 A840h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DMERRW	—	—	—	DMECHSAM	—	—	—	—	DMECH[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DMECH[3:0]	EXDMAC Error Channel Flag	Indicates the channel number causing the error 0000: Error occurred on channel 0 0001: Error occurred on channel 1	R
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	DMECHSAM	EXDMAC Error Channel Security Attribution Monitor Flag	Indicates the security attribution of a channel causing the error 0: Secure channel 1: Non-secure channel	R
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	DMERRW	EXDMAC Error Access Read/ Write Attribute Flag	Indicates the read/write attribute of the error access 0: Read access 1: Write access	R
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DMESTA	EXDMAC Error Status Flag	0: No DMA transfer error occurred 1: DMA transfer error occurred	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

When reading this register, it can be accessed from both secure and non-secure access. When writing this register, it depends on the value of the EDMECHR.DMECHSAM flag.

- When the value of the EDMECHR.DMECHSAM flag is 1, it can be accessed from secure and non-secure access.
- When the value of the EDMECHR.DMECHSAM flag is 0, it can be accessed from secure. An error is returned when write access is performed in a non-secure access.

This register is cleared by a reset. On debugging a program, select an interrupt instead of a reset in the corresponding bits of the registers listed in the interrupt/reset selection column of Table 19.18 in section 19.6.2, Transfer Error Interrupt.

DMECH[3:0] Flag (EXDMAC Error Channel Flag)

When a transfer error due to DMA transfer occurs, this flag stores the channel number of the EXDMAC that was violated. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- When the DMA transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA flag.

DMECHSAM Flag (EXDMAC Error Channel Security Attribution Monitor Flag)

When a transfer error due to DMA transfer occurs, this flag indicates the security attribution of the violating EXDMAC channel. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- When the DMA transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA flag.

DMERRW Flag (EXDMAC Error Access Read/Write Attribute Flag)

Indicates the read/write attribute of the error access.

[Setting condition]

- A DMA transfer error occurs when writing data.

[Clearing condition]

- When 1 is written to DMESTA flag.

DMESTA Flag (EXDMAC Error Status Flag)

Indicates whether or not a DMA transfer error occurred. DMECH[3:0] bits, DMECHSAM flag, DMESTA flag are cleared by writing 1 to DMESTA flag. Writing 0 to DMESTA flag is ignored. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- When the DMA transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA flag.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. When DMECHSAM = 0, it cannot be cleared in the non-secure state.

19.2.21 EXDMAC Control Register (EDMCTL)

Address(es): EXDMAC.EDMCTL 8701 A810h,
EXDMAC_NS.EDMCTL 0701 A810h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PR	Priority Control Select	0: Fixed priority 1: Round-robin	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Write to this register while the EXDMAC operation is stopped or DMA transfer is disabled. Do not write to it during data transfer.

PR Bit (Priority Control Select)

When the EDMCTL.PR bit is set to 0, arbitration is performed in the fixed priority mode of channel 0 > channel 1 (channel 0: highest priority) and DMA transfer is started. When the EDMCTL.PR bit is set to 1, arbitration is performed in the round-robin mode and DMA transfer is started.

19.2.22 EXDMAC Peripheral Module Request Flag Register (EDMPRF)

Address(es): EXDMAC0.EDMPRF 8701 A03Eh, EXDMAC1.EDMPRF 8701 A07Eh, EXDMAC0_NS.EDMPRF 0701 A03Eh, EXDMAC1_NS.EDMPRF 0701 A07Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	PREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PREQ	Peripheral Module Request Flag	0: No request 1: Requested	R/W*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. writing 0 has no effect.

The EDMPRF register detects a DMA transfer request generated by peripheral module.

PREQ Flag (Peripheral Module Request Flag)

The PREQ flag indicates that a DMA transfer request has been detected from a peripheral module.

[Setting condition]

- When a DMA transfer request occurs form a peripheral module.

[Clearing condition]

- When a DMA transfer request is generated from a peripheral module and the DMA transfer starts.
- When 1 is written to the PREQ flag.

19.3 Operation

19.3.1 Transfer Mode

(1) Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the EDMCRAL[15:0] bits. When these bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running mode). Setting the EDMCRB register is invalid in normal transfer mode. Except in free running mode, a transfer end interrupt request can be generated after completion of the specified number of transfer operations. Table 19.5 lists the register update operation in normal transfer mode, and Figure 19.2 shows an operation example in normal transfer mode.

Table 19.5 Register Update Operation in Normal Transfer Mode

Register	Function	Update Operation after Completion of a Transfer by One Transfer Request
EDMSAR	Transfer source address	Increment/decrement/fixed/offset addition
EDMDAR	Transfer destination address	Increment/decrement/fixed/offset addition
EDMCRA.EDMCRAL[15:0]	Transfer counter	Decremented by one/not updated (in free running mode)
EDMCRA.EDMCRAH[9:0]	—	Not updated (Not used in normal transfer mode)
EDMCRB	—	Not updated (Not used in normal transfer mode)

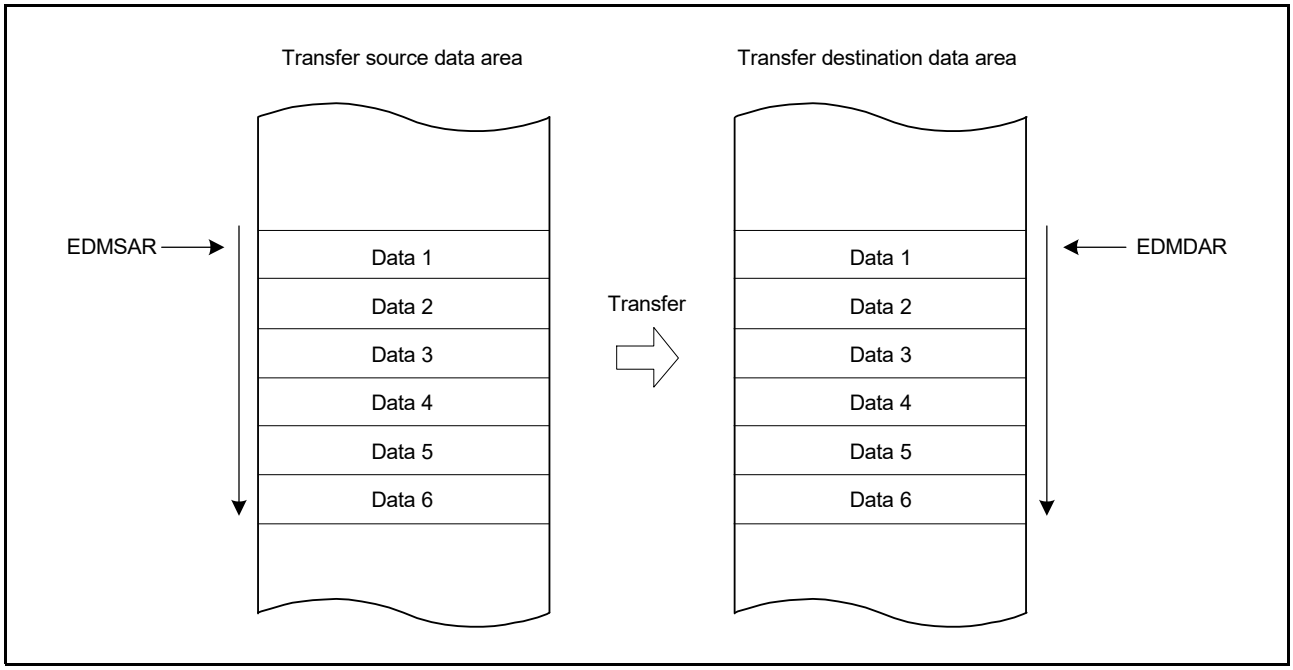


Figure 19.2 Operation Example in Normal Transfer Mode

(2) Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request. A maximum of 1K data can be set as a total repeat transfer size using the EDMCRA register. A maximum of 64K can be set as the number of repeat transfer operations using the EDMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size. Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (EDMSAR or EDMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the EDMCNT.DTE bit in the repeat size end interrupt handling. A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations. Table 19.6 lists the register update operation in repeat transfer mode, and Figure 19.3 shows an operation example in repeat transfer mode.

Table 19.6 Register Update Operation in Repeat Transfer Mode

Register	Function	Update Operation after Completion of a Transfer by One Transfer Request	
		When the EDMCRA.EDMCRAL [15:0] bits are not 1	When the EDMCRA.EDMCRAL[15:0] bits are 1. (Transfer of the Last Data in Repeat Size)
EDMSAR	Transfer source address	Increment/decrement/fixed/ offset addition	• EDMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 01b Initial value of EDMSAR • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMDAR	Transfer destination address	Increment/decrement/fixed/ offset addition	• EDMTMD.DTS[1:0] = 00b Initial value of DMDAR • EDMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMCRA.EDMCRAH [9:0]	Repeat size	Not updated	Not updated
EDMCRA.EDMCRAL [15:0]	Transfer counter	Decremented by one	EDMCRA.EDMCRAH[9:0]
EDMCRB.EDMCRBH [15:0]	Number of repeat transfer operations	Not updated	Not updated
EDMCRB.EDMCRBL [15:0]	Count of repeat transfer operations	Not updated	Decremented by one

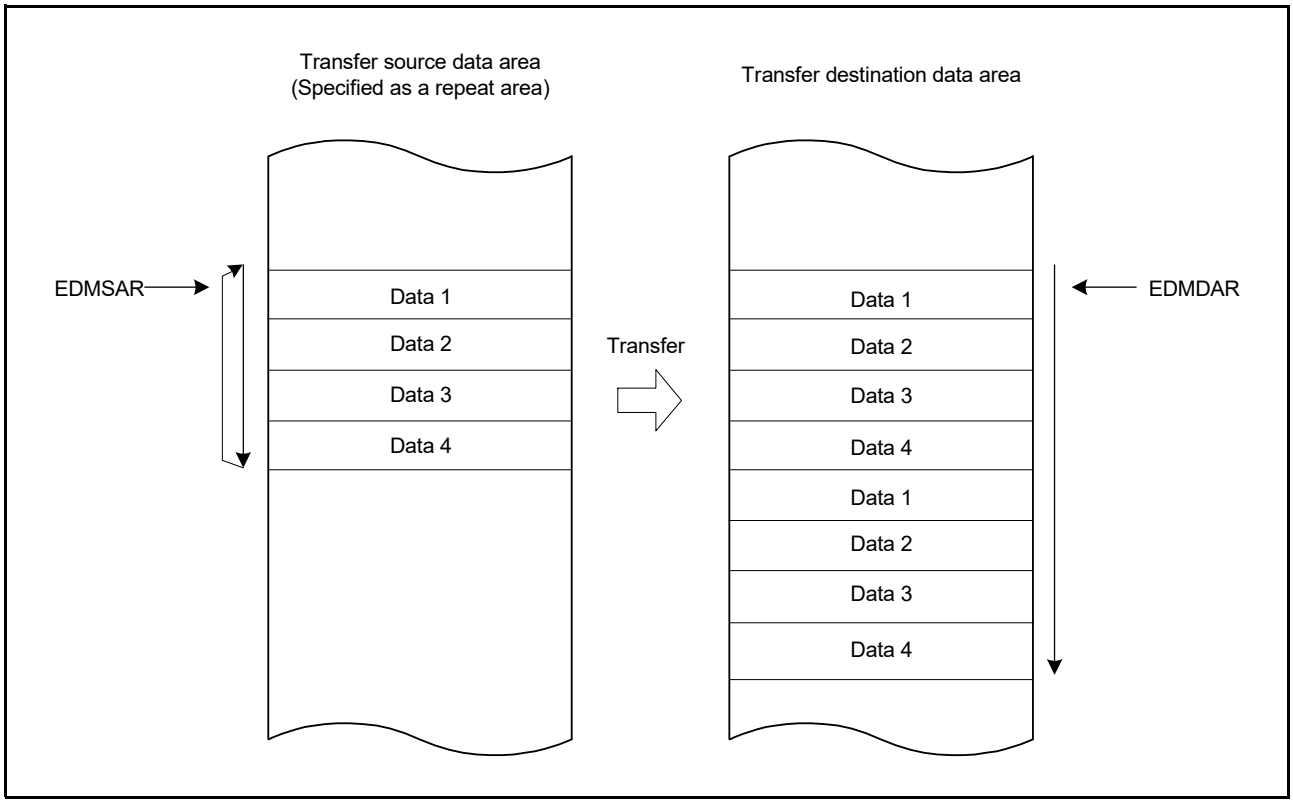

Figure 19.3 Operation Example in Repeat Transfer Mode

(3) Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request. A maximum of 1K data can be set as a total block transfer size using the EDMCRA register. A maximum of 64K can be set as the number of block transfer operations using the EDMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size. Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (EDMSAR or EDMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the EDMCNT.DTE bit in the repeat size end interrupt handling. Transfer end interrupt request can be generated after completion of the specified number of block transfer operations. Table 19.7 lists the register update operation in block transfer mode, and Figure 19.4 shows an operation example in block transfer mode.

Table 19.7 Register Update Operation in Block Transfer Mode

Register	Function	Update Operation after Completion of Single-Block Transfer by One Transfer Request
EDMSAR	Transfer source address	• EDMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 01b Initial value of EDMSAR • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMDAR	Transfer destination address	• EDMTMD.DTS[1:0] = 00b Initial value of EDMDAR • EDMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMCRA.EDMCRAH[9:0]	Block size	Not updated
EDMCRA.EDMCRAL[15:0]	Transfer count	EDMCRA.EDMCRAH[9:0]
EDMCRB.EDMCRBH[15:0]	Number of block transfer operations	Not updated
EDMCRB.EDMCRBL[15:0]	Count of block transfer operations	Decremented by one

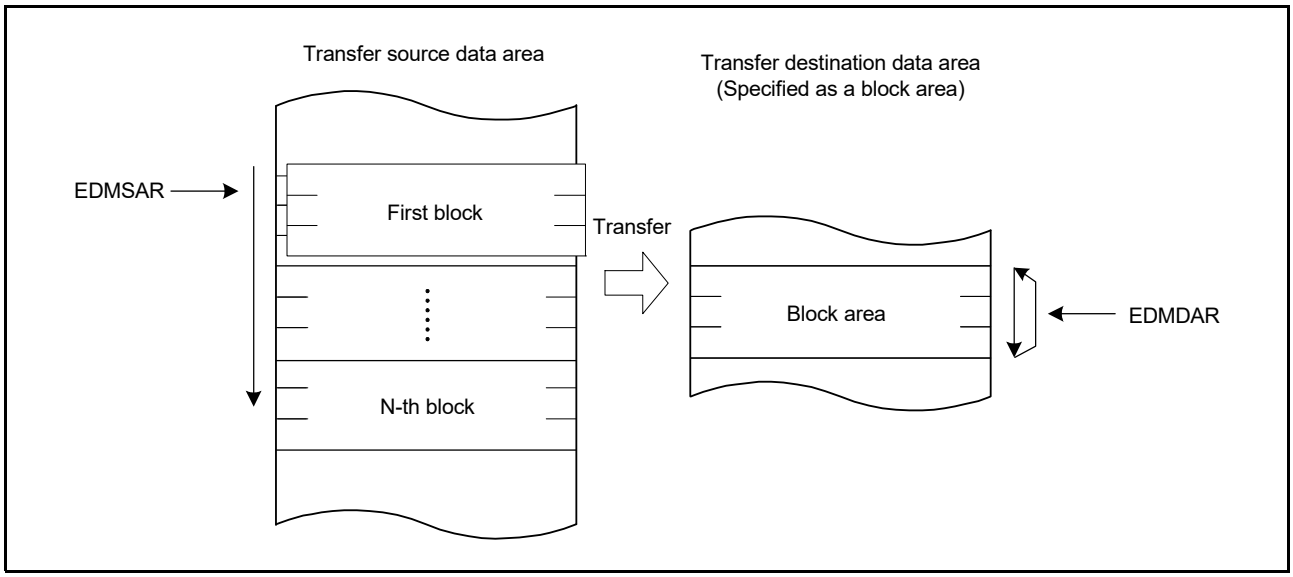

Figure 19.4 Operation Example in Block Transfer Mode

(4) Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.
Repeat function: Added function (ring buffer) to repeat specified address area.
Offset function: Multiple areas with offset can be specified within one block transfer.
The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer. Figure 19.5 shows an example of adding a repeat function to the transfer destination. Figure 19.6 shows repeat-block transfer with an offset to the transfer destination. In repeat-block transfer mode, a single block data is transferred by one transfer request. A maximum of 1K data can be set as a total block transfer size using EDMCRA. A maximum of 64K can be set as the number of block transfer operations using EDMCRB; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.
Generation of a transfer end interrupt request on completion of a specified number of transfer operations is selectable.

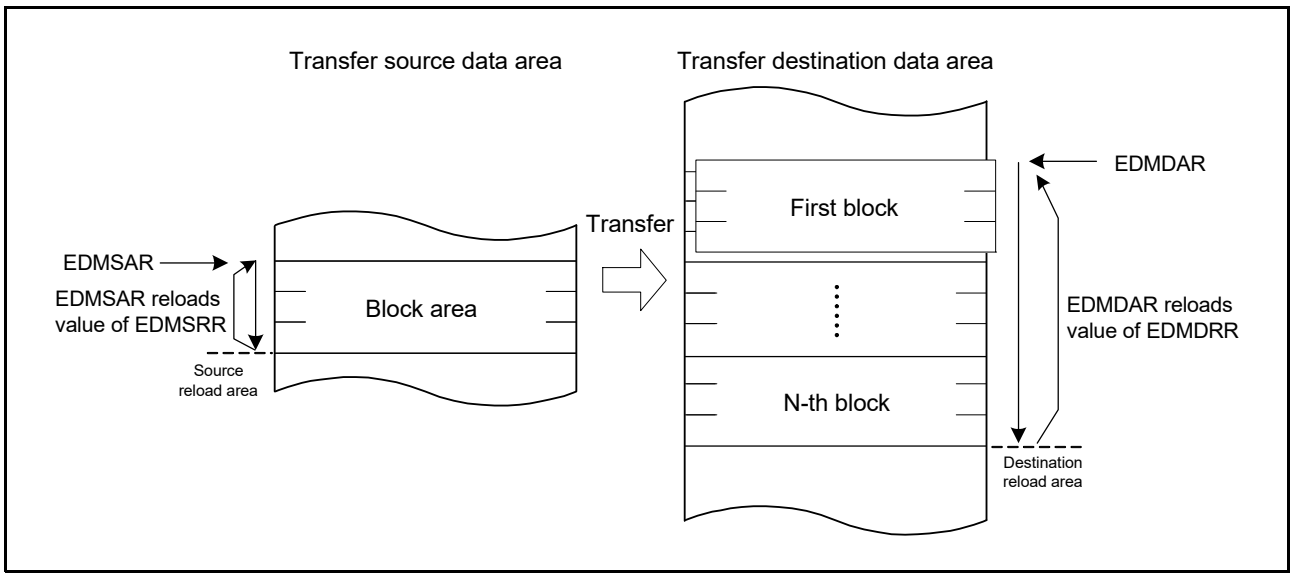

Figure 19.5 Operation Example in Repeat-Block Transfer Mode

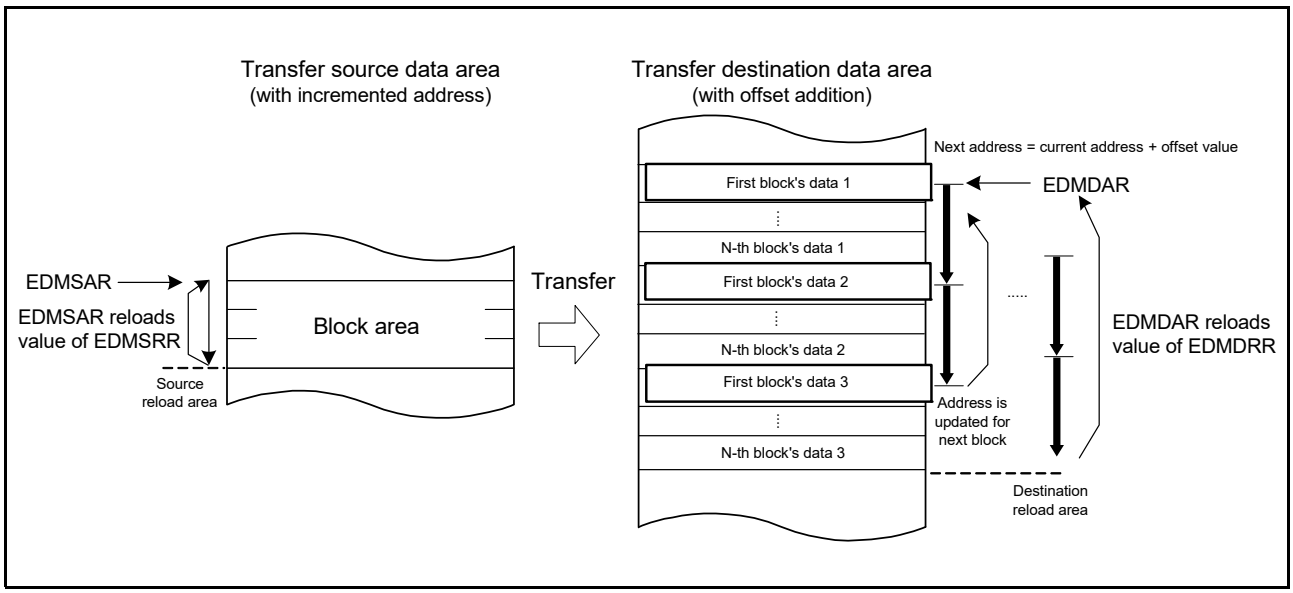

Figure 19.6 Operation Example in Repeat-Block Transfer Mode with Offset Addition

Table 19.8 to Table 19.13 list the register update operations in repeat-block transfer mode.

Table 19.8 Register Update Operation Associated with Source Area in Repeat-Block Transfer Mode (Fixed Address EDMAMD.SM[1:0] = 00b)

For more information about address update operation in repeat-block transfer mode, see section 19.3.5, Address Update Function in Repeat-Block Transfer Mode.

19.3.2 Extended Repeat Area Function

The EXDMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas. The extended repeat areas can be specified separately to the transfer source address register (EDMSAR) and transfer destination address register (EDMDAR). The extended repeat area on the source address is specified by the EDMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the EDMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides. However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area. When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt due to an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the EDMINT.SARIE bit is set to 1, the EDMSTS.ESIF flag is set to 1 and the EDMCNT.DTE bit is set to 0 to stop DMA transfer. At this time, if the EDMINT.ESIE bit is set to 1, an interrupt due to an extended repeat area overflow is requested. When the EDMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the EDMCNT.DTE bit in the interrupt handling. Figure 19.7 shows an example of the extended repeat area operation.

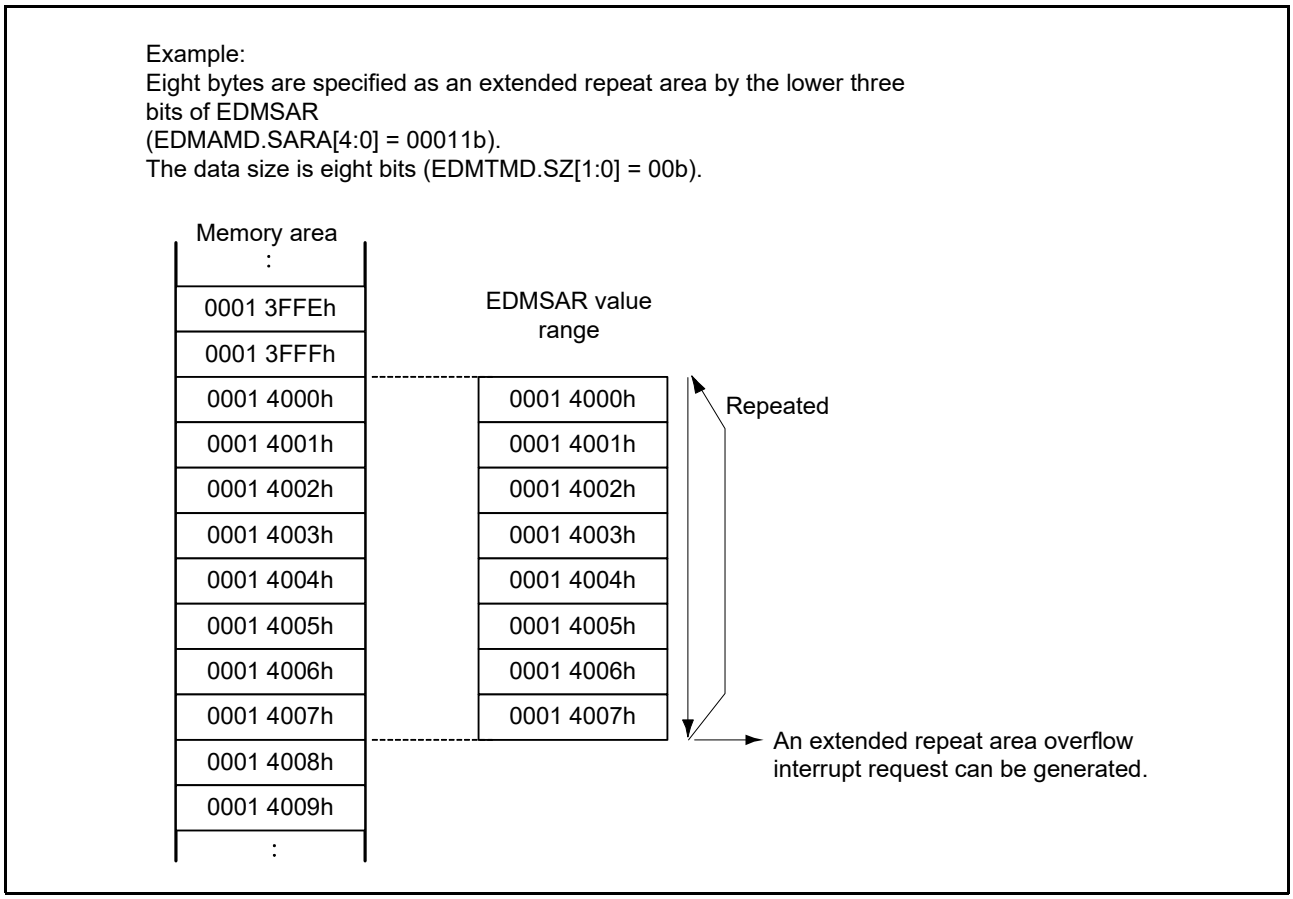

Figure 19.7 Example of Extended Repeat Area Operation

When an interrupt due to an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration. When a transfer is stopped by an interrupt due to an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt due to the overflow is suspended until transfer of the block is completed, and the transfer overruns. Figure 19.8 shows an example when the extended repeat area function is used in block transfer mode.

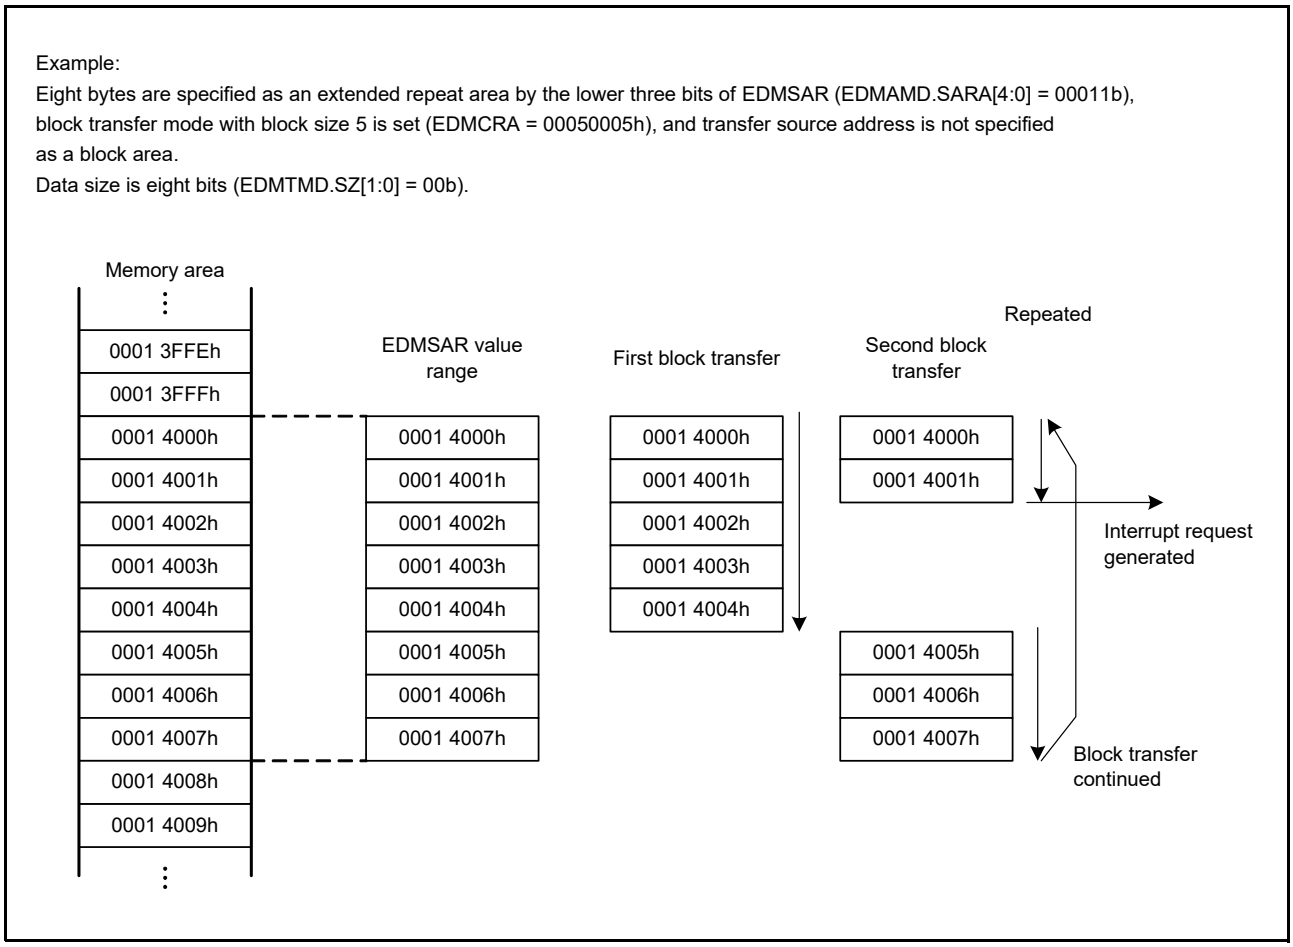

Figure 19.8 Example of Extended Repeat Area Function in Block Transfer Mode

19.3.3 Free-Running Function

The EXDMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

(1) In Normal Transfer Mode

In normal transfer mode, when EDMCRA.EDMCRAL[15:0] bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped. For more information, see section (1), Normal Transfer Mode.

(2) In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the EXDMAC supports free-running function using the EDMTMD.TKP bit. If the EDMTMD.TKP bit is set to 1, the transfer is not stopped by completion of specified total number of transfer operations and the value of the EDMCRBH[9:0] bits is reloaded repeatedly. Figure 19.9 shows an example of block transfer operation without free-running function.

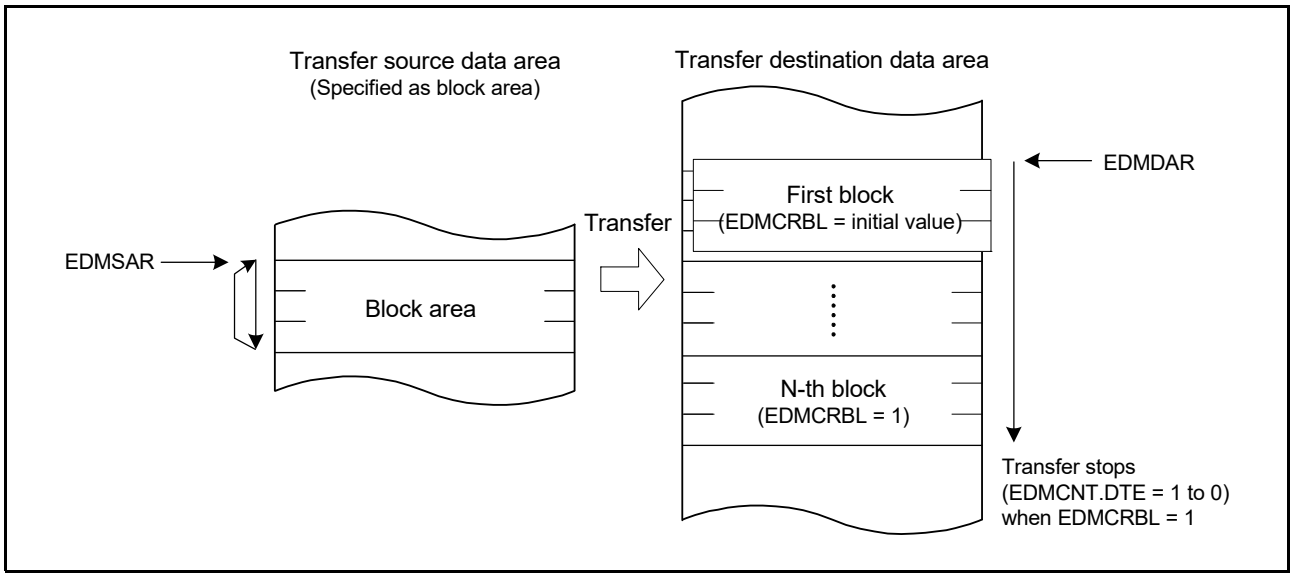

Figure 19.9 Operation in Block Transfer Mode with EDMTMD.TKP = 0

Figure 19.10 shows an example of block transfer operation with free-running function.

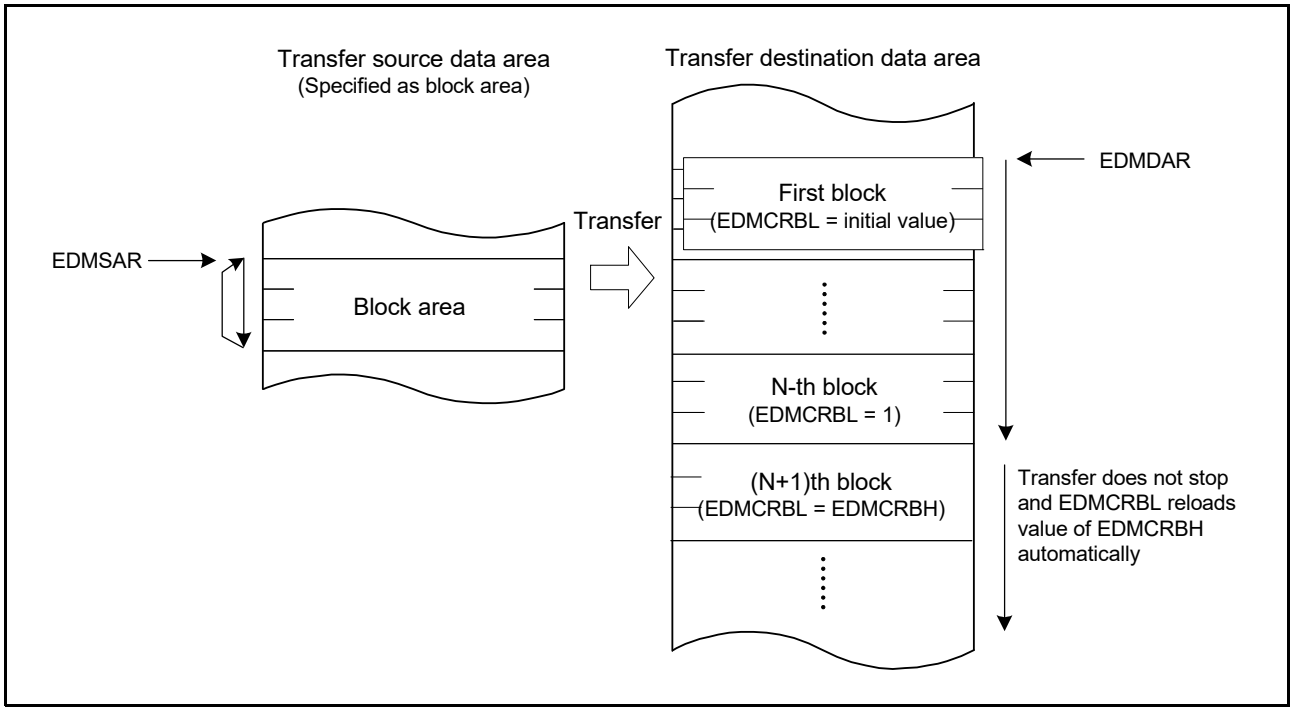

Figure 19.10 Operation in Block Transfer Mode with EDMTMD.TKP = 1

19.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (EDMOFR) is added to the address every time the EXDMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas. Offset subtraction can also be realized by setting a negative value in EDMOFR register. In this case, the negative value must be 2's complement. EDMSBS or EDMDBS registers are used instead of EDMOFR register in repeat-block transfer mode. For more information, see section (4), Repeat-Block Transfer Mode and section 19.3.5, Address Update Function in Repeat-Block Transfer Mode. Table 19.14 lists the address update method in each address update mode.

Table 19.14 Address Update Method in Each Address Update Mode

Address Update Mode	Settings of EDMAMD.SM[1:0] and EDMAMD.DM[1:0] for Address Update Modes	Address Update Method (for Different EDMTMD.SZ[1:0] Settings)			
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b	SZ[1:0] = 11b
Address fixed	00b	Fixed			
Offset addition	01b	+EDMOFR*1			
Increment	10b	+1	+2	+4	+8
Decrement	11b	–1	–2	–4	–8

Note 1. When setting a negative value in the DMA offset register, the value must be 2's complement. The 2's complement is obtained by the following formula.
2's complement of a negative offset value = ~ (offset) + 1 (~: Bit inversion)

(1) Basic Transfer Using Offset Addition

Figure 19.11 shows an example of address updating using offset addition.

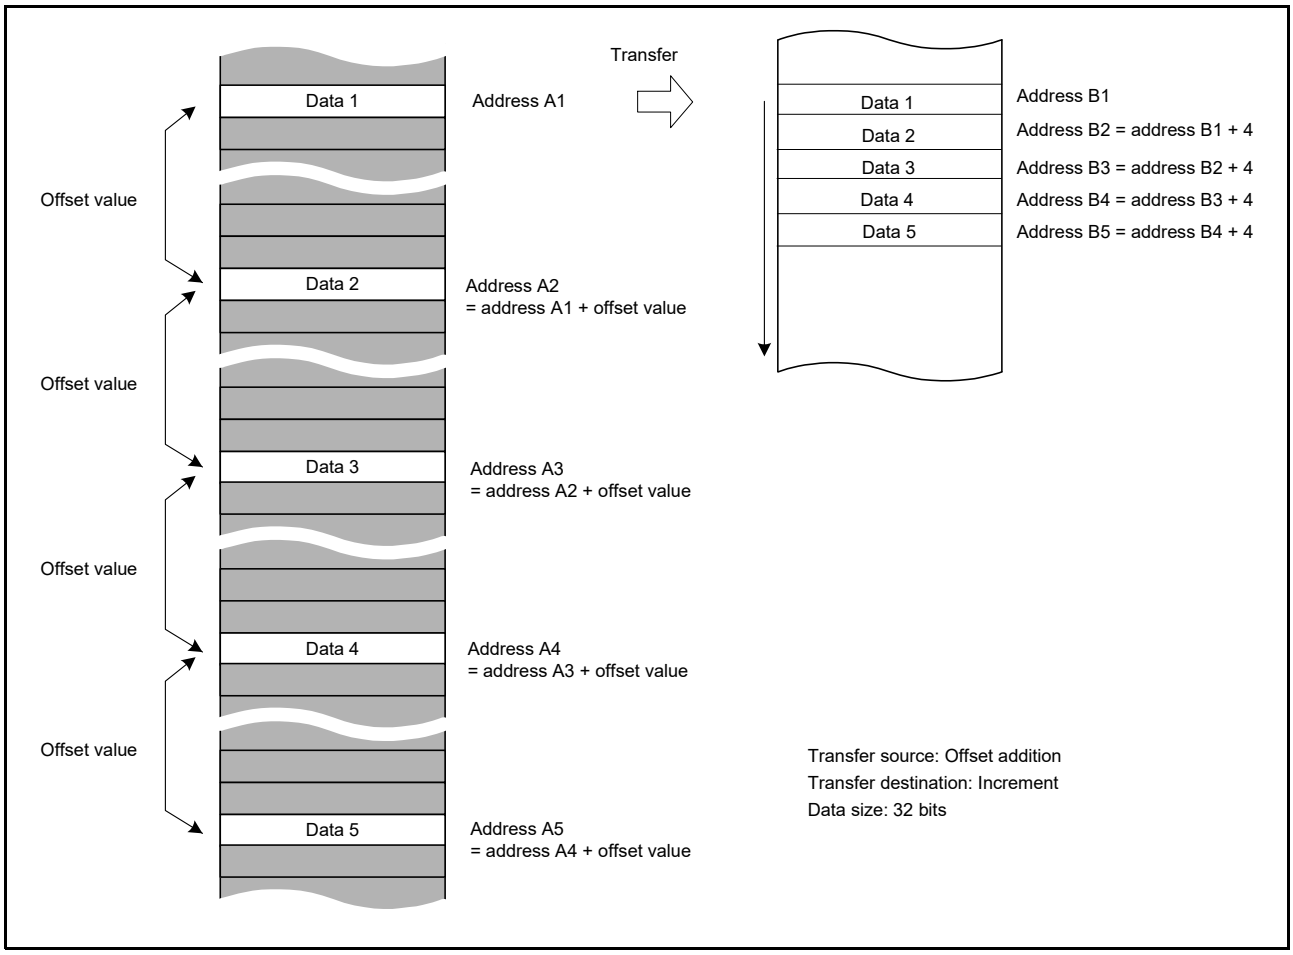

Figure 19.11 Example of Address Updating by Offset Addition

In Figure 19.11, the transfer data is 32 bits long, and offset addition and increment are set as the transfer source address update mode and transfer destination address update mode, respectively. The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

(2) Example of XY Conversion Using Offset Addition

Figure 19.12 shows the XY conversion using offset addition in repeat transfer mode. Settings are as follows:

- EDMAMD.SM[1:0]: Source address update mode select: Offset addition
- EDMAMD.DM[1:0]: Destination address update mode select: Destination address is incremented.
- EDMTMD.SZ[1:0]: Data transfer size: 32 bits
- EDMTMD.MD[1:0]: Transfer mode select: Repeat transfer
- EDMTMD.DTS[1:0]: Repeat area select: The source is specified as the repeat area.
- EDMOFR: Offset address: 10h
- EDMCRA.EDMCRAH[9:0]: Repeat size: 4h
- EDMINT.RPTIE: The repeat size end interrupt is enabled.

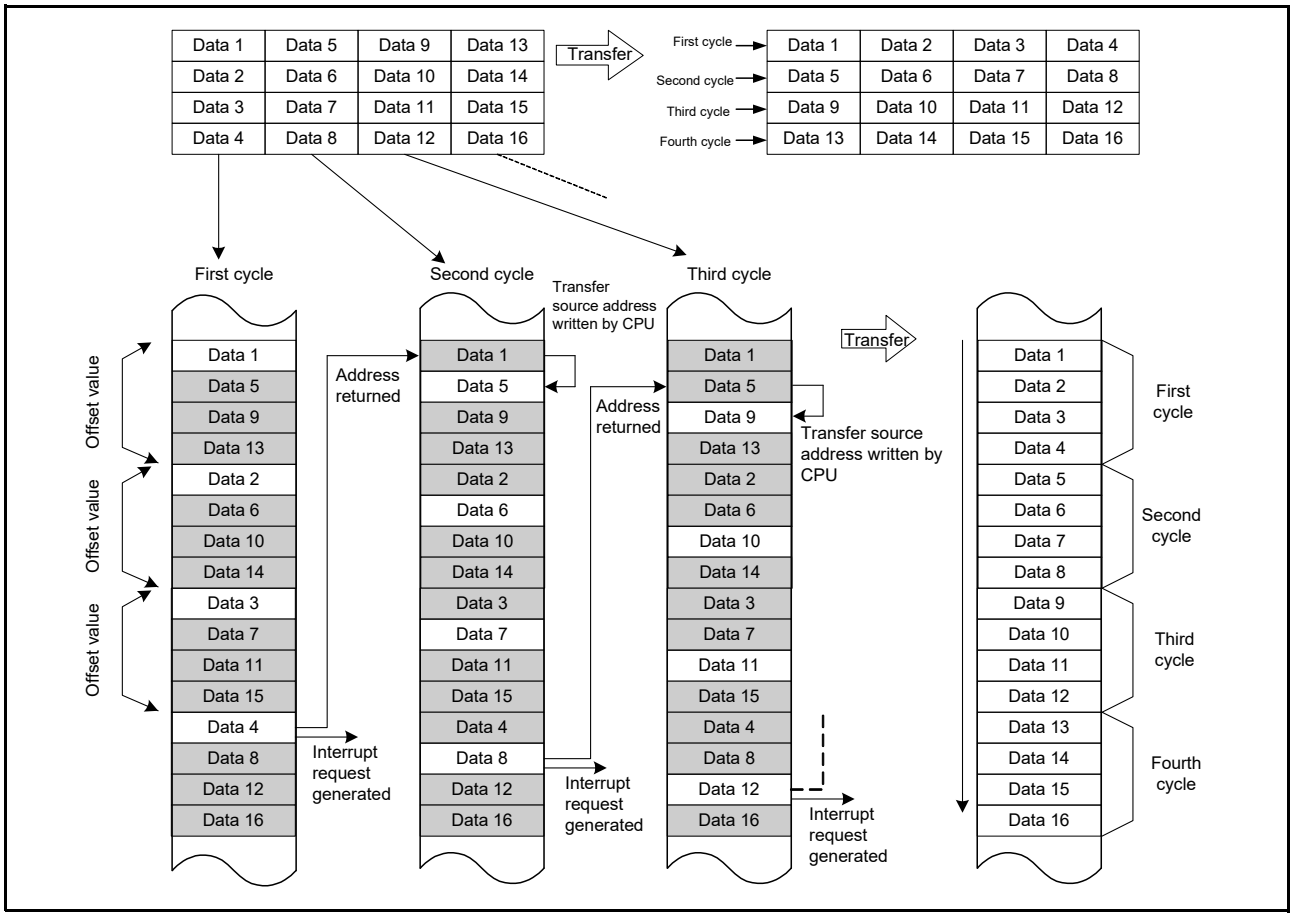

Figure 19.12 XY Conversion Operation Using Offset Addition in Repeat Transfer Mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to the destination continuous addresses. When data 4 is transferred, which means that the repeat size of transfers is completed, the transfer source address returns to the transfer start address (address of data 1 on the transfer source) and a repeat size end interrupt is requested. While this interrupt stops the transfer temporarily, perform the following.

- EDMSAR register: Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- EDMCNT register: Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 19.13 shows a flowchart of the XY conversion.

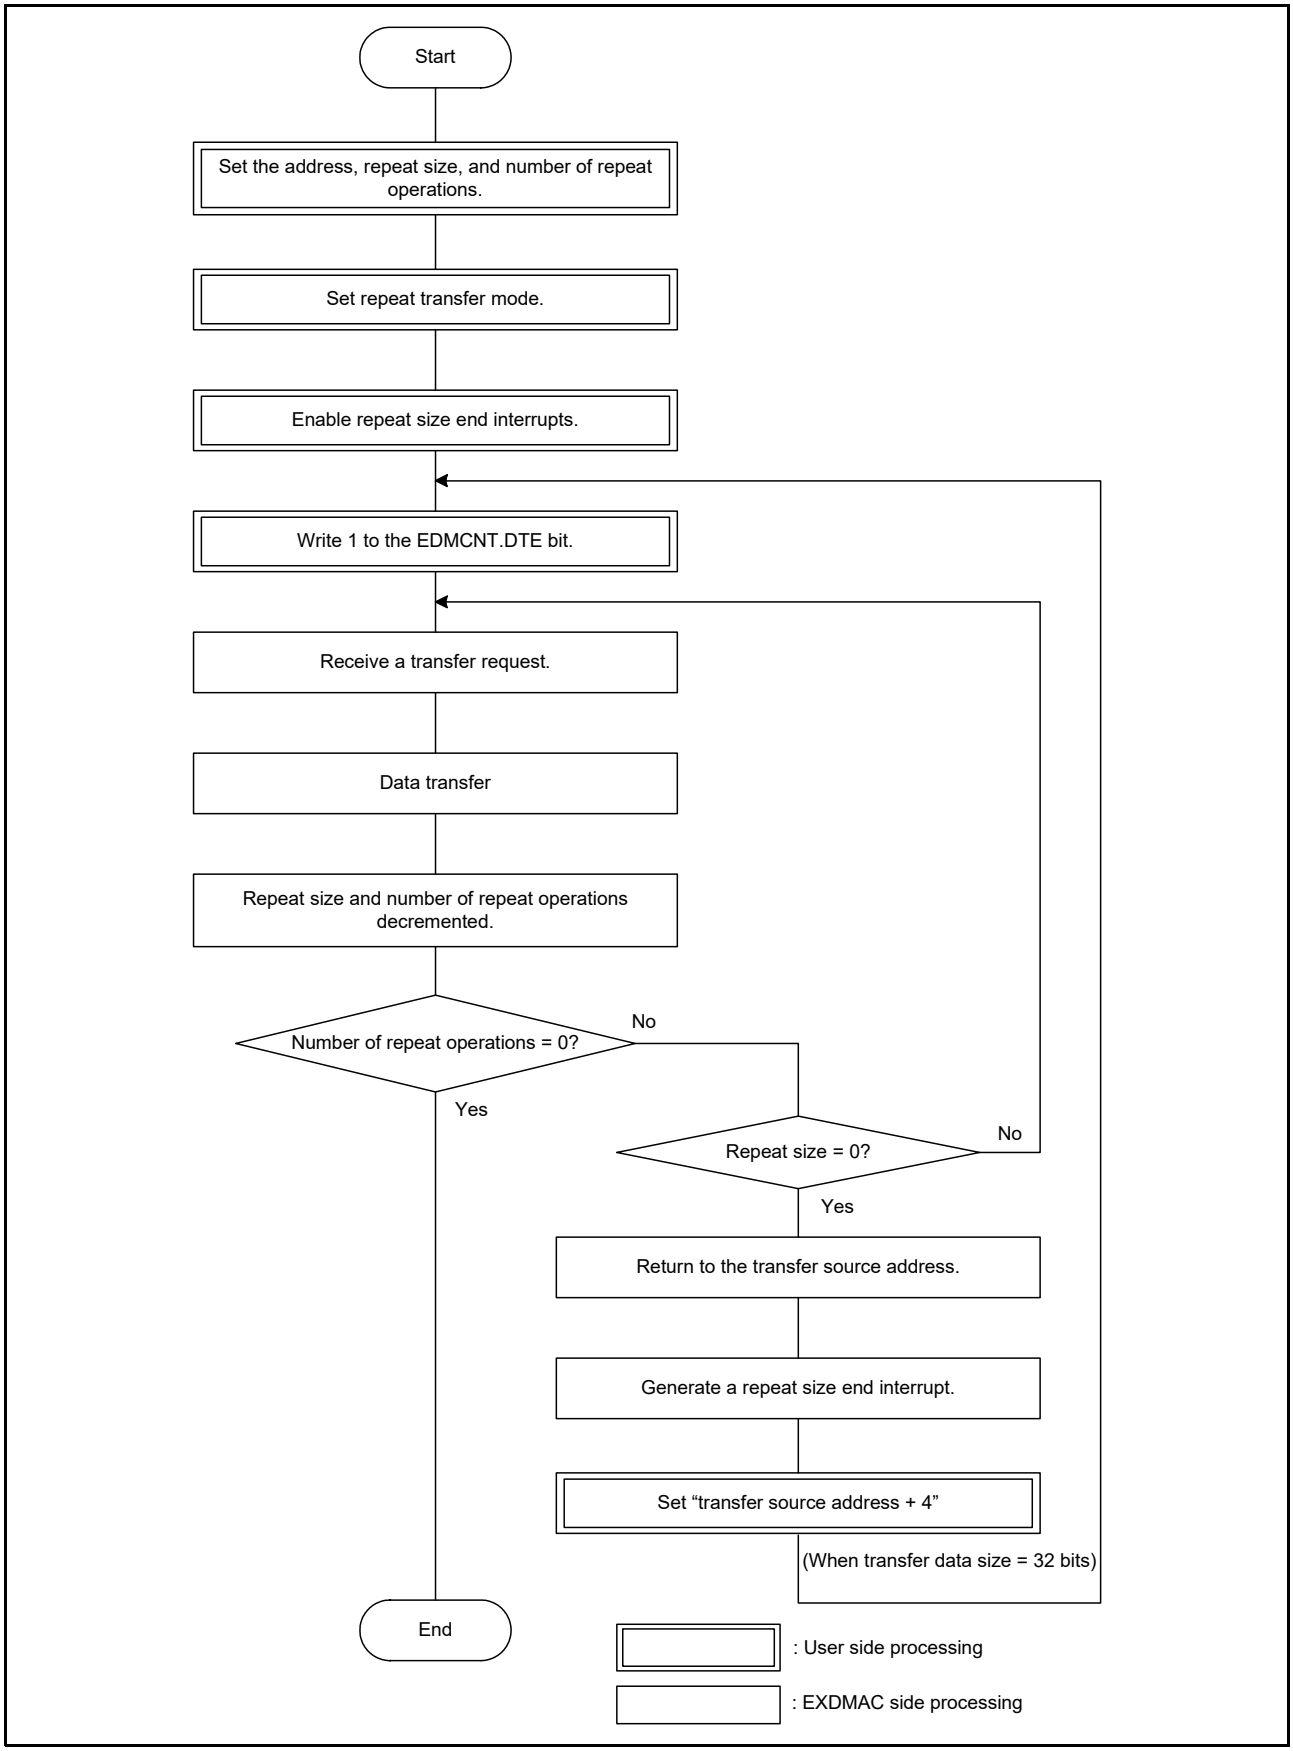

Figure 19.13 XY Conversion Flowchart Using Offset Addition in Repeat Transfer Mode

19.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

(1) Fixed Address Mode

When EDMAMD.SM[1:0] bits is set to 00b, the address update mode of the source is fixed address. And when EDMAMD.DM[1:0] bits is set to 00b, the address update mode of the destination is fixed address. In fixed address, the address is not updated from the initial value of EDMSAR and EDMDAR registers. If the block size (EDMCRA) is larger than 1, the same data will be transferred multiple times for one request. Figure 19.14 shows address update in fixed address.

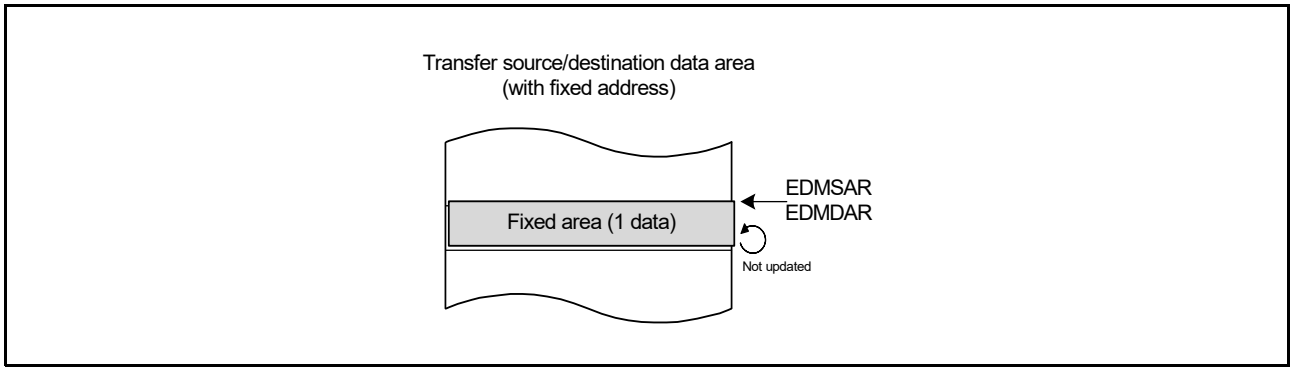

Figure 19.14 Address Update in Fixed Address

(2) Incremental and Decremental Address Mode

When EDMAMD.SM[1:0] bits is set to 10b, the address update mode of the source is incremental address. And when EDMAMD.DM[1:0] bits is set to 10b, the address update mode of the destination is incremental address. When EDMAMD.SM[1:0] bits is set to 11b, the address update mode of the source is decremental address. And when EDMAMD.DM[1:0] bits is set to 11b, the address update mode of the destination is decremental address. In these update modes, the address is incremented or decremented according to the setting of EDMTMD.SZ[1:0] bits. In these update modes EDMSBS and EDMDBS registers indicates a reload area. The unit of EDMSBS and EDMDBS registers is "number of data". At the start of transfer, EDMSBSL and EDMDBSL registers, which is the lower 16 bits of EDMSBS and EDMDBS registers, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, EDMSAR and EDMDAR registers reloads the value of EDMSRR and EDMDRR registers. Figure 19.15 shows address update in incremental address.

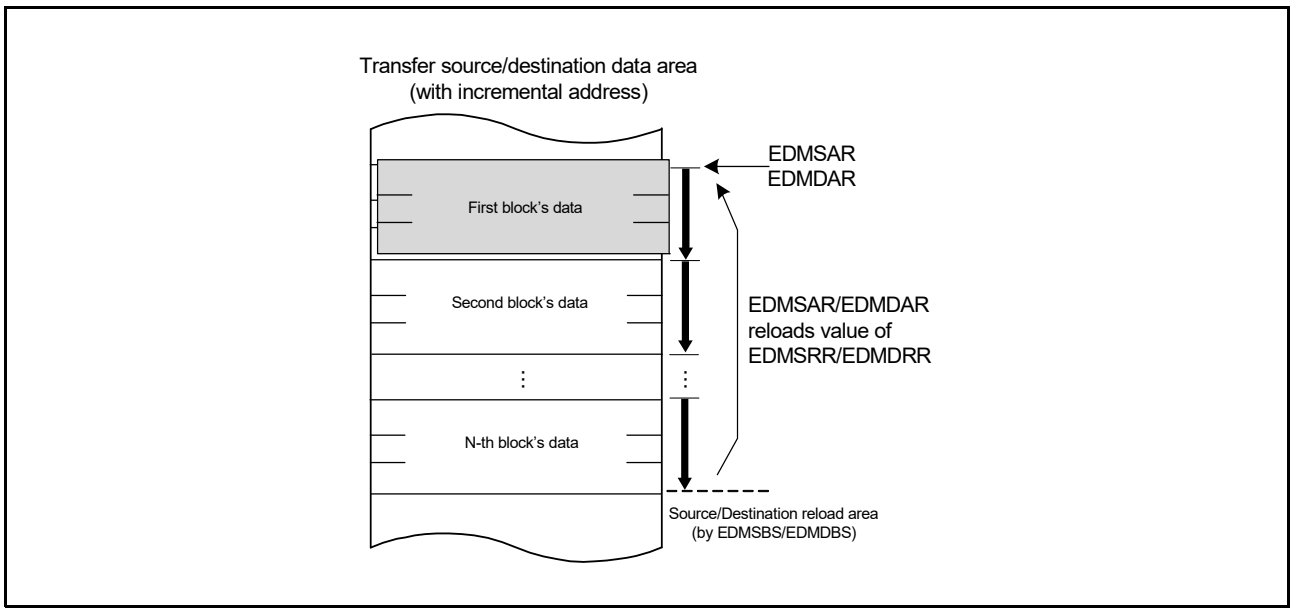

Figure 19.15 Address Update in Incremental Address

(3) Offset Addition Mode

When EDMAMD.SM[1:0] bits is set to 01b, the address update mode of the source is offset addition. And when EDMAMD.DM[1:0] bits is set to 01b, the address update mode of the destination is offset addition. In offset addition, EDMSBS and EDMDBS registers indicates reload area and also works as an access offset value. Unlike other transfer modes, EDMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of EDMSBS and EDMDBS registers is the number of blocks. When the transfer starts, EDMCRAL[15:0] bits operates as a down counter, EDMSAR and EDMDAR registers reloads the value of EDMSRR and EDMDRR registers every time one block is transferred. In addition, EDMSBSL[15:0] and EDMDBSL[15:0] bits, which is the lower 16 bits of EDMSBS and EDMDBS registers, also operates as a down counter and decrements every time one block is transferred. When the EDMSBS and EDMDBS registers value becomes 1, EDMSAR and EDMDAR registers reloads the value of EDMSRR and EDMDRR registers. When EDMAMD.SADR and EDMAMD.DADR bits is set to 0, offset addition operation of the same area is repeated. EDMDAR register only reloads EDMDRR register. Figure 19.16 shows address update in offset addition with EDMAMD.SADR and EDMAMD.DADR = 0.

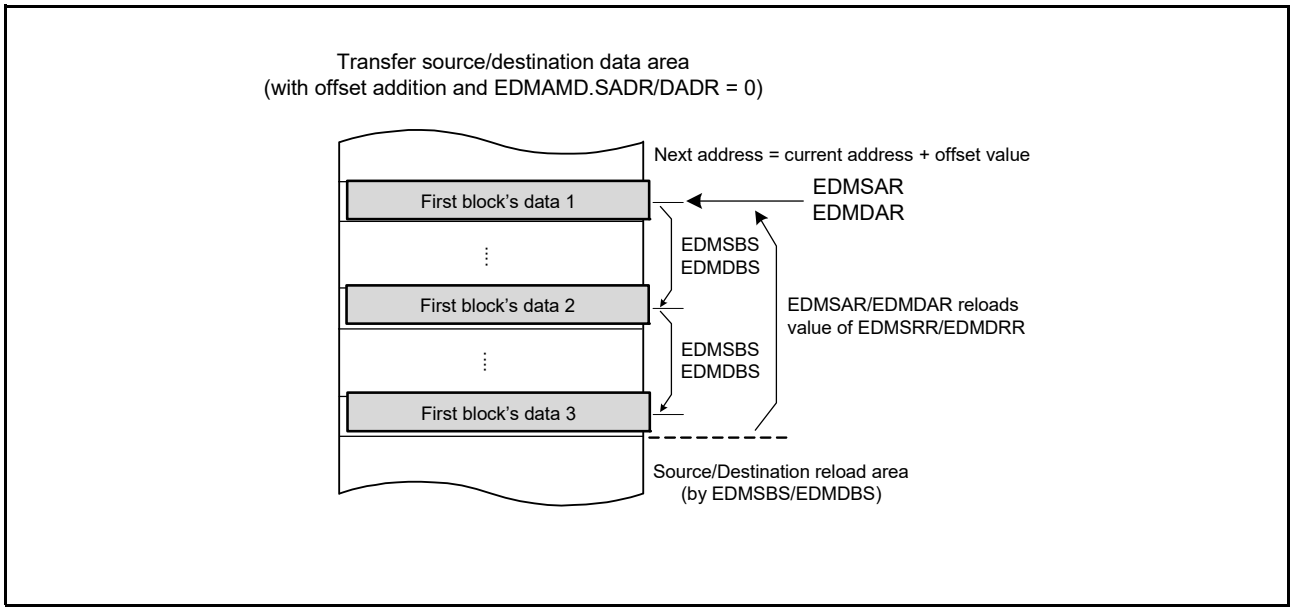

Figure 19.16 Address Update in Offset Addition with EDMAMD.SADR and EDMAMD.DADR = 0

When EDMAMD.SADR and EDMAMD.DADR bits is set to 1, the address is incremented by one data unit after EDMSRR and EDMDRR registers is reloaded by EDMCRAL[15:0] = 1. In other words, an index value ((EDMDBSH – EDMDBSL) × transfer data size) is added to EDMDAR register after EDMDRR register is reloaded. This behavior is used to implement multiple ring buffers. Figure 19.17 shows address update in offset addition with EDMAMD.SADR and EDMAMD.DADR = 1.

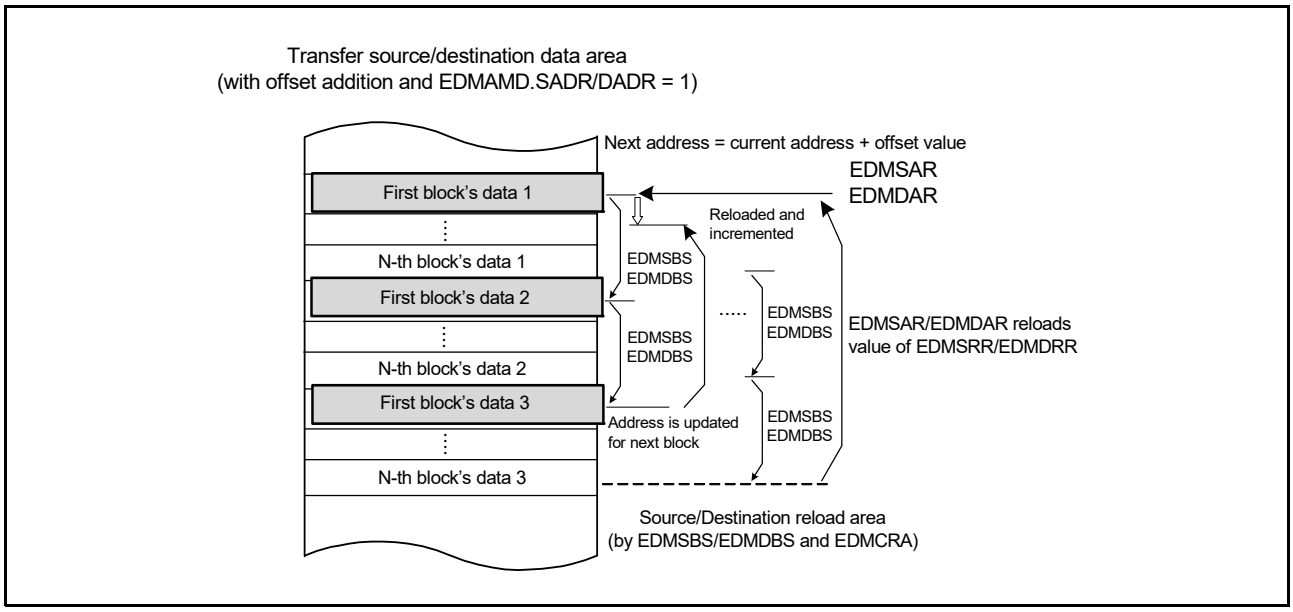

Figure 19.17 Address Update in Offset Addition with EDMAMD.SADR and EDMAMD.DADR = 1

19.3.6 Trigger Sources

Software, the interrupt requests from the peripheral modules, and the external interrupt requests can be specified as the EXDMAC trigger sources. Setting the EDMTMD.DCTG[1:0] bits selects the trigger source.

(1) Trigger by Software

When DMA transfer is started by software, follow below procedure.

1. Set the EDMTMD.DCTG[1:0] bits to 00b.
2. Set the EDMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the EDMAST.DMST bit set to 1 (EXDMAC activation enabled).
4. Set the EDMREQ.SWREQ bit to 1 (DMA requested).

When the EXDMAC is activated by software while the EDMREQ.CLRS bit is 0, the EDMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request. When the EXDMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

(2) Trigger by Interrupt Request

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as EXDMAC trigger sources. The trigger sources can be selected individually for each channel in the ICU.SELEXDRn register (n = 0, 1). To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set the EDMCNT.DTE bit to 0 (disable DMA transfer).
2. Set the ICU.SELEXDRn register (n = 0, 1) to the event number, and then clear the corresponding IR flag.
3. Set the EDMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
4. Set EDMPRF.PREQ bit to 1 to clear the PREQ flag to 0.
5. Set the EDMCNT.DTE bit to 1 (enable DMA transfer).
6. Set the EDMAST.DMST bit to 1 (EXDMAC activation enabled).

For interrupt requests specified as EXDMAC trigger sources, see Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

19.3.7 Operation Timing

Figure 19.18 and Figure 19.19 show EXDMAC operation timing examples.

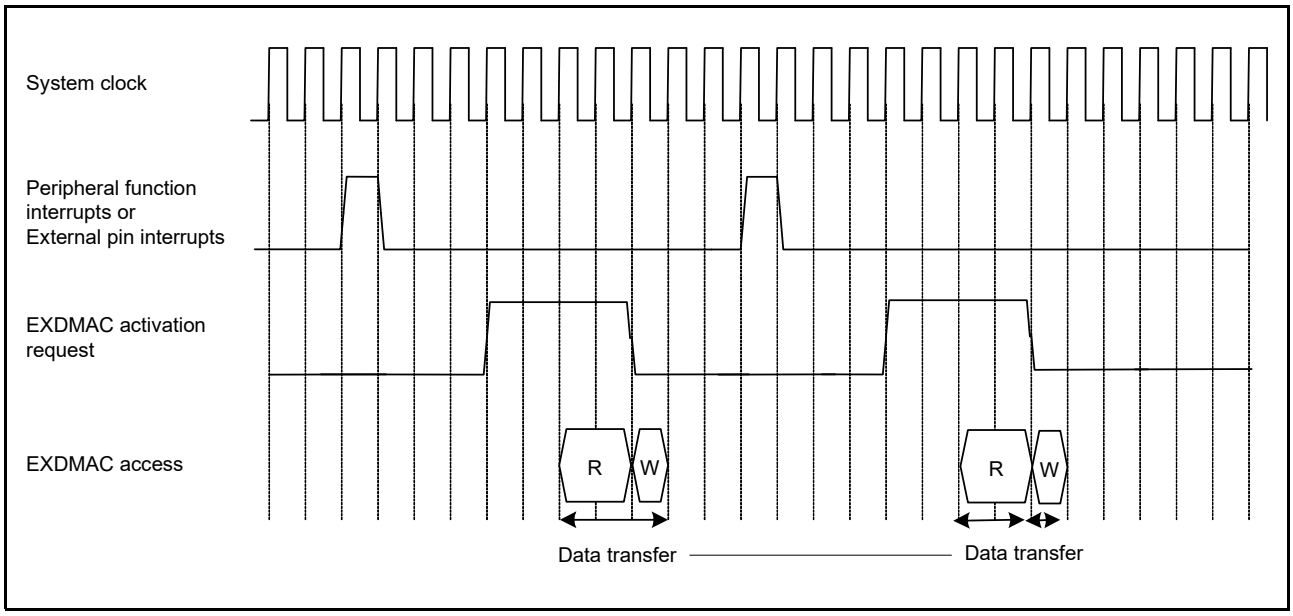

Figure 19.18 EXDMAC Operation Timing Example (1) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Normal Transfer Mode, Repeat Transfer Mode)

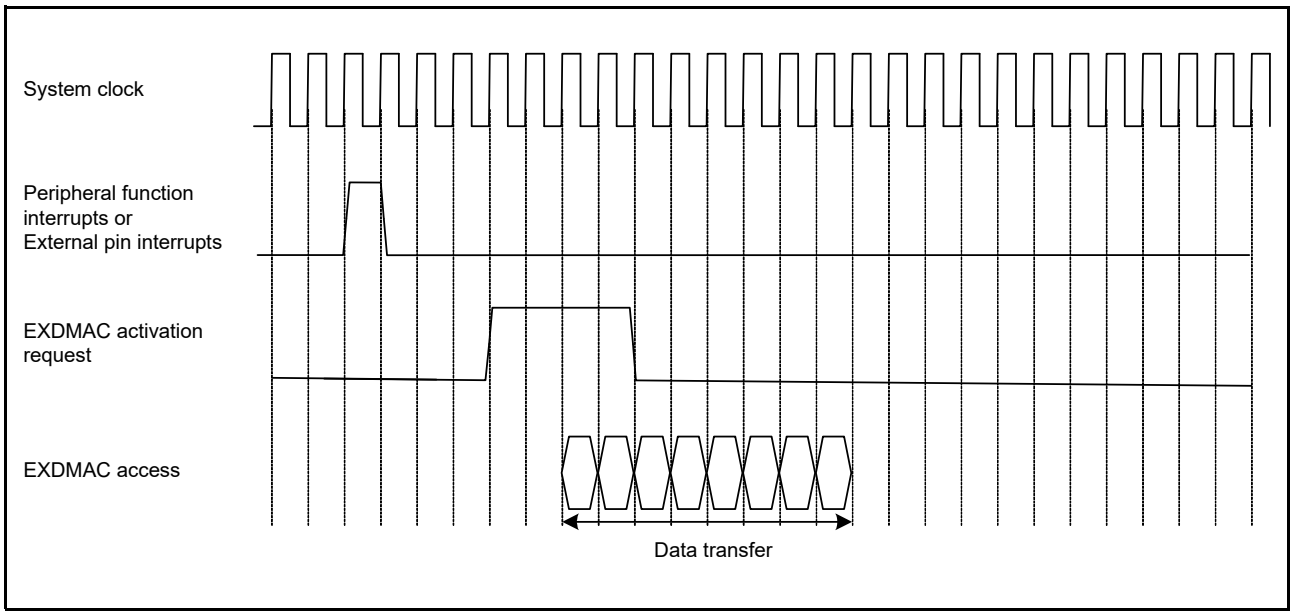

Figure 19.19 EXDMAC Operation Timing Example (2) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Block Transfer Mode, Block Size = 4)

19.3.8 Activating the EXDMAC

Table 19.15 lists the register setting procedure of normal, repeat and block transfer mode and Table 19.16 lists register setting procedure of repeat-block transfer mode.

Table 19.15 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the EXDMAC trigger source.	To use peripheral function interrupts as EXDMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQi pin as the EXDMAC trigger source.	To use external pin interrupts as EXDMAC trigger sources.
3	Clear the EDMCNT.DTE bit to 0	Disable DMA transfer.
4	Set the SELEXDRn register of the ICU to specify an interrupt source to trigger operation of the EXDMAC.	Select the use of a peripheral function interrupt or external pin interrupt to trigger operation of the EXDMAC. Enable the interrupt bit for the trigger source. Set the EXDMAC trigger source.
5	Set the peripheral module as a EXDMAC trigger source	To use peripheral function interrupt as a EXDMAC trigger source. Set the control register for the peripheral function.
6	Set the IRQi pin function by using the ICU.	To use external pin interrupt as a EXDMAC trigger source. Set the IRQi pin function by using the ICU.
7	Set the EDMAMD.DM[1:0] bits. Set the EDMAMD.SM[1:0] bits. Set the EDMAMD.DARA[4:0] bits. Set the EDMAMD.SARA[4:0] bits.	Set the destination address update mode select bits. Set the source address update mode select bits. Set the destination address extended repeat area setting bits. Set the source address extended repeat area setting bits.
8	Set the EDMTMD.DCTG[1:0] bits. Set the EDMTMD.SZ[1:0] bits. Set the EDMTMD.DTS[1:0] bits. Set the EDMTMD.MD[1:0] bits. Set the EDMTMD.TKP bit.	Set the transfer request source select bits. Set the data transfer size bits. Set the repeat area select bits. Set the transfer mode select bits. Set the transfer keeping bit.
9	Set the EDMSAR register. Set the EDMDAR register. Set the EDMCRA register.	Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations.
10	Set the EDMCRB register.	To use block transfer mode or repeat transfer mode. Set the number of block transfer operations.
11	Set the EDMOFR register.	To use the address update function with offset. Set the offset value.
12	Set the EDMINT.DTIE bit to 1.	To use the transfer end interrupts. Enable transfer end interrupts.
13	Set the EDMINT.RPTIE bit. Set the EDMINT.SARIE bit. Set the EDMINT.DARIE bit. Set the EDMINT.ESIE bit to 1.	To use the transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the transfer escape end interrupt.
14	Write 1 to the EDMPRF.PREQ flag.	Clear the RPEQ flag.
15	Set the EDMCNT.DTE bit to 1.	Enable DMA transfer.
16	Set the EDMAST.DMST bit to 1.	Enable EXDMAC operation.*1 Common settings for EXDMAC
17	Start the peripheral function as a EXDMAC trigger source.	To use peripheral function interrupt as a EXDMAC trigger source
18	Enable the IRQi pin as a EXDMAC trigger source.	To use external pin interrupt as a EXDMAC trigger source
19	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (EDMREQ.SWREQ) starts DMA transfer.

n: EXDMAC channel (n = 0, 1)

Note 1. The EDMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

Table 19.16 Register Setting Procedure of Repeat-Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the EXDMAC trigger source.	To use peripheral function interrupts as EXDMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQi pin as the EXDMAC trigger source.	To use external pin interrupts as EXDMAC trigger sources.
3	Clear the EDMCNT.DTE bit to 0.	Disable DMA transfer.
4	Set the interrupt source as a EXDMAC trigger source to the SELEXDRn register by using the ICU.	To use internal peripheral interrupts or external pin interrupts as EXDMAC trigger sources. Enable the interrupt bit for the trigger source. Set the EXDMAC trigger source.
5	Set the peripheral module as a EXDMAC request source.	To use peripheral function interrupt as a EXDMAC trigger source. Set the control register for the peripheral function.
6	Set the IRQi pin function by using the ICU.	To use external pin interrupt as a EXDMAC trigger source. Set the IRQi pin function by using the ICU.
7	Set the EDMAMD.DM[1:0] bits. Set the EDMAMD.SM[1:0] bits. Set the EDMAMD.DADR bit. Set the EDMAMD.SADR bit.	Set the destination address update mode select bits. Set the source address update mode select bits. Set the destination address update setting after reload bit. Set the source address update setting after reload bit.
8	Set the EDMTMD.DCTG[1:0] bits. Set the EDMTMD.SZ[1:0] bits. Set the EDMTMD.MD[1:0] bits. Set the EDMTMD.TKP bit.	Set the transfer request source select bits. Set the data transfer size bits. Set the transfer mode to repeat-block transfer mode. Set the transfer keeping bit.
9	Set the EDMSAR register. Set the EDMDAR register. Set the EDMSRR register. Set the EDMDRR register. Set the EDMCRA register. Set the EDMCRB register.	Set the transfer source start address. Set the transfer destination start address. Set the initial value of source start address. Set the initial value of destination start address. Set the number of transfer operations. Set the number of block transfer operations.
10	Set the EDMSBS register. Set the EDMDBS register.	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset. Set the destination buffer size and access offset.
11	Set the EDMINT.DTIE bit to 1.	To use transfer end interrupts. Enable transfer end interrupts.
12	Write 1 to the EDMPRF.PREQ flag.	Clear the PREQ flag.
13	Set the EDMCNT.DTE bit to 1.	Enable DMA transfer.
14	Set the EDMAST.DMST bit to 1.	Enable EXDMAC operation.*1
15	Start the peripheral function as a EXDMAC trigger source.	To use peripheral function interrupt as a DMA trigger source
16	Enable the IRQi pin as a EXDMAC trigger source.	To use external pin interrupt as a DMA trigger source
17	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (EDMREQ.SWREQ) starts DMA transfer.

n: EXDMAC channel (n = 0, 1)

Note 1. The EDMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

19.3.9 Starting DMA Transfer

To enable the DMA transfer of EXDMACn (n = 0, 1), set the EDMCNT.DTE bit to 1 (DMA transfer enabled), and then set the EDMAST.DMST bit to 1 (EXDMAC module start). Another transfer request cannot be accepted during the transfer of other EXDMAC channel or DTC. When the proceeding transfer is completed, channel arbitration is performed where a DMA transfer request of the highest priority channel is accepted and DMA transfer of the channel starts. When DMA transfer starts, the EDMSTS.ACT flag is set to 1 (the EXDMAC is in the active state).

19.3.10 Registers during DMA Transfer

The EXDMACn registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are EDMSAR, EDMDAR, EDMCRA, EDMCRB, EDMSBS, EDMCNT, and EDMSTS.

(1) EXDMA Source Address Register (EDMSAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(2) EXDMA Destination Address Register (EDMDAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(3) EXDMA Transfer Count Register (EDMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(4) EXDMA Block Transfer Count Register (EDMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(5) EXDMA Source Buffer Size Register (EDMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(6) EXDMA Destination Buffer Size Register (EDMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(7) EXDMA Transfer Enable Bit (EDMCNT.DTE)

Although the EDMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically set to 0 by the EXDMAC according to the DMA transfer state. The conditions for clearing this bit by the EXDMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt

- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding EDMCNT.DTE bit is set to 1 is prohibited (except for the EDMCNT register). In this case, writing must be performed after the bit is set to 0.

(8) EXDMA Active Flag (EDMSTS.ACT)

The EDMSTS.ACT flag indicates whether the EXDMACn is in the idle or active state. This flag is set to 1 when the EXDMACn starts data transfer, and is set to 0 when data transfer in response to one transfer request is completed. Even when DMA transfer is stopped by writing 0 to the EDMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

(9) Transfer End Interrupt Flag (EDMSTS.DTIF)

The EDMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed. When both this flag and the EDMINT.DTIE bit are set to 1, a transfer end interrupt is requested. This flag is set to 1 when the DMA transfer bus cycle is completed and the EDMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the EDMCNT.DTE bit is set to 1 during the interrupt handling.

(10) Transfer Escape End Interrupt Flag (EDMSTS.ESIF)

The EDMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When both this flag and the EDMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested. This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the EDMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the EDMCNT.DTE bit is set to 1 during an interrupt handling. Before sending an interrupt request from the EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

19.3.11 Channel Priority

When multiple DMA transfer requests are present, the EXDMAC determines the priority of channels that have DMA transfer requests. When EDMCTL.PR = 0, the channel priority is fixed as channel 0 > channel 1 (channel 0: Highest). When EDMCTL.PR = 1, the EXDMAC determines the priority of channels at round-robin. When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

19.3.12 Channel Security

The security attribute can be set with CPSCU.EDMACCHSAR.SADMACXn bit for each EXDMAC channel.
When the CPSCU.EDMACCHSAR.SADMACXn bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.EDMACCHSAR.SADMACXn bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Do not change the CPSCU.EDMACCHSAR bit while DMA transfer.

19.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the EDMCNT.DTE bit and the EDMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

19.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (EDMTMD.MD[1:0] = 00b)

When the value of the EDMCRAL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (EDMTMD.MD[1:0] = 01b)

When the value of the EDMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the EDMTMD.TKP bit is set to 1 (free-running function), the EDMSTS.DTIF flag is set to 1, but the EDMCNT.DTE bit does not become 0.

(3) In Block Transfer Mode (EDMTMD.MD[1:0] = 10b)

When the value of the EDMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the EDMTMD.TKP bit is set to 1 (free-running function), the EDMSTS.DTIF flag is set to 1, but the EDMCNT.DTE bit does not become 0.

(4) In Repeat-Block Transfer Mode (EDMTMD.MD[1:0] = 11b)

When the value of the EDMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Before sending an interrupt request from the
When the EDMTMD.TKP bit is set to 1 (free-running function), the EDMSTS.DTIF flag is set to 1, but the EDMCNT.DTE bit does not become 0.
EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

19.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of each single-repeat size of data is completed while the EDMINT.RPTIE bit is set to 1. When the interrupt is requested, DMA transfer is terminated regardless of the value of the EDMTMD.TKP bit, the EDMCNT.DTE bit is set to 0, and the EDMSTS.ESIF flag is set to 1. If the EDMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the EDMCNT.DTE bit. A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of each single-block size of data is completed. Repeat size end interrupt cannot be requested in repeat-block transfer mode.
Before sending an interrupt request from the EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).
For the interrupt outputs, refer to Figure 19.20, Schematic Logic Diagram of Interrupt Outputs.

19.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area address occurs while the source address extended repeat area is specified with the EDMINT.SARIE bit set to 1 or the destination address extended repeat area is specified with the EDMINT.DARIE bit set to 1, an interrupt due to an extended repeat area overflow is requested. When the interrupt is requested, DMA transfer is terminated regardless of the value of the EDMTMD.TKP bit, the EDMCNT.DTE bit is set to 0, and the EDMSTS.ESIF flag is set to 1. If the EDMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Even if an interrupt due to an extended repeat area overflow is requested during a read cycle, the subsequent write cycle proceeds. In block transfer mode, even if an interrupt due to an extended repeat area overflow is requested during a single-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer. An interrupt due to an extended repeat area overflow is not possible in repeat-block transfer mode. Before interrupt requests can be sent from the EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM). For the interrupt outputs, see Figure 19.20, Schematic Logic Diagram of Interrupt Outputs.

19.5 Processing on DMA Transfer Error

If an access error occurs during DMA transfer, the EXDMAC stops the transfer.*1 The EXDMAC also clears the EDMCNT.DTE bit of the error causing channel. Write back of the DMA transfer setting to each register is not performed. The information of the channel that caused the error is set in EDMECHR register. For details on bus errors, see section 16.8, Bus Error Monitoring Section.

Note 1. If a bufferable write error occurs, however, the EXDMAC does not stop the transfer.

19.6 Interrupts

19.6.1 Transfer End Interrupt

Each EXDMAC channel can output an interrupt request to the CPU or the DTC after transfer in response to one request is completed. An interrupt request occurs after the bus response to the last write in a DMA transfer. The timing of the bus response to a DMA write access depends on the EDMBWR.BWE bit and the transfer destination. For details, refer to section 19.8.2, Access to the Registers during DMA Transfer. In repeat-block transfer mode, do not enable escape transfer end interrupt. Table 19.17 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 19.20 shows the schematic logic diagram of interrupt outputs . Figure 19.21 shows the EXDMAC interrupt handling routine to resume/terminate DMA transfer.

Table 19.17 Relation among Interrupt Sources, Interrupt Status Flags, and Interrupt Enable Bits

Interrupt Sources		Interrupt Enable Bits	Interrupt Status Flags	Request Output Enable Bits
Transfer end		—	EDMSTS.DTIF	EDMINT.DTIE
Escape transfer end	Repeat size end	EDMINT.RPTIE	EDMSTS.ESIF	EDMINT.ESIE
	Source address extended repeat area overflow	EDMINT.SARIE		
	Destination address extended repeat area overflow	EDMINT.DARIE		

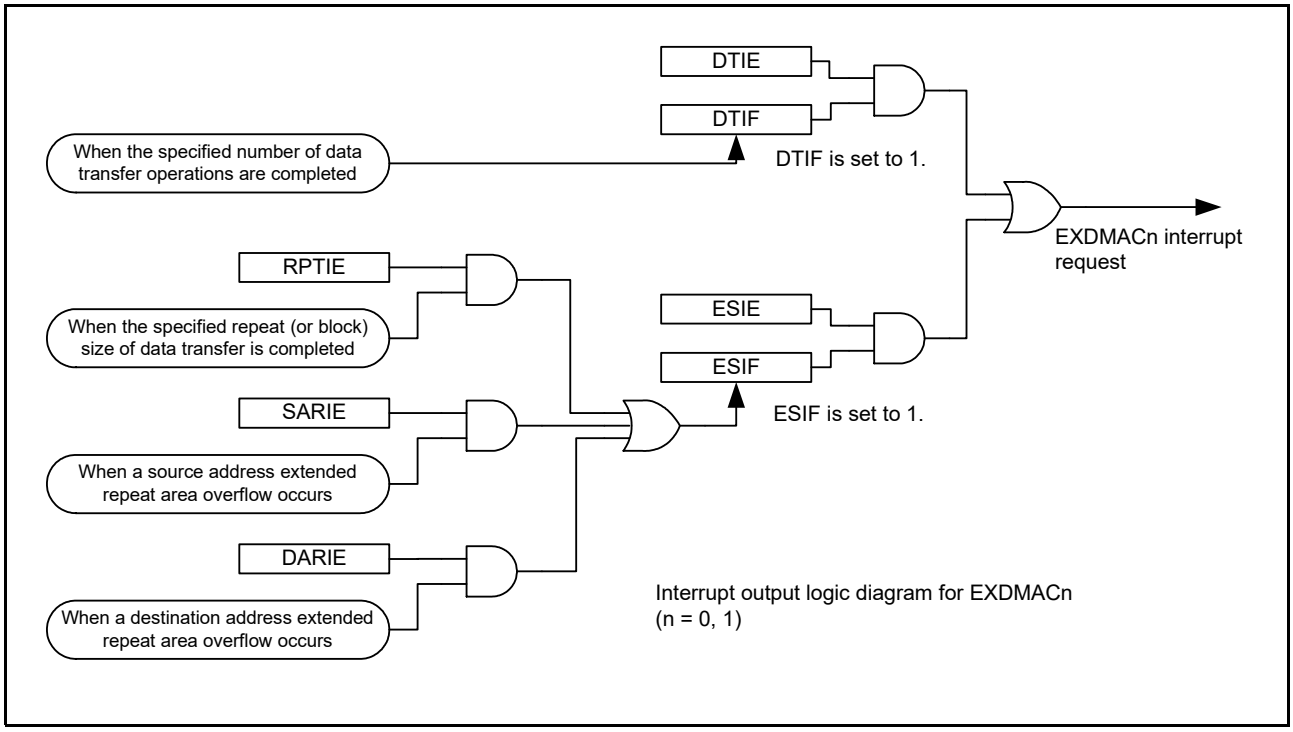

Figure 19.20 Schematic Logic Diagram of Interrupt Outputs

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases: (1) discontinuing or terminating DMA transfer and (2) continuing DMA transfer.

(1) When Discontinuing or Terminating DMA Transfer

Write 0 to the EDMSTS.DTIF flag to clear a transfer end interrupt, and to the EDMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The EXDMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the EDMCNT.DTE bit to 1 (DMA transfer enabled).

(2) When Continuing DMA Transfer

Write 1 to the EDMCNT.DTE bit. The EDMSTS.ESIF flag is automatically set to 0 (interrupt source cleared), and DMA transfer is resumed.

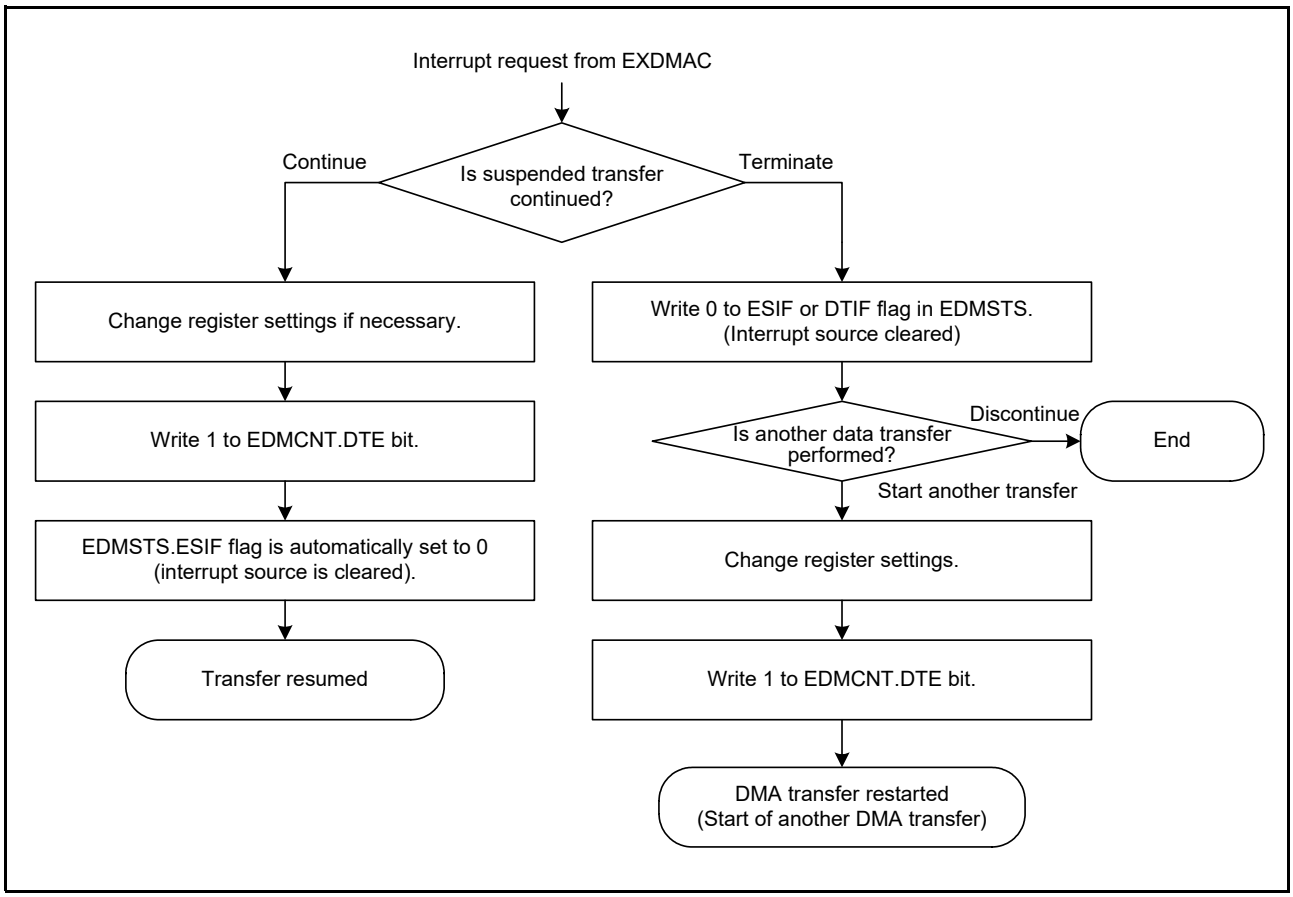

Figure 19.21 EXDMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

19.6.2 Transfer Error Interrupt

A transfer error occurring during DMA transfer is detected as a bus error. For details, see section 16.8, Bus Error Monitoring Section.

Table 19.18 Interrupt and Error Information Due to DMA Transfer Error Cause

Transfer Error Factor	Interrupt/Reset Selection	NMI	Interrupt	Bus Error Status	Error Channel Information
MSAU Error	BUS.MSAOAD.OAD	ICU.NMISR.BUSST	ICU.IR016.IR	BUS.BUSERRSTATEXDMAC.MSERRSTAT	EDMECHR
Illegal Access Error	BUS.BUSOAD.ILERROAD			BUS.BUSERRSTATEXDMAC.ILERRSTAT	
Slave Bus Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATEXDMAC.SLERRSTAT	
Protect Zone Access Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATEXDMAC.SLERRSTAT	

19.7 Low-Power Consumption Function

Before transition to the module-stop state, software standby mode, or deep software standby mode, set the EDMAST.DMST bit to 0 (the EXDMAC suspended), and then perform the following.

(1) Module-Stop Function

Writing 1 to the module-stop setting bit (transition to the module-stop state) enables the module-stop function of the EXDMAC. If DMA transfer is in progress at the time a 1 is written to the module-stop setting bit, the transition to the module-stop state proceeds after DMA transfer has ended. While the module-stop setting bit is 1, accessing the EXDMAC registers are prohibited. Writing 0 to the module-stop setting bit releases the EXDMAC from the module-stop state.

(2) Software Standby and Deep Software Standby Modes

Make settings in accord with the procedure under section 11.6.2.1, Transitioning to Software Standby Mode or section 11.6.3.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption. If DMA transfer operations are in progress at the time the WAIT instruction is executed, the transition to software standby or deep software standby follows the completion of DMA transfer.

(3) Note on Low-Power Consumption Function

For the WAIT instruction and the register setting procedure, see section 11.8.6, Timing of the WAIT Instruction in section 11, Low Power Consumption. To perform DMA transfer after returning from low-power consumption mode, set the EDMAST.DMST bit to 1 again.

19.8 Usage Notes

19.8.1 Bus Response to DMA Write Access

The timing of the bus response to a DMA write access depends on the setting of the EDMBWR.BWE bit and the transfer destination. If the EDMBWR.BWE bit is set to 1, the bus response returns from the intermediate point described in section 16.2.5.2, Bufferable Write. Also, for writes to the destinations described in section 16.2.5.3, Notes on the Timing of Writing Completion, the bus response returns before the write is complete.

19.8.2 Access to the Registers during DMA Transfer

Do not write to the following registers while the EDMSTS.ACT flag of the same channel is set to 1 (EXDMAC active state) or the EDMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled): EDMSAR, EDMDAR, EDMCRA, EDMCRB, EDMTMD, EDMINT, EDMAMD, EDMOFR, EDMREQ, EDMSBS, EDMDBS, EDMSRR, EDMDRR, EDMBWR, EDMCTL, EDMBAC, and EDMPRF.

19.8.3 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

20. Data Transfer Controller (DTCA)

This MCU incorporates a data transfer controller (DTC).
The DTC is triggered by an interrupt request to perform data transfers.
In addition to the conventional methods of DTC transfer (normal, repeat, block, and chain), DTCA supports sequential transfer, in which it handles a series of transfers made up of a combination of the other methods. In sequential transfer, the data that is initially transferred selects one from possible 256 sequences for execution. The DTCA can divide one sequence into several transfers depending on how the parts of the sequence are combined.

20.1 Overview

Table 20.1 lists the specifications of the DTC, and Figure 20.1 shows a block diagram of the DTC.

Table 20.1 DTC Specifications

Item	Description
Number of transfer channels	• The same number as all interrupt sources that can start the DTC transfer.
Transfer modes	• Normal transfer mode A single transfer request leads to a single data transfer. • Repeat transfer mode A single transfer request leads to a single data transfer. The transfer address is returned to the transfer start address after the number of data transfers corresponding to “repeat size”. The maximum number of repeat transfers is 256, and the maximum data transfer size is 256 × 64 bits, 2048 bytes. • Block transfer mode A single transfer request leads to the transfer of a single block. The maximum block size is 256 × 64 bits = 2048 bytes.
Chain transfer	• Multiple types of data transfers can sequentially be executed in response to a single request. • Either “performed only when the transfer counter becomes 0” or “every time” can be selected.
Sequence transfer	A series of complicated transfers can be registered as a sequence. Any sequence can be selected by the transfer data and executed. • Only one trigger source can be set at a time. • Up to 256 sequences for a single trigger source • The data that is initially transferred in response to a transfer request determines a sequence • The whole sequence can be executed on a single request, or be suspended in the middle of the sequence and resumed on the next transfer request (division of sequence).
Transfer space	• 4 Gbytes (Area from 0000 0000h to FFFF FFFFh except reserved areas)
Data transfer units	• Single data: 1 byte (8 bits), 1 word (16 bits), 1 longword (32 bits), 1 double longword (64 bits) • Single block size: 1 to 256 data
CPU interrupt source	• An interrupt request can be generated to the CPU on a request source for a data transfer. • An interrupt request can be generated to the CPU after a single data transfer. • An interrupt request can be generated to the CPU after data transfer of specified volume.
Transfer error handling	If a transfer error (bus error) occurs, the transfer is aborted and the IR flag of the transfer request source is cleared.
Event link function	An event link request is generated after one data transfer (for block, after one block transfer).
Read skip	Reading of the transfer information can be skipped when the same transfer is repeated.
Write-back skip	Write-back of the transferred data that is not updated can be skipped when the address of the transfer source or destination is fixed.
Write-back disable	Allows disabling the write-back of transfer information.
Displacement addition	The displacement value can be added to the transfer source address (for each transfer information)
Low power consumption function	Module stop state can be set.
Protect Zone filter	Security attributes can be set.

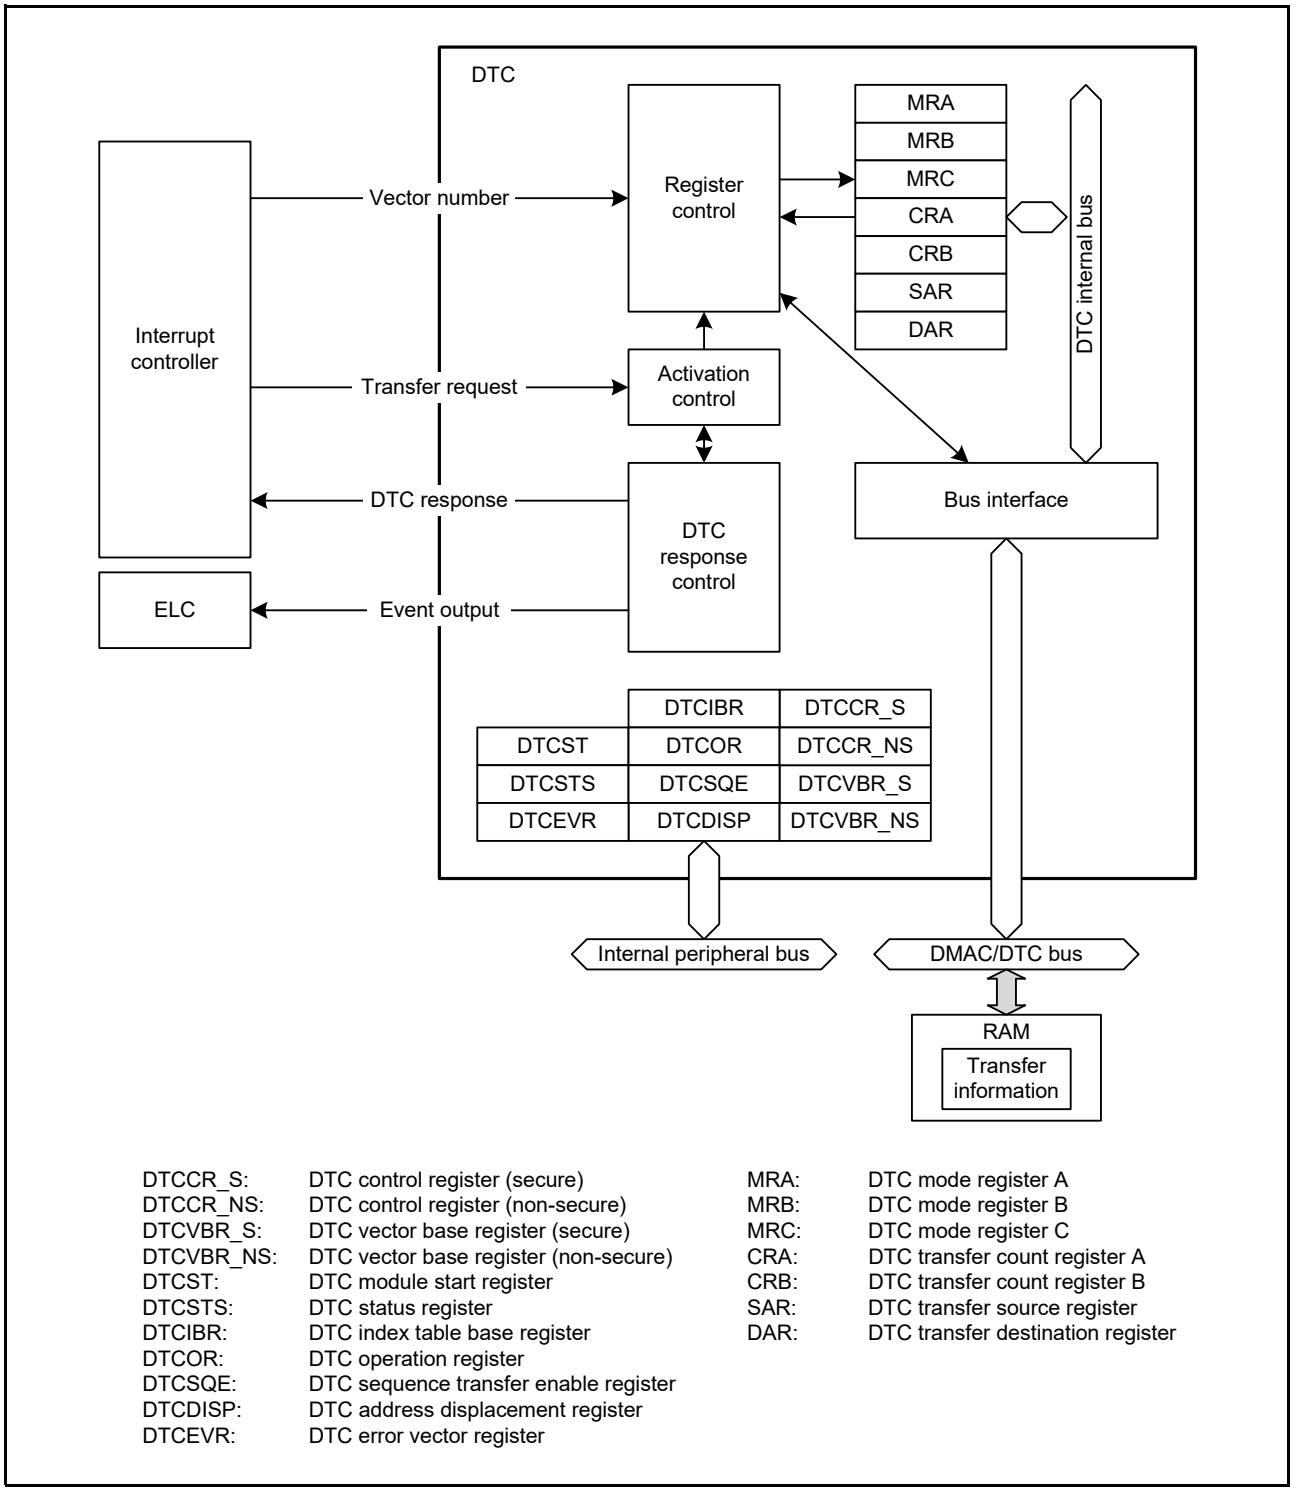

Figure 20.1 DTC Block Diagram

20.2 Register Descriptions

Registers MRA, MRB, MRC, SAR, DAR, CRA, and CRB are DTC internal registers, which cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the RAM area as transfer information. When accepting a transfer request, the DTC reads the transfer information from the RAM area and sets it in the internal registers. After the data transfer ends, the values of the updated internal register are written back to the RAM area as transfer information.

20.2.1 DTC Mode Register A (MRA)

Address(es): (inaccessible directly from the CPU)

	b7	b6	b5	b4	b3	b2	b1	b0
	MD[1:0]		SZ[1:0]		SM[1:0]		—	WBDIS
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	WBDIS	Write-Back Disable	0: Writes back the transfer information on completion of the data transfer 1: Does not write back the transfer information on completion of the data transfer	—
b1	—	Reserved	Set this bit to 0.	—
b3, b2	SM[1:0]	Transfer Source Address Addressing Mode	b3 b2 0 0: The address in the SAR register is fixed. (write-back to SAR is skipped.) 0 1: The address in the SAR register is fixed. (write-back to SAR is skipped.) 1 0: The SAR value is incremented after a data transfer. (+1 when the SZ[1:0] bits are 00b, +2 when 01b, +4 when 10b, +8 when 11b) 1 1: The SAR value is decremented after a data transfer. (–1 when the SZ[1:0] bits are 00b, –2 when 01b, –4 when 10b, –8 when 11b)	—
b5, b4	SZ[1:0]	DTC Data Transfer Size	b5 b4 0 0: Byte (8-bit) transfer 0 1: Word (16-bit) transfer 1 0: Longword (32-bit) transfer 1 1: Double longword (64-bit) transfer	—
b7, b6	MD[1:0]	DTC Transfer Mode Select	b7 b6 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited	—

MRA register is used to select the DTC operating mode and cannot be accessed directly from the CPU.

WBDIS Bit (Write-Back Disable)

The WBDIS bit selects whether to write back the transfer information.

When the bit is 0, updated transfer information is written back.

When the bit is 1, updated transfer information is not written back even with the setting of that address is incremented after a transfer, and the same data transfer is executed every time for each transfer request. The transfer information can be stored in ROM because the transfer information is not written back.

While the WBDIS bit is 1, operation for each transfer mode is as follows:

(1) Normal transfer and repeat transfer modes
1 byte, 1 word, 1 longword, or 1 double longword of data is transferred on a single transfer request. The transfer address and transfer count are not updated so that the same transfer is repeated on each transfer request. When the transfer count is 1, the ICU.DTCERn.DTCE bit is not set to 0, and data transfer continues in response to the next transfer request.

(2) Block transfer mode
1-block of data is transferred on a single transfer request. The transfer address and transfer count are not updated so that the same block transfer is repeated on each transfer request. When the block transfer count is 1, the ICU.DTCERn.DTCE bit is not set to 0, and data transfer continues in response to the next transfer request.

When setting the MRC.DISPE bit to 1, set the WBDIS bit to 1 (does not write back the transfer information). If the value of the WBDIS bit in any transfer information is 1, set the DTCCR.RRS bit to 0 (so that reading of the transfer information is not skipped).

20.2.2 DTC Mode Register B (MRB)

Address(es): (inaccessible directly from the CPU)

	b7	b6	b5	b4	b3	b2	b1	b0
	CHNE	CHNS	DISEL	DTS	DM[1:0]		INDX	SQEND
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	SQEND	Sequence Transfer End	0: Continue the sequence transfer 1: End the sequence transfer	—
b1	INDX	Index Table Reference	0: Does not refer to the index table 1: Refers the index table based on the transferred data*1	—
b3, b2	DM[1:0]	Transfer Destination Address Addressing Mode	b3 b2 0 0: The address in the DAR register is fixed. (Write-back to DAR is skipped.) 0 1: The address in the DAR register is fixed. (Write-back to DAR is skipped.) 1 0: The DAR value is incremented after data transfer. (+1 when the MRA.SZ[1:0] bits are 00b, +2 when 01b, +4 when 10b, +8 when 11b) 1 1: The DAR value is decremented after data transfer. (–1 when the MRA.SZ[1:0] bits are 00b, –2 when 01b, –4 when 10b, –8 when 11b)	—
b4	DTS	DTC Transfer Mode Select	0: Transfer destination side is repeat area or block area. 1: Transfer source side is repeat area or block area.	—
b5	DISEL	DTC Interrupt Select	0: An interrupt request to the CPU is generated on completion of the specified number of data transfers. 1: An interrupt request to the CPU is generated for each data transfer.	—
b6	CHNS	DTC Chain Transfer Select	0: Chain transfer is performed on completion of each transfer. 1: Chain transfer is performed only when the transfer counter is changed from 1 to 0 or 1 to CRAH.	—
b7	CHNE	DTC Chain Transfer Enable	0: Chain transfer is disabled. 1: Chain transfer is enabled.	—

Note 1. Set the MRA.MD[1:0] bits to 00b (normal transfer mode) when setting the INDX bit to 1.

MRB register is used to select the DTC operating mode and cannot be accessed directly from the CPU.

SQEND Bit (Sequence Transfer End)

The SQEND bit selects whether to continue or end sequence transfer. Refer to Table 20.2 for details.
This bit can only be set to 1 for transfer information referred to by the DTC index table. Set this bit to 0 for transfer information referred to by the DTC vector table.

INDX Bit (Index Table Reference)

When the value of the INDX bit in transfer information that is read is 1, a sequence transfer proceeds. Refer to Table 20.2 for details.
Set this bit to 0 for transfer information which is not associated with sequence transfer or is not intended to start sequence transfer. Do not allow transfer requests to be generated by the sources different from that specified in the DTCSQE register but having the INDX bit set to 1.

Table 20.2 Values of Bits CHNE, SQEND, and INDX in the Sequence Transfer and DTC Operation

CHNE Bit	SQEND Bit	INDX Bit	Operation	Usage
0	0	1	Start sequence transfer	Use this setting for the transfer information that is first read in response to a transfer request from the source specified in the DTCSQE register.
1	0	0	Continue sequence transfer	Use this setting for the first or intermediate transfer information in a sequence.
0	0	0	Suspend sequence transfer	Use this setting for the first or intermediate transfer information in a sequence.
0	1	0	End sequence transfer	Use this setting with the last transfer information in a sequence.
0	1	1	End current sequence transfer and start new sequence transfer	Use this setting with the last transfer information in a sequence.

Note: Do not set the values other than listed above.

DTS Bit (DTC Transfer Mode Select)

The DTS bit specifies the side (transfer source or destination) to be a repeat area or block area in repeat transfer mode or block transfer mode.

CHNS Bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition.

When the CHNE bit is 0, setting of the CHNS bit is ignored. For details on the conditions to select the chain transfer, refer to Table 20.4, Chain Transfer Conditions.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the interrupt status flag for the request source is not cleared, and an interrupt request to the CPU is not generated.

CHNE Bit (DTC Chain Transfer Enable)

The CHNE bit enables or disables chain transfer.

The chain transfer condition is selected by the CHNS bit.

For details of chain transfer, refer to section 20.4.6, Chain Transfer.

Refer to Table 20.2 for the setting value to be used in the sequence transfer.

20.2.3 DTC Mode Register C (MRC)

Address(es): (inaccessible directly from the CPU)

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DISPE
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	DISPE	Displacement Addition	0: The displacement value is not added to the transfer source address. 1: The displacement value is added to the transfer source address.	—
b7 to b1	—	Reserved	Set these bits to 0.	—

The MRC register is used to select DTC operating mode and cannot be accessed directly from the CPU.

DISPE Bit (Displacement Addition)

This bit specifies whether to use the SAR + DTCDISP value as the transfer source address.

When setting the DISPE bit to 1, set the MRA.WBDIS bit to 1 (does not write back the transfer information) and set the DTCCR.RRS bit to 0 (transfer information read is not skipped).

20.2.4 DTC Transfer Source Register (SAR)

Address(es): (inaccessible directly from the CPU)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

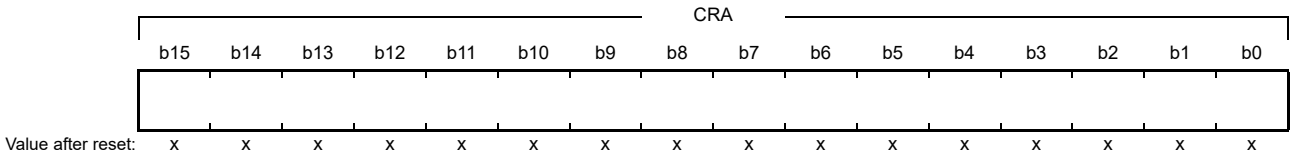
SAR register is used to set the transfer source start address.
SAR register cannot be accessed directly from the CPU.

20.2.5 DTC Transfer Destination Register (DAR)

Address(es): (inaccessible directly from the CPU)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

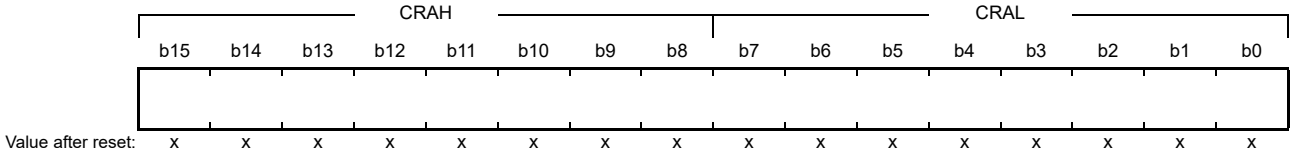


x: Undefined

DAR register is used to set the transfer destination start address.
DAR register cannot be accessed directly from the CPU.

20.2.6 DTC Transfer Count Register A (CRA)

- Normal transfer mode



Address(es): (inaccessible directly from the CPU)

x: Undefined

- Repeat transfer mode/block transfer mode

Address(es): (inaccessible directly from the CPU)

x: Undefined

Symbol	Register Name	Description	R/W
CRAL	Transfer Counter A Lower Register	Set transfer count. This register functions as a transfer counter during data transfer.	—
CRAH	Transfer Counter A Upper Register	Set transfer count. This register functions as a reload register during data transfer.	—

Note: The function depends on transfer mode.
Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

This register is for counting the number of transfers and cannot be accessed directly from the CPU.

(1) Normal transfer mode (MRA.MD[1:0] bits = 00b)

CRA register functions as a 16-bit transfer counter in normal transfer mode.
The transfer count is 1, 65535, and 65536 when the set value is 0001h, FFFFh, and 0000h, respectively.
The CRA value is decremented (–1) at each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] bits = 01b)

The CRAH register retains the transfer count and the CRAL register functions as an 8-bit transfer counter.
The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively.
The CRAL value is decremented (–1) at each data transfer. When it reaches 00h, the CRAH value is reloaded to the CRAL register.

(3) Block transfer mode (MRA.MD[1:0] bits = 10b)

The CRAH register retains the block size and the CRAL register functions as an 8-bit block size counter.
The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively.
The CRAL value is decremented (–1) at each data transfer. When it reaches 00h, the CRAH value is reloaded to the CRAL register.

20.2.7 DTC Transfer Count Register B (CRB)

Address(es): (inaccessible directly from the CPU)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

CRB register is used to set the block transfer count for block transfer mode and cannot be accessed directly from the CPU.
The transfer count is 1, 65535, and 65536 when the set value is 0001h, FFFFh, and 0000h, respectively.
The CRB value is decremented (–1) when the final data of a single block size is transferred.
When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

20.2.8 DTC Control Register for Secure Application (DTCCR_S), DTC Control Register for Non-secure Application (DTCCR_NS)

Address(es): DTC.DTCCR_S 8700 7C10h*1, DTC_NS.DTCCR_NS 0700 7C00h*2

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b4	RRS	DTC Transfer Information Read Skip Enable*3	0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
Note 2. This register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.
Note 3. Set this bit to 0 when using the sequence transfer.

DTCCR register is used to control the DTC operation. There are two registers: one for secure application developers (DTCCR_S) and one for non-secure application developers (DTCCR_NS).

RRS Bit (DTC Transfer Information Read Skip Enable)

The DTC vector number is compared with the vector number in the previous data transfer.
When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transferred information. However, when the previous transfer was chain transfer, the transferred information is read regardless of the value of the RRS bit.
Furthermore, when the transfer counter (CRA register) became 0 during the previous normal transfer and when the transfer counter (CRB register) became 0 during the previous block transfer, the transferred information is read regardless of the RRS bit value.
If the value of the MRA.WBDIS bit in any transfer information is 1, set the RRS bit to 0. Note that the MRA.WBDIS bit

should be set to 1 when the MRC.DISPE bit is set to 1.
Like chain transfer, sequence transfer handles sequences of multiple types of data transfer. When sequence transfer is to be used, set the RRS bit to 0 so that the previous data transfer will not be repeated.

20.2.9 DTC Vector Base Register for Secure Application (DTCVBR_S), DTC Vector Base Register for Non-secure Application (DTCVBR_NS)

Address(es): DTC.DTCVBR_S 8700 7C14h*1, DTC_NS.DTCVBR_NS 0700 7C04h*2

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. This register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
Note 2. This register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCVBR register is used to set the base address for calculating the address to which the DTC vector is allocated.
The lower 10 bits are reserved and the values are fixed to 0. Write 0 to the lower 10 bits if necessary.
There are two registers: one for Secure application developers (DTCVBR_S) and one for Non-secure application developers (DTCVBR_NS).
The DTCVBR_NS register can be set in the range of 0000 0000h to 7FFF FC00h, and the DTCVBR_S register in the range of 8000 0000h to FFFF FC00h in 1-Kbyte units.

20.2.10 DTC Module Start Register (DTCST)

Address(es): DTC.DTCST 8700 7C0Ch, DTC_NS.DTCST 0700 7C0Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTCST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DTCST	DTC Module Start	0: DTC module stop 1: DTC module start	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DTCST Bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted.

If this bit is set to 0 during data transfer, the accepted transfer request is active until the processing is completed.

Set the DTCST bit to 0 before making a transition to the module stop state, software standby mode, or deep software standby mode.

Set the DTCST bit to 1 to resume the data transfer after returning from the module stop state or software standby mode.

For details on transitions to the module stop state, software standby mode, and deep software standby mode, refer to section 20.9, Low Power Consumption Function, and section 11, Low Power Consumption.

20.2.11 DTC Status Register (DTCSTS)

Address(es): DTC.DTCSTS 8700 7C0Eh, DTC_NS.DTCSTS 0700 7C0Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	VECN[7:0]	DTC Active Vector Number Monitoring Flag	These bits indicate the vector number for the request source when data transfer is in progress. The value is only valid if data transfer is in progress (the value of the ACT flag is 1).	R
b14 to b8	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b15	ACT	DTC Active Flag	0: Data transfer is not in progress. 1: Data transfer is in progress.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

VECN[7:0] Flags (DTC Active Vector Number Monitoring Flag)

While data transfer is in progress, these bits indicate the vector number corresponding to the request source for the transfer.

When the DTCSTS register is read, the value of the VECN[7:0] flags is valid if the value of the ACT flag was 1 (data transfer is in progress) and invalid if the value of the ACT flag was 0 (data transfer is not in progress).

For the correspondence between the DTC request sources and the vector addresses, refer to Table 15.6, Interrupt Vector Table in section 15, Interrupt Controller (ICUM).

ACT Flag (DTC Active Flag)

This flag indicates the state of data transfer operation.

[Setting condition]

- When the data transfer is started by a transfer request.
- When the sequence transfer is resumed.

[Clearing condition]

- When the data transfer is completed in response to a transfer request.
- When the sequence transfer is suspended.

20.2.12 DTC Index Table Base Register (DTCIBR)

Address(es): DTC.DTCIBR 8700 7C24h, DTC_NS.DTCIBR 0700 7C24h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCIBR register is used to set the base address for calculating the address to which the DTC index is allocated.
Values for the upper 4 bits (b31 to b28) cannot be written but reflect the value written to b27.
The lower 10 bits (b9 to b0) are reserved bits and fixed to 0. When writing this register, set these bits to 0.
It can be set in the range of 0000 0000h to 07FF FC00h and F800 0000h to FFFF FC00h in 1-Kbyte units.

20.2.13 DTC Operation Register (DTCOR)

Address(es): DTC.DTCOR 8700 7C28h, DTC_NS.DTCOR 0700 7C28h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SQTFRL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SQTFRL	Sequence Transfer Terminate	Writing 1 to this bit terminates the sequence transfer in progress. This bit is read as 0.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCOR register sets the operation of the DTC module.

SQTFRL Bit (Sequence Transfer Terminate)

Setting the SQTFRL bit to 1 terminates the sequence transfer in progress.
When the DTCSQE.ESPSEL bit is 1 (Sequence transfer is enabled), follow the procedure shown in Figure 20.2 to terminate the sequence transfer.
Writing 1 to the bit, while no sequence transfer is performed, have no effect.

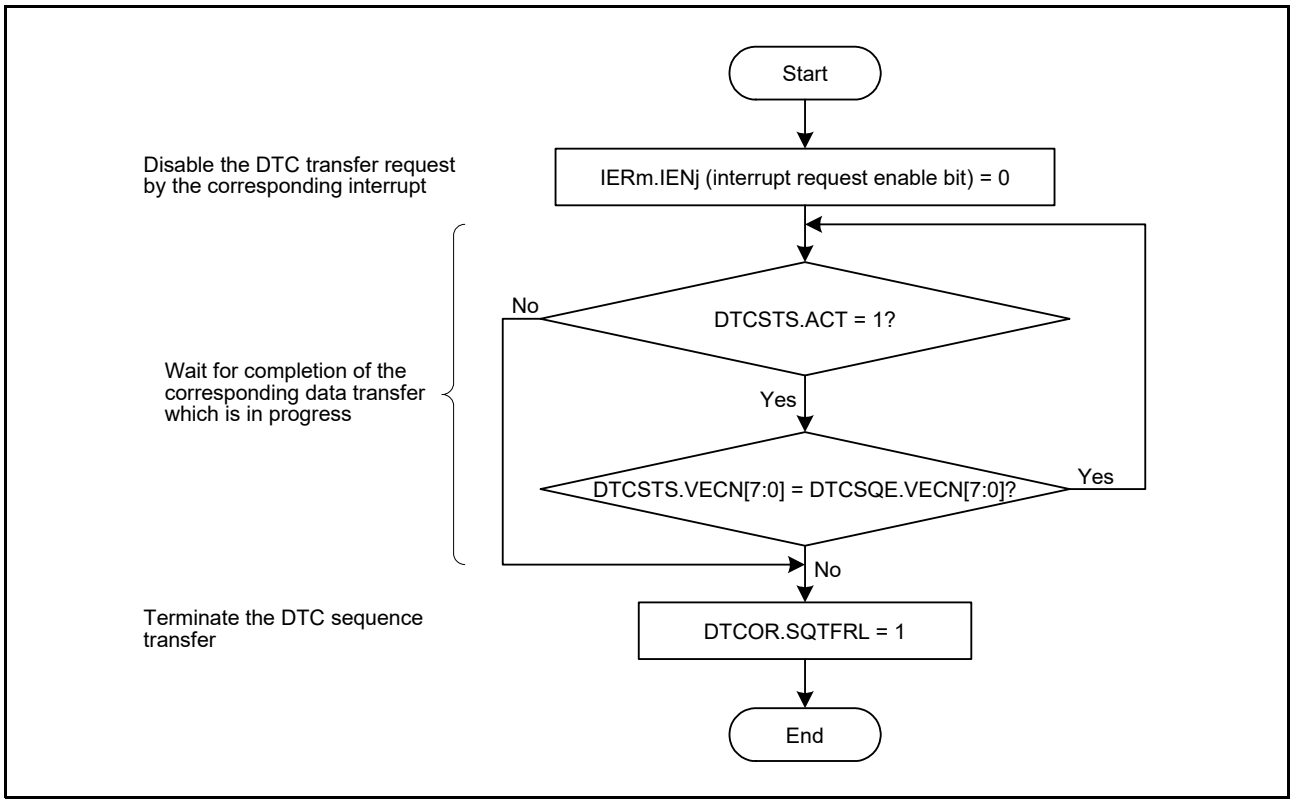


Figure 20.2 Procedure to Terminate Sequence Transfer

20.2.14 DTC Sequence Transfer Enable Register (DTCSQE)

Address(es): DTC.DTCSQE 8700 7C2Ch, DTC_NS.DTCSQE 0700 7C2Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ESPSEL	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	VECN[7:0]	Sequence Transfer Vector Number Setting	Specify the vector number by which a sequence transfer is enabled. The value is only valid when the ESPSEL bit is 1.	R/W
b14 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b15	ESPSEL	Sequence Transfer Enable	0: Sequence transfer is disabled. 1: Sequence transfer is enabled.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCSQE register is used to specify sequence transfer. Follow Figure 20.23 for details on the setting procedure.

VECN[7:0] Bit (Sequence Transfer Vector Number Setting)

This bit is used to specify for which vector number to perform sequence transfer. Sequence transfer can occur only for this trigger source.
Table 15.6, Interrupt Vector Table in section 15, Interrupt Controller (ICUM) shows the relationship between the trigger source and the vector number.

ESPSEL Bit (Sequence Transfer Enable)

The ESPSEL bit specifies whether sequence transfer is used.

20.2.15 DTC Address Displacement Register (DTCDISP)

Address(es): DTC.DTCDISP 8700 7C18h, DTC_NS.DTCDISP 0700 7C18h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCDISP register is used to specify the displacement value to add to the DTC transfer source address.

If MRC.DISPE bit is 1, the value SAR + DTCDISP is used as the transfer source address.

20.2.16 DTC Error Vector Register (DTCEVR)

Address(es): DTC.DTCEVR 8700 7C20h, DTC_NS.DTCEVR 0700 7C20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERRSTS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WBCF	ERRTI[2:0]			—	—	—	ERRSAF	ERRVCT[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	ERRVCT[7:0]	Error Occurrence Vector Number Indication	These bits indicate the vector number for the DTC trigger source when a transfer error occurs.	R*1
b8	ERRSAF	Error Occurrence Vector Security Attribute	0: Secure 1: Non-secure	R*1
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	ERRTI[2:0]	Error Occurrence Timing Indication	b14 b12 0 0 0: When reading the DTC vector 0 0 1: When reading the transfer information 0 1 0: When reading data from the source address 0 1 1: When writing data to the destination address 1 0 0: When writing back the transfer information 1 0 1: When referring the DTC index table Other than above: Reserved	R
b15	WBCF	Write-Back Completion Flag	0: Write-back of transfer information has not been completed. 1: Write-back of transfer information has been completed.	R*1
b16	ERRSTS	Error Status Flag	0: No transfer error 1: Transfer error occurred	R/W*2
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: This register can be read by both secure and non-secure transactions.
When the ERRSAF flag is set to 0 (secure), this register can only be written by secure transactions. Writes by non-secure transactions are ignored, and a Protect Zone access error is generated.
When the ERRSAF flag is set to 1 (non-secure), this register can be written by any transaction.
Note 1. Clearing the ERRSTS flag also clears these flags and bits.
Note 2. Writing 1 to this flag clears it.

The DTCEVR register indicates detailed information when a transfer error occurs. The information in this register is updated only when the ERRSTS flag changes from 0 to 1. It is not updated unless the ERRSTS flag is cleared.

ERRSAF Flag (Error Occurrence Vector Security Attribute)

This flag indicates the security attribute of the DTC trigger source that caused the transfer error. The security attribute of the DTC trigger source is the same as the security attribute of the ICU.DTCERn register.

WBCF Flag (Write-Back Completion Flag)

This flag indicates whether write-back of the transfer information has been completed when a transfer error occurs.

ERRSTS Flag (Error Status Flag)

This flag indicates that a bus error has occurred during DTC transfer.

[Setting condition]

- When a transfer error occurs when this flag is 0.

[Clearing condition]

- When 1 is written to this flag.

20.2.17 DTC Security Attribution Register (DTCSAR)

Address(es): CPSCU.DTCSAR 8701 8030h, CPSCU_NS.DTCSAR 0701 8030h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADTC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SADTC0	DTC Security Attribution 0	0: Secure 1: Non-secure	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is used to set the security attributes for the DTC module.

SADTC0 Bit (DTC Security Attribution 0)

This bit is used to set the security attributes of the DTC registers (DTCST, DTCSTS, DTCIBR, DTCOR, DTCSQE, and DTCDISP), except for the DTCCR, DTCVBR, and DTCEVR registers*1.

Note 1. The DTCCR and DTCVBR registers have two sets of registers, one for secure applications and one for non-secure applications, and their security attributes are fixed. The security attribute of the DTCEVR register is special.

20.3 Request Sources

The DTC data transfer is triggered by an interrupt request. Setting the ICU.DTCERn.DTCE bit (n = interrupt vector number) to 1 selects the corresponding interrupt request as a request source for the DTC. The security attribute of the DTC request source is the same as the security attribute of the ICU.DTCERn register and is set by the CPSCU.ICU0SAR0 to ICU0SAR7 registers.
For the correspondence between the DTC request sources and the vector addresses, refer to Table 15.6, Interrupt Vector Table in section 15, Interrupt Controller (ICUM). For request by software, refer to section 15.2.5, Software Interrupt Generation Register (SWINTR) and section 15.2.6, Software Interrupt 2 Generation Register (SWINT2R) in section 15, Interrupt Controller (ICUM).
Once the DTC has accepted a transfer request, it does not accept another transfer request until transfer for that single request is completed, regardless of the priority of the requests.
When multiple transfer requests are generated during data transfer by the DMAC/DTC, the request with the highest priority on completion of the current transfer is accepted. When multiple transfer requests are generated while the DTCST.DTCST bit is 0 (DTC module stop), the request with the highest priority at the moment when the bit is subsequently set to 1 (DTC module start) is accepted.

The DTC performs the following operations at the start of a single data transfer (or the last of the consecutive transfers in the case of a chain transfer).

- On completion of a specified number of data transfer, the ICU.DTCERn.DTCE bit is set to 0 and an interrupt is requested to the CPU.
- If the MRB.DISEL bit is 1, an interrupt is requested to the CPU on completion of data transfer.
- For the other transfers, the interrupt status flag of the request source is set to 0 at the start of data transfer.

20.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information corresponding to each request source from the vector table and reads the transfer information starting at that address. There is one vector table each in the Secure world and Non-secure world, and the table that matches the security attribute of the request source is used.
The vector table should be located on a 1-Kbyte boundary so that the lower 10 bits of the base address (start address) are 0. Use the DTC vector base register for Secure application (DTCVBR_S) to set the base address of the DTC vector table in the Secure world, and use the DTC vector base register for Non-secure application (DTCVBR_NS) to set the base address of the DTC vector table in the Non-secure world.
Transfer information is allocated in the RAM area. Transfer information can be allocated in the ROM area when the MRA.WBDIS bit is set to 1. The start address of the transfer information n with vector number n should be allocated at DTCVBR + 4n.
Transfer information should be aligned on a 16-byte boundary.
Figure 20.3 shows the relationship between the DTC vector table and transfer information.
Figure 20.4 shows the allocation of transfer information in the RAM area. The lower addresses vary according to the endian of the corresponding allocation area. For details, refer to section 20.10.2, Allocating Transfer Information.

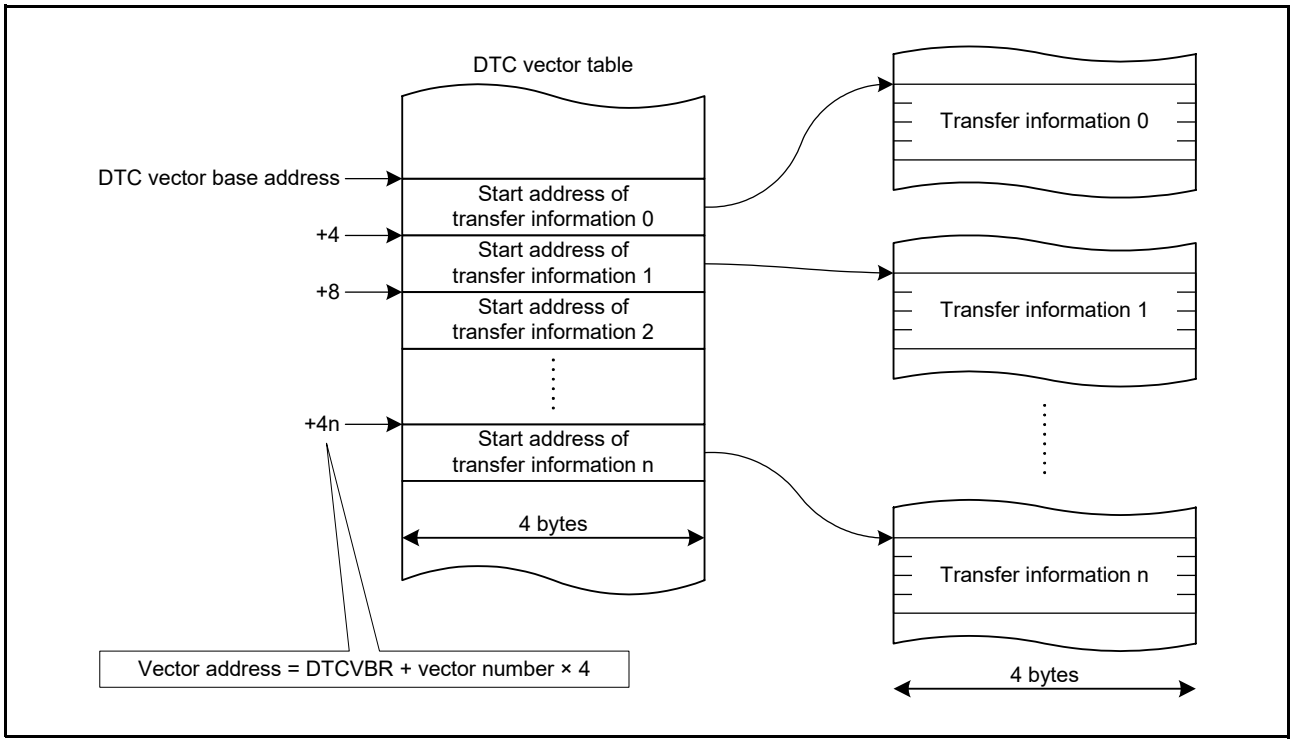

Figure 20.3 DTC Vector Table and Transfer Information

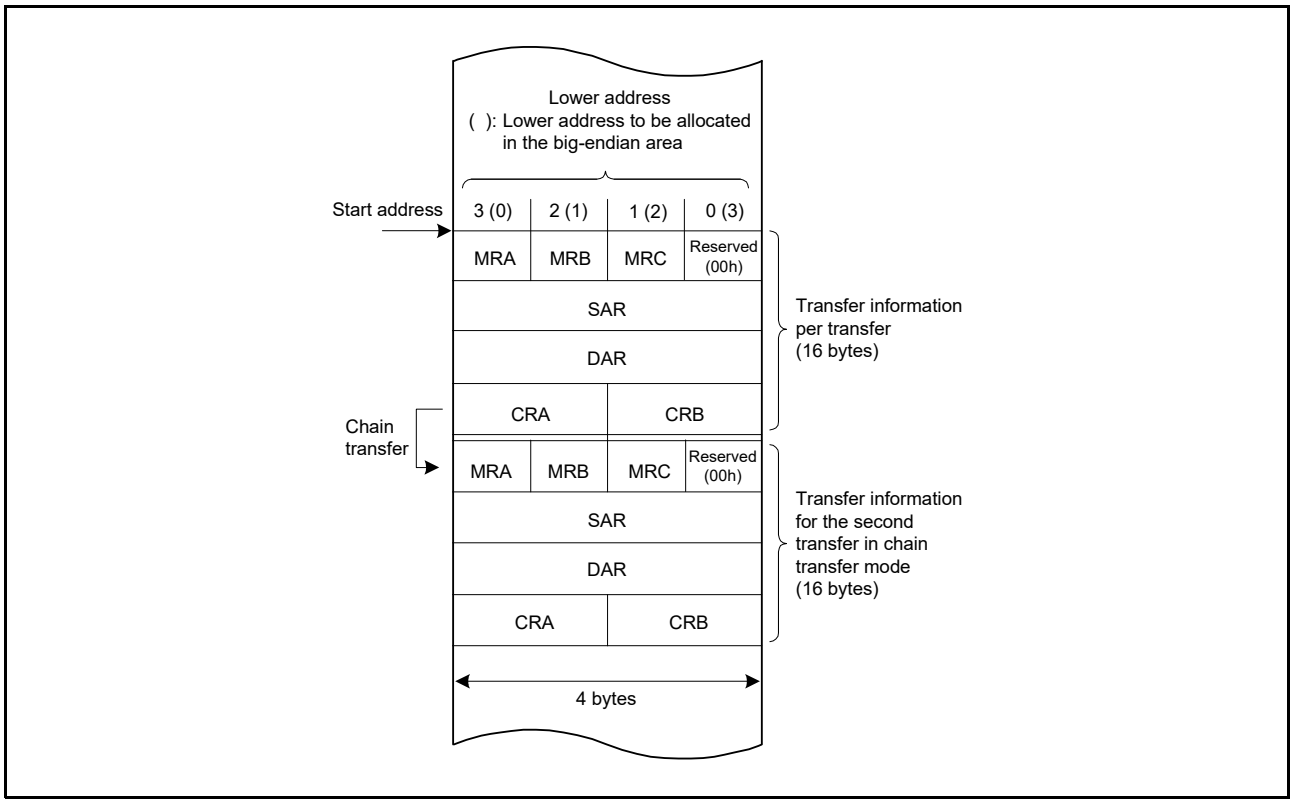

Figure 20.4 Allocation of Transfer Information in the RAM Area

20.4 Operation

The DTC transfers data in accordance with the transfer information. Storage of the transfer information in the RAM area is required before DTC operation.

When the DTC accepts a transfer request, it reads the DTC vector corresponding to the vector number. Next, the DTC reads transfer information from the address pointed by the DTC vector, transfers data, and then writes back the transfer information after the data transfer. Allocating transfer information in the RAM area allows data transfer of arbitrary number of channels.

There are three transfer modes: normal transfer mode, repeat transfer mode, and block transfer mode.

Set a transfer source address in the SAR register and a transfer destination address in the DAR register. The SAR and DAR registers are updated after the transfer according to the respective settings (increment, decrement, or fixed).

Table 20.3 lists transfer modes of the DTC.

Table 20.3 Transfer Modes of the DTC

Transfer Mode	Data Size Transferred on Single Transfer Request	Increment/Decrement of Memory Address	Settable Transfer Count
Normal transfer mode	1 byte/1 word/1 longword/1 double longword	Incremented/decremented by 1, 2, 4, or 8 or address fixed	1 to 65536
Repeat transfer mode*1	1 byte/1 word/1 longword/1 double longword	Incremented/decremented by 1, 2, 4, or 8 or address fixed	1 to 256*3
Block transfer mode*2	Block size specified in CRAH (1 to 256 bytes/1 to 256 words/1 to 256 longwords/1 to 256 double longwords)	Incremented/decremented by 1, 2, 4, or 8 or address fixed	1 to 65536

Note 1. Set transfer source or transfer destination in the repeat area.
Note 2. Set transfer source or transfer destination in the block area.
Note 3. After data transfer of the specified count, the initial state is restored and the operation is continued (repeated).

Setting the MRB.CHNE bit to 1 allows multiple transfers (chain transfer) on a single transfer request. The setting in combination with the MRB.CHNS bit enables a chain transfer when the specified number of data transfers is completed. Figure 20.5 shows the operation flowchart of the DTC. Table 20.4 lists chain transfer conditions.

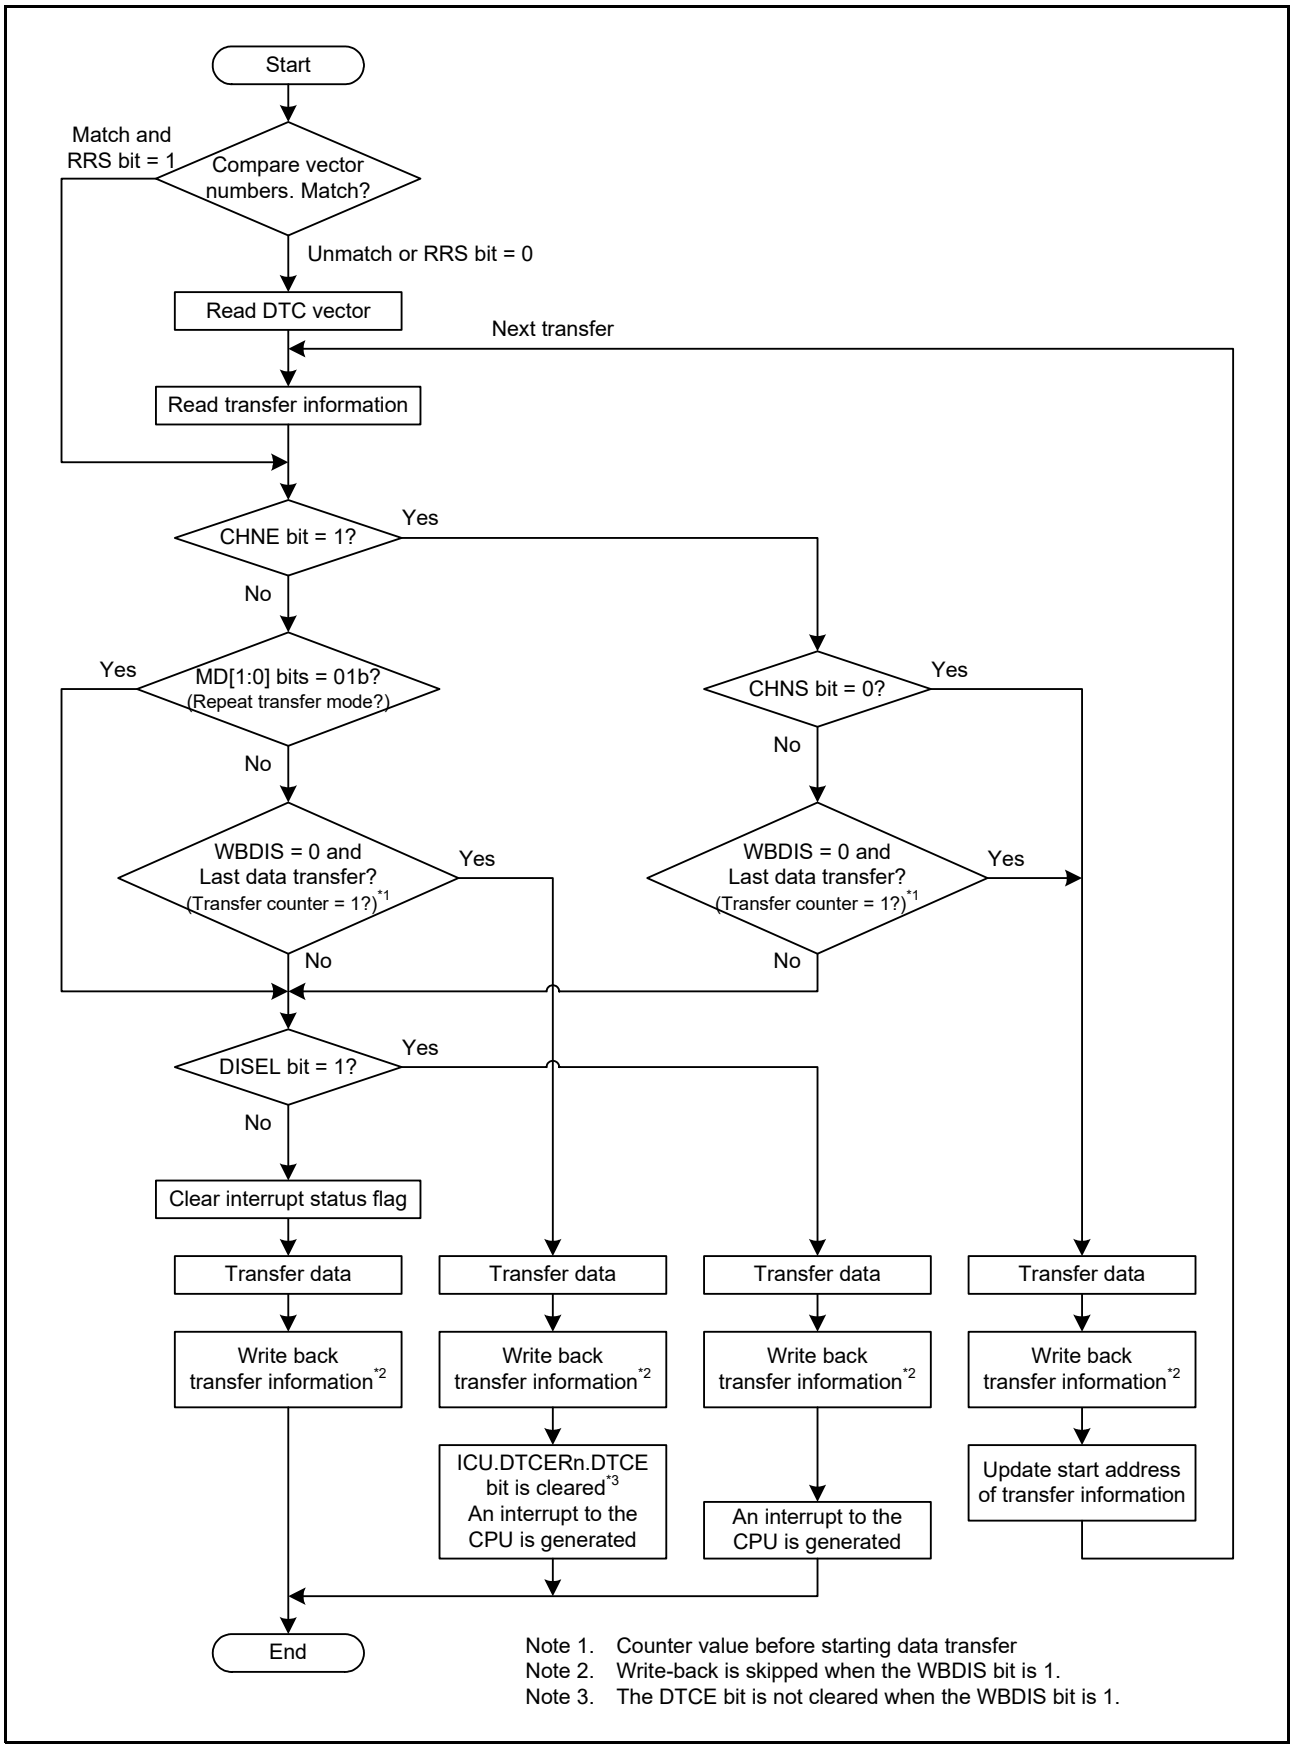

Figure 20.5 Operation Flowchart of the DTC

Table 20.4 Chain Transfer Conditions

First Transfer				Second Transfer*3				
CHNE Bit	CHNS Bit	DISEL Bit	Transfer Counter*1,*2	CHNE Bit	CHNS Bit	DISEL Bit	Transfer Counter*1,*2	Data Transfer
0	—	0	Other than (1 → 0)	—	—	—	—	Ends after the first transfer
0	—	0	(1 → 0)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU
0	—	1	—	—	—	—	—	
1	0	—	—	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	0	Other than (1 → ∗)	—	—	—	—	Ends after the first transfer
1	1	—	(1 → ∗)	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	1	Other than (1 → ∗)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU

Note 1. The transfer counters used depend on transfer modes as follows:
Normal transfer mode: CRA register
Repeat transfer mode: CRAL register
Block transfer mode: CRB register

Note 2. On completion of data transfer, the counters operate as follows:
1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → ∗) in the table indicates both of the two operations above.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The condition combination of “second transfer and the CHNE bit is 1” is omitted.

20.4.1 Transfer Information Read Skip Function

Reading of DTC vector and transfer information can be skipped by the setting of the DTCCR.RRS bit.

When a DTC transfer request is accepted, the current DTC vector number is compared with the DTC vector number in the previous data transfer. When these vector numbers match and the RRS bit is 1, the DTC does not read the DTC vector and transfer information, and transfers data according to the transfer information remained in the DTC.

However, when the previous transfer was chain transfer, the DTC vector and transfer information are read. Furthermore, when the transfer counter (CRA register) became 0 during the previous normal transfer and when the transfer counter (CRB register) became 0 during the previous block transfer, transfer information is read regardless of the value of the RRS bit. Figure 20.13 shows an example of transfer information read skip.

When updating the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, and then set the RRS bit to 1. Setting the RRS bit to 0 discards the vector numbers retained in the DTC. The updated DTC vector table and transfer information are read in the next data transfer.

20.4.2 Transfer Information Write-Back Skip Function

20.4.2.1 Write-Back Skip by Fixing Addresses

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to “address is fixed” (00b or 01b), a part of transfer information is not written back.

Table 20.5 lists transfer information write-back skip conditions and applicable registers. The CRA and CRB registers are written back, but write-back of registers MRA, MRB, and MRC is skipped.

Table 20.5 Transfer Information Write-Back Skip Conditions and Applicable Registers

MRA.SM[1:0] Bits		MRB.DM[1:0] Bits			
b3	b2	b3	b2	**SAR Register**	**DAR Register**
0	0	0	0	Skip	Skip
0	0	0	1		
0	1	0	0		
0	1	0	1		
0	0	1	0	Skip	Write-back
0	0	1	1		
0	1	1	0		
0	1	1	1		
1	0	0	0	Write-back	Skip
1	0	0	1		
1	1	0	0		
1	1	0	1		
1	0	1	0	Write-back	Write-back
1	0	1	1		
1	1	1	0		
1	1	1	1		

20.4.2.2 Write-Back Skip by the MRA.WBDIS Bit

When the MRA.WBDIS bit is 1, the transfer information (SAR, DAR, CRA, and CRB) is not written back regardless of the settings of the transfer information.

The transfer information on the memory is not updated, data can be transferred by the DTC without copying the transfer information from ROM to RAM. Skipping a write-back reduces time for post-processing of the data transfer.

20.4.3 Normal Transfer Mode

This mode allows 1-byte, 1-word, 1-longword, or 1-double-longword data transfer on a single transfer request. The transfer count can be set to 1 to 65536.

Transfer source addresses and transfer destination addresses can be set to increment, decrement, or fixed independently.

This mode enables an interrupt request to the CPU to be generated at the end of specified-count transfer.

Table 20.6 lists register functions in normal transfer mode, and Figure 20.6 shows the memory map of normal transfer mode.

Table 20.6 Register Functions in Normal Transfer Mode

Register	Description	Value Written Back by Writing Transfer Information*1
SAR	Transfer source address	Increment/decrement/fixed*2
DAR	Transfer destination address	Increment/decrement/fixed*2
CRA	Transfer counter A	CRA – 1
CRB	Transfer counter B	Not updated

Note 1. Write-back operation is skipped when the MRA.WBDIS bit is 1.
Note 2. Write-back operation is skipped when address is fixed.

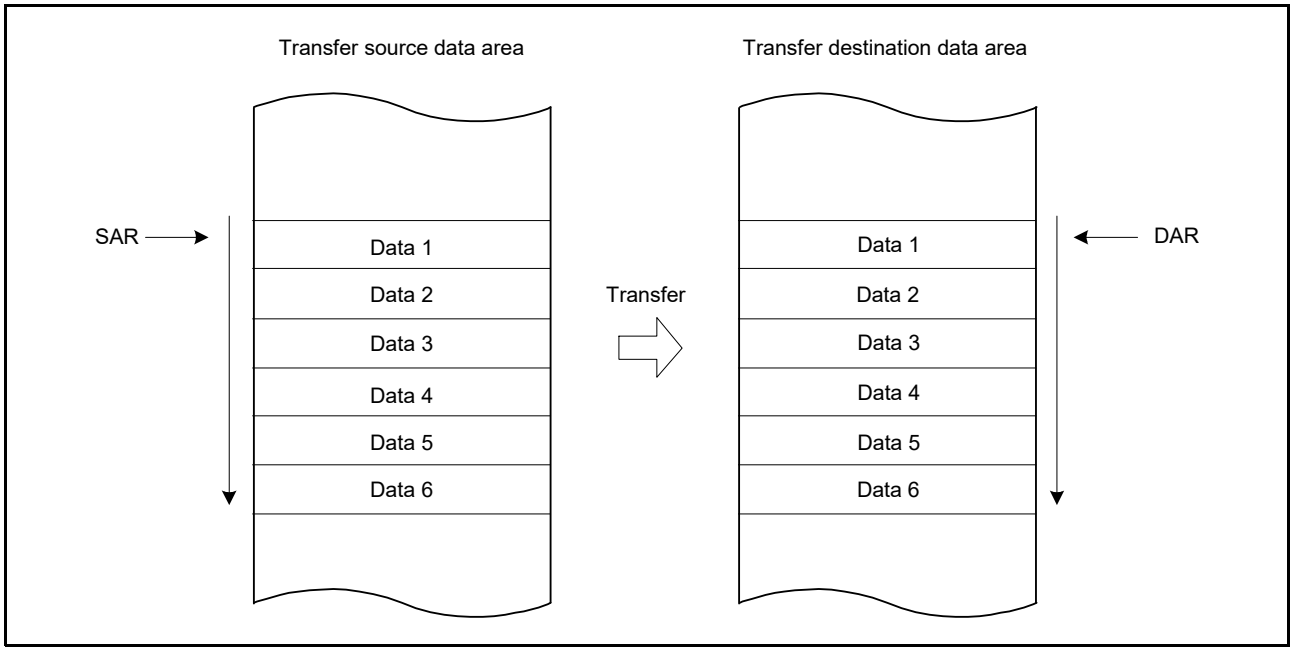

Figure 20.6 Memory Map of Normal Transfer Mode

20.4.4 Repeat Transfer Mode

This mode allows 1-byte, 1-word, 1-longword, or 1-double-longword data transfer on a single transfer request.
Specify either transfer source or transfer destination for the repeat area by the MRB.DTS bit. The transfer count can be set to 1 to 256. When the specified-count transfer is completed, the initial value of the address register specified in the transfer counter and the repeat area is restored and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.
When the transfer counter CRAL is decreased to 00h in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. Thus the transfer counter does not become 00h, which disables an interrupt request to be generated to the CPU when the MRB.DISEL bit is set to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers).
Table 20.7 lists the register functions in repeat transfer mode, and Figure 20.7 shows the memory map of repeat transfer mode.

Table 20.7 Register Functions in Repeat Transfer Mode

		Value Written Back by Writing Transfer Information*1		
			When CRAL = 1	
Register	**Description**	**When CRAL ≠ 1**	**When the MRB.DTS Bit is 0**	**When the MRB.DTS Bit is 1**
SAR	Transfer source address	Increment/decrement/fixed*2	Increment/decrement/fixed*2	SAR register initial value
DAR	Transfer destination address	Increment/decrement/fixed*2	DAR register initial value	Increment/decrement/fixed*2
CRAH	Retains initial value of transfer counter	CRAH	CRAH	
CRAL	Transfer counter A	CRAL – 1	CRAH	
CRB	Transfer counter B	Not updated	Not updated	

Note 1. Write-back operation is skipped when the MRA.WBDIS bit is 1.
Note 2. Write-back operation is skipped when address is fixed.

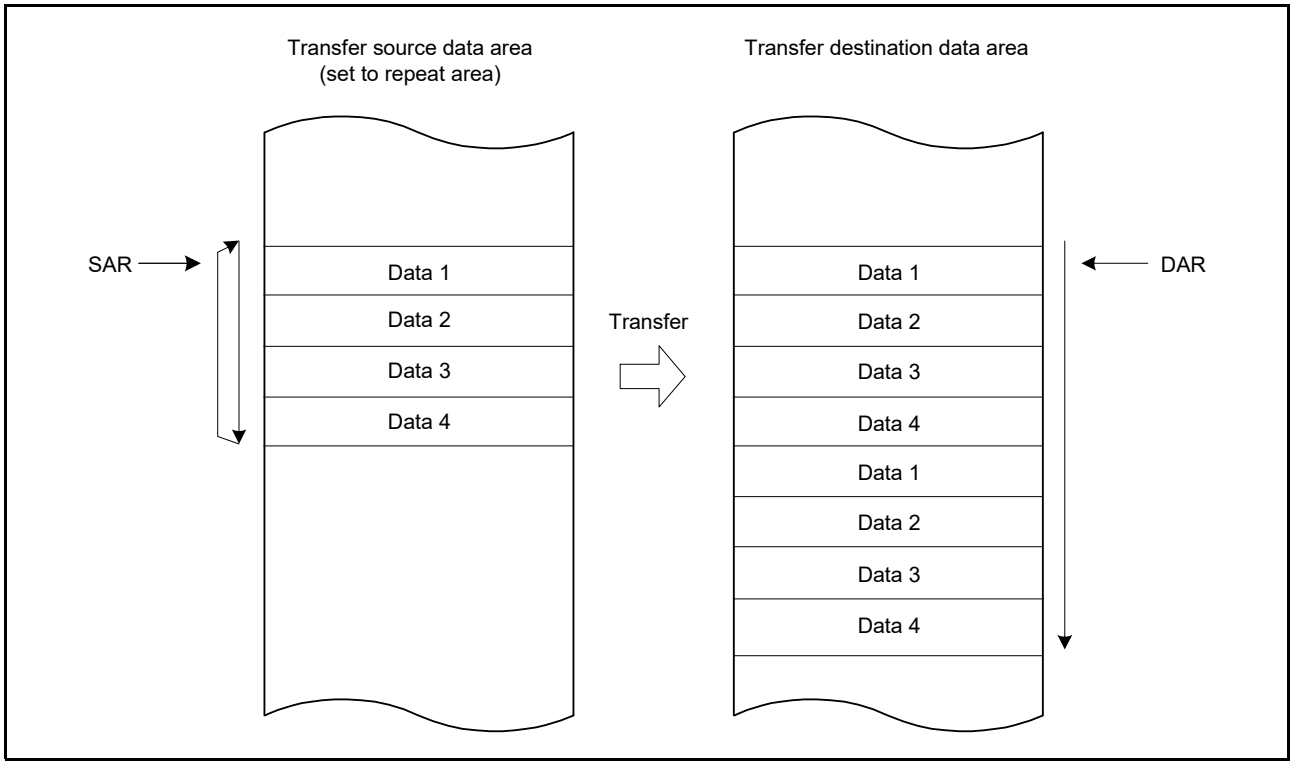

Figure 20.7 Memory Map of Repeat Transfer Mode (Transfer Source: Repeat Area)

20.4.5 Block Transfer Mode

This mode allows single-block data transfer on a single transfer request.
Specify either transfer source or transfer destination for the block area by the MRB.DTS bit. The block size can be set to 1 to 256 bytes, 1 to 256 words, 1 to 256 longwords, or 1 to 256 double longwords.
When transfer of the specified one block is completed, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS bit is 1 or the DAR register when the DTS bit is 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.
The transfer count (block count) can be set to 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of specified-count block transfer.
Table 20.8 lists register functions in block transfer mode, and Figure 20.8 shows the memory map of block transfer mode.

Table 20.8 Register Functions in Block Transfer Mode

		Value Written Back by Writing Transfer Information*1	
Register	**Description**	**When MRB.DTS Bit is 0**	**When MRB.DTS Bit is 1**
SAR	Transfer source address	Increment/decrement/fixed*2	SAR register initial value
DAR	Transfer destination address	DAR register initial value	Increment/decrement/fixed*2
CRAH	Retains initial value of block size	CRAH	
CRAL	Block size counter	CRAH	
CRB	Block transfer counter	CRB – 1	

Note 1. Write-back operation is skipped when the MRA.WBDIS bit is 1.
Note 2. Write-back operation is skipped when address is fixed.

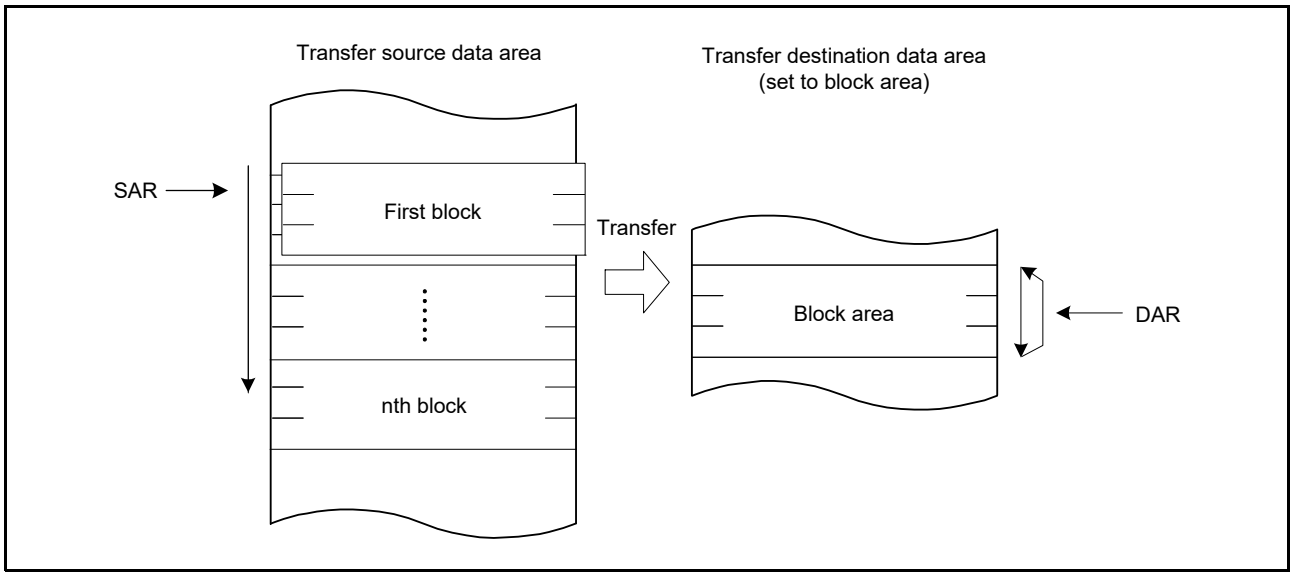

Figure 20.8 Memory Map of Block Transfer Mode (Transfer Destination: Block Area)

20.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single transfer request. If the MRB.CHNE bit is 1 and the MRB.CHNS bit is 0, an interrupt request to the CPU is not generated when the specified number of data transfers is completed, or while the MRB.DISEL bit is 1 (an interrupt request to the CPU is generated for every data transfer). Data transfer has no effect on the interrupt status flag, which is the request source. The transfer information (SAR, DAR, CRA, CRB, MRA, MRB, and MRC) that define a data transfer can be specified independently of each other. Figure 20.9 shows chain transfer operation.

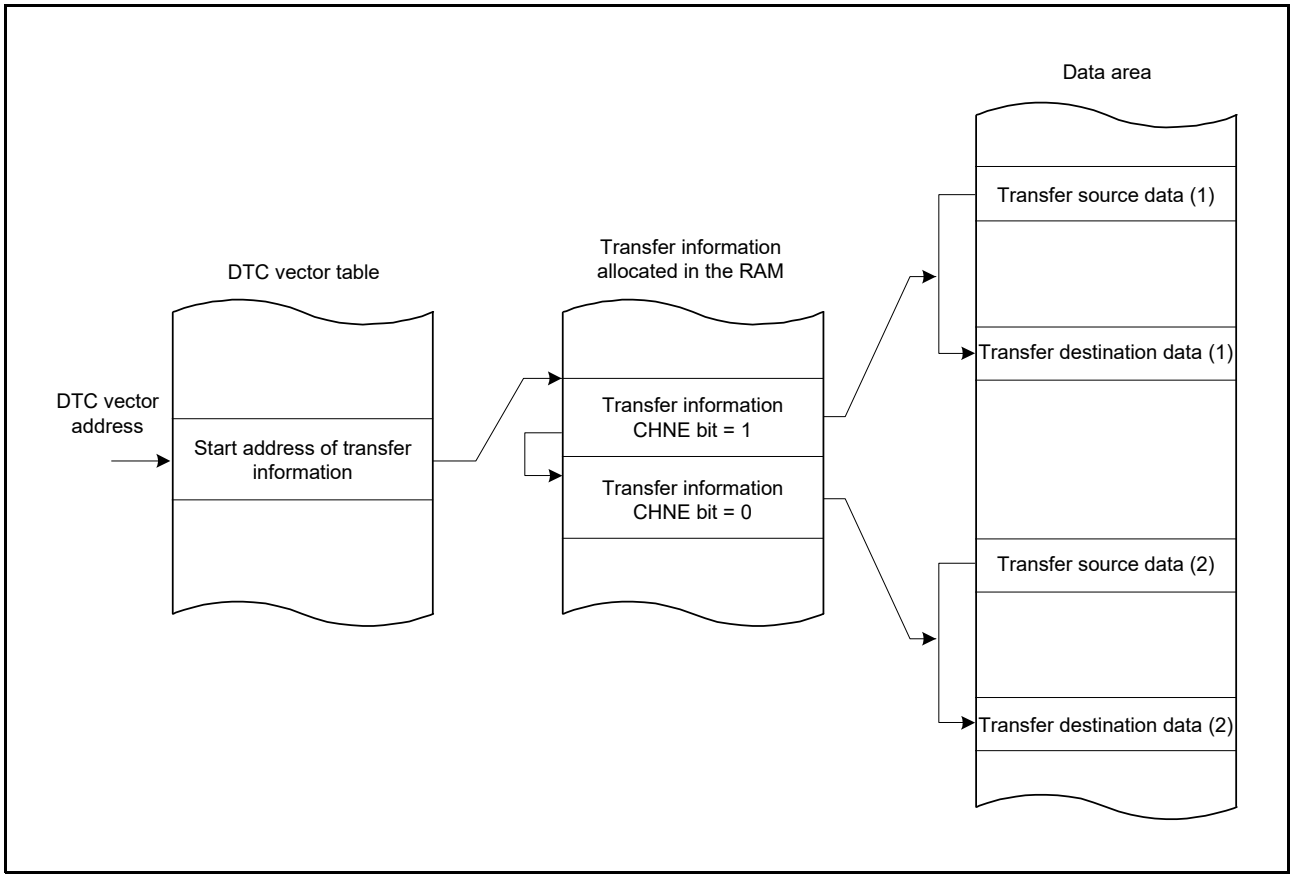

Figure 20.9 Chain Transfer Operation

If the MRB.CHNE bit is 1 and the CHNS bit is 1, chain transfer is performed only after completion of specified number of data transfers. In repeat transfer mode, chain transfer is performed after completion of specified number of data transfers.

For details on chain transfer conditions, refer to Table 20.4, Chain Transfer Conditions.

20.4.7 Operation Timing

Figure 20.10 to Figure 20.13 show examples of DTC operation timing.

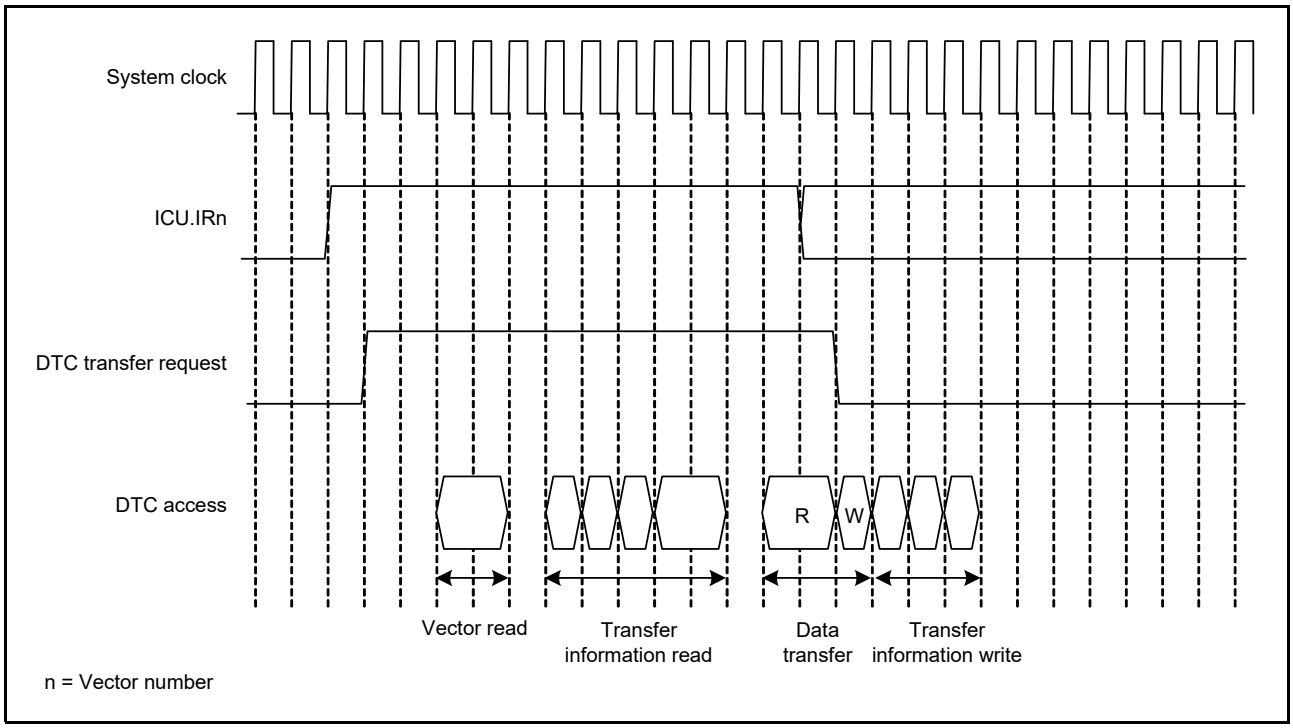

Figure 20.10 Example (1) of DTC Operation Timing (Normal Transfer Mode, Repeat Transfer Mode)

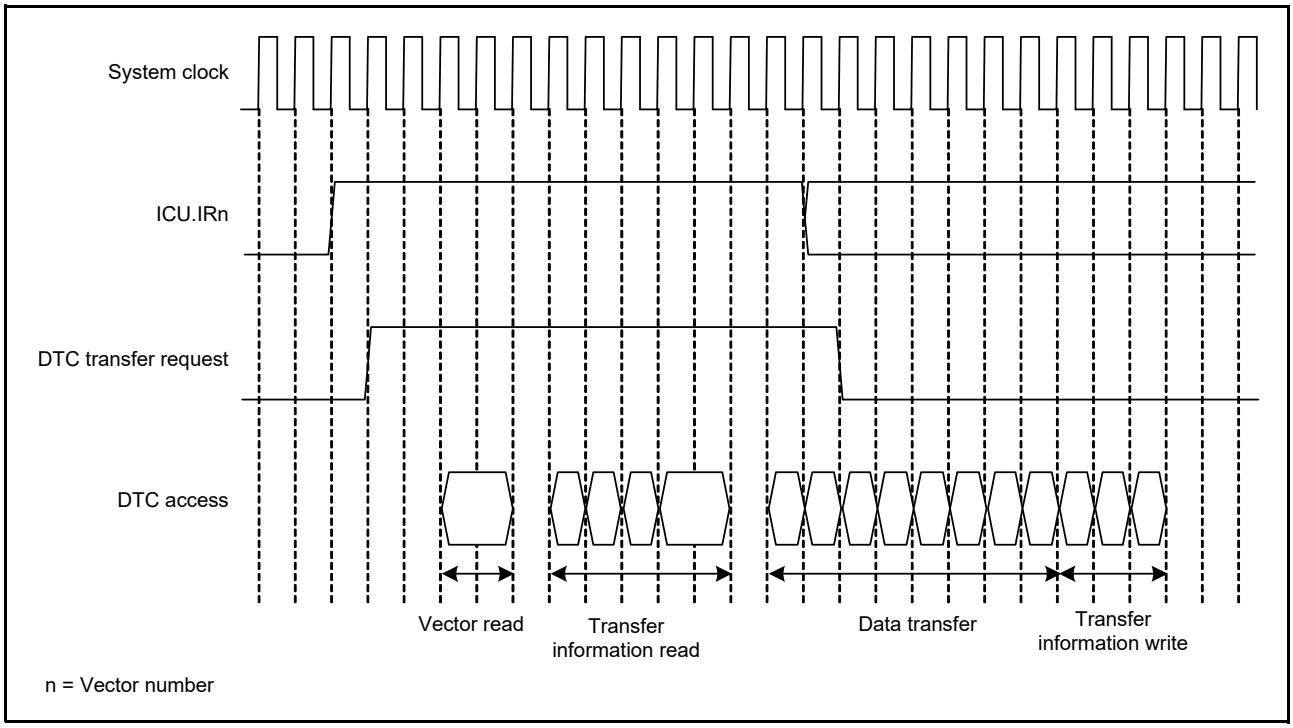

Figure 20.11 Example (2) of DTC Operation Timing (Block Transfer Mode, Block Size = 4)

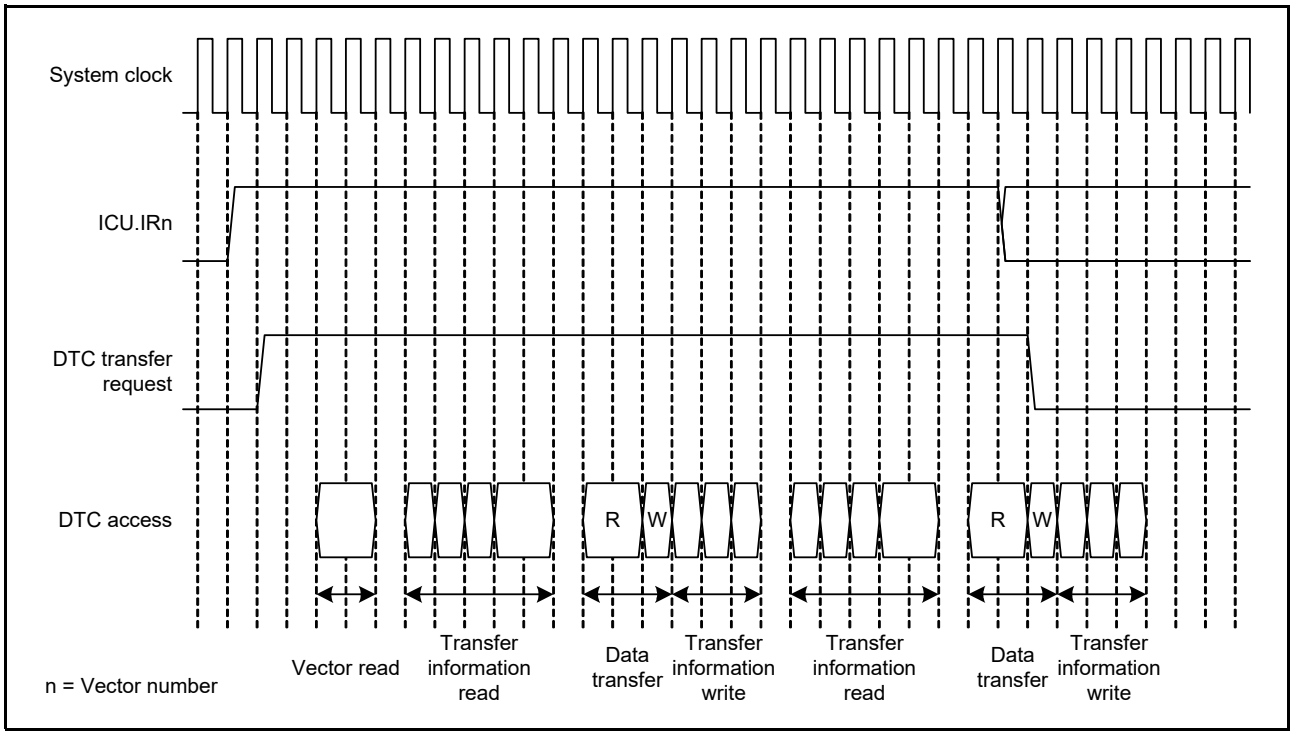

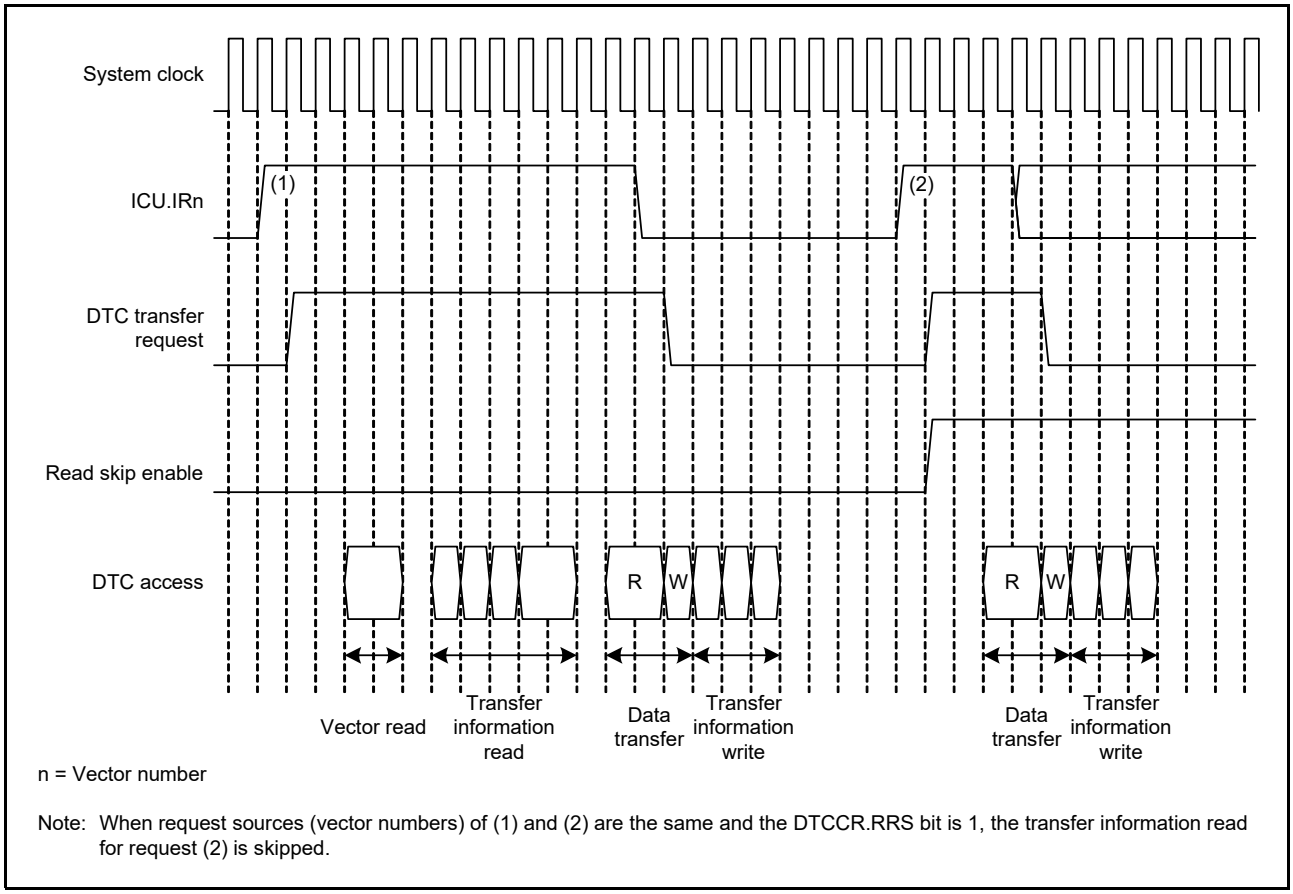

Figure 20.12 Example (3) of DTC Operation Timing (Chain Transfer)

Note: When request sources (vector numbers) of (1) and (2) are the same and the DTCCR.RRS bit is 1, the transfer information read for request (2) is skipped.

Figure 20.13 Example of Operation When Transfer Information Read Skip is Executed (Vector, Transfer Information, and Transfer Destination Data on the RAM, and Transfer Source Data on the Peripheral Module)

20.4.8 Sequence Transfer

A sequence transfer can be executed on the request source that is specified in the DTCSQE register. A sequence transfer is started by setting the MRB.INDX bit to 1 and ended by setting the MRB.SQEND bit to 1. Setting the DTCOR.SQTFRL bit to 1, even during a sequence transfer, forcibly ends the transfer and the next DTC transfer request starts new sequence transfer with reference to the index table.
A sequence transfer includes the following processing.

(1) The first data transfer is executed by referring to the DTC vector table in response to a DTC transfer request from the source specified in the DTCSQE register.
(2) The DTC index table is referred based on the value of the lower 8 bits of the first data transferred data in (1) (sequence number).
(3) The transfer information is read from the address obtained from the DTC index table.
(4) A data transfer is executed in accordance with the transfer information. On completion of the data transfer, either one of the following operations is performed by using the values of bits MRB.CHNE and MRB.SQEND.
- A chain transfer is executed when the CHNE bit is 1. The next transfer information is read. Go to (4).
- The sequence transfer is suspended when the CHNE bit is 0 and the SQEND bit is 0. Go to (5).
- The sequence transfer ends when the CHNE bit is 0 and the SQEND bit is 1.

(5) When a DTC transfer request from the source specified in the DTCSQE register is accepted, the suspended sequence transfer is resumed and the next transfer information is read. Go to (4).

Note 1. When the ICU.DTCERn.DTCE bit becomes 0 based on the result of the data transfer, a DTC transfer request is not generated. Set the DTCE bit to 1 to resume sequence transfer. Refer to Figure 20.5 or section 15, Interrupt Controller (ICUM) for the conditions where the DTCE bit becomes 0.

Figure 20.14 and Figure 20.15 shows a basic sequence transfer operation.

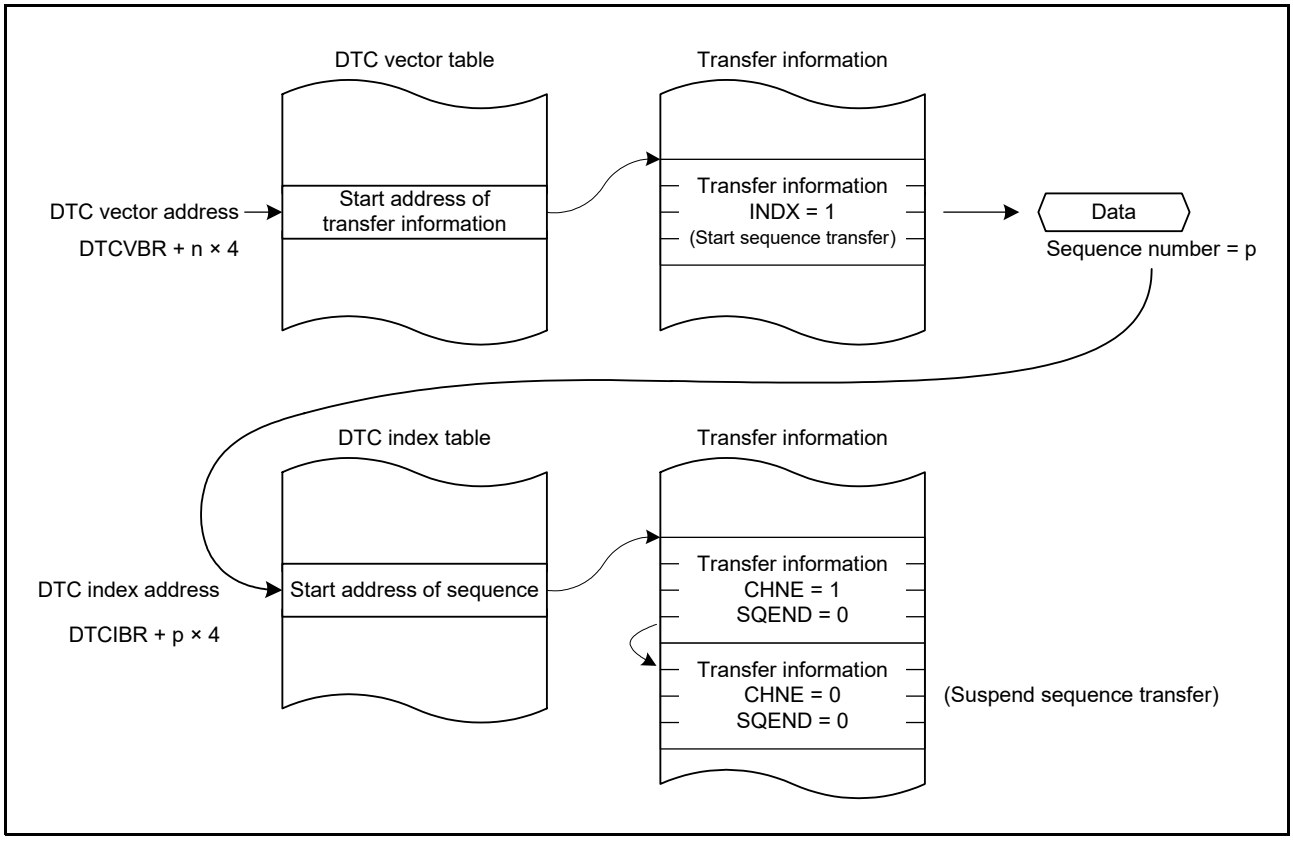

Figure 20.14 Start and Suspension of Sequence Transfer

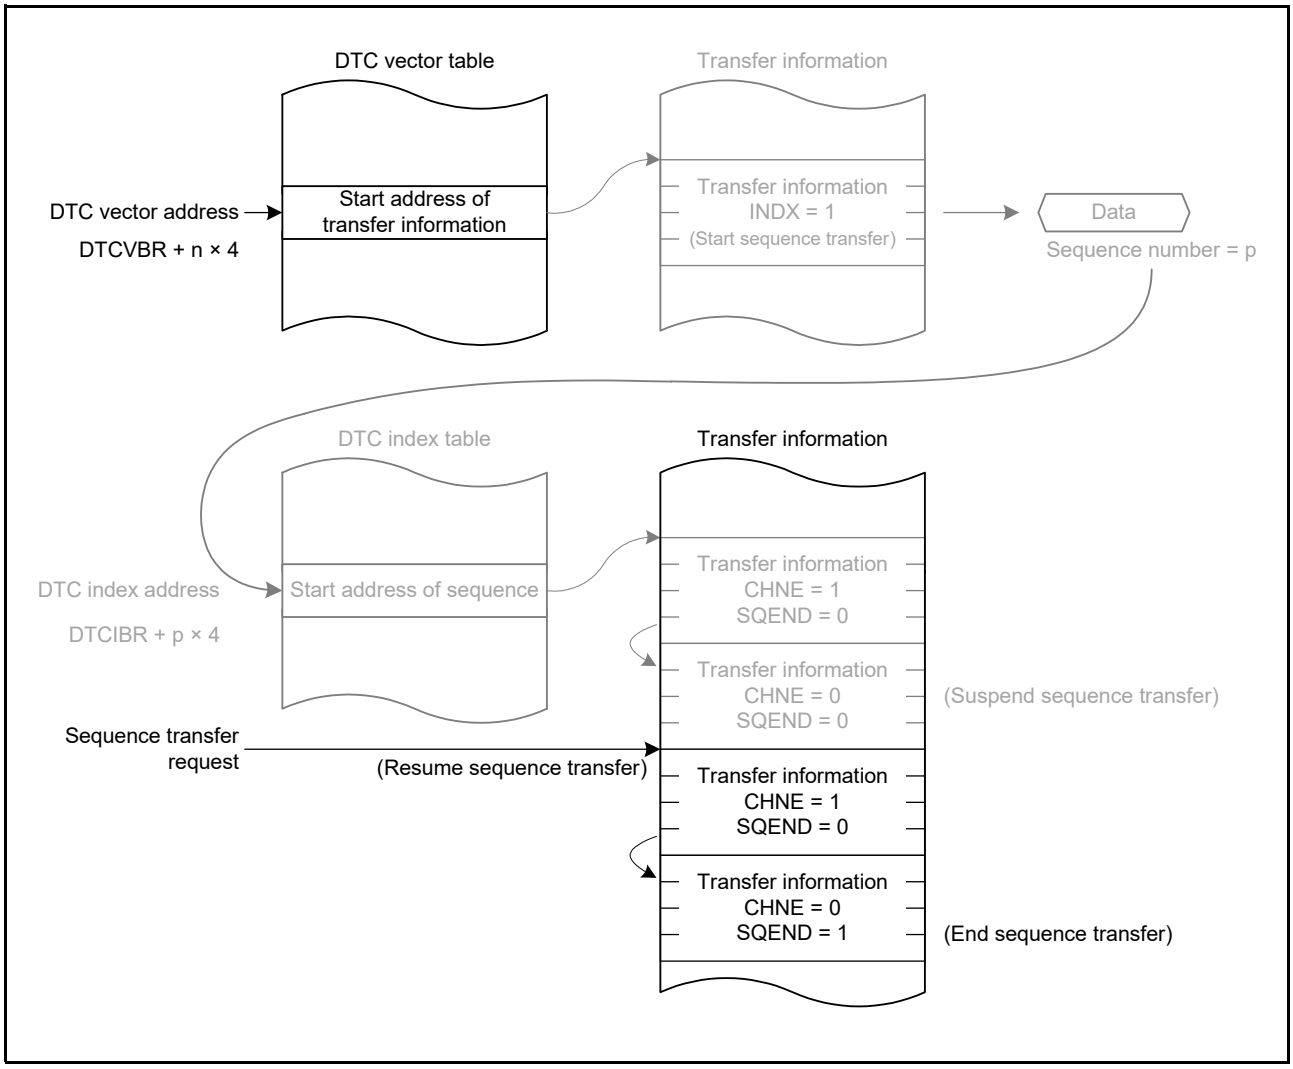

Figure 20.15 Resumption and End of Sequence Transfer

Table 20.9 lists the settings of bits CHNE, SQEND, and INDX during the sequence transfer.

Table 20.9 Sequence Transfer Process and Values of Bits CHNE, SQEND, and INDX

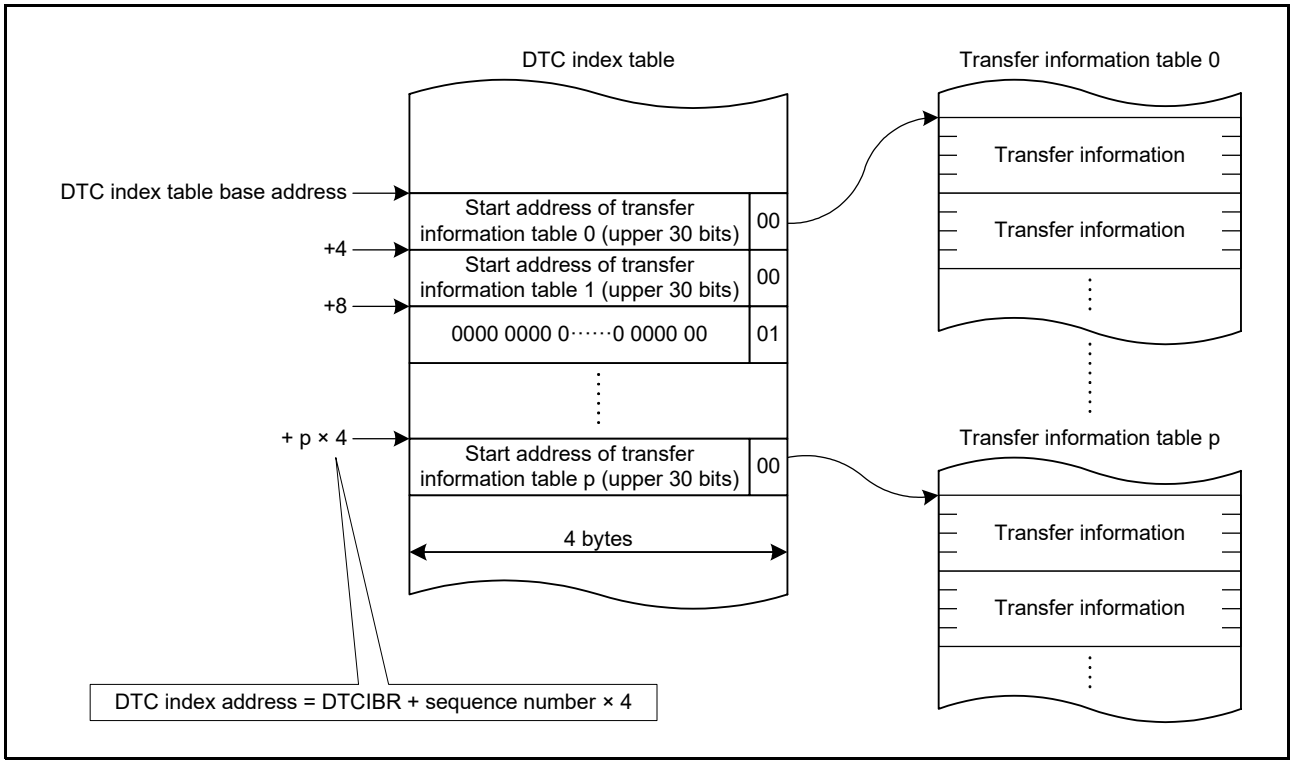
DTC Operations	CHNE Bit	SQEND Bit	INDX Bit
Start sequence transfer	0	0	1*1
Continue sequence transfer	1	0	0
Suspend sequence transfer*2	0	0	0
End sequence transfer	0	1	0
End current sequence transfer and start new sequence transfer	0	1	1*1
Some other transfer (not sequence transfer)	—	0	0

Note: Do not set the values other than listed above.
Note 1. Set MRA.MD[1:0] bits to 00b (normal transfer mode) when setting the INDX bit to 1.
Note 2. When a sequence transfer is suspended, the ICU.DTCERn.DTCE bit may become 0. Set the DTCE bit to 1 to resume sequence transfer.

Even when a sequence transfer is suspended, a new sequence transfer cannot start until the suspended sequence transfer is eventually completed. When a sequence transfer request is received during suspension of the sequence transfer, the suspended sequence transfer is resumed.

20.4.9 DTC Index Table

The DTC index table is allocated to the area where its start address is configured in the DTCIBR register.
Store the start address of transfer information table p for sequence number p in the address of DTCIBR + p × 4.
The upper 30 bits of the start address is set to the upper 30 bits of the DTC index. Set the CPUSEL bit to select either of reading the transfer information and starting the sequence, or output an interrupt request to the CPU without starting the sequence. For a complicated sequence that the DTC cannot handle, set the CPUSEL bit to 1 to allow the CPU to handle such a sequence.



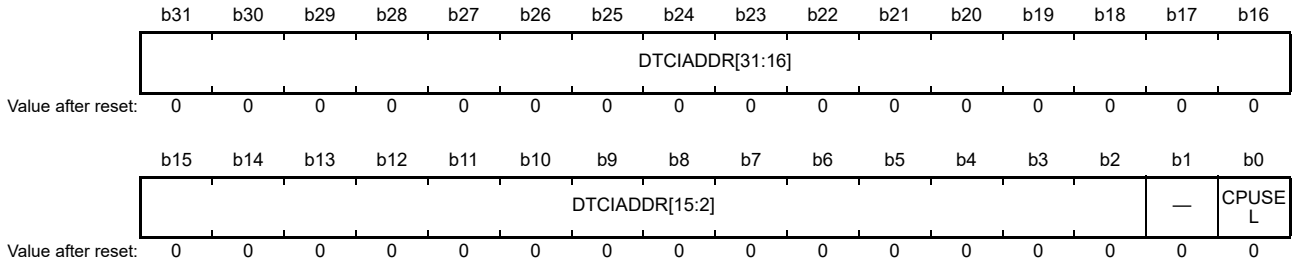


Figure 20.16 DTC Index Table

- DTC Index

Address(es): DTCIBR + p × 4

Bit	Symbol	Bit Name	Description	R/W
b0	CPUSEL	Sequence Transfer/CPU Interrupt Select	0: Continues the sequence transfer (starts the sequence) 1: Ends the sequence transfer and outputs an interrupt request to the CPU	—
b1	—	Reserved	Set this bit to 0.	—
b31 to b2	DTCIADDR[31:2]	Transfer Information Table Address	Set the upper 30 bits of the start address of the transfer information table to these bits. Writing to the upper 4 bits (b31 to b28) is ignored and the values in b31 to b28 become the same value as b27.	—

When the CPUSEL bit in the DTC index that the obtained sequence number indicates is 1, an interrupt request to the CPU is generated. At this time, the ICU.DTCERn.DTCE bit becomes 0. From this point, the interrupt request signal from the request source that is specified in the DTCSQE register is sent to the CPU, but not DTC. After completion of CPU interrupt processing, set the ICU.DTCERn.DTCE bit to 1 to enable DTC transfer request for starting the next sequence transfer.

20.4.10 Example of Sequence Transfer

Figure 20.17 shows a typical examples of a sequence transfer and Figure 20.18 to Figure 20.22 show configurations of the transfer information for the examples of the transfers in the figure.
In these examples, the interrupt source of vector number n is set as the source of the sequence transfer (DTCSQE.VECN[7:0] = n).
Once the DTC transfer request due to the interrupt source of vector number n (hereinafter referred to as “transfer request n”) is input, the DTC refers to the DTC vector table and reads the corresponding transfer information. The lower 8 bits that have been transferred based on the transfer information become a sequence number, selecting one sequence among possible 256 sequences.

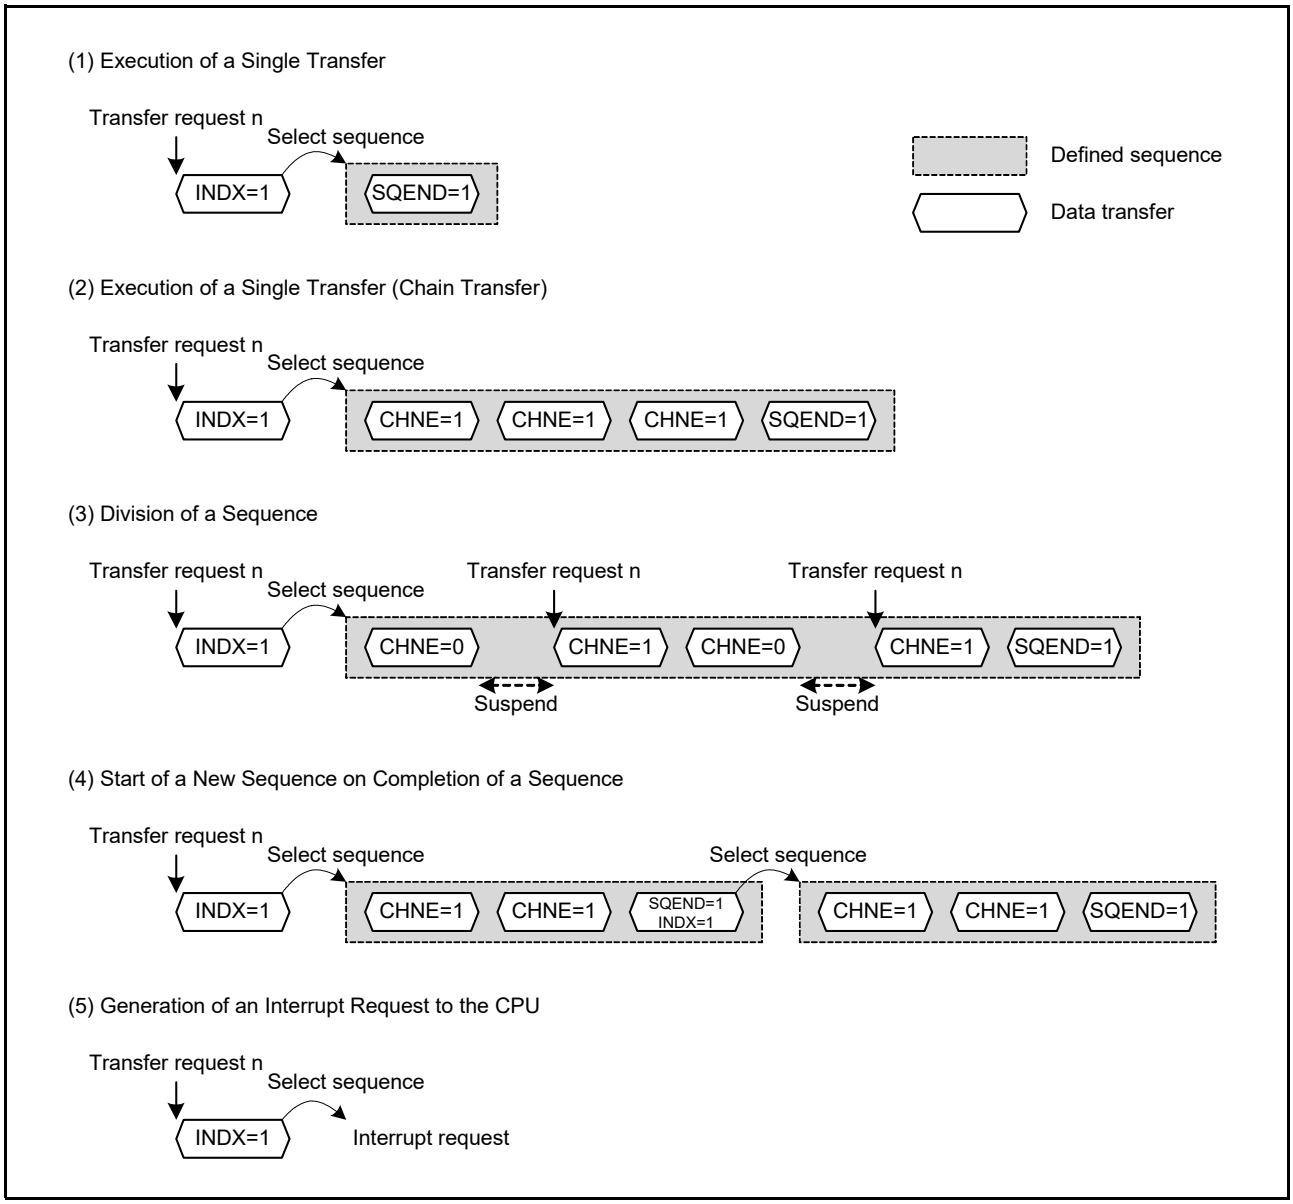

Figure 20.17 Examples of Sequence Transfers

(1) When Executing a Single Transfer

Figure 20.18 shows an example of a single transfer (normal, repeat, or block).
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number p.
Since the values of the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively, the sequence ends after the specified transfer is executed.

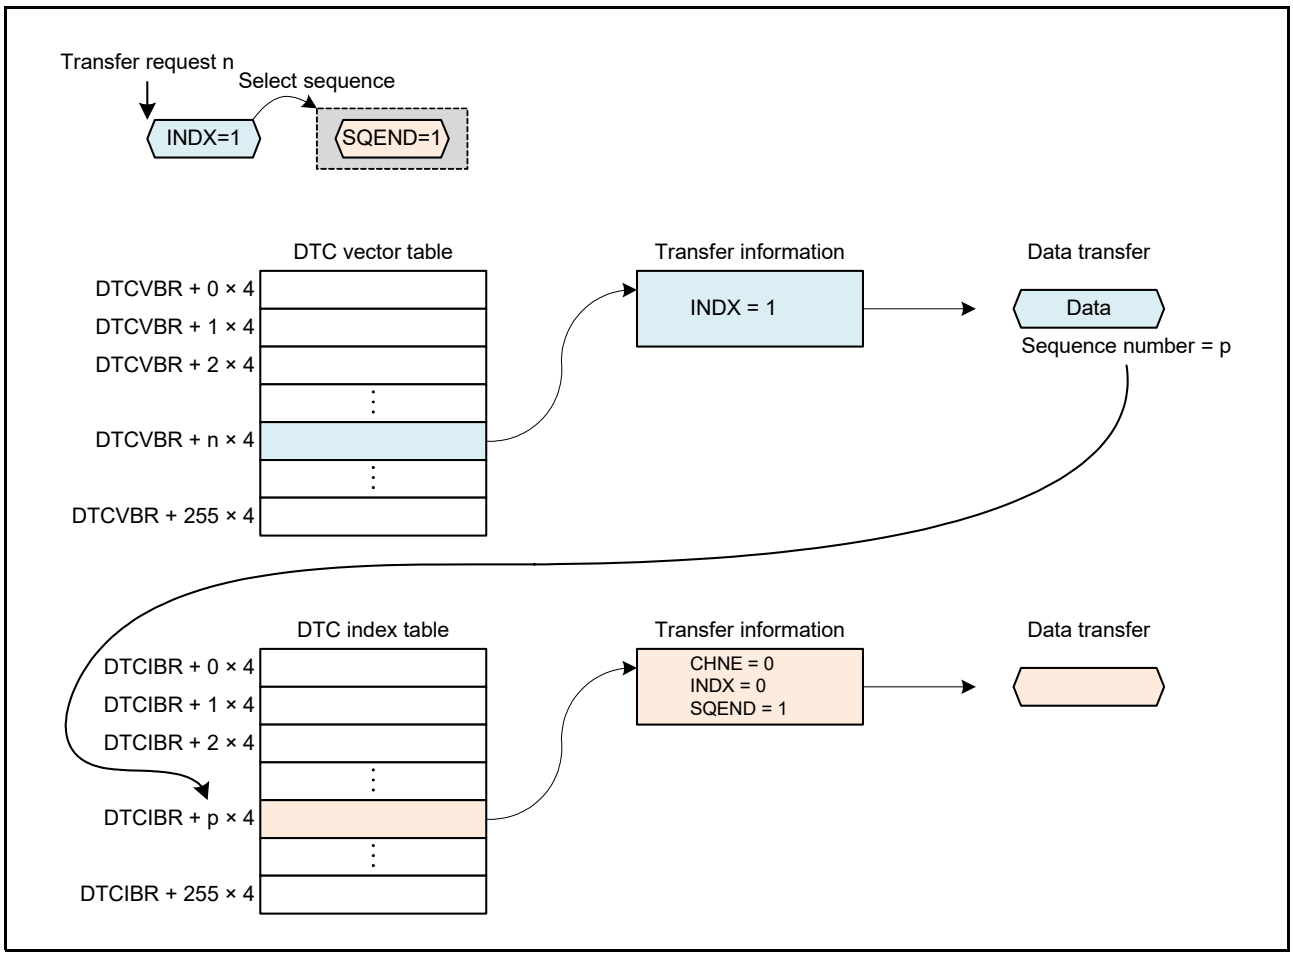

Figure 20.18 Example of a Sequence of Single Transfer

(2) When Executing a Single Chain Transfer

Figure 20.19 is an example of a sequence for a single chain transfer.
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number q.
While the values of the CHNE, INDX, and SQEND bits are 1, 0, and 0 respectively, the specified chain transfer is executed. When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively is read, the sequence ends after the specified transfer is executed.

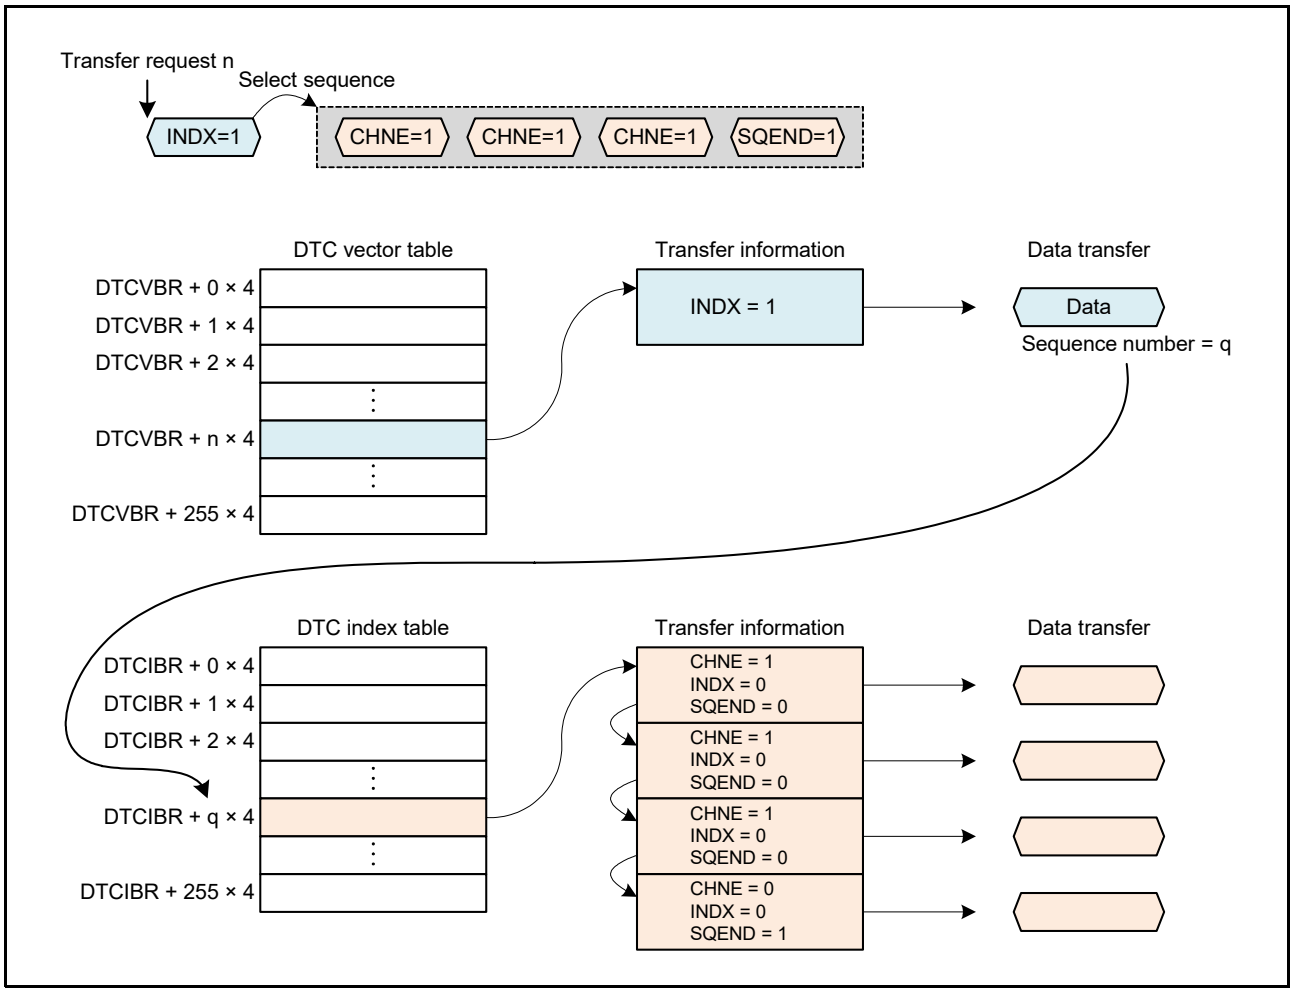

Figure 20.19 Example of Sequence of a Single Chain Transfer

(3) When Dividing a Sequence

Figure 20.20 is an example of the sequence that is divided into 3 parts.
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number r.
Since the values of the CHNE, INDX, and SQEND bits in the transfer information are 0, 0, and 0 respectively, the sequence is suspended after the specified transfer is executed and the DTC waits for the next transfer request n.
When the transfer request n is input during a sequence transfer, the DTC vector table is not referred and the suspended sequence is resumed.
When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively is read, the sequence ends after the specified transfer is executed.

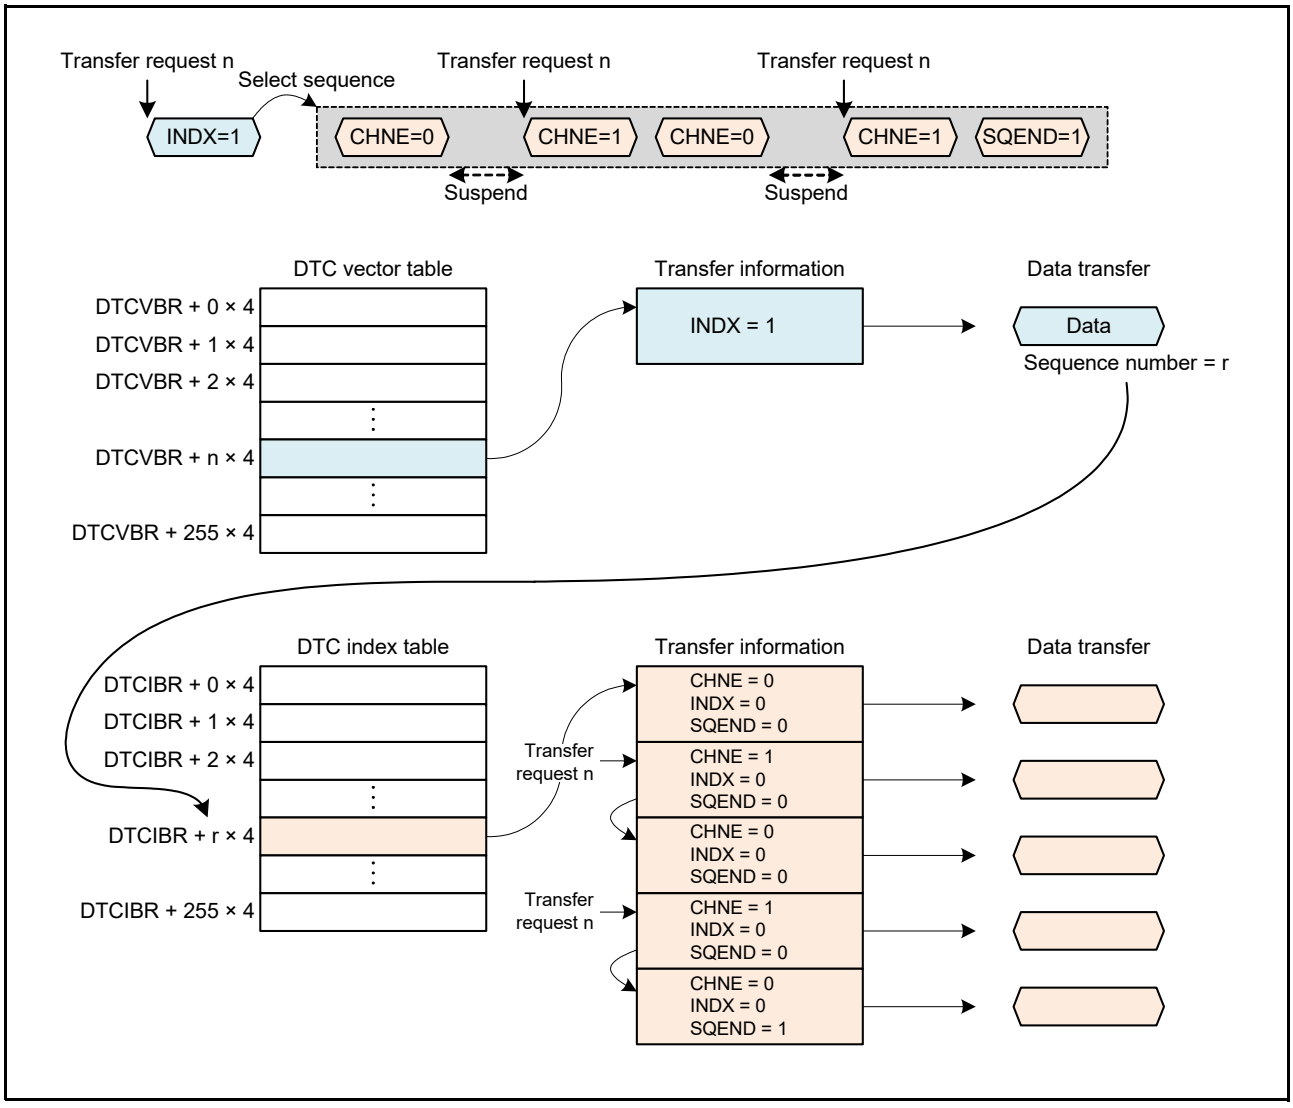

Figure 20.20 Example of Divided Sequence

(4) When Starting a New Sequence on completion of a Sequence

Figure 20.21 is an example for starting the next and new sequence on completion of the first sequence.
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number s.
When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 1, and 1 respectively is read, the specified transfer is executed, then a new sequence number is obtained from the lower 8 bits of the transferred data.
The DTC again refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number k and then starts a new sequence.
When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively is read, the sequence ends after the specified transfer is executed.

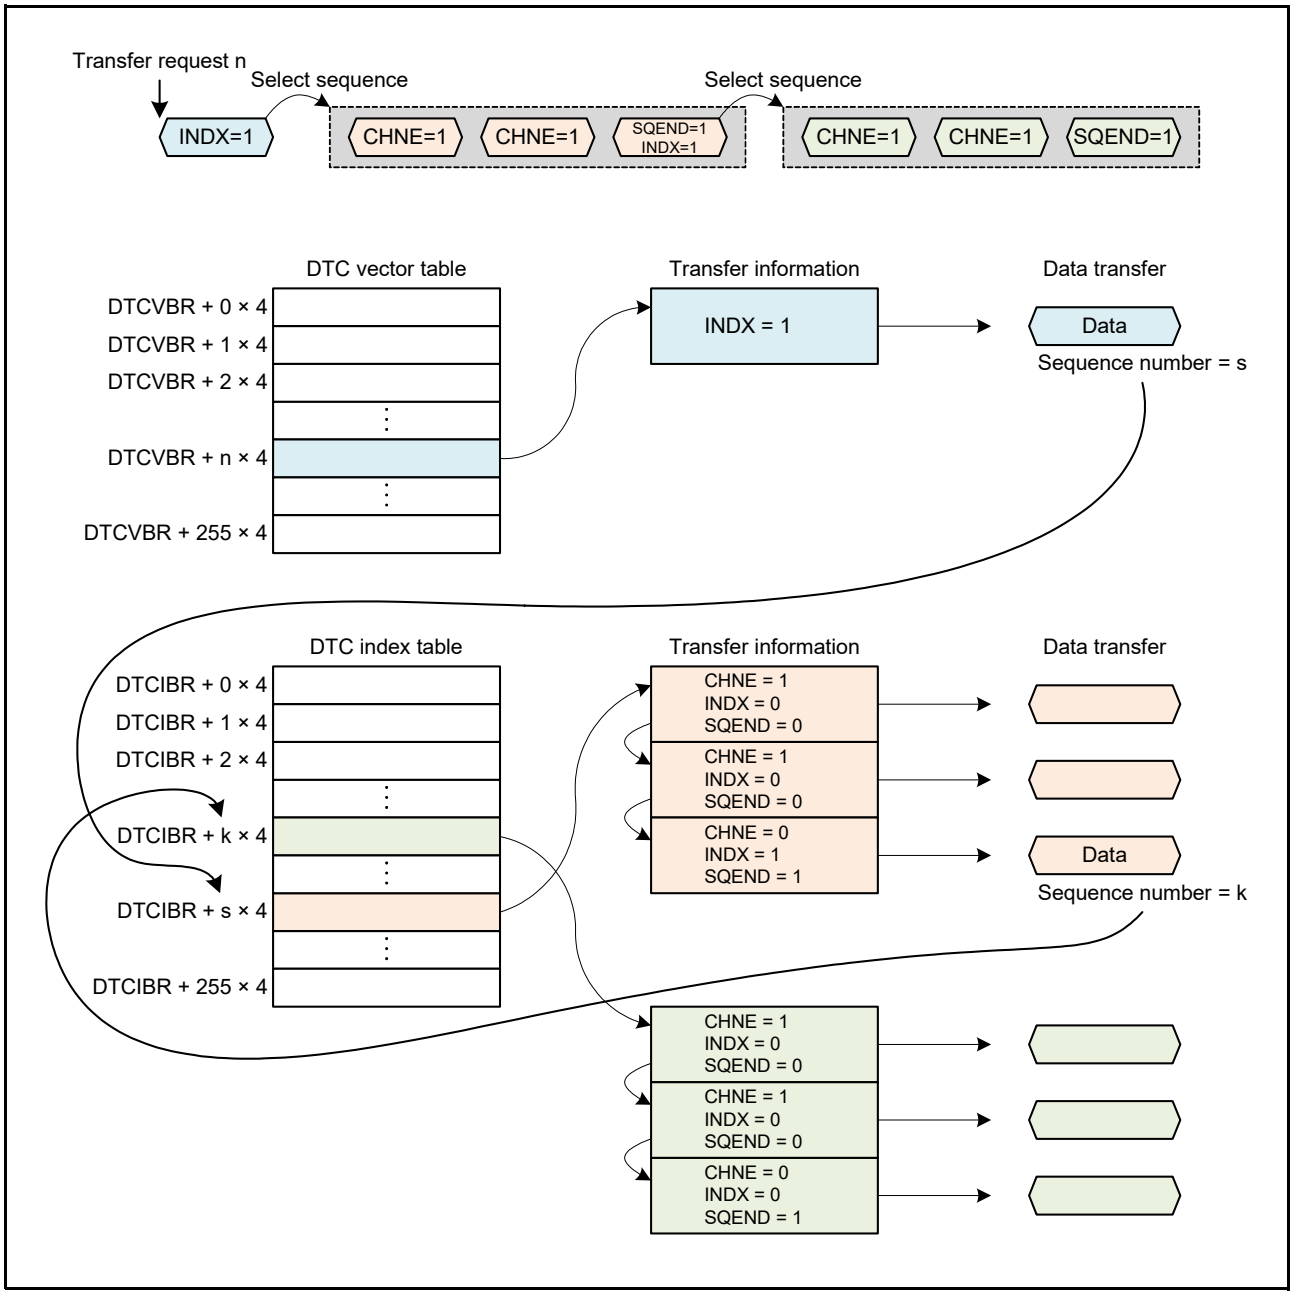

Figure 20.21 Example When Starting a New Sequence on Completion of a Sequence

(5) When Generating an Interrupt Request to the CPU

Figure 20.22 is an example of that an interrupt request is output to the CPU without starting of sequence.
The DTC obtains a DTC index that corresponds to the obtained sequence number t.
When the CPUSEL bit of the obtained DTC index is 1, the DTC ends the sequence transfer without starting the sequence, and then outputs an interrupt request to the CPU.

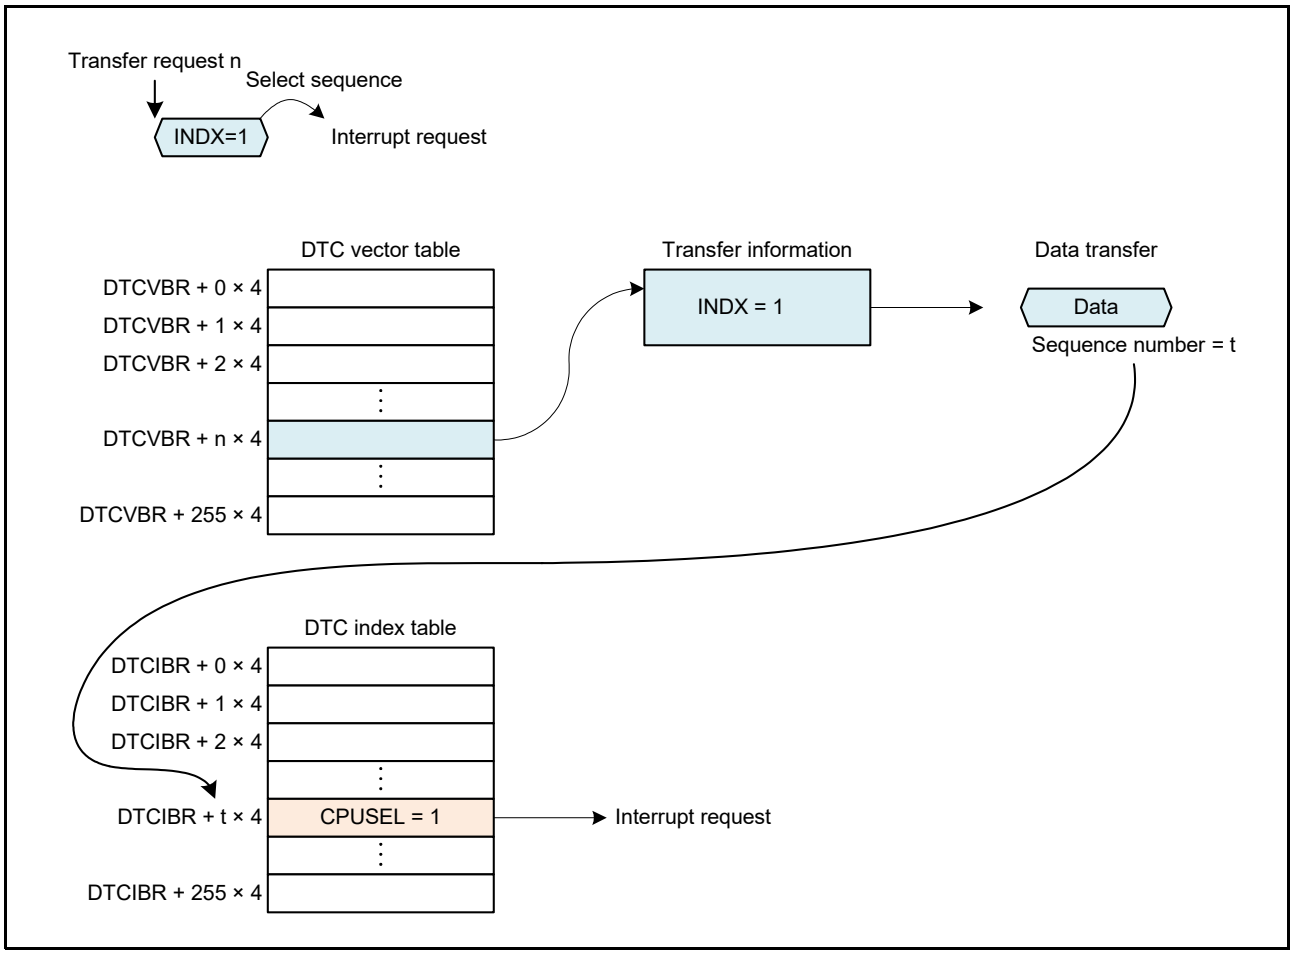

Figure 20.22 Example of Output of an Interrupt Request to the CPU

20.5 DTC Setting Procedure

Before using the DTC, set the DTC vector base register (DTCVBR). When using sequence transfer, also set the DTC index table base register (DTCIBR).

Figure 20.23 shows the procedure to set the DTC.

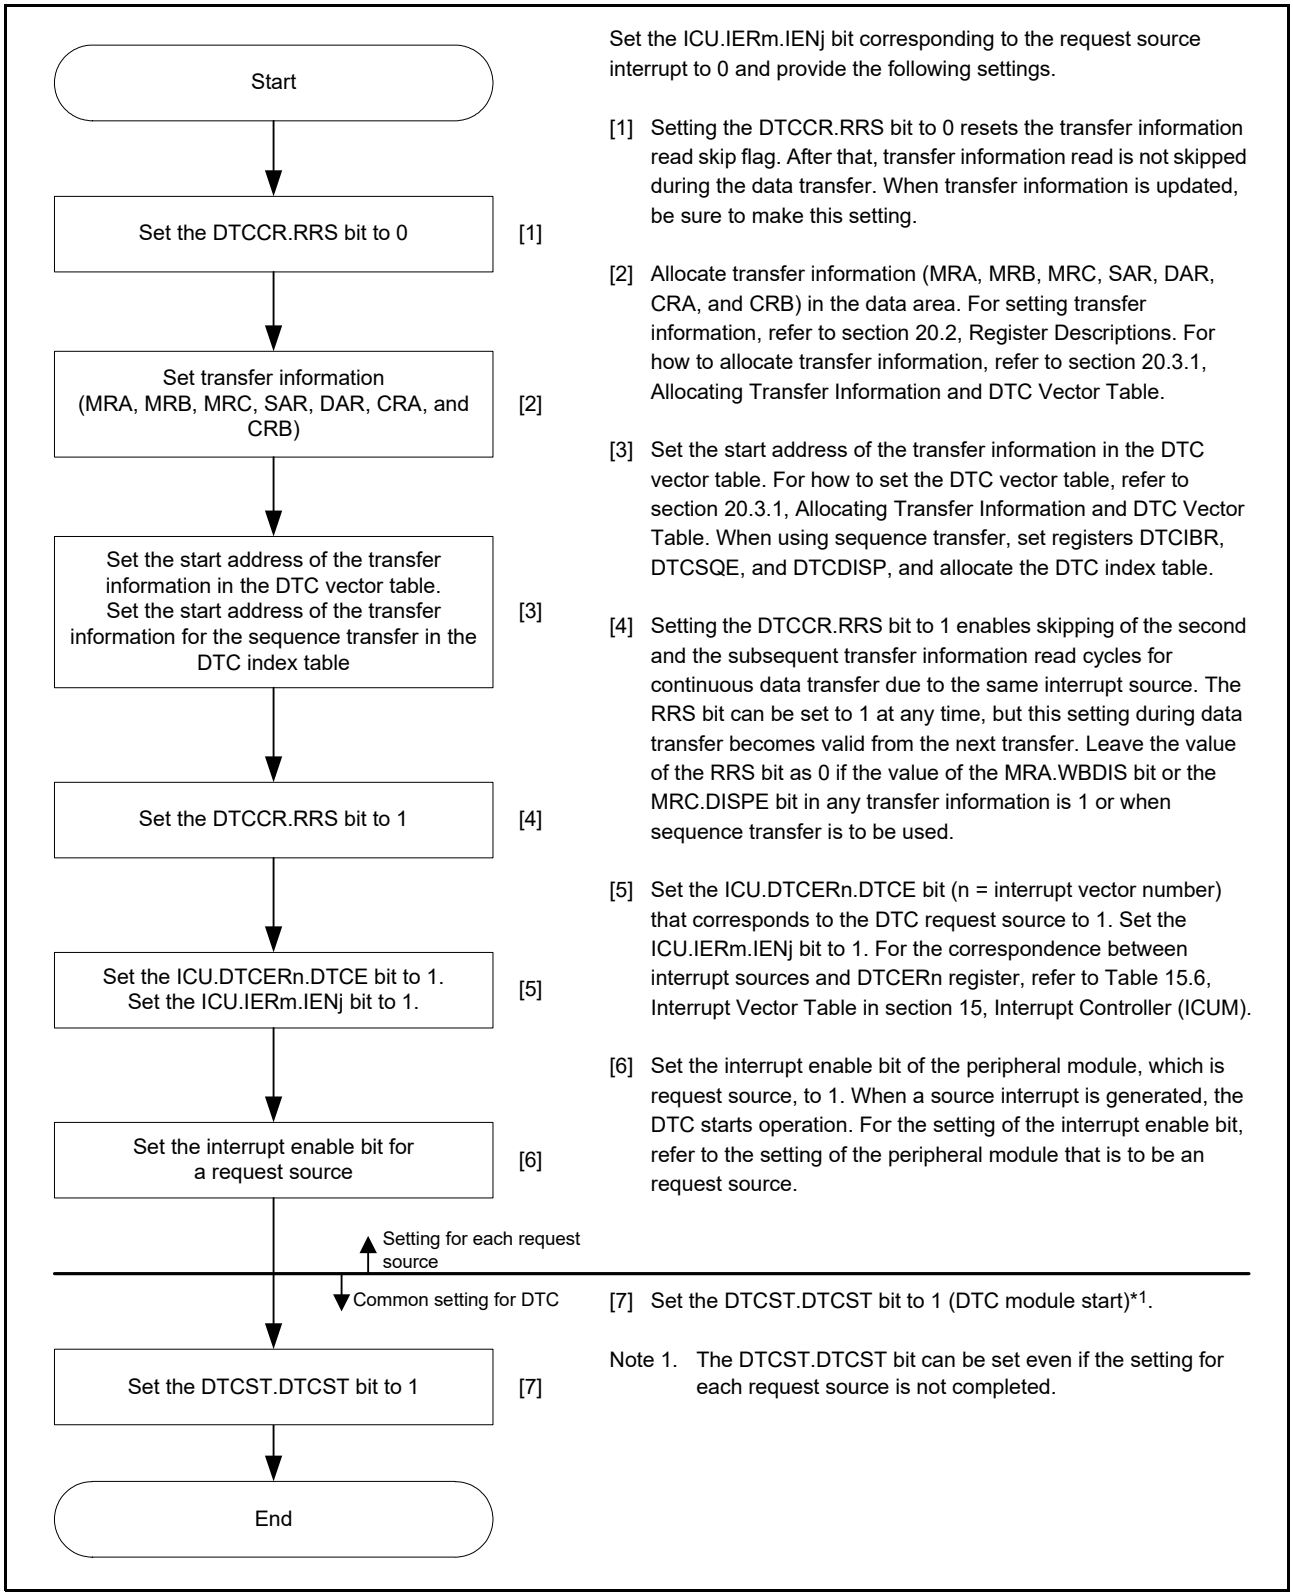

Figure 20.23 Procedure to Set the DTC

20.6 Examples of DTC Usage

20.6.1 Normal Transfer

As an example of DTC usage, its employment in the reception of 128 bytes of data by an RSCI is described below.

(1) Transfer Information Setting

Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 00b (byte transfer), and the MRA.SM[1:0] bits to 00b (source address is fixed). Set the MRB.CHNE bit to 0 (chain transfer is disabled), the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), and the MRB.DM[1:0] bits to 10b (DAR is incremented after data transfer). The MRB.DTS bit can be set to any value. Set the RDR register address of the RSCI in the SAR register, the start address of the RAM area for data storage in the DAR register, and 128 (0080h) in the CRA register. The CRB register can be set to any value.

(2) DTC Vector Table Setting

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU Setting and DTC Module Activation

Set the corresponding ICU.DTCERn.DTCE bit to 1 and the ICU.IERm.IENj bit to 1.
Set the DTCST.DTCST bit to 1.

(4) RSCI Setting

Enable the RXI interrupt by setting the SCR0.RIE bit in the RSCI to 1. If a reception error occurs during the RSCI receive operation, further reception is not performed. Accordingly, make settings so that the CPU can accept receive error interrupts.

(5) DTC Transfer

Every time the reception of 1 byte by the RSCI is completed, an RXI interrupt is generated to start the data transfer. The DTC transfers the received byte from the RDR of the RSCI to RAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt Handling

After 128 times of data transfers have been completed and the value in the CRA register becomes 0, an RXI interrupt request is output to the CPU. Complete the process in the handling routine for this interrupt.

20.6.2 Chain Transfer

As an example of chain transfer by the DTC, its employment in the output of pulses by a GPTW is described below. Chain transfer is used to transfer the compare value and period of the PWM timer and change the duty and period of the PWM timer. For the first chain transfer, specify normal transfer mode for the transfer to the GPTWn.GTCCRC register. For the second chain transfer, specify normal transfer mode for the transfer to the GPTWn.GTCCRE register. For the third chain transfer, specify normal transfer mode for the transfer to the GPTWn.GTPBR register.
An example of using the overflow interrupt of the GPTWn.GTCNT counter as a request source for the DTC is provided below.

(1) First Transfer Information Setting

Settings should be made for transfer to the GPTWn.GTCCRC register. Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 10b (longword transfer), and the MRA.SM[1:0] bits to 10b (SAR is incremented after data transfer). Set the MRB.CHNE bit to 1 (chain transfer is enabled), the MRB.CHNS bit to 0 (chain transfer is performed after each transfer), and the MRB.DM[1:0] bits to 00b (destination address is fixed). Set the SAR to the start address of the data table, the DAR register to the address of the GPTWn.GTCCRC register, and the CRA register to the size of the data table. The CRB register can be set to any value.

(2) Second Transfer Information Setting

Settings should be made for transfer to the GPTWn.GTCCRE register. Make the same settings as (1) except for setting the DAR register to the address of the GPTWn.GTCCRE register.

(3) Third Transfer Information Setting

Settings should be made for transfer to the GPTWn.GTPBR register. Make the same settings as (1) except for setting the MRB.CHNE bit to 0 (chain transfer is disabled), DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), and the DAR register to the address of the GPTWn.GTPBR register.

(4) Transfer Information Assignment

Place the second and third transfer information immediately after the first transfer information.

(5) DTC Vector Table

In the DTC vector table, set the address where the first transfer information starts.

(6) ICU Setting and DTC Module Activation

Set the ICU.DTCERn.DTCE bit corresponding to the GTCIVn interrupt and the ICU.IERm.IENj bit to 1.
Set the DTCST.DTCST bit to 1.

(7) GPTW Setting

Set the GPTWn.GTIOR register so that the output changes on a compare match with the GPTWn.GTCCRA and GTCCRB registers. Set the compare match value for the first cycle in the GTCCRA and GTCCRB registers, and the compare match value for the second cycle in the GTCCRC and GTCCRE registers. Set the period of the first cycle of the PWM waveform in the GTPR register, and the period of the second cycle in the GTPBR register. Enable the output of the GTIOCnA and GTIOCnB pins using the PijPFS registers.

(8) GPTW Activation

Set the GPTWn.GTSTR.CSTARTn bit to 1 to start counting operation of the GPTWn.GTCNT counter.

(9) DTC Transfer

Every time the GPTWn.GTCNT counter overflows, the next compare match values are transferred to the GTCCRC and GTCCRE registers, and the next period value is transferred to the GTPBR register.

(10) Interrupt Handling

When the specified number of data transfers is completed (i.e. when the value of the CRA register for third transfer becomes 0), a GTCIVn interrupt request is issued for the CPU. Complete the process in the handling routine for this interrupt.

20.6.3 Chain Transfer When the Counter is 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second data transfer. Repeating this chain transfer enables transfers to be repeated more than 256 times.
The following shows an example of configuring a 128-Kbyte input buffer to addresses 0200 0000h to 0201 FFFFh (where the input buffer is set so that its lower address starts with 0000h). Figure 20.24 shows a chain transfer when the counter is 0.

(1) Set normal transfer mode for input data for the first data transfer. Set the following:
Transfer source address: Fixed, the CRA register is 0000h (65,536 times), the MRB.CHNE bit is 1 (chain transfer is enabled), the MRB.CHNS bit is 1 (chain transfer is performed only when the transfer counter becomes 0), and the MRB.DISEL bit is 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers).
(2) Prepare the upper 16 bits (in this case, 0201h and 0200h) of the start address at every 65,536 times of the transfer destination address for the first data transfer in another area (such as ROM).
(3) For the second data transfer, set repeat transfer mode (source is repeat area) for rewriting the transfer destination address of the first data transfer. The transfer destination is the address where the upper 16 bits of the DAR register in the first transfer information is allocated. In this case, set the MRB.CHNE bit to 0 (chain transfer is disabled) and the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers). In this case, set the transfer counter to 2.
(4) When a transfer request is accepted, the first data transfer is executed. When transfer is executed 65,536 times and the transfer counter of the first data transfer becomes 0, the second data transfer is started and the upper 16 bits of the transfer destination address of the first data transfer is set to 0201h. At this time, the lower 16 bits of the transfer destination address and the transfer counter of the first data transfer have become 0000h.
(5) In succession, when another transfer request is accepted, the first data transfer is executed. When transfer is executed 65,536 times and the transfer counter of the first data transfer becomes 0, the second data transfer is started and the upper 16 bits of the transfer destination address of the first data transfer is set to 0200h. At this time, the lower 16 bits of the transfer destination address and the transfer counter of the first data transfer have become 0000h.
(6) Steps (4) and (5) above are repeated infinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

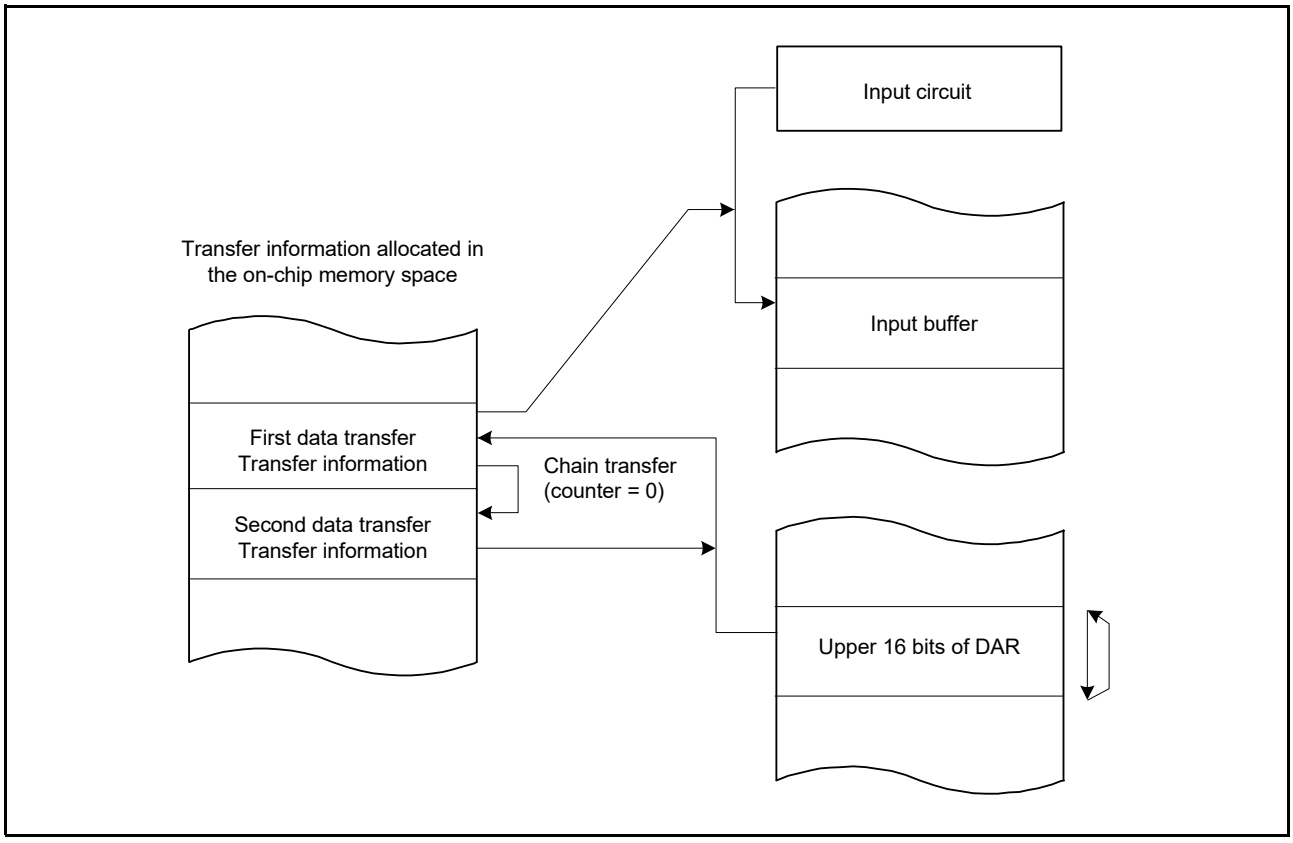

Figure 20.24 Chain Transfer When the Counter is 0

20.6.4 Sequence Transfer

The following is an example of using the RSCI receive interrupt as a request source of sequence transfer.

(1) Transfer Information Settings

Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 00b (byte transfer), and the MRA.SM[1:0] bits to 00b (source address is fixed). Set the MRB.CHNE bit to 0 (chain transfer is disabled), the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), the MRB.DM[1:0] bits to 10b (DAR is incremented after data transfer), the MRB.INDX bit to 1 (start sequence transfer), and the MRB.SQEND bit to 0 (continue the sequence transfer). The MRB.DTS bit can be set to any value. Set the address of the RSCIk.RDR register in the SAR register and set the start address of the RAM area which stores the data in the DAR register.
When the MRA.WBDIS bit is set to 1 (Does not write back the transfer information), the values of registers CRA and CRB are ignored.

(2) DTC Vector Table Setting

Set the start address of the transfer information for the corresponding receive data full interrupt (RXI) in the DTC vector table.

(3) DTC Index Table Setting

Set the start address of the transfer information for each sequence in the DTC index table.

(4) ICU Setting and DTC Module Activation

Set the corresponding ICU.DTCERn.DTCE bit to 1 and the ICU.IERm.IENj bit to 1. Set the DTCST.DTCST bit to 1.

(5) RSCI Setting

Set the RSCIk.SCR0.RIE bit to 1 to enable the RXI interrupt. If a reception error occurs during the RSCI receive operation, subsequent receptions are not performed. Accordingly, make settings so that the CPU can accept receive error interrupts.

(6) Start of the Sequence Transfer

On completion of reception of 1-byte data by the RSCI, an RXI interrupt is generated to start the DTC. The DTC transfers the received data from the RSCIk.RDR register to the RAM. The DTC looks up the DTC index table by using the value from the received data (sequence number) and continues to transfer data corresponding to the that number. When the CPUSEL bit in the DTC index is 1, the DTC does not read the transfer information and sets the ICU.DTCERn.DTCE bit to 0. Then the DTC outputs an interrupt request to the CPU and ends the sequence transfer.

(7) During Suspension of the Sequence Transfer

Set the ICU.DTCERn.DTCE bit to 1 if the bit is 0. The DTC continues to transfer the data for every generation of the DTC transfer request in response to the corresponding RXI interrupt.

(8) End of the Sequence Transfer

Set the MRB.SQEND bit in the last transfer information of the sequence transfer to 1. After execution of this data transfer, the DTC ends the sequence transfer. The DTC starts to refer to the DTC vector table when a DTC transfer request is generated due to the next corresponding RXI interrupt.

20.7 Interrupt Source

When the DTC has finished data transfer of specified count or when data transfer with the MRB.DISEL bit set to 1 (an interrupt request to the CPU is generated each time the data transfer is performed) has been completed, an interrupt to the CPU is generated by the DTC trigger source. Such interrupts to the CPU are controlled according to the PSW.I bit (interrupt enable) of the CPU, the PSW.IPL[4:0] bits (processor interrupt priority level), and the priority level of the interrupt controller.

20.8 Event Link

The DTC outputs an event signal on completing data transfer in response to one request.

20.9 Low Power Consumption Function

Before making a transition to the module stop state, software standby mode, or deep software standby mode, set the DTCST.DTCST bit to 0 (DTC module stop), and then perform the following.

(1) Module Stop Function

Writing 1 (transition to the module-stop state is made) to the MSTPCRA.MSTPA22 bit enables the module stop function of the DTC. If data transfer is in progress at the time 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module stop state proceeds after data transfer has ended. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited.
Writing 0 (release from the module-stop state) to the MSTPCRA.MSTPA22 bit releases the DTC from the module stop state.

(2) Software Standby and Deep Software Standby Modes

Make settings according to the procedure under section 11.6.2.1, Transitioning to Software Standby Mode or section 11.6.3.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption.
If any data transfer is in progress at the time the WAIT instruction is executed, the transition to software standby mode or deep software standby mode follows the completion of the data transfer.

(3) Notes on Low Power Consumption Function

For the WAIT instruction and the register setting procedure, refer to section 11.8.6, Timing of the WAIT Instruction in section 11, Low Power Consumption.
To perform data transfer after returning from a low power consumption mode, set the DTCST.DTCST bit to 1 again.
To use a request that is generated in software standby mode as an interrupt request to the CPU but not as a DTC transfer request, specify the CPU as the interrupt request destination according to the description in section 15.7.3.1, Interrupt Request Destination Setting Procedure in section 15, Interrupt Controller (ICUM), and then execute the WAIT instruction.

20.10 Usage Notes

20.10.1 Start Address of Transfer Information

Set multiples of 16 for the start addresses of the transfer information to be specified in the DTC vector table.

20.10.2 Allocating Transfer Information

Allocate transfer information in the memory area according to the endian of the area as shown in Figure 20.25. For example, when writing CRA and CRB settings in 16-bit units in big endian, write the CRA setting to the address plus Ch and the CRB setting to the address plus Eh. In little endian, write the CRB setting to the address plus Ch and the CRA setting to the address plus Eh. When writing CRA and CRB settings in 32-bit units, allocate the CRA setting at the MSB side of the 32 bits and the CRB setting at the LSB side, and write the settings to the address plus Ch, regardless of endian.

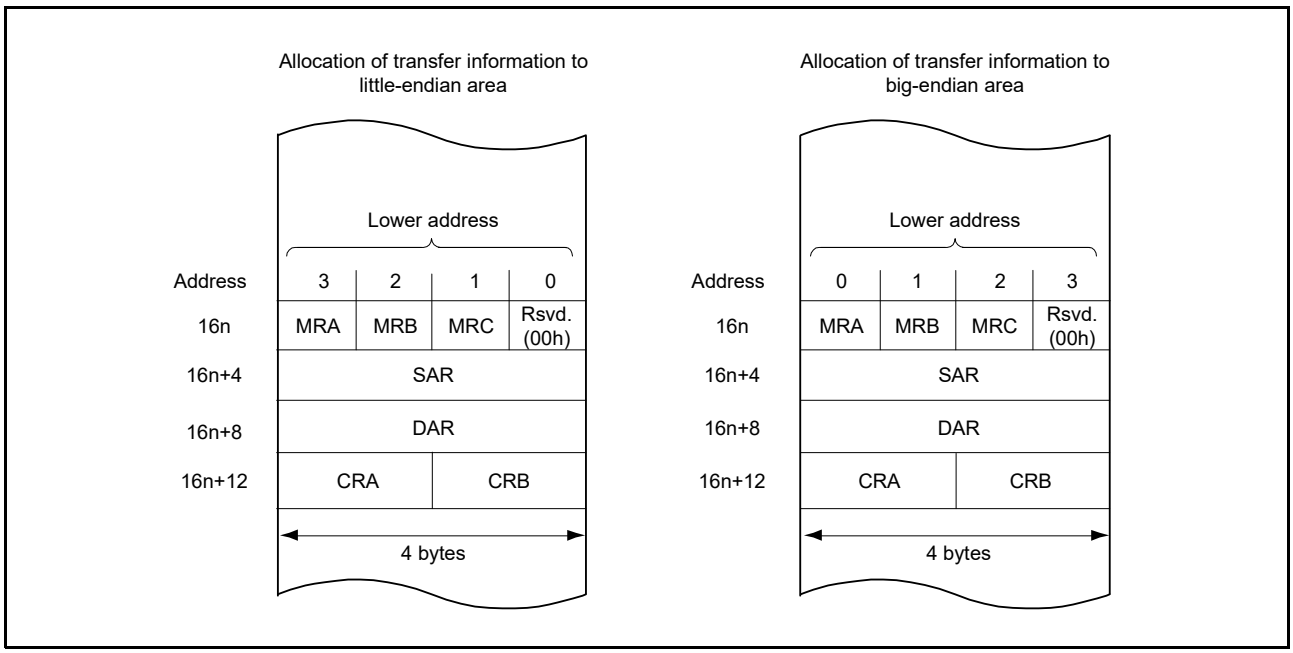

Figure 20.25 Allocation of Transfer Information

20.10.3 Setting the DTC Transfer Request Enable Register in the Interrupt Controller (ICU.DTCERn)

The DMA request should not be issued by setting the DMAC trigger select register (ICU.DMRSRm (m = DMAC channel number)) to the same vector number that has been specified by setting the ICU.DTCERn.DTCE bit to 1 (the corresponding interrupt source is selected as the DTC trigger). For details on the ICU.DTCERn and ICU.DMRSRm registers (m = DMAC channel number), refer to section 15, Interrupt Controller (ICUM).

20.10.4 Notes on Using the Sequence Transfer

When sequence transfer is to be used, make sure that the DTCCR.RRS bit is 0 (transfer information read is not skipped). In addition, set the MRB.CHNE bit to 0 (chain transfer is disabled) when setting the MRB.INDX bit to 1 (start sequence transfer and refer the index table) or the MRB.SQEND bit to 1 (end the sequence transfer).

21. Event Link Controller (ELC)

21.1 Overview

The event link controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals, and interconnects (links) peripheral modules. As a result, peripheral modules can directly perform interlinked operation among them without using software.
Event signals can be output regardless of the settings of the corresponding interrupt request enable bits.

Table 21.1 lists the specifications of the ELC, and Figure 21.1 shows a block diagram of the ELC.

Table 21.1 ELC Specifications

Item	Description
Event link function	• 381 types of event signals can be directly interconnected to modules. • Operation for timer modules when inputting an event signal can be selected.
Low power consumption function	Module stop state can be set.
Protect Zone filter	Security attribute can be set for each register.

b27	ELSR91	ELSR91 Security Attribution		R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is used to set the security attributes for the ELSR64 to ELSR78, and ELSR88 to ELSR91 registers.

21.2.5 Event Link Control Register (ELCR)

Address(es): ELC.ELCR 8780 1000h, ELC_NS.ELCR 0780 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	ELCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	ELCON	All Event Link Enable	0: ELC function is disabled. 1: ELC function is enabled.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELCR register controls operation of the ELC.

21.2.6 Software Event Generation Register m (ELSEGRm) (m = 0 to 3)

Address(es): ELC.ELSEGR0 8780 1004h, ELC.ELSEGR1 8780 1008h, ELC.ELSEGR2 8780 100Ch, ELC.ELSEGR3 8780 1010h, ELC_NS.ELSEGR0 0780 1004h, ELC_NS.ELSEGR1 0780 1008h, ELC_NS.ELSEGR2 0780 100Ch, ELC_NS.ELSEGR3 0780 1010h

	b7	b6	b5	b4	b3	b2	b1	b0
	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SEG	Software Event Generation	Writing 1 to this bit generates a software event. This bit is read as 0.	W
b5 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	WE	SEG Bit Write Enable	0: Write to SEG bit is disabled. 1: Write to SEG bit is enabled.	R/W
b7	WI	ELSEGR Register Write Disable	0: Write to ELSEGR register is enabled. 1: Write to ELSEGR register is disabled.	W*1

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. The written value is not retained. The read value is always 1.

These registers are used to generate software events 0 to 3, which are respectively assigned to event numbers 050h to 053h.

SEG Bit (Software Event Generation)

When 1 is written to this bit after setting the WE bit to 1, a software event is generated.

WE Bit (SEG Bit Write Enable)

This bit controls writing to the SEG bit. Set this bit to 1 before writing to the SEG bit.

WI Bit (ELSEGR Register Write Disable)

This bit controls writing to this register. Writing to this register is possible only when this register is written in 8-bit units with this bit set to 0.

21.2.7 Event Link Setting Register n (ELSRn) (n = 0 to 26, 46, 47, 50 to 78, 88 to 91)

Address(es): ELC.ELSR0 8780 1100h, ELC.ELSR1 8780 1104h, ELC.ELSR2 8780 1108h, ELC.ELSR3 8780 110Ch, ELC.ELSR4 8780 1110h, ELC.ELSR5 8780 1114h, ELC.ELSR6 8780 1118h, ELC.ELSR7 8780 111Ch, ELC.ELSR8 8780 1120h, ELC.ELSR9 8780 1124h, ELC.ELSR10 8780 1128h, ELC.ELSR11 8780 112Ch, ELC.ELSR12 8780 1130h, ELC.ELSR13 8780 1134h, ELC.ELSR14 8780 1138h, ELC.ELSR15 8780 113Ch, ELC.ELSR16 8780 1140h, ELC.ELSR17 8780 1144h, ELC.ELSR18 8780 1148h, ELC.ELSR19 8780 114Ch, ELC.ELSR20 8780 1150h, ELC.ELSR21 8780 1154h, ELC.ELSR22 8780 1158h, ELC.ELSR23 8780 115Ch, ELC.ELSR24 8780 1160h, ELC.ELSR25 8780 1164h, ELC.ELSR26 8780 1168h, ELC.ELSR46 8780 11B8h, ELC.ELSR47 8780 11BCh, ELC.ELSR50 8780 11C8h, ELC.ELSR51 8780 11CCh, ELC.ELSR52 8780 11D0h, ELC.ELSR53 8780 11D4h, ELC.ELSR54 8780 11D8h, ELC.ELSR55 8780 11DCh, ELC.ELSR56 8780 11E0h, ELC.ELSR57 8780 11E4h, ELC.ELSR58 8780 11E8h, ELC.ELSR59 8780 11ECh, ELC.ELSR60 8780 11F0h, ELC.ELSR61 8780 11F4h, ELC.ELSR62 8780 11F8h, ELC.ELSR63 8780 11FCh, ELC.ELSR64 8780 1200h, ELC.ELSR65 8780 1204h, ELC.ELSR66 8780 1208h, ELC.ELSR67 8780 120Ch, ELC.ELSR68 8780 1210h, ELC.ELSR69 8780 1214h, ELC.ELSR70 8780 1218h, ELC.ELSR71 8780 121Ch, ELC.ELSR72 8780 1220h, ELC.ELSR73 8780 1224h, ELC.ELSR74 8780 1228h, ELC.ELSR75 8780 122Ch, ELC.ELSR76 8780 1230h, ELC.ELSR77 8780 1234h, ELC.ELSR78 8780 1238h, ELC.ELSR88 8780 1260h, ELC.ELSR89 8780 1264h, ELC.ELSR90 8780 1268h, ELC.ELSR91 8780 126Ch,

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	ELS[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	ELS[9:0]	Event Link Select	000h: Event signal output to the corresponding peripheral module is disabled. 021h to 33Bh: Set the number for the event signal to be linked. Settings other than above are prohibited.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, the behavior changes depending on the trusted event route setting.
When the trusted event route is disabled, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.
When the trusted event route is enabled, it can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

The ELSRn register specifies an event signal to be linked to for each peripheral module. Table 21.2 shows the correspondence between the ELSRn register and the peripheral modules. Table 21.3 shows the correspondence between values set in the ELSRn register and event signals.

21.2.8 Event Link Option Setting Register A (ELOPA)

Address(es): ELC.ELOPA 8780 1090h, ELC_NS.ELOPA 0780 1090h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMT1MD[1:0]		—	—
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b3, b2	CMT1MD[1:0]	CMT1 Operation Select	b3 b2 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPA register specifies the operations of CMT1 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.2.9 Event Link Option Setting Register B (ELOPB)

Address(es): ELC.ELOPB 8780 1094h, ELC_NS.ELOPB 0780 1094h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CMTW0MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CMTW0MD[1:0]	CMTW0 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b2	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPB register specifies the operation of CMTW0 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.2.10 Event Link Option Setting Register C (ELOPC)

Address(es): ELC.ELOPC 8780 1098h, ELC_NS.ELOPC 0780 1098h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	TMR1MD[1:0]		TMR0MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TMR0MD[1:0]	TMR0 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b3, b2	TMR1MD[1:0]	TMR1 Operation Select	b3 b2 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPC register specifies the operations of TMR0 and TMR1 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.2.11 Event Link Option Setting Register D (ELOPD)

Address(es): ELC.ELOPD 8780 109Ch, ELC_NS.ELOPD 0780 109Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	TMR3MD[1:0]		TMR2MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TMR2MD[1:0]	TMR2 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b3, b2	TMR3MD[1:0]	TMR3 Operation Select	b3 b2 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPD register specifies the operations of TMR2 and TMR3 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.3 Operation

21.3.1 Relation between Interrupt Handling and Event Linking

The peripheral modules incorporated in the MCU are provided with the interrupt request status flags and the interrupt enable bits to enable/disable these interrupt requests. When an interrupt request is generated in a peripheral module, the corresponding interrupt request status flag becomes 1. If the corresponding interrupt request is enabled then, the interrupt is requested to the CPU.

In contrast, the event link controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals, interconnects (links) peripheral modules, and then, makes peripheral modules perform direct interlinked operation among them without using software. Event signals can be output regardless of the setting of the corresponding interrupt enable bit.

Figure 21.2 shows the relation between the interrupt handling and ELC.

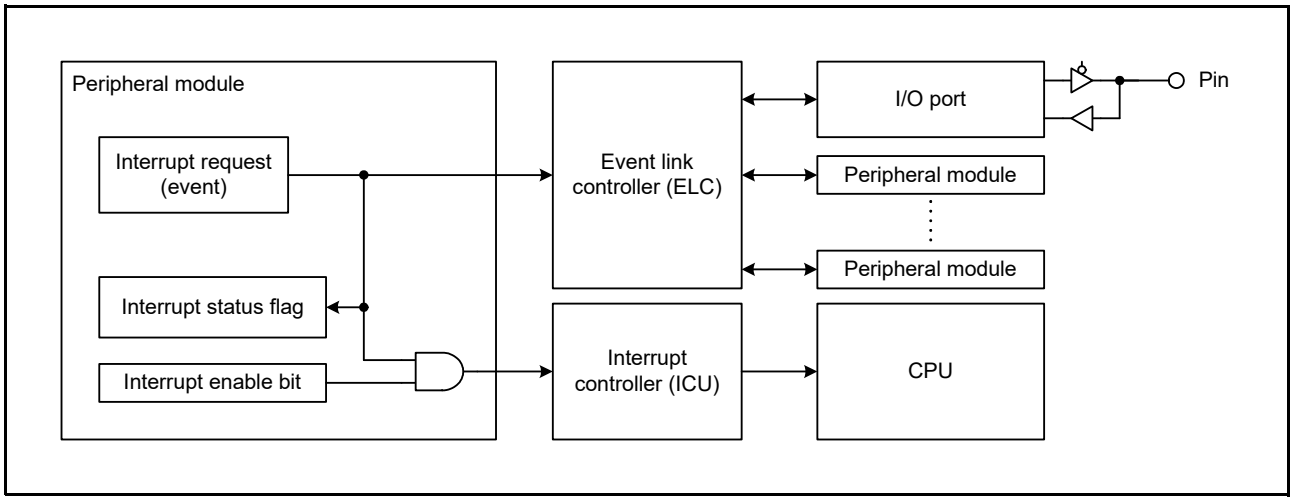

Figure 21.2 Relation between Interrupt Handling and ELC

21.3.2 Event Linkage

When events are specified in the ELSRn registers, the corresponding peripheral modules can be operated at generation of the specified events. A single peripheral module can link only with a single event. Set the ELSRn register after completing the initialization of the peripheral module to operate by an event. Table 21.4 lists the operations of peripheral modules when an event signal is input.

Table 21.4 Operations of Peripheral Modules When Event Signal is Input

Peripheral Module	Operations When Event Signal is Input
CMT CMTW TMR	The following operations can be selected by setting the ELOPA to ELOPD registers: • Starts counting when an event signal is input. • Restarts counting when an event signal is input. • Counts the input events.
GPTW	The following operations can be selected by setting registers in GPTW: • Starts counting when an event signal is input. • Stops counting when an event signal is input. • Clears counter when an event signal is input. • Switches the direction of counting when an event signal is input. • Increments counter when an event signal is input. • Decrements counter when an event signal is input. • Performs input-capture operation when an event signal is input.
RI3C	Captures the T_C1 counter when an event signal is input.
GPTP	Generates the media clock capture event when an event signal is input.
ESC	Generates the LATCH event when an event signal is input.
DSMIF	• Captures the current data when an event signal is input. • The frequency division counter for decimation is initialized when an event signal is input.
PCIF	The following operations can be selected by setting registers in PCIF: • Event input signal for carrier period • Clears the internal counter when an event signal is input. • Z-phase output signal is generated when an event signal is input.
A/D converter	Starts A/D conversion when an event signal is input.
D/A converter	Starts D/A conversion when an event signal is input.
I/O ports	• Changes the signal levels of the output pins according to the settings of the PORTx.EORR and PORTx.EOSR registers. • Latches the signal levels of the input pins into the PORTx.EIDR register. • Ports B to E can be controlled by the ELC.
Interrupt controller	Request an interrupt to the CPU, starts DMA transfer, or starts DTC transfer when an event signal is input.

21.3.3 Operation of Peripheral Timer Modules When Event Signal is Input

For the timer modules except GPTW, set the ELOPA to ELOPD register to specify the operation for when an event signal is input.

(1) Count Start Operation

When an event signal is input, the timer starts counting and the count start bit*1 in each timer control register becomes 1. An event signal that is input while the count start bit is 1 is ignored.

(2) Count Restart Operation

When an event signal is input, the timer counter is cleared. Since the count start bit*1 in each timer control register is retained, counting is restarted when an event signal is input while the count start bit is 1.

(3) Event Counter Operation

Event signal is selected as the timer count source. When an event signal is input, the timer counter is incremented.

Note 1. Refer to the register descriptions on starting the timer in the relevant peripheral timer module section.

21.3.4 Operation of GPTW When Event Signal is Input

Eight event signals specified by the ELSR6 to ELSR13 registers are connected to every channel of GPTW as GPTW event sources A to H. To set the operation of GPTW when inputting an event signal, enable any of the event sources A to H by a corresponding bit in registers listed in Table 21.5.

Table 21.5 Operations When Event Signal is Input and Corresponding Source Select Registers

Operations on Event	Register Symbol	Register Name
Count start	GTSSR	General PWM Timer Start Source Select Register
Count stop	GTPSR	General PWM Timer Stop Source Select Register
Counter clear	GTCSR	General PWM Timer Clear Source Select Register
Count switch	GTSWSR	General PWM Timer Switch Source Select Register
Count-up	GTUPSR	General PWM Timer Count-Up Source Select Register
Count-down	GTDNSR	General PWM Timer Count-Down Source Select Register
Input capture A	GTICASR	General PWM Timer Input Capture Source Select Register A
Input capture B	GTICBSR	General PWM Timer Input Capture Source Select Register B

21.3.5 Operation of A/D and D/A Converters When Event Signal is Input

When any of the event signal specified by the ELSR18 to ELSR26 registers is input, the A/D converter starts A/D conversion.
When an event signal specified by the ELSR46 or ELSR47 register is input, the D/A converter starts D/A conversion.
Refer to the A/D converter and D/A converter sections for details.

21.3.6 Example of Procedure for Linking Events

The following describes the procedure for linking events.

(1) Initialize the peripheral module (destination) that operates based on an event signal.
(2) Set the number of the event signal to the ELSRn register corresponding to the destination peripheral module.
(3) To link an event to a timer module, set any of the ELOPA to ELOPD registers corresponding to the timer as required.
(4) Set the ELCR.ELCON bit to 1, which enables linkage of all the events.
(5) Set the operation of the peripheral module (source) from which an event signal is output, and activate the module. The preset operation of the destination peripheral module is started by the event signal that is output from the source peripheral module.
(6) To stop event linkage of independent peripheral module, set 00h to the ELSRn register corresponding to the peripheral module. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

Note: If event signal output from the RTC is to be used, make the ELC settings after the RTC settings (initialization, time setting, etc.). Unintended events may be generated if RTC settings are made after the ELC settings.
Note: When using event signal output from the PVD, set the PVD and then the ELC. Set the corresponding ELSRn register to 00h and then disable the PVD.

21.4 Usage Notes

21.4.1 Setting ELSR88, ELSR89, ELSR90, and ELSR91 Registers

Specify an event number from among 050h to 053h, and 313h. Do not set the value other than preceding numbers.

21.4.2 Linking DMA/DTC Transfer End Signal as Event

When linking the DMA/DTC transfer end signal as an event signal, do not set the same peripheral module as the DMA/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMA/DTC transfer to the peripheral module is completed.

21.4.3 Clock Settings

To link events, make sure that the ELC and the related peripheral modules are in an operational condition. The peripheral modules cannot operate if they are in the module stop state or in mode which they stop (software standby mode or deep software standby mode).

21.4.4 Module Stop Function Setting

ELC operation can be disabled or enabled using module stop control register C (MSTPCRC). After reset is released, the ELC function is disabled. Register access is enabled by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

21.4.5 Internal Propagation Delay Times in the ELC

As shown in Figure 21.3, an event signal generated by a source peripheral module is propagated to a destination peripheral module via the ELC. The ELC includes synchronization (clock domain crossing, or CDC) circuits to ensure the transmission of event signals between modules operating with different clocks, and these circuits lead to propagation delays. Table 21.6 lists the internal propagation delay times of the ELC. Table 21.7 lists the clock domains of the peripheral modules.

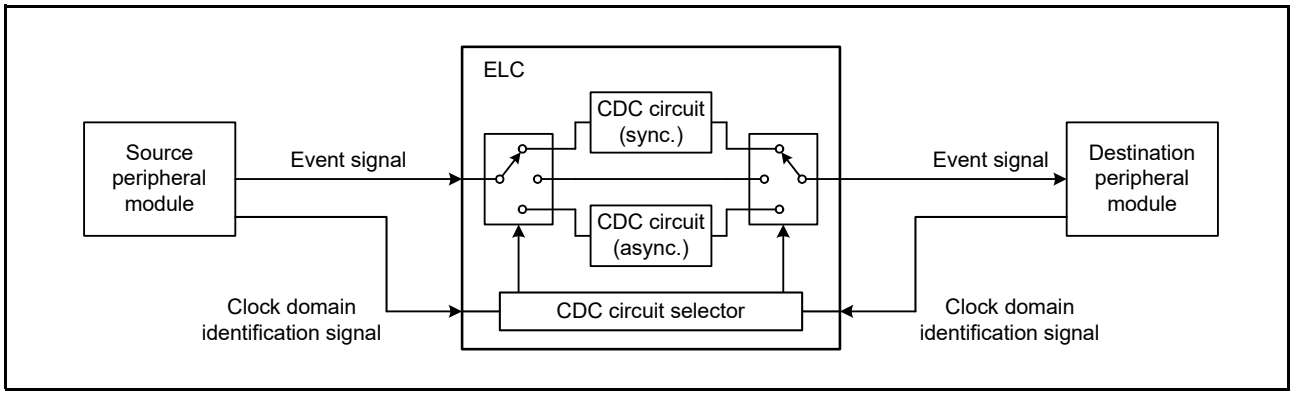

Figure 21.3 Event Signal Synchronization Circuits

Table 21.6 Internal Propagation Delay Times

Operating Clock (Clock Domain)		
Source Peripheral Module	**Destination Peripheral Module**	**Internal Propagation Delay Time**
PCLKA	PCLKA	0 cycles
	PCLKB or PCLKD	1 to 2 cycles of the slower clock of those for the source and destination modules
	Other than PCLK	5 PCLKA cycles + 4 cycles of the operating clock for the destination module
PCLKB	PCLKA or PCLKD	1 to 2 cycles of the slower clock of those for the source and destination modules
	PCLKB	0 cycles
	Other than PCLK	5 PCLKB cycles + 4 cycles of the operating clock for the destination module
PCLKD	PCLKA or PCLKB	1 to 2 cycles of the slower clock of those for the source and destination modules
	PCLKD	0 cycles
	Other than PCLK	5 PCLKD cycles + 4 cycles of the operating clock for the destination module
GPTCLK	PCLK	5 GPTCLK cycles + 4 PCLK cycles
	GPTCLK	0 cycles
	Other than PCLK and GPTCLK	5 GPTCLK cycles + 4 cycles of the operating clock for the destination module

Table 21.7 Clock Domains of Peripheral Modules

Peripheral Module		Clock Domain
Source	RSCI, RSPI, RI3C, ADC, DOC, GPTP, ESC, or RIICHS	PCLKA
	DMAC, DTC, PVD, Clock generation circuit, IWDT, WDT, RTC, ELC, I/O ports, CMT, CMTW, or TMR	PCLKB
	GPTW	GPTCLK or PCLKD
Destination	RI3C, GPTP, or ESC	PCLKA
	I/O ports, DAC, CMT, CMTW, TMR, or ICU	PCLKB
	GPTW	GPTCLK or PCLKD
	ADC	ADCCK, GPTCLK, or PCLKA
	DSMIF	DSMIFCLK, GPTCLK, or PCLKA
	PCIF	GPTCLK or PCLKB

22. I/O Ports

22.1 Overview

The pins of an I/O port may function as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O pins, pins for the ELC port group function, or bus control pins. All pins except P302 (the TDO pin of the JTAG port by default) operate as input pins immediately after a reset and the I/O directions of the pins are switched by register settings. Whether each pin operates as an I/O port or a pin for a peripheral module can be specified by the registers corresponding to the pins. The configuration of the I/O ports depends on the package. Table 22.1 lists the specifications of the I/O ports and Table 22.2 lists the port functions.

Table 22.1 Specifications of I/O Ports

Port Symbol	Package 320-Pin	Number of Pins	Package 224-Pin	Number of Pins	Package 176-Pin	Number of Pins	Package 144-Pin	Number of Pins	Package 100-Pin	Number of Pins

Note 1. Specifying a non-supported driving ability is prohibited.
Note 2. When an I3C function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the I3C or I^2C is selected.
Note 3. When an I^2C function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the I^2C is selected.
Note 4. When a JTAG function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the JTAG is selected.
Note 5. When a FINE function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the FINE is selected.

22.2 Configuration of I/O Ports

Note: This figure shows the basic configuration of ports. Details can vary from port to port.

Figure 22.1 Configuration of I/O Ports

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is readable and writable in 32-bit units and is used to select the input/output direction and output data for the individual pins of the corresponding port when the pins are configured as general I/O port pins.
A bit corresponding to a pin that does not exist is reserved. A reserved bit is read as 0. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the PDR05, PDR08, PDR09, PODR05, PODR08, and PODR09 bits in the PCNTR1 register for PORT3 are also reserved.

22.3.2 Port Direction Register (PDR)

Address(es): PORT0.PDR 87C0 0000h, PORT1.PDR 87C0 0020h, PORT2.PDR 87C0 0040h, PORT3.PDR 87C0 0060h, PORT4.PDR 87C0 0080h, PORT5.PDR 87C0 00A0h, PORT6.PDR 87C0 00C0h, PORT7.PDR 87C0 00E0h, PORT8.PDR 87C0 0100h, PORT9.PDR 87C0 0120h, PORTA.PDR 87C0 0140h, PORTB.PDR 87C0 0160h, PORTC.PDR 87C0 0180h, PORTD.PDR 87C0 01A0h, PORTE.PDR 87C0 01C0h, PORTF.PDR 87C0 01E0h, PORTG.PDR 87C0 0200h,

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is used to select the input/output direction for the individual pins of the corresponding port when the pins are configured as general I/O port pins and makes up the 16 lower-order bits of the PCNTR1 register. This register is accessible in 8- or 16-bit units.

A bit corresponding to a pin that does not exist is reserved. Make settings according to the description in section 22.6.11, Initialization of the Port Direction Register (PDR).

As the P305, P308, and P309 pins are input-only, the PORT3.PDR.PDR05, PORT3.PDR.PDR08, and PORT3.PDR.PDR09 bits are also reserved.

22.3.3 Port Output Data Register (PODR)

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is used to select the output data for the individual pins of the corresponding port when the pins are configured as general I/O port pins and makes up the 16 higher-order bits of the PCNTR1 register. This register is accessible in 8- or 16-bit units.

A bit corresponding to a pin that does not exist is reserved. A reserved bit is read as 0. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the PODR05, PODR08, and PODR09 bits in the PODR register for PORT3 are also reserved.

22.3.4 Port Control Register 2 (PCNTR2)

b31 to b24	—	Reserved	These bits are read as 0.	R

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

Note 1. Only ports B to E have this bit.

This register is read-only in 32-bit units and is used to read the input level and port event input data on the Pmn pins (n = 00 to 15). A bit corresponding to a pin that does not exist is reserved. The value read from a reserved bit is undefined.

22.3.5 Port Input Data Register (PIDR)

Address(es): PORT0.PIDR 87C0 0004h, PORT1.PIDR 87C0 0024h, PORT2.PIDR 87C0 0044h, PORT3.PIDR 87C0 0064h, PORT4.PIDR 87C0 0084h, PORT5.PIDR 87C0 00A4h, PORT6.PIDR 87C0 00C4h, PORT7.PIDR 87C0 00E4h, PORT8.PIDR 87C0 0104h, PORT9.PIDR 87C0 0124h, PORTA.PIDR 87C0 0144h, PORTB.PIDR 87C0 0164h, PORTC.PIDR 87C0 0184h, PORTD.PIDR 87C0 01A4h, PORTE.PIDR 87C0 01C4h, PORTF.PIDR 87C0 01E4h, PORTG.PIDR 87C0 0204h, PORT0_NS.PIDR 07C0 0004h, PORT1_NS.PIDR 07C0 0024h, PORT2_NS.PIDR 07C0 0044h, PORT3_NS.PIDR 07C0 0064h, PORT4_NS.PIDR 07C0 0084h, PORT5_NS.PIDR 07C0 00A4h, PORT6_NS.PIDR 07C0 00C4h, PORT7_NS.PIDR 07C0 00E4h, PORT8_NS.PIDR 07C0 0104h, PORT9_NS.PIDR 07C0 0124h, PORTA_NS.PIDR 07C0 0144h, PORTB_NS.PIDR 07C0 0164h, PORTC_NS.PIDR 07C0 0184h, PORTD_NS.PIDR 07C0 01A4h, PORTE_NS.PIDR 07C0 01C4h, PORTF_NS.PIDR 07C0 01E4h, PORTG_NS.PIDR 07C0 0204h

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register reflects the input level on the Pmn pins (n = 00 to 15) and makes up the 16 lower-order bits of the PCNTR2 register. This register is accessible in 8- or 16-bit units. The level on a pin can be read from the corresponding PIDRn bit regardless of the value of the PMR bit in the PmnPFS register or the PDRn bit in the PCNTR1 register for PORTm. If any of the following functions is selected for a pin, the level on the pin is not reflected in the PIDRn bit.

- RTC time capture input (RTCIC0 to RTCIC2) and tamper detection (TAMPI0 to TAMPI2)
- Analog function (the ASEL bit in the PmnPFS register is 1)
- JTAG or SWD interface (TCK or SWCLK, TMS or SWDIO, TDI, or TDO)

22.3.6 Port Event Input Data Register (EIDR)

Address(es): PORTB.EIDR 87C0 0166h, PORTC.EIDR 87C0 0186h, PORTD.EIDR 87C0 01A6h, PORTE.EIDR 87C0 01C6h, PORTB_NS.EIDR 07C0 0166h, PORTC_NS.EIDR 07C0 0186h, PORTD_NS.EIDR 07C0 01A6h, PORTE_NS.EIDR 07C0 01C6h

b3	EIDR03	Port Event Input Data 03		R
b4	EIDR04	Port Event Input Data 04		R
b5	EIDR05	Port Event Input Data 05		R
b6	EIDR06	Port Event Input Data 06		R
b7	EIDR07	Port Event Input Data 07		R
b15 to b8	—	Reserved	These bits are read as 0.	R

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is used to read the level latched on the individual pins when a corresponding ELC_PORTm event has occurred and makes up the 16 higher-order bits of the PCNTR2 register. This register is accessible in 8- or 16-bit units. An EIDRn bit only reflects the level on the corresponding pin when both the PMR bit in the PmnPFS register (n = 00 to 07) and the PDRn bit in the PDR register for PORTm are set to 0. If the ASEL bit in the PmnPFS register is set to 1, the EIDRn bit does not reflect the level on the corresponding pin. A bit corresponding to a pin that does not exist is reserved. A reserved bit is read as 0.

22.3.7 Port Control Register 3 (PCNTR3)

Address(es): PORT0.PCNTR3 87C0 0008h, PORT1.PCNTR3 87C0 0028h, PORT2.PCNTR3 87C0 0048h, PORT3.PCNTR3 87C0 0068h, PORT4.PCNTR3 87C0 0088h, PORT5.PCNTR3 87C0 00A8h, PORT6.PCNTR3 87C0 00C8h, PORT7.PCNTR3 87C0 00E8h, PORT8.PCNTR3 87C0 0108h, PORT9.PCNTR3 87C0 0128h, PORTA.PCNTR3 87C0 0148h, PORTB.PCNTR3 87C0 0168h, PORTC.PCNTR3 87C0 0188h, PORTD.PCNTR3 87C0 01A8h, PORTE.PCNTR3 87C0 01C8h, PORTF.PCNTR3 87C0 01E8h, PORTG.PCNTR3 87C0 0208h,

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

Note: This register is write-only. It is always read as 0.

This register is writable in 32-bit units and is used to set or reset the data output through the Pmn pins (n = 00 to 15). Do not set both the PORRn and POSRn bits for a single pin to 1. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the POSR05, POSR08, POSR09, PORR05, PORR08, and PORR09 bits in the PCNTR3 register for PORT3 are also reserved.

22.3.8 Port Output Set Register (POSR)

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is accessible in 8- or 16-bit units and is used to set the corresponding bits in the PODR register to 1. This register is always read as 0. Writing 1 to a POSRn bit (n = 00 to 15) sets the corresponding PODRn bit in the PODR register to 1. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the POSR05, POSR08, and POSR09 bits in the POSR register for PORT3 are also reserved.

b5	EOSR05	Pm05 Event Output Set		R/W
b6	EOSR06	Pm06 Event Output Set		R/W
b7	EOSR07	Pm07 Event Output Set		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

After an EOSRn bit has been set to 1, the corresponding PODRn bit in the PODR register is set to 1 when an ELC_PORTm event occurs (n = 00 to 07). When the EORRn bit for a pin is set to 1 in the EORR register, the EOSRn bit for the pin in this register should be set to 0. This register is accessible in 8- or 16-bit units. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them.

22.3.12 Event Output Reset Register (EORR)

Address(es): PORTB.EORR 87C0 016Eh, PORTC.EORR 87C0 018Eh, PORTD.EORR 87C0 01AEh, PORTE.EORR 87C0 01CEh, PORTB_NS.EORR 07C0 016Eh, PORTC_NS.EORR 07C0 018Eh, PORTD_NS.EORR 07C0 01AEh, PORTE_NS.EORR 07C0 01CEh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b5	EORR05	Pm05 Event Output Reset		R/W
b6	EORR06	Pm06 Event Output Reset		R/W
b7	EORR07	Pm07 Event Output Reset		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

After an EORRn bit has been set to 1, the corresponding PODRn bit in the PODR register is set to 0 when an ELC_PORTm event occurs (n = 00 to 07). When the EOSRn bit for a pin is set to 1 in the EOSR register, the EORRn bit for the pin in this register should be set to 0. This register is accessible in 8- or 16-bit units. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them.

22.3.13 Pmn Pin Function Selection Register (PmnPFS) (m = 0 to 9, A to G; n = 00 to 15)

Address(es): PFS.P000PFS 87C0 0800h to PFS.P015PFS 87C0 083Ch,

b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b30 to b24	PSEL[6:0]	Peripheral Function Select	These bits are used to select a peripheral function. For the peripheral functions that are selectable for each pin, see the relevant tables in this section.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. The bits are initialized to the following values.
- PSEL[6:0] bits in the PF00PFS and PF01PFS registers: 0010011b
- PMR bit in the P300PFS, P301PFS, P302PFS, P303PFS, P315PFS, PF00PFS, and PF01PFS registers: 1
- DSCR[3:0] bits in the P300PFS, P302PFS, and P315PFS registers: 0001b
- PCR bit in the P300PFS, P301PFS, P303PFS, and P315PFS registers: 1

Note 2. Specifying a non-supported driving ability is prohibited. For the driving abilities supported by the individual pins, see Table 22.2, Port Functions.

Note 3. Only ports B to E have these bits.

This register is readable and writable in 32-bit, 16-bit, or 8-bit units and is used to specify various functions of the Pmn pin. The PmnPFS register is protected by the PWPR register. Release the protection before modifying the value of this register.

PODR Bit (Port Output Data)

The function of this bit is the same as that of the corresponding PODRn bit in the PODR register for PORTm.

PIDR Bit (Port Input Data)

The function of this bit is the same as that of the corresponding PIDRn bit in the PIDR register for PORTm.

PDR Bit (Port I/O Direction Select)

The function of this bit is the same as that of the corresponding PDRn bit in the PDR register for PORTm.

PCR Bit (Input Pull-up Resistor Control)

This bit enables or disables the input pull-up resistor for the pin. When the pin is set as an input and this bit is set to 1, the pull-up resistor connected to the pin is enabled. When the pin is set as a general output port or an output pin for a peripheral function, the pull-up resistor is disabled regardless of the setting of this bit.

DSCR[3:0] Bits (Driving Ability Select)

These bits switch the driving ability of the output buffer for the pin. Specifying a driving ability that is not supported for the pin is prohibited. For the driving abilities supported by the individual pins, see Table 22.2. These bits are reserved for a pin that has a fixed driving ability. The write value should be 0000b in this case.

EOFR[1:0] Bits (Port Group Input Edge Detection Select)

These bits select the edges to be detected in the input signal for the pin in a port group. Rising edges, falling edges, or both edges can be selected. While these bits are set to 01b, 10b, or 11b, an event pulse is applied to the ELC when the level on the external pin changes in the corresponding way.

ISEL Bit (Interrupt Input Function Select)

This bit specifies the use of the pin as an IRQ input pin. The pin can be set to work as both an IRQ input pin and a peripheral function pin. Note that when a single IRQ signal is assignable to multiple pins, the ISEL bit for only one of the pins should be set to 1. This bit is reserved for a pin to which an IRQ signal is not assigned.

ASEL Bit (Analog Function Select)

This bit specifies the use of the pin as an analog I/O signal pin. When setting this bit to 1, set each of the corresponding PMR, PCR, and PDR bits to 0. This bit is reserved for a pin to which an analog I/O signal is not assigned.

PSEL[6:0] Bits (Peripheral Function Select)

These bits select the signal to be assigned to the pin. When a single peripheral function signal is assignable to multiple pins, the PSEL[6:0] bits for only one of the pins should be set to select the signal. For the settings of the individual signals for peripheral functions, see Table 22.3 to Table 22.28.

Note 1. Suffixes such as “-A” or “-B” appended to pin names indicate pin group identifiers. Electrical characteristics were evaluated per pin group. AC electrical characteristics are only guaranteed when pins within the same group are used together.
Note 2. When the CRSEP bit in the SCR1 register is set to 1, this pin cannot be used for the CTSn# signal. It can be used for the RTSn# signal.

Note 1. Suffixes such as “-A” or “-B” appended to pin names indicate pin group identifiers. Electrical characteristics were evaluated per pin group. AC electrical characteristics are only guaranteed when pins within the same group are used together.
Note 2. When the CRSEP bit in the SCR1 register is set to 1, this pin cannot be used for the CTSn# signal. It can be used for the RTSn# signal.

Note 1. Suffixes such as “-A” or “-B” appended to pin names indicate pin group identifiers. Electrical characteristics were evaluated per pin group. AC electrical characteristics are only guaranteed when pins within the same group are used together.

Note 2. When the CRSEP bit in the SCR1 register is set to 1, this pin cannot be used for the CTSn# signal. It can be used for the RTSn# signal.

22.3.14 Non-secure World Write Protection Register (PWPR_NS)

Address(es): PFS_NS.PWPR_NS 07C0 0D0Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PFSWE	PmnPFS Register Write Enable	0: Writing to the PmnPFS registers is disabled. 1: Writing to the PmnPFS registers is enabled.	R/W
b7	B0WI	PFSWE Bit Write Disable	0: Writing to the PFSWE bit is enabled. 1: Writing to the PFSWE bit is disabled.	R/W

m = 0 to 9 or A to G; n = 00 to 15

Note: This register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note: Access to this register is not controlled by any security attribute registers.

This register is used to protect the PmnPFS registers corresponding to the pins placed in the non-secure world by the PmSAR registers.

PFSWE Bit (PmnPFS Register Write Enable)

Writing to the PmnPFS registers is only enabled when this bit is set to 1. Set the B0WI bit to 0 before setting this bit to 1.

B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is only enabled when this bit is set to 0.

22.3.15 Secure World Write Protection Register (PWPR_S)

Address(es): PFS.PWPR_S 87C0 0D14h

	b7	b6	b5	b4	b3	b2	b1	b0
	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PFSWE	PmnPFS Register Write Enable	0: Writing to the PmnPFS registers is disabled. 1: Writing to the PmnPFS registers is enabled.	R/W
b7	B0WI	PFSWE Bit Write Disable	0: Writing to the PFSWE bit is enabled. 1: Writing to the PFSWE bit is disabled.	R/W

m = 0 to 9 or A to G; n = 00 to 15

Note: This register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.

This register is used to protect the PmnPFS registers corresponding to the pins placed in the secure world by the PmSAR registers

PFSWE Bit (PmnPFS Register Write Enable)

Writing to the PmnPFS registers is only enabled when this bit is set to 1. Set the B0WI bit to 0 before setting this bit to 1.

B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is only enabled when this bit is set to 0.

22.3.16 Port m Security Attribute Setting Register (PmSAR) (m = 0 to 9, A to G)

Address(es): PFS.P0SAR 87C0 0D30h, PFS.P1SAR 87C0 0D34h, PFS.P2SAR 87C0 0D38h, PFS.P3SAR 87C0 0D3Ch, PFS.P4SAR 87C0 0D40h, PFS.P5SAR 87C0 0D44h, PFS.P6SAR 87C0 0D48h, PFS.P7SAR 87C0 0D4Ch, PFS.P8SAR 87C0 0D50h, PFS.P9SAR 87C0 0D54h, PFS.PASAR 87C0 0D58h, PFS.PBSAR 87C0 0D5Ch, PFS.PCSAR 87C0 0D60h, PFS.PDSAR 87C0 0D64h, PFS.PESAR 87C0 0D68h, PFS.PFSAR 87C0 0D6Ch, PFS.PGSAR 87C0 0D70h,
PFS_NS.P0SAR 07C0 0D30h, PFS_NS.P1SAR 07C0 0D34h, PFS_NS.P2SAR 07C0 0D38h, PFS_NS.P3SAR 07C0 0D3Ch, PFS_NS.P4SAR 07C0 0D40h, PFS_NS.P5SAR 07C0 0D44h, PFS_NS.P6SAR 07C0 0D48h, PFS_NS.P7SAR 07C0 0D4Ch, PFS_NS.P8SAR 07C0 0D50h, PFS_NS.P9SAR 07C0 0D54h, PFS_NS.PASAR 07C0 0D58h, PFS_NS.PBSAR 07C0 0D5Ch, PFS_NS.PCSAR 07C0 0D60h, PFS_NS.PDSAR 07C0 0D64h, PFS_NS.PESAR 07C0 0D68h, PFS_NS.PFSAR 07C0 0D6Ch, PFS_NS.PGSAR 07C0 0D70h

b15	Pm15SA	Pm15 Security Attribute Setting		R/W

m = 0 to 9 or A to G

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is readable and writable in 8-bit or 16-bit units and is used to specify the security attributes for the individual pins.

22.3.17 Low-Voltage Operating Characteristics Control Register (LVOCR)

Address(es): SYSC.LVOCR 8701 9AB0h, SYSC_NS.LVOCR 0701 9AB0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LVO0E
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b0	LVO0E	Low-Voltage Operating Characteristics Control 0	0: VCC ≥ 2.7 V 1: VCC < 2.7 V	R/W
b1	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

This register is used to control the operating characteristics of the input/output buffers.

LVO0E Bit (Low-Voltage Operating Characteristics Control 0)

Set this bit to 0 when the VCC voltage to be used is 2.7 V or higher. Leave this bit as 1 when the VCC voltage to be used is below 2.7 V.

22.4 Operation

22.4.1 General-Purpose I/O Port

All pins except P300 to P303, P315, PF00, or PF01 operate as general input port pins after a reset. Each general I/O port consists of 16 pins. The ports can be accessed in port units through the port control registers (PCNTRn, n = 1 to 4) or in pin units through the Pmn pin function selection registers (PmnPFS, m = 0 to 9 or A to G, n = 00 to 15). For details of the registers, refer to section 22.3, Register Descriptions.

22.4.2 Selecting Pin Functions

The following functions can be controlled for the individual pins through register settings.

- The security attribute is selectable per-pin as desired.
- Selection of CMOS or N-channel open-drain output, pull-up resistors, and driving ability can be controlled.
- The I/O directions of port pins can be selected, the data to be output can be specified, and the input data can be read.
- The I/O signals of peripheral functions are assignable to pins.

22.4.3 Port Group Function of the ELC

Ports B to E are assigned to the ELC port group function in this MCU.

22.4.3.1 Operation when the ELC_PORTn (n = B to E) Signal is Input from the ELC

This MCU has the following two functions to be activated in response to the input of an ELC_PORTn (n = B to E) signal from the ELC.

(1) Event input

When the ELC_PORTn (n = B to E) signal is generated by the ELC, the levels on the pins in the corresponding port group are transferred to the EIDR bits if the pins are general input pins (PDR = 0 and PMR = 0 in the PmnPFS register). See Figure 22.2. If the pins are general output pins (PDR = 1) or the I/O pins for peripheral functions (PMR = 1), the corresponding EIDR bits are set to 0 regardless of the levels on the pins.

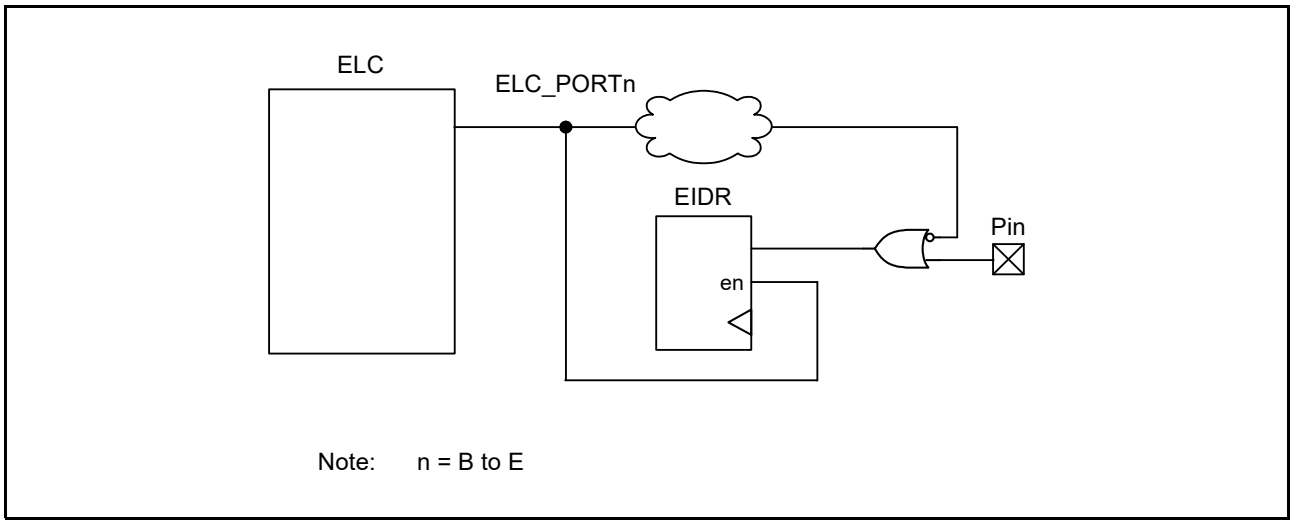

Figure 22.2 Data Input from an Event Port Group

(2) Setting the PODR Register through the EOSR and EORR Registers

When the ELC_PORTn (n = B to E) signal is generated, the PODR register is set according to the settings of the EOSR and EORR registers.

- If a bit in the EOSR register is set to 1, the corresponding bit in the PODR register is set to 1 in response to generation of the ELC_PORTn signal.
  If a bit in the EOSR register is set to 0, the corresponding bit in the PODR register retains its value.
- If a bit in the EORR register is set to 1, the corresponding bit in the PODR register is set to 0 in response to generation of the ELC_PORTn signal.
  If a bit in the EORR register is set to 0, the corresponding bit in the PODR register retains its value.

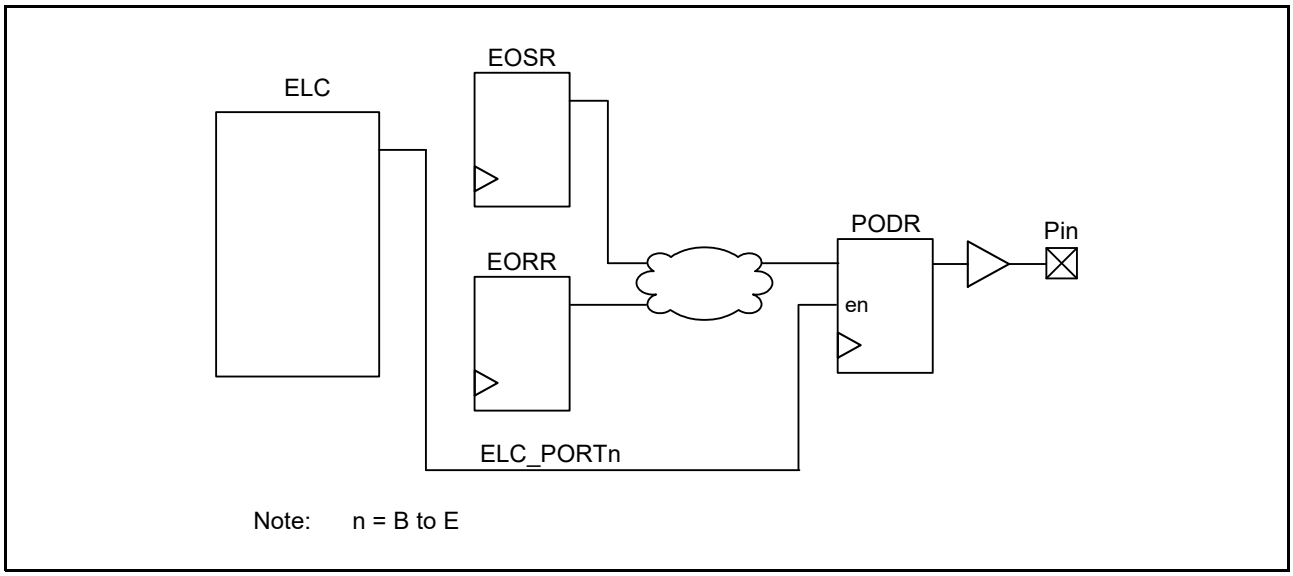

Figure 22.3 Data Output from an Event Port Group

22.4.3.2 Operation when an Event Pulse is Applied to the ELC

Use the EOFR[1:0] bits in the PmnPFS register to apply an event pulse from external pins to the ELC. For details, refer to section 22.3.13, Pmn Pin Function Selection Register (PmnPFS) (m = 0 to 9, A to G; n = 00 to 15). For example, when data are input to port B (PB00 to PB07), the logical OR of the data values from these eight pins are taken and the result is applied to the ELC as an event pulse. Ports C to E operate in the same way. See Figure 22.4.

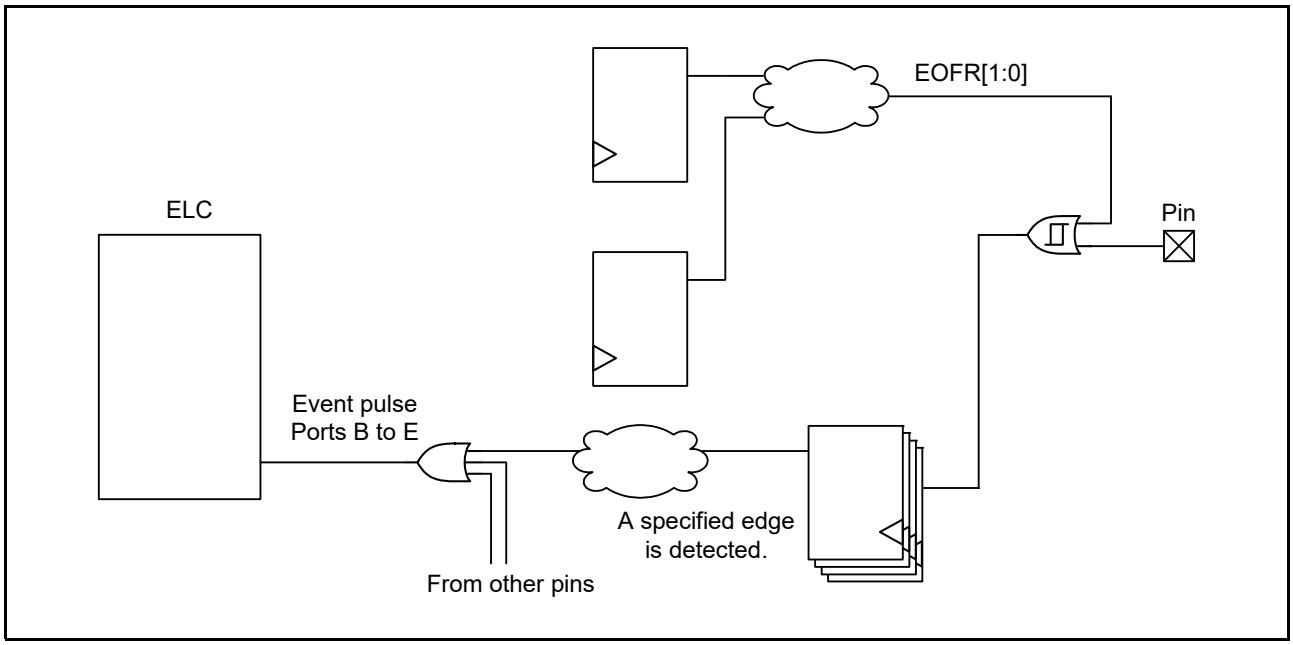

Figure 22.4 Generating an Event Pulse

22.5 Handling of Unused Pins

Details on the handling of unused pins are given in Table 22.29.

Table 22.29 Handling of Unused Pins

Pin Name	Handling
P315/MD	This pin must always be used as the mode pin.
RES#	Pull this pin up to VCC via a resistor.
PF00/USB0_DP, PF01/USB0_DM	Leave these pins open-circuit when the PMR bit is set to 1 in both the PF00PFS and PF01PFS registers. Set these pins as follows when the PMR bit is set to 0 in either the PF00PFS or PF01PFS register. • When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to VCC_USB or VSS via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
P305/NMI	Pull this pin up to VCC via a resistor.
P306/EXTAL	Set the MOSTP bit of the MOSCCR register in the SYSC to 1 (selecting general port pin P306) when the main clock oscillator is not to be used. If this pin is not used either for clock oscillation or as port pin P306, handle it in the way stated for “Other ports” below.
P307/XTAL	Set the MOSTP bit of the MOSCCR register in the SYSC to 1 (selecting general port pin P307) when the main clock oscillator is not to be used. The XTAL pin works as P307 when an external clock is input to the EXTAL pin. If this pin is not used either for clock oscillation or as port pin P307, handle it in the way stated for “Other ports” below.
P309/XCIN/EXCIN	Set the SOSTP bit of the SOSCCR register in the SYSC to 1 (selecting general port pin P309) when the sub-clock oscillator is not to be used. Set the SOSEL bit of the SOMCR register in the SYSC to 0 (selecting general port pin P309) when an external clock is not to be used. If this pin is not used either for clock oscillation or as port pin P309, pull it down to VSS via a resistor.
P308/XCOUT	Set the SOSTP bit of the SOSCCR register in the SYSC to 1 (selecting general port pin P308) when the sub-clock oscillator is not to be used. If this pin is not used either for clock oscillation or as port pin P308, pull it down to VSS via a resistor.
P300, P301, P303	Do not pull these pins down because the input pull-up resistors are enabled (PCR bit in the PmnPFS register = 1) after release from the reset state.
P302	Be careful since this pin operates as an output pin after release from the reset state.
P400 to P415	• When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to AVCC0 or AVSS0 via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
P600 to P607. P900 to P907, PD00 to PD07	• When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to VCC2 or VSS via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
Other ports	• When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to VCC or VSS via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
VREFH0	Connect this pin to AVCC0.
VREFL0	Connect this pin to AVSS0.
USBHS_DP, USBHS_DM, USBHS_RREF	Prerequisites • AVCC_USBHS = VCC_USBHS: Both are connected to VCC. • AVSS_USBHS = VSS_USBHS: Both are connected to VSS. - The USBHS is placed in the module-stop state (MSTPB12 bit in the MSTPCRB register = 1) Handling • Leave the USBHS_DP, USBHS_DM, and USBHS_RREF pins open-circuit.
VLO	Leave this pin open-circuit.*2
VBATT	Connect this pin to VCC.

Note 1. Set the PMR, ISEL, PCR, and ASEL bits in the relevant PmnPFS register to 0.

Note 2. For details, refer to section 68, Internal Voltage Regulator.

22.6 Notes

22.6.1 Procedure for Setting Pin Functions

Use the following procedure to specify the function of an I/O pin.

1. Set the B0WI bit in the PWPR_NS register to 0 to enable writing to the PFSWE bit in the PWPR_NS register.*1
2. Set the PFSWE bit in the PWPR_NS register to 1 to enable writing to the PmnPFS register.*1
3. Set the PMR bit in the PmnPFS register corresponding to the target pin to 0 to set the pin as a general I/O port pin.
4. Set the PSEL[6:0] bits in the PmnPFS register to select the peripheral module function pins.
5. Set the PMR bit in the PmnPFS register to 1 to switch the pin to the selected peripheral function as required.
6. Set the PFSWE bit in the PWPR_NS register to 0 to disable writing to the PmnPFS register.*1
7. Set the B0WI bit in the PWPR_NS register to 1 to disable writing to the PFSWE bit in the PWPR_NS register.*1

Note 1. When the security attribute of the Pmn pin is set to 0 in the PmSAR register, use the PWPR_S register to enable or disable writing to the PmnPFS register.

22.6.2 Procedure for Using the Event Output Function to ELC

Use the following procedure to use changes in the input to a port group (B to E) as an event.

1. Set the ELS[9:0] bits of the ELSRx register in the ELC to 000h to prevent malfunctions due to an unexpected event. Whether an unexpected event may be generated depends on the states of external pins.
2. Use the EOFR[1:0] bits in the PmnPFS register to select the input edges to be detected.
3. Wait for 100 ns.
4. Use the ELS[9:0] bits of the ELSRx register in the ELC to select the target for linking of the port event.

22.6.3 Method of Setting the Port Output Data Register (PODR)

The following methods can be used to specify a value in the PODR register.

- Set the EORR bit in the PCNTR4 register to 1 to set the corresponding bit in the PODR register to 0 when the ELC_PORTn (n = B to E) signal is generated.
- Set the EOSR bit in the PCNTR4 register to 1 to set the corresponding bit in the PODR register to 1 when the ELC_PORTn (n = B to E) signal is generated.
- Set the PORR bit in the PCNTR3 register to 1 to set the corresponding bit in the PODR register to 0.
- Set the POSR bit in the PCNTR3 register 1 to set the corresponding bit in the PODR register to 1.
- Set the PODRn bit in the PCNTR1 register to set the corresponding bit in the PODR register to 0 or 1.
- Set the PODRn bit in the PmnPFS register to set the corresponding bit in the PODR register to 0 or 1.

In case of simultaneous direct writing to and event-driven modification of a register, event-driven modification takes priority.

22.6.4 Note on Using Analog Functions

To use a pin for an analog signal, set both the pin mode select (PMR) bit in the PmnPFS register and the port I/O direction select (PDRn) bit in the PCNTR1 register to 0 to make the pin operate as a general input port pin. After that, set the analog function select (ASEL) bit in the PmnPFS register to 1.

22.6.5 Notes on Using the RTC Time-Capture Event Inputs and Tampering Detection

To use the P310, P311, and P312 pins for RTC time-capture event input and tampering detection, set the TAMPICR1.CHnEN (n = 0 to 2) bits of the SYSC to 1. When the setting of a TAMPICR1.CHnEN bit is 1, the settings of registers related to the P31n pins in this section are ignored. Note, however, that the settings of the P31nPFS.ISEL bits are valid.

The TAMPICR1 register is not initialized by a reset. Therefore, when RTC input and tampering detection are not to be used, the corresponding bits in the TAMPICR1 register require setting to 0 after a reset. For details of the TAMPICR1 register, refer to section 12.2.11, Tamper/RTCIC Input Control Register 1 (TAMPICR1).

22.6.6 Selecting the USB0_DP and USB0_DM Pins

The USB0_DP and USB0_DM pins are respectively multiplexed with the PF00 and PF01 pins. Use the PMR and PSEL[6:0] bits in the PF00PFS register to select the USB0_DP or PF00 pin function and use the PMR and PSEL[6:0] bits in the PF01PFS register to select the USB0_DM or PF01 pin function. Table 22.30 lists the PFS register settings and the corresponding functions selected for the PF00 and PF01 pins.

Table 22.30 Selection of the USB or Port Pins

PFS Register Settings				Pin Function	
PF00PFS		PF01PFS			
PMR	PSEL[6:0]	PMR	PSEL[6:0]	PF00 Pin	PF01 Pin
0	Don't care	0	Don't care	General I/O	General I/O
0	Don't care	1	Other than 0010011b	General I/O	Peripheral function other than USB
0	Don't care	1	0010011b	General I/O	This pin cannot be used.
1	Other than 0010011b	0	Don't care	Peripheral function other than USB	General I/O
1	Other than 0010011b	1	Other than 0010011b	Peripheral function other than USB	Peripheral function other than USB
1	Other than 0010011b	1	0010011b	Peripheral function other than USB	This pin cannot be used.
1	0010011b	0	Don't care	This pin cannot be used.	General I/O
1	0010011b	1	Other than 0010011b	This pin cannot be used.	Peripheral function other than USB
1	0010011b	1	0010011b	USB0_DP	USB0_DM

Note: When the PF00 and PF01 pins are to be used for general I/O signals (the PF00 and PF01 signals) or for a peripheral function other than the USB, use the registers related to the USB with their initial values.
Note: When the PF00 and PF01 pins are to be used for USB signals (the USB0_DP and USB0_DM signals), use the registers related to the PF00 and PF01 general I/O signals with their initial values.
Note: Only set the PF00PFS and PF01PFS registers for selecting the pin functions once after a reset.

22.6.7 Pulling the PF00 and PF01 Pins Used for USB or General I/O Signals Up or Down

When the PF00 and PF01 pins are used for general I/O signals, the pull-up and pull-down functions of the USB affect the PF00 and PF01 pins. Therefore, the pull-up or pull-down functions need to be disabled before the pins are used for general I/O signals. The pull-up and pull-down functions of the USB are controlled by the DPRPU and DRPD bits of the SYSCFG register in USB0.

22.6.8 Note on Using the NMI Pin

To use the P305 pin as an NMI pin, set the NMIER.NMIEN bit of the ICU to 1. Register settings for control of the pin as a port pin are not required. For details on the NMIER register, see section 15.2.11, Non-Maskable Interrupt Enable Register (NMIER).

22.6.9 Note on Using the Main Clock Oscillator

To use a resonator, set the MOMCR.MOSEL bit of the SYSC to 0, and set the P307 and P306 pins for use as general-purpose input port pins. To use the external clock input, set the MOMCR.MOSEL bit to 1, and set the P307 pin for use as a general-purpose input port pin. For details on the MOMCR register, see section 9.2.28, Main Clock Oscillator Mode Oscillation Control Register (MOMCR).

22.6.10 Note on Using the Sub-Clock Oscillator

To use a resonator, set the SOMCR.SOSEL bit of the SYSC to 0, and set the P309 and P308 pins for use as general-purpose input port pins. To use the external clock input, set the SOMCR.SOSEL bit to 1, and set the P309 pin for use as a general-purpose input port pin. For details on the SOMCR register, see section 9.2.29, Sub-Clock Oscillator Mode Control Register (SOMCR).

22.6.11 Initialization of the Port Direction Register (PDR)

Initialize reserved bits in the PDR register according to Table 22.31 to Table 22.35.

- The blank columns in Table 22.31 to Table 22.35 indicate the bits corresponding to the pins listed in Table 22.1, Specifications of I/O Ports.
  The corresponding bits should be set to 1 (output) or 0 (input) depending on the user system. However, the corresponding PORT3.PDR.PDR05, PDR08, and PDR09 bits on the input-only P305, P308, and P309 terminals are reserved bits. These bits should be set to 0 (input).
- The columns other than the blank columns in Table 22.31 to Table 22.35 indicate reserved bits.
  A reserved bit should be set to 0 (input) or 1 (output) according to Table 22.31 to Table 22.35.

23. Software Configurable 32-Bit Programmable I/O Port (PIO)

23.1 Overview

The software configurable 32-bit programmable I/O port module (PIO) allows the selection of up to 32 out of 64 I/O port pins implemented as peripheral functions, and the result is usable just as if the pins were under the control of a general-purpose I/O port with up to 32 effective bits. This allows virtual bundling of the pins, so that simultaneous reflection of the port pin states in a register and simultaneous switching of the output signals on the selected port pins are both possible. Table 23.1 lists the specifications and Figure 23.1 shows a block diagram of the PIO.

Table 23.1 Specifications of the PIO

Items	Description
Operating clock	• PCLKB
Functions	• Of the 64 port pins denoted as PIO_x pins (x = 000 to 063), up to 32 can be selected for simultaneous reflection of the port pin states in a register and simultaneous switching of the output signals. • Input or output can be enabled, and for outputs, the high or low level can be specified through register settings. • The port pin states can be read through a register. • The output from any port pin can respectively be changed to the high or low level by using the port output setting or resetting register.
Protect Zone filter	• Security attribute can be set.

Note 1. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

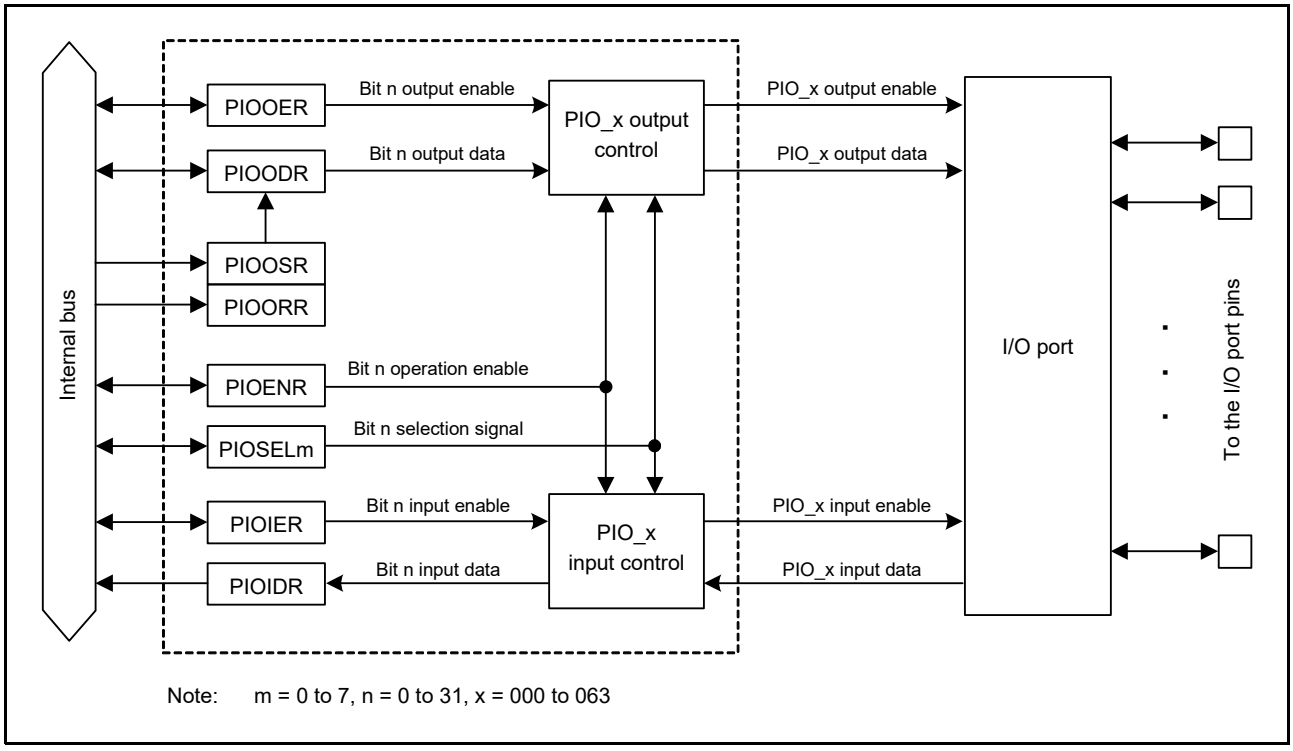

Figure 23.1 Block Diagram of the PIO

23.2 Register Descriptions

23.2.1 PIO Operation Enable Register (PIOENR)

Address(es): PIO.PIOENR 8780 6000h, PIO_NS.PIOENR 0780 6000h

	OE15	OE14	OE13	OE12	OE11	OE10	OE9	OE8	OE7	OE6	OE5	OE4	OE3	OE2	OE1	OE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OE0	Port Output Enable 0	0: Output is disabled. 1: Output is enabled.	R/W
b1	OE1	Port Output Enable 1		R/W
b2	OE2	Port Output Enable 2		R/W
b3	OE3	Port Output Enable 3		R/W
b4	OE4	Port Output Enable 4		R/W
b5	OE5	Port Output Enable 5		R/W
b6	OE6	Port Output Enable 6		R/W
b7	OE7	Port Output Enable 7		R/W
b8	OE8	Port Output Enable 8		R/W
b9	OE9	Port Output Enable 9		R/W
b10	OE10	Port Output Enable 10		R/W
b11	OE11	Port Output Enable 11		R/W
b12	OE12	Port Output Enable 12		R/W
b13	OE13	Port Output Enable 13		R/W
b14	OE14	Port Output Enable 14		R/W
b15	OE15	Port Output Enable 15		R/W
b16	OE16	Port Output Enable 16		R/W
b17	OE17	Port Output Enable 17		R/W
b18	OE18	Port Output Enable 18		R/W
b19	OE19	Port Output Enable 19		R/W
b20	OE20	Port Output Enable 20		R/W
b21	OE21	Port Output Enable 21		R/W
b22	OE22	Port Output Enable 22		R/W
b23	OE23	Port Output Enable 23		R/W
b24	OE24	Port Output Enable 24		R/W
b25	OE25	Port Output Enable 25		R/W
b26	OE26	Port Output Enable 26		R/W
b27	OE27	Port Output Enable 27		R/W
b28	OE28	Port Output Enable 28		R/W
b29	OE29	Port Output Enable 29		R/W
b30	OE30	Port Output Enable 30		R/W
b31	OE31	Port Output Enable 31		R/W

The PIOOER register is used to enable or disable output from the PIO target port pins. For details, see section 23.3.2, Output.

23.2.4 PIO Port Input Data Register (PIOIDR)

Address(es): PIO.PIOIDR 8780 6020h, PIO_NS.PIOIDR 0780 6020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ODR0	Port Output Data 0	0: Low-level output 1: High-level output	R/W
b1	ODR1	Port Output Data 1		R/W
b2	ODR2	Port Output Data 2		R/W
b3	ODR3	Port Output Data 3		R/W
b4	ODR4	Port Output Data 4		R/W
b5	ODR5	Port Output Data 5		R/W
b6	ODR6	Port Output Data 6		R/W
b7	ODR7	Port Output Data 7		R/W
b8	ODR8	Port Output Data 8		R/W
b9	ODR9	Port Output Data 9		R/W
b10	ODR10	Port Output Data 10		R/W
b11	ODR11	Port Output Data 11		R/W
b12	ODR12	Port Output Data 12		R/W
b13	ODR13	Port Output Data 13		R/W
b14	ODR14	Port Output Data 14		R/W
b15	ODR15	Port Output Data 15		R/W
b16	ODR16	Port Output Data 16		R/W
b17	ODR17	Port Output Data 17		R/W
b18	ODR18	Port Output Data 18		R/W
b19	ODR19	Port Output Data 19		R/W
b20	ODR20	Port Output Data 20		R/W
b21	ODR21	Port Output Data 21		R/W
b22	ODR22	Port Output Data 22		R/W
b23	ODR23	Port Output Data 23		R/W
b24	ODR24	Port Output Data 24		R/W
b25	ODR25	Port Output Data 25		R/W
b26	ODR26	Port Output Data 26		R/W
b27	ODR27	Port Output Data 27		R/W
b28	ODR28	Port Output Data 28		R/W
b29	ODR29	Port Output Data 29		R/W
b30	ODR30	Port Output Data 30		R/W
b31	ODR31	Port Output Data 31		R/W

The PIOODR register holds the data for output from the PIO target port pins. For details, see section 23.3.2, Output.

23.2.6 PIO Port Output Setting Register (PIOOSR)

Address(es): PIO.PIOOSR 8780 6030h, PIO_NS.PIOOSR 0780 6030h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

The PIOOSR register is used to set the data for output from the PIO target port pins.

OSRn Bits (Port Output Setting n) (n = 0 to 31)

Setting an OSRn bit to 1 sets the corresponding ODRn (n = 0 to 31) bit in the PIOODR register to 1. Setting of 0 has no effect on the PIOODR register. Setting of this register is not usable with bits to which port pins have not been assigned by the PIOSELm (m = 0 to 7) registers. All bits are read as 0. For details, see section 23.3.2, Output.

23.2.7 PIO Port Output Resetting Register (PIOORR)

Address(es): PIO.PIOORR 8780 6034h, PIO_NS.PIOORR 0780 6034h

The PIOORR register is used to reset the data for output from the PIO target port pins.

ORRn Bits (Port Output Resetting n) (n = 0 to 31)

Setting an ORRn bit to 1 sets the corresponding ODRn (n = 0 to 31) bit in the PIOODR register to 0. Setting of 0 has no effect on the PIOODR register. Setting of this register is not usable with bits to which port pins have not been assigned by the PIOSELm (m = 0 to 7) registers. All bits are read as 0. For details, see section 23.3.2, Output.

23.2.8 PIO Port Selection Register 0 (PIOSEL0)

Address(es): PIO.PIOSEL0 8780 6040h, PIO_NS.PIOSEL0 0780 6040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	DR29SEL[7:0]								DR28SEL[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	DR28SEL[7:0]	DR28 I/O Port Selection	Specify the PIO_x pins for allocation for control by each of the bits n of the 32-bit port. The pins are selected from among those with x in the range from 0 to 63. Note that setting a value of or greater than 64 leads to no allocation of port pins.	R/W
b15 to b8	DR29SEL[7:0]	DR29 I/O Port Selection		R/W
b23 to b16	DR30SEL[7:0]	DR30 I/O Port Selection		R/W
b31 to b24	DR31SEL[7:0]	DR31 I/O Port Selection		R/W

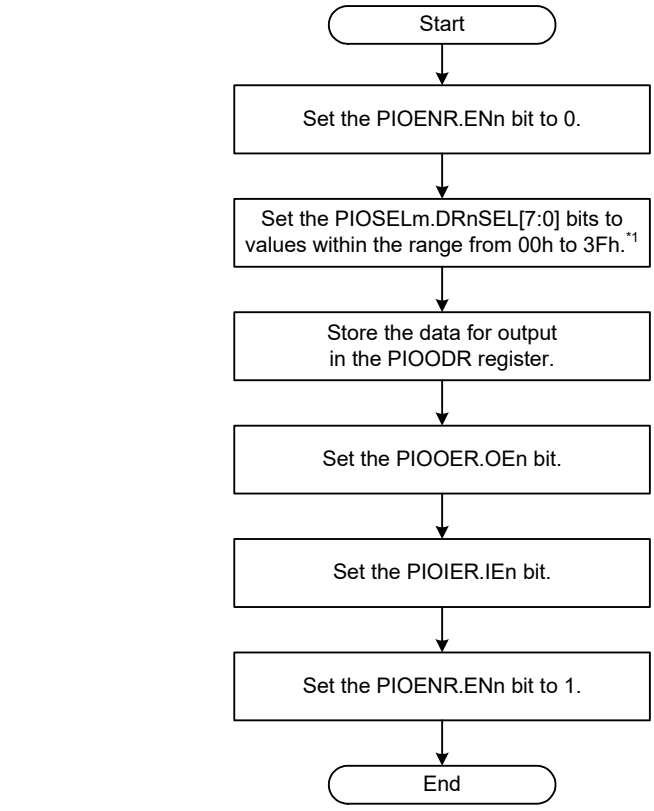
The PIOSEL7 register is used to specify the PIO_x pins (x = 000 to 063) to be controlled by bits 31 to 28 of the 32-bit port. Setting the same value in multiple PIOSELm.DRnSEL[7:0] bits (m = 0 to 7, n = 0 to 31) is prohibited.

23.3 Operation

23.3.1 Input

The states of the PIO target port pins are reflected in the PIOIDR register by making the following settings.

- Set the PIOSELm.DRnSEL[7:0] bits to select the PIO target port pins from among the PIO_x pins (x = 000 to 063).
- Set the PIOENR register to enable the operation of the PIO target port pins.
- Set the PIOIER register to enable input to the PIO target port pins.



23.3.2 Output

The data stored in the PIOODR register are output from the PIO target port pins by making the following settings. The PIOODR register can also be set by using the PIOOSR and PIOORR registers.

- Set the PIOSELm.DRnSEL[7:0] bits to select the PIO target port pins from among the PIO_x pins (x = 000 to 063).
- Set the PIOENR register to enable the operation of the PIO target port pins.
- Set the PIOOER register to enable output from the PIO target port pins.

23.4 Initial Settings

Figure 23.2 shows the procedure for initial settings of PIO pins. The initial settings are required to change the assignment of the PIO target port pins or to change the direction (input/output) of the PIO target port pins.

Note 1. Setting the same value to multiple PIOSELm.DRnSEL[7:0] bits is prohibited.

Figure 23.2 Example Flowchart for PIO Initial Settings

24. General PWM Timer (GPTW)

This MCU has a general PWM timer (GPTW) consisting of sixteen 32-bit timer channels.

24.1 Overview

Table 24.1 lists the specifications for the GPTW, and Table 24.2 shows the functions of the GPTW. Figure 24.1, Figure 24.2 and Figure 24.3 show block diagrams of the GPTW.

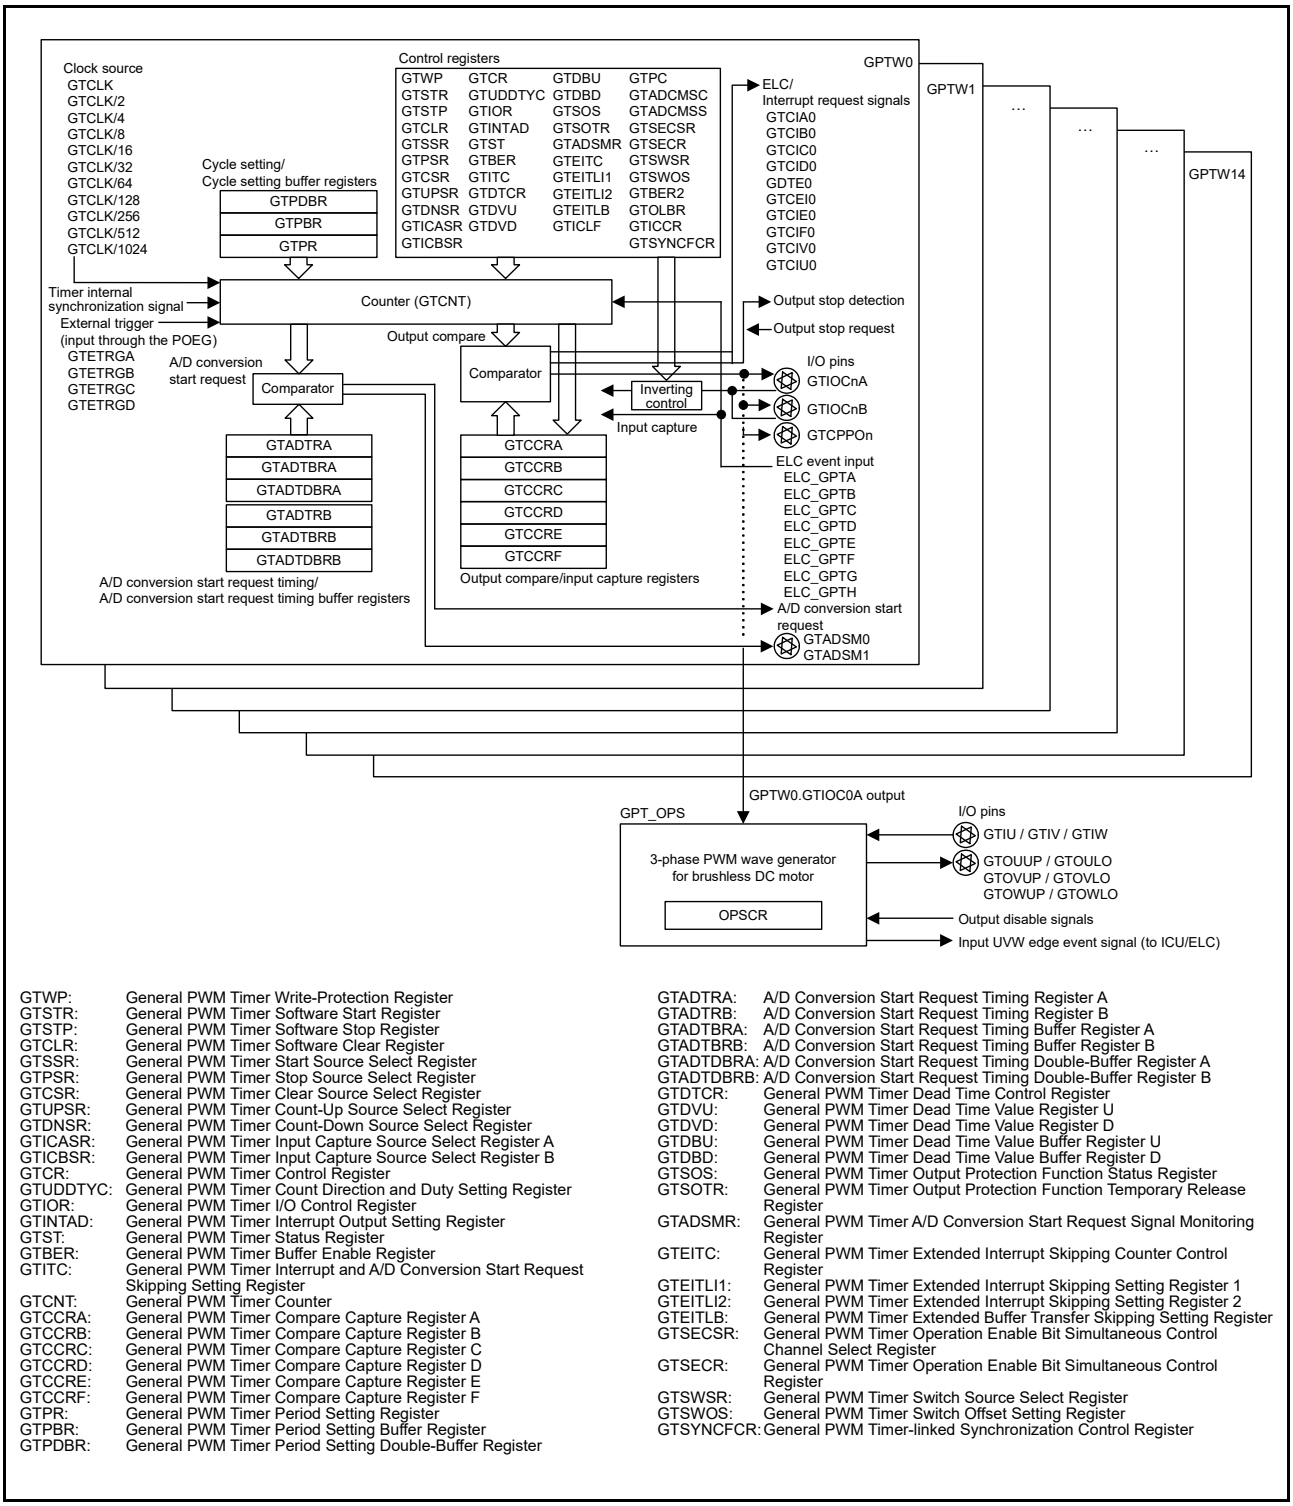
Table 24.1 GPTW Specifications

Item	Description
Functions	• 32 bits × 16 channels • Up-counting or down-counting (sawtooth waves) or up/down-counting (triangle waves) for each counter. • Clock sources independently selectable for each channel • Two I/O pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can take place at crests or troughs, enabling the generation of laterally asymmetrical PWM waveforms. • Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) • Generation of dead times in PWM operation • The direction of counting can be switched in triangle-wave PWM mode. • Complementary PWM control with use of the sawtooth-wave one-shot pulse mode or the triangle-wave PWM mode • Generation of high-accuracy duty cycles in the vicinity of 0% and 100% for complementary PWM output in the complementary PWM mode • In output compare operation, setting compare register is immediately used to generate PWM waveform with dead times • Output with 0% or 100% duty cycle • Simultaneous start/stop/clearing/switch of desired channel counters • Operation of count start/count stop/counter clearing/count switch/up-counting/down-counting/input capture by maximum of eight ELC events based on the ELC setting • Operation of count start/count stop/counter clearing/up-counting/down-counting/input capture by detecting two input signal conditions • Operation of count start/count stop/counter clearing/count switch/up-counting/down-counting/input capture by maximum of four external triggers • Function to control output negation by dead time error and requests for disabling of output from the POEG • A/D conversion start trigger generation function • Event signals for compare match A to F and for overflow/underflow can be output to the ELC • Input capture input can select noise filter function • Cycle count function • External pulse width measuring function • Logical operation between the channel output • Synchronous counter clearing/counter setting/input capture among channels • The timer-linked synchronization signal output function enables synchronous operation between channels synchronized with the timer period, and synchronous operation with other IPs synchronized with the timer period. • GTIOCnA/GTIOCnB pin input/output polarity inversion • Bus clock: PCLKA, GPTW count reference clock: GTCLK*1 Frequency ratio between PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64) when the synchronous clock is in use; PCLKA ≤ GPTCLK when the asynchronous clock is in use • Low power consumption function Module stop state can be set. • Protect Zone filter Security attribute can be set for each register*2

Note 1. Selection of the synchronous clock leads to the selection of PCLKD and selection of the asynchronous clock leads to the selection of GPTCLK as the GPTW count reference clock (GTCLK). Refer to Figure 24.5, Select GPTW Count Reference Clock.

Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Table 24.2 GPTW Functions (1/2)



Item		GPTW0 to GPTW3	GPTW4 to GPTW9	GPTW10 to GPTW14	GPTW15

Figure 24.3 GPTW15 Block Diagram (Sawtooth-wave PWM mode, Sawtooth-wave one-shot pulse mode, and Triangle-wave PWM mode 1/2/3)

In this specification, three consecutive channels to configure complementary PWM mode is defined as complementary PWM mode channel group. The lowest position channel of complementary PWM mode channel group is defined as master channel. The second channel is defined as slave channel 1. The highest position channel is defined as slave channel 2.

b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	PRKEY[7:0]	GTWP Key Code	These bits are read as 0. To modify the WP, STRWP, STPWP, CLRWP, and CMNWP bits, write A5h.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTWP register enables or disables writing to registers to prevent accidental modification.
Protection by the GTWP register only covers the CPU write operation.
Such protection does not cover a register updating generated in coordination with the CPU write.
For registers that are write enabled or disabled depending on the setting of the GTWP register, see section 24.8.1, Write-Protection for Registers.

WP Bit (Register Write Disable)

This bit enables or disables writing to the registers of GPTW.
Registers which are targets of write enable/disable are as follows:
GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC*1, GTADCMSC*1, GTADCMSS, GTSWSR, GTSWOS, GTBER2*1, GTOLBR, GTICCR, GTSYNCFCR, GTSYNCSCR

Note 1. The register write protection constraint applies only to channels GPTW4 to GPTW9.

STRWP Bit (GTSTR.CSTRT Bit Write Disable)

This bit enables or disables starting the update of counter values by writing to the CSTRTn bit corresponding to the channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR registers is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel will not be updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GPTW0.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPTW1.GTSTR.CSTRT0 bit when its current setting is 0 will lead to updating of the value, and the GPTW0.GTCNT counter starts running. When the setting of the GPTW0.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPTW1.GTSTR.CSTRT0 bit when its current setting is 0 will leave the bit with the value 0, and the GPTW0.GTCNT counter will not start running.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

STPWP Bit (GTSTP.CSTOP Bit Write Disable)

This bit enables or disables stopping the counter by writing to the CSTOPn bit corresponding to the channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel will not be updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GPTW0.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPTW1.GTSTP.CSTOP0 bit when its current setting is 0 will lead to updating of the value, and the GPTW0.GTCNT counter is stopped. When the setting of the GPTW0.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPTW1.GTSTP.CSTOP0 bit when its current setting is 0 will leave the bit with the value 0, and the GPTW0.GTCNT counter will not be stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

CLRWP Bit (GTCLR.CCLR Bit Write Disable)

This bit enables or disables updating the value of the CCLRn bit by writing to the bit corresponding to the channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel will not be updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GPTW0.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPTW1.GTCLR.CCLR0 bit when its current setting is 0 will lead to updating of the value, and the GPTW0.GTCNT counter is cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

CMNWP Bit (Common Register Write Disable)

This bit enables or disables updating of values by writing to the SECSELn bit (n = 0 to 15) corresponding to the channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel will not be updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) will be updated.

For example, when the setting of the GPTW0.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPTW1.GTSECSR.SECSEL0 bit will lead to updating of the value of the GPTW0.GTSECSR.SECSEL0 bit. In the same way, writing to the GPTW1.GTSECR register will update the value of the GPTW0.GTSECR register. When the setting of the GPTW0.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPTW1.GTSECSR.SECSEL0 bit will not lead to updating of the value of the GPTW0.GTSECSR.SECSEL0 bit. In the same way, writing to the GPTW1.GTSECR register will not lead to updating of the value of the GPTW0.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

PRKEY[7:0] Bits (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

24.2.2 General PWM Timer Software Start Register (GTSTR)

Address(es): GPTW0.GTSTR 8742 C004h, GPTW1.GTSTR 8742 C104h, GPTW2.GTSTR 8742 C204h, GPTW3.GTSTR 8742 C304h, GPTW4.GTSTR 8742 C404h, GPTW5.GTSTR 8742 C504h, GPTW6.GTSTR 8742 C604h, GPTW7.GTSTR 8742 C704h, GPTW8.GTSTR 8742 C804h, GPTW9.GTSTR 8742 C904h, GPTW10.GTSTR 8742 CA04h, GPTW11.GTSTR 8742 CB04h, GPTW12.GTSTR 8742 CC04h, GPTW13.GTSTR 8742 CD04h, GPTW14.GTSTR 8742 CE04h, GPTW15.GTSTR 8742 CF04h, GPTW0_NS.GTSTR 0742 C004h, GPTW1_NS.GTSTR 0742 C104h, GPTW2_NS.GTSTR 0742 C204h, GPTW3_NS.GTSTR 0742 C304h, GPTW4_NS.GTSTR 0742 C404h, GPTW5_NS.GTSTR 0742 C504h, GPTW6_NS.GTSTR 0742 C604h, GPTW7_NS.GTSTR 0742 C704h, GPTW8_NS.GTSTR 0742 C804h, GPTW9_NS.GTSTR 0742 C904h, GPTW10_NS.GTSTR 0742 CA04h, GPTW11_NS.GTSTR 0742 CB04h, GPTW12_NS.GTSTR 0742 CC04h, GPTW13_NS.GTSTR 0742 CD04h, GPTW14_NS.GTSTR 0742 CE04h, GPTW15_NS.GTSTR 0742 CF04h

b14	CSTRT14	Channel 14 Count Start		R/W
b15	CSTRT15	Channel 15 Count Start		R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSTR register starts the GTCNT counter operation.

A bit position of the GTSTR register indicates a channel number. The GTSTR register of each channel is a common register, and updating the GTSTR register of any channel by setting bits to 1 starts the operation of the GTCNT counters in all the channels corresponding to those bit positions. No change in counter operation or register value occurs when writing 0 to the bit.

In complementary PWM mode, only writing to the CSTRTn bit of the master channel is valid. The bit on the slave channels reflects the bit value of the master channel.

CSTRTn Bit (Channel n Count Start) (n = 0 to 15)

This bit starts the GTCNT counter for channel n.

A read value indicates the state of the counter operation in a corresponding channel (GTCR.CST bit). The bit with 0 indicates that the counter is stopped, while the bit with 1 indicates that the counter is in operation.

24.2.3 General PWM Timer Software Stop Register (GTSTP)

The GTSTP register stops the GTCNT counter operation.

A bit position of the GTSTP register indicates a channel number. The GTSTP register of each channel is a common register, and updating the GTSTP register of any channel by setting bits to 1 stops the operation of the GTCNT counters in all the channels corresponding to those bit positions. No change in counter operation or register value occurs when writing 0 to the bit.

In complementary PWM mode, only writing to the CSTOPn bit of the master channel is valid. The bit on the slave channels reflects the bit value of the master channel.

CSTOPn Bit (Channel n Count Stop) (n = 0 to 15)

This bit stops the GTCNT counter for channel n.

A read value indicates the state of the counter operation in a corresponding channel (inverted GTCR.CST bit). The bit with 0 indicates that the counter is in operation, while the bit with 1 indicates that the counter is stopped.

b31 to b16	—	Reserved	The write value should be 0.	W

The GTCLR register is a write-only register that clears the GTCNT counter.

A bit position of the GTCLR register indicates a channel number. The GTCLR register of each channel is a common register, and updating the GTCLR register of any channel by setting bits to 1 clears the GTCNT counters to 0 in all the channels corresponding to those bit positions. No change in counter operation or register value occurs when writing 0 to the bit.

In complementary PWM mode, only writing to the CCLRn bit of the master channel is valid. The bit on the slave channels reflects the bit value of the master channel.

CCLRn Bit (Channel n Counter Clear) (n = 0 to 15)

When the counting direction flag is set for decrementation (GTST.TUCF flag = 0) with sawtooth-wave mode selected in the GTCR.MD[2:0] or the GTCR.MD[3:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0000 0000h with other settings.

n = 0 to 15

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. These bits are invalid in complementary PWM mode for GPTW4 to GPTW9.

The GTSSR register sets a count start source for the GTCNT counter.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. These bits are invalid in complementary PWM mode for GPTW4 to GPTW9.

Note 3. This bit in each of GPTW0 to GPTW3 and GPTW10 to GPTW15 is reserved, and is read as 0. When writing, write 0 to the bit.

The GTCSR register sets a counter clear source for the GTCNT counter.

Counter clearing can be executed whether the counter is running (the GTCR.CST bit = 1) or stopped (the GTCR.CST bit = 0).

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

CSCMSC[2:0] Bits (Compare Match/Input Capture/Synchronous Counter Clearing Source Counter Clear Enable)

Select whether to enable or disable for the counter clear of the GTCNT counter by compare match/input capture/ synchronous counter clearing group. When counter clearing in response to a match in comparison or input capture is enabled, either can be used as a source for synchronous clearing by inter channel cooperation as described in section 24.3.9.3, Synchronous Clear Operation by Inter Channel Cooperation.

In addition, an input capture triggered by a source from another channel can be used as a source for counter clearing (by setting the GTICASR.ASOC bit or GTICBSR.BSOC bit to 1). Input capture triggered by a source from another channel cannot be used as the synchronous clearing source in interlinked channel operation but can be used as a counter-clearing source for the channel itself.

Since the compare match by the register that is performing the buffer operation (including the wave mode specific case) does not occur, the counter clear enable setting that makes the target register of the buffer operation the compare match factor is invalid.

In complementary PWM mode, the counter clear enable setting for compare match of the GTCCRB register, GTCCRE register, and GTCCRF register is invalid even when the buffer operation is not performed.

CP1CCE Bit (Complementary PWM Mode 1 Crest Source Counter Clear Enable)

Select enable or disable for the counter clear at the crest of complementary PWM mode 1.

To enable this bit, do not set 1 to the PSYE bit of the GTIOR register.

It is valid only for the master channel in complementary PWM mode. The master channel setting also clears the GTCNT counters of the slave channels 1 and 2 in complementary PWM mode.

b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

n = 0 to 15

The GTUPSR register sets a count-up source for the GTCNT counter.

The GTUPSR register is primarily used as described in 24.3.12, Phase Counting Mode, and 24.3.13, External Pulse Width Measuring Function.

When at least one bit among bits in the GTUPSR register is set as 1, counting of the GTCNT counter by the count clock set by the GTCR.TPCS[3:0] bits becomes invalid, and the count-up by a source set as 1 by the GTUPSR register is executed.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

The GTDNSR register sets a count-down source for the GTCNT counter.

The GTDNSR register is primarily used in 24.3.12 Phase Counting Mode and 24.3.13 External Pulse Width Measuring Function.

When at least one bit among bits in the GTDNSR register is set as 1, counting of the GTCNT counter by the count clock set by the GTCR.TPCS[3:0] bits becomes invalid, and the count-down by a source set as 1 by the GTDNSR register is executed.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

The GTICASR register sets an input capture source for the GTCCRA register.
When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.
Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

ASOC Bit (Other Channel Source GTCCRA Input Capture Enable)

This bit enables or disables triggering of input capture of a timer value by the GTCCRA register through interlinked channel operation with the trigger source specified in the GTICCR register in another channel. Input capture triggered by a source in another channel enabled by this bit cannot be used as a source to trigger input capture in another channel through specification by the ICAFA and ICBFA bits in the GTICCR register in its own channel.

n = 0 to 15

The GTICBSR register sets an input capture source for the GTCCRB register.
When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.
Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

BSOC Bit (Other Channel Source GTCCRB Input Capture Enable)

This bit enables or disables triggering of input capture of a timer value by the GTCCRB register through interlinked channel operation with the trigger source specified in the GTICCR register in another channel. Input capture triggered by a source in another channel enabled by this bit cannot be used as a source to trigger input capture in another channel through specification by the ICAFB and ICBFB bits in the GTICCR register in its own channel.

24.2.12 General PWM Timer Switch Source Select Register (GTSWSR)

The GTSWSR register sets a count switch source for the GTCNT counter.
Count switch can be executed whether the counter is running (the GTCR.CST bit = 1) or stopped (the GTCR.CST bit = 0).
Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTWn via the POEG. Set the polarity of these signals with the POEG.

24.2.13 General PWM Timer Switch Offset Setting Register (GTSWOS)

The GTSWOS register is a readable/writable register that sets the offset value of GTCNT counter which is reloaded by count switch operation.

Access in 8-bit or 16-bit units to the GTSWOS register is prohibited, and it should be accessed in 32-bit units.

The GTSWOS register is writable even while the GTCNT counter operation. If the GTSWOS register writing and the event input of count switch occur at the same time, the GTSWOS register setting before writing is reloaded to GTCNT counter. Write the GTSWOS register earlier than the event input of count switch to ensure that the written GTSWOS register value is reloaded by the count switch operation.

The GTCR register controls the GTCNT counter.

CST Bit (Count Start)

This bit controls start or stop for the GTCNT counter.

[Setting conditions]

- When 1 is written to a bit related to a channel number for the GTSTR register while the GTSSR.CSTRT bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input (n = 0 to 3, 10 to 15), which is enabled as a count start source by the GTSSR register, is generated
- 1 is written by software

[Clearing conditions]

- When 1 is written to a bit related to a channel number for the GTSTP register while the GTPSR.CSTOP bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input, which is enabled as a count stop source by the GTPSR register, is generated
- A cycle-counting operation is completed while the GTPC.ASTP bit is 1
- 0 is written by software

AINV Bit (GTIOCnA Input/Output Pin Polarity Reversal Control) (n = 0 to 3, 10 to 15)

This bit selects GTIOCnA input/output pin polarity reversal control.

BINV Bit (GTIOCnB Input/Output Pin Polarity Reversal Control) (n = 0 to 3, 10 to 15)

This bit selects GTIOCnB input/output pin polarity reversal control.

ICDS Bit (Input Capture Operation Select at Count Stop)

This bit selects input capture operation at count stop when the input capture function is selected.

SCGTIOC Bit (GTIOC Input Source Synchronous Clear Enable)

This bit enables or disables the use of counter clearing at the GTIOCnA/GTIOCnB input pin selected by the GTCSR register as a counter clear factor for other channels.

SSCGRP[1:0] Bits (Synchronous Set/Clear Group Select)

This bit selects the synchronization set/clear channel group.

SSCEN Bit (Synchronous Set/Clear Enable)

This bit enables or disables synchronous set/clear.
In complementary PWM mode, slave channels are also controlled by setting the SSCEN bits of the master channel.

MD[2:0] Bits (Mode Select)

These bits select the GPTW operating mode.
Only the MD[2] bit is valid at input capture.
Counting in sawtooth-wave mode is performed with 0 for the MD[2] bit, counting in triangle-wave mode is performed with 1 for the MD[2] bit.
Set the MD[2:0] bits while the GTCNT counter operation is stopped.
During the event count operation (at least one of the bits in the GTUPSR or GTDNSR register is 1), set the MD[2:0] bits to the initial value (000b).

TPCS[3:0] Bits (Timer Prescaler Select)

These bits select a clock for the GTCNT counter. The clock source can be selected independently for each channel.
Set the TPCS[3:0] bits while the GTCNT counter operation is stopped.

CKEG[1:0] Bits (Clock Edge Select)

When GTETRG input is selected by the TPCS[3:0] bits, the CKEG[1:0] bits select the edge of GTETRG input used as the clock of GTCNT counter.
Set the CKEG[1:0] bits only when the GTCNT counter operation is stopped.

SWMD[2:0] Bits (Switch Mode Select)

These bits select the switch mode.
Set the SWMD[2:0] bits while the GTCNT counter operation is stopped.
The setting is invalid except in triangle-wave PWM mode.

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTCR register controls the GTCNT counter.

CST Bit (Count Start)

This bit controls start or stop for the GTCNT counter.

[Setting conditions]

- When 1 is written to a bit related to a channel number for the GTSTR register while the GTSSR.CSTRT bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input (n = 4 to 9), which is enabled as a count start source by the GTSSR register, is generated
- 1 is written by software

[Clearing conditions]

- When 1 is written to a bit related to a channel number for the GTSTP register while the GTPSR.CSTOP bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input, which is enabled as a count stop source by the GTPSR register, is generated
- A cycle-counting operation is completed while the GTPC.ASTP bit is 1
- 0 is written by software

AINV Bit (GTIOCnA Input/Output Pin Polarity Reversal Control) (n = 4 to 9)

This bit selects GTIOCnA input/output pin polarity reversal control.

BINV Bit (GTIOCnB Input/Output Pin Polarity Reversal Control) (n = 4 to 9)

This bit selects GTIOCnB input/output pin polarity reversal control.

ICDS Bit (Input Capture Operation Select at Count Stop)

This bit selects input capture operation at count stop when the input capture function is selected.

SCGTIOC Bit (GTIOC Input Source Synchronous Clear Enable)

This bit enables or disables the use of counter clearing at the GTIOCnA/GTIOCnB input pin selected by the GTCSR register as a counter clear factor for other channels.

SSCGRP[1:0] Bits (Synchronous Set/Clear Group Select)

This bit selects the synchronization set/clear channel group.
In complementary PWM mode, slave channels are also controlled by setting the SSCGRP[1:0] bits of the master channel.

SSCEN Bit (Synchronous Set/Clear Enable)

This bit enables or disables synchronous set/clear.
In complementary PWM mode, slave channels are also controlled by setting the SSCEN bits of the master channel.

MD[3:0] Bits (Mode Select)

These bits select the GPTW operating mode.
In complementary PWM mode, the master channel setting of the MD[3:0] bits is also used to control the slave channels.
Only the MD[3:2] bits are valid at input capture.
Counting in sawtooth-wave mode is performed with 00b for the MD[3:2] bits, counting in triangle-wave mode is performed with 01b for the MD[3:2] bits.
Set the MD[3:0] bits while the GTCNT counter operation is stopped.
During the event count operation (at least one of the bits in the GTUPSR or GTDNSR register is 1), set the MD[3:0] bits to the initial value (0000b).

TPCS[3:0] Bits (Timer Prescaler Select)

These bits select a clock for the GTCNT counter. The clock source can be selected independently for each channel.
Set the TPCS[3:0] bits while the GTCNT counter operation is stopped.

CKEG[1:0] Bits (Clock Edge Select)

When GTETRG input is selected by the TPCS[3:0] bits, the CKEG[1:0] bits select the edge of GTETRG input used as the clock of GTCNT counter.
Set the CKEG[1:0] bits only when the GTCNT counter operation is stopped.

SWMD[2:0] Bits (Switch Mode Select)

These bits select the switch mode.
Set the SWMD[2:0] bits while the GTCNT counter operation is stopped.
The setting is invalid except in triangle-wave PWM mode.

24.2.15 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC)

Address(es): GPTW0.GTUDDTYC 8742 C030h, GPTW1.GTUDDTYC 8742 C130h, GPTW2.GTUDDTYC 8742 C230h, GPTW3.GTUDDTYC 8742 C330h, GPTW4.GTUDDTYC 8742 C430h, GPTW5.GTUDDTYC 8742 C530h, GPTW6.GTUDDTYC 8742 C630h, GPTW7.GTUDDTYC 8742 C730h, GPTW8.GTUDDTYC 8742 C830h, GPTW9.GTUDDTYC 8742 C930h, GPTW10.GTUDDTYC 8742 CA30h, GPTW11.GTUDDTYC 8742 CB30h, GPTW12.GTUDDTYC 8742 CC30h, GPTW13.GTUDDTYC 8742 CD30h, GPTW14.GTUDDTYC 8742 CE30h, GPTW15.GTUDDTYC 8742 CF30h,

R/W
b28	OABDTYT	GTIOCnm Pin Output 0%/ 100% Duty Cycle Setting Reflection Timing	0: A new output duty-cycle setting is reflected in a trough 1: A new output duty-cycle setting is reflected in a trough or crest The setting “1” is prohibited except in the triangle-wave mode.	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

n = 0 to 15; m = A, B

The GTUDDTYC register sets the count direction (up-counting/down-counting) for the GTCNT counter and configures duty setting for output from the GTIOCnA and GTIOCnB pins.
The setting is invalid during the event count operation, sawtooth-wave PWM mode 2, and complementary PWM mode.

(1) Setting of Count Direction

- In sawtooth-wave mode

When the UD bit value is set to 0 during up-counting, the count direction is changed at an overflow (count clock when the GTCNT counter value is equal to the GTPR register value). When the UD bit value is set to 1 during down-counting, the count direction is changed at an underflow (count clock when the GTCNT counter value is equal to 0000 0000h).
If the UD bit value is changed from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up-counting and the count direction is changed at an overflow (count clock when the GTCNT counter value is equal to the GTPR register value).
If the UD bit value is changed from 0 to 1 with the UDF bit being 0 and while counting is stopped, the counter starts down-counting and the count direction is changed at an underflow (count clock when the GTCNT counter value is equal to 0000 0000h).
When the UDF bit is set to 1 while counting is stopped, the UD bit value at that time is reflected in the count direction when counting starts.

- In triangle-wave mode

Even if the UD bit value is changed during counting, the change will not be reflected in the count direction.
If the UD bit value is modified while the UDF bit is 0 and counting is stopped, the change will not be reflected in the count direction when counting starts. If the UDF bit is set to 1 while counting is stopped, the UD bit value at that time is reflected in the count direction when counting starts.

UD Bit (Count Direction Setting)

This bit sets the count direction (up-counting or down-counting) for the GTCNT counter.

UDF Bit (Forcible Count Direction Setting)

This bit forcibly sets the count direction when the GTCNT counter starts operation as the UD bit value.
Only 0 should be written to this bit during count operation.
When 1 has been written to this bit while counting is stopped, this bit should be returned to 0 before counting starts.

(2) Setting of Output Duty

- In sawtooth-wave mode

When the OADTY[1:0]/OBDTY[1:0] bits are changed during the up-count operation, the updated duty-cycle setting applied at an overflow.
When the OADTY[1:0]/OBDTY[1:0] bits are changed during the down-count operation, the updated duty-cycle setting applied at an underflow.
If the OADTYF/OBDTYF bit is 0 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is not applied in the first count operation, but it is applied at an overflow when counting up and at an underflow when counting down.
If the OADTYF/OBDTYF bit is 1 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is immediately applied in the first count operation.

- In triangle-wave mode

When the OADTY[1:0]/OBDTY[1:0] bits are changed during the count operation, the updated duty-cycle setting is applied at an underflow.
If the OADTYF/OBDTYF bit is 0 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is not applied in the first count operation, but it is applied at an underflow.

If the OADTYF/OBDTYF bit is 1 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is immediately applied in the first count operation.

In both sawtooth-wave mode and triangle-wave mode, if the duty of the first cycle after the count starts is configured using the OADTY[1:0]/OBDTY[1:0] bits while the OADTYF/OBDTYF bit is 1 and the count operation is stopped, then even if the OADTYF/OBDTYF bit is changed to 0 and the OADTY[1:0]/OBDTY[1:0] bits are reconfigured, after the count starts the duty for the first and second cycles will remain as the values set during the count stop.

OmDTY[1:0] Bits (GTIOCnm Pin Output Duty Setting) (n = 0 to 15; m = A, B)

These bits set the output of the duty cycle (0%, 100% or compare match control) on the GTIOCnm pin.

OmDTYF Bit (GTIOCnm Pin Output Duty Forced Setting) (n = 0 to 15; m = A, B)

This bit forcibly specifies the duty cycle at the start of the GTCNT counter in the OmDTY[1:0] bits.
Always write 0 to the bit during count operation.
When writing 1 to the bit while the count operation is stopped, reset the bit to 0 by the end of the first cycle after the count operation starts and specify the next cycle setting.

OmDTYR Bit (Output after Release of GTIOCnm Pin Output 0%/100% Duty Cycle Settings) (n = 0 to 15; m = A, B)

When the GTIOCnm pin setting is changed from 0% or 100% duty cycle to compare match and the GTIOR.GTIOm[3:2] bits are set to 00b (output maintained at the end of the cycle) or 11b (output toggled), this bit specifies the value to maintain or toggle.
The GPTW internally continues to perform compare match operation during duty-cycle 0% or 100% operation. If the OmDTYR bit is 1, the value at the end of a cycle of compare match operation is applied to the GTIOm[3:2] bits setting.

OABDTYT Bit (GTIOCnm Pin Output 0%/100% Duty Cycle Setting Reflection Timing) (n = 0 to 15; m = A, B)

Select the timing of reflection of the 0% or 100% duty-cycle setting for the GTIOCnm pin in the triangle-wave mode. When the setting of the OABDTYT bit is 0, a new output duty-cycle setting in the GTUDDTYC.OADTY[1:0] or OBDTY[1:0] bits is reflected in response to an underflow. When the setting of the OABDTYT bit is 1, a new output duty-cycle setting in the GTUDDTYC.OADTY[1:0] or OBDTY[1:0] bits is reflected in response to an underflow or at the peak of the triangle wave.

n = 0 to 15

Note 1. This bit in each of GPTW0 to GPTW3 and GPTW10 to GPTW15 is reserved, and is read as 0. When writing, write 0 to the bit.

The GTIOR register configures the functions of the GTIOCnA, GTIOCnB, and GTCPPOn pins.

GTIOA[4:0] Bits (GTIOCnA Pin Function Select) (n = 0 to 15)

These bits select the GTIOCnA pin function. For details, see Table 24.4.

CPSCIR Bit (Complementary PWM Mode Initial Output at Synchronous Clear Disable)

This bit selects the output waveform to be generated when synchronous clear occurs in complementary PWM mode. The initial output is disabled by this function only when synchronous clear occurs in the trough in complementary PWM mode. If a synchronous clear occurs at any other time, the initial value set by the GTIOA[4]/GTIOB[4] bits is output regardless of the CPSCIR bit setting. In addition, the initial value set by the GTIOA[4]/GTIOB[4] bits is output even when the synchronous clear occurs in the trough immediately after the count starts.

OADFLT Bit (GTIOCnA Pin Output Value Setting at the Count Stop) (n = 0 to 15)

This bit sets whether the GTIOCnA pin outputs high or low when counting is stopped.

OAHLD Bit (GTIOCnA Pin Output Retention at the Start/Stop Count) (n = 0 to 15)

This bit specifies whether the GTIOCnA pin output level is retained or the level depends on the register setting when counting is started or stopped.

[When the OAHLD bit is set to 0]

- The value specified by the GTIOA[4] bit is output when counting starts.
- The value specified by the OADFLT bit is output when counting stops.
- If the OADFLT bit is modified while counting is stopped, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

OAE Bit (GTIOCnA Pin Output Enable) (n = 0 to 15)

This bit enables or disables output on the GTIOCnA pin.
When the GTCCRA register is used as an input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit setting.

OADF[1:0] Bits (GTIOCnA Pin Negate Value Setting) (n = 0 to 15)

These bits specify the value for output from the GTIOCnA pin in response to a request to disable output from the POEG.

OAEOCD Bit (GTCCRA Register Compare Match Cycle End Output Invalidate)

This bit selects whether to disable or enable the GTIOA[3:2] bit setting when the cycle end coincides with the timing of the compare match of the GTCCRA register in sawtooth-wave PWM mode 1 and 2.
If this bit is 1 (setting not applied), the GTIOCnA pin maintains the output level when the cycle end and the GTCCRA compare match timing coincide.

PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables output from GTCPPOn pins synchronized with the PWM cycle. The output signal toggles at crest/trough/GTCNT counter clear in complementary PWM mode or in triangle-wave mode, and at the end of the cycle in sawtooth-wave mode. The initial output of the GTCPPOn pins is low, and changes to high at count start.

NFAEN Bit (GTIOCnA Pin Input Noise Filter Enable) (n = 0 to 15)

This bit sets enable or disable of the noise filter function for the GTIOCnA pin input. Switch these bits while the corresponding pin function for the timer I/O control register is set as the output compare function, because unintended internal edge may be generated when these bits are switched.

NFCSA[1:0] Bits (GTIOCnA Pin Input Noise Filter Sampling Clock Select) (n = 0 to 15)

These bits set a sampling clock for the noise filter to the GTIOCnA pin input. Set the input capture function after waiting two cycles for the sampling clock cycle following the setting of these bits.

GTIOB[4:0] Bits (GTIOCnB Pin Function Select) (n = 0 to 15)

These bits select the GTIOCnB pin function. For details, see Table 24.4.
In sawtooth-wave PWM mode 2, only the GTIOB[1:0] bits take effect, and the GTIOCnA pin output is selected instead of the GTIOCnB pin by the GTCCRB register compare match.

OBDFLT Bit (GTIOCnB Pin Output Value Setting at the Count Stop) (n = 0 to 15)

This bit sets whether the GTIOCnB pin outputs high or low when counting is stopped.

OBHLD Bit (GTIOCnB Pin Output Retention at the Start/Stop Count) (n = 0 to 15)

This bit specifies whether the GTIOCnB pin output level is retained or the level depends on the register setting when counting is started or stopped.
[When the OBHLD bit is set to 0]

- The value specified by the GTIOB[4] bit is output when counting starts.
- The value specified by the OBDFLT bit is output when counting stops.
- If the OBDFLT bit is modified while counting is stopped, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

OBE Bit (GTIOCnB Pin Output Enable) (n = 0 to 15)

This bit enables or disables output on the GTIOCnB pin.
When the GTCCRB register is used as an input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit setting.

OBDF[1:0] Bits (GTIOCnB Pin Negate Value Setting) (n = 0 to 15)

These bits specify the value for output from the GTIOCnB pin in response to a request to disable output from the POEG.

OBEOCD Bit (GTCCRB Register Compare Match Cycle End Output Invalidate)

This bit selects whether to disable or enable the GTIOB[3:2] bit setting for sawtooth-wave PWM mode 1 or the GTIOA[3:2] bit setting for sawtooth-wave PWM mode 2 when the cycle end coincides with the timing of the compare match of the GTCCRB register.
If this bit is 1 (setting not applied), the GTIOCnB pin or GTIOCnA pin maintains the output level when the cycle end and the GTCCRB compare match timing coincide in sawtooth-wave PWM mode 1 or 2 respectively.

NFBEN Bit (GTIOCnB Pin Input Noise Filter Enable) (n = 0 to 15)

This bit sets enable or disable of the noise filter function for the GTIOCnB pin input. Switch these bits while the corresponding pin function for the timer I/O control register is set as the output compare function, because unintended internal edge may be generated when these bits are switched.

NFCSB[1:0] Bits (GTIOCnB Pin Input Noise Filter Sampling Clock Select) (n = 0 to 15)

These bits set a sampling clock for the noise filter to the GTIOCnB pin input. Set the input capture function after waiting two cycles for the sampling clock cycle following the setting of these bits.

Table 24.4 Settings of GTIOA[4:0] Bits (GTIOB[4:0] Bits) (Sawtooth-wave mode, Triangle-wave mode) (1/2)

GTIOA[4:0] (GTIOB[4:0]) Bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	0	0	0	Initial output is Low.	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Table 24.4 Settings of GTIOA[4:0] Bits (GTIOB[4:0] Bits) (Sawtooth-wave mode, Triangle-wave mode) (2/2)

GTIOA[4:0] (GTIOB[4:0]) Bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
1	0	0	0	0	Initial output is High.	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note: In sawtooth-wave mode, “end of a cycle” refers to an overflow (the value of the GTCNT counter changing from that of the GTPR register to 0000 0000h in up-counting), an underflow (the value of the GTCNT counter changing from 0000 0000h to that of the GTPR register in down-counting), or counter clearing. It refers to a trough in triangle-wave mode (the value of the GTCNT counter changing from 0000 0000h to 0000 0001h)).

Note: When the timing of an end of a cycle and the timing of a GTCCRA/GTCCRB register compare match are the same in a compare-match operation, if the OAEOCD and OBEOCD bits are set to 0 and the end of cycle output is enabled, the b3 and b2 settings are given priority in sawtooth-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note: During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), the b3 and b2 settings become invalid.

Note: In sawtooth-wave PWM mode 2, the GTIOB[4:2] bits are invalid. Since only the GTIOCnA pin is the output pin, set the GTIOA[4] bit for the initial output. Set the GTIOA[3:2] bits for output at the end of the cycle.

Table 24.5 Settings of GTIOA[4:0] Bits (GTIOB[4:0] Bits) (Complementary PWM mode)

GTIOA[4:0] (GTIOB[4:0]) Bits					Function		
					Initial Output/Active Level	Compare Match Output (Up-counting)	Compare Match Output (Down-counting)
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	1	1	0	Initial output is Low. Active level is High.	Low output	High output
0	1	0	0	1		High output	Low output
1	0	1	1	0	Initial output is High. Active level is Low.	Low output	High output
1	1	0	0	1		High output	Low output

Note: In complementary PWM mode, the only values that can be set in the GTIOA[4:0] bits are 01001b, and 10110b. Setting other values is prohibited.

Note: In complementary PWM mode, the only values that can be set in the GTIOB[4:0] bits are 00110b, and 11001b. Setting other values is prohibited.

Note: In complementary PWM mode, setting the GTIOB[4:0] bits does not use compare match of the GTCCRB register. The combination of counter and register that is the target of compare match depends on the operation period of complementary PWM mode. For details, see section 24.3.3.7, Complementary PWM mode 1, 2, 3.

24.2.17 General PWM Timer Interrupt Output Setting Register (GTINTAD)

Address(es): GPTW0.GTINTAD 8742 C038h, GPTW1.GTINTAD 8742 C138h, GPTW2.GTINTAD 8742 C238h, GPTW3.GTINTAD 8742 C338h, GPTW4.GTINTAD 8742 C438h, GPTW5.GTINTAD 8742 C538h, GPTW6.GTINTAD 8742 C638h, GPTW7.GTINTAD 8742 C738h, GPTW8.GTINTAD 8742 C838h, GPTW9.GTINTAD 8742 C938h, GPTW10.GTINTAD 8742 CA38h, GPTW11.GTINTAD 8742 CB38h, GPTW12.GTINTAD 8742 CC38h, GPTW13.GTINTAD 8742 CD38h, GPTW14.GTINTAD 8742 CE38h, GPTW15.GTINTAD 8742 CF38h, GPTW0_NS.GTINTAD 0742 C038h, GPTW1_NS.GTINTAD 0742 C138h, GPTW2_NS.GTINTAD 0742 C238h, GPTW3_NS.GTINTAD 0742 C338h, GPTW4_NS.GTINTAD 0742 C438h, GPTW5_NS.GTINTAD 0742 C538h, GPTW6_NS.GTINTAD 0742 C638h, GPTW7_NS.GTINTAD 0742 C738h, GPTW8_NS.GTINTAD 0742 C838h, GPTW9_NS.GTINTAD 0742 C938h, GPTW10_NS.GTINTAD 0742 CA38h, GPTW11_NS.GTINTAD 0742 CB38h, GPTW12_NS.GTINTAD 0742 CC38h, GPTW13_NS.GTINTAD 0742 CD38h, GPTW14_NS.GTINTAD 0742 CE38h, GPTW15_NS.GTINTAD 0742 CF38h

The GTINTAD register enables or disables interrupt request, A/D conversion start request, and output stop detection.

GTINTA Bit (GTCCRA Register Compare Match/Input Capture Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRA register compare match/input capture (GTCIA).

GTINTB Bit (GTCCRB Register Compare Match/Input Capture Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRB register compare match/input capture (GTCIB).

GTINTC Bit (GTCCRC Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRC register compare match (GTCIC).

GTINTD Bit (GTCCRD Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRD register compare match (GTCID).

GTINTE Bit (GTCCRE Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRE register compare match (GTCIE).

GTINTF Bit (GTCCRF Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRF register compare match (GTCIF).

GTINTPR[1:0] Bits (GTPR Register Compare Match Interrupt Enable)

These bits enable or disable interrupt requests by a GTPR register compare match (GTCNT counter overflow) and those by a GTCNT counter underflow (GTCIV/GTCIU).

SCFA Bit (GTCCRA Register Compare Match/Input Capture Source Synchronous Clear Enable)

This bit enables or disables the GTCCRA register compare match/input capture as a clearing factor for other channels.

SCFB Bit (GTCCRB Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRB register compare match/input capture as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFC Bit (GTCCRC Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRC register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFD Bit (GTCCRD Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRD register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFE Bit (GTCCRE Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRE register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFF Bit (GTCCRF Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRF register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFPO Bit (Overflow Source Synchronous Clear Enable)

This bit enables or disables overflow as a clearing factor for other channels.
In complementary PWM mode, this setting is valid only for the master channel.

SCFPU Bit (Underflow Source Synchronous Clear Enable)

This bit enables or disables underflow as a clearing factor for other channels.
In complementary PWM mode, this setting is valid only for the master channel.

ADTRAUEN Bit (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRA register compare matches during GTCNT counter up-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

ADTRADEN Bit (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRA register compare matches during GTCNT counter down-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

ADTRBUEN Bit (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRB register compare matches during GTCNT counter up-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

ADTRBDEN Bit (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRB register compare matches during GTCNT counter down-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

GRP[1:0] Bits (Output Stop Group Select)

Select the group to detect disabling of output from the GPTW to the POEG and to request of disabling of output from the POEG to the GPTW.
Each signal indicating detection of disabling in response to a dead-time error or simultaneous driving of outputs to the high or low level is output to the group selected in the GRP[1:0] bits while the respective output stop detection enable bits are 1.
Requests to disabling output from the POEG for the group selected in the GRP[1:0] bits can be monitored with the GTST.ODF flag.
Set the GRP[1:0] bits while both of the OAE and OBE bits in the GTIOR register are set to 0.

GRPDTE Bit (Dead Time Error Output Stop Detection Enable)

This bit enables or disables output stop detection due to a dead time error.
The dead time error output stop detection is not generated during the event count operation.

GRPABH Bit (Simultaneous High Output Stop Detection Enable)

This bit enables or disables output stop detection, which occurs when both GTIOCnA and GTIOCnB pins become high simultaneously.

GRPABL Bit (Simultaneous Low Output Stop Detection Enable)

This bit enables or disables output stop detection, which occurs when both GTIOCnA and GTIOCnB pins become low simultaneously.

GTINTPC Bit (Cycle Count End Interrupt Enable)

This bit enables or disables the request of the cycle count end interrupt (GTCEI).

24.2.18 General PWM Timer Status Register (GTST)

Address(es): GPTW0.GTST 8742 C03Ch, GPTW1.GTST 8742 C13Ch, GPTW2.GTST 8742 C23Ch, GPTW3.GTST 8742 C33Ch, GPTW4.GTST 8742 C43Ch, GPTW5.GTST 8742 C53Ch, GPTW6.GTST 8742 C63Ch, GPTW7.GTST 8742 C73Ch, GPTW8.GTST 8742 C83Ch, GPTW9.GTST 8742 C93Ch, GPTW10.GTST 8742 CA3Ch, GPTW11.GTST 8742 CB3Ch, GPTW12.GTST 8742 CC3Ch, GPTW13.GTST 8742 CD3Ch, GPTW14.GTST 8742 CE3Ch, GPTW15.GTST 8742 CF3Ch, GPTW0_NS.GTST 0742 C03Ch, GPTW1_NS.GTST 0742 C13Ch, GPTW2_NS.GTST 0742 C23Ch, GPTW3_NS.GTST 0742 C33Ch, GPTW4_NS.GTST 0742 C43Ch, GPTW5_NS.GTST 0742 C53Ch, GPTW6_NS.GTST 0742 C63Ch, GPTW7_NS.GTST 0742 C73Ch, GPTW8_NS.GTST 0742 C83Ch, GPTW9_NS.GTST 0742 C93Ch, GPTW10_NS.GTST 0742 CA3Ch, GPTW11_NS.GTST 0742 CB3Ch, GPTW12_NS.GTST 0742 CC3Ch, GPTW13_NS.GTST 0742 CD3Ch, GPTW14_NS.GTST 0742 CE3Ch, GPTW15_NS.GTST 0742 CF3Ch

b30	OABLF	Simultaneous Low Output Flag	0: No simultaneous generation of 0 both for the GTIOCnA and GTIOCnB pins has occurred. 1: A simultaneous generation of 0 both for the GTIOCnA and GTIOCnB pins has occurred.	R
b31	PCF	Cycle Count End Flag	0: No cycle count end has occurred. 1: A cycle count end has occurred.	R/(W) *1

n = 0 to 15

Note 1. Only 0 can be written to clear the flag. When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.

The GTST register indicates the status of the GPTW.

TCFA Flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of the GTCCRA register.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- The GTCNT counter value is transferred to the GTCCRA register by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB Flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of the GTCCRB register.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- The GTCNT counter value is transferred to the GTCCRB register by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC Flag (Compare Match Flag C)

The TCFC flag indicates the status for the compare match of the GTCCRC register.

When the GTCCRC register performs buffer operation, the GTCCRC register doesn't perform compare match.

[Setting conditions]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)

- GTBER.CCRA[1:0] = 01b, 10b, 11b (the GTCCRC register performs buffer operation).

TCFD Flag (Compare Match Flag D)

The TCFD flag indicates the status for the compare match of the GTCCRD register.
When the GTCCRD register performs buffer operation, the GTCCRD register doesn't perform compare match.
[Setting conditions]

- GTCNT = GTCCRD

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (the GTCCRD register performs buffer operation).

TCFE Flag (Compare Match Flag E)

The TCFE flag indicates the status for the compare match of the GTCCRE register.
When the GTCCRE register performs buffer operation, the GTCCRE register doesn't perform compare match.
[Setting conditions]

- GTCNT = GTCCRE

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (the GTCCRE register performs buffer operation).

TCFF Flag (Compare Match Flag F)

The TCFF flag indicates the status for the compare match of the GTCCRF register.
When the GTCCRF register performs buffer operation, the GTCCRF register doesn't perform compare match.
[Setting conditions]

- GTCNT = GTCCRF

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode).
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (the GTCCRF register performs buffer operation).

TCFPO Flag (Overflow Flag)

The TCFPO flag indicates whether an overflow or crest has occurred.
[Setting conditions]

- In sawtooth-wave mode, an overflow (the GTCNT counter changes from the GTPR register value to 0 in up-counting) has occurred.
- In triangle-wave mode, a crest (the GTCNT counter changes from the GTPR register value to GTPR – 1) has occurred.
- In counting by hardware sources, an overflow (the GTCNT counter changes from the GTPR register value to 0 in

up-counting) has occurred.
[Clearing condition]

- 0 is written to this flag.

TCFPU Flag (Underflow Flag)

The TCFPU flag indicates whether an underflow or trough has occurred.
[Setting conditions]

- In sawtooth-wave mode, an underflow (the GTCNT counter changes from 0 to the GTPR register value in down-counting) has occurred.
- In triangle-wave mode, a trough (the GTCNT counter changes from 0 to 1) has occurred.
- In counting by hardware sources, an underflow (the GTCNT counter changes from 0 to the GTPR register value in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

ITCNT[2:0] Bits (GTCIV/GTCIU Interrupt Skipping Count Counter)

When the GTCIV/GTCIU interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter is incremented by 1 every time the GTCIV/GTCIU interrupt source is generated.
These bits are operated independently of the extended interrupt skipping by the GTEITC register.
[Clearing conditions]

- The GTCIV/GTCIU interrupt skipping function is not used (the GTITC.IVTT[2:0] bits are 000b when the IVTC[1:0] bits are 00b).
- The GTCIV/GTCIU interrupt skipping count matches the specified count (the ITCNT[2:0] bits match the skipping count specified by the IVTT[2:0] bits).
- When the count operation is stopped.

TUCF Flag (Count Direction Flag)

This flag indicates the count direction of the GTCNT counter.
This flag indicates 1 when in up-counting and indicates 0 when in down-counting during the event count operation.

ADTRAUF Flag (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in up-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRA register in up-counting

[Clearing conditions]

- 0 is written to the ADTRAUF flag

ADTRADF Flag (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in down-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRA register in down-counting

[Clearing conditions]

- 0 is written to the ADTRADF flag

ADTRBUF Flag (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in up-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRB register in up-counting

[Clearing conditions]

- 0 is written to the ADTRBUF flag

ADTRBDF Flag (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in down-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRB register in down-counting

[Clearing conditions]

- 0 is written to the ADTRBDF flag

ODF Flag (Output Stop Request Flag)

This flag monitors the output stop request for the group selected by the GTINTAD.GRP[1:0] bits.
Even if a request to disable output is de-asserted after the request is made, releasing the control of negation on the PWM pins has to wait until the end of the PWM cycle.

DTEF Flag (Dead Time Error Flag)

This flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the count period.
This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is back within the period. This flag can only be read from. (Writing 0 to clear the flag is not allowed.)
When an interrupt by the DTEF flag is enabled (when the GTINTAD.GRPDTE bit is 1), the DTEF flag is output as the output stop detection to the POEG, and an GDTE interrupt is generated whenever the DTEF flag changes from 0 to 1.
[Setting condition]

- When a change point of the waveform after the automatic setting of dead time has exceeded the count period (in the following cases)
  Up-counting in triangle-wave mode: GTCCRA register – GTDVU register ≤ 0
  Down-counting in triangle-wave mode: GTCCRA register – GTDVD register < 0
  Up-counting in sawtooth-wave one-shot pulse mode:
  When GTCCRA register – GTDVU register < 0, or GTCCRA register + GTDVD register > GTPR register
  Down-counting in sawtooth-wave one-shot pulse mode:
  When GTCCRA register + GTDVU register > GTPR register, or GTCCRA register – GTDVD register < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the count period.

OABHF Flag (Simultaneous High Output Flag)

This flag indicates that both the GTIOCnA and GTIOCnB pins output 1 simultaneously.
When either the GTIOCnA or GTIOCnB pin changes to 0, the flag is set to 0.
This flag is read-only. (Writing 0 to clear the flag is not allowed.)
When the output stop detection by the OABHF flag is enabled (the GTINTAD.GRPABH bit is 1), the OABHF flag is output as the output stop detection to the POEG. The GPTW does not have an interrupt triggered by simultaneous High outputs. Use the interrupt function in the POEG if this is required.
[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 simultaneously while both the OAE and OBE bits in the GTIOR register are set to 1.

[Clearing conditions]

- The GTIOCnA and GTIOCnB pins output different values while both the OAE and OBE bits are set to 1.
- The GTIOCnA and GTIOCnB pins output 0 simultaneously while both the OAE and OBE bits are set to 1.
- At least one of the OAE and OBE bits is set to 0.

OABLF Flag (Simultaneous Low Output Flag)

This flag indicates that both the GTIOCnA and GTIOCnB pins output 0 simultaneously.
When either the GTIOCnA or GTIOCnB pin changes to 1, the flag is set to 0.
This flag is read-only. (Writing 0 to clear the flag is not allowed.)
When the output stop detection by the OABLF flag is enabled (the GTINTAD.GRPABL bit is 1), the OABLF flag is output as the output stop detection to the POEG. The GPTW does not have an interrupt triggered by simultaneous Low outputs. Use the interrupt function in the POEG if this is required.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 simultaneously while both the OAE and OBE bits in the GTIOR register are set to 1.

[Clearing conditions]

- The GTIOCnA and GTIOCnB pins output different values while both the OAE and OBE bits are set to 1.
- The GTIOCnA and GTIOCnB pins output 1 simultaneously while both the OAE and OBE bits are set to 1.
- At least one of the OAE and OBE bits is set to 0.

Comparison for the output value to generate the OABHF or OABLF flag uses the value before the compare match output (PWM output) is masked by the output negate function. Even during the output negate condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

PCF Flag (Cycle Count End Flag)

This status flag indicates the end of the cycle count operation.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing conditions]

- 0 is written to the PCF flag

24.2.19 General PWM Timer Buffer Enable Register (GTBER)

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTBER register makes settings for buffer operation.
Set the GTBER register except the BD[3:0] bits while the GTCNT counter is stopped.

BD[0] Bit (GTCCRA/GTCCRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTCCRA, GTCCRC, and GTCCRD registers together and buffer operation using the GTCCRB, GTCCRE, and GTCCRF registers together.
Even though the BD[0] bit is set to 0, buffer operation in the GTCCRB register is not performed if the GTDTCR.TDE bit is set to 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode. Instead, the compare match value for negative-phase waveform with dead time is set automatically.
In complementary PWM mode, it is valid only for the buffer operation of GTCCRC register and GTCCRE register. The buffer operation of GTCCRA registers cannot be disabled. No buffer transfer to GTCCRB is performed in

complementary PWM mode. Buffer operation of GTCCRE register and GTCCRF register is enabled/disabled by GTBER2.CP3DB bit.
If 1 is written to the SBDCE or SBDCD bit in the GTSECR register, a value can be set for the BD[0] bit of the channel whose corresponding bit in the GTSECSR register is 1.
When the DBRTECm (m = A, B) bit is 1, setting the BD[0] bit to 1 while the mode of operation is sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3 results in transfer from the intermediate buffer to the GTCCRm register.

BD[1] Bit (GTPR Register Buffer Operation Disable)

This bit disables buffer operation using the GTPR, GTPBR, and GTPDBR registers together.
A value for the BD[1] bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDPE or SBDPD bit in the GTSECR register.
In complementary PWM mode, the slave channel is also controlled by setting the BD[1] bit of the master channel.

BD[2] Bit (GTADTRA/GTADTRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTADTRA, GTADTBRA, and GTADTDBRA registers together and buffer operation using the GTADTRB, GTADTBRB, and GTADTDBRB registers together.
The setting is invalid during the event count operation, and the buffer operation using the GTADTRA and GTADTRB registers is not performed.
A value for the BD[2] bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDAE or SBDAD bit in the GTSECR register.

BD[3] Bit (GTDVU/GTDVD Registers Buffer Operation Disable)

In sawtooth-wave PWM mode 1, sawtooth-wave one-shot pulse mode or triangle-wave PWM mode, this bit disables buffer operation using the GTDVU and GTDBU registers together and buffer operation using the GTDVD and GTDBD registers together.
Even though the BD[3] bit is set to 0, buffer operation in the GTDVD register is not performed if the GTDTCR.TDFER bit is set to 1. Instead, the value in the GTDVU register is set automatically.
In sawtooth-wave PWM mode 2 or complementary PWM mode, this bit is invalid and GTDVU and GTDVD registers don’t perform buffer operation.
The setting is invalid during the event count operation, and the buffer operation using the GTDVU and GTDVD registers is not performed.
A value for the BD[3] bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDDE or SBDDD bit in the GTSECR register.

DBRTECm Bit (GTCCRm Register Double Buffer Repeat Operation Enable) (m = A, B)

This setting enables the operation to repeat a transfer to the GTCCRm register from the intermediate buffer by cycle during the buffer transfer disable period when performing the double buffer operation using the GTCCRm register. It is valid in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3.
The disabling period of buffer transfer indicates the period that buffer transfer is stopped by setting of the BD[0] bit (CPU writing or simultaneous buffer operation control by the GTSECSR register) and the period for buffer transfer extended skipping (except the case for skipping by counting both crests and troughs) by the GTEITLB register.
When the DBRTECm bit is 1, writing by the CPU to the GTCCRm register sets the same value in temporary register x (x = C, E). The value of the GTCCRx (x = C, E) register is also transferred to the temporary register x (x = C, E) by forcible buffer transfer.

CCRA[1:0] Bits (GTCCRA Register Buffer Operation)

These bits set buffer operation with the GTCCRA, GTCCRC, and GTCCRD registers combined. When buffer operation is restricted by the operating mode set in the GTCR register, the GTCR register setting is given priority.*1

CCRB[1:0] Bits (GTCCRB Register Buffer Operation)

These bits set buffer operation with the GTCCRB, GTCCRE, and GTCCRF registers combined. When buffer operation is restricted by the operating mode set in the GTCR register, the GTCR register setting is given priority.*1

PR[1:0] Bits (GTPR Register Buffer Operation)

These bits set buffer operation with the GTPR, GTPBR, and GTPDBR registers combined.
The setting is invalid in complementary PWM mode. Buffer operation unique to complementary PWM mode is performed regardless of the setting value of the PR[1:0] bits.

CCRSWT Bit (GTCCRA and GTCCRB Registers Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs buffer transfer of the GTCCRA and GTCCRB registers. This bit automatically returns to 0 after the writing of 1. This bit is read as 0.
This bit is valid only when counting is stopped with compare match operation specified.
The setting is invalid in complementary PWM mode.

ADTTA[1:0] Bits (GTADTRA Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRA, GTADTBRA, and GTADTDBRA registers.
The setting is invalid during the event count operation.

ADTDA Bit (GTADTRA Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.
The setting is invalid during the event count operation.

ADTTB[1:0] Bits (GTADTRB Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRB, GTADTBRB, and GTADTDBRB registers.
The setting is invalid during the event count operation.

ADTDB Bit (GTADTRB Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.
The setting is invalid during the event count operation.

Note 1. The buffer operation mode is fixed in sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3 (64-bit transfer at trough), or complementary PWM mode.

Bit	Symbol	Bit Name	Description	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits in each of GPTW0 to GPTW3, and GPTW10 to GPTW15 are reserved, and are read as 0. When writing, write 0 to the bits.

The GTBER2 register makes settings for buffer operation.
Set the CP3DB bit and OLTTm[1:0] (m = A, B) bits when the GTCNT counter is stopped.

CCTCm Bit (Counter Clear Source GTCCRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by counter clear using the GTCCRm, GTCCRn, and GTCCRx registers together (m = A, B; n = C, E; x = D, F).
This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTCm bit is 0, buffer transfer is not performed by counter clear.
If there is a conflict with the CMTCm bit setting, the CCTCm bit setting has priority.
The setting is invalid during the event count operation.

CCTPR Bit (Counter Clear Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTPR, GTPBR, and GTPDBR registers together.
This bit is effective when the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTPR bit is 0, buffer transfer is not performed by counter clear.
The setting is invalid during the event count operation.

CCTADm Bit (Counter Clear Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by counter clear using the GTADTRm, GTADTBRm and GTADTDBRm registers together.
This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.ADTTm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTADm bit is 0, buffer transfer is not performed by counter clear.
If there is a conflict with the CMTADm bit setting, the CCTADm bit setting has priority.
The setting is invalid during the event count operation.

CCTDV Bit (Counter Clear Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTDVU and GTDBU or GTDVD and GTDBD registers together.
This bit is effective when the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTDV bit is 0, buffer transfer is not performed by counter clear.
The setting is invalid during the event count operation.

CMTCA[1:0] Bits (Compare Match Source GTCCRA Register Buffer Transfer Enable)

These bits enable buffer transfer by compare match of GTCCRA using the GTCCRA, GTCCRC and GTCCRD registers together.
These bits are effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected

by the GTBER.CCRA[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
If there is a conflict with the CCTCA bit setting, the CCTCA bit setting has priority.
The setting is invalid during the event count operation.

CMTCB[1:0] Bits (Compare Match Source GTCCRB Register Buffer Transfer Enable)

These bits enable buffer transfer by compare match of GTCCRB using the GTCCRB, GTCCRE and GTCCRF registers together.
These bits are effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
If there is a conflict with the CCTCB bit setting, the CCTCB bit setting has priority.
The setting is invalid during the event count operation.

CMTADm Bit (Compare Match Source GTADTRm Register Buffer Transfer Enable) (m = A, B)

This bit enables buffer transfer by compare match of the GTADTRm using the GTADTRm, GTADTBRm and GTADTDBRm registers together.
This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.ADTTm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
If there is a conflict with the CCTADm bit setting, the CCTADm bit setting has priority.
The setting is invalid during the event count operation.

CPTCA Bit (Overflow/Underflow Source GTCCRA Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTCCRA, GTCCRC and GTCCRD registers together.
This bit is effective when the CCTCA bit is 0 (GTCCRA register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTCB Bit (Overflow/Underflow Source GTCCRB Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTCCRB, GTCCRE and GTCCRF registers together.
This bit is effective when the CCTCB bit is 0 (GTCCRB register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTPR Bit (Overflow/Underflow Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTPR, GTPBR and GTPDBR registers together.
This bit is effective when the CCTPR bit is 0 (GTPR register buffer transfer by counter clear is enabled), the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTADm Bit (Overflow/Underflow Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTADTRm, GTADTBRm and GTADTDBRm registers together.
This bit is effective when the CCTADm bit is 0 (GTADTRm register buffer transfer by counter clear is enabled), the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.ADTTm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTDV Bit (Overflow/Underflow Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTDVU and GTDBU or GTDVD and GTDBD registers together.
This bit is effective when the CCTDV bit is 0 (GTDVU/GTDVD register buffer transfer by counter clear is enabled), the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CP3DB Bit (Complementary PWM Mode 3,4 Double Buffer Select)

This bit enables buffer transfer using the GTCCRA, GTCCRE and GTCCRF registers together in complementary PWM mode 3,4.

CPBTD Bit (Complementary PWM Mode Buffer Transfer Disable)

This bit disables buffer transfer from temporary register (temporary register A and temporary register P) to the GTCCRC and GTPBR registers during timer counting in complementary PWM mode 1, 2 and 3. When CP3DB bit is 1, the buffer transfer from temporary register B to GTCCRE register is also disabled. The setting is invalid in complementary PWM mode 4.

OLTTm[1:0] Bits (GTIOCnm Output Level Buffer Transfer Timing Select) (m = A, B)

These bits set the timing of buffer transfer from GTOLBR.GTIOmB[4:0] bits to GTIOR.GTIOm[4:0] bits.
The setting is invalid during the event count operation.

b14	ADTBL	GTADTRB Register A/D Conversion Start Request Link	0: Not linked with GTCIV/GTCIU interrupt skipping function. 1: Linked with GTCIV/GTCIU interrupt skipping function.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This function is not usable with GPTW4 to GPTW9 in the sawtooth-wave PWM mode 2.

The GTITC register configures the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (GTCIV)/underflow interrupt (GTCIU), and determines whether other interrupts and A/D conversion start requests are linked to the GTCIV/GTCIU interrupt skipping function. Note that output stop detection to the POEG and dead-time error interrupts cannot be linked with the GTCIV or GTCIU interrupt skipping function. Additionally, when the interrupt skipping function is performed, the change in the status flag is also skipped.
The setting is invalid during the event count operation.
The setting is operated independently of the extended interrupt skipping by the GTEITC register.

ITLA Bit (GTCCRA Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the GTCIV/GTCIU interrupt skipping function.

ITLB Bit (GTCCRB Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the GTCIV/GTCIU interrupt skipping function.

ITLC Bit (GTCCRC Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the GTCIV/GTCIU interrupt skipping function.

ITLD Bit (GTCCRD Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the GTCIV/GTCIU interrupt skipping function.

ITLE Bit (GTCCRE Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the GTCIV/GTCIU interrupt skipping function.

ITLF Bit (GTCCRF Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the GTCIV/GTCIU interrupt skipping function.

IVTC[1:0] Bits (GTCIV/GTCIU Interrupt Skipping Function Select)

These bits set the skipping function for the GTPR compare match (GTCNT counter overflow) interrupt (GTCIV)/GTCNT counter underflow interrupt (GTCIU).

IVTT[2:0] Bits (GTCIV/GTCIU Interrupt Skipping Count Select)

These bits set the skipping count for the GTPR compare match (GTCNT counter overflow) interrupt (GTCIV)/GTCNT counter underflow interrupt (GTCIU).
When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL Bit (GTADTRA Register A/D Conversion Start Request Link)

This bit specifies whether to link the A/D conversion start request, which is generated in response to a compare match

with the GTCNT counter and the GTADTRA register, with the GTCIV/GTCIU interrupt skipping function.

ADTBL Bit (GTADTRB Register A/D Conversion Start Request Link)

This bit specifies whether to link the A/D conversion start request, which is generated in response to a compare match with the GTCNT counter and the GTADTRB register, with the GTCIV/GTCIU interrupt skipping function.

24.2.22 General PWM Timer Counter (GTCNT)

Address(es): GPTW0.GTCNT 8742 C048h, GPTW1.GTCNT 8742 C148h, GPTW2.GTCNT 8742 C248h, GPTW3.GTCNT 8742 C348h, GPTW4.GTCNT 8742 C448h, GPTW5.GTCNT 8742 C548h, GPTW6.GTCNT 8742 C648h, GPTW7.GTCNT 8742 C748h, GPTW8.GTCNT 8742 C848h, GPTW9.GTCNT 8742 C948h, GPTW10.GTCNT 8742 CA48h, GPTW11.GTCNT 8742 CB48h, GPTW12.GTCNT 8742 CC48h, GPTW13.GTCNT 8742 CD48h, GPTW14.GTCNT 8742 CE48h, GPTW15.GTCNT 8742 CF48h, GPTW0_NS.GTCNT 0742 C048h, GPTW1_NS.GTCNT 0742 C148h, GPTW2_NS.GTCNT 0742 C248h, GPTW3_NS.GTCNT 0742 C348h, GPTW4_NS.GTCNT 0742 C448h, GPTW5_NS.GTCNT 0742 C548h, GPTW6_NS.GTCNT 0742 C648h, GPTW7_NS.GTCNT 0742 C748h, GPTW8_NS.GTCNT 0742 C848h, GPTW9_NS.GTCNT 0742 C948h, GPTW10_NS.GTCNT 0742 CA48h, GPTW11_NS.GTCNT 0742 CB48h, GPTW12_NS.GTCNT 0742 CC48h, GPTW13_NS.GTCNT 0742 CD48h, GPTW14_NS.GTCNT 0742 CE48h, GPTW15_NS.GTCNT 0742 CF48h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTCNT counter is a 32-bit readable/writable counter. There is one GTCNT counter for each channel. Writing is available only when counting is stopped, and thus writing is disabled while counting is in progress (when CST = 1). Access in 8-bit or 16-bit units to the GTCNT counter is prohibited, and it should be accessed in 32-bit units.
When the sawtooth or triangle waves are to be used in GPTW4 to GPTW9, set the GTCNT counter within the range from 0 up to the value of the GTPR register.

24.2.23 General PWM Timer Compare Capture Register m (GTCCRm) (m = A to F)

The GTCCRm register is a 32-bit readable/writable register.

Access in 8-bit or 16-bit units to the GTCCRm register is prohibited, and it should be accessed in 32-bit units.

The GTCCRA and GTCCRB registers are registers used for both output compare and input capture.

The GTCCRC and GTCCRE registers are compare match registers, and can also function as buffer registers for the GTCCRA and GTCCRB registers.

The GTCCRD and GTCCRF registers are compare match registers, and can also function as buffer registers for the GTCCRC and GTCCRE registers (double buffer registers for the GTCCRA and GTCCRB registers).

24.2.24 General PWM Timer Period Setting Register (GTPR)

Address(es): GPTW0.GTPR 8742 C064h, GPTW1.GTPR 8742 C164h, GPTW2.GTPR 8742 C264h, GPTW3.GTPR 8742 C364h, GPTW4.GTPR 8742 C464h, GPTW5.GTPR 8742 C564h, GPTW6.GTPR 8742 C664h, GPTW7.GTPR 8742 C764h, GPTW8.GTPR 8742 C864h, GPTW9.GTPR 8742 C964h, GPTW10.GTPR 8742 CA64h, GPTW11.GTPR 8742 CB64h, GPTW12.GTPR 8742 CC64h, GPTW13.GTPR 8742 CD64h, GPTW14.GTPR 8742 CE64h, GPTW15.GTPR 8742 CF64h, GPTW0_NS.GTPR 0742 C064h, GPTW1_NS.GTPR 0742 C164h, GPTW2_NS.GTPR 0742 C264h, GPTW3_NS.GTPR 0742 C364h, GPTW4_NS.GTPR 0742 C464h, GPTW5_NS.GTPR 0742 C564h, GPTW6_NS.GTPR 0742 C664h, GPTW7_NS.GTPR 0742 C764h, GPTW8_NS.GTPR 0742 C864h, GPTW9_NS.GTPR 0742 C964h, GPTW10_NS.GTPR 0742 CA64h, GPTW11_NS.GTPR 0742 CB64h, GPTW12_NS.GTPR 0742 CC64h, GPTW13_NS.GTPR 0742 CD64h, GPTW14_NS.GTPR 0742 CE64h, GPTW15_NS.GTPR 0742 CF64h

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTPR register is a 32-bit readable/writable register that sets the maximum count value of the GTCNT counter.
Access in 8-bit or 16-bit units to the GTPR register is prohibited, and it should be accessed in 32-bit units.
The setting is invalid in the sawtooth-wave PWM mode 2. In sawtooth-wave mode except the sawtooth-wave PWM mode 2, the value of (GTPR register + 1) is the count period. In triangle-wave mode or complementary PWM mode, the value of (GTPR register value × 2) is the count period.
When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

24.2.25 General PWM Timer Period Setting Buffer Register (GTPBR)

Address(es): GPTW0.GTPBR 8742 C068h, GPTW1.GTPBR 8742 C168h, GPTW2.GTPBR 8742 C268h, GPTW3.GTPBR 8742 C368h, GPTW4.GTPBR 8742 C468h, GPTW5.GTPBR 8742 C568h, GPTW6.GTPBR 8742 C668h, GPTW7.GTPBR 8742 C768h, GPTW8.GTPBR 8742 C868h, GPTW9.GTPBR 8742 C968h, GPTW10.GTPBR 8742 CA68h, GPTW11.GTPBR 8742 CB68h, GPTW12.GTPBR 8742 CC68h, GPTW13.GTPBR 8742 CD68h, GPTW14.GTPBR 8742 CE68h, GPTW15.GTPBR 8742 CF68h, GPTW0_NS.GTPBR 0742 C068h, GPTW1_NS.GTPBR 0742 C168h, GPTW2_NS.GTPBR 0742 C268h, GPTW3_NS.GTPBR 0742 C368h, GPTW4_NS.GTPBR 0742 C468h, GPTW5_NS.GTPBR 0742 C568h, GPTW6_NS.GTPBR 0742 C668h, GPTW7_NS.GTPBR 0742 C768h, GPTW8_NS.GTPBR 0742 C868h, GPTW9_NS.GTPBR 0742 C968h, GPTW10_NS.GTPBR 0742 CA68h, GPTW11_NS.GTPBR 0742 CB68h, GPTW12_NS.GTPBR 0742 CC68h, GPTW13_NS.GTPBR 0742 CD68h, GPTW14_NS.GTPBR 0742 CE68h, GPTW15_NS.GTPBR 0742 CF68h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTPBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPR register.
Access in 8-bit or 16-bit units to the GTPBR register is prohibited, and it should be accessed in 32-bit units.
The setting is invalid in the sawtooth-wave PWM mode 2. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

24.2.26 General PWM Timer Period Setting Double-Buffer Register (GTPDBR)

Address(es): GPTW0.GTPDBR 8742 C06Ch, GPTW1.GTPDBR 8742 C16Ch, GPTW2.GTPDBR 8742 C26Ch, GPTW3.GTPDBR 8742 C36Ch, GPTW4.GTPDBR 8742 C46Ch, GPTW5.GTPDBR 8742 C56Ch, GPTW6.GTPDBR 8742 C66Ch, GPTW7.GTPDBR 8742 C76Ch, GPTW8.GTPDBR 8742 C86Ch, GPTW9.GTPDBR 8742 C96Ch, GPTW10.GTPDBR 8742 CA6Ch, GPTW11.GTPDBR 8742 CB6Ch, GPTW12.GTPDBR 8742 CC6Ch, GPTW13.GTPDBR 8742 CD6Ch, GPTW14.GTPDBR 8742 CE6Ch, GPTW15.GTPDBR 8742 CF6Ch, GPTW0_NS.GTPDBR 0742 C06Ch, GPTW1_NS.GTPDBR 0742 C16Ch, GPTW2_NS.GTPDBR 0742 C26Ch, GPTW3_NS.GTPDBR 0742 C36Ch, GPTW4_NS.GTPDBR 0742 C46Ch, GPTW5_NS.GTPDBR 0742 C56Ch, GPTW6_NS.GTPDBR 0742 C66Ch, GPTW7_NS.GTPDBR 0742 C76Ch, GPTW8_NS.GTPDBR 0742 C86Ch, GPTW9_NS.GTPDBR 0742 C96Ch, GPTW10_NS.GTPDBR 0742 CA6Ch, GPTW11_NS.GTPDBR 0742 CB6Ch, GPTW12_NS.GTPDBR 0742 CC6Ch, GPTW13_NS.GTPDBR 0742 CD6Ch, GPTW14_NS.GTPDBR 0742 CE6Ch, GPTW15_NS.GTPDBR 0742 CF6Ch

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTPDBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPBR register (a double buffer register for the GTPR register).

Access in 8-bit or 16-bit units to the GTPDBR register is prohibited, and it should be accessed in 32-bit units.

The setting is invalid in the sawtooth-wave PWM mode 2. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTADTRm register is a 32-bit readable/writable register that sets the timing of A/D conversion start request generation.

Access in 8-bit or 16-bit units to the GTADTRm register is prohibited, and it should be accessed in 32-bit units.

When the GTADTRm register value matches the GTCNT counter value, an A/D conversion start request is generated. In complementary PWM mode, A/D conversion start request is generated when the GTCNT counter of the master channel matches this register.

Bit	Symbol	Bit Name	Description	R/W
b0	TDE	Negative-Phase Waveform Setting	0: GTCCRB register is set without using GTDVU and GTDVD registers. 1: GTDVU and GTDVD registers are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB register.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TDBUE	GTDVU Register Buffer Operation Enable	0: GTDVU register buffer operation is disabled 1: GTDVU register buffer operation is enabled	R/W
b5	TDBDE	GTDVD Register Buffer Operation Enable	0: GTDVD register buffer operation is disabled 1: GTDVD register buffer operation is enabled	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TDFER	GTDVD Register Setting	0: GTDVU and GTDVD registers are set separately. 1: The value written to GTDVU register is automatically set to GTDVD register.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTDTCR register enables automatic setting of a compare match value for negative-phase waveform with dead time. The setting is invalid during the event count operation.
This register is invalid in sawtooth-wave PWM mode 1, 2 or complementary PWM mode.

TDE Bit (Negative-Phase Waveform Setting)

This bit sets whether to use the GTDVU and GTDVD registers. When the GTDVU and GTDVD registers are used, the compare match value for a negative-phase waveform with dead time that was obtained by the compare match value of a positive-phase waveform (GTCCRA register) and the dead time value (GTDVU and GTDVD registers) is automatically set in the GTCCRB register.
The TDE bit setting is ignored in sawtooth-wave PWM mode, and the GTCCRB register is not automatic setting.
The automatically set value of the GTCCRB register has the following upper and lower limits:

- Triangle wave PWM mode
  Upper limit: the GTPR register value – 1
  Lower limit: 0000 0001h in up-counting, 0000 0000h in down-counting
- Sawtooth-wave one-shot pulse mode
  Upper limit: the GTPR register value
  Lower limit: 0000 0000h

If the obtained GTCCRB register value is not within the range between the upper and lower limits, the upper or lower limit is set in the GTCCRB register, and the GTST.DTEF flag becomes 1. However, if the obtained GTCCRB register value exceeds the upper limit in triangle-wave PWM mode, the DTEF flag becomes 0.

TDBUE Bit (GTDVU Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVU and GTDBU registers combined.
The timing of buffer transfer is at troughs in triangle-wave mode, and at overflows or underflows in sawtooth-wave mode.

TDBDE Bit (GTDVD Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVD and GTDBD registers combined.
The buffer transfer timing is the trough in triangle-wave mode, and at an overflow or underflow in sawtooth-wave mode.
When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER Bit (GTDVD Register Setting)

This bit specifies whether the value written to the GTDVU register is automatically set to the GTDVD register.

24.2.31 General PWM Timer Dead Time Value Register m (GTDVm) (m = U, D)

Address(es): GPTW0.GTDVU 8742 C08Ch, GPTW1.GTDVU 8742 C18Ch, GPTW2.GTDVU 8742 C28Ch, GPTW3.GTDVU 8742 C38Ch, GPTW4.GTDVU 8742 C48Ch, GPTW5.GTDVU 8742 C58Ch, GPTW6.GTDVU 8742 C68Ch, GPTW7.GTDVU 8742 C78Ch, GPTW8.GTDVU 8742 C88Ch, GPTW9.GTDVU 8742 C98Ch, GPTW10.GTDVU 8742 CA8Ch, GPTW11.GTDVU 8742 CB8Ch, GPTW12.GTDVU 8742 CC8Ch, GPTW13.GTDVU 8742 CD8Ch, GPTW14.GTDVU 8742 CE8Ch, GPTW15.GTDVU 8742 CF8Ch, GPTW0.GTDVD 8742 C090h, GPTW1.GTDVD 8742 C190h, GPTW2.GTDVD 8742 C290h, GPTW3.GTDVD 8742 C390h, GPTW4.GTDVD 8742 C490h, GPTW5.GTDVD 8742 C590h, GPTW6.GTDVD 8742 C690h, GPTW7.GTDVD 8742 C790h, GPTW8.GTDVD 8742 C890h, GPTW9.GTDVD 8742 C990h, GPTW10.GTDVD 8742 CA90h, GPTW11.GTDVD 8742 CB90h, GPTW12.GTDVD 8742 CC90h, GPTW13.GTDVD 8742 CD90h, GPTW14.GTDVD 8742 CE90h, GPTW15.GTDVD 8742 CF90h, GPTW0_NS.GTDVU 0742 C08Ch, GPTW1_NS.GTDVU 0742 C18Ch, GPTW2_NS.GTDVU 0742 C28Ch, GPTW3_NS.GTDVU 0742 C38Ch, GPTW4_NS.GTDVU 0742 C48Ch, GPTW5_NS.GTDVU 0742 C58Ch, GPTW6_NS.GTDVU 0742 C68Ch, GPTW7_NS.GTDVU 0742 C78Ch, GPTW8_NS.GTDVU 0742 C88Ch, GPTW9_NS.GTDVU 0742 C98Ch, GPTW10_NS.GTDVU 0742 CA8Ch, GPTW11_NS.GTDVU 0742 CB8Ch, GPTW12_NS.GTDVU 0742 CC8Ch, GPTW13_NS.GTDVU 0742 CD8Ch, GPTW14_NS.GTDVU 0742 CE8Ch, GPTW15_NS.GTDVU 0742 CF8Ch, GPTW0_NS.GTDVD 0742 C090h, GPTW1_NS.GTDVD 0742 C190h, GPTW2_NS.GTDVD 0742 C290h, GPTW3_NS.GTDVD 0742 C390h, GPTW4_NS.GTDVD 0742 C490h, GPTW5_NS.GTDVD 0742 C590h, GPTW6_NS.GTDVD 0742 C690h, GPTW7_NS.GTDVD 0742 C790h, GPTW8_NS.GTDVD 0742 C890h, GPTW9_NS.GTDVD 0742 C990h, GPTW10_NS.GTDVD 0742 CA90h, GPTW11_NS.GTDVD 0742 CB90h, GPTW12_NS.GTDVD 0742 CC90h, GPTW13_NS.GTDVD 0742 CD90h, GPTW14_NS.GTDVD 0742 CE90h, GPTW15_NS.GTDVD 0742 CF90h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTDVm register is a 32-bit readable/writable register that sets the dead time for generating PWM waveforms with dead time.

Access in 8-bit or 16-bit units to the GTDVm register is prohibited, and it should be accessed in 32-bit units.

The setting is invalid in sawtooth-wave PWM mode 1, 2.

In complementary PWM mode, the GTDVD register is invalid and the GTDVU register is used as the dead time value during both up-counting and down-counting. No matter which GTDVU register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

In triangle-wave mode, the GTDVU register is used for up-counting, and the GTDVD register is used for down-counting.

In sawtooth-wave mode, the GTDVU register controls the first-half dead time, and the GTDVD register controls the second-half dead time, both in up-counting and down-counting.

Do not set this register to a value equal to or larger than that of the GTPR register.

- GTDVU > 0
- GTDVU < GTPR/2
- GTDVU + GTPR ≤ FFFF FFFFh

In addition, when using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When using the GTDVm register, writing to the GTCCRB register is prohibited. In modes other than complementary PWM, setting this register to 0 leads to the output of waveforms without dead time.

When the GTDTCR.TDFER bit is 1, writing to the GTDVD register has no effect. In this case, reading the GTDVD register returns the value of the GTDVU register.

24.2.32 General PWM Timer Dead Time Value Buffer Register m (GTDBm) (m = U, D)

Address(es): GPTW0.GTDBU 8742 C094h, GPTW1.GTDBU 8742 C194h, GPTW2.GTDBU 8742 C294h, GPTW3.GTDBU 8742 C394h, GPTW4.GTDBU 8742 C494h, GPTW5.GTDBU 8742 C594h, GPTW6.GTDBU 8742 C694h, GPTW7.GTDBU 8742 C794h, GPTW8.GTDBU 8742 C894h, GPTW9.GTDBU 8742 C994h, GPTW10.GTDBU 8742 CA94h, GPTW11.GTDBU 8742 CB94h, GPTW12.GTDBU 8742 CC94h, GPTW13.GTDBU 8742 CD94h, GPTW14.GTDBU 8742 CE94h, GPTW15.GTDBU 8742 CF94h, GPTW0.GTDBD 8742 C098h, GPTW1.GTDBD 8742 C198h, GPTW2.GTDBD 8742 C298h, GPTW3.GTDBD 8742 C398h, GPTW4.GTDBD 8742 C498h, GPTW5.GTDBD 8742 C598h, GPTW6.GTDBD 8742 C698h, GPTW7.GTDBD 8742 C798h, GPTW8.GTDBD 8742 C898h, GPTW9.GTDBD 8742 C998h, GPTW10.GTDBD 8742 CA98h, GPTW11.GTDBD 8742 CB98h, GPTW12.GTDBD 8742 CC98h, GPTW13.GTDBD 8742 CD98h, GPTW14.GTDBD 8742 CE98h, GPTW15.GTDBD 8742 CF98h, GPTW0_NS.GTDBU 0742 C094h, GPTW1_NS.GTDBU 0742 C194h, GPTW2_NS.GTDBU 0742 C294h, GPTW3_NS.GTDBU 0742 C394h, GPTW4_NS.GTDBU 0742 C494h, GPTW5_NS.GTDBU 0742 C594h, GPTW6_NS.GTDBU 0742 C694h, GPTW7_NS.GTDBU 0742 C794h, GPTW8_NS.GTDBU 0742 C894h, GPTW9_NS.GTDBU 0742 C994h, GPTW10_NS.GTDBU 0742 CA94h, GPTW11_NS.GTDBU 0742 CB94h, GPTW12_NS.GTDBU 0742 CC94h, GPTW13_NS.GTDBU 0742 CD94h, GPTW14_NS.GTDBU 0742 CE94h, GPTW15_NS.GTDBU 0742 CF94h, GPTW0_NS.GTDBD 0742 C098h, GPTW1_NS.GTDBD 0742 C198h, GPTW2_NS.GTDBD 0742 C298h, GPTW3_NS.GTDBD 0742 C398h, GPTW4_NS.GTDBD 0742 C498h, GPTW5_NS.GTDBD 0742 C598h, GPTW6_NS.GTDBD 0742 C698h, GPTW7_NS.GTDBD 0742 C798h, GPTW8_NS.GTDBD 0742 C898h, GPTW9_NS.GTDBD 0742 C998h, GPTW10_NS.GTDBD 0742 CA98h, GPTW11_NS.GTDBD 0742 CB98h, GPTW12_NS.GTDBD 0742 CC98h, GPTW13_NS.GTDBD 0742 CD98h, GPTW14_NS.GTDBD 0742 CE98h, GPTW15_NS.GTDBD 0742 CF98h

The GTDBm register is a 32-bit readable/writable register that functions as a buffer register for the GTDVm register. Access in 8-bit or 16-bit units to the GTDBm register is prohibited, and it should be accessed in 32-bit units.

24.2.33 General PWM Timer Output Protection Function Status Register (GTSOS)

b9, b8	—	Reserved	The read value is undefined.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

The GTSOS register is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (the GTDTCR.TDE bit is 1) in triangle-wave mode.

SOS[1:0] Bits (Output Protection Function Status)

These bits indicate the status of the output protection function in triangle-wave PWM mode. For details of the output protection function, see section 24.8.4, Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B).

24.2.34 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPTW0.GTSOTR 8742 C0A0h, GPTW1.GTSOTR 8742 C1A0h, GPTW2.GTSOTR 8742 C2A0h, GPTW3.GTSOTR 8742 C3A0h, GPTW4.GTSOTR 8742 C4A0h, GPTW5.GTSOTR 8742 C5A0h, GPTW6.GTSOTR 8742 C6A0h, GPTW7.GTSOTR 8742 C7A0h, GPTW8.GTSOTR 8742 C8A0h, GPTW9.GTSOTR 8742 C9A0h, GPTW10.GTSOTR 8742 CAA0h, GPTW11.GTSOTR 8742 CBA0h, GPTW12.GTSOTR 8742 CCA0h, GPTW13.GTSOTR 8742 CDA0h, GPTW14.GTSOTR 8742 CEA0h, GPTW15.GTSOTR 8742 CFA0h, GPTW0_NS.GTSOTR 0742 C0A0h, GPTW1_NS.GTSOTR 0742 C1A0h, GPTW2_NS.GTSOTR 0742 C2A0h, GPTW3_NS.GTSOTR 0742 C3A0h, GPTW4_NS.GTSOTR 0742 C4A0h, GPTW5_NS.GTSOTR 0742 C5A0h, GPTW6_NS.GTSOTR 0742 C6A0h, GPTW7_NS.GTSOTR 0742 C7A0h, GPTW8_NS.GTSOTR 0742 C8A0h, GPTW9_NS.GTSOTR 0742 C9A0h, GPTW10_NS.GTSOTR 0742 CAA0h, GPTW11_NS.GTSOTR 0742 CBA0h, GPTW12_NS.GTSOTR 0742 CCA0h, GPTW13_NS.GTSOTR 0742 CDA0h, GPTW14_NS.GTSOTR 0742 CEA0h, GPTW15_NS.GTSOTR 0742 CFA0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SOTR	Output Protection Function Temporary Release	0: Protected state is not released 1: Protected state is released	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSOTR register temporarily releases the protected state of GTIOCnB pin output (n = 0 to 15) when output protection has been set.

The protected state can be released only for the case of the GTSOS.SOS[1:0] bits are 10b (protected state in which GTCCRA register ≥ GTPR register has occurred during transfer at trough). The protected state cannot be released for any other case.

SOTR Bit (Output Protection Function Temporary Release)

This bit sets whether to temporarily release the protected state of the GTIOCnB pin output in an output protected state. After the SOTR bit has been set to 1, the output protection function is canceled from the first trough. After the SOTR bit has been set to 0, output protection is resumed from the first trough.

24.2.35 General PWM Timer A/D Conversion Start Request Signal Monitoring Register (GTADSMR)

Address(es): GPTW0.GTADSMR 8742 C0A4h, GPTW1.GTADSMR 8742 C1A4h, GPTW2.GTADSMR 8742 C2A4h, GPTW3.GTADSMR 8742 C3A4h, GPTW4.GTADSMR 8742 C4A4h, GPTW5.GTADSMR 8742 C5A4h, GPTW6.GTADSMR 8742 C6A4h, GPTW7.GTADSMR 8742 C7A4h, GPTW8.GTADSMR 8742 C8A4h, GPTW9.GTADSMR 8742 C9A4h, GPTW10.GTADSMR 8742 CAA4h, GPTW11.GTADSMR 8742 CBA4h, GPTW12.GTADSMR 8742 CCA4h, GPTW13.GTADSMR 8742 CDA4h, GPTW14.GTADSMR 8742 CEA4h, GPTW15.GTADSMR 8742 CFA4h, GPTW0_NS.GTADSMR 0742 C0A4h, GPTW1_NS.GTADSMR 0742 C1A4h, GPTW2_NS.GTADSMR 0742 C2A4h, GPTW3_NS.GTADSMR 0742 C3A4h, GPTW4_NS.GTADSMR 0742 C4A4h, GPTW5_NS.GTADSMR 0742 C5A4h, GPTW6_NS.GTADSMR 0742 C6A4h, GPTW7_NS.GTADSMR 0742 C7A4h, GPTW8_NS.GTADSMR 0742 C8A4h, GPTW9_NS.GTADSMR 0742 C9A4h, GPTW10_NS.GTADSMR 0742 CAA4h, GPTW11_NS.GTADSMR 0742 CBA4h, GPTW12_NS.GTADSMR 0742 CCA4h, GPTW13_NS.GTADSMR 0742 CDA4h, GPTW14_NS.GTADSMR 0742 CEA4h, GPTW15_NS.GTADSMR 0742 CFA4h

b17, b16	ADSMS1[1:0]	A/D Conversion Start Request Signal Monitor 1 Selection	b17b16 0 0: A/D conversion start request signal generated by the GTADTRA register during up-counting 0 1: A/D conversion start request signal generated by the GTADTRA register during down-counting 1 0: A/D conversion start request signal generated by the GTADTRB register during up-counting 1 1: A/D conversion start request signal generated by the GTADTRB register during down-counting	R/W
b23 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24	ADSMEN1	A/D Conversion Start Request Signal Monitor 1 Output Enabling	0: Output of A/D conversion start request signal monitor 1 is disabled. 1: Output of A/D conversion start request signal monitor 1 is enabled.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register configures the monitoring of the A/D conversion start request signal that is synchronized with a frame.

ADSMSk[1:0] Bits (A/D Conversion Start Request Signal Monitor k Selection) (k = 0, 1)

These bits are used to select an A/D conversion start request signal synchronized with a frame to be monitored by the GTADSMk pin.

In triangle-wave PWM mode or complementary PWM mode, the following settings are prohibited:

- Set the ADSMSk[1:0] bits to 00b (A/D conversion start request during up-counting) when GTADTRA = 0
- Set the ADSMSk[1:0] bits to 10b (A/D conversion start request during up-counting) when GTADTRB = 0
- Set the ADSMSk[1:0] bits to 01b (A/D conversion start request during down-counting) when GTADTRA = GTPR
- Set the ADSMSk[1:0] bits to 11b (A/D conversion start request during down-counting) when GTADTRB = GTPR

ADSMENk Bit (A/D Conversion Start Request Signal Monitor k Output Enabling) (k = 0, 1)

This bit enables or disables the monitor output to the GTADSMk pin.
When the output is disabled, the GTADSMk pin goes to the low level.

When this bit is 1, the GTADSMk pin goes high on assertion of the A/D conversion start request signal selected by the ADSMSk[1:0] bits, and returns low at the end of the timer cycle for the channel that generated the request. If the counter stops, the output retains the level at the time the counter stopped. Set the ADSMENk bit to 0 to output a low level.
When a signal to request the start of A/D conversion is generated at the end of a timer period, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next period.
When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPTW.

24.2.36 General PWM Timer Extended Interrupt Skipping Counter Control Register (GTEITC)

Address(es): GPTW0.GTEITC 8742 C0A8h, GPTW1.GTEITC 8742 C1A8h, GPTW2.GTEITC 8742 C2A8h, GPTW3.GTEITC 8742 C3A8h, GPTW4.GTEITC 8742 C4A8h, GPTW5.GTEITC 8742 C5A8h, GPTW6.GTEITC 8742 C6A8h, GPTW7.GTEITC 8742 C7A8h, GPTW8.GTEITC 8742 C8A8h, GPTW9.GTEITC 8742 C9A8h, GPTW10.GTEITC 8742 CAA8h, GPTW11.GTEITC 8742 CBA8h, GPTW12.GTEITC 8742 CCA8h, GPTW13.GTEITC 8742 CDA8h, GPTW14.GTEITC 8742 CEA8h, GPTW15.GTEITC 8742 CFA8h, GPTW0_NS.GTEITC 0742 C0A8h, GPTW1_NS.GTEITC 0742 C1A8h, GPTW2_NS.GTEITC 0742 C2A8h, GPTW3_NS.GTEITC 0742 C3A8h, GPTW4_NS.GTEITC 0742 C4A8h, GPTW5_NS.GTEITC 0742 C5A8h, GPTW6_NS.GTEITC 0742 C6A8h, GPTW7_NS.GTEITC 0742 C7A8h, GPTW8_NS.GTEITC 0742 C8A8h, GPTW9_NS.GTEITC 0742 C9A8h, GPTW10_NS.GTEITC 0742 CAA8h, GPTW11_NS.GTEITC 0742 CBA8h, GPTW12_NS.GTEITC 0742 CCA8h, GPTW13_NS.GTEITC 0742 CDA8h, GPTW14_NS.GTEITC 0742 CEA8h, GPTW15_NS.GTEITC 0742 CFA8h

b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b23 to b20	EIVTT2[3:0]	Extended Interrupt Skipping 2 Skipping Count Setting	Skipping count for the extended interrupt skipping 2	R/W
b27 to b24	EITCNT2IV[3:0]	Extended Interrupt Skipping Counter 2 Initial Value	The extended interrupt skipping counter 2 initial value	R/W *1
b31 to b28	EITCNT2[3:0]	Extended Interrupt Skipping Counter 2	The extended interrupt skipping counter 2	R

Note 1. The EITCNT2IV[3:0] bits are only writable when the value other than 00b is written to the EIVTC2[1:0] bits that have been 00b.

The GTEITC register sets the extended interrupt skipping function to skip the interrupts, A/D conversion start requests, and buffer transfers independently by counting at overflow and underflow in the GTCNT counter.
The setting is operated independently of the interrupt skipping by the GTITC register, or the GTADCMSC register in GPTW4 to GPTW9.
The setting is invalid during the event count operation.
Access in 8-bit units to GTEITC is prohibited.

EIVTCk[1:0] Bits (Extended Interrupt Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the extended interrupt skipping counter k. Setting only with these bits does not skip the interrupts, A/D conversion start requests, and buffer transfers.
Skipping function for the interrupt, A/D conversion start request, and buffer transfer, all of which are a target of skipping, is set individually with the GTEITLI1, GTEITLI2, and GTEITLB registers.

EIVTTk[3:0] Bits (Extended Interrupt Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the EIVTCk[1:0] bits to the next generation of the count source. When the count source is generated while the EIVTTk[3:0] bits match the EITCNTk[3:0] bits, the EITCNTk[3:0] bits are cleared.
When these bits are 0000b, skipping is not performed.

EITCNT1[3:0] Bits (Extended Interrupt Skipping Counter 1)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated.
Counting is performed periodically within the range between 0 and the EIVTT1[3:0] bits.
Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.
[Clearing conditions]

- 00b is written to the EIVTC1[1:0] bits
- 0000b is written to the EIVTT1[3:0] bits
- A count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated when the extended interrupt skipping 1 skipping count set by the EIVTT1[3:0] bits match the value for the EITCNT1[3:0]

EITCNT2IV[3:0] Bits (Extended Interrupt Skipping Counter 2 Initial Value)

These bits are the initial value for the extended interrupt skipping counter 2. Writing to the EITCNT2IV[3:0] is performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the EITCNT2[3:0] bits are set not to count (EIVTC2[1:0] bits are 00b). When the EITCNT2IV[3:0] bits are written, the value written to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits simultaneously.
Writing to the EITCNT2IV[3:0] bits is ignored when the EITCNT2[3:0] bits are set to count (EIVTC2[1:0] bits are other than 00b) or when attempt to write 00b (do not count) to the EIVTC2[1:0] bits.
The EITCNT2IV[3:0] bits are not reset by writing 00b to the EIVTC2[1:0] bits.

EITCNT2[3:0] Bits (Extended Interrupt Skipping Counter 2)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated.
Counting is performed periodically within the range between 0 and the EIVTT2[3:0] bits.
Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.
Setting of the initial value for the EITCNT2[3:0] bits are performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the extended interrupt skipping counter 2 is set as not to count (00b is written to the EIVTC2[1:0] bits).

When the initial value is set, the written value to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits as the initial value.
[Clearing conditions]

- 00b is written to the EIVTC2[1:0] bits
- 0000b is written to the EIVTT2[3:0] bits
- When the EIVTC2[1:0] bits are 00b, a value other than 00b is written to the EIVTC2[1:0] bits and 0000b is written to the EITCNT2IV[3:0] bits at the same time.
- A count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the EIVTT2[3:0] bits match the value for the EITCNT2[3:0]

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

The GTEITLI1 register sets the extended skipping function for interrupts such as compare match/input capture, overflow, and underflow.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding

extended interrupt skipping counter operates the counting.
The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.
The setting is invalid during the event count operation.

EITLm[2:0] Bits (GTCCRm Register Compare Match/Input Capture Interrupt Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip the compare match/input capture interrupt (GTCIm) in the GTCCRm register.
Refer to Table 24.6.

EITLx[2:0] Bits (GTCCRx Register Compare Match Interrupt Extended Skipping Function Select) (x = C, D, E, F)

These bits select the extended interrupt skipping function to skip the compare match interrupt (GTCIx) in the GTCCRx register.
Refer to Table 24.6.

EITLV[2:0] Bits (Overflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at overflow.
Refer to Table 24.6.

EITLU[2:0] Bits (Underflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at underflow.
Refer to Table 24.6.

Table 24.6 Setting the Function Select for the GTEITLI1 Register

EITLy[2:0] Bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An interrupt is output in the period of EITCNT1 bit = 0)
0 1 0	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An interrupt is output in the period of EITCNT2 bit = 0)
0 1 1	Skip an interrupt in the period the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An interrupt is output in the period of EITCNT1 bit = 0 and EITCNT2 bit = 0)
1 0 0	Do not set this value
1 0 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An interrupt is output in the period of EITCNT1 bit = EIVTT1 bit)
1 1 0	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An interrupt is output in the period of EITCNT2 bit = EIVTT2 bit)
1 1 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An interrupt is output in the period of EITCNT1 bit = EIVTT1 bit and EITCNT2 bit = EIVTT2 bit)

y = A, B, C, D, E, F, V, U; k = 1, 2
Note: When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
Note: When the EITLy[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

24.2.38 General PWM Timer Extended Interrupt Skipping Setting Register 2 (GTEITLI2)

Address(es): GPTW0.GTEITLI2 8742 C0B0h, GPTW1.GTEITLI2 8742 C1B0h, GPTW2.GTEITLI2 8742 C2B0h, GPTW3.GTEITLI2 8742 C3B0h, GPTW4.GTEITLI2 8742 C4B0h, GPTW5.GTEITLI2 8742 C5B0h, GPTW6.GTEITLI2 8742 C6B0h, GPTW7.GTEITLI2 8742 C7B0h, GPTW8.GTEITLI2 8742 C8B0h, GPTW9.GTEITLI2 8742 C9B0h, GPTW10.GTEITLI2 8742 CAB0h, GPTW11.GTEITLI2 8742 CBB0h, GPTW12.GTEITLI2 8742 CCB0h, GPTW13.GTEITLI2 8742 CDB0h, GPTW14.GTEITLI2 8742 CEB0h, GPTW15.GTEITLI2 8742 CFB0h, GPTW0_NS.GTEITLI2 0742 C0B0h, GPTW1_NS.GTEITLI2 0742 C1B0h, GPTW2_NS.GTEITLI2 0742 C2B0h, GPTW3_NS.GTEITLI2 0742 C3B0h, GPTW4_NS.GTEITLI2 0742 C4B0h, GPTW5_NS.GTEITLI2 0742 C5B0h, GPTW6_NS.GTEITLI2 0742 C6B0h, GPTW7_NS.GTEITLI2 0742 C7B0h, GPTW8_NS.GTEITLI2 0742 C8B0h, GPTW9_NS.GTEITLI2 0742 C9B0h, GPTW10_NS.GTEITLI2 0742 CAB0h, GPTW11_NS.GTEITLI2 0742 CBB0h, GPTW12_NS.GTEITLI2 0742 CCB0h, GPTW13_NS.GTEITLI2 0742 CDB0h, GPTW14_NS.GTEITLI2 0742 CEB0h, GPTW15_NS.GTEITLI2 0742 CFB0h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	EADTBL[2:0]			—	EADTAL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	EADTAL[2:0]	GTADTRA A/D Conversion Start Request Extended Skipping Function Select	See Table 24.7.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6 to b4	EADTBL[2:0]	GTADTRB A/D Conversion Start Request Extended Skipping Function Select	See Table 24.7.	R/W
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTEITLI2 register sets the extended skipping function for A/D conversion start requests.
Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.
The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.
The setting is invalid during the event count operation.

EADTmL[2:0] Bits (GTADTRm A/D Conversion Start Request Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip A/D conversion start requests for the compare match in the GTADTRm register.
Refer to Table 24.7.

Table 24.7 Setting the Function Select for the GTEITLI2 Register

EADTmL[2:0] Bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An A/D conversion start request is output in the period of EITCNT1 bit = 0)
0 1 0	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An A/D conversion start request is output in the period of EITCNT2 bit = 0)
0 1 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An A/D conversion start request is output in the period of EITCNT1 bit = 0 and EITCNT2 bit = 0)
1 0 0	Do not set this value
1 0 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of EITCNT1 bit = EIVTT1 bit)
1 1 0	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of EITCNT2 bit = EIVTT2 bit)
1 1 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of EITCNT1 bit = EIVTT1 bit and EITCNT2 bit = EIVTT2 bit)

m = A, B; k = 1, 2

Note: When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.

Note: When the EADTmL[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. In the complementary PWM mode, writing to these bits in any of the registers in the master channel, slave channel 1, or slave channel 2 simultaneously applies to all three channels.

The GTEITLB register sets the extended skipping function for buffer transfers.
Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.
The setting is operated independently of the interrupt skipping by the GTITC register.
The buffer transfer from the GTOLBR register to the GTIOR.GTIOA[4:0], GTIOB[4:0] bits is not target of the extended buffer transfer skipping function.
The setting is invalid during the event count operation.

EBTLCA[2:0] Bits (GTCCRA Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRA, GTCCRC, GTCCRD registers and a temporary register A) in the GTCCRA register.
An extended skipping of buffer transfers in the GTCCRA register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRA register should be performed in the condition of not performing the extended buffer transfer skipping.
The buffer transfer between the GTCCRC, GTCCRE register, and GTCCRA register in complementary PWM mode cannot be skipped.

EBTLCB[2:0] Bits (GTCCRB Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRB, GTCCRE, GTCCRF registers and a temporary register B) in the GTCCRB register.
An extended skipping of buffer transfers in the GTCCRB register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRB register should be performed in the condition of not performing the extended buffer transfer skipping.

EBTLPR[2:0] Bits (GTPR Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTPR, GTPBR, and GTPDBR registers) in the GTPR register.
When skipping GTPR buffer transfers in complementary PWM mode, GTEITC register setting of slave channel should be matched to the master channel so that the buffer transfer timing of the slave channel matches the master channel.

EBTLADm[2:0] Bits (GTADTRm Register Buffer Transfer Extended Skipping Function Select) (m = A, B)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTADTRm, GTADTBRm, and GTADTDBRm registers) in the GTADTRm register.

EBTLDVm[2:0] Bits (GTDVm Register Buffer Transfer Extended Skipping Function Select) (m = U, D)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers between the GTDVm and GTDBm registers) in the GTDVm register.

Table 24.8 Setting the Function Select for the GTEITLB Register

EBTLx[2:0] Bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than 0 (A buffer transfer is output in the period of EITCNT1 bit = 0)
0 1 0	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than 0 (A buffer transfer is output in the period of EITCNT2 bit = 0)
0 1 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (A buffer transfer is output in the period of EITCNT1 bit = 0 and EITCNT2 bit = 0)
1 0 0	Do not set this value
1 0 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (A buffer transfer is output in the period of EITCNT1 bit = EIVTT1 bit)
1 1 0	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (A buffer transfer is output in the period of EITCNT2 bit = EIVTT2 bit)
1 1 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (A buffer transfer is output in the period of EITCNT1 bit = EIVTT1 bit and EITCNT2 bit = EIVTT2 bit)

x = CA, CB, PR, ADA, ADB, DVU, DVD; k = 1, 2

Note: When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
Note: When the EBTLx[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

24.2.40 General PWM Timer Inter Channel Logical Operation Function Setting Register (GTICLF)

Address(es): GPTW0.GTICLF 8742 C0B8h, GPTW1.GTICLF 8742 C1B8h, GPTW2.GTICLF 8742 C2B8h, GPTW3.GTICLF 8742 C3B8h, GPTW4.GTICLF 8742 C4B8h, GPTW5.GTICLF 8742 C5B8h, GPTW6.GTICLF 8742 C6B8h, GPTW7.GTICLF 8742 C7B8h, GPTW8.GTICLF 8742 C8B8h, GPTW9.GTICLF 8742 C9B8h, GPTW10.GTICLF 8742 CAB8h, GPTW11.GTICLF 8742 CBB8h, GPTW12.GTICLF 8742 CCB8h, GPTW13.GTICLF 8742 CDB8h, GPTW14.GTICLF 8742 CEB8h, GPTW15.GTICLF 8742 CFB8h, GPTW0_NS.GTICLF 0742 C0B8h, GPTW1_NS.GTICLF 0742 C1B8h, GPTW2_NS.GTICLF 0742 C2B8h, GPTW3_NS.GTICLF 0742 C3B8h, GPTW4_NS.GTICLF 0742 C4B8h, GPTW5_NS.GTICLF 0742 C5B8h, GPTW6_NS.GTICLF 0742 C6B8h, GPTW7_NS.GTICLF 0742 C7B8h, GPTW8_NS.GTICLF 0742 C8B8h, GPTW9_NS.GTICLF 0742 C9B8h, GPTW10_NS.GTICLF 0742 CAB8h, GPTW11_NS.GTICLF 0742 CBB8h, GPTW12_NS.GTICLF 0742 CCB8h, GPTW13_NS.GTICLF 0742 CDB8h, GPTW14_NS.GTICLF 0742 CEB8h, GPTW15_NS.GTICLF 0742 CFB8h

R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The signal before performing output disable control is selected.
Note 2. When channel's own GTIOCnA is selected, C is treated as 1.
Note 3. When channel's own GTIOCnB is selected, D is treated as 1.

The GTICLF register sets the logical operation function between compare match outputs.
The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control.
The output disable control is performed with the signal after logical operation.
Access in 8-bit units to the GTICLF register is prohibited.

ICLFm[2:0] Bits (GTIOCnm Output Logical Operation Function Select) (n = 0 to 15; m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. Logical operations involving the C or D signal take an additional clock cycle of GTCLK. When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as 1.

ICLFSELk[5:0] Bits (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

Bit	Symbol	Bit Name	Description	R/W
b0	PCEN	Cycle Count Function Enable	0: Cycle count function is disabled. 1: Cycle count function is enabled.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	ASTP	Automatic Stop Function Enable	0: Automatic function is disabled. 1: Automatic function is enabled.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b27 to b16	PCNT[11:0]	Cycle Counter	Counter for number of cycles.	R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTPC register counts the number of period.

PCEN Bit (Cycle Count Function Enable)

This bit enables or disables cycle count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

ASTP Bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bis is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

PCNT[11:0] Bits (Cycle Counter)

This counter counts the number of cycles.

When the PCEN bis is 0, writing the number of cycles is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of cycle. In sawtooth-wave mode, the end of cycle refers to overflow, underflow, or GTCNT counter clearing. In triangle-wave mode or complementary PWM mode, it refers to trough.

When the PCNT counter is 1 at the end of cycle, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while cycle count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value. When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

b31 to b28	ADCMSCNT2[3:0]	A/D Conversion Start Request Compare Match Skipping Counter 2	A/D Conversion Start Request Compare Match Skipping Counter 2	R/W

Note 1. Writing is possible only when the ADCMSC1[1:0] bits are 00b and a value other than 00b is written to the ADCMSC1[1:0] bits.
Note 2. Writing is possible only when the ADCMSC2[1:0] bits are 00b and a value other than 00b is written to the ADCMSC2[1:0] bits.

The GTADCMSC register is a register that controls the skipping counter of the A/D conversion start request compare match skipping function that counts compare matches of GTADTRA register and GTADTRB register, and skipping A/D conversion start request and buffer transfer independently.
This register setting is operated independently of the interrupt skipping by the GTITC register or GTEITC register.
The setting is invalid during the event count operation.

Access in 8-bit units to GTADCMSC is prohibited.

ADCMSCk[1:0] Bits (A/D Conversion Start Request Compare Match Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the A/D conversion start request compare match skipping counter k.
Setting only with these bits does not skip the A/D conversion start requests and buffer transfers. Skipping function for the A/D conversion start request and buffer transfer which are a target of skipping is set individually with the GTADCMSS register.

ADCMSTk[3:0] Bits (A/D Conversion Start Request Compare Match Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the ADCMSCk[1:0] bits to the next generation of the count source.
When the count source is generated while the ADCMSTk[3:0] bits match the ADCMSCNTk[3:0] bits, the ADCMSCNTk[3:0] bits are cleared.
When these bits are 0000b, skipping is not performed.

ADCMSCNTkIV[3:0] Bits (A/D Conversion Start Request Compare Match Skipping Counter k Initial Value) (k = 1, 2)

These bits are the value of the initial value for the A/D conversion start request compare match skipping counter k.
Writing to the ADCMSCNTkIV[3:0] is performed only when the writing value to the ADCMSCk[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the ADCMSCNTk[3:0] bits are set not to count (ADCMSCk[1:0] bits are 00b). When the ADCMSCNTkIV[3:0] bits are written, the value written to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits simultaneously.
The writing to the ADCMSCNTkIV[3:0] bits are ignored when the ADCMSCNTk[3:0] bits are set to count (ADCMSCk[1:0] bits are other than 00b) or perform the setting of not to count (00b is written to the ADCMSCk[1:0] bits).
The ADCMSCNTkIV[3:0] bits are not reset by the writing 00b to the ADCMSCk[1:0] bits.

ADCMSCNTk[3:0] Bits (A/D Conversion Start Request Compare Match Skipping Counter k) (k = 1, 2)

The counting is incremented by 1 every time a count source selected by the ADCMSCk[1:0] bits is generated.
Counting is performed periodically within the range between 0 and the ADCMSTk[3:0] bits.
Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.
Setting of the initial value for the ADCMSCNTk[3:0] bits are performed only when the writing value to the ADCMSCk[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the A/D conversion start request compare match skipping counter k is set as not to count (ADCMSCk[1:0] bits are 00b).
When the initial value is set, the written value to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits as the initial value.
[Clearing condition]

- 00b is written to the ADCMSCk[1:0] bits.
- 0000b is written to the ADCMSTk[3:0] bits.
- When the ADCMSCk[1:0] bits are 00b, a value other than 00b is written to the ADCMSCk[1:0] bits and 0000b is written to the ADCMSCNTkIV[3:0] bits at the same time.
- A count source selected by the ADCMSCk[1:0] bits is generated when the extended interrupt skipping k skipping count set by the ADCMSTk[3:0] bits match the value for the ADCMSCNTk[3:0].

b31 to b23	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTADCMSS register is a register that controls the skipping counter of the A/D conversion start request compare match skipping function that counts compare matches of GTADTRA register and GTADTRB register, and skipping A/D conversion start request and buffer transfer independently.
This register setting is operated independently of the interrupt skipping by the GTITC register or GTEITC register.
The setting is invalid during the event count operation.

ADCMSmL[2:0] Bits (GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select) (m = A, B)

These bits select the A/D conversion start request compare match skipping function of the GTADTRm (m = A, B) register.
Refer to Table 24.9.

Table 24.9 Setting of GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select bit

ADCMSmL[2:0] Bits	Function
0 0 0	Do not perform an A/D conversion start request compare match skipping
0 0 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0000b (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0000b)
0 1 0	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0000b (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = 0000b)
0 1 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0000b (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0000b and the ADCMSCNT2[3:0] bits = 0000b)
1 0 0	Setting prohibited
1 0 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits)
1 1 0	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)
1 1 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)

m = A, B

Note: When the intended skipping counter is set as not to count (the ADCMSCk[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0000b), skipping is not performed. (k = 1, 2)

Note: When the ADCMSmL[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

ADCMBSm[2:0] Bits (GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select) (m = A, B)

These bits select the A/D conversion start request comparison match skip function for buffer transfers in the GTADTRm register (transfers between the GTADTRm register, GTADTBRm register, and GTADTDBRm register).
Refer to Table 24.10.

Table 24.10 Setting of the GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select bit

ADCMBSm[2:0] Bits	Function
0 0 0	Do not perform an GTADTRm register buffer transfer by A/D conversion start request compare match skipping
0 0 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0000b)
0 1 0	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = 0000b)
0 1 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0000b and the ADCMSCNT2[3:0] bits = 0000b)
1 0 0	Setting prohibited
1 0 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits)
1 1 0	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)
1 1 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (A Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)

m = A, B

Note: When the intended skipping counter is set as not to count (the ADCMSCk[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0000b), skipping is not performed. (k = 1, 2)

Note: When the ADCMBSm[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

24.2.44 General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register (GTSECSR)

The GTSECSR register selects the channels whose operation enable bit is to be updated using the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.
Access in 8-bit or 16-bit units to the GTSECSR register is prohibited, and it should be accessed in 32-bit units.

SECSELn Bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 15)

This bit enables or disables the simultaneous control of operation enable in channel n.
When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

24.2.45 General PWM Timer Operation Enable Bit Simultaneous Control Register (GTSECR)

Address(es): GPTW0.GTSECR 8742 C0D4h, GPTW1.GTSECR 8742 C1D4h, GPTW2.GTSECR 8742 C2D4h, GPTW3.GTSECR 8742 C3D4h, GPTW4.GTSECR 8742 C4D4h, GPTW5.GTSECR 8742 C5D4h, GPTW6.GTSECR 8742 C6D4h, GPTW7.GTSECR 8742 C7D4h, GPTW8.GTSECR 8742 C8D4h, GPTW9.GTSECR 8742 C9D4h, GPTW10.GTSECR 8742 CAD4h, GPTW11.GTSECR 8742 CBD4h, GPTW12.GTSECR 8742 CCD4h, GPTW13.GTSECR 8742 CDD4h, GPTW14.GTSECR 8742 CED4h, GPTW15.GTSECR 8742 CFD4h, GPTW0_NS.GTSECR 0742 C0D4h, GPTW1_NS.GTSECR 0742 C1D4h, GPTW2_NS.GTSECR 0742 C2D4h, GPTW3_NS.GTSECR 0742 C3D4h, GPTW4_NS.GTSECR 0742 C4D4h, GPTW5_NS.GTSECR 0742 C5D4h, GPTW6_NS.GTSECR 0742 C6D4h, GPTW7_NS.GTSECR 0742 C7D4h, GPTW8_NS.GTSECR 0742 C8D4h, GPTW9_NS.GTSECR 0742 C9D4h, GPTW10_NS.GTSECR 0742 CAD4h, GPTW11_NS.GTSECR 0742 CBD4h, GPTW12_NS.GTSECR 0742 CCD4h, GPTW13_NS.GTSECR 0742 CDD4h, GPTW14_NS.GTSECR 0742 CED4h, GPTW15_NS.GTSECR 0742 CFD4h

b25	SSCD	Synchronous Set/Clear Simultaneous Disable	0: Disable simultaneous disabling synchronous set/clear 1: Disable synchronous set/clear simultaneously	R/W *1
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers. Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.
A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.
Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

SBDCE Bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.
Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPE Bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPBR, and GTPDBR registers are enabled.
Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAE Bit (GTADTR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are enabled.
Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDDE Bit (GTDV Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are enabled.
Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SBDCD Bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.
Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPD Bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPBR, and GTPDBR registers are disabled.
Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAD Bit (GTADTR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are disabled.
Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDDD Bit (GTDV Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR

register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are disabled.
Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SPCE Bit (Cycle Count Function Simultaneous Enable)

Writing 1 to this bit simultaneously sets any GTPC.PCEN bits to 1 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and enables the cycle-counting function.
Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCE Bit (Synchronous Set/Clear Simultaneous Enable)

Writing 1 to this bit simultaneously sets any GTCR.SSCEN bits to 1 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and enables the synchronous set/clear function.
Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

SPCD Bit (Cycle Count Function Simultaneous Disable)

Writing 1 to this bit simultaneously sets any GTPC.PCEN bits to 0 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and disables the cycle-counting function.
Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCD Bit (Synchronous Set/Clear Simultaneous Disable)

Writing 1 to this bit simultaneously sets any GTCR.SSCEN bits to 0 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and disables the synchronous set/clear function.
Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

24.2.46 General PWM Timer Output Level Buffer Register (GTOLBR)

Address(es): GPTW4.GTOLBR 8742 C4E4h, GPTW5.GTOLBR 8742 C5E4h, GPTW6.GTOLBR 8742 C6E4h, GPTW7.GTOLBR 8742 C7E4h, GPTW8.GTOLBR 8742 C8E4h, GPTW9.GTOLBR 8742 C9E4h, GPTW4_NS.GTOLBR 0742 C4E4h, GPTW5_NS.GTOLBR 0742 C5E4h, GPTW6_NS.GTOLBR 0742 C6E4h, GPTW7_NS.GTOLBR 0742 C7E4h, GPTW8_NS.GTOLBR 0742 C8E4h, GPTW9_NS.GTOLBR 0742 C9E4h

b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTOLBR register is a buffer register for the GTIOR.GTIOA[4:0] bits and GTIOR.GTIOB[4:0] bits.

GTIOmB[4:0] Bits (GTIOm Buffer) (m = A, B)

These bits are buffer bits of GTIOR.GTIOm[4:0] bits.

These bits are transferred to the GTIOR.GTIOm[4:0] bits at the transfer timing selected by the GTBER2.OLTTm[1:0] (m = A, B) bits.

b29 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit Name	Description	R/W
b31, b30	ICBGRP[1:0]	GTCCRB Input Capture Group Select	b31b30 0 0: Group A 0 1: Group B 1 0: Group C 1 1: Group D	R/W

The GTICCR register is a register that controls input capture by inter channel link.
For channels that perform input capture in cooperation, the input capture factor set in the GTCCRA and GTCCRB registers is invalid.

ICAFm Bit (Enable GTCCRm Register Compare Match/Input Capture as Source of Other Channel GTCCRA Input Capture) (m = A, B)

This bit enables or disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRA register.

ICAFn Bit (Enable GTCCRn Register Compare Match as Source of Other Channel GTCCRA Input Capture) (n = C, D, E, F)

This bit enables or disables the use of compare match of GTCCRn register as the input capture source of other channel's GTCCRA register.

ICAFPO Bit (Enable Overflow as Source of Other Channel GTCCRA Input Capture)

This bit enables or disables the use of overflow of sawtooth-waves, the crest of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICAFPU Bit (Enable Underflow as Source of Other Channel GTCCRA Input Capture)

This bit enables or disables the use of underflow of sawtooth-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICACLK Bit (Enable Count Clock as Source of Other Channel GTCCRA Input Capture)

This bit enables or disables the use of count clock as the input capture source of other channel's GTCCRA register.

ICAGRP[1:0] Bits (GTCCRA Input Capture Group Select)

These bits select the group of input capture by inter channel cooperation for GTCCRA register.
For channels that accept input capture of the GTCCRA register due to input capture sources from other channels, set the GTICASR.ASOC bit to 1 and select the group of inter channel cooperation with the ICAGRP[1:0] bits.

ICBFm Bit (Enable GTCCRm Register Compare Match/Input Capture as Source of Other Channel GTCCRB Input Capture) (m = A, B)

This bit enables or disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRB register.

ICBFn Bit (Enable GTCCRn Register Compare Match as Source of Other Channel GTCCRB Input Capture) (n = C, D, E, F)

This bit enables or disables the use of compare match of GTCCRn register as the input capture source of other channel's GTCCRB register.

ICBFPO Bit (Enable Overflow as Source of Other Channel GTCCRB Input Capture)

This bit enables or disables the use of overflow of sawtooth-waves, the crest of triangle-waves or complementary PWM

mode as the input capture source of other channel's GTCCRB register.

ICBFPU Bit (Enable Underflow as Source of Other Channel GTCCRB Input Capture)

This bit enables or disables the use of underflow of sawtooth-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRB register.

ICBCLK Bit (Enable Count Clock as Source of Other Channel GTCCRB Input Capture)

This bit enables or disables the use of count clock as the input capture source of other channel's GTCCRB register.

ICBGRP[1:0] Bits (GTCCRB Input Capture Group Select)

These buts select the group of input capture by inter channel cooperation for GTCCRB register.
For channels that accept input capture of the GTCCRB register due to input capture sources from other channels, set the GTICBSR.BSOC bit to 1 and select the group of inter channel cooperation with the ICBGRP[1:0] bits.

24.2.48 General PWM Timer-linked Synchronization Control Register (GTSYNCFCR)

R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSYNCSCR register controls enabling and disabling of output of the timer-linked synchronization signal and the timer-internal synchronization signal.
For the timer-linked synchronization signal and the timer-internal synchronization signal, refer to section 24.3.17, Timer-Linked Synchronization Signal Output Function.

SYSG[1:0] Bits (Timer-Linked Synchronization Signal and Timer-Internal Synchronization Signal Output Enable)

These bits enable or disable timer-linked synchronization signal output in response to compare match and timer-internal synchronization signal output on overflow in sawtooth-wave PWM mode 1.

24.2.50 Output Phase Switching Control Register (OPSCR)

Address(es): GPTW.OPSCR 8742 BF00h, GPTW_NS.OPSCR 0742 BF00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	UF	Input Phase Software Setting	These bits set the input phase from software settings. Setting these bits is valid when FB = 1.	R/W
b1	VF			R/W
b2	WF			R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	U	Input U-Phase Monitor	This bit monitors the state of the input phase. • FB = 0 External input that are synchronized by GTCLK • FB = 1 The software settings (UF, VF, WF bit)	R
b5	V	Input V-Phase Monitor		R
b6	W	Input W-Phase Monitor		R
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b8	EN	Output Phase Enable	0: Do not output (Hi-Z external pin) 1: Output*1	R/W
b15-b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	FB	External Feedback Signal Enable	This bit selects the input phase from software settings and external input. 0: The external input 1: The software setting (UF, VF, WF bit)	R/W
b17	P	Positive-Phase Output (P) Control	0: Level signal output 1: PWM signal output (PWM of GPTW0)	R/W
b18	N	Negative-Phase Output (N) Control	0: Level signal output 1: PWM signal output (PWM of GPTW0)	R/W
b19	INV	Output Phase Invert Control	0: Positive logic (active-high) output 1: Negative logic (active-low) output	R/W
b20	RV	Output Phase Rotation Direction Reversal Control	0: Positive rotation 1: Reverse rotation	R/W
b21	ALIGN	Input Phase Alignment	0: Input phase aligned to GTCLK 1: Input phase aligned to the falling edge of PWM	R/W
b23, b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b25, b24	GRP[1:0]	Output Disabled Source Selection	b25b24 0 0: Group A output disable source 0 1: Group B output disable source 1 0: Group C output disable source 1 1: Group D output disable source	R/W
b26	GODF	Group Output Disable Function	0: This bit function is ignored 1: When the signal value of the source selected by the GRP[1:0] bits becomes High, the EN bit is cleared	R/W
b28, b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b29	NFEN	External Input Noise Filter Enable	0: The noise filter for the external input is disabled. 1: The noise filter for the external input is enabled.	R/W

Bit	Symbol	Bit Name	Description	R/W
b31, b30	NFCS[1:0]	External Input Noise Filter Clock Select	b31b30 0 0: GTCLK/1 0 1: GTCLK/4 1 0: GTCLK/16 1 1: GTCLK/64	R/W

Note 1. When the GODF bit is 1 and the signal value of the source selected by the GRP[1:0] bits becomes High, the EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

UF, VF, WF Bits (Input Phase Software Setting)

The UF, VF, and WF bits set the input phase from the software settings. When the FB bit is 1, these bits are valid. The set value of the UF, VF, and WF bit takes the place of the U, V, W external input.

U, V, W Bits (Input m-Phase Monitor) (m = U, V, W)

When the FB bit is 0, external inputs that are synchronized by GTCLK are monitored by these bits. When the FB bit is 1, the U, V, and W bits can read the UF, VF, and WF bits.

EN Bit (Output Phase Enable)

The EN bit controls the output enable signal of output phase (positive phase/negative phase).
When the EN bit is 1, the signal waveform is output.
When the EN bit is 0, first set FB, UF, VF, and WF (software setting is selected), P, N, INV, RV, ALIGN, GRP[1:0], GODF, NFEN, and NFCS[1:0] bits. Then, set this bit to 1. The EN bit should be set when no output disable request is issued by POEG. When the GODF bit is 1 and the signal value selected in the GRP[1:0] bits is high, the EN bit is set to 0. To reenable output, clear the output request in software and then set the EN bit to 1.

- EN bit priority (conflict)

When a conflict occurs between setting the EN bit by software and clearing it due to an output disable request, the EN bit is set to 0.

FB Bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (UF, VF, and WF bits) and external input such as a Hall element.

P Bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output or PWM signal output for the positive-phase output (GTOUUP, GTOVUP and GTOWUP pins).

N Bit (Negative-Phase Output (N) Control)

The P bit selects one of the level signal output or PWM signal output for the negative-phase output (GTOULO, GTOVLO and GTOWLO pins).

INV Bit (Output Phase Invert Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

RV Bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

ALIGN Bit (Input Phase Alignment)

The ALIGN bit selects the GTCLK or PWM for the sampling of the input phase (input phase is specified in the FB bit).

When ALIGN bit is 0, input phase is aligned to GTCLK.

Note: When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

When ALIGN bit is 1, input phase is aligned with the falling edge of PWM.

GRP[1:0] Bits (Output Disabled Source Selection)

The GRP[1:0] bits select the output disable source.

Set the GRP[1:0] bits while the GODF bit is 0.

GODF Bit (Group Output Disable Function)

When the GODF bit is 1 and the signal selected by the GRP[1:0] bits is high, the EN bit is set to 0.

When the GODF bit is 0, this bit is ignored.

Set the GODF bit while there is no output disable request from POEG.

NFEN Bit (External Input Noise Filter Enable)

The NFEN bit enables or disables the external input noise filter.

Note: Set this bit during the EN bit is 0 to avoid generation of unintentional internal edge caused by this bit switching.

NFCS[1:0] Bits (External Input Noise Filter Clock Select)

The NFCS[1:0] bits select the clock for the external input noise filter.

1. Set the NFCS[1:0] bits.
2. Wait for 2 cycles.
3. Set the EN bit to 1.

24.2.51 General PWM Timer Clock Control Register (GTCLKCR)

Address(es): GPTW.GTCLKCR 8742 BF10h, GPTW_NS.GTCLKCR 0742 BF10h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BPEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BPEN	Synchronization Circuit Bypass Enable	0: The bus clock and GPTW counter reference clock are asynchronously in use. 1: The bus clock and GPTW counter reference clock are synchronously in use.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTCLKCR register controls supply of the clock to the GPTW module.
Set this register before the GPTW module is released from the module stop state after a reset. Changing the setting of the effective bit in the register is prohibited after release from the module stop state.

BPEN Bit (Synchronization Circuit Bypass Enable)

This bit enables or disables bypassing of the synchronization between the bus clock (PCLKA) and GPTW counter reference clock (GTCLK). Set this bit to 0 or 1 according to whether the asynchronous or synchronous clock is to be used as the GPTW counter reference clock, respectively.

24.3 Operation

24.3.1 Basic Operation

The timer in each channel performs periodic count operation by count clock or hardware source. The GTCNT counter performs up-counting, or down-counting. The timer period is controlled by the GTPR or GTCCRm (m = A to F) registers. When the GTCNT counter value matches the values for GTCCRA or GTCCRB registers, the GTIOCnA or GTIOCnB pin outputs (n = 0 to 15) can be changed respectively. Also, the GTCCRA or GTCCRB registers can be used as the input capture registers by hardware source. The GTCCRC and GTCCRD registers can be performed as buffer registers for GTCCRA register, and the GTCCRE and GTCCRF registers can be performed as buffer registers for GTCCRB register.

24.3.1.1 Counter Operation

(1) Count Start/Count Stop

The counter in each channel starts counting operation when the corresponding GTCR.CST bit is set to 1, and stops counting when the bit is set to 0.
CST bit value can be changed by the following sources:

- Writing to the GTCR register
- Writing 1 to the bit corresponding to the channel number for the GTSTR register while the GTSSR.CSTRT bit is 1
- Writing 1 to the bit corresponding to the channel number for the GTSTP register while the GTPSR.CSTOP bit is 1
- Hardware source specified by the GTSSR register
- Hardware source specified by the GTPSR register
- Completion of the cycle count operation while the GTPC.ASTP bit is 1.

(2) Periodic Count Operation (In Up-Counting by the Count Clock)

The counter in each channel starts up-counting when the corresponding GTCR.CST bit is set to 1 while the GTUPSR register and the GTDNSR register are 0000 0000h. When the value of the GTCNT counter changes from the GTPR register value to 0000 0000h (an overflow), or the GTCCRm (m = A to F) register value selected by the GTCSR.CSCMSC[2:0] bits changes to 0000 0000h in sawtooth-wave PWM mode 2, the GTST.TCFPO flag is set to 1, and if the setting of the GTINTAD.GTINTPR[0] bit is 1, a GTCIV interrupt request is also issued. After the GTCNT counter has overflowed, counting up is resumed from 0000 0000h.
Figure 24.6 shows an example of periodic count operation in up-counting by count clock.

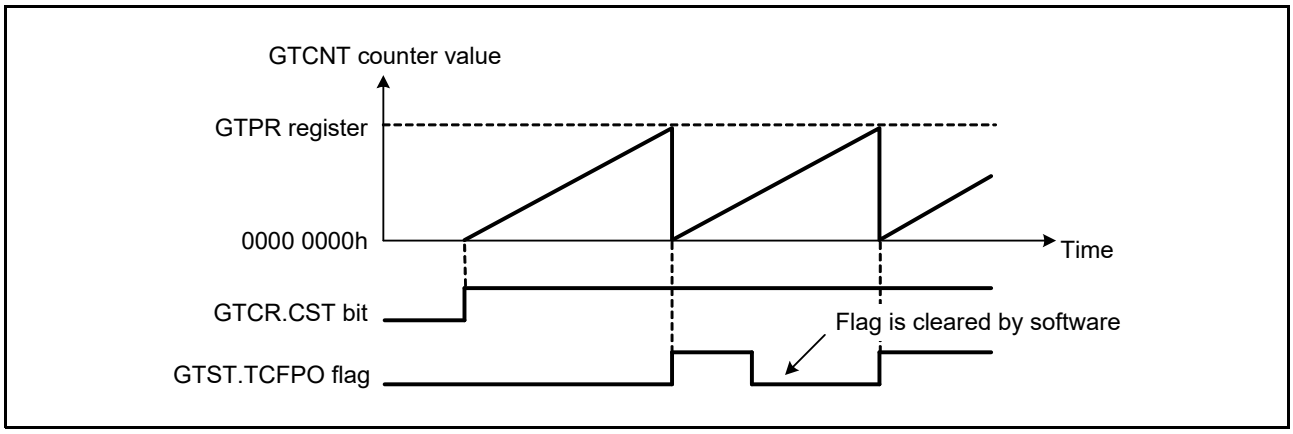

Figure 24.6 Example of Periodic Count Operation (In Up-Counting by the Count Clock)

Figure 24.7 shows an example for setting periodic count operation in up-counting.

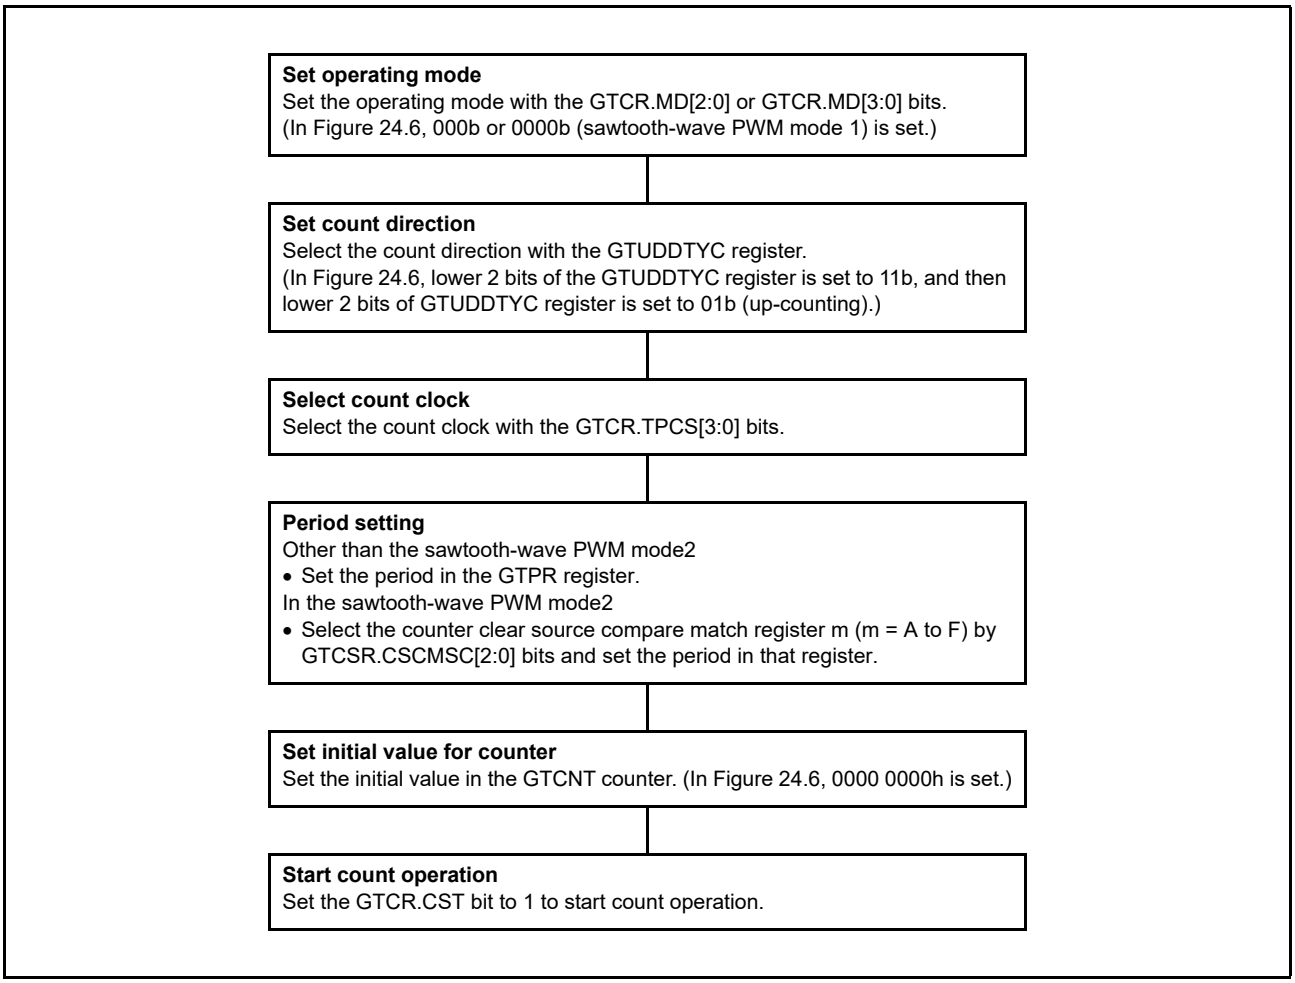

Figure 24.7 Example for Setting Periodic Count Operation (In Up-Counting by the Count Clock)

(3) Periodic Count Operation (In Down-Counting by the Count Clock)

The counter in each channel can start counting down when the corresponding GTUDDTYC.UD bit is set to 0 while the settings of the GTUPSR and GTDNSR registers are both 0000 0000h. When the value of the GTCNT counter changes from that of the GTPR register to 0000 0000h (an underflow), the GTST.TCFPU flag is set to 1, and if the setting of the GTINTAD.GTINTPR[1] bit is 1, a GTCIU interrupt request is also issued. After the GTCNT counter underflows, down-counting is resumed from the GTPR register value.

Figure 24.8 shows an example of periodic count operation in down-counting by count clock.

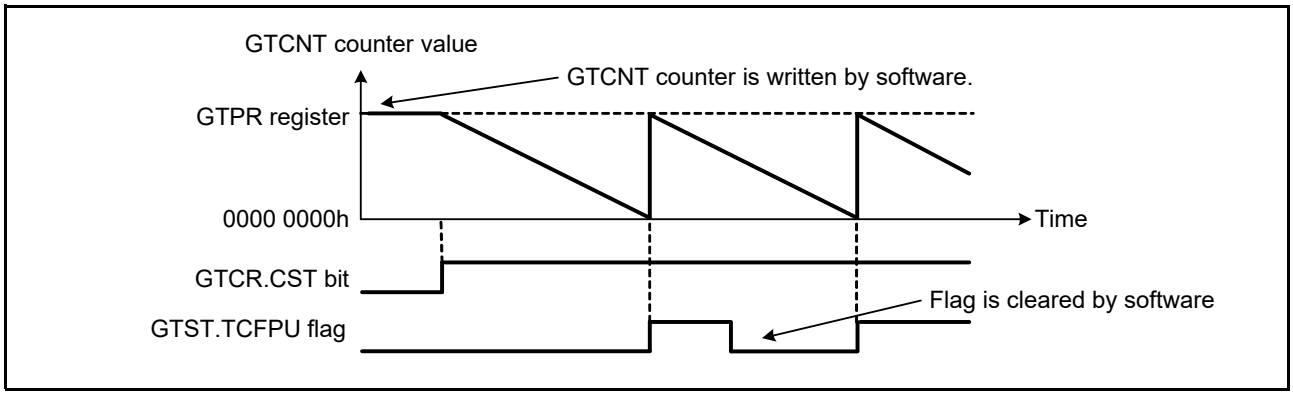

Figure 24.8 Example of Periodic Count Operation (In Down-Counting by the Count Clock)

Figure 24.9 shows an example for setting periodic count operation in down-counting by count clock.

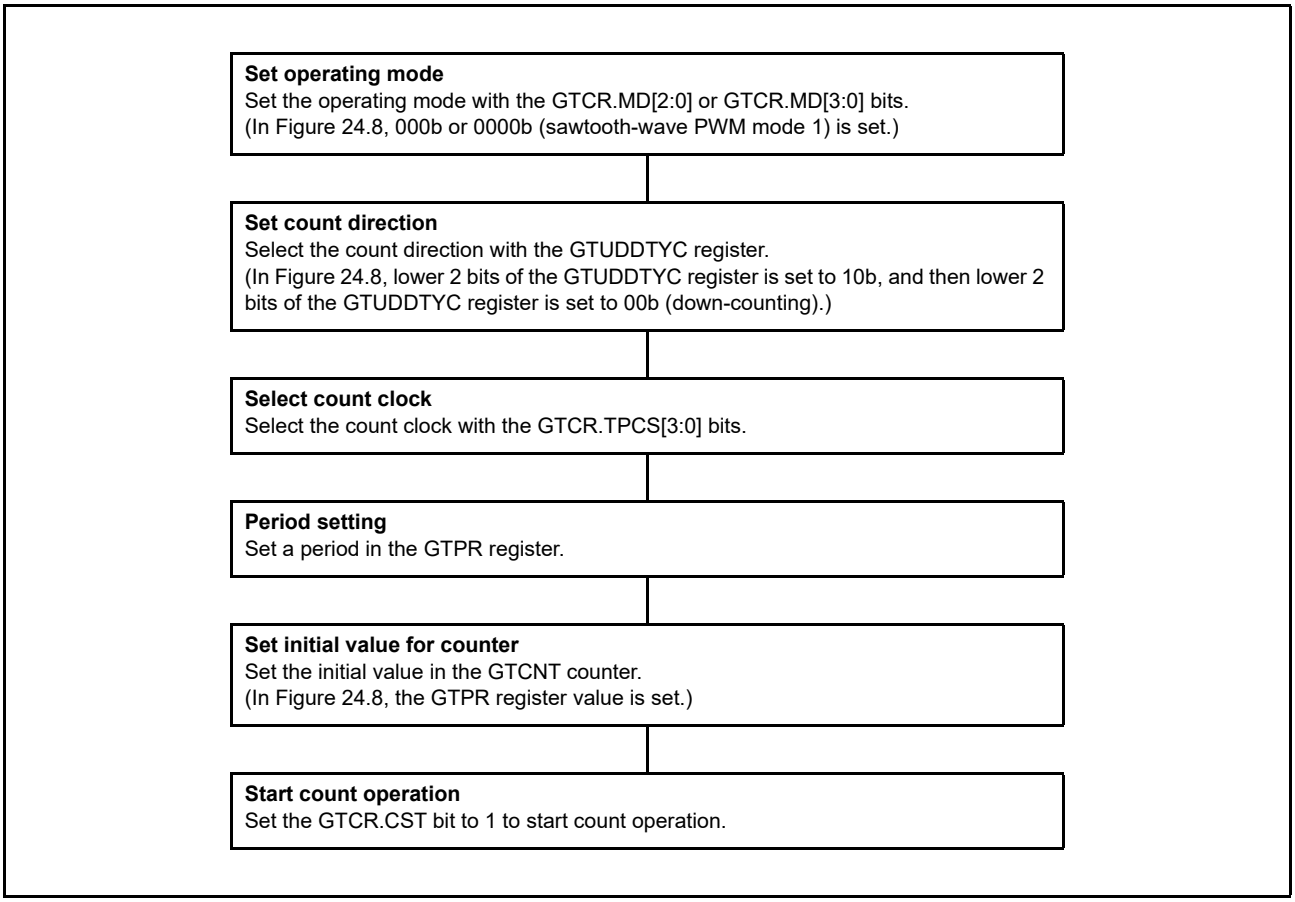

Figure 24.9 Example for Setting Periodic Count Operation (In Down-Counting by the Count Clock)

(4) Event Count Operation (In Up-Counting by Hardware Source)

The counter in each channel can start up-counting by hardware source by setting the GTUPSR register. When the GTUPSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value will not change.

Operation due to overflow in up-counting by hardware source is the same as the periodic count operation by the count clock.

To perform up-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. As the starting the count operation is synchronized with the count clock selected by TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start up-counting operation. To start up-counting after one GTCLK from setting the CST bit to 1, set the TPCS[3:0] bits to 0000b.

Figure 24.10 and Figure 24.11 show examples of up-counting operation by hardware source (the rising edge of GTETRGA pin input and the rising edge of GTIOCnA pin input).

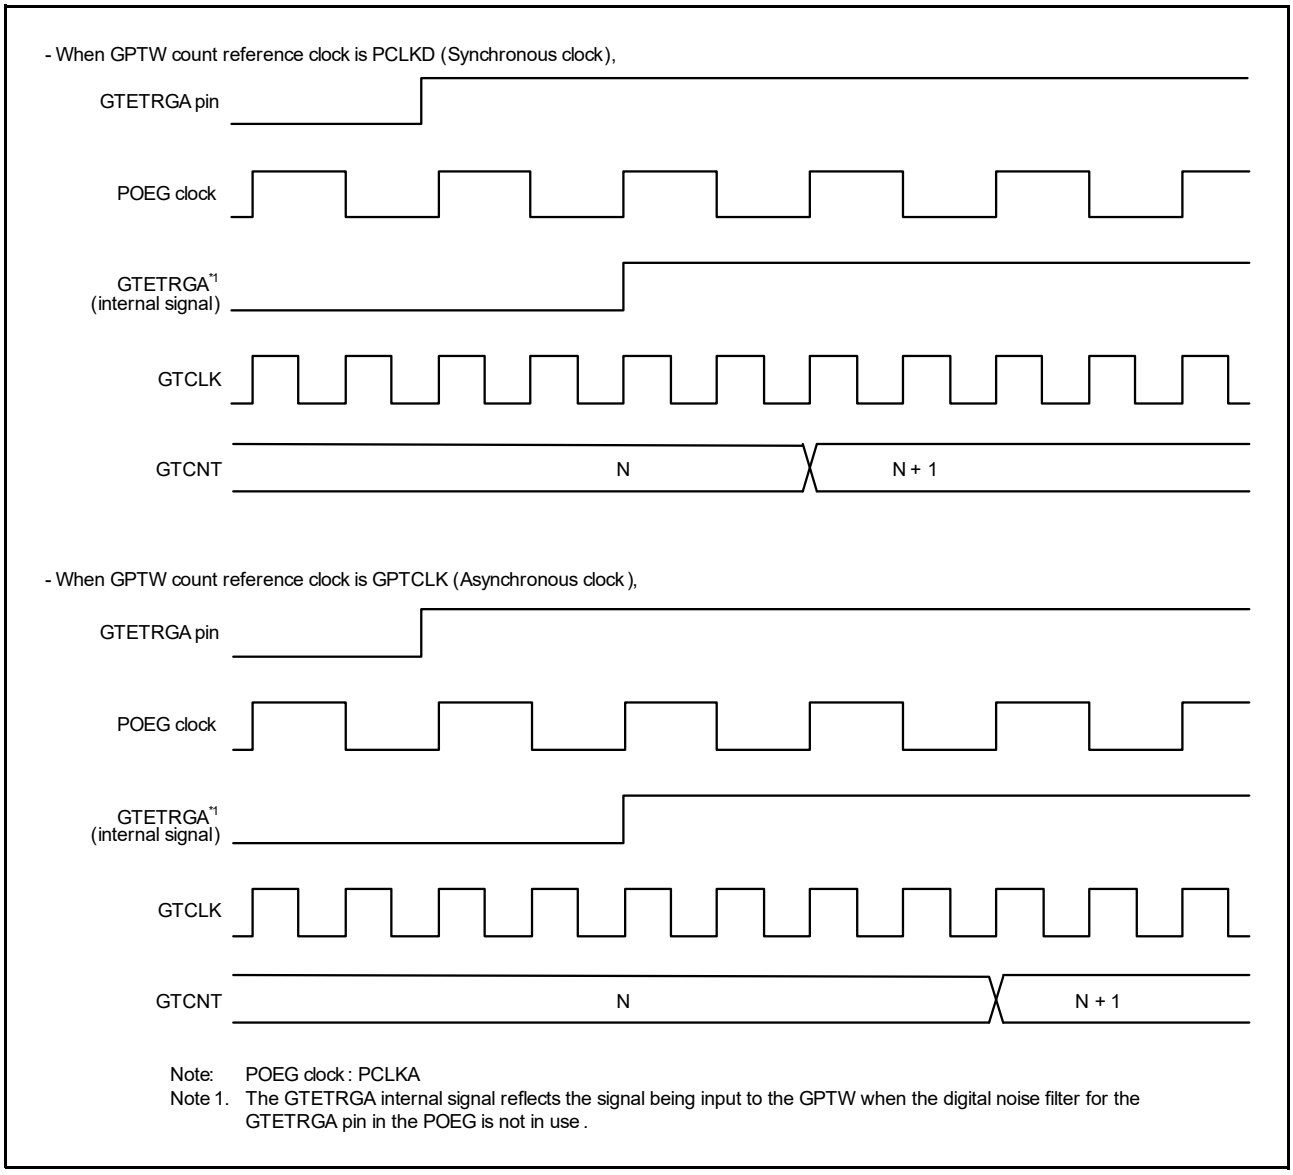

Figure 24.10 Example of Event Count Operation (Up-Counting of Rising Edges of the Input on the GTETRGA Pin)

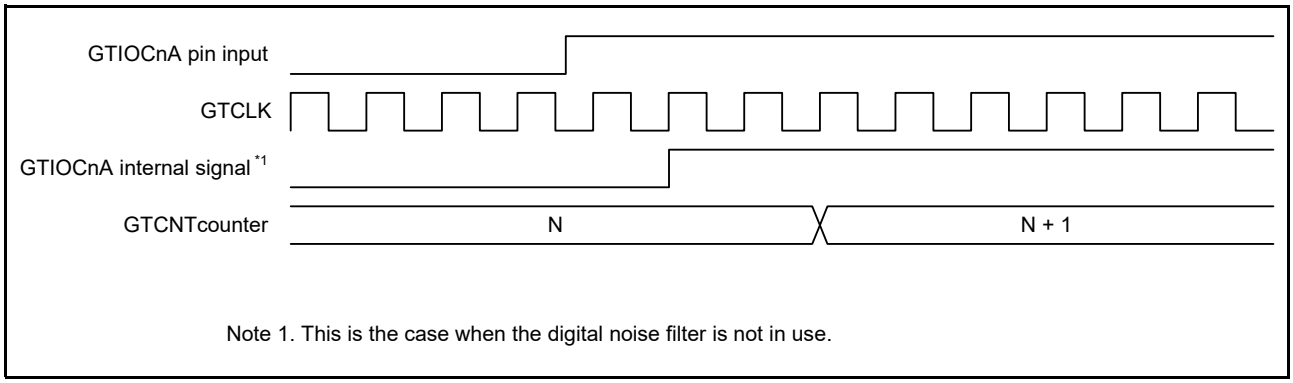

Figure 24.11 Example of Event Count Operation (Up-Counting of Rising Edges of the Input on the GTIOCnA Pin)

Figure 24.12 shows an example of event counting when the hardware source is an ELC event input.
This example shows the following signal flow:

- A compare match with the GPTW0.GTCCRA register outputs an event signal to the ELC.
- The ELC routes this signal to the GPTW as event source A, causing GPTW1.GTCNT to count events.

The ELC receives the GPTW0 compare match A signal, which is synchronized with GTCLK, and re-synchronizes it with PCLKB. After one PCLKB cycle, the ELC outputs the signal as GPTW event source A.

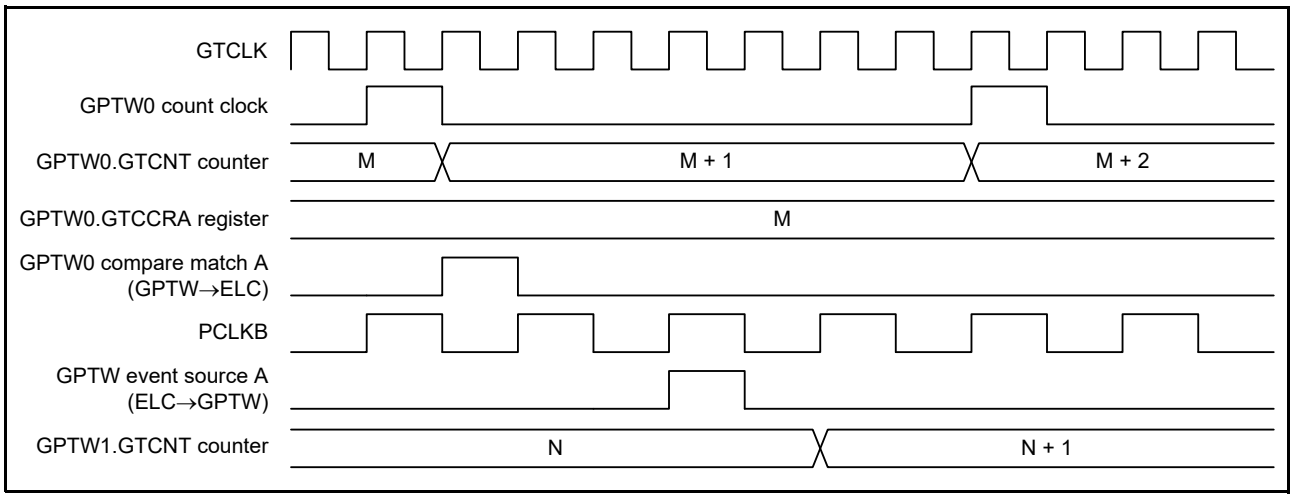

Figure 24.12 Example of Event Count Operation (Up-Counting the Number of Event Signals Input from the ELCA)

Figure 24.13 shows an example for setting event count operation in up-counting by hardware source.

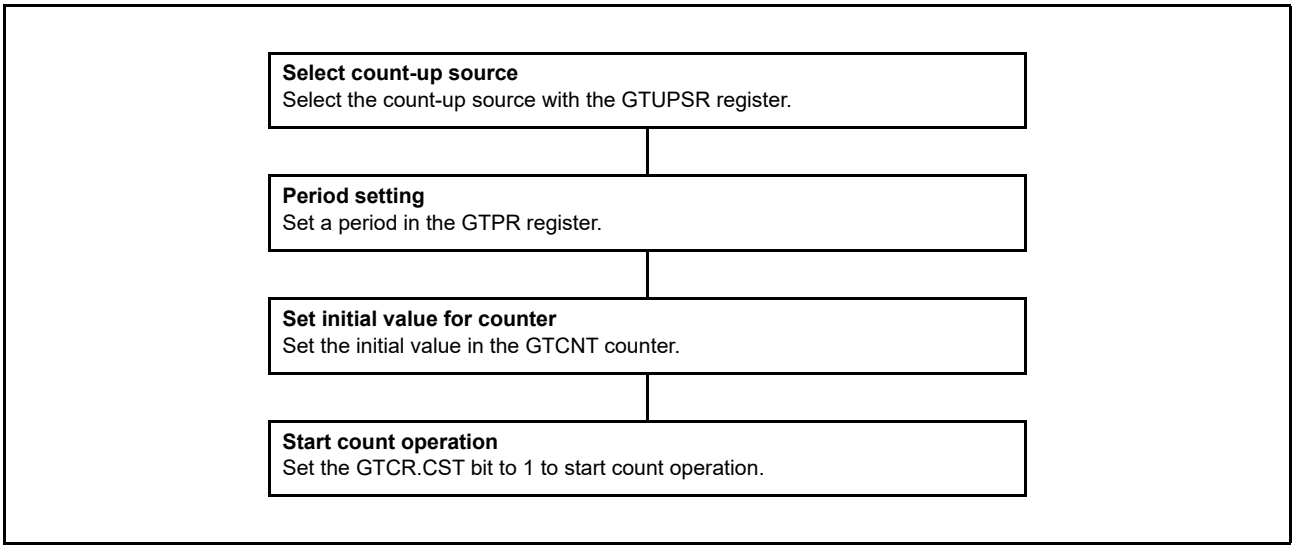

Figure 24.13 Example for Setting Event Count Operation (In Up-Counting by Hardware Source)

(5) Event Count Operation (In Down-Counting by Hardware Source)

The counter in each channel can start down-counting by hardware source by setting the GTDNSR register. When the GTDNSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value will not change.

Operation due to underflow in down-counting by hardware source is the same as the periodic count operation by the count clock.

To perform down-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. As the starting the count operation is synchronized with the count clock selected by TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start down-counting operation. To start down-counting after one GTCLK from setting the CST bit to 1, set the TPCS[3:0] bits to 0000b.

Figure 24.14 shows an example of down-counting operation by hardware source.

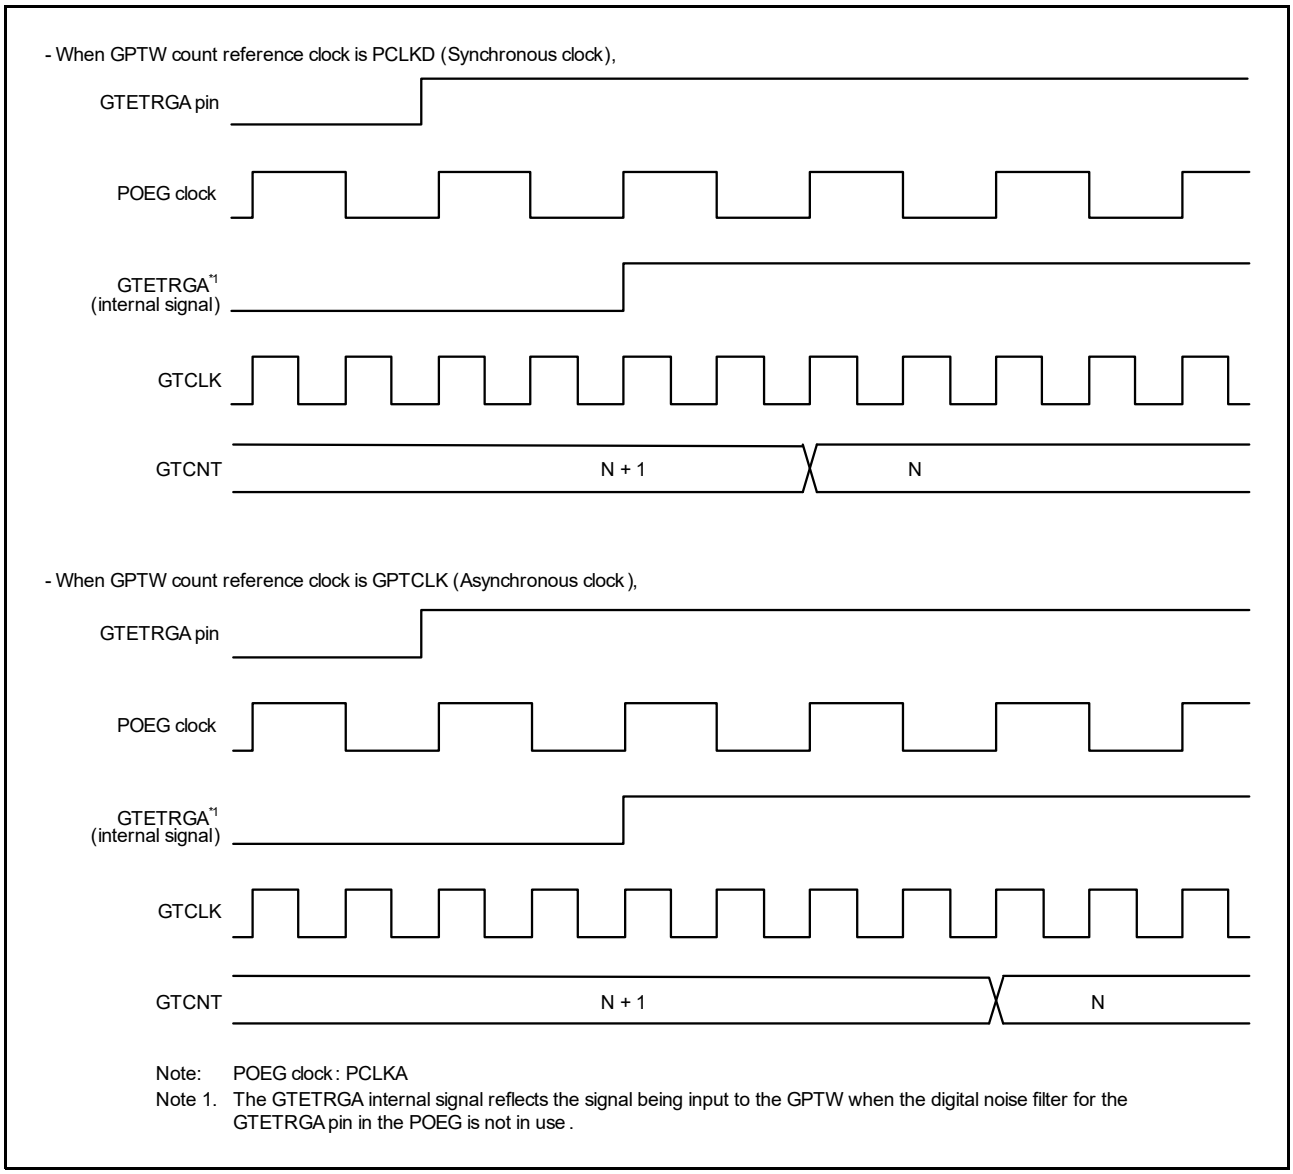

Figure 24.14 Example of Event Count Operation (Down-Counting of Rising Edges of the Input on the GTETRGA Pin)

Figure 24.15 shows an example for setting event count operation in down-counting by hardware source.

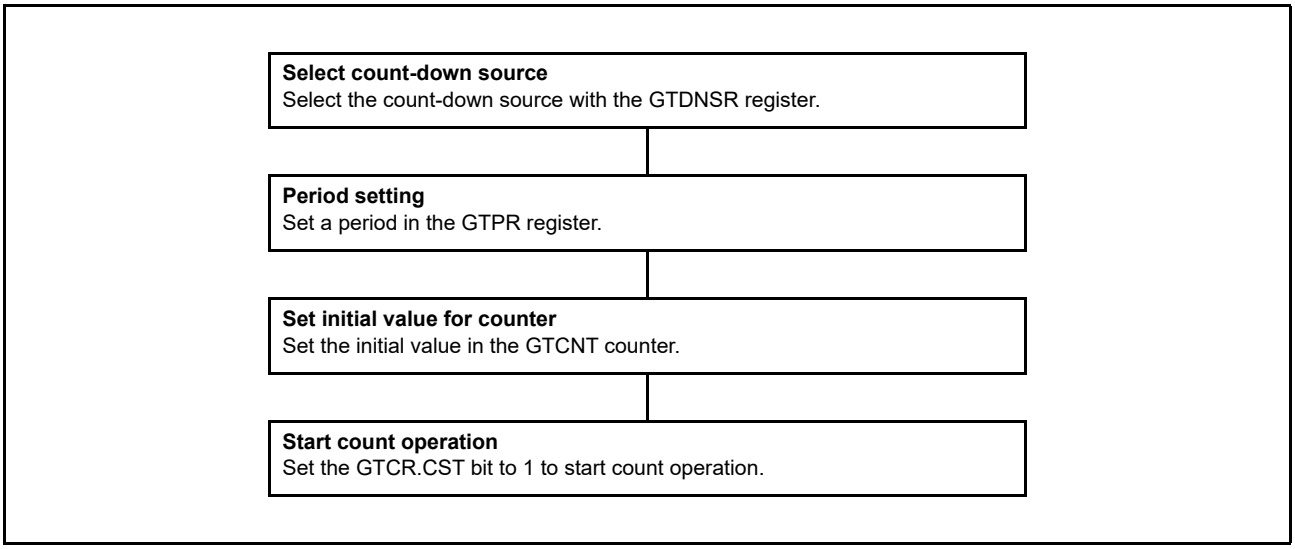

Figure 24.15 Example for Setting Event Count Operation (In Down-Counting by Hardware Source)

(6) Counter Clearing Operation

The counter in each channel can be cleared by the following sources:

- Writing to the GTCNT counter
- Writing 1 to the bit corresponding to the channel number for the GTCLR register while the GTCSR.CCLR bit is 1
- Hardware source specified by the GTCSR register

Do not write to the GTCNT register during counting.
GTCLR register can be written to and cleared by hardware source whether the count operation is performed (GTCR.CST bit = 1) or is stopped (CST bit = 0). When the count direction flag is set as decrement (GTST.TUCF flag = 0) in sawtooth-wave mode (except sawtooth-wave PWM mode 2) selected with GTCR.MD[2:0] or GTCR.MD[3:0] bits, the GTCNT counter value for writing to the GTCLR register and for clearing by hardware source becomes the GTPR register value whether the counter is in operation or is stopped. The GTCNT counter value becomes 0000 0000h for other settings.
When the event count operation is set (at least one of bits for the GTUPSR or the GTDNSR register is set as 1), writing to the GTCLR register and clearing by hardware source are performed right after the clear source is generated (the operation is based on GTCLK). For other settings, clearing operation is synchronized with the count clock selected with the GTCR.TPCS[3:0] bits.

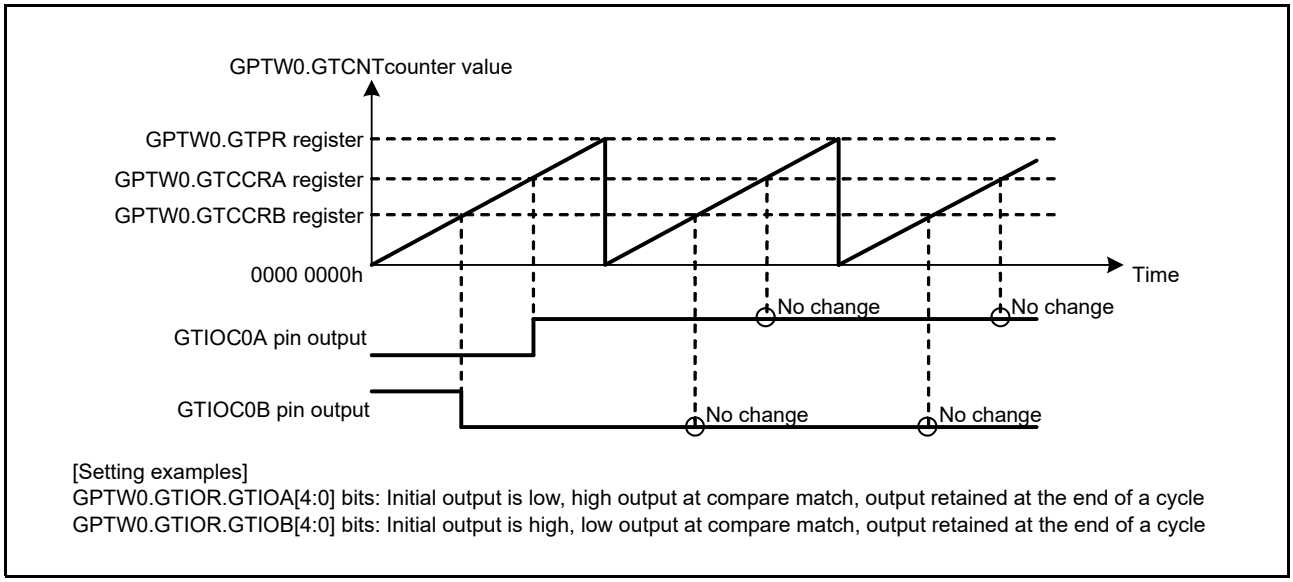
24.3.1.2 Waveform Output by Compare Match

Compare match refers to when the GTCNT counter value matches the GTCCRA or GTCCRB register value. The output of the corresponding GTIOCnA or GTIOCnB pin (n = 0 to 15) can be set to be driven low, high, or toggled in synchronization with the counter clock (including in the case of event counting) after the match.
In addition, the GTIOCnA or GTIOCnB pin output can be driven low, high, or toggled at the “end of the cycle” which is determined by the GTPR register or GTCCRm selected as a counter clear source by the GTCSR.CSCMSC[2:0] bits in sawtooth-wave PWM mode 2 (n = 0 to 7, m = A to F). The end of the cycle is as follows:

- For sawtooth waves (except sawtooth-wave PWM mode 2) in up-counting: When the GTCNT counter value changes from the GTPR register value to 0000 0000h (overflow)
- For sawtooth waves (except sawtooth-wave PWM mode 2) in down-counting: When the GTCNT counter value changes from 0000 0000h to the GTPR register value (underflow)
- For sawtooth-wave PWM mode 2 and GTCCRm register (m = A to F) selected as a counter clear source by the GTCSR.CSCMSC[2:0] bits. When the GTCNT counter value changes from the GTCCRm register value to 0000 0000h
- For sawtooth waves with the GTCNT counter clear
- For triangle waves or complementary PWM mode: When the GTCNT counter value changes from 0000 0000h to 0000 0001h (trough)

(1) Low Output and High Output

Figure 24.16 shows an example of low output and high output operation by a compare match of the GTCNT counter and GTCCRA register and of the GTCNT counter and GTCCRB register.
In this example, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that high is output from the GTIOC0A pin by a GPTW0.GTCCRA register compare match, and low is output from the GTIOC0B pin by a GPTW0.GTCCRB register compare match. The pin level does not change when the specified level and pin level match.



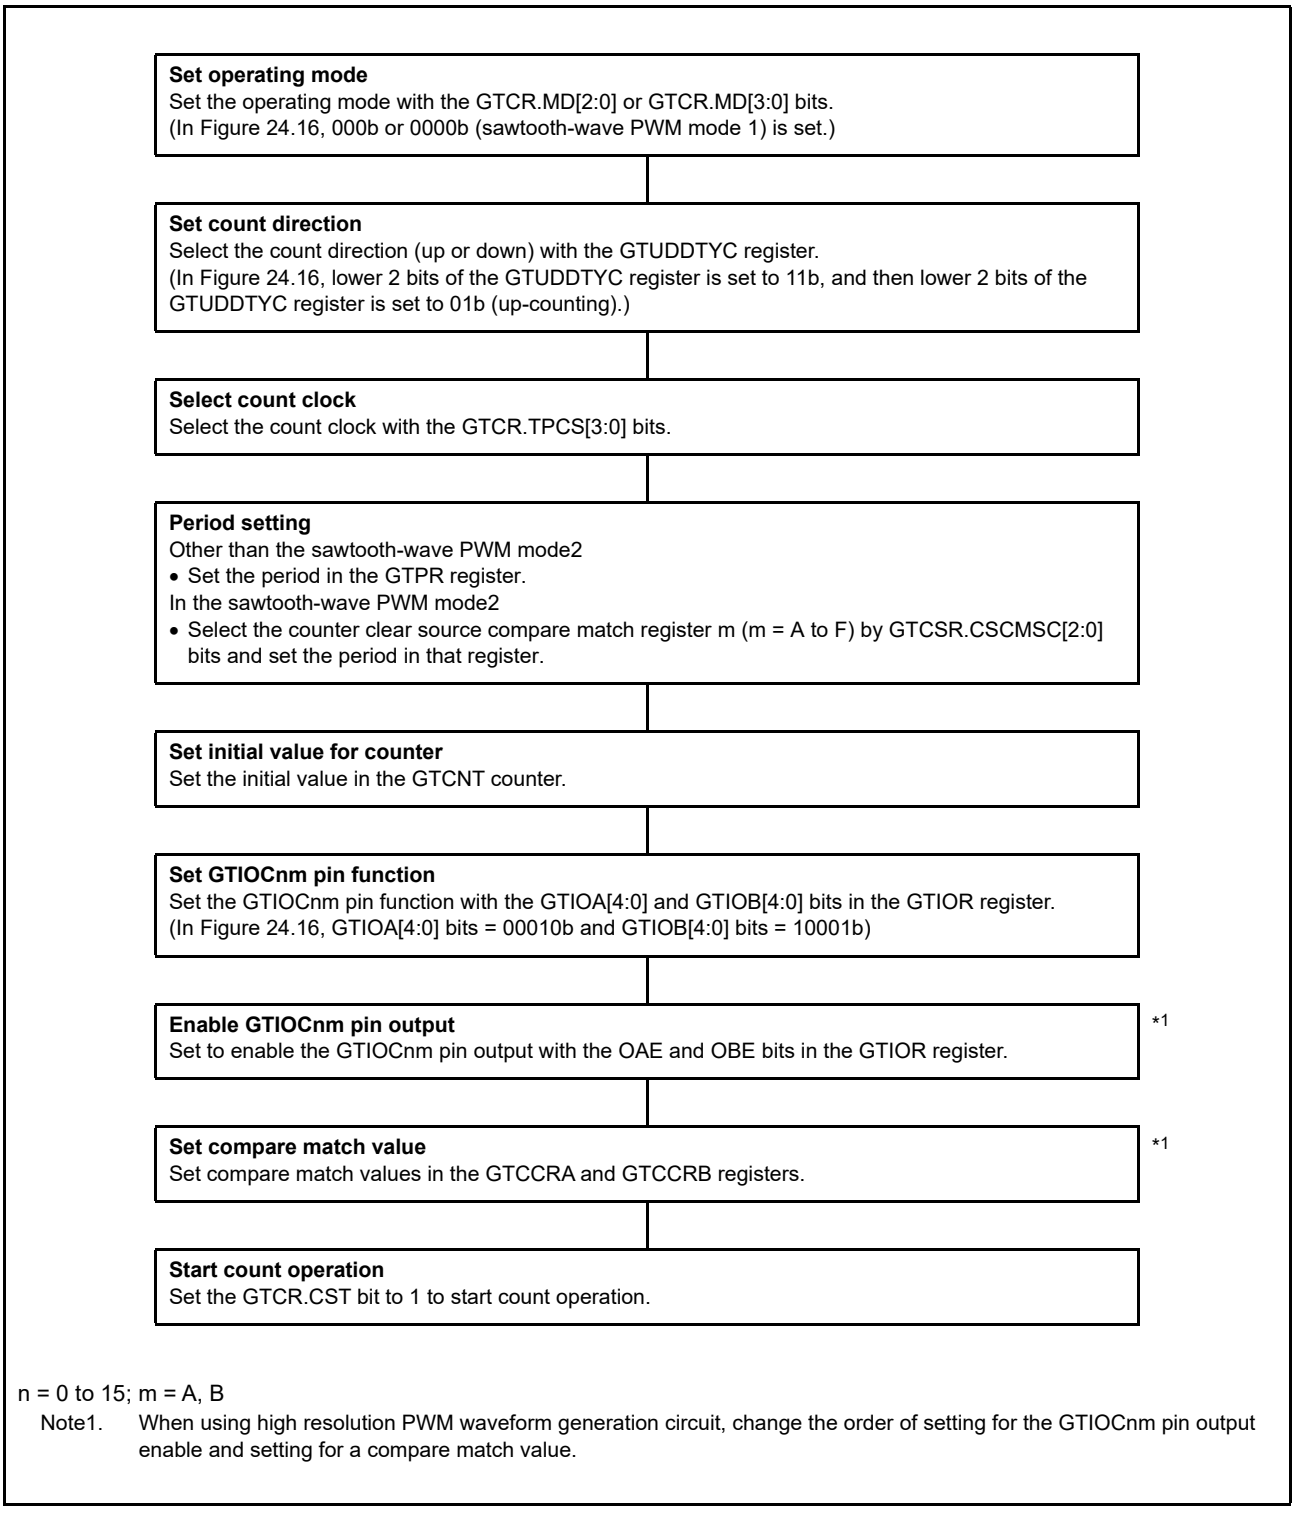


Figure 24.16 Example of Low Output and High Output Operation

Figure 24.17 shows an example for setting Low/High output operation.

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.17 Example for Setting Low/High Output Operation

(2) Toggled Output

Figure 24.18 and Figure 24.19 show examples of toggle output operations by compare match between the GPTW0.GTCNT counter and the GTCCRA and GTCCRB registers.

In Figure 24.18, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that the GTIOC0A pin output by a GPTW0.GTCCRA register compare match and GTIOC0B pin output by a GPTW0.GTCCRB register compare match are toggled.

In Figure 24.19, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that the GTIOC0A pin output is toggled by a compare match of GPTW0.GTCCRA register and the GTIOC0B pin output is toggled at the end of the cycle.

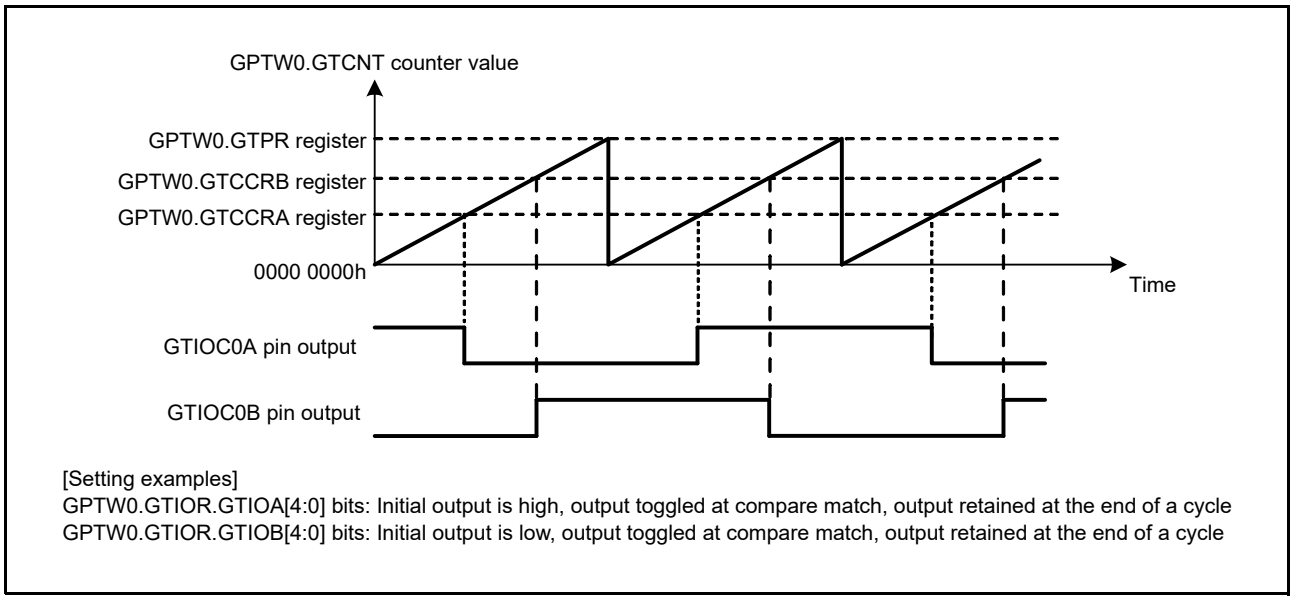

Figure 24.18 Example of Toggled Output Operation (1)

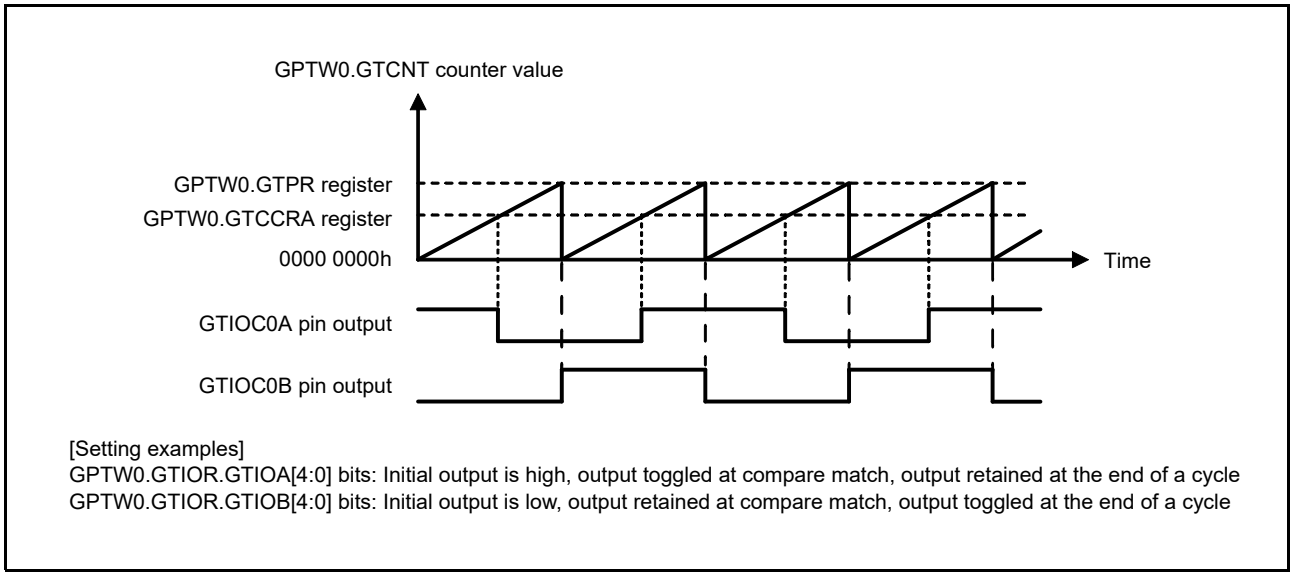

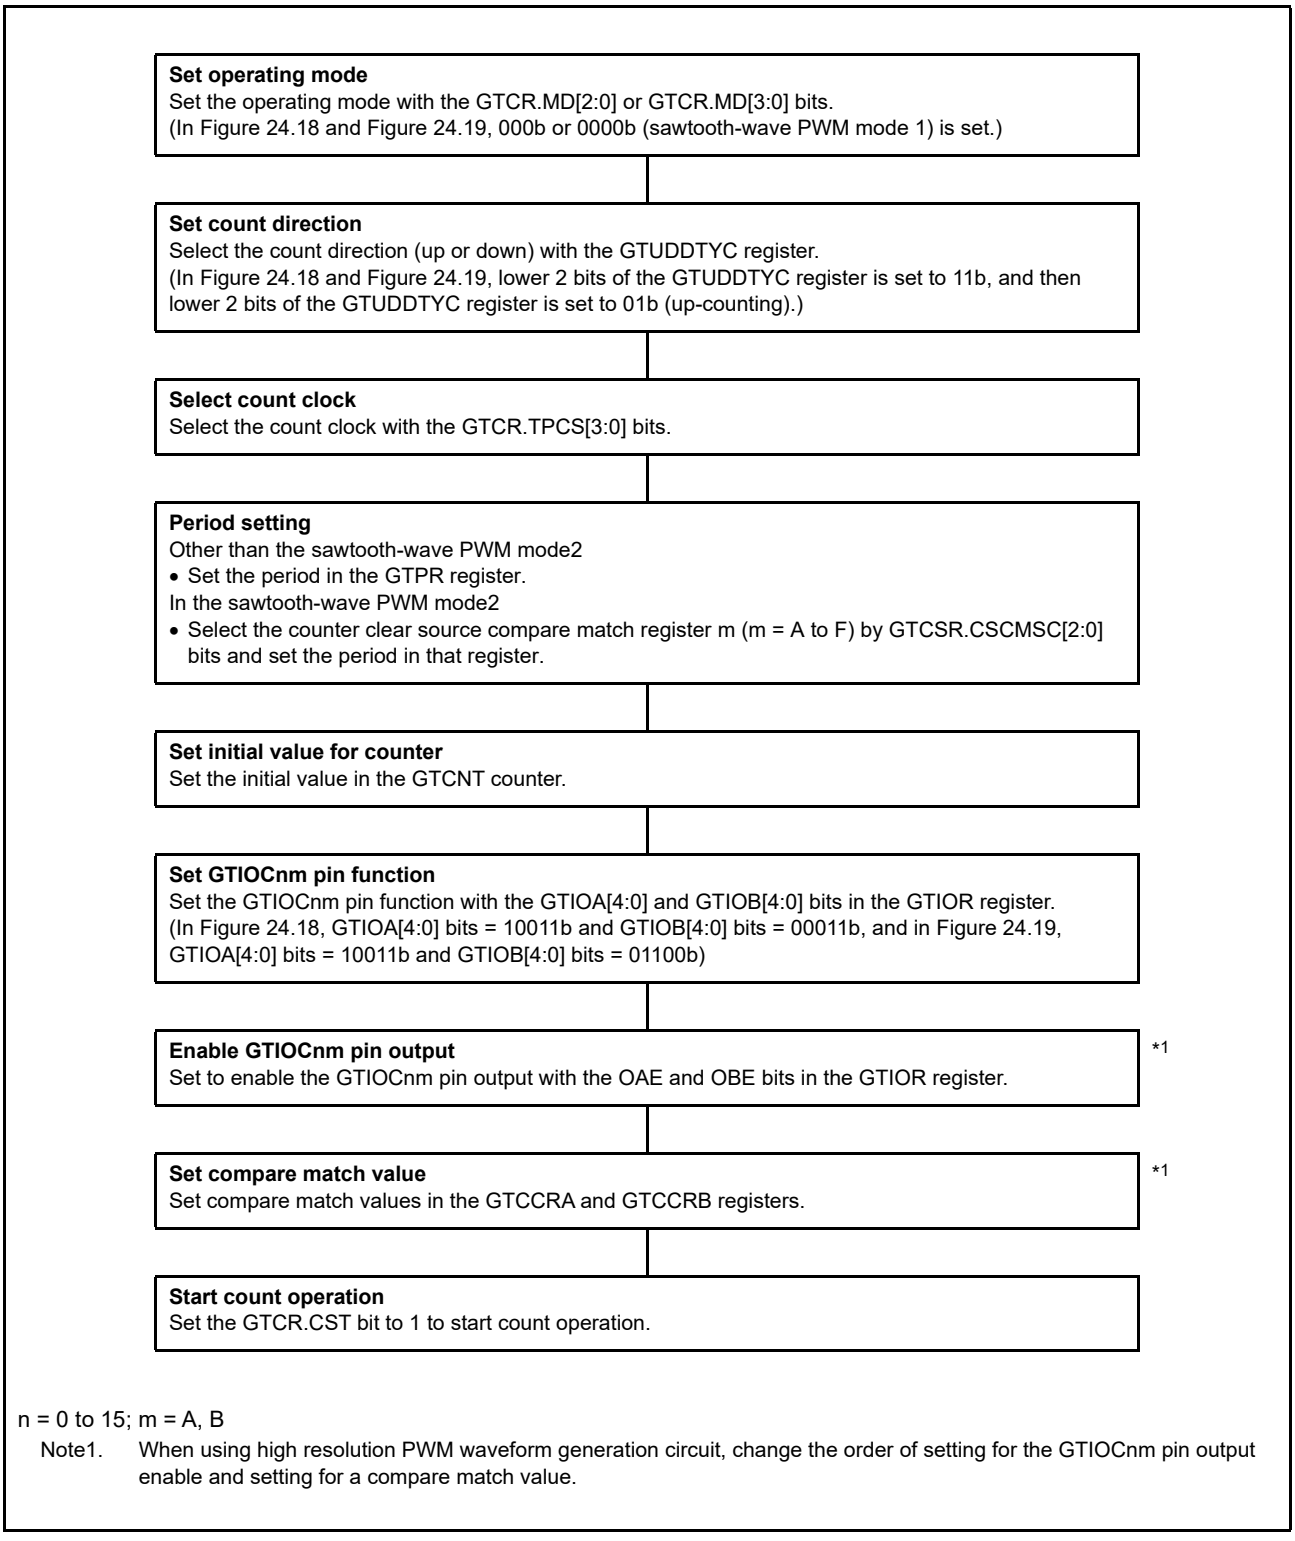

Figure 24.19 Example of Toggled Output Operation (2)

Figure 24.20 shows an example for setting toggled output operation.

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.20 Example for Setting Toggled Output Operation

24.3.1.3 Input Capture Function

Through detecting hardware sources selected by the GTICASR and GTICBSR registers, the GTCNT counter values can be transferred to the GTCCRA and GTCCRB registers respectively.

In complementary PWM mode, the GTCCRA and GTCCRB registers do not function as input capture registers.

Figure 24.21 shows an example of input capture function operation.

In this example, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that an input capture is performed at both edges of the GTIOC0A pin input and at the rising edge of the GTIOC0B pin input.

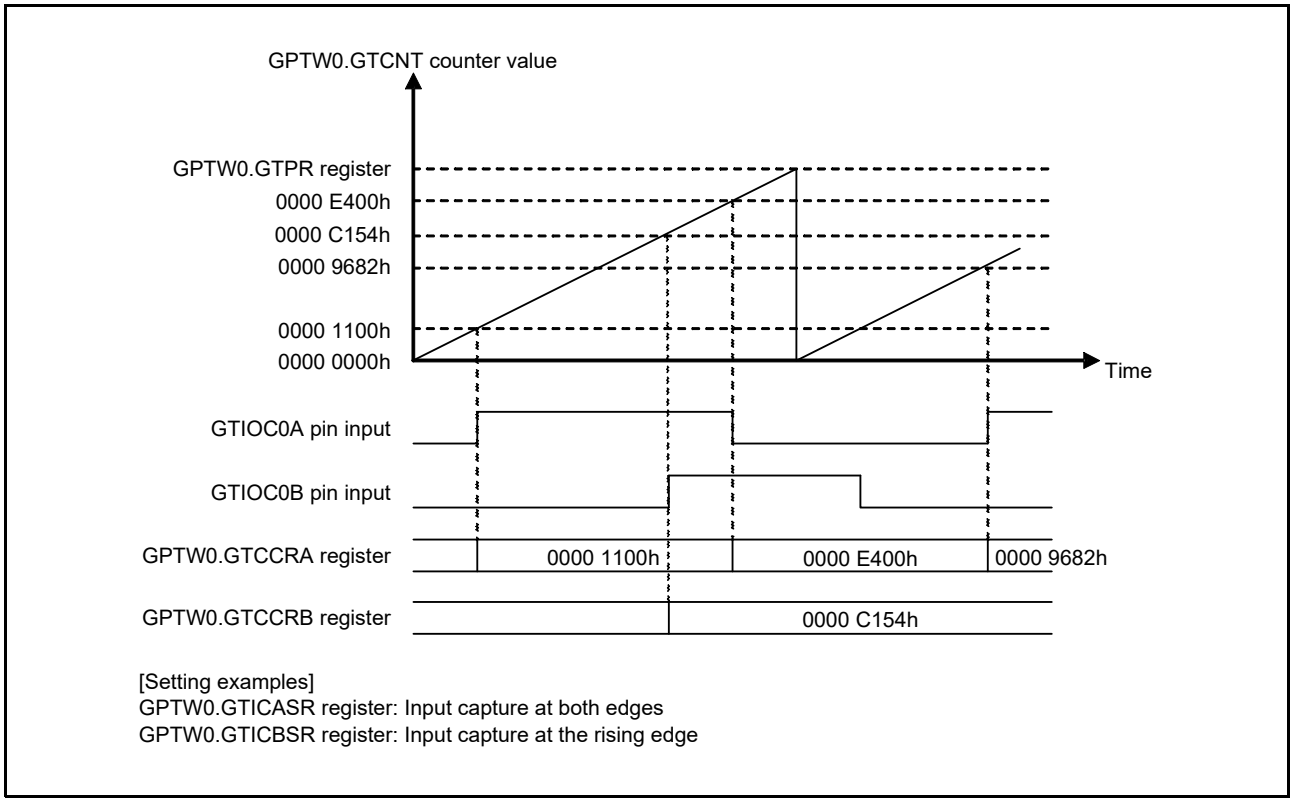

Figure 24.21 Example of Input Capture Operation

Figure 24.22 shows an example for setting input capture operation.

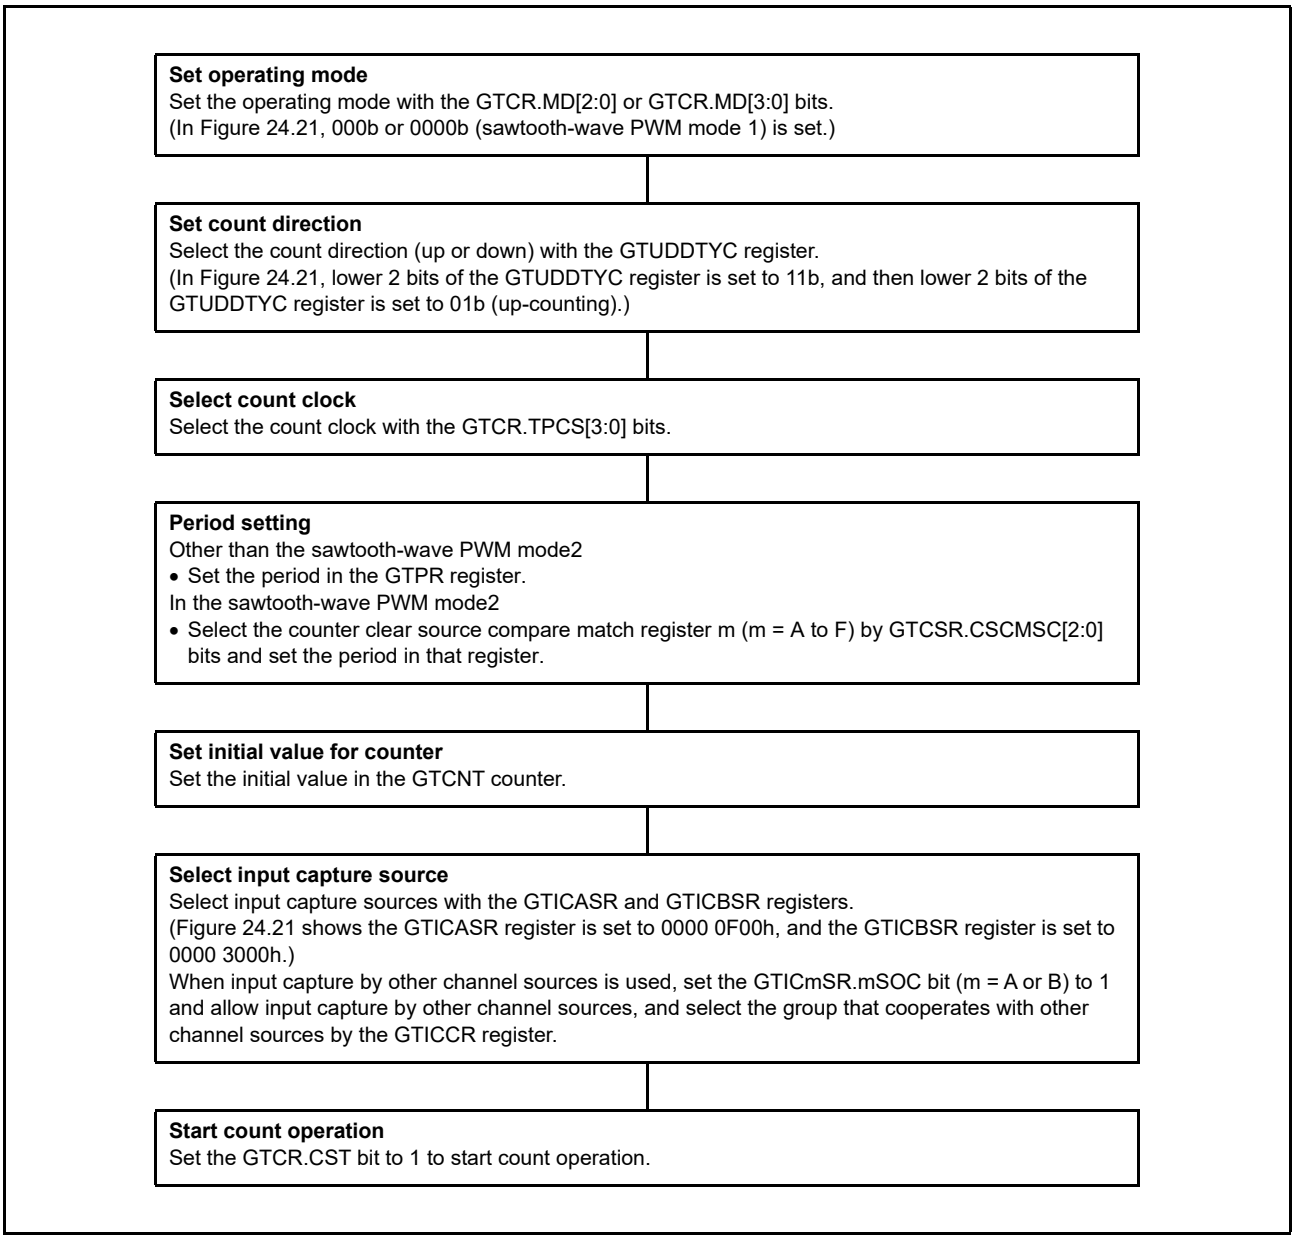

Figure 24.22 Example for Setting Input Capture Operation

Figure 24.23 shows an example of the timing of input capture operation in response to a rising edge of the input on the GTETRGA pin.

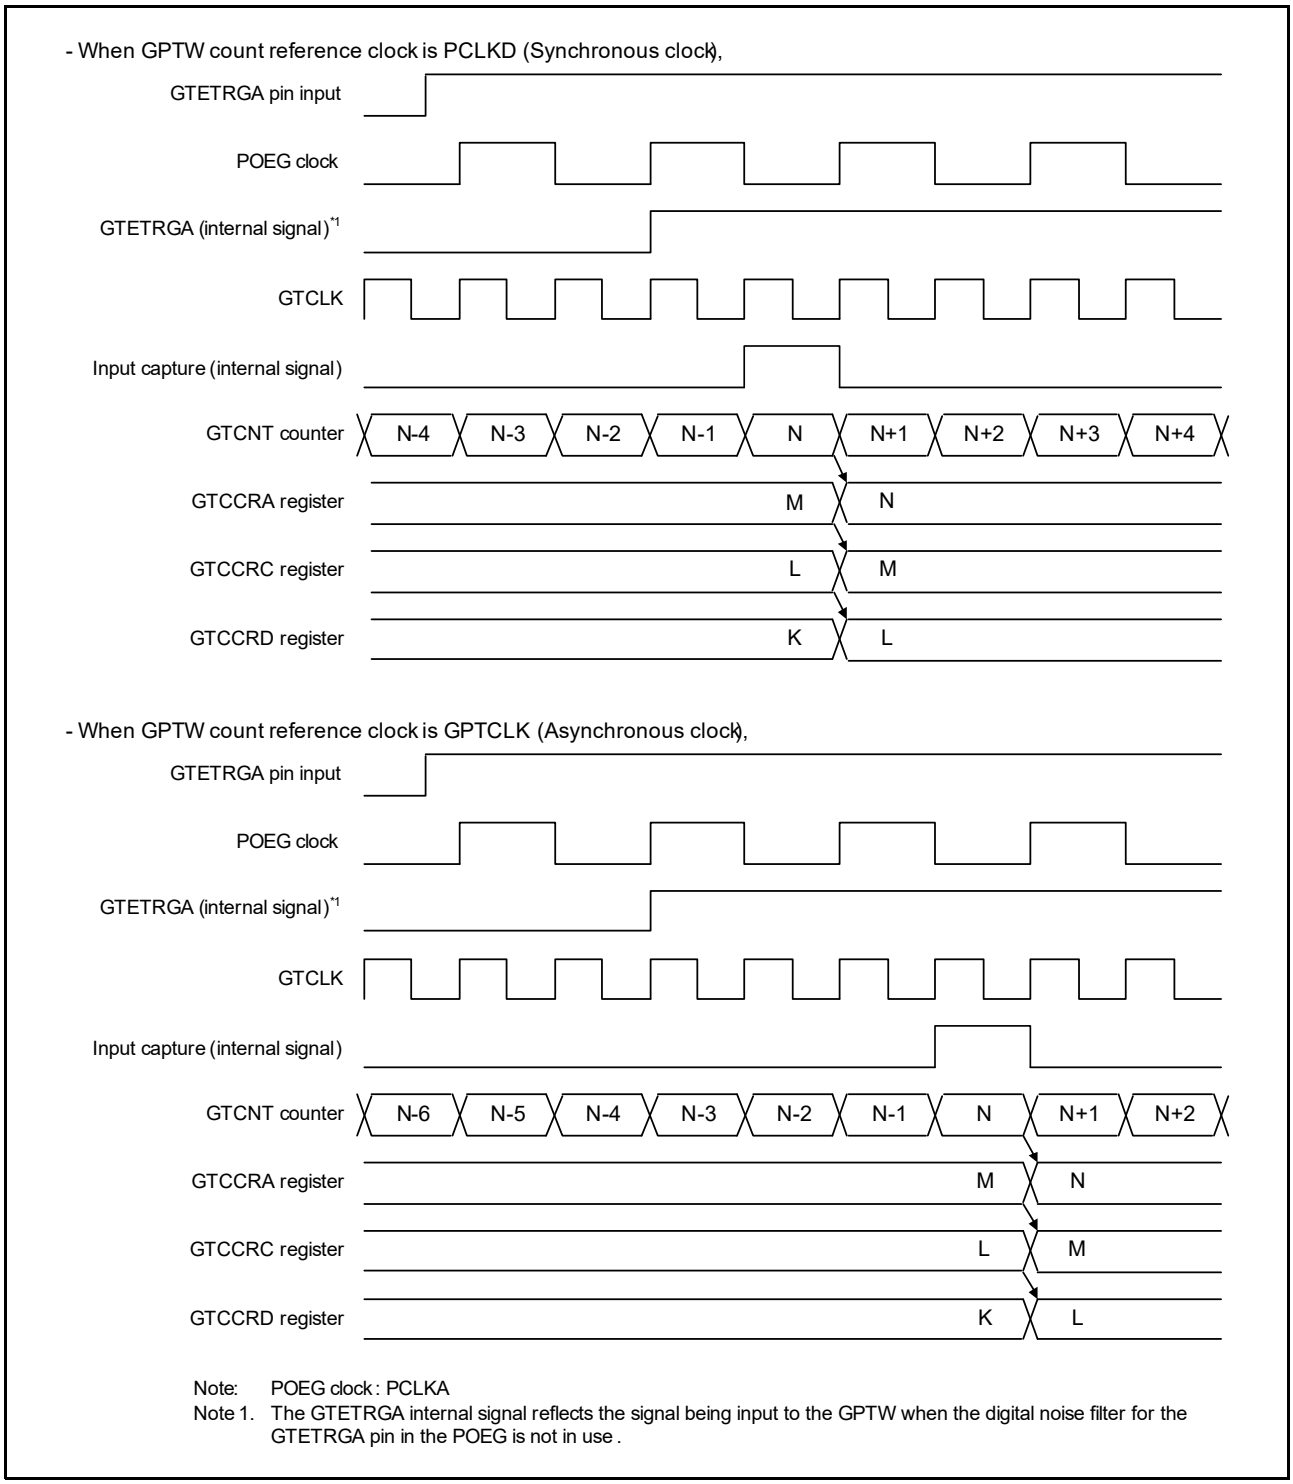

Figure 24.23 Example of the Timing of Input Capture Operation in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 24.24 shows an example of the timing of input capture operation in response to a rising edge of the input on the GTIOCnA pin.

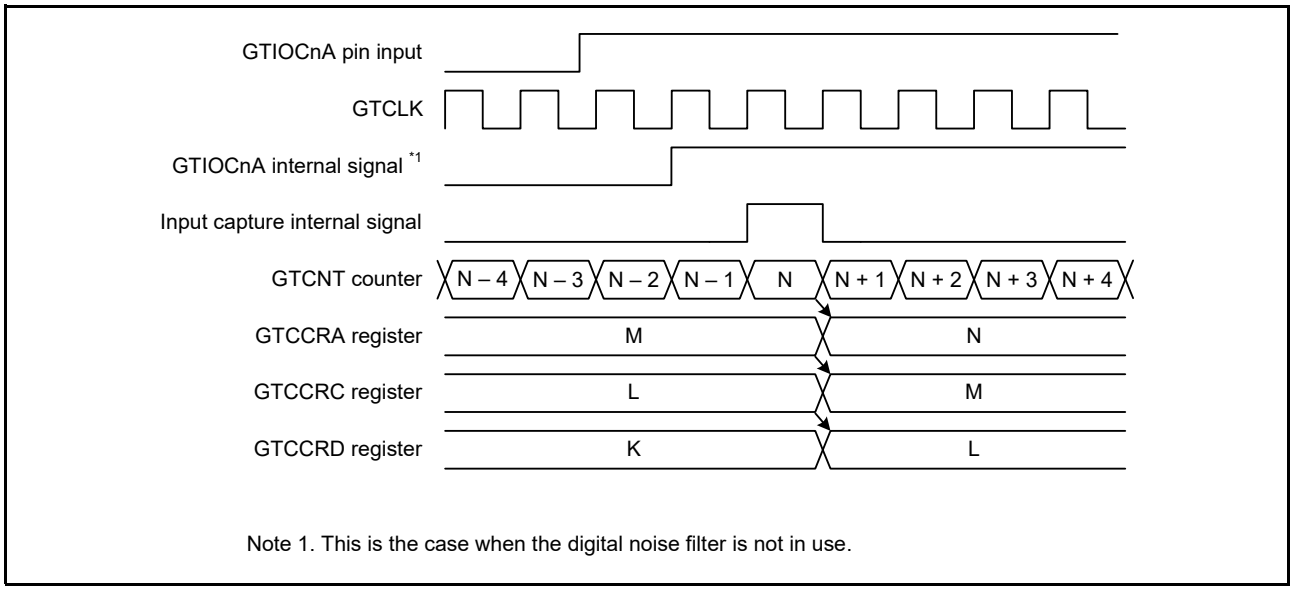

Figure 24.24 Example of the Timing of Input Capture Operation in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 24.25 shows an example of the timing of operations for input capture in response to event input from the ELCA. This is an example of capture of the counter value by the GPTW1.GTCCRA register in response to an input signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A. The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed.

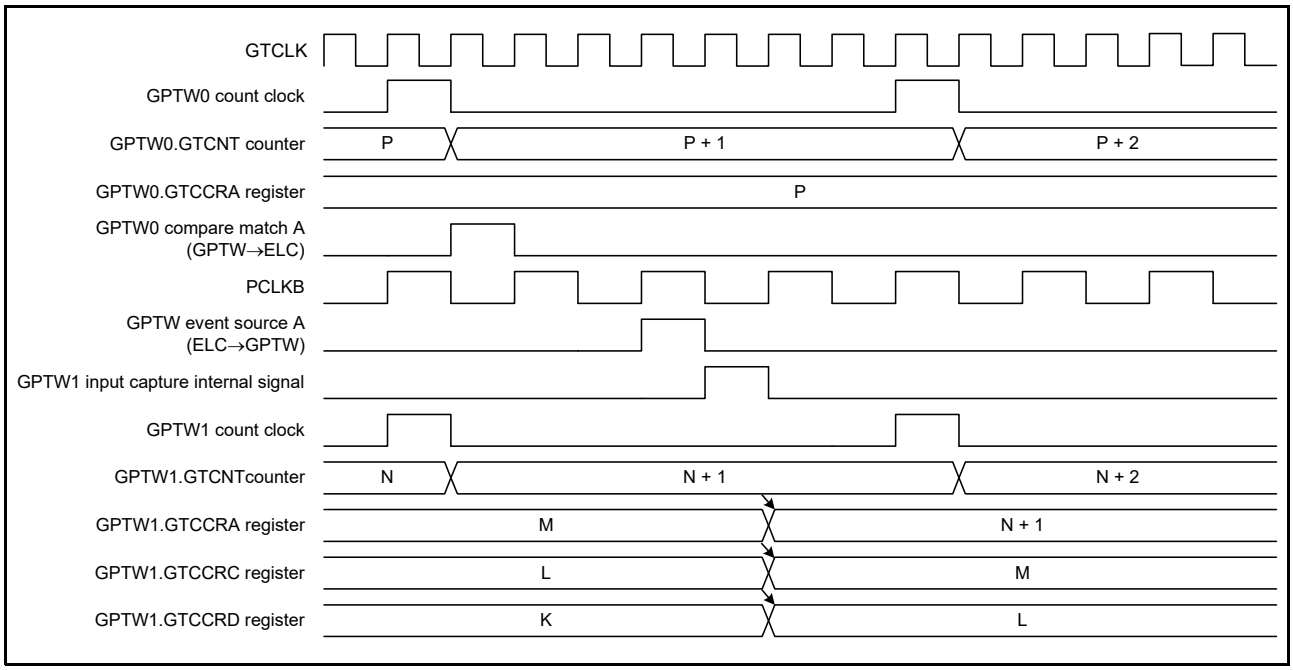

Figure 24.25 Example of the Timing of Operations for Input Capture in Response to Event Input from the ELCA

Figure 24.26 shows the input capture operation timing by the counter clock of other channels.

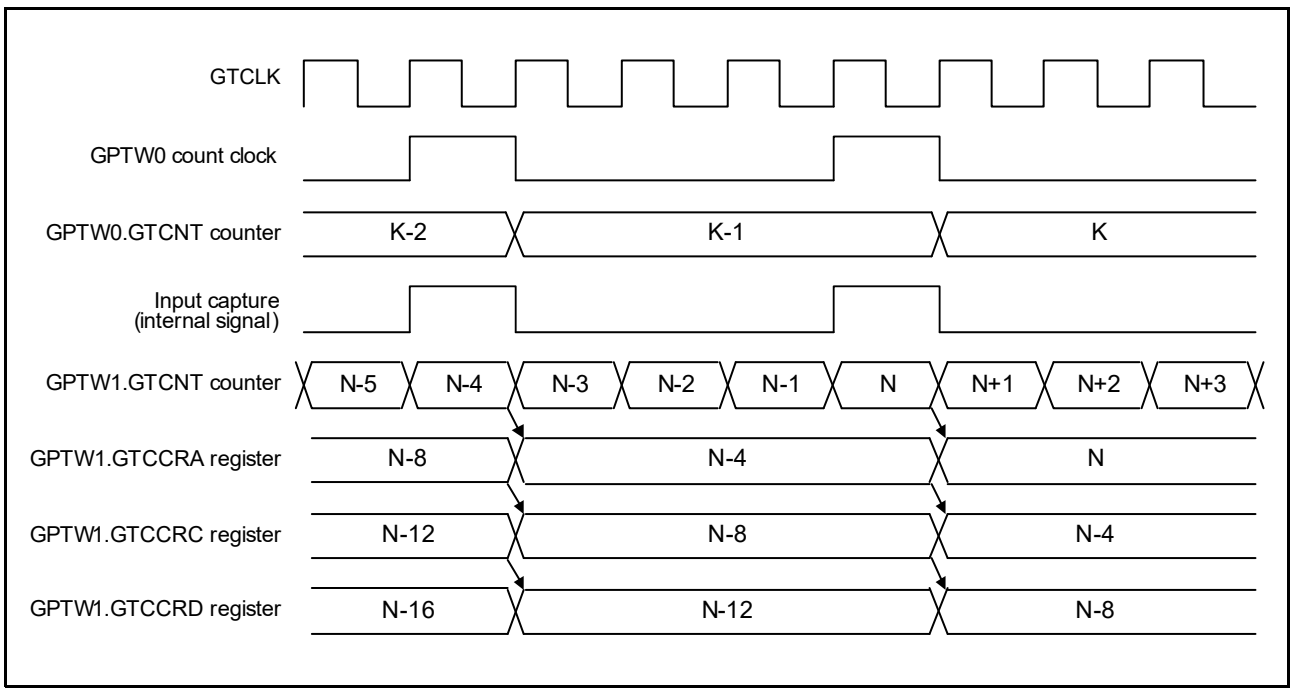

Figure 24.26 Example of the Timing of Input Capture Operation in Response to Count Clock from Other Channel

24.3.2 Buffer Operation

The following buffer operation can be set with the GTBER register.

- Buffer operation with the GTPR, GTPBR, and GTPDBR registers used together
- Buffer operation with the GTCCRA, GTCCRC, and GTCCRD registers used together
- Buffer operation with the GTCCRB, GTCCRE, and GTCCRF registers used together
- Buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers used together
- Buffer operation with the GTADTRB, GTADTBRB, and GTADTDBRB registers used together

The following buffer operation can be set with the GTDTCR register.

- Buffer operation with the GTDVU and GTDBU registers used together
- Buffer operation with the GTDVD and GTDBD registers used together

The following buffer operation can be set with the GTBER2 register.

- Buffer operation with the GTCCRA, GTCCRE, and GTCCRF registers (in complementary PWM mode 3, 4)
- Buffer operation with the GTOLBR.GTIOAB[4:0] bits and GTIOR.GTIOA[4:0] bits
- Buffer operation with the GTOLBR.GTIOBB[4:0] bits and GTIOR.GTIOB[4:0] bits

24.3.2.1 GTPR Register Buffer Operation

The GTPBR register can function as a buffer register for the GTPR register, and the GTPDBR register can function as a buffer register for the GTPBR register (double buffer register for the GTPR register).
In complementary PWM mode, the buffer transfer from the GTPDBR register to the temporary register P is performed only in the master channel (GPTWn). The temporary register P is transferred to each GTPBR register of master channel, slave channel 1 (GPTWn+1), and slave channel 2 (GPTWn+2). Transfer from the GTPBR register to the GTPR register is made concurrently in three channels. Therefore, the same value is stored in the same register of the three channels. The GTPR register of the master channel represents the period of the GTCNT counters of the three channels. In the slave channels, periods are controlled using the GTPR register value and the GTDVU register value.
The setting is invalid in the sawtooth-wave PWM mode 2.
The buffer transfer is performed at an overflow (in up-counting) or underflow (in down-counting) in sawtooth-wave mode or in event counting, or at a trough in triangle-wave mode.
When in sawtooth-wave mode and in event counting, the buffer transfer is performed even when the counter clearing shown below occurs during the counting operation.

- Hardware source clearing

(Clear source selected with GTCSR.CSGTRGAR, CSGTRGAF, CSGTRGBR, CSGTRGBF, CSGTRGCR, CSGTRGCF, CSGTRGDR, CSGTRGDF, CSCARBL, CSCARBH, CSCAFBL, CSCAFBH, CSCBRAL, CSCBRAH, CSCBFAL, CSCBFAH, CSELCA, CSELCB, CSELCC, CSELCD, CSELCE, CSELCF, CSELCG, CSELCH, CSCMSC[2:0], or CP1CCE bit)

- Clearing by software

(When the GTCLR.CCLRn bit is written to 1 during the GTCSR.CCLR bit is set to 1) (n = 0 to 15)
In the case of sawtooth waves, the buffer transfer by clearing counter can be prohibited by the GTBER2.CCTPR bit.
Figure 24.12 shows the buffer transfer timing in the complementary PWM mode.

Table 24.11 The GTPR Buffer Transfer Timing in Complementary PWM Mode

Mode	Complementary PWM mode 1	Complementary PWM mode 2	Complementary PWM mode 3 Complementary PWM mode 4
GTPDBR register ↓ Temporary register P	Counter running • One cycle of GTCLK after writing to the GTCCRD register for slave channel 2 (GPTWn+2) Counter stopped • One cycle of GTCLK after writing to the GTPDBR register	Counter running • One cycle of GTCLK after writing to the GTCCRD register for slave channel 2 (GPTWn+2) Counter stopped • One cycle of GTCLK after writing to the GTPDBR register	Counter running • One cycle of GTCLK after writing to the GTCCRD register for slave channel 2 (GPTWn+2) Counter stopped • One cycle of GTCLK after writing to the GTPDBR register
Temporary register P ↓ GTPBR register	When data is transferred to the temporary register P during up-counting middle • One cycle of GTCLK after transfer of data to the temporary register P When data is transferred to the temporary register P during a section other than up-counting middle • At the end of trough Counter stopped • One cycle of GTCLK after transfer of data to the temporary register P	When data is transferred to the temporary register P during down-counting middle • One cycle of GTCLK after transfer of data to the temporary register P When data is transferred to the temporary register P during a section other than down-counting middle • At the end of crest Counter stopped • One cycle of GTCLK after transfer of data to the temporary register P	When data is transferred to the temporary register P middle • One cycle of GTCLK after transfer of data to the temporary register P When data is transferred to the temporary register P during a section other than middle • At the end of crest/trough Counter stopped • One cycle of GTCLK after transfer of data to the temporary register P
GTPBR register ↓ GTPR register	At the end of crest • Counter clearing in an up-counting middle or crest section, including counter clearing enabled by setting the GTCSR.CP1CCE bit	At the end of trough • Counter clearing in a down-counting middle or trough section	At the end of crest At the end of trough • Counter clearing

To enable double buffer operation for the GTPR register, set the GTBER.PR[1:0] bits to 10b or 11b. For single buffer operation, set 01b. To disable buffering, set 00b.

In complementary PWM mode, complementary PWM mode-specific buffer operation is performed regardless of the GTBER.PR[1:0] bits setting.

Figure 24.27 to Figure 24.29 show examples of the GTPR register buffer operation and Figure 24.33 shows an example for setting the GTPR register buffer operation.

For details of operation settings in complementary PWM mode, refer to section 24.3.3, PWM Output Operating Mode.

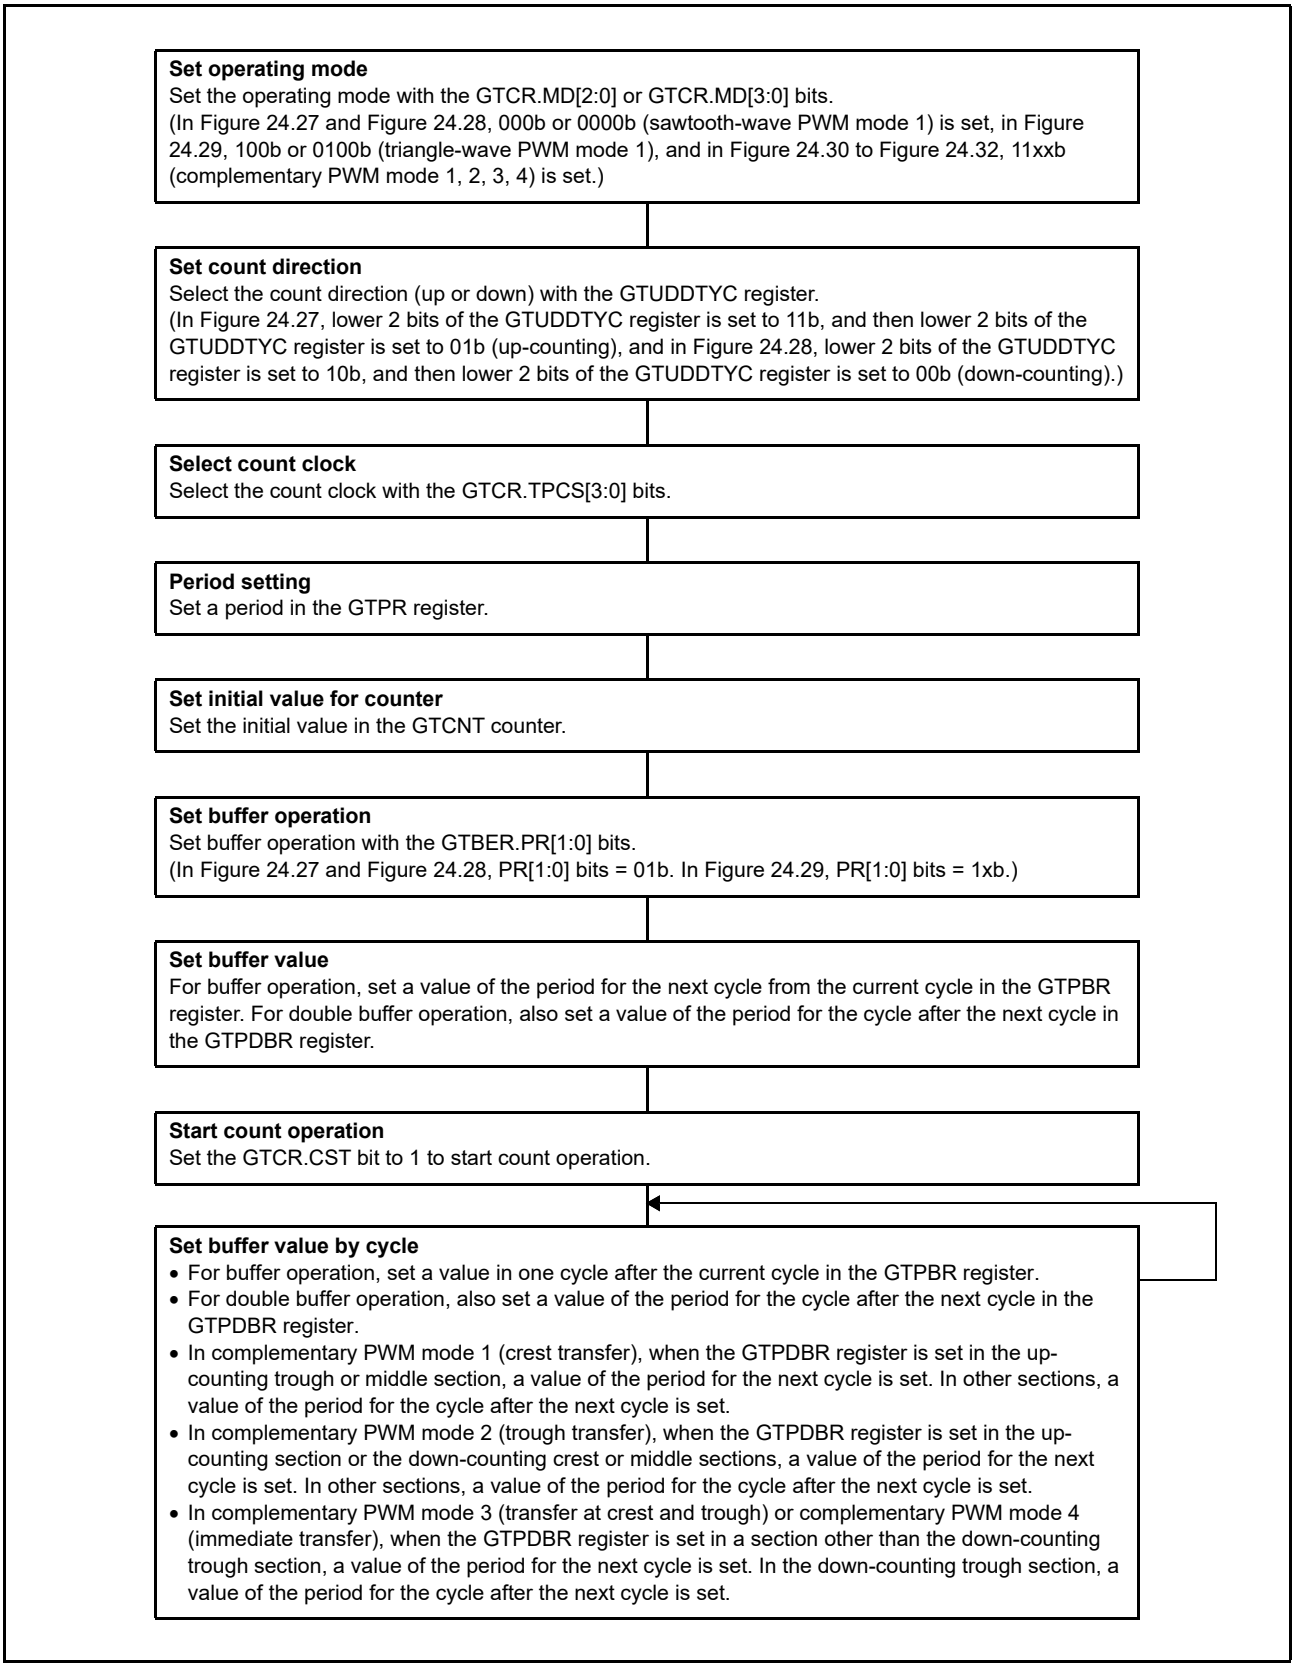

Figure 24.33 Example for Setting the GTPR Register Buffer Operation

24.3.2.2 Buffer Operation for the GTCCRA and GTCCRB Registers

The GTCCRC register can function as the GTCCRA buffer register and the GTCCRD register can function as the GTCCRC buffer register (double buffer register for the GTCCRA register). Similarly, the GTCCRE register can function as the GTCCRB buffer register and the GTCCRF register can function as the GTCCRE buffer register (double buffer register for the GTCCRB register).
To enable double buffer operation for the GTCCRA or GTCCRB register, set the GTBER.CCRA[1:0] or GTBER.CCRB[1:0] bits to 10b or 11b, respectively. For single buffer operation, set 01b. To disable buffering, set 00b.
In sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode, the buffer operations specific to each PWM output operating mode are performed regardless of the settings of the GTBER.CCRA[1:0] and GTBER.CCRB[1:0] bits. For details on the buffer operations in sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, and complementary PWM mode, refer to section 24.3.3, PWM Output Operating Mode.
The following describes buffer operation during output compare and input capture operation.

(1) When the GTCCRA or GTCCRB Register Functions as Output Compare Register

In sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode, the buffer operation is performed as appropriate for the PWM output operating mode regardless of the setting of the GTBER.CCRA[1:0] and GTBER.CCRB[1:0] bits. For details, refer to section 24.3.3, PWM Output Operating Mode. Other than the above PWM output operating mode, buffer transfer is performed in the following four cases:

- Buffer transfer at an overflow (in up-counting) and underflow (in down-counting)
  Buffer transfer is performed at an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode and in event counting, and at a trough (triangle-wave PWM mode 1) or at a crest/trough (triangle-wave PWM mode 2) in triangle-wave mode.
- Buffer transfer by counter clearing
  In sawtooth-wave mode and in event counting, the buffer transfer by the same counter clearing sources described in section 24.3.2.1, GTPR Register Buffer Operation, is performed during counting operation, in the same way as at an overflow (in up-counting) or an underflow (in down-counting).
  In sawtooth-wave, the buffer transfer of GTCCRm register by counter clearing can be disabled with the GTBER2.CCTCm bit (m = A, B).
  In triangle-wave mode, buffer transfer by counter clearing is not performed.
- Buffer transfer by compare match
  In sawtooth-wave, the buffer transfer by the compare match of GTCCRm register enabled by GTBER2.CMTCm (m = A, B) bit is performed.
- Forcible buffer transfer
  In sawtooth-wave mode, triangle-wave mode, and event counting, buffer transfer of the GTCCRA and GTCCRB registers is forcibly performed by writing 1 to the GTBER.CCRSWT bit while the counting is stopped.
  In sawtooth-wave one-shot pulse mode and triangle-wave PWM mode 3, buffer transfer from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B is also performed using the forcible buffer operation.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffers to the GTCCRm (m = A, B) registers is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or buffer transfer extended skipping function (function for repeated double-buffer operation while buffer transfer is disabled). For details, refer to section 24.8.2.2, Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.
Figure 24.34 to Figure 24.37 show examples of the GTCCRA and GTCCRB registers buffer operations, and Figure 24.38 shows an example for setting the GTCCRA and GTCCRB registers buffer operations.

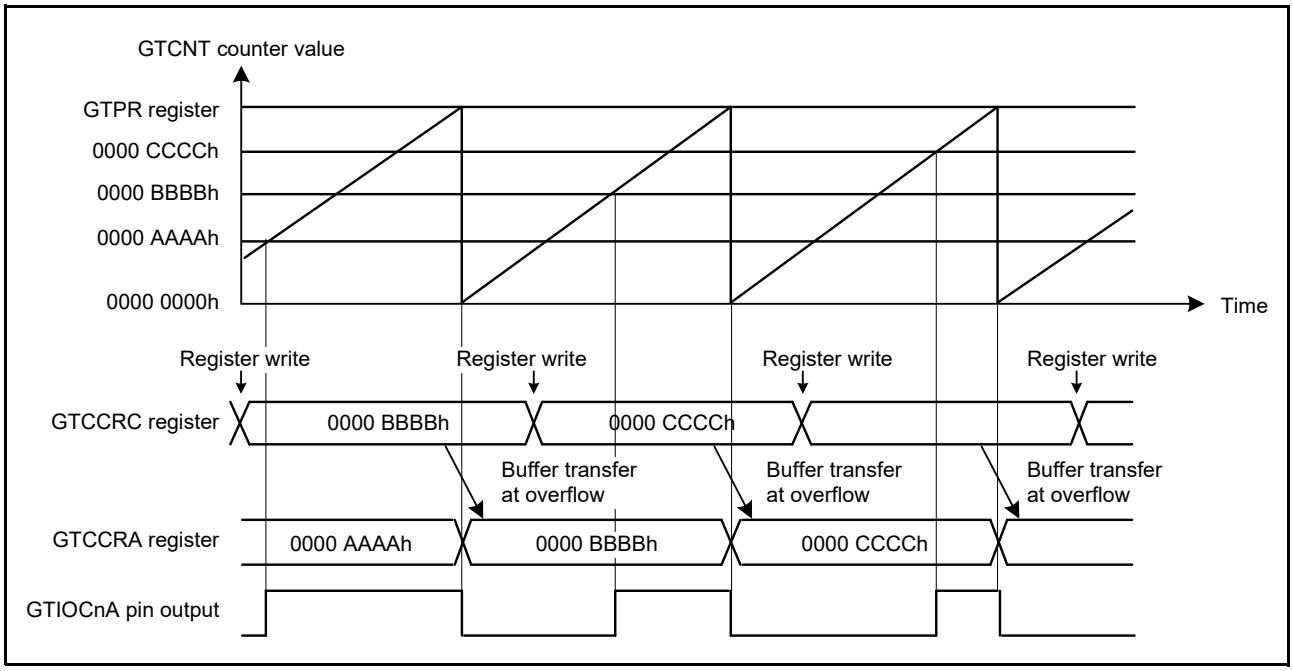

Figure 24.34 Example of GTCCRA and GTCCRB Registers Buffer Operation (Output Compare, Sawtooth-Waves, Sawtooth-Wave PWM mode 1 in Up-Counting, High Output at GTCCRA Register Compare Match, Low Output at the End of the Cycle) (n = 0 to 15)

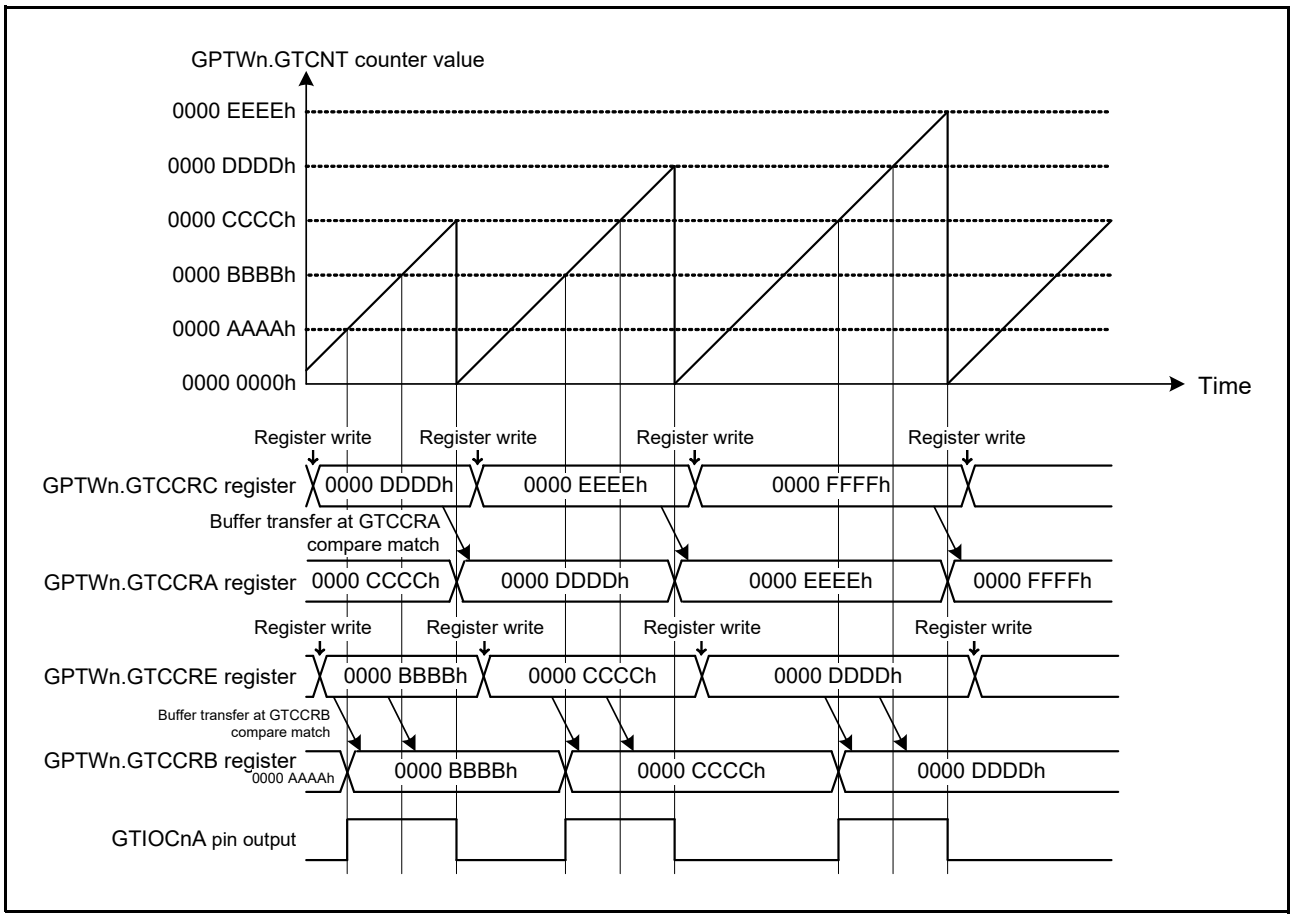

Figure 24.35 Example of GTCCRA and GTCCRB Registers Buffer Operation (Output Compare, Sawtooth-Wave PWM mode 2, Buffer Transfer at GTCCRA Register Compare Match, Counter Clearing, Low Output, Buffer Transfer at GTCCRB Register Compare Match, High Output) (n = 0 to 15)

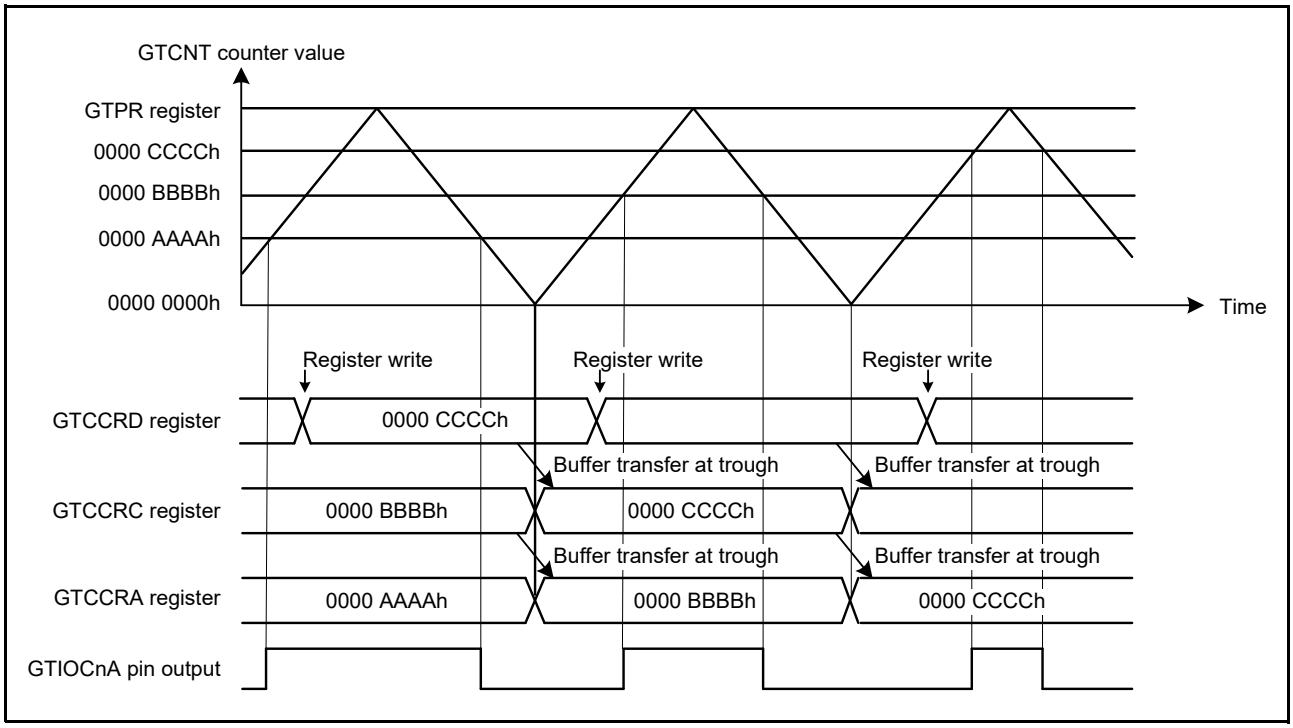

Figure 24.36 Example of GTCCRA and GTCCRB Registers Double Buffer Operation (Output Compare, Triangle Waves, Buffer Operation at Trough, Output Toggled at GTCCRA Register Compare Match, Output Retained at the End of the Cycle) (n = 0 to 15)

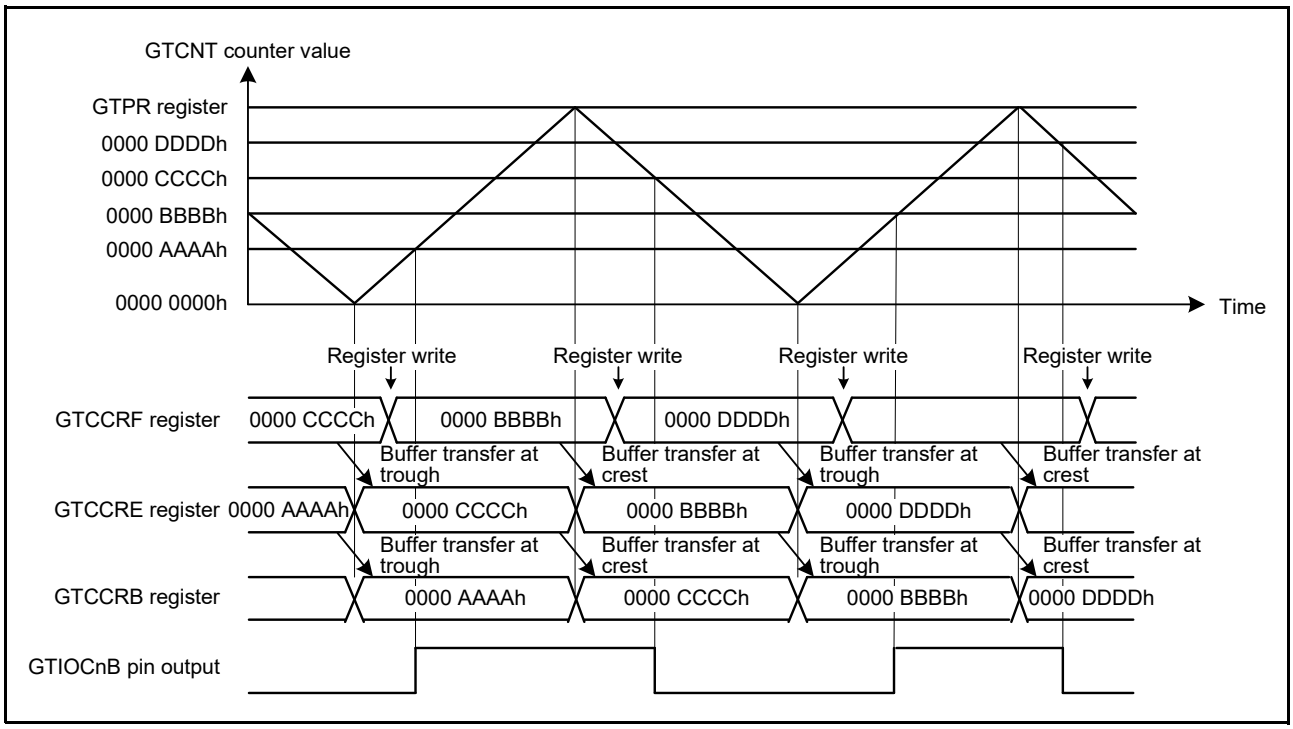

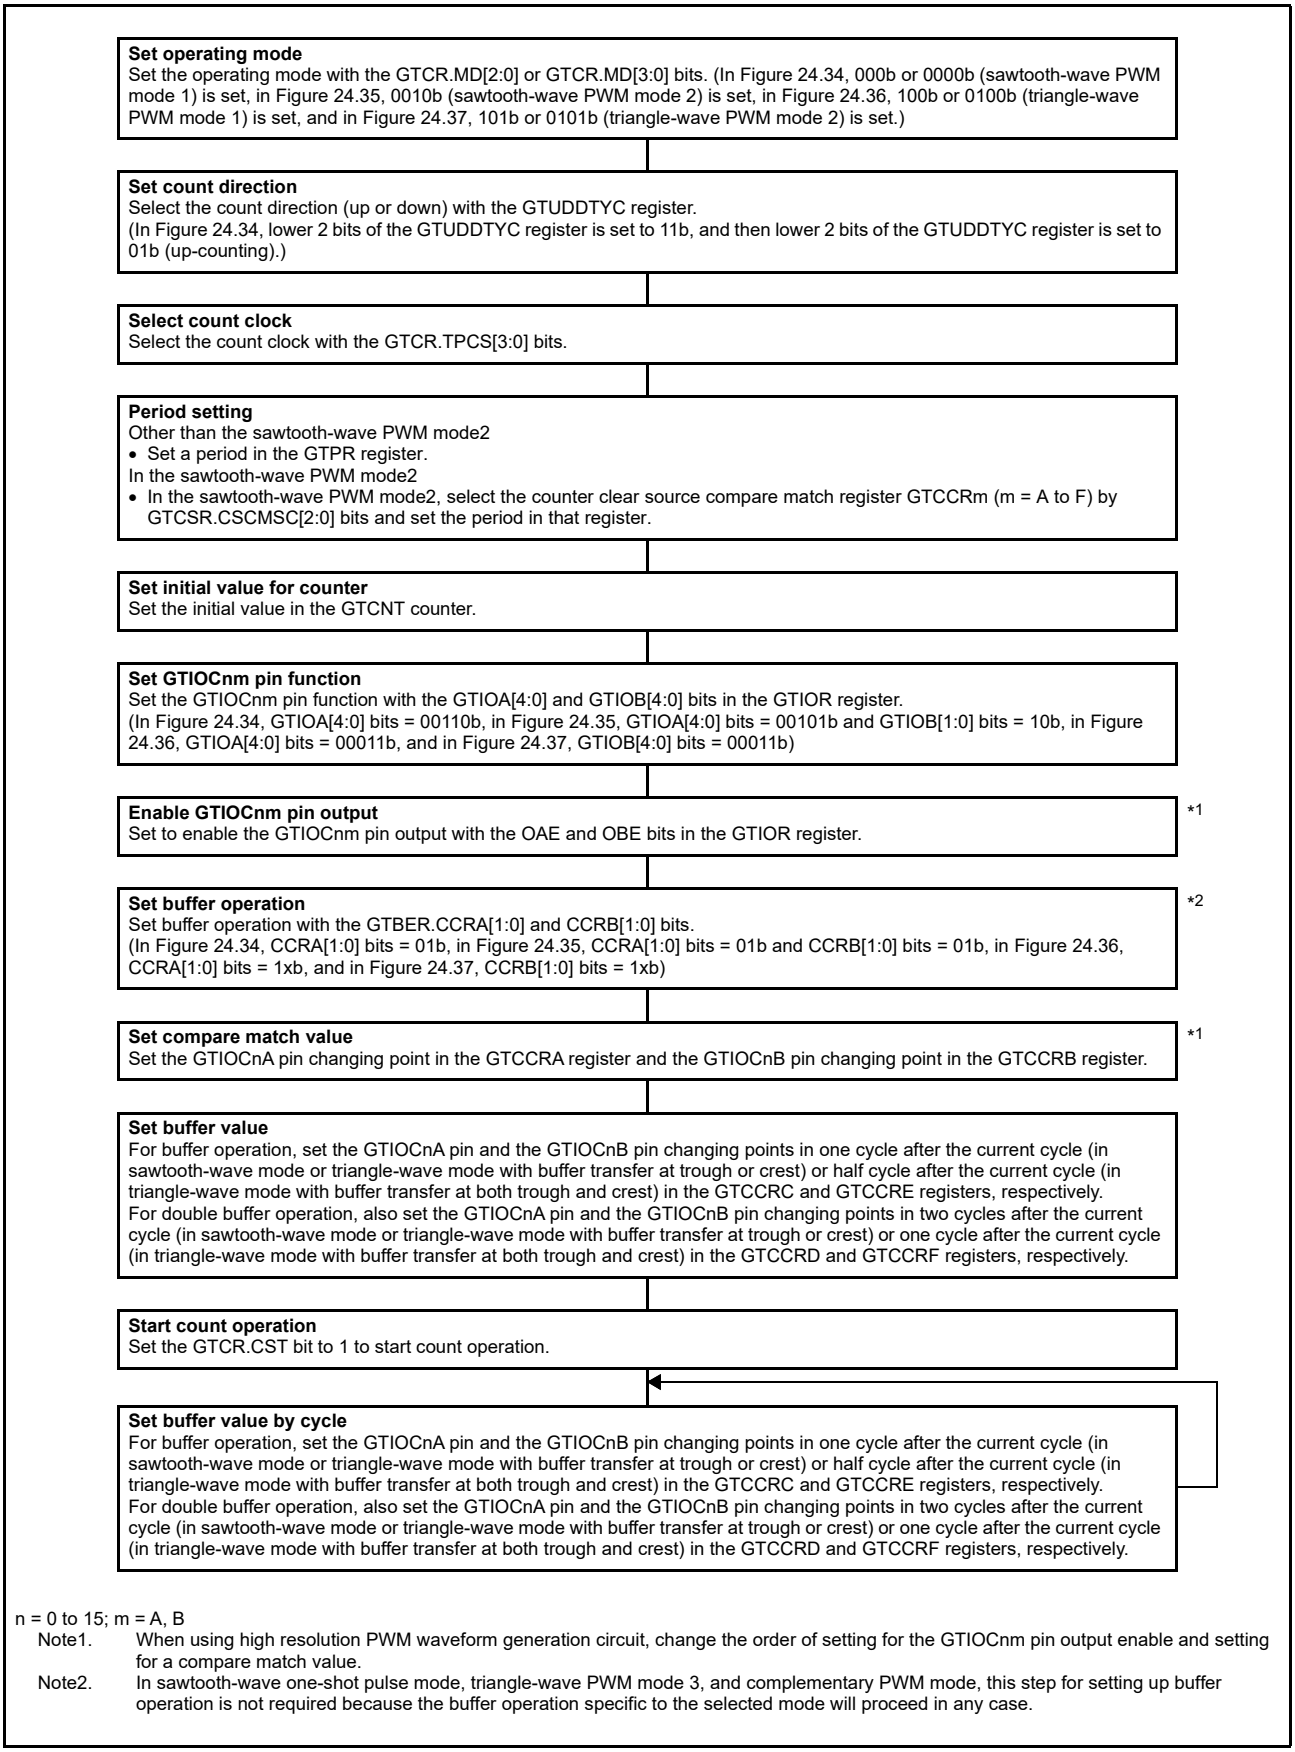

Figure 24.37 Example of GTCCRA and GTCCRB Registers Double Buffer Operation (Output Compare, Triangle Waves, Buffer Operation at Both Troughs and Crests, Output Toggled at GTCCRB Register Compare Match, Output Retained at the End of the Cycle) (n = 0 to 15)

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Note2. In sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, and complementary PWM mode, this step for setting up buffer operation is not required because the buffer operation specific to the selected mode will proceed in any case.

Figure 24.38 Example for Setting Buffer Operation of the GTCCRA and GTCCRB Registers (for Output Compare)

(2) When the GTCCRA or GTCCRB Register Functions as Input Capture Register

The transfer to the buffers is performed when an input capture occurs. Upon input capture, the GTCNT counter value is transferred to the GTCCRA and GTCCRB registers and the values previously stored in the GTCCRA and GTCCRB registers are transferred to the buffer registers. Buffer transfer by counter clearing does not occur when input capture is in use.

Figure 24.39 and Figure 24.40 show examples of buffer operation of the GTCCRA and GTCCRB registers, and Figure 24.41 shows an example for setting buffer operation of the GTCCRA and GTCCRB registers.

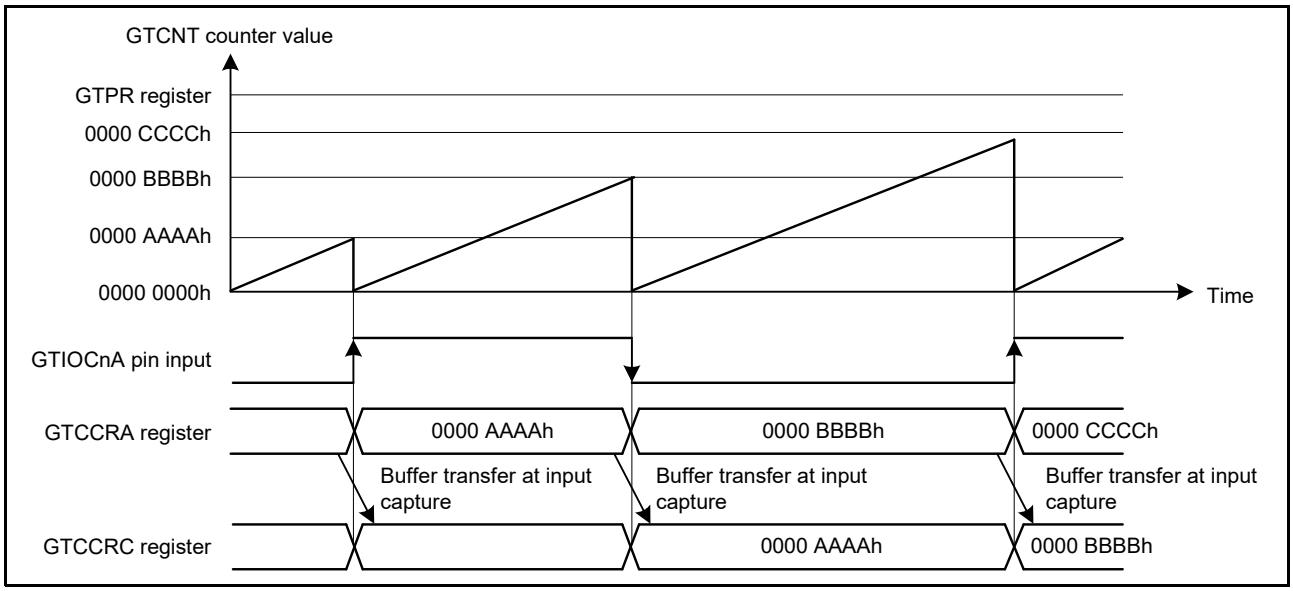

Figure 24.39 Example of Buffer Operation of the GTCCRA and GTCCRB Registers (Counting up to Produce a Sawtooth Wave, and Clearing the GTCNT Counter and Input Capture on Both Edges of the Input on the GTIOCnA Pin) (n = 0 to 15)

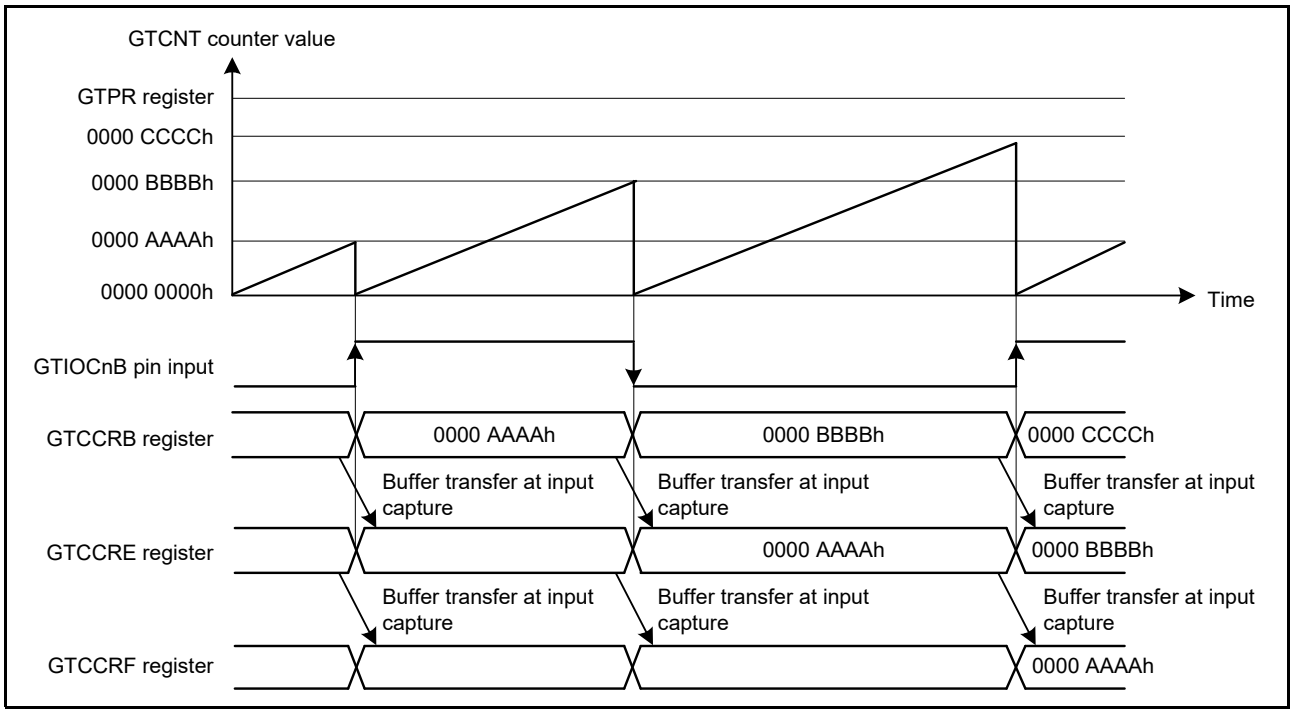

Figure 24.40 Example of Double Buffer Operation of the GTCCRA and GTCCRB Registers (Counting up to Produce a Sawtooth Wave, and Clearing the GTCNT Counter and Input Capture on Both Edges of the Input on the GTIOCnB Pin) (n = 0 to 15)

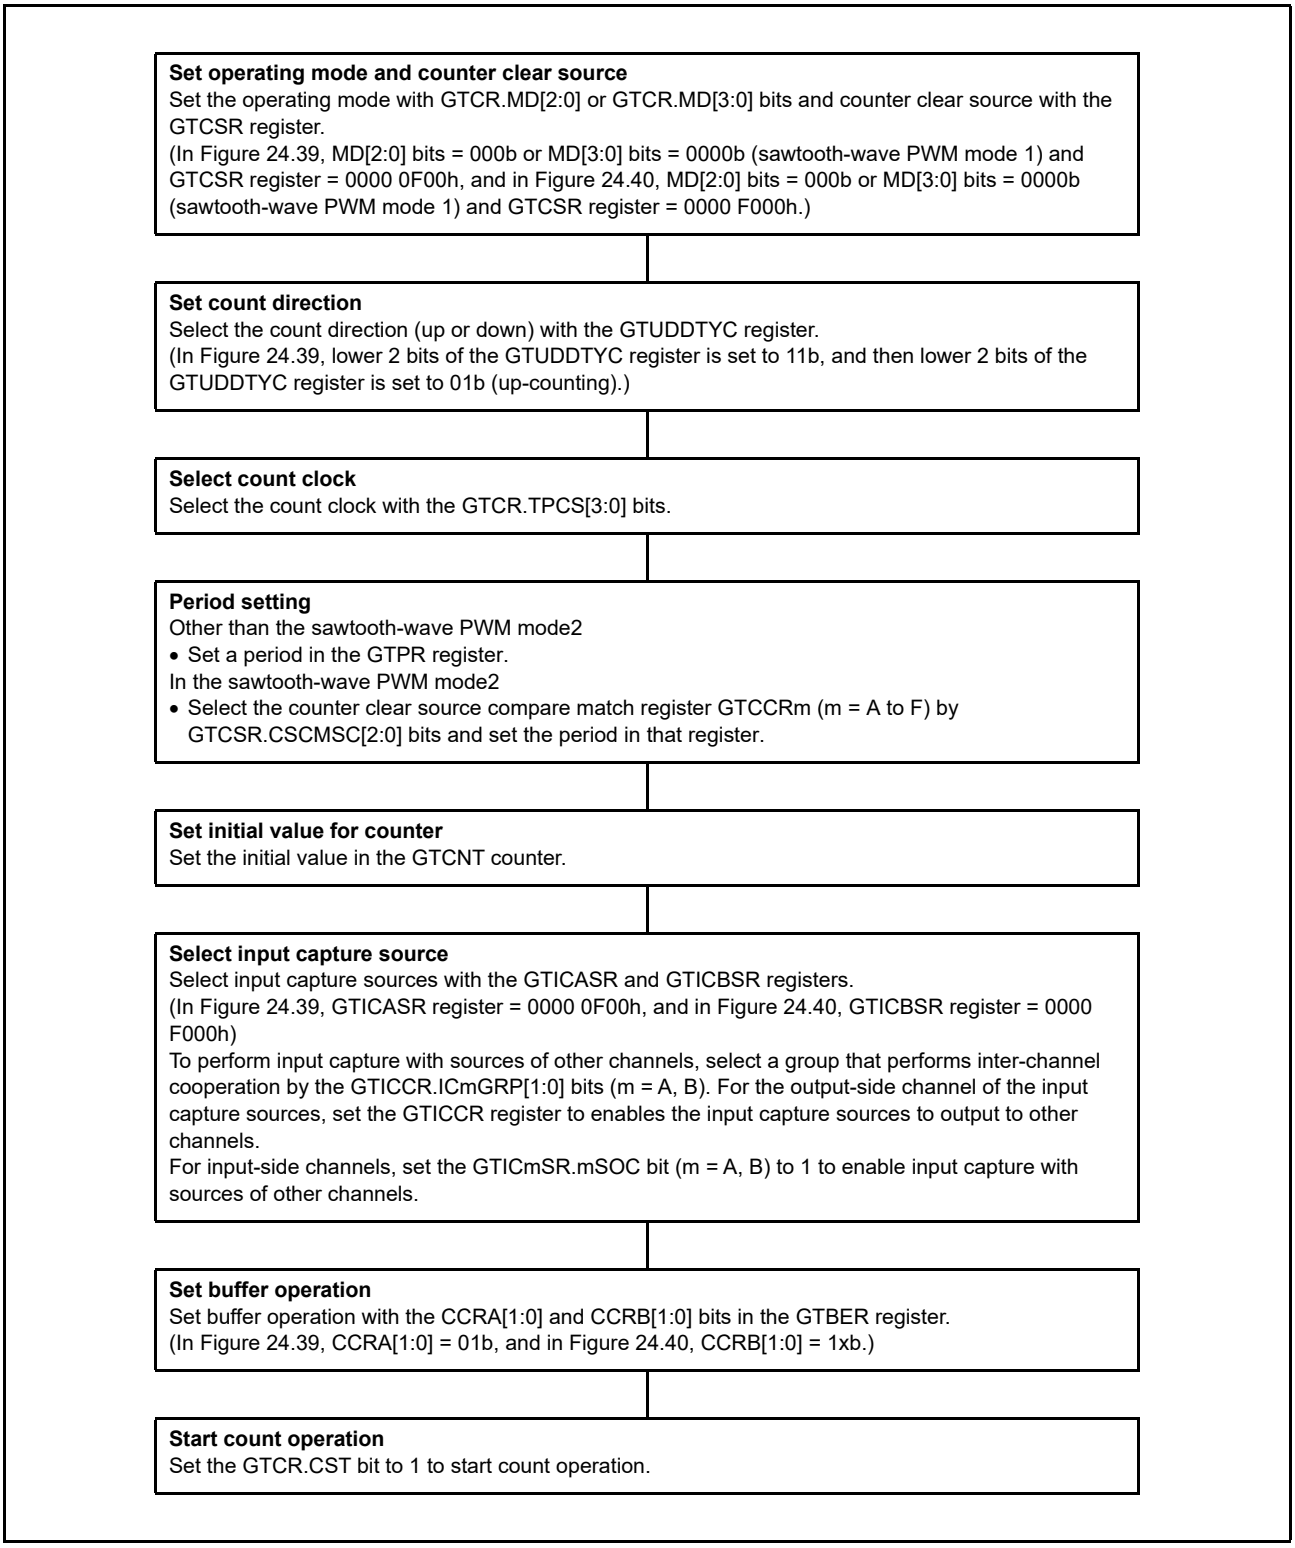

Figure 24.41 Example for Setting Buffer Operation of the GTCCRA and GTCCRB Registers (for Input Capture)

24.3.2.3 Buffer Operation for the GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To enable double buffer operation for the GTADTRA or GTADTRB register, set the GTBER.ADTDA or ADTDB bit to 1, respectively. For single buffer operation, set 0. To disable buffering, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b.

The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to11b for both crest and trough in triangle-wave mode or complementary PWM mode.

In sawtooth-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to a value other than 00b and in count operation, the buffer transfer by the same counter clearing sources described in section 24.3.2.1, GTPR Register Buffer Operation, is performed in the same way as at an overflow (in up-counting) or an underflow (in down-counting).

In complementary PWM mode, the buffer transfer is performed after one GTCLK cycle from the GTCCRD register write of slave channel 2.

In sawtooth-wave mode, the buffer transfer of GTADTRm register by counter clearing can be disabled by GTBER2.CCTADm (m = A, B) bit setting.

In sawtooth-wave mode, the buffer transfer of GTADTRm register by its own compare match can be enabled by the GTBER2.CMTADm (m = A, B) bit setting.

Figure 24.42 to Figure 24.46 show examples of buffer operation of the GTADTRA and GTADTRB registers, and Figure 24.47 shows an example for setting buffer operation of the GTADTRA and GTADTRB registers.

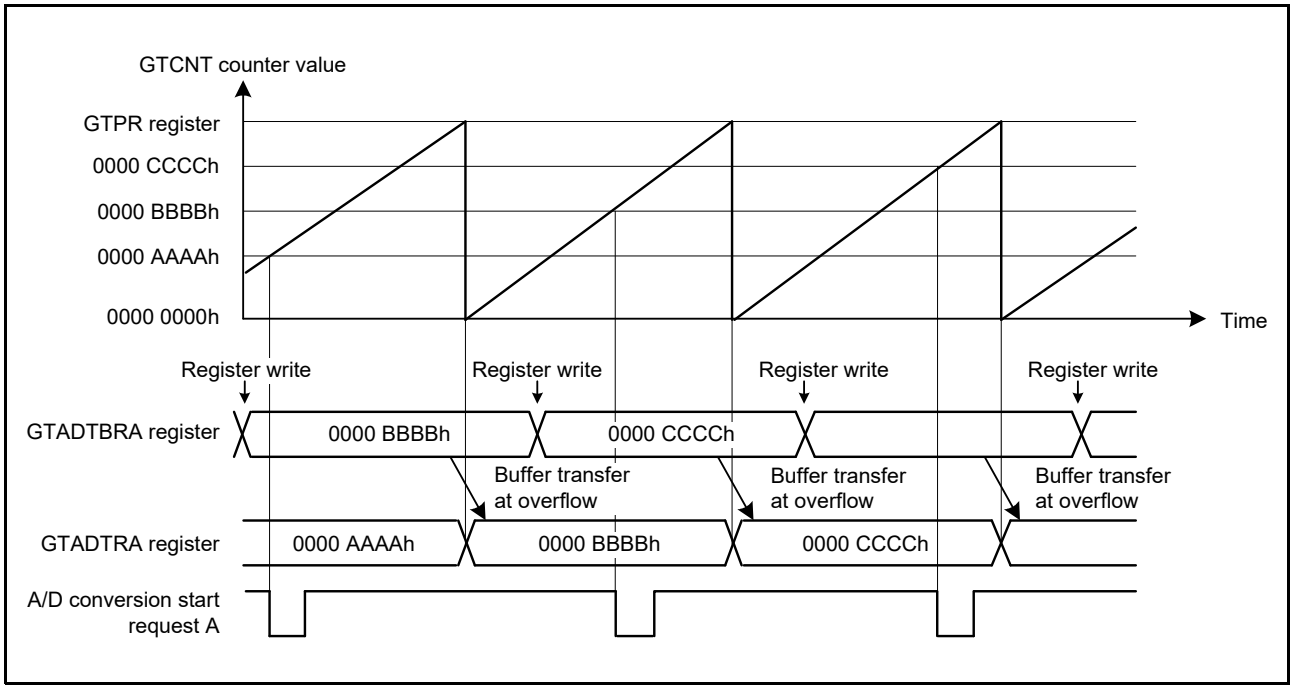

Figure 24.42 Example of Buffer Operation of the GTADTRA and GTADTRB Registers (Sawtooth Waves in Up-Counting, A/D Conversion Start Request Generated by Up-Counting)

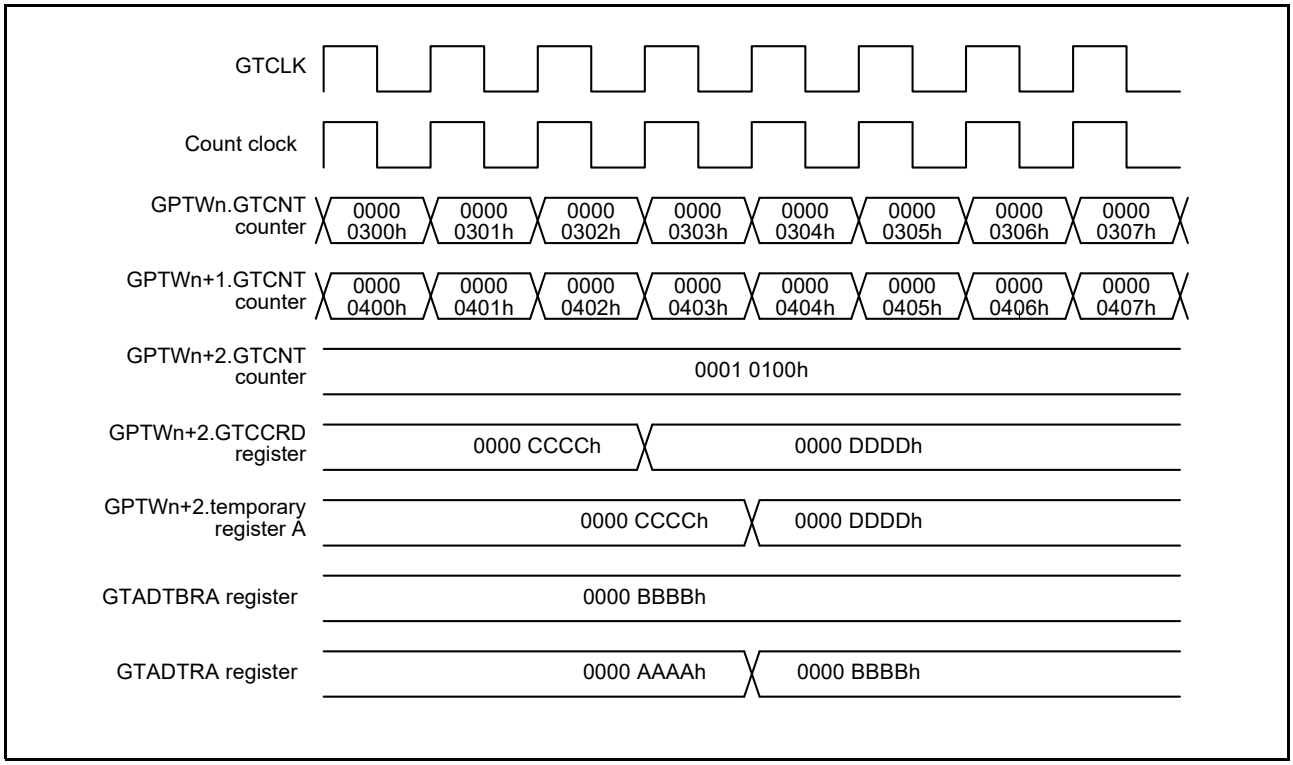

Figure 24.46 Example of Buffer Operation of the GTADTRA and GTADTRB Registers at the GTCCRD Register of Slave Channel 2 Updating in Complementary PWM Mode

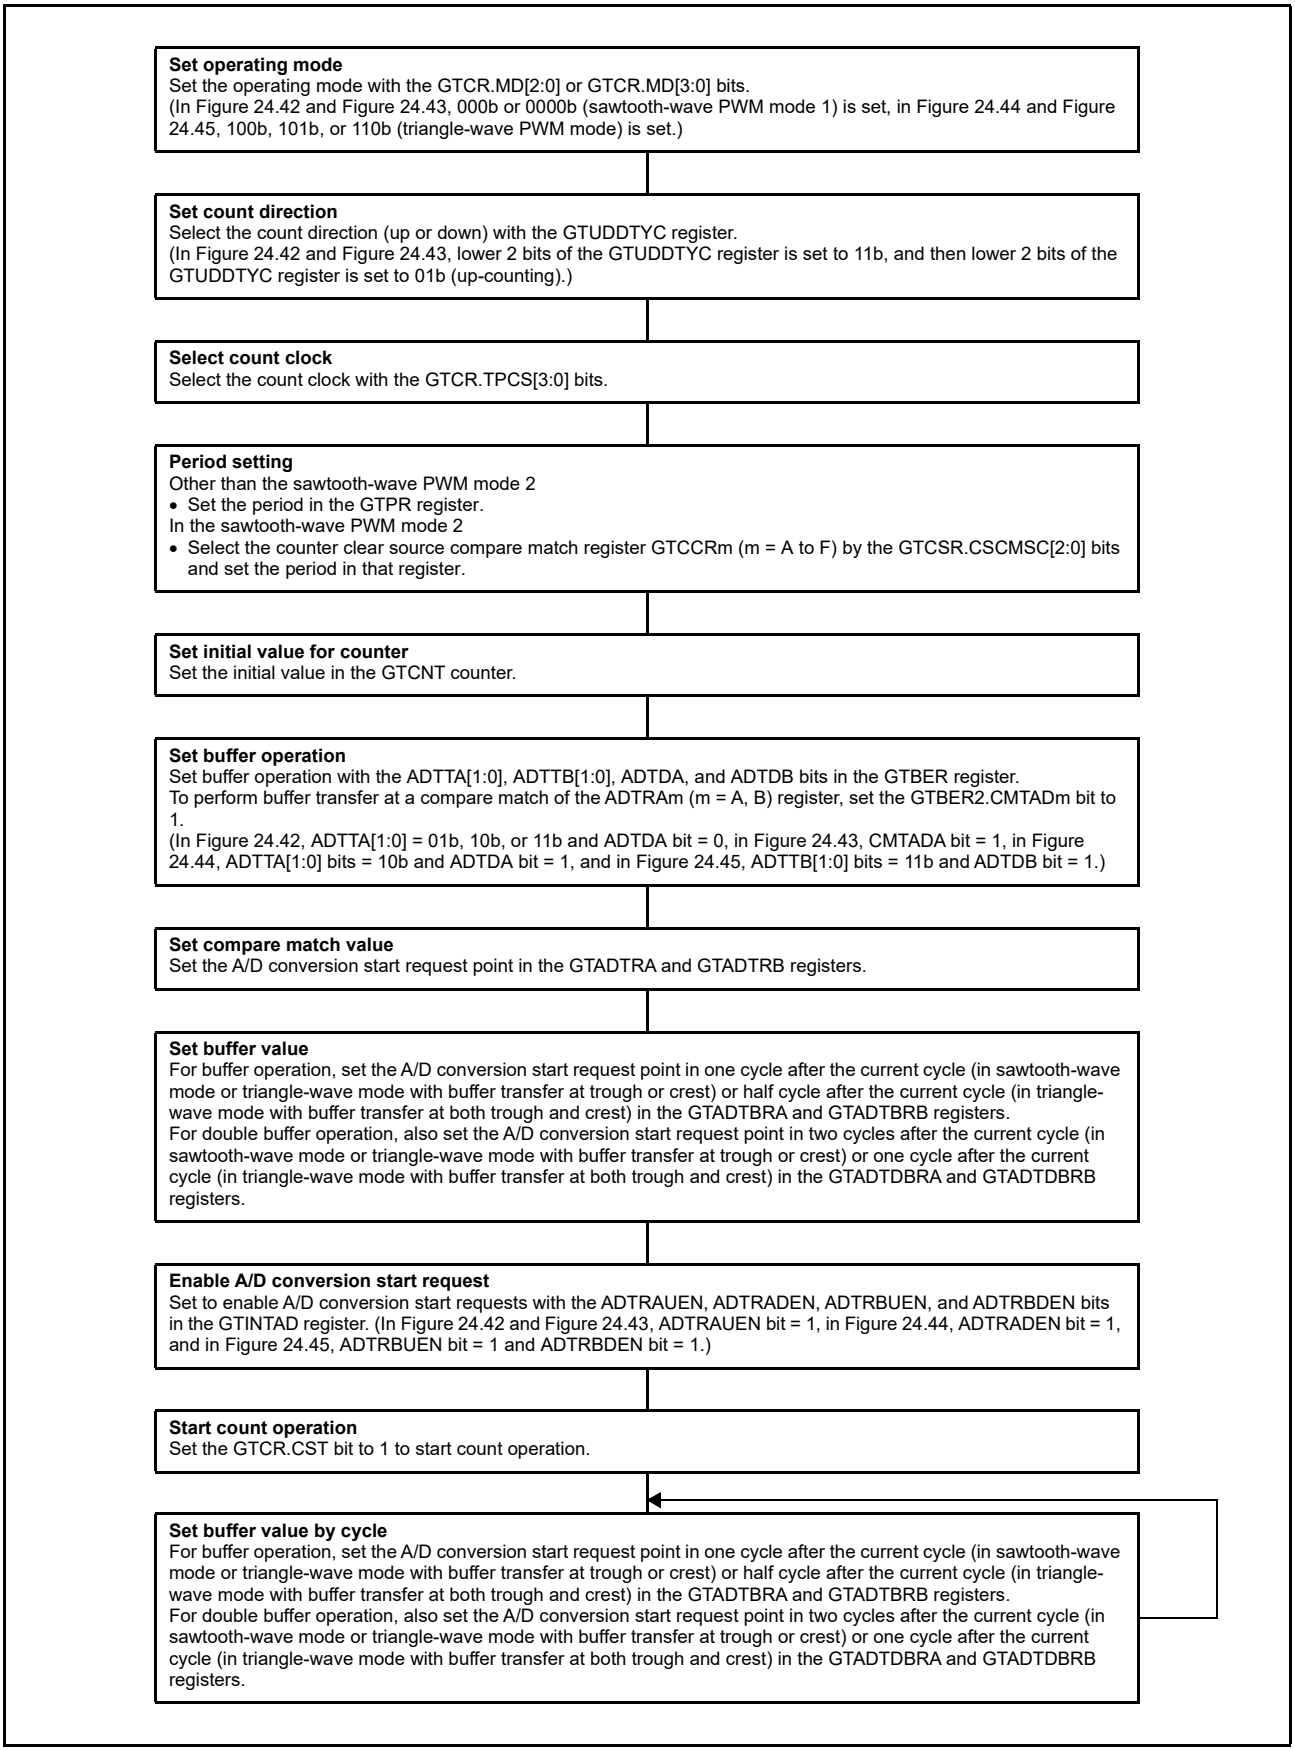

Figure 24.47 Example for Setting Buffer Operation of the GTADTRA and GTADTRB Registers

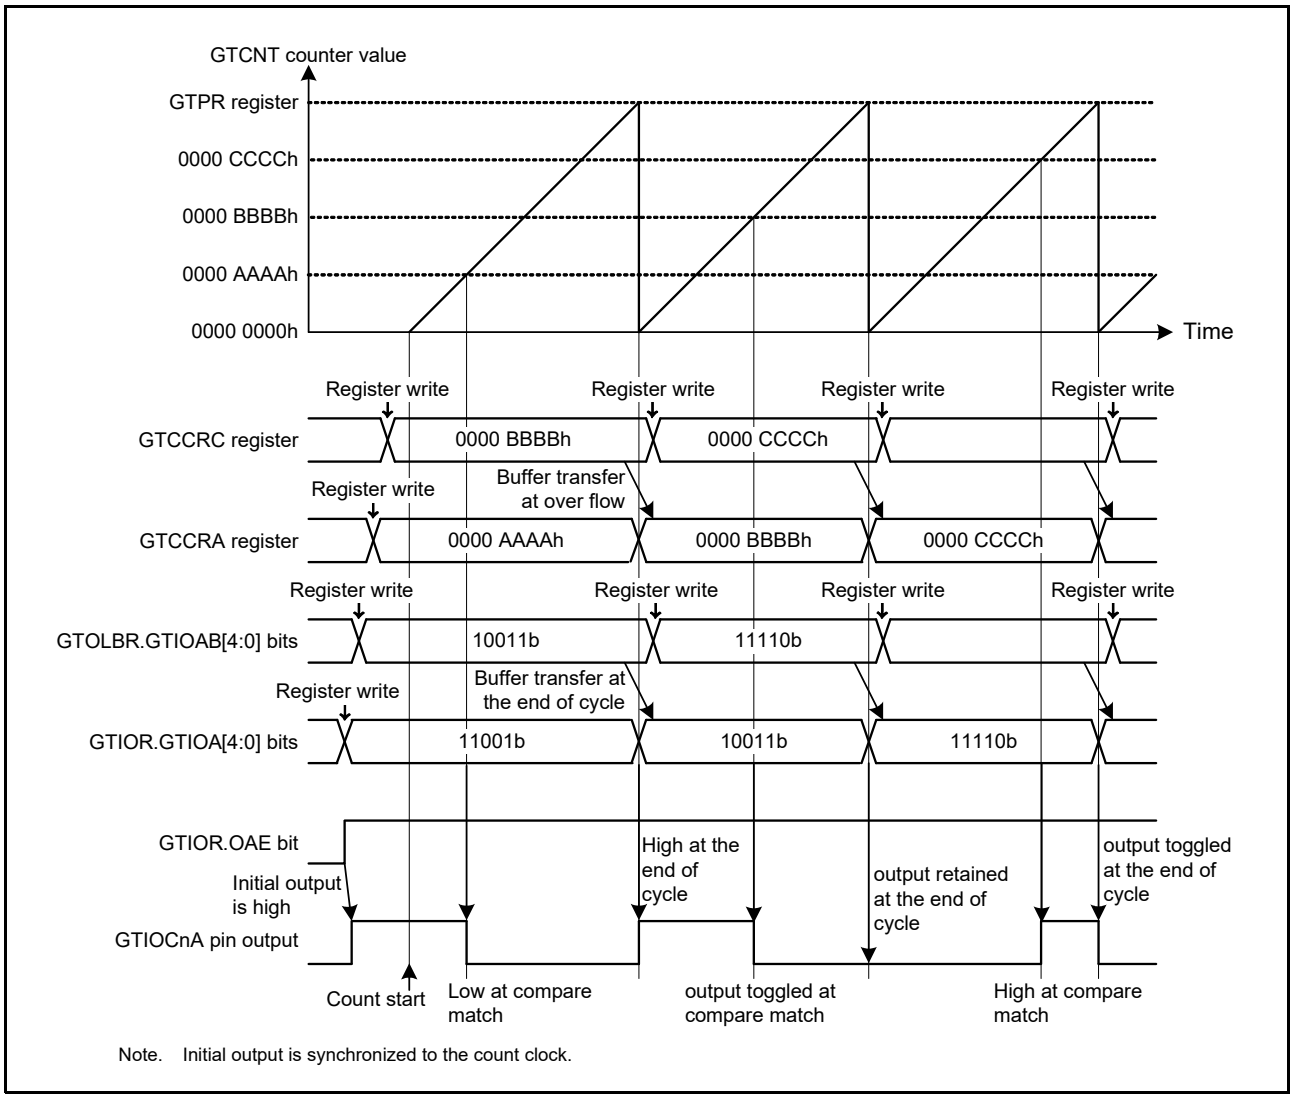
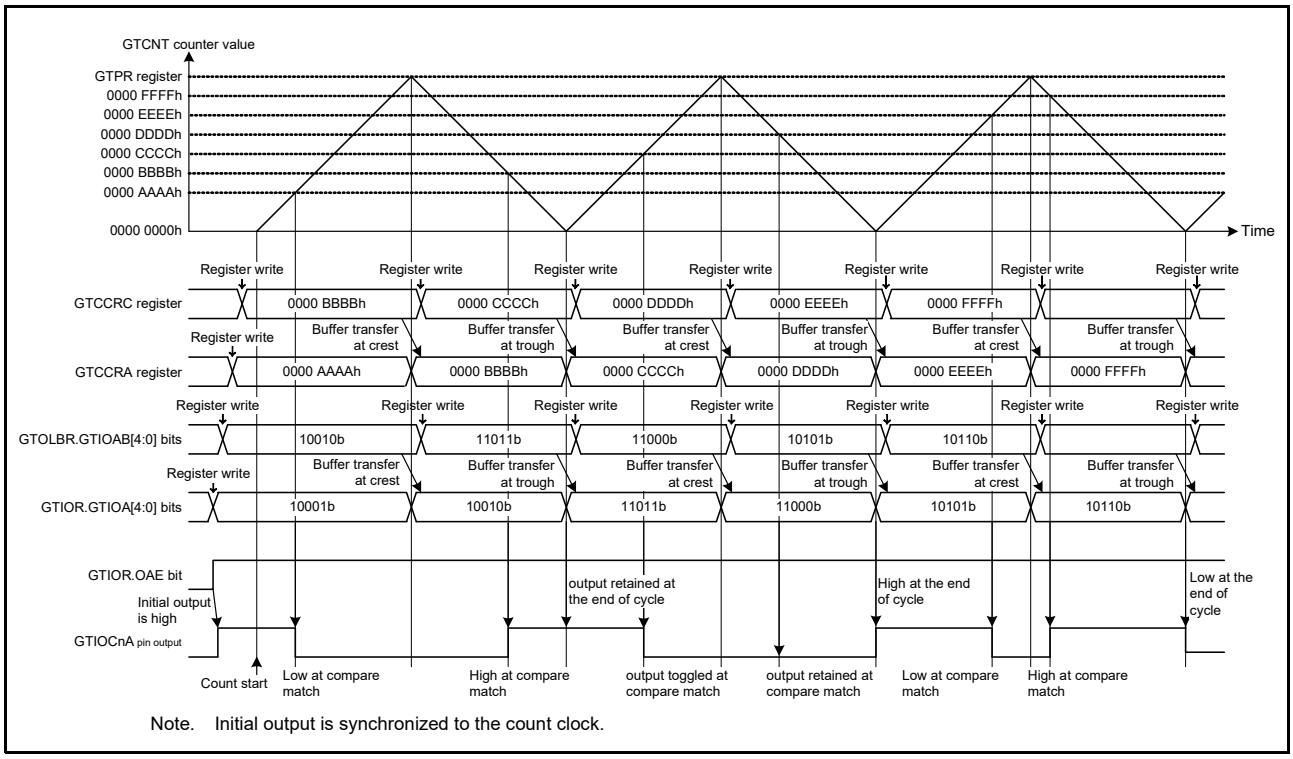
24.3.2.4 Buffer Operation for the GTIOA[4:0] and GTIOB[4:0] Bits

The GTOLBR.GTIOAB[4:0] bits can function as the buffer register of the GTIOR.GTIOA[4:0] bits and the GTOLBR.GTIOBB[4:0] bits can function as the buffer register of the GTIOR.GTIOB[4:0] bits.
Buffer transfer timing can be set with the GTBER2.OLTTm[1:0] bits (m = A, B). It can be selected from the end of cycle or GTCCR register compare match (in sawtooth-wave mode), from crest, trough, or both crest and trough (in triangle-wave mode and complementary PWM mode). In the case that the GTBER2.OLTTm[1:0] bits are 00b, buffer transfer is not performed.
In complementary PWM mode, the setting to change GTIOA and GTIOB by buffer transfer during the dead time of complementary PWM is prohibited. Therefore, when changing the GTIOA[4:0] and GTIOB[4:0] bits by buffer transfer, it is necessary to set the timings of the crest and trough such that they do not overlap with the dead time and change the GTOLBR.GTIOAB[4:0] and GTOLBR.GTIOBB[4:0] bits. When the timing of buffer transfer is at the crest, set the GTCCRm (m = A, C, E) register to satisfy GTCCRm < GTPR. When the timing of buffer transfer is in the trough, set the GTCCRm register to satisfy GTDVU < GTCCRm.
Figure 24.48 to Figure 24.50 show examples of buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits. Figure 24.51 shows an example for setting buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits.





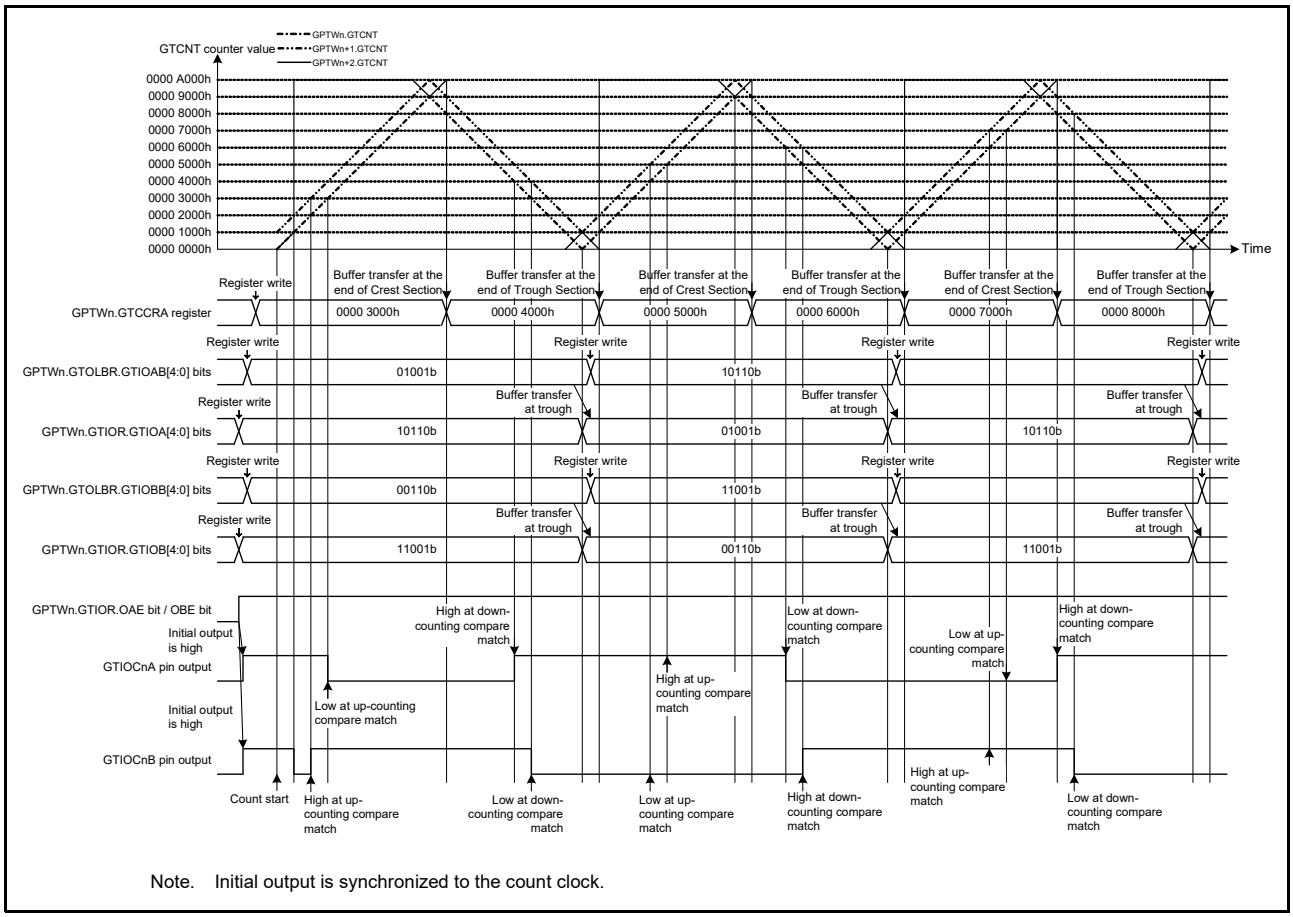


Figure 24.48 Example of Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits (Up-Counting in Sawtooth-Wave PWM Mode 1, Buffer Transfer at the End of Period)

Note. Initial output is synchronized to the count clock.

Figure 24.49 Example of Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits (Triangle-Waves PWM Mode 2, Buffer Transfer at Both Troughs and Crests)

Note. Initial output is synchronized to the count clock.

Figure 24.50 Example of Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits (Complementary PWM Mode 3, Buffer Transfer at Troughs)

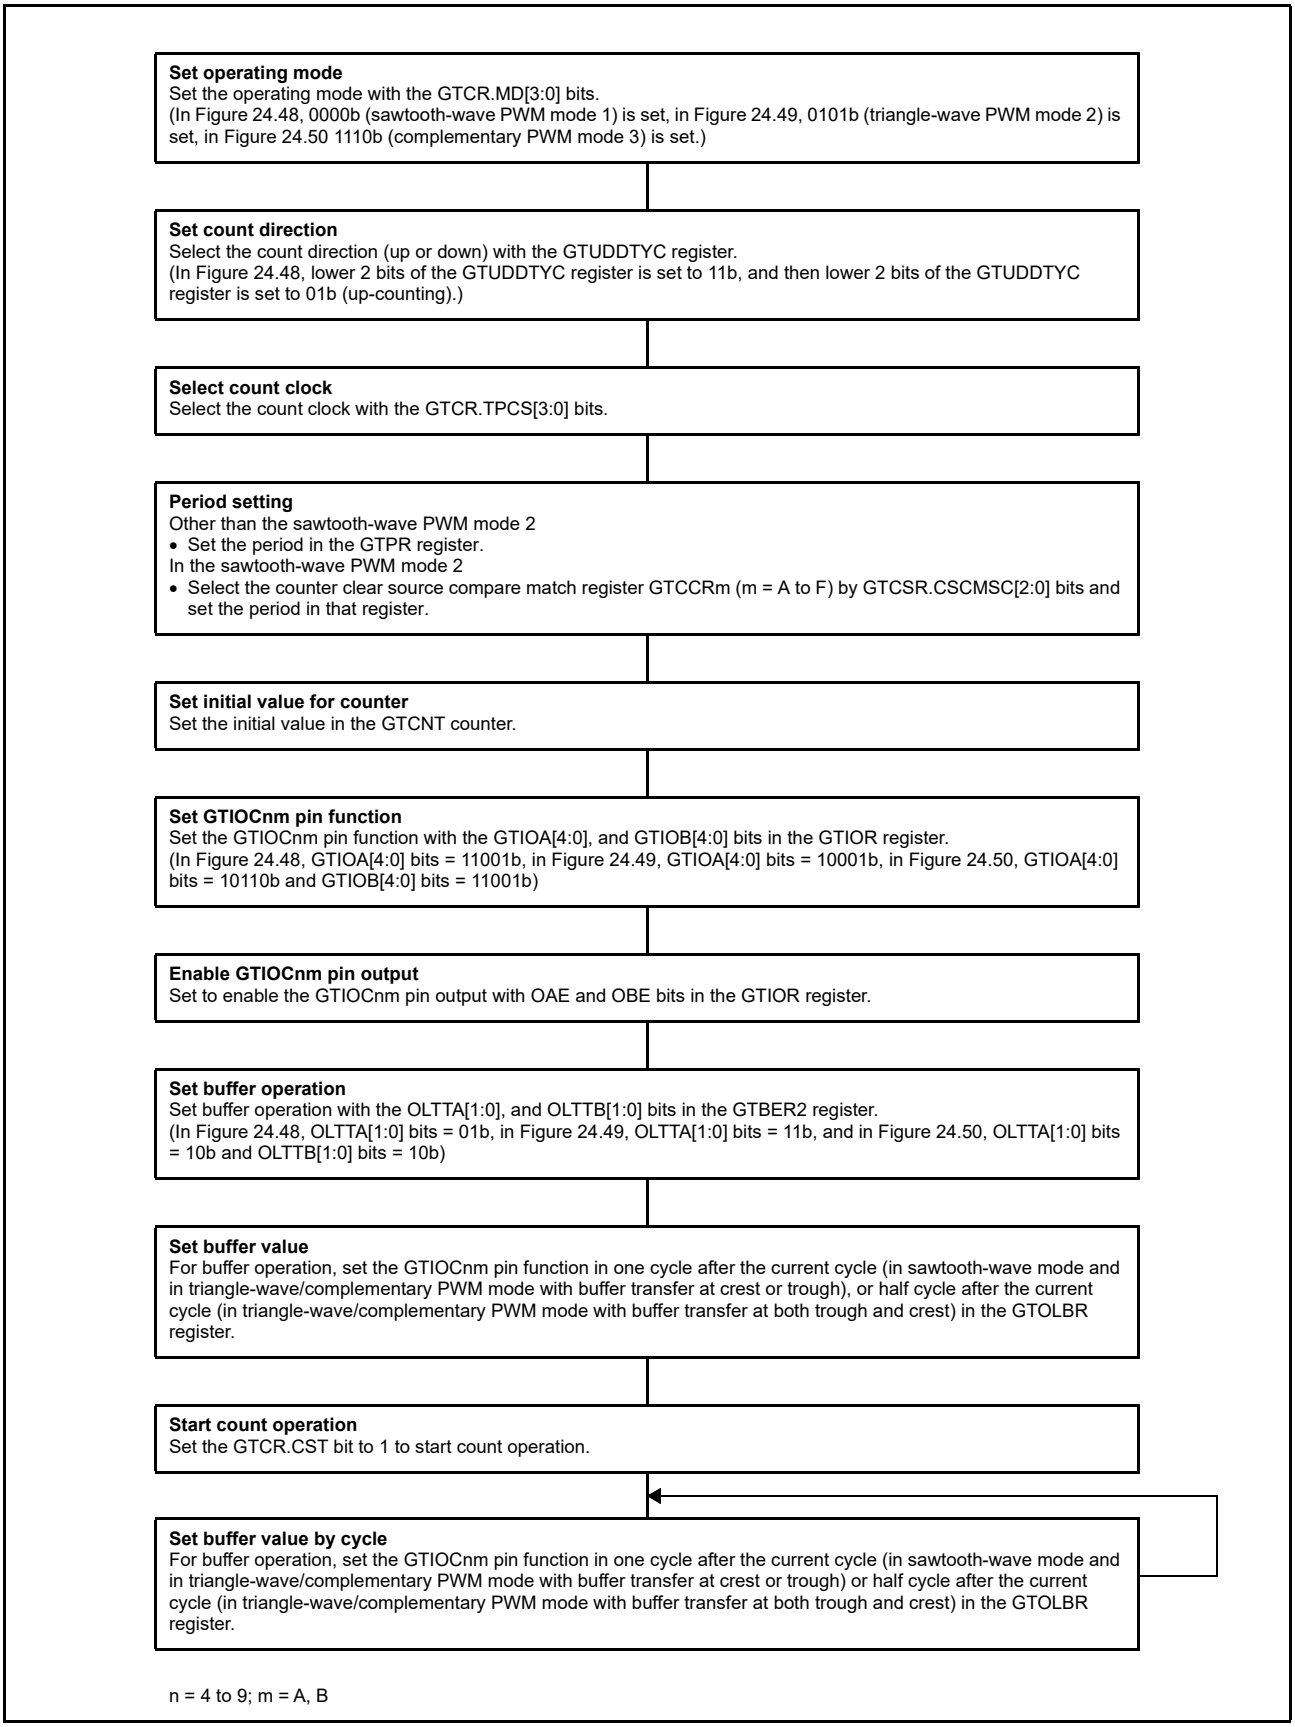

Figure 24.51 Example for Setting Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits

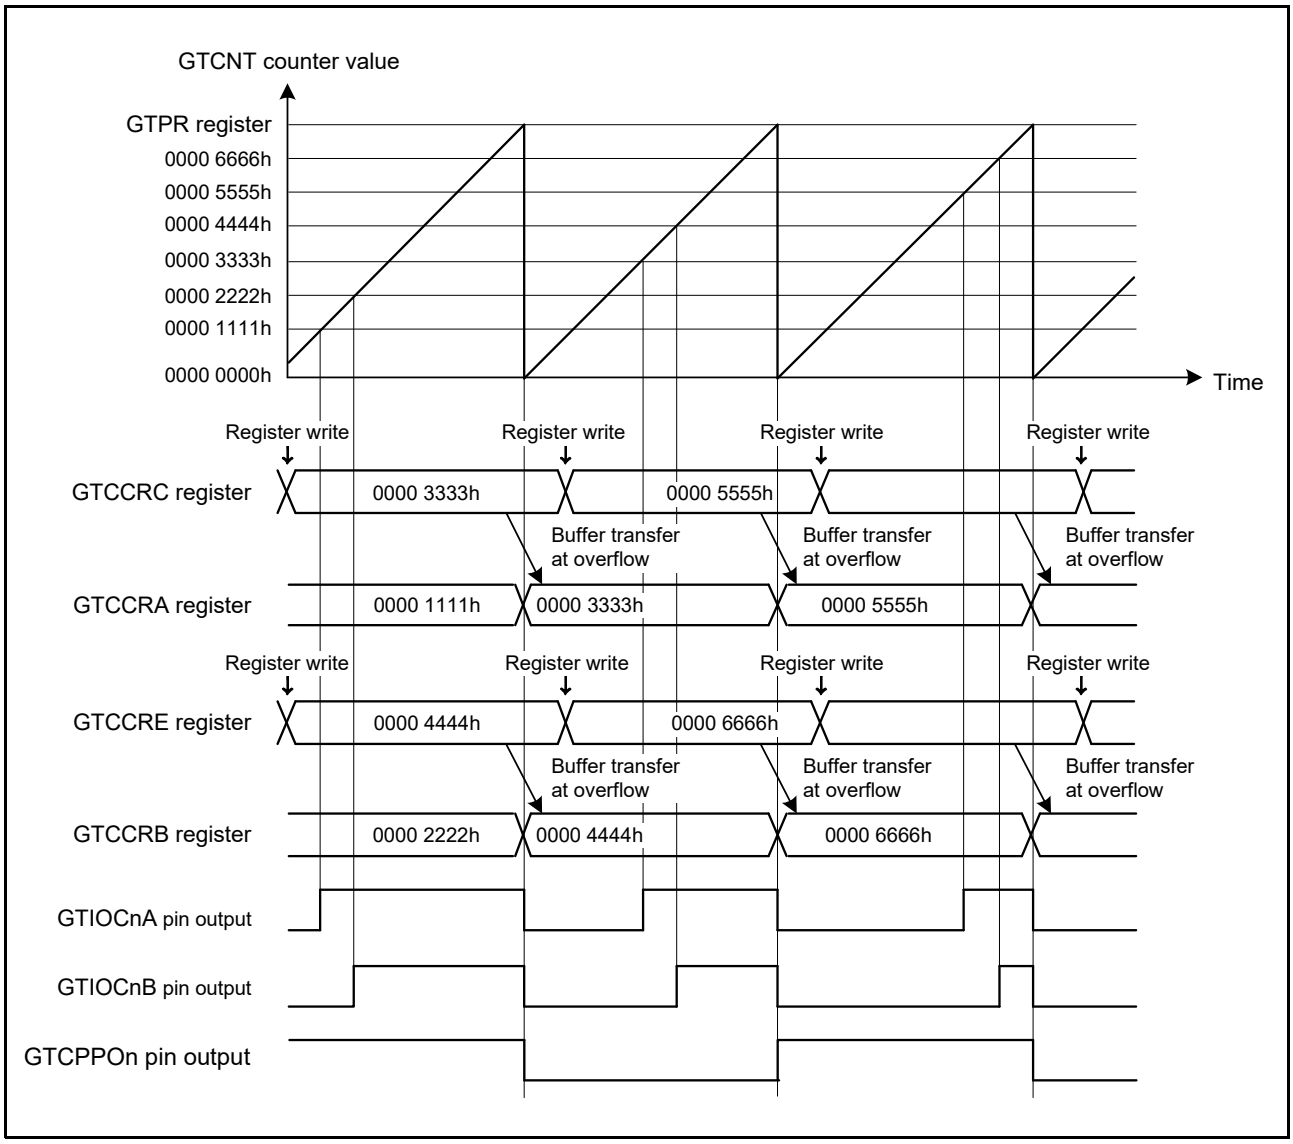
24.3.3 PWM Output Operating Mode

The GPTW can output PWM waveforms to the GTIOCnA pin or GTIOCnB pin (n = 0 to 15) by a compare match between the GTCNT counter and the GTCCRA or GTCCRB register.
By setting the GTDTCR, GTDVU, and GTDVD registers, the compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.
In complementary PWM mode, it is possible to output PWM waveforms (positive phase, negative phase) with dead time that guarantees the linearity of the PWM output pulse width near 0% and 100% duty.
In sawtooth-wave modes other than sawtooth-wave PWM mode 2, in triangle-wave mode, or in the master channel of complementary PWM mode, a signal synchronized with the PWM cycle is output from the GTCPPOn terminal when the GTIOR.PSYE bit is set to 1. The GTCPPOn output is toggled at the end of the cycle in sawtooth-wave mode, or at the crest/trough/GTCNT counter clearing timing in triangle-wave mode or complementary PWM mode. The initial output of GTCPPOn is low, and it becomes high when the count starts.

24.3.3.1 Sawtooth-Wave PWM Mode 1

In sawtooth-wave PWM mode 1, the GTCNT counter performs sawtooth-wave (half-wave) operation by setting the period in the GTPR register and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.
When 0 is set in the GTIOR.OmEOCD (m = A, B) bit and the timing of the end of cycle and the timing of the GTCCRm register compare match are the same time, the output pin performs along the PWM output setting for the end of cycle set by the GTIOR.GTIOm[3:2] bits.
When 1 is set in the GTIOR.OmEOCD bit, GTIOCnm output is retained.
Figure 24.52 shows an example of sawtooth-wave PWM mode 1 operation, and Figure 24.53 shows an example for setting sawtooth-wave PWM mode 1.



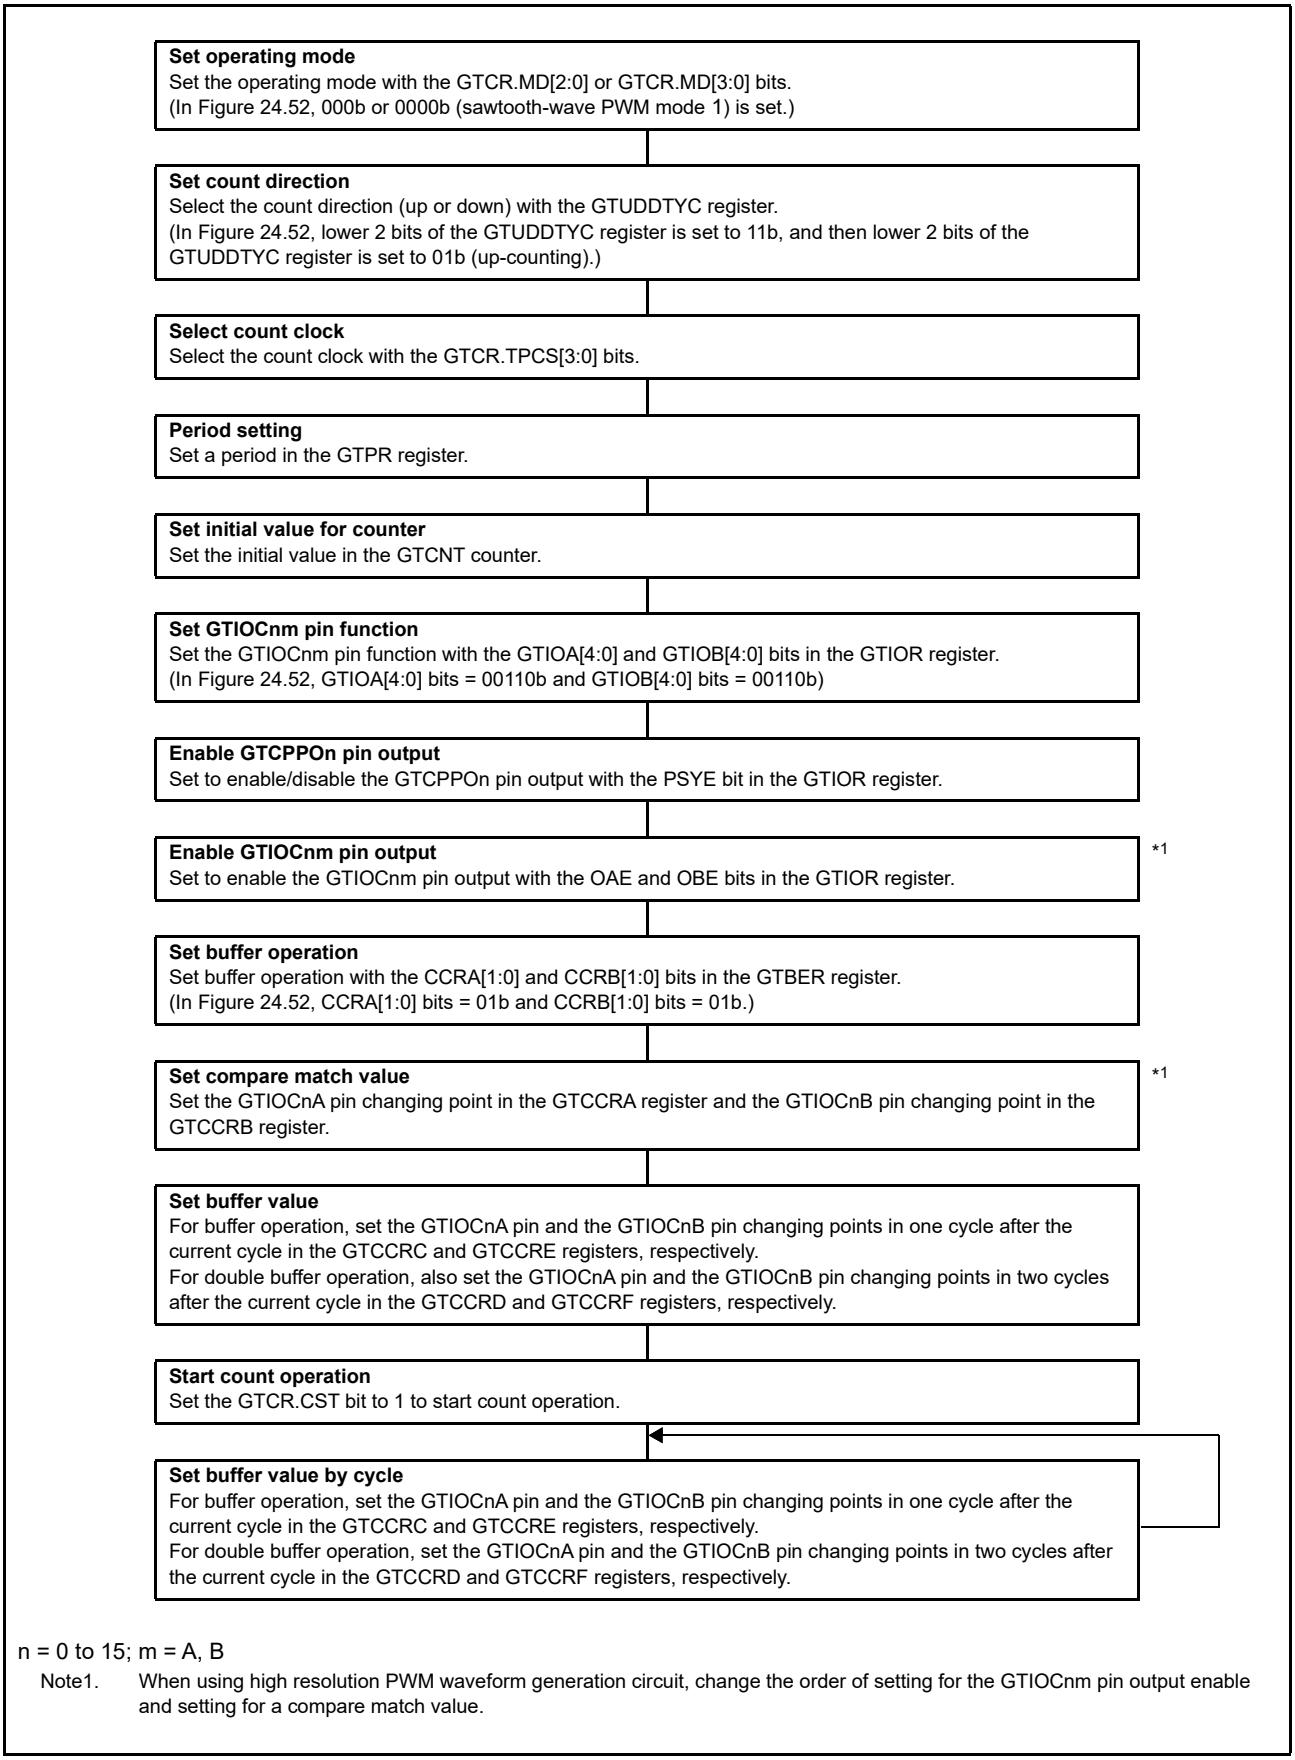


Figure 24.52 Example of Sawtooth-Wave PWM Mode 1 Operation (Up-Counting, Buffer Operation, High Output on Compare Match between the GTCCRA and GTCCRB Registers, Low Output at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.53 Example for Setting Sawtooth-Wave PWM Mode 1

24.3.3.2 Sawtooth-Wave PWM Mode 2

The sawtooth-wave PWM mode 2 is a mode in which the GTCNT counter is operated as a sawtooth wave by up-counting without using the GTPR register, and the PWM waveform is output by the compare match of the GTCCRA and GTCCRB registers.

The pin output level can be selected from low output, high output, or toggle output separately for a compare match according to the GTIOR register setting.

The GTIOCnA (n = 0 to 2, 4 to 6) pin is used as an output pin. Use the GTIOR.GTIOB[1:0] bits for setting the GTIOCnA pin output at a compare match of the GTCCRB register.

When a counter clear occurs due to the GTCNT counter clearing source selected in the GTCSR register, this is handled at the end of cycle and PWM output operation at the end of the cycle selected with the GTIOR.GTIOA[3:2] bits is performed.

If a counter clear (at the end of cycle) conflicts with a PWM output change due to a GTCCRm (m = A, B) register compare match, PWM output operation is performed at the end of cycle (in the case of the GTIOR.OmEOCD bit = 0) or the PWM output is retained (in the case of GTIOR.OmEOCD bit = 1).

Figure 24.54 to Figure 24.56 show examples of sawtooth-wave PWM mode 2 operation. Figure 24.57 shows an example for setting sawtooth-wave PWM mode 2.

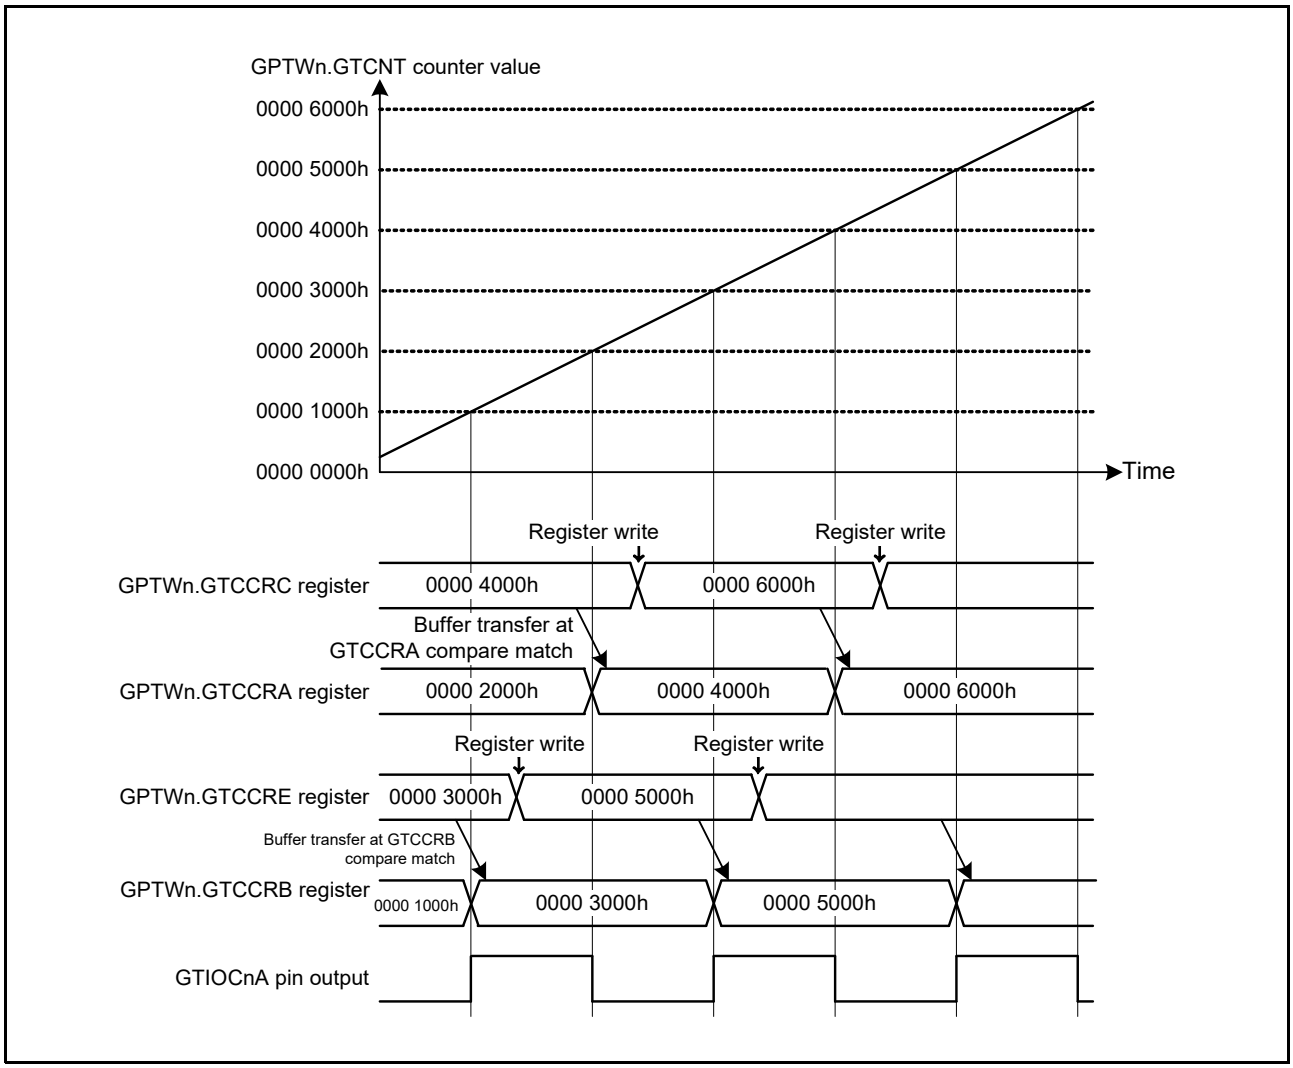

Figure 24.54 Example of Sawtooth-Wave PWM Mode 2 Operation (Low Output GTCCRA Register Compare Match, High Output at the GTCCRB Register Compare Match, Single Buffer Operation, and No Clear Setting) (n = 4 to 9)

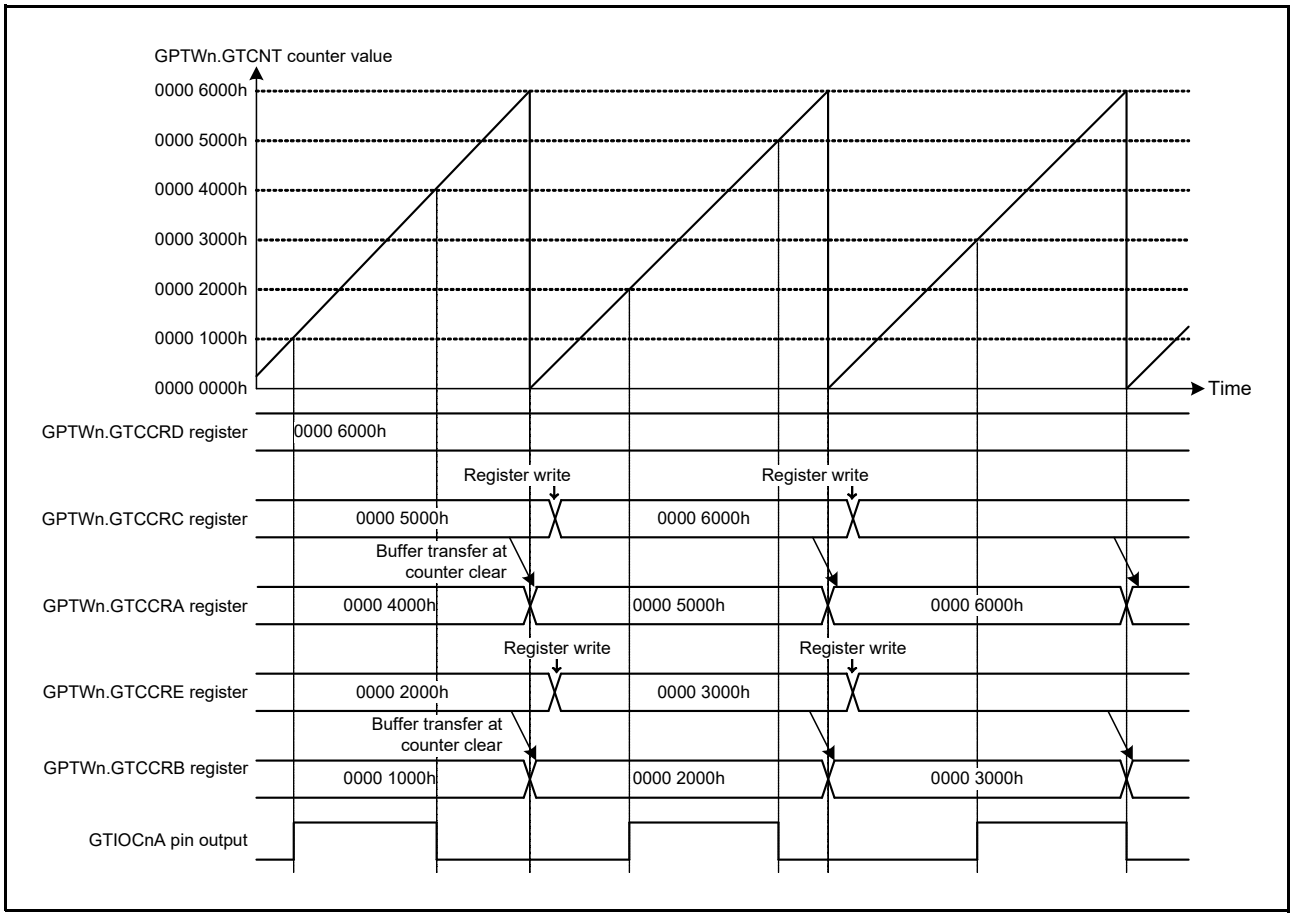

Figure 24.55 Example of Sawtooth-Wave PWM Mode 2 Operation (Low Output at the GTCCRA Register Compare Match, High Output at the GTCCRB Register Compare Match, Low Output at the End of the Cycle, Single Buffer Operation, Cleared at the GTCCRD Register Compare Match, and the GTIOR.OAEOCD Bit = 0) (n = 4 to 9)

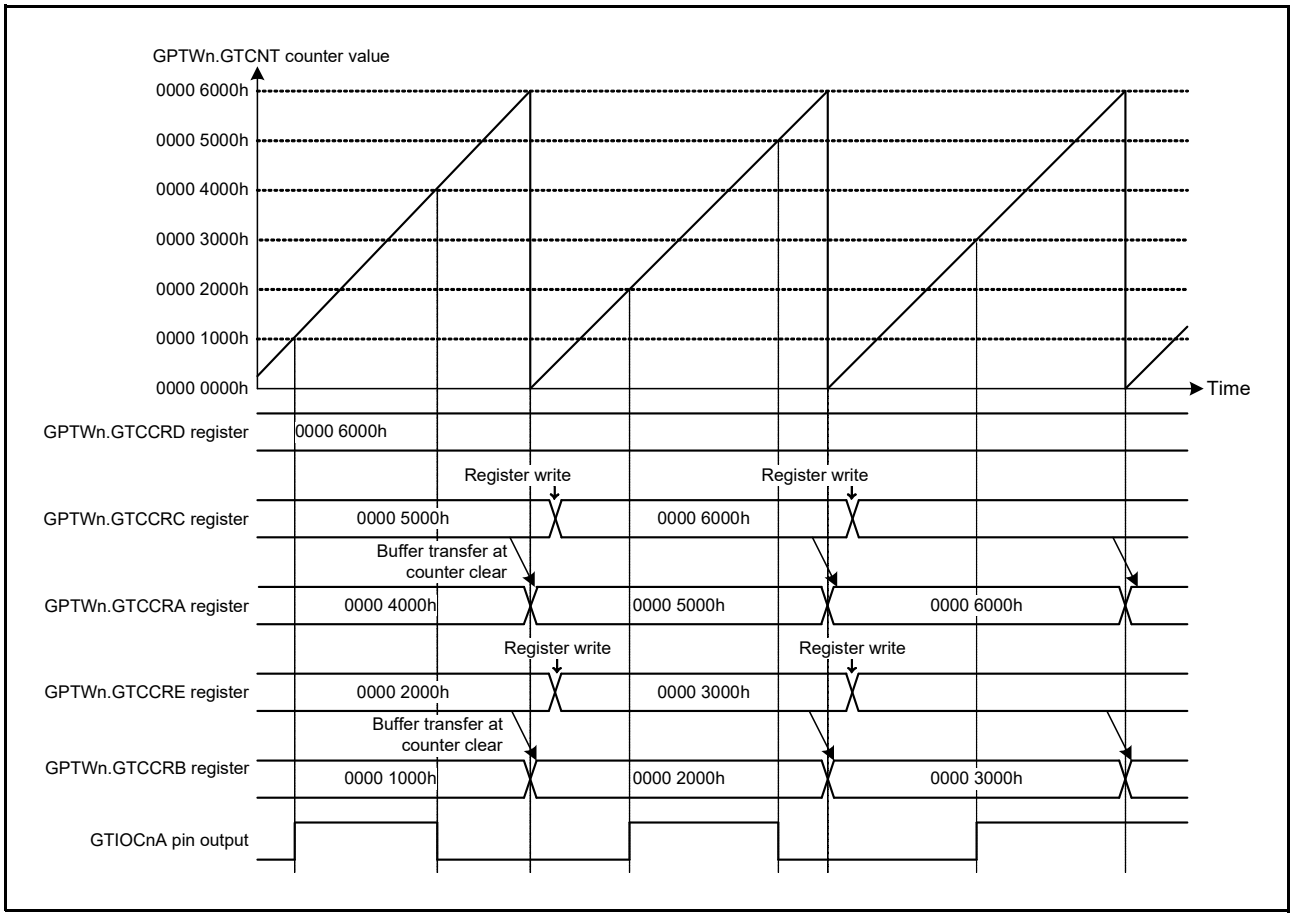

Figure 24.56 Example of Sawtooth-Wave PWM Mode 2 Operation (Low Output at the GTCCRA Register Compare Match, High Output at the GTCCRB Register Compare Match, Low Output at the End of Cycle, Single Buffer Operation, Cleared at the GTCCRD Register Compare Match, and GTIOR.OAEOCD Bit = 1) (n = 4 to 9)

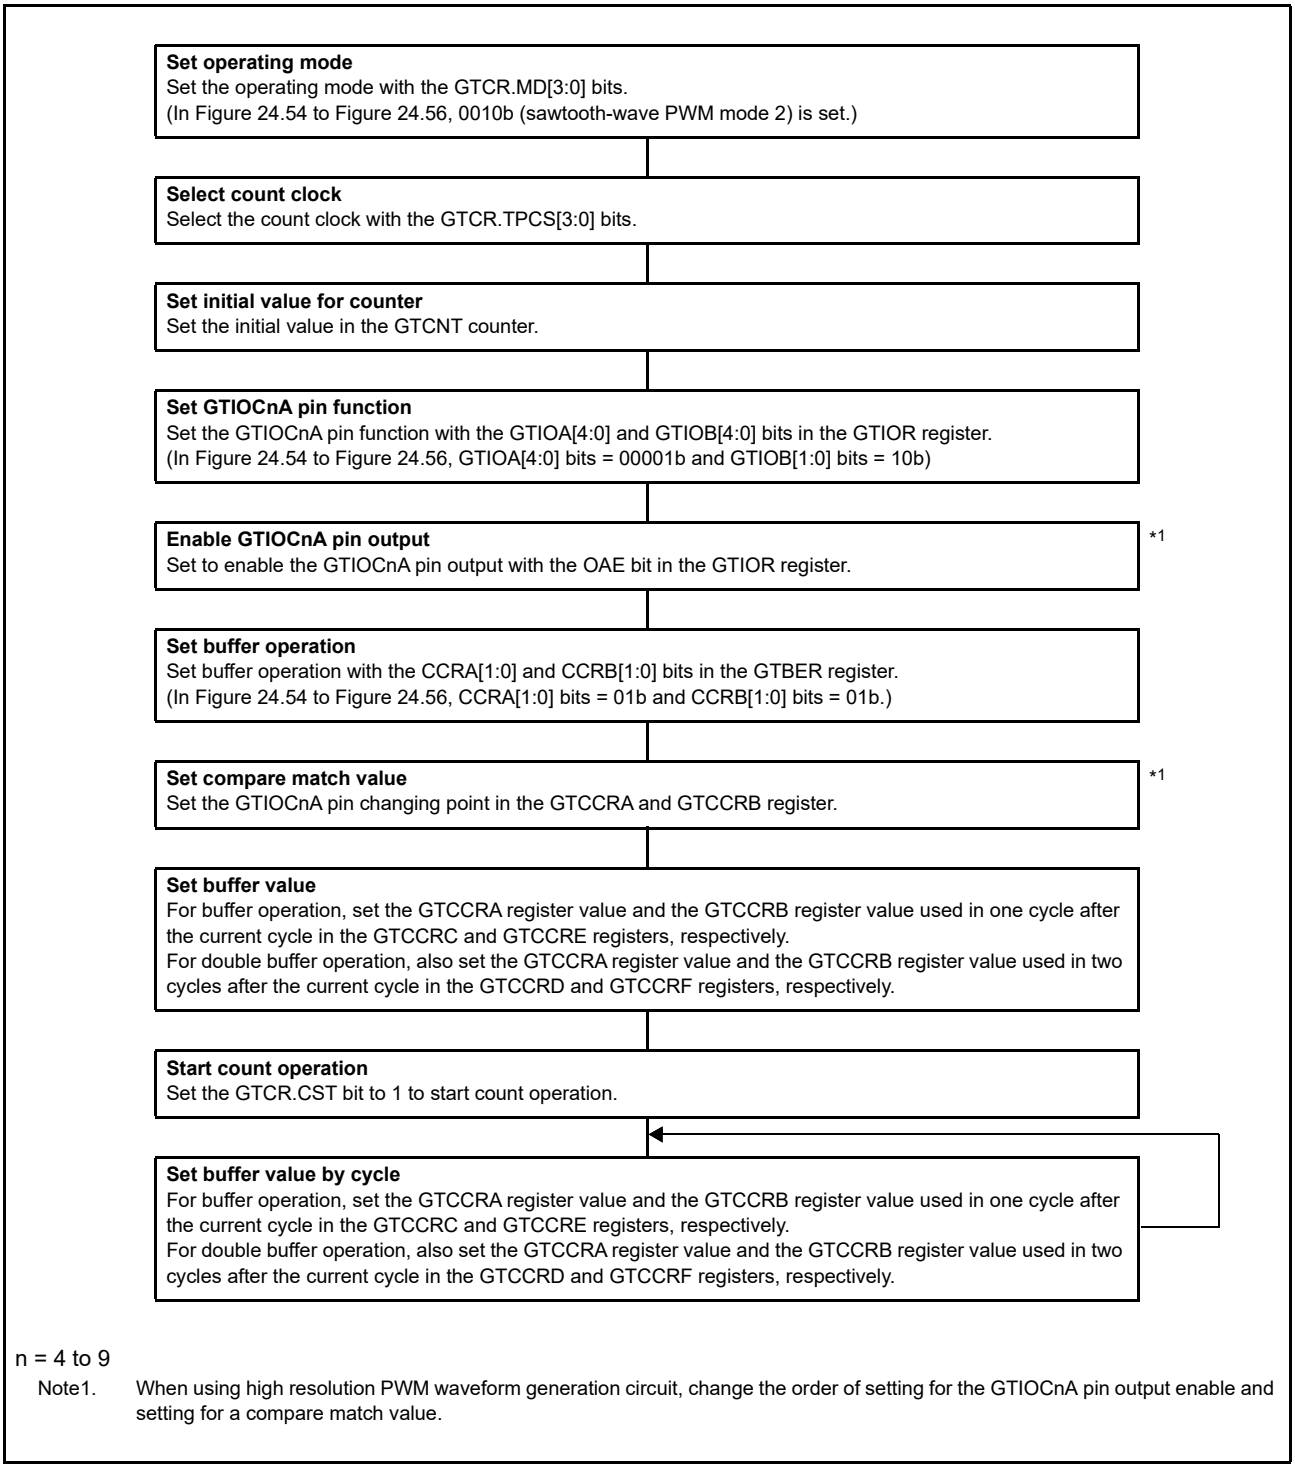

Figure 24.57 Example for Setting Sawtooth-Wave PWM Mode 2

24.3.3.3 Sawtooth-Wave One-Shot Pulse Mode

The sawtooth-wave one-shot pulse mode is a mode in which the period is set in the GTPR register, the GTCNT counter performs sawtooth-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed (n = 0 to 15).

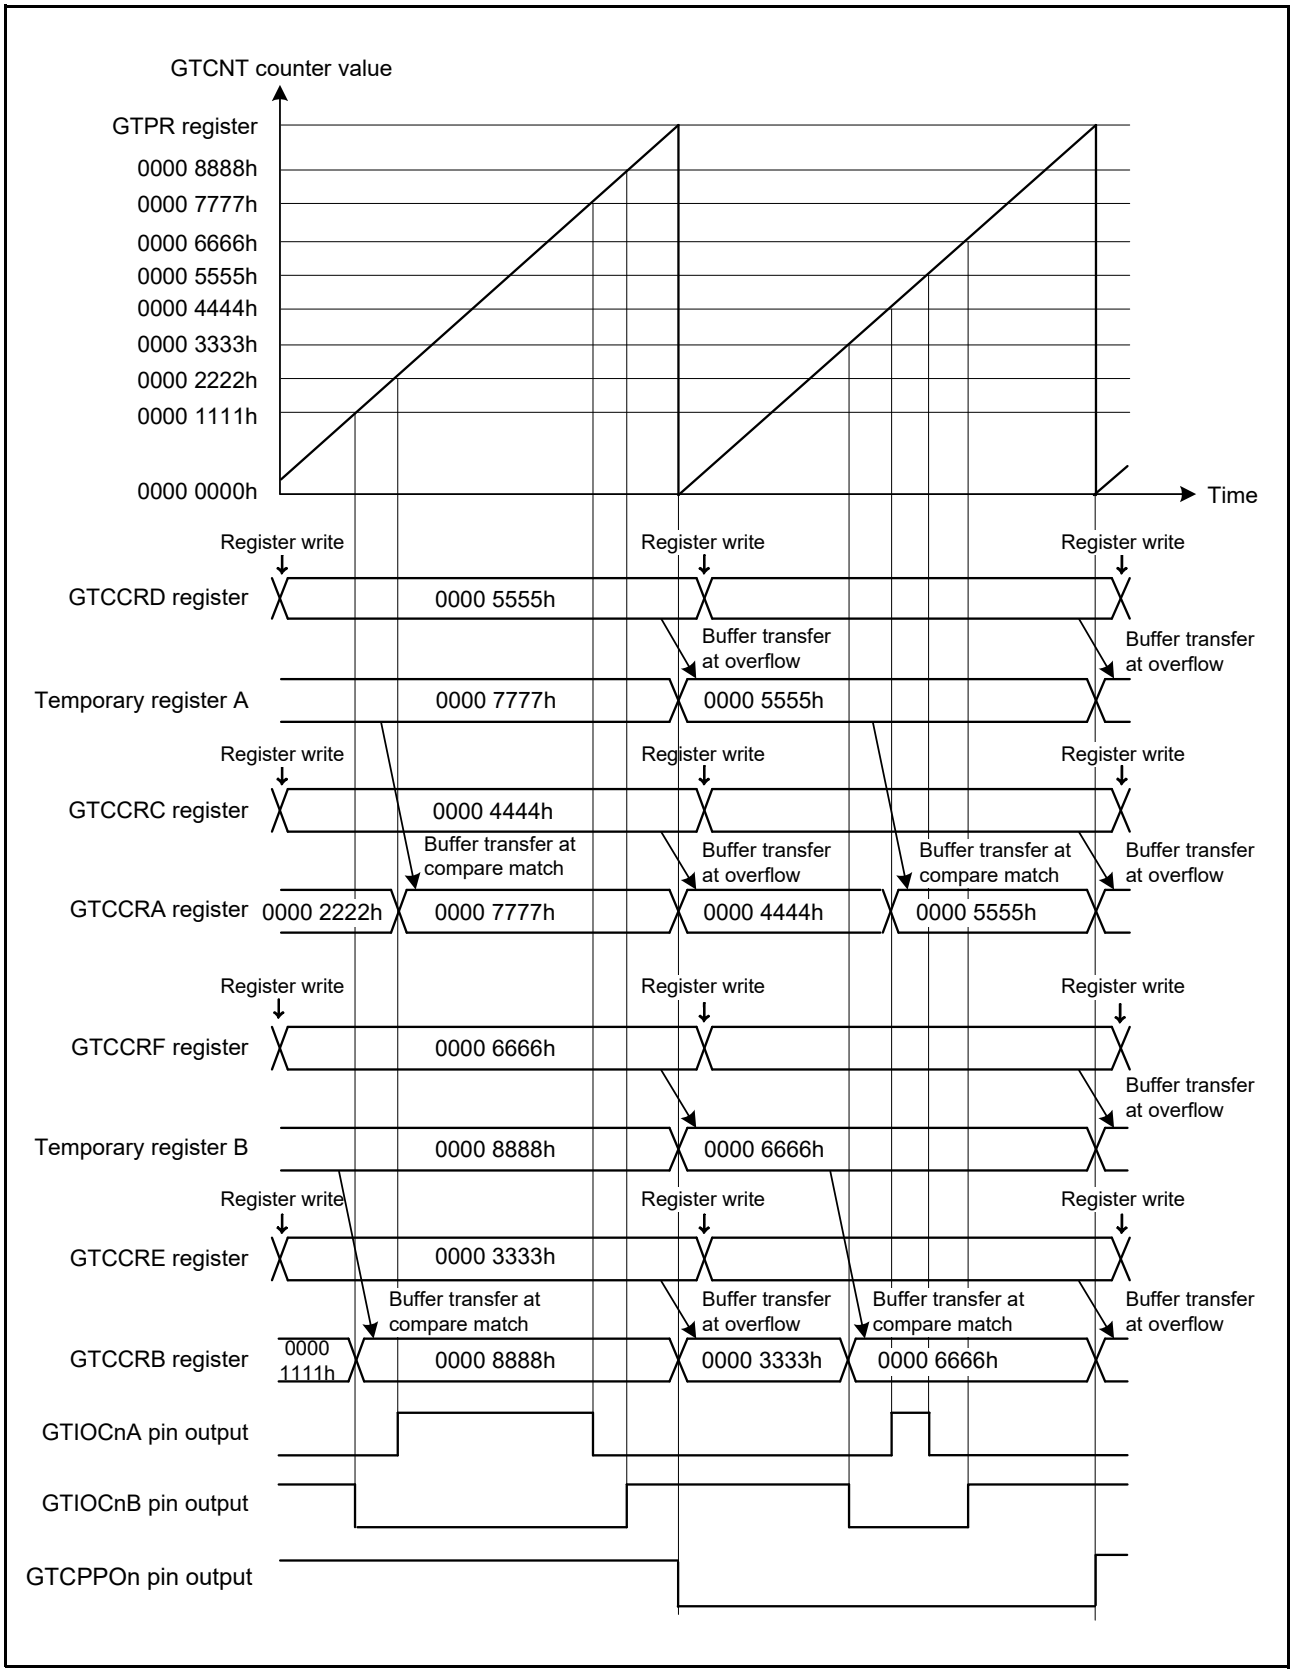
Buffer operation in sawtooth-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the GTCCRC register to the GTCCRA register, from the GTCCRE register to the GTCCRB register, from the GTCCRD register to the temporary register A, and from the GTCCRF register to the temporary register B at the end of the cycle, and from the temporary register A to the GTCCRA register at a GTCCRA register compare match and from the temporary register B to the GTCCRB register at a GTCCRB register compare match. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the end of the cycle according to the GTIOR register setting.

The temporary register A and the temporary register B can perform forcible buffer transfers from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B respectively by writing 1 to the GTBER.CCRSWT bit while the count is stopped.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis with using the temporary register x (x = C, E) and temporary register m (m = A, B) which operate as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm (m = A, B) registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, refer to section 24.8.2.2, Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 24.58 shows an example of sawtooth-wave one-shot pulse mode operation, and Figure 24.59 shows an example for setting sawtooth-wave one-shot pulse mode.



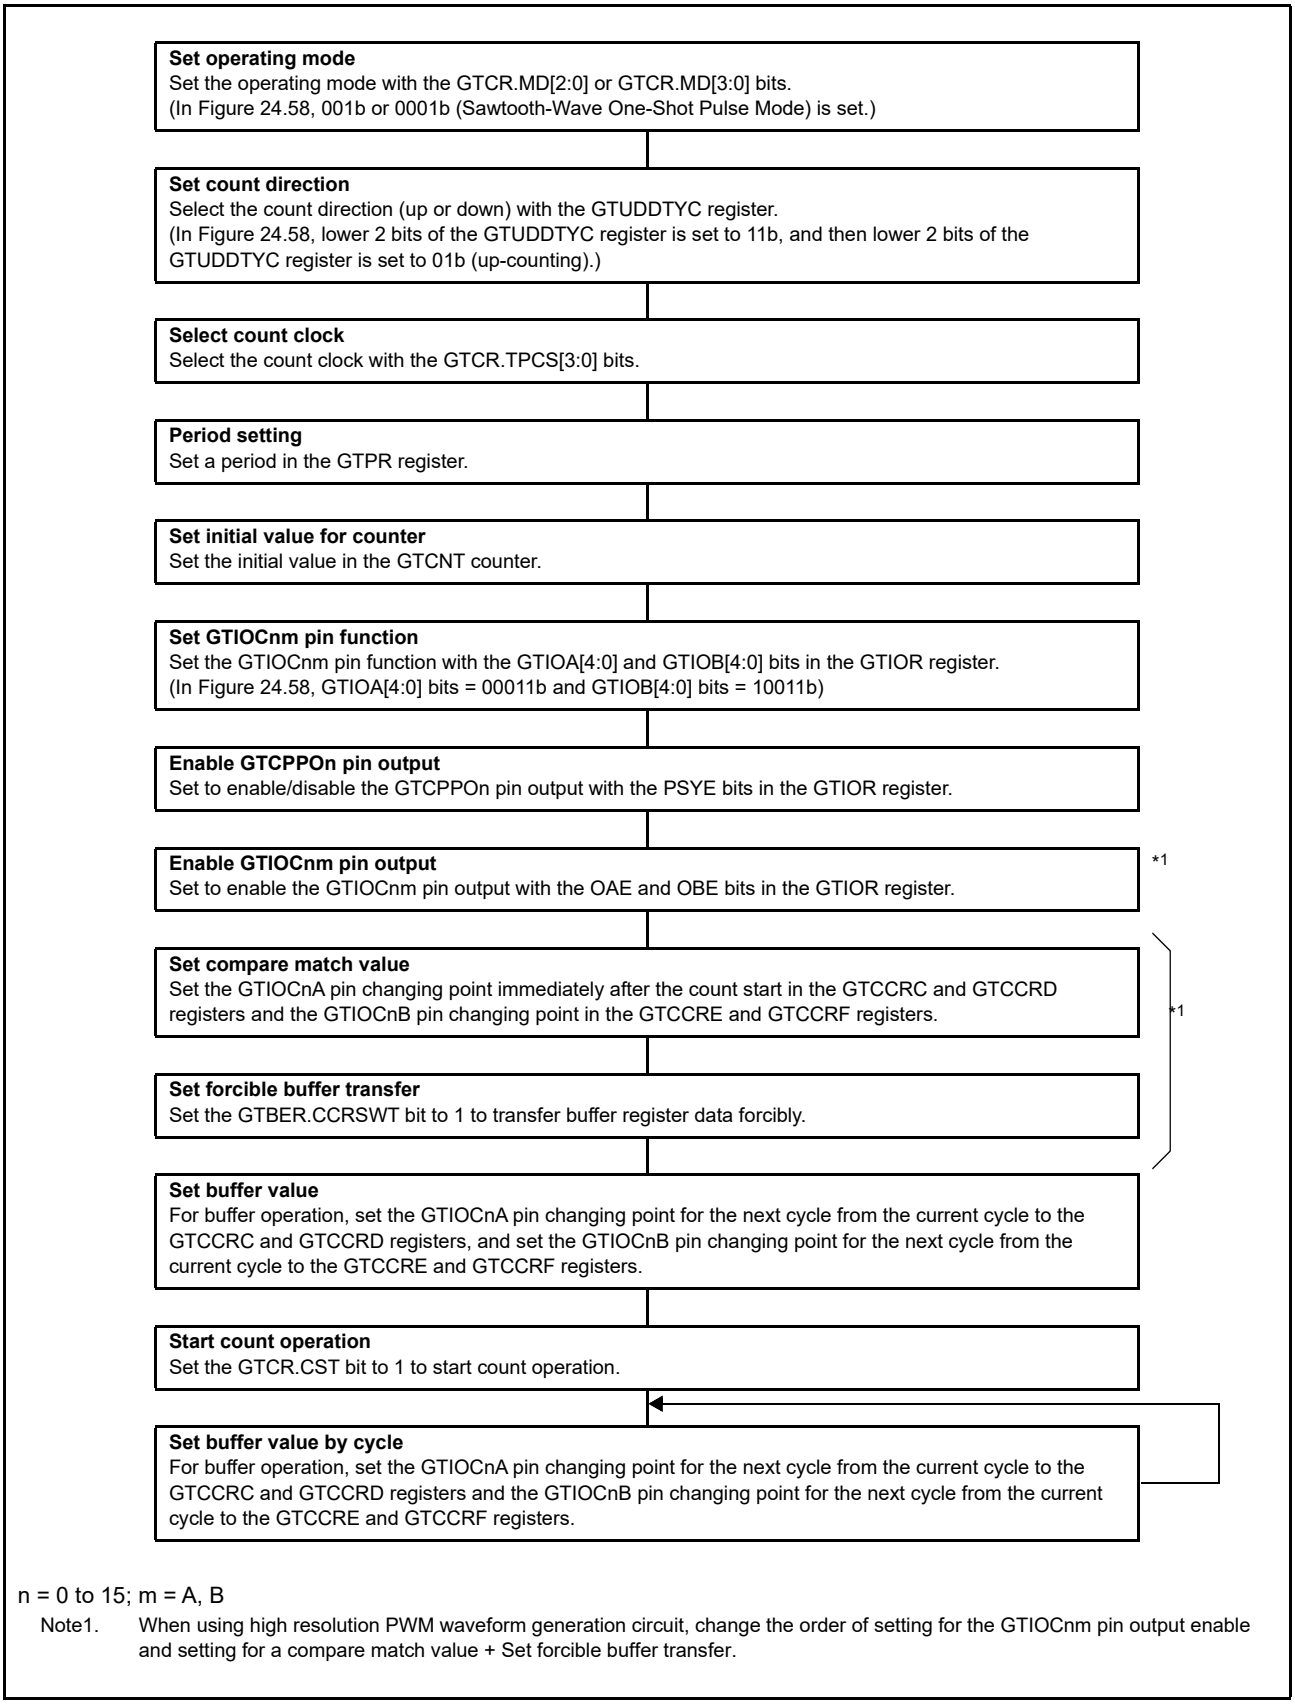


Figure 24.58 Example of Sawtooth-Wave One-Shot Pulse Mode Operation (Up-Counting, Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

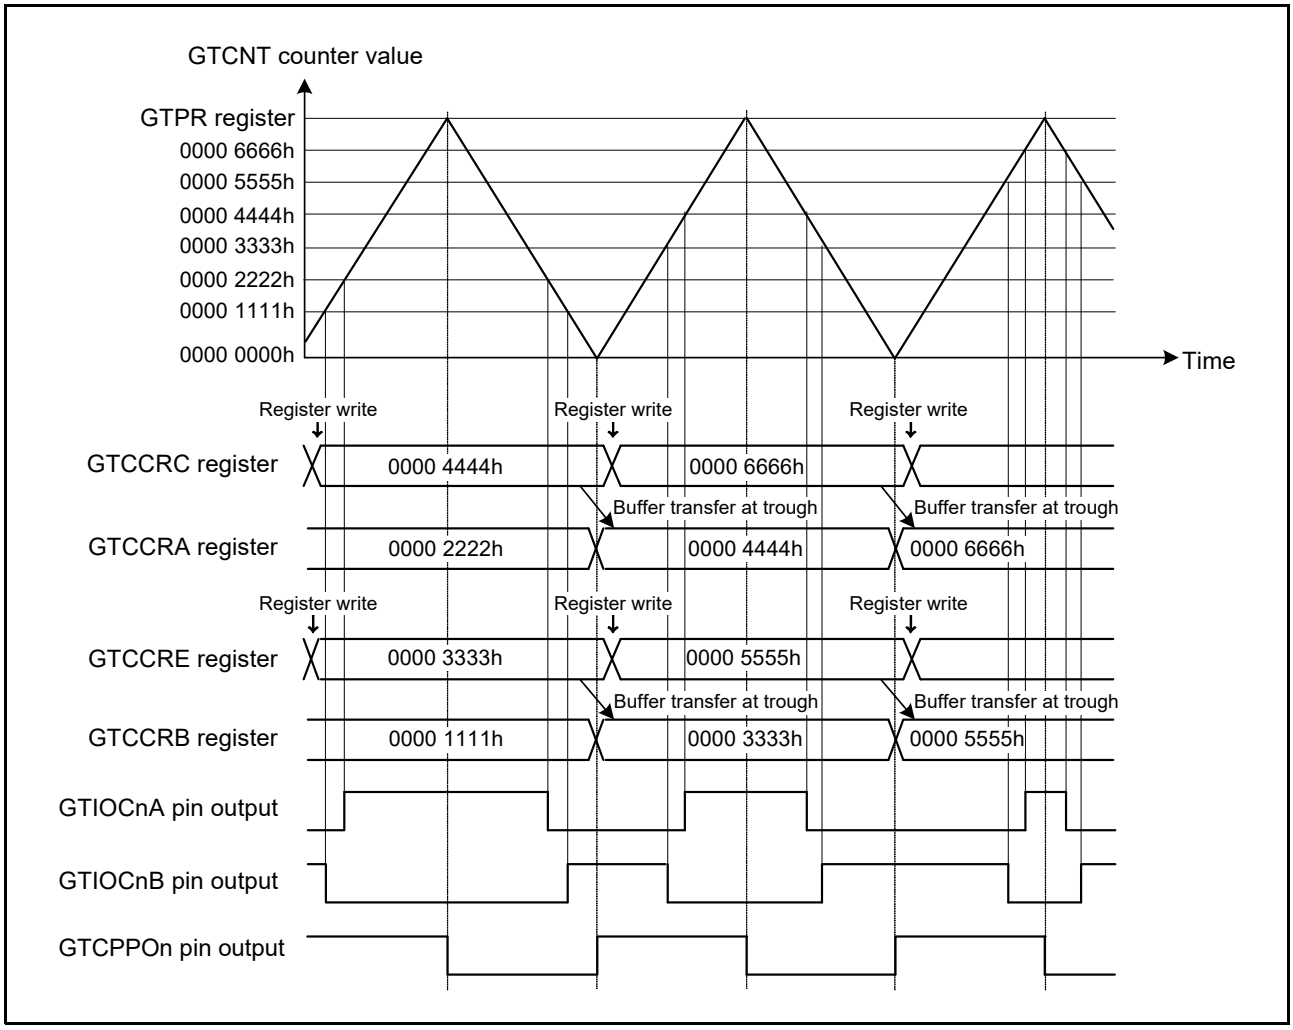
n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value + Set forcible buffer transfer.

Figure 24.59 Example for Setting Sawtooth-Wave One-Shot Pulse Mode

24.3.3.4 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs (n = 0 to 15).
Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.
By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.
Figure 24.60 shows an example of triangle-wave PWM mode 1 operation, and Figure 24.61 shows an example for setting triangle-wave PWM mode 1.



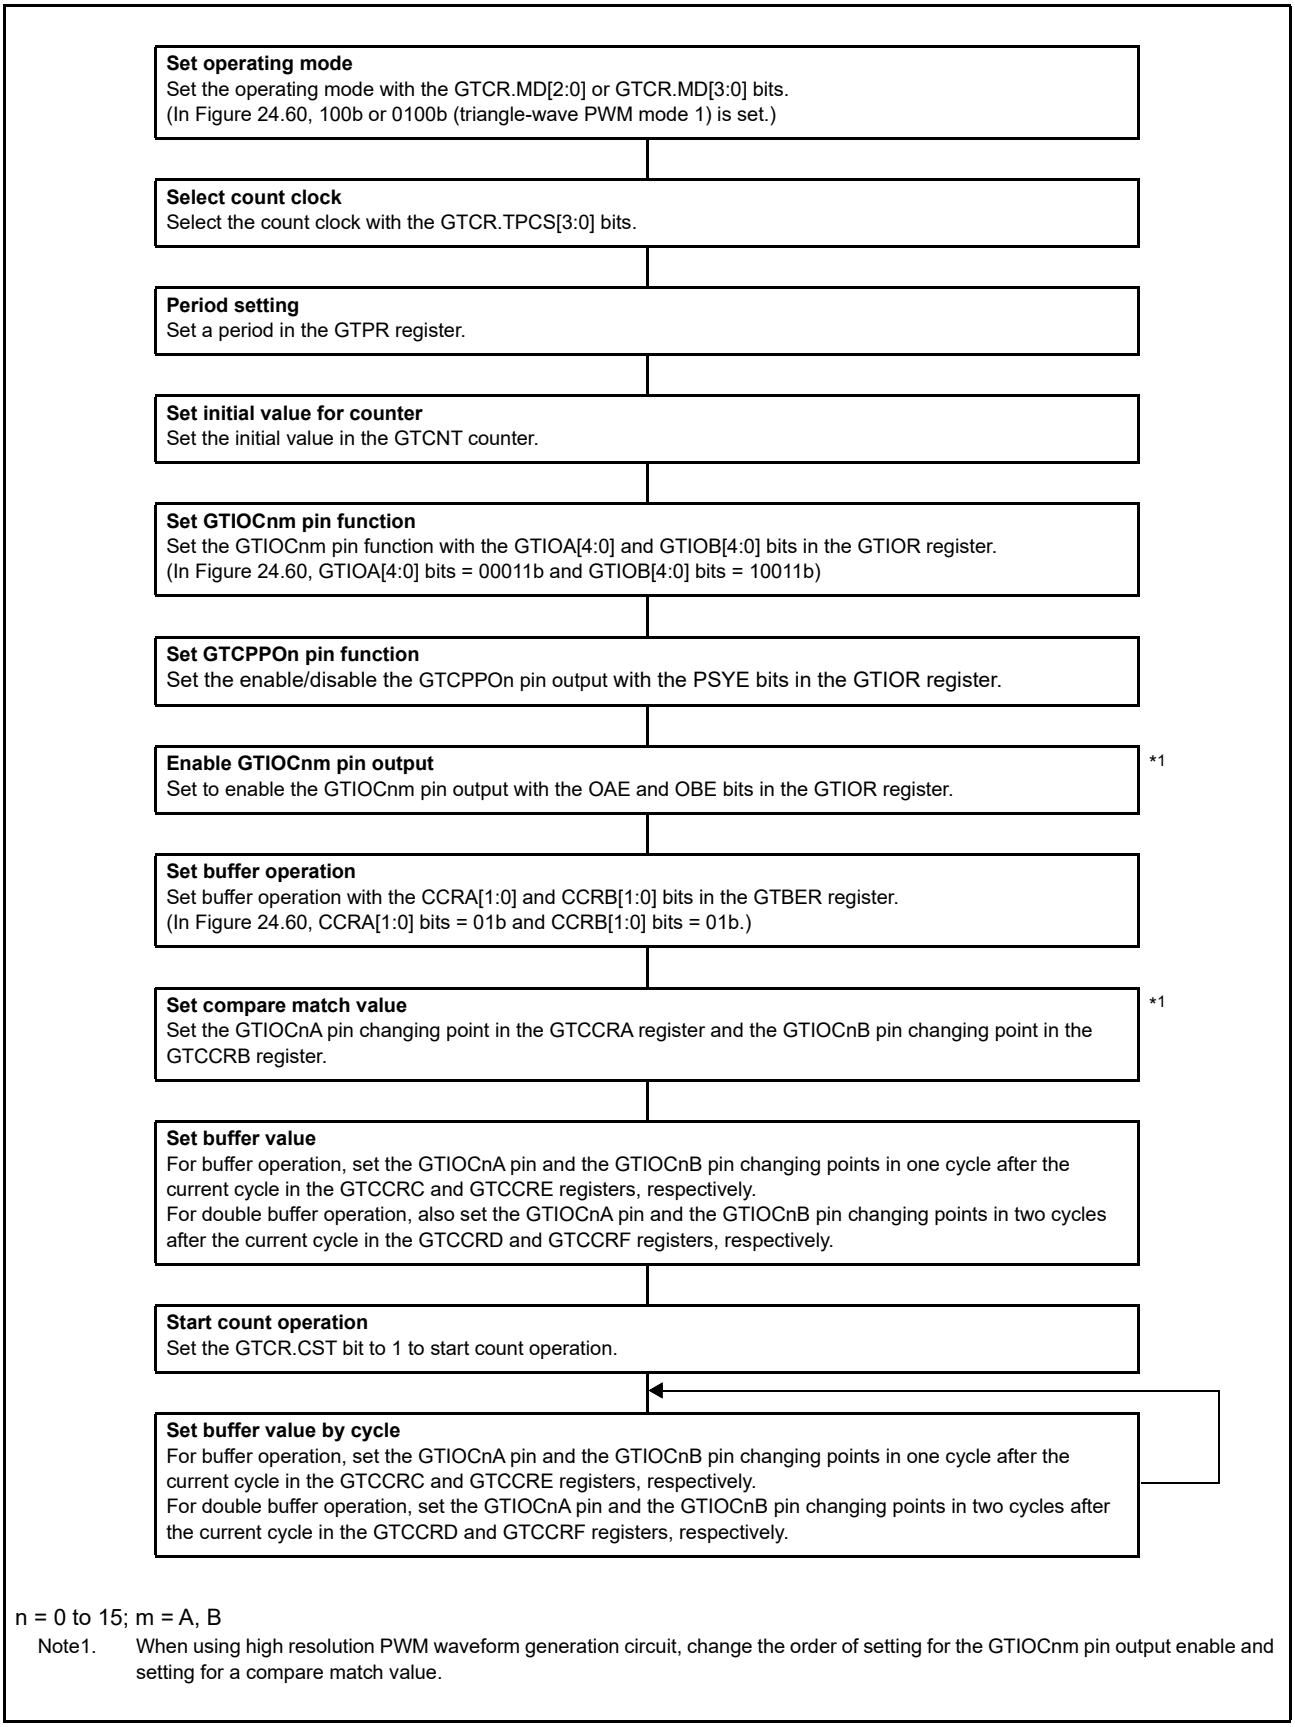


Figure 24.60 Example of Triangle-Wave PWM Mode 1 Operation (Buffer Operation, Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

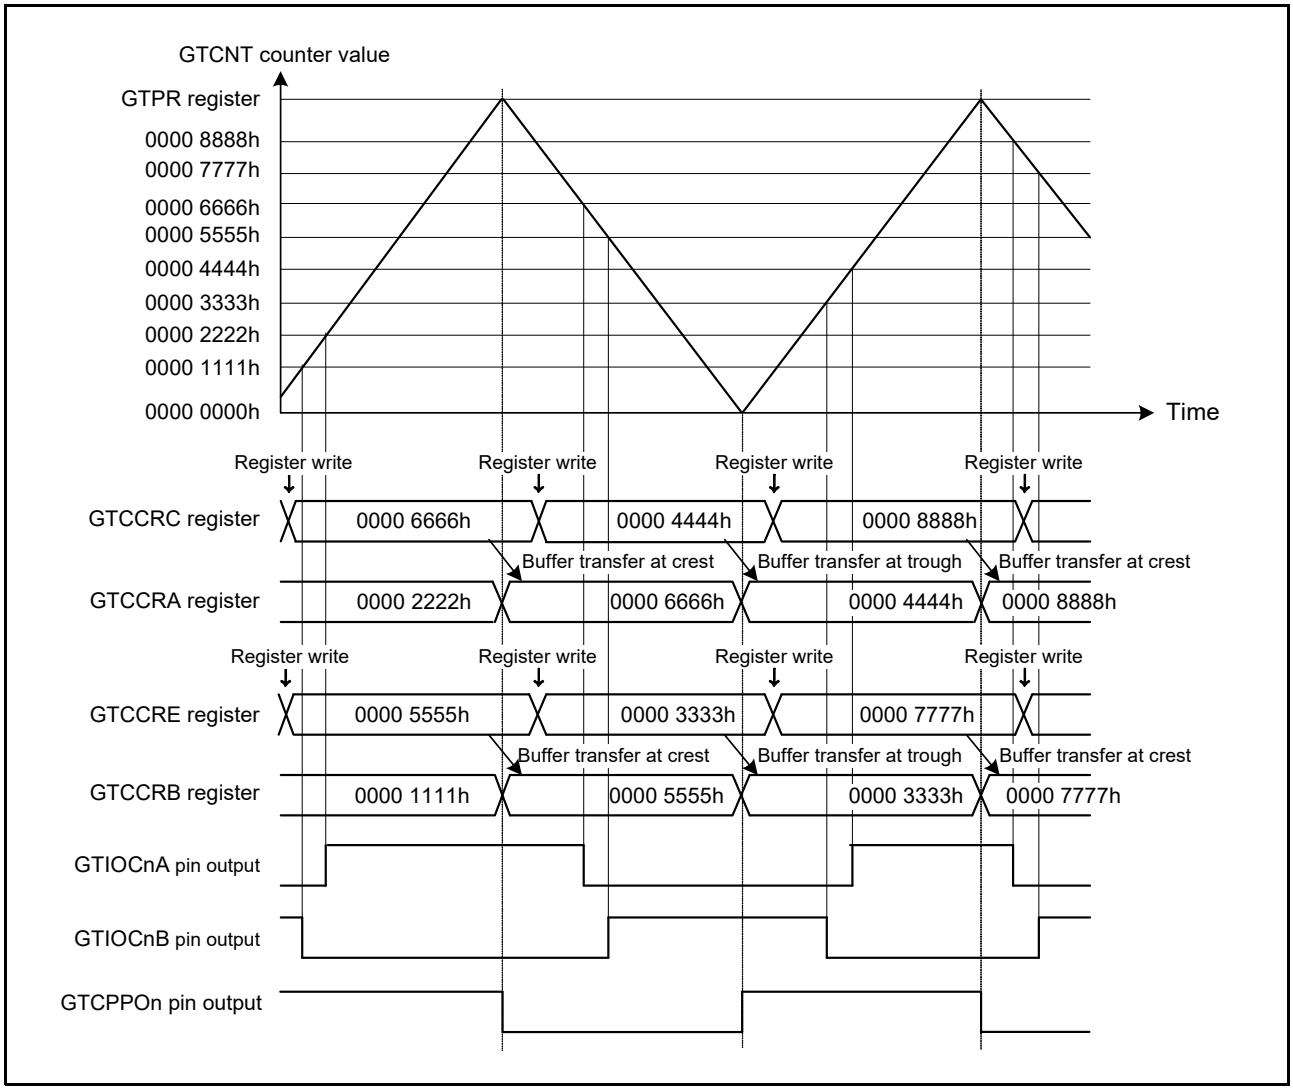
n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.61 Example for Setting Triangle-Wave PWM Mode 1

24.3.3.5 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs (n = 0 to 15). The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.
By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.
Figure 24.62 shows an example of triangle-wave PWM mode 2 operation, and Figure 24.63 shows an example for setting triangle-wave PWM mode 2.



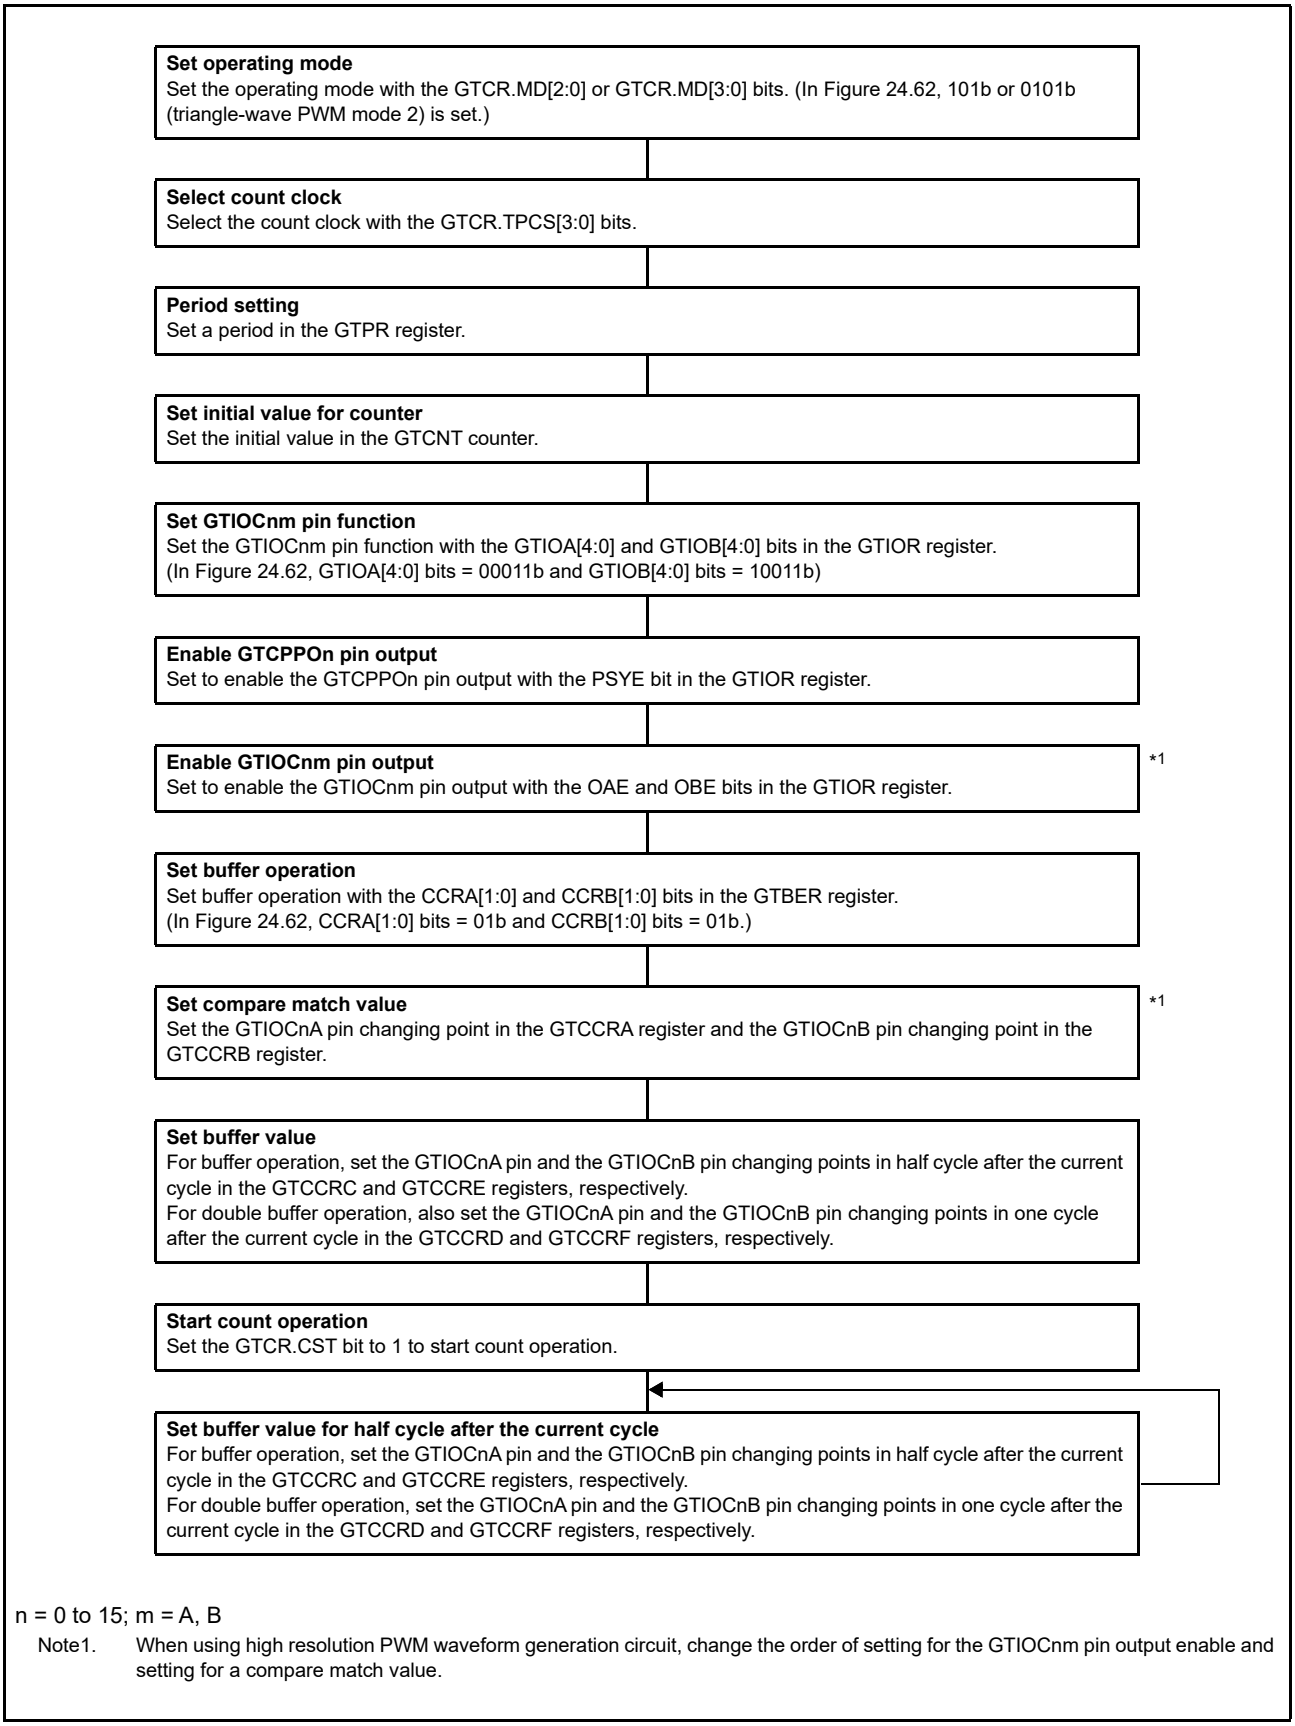


Figure 24.62 Example of Triangle-Wave PWM Mode 2 Operation (Buffer Operation, Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.63 Example for Setting Triangle-Wave PWM Mode 2

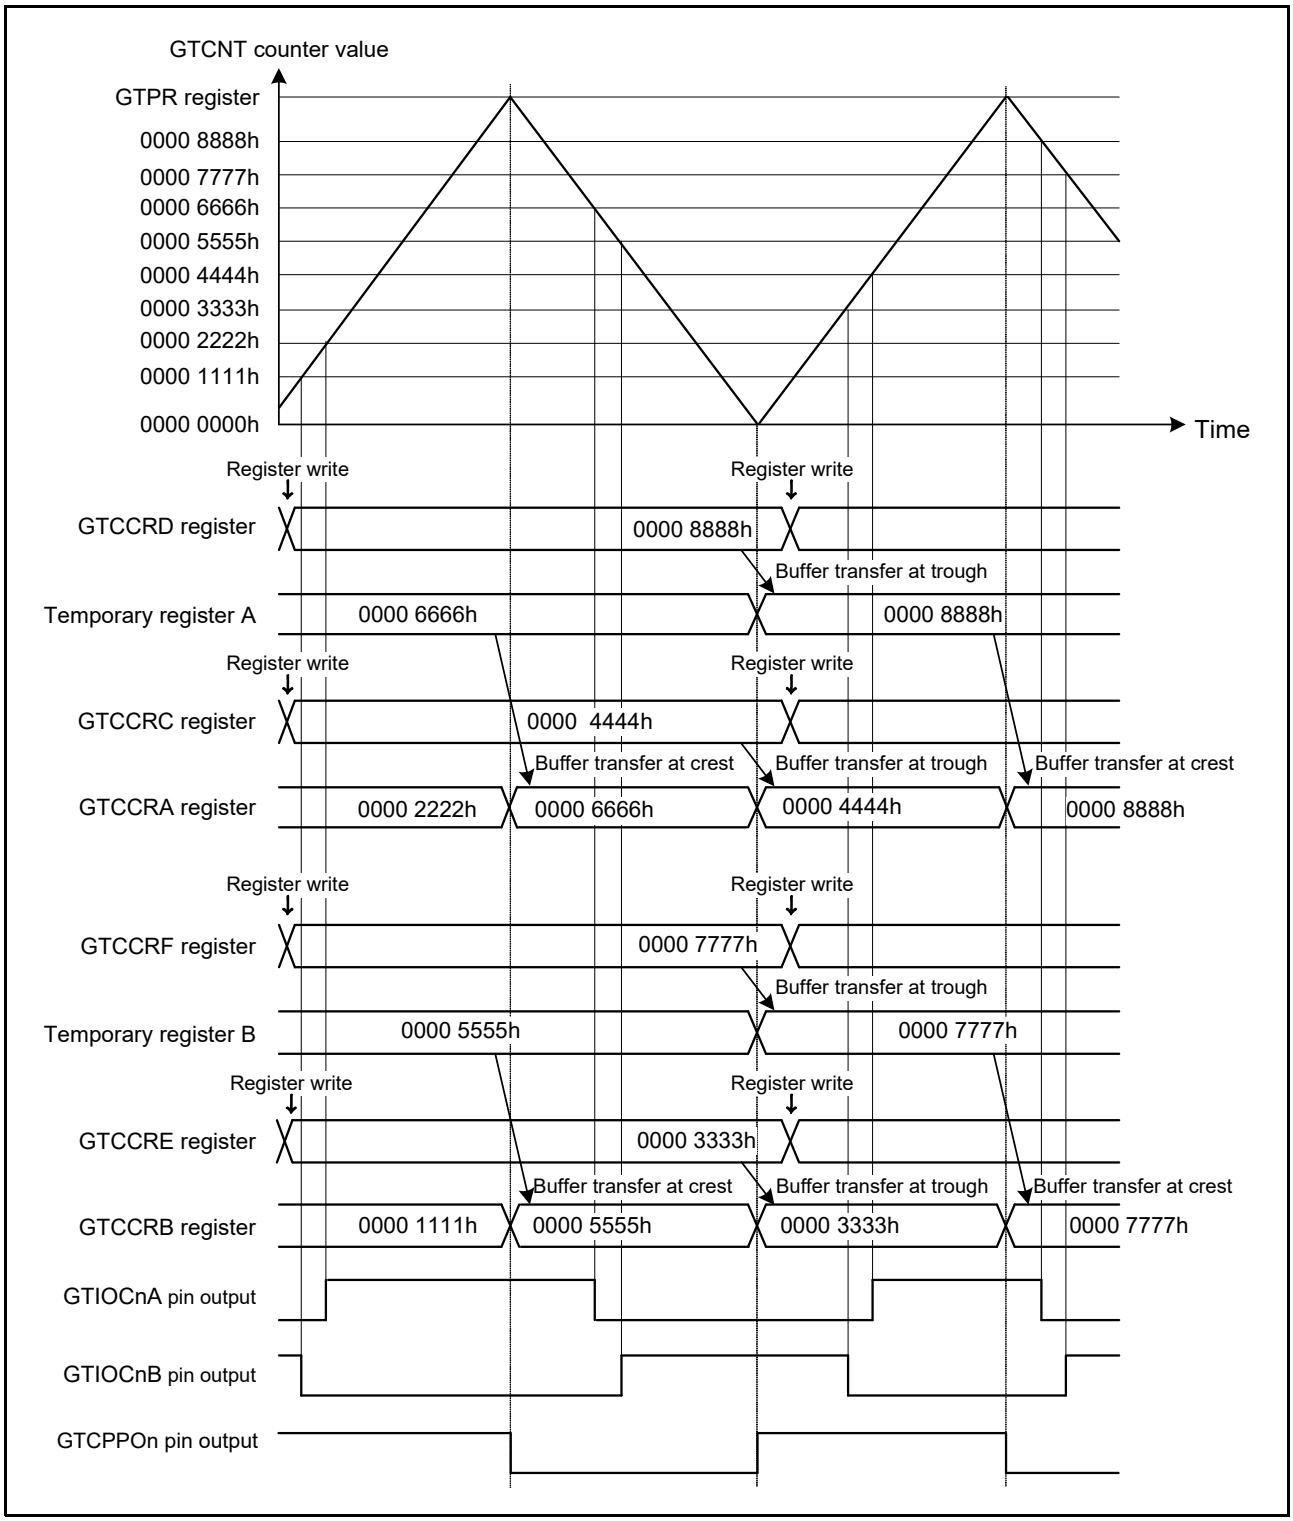
24.3.3.6 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed (n = 0 to 15). Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the GTCCRC register to the GTCCRA register, from the GTCCRE register to the GTCCRB register, from the GTCCRD register to the temporary register A, and from the GTCCRF register to the temporary register B at the trough, and from the temporary register A to the GTCCRA register and from the temporary register B to the GTCCRB register at the crest. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis with using the temporary register x (x = C, E) and temporary register m (m = A, B) which operate as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm (m = A, B) registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, refer to section 24.8.2.2, Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 24.64 shows an example of triangle-wave PWM mode 3 operation, and Figure 24.65 shows an example for setting triangle-wave PWM mode 3.



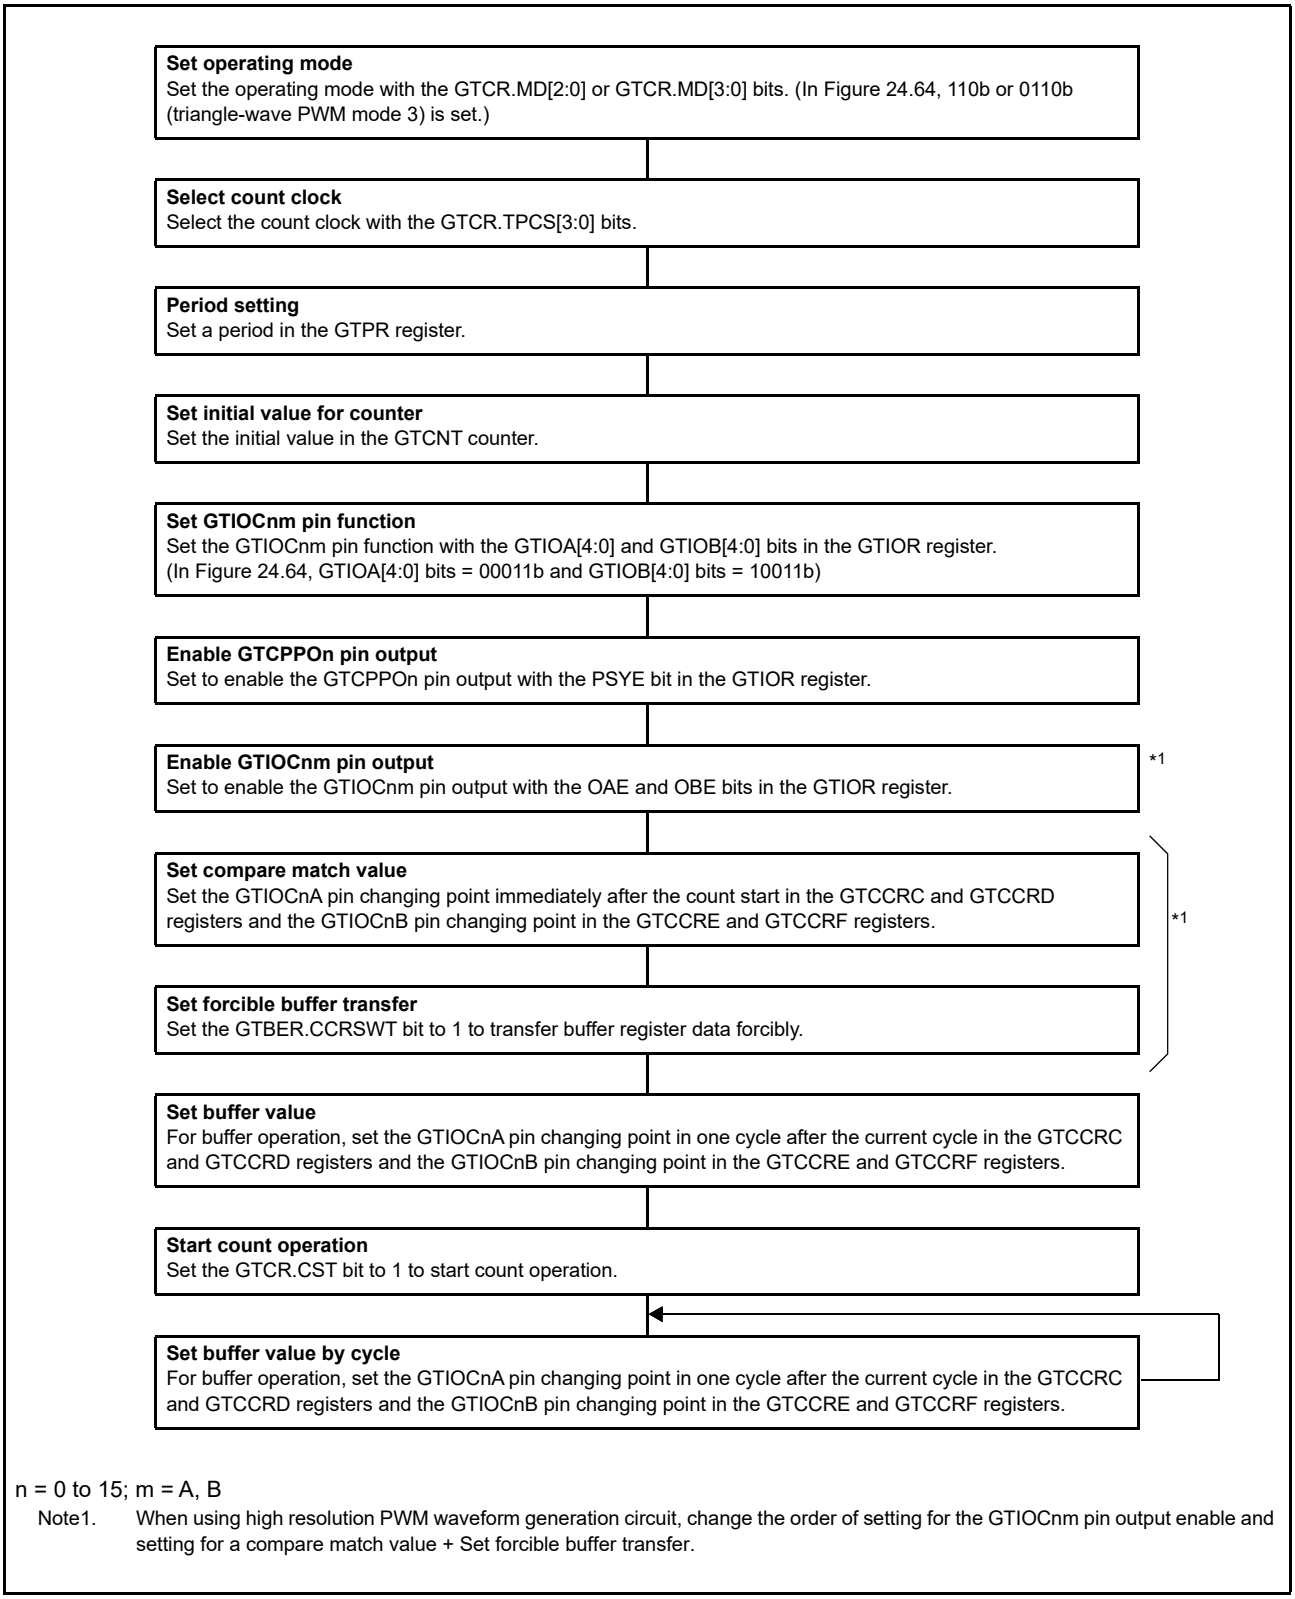


Figure 24.64 Example of Triangle-Wave PWM Mode 3 Operation (Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value + Set forcible buffer transfer.

Figure 24.65 Example for Setting Triangle-Wave PWM Mode 3

24.3.3.7 Complementary PWM mode 1, 2, 3

In complementary PWM mode, a three-phase PWM waveform with dead time that ensures the linearity in the vicinity of duty 0% and 100% can be output using the GTCNT counter of consecutive three channels. There are four modes depending on differences in buffer operation: (1) complementary PWM mode 1 (transfer at crests), (2) complementary PWM mode 2 (transfer at troughs), (3) complementary PWM mode 3 (transfer at crests and troughs), and (4) complementary PWM mode 4 (immediate transfer).

Figure 24.66 shows the block diagram in complementary PWM modes 1 to 3.

Among consecutive three channels, the lowest channel is referred to as master channel, and the adjacent upper two channels are referred to as slave channel 1 (lower) and slave channel 2 (upper).

The GTCNT counter of each channel performs individual count operation under the cycle operation by the master channel.

In each channel, compare match with the GTCCRA register is performed selecting one of the three GTCNT counters in each operation section, and a positive-phase waveform and a negative-phase waveform are output from the GTIOCnA pin (n = 4 to 9) and the GTIOCnB pin (n = 4 to 9) respectively with a non-overlapping section of the dead time value set in the GTDVU register of the master channel.

The GTCCRA register performs buffer operation by the GTCCRC register, temporary register A, and GTCCRD register. In complementary PWM mode 3, setting the GTBER2.CP3DB bit to 1 also enables buffer operation of the GTCCRA register by the GTCCRE register, temporary register B, and GTCCRF register, allowing double buffer operation.

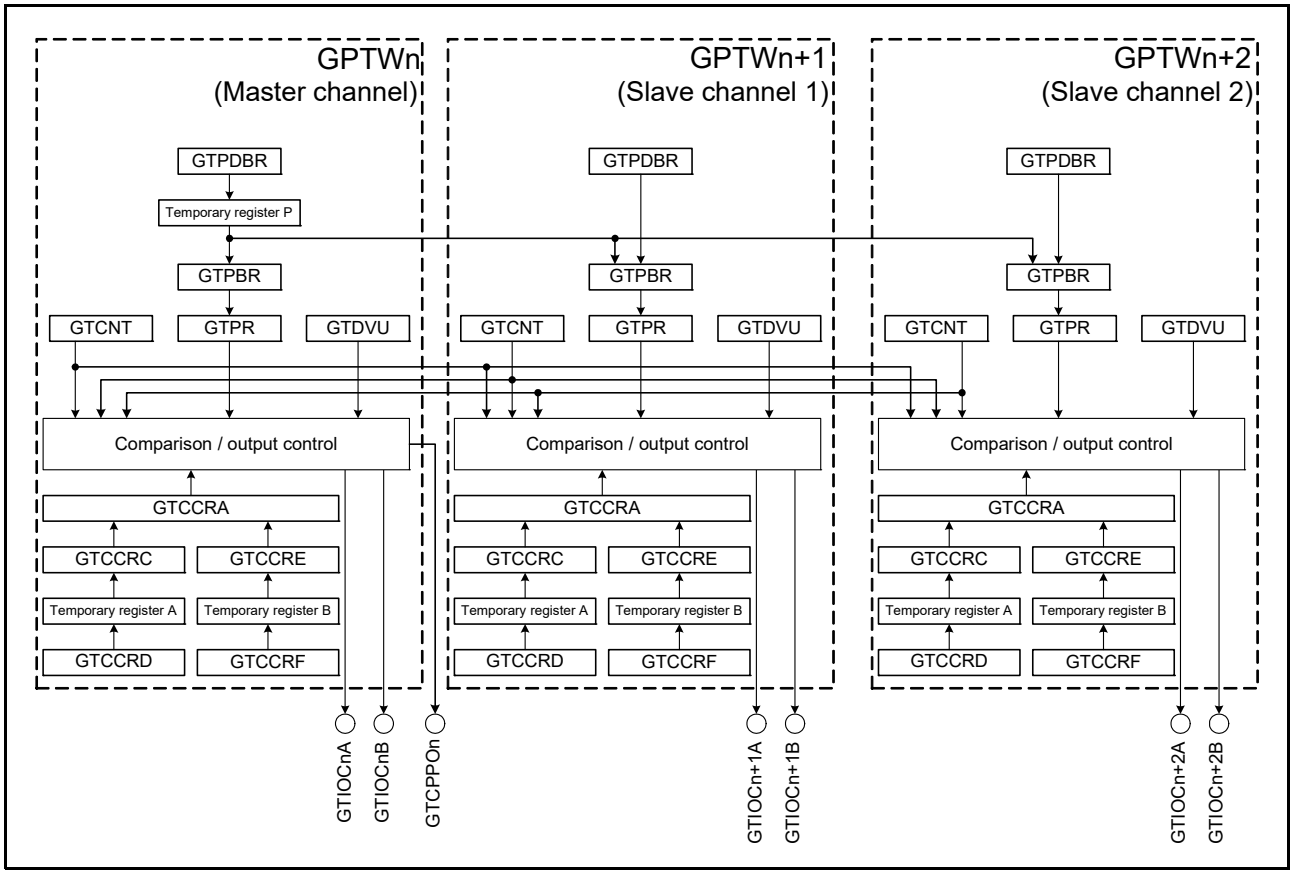

Figure 24.66 Block Diagram in Complementary PWM Mode 1, 2, 3 (n = 4, 7)

The GPTWn.GTCNT counter performs count operation for triangle waves using the GPTWn.GTPR register as a cycle register. A section where the GPTWn.GTCNT counter value is not larger than the dead time value is referred to as trough section.

The GPTWn+1.GTCNT counter performs count operation with the value (GPTWn.GTCNT counter value + dead time value set in the GPTWn.GTDVU register). A section where the GPTWn+1.GTCNT counter value is larger than the

GPTWn.GTPR register value is referred to as crest section.
Crest section and trough section are classified into up-counting crest section, down-counting crest section, up-counting trough section, and down-counting trough section according to counting direction. A section between trough section and crest section is referred to as up-counting middle section or down-counting middle section according to counting direction.
A section equivalent to the up-counting trough section after starting count operation is referred to as initial output section where operation differs partially from other up-counting trough sections.
The GPTWn+2.GTCNT counter functions as a counter to ensure the linearity in the vicinity of duty 0% and 100%. In a crest section, this counter performs count operation for a triangle wave (up-counting after down-counting) with the value (GPTWn.GTPR register value + dead time value) as an initial value and the GPTWn.GTPR register value as a trough. This counter is cleared to 0 at the end of the crest section, and then stops counting until the next trough section. In a trough section, this counter performs count operation for a triangle wave with an initial value of 0 and dead time value as a crest.
This counter becomes the value (GPTWn.GTPR register value + dead time value) at the end of the trough section, and then stops counting until the next crest section. In the initial output section, however, this counter counts up with an initial value of 0 until the dead time value, and then becomes the value (GPTWn.GTPR register value + dead time value). If the counter stops and then restarts in complementary PWM mode, the counter of each channel returns to the initial value after starting count operation, and then starts counting from the initial output section.
Table 24.12 and Table 24.13 show count operation (counting direction/counting range) in each section. In these tables, registers with no channel identification indicate that the same value is stored in them of the master channel, slave channel 1, and slave channel 2.

Table 24.12 Count Operation in Complementary PWM Mode (1) (n = 4, 7)

Counter	Initial Value	Initial Output Section (After Start)	Up-Counting Middle Section	Up-Counting Crest Section	Down-Counting Crest Section
GPTWn.GTCNT	0	Up-Counting 0 to GTDVU	Up-Counting GTDVU + 1 to GTPR – GTDVU	Up-Counting GTPR – GTDVU + 1 to GTPR	Down-Counting GTPR – 1 to GTPR – GTDVU
GPTWn+1.GTCNT	GTDVU	Up-Counting GTDVU to GTDVU × 2	Up-Counting GTDVU × 2 + 1 to GTPR	Up-Counting GTPR + 1 to GTPR + GTDVU	Down-Counting GTPR + GTDVU – 1 to GTPR
GPTWn+2.GTCNT	0	Up-Counting 0 to GTDVU	Stop GTPR + GTDVU	Down-Counting GTPR + GTDVU – 1 to GTPR	Up-Counting GTPR + 1 to GTPR + GTDVU

Table 24.13 Count Operation in Complementary PWM Mode (2) (n = 4, 7)

Counter	Down-Counting Middle Section	Down-Counting Trough Section	Up-Counting Trough Section
GPTWn.GTCNT	Down-Counting GTPR – GTDVU – 1 to GTDVU	Down-Counting GTDVU – 1 to 0	Up-Counting 1 to GTDVU
GPTWn+1.GTCNT	Down-Counting GTPR – 1 to GTDVU × 2	Down-Counting GTDVU × 2 – 1 to GTDVU	Up-Counting GTDVU + 1 to GTDVU × 2
GPTWn+2.GTCNT	Stop 0	Up-Counting 1 to GTDVU	Down-Counting GTDVU – 1 to 0

In complementary PWM mode, the GTCCRA register buffer operation is different from normal buffer operation.
Data transfers from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B are performed at the same time in three channels by writing a value to the GTCCRD register of the GPTWn+2 channel.
Data transfers from the temporary register A and temporary register B to the GTCCRC and GTCCRE registers vary depending on the transfer timing to the temporary register A and temporary register B. Data transfers from the GTCCRC and GTCCRE registers to the GTCCRA register are performed according to each complementary PWM mode name (crest transfer, trough transfer, and crest/trough transfer).
Buffer operation of the GTPR register in complementary PWM mode is described in section 24.3.2.1, GTPR Register Buffer Operation. Do not perform buffer operation for the GTDVU register in complementary PWM mode.

Table 24.14 shows buffer transfer timing during single buffer operation in complementary PWM modes 1 to 3. Table 24.15 shows buffer transfer timing during double buffer operation in complementary PWM mode 3.

Table 24.14 Single Buffer Transfer Timing in Complementary PWM Mode 1, 2, 3 (n = 4, 7)

Buffer Transfer	Complementary PWM Mode 1	Complementary PWM Mode 2	Complementary PWM Mode 3
GTCCRD ↓ Temporary register A	After one GTCLK cycle from the GTCCRD register write of slave channel 2 (GPTWn+2)	After one GTCLK cycle from the GTCCRD register write of slave channel 2 (GPTWn+2)	After one GTCLK cycle from the GTCCRD register write of slave channel 2 (GPTWn+2)
Temporary register A ↓ GTCCRC	(1) When transferring to the temporary register A at the middle section of the up-count • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring to the temporary register A at other than the middle section of the up-count • The end of the trough (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A	(1) When transferring to the temporary register A at the middle section of the down-count • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring to the temporary register A at other than the middle section of the down-count • The end of the crest (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A	(1) When transferring to the temporary register A at the middle section • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring to the temporary register A at other than the middle section • The end of the crest/trough (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A
GTCCRC ↓ GTCCRA	• The end of the trough • Counter clear in the up-count intermediate section and crest section	• The end of the trough section excluding the initial output section • Counter clear in the down-count intermediate section and trough section	• The end of the trough • The end of the trough section excluding the initial output section • Counter clear

Table 24.15 Double Buffer Transfer Timing in Complementary PWM Mode 3 (n = 4, 7)

Buffer Transfer	Transfer Timing
GTCCRD ↓ Temporary register A	After 1 GTCLK after slave channel 2 (GPTWn+2) writes to the GTCCRD register
Temporary register A ↓ GTCCRC	(1) When transferring data to the temporary register A at the middle section • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring data to the temporary register A at other than the middle section • At the end of crest and trough sections (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A
GTCCRC ↓ GTCCRA	• The end of the crest • Counter clear

Buffer Transfer	Transfer Timing
GTCCRF ↓ Temporary register B	After 1 GTCLK after slave channel 2 (GPTWn+2) writes to the GTCCRD register
Temporary register B ↓ GTCCRE	(1) When transferring data to the temporary register B at the middle section • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register B (2) When transferring data to the temporary register B at other than the middle section • At the end of crest and trough sections (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register B
GTCCRE ↓ GTCCRA	• The end of the trough section excluding the initial output section

The change in the output level of the positive phase waveform output from the GTIOCnA pin (n = 4 to 9) and the negative phase waveform output from the GTIOCnB pin (n = 4 to 9) is determined by the compare match by the combination of the counter and register in each operation section. In the middle section, the compare match between the GPTWn.GTCNT counter and the GTCCRA register changes the positive phase waveform output level, and the compare match between the GPTWn+1.GTCNT counter and the GTCCRA register changes the negative phase waveform output level. The crest and trough sections use the GPTWn+2.GTCNT counter, GTCCRC register, and GTCCRE register to

perform a compare match operation to ensure linearity near 0% and 100% duty.
When the compare match value is greater than or equal to the GPTWn.GTPR register value, the duty is 0% (positive phase waveform OFF, negative phase waveform ON). When the compare match value is 0, the duty is 100% (positive phase waveform ON, negative phase waveform OFF).
Table 24.16 shows the counter and register combinations used in the comparative match operation to generate a positive-phase waveform and a negative-phase waveform in each operating section.

Table 24.16 Combinations of Counters and Registers for Compare Match Operation in Complementary PWM Mode

	Up-Counting Middle Section	Up-Counting Crest Section	Down-Counting Crest Section	Down-Counting Middle Section	Down-Counting Trough Section	Up-Counting Trough Section
Negative-Phase OFF	GPTWn+1.GTCNT	GPTWn+1.GTCNT	—	GPTWn+2.GTCNT*1	GPTWn+2.GTCNT	GPTWn+1.GTCNT
	GTCCRA	GTCCRA	—	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)
Positive-Phase ON	GPTWn.GTCNT	GPTWn.GTCNT	GPTWn+2.GTCNT	—	GPTWn+2.GTCNT*1	GPTWn+2.GTCNT
	GTCCRA	GTCCRA	GTCCRA	—	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)
Negative-Phase OFF	GPTWn+2.GTCNT*1	GPTWn+2.GTCNT	GPTWn.GTCNT	GPTWn.GTCNT	GPTWn.GTCNT	—
	GTCCRC	GTCCRC	GTCCRC	GTCCRA	GTCCRA	—
Positive-Phase ON	—	GPTWn+1.GTCNT*1	GPTWn+1.GTCNT	GPTWn+1.GTCNT	GPTWn+1.GTCNT	GPTWn+2.GTCNT
	—	GTCCRC	GTCCRC	GTCCRA	GTCCRA	GTCCRA

Note 1. Compare match is performed only at the time of final count in the target section, but is not performed at count values other than the final count.

In the case of normal complementary PWM mode waveform, a PWM waveform change occurs in the order of negative-phase OFF → positive-phase ON → positive-phase OFF → negative-phase ON. However, this order may vary depending on operation section and register values. In this case, OFF takes precedence in trough sections and ON takes precedence in crest sections (for negative-phase waveforms), and ON takes precedence in trough sections and OFF takes precedence in crest sections (for positive-phase waveforms). A lower-priority compare match that occurs at the same time or after a higher-priority compare match is ignored.
In the initial output section, the initial output set in the GTIOR register is retained. In the case that the GTCCRA register value is larger than the GTDVU register value at the end of the initial output section, negative phase is enabled. In the case that the GTCCRA register value is not larger than the GTDVU register value, positive phase is enabled.
As operation examples of normal complementary PWM mode waveform where compare match operation occurs in the middle section, Figure 24.67 and Figure 24.68 show complementary PWM mode 1, Figure 24.69 and Figure 24.70 show complementary PWM mode 2, Figure 24.71 and Figure 24.72 show single buffer complementary PWM mode 3, and Figure 24.73 and Figure 24.74 show double buffer complementary PWM mode 3.

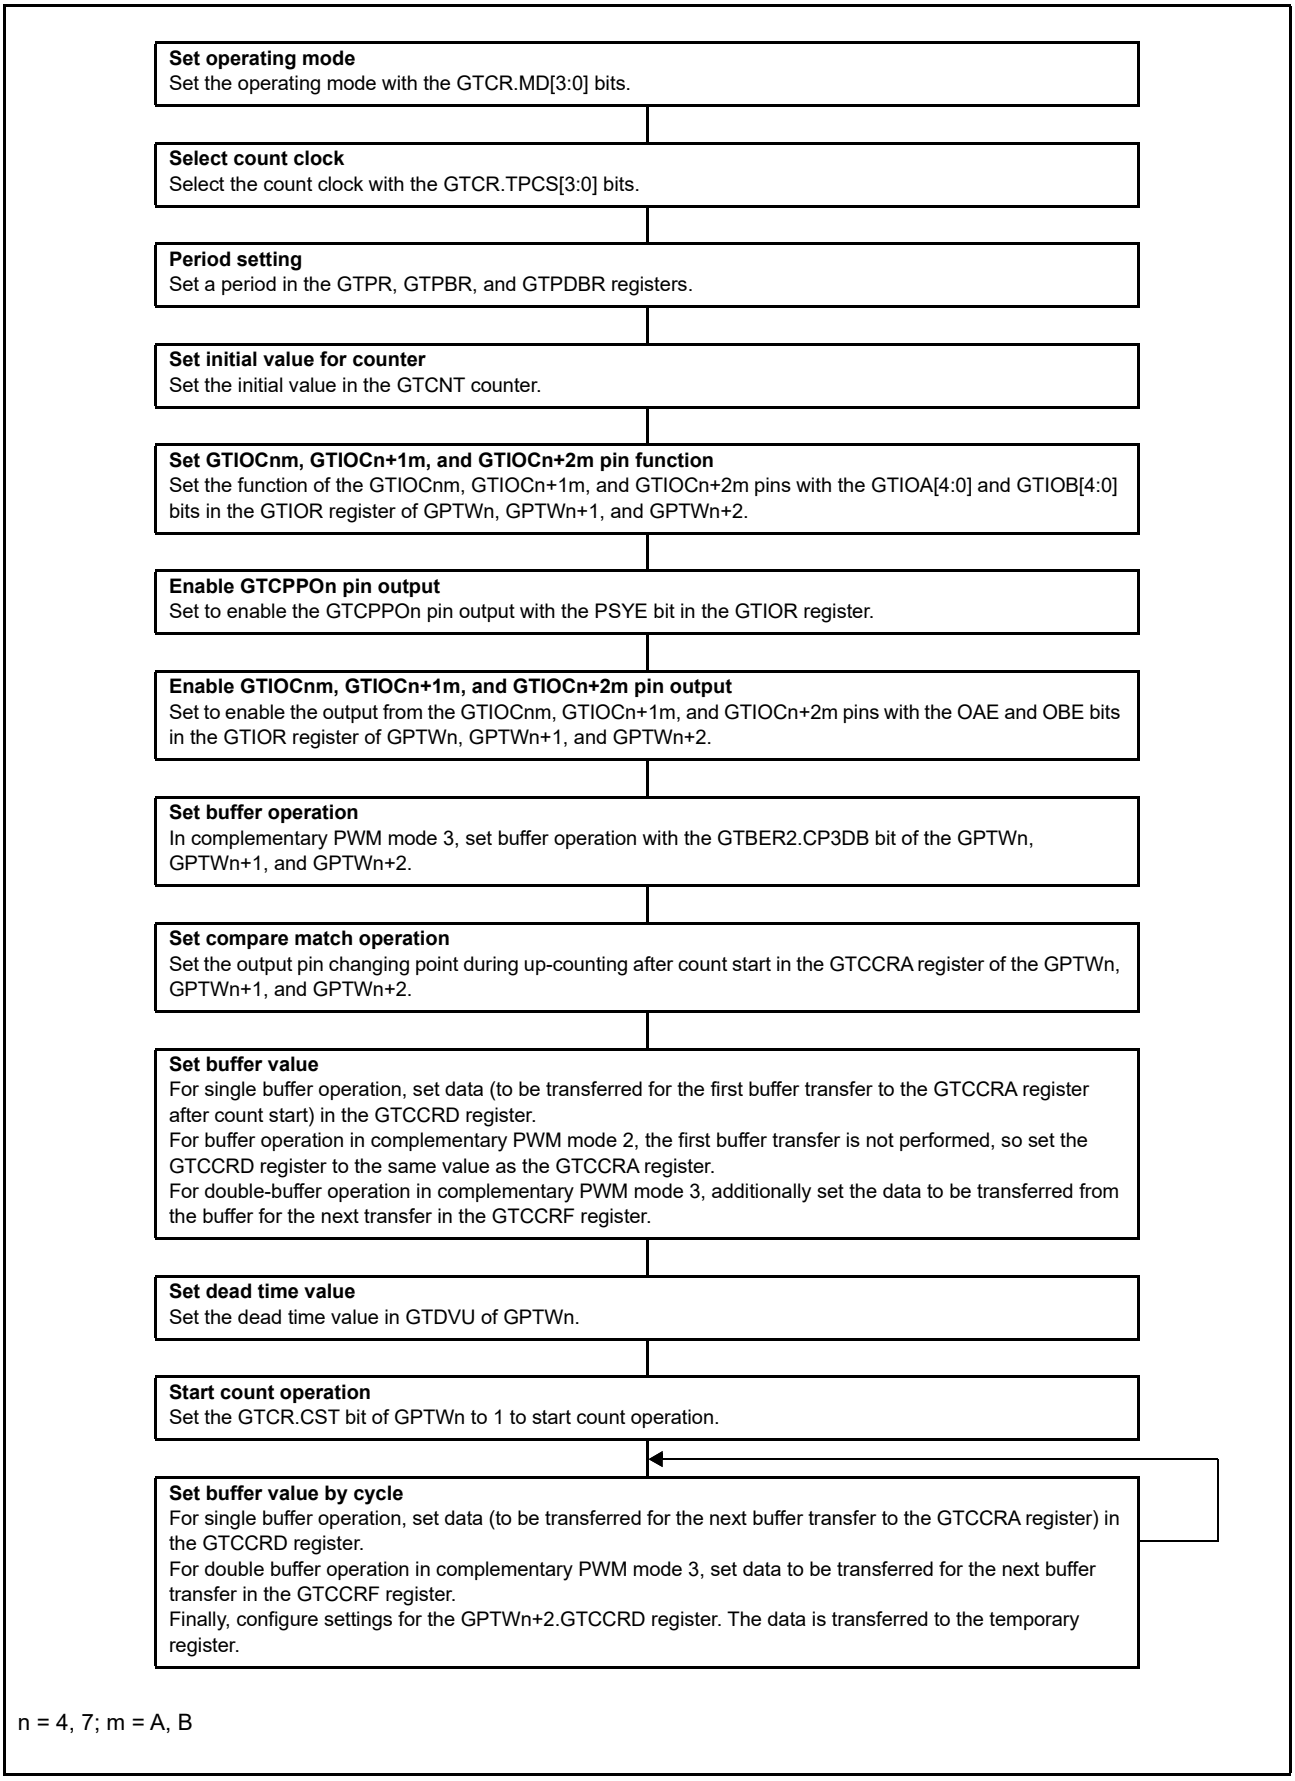

Figure 24.89 Example for Setting Complementary PWM Mode 1, 2, 3

24.3.3.8 Complementary PWM Mode 4

In complementary PWM mode 4, the value written to the GTCCRD and GTCCRF registers is immediately applied to compare match operation by transferring data also to the GTCCRA register during buffer transfer to a temporary register before crest or trough transfer timing.

Figure 24.90 shows the block diagram in complementary PWM mode 4.

In the configuration of complementary PWM mode 4, a buffer transfer path from the GTCCRD register to the GTCCRC and GTCCRA registers and a buffer transfer path from the GTCCRF register to the GTCCRE and GTCCRA registers are added to other complementary PWM modes shown in Figure 24.66.

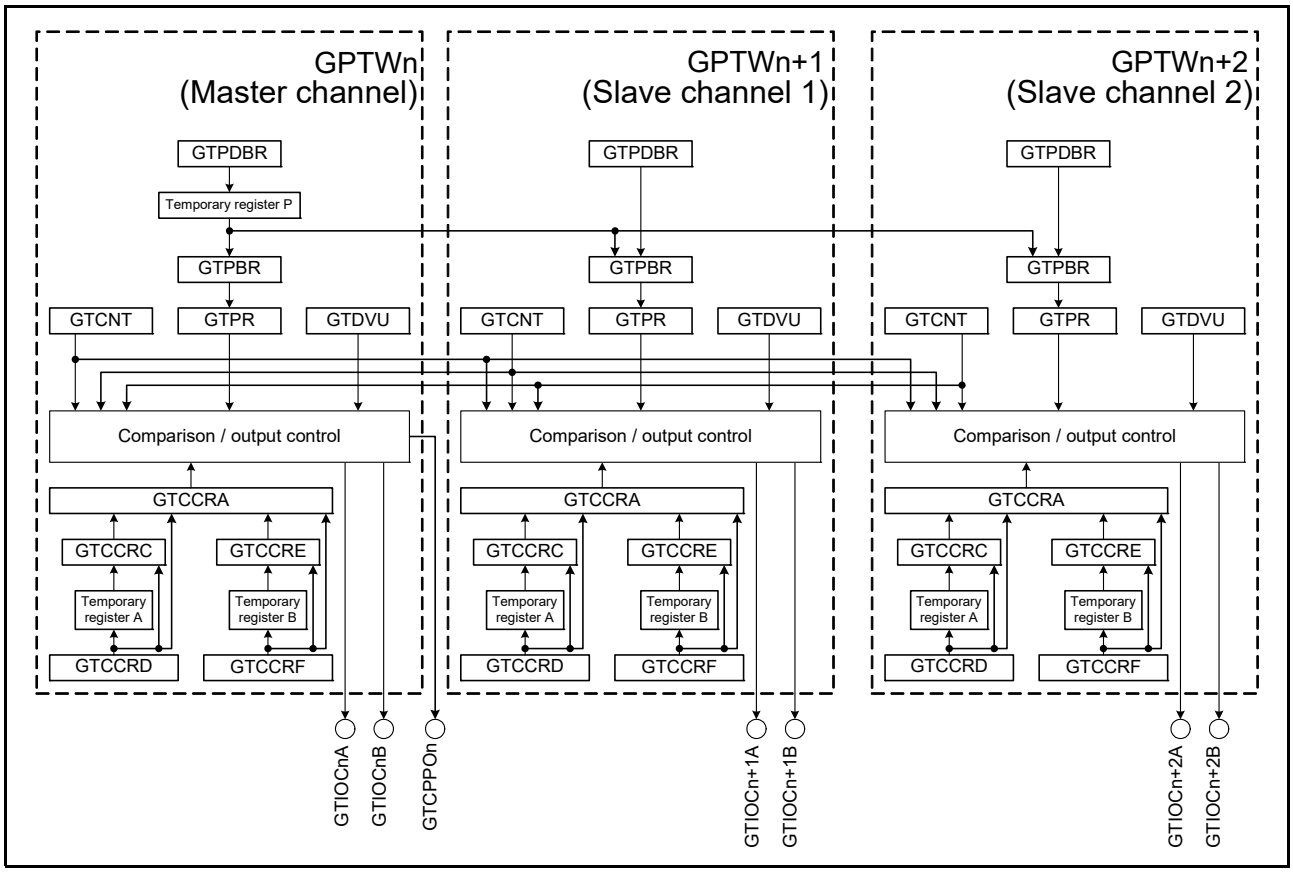

Figure 24.90 Block Diagram in Complementary PWM Mode 4 (n = 4, 7)

Count operation is performed in the same way as complementary PWM modes 1 to 3. See Table 24.12 and Table 24.13.

With respect to buffer operation and PWM waveform changes in complementary PWM mode 4, buffer transfer (shown in Figure 24.90) from the GTCCRD and GTCCRF registers is added based on the complementary PWM mode 3 operation.

Buffer transfer and PWM waveform are controlled according to operation section, state of comparison with the GTCCRA register, and write value.

The double buffer function by writing to the GTCCRF register can be enabled or disabled with the GTBER2.CP3DB bit.

In double buffer operation, the value written to the GTCCRD register is used as a compare match value for positive-phase OFF (negative-phase ON) during down-counting, and the value written to the GTCCRF register is used as a compare match value for negative-phase OFF (positive-phase ON) during up-counting. Transfer register, transfer value, and PWM output changes are controlled by operation section (where the value is written), state of comparison with the GTCCRA register, and write value.

Double buffer operation is guaranteed only in the up-counting middle section and down-counting middle section. Setting a value that is less than or equal to the dead time value, or greater than or equal to the count cycle, is prohibited.

In single buffer operation, a compare match value is written only to the GTCCRD register, and transfer register, transfer value, and PWM output changes are controlled by operation section (where the value is written), state of comparison with the GTCCRA register, and write value.
Transfer from the GTCCRD register to the temporary register A and transfer from the GTCCRF register to the temporary register B are performed in the same way as other complementary PWM modes. Transfers are concurrently performed in three channels by writing a value to the GPTWn+2.GTCCRD register. Transfer from the GTCCRD register to the GTCCRC register, GTCCRA register, temporary register B, and GTCCRE register and transfer from the GTCCRF register to the GTCCRE register and the GTCCRA register are performed at the same time as the above-mentioned transfer to the temporary register.
Table 24.17 and Table 24.18 show immediate buffer transfer (for transfer to the temporary register by writing a value to the GPTWn+2.GTCCRD register) to the GTCCRC and GTCCRA registers by writing a value to the GTCCRD register during single buffer operation in complementary PWM mode 4 for each compare match state in each operation section. Transfers (from the GTCCRD register to the temporary register A, from the temporary register A to the GTCCRC register, and from the GTCCRC register to the GTCCRA register) other than those shown in Table 24.17 and Table 24.18 are the same as single buffer transfer in complementary PWM mode 3 shown in Table 24.14.
Table 24.19 and Table 24.20 show immediate buffer transfer (for transfer to the temporary register by writing a value to the GPTWn+2.GTCCRD register) to each register by writing a value to the GTCCRD and GTCCRF registers during double buffer operation in complementary PWM mode 4 for each compare match state in each operation section. Transfers (from the GTCCRD register to the temporary register A, from the GTCCRF register to the temporary register B, from the temporary register A to the GTCCRC register, from the temporary register B to the GTCCRE register, and from the GTCCRC and GTCCRE registers to the GTCCRA register) other than those shown in Table 24.19 and Table 24.20 are the same as double buffer transfer in complementary PWM mode 3 shown in Table 24.15.

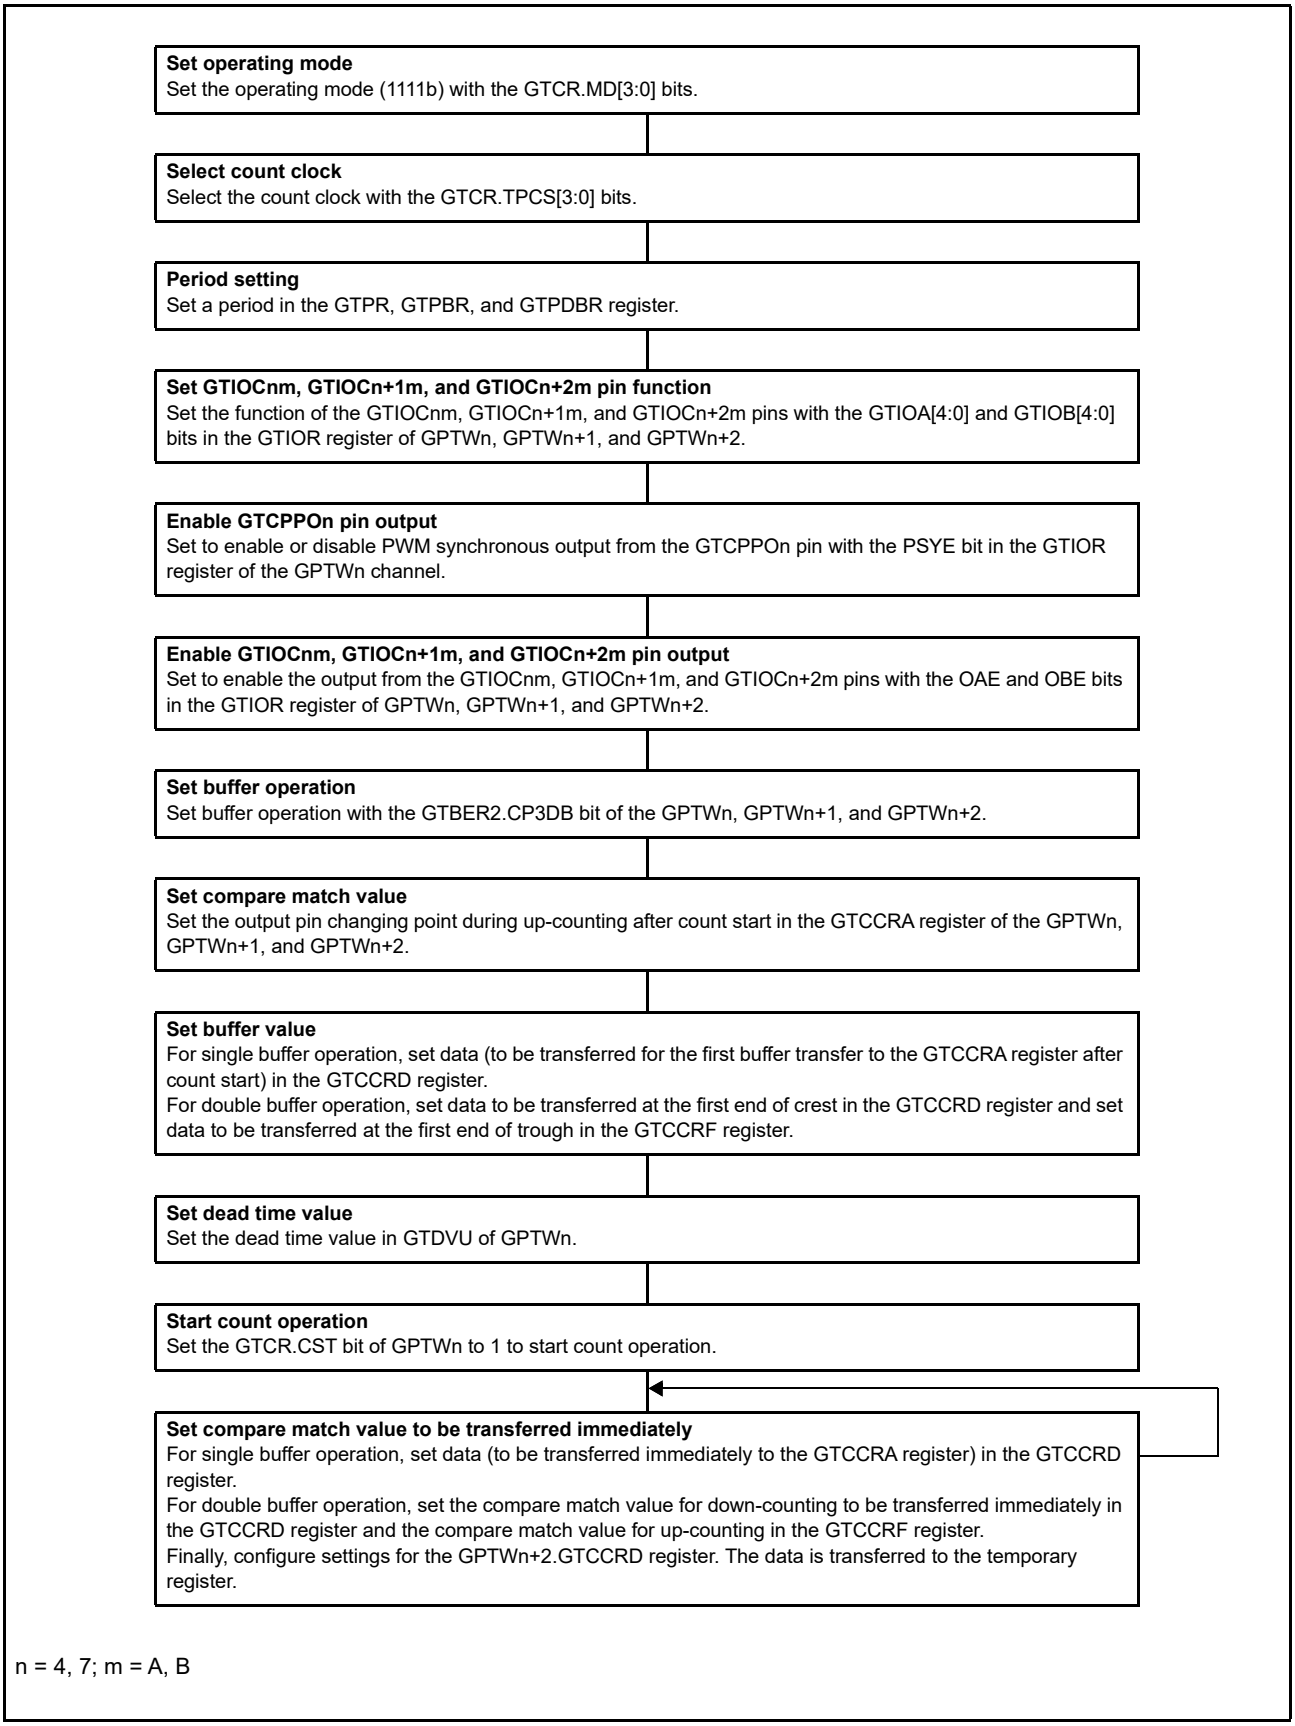

Figure 24.100 Example for Setting Complementary PWM Mode 4

24.3.4 Automatic Dead Time Setting Function

By setting the GTDTCR register, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (the GTCCRA register value) and specified dead time values (the GTDVU and GTDVD registers values) can automatically be set to the GTCCRB register.
The automatic dead time setting function can be used in sawtooth-wave one-shot pulse mode and all the triangle PWM modes.
Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in the GTDVU register and that in the second half is set in the GTDVD register. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.
The GTDBU register can be used as a buffer register of the GTDVU register, and the GTDBD register can be used as a buffer register of the GTDVD register. Buffer transfer is performed at the end of the cycle (in sawtooth-wave mode: either of an overflow of the GTCNT counter (up-counting), an underflow (down-counting), or the GTCNT counter clearing; in triangle-wave mode: a trough).
The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to the GTCCRB register is prohibited when the automatic dead time setting function is used.

Do not set the dead-time that makes the change point of the waveform exceeding the count period. When any dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in Table 24.21. The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to judge the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.
If the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.
If dead-time exceeds the count period by setting 0000 0000h or a value greater than or equal to the setting value of the GTPR register is set in the GTCCRA register in triangle-wave PWM mode, output change is controlled by the output protection function (refer to section 24.8.4, Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)). When GTCCRA register is greater than or equal to [GTPR register + GTDVm register], [GTPR register – 1] is set in the GTCCRB register as the upper limit. (m = U, D)
Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it also can be done at the next count clock from the current crest.

Table 24.21 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs

PWM Output Operating Mode	Count Direction	Period	Condition for Dead-Time Error	Change Point of the Positive-Phase Waveform after Adjustment	Change Point of the Negative-Phase Waveform after Adjustment
Sawtooth-wave one-shot pulse mode	Up-counting	First half	GTCCRA – GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVD > GTPR (GTCCRA + GTDVU > GTPR)*1	GTPR – GTDVD (GTPR – GTDVU)*1	GTPR
	Down-counting	First half	GTCCRA + GTDVU > GTPR	GTPR – GTDVU	GTPR
		Second half	GTCCRA – GTDVD < 0 (GTCCRA – GTDVU < 0)*1	GTDVD (GTDVU)*1	0
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	GTCCRA – GTDVU≤0	GTDVU + 1	1
	Down-counting	(Second half)	GTCCRA – GTDVD < 0 (GTCCRA – GTDVU < 0)*1	GTDVD (GTDVU)*1	0

Note 1. In the case of GTDTCR.TDFER = 1.

Figure 24.101 to Figure 24.104 show examples of automatic dead time setting function operation. Figure 24.105 and Figure 24.106 show the setting examples.

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.106 Example for Setting Automatic Dead Time Setting Function (Triangle-Wave PWM Mode 1 or 2)

24.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the GTUDDTYC.UD bit.
In sawtooth-wave mode, if the UD bit is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the UD bit is modified while count operation is stopped and the GTUDDTYC.UDF bit is 0, the UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while count operation is stopped, the UD bit value at that time is reflected at the start of counting.
In triangle-wave mode, changing the value of the GTUDDTYC.UD bit during counting does not switch the direction of counting. Likewise, changing the value of the GTUDDTYC.UD bit while the GTUDDTYC.UDF bit is 0 and counting is stopped does not actually update the value of the bit. If 1 is written to the GTUDDTYC.UDF bit while counting is stopped, the value of the GTUDDTYC.UD bit at that time is reflected from the time counting is started.
When counting direction is switched during count operation in sawtooth-wave mode, the value of the GTPR register after start of up-counting is reflected to the count period in up-counting operation, and the value of the GTPR register after the start of down-counting is reflected to the count period in down-counting operation.
Figure 24.107 shows an example of count direction changing function operation.

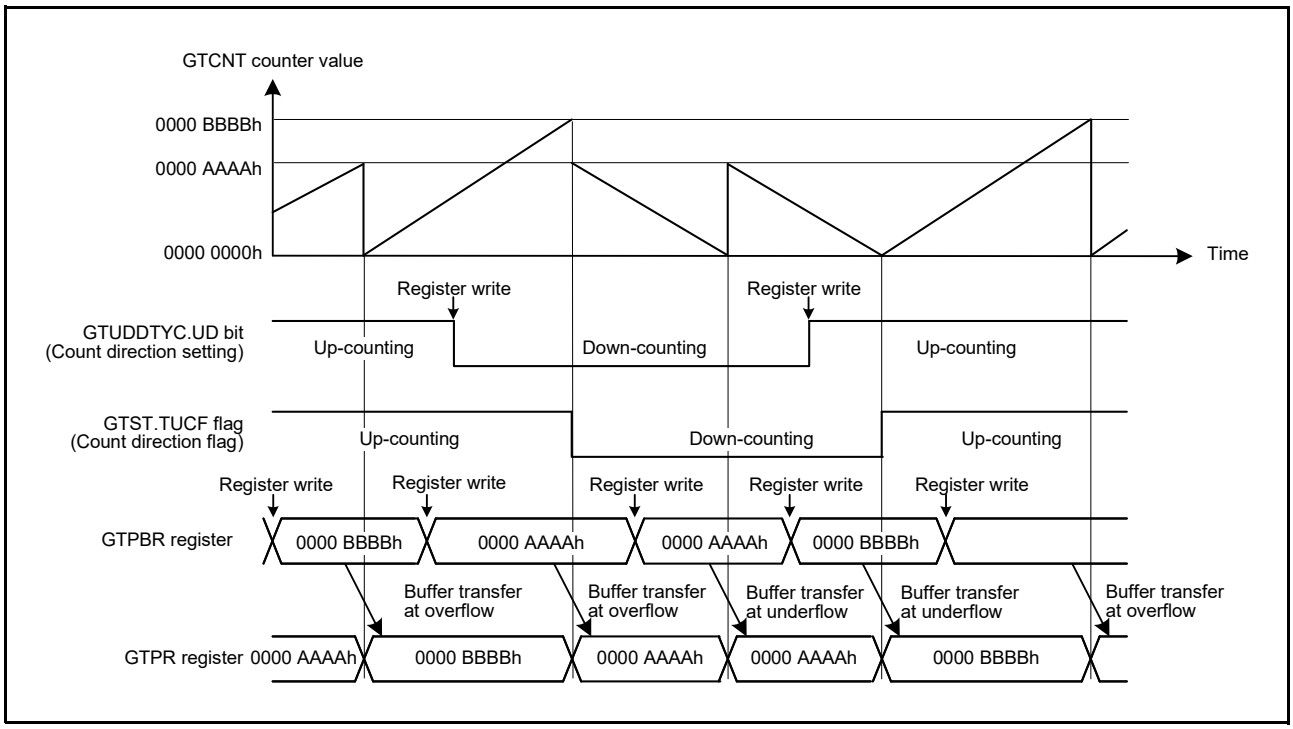

Figure 24.107 Example of Count Direction Changing Function Operation (during Buffer Operation)

24.3.6 Duty Cycle 0%/100% Output Function

Changing the value of the GTUDDTYC.OADTY[1:0] bits and GTUDDTYC.OBDTY[1:0] bits specifies the output duty setting on the GTIOCnA and GTIOCnB pins to 0% or 100%. (n = 0 to 15)

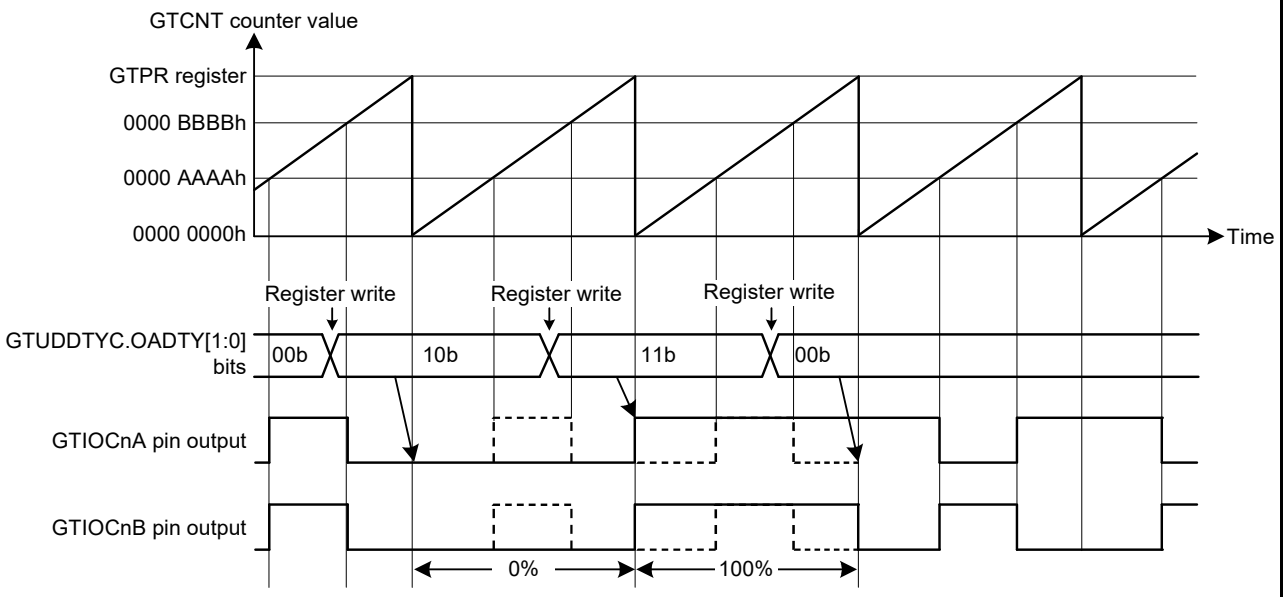
This function is invalid in sawtooth-wave PWM mode 2 or complementary PWM mode. For complementary PWM mode, 0%/100% duty output is possible regardless of the setting of the OADTY[1:0] bits or OBDTY[1:0] bits.

In sawtooth-wave mode, if the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed during the count operation, the output duty-cycle setting is reflected at an overflow (when changed during up-counting) or an underflow (when changed during down-counting). When the GTUDDTYC.OADTYF bit or GTUDDTYC.OBDTYF bit is 0 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the updated output duty-cycle setting is not applied at the count start, but it is applied at an overflow or underflow. When the OADTYF bit or OBDTYF bit is 1 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the value of the OADTY[1:0] bits or OBDTY[1:0] bits at that time is reflected at the start of counting.

In triangle-wave mode, if the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed during count operation, the updated output duty-cycle setting is applied at an underflow when the GTUDDTYC.OABDTYT bit is set to 0. When the GTUDDTYC.OABDTYT bit is set to 1, the updated output duty-cycle setting is applied at an underflow or at the top of the triangle-wave.

When the OADTYF bit or OBDTYF bit is 0 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the updated output duty-cycle setting is not applied at the start of counting, but is applied at an underflow. When the OADTYF bit or OBDTYF bit is 1 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the updated output duty-cycle setting is applied from the start of counting.

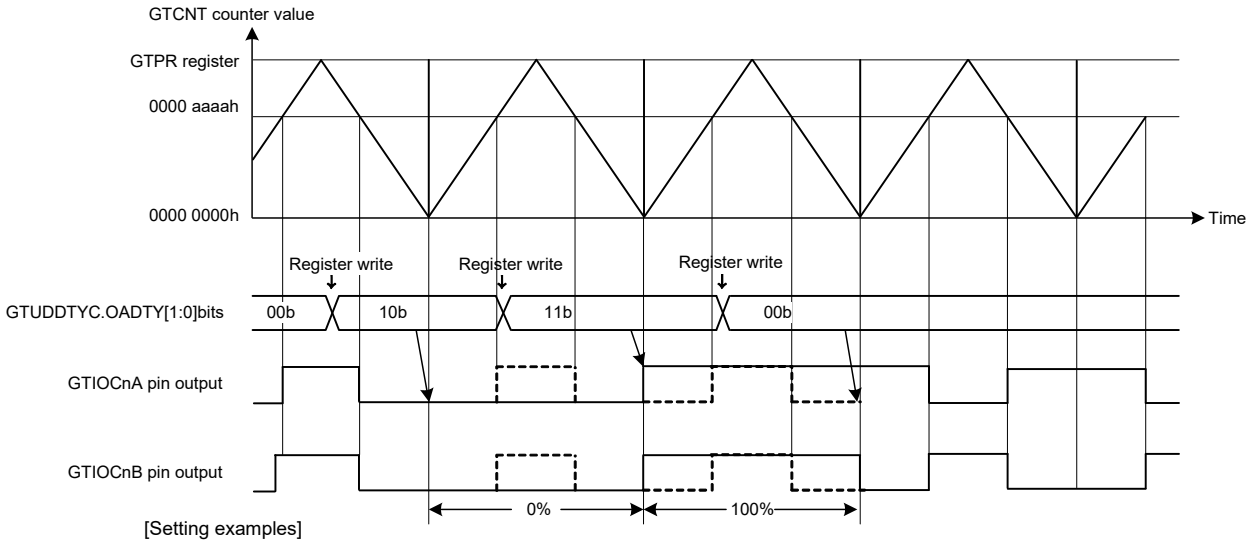
During the operation under the settings of duty cycle for 0%/100%, compare match operation inside the GPTW continues to perform interrupt outputs and buffer operations.



When the output duty setting is changed from 0% or 100% to a compare match, the GTIOR.GTIOA[3:2] bits and the OADTYR bits determine the level output on the GTIOCnA pin and GTIOR.GTIOB[3:2] bits and OBDTYR bits determine the level output on the GTIOCnB pin at the end of the cycle. When the GTIOA[3:2], GTIOB[3:2] bits are set as 01b, output is driven Low at the end of the cycle, and when set as 10b, output is driven High at the end of the cycle. The output is retained at the end of the cycles when the GTIOA[3:2] or GTIOB[3:2] bits are 00b, and toggled at the end of the cycles when the GTIOA[3:2] or GTIOB[3:2] bits are 11b. A value to be output is selectable in the OADTYR or OBDTYR bit when the corresponding GTIOA[3:2] or GTIOB[3:2] bits are either 00b or 11b. Table 24.22 lists the output values at the end of the cycle when the output setting is changed from duty 0% or 100% to compare match.

Table 24.22 Output Value after Release of Duty 0%/100%

GTIOR.GTIOm[3:2]	Value at Compare Match Output at the End of the Cycle in the Case of Masking by a Duty Cycle 0% or 100%	The GTUDDTYC.OmDTYR Bit at Duty 0% Setting		The GTUDDTYC.OmDTYR Bit at Duty 100% Setting	
		0	1	0	1
00b (Output retained at the end of the cycle)	Low	0	0	1	0
	High	0	1	1	1
01b (Low output at the end of the cycle)	—	0	0	0	0
10b (High output at the end of the cycle)	—	1	1	1	1
11b (Toggle output at the end of the cycle)	Low	1	1	0	1
	High	1	0	0	0



m = A, B

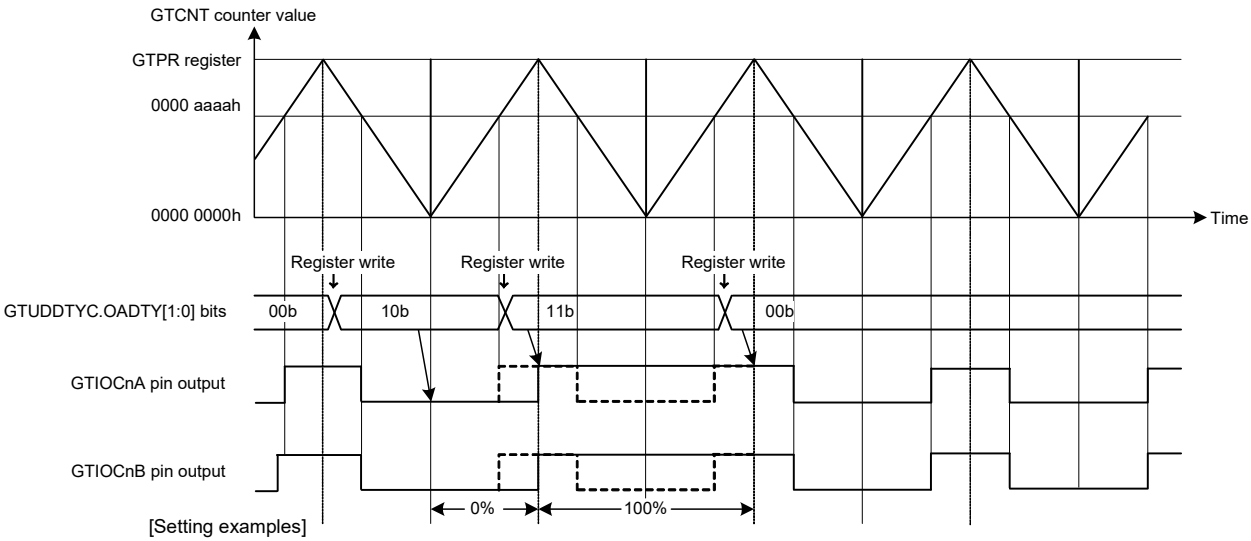
Figure 24.108 to Figure 24.110 shows an example of operation of the output of the duty cycle 0% or 100% (n = 0 to 15).

[Setting examples]
GTIOR.GTIOA[4:0] bits: 00011b
The initial output is Low, the output is toggled on a compare match, and the output is maintained at the end of the period.
GTUDDTYC.OADTYR bit: 0
The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.
GTIOR.GTIOB[4:0] bits: 00011b
The initial output is Low, the output is toggled on a compare match, and the output is maintained at the end of the period.
GTUDDTYC.OBDTYR bit: 1
The function of the GTIOB[3:2] bits is applied to the compare match output value which is masked after 0 or 100% duty setting release.

Figure 24.108 Example of Operation of Output of Duty Cycle 0% or 100% (n = 0 to 15)

[Setting examples]

GTIOR.GTIOA[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.



GTUDDTYC.OADTYR bit: 0
The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.

GTIOR.GTIOB[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.

GTUDDTYC.OBDTYR bit: 1
The function of the GTIOB[3:2] bits is applied to the compare match output value which is masked after 0 or 100% duty setting release.

GTUDDTYC.OABDTYT bit: 0
The activation timing of 0 or 100% duty setting is set to the trough.

Figure 24.109 Example of Operation of Output of Duty Cycle 0% or 100% (Activate at Trough) in Triangle-Wave PWM Mode 1 (n = 0 to 15)

[Setting examples]

GTIOR.GTIOA[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.

GTUDDTYC.OADTYR bit: 0
The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.

GTIOR.GTIOB[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.

GTUDDTYC.OBDTYR bit: 1
The function of the GTIOB[3:2] bits is applied to the compare match output value which is masked after 0 or 100% duty setting release.

GTUDDTYC.OABDTYT bit: 1
The activation timing of 0 or 100% duty setting is set to the trough and crest.

Figure 24.110 Example of Operation of Output of Duty Cycle 0% or 100% (Activate at Trough, Crest) in Triangle-Wave PWM Mode 1 (n = 0 to 15)

24.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by hardware sources in this MCU. There are 3 types of hardware sources, including external trigger input, ELC event input, and GTIOCnm pin input (n = 0 to 15; m = A, B)

24.3.7.1 Hardware Start Operation

The GTCNT counter can be started by a hardware source. Select a hardware source to start counting using the GTSSR register, and enable to start counting.
Figure 24.111 shows an example of count start operation by a hardware source. Figure 24.112 shows the setting example.

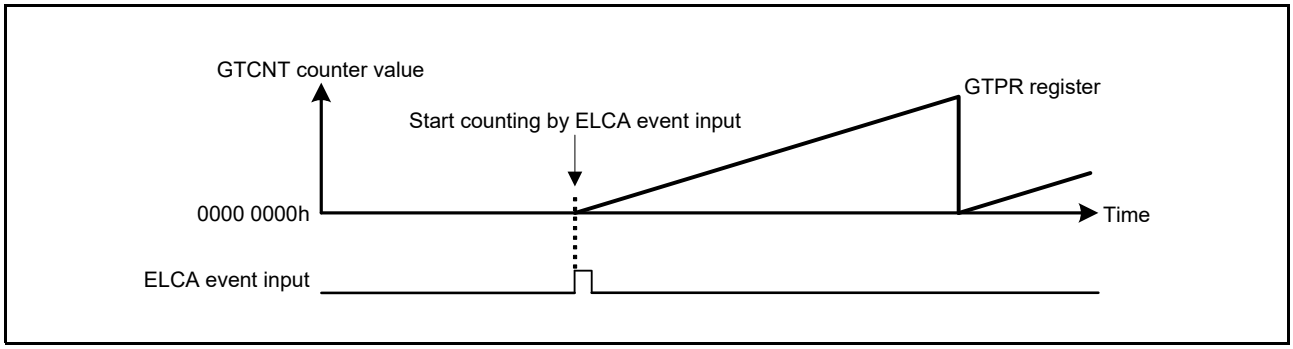


Figure 24.111 Example of Count Start Operation by Hardware Source (At starting by ELCA event)

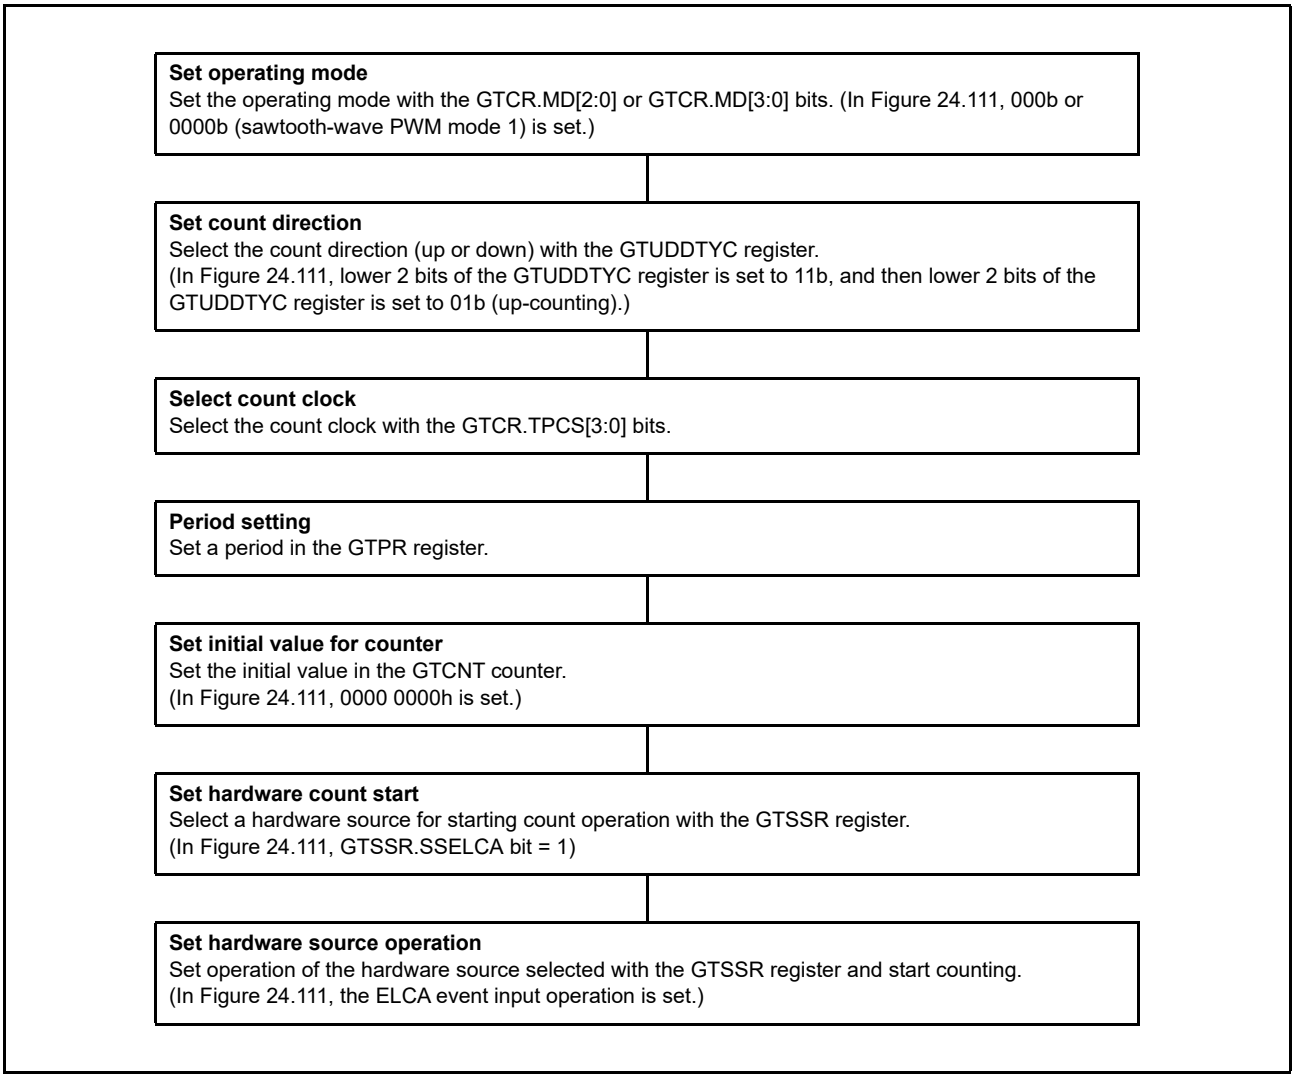

Figure 24.112 Example for Setting Count Start Operation by Hardware Source

Figure 24.113 shows an example of timing of operations to start counting in response to a rising edge of the input on the GTETRGA pin.

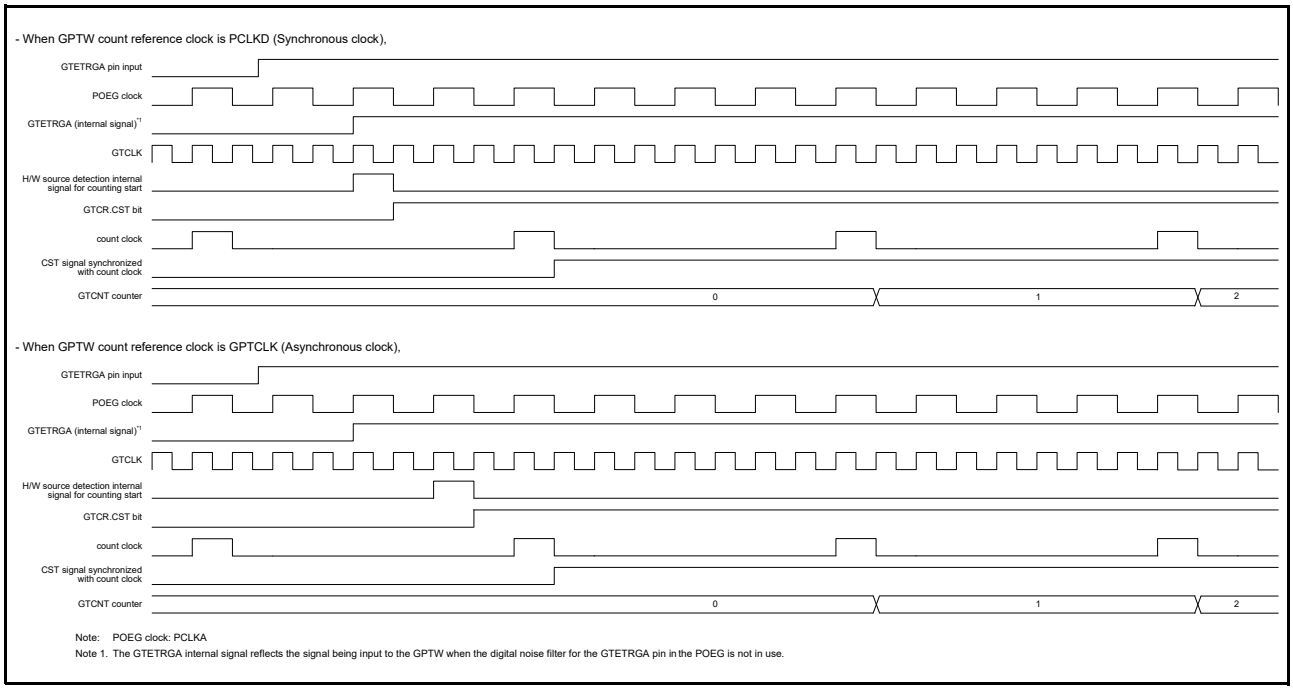

Figure 24.113 Example of Timing of Operations to Start Counting in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 24.114 shows an example of timing of operations to start counting in response to a rising edge of the input on the GTIOCnA pin.

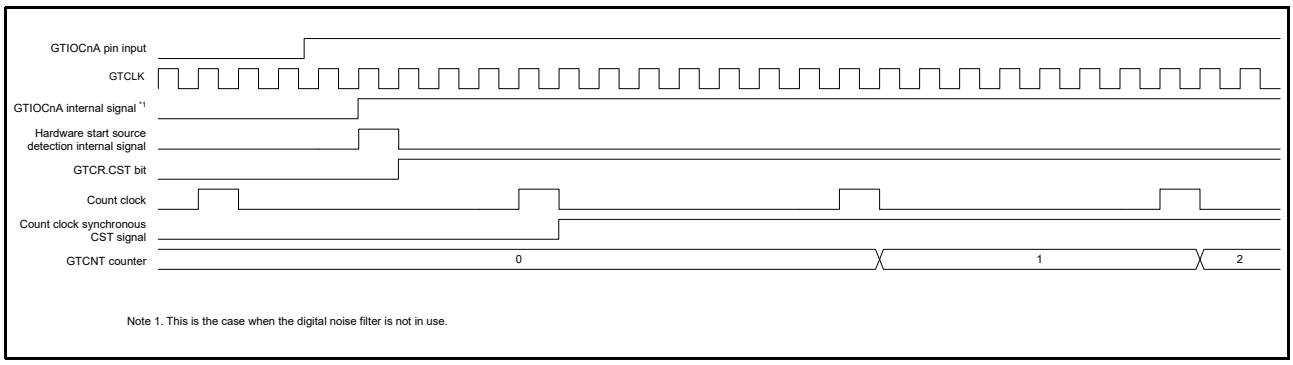

Figure 24.114 Example of Timing of Operations to Start Counting in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 24.115 shows an example of timing of operations to start counting in response to event input from the ELCA. This is an example of operations to start counting by the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A. The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed.

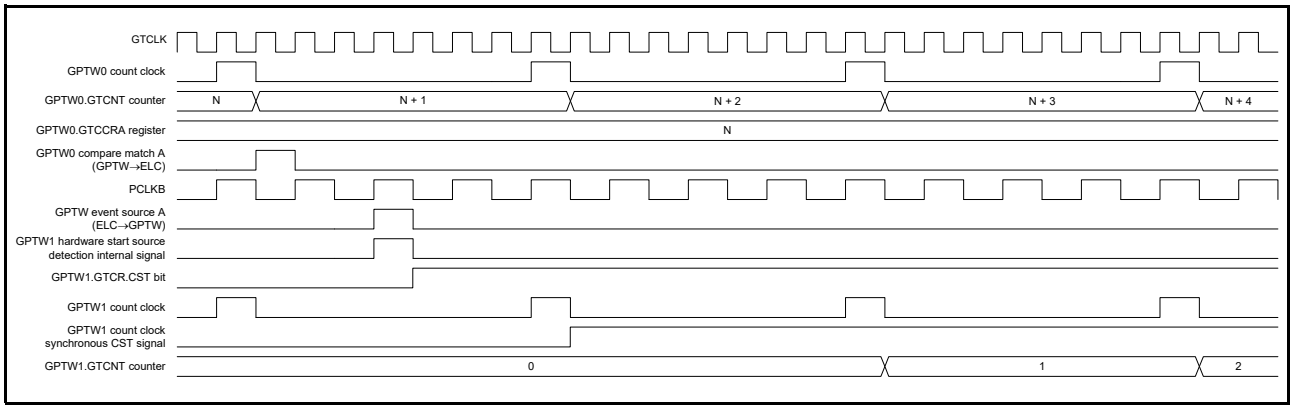

Figure 24.115 Example of Timing of Operations to Start Counting in Response to Event Input from the ELCA

24.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by a hardware source. Select a hardware source to stop counting with the GTPSR register, and enable to stop counting.

Figure 24.116 shows an example of count stop operation by a hardware source. Figure 24.117 shows the setting example. In this example, the count operation is stopped by the ELCA event input, and is restarted by the ELCB event input.

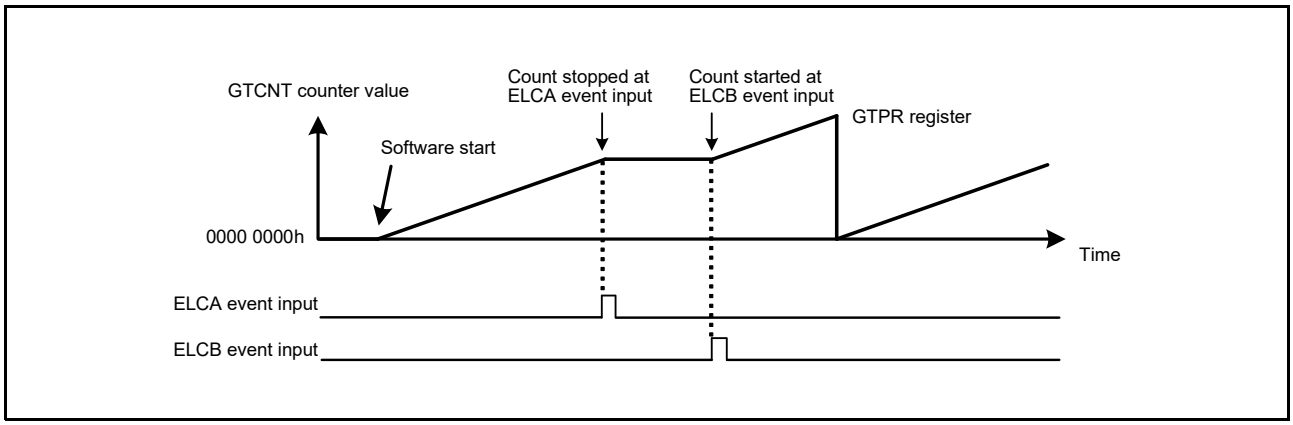

Figure 24.116 Example of Count Stop Operation by Hardware Source (Started by Software, Stopped at ELCA event input, and Restarted at ELCB event input)

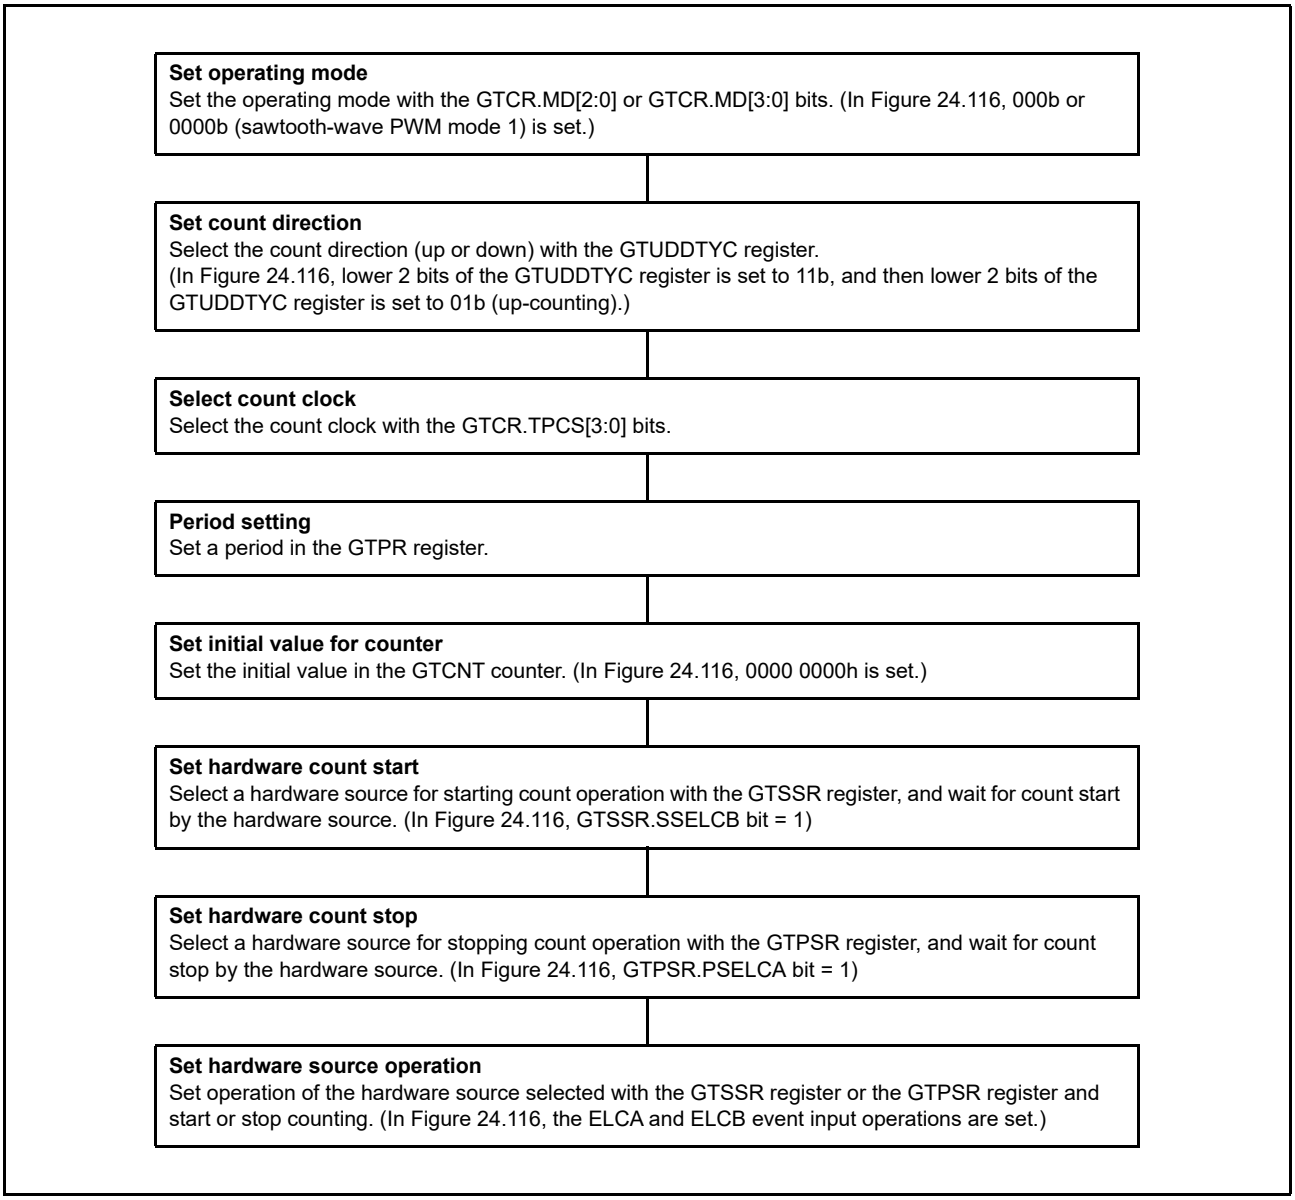

Figure 24.117 Example for Setting Count Stop Operation by Hardware Source

Figure 24.118 shows an example of count start/stop operation by a hardware source. Figure 24.119 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA pin.

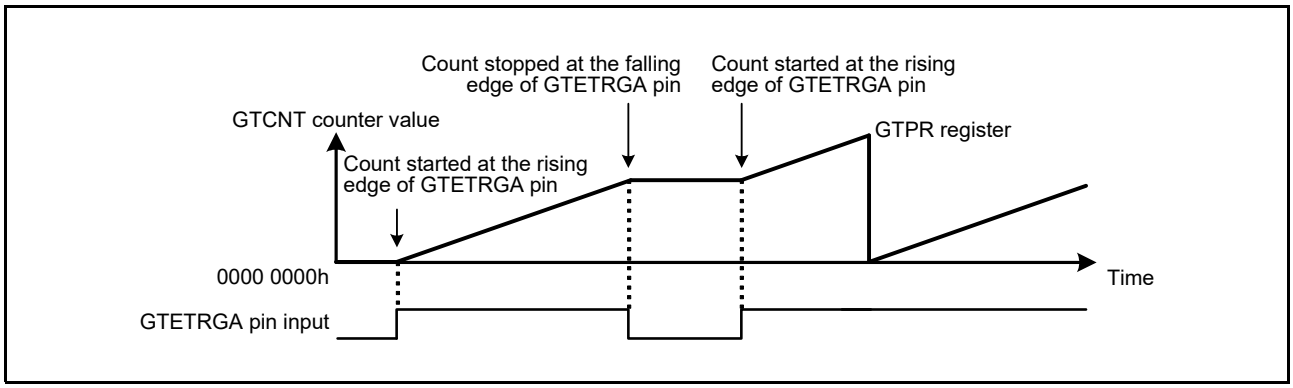

Figure 24.118 Example of Count Start/Stop Operation by Hardware Source (Started at Rising Edge of GTETRGA Pin Input, Stopped at Falling Edge of GTETRGA Pin Input)

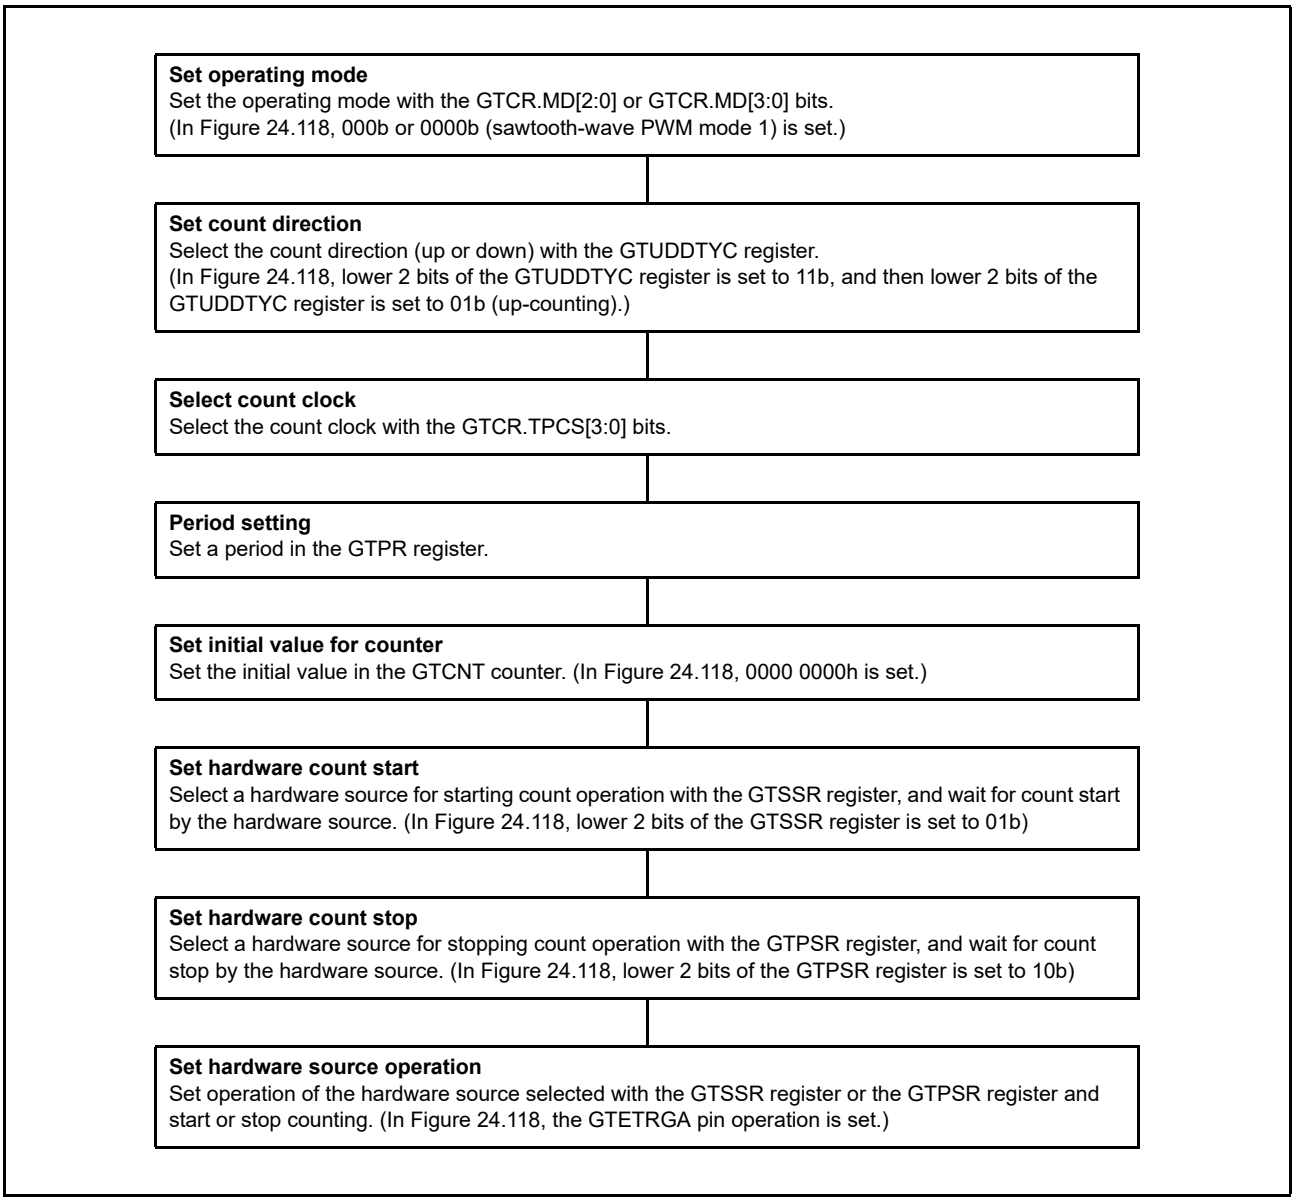

Figure 24.119 Example for Setting Count Start/Stop Operation by Hardware Source

Figure 24.120 shows an example of timing of operations to stop counting in response to a rising edge of the input on the GTETRGA pin.

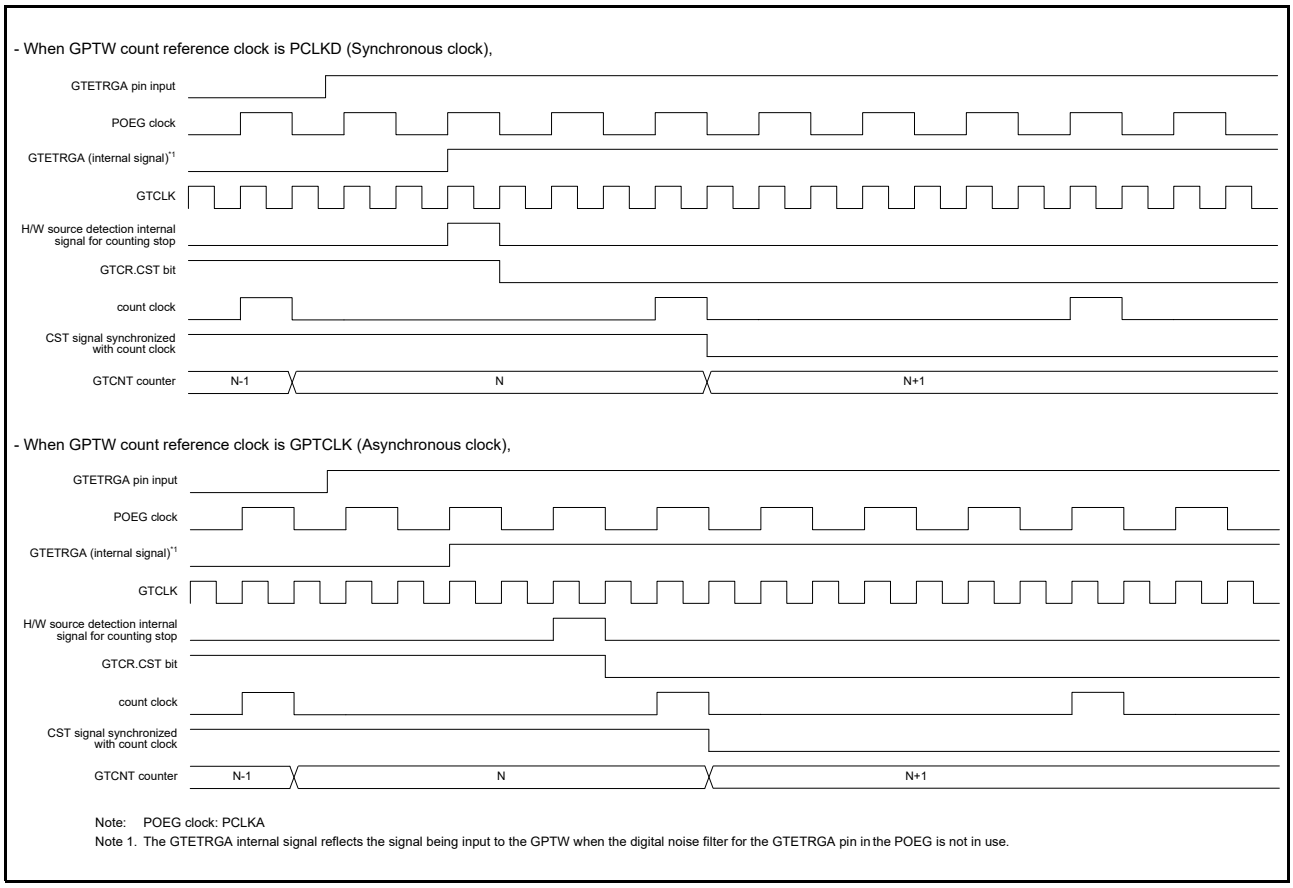

Figure 24.120 Example of Timing of Operations to Stop Counting in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 24.121 shows an example of timing of operations to stop counting in response to a rising edge of the input on the GTIOCnA pin.

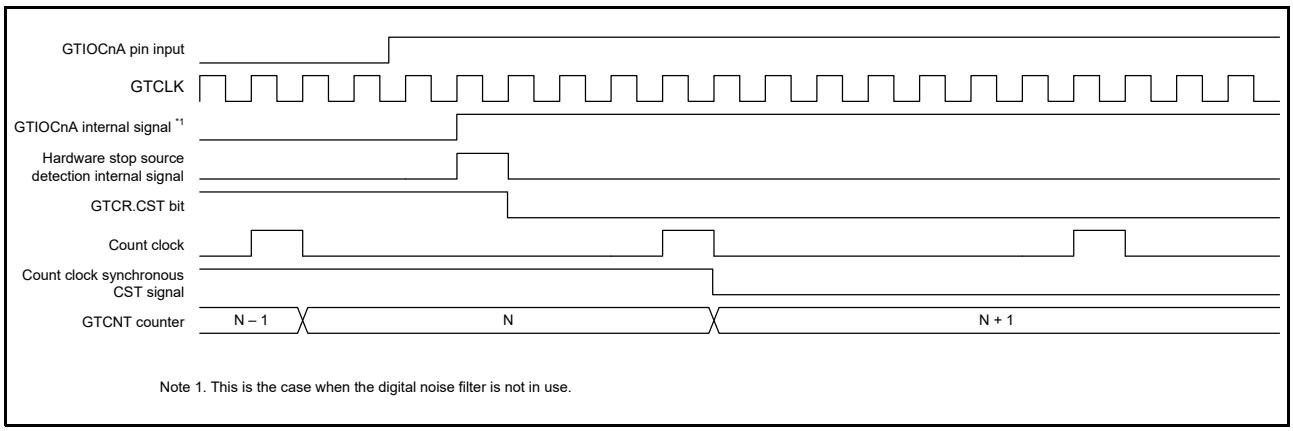

Figure 24.121 Example of Timing of Operations to Stop Counting in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 24.122 shows an example of timing of operations to stop counting in response to event input from the ELCA. This is an example of operations to stop counting by the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A. The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed.

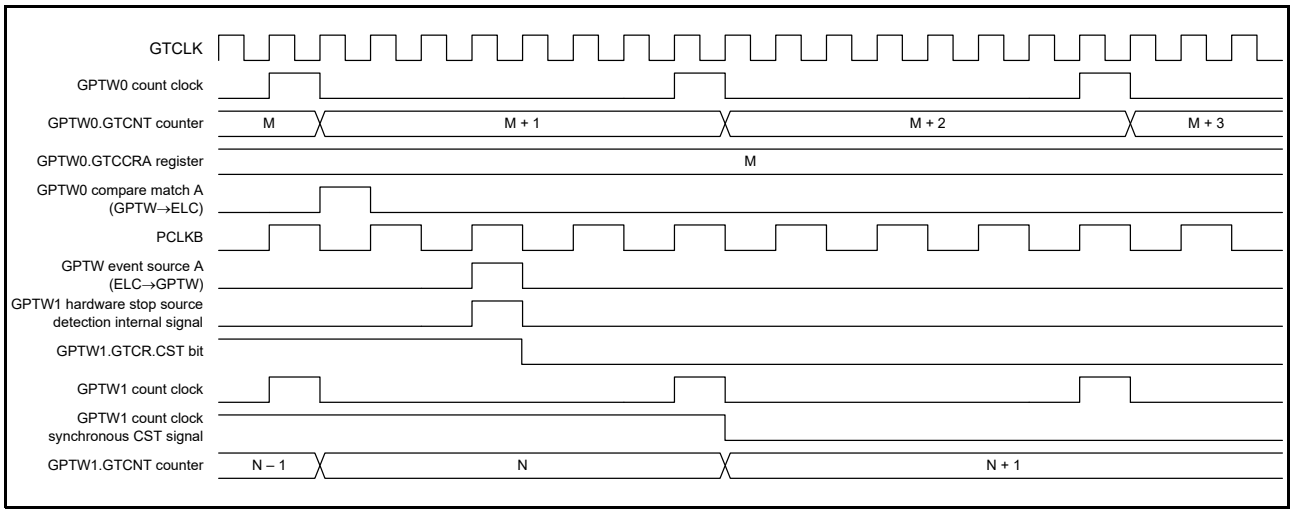

Figure 24.122 Example of Timing of Operations to Stop Counting in Response to Event Input from the ELCA

24.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by a hardware source. Select a hardware source to clear the counter with the GTCSR register, and enable clearing the counter.

Note that the GTCIV/GTCIU interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 24.123 and Figure 24.124 show examples of the GTCNT counter clearing operation by a hardware source. Figure 24.125 shows the setting example. In this example, the GTCNT counter is started at the ELCA event input, and is stopped/cleared at the ELCB event input.

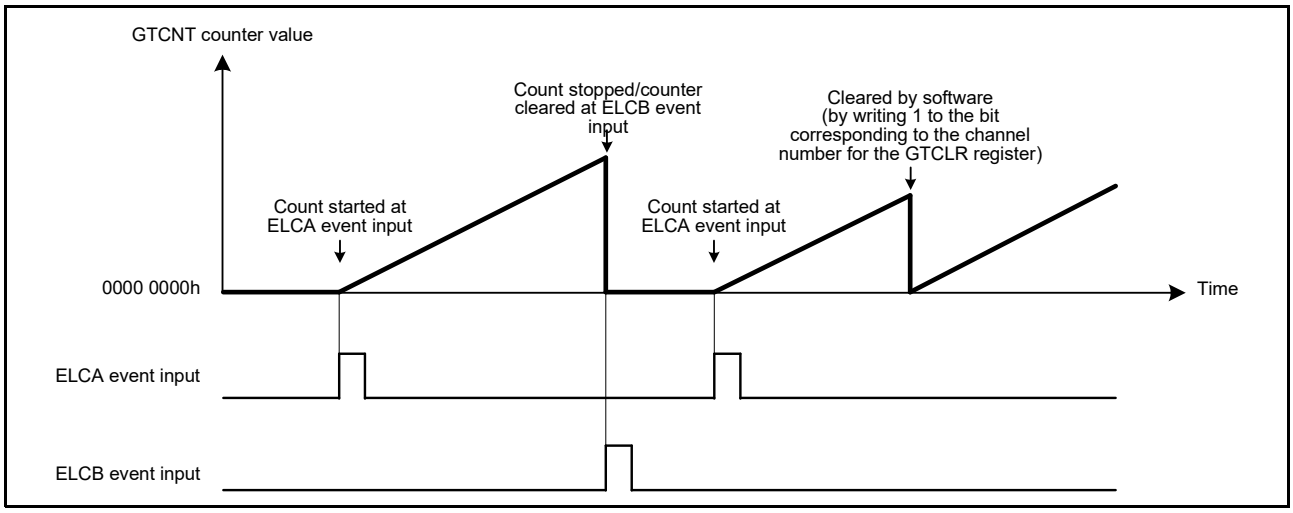

Figure 24.123 Examples of Counter Clearing Operation by Hardware Source (Sawtooth-Wave Up-Counting, Started at ELCA event input, and Count Stopped/Counter Cleared at ELCB event input)

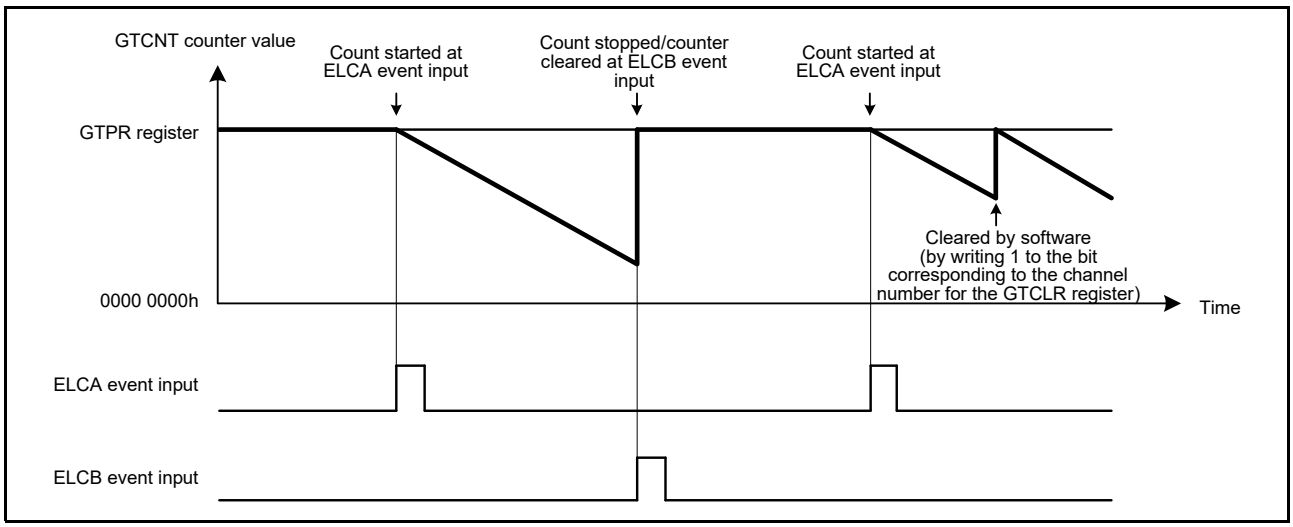

Figure 24.124 Examples of Counter Clearing Operation by Hardware Source (Sawtooth-Wave Down-Counting, Started at ELCA event input, and Count Stopped/Counter Cleared at ELCB event input)

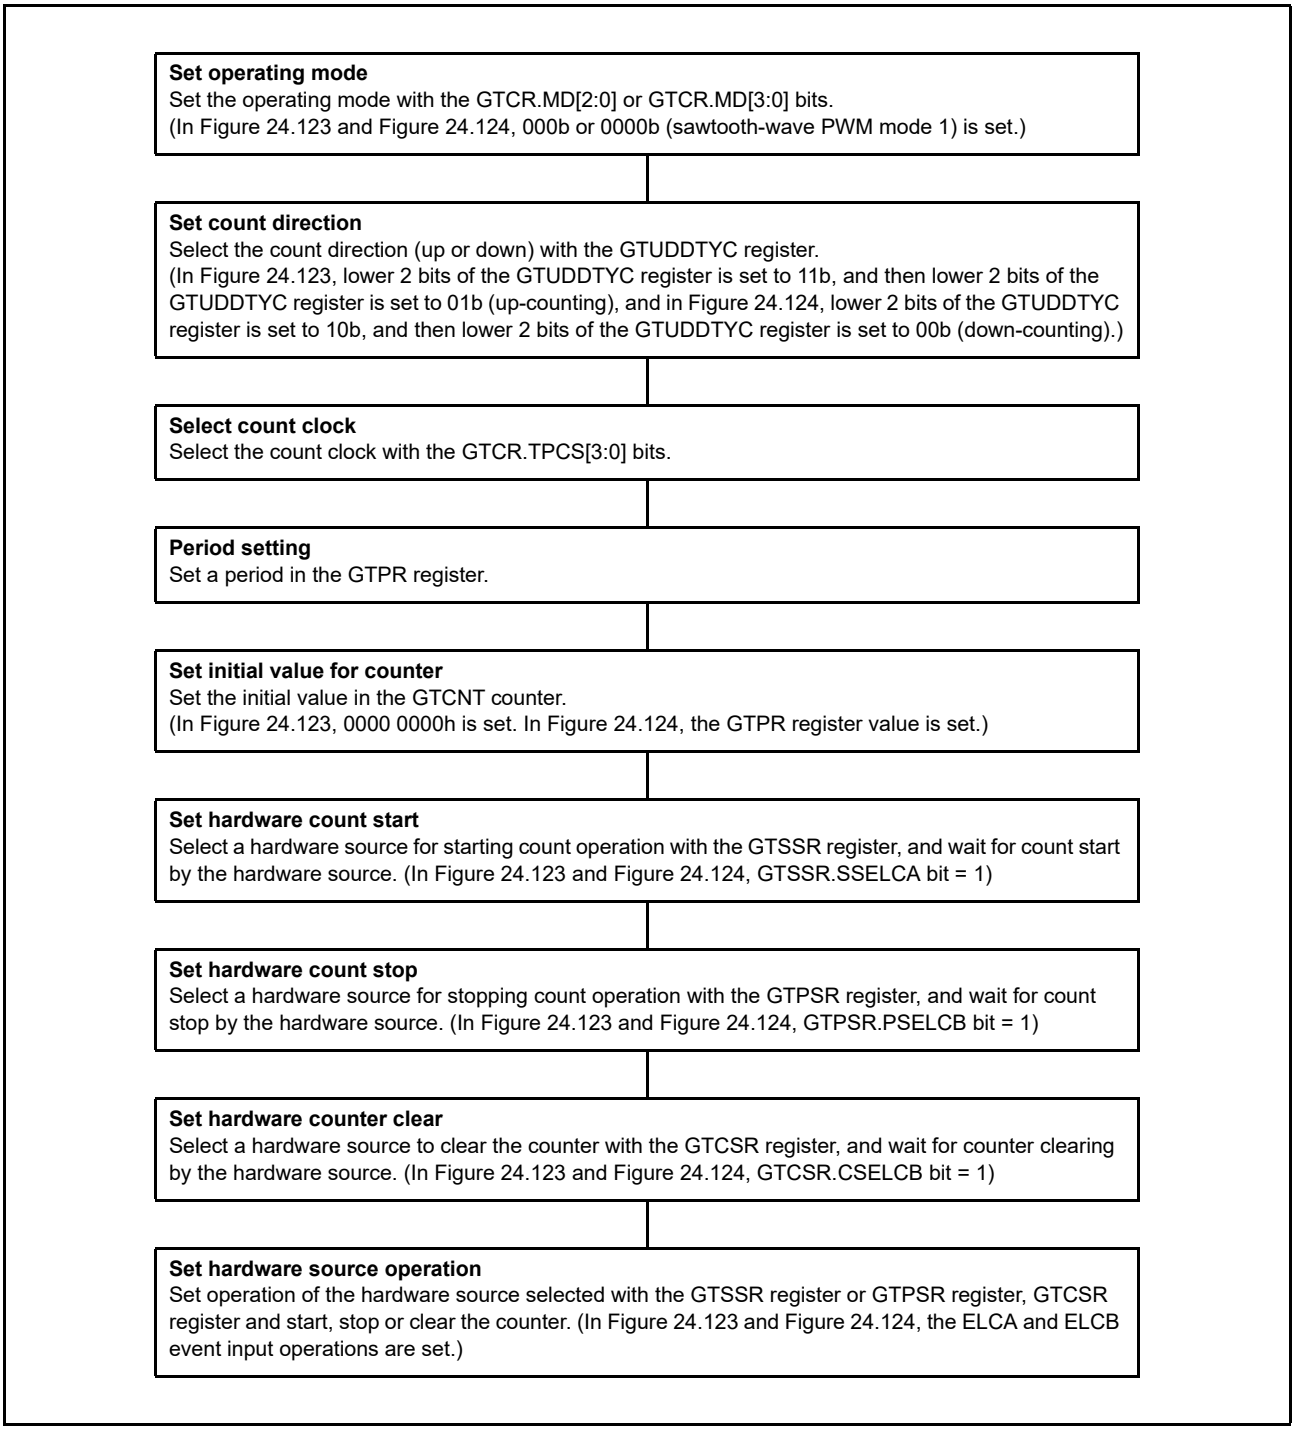

Figure 24.125 Example for Setting Counter Clearing Operation by Hardware Source

The GTCIV/GTCIU interrupt (overflow/underflow interrupt) does not occur when the counter is cleared by a hardware source. In the same way, the GTCIV/GTCIU interrupt does not occur when the counter is cleared by software.
Figure 24.126 shows the relationship between counter clearing by a hardware source and the GTCIV interrupt.

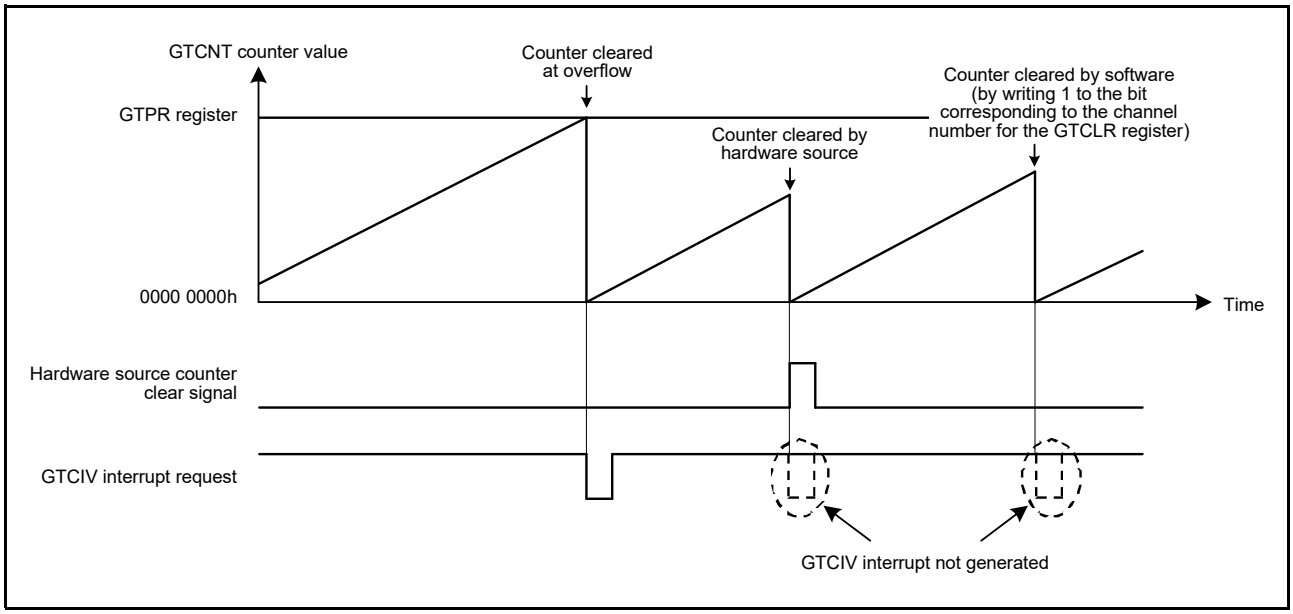

Figure 24.126 Relationship between Counter Clearing by Hardware Source and GTCIV Interrupt

Figure 24.127 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTETRGA pin when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.
The GTCNT counter is cleared at the next counting operation after the GPTW detects the internal clearing signal.

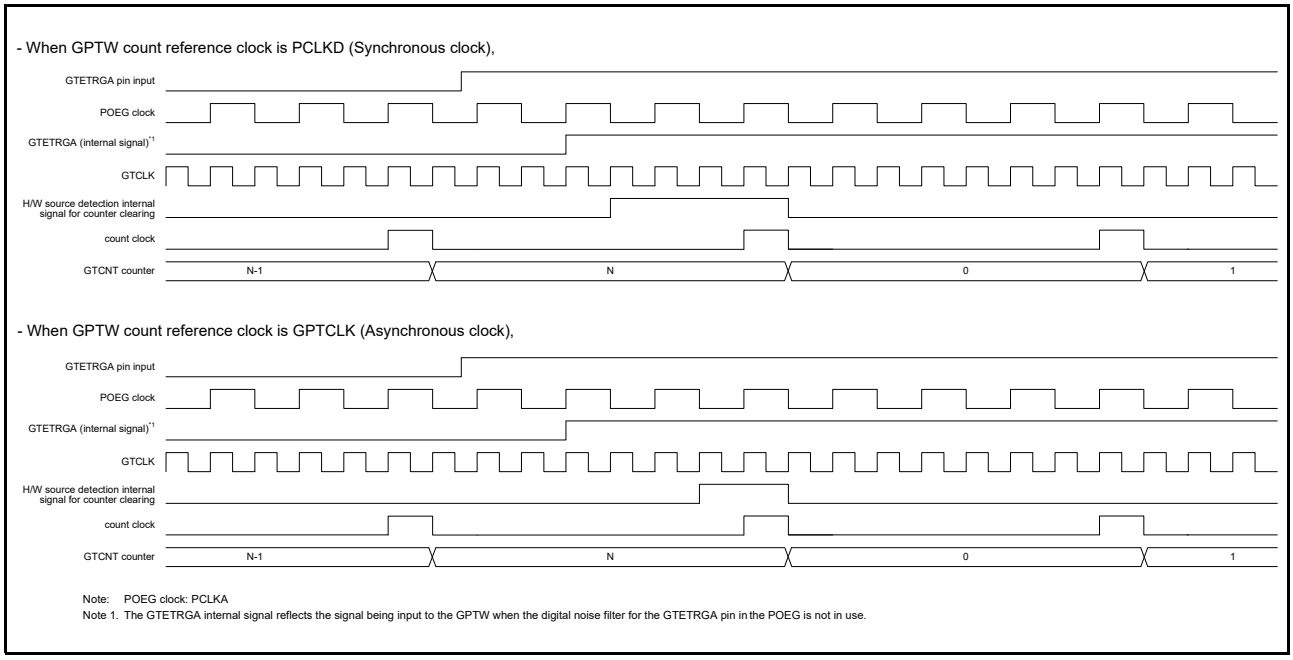

Figure 24.127 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTETRGA Pin (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 24.128 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTIOCnA pin when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.
The GTCNT counter is cleared at the next counting operation after the GPTW detects the internal clearing signal.

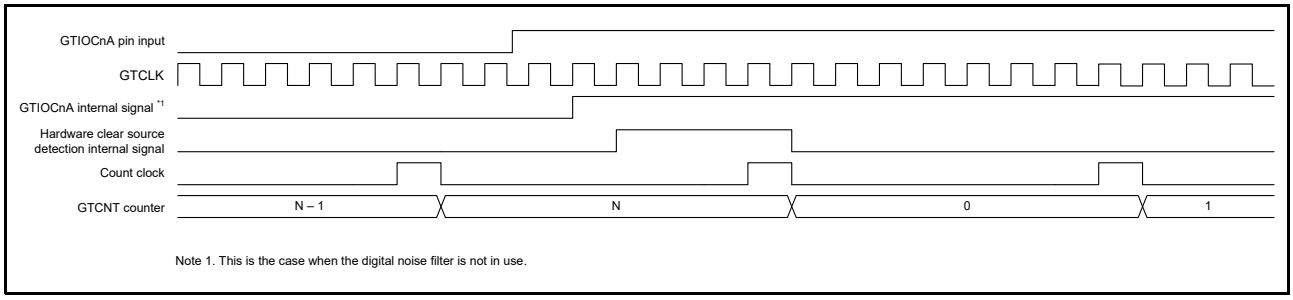

Figure 24.128 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTIOCnA Pin (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 24.129 shows an example of the timing of operations to clear the counter in response to event input from the ELCA when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.
This is an example of operations to clear the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A.
The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed. The GTCNT counter is cleared at the next counting operation after the GPTW detects the internal clearing signal.

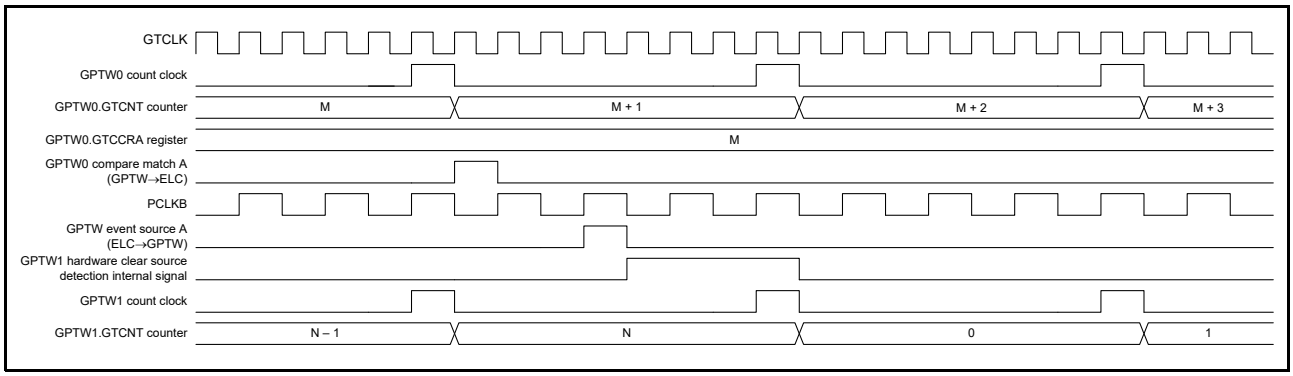

Figure 24.129 Example of the Timing of Operations for Counter Clearing in Response to Event Input from the ELCA (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 24.130 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTETRGA pin input when counting is triggered by a hardware source.
The GTCNT counter is cleared in synchronization with GTCLK after the GPTW has detected the internal clearing signal.

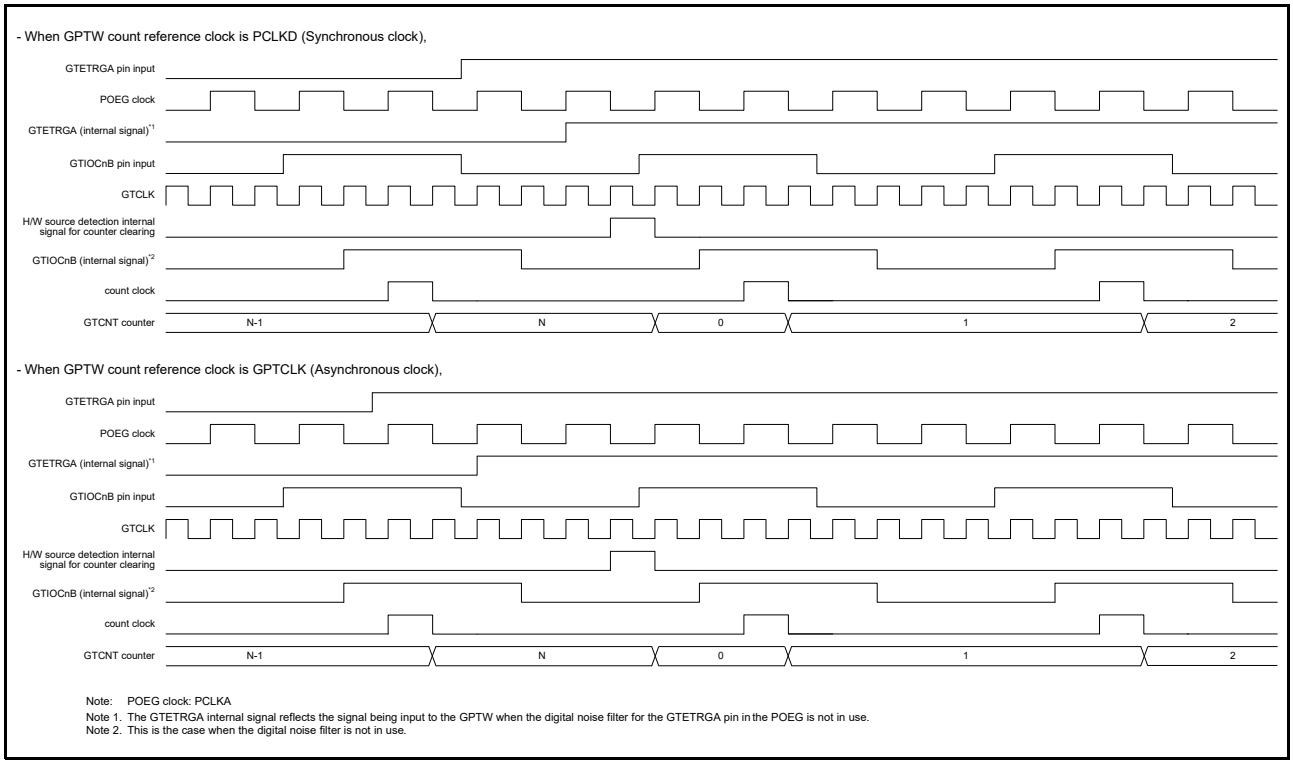

Figure 24.130 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTETRGA Pin (During Counting Triggered by Hardware Source)

Figure 24.131 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTIOCnA pin input when counting is triggered by a hardware source.
The GTCNT counter is cleared in synchronization with GTCLK after the GPTW has detected the internal clearing signal.

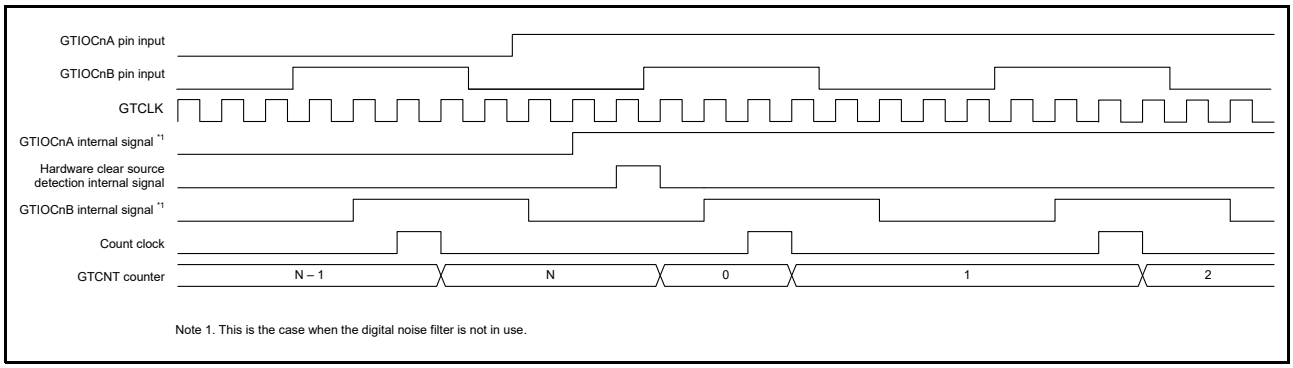

Figure 24.131 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTIOCnA Pin (During Counting Triggered by Hardware Source)

Figure 24.132 shows an example of the timing of operations for clearing the counter in response to the input of an event signal from the ELCA when counting is triggered by a hardware source.
This is an example of operations to clear the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A.
The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed. The GTCNT counter is cleared in synchronization with GTCLK after the GPTW has detected the internal clearing signal.

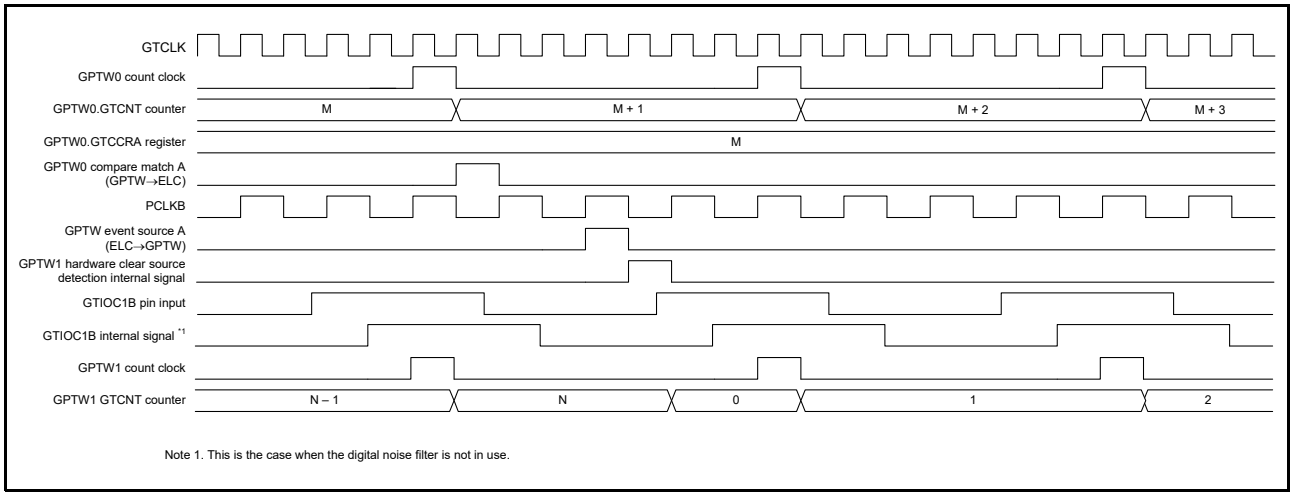

Figure 24.132 Example of the Timing of Operations for Counter Clearing in Response to Event Input from the ELCA (During Counting Triggered by Hardware Source)

24.3.8 Hardware Count Switch Operation

In the triangle-wave PWM mode, the GTCNT counter can be switched by a hardware source. Select the count switch operation with the GTCR.SWMD[2:0] bits and select a hardware source to switch the direction of counting with the GTSWSR register and enable to switch the direction of counting.

When the offset reload is enabled by the GTCR.SWMD[2:0] bits, the offset value of the GTCNT counter reloaded by count switch is set by the GTSWOS register in the range of 0 to GTPR.

If the count switch and counter clear occur at the same time, the counter clear has priority.

Figure 24.133 to Figure 24.136 show examples of the GTCNT count switch operation by a hardware source. Figure 24.137 shows the setting example. In this example, the GTCNT counter is started at the ELCA event input, is stopped/cleared at the ELCB event input, and is switched at the ELCC event input.

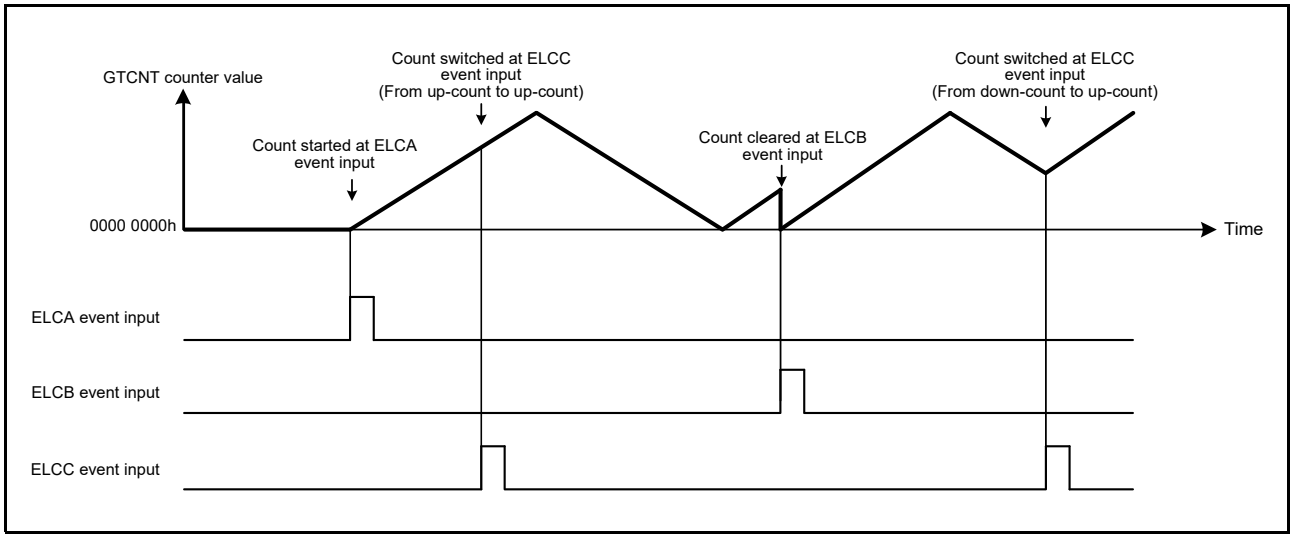

Figure 24.133 Examples of Count Switch Operation by Hardware Source (Switched to Up-count without Reload at ELCC Event Input)

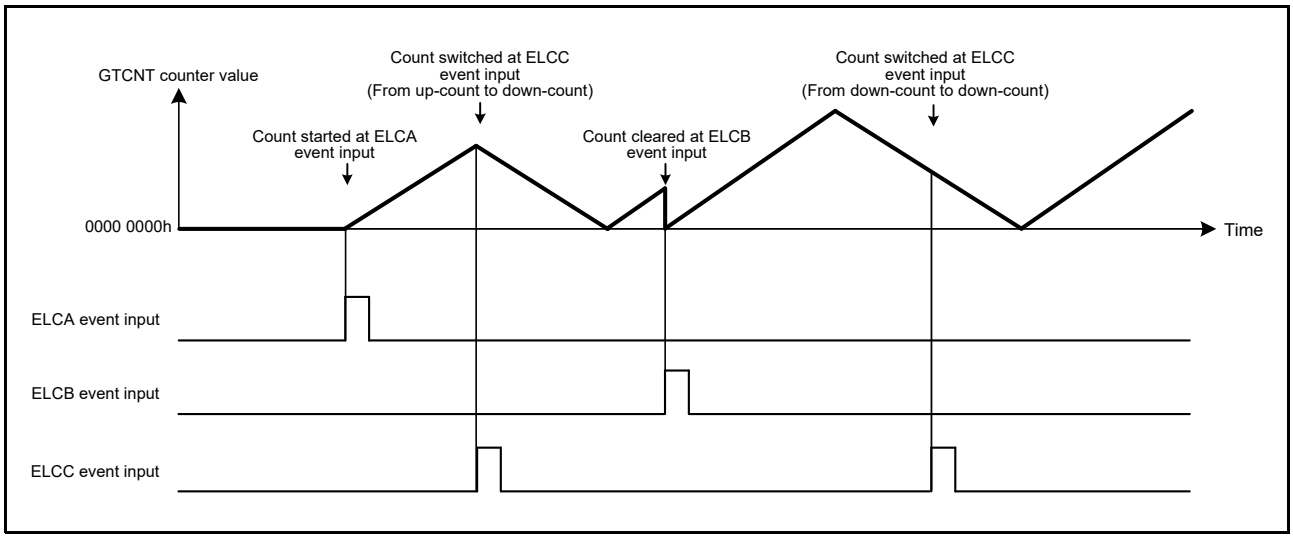

Figure 24.134 Examples of Count Switch Operation by Hardware Source (Switched to Down-count without Reload at ELCC Event Input)

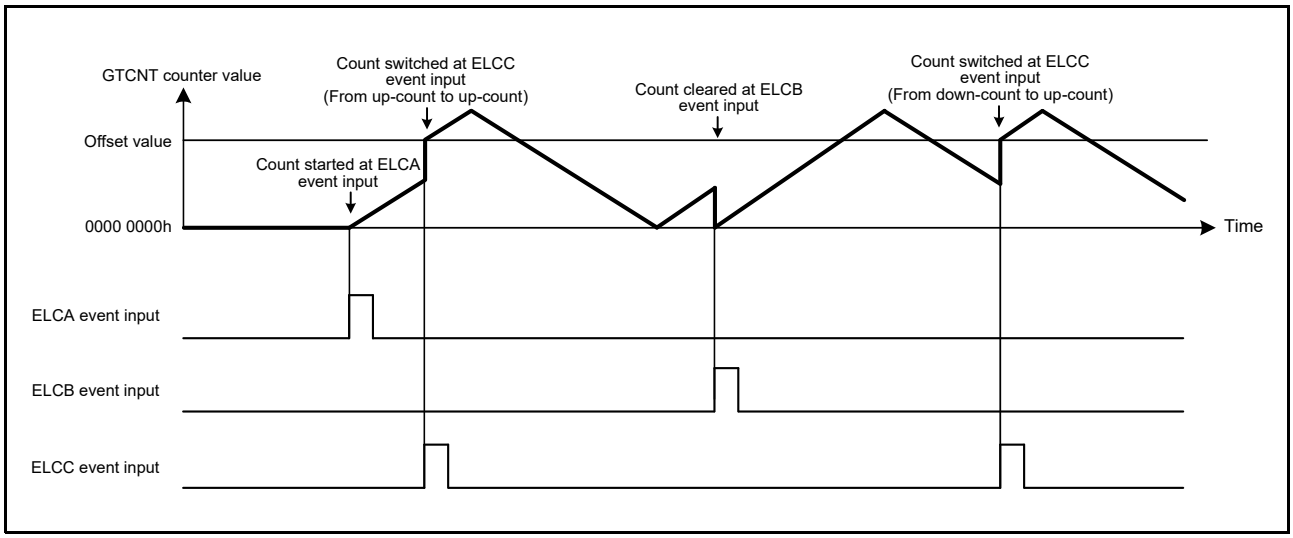

Figure 24.135 Examples of Count Switch Operation by Hardware Source (Switched to Up-count with Reload at ELCC Event Input)

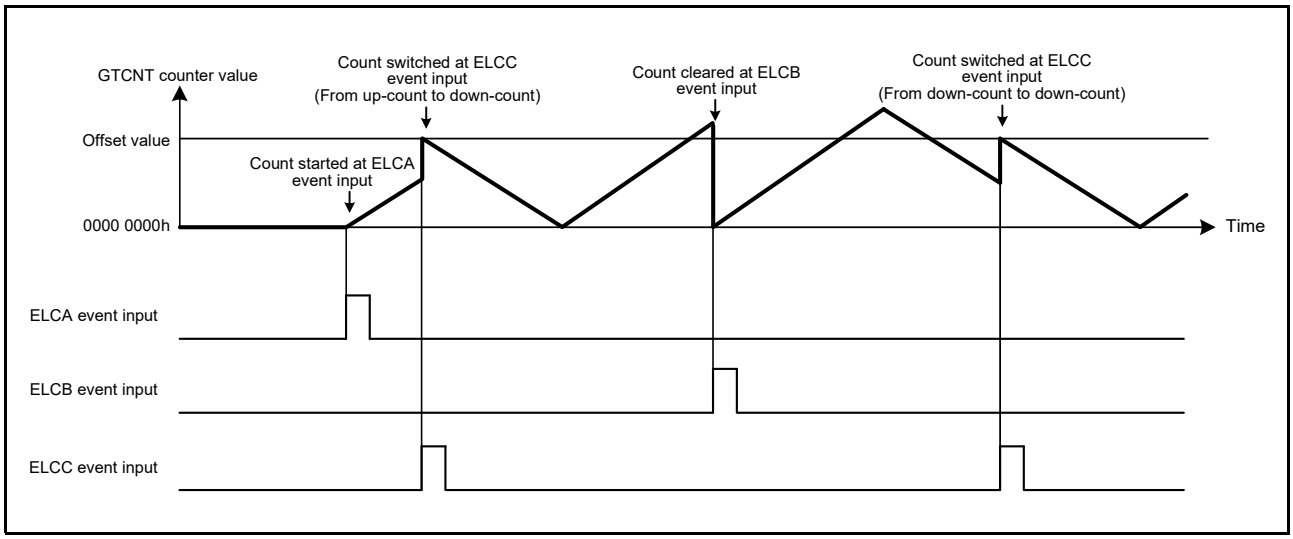

Figure 24.136 Examples of Count Switch Operation by Hardware Source (Switched to Down-count with Reload at ELCC Event Input)

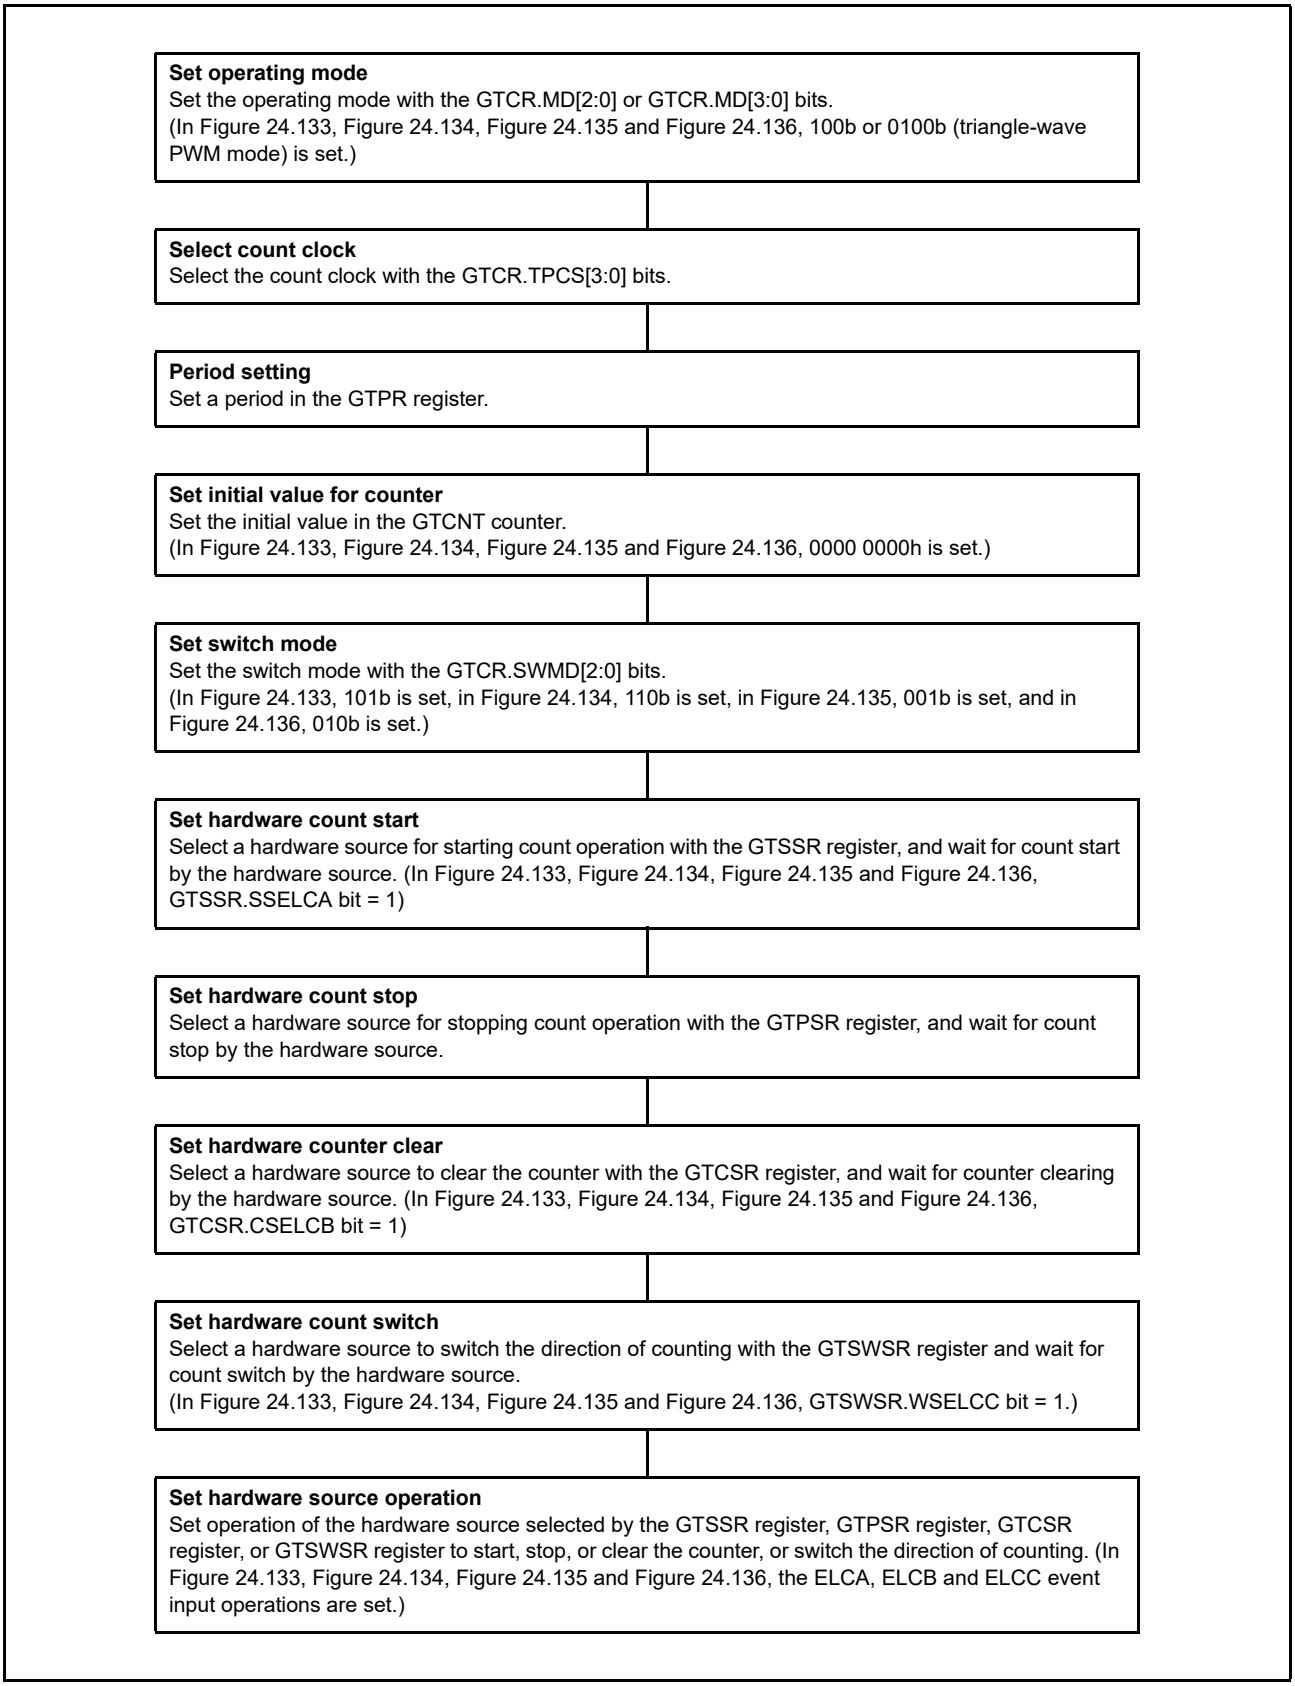

Figure 24.137 Example for Setting Count Switch Operation by Hardware Source

The compare match operation is effective even when the count switch and the compare match occur at the same time. Similarly, even when the count switch occurs at the crest (GTCNT counter matches GTPR register value during up-counting) or trough (GTCNT counter is 0 during down-counting) of triangle-waves, overflow or underflow interrupt is output and the buffer transfer of crest or trough works normally.
If the count switch is required at the crest or trough without the offset reload, the count switch is ignored, and the direction of counting changes to down-count or up-count after the crest or trough. Also, if the count switch is required at the count clear state (GTCNT counter value is 0 during up count) without the offset reload, the count switch is ignored, and the direction of counting continues up-count.
If the switch mode is set to “Switch to up-count with offset reload” with the GTCR.SWMD[2:0] bits and the offset is set to 0 with the GTSWOS register, the count switch works same as the counter clear and the GTCNT counter does not operate as the trough. Also, if the switch mode is set to “Switch to down-count with offset reload” and the offset is set to the GTPR value, the GTCNT counter does not operate as the crest. On the other hand, if the switch mode is set to “Switch to up-count with offset reload” and the offset is set to the GTPR value, the GTCNT counter operate as the crest, if the switch mode is set to “Switch to down-count with offset reload” and the offset is set to 0, the GTCNT counter operate as the trough, and in these cases, the interrupt outputs and the buffer transfers of the crest and the trough works normally. If the crest or the trough due to the count switch occurs at the timing when the GTCNT counter value is the crest or the trough, the buffer transfer and the interrupt output at the crest or trough will occur twice in a row. Table 24.23 shows the triangle-waves condition after the count switch with offset reload.

Table 24.23 The Triangle-Waves Condition After the Count Switch with Offset Reload

Count Direction of Switch Mode (GTCR.SWMD[2:0])	Offset (GTSWOS)	The Triangle-Waves Condition After the Count Switch			
		GTCNT	GTST.TUCF	Triangle-Waves Condition	Buffer Transfer/ Interrupt Output
Up-count	0	GTSWOS register value	1	Counter Clear (Start of Up-count)	Nothing
	1 to GTPR−1			Up-count	Nothing
	GTPR			Crest (End of Up-count)	Buffer Transfer available (Only Triangle-Wave PWM Mode 2)/ GTCIVn Output
Down-count	0		0	Trough (End of Down-count)	Buffer Transfer available/ GTCIUn Output
	1 to GTPR−1			Down-count	Nothing
	GTPR			Start of Down-count	Nothing

Figure 24.138 and Figure 24.139 show examples of the buffer operation due to the count switch when the offset is set to 0 and GTPR. Figure 24.140 shows an example of the buffer operation due to the count switch when the offset is set to values other than the crest and trough.

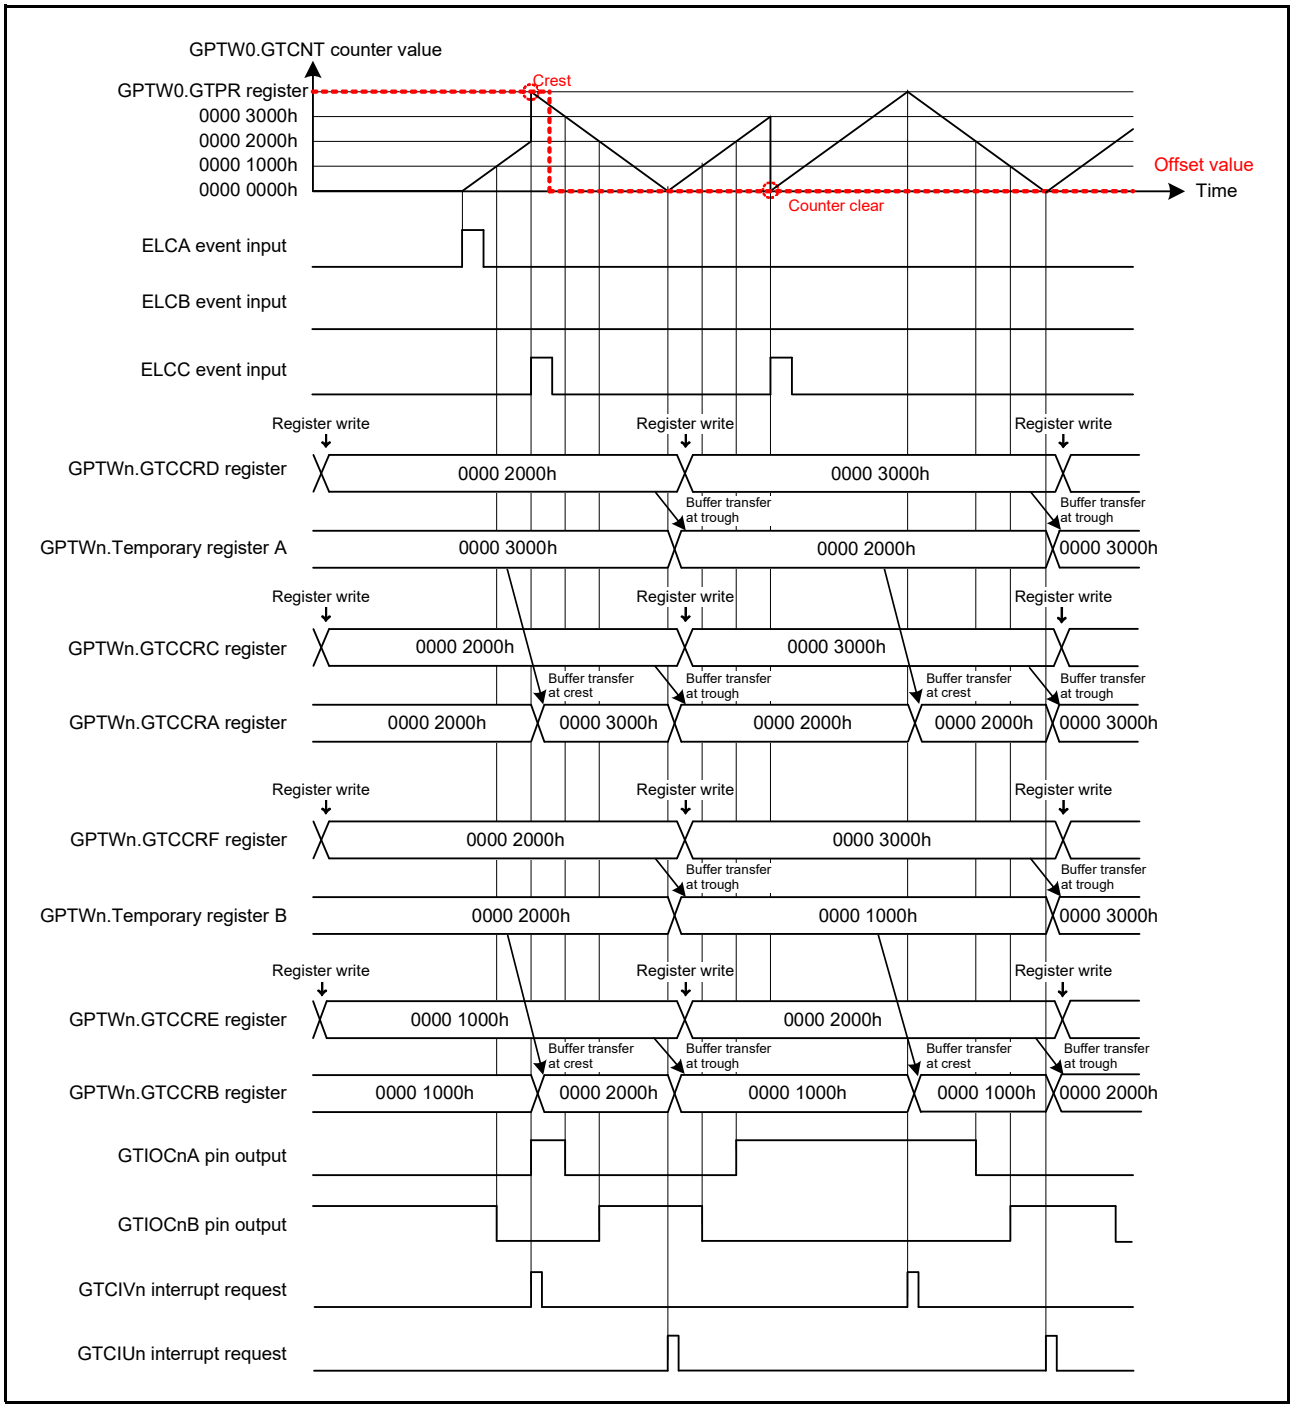

Figure 24.138 Example of the Buffer Operation Due to the Count Switch (Triangle-Wave PWM Mode 3, Offset is Set to 0 and GTPR and Switch to Up-count) (n = 0 to 15)

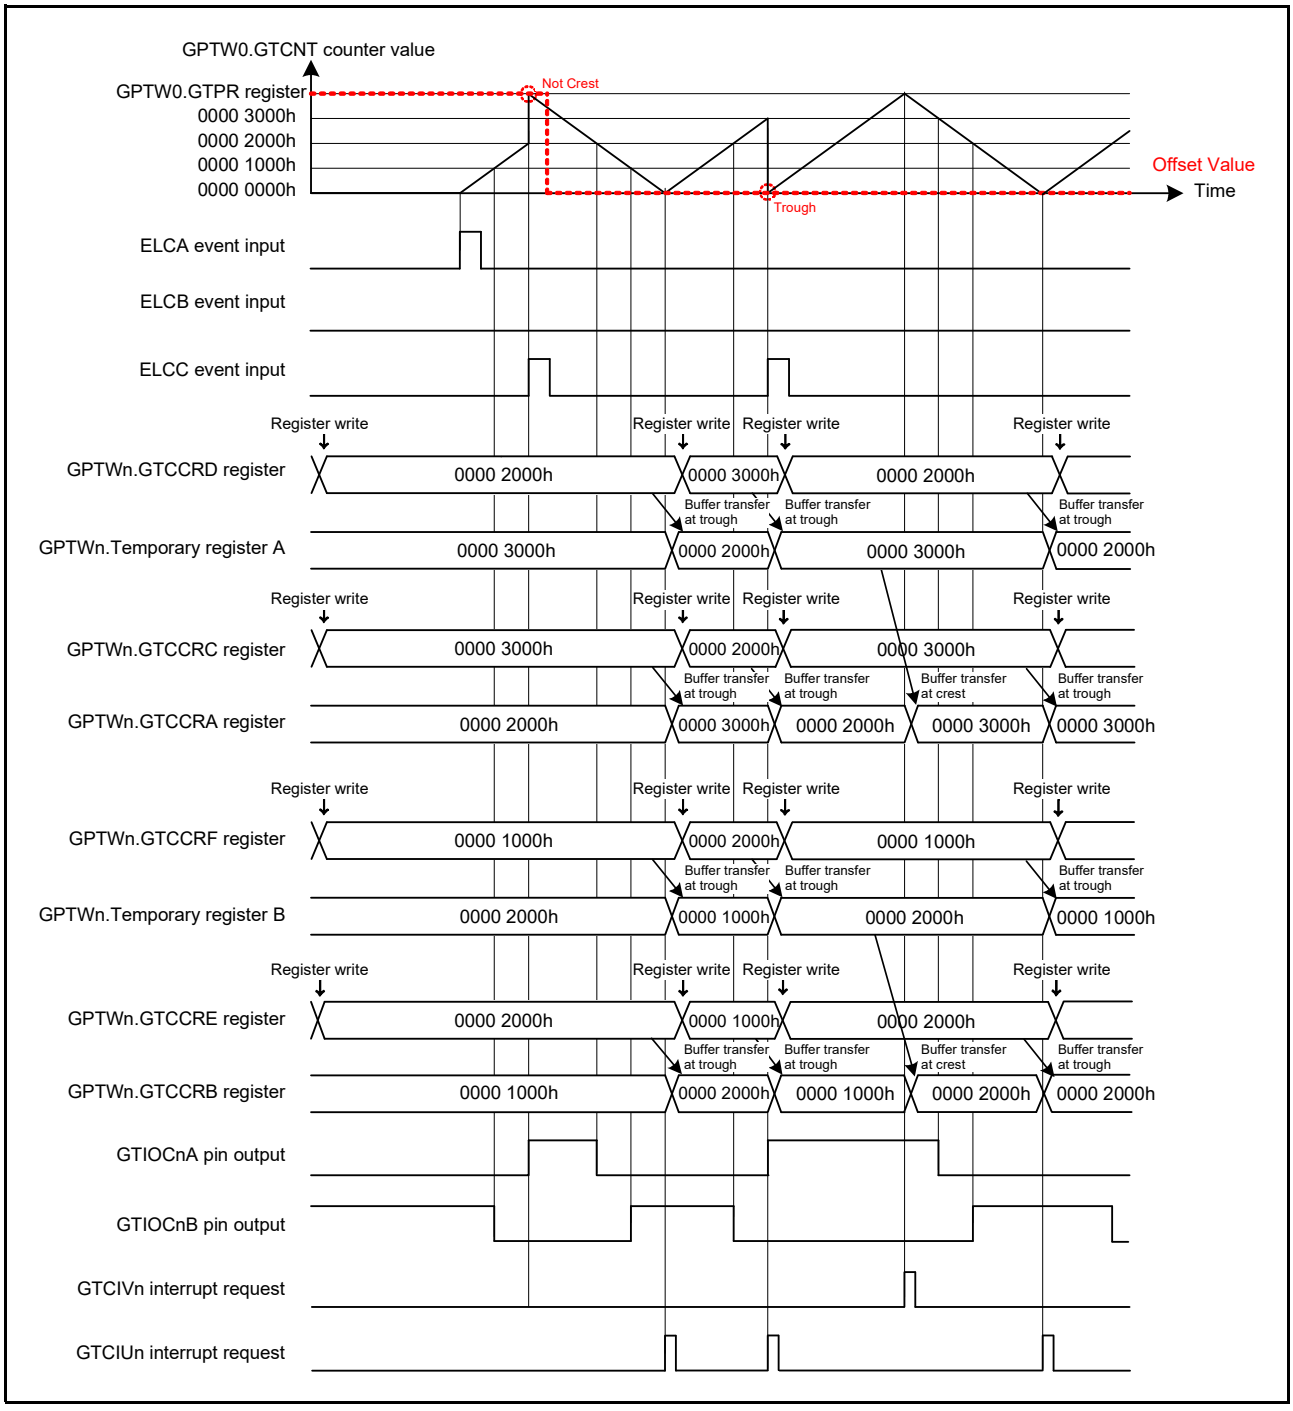

Figure 24.139 Example of the Buffer Operation Due to the Count Switch (Triangle-Wave PWM Mode 3, Offset is Set to 0 and GTPR and Switch to Down-count) (n = 0 to 15)

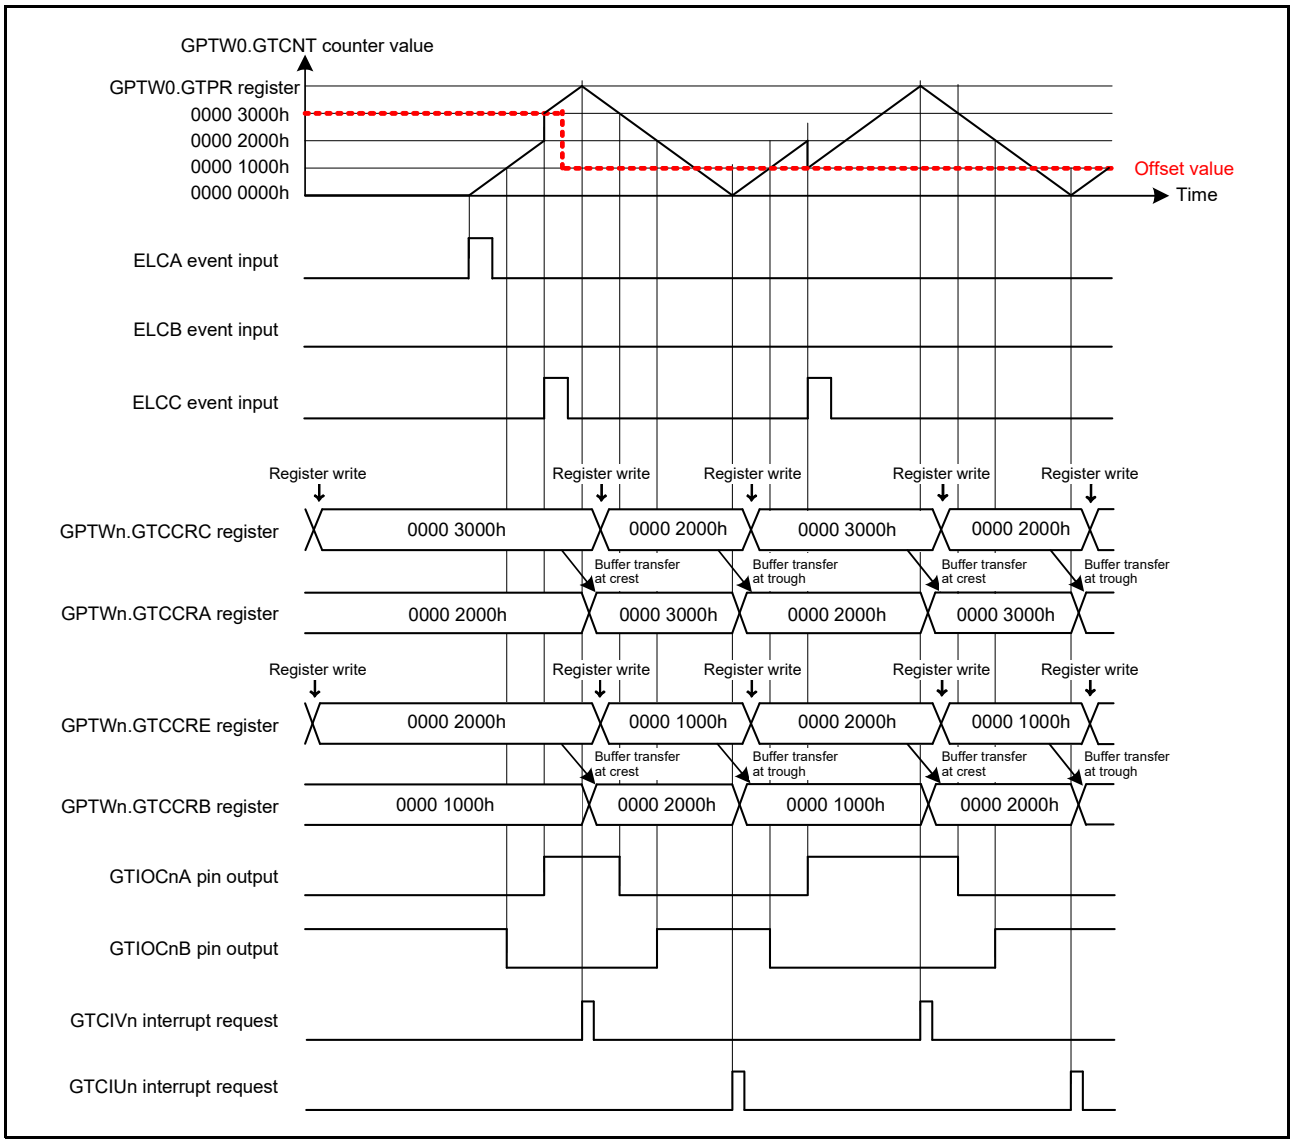

Figure 24.140 Example of the Buffer Operation Due to the Count Switch (Triangle-Wave PWM Mode 2, No Crest and Trough Occurrence Due to the Count Switch) (n = 0 to 15)

When the counter value skips the compare match value by the count switch, no compare match occurs and the GTIOCnm pin output does not change. Figure 24.141 shows an example of the operation when the compare match is skipped by switch operation.

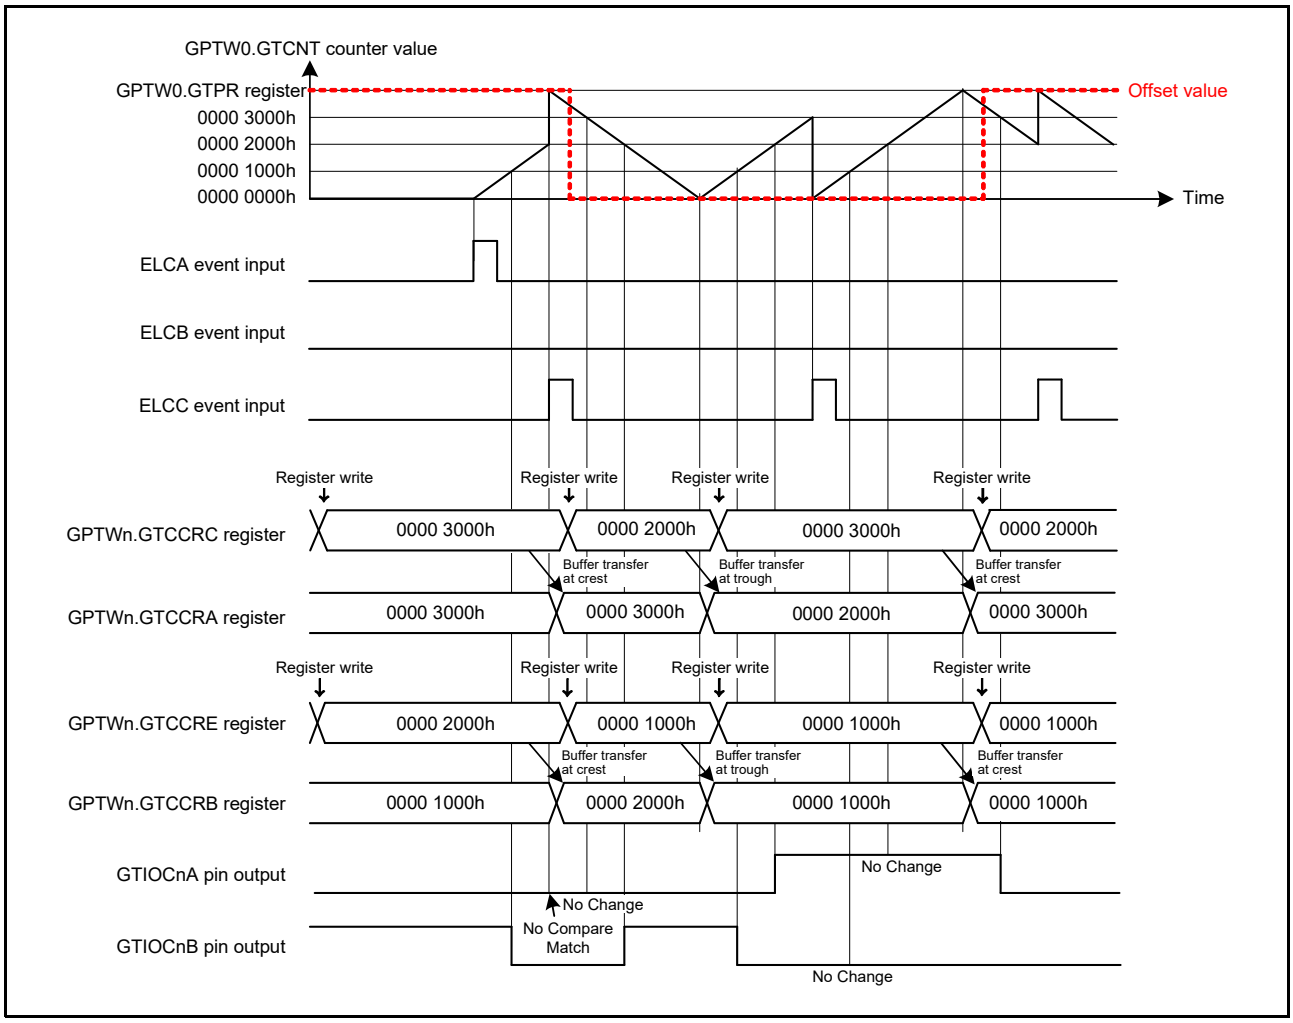

Figure 24.141 Example of the Exception Operation Due to the Count Switch (Switch to Up-count with Offset Reload by ELCC event) (n = 0 to 15)

Figure 24.142 and Figure 24.143 show examples of the timing to switch the direction of counting in response to a rising edge of the input on the GTETRGA pin when a clock signal produced by frequency-dividing the GTCLK signal is in use as the counter clock for the GTCNT counter.
The GTCNT counter is switched at the next counting operation after the GPTW detects the internal switching signal.

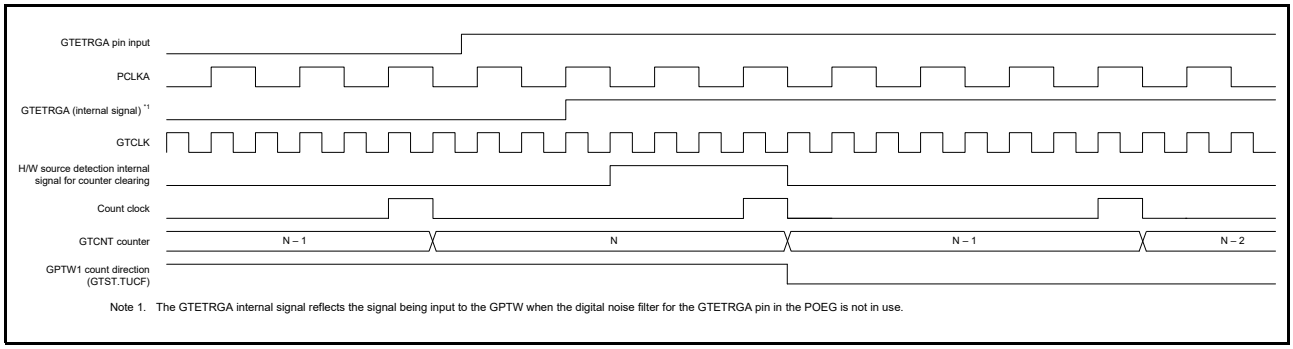

Figure 24.142 Example of the Timing to Switch the Direction of Counting in Response to a Rising Edge of the Input on the GTETRGA Pin: Switch to Counting Down without Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency

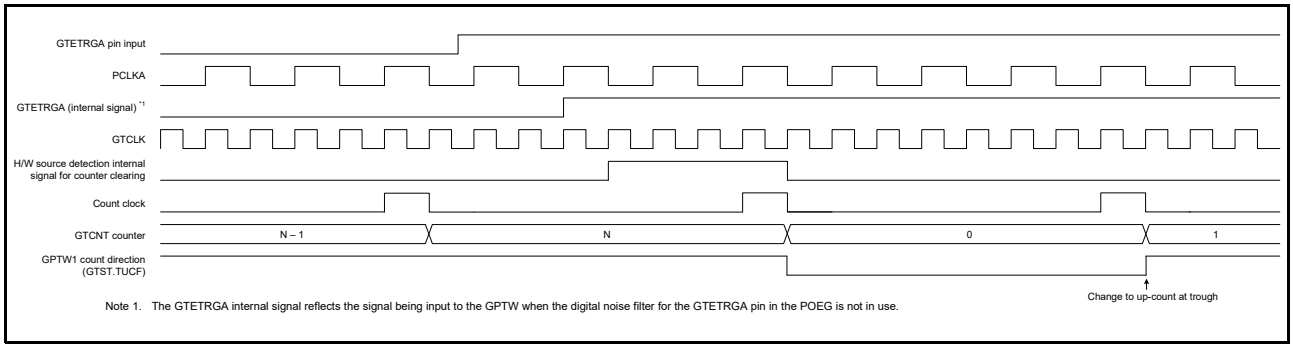

Figure 24.143 Example of the Timing to Switch the Direction of Counting in Response to a Rising Edge of the Input on the GTETRGA Pin: Switch to Counting Down with Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency and Offset Value is 0

Figure 24.144 and Figure 24.145 show examples of the timing to switch the direction of counting in response to ELCA event input when a clock signal produced by frequency-dividing the GTCLK signal is in use as the counter clock for the GTCNT counter, and the frequency of GTCLK is double that of PCLKB.
This is an example of operations to switch the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A.
The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed. The GTCNT counter is switched in synchronization with GTCLK after the GPTW has detected the internal switching signal.

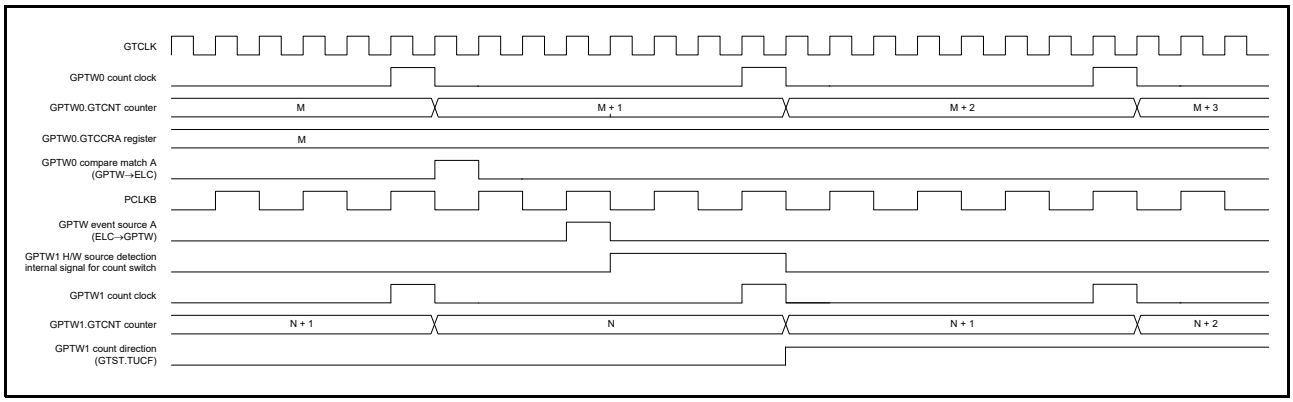

Figure 24.144 Example of the Timing of Count Switch Operations in Response to Event Input from the ELCA: Switch to Counting Up without Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency

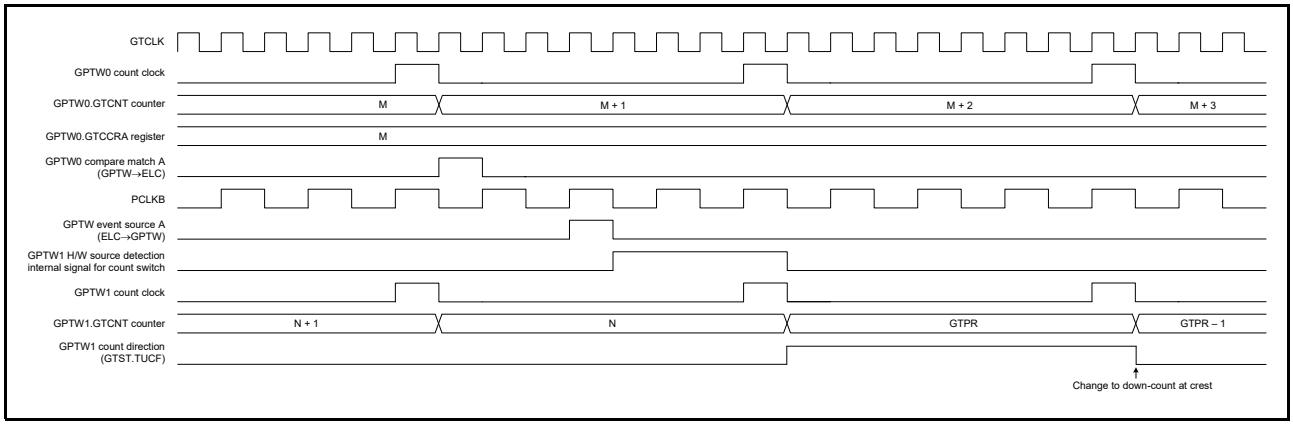

Figure 24.145 Example of the Timing of Count Switch Operations in Response to Event Input from the ELCA: Switch to Counting Up with Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency and Offset value is GTPR

24.3.9 Inter-Channel Synchronous Operation

Synchronous operation on channels (synchronous start/stop/clear/switch operation) can be performed.

24.3.9.1 Software Control of Inter-Channel Synchronous Operation

The count operations for respective channels can be started, stopped and cleared simultaneously by setting multiple bits of the GTSTR, GTSTP, and GTCLR registers to 1 at the same time.
Count start with phase differences among channels is possible firstly by setting the GTCNT counter value before counting starts, and then, by setting simultaneously multiple bits in the GTSTR register to 1.
The GTCNT counter value settings are synchronized by setting the GTCR.SSCEN bit to 1, and can be written simultaneously to multiple channels set in the same group by the GTCR.SSCGRP[1:0] bits. Synchronous sets are not valid for channels that are set to complementary PWM mode.
When either the SSCE bit or the SSCD bit of the GTSECR register is set to 1, the GTCR.SSCEN bits of the channels for which 1 is set in the GTSECSR register are set to 0 or 1 accordingly, and the GTCNT synchronous set/clear is enabled or disabled on multiple channels at the same time.
As the count operation clock is selected by the GTCR.TPCS[3:0] bits in each channel, if the clock period of channels performing synchronous operation (count start/stop/clear) differ, the synchronous operation timings will not be exactly the same.
The Figure 24.146 shows an example of simultaneous start/stop/clearing of four channels by software, and Figure 24.147 shows an example of phase shift start among four channels by software. Figure 24.148 to Figure 24.150 show examples of simultaneous start/stop/clearing with different count period.

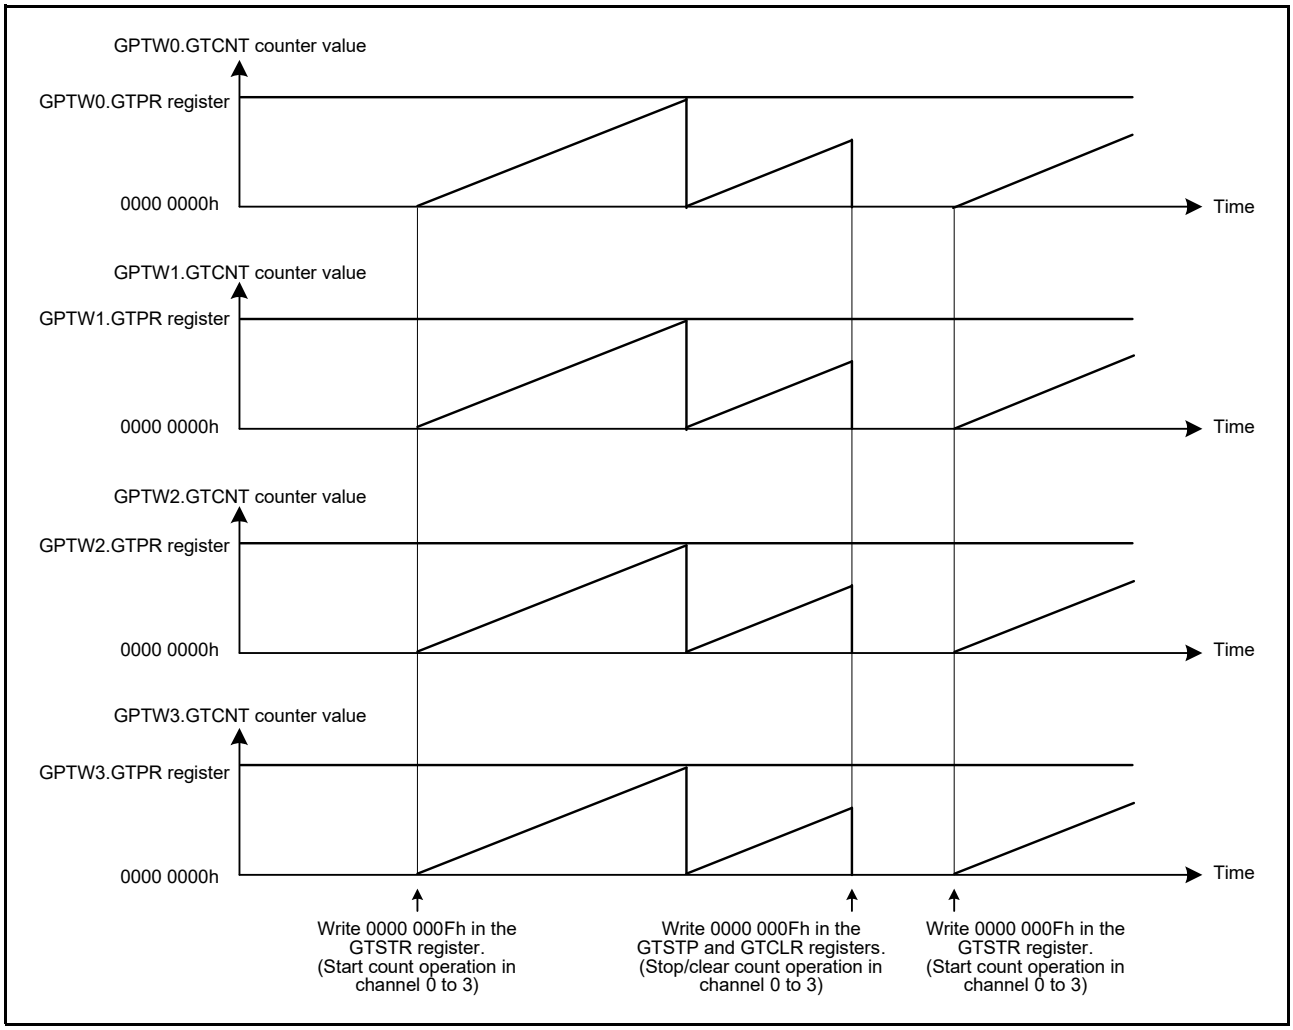

Figure 24.146 Example of Simultaneous Start/Stop/Clearing Operation by Software (with the Same Count Period (GTPR Register Value))

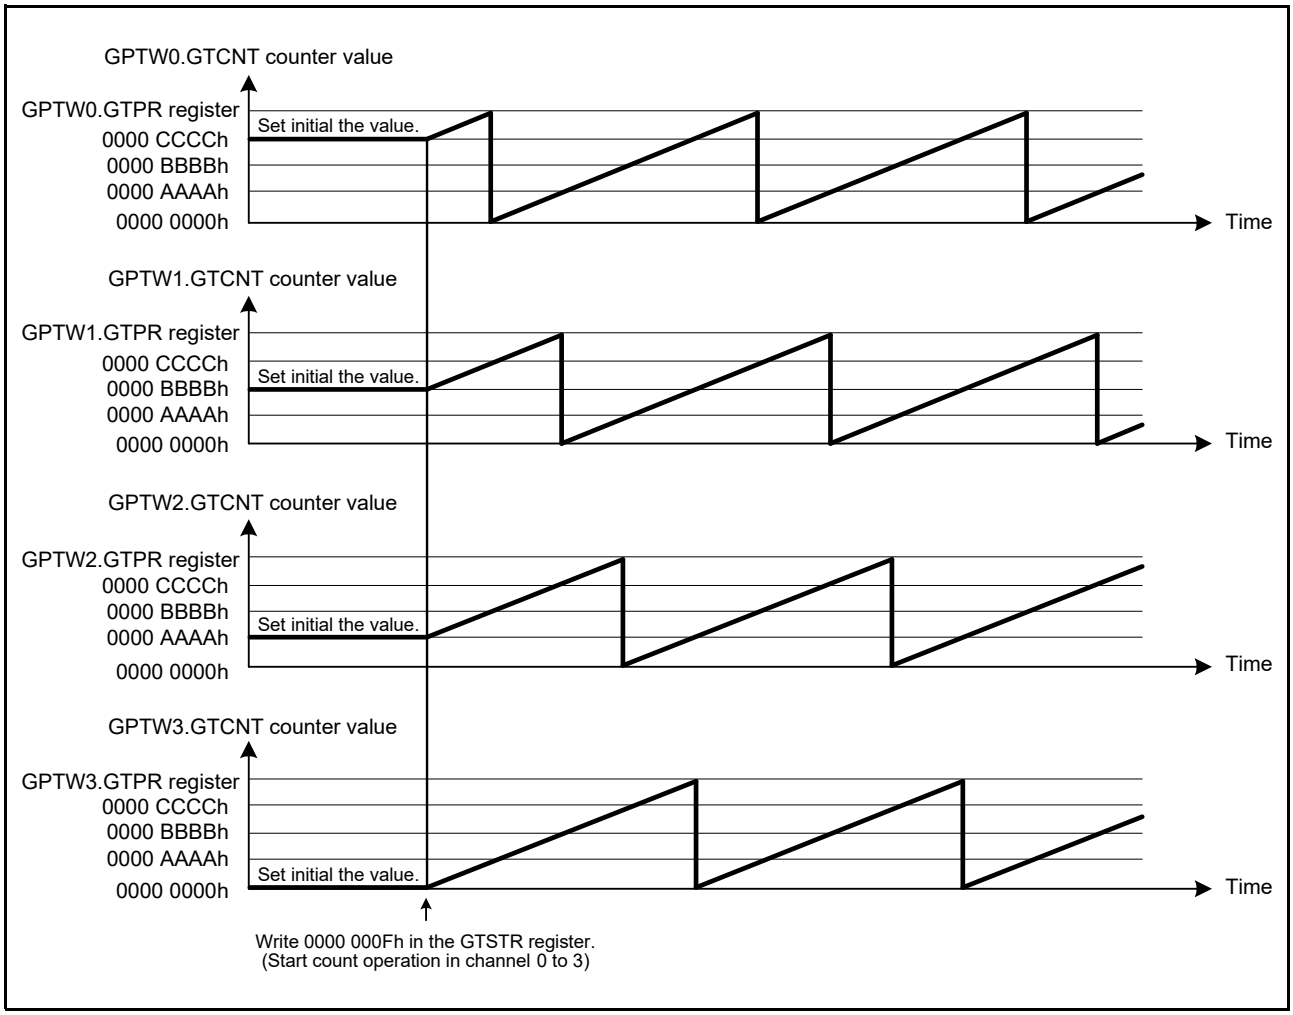

Figure 24.147 Example of Software Phase Shift Start (with Same Count Period (GTPR Register Value))

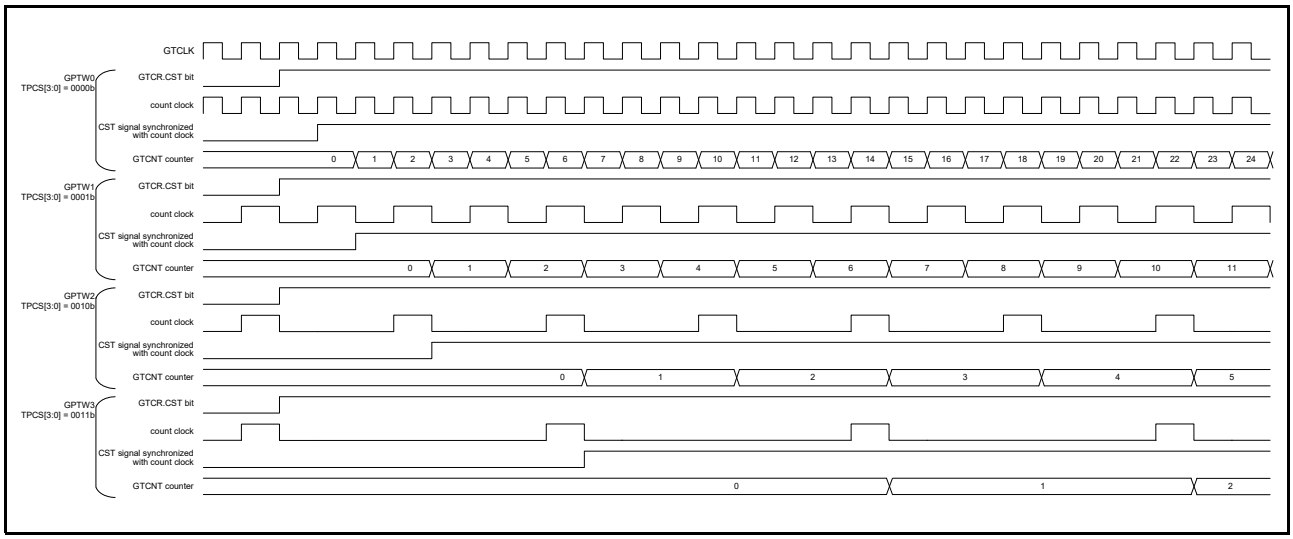

Figure 24.148 Example of Simultaneous Start Operation by Software (with Different Count Period)

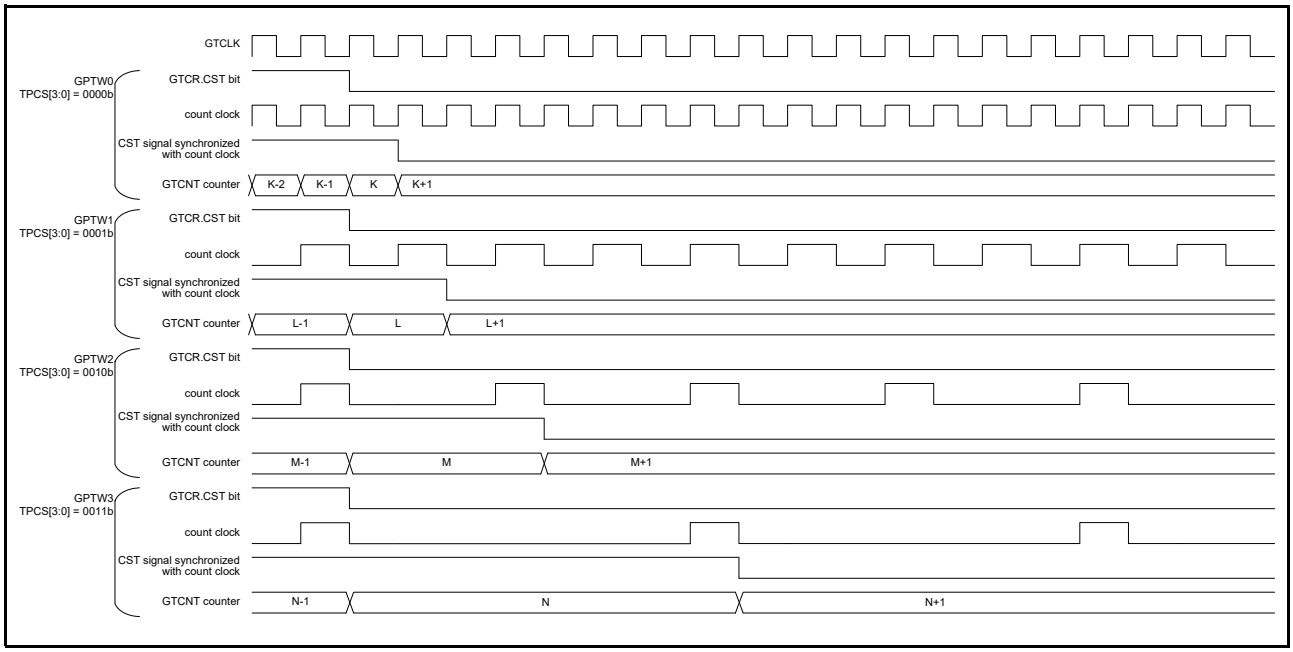

Figure 24.149 Example of Simultaneous Stop Operation by Software (with Different Count Period)

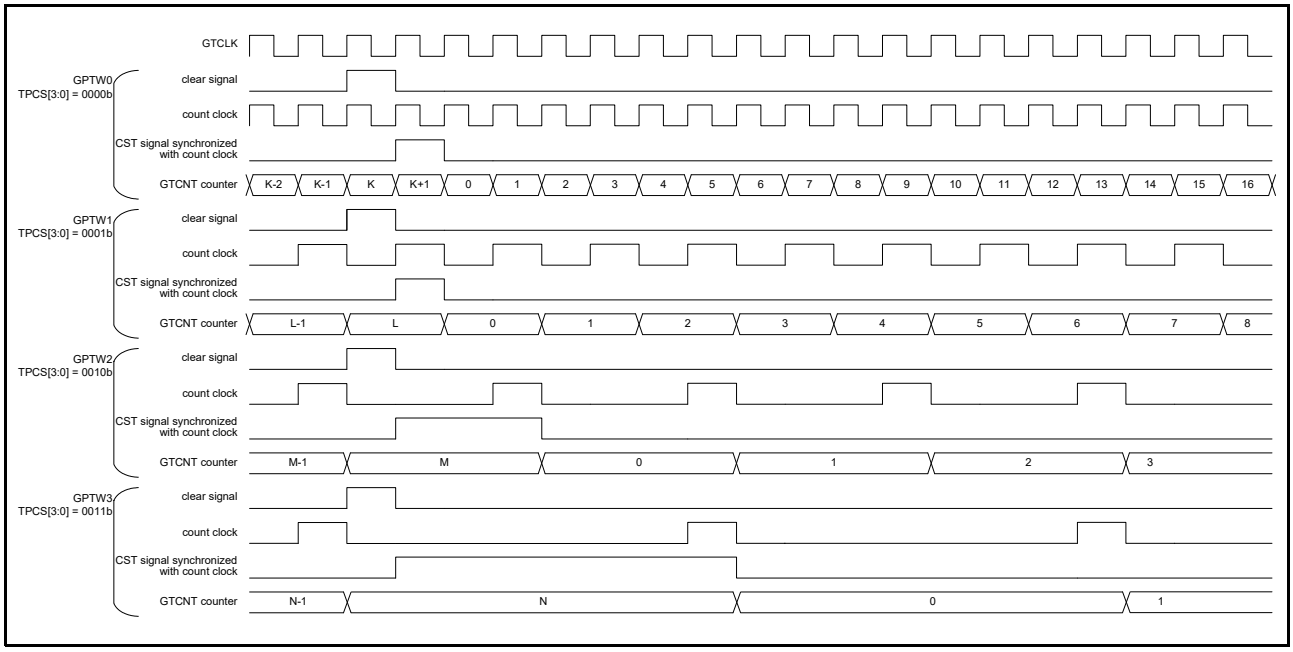

Figure 24.150 Example of Simultaneous Clearing Operation by Software (with Different Count Period)

24.3.9.2 Hardware Source Control of Inter-Channel Synchronous Operation

The count operations for respective channels can be started/stopped/cleared/switched simultaneously by following hardware sources: external trigger input, and ELC event input.

Synchronous operation by the GTIOCnA and GTIOCnB pin inputs (n = 0 to 15) can be performed by setting the ELC event by input capture as a hardware source.

Setting the GTCNT counter values for the respective channels before counting starts makes it possible to start counting with phase differences among the channels.

Figure 24.151 shows an example of simultaneous start/stop/clearing operation of four channels by hardware source, and Figure 24.152 shows an example for setting simultaneous start by hardware source.

Figure 24.153 shows an example of simultaneous start/stop/clearing/switching operation of five channels by hardware source, and Figure 24.154 shows an example for setting simultaneous start by hardware source.

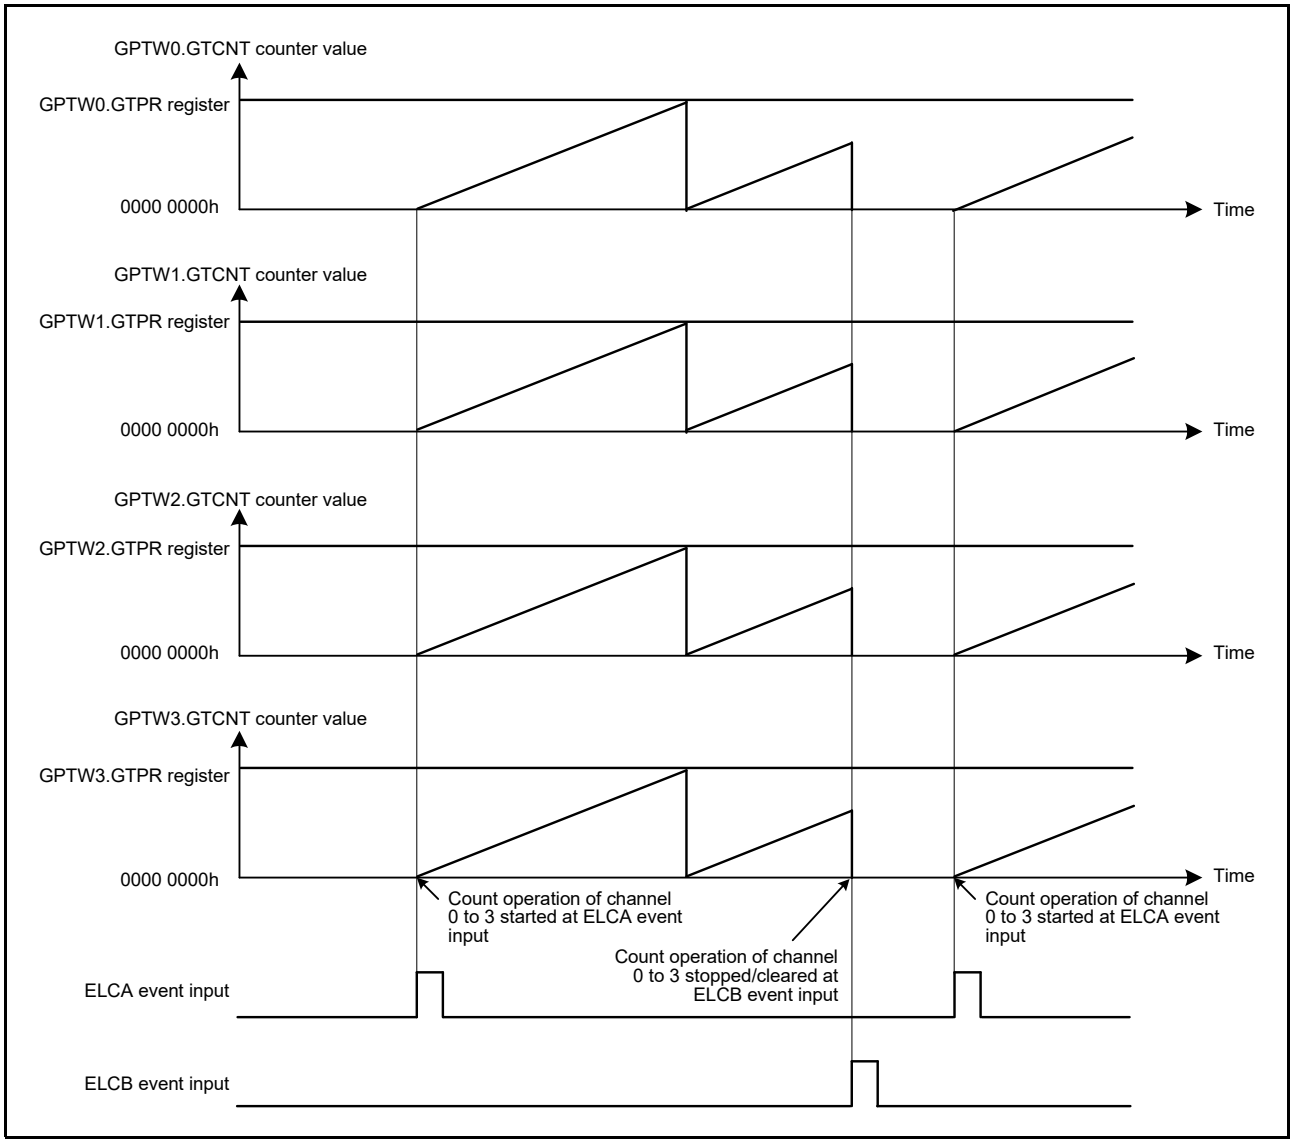

Figure 24.151 Example of Simultaneous Start/Stop/Clearing Operation by Hardware Source (with Same Count Period (GTPR Register Value))

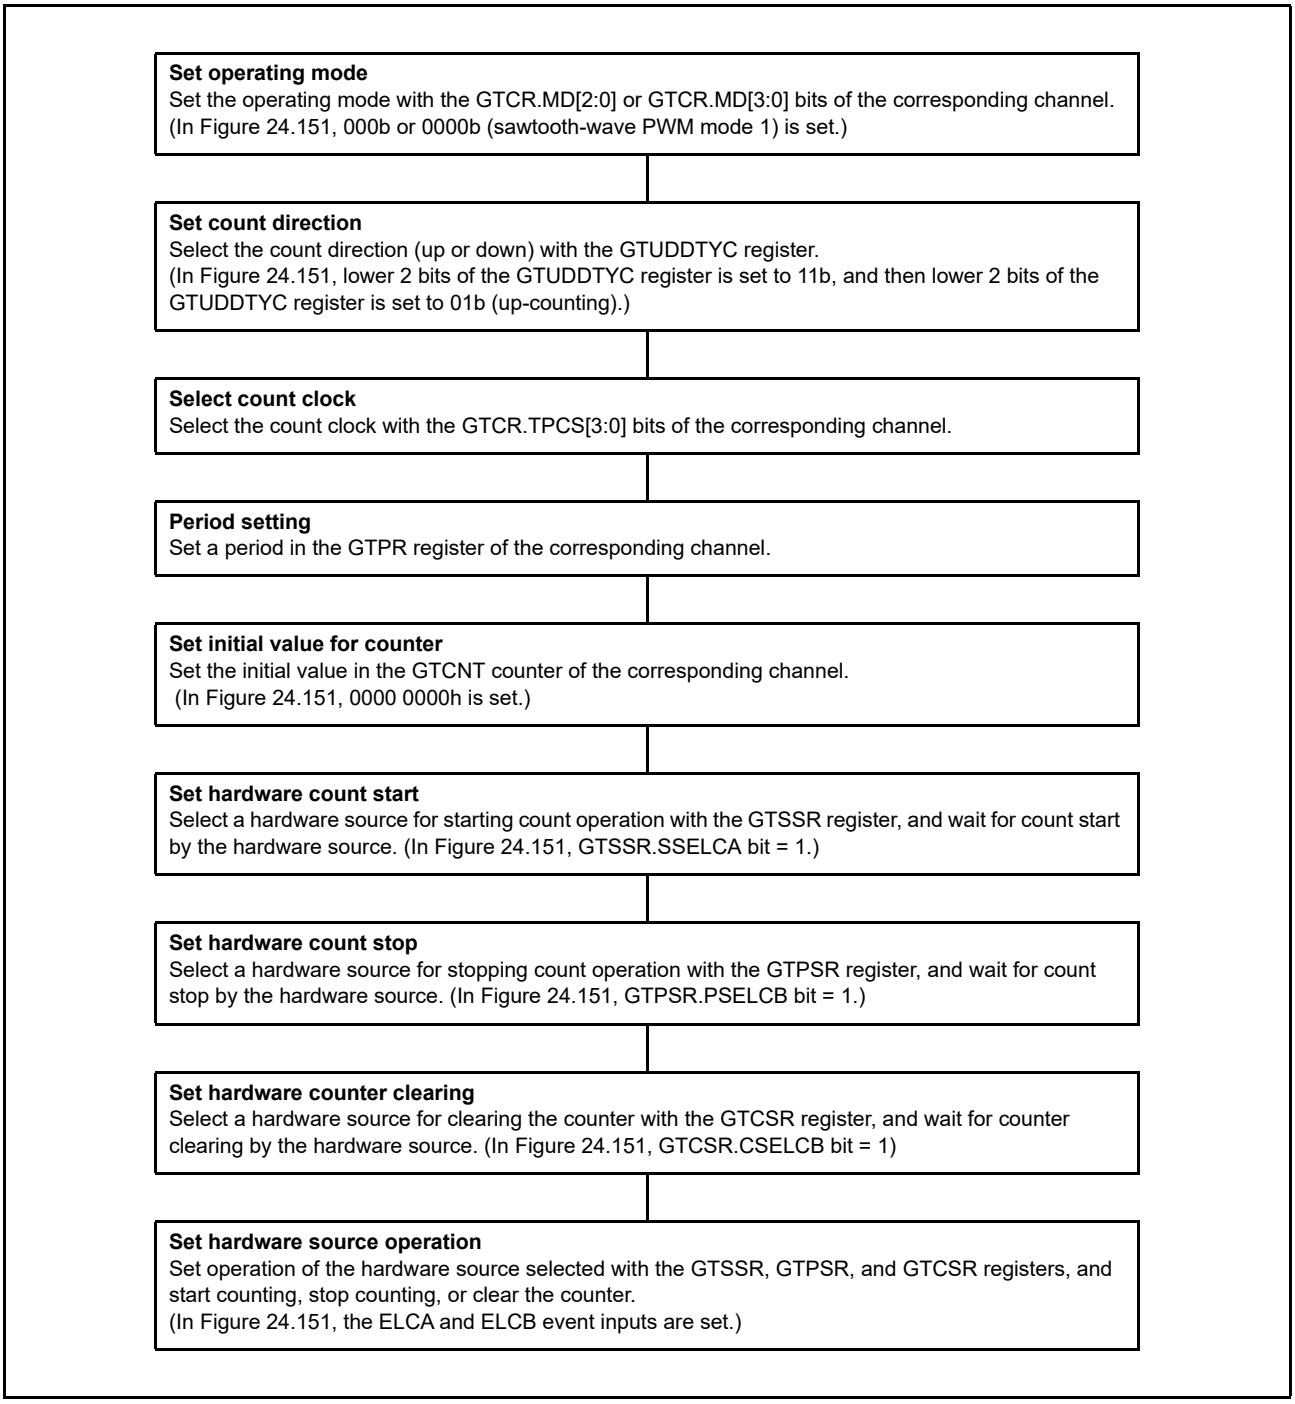

Figure 24.152 Example for Setting Simultaneous Start by Hardware Source

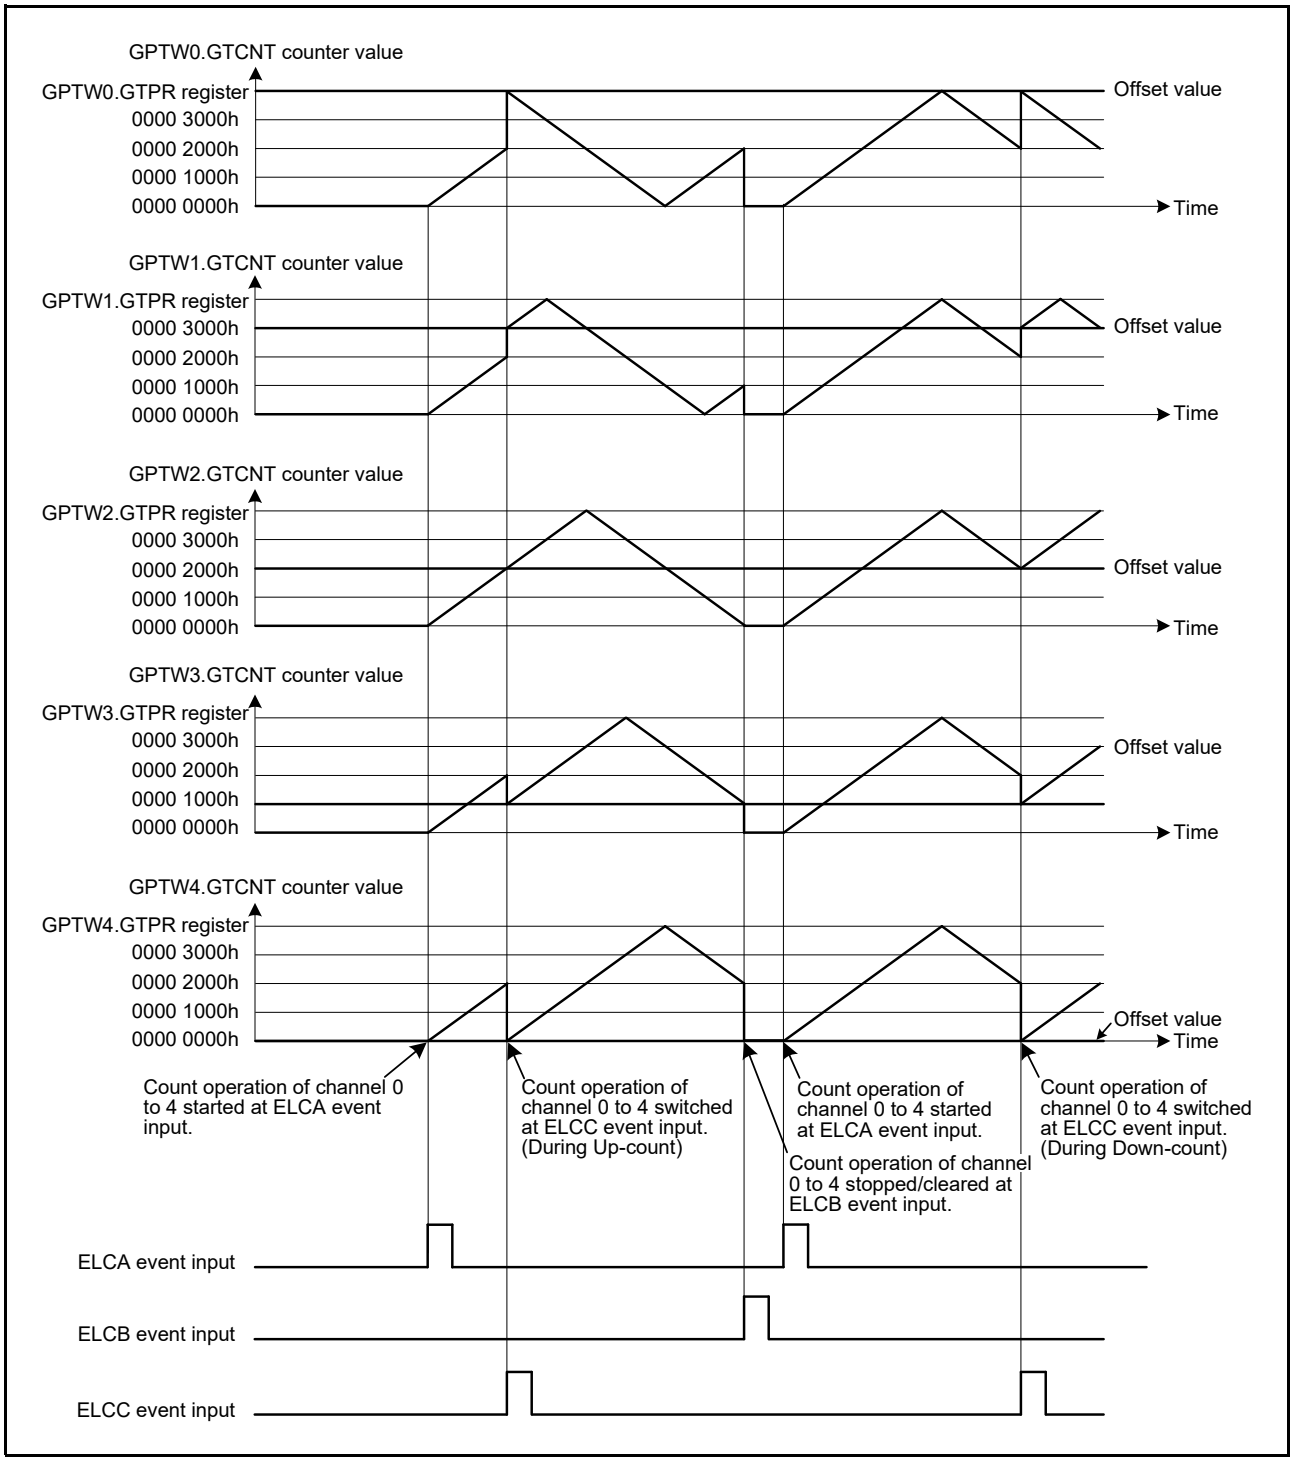

Figure 24.153 Example of Simultaneous Start/Stop/Clearing/Switch Operation by Hardware Source (Switch to Up-count with Offset Reload by ELCC Event, with Same Count Period (GTPR Register Value))

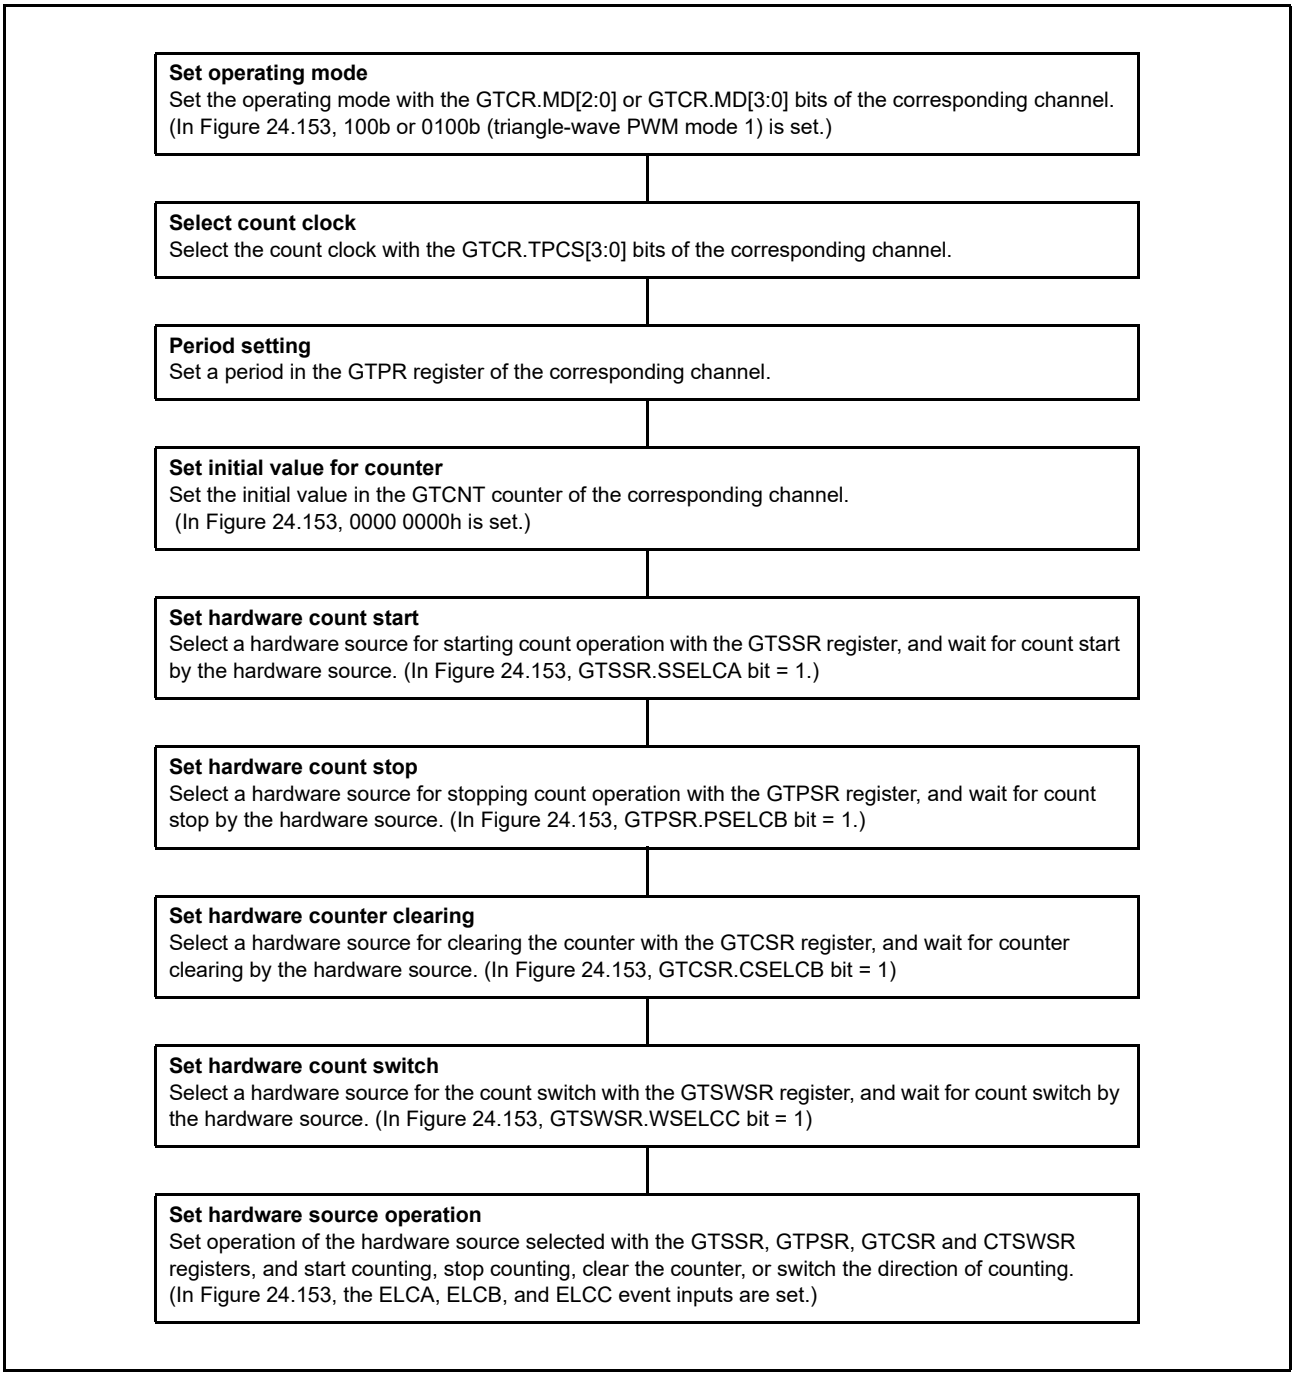

Figure 24.154 Example for Setting Simultaneous Start by Hardware Source (with Count Switch)

24.3.9.3 Synchronous Clear Operation by Inter Channel Cooperation

The counters of other channels can be cleared at the same time with the counter clear of some channel caused by the compare match, input capture, sawtooth wave up-count overflow, sawtooth wave down-count underflow, and the GTIOCnA/GTIOCnB pin input selected in the GTCSR register.

The counter clear caused by GTCLR register, external trigger input and the ELC input can perform as synchronous clear when the same counter clear factor is set to target channels of synchronous clear. Therefore, these factors are not prepared for the synchronous clear operation by inter channel cooperation.

Set the channel that generates the synchronous clear source and the channel that is synchronously cleared in the same synchronous set/clear group using the GTCR.SSCGRP[1:0] bits.

Similar to the synchronous operation in section 24.3.9.1, Software Control of Inter-Channel Synchronous Operation, if the count clock selected by the GTCR.TPCS[3:0] bits differs between channels, the synchronous clear operation cannot be performed at exactly the same timing. Similar to the example of simultaneous clearing operation by software in Figure 24.150, if the count clock differs between channels, the synchronous clear factor is synchronized with the count clock of each channel before counter clearing.

When either the SSCE bit or the SSCD bit of the GTSECR register is set to 1, the GTCR.SSCEN bits of the channels for which 1 is set in the GTSECSR register are set to 0 or 1 accordingly, and the GTCNT synchronous set/clear is enabled or disabled on multiple channels at the same time.

Table 24.24 lists the settings of the registers used to set sources for synchronous clearing. Figure 24.155 shows an example of synchronous clear operation by inter channel cooperation and Figure 24.156 shows an example for setting synchronous clear operation by inter channel cooperation.

Table 24.24 Settings of the Registers Used to Set Sources for Synchronous Clearing

Sources for Synchronous Clearing by Inter Channel Cooperation	Register.Bit(s)	Value
GTCCRA register compare match/input capture	GTINTAD.SCFA	1b
	GTCSR.CSCMSC[2:0]	001b
GTCCRB register compare match/input capture	GTINTAD.SCFB	1b
	GTCSR.CSCMSC[2:0]	010b
GTCCRC register compare match	GTINTAD.SCFC	1b
	GTCSR.CSCMSC[2:0]	011b
GTCCRD register compare match	GTINTAD.SCFD	1b
	GTCSR.CSCMSC[2:0]	100b
GTCCRE register compare match	GTINTAD.SCFE	1b
	GTCSR.CSCMSC[2:0]	101b
GTCCRF register compare match	GTINTAD.SCFF	1b
	GTCSR.CSCMSC[2:0]	110b
Sawtooth wave up-count overflow	GTINTAD.SCFPO	1b
Sawtooth wave down-count underflow	GTINTAD.SCFPU	1b
Clearing due to input on the GTIOCnA or GTIOCnB pin	GTCR.SCGTIOC	1b

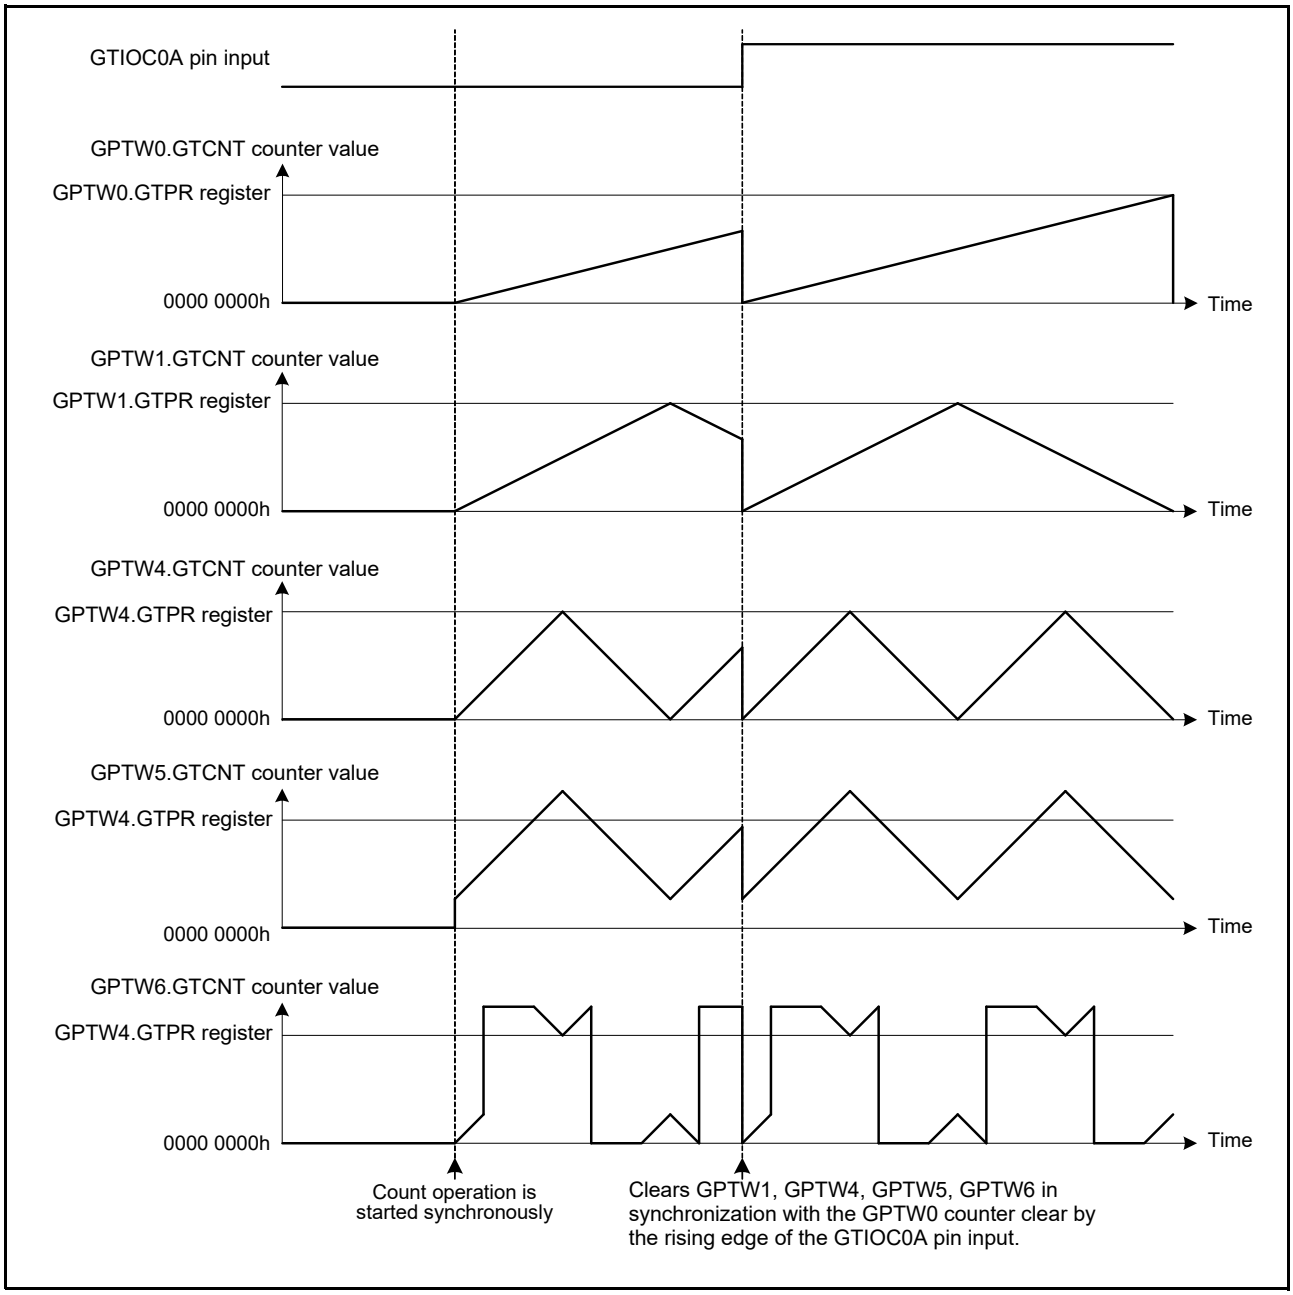

Figure 24.155 Example of Synchronous Clear Operation by Inter Channel Cooperation (Clear Caused by GTIOCnA/GTIOCnB Pin)
(GPTW0 is sawtooth wave and counter is cleared by the rising edge of the GTIOC0A,
GPTW1 is triangle wave,
GPTW4, GPTW5, GPTW6 are complementary PWM mode.
GPTW0, GPTW1, GPTW4, GPTW5, GPTW6 are the same synchronous set/clear group)

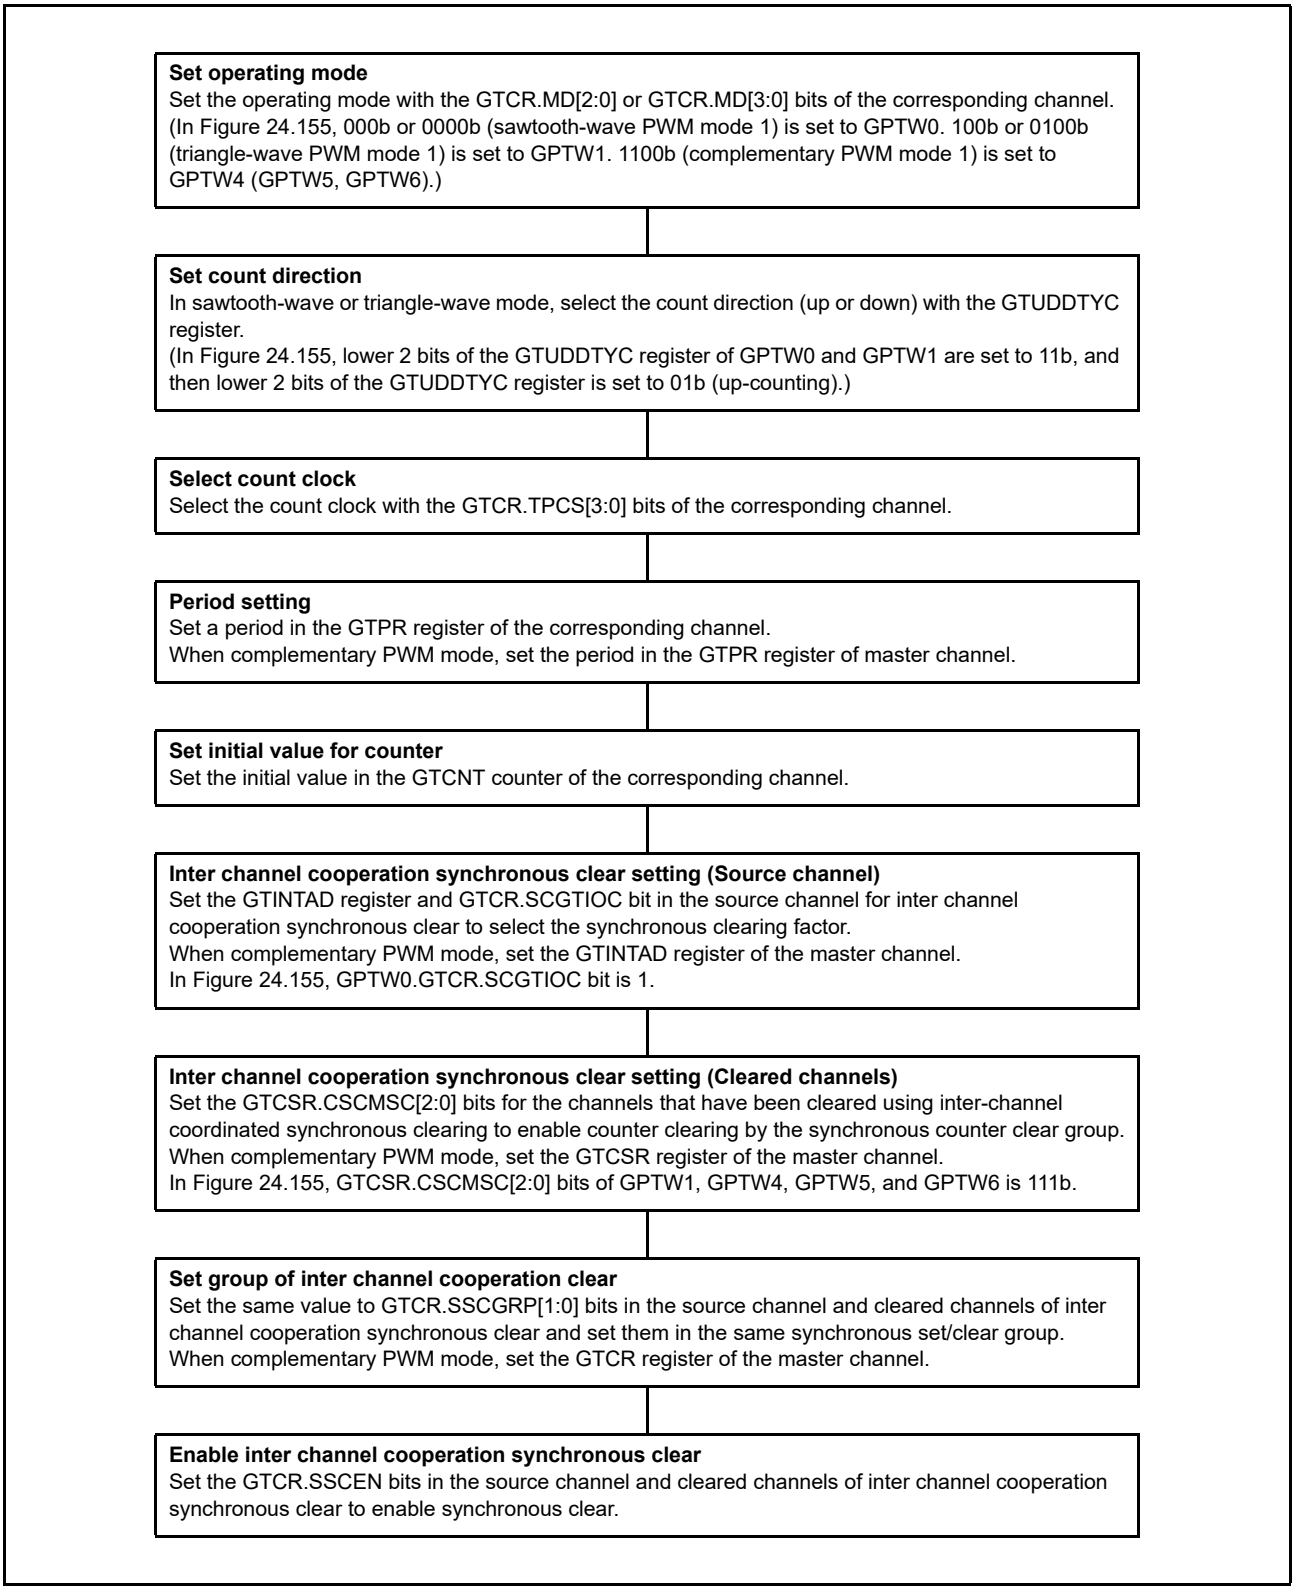

Figure 24.156 Example for Setting Synchronous Clear Operation by Inter Channel Cooperation (Clear Caused by GTIOCnA/GTIOCnB Pin)

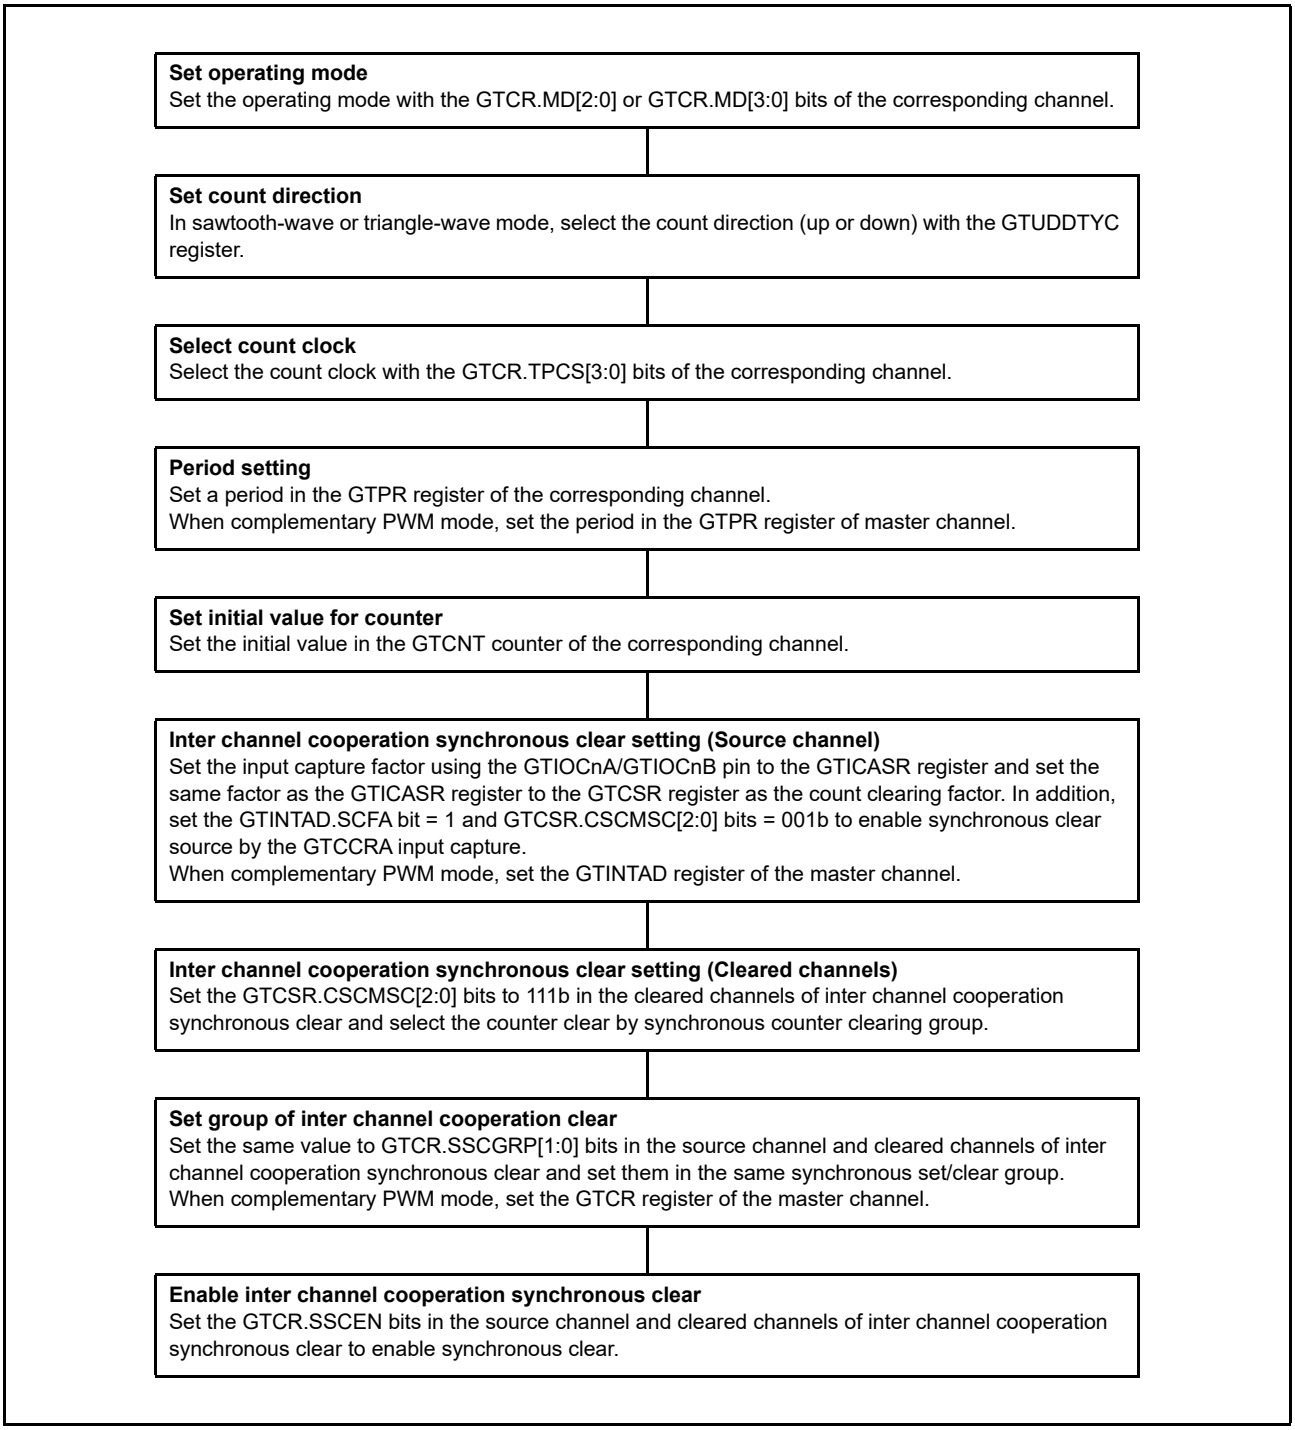

Figure 24.157 Example for Setting Synchronous Clear Operation by Inter Channel Cooperation (Clear Caused by the GTCCRA input capture using the GTIOCnA/GTIOCnB Pin)

24.3.9.4 Input Capture Operation by Inter Channel Cooperation

The events of compare match, input capture, sawtooth wave up-count overflow, sawtooth wave down-count underflow, the crest and trough of triangle wave and complementary PWM mode and the count clock can be used as the input capture factor for the GTCCRm register (m = A or B) of other channels.

The input capture factor by inter channel cooperation can be set by the GTICCR register of the channel that generates the input capture factor. The input capture by the factors of other channels is enabled by the GTICmSR.mSOC bit (m = A or B) in the channels to be captured. Set the channels that generate input capture factors and the channels to be captured to the same input capture group using the GTICCR.ICmGRP[1:0] bits (m = A or B).

Figure 24.158 shows an example of input capture operation by inter channel cooperation and Figure 24.159 shows an example for setting input capture operation by inter channel cooperation.

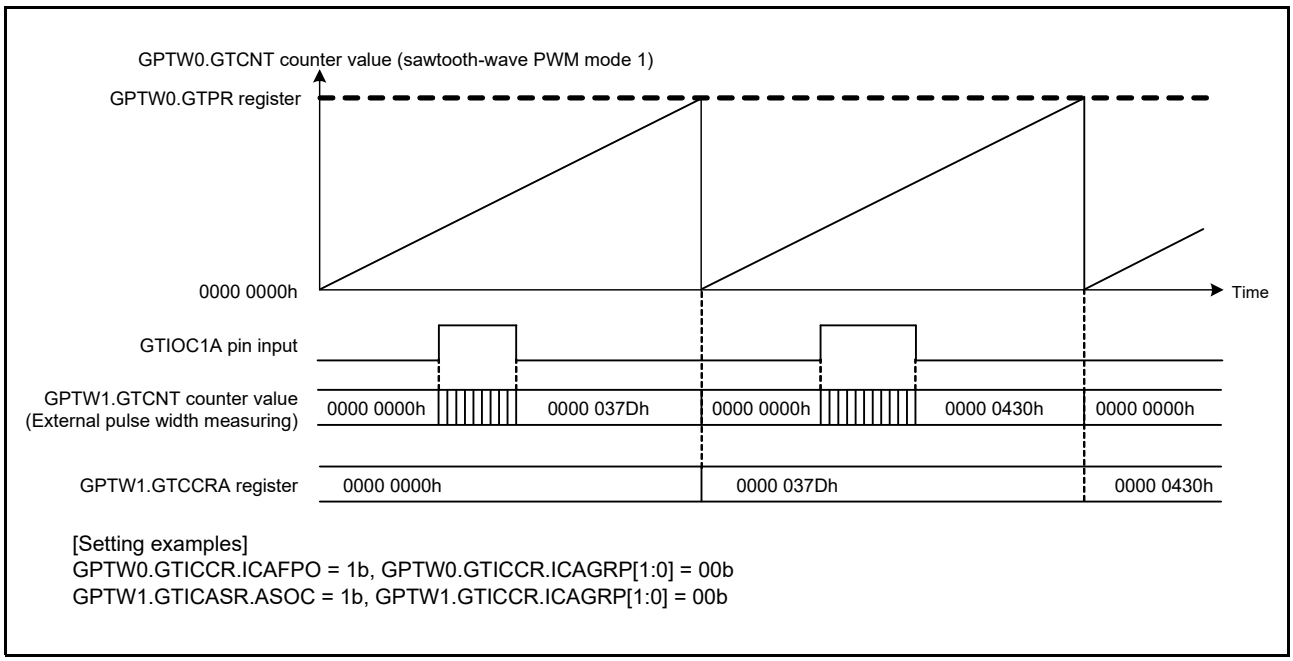

Figure 24.158 Example of Input Capture Operation by Inter Channel Cooperation (Channel 1 is captured by the overflow of Channel 0)

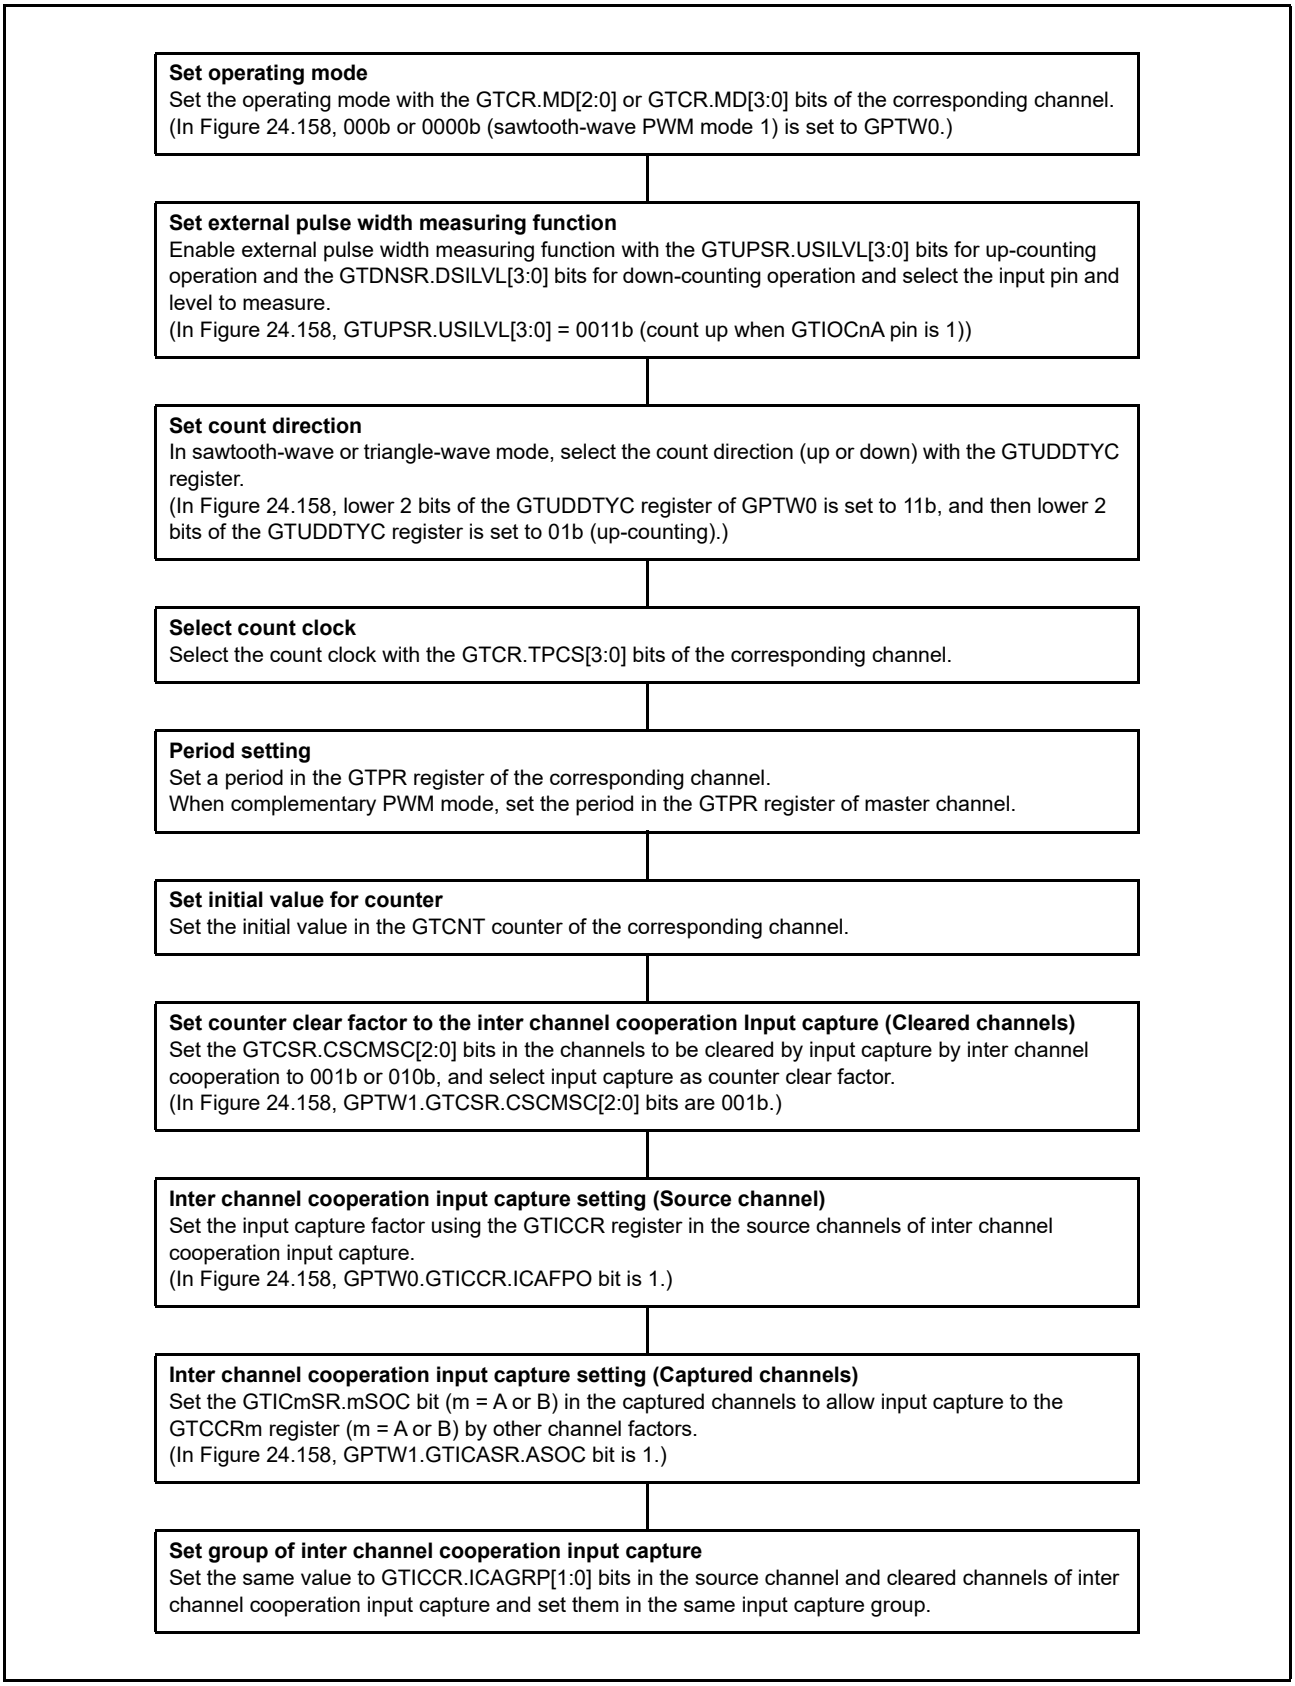

Figure 24.159 Example for Setting Input Capture Operation by Inter Channel Cooperation

24.3.10 PWM Output Operation Examples

(1) Synchronous PWM Output

The GPTW can output two phases of linked PWM waveforms for one channel, or 32 phases of linked PWM waveforms for a maximum of 16 channels by synchronizing operation of the channels.

Figure 24.160 shows an example in which four channels perform synchronous operation in sawtooth-wave PWM mode 1 and eight phases of PWM waveforms are output. The GTIOCnA pin (n = 0 to 3) is set so that it will output low as the initial output, high at a GTCCRA register compare match, and low at the end of the cycle. The GTIOCnB pin is set so that it will output low as the initial output, high at a GTCCRB register compare match, and low at the end of the cycle.

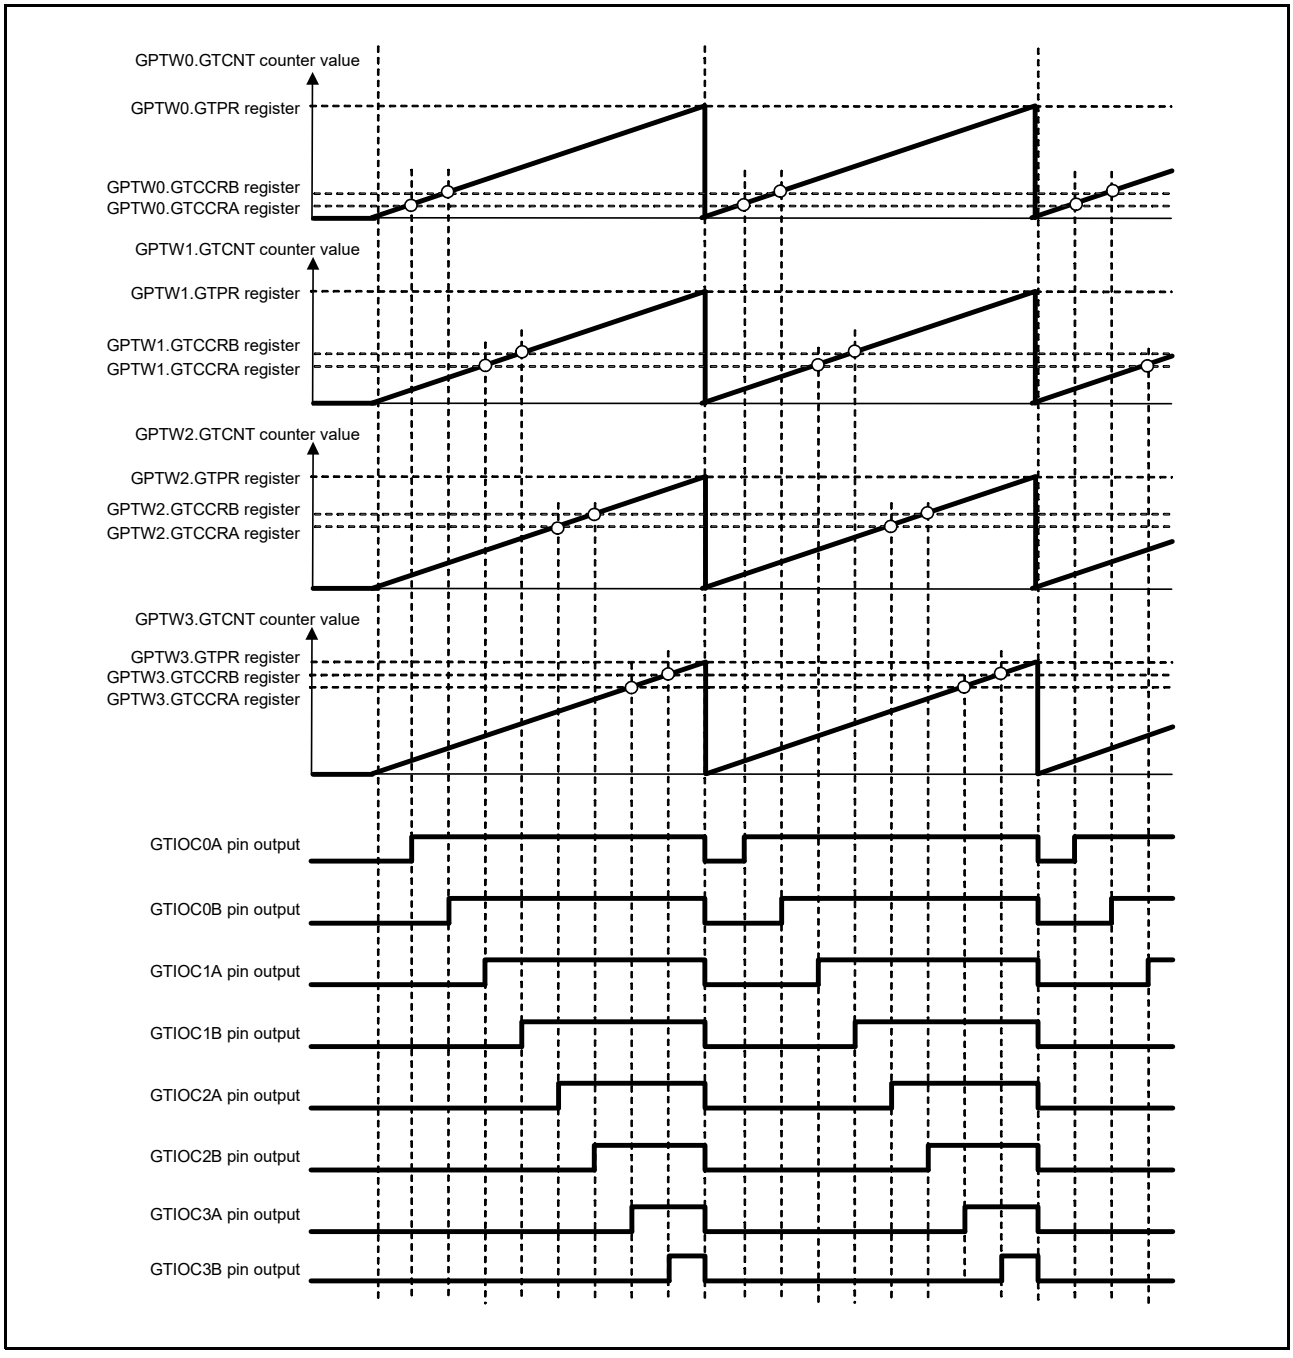

Figure 24.160 Example of Synchronous PWM Output

(2) Three-Phase Sawtooth-Wave Complementary PWM Output

Figure 24.161 shows an example in which three channels perform synchronous operation in sawtooth-wave PWM mode 1 and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, high at a GTCCRA register compare match, and low at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, low at a GTCCRB register compare match, and high at the end of the cycle.

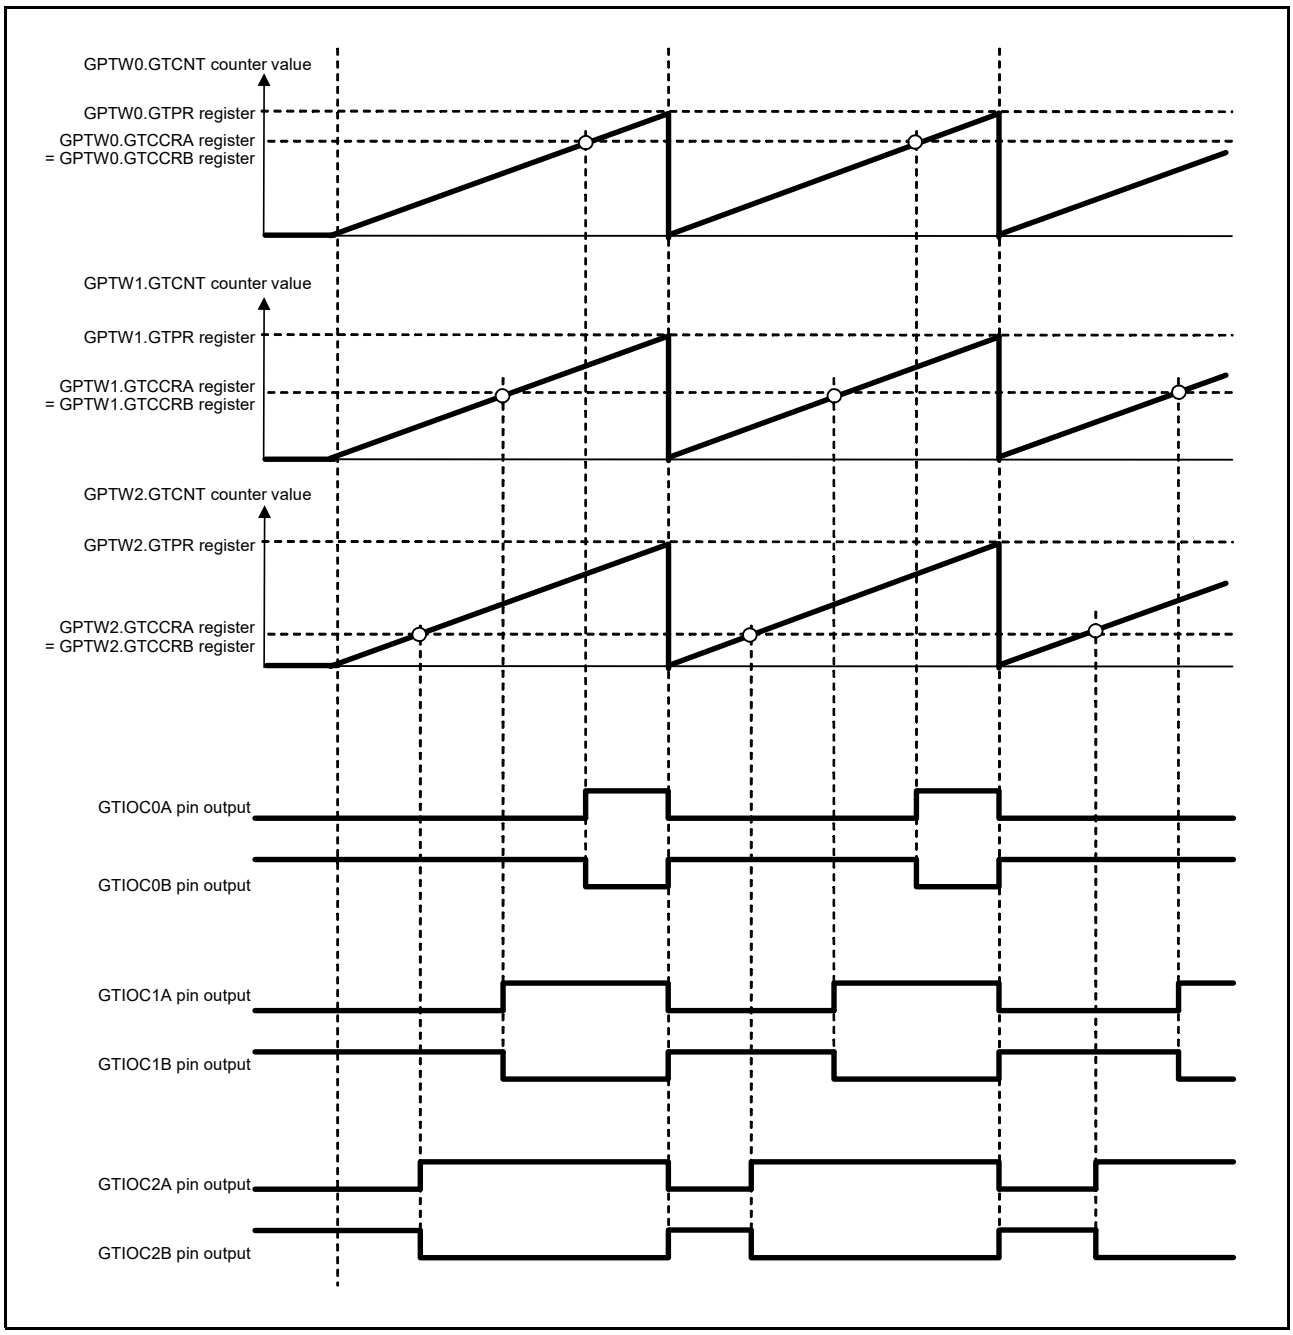

Figure 24.161 Example of Three-Phase Sawtooth-Wave Complementary PWM Output

(3) Three-Phase Sawtooth-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 24.162 shows an example in which three channels perform synchronous operation in sawtooth-wave one-shot pulse mode with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

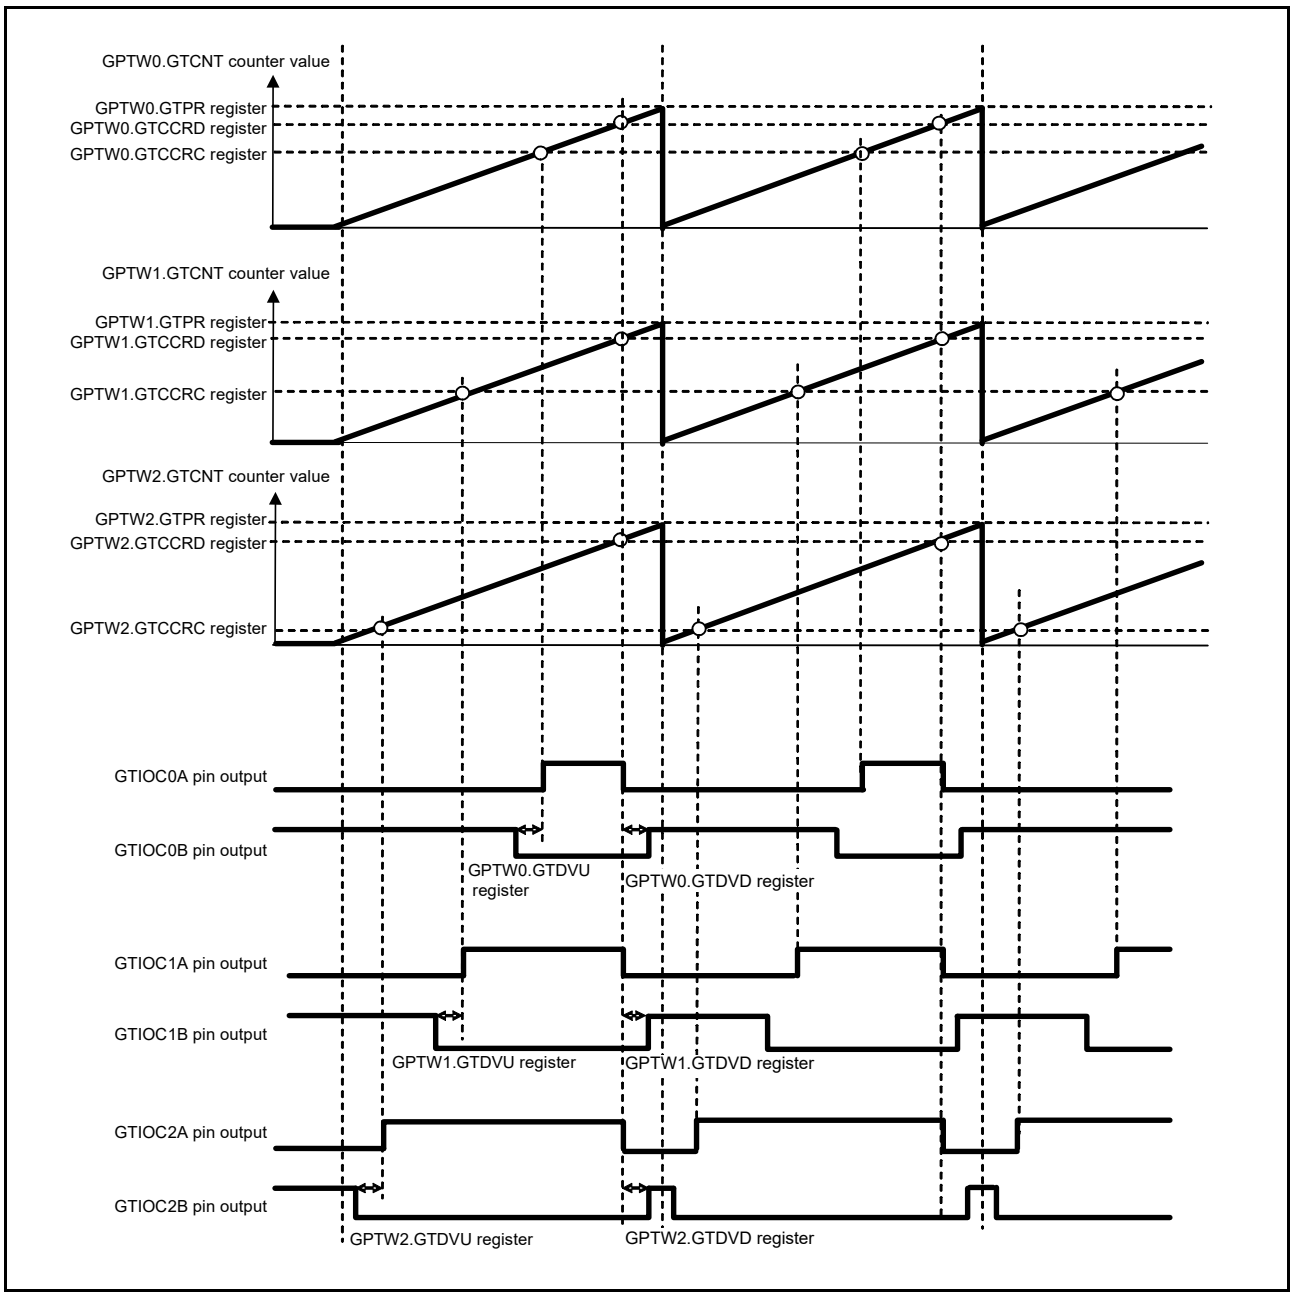

Figure 24.162 Example of Three-Phase Sawtooth-Wave Complementary PWM Output with Automatic Dead Time Setting

(4) Three-Phase Triangle-Wave Complementary PWM Output

Figure 24.163 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 1 and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

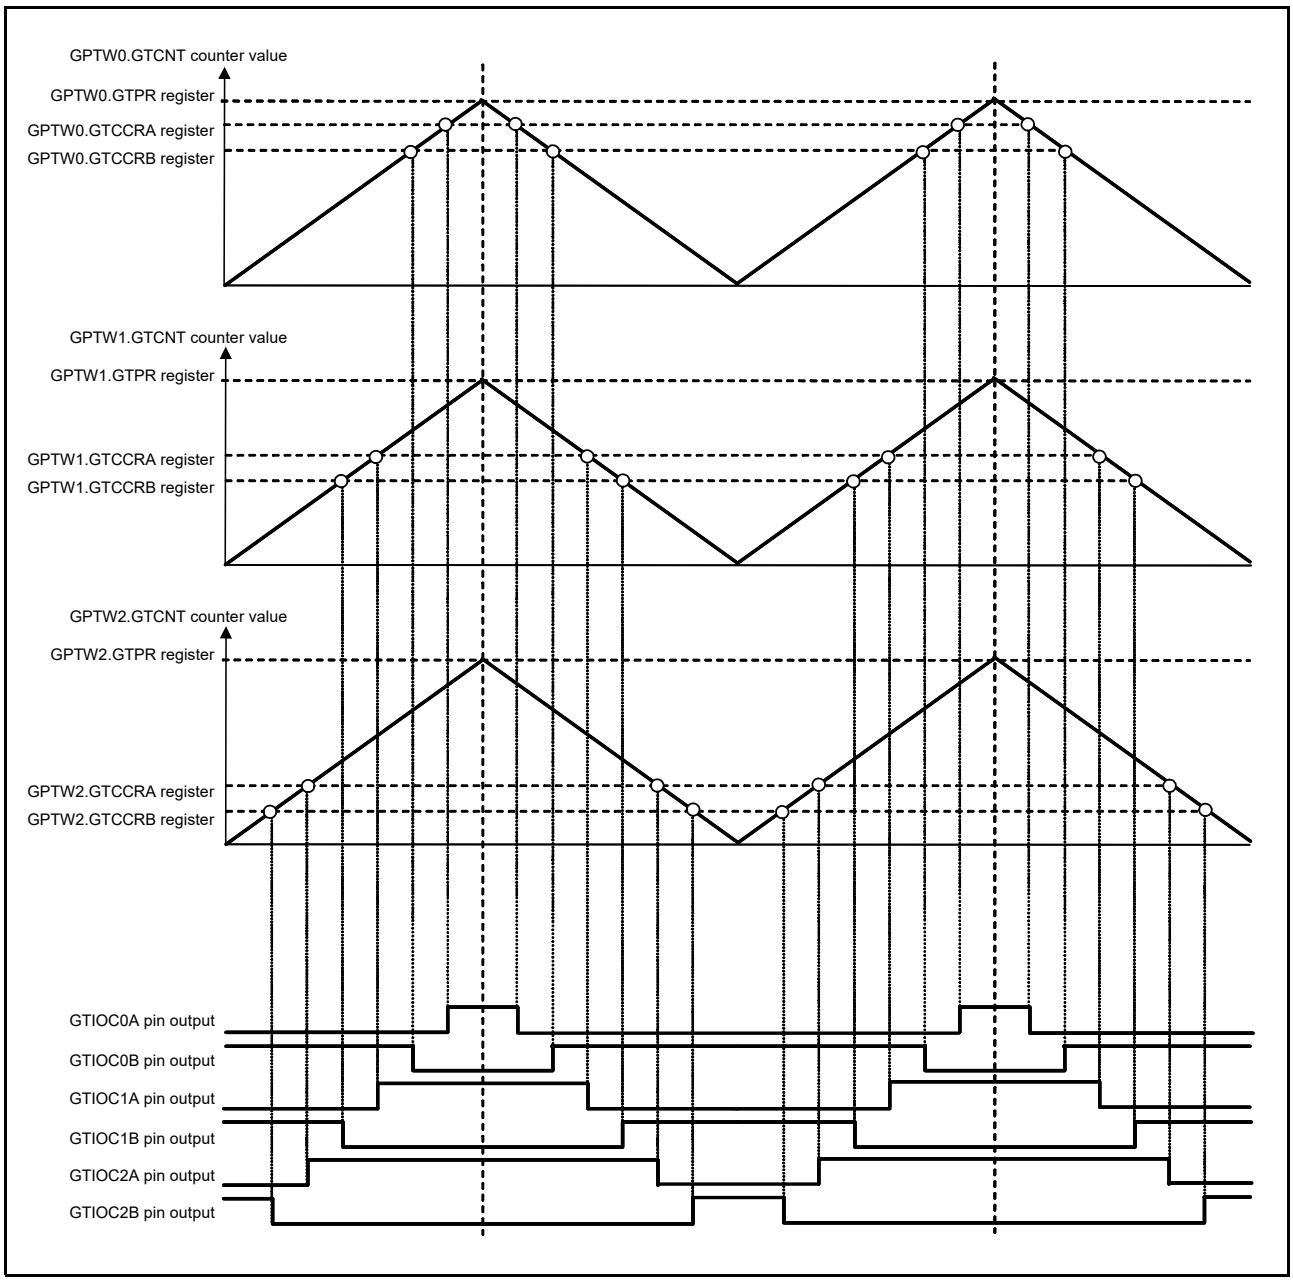

Figure 24.163 Example of Three-Phase Triangle-Wave Complementary PWM Output

(5) Three-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 24.164 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 1 with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

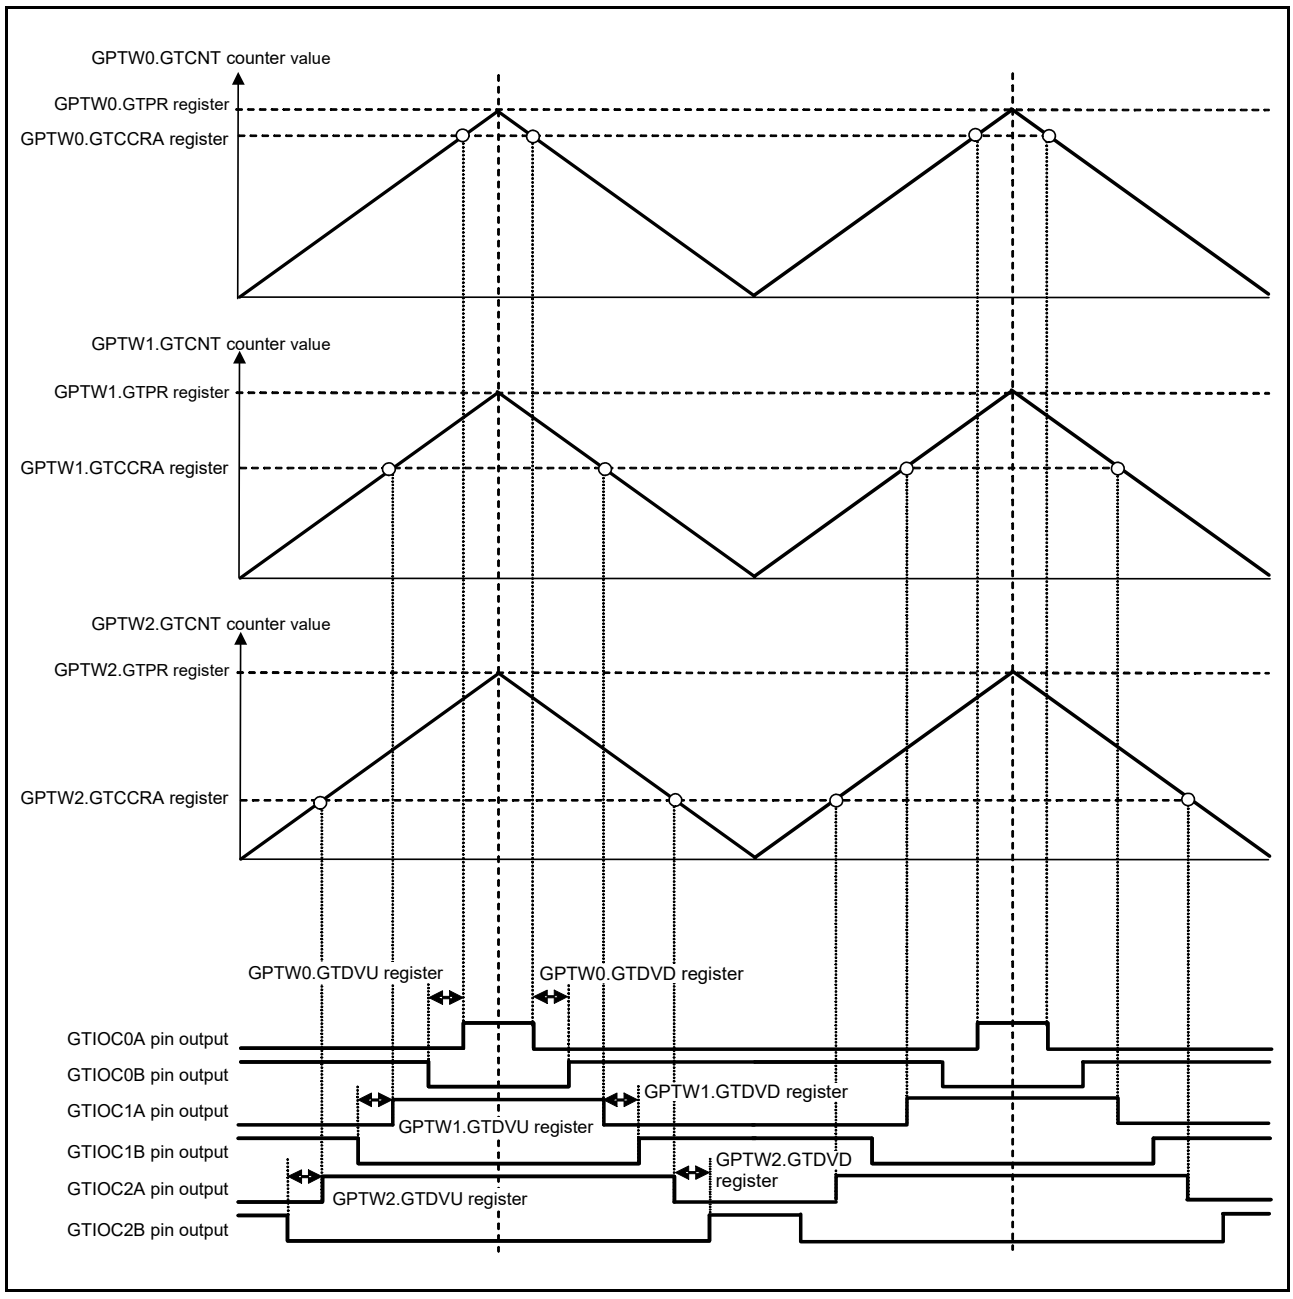

Figure 24.164 Example of Three-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

(6) Three-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 24.165 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 3 with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

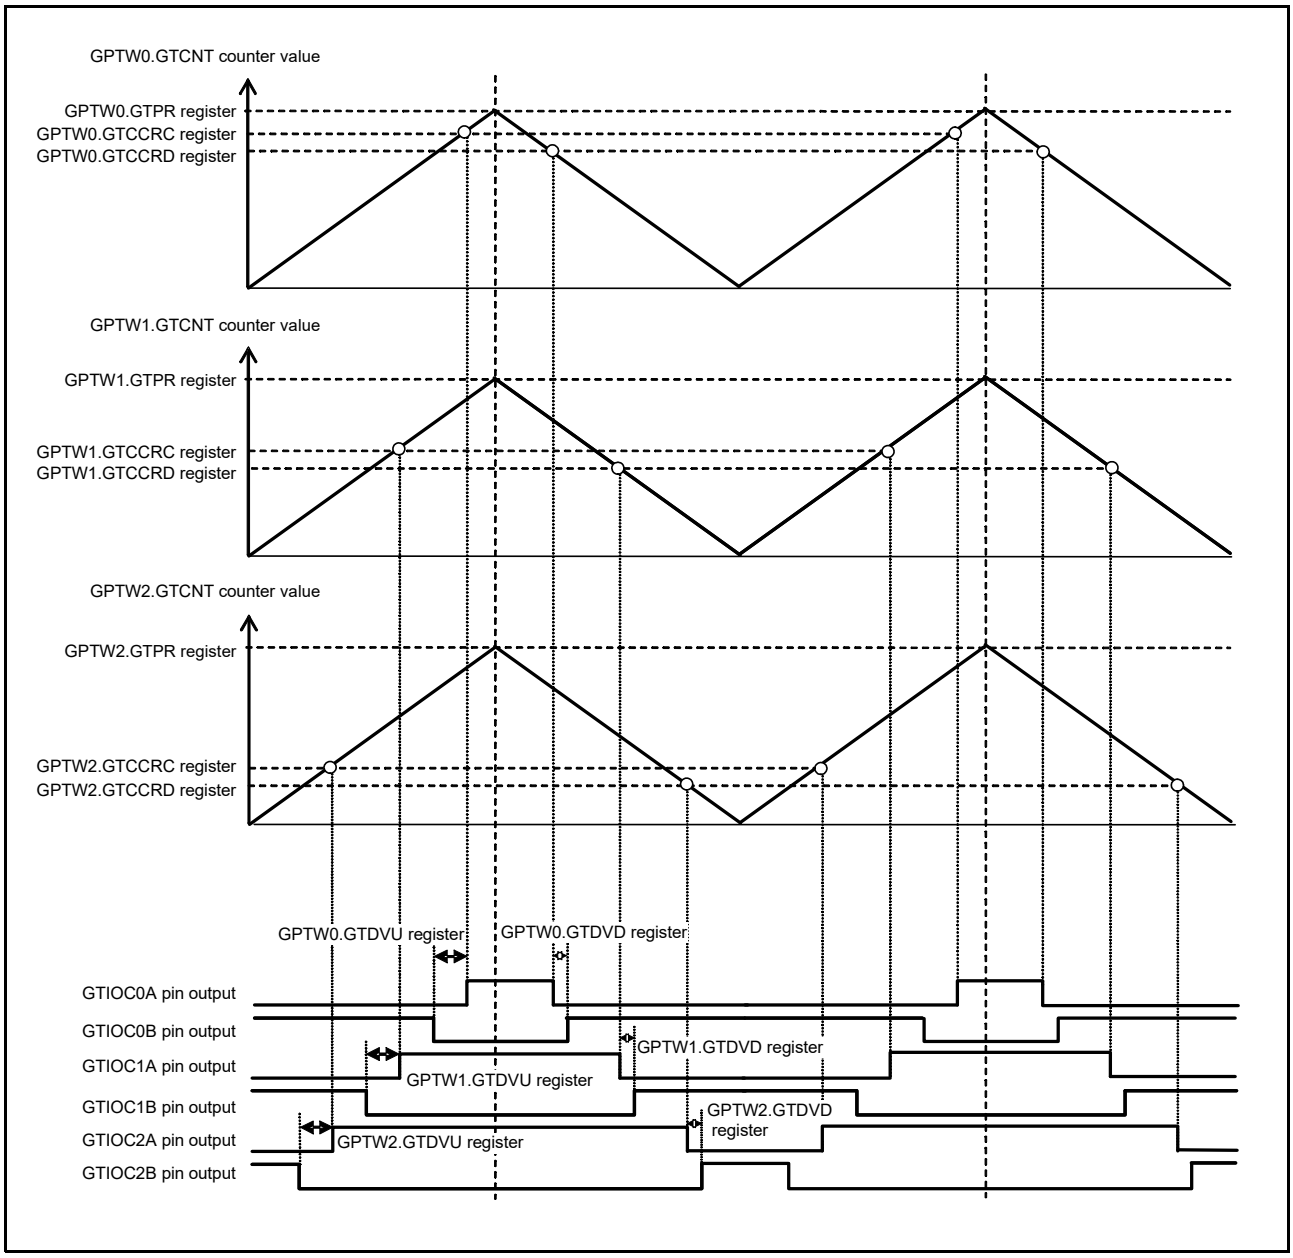

Figure 24.165 Example of Three-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

24.3.11 Cycle Count Function

By setting the GTPC register, the end of cycle can be counted.

The number of cycle to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of cycle. When the PCNT counter is 1 at the end of cycle, it becomes 0 and counting is stopped to finish the cycle count operation. At that time, the GTST.PCF flag is set, and a cycle count end interrupt request (GTCEIn) is generated if the setting of the GTINTAD.GTINTPC bit is 1. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the cycle count operation is finished.

When the GTCNT counter is stopped while cycle count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value. When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the cycle count function for multiple channels.

Figure 24.166 and Figure 24.167 show examples of PWM cycle count function.

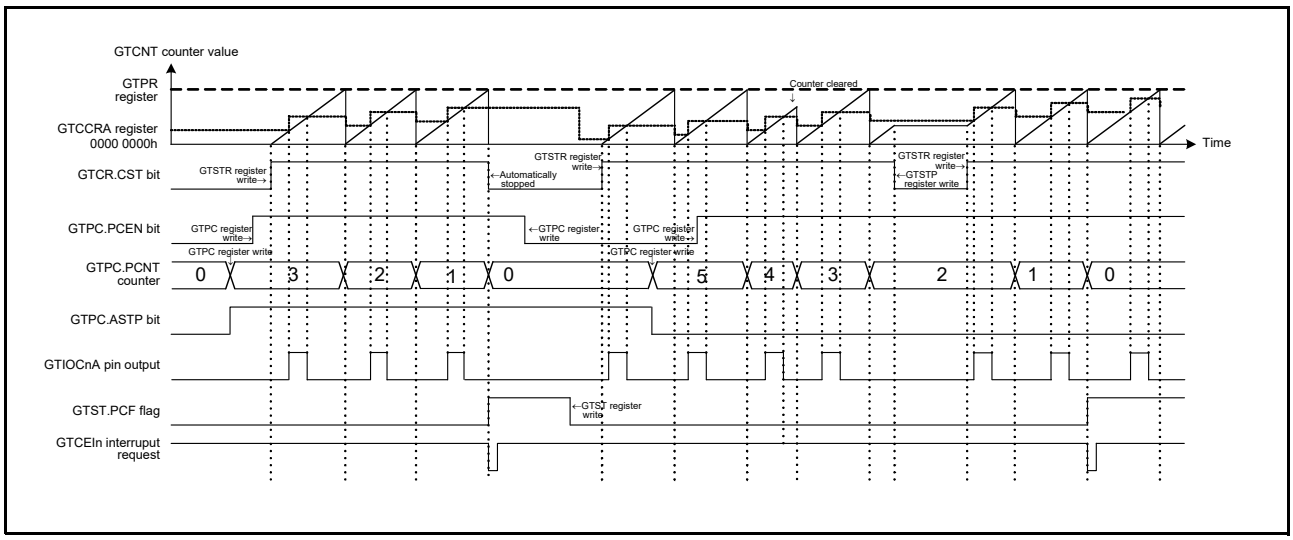

Figure 24.166 Example of PWM Cycle Count Function (Sawtooth-Wave One-Shot Pulse Mode) (n = 0 to 15)

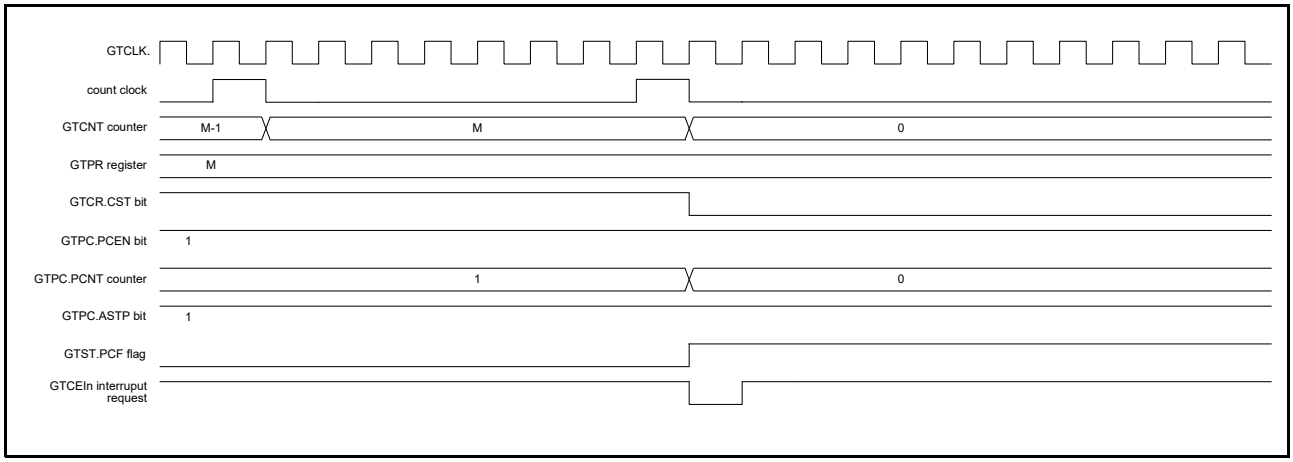

Figure 24.167 Example of the Timing of Operations for PWM Cycle Count Function (Sawtooth-Wave, Up-Counting) (n = 0 to 15)

24.3.12 Phase Counting Mode

The GTCNT counter can be up-counting or down-counting by detecting the phase difference between the GTIOCnA pin input (n = 0 to 15) and the GTIOCnB pin input.
Detection of the phase difference can be performed by setting the relationship between the edge and the level of the GTIOCnA pin input and the GTIOCnB pin input using the GTUPSR and GTDNSR registers for input combination.
Refer to section 24.3.1.1, Counter Operation for count operation.
Figure 24.168 to Figure 24.177 show the examples of setting procedure for the phase counting mode 1 to 5, and the Table 24.25 to Table 24.34 show the setting of the GTUPSR and GTDNSR registers and up-counting and down-counting conditions.

24.3.13 External Pulse Width Measuring Function

The pulse width of GTIOCnA pin input (n = 0 to 15), GTIOCnB pin input, and GTETRGA/GTETRGB/GTETRGC/GTETRGD pin inputs can be measured.

The setting to enable or disable count-up of the GTCNT counter and the input pin and level which measured pulse width are selected by the USILVL[3:0] bits of the GTUPSR register.

The setting to enable or disable count-down of the GTCNT counter and the input pin and level which measured pulse width are selected by the DSILVL[3:0] bits of the GTDNSR register.

The setting to enable both count-up and count-down of the GTCNT counter at the same time is prohibited.

The counting operation performs periodic counting with the period of the GTPR register.

If the phase counting function and the pulse width measuring function are enabled at the same time, the pulse width measuring function does not work and the phase counting function works.

Figure 24.178 and Figure 24.179 show examples of external pulse width measuring function and Figure 24.180 shows an example for setting external pulse width measuring function.

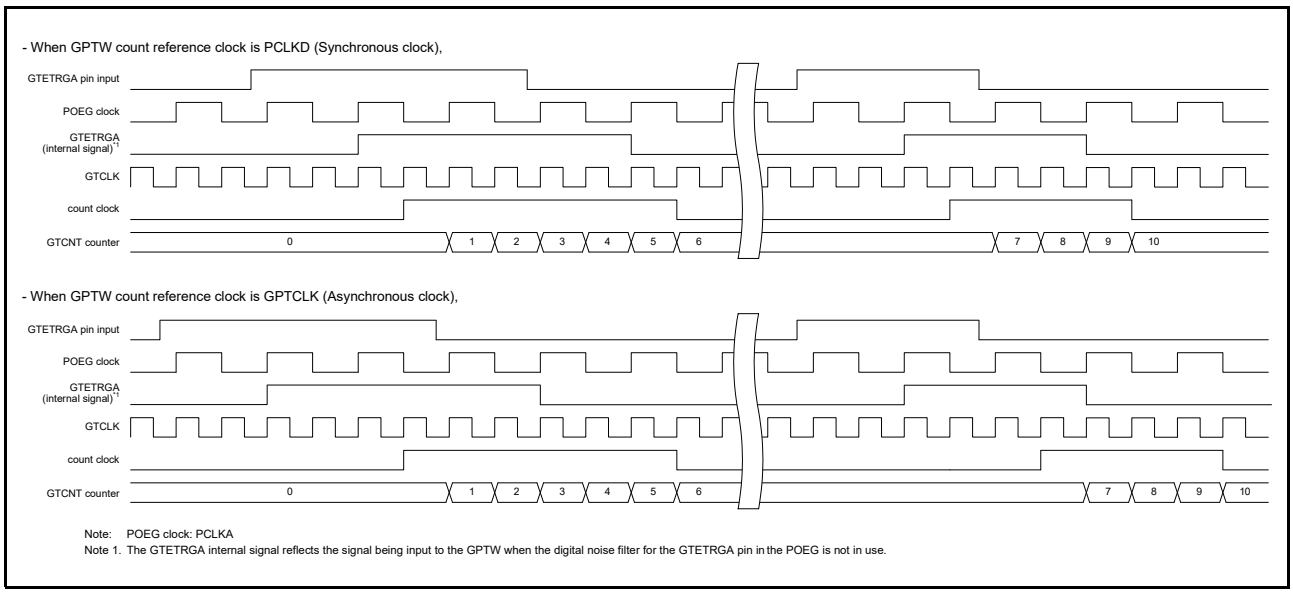

Figure 24.178 Example of External Pulse Width Measuring Function (Up-Counting)

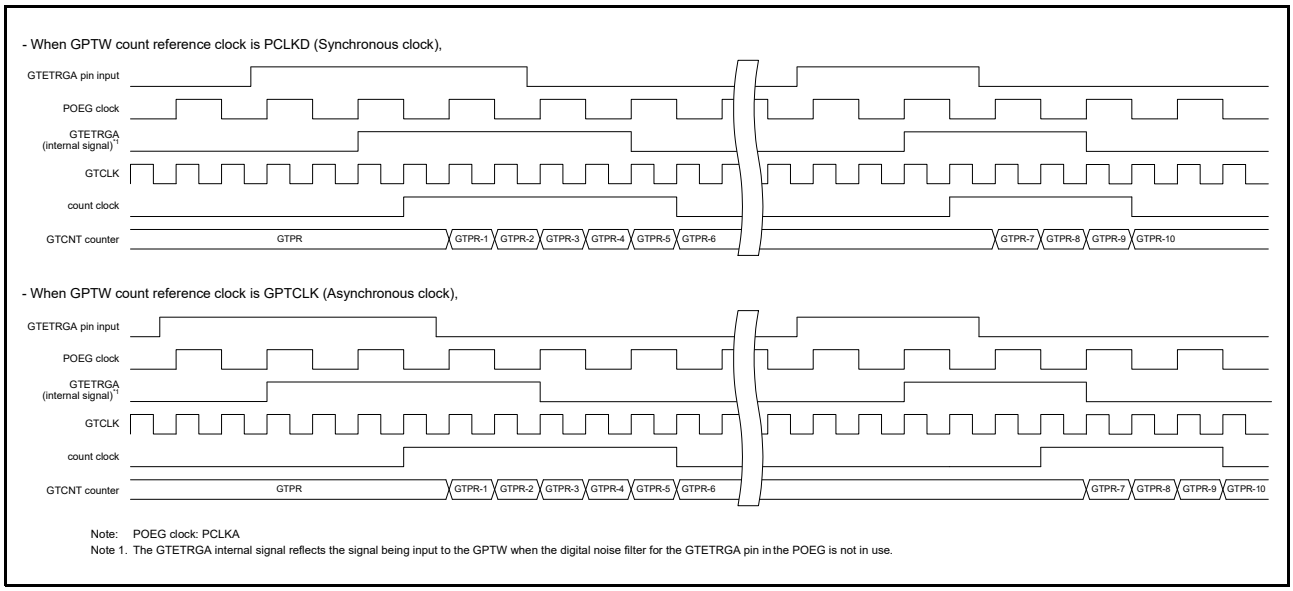

Figure 24.179 Example of External Pulse Width Measuring Function (Down-Counting)

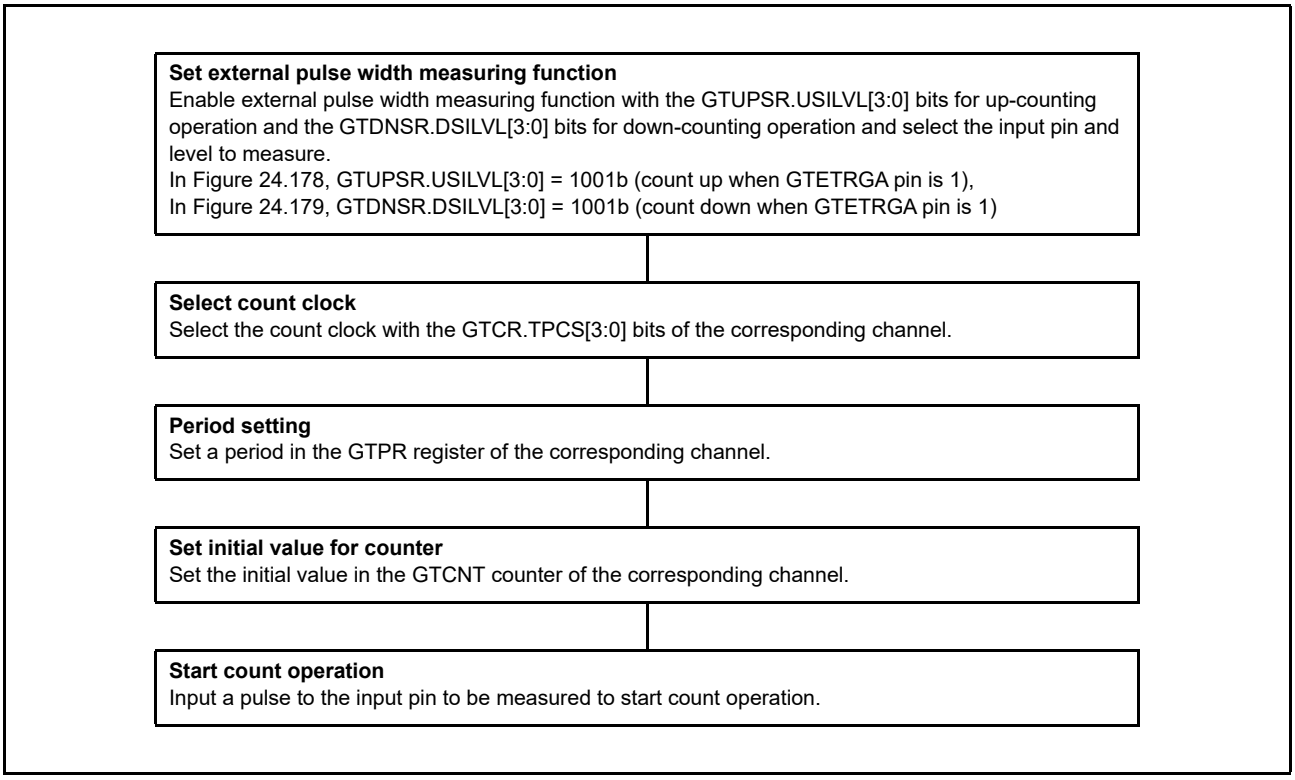

Figure 24.180 Example for Setting External Pulse Width Measuring Function

24.3.14 Output Phase Switching Control Function (OPS)

OPS can easily control Brushless DC motor using Output Phase Switching Control Register (OPSCR).
OPS uses S/W setting value (OPSCR.UF, VF, WF bits) or external signals detected by the Hall element as input signals.
OPS outputs either level signals or chopped signals by GPTW0's PWM as the 6-phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) signals to control motor.
Figure 24.181 shows the block diagram of OPS.
The GPT_UVWEDGE signal is output signal to ELC generated by detecting the edge of input signal.

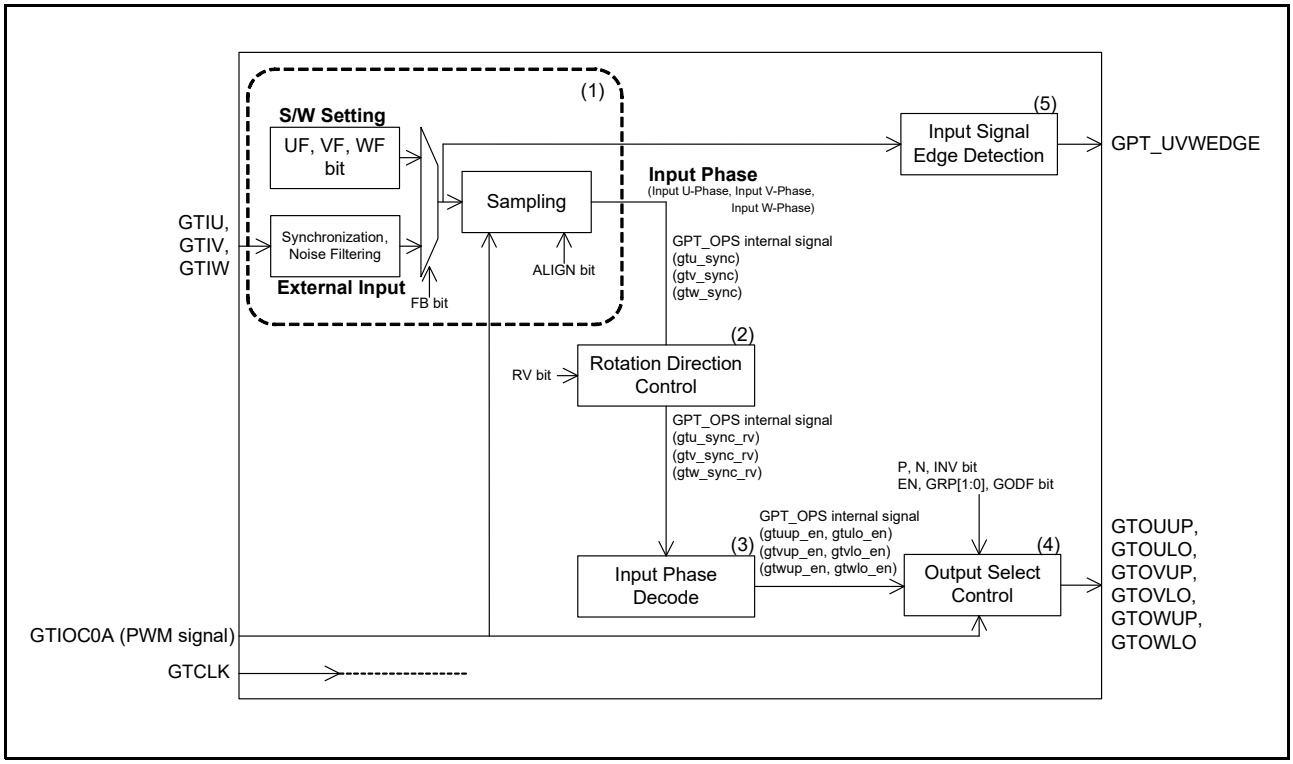

Figure 24.181 OPS Block Diagram

Figure 24.182 and Figure 24.183 show examples of OPS level output operation.

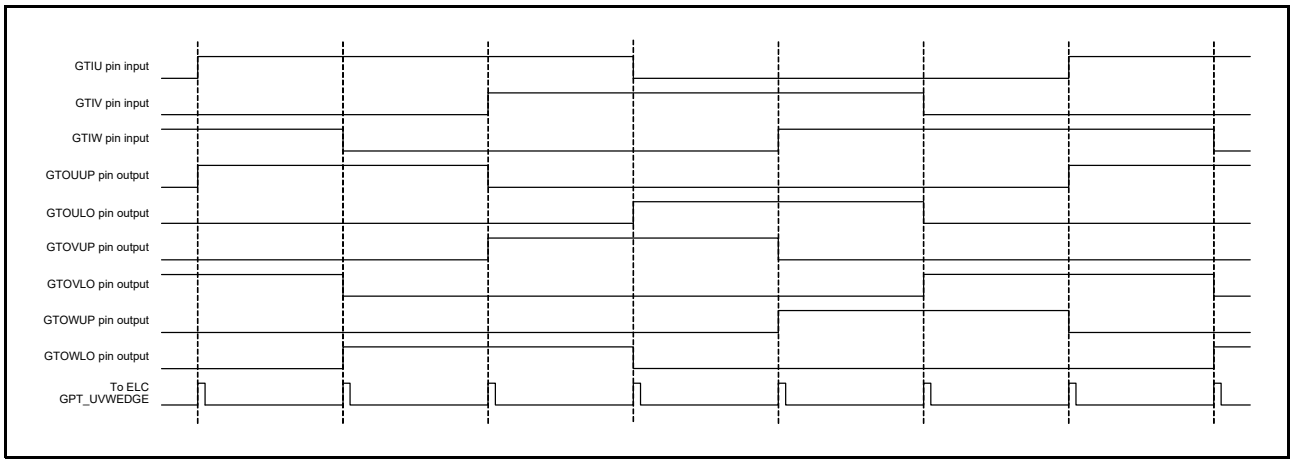

Figure 24.182 Example of OPS Level Output Operation (Forward Rotation) (FB = 0, RV = 0, P = 0, N = 0, INV = 0)

Figure 24.186 shows an example of OPS output disable control operation.

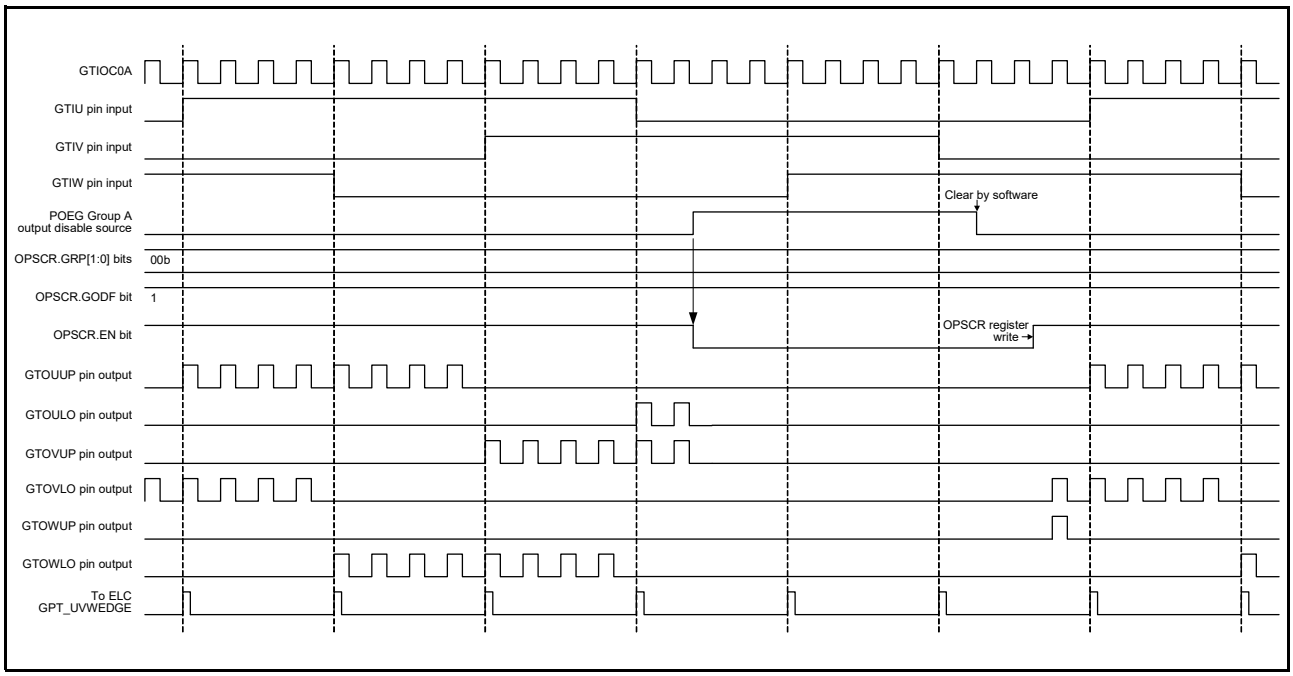

Figure 24.186 Example of OPS Output Disable Control Operation (FB = 0, RV = 0, P = 1, N = 1, INV = 0)

24.3.14.1 Input Selection and Sampling

The FB bit selects either the software setting value or external input for the input signal.
When the FB bit is 0, the GTIU, GTIV, GTIW external input are selected for the input signal to OPS after synchronization with the GPTW count reference clock (GTCLK) and noise filtering.
When the FB bit is 1, the software setting value (UF, VF, WF bits) are selected for the input signal to OPS.
The selected input signals are sampled by the method selected by the ALIGN bit, and they are treated as input phase of OPS.
When the ALIGN bit is 0, the input signals are sampled by GTCLK.
When the ALIGN bit is 1, the input signals are sampled by the falling edge of GTIOC0A pin output.
The signals after sampling can be read by the U, V, W bits.
Table 24.35 shows the input selection by the FB bit and sampling method by the ALIGN bit.

Table 24.35 Input Selection and Sampling Method

OPSCR Register		Input Selection Sampling Method	Interrupt Phase (OPS internal signal)
FB bit	ALIGN bit		
0	0	GTIU, GTIV, GTIW external input GTCLK sampling	Input U-phase (gtu_sync) Input V-phase (gtv_sync) Input W-phase (gtw_sync)
	1	GTIU, GTIV, GTIW external input GTIOC0A falling edge sampling	
1	0	Software setting value UF, VF, WF bit GTCLK sampling	
	1	Software setting value UF, VF, WF bit GTIOC0A falling edge sampling	

24.3.14.2 Rotation Direction Control

When the rotation direction is reverse (RV = 1), the input phase is inverted.

24.3.14.3 Input Phase Decode

The 6-phase signals by decoding input phase after rotation direction control are generated.
Table 24.36 and Table 24.37 show the decode tables of input phase to rotate motor in forward (RV = 0) and reverse (RV = 1).

Table 24.36 The Decode Table of Input Phase (Forward Rotation)

Input Phase			Input Phase after Rotation Direction Control			6-Phase Signals					
U-phase	V-phase	W-phase	U-phase	V-phase	W-phase	Positive U-phase	Negative U-phase	Positive V-phase	Negative V-phase	Positive W-phase	Negative W-phase

gtu_sync	**gtv_sync**	**gtw_sync**	**gtu_sync_rv**	**gtv_sync_rv**	**gtw_sync_rv**	**gtuup_en**	**gtulo_en**	**gtvup_en**	**gtvlo_en**	**gtwup_en**	**gtwlo_en**
1	0	1	0	1	0	0	1	1	0	0	0
1	0	0	0	1	1	0	1	0	0	1	0
1	1	0	0	0	1	0	0	0	1	1	0
0	1	0	1	0	1	1	0	0	1	0	0
0	1	1	1	0	0	1	0	0	0	0	1
0	0	1	1	1	0	0	0	1	0	0	1
0	0	0	0	0	0	0	0	0	0	0	0
1	1	1	1	1	1	0	0	0	0	0	0

24.3.14.4 Output Selection Control

The EN, P, N, INV bits select the output wave.
The EN bit enables output of the 6-phase output. When the EN bit is 1, output of the 6-phase output is enabled. When the EN bit is 0, the external pin output is Hi-Z.
The P, N bits select whether chopping positive and negative phase are performed or not. When P, N bits are 1, chopping is performed by GTIOC0A pin output.
When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.
The INV bit selects the polarity (either positive logic or negative logic) of phase output.
Table 24.38 and Table 24.39 show the output selection control method for positive and negative phase output.

Table 24.38 Output Selection Control Method (Positive Phase)

EN bit	P bit	INV bit	GTOnUP
0	—	—	0 (External pin output Hi-z)
1	0	0	Positive logic level output (gtmup_en)
1	0	1	Negative logic level output (~gtmup_en)
1	1	0	Positive logic chopped output (GTIOC0A & gtmup_en)
1	1	1	Negative logic chopped output (~(GTIOC0A & gtmup_en))

n = U, V, W
m = u, v, w

Table 24.39 Output Selection Control Method (Negative Phase)

EN bit	P bit	INV bit	GTOnLO
0	—	—	0 (External pin output Hi-z)
1	0	0	Positive logic level output (gtmlo_en)
1	0	1	Negative logic level output (~gtmlo_en)
1	1	0	Positive logic chopped output (GTIOC0A & gtmlo_en)
1	1	1	Negative logic chopped output (~(GTIOC0A & gtmlo_en))

n = U, V, W
m = u, v, w

24.3.14.5 Output Selection Control (Group Output Disable Function)

When the GODF bit is 1 and signal value selected by the GRP[1:0] bits is High (Output Disable Request), OPS's output pins are changed to Hi-Z asynchronously and the OPSCR.EN bit is cleared by the output disable request signal synchronized with GTCLK.
For the return, after clearing the Output Disable Request by software, set the EN bit to 1.
The timing of EN bit cleared is 3 GTCLK cycles after generating the output disable request. In order to perform the output disable control surely, the output disable request flag in POEG should be cleared in the timing that terminating the output disable request is at least 4 GTCLK cycles after generating the output disable request.
The example of the operation of the group output disable control, see the above-mentioned Figure 24.186.

24.3.14.6 Event Link Controller (ELC) Output

The logical sum of the pulse detected by rising and falling edge of U, V, W phase input is output to the event link controller (ELC). When the high level period of input phase is short, there are cases that the detected edge is not transmitted to the ELC correctly because of the logical sum.

24.3.14.7 OPS Start Operation Setting Flow

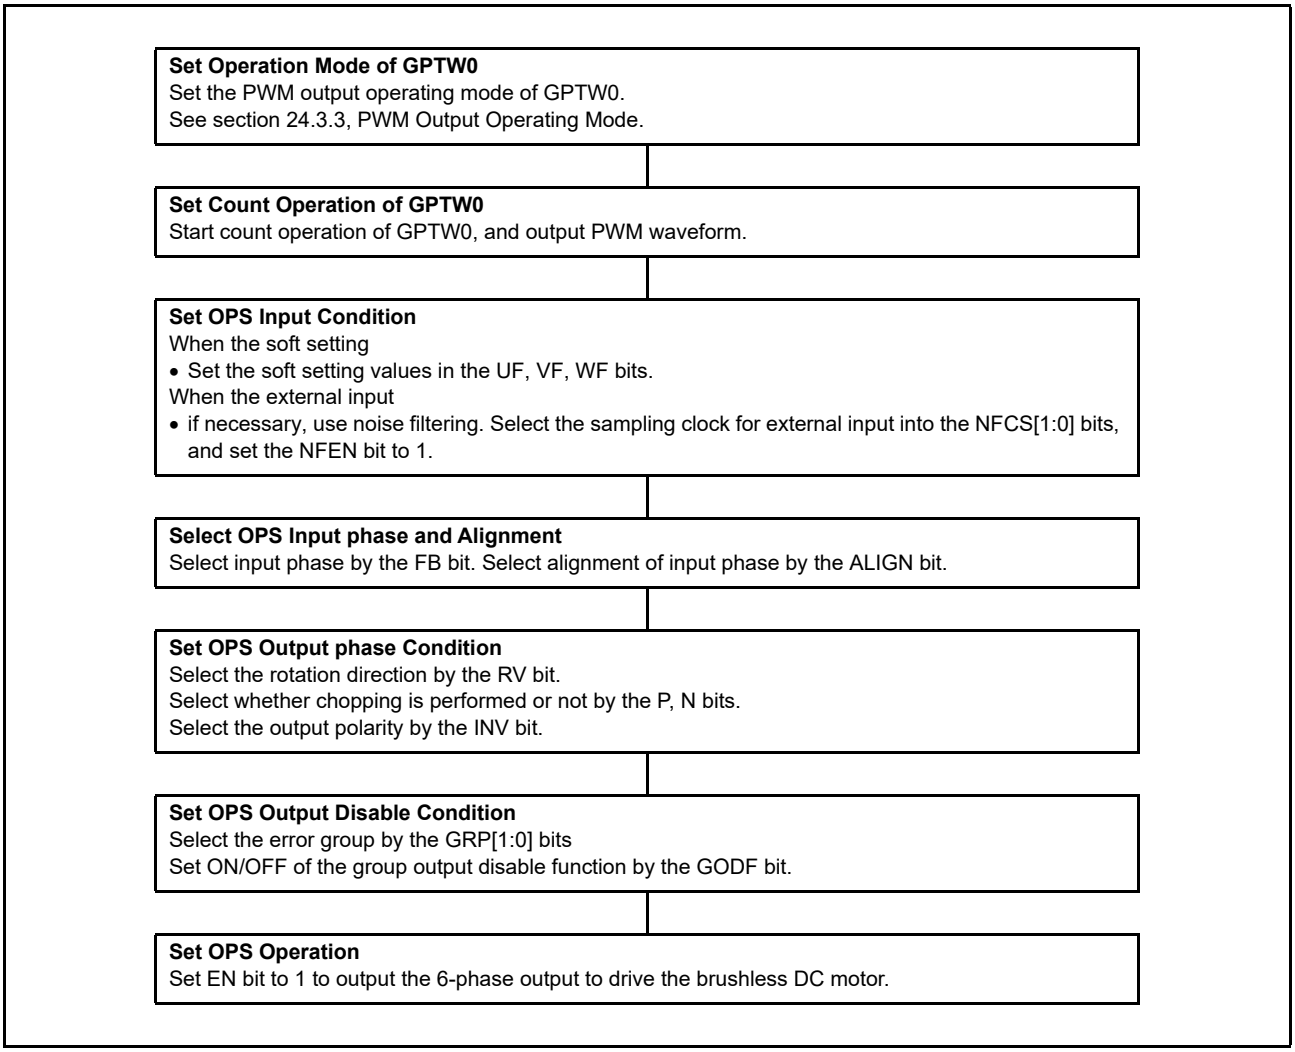

Figure 24.187 Example for Setting OPS Start Operation

24.3.15 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

Figure 24.188 shows the block diagram of inter channel logical operation.

To prevent hazard to the this function output, the signal after logical operation is latched with GTCLK. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 GTCLK is selected, the output enable signal is also delayed with 1 GTCLK and input to the output disable control. The execution of a logical operation does not delay the interrupts, A/D conversion start requests, and event signal output to the ELC.

When the same signal (C = A or D = B) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

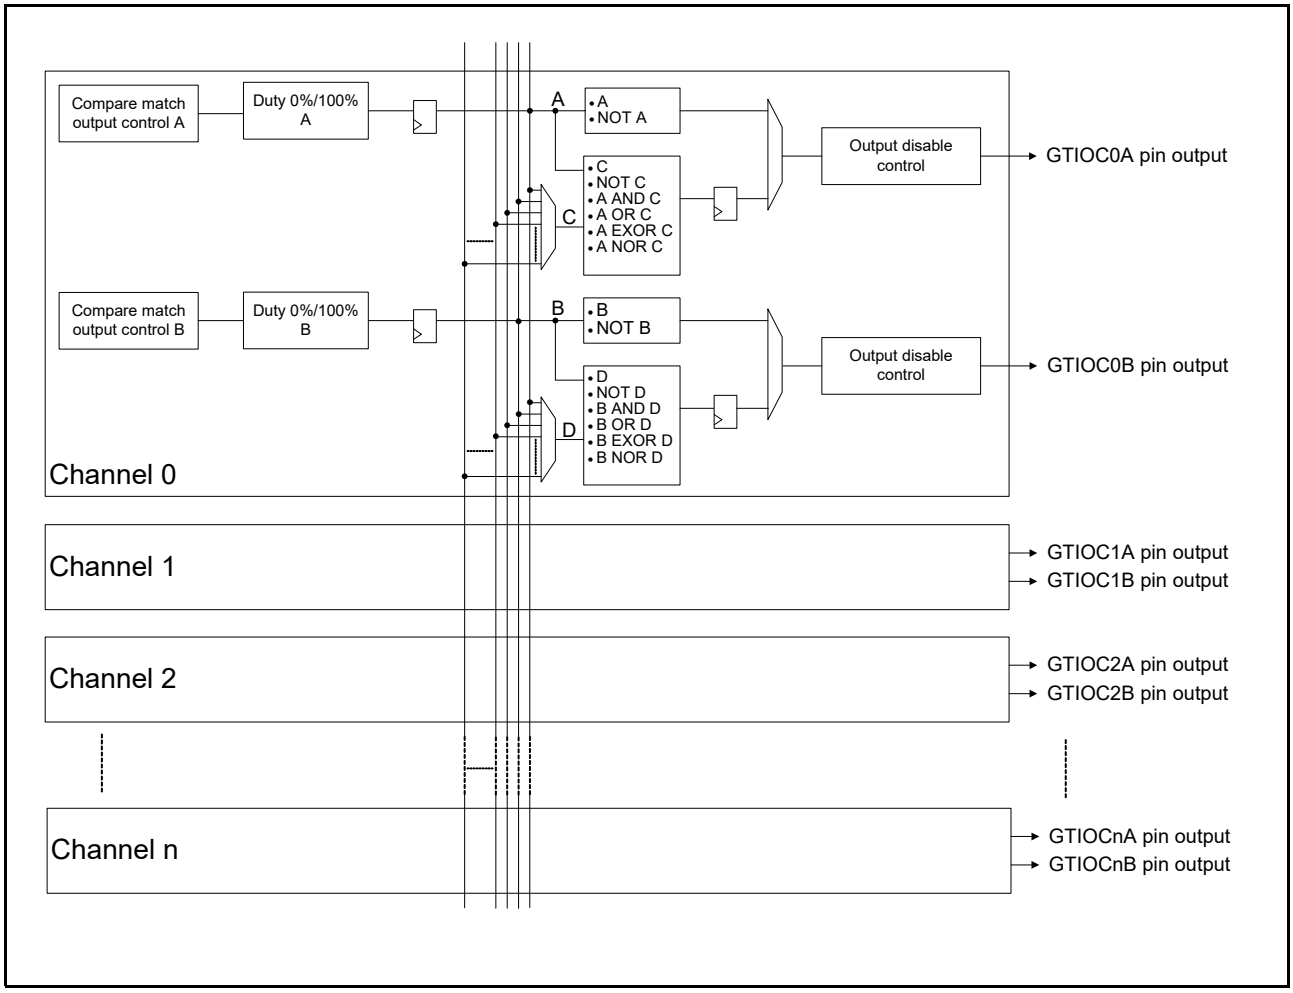

Figure 24.188 Block Diagram of Inter Channel Logical Operation

Figure 24.189 shows an example of inter channel logical operation.

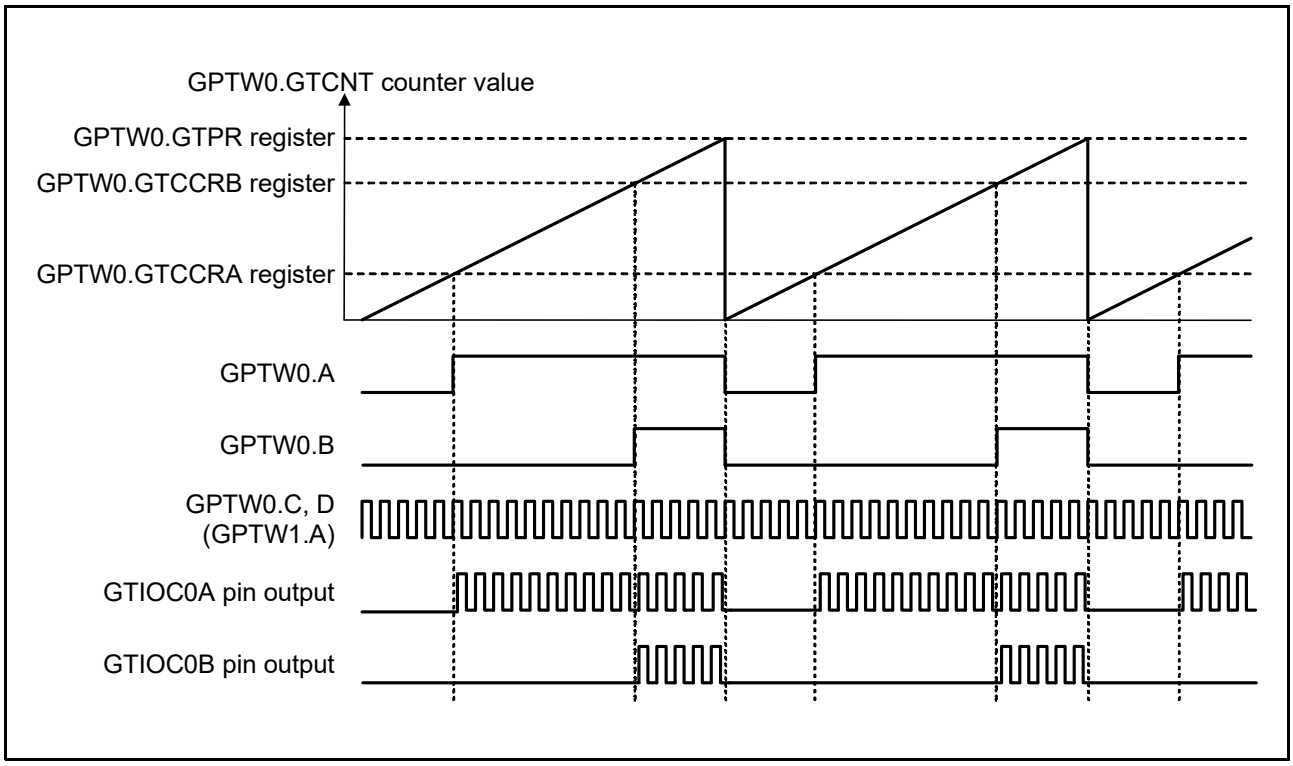

Figure 24.189 Example of Inter Channel Logical Operation (When GPTW0.GTICLF.ICLFA[2:0] = 100b, ICLFB[2:0] = 100b, GPTW0.GTICLF.ICLFSELC[5:0] = 000010b, ICLFSELD[5:0] = 000010b)

24.3.16 GTIOCnA/GTIOCnB Input/Output Pin Polarity Reversal Function

The polarity of the GTIOCnA, GTIOCnB input pins and the GTIOCnA, GTIOCnB output pins can be inverted according to the polarity of the external device.

When the GTCR.AINV bit is 1, the input and output of GTIOCnA are inverted. When the GTCR.BINV bit is 1, the input and output of GTIOCnB are inverted.

The input and output of GTIOCnA and GTIOCnB are inverted immediately after input and at the final output stage, respectively. Configure the settings considering that the external input and output signals are inverted, especially when GTIOCnA and GTIOCnB are used as factors for count start/stop/clear, count-down/count-up, or input capture, or when low/high/toggle output is used as PWM output.

Set GTCR.AINV and BINV after setting the GTIOCnm pin functions during initial settings.

24.3.17 Timer-Linked Synchronization Signal Output Function

The pulse signal (timer-linked synchronization signal) GTSYNC0A can be output to synchronize the A/D converter (ADC16H) and the timer operation of the GPTW upon compare match of the GTCNT counter value and the GTCCRA register value.
It is also possible to output a pulse signal (timer-internal synchronization signal) GTSYNCIN0 for synchronous operation between channels in the GPTW when an overflow (during up-count operation) occurs in sawtooth-wave PWM mode 1.
The SYSG[1:0] bits of the GTSYNCSCR register can be used to select whether to enable or disable output of the timer-linked synchronization signal and the timer-internal synchronization signal.
When GTSYNCSCR.SYSG[1:0] is 01b, the timer-linked synchronization signal pulse is output in response to a compare match with GTCCRA register, and the timer-internal synchronization signal pulse is output when an overflow (during counting up) occurs in sawtooth-wave PWM mode 1.
The SYST bit of the GTSYNCFCR register can be used to select the channel to be synchronized with the timer-internal synchronization signal for the count start/stop/clear operations.
Refer to section 62, 16-Bit A/D Converter (ADC16H) for the control method for synchronously operating ADC16H using the timer-linked synchronization signal.
Set the sawtooth wave PWM mode 1 for the channel that outputs the timer-linked synchronization signal and the timer-internal synchronization signal.
Set the GTSYNCFCR and GTSYNCSCR register before starting the count during initial setting.
Set the GTPR values of the synchronization control channel and synchronization target channel according to the synchronization period cycle of ADC16H to be synchronized with the timer of GPTW.
Set the GTPR value of the synchronization control channel to the same count cycle as the synchronization period of ADC16H. Setting the GTPR value of the synchronization control channel to 0 is prohibited.
Set the GTPR value of the synchronization target channel to a period that is an integral multiple of the GTPR value of the synchronization control channel. Figure 24.194 shows an example of the relationship between ADC16H, synchronization control channel, and synchronization target channel count cycles.
The specifications for the synchronization control channel are as follows.

- Only sawtooth PWM mode 1 is available.
- Only up-counting is possible for the counting direction.
- Synchronization control channel is prohibited from using a frequency-divided clock. Set the GTCR.TPCS[3:0] bits to 0000b.
- The GPTW's own frequency-divided clock is also synchronized with the timer-internal synchronization signal. If the synchronization control channel is stopped, the divided clock is resynchronized when the synchronization control channel is restarted.
- Start counting while all GPTW channels and ADC16H are stopped.
- Always operate the synchronization control channel while GPTW and ADC16H are operating.
- Always operate the synchronization control channel except when resetting.
- Stop the counter when changing the GTCCRA register value and the GTPR value of the synchronization control channel.
- Buffer setting is prohibited for synchronization control channel.
- Clear the counter when stop the synchronization control channel counter and start counting again.

The specifications for the synchronization target channel are as follows.

- Supports all PWM modes. (When using complementary PWM mode as a synchronization target, not only the master channel but also the slave channel must be set as a synchronization target.)
- Synchronization target channel can use divided clock.
- The count start/stop/clear is synchronized with the timer-internal synchronization signal.

- When performing synchronous clearing by inter channel cooperation, the GTSYNCFCR.SYST bit setting must match the opposite channel setting.

Figure 24.190 and Figure 24.191 show examples of synchronization control channel settings.
Figure 24.192 shows a configuration example of the timer-linked synchronization signal and the timer-internal synchronization signal.
Figure 24.193 shows an example of the timer-linked synchronization signal and the timer-internal synchronization signal operation.
Figure 24.194 shows the relationship of synchronization between the synchronization control channel, synchronization target channel, and ADC16H.

24.4 Interrupt Sources

24.4.1 Interrupt Sources and Priorities

There are four kinds of interrupt sources; GTCCRm register (m = A to F) input capture/compare match GTCNT counter overflow (GTPR register compare match)/underflow, cycle count finish, and dead time error.
Each interrupt source has its own status flag and control bit for generating interrupt request signals, where the generation of interrupt request signals can be enabled or disabled individually.
When an interrupt source condition is satisfied, the corresponding status flag in the GTST register is set to 1, and an interrupt request is generated if the corresponding interrupt request enable or disable bit in the GTINTAD register is 1.
The corresponding status flag in the GTST register can be cleared by writing to it. If a flag set and a flag clear occur simultaneously, clearing has priority over setting.
For details, refer to section 15, Interrupt Controller (ICUM). Table 24.40 shows a list of GPTW interrupt sources.

Table 24.40 GPTW Interrupt Sources (n = 0 to 15)

Channel	Name	Interrupt Source	Interrupt Flag
GPTWn	GTCIAn	GTCCRA register input capture/compare match	GPTWn.GTST.TCFA
	GTCIBn	GTCCRB register input capture/compare match	GPTWn.GTST.TCFB
	GTCICn	GTCCRC register compare match	GPTWn.GTST.TCFC
	GTCIDn	GTCCRD register compare match	GPTWn.GTST.TCFD
	GDTEn	Dead time error	GPTWn.GTST.DTEF
	GTCEIn	Cycle count end	GPTWn.GTST.PCF
	GTCIEn	GTCCRE register compare match	GPTWn.GTST.TCFE
	GTCIFn	GTCCRF register compare match	GPTWn.GTST.TCFF
	GTCIVn	GTCNT counter overflow (GTPR register compare match)	GPTWn.GTST.TCFPO
	GTCIUn	GTCNT counter underflow	GPTWn.GTST.TCFPU

(1) GTCIAn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTA bit is 1, an interrupt request is generated under the following conditions.

- When the GTCCRA register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the input-capture signal has caused transfer of the GTCNT counter value to the GTCCRA register. In complementary PWM mode, GTCCRA register does not function as an input capture register.

(2) GTCIBn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTB bit is 1, an interrupt request is generated under the following conditions.

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches the GTCCRB register.In complementary PWM mode, GTCCRB register does not function as a compare match register.
- When the GTCCRB register functions as an input capture register, the input-capture signal has caused transfer of the GTCNT counter value to the GTCCRB register. In complementary PWM mode, GTCCRB register does not function as an input capture register.

(3) GTCICn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTC bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRC register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRC register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] bits = 01b, 10b, 11b (buffer operation with the GTCCRC register)

(4) GTCIDn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTD bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRD register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRD register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] bits = 10b, 11b (buffer operation with the GTCCRD register)

(5) GTCIEn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTE bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRE register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] bits = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(6) GTCIFn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTF bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRF register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRF register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] bits = 10b, 11b (buffer operation with the GTCCRF register)

(7) GTCIVn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTPR[0] bit is 1, an interrupt request is generated under the following conditions.

- In sawtooth-wave mode, interrupt requests are enabled at overflows (the GTCNT counter value changes from the GTPR register value to 0 during up-counting).
- In sawtooth-wave PWM mode 1 and sawtooth-wave one-shot pulse mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from the GTPR register value to 0 during up-counting).
- In sawtooth-wave PWM mode 2, interrupt requests are enabled at overflows (the GTCNT counter value changes

from GTCCRm (m = A to F) register value selected with GTCSR.CSCMSC[2:0] bits to 0000 0000h) or the time when GTCNT counter value matches GTPR register value.

- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT counter value changes from the GTPR register value to the GTPR register value minus 1).
- In complementary PWM mode, interrupt requests are enabled at crests (the GTCNT counter value of master channel changes from the GTPR register value to the GTPR register value minus 1).
- In counting driven by a hardware source, including counting for the external pulse width measuring function, interrupt requests are enabled on overflows (that is, when the GTCNT counter value changes from the GTPR register value to 0 during up-counting).

(8) GTCIUn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTPR[1] bit is 1, an interrupt request is generated under the following conditions.

- In sawtooth-wave mode, interrupt requests are enabled at underflows (the GTCNT counter value changes from 0 to the GTPR register value during down-counting).
- In sawtooth-wave PWM mode 1 and sawtooth-wave one-shot pulse mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from the GTPR register to 0 during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT counter value changes from 0 to 1).
- In complementary PWM mode, interrupt requests are enabled at troughs (the GTCNT counter value of master channel changes from 0 to 1).
- In count operation by a hardware source (include external pulse width measuring function), interrupt requests are enabled at underflows (the GTCNT counter value changes from 0 to the GTPR register value during down-counting).

(9) GDTEn Interrupt (n = 0 to 15)

When automatic dead time setting has been made, the GTST.DTEF flag becomes 1 when the timer output toggle point with dead time added exceeds the count period. If the GTINTAD.GRPDTE bit is 1 at this time, a dead time error interrupt request (GDTE) is generated.
In addition, when the timer output toggle point with dead time added is back within the count period, the GTST.DTEF flag changes from 1 to 0.

(10) GTCEIn Interrupt (n = 0 to 15)

When the GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1, and the end of the cycle is reached, if the GTINTAD.GTINTPC bit is 1, a cycle count end interrupt (GTCEI) request is generated.

Table 24.41 shows relationships between interrupt signals and interrupt enable bits.

Table 24.41 Relationship between Interrupt Signals and Interrupt Enable Bits (n = 0 to 15)

Interrupt Signal	Interrupt Enable Bit	Status Flag
GTCIAn	GTINTAD.GTINTA bit	GTST.TCFA Flag
GTCIBn	GTINTAD.GTINTB bit	GTST.TCFB Flag
GTCICn	GTINTAD.GTINTC bit	GTST.TCFC Flag
GTCIDn	GTINTAD.GTINTD bit	GTST.TCFD Flag
GDTEn	GTINTAD.GRPDTE	GTST.DTEF Flag
GTCEIn	GTINTAD.GTINTPC	GTST.PCF Flag
GTCIEn	GTINTAD.GTINTE bit	GTST.TCFE Flag
GTCIFn	GTINTAD.GTINTF bit	GTST.TCFF Flag
GTCIVn	GTINTAD.GTINTPR[1:0] bits	GTST.TCFPO Flag
GTCIUn		GTST.TCFPU Flag

24.4.2 DMAC/DTC Activation

The DMAC and DTC can be triggered by the interrupt request in each channel. For details, see section 15, Interrupt Controller (ICUM), section 18, DMA Controller (DMACAa), section 20, Data Transfer Controller (DTCA).

24.4.3 Interrupt and A/D Conversion Start Request Skipping Function

24.4.3.1 Interrupt Skipping Function by GTITC Register

By setting the GTITC register, the GTCNT counter overflow (GTPR register compare match) interrupt (GTCIV) and underflow interrupt (GTCIU) can be skipped. Other interrupts and A/D conversion start request signals can be skipped in coordination with the GTCIV/GTCIU skipping function. However, the dead time error interrupts cannot be linked with the GTCIV/GTCIU skipping function.

When the interrupt is skipped, the updating of relevant status flag is also skipped. The interrupt skipping is continued even if the status flag is set to 1.

The interrupt skipping function is related only to the GTITC register setting, and is not related to setting of the GTINTAD register interrupt enable bit. The interrupt enable bit is used only to control the output of the interrupt signal after thinning out.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GTCIV/GTCIU interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. Therefore, in order to count both troughs and crests and generate the GTCIV/GTCIU interrupts at troughs only or crests only in triangle-wave mode, the number of times of skipping should be even.

Similarly, in sawtooth-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GTCIV/GTCIU interrupt requests cannot be generated at overflows only or at underflows only. Therefore, in order to count both overflows and underflows with the count direction changed and generate the GTCIV/GTCIU interrupts at overflows only or underflows only in sawtooth-wave mode, the skipping state should be carefully checked before using.

When changing the skipping count, be sure to release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 24.195 to Figure 24.200 show examples of skipping function operation.

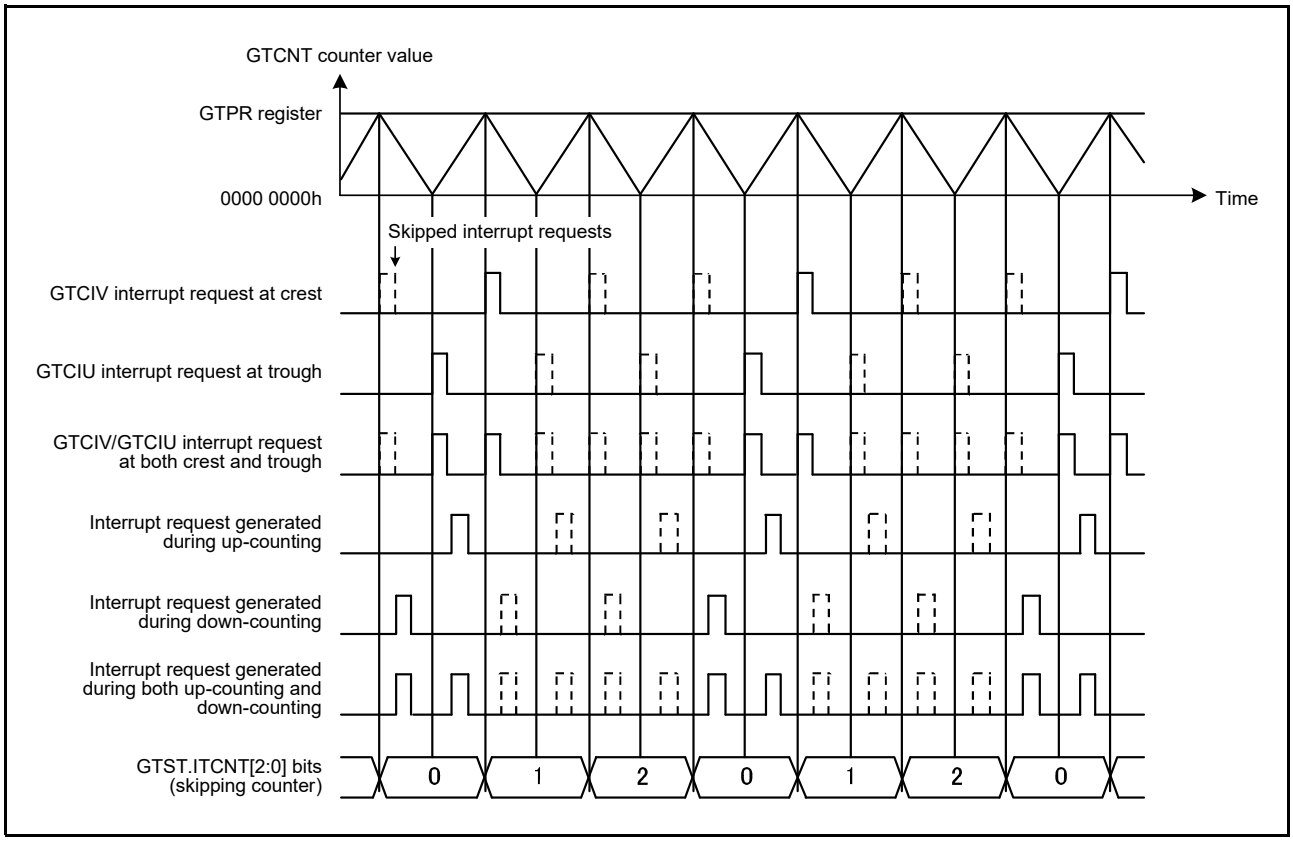

Figure 24.195 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Crests, Skipping Count: 2)

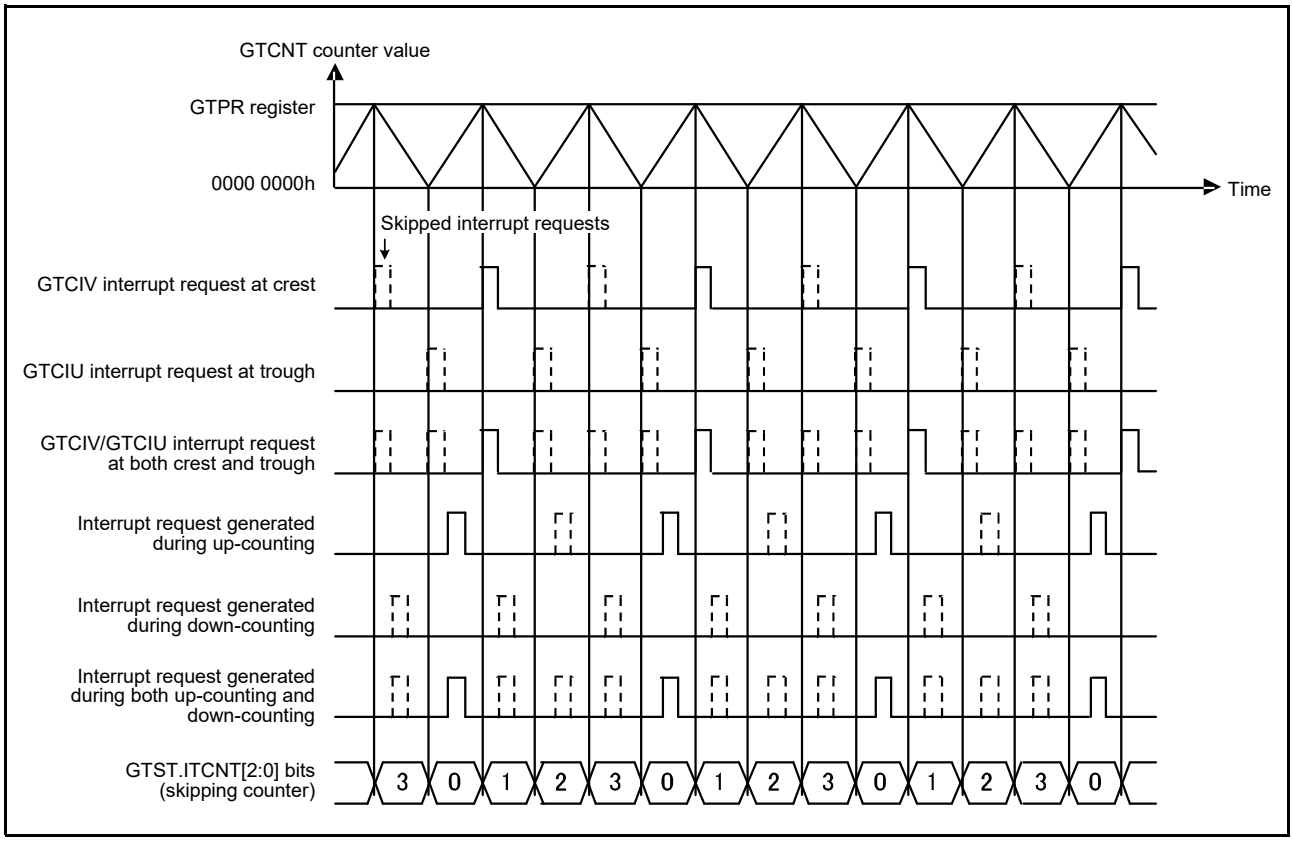

Figure 24.199 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Down-Counting)

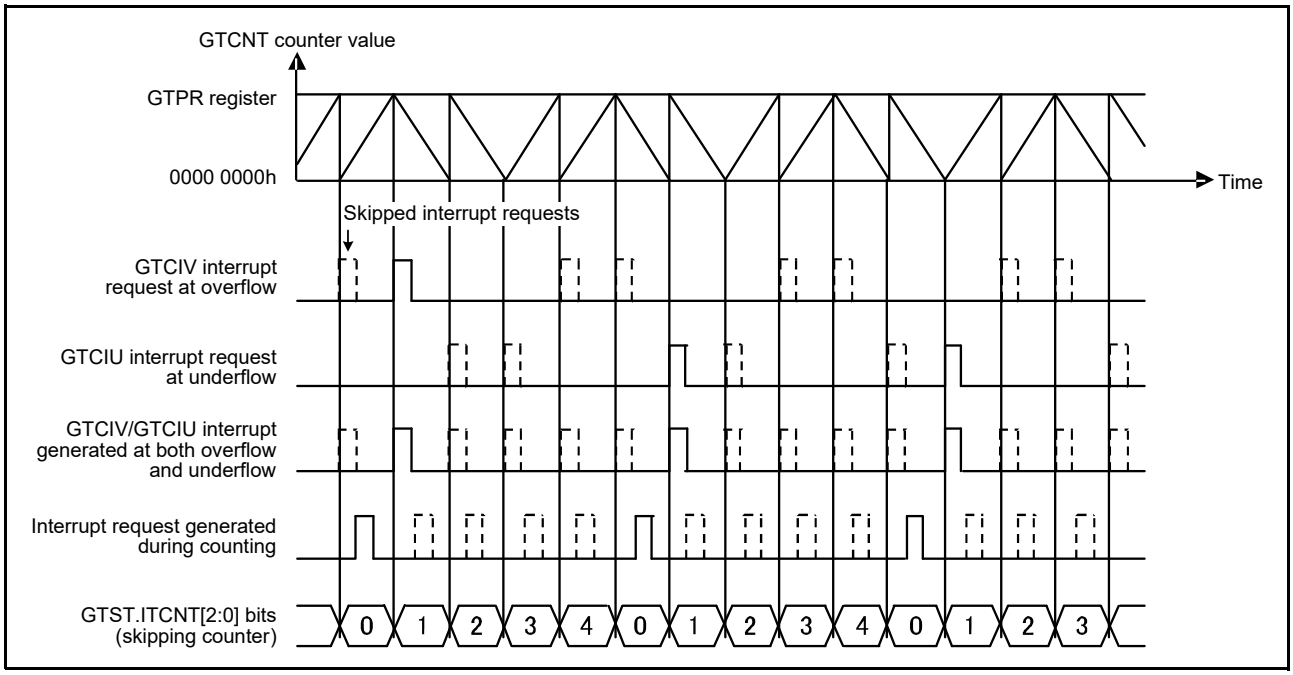

Figure 24.200 Example of Interrupt Skipping Function Operation (Sawtooth Waves, Operation with Count Direction Changed, Counting and Skipping Both Overflows and Underflows, Skipping Count: 4)

24.4.3.2 Extended Interrupt Skipping Function

Overflow/underflow interrupt, compare match/input capture interrupt, A/D conversion start request, and buffer transfer can be skipped by counting the GTCNT counter overflow or underflow based on settings of the GTEITC, GTEITLI1, GTEITLI2 and GTEITLB registers. The dead time error interrupt cannot be skipped.

The skipping enable setting and the skipping period can be individually configured using the GTEITLI1, GTEITLI2, and GTEITLB registers for overflow/underflow interrupt, compare match/input capture interrupt, A/D conversion start request, and buffer transfer.

The skipping period is configured based on the values of the two independent extended interrupt skipping counters (the EITCNT1[3:0] and EITCNT2[3:0] bits in the GTEITC registers). It can be specified during the period in which either skipping counter value is other than 0 or other than the skipping count. It can also be specified during the period in which both skipping counters are other than 0 or other than the skipping count.

Figure 24.201 shows the counter operation for interrupt skipping by the GTITC register and extended interrupt skipping.

The counter operation for extended interrupt skipping is set by the GTEITC register.

The EITCNT1[3:0] bits count the count source (in Figure 24.201, a crest is selected) selected by the extended interrupt counter 1 count source select bit (the EIVTC1[1:0] bits) from the initial value of 0. It returns to 0 when the counter reaches the skipping count (in Figure 24.201, count is 2) set by the extended interrupt skipping 1 skipping count setting bit (the EIVTT1[3:0] bits), and then repeats the counting operation.

The EITCNT2[3:0] bits can set the initial value, count the count source (in Figure 24.201, a trough is selected) selected by the extended interrupt counter 2 count source select bit (the EIVTC2[1:0] bits), and repeat the count operation which return to 0 when the skipping count (in Figure 24.201, count is 2) set by the EIVTT2[3:0] bits is achieved. The initial value is set when the GTEITC register is written by the access of upper 16 bits or 32 bits and when the written value to the EIVTC2[1:0] bits is other than 00b, while the setting for the extended interrupt skipping counter 2 is not in counting (the EIVTC2[1:0] bits are 00b).

When the initial value is set, the written value to the extended interrupt skipping counter 2 initial value bit (the EITCNT2IV[3:0] bits) is set as the initial value for the EITCNT2[3:0] bits.

The extended interrupt skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The interrupt skipping count counter (the GTST.ITCNT[2:0] bits) by the GTITC register is reset to 000b when the GTCNT counter operation is stopped: however, the EITCNT1[3:0] and EITCNT2[3:0] bits which are an extended interrupt skipping function retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped. When values for the EITCNT1[3:0] and EITCNT2[3:0] bits are to be reset (0000b), set the EIVTC1[1:0] and EIVTC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the EIVTC1[1:0] bits or the EIVTC2[1:0] bits to 00b).

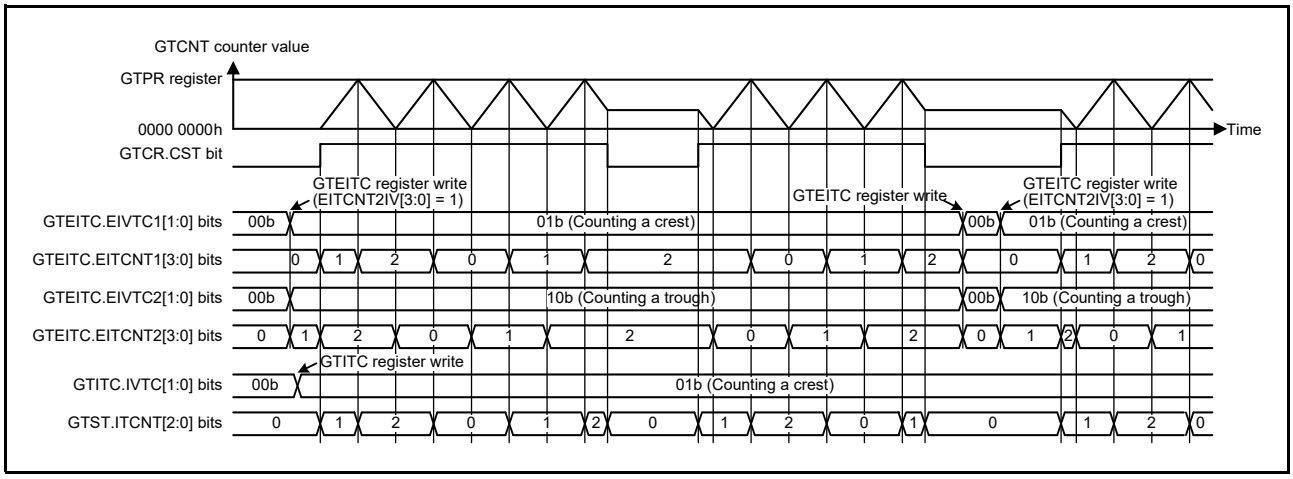

Figure 24.201 Counter Operation for Interrupt Skipping

Interrupt skipping by the GTEITLI1 register and A/D conversion start request skipping by the GTEITLI2 register can be performed simultaneously with interrupt skipping by the GTITC register or GTADCMSC register. A skipping period at this time is represented by ORed skipping periods of respective registers.
Figure 24.202 shows an example of simultaneous interrupt skipping operations by different registers.

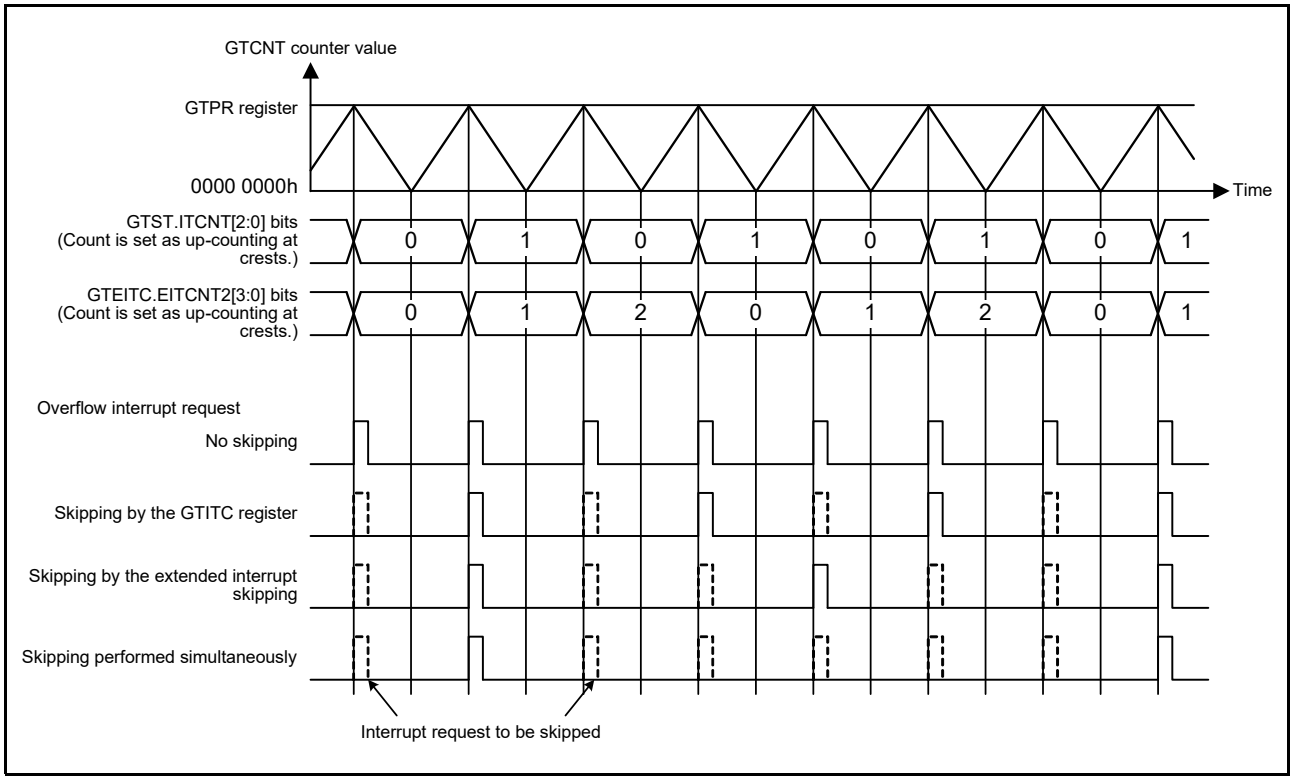

Figure 24.202 Example of Interrupt Skipping Operation (Skipping by the GTITC Register: Counting Crests, Extended Interrupt Skipping: EIVTC1[1:0] bits = 00b, EIVTC2[1:0] bits = 01b, EITLV[2:0] bits = 010b)

When the extended interrupt skipping selected by the GTEITLI1 register is performed, the relevant status flag is also skipped. The skipping function is continued even if the status flag is set to 1.
When an A/D conversion start request is skipped by the GTEITLI2 register, skipping of the corresponding status flag update and ELC event source outputs is controlled by the GTITC register and the extended interrupt skipping register, and the setting of A/D conversion start request enable bit in the GTINTAD register has no effect. The A/D conversion start request enable bit is used only for A/D conversion start request output (ELC event source output) after skipping.
Skipping of buffer transfer by the GTEITLB register applies to buffer operations enabled by the GTBER, GTDTCR, and GTBER2 registers, as well as all buffer operations performed by sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode (except for buffer transfer from GTCCRC, GTCCRE to GTCCRA).
Interrupt skipping and buffer transfer skipping operate independently. For a buffer transfer accompanied by an interrupt output, it is possible to output an interrupt without performing a buffer transfer, or to perform a buffer transfer without outputting an interrupt.
Figure 24.203 to Figure 24.210 show examples of skipping function operation.

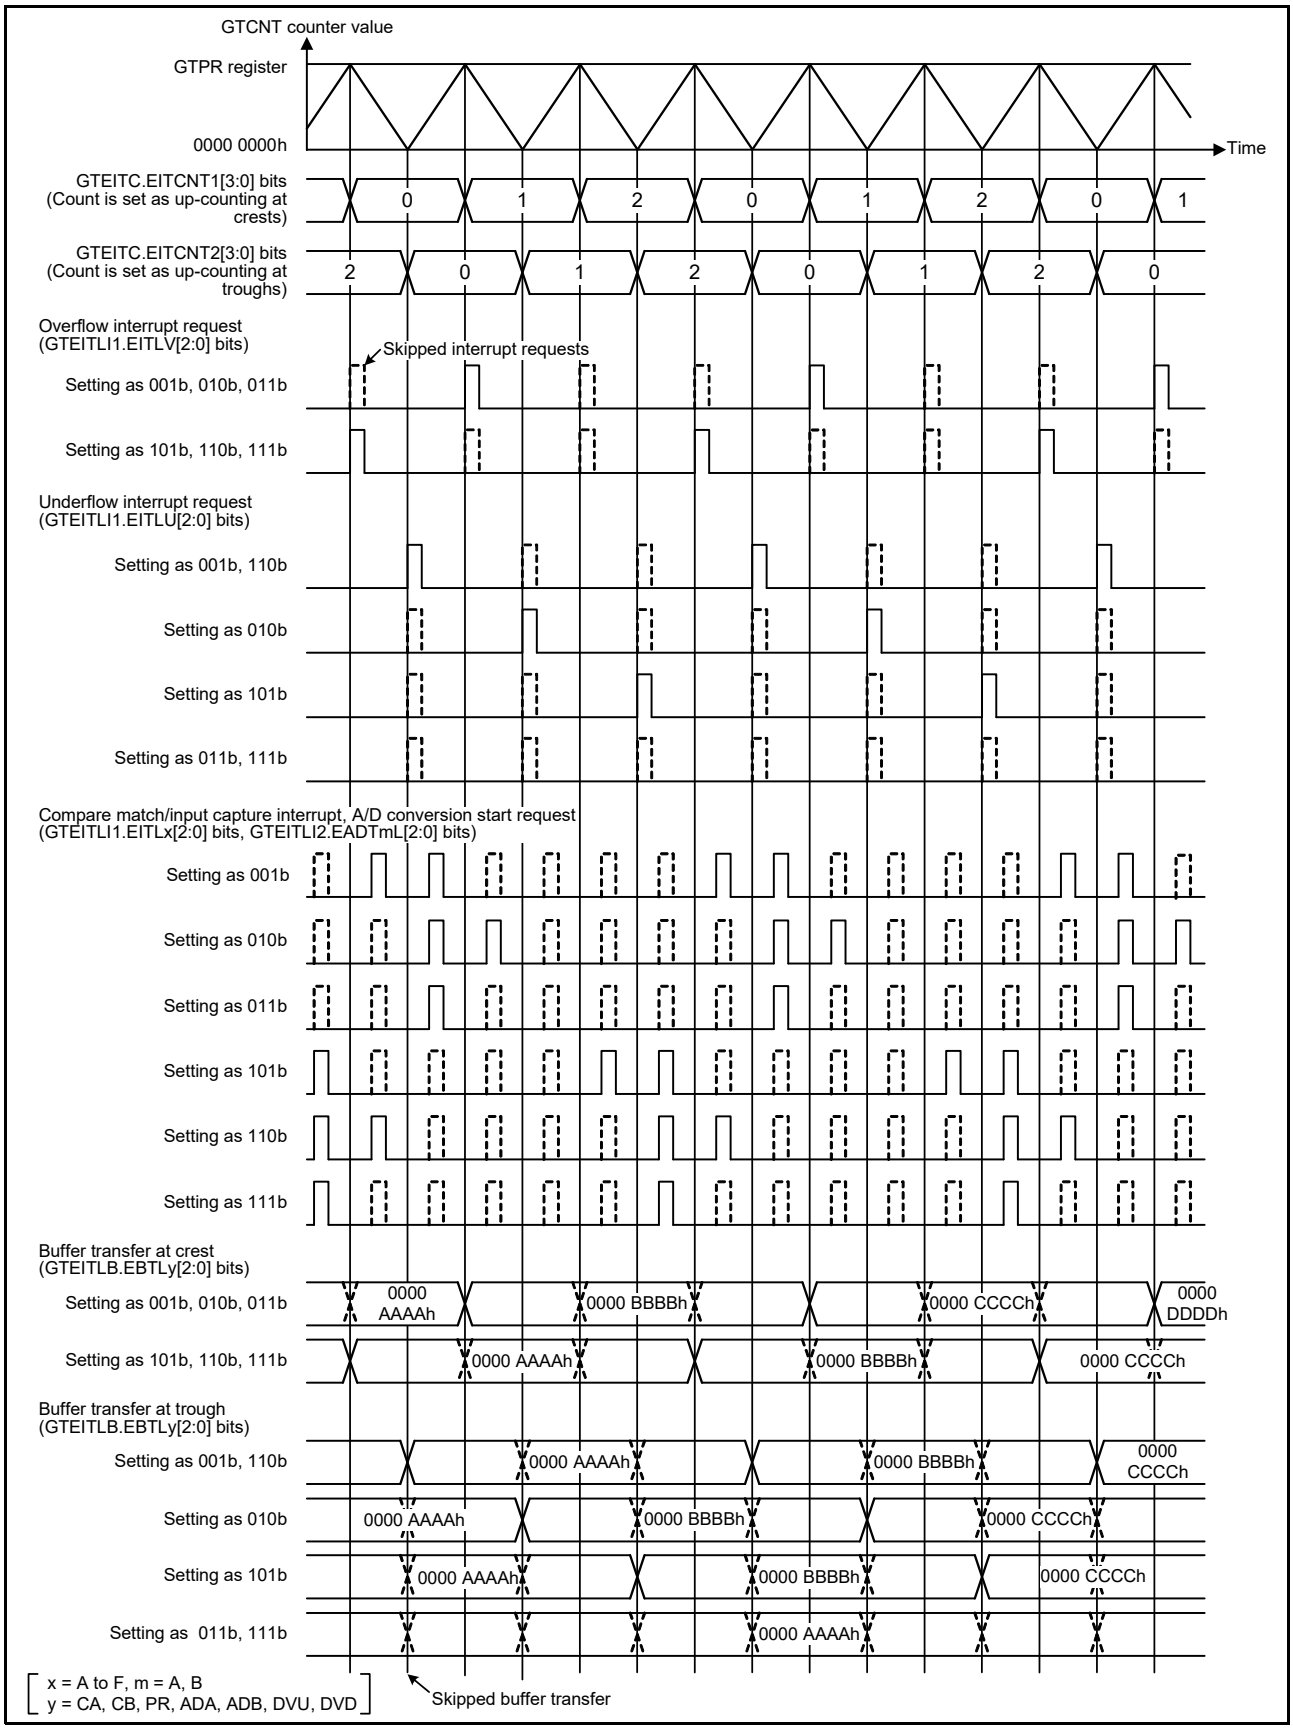

Figure 24.203 Example of Extended Interrupt Skipping Function (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Troughs, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0)

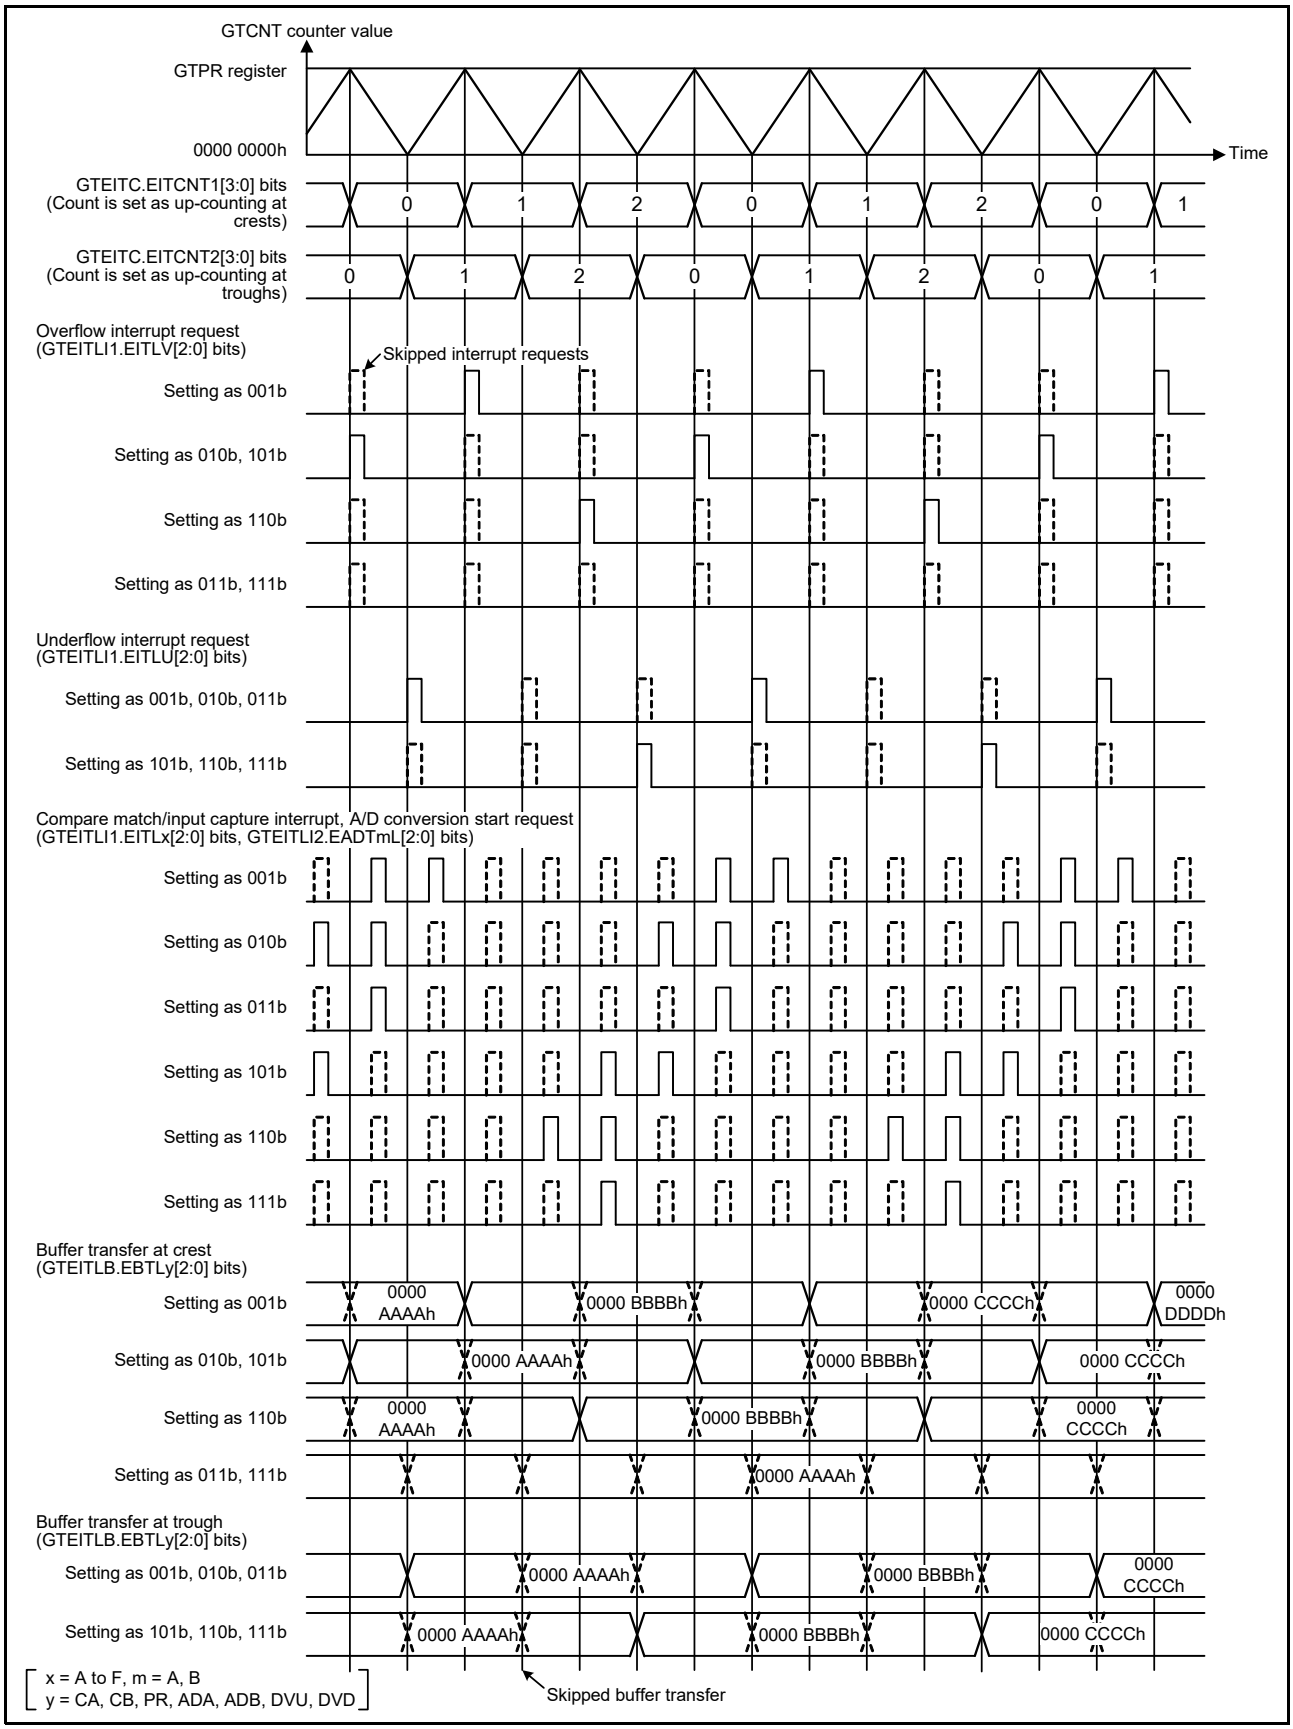

Figure 24.204 Example of Extended Interrupt Skipping Function (Triangle Waves, Count Crests by the Extended Interrupt Skipping 1 with Skipping Count: 2, Count Troughs by the Extended Interrupt Skipping 2 with Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 1)

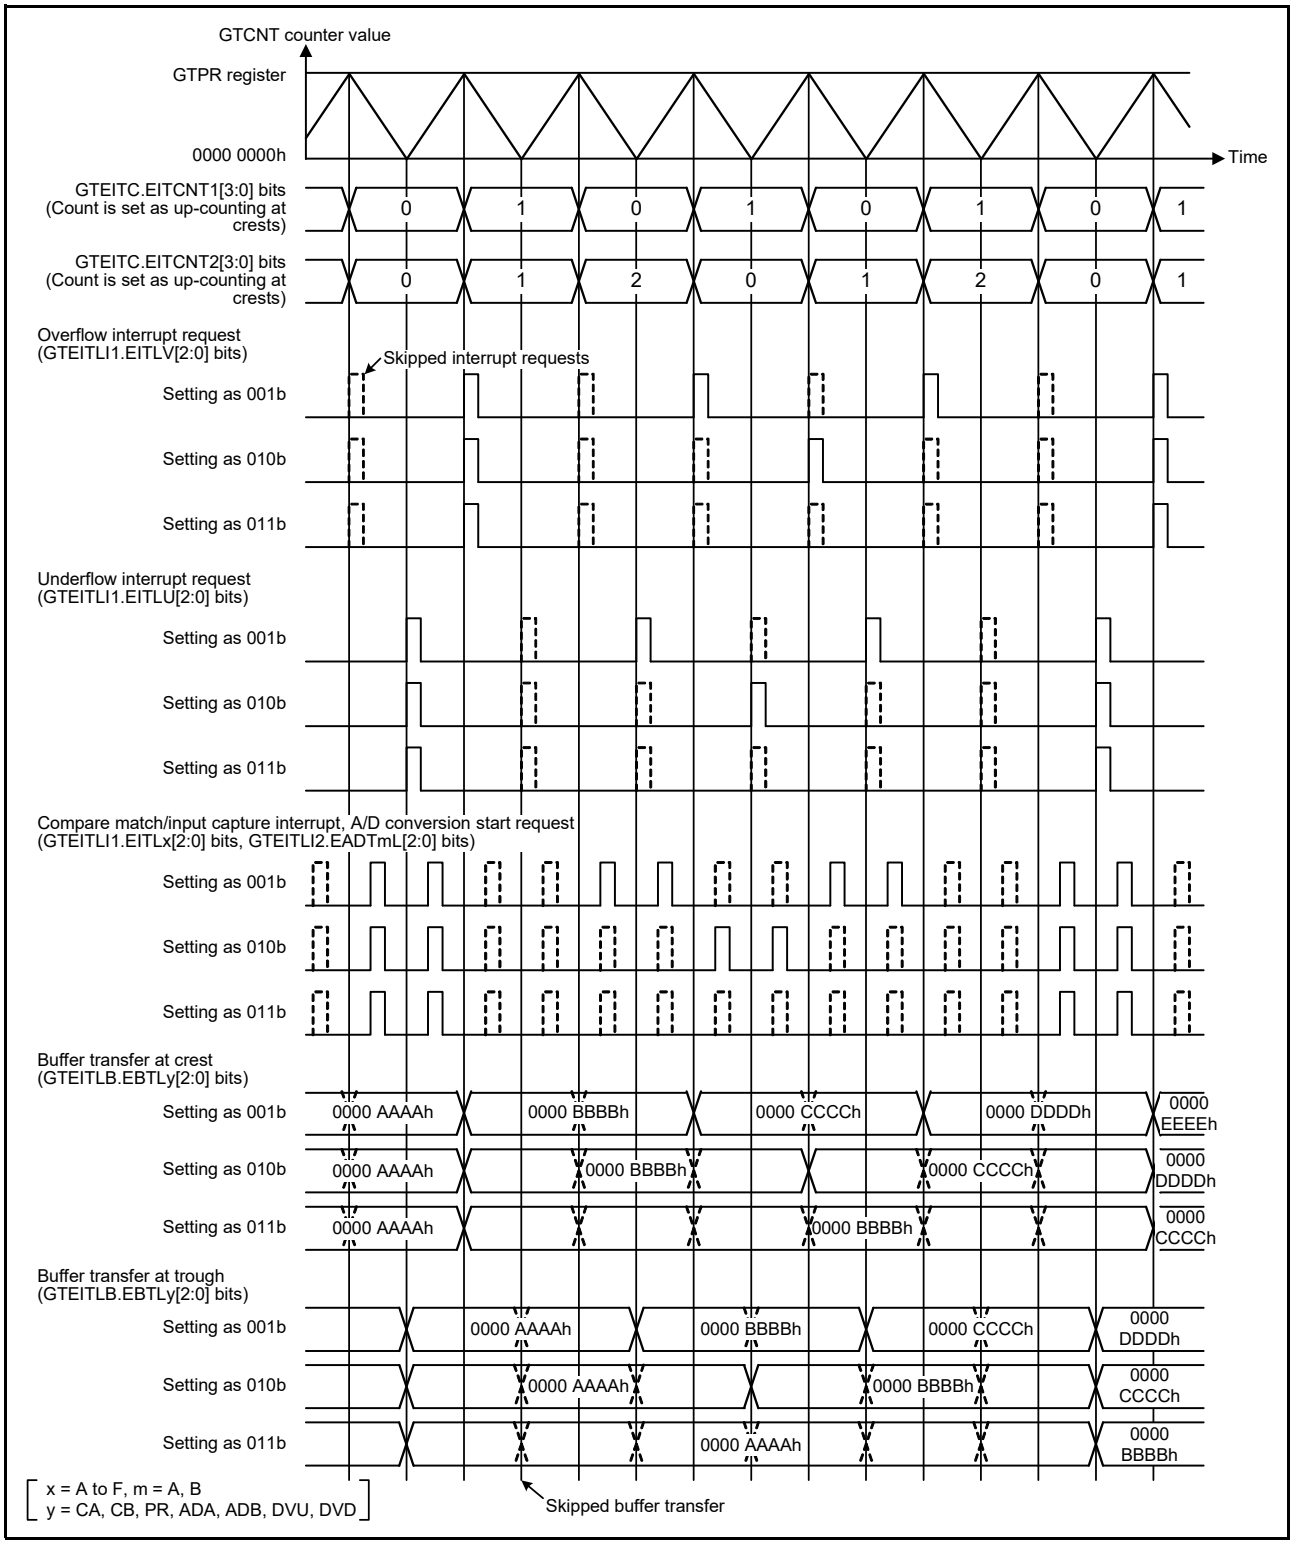

Figure 24.205 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 1, Counting Crests, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

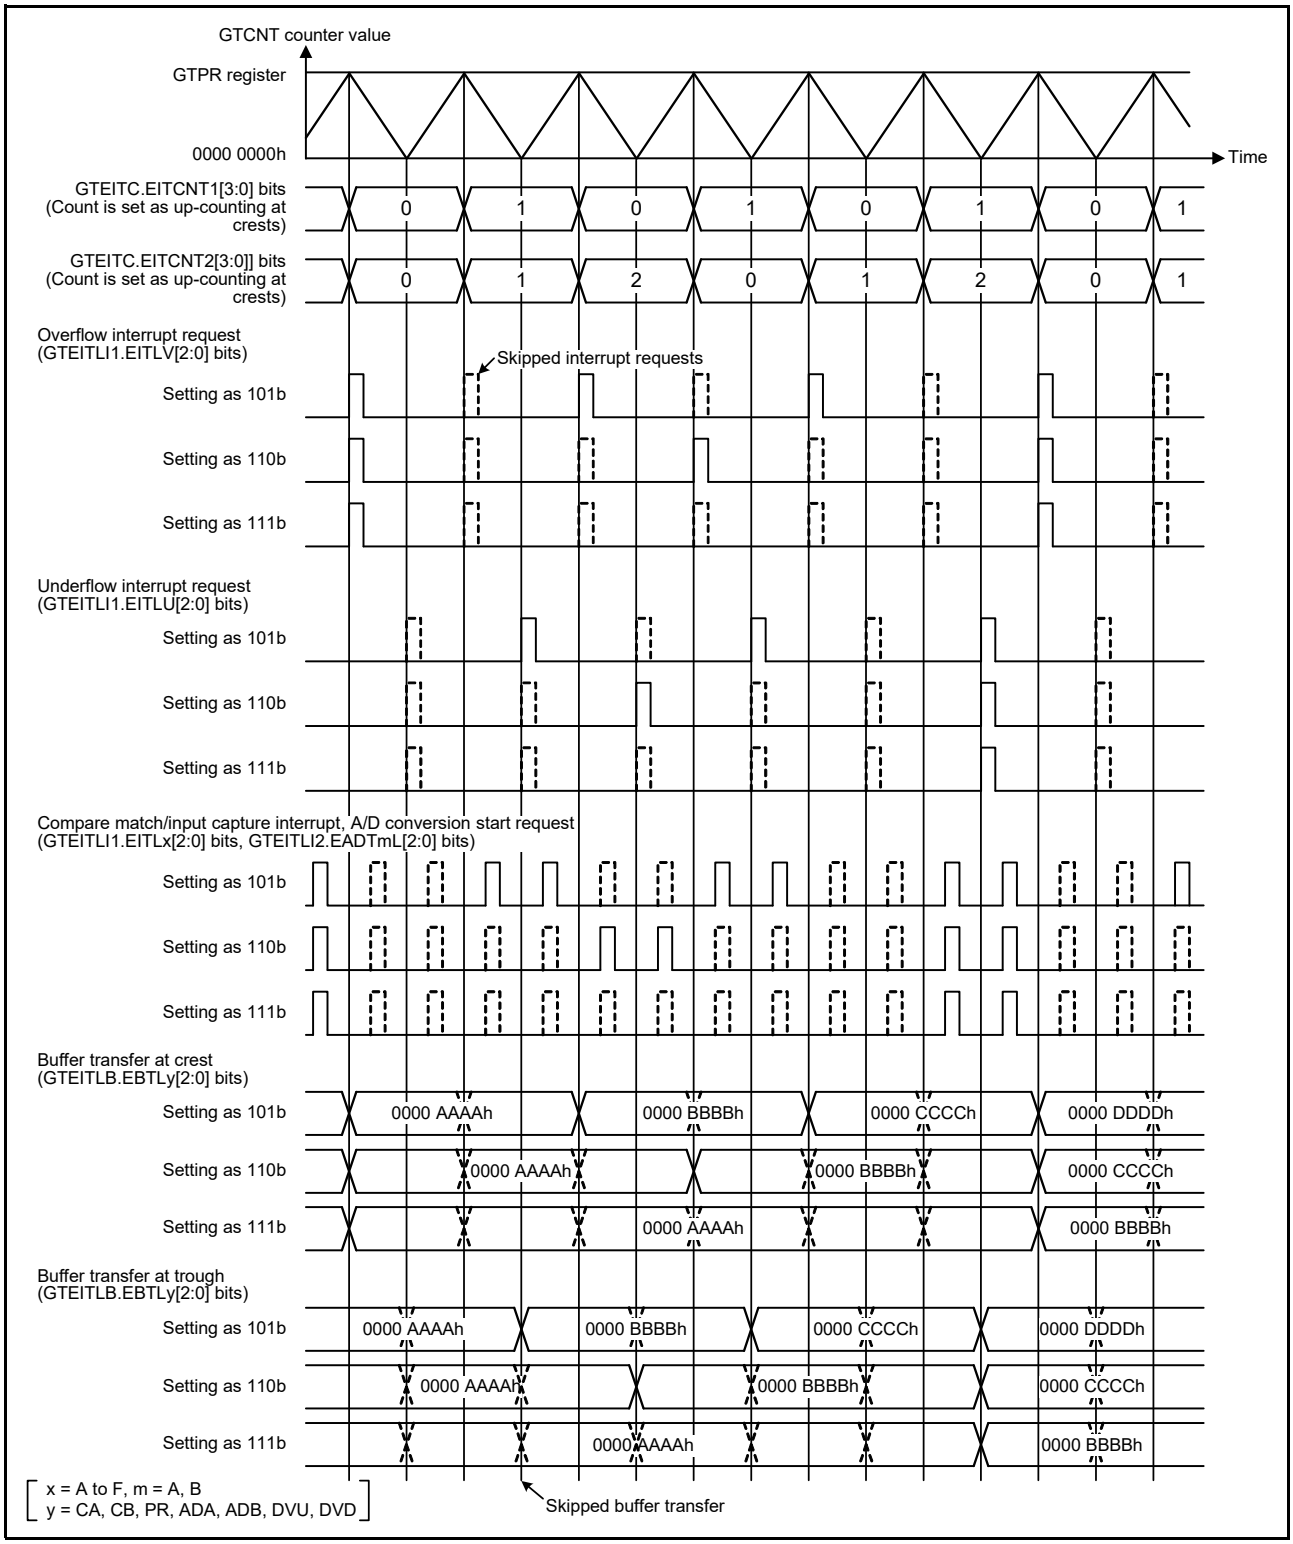

Figure 24.206 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 1, Counting Crests, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

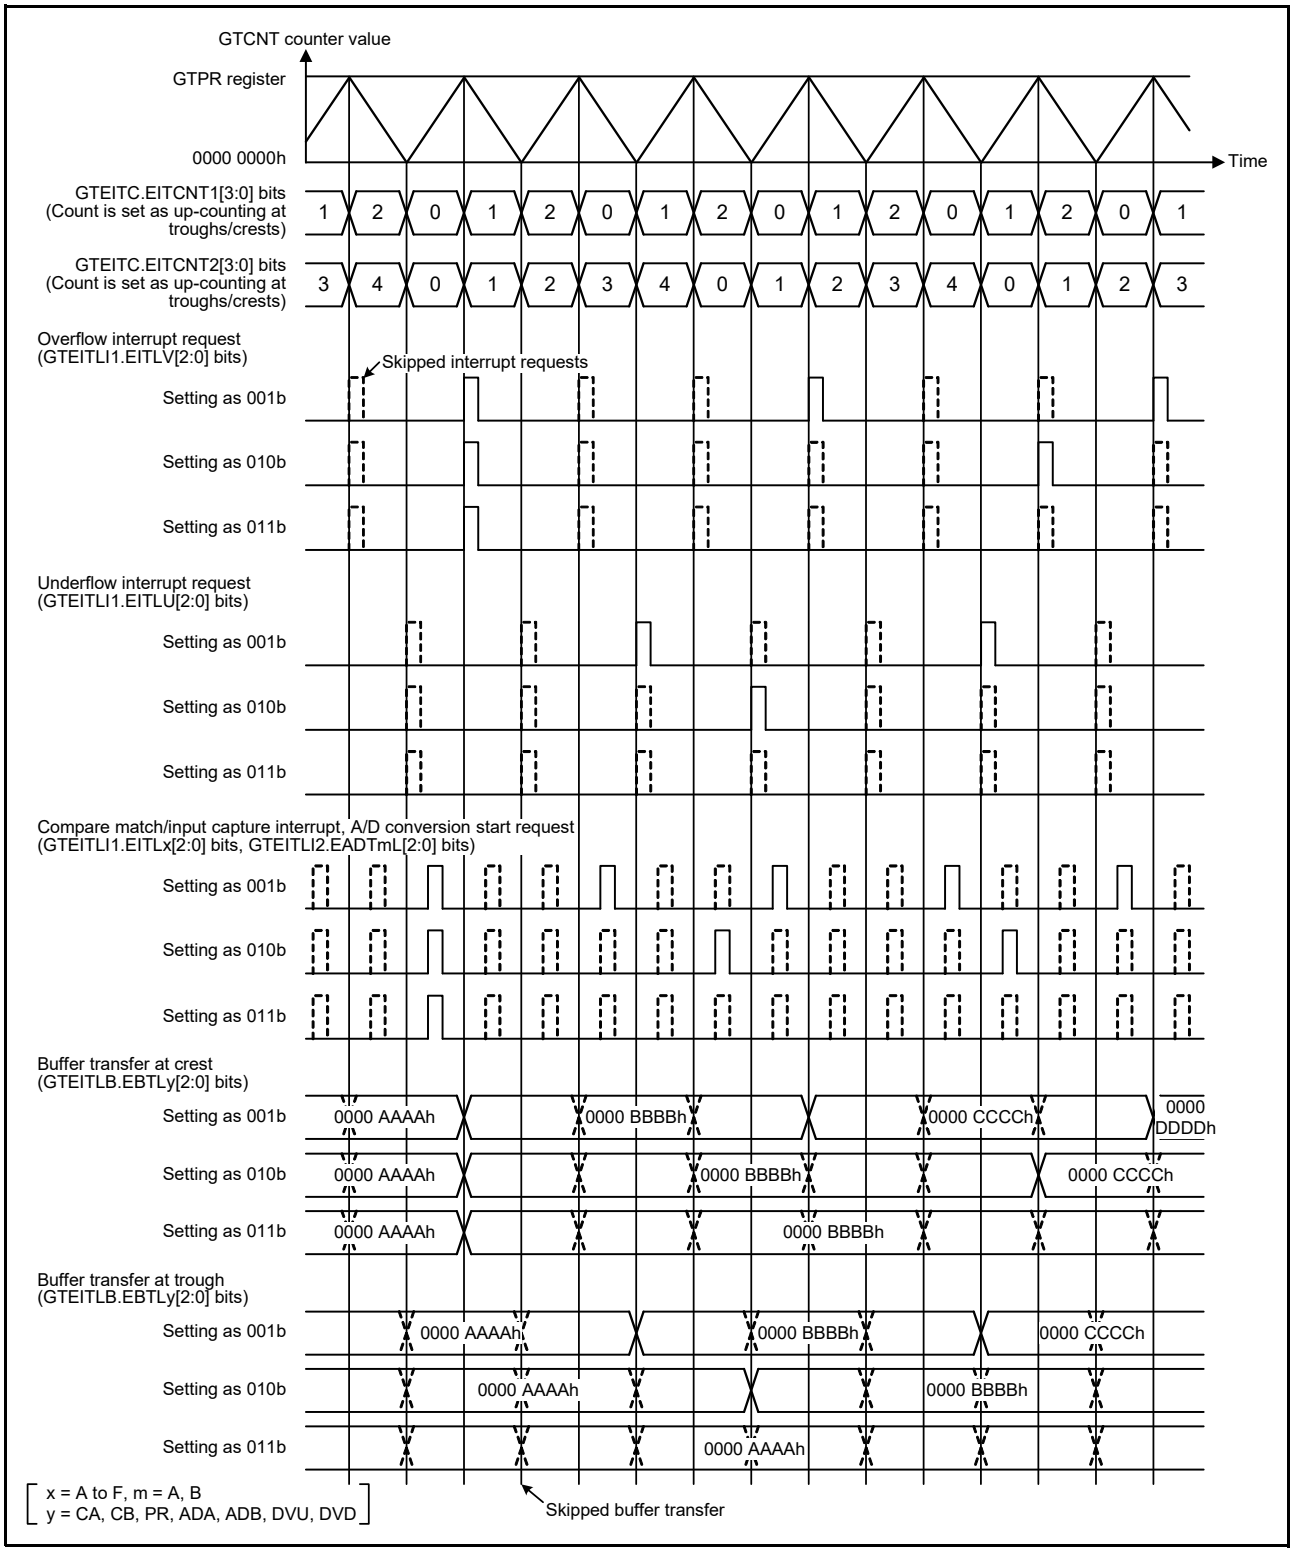

Figure 24.207 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting both Crests and Troughs, Extended Interrupt Skipping 1 Skipping Count: 2, Counting both Crests and Troughs, Extended Interrupt Skipping 2 Skipping Count: 4, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

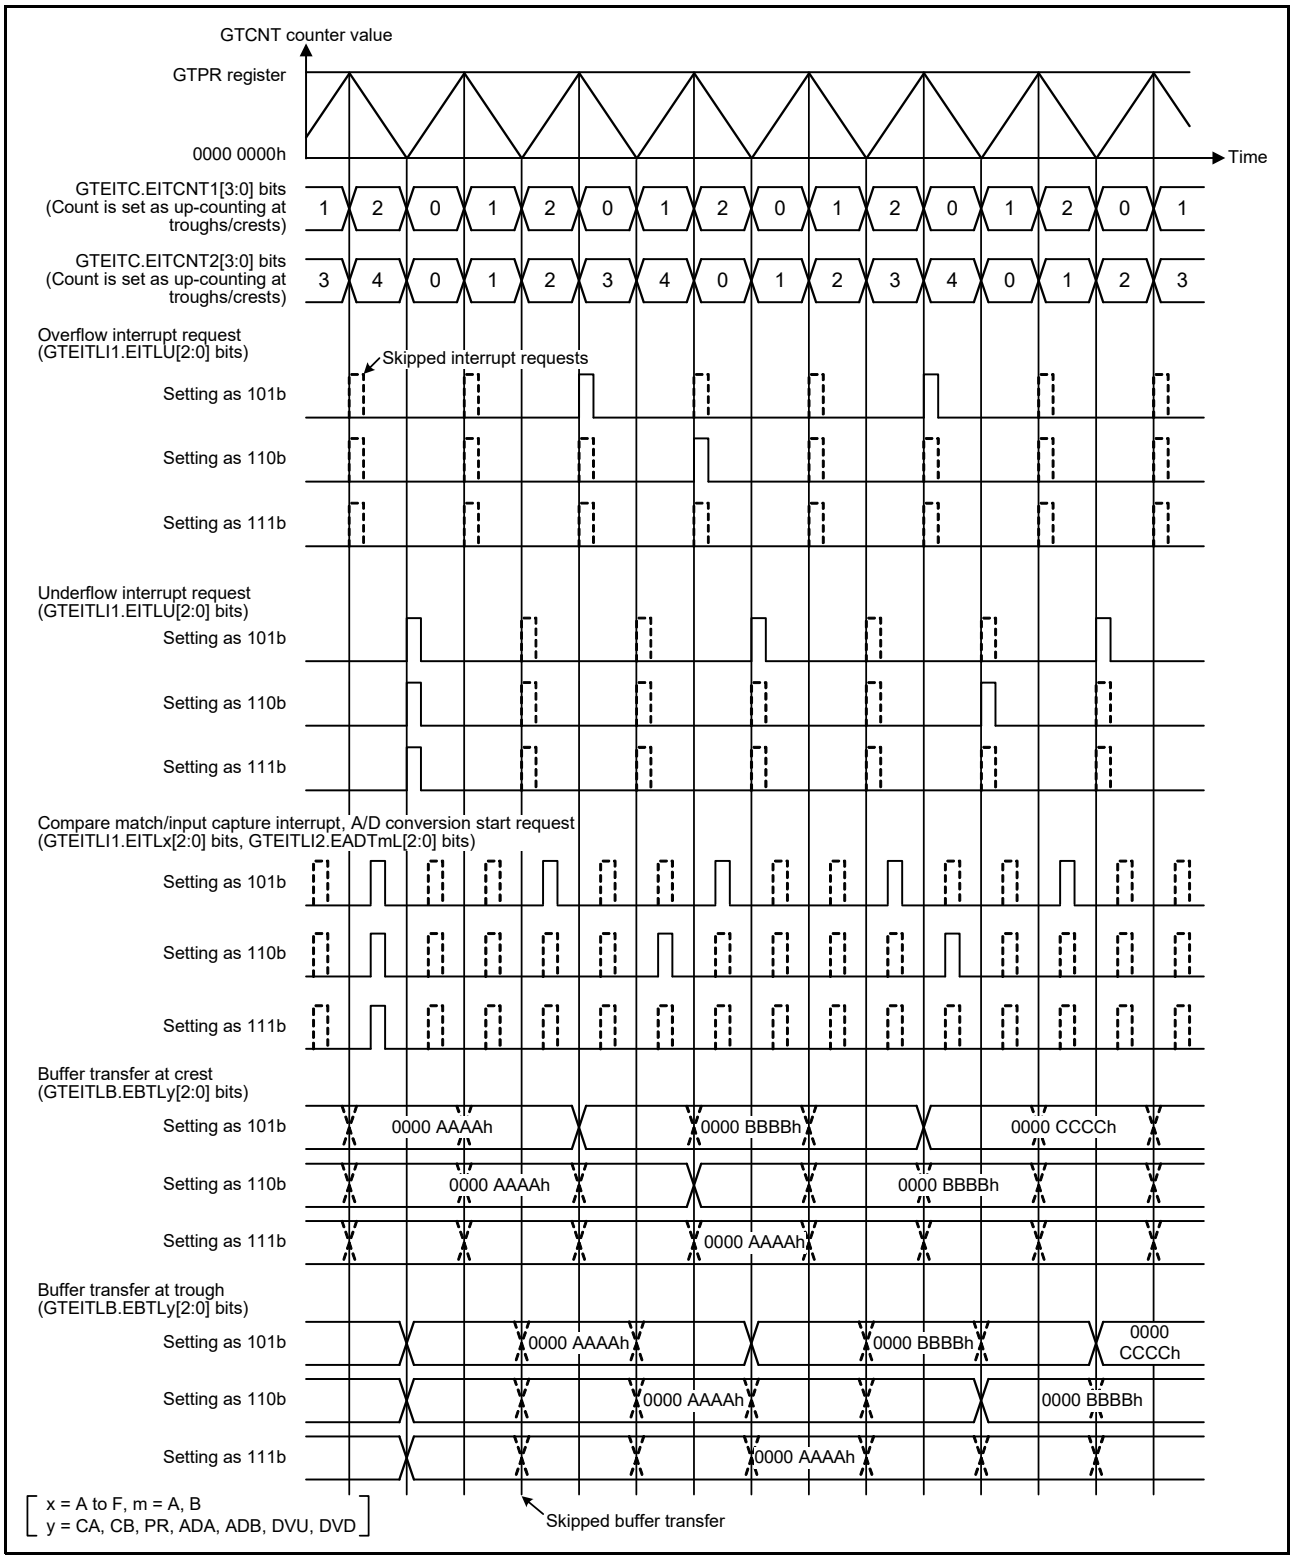

Figure 24.208 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting both Crests and Troughs, Extended Interrupt Skipping 1 Skipping Count: 2, Counting both Crests and Troughs, Extended Interrupt Skipping 2 Skipping Count: 4, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

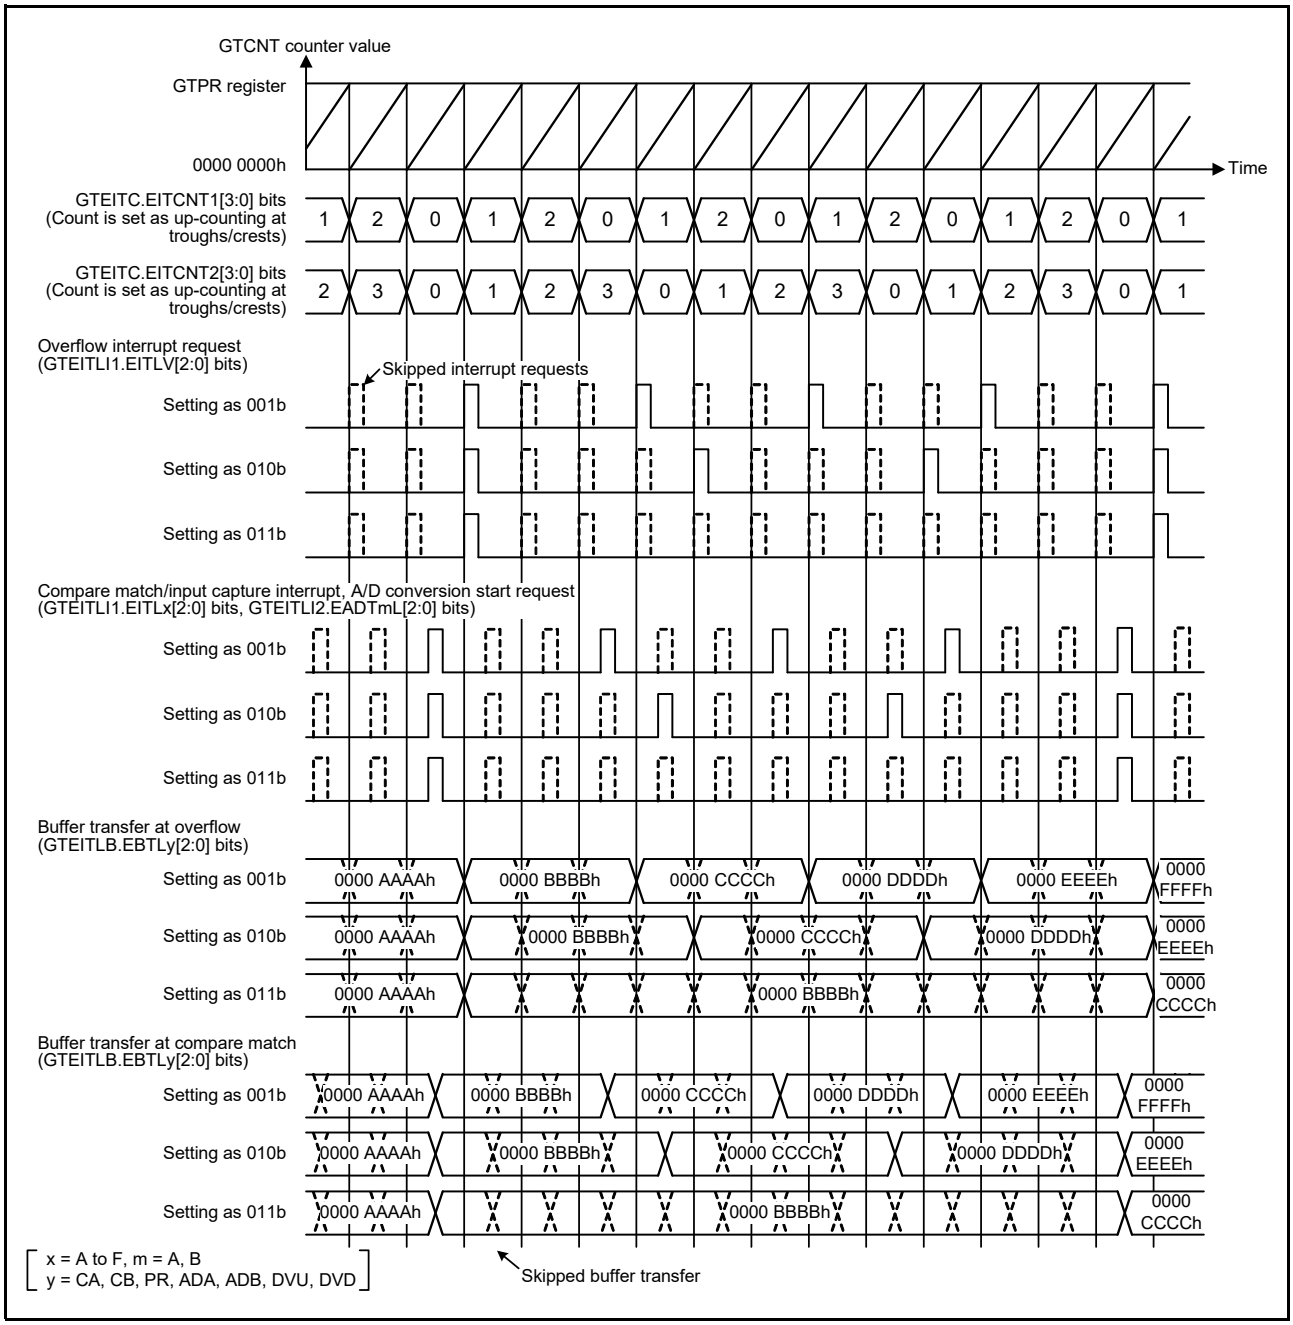

Figure 24.209 Example of Extended Interrupt Skipping Function Operation (Up-Counting in Sawtooth Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Overflow, Extended Interrupt Skipping 2 Skipping Count: 3, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

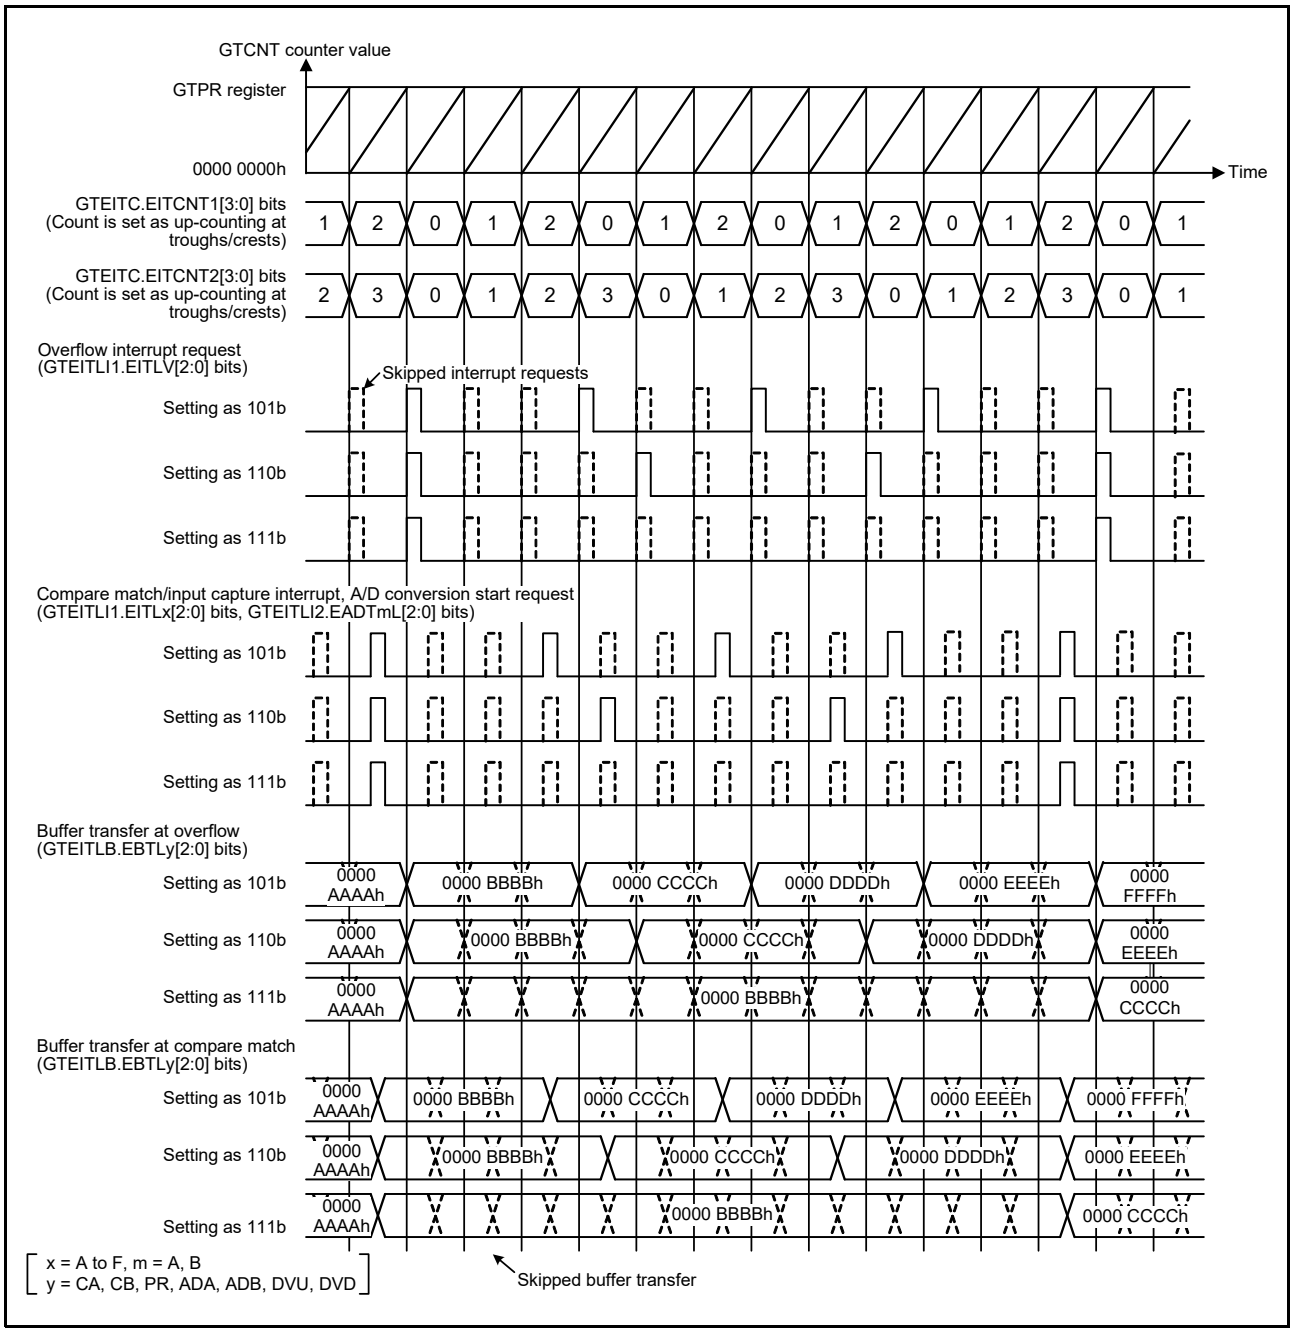

Figure 24.210 Example of Extended Interrupt Skipping Function Operation (Up-Counting Sawtooth Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Overflow, Extended Interrupt Skipping 2 Skipping Count: 3, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

Figure 24.211 shows an example of the extended interrupt skipping operation on the input capture. When the setting is for the input capture operation setting (GTCR.ICDS bit = 0) at count stop of the GTCNT counter, the interrupt by the input capture and the extended skipping on buffer transfer is enabled even at count stop of the GTCNT counter.
When the input capture is generated at count stop of the GTCNT counter by setting the ICDS bit as 0, an interrupt and a buffer transfer are skipped if the skipping counter value is the same with the skipping period set in a corresponding interrupt function select bit.

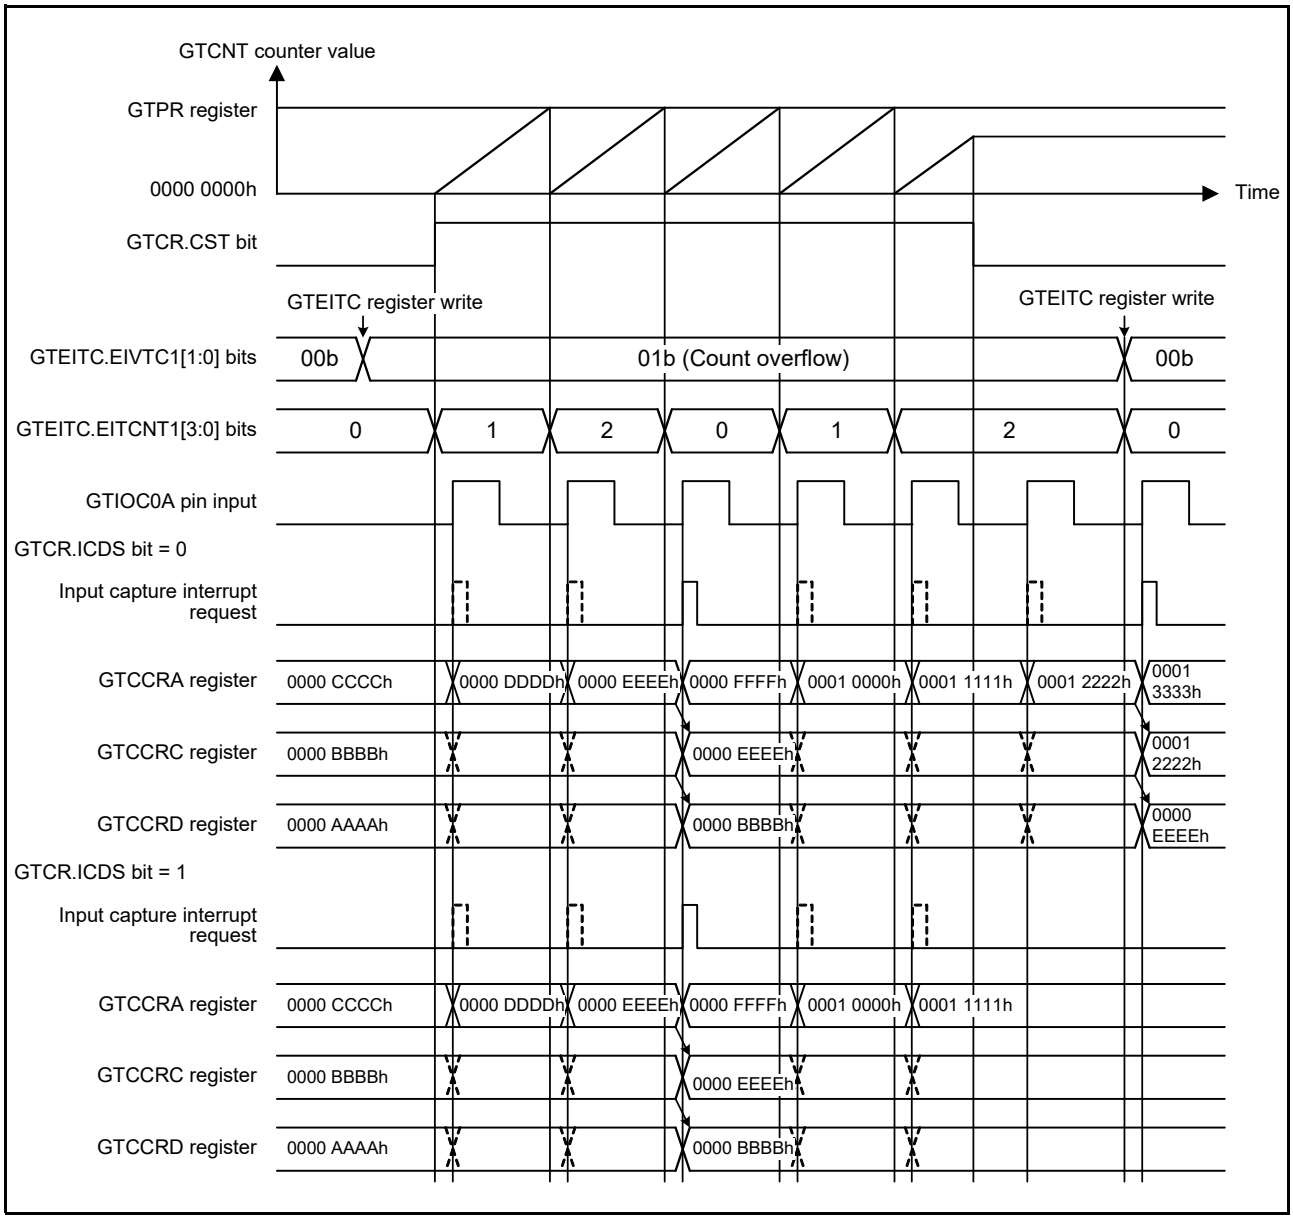

Figure 24.211 Example of Input Capture Operation in the Extended Interrupt Skipping Function Operation (Up-Counting Sawtooth Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Skipped in the Period other than the EITCNT1 as 0, Input Capture at the Input Rising)

Figure 24.212 shows an example for setting the extended interrupt skipping.

The initial value of the extended interrupt skipping counter 2 is set by the value written to the GTEITC.ETICNT2IV[3:0] bits. The initial value setting is applied when the setting of the extended interrupt skipping counter source is changed from “not counting” (GTEITC.EIVTC2[1:0] bits = 00b) to “counting” (GTEITC.EIVTC2[1:0] bits = other than 00b). Values written to the ETICNT2IV[3:0] bits are applied only in this condition.

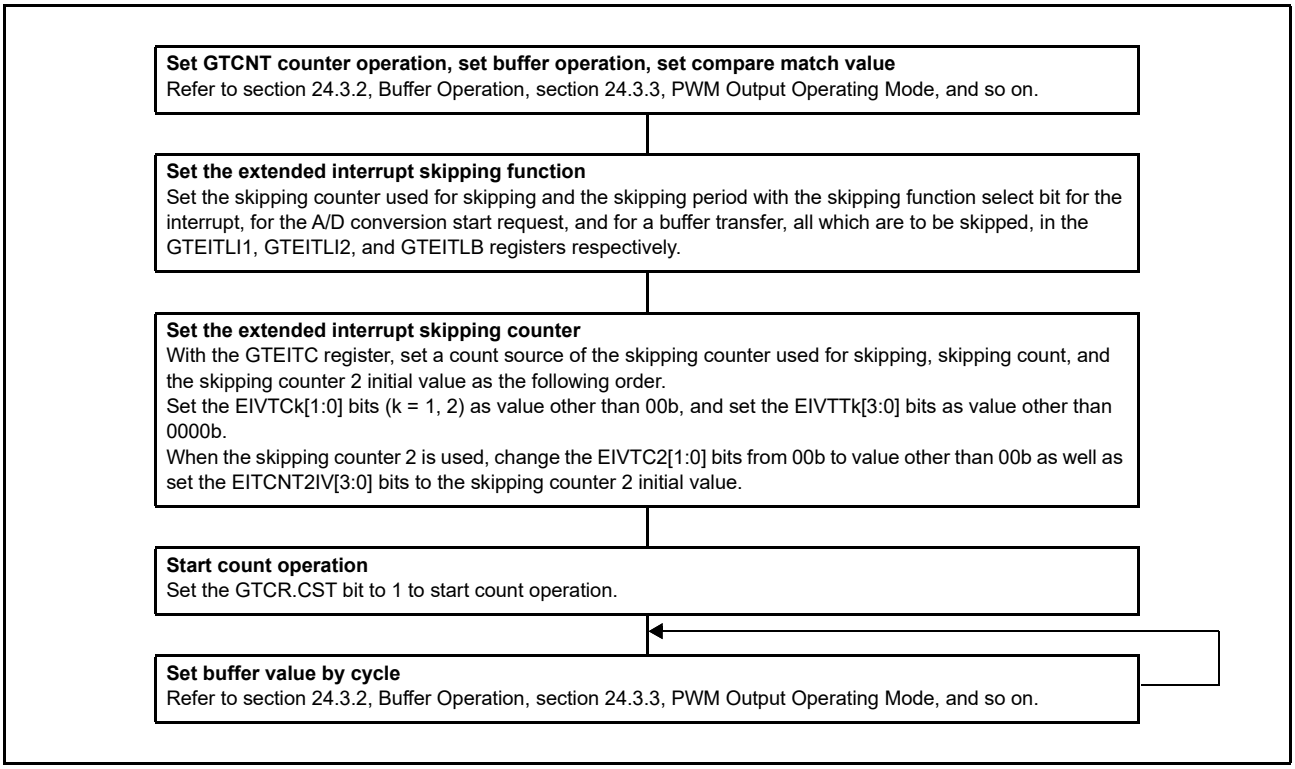

Figure 24.212 Example for Setting the Extended Interrupt Skipping

24.4.3.3 A/D conversion Start Request Compare Match Skipping Function

The A/D conversion start request and GTADTR register buffer transfer can be skipped by counting the compare matches of GTADTRA register and GTADTRB register based on settings of the GTADCMSC register and GTADCMSS register. The skipping period is set, related to the operation of the two independent A/D conversion start request compare match skipping counters (the ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits in the GTADCMSC register), as a period that either of the counter value for such skipping counters is other than 0 or other than the skipping count. The skipping period can also be set as a period that the both skipping counters are set as other than 0 or other than the skipping count for the counter value.

Figure 24.213 shows the counter operation for A/D conversion start request compare match skipping.

The counter operation for A/D conversion start request compare match skipping is set by the GTADCMSC register.

The ADCMSCNT1[3:0] bits count the count source (in Figure 24.213, a crest is selected) selected by the A/D conversion start request compare match skipping counter 1 count source select bit (the GTADCMSC.ADCMSC1[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in Figure 24.213, count is 2) set by the A/D conversion start request compare match skipping 1 skipping count setting bit (the ADCMST1[3:0] bits) is achieved.

The ADCMSCNT2[3:0] bits count the count source (in Figure 24.213, a trough is selected) selected by the A/D conversion start request compare match skipping counter 2 count source select bit (the GTADCMSC.ADCMSC2[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in Figure 24.213, count is 2) set by the A/D conversion start request compare match skipping 2 skipping count setting bit (the ADCMST2[3:0] bits) is achieved.

The ADCMSCNTk[3:0] bits (k = 1, 2) can be set for the initial value. The initial value is set when the GTADCMSC register is written by the access of 16 bits or 32 bits while the setting for the A/D conversion start request compare match skipping counter k is not counted (the ADCMSCk[1:0] bits are 00b) and the write value to the ADCMSCk[1:0] bits is other than 00b. When setting the initial value, the write value to the A/D conversion start request compare match skipping counter k initial value bits (the ADCMSCNTkIV[3:0] bits) are set as the initial value for the ADCMSCNTk[3:0] bits.

The A/D conversion start request compare match skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits for the A/D conversion start request compare match skipping function retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped.

When values for the ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits are to be reset (0000b), set the ADCMSC1[1:0] and ADCMSC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the ADCMSC1[1:0] bits or the ADCMSC2[1:0] bits to 00b).

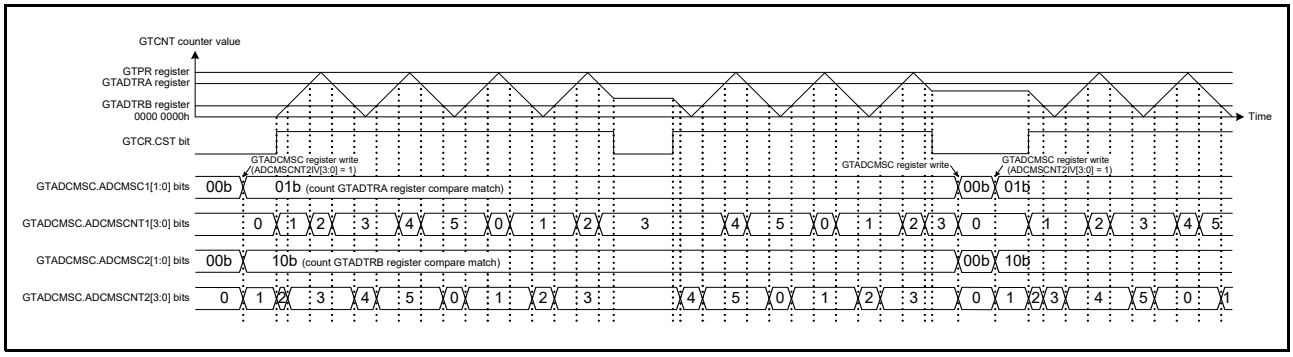

Figure 24.213 Example of A/D Conversion Start Request Compare Match Skipping Function Operation

A/D conversion start request skipping by the ADCMSC register can be performed simultaneously with skipping by the GTITC register or GTEITC register. A skipping period in this case is represented by ORed skipping periods of respective registers.

Figure 24.214 shows an example of simultaneous interrupt skipping operations by different registers.

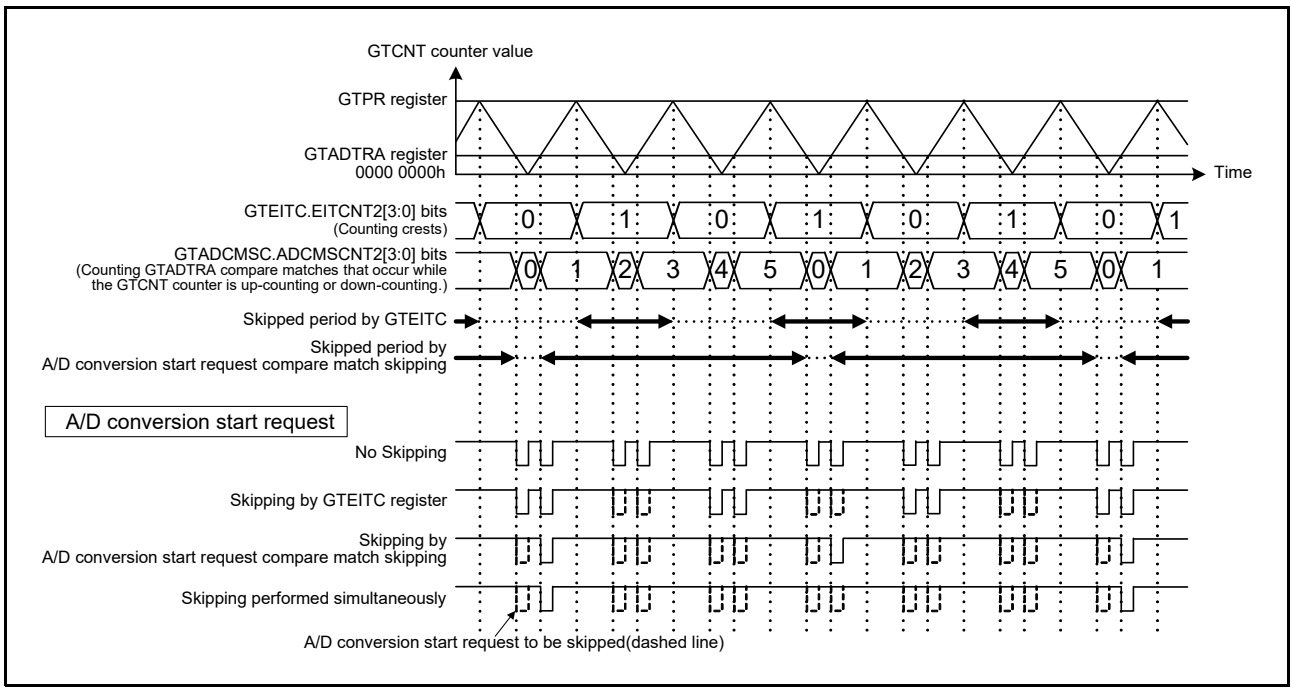

Figure 24.214 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (GTADTRA register compare match: GTINTAD.ADTRAUEN = 1, ADTRADEN = 1, Extended Interrupt Skipping: GTEITC.EIVTT2[3:0] = 001b, EIVTC2[1:0] = 01b, GTEITLI2.EADTAL[2:0] = 010b, A/D Conversion Start Request Compare Match Skipping: GTADCMSC.ADCMST2[3:0] = 101b, ADCMSC2[1:0] = 01b, ADCMSAL[2:0] = 010b)

When an A/D conversion start request is skipped by the GTADCMSS register, updating of the corresponding status flag and ELC event output are controlled by the A/D conversion start request enable bit in the GTINTAD register. All operations triggered by A/D conversion start request that are disabled by the GTINTAD register are not performed. Skipping of buffer transfer by the GTADCMSS register applies to all buffer operations enabled by the GTBER and GTBER2 registers, as well as all buffer operations performed in sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode (except for buffer transfer from GTCCRC, GTCCRE to GTCCRA). The skipping of an A/D conversion start request and the skipping of buffer transfer operate independently.
Figure 24.215 and Figure 24.216 show examples of extended skipping function operation.

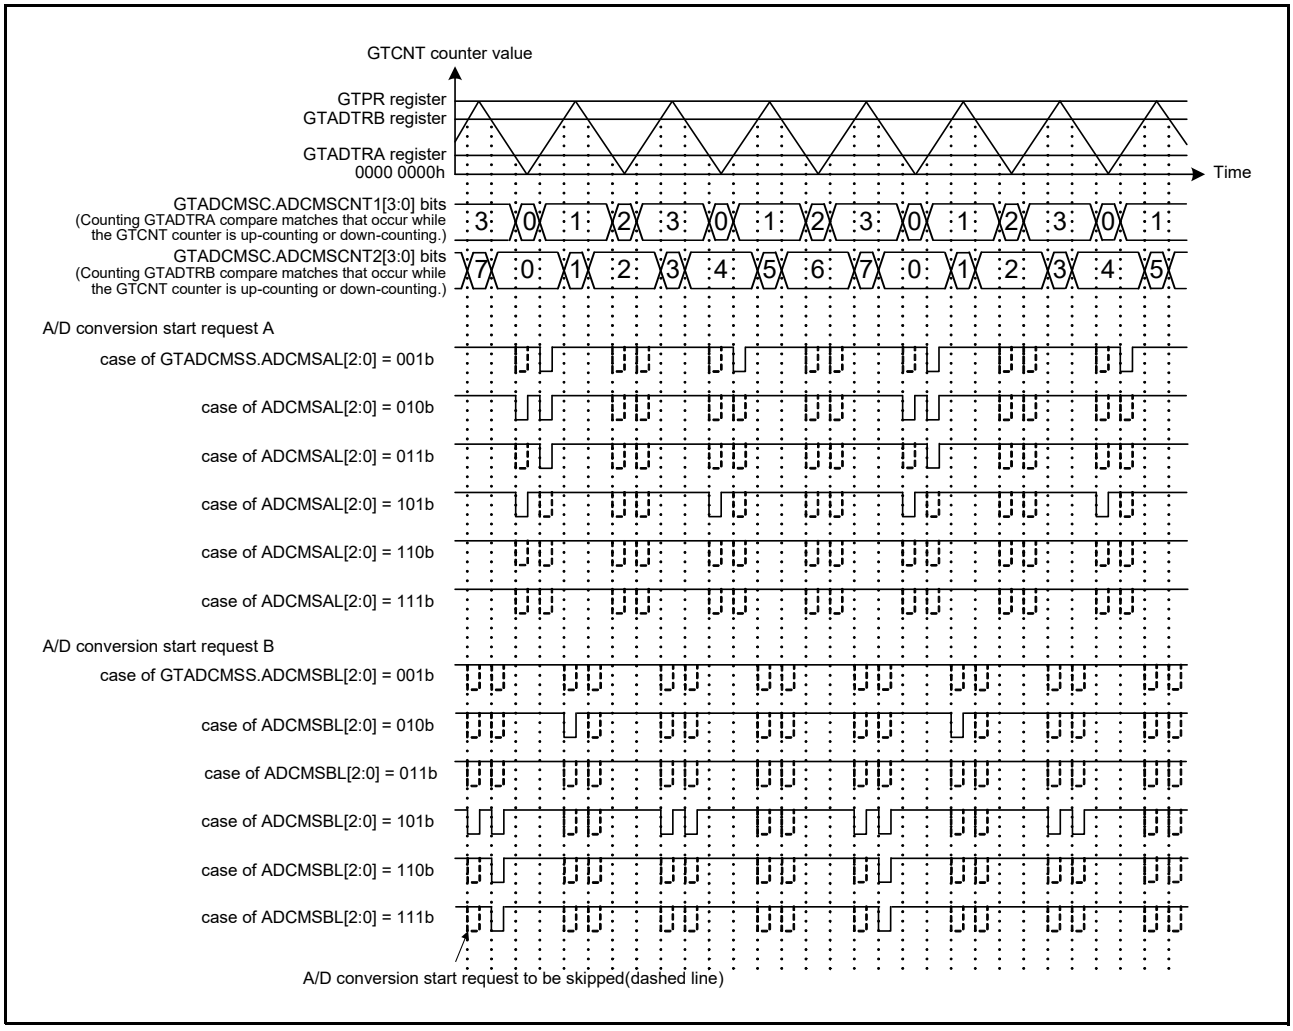

Figure 24.215 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (Triangle wave, A/D Conversion Start Request Compare Match Skipping 1 Skipping Count: 3 Counting GTADTRA compare match: GTINTAD.ADTRAUEN = 1, ADTRADEN = 1, GTADCMSS.ADCMSC1[1:0] = 01b, ADCMST1[3:0] = 011b, A/D Conversion Start Request Compare Match Skipping 2 Skipping Count: 7 Counting GTADTRB compare match: GTINTAD.ADTRBUEN = 1, ADTRBDEN = 1, GTADCMSS.ADCMSC2[1:0] = 10b, ADCMST2[3:0] = 111b)

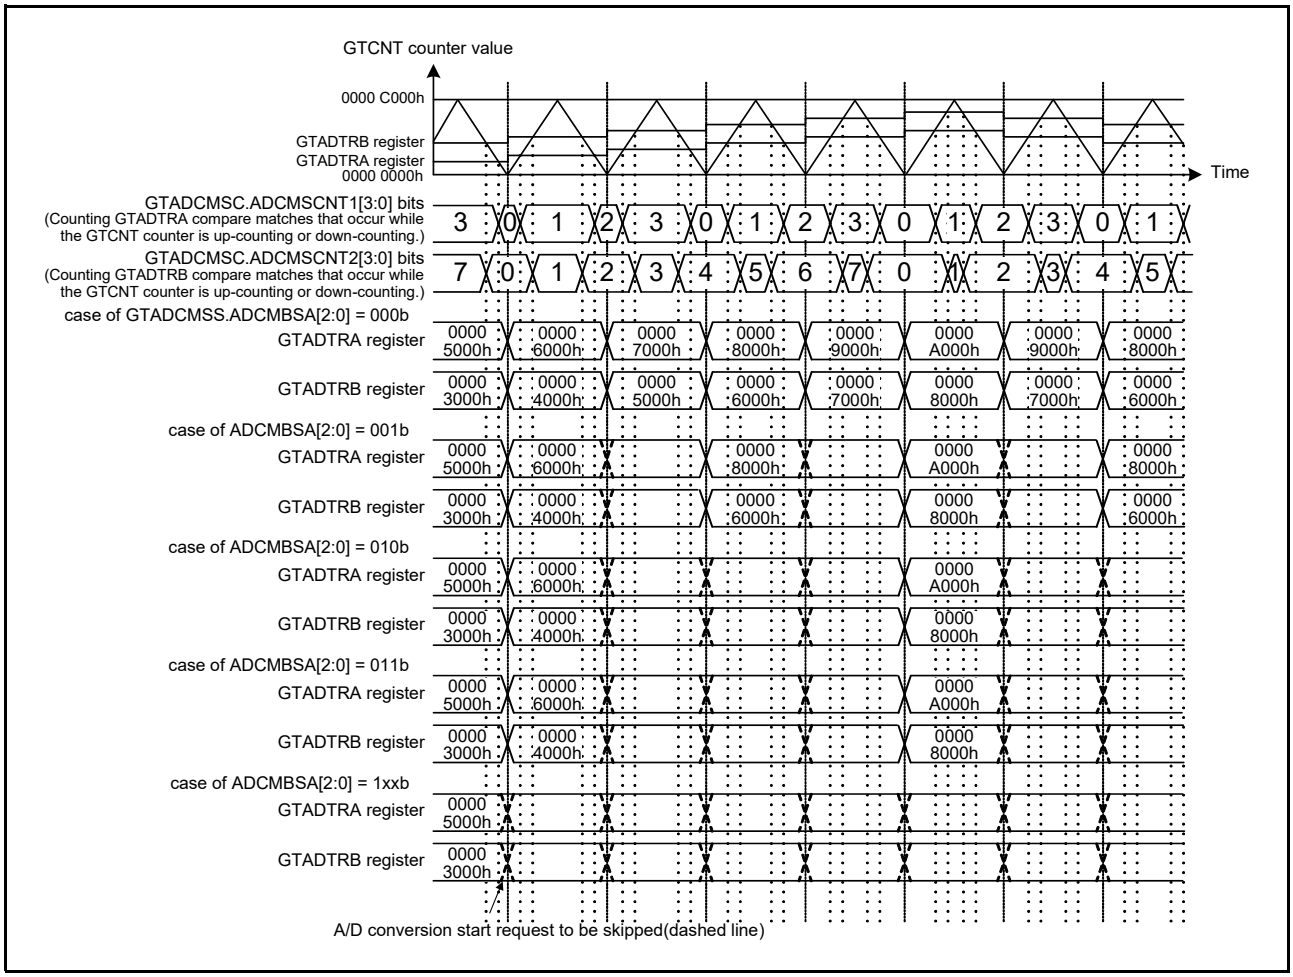

Figure 24.216 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (Triangle wave, A/D Conversion Start Request Compare Match Skipping 1 Skipping Count: 3 Counting GTADTRA compare match: GTINTAD.ADTRAUEN = 1, ADTRADEN = 1, GTADCMSS.ADCMSC1[1:0] = 01b, ADCMST1[3:0] = 011b, A/D Conversion Start Request Compare Match Skipping 2 Skipping Count: 7 Counting GTADTRB compare match: GTINTAD.ADTRBUEN = 1, ADTRBDEN = 1, GTADCMSS.ADCMSC2[1:0] = 10b, ADCMST2[3:0] = 111b, Buffer transfer of GTADTRA and GTADTRB at trough: GTBER.BD[2] = 1, ADTTA[1:0] = 10b)

Figure 24.217 shows an example of setting the A/D conversion start request compare match skipping.
The initial value of the A/D conversion start request compare match skipping counter 2 is set by the value written to the GTADCMSC.ADCMSCNT2IV[3:0] bits. The initial value setting is applied when the setting of the extended interrupt skipping counter 2 count source is changed from “not counting” (the GTADCMSC.ADCMSC2[1:0] bits = 00b) to “counting” (the GTADCMSC.ADCMSC2[1:0] bits = other than 00b). Value written to the ADCMSCNT2IV[3:0] bits are applied only in this condition.

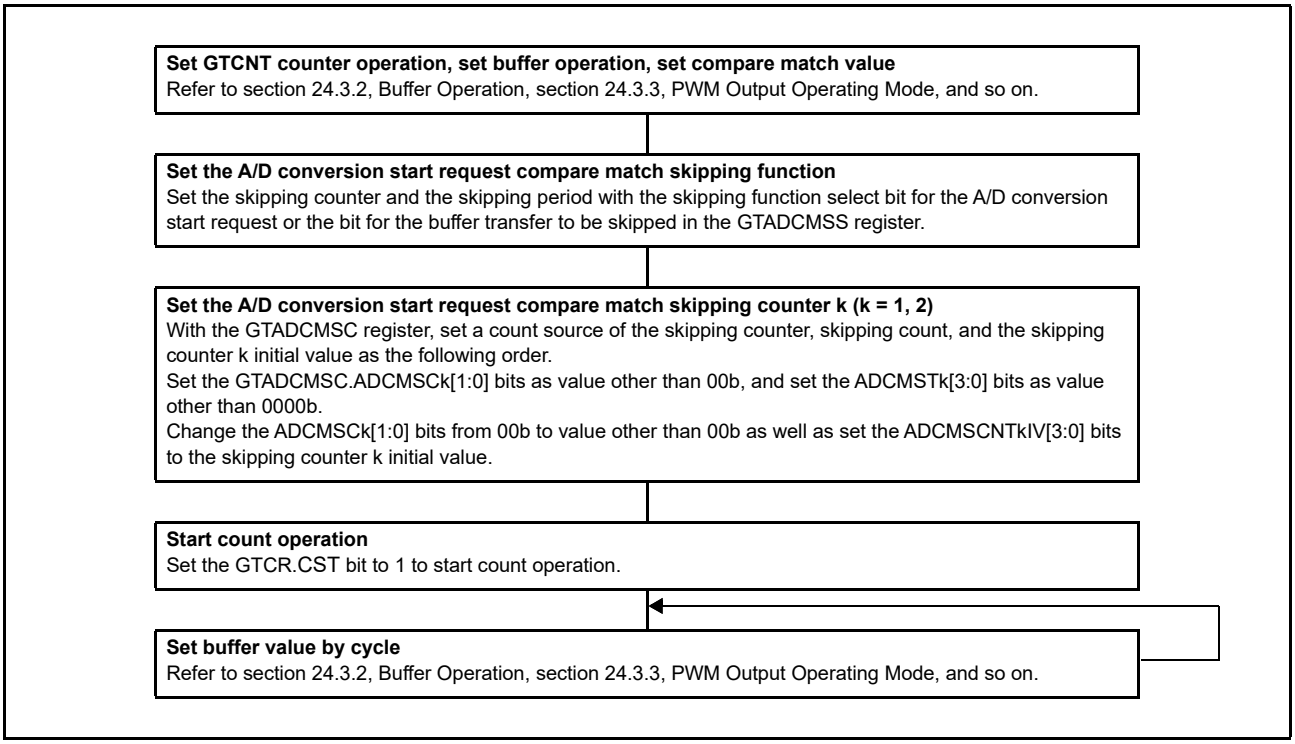

Figure 24.217 Example for Setting the A/D Conversion Start Request Compare Match Skipping

24.5 A/D Conversion Start Request

An A/D conversion start request can be issued at a compare match between the GTCNT counter and the GTADTRA or GTADTRB register, up-counting only, down-counting only, or both up-counting and down-counting can be specified by setting the GTINTAD register.

In complementary PWM mode, the A/D conversion start request can be issued at a compare match with the GTCNT counter of master channel.

During event count operation, the A/D conversion start request cannot be generated.

The request can be directly output to the A/D converter or output as an event signal to the ELC.

Each of the GTADTRA and GTADTRB registers has two buffer registers. Buffer operation with the GTADTRA register used together with the GTADTBRA and GTADTDBRA registers, and buffer operation with the GTADTRB register used together with the GTADTBRB and GTADTDBRB registers can be performed.

The generation timing of the A/D conversion start request can be monitored by an external pin. When the A/D conversion start request signal to be monitored is selected using the GTADSMR.ADSMSk bit (k = 0, 1) and the output is enabled by the ADSMENk bit, a signal is output on the GTADSMk pin synchronized with a cycle frame of the timer used to generate the A/D conversion start request signal. The output is driven high at the generation of the A/D conversion start request signal, and is driven low at the end of the cycle. When a signal to request the start of A/D conversion is generated at the end of the cycle, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next cycle. The registers (GTADTRA and GTADTRB) that are sources of generating the A/D conversion start request signals and their counting directions can be checked by the A/D conversion start request flags (ADTRAUF, ADTRADF, ADTRBUF, and ADTRBDF) in the GTST register. When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPTW.

Figure 24.218 shows an example of A/D conversion start request operation, Figure 24.219 shows an example for setting A/D conversion start request operation, and Figure 24.220 shows an example for A/D conversion start request timing operation.

Figure 24.220 shows an example of outputting A/D conversion start request A generated by a compare match with the GTADTRA register directly to the A/D converter. When the GPTW operates with the PCLKD clock and the A/D converter operates with the PCLKA clock, A/D conversion start request A is output to the A/D converter at the next rising edge of PCLKA. When both the GPTW and A/D converter operate with the GPTCLK clock, the request is output to the A/D converter without delay. With the other combinations of clocks, the request is output to the A/D converter in synchronization with the operating clock for the A/D converter.

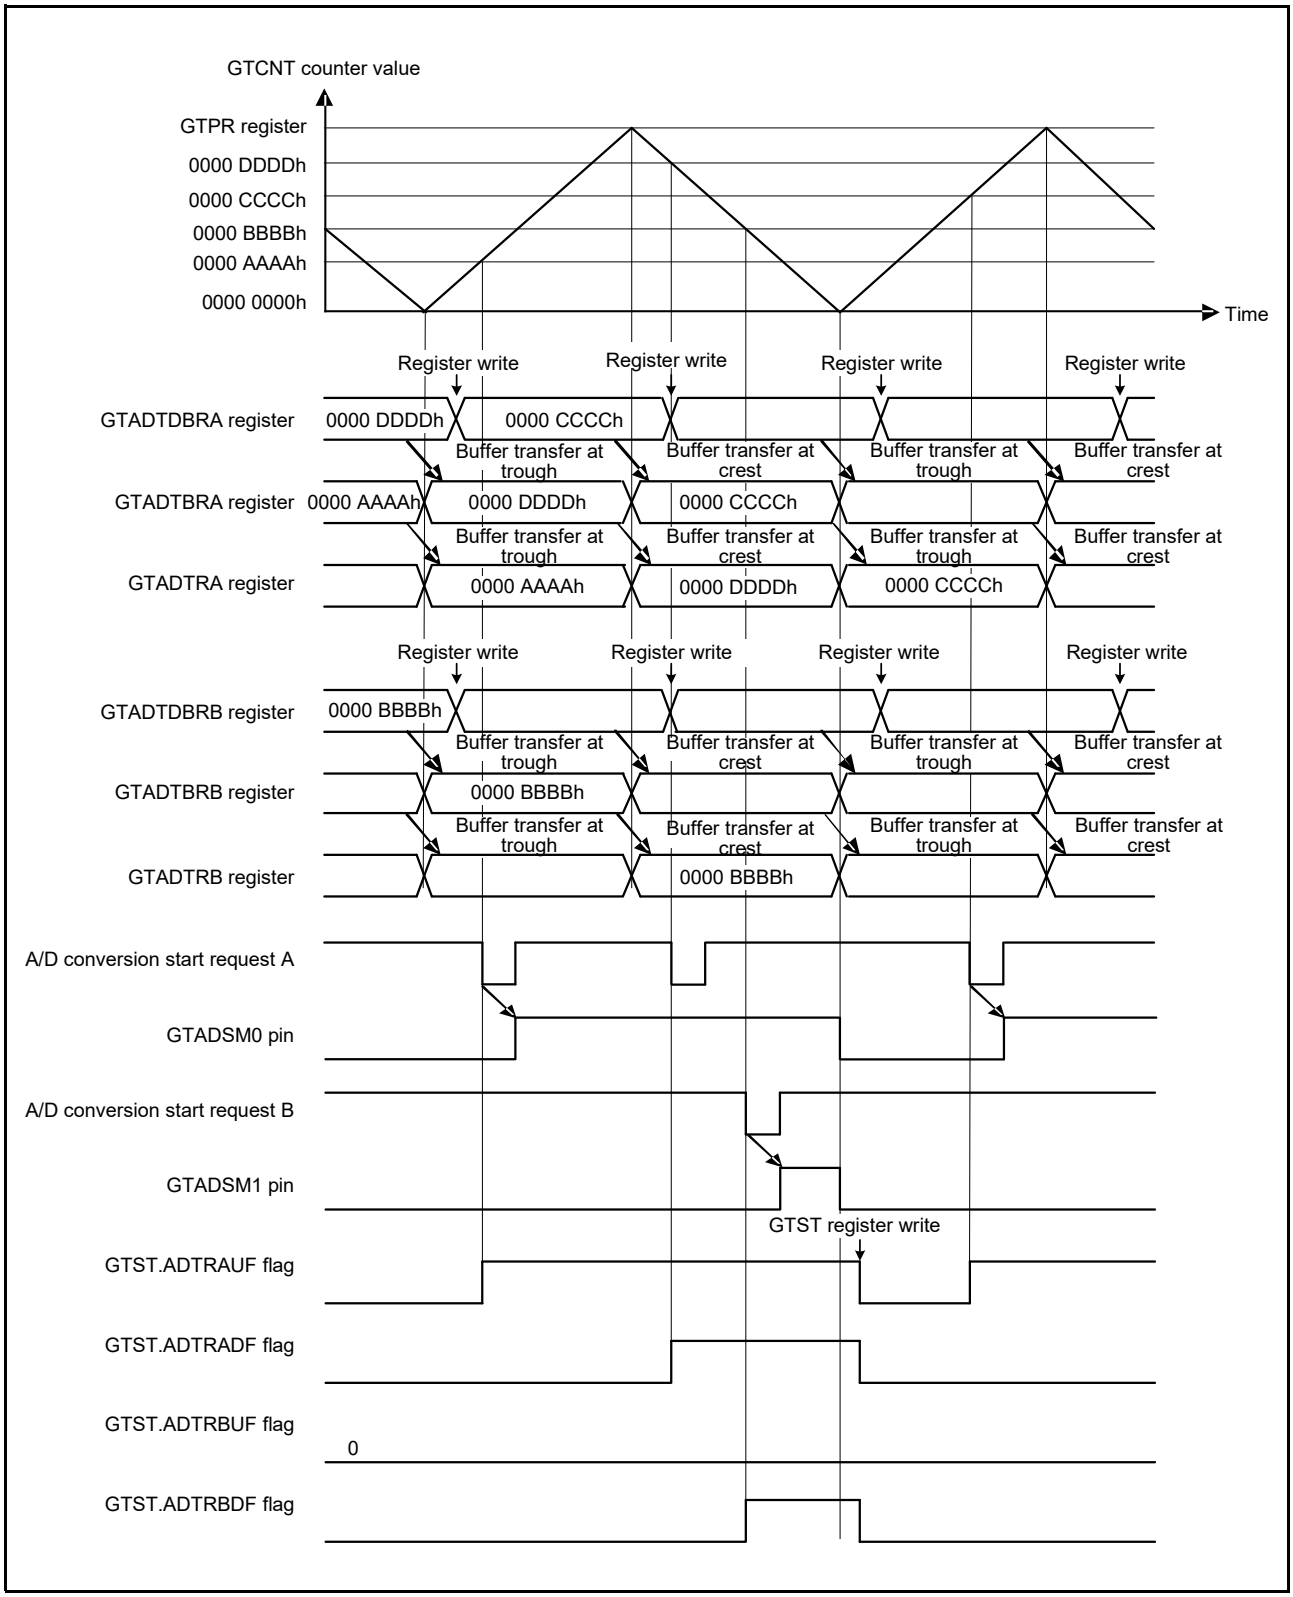

Figure 24.218 Example of A/D Conversion Start Request Timing Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Requested by GTADTRA Register at Both Up-Counting and Down-Counting, A/D Conversion Start Requested by GTADTRB Register at Down-Counting, Monitoring of the GTADTRA Register Up-Counting by the GTADSM0 Pin, Monitoring of the GTADTRB Register Down-Counting by the GTADSM1 Pin)

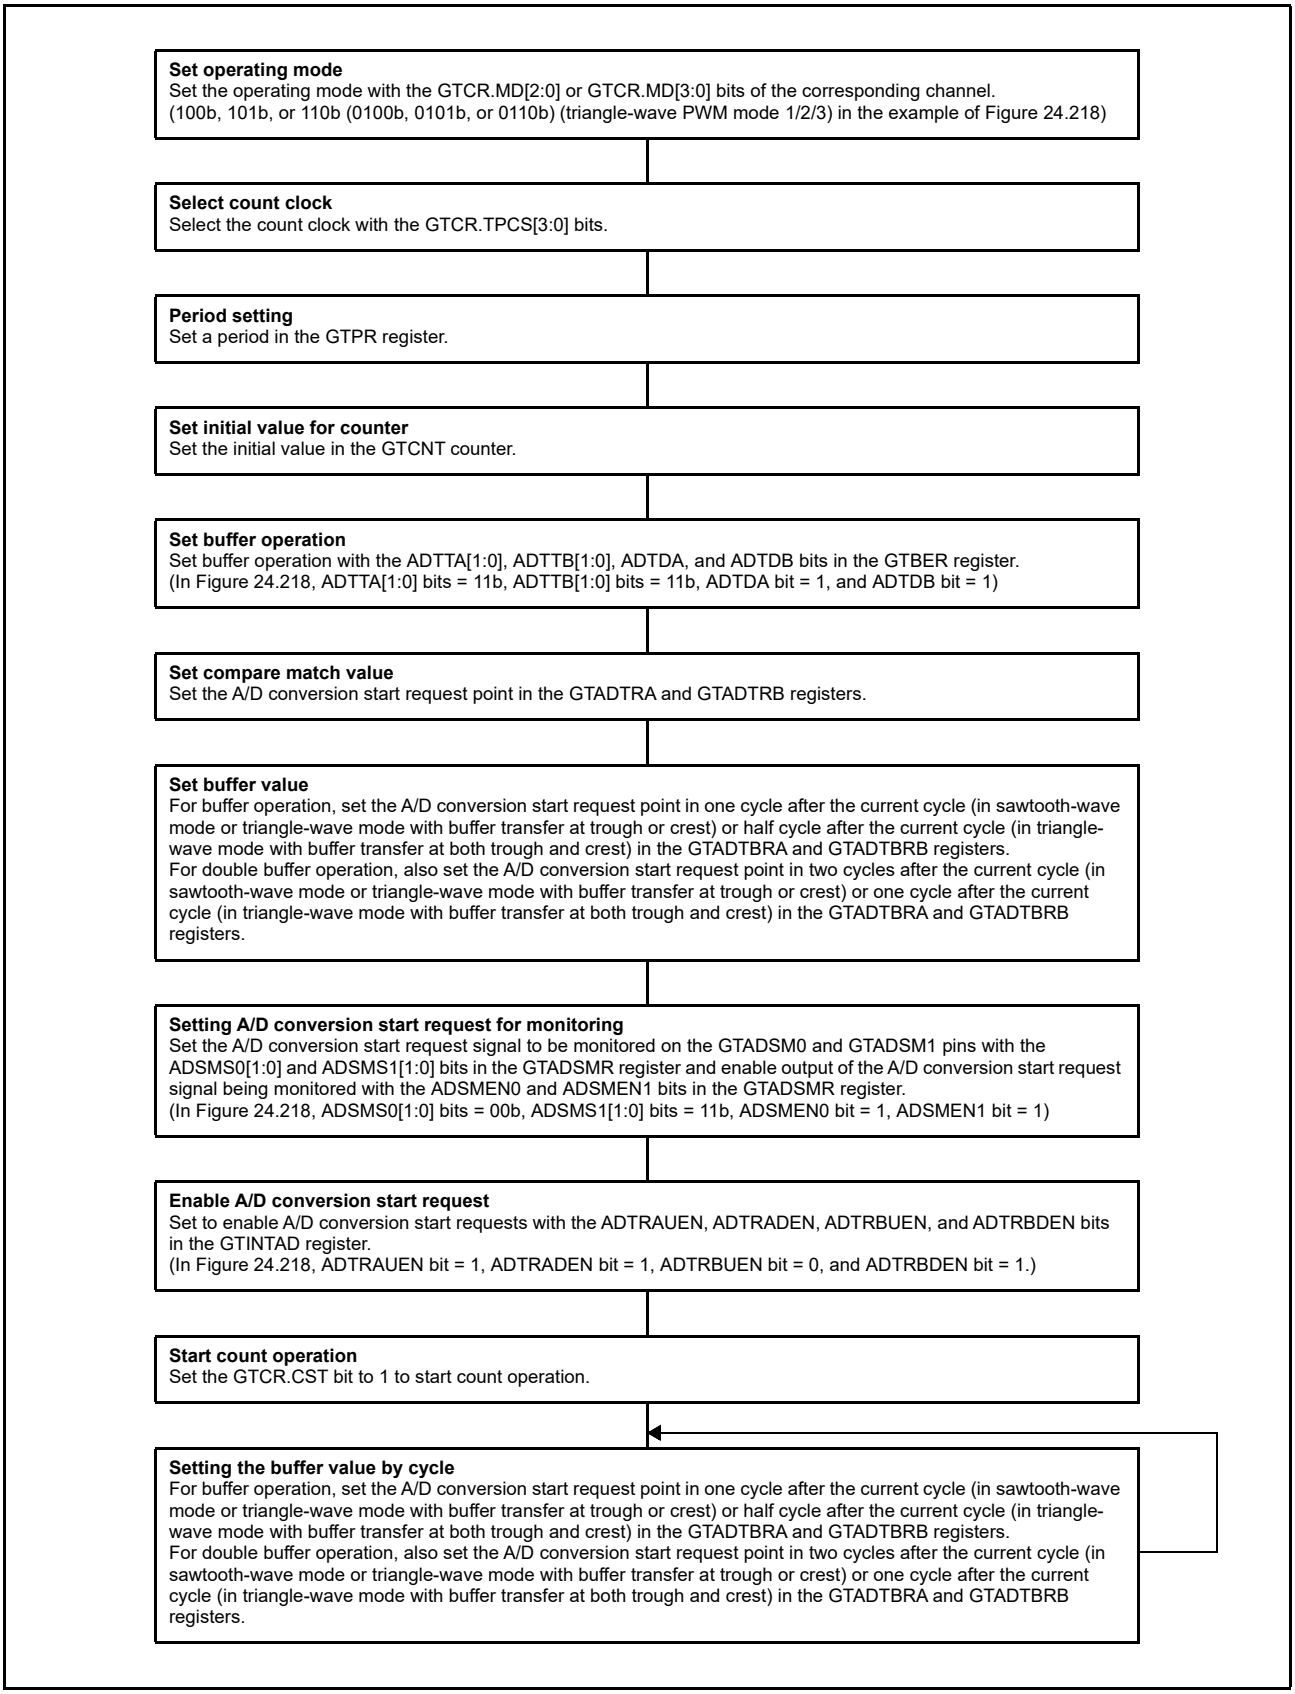

Figure 24.219 Example for Setting A/D Conversion Start Request Operation

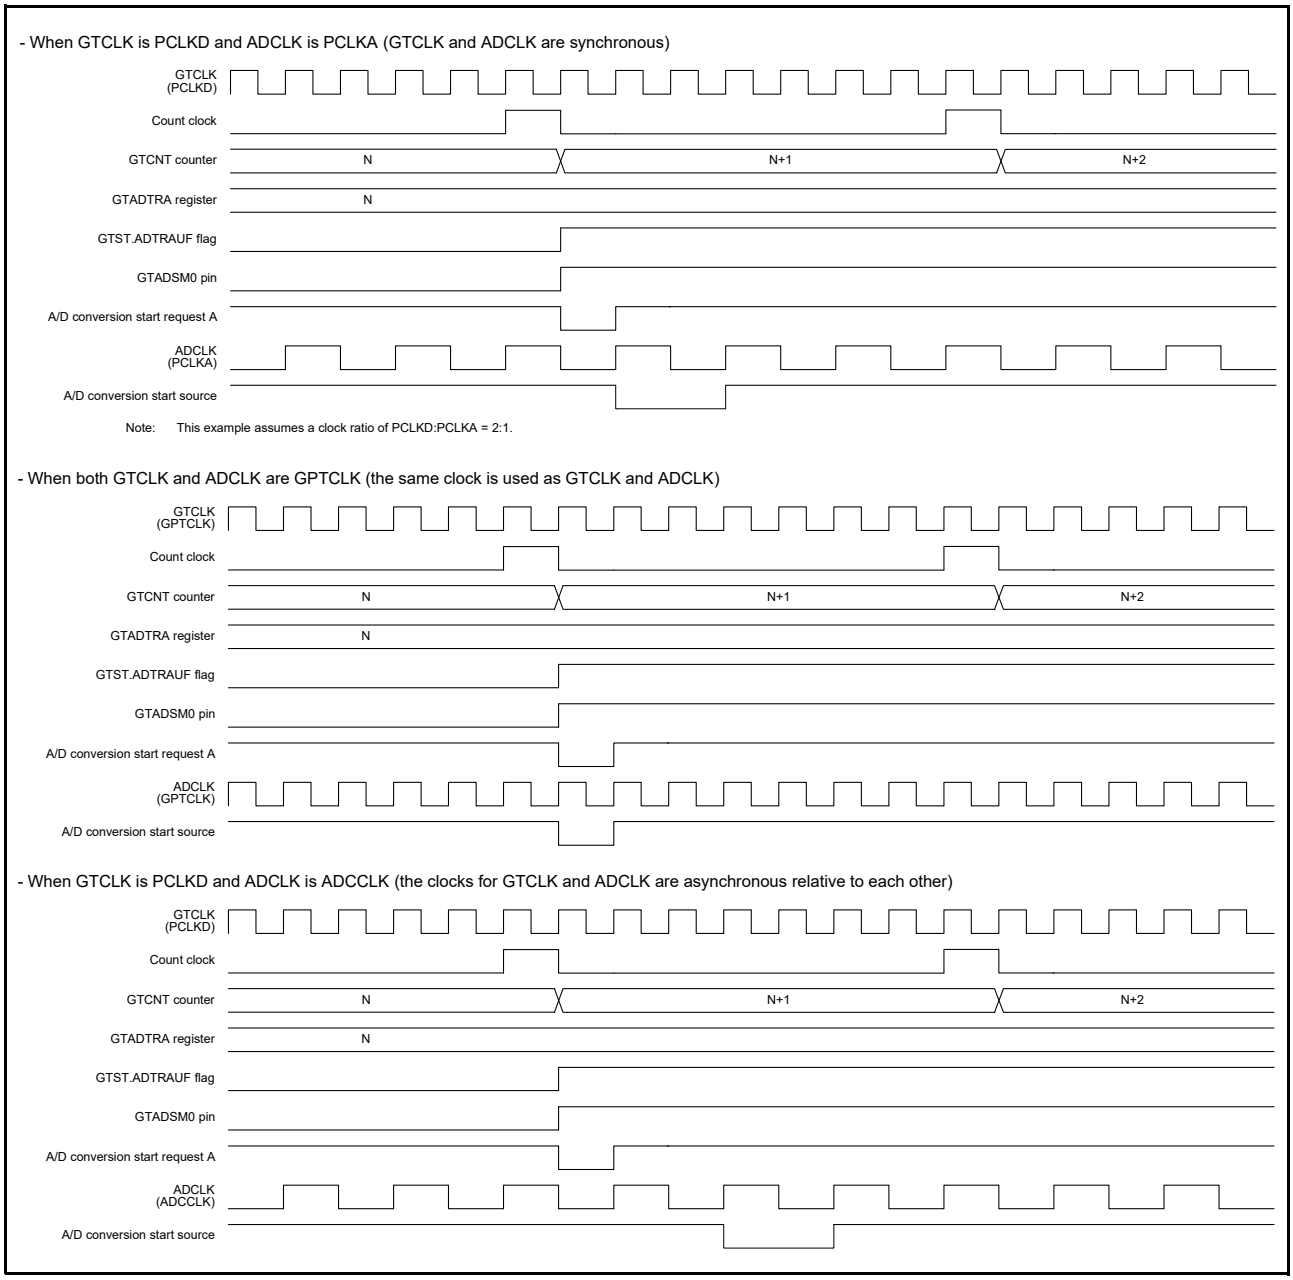

Figure 24.220 Examples of Timing of Operations with an A/D Conversion Start Request

24.6 Operations Linked by the ELC

24.6.1 Event Signal Output to the ELC

GPTW is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).
The event signal can be output regardless of the setting of the corresponding interrupt request enable bits except the A/D conversion start request.
The A/D conversion start request during up-counting/down-counting can be enabled/disabled individually with the A/D conversion start request enable bit to output to the ELC.
The following is a list of the event signals output by the GPTW to the ELC. Each GPTW channel has the first 11 event signals. The last of the listed event signals is common to all channels. A dead time error interrupt does not have a corresponding event signal.

- Generation of compare match A interrupt
- Generation of compare match B interrupt
- Generation of compare match C interrupt
- Generation of compare match D interrupt
- Generation of compare match E interrupt
- Generation of compare match F interrupt
- Generation of overflow interrupt
- Generation of underflow interrupt
- Generation of A/D conversion start request A
- Generation of A/D conversion start request B
- End of the cycle count operation
- GPTW (OPS) U-/V-/W-phase input edge detected

24.6.2 GPTW Operations in Response to Receiving Event Signals from the ELC

The GPTW can perform the following operations by the signals for sources A to H which are output from the ELC. Each signal is provided to all channels. Select an event source for a desired operation by a relevant source select register in a channel.

- Operation of count start/count stop/counter clearing/count switch
- Operation of up-counting/down-counting
- Operation of input capture A and B

Refer to operation by hardware sources in section 24.3.1.1, Counter Operation for respective operations.

24.7 Noise Filter Function

Each pin for use in input capture to the GPTW is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses of which length is less than three sampling periods.
The noise filter functionality includes enabling and disabling of the noise filter for each pin and setting of the sampling clock for each channel.
Figure 24.221 shows the timing of noise filtering.

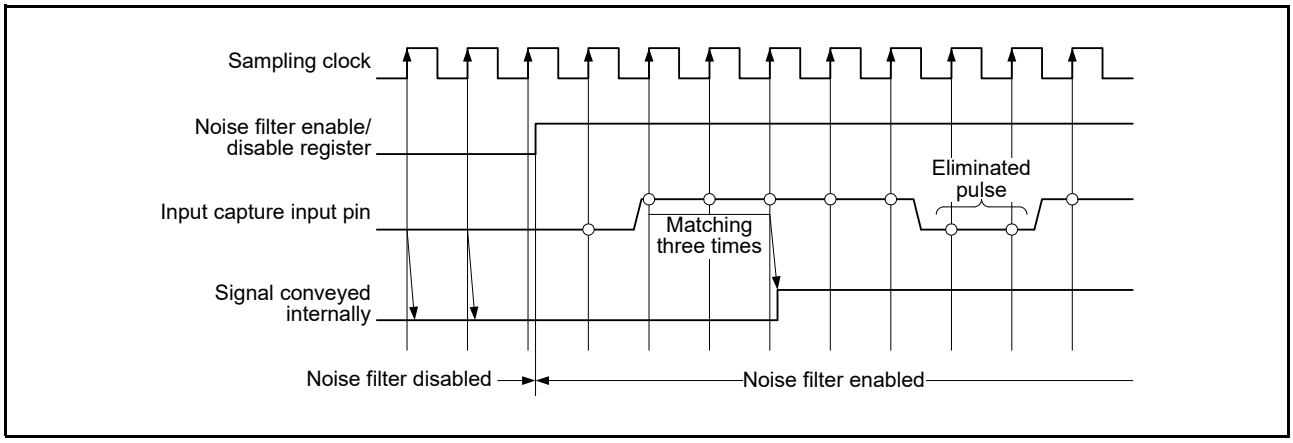

Figure 24.221 Timing of Noise Filtering

If noise filtering is enabled, input capture operation is performed on the edges of noise-filtered signal after a minimum delay of (sampling interval × 2 + GTCLK) due to noise filtering for the input capture input.

24.8 Protection Function

24.8.1 Write-Protection for Registers

In order to avoid incorrect writing to registers, write access to registers can be enabled or disabled per channel by setting the GTWP.WP bit for the given channel.
The WP bits enable or disable writing to the registers listed below.
GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC, GTADCMSC, GTADCMSS, GTSWSR, GTSWOS, GTBER2, GTOLBR, GTICCR, GTSYNCFCR, GTSYNCSCR
The GTSTR, GTSTP, and GTCLR registers, which can control all channels by updating the registers of any channel, can be protected from accidental writes by enabling or disabling writes to the bit corresponding to each channel using the GTWP.STRWP, STPWP, and CLRWP bits on a per-channel basis.
Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels, can be enabled or disabled for each channel by the setting of the GTWP.CMNWP bit.
Protection by the GTWP register only targets writing operation by the CPU. Register updates that occur with CPU writes are not protected.

24.8.2 Disabling of Buffer Operation

If the timing of buffer register write is too late for the buffer transfer timing, buffer operation can be suspended with setting the BD[0], BD[1], BD[2], and BD[3] bits in the GTBER register.
Specifically, buffer transfer can be temporarily disabled, even when a buffer transfer condition is satisfied during buffer register write, by setting the corresponding BD[0], BD[1], BD[2], and BD[3] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.
The BD[0], BD[1], BD[2], and BD[3] bits can be set on a per-channel basis by writing directly to the GTBER register or they can be set simultaneously for multiple channels specified by the GTSECSR register using the GTSECR register.
Figure 24.222 shows an example of operation for disabling buffer operation.

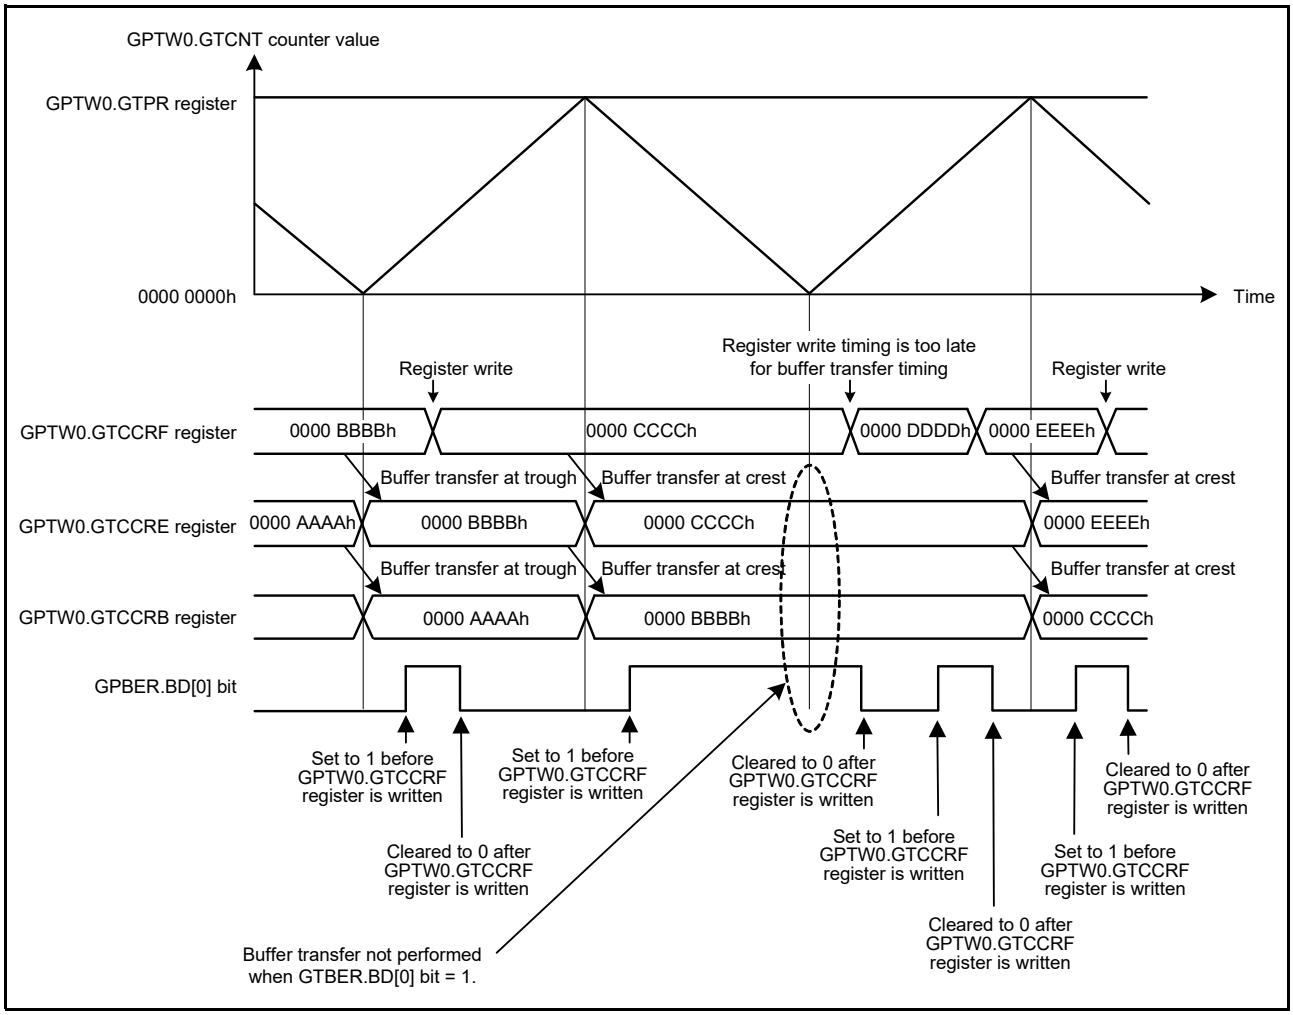

Figure 24.222 Example of Operation for Disabling Buffer Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests)

24.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.
Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

(1) Select the channels for simultaneously setting of the GTSECSR register

Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.

(2) Simultaneously set the GTBER.BD bits by updating the GTSECR register

In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register. Figure 24.223 and Figure 24.224 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

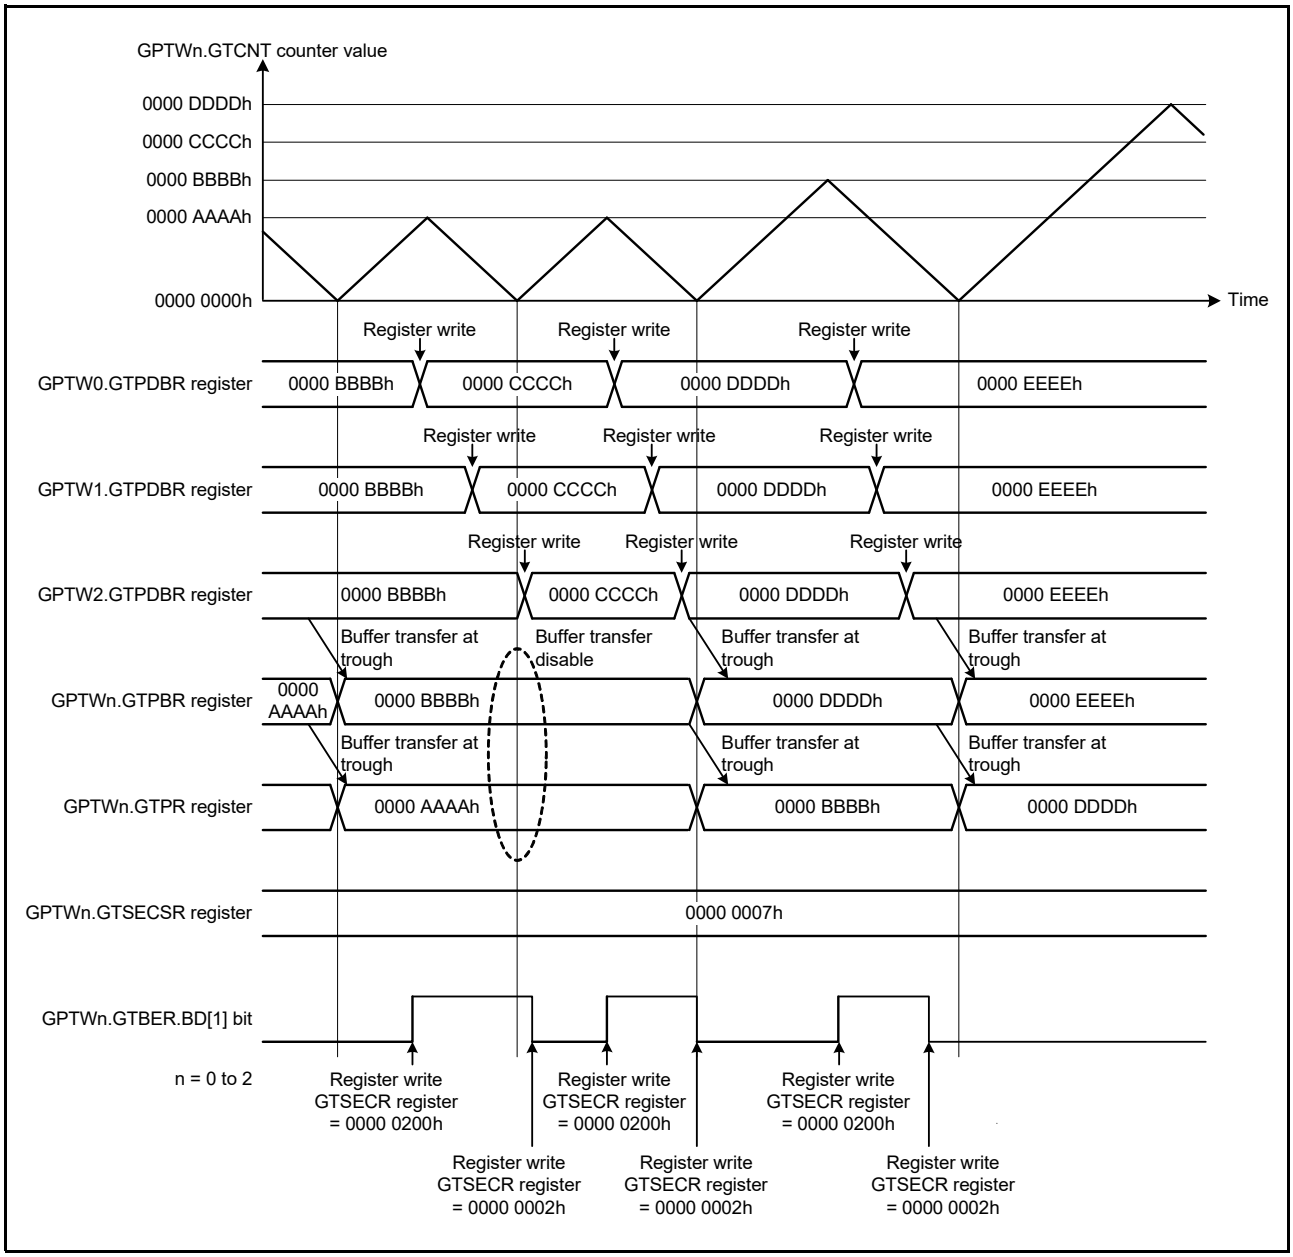

Figure 24.223 Example of Multiple Channel Operation for Simultaneous Control of Buffer Operation (Triangle Waves, Double Buffer Operation)

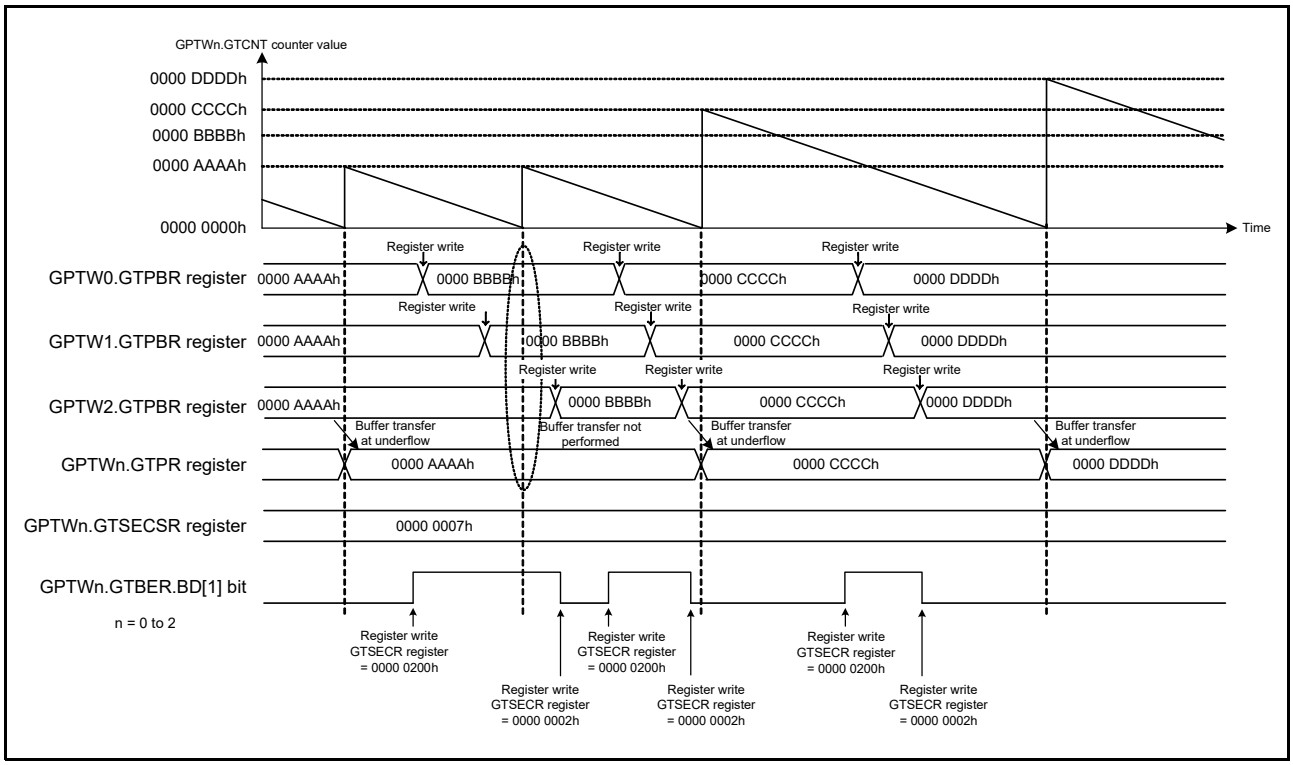

Figure 24.224 Example of Multiple Channel Operation for Simultaneous Control of Buffer Operation (Sawtooth Waves, Single Buffer Operation)

24.8.2.2 Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer

When a GTBER.DBRTECm (m = A, B) bit is set to 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or by the buffer transfer extended skipping function.

(1) In sawtooth-wave one-shot pulse mode

In sawtooth-wave one-shot pulse mode, the compare match value for the first half of a waveform is stored in temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRm (m = A, B) registers.

Table 24.42 lists the types of buffer transfer of the GTCCR register during counting in sawtooth-wave one-shot pulse mode. While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer.

In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 24.42 GTCCR Buffer Operation in Sawtooth-Wave One-Shot Pulse Mode

GTBER.DBRTECm	Buffer transfer	Timing of transfer				
		GTCCRx ↓ GTCCRm	GTCCRx ↓ Temporary register x	Temporary register x ↓ GTCCRm	GTCCRy ↓ Temporary register m	Temporary register m ↓ GTCCRm
0	Transfer-enabled period	Overflow or underflow	No transfer	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer-disabled period	No transfer	No transfer	No transfer	No transfer	No transfer
1	Transfer-enabled period	Overflow or underflow	Overflow or underflow	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer-disabled period	No transfer	No transfer	Overflow or underflow	No transfer	GTCCRm compare match

Figure 24.225 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer disabled in sawtooth-wave one-shot pulse mode.

Figure 24.226 shows the operation of generating transfer-disabled period by updating the GTBER.BD[0] bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in sawtooth-wave one-shot pulse mode.

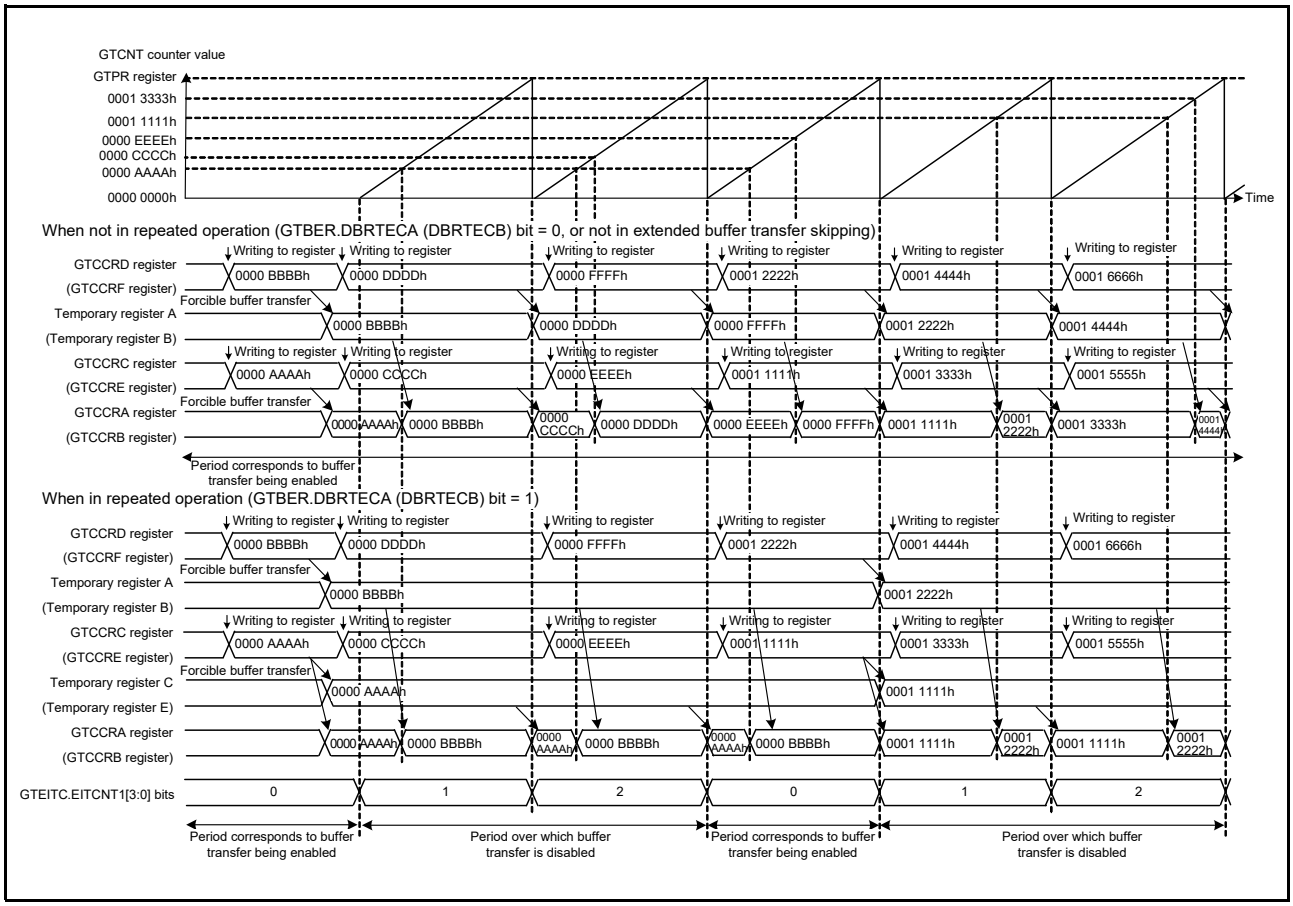

Figure 24.225 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Sawtooth-Wave One-Shot Pulse Mode, Using Extended Buffer Transfer Skipping, GTBER.BD[0] is Constantly 0)

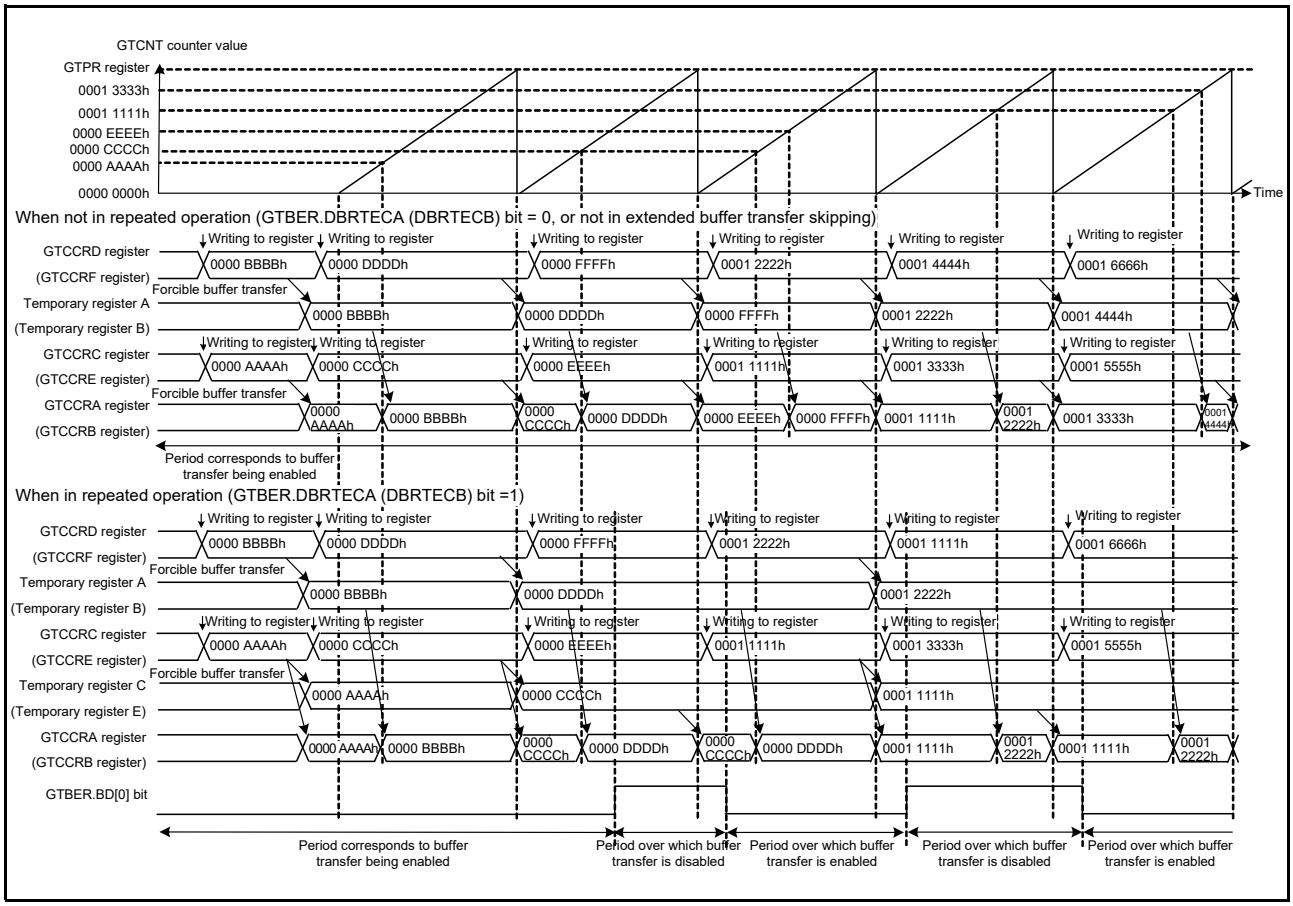

Figure 24.226 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Sawtooth-Wave One-Shot Pulse Mode, Updating the GTBER.BD[0] Bit)

(2) In triangle-wave PWM mode 3

In triangle-wave PWM mode 3, the compare match value for the first half of a waveform is stored in the temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRm (m = A, B) register.

Table 24.43 lists the types of buffer transfer of the GTCCR register during counting operation in triangle-wave PWM mode 3.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is set to 1, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 24.43 GTCCR Buffer Operation in Triangle-Wave PWM Mode 3

GTBER.DBRTECm	Buffer transfer	Timing of transfer				
		GTCCRx ↓ GTCCRm	GTCCRx ↓ Temporary register x	Temporary register x ↓ GTCCRm	GTCCRy ↓ Temporary register m	Temporary register m ↓ GTCCRm
0	Transfer-enabled period	Trough	No transfer	No transfer	Trough	Crest
	Transfer-disabled period	No transfer	No transfer	No transfer	No transfer	No transfer
1	Transfer-enabled period	Trough	Trough	No transfer	Trough	Crest
	Transfer-disabled period	No transfer	No transfer	Trough	No transfer	Crest

Figure 24.227 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer disabled in triangle-wave PWM mode 3.

Figure 24.228 shows the operation of generating transfer-disabled period by updating the GTBER.BD[0] bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in triangle-wave PWM mode 3.

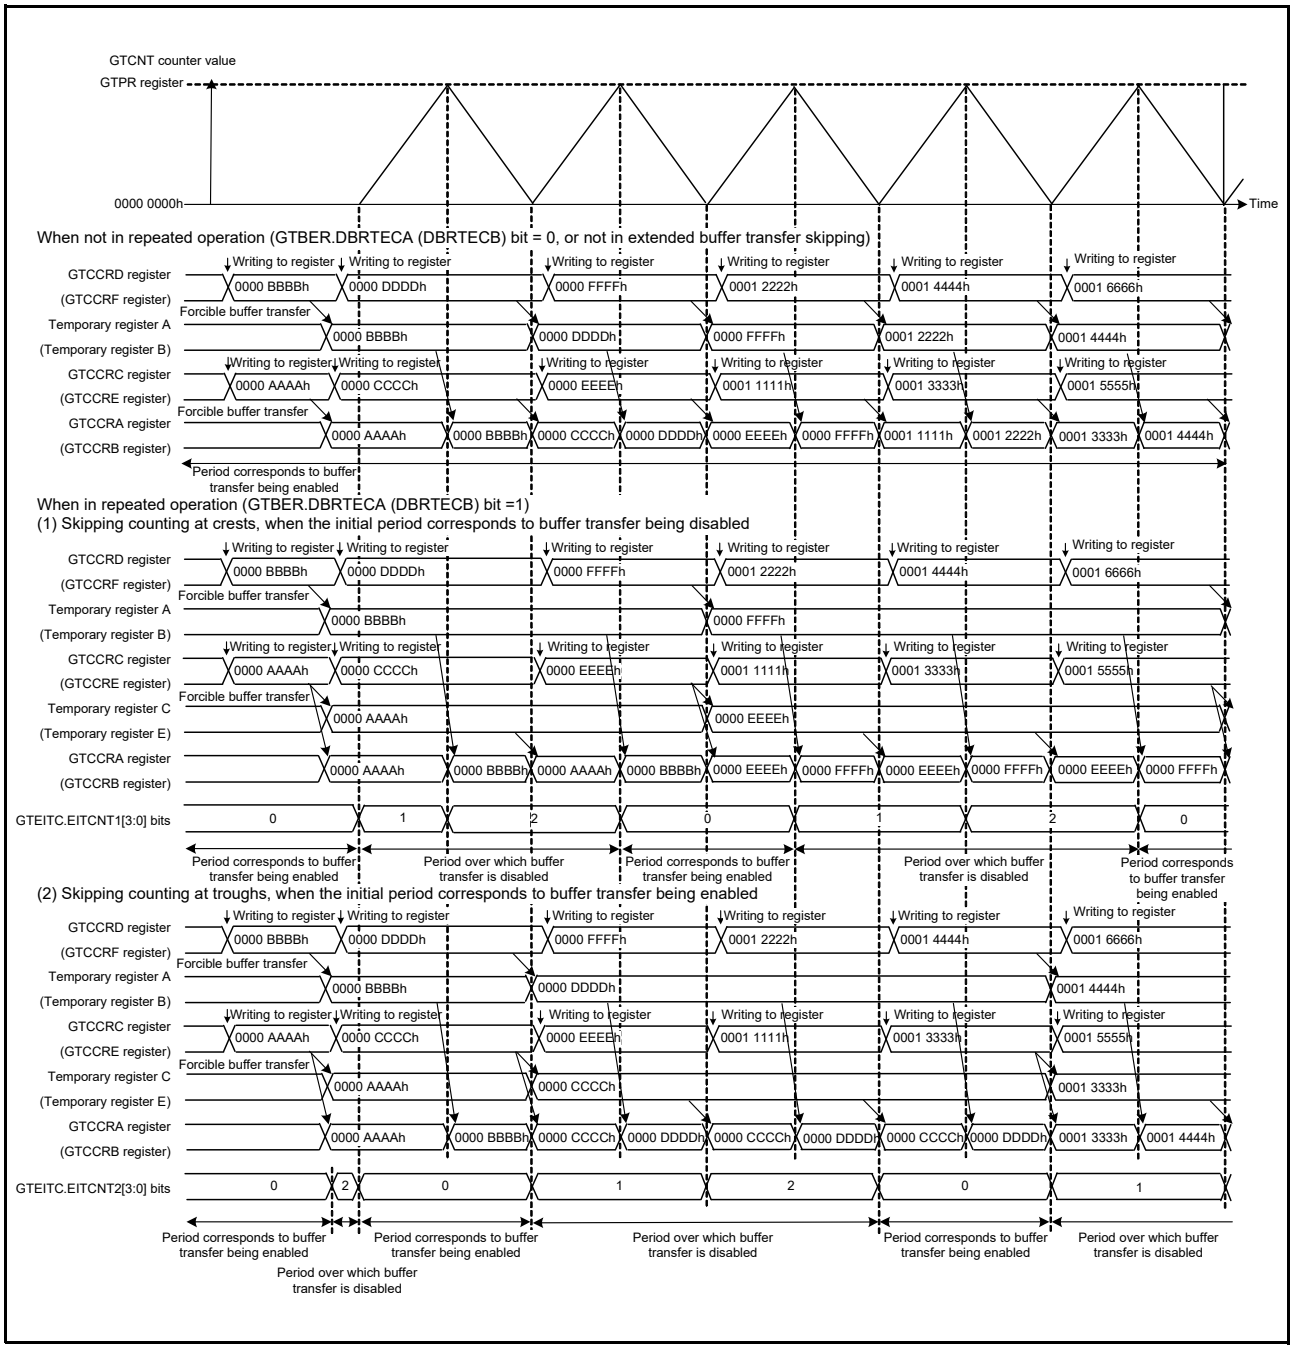

Figure 24.227 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Triangle-Wave PWM Mode 3, Using Extended Buffer Transfer Skipping, GTBER.BD[0] is Constantly 0)

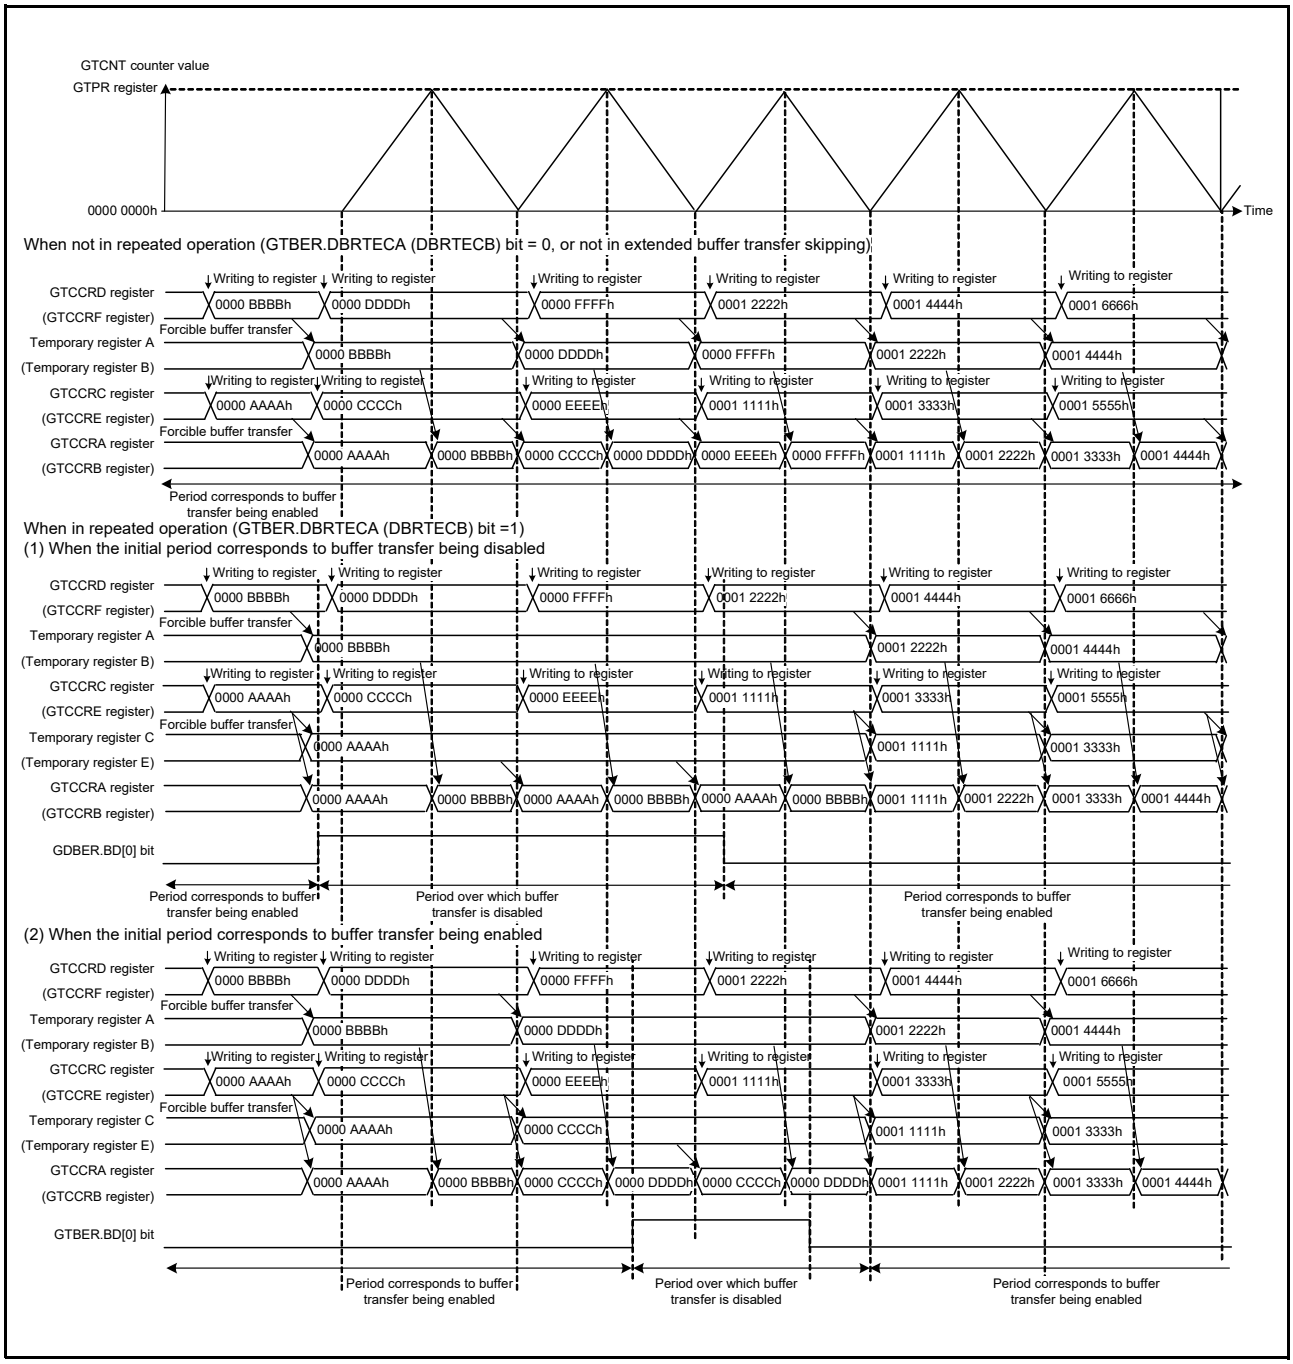

Figure 24.228 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Triangle-Wave PWM Mode 3, Updating the GTBER.BD[0] Bit)

24.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 15; m = A, B)

For protection from system failure, the output negate control which changes the GTIOCnm pin output forcibly by the output stop request from the POEG is provided.

Output protection is required when a dead-time error or the same output level being on the GTIOCnA and GTIOCnB pins is detected. At that time, the detection of disabling of output is output to the group of the POEG set in the GTINTAD.GRP[1:0] bits based on the setting of the output stop detection enable bits, i.e. the GRPDTE, GRPABH, and GRPABL bits in the GTINTAD register. The POEG takes the logical OR of detection of the types described above and other forms of detection of the disabling of output, and outputs requests for the disabling of output to the GPTW.

By setting the GTINTAD.GRP[1:0] bits, one output stop request can be selected out of four output stop requests which are input from the POEG as output stop request signal common in the GTIOCnA and GTIOCnB pins. Selected output stop request can be checked by reading the GTST.ODF flag.

The states of outputs at the time of control for their negation can be set with the GTIOR.OADF[1:0] bits for the GTIOCnA pin and with the GTIOR.OBDF[1:0] bits for the GTIOCnB pin.

Transition to the output negate condition by generating the output stop request from the POEG is performed asynchronously, while a release from the output negate condition by making the output stop request no longer satisfied is performed at the end of the cycle. The output negate condition is released no sooner than 3 GTCLK cycles after the output stop request is cleared. To reliably control output negation, clear the flag of POEG so that the output disable request is terminated at least 4 GTCLK cycles after it is generated.

To release the output stop condition during event count operation, in sawtooth-wave PWM mode 2, or without waiting the end of the cycle, set the OADF[1:0] bits to 00b for the GTIOCnA pin, and set the OBDF[1:0] bits to 00b for the GTIOCnB pin.

Figure 24.229 shows the output negate control operation for the GTIOCnm pin output.

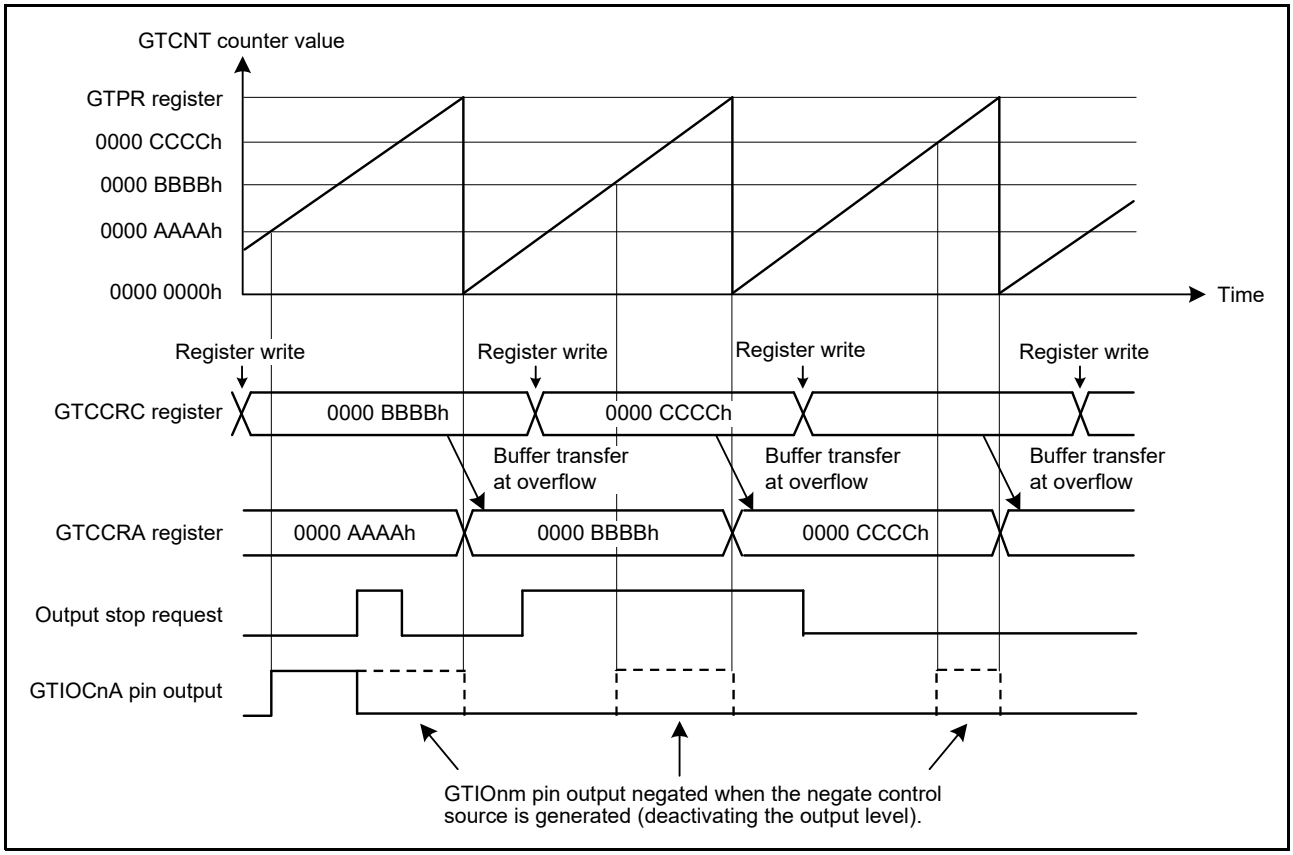

Figure 24.229 Example of Operation for GTIOCnm Pin Output Negate Control (Sawtooth-Wave Up-Counting, Buffer Operation, Active Level: High Output at GTCCRA Register Compare Match, Low Output at the End of the Cycle) and Low Output at Output Negate) (n = 0 to 15; m = A, B)

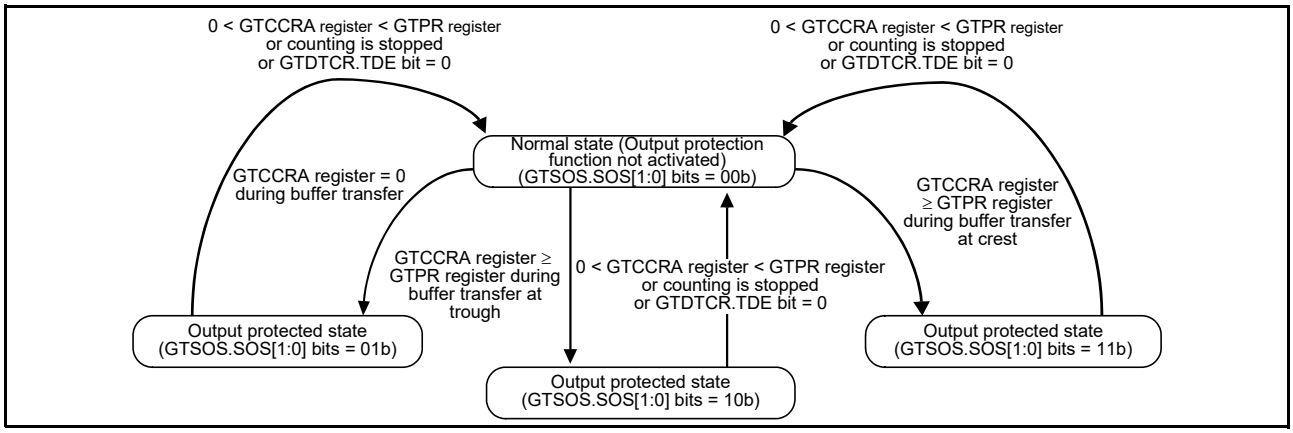
24.8.4 Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)

To prepare for a case when an incorrect value (0000 0000h or a value greater than or equal to the GTPR register value) is set in the GTCCRA register, the output protection function for the GTIOCnm pin output (disabling function) is activated when the automatic dead time is set (GTDTCR.TDE bit = 1) in triangle-wave PWM mode.
The status of the output protection function can be read from the GTSOS.SOS[1:0] bits.
Figure 24.230 shows the output protection function state transition.



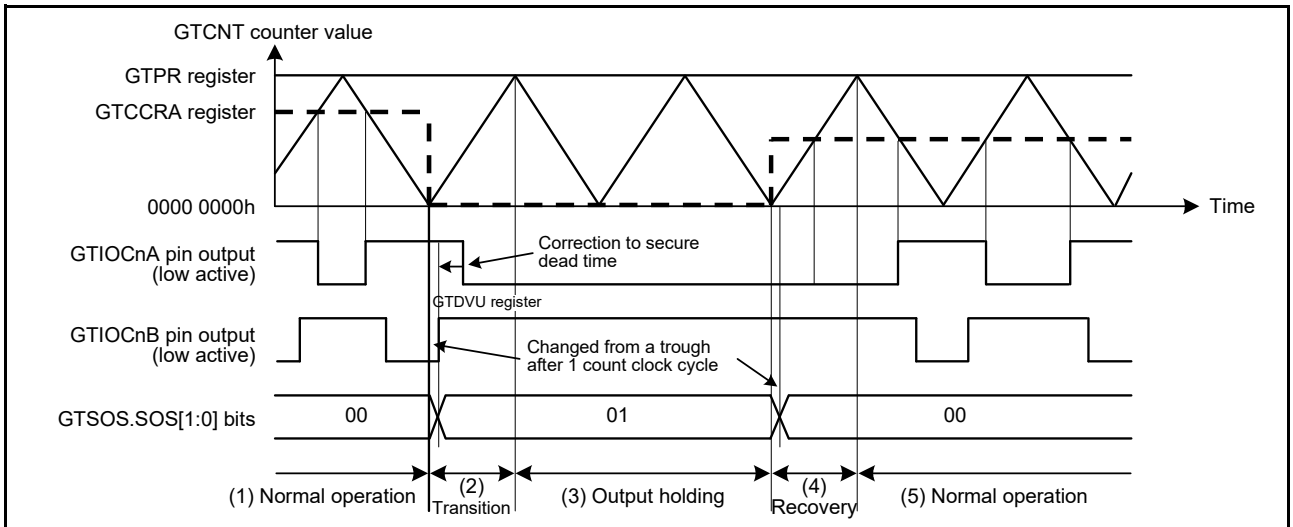


Figure 24.230 Output Protection Function

(1) Output Protection Function when the GTCCRA Register is Set to 0000 0000h during Buffer Transfer

Figure 24.231 and Figure 24.232 show examples of output protection function operation when the GTCCRA register is set to 0000 0000h during buffer transfer at troughs, and Figure 24.233 and Figure 24.234 show examples when the GTCCRA register is set to 0000 0000h during buffer transfer at crests.

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 24.231 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

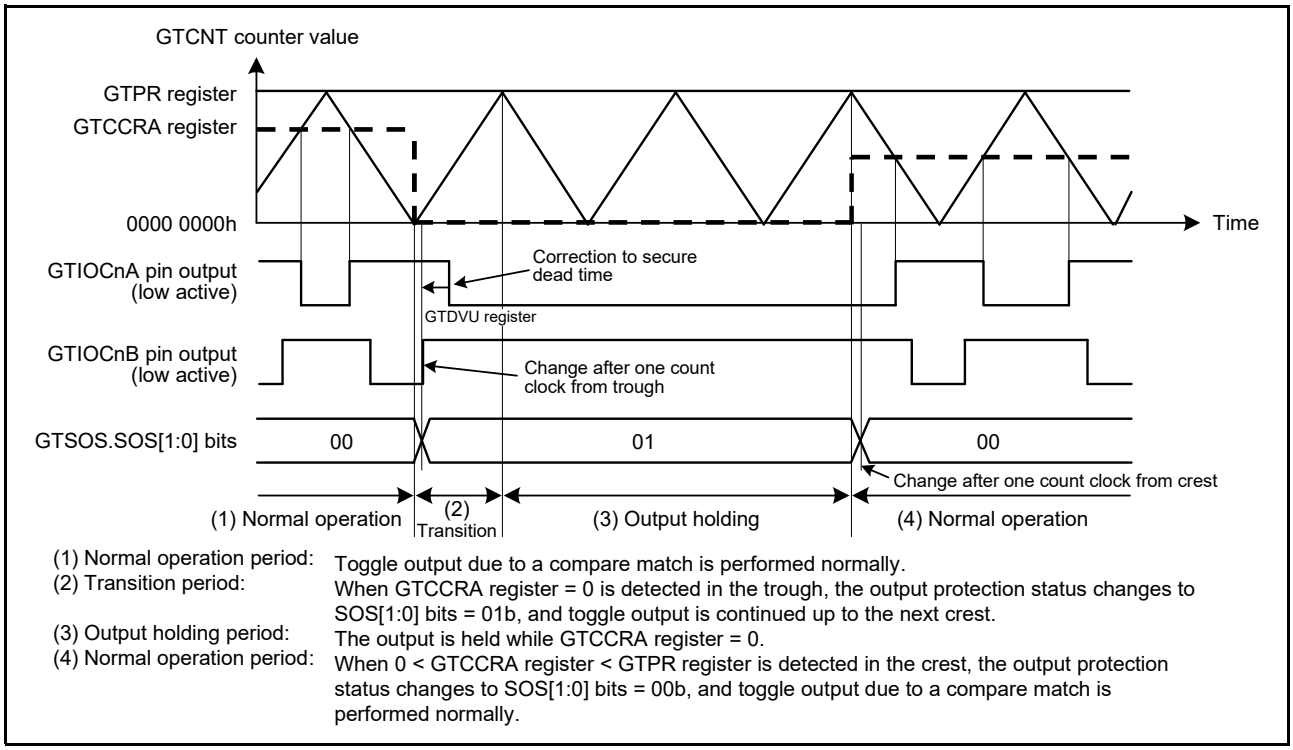

Figure 24.232 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

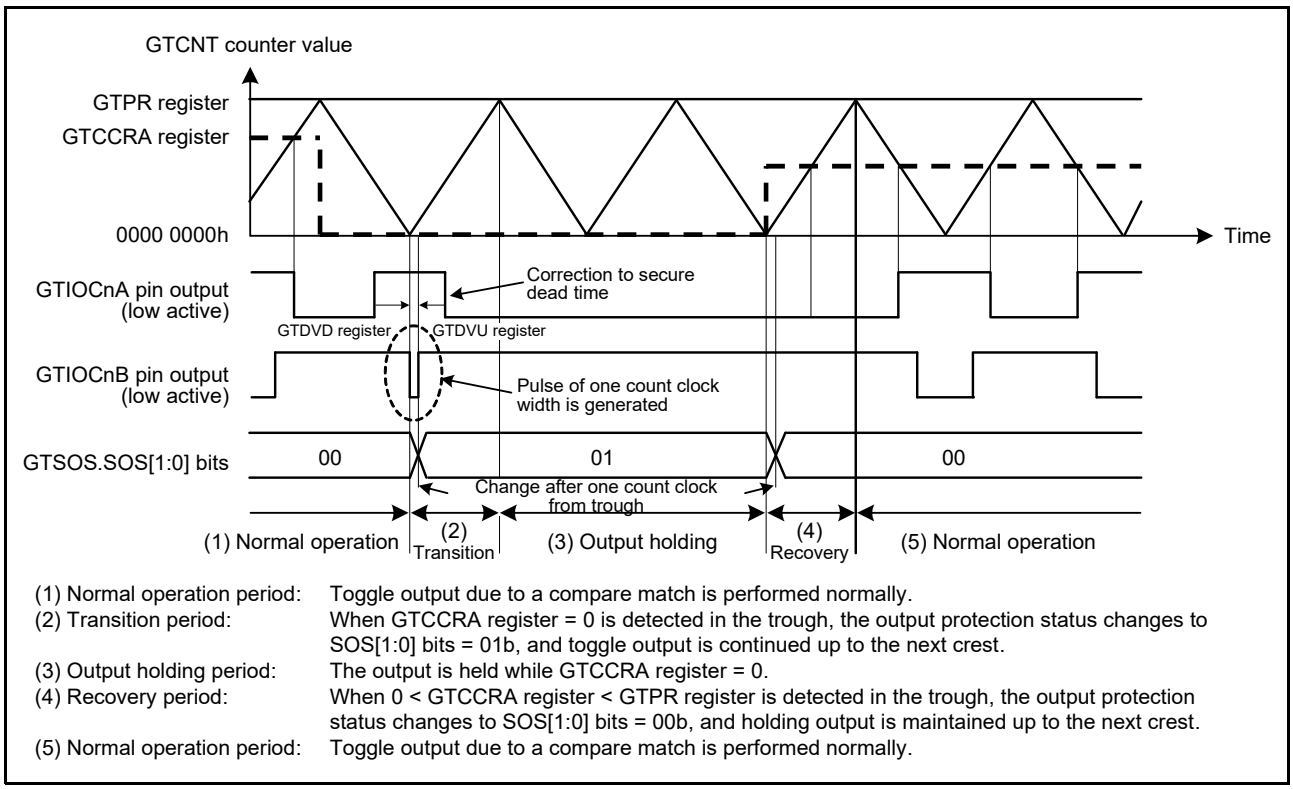

Figure 24.233 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

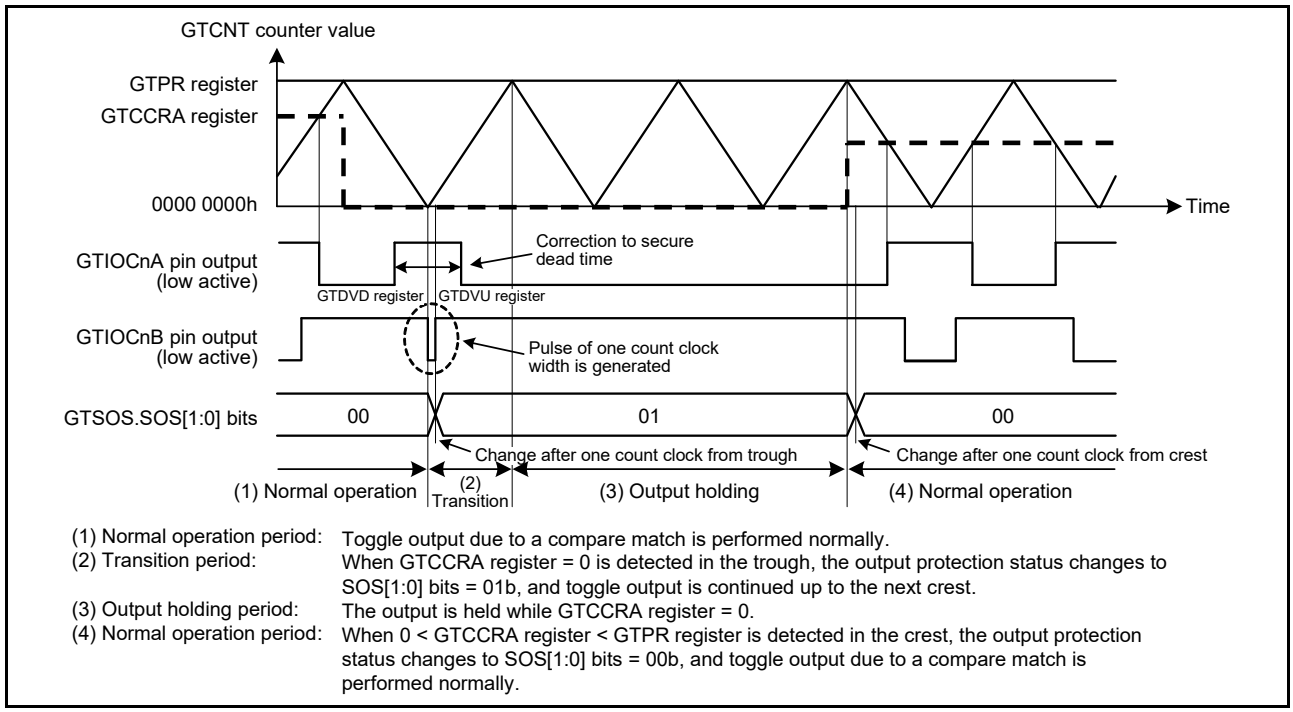

Figure 24.234 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

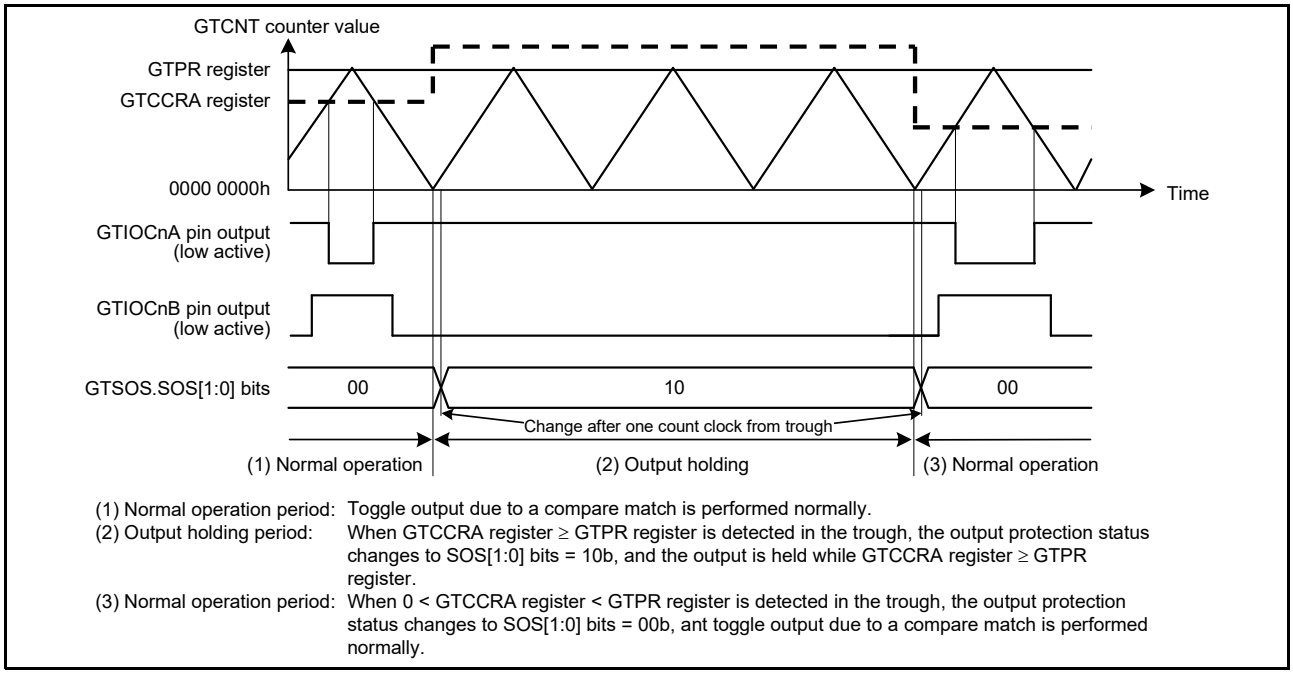
(2) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs

Figure 24.235 and Figure 24.236 show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at troughs.



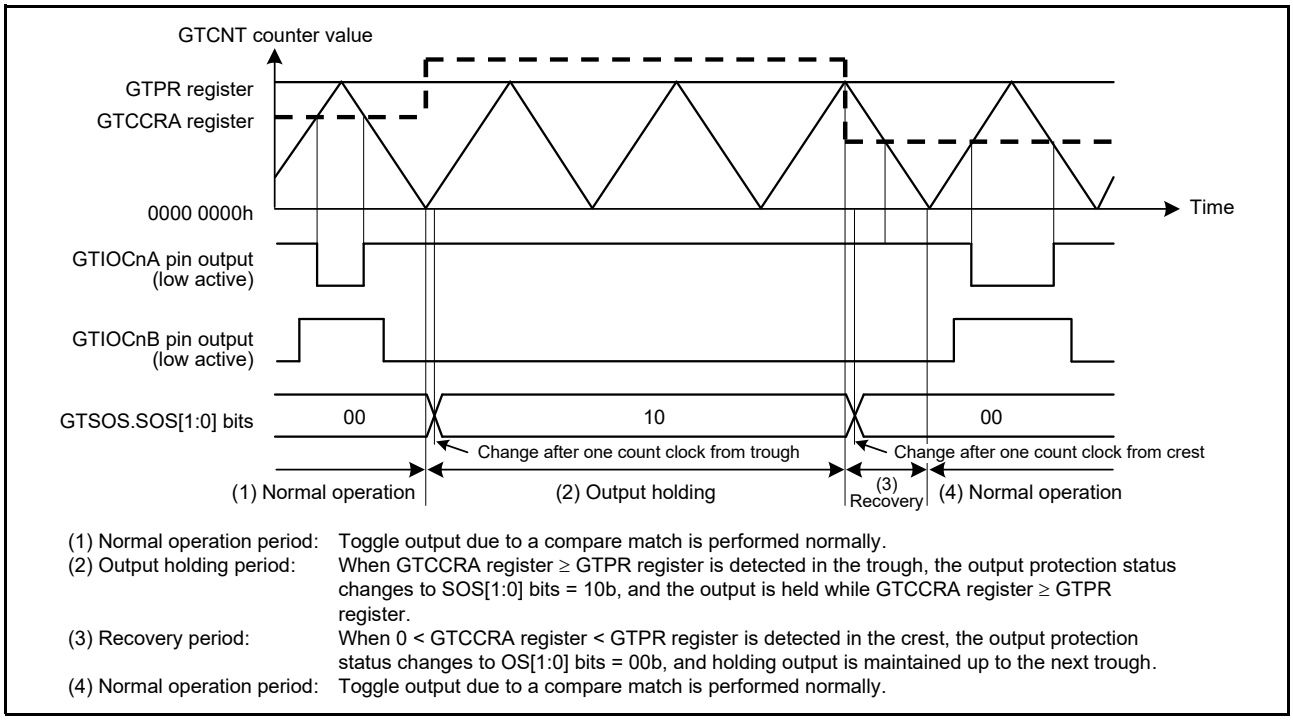


Figure 24.235 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

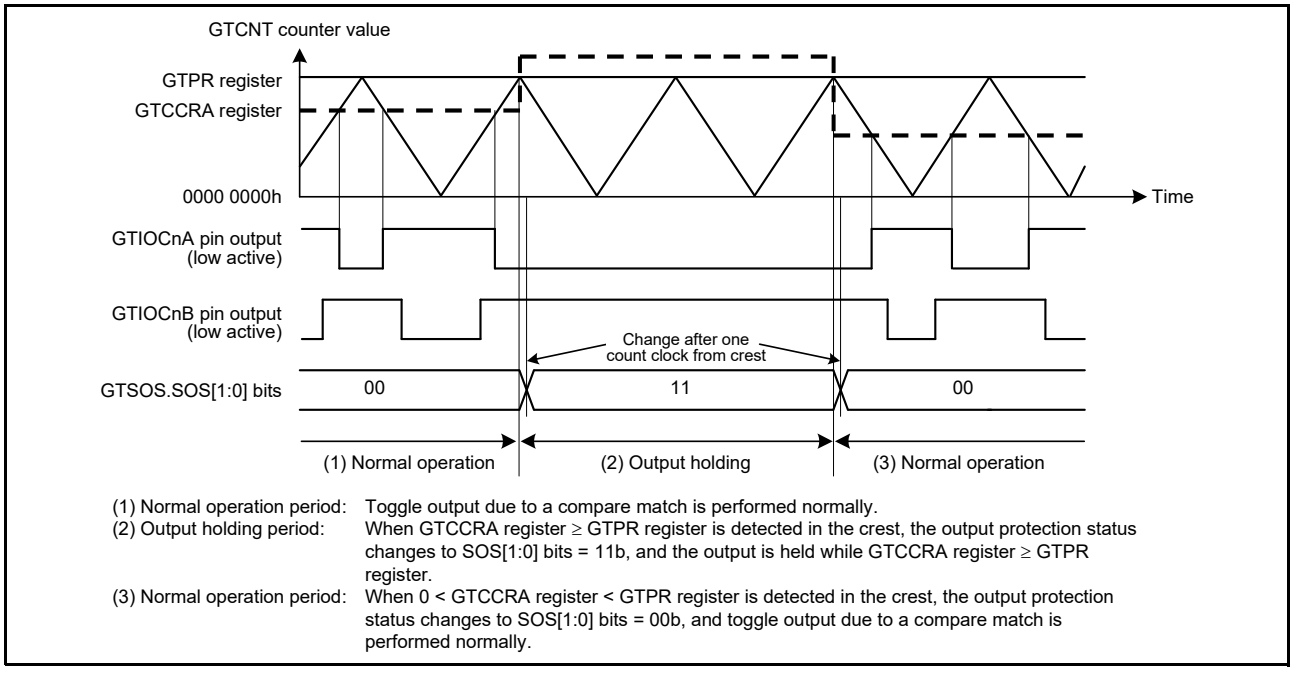
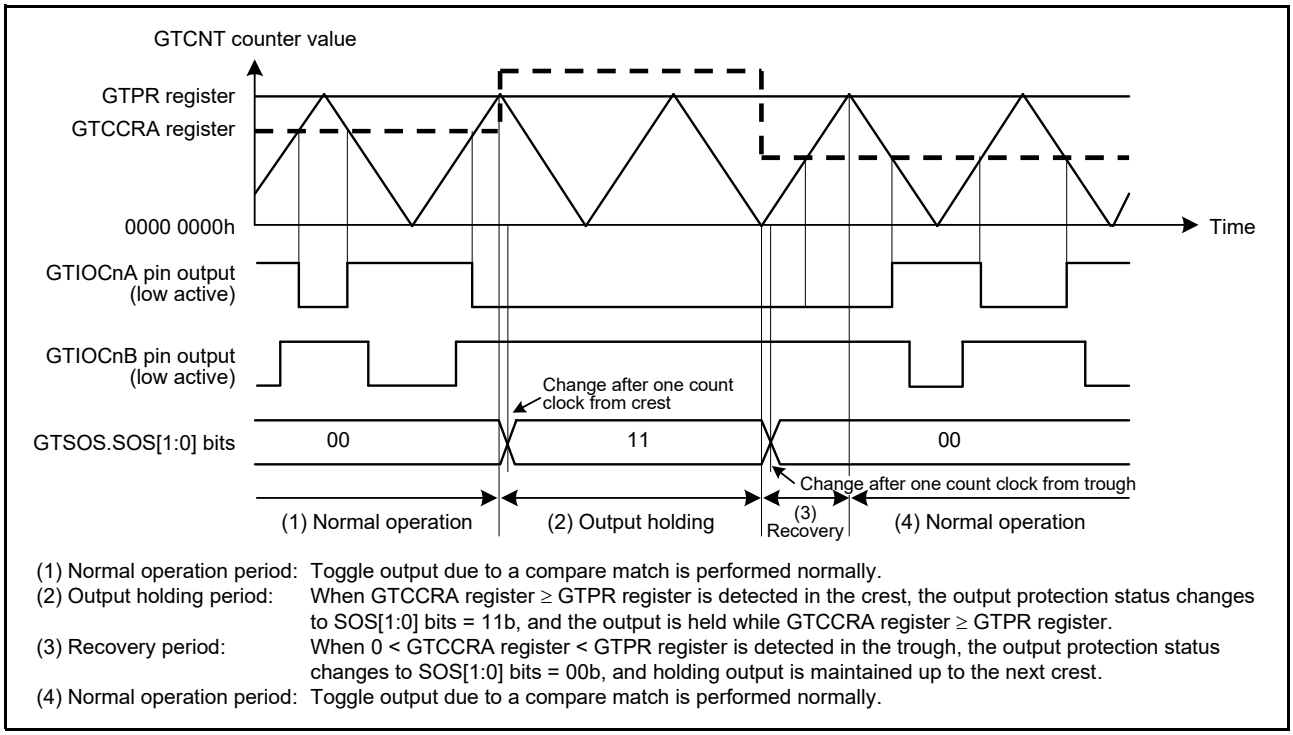


(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to OS[1:0] bits = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 24.236 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)



(3) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests

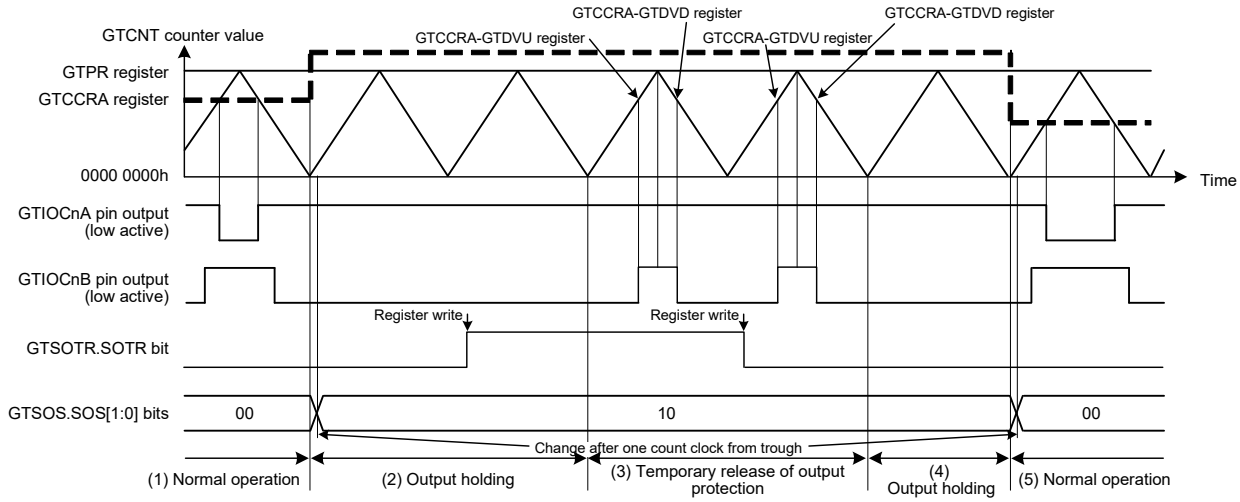
Figure 24.237 and Figure 24.238 show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at crests.

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the crest, the output protection status changes to SOS[1:0] bits = 11b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 24.237 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the crest, the output protection status changes to SOS[1:0] bits = 11b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 24.238 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)



(4) Restricted Specification of Output Protection Function

Even if an incorrect value (0000 0000h or a value greater than or equal to the GTPR register value) is set in the GTCCRA register during count operation, the output protection functions in a specific way such that one of the positive- and negative-phase outputs becomes non-active. However, if the following condition is not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of count operation is greater than 0000 0000h, and less than the setting value of the GTPR register

(5) Temporary Release of Output Protection Function

When the GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA register ≥ GTPR register has occurred during transfer at trough), the protected state of the GTIOCnB pin output can be temporarily released by setting the GTSOTR.SOTR bit to 1. The SOS[1:0] bits retain 10b even if the output protection function is released.
When the SOTR bit is set to 0, the GTIOCnB pin output protection can be restarted.
Figure 24.239 shows an example of the operation of temporary release of output protection when the setting of the GTCCRA register ≥ GTPR register during buffer transfer at troughs.

(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register. Even when the SOTR bit is set to 1, the GTIOCnB pin output is held until the first trough.
(3) Output protection temporary release period:	After the SOTR bit is set to 1, the GTIOCnB pin output is performed normally from the first trough. Even after the SOTR bit is set to 0, temporary release of output protection for the GTIOCnB pin continues until the next trough.
(4) Output holding period:	The output is held until 0 < GTCCRA register < GTPR register is detected in the tough.
(5) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 24.239 Example of the Operation of Temporary Release of Output Protection When the Setting of the GTCCRA Register ≥ GTPR Register during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

24.9 Initialization Method of Output Pins

24.9.1 Pin Settings after Reset

The GPTW registers are initialized at a reset. Initialize the GPTW for output to the external pins by making the port mode settings and setting the OAE and OBE bits in the GTIOR register, and then start the counter counting.

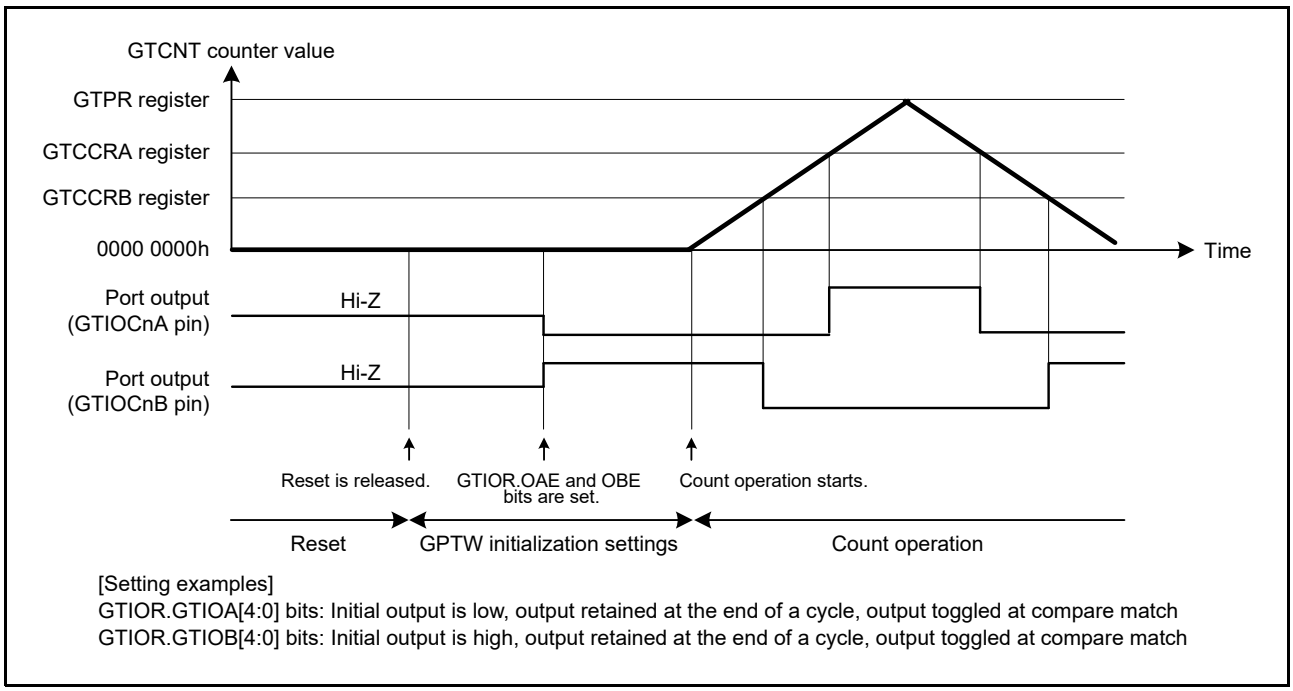


Figure 24.240 Example of Pin Settings after Reset (n = 0 to 15)

24.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPTW operation, the following four types of pin processing can be performed before pin initialization.

(1) Set OAHLD and OBHLD bits in the GTIOR register to 1 and retain the outputs at count stop.
(2) Set OAHLD and OBHLD bits to 0, specify arbitrary output values at OADFLT and OBDFLT bits in the GTIOR register, and output the arbitrary values at count stop.
(3) Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR, and PMR registers of the I/O port in advance. Set the OAE and OBE bits in the GTIOR register to 0 and the control bit in PMR register that corresponds to the pin to 0 to allow the arbitrary values to be output from the pin set as a general output port when an error occurs.
(4) Drive the output to a high impedance state using the POEG function.

When automatic dead time setting is enabled, set the GTDTCR.TDE bit to 0 once after counting is stopped.
When counting is stopped, only the values of registers that are changed by a GPTW external source will change. If counting is resumed, operation will carry on from where it was stopped.
If counting is stopped, registers should be initialized before restarting the count operation.

24.10 Usage Notes

24.10.1 Module Stop Function Setting

Operation of the GPTW can be disabled or enabled by the module stop control register. The initial setting is for operation of the GPTW to be halted. Register access is enabled by clearing module stop state. For details, see section 11, Low Power Consumption.

24.10.2 Settings of the GTCCRm Register during Compare Match Operation (m = A to F)

(1) When Automatic Dead Time Setting has been Made in Triangle-Wave PWM Mode

The GTCCRA register should satisfy the following conditions:

GTCCRA register > GTDVU register,
GTCCRA register > GTDVD register, and
GTCCRA register < GTPR register.

When the GTCCRA register is set to 0000 0000h or a value greater than or equal to the GTPR register value during count operation, the output protection function is activated.
However, if the following conditions are not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of count operation is 0000 0001h or greater, and less than the setting value of the GTPR register

For details, refer to section 24.8.4, Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B).

(2) When Automatic Dead Time Setting has not been Made in Triangle-Wave PWM Mode

Set a value greater than 0000 0000h, and less than the setting value of the GTPR register in the GTCCRA register. When 0000 0000h or the same value as that of the GTPR register is set in the GTCCRA register, compare match is generated in one cycle only when [GTCCRA register = 0000 0000h] or [GTCCRA register = GTPR register] is met. Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRA register, compare match does not occur. Similarly, set a value greater than 0000 0000h, and less than the setting value of the GTPR register in the GTCCRB register. When 0000 0000h or the same value as that of the GTPR register is set in the GTCCRB register, compare match is generated in one cycle only when [GTCCRB register = 0000 0000h] or [GTCCRB register = GTPR register] is met. Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRB register, compare match does not occur.

(3) When Automatic Dead Time Setting has been Made in Sawtooth-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers should be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time may not be obtained.

- In up-counting:
  GTCCRC register < GTCCRD register
  GTCCRC register > GTDVU register
  GTCCRD register < GTPR register – GTDVD register
- In down-counting:
  GTCCRC register > GTCCRD register
  GTCCRC register < GTPR register – GTDVU register
  GTCCRD register > GTDVD register

(4) When Automatic Dead Time Setting has not been Made in Sawtooth-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers should be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC register < GTCCRD register < GTPR register
- In down-counting: GTPR register > GTCCRC register > GTCCRD register > 0

Similarly, GTCCRE and GTCCRF registers should be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE register < GTCCRF register < GTPR register
- In down-counting: GTPR register > GTCCRE register > GTCCRF register > 0

(5) In Sawtooth-Wave PWM Mode 1

The GTCCRA register should be set with the range of 0000 0000h < GTCCRA register < GTPR register. If GTCCRA register = 0000 0000h or GTCCRA register = GTPR register is set, a compare match occurs within the cycle only when GTCCRA register = 0000 0000h or GTCCRA register = GTPR register is satisfied. If GTCCRA register > GTPR register is set, no compare match occurs.
Similarly, GTCCRB register should be set with the range of 0000 0000h < GTCCRB register < GTPR register. If GTCCRB register = 0000 0000h or GTCCRB register = GTPR register is set, a compare match occurs within the cycle only when GTCCRB register = 0000 0000h or GTCCRB register = GTPR register is satisfied. If GTCCRB register > GTPR register is set, no compare match occurs.

(6) In Complementary PWM mode 1, 2, 3

The GTCCRn register must be set with the range of 0 ≤ GTCCRn ≤ GTPR + GTDVU.

(7) In Complementary PWM mode 4

In single buffer operation, the GTCCRn register must be set with the range of 0 ≤ GTCCRn ≤ GTPR + GTDVU.
In double buffer operation, the GTCCRn register must be set with the range of GTDVU < GTCCRn < GTPR.

24.10.3 Range of Settings for the GTPBR and GTPDBR Registers in the Complementary PWM Mode

When buffer transfer with the use of the GTPR register is to proceed at the end of a crest section in complementary PWM mode 1, 3, or 4, set the GTPBR and GTPDBR registers so that the GTPR register is within the following range after the transfer.
The range consists of values no less than the GTCNT counter value of the master channel at the end of a crest section, that is, the GTPR register before the transfer – the GTDVU register (GTPBR register ≥ GTPR register – GTDVU register, GTPDBR register ≥ GTPR register – GTDVU register)
When buffer transfer with the use of the GTPR register is to proceed at the end of a trough section or on counter clearing, no restriction applies to the ranges of settings for the GTPBR and GTPDBR registers.

24.10.4 Setting Range of the GTCNT Counter

Other than the sawtooth-wave PWM mode 2 and complementary PWM mode, set the range of the GTCNT counter within the range of 0 ≤ GTCNT counter ≤ GTPR register.

24.10.5 The GTCNT Counter Start/Stop

The GTCNT counter start/stop control by the GTCR.CST bit is synchronized with the count clock selected by the GTCR.TPCS[3:0] bits. Since the GTCNT counter starts or stops after one count clock cycle selected by the TPCS[3:0] bits following the CST bit updating, events until the GTCNT counter actually starts are ignored, and events may be generated after the CST bit becomes 0.
Similarly, when synchronizing with the timer-internal synchronization signal of the timer-linked synchronization signal output function, since the GTCNT counter starts or stops after timer-internal synchronization signal selected by the GTSYNCFCR.SYST bits, events until the GTCNT counter actually starts are ignored, and events may be accepted and the interrupt may be generated after the GTCR.CST bit becomes 0.

24.10.6 Order of Priority in Events

(1) GTCNT Counter

Order of priority in events to update the GTCNT counter is shown below.

Table 24.44 Order of Priority in Updating GTCNT Counter

The GTCNT counter updating source	Order of priority
CPU writing (GTCNT counter writing/GTCLR register writing)	High ↑
Clearing by a hardware source set by the GTCSR register	
Up-counting/down-counting by a hardware source set by the GTUPSR and GTDNSR registers	
Count operation	Low

In case of contention between up-counting by the GTUPSR register and down-counting by the GTDNSR register, the counter value is not updated.
When updating of the GTCNT counter conflicts with reading by the CPU, the value before updating is reflected.

(2) The GTCR.CST Bit

In case that start/stop by a hardware source set by the GTSSR and GTPSR registers conflicts with the CPU writing (GTCR register writing/GTSTR register writing /GTSTP register writing), the CPU writing takes priority.
In case that stop by the cycle count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the cycle count operation is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.
In case of contention between start by a hardware source set by the GTSSR register and stop by a hardware source set by the GTPSR register, the state of the CST bit does not change.
In case of contention between the CST bit updating and the CPU reading (GTCR register reading/GTSTR register reading /GTSTP register reading), data before updating is read.

(3) GTCCRm Register (m = A to F)

In case of contention between the GTCCRm register writing and an input capture/buffer transfer, the GTCCRm register writing takes priority over an input capture/buffer transfer.
In case that an input capture conflicts with the CPU writing or the counter updating by a hardware source, the counter value before updating is captured.
In case of contention between the GTCCRm register updating and the CPU reading, data before updating is read.

(4) GTPR Register

In case of contention between a buffer transfer and the GTPR register writing, the GTPR register writing takes priority over a buffer transfer.
In case of contention between the GTPR register updating and the CPU reading, data before updating is read.

(5) GTADTRm Register (m = A, B)

In case of contention between a buffer transfer and the GTADTRm register writing, the GTADTRm register writing takes priority over a buffer transfer.
In case of contention between the GTADTRm register updating and the CPU reading, data before updating is read.

(6) GTDVm Register (m = U, D)

In case of contention between a buffer transfer and the GTDVm register writing, the GTDVm register writing takes priority over a buffer transfer.
In case of contention between the GTDVm register updating and the CPU reading, data before updating is read.

(7) GTIOR.GTIOm bit (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTIOR.GTIOm bit, writing to GTIOR.GTIOm bit has priority over buffer transfer operation.
When there is a conflict between updating the GTIOR.GTIOm bit and reading by the CPU, pre-update data is read.

24.10.7 Note on Counter Clearing in the Complementary PWM Mode

Counter clearing at the end of a trough section or the end of the initial output section must be avoided in the complementary PWM mode. This can be achieved by using synchronous clearing in response to a match in comparison in another channel set as the source of the trigger, as described in section 24.3.9.3, Synchronous Clear Operation by Inter Channel Cooperation. When using counter clearing other than as stated above, adjust the timing of the operations to avoid counter clearing at the end of a trough section or the end of the initial output section.

24.10.8 Note on Disabling PWM Initial Output After Synchronous Clearing in the Complementary PWM Mode

When initial output on the GTIOCnA and GTIOCnB pins after synchronous clearing in a trough section in the complementary PWM mode has been disabled by setting the GTIOR.CPSCIR bit to 1, the respective values set in the compare match registers (the GTCCRA, GTCCRC, GTCCRD,GTCCRE, and GTCCRF registers) must be more than twice that of the GTDVU register.

24.10.9 Correspondence to Count Switch Operation of Each Function

Some functions cannot be used at the same time as the count switch operation. Table 24.45 shows the availability of each function at the same time as the count switch operation.

Table 24.45 Availability of Each Function at the Same Time as the Count Switch Operation (1/2)

Function	Availability at the same time as the count switch operation
Counter Start/Count Stop	Available
Periodic Count Operation	Available
Event Count Operation	Not available
Counter Clear Operation	Available
Compare Match Function	Available
Input Capture Function	Available
GTIOCnA/B input/output pin polarity reversal function	Available
Buffer Operation	Available
Sawtooth-Wave PWM Mode 1	Not available
Sawtooth-Wave PWM Mode 2	Not available

Table 24.45 Availability of Each Function at the Same Time as the Count Switch Operation (2/2)

Function	Availability at the same time as the count switch operation
Sawtooth-Wave One-Shot Pulse Mode	Not available
Triangle-Wave PWM Mode 1	Available
Triangle-Wave PWM Mode 2	Available
Triangle-Wave PWM Mode 3	Available
Complementary PWM Mode 1	Not available
Complementary PWM Mode 2	Not available
Complementary PWM Mode 3	Not available
Complementary PWM Mode 4	Not available
Automatic Dead Time Setting Function	Not available
Count Direction Changing Function	Not available
Function of Output Duty 0% and 100%	Not available
Hardware Count Start/Count Stop and Clear Operation	Available
Synchronous Operation	Available
PWM Output Operation	Available
Cycle Count Function	Not available
Phase Counting Mode	Not available
External pulse width measuring function	Not available
Output Phase Switching (OPS)	Not available
Inter Channel Logical Operation Function	Available
Timer-linked synchronization signal output function	Not available
Interrupt Sources	Available
DMAC/DTC Activation	Available
Interrupt Skipping Function	Not available
A/D Conversion Start Request	Available
Operations Linked by the ELC	Available
Noise Filter Function	Available
Write-Protection for Registers	Available
Simultaneous Control of Buffer Operations of Multiple Channels	Available
Repeated Double-Buffered Operation	Not available
GTIOCnm Pin Output Negate Control	Available
Output Protection Function for GTIOCnm Pin Output	Not available
Initialization Method of Output Pins	Available

24.10.10 Note on Transitions to Software Standby Mode

Only place the MCU in software standby mode after having ensured that no counter start source events will be generated and then stopped counting by setting the GTCR.CST bit to 0.

24.10.11 Interval between Interrupt Requests

When GPTCLK is selected as the GPTW counter reference clock (GTCLK), interrupts may be lost if the interval between the interrupt signals from the same source is shorter than the value obtained from the equation below. Note that this restriction does not apply to interrupt signals from different sources.

Interrupt interval (ns) = GPTCLK period (ns) × 6 + PCLKA period (ns) × 4

In addition, when the combination of the selected GPTW and ADC clocks is any of those indicated in Table 24.46, A/D conversion start requests may be lost if the interval between the A/D conversion start requests due to the same event is shorter than the value obtained from the equation below. Note that this restriction does not apply to requests due to different events.

Event interval (ns) = GPTCLK period (ns) × 6 + ADCLK period (ns) × 4

Table 24.46 Clock Combinations that Impose a Restriction on the Event Interval

GTCLK	ADCLK
GPTCLK	PCLKA or ADCCLK
PCLKD	ADCCLK or GPTCLK

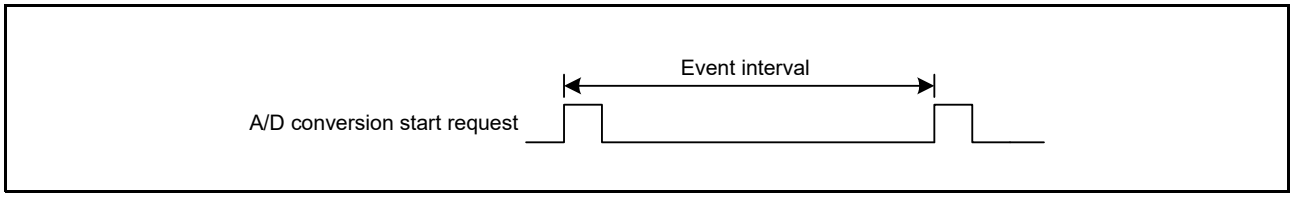

Figure 24.241 Example of an Interval between A/D Conversion Start Request Events

25. High Resolution PWM Waveform Generation Circuit (HRPWMb)

25.1 Overview

This MCU has a high resolution PWM waveform generation circuit (HRPWM0) which finely adjusts a PWM waveform generated by GPTW0 to GPTW3 with a resolution of at least around 49 ps. Using the HRPWM, a digital power supply control with high conversion efficiency can be realized. Table 25.1 lists the specifications of the HRPWM, Figure 25.1 shows a block diagram, and Table 25.2 lists the I/O pins.

Table 25.1 Specifications of the HRPWM

Item	Description
Function	• A maximum of four channels of complementary PWM waveforms are finely adjusted at high resolution. • Using a delay locked loop (DLL) circuit, a high resolution of 1/64 or 1/128 times of a GTCLK period (minimum of around 49 ps) is achieved. • Timing for rising and falling of the PWM waveform can be adjusted individually.*1 • A waveform generated by the GPTW can be output directly by bypassing the HRPWM.
Operating clock (GTCLK)	Either PCLKD or GPTCLK can be selected by setting the GPTW register.
Operating frequency (f(GTCLK))	80 to 200 MHz
Protect Zone filter	Security attribute can be set.*2

Note 1. Adjustment of timing for rising and falling of PWM signals which are output from the GPTW0 to GPTW3 is realized by a delay of a resolution of 1/64 or 1/128 times of a GTCLK period.

Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

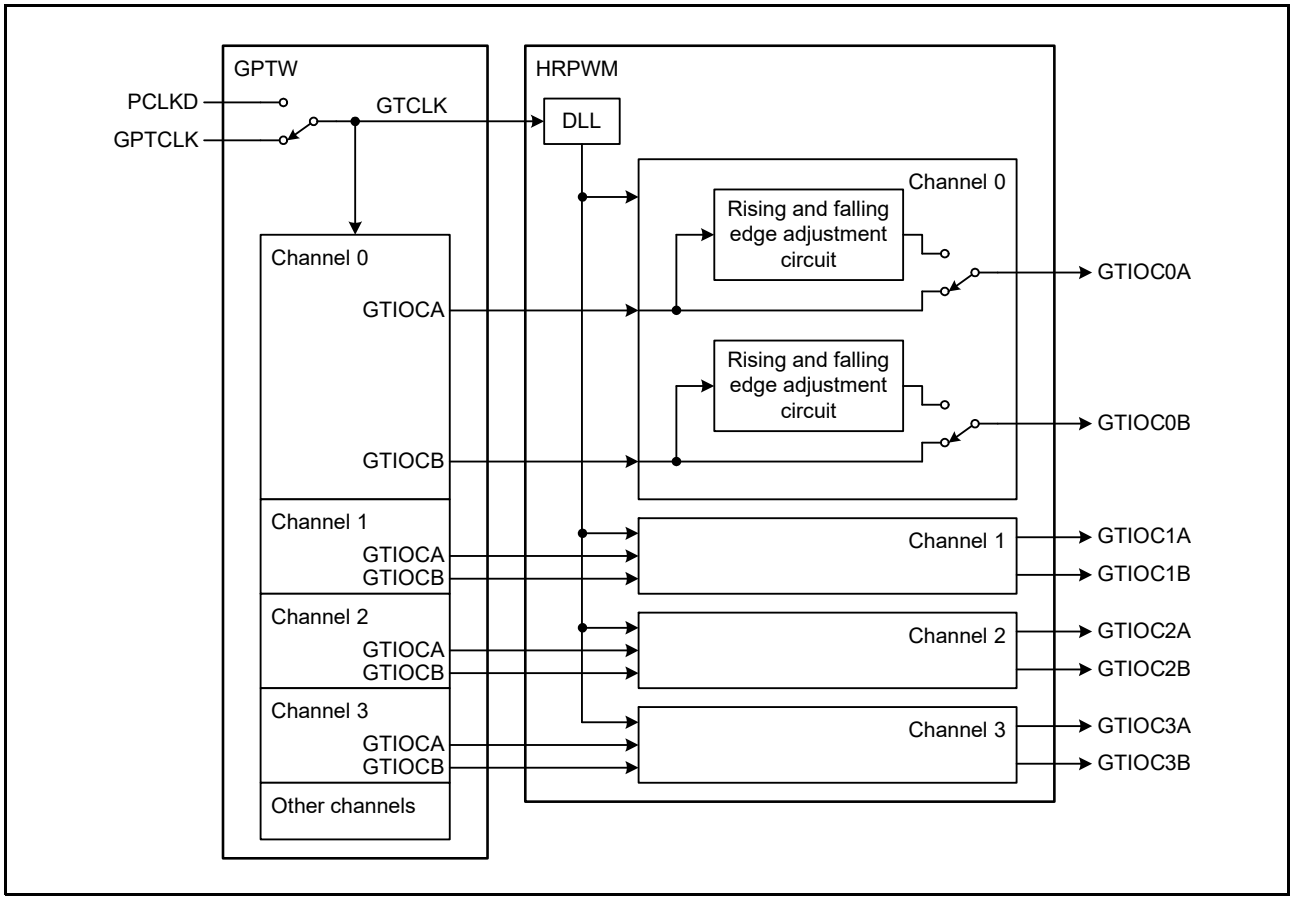

Figure 25.1 Block Diagram of the HRPWM

Table 25.2 I/O Pins of the HRPWM

Pin Name	I/O	Function
GTIOC0A	Output	High resolution output of a PWM waveform generated by the GPTW0
GTIOC0B	Output	High resolution output of a PWM waveform generated by the GPTW0
GTIOC1A	Output	High resolution output of a PWM waveform generated by the GPTW1
GTIOC1B	Output	High resolution output of a PWM waveform generated by the GPTW1
GTIOC2A	Output	High resolution output of a PWM waveform generated by the GPTW2
GTIOC2B	Output	High resolution output of a PWM waveform generated by the GPTW2
GTIOC3A	Output	High resolution output of a PWM waveform generated by the GPTW3
GTIOC3B	Output	High resolution output of a PWM waveform generated by the GPTW3

25.2 Register Descriptions

25.2.1 HRPWM Operation Control Register (HROCR)

Address(es): HRPWM0.HROCR 8742 4000h, HRPWM0_NS.HROCR 0742 4000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	FRANGE	—	—	—	—	—	—	HRRST	DLLEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DLLEN	DLL Operation Enable	0: DLL operation is disabled 1: DLL operation is enabled	R/W
b1	HRRST	High Resolution PWM Waveform Generation Circuit Reset	0: Release from reset 1: Reset	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FRANGE	Operating Clock Frequency Range Setting	0: 80 to 160 MHz (resolution: 1/128 times of the period) 1: 155 to 200 MHz (resolution: 1/64 times of the period)	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register controls the operation of the entire HRPWM module. The register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTW0.GTWP.WP = 0).

DLLEN Bit (DLL Operation Enable)

This bit selects whether the internal DLL in the HRPWM is activated or not. After activation, wait for 20 µs until the output of the DLL becomes stable.

HRRST Bit (High Resolution PWM Waveform Generation Circuit Reset)

This bit resets the internal state of the HRPWM. After releasing from reset, wait for five cycles of GTCLK. When resetting during operation, the PWM output is fixed to low after five cycles of GTCLK.

FRANGE Bit (Operating Clock Frequency Range Setting)

This bit is used to set the frequency range of the HRPWM operating clock. Set this bit when the DLLEN bit is 0. The resolution of the delay time is determined by the setting of this bit.

25.2.2 HRPWM Operation Control Register 2 (HROCR2)

Address(es): HRPWM0.HROCR2 8742 4002h, HRPWM0_NS.HROCR2 0742 4002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	HRDIS3	HRDIS2	HRDIS1	HRDIS0	—	—	—	—	HRSEL3	HRSEL2	HRSEL1	HRSEL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	HRSEL0	Channel 0 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW0 from the GTIOC0A and GTIOC0B pins 1: Output a high resolution PWM waveform from the GTIOC0A and GTIOC0B pins	R/W
b1	HRSEL1	Channel 1 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW1 from the GTIOC1A and GTIOC1B pins 1: Output a high resolution PWM waveform from the GTIOC1A and GTIOC1B pins	R/W
b2	HRSEL2	Channel 2 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW2 from the GTIOC2A and GTIOC2B pins 1: Output a high resolution PWM waveform from the GTIOC2A and GTIOC2B pins	R/W
b3	HRSEL3	Channel 3 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW3 from the GTIOC3A and GTIOC3B pins 1: Output a high resolution PWM waveform from the GTIOC3A and GTIOC3B pins	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	HRDIS0	Channel 0 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 0 rising and falling edge adjustment circuit 1: Disable operation of Channel 0 rising and falling edge adjustment circuit	R/W
b9	HRDIS1	Channel 1 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 1 rising and falling edge adjustment circuit 1: Disable operation of Channel 1 rising and falling edge adjustment circuit	R/W
b10	HRDIS2	Channel 2 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 2 rising and falling edge adjustment circuit 1: Disable operation of Channel 2 rising and falling edge adjustment circuit	R/W
b11	HRDIS3	Channel 3 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 3 rising and falling edge adjustment circuit 1: Disable operation of Channel 3 rising and falling edge adjustment circuit	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register controls the HRPWM module by channel. The register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTW0.GTWP.WP = 0).

HRSELn Bit (Channel n High Resolution PWM Waveform Output Select) (n = 0 to 3)

This bit allows to select whether to output a waveform generated by the HRPWM from the GTIOCnA and GTIOCnB pins or to output an original waveform of the GPTW by bypassing the circuit.
The PWM waveform generated by the HRPWM is output with a delay of three full cycles of GTCLK from the output when the circuit is bypassed, even if the setting for the amount of delay is 0.

HRDISn Bit (Channel n Rising and Falling Edge Adjustment Circuit Disable) (n = 0 to 3)

This bit enables/disables the operation of the rising and falling edge adjustment circuit by relevant channel in the GPTW.

Set this bit to 1 for a channel which will not be used.

25.2.3 GTIOCnA Pin Rising Edge Adjustment Register (HRREARnA) (n = 0 to 3)

Address(es): HRPWM0.HRREAR0A 8742 4018h, HRPWM0.HRREAR1A 8742 401Ch, HRPWM0.HRREAR2A 8742 4020h, HRPWM0.HRREAR3A 8742 4024h,
HRPWM0_NS.HRREAR0A 0742 4018h, HRPWM0_NS.HRREAR1A 0742 401Ch, HRPWM0_NS.HRREAR2A 0742 4020h, HRPWM0_NS.HRREAR3A 0742 4024h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DLY[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to rising edge of a PWM waveform output from the GTIOCnA pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).
This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.2.4 GTIOCnA Pin Falling Edge Adjustment Register (HRFEARnA) (n = 0 to 3)

Address(es): HRPWM0.HRFEAR0A 8742 4028h, HRPWM0.HRFEAR1A 8742 402Ch, HRPWM0.HRFEAR2A 8742 4030h, HRPWM0.HRFEAR3A 8742 4034h,
HRPWM0_NS.HRFEAR0A 0742 4028h, HRPWM0_NS.HRFEAR1A 0742 402Ch, HRPWM0_NS.HRFEAR2A 0742 4030h, HRPWM0_NS.HRFEAR3A 0742 4034h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DLY[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to falling edge of a PWM waveform output from the GTIOCnA pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.2.5 GTIOCnB Pin Rising Edge Adjustment Register (HRREARnB) (n = 0 to 3)

Address(es): HRPWM0.HRREAR0B 8742 401Ah, HRPWM0.HRREAR1B 8742 401Eh, HRPWM0.HRREAR2B 8742 4022h, HRPWM0.HRREAR3B 8742 4026h,
HRPWM0_NS.HRREAR0B 0742 401Ah, HRPWM0_NS.HRREAR1B 0742 401Eh, HRPWM0_NS.HRREAR2B 0742 4022h, HRPWM0_NS.HRREAR3B 0742 4026h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DLY[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to rising edge of a PWM waveform output from the GTIOCnB pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.2.6 GTIOCnB Pin Falling Edge Adjustment Register (HRFEARnB) (n = 0 to 3)

Address(es): HRPWM0.HRFEAR0B 8742 402Ah, HRPWM0.HRFEAR1B 8742 402Eh, HRPWM0.HRFEAR2B 8742 4032h, HRPWM0.HRFEAR3B 8742 4036h,
HRPWM0_NS.HRFEAR0B 0742 402Ah, HRPWM0_NS.HRFEAR1B 0742 402Eh, HRPWM0_NS.HRFEAR2B 0742 4032h, HRPWM0_NS.HRFEAR3B 0742 4036h

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to falling edge of a PWM waveform output from the GTIOCnB pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.3 Operation

25.3.1 Adjustment to the Timing of Rising and Falling Edges in PWM Waveforms

The HRPWM delays timing for rising and falling of the PWM signals which are output from the GPTW with a resolution of 1/64 or 1/128 times (at least around 49 ps) of a GTCLK period (tC(GTCLK)) based on the delay locked loop (DLL) operating with GTCLK as a reference clock. The PWM signal which was delayed is output from the GTIOCnA and GTIOCnB pins (n = 0 to 3).

The amount of delay can be adjusted within a range of 0/64 to 63/64 or 0/128 to 127/128 of tC(GTCLK). The amount of delay out of this range cannot be specified. When setting the amount of delay with the value out of such range, change the setting in the general PWM timer compare capture register x (GTCCRx) in the GPTW.

The HRPWM is required to set the HROCR.DLLEN bit to 1 before operation and wait for stabilization time as it has the DLL. In addition, wait for five cycles of GTCLK after setting the HROCR.HRRST bit to 0 in order to output the reliable PWM waveform. Refer to Figure 25.2 for the detailed procedures.

Specify the amount of delay by the HRREARnA and HRFEARnA registers for the GTIOCnA pin and by the HRREARnB and HRFEARnB registers for the GTIOCnB pin. The PWM waveform has specific setting registers for delay at rising and at falling respectively, which allows fine adjustments for the width of high and low. Refer to Table 25.3 for the correspondence between pins and registers.

The amount of delay specified by a relevant register is reflected to the pin via a temporary register. Timing for reflecting the setting differs by PWM output operation mode in the general PWM timer. Refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

In the HRPWM, setting of DLL enabling/disabling and reset setting/releasing is common for all channels; however, the rest of settings can be specified individually by channel.

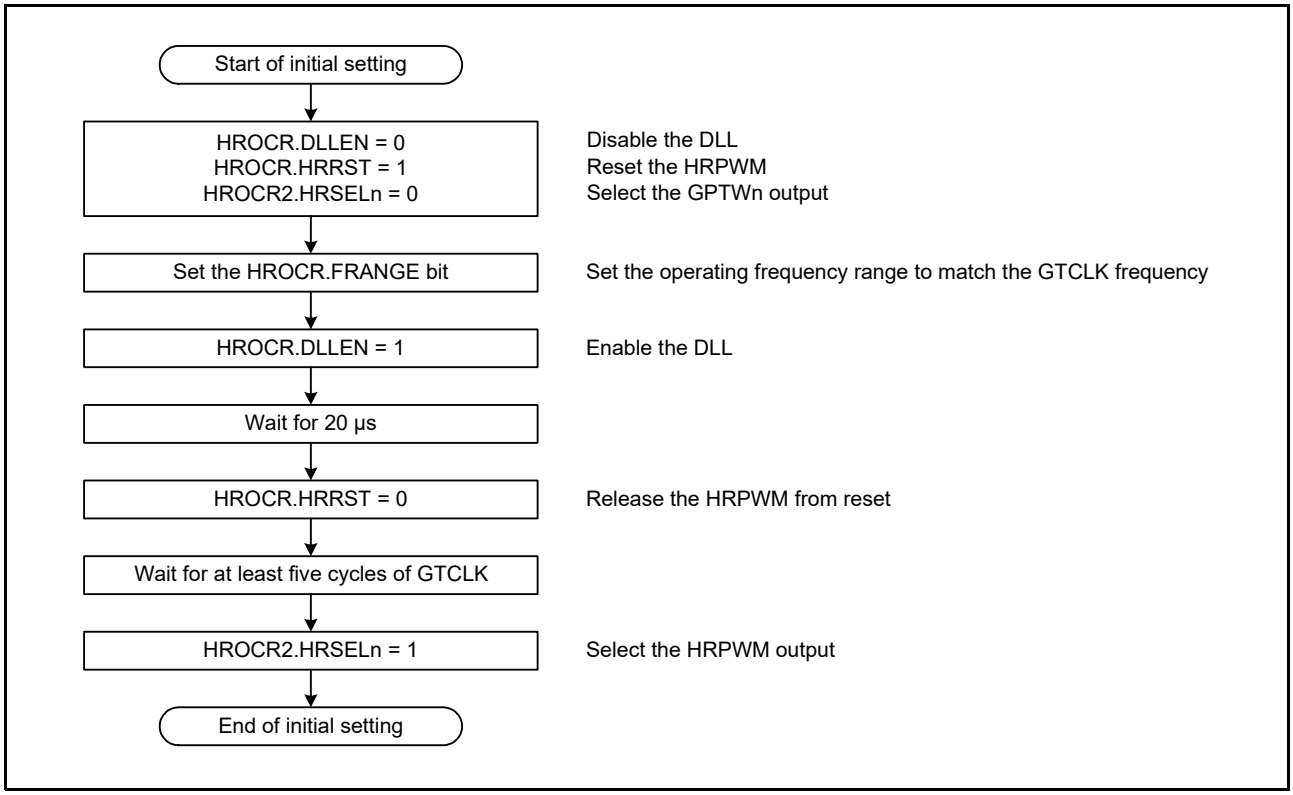

Figure 25.2 Initialization flow for the HRPWM (n = 0 to 3)

Table 25.3 Correspondence between PWM Waveform Output Pins and Delay Setting Registers

PWM Waveform Output Pin	Rising Edge Adjustment Register	Falling Edge Adjustment Register
GTIOC0A	HRREAR0A	HRFEAR0A
GTIOC0B	HRREAR0B	HRFEAR0B
GTIOC1A	HRREAR1A	HRFEAR1A
GTIOC1B	HRREAR1B	HRFEAR1B
GTIOC2A	HRREAR2A	HRFEAR2A
GTIOC2B	HRREAR2B	HRFEAR2B
GTIOC3A	HRREAR3A	HRFEAR3A
GTIOC3B	HRREAR3B	HRFEAR3B

25.3.2 Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3)

Settings of the HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB registers are transferred to a temporary register first, and reflected to the amount of delay for the PWM waveform in the GTIOCnA and GTIOCnB pins then. Such settings are transferred to a temporary register at the end of PWM period (at an overflow (during up-count operation) or an underflow (during down-count operation) in sawtooth wave mode, and at a trough in triangle wave mode).

Figure 25.3 and Figure 25.4 show examples of the operation of the HRREAR0A and HRFEAR0A registers.

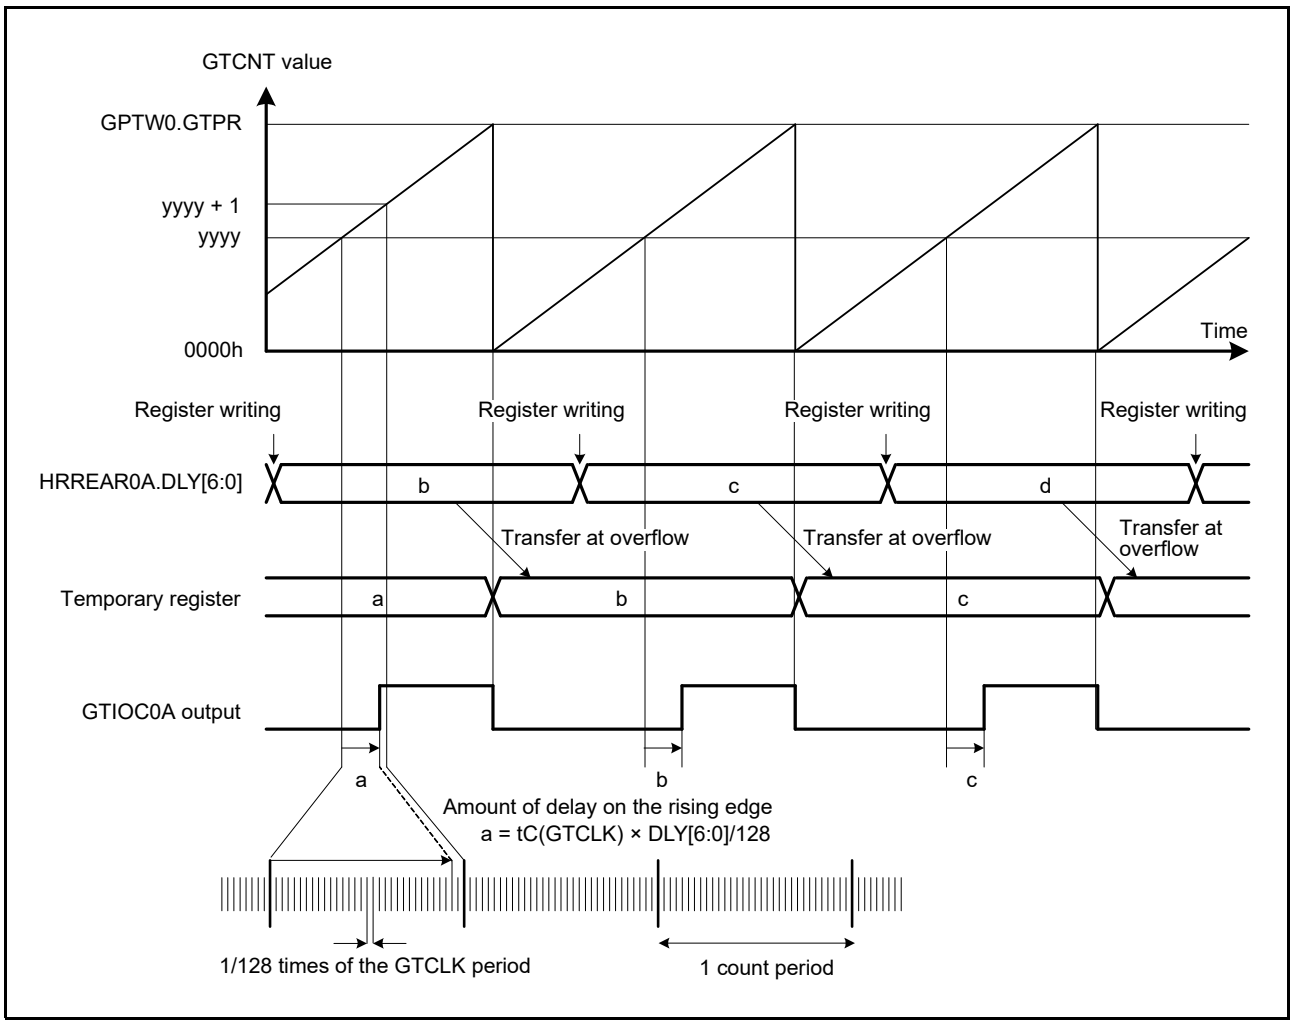

Figure 25.3 Operation Example When Changing the HRREAR0A Register Setting (in Sawtooth Wave Mode)

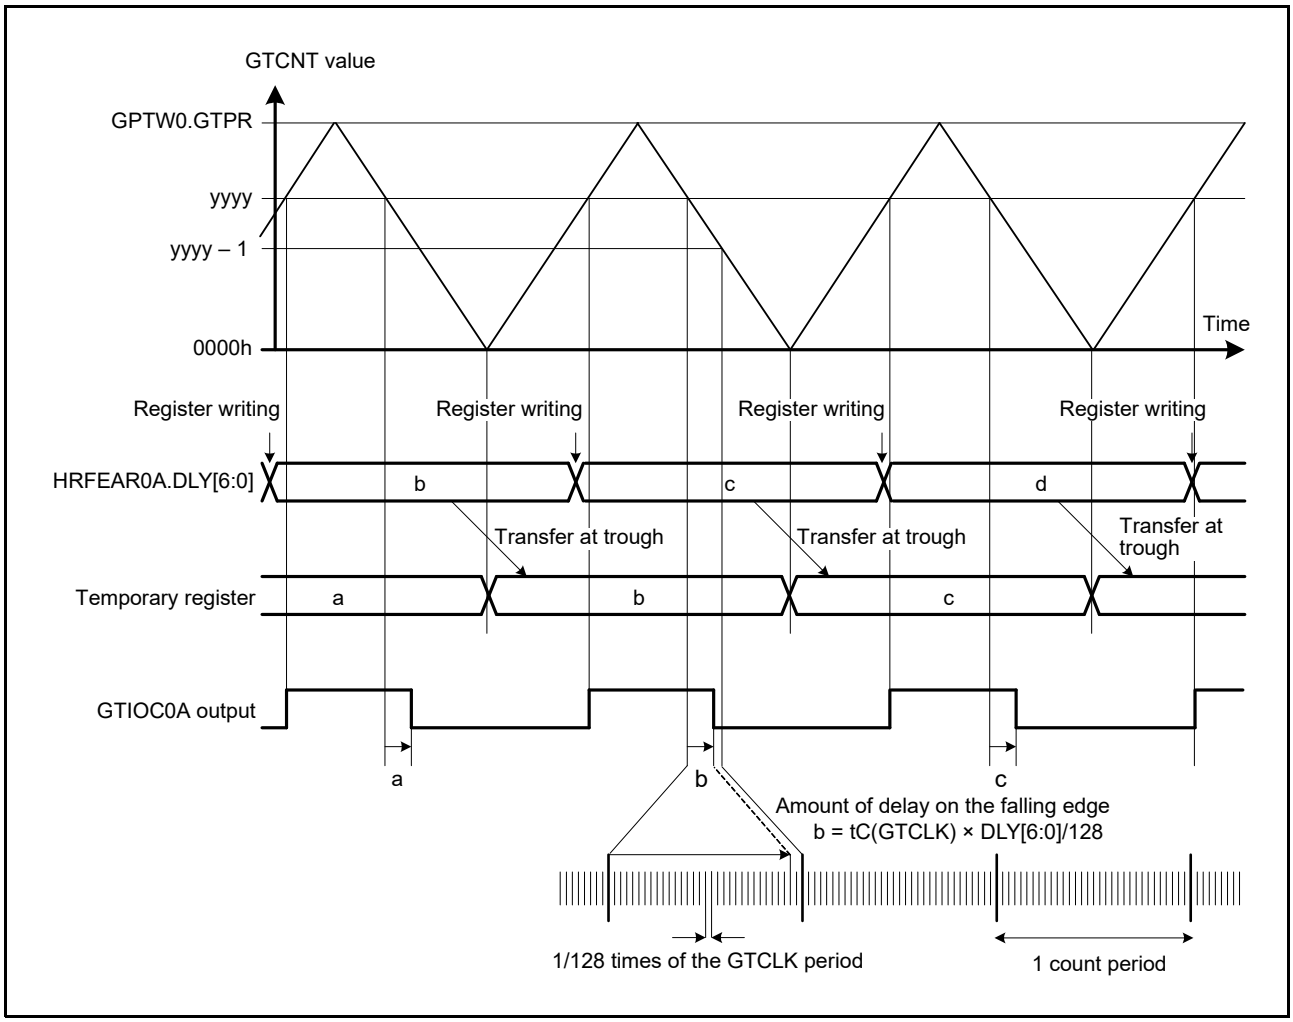

Figure 25.4 Operation Example When Changing the HRFEAR0A Register Setting (in Triangle Wave Mode)

25.4 Usage Notes

25.4.1 Settings for the Module-Stop Function

Operation of the HRPWM can be disabled or enabled using Module Stop Control Register (MSTPCRD). The HRPWM is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, refer to section 11, Low Power Consumption.

25.4.2 Note on Selecting Timer Prescaler in the GTCNT Counter While Using the HRPWM

The PWM signals output from the GPTW are generated based on the GTCNT counter operating at resolution equivalent to one clock period which is set by the GPTWn.GTCR.TPCS[3:0] bits (n = 0 to 3). Note that a delay at resolution of 0/128 × tC(GTCLK) to 127/128 × tC(GTCLK) is applied to edges of the PWM signals at low resolution generated based on a selected clock when a setting for the GPTWn.GTCCRx register (x = A to F) is changed while the TPCS[3:0] bits are specified to the setting other than 0000b (GTCLK/1).

25.4.3 Notes on Delay Settings for HRPWM

Within three cycles of GTCLK from the end of the PWM period, do not change the settings for the HRFEARnA, HRREARnA, HRFEARnB, and HRREARnB registers. Any changes made during the above period will be reflected with a delay of one cycle of the PWM waveform.

26. GPTW Port Output Enable (POEGd)

26.1 Overview

The POEG issues requests to disable output from output pins of the general PWM timer (GPTW). The combination of output pins of the POEG to be disabled can be specified from any channel of the GPTW.
Select the method of detection for disabling the output from the list below.

- Input level detection on the GTETRGx pin (x = A to D)
- Detection of input level or input edge on the POEGx pin (x = A to D)
- Output disabling condition detection by the GPTW
- Detection of notification signals from the DSMIFm overcurrent detection window (m = 0, 1)
- Detection of stopping of oscillation by the oscillation stop detection circuit for the main clock
- Register setting

The GTETRGx pins can also be used as the external trigger input pins for the GPTW.
Table 26.1 shows specifications, Figure 26.1 shows a system block diagram around the POEG, Figure 26.2 shows a block diagram of the POEG, and Table 26.2 shows input pins.

Table 26.1 POEG Specifications (x = A to D)

Item	Description
Output disabling request by input level detection on the GTETRGx pin	• The output disabling request is issued to the GPTW when a POEGGx.PIDF flag is set to 1 by the detection of input of the selected level on the GTETRGx pin.
Output disabling request by detection of input level or edge on the POEGx pin	• The output disabling request is issued to the GPTW when a POEGPICRx.PIDF flag is set to 1 by the detection of either input of the selected level or the selected edge on the POEGx pin.
Output disabling request by output disabling condition detection signal from the GPTW	• The output disabling request is issued to the GPTW when the GPTW detects a simultaneous active level (high or low) on the GTIOCA and GTIOCB pins and the POEGGx.IOCF flag is set to 1. • The output disabling request is issued to the GPTW when the GPTW detects a dead-time error and the POEGGx.IOCF flag is set to 1.
Output disabling request in response to detecting the overcurrent of DSMIF	The output disabling request is issued to the GPTW when the POEGGx.DERRmST flag is set to 1 by notifications from the DSMIFm overcurrent detection window (m = 0, 1).
Output disabling request in response to detecting the stopping of oscillation	The output disabling request is issued to the GPTW when the oscillation stop detection circuit for the main clock detects the oscillation stop and the POEGGx.OSTPF flag is set to 1.
Output disabling request by software	The output disabling request is issued to the GPTW when the software sets the POEGGx.SSF bit to 1.
Interrupt	• An interrupt is generated by an output disabling request via the POEGGx.PIDF flag. • An interrupt is generated by an output disabling request via the POEGGx.IOCF flag. • An interrupt is generated by an output disabling request via the POEGGx.DERRmST flag. • An interrupt is generated by an output disabling request via the POEGPICRx.PIDF flag.
External trigger output to the GPTW	The input signal from the GTETRGx pin is output to the GPTW as an external trigger.
Noise removal	Each GTETRGx pin has a digital noise filter. • Four types of sampling clock are selectable for the filter. Each POEGx pin has a digital noise filter. • Six types of sampling clock are selectable for the filter. • Match detection conditions can be selected from two to 64 consecutive samples with the same level.
Protect Zone filter	Security attribute can be set for each group of the POEG.*1

Note 1. When each group is set to the secure attribute, registers in the group are accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When each group is set to the non-secure attribute, registers in the group are accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. Only 0 can be written to clear the flag.
Note 2. This bit can be written only once after reset.

The POEGGx register controls output disabling requests and an external trigger for the GPTW in response to the various detection signals.

SSF Bit (Software Output Disabling Request)

Writing 1 to this bit leads to an output disabling request being issued to the GPTW, and writing 0 to the bit releases the GPTW from the output disabling request.

26.2.2 POEGx Pin Input Control Register (POEGPICRx) (x = A to D)

Address(es): POEG.POEGPICRA 8741 2030h, POEG.POEGPICRB 8741 2130h, POEG.POEGPICRC 8741 2230h, POEG.POEGPICRD 8741 2330h, POEG_NS.POEGPICRA 0741 2030h, POEG_NS.POEGPICRB 0741 2130h, POEG_NS.POEGPICRC 0741 2230h, POEG_NS.POEGPICRD 0741 2330h

b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the flag.
Note 2. This bit can be written only once after reset.

26.3 Operation

The POEG has four groups (A to D), all of which operate the same and are independent of each other.
The output signal of each channel of the GPTW is connected to all groups of the POEG, and the output signal of each group of the POEG is connected to all channels of the GPTW. Use the GPTW register to configure which group the GPTW channel is controlled by.

26.3.1 Output Disabling Request by Detection of Input Level on the GTETRGx Pin (x = A to D)

The output disabling requests using the GTETRGx pin are issued via the POEGGx.PIDF flag.
When the input level set by the POEGGx.NFCS[1:0], NFEN, and INV bits is detected while the POEGGx.PIDE bit is 1, the PIDF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the PIDF flag. For details, refer to section 26.3.7.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.

26.3.1.1 Digital Noise Filter

Each GTETRGx pin has a digital noise filter (x = A to D). Figure 26.3 shows an example of the noise filter operation. This example assumes that the POEGGx.INV bit is 0 (no inversion, i.e., high level detection) and NFEN bit is 1 (noise filter enabled).
The signal level on the GTETRGx pin is sampled with the sampling clock selected by the POEGGx.NFCS[1:0] bits, and when last three consecutive samples are high, the POEG determines that high is input and issues an output disabling request to the GPTW.
At this time, if low is detected even once, the POEG does not determine that high is input. Note that changes in the GTETRGx pin level that occur between sampling timings are ignored.
The output of the digital noise filter is used for two purposes: output disabling request via the POEGGx.PIDF flags and an external trigger output to the GPTW.

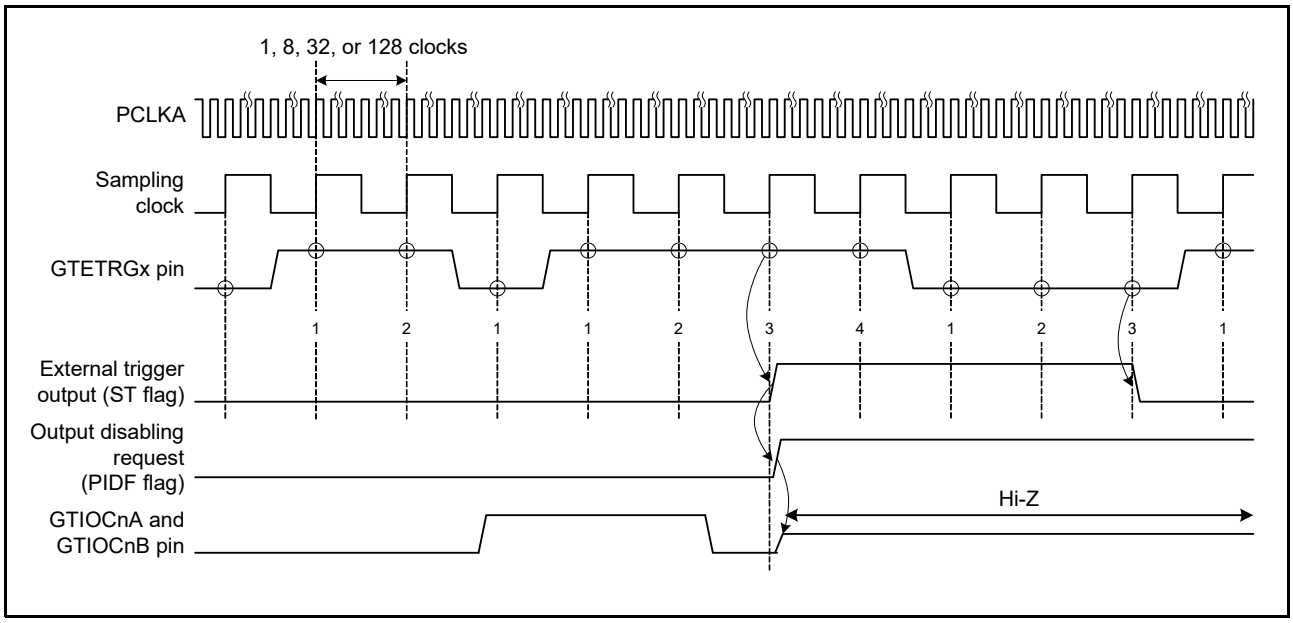

Figure 26.3 Example for Operation of Digital Noise Filter

26.3.2 Output Disabling Request by Detection of Input Level or Input Edge on the POEGx Pin (x = A to D)

The output disabling requests using the POEGx pin are issued via the POEGPICRx.PIDF flag.
When the input level or edge set by the POEGPICRx.NFEN, NFCS[3:0], PIDM[1:0], NFSCS[3:0], and INV bits is detected while the POEGPICRx.PIDE bit is 1, the PIDF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the PIDF flag. For details, refer to section 26.3.7.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.

26.3.2.1 Digital Noise Filter

Each POEGx pin has a digital noise filter (x = A to D). Figure 26.4 shows an example of the noise filter operation. This example assumes that the POEGPICRx.INV bit is 0 (no inversion, i.e., high level detection), NFSCS[3:0] bits are 0001b (three times), and NFEN bit is 1 (noise filter enabled).
The signal level on the POEGx pin is sampled with the sampling clock selected by the POEGPICRx.NFCS[3:0] bits, and when last consecutive samples for the number of times set by the NFSCS[3:0] bits (three times in this example) are high, the POEG determines that high is input and issues an output disabling request to the GPTW.
At this time, if low is detected even once, the POEG does not determine that high is input. Note that changes in the POEGx pin level that occur between sampling timings are ignored.

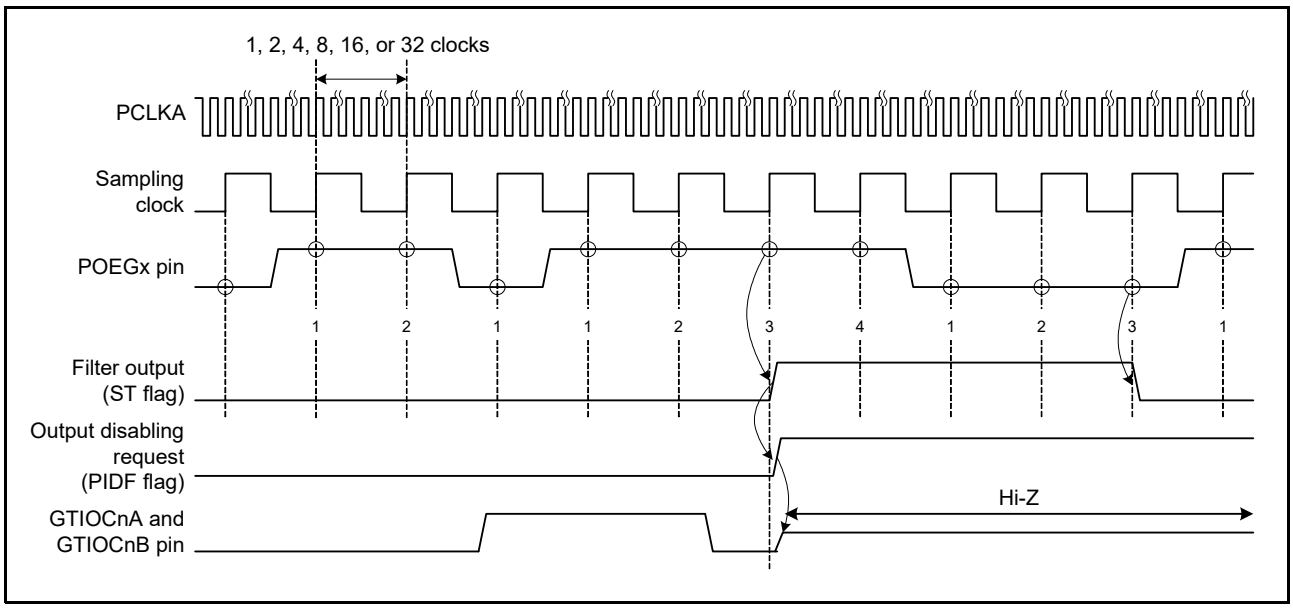

Figure 26.4 Example for Operation of Digital Noise Filter

26.3.3 Output Disabling Request by Output Disabling Condition Detection Signal from GPTW

When the GPTW detects a dead-time error or simultaneous high or low output while the POEGGx.IOCE bit is 1, the IOCF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the IOCF flag. For details, refer to section 26.3.7.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.
To detect a dead-time error, simultaneous high output, or simultaneous low output in the GPTW, set the GPTWn.GTINTAD.GRPDTE, GRPABH, or GRPABL bit to 1, respectively. The output disabling condition detection signal generated by each GPTW channel is output only to the POEG group selected by the GPTWn.GTINTAD.GRP[1:0] bits. For details, refer to section 24.2.17, General PWM Timer Interrupt Output Setting Register (GTINTAD).

26.3.4 Output Disabling Request by Notifications from DSMIF Overcurrent Detection Window

When the notification signals from the DSMIFm overcurrent detection window becomes 1 while the POEGGx.DERRmE bit is 1 (m = 0, 1), the DERRmST flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the DERRmST flag. For details, refer to section 26.3.7.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register

26.3.5 Output Disabling Request by Oscillation Stop Detection Signal

When the oscillation stop detection circuit in the clock generation circuit detects the oscillation stop while the POEGGx.OSTPE bit is 1, the OSTPF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the OSTPF flag. For details, refer to section 26.3.7.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.

26.3.6 Output Disabling Request by a Register

When the POEGGx.SSF bit is set to 1, an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, set the SSF bit to 0. For details, refer to section 26.3.7, Canceling Output Disabling Request.

26.3.7 Canceling Output Disabling Request

There are two ways to cancel an output disabling request as follows.

- Reset (return to the initial state)
- Clearing the flags in the POEGGx or POEGPICRx register

26.3.7.1 Cancellation of Output Disabling Request by Reset

Any type of reset can cancel an output disabling request. For details on resets, refer to section 6, Resets.

26.3.7.2 Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register

An output disabling request is canceled by setting all of the following flags and bit that are set to 1 to 0.

- POEGGx.PIDF flag
- POEGGx.IOCF flag
- POEGGx.OSTPF flag
- POEGGx.SSF bit
- POEGGx.DERR0ST flag
- POEGGx.DERR1ST flag
- POEGPICRx.PIDF flag

When the output disabling request is canceled, the GPTW captures this signal at the end of the next PWM cycle and releases the PWM outputs from the disabled state after three GTCLK cycles at the earliest. Figure 26.5 shows the timing for releasing the output disabled state.
To clear the flag, make sure that the detection signals that set the flag to 1 is 0 before writing 0 to the flag. Writing 0 to the flag when the detection signal is 1 does not clear the flag.
The status of the level detection signals can be monitored using the following status flags.

- GTETRGx pin input signal: POEGGx.ST flag (GTETRGx signal status flag)
- Output disabling condition detection signals: GPTWn.GTST.DTEF flag (dead time error flag)
  GPTWn.GTST.OABLF flag (simultaneous low output flag)
  GPTWn.GTST.OABHF flag (simultaneous high output flag)
- Oscillation stop detection signal: OSTDSR.OSTDF flag (oscillation stop detection flag)
- DSMIFm notification signals: DSMIFm.DSCOCNSR.OWDrNn flag (overcurrent detection window notification flag)
- POEGx pin input signal: POEGPICRx.ST flag (POEGx signal status flag)

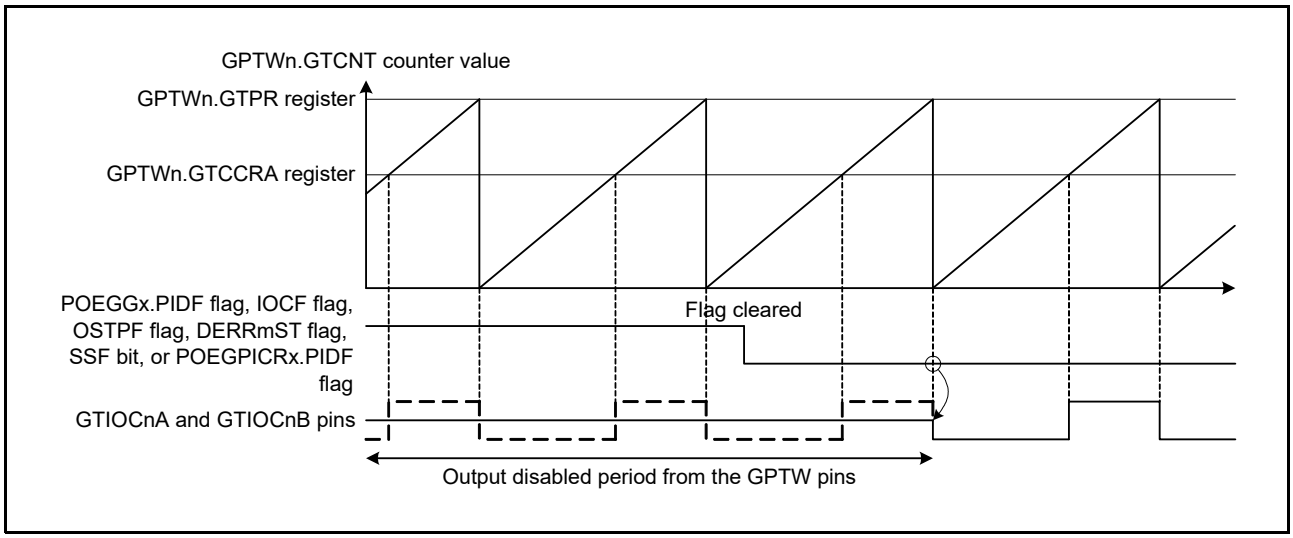

Figure 26.5 Timing for Releasing the Output Disabled State of the GPTW Pins by Canceling the Output Disabling Request

26.4 Interrupt Sources

The POEG has the following interrupt sources for each group.

- Detection of input level on the GTETRGx pin (x = A to D)
- Detection of output disabling condition detection signal from the GPTW
- Detection of notification signals from the DSMIFm overcurrent detection window (m = 0, 1)
- Detection of input level or input edge on the POEGx pin (x = A to D)

Table 26.3 lists the interrupt sources.

Table 26.3 Interrupt sources

Interrupt Name	Symbol	Corresponding Flag	Interrupt Source
Group A Interrupt	POEGGAI	POEGGA.PIDF	Input signal from the GTETRGA pin
		POEGGA.IOCF	Output disabling condition detection signal from the GPTW
		POEGGA.DERRmST	Notification signals from the DSMIFm overcurrent detection window
		POEGPICRA.PIDF	Input signal from the POEGA pin
Group B Interrupt	POEGGBI	POEGGB.PIDF	Input signal from the GTETRGB pin
		POEGGB.IOCF	Output disabling condition detection signal from the GPTW
		POEGGB.DERRmST	Notification signals from the DSMIFm overcurrent detection window
		POEGPICRB.PIDF	Input signal from the POEGB pin
Group C Interrupt	POEGGCI	POEGGC.PIDF	Input signal from the GTETRGC pin
		POEGGC.IOCF	Output disabling condition detection signal from the GPTW
		POEGGC.DERRmST	Notification signals from the DSMIFm overcurrent detection window
		POEGPICRC.PIDF	Input signal from the POEGC pin
Group D Interrupt	POEGGDI	POEGGD.PIDF	Input signal from the GTETRGD pin
		POEGGD.IOCF	Output disabling condition detection signal from the GPTW
		POEGGD.DERRmST	Notification signals from the DSMIFm overcurrent detection window
		POEGPICRD.PIDF	Input signal from the POEGD pin

26.5 External Trigger Output to GPTW

The POEG outputs the input signals on the GTETRGx pin (x = A to D) to the GPTW as external trigger signals via polarity conversion and a digital noise filter. The external trigger signal can be monitored by the POEGGx.ST flag. The GPTW can perform the following operations with the external trigger signal.

- Count start
- Count stop
- Counter clear
- Count up
- Count down
- Input capture

For details, refer to section 24, General PWM Timer (GPTW).

26.6 Usage Notes

26.6.1 Transitions to Low-Power Consumption Mode

When using the POEG, do not enter software standby mode 1 or 2 or deep software standby mode 1, 2, or 3. In this mode, the POEG is stopped and output disabling request cannot be issued.

26.6.2 Setting the Function for Stopping the Module

Operation of the POEG can be disabled or enabled using the module stop control register D (MSTPCRD). After reset is released, the POEG function is disabled. Register access is enabled by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

26.6.3 Duplication of Output Disabling Request

The output disabling request via flags is a logical OR of the POEGGx.PIDF, IOCF, OSTPF, DERR0ST, DERR1ST flags, the SSF bit, and the POEGPICRx.PIDF flag. Therefore, note that the output disabling request will not be canceled if any one of the flags/bit is set to 1.

27. 8-Bit Timer (TMRa)

This MCU has two units (unit 0, unit 1) of an on-chip 8-bit timer (TMR) module that comprise two 8-bit counter channels, totaling four channels. The 8-bit timer module can be used to count external events and also be used as a multi-function timer in a variety of applications, such as generation of counter reset signal, interrupt requests, and pulse output with a desired duty cycle using a compare-match signal with two registers.
Unit 0 and unit 1 have the same functions, and can generate a base clock for the RSCI.
In this section, “PCLK” is used to refer to PCLKB.

27.1 Overview

Table 27.1 lists the specifications of the TMR. Table 27.2 lists the TMR functions.
Figure 27.1 shows a block diagram of the 8-bit timer module (unit 0), and Figure 27.2 shows that of the 8-bit timer module (unit 1).

Table 27.1 Specifications of TMR

Item	Description
Count clock	• Internal clock: PCLK/1, PCLK/2, PCLK/8, PCLK/32, PCLK/64, PCLK/1024, PCLK/8192 • External clock: external count clock
Number of channels	(8 bits × 2 channels) × 2 units
Compare match	• 8-bit mode (compare match A, compare match B) • 16-bit mode (compare match A, compare match B)
Counter clear	Selected by compare match A or B, or an external counter reset signal.
Timer output	Output pulses with a desired duty cycle or PWM output
Cascading of two channels	• 16-bit count mode 16-bit timer using TMR0 for the upper 8 bits and TMR1 for the lower 8 bits (TMR2 for the upper 8 bits and TMR3 for the lower 8 bits) • Compare match count mode TMR1 can be used to count TMR0 compare matches (TMR3 can be used to count TMR2 compare matches).
Interrupt sources	Compare match A, compare match B, and overflow
Event link function (Output)	Compare match A, compare match B, and overflow (TMR0 to TMR3)
Event link function (Input)	One of the following three operations proceeds in response to an event reception: (1) Counting start operation (TMR0 to TMR3) (2) Event counting operation (TMR0 to TMR3) (3) Counting restart operation (TMR0 to TMR3)
DTC activation	DTC can be activated by compare match A interrupts or compare match B interrupts.
Capable of generating base clock for RSCI	Generates base clock for RSCI.*1
Low power consumption function	Each unit can be placed in a module stop state
Protect Zone filter	Security attribute can be set for each unit.*2

Note 1. For details, refer to section 43, Serial Communications Interface (RSCI).
Note 2. When each unit is set to the secure attribute, registers in the unit are accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When each unit is set to the non-secure attribute, registers in the unit are accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Table 27.2 TMR Functions

Item		Unit 0			Unit 1		
Counter mode		**8 Bits**		**16 Bits**	**8 Bits**		**16 Bits**
Channel		**TMR0**	**TMR1**	**TMR0 + TMR1**	**TMR2**	**TMR3**	**TMR2 + TMR3**

0782 5016h	TMR23_NS.TCORB	TMR2_NS.TCORB	TMR3_NS.TCORB
0782 501Ah	TMR23_NS.TCCR	TMR2_NS.TCCR	TMR3_NS.TCCR

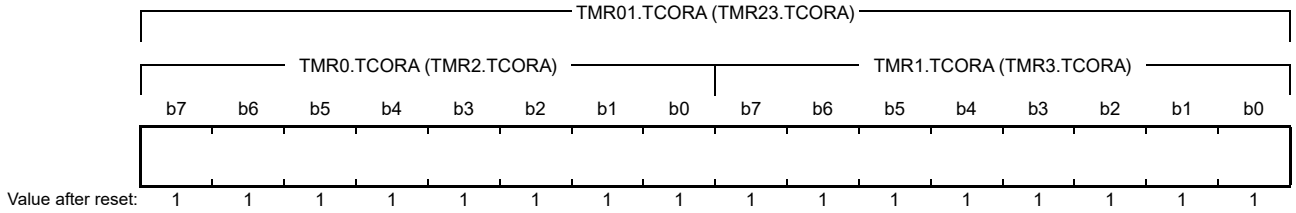
27.2.1 Timer Counter (TCNT)

Address(es): TMR0.TCNT 8782 5008h, TMR1.TCNT 8782 5009h, TMR2.TCNT 8782 5018h, TMR3.TCNT 8782 5019h, TMR01.TCNT 8782 5008h, TMR23.TCNT 8782 5018h, TMR0_NS.TCNT 0782 5008h, TMR1_NS.TCNT 0782 5009h, TMR2_NS.TCNT 0782 5018h, TMR3_NS.TCNT 0782 5019h, TMR01_NS.TCNT 0782 5008h, TMR23_NS.TCNT 0782 5018h

TCNT is an 8-bit readable/writable up-counter.

TMR0.TCNT and TMR1.TCNT (TMR2.TCNT and TMR3.TCNT) comprise a single 16-bit counter (TMR01.TCNT, TMR23.TCNT) so they can be accessed together in 16-bit units.

The TCCR.CSS[1:0] and CKS[2:0] bits are used to select a count clock.



TCNT can be cleared by an external counter reset signal, compare match A, or compare match B. Which compare match to be used for clearing is selected by the TCR.CCLR[1:0] bits.

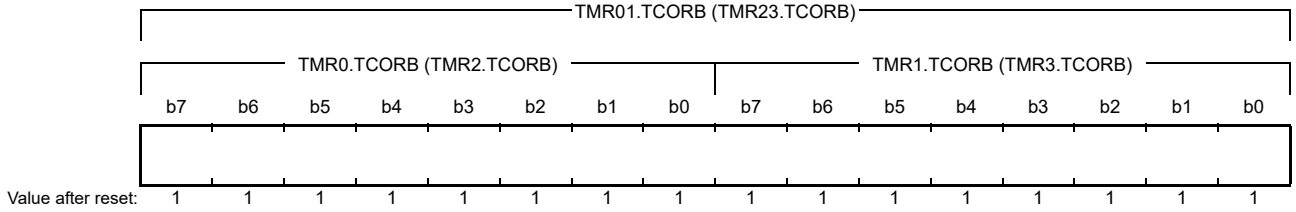
When TCNT overflows (its value changes from FFh to 00h), an overflow interrupt is output provided the interrupt request is enabled by the TCR.OVIE bit.

For details on the corresponding interrupt vector number, refer to section 15, Interrupt Controller (ICUM), and Table 27.6, TMR Interrupt Sources.

27.2.2 Time Constant Register A (TCORA)

Address(es): TMR0.TCORA 8782 5004h, TMR1.TCORA 8782 5005h, TMR2.TCORA 8782 5014h, TMR3.TCORA 8782 5015h, TMR01.TCORA 8782 5004h, TMR23.TCORA 8782 5014h, TMR0_NS.TCORA 0782 5004h, TMR1_NS.TCORA 0782 5005h, TMR2_NS.TCORA 0782 5014h, TMR3_NS.TCORA 0782 5015h, TMR01_NS.TCORA 0782 5004h, TMR23_NS.TCORA 0782 5014h

TCORA is an 8-bit readable/writable register.



TMR0.TCORA and TMR1.TCORA (TMR2.TCORA and TMR3.TCORA) comprise a single 16-bit register (TMR01.TCORA, TMR23.TCORA) so they can be accessed together in 16-bit units.

The value in TCORA is continually compared with the value in TCNT. When a match is detected, the corresponding compare match A is generated, and a compare match A interrupt is output provided the interrupt request is enabled by the TCR.CMIEA bit.

However, comparison is not performed during writing to TCORA. The timer output from the TMOn pin can be freely controlled by this compare match A and the settings of the TCSR.OSA[1:0] bits.

27.2.3 Time Constant Register B (TCORB)

Address(es): TMR0.TCORB 8782 5006h, TMR1.TCORB 8782 5007h, TMR2.TCORB 8782 5016h, TMR3.TCORB 8782 5017h, TMR01.TCORB 8782 5006h, TMR23.TCORB 8782 5016h, TMR0_NS.TCORB 0782 5006h, TMR1_NS.TCORB 0782 5007h, TMR2_NS.TCORB 0782 5016h, TMR3_NS.TCORB 0782 5017h, TMR01_NS.TCORB 0782 5006h, TMR23_NS.TCORB 0782 5016h

TCORB is an 8-bit readable/writable register.

TMR0.TCORB and TMR1.TCORB (TMR2.TCORB and TMR3.TCORB) comprise a single 16-bit register (TMR01.TCORB, TMR23.TCORB) so they can be accessed together in 16-bit units.

The value in TCORB is continually compared with the value in TCNT. When a match is detected, the corresponding compare match B is generated, and a compare match B interrupt is output provided the interrupt request is enabled by the TCR.CMIEB bit.

However, comparison is not performed during writing to TCORB. The timer output from the TMOn pin can be freely controlled by this compare match B and the settings of the TCSR.OSB[1:0] bits.

27.2.4 Timer Control Register (TCR)

Address(es): TMR0.TCR 8782 5000h, TMR1.TCR 8782 5001h, TMR2.TCR 8782 5010h, TMR3.TCR 8782 5011h, TMR0_NS.TCR 0782 5000h, TMR1_NS.TCR 0782 5001h, TMR2_NS.TCR 0782 5010h, TMR3_NS.TCR 0782 5011h

	b7	b6	b5	b4	b3	b2	b1	b0
	CMIEB	CMIEA	OVIE	CCLR[1:0]		—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4, b3	CCLR[1:0]	Counter Clear	b4 b3 0 0: Clearing is disabled 0 1: Cleared by compare match A 1 0: Cleared by compare match B 1 1: Cleared by the external counter reset signal*1 (Select edge or level by the TMRIS bit in TCCR.)	R/W
b5	OVIE	Overflow Interrupt Enable	0: Overflow interrupt requests (OVIn) are disabled 1: Overflow interrupt requests (OVIn) are enabled	R/W
b6	CMIEA	Compare Match A Interrupt Enable	0: Compare match A interrupt requests (CMIAn) are disabled 1: Compare match A interrupt requests (CMIAn) are enabled	R/W
b7	CMIEB	Compare Match B Interrupt Enable	0: Compare match B interrupt requests (CMIBn) are disabled 1: Compare match B interrupt requests (CMIBn) are enabled	R/W

Note 1. To use an external counter reset signal, set the corresponding pin function. For details, refer to section 22, I/O Ports.

CCLR[1:0] Bits (Counter Clear)

Select the condition by which TCNT is cleared.

OVIE Bit (Overflow Interrupt Enable)

Selects whether overflow interrupt requests (OVIn) issued by TCNT are enabled or disabled.

CMIEA Bit (Compare Match A Interrupt Enable)

Selects whether compare match A interrupt requests (CMIAn) that are issued when the value of TCORA corresponds to that of TCNT are enabled or disabled.

CMIEB Bit (Compare Match B Interrupt Enable)

Selects whether compare match B interrupt requests (CMIBn) that are issued when the value of TCORB corresponds to that of TCNT are enabled or disabled.

27.2.5 Timer Counter Control Register (TCCR)

Address(es): TMR0.TCCR 8782 500Ah, TMR1.TCCR 8782 500Bh, TMR2.TCCR 8782 501Ah, TMR3.TCCR 8782 501Bh, TMR01.TCCR 8782 500Ah, TMR23.TCCR 8782 501Ah, TMR0_NS.TCCR 0782 500Ah, TMR1_NS.TCCR 0782 500Bh, TMR2_NS.TCCR 0782 501Ah, TMR3_NS.TCCR 0782 501Bh, TMR01_NS.TCCR 0782 500Ah, TMR23_NS.TCCR 0782 501Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	TMRIS	—	—	CSS[1:0]		CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	CKS[2:0]	Clock Select*1	See Table 27.5.	R/W
b4, b3	CSS[1:0]	Clock Source Select	See Table 27.5.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TMRIS	Timer Reset Detection Condition Select	0: Cleared at rising edge of the external counter reset signal 1: Cleared when the external counter reset signal is high	R/W

Note 1. To use an external count clock, set the corresponding pin function. For details, refer to section 22, I/O Ports.

TCCR register is a 8-bit register used to configure the basic operation of the counter. Two TCCR registers can be accessed simultaneously by accessing the address of the even channel TCCR register in 16-bit units.

CKS[2:0] Bits (Clock Select)
CSS[1:0] Bits (Clock Source Select)

The CKS[2:0] and CSS[1:0] bits select a clock. For details, see Table 27.5.

TMRIS Bit (Timer Reset Detection Condition Select)

This bit is enabled when the TCR.CCLR[1:0] bits are 11b (cleared by external counter reset signal) and selects the condition for detecting counter reset (level or edge).

Table 27.5 Clock Input to TCNT and Count Condition

Channel	TCCR Register					Description
	CSS[1:0]		CKS[2:0]			
	b4	b3	b2	b1	b0	
TMR0 (TMR2)	0	0	—	0	0	Clock input prohibited
					1	Uses external count clock. Counts at rising edge*1.
				1	0	Uses external count clock. Counts at falling edge*1.
					1	Uses external count clock. Counts at both rising and falling edges*1.
	0	1	0	0	0	Uses internal clock. Counts at PCLK.
					1	Uses internal clock. Counts at PCLK/2.
				1	0	Uses internal clock. Counts at PCLK/8.
					1	Uses internal clock. Counts at PCLK/32.
			1	0	0	Uses internal clock. Counts at PCLK/64.
					1	Uses internal clock. Counts at PCLK/1024.
				1	0	Uses internal clock. Counts at PCLK/8192.
					1	Clock input prohibited
	1	0	—	—	—	Setting prohibited
	1	1	—	—	—	Counts at TMR1.TCNT (TMR3.TCNT) overflow signal*2.
TMR1 (TMR3)	0	0	—	0	0	Clock input prohibited
					1	Uses external count clock. Counts at rising edge*1.
				1	0	Uses external count clock. Counts at falling edge*1.
					1	Uses external count clock. Counts at both rising and falling edges*1.
	0	1	0	0	0	Uses internal clock. Counts at PCLK.
					1	Uses internal clock. Counts at PCLK/2.
				1	0	Uses internal clock. Counts at PCLK/8.
					1	Uses internal clock. Counts at PCLK/32.
			1	0	0	Uses internal clock. Counts at PCLK/64.
					1	Uses internal clock. Counts at PCLK/1024.
				1	0	Uses internal clock. Counts at PCLK/8192.
					1	Clock input prohibited
	1	0	—	—	—	Setting prohibited
	1	1	—	—	—	Counts at TMR0.TCNT (TMR2.TCNT) compare match A*2.

Note 1. To use an external count clock, set the corresponding pin function. For details, refer to section 22, I/O Ports.
Note 2. If the clock input of TMR0 (TMR2) is the overflow signal of the TMR1.TCNT (TMR3.TCNT) counter and that of TMR1 (TMR3) is the compare match signal of the TMR0.TCNT (TMR2.TCNT) counter, no TCNT count clock is generated. Do not use this setting.

27.2.6 Timer Control/Status Register (TCSR)

- TMR0.TCSR, TMR2.TCSR

Address(es): TMR0.TCSR 8782 5002h, TMR2.TCSR 8782 5012h, TMR0_NS.TCSR 0782 5002h, TMR2_NS.TCSR 0782 5012h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	OSB[1:0]		OSA[1:0]	
Value after reset:	x	x	x	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	OSA[1:0]	Output Select A*1	b1 b0 0 0: No change 0 1: Low is output 1 0: High is output 1 1: Output is inverted (toggle output)	R/W
b3, b2	OSB[1:0]	Output Select B*1	b3 b2 0 0: No change 0 1: Low is output 1 0: High is output 1 1: Output is inverted (toggle output)	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b5	—	Reserved	These bits are read as an undefined value. The write value should be 1.	R/W

Note 1. When all OSA[1:0] and OSB[1:0] bits are 0, the output enable signal corresponding to the TMOn pin is negated and a request for high-impedance output is issued to the I/O port. Timer output pin is driven low until the first compare-match occurs after a reset when at least one of the OSA[1:0] and OSB[1:0] bits is 1.

OSA[1:0] Bits (Output Select A)

These bits select a method of TMOn pin output when compare match A of TCORA and TCNT occurs.

OSB[1:0] Bits (Output Select B)

These bits select a method of TMOn pin output when compare match B of TCORB and TCNT occurs.

- TMR1.TCSR, TMR3.TCSR

Address(es): TMR1.TCSR 8782 5003h, TMR3.TCSR 8782 5013h, TMR1_NS.TCSR 0782 5003h, TMR3_NS.TCSR 0782 5013h

b4	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7 to b5	—	Reserved	These bits are read as an undefined value. The write value should be 1.	R/W

Note 1. When all OSA[1:0] and OSB[1:0] bits are 0, the output enable signal corresponding to the TMOn pin is negated and a request for high-impedance output is issued to the I/O port. Timer output pin is driven low until the first compare match occurs after a reset when at least one of the OSA[1:0] and OSB[1:0] bits is 1.

OSA[1:0] Bits (Output Select A)

These bits select a method of TMOn pin output when compare match A of TCORA and TCNT occurs.

OSB[1:0] Bits (Output Select B)

These bits select a method of TMOn pin output when compare match B of TCORB and TCNT occurs.

27.2.7 Timer Counter Start Register (TCSTR)

Address(es): TMR0.TCSTR 8782 500Ch, TMR1.TCSTR 8782 500Dh, TMR2.TCSTR 8782 501Ch, TMR3.TCSTR 8782 501Dh, TMR0_NS.TCSTR 0782 500Ch, TMR1_NS.TCSTR 0782 500Dh, TMR2_NS.TCSTR 0782 501Ch, TMR3_NS.TCSTR 0782 501Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TCS
Value after reset:	x	x	x	x	x	x	x	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	TCS	Timer Counter Status	0: Count stopped state in response to ELC. 1: Count start state in response to ELC.	R/W
b7 to b1	—	Reserved	These bits are read as an undefined value. The write value should be 0.	R/W

TCS Bit (Timer Counter Status)

The TCS bit is used to check the state of the timer count in response to ELC.

When this bit is read as 1, it shows the timer start state in response to ELC. When this bit is read as 0, it shows the timer stopped state in response to ELC.

This bit is cleared by writing 0. Do not write 1 to this bit.

The TCS bit is valid only when the count start operation is selected by the ELOPC or ELOPD register of the event controller (ELC).

For details, refer to section 27.7, Link Operation by ELC, or section 21, Event Link Controller (ELC).

27.3 Operation

27.3.1 Pulse Output

Figure 27.3 shows an example of the 8-bit timer being used to generate a pulse output with a desired duty cycle.

1. Set the TCR.CCLR[1:0] bits to 01b (cleared by compare match A) so that TCNT is cleared at a compare match of TCORA.
2. Set the TCSR.OSA[1:0] bits to 10b (high is output) and TCSR.OSB[1:0] bits to 01b (low is output), causing the output to change to high at a compare match of TCORA and to low at a compare match of TCORB.

With these settings, the 8-bit timer provides pulses output at a cycle determined by TCORA with a pulse width determined by TCORB. No software intervention is required.
The timer output pin is low after the TCSR.OSA[1:0] or TCSR.OSB[1:0] bits are set until the first compare match occurs after a reset.

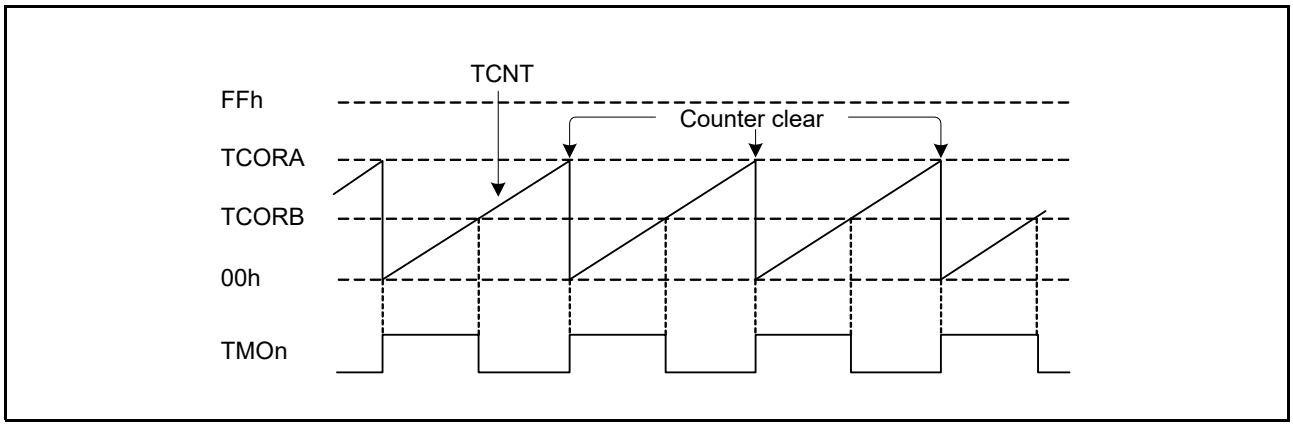

Figure 27.3 Example of Pulse Output (n = 0 to 3)

27.3.2 External Counter Reset Input

Figure 27.4 shows an example of the 8-bit timer being used to generate a pulse which is output after a desired delay time from a TMRIn input.

1. Set the TCR.CCLR[1:0] bits to 11b (cleared by external counter reset signal) and set the TMRIS bit in TCCR to 1 (cleared when the external counter reset signal is high) so that TCNT is cleared at the high level input of the TMRIn signal.
2. Set the TCSR.OSA[1:0] bits to 10b (high output) and the TCSR.OSB[1:0] bits to 01b (low output), causing the output to change to high at a compare match of TCORA and to low at a compare match of TCORB.

With these settings, the 8-bit timer provides pulses output at a desired delay time from a TMRIn input determined by TCORA and with a pulse width determined by TCORB and TCORA.

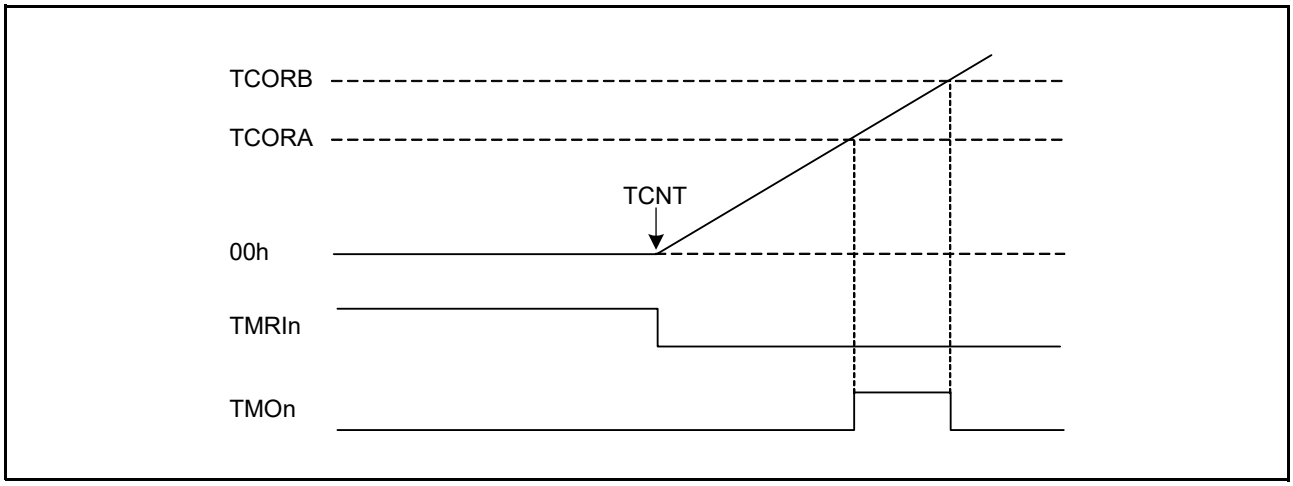

Figure 27.4 Example of External Counter Reset Signal Input (n = 0 to 3)

27.4 Operation Timing

27.4.1 TCNT Count Timing

Figure 27.5 shows the count timing of TCNT for internal clock. Figure 27.6 shows the count timing of TCNT for external clock.

Note that the external clock pulse width must be at least 1.5 PCLK cycles for increment at a single edge, and at least 2.5 PCLK cycles for increment at both edges. The counter will not increment correctly if the pulse width is less than these values.

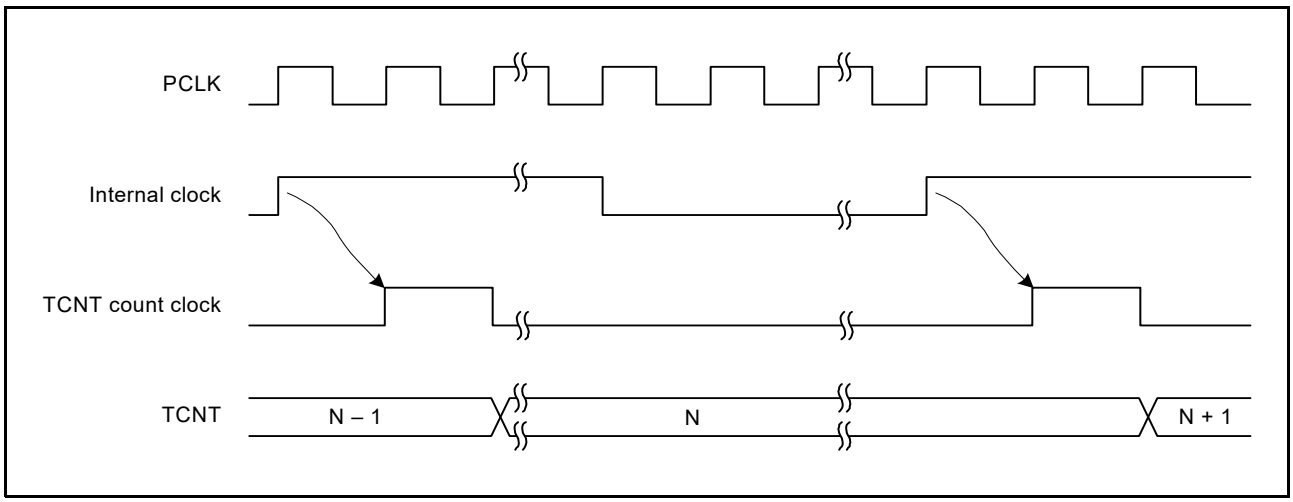

Figure 27.5 Count Timing for Internal Clock

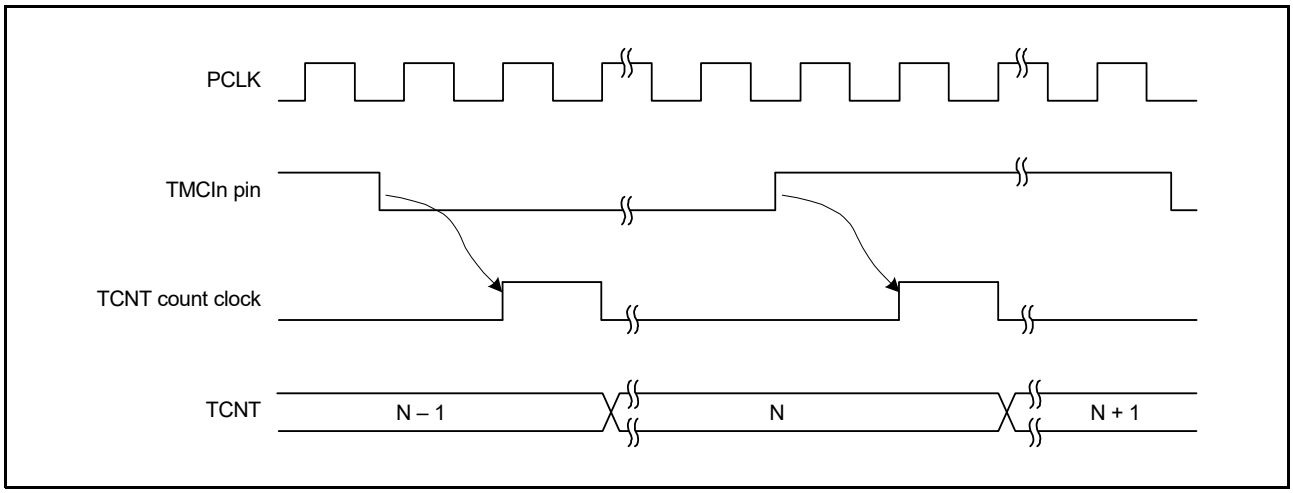

Figure 27.6 Count Timing for External Clock (at Both Edges)

27.4.2 Timing of Interrupt Signal Output on a Compare Match

A compare match refers to a match between the value of the TCORA or TCORB register and the TCNT, and a compare match interrupt signal is output at this time if the interrupt request is enabled. The compare match is generated in the last cycle in which the values match (at the time at which the value counted by TCNT to produce the match is updated). Accordingly, after a match between TCNT and the TCORA or TCORB register is detected, the compare match is not actually generated until the next cycle of the TCNT count clock. Figure 27.7 shows the timing of output of the interrupt signal.
For the corresponding interrupt vector number, refer to section 15, Interrupt Controller (ICUM) and Table 27.6.

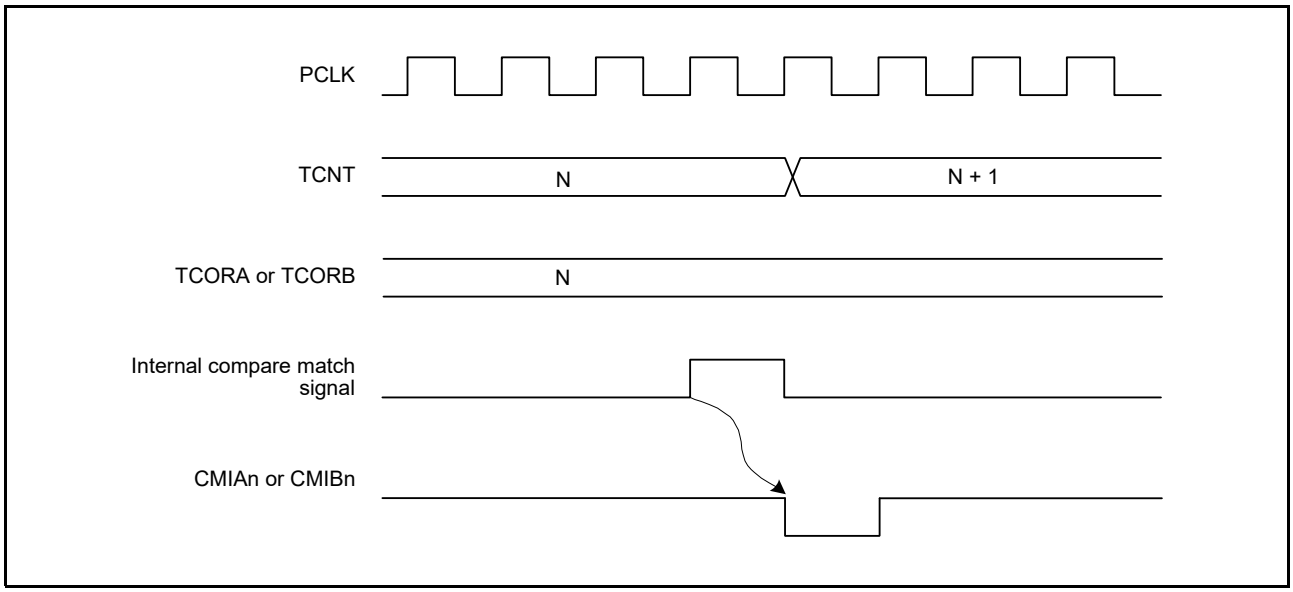

Figure 27.7 Timing of Interrupt Flag Setting to 1 at Compare Match (n = 0 to 3)

27.4.3 Timing of Timer Output Signal at Compare Match

When a compare match signal is generated, the output value specified by the TCSR.OSA[1:0] and OSB[1:0] bits is output on the timer output pin (TMOn).
Figure 27.8 shows the timing when the timer output is toggled by the compare match A signal.

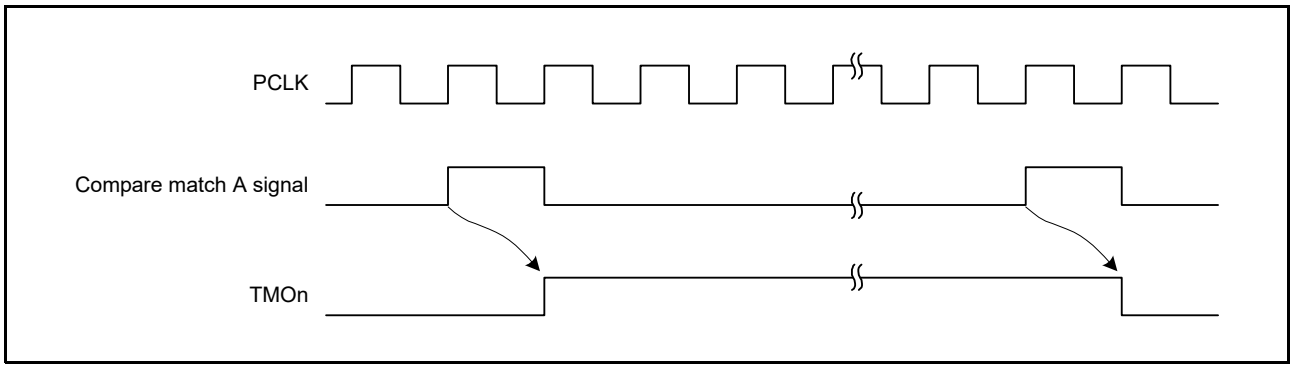

Figure 27.8 Timing of Timer Output Signal at Compare Match A Signal (n = 0 to 3)

27.4.4 Timing of Counter Clear by Compare Match

TCNT is cleared when compare match A or B occurs, depending on the settings of the TCR.CCLR[1:0] bits.
Figure 27.9 shows the timing of this operation.

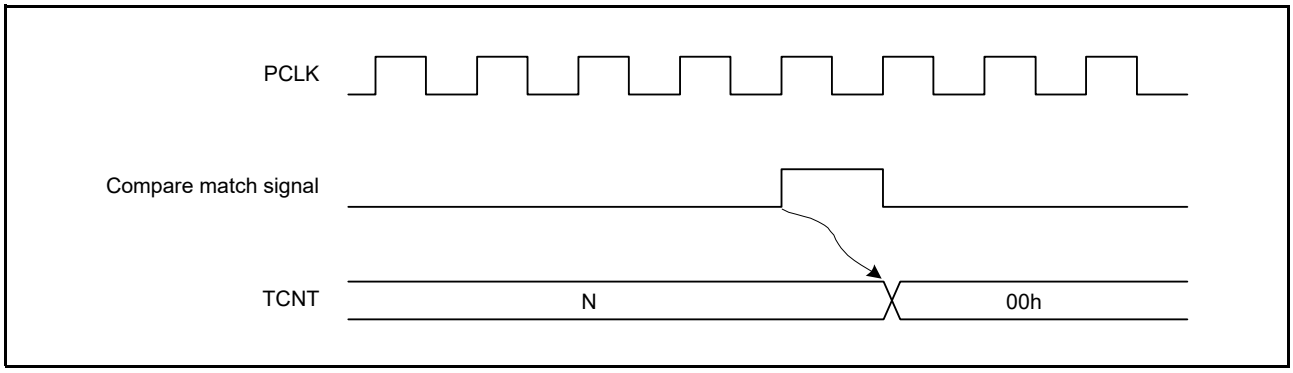

Figure 27.9 Timing of Counter Clear by Compare Match

27.4.5 Timing of the External Reset for TCNT

TCNT is cleared at the rising edge or high level of an external counter reset signal, depending on the settings of the TCR.CCLR[1:0] bits. At least 2 PCLK cycles are required from a reset input to clearing of TCNT.
Figure 27.10 and Figure 27.11 show the timing of this operation.

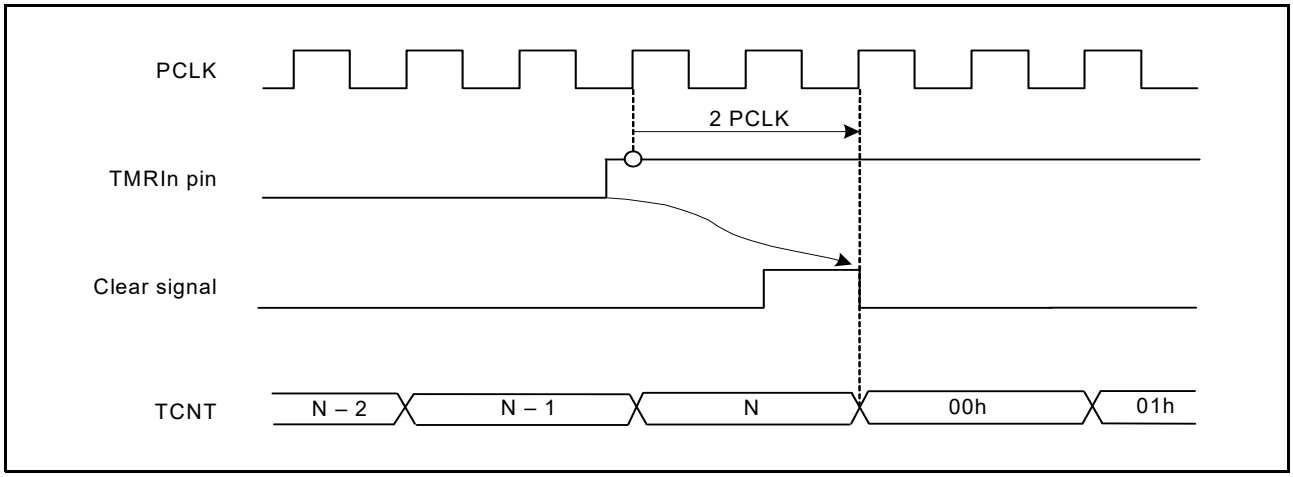

Figure 27.10 Clear Timing by External Counter Reset Signal (Rising Edge)

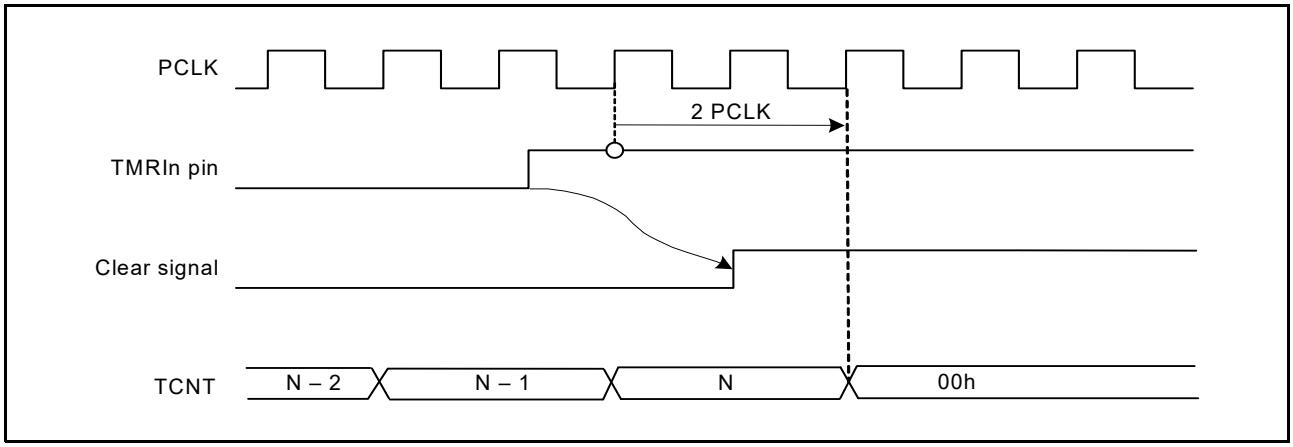

Figure 27.11 Clear Timing by External Counter Reset Signal (High Level)

27.4.6 Timing of Interrupt Signal Output on an Overflow

When TCNT overflows (changes from FFh to 00h), an overflow interrupt signal is output if this interrupt request is enabled.

Figure 27.12 shows the timing of output of the interrupt signal.

For the corresponding interrupt vector number, refer to section 15, Interrupt Controller (ICUM) and Table 27.6.

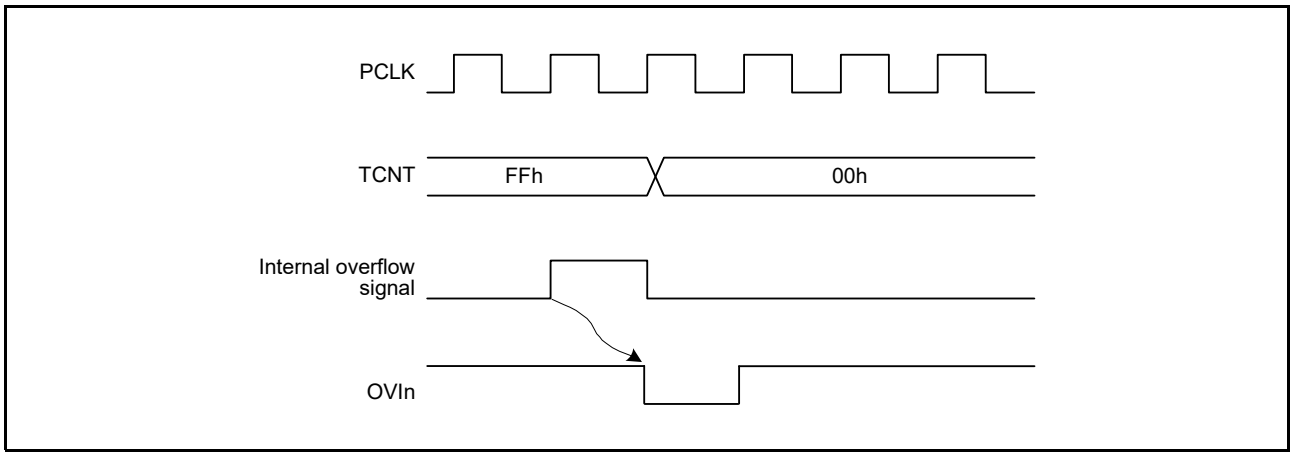

Figure 27.12 Timing of Overflow Interrupt Flag Setting to 1 (n = 0 to 3)

27.5 Operation with Cascaded Connection

If the CSS[1:0] bits in either TMR0.TCCR or TMR1.TCCR are set to 11b, the TMR of the two channels are cascaded. With this configuration, a single 16-bit timer could be used (16-bit counter mode) or compare matches of TMR0 could be counted by TMR1 (compare match count mode).
This section describes unit 0. The operation of unit 1 with cascaded connection is the same as unit 0.

27.5.1 16-Bit Count Mode

When the TMR0.TCCR.CSS[1:0] bits are set to 11b, the timer functions as a single 16-bit timer with TMR0 occupying the upper 8 bits and TMR1 occupying the lower 8 bits.

(1) Counter Clear Specification

- The settings of the TMR0.TCR.CCLR[1:0] bits become effective for the 16-bit counter. If the TMR0.TCR.CCLR[1:0] bits have been set for counter clear at compare match, the 16-bit counter (TMR0.TCNT and TMR1.TCNT together) is cleared when a 16-bit compare match event occurs. The 16-bit counter (TMR0.TCNT and TMR1.TCNT together) is cleared even if counter clear by the TMRI0 pin has been set.
- The settings of the TMR1.TCR.CCLR[1:0] bits are ignored.

(2) Pin Output

- Control of output from the TMO0 pin by the TMR0.TCSR.OSA[1:0] and OSB[1:0] bits is in accordance with the 16-bit compare match conditions.
- Control of output from the TMO1 pin by the TMR1.TCSR.OSA[1:0] and OSB[1:0] bits is in accordance with the lower 8-bit compare match conditions.

27.5.2 Compare Match Count Mode

When the TMR1.TCCR.CSS[1:0] bits are set to 11b, TMR1.TCNT counts the number of occurrences of compare match A for TMR0. TMR0 and TMR1 are controlled independently. Conditions such as generation of interrupts, output from the TMOn pin (n = 0, 1), and counter clear are in accordance with the settings for each channel.

27.6 Interrupt Sources

27.6.1 Interrupt Sources and DTC Activation

There are three interrupt sources for TMRn: CMIAn, CMIBn, and OVIn. Their interrupt sources and priorities are listed in Table 27.6.
It is also possible to activate the DTC by means of CMIAn and CMIBn interrupts.

Table 27.6 TMR Interrupt Sources

Name	Interrupt Sources	DTC Activation
CMIA0	TMR0.TCORA compare match	Possible
CMIB0	TMR0.TCORB compare match	Possible
OVI0	TMR0.TCNT overflow	Not possible
CMIA1	TMR1.TCORA compare match	Possible
CMIB1	TMR1.TCORB compare match	Possible
OVI1	TMR1.TCNT overflow	Not possible
CMIA2	TMR2.TCORA compare match	Possible
CMIB2	TMR2.TCORB compare match	Possible
OVI2	TMR2.TCNT overflow	Not possible
CMIA3	TMR3.TCORA compare match	Possible
CMIB3	TMR3.TCORB compare match	Possible
OVI3	TMR3.TCNT overflow	Not possible

27.7 Link Operation by ELC

27.7.1 Event Signal Output to ELC

The TMR uses the event link controller (ELC) to perform link operation to the previously specified module using the interrupt request signal as the event signal. The TMR outputs compare match A, compare match B, and overflow signals as event signals. Channels that can be used in this way are TMR0 to TMR3.
The event signal can be output regardless of the setting of the corresponding interrupt request enable bits (TMRn.TCR.OVIE, TMRn.TCR.CMIEA, and TMRn.TCR.CMIEB (n = 0 to 3)). For details, refer to section 21, Event Link Controller (ELC).
The event output function can be used for the cascaded operation.

27.7.2 TMR Operation when Receiving an Event Signal from ELC

The TMR can perform either of the following operations upon the event previously specified by the ELSRn register of the ELC. However, the ELC does not support the cascaded operation.

(1) Count Start

When the TMR count start operation is selected by the ELOPC or ELOPD register of the ELC and the event specified by ELSRn occurs, the TCSTR.TCS bit is set to 1, starting the TMR count operation. After the TMR count start operation is selected by the ELOPC or ELOPD register of the ELC, use the TCCR.CKS[2:0] and CSS[1:0] bits to select the count source.
If the specified event occurs while the TCS bit is 1, the event is ignored.
Write 0 to the TCSTR.TCS bit to stop counting.
When the count start event is input in the count stopped state, the TMR starts counting again according to the CKS[2:0] and CSS[1:0] bits.
The TCS bit is valid only when the ELOPC.TMR0MD[1:0], ELOPC.TMR1MD[1:0], ELOPD.TMR2MD[1:0], or ELOPD.TMR3MD[1:0] bits of the ELC select the count start operation.

(2) Event Count

When the TMR event count operation is selected by the ELOPC or ELOPD register of the ELC and the event specified by ELSRn occurs, the events are counted as the count source regardless of the TCCR.CKS[2:0] and CSS[1:0] bit settings. Reading the counter value returns the number of events that have been actually input.

(3) Count Restart

When the TMR count restart operation is selected by the ELOPC or ELOPD register of the ELC and the event specified by ELSRn occurs, the TCNT counter value is modified to the initial value. If the CKS[2:0] and CSS[1:0] bit settings are not disabling the clock input, the count operation is continued.

27.7.3 Notes on Operating TMR According to an Event Signal from ELC

The following describes the notes on operating the TMR using the event link feature.

(1) Count Start

When the event specified by ELSRn occurs during the write cycle to the TCSTR.TCS bit, the cycle is not completed; setting 1 according to the event occurrence takes priority.

(2) Event Count

When the event specified by ELSRn occurs during the write cycle to the TCNT, the cycle is not completed; event count operation according to the event occurrence takes priority.

(3) Count Restart

When the event specified by ELSRn occurs during the write cycle to the TCNT, the cycle is not completed; count value initialization according to the event occurrence takes priority.

27.8 Usage Notes

27.8.1 Module Stop State Setting

Operation of the TMR can be disabled or enabled by using the module stop control registers. The initial setting is for halting of TMR operation. Register access becomes possible after release from the module stop state. For details, refer to section 11, Low Power Consumption.

27.8.2 Notes on Setting Cycle

If the compare match is selected for counter clear, TCNT is cleared at the last PCLK in the cycle in which the value of TCNT matches with that of TCORA or TCORB. TCNT updates the counter value at this last state. Therefore, the counter frequency is obtained by the following formula (f: Counter frequency, PCLK: Operating frequency, N: TCORA and TCORB register setting value).

$$f = PCLK / (N + 1)$$

27.8.3 Conflict between TCNT Write and Counter Clear

If a counter clear signal is generated concurrently with CPU write to TCNT, the clear takes priority and the write is not performed as shown in Figure 27.13.

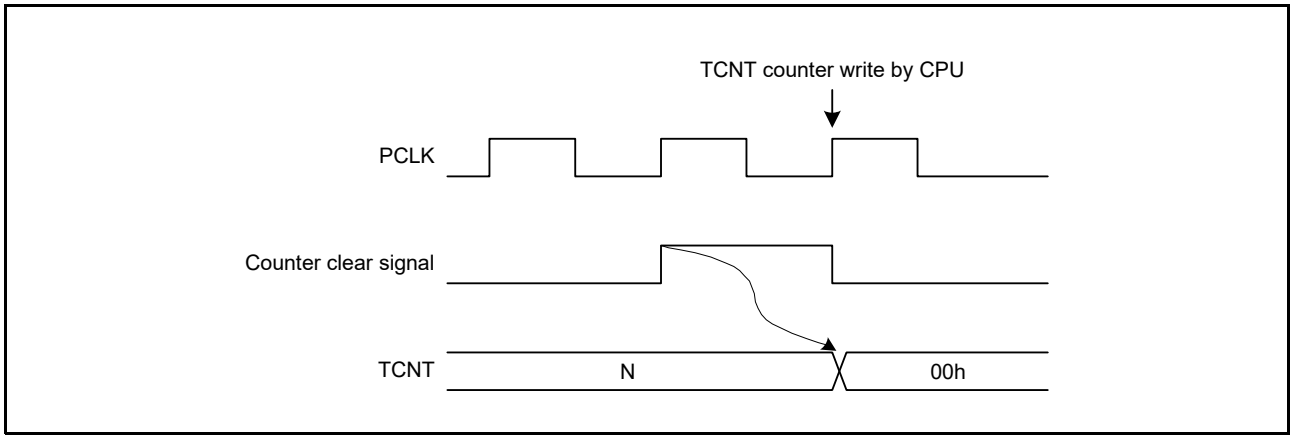

Figure 27.13 Conflict between TCNT Write and Counter Clear

27.8.4 Conflict between TCNT Write and Increment

Even if a counting-up signal is generated concurrently with CPU write to TCNT, the counting-up is not performed and the write takes priority as shown in Figure 27.14.

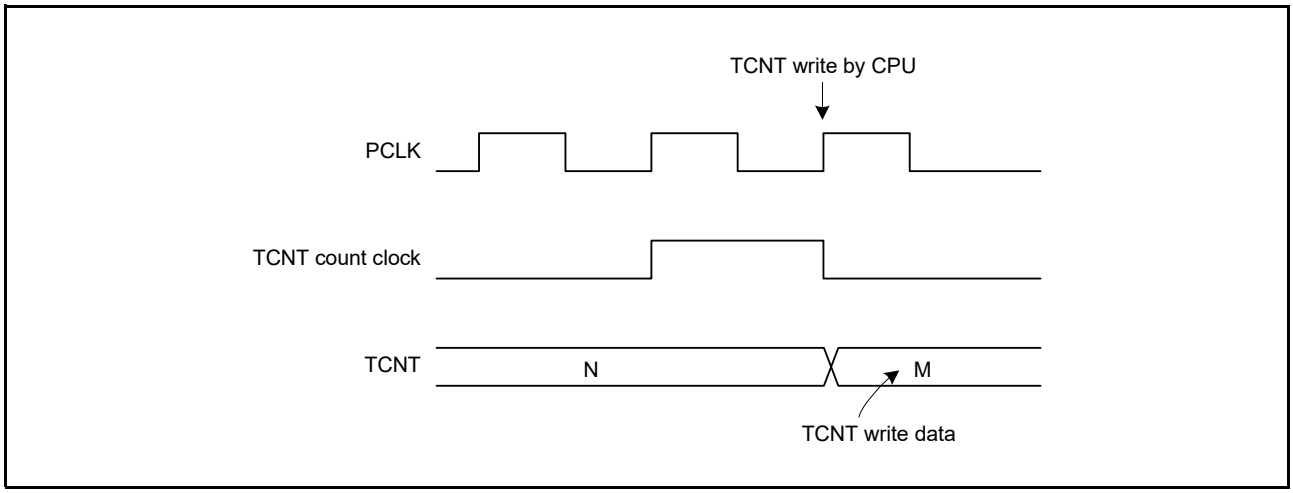

Figure 27.14 Conflict between TCNT Write and Increment

27.8.5 Conflict between TCORA or TCORB Write and Compare Match

Even if a compare match signal is generated simultaneously with CPU write to TCORA or TCORB as shown in Figure 27.15, the write takes priority and the compare match signal does not reach High level.

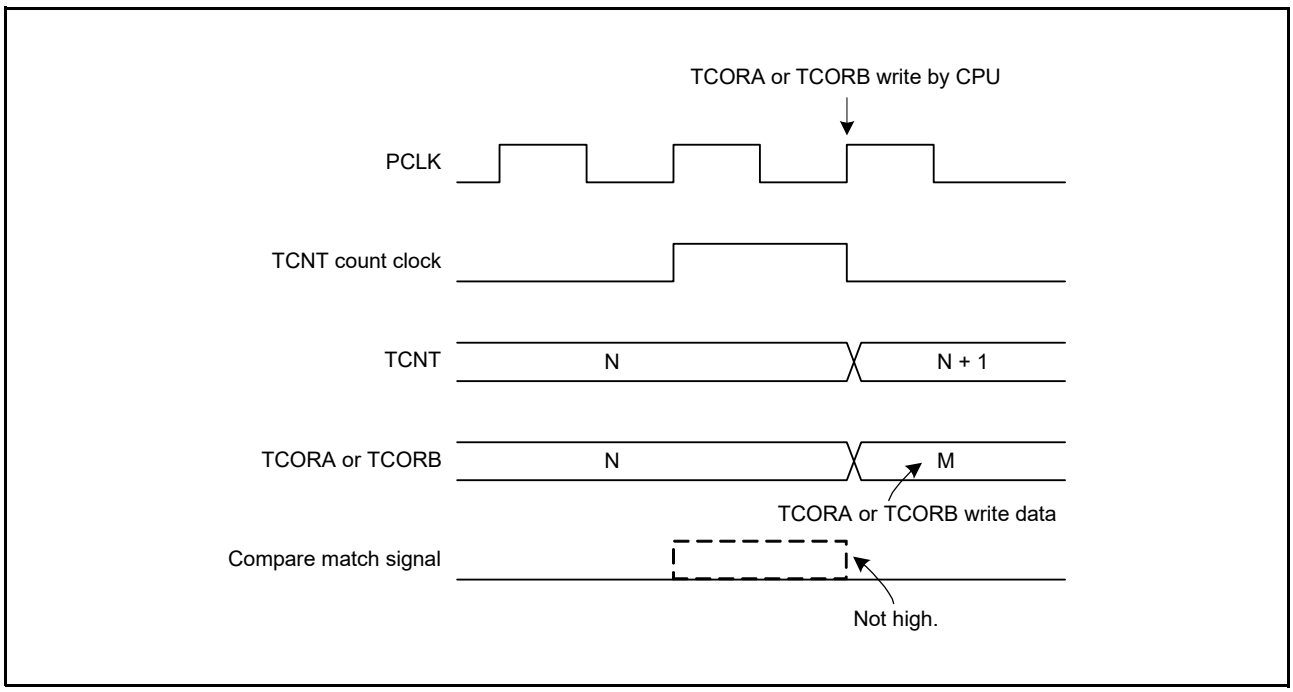

Figure 27.15 Conflict between TCORA or TCORB Write and Compare Match

27.8.6 Conflict between Compare Matches A and B

If compare match events A and B occur at the same time, the 8-bit timer operates in accordance with the priorities for the output methods high for compare match A and compare match B, as listed in Table 27.7.

Table 27.7 Timer Output Priorities

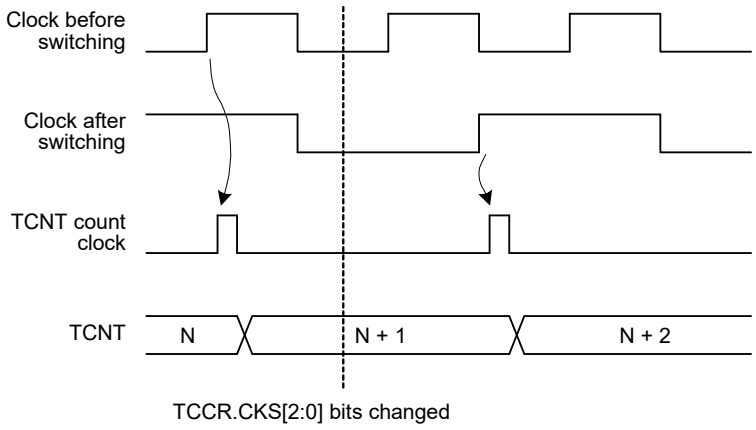
Output Setting	Priority
Toggle output	High
High output	↑
Low output	
No change	Low

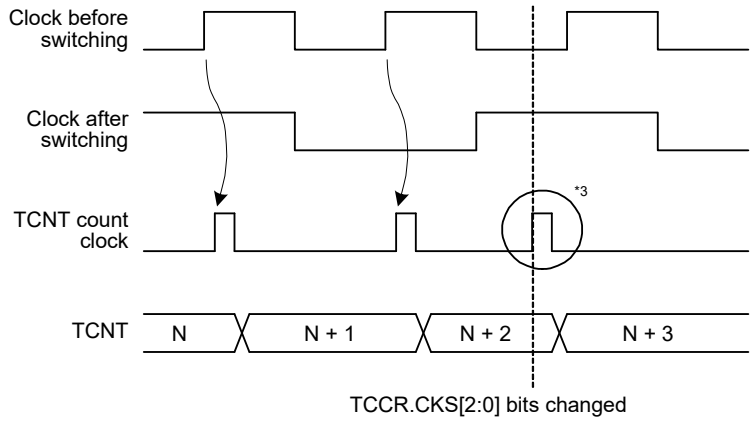
27.8.7 Switching of Internal Clocks and TCNT Operation

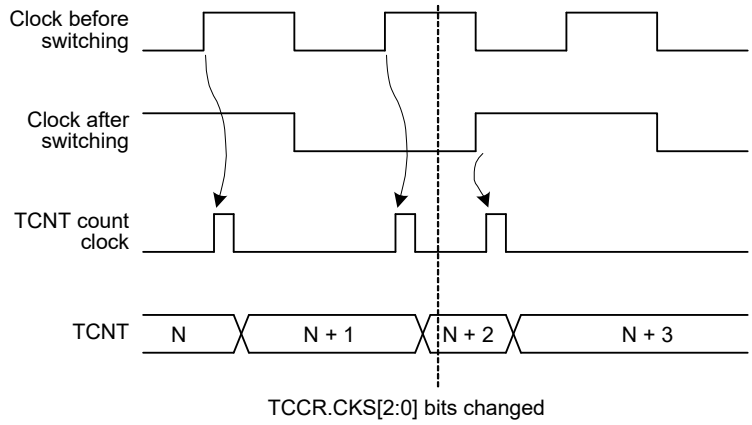
TCNT may be incremented erroneously depending on when the internal clock is switched. Table 27.8 lists the relationship between the timing at which the internal clock is switched (by writing to the TCCR.CKS[2:0] bits) and the operation of TCNT.

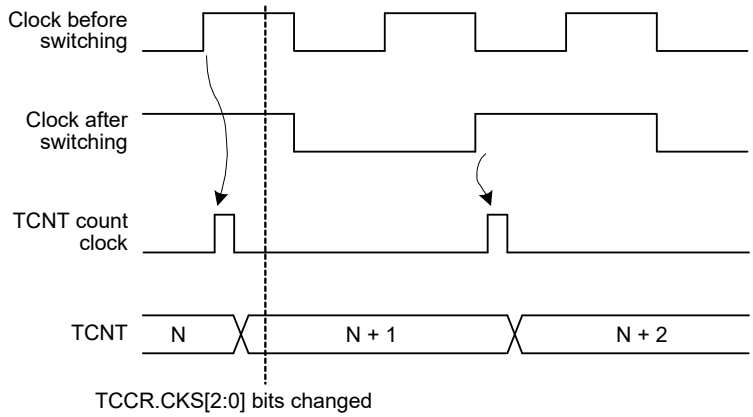
When TCNT count clock is generated from an internal clock, the rising edge of the internal clock pulse are always monitored. If the signal levels of the clocks before and after switching change from low to high as shown in No. 2 in Table 27.8, the change is considered as an edge. Therefore, a TCNT count clock is generated and TCNT is incremented. The erroneous increment of TCNT can also happen when switching between internal and internal clocks.

Table 27.8 Switching of Internal Clocks and TCNT Operation (1/2)









No.	Timing to Change the TCCR.CKS[2:0] Bits	TCNT Counter Operation
1	Switching from low to low*1	
2	Switching from low to high*2	

Table 27.8 Switching of Internal Clocks and TCNT Operation (2/2)

No.	Timing to Change the TCCR.CKS[2:0] Bits	TCNT Counter Operation
3	Switching from high to low*4	
4	Switching from high to high	

Note 1. Includes switching from low to stop, and from stop to low.
Note 2. Includes switching from stop to high.
Note 3. Generated because the change of the signal levels is considered as an edge; TCNT counter is incremented.
Note 4. Includes switching from high to stop.

27.8.8 Clock Source Setting with Cascaded Connection

If 16-bit counter mode and compare match count mode are specified at the same time, count clocks for TMR0.TCNT and TMR1.TCNT (TMR2.TCNT and TMR3.TCNT) are not generated, and the counter stops. Do not specify 16-bit counter mode and compare match count mode simultaneously.

27.8.9 Continuous Output of Compare Match Interrupt Signal

When TCORA or TCORB is set to 00h, PCLK/1 is set as the internal clock, and compare match is set as the counter clear source, the TCNT counter remains 00h and is not updated, and a compare match interrupt signal is output continuously to form a flat signal level.
At this time, the interrupt controller cannot detect the second and subsequent interrupts.
Figure 27.16 shows operation timing when the compare match interrupt signal is continuously output.

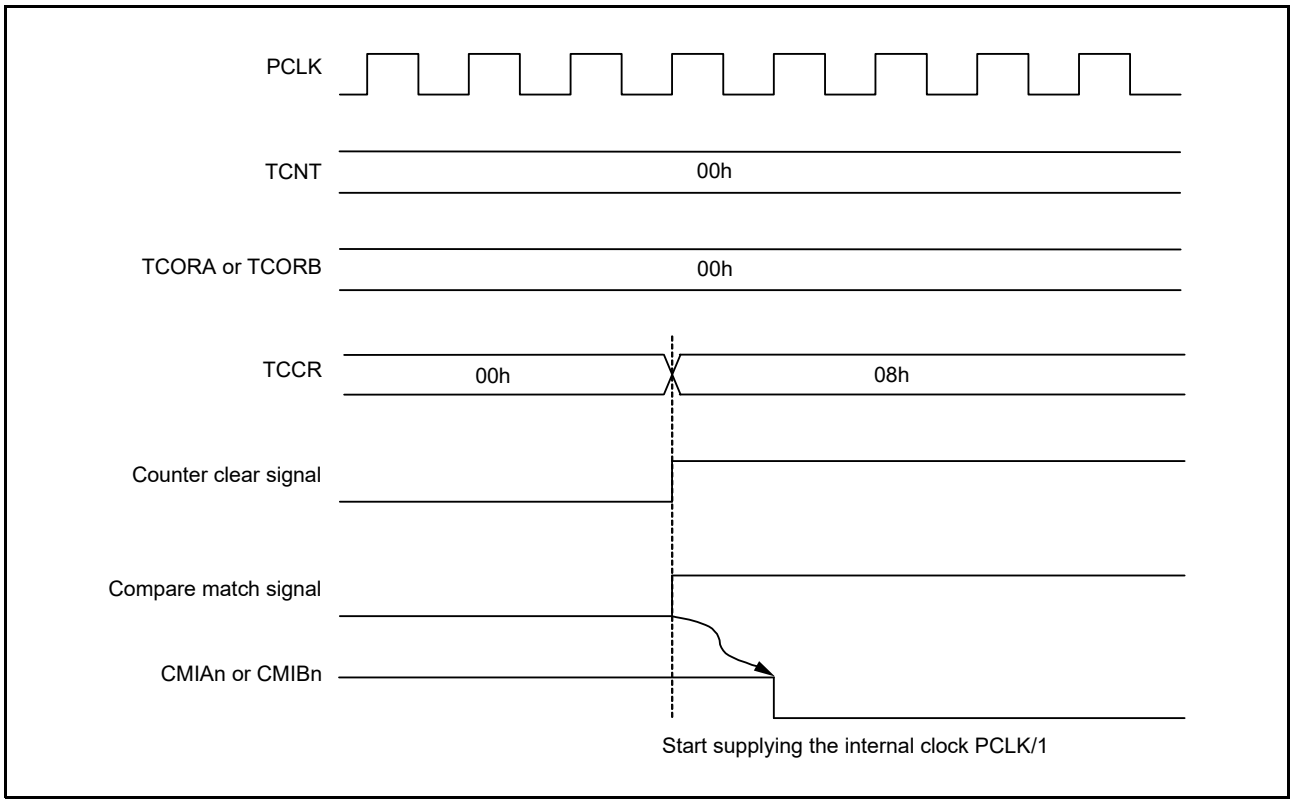


Figure 27.16 Continuous Output of Compare Match Interrupt Signal (n = 0 to 3)

27.8.10 Transition to Software Standby Mode

Before transitioning to software standby mode, set the TCCR.CSS[1:0] bits to 00b and the TCCR.CKS[2:0] bits to 000b for all channels to stop the clock supply to the counters. After returning from software standby mode, restoring the TCCR.CSS[1:0] and the TCCR.CKS[2:0] bits to their original values will resume counting from the value held prior to the transition.

28. Compare Match Timer (CMT)

This MCU has two on-chip compare match timer (CMT) units (unit 0 and unit 1), each consisting of a two-channel 16-bit timer (i.e., a total of four channels). The CMT has a 16-bit counter, and can generate interrupts at set intervals.
In this section, “PCLK” is used to refer to PCLKB.

28.1 Overview

Table 28.1 lists the specifications for the CMT.
Figure 28.1 shows a block diagram of the CMT (unit 0). A two-channel CMT constitutes a unit. Unit 0 and unit 1 are the same in terms of specifications. Compare match timer start register 0 (CMSTR0) and compare match interrupts (CMI0 and CMI1) of unit 0 correspond to compare match timer start register 1 (CMSTR1) and compare match interrupts (CMI2 and CMI3) of unit 1.

Table 28.1 CMT Specifications

Item	Description
Count clocks	• Four frequency dividing clocks One clock from PCLK/8, PCLK/32, PCLK/128, and PCLK/512 can be selected for each channel.
Interrupt	A compare match interrupt can be requested for each channel.
Event link function (output)	An event signal is output upon a CMT1 compare match.
Event link function (input)	Linking to the specified module is possible. CMT1 count start, event counter, or count restart operation is possible.
Low power consumption function	Each unit can be placed in a module stop state.
Protect Zone filter	Security attributes can be set for each unit.*1

Note 1. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

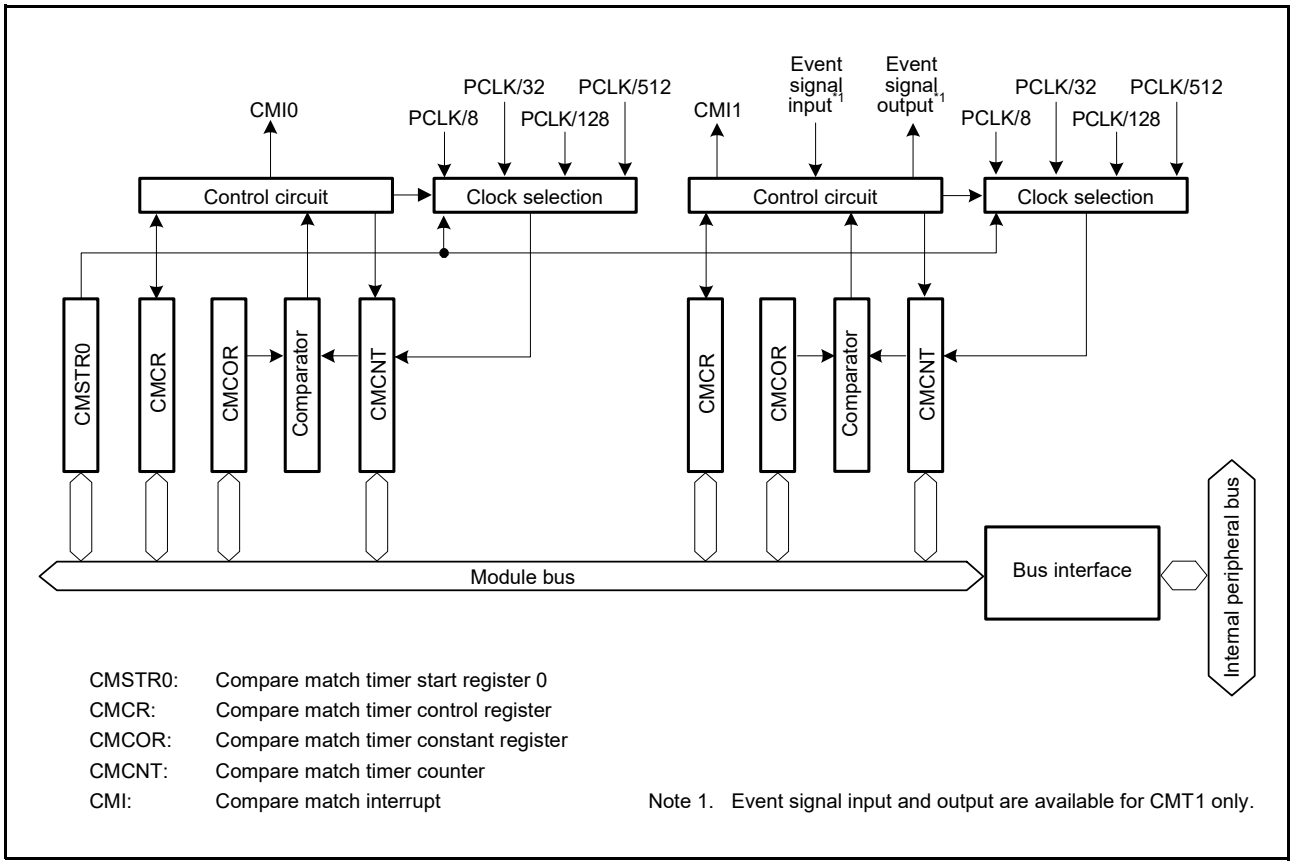

Figure 28.1 CMT (Unit 0) Block Diagram

28.2 Register Descriptions

28.2.1 Compare Match Timer Start Register 0 (CMSTR0)

Address(es): CMT.CMSTR0 8782 6000h, CMT_NS.CMSTR0 0782 6000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR1	STR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR0	Count Start 0	0: CMT0.CMCNT count is stopped. 1: CMT0.CMCNT count is started.	R/W
b1	STR1	Count Start 1	0: CMT1.CMCNT count is stopped. 1: CMT1.CMCNT count is started.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

28.2.2 Compare Match Timer Start Register 1 (CMSTR1)

Address(es): CMT.CMSTR1 8782 6010h, CMT_NS.CMSTR1 0782 6010h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR3	STR2
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR2	Count Start 2	0: CMT2.CMCNT count is stopped. 1: CMT2.CMCNT count is started.	R/W
b1	STR3	Count Start 3	0: CMT3.CMCNT count is stopped. 1: CMT3.CMCNT count is started.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

28.2.3 Compare Match Timer Control Register (CMCR)

Address(es): CMT0.CMCR 8782 6002h, CMT1.CMCR 8782 6008h, CMT2.CMCR 8782 6012h, CMT3.CMCR 8782 6018h, CMT0_NS.CMCR 0782 6002h, CMT1_NS.CMCR 0782 6008h, CMT2_NS.CMCR 0782 6012h, CMT3_NS.CMCR 0782 6018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	CMIE	—	—	—	—	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: PCLK/8 0 1: PCLK/32 1 0: PCLK/128 1 1: PCLK/512	R/W
b5 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CMIE	Compare Match Interrupt Enable	0: Compare match interrupt (CMIn) disabled 1: Compare match interrupt (CMIn) enabled	R/W
b7	—	Reserved	This bit is read as undefined. The write value should be 1.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CKS[1:0] Bits (Clock Select)

These bits select the count source from four frequency dividing clocks obtained by dividing the peripheral module clock (PCLK).

When the CMSTRm.STRn (m = 0, 1; n = 0 to 3) bit is set to 1, the CMCNT counter starts counting up on the clock selected with the CKS[1:0] bits.

CMIE Bit (Compare Match Interrupt Enable)

The CMIE bit enables or disables compare match interrupt (CMIn) (n = 0 to 3) generation when the CMCNT counter and the CMCOR register values match.

28.2.4 Compare Match Counter (CMCNT)

Address(es): CMT0.CMCNT 8782 6004h, CMT1.CMCNT 8782 600Ah, CMT2.CMCNT 8782 6014h, CMT3.CMCNT 8782 601Ah, CMT0_NS.CMCNT 0782 6004h, CMT1_NS.CMCNT 0782 600Ah, CMT2_NS.CMCNT 0782 6014h, CMT3_NS.CMCNT 0782 601Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMCNT counter is a readable/writable up-counter.
When an frequency dividing clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0, 1; n = 0 to 3) bit is set to 1, the CMCNT counter starts counting up using the selected clock.
When the value in the CMCNT counter and the value in the CMCOR register match, the CMCNT counter is set to 0000h. At the same time, a compare match interrupt (CMIn) (n = 0 to 3) is generated.

28.2.5 Compare Match Constant Register (CMCOR)

Address(es): CMT0.CMCOR 8782 6006h, CMT1.CMCOR 8782 600Ch, CMT2.CMCOR 8782 6016h, CMT3.CMCOR 8782 601Ch, CMT0_NS.CMCOR 0782 6006h, CMT1_NS.CMCOR 0782 600Ch, CMT2_NS.CMCOR 0782 6016h, CMT3_NS.CMCOR 0782 601Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The CMCOR register is a readable/writable register to set a value for compare match with the CMCNT counter.

28.3 Operation

28.3.1 Cyclic Count Operation

When an frequency dividing clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0, 1; n = 0 to 3) bit is set to 1, the CMCNT counter starts counting up using the selected clock.
When the value in the counter and the value in the register match, a compare match interrupt (CMIn) (n = 0 to 3) is generated. The CMCNT counter then starts counting up again from 0000h. Figure 28.2 shows the operation of the CMCNT counter.

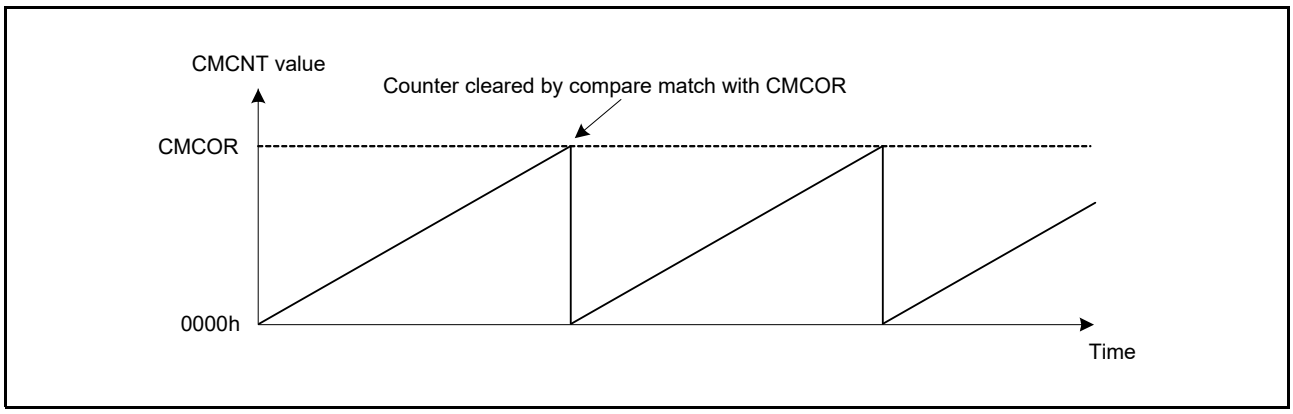

Figure 28.2 CMCNT Counter Operation

28.3.2 CMCNT Count Timing

As the count clock to be input to the CMCNT counter, one of four frequency dividing clocks (PCLK/8, PCLK/32, PCLK/128, and PCLK/512) obtained by dividing the peripheral module clock (PCLK) can be selected with the CMCR.CKS[1:0] bits. Figure 28.3 shows the timing of the CMCNT counter.

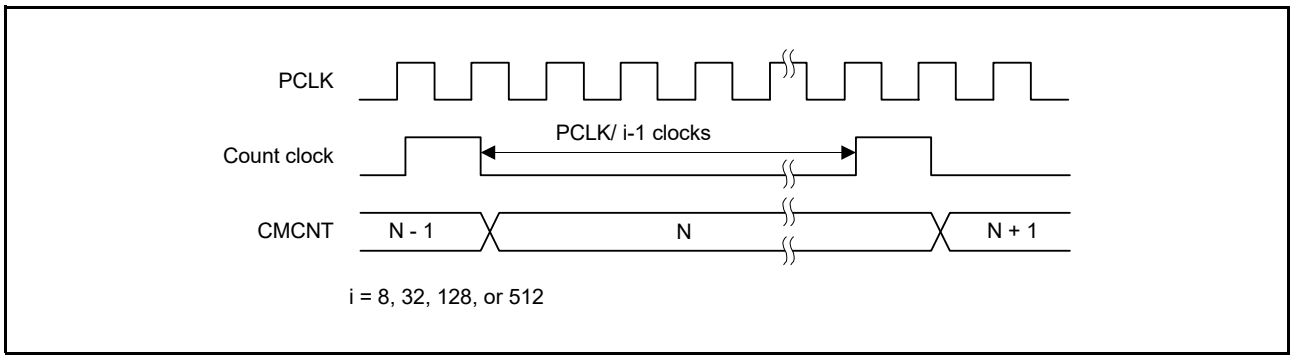

Figure 28.3 CMCNT Count Timing

28.4 Interrupts

28.4.1 Interrupt Sources

The CMT has channels and each of them to which a different vector address is allocated has a compare match interrupt (CMIn) (n = 0 to 3). When a compare match interrupt occurs, the corresponding interrupt request is output.
When the interrupt request is used to generate a CPU interrupt, the priority of channels can be changed by the interrupt controller settings. For details, see section 15, Interrupt Controller (ICUM).

Table 28.2 CMT Interrupt Sources

Name	Interrupt Sources	DTC Activation	DMAC Activation
CMI0	Compare match in CMT0	Possible	Possible
CMI1	Compare match in CMT1	Possible	Possible
CMI2	Compare match in CMT2	Possible	Possible
CMI3	Compare match in CMT3	Possible	Possible

28.4.2 Timing of Compare Match Interrupt Generation

When the CMCNT counter and the CMCOR register match, a compare match interrupt (CMIn) (n = 0 to 3) is generated. A compare match signal is generated at the last state in which the values match (the timing when the CMCNT counter updates the matched count value). That is, after a match between the CMCOR register and the CMCNT counter, the compare match signal is not generated until the next the CMCNT counter input clock.
Figure 28.4 shows the timing of a compare match interrupt.

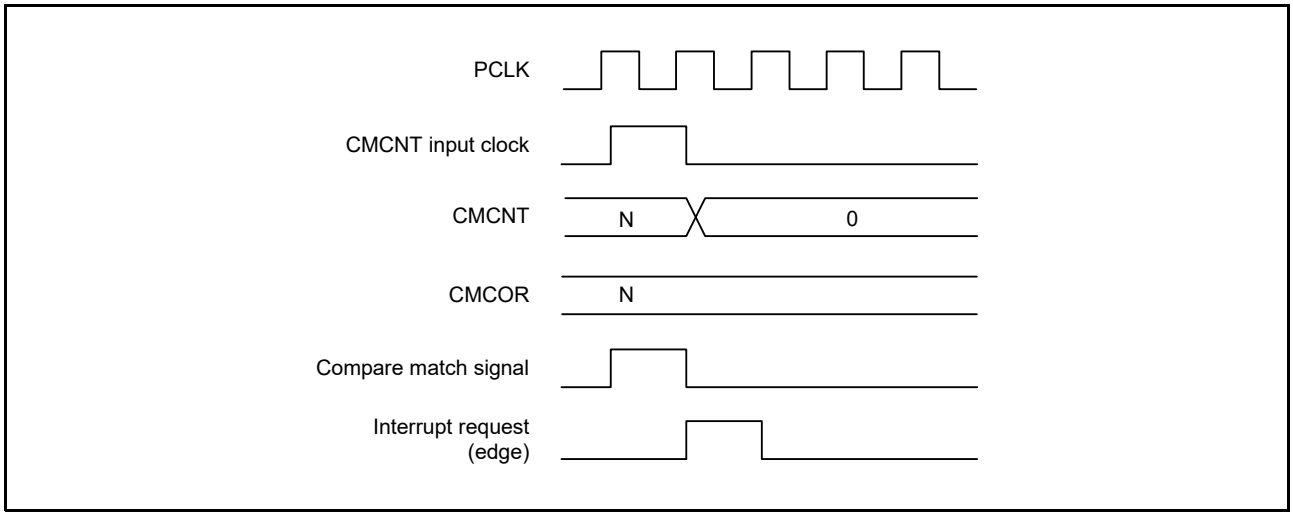

Figure 28.4 Timing of a Compare Match Interrupt

28.5 Link Operations by ELC

28.5.1 Event Signal Output to ELC

The CMT uses the event link controller (ELC) to perform link operation to a preset module using the interrupt request signal as the event signal. The CMT outputs the event signal upon a CMT1 compare match.
The event signal can be output regardless of the setting of the corresponding interrupt request enable bit (CMTn.CMCR.CMIE).

28.5.2 CMT Operation When Receiving an Event Signal from ELC

The CMT can perform either of the following operations upon the event preset by the ELSR0 register of the ELC.

(1) Count Start

When the CMT count start operation is selected by the ELOPA register of the ELC and the event specified by ELSR0 occurs, the CMSTR0.STR1 bit is set to 1, starting the CMT count operation.
However, if the specified event occurs while the CMSTR0.STR1 bit is 1, the event is ignored.

(2) Event Count

When the CMT event count operation is selected by the ELOPA register of the ELC and the event specified by ELSR0 occurs with the CMSTR0.STR1 bit being 1, the events are counted as the count source regardless of the CMT1.CMCR.CKS[1:0] bit setting. Reading the counter value returns the number of events that have been actually input.

(3) Count Restart

When the CMT count restart operation is selected by the ELOPA register of the ELC and the event specified by ELSR0 occurs, the CMT1.CMCNT counter value is modified to the initial value. If the CMSTR0.STR1 bit is 1 here, the count operation can be continued.

28.5.3 Notes on Operating CMT According to an Event Signal from ELC

The following describes the notes on operating the CMT using the event link feature.

(1) Count Start

When the event specified by ELSR0 occurs during the write cycle to the CMSTR0.STR1 bit, the cycle is not completed; setting 1 according to the event occurrence takes priority.

(2) Event Count

When the event specified by ELSR0 occurs during the write cycle to the CMT1.CMCNT, the cycle is not completed; event count operation according to the event occurrence takes priority.

(3) Count Restart

When the event specified by ELSR0 occurs during the write cycle to the CMT1.CMCNT, the cycle is not completed; count value initialization according to the event occurrence takes priority.

28.6 Usage Notes

28.6.1 Setting the Module Stop Function

The CMT can be enabled or disabled using the module stop control register. After a reset, the CMT is in the module stop state. The registers can be accessed by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

28.6.2 Conflict between CMCNT Counter Writing and Compare Match

When the compare match signal is generated while writing to the CMCNT counter, clearing the CMCNT counter has priority over writing to it. In this case, the CMCNT counter is not written to. Figure 28.5 shows the timing to clear the CMCNT counter.

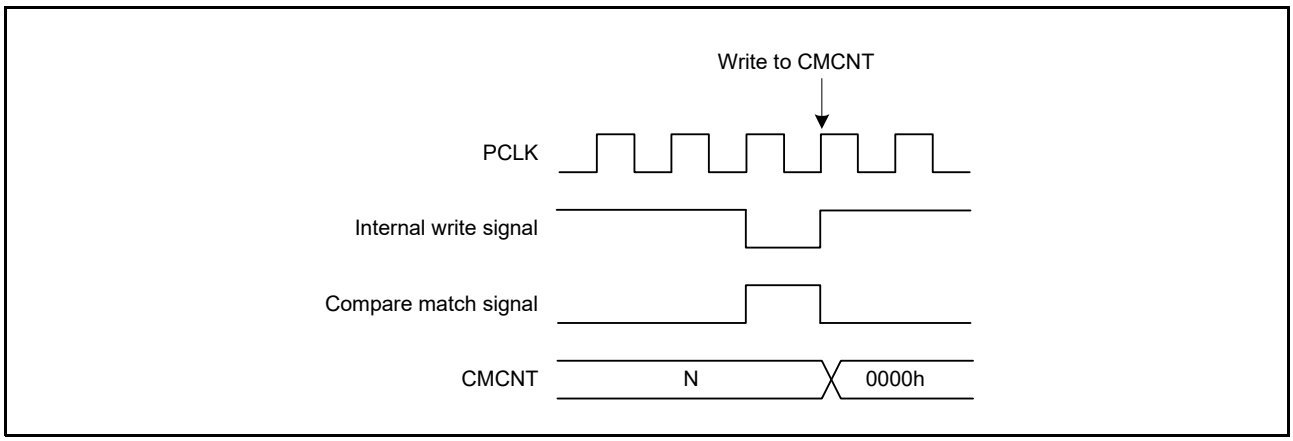

Figure 28.5 Conflict between CMCNT Counter Writing and Compare Match

28.6.3 Conflict between CMCNT Counter Writing and Incrementing

If writing to the counter and the incrementing conflict, the writing has priority over the incrementing. Figure 28.6 shows the timing to write the CMCNT counter.

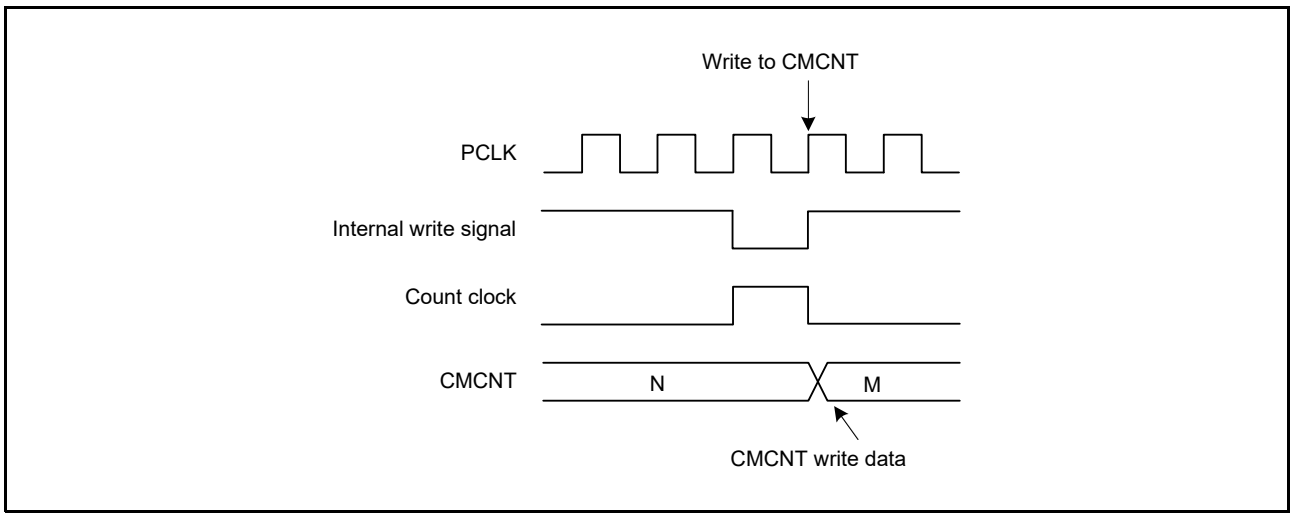

Figure 28.6 Conflict between CMCNT Counter Writing and Incrementing

28.6.4 Transition to Software Standby Mode

Before transitioning to software standby mode, set the CMSTR0 and CMSTR1 registers to 00h to stop all counters. After returning from software standby mode, setting the CMSTRm.STRn bit (m = 0, 1; n = 0 to 3) to 1 will resume counting from the value held prior to the transition.

29. Compare Match Timer W (CMTW)

This MCU includes two units (unit 0 and unit 1) with one channel of 32-bit compare match timer W (CMTW).
CMTW has a 32-bit counter and can generate interrupts each time a set period elapses.
In this section, “PCLK” is used to refer to PCLKB.

29.1 Overview

Table 29.1 shows the specifications of the CMTW.
Figure 29.1 shows a block diagram of the CMTW0 and Figure 29.2 shows a block diagram of the CMTW1.

Table 29.1 CMTW Specifications

Item	Function
Number of channels	Two channels (unit 0, unit 1)
Timer counter	16-bit/32-bit selectable up-counter The counter returns to 0000 0000h after a compare match.
Prescaler	Four dividing clocks are output. Selectable from any of PCLK/8, PCLK/32, PCLK/128, and PCLK/512
Input capture	Up to two input capture input signals available.
Output compare	Up to two output compare output signals available.
Compare match	One compare match available (no output compare output pin used).
Interrupts	Compare match interrupt Input capture 0 and 1 interrupts Output compare 0 and 1 interrupts
Event link function (output) (Unit 0)	Compare match
Event link function (input) (Unit 0)	One of the following operations is enabled after an event is accepted: • Count start operation • Event count operation • Count restart operation
Low power consumption function	Each unit can be placed in the module stop state.
Protect Zone filter	Security attributes can be set for each unit.*1

Note 1. When each unit is set to the secure attribute, registers in the unit are accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When each unit is set to the non-secure attribute, registers in the unit are accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

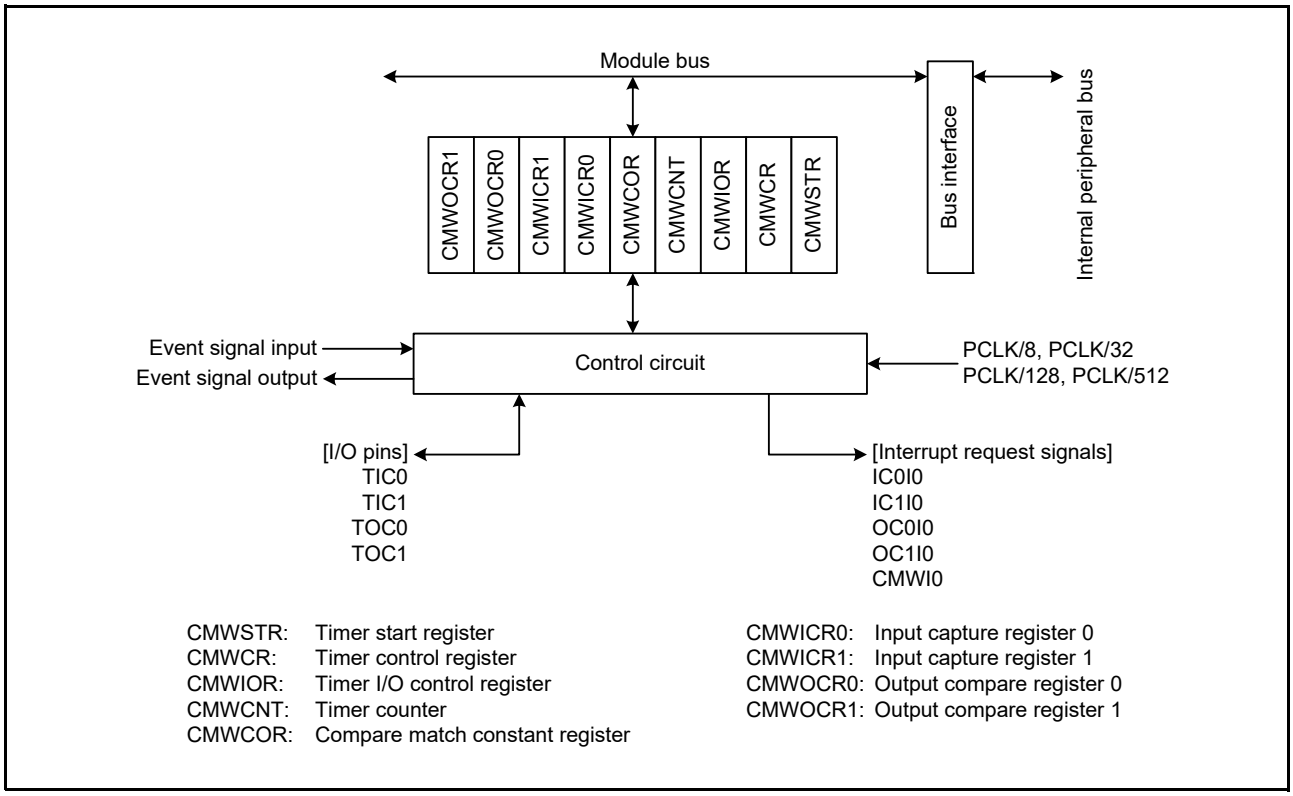

Figure 29.1 CMTW0 Block Diagram

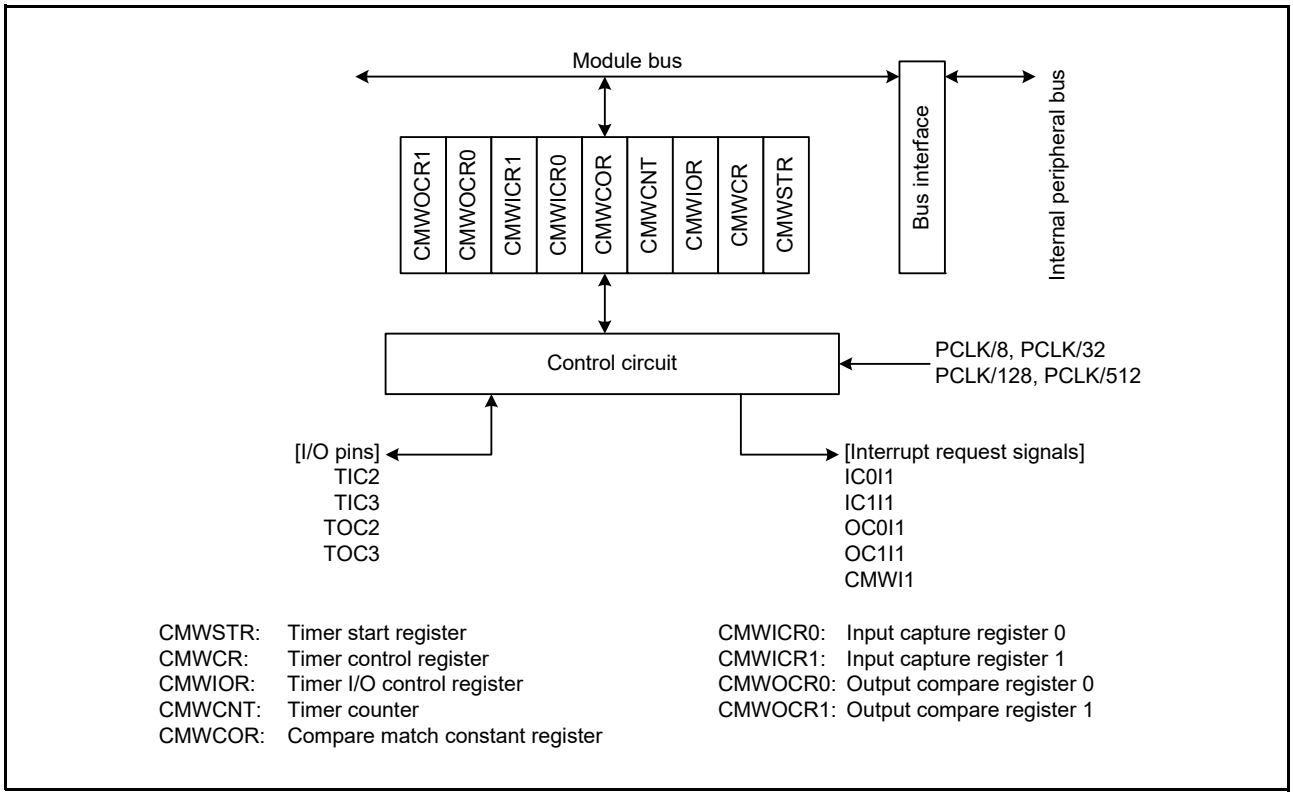

Figure 29.2 CMTW1 Block Diagram

Table 29.2 shows the CMTW pin configuration.

Table 29.2 CMTW Pin Configuration

Unit	Pin Name	I/O	Description
CMTW0	TIC0	Input	Input capture input for the CMTW0.CMWICR0 register
	TIC1	Input	Input capture input for the CMTW0.CMWICR1 register
	TOC0	Output	Output compare output for the CMTW0.CMWOCR0 register
	TOC1	Output	Output compare output for the CMTW0.CMWOCR1 register
CMTW1	TIC2	Input	Input capture input for the CMTW1.CMWICR0 register
	TIC3	Input	Input capture input for the CMTW1.CMWICR1 register
	TOC2	Output	Output compare output for the CMTW1.CMWOCR0 register
	TOC3	Output	Output compare output for the CMTW1.CMWOCR1 register

29.2 Register Descriptions

29.2.1 Timer Start Register (CMWSTR)

Address(es): CMTW0.CMWSTR 8782 6100h, CMTW1.CMWSTR 8782 6140h,
CMTW0_NS.CMWSTR 0782 6100h, CMTW1_NS.CMWSTR 0782 6140h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR	Counter Start	0: CMWCNT counter count is stopped. (The value immediately before count operation stops is retained and the count operation is stopped.) 1: CMWCNT counter count is started.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

STR Bit (Counter Start)

Specifies whether the timer counter operates or is stopped. The relevant prescaler operates or is stopped according to the settings of the STR bit.

29.2.2 Timer Control Register (CMWCR)

Address(es): CMTW0.CMWCR 8782 6104h, CMTW1.CMWCR 8782 6144h,
CMTW0_NS.CMWCR 0782 6104h, CMTW1_NS.CMWCR 0782 6144h

b9	CMS	Timer Counter Size	0: 32 bits 1: 16 bits	R/W
b12 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b13	CCLR[2:0]	Counter Clear	b15 b13 0 0 0: CMWCNT counter cleared by CMWCOR register compare match 0 0 1: Clearing of CMWCNT counter disabled 0 1 0: Clearing of CMWCNT counter disabled 0 1 1: Clearing of CMWCNT counter disabled 1 0 0: CMWCNT counter cleared by CMWICR0 register input capture 1 0 1: CMWCNT counter cleared by CMWICR1 register input capture 1 1 0: CMWCNT counter cleared by CMWOCR0 register compare match 1 1 1: CMWCNT counter cleared by CMWOCR1 register compare match	R/W

The CMWCR register should be set while the timer counter (CMWCNT) operation is stopped.

CKS[1:0] Bits (Clock Select)

Select the clock to be input to the CMWCNT counter among four internal clocks obtained by dividing the peripheral module clock (PCLK). When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting based on the clock selected with the CMWCR.CKS[1:0] bits.

CMWIE Bit (Compare Match Interrupt Request Enable)

Enables or disables compare match interrupt request (CMWI) generation when the CMWCNT counter and the CMWCOR register values match.

IC0IE Bit (Input Capture 0 Interrupt Request Enable)

Enables or disables input capture 0 interrupt request (IC0I) generation when input capture is generated in the CMWICR0 register.

IC1IE Bit (Input Capture 1 Interrupt Request Enable)

Enables or disables input capture 1 interrupt request (IC1I) generation when input capture is generated in the CMWICR1 register.

OC0IE Bit (Output Compare 0 Interrupt Request Enable)

Enables or disables output compare 0 interrupt request (OC0I) generation when the CMWCNT counter and the CMWOCR0 register values match.

OC1IE Bit (Output Compare 1 Interrupt Request Enable)

Enables or disables output compare 1 interrupt request (OC1I) generation when the CMWCNT counter and CMWOCR1 register values match.

CMS Bit (Timer Counter Size)

Selects either 16 or 32 bits as the size of the timer counter (CMWCNT). The size selected with the CMS bit is valid in the CMWCOR, CMWICR0, CMWICR1, CMWOCR0, and CMWOCR1 registers.

CCLR[2:0] Bits (Counter Clear)

Select the CMWCNT counter clearing source.

29.2.3 Timer I/O Control Register (CMWIOR)

Address(es): CMTW0.CMWIOR 8782 6108h, CMTW1.CMWIOR 8782 6148h,
CMTW0_NS.CMWIOR 0782 6108h, CMTW1_NS.CMWIOR 0782 6148h

b12	OC0E	Output Compare 0 Enable	0: Output compare 0 operation disabled 1: Output compare 0 operation enabled	R/W
b13	OC1E	Output Compare 1 Enable	0: Output compare 1 operation disabled 1: Output compare 1 operation enabled	R/W
b14	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15	CMWE	Compare Match Enable	0: Compare match operation disabled 1: Compare match operation enabled	R/W

Note 1. After reset, low is output until the CMWIOR register is set.

29.2.4 Timer Counter (CMWCNT)

Address(es): CMTW0.CMWCNT 8782 6110h, CMTW1.CMWCNT 8782 6150h,
CMTW0_NS.CMWCNT 0782 6110h, CMTW1_NS.CMWCNT 0782 6150h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMWCNT counter is a readable/writable up-counter.
Before starting count operation, the timer control register (CMWCR) should be set. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in this register are valid. When writing to the CMWCNT counter, write data in 32-bit units with the upper bits set to 0000h. The CMWCNT counter can only be accessed in longword units.
When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting. When the CMWSTR.STR bit is set to 0, the CMWCNT counter retains the value immediately before a stop of counting and stops counting.

29.2.5 Compare Match Constant Register (CMWCOR)

Address(es): CMTW0.CMWCOR 8782 6114h, CMTW1.CMWCOR 8782 6154h,
CMTW0_NS.CMWCOR 0782 6114h, CMTW1_NS.CMWCOR 0782 6154h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The CMWCOR register is a readable/writable register that specifies the time up to a compare match between the timer counter (CMWCNT) value and CMWCOR value. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in this register are valid. When writing to the CMWCOR register, write data in 32-bit units with the upper bits set to 0000h. The CMWCOR register can only be accessed in longword units. To detect an overflow, set the CMWCOR register value to FFFF FFFFh (32-bit count operation) or 0000 FFFFh (16-bit count operation). When the CMWCNT counter is set to 0, a compare match interrupt request (CMWI) can be used as an overflow detection signal.

29.2.6 Input Capture Register n (CMWICRn) (n = 0, 1)

Address(es): CMTW0.CMWICR0 8782 6118h, CMTW0.CMWICR1 8782 611Ch, CMTW1.CMWICR0 8782 6158h, CMTW1.CMWICR1 8782 615Ch, CMTW0_NS.CMWICR0 0782 6118h, CMTW0_NS.CMWICR1 0782 611Ch, CMTW1_NS.CMWICR0 0782 6158h, CMTW1_NS.CMWICR1 0782 615Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMWICRn register is a read-only register in which the CMWCNT value is stored when an input capture is generated.

When the 16-bit counter size is selected with the CMWCR.CMS bit, bits 15 to 0 in these registers are valid. Writing to these registers is invalid. The CMWICRn register can only be accessed in longword units.

29.2.7 Output Compare Register n (CMWOCRn) (n = 0, 1)

Address(es): CMTW0.CMWOCR0 8782 6120h, CMTW0.CMWOCR1 8782 6124h, CMTW1.CMWOCR0 8782 6160h, CMTW1.CMWOCR1 8782 6164h, CMTW0_NS.CMWOCR0 0782 6120h, CMTW0_NS.CMWOCR1 0782 6124h, CMTW1_NS.CMWOCR0 0782 6160h, CMTW1_NS.CMWOCR1 0782 6164h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The CMWOCRn register is a readable/writable register that set the value to be compared when an output compare is generated.

When the 16-bit counter size is selected with the CMWCR.CMS bit, bits 15 to 0 of these registers become valid. When writing to these registers, write data in 32-bit units with the upper bits set to 0000h.

The CMWOCRn register can only be accessed in longword units. The initial value of CMWOCR0 and CMWOCR1 registers is FFFF FFFFh.

29.3 Operation

When the CMWCR register is set and then the STR bit in CMWSTR is set to 1, the CMTW starts count operation. Setting the CMWSTR.STR bit to 0 enables the CMWCNT counter to retain the value immediately before a stop of counting and stop counting. Setting the CMWIOR register enables using the compare match function, input capture input function, and output compare output function.

29.3.1 Cyclic Count Operation

When the counter clock is selected by using the CMWCR.CKS[1:0] bits and the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting cycles of the selected clock. When clearing of the counter is selected by the CMWCR.CCLR[2:0] bits and the counter clearing source is generated, the CMWCNT counter becomes 0000 0000h and continues counting. When clearing of the counter is not selected, an overflow is generated when FFFF FFFFh changes to 0000 0000h during 32-bit count operation and 0000 FFFFh changes to 0000 0000h during 16-bit count operation, and the CMWCNT counter continues counting.

29.3.2 Compare Match Function

When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter becomes 0000 0000h. At this time, a compare match interrupt request (CMWI) is generated. The CMWCNT counter restarts counting from 0000 0000h.

To enable overflow detection, the CMWCOR register value should be set to FFFF FFFFh (when the counter size is 32 bits) or 0000 FFFFh (when the counter size is 16 bits). When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter becomes 0000 0000h. In this case, the compare match interrupt request (CMWI) is generated. The CMWCNT counter then restarts counting from 0000 0000h.

Figure 29.3 shows an example of procedure for setting compare match operation.

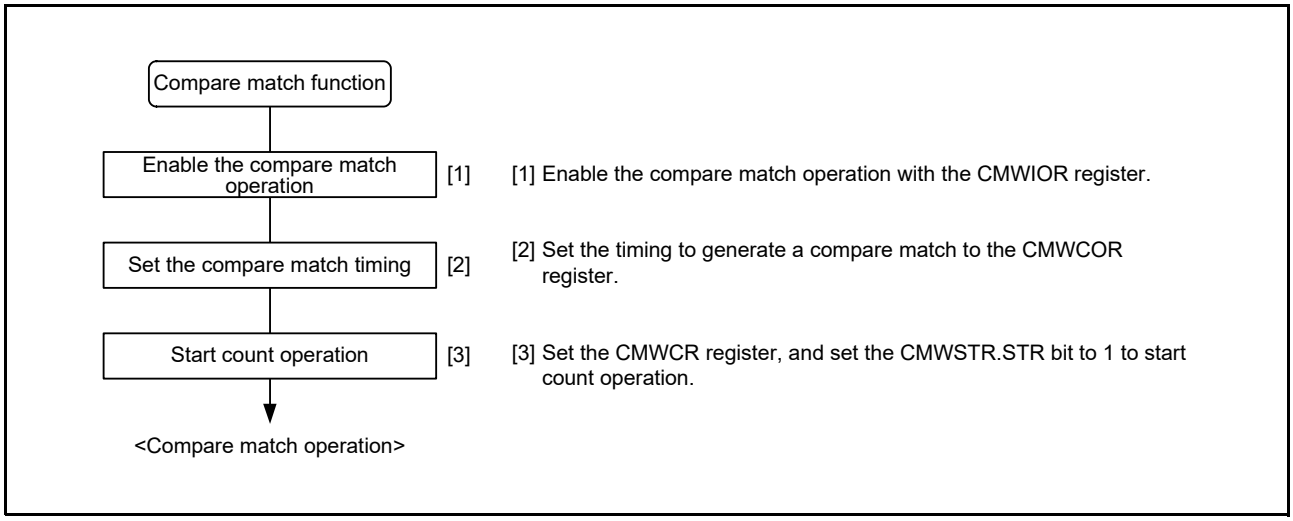

Figure 29.3 Procedure for Setting Compare Match Operation

Figure 29.4 shows an example when compare match with CMWCOR is set as a counter clearing source.

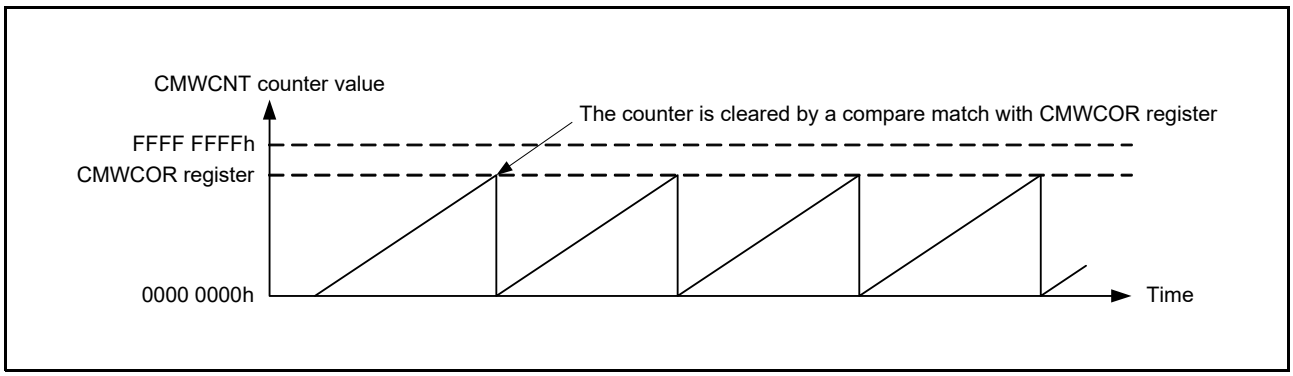

Figure 29.4 Example of Compare Match Operation

Figure 29.5 shows an example when CMWCOR is set to FFFF FFFFh and an overflow is detected.

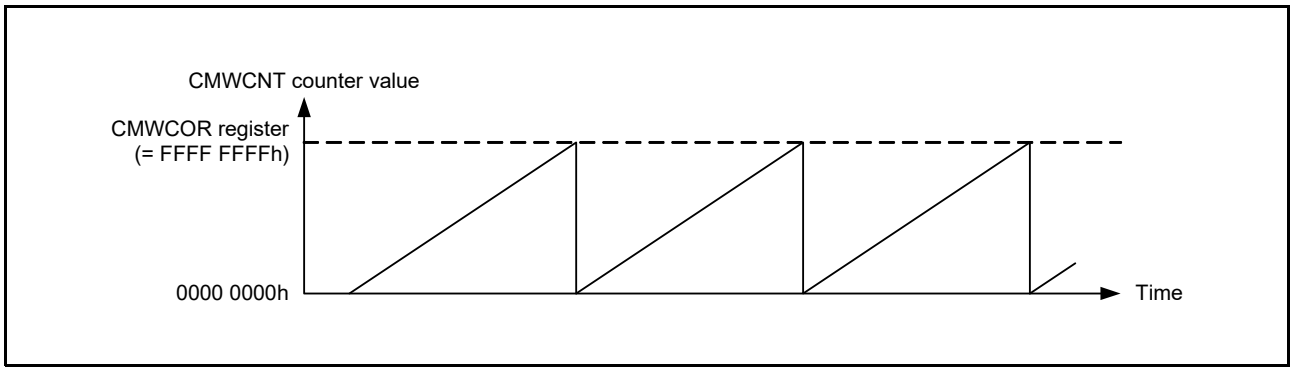

Figure 29.5 Example of Compare Match Operation (Overflow Detected)

29.3.3 Output Compare Function

The output compare function can be used for toggle waveform output. When the CMWCNT counter value matches either of the values of the CMWOCR0 or CMWOCR1 register, the output compare interrupt request (OC0I or OC1I) is generated. Figure 29.6 shows an example of procedure for setting output compare operation.

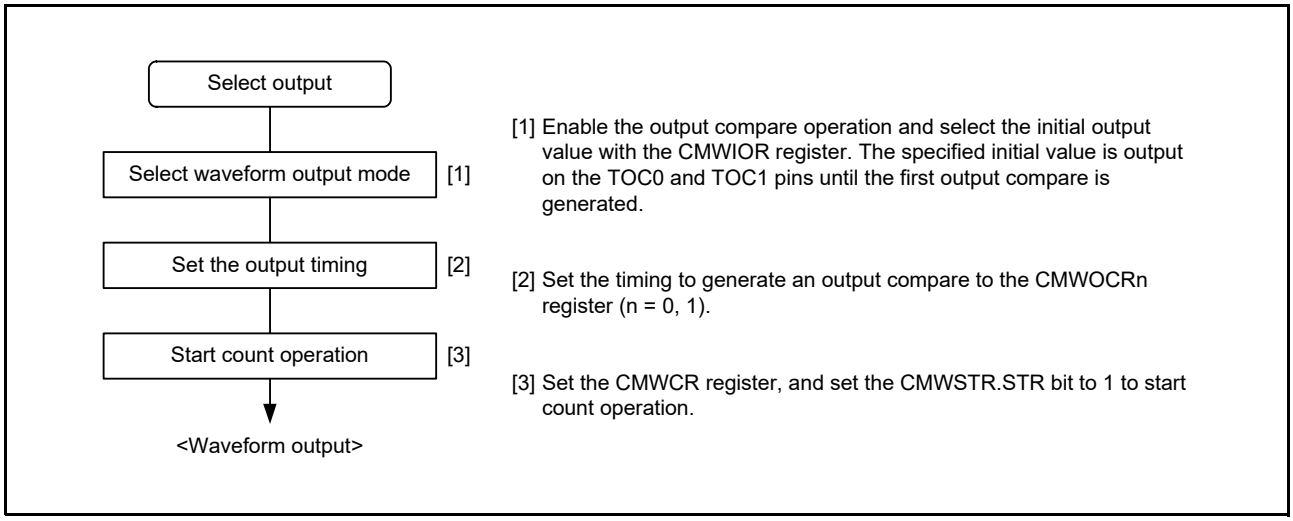

Figure 29.6 Procedure for Setting Output Compare Operation

Figure 29.7 shows an example of toggle waveform output from the TOC0 and TOC1 pins when the counter is set to be cleared by compare match with the CMWOCR1 register.

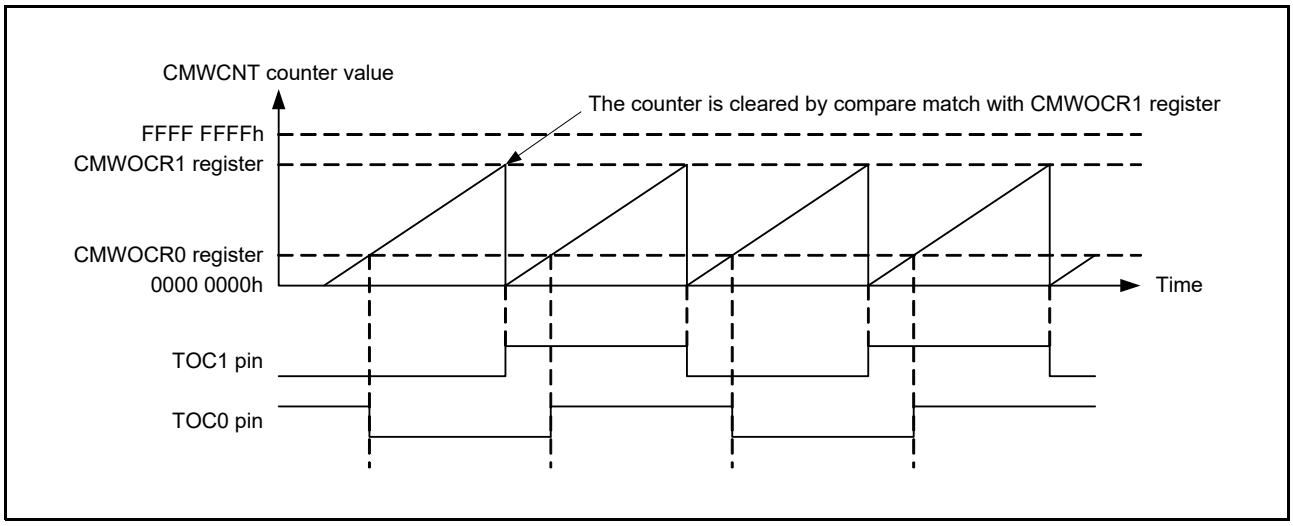

Figure 29.7 Example of Output Compare Operation (Unit 0)

29.3.4 Input Capture Function

Through detecting the edge on the TIC0 and TIC1 pin input, the CMWCNT counter value can be transferred to the CMWICR0 and CMWICR1 registers, respectively. The edges to be detected can be selected from among the rising edge alone, falling edge alone, and both the rising and falling edges. When the CMWCNT counter value is transferred to the CMWICR0 or CMWICR1 register using the input capture operation, an input capture interrupt request (IC0I or IC1I) is generated. Figure 29.8 shows an example of procedure for setting input capture operation.

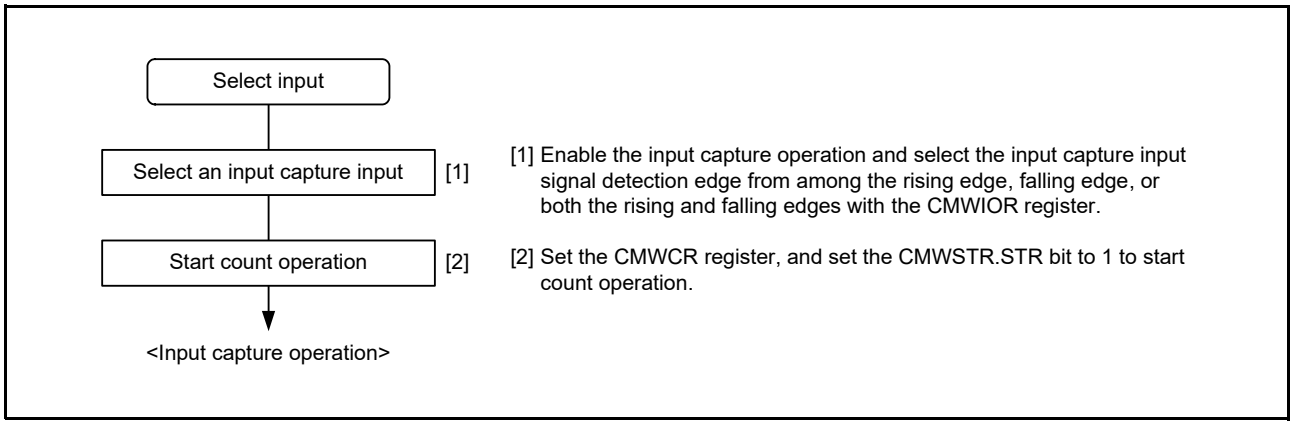

Figure 29.8 Procedure for Setting Input Capture Operation

Figure 29.9 shows an example in which both edges are selected for the TIC0 pin input capture detection edge and the falling edge for the TIC1 pin, and the CMWCNT counter is cleared by a CMWICR1 register input capture.

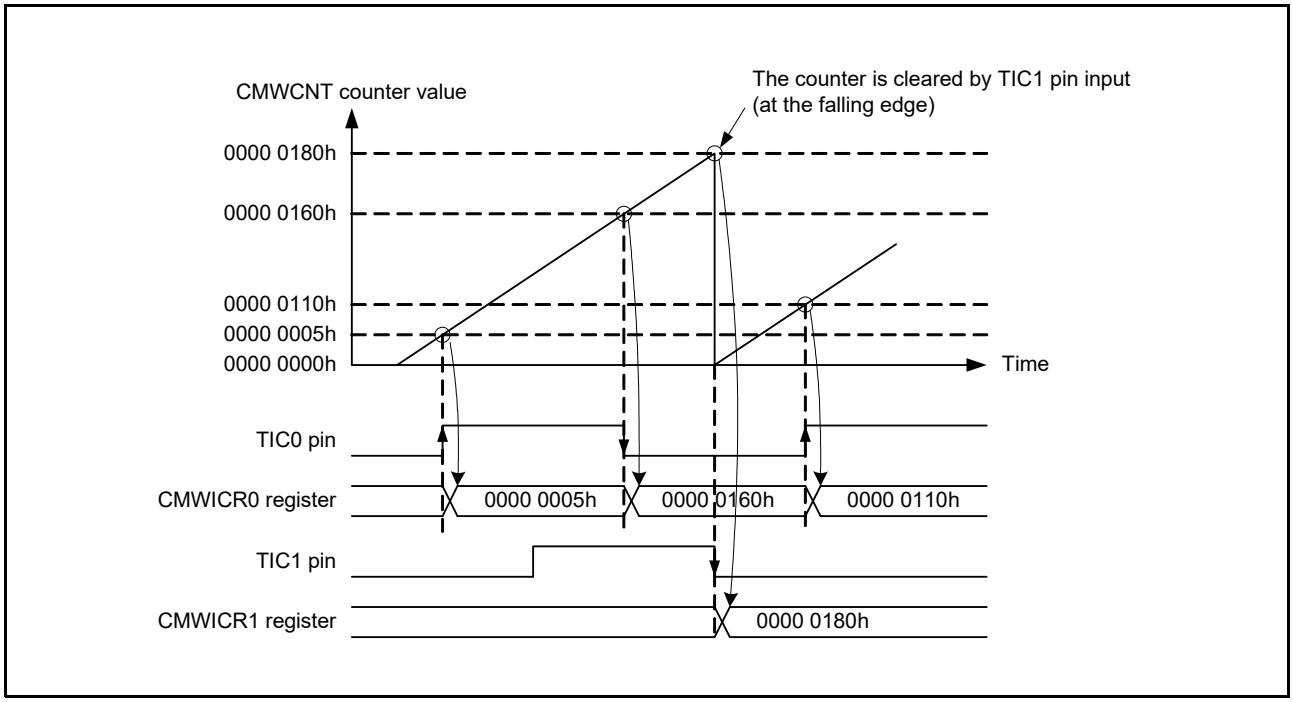

Figure 29.9 Example of Input Capture Operation (Unit 0)

29.3.5 Counter Size

With the CMTW, either 16 or 32 bits can be selected as the counter size by using the CMWCR.CMS bit.
When the counter is used as a 16-bit counter, set the value of the CMWCOR register in 32-bit units with the upper 16 bits set to 0000h. 0000 FFFFh should be set to detect an overflow. Similarly, set the values of the CMWOCR0 and CMWOCR1 registers in 32-bit units with the upper 16 bits set to 0000h. Read the CMWOCR0 and CMWOCR1 registers in 32-bit units. The upper 16 bits can be read as 0000h.

29.3.6 Count Timing of CMWCNT Counter

By setting the CMWCR.CKS[1:0] bits, one of four clocks (PCLK/8, PCLK/32, PCLK/128, and PCLK/512) obtained by dividing the peripheral module clock (PCLK) can be selected as the counter clock to be input to the CMWCNT counter.
Figure 29.10 shows the timing.

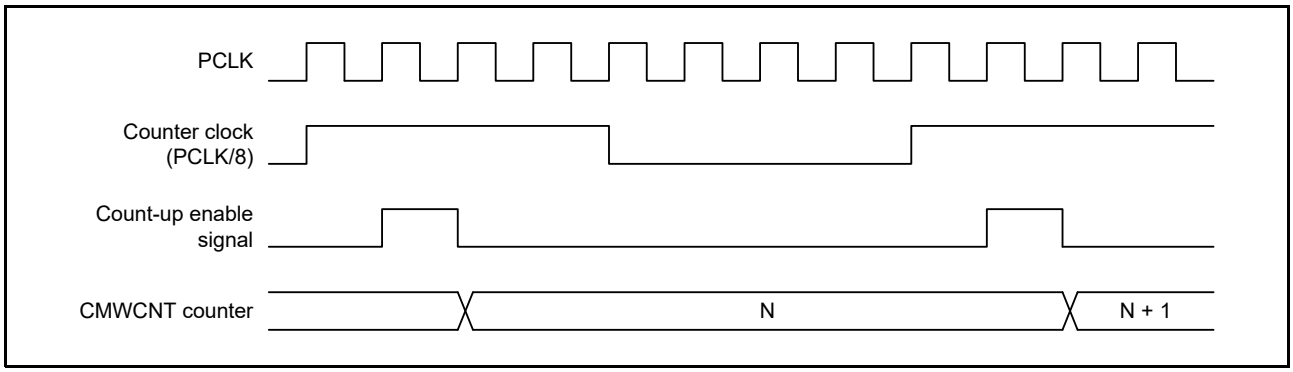

Figure 29.10 Count Timing (PCLK/8)

29.3.7 Output Compare Output Timing

A compare match signal is generated in the last state in which the CMWOCRn register (n = 0, 1) and CMWCNT counter values match (the CMWCNT counter value is updated immediately after the state). The compare match signal is generated if the CMWCNT count-up enable signal is input after a match between the CMWOCRn register and CMWCNT counter values. When a compare match signal is generated, output of the output compare pin (TOC pin) is toggled.
Figure 29.11 shows output compare output timing.

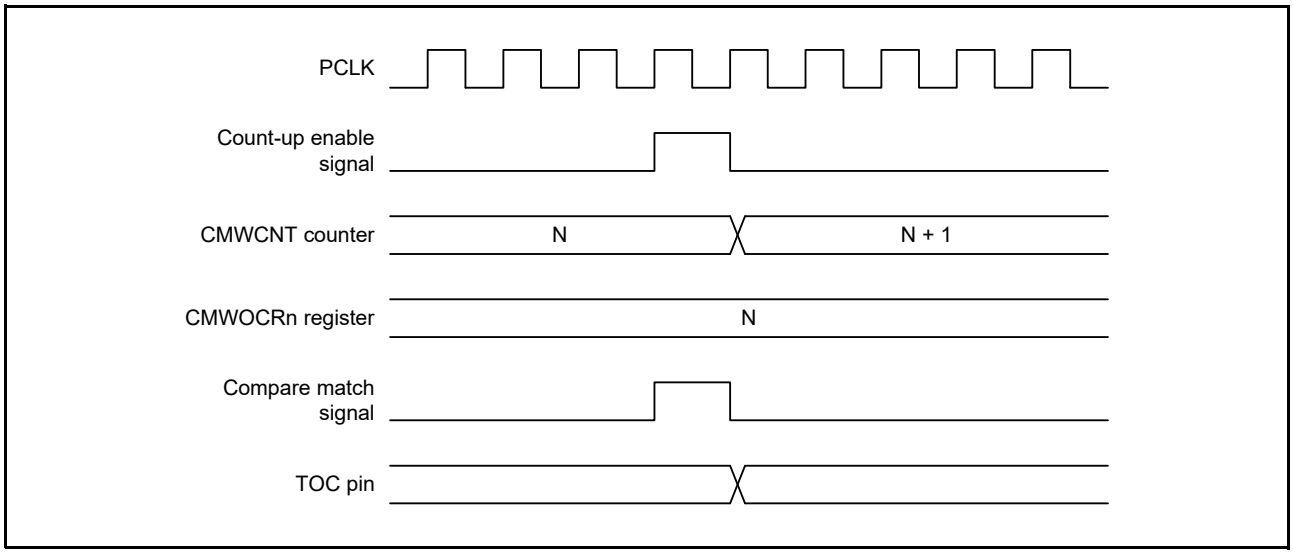

Figure 29.11 Output Compare Output Timing

29.3.8 Input Capture Timing

Figure 29.12 shows the timing of input capture operation at both edges.
When the edge of the TIC0 and TIC1 pins is detected, the CMWCNT counter value is transferred to the CMWICR0 and CMWICR1 registers, respectively.

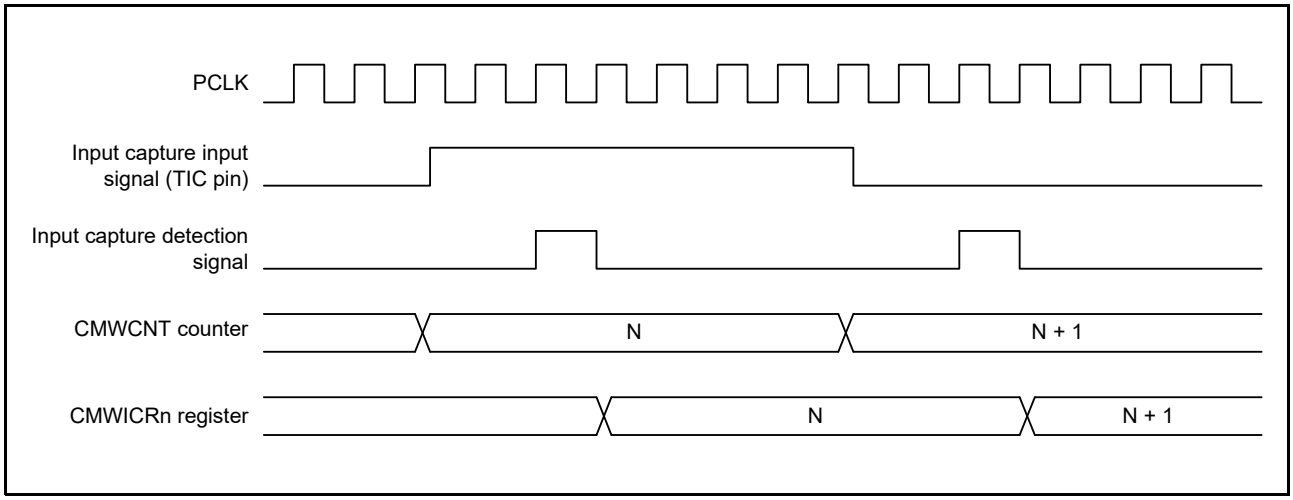

Figure 29.12 Input Capture Timing (Unit 0, Both-Edge Detection) (n = 0, 1)

29.4 Interrupts

29.4.1 CMTW Interrupt Sources and DTC/DMAC Transfer Requests

The CMTW has five interrupt sources: two input capture interrupt requests (IC0I and IC1I), two output compare interrupt requests (OC0I and OC1I), and a compare match interrupt request (CMWI).
Table 29.3 shows the interrupt sources. The interrupt sources can be enabled or disabled using the IC0IE, IC1IE, OC0IE, OC1IE, and CMWIE bits in CMWCR and are separately generated to the interrupt controller.
Each interrupt request can activate the DMAC or DTC. When the DMAC is used for data transfer, an interrupt request is not generated to the CPU. For generating an interrupt request to the CPU during data transfer using the DTC, refer to section 20, Data Transfer Controller (DTCA).

Table 29.3 CMTW Interrupt Sources

Unit	Name	Interrupt Request	Interrupt Request Enable Bit	DMAC/DTC Activation
CMTW0	CMWI0	Compare match of CMTW0.CMWCOR register	CMTW0.CMWCR.CMWIE	Possible
	IC0I0	Input capture of CMTW0.CMWICR0 register	CMTW0.CMWCR.IC0IE	Possible
	IC1I0	Input capture of CMTW0.CMWICR1 register	CMTW0.CMWCR.IC1IE	Possible
	OC0I0	Output compare of CMTW0.CMWOCR0 register	CMTW0.CMWCR.OC0IE	Possible
	OC1I0	Output compare of CMTW0.CMWOCR1 register	CMTW0.CMWCR.OC1IE	Possible
CMTW1	CMWI1	Compare match of CMTW1.CMWCOR register	CMTW1.CMWCR.CMWIE	Possible
	IC0I1	Input capture of CMTW1.CMWICR0 register	CMTW1.CMWCR.IC0IE	Possible
	IC1I1	Input capture of CMTW1.CMWICR1 register	CMTW1.CMWCR.IC1IE	Possible
	OC0I1	Output compare of CMTW1.CMWOCR0 register	CMTW1.CMWCR.OC0IE	Possible
	OC1I1	Output compare of CMTW1.CMWOCR1 register	CMTW1.CMWCR.OC1IE	Possible

29.4.2 Timing of Compare Match Interrupt Generation

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt request (CMWI) is generated. The compare match signal is generated at the end of the cycle where the values matched (i.e. when the CMWCNT counter is updated from the matching counter value).The compare match signal, therefore, is not generated until a count-up enable signal is generated after the values of the CMWCNT counter and CMWCOR register have matched. Figure 29.13 shows the timing of compare match interrupt generation.

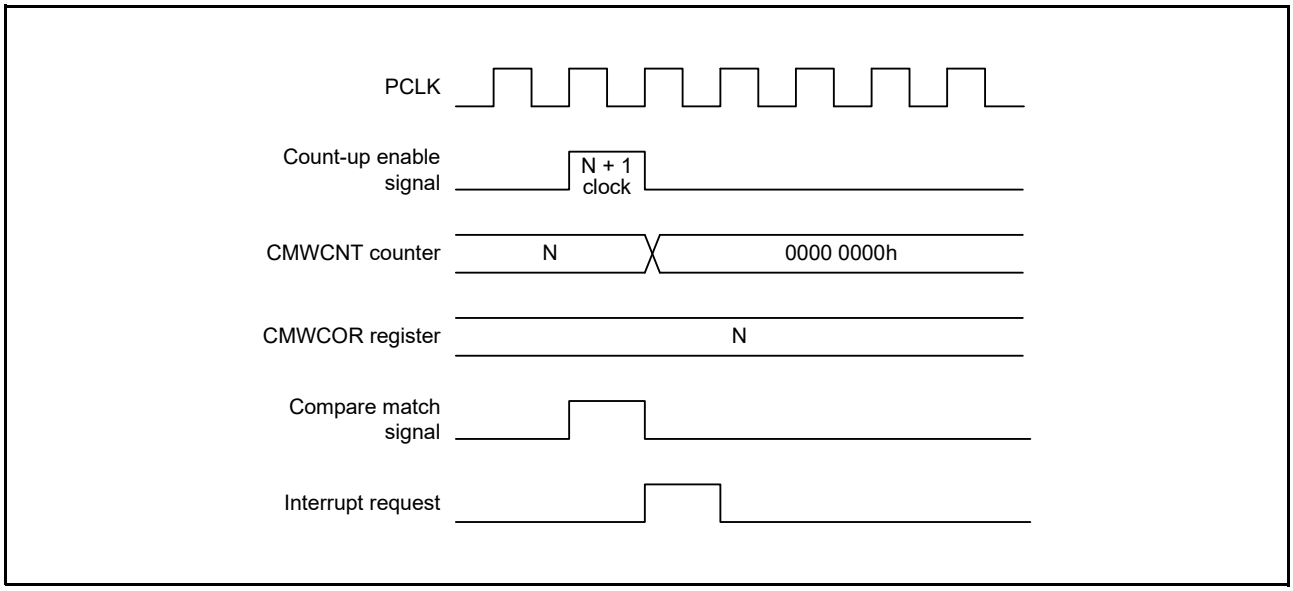

Figure 29.13 Timing of Compare Match Interrupt Generation

(a) Timing of Output Compare Interrupt Generation

Figure 29.14 shows the timing of output compare interrupt generation.

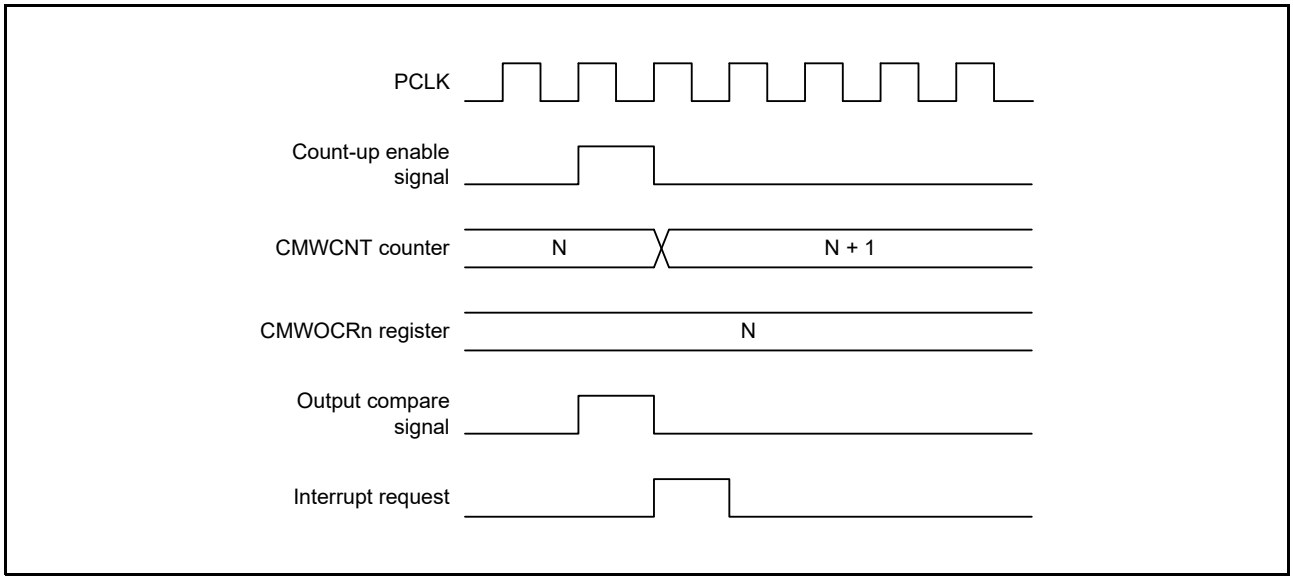

Figure 29.14 Timing of Output Compare Interrupt Generation (n = 0, 1)

(b) Timing of Input Capture Interrupt Generation

Figure 29.15 shows the timing of input capture interrupt generation.

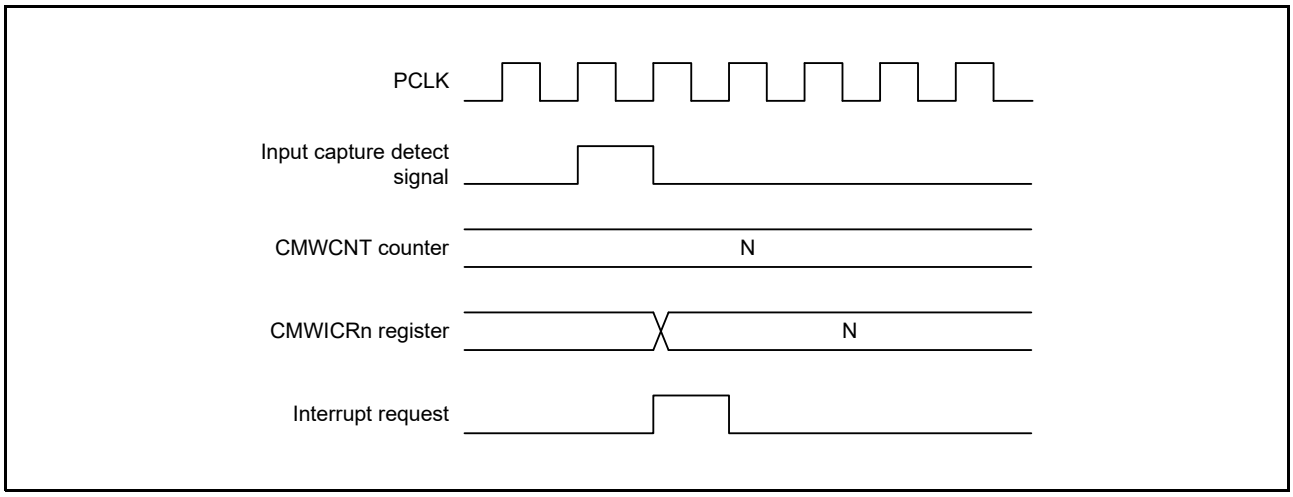

Figure 29.15 Timing of Input Capture Interrupt Generation (n = 0, 1)

29.5 Link Operations by ELC

29.5.1 Event Signal Output to ELC

The CMTW uses the event link controller (ELC) to perform link operation to a preset module using the interrupt request signal as the event signal.
The CMTW outputs the event signal upon a compare match. The corresponding channel is channel 0. The event signal can be output regardless of the corresponding interrupt request enable bit (CMWCR.CMWIE).
For details, refer to section 21, Event Link Controller (ELC).

(1) Compare Match Event

In response to a compare match, the CMTW simultaneously issues an interrupt request and a compare match event signal to the ELC. The event signal is issued regardless of the settings of the corresponding interrupt request enable bit (CMWCR.CMWIE bit).

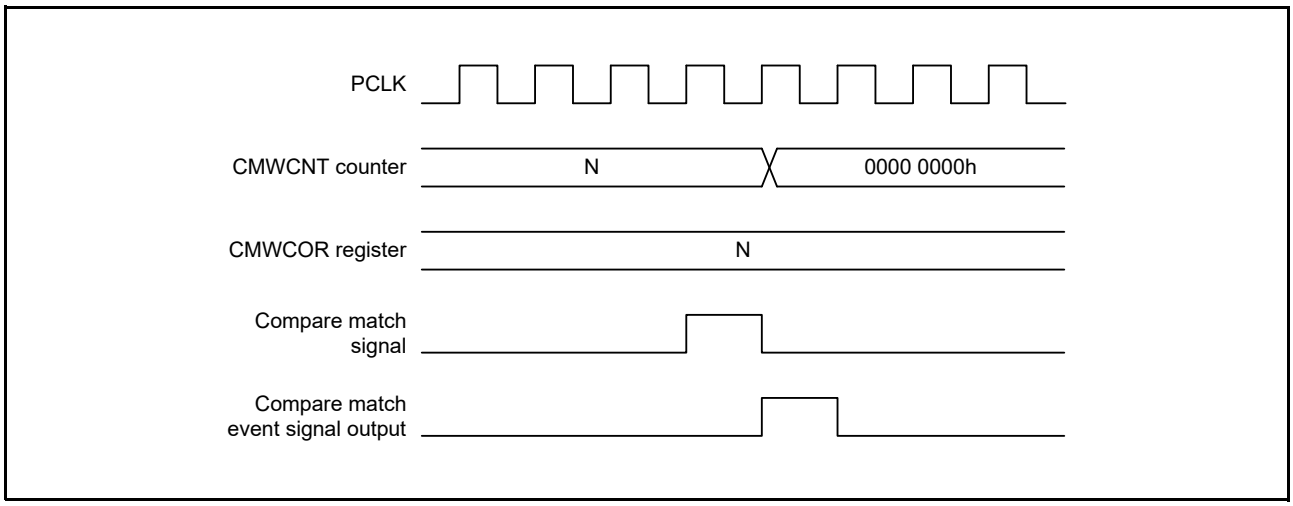

Figure 29.16 Timing of Issuing a Compare Match Event Signal

29.5.2 CMTW Operation When Receiving an Event Signal from ELC

The CMTW can perform any of the following operations according to the event preset by the ELSRn register of the ELC.

(1) Count Start

The CMTW count start operation is selected by the ELOPB register of the ELC. If the event specified by the ELSRn register occurs, the CMWSTR.STR bit is set to 1, starting the CMTW count operation.
However, if the specified event occurs while the CMWSTR.STR bit is 1, the event is ignored.

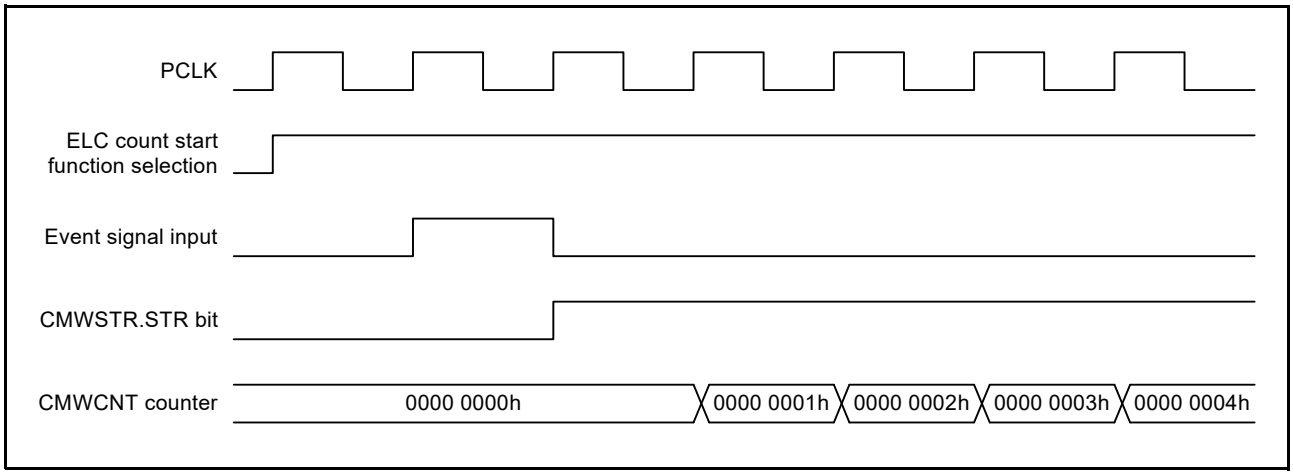

Figure 29.17 Count Start Operation on Acceptance of the Event Signal

(2) Event Count

The CMTW event count operation is selected by the ELOPB register of the ELC. If the event specified by the ELSRn register occurs when the CMWSTR.STR bit is 1, the event is counted as the count source regardless of the CMWCR.CKS[1:0] bit setting.
Reading the counter value returns the number of events that have been actually input.

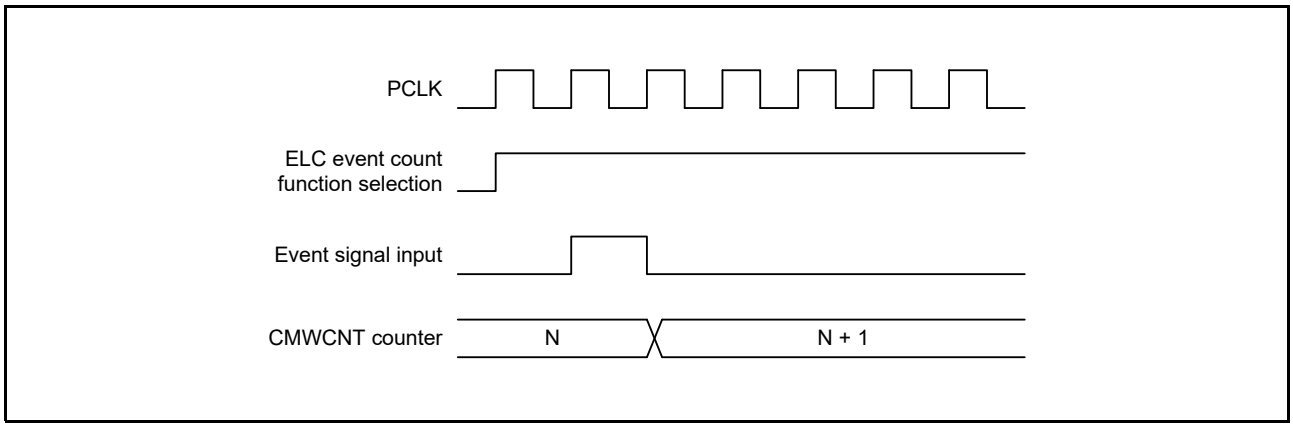

Figure 29.18 Event Count Operation on Acceptance of the Event Signal

(3) Count Restart

The CMTW count restart operation is selected by the ELOPB register of the ELC. If the event specified by the ELSRn register occurs, the CMWCNT counter value becomes 0000 0000h. If the CMWSTR.STR bit is 1, the count operation can be continued.

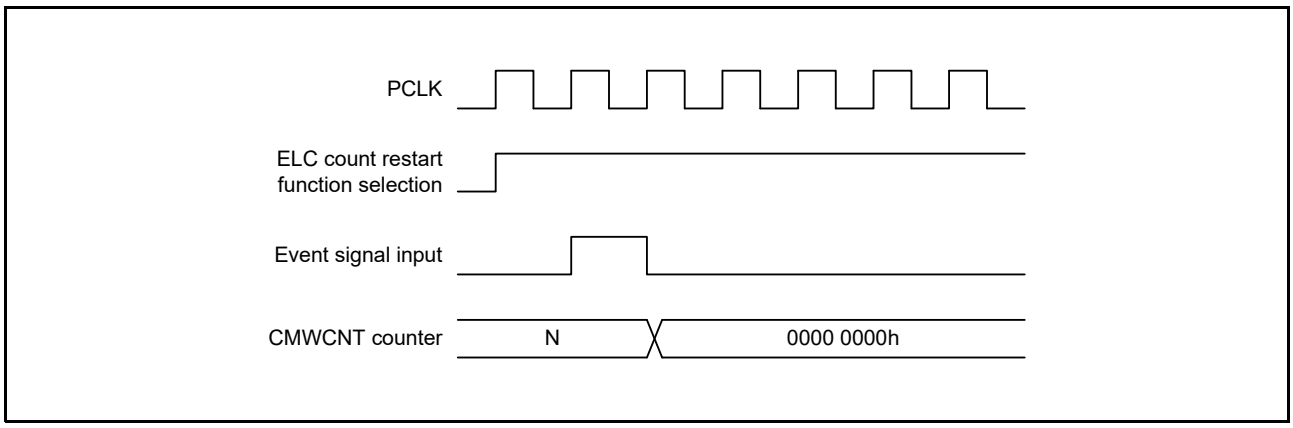

Figure 29.19 Count Restart Operation on Acceptance of the Event Signal

29.5.3 Conflict between Event Link Operation and Register Access

The followings are the notes on using CMTW for event link operations.
Table 29.4 lists count operations when event link operation and register access conflict.

Table 29.4 Count Operations When Event Link Operation and Register Access Conflict (n = 0, 1)

Event Link Operation	Register Access	CMWCNT Counter Status	Operation to be Performed
Count start	Writing to the CMWSTR.STR bit	Stopped state	Count start
		Compare match	Count start
		Counting up	Count start
Event count	Writing to CMWCNT counter	—	Event count
	Writing to CMWCOR register	Compare match	Compare match
Count restart	Writing to CMWCNT counter	Other than compare match	Count restart
	Writing to CMWCNT counter	Compare match	Compare match
	(No access to registers)	Compare match	Compare match
(No events)	Writing to CMWCNT counter	Compare match	Output of compare match interrupt request Writing to CMWCNT counter
		Counting up	Writing to CMWCNT counter
	Writing to CMWCOR register	Compare match	Compare match
	Writing to CMWOCRn register	Compare match	Compare match
	Reading from CMWCNT counter	Counting up	Counting up and reading of the previous value

(1) Count Start

When writing to the STR bit in the CMWSTR register and acceptance of the event signal are in contention, writing to the STR bit does not proceed since setting of the STR bit to 1 in response to the event takes priority.

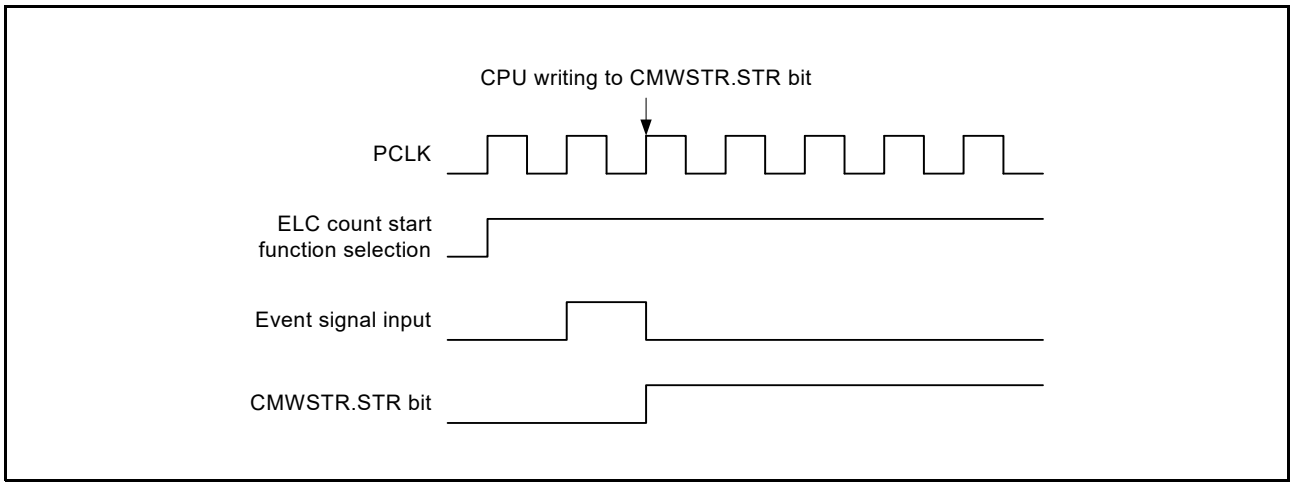

Figure 29.20 Conflict between Event Acceptance and Register Access in Count Start Operation

(2) Event Count

When writing to the CMWCNT counter and acceptance of the event signal are in contention, writing to the CMWCNT counter does not proceed since the count operation in response to the event takes priority.

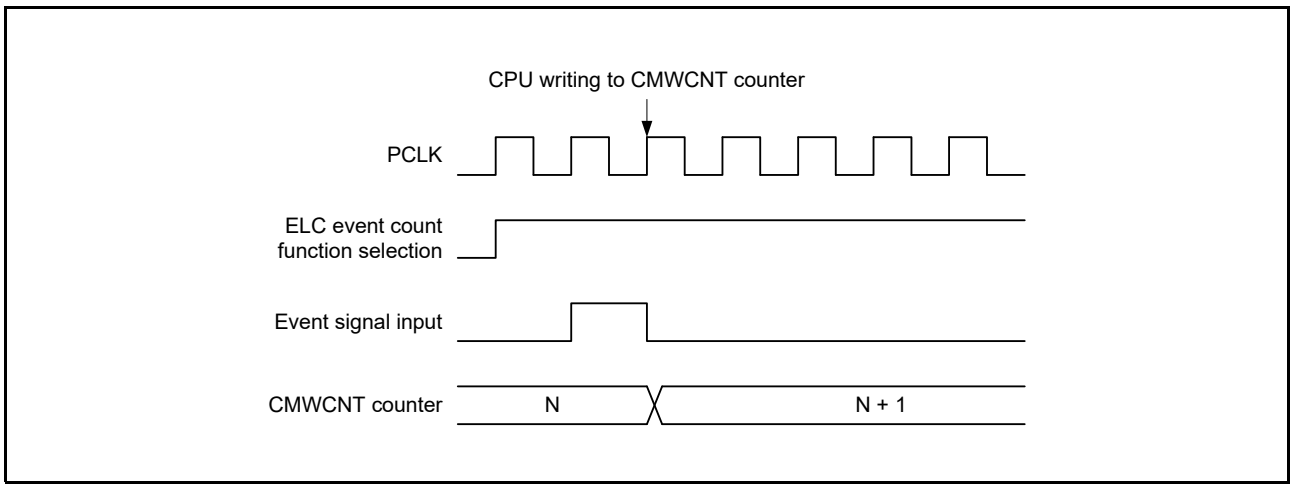

Figure 29.21 Conflict between Event Acceptance and Register Access in Event Counting Operation

(3) Count Restart

When writing to the CMWCNT counter and acceptance of the event signal are in contention, writing to the CMWCNT counter does not proceed since the counter value initialization in response to the event occurrence takes priority.

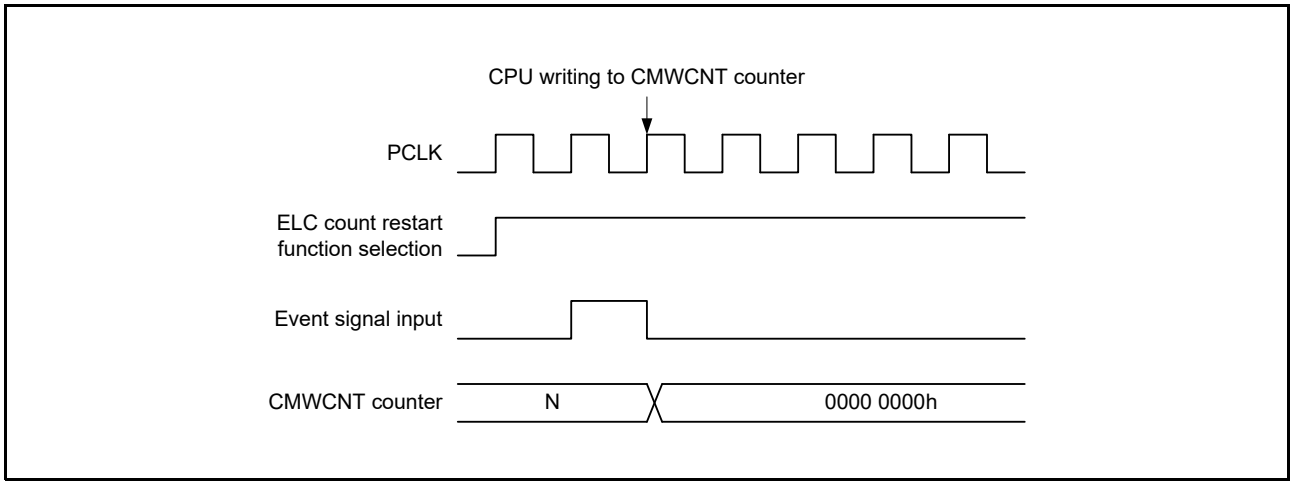

Figure 29.22 Conflict between Event Acceptance and Register Access in Count Restart Operation

29.6 Usage Notes

29.6.1 Setting the Module Stop Function

The CMTW operation can be enabled or disabled using the MSTPCRF register. The CMTW0 and CMTW1 are initially disabled after a reset. Register access is enabled by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

29.6.2 Conflict between CMWCNT Counter Writing and Compare Match

If the compare match signal is generated during writing to the CMWCNT counter, the compare match request is output but the counter is not cleared since writing to the counter takes priority.
Figure 29.23 shows the timing of conflict between CMWCNT counter writing and compare match.

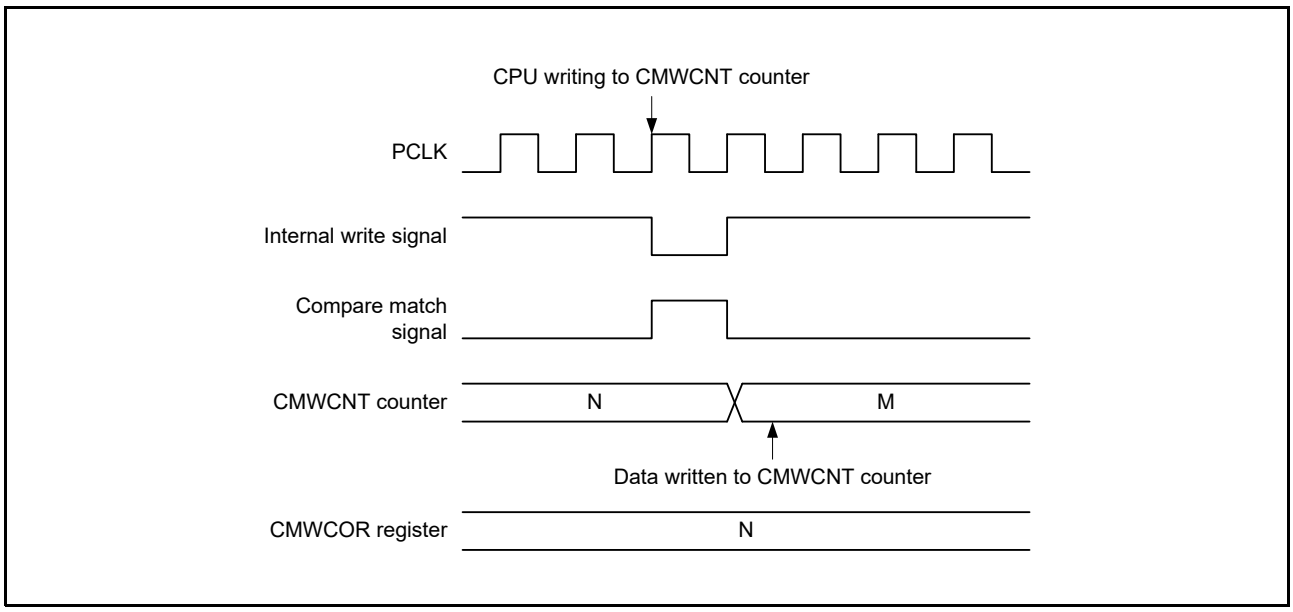

Figure 29.23 Conflict between CMWCNT Counter Writing and Compare Match

29.6.3 Conflict between CMWCNT Counter Writing and Incrementing or Clearing

In case of conflict between incrementation or clearing of the CMWCNT counter and writing to the CMWCNT counter, the counter is not actually incremented or cleared since writing to the CMWCNT counter takes priority.
Figure 29.24 shows the timing in the case of contention between writing to the CMWCNT counter and incrementation or clearing.

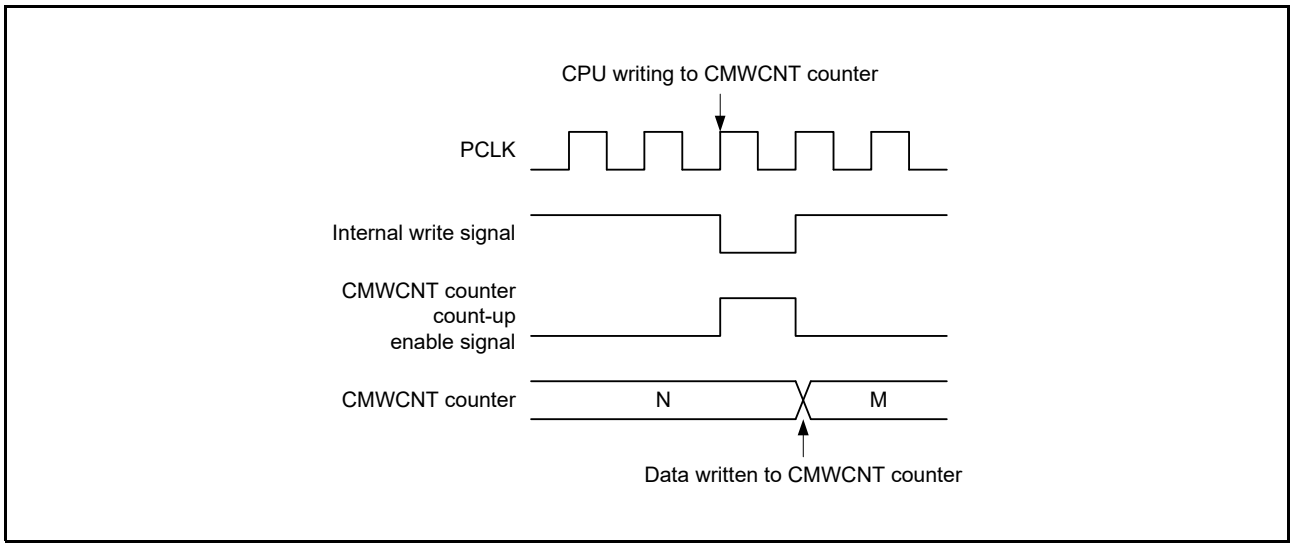

Figure 29.24 Conflict between CMWCNT Counter Writing and Incrementing

29.6.4 Conflict between CMWCOR Register Writing and Compare Match

If the compare match is generated during the CMWCOR register write cycle, the writing to the CMWCOR register takes priority and also the compare match signal is output.
Figure 29.25 shows the timing of conflict between CMWCOR register writing and compare match.

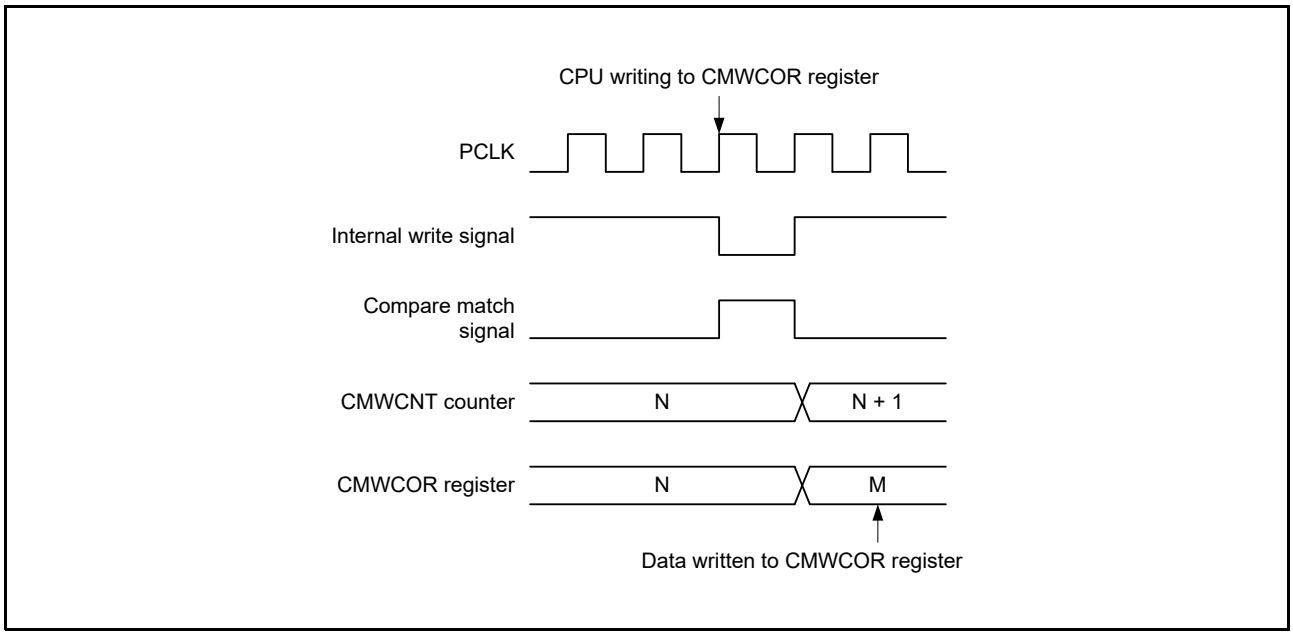

Figure 29.25 Conflict between CMWCOR Register Writing and Compare Match

29.6.5 Conflict between CMWOCRn Register Writing and Compare Match (n = 0, 1)

If the compare match is generated during the CMWOCRn register write cycle, the writing to the CMWOCRn register takes priority and also the compare match signal is output.
Figure 29.26 shows the timing of conflict between CMWOCRn register writing and compare match.

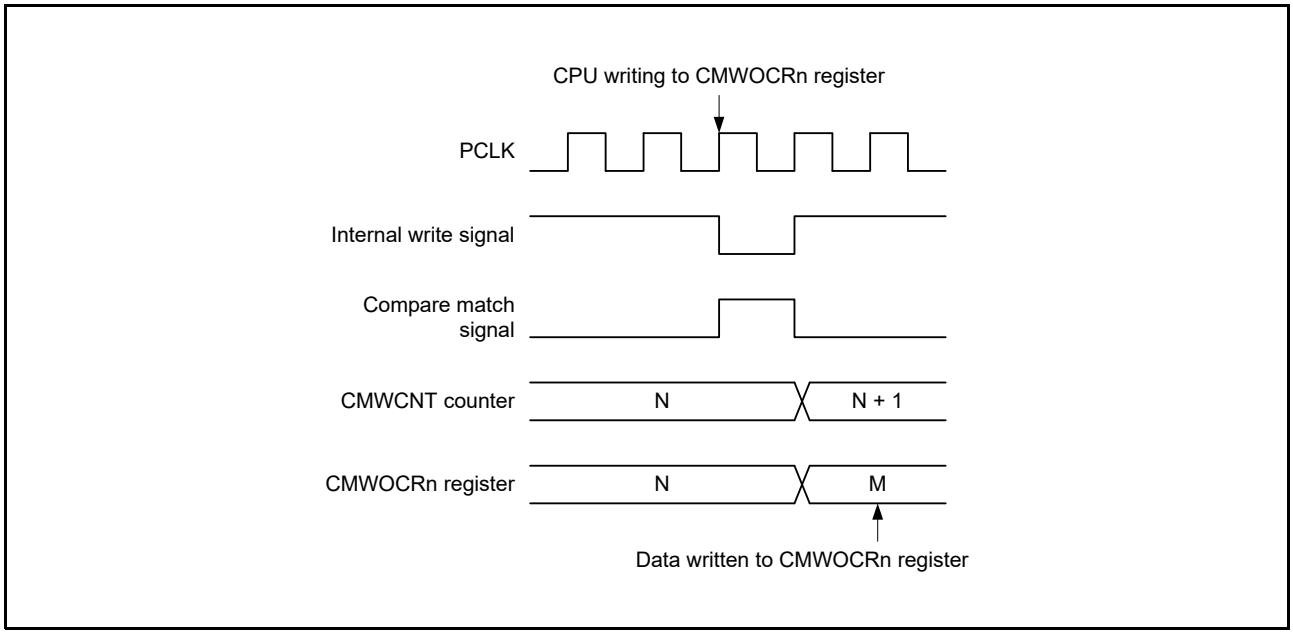

Figure 29.26 Conflict between CMWOCRn Register Writing and Compare Match

29.6.6 Conflict between CMWCNT Counter Reading and Incrementing or Clearing

If the CMWCNT counter incrementing or clearing process occurs at the same time that the data of the CMWCNT counter is read, the value having been in the CMWCNT counter before incremented or cleared is read.
Figure 29.27 shows the timing of conflict between CMWCNT counter reading and incrementing.

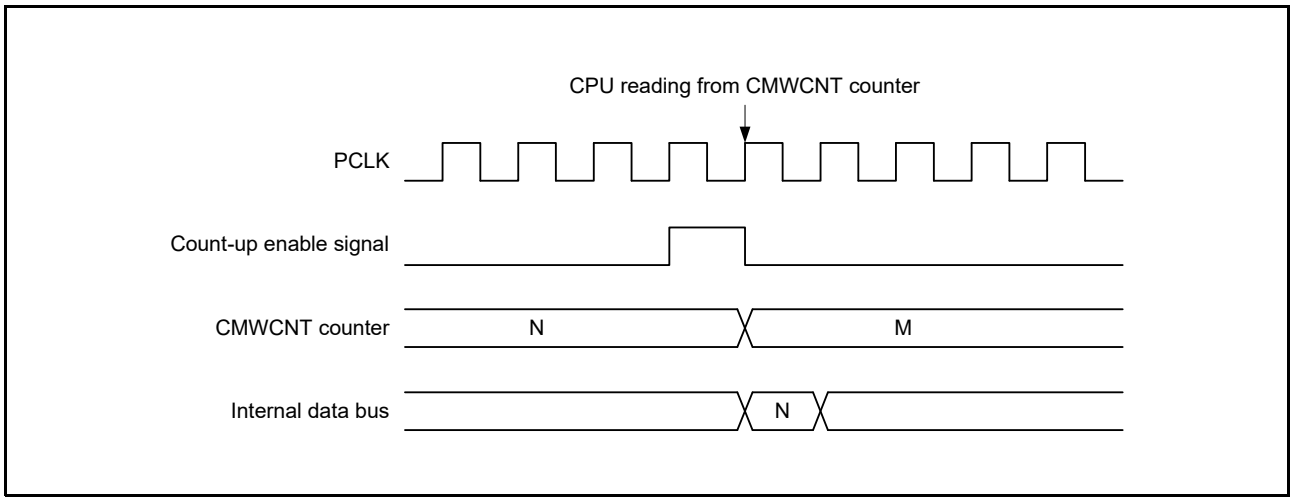

Figure 29.27 Conflict between CMWCNT Counter Reading and Incrementing

29.6.7 Conflict between CMWICRn Register Reading and Input Capture (n = 0, 1)

If the input capture detection signal is generated at the same time that the data of the CMWICRn register is read, the value having been in the CMWICRn register before updated by input capture transfer is read.
Figure 29.28 shows the timing of conflict between CMWICRn register reading and input capture.

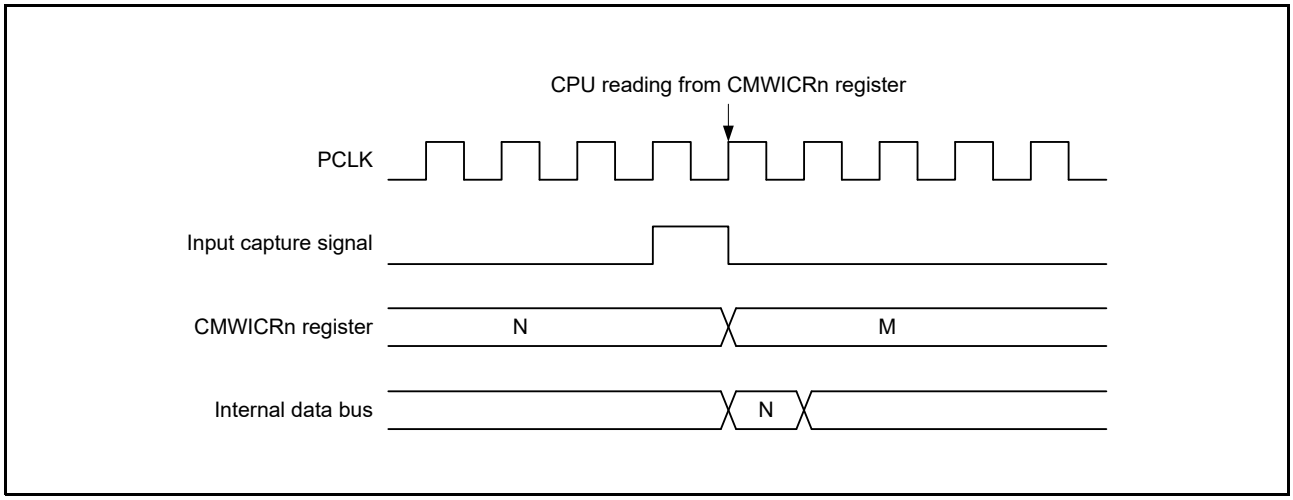

Figure 29.28 Conflict between CMWICRn Register Reading and Input Capture

29.6.8 Transition to Software Standby Mode

Before transitioning to software standby mode, set the CMWSTR.STR bits to 0 for all channels to stop the counters. After returning from software standby mode, setting the CMWSTR.STR bit to 1 will resume counting from the value held prior to the transition.

30. Realtime Clock (RTCBb)

30.1 Overview

The RTC has two types of counting modes: calendar count mode and binary count mode. They are used by switching the register settings.

For calendar count mode, the RTC has a 100 year calendar from 2000 to 2099 and automatically adjusts dates for leap years.

For binary count mode, the RTC does not count in terms of years, months, dates, day-of-week, hours, or minutes; it counts seconds, and retains the information as a serial value. This mode can be used for calendars other than the Gregorian calendar.

The clock source of the time counters is selectable as the sub-clock or LOCO clock.

The RTC uses the 128-Hz clock which is acquired by the clock source divided by the prescaler as the reference clock.

Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted in 1/128 second units.

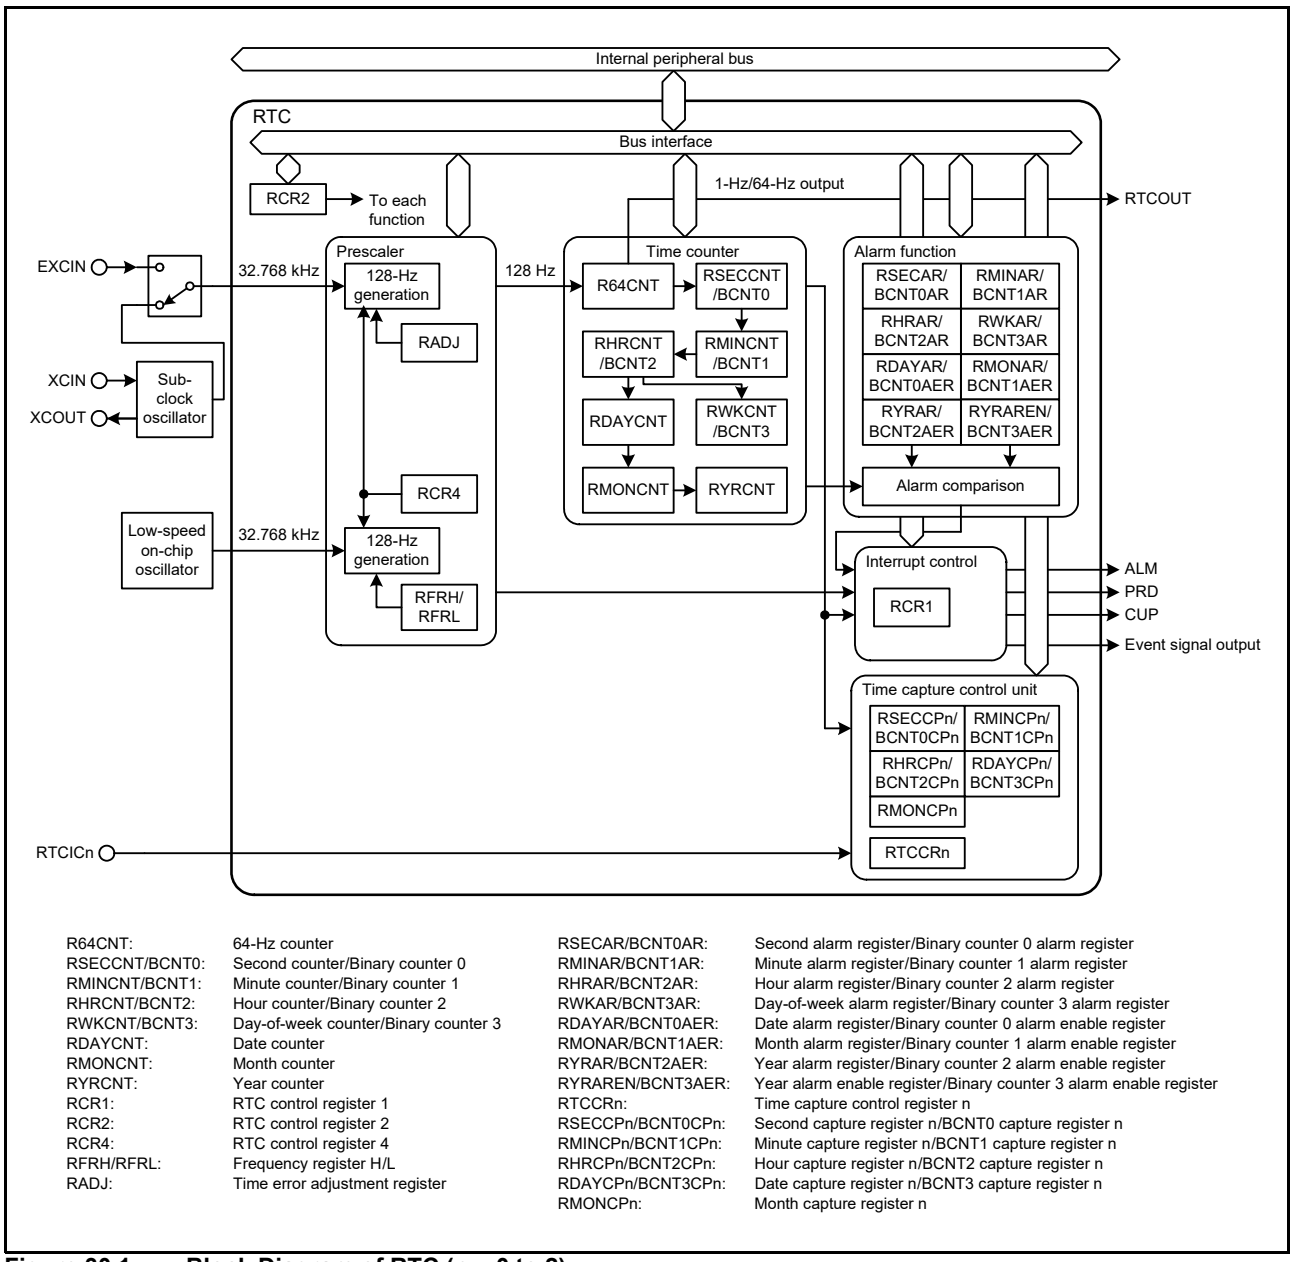

Table 30.1 lists the specifications of the RTC, Figure 30.1 shows a block diagram of the RTC, and Table 30.2 shows the pin configuration of the RTC.

Table 30.1 RTC Specifications

Item	Description
Count mode	Calendar count mode/binary count mode
Clock source*1	Sub-clock (XCIN or EXCIN) or LOCO clock
Clock and calendar functions	• Calendar count mode Year, month, date, day-of-week, hour, minute, second are counted, BCD display 12 hours/24 hours mode switching function 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to one minute) Automatic adjustment function for leap years • Binary count mode Count seconds in 32 bits, binary display • Common to both modes Start/stop function The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz). Clock error correction function Clock (1 Hz/64 Hz) output
Interrupts	• Alarm interrupt (ALM) As an alarm interrupt condition, selectable which of the below is compared with: - Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected - Binary count mode: Each bit of the 32-bit binary counter • Periodic interrupt (PRD) 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. • Carry interrupt (CUP) An interrupt is generated at either of the following timings: - When a carry from the 64-Hz counter to the second counter is generated. - When the 64-Hz counter is changed and the R64CNT register is read at the same time. • Recovery from software standby mode or deep software standby mode can be performed by an alarm interrupt or periodic interrupt
Time capture function	• Times can be captured when the edge of the time capture event input pin is detected. For every event input, month, date, hour, minute, and second are captured or 32-bit binary counter value is captured.
Event link function	Periodic event output
Protect Zone filter	Security attribute can be set.*2

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the clock source.

Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Pin Name	I/O	Function
XCIN	Input	These pins are used to connect a 32.768-kHz crystal for the sub-clock.
XCOUT	Output	
EXCIN	Input	This pin is used to input a 32.768-kHz external clock for the sub-clock.
RTCOUT	Output	This pin is used to output a 1-Hz/64-Hz waveform, but not in deep software standby mode.
RTCIC0	Input	These pins are used to input time capture events
RTCIC1	Input	
RTCIC2	Input	

30.2 Register Descriptions

When writing to or reading from RTC registers, do so in accordance with section 30.6.5, Notes on Writing to and Reading from Registers.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power consumption state during counting operations (i.e. while the RCR2.START bit is 1), the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate. Note that a reset generated during writing to or updating of a register might destroy the register value. In addition, do not allow the chip to enter software standby mode or deep software standby mode immediately after setting any of these registers. For details, refer to section 30.6.4, Transitions to Low Power Consumption Modes after Setting Registers.

30.2.1 64-Hz Counter (R64CNT)

Address(es): RTC.R64CNT 8780 2000h, RTC_NS.R64CNT 0780 2000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Value after reset:	0	x	x	x	x	x	x	x

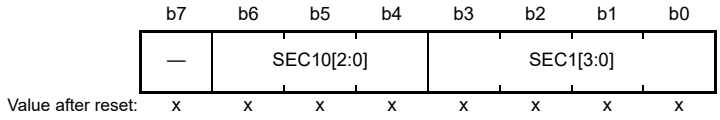
x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	F64HZ	64 Hz	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.	R
b1	F32HZ	32 Hz		R
b2	F16HZ	16 Hz		R
b3	F8HZ	8 Hz		R
b4	F4HZ	4 Hz		R
b5	F2HZ	2 Hz		R
b6	F1HZ	1 Hz		R
b7	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R

The R64CNT counter is used in both calendar count mode and in binary count mode.

The 64-Hz counter (R64CNT) generates a period of one second by counting the 128-Hz reference clock.

The state in the sub-second range can be confirmed by reading this counter.



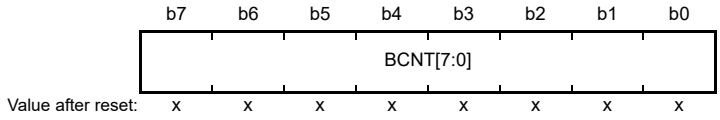
This counter is set to 00h by an RTC software reset or executing 30-second adjustment.

To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0)

(1) In calendar count mode:

Address(es): RTC.RSECCNT 8780 2002h, RTC_NS.RSECCNT 0780 2002h



x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Count	Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	SEC10[2:0]	10-Second Count	Counts from 0 to 5 for 60-second counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RSECCNT counter is used for setting and counting the BCD-coded second value. It counts carries generated once per second in the 64-Hz counter.
The setting range is decimal 00 to 59. The RTC will not operate normally if any other value is set. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RSECCNT register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT0 8780 2002h, RTC_NS.BCNT0 0780 2002h

x: Undefined

The BCNT0 counter is a readable/writable 32-bit binary counter b7 to b0.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1)

(1) In calendar count mode:

Address(es): RTC.RMINCNT 8780 2004h, RTC_NS.RMINCNT 0780 2004h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Count	Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	MIN10[2:0]	10-Minute Count	Counts from 0 to 5 for 60-minute counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RMINCNT counter is used for setting and counting the BCD-coded minute value. It counts carries generated once per minute in the second counter.
A value from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RMINCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT1 8780 2004h, RTC_NS.BCNT1 0780 2004h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT1 counter is a readable/writable 32-bit binary counter b15 to b8.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2)

(1) In calendar count mode:

Address(es): RTC.RHRCNT 8780 2006h, RTC_NS.RHRCNT 0780 2006h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	HR1[3:0]	1-Hour Count	Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	HR10[1:0]	10-Hour Count	Counts from 0 to 2 once per carry from the ones place.	R/W
b6	PM	PM	Time Counter Setting for a.m./p.m. 0: a.m. 1: p.m.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RHRCNT counter is used for setting and counting the BCD-coded hour value. It counts carries generated once per hour in the minute counter.
The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).
When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)
If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect.
After writing to the RHRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT2 8780 2006h, RTC_NS.BCNT2 0780 2006h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2 counter is a readable/writable 32-bit binary counter b23 to b16.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3)

(1) In calendar count mode:

Address(es): RTC.RWKCNT 8780 2008h, RTC_NS.RWKCNT 0780 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Counting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting Prohibited	R/W
b7 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W

The RWKCNT counter is used for setting and counting in the coded day-of-week value. It counts carries generated once per day in the hour counter.
A value from 0 through 6 can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT3 8780 2008h, RTC_NS.BCNT3 0780 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3 counter is a readable/writable 32-bit binary counter b31 to b24.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.6 Date Counter (RDAYCNT)

Address(es): RTC.RDAYCNT 8780 200Ah, RTC_NS.RDAYCNT 0780 200Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	0	0	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DATE1[3:0]	1-Day Count	Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	DATE10[1:0]	10-Day Count	Counts from 0 to 3 once per carry from the ones place.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RDAYCNT counter is used in calendar count mode.
The RDAYCNT counter is used for setting and counting the BCD-coded date value. It counts carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year.
Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.
A value from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. (When specifying a value, note that the range of specifiable days depends on the month and whether the year is a leap year.) Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RHRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

30.2.7 Month Counter (RMONCNT)

Address(es): RTC.RMONCNT 8780 200Ch, RTC_NS.RMONCNT 0780 200Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Count	Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.	R/W
b4	MON10	10-Month Count	Counts from 0 to 1 once per carry from the ones place.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RMONCNT counter is used in calendar count mode.
The RMONCNT counter is used for setting and counting the BCD-coded month value. It counts carries generated once per month in the date counter.
A value from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RMONCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

30.2.8 Year Counter (RYRCNT)

Address(es): RTC.RYRCNT 8780 200Eh, RTC_NS.RYRCNT 0780 200Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	YR1[3:0]	1-Year Count	Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.	R/W
b7 to b4	YR10[3:0]	10-Year Count	Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RYRCNT counter is used in calendar count mode.
The RYRCNT counter is used for setting and counting the BCD-coded year value. It counts carries generated once per year in the month counter.
A value from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RYRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

30.2.9 Second Alarm Register (RSECAR)/ Binary Counter 0 Alarm Register (BCNT0AR)

(1) In calendar count mode:

Address(es): RTC.RSECAR 8780 2010h, RTC_NS.RSECAR 0780 2010h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	SEC1[3:0]	1 Second	Value for the ones place of seconds	R/W
b6 to b4	SEC10[2:0]	10 Seconds	Value for the tens place of seconds	R/W
b7	ENB	ENB	0: The register value is not compared with the RSECCNT counter value. 1: The register value is compared with the RSECCNT counter value.	R/W

The RSECAR register is an alarm register corresponding to the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RSECAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RSECAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT0AR 8780 2010h, RTC_NS.BCNT0AR 0780 2010h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT0AR register is a readable/writable alarm register corresponding to 32-bit binary counter b7 to b0.
This register is set to 00h by an RTC software reset.

30.2.10 Minute Alarm Register (RMINAR)/ Binary Counter 1 Alarm Register (BCNT1AR)

(1) In calendar count mode:

Address(es): RTC.RMINAR 8780 2012h, RTC_NS.RMINAR 0780 2012h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MIN1[3:0]	1 Minute	Value for the ones place of minutes	R/W
b6 to b4	MIN10[2:0]	10 Minutes	Value for the tens place of minutes	R/W
b7	ENB	ENB	0: The register value is not compared with the RMINCNT counter value. 1: The register value is compared with the RMINCNT counter value.	R/W

The RMINAR register is an alarm register corresponding to the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RMINAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RMINAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT1AR 8780 2012h, RTC_NS.BCNT1AR 0780 2012h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT1AR register is a readable/writable alarm register corresponding to 32-bit binary counter b15 to b8.
This register is set to 00h by an RTC software reset.

30.2.11 Hour Alarm Register (RHRAR)/ Binary Counter 2 Alarm Register (BCNT2AR)

(1) In calendar count mode:

Address(es): RTC.RHRAR 8780 2014h, RTC_NS.RHRAR 0780 2014h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	HR1[3:0]	1 Hour	Value for the ones place of hours	R/W
b5, b4	HR10[1:0]	10 Hours	Value for the tens place of hours	R/W
b6	PM	PM	Time Alarm Setting for a.m./p.m. 0: a.m. 1: p.m.	R/W
b7	ENB	ENB	0: The register value is not compared with the RHRCNT counter value. 1: The register value is compared with the RHRCNT counter value.	R/W

The RHRAR register is an alarm register corresponding to the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).
When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)
If a value outside of this range is specified, the RTC does not operate correctly.
When the RCR2.HR24 bit is 0, be sure to set the PM bit.
When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect.
After writing to the RHRAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT2AR 8780 2014h, RTC_NS.BCNT2AR 0780 2014h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2AR register is a readable/writable alarm register corresponding to 32-bit binary counter b23 to b16.
This register is set to 00h by an RTC software reset.

30.2.12 Day-of-Week Alarm Register (RWKAR)/ Binary Counter 3 Alarm Register (BCNT3AR)

(1) In calendar count mode:

Address(es): RTC.RWKAR 8780 2016h, RTC_NS.RWKAR 0780 2016h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Setting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting Prohibited	R/W
b6 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RWKCNT counter value. 1: The register value is compared with the RWKCNT counter value.	R/W

The RWKAR register is an alarm register corresponding to the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RWKAR values from 0 through 6 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RWKAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT3AR 8780 2016h, RTC_NS.BCNT3AR 0780 2016h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3AR register is a readable/writable alarm register corresponding to 32-bit binary counter b31 to b24.
This register is set to 00h by an RTC software reset.

30.2.13 Date Alarm Register (RDAYAR)/ Binary Counter 0 Alarm Enable Register (BCNT0AER)

(1) In calendar count mode:

Address(es): RTC.RDAYAR 8780 2018h, RTC_NS.RDAYAR 0780 2018h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DATE1[3:0]	1 Day	Value for the ones place of days	R/W
b5, b4	DATE10[1:0]	10 Days	Value for the tens place of days	R/W
b6	—	Reserved	Set this bit to 0. It is read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RDAYCNT counter value. 1: The register value is compared with the RDAYCNT counter value.	R/W

The RDAYAR register is an alarm register corresponding to the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RDAYAR values from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RDAYAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT0AER 8780 2018h, RTC_NS.BCNT0AER 0780 2018h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT0AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b7 to b0. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 00h by an RTC software reset.

30.2.14 Month Alarm Register (RMONAR)/ Binary Counter 1 Alarm Enable Register (BCNT1AER)

(1) In calendar count mode:

Address(es): RTC.RMONAR 8780 201Ah, RTC_NS.RMONAR 0780 201Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	MON10	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MON1[3:0]	1 Month	Value for the ones place of months	R/W
b4	MON10	10 Months	Value for the tens place of months	R/W
b6, b5	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RMONCNT counter value. 1: The register value is compared with the RMONCNT counter value.	R/W

The RMONAR register is an alarm register corresponding to the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RMONAR values from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RMONAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT1AER 8780 201Ah, RTC_NS.BCNT1AER 0780 201Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT1AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b15 to b8. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 00h by an RTC software reset.

30.2.15 Year Alarm Register (RYRAR)/ Binary Counter 2 Alarm Enable Register (BCNT2AER)

(1) In calendar count mode:

Address(es): RTC.RYRAR 8780 201Ch, RTC_NS.RYRAR 0780 201Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	YR1[3:0]	1 Year	Value for the ones place of years	R/W
b7 to b4	YR10[3:0]	10 Years	Value for the tens place of years	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RYRAR register is an alarm register corresponding to the BCD-coded year counter RYRCNT.
RYRAR values from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RYRAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 0000h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT2AER 8780 201Ch, RTC_NS.BCNT2AER 0780 201Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ENB[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b23 to b16. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 0000h by an RTC software reset.

30.2.16 Year Alarm Enable Register (RYRAREN)/ Binary Counter 3 Alarm Enable Register (BCNT3AER)

(1) In calendar count mode:

Address(es): RTC.RYRAREN 8780 201Eh, RTC_NS.RYRAREN 0780 201Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RYRCNT counter value. 1: The register value is compared with the RYRCNT counter value.	R/W

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT3AER 8780 201Eh, RTC_NS.BCNT3AER 0780 201Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b31 to b24. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 00h by an RTC software reset.

30.2.17 RTC Control Register 1 (RCR1)

Address(es): RTC.RCR1 8780 2022h, RTC_NS.RCR1 0780 2022h

	b7	b6	b5	b4	b3	b2	b1	b0
	PES[3:0]				RTCOS	PIE	CIE	AIE
Value after reset:	x	x	x	x	0	x	0	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	AIE	Alarm Interrupt Enable	0: An alarm interrupt request is disabled. 1: An alarm interrupt request is enabled.	R/W
b1	CIE	Carry Interrupt Enable	0: A carry interrupt request is disabled. 1: A carry interrupt request is enabled.	R/W
b2	PIE	Periodic Interrupt Enable	0: A periodic interrupt request is disabled. 1: A periodic interrupt request is enabled.	R/W
b3	RTCOS	RTCOUT Output Select	0: RTCOUT outputs 1 Hz. 1: RTCOUT outputs 64 Hz.	R/W
b7 to b4	PES[3:0]	Periodic Interrupt Select	b7 b4 0 1 1 0: A periodic interrupt is generated every 1/256 second.*1 0 1 1 1: A periodic interrupt is generated every 1/128 second. 1 0 0 0: A periodic interrupt is generated every 1/64 second. 1 0 0 1: A periodic interrupt is generated every 1/32 second. 1 0 1 0: A periodic interrupt is generated every 1/16 second. 1 0 1 1: A periodic interrupt is generated every 1/8 second. 1 1 0 0: A periodic interrupt is generated every 1/4 second. 1 1 0 1: A periodic interrupt is generated every 1/2 second. 1 1 1 0: A periodic interrupt is generated every 1 second. 1 1 1 1: A periodic interrupt is generated every 2 seconds. Other than above: No periodic interrupts are generated.	R/W

Note 1. When the LOCO clock is selected (RCR4.RCKSEL bit = 1) while the PES[3:0] bits are 0110b, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and in binary count mode.
Bits AIE, PIE, and PES[3:0] are updated synchronously with the clock source. When the RCR1 register is modified, check that all the bits have been updated before proceeding to the next processing.

AIE Bit (Alarm Interrupt Enable)

This bit enables or disables alarm interrupt requests.
If the times indicated by the counters and alarm settings match in deep software standby mode, the MCU returns from the mode regardless of the value of the AIE bit.

CIE Bit (Carry Interrupt Enable)

This bit enables and disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE Bit (Periodic Interrupt Enable)

This bit enables or disabled a periodic interrupt.
If the periods indicated by the counters and PES[3:0] settings match in deep software standby mode, the MCU returns from the mode regardless of the value of the PIE bit.

RTCOS Bit (RTCOUT Output Select)

This bit selects the RTCOUT output period. The RTCOS bit must be rewritten while count operation is stopped (the RCR2.START bit is 0) and RTCOUT output is disabled (the RCR2.RTCOE bit is 0). When the RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

PES[3:0] Bits (Periodic Interrupt Select)

These bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified by these bits.

30.2.18 RTC Control Register 2 (RCR2)

Address(es): RTC.RCR2 8780 2024h, RTC_NS.RCR2 0780 2024h

	b7	b6	b5	b4	b3	b2	b1	b0
	CNTMD	HR24	AADJP	AADJE	RTCOE	ADJ30	RESET	START
Value after reset:	x	x	x	x	0	0	0	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	START	Start*4	0: Prescaler and counter are stopped. 1: Prescaler and counter operate normally.	R/W
b1	RESET	RTC Software Reset	• In writing 0: Writing is invalid. 1: The prescaler and the target registers for RTC software reset*1 are initialized. • In reading 0: In normal time operation, or an RTC software reset has completed. 1: During an RTC software reset	R/W
b2	ADJ30	30-Second Adjustment*2	• In writing 0: Writing is invalid. 1: 30-second adjustment is executed. • In reading 0: In normal time operation, or 30-second adjustment has completed. 1: During 30-second adjustment	R/W
b3	RTCOE	RTCOUT Output Enable	0: RTCOUT output disabled. 1: RTCOUT output enabled.	R/W
b4	AADJE	Automatic Adjustment Enable*3, *4	0: Automatic adjustment is disabled. 1: Automatic adjustment is enabled.	R/W
b5	AADJP	Automatic Adjustment Period Select*3, *4	0: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every minute (every 32 seconds in binary counter mode). 1: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds (every 8 seconds in binary counter mode).	R/W
b6	HR24	Hours Mode*2, *4	0: The RTC operates in 12-hour mode. 1: The RTC operates in 24-hour mode.	R/W
b7	CNTMD	Count Mode Select*4	0: The calendar count mode. 1: The binary count mode.	R/W

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRn, RSECCPn/BCNT0CPn, RMINCPn/BCNT1CPn, RHRCPn/BCNT2CPn, RDAYCPn/BCNT3CPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP
Note 2. This bit is reserved in binary counter mode. The write value should be 0.
Note 3. When the LOCO clock is selected, the setting of this bit is disabled.
Note 4. After writing to this bit, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers regarding changes to the values of the AADJE, AADJP, and HR24 bits.

The RCR2 register is related to hours mode, automatic adjustment function, enabling the RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

START Bit (Start)

This bit stops or restarts the prescaler or counter (clock) operation.
The START bit is updated in synchronization with the clock source. When the START bit is modified, check that the bit is updated before proceeding to the next processing.

RESET Bit (RTC Software Reset)

This bit initializes the prescaler and registers to be reset by RTC software reset.
When 1 is written to the RESET bit, the initialization starts in synchronization with the clock source. When the initialization is completed, the RESET bit is automatically set to 0.
When 1 is written to the RESET bit, check that the bit is set to 0, and then make next settings.

ADJ30 Bit (30-Second Adjustment)

This bit is for 30-second adjustment.
When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.
The 30-second adjustment is performed in synchronization with the clock source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is completed. In case when 1 is written to the ADJ30 bit, check that the bit is set to 0, and then make next settings.
When the 30-second adjustment is performed, the prescaler and R64CNT are also reset.
The ADJ30 bit is set to 0 by an RTC software reset.
This bit is reserved in binary counter mode. The write value should be 0.

RTCOE Bit (RTCOUT Output Enable)

This bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.
Use the START bit to stop counting by the counters before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.
When RTCOUT signal is to be output from an external pin, set the RTCOE bit to 1 and set up the port control for the pin.

AADJE Bit (Automatic Adjustment Enable)

This bit controls (enables or disables) automatic adjustment.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.
The AADJE bit is set to 0 by an RTC software reset.

AADJP Bit (Automatic Adjustment Period Select)

This bit selects the automatic-adjustment period.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.
The AADJP bit is set to 0 by an RTC software reset.

HR24 Bit (Hours Mode)

This bit specifies whether the RTC will operate in 12- or 24-hour mode.
Use the START bit to stop counting by the counters before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.
This bit is reserved in binary counter mode. The write value should be 0.

CNTMD Bit (Count Mode Select)

This bit specifies whether the RTC count mode is operated in calendar count mode or in binary count mode.
After setting the count mode, execute an RTC software reset and start again from the initial settings.
The CNTMD bit is updated in synchronization with the clock source, so when the value of the CNTMD bit has been changed, check that the value of the bit has actually been updated before applying the RTC software reset. The count mode changes to that which was specified beforehand in the CNTMD bit after the RTC software reset is applied.
For details on initial settings, refer to section 30.3.1, Outline of Initial Settings of Registers after Power On.

30.2.19 RTC Control Register 4 (RCR4)

Address(es): RTC.RCR4 8780 2028h, RTC_NS.RCR4 0780 2028h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RCKSEL
Value after reset:	0	0	0	0	0	0	0	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	RCKSEL	Clock Source Select	0: Sub-clock is selected. 1: LOCO clock is selected.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RCR4 register is used for selecting the clock source. This function is used in both calendar count mode and binary count mode.
When the RCKSEL bit is set to 0, the time is counted with the sub-clock. When the bit is set to 1, the time is counted with the LOCO clock.

RCKSEL Bit (Clock Source Select)

This bit selects the clock source from the sub-clock and the LOCO clock.
The clock source should be selected only once before the initial settings of the RTC registers at power on.

30.2.20 Frequency Register H/L (RFRH/RFRL)

Address(es): RTC.RFRH 8780 202Ah, RTC_NS.RFRH 0780 202Ah

	RFC[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

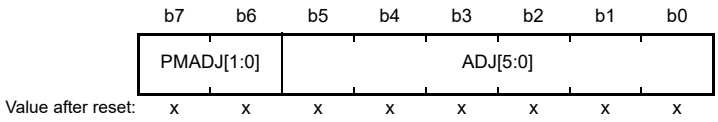
- RFRH register

Bit	Symbol	Bit Name	Description	R/W
b0	RFC[16]	Frequency Divide Ratio Setting	Set the divide ratio of the LOCO clock to generate the reference clock of 128 Hz. If the setting value in the RFC[16:0] bits is n, the prescaler divides the LOCO clock by n + 1.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

- RFRL register

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RFC[15:0]	Frequency Divide Ratio Setting	Set the divide ratio of the LOCO clock to generate the reference clock of 128 Hz. If the setting value in the RFC[16:0] bits is n, the prescaler divides the LOCO clock by n + 1.	R/W

RFRH/RFRL is a register for controlling the prescaler when the LOCO clock is selected.
The RTC time counter operates on a 128-Hz clock signal as the reference clock. Therefore, when the main clock is selected, the LOCO clock is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency divide ratio in the RFC[16:0] bits to generate a 128-Hz clock from the LOCO clock frequency. As for the calculation method, refer to the formula below.



A value from 0 00D9h through 0 0127h can be specified in the RFC[16:0] bits; if a value outside of this range is specified, the RTC does not operate correctly. Rewrite this register while the RCR2.START bit is 0 (counter is stopped). The frequency of the peripheral module clock and the LOCO clock should be in the relationship that the peripheral module clock ≥ the LOCO clock.

- Calculation method of frequency comparison value

RFC[16:0] = (LOCO clock frequency) ÷ 128 – 1

30.2.21 Time Error Adjustment Register (RADJ)

Address(es): RTC.RADJ 8780 202Eh, RTC_NS.RADJ 0780 202Eh

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	ADJ[5:0]	Adjustment Value	These bits specify the adjustment value from the prescaler.	R/W
b7, b6	PMADJ[1:0]	Plus–Minus	b7 b6 0 0: Adjustment is not performed. 0 1: Adjustment is performed by the addition to the prescaler. 1 0: Adjustment is performed by the subtraction from the prescaler. 1 1: Setting prohibited	R/W

Adjustment is performed by the addition to or subtraction from the prescaler.
In case when the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ.
In case when the RCR2.AADJE bit is 1, adjustment is performed in the interval specified by the automatic adjustment period select (RCR2.AADJP) bit.
The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the clock source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the clock source after the register setting and then specify the next adjustment value.
RADJ is updated in synchronization with the clock source. When RADJ is modified, check that all the bits have been updated before continuing with further processing.
This register is set to 00h by an RTC software reset.
The setting of this register is enabled only when the sub-clock is selected.
When the LOCO clock is selected, adjustment is not performed.

ADJ[5:0] Bits (Adjustment Value)

These bits specify the adjustment value (the number of sub-clock cycles) from the prescaler.

PMADJ[1:0] Bits (Plus–Minus)

These bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

30.2.22 Time Capture Control Register n (RTCCRn) (n = 0 to 2)

Address(es): RTC.RTCCR0 8780 2040h, RTC.RTCCR1 8780 2042h, RTC.RTCCR2 8780 2044h, RTC_NS.RTCCR0 0780 2040h, RTC_NS.RTCCR1 0780 2042h, RTC_NS.RTCCR2 0780 2044h

	b7	b6	b5	b4	b3	b2	b1	b0
	TCEN	—	TCNF[1:0]		—	TCST	TCCT[1:0]	
Value after reset:	x	0	x	x	0	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TCCT[1:0]	Time Capture Control	b1 b0 0 0: No event is detected. 0 1: Rising edge is detected. 1 0: Falling edge is detected. 1 1: Both edges are detected.	R/W
b2	TCST	Time Capture Status Flag	0: No event is detected. 1: An event is detected.	R/(W) *1
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5, b4	TCNF[1:0]	Time Capture Noise Filter Control	b5 b4 0 0: The noise filter is off. 0 1: Setting prohibited 1 0: The noise filter is on (clock source). 1 1: The noise filter is on (clock source by divided by 32).	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	TCEN	Time Capture Event Input Pin Enable	0: The RTCICn pin is disabled as the time capture event input. 1: The RTCICn pin is enabled as the time capture event input.	R/W

Note 1. Writing 1 has no effect. This flag is cleared by writing 0.

The RTCCRn register is used both in calendar count mode and in binary count mode.
RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.
RTCCRn is updated in synchronization with the clock source. When RTCCRn is modified, check that all the bits except for the TCST flag have been updated before continuing with further processing.
This register is set to 00h by an RTC software reset.

TCCT[1:0] Bits (Time Capture Control)

These bits control the edge detection of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2). The detection edge is selectable. The TCCT[1:0] bits should be set while the RCR2.START and TCEN bits are 1.

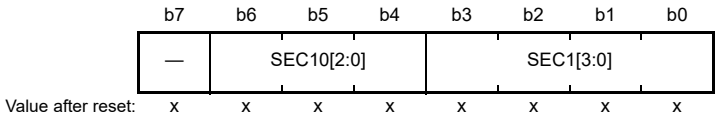
TCST Flag (Time Capture Status Flag)

This flag indicates that an event of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2) has been detected.
When the TCST flag is 0, no event is detected.
When the TCST flag is 1, this flag indicates that an event of the corresponding pin has been detected and the capture register is valid. When multiple events have been detected, the capture time for the first event is retained.
Writing 0 sets the TCST flag to 0. In addition, writing any other value except 0 has no effect.
Set the TCST flag while the TCCT[1:0] bits are 00b (no event is detected).
The TCST flag is set to 0 in synchronization with the clock source. When the TCST flag is set to 0, check that the flag has been updated before continuing with further processing.

TCNF[1:0] Bits (Time Capture Noise Filter Control)

These bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).
When the noise filter is on, the clock source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.
Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCEN bit to 1, set the TCNF[1:0] bits, wait for three cycles of the specified sampling period, and then set the TCCT[1:0] bits.

TCEN Bit (Time Capture Event Input Pin Enable)



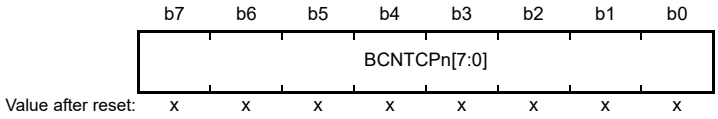
This bit enables or disables the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).
When the time capture event input pin functions (RTCIC0, RTCIC1, and RTCIC2) are allocated to the same pins as other multiplexed functions, make the general input port pin settings for the corresponding pins, set the corresponding TAMPICR1.CHnEN bit*1 (n = 0 to 2) to 1, and then set this bit to 1. If the TCEN bit is set to 0, set also the TCCT[1:0] bits to 00b.

Note 1. For details, refer to section 12, Battery Backup Function (VBATTBa).

30.2.23 Second Capture Register n (RSECCPn) (n = 0 to 2)/ BCNT0 Capture Register n (BCNT0CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RSECCP0 8780 2052h, RTC.RSECCP1 8780 2062h, RTC.RSECCP2 8780 2072h, RTC_NS.RSECCP0 0780 2052h, RTC_NS.RSECCP1 0780 2062h, RTC_NS.RSECCP2 0780 2072h



x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Capture	Capture value for the ones place of seconds	R
b6 to b4	SEC10[2:0]	10-Second Capture	Capture value for the tens place of seconds	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

The RSECCPn register is a read-only register that captures the RSECCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT0CP0 8780 2052h, RTC.BCNT0CP1 8780 2062h, RTC.BCNT0CP2 8780 2072h, RTC_NS.BCNT0CP0 0780 2052h, RTC_NS.BCNT0CP1 0780 2062h, RTC_NS.BCNT0CP2 0780 2072h

x: Undefined

The BCNT0CPn register is a read-only register that captures the BCNT0 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT0CP0, BCNT0CP1, and BCNT0CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.24 Minute Capture Register n (RMINCPn) (n = 0 to 2)/ BCNT1 Capture Register n (BCNT1CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RMINCP0 8780 2054h, RTC.RMINCP1 8780 2064h, RTC.RMINCP2 8780 2074h, RTC_NS.RMINCP0 0780 2054h, RTC_NS.RMINCP1 0780 2064h, RTC_NS.RMINCP2 0780 2074h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Capture	Capture value for the ones place of minutes	R
b6 to b4	MIN10[2:0]	10-Minute Capture	Capture value for the tens place of minutes	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

The RMINCPn register is a read-only register that captures the RMINCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT1CP0 8780 2054h, RTC.BCNT1CP1 8780 2064h, RTC.BCNT1CP2 8780 2074h, RTC_NS.BCNT1CP0 0780 2054h, RTC_NS.BCNT1CP1 0780 2064h, RTC_NS.BCNT1CP2 0780 2074h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTCPn[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT1CPn register is a read-only register that captures the BCNT1 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT1CP0, BCNT1CP1, and BCNT1CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.25 Hour Capture Register n (RHRCPn) (n = 0 to 2)/ BCNT2 Capture Register n (BCNT2CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RHRCP0 8780 2056h, RTC.RHRCP1 8780 2066h, RTC.RHRCP2 8780 2076h, RTC_NS.RHRCP0 0780 2056h, RTC_NS.RHRCP1 0780 2066h, RTC_NS.RHRCP2 0780 2076h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PM	HR10[1:0]		HR1[3:0]

b3 to b0	HR1[3:0]	1-Hour Capture	Capture value for the ones place of hours	R
b5, b4	HR10[1:0]	10-Hour Capture	Capture value for the tens place of hours	R
b6	PM	PM	0: a.m. 1: p.m.	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

The RHRCPn register is a read-only register that captures the RHRCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively.
The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT2CP0 8780 2056h, RTC.BCNT2CP1 8780 2066h, RTC.BCNT2CP2 8780 2076h, RTC_NS.BCNT2CP0 0780 2056h, RTC_NS.BCNT2CP1 0780 2066h, RTC_NS.BCNT2CP2 0780 2076h

	BCNTCPn[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2CPn register is a read-only register that captures the BCNT2 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT2CP0, BCNT2CP1, and BCNT2CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.26 Date Capture Register n (RDAYCPn) (n = 0 to 2)/ BCNT3 Capture Register n (BCNT3CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RDAYCP0 8780 205Ah, RTC.RDAYCP1 8780 206Ah, RTC.RDAYCP2 8780 207Ah, RTC_NS.RDAYCP0 0780 205Ah, RTC_NS.RDAYCP1 0780 206Ah, RTC_NS.RDAYCP2 0780 207Ah

Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3CPn register is a read-only register that captures the BCNT3 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT3CP0, BCNT3CP1, and BCNT3CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.27 Month Capture Register n (RMONCPn) (n = 0 to 2)

Address(es): RTC.RMONCP0 8780 205Ch, RTC.RMONCP1 8780 206Ch, RTC.RMONCP2 8780 207Ch,
RTC_NS.RMONCP0 0780 205Ch, RTC_NS.RMONCP1 0780 206Ch, RTC_NS.RMONCP2 0780 207Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

x: Undefined

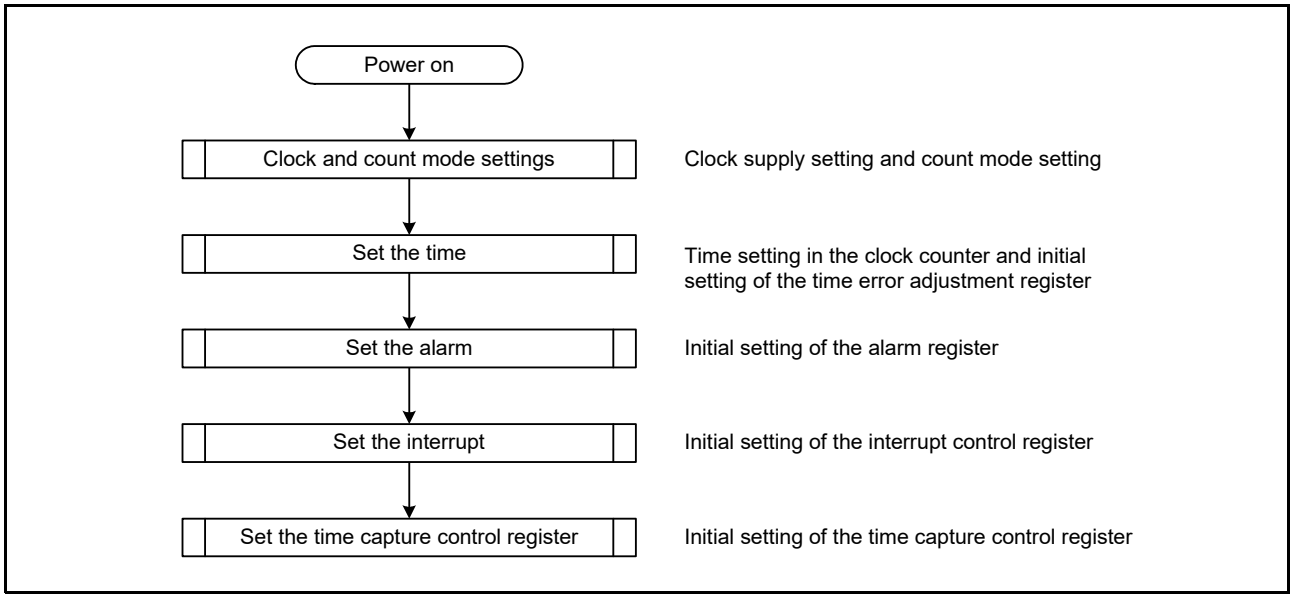
Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Capture	Capture value for the ones place of months	R
b4	MON10	10-Month Capture	Capture value for the tens place of months	R
b7 to b5	—	Reserved	These bits are read as 0	R

The RMONCPn register is a read-only register that captures the RMONCNT value when a time capture event is detected.
The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.3 Operation

30.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register should be performed.



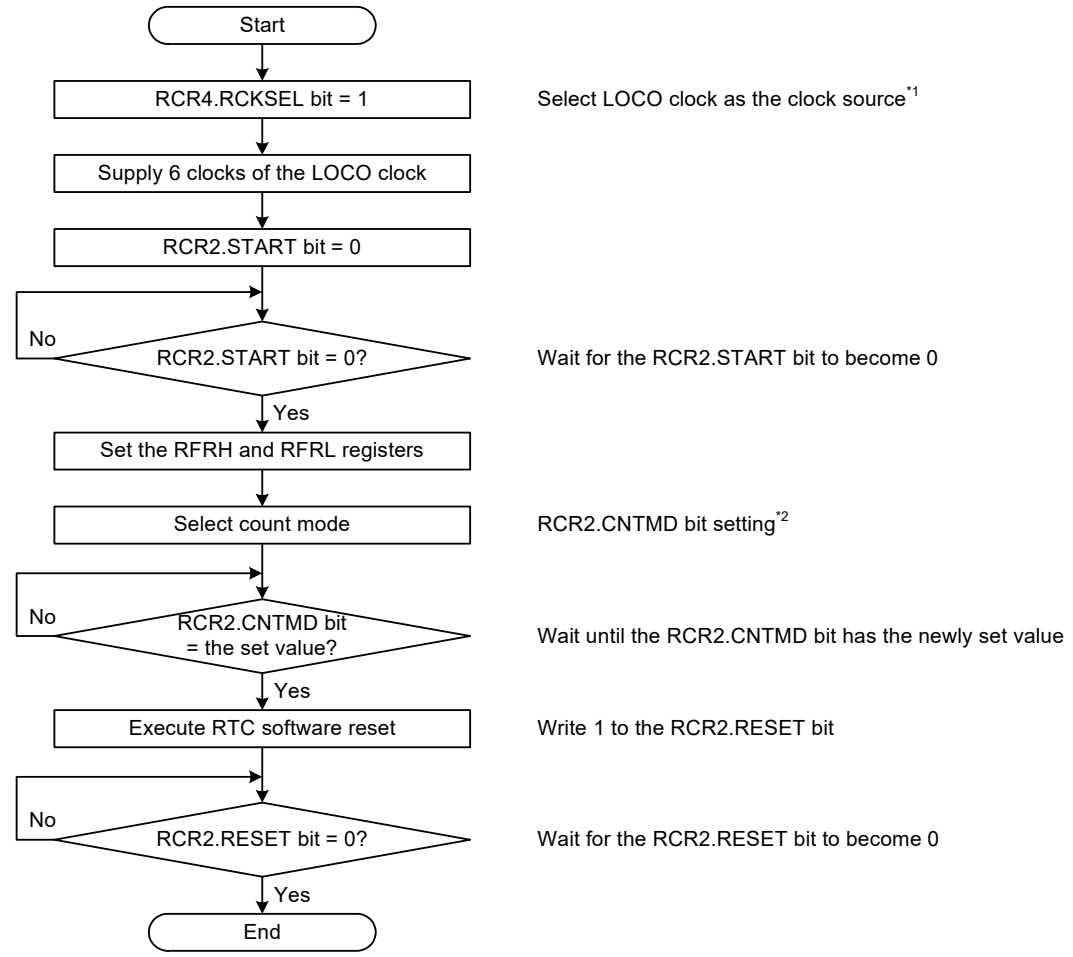


Figure 30.2 Outline of Initial Settings after Power On

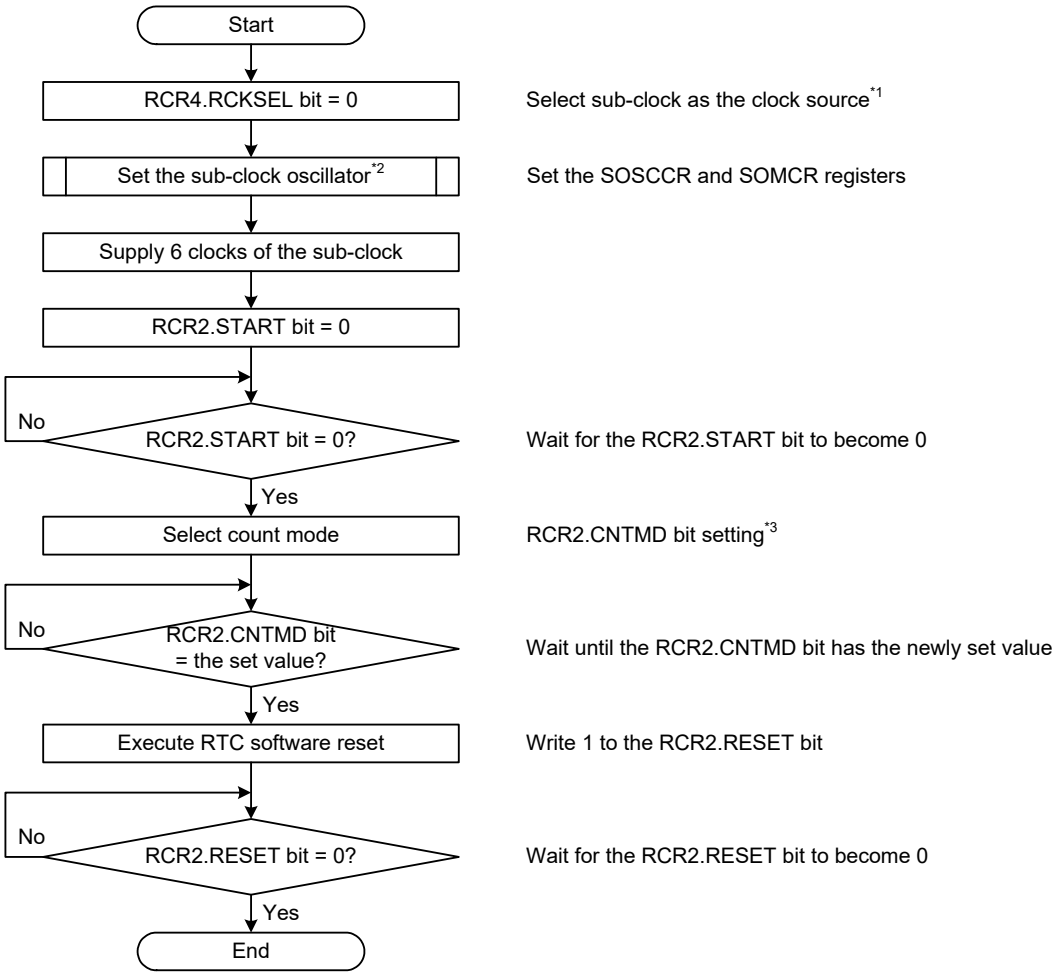
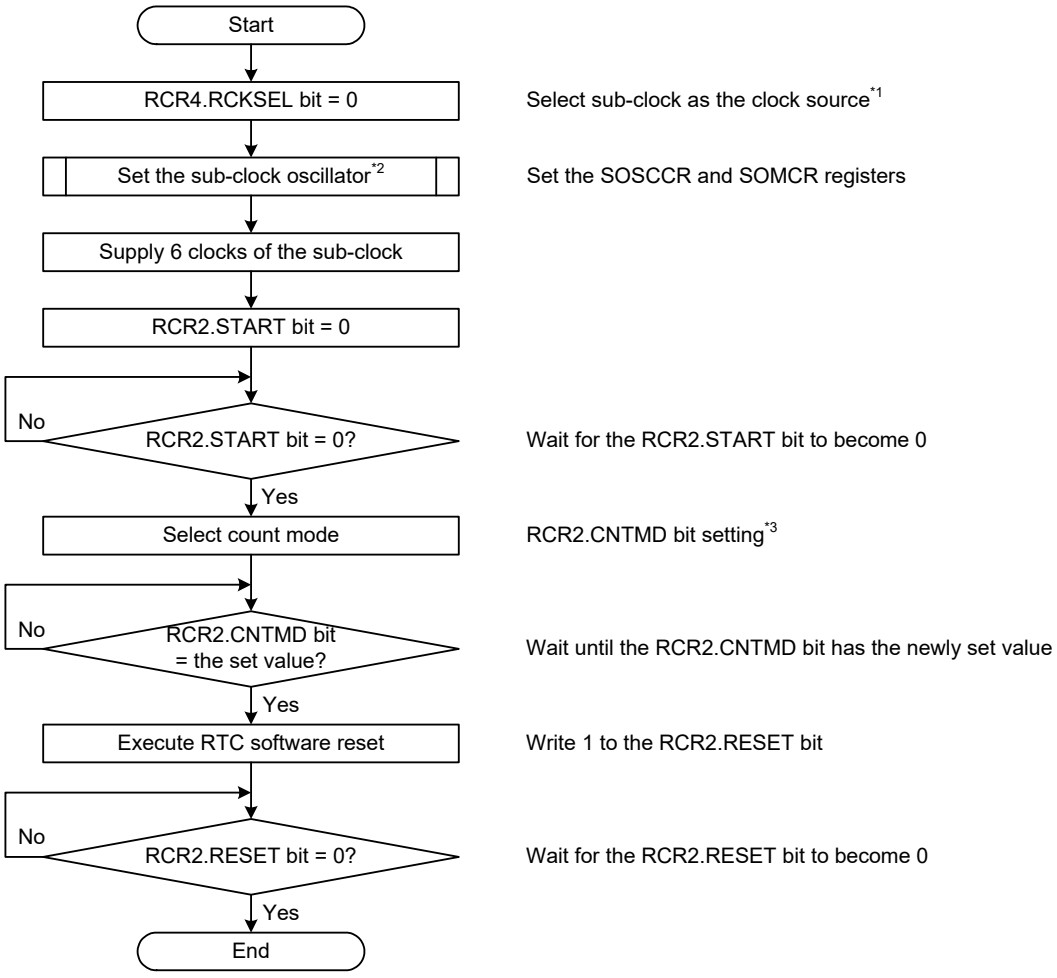


30.3.2 Clock and Count Mode Setting Procedure

Figure 30.3, Figure 30.4, and Figure 30.5 show how to set the clock and the count mode.

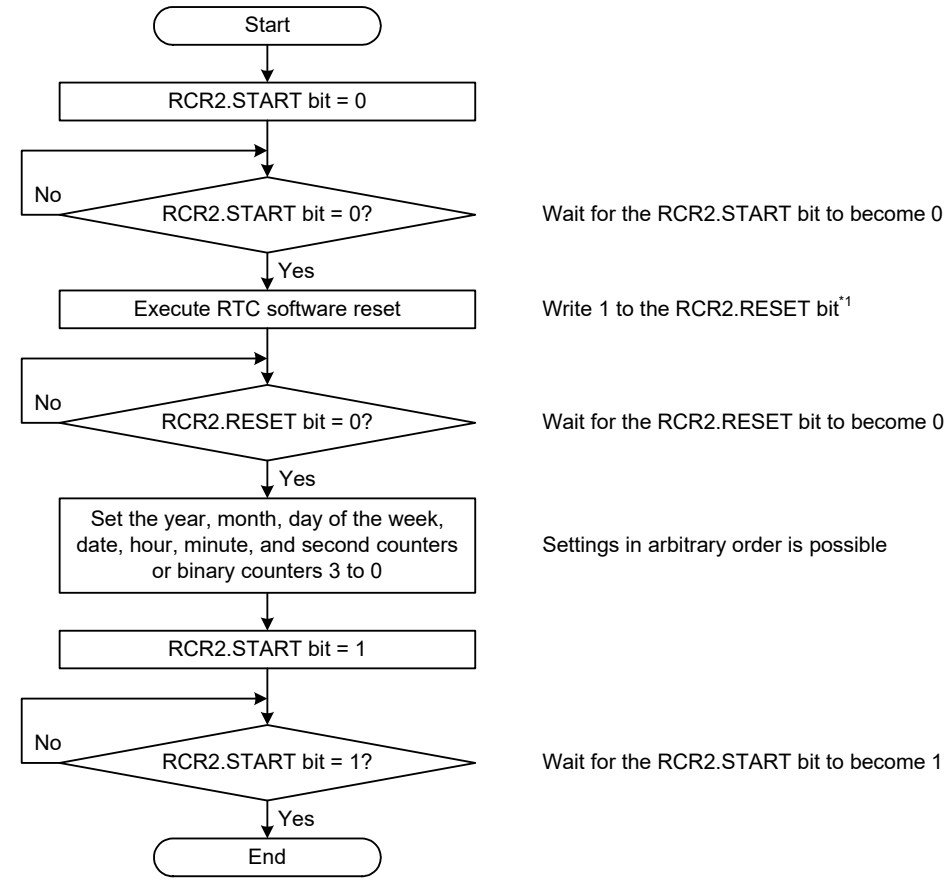


Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. This step is not necessary if the count mode has been set concurrently with setting the RCR2.START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 30.3 Clock and Count Mode Setting Procedure (When Using LOCO Clock)

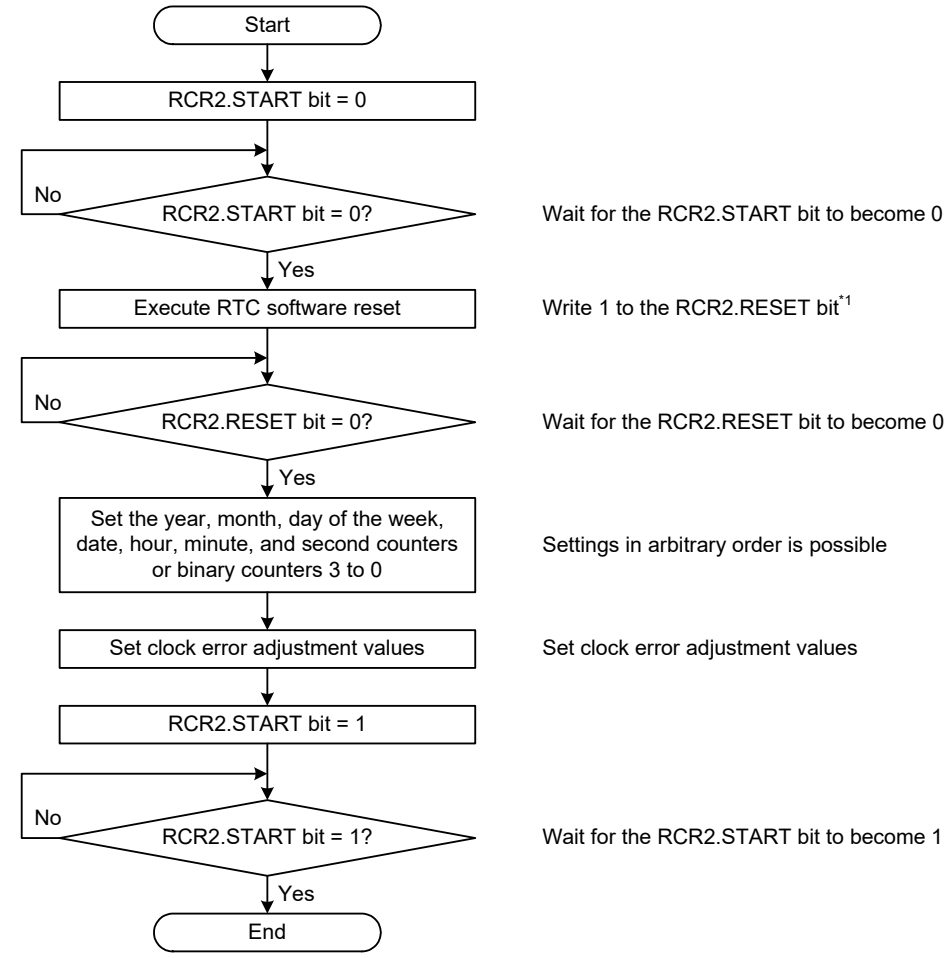
Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. For the procedure for setting up a sub-clock oscillator, refer to section 9, Clock Generation Circuit.
Note 3. This step is not necessary if the count mode has been set concurrently with setting the RCR2.START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 30.4 Clock and Count Mode Setting Procedure (When Using Sub-Clock Oscillator)



Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. For the procedure for setting up a sub-clock oscillator, refer to section 9, Clock Generation Circuit.
Note 3. This step is not necessary if the count mode has been set concurrently with setting the RCR2.START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 30.5 Clock and Count Mode Setting Procedure (When Using External Sub-Clock Input)



30.3.3 Setting the Time

Figure 30.6 and Figure 30.7 show how to set the time.

Note 1. This step is not required in the initial settings after power is supplied because an RTC software reset is applied in the clock setting procedure within the initial settings.

Figure 30.6 Setting the Time (When Using LOCO Clock)

Note 1. This step is not required in the initial settings after power is supplied because an RTC software reset is applied in the clock setting procedure within the initial settings.

Figure 30.7 Setting the Time (When Using Sub-Clock)

30.3.4 30-Second Adjustment

Figure 30.8 shows how to execute 30-second adjustment.

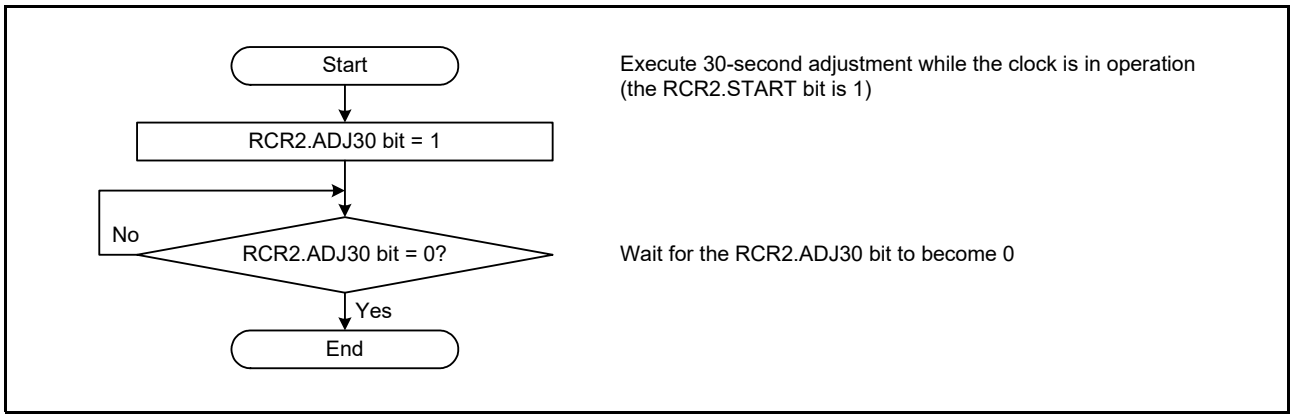


Figure 30.8 30-Second Adjustment

30.3.5 Reading 64-Hz Counter and Time

Figure 30.9 shows how to read the 64-Hz counter and time.
If a carry occurs while the 64-Hz counter and time are being read, the correct time will not be obtained, so they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 30.9, and the procedure using carry interrupts in (b). To keep the program simple, method (a) should be used in most cases.

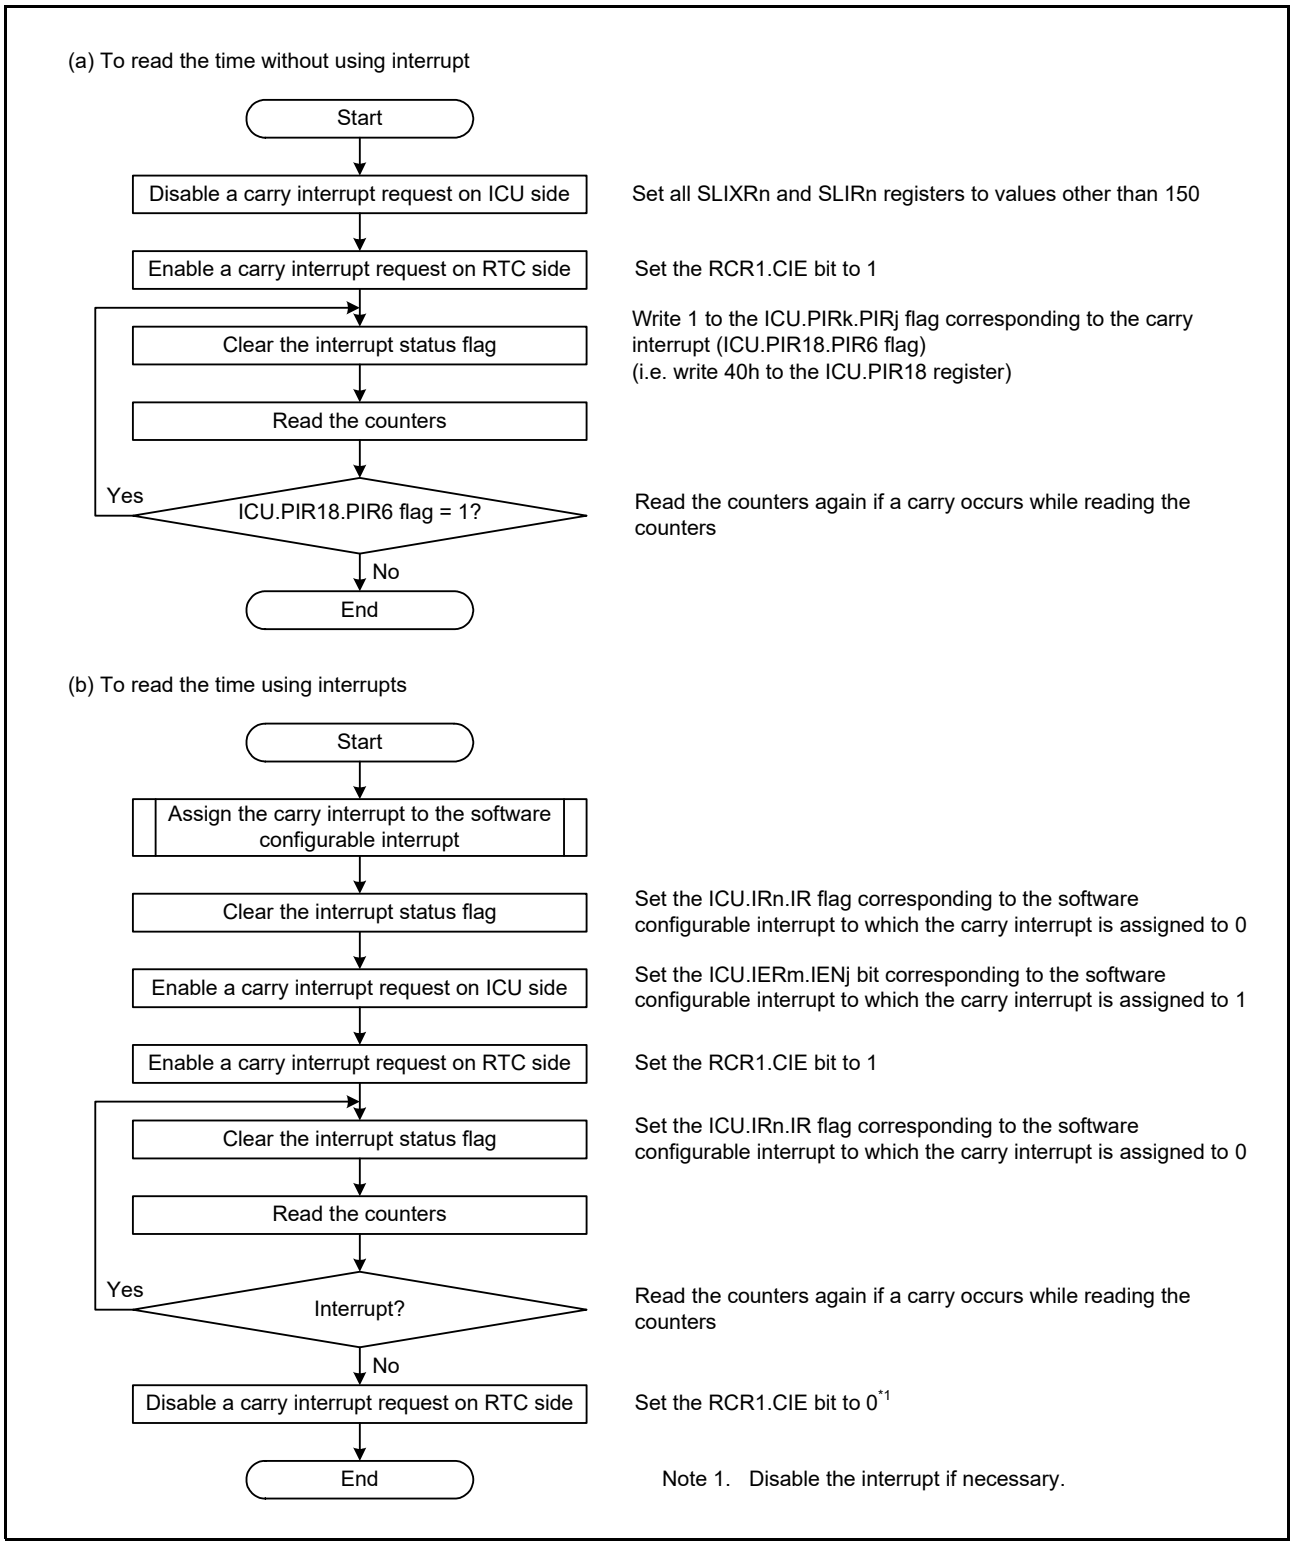

Figure 30.9 Reading Time

30.3.6 Alarm Function

Figure 30.10 shows how to use the alarm function.

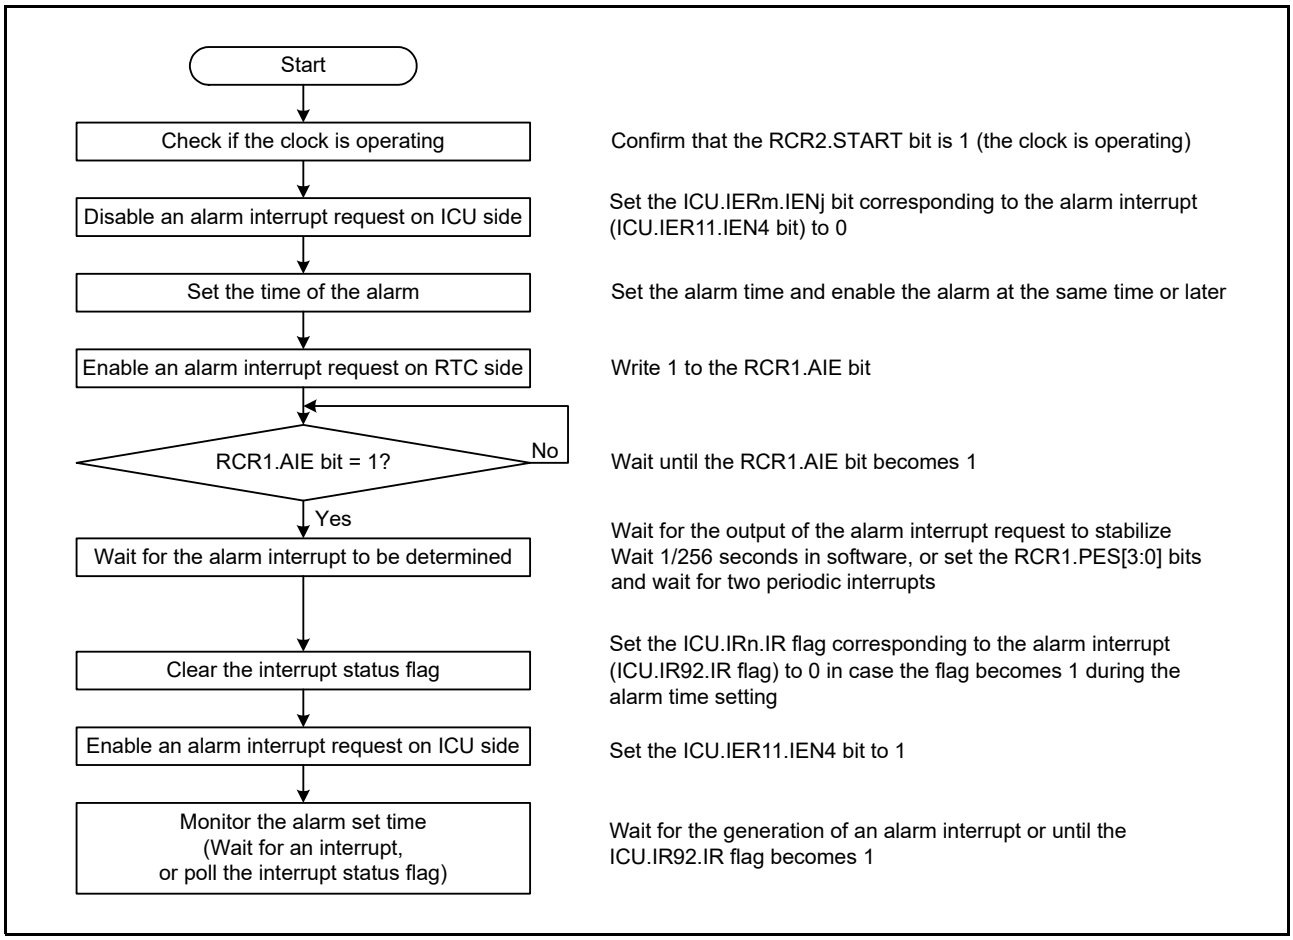

Figure 30.10 Using Alarm Function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the alarm enable register corresponding to the target bit of the alarm, and set the alarm time to the alarm register. For bits that are not target of the alarm, write 0 to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1. Alarm detection can be confirmed by reading this bit, but an interrupt should be used in most cases. If 1 has been set in the interrupt request enable bit corresponding to the alarm interrupt (ICU.IER11.IEN4 bit), an alarm interrupt is generated in the event of alarm, enabling the alarm to be detected.

Writing 0 sets the ICU.IR92.IR flag to 0.

When the counter and the alarm time match in a low power consumption state, the MCU returns from the low power consumption state. In deep software standby mode, the MCU returns from the deep software standby mode even when the alarm interrupt request is disabled.

30.3.7 Procedure for Disabling Alarm Interrupt

Figure 30.11 shows the procedure for disabling the enabled alarm interrupt request.

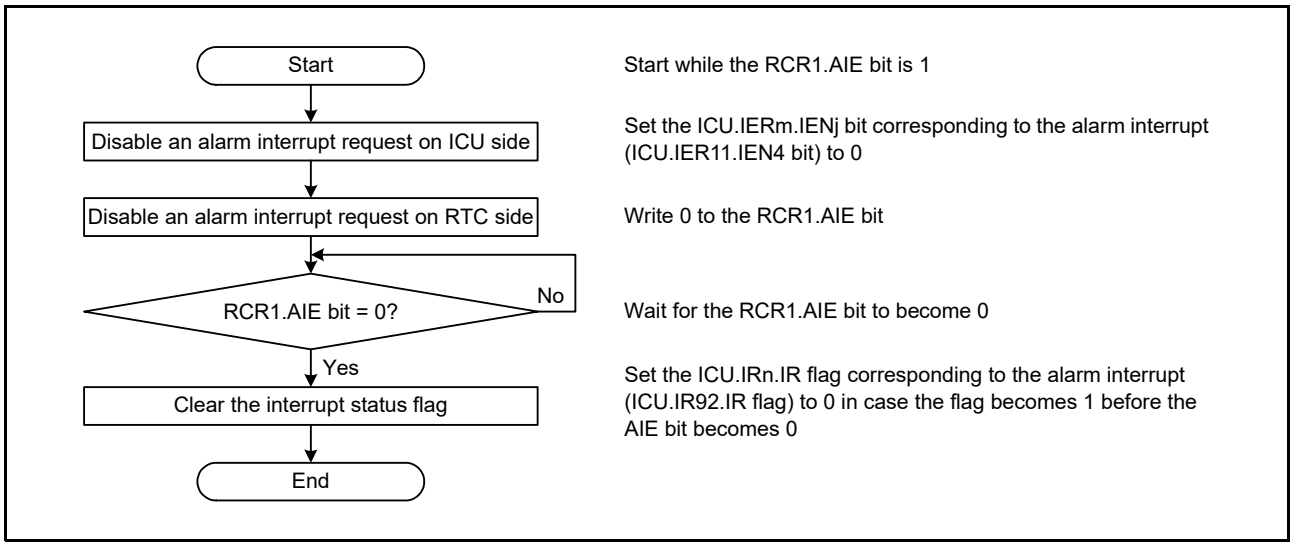

Figure 30.11 Procedure for Disabling Alarm Interrupt Request

30.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors (running fast or slow) in the time due to the precision of oscillation by the sub-clock. Since 32,768 cycles of the sub-clock constitute 1 second of operation when the sub-clock is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. This function can be used to correct errors due to the clock running fast or slow.
Two types of time error adjustment functions are provided: automatic adjustment and adjustment by software.
Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

30.3.8.1 Automatic Adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.
Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJE bit elapses.
Examples are shown below.

[Example 1] Sub-clock running at 32.769 kHz
Adjustment procedure:
When the sub-clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler.)
- RADJ.ADJ[5:0] = 60 (3Ch)

[Example 2] Sub-clock running at 32.766 kHz
Adjustment procedure:
When the sub-clock is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by two clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 20 (14h)

[Example 3] Sub-clock running at 32.764 kHz
Adjustment procedure:
At 32.764 kHz, 1 second elapses on 32,764 clock cycles. Since the RTC operates for 32,768 clock cycles as 1 second, the clock is delayed for four clock cycles per second. In 8 seconds, the delay is 32 clock cycles, so correction can be made by proceeding the clock for 32 clock cycles every 8 seconds.

Register settings when the RCR2.CNTMD bit is 1

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 32 (20h)

30.3.8.2 Adjustment by Software

Enable adjustment by software by setting the RCR2.AADJE bit to 0.
Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register at the time of execution of an instruction for writing to the RADJ register.
An example is shown below.

[Example 1] Sub-clock running at 32.769 kHz
Adjustment procedure:
When the sub-clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by one cycle every second.

Register settings:

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler.)
- RADJ.ADJ[5:0] = 1 (01h)
  This is written to the RADJ register once per 1-second interrupt.

30.3.8.3 Procedure for Changing the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
(2) Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
(3) Use the RCR2.AADJP bit to select the period of adjustment.
(4) In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
(2) Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
(3) Proceed with adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the desired time. After that, the time is adjusted every time a value is written to the RADJ register.

30.3.8.4 Procedure for Stopping Adjustment

Stop adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

30.3.9 Time Capture Function

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the TCST flag is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Operation when the noise filter is off is shown in Figure 30.12 and operation when the noise filter is on is shown in Figure 30.13.

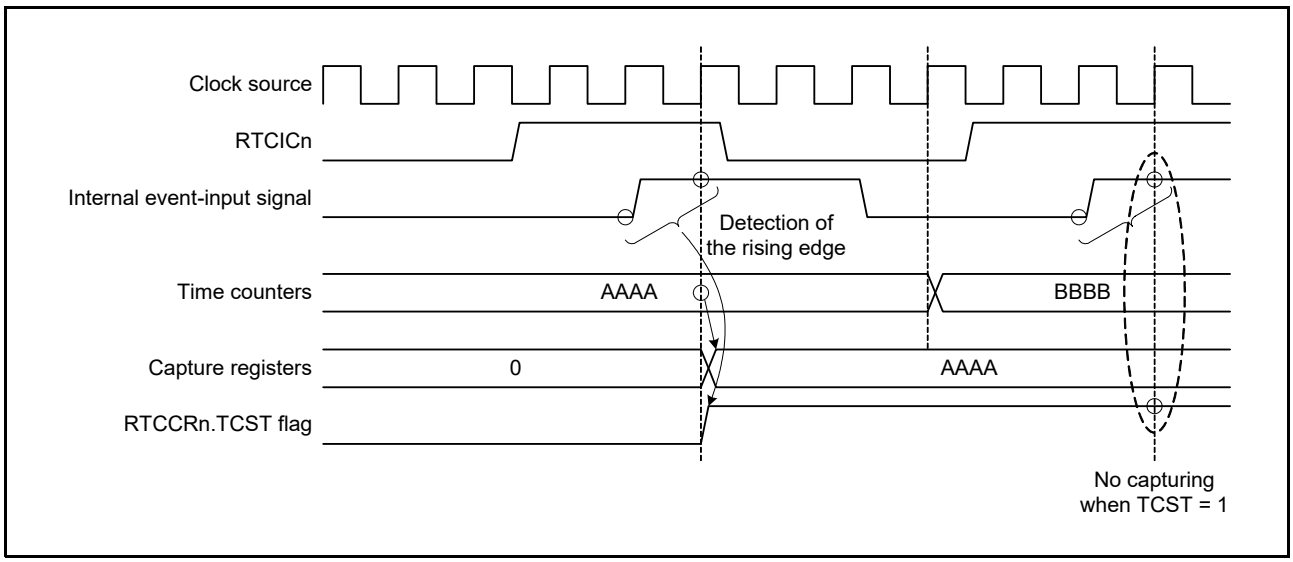

Figure 30.12 Timing of a Time Capture Operation (with the Filter Off) (n = 0 to 2)

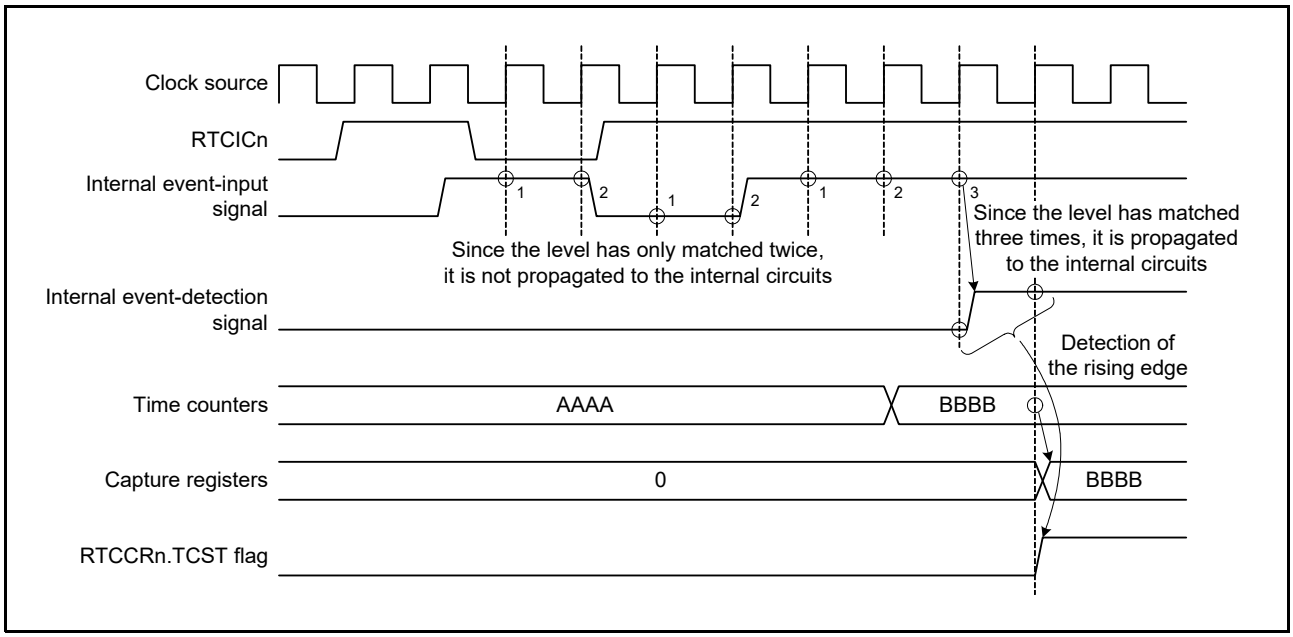

Figure 30.13 Timing of a Time Capture Operation (with the Filter On) (n = 0 to 2)

30.4 Interrupt Sources

There are three interrupt sources in the realtime clock. Table 30.3 lists interrupt sources for the RTC.

Table 30.3 RTC Interrupt Sources

Name	Interrupt Sources	Interrupt Status Flag	Interrupt Request Enable Bit
ALM	Alarm interrupt	IR92.IR	IER11.IEN4
PRD	Periodic interrupt	IR93.IR	IER11.IEN5
CUP	Carry interrupt	PIR18.PIR6	— (software configurable interrupt)

(1) Alarm interrupt (ALM)

This interrupt is generated according to the result of comparison between the alarm registers and realtime clock counters (for details, refer to section 30.3.6, Alarm Function).

Since there is a possibility that the interrupt flag may be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and set the ICU.IR92.IR flag to 0 again after modifying values of the alarm registers. Once the interrupt flag for the alarm interrupt has been set to 1 and the state has returned to non-matching of the alarm registers and clock counters, the flag will not be set again until there is a further match or the values of the alarm registers are modified again.

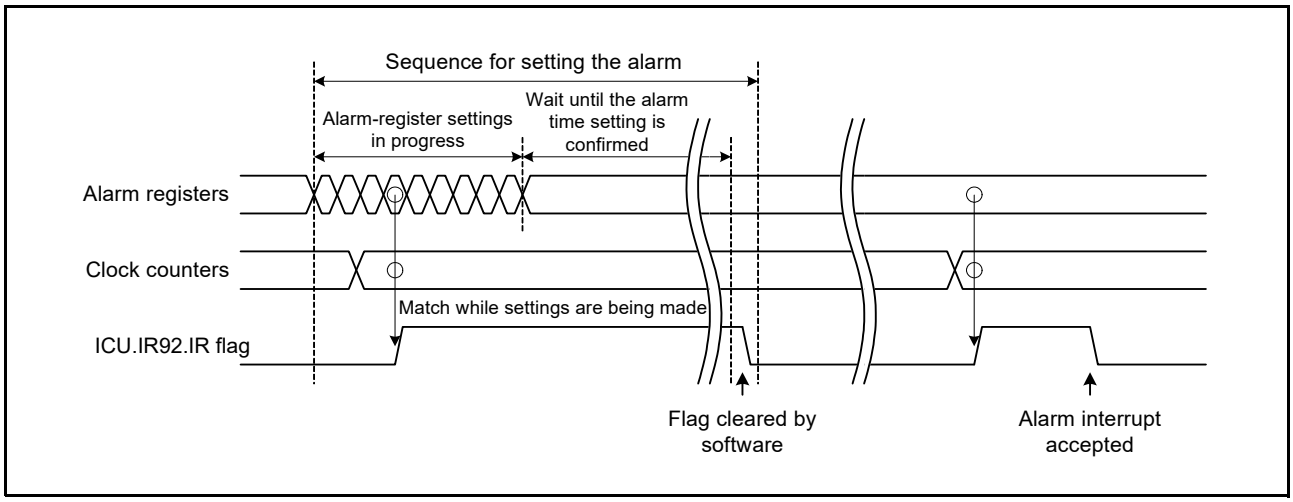

Figure 30.14 Timing Chart for the Alarm Interrupt

(2) Periodic interrupt (PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

(3) Carry interrupt (CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

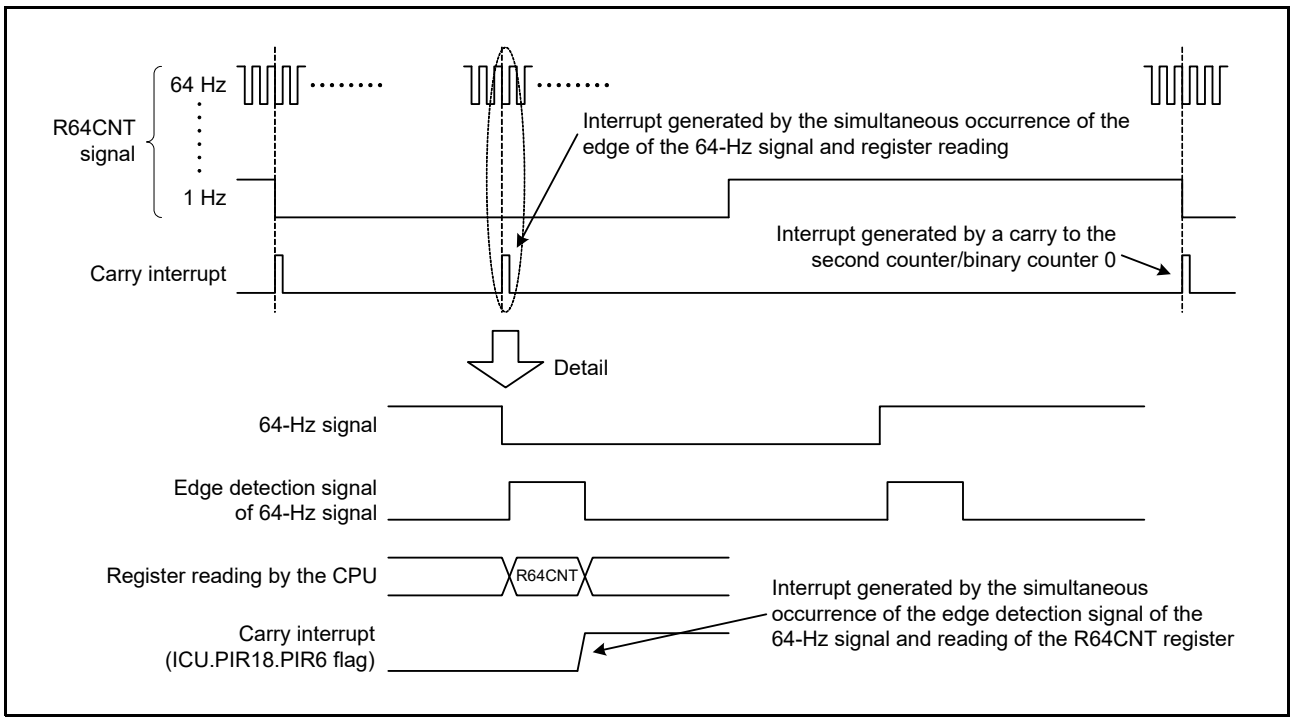

Figure 30.15 Carry Interrupt Timing Chart

30.5 Event Link Output

The RTC outputs the following event signals for the event link controller (ELC), and these can be used to initiate operations by other modules selected in advance.

(1) Periodic event output

The periodic event signal is output at the interval selected from among 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by the setting of the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is to be used, only make the ELC settings after making the RTC settings (initialization, time settings, etc.). Making the RTC settings after the ELC settings can lead to the output of unexpected event signals.

30.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output for the CPU when an interrupt source is generated while the corresponding enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal via the ELC when an interrupt source is generated, regardless of the setting of the corresponding interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during software standby mode or deep software standby mode, the periodic event signals for the ELC are not output.

30.6 Usage Notes

30.6.1 Register Writing during Counting

The following registers should not be written to during counting (while the RCR2.START bit = 1).

RSECCNT/BCNT0, RMINCNT/BCNT1, RHRCNT/BCNT2, RDAYCNT, RWKCNT/BCNT3, RMONCNT, RYRCNT, RCR1.RTCOS, RCR2.RTCOE, RCR2.HR24, RFRH, RFRL

The counter must be stopped before writing to any of the above registers.

30.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in Figure 30.16.
The generation and period of the periodic interrupt can be changed by the setting of the RCR1.PES[3:0] bits. However, since the prescaler, R64CNT, and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting of the RCR1.PES[3:0] bits.
Furthermore, stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the interrupt period. When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted according to the adjustment value.

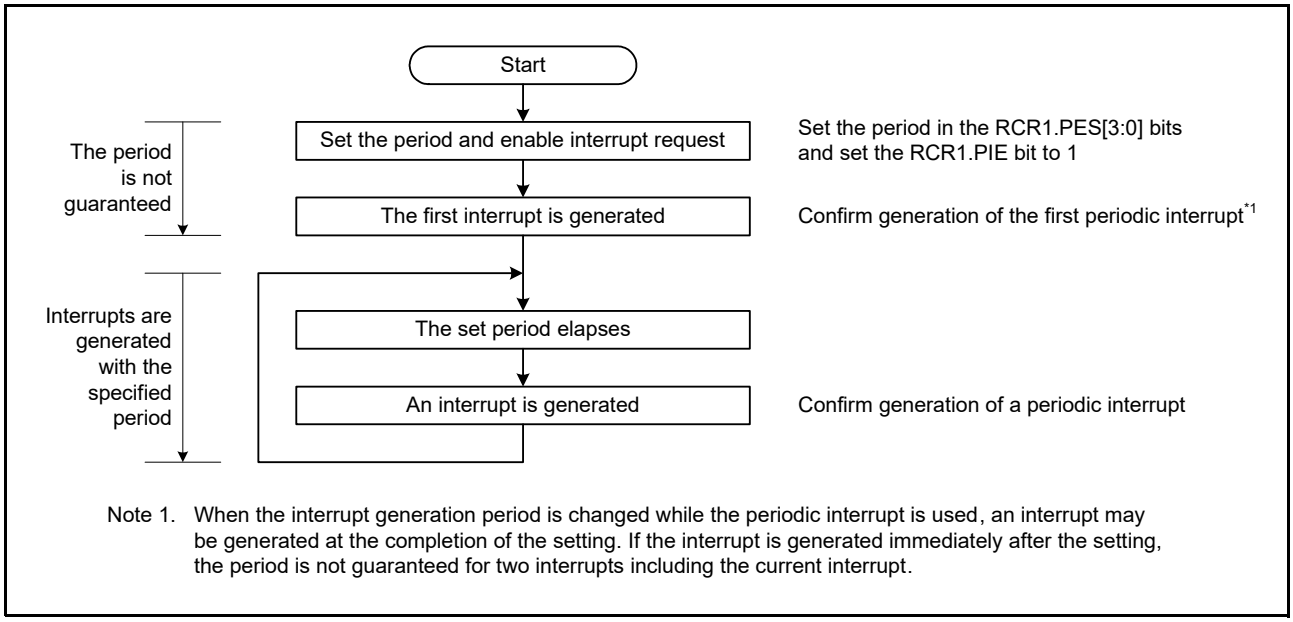

Figure 30.16 Using Periodic Interrupt Function

30.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted according to the adjustment value.

30.6.4 Transitions to Low Power Consumption Modes after Setting Registers

A transition to a low power consumption state (software standby mode, deep software standby mode, or battery backup) during writing to or updating of an RTC register might destroy the register's value. After setting a register, confirm that the setting is in place before initiating a transition to a low power consumption state.

30.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter/binary counter 0 after having written to the counter register, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4, RFRH, or RFRL register is reflected when four read operations are performed after writing.
- The values written to the RCR1.CIE, RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after return from a reset, deep software standby mode, software standby mode, or the battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register when six cycles of the clock source have elapsed.

30.6.6 Changing the Count Mode

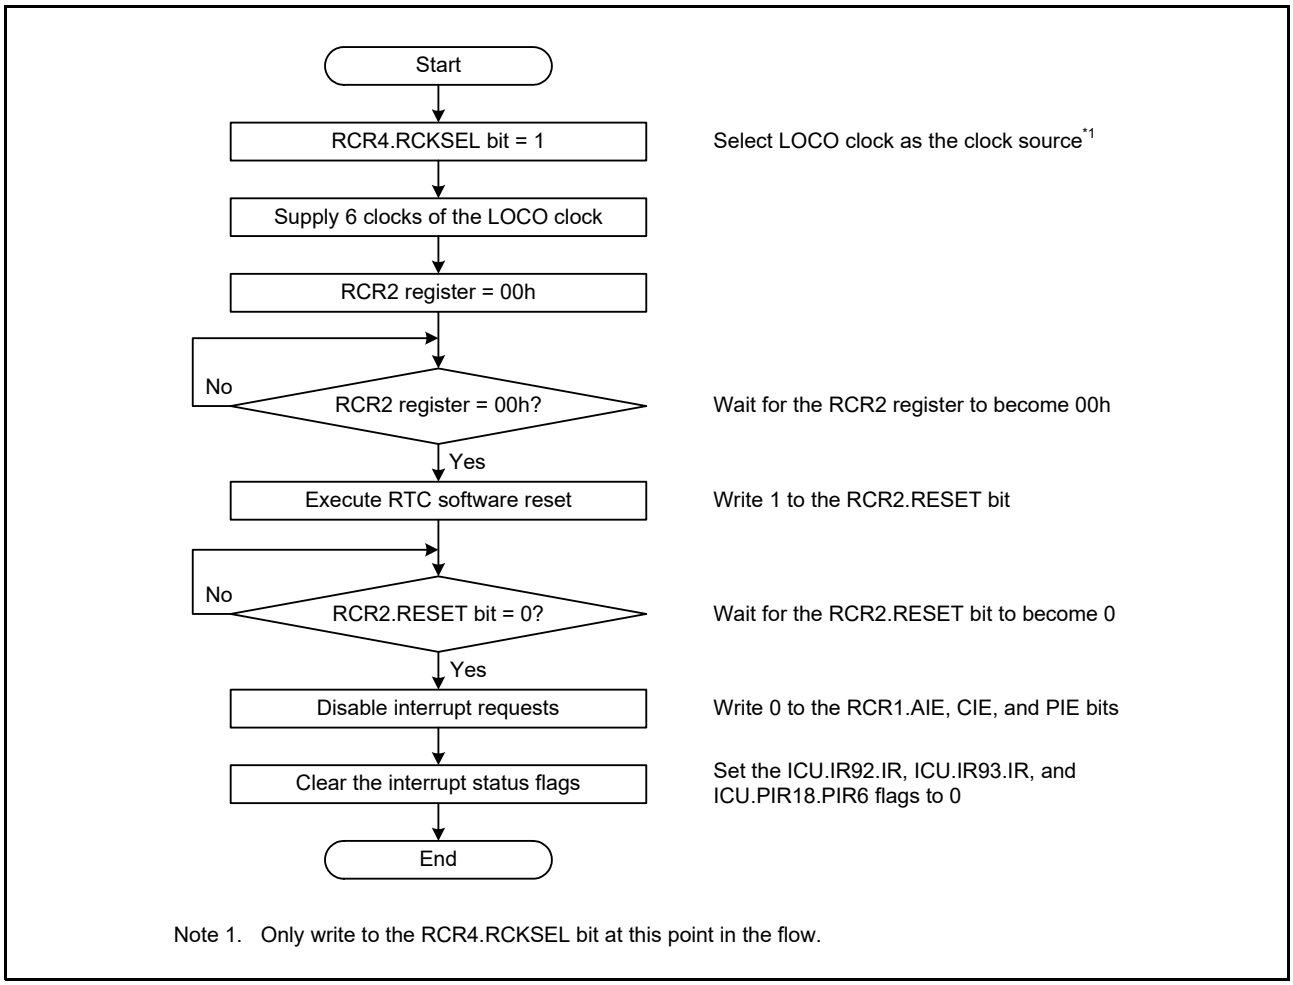
When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop counting operation, then start again from the initial setting. For details on initial setting, refer to section 30.3.1, Outline of Initial Settings of Registers after Power On.

30.6.7 Notes on Using the Time Capture Function

When the time capture function is to be used, set both the RTCCRn.TCEN and TAMPICR1.CHnEN bits (n = 0 to 2) to 1. When tampering is not to be detected, leave the TAMPCR, TCECR, and TAMPICR2 registers in the tamper detector at their initial values.
When the time capture function is to be used to obtain the time stamps in response to the detection of tampering, use the noise filter in the tamper detector and set the RTCCRn.TCNF[1:0] bits to 00b (switch the noise filter of the RTC off).

30.6.8 Initialization Procedure When the Realtime Clock is Not to be Used

Registers in the RTC are not initialized by a reset. Accordingly, depending on the initial state, the generation of an unintentional interrupt request or operation of the counter may lead to increased power consumption.
For products that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 30.17 or Figure 30.18.



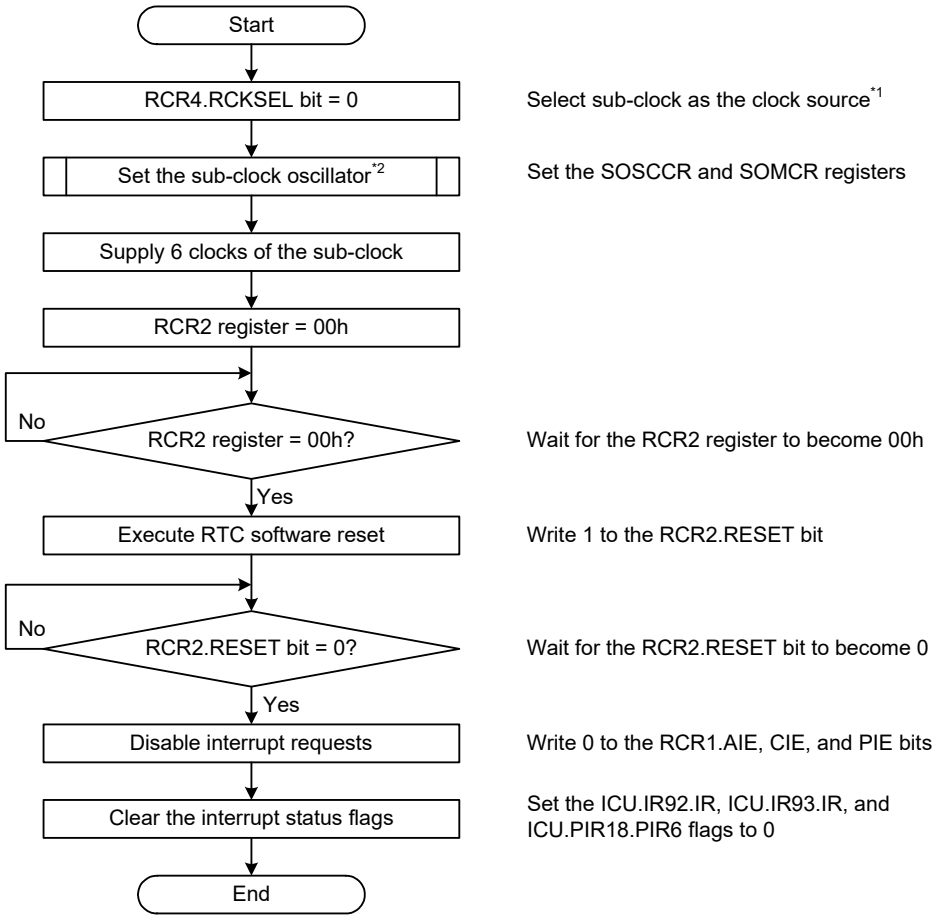


Figure 30.17 Initialization Procedure (When Using LOCO Clock)

Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. For the procedure for setting up a sub-clock oscillator, refer to section 9, Clock Generation Circuit.

Figure 30.18 Initialization Procedure (When Using Sub-Clock)

31. Watchdog Timer (WDTA)

The watchdog timer (WDT) is a 14-bit down-counter. It can be used to reset this MCU when the counter underflows because its value cannot be refreshed due to the system being out of control.
In addition, a non-maskable or maskable interrupt can be generated on an underflow.
The refresh-permitted period can be set to refresh the counter and used as the condition to detect when the system runs out of control.

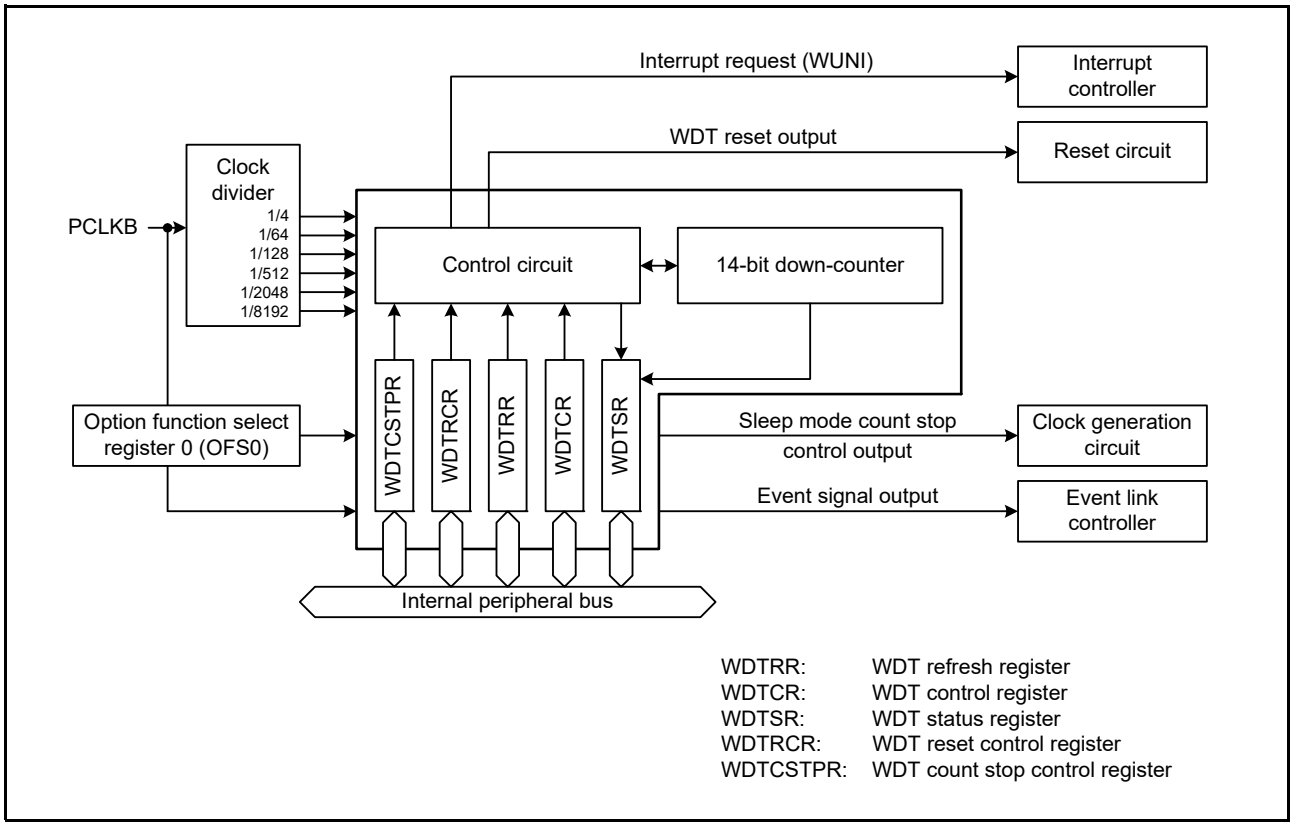
31.1 Overview

Table 31.1 lists the specifications of the WDT and Figure 31.1 shows a block diagram of the WDT.

Table 31.1 WDT Specifications

Item	Description
Count source	Peripheral module clock (PCLKB)
Clock divide ratio	Divide by 4, 64, 128, 512, 2048, or 8192
Counter operation	Counting down using a 14-bit counter
Conditions for starting the counter	• Auto-start mode: Counting automatically starts after a reset is released • Register start mode: Counting is started by refresh operation (writing 00h and then FFh to the WDTRR register)
Conditions for stopping the counter	• Reset • In low power consumption modes (depends on the register setting*1) • A counter underflows or a refresh error occurs (only in register start mode)
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Reset output sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/ maskable interrupt sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading the counter value	The counter value can be read by the WDTSR register.
Event link function (output)	• Counter underflow event output • Refresh error event output
ProtectZone filter	Security attribute can be set.*2

Note 1. When the OFS0.WDT0SLCSTP bit is 1 in auto-start mode, and when the WDTCSTPR.SLCSTP bit is 1 in register start mode.
Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.



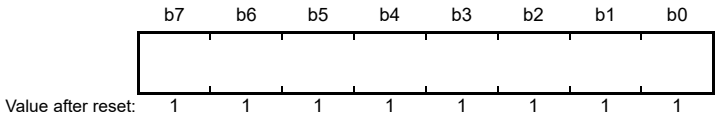


Figure 31.1 WDT Block Diagram

31.2 Register Descriptions

31.2.1 WDT Refresh Register (WDTRR)

Address(es): WDT0.WDTRR 8780 2600h, WDT0_NS.WDTRR 0780 2600h

Bit	Description	R/W
b7 to b0	The counter is refreshed by writing 00h and then writing FFh to this register	R/W

The WDTRR register is used to refresh the counter of the WDT.
The counter of the WDT is refreshed by writing 00h and then writing FFh to the WDTRR register (refresh operation) within the refresh-permitted period.
After the counter has been refreshed, it starts counting down from the value selected by setting the WDT0TOPS[1:0] bits in option function select register 0 (OFS0) in auto-start mode. In register start mode, counting down starts from the value selected by setting the WDTCR.TOPS[1:0] bits.
When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh.
For details of the refresh operation, refer to section 31.3.2, Refresh Operation.

31.2.2 WDT Control Register (WDTCR)

Address(es): WDT0.WDTCR 8780 2602h, WDT0_NS.WDTCR 0780 2602h

b15, b14	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the time until a timeout occurs and the refresh-permitted period when using register start mode.

In auto-start mode, the settings in the WDTCR register are disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the WDTCR register can also be made in the OFS0 register. For details, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

TOPS[1:0] Bits (Timeout Period Select)

These bits select the timeout period (period until the counter underflows) from among 1024, 4096, 8192, and 16384 cycles of the count clock.

After the counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of PCLKB cycles) until the counter underflows.

Relations between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles are listed in Table 31.2.

Table 31.2 Timeout Period Settings

CKS[3:0] Bits				TOPS[1:0] Bits				
b7	b6	b5	b4	b1	b0	Clock Divide Ratio	Timeout Period (Number of Cycles)	Cycles of PCLKB

				1	1		16384	134217728

CKS[3:0] Bits (Clock Divide Ratio Select)

These bits specify the frequency of the clock used for the counter (count clock). The count clock frequency can be selected from among the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, a count period between 4,096 and 134,217,728 cycles of the PCLKB can be selected for the WDT.

RPES[1:0] Bits (Window End Position Select)

These bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. The selected window end position should be a value smaller than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

RPSS[1:0] Bits (Window Start Position Select)

These bits specify the window start position that indicates the refresh-permitted period. 25%, 50%, 75%, or 100% of the timeout period can be selected for the window end position. The window start position should be set to a value greater the window end position. If the window start position is set to a value smaller than or equal to the window end position, the window end position is set to 0%.

Table 31.3 lists the counter values for the window start and end positions and Figure 31.2 shows the refresh-permitted period set by the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 31.3 Relationship between Timeout Period and Window Start and End Counter Values

TOPS[1:0] Bits		Timeout Period		Window Start and End Counter Value			
		Cycles	Counter Value	100%	75%	50%	25%
0	0	1024	03FFh	03FFh	02FFh	01FFh	00FFh
0	1	4096	0FFFh	0FFFh	0BFFh	07FFh	03FFh
1	0	8192	1FFFh	1FFFh	17FFh	0FFFh	07FFh
1	1	16384	3FFFh	3FFFh	2FFFh	1FFFh	0FFFh

RPSS[1:0] Bits		RPES[1:0] Bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note. If the window end setting is greater than or equal to the window start setting, the window end position is set to 0%.

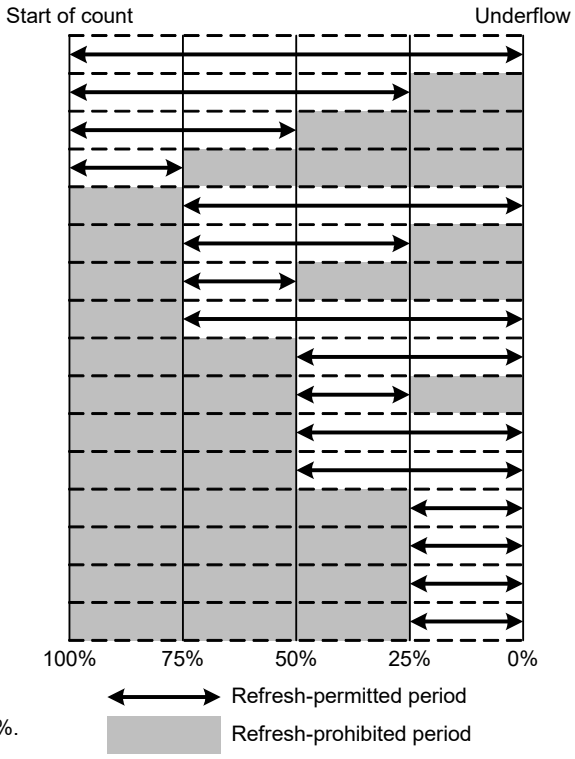

Figure 31.2 RPSS[1:0] and RPES[1:0] Bit Settings and the Refresh-Permitted Period

31.2.3 WDT Status Register (WDTSR)

Address(es): WDT0.WDTSR 8780 2604h, WDT0_NS.WDTSR 0780 2604h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b13 to b0	CNTVAL[13:0]	Counter Value	Value counted by the counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred	R/(W) *1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred	R/(W) *1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] Bits (Counter Value)

These bits are used to confirm the value of the counter, but note that the read value may differ from the actual count by a value of one count.

UNDFF Flag (Underflow Flag)

This flag is used to confirm whether or not an underflow has occurred in the counter.
The value 1 indicates that the counter has underflowed. The value 0 indicates that the counter has not underflowed.
To clear the flag, write 0 to the UNDFF flag. The flag will be cleared five PCLKB cycles after writing 0.
Note that after an underflow occurs, the flag cannot be cleared for a period of one count clock cycle and two PCLKB cycles. Wait for the period before clearing the flag.

REFEF Flag (Refresh Error Flag)

This flag is used to confirm whether or not a refresh error (performing a refresh operation during a refresh-prohibited period) has occurred.
The value 1 indicates that a refresh error has occurred. The value 0 indicates that no refresh error has occurred.
To clear the flag, write 0 to the REFEF flag. The flag will be cleared five PCLKB cycles after writing 0.
Note that after a refresh error occurs, the flag cannot be cleared for a period of one count clock cycle and two PCLKB cycles. Wait for the period before clearing the flag.

31.2.4 WDT Reset Control Register (WDTRCR)

Address(es): WDT0.WDTRCR 8780 2606h, WDT0_NS.WDTRCR 0780 2606h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	RSTIRQS	Reset Interrupt Request Select	0: Non-maskable interrupt request or maskable interrupt request is output. 1: Reset signal is output.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the behavior when a timeout or refresh error occurs when using register start mode. In auto-start mode, the WDTRCR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the WDTRCR register can also be made in the OFS0 register. For details, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

31.2.5 WDT Count Stop Control Register (WDTCSTPR)

Address(es): WDT0.WDTCSTPR 8780 2608h, WDT0_NS.WDTCSTPR 0780 2608h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	SLCSTP	Sleep Mode Count Stop Control	0: Counter continues counting in sleep mode or deep sleep mode. 1: Counter stops in low power consumption mode.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify whether the counter operates in sleep mode or deep sleep mode when using register start mode.

In auto-start mode, the WDTCSTPR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting mode to the WDTCSTPR register can also be made in the OFS0 register. For details, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

SLCSTP Bit (Sleep Mode Count Stop Control)

This bit selects whether the counter continues or stops counting in sleep mode or deep sleep mode.

31.2.6 Option Function Select Register 0 (OFS0)

For details on the OFS0 register, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

31.3 Operation

31.3.1 Count Operation in Each Start Mode

The WDT has two start modes: auto-start mode, in which counting automatically starts after a reset is released, and register start mode, in which counting is started by refresh operation (writing to the register).
In auto-start mode, counting automatically starts after a reset is released in accordance with the settings in option function select register 0 (OFS0).
In register start mode, counting is started by refresh operation (writing to the register) after the respective registers are set after a reset is released.
Select auto-start mode or register start mode by setting the OFS0.WDT0STRT bit.
When the auto-start mode is selected, the settings in the WDTCR, WDTRCR, and WDTCSTPR registers are disabled, and the settings in the OFS0 register are enabled.
On the other hand, when the register start mode is selected, the setting of the OFS0 register is disabled, and the settings of the WDTCR, WDTRCR, and WDTCSTPR registers are enabled.

31.3.1.1 Register Start Mode

When the OFS0.WDT0STRT bit is 1, register start mode is selected, and the WDTCR, WDTRCR, and WDTCSTPR registers are enabled.
After a reset is released, set the clock divide ratio, window start and end positions, and timeout period in the WDTCR register, the reset output or interrupt request output in the WDTRCR register, and the counter operation/stop in sleep mode or deep sleep mode in the WDTCSTPR register. Then, refresh the counter to start counting down from the value set by the WDTCR.TOPS[1:0] bits.
Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The WDT does not output the reset signal as long as this continues. However, if the counter underflows because the counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs a reset signal or an interrupt request (WUNI). Reset signal output or interrupt request output can be selected by setting the WDTRCR.RSTIRQS bit.

Figure 31.3 shows an example of operation under the following conditions.

- Register start mode (OFS0.WDT0STRT = 1)
- Reset output is enabled (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

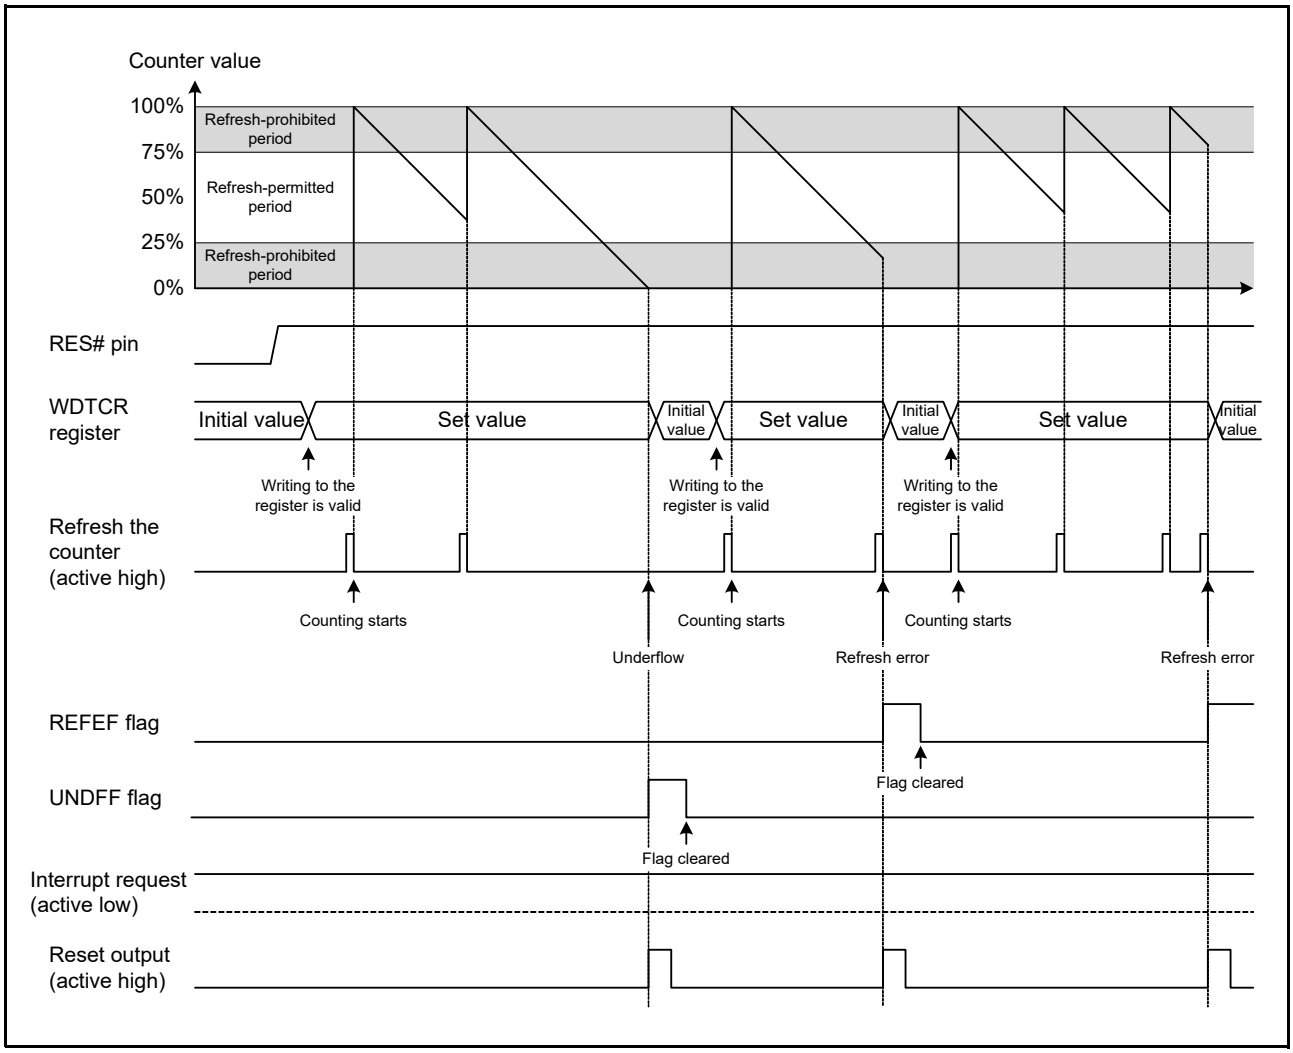

Figure 31.3 Operation Example in Register Start Mode

31.3.1.2 Auto-Start Mode

When the WDT0STRT bit in option function select register 0 (OFS0) is 0, auto-start mode is selected, the WDTCR, WDTRCR, and WDTCSTPR registers are disabled, and the settings in the OFS0 register are enabled.
During the reset state, the setting values (clock divide ratio, window start and end positions, timeout period, reset output or interrupt request output, and counter operation/stop in sleep mode or deep sleep mode) of the OFS0 register are set in the WDT registers. When the reset is released, the counter automatically starts counting down from the value set by the OFS0.WDT0TOPS[1:0] bits.
After that, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The WDT does not output the reset signal as long as this continues. However, if the counter underflows because refreshing of the counter is not possible due to the program having entered crashed execution or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or interrupt request (WUNI).
After the reset signal or interrupt request is output of for one cycle of counting, the value of the timeout period is set in the counter counting is restarted.
Reset signal output or interrupt request output can be selected by setting the OFS0.WDT0RSTIRQS bit.

Figure 31.4 shows an example of operation under the following conditions.

- Auto-start mode (OFS0.WDT0STRT = 0)
- Interrupt request output is enabled (OFS0.WDT0RSTIRQS = 0)
- The window start position is 75% (OFS0.WDT0RPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDT0RPES[1:0] = 10b)

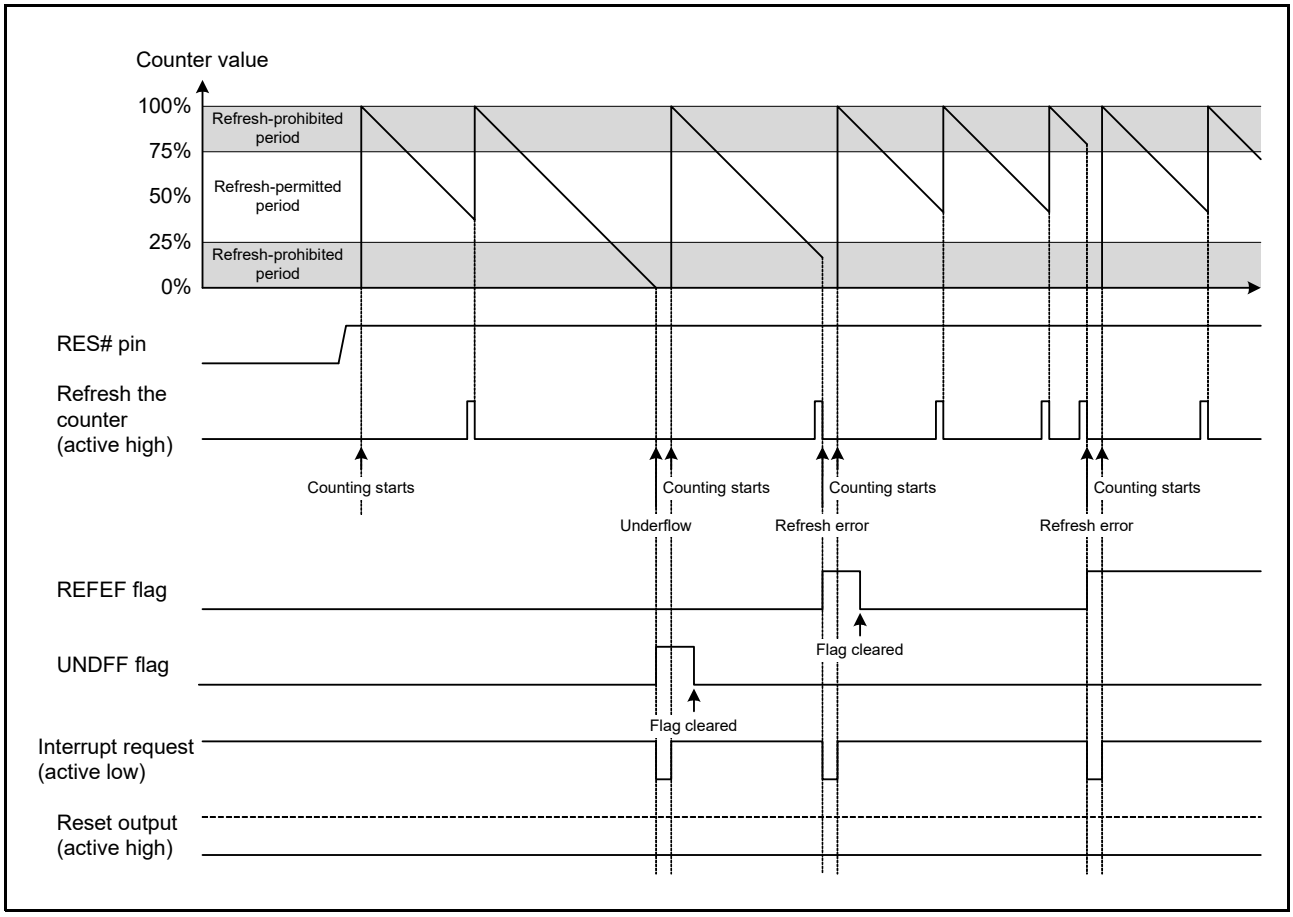

Figure 31.4 Operation Example in Auto-Start Mode

31.3.2 Refresh Operation

The counter is refreshed by writing the values 00h and then FFh to the WDTRR register. If a value other than FFh is written after 00h, the counter is not refreshed. After such invalid writing, correct refreshing is performed by again writing to 00h and then FFh to the WDTRR register.
Even if a register other than the WDTRR register is accessed or the WDTRR register is read between writing 00h and writing FFh to the WDTRR register, correct refreshing will be done.
Writing to refresh the counter must be performed within the refresh-permitted period. Whether writing is done within the refresh-permitted period is determined when writing FFh. For this reason, correct refreshing will be done even if 00h is written outside the refresh-permitted period.

[Sample sequences of writing that are valid for refreshing the counter]

- 00h → FFh
- 00h (n–1-th time) → 00h (nth time) → FFh
- 00h → access to another register or read from the WDTRR register → FFh

[Sample sequences of writing that are not valid for refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h→ AAh (00h and a value other than FFh) → FFh

After FFh is written to the WDTRR register, refreshing the counter requires up to four cycles of the signal for counting. Therefore, writing FFh to the WDTRR register should be completed four-count cycles before the counter underflows.

Figure 31.5 shows the WDT refresh operation waveforms when the count clock is PCLKB/64.

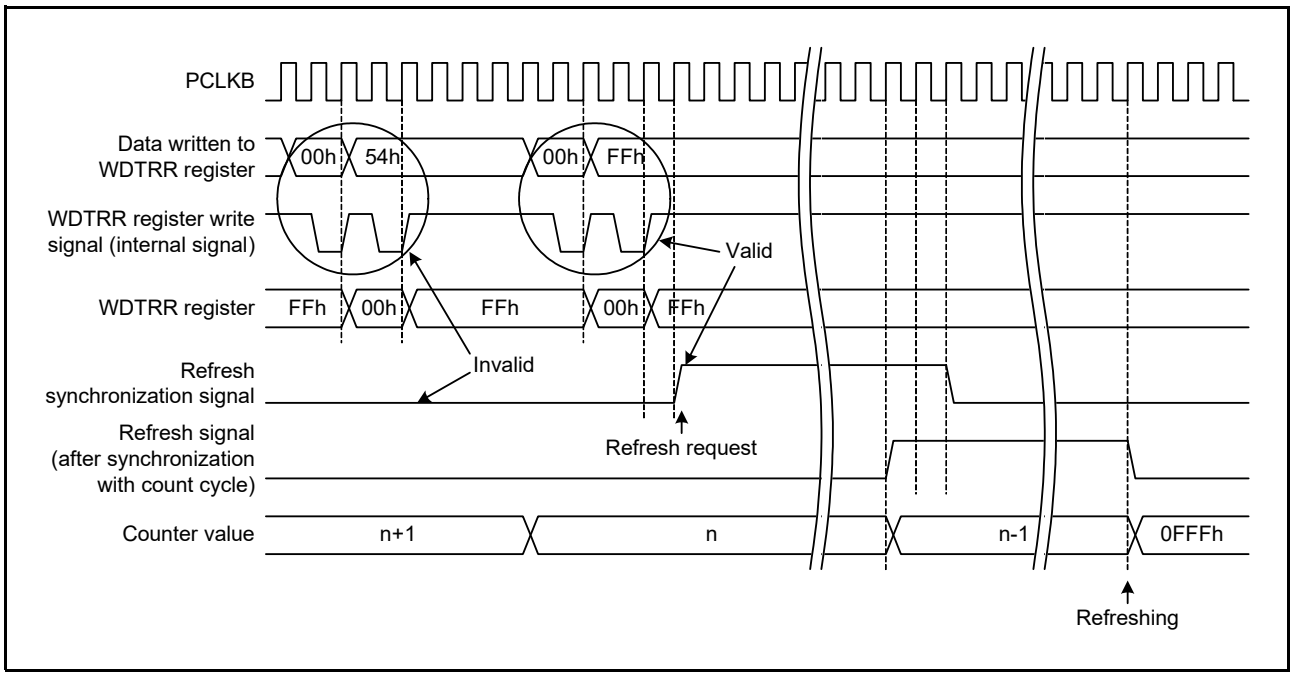

Figure 31.5 WDT Refresh Operation Waveforms (WDTCR.CKS[3:0] = 0100b, WDTCR.TOPS[1:0] = 01b)

31.3.3 Reset Output

When the WDTRCR.RSTIRQS bit is set to 1 in register start mode or when the WDT0RSTIRQS bit in option function select register 0 (OFS0) is set to 1 in auto-start mode, a reset signal is output when an underflow in the counter or a refresh error occurs.
In register start mode, all registers are initialized after output of the reset signal. To start down-counting, set the registers again after the reset is released and then perform a refresh operation.
In auto-start mode, counting down automatically starts after the reset output.

31.3.4 Interrupt Source

When the WDTRCR.RSTIRQS bit is set to 0 in register start mode or when the OFS0.WDT0RSTIRQS bit is set to 0 in auto-start mode, an interrupt (WUNI) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or a maskable interrupt. For details, refer to section 15, Interrupt Controller (ICUM).

Table 31.4 WDT Interrupt Source

Name	Interrupt Source	DTC Activation	DMAC Activation
WUNI	Counter underflow Refresh error	Not possible	Not possible

31.3.5 Reading the Counter Value

The WDT stores the counter value in the WDTSR.CNTVAL[13:0] bits. Thus, the counter value can be checked through the WDTSR.CNTVAL[13:0] bits.
Figure 31.6 shows the processing for reading the WDT counter value when the count clock is PCLKB/64.

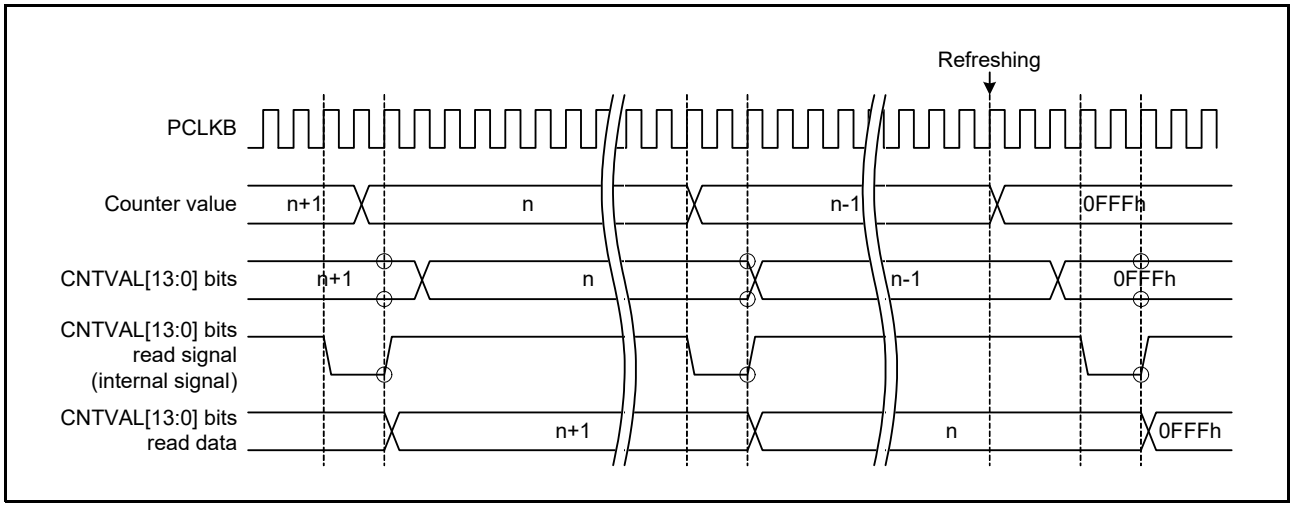

Figure 31.6 Processing for Reading WDT Counter Value (WDTCR.CKS[3:0] = 0100b, WDTCR.TOPS[1:0] = 01b)

31.3.6 Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers

Table 31.5 lists the correspondence between option function select register 0 (OFS0) used in auto-start mode and the registers used in register start mode.
For details on the OFS0 register, refer to section 7.2.2, Option Function Select Register 0 (OFS0).

Table 31.5 Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers

Target of Control	Function	OFS0 Register (Enabled in Auto-Start Mode) OFS0.WDT0STRT = 0	WDT Registers (Enabled in Register Start Mode) OFS0.WDT0STRT = 1
Counter	Timeout period selection	OFS0.WDT0TOPS[1:0]	WDTCR.TOPS[1:0]
	Clock divide ratio selection	OFS0.WDT0CKS[3:0]	WDTCR.CKS[3:0]
	Window start position selection	OFS0.WDT0RPSS[1:0]	WDTCR.RPSS[1:0]
	Window end position selection	OFS0.WDT0RPES[1:0]	WDTCR.RPES[1:0]
Reset output or interrupt request output	Reset output or interrupt request output selection	OFS0.WDT0RSTIRQS	WDTRCR.RSTIRQS
Count stop	Sleep mode count stop control	OFS0.WDT0SLCSTP	WDTCSTPR.SLCSTP

31.4 Link Operation by ELC

The event link controller (ELC) can use the interrupt request signal generated by the WDT as the event signal. Therefore, the ELC generates an event to the module specified previously when the WDT outputs an interrupt request. The event signal is output by the counter underflow and refresh error.
An event signal is output regardless of the setting of the WDTRCR.RSTIRQS bit in register start mode or the OFS0.WDT0RSTIRQS bit in auto-start mode. An event signal can also be output upon generation of the next interrupt source while the WDTSR.REFEF or WDTSR.UNDFF flag is 1.
For details, see section 21, Event Link Controller (ELC).

32. Independent Watchdog Timer (IWDTa)

The independent watchdog timer (IWDT) can be used to detect programs being out of control.
The user can detect when a program runs out of control if an underflow occurs, by creating a program that refreshes the IWDT counter before it underflows.
The functions of the IWDT are different from those of the WDT in the following respects.

- The divided IWDT clock (IWDTCLK) is used as the count clock (not affected by the peripheral module clock).
- The IWDTCSTPR.SLCSTP bit or the OFS0.IWDTSLCSTP bit can be used to select not to stop the counter not only in sleep mode and deep sleep mode but also in software standby mode and deep software standby mode 1.

32.1 Overview

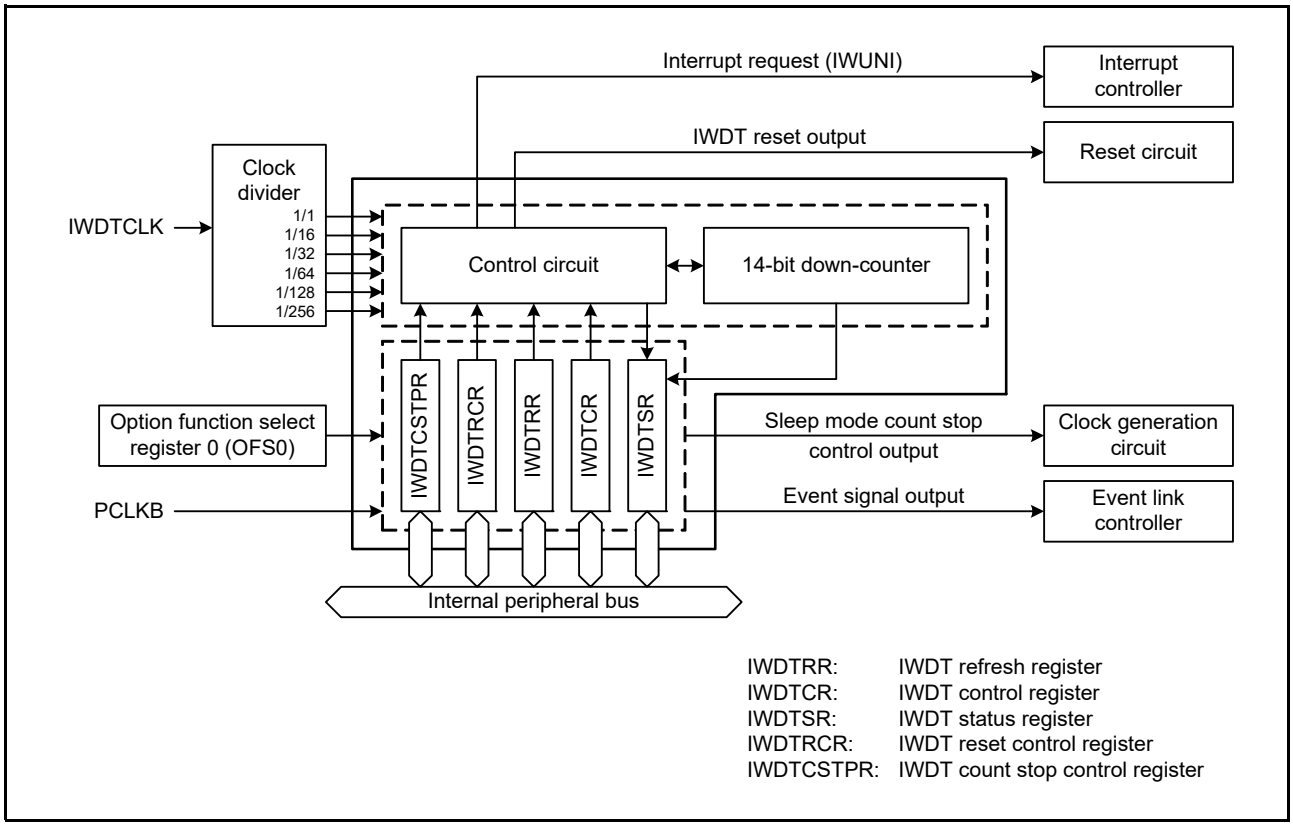
Table 32.1 lists the specifications of the IWDT.

Table 32.1 IWDT Specifications

Item	Description
Count source*1	IWDT clock (IWDTCLK)
Clock divide ratio	Divide by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit counter
Conditions for starting the counter	• Auto-start mode: Counting automatically starts after a reset is released • Register start mode: Counting is started by refresh operation (writing 00h and then FFh to the IWDTRR register).
Conditions for stopping the counter	• Reset • In low power consumption modes (depends on the register setting*2) • A counter underflows or a refresh error occurs (only in register start mode)
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Reset output sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/ maskable interrupt sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading the counter value	The counter value can be read by the IWDTSR register.
Event link function (output)	• Counter underflow event output • Refresh error event output
Auto-start mode (controlled by option function select register 0 (OFS0))	• Selecting the clock frequency divide ratio after a reset (OFS0.IWDTCKS[3:0] bits) • Selecting the timeout period of the independent watchdog timer (OFS0.IWDTTOPS[1:0] bits) • Selecting the window start position in the independent watchdog timer (OFS0.IWDTRPSS[1:0] bits) • Selecting the window end position in the independent watchdog timer (OFS0.IWDTRPES[1:0] bits) • Selecting the reset output or interrupt request output (OFS0.IWDTRSTIRQS bit) • Selecting the counter operation/stop in low power consumption mode (OFS0.IWDTSLCSTP bit)
Register start mode (controlled by the IWDT registers)	• Selecting the clock frequency divide ratio after refreshing (IWDTCR.CKS[3:0] bits) • Selecting the timeout period of the independent watchdog timer (IWDTCR.TOPS[1:0] bits) • Selecting the window start position in the independent watchdog timer (IWDTCR.RPSS[1:0] bits) • Selecting the window end position in the independent watchdog timer (IWDTCR.RPES[1:0] bits) • Selecting the reset output or interrupt request output (IWDTRCR.RSTIRQS bit) • Selecting the counter operation/stop in low power consumption mode (IWDTCSTPR.SLCSTP bit)
ProtectZone filter	Security attribute can be set.*3

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 32 × (the frequency of the count clock).
Note 2. When the OFS0.IWDTSLCSTP bit is 1 in auto-start mode, and when the IWDTCSTPR.SLCSTP bit is 1 in register start mode.
Note 3. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Figure 32.1 is a block diagram of the IWDT.
In IWDT, the bus interface and registers operate with the peripheral module clock (PCLKB), while the 14-bit down-counter and control circuits operate with IWDTCLK.



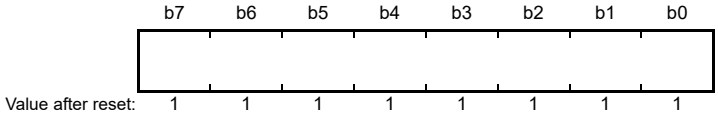


Figure 32.1 IWDT Block Diagram

32.2 Register Descriptions

32.2.1 IWDT Refresh Register (IWDTRR)

Address(es): IWDT.IWDTRR 8780 2200h, IWDT_NS.IWDTRR 0780 2200h

Bit	Description	R/W
b7 to b0	The counter is refreshed by writing 00h and then writing FFh to this register.	R/W

The IWDTRR register is used to refresh the counter of the IWDT.
The counter of the IWDT is refreshed by writing 00h and then writing FFh to the IWDTRR register (refresh operation) within the refresh-permitted period.
After the counter has been refreshed, it starts counting down from the value selected by the IWDTTOPS[1:0] bits in option function select register 0 (OFS0) in auto-start mode. In register start mode, counting down starts from the value selected by setting the IWDTCR.TOPS[1:0] bits in the first refresh operation after a reset is released.
When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh.
For details of the refresh operation, refer to section 32.3.2, Refresh Operation.

32.2.2 IWDT Control Register (IWDTCR)

Address(es): IWDT.IWDTCR 8780 2202h, IWDT_NS.IWDTCR 0780 2202h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15, b14	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the time until a timeout occurs and the refresh-permitted period when using register start mode.

In auto-start mode, the settings in the IWDTCR register are disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the IWDTCR register can also be made in the OFS0 register. For details, refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

TOPS[1:0] Bits (Timeout Period Select)

These bits select the timeout period (period until the counter underflows) from among 128, 512, 1024, or 2048 cycles of the count clock.

After the counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of IWDTCLK cycles) until the counter underflows.

Relations between the CKS[3:0] and TOPS[1:0] bit setting, the timeout period, and the number of IWDTCLK cycles are listed in Table 32.2.

Table 32.2 Settings and Timeout Periods

CKS[3:0] Bits				TOPS[1:0] Bits				
b7	b6	b5	b4	b1	b0	Clock Divide Ratio	Timeout Period (Number of Cycles)	Cycles of IWDTCLK
0	0	0	0	0	0	No division	128	128
				0	1		512	512
				1	0		1024	1024
				1	1		2048	2048
0	0	1	0	0	0	Divide-by-16	128	2048

				1	1		2048	32768
0	0	1	1	0	0	Divide-by-32	128	4096
				0	1		512	16384
				1	0		1024	32768
				1	1		2048	65536
0	1	0	0	0	0	Divide-by-64	128	8192
				0	1		512	32768
				1	0		1024	65536
				1	1		2048	131072
1	1	1	1	0	0	Divide-by-128	128	16384
				0	1		512	65536
				1	0		1024	131072
				1	1		2048	262144
0	1	0	1	0	0	Divide-by-256	128	32768
				0	1		512	131072
				1	0		1024	262144
				1	1		2048	524288

CKS[3:0] Bits (Clock Divide Ratio Select)

These bits specify the frequency of the clock used for the counter (count clock). The count clock frequency can be selected from among the IWDTCLK divided by 1, 16, 32, 64, 128, and 256. Combination with the TOPS[1:0] bit setting, a count period between 128 and 524288 cycles of the IWDTCLK can be selected for the IWDT.

RPES[1:0] Bits (Window End Position Select)

These bits select 75%, 50%, 25% or 0% of the count period for the window end position of the counter. The window end position should be a value smaller than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.
The counter values for the window start and end positions selected by setting the RPSS[1:0] and RPES[1:0] bits change depending on the TOPS[1:0] bit setting.
Table 32.3 lists the counter values for the window start and end positions corresponding to TOPS[1:0] bit values.

Table 32.3 Relationship between Timeout Period and Window Start and End Counter Values

TOPS[1:0] Bits		Timeout Period		Window Start and End Counter Value			
b1	b0	Cycles	Counter Value	100%	75%	50%	25%
0	0	128	007Fh	007Fh	005Fh	003Fh	001Fh
0	1	512	01FFh	01FFh	017Fh	00FFh	007Fh
1	0	1024	03FFh	03FFh	02FFh	01FFh	00FFh
1	1	2048	07FFh	07FFh	05FFh	03FFh	01FFh

RPSS[1:0] Bits (Window Start Position Select)

These bits select a counter window start position from 100%, 75%, 50%, or 25% of the count period (100% when the count starts and 0% when the counter underflows). The interval between the window start position and window end position is the refresh-permitted period and the other periods are refresh-prohibited periods.
Figure 32.2 shows the relationship between of the RPSS[1:0] and RPES[1:0] bit setting and the refresh-permitted and refresh-prohibited periods.

RPSS[1:0] Bits		RPES[1:0] Bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note. If the window end setting is greater than or equal to the window start setting, the window end position is set to 0%.

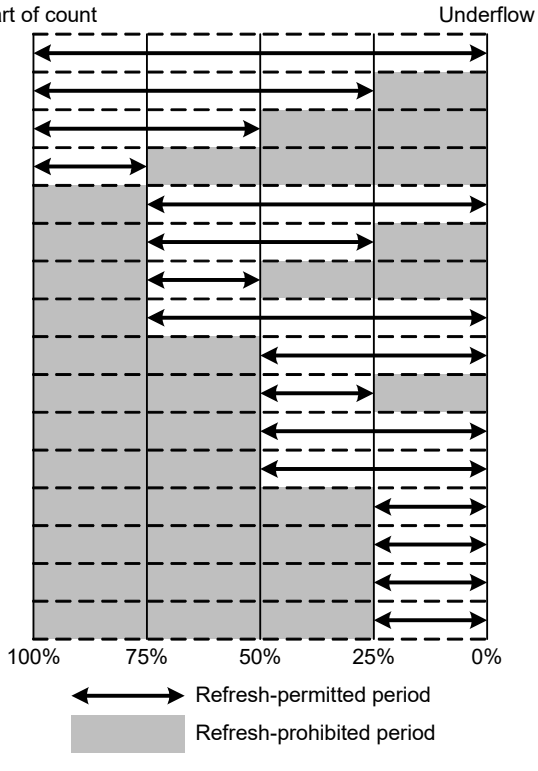

Figure 32.2 RPSS[1:0] and RPES[1:0] Bit Settings and the Refresh-Permitted Period

32.2.3 IWDT Status Register (IWDTSR)

Address(es): IWDT.IWDTSR 8780 2204h, IWDT_NS.IWDTSR 0780 2204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b13 to b0	CNTVAL[13:0]	Counter Value	Value counted by the counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred	R/(W) *1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred	R/(W) *1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] Bits (Counter Value)

These bits are used to confirm the value of the counter, but note that the read value may differ from the actual count by a value of one count.

UNDFF Flag (Underflow Flag)

This flag is used to confirm whether or not an underflow has occurred in the counter.
The value 1 indicates that the counter has underflowed. The value 0 indicates that the counter has not underflowed.
To clear the flag, write 0 to the UNDFF flag. The flag will be cleared three IWDTCLK cycles and 32 PCLKB cycles after writing 0.
Note that after an underflow occurs, the flag cannot be cleared for a period of one count clock cycle and two IWDTCLK cycles. Wait for the period before clearing the flag.

REFEF Flag (Refresh Error Flag)

This flag is used to confirm whether or not a refresh error (performing a refresh operation during a refresh-prohibited period) has occurred.
The value 1 indicates that a refresh error has occurred. The value 0 indicates that no refresh error has occurred.
To clear the flag, write 0 to the REFEF flag. The flag will be cleared three IWDTCLK cycles and 32 PCLKB cycles after writing 0.
Note that after a refresh error occurs, the flag cannot be cleared for a period of one count clock cycle and two IWDTCLK cycles. Wait for the period before clearing the flag.

32.2.4 IWDT Reset Control Register (IWDTRCR)

Address(es): IWDT.IWDTRCR 8780 2206h, IWDT_NS.IWDTRCR 0780 2206h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	RSTIRQS	Reset Interrupt Request Select	0: Non-maskable interrupt request or maskable interrupt request is output. 1: Reset signal is output.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the behavior when a timeout or refresh error occurs when using register start mode. In auto-start mode, the IWDTRCR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the IWDTRCR register can also be made in the OFS0 register. For details, refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

32.2.5 IWDT Count Stop Control Register (IWDTCSTPR)

Address(es): IWDT.IWDTCSTPR 8780 2208h, IWDT_NS.IWDTCSTPR 0780 2208h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	SLCSTP	Sleep Mode Count Stop Control	0: Counter continues counting even in low power consumption mode.*1 1: Counter stops in low power consumption mode.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.
Note 1. The counter continues counting in sleep mode, deep sleep mode, software standby mode, or deep software standby mode 1. The MCU does not enter deep software standby mode 2 or 3.

This register is used to specify whether the counter operates in low power consumption mode when using register start mode.
In auto-start mode, the IWDTCSTPR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting mode to the IWDTCSTPR register can also be made in the OFS0 register. For details, refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

SLCSTP Bit (Sleep Mode Count Stop Control)

This bit selects whether the counter continues or stops counting in low power consumption mode.

32.2.6 Option Function Select Register 0 (OFS0)

For option function select register 0 (OFS0), refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

32.3 Operation

32.3.1 Count Operation in Each Start Mode

Select the IWDT start mode by setting the IWDTSTRT bit in option function select register 0 (OFS0).
When the OFS0.IWDTSTRT bit is 1 (register start mode), the IWDTCR, IWDTRCR, and IWDTCSTPR registers are enabled, and counting is started by refresh operation (writing) to the IWDTRR register. When the OFS0.IWDTSTRT bit is 0 (auto-start mode), the setting of the OFS0 register is enabled, and counting automatically starts after reset.

32.3.1.1 Register Start Mode

When the OFS0.IWDTSTRT bit in option function select register 0 is 1, register start mode is selected, and the IWDTCR, IWDTRCR, and IWDTCSTPR registers are enabled.
After a reset is released, set the clock divide ratio, window start and end positions, and timeout period in the IWDTCR register, the reset output or interrupt request output in the IWDTRCR register, and counter operation/stop in low power consumption mode in the IWDTCSTPR register. Then, refresh the counter to start counting down from the value selected by setting the IWDTCR.TOPS[1:0] bits.
Thereafter, as long as the program continues normal operation and the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The IWDT does not output the reset signal as long as this continues. However, if the counter underflows because the counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the IWDT outputs a reset signal or an interrupt request (IWUNI). Set the IWDTRCR.RSTIRQS bit to select either reset signal output or interrupt request output.

Figure 32.3 shows an example of operation under the following conditions.

- Register start mode (OFS0.IWDTSTRT = 1)
- Reset output is enabled (IWDTRCR.RSTIRQS = 1)
- The window start position is 75% (IWDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (IWDTCR.RPES[1:0] = 10b)

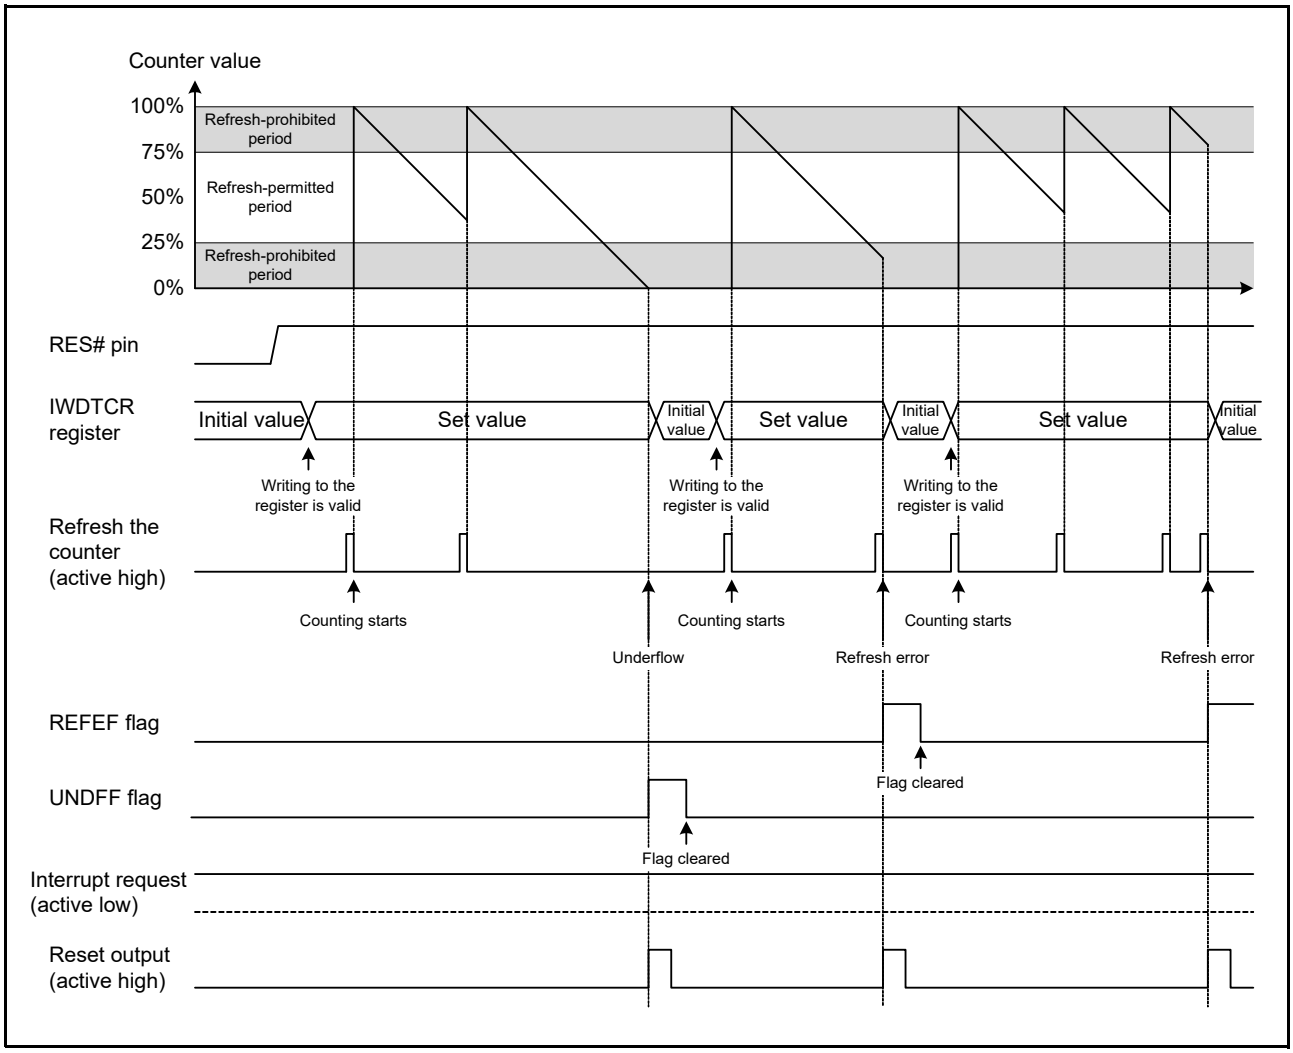

Figure 32.3 Operation Example in Register Start Mode

32.3.1.2 Auto-Start Mode

When the IWDTSTRT bit in option function select register 0 (OFS0) is 0, auto-start mode is selected, and the IWDTCR, IWDTRCR, and IWDTCSTPR registers are disabled.

During the reset state, the clock divide ratio, window start and end positions, timeout period, reset output or interrupt request output, and counter operation/stop in low power consumption mode are set using the values specified in the OFS0 register. When the reset is released, the counter automatically starts counting down from the value selected by the OFS0.IWDTTOPS[1:0] bits.

After that, as long as the program continues normal operation and the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The IWDT does not output the reset signal as long as this continues. However, if the counter underflows because refreshing of the counter is not possible due to the program having entered crashed execution or if a refresh error occurs due to refreshing outside the refresh-permitted period, the IWDT outputs the reset signal or an interrupt request (IWUNI). After the reset signal or interrupt request (IWUNI) is generated, the counter reloads the timeout period after counting for one cycle, and restarts counting. Set the OFS0.IWDTRSTIRQS bit to select either reset signal output or interrupt request output.

Figure 32.4 shows an example of operation under the following conditions.

- Auto-start mode (OFS0.IWDTSTRT = 0)
- Interrupt request output is enabled (OFS0.IWDTRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDTRPES[1:0] = 10b)

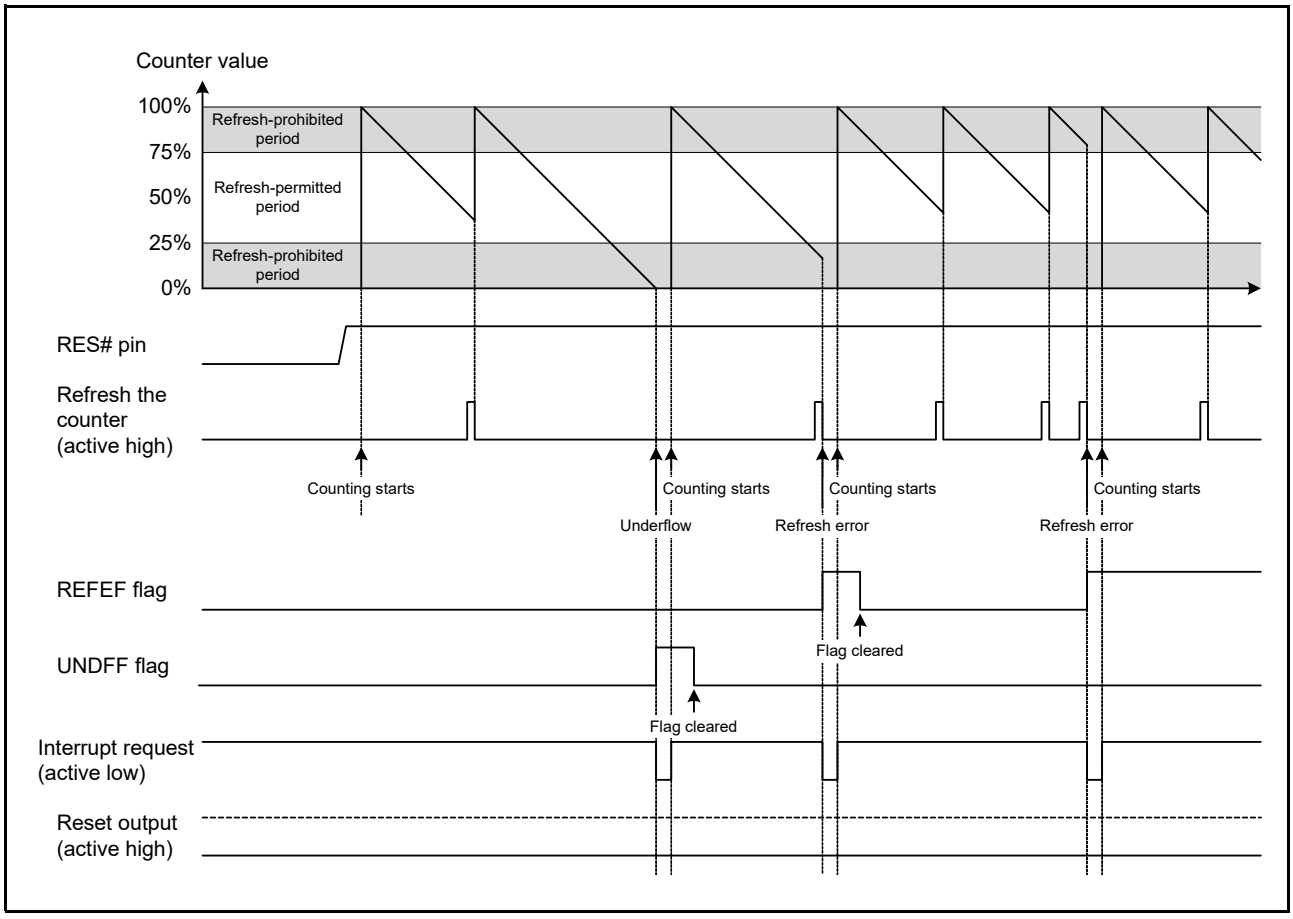

Figure 32.4 Operation Example in Auto-Start Mode

32.3.2 Refresh Operation

The counter is refreshed and starts operation (counting is started by refreshing) by writing the values 00h and then FFh to the IWDTRR register. If a value other than FFh is written after 00h, the counter is not refreshed. After such invalid writing, correct refreshing is performed by again writing 00h and then FFh to the IWDTRR register.
When writing is done in the order of 00h (first time) → 00h (second time), and if FFh is written after that, the writing order 00h → FFh is satisfied; writing 00h (n–1-th time) → 00h (nth time) → FFh is valid and correct refreshing will be done. Even when the first value written before 00h is not 00h, correct refreshing will be done if the operation contains the set of writing 00h → FFh. Moreover, even if a register other than the IWDTRR register is accessed or the IWDTRR register is read between writing 00h and writing FFh to the IWDTRR register, correct refreshing will be done.

[Sample sequences of writing that are valid for refreshing the counter]

- 00h → FFh
- 00h (n–1-th time) → 00h (nth time) → FFh
- 00h → access to another register or read from the IWDTRR register → FFh

[Sample sequences of writing that are not valid for refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h → AAh (00h and a value other than FFh) → FFh

Even when 00h is written to the IWDTRR register outside the refresh-permitted period, if FFh is written to the IWDTRR register in the refresh-permitted period, the writing sequence is valid and refreshing will be done.
After FFh is written to the IWDTRR register, refreshing the counter requires up to four cycles of the signal for counting (the IWDTCR.CKS[3:0] bits determine how many cycles of the IWDTCLK make up one cycle for counting). Therefore, writing FFh to the IWDTRR register should be completed four-count cycles before the end position of the refresh-permitted period or a counter underflow. The value of the counter can be checked by the IWDTSR.CNTVAL[13:0] bits.

[Sample refreshing timings]

- When the window start position is set to 01FFh, even if 00h is written to the IWDTRR register before 01FFh is reached (0202h, for example), refreshing is done if FFh is written to the IWDTRR register after the value of the IWDTSR.CNTVAL[13:0] bits has reached 01FFh.
- When the window end position is set to 01FFh, refreshing is done if 0203h (four-count cycles before 01FFh) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 00h → FFh to the IWDTRR register.
- When the refresh-permitted period continues until count 0000h, refreshing can be done immediately before an underflow. In this case, if 0003h (four-count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 00h → FFh to the IWDTRR register, no underflow occurs and refreshing is done.

Figure 32.5 shows the IWDT refresh operation waveforms when PCLKB > IWDTCLK and the count clock is IWDTCLK/1.

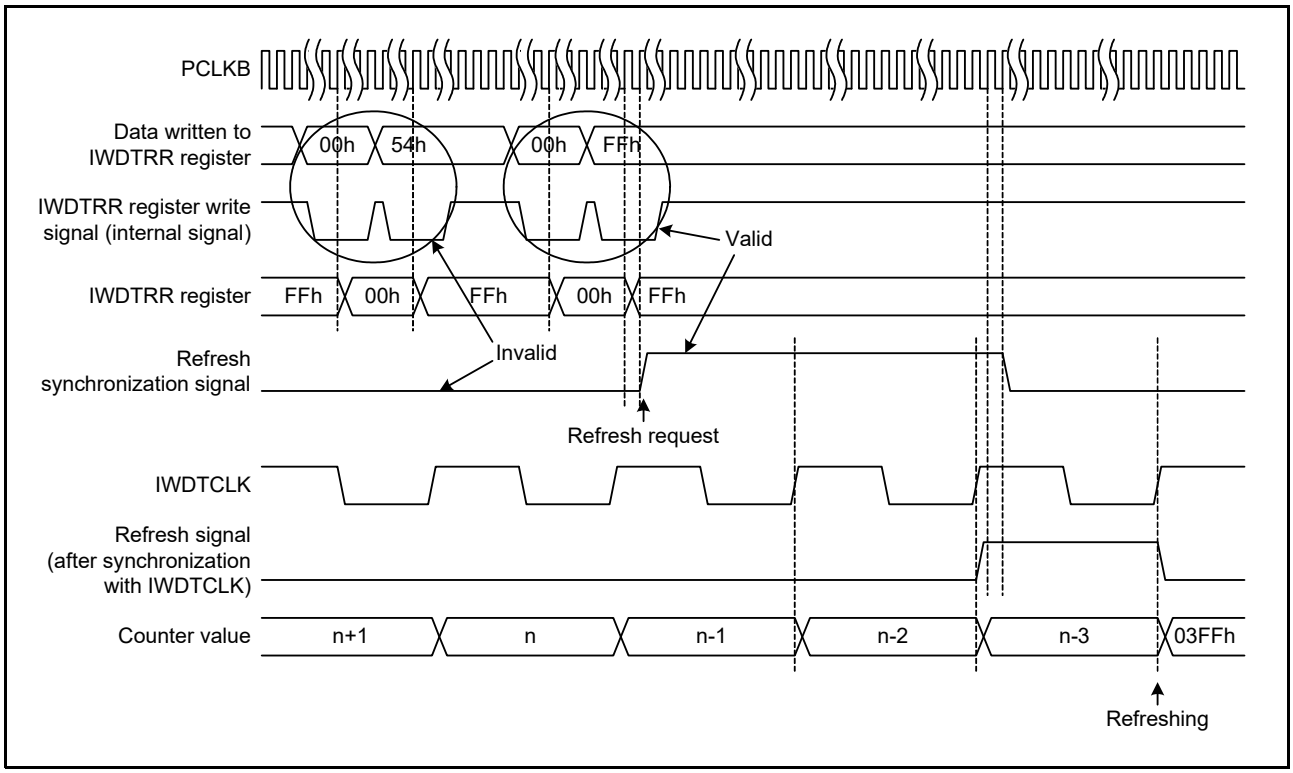

Figure 32.5 IWDT Refresh Operation Waveforms (IWDTCR.CKS[3:0] = 0000b, IWDTCR.TOPS[1:0] = 10b)

32.3.3 Status Flags

The IWDTSR.REFEF and IWDTSR.UNDFF flags retain the source of the interrupt request from the IWDT.
Thus, after interrupt request generation, read the IWDTSR.REFEF and IWDTSR.UNDFF flags to check for the interrupt source.
For each flag, writing 0 clears the bit and writing 1 has no effect.
Leaving the status flags unchanged does not affect operation. If the flags are not cleared, at the time of the next interrupt request from the IWDT, the earlier interrupt source is cleared and the new interrupt source is written.

32.3.4 Reset Output

When the IWDTRCR.RSTIRQS bit is set to 1 in register start mode or when the IWDTRSTIRQS bit in option function select register 0 (OFS0) is set to 1 in auto-start mode, a reset signal is output when an underflow in the counter or a refresh error occurs.
In register start mode, all registers are initialized after output of the reset signal. To start down-counting, set the registers again after the reset is released and then perform a refresh operation.
In auto-start mode, counting down automatically starts after the reset output.

32.3.5 Interrupt Sources

When the IWDTRCR.RSTIRQS bit is set to 0 in register start mode or when the OFS0.IWDTRSTIRQS bit is set to 0 in auto-start mode, an interrupt (IWUNI) signal is output when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or a maskable interrupt. For details, refer to section 15, Interrupt Controller (ICUM).

Table 32.4 IWDT Interrupt Source

Name	Interrupt Source	DTC Activation	DMAC Activation
IWUNI	Counter underflow Refresh error	Not possible	Not possible

32.3.6 Reading the Counter Value

As the counter in IWDTCLK, the counter value cannot be read directly. The IWDT synchronizes the counter value with the PCLKB and stores it in the IWDTSR.CNTVAL[13:0] bits. Thus, the counter value can be checked indirectly through the IWDTSR.CNTVAL[13:0] bits.

Reading the counter value requires multiple PCLKB clock cycles (up to four clock cycles), and the read counter value may differ from the actual counter value by a value of one count.

Figure 32.6 shows the processing for reading the IWDT counter value when PCLKB > IWDTCLK and the count clock is IWDTCLK/1.

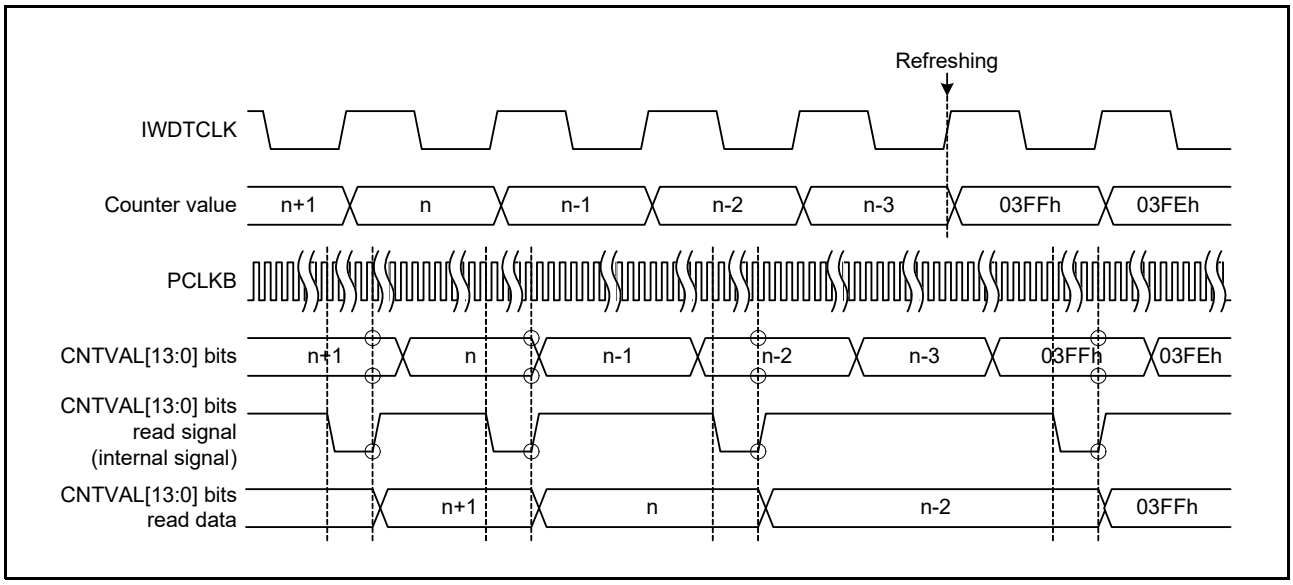

Figure 32.6 Processing for Reading IWDT Counter Value (IWDTCR.CKS[3:0] = 0000b, IWDTCR.TOPS[1:0] = 10b)

32.3.7 Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers

Table 32.5 lists the correspondence between option function select register 0 (OFS0) used in auto-start mode and the registers used in register start mode.
For details on the OFS0 register, refer to section 7.2.2, Option Function Select Register 0 (OFS0).

Table 32.5 Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers

Target of Control	Function	OFS0 Register (Enabled in Auto-Start Mode) OFS0.IWDTSTRT = 0	IWDT Registers (Enabled in Register Start Mode) OFS0.IWDTSTRT = 1
Counter	Timeout period selection	OFS0.IWDTTOPS[1:0]	IWDTCR.TOPS[1:0]
	Clock divide ratio selection	OFS0.IWDTCKS[3:0]	IWDTCR.CKS[3:0]
	Window start position selection	OFS0.IWDTRPSS[1:0]	IWDTCR.RPSS[1:0]
	Window end position selection	OFS0.IWDTRPES[1:0]	IWDTCR.RPES[1:0]
Reset output or interrupt request output	Reset output or interrupt request output selection	OFS0.IWDTRSTIRQS	IWDTRCR.RSTIRQS
Count stop	Sleep mode count stop control	OFS0.IWDTSLCSTP	IWDTCSTPR.SLCSTP

32.4 Link Operation by ELC

The event link controller (ELC) can use the interrupt request signal generated by the IWDT as the event signal. Therefore, the ELC generates an event to the module specified previously when the IWDT outputs an interrupt request. The event signal is output by the counter underflow and refresh error.
An event signal is output regardless of the setting of the IWDTRCR.RSTIRQS bit in register start mode or the OFS0.IWDTRSTIRQS bit in auto-start mode. An event signal can also be output upon generation of the next interrupt source while the IWDTSR.REFEF or IWDTSR.UNDFF flag is 1.
For details, see section 21, Event Link Controller (ELC).

32.5 Usage Notes

32.5.1 Refresh Operations

When making the settings to control the timing of refreshing, consider variations in the range of errors due to the accuracy of the PCLKB and IWDTCLK and set values which ensure that refreshing is possible.

32.5.2 Count Clock Frequency Setting

Satisfy the frequency of the PCLKB ≥ 32 × (the frequency of the count clock).

32.5.3 Reading Counter after Returning from Deep Software Standby Mode 1

After returning from deep software standby mode 1, the value of the IWDTSR.CNTVAL[13:0] bits will be 0000h until the first count clock is supplied. To obtain the down counter value, use one of the following methods:

- Continue reading the CNTVAL[13:0] bits until a value other than 0000h is read.
- Wait until the count clock is supplied, then read the CNTVAL[13:0] bits.
- If the entire period is set as the refresh-permitted period, refresh the counter and then read the CNTVAL[13:0] bits.

32.5.4 Transitions to Low Power Consumption Mode

If the timer-refresh procedure is started immediately before entry to low power consumption mode, complete the procedure, confirm that FFh has been written to the IWDTRR register, and then execute a WAIT instruction.

33. Ethernet Module

33.1 Overview

The Ethernet module (ESWM) system consists of the following six modules.

- Ethernet message forwarding engine (MFWD)
- Ethernet common agent (COMA)
- Ethernet agent (ETHA)
- Ethernet MAC (RMAC)
- Ethernet CPU agent (GWCA)
- Ethernet generalized PTP timer (GPTP)

This MCU has two Ethernet ports compliant with the IEEE 802.3 Media Access Control (MAC) layer protocol. The 128-bit wide fabric bus and protocol analysis function at the network layer enable Ethernet switches that support high-speed, advanced routing functions, and protocol conversion.

Table 33.1 lists the specifications of ESWM. Figure 33.1 shows the block diagram of the ESWM system. Table 33.2 lists the I/O pins of ESWM.

Table 33.1 ESWM Specifications (1/2)

Item		Description
MAC	Number or ports	2 ports
	Supported standard	IEEE 802.3
	Supported PHY interfaces	MII, RMII, GMII, RGMII
	Data rate	10 Mbps, 100 Mbps, 1000 Mbps
	Mode	Full duplex Half duplex (10 Mbps or 100 Mbps only)
	Jumbo frame support	Up to 64 Kbytes
	Management interface	MDIO
	MAC-to-MAC connection	Full-duplex communication at 10 Mbps or 100 Mbps is possible by connecting MII to MII.
	Power reduction	Supports Energy Efficient Ethernet (IEEE 802.3az)
	Wake-on-LAN	Magic Packet™ detection, WOL signal output
Ethernet switch	Forwarding modes	Layer 3, Layer 2, VLAN
	Architecture	Cut through/store and forward
	MAC table	2048
	VLAN table	4096
	Stream table	256 (Perfect filter, Layer 3, Layer 2)
	Layer2/Layer3 update rule table	256
Generalized PTP timer	Number of channels	2
	Media clock capture input	2
	Media clock recovery output	2
	PTP pulse generator	four output timers
Ethernet AVB	Supported standards	• IEEE 802.1BA (The AVB Profile) • IEEE 1722-2011 (Media Transport Protocol for Audio, Video) • IEEE 802.1AS-2011 (gPTP: A profile of IEEE 1588 for AVB systems) • IEEE 802.1Qav-2009 (Credit Based Shaper for bandwidth reservation)

Table 33.1 ESWM Specifications (2/2)

Item		Description
Ethernet TSN	Supported standards	• IEEE 802.1AS-Rev (Adds Redundancy and enhancements to gPTP) • IEEE 802.1Qbv-2015 (Time Aware Shaper) • IEEE 802.1Qbu-2016 (802.3br) (Frame Pre-emption) • IEEE 802.1Qcr (Asynchronous Traffic Shaping) • IEEE 802.1Qci-2017 (Stream based Filtering and Policing) • IEEE 802.1CB-2017 (Frame Replication and Elimination for Reliability) • IEEE 802.1Qch-2017 (Cyclic Queuing & Forwarding)
Protect Zone filter	Security attribute can be set.*1	

Note 1. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

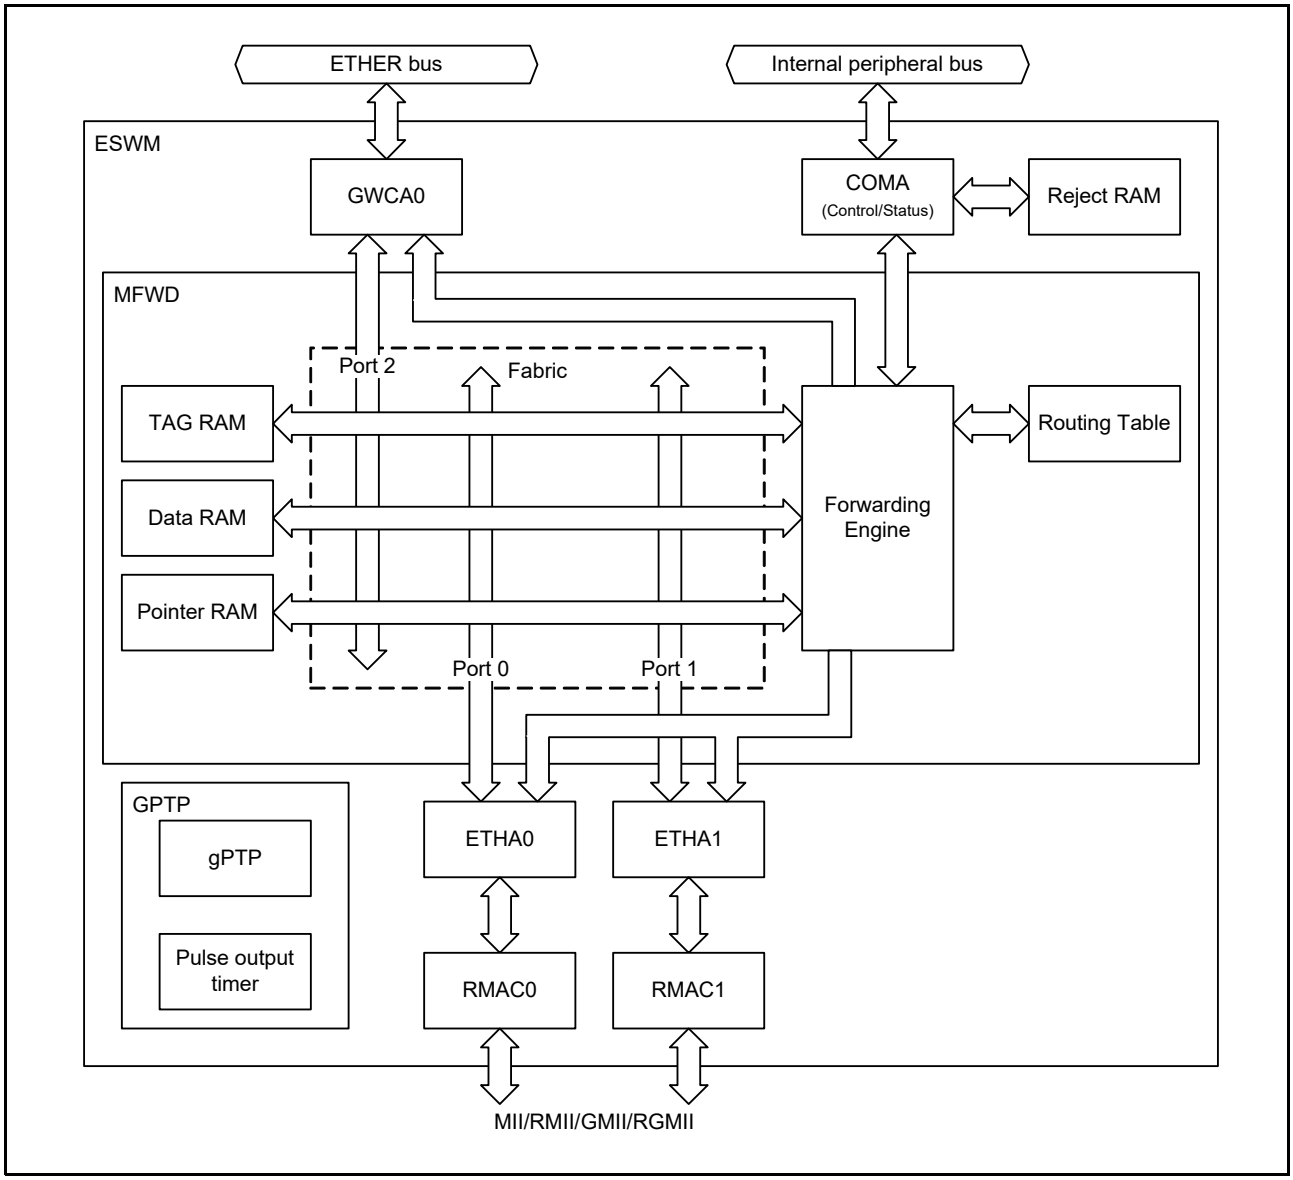

Figure 33.1 ESWM Block Diagram

Table 33.2 ESWM I/O Pins (n = 0, 1)

Interface	Pin Name	I/O	Description
MII/GMII	ETn_GTX_CLK	Output	1000 Mbps transmit clock
	ETn_TX_CLK	I/O	100 Mbps, 10 Mbps transmit clock
	ETn_RX_CLK	I/O	Receive clock
	ETn_TX_EN	Output	Transmit enable
	ETn_TXD7 to ETn_TXD0	Output	Transmit data
	ETn_TX_ER	Output	Transmit coding error
	ETn_RX_DV	Input	Receive data valid
	ETn_RXD7 to ETn_RXD0	Input	Receive data
	ETn_RX_ER	Input	Receive error
	ETn_MDC	Output	Management data clock
	ETn_MDIO	I/O	Management data input/output
	ETn_CRS	Input	Receive Carrier Sense for MII Half Duplex
	ETn_COL	Input	Receive Collision detection for MII Half Duplex
RGMII	RGMIIn_TXC	Output	Transmit clock
	RGMIIn_RXC	Input	Receive clock
	RGMIIn_TX_CTL	Output	Transmit control
	RGMIIn_TXD3 to RGMIIn_TXD0	Output	Transmit data
	RGMIIn_RX_CTL	Input	Receive control
	RGMIIn_RXD3 to RGMIIn_RXD0	Input	Receive data
RMII	RMIIn_REF50CK	Input	Synchronous clock reference
	RMIIn_TX_EN	Output	Transmit enable
	RMIIn_TXD1, RMIIn_TXD0	Output	Transmit data
	RMIIn_CRS_DV	Input	Carrier sense/Receive data valid
	RMIIn_RXD1, RMIIn_RXD0	Input	Receive data
	RMIIn_RX_ER	Input	Receive error
Common	ETn_LINKSTA	Input	PHY link status
	ETn_INT	Input	PHY interrupt
	ETn_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received.
GPTP	GPTP_CAPTURE0, GPTP_CAPTURE1	Input	Media clock capture input
	GPTP_MATCH0, GPTP_MATCH1	Output	Media clock recovery output
	GPTPn_PPS	Output	PPS signal
	GPTP_PTPOUT0 to GPTP_PTPOUT3	Output	PTP Pulse generator signal
TSN	ET_TAS_STA0 to ET_TAS_STA3	Output	TAS status monitor

Table 33.3 lists an overview of each modules that configures the ESWM system.

Table 33.3 ESWM Functional Blocks

Module	Function	Operating Clock*1	Address
ESWM	Top module	—	874C 8000h to 874C 8FFFh, 874E 1400h to 874E 1FFFh
MFWD	Core module of the ESWM system. Forwards descriptors received from a port (GWCA or ETHA) to other ports based on the destination MAC address, VLAN code, IP address, port number, etc.	ESWCLK	874C 0000h to 874C 7FFFh
COMA	Interface module between CPU and ESWM system. Access control of ESWM internal registers, pointer control of ESWM local RAM.	PCLKA ESWCLK	874C 9000h to 874C 9FFFh
ETHA	Ethernet frame generation module. Transmission: Generates Ethernet frames based on the descriptors received from MFWD. Reception: Forwards frames received from RMAC to MFWD.	ESWCLK	874C A000h to 874C AFFFh, 874C C000h to 874C CFFFh
RMAC	IEEE 802.3 compliant media access controller. Interfaces physical layer LSI chip (PHY-LSI) with ETHA and performs message filtering.	ESWCLK ESWPHYCLK (RGMII)	874C B000h to 874C BFFFh, 874C D000h to 874C DFFFh
GWCA	Interface module with ETHER bus (bus master). Transmission: Transfers descriptors and frame data read from CPU memory to MFWD. Reception: Transfers descriptors and frame data received from MFWD to CPU memory.	ICLK ESWCLK	874C E000h to 874C EFFFh
GPTP	gPTP timer module Pulse output timer	PCLKA ESWCLK	874E 0000h to 874E 13FFh

Note 1. Refer to section 33.3.1, Operating Clocks for the frequency of each clock.

33.2 Register Description

33.2.1 ESWM Interface Control Registers

33.2.1.1 Media Interface Reset Register (MIIRR)

Address(es): ESWM.MIIRR 874E 1400h, ESWM_NS.MIIRR 074E 1400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b2	M2MEN	MAC-to-MAC Connection Enable	0: Setting for PHY-LSI connection (TX_CLK and RX_CLK are input). 1: Setting for MAC-to-MAC connection (TX_CLK and RX_CLK are output).	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5, b4	M2MCS[1:0]	ESWPHYCLK Select for MAC-to-MAC Connection*1	b5 b4 0 0: 500 MHz 0 1: 200 MHz 1 0: 100 MHz 1 1: Setting prohibited	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	DIVSTP	Clock Divider Stop	0: Enable 1: Stop	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	TXCIDE	RGMII TXC Internal Delay Enable	0: TXC Internal delay is disabled. 1: TXC Internal delay is enabled.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Refer to section 33.3.2, Interface Modes for the M2MCS[1:0] bit settings.

M2MEN Bit (MAC-to-MAC Connection Enable)

Set this bit to 1 when connecting to the MAC interface of another LSI. When this bit is set to 1, the ETn_TX_CLK and ETn_RX_CLK pins become outputs. If connecting ESWM modules together, set this bit to 1 for only one of the ESWM modules.

M2MCS[1:0] Bits (ESWPHYCLK Select for MAC-to-MAC Connection)

Set the frequency of the ESWPHYCLK generated by the clock generation circuit to these bits. These bits are valid when the M2MEN bit is set to 1.

DIVSTP Bit (Clock Divider Stop)

This bit is used to stop the frequency divider that generates each transmit clock from the ESWPHYCLK. this bit can be used in Low Power Idle (LPI) mode of Energy Efficient Ethernet.

33.2.1.3 Media Clock Capture Event Select Register (MCCESR)

Address(es): ESWM.MCCESR 874E 1410h, ESWM_NS.MCCESR 074E 1410h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ENDIAN	Bus Endian Select	0: Little endian 1: Big endian	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ENDIAN Bit (Bus Endian Select)

This bit is used to set the endian of the ESWM bus interface. Set this bit to the same endian as the CPU.

33.2.2 Interrupt Mapping Function Registers

33.2.2.1 Error and Status Interrupt Mapping Register 1 (TPEMIMC1)

Address(es): ESWM.TPEMIMC1 874C 8004h, ESWM_NS.TPEMIMC1 074C 8004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	CSICM[2:0]			—	—	CSIGM	CSIM	—	CEICM[2:0]			—	—	CEIGM	CEIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FSICM[2:0]			—	—	FSIGM	FSIM	—	FEICM[2:0]			—	—	FEIGM	FEIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FEIM	MFWD Error Interrupt Mapping	0: Generates an FWEI interrupt. 1: Follows the setting of the FEIGM and FEICM[2:0] bits. MFWD error interrupt includes the following sources: • MFWD.FWEIS0i (i = 0 to 2) • MFWD.FWEIS1 • MFWD.FWEIS2 • MFWD.FWEIS5 • MFWD.FWEIS6i (i = 0 to 3) • MFWD.FWEIS7i (i = 0 to 3) • MFWD.FWEIS8i (i = 0 to 3)	R/W
b1	FEIGM	MFWD Error Interrupt GWCA Mapping	This bit is valid only when the FEIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the FEICM[2:0] bits. 1: Does not output MFWD error interrupt.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b6 to b4	FEICM[2:0]	MFWD Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	FSIM	MFWD Status Interrupt Mapping	0: Generates an FWSI interrupt. 1: Follows the setting of the FSIGM and FSICM[2:0] bits. MFWD status interrupt includes the following sources: • MFWD.FWMIS0	R/W
b9	FSIGM	MFWD Status Interrupt GWCA Mapping	This bit is valid only when the FSIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the FSICM[2:0] bits. 1: Does not output MFWD status interrupt.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	FSICM[2:0]	MFWD Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b16	CEIM	COMA Error Interrupt Mapping	0: Generates a CAEI interrupt. 1: Follows the setting of the CEIGM and CEICM[2:0] bits. COMA error interrupt includes the following sources: • COMA.CAEIS0 • COMA.CAEIS1	R/W
b17	CEIGM	COMA Error Interrupt GWCA Mapping	This bit is valid only when the CEIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the CEICM[2:0] bits. 1: Does not output COMA error interrupt.	R/W
b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b22 to b20	CEICM[2:0]	COMA Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R
b24	CSIM	COMA Status Interrupt Mapping	0: Generates a CASI interrupt. 1: Follows the setting of the CSIGM and CSICM[2:0] bits. COMA status interrupt includes the following sources: • COMA.CAMIS0 • COMA.CAMIS1	R/W
b25	CSIGM	COMA Status Interrupt GWCA Mapping	This bit is valid only when the CSIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the CSICM[2:0] bits. 1: Does not output COMA status interrupt.	R/W
b27, b26	—	Reserved	These bits are read as 0. The write value should be 0.	R
b30 to b28	CSICM[2:0]	COMA Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

33.2.2.2 Error and Status Interrupt Mapping Register 2 (TPEMIMC2)

Address(es): ESWM.TPEMIMC2 874C 8008h, ESWM_NS.TPEMIMC2 074C 8008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EEIM0	ETHA0 Error Interrupt Mapping	0: Generates an EAEI0 interrupt. 1: Follows the setting of the EEIGM0 and EEICM0[2:0] bits. ETHA0 error interrupt includes the following sources: • ETHA0.EAEIS0 • ETHA0.EAEIS1 • ETHA0.EAEIS2 • RMAC0.MEIS	R/W
b1	EEIGM0	ETHA0 Error Interrupt GWCA Mapping	This bit is valid only when the EEIM0 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the EEICM0[2:0] bits. 1: Does not output ETHA0 error interrupt.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b6 to b4	EEICM0[2:0]	ETHA0 Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	ESIM0	ETHA0 Status Interrupt Mapping	0: Generates an EASI0 interrupt. 1: Follows the setting of the ESIGM0 and ESICM0[2:0] bits. ETHA0 status interrupt includes the following sources: • RMAC0.MMIS0	R/W
b9	ESIGM0	ETHA0 Status Interrupt GWCA Mapping	This bit is valid only when the ESIM0 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the ESICM0[2:0] bits. 1: Does not output ETHA0 status interrupt.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	ESICM0[2:0]	ETHA0 Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.2.4 Error and Status Interrupt Mapping Register 4 (TPEMIMC4)

Address(es): ESWM.TPEMIMC4 874C 8010h, ESWM_NS.TPEMIMC4 074C 8010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EEIM1	ETHA1 Error Interrupt Mapping	0: Generates an EAEI1 interrupt. 1: Follows the setting of the EEIGM1 and EEICM1[2:0] bits. ETHA1 error interrupt includes the following sources: • ETHA1.EAEIS0 • ETHA1.EAEIS1 • ETHA1.EAEIS2 • RMAC1.MEIS	R/W
b1	EEIGM1	ETHA1 Error Interrupt GWCA Mapping	This bit is valid only when the EEIM1 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the EEICM1[2:0] bits. 1: Does not output ETHA1 error interrupt.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b6 to b4	EEICM1[2:0]	ETHA1 Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	ESIM1	ETHA1 Status Interrupt Mapping	0: Generates an EASI1 interrupt. 1: Follows the setting of the ESIGM1 and ESICM1[2:0] bits. ETHA1 status interrupt includes the following sources: • RMAC1.MMIS0	R/W
b9	ESIGM1	ETHA1 Status Interrupt GWCA Mapping	This bit is valid only when the ESIM1 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the ESICM1[2:0] bits. 1: Does not output ETHA1 status interrupt.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	ESICM1[2:0]	ETHA1 Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.2.5 Error and Status Interrupt Mapping Register 6n (TPEMIMC6n) (n = 0, 1)

Address(es): ESWM.TPEMIMC60 874C 8080h, ESWM.TPEMIMC61 874C 8084h,
ESWM_NS.TPEMIMC60 074C 8080h, ESWM_NS.TPEMIMC61 074C 8084h

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	GDICM0[2:0]	GWCA0 Data Interrupt Core Mapping	GWCA0 data interrupt n is output as a GWDI0m interrupt. These bits specify the value of m. GWCA0 data interrupt n includes the following sources: • GWCA0.GWDISi.DISn (i = 0, 1) • GWCA0.GWEIS2i.DFESn (i = 0, 1) • GWCA0.GWEIS3.IAOESk (k = 0 to 3)	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.3 Interrupt Mirroring Registers

33.2.3.1 ESWM Interrupt Mirroring Register (TSIM)

Address(es): ESWM.TSIM 874C 8700h, ESWM_NS.TSIM 074C 8700h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b4	MMISIM	MMIS0 Interrupt Mirroring Flag	0: All flags in the RMAC1.MMIS0 register are set to 0. 1: Any flag in the RMAC1.MMIS0 register is set to 1.	R
b5	EAEISIM3	EAEIS3 Interrupt Mirroring Flag	0: All flags in the ETHA1.EAEIS3 register are set to 0. 1: Any flag in the ETHA1.EAEIS3 register is set to 1.	R
b31 to b6	—	Reserved	These bits are read as 0.	R

33.3 Operation

33.3.1 Operating Clocks

Table 33.4 lists the operating clocks for the ESWM system. These clocks are supplied by Clock Generation Circuit. Set the clock before starting operation of ESWM.

Table 33.4 Configurable Range of Clocks

Interface Mode	Operating Speed	ICLK	PCLKA	ESWCLK	ESWPHYCLK
GMII/RGMII	1000 Mbps	150 to 300 MHz	Up to 150 MHz, < ESWCLK, < ICLK	150 to 250 MHz, ≤ ICLK × 1.5	500 MHz
MII/RMII/RGMII	100/10 Mbps	50 to 300 MHz	Up to 150 MHz, < ESWCLK, < ICLK	50 to 250 MHz, ≤ ICLK × 1.5	500 MHz (RGMII only)
MAC-to-MAC connection	100/10 Mbps	50 to 300 MHz	Up to 150 MHz, < ESWCLK, < ICLK	50 to 250 MHz, ≤ ICLK × 1.5	100/200/500 MHz

33.3.2 Interface Modes

Table 33.5 lists the interface modes and their register settings. Set the MIICRn register before setting the RMACn.MPIC register.

Table 33.5 Interface Modes and Register Settings (n = 0, 1)

		MIICRn Register			RMACn.MPIC Register	
Interface Mode	Speed	MIISEL[1:0] Bits	M2MEN Bit	M2MCS[1:0] Bits	LSC[2:0] Bits	PIS[2:0] Bits
MII	10 Mbps	00b	0	00b (not used)	000b	000b (MII)
MII	100 Mbps	00b	0	00b (not used)	001b	000b (MII)
GMII	1000 Mbps	00b	0	00b (500 MHz)	010b	010b (GMII)
RGMII	10 Mbps	01b	0	00b (500 MHz)	000b	000b (MII)
RGMII	100 Mbps	01b	0	00b (500 MHz)	001b	000b (MII)
RGMII	1000 Mbps	01b	0	00b (500 MHz)	010b	010b (GMII)
RMII	10 Mbps	10b	0	00b (not used)	000b	000b (MII)
RMII	100 Mbps	10b	0	00b (not used)	001b	000b (MII)
MAC-to-MAC	10 Mbps	00b	1	00b (500 MHz)	000b	000b (MII)
MAC-to-MAC	10 Mbps	00b	1	01b (200 MHz)	000b	000b (MII)
MAC-to-MAC	10 Mbps	00b	1	10b (100 MHz)	000b	000b (MII)
MAC-to-MAC	100 Mbps	00b	1	00b (500 MHz)	001b	000b (MII)
MAC-to-MAC	100 Mbps	00b	1	01b (200 MHz)	001b	000b (MII)
MAC-to-MAC	100 Mbps	00b	1	10b (100 MHz)	001b	000b (MII)

33.3.2.1 MII/GMII Interface

When the MIICRn.MIISEL[1:0] bits are set to 00b, MII/GMII interface is selected.
When using GMII, set the frequency of the ESWPHYCLK to 500 MHz. In this case, the ESWPHYCLK is divided by 4 to generate a 125 MHz GTX_CLK.

33.3.2.2 RGMII Interface

When the MIICRn.MIISEL[1:0] bits are set to 01b, RGMII interface is selected.
When using RGMII, set the frequency of the ESWPHYCLK to 500 MHz. In this case, the ESWPHYCLK is divided by 4 to generate a 125 MHz TXC.
The RGMII interface remains reset after the MCU reset is released. The RGMII interface can be enabled by setting the MIICRn.MIISEL[1:0] bits to 01b and then setting the MIIRR.RGRSTn bit to 1.

(1) RGMII Internal Delay Mode

The RGMII interface support internal delay mode for RGMIIn_TXC.

33.3.2.3 RMII Interface

When the MIICRn.MIISEL[1:0] bits are set to 10b, RMII interface is selected.
The RMII interface remains reset after the MCU reset is released. The RMII interface can be enabled by setting the MIICRn.MIISEL[1:0] bits to 10b and then setting the MIIRR.RMRSTn bit to 1.

33.3.2.4 MAC-to-MAC Connection

ESWM has a function to directly connect and communicate between the MAC of this MCU and the MAC of another LSI. MAC-to-MAC connection only supports 10 Mbps or 100 Mbps full-duplex communication using MII. This function is enabled by setting the MIICRn.M2MEN bit to 1.
When using the MAC-to-MAC connection, set the frequency of the ESWPHYCLK to 100, 200, or 500 MHz and set the MIICRn.M2MCS[1:0] bits to match the frequency. At this time, the ESWPHYCLK is divided according to the settings of each bit to generate RX_CLK and TX_CLK. The generated clocks are output from the ETn_RX_CLK pin and ETn_TX_CLK pins.
Figure 33.2 shows an example of the MAC-to-MAC connection.

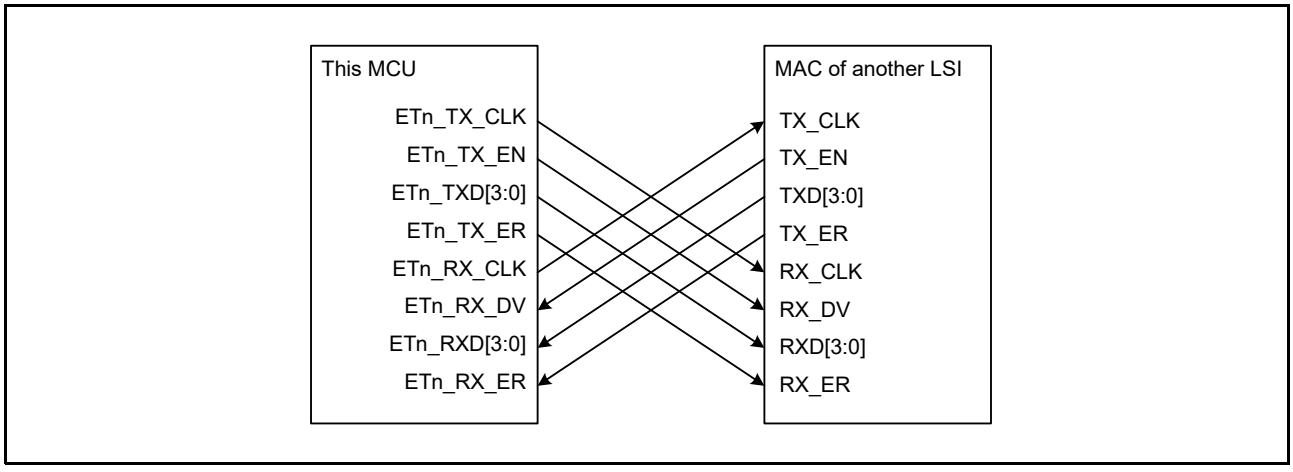

Figure 33.2 MAC-to-MAC Connection

33.3.3 ESWM Forwarding Modes

33.3.3.1 Hub Mode

(1) Background

A hub (repeater hub) is a network device that relays frames at layer 1 (physical layer) of the OSI reference model. It does not consider any kind of addressing and, consequently, is not aware of the kind of traffic which goes through it and can create security issues.

Figure 33.3 shows a hub operation.

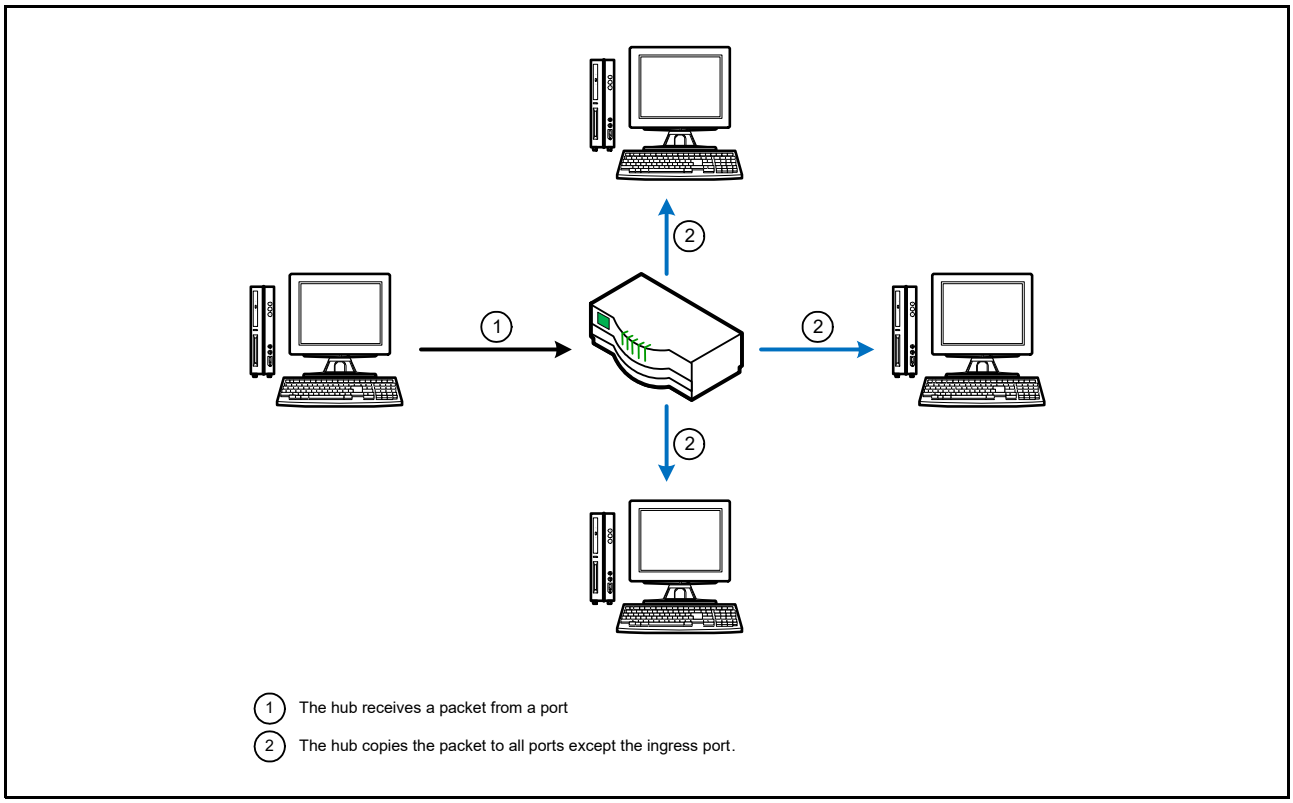

Figure 33.3 Hub Operation

Note: • In hub mode, the internal port (GWCA) behaves like an Ethernet port. In the following configuration, the internal port will receive all frames by AXI descriptor queue number 0 and transmit all frames by AXI descriptor queue number 1.

(2) Settings

The setting required to set ESWM in hub mode are described in Table 33.6. This setting should be done by using the ESWM initialization flow described in section 33.3.4.1, Initialization Flow. Any register not mentioned in the table should be kept to its initial value, so it does not need to be set. After using the ESWM initialization flow, any used port should be moved to OPERATION mode when required.

Table 33.6 Hub Settings

Module	Register/Bit	Setting value	Explanation
MFWD	FWPBFCi.PBDV[2:0]	Set all bits to 1 except for the FWPBFCi.PBDV[i] bit to 0.	All ports are configured to send their incoming frames to all ports except themselves.
ETHA	EAIRC	00000000h	All frames are directed to descriptor queue 0
	EATDQDCq.DQD[9:0]	If q=0, set to 512 Else set to 0	There is no QoS, so all frames are stored in priority 0 queue. As a result, all the output descriptor queue memory is reserved for queue 0.
	EAVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	EARTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
RMAC	MPIC.PIS	User defined	Set the PHY interface type
	MPIC.LSC	User defined	Set the PHY speed
	MRAFC	03C703C7h	Set MAC reception in promiscuous mode
GWCA	GWIRC	00000000h	All frames are directed to descriptor queue 0
	GWRDQDCq.DQD[9:0]	If q=0, set to 512 Else set to 0	There is no QoS, so all frames are stored in priority 0 queue. As a result, all the output descriptor queue memory is reserved for queue 0.
	GWVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	GWTTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
	GWDCBAC0, GWDCBAC1	User defined	Set the LINKFIX table base address
	GWDCCi	For i = 1: • Set DQTi to 1 • Set OSIDi to user defined. Else: • Set OSIDi to user defined.	Queue 0 is used for data reception and queue 1 is used for data transmission. All other queues are not used.

33.3.3.2 Layer 2 Switch Mode

(1) Background

A layer 2 switch is an Ethernet network interconnection system (OSI) which only works on layer 2 using MAC addresses. MAC addresses are used to filter and forward messages. A layer 2 switch has three main functions:

- Address learning: A switch can learn MAC addresses by looking at received frame source MAC addresses.
- Address aging: A switch can suppress a MAC address if a frame from the corresponding source has not been received since a given period (Usually 5 minutes).
- Frame forward/filter: A switch can decide to forward or filter a frame based on its destination MAC address.

Figure 33.4 shows the operation of a layer 2 switch.

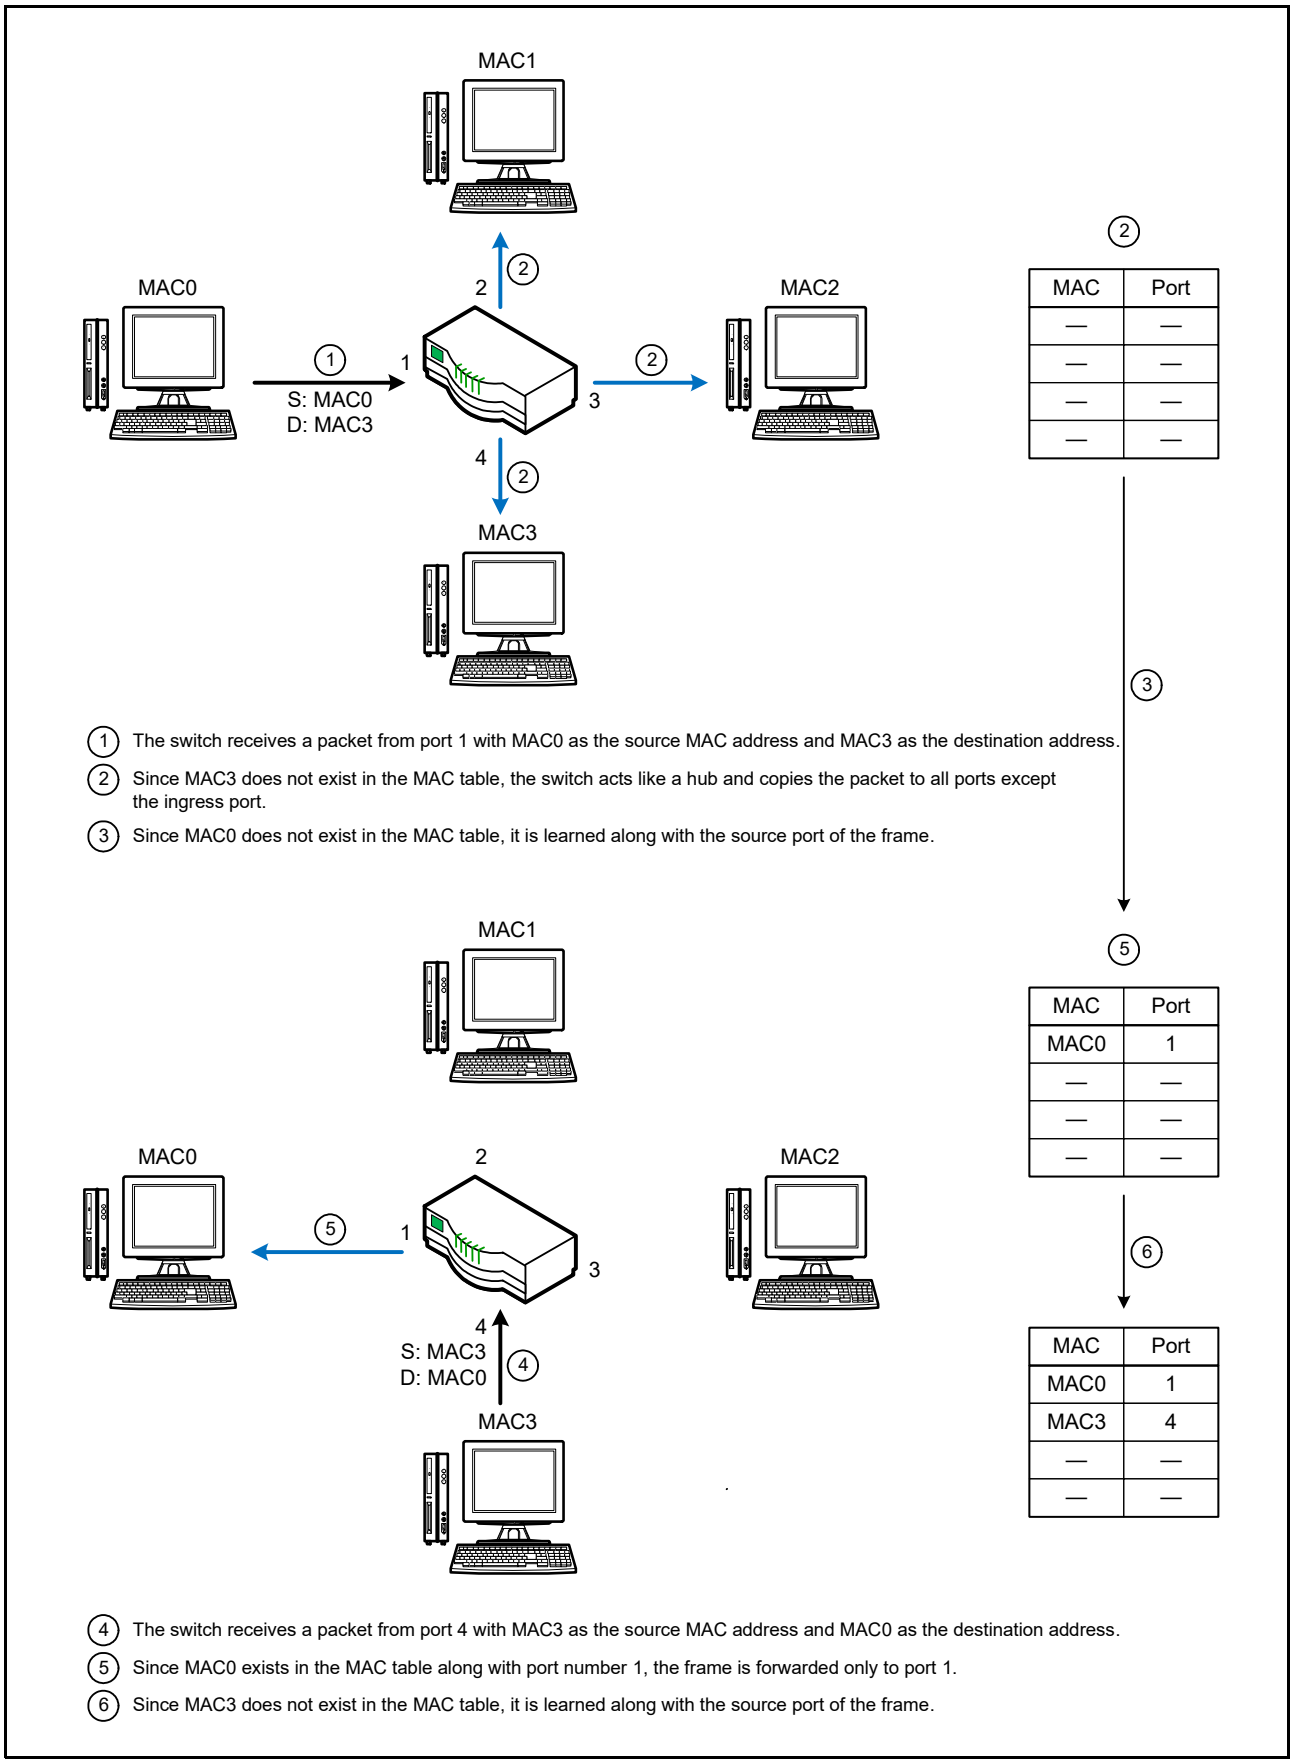

Figure 33.4 Layer 2 Switch Operation

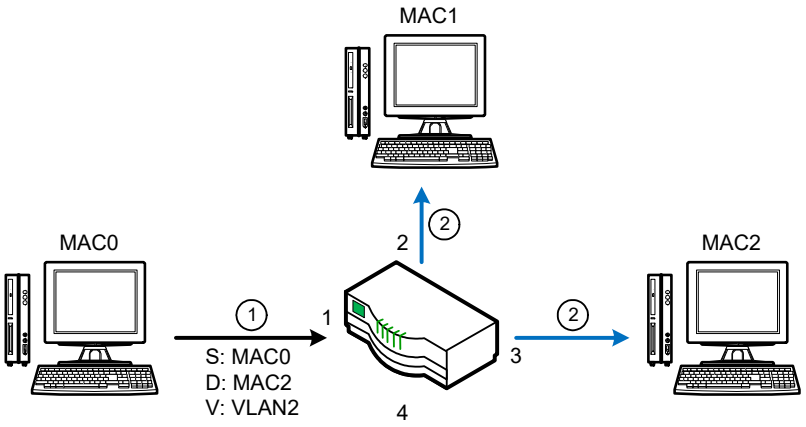
(2) Settings

The setting required to set ESWM in layer 2 switch mode are described in Table 33.7. This setting should be done through using the ESWM initialization flow described in section 33.3.4.1, Initialization Flow. Any register not mentioned in the table should be kept to its initial value, so it does not need to be set. After using the ESWM initialization flow, any used port should be moved to OPERATION mode when required.

Table 33.7 Layer 2 Switch Settings

Module	Register/Bit	Setting value	Explanation
MFWD	FWPBFCi.PBDV[2:0]	Set all bits to 1 except for the FWPBFCi.PBDV[i] bit to 0.	All ports are set to send their incoming frames to all ports except themselves
	FWPCi0.MACDSAi	1	MAC destination search happens for all ports
	FWPCi0.MACSAi	1	MAC source search happens for all ports
	FWPCi0.MACHLAi	1	MAC source hardware learning is enabled for all ports
	FWPCi0.MACHMAi	1	MAC source hardware migration is enabled for all ports
	FWCLPRC.USMACLF	User define	Unknown source MAC addresses can be sent to CPU for learning monitoring
	FWCLPTC.LPCSD	2	Set the learning path queue number to 2
	FWCLPTC.LPCS	User defined	Select which CPU will be used for learning monitoring
ETHA	EAIRC	00000000h	All frames are directed to descriptor queue 0
	EATDQDCq.DQD[9:0]	If q=0, set to 512 Else set to 0	There is no QoS, so all frames are stored in priority 0 queue. As a result, all the output descriptor queue memory is reserved for queue 0.
	EAVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	EARTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
RMAC	MPIC.PIS	User defined	Set the PHY interface type
	MPIC.LSC	User defined	Set the PHY speed
	MRAFC	03C703C7h	Set MAC reception in promiscuous mode
GWCA	GWIRC	00000000h	All frames are directed to descriptor queue 0
	GWRDQDCq.DQD[9:0]	If q=0, set to 512 Else set to 0	There is no QoS, so all frames are stored in priority 0 queue. As a result, all the output descriptor queue memory is reserved for queue 0.
	GWVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	GWTTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
	GWDCBAC0, GWDCBAC1	User defined	Set the LINKFIX table base address
	GWDCCi	For i = 1: • Set DQTi to 1 • Set OSIDi to user defined. Else: • Set OSIDi to user defined.	Queue 0 is used for data reception, queue 1 is used for data transmission and queue 2 is used for learning monitoring. All other queues are not used. Notes: For learning monitoring, extended descriptors should be used.

Note: Any MAC address learned by HW coming from an internal port (GWCA) will always be learned along with AXI descriptor queue 0. As a result, AXI descriptor queue 0 should always be reserved for hardware learned MAC addresses corresponding frames reception queue.



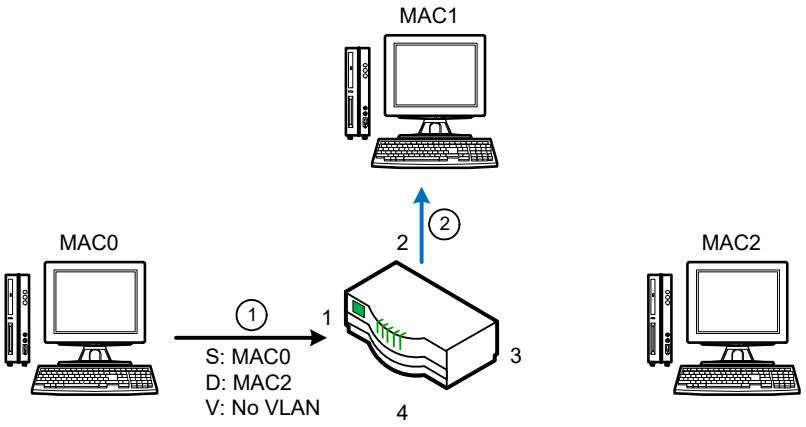
33.3.3.3 VLAN-Aware Layer 2 Switch Mode

(1) Background

A VLAN-aware layer 2 switch is an Ethernet network interconnection system (OSI) which works on layer 2 using MAC addresses and which can reduce its broadcast domains in sub-domains using VLAN IDs. A VLAN-aware layer 2 switch has the same functions has a layer 2 switch but is also able to handle VLANs.

Figure 33.5 shows the operation of a VLAN-aware layer 2 switch.

.



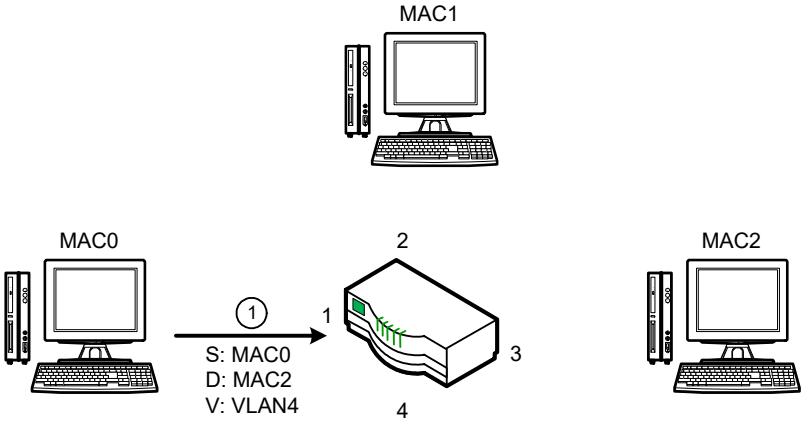
② ②

VLAN	Port
VLAN2	1/2/3
—	—
—	—
—	—

MAC	Port
MAC0	1
MAC1	2
—	—
—	—

① The switch receives a packet from port 1 with MAC0 as the source MAC address, MAC2 as the destination MAC address, and VLAN2 as the VLAN.

② Since MAC2 does not exist in the MAC table, the switch copies the packet to all ports in the VLAN2 domain (ports 1, 2, and 3) except the ingress port.



② ②

VLAN	Port
VLAN2	1/2/3
VLAN1	1/2
—	—
—	—

MAC	Port
MAC0	1
MAC1	2
—	—
—	—

① The switch receives a packet from port 1 with MAC0 as the source MAC address, MAC2 as the destination MAC address, and no VLAN.

② Since MAC2 does not exist in the MAC table, the switch copies the packet to all ports in the default VLAN (VLAN1) domain (ports 1 and 2) except the ingress port.

② ②

VLAN	Port
VLAN2	1/2/3
VLAN1	1/2
—	—
—	—

MAC	Port
MAC0	1
MAC1	2
—	—
—	—

① The switch receives a packet from port 1 with MAC0 as the source MAC address, MAC2 as the destination MAC address, and VLAN4 as the VLAN.

② Since VLAN4 is unknown, the packet is rejected.

Figure 33.5 VLAN-Aware Layer 2 Switch Operation

(2) Settings

The setting required to set ESWM in VLAN-aware layer 2 switch mode are described in Table 33.8. This setting should be done through using the ESWM initialization flow described in section 33.3.4.1, Initialization Flow. Any register not mentioned in the table should be kept to its initial value, so it does not need to be set. After using the ESWM initialization flow, any used port should be moved to OPERATION mode when required.

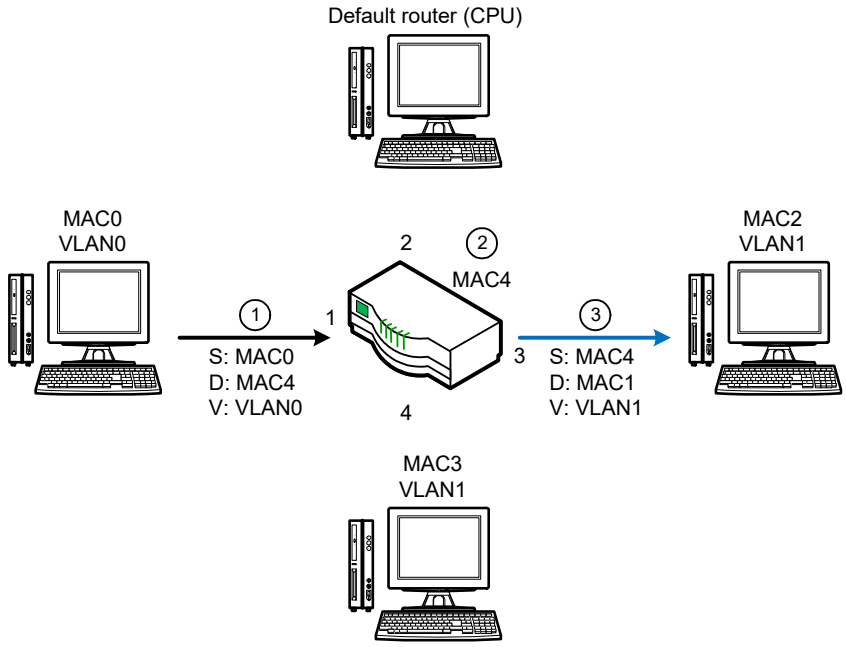
Table 33.8 VLAN-Aware Layer 2 Switch Settings

Module	Register/Bit	Setting value	Explanation
MFWD	FWGC.SVM	01b	Set ESWM in C-TAG mode
	FWPBFCi.PBDV[2:0]	Set all bits to 1 except for the FWPBFCi.PBDV[i] bit to 0.	All ports are set to send their incoming frames to all ports except themselves
	FWPCi0.MACDSAi	1	MAC destination search happens for all ports
	FWPCi0.MACSAi	1	MAC source search happens for all ports
	FWPCi0.MACHLAi	1	MAC source hardware learning is enabled for all ports
	FWPCi0.MACHMAi	1	MAC source hardware migration is enabled for all ports
	FWPCi0.VLANSAi	1	VLAN search happens for all ports
	FWPCi0.VLANRUi	1	Unknown VLANs are rejected.
	FWCLPRC.USMACLF	User defined	Unknown source MAC addresses can be sent to CPU for learning monitoring
	FWCLPRC.UVLANLF	User defined	Unknown VLANs can be sent to CPU for learning
	FWCLPTC.LPCSD	2	Set the learning path queue number to 2
	FWCLPTC.LPCS	User defined	Select which CPU will be used for learning monitoring
	FWVLANTL0, FWVLANTL1, FWVLANTL2, FWVLANTL30, FWVLANTL4	User defined	New VLANs can be added to the VLAN table For details, refer to Table 33.9
ETHA	EATDQDCq.DQD[9:0]	User defined	The number of descriptors in descriptor queues can be set
	EAVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	EAVTC.CTV	FFFh	Set the default VLAN value to 1
	EARTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
RMAC	MPIC.PIS	User defined	Set the PHY interface type
	MPIC.LSC	User defined	Set the PHY speed
	MRAFC	03C703C7h	Set MAC reception in promiscuous mode
GWCA	GWRDQDCq.DQD[9:0]	User defined	The number of descriptors in descriptor queues can be set
	GWVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	GWVTC.CTV	FFFh	Set the default VLAN value to 1
	GWTTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
	GWDCBAC0, GWDCBAC1	User defined	Set the LINKFIX table base address
	GWDCCi	For i = 1: • Set DQTi to 1 • Set OSIDi to user defined. Else: • Set OSIDi to user defined.	Queue 0 is used for data reception, queue 1 is used for data transmission and queue 2 is used for learning monitoring. All other queues are not used. Notes: For learning monitoring, extended descriptors should be used.

Table 33.9 VLAN Learning in VLAN Table

Field name VLAN.	Setting value	Explanation
SL	0	No secure entry used
HLD	0	Hardware learning for MAC addresses not disabled for any VLAN
SLV	Set to 1 for ports included in VLAN	Only authorize to receive corresponding VLAN from ports included in this VLAN
DV	Set to 1 for ports included in VLAN	Only authorize to send corresponding VLAN to ports included in this VLAN
CSD	0	Frames received by CPUs on sub-destination 0
CME	0	No mirroring
EME	0	No mirroring
IPU	0	No frame priority update
IPV	000b	No frame priority update

Note: When both VLAN and destination MAC addresses are found in forwarding tables and corresponding frame is forwarded to an internal port, the AXI descriptor queue (CPU sub-destination) chosen for forwarding is the one set in the MAC table. In this example, because both are set to 0, it raises no issue but, when AXI descriptor queue are used for virtualization it should be taken in account during system design.

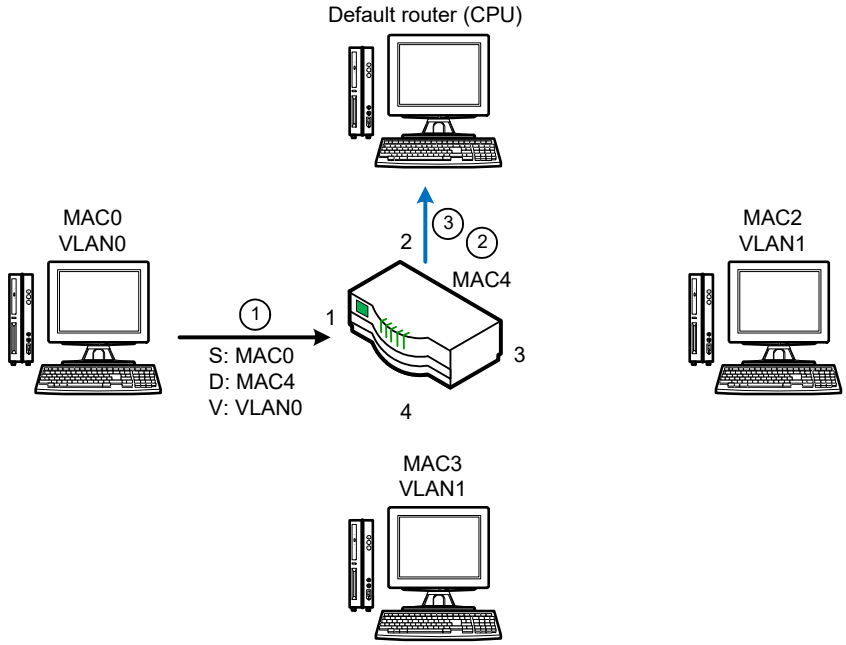


33.3.3.4 Layer 3 Switch Mode

(1) Background

A layer 3 switch is an Ethernet network interconnection system (OSI) which works on layer 3 using IP addresses. Because ESWM is only able to perform perfect matches by stream forwarding, when developing a layer 3 switch, it is recommended to use perfect filters (MFWD).

Figure 33.6 shows the operation of a layer 3 switch.



.

(1) The switch receives a packet from port 1 with MAC0 as the source MAC address, MAC4 as the destination MAC address, and VLAN0 as the VLAN.

(2) Suppose the IP address of the packet matches the cascade filter and is defined to be routed to port 3.

(3) The switch updates the destination MAC address to MAC1, the source MAC address to MAC4, and the VLAN to VLAN1, and sends the frame to port 3.

(1) The switch receives a packet from port 1 with MAC0 as the source MAC address, MAC4 as the destination MAC address, and VLAN0 as the VLAN.

(2) Suppose the address of the packet is unknown. In this case, routing cannot be performed.

(3) The switch forwards the received frame to the default router (CPU) without updating the routing.

Figure 33.6 Layer 3 Switch Operation

(2) Settings

The setting required to set ESWM in layer 3 switch mode are described in Table 33.10. This setting should be done through using the ESWM initialization flow described in section 33.3.4.1, Initialization Flow. Any register not mentioned in the table should be kept to its initial value, so it does not need to be set. After using the ESWM initialization flow, any used port should be moved to OPERATION mode when required.

Table 33.10 Layer 3 Switch Settings

Module	Register/Bit	Setting value	Explanation
MFWD	FWGC.SVM	01b	Set ESWM in C-TAG mode
	FWPBFCi.PBDV[2:0]	Set all bits to 1 except for the FWPBFCi.PBDV[i] bit to 0.	All ports are set to send their incoming frames to all ports except themselves
	FWPCi0.MACDSAi	1	MAC destination search happens for all ports
	FWPCi0.MACSAi	1	MAC source search happens for all ports
	FWPCi0.MACHLAi	1	MAC source hardware learning is enabled for all ports
	FWPCi0.MACHMAi	1	MAC source hardware migration is enabled for all ports
	FWPCi0.VLANSAi	1	VLAN search happens for all ports
	FWCLPRC.USMACLF	User defined	Unknown source MAC addresses can be sent to CPU for learning monitoring
	FWCLPRC.UVLANLF	1	Unknown VLANs are sent to CPU for learning
	FWCLPTC.LPCSD	2	Set the learning path queue number to 2
	FWCLPTC.LPCS	User defined	Select which CPU will be used for learning monitoring
	FWVLANTL0, FWVLANTL1, FWVLANTL2, FWVLANTL30, FWVLANTL4	User defined	New VLANs can be added to the VLAN table For details, refer to Table 33.11
ETHA	EATDQDCq.DQD[9:0]	User defined	The number of descriptors in descriptor queues can be set
	EAVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	EAVTC.CTV	FFFh	Set the default VLAN value to 1
	EARTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
RMAC	MPIC.PIS	User defined	Set the PHY interface type
	MPIC.LSC	User defined	Set the PHY speed
	MRAFC	03C703C7h	Set MAC reception in promiscuous mode
GWCA	GWRDQDCq.DQD[9:0]	User defined	The number of descriptors in descriptor queues can be set
	GWVCC.VEM	011b	Allows SC-Tagged frames and C-tagged frames to go through transparently.
	GWVTC.CTV	FFFh	Set the default VLAN value to 1
	GWTTFC.UT	0	Allows any TAG formats to go through even the unsupported ones.
	GWDCBAC0, GWDCBAC1	User defined	Set the LINKFIX table base address
	GWDCCi	For i = 1: • Set DQTi to 1 • Set OSIDi to user defined. Else: • Set OSIDi to user defined.	Queue 0 is used for data reception, queue 1 is used for data transmission and queue 2 is used for learning monitoring. All other queues are not used. Notes: For learning monitoring, extended descriptors should be used.

Table 33.11 VLAN Learning in VLAN Table

Field name VLAN.	Setting value	Explanation
SL	0	Entry is unsecure
HLD	0	Hardware learning for MAC addresses not disabled for any VLAN
SLV	Set to 1 for ports included in VLAN	Only authorize to receive corresponding VLAN from ports included in this VLAN
DV	Set to 1 for ports included in VLAN	Only authorize to send corresponding VLAN to ports included in this VLAN
CSD	0	Frames received by CPUs on sub-destination 0
CME	0	No mirroring
EME	0	No mirroring
IPU	0	No frame priority update
IPV	000b	No frame priority update

33.3.4 Software Flows

33.3.4.1 Initialization Flow

Figure 33.7 shows the initialization flow for ESWM.

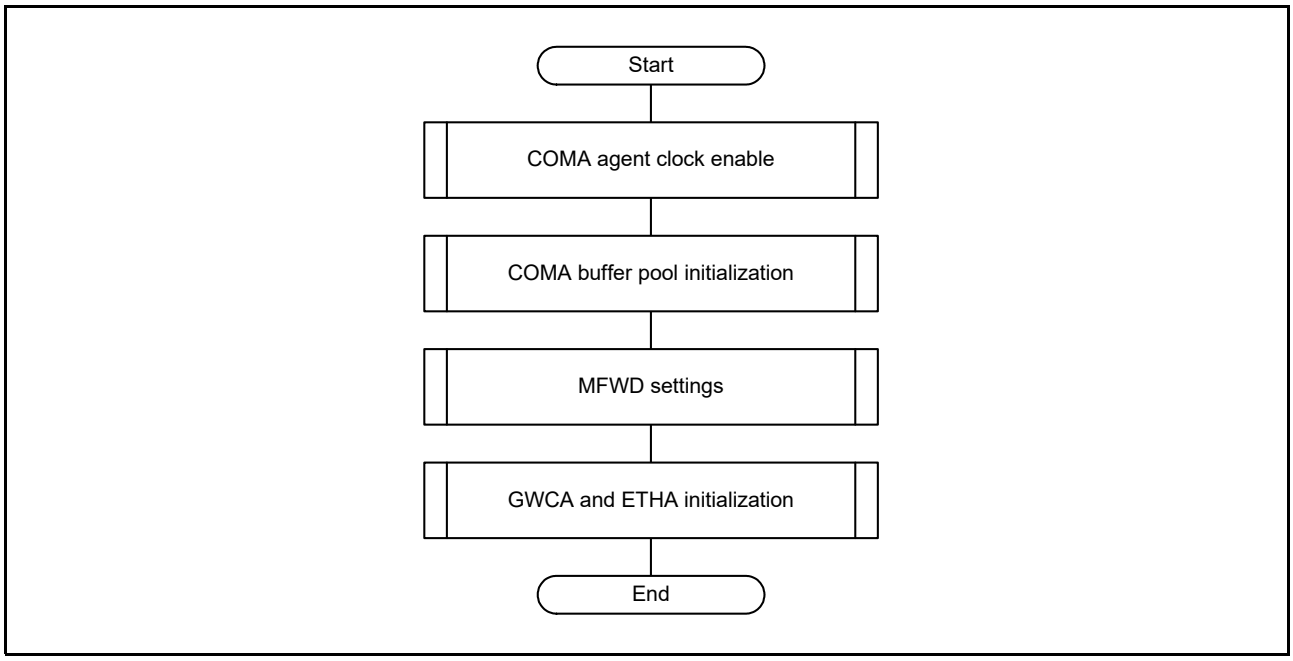


Figure 33.7 ESWM Initialization Flow

33.3.4.2 Disable Flow

Figure 33.8 shows the disable flow for ESWM.

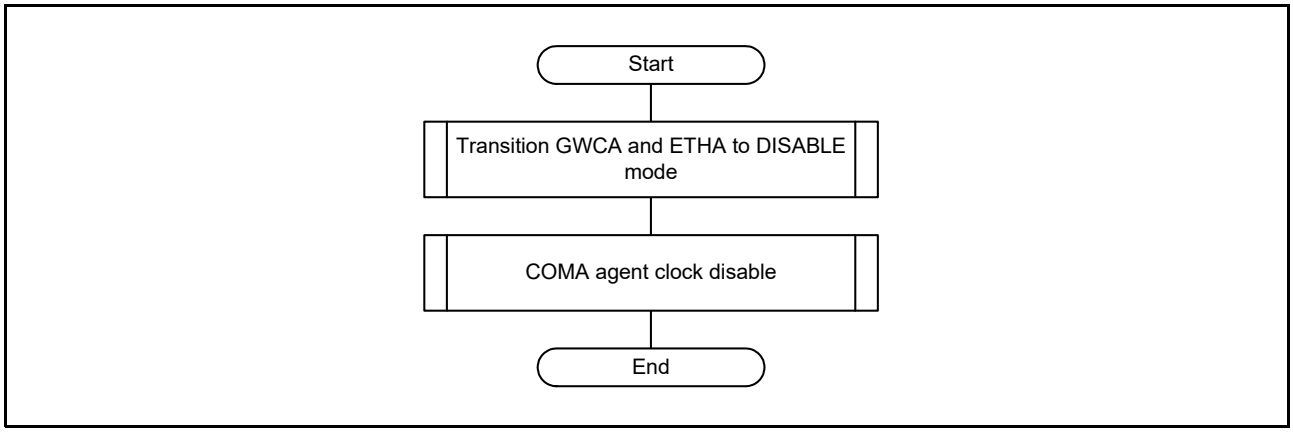

Figure 33.8 ESWM Disable Flow

33.3.4.3 Reset Flow

Figure 33.9 shows the reset flow for ESWM.

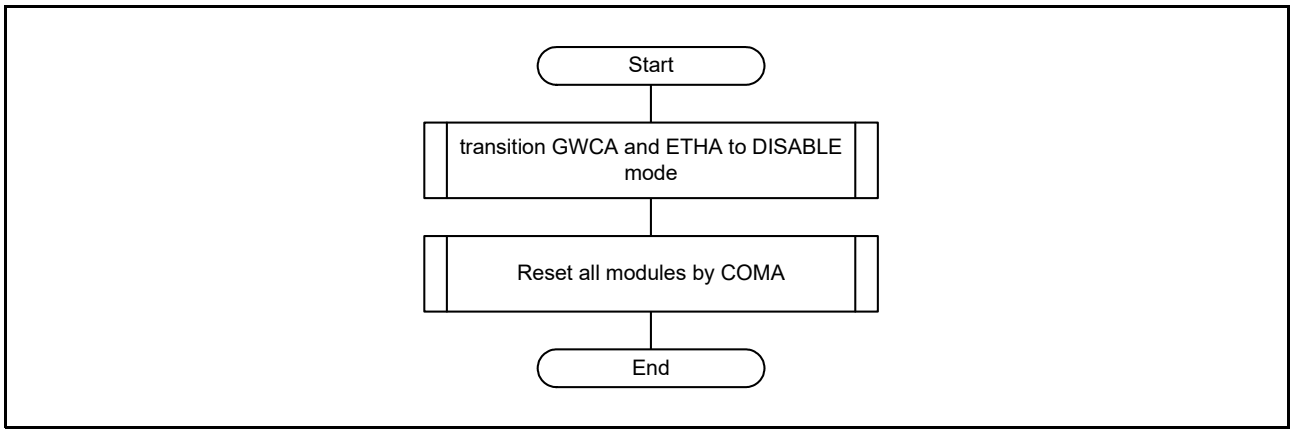

Figure 33.9 ESWM Reset Flow

33.3.4.4 Emergency Reset Flow

Figure 33.10 shows the emergency reset flow for ESWM.
This is used when ETHA is locked.
For example, when using MII, if an error occurs in the PHY-LSI and the transmit clock (ETn_TX_CLK) stops, ESWM cannot transmit data and cannot release the pointer (ETHA is locked in operation mode). This state will be resolved when the transmit clock resumes, but use an emergency reset if necessary.

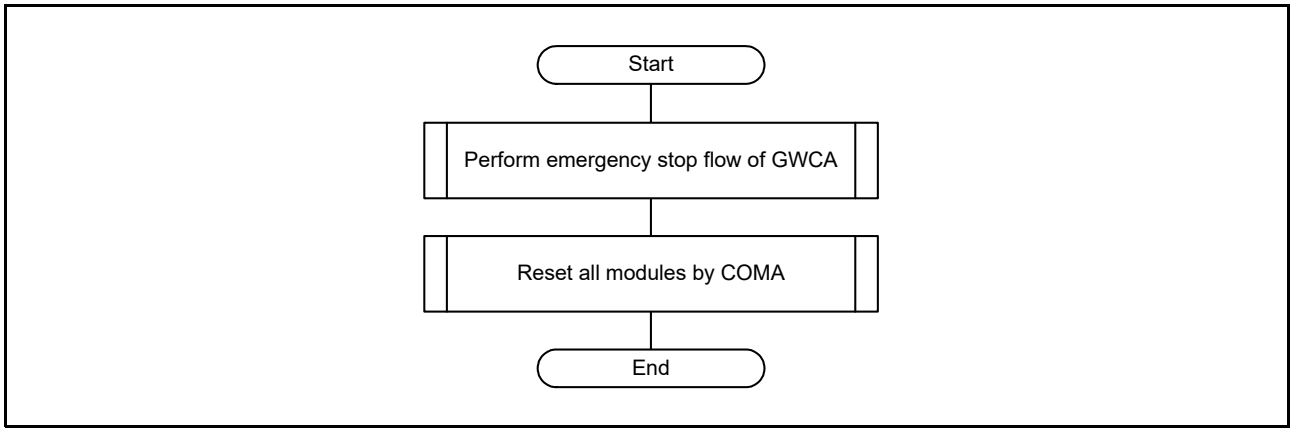

Figure 33.10 ESWM Emergency Reset Flow

33.4 Interrupts and Events

Table 33.12 Interrupt and Event Outputs

Module	Symbol	Name	Interrupt Source	Interrupt Detection
ESWM	FWEI	MFWD error interrupt	MFWD.FWEIS0i (i = 0 to 2), MFWD.FWEIS1, MFWD.FWEIS2, MFWD.FWEIS5, MFWD.FWEIS6i (i = 0 to 3), MFWD.FWEIS7i (i = 0 to 3), MFWD.FWEIS8i (i = 0 to 3)	Level
	CAEI	COMA error interrupt	COMA.CAEIS0, COMA.CAEIS1	Level
	GWEI0	GWCA0 error interrupt	GWCA0.GWEIS0 (excluding TDFES), GWCA0.GWEIS1, GWCA0.GWEIS4, GWCA0.GWEIS5	Level
	EAEI0	ETHA0 error interrupt	ETHA0.EAEIS0, ETHA0.EAEIS1, ETHA0.EAEIS2, ETHA0.EAEIS3, RMAC0.MEIS	Level
	EAEI1	ETHA1 error interrupt	ETHA1.EAEIS0, ETHA1.EAEIS1, ETHA1.EAEIS2, ETHA1.EAEIS3, RMAC1.MEIS	Level
	PTPSI0	gPTP status interrupt 0	GPTP.PTPIS0	Level
	PTPSI1	gPTP status interrupt 1	GPTP.PTPIS1	Level
	FWSI	MFWD status interrupt	MFWD.FWMIS0	Level
	CASI	COMA status interrupt	COMA.CAMIS0, COMA.CAMIS1	Level
	EASI0	ETHA0 status interrupt	RMAC0.MMIS0	Level
	EASI1	ETHA1 status interrupt	RMAC1.MMIS0	Level
	GWDI00	GWCA0 data interrupt 0	GWCA0.GWDIS0, GWCA0.GWDIS1, GWCA0.GWEIS20, GWCA0.GWEIS21, GWCA0.GWEIS3	Level
	GWDI01	GWCA0 data interrupt 1		Level
	GWDI02	GWCA0 data interrupt 2		Level
	GWDI03	GWCA0 data interrupt 3		Level
	GWDI04	GWCA0 data interrupt 4		Level
	GWDI05	GWCA0 data interrupt 5		Level
	GWDI06	GWCA0 data interrupt 6		Level
	GWDI07	GWCA0 data interrupt 7		Level
	TSDI00	GWCA0 timestamp interrupt 0	GWCA0.GWTSDIS.TSDIS0, GWCA0.GWEIS0.TDFES0	Level
	TSDI01	GWCA0 timestamp interrupt 1	GWCA0.GWTSDIS.TSDIS1, GWCA0.GWEIS0.TDFES1	Level
	MDIO0	ETHA0 MDIO interrupt	RMAC0.MMIS1	Level
	MDIO1	ETHA1 MDIO interrupt	RMAC1.MMIS1	Level
	RMPI0	RMAC0 PHY interrupt	RMAC0.MMIS2	Level
	RMPI1	RMAC1 PHY interrupt	RMAC1.MMIS2	Level
GPTP	MATCH0	Media clock 0 recovery interrupt/event	—	Edge
	MATCH1	Media clock 1 recovery interrupt/event	—	Edge
	PTPOUT0	Pulse output 0 interrupt/event	—	Edge
	PTPOUT1	Pulse output 1 interrupt/event	—	Edge
	PTPOUT2	Pulse output 2 interrupt/event	—	Edge
	PTPOUT3	Pulse output 3 interrupt/event	—	Edge

Table 33.13 Event Inputs

Module	Symbol	Name	Event Source
GPTP	CAPTURE0	gPTP media clock capture event 0	An event selected by the ELC.ELSR51 register
	CAPTURE1	gPTP media clock capture event 1	An event selected by the ELC.ELSR52 register

33.5 Usage Notes

33.5.1 Module-Stop Function Setting

Operation of the ESWM module can be disabled or enabled by setting a bit in the module stop control register C (MSTPCRC). The ESWM is initially disabled after a reset. Registers in the ESWM only become accessible after it has been released from the module-stop state. For details, refer to section 11., Low Power Consumption.

33.5.2 Transition to Software Standby Mode

Before transitioning to software standby mode, stop ESWM operation as described in section 33.3.4.2, Disable Flow. If RGMII or RMII interface is selected, it must be reset by the MIIRR register after the above procedure.

33.5.3 Return from Software Standby Mode

After returning from software standby mode, ESWM must be initialized as described in section 33.3.4.1, Initialization Flow.

33.5.4 Notes on Cutting Off the Power Supply to ESWM

Before cutting off the power supply to the ESWM power domain, stop the operation of ESWM as described in section 33.3.4.2, Disable Flow. If RGMII or RMII interface is selected, it must be reset by the MIIRR register after the above procedure.

33.5.5 Note on Resuming Power Supply to ESWM

After resuming power supply to the ESWM power domain, ESWM must be initialized as described in section 33.3.4.1, Initialization Flow.

33.5.6 Notes on Using Half-Duplex Mode

Notes on using half-duplex mode are listed below.

- Do not use the TSN function.
- The size of the transmit and receive frames must comply with IEEE 802.3.
- Do not use loopback mode.
- Do not use cut-through mode.
- Do not use with GMII or RGMII interface.
- The LPI function is disabled.

34. Ethernet Message Forwarding Engine (MFWD)

34.1 Overview

Ethernet message forwarding engine (MFWD) is part of ESWM system and aims at filtering, forwarding and routing the switch frames.
It snoops the frame information from Fabric to redistribute them to the agent after filtering, forwarding and routing mechanisms.

Table 34.1 shows the specifications of the MFWD, and Table 34.2 shows the specifications of the Fabric.

Table 34.1 MFWD Specifications

Function		Details
Overall function	Cut-through	Forwarding frames while receiving them depending on Layer 2
	Direct forwarding	Forwarding frames coming from GWCA by bypassing the MFWD
	Layer 3 forwarding	Forwarding frames based on a stream ID
	Layer 2 forwarding	Forwarding frames based on destination MAC addresses and VLAN
	Port based forwarding	Forwarding frames depending on source port
	L23U	Update of Layer 2 and Layer 3 depending on Layer 3 forwarding
	PSFP	PSFP filtering [PSFP] depending on Layer 3 forwarding
	ATS	ATS traffic shaping [ATS]
	FRER	FRER [FRER] depending on Layer 3 forwarding
Data provision	Ethernet Frames	Corresponds to the IEEE 802.3, 802.1Q and 802.1CB standards [802.3] [802.1Q] [802.1CB].
	Descriptors	Local Ethernet Descriptor, Local Direct Descriptor (Agents to MFWD) Forwarding descriptor (MFWD to Agents)

Table 34.2 Fabric Specifications

Function		Details
Overall function	Data transfer	• Function to transfer data and access to RAMs
Data provision		• Data for Fabric • Initial frame data + Intermediate data + Last frame data + Frame Descriptor • Data width: 185 bits
Control function	Time arbiter	• Arbitration between Time-critical agents [ETHA] for data bus. Arbitration scheme depends on each Time critical agents [ETHA] PHY link/Internal speed
	Arbitration	• LRU for Time critical-agents [ETHA], Slow agents [GWCA], and Common Agent (COMA) error read requests arbitration. • LRU between Slow agents [GWCA] for read/write bus arbitration. • Strict priority like arbitration between time arbiter, Error LRU, and slow LRU. Priority: time arbiter > slow LRU > Error LRU
	RAM access	• Function that writes and reads to RAM
	Transfer write request to MFWD	• Function to transfer write request sent from Ethernet Agents (ETHA) or GWCA to MFWD

Figure 34.1 shows MFWD block diagram. Figure 34.2 shows Fabric block diagram.

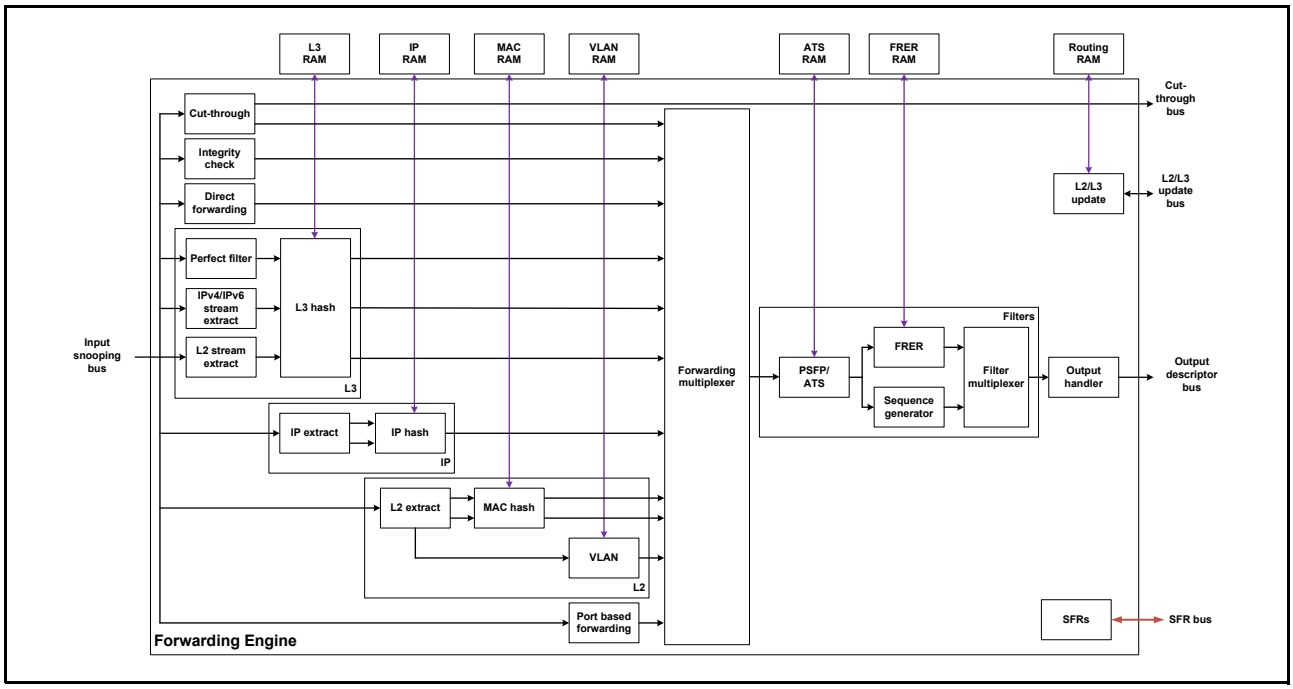

Figure 34.1 MFWD Block Diagram

Table 34.3 MFWD Functional Blocks

Block name	Function
Cut-through	Filter L2 frames and send them to while receiving them.
Direct forwarding	Forward frames coming from a CPU with the forwarding information already present.
L3	L2 to L4 Stream based forwarding/routing engine
L2	L2 switch
Port based forwarding	Source port-based forwarding
Forwarding multiplexer	Arbitrate between all the forwarding/ routing mechanisms
PSFP/ATS	Per stream filtering and policing [802.1Qci] and asynchronous traffic shaping [802.1Qcr]
FRER	Frame Replication and Elimination for Reliability [802.1CB]
Sequence generator	Sequence number generation for FRER proxy functionality [802.1CB]
Filter multiplexer	Arbitrate between forwarding results and filtering results.
Output handler	Copy and send descriptors to targets. Manage overflow and security error recovery.

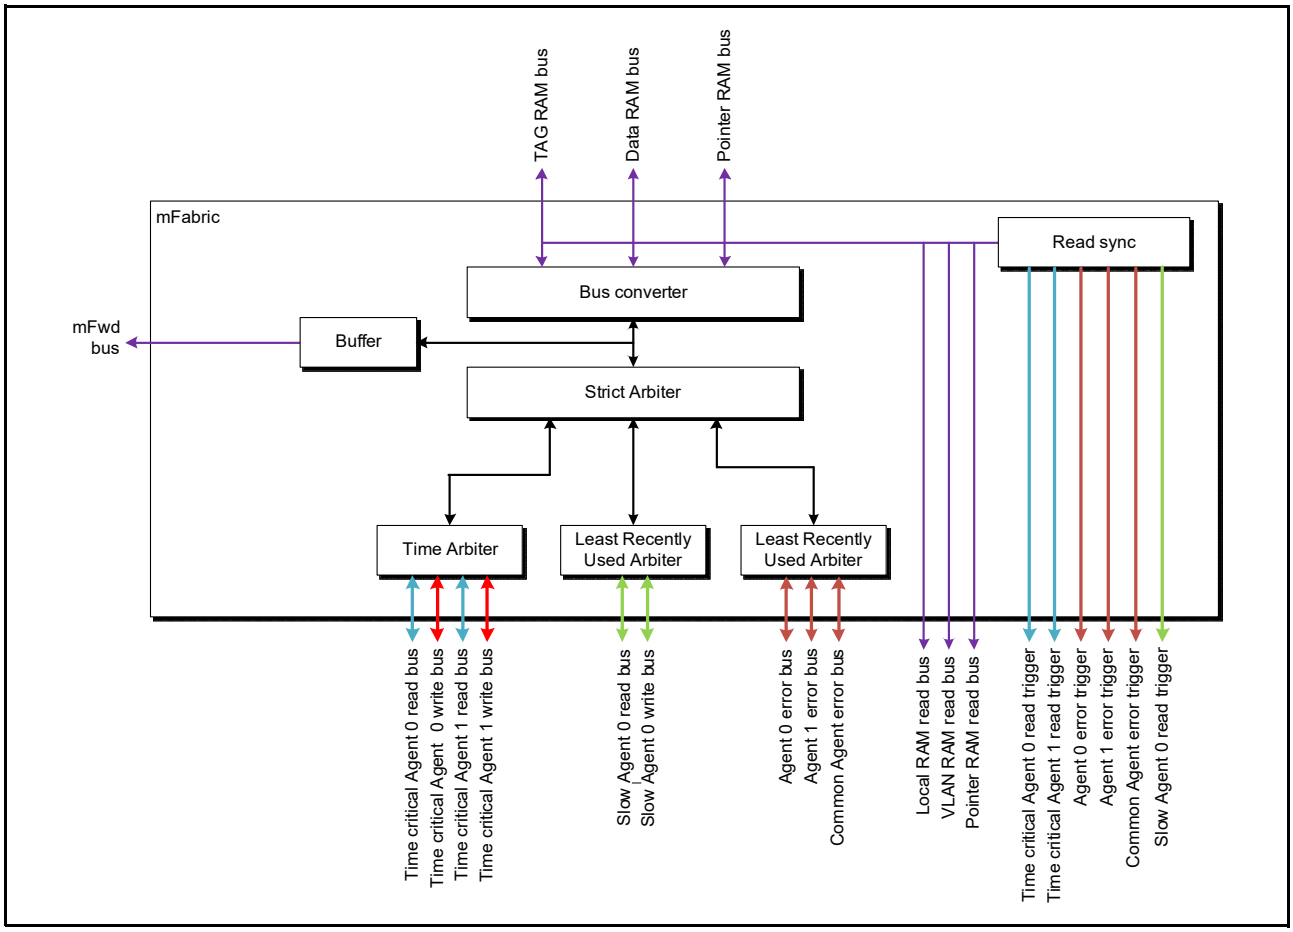

Figure 34.2 Fabric Block Diagram

Table 34.4 Fabric Functional Blocks

Block name	Function
Time arbiter	Function to share the Fabric throughput per agent depending on agent modes and PHY speed.
Least Recently Used arbiter	Arbiter between several buses. (LRU) If multiple error read requests collide, LRU arbitration is executed on a cycle by cycle basis.
Strict arbiter	Arbiter between several buses. If requests from Time arbiter, Round robin arbiter and GWCA collide, the higher priority request will be processed first. Priority ordering: Time-critical Write/Read request > Slow Write/Read request > Agent Error Read request
Read sync	Module that generates a signal indicating whether data read from RAM is valid or invalid.
Bus converter	Module that converts the internal access request in RAM protocol
Buffer	Register slices to meet design timings.

34.2 Register Descriptions

34.2.1 General Function Registers

34.2.1.1 General Configuration Register (FWGC)

Address(es): MFWD.FWGC 874C 0000h, MFWD_NS.FWGC 074C 0000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SVM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	SVM[1:0]	Switch VLAN Mode	b1 b0 0 0: No VLAN mode (VLAN not used for forwarding) 0 1: C-TAG mode (C-TAG used for forwarding) 1 0: SC-TAG mode (S-TAG used for forwarding) 1 1: Reserved	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

SVM[1:0] Bits (Switch VLAN Mode)

[Functions]

- For more details, refer to section 33, Ethernet Module.
- HW: If FWGC.SVM[1:0] are set to 00b, incoming packet PCP and DEI fields will be considered as 0 by MFWD.
- For more details, refer to section 34.3.1.2, ESWM Modes.

34.2.1.2 TAG TPID Configuration Register 0 (FWTTC0)

Address(es): MFWD.FWTTC0 874C 0010h, MFWD_NS.FWTTC0 074C 0010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	STT[15:0]															
Value after reset:	1	0	0	0	1	0	0	0	1	0	1	0	1	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTT[15:0]															
Value after reset:	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	CTT[15:0]	C-TAG TPID [801.2Q]	Configure the C-TAG TPID.	R/W
b31 to b16	STT[15:0]	S-TAG TPID [801.2Q]	Configure the S-TAG TPID.	R/W

CTT[15:0] Bits (C-TAG TPID [801.2Q])

[Restrictions]

- SW: The FWTTC0.CTT[15:0], FWTTC0.STT[15:0] and FWTTC1.RTT[15:0] bits should always be set to different values.
- SW: These bits cannot be set to 0000h to 05FFh, 0800h nor 86DDh

STT[15:0] Bits (S-TAG TPID [801.2Q])

[Restrictions]

- SW: The FWTTC0.CTT[15:0], FWTTC0.STT[15:0] and FWTTC1.RTT[15:0] bits should always be set to different values.
- SW: These bits cannot be set to 0000h to 05FFh, 0800h nor 86DDh

34.2.1.3 TAG TPID Configuration Register 1 (FWTTC1)

Address(es): MFWD.FWTTC1 874C 0014h, MFWD_NS.FWTTC1 074C 0014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RTT[15:0]															
Value after reset:	1	1	1	1	0	0	0	1	1	1	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RTT[15:0]	R-TAG TPID [801.2CB]	Configure the R-TAG TPID.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

RTT[15:0] Bits (R-TAG TPID [801.2CB])

[Restrictions]

- SW: The FWTTC0.CTT[15:0], FWTTC0.STT[15:0] and FWTTC1.RTT[15:0] bits should always be set to different values.
- SW: These bits cannot be set to 0000h to 05FFh, 0800h nor 86DDh

34.2.1.4 CPU Exceptional Path Target Configuration Register (FWCEPTC)

Address(es): MFWD.FWCEPTC 874C 0020h, MFWD_NS.FWCEPTC 074C 0020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	EPSL	—	—	—	—	—	—	—	EPCS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	EPIPV[2:0]			—	—	—	—	—	—	EPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	EPCSD[5:0]	Exceptional Path CPU Sub Destination	Configures the CPU sub destination to which exceptional frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	EPIPV[2:0]	Exceptional Path Internal Priority Value	Configures the priority to which exceptional frames will be sent.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b16	EPCS	Exceptional Path CPU Select	Configures CPU to which exceptional frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	EPSL	Exceptional Path Security Level	Configures descriptor security level for exceptional path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

EPCS Bit (Exceptional Path CPU Select)

Refer to Table 34.83 for port mapping.

[Restriction]

- This bit should be set to 0.

34.2.1.5 CPU Exceptional Path Reason Configuration Register 0 (FWCEPRC0)

Address(es): MFWD.FWCEPRC0 874C 0024h, MFWD_NS.FWCEPRC0 074C 0024h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	DDFSFEF	—	DDEEF	—	—	GDNEEF	GTFEF	—	GSEQEEF	GAXEEF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	ETFEF	EOEEF	EUEEF	EBOEEF	ERPOOEF	ERFFEF	ECFFCEEF	ECFSEEF	EFFMEEF	EFCSEEF	ENIBEEF	—	EPHYEEF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EPHYEEF	Ethernet PHY Error Exceptional Forwarding	0: Frames received with PHY Error are discarded. 1: Frames received with PHY Error are forwarded to exceptional path.	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	ENIBEEF	Ethernet Nibble Error Exceptional Forwarding	0: Frames received with Nibble Error are discarded. 1: Frames received with Nibble Error are forwarded to exceptional path.	R/W
b3	EFCSEEF	Ethernet FCS Error Exceptional Forwarding	0: Frames received with FCS Error are discarded. 1: Frames received with FCS Error are forwarded to exceptional path.	R/W
b4	EFFMEEF	Ethernet Final Fragment Missing Error Exceptional Forwarding	0: Frames received with Final Fragment Missing Error are discarded. 1: Frames received with Final Fragment Missing Error are forwarded to exceptional path.	R/W
b5	ECFSEEF	Ethernet C-Fragment SMD Error Exceptional Forwarding	0: Frames received with C-Fragment SMD Error are discarded. 1: Frames received with C-Fragment SMD Error are forwarded to exceptional path.	R/W
b6	ECFFCEEF	Ethernet C-Fragment FRAG_COUNT Error Exceptional Forwarding	0: Frames received with C-Fragment FRAG_COUNT Error are discarded. 1: Frames received with C-Fragment FRAG_COUNT Error are forwarded to exceptional path.	R/W
b7	ERFFEF	Ethernet RMAC Frame Filtered Exceptional Forwarding	0: Frames received with RMAC Frame Filtered flag are discarded. 1: Frames received with RMAC Frame Filtered flag are forwarded to exceptional path.	R/W
b8	ERPOOEF	Ethernet Reception Partially Out of Operation Exceptional Forwarding	0: Frames received with Reception Partially Out of Operation flag are discarded. 1: Frames received with Reception Partially Out of Operation flag are forwarded to exceptional path.	R/W
b9	EBOEEF	Ethernet Buffer Overflow Error Exceptional Forwarding	0: Frames received with Buffer Overflow Error are discarded. 1: Frames received with Buffer Overflow Error are forwarded to exceptional path.	R/W
b10	EUEEF	Ethernet Undersize Error Exceptional Forwarding	0: Frames received with Undersize Error are discarded. 1: Frames received with Undersize Error are forwarded to exceptional path.	R/W
b11	EOEEF	Ethernet Oversize Error Exceptional Forwarding	0: Frames received with Oversize Error are discarded. 1: Frames received with Oversize Error are forwarded to exceptional path.	R/W
b12	ETFEF	Ethernet TAG Filtering Exceptional Forwarding	0: Frames received with TAG Filtering flag are discarded. 1: Frames received with TAG Filtering flag are forwarded to exceptional path.	R/W

Bit	Symbol	Bit Name	Description	R/W
b16 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17	GAXEEF	GWCA AXI Error Exceptional Forwarding	0: Frames received with AXI Error are discarded. 1: Frames received with AXI Error are forwarded to exceptional path.	R/W
b18	GSEQEEF	GWCA Sequence Error Exceptional Forwarding	0: Frames received with Sequence Error are discarded. 1: Frames received with Sequence Error are forwarded to exceptional path.	R/W
b19	—	Reserved	This bit is read as 0. The write value should be 0.	R
b20	GTFEF	GWCA TAG Filtering Exceptional Forwarding	0: Frames received with TAG Filtering flag are discarded. 1: Frames received with TAG Filtering flag are forwarded to exceptional path.	R/W
b21	GDNEEF	GWCA Descriptor Number Error Exceptional Forwarding	0: Frames received with Descriptor Number Error are discarded. 1: Frames received with Descriptor Number Error are forwarded to exceptional path.	R/W
b23, b22	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	DDEEF	Direct Descriptor Error Exceptional Forwarding	0: Frames with Direct Descriptor Error are discarded. 1: Frames with Direct Descriptor Error are forwarded to exceptional path.	R/W
b25	—	Reserved	This bit is read as 0. The write value should be 0.	R
b26	DDFSFEF	Direct Descriptor Format Security Filtering Exceptional Forwarding	0: Frames with Direct Descriptor Format Security Error are discarded. 1: Frames with Direct Descriptor Format Security Error are forwarded to exceptional path.	R/W
b31 to b27	—	Reserved	This bit is read as 0. The write value should be 0.	R

Note: For Ethernet error/flag explanations, refer to section 36, Ethernet Agent (ETHA).
Note: For GWCA error/flag explanations, refer to section 38, Ethernet CPU Agent (GWCA).

34.2.1.6 CPU Exceptional Path Reason Configuration Register 1 (FWCEPRC1)

Address(es): MFWD.FWCEPRC1 874C 0028h, MFWD_NS.FWCEPRC1 074C 0028h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FLTHUFEF	Layer 3 Unknown Filtering Exceptional Forwarding	0: Frames filtered because their stream ID is unknown are discarded. 1: Frames filtered because their stream ID is unknown are forwarded to exceptional path.	R/W
b2, b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b3	FDMACUFEF	Destination MAC Unknown Filtering Exceptional Forwarding	0: Frames filtered because their Destination MAC is unknown are discarded. 1: Frames filtered because their Destination MAC is unknown are forwarded to exceptional path.	R/W
b4	FSMACUFEF	Source MAC Unknown Filtering Exceptional Forwarding	0: Frames filtered because their Source MAC is unknown are discarded. 1: Frames filtered because their Source MAC is unknown are forwarded to exceptional path.	R/W
b5	FVLANUFEF	VLAN Unknown Filtering Exceptional Forwarding	0: Frames filtered because their VLAN is unknown are discarded. 1: Frames filtered because their VLAN is unknown are forwarded to exceptional path.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	FDDNTFEF	Direct Descriptor No Target Filtering Exceptional Forwarding	0: Frames filtered because no target during direct forwarding is detected are discarded. 1: Frames filtered because no target during direct forwarding is detected are forwarded to exceptional path.	R/W
b9	FLTHNTFEF	Layer 3 No Target Filtering Exceptional Forwarding	0: Frames filtered because no target during Layer 3 forwarding is detected are discarded. 1: Frames filtered because no target during Layer 3 forwarding is detected are forwarded to exceptional path.	R/W
b10	—	Reserved	This bit is read as 0. The write value should be 0.	R
b11	FLTWNTFEF	Layer 2 No Target Filtering Exceptional Forwarding	0: Frames filtered because the combination on VLAN destination vector and destination MAC destination vector is null are discarded. 1: Frames filtered because the combination on VLAN destination vector and destination MAC destination vector is null are forwarded to exceptional path.	R/W
b12	FPBNTFEF	Port Based No Target Filtering Exceptional Forwarding	0: Frames filtered because no target during Port Based forwarding is detected are discarded. 1: Frames filtered because no target during Port Based forwarding is detected are forwarded to exceptional path.	R/W
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b16	FLTHSLFEF	Layer 3 Source Lock Filtering Exceptional Forwarding	0: Frames filtered because of Layer 3 source lock are discarded. 1: Frames filtered because of Layer 3 source lock are forwarded to exceptional path.	R/W
b18, b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b19	FDMACSLFEF	Destination MAC Source Lock Filtering Exceptional Forwarding	0: Frames filtered because of Destination MAC source lock are discarded. 1: Frames filtered because of Destination MAC source lock are forwarded to exceptional path.	R/W
b20	FSMACSLFEF	Source MAC Source Lock Filtering Exceptional Forwarding	0: Frames filtered because of Source MAC source lock are discarded. 1: Frames filtered because of Source MAC source lock are forwarded to exceptional path.	R/W
b21	FVLANSLFEF	VLAN Source Lock Filtering Exceptional Forwarding	0: Frames filtered because of VLAN source lock are discarded. 1: Frames filtered because of VLAN source lock are forwarded to exceptional path.	R/W
b25 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R
b26	FWMFEF	Watermark Filtering Exceptional Forwarding	0: Frames filtered because of watermark are discarded. 1: Frames filtered because of watermark are forwarded to exceptional path.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.1.8 CPU Learning Path Target Configuration Register (FWCLPTC)

Address(es): MFWD.FWCLPTC 874C 0030h, MFWD_NS.FWCLPTC 074C 0030h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	LPSL	—	—	—	—	—	—	—	LPCS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	LPIPV[2:0]			—	—	—	—	—	—	LPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	LPCSD[5:0]	Learning Path CPU Sub Destination	Configures the CPU sub destination to which Learning frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	LPIPV[2:0]	Learning Path Internal Priority Value	Configures the priority to which Learning frames will be sent.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b16	LPCS	Learning Path CPU Select	Configures CPU to which Learning frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	LPSL	Learning Path Security Level	Configures descriptor security level for Learning path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

LPCS Bit (Learning Path CPU Select)

Refer to Table 34.83 for port mapping.

[Restriction]

- Set this bit to 0.

34.2.1.9 CPU Learning Path Reason Configuration Register (FWCLPRC)

Address(es): MFWD.FWCLPRC 874C 0034h, MFWD_NS.FWCLPRC 074C 0034h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	UVLANLF	UPSMACLF	USMACLF	UDMACLF	—	—	—	USIDLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	USIDLF	Unknown Stream ID Learning Forwarding	0: Frames received with an unknown stream ID are not forwarded to Learning path. 1: Frames received with an unknown stream ID are forwarded to Learning path.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b4	UDMACLF	Unknown Destination MAC Learning Forwarding	0: Frames received with an unknown destination MAC address are not forwarded to Learning path. 1: Frames received with an unknown destination MAC address are forwarded to Learning path.	R/W
b5	USMACLF	Unknown Source MAC Learning Forwarding	0: Frames received with an unknown Source MAC are not forwarded to Learning path. 1: Frames received with an unknown Source MAC are forwarded to Learning path.	R/W
b6	UPSMACLF	Unknown Port for Source MAC Learning Forwarding	0: Frames received with an unknown port for Source MAC are not forwarded to Learning path. 1: Frames received with an unknown port for Source MAC are forwarded to Learning path.	R/W
b7	UVLANLF	Unknown VLAN Learning Forwarding	0: Frames received with an unknown VLAN are not forwarded to Learning path. 1: Frames received with an unknown VLAN are forwarded to Learning path.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.1.10 CPU Mirroring Path Target Configuration Register (FWCMPTC)

Address(es): MFWD.FWCMPTC 874C 0040h, MFWD_NS.FWCMPTC 074C 0040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	CMPSL	—	—	—	—	—	—	—	CMPCS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMPIPU	CMPIPV[2:0]			—	—	—	—	—	—	CMPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	CMPCSD[5:0]	CPU Mirroring Path CPU Sub Destination	Configures the CPU sub destination to which CPU mirroring frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	CMPIPV[2:0]	CPU Mirroring Path Internal Priority Value	CPU Mirroring Path Internal Priority Value	R/W
b15	CMPIPU	CPU Mirroring Path Internal Priority Update	0: Frames mirrored to CPU path are sent with the same priority as for forwarding. 1: Frames mirrored to CPU path are sent with FWCMPTC.CMPIPV[2:0] priority.	R/W
b16	CMPCS	CPU Mirroring Path CPU Select	Configures CPU to which CPU mirroring frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	CMPSL	CPU Mirroring Path Security Level	Configures descriptor security level for CPU mirroring path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

CMPCS Bit (CPU Mirroring Path CPU Select)

Refer to Table 34.83 for port mapping.

[Restriction]

- Set this bit to 0.

34.2.1.11 Ethernet Mirroring Path Target Configuration Register (FWEMPTC)

Address(es): MFWD.FWEMPTC 874C 0044h, MFWD_NS.FWEMPTC 074C 0044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	EMPSL	—	—	—	—	—	—	—	EMPPS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EMPIPU	EMPIPV[2:0]			—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	EMPIPV[2:0]	Ethernet Mirroring Path Internal Priority Value	Ethernet Mirroring Path Internal Priority Value	R/W
b15	EMPIPU	Ethernet Mirroring Path Internal Priority Update	0: Frames mirrored to Ethernet path are sent with the same priority as for forwarding. 1: Frames mirrored to Ethernet path are sent with FWEMPTC.EMPIPV[2:0] priority.	R/W
b16	EMPPS	Ethernet Mirroring Path Port Select	Configures port to which Ethernet mirroring frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	EMPSL	Ethernet Mirroring Path Security Level	Configures descriptor security level for Ethernet mirroring path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

EMPPS Bit (Ethernet Mirroring Path Port Select)

Refer to Table 34.83 for port mapping.

34.2.1.12 Source-Destination Mirroring Path Target Configuration Register (FWSDMPTC)

Address(es): MFWD.FWSDMPTC 874C 0050h, MFWD_NS.FWSDMPTC 074C 0050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	SDMPSL	—	—	—	—	—	—	SDMPPS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SDMPIPU	SDMPIPV[2:0]			—	—	—	—	—	—	SDMPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	SDMPCSD[5:0]	Source-Destination Mirroring Path CPU Sub Destination	Configures the CPU sub destination to which Source-Destination mirroring frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	SDMPIPV[2:0]	Source-Destination Mirroring Path Internal Priority Value	Source-Destination Mirroring Path Internal Priority Value	R/W
b15	SDMPIPU	Source-Destination Mirroring Path Internal Priority Update	0: Frames mirrored to Source-Destination path are sent with the same priority as for forwarding. 1: Frames mirrored to Source-Destination path are sent with FWSDMPTC.SDMPIPV[2:0] priority.	R/W
b17, b16	SDMPPS[1:0]	Source-Destination Mirroring Path Port Select	Configures Port to which Source-Destination mirroring frames will be sent.	R/W
b23 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	SDMPSL	Source-Destination Mirroring Path Security Level	Configures descriptor security level for Source-Destination mirroring path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

SDMPPS[1:0] Bits (Source-Destination Mirroring Path Port Select)

Refer to Table 34.83 for port mapping.

[Restriction]

- SW: These bits should not be set to a value larger than 2.

34.2.1.13 Source-Destination Mirroring Path Vector Configuration Register (FWSDMPVC)

Address(es): MFWD.FWSDMPVC 874C 0054h, MFWD_NS.FWSDMPVC 074C 0054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SDMSV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	SDMDV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	SDMDV[2:0]	Source-Destination Mirroring Destination Vector		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	SDMSV[2:0]	Source-Destination Mirroring Source Vector		R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

SDMDV[2:0] Bits (Source-Destination Mirroring Destination Vector)

Frames coming from a port set in the FWSDMPVC.SDMSV[2:0] bits and sent to a port set in the FWSDMPVC.SDMDV[2:0] bits are also duplicated to Source-Destination mirroring path.
Setting these bits to 000b disable Source-Destination mirroring path.

SDMSV[2:0] Bits (Source-Destination Mirroring Source Vector)

Frames coming from a port set in the FWSDMPVC.SDMSV[2:0] bits and sent to a port set in the FWSDMPVC.SDMDV[2:0] bits are also duplicated to Source-Destination mirroring path.
Setting these bits to 000b disable Source-Destination mirroring path.

34.2.1.14 Port i Level Based Watermark Configuration Register (FWLBWMCi) (i = 0 to 2)

Address(es): MFWD.FWLBWMC0 874C 0080h, MFWD.FWLBWMC1 874C 0084h, MFWD.FWLBWMC2 874C 0088h, MFWD_NS.FWLBWMC0 074C 0080h, MFWD_NS.FWLBWMC1 074C 0084h, MFWD_NS.FWLBWMC2 074C 0088h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	WMFL PR15	WMFL PR14	WMFL PR13	WMFL PR12	WMFL PR11	WMFL PR10	WMFL PR9	WMFL PR8	WMFL PR7	WMFL PR6	WMFL PR5	WMFL PR4	WMFL PR3	WMFL PR2	WMFL PR1	WMFL PR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WMCL PR15	WMCL PR14	WMCL PR13	WMCL PR12	WMCL PR11	WMCL PR10	WMCL PR9	WMCL PR8	WMCL PR7	WMCL PR6	WMCL PR5	WMCL PR4	WMCL PR3	WMCL PR2	WMCL PR1	WMCL PR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	WMCLPR0	Watermark Critical Level Priority 0 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b1	WMCLPR1	Watermark Critical Level Priority 1 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b2	WMCLPR2	Watermark Critical Level Priority 2 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b3	WMCLPR3	Watermark Critical Level Priority 3 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b4	WMCLPR4	Watermark Critical Level Priority 4 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b5	WMCLPR5	Watermark Critical Level Priority 5 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b6	WMCLPR6	Watermark Critical Level Priority 6 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W

Bit	Symbol	Bit Name	Description	R/W
b7	WMCLPR7	Watermark Critical Level Priority 7 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b8	WMCLPR8	Watermark Critical Level Priority 8 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b9	WMCLPR9	Watermark Critical Level Priority 9 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b10	WMCLPR10	Watermark Critical Level Priority 10 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b11	WMCLPR11	Watermark Critical Level Priority 11 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b12	WMCLPR12	Watermark Critical Level Priority 12 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b13	WMCLPR13	Watermark Critical Level Priority 13 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b14	WMCLPR14	Watermark Critical Level Priority 14 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b15	WMCLPR15	Watermark Critical Level Priority 15 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b16	WMFLPR0	Watermark Flush Level Priority 0 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W

Bit	Symbol	Bit Name	Description	R/W
b17	WMFLPR1	Watermark Flush Level Priority 1 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b18	WMFLPR2	Watermark Flush Level Priority 2 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b19	WMFLPR3	Watermark Flush Level Priority 3 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b20	WMFLPR4	Watermark Flush Level Priority 4 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b21	WMFLPR5	Watermark Flush Level Priority 5 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b22	WMFLPR6	Watermark Flush Level Priority 6 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b23	WMFLPR7	Watermark Flush Level Priority 7 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b24	WMFLPR8	Watermark Flush Level Priority 8 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b25	WMFLPR9	Watermark Flush Level Priority 9 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b26	WMFLPR10	Watermark Flush Level Priority 10 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W

Bit	Symbol	Bit Name	Description	R/W
b27	WMFLPR11	Watermark Flush Level Priority 11 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b28	WMFLPR12	Watermark Flush Level Priority 12 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b29	WMFLPR13	Watermark Flush Level Priority 13 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b30	WMFLPR14	Watermark Flush Level Priority 14 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b31	WMFLPR15	Watermark Flush Level Priority 15 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W

Note: {DEI,IPV} refers to the bit association {DEI,IPV[2:0]}, so in decimal it can be written 8 × DEI + IPV.

34.2.1.15 Port i Configuration Register 0 (FWPCi0) (i = 0 to 2)

Address(es): MFWD.FWPC00 874C 0100h, MFWD.FWPC10 874C 0110h, MFWD.FWPC20 874C 0120h, MFWD_NS.FWPC00 074C 0100h, MFWD_NS.FWPC10 074C 0110h, MFWD_NS.FWPC20 074C 0120h

b1	LTHRUS	L3 Reject Unknown Streams	0: Unknown streams coming from source port i are not rejected. 1: Unknown streams coming from source port i are rejected.	R/W
b2	LTHRUSS	L3 Reject Unknown Secure Streams	0: Unknown secure streams coming from source port i are not rejected. 1: Unknown secure streams coming from source port i are rejected.	R/W
b3	IP4UE	IPv4 UDP Enable	0: IPv4/UDP detection disabled for source port i. 1: IPv4/UDP detection enabled for source port i.	R/W
b4	IP4TE	IPv4 TCP Enable	0: IPv4/TCP detection disabled for source port i. 1: IPv4/TCP detection enabled for source port i.	R/W
b5	IP4OE	IPv4 Other Enable	0: non-TCP non-UDP IPv4 detection disabled for source port i. 1: non-TCP non-UDP IPv4 detection enabled for source port i.	R/W
b6	IP6UE	IPv6 UDP Enable	0: IPv6/UDP detection disabled for source port i. 1: IPv6/UDP detection enabled for source port i.	R/W
b7	IP6TE	IPv6 TCP Enable	0: IPv6/TCP detection disabled for source port i. 1: IPv6/TCP detection enabled for source port i.	R/W
b8	IP6OE	IPv6 Other Enable	0: non-TCP non-UDP IPv6 detection disabled for source port i. 1: non-TCP non-UDP IPv6 detection enabled for source port i.	R/W
b9	L2SE	L2 Stream Enable	0: L2 stream disabled for source port i. 1: L2 stream enabled for source port i.	R/W
b19 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b20	MACDSA	MAC Destination Search Active	0: MAC Destination search is disabled for source port i. 1: MAC Destination search is enabled for source port i.	R/W
b21	MACRUDA	MAC Reject Unknown Destination Addresses	0: Unknown MAC Destination addresses coming from source port i are not rejected. 1: Unknown MAC Destination addresses coming from source port i are rejected.	R/W
b22	MACRUDSA	MAC Reject Unknown Destination Secure Addresses	0: Unknown secure MAC Destination addresses coming from source port i are not rejected. 1: Unknown secure MAC Destination addresses coming from source port i are rejected.	R/W
b23	MACSSA	MAC Source Search Active	0: MAC Source search is disabled for source port i. 1: MAC Source search is enabled for source port i.	R/W

Bit	Symbol	Bit Name	Description	R/W
b24	MACRUSA	MAC Reject Unknown Source Addresses	0: Unknown MAC Source addresses coming from source port i are not rejected. 1: Unknown MAC Source addresses coming from source port i are rejected.	R/W
b25	MACRUSSA	MAC Reject Unknown Source Secure Addresses	0: Unknown secure MAC Source addresses coming from source port i are not rejected. 1: Unknown secure MAC Source addresses coming from source port i are rejected.	R/W
b26	MACHLA	MAC Hardware Learning Active	0: Unknown unicast MAC Source addresses coming from source port i are not added to the MAC table. 1: Unknown unicast MAC Source addresses coming from source port i are added to the MAC table.	R/W
b27	MACHMA	MAC Hardware Migration Active	0: Known unicast MAC Source addresses coming from source port i with a wrong source port in MAC.DV are not overwritten. 1: Known unicast MAC Source addresses coming from source port i with a wrong source port in MAC.DV are overwritten.	R/W
b28	VLANSA	VLAN Search Active*1	0: VLAN search is disabled for source port i. 1: VLAN search is enabled for source port i.	R/W
b29	VLANRU	VLAN Reject Unknown*1	0: Unknown VLAN coming from source port i are not rejected. 1: Unknown VLAN coming from source port i are rejected.	R/W
b30	VLANRUS	VLAN Reject Unknown Secure*1	0: Unknown secure VLAN coming from source port i are not rejected. 1: Unknown secure VLAN coming from source port i are rejected.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

Note 1. This bit should be set to 0 if FWGC.SVM[1:0] are set to 00b.

VLANSA Bit (VLAN Search Active)

HW: If VLAN Destination search is disable for port i, all frames coming from port i are considered as unknown for VLAN search.

34.2.1.16 Port i Configuration Register 1 (FWPCi1) (i = 0 to 2)

Address(es): MFWD.FWPC01 874C 0104h, MFWD.FWPC11 874C 0114h, MFWD.FWPC21 874C 0124h, MFWD_NS.FWPC01 074C 0104h, MFWD_NS.FWPC11 074C 0114h, MFWD_NS.FWPC21 074C 0124h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	LTWFM0	Layer 2 Forwarding Mask 0	0: Frames forwarded by Layer 2 forwarding can be forwarded to port 0. 1: Frames forwarded by Layer 2 forwarding cannot be forwarded to port 0.	R/W
b17	LTWFM1	Layer 2 Forwarding Mask 1	0: Frames forwarded by Layer 2 forwarding can be forwarded to port 1. 1: Frames forwarded by Layer 2 forwarding cannot be forwarded to port 1.	R/W
b18	LTWFM2	Layer 2 Forwarding Mask 2	0: Frames forwarded by Layer 2 forwarding can be forwarded to port 2. 1: Frames forwarded by Layer 2 forwarding cannot be forwarded to port 2.	R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. The value after reset is 1 for the FWPC22 register.
Note 2. The value after reset is 1 for the FWPC12 register.
Note 3. The value after reset is 1 for the FWPC02 register.

34.2.2 Cut-Through Forwarding Function Registers

34.2.2.1 Cut-Through General Configuration Register i0 (FWCTGCi0) (i = 0 to 7)

Address(es): MFWD.FWCTGC00 874C 0400h, MFWD.FWCTGC10 874C 0440h, MFWD.FWCTGC20 874C 0480h, MFWD.FWCTGC30 874C 04C0h, MFWD.FWCTGC40 874C 0500h, MFWD.FWCTGC50 874C 0540h, MFWD.FWCTGC60 874C 0580h, MFWD.FWCTGC70 874C 05C0h, MFWD_NS.FWCTGC00 074C 0400h, MFWD_NS.FWCTGC10 074C 0440h, MFWD_NS.FWCTGC20 074C 0480h, MFWD_NS.FWCTGC30 074C 04C0h, MFWD_NS.FWCTGC40 074C 0500h, MFWD_NS.FWCTGC50 074C 0540h, MFWD_NS.FWCTGC60 074C 0580h, MFWD_NS.FWCTGC70 074C 05C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	CTRTGI	CTVCTRL[1:0]		CTFI	—	—	CTETE	CTSDE	CTSPE	CTSVE	CTCDE	CTCPE	CTCVE	CTMSE	CTMDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CTMDE	Cut-Through MAC Destination Enable	0: MAC destination not included in Cut-Through separation for separation rule i. 1: MAC destination included in Cut-Through separation for separation rule i.	R/W
b1	CTMSE	Cut-Through MAC Source Enable	0: MAC Source not included in Cut-Through separation for separation rule i. 1: MAC Source included in Cut-Through separation for separation rule i.	R/W
b2	CTCVE	Cut-Through C-TAG VLAN Enable *1	0: C-TAG VLAN not included in Cut-Through separation for separation rule i. 1: C-TAG VLAN included in Cut-Through separation for separation rule i.	R/W
b3	CTCPE	Cut-Through C-TAG PCP Enable*1	0: C-TAG PCP not included in Cut-Through separation for separation rule i. 1: C-TAG PCP included in Cut-Through separation for separation rule i.	R/W
b4	CTCDE	Cut-Through C-TAG DEI Enable*1	0: C-TAG DEI not included in Cut-Through separation for separation rule i. 1: C-TAG DEI included in Cut-Through separation for separation rule i.	R/W
b5	CTSVE	Cut-Through S-TAG VLAN Enable *2	0: S-TAG VLAN not included in Cut-Through separation for separation rule i. 1: S-TAG VLAN included in Cut-Through separation for separation rule i.	R/W
b6	CTSPE	Cut-Through S-TAG PCP Enable*2	0: S-TAG PCP not included in Cut-Through separation for separation rule i. 1: S-TAG PCP included in Cut-Through separation for separation rule i.	R/W
b7	CTSDE	Cut-Through S-TAG DEI Enable*2	0: S-TAG DEI not included in Cut-Through separation for separation rule i. 1: S-TAG DEI included in Cut-Through separation for separation rule i.	R/W
b8	CTETE	Cut-Through Ethernet Type Enable	0: Ethernet Type not included in Cut-Through separation for separation rule i. 1: Ethernet Type included in Cut-Through separation for separation rule i.	R/W
b10, b9	—	Reserved	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b11	CTFI	Cut-Through FCS In	0: The frame matching separation rule i has no FCS included. 1: The frame matching separation rule i has an FCS included.	R/W
b13, b12	CTVCTRL[1:0]	Cut-Through VLAN Control [GWCA] [ETHA]	b13 b12 0 0: The ingress matching separation rule i frame is a No TAG frame 0 1: The ingress matching separation rule i frame is a C-TAG frame 1 0: The ingress matching separation rule i frame is a SC-TAG frame 1 1: The ingress matching separation rule i frame is a CoS TAG frame	R/W
b14	CTRTGI	Cut-Through R-Tag In [GWCA] [ETHA]	0: R-TAG is not included in cut-through frame. 1: R-TAG is included in cut-through frame.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. This bit can be set to 1 only if FWGC.SVM[1:0] bits are set to 10b or 01b.
Note 2. This bit can be set to 1 only if FWGC.SVM[1:0] bits are set to 10b.

CTFI Bit (Cut-Through FCS In)

This bit is used as FDESCR.FI for cut-through.

[Restriction]

- SW: This bit should be set to the frame source port MRGC.RCPT (same) value [RMAC].
  case.1: CTFI = 1, RCPT = 1 and correct FCS frame incoming
  → correct FCS frame forwarded
  (The FCS attached to the input frame is output as it is. If the tag is converted, the FCS value will be invalid.)
  case.2: CTFI = 1, RCPT = 1 and incorrect FCS frame incoming
  → incorrect FCS frame forwarded
  case.3: CTFI = 0, RCPT = 0 and correct FCS frame incoming
  → correct FCS frame forwarded
  case.4: CTFI = 0, RCPT = 0 and incorrect FCS frame incoming
  → correct FCS frame forwarded (The correct FCS will be added after the incorrect FCS.)

CTVCTRL[1:0] Bits (Cut-Through VLAN Control [GWCA] [ETHA])

These bits are used as FDESCR.VCTRL[1:0] for cut-through.

CTRTGI Bit (Cut-Through R-Tag In [GWCA] [ETHA])

This bit is used as FDESCR.RTGI for cut-through.

34.2.2.2 Cut-Through General Configuration Register i1 (FWCTGCi1) (i = 0 to 7)

Address(es): MFWD.FWCTGC01 874C 0404h, MFWD.FWCTGC11 874C 0444h, MFWD.FWCTGC21 874C 0484h, MFWD.FWCTGC31 874C 04C4h, MFWD.FWCTGC41 874C 0504h, MFWD.FWCTGC51 874C 0544h, MFWD.FWCTGC61 874C 0584h, MFWD.FWCTGC71 874C 05C4h, MFWD_NS.FWCTGC01 074C 0404h, MFWD_NS.FWCTGC11 074C 0444h, MFWD_NS.FWCTGC21 074C 0484h, MFWD_NS.FWCTGC31 074C 04C4h, MFWD_NS.FWCTGC41 074C 0504h, MFWD_NS.FWCTGC51 074C 0544h, MFWD_NS.FWCTGC61 074C 0584h, MFWD_NS.FWCTGC71 074C 05C4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	CTMT[25:16]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTMT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b25 to b0	CTMT[25:0]	Cut-Through Maximum Time	Describes maximum time on the PHY in ns of frames matching separation rule i	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

CTMT[25:0] Bits (Cut-Through Maximum Time)

This time should take in account the whole frame (including preamble, SFD, TAGs and FCS) and IFG.
This size will be used for TAS calculations [ETHA].
[Cautions]

- If these bits do not have the correct value, some frames could cross a closed gate in TAS [ETHA].
- If TAS is enabled, sending frames less than these bits value will decrease the PHY throughput because the frame time will be reserved at these bits value [ETHA]. Therefore, TAS gate open time must be larger than CTMT[25:0] value.

34.2.2.3 Cut-Through Target Configuration Register i0 (FWCTTCi0) (i = 0 to 7)

Address(es): MFWD.FWCTTC00 874C 0408h, MFWD.FWCTTC10 874C 0448h, MFWD.FWCTTC20 874C 0488h, MFWD.FWCTTC30 874C 04C8h, MFWD.FWCTTC40 874C 0508h, MFWD.FWCTTC50 874C 0548h, MFWD.FWCTTC60 874C 0588h, MFWD.FWCTTC70 874C 05C8h, MFWD_NS.FWCTTC00 074C 0408h, MFWD_NS.FWCTTC10 074C 0448h, MFWD_NS.FWCTTC20 074C 0488h, MFWD_NS.FWCTTC30 074C 04C8h, MFWD_NS.FWCTTC40 074C 0508h, MFWD_NS.FWCTTC50 074C 0548h, MFWD_NS.FWCTTC60 074C 0588h, MFWD_NS.FWCTTC70 074C 05C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CTDFM1	CTDFM0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CTDV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	CTDV[2:0]	Cut-Through Destination Vector	Select the ports to which the frames matching separation rule i will be sent.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	CTDFM0	Cut-Through Destination 0 Forwarding Mode	0: Frame is forwarded in Cut-through mode 1: Frame is forwarded in Store and forward mode	R/W
b17	CTDFM1	Cut-Through Destination 1 Forwarding Mode	0: Frame is forwarded in Cut-through mode 1: Frame is forwarded in Store and forward mode	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

CTDV[2:0] Bit (Cut-Through Destination Vector)

Enables cut-through for separation rule i.

[Restriction]

- When cut-through is enabled for rule i, at least one bit set to 1 in FWCTTCi0.CTDV[1] or FWCTTCi0.CTDV[0] and should be set FWCTTCi0.CTDFM0 to 0 for a cut-through able destination agent (when cut-through is enabled, at least one Ethernet destination port should use with cut-through mode).

CTDFMn Bit (Cut-Through Destination Forwarding Mode n) (n = 0, 1)

[Restriction]

- HW: In Cut-through mode, a frame with an error cannot be rejected and is forwarded to its destination ports.

34.2.2.4 Cut-Through Target Configuration Register i1 (FWCTTCi1) (i = 0 to 7)

Address(es): MFWD.FWCTTC01 874C 040Ch, MFWD.FWCTTC11 874C 044Ch, MFWD.FWCTTC21 874C 048Ch, MFWD.FWCTTC31 874C 04CCh, MFWD.FWCTTC41 874C 050Ch, MFWD.FWCTTC51 874C 054Ch, MFWD.FWCTTC61 874C 058Ch, MFWD.FWCTTC71 874C 05CCh, MFWD_NS.FWCTTC01 074C 040Ch, MFWD_NS.FWCTTC11 074C 044Ch, MFWD_NS.FWCTTC21 074C 048Ch, MFWD_NS.FWCTTC31 074C 04CCh, MFWD_NS.FWCTTC41 074C 050Ch, MFWD_NS.FWCTTC51 074C 054Ch, MFWD_NS.FWCTTC61 074C 058Ch, MFWD_NS.FWCTTC71 074C 05CCh

	—	—	—	—	—	—	—	TWBFM	—	—	—	—	—	—	TWBFUM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TWBFUM[1:0]	Two-Byte Filter Unit Mode	b1 b0 0 0: Mask mode 0 1: Expand mode 1 0: Precise mode 1 1: Reserved	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	TWBFM	Two-Byte Filtering Mode	0: Offset filtering. 1: VLAN TAG filtering.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b23 to b16	TWBFOV[7:0]	Two-Byte Filter Offset Value	If FWTWBFCi.TWBFM is 0: Offset in byte where the filter i will start filtering the frame data. If FWTWBFCi.TWBFM is 1: Offset in byte where the filter i will start filtering the frame TAGs.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

TWBFUM[1:0] Bits (Two-Byte Filter Unit Mode)

[Restriction]

- SW: These bits should not be set to 01b if the FWTWBFCi.TWBFM bit is set to 1.

TWBFM Bit (Two-Byte Filtering Mode)

[Restriction]

- SW: This bit should not be set to 1 if the FWGC.SVM[1:0] bits are set to 00b.

TWBFOV[7:0] Bits (Two-Byte Filter Offset Value)

[Restrictions]

- SW: If the FWTWBFCi.TWBFM bit is set to 1, these bits should be set to 00h to filter S-TAG and set to 2 to filter C-TAG.
- SW: If the FWTWBFCi.TWBFM bit is set to 1 and the FWGC.SVM[1:0] bits are set to 01b, these bits should not

be set to 00h.

34.2.3.2 Two-Byte Filter Value Configuration Register i (FWTWBFVCi) (i = 0 to 15)

Address(es): MFWD.FWTWBFVC0 874C 1004h, MFWD.FWTWBFVC1 874C 1014h, MFWD.FWTWBFVC2 874C 1024h, MFWD.FWTWBFVC3 874C 1034h, MFWD.FWTWBFVC4 874C 1044h, MFWD.FWTWBFVC5 874C 1054h, MFWD.FWTWBFVC6 874C 1064h, MFWD.FWTWBFVC7 874C 1074h, MFWD.FWTWBFVC8 874C 1084h, MFWD.FWTWBFVC9 874C 1094h, MFWD.FWTWBFVC10 874C 10A4h, MFWD.FWTWBFVC11 874C 10B4h, MFWD.FWTWBFVC12 874C 10C4h, MFWD.FWTWBFVC13 874C 10D4h, MFWD.FWTWBFVC14 874C 10E4h, MFWD.FWTWBFVC15 874C 10F4h,
MFWD_NS.FWTWBFVC0 074C 1004h, MFWD_NS.FWTWBFVC1 074C 1014h, MFWD_NS.FWTWBFVC2 074C 1024h, MFWD_NS.FWTWBFVC3 074C 1034h, MFWD_NS.FWTWBFVC4 074C 1044h, MFWD_NS.FWTWBFVC5 074C 1054h, MFWD_NS.FWTWBFVC6 074C 1064h, MFWD_NS.FWTWBFVC7 074C 1074h, MFWD_NS.FWTWBFVC8 074C 1084h, MFWD_NS.FWTWBFVC9 074C 1094h, MFWD_NS.FWTWBFVC10 074C 10A4h, MFWD_NS.FWTWBFVC11 074C 10B4h, MFWD_NS.FWTWBFVC12 074C 10C4h, MFWD_NS.FWTWBFVC13 074C 10D4h, MFWD_NS.FWTWBFVC14 074C 10E4h, MFWD_NS.FWTWBFVC15 074C 10F4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

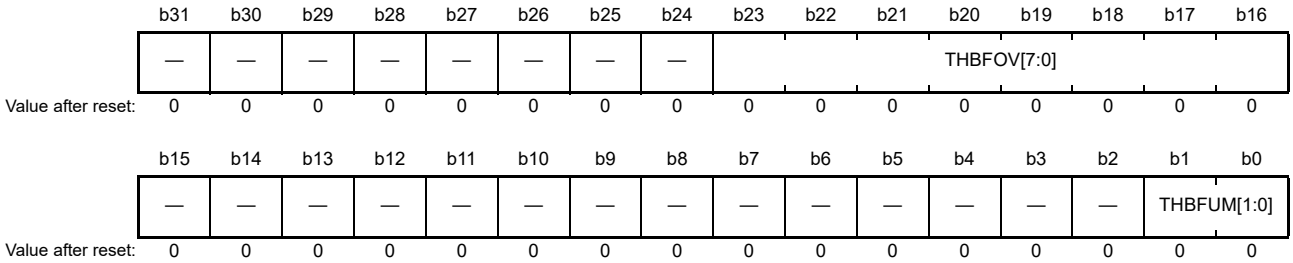
	TWBFV0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TWBFV0[15:0]	Two-Byte Filter Value 0	If the FWTWBFCi.TWBFUM[1:0] bits are 00b: Used as a 2-byte filter value masked by the FWTWBFVCi.TWBFV1[15:0] bits with a filter ID of 2 × i. If the FWTWBFCi.TWBFUM[1:0] bits are 01b: Used as the first 2-byte of a 4-byte filter extended by the FWTWBFVCi.TWBFV1[15:0] bits with a filter ID of 2 × i (Compare value is {FWTWBFVCi.TWBFV0[15:0], FWTWBFVCi.TWBFV1[15:0]}). If the FWTWBFCi.TWBFUM[1:0] bits are 10b: Used as 2-byte filter value with a filter ID of 2 × i.	R/W
b31 to b16	TWBFV1[15:0]	Two-Byte Filter Value 1	If the FWTWBFCi.TWBFUM[1:0] bits are 00b: Used as a mask for the FWTWBFVCi.TWBFV0[15:0] bits. If the FWTWBFCi.TWBFUM[1:0] bits are 01b: Used as an extension for the FWTWBFVCi.TWBFV0[15:0] bits (Compare value is {FWTWBFVCi.TWBFV0[15:0], FWTWBFVCi.TWBFV1[15:0]}). If the FWTWBFCi.TWBFUM[1:0] bits are 10b: Used as 2-byte filter value with a filter ID of 2 × i +1.	R/W

TWBFV0[15:0] Bits (Two-Byte Filter Value 0)

[Update condition]

- HW: Writing to the FWTWBFCi register will update these bits to the last value that has been written to any of the FWTWBFVCi.TWBFV0[15:0] bits by the same APB interface.



TWBFV1[15:0] Bits (Two-Byte Filter Value 1)

[Update condition]

- HW: Writing to the FWTWBFCi register will update these bits to the last value that has been written to any of the FWTWBFVCi.TWBFV1[15:0] bits by the same APB interface.

34.2.3.3 Three-Byte Filter Configuration Register i (FWTHBFCi) (i = 0 to 15)

Address(es): MFWD.FWTHBFC0 874C 1400h, MFWD.FWTHBFC1 874C 1410h, MFWD.FWTHBFC2 874C 1420h, MFWD.FWTHBFC3 874C 1430h, MFWD.FWTHBFC4 874C 1440h, MFWD.FWTHBFC5 874C 1450h, MFWD.FWTHBFC6 874C 1460h, MFWD.FWTHBFC7 874C 1470h, MFWD.FWTHBFC8 874C 1480h, MFWD.FWTHBFC9 874C 1490h, MFWD.FWTHBFC10 874C 14A0h, MFWD.FWTHBFC11 874C 14B0h, MFWD.FWTHBFC12 874C 14C0h, MFWD.FWTHBFC13 874C 14D0h, MFWD.FWTHBFC14 874C 14E0h, MFWD.FWTHBFC15 874C 14F0h,

b15 to b8	RFSV1[15:8]	Range Filter Start Value 1	Used as range filter start value with a filter ID of 2 × (i + 48) + 1 (Matching values are contained in [FWRFVCi.RFSV1[15:8]:FWRFVCi.RFSV1[15:8] + FWRFVCi.RFRV[3:0]]).	R/W
b19 to b16	RFRV[3:0]	Range Filter Range Value	Used as range value for filters values FWRFVCi.RFSV1[15:8] and FWRFVCi.RFSV0[7:0].	R/W
b31 to b20	—	Reserved	These bits are read as 0. The write value should be 0.	R

RFSV0[7:0] Bits (Range Filter Start Value 0)

[Update condition]

- HW: Writing to the FWRFCi register will update these bits to the last value that has been written to any of the FWRFVCi.RFSV0[7:0] bits by the same APB interface.

RFSV1[15:8] Bits (Range Filter Start Value 1)

[Update condition]

- HW: Writing to the FWRFCi register will update these bits to the last value that has been written to any of the FWRFVCi.RSCV1[15:8] bits by the same APB interface.

RFRV[3:0] Bits (Range Filter Range Value)

[Update condition]

- HW: Writing to the FWRFCi register will update these bits to the last value that has been written to any of the FWRFVCi.RFRV[3:0] bits by the same APB interface.

[Restriction]

- SW: FWRFVCi.RFSV0[7:0] + FWRFVCi.RFRV[3:0] and FWRFVCi.RFSV1[15:8] + FWRFVCi.RFRV[3:0] should always be less than or equal to 255.

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	CFFN[6:0]	Cascade Filter Filter Number	Map filter number FWCFMCij.CFFN[6:0] to cascade filter number i.	R/W
b14 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R
b15	CFFV	Cascade Filter Valid	Enables FWCFMCij.CFFN[6:0] for cascade filter i.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

CFFN[6:0] Bits (Cascade Filter Filter Number)

[Update condition]

- HW: Writing to the FWCFCi register will update these bits to the last value that has been written to the FWCFMCkj.CFFN[6:0] bits (k can take any value) by the same APB interface.

CFFV Bit (Cascade Filter Valid)

If no one of the FWCFMCij.CFFV bit is equal to 1, cascade filter i is disabled.

[Update condition]

- HW: Writing to the FWCFCi register will update this bit to the last value that has been written to the FWCFMCkj.CFFV bit (k can take any value) by the same APB interface.

b24	IP6IDPTS	IPv6 Include Destination Port in Stream	0: TCP/UDP Destination port is not included in L3 IPv6 stream ID 1: TCP/UDP Destination port is included in L3 IPv6 stream ID	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. If the FWGC.SVM[1:0] bits are set to 00b or 01b, this bit should be set to 0.
Note 2. If the FWGC.SVM[1:0] bits are set to 00b, this bit should be set to 0.

IP6II0S Bit (IPv6 Include IP 0 in Stream)

IPv6 IP address part 0 is a 4-byte byte length field extracted from the IP source or destination address depending on FWIP6OC configuration.

IP6II1S Bit (IPv6 Include IP 1 in Stream)

IPv6 IP address part 1 is a 4-byte byte length field extracted from the IP source or destination address depending on FWIP6OC configuration.

34.2.4.3 IPv6 Offset Configuration Register (FWIP6OC)

Address(es): MFWD.FWIP6OC 874C 401Ch, MFWD_NS.FWIP6OC 074C 401Ch

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	IP4HE0	IPv4 Stream Filter Hash Equation 0	Setting this bit to 1, hash equation 1 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b1	IP4HE1	IPv4 Stream Filter Hash Equation 1	Setting this bit to 1, hash equation 1 + x^2 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b2	IP4HE2	IPv4 Stream Filter Hash Equation 2	Setting this bit to 1, hash equation 1 + x^3 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b3	IP4HE3	IPv4 Stream Filter Hash Equation 3	Setting this bit to 1, hash equation 1 + x^4 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b4	IP4HE4	IPv4 Stream Filter Hash Equation 4	Setting this bit to 1, hash equation 1 + x^5 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b5	IP4HE5	IPv4 Stream Filter Hash Equation 5	Setting this bit to 1, hash equation 1 + x^6 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b6	IP4HE6	IPv4 Stream Filter Hash Equation 6	Setting this bit to 1, hash equation 1 + x^7 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b7	IP4HE7	IPv4 Stream Filter Hash Equation 7	Setting this bit to 1, hash equation 1 + x^8 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b8	IP4HE8	IPv4 Stream Filter Hash Equation 8	Setting this bit to 1, hash equation 1 + x^9 + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b9	IP4HE9	IPv4 Stream Filter Hash Equation 9	Setting this bit to 1, hash equation 1 + x^{10} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b10	IP4HE10	IPv4 Stream Filter Hash Equation 10	Setting this bit to 1, hash equation 1 + x^{11} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b11	IP4HE11	IPv4 Stream Filter Hash Equation 11	Setting this bit to 1, hash equation 1 + x^{12} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b12	IP4HE12	IPv4 Stream Filter Hash Equation 12	Setting this bit to 1, hash equation 1 + x^{13} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b13	IP4HE13	IPv4 Stream Filter Hash Equation 13	Setting this bit to 1, hash equation 1 + x^{14} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b14	IP4HE14	IPv4 Stream Filter Hash Equation 14	Setting this bit to 1, hash equation 1 + x^{15} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b15	IP4HE15	IPv4 Stream Filter Hash Equation 15	Setting this bit to 1, hash equation 1 + x^{16} + x^{17} is activated in Hash function for IPv4 Hash calculation.	R/W
b16	IP6HE0	IPv6 Stream Filter Hash Equation 0	Setting this bit to 1, hash equation 1 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b17	IP6HE1	IPv6 Stream Filter Hash Equation 1	Setting this bit to 1, hash equation 1 + x^2 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b18	IP6HE2	IPv6 Stream Filter Hash Equation 2	Setting this bit to 1, hash equation 1 + x^3 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b19	IP6HE3	IPv6 Stream Filter Hash Equation 3	Setting this bit to 1, hash equation 1 + x^4 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W

Bit	Symbol	Bit Name	Description	R/W
b20	IP6HE4	IPv6 Stream Filter Hash Equation 4	Setting this bit to 1, hash equation 1 + x^5 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b21	IP6HE5	IPv6 Stream Filter Hash Equation 5	Setting this bit to 1, hash equation 1 + x^6 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b22	IP6HE6	IPv6 Stream Filter Hash Equation 6	Setting this bit to 1, hash equation 1 + x^7 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b23	IP6HE7	IPv6 Stream Filter Hash Equation 7	Setting this bit to 1, hash equation 1 + x^8 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b24	IP6HE8	IPv6 Stream Filter Hash Equation 8	Setting this bit to 1, hash equation 1 + x^9 + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b25	IP6HE9	IPv6 Stream Filter Hash Equation 9	Setting this bit to 1, hash equation 1 + x^{10} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b26	IP6HE10	IPv6 Stream Filter Hash Equation 10	Setting this bit to 1, hash equation 1 + x^{11} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b27	IP6HE11	IPv6 Stream Filter Hash Equation 11	Setting this bit to 1, hash equation 1 + x^{12} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b28	IP6HE12	IPv6 Stream Filter Hash Equation 12	Setting this bit to 1, hash equation 1 + x^{13} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b29	IP6HE13	IPv6 Stream Filter Hash Equation 13	Setting this bit to 1, hash equation 1 + x^{14} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b30	IP6HE14	IPv6 Stream Filter Hash Equation 14	Setting this bit to 1, hash equation 1 + x^{15} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W
b31	IP6HE15	IPv6 Stream Filter Hash Equation 15	Setting this bit to 1, hash equation 1 + x^{16} + x^{17} is activated in Hash function for IPv6 Hash calculation.	R/W

If several Hash equations are activated, the result of all activated equation are XORed to give the final Hash ID.

34.2.4.6 Software Hash Calculation Request Register 0 (FWSHCR0)

Address(es): MFWD.FWSHCR0 874C 4040h, MFWD_NS.FWSHCR0 074C 4040h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	SHCCV[11:0]	Software Hash Calculation C-TAG VLAN		R/W
b12	SHCCD	Software Hash Calculation C-TAG DEI		R/W
b15 to b13	SHCCP[2:0]	Software Hash Calculation C-TAG PCP		R/W
b27 to b16	SHCSV[11:0]	Software Hash Calculation S-TAG VLAN		R/W
b28	SHCSD	Software Hash Calculation S-TAG DEI		R/W
b31 to b29	SHCSP[2:0]	Software Hash Calculation S-TAG PCP		R/W

This register is used to accelerate hash calculation.

34.2.4.10 Software Hash Calculation Request Register 4 (FWSHCR4)

Address(es): MFWD.FWSHCR4 874C 4050h, MFWD_NS.FWSHCR4 074C 4050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHCFF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	SHCP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	SHCP[7:0]	Software Hash Calculation Protocol (Next header for IPv6)		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	SHCFF	Software Hash Calculation Frame Format	0: IPv4 Hash Calculation 1: IPv6 Hash Calculation	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used to accelerate hash calculation.

34.2.4.11 Software Hash Calculation Request Register 5 (FWSHCR5)

Address(es): MFWD.FWSHCR5 874C 4054h, MFWD_NS.FWSHCR5 074C 4054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCISP0[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCISP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCISP0[31:0]	Software Hash Calculation IP Source Part 0		R/W

This register is used to accelerate hash calculation.

[Restriction]

- Should be set to 0000 0000h for IPv4 Hash calculation

34.2.4.12 Software Hash Calculation Request Register 6 (FWSHCR6)

Address(es): MFWD.FWSHCR6 874C 4058h, MFWD_NS.FWSHCR6 074C 4058h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCISP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCISP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCISP1[31:0]	Software Hash Calculation IP Source Part 1		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to 0000 0000h for IPv4 Hash calculation

34.2.4.13 Software Hash Calculation Request Register 7 (FWSHCR7)

Address(es): MFWD.FWSHCR7 874C 405Ch, MFWD_NS.FWSHCR7 074C 405Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCISP2[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCISP2[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCISP2[31:0]	Software Hash Calculation IP Source Part 2		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to 0000 0000h for IPv4 Hash calculation

34.2.4.14 Software Hash Calculation Request Register 8 (FWSHCR8)

Address(es): MFWD.FWSHCR8 874C 4060h, MFWD_NS.FWSHCR8 074C 4060h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCISP3[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCISP3[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCISP3[31:0]	Software Hash Calculation IP Source Part 3		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to IP source address for IPv4 Hash calculation

34.2.4.15 Software Hash Calculation Request Register 9 (FWSHCR9)

Address(es): MFWD.FWSHCR9 874C 4064h, MFWD_NS.FWSHCR9 074C 4064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCIDP0[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCIDP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCIDP0[31:0]	Software Hash Calculation IP Destination Part 0		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to 0000 0000h for IPv4 Hash calculation

34.2.4.16 Software Hash Calculation Request Register 10 (FWSHCR10)

Address(es): MFWD.FWSHCR10 874C 4068h, MFWD_NS.FWSHCR10 074C 4068h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCIDP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCIDP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCIDP1[31:0]	Software Hash Calculation IP Destination Part 1		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to 0000 0000h for IPv4 Hash calculation

34.2.4.17 Software Hash Calculation Request Register 11 (FWSHCR11)

Address(es): MFWD.FWSHCR11 874C 406Ch, MFWD_NS.FWSHCR11 074C 406Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCIDP2[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCIDP2[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCIDP2[31:0]	Software Hash Calculation IP Destination Part 2		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to 0000 0000h for IPv4 Hash calculation

34.2.4.18 Software Hash Calculation Request Register 12 (FWSHCR12)

Address(es): MFWD.FWSHCR12 874C 4070h, MFWD_NS.FWSHCR12 074C 4070h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCIDP3[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCIDP3[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SHCIDP3[31:0]	Software Hash Calculation IP Destination Part 3		R/W

This register is used to accelerate hash calculation.
[Restriction]

- Should be set to IP destination address for IPv4 Hash calculation

34.2.4.19 Software Hash Calculation Request Register 13 (FWSHCR13)

Address(es): MFWD.FWSHCR13 874C 4074h, MFWD_NS.FWSHCR13 074C 4074h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHCSP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCDP[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	SHCDP[15:0]	Software Hash Calculation Destination Port		R/W
b31 to b16	SHCSP[15:0]	Software Hash Calculation Source Port		R/W

This register is used to accelerate hash calculation.

34.2.4.20 Software Hash Calculation Request Result Register (FWSHCRR)

Address(es): MFWD.FWSHCRR 874C 4078h, MFWD_NS.FWSHCRR 074C 4078h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SHC	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SHCR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	SHCR[15:0]	Software Hash Calculation Result		R
b30 to b16	—	Reserved	These bits are read as 0.	R
b31	SHC	Software Hash Calculation		R

This register is used to accelerate hash calculation.

SHCR[15:0] Bits (Software Hash Calculation Result)

[Update condition]

- HW: FWSHCRR.SHC clear event.

SHC Bit (Software Hash Calculation)

[Setting condition]

- HW: Writing to the FWSHCR13 register will set this bit.

[Clearing condition]

- HW: This bit will be de-asserted when hash calculation is completed.

34.2.5 Layer 3/4 Forwarding/Routing Hash Function Registers

34.2.5.1 L3 Hash Entry Configuration Register (FWLTHHEC)

Address(es): MFWD.FWLTHHEC 874C 4090h, MFWD_NS.FWLTHHEC 074C 4090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	LTHHMUE[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	LTHHMC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	LTHHMC[7:0]	L3 Hash Maximum Collision	Maximum collision number from which hash search by HW will be given up.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24 to b16	LTHHMUE[8:0]	L3 Hash Maximum Unsecure Entry	Maximum unsecure entry number that can be set in table	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.5.2 L3 Hash Configuration Register (FWLTHHC)

Address(es): MFWD.FWLTHHC 874C 4094h, MFWD_NS.FWLTHHC 074C 4094h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	LTHHE7	LTHHE6	LTHHE5	LTHHE4	LTHHE3	LTHHE2	LTHHE1	LTHHE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	LTHHE0	L3 Hash Equation 0	Setting this bit to 1, hash equation 1 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b1	LTHHE1	L3 Hash Equation 1	Setting this bit to 1, hash equation 1 + x^2 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b2	LTHHE2	L3 Hash Equation 2	Setting this bit to 1, hash equation 1 + x^3 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b3	LTHHE3	L3 Hash Equation 3	Setting this bit to 1, hash equation 1 + x^4 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b4	LTHHE4	L3 Hash Equation 4	Setting this bit to 1, hash equation 1 + x^5 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b5	LTHHE5	L3 Hash Equation 5	Setting this bit to 1, hash equation 1 + x^6 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b6	LTHHE6	L3 Hash Equation 6	Setting this bit to 1, hash equation 1 + x^7 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b7	LTHHE7	L3 Hash Equation 7	Setting this bit to 1, hash equation 1 + x^8 + x^9 is activated in Hash function for L3 Hash calculation.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

If several Hash equations are activated, the result of all activated equation are XORed to give the final Hash ID.

34.2.5.3 L3 Table Learn Register 0 (FWLTHTL0)

Address(es): MFWD.FWLTHTL0 874C 40A0h, MFWD_NS.FWLTHTL0 074C 40A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LTHSLL	—	—	—	—	—	LTHSLP0[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	LTHSLP0[2:0]	L3 Stream Learn Part 0	Used for learning/overwriting an entry in L3 table. Stream ID correspond to {FWLTHTL0.LTHSLP0[2:0], FWLTHTL1.LTHSLP1[31:0], FWLTHTL2.LTHSLP2[31:0], FWLTHTL3.LTHSLP3[31:0], FWLTHTL4.LTHSLP4[31:0]}.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	LTHSLL	L3 Security Level Learn	Used for learning/overwriting an entry in L3 table.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	LTHED	L3 Entry Delete	0: Learn/overwrite the set stream ID in L3 table. 1: Delete the set stream ID in L3 table.	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.5.4 L3 Table Learn Register 1 (FWLTHTL1)

Address(es): MFWD.FWLTHTL1 874C 40A4h, MFWD_NS.FWLTHTL1 074C 40A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b19 to b16	LTHMSDUNL[3:0]	L3 MSDU Number Learn		R/W
b30 to b20	—	Reserved	These bits are read as 0. The write value should be 0.	R
b31	LTHMSDUVL	L3 MSDU Valid Learn		R/W

This register is used for learning/overwriting an entry in L3 table.

34.2.5.9 L3 Table Learn Register 6 (FWLTHTL6)

Address(es): MFWD.FWLTHTL6 874C 40B8h, MFWD_NS.FWLTHTL6 074C 40B8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHMTRVL	—	—	—	—	—	—	—	—	—	—	LTHMTRNL[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHFRERVL	—	—	—	—	—	—	—	—	LTHFRERNL[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	LTHFRERNL[6:0]	L3 FRER Number Learn		R/W
b14 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R
b15	LTHFRERVL	L3 FRER Valid Learn		R/W
b20 to b16	LTHMTRNL[4:0]	L3 Meter Number Learn		R/W
b30 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R
b31	LTHMTRVL	L3 Meter Valid Learn		R/W

This register is used for learning/overwriting an entry in L3 table.

34.2.5.10 L3 Table Learn Register 7 (FWLTHTL7)

Address(es): MFWD.FWLTHTL7 874C 40BCh, MFWD_NS.FWLTHTL7 074C 40BCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHSLVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHRVL	—	—	—	—	—	—	—	LTHRNL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	LTHRNL[7:0]	L3 Routing Number Learn		R/W
b14 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b15	LTHRVL	L3 Routing Valid Learn		R/W
b18 to b16	LTHSLVL[2:0]	L3 Source Lock Vector Learn		R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in L3 table.

34.2.5.11 L3 Table Learn Register 80 (FWLTHTL80)

Address(es): MFWD.FWLTHTL80 874C 40C0h, MFWD_NS.FWLTHTL80 074C 40C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	LTHCSDL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	LTHCSDL[5:0]	L3 CPU Sub-Destination Learn		R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in L3 table.

34.2.5.12 L3 Table Learn Register 9 (FWLTHTL9)

Address(es): MFWD.FWLTHTL9 874C 40D0h, MFWD_NS.FWLTHTL9 074C 40D0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	LTHCMEL	LTHEMEL	LTHIPUL	LTHIPVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHDVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	LTHDVL[2:0]	L3 Destination Vector Learn		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	LTHIPVL[2:0]	L3 Internal Priority Value Learn		R/W
b19	LTHIPUL	L3 Internal Priority Update Learn		R/W
b20	LTHEMEL	L3 Ethernet Mirroring Enable Learn		R/W
b21	LTHCMEL	L3 CPU Mirroring Enable Learn		R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in L3 table.

34.2.5.13 L3 Table Learn Result Register (FWLTHTLR)

Address(es): MFWD.FWLTHTLR 874C 40D4h, MFWD_NS.FWLTHTLR 074C 40D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHTL	—	—	—	—	—	—	—	LTHLCN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	LTHLO	—	LTHLSF	LTHLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LTHLF	L3 Learn Fail	0: Entry learning did not fail (refer to section 34.3.2.4 (4) (b) SW Learning) 1: Entry learning failed (refer to section 34.3.2.4 (4) (b) SW Learning)	R
b1	LTHLSF	L3 Learn Security Fail	0: Entry learning did not fail because of a security error (refer to section 34.3.2.4 (4) (b) SW Learning). 1: Entry learning failed because of a security error (refer to section 34.3.2.4 (4) (b) SW Learning).	R
b2	—	Reserved	This bit is read as 0.	R
b3	LTHLO	L3 Learn Overwrite	0: The entry learning did not overwrite an existing entry. 1: The entry learning overwrote an existing entry.	R
b15 to b4	—	Reserved	These bits are read as 0.	R
b23 to b16	LTHLCN[7:0]	L3 Learn Collision Number		R
b30 to b24	—	Reserved	These bits are read as 0.	R
b31	LTHTL	L3 Table Learn		R

This register is used for learning/overwriting an entry in L3 table.

LTHLF Bit (L3 Learn Fail)

[Update Condition]

- HW: FWLTHTLR.LTHTL clear event.

LTHLSF Bit (L3 Learn Security Fail)

[Update Condition]

- HW: FWLTHTLR.LTHTL clear event.

LTHLO Bit (L3 Learn Overwrite)

[Update Condition]

- HW: FWLTHTLR.LTHTL clear event.

LTHLCN[7:0] Bits (L3 Learn Collision Number)

[Update Condition]

- HW: FWLTHTLR.LTHTL clear event.

LTHTL Bit (L3 Table Learn)

[Setting Condition]

- HW: Writing to the FWLTHTL9 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when learning is completed.

34.2.5.14 L3 Table Initialization Monitoring Register (FWLTHTIM)

Address(es): MFWD.FWLTHTIM 874C 40E0h, MFWD_NS.FWLTHTIM 074C 40E0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHTR	LTHTIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LTHTIOG	L3 Table Initialization Ongoing		R/W
b1	LTHTR	L3 Table Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

LTHTIOG Bit (L3 Table Initialization Ongoing)

[Setting Condition]

- SW: By writing 1 to this bit. It starts L3 Table initialization.

[Clearing Condition]

- HW: This bit is cleared when L3 Table initialization is finished.

LTHTR Bit (L3 Table Ready)

[Setting Conditions]

- HW: When the FWLTHTIM.LTHTIOG bit is getting cleared.
- HW: This bit is set at “clk_period [ns] × 256” time from L3 table initialization starting

[Clearing Condition]

- SW: By writing 1 to the FWLTHTIM.LTHTIOG bit.

34.2.5.15 L3 Table Entry Monitoring Register (FWLTHTEM)

Address(es): MFWD.FWLTHTEM 874C 40E4h, MFWD_NS.FWLTHTEM 074C 40E4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	LTHTUEN[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LTHTEN[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b8 to b0	LTHTEN[8:0]	L3 Table Entry Number		R
b15 to b9	—	Reserved	These bits are read as 0.	R
b24 to b16	LTHTUEN[8:0]	L3 Table Unsecure Entry Number		R
b31 to b25	—	Reserved	These bits are read as 0.	R

LTHTEN[8:0] Bit (L3 Table Entry Number)

[Increment condition]

- HW: An entry is learned successfully.

[Decrement condition]

- HW: An entry is deleted successfully.

LTHTUEN[8:0] Bit (L3 Table Unsecure Entry Number)

[Increment condition]

- HW: An unsecure entry is learned successfully.

[Decrement condition]

- HW: An unsecure entry is deleted successfully.

34.2.5.16 L3 Table Search Register 0 (FWLTHTS0)

Address(es): MFWD.FWLTHTS0 874C 4100h, MFWD_NS.FWLTHTS0 074C 4100h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHSSP0[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	LTHSSP0[2:0]	L3 Stream Search Part 0		R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for searching an entry in L3 table.

34.2.5.17 L3 Table Search Register 1 (FWLTHTS1)

Address(es): MFWD.FWLTHTS1 874C 4104h, MFWD_NS.FWLTHTS1 074C 4104h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHSSP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHSSP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSSP1[31:0]	L3 Stream Search Part 1		R/W

This register is used for searching an entry in L3 table.

34.2.5.18 L3 Table Search Register 2 (FWLTHTS2)

Address(es): MFWD.FWLTHTS2 874C 4108h, MFWD_NS.FWLTHTS2 074C 4108h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHSSP2[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHSSP2[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSSP2[31:0]	L3 Stream Search Part 2		R/W

This register is used for searching an entry in L3 table.

34.2.5.19 L3 Table Search Register 3 (FWLTHTS3)

Address(es): MFWD.FWLTHTS3 874C 410Ch, MFWD_NS.FWLTHTS3 074C 410Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHSSP3[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHSSP3[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSSP3[31:0]	L3 Stream Search Part 3		R/W

This register is used for searching an entry in L3 table.

34.2.5.20 L3 Table Search Register 4 (FWLTHTS4)

Address(es): MFWD.FWLTHTS4 874C 4110h, MFWD_NS.FWLTHTS4 074C 4110h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	LTHSLS	—	—	—	—	—	—	LTHSNF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0.	R
b1	LTHSNF	L3 Search Not Found	0: Stream ID found in L3 Table. 1: Stream ID not found in L3 Table.	R
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	LTHSLS	L3 Security Level Search		R
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b23 to b16	LTHSCN[7:0]	L3 Search Collision Number		R
b30 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R
b31	LTHTS	L3 Table Search		R

This register is used for searching an entry in L3 table.

LTHSNF Bit (L3 Search Not Found)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHSLS Bit (L3 Security Level Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHSCN[7:0] Bits (L3 Search Collision Number)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHTS Bit (L3 Table Search)

[Setting Condition]

- HW: Writing to the FWLTHTS4 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when searching is completed.

34.2.5.22 L3 Table Search Result Register 1 (FWLTHTSR1)

Address(es): MFWD.FWLTHTSR1 874C 4124h, MFWD_NS.FWLTHTSR1 074C 4124h

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	These bits are read as 0.	R
b19 to b16	LTHMSDUNS[3:0]	L3 MSDU Number Search		R
b30 to b20	—	Reserved	These bits are read as 0.	R
b31	LTHMSDUVS	L3 MSDU Valid Search		R

This register is used for searching an entry in L3 table.

LTHMSDUNS[3:0] Bits (L3 MSDU Number Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHMSDUVS Bit (L3 MSDU Valid Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

34.2.5.23 L3 Table Search Result Register 2 (FWLTHTSR2)

Address(es): MFWD.FWLTHTSR2 874C 4128h, MFWD_NS.FWLTHTSR2 074C 4128h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHMTRVS	—	—	—	—	—	—	—	—	—	—	LTHMTRNS[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHFRERVS	—	—	—	—	—	—	—	—	LTHFRERNS[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	LTHFRERNS[6:0]	L3 FRER Number Search		R
b14 to b7	—	Reserved	These bits are read as 0.	R
b15	LTHFRERVS	L3 FRER Valid Search		R
b20 to b16	LTHMTRNS[4:0]	L3 Meter Number Search		R
b30 to b21	—	Reserved	These bits are read as 0.	R
b31	LTHMTRVS	L3 Meter Valid Search		R

This register is used for searching an entry in L3 table.

LTHFRERNS[6:0] Bits (L3 FRER Number Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHFRERVS Bit (L3 FRER Valid Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHMTRNS[4:0] Bits (L3 Meter Number Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHMTRVS Bit (L3 Meter Valid Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

34.2.5.24 L3 Table Search Result Register 3 (FWLTHTSR3)

Address(es): MFWD.FWLTHTSR3 874C 412Ch, MFWD_NS.FWLTHTSR3 074C 412Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHSLVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHRVS	—	—	—	—	—	—	—	LTHRNS[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	LTHRNS[7:0]	L3 Routing Number Search		R
b14 to b8	—	Reserved	These bits are read as 0.	R
b15	LTHRVS	L3 Routing Valid Search		R
b18 to b16	LTHSLVS[2:0]	L3 Source Lock Vector Search		R
b31 to b19	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in L3 table.

LTHRNS[7:0] Bits (L3 Routing Number Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHRVS Bit (L3 Routing Valid Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHSLVS[2:0] Bits (L3 Source Lock Vector Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

34.2.5.25 L3 Table Search Result Register 40 (FWLTHTSR40)

Address(es): MFWD.FWLTHTSR40 874C 4130h, MFWD_NS.FWLTHTSR40 074C 4130h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	LTHCSDS[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	LTHCSDS[5:0]	L3 CPU Sub-Destination Search		R
b31 to b6	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in L3 table.

LTHCSDS[5:0] Bits (L3 CPU Sub-Destination Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

34.2.5.26 L3 Table Search Result Register 5 (FWLTHTSR5)

Address(es): MFWD.FWLTHTSR5 874C 4140h, MFWD_NS.FWLTHTSR5 074C 4140h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	LTHCMES	LTHEMES	LTHIPUS	LTHIPVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHDVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	LTHDVS[2:0]	L3 Destination Vector Search		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	LTHIPVS[2:0]	L3 Internal Priority Value Search		R
b19	LTHIPUS	L3 Internal Priority Update Search		R
b20	LTHEMES	L3 Ethernet Mirroring Enable Search		R
b21	LTHCMES	L3 CPU Mirroring Enable Search		R
b31 to b22	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in L3 table.

LTHDVS[2:0] Bits (L3 Destination Vector Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHIPVS[2:0] Bits (L3 Internal Priority Value Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHIPUS Bit (L3 Internal Priority Update Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHEMES Bit (L3 Ethernet Mirroring Enable Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

LTHCMES Bit (L3 CPU Mirroring Enable Search)

[Update Condition]

- HW: FWLTHTSR0.LTHTS clear event.

34.2.5.27 L3 Table Read Register (FWLTHTR)

Address(es): MFWD.FWLTHTR 874C 4150h, MFWD_NS.FWLTHTR 074C 4150h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	LTHAR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	LTHAR[7:0]	L3 Address Read		R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for searching an entry in L3 table.

34.2.5.28 L3 Table Read Result Register 0 (FWLTHTRR0)

Address(es): MFWD.FWLTHTRR0 874C 4154h, MFWD_NS.FWLTHTRR0 074C 4154h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHTR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHEVR	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0.	R
b1	LTHEVR	L3 Entry Valid Read		R
b30 to b2	—	Reserved	These bits are read as 0.	R
b31	LTHTR	L3 Table Read		R

This register is used for reading an entry in L3 table.

LTHEVR Bit (L3 Entry Valid Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHTR Bit (L3 Table Read)

[Setting Condition]

- HW: Writing to the FWLTHTR register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when reading is completed.

34.2.5.29 L3 Table Read Result Register 1 (FWLTHTRR1)

Address(es): MFWD.FWLTHTRR1 874C 4158h, MFWD_NS.FWLTHTRR1 074C 4158h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LTHSLR	—	—	—	—	—	LTHSRP0[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

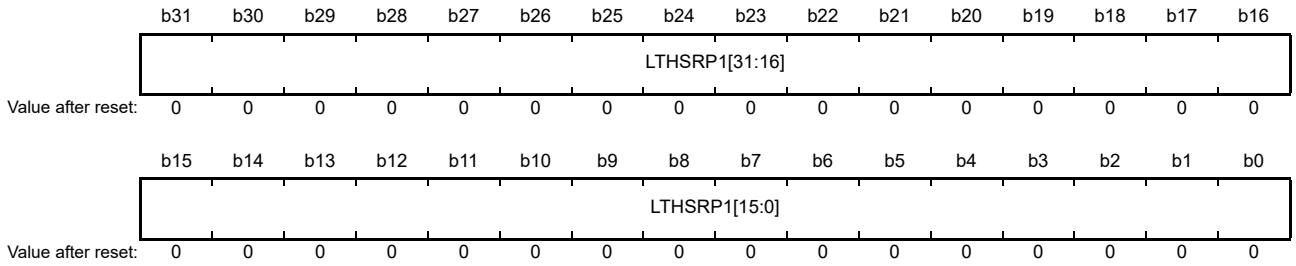
Bit	Symbol	Bit Name	Description	R/W
b2 to b0	LTHSRP0[2:0]	L3 Stream Read Part 0		R
b7 to b3	—	Reserved	These bits are read as 0.	R
b8	LTHSLR	L3 Security Level Read		R
b31 to b9	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in L3 table.

LTHSRP0[2:0] Bits (L3 Stream Read Part 0)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.



LTHSLR Bit (L3 Security Level Read)

[Update Condition]

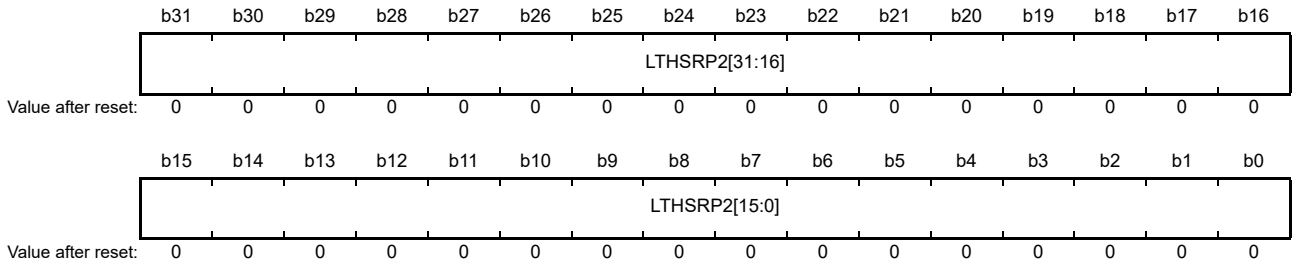
- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.30 L3 Table Read Result Register 2 (FWLTHTRR2)

Address(es): MFWD.FWLTHTRR2 874C 415Ch, MFWD_NS.FWLTHTRR2 074C 415Ch

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSRP1[31:0]	L3 Stream Read Part 1		R

This register is used for reading an entry in L3 table.



LTHSRP1[31:0] Bits (L3 Stream Read Part 1)

[Update Condition]

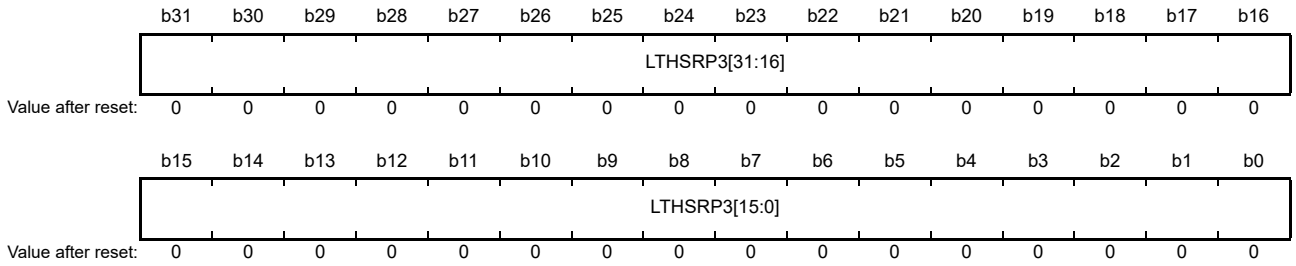
- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.31 L3 Table Read Result Register 3 (FWLTHTRR3)

Address(es): MFWD.FWLTHTRR3 874C 4160h, MFWD_NS.FWLTHTRR3 074C 4160h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSRP2[31:0]	L3 Stream Read Part 2		R

This register is used for reading an entry in L3 table.



LTHSRP2[31:0] Bits (L3 Stream Read Part 2)

[Update Condition]

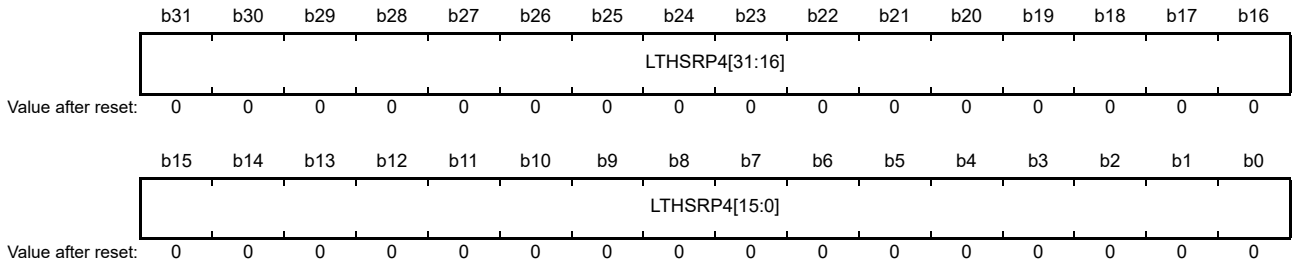
- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.32 L3 Table Read Result Register 4 (FWLTHTRR4)

Address(es): MFWD.FWLTHTRR4 874C 4164h, MFWD_NS.FWLTHTRR4 074C 4164h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSRP3[31:0]	L3 Stream Read Part 3		R

This register is used for reading an entry in L3 table.



LTHSRP3[31:0] Bits (L3 Stream Read Part 3)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.33 L3 Table Read Result Register 5 (FWLTHTRR5)

Address(es): MFWD.FWLTHTRR5 874C 4168h, MFWD_NS.FWLTHTRR5 074C 4168h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHSRP4[31:0]	L3 Stream Read Part 4		R

This register is used for reading an entry in L3 table.

LTHSRP4[31:0] Bits (L3 Stream Read Part 4)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.34 L3 Table Read Result Register 6 (FWLTHTRR6)

Address(es): MFWD.FWLTHTRR6 874C 416Ch, MFWD_NS.FWLTHTRR6 074C 416Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTHMSDUVR	—	—	—	—	—	—	—	—	—	—	—	LTHMSDUNR[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	These bits are read as 0.	R
b19 to b16	LTHMSDUNR[3:0]	L3 MSDU Number Read		R
b30 to b20	—	Reserved	These bits are read as 0.	R
b31	LTHMSDUVR	L3 MSDU Valid Read		R

This register is used for reading an entry in L3 table.

LTHMSDUNR[3:0] Bits (L3 MSDU Number Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHMSDUVR Bits (L3 MSDU Valid Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.35 L3 Table Read Result Register 7 (FWLTHTRR7)

Address(es): MFWD.FWLTHTRR7 874C 4170h, MFWD_NS.FWLTHTRR7 074C 4170h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	LTHFRERVR	—	—	—	—	—	—	—	—	LTHFRERNR[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	LTHFRERNR[6:0]	L3 FRER Number Read		R
b14 to b7	—	Reserved	These bits are read as 0.	R
b15	LTHFRERVR	L3 FRER Valid Read		R
b20 to b16	LTHMTRNR[4:0]	L3 Meter Number Read		R
b30 to b21	—	Reserved	These bits are read as 0.	R
b31	LTHMTRVR	L3 Meter Valid Read		R

This register is used for reading an entry in L3 table.

LTHFRERNR[6:0] Bits (L3 FRER Number Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHFRERVR Bit (L3 FRER Valid Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHMTRNR[4:0] Bits (L3 Meter Number Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHMTRVR Bit (L3 Meter Valid Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.36 L3 Table Read Result Register 8 (FWLTHTRR8)

Address(es): MFWD.FWLTHTRR8 874C 4174h, MFWD_NS.FWLTHTRR8 074C 4174h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHSLVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHRVR	—	—	—	—	—	—	—	LTHRNR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	LTHRNR[7:0]	L3 Routing Number Read		R
b14 to b8	—	Reserved	These bits are read as 0.	R
b15	LTHRVR	L3 Routing Valid Read		R
b18 to b16	LTHSLVR[2:0]	L3 Source Lock Vector Read		R
b31 to b19	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in L3 table.

LTHRNR[7:0] Bits (L3 Routing Number Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHRVR Bit (L3 Routing Valid Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHSLVR[2:0] Bits (L3 Source Lock Vector Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.37 L3 Table Read Result Register 90 (FWLTHTRR90)

Address(es): MFWD.FWLTHTRR90 874C 4180h, MFWD_NS.FWLTHTRR90 074C 4180h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	LTHCSDR[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	LTHCSDR[5:0]	L3 CPU Sub-Destination Read		R
b31 to b6	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in L3 table.

LTHCSDR[5:0] Bits (L3 CPU Sub-Destination Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.5.38 L3 Table Read Result Register 10 (FWLTHTRR10)

Address(es): MFWD.FWLTHTRR10 874C 4190h, MFWD_NS.FWLTHTRR10 074C 4190h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	LTHCMER	LTHEMER	LTHIPUR	LTHIPVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LTHDVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	LTHDVR[2:0]	L3 Destination Vector Read		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	LTHIPVR[2:0]	L3 Internal Priority Value Read		R
b19	LTHIPUR	L3 Internal Priority Update Read		R
b20	LTHEMER	L3 Ethernet Mirroring Enable Read		R
b21	LTHCMER	L3 CPU Mirroring Enable Read		R
b31 to b22	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in L3 table.

LTHDVR[2:0] Bits (L3 Destination Vector Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHIPVR[2:0] Bits (L3 Internal Priority Value Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHIPUR Bit (L3 Internal Priority Update Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHEMER Bit (L3 Ethernet Mirroring Enable Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

LTHCMER Bit (L3 CPU Mirroring Enable Read)

[Update Condition]

- HW: FWLTHTRR0.LTHTR clear event.

34.2.6 Layer 2 Forwarding Function Registers

34.2.6.1 MAC Hash Entry Configuration Register (FWMACHEC)

Address(es): MFWD.FWMACHEC 874C 4620h, MFWD_NS.FWMACHEC 074C 4620h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	MACHMUE[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MACHMC[10:0]										
Value after reset:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b10 to b0	MACHMC[10:0]	MAC Hash Maximum Collision	Maximum collision number from which hash search by HW will be given up.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R
b27 to b16	MACHMUE[11:0]	MAC Hash Maximum Unsecure Entry	Maximum unsecure entry number that can be set in table	R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.6.2 MAC Hash Configuration Register (FWMACHC)

Address(es): MFWD.FWMACHC 874C 4624h, MFWD_NS.FWMACHC 074C 4624h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MACHE10	MACHE9	MACHE8	MACHE7	MACHE6	MACHE5	MACHE4	MACHE3	MACHE2	MACHE1	MACHE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	MACHE0	MAC Hash Equation 0	Setting this bit to 1, hash equation 1 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b1	MACHE1	MAC Hash Equation 1	Setting this bit to 1, hash equation 1 + x^2 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b2	MACHE2	MAC Hash Equation 2	Setting this bit to 1, hash equation 1 + x^3 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b3	MACHE3	MAC Hash Equation 3	Setting this bit to 1, hash equation 1 + x^4 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b4	MACHE4	MAC Hash Equation 4	Setting this bit to 1, hash equation 1 + x^5 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b5	MACHE5	MAC Hash Equation 5	Setting this bit to 1, hash equation 1 + x^6 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b6	MACHE6	MAC Hash Equation 6	Setting this bit to 1, hash equation 1 + x^7 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b7	MACHE7	MAC Hash Equation 7	Setting this bit to 1, hash equation 1 + x^8 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b8	MACHE8	MAC Hash Equation 8	Setting this bit to 1, hash equation 1 + x^9 + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b9	MACHE9	MAC Hash Equation 9	Setting this bit to 1, hash equation 1 + x^{10} + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b10	MACHE10	MAC Hash Equation 10	Setting this bit to 1, hash equation 1 + x^{11} + x^{12} is activated in Hash function for MAC Hash calculation.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

If several Hash equations are activated, the result of all activated equation are XORed to give the final Hash ID.

34.2.6.3 MAC Table Learn Register 0 (FWMACTL0)

Address(es): MFWD.FWMACTL0 874C 4630h, MFWD_NS.FWMACTL0 074C 4630h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MACED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MACHLDL	MACDEL	MACSLL	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	MACSLL	MAC Security Level Learn		R/W
b9	MACDEL	MAC Dynamic Entry Learn		R/W
b10	MACHLDL	MAC Hardware Learning Disable Learn		R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	MACED	MAC Entry Delete	0: Learn/overwrite the set MAC address in MAC table. 1: Delete the set MAC address in MAC table.	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in MAC table.

34.2.6.4 MAC Table Learn Register 1 (FWMACTL1)

Address(es): MFWD.FWMACTL1 874C 4634h, MFWD_NS.FWMACTL1 074C 4634h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACMALP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MACMALP0[15:0]	MAC MAC Address Learn Part 0		R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in MAC table.

34.2.6.5 MAC Table Learn Register 2 (FWMACTL2)

Address(es): MFWD.FWMACTL2 874C 4638h, MFWD_NS.FWMACTL2 074C 4638h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MACMALP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACMALP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	MACMALP1[31:0]	MAC MAC Address Learn Part 1		R/W

This register is used for learning/overwriting an entry in MAC table.

34.2.6.6 MAC Table Learn Register 3 (FWMACTL3)

Address(es): MFWD.FWMACTL3 874C 463Ch, MFWD_NS.FWMACTL3 074C 463Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACDSLVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACSSLVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	MACSSLVL[2:0]	MAC Source Source Lock Vector Learn		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	MACDSLVL[2:0]	MAC Destination Source Lock Vector Learn		R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in MAC table.

34.2.6.7 MAC Table Learn Register 40 (FWMACTL40)

Address(es): MFWD.FWMACTL40 874C 4640h, MFWD_NS.FWMACTL40 074C 4640h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	MACCSDL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	MACCSDL[5:0]	MAC CPU Sub-Destination Learn		R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in MAC table.

34.2.6.8 MAC Table Learn Register 5 (FWMACTL5)

Address(es): MFWD.FWMACTL5 874C 4650h, MFWD_NS.FWMACTL5 074C 4650h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	MACCMEL	MACEMEL	MACIPUL	MACIPVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACDVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	MACDVL[2:0]	MAC Destination Vector Learn		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	MACIPVL[2:0]	MAC Internal Priority Value Learn		R/W
b19	MACIPUL	MAC Internal Priority Update Learn		R/W
b20	MACEMEL	MAC Ethernet Mirroring Enable Learn		R/W
b21	MACCMEL	MAC CPU Mirroring Enable Learn		R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in MAC table.

34.2.6.9 MAC Table Learn Result Register (FWMACTLR)

Address(es): MFWD.FWMACTLR 874C 4654h, MFWD_NS.FWMACTLR 074C 4654h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MACTL	—	—	—	—	MACLCN[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	MACLO	—	MACLSF	MACLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MACLF	MAC Learn Fail	0: Entry learning did not fail (refer to section 34.3.2.5 (2) (b) SW Learning). 1: Entry learning failed (refer to section 34.3.2.5 (2) (b)).	R
b1	MACLSF	MAC Learn Security Fail	0: Entry learning did not fail because of a security error (refer to section 34.3.2.5 (2) (b) SW Learning). 1: Entry learning failed because of a security error (refer to section 34.3.2.5 (2) (b) SW Learning).	R
b2	—	Reserved	This bit is read as 0.	R
b3	MACLO	MAC Learn Overwrite	0: The entry learning did not overwrite an existing entry. 1: The entry learning overwrote an existing entry.	R
b15 to b4	—	Reserved	These bits are read as 0.	R
b26 to b16	MACLCN[10:0]	MAC Learn Collision Number		R
b30 to b27	—	Reserved	These bits are read as 0.	R
b31	MACTL	MAC Table Learn		R

This register is used for learning/overwriting an entry in MAC table.

MACLF Bit (MAC Learn Fail)

[Update Condition]

- HW: FWMACTLR.MACTL clear event.

MACLSF Bit (MAC Learn Security Fail)

[Update Condition]

- HW: FWMACTLR.MACTL clear event.

MACLO Bit (MAC Learn Overwrite)

[Update Condition]

- HW: FWMACTLR.MACTL clear event.

MACLCN[10:0] Bits (MAC Learn Collision Number)

[Update Condition]

- HW: FWMACTLR.MACTL clear event.

MACTL Bit (MAC Table Learn)

[Setting Condition]

- HW: Writing to the FWMACTL5 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when learning is completed.

34.2.6.10 MAC Table Initialization Monitoring Register (FWMACTIM)

Address(es): MFWD.FWMACTIM 874C 4660h, MFWD_NS.FWMACTIM 074C 4660h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MACTR	MACTIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MACTIOG	MAC Table Initialization Ongoing		R/W
b1	MACTR	MAC Table Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

MACTIOG Bit (MAC Table Initialization Ongoing)

[Setting Condition]

- SW: By writing 1 to this bit. It starts MAC Table initialization.

[Clearing Condition]

- HW: This bit is cleared when MAC Table initialization is finished.

MACTR Bit (MAC Table Ready)

[Setting Conditions]

- HW: When the FWMACTIM.MACTIOG bit is getting cleared.
- HW: This bit is set at “clk_period [ns] × 2048” time from MAC table initialization starting.

[Clearing Condition]

- SW: By writing 1 to the FWMACTIM.MACTIOG bit.

34.2.6.11 MAC Table Entry Monitoring Register (FWMACTEM)

Address(es): MFWD.FWMACTEM 874C 4664h, MFWD_NS.FWMACTEM 074C 4664h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	MACTUEN[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MACTEN[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	MACTEN[11:0]	MAC Table Entry Number		R
b15 to b12	—	Reserved	These bits are read as 0.	R
b27 to b16	MACTUEN[11:0]	MAC Table Unsecure Entry Number		R
b31 to b28	—	Reserved	These bits are read as 0.	R

MACTEN[11:0] Bit (MAC Table Entry Number)

[Increment Condition]

- HW: An entry is learned successfully.

[Decrement Condition]

- HW: An entry is deleted successfully.

MACTUEN[11:0] Bit (MAC Table Unsecure Entry Number)

[Increment Condition]

- HW: An unsecure entry is learned successfully.

[Decrement Condition]

- HW: An unsecure entry is deleted successfully.

34.2.6.12 MAC Table Search Register 0 (FWMACTS0)

Address(es): MFWD.FWMACTS0 874C 4670h, MFWD_NS.FWMACTS0 074C 4670h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACMASP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MACMASP0[15:0]	MAC MAC Address Search Part 0		R/W
b30 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for searching an entry in MAC table.

34.2.6.13 MAC Table Search Register 1 (FWMACTS1)

Address(es): MFWD.FWMACTS1 874C 4674h, MFWD_NS.FWMACTS1 074C 4674h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MACMASP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACMASP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	MACMASP1[31:0]	MAC MAC Address Search Part 1		R/W

This register is used for searching an entry in MAC table.

34.2.6.14 MAC Table Search Result Register 0 (FWMACTSR0)

Address(es): MFWD.FWMACTSR0 874C 4678h, MFWD_NS.FWMACTSR0 074C 4678h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MACTS	—	—	—	—	MACSCN[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MACHLDS	MACDES	MACSLS	—	—	—	—	—	—	MACSNF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0.	R
b1	MACSNF	MAC Search Not Found	0: MAC address found in MAC Table. 1: MAC address not found in MAC Table.	R
b7 to b2	—	Reserved	These bits are read as 0.	R
b8	MACSLS	MAC Security Level Search		R
b9	MACDES	MAC Dynamic Entry Search		R
b10	MACHLDS	MAC Hardware Learning Disable Search		R
b15 to b11	—	Reserved	These bits are read as 0.	R
b26 to b16	MACSCN[10:0]	MAC Search Collision Number		R
b30 to b27	—	Reserved	These bits are read as 0.	R
b31	MACTS	MAC Table Search		R

This register is used for searching an entry in MAC table.

MACSNF Bit (MAC Search Not Found)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACSLS Bit (MAC Security Level Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACDES Bit (MAC Dynamic Entry Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACHLDS Bit (MAC Hardware Learning Disable Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACSCN[10:0] Bits (MAC Search Collision Number)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACTS Bit (MAC Table Search)

[Setting Condition]

- HW: Writing to the FWMACTS1 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when searching is completed.

34.2.6.15 MAC Table Search Result Register 1 (FWMACTSR1)

Address(es): MFWD.FWMACTSR1 874C 467Ch, MFWD_NS.FWMACTSR1 074C 467Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACDSLVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACSSLVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	MACSSLVS[2:0]	MAC Source Source Lock Vector Search		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	MACDSLVS[2:0]	MAC Destination Source Lock Vector Search		R
b31 to b19	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in MAC table.

MACSSLVS[2:0] Bits (MAC Source Source Lock Vector Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACDSLVS[2:0] Bits (MAC Destination Source Lock Vector Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

34.2.6.16 MAC Table Search Result Register 20 (FWMACTSR20)

Address(es): MFWD.FWMACTSR20 874C 4680h, MFWD_NS.FWMACTSR20 074C 4680h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	MACCSDS[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	MACCSDS[5:0]	MAC CPU Sub-Destination Search		R
b31 to b6	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in MAC table.

MACCSDS[5:0] Bits (MAC CPU Sub-Destination Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

34.2.6.17 MAC Table Search Result Register 3 (FWMACTSR3)

Address(es): MFWD.FWMACTSR3 874C 4690h, MFWD_NS.FWMACTSR3 074C 4690h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	MACCMES	MACEMES	MACIPUS	MACIPVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACDVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	MACDVS[2:0]	MAC Destination Vector Search		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	MACIPVS[2:0]	MAC Internal Priority Value Search		R
b19	MACIPUS	MAC Internal Priority Update Search		R
b20	MACEMES	MAC Ethernet Mirroring Enable Search		R
b21	MACCMES	MAC CPU Mirroring Enable Search		R
b31 to b22	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in MAC table.

MACDVS[2:0] Bits (MAC Destination Vector Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACIPVS[2:0] Bits (MAC Internal Priority Value Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACIPUS Bit (MAC Internal Priority Update Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACEMES Bit (MAC Ethernet Mirroring Enable Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

MACCMES Bit (MAC CPU Mirroring Enable Search)

[Update Condition]

- HW: FWMACTSR0.MACTS clear event.

34.2.6.18 MAC Table Read Register (FWMACTR)

Address(es): MFWD.FWMACTR 874C 46A0h, MFWD_NS.FWMACTR 074C 46A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MACAR[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b10 to b0	MACAR[10:0]	MAC Address Read		R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for reading an entry in MAC table.

34.2.6.19 MAC Table Read Result Register 0 (FWMACTRR0)

Address(es): MFWD.FWMACTRR0 874C 46A4h, MFWD_NS.FWMACTRR0 074C 46A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MACTR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MACEVR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MACEVR	MAC Entry Valid Read		R
b30 to b1	—	Reserved	These bits are read as 0.	R
b31	MACTR	MAC Table Read		R

This register is used for reading an entry in MAC table.

MACEVR Bit (MAC Entry Valid Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACTR Bit (MAC Table Read)

[Setting Condition]

- HW: Writing to the FWMACTR register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when reading is completed.

34.2.6.20 MAC Table Read Result Register 1 (FWMACTRR1)

Address(es): MFWD.FWMACTRR1 874C 46A8h, MFWD_NS.FWMACTRR1 074C 46A8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MACABR	MACHLDR	MACDER	MACSLR	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0.	R
b8	MACSLR	MAC Security Level Read		R
b9	MACDER	MAC Dynamic Entry Read		R
b10	MACHLDR	MAC Hardware Learn Disable Read		R
b11	MACABR	MAC Aging Bit Read		R
b31 to b12	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in MAC table.

MACSLR Bit (MAC Security Level Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACDER Bit (MAC Dynamic Entry Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACHLDR Bit (MAC Hardware Learn Disable Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACABR Bit (MAC Aging Bit Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

34.2.6.21 MAC Table Read Result Register 2 (FWMACTRR2)

Address(es): MFWD.FWMACTRR2 874C 46ACh, MFWD_NS.FWMACTRR2 074C 46ACh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACMARP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MACMARP0[15:0]	MAC Address Read Part 0		R
b31 to b16	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in MAC table.

MACMARP0[15:0] Bits (MAC Address Read Part 0)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

34.2.6.22 MAC Table Read Result Register 3 (FWMACTRR3)

Address(es): MFWD.FWMACTRR3 874C 46B0h, MFWD_NS.FWMACTRR3 074C 46B0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MACMARP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACMARP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	MACMARP1[31:0]	MAC Address Read Part 1		R

This register is used for reading an entry in MAC table.

MACMARP1[31:0] Bits (MAC Address Read Part 1)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

34.2.6.23 MAC Table Read Result Register 4 (FWMACTRR4)

Address(es): MFWD.FWMACTRR4 874C 46B4h, MFWD_NS.FWMACTRR4 074C 46B4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACDSLVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACSSLVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	MACSSLVR[2:0]	MAC Source Source Lock Vector Read		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	MACDSLVR[2:0]	MAC Destination Source Lock Vector Read		R
b31 to b19	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in MAC table.

MACSSLVR[2:0] Bits (MAC Source Source Lock Vector Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACDSLVR[2:0] Bits (MAC Destination Source Lock Vector Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

34.2.6.24 MAC Table Read Result Register 50 (FWMACTRR50)

Address(es): MFWD.FWMACTRR50 874C 46C0h, MFWD_NS.FWMACTRR50 074C 46C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	MACCSDR[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	MACCSDR[5:0]	MAC CPU Sub-Destination Read		R
b31 to b6	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in MAC table.

MACCSDR[5:0] Bits (MAC CPU Sub-Destination Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

34.2.6.25 MAC Table Read Result Register 6 (FWMACTRR6)

Address(es): MFWD.FWMACTRR6 874C 46D0h, MFWD_NS.FWMACTRR6 074C 46D0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	MACCMER	MACEMER	MACIPUR	MACIPVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MACDVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	MACDVR[2:0]	MAC Destination Vector Read		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	MACIPVR[2:0]	MAC Internal Priority Value Read		R
b19	MACIPUR	MAC Internal Priority Update Read		R
b20	MACEMER	MAC Ethernet Mirroring Enable Read		R
b21	MACCMER	MAC CPU Mirroring Enable Read		R
b31 to b22	—	Reserved	These bits are read as 0.	R

This register is used for reading an entry in MAC table.

MACDVR[2:0] Bits (MAC Destination Vector Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACIPVR[2:0] Bits (MAC Internal Priority Value Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACIPUR Bit (MAC Internal Priority Update Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACEMER Bit (MAC Ethernet Mirroring Enable Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

MACCMER Bit (MAC CPU Mirroring Enable Read)

[Update Condition]

- HW: FWMACTRR0.MACTR clear event.

34.2.6.26 MAC Aging US Prescaler Configuration Register (FWMACAGUSPC)

Address(es): MFWD.FWMACAGUSPC 874C 4880h, MFWD_NS.FWMACAGUSPC 074C 4880h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MACAGUSP[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	MACAGUSP[9:0]	MAC Aging US Prescaler		R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

MACAGUSP[9:0] Bits (MAC Aging US Prescaler)

These bits are used to creates an internal clock for aging at 1 MHz to derive the aging 1 Hz clock.

[Restriction]

- SW: These bits should be set to the number of ESWCLK clock contained in 1 µs.

34.2.6.27 MAC Aging Configuration Register (FWMACAGC)

Address(es): MFWD.FWMACAGC 874C 4884h, MFWD_NS.FWMACAGC 074C 4884h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	MACDESOG	MACAGOG	—	—	—	MACDES	—	—	—	—	—	MACAGPM	MACAGSL	MACAGE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MACAGT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MACAGT[15:0]	MAC Aging Time	Defines the time in seconds the MFWD will wait between two MAC address aging.	R/W
b16	MACAGE	MAC Aging Enable	0: MAC aging is disabled 1: MAC aging is enabled and will happen every FWMACAGC.MACAGT[15:0] seconds.	R/W
b17	MACAGSL	MAC Aging Security Level	0: Only unsecure entries will be aged (MAC.SL = 0) 1: All entries will be aged.	R/W
b18	MACAGPM	MAC Aging Polling Mode	0: MAC aging polling mode disabled 1: MAC aging polling mode enabled	R/W
b23 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	MACDES	MAC Dynamic Entry Suppression	Writing 1 to this bit will start dynamic entry suppression.	R/W
b27 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R
b28	MACAGOG	MAC Aging Ongoing	0: MAC aging is not ongoing 1: MAC aging is ongoing	R
b29	MACDESOG	MAC Dynamic Entry Suppression Ongoing	0: MAC Dynamic Entry Suppression is not ongoing 1: MAC Dynamic Entry Suppression is ongoing	R
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

MACAGPM Bit (MAC Aging Polling Mode)

When set, allows software to check all MAC addresses are suppressed by aging.

MACDES Bit (MAC Dynamic Entry Suppression)

[Restriction]

- Dynamic Entry Suppression can only happen when aging is disabled (the FWMACAGC.MACAGE bit is not set).

34.2.6.28 MAC Aging Monitoring Register 0 (FWMACAGM0)

Address(es): MFWD.FWMACAGM0 874C 4888h, MFWD_NS.FWMACAGM0 074C 4888h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AGMACAP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	AGMACAP0[15:0]	Aged MAC Address Part 0	Shows the MAC address part 0 of the latest aged entry.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

34.2.6.29 MAC Aging Monitoring Register 1 (FWMACAGM1)

Address(es): MFWD.FWMACAGM1 874C 488Ch, MFWD_NS.FWMACAGM1 074C 488Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	AGMACAP1[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AGMACAP1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	AGMACAP1[31:0]	Aged MAC Address Part 1	Shows the MAC address part 1 of the latest aged entry.	R

34.2.6.30 VLAN Table Entry Configuration Register (FWVLANTEC)

Address(es): MFWD.FWVLANTEC 874C 4900h, MFWD_NS.FWVLANTEC 074C 4900h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	VLANTMUE[12:0]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b28 to b16	VLANTMUE[12:0]	VLAN Table Maximum Unsecure Entry	SW: Maximum unsecure entry number that can be set in table	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.6.31 VLAN Table Learn Register 0 (FWVLANTL0)

Address(es): MFWD.FWVLANTL0 874C 4910h, MFWD_NS.FWVLANTL0 074C 4910h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLANED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	VLANHLDL	—	VLANSLL	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	VLANSLL	VLAN Security Level Learn		R/W
b9	—	Reserved	This bit is read as 0. The write value should be 0.	R
b10	VLANHLDL	VLAN Hardware Learning Disable Learn		R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	VLANED	VLAN Entry Delete	0: Learn/overwrite the set VLAN address in VLAN table. 1: Delete the set VLAN address in VLAN table.	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in VLAN table.

34.2.6.32 VLAN Table Learn Register 1 (FWVLANTL1)

Address(es): MFWD.FWVLANTL1 874C 4914h, MFWD_NS.FWVLANTL1 074C 4914h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	VLANVIDL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	VLANVIDL[11:0]	VLAN VID Learn		R/W
b31 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in VLAN table.

34.2.6.33 VLAN Table Learn Register 2 (FWVLANTL2)

Address(es): MFWD.FWVLANTL2 874C 4918h, MFWD_NS.FWVLANTL2 074C 4918h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	VLANSLVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	VLANSLVL[2:0]	VLAN Source Lock Vector Learn		R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in VLAN table.

34.2.6.34 VLAN Table Learn Register 30 (FWVLANTL30)

Address(es): MFWD.FWVLANTL30 874C 4920h, MFWD_NS.FWVLANTL30 074C 4920h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	VLANCSDL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	VLANCSDL[5:0]	VLAN CPU Sub-Destination Learn		R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in VLAN table.

34.2.6.35 VLAN Table Learn Register 4 (FWVLANTL4)

Address(es): MFWD.FWVLANTL4 874C 4930h, MFWD_NS.FWVLANTL4 074C 4930h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	VLANCMEL	VLANEMEL	VLANIPUL	VLANIPVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	VLANDVL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	VLANDVL[2:0]	VLAN Destination Vector Learn		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	VLANIPVL[2:0]	VLAN Internal Priority Value Learn		R/W
b19	VLANIPUL	VLAN Internal Priority Update Learn		R/W
b20	VLANEMEL	VLAN Ethernet Mirroring Enable Learn		R/W
b21	VLANCMEL	VLAN CPU Mirroring Enable Learn		R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for learning/overwriting an entry in VLAN table.

34.2.6.36 VLAN Table Learn Result Register (FWVLANTLR)

Address(es): MFWD.FWVLANTLR 874C 4934h, MFWD_NS.FWVLANTLR 074C 4934h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	VLANTL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	VLANLO	—	VLANLSF	VLANLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	VLANLF	VLAN Learn Fail	0: Entry learning did not fail (refer to section 34.3.2.5 (3) (b) SW Learning). 1: Entry learning failed (refer to section 34.3.2.5 (3) (b) SW Learning).	R
b1	VLANLSF	VLAN Learn Security Fail	0: Entry learning did not fail because of a security error (refer to section 34.3.2.5 (3) (b) SW Learning). 1: Entry learning failed because of a security error (refer to section 34.3.2.5 (3) (b) SW Learning).	R
b2	—	Reserved	This bit is read as 0.	R
b3	VLANLO	VLAN Learn Overwrite	0: The entry learning did not overwrite an existing entry. 1: The entry learning overwrote an existing entry.	R
b30 to b4	—	Reserved	These bits are read as 0.	R
b31	VLANTL	VLAN Table Learn		R

This register is used for learning/overwriting an entry in VLAN table.

VLANLF Bit (VLAN Learn Fail)

[Update Condition]

- HW: FWVLANTLR.VLANTL clear event.

VLANLSF Bit (VLAN Learn Security Fail)

[Update Condition]

- HW: FWVLANTLR.VLANTL clear event.

VLANLO Bit (VLAN Learn Overwrite)

[Update Condition]

- HW: FWVLANTLR.VLANTL clear event.

VLANTL Bit (VLAN Table Learn)

[Setting Condition]

- HW: Writing to the FWVLANTL4 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when learning is completed.

34.2.6.37 VLAN Table Initialization Monitoring Register (FWVLANTIM)

Address(es): MFWD.FWVLANTIM 874C 4940h, MFWD_NS.FWVLANTIM 074C 4940h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VLANTR	VLANTIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	VLANTIOG	VLAN Table Initialization Ongoing		R/W
b1	VLANTR	VLAN Table Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

VLANTIOG Bit (VLAN Table Initialization Ongoing)

[Setting Condition]

- SW: By writing 1 to this bit. It starts VLAN Table initialization.

[Clearing Condition]

- This bit is cleared when VLAN Table initialization is finished.

VLANTR Bit (VLAN Table Ready)

[Setting Conditions]

- HW: When the FWVLANTIM.VLANTIOG bit is getting cleared.
- HW: This bit is set at “clk_period[ns] × 4096” time from VLAN table initialization starting.

[Clearing Condition]

- SW: By writing 1 to the FWVLANTIM.VLANTIOG bit.

34.2.6.38 VLAN Table Entry Monitoring Register (FWVLANTEM)

Address(es): MFWD.FWVLANTEM 874C 4944h, MFWD_NS.FWVLANTEM 074C 4944h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	VLANTUEN[12:0]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	VLANTEN[12:0]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b12 to b0	VLANTEN[12:0]	VLAN Table Entry Number		R
b15 to b13	—	Reserved	These bits are read as 0.	R
b28 to b16	VLANTUEN[12:0]	VLAN Table Unsecure Entry Number		R
b31 to b29	—	Reserved	These bits are read as 0.	R

VLANTEN[12:0] Bits (VLAN Table Entry Number)

[Increment Condition]

- HW: An entry is learned successfully.

[Decrement Condition]

- HW: An entry is deleted successfully.

VLANTUEN[12:0] Bits (VLAN Table Unsecure Entry Number)

[Increment Condition]

- HW: An unsecure entry is learned successfully.

[Decrement Condition]

- HW: An unsecure entry is deleted successfully.

34.2.6.39 VLAN Table Search Register (FWVLANTS)

Address(es): MFWD.FWVLANTS 874C 4950h, MFWD_NS.FWVLANTS 074C 4950h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	VLANVIDS[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	VLANVIDS[11:0]	VLAN VID Search		R/W
b30 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used for searching an entry in VLAN table.

34.2.6.40 VLAN Table Search Result Register 0 (FWVLANTSR0)

Address(es): MFWD.FWVLANTSR0 874C 4954h, MFWD_NS.FWVLANTSR0 074C 4954h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	VLANTS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	VLANHLDS	—	VLANSLS	—	—	—	—	—	—	VLANSNF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0.	R
b1	VLANSNF	VLAN Search Not Found	0: VLAN found in VLAN Table. 1: VLAN not found in VLAN Table.	R
b7 to b2	—	Reserved	These bits are read as 0.	R
b8	VLANSLS	VLAN Security Level Search		R
b9	—	Reserved	This bit is read as 0.	R
b10	VLANHLDS	VLAN Hardware Learning Disable Search		R
b30 to b11	—	Reserved	These bits are read as 0.	R
b31	VLANTS	VLAN Table Search		R

This register is used for searching an entry in VLAN table.

VLANSNF Bit (VLAN Search Not Found)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANSLS Bit (VLAN Security Level Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANHLDS Bit (VLAN Hardware Learning Disable Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANTS Bit (VLAN Table Search)

[Setting Condition]

- HW: Writing to the FWVLANTS register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when searching is completed.

34.2.6.41 VLAN Table Search Result Register 1 (FWVLANTSR1)

Address(es): MFWD.FWVLANTSR1 874C 4958h, MFWD_NS.FWVLANTSR1 074C 4958h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	VLANSLVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	VLANSLVS[2:0]	VLAN Source Lock Vector Search		R
b31 to b3	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in VLAN table.

VLANSLVS[2:0] Bits (VLAN Source Lock Vector Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

34.2.6.42 VLAN Table Search Result Register 20 (FWVLANTSR20)

Address(es): MFWD.FWVLANTSR20 874C 4960h, MFWD_NS.FWVLANTSR20 074C 4960h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	VLANCSDS[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	VLANCSDS[5:0]	VLAN CPU Sub-Destination Search		R
b31 to b6	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in VLAN table.

VLANCSDS[5:0] Bits (VLAN CPU Sub-Destination Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

34.2.6.43 VLAN Table Search Result Register 3 (FWVLANTSR3)

Address(es): MFWD.FWVLANTSR3 874C 4970h, MFWD_NS.FWVLANTSR3 074C 4970h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	VLANCMES	VLANEMES	VLANIPUS	VLANIPVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	VLANDVS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	VLANDVS[2:0]	VLAN Destination Vector Search		R
b15 to b3	—	Reserved	These bits are read as 0.	R
b18 to b16	VLANIPVS[2:0]	VLAN Internal Priority Value Search		R
b19	VLANIPUS	VLAN Internal Priority Update Search		R
b20	VLANEMES	VLAN Ethernet Mirroring Enable Search		R
b21	VLANCMES	VLAN CPU Mirroring Enable Search		R
b31 to b22	—	Reserved	These bits are read as 0.	R

This register is used for searching an entry in VLAN table.

VLANDVS[2:0] Bits (VLAN Destination Vector Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANIPVS[2:0] Bits (VLAN Internal Priority Value Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANIPUS Bit (VLAN Internal Priority Update Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANEMES Bit (VLAN Ethernet Mirroring Enable Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

VLANCMES Bit (VLAN CPU Mirroring Enable Search)

[Update Condition]

- HW: FWVLANTSR0.VLANTS clear event.

34.2.7 Port Based Forwarding Function Registers

34.2.7.1 Port Based Forwarding Configuration Register i (FWPBFCi) (i = 0 to 2)

Address(es): MFWD.FWPBFC0 874C 4A00h, MFWD.FWPBFC1 874C 4A10h, MFWD.FWPBFC2 874C 4A20h, MFWD_NS.FWPBFC0 074C 4A00h, MFWD_NS.FWPBFC1 074C 4A10h, MFWD_NS.FWPBFC2 074C 4A20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	FAIFP	IP6PDE	IP4PDM	IP4PDE	PBSL	PBCME	PBEME	PBIPU	PBIPV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PBDV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	PBDV[2:0]	Port Based Destination Vector	Destination vector for port i port-based forwarding.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	PBIPV[2:0]	Port Based Internal Priority Value	Internal priority value for port i port-based forwarding.	R/W
b19	PBIPU	Port Based Internal Priority Update	Enables frame priority update to internal priority value (FWPBFCi.PBIPV[2:0]) for port i.	R/W
b20	PBEME	Port Based Ethernet Mirroring Enabled	Enables Ethernet mirroring for port i.	R/W
b21	PBCME	Port Based CPU Mirroring Enabled	Enables CPU mirroring for port i.	R/W
b22	PBSL	Port Based Security Level	Set descriptor security level for port i.	R/W
b23	IP4PDE	IPv4 Priority Decode Enable	0: For port i, Input frame priority is taken from VLAN TAGs for port i. 1: For port i, If an IPv4 frame is detected, input frame priority is taken from precedence ToS. Else Input frame priority is taken from VLAN TAGs.	R/W
b24	IP4PDM	IPv4 Priority Decode Mode	0: For port i, Input frame priority is taken from precedence field in ToS. 1: For port i, Input frame priority is decoded from DSCP field in ToS.	R/W
b25	IP6PDE	IPv6 Priority Decode Enable	0: For port i, Input frame priority is taken from VLAN TAGs. 1: For port i, If an IPv6 frame is detected, input frame priority is decoded from DSCP field in ToS. Else Input frame priority is taken from VLAN TAGs.	R/W
b26	FAIFP	Force All Input Frame Priority Enable	0: For port i, Input frame priority is given by frame decoding. 1: For port i, Input frame priority is forced to FWPBFCi.PBIPV[2:0]	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.7.2 Port i Port Based Forwarding CSD Configuration Register 0 (FWPBFCSDCi0) (i = 0 to 2)

Address(es): MFWD.FWPBFCSDC00 874C 4A04h, MFWD.FWPBFCSDC10 874C 4A14h, MFWD.FWPBFCSDC20 874C 4A24h, MFWD_NS.FWPBFCSDC00 074C 4A04h, MFWD_NS.FWPBFCSDC10 074C 4A14h, MFWD_NS.FWPBFCSDC20 074C 4A24h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	L23UCDEIL	L23UCPCPL[2:0]			L23UCVIDL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	L23UCVIDL[11:0]	Layer 2/Layer 3 Update C-TAG VID Learn		R/W
b14 to b12	L23UCPCPL[2:0]	Layer 2/Layer 3 Update C-TAG PCP Learn		R/W
b15	L23UCDEIL	Layer 2/Layer 3 Update C-TAG DEI Learn		R/W
b27 to b16	L23USVIDL[11:0]	Layer 2/Layer 3 Update S-TAG VID Learn		R/W
b30 to b28	L23USPCPL[2:0]	Layer 2/Layer 3 Update S-TAG PCP Learn		R/W
b31	L23USDEIL	Layer 2/Layer 3 Update S-TAG DEI Learn		R/W

This register is used to learn a Layer 2/Layer 3 Update rule.

34.2.8.5 Layer 2/Layer 3 Update Rule Learn Result Register (FWL23URLR)

Address(es): MFWD.FWL23URLR 874C 4E10h, MFWD_NS.FWL23URLR 074C 4E10h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	L23URL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	L23ULF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	L23ULF	Layer 2/Layer 3 Update Learn Fail	0: Entry learning did not fail because the Layer 2/Layer 3 table is ready. 1: Entry learning failed because the Layer 2/Layer 3 table is not ready.	R
b30 to b1	—	Reserved	These bits are read as 0.	R
b31	L23URL	Layer 2/Layer 3 Update Rule Learn		R

L23ULF Bit (Layer 2/Layer 3 Update Learn Fail)

[Update Condition]

- HW: FWL23URLR.L23URL clear event.

L23URL Bit (Layer 2/Layer 3 Update Rule Learn)

[Setting Condition]

- HW: Writing FWL23URL3 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when learning is completed.

34.2.8.6 Layer 2/Layer 3 Update Table Initialization Monitoring Register (FWL23UTIM)

Address(es): MFWD.FWL23UTIM 874C 4E20h, MFWD_NS.FWL23UTIM 074C 4E20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	L23UTR	L23UTIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	L23UTIOG	Layer 2/Layer 3 Update Table Initialization Ongoing		R/W
b1	L23UTR	Layer 2/Layer 3 Update Table Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

L23UTIOG Bit (Layer 2/Layer 3 Update Table Initialization Ongoing)

[Setting Condition]

- SW: By writing 1 to this bit. It starts Layer 2/Layer 3 Update Table initialization.

[Clearing Condition]

- HW: This bit is cleared when Layer 2/Layer 3 Update Table initialization is finished.

L23UTR Bit (Layer 2/Layer 3 Update Table Ready)

[Setting Conditions]

- HW: When the FWL23UTIM.L23UTIOG bit is getting cleared.
- HW: This bit is set at “clk_period [ns] × 256” time from Layer 2/Layer 3 Update table initialization starting.

[Clearing Condition]

- SW: By writing 1 to the FWL23UTIM.L23UTIOG bit.

34.2.8.7 Layer 2/Layer 3 Update Rule Read Register (FWL23URR)

Address(es): MFWD.FWL23URR 874C 4E30h, MFWD_NS.FWL23URR 074C 4E30h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	L23RNR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	L23RNR[7:0]	Layer 2/Layer 3 Routing Number Read		R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used to read a Layer 2/Layer 3 Update rule.

34.2.8.8 Layer 2/Layer 3 Update Rule Read Result Register 0 (FWL23URRR0)

Address(es): MFWD.FWL23URRR0 874C 4E34h, MFWD_NS.FWL23URRR0 074C 4E34h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	L23URR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	L23URPVR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	L23URPVR[2:0]	Layer 2/Layer 3 Update Routing Port Valid Read	Used to read a Layer 2/Layer 3 Update rule	R
b30 to b3	—	Reserved	These bits are read as 0.	R
b31	L23URR	Layer 2/Layer 3 Update Rule Read		R

L23URPVR[2:0] Bits (Layer 2/Layer 3 Update Routing Port Valid Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23URR Bit (Layer 2/Layer 3 Update Rule Read)

[Setting Condition]

- HW: Writing to the FWL23URR register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when reading is completed.

34.2.8.9 Layer 2/Layer 3 Update Rule Read Result Register 1 (FWL23URRR1)

Address(es): MFWD.FWL23URRR1 874C 4E38h, MFWD_NS.FWL23URRR1 074C 4E38h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	L23URTUR[1:0]		L23USDEIUR	L23USPCPUR	L23USVIDUR	L23UCDEIUR	L23UCPCPUR	L23UCVIDUR	L23UMSAUR	L23UMDAUR	L23UTTLUR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	L23UMDARP0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	L23UMDARP0[15:0]	Layer 2/Layer 3 MAC Destination Address Read Part 0		R
b16	L23UTTLUR	Layer 2/Layer 3 Time To Live Update Read		R
b17	L23UMDAUR	Layer 2/Layer 3 MAC Destination Address Update Read		R
b18	L23UMSAUR	Layer 2/Layer 3 MAC Source Address Update Read		R
b19	L23UCVIDUR	Layer 2/Layer 3 C-TAG VID Update Read		R
b20	L23UCPCPUR	Layer 2/Layer 3 C-TAG PCP Update Read		R
b21	L23UCDEIUR	Layer 2/Layer 3 C-TAG DEI Update Read		R
b22	L23USVIDUR	Layer 2/Layer 3 S-TAG VID Update Read		R
b23	L23USPCPUR	Layer 2/Layer 3 S-TAG PCP Update Read		R
b24	L23USDEIUR	Layer 2/Layer 3 S-TAG DEI Update Read		R
b26, b25	L23URTUR[1:0]	Layer 2/Layer 3 R-TAG Update Read		R
b31 to b27	—	Reserved	These bits are read as 0.	R

This register is used to read a Layer 2/Layer 3 Update rule.

L23UMDARP0[15:0] Bits (Layer 2/Layer 3 MAC Destination Address Read Part 0)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23UTTLUR Bit (Layer 2/Layer 3 Time To Live Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23UMDAUR Bit (Layer 2/Layer 3 MAC Destination Address Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23UMSAUR Bit (Layer 2/Layer 3 MAC Source Address Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23UCVIDUR Bit (Layer 2/Layer 3 C-TAG VID Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23UCPCPUR Bit (Layer 2/Layer 3 C-TAG PCP Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23UCDEIUR Bit (Layer 2/Layer 3 C-TAG DEI Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23USVIDUR Bit (Layer 2/Layer 3 S-TAG VID Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23USPCPUR Bit (Layer 2/Layer 3 S-TAG PCP Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23USDEIUR Bit (Layer 2/Layer 3 S-TAG DEI Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

L23URTUR[1:0] Bits (Layer 2/Layer 3 R-TAG Update Read)

[Update Condition]

- HW: FWL23URRR0.L23URR clear event.

34.2.8.10 Layer 2/Layer 3 Update Rule Read Result Register 2 (FWL23URRR2)

Address(es): MFWD.FWL23URRR2 874C 4E3Ch, MFWD_NS.FWL23URRR2 074C 4E3Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	RMRN[7:0]	Remapping Rule Number	Set the rule number that should be remapped for remapping rule i	R/W
b11 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b13, b12	RMDPN[1:0]	Remapping Destination Port Number	Set the port number for which rule number should be remapped for remapping rule i	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R
b23 to b16	RMNRN[7:0]	Remapping New Rule Number	Set the rule number to which routing should be remapped for remapping rule i	R/W
b27 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R
b28	RME	Remapping Enable	0: Remapping rule i disabled 1: Remapping rule i enabled	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R

RME Bit (Remapping Enable)

[Setting Condition]

- SW: Writing 1 to this bit will set it.

34.2.9 PSFP (Per Stream Filtering and Policing) [802.1Qci]

34.2.9.1 PSFP MSDU Filter i Global Configuration Register (FWPMFGCi) (i = 0 to 15)

Address(es): MFWD.FWPMFGC0 874C 5000h, MFWD.FWPMFGC1 874C 5004h, MFWD.FWPMFGC2 874C 5008h, MFWD.FWPMFGC3 874C 500Ch, MFWD.FWPMFGC4 874C 5010h, MFWD.FWPMFGC5 874C 5014h, MFWD.FWPMFGC6 874C 5018h, MFWD.FWPMFGC7 874C 501Ch, MFWD.FWPMFGC8 874C 5020h, MFWD.FWPMFGC9 874C 5024h, MFWD.FWPMFGC10 874C 5028h, MFWD.FWPMFGC11 874C 502Ch, MFWD.FWPMFGC12 874C 5030h, MFWD.FWPMFGC13 874C 5034h, MFWD.FWPMFGC14 874C 5038h, MFWD.FWPMFGC15 874C 503Ch,

Bit	Symbol	Bit Name	Description	R/W
b0	MTRFE	Meter Filter Enable	0: Meter i disabled (Pass through all frames.) 1: Meter i enabled (Reject target stream frames by meter filter.)	R/W
b2, b1	MTRFM[1:0]	Meter Filter Mode	b2 b1 0 0: Normal mode: Any frame linked to Meter filter i thanks to L3 table received when not enough token is available will be red. 0 1: Throttle mode: Any frame linked to Meter filter i thanks to L3 table received when not enough token is available or when FWEIS5.PMRFSi is set will be red. 1 0: ATS mode: Any frame linked to Meter filter i thanks to L3 table received when not enough token is available will be stored in ATS RAM until enough tokens are available. When enough tokens are available, frame will be forwarded as yellow or green. 1 1: ATS throttle mode: Any frame linked to Meter filter i thanks to L3 table received when not enough token is available will be stored in ATS RAM until enough tokens are available. When enough tokens are available, frame will be forwarded as yellow or green if FWEIS5.PMRFSi is not set and will be red if FWEIS5.PMRFSi is set.	R/W
b3	MTRFRFD	Meter Filter Red Frame Drop	0: Red frames are not dropped by meter i 1: Red frames are dropped by meter i	R/W
b4	MTRCF	Meter Coupling Flag	0: When green bucket is full, CIR tokens are lost. 1: When green bucket is full, CIR tokens are added to the yellow bucket.	R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R

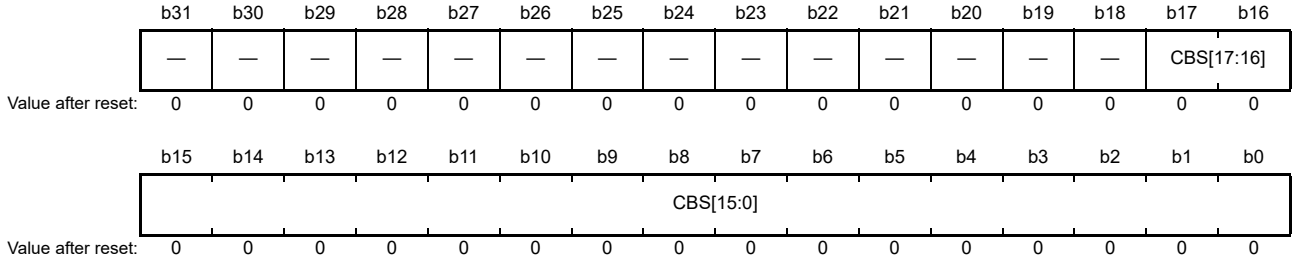
Bit	Symbol	Bit Name	Description	R/W
b16	MTRCM0	Meter Color Mode 0	0: Incoming frame with {PCP,DEI} == 0 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 0 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b17	MTRCM1	Meter Color Mode 1	0: Incoming frame with {PCP,DEI} == 1 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 1 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b18	MTRCM2	Meter Color Mode 2	0: Incoming frame with {PCP,DEI} == 2 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 2 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b19	MTRCM3	Meter Color Mode 3	0: Incoming frame with {PCP,DEI} == 3 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 3 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b20	MTRCM4	Meter Color Mode 4	0: Incoming frame with {PCP,DEI} == 4 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 4 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b21	MTRCM5	Meter Color Mode 5	0: Incoming frame with {PCP,DEI} == 5 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 5 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b22	MTRCM6	Meter Color Mode 6	0: Incoming frame with {PCP,DEI} == 6 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 6 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b23	MTRCM7	Meter Color Mode 7	0: Incoming frame with {PCP,DEI} == 7 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 7 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b24	MTRCM8	Meter Color Mode 8	0: Incoming frame with {PCP,DEI} == 8 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 8 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b25	MTRCM9	Meter Color Mode 9	0: Incoming frame with {PCP,DEI} == 9 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 9 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b26	MTRCM10	Meter Color Mode 10	0: Incoming frame with {PCP,DEI} == 10 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 10 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b27	MTRCM11	Meter Color Mode 11	0: Incoming frame with {PCP,DEI} == 11 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 11 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W

Bit	Symbol	Bit Name	Description	R/W
b28	MTRCM12	Meter Color Mode 12	0: Incoming frame with {PCP,DEI} == 12 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 12 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b29	MTRCM13	Meter Color Mode 13	0: Incoming frame with {PCP,DEI} == 13 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 13 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b30	MTRCM14	Meter Color Mode 14	0: Incoming frame with {PCP,DEI} == 14 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 14 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W
b31	MTRCM15	Meter Color Mode 15	0: Incoming frame with {PCP,DEI} == 15 is coming as green (Green or yellow bucket can be used by the frame). 1: Incoming frame with {PCP,DEI} == 15 is coming as Yellow (Only yellow bucket can be used by the frame).	R/W

MTRCF Bit (Meter Coupling Flag)

[Restriction]

- HW: This bit is only valid if i = 0 to 7

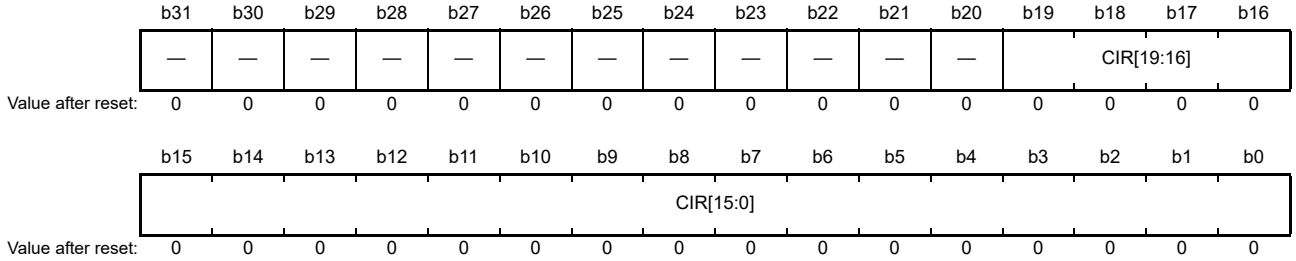


MTRCMn Bit (Meter Color Mode n) (n = 0 to 15)

[Restrictions]

- HW: This bit is only valid if i = 0 to 7
- SW: in ATS mode (the FWPMTRFCi.MTRFM[1:0] bits are set to 10b) or in ATS throttle mode (the FWPMTRFCi.MTRFM[1:0] bits are set to 11b) Color mode is not available so this bit should be set to ALL0.

34.2.9.3 PSFP Meter i CBS Configuration Register (FWPMTRCBSCi) (i = 0 to 31)



Address(es): MFWD.FWPMTRCBSC0 874C 5604h, MFWD.FWPMTRCBSC1 874C 5624h, MFWD.FWPMTRCBSC2 874C 5644h, MFWD.FWPMTRCBSC3 874C 5664h, MFWD.FWPMTRCBSC4 874C 5684h, MFWD.FWPMTRCBSC5 874C 56A4h, MFWD.FWPMTRCBSC6 874C 56C4h, MFWD.FWPMTRCBSC7 874C 56E4h, MFWD.FWPMTRCBSC8 874C 5704h, MFWD.FWPMTRCBSC9 874C 5724h, MFWD.FWPMTRCBSC10 874C 5744h, MFWD.FWPMTRCBSC11 874C 5764h, MFWD.FWPMTRCBSC12 874C 5784h, MFWD.FWPMTRCBSC13 874C 57A4h, MFWD.FWPMTRCBSC14 874C 57C4h, MFWD.FWPMTRCBSC15 874C 57E4h, MFWD.FWPMTRCBSC16 874C 5804h, MFWD.FWPMTRCBSC17 874C 5824h, MFWD.FWPMTRCBSC18 874C 5844h, MFWD.FWPMTRCBSC19 874C 5864h, MFWD.FWPMTRCBSC20 874C 5884h, MFWD.FWPMTRCBSC21 874C 58A4h, MFWD.FWPMTRCBSC22 874C 58C4h, MFWD.FWPMTRCBSC23 874C 58E4h, MFWD.FWPMTRCBSC24 874C 5904h, MFWD.FWPMTRCBSC25 874C 5924h, MFWD.FWPMTRCBSC26 874C 5944h, MFWD.FWPMTRCBSC27 874C 5964h, MFWD.FWPMTRCBSC28 874C 5984h, MFWD.FWPMTRCBSC29 874C 59A4h, MFWD.FWPMTRCBSC30 874C 59C4h, MFWD.FWPMTRCBSC31 874C 59E4h,
MFWD_NS.FWPMTRCBSC0 074C 5604h, MFWD_NS.FWPMTRCBSC1 074C 5624h, MFWD_NS.FWPMTRCBSC2 074C 5644h, MFWD_NS.FWPMTRCBSC3 074C 5664h, MFWD_NS.FWPMTRCBSC4 074C 5684h, MFWD_NS.FWPMTRCBSC5 074C 56A4h, MFWD_NS.FWPMTRCBSC6 074C 56C4h, MFWD_NS.FWPMTRCBSC7 074C 56E4h, MFWD_NS.FWPMTRCBSC8 074C 5704h, MFWD_NS.FWPMTRCBSC9 074C 5724h, MFWD_NS.FWPMTRCBSC10 074C 5744h, MFWD_NS.FWPMTRCBSC11 074C 5764h, MFWD_NS.FWPMTRCBSC12 074C 5784h, MFWD_NS.FWPMTRCBSC13 074C 57A4h, MFWD_NS.FWPMTRCBSC14 074C 57C4h, MFWD_NS.FWPMTRCBSC15 074C 57E4h, MFWD_NS.FWPMTRCBSC16 074C 5804h, MFWD_NS.FWPMTRCBSC17 074C 5824h, MFWD_NS.FWPMTRCBSC18 074C 5844h, MFWD_NS.FWPMTRCBSC19 074C 5864h, MFWD_NS.FWPMTRCBSC20 074C 5884h, MFWD_NS.FWPMTRCBSC21 074C 58A4h, MFWD_NS.FWPMTRCBSC22 074C 58C4h, MFWD_NS.FWPMTRCBSC23 074C 58E4h, MFWD_NS.FWPMTRCBSC24 074C 5904h, MFWD_NS.FWPMTRCBSC25 074C 5924h, MFWD_NS.FWPMTRCBSC26 074C 5944h, MFWD_NS.FWPMTRCBSC27 074C 5964h, MFWD_NS.FWPMTRCBSC28 074C 5984h, MFWD_NS.FWPMTRCBSC29 074C 59A4h, MFWD_NS.FWPMTRCBSC30 074C 59C4h, MFWD_NS.FWPMTRCBSC31 074C 59E4h

Bit	Symbol	Bit Name	Description	R/W
b17 to b0	CBS[17:0]	CBS	Maximum number of tokens (in bytes) contained in meter i green bucket.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.9.4 PSFP Meter i CIR Configuration Register (FWPMTRCIRCi) (i = 0 to 31)

Address(es): MFWD.FWPMTRCIRC0 874C 5608h, MFWD.FWPMTRCIRC1 874C 5628h, MFWD.FWPMTRCIRC2 874C 5648h, MFWD.FWPMTRCIRC3 874C 5668h, MFWD.FWPMTRCIRC4 874C 5688h, MFWD.FWPMTRCIRC5 874C 56A8h, MFWD.FWPMTRCIRC6 874C 56C8h, MFWD.FWPMTRCIRC7 874C 56E8h, MFWD.FWPMTRCIRC8 874C 5708h, MFWD.FWPMTRCIRC9 874C 5728h, MFWD.FWPMTRCIRC10 874C 5748h, MFWD.FWPMTRCIRC11 874C 5768h, MFWD.FWPMTRCIRC12 874C 5788h, MFWD.FWPMTRCIRC13 874C 57A8h, MFWD.FWPMTRCIRC14 874C 57C8h, MFWD.FWPMTRCIRC15 874C 57E8h, MFWD.FWPMTRCIRC16 874C 5808h, MFWD.FWPMTRCIRC17 874C 5828h, MFWD.FWPMTRCIRC18 874C 5848h, MFWD.FWPMTRCIRC19 874C 5868h, MFWD.FWPMTRCIRC20 874C 5888h, MFWD.FWPMTRCIRC21 874C 58A8h, MFWD.FWPMTRCIRC22 874C 58C8h, MFWD.FWPMTRCIRC23 874C 58E8h, MFWD.FWPMTRCIRC24 874C 5908h, MFWD.FWPMTRCIRC25 874C 5928h, MFWD.FWPMTRCIRC26 874C 5948h, MFWD.FWPMTRCIRC27 874C 5968h, MFWD.FWPMTRCIRC28 874C 5988h, MFWD.FWPMTRCIRC29 874C 59A8h, MFWD.FWPMTRCIRC30 874C 59C8h, MFWD.FWPMTRCIRC31 874C 59E8h,
MFWD_NS.FWPMTRCIRC0 074C 5608h, MFWD_NS.FWPMTRCIRC1 074C 5628h, MFWD_NS.FWPMTRCIRC2 074C 5648h, MFWD_NS.FWPMTRCIRC3 074C 5668h, MFWD_NS.FWPMTRCIRC4 074C 5688h, MFWD_NS.FWPMTRCIRC5 074C 56A8h, MFWD_NS.FWPMTRCIRC6 074C 56C8h, MFWD_NS.FWPMTRCIRC7 074C 56E8h, MFWD_NS.FWPMTRCIRC8 074C 5708h, MFWD_NS.FWPMTRCIRC9 074C 5728h, MFWD_NS.FWPMTRCIRC10 074C 5748h, MFWD_NS.FWPMTRCIRC11 074C 5768h, MFWD_NS.FWPMTRCIRC12 074C 5788h, MFWD_NS.FWPMTRCIRC13 074C 57A8h, MFWD_NS.FWPMTRCIRC14 074C 57C8h, MFWD_NS.FWPMTRCIRC15 074C 57E8h, MFWD_NS.FWPMTRCIRC16 074C 5808h, MFWD_NS.FWPMTRCIRC17 074C 5828h, MFWD_NS.FWPMTRCIRC18 074C 5848h, MFWD_NS.FWPMTRCIRC19 074C 5868h, MFWD_NS.FWPMTRCIRC20 074C 5888h, MFWD_NS.FWPMTRCIRC21 074C 58A8h, MFWD_NS.FWPMTRCIRC22 074C 58C8h, MFWD_NS.FWPMTRCIRC23 074C 58E8h, MFWD_NS.FWPMTRCIRC24 074C 5908h, MFWD_NS.FWPMTRCIRC25 074C 5928h, MFWD_NS.FWPMTRCIRC26 074C 5948h, MFWD_NS.FWPMTRCIRC27 074C 5968h, MFWD_NS.FWPMTRCIRC28 074C 5988h, MFWD_NS.FWPMTRCIRC29 074C 59A8h, MFWD_NS.FWPMTRCIRC30 074C 59C8h, MFWD_NS.FWPMTRCIRC31 074C 59E8h

Bit	Symbol	Bit Name	Description	R/W
b19 to b0	CIR[19:0]	CIR	Used to increment green token tokens when meter i green bucket is not full.	R/W
b31 to b20	—	Reserved	These bits are read as 0. The write value should be 0.	R

CIR[19:0] Bits (CIR)

CIR[19:16] is the credit increment in byte per clock and CIR[15:0] is the credit increment in sub-byte per clock.

[Caution]

- SW: In ATS mode, setting these bits to 0 or a value close to 0 would set corresponding queue to a very low throughput or could stuck the corresponding queue and lead to a queue overflow.

34.2.9.5 PSFP Meter i EBS Configuration Register (FWPMTREBSCi) (i = 0 to 7)

Address(es): MFWD.FWPMTREBSC0 874C 560Ch, MFWD.FWPMTREBSC1 874C 562Ch, MFWD.FWPMTREBSC2 874C 564Ch, MFWD.FWPMTREBSC3 874C 566Ch, MFWD.FWPMTREBSC4 874C 568Ch, MFWD.FWPMTREBSC5 874C 56ACh, MFWD.FWPMTREBSC6 874C 56CCh, MFWD.FWPMTREBSC7 874C 56ECh, MFWD_NS.FWPMTREBSC0 074C 560Ch, MFWD_NS.FWPMTREBSC1 074C 562Ch, MFWD_NS.FWPMTREBSC2 074C 564Ch, MFWD_NS.FWPMTREBSC3 074C 566Ch, MFWD_NS.FWPMTREBSC4 074C 568Ch, MFWD_NS.FWPMTREBSC5 074C 56ACh, MFWD_NS.FWPMTREBSC6 074C 56CCh, MFWD_NS.FWPMTREBSC7 074C 56ECh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EBS[17:16]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EBS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b17 to b0	EBS[17:0]	EBS	Maximum number of tokens (in bytes) contained in meter i yellow bucket.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

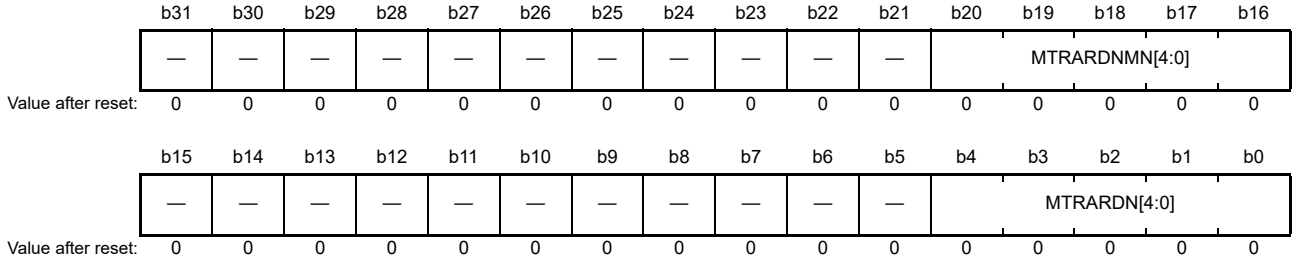
34.2.9.6 PSFP Meter i EIR Configuration Register (FWPMTREIRCi) (i = 0 to 7)

Address(es): MFWD.FWPMTREIRC0 874C 5610h, MFWD.FWPMTREIRC1 874C 5630h, MFWD.FWPMTREIRC2 874C 5650h, MFWD.FWPMTREIRC3 874C 5670h, MFWD.FWPMTREIRC4 874C 5690h, MFWD.FWPMTREIRC5 874C 56B0h, MFWD.FWPMTREIRC6 874C 56D0h, MFWD.FWPMTREIRC7 874C 56F0h, MFWD_NS.FWPMTREIRC0 074C 5610h, MFWD_NS.FWPMTREIRC1 074C 5630h, MFWD_NS.FWPMTREIRC2 074C 5650h, MFWD_NS.FWPMTREIRC3 074C 5670h, MFWD_NS.FWPMTREIRC4 074C 5690h, MFWD_NS.FWPMTREIRC5 074C 56B0h, MFWD_NS.FWPMTREIRC6 074C 56D0h, MFWD_NS.FWPMTREIRC7 074C 56F0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	EIR[19:16]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EIR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b19 to b0	EIR[19:0]	EIR	Used to increment green token tokens when meter i yellow bucket is not full.	R/W
b31 to b20	—	Reserved	These bits are read as 0. The write value should be 0.	R



EIR[19:0] Bits (EIR)

EIR[19:16] is the credit increment in byte per clock and EIR[15:0] is the credit increment in sub-byte per clock.
[Caution]

- SW: In ATS mode, setting these bits to 0 or a value close to 0 would set corresponding queue to a very low throughput or could stuck the corresponding queue and lead to a queue overflow.

34.2.9.7 PSFP Meter i Filter Monitoring Register (FWPMTRFMi) (i = 0 to 31)

Address(es): MFWD.FWPMTRFM0 874C 5614h, MFWD.FWPMTRFM1 874C 5634h, MFWD.FWPMTRFM2 874C 5654h, MFWD.FWPMTRFM3 874C 5674h, MFWD.FWPMTRFM4 874C 5694h, MFWD.FWPMTRFM5 874C 56B4h, MFWD.FWPMTRFM6 874C 56D4h, MFWD.FWPMTRFM7 874C 56F4h, MFWD.FWPMTRFM8 874C 5714h, MFWD.FWPMTRFM9 874C 5734h, MFWD.FWPMTRFM10 874C 5754h, MFWD.FWPMTRFM11 874C 5774h, MFWD.FWPMTRFM12 874C 5794h, MFWD.FWPMTRFM13 874C 57B4h, MFWD.FWPMTRFM14 874C 57D4h, MFWD.FWPMTRFM15 874C 57F4h, MFWD.FWPMTRFM16 874C 5814h, MFWD.FWPMTRFM17 874C 5834h, MFWD.FWPMTRFM18 874C 5854h, MFWD.FWPMTRFM19 874C 5874h, MFWD.FWPMTRFM20 874C 5894h, MFWD.FWPMTRFM21 874C 58B4h, MFWD.FWPMTRFM22 874C 58D4h, MFWD.FWPMTRFM23 874C 58F4h, MFWD.FWPMTRFM24 874C 5914h, MFWD.FWPMTRFM25 874C 5934h, MFWD.FWPMTRFM26 874C 5954h, MFWD.FWPMTRFM27 874C 5974h, MFWD.FWPMTRFM28 874C 5994h, MFWD.FWPMTRFM29 874C 59B4h, MFWD.FWPMTRFM30 874C 59D4h, MFWD.FWPMTRFM31 874C 59F4h,
MFWD_NS.FWPMTRFM0 074C 5614h, MFWD_NS.FWPMTRFM1 074C 5634h, MFWD_NS.FWPMTRFM2 074C 5654h, MFWD_NS.FWPMTRFM3 074C 5674h, MFWD_NS.FWPMTRFM4 074C 5694h, MFWD_NS.FWPMTRFM5 074C 56B4h, MFWD_NS.FWPMTRFM6 074C 56D4h, MFWD_NS.FWPMTRFM7 074C 56F4h, MFWD_NS.FWPMTRFM8 074C 5714h, MFWD_NS.FWPMTRFM9 074C 5734h, MFWD_NS.FWPMTRFM10 074C 5754h, MFWD_NS.FWPMTRFM11 074C 5774h, MFWD_NS.FWPMTRFM12 074C 5794h, MFWD_NS.FWPMTRFM13 074C 57B4h, MFWD_NS.FWPMTRFM14 074C 57D4h, MFWD_NS.FWPMTRFM15 074C 57F4h, MFWD_NS.FWPMTRFM16 074C 5814h, MFWD_NS.FWPMTRFM17 074C 5834h, MFWD_NS.FWPMTRFM18 074C 5854h, MFWD_NS.FWPMTRFM19 074C 5874h, MFWD_NS.FWPMTRFM20 074C 5894h, MFWD_NS.FWPMTRFM21 074C 58B4h, MFWD_NS.FWPMTRFM22 074C 58D4h, MFWD_NS.FWPMTRFM23 074C 58F4h, MFWD_NS.FWPMTRFM24 074C 5914h, MFWD_NS.FWPMTRFM25 074C 5934h, MFWD_NS.FWPMTRFM26 074C 5954h, MFWD_NS.FWPMTRFM27 074C 5974h, MFWD_NS.FWPMTRFM28 074C 5994h, MFWD_NS.FWPMTRFM29 074C 59B4h, MFWD_NS.FWPMTRFM30 074C 59D4h, MFWD_NS.FWPMTRFM31 074C 59F4h

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	MTRARDN[4:0]	Meter ATS RAM Descriptor Number	Shown the number of descriptors in the ATS RAM for meter number i.	R
b15 to b5	—	Reserved	These bits are read as 0.	R
b20 to b16	MTRARDNMN[4:0]	Meter ATS RAM Descriptor Number Maximum Number		R
b31 to b21	—	Reserved	These bits are read as 0.	R

MTRARDN[4:0] Bits (Meter ATS RAM Descriptor Number)

[Increment Condition]

- A descriptor is received for meter i but there is already a descriptor in the ATS RAM for meter i or there is not even token available for the frame.

MTRARDNMN[4:0] Bits (Meter ATS RAM Descriptor Number Maximum Number)

[Update Conditions]

- SW: Reading these bits update it to FWPMTRFMi.MTRARDN[4:0] value.
- HW: When FWPMTRFMi.MTRARDNMN[4:0] < FWPMTRFMi.MTRARDN[4:0], these bits are updated to FWPMTRFMi.MTRARDN[4:0] value.

34.2.10 FRER (Frame Replication and Elimination for Reliability) [802.1CB]

34.2.10.1 FRER Table Learn Register 0 (FWFTL0)

Address(es): MFWD.FWFTL0 874C 6000h, MFWD_NS.FWFTL0 074C 6000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	FSRPL[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	FEAL[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	FEAL[6:0]	FRER Entry Address Learn		R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R
b22 to b16	FSRPL[6:0]	FRER Sequence Recovery Pointer Learn		R/W
b31 to b23	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used to set an FRER entry in FRER RAM.

34.2.10.2 FRER Table Learn Register 1 (FWFTL1)

Address(es): MFWD.FWFTL1 874C 6004h, MFWD_NS.FWFTL1 074C 6004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	FSRRTL[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	FSRPVL	FTNSL	—	—	—	—	FSHLL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	FSHLL[3:0]	FRER Sequence History Length Learn		R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	FTNSL	FRER Take No Sequence Learn		R/W
b9	FSRPVL	FRER Sequence Recovery Pointer Valid Learn		R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	FSRRTL[9:0]	FRER Sequence Recovery Remaining Ticks Learn		R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used to set an FRER entry in FRER RAM.

FSHLL[3:0] Bits (FRER Sequence History Length Learn)

[Restriction]

- SW: These bits should never be set to a value larger than 14.

34.2.10.3 FRER Table Learn Result Register (FWFTLR)

Address(es): MFWD.FWFTLR 874C 6008h, MFWD_NS.FWFTLR 074C 6008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	FTL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FLF	FRER Learn Fail	0: Entry learning did not fail because the FRER RAM is ready. 1: Entry learning failed because the FRER RAM is not ready.	R
b30 to b1	—	Reserved	These bits are read as 0.	R
b31	FTL	FRER Table Learn		R

FLF Bit (FRER Learn Fail)

[Update Condition]

- HW: FWFTLR.FTL clear event.

FTL Bit (FRER Table Learn)

[Setting Condition]

- HW: Writing to the FWFTL1 register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when learning is completed.

34.2.10.4 FRER Timeout Configuration Register (FWFTOC)

Address(es): MFWD.FWFTOC 874C 6010h, MFWD_NS.FWFTOC 074C 6010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TOOG	TOCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TOT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TOT[15:0]	Timeout Time (ms)	When timeout check is enabled (FWFTOC.TOCE set to 1), timeout check will happen every FWFTOC.TOT[15:0] milliseconds.	R/W
b16	TOCE	Timeout Check Enable	0: Timeout check is disabled. 1: Timeout check is enabled.	R/W
b17	TOOG	Timeout Ongoing	0: Timeout check is not ongoing 1: Timeout check is ongoing	R
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.10.5 FRER Timeout Prescaler Configuration Register (FWFTOPC)

Address(es): MFWD.FWFTOPC 874C 6014h, MFWD_NS.FWFTOPC 074C 6014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	USP[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	USP[9:0]	Microsecond Prescaler	Used to creates an internal clock for timeout at 1 MHz to derive the Timeout 1 kHz clock.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

USP[9:0] Bits (Microsecond Prescaler)

[Restriction]

- SW: These bits should be set to the number of ESWCLK clock contained in 1 µs.

34.2.10.6 FRER Table Initialization Monitoring Register (FWFTIM)

Address(es): MFWD.FWFTIM 874C 6020h, MFWD_NS.FWFTIM 074C 6020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FTR	FTIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FTIOG	FRER Table Initialization Ongoing		R/W
b1	FTR	FRER Table Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

FTIOG Bit (FRER Table Initialization Ongoing)

[Setting Condition]

- SW: By writing 1 to this bit. It starts FRER Table initialization.

[Clearing Condition]

- HW: This bit is cleared when FRER Table initialization is finished.

FTR Bit (FRER Table Ready)

[Setting Conditions]

- HW: When FWFTIM.FTIOG is getting cleared.
- HW: This bit is set at “clk_period [ns] × 128” time from buffer pool initialization starting.

[Clearing Condition]

- SW: By writing 1 to the FWFTIM.FTIOG bit.

34.2.10.7 FRER Table Read Register (FWFTR)

Address(es): MFWD.FWFTR 874C 6030h, MFWD_NS.FWFTR 074C 6030h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	FEAR[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	FEAR[6:0]	FRER Entry Address Read		R/W
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used to read an FRER entry in FRER RAM.

34.2.10.8 FRER Table Read Result Register 0 (FWFTRR0)

Address(es): MFWD.FWFTRR0 874C 6034h, MFWD_NS.FWFTRR0 074C 6034h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	FTR	—	—	—	—	—	FSRRTR[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	FSRPVR	FTNSR	—	—	—	—	FSHLR[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	FSHLR[3:0]	FRER Sequence History Length Read		R
b7 to b4	—	Reserved	These bits are read as 0.	R
b8	FTNSR	FRER Take No Sequence Read		R
b9	FSRPVR	FRER Sequence Recovery Pointer Valid Read		R
b15 to b10	—	Reserved	These bits are read as 0.	R
b25 to b16	FSRRTR[9:0]	FRER Set Recovery Remaining Ticks Read		R
b30 to b26	—	Reserved	These bits are read as 0.	R
b31	FTR	FRER Table Read		R

FSHLR[3:0] Bits (FRER Sequence History Length Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

FTNSR Bit (FRER Take No Sequence Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

FSRPVR Bit (FRER Sequence Recovery Pointer Valid Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

FSRRTR[9:0] Bits (FRER Set Recovery Remaining Ticks Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

FTR Bit (FRER Table Read)

[Setting Condition]

- HW: Writing to the FWFTR register will set this bit.

[Clearing Condition]

- HW: This bit will be de-asserted when reading is completed.

34.2.10.9 FRER Table Read Result Register 1 (FWFTRR1)

Address(es): MFWD.FWFTRR1 874C 6038h, MFWD_NS.FWFTRR1 074C 6038h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	FSRPR[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

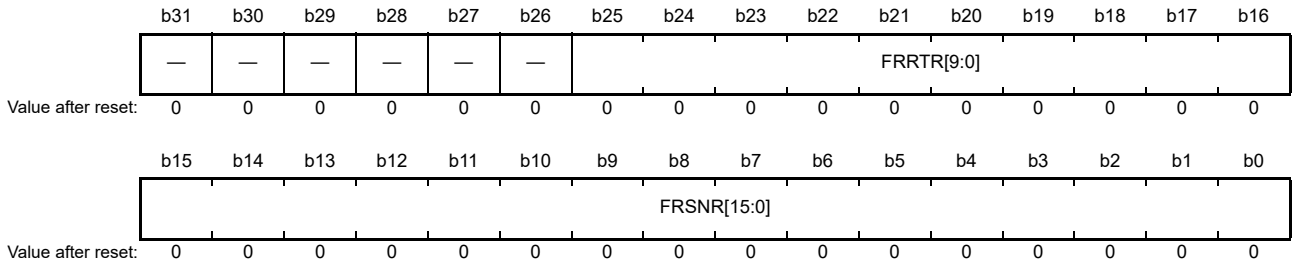
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FSHR[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b14 to b0	FSHR[14:0]	FRER Sequence History Read		R
b15	—	Reserved	This bit is read as 0.	R
b22 to b16	FSRPR[6:0]	FRER Sequence Recovery Pointer Read		R
b31 to b23	—	Reserved	These bits are read as 0.	R

FSHR[14:0] Bits (FRER Sequence History Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.



FSRPR[6:0] Bits (FRER Sequence Recovery Pointer Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

34.2.10.10 FRER Table Read Result Register 2 (FWFTRR2)

Address(es): MFWD.FWFTRR2 874C 603Ch, MFWD_NS.FWFTRR2 074C 603Ch

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	FRSNR[15:0]	FRER Recovery Sequence Number Read		R
b25 to b16	FRRTR[9:0]	FRER Recovery Remaining Ticks Read		R
b31 to b26	—	Reserved	These bits are read as 0.	R

FRSNR[15:0] Bits (FRER Recovery Sequence Number Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

FRRTR[9:0] Bits (FRER Recovery Remaining Ticks Read)

[Update Condition]

- HW: FWFTRR0.FTR clear event.

34.2.10.11 Sequence Number Generation i Configuration Register (FWSEQNGCi) (i = 0 to 31)

Address(es): MFWD.FWSEQNGC0 874C 6100h, MFWD.FWSEQNGC1 874C 6108h, MFWD.FWSEQNGC2 874C 6110h, MFWD.FWSEQNGC3 874C 6118h, MFWD.FWSEQNGC4 874C 6120h, MFWD.FWSEQNGC5 874C 6128h, MFWD.FWSEQNGC6 874C 6130h, MFWD.FWSEQNGC7 874C 6138h, MFWD.FWSEQNGC8 874C 6140h, MFWD.FWSEQNGC9 874C 6148h, MFWD.FWSEQNGC10 874C 6150h, MFWD.FWSEQNGC11 874C 6158h, MFWD.FWSEQNGC12 874C 6160h, MFWD.FWSEQNGC13 874C 6168h, MFWD.FWSEQNGC14 874C 6170h, MFWD.FWSEQNGC15 874C 6178h, MFWD.FWSEQNGC16 874C 6180h, MFWD.FWSEQNGC17 874C 6188h, MFWD.FWSEQNGC18 874C 6190h, MFWD.FWSEQNGC19 874C 6198h, MFWD.FWSEQNGC20 874C 61A0h, MFWD.FWSEQNGC21 874C 61A8h, MFWD.FWSEQNGC22 874C 61B0h, MFWD.FWSEQNGC23 874C 61B8h, MFWD.FWSEQNGC24 874C 61C0h, MFWD.FWSEQNGC25 874C 61C8h, MFWD.FWSEQNGC26 874C 61D0h, MFWD.FWSEQNGC27 874C 61D8h, MFWD.FWSEQNGC28 874C 61E0h, MFWD.FWSEQNGC29 874C 61E8h, MFWD.FWSEQNGC30 874C 61F0h, MFWD.FWSEQNGC31 874C 61F8h,
MFWD_NS.FWSEQNGC0 074C 6100h, MFWD_NS.FWSEQNGC1 074C 6108h, MFWD_NS.FWSEQNGC2 074C 6110h, MFWD_NS.FWSEQNGC3 074C 6118h, MFWD_NS.FWSEQNGC4 074C 6120h, MFWD_NS.FWSEQNGC5 074C 6128h, MFWD_NS.FWSEQNGC6 074C 6130h, MFWD_NS.FWSEQNGC7 074C 6138h, MFWD_NS.FWSEQNGC8 074C 6140h, MFWD_NS.FWSEQNGC9 074C 6148h, MFWD_NS.FWSEQNGC10 074C 6150h, MFWD_NS.FWSEQNGC11 074C 6158h, MFWD_NS.FWSEQNGC12 074C 6160h, MFWD_NS.FWSEQNGC13 074C 6168h, MFWD_NS.FWSEQNGC14 074C 6170h, MFWD_NS.FWSEQNGC15 074C 6178h, MFWD_NS.FWSEQNGC16 074C 6180h, MFWD_NS.FWSEQNGC17 074C 6188h, MFWD_NS.FWSEQNGC18 074C 6190h, MFWD_NS.FWSEQNGC19 074C 6198h, MFWD_NS.FWSEQNGC20 074C 61A0h, MFWD_NS.FWSEQNGC21 074C 61A8h, MFWD_NS.FWSEQNGC22 074C 61B0h, MFWD_NS.FWSEQNGC23 074C 61B8h, MFWD_NS.FWSEQNGC24 074C 61C0h, MFWD_NS.FWSEQNGC25 074C 61C8h, MFWD_NS.FWSEQNGC26 074C 61D0h, MFWD_NS.FWSEQNGC27 074C 61D8h, MFWD_NS.FWSEQNGC28 074C 61E0h, MFWD_NS.FWSEQNGC29 074C 61E8h, MFWD_NS.FWSEQNGC30 074C 61F0h, MFWD_NS.FWSEQNGC31 074C 61F8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEQNGE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	SEQNGRN[7:0]	Sequence Number Generation Routing Number	Specifies the routing number for which sequence number will be generated	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	SEQNGE	Sequence Number Generation Enable	0: Sequence number generation disabled for routing number FWSEQNGCi.SEQNGRN[7:0] 1: Sequence number generation enabled for routing number FWSEQNGCi.SEQNGRN[7:0]	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.10.12 Sequence Number Generation i Monitoring Register (FWSEQNGMi) (i = 0 to 31)

Address(es): MFWD.FWSEQNGM0 874C 6104h, MFWD.FWSEQNGM1 874C 610Ch, MFWD.FWSEQNGM2 874C 6114h, MFWD.FWSEQNGM3 874C 611Ch, MFWD.FWSEQNGM4 874C 6124h, MFWD.FWSEQNGM5 874C 612Ch, MFWD.FWSEQNGM6 874C 6134h, MFWD.FWSEQNGM7 874C 613Ch, MFWD.FWSEQNGM8 874C 6144h, MFWD.FWSEQNGM9 874C 614Ch, MFWD.FWSEQNGM10 874C 6154h, MFWD.FWSEQNGM11 874C 615Ch, MFWD.FWSEQNGM12 874C 6164h, MFWD.FWSEQNGM13 874C 616Ch, MFWD.FWSEQNGM14 874C 6174h, MFWD.FWSEQNGM15 874C 617Ch, MFWD.FWSEQNGM16 874C 6184h, MFWD.FWSEQNGM17 874C 618Ch, MFWD.FWSEQNGM18 874C 6194h, MFWD.FWSEQNGM19 874C 619Ch, MFWD.FWSEQNGM20 874C 61A4h, MFWD.FWSEQNGM21 874C 61ACh, MFWD.FWSEQNGM22 874C 61B4h, MFWD.FWSEQNGM23 874C 61BCh, MFWD.FWSEQNGM24 874C 61C4h, MFWD.FWSEQNGM25 874C 61CCh, MFWD.FWSEQNGM26 874C 61D4h, MFWD.FWSEQNGM27 874C 61DCh, MFWD.FWSEQNGM28 874C 61E4h, MFWD.FWSEQNGM29 874C 61ECh, MFWD.FWSEQNGM30 874C 61F4h, MFWD.FWSEQNGM31 874C 61FCh,
MFWD_NS.FWSEQNGM0 074C 6104h, MFWD_NS.FWSEQNGM1 074C 610Ch, MFWD_NS.FWSEQNGM2 074C 6114h, MFWD_NS.FWSEQNGM3 074C 611Ch, MFWD_NS.FWSEQNGM4 074C 6124h, MFWD_NS.FWSEQNGM5 074C 612Ch, MFWD_NS.FWSEQNGM6 074C 6134h, MFWD_NS.FWSEQNGM7 074C 613Ch, MFWD_NS.FWSEQNGM8 074C 6144h, MFWD_NS.FWSEQNGM9 074C 614Ch, MFWD_NS.FWSEQNGM10 074C 6154h, MFWD_NS.FWSEQNGM11 074C 615Ch, MFWD_NS.FWSEQNGM12 074C 6164h, MFWD_NS.FWSEQNGM13 074C 616Ch, MFWD_NS.FWSEQNGM14 074C 6174h, MFWD_NS.FWSEQNGM15 074C 617Ch, MFWD_NS.FWSEQNGM16 074C 6184h, MFWD_NS.FWSEQNGM17 074C 618Ch, MFWD_NS.FWSEQNGM18 074C 6194h, MFWD_NS.FWSEQNGM19 074C 619Ch, MFWD_NS.FWSEQNGM20 074C 61A4h, MFWD_NS.FWSEQNGM21 074C 61ACh, MFWD_NS.FWSEQNGM22 074C 61B4h, MFWD_NS.FWSEQNGM23 074C 61BCh, MFWD_NS.FWSEQNGM24 074C 61C4h, MFWD_NS.FWSEQNGM25 074C 61CCh, MFWD_NS.FWSEQNGM26 074C 61D4h, MFWD_NS.FWSEQNGM27 074C 61DCh, MFWD_NS.FWSEQNGM28 074C 61E4h, MFWD_NS.FWSEQNGM29 074C 61ECh, MFWD_NS.FWSEQNGM30 074C 61F4h, MFWD_NS.FWSEQNGM31 074C 61FCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SEQN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	SEQN[15:0]	Sequence Number	Displays the next sequence number to be appended to a descriptor for sequence number generation rule i	R
b31 to b16	—	Reserved	These bits are read as 0.	R

SEQN[15:0] Bits (Sequence Number)

[Increment Condition]

- HW: When the FWSEQNGCi.SEQNGE bit is set and a descriptor is forwarded with FDESCR.RV set and FDESCR.RN set to the FWSEQNGCi.SEQNGRN[7:0] bits.

[Clearing Condition]

- SW: Writing 1 to the FWSEQNRC.SEQNRi bit will clear these bits.

34.2.10.13 Sequence Number Reset Configuration Register (FWSEQNRC)

Address(es): MFWD.FWSEQNRC 874C 6200h, MFWD_NS.FWSEQNRC 074C 6200h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

34.2.11 MFWD Counter Registers

34.2.11.1 Port i Cut-Through Forwarded Descriptor Counter Register (FWCTFDCNi) (i = 0, 1)

Address(es): MFWD.FWCTFDCN0 874C 6300h, MFWD.FWCTFDCN1 874C 6320h,
MFWD_NS.FWCTFDCN0 074C 6300h, MFWD_NS.FWCTFDCN1 074C 6320h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CTFDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTFDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

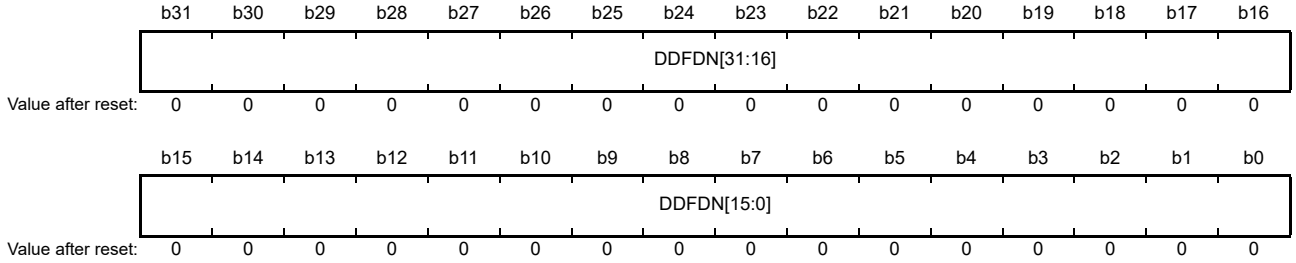
Bit	Symbol	Bit Name	Description	R/W
b31 to b0	CTFDN[31:0]	Cut-Through Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Cut-Through forwarding for port i.	R

CTFDN[31:0] Bits (Cut-Through Forwarded Descriptor Number)

[Clearing Condition]

- HW: SW: Reading these bits clears it.

[Increment Condition]



- HW: Incremented by 1 when a frame coming from port i is forwarded by Cut-Through Forwarding in store and forward mode and if these bits have a value different than FFFF FFFFh.

[Restriction]

- HW: These bits do not take in account the cut-through path of cut-through forwarding but only the store and forward path so, any frame forwarded in store and forward with cut-through (for at least one value of j, if the FWCTTCi0.CTDV[2:0] bits are set, the FWCTTCi0.CTDFMj bit is also set) with be counted here.

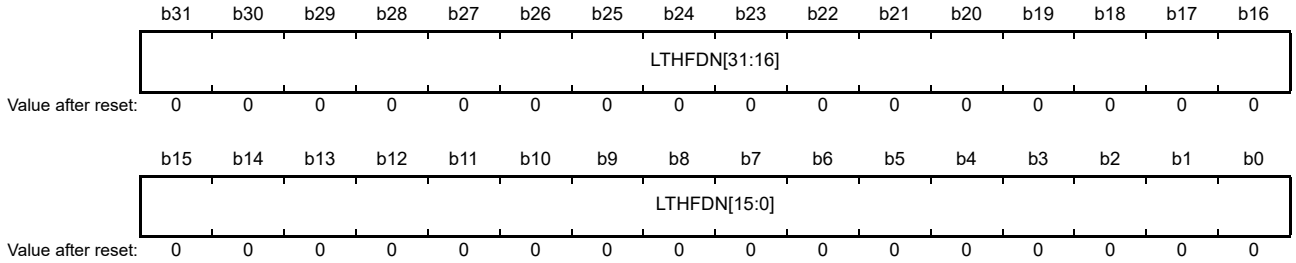
34.2.11.2 Port 2 Direct Descriptor Forwarded Descriptor Counter Register (FWDDFDCN2)

Address(es): MFWD.FWDDFDCN2 874C 6340h, MFWD_NS.FWDDFDCN2 074C 6340h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	DDFDN[31:0]	Direct Descriptor Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Direct Descriptor forwarding for port 2.	R

DDFDN[31:0] Bits (Direct Descriptor Forwarded Descriptor Number)

[Clearing Condition]



- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port 2 is forwarded by Direct Descriptor Forwarding and if these bits have a value different than FFFF FFFFh.

34.2.11.3 Port i Layer 3 Forwarded Descriptor Counter Register (FWLTHFDCNi) (i = 0 to 2)

Address(es): MFWD.FWLTHFDCN0 874C 6304h, MFWD.FWLTHFDCN1 874C 6324h, MFWD.FWLTHFDCN2 874C 6344h, MFWD_NS.FWLTHFDCN0 074C 6304h, MFWD_NS.FWLTHFDCN1 074C 6324h, MFWD_NS.FWLTHFDCN2 074C 6344h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTHFDN[31:0]	Layer 3 Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Layer 3 forwarding for port i.	R

LTHFDN[31:0] Bits (Layer 3 Forwarded Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is forwarded by Layer 3 Forwarding and if these bits have a value different than FFFF FFFFh.

[Restriction]

- HW: These bits count the frame selected by Layer 3 forwarding mechanism before PSFP/ATS and FRER filtering functions. Frame rejected by these filtering functions are still taken in account here.

34.2.11.4 Port i Layer 2 Forwarded Descriptor Counter Register (FWLTWFDCNi) (i = 0 to 2)

Address(es): MFWD.FWLTWFDCN0 874C 630Ch, MFWD.FWLTWFDCN1 874C 632Ch, MFWD.FWLTWFDCN2 874C 634Ch, MFWD_NS.FWLTWFDCN0 074C 630Ch, MFWD_NS.FWLTWFDCN1 074C 632Ch, MFWD_NS.FWLTWFDCN2 074C 634Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LTWFDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTWFDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	LTWFDN[31:0]	Layer 2 Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Layer 2 forwarding for port i.	R

LTWFDN[31:0] Bits (Layer 2 Forwarded Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is forwarded by Layer 2 Forwarding and if these bits have a value different than FFFF FFFFh.

34.2.11.5 Port i Port Based Forwarded Descriptor Counter Register (FWPBFDCNi) (i = 0 to 2)

Address(es): MFWD.FWPBFDCN0 874C 6310h, MFWD.FWPBFDCN1 874C 6330h, MFWD.FWPBFDCN2 874C 6350h, MFWD_NS.FWPBFDCN0 074C 6310h, MFWD_NS.FWPBFDCN1 074C 6330h, MFWD_NS.FWPBFDCN2 074C 6350h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PBFDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PBFDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	PBFDN[31:0]	Port Based Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Port Based forwarding for port i.	R

PBFDN[31:0] Bits (Port Based Forwarded Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is forwarded by Port Based Forwarding and if these bits have a value different than FFFF FFFFh.

34.2.11.6 Port i MAC Hardware Learn Counter Register (FWMHLCNi) (i = 0 to 2)

Address(es): MFWD.FWMHLCN0 874C 6314h, MFWD.FWMHLCN1 874C 6334h, MFWD.FWMHLCN2 874C 6354h, MFWD_NS.FWMHLCN0 074C 6314h, MFWD_NS.FWMHLCN1 074C 6334h, MFWD_NS.FWMHLCN2 074C 6354h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MHLN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MHLN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	MHLN[31:0]	MAC Hardware Learn Number	These bits count the number of MAC source addresses that has been learned or migrated for port i.	R

MHLN[31:0] Bits (MAC Hardware Learn Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame is selected for source MAC address HW learning or HW migrated (refer to section 34.3.1.5 (2) CPU Learning Path) and learning rate is not too high and if these bits have a value different than FFFF FFFFh.
  This counter is incremented regardless of the MAC learn result Table 34.45. (It counts even if it fails)
  This counter is incremented only on learning or migrated HW request. So, the counter increments twice even for consecutive requests with the same content. Since the processing is the same, it looks like one time.

34.2.11.7 Port i Watermark Rejected Descriptor Counter Register (FWWMRDCNi) (i = 0 to 2)

Address(es): MFWD.FWWMRDCN0 874C 6504h, MFWD.FWWMRDCN1 874C 6524h, MFWD.FWWMRDCN2 874C 6544h, MFWD_NS.FWWMRDCN0 074C 6504h, MFWD_NS.FWWMRDCN1 074C 6524h, MFWD_NS.FWWMRDCN2 074C 6544h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WMRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	WMRDN[15:0]	Watermark Rejected Descriptor Number	These bits count the number of descriptors rejected by Watermark for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

WMRDN[15:0] Bits (Watermark Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is rejected by Watermark and if these bits have a value different than FFFFh.

34.2.11.8 Port i Cut-Through Rejected Descriptor Counter Register (FWCTRDCNi) (i = 0, 1)

Address(es): MFWD.FWCTRDCN0 874C 6508h, MFWD.FWCTRDCN1 874C 6528h, MFWD_NS.FWCTRDCN0 074C 6508h, MFWD_NS.FWCTRDCN1 074C 6528h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	CTRDN[15:0]	Cut-Through Rejected Descriptor Number	These bits count the number of descriptors rejected by Cut-through forwarding for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

CTRDN[15:0] Bits (Cut-Through Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is forwarded by Cut-Through Forwarding but not in store and forward mode and if these bits have a value different than FFFF FFFFh.

[Restriction]

- HW: These bits do not take in account the cut-through path of cut-through forwarding but only the store and forward path so, any frame not forwarded in store and forward with cut-through (for any j, if the FWCTTCi0.CTDV[2:0] bits are set, the FWCTTCi0.CTDFMj bit is not set) will be counted here.

34.2.11.9 Port 2 Direct Descriptor Rejected Descriptor Counter Register (FWDDRDCN2)

Address(es): MFWD.FWDDRDCN2 874C 6548h, MFWD_NS.FWDDRDCN2 074C 6548h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DDRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DDRDN[15:0]	Direct Descriptor Rejected Descriptor Number	These bits count the number of descriptors rejected by Direct Descriptor forwarding for port 2.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DDRDN[15:0] Bits (Direct Descriptor Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port 2 is rejected by Direct Descriptor forwarding and if these bits have a value different than FFFFh.

34.2.11.10 Port i Layer 3 Rejected Descriptor Counter Register (FWLTHRDCNi) (i = 0 to 2)

Address(es): MFWD.FWLTHRDCN0 874C 650Ch, MFWD.FWLTHRDCN1 874C 652Ch, MFWD.FWLTHRDCN2 874C 654Ch, MFWD_NS.FWLTHRDCN0 074C 650Ch, MFWD_NS.FWLTHRDCN1 074C 652Ch, MFWD_NS.FWLTHRDCN2 074C 654Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTHRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	LTHRDN[15:0]	Layer 3 Rejected Descriptor Number	These bits count the number of descriptors rejected by Layer 3 forwarding for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

LTHRDN[15:0] Bits (Layer 3 Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is rejected by Layer 3 forwarding and if these bits have a value different than FFFFh.

34.2.11.11 Port i Layer 2 Rejected Descriptor Counter Register (FWLTWRDCNi) (i = 0 to 2)

Address(es): MFWD.FWLTWRDCN0 874C 6514h, MFWD.FWLTWRDCN1 874C 6534h, MFWD.FWLTWRDCN2 874C 6554h, MFWD_NS.FWLTWRDCN0 074C 6514h, MFWD_NS.FWLTWRDCN1 074C 6534h, MFWD_NS.FWLTWRDCN2 074C 6554h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LTWRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	LTWRDN[15:0]	Layer 2 Rejected Descriptor Number	These bits count the number of descriptors rejected by Layer 2 forwarding for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

LTWRDN[15:0] Bits (Layer 2 Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is rejected by Layer 2 forwarding and if these bits have a value different than FFFFh.

34.2.11.12 Port i Port Based Rejected Descriptor Counter Register (FWPBRDCNi) (i = 0 to 2)

Address(es): MFWD.FWPBRDCN0 874C 6518h, MFWD.FWPBRDCN1 874C 6538h, MFWD.FWPBRDCN2 874C 6558h, MFWD_NS.FWPBRDCN0 074C 6518h, MFWD_NS.FWPBRDCN1 074C 6538h, MFWD_NS.FWPBRDCN2 074C 6558h

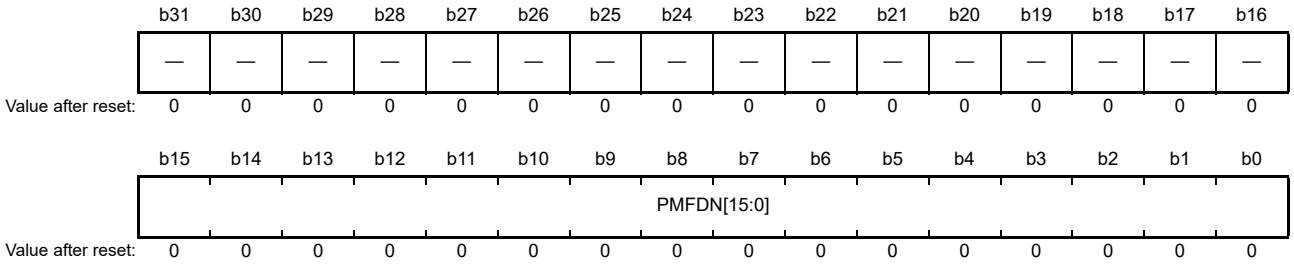
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PBRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PBRDN[15:0]	Port Based Rejected Descriptor Number	These bits count the number of descriptors rejected by Port Based forwarding for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

PBRDN[15:0] Bits (Port Based Rejected Descriptor Number)

[Clearing Condition]



- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is rejected by Port Based forwarding and if these bits have a value different than FFFFh.

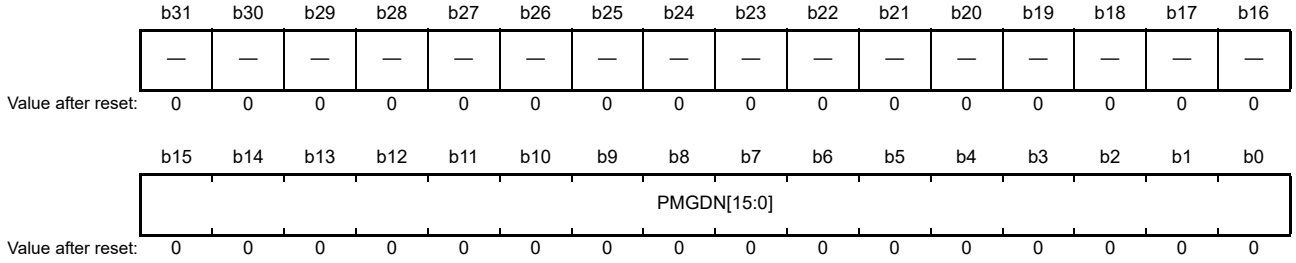
34.2.11.13 PSFP MSDU i Filtered Descriptor Counter Register (FWPMFDCNi) (i = 0 to 15)

Address(es): MFWD.FWPMFDCN0 874C 6700h, MFWD.FWPMFDCN1 874C 6704h, MFWD.FWPMFDCN2 874C 6708h, MFWD.FWPMFDCN3 874C 670Ch, MFWD.FWPMFDCN4 874C 6710h, MFWD.FWPMFDCN5 874C 6714h, MFWD.FWPMFDCN6 874C 6718h, MFWD.FWPMFDCN7 874C 671Ch, MFWD.FWPMFDCN8 874C 6720h, MFWD.FWPMFDCN9 874C 6724h, MFWD.FWPMFDCN10 874C 6728h, MFWD.FWPMFDCN11 874C 672Ch, MFWD.FWPMFDCN12 874C 6730h, MFWD.FWPMFDCN13 874C 6734h, MFWD.FWPMFDCN14 874C 6738h, MFWD.FWPMFDCN15 874C 673Ch,
MFWD_NS.FWPMFDCN0 074C 6700h, MFWD_NS.FWPMFDCN1 074C 6704h, MFWD_NS.FWPMFDCN2 074C 6708h, MFWD_NS.FWPMFDCN3 074C 670Ch, MFWD_NS.FWPMFDCN4 074C 6710h, MFWD_NS.FWPMFDCN5 074C 6714h, MFWD_NS.FWPMFDCN6 074C 6718h, MFWD_NS.FWPMFDCN7 074C 671Ch, MFWD_NS.FWPMFDCN8 074C 6720h, MFWD_NS.FWPMFDCN9 074C 6724h, MFWD_NS.FWPMFDCN10 074C 6728h, MFWD_NS.FWPMFDCN11 074C 672Ch, MFWD_NS.FWPMFDCN12 074C 6730h, MFWD_NS.FWPMFDCN13 074C 6734h, MFWD_NS.FWPMFDCN14 074C 6738h, MFWD_NS.FWPMFDCN15 074C 673Ch

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PMFDN[15:0]	PSFP MSDU Filtered Descriptor Number	These bits count the number of descriptors rejected by PSFP MSDU Filter i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

PMFDN[15:0] Bits (PSFP MSDU Filtered Descriptor Number)

[Clearing Condition]



- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame is rejected by rejected by PSFP MSDU Filter i and if these bits have a value different than FFFFh.

34.2.11.14 PSFP Meter i Green Descriptor Counter Register (FWPMGDCNi) (i = 0 to 31)

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PMGDN[15:0]	PSFP Meter Green Descriptor Number	These bits count the number of descriptors with the color green given by PSFP meter Filter i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

PMGDN[15:0] Bits (PSFP Meter Green Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame has green color associated by PSFP meter Filter i and if these bits have a value different than FFFFh.

34.2.11.15 PSFP Meter i Yellow Descriptor Counter Register (FWPMYDCNi) (i = 0 to 7)

Address(es): MFWD.FWPMYDCN0 874C 6804h, MFWD.FWPMYDCN1 874C 6814h, MFWD.FWPMYDCN2 874C 6824h, MFWD.FWPMYDCN3 874C 6834h, MFWD.FWPMYDCN4 874C 6844h, MFWD.FWPMYDCN5 874C 6854h, MFWD.FWPMYDCN6 874C 6864h, MFWD.FWPMYDCN7 874C 6874h, MFWD_NS.FWPMYDCN0 074C 6804h, MFWD_NS.FWPMYDCN1 074C 6814h, MFWD_NS.FWPMYDCN2 074C 6824h, MFWD_NS.FWPMYDCN3 074C 6834h, MFWD_NS.FWPMYDCN4 074C 6844h, MFWD_NS.FWPMYDCN5 074C 6854h, MFWD_NS.FWPMYDCN6 074C 6864h, MFWD_NS.FWPMYDCN7 074C 6874h

Bit	Symbol	Bit Name	Description	R/W
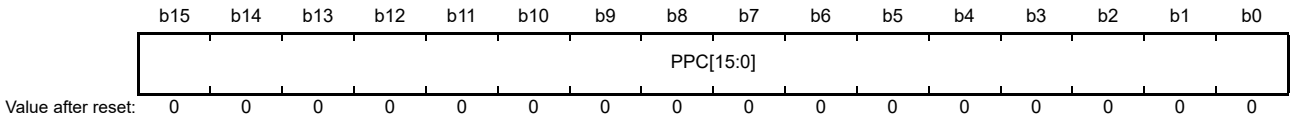
b15 to b0	PMRDN[15:0]	PSFP Meter Red Descriptor Number	These bits count the number of descriptors with the color Red given by PSFP meter Filter i. (All and only frames rejected by meter filter are accounted)	R
b31 to b16	—	Reserved	These bits are read as 0.	R

PMRDN[15:0] Bits (PSFP Meter Red Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.



[Increment Conditions]

- HW: Incremented by 1 when a frame has Red color associated and is rejected by PSFP meter Filter i and if these bits have a value different than FFFFh.
- HW: Incremented by 1 when a frame is rejected by PSFP meter Filter i because ATS RAM corresponding queue is full and if these bits have a value different than FFFFh.
- HW: Incremented by 1 when a frame is rejected by PSFP meter Filter i because corresponding meter is disabled and if these bits have a value different than FFFFh.

34.2.11.17 FRER i Passed Packet Counter Register (FWFRPPCNi) (i = 0 to 127)

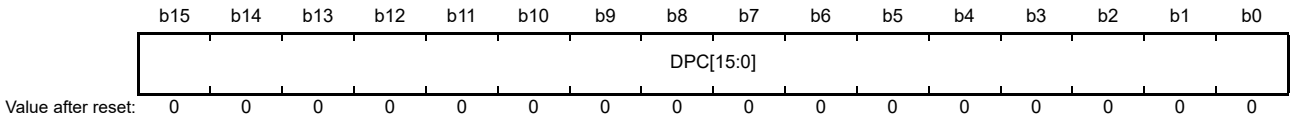
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PPC[15:0]	Passed Packet Count	These bits count the number of packets that passed FRER recovery rule number i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

PPC[15:0] Bits (Passed Packet Count)

[Clearing Condition]

- SW: Reading these bits clears it.



[Increment Conditions]

- HW: Incremented by 1 when a frame passed FRER recovery rule number i and if these bits have a value different than FFFFh.

34.2.11.18 FRER i Discarded Packet Counter Register (FWFRDPCNi) (i = 0 to 127)

Address(es): MFWD.FWFRDPCN0 874C 6A04h, MFWD.FWFRDPCN1 874C 6A0Ch, MFWD.FWFRDPCN2 874C 6A14h, MFWD.FWFRDPCN3 874C 6A1Ch, MFWD.FWFRDPCN4 874C 6A24h, MFWD.FWFRDPCN5 874C 6A2Ch, MFWD.FWFRDPCN6 874C 6A34h, MFWD.FWFRDPCN7 874C 6A3Ch, MFWD.FWFRDPCN8 874C 6A44h, MFWD.FWFRDPCN9 874C 6A4Ch, MFWD.FWFRDPCN10 874C 6A54h, MFWD.FWFRDPCN11 874C 6A5Ch, MFWD.FWFRDPCN12 874C 6A64h, MFWD.FWFRDPCN13 874C 6A6Ch, MFWD.FWFRDPCN14 874C 6A74h, MFWD.FWFRDPCN15 874C 6A7Ch, MFWD.FWFRDPCN16 874C 6A84h, MFWD.FWFRDPCN17 874C 6A8Ch, MFWD.FWFRDPCN18 874C 6A94h, MFWD.FWFRDPCN19 874C 6A9Ch, MFWD.FWFRDPCN20 874C 6AA4h, MFWD.FWFRDPCN21 874C 6AACh, MFWD.FWFRDPCN22 874C 6AB4h, MFWD.FWFRDPCN23 874C 6ABCh, MFWD.FWFRDPCN24 874C 6AC4h, MFWD.FWFRDPCN25 874C 6ACCh, MFWD.FWFRDPCN26 874C 6AD4h, MFWD.FWFRDPCN27 874C 6ADCh, MFWD.FWFRDPCN28 874C 6AE4h, MFWD.FWFRDPCN29 874C 6AECh, MFWD.FWFRDPCN30 874C 6AF4h, MFWD.FWFRDPCN31 874C 6AFCh, MFWD.FWFRDPCN32 874C 6B04h, MFWD.FWFRDPCN33 874C 6B0Ch, MFWD.FWFRDPCN34 874C 6B14h, MFWD.FWFRDPCN35 874C 6B1Ch, MFWD.FWFRDPCN36 874C 6B24h, MFWD.FWFRDPCN37 874C 6B2Ch, MFWD.FWFRDPCN38 874C 6B34h, MFWD.FWFRDPCN39 874C 6B3Ch, MFWD.FWFRDPCN40 874C 6B44h, MFWD.FWFRDPCN41 874C 6B4Ch, MFWD.FWFRDPCN42 874C 6B54h, MFWD.FWFRDPCN43 874C 6B5Ch, MFWD.FWFRDPCN44 874C 6B64h, MFWD.FWFRDPCN45 874C 6B6Ch, MFWD.FWFRDPCN46 874C 6B74h, MFWD.FWFRDPCN47 874C 6B7Ch, MFWD.FWFRDPCN48 874C 6B84h, MFWD.FWFRDPCN49 874C 6B8Ch, MFWD.FWFRDPCN50 874C 6B94h, MFWD.FWFRDPCN51 874C 6B9Ch, MFWD.FWFRDPCN52 874C 6BA4h, MFWD.FWFRDPCN53 874C 6BACh, MFWD.FWFRDPCN54 874C 6BB4h, MFWD.FWFRDPCN55 874C 6BBCh, MFWD.FWFRDPCN56 874C 6BC4h, MFWD.FWFRDPCN57 874C 6BCCh, MFWD.FWFRDPCN58 874C 6BD4h, MFWD.FWFRDPCN59 874C 6BDCh, MFWD.FWFRDPCN60 874C 6BE4h, MFWD.FWFRDPCN61 874C 6BECh, MFWD.FWFRDPCN62 874C 6BF4h, MFWD.FWFRDPCN63 874C 6BFCh, MFWD.FWFRDPCN64 874C 6C04h, MFWD.FWFRDPCN65 874C 6C0Ch, MFWD.FWFRDPCN66 874C 6C14h, MFWD.FWFRDPCN67 874C 6C1Ch, MFWD.FWFRDPCN68 874C 6C24h, MFWD.FWFRDPCN69 874C 6C2Ch, MFWD.FWFRDPCN70 874C 6C34h, MFWD.FWFRDPCN71 874C 6C3Ch, MFWD.FWFRDPCN72 874C 6C44h, MFWD.FWFRDPCN73 874C 6C4Ch, MFWD.FWFRDPCN74 874C 6C54h, MFWD.FWFRDPCN75 874C 6C5Ch, MFWD.FWFRDPCN76 874C 6C64h, MFWD.FWFRDPCN77 874C 6C6Ch, MFWD.FWFRDPCN78 874C 6C74h, MFWD.FWFRDPCN79 874C 6C7Ch, MFWD.FWFRDPCN80 874C 6C84h, MFWD.FWFRDPCN81 874C 6C8Ch, MFWD.FWFRDPCN82 874C 6C94h, MFWD.FWFRDPCN83 874C 6C9Ch, MFWD.FWFRDPCN84 874C 6CA4h, MFWD.FWFRDPCN85 874C 6CACh, MFWD.FWFRDPCN86 874C 6CB4h, MFWD.FWFRDPCN87 874C 6CBCh, MFWD.FWFRDPCN88 874C 6CC4h, MFWD.FWFRDPCN89 874C 6CCCh, MFWD.FWFRDPCN90 874C 6CD4h, MFWD.FWFRDPCN91 874C 6CDCh, MFWD.FWFRDPCN92 874C 6CE4h, MFWD.FWFRDPCN93 874C 6CECh, MFWD.FWFRDPCN94 874C 6CF4h, MFWD.FWFRDPCN95 874C 6CFCh, MFWD.FWFRDPCN96 874C 6D04h, MFWD.FWFRDPCN97 874C 6D0Ch, MFWD.FWFRDPCN98 874C 6D14h, MFWD.FWFRDPCN99 874C 6D1Ch, MFWD.FWFRDPCN100 874C 6D24h, MFWD.FWFRDPCN101 874C 6D2Ch, MFWD.FWFRDPCN102 874C 6D34h, MFWD.FWFRDPCN103 874C 6D3Ch, MFWD.FWFRDPCN104 874C 6D44h, MFWD.FWFRDPCN105 874C 6D4Ch, MFWD.FWFRDPCN106 874C 6D54h, MFWD.FWFRDPCN107 874C 6D5Ch, MFWD.FWFRDPCN108 874C 6D64h, MFWD.FWFRDPCN109 874C 6D6Ch, MFWD.FWFRDPCN110 874C 6D74h, MFWD.FWFRDPCN111 874C 6D7Ch, MFWD.FWFRDPCN112 874C 6D84h, MFWD.FWFRDPCN113 874C 6D8Ch, MFWD.FWFRDPCN114 874C 6D94h, MFWD.FWFRDPCN115 874C 6D9Ch, MFWD.FWFRDPCN116 874C 6DA4h, MFWD.FWFRDPCN117 874C 6DACh, MFWD.FWFRDPCN118 874C 6DB4h, MFWD.FWFRDPCN119 874C 6DBCh, MFWD.FWFRDPCN120 874C 6DC4h, MFWD.FWFRDPCN121 874C 6DCCh, MFWD.FWFRDPCN122 874C 6DD4h, MFWD.FWFRDPCN123 874C 6DDCh, MFWD.FWFRDPCN124 874C 6DE4h, MFWD.FWFRDPCN125 874C 6DECh, MFWD.FWFRDPCN126 874C 6DF4h, MFWD.FWFRDPCN127 874C 6DFCh,

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DPC[15:0]	Discarded Packet Count	These bits count the number of packets that has been discarded by FRER recovery rule number i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DPC[15:0] Bits (Discarded Packet Count)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Conditions]

- HW: Incremented by 1 when a frame has been discarded by FRER recovery rule number i and if these bits have a value different than FFFFh.

34.2.12 MFWD Interrupt Registers

34.2.12.1 Port i Error Interrupt Status Register 0 (FWEIS0i) (i = 0 to 2)

Address(es): MFWD.FWEIS00 874C 7900h, MFWD.FWEIS01 874C 7910h, MFWD.FWEIS02 874C 7920h, MFWD_NS.FWEIS00 074C 7900h, MFWD_NS.FWEIS01 074C 7910h, MFWD_NS.FWEIS02 074C 7920h

b19	SMHMFS	Source MAC Hardware Migration Fail Status Flag	0: No Source MAC Hardware Migration Fail 1: Source MAC Hardware Migration Fail occurred.	R/(W)
b21, b20	—	Reserved	These bits are read as 0. The write value should be 0.	R
b22	WMCFS	Watermark Critical Filtering Status Flag	0: No Watermark Critical Filtering 1: Watermark Critical Filtering occurred.	R/(W)
b23	WMFFS	Watermark Flush Filtering Status Flag	0: No Watermark Flush Filtering 1: Watermark Flush Filtering occurred.	R/(W)
b24	WMISFS	Watermark IPV Secure Filtering Status Flag	0: No Watermark IPV Secure Filtering 1: Watermark IPV Secure Filtering occurred.	R/(W)
b25	WMIUFS	Watermark IPV Unsecure Filtering Status Flag	0: No Watermark IPV Unsecure Filtering 1: Watermark IPV Unsecure Filtering occurred.	R/(W)

Bit	Symbol	Bit Name	Description	R/W
b26	DDES	Direct Descriptor Error Status Flag	0: No Direct Descriptor Error 1: Direct Descriptor Error occurred.	R/(W)
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R
b28	DDSES	Direct Descriptor Security Error Status Flag	0: No Direct Descriptor Security Error 1: Direct Descriptor Security Error occurred.	R/(W)
b29	DDNTFS	Direct Descriptor No Target Filtering Status Flag	0: No Direct Descriptor No Target Filtering 1: Direct Descriptor No Target Filtering occurred.	R/(W)
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

LTHSPFS Flag (Layer 3 Source Port Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “Layer 3 routing secure error” block in Figure 34.41 and L3.SLV[i] is not set.
- HW: When forwarding flow for a frame coming from port i goes until “Layer 3 routing error” block in Figure 34.42 and L3.SLV[i] is not set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTHNTFS Flag (Layer 3 No Target Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “Layer 3 routing secure error” block in Figure 34.41 and L3.DV & ! FWPCi1.LTHFMi is null.
- HW: When forwarding flow for a frame coming from port i goes until “Layer 3 routing error” block in Figure 34.42 and L3.DV & ! FWPCi1.LTHFMi is null.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTHUFS Flag (Layer 3 Unknown Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “Layer 3 routing unknown secure stream error” block in Figure 34.41 and FWPCi0.LTHRUSS is set.
- HW: When forwarding flow for a frame coming from port i goes until “Layer 3 routing error” block in Figure 34.42 and FWPCi0.LTHRUS is set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWDSPFS Flag (Layer 2 Destination Source Port Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, FWPCi0.MACDSA is set, Destination MAC is set in the MAC table, MAC.SL is set and MAC.DSLV is not set for destination MAC.

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, FWPCi0.MACDSA is set, Destination MAC is set in the MAC table and MAC.DSLV is not set for destination MAC.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWSSPFS Flag (Layer 2 Source Source Port Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, FWPCi0.MACSSA is set, Source MAC is set in the MAC table, MAC.SL is set and MAC.SSLV is not set for source MAC.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, FWPCi0.MACSSA is set, Source MAC is set in the MAC table and MAC.SSLV is not set for source MAC.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWVSPFS Flag (Layer 2 VLAN Source Port Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, FWPCi0.VLANSA is set, VLAN ID is valid, VLAN ID is set in the VLAN table, VLAN.SL is set and VLAN.SLV is not set for VLAN ID.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, FWPCi0.VLANSA is set, VLAN ID is valid, VLAN ID is set in the VLAN table and VLAN.SLV is not set for VLAN ID.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWNTFS Flag (Layer 2 No Target Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, FWPCi0.MACDSA is set, Destination MAC is set in the MAC table, MAC.SL is set, FWPCi0.VLANSA is set, VLAN ID is valid, VLAN ID is set in the VLAN table, VLAN.SL is set and MAC.DV & VLAN.DV & ! FWPCi2.LTWFMi is null.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, FWPCi0.MACDSA is set, Destination MAC is set in the MAC table, MAC.SL is set, {FWPCi0.VLANSA is not set or VLAN ID is not valid or VLAN ID is not set in the VLAN table or VLAN.SL is not set} and MAC.DV & !FWPCi2.LTWFMi is null.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, {FWPCi0.MACDSA is not set or Destination MAC is not set in the MAC table or MAC.SL is not set}, VLAN ID is valid, VLAN ID is set in the VLAN table, VLAN.SL is set and VLAN.DV & ! FWPCi2.LTWFMi is null.

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, FWPCi0.MACDSA is set, Destination MAC is set in the MAC table, FWPCi0.VLANSA is set, VLAN ID is valid, VLAN ID is set in the VLAN table and MAC.DV & VLAN.DV & ! FWPCi2.LTWFMi is null.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, FWPCi0.MACDSA is set, Destination MAC is set in the MAC table, { FWPCi0.VLANSA is not set or VLAN ID is not valid or VLAN ID is not set in the VLAN table} and MAC.DV & !FWPCi2.LTWFMi is null.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, {FWPCi0.MACDSA is not set or Destination MAC is not set in the MAC table}, VLAN ID is valid, VLAN ID is set in the VLAN table and VLAN.DV & ! FWPCi2.LTWFMi is null.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWSUFS Flag (Layer 2 Source Unknown Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, {FWPCi0.MACSSA is not set or Source MAC is not set in the MAC table or MAC.SL is not set for Source MAC} and FWPCi0.MACRUSSA is set.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, {FWPCi0.MACSSA is not set or Source MAC is not set in the MAC table} and FWPCi0.MACRUSA is set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWDUFS Flag (Layer 2 Destination Unknown Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, {FWPCi0.MACDSA is not set or Destination MAC is not set in the MAC table or MAC.SL is not set for destination MAC} and FWPCi0.MACRUDSA is set.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, {FWPCi0.MACDSA is not set or Destination MAC is not set in the MAC table} and FWPCi0.MACRUDA is set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

LTWVUFS Flag (Layer 2 VLAN Unknown Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding secure error” block in Figure 34.51 and, {FWPCi0.VLANSA is not set or VLAN is not valid or VLAN ID is not set in the VLAN table or VLAN.SL is not set for VLAN ID} and FWPCi0.VLANRUS is set.
- HW: When forwarding flow for a frame coming from port i goes until “L2 forwarding error” block in Figure 34.52 and, {FWPCi0.VLANSA is not set or VLAN is not valid or VLAN ID is not set in the VLAN table} and FWPCi0.VLANRU is set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

PBNTFS Flag (Port Based No Target Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “Port based forwarding secure error” block in Figure 34.55 and FWPBFCi.PBDV[2:0] is null.
- HW: When forwarding flow for a frame coming from port i goes until “Port based forwarding unsecure error” block in Figure 34.56 and FWPBFCi.PBDV[2:0] is null.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

SMHLFS Flag (Source MAC Hardware Learning Fail Status Flag)

[Setting Condition]

- HW: When a frame is selected for source MAC address HW learning (refer to section 34.3.1.5 (2) CPU Learning Path) and it could not be learned because the learning rate is too high.
  This error has nothing to do with fail of Table 34.45.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

SMHMFS Flag (Source MAC Hardware Migration Fail Status Flag)

[Setting Conditions]

- HW: When a frame is selected for source MAC address HW migration (refer to section 34.3.1.5 (2) CPU Learning Path) and it could not be learned because the learning rate is too high.
- HW: When a frame is selected for source MAC address HW migration and its source MAC address contained in the table is static (MAC.DE is not set).
- HW: When a frame is selected for source MAC address HW migration and its source MAC address contained in the table is secure (MAC.SL is set).
- HW: When a frame is selected for source MAC address HW migration and its source MAC address contained in the table has one of its destination port which does not allow migration (for at least one i, MAC.DV[i] is set and the FWPCi0.MACHMA bit is not set).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMCFS Flag (Watermark Critical Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and the FWLBWMCi.WMCLPRi bit {DEI,IPV} is set and coa_watermark_critical[i] pin is set (where DEI is set to input frame C-TAG DEI if the FWGC.SVM[1:0] bits are set to 01b, input frame S-TAG DEI if the FWGC.SVM[1:0] bits

are set to 10b and set to 0 if the FWGC.SVM[1:0] bits are set to 00b and IPV is the Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.IPV value).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMFFS Flag (Watermark Flush Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and the FWLBWMCi.WMFLPRi bit {DEI,IPV} is set and coa_watermark_flush[i] pin is set (where DEI is set to input frame C-TAG DEI if the FWGC.SVM[1:0] bits are set to 01b, input frame S-TAG DEI if the FWGC.SVM[1:0] bits are set to 10b and set to 0 if the FWGC.SVM[1:0] bits are set to 00b and IPV is the Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.IPV value).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMISFS Flag (Watermark IPV Secure Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and corresponding IPV is rejected by IPV based unsecure watermark [COMA] (where IPV is Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.IPV value before filtering).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMIUFS Flag (Watermark IPV Unsecure Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and SEC is not set and corresponding IPV is rejected by IPV based secure watermark [COMA] (where SEC and IPV are respectively Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.SEC and FDESCR.IPV values before filtering).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

DDES Flag (Direct Descriptor Error Status Flag)

[Setting Condition]

- HW: When a direct descriptor (LDESCR.FMT [GWCA] set to 1) is received from port 2 + i and FWPCi1.DDE is not set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

[Restriction]

- HW: This flag is only valid for i = 2.

DDSES Flag (Direct Descriptor Security Error Status Flag)

[Setting Condition]

- HW: When a secure direct descriptor (LDESCR.FMT [GWCA] and LDESCR.SEC [GWCA] are both set to 1) is received from port 2 + i, FWPCi1.DDE is set and FWPCi1.DDSL is not set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

[Restriction]

- HW: This flag is only valid for i = 2.

DDNTFS Flag (Direct Descriptor No Target Filtering Status Flag)

[Setting Condition]

- HW: HW: When a directed descriptor (LDESCR.FMT [GWCA] set to 1) is received from port 2 + i and LDESCR.DV [GWCA] is set to ALL0.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

[Restriction]

- HW: This flag is only valid for i = 2.

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID0i register.

LTHSPFE Bit (Layer 3 Source Port Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTHSPFD bit will clear this bit.

LTHNTFE Bit (Layer 3 No Target Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTHNTFD bit will clear this bit.

LTHUFE Bit (Layer 3 Unknown Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTHUFD bit will clear this bit.

LTWDSPFE Bit (Layer 2 Destination Source Port Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWDSPFD bit will clear this bit.

LTWSSPFE Bit (Layer 2 Source Source Port Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWSSPFD bit will clear this bit.

LTWVSPFE Bit (Layer 2 VLAN Source Port Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWVSPFD bit will clear this bit.

LTWNTFE Bit (Layer 2 No Target Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWNTFD bit will clear this bit.

LTWSUFE Bit (Layer 2 Source Unknown Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWSUFD bit will clear this bit.

LTWDUFE Bit (Layer 2 Destination Unknown Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWDUFD bit will clear this bit.

LTWVUFE Bit (Layer 2 VLAN Unknown Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.LTWVUFD bit will clear this bit.

PBNTFE Bit (Port Based No Target Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.PBNTFD bit will clear this bit.

SMHLFE Bit (Source MAC Hardware Learning Fail Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.SMHLFD bit will clear this bit.

SMHMFE Bit (Source MAC Hardware Migration Fail Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.SMHMFD bit will clear this bit.

WMCFE Bit (Watermark Critical Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMCFD bit will clear this bit.

WMFFE Bit (Watermark Flush Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMFFD bit will clear this bit.

WMISFE Bit (Watermark IPV Secure Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMISFD bit will clear this bit.

WMIUFE Bit (Watermark IPV Unsecure Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMIUFD bit will clear this bit.

DDEE Bit (Direct Descriptor Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDED bit will clear this bit.

DDFEE Bit (Direct Descriptor Format Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDFED bit will clear this bit.

DDSEE Bit (Direct Descriptor Security Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDSED bit will clear this bit.

DDNTFE Bit (Direct Descriptor No Target Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDNTFD bit will clear this bit.

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R
b1	LTHTSES	L3 Table Security Error Status Flag	0: No L3 Table Security Error 1: L3 Table Security Error occurred.	R/(W)
b4 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b5	MACTSES	MAC Table Security Error Status Flag	0: No MAC Table Security Error 1: MAC Table Security Error occurred.	R/(W)
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R
b7	VLANTSES	VLAN Table Security Error Status Flag	0: No VLAN Table Security Error 1: VLAN Table Security Error occurred.	R/(W)
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

LTHTSES Flag (L3 Table Security Error Status Flag)

[Setting Condition]

- HW: A CPU tried to learn an unsecure entry, but the unsecure entry maximum number is already reached.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Unsecure entry will not be learned
- SW: System dependent, cannot be defined here.

MACTSES Flag (MAC Table Security Error Status Flag)

[Setting Condition]

- HW: A CPU tried to learn an unsecure entry, but the unsecure entry maximum number is already reached.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Unsecure entry will not be learned
- SW: System dependent, cannot be defined here.

VLANTSES Flag (VLAN Table Security Error Status Flag)

[Setting Condition]

- HW: A CPU tried to learn an unsecure entry, but the unsecure entry maximum number is already reached.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Unsecure entry will not be learned
- SW: System dependent, cannot be defined here.

34.2.12.5 Error Interrupt Enable Register 1 (FWEIE1)

Address(es): MFWD.FWEIE1 874C 7A04h, MFWD_NS.FWEIE1 074C 7A04h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	VLANTSEE	—	MACTSEE	—	—	—	LTHTSEE	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R
b1	LTHTSEE	L3 Table Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b4 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b5	MACTSEE	MAC Table Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R
b7	VLANTSEE	VLAN Table Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID1 register.

LTHTSEE Bit (L3 Table Security Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID1.LTHTSED bit will clear this bit.

MACTSEE Bit (MAC Table Security Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID1.MACTSED bit will clear this bit.

VLANTSEE Bit (VLAN Table Security Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID1.VLANTSED bit will clear this bit.

34.2.12.6 Error Interrupt Disable Register 1 (FWEID1)

Address(es): MFWD.FWEID1 874C 7A08h, MFWD_NS.FWEID1 074C 7A08h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b12	PMFS12	PSFP MSDU 12 Filtering Status Flag	0: No PSFP MSDU 12 Filtering 1: PSFP MSDU 12 Filtering occurred.	R/(W)
b13	PMFS13	PSFP MSDU 13 Filtering Status Flag	0: No PSFP MSDU 13 Filtering 1: PSFP MSDU 13 Filtering occurred.	R/(W)
b14	PMFS14	PSFP MSDU 14 Filtering Status Flag	0: No PSFP MSDU 14 Filtering 1: PSFP MSDU 14 Filtering occurred.	R/(W)
b15	PMFS15	PSFP MSDU 15 Filtering Status Flag	0: No PSFP MSDU 15 Filtering 1: PSFP MSDU 15 Filtering occurred.	R/(W)
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

PMFSi Flag (PSFP MSDU i Filtering Status Flag) (i = 0 to 15)

[Setting Condition]

- HW: This flag is set when a descriptor is rejected by MSDU filter number i (refer to section 34.3.3.1 (1) MSDU Filter).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.8 Error Interrupt Enable Register 2 (FWEIE2)

Address(es): MFWD.FWEIE2 874C 7A14h, MFWD_NS.FWEIE2 074C 7A14h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PMFE0	PSFP MSDU 0 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	PMFE1	PSFP MSDU 1 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b2	PMFE2	PSFP MSDU 2 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b3	PMFE3	PSFP MSDU 3 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b4	PMFE4	PSFP MSDU 4 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b5	PMFE5	PSFP MSDU 5 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b6	PMFE6	PSFP MSDU 6 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b7	PMFE7	PSFP MSDU 7 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b8	PMFE8	PSFP MSDU 8 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b9	PMFE9	PSFP MSDU 9 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b10	PMFE10	PSFP MSDU 10 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b11	PMFE11	PSFP MSDU 11 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b12	PMFE12	PSFP MSDU 12 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b13	PMFE13	PSFP MSDU 13 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b14	PMFE14	PSFP MSDU 14 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b15	PMFE15	PSFP MSDU 15 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID2 register.

PMFEi Bit (PSFP MSDU i Filtering Enable) (i = 0 to 15)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to FWEID2.PMFDi bit will clear this bit.

34.2.12.9 Error Interrupt Disable Register 2 (FWEID2)

Address(es): MFWD.FWEID2 874C 7A18h, MFWD_NS.FWEID2 074C 7A18h

PMRFSi Flag (PSFP Meter i Filtering Status Flag) (i = 0 to 31)

[Setting Condition]

- HW: This flag is set when a descriptor is filtered by PSFP Meter filter number i (refer to section 34.3.3.1 (2) Meter Filter/ATS).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.11 Error Interrupt Enable Register 5 (FWEIE5)

b9	PMRFE9	PSFP Meter 9 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b10	PMRFE10	PSFP Meter 10 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b11	PMRFE11	PSFP Meter 11 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b12	PMRFE12	PSFP Meter 12 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b13	PMRFE13	PSFP Meter 13 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b14	PMRFE14	PSFP Meter 14 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b15	PMRFE15	PSFP Meter 15 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b16	PMRFE16	PSFP Meter 16 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b17	PMRFE17	PSFP Meter 17 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b18	PMRFE18	PSFP Meter 18 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b19	PMRFE19	PSFP Meter 19 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Bit	Symbol	Bit Name	Description	R/W
b20	PMRFE20	PSFP Meter 20 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b21	PMRFE21	PSFP Meter 21 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b22	PMRFE22	PSFP Meter 22 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b23	PMRFE23	PSFP Meter 23 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b24	PMRFE24	PSFP Meter 24 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b25	PMRFE25	PSFP Meter 25 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b26	PMRFE26	PSFP Meter 26 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b27	PMRFE27	PSFP Meter 27 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b28	PMRFE28	PSFP Meter 28 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b29	PMRFE29	PSFP Meter 29 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b30	PMRFE30	PSFP Meter 30 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	PMRFE31	PSFP Meter 31 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID5 register.

PMRFEi Bit (PSFP Meter i Filtering Enable) (i = 0 to 31)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID5.PMRFDi bit will clear this bit.

34.2.12.12 Error Interrupt Disable Register 5 (FWEID5)

FFSi Flag (FRER i Filtering Status Flag) (i = 96 to 127)

[Setting Conditions]

- HW: If FRER rule i is used for individual recovery, this flag is set when a descriptor is filtered by FRER rule number i because of no sequence error or struck error (refer to 5. Individual recovery algorithms in section 34.3.3.2 (3) (b)).
- HW: If FRER rule i is used for sequence recovery, this flag is set when a descriptor is filtered by FRER rule number i because of no sequence error (refer to 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.14 Error Interrupt Enable Register 60 (FWEIE60)

FFSi Flag (FRER i Filtering Status Flag) (i = 64 to 95)

[Setting Conditions]

- HW: If FRER rule i is used for individual recovery, this flag is set when a descriptor is filtered by FRER rule number i because of no sequence error or struck error (refer to 5. Individual recovery algorithms in section 34.3.3.2 (3) (b)).
- HW: If FRER rule i is used for sequence recovery, this flag is set when a descriptor is filtered by FRER rule number i because of no sequence error (refer to 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.17 Error Interrupt Enable Register 61 (FWEIE61)

b27	FFE91	FRER 91 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b28	FFE92	FRER 92 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b29	FFE93	FRER 93 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b30	FFE94	FRER 94 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	FFE95	FRER 95 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID61 register.

FFEi Bit (FRER i Filtering Enable) (i = 64 to 95)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID61.FFDi bit will clear this bit.

FFSi Flag (FRER i Filtering Status Flag) (i = 32 to 63)

[Setting Conditions]

- HW: If FRER rule i is used for individual recovery, this flag is set when a descriptor is filtered by FRER rule number i because of no sequence error or struck error (refer to 5. Individual recovery algorithms in section 34.3.3.2 (3) (b)).
- HW: If FRER rule i is used for sequence recovery, this flag is set when a descriptor is filtered by FRER rule number i because of no sequence error (refer to 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.20 Error Interrupt Enable Register 62 (FWEIE62)

b28	FFE60	FRER 60 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b29	FFE61	FRER 61 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b30	FFE62	FRER 62 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	FFE63	FRER 63 Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID62 register.

FFEi Bit (FRER i Filtering Enable) (i = 32 to 63)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID62.FFDi bit will clear this bit.

FOORSi Flag (FRER i Out of Range Status Flag) (i = 96 to 127)

[Setting Conditions]

- HW: If FRER rule i is used with match algorithm, this flag is set when a descriptor an out of range error happens (refer to 5. Individual recovery algorithms and 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).
- HW: If FRER rule i is used with vector algorithm, this flag is set when a descriptor is filtered by FRER rule number i because of an out of range error (refer to 5. Individual recovery algorithms and 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.26 Error Interrupt Enable Register 70 (FWEIE70)

b30	FOORE126	FRER 126 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	FOORE127	FRER 127 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID70 register.

FOOREi Bit (FRER i Out of Range Enable) (i = 96 to 127)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID70.FOORDi bit will clear this bit.

FOORSi Flag (FRER i Out of Range Status Flag) (i = 64 to 95)

[Setting Conditions]

- HW: If FRER rule i is used with match algorithm, this flag is set when a descriptor an out of order error happens (refer to 5. Individual recovery algorithms and 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).
- HW: If FRER rule i is used with vector algorithm, this flag is set when a descriptor is filtered by FRER rule number i because of an out of range error (refer to 5. Individual recovery algorithms and 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

b30	FOORE94	FRER 94 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	FOORE95	FRER 95 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID71 register.

FOOREi Bit (FRER i Out of Range Enable) (i = 64 to 95)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID71.FOORDi bit will clear this bit.

FOORSi Flag (FRER i Out of Range Status Flag) (i = 32 to 63)

[Setting Conditions]

- HW: If FRER rule i is used with match algorithm, this flag is set when a descriptor an out of order error happens (refer to 5. Individual recovery algorithms and 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).
- HW: If FRER rule i is used with vector algorithm, this flag is set when a descriptor is filtered by FRER rule number i because of an out of range error (refer to 5. Individual recovery algorithms and 6. Sequence recovery algorithms in section 34.3.3.2 (3) (b)).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

b31	FOORE63	FRER 63 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID72 register.

FOOREi Bit (FRER i Out of Range Enable) (i = 32 to 63)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID72.FOORDi bit will clear this bit.

b28	FOORE28	FRER 28 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b29	FOORE29	FRER 29 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b30	FOORE30	FRER 30 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	FOORE31	FRER 31 Out of Range Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID73 register.

FOOREi Bit (FRER i Out of Range Enable) (i = 0 to 31)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID73.FOORDi bit will clear this bit.

TOSi Flag (Timeout Status Flag i) (i = 96 to 127)

[Setting Condition]

- HW: When timeout happens for FRER rule i (refer to section 34.3.3.2 (3) (c) Timeout).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

b30	TOE126	Timeout Enable 126	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	TOE127	Timeout Enable 127	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID80 register.

TOEi Bit (Timeout Enable i) (i = 96 to 127)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID80.TODi bit will clear this bit.

TOSi Flag (Timeout Status Flag i) (i = 64 to 95)

[Setting Condition]

- HW: When timeout happens for FRER rule i (refer to section 34.3.3.2 (3) (c) Timeout).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.41 Error Interrupt Enable Register 81 (FWEIE81)

b30	TOE94	Timeout Enable 94	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	TOE95	Timeout Enable 95	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID81 register.

TOEi Bit (Timeout Enable i) (i = 64 to 95)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID81.TODi bit will clear this bit.

b31	TOE63	Timeout Enable 63	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID82 register.

TOEi Bit (Timeout Enable i) (i = 32 to 63)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID82.TODi bit will clear this bit.

34.2.12.45 Error Interrupt Disable Register 82 (FWEID82)

TOSi Flag (Timeout Status Flag i) (i = 0 to 31)

[Setting Condition]

- HW: When timeout happens for FRER rule i (refer to section 34.3.3.2 (3) (c) Timeout).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

34.2.12.47 Error Interrupt Enable Register 83 (FWEIE83)

b29	TOE29	Timeout Enable 29	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b30	TOE30	Timeout Enable 30	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31	TOE31	Timeout Enable 31	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID83 register.

TOEi Bit (Timeout Enable i) (i = 0 to 31)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID83.TODi bit will clear this bit.

Bit	Symbol	Bit Name	Description	R/W
b0	LTHTFS	L3 Table Full Status Flag	0: No L3 Table Full 1: L3 Table Full occurred.	R/(W)
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	MACTFS	MAC Table Full Status Flag	0: No MAC Table Full 1: MAC Table Full occurred.	R/(W)
b3	VLANTFS	VLAN Table Full Status Flag	0: No VLAN Table Full 1: VLAN Table Full occurred.	R/(W)
b16 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17	MACADAS	MAC Address Deleted Aging Status Flag	0: No MAC Address Deleted Aging 1: MAC Address Deleted Aging occurred.	R/(W)
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

LTHTFS Flag (L3 Table Full Status Flag)

[Setting Condition]

- HW: L3 table becomes full

[Clearing Condition]

- Writing 1 to this flag will clear it.

MACTFS Flag (MAC Table Full Status Flag)

[Setting Condition]

- HW: MAC table becomes full

[Clearing Condition]

- Writing 1 to this flag will clear it.

VLANTFS Flag (VLAN Table Full Status Flag)

[Setting Condition]

- HW: VLAN table becomes full

[Clearing Condition]

- Writing 1 to this flag will clear it.

MACADAS Flag (MAC Address Deleted Aging Status Flag)

[Setting Condition]

- HW: A MAC address has been suppressed by aging or dynamic entry delete

[Clearing Condition]

- Writing 1 to this flag will clear it.

	—	—	—	—	—	—	—	—	—	—	—	—	VLANTFE	MACTFE	—	LTHTFE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LTHTFE	L3 Table Full Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	MACTFE	MAC Table Full Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b3	VLANTFE	VLAN Table Full Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b16 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17	MACADAE	MAC Address Deleted Aging Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWMID0 register.

LTHTFE Bit (L3 Table Full Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWMID0.LTHTFD bit will clear this bit.

MACTFE Bit (MAC Table Full Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWMID0.MACTFD bit will clear this bit.

VLANTFE Bit (VLAN Table Full Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWMID0.VLANTFD bit will clear this bit.

MACADAE Bit (MAC Address Deleted Aging Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWMID0.MACADAD bit will clear this bit.

34.2.12.51 Monitoring Interrupt Disable Register 0 (FWMID0)

Address(es): MFWD.FWMID0 874C 7C08h, MFWD_NS.FWMID0 074C 7C08h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LTHTFD	L3 Table Full Disable	0: Has no effects. 1: Sets FWMIE0.LTHTFE bit to 0.	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	MACTFD	MAC Table Full Disable	0: Has no effects. 1: Sets FWMIE0.MACTFE bit to 0.	R/W
b3	VLANTFD	VLAN Table Full Disable	0: Has no effects. 1: Sets FWMIE0.VLANTFE bit to 0.	R/W
b16 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17	MACADAD	MAC Address Deleted Aging Disable	0: Has no effects. 1: Sets FWMIE0.MACADAE bit to 0.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.3 Operations

34.3.1 General Functionalities

General functionalities are separated in several types:

- Descriptors
- ESWM modes.
- ESWM TPIDs.
- ESWM debug functions.
- ESWM watermark.

34.3.1.1 Descriptors

To forward a frame to one or several port, the MFWD emits descriptors through the descriptor bus. All descriptor emitted by the MFWD shall follow the descriptor format described in Table 34.5. In following sections the format when a function emits a descriptor will be explained using the field name. Only fields that are not determined by the input local descriptor or the input frame will be explained.

Table 34.5 Descriptor Field

Field name FDESCR.	Bit width	Field explanation	Values
DV	3	Bit i set to 0: Descriptor not valid for port i Bit i set to 1: Descriptor valid for port i	Depends on descriptor. Will be explained per descriptor in following sections.
SEC	1	0: Descriptor is unsecure 1: Descriptor is secure	Depends on descriptor. Will be explained per descriptor in following sections.
CSD	6	FDESCR.CSD0 defines the CPU Sub destination for GWCA0 (CPU Sub destination is equivalent to AXI descriptor queue number)	Depends on descriptor. Will be explained per descriptor in following sections.
IPV	3	Internal priority value before agent internal priority remapping	Depends on descriptor. Will be explained per descriptor in following sections.
SPN	2	Port number from which the frame came from	Set to the source agent port number given by mfw_spn_fwd pin
TPL	16	Input frame total payload length.	Set to the TPL value given by agent through local descriptors
MINFO	24	Meta-information associated to a frame for CPU forwarding	Depends on descriptor. Will be explained per descriptor in following sections.
RV	1	Routing valid. Informs agents that routing rules should be fetched to MFWD through L23 update bus to update frame information	Depends on descriptor. Will be explained per descriptor in following sections.
RN	8	Routing number. Informs agents that routing number should be used when FDESCR.RV is set	Depends on descriptor. Will be explained per descriptor in following sections.
VCTRL	3	VLAN control information.	Set to the VCTRL value given by agent through local descriptors
RTGI	1	R-TAG in	Set to the RTGI value given by agent through local descriptors
SEQN	16	Frame sequence number	Depends on descriptor. Will be explained per descriptor in following sections.
FI	1	0: Input frame does not contain its FCS 1: Input frame contains its FCS	Set to the FI value given by agent through local descriptors
FW	1	0: If input frame contains its FCS, it was correct when given to the switch 1: If input frame contains its FCS, it was incorrect when given to the switch	Set to the FW value given by agent through local descriptors

34.3.1.2 ESWM Modes

ESWM modes define the general behavior of the ESWM module using FWGC registers.
[Function]

- FWGC register sets the VLAN format that will be used by the MFWD. Depending on this setting all the agents should convert Ethernet frames in the required format (for format conversion refer to section 38, Ethernet CPU Agent (GWCA)).

34.3.1.3 ESWM TPIDs

ESWM TPIDs for C-TAG, S-TAG and R-TAG [801.2Q] [801.2CB] can be set by the user using FWTTC0 and FWTTC1 registers.

[Functions]

- FWTTC0 register sets the S-TAG and C-TAG TPIDs [801.2Q].
- FWTTC1 register sets the R-TAG TPID [801.2CB].
- FWTTC0 and FWTTC1 registers reset values are as per defined in IEEE standards [801.2Q] [801.2CB].

34.3.1.4 ESWM Frame Input Priority

Any incoming frame will have an input priority given by MFWD depending on switch mode FWGC.SVM[1:0], and the incoming priority settings in FWPBFCi register and the frame format. Figure 34.3 describes frame input priority assignment for a frame coming from port i (the ToS DSCP field decoding is fixed in hardware and described in Table 34.6).

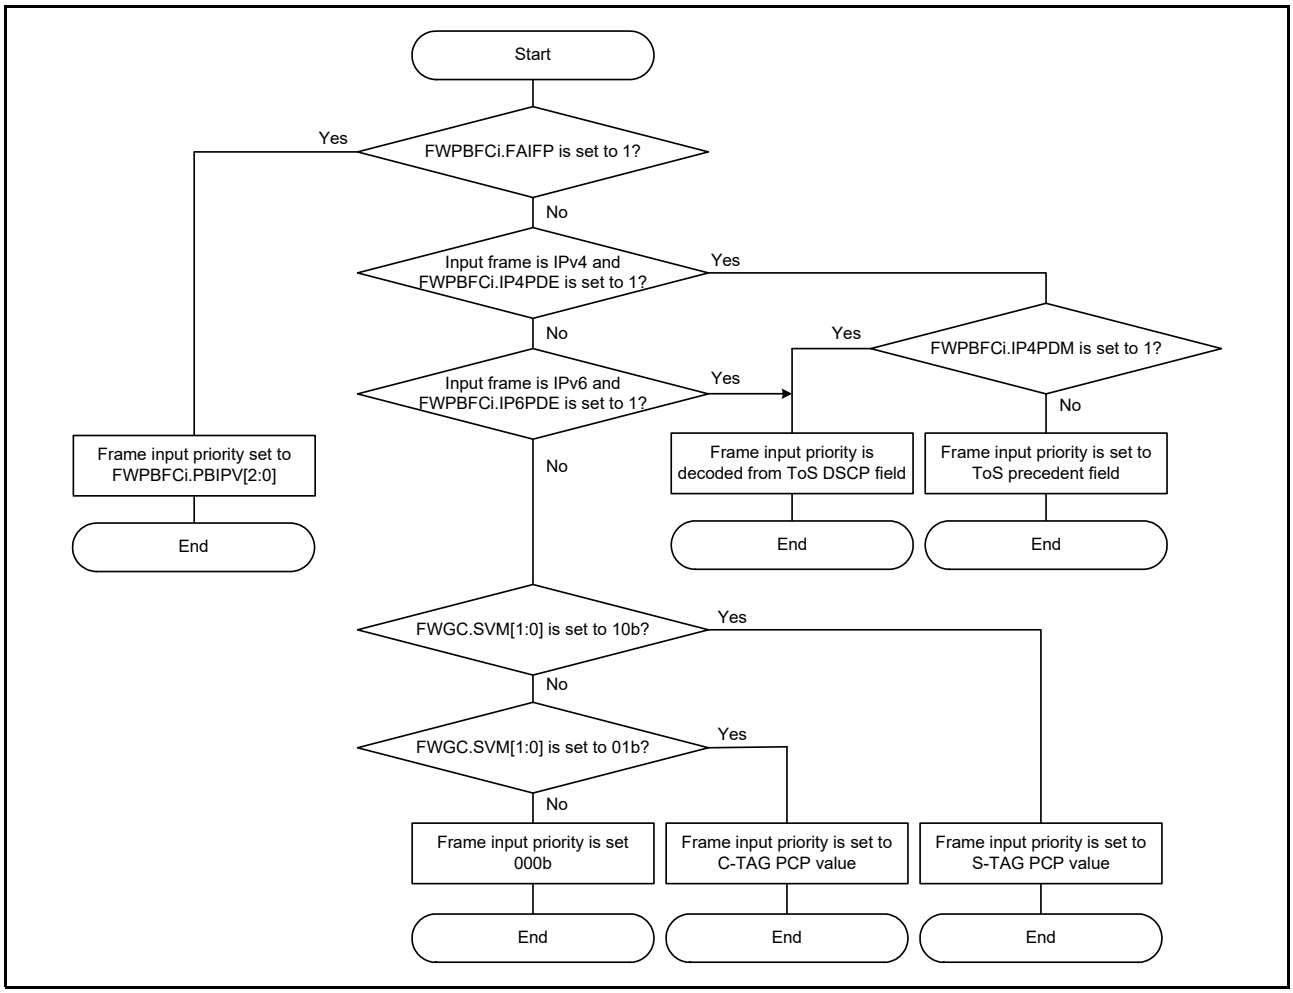

Figure 34.3 Frame Input Priority Assignment for Port i

[Restriction]

- HW: For cut-through forwarding, ToS and DSCP are not considered as frame input priority. Frame input priority is always extracted from S-TAG or set to 0.

Table 34.6 DSCP to Priority Mapping

DSCP values in decimal	Frame input priority
56	7
48	6
40, 46	5
32, 34, 36, 38	4
24, 26, 28, 30	3
16, 18, 20, 22	2
8, 10, 12, 14	1
Others	0

34.3.1.5 ESWM Debug Functions

(1) CPU Exceptional Path

Exceptional path is used to forward faulty frames to CPU for diagnosis using FWCEPTC, FWCEPRC0, FWCEPRC1, and FWCEPRC2 registers. When a frame is selected by exceptional path an exceptional descriptor is emitted.

[Functions]

- FWCEPTC register sets the target to which type of faulty frames will be forwarded.
- FWCEPRC0, FWCEPRC1, and FWCEPRC2 registers set which error frame will be forwarded to the exceptional path.

Note: For exceptional path descriptor formats and associated error details, refer to section 34.3.2.3 (3) Direct Exceptional Descriptor, section 34.3.2.4 (5) (d) Layer 3 Exceptional Descriptor, section 34.3.2.5 (4) (c) Layer 2 Exceptional Descriptor, section 34.3.2.6 (3) Port Based Exceptional Descriptor, and section 34.3.2.4 (5) (e) Filter Exceptional Descriptor.

(2) CPU Learning Path

Learning path is used to forward frames containing an unknown field to CPU for learning using FWCLPTC and FWCLPRC registers for the CPU to learn it. Learning can also be done by hardware using FWPCi0 register and can be monitored using FWEIS0i interrupt register. Table 34.7 sums-up the field that can be learned in software (corresponding frames will be forwarded to learning path) and Table 34.8 sums-up the field that can be learned in hardware. Any frame sent to learning path will be sent using learning descriptor described in section 34.3.1.5 (2) (a) Learning Descriptor.

[Restriction]

- HW: Any frame rejected by Watermark is not analyzed for learning. As a result, learning path is deactivated and hardware learning does not happen.

[Functions]

- FWCLPTC register sets the target to which unknown frames will be forwarded.
- FWCLPRC register sets which field should be unknown for a frame to be forwarded to the learning path.
- FWPCi0 register sets for which fields hardware learning should happen.
- FWEIS0i register notifies that a field could not be learned in hardware.

Table 34.7 Software Learning Summary Table

Field to learn	Learning type	Learning detection conditions for a frame coming from port i	Learning enable bit in FWCLPRC register	Hardware learning possible
Stream ID	Learning	FWPCi0.LTHTA is set At least a stream ID is valid Stream ID is not set in layer 3 table	USIDLF	No
Destination MAC	Learning	FWPCi0.MACDSA is set Destination MAC is not set in MAC table	UDMACLF	No
Source MAC	Learning	FWPCi0.MACSSA is set Source MAC is a unicast address Source MAC is not set in MAC table	USMACLF	Yes Refer to Table 34.8.
Source MAC port	Migration	FWPCi0.MACSSA is set Source MAC is a unicast address Source MAC is set in MAC table MAC.DV[i] is not set	UPSMACLF	Yes Refer to Table 34.8.
VLAN	Learning	FWPCi0.VLANSA is set VLAN is valid VLAN ID is not set in VLAN table	UVLANLF	No

Table 34.8 Hardware Learning Summary Table

Field to learn	Learning type	Hardware learning enable bit in FWPCi0 register for port i	Hardware learning fail interrupt in FWEIS0i register for port i	Hardware learning condition	Hardware learning disable condition (For certain frames HW learning can be disabled)
Source MAC	Learning	MACHLA	SMHLFS	Same as SW learning refer to Table 34.7	FWPCi0.MACDSA is set Destination MAC is set in MAC table MAC.HLD is set Or FWPCi0.VLANSA is set VLAN is valid VLAN ID is set in VLAN table VLAN.HLD is set
Source MAC port	Migration	MACHMA	SMHMFS	Same as SW learning refer to Table 34.7	FWPCi0.MACDSA is set Destination MAC is set in MAC table MAC.HLD is set Or FWPCi0.VLANSA is set VLAN is valid VLAN ID is set in VLAN table VLAN.HLD is set

Note: A multicast MAC address is an address with bit 40 set to 1.

(a) Learning Descriptor

Learning descriptor fields are described in Table 34.9.

Table 34.9 Learning Descriptor Fields

Field name FDESCR.	Values
DV	Learning descriptors are forwarded to GWCA0 (port 2)
SEC	FWCLPTC.LPSL
CSDj	FWCLPTC.LPCSD[5:0]
IPV	FWCLPTC.LPIPV[2:0]
MINFO	Refer to Figure 34.4 and Table 34.10.
RV	0
RN	ALL0
SEQN	Set to corresponding normal descriptor sequence number

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	RSV				FWDC[3:0]			
1	VL	SMPL	SML	DML	RSV			SIDL
2	RSV				SMHMF	SMHLF	SMHM	SMHL

Figure 34.4 Learning Descriptor MINFO Format

Table 34.10 Learning Descriptor MINFO Field Explanation

Field name FDESCR.	Bit width	Field explanation	Values
FWDC	4	ForWarDing Code Present in all descriptors, allows to identify the type of forwarding	Fixed to 13 for Learning descriptors
SIDL	1	Stream ID Learn	Refer to section 34.3.1.5 (2) CPU Learning Path.
DML	1	Destination MAC Learn	Refer to section 34.3.1.5 (2) CPU Learning Path.
SML	1	Source MAC Learn	Refer to section 34.3.1.5 (2) CPU Learning Path.
SMPL	1	Source MAC Port Learn (migration)	Refer to section 34.3.1.5 (2) CPU Learning Path.
VL	1	VLAN Learn	Refer to section 34.3.1.5 (2) CPU Learning Path.
SMHL	1	Source MAC Hardware Learn*1	Refer to section 34.3.1.5 (2) CPU Learning Path.
SMHM	1	Source MAC Hardware Migration*1	Refer to section 34.3.1.5 (2) CPU Learning Path.
SMHLF	1	Source MAC Hardware Learn Fail*1	Refer to section 34.3.1.5 (2) CPU Learning Path.
SMHMF	1	Source MAC Hardware Migration Fail*1	Refer to section 34.3.1.5 (2) CPU Learning Path.

Note 1. “Hardware Learn/Migration” will set regardless of “Hardware Learn/Migration Fail”. (If “Hardware Learn Fail” is set, “Hardware Learn” is always set.)

(3) Mirroring Paths

MFWD contains 3 mirroring paths:

- CPU mirroring path
- Ethernet mirroring path
- Source-destination mirroring path

(a) CPU Mirroring Path

CPU Mirroring path is used to copy frames to a CPU for monitoring purpose using FWCMPTC register. Table 34.11 describes CPU mirroring selection conditions depending on the forwarding mechanism selected by forwarding flow. When a frame is selected for CPU mirroring, a mirroring descriptor is emitted (refer to section 34.3.1.5 (3) (d) Mirroring Descriptor).

[Function]

- FWCMPTC register sets the target to which mirrored frames will be forwarded.

Table 34.11 CPU Mirroring Selection Conditions

Descriptor selected by forwarding flow	Mirroring selection conditions
Cut-through normal descriptor (Figure 34.9)	Cut-through rule corresponding FWCTTCi1.CTCME is set.
Layer 3 normal descriptor (Figure 34.41, Figure 34.42)	L3.CME is set for stream ID

Table 34.11 CPU Mirroring Selection Conditions

Descriptor selected by forwarding flow	Mirroring selection conditions
Layer 2 normal descriptor (Figure 34.51, Figure 34.52)	if {MAC.CME is set for destination MAC or VLAN.CME is set} when MAC destination address and VLAN ID are both found and MAC.SL = VLAN.SL. if MAC.CME is set for destination MAC when MAC destination only is found or if MAC destination address and VLAN ID are both found and MAC.SL & !VLAN.SL. if VLAN.CME is set when VLAN ID only is found or if MAC destination address and VLAN ID are both found and !MAC.SL & VLAN.SL,
Port based normal descriptor (Figure 34.55, Figure 34.56)	If FWPBFCi.PBCME is set for incoming frame source port.

(b) Ethernet Mirroring Path

Ethernet Mirroring path is used to copy frames to an Ethernet agent for monitoring purpose using FWEMPTC register. Table 34.12 describes Ethernet mirroring selection conditions depending on the forwarding mechanism selected by forwarding flow. When a frame is selected for Ethernet mirroring, a mirroring descriptor is emitted (refer to section 34.3.1.5 (3) (d) Mirroring Descriptor).

[Function]

- FWEMPTC register sets the target to which mirrored frames will be forwarded.

Table 34.12 Ethernet Mirroring Selection Conditions

Descriptor selected by forwarding flow	Mirroring selection conditions
Cut-through normal descriptor (Figure 34.9)	Cut-through rule corresponding FWCTTCi1.CTEME is set.
Layer 3 normal descriptor (Figure 34.41, Figure 34.42)	L3.EME is set for stream ID
Layer 2 normal descriptor (Figure 34.51, Figure 34.52)	if {MAC.EME is set for destination MAC or VLAN.EME is set} when MAC destination address and VLAN ID are both found and MAC.SL = VLAN.SL. if MAC.EME is set for destination MAC when MAC destination only is found or if MAC destination address and VLAN ID are both found and MAC.SL & !VLAN.SL. if VLAN.EME is set when VLAN ID only is found or if MAC destination address and VLAN ID are both found and !MAC.SL & VLAN.SL,
Port based normal descriptor (Figure 34.55, Figure 34.56)	If FWPBFCi.PBEME is set for incoming frame source port.

(c) Source-Destination Mirroring Path

Mirroring path is used to copy frames to an Ethernet port or a CPU for monitoring purpose using FWSDMPTC and FWSDMPVC registers. When a frame is selected for Source-destination mirroring, a mirroring descriptor is emitted (refer to section 34.3.1.5 (3) (d) Mirroring Descriptor).

[Functions]

- FWSDMPTC register sets the target to which mirrored frames will be forwarded.
- FWSDMPVC register sets the source from which should come and the destination where should go a frame to be mirrored.
- A frame is selected for source-destination mirroring if the descriptor selected by forwarding flow is {Layer 3 normal descriptor (Figure 34.41, Figure 34.42) or Layer 2 normal descriptor (Figure 34.51, Figure 34.52) or Port based normal descriptor (Figure 34.55, Figure 34.56)}, if the frame source port is set in FWSDMPVC.SDMSV[2:0] bits and if FDESCR.DV & FWSDMPVC.SDMDV[2:0] is not 000b.

(d) Mirroring Descriptor

Mirroring descriptor fields are described in Table 34.13.

Table 34.13 Mirroring Descriptor Fields

Field name FDESCR.	Values for CPU mirroring	Values for Ethernet mirroring	Values for Source-destination mirroring
DV	Mirroring descriptors are forwarded to GWCA number FWCMPTC.CMPCS (port number 2 + FWCMPTC.CMPCS)	Mirroring descriptors are forwarded to ETHA number FWEMPTC.EMPPS (port number FWEMPTC.EMPPS)	Mirroring descriptors are forwarded to port number FWSDMPTC.SDMPPS[1:0]
SEC	FWCMPTC.CMPSL	FWEMPTC.EMPSL	FWSDMPTC.SDMPSL
CSDj	FWCMPTC.CMPCSD[5:0]	ALL0	ALL0
IPV	If FWCMPTC.CMPIPU is set, FWCMPTC.CMPIPV[2:0] If FWCMPTC.CMPIPU is not set, same IPV as normal descriptor	If FWEMPTC.EMPIPU is set, FWEMPTC.EMPIPV[2:0] If FWEMPTC.EMPIPU is not set, same IPV as normal descriptor	If FWSDMPTC.SDMPIPU is set, FWSDMPTC.SDMPIPV[2:0] If FWSDMPTC.SDMPIPU is not set, same IPV as normal descriptor
MINFO	Refer to Figure 34.5 and Table 34.14.	Refer to Figure 34.5 and Table 34.14.	Refer to Figure 34.5 and Table 34.14.
RV	0	0	0

Field name FDESCR.	Bit width	Field explanation	Values
FWDC	4	ForWarDing Code Present in all descriptors, allows to identify the type of forwarding	Fixed to 14 for Mirroring descriptors
NDFB	8	Normal Descriptor First Byte	Set to mirrored frame corresponding normal descriptor FDESCR.MINFO[7:0] value

34.3.1.6 Watermark

ESWM watermark defines the switch behavior in case of overflow using FWLBWMCi and FWCEPRC2 registers and can be monitored using FWEIS0i register.

[Functions]

- FWLBWMCi is used to set which frame should be discarded by level-based watermark [COMA].
- FWCEPRC2 register enables exceptional path for error descriptors.
- FWEIS0i register notifies that a frame coming from port i has been rejected because of watermark.
- Watermark uses as frame priority the IPV value given by forwarding mechanism before filtering. This correspond to the FDESCR.IPV in the normal descriptor emitted by the selected forwarding.
- Watermark uses as DEI value the value extracted from the input frame which is the S-TAG DEI value when FWGC.SVM[1:0] is set to 10b, the C-TAG DEI value when FWGC.SVM[1:0] is set to 01b, and 0 when FWGC.SVM[1:0] is set to 00b.

[Caution]

- SW: The watermark is an indispensable functionality for switch QoS behavior definition, it is not advised to disable it.

Note: Error frames are not going through watermark.

(1) Watermark Errors

Table 34.15 describes the Watermark errors. Instead of being discarded by MFWD, an error frame can be forwarded to exceptional path using Watermark exceptional descriptor described in section 34.3.1.6 (2) Watermark Exceptional Descriptor by setting corresponding error exceptional bit. For error set conditions, refer to corresponding error interrupt register explanations.

Table 34.15 Watermark Errors

Error	Error name	Error interrupt	Error exceptional bit
WMCF	WaterMark Critical Filtering	FWEIS0i.WMCFS	FWCEPRC2.FWMFEF
WMFF	WaterMark Flush Filtering	FWEIS0i.WMFFS	FWCEPRC2.FWMFEF
WMISF	WaterMark IPV Secure Filtering	FWEIS0i.WMISFS	FWCEPRC2.FWMFEF
WMIUF	WaterMark IPV Unsecure Filtering	FWEIS0i.WMIUFS	FWCEPRC2.FWMFEF

(2) Watermark Exceptional Descriptor

Watermark exceptional descriptor fields are described in Table 34.16.

Table 34.16 Watermark Exceptional Descriptor Fields

Field name FDESCR.	Values
DV	Exceptional descriptors are forwarded to GWCA number FWCEPTC.EPCS (port number 2 + FWCEPTC.EPCS)
SEC	FWCEPTC.EPSL
CSDj	FWCEPTC.EPCSD[5:0]
IPV	FWCEPTC.EPIPV[2:0]
MINFO	Refer to Figure 34.6 and Table 34.17.

Field name FDESCR.	Bit width	Field explanation	Values
FWDC	4	ForWarDing Code Present in all descriptors, allows to identify the type of forwarding	Fixed to 4 for Watermark exceptional descriptors
WMCF	1	WaterMark Critical Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.
WMFF	1	WaterMark Flush Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.
WMISF	1	WaterMark IPV Secure Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.
WMIUF	1	WaterMark IPV Unsecure Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.

34.3.2 Forwarding/Routing

MFWD contains different types of forwarding which are:

- Cut-through forwarding
- Direct descriptor forwarding
- L3 forwarding/routing
- L2 forwarding
- Port based forwarding

34.3.2.1 Cut-Through Forwarding

Cut-through forwarding is used to forward high priority frames without storing them in the local memory to suppress the frame reception time impact on the latency. Under the condition of ESWM insure a best latency (no busy traffic on MFWD and no TAG frame) of
0.7 µs* + “PHY clock 4 cycle” (ns), 4.6 µs* + “PHY clock 4 cycle” (ns) and 46 µs* + “PHY clock 4 cycle” (ns) at respectively 1 Gbps, 100 Mbps and 10 Mbps [ETHA].
Depending on the setting conditions, the value may be smaller than these.
Generally, “Cut-through” only checks 6 bytes (Destination MAC Address) of a frame head and starts frame forwarding after this check immediately. Since internal data bus width in this switch is wider than 6 bytes, it needs more data bytes to start frame forwarding. Because of this logic, “Cut-through” forwarding time of this switch needs above times.
The Cut-through forwarding block diagram is represented in Figure 34.7.

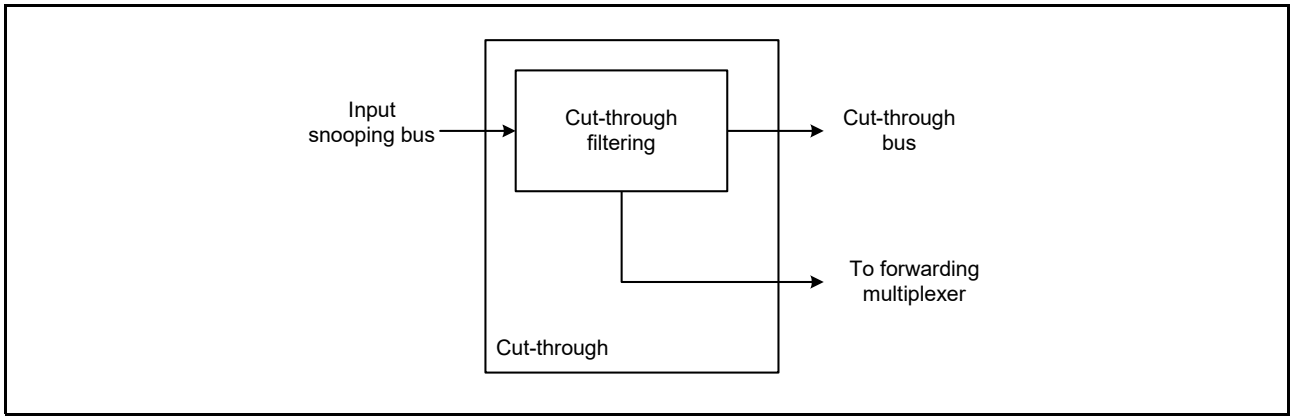

Figure 34.7 Cut-Through Forwarding Block Diagram

The Cut-through forwarding function has one functional block:

- Cut-through filtering: This function filters incoming frame first beat of data to select set frames for cut-through forwarding, creates the cut-through bus protocol destinated to time agents [ETHA] and send required information to forwarding multiplexer to apply store and forward to cut-through frames.

Note: Forwarding multiplexer contains the forwarding flow. The forwarding flow is explained per forwarding type. For Cut-through, related Forwarding flow is described in Figure 34.9

[Restrictions]

- HW: The usage “From-one-to-one between same PHY speed” is recommended. So in case of MFWD back pressure, it can happen that cut-through frames are cut in the middle and lost.
- HW: P-frames cannot be forwarded by cut-through.
- HW: Cut-through forwarding should not be set for ingress ports in Port-based VLAN mode because cut-through can only forward frame as they were received. ([ETHA] EAVCC.VIM set to 0)

- HW: Watermark is not applied on Cut-through frames.
- HW: Cut-through frames can be ingress tagging by FWCTGCi0.CTVCTRL[1:0] but not egress tagging.
- HW: L23 update is not applied on Cut-through frames.
- HW: Data padding applied on Cut-through frames.
- HW: Cut-through frames can be shaped using TAS but not CBS.
- HW: Cut-through frames will be forward in cut-through mode as there are received and will not be updated.
- HW: For cut-through, only mirroring set in FWCTTCi1 and FWCTTCi20 registers is available. All other debugging and mirroring are disabled.
- HW: Cut-through frames will not be filtered by [RMAC] MAC Address filtering on Reception. Because [ETHA] and [GWCA] reception filter information are ignored.
  For example, a frame which is having a nibble alignment error ([ETHA] reception filter information) is ignored by cut through forwarding. And a frame is transmitted out by padding bits of data to complete a byte.

(1) Cut-Through Filtering

Cut-through filtering is used to identify cut-through frames using FWCTGCi0, FWCTGCi1, FWCTSCi0, FWCTSCi1, FWCTSCi2, FWCTSCi3, and FWCTSCi4 registers. Cut-through filtering and register utilization are summarized in Figure 34.8.

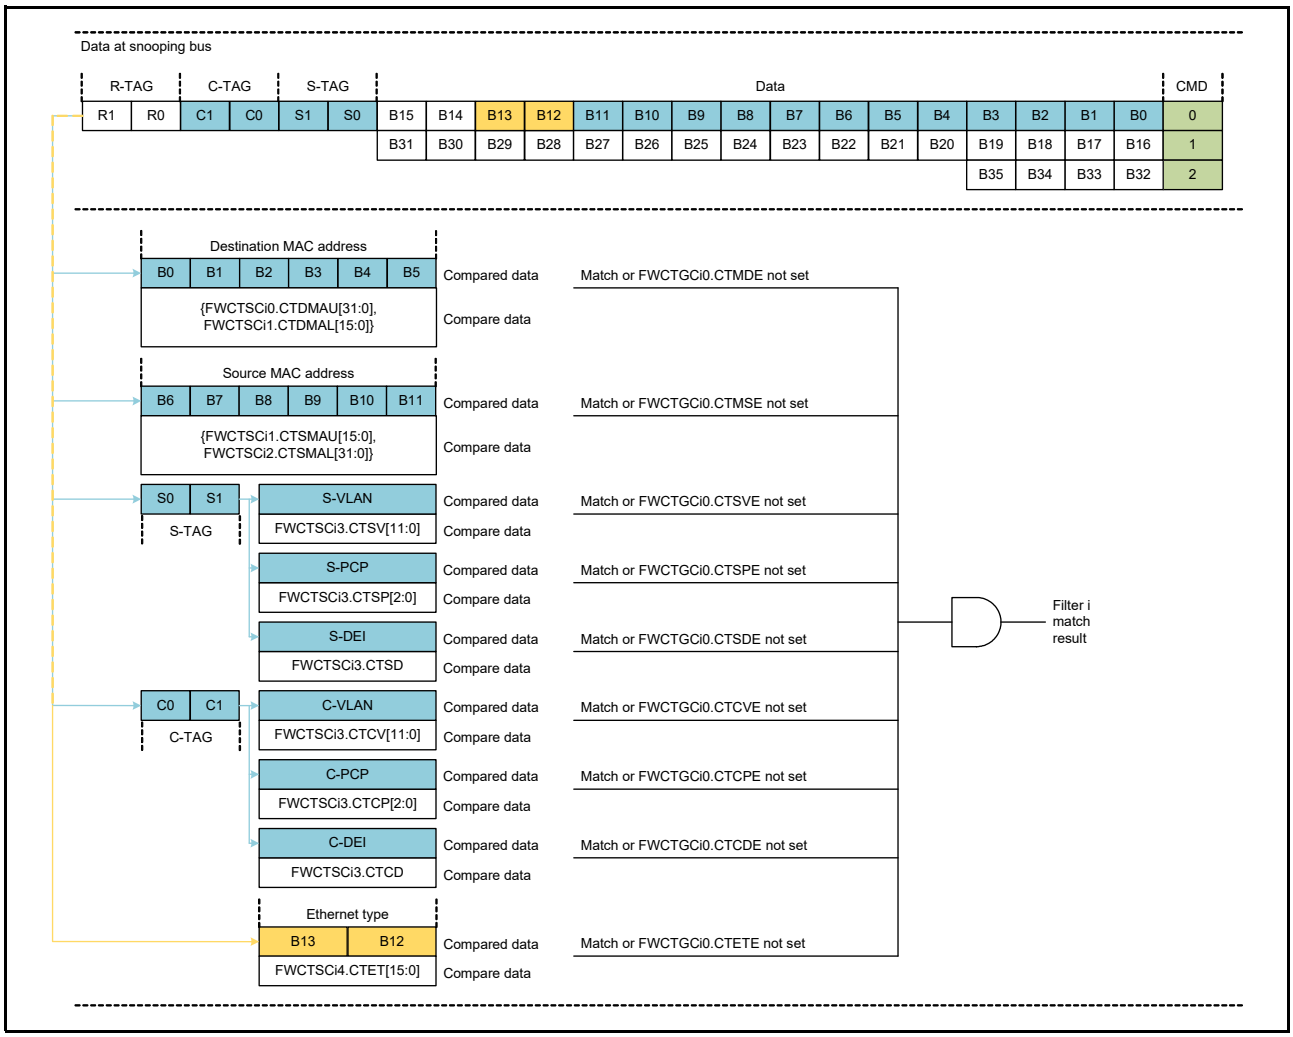

Figure 34.8 Cut-Through Filtering

[Functions]

- A cut-through rule can only match frames from corresponding source port FWCTSCi4.CTSPN.
- If several Cut-through rules match the same frame, the Cut-through rules with the highest number will be selected.
- A cut-through rule is only valid when corresponding FWCTTCi0.CTDV[2:0] is different than ALL0.
- A cut-through matching frames is forwarded by cut-through and store and forward independently from any error that could have happened in the ingress agent.
- For register FWCTGCi0.CTETE, CTSDE, CTSPE, CTSVE, CTCDE, CTCPE, CTCVE, CTMSE, and CTMDE set to 0 (all fields compare match is disabled), Cut through becomes “port based cut through” by FWCTTCi0.CTDV[2:0].

(2) Cut-Through Forwarding

Cut-through forwarding function creates the cut-through bus protocol destined to time agents [ETHA] using FWCTTCi0, FWCTGCi0, and FWCTGCi1 registers. It is used to send frames while receiving them to reduce latency through cut-through bus.

[Functions]

- FWCTTCi0 register is to determine the target port for cut-through. All ports set in FWCTTCi0.CTDV[1] or FWCTTCi0.CTDV[0] and not set in FWCTTCi0.CTDFM0 are targeted for rule i cut-through forwarding. Any frame received from an agent with an error will still be forwarded/mirrored by cut-through forwarding.
- FWCTGCi1.CTMT[25:0], FWCTGCi0.CTVCTRL[1:0], and FWCTGCi0.CTFI bits are respectively used as Maximum Time on the PHY, VLAN control and FCS in for the matching cut-through frame.

[Restrictions]

- HW: Ethernet timestamping functionalities are not available during cut-through forwarding [ETHA]. E.g. while forwarding frames to RMAC [RMAC], the Ethernet agent will fix “Timestamp capture” TX interface bit to 0.
- HW: For cut-through forwarding, all (From & To) PHY speeds have to be the same [ETHA] [RMAC].
- SW: FWCTGCi0.CTRTGI and FWCTGCi0.CTVCTRL[1:0] should always correspond to the ingress frame format. If then do no correspond, errors can happen.

(3) Store and Forward Forwarding

Store and forward forwarding function apply store and forward to cut-through frames using FWCTTCi0, FWCTTCi1, and FWCTTCi20. Cut-through forwarding flow for Store and forward forwarding is described in Figure 34.9.

Functions:
FWCTTCi0 register is to determine the target port for store and forward. All ports set in FWCTTCi0.CTDV[1] or FWCTTCi0.CTDV[0] and set in FWCTTCi0.CTDFM0 are targeted for rule i store and forward forwarding, so are ports set in FWCTTCi0.CTDV[2]. Any frame received from an agent with an error will still be forwarded/mirrored in store and forward mode.
FWCTTCi1 and FWCTTCi20 registers sets the forwarding information.

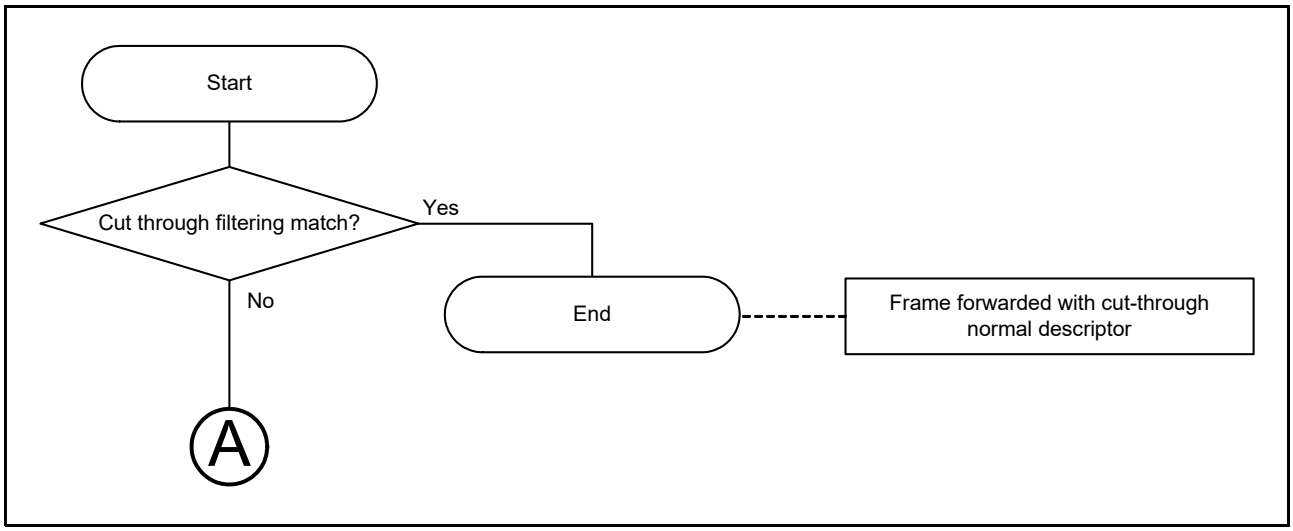

Figure 34.9 Cut-Through Forwarding Flow

Note: Link A links to Figure 34.12.

(a) Cut-Through Normal Descriptor

Cut-through normal descriptor fields for a frame matching cut-through rule number i are described in Table 34.18.

Table 34.18 Cut-Through Normal Descriptor Fields

Field name FDESCR.	Values
DV	{FWCTTCi0.CTDV[2], {FWCTTCi0.CTDV[1] & FWCTTCi0.CTDFM0}}
SEC	1
CSDj	FWCTTCi20.CTCSD[5:0]
IPV	If FWCTTCi1.CTIPU is set, set to FWCTTCi1.CTIPV[2:0] If FWCTTCi1.CTIPU not set and FWGC.SVM[1:0] is set to 10b, set to frame input S-TAG PCP If FWCTTCi1.CTIPU not set and FWGC.SVM[1:0] is set to 01b, set to frame input C-TAG PCP If FWCTTCi1.CTIPU not set and FWGC.SVM[1:0] is set to 00b, set to frame input 0

RSV	—	Reserved field	Set to 0

34.3.2.2 Integrity Check

Integrity check is used to check if a frame can be forwarded or if it contains an error. The Integrity check block diagram is represented in Figure 34.11. Integrity check flow is described in Figure 34.12.

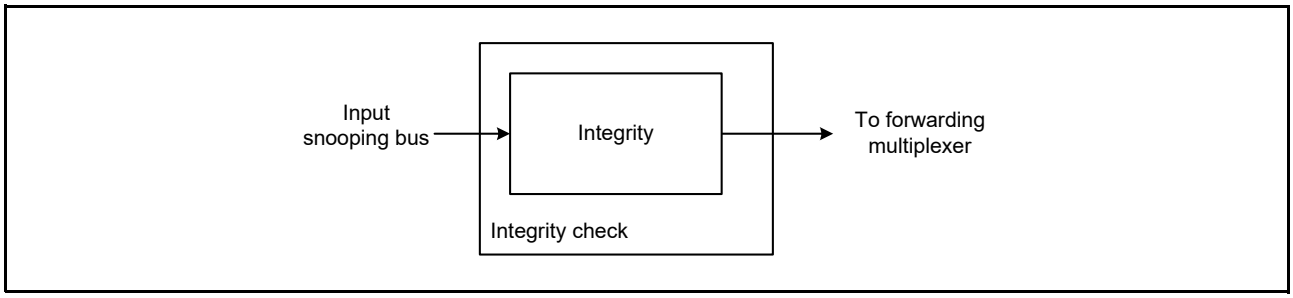

Figure 34.11 Integrity Check Block Diagram

The Integrity check function has one functional block:

- Integrity: The ether type 8100h, 88A8h and F1C1h are ignored and the next ether type field are extracted. However, invalid frames (exp CC-TAG) are judged to have no header, and the first ether type field is the extract.
- Integrity: This functions check if an error has been received from the input agent or if incoming frames do not respect the required format.
- Integrity check for both IPv4 filtering and IPv6 filtering will happen based on ether type field. i.e Ether type is only used for parsing frame type in MFWD integrity check and is irrespective of header length or TPL size of the required frame type.

Note: Forwarding multiplexer contains the forwarding flow. The forwarding flow is explained per forwarding type. For integrity check, related Forwarding flow is described in Figure 34.12.

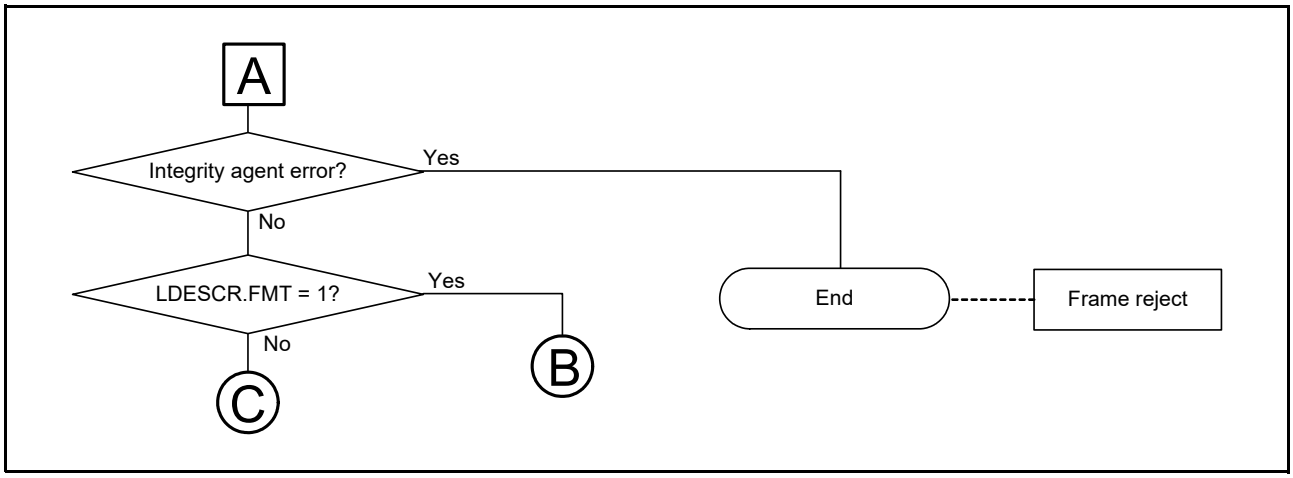

Figure 34.12 Integrity Check Flow

Note: Integrity check errors are described in section 34.3.2.2 (1) Integrity Check Errors.
Note: Link A is linked from Figure 34.9.
Note: Link B links to Figure 34.14.
Note: Link C links to Figure 34.41.

(1) Integrity Check Errors

Table 34.20 describes the Integrity check errors. Instead of being discarded by MFWD, an error frame can be forwarded to exceptional path using Integrity exceptional descriptor described in section 34.3.2.2 (2) Integrity Exceptional Descriptor by setting its corresponding error exceptional bit.

Table 34.20 Integrity Check Errors

Error	Error name	Error interrupt/Explanation	Error exceptional bit
Integrity agent errors			
GTFE	GWCA TAG filtering error	Happens when a frame is received from a GWCA and LDESCR.SAEF[0] is set [GWCA]	FWCEPRC0.GTFEF
GAXE	GWCA AXI Error	Happens when a frame is received from a GWCA and LDESCR.SAEF[3] is set [GWCA]	FWCEPRC0.GAXEEF
GSEGE	GWCA Sequence Error	Happens when a frame is received from a GWCA and LDESCR.SAEF[4] is set [GWCA]	FWCEPRC0.GSEQEEF
GDNE	GWCA Descriptor Number Error	Happens when a frame is received from a GWCA and LDESCR.SAEF[6] is set [GWCA]	FWCEPRC0.GDNEEF
ETFE	Ethernet TAG filtering Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF[0] is set [ETHA]	FWCEPRC0.ETFEF
EPHYE	Ethernet TAG PHY Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 1 [ETHA]	FWCEPRC0.EPHYEEF
ENIBE	Ethernet Nibble Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 3 [ETHA]	FWCEPRC0.ENIBEEF
EFCSE	Ethernet FCS Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 4 [ETHA]	FWCEPRC0.EFCSEEF
EFFME	Ethernet Final Fragment Missing Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 5 [ETHA]	FWCEPRC0.EFFMEEF
ECFSE	Ethernet C-Fragment SMD Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 6 [ETHA]	FWCEPRC0.ECFSEEF
ECFFCE	Ethernet C-Fragment FRAG_COUNT Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 7 [ETHA]	FWCEPRC0.ECFFCEEF
ERFF	Ethernet RMAC Frame Filtered	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 8 [ETHA]	FWCEPRC0.ERFFEF
ERPOO	Ethernet Reception Partially Out of Operation	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC0 is set to 9 [ETHA]	FWCEPRC0.ERPOOEF
EBOE	Ethernet Buffer Overflow Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC1 is set to 1 [ETHA]	FWCEPRC0.EBOEEF
EUE	Ethernet Undersize Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC1 is set to 2 [ETHA]	FWCEPRC0.EUEEF
EOE	Ethernet Oversize Error	Happens when a frame is received from an Ethernet agent and LDESCR.SAEF.EC1 is set to 3 [ETHA]	FWCEPRC0.EOEEF

(2) Integrity Exceptional Descriptor

Integrity exceptional descriptor fields are described in Table 34.21.

Table 34.21 Integrity Exceptional Descriptor Fields

Field name FDESCR.	Values

34.3.2.3 Direct Descriptor Forwarding

Direct descriptor forwarding is used to forward local direct descriptors (LDESCR.FMT [GWCA] set to 1) received from a slow interface [GWCA] using FWPCi1 and FWCEPRC0 registers and can be monitored using FWEIS0i register. Direct descriptor forwarding flow is described in Figure 34.14.

[Functions]

- FWPCi1.DDE bit is used to enable direct descriptor reception from port i.
- FWPCi1.DDSL bit is used to enable secure direct descriptor reception from port i when direct descriptor reception from port i is enabled.
- FWCEPRC0 register enables exceptional path for error descriptors.
- FWEIS0i register notifies that a direct descriptor has been rejected.

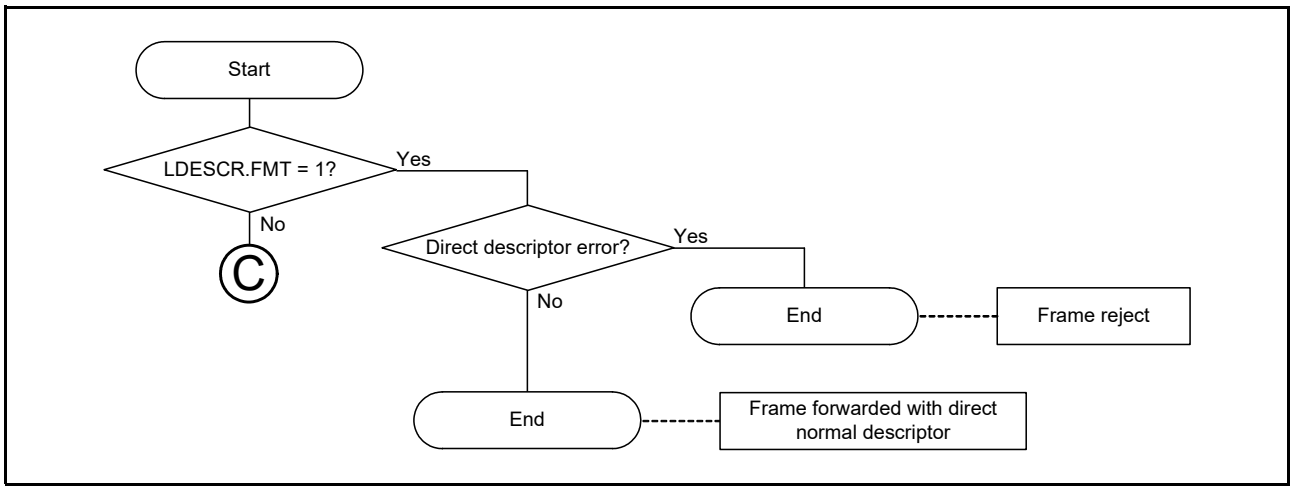

Figure 34.14 Direct Descriptor Forwarding Flow

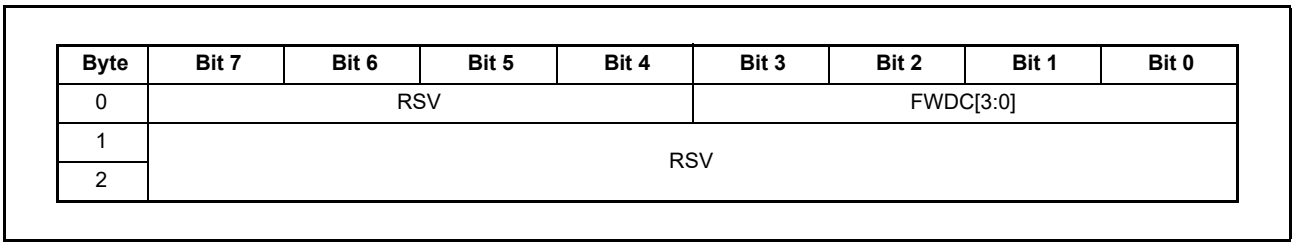
Note: Direct descriptor errors are described in section 34.3.2.3 (1) Direct Descriptor Forwarding Errors.
Note: Direct normal descriptor format is described in section 34.3.2.3 (2) Direct Normal Descriptor.
Note: Link C links to Figure 34.41.

(1) Direct Descriptor Forwarding Errors

Table 34.23 describes the Direct descriptor forwarding errors. Instead of being discarded by MFWD, an error frame can be forwarded to exceptional path using Direct exceptional descriptor described in section 34.3.2.3 (3) Direct Exceptional Descriptor by setting corresponding error exceptional bit. For error set conditions, refer to corresponding error interrupt register explanations.

Table 34.23 Direct Descriptor Errors



Error	Error name	Error interrupt	Error exceptional bit
DDE	Direct Descriptor Error	FWEIS0i.DDES	FWCEPRC0.DDEEF
DDSF	Direct Descriptor Security Filtering	FWEIS0i.DDSES	FWCEPRC0.DDFSFEF
NTF	No Target Filtering	FWEIS0i.DDNTFS	FWCEPRC2.DDNTFEF

(2) Direct Normal Descriptor

Direct normal descriptor fields are described in Table 34.24. For LDESCR explanation, refer to section 38, Ethernet CPU Agent (GWCA).

34.3.2.4 Layer 3 Forwarding/Routing/Filtering

The Layer 3 forwarding/routing/filtering block diagram is represented in Figure 34.17. This block is denominated by "L3", but it contains all the stream-based functions of the MFWD, even the Layer 2 streams.

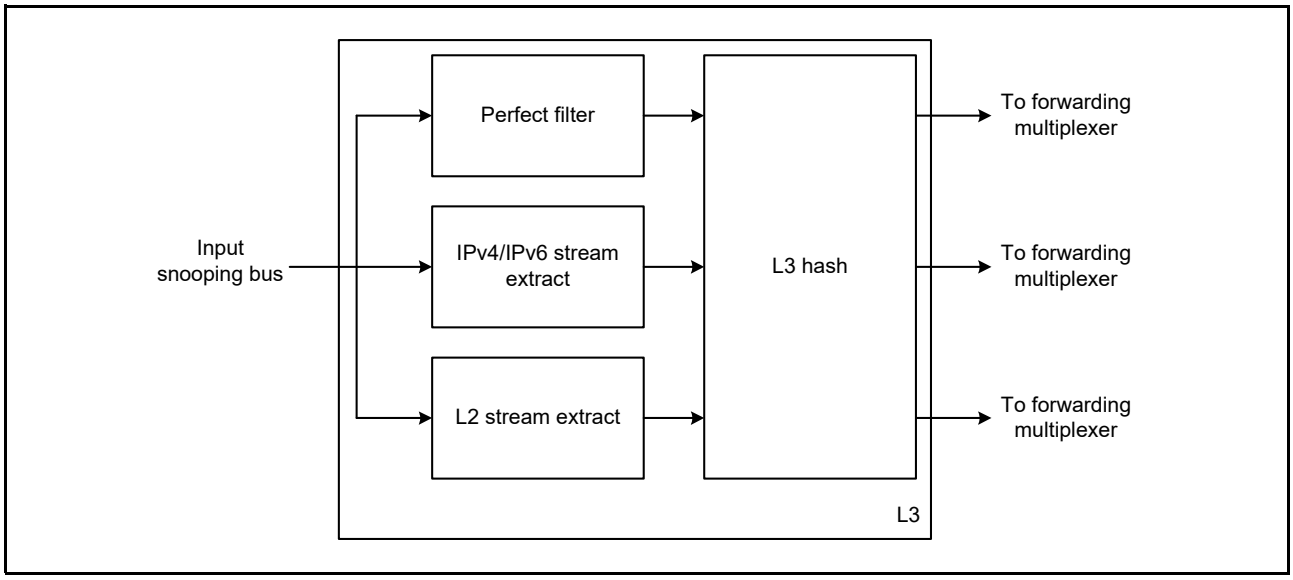

Figure 34.17 Layer 3 Forwarding/Routing/Filtering Block Diagram

The Layer 3 forwarding/routing/filtering function is separated in four functional blocks:

- Perfect filter: This block snoops all the needed information from the MFWD snooping bus and create a user defined stream.
- IPv4/IPv6 stream extract: This block snoops all the needed information from the MFWD snooping bus and create an IPv4/IPv6 stream.
- L2 stream extract: This block snoops all the needed information from the MFWD snooping bus and create a L2 stream.
- L3 hash: This block handles the stream meta information such as forwarding, routing and filtering information using a hash function.

Note: Forwarding multiplexer contains the forwarding flow. The forwarding flow is explained per forwarding type. For Layer 3 forwarding/routing/filtering, related Forwarding flow is described in Figure 34.41, Figure 34.42 and Figure 34.43.

(1) Perfect Filter

The perfect filter is used to identify streams. This filter has the advantage to be flexible and can identify a stream without any statistic error but, because of its high cost, is available in a limited number (16 streams available).
The Perfect filter block diagram is represented in Figure 34.18.

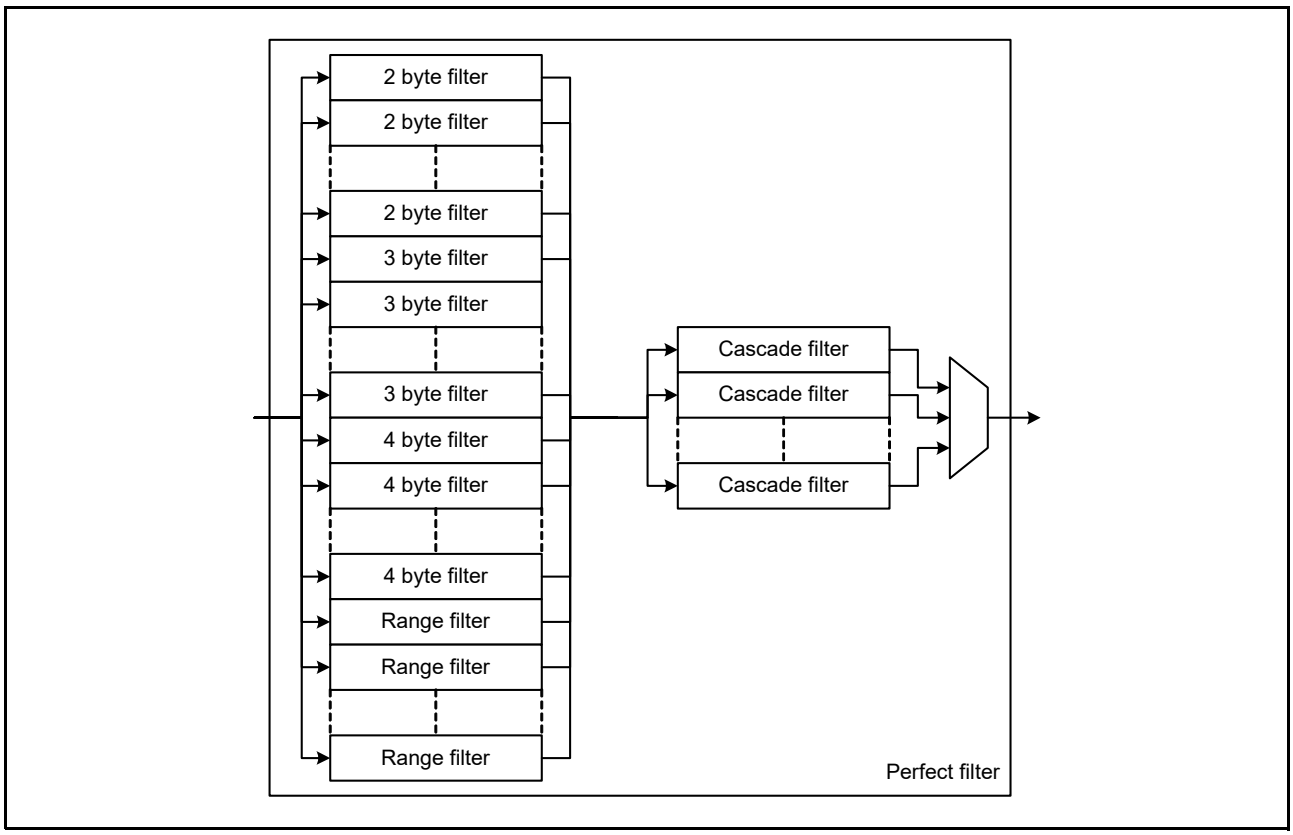

Figure 34.18 Perfect Filter Block Diagram

The perfect filtering happens in two steps:

- The first step is done by 2-byte, 3-byte, 4-byte and range filters. Each one of these filters is independent from others but only able to filter a precise part of a frame.
- The second step is done by Cascade filters. Each one of the cascade filters can associate 7 filtering results from the first step to create a stream ID.

[Restrictions]

- HW: All frames smaller than 33 bytes (received with no command 1 from snooping bus, the 33 bytes are not including the TAG saved in the TAG RAM) will be considered has unknown frames by the perfect filter.

(a) 2-Byte Filters

A 2-byte filter aims at filtering a specific a portion of a frame and happens in two steps, the data extraction and the filtering.

1. Data extraction for filtering

A 2-byte filter has two modes to extract the data from a frame. Figure 34.19 describes these modes using examples.

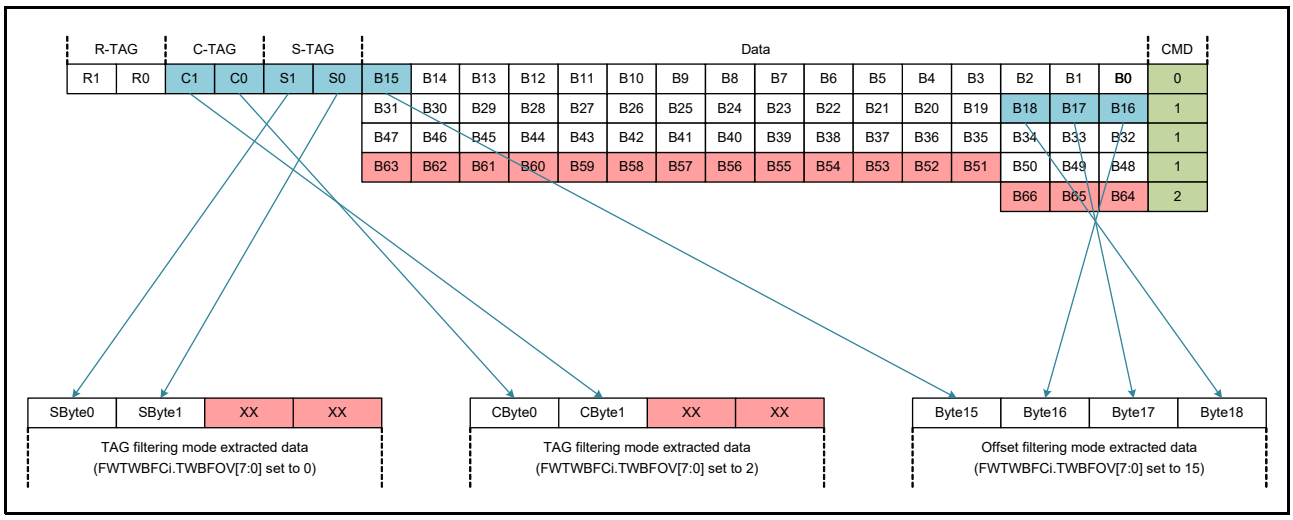

Figure 34.19 2-Byte Filter Data Extraction for Filtering

In Offset filtering mode (FWTWBFCi.TWBFM == 0):

- Data bytes from byte FWTWBFCi.TWBFOV[7:0] to byte FWTWBFCi.TWBFOV[7:0] + 3 are extracted for filtering.

In TAG filtering mode (FWTWBFCi.TWBFM == 1):

- If FWTWBFCi.TWBFOV[7:0] is set to 0, VLAN S-TAG is extracted for filtering.
- If FWTWBFCi.TWBFOV[7:0] is set to 2, VLAN C-TAG is extracted for filtering.

[Restrictions]

- HW: The data for filtering in 2-byte filters can only be extracted until the first three bytes in the penultimate beat of data (first three bytes of the last time CMD is equal to 1. In Figure 34.19, the bytes colored in red are the non-extractible bytes for filtering). I.e., the offset filtering will only be effective if the offset value is set until the last byte of the ante-penultimate beat of data (the last before last time CMD is equal to 1. Byte 47 in Figure 34.19).
- HW: A filter with a setting that should use non-extractible data for filtering will always unmatched.
- HW: In TAG filtering mode, if S-TAG or C-TAG is not present in the frame for filtering, the value 0 will be extracted by the filter.

2. Extracted data filtering

A 2-byte filter has three modes to filter extracted data. Figure 34.20 describes these modes.

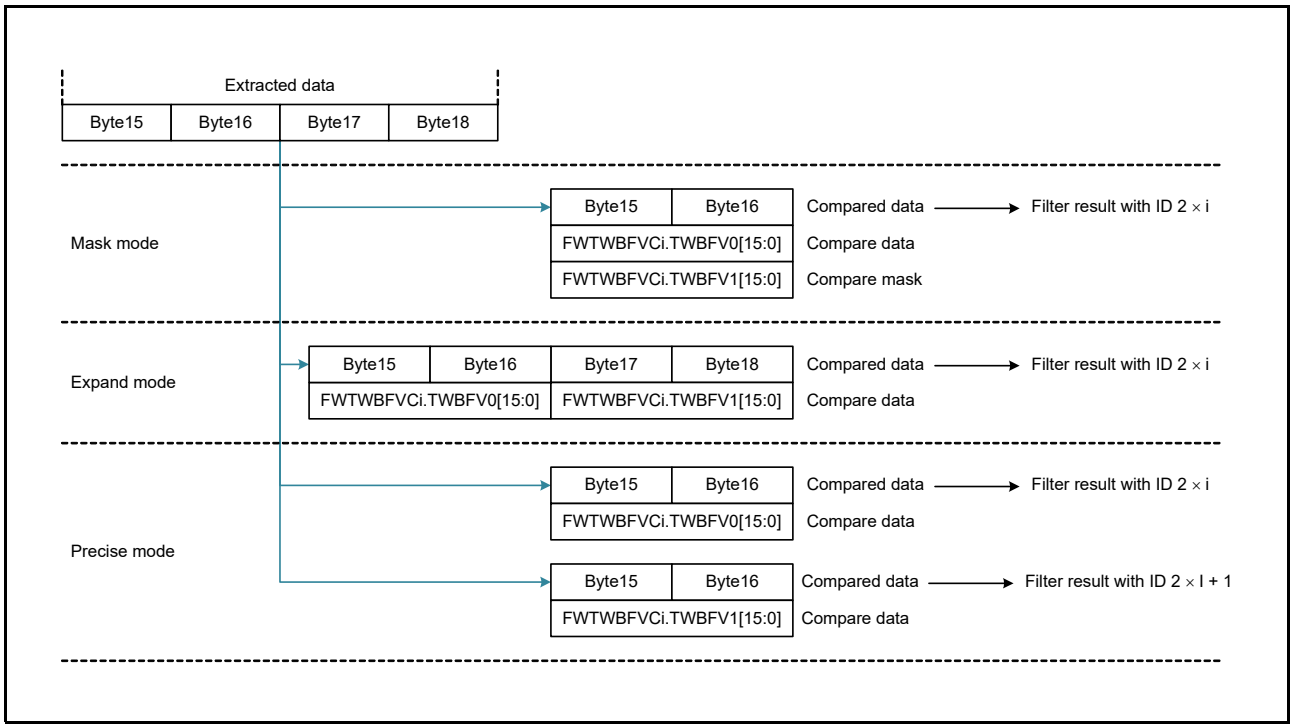

Figure 34.20 2-Byte Filter Data Extraction for Filtering

In mask mode (FWTWBFCi.TWBFUM[1:0] == 00b):

- The first two bytes of the extracted data are compared to FWTWBFVCi.TWBFV0[15:0] using FWTWBFVCi.TWBFV1[15:0] as a mask (when a bit is set to 1, the corresponding bit is not used for comparison). The result is associated to 2 × i filter ID.

In Expand mode (FWTWBFCi.TWBFUM[1:0] == 01b):

- The four-byte extracted data is compared to {FWTWBFVCi.TWBFV0[15:0], FWTWBFVCi.TWBFV1[15:0]}. The result is associated to 2 × i filter ID.

In Precise mode (FWTWBFCi.TWBFUM[1:0] == 10b):

- The first two bytes of the extracted data are compared to FWTWBFVCi.TWBFV0[15:0]. The result is associated to 2 × i filter ID.
- The first two bytes of the extracted data are compared to FWTWBFVCi.TWBFV1[15:0]. The result is associated to 2 × i + 1 filter ID.

(b) 3-Byte Filters

A 3-byte filter aims at filtering a specific a portion of a frame and happens in two steps, the data extraction and the filtering.

1. Data extraction for filtering

A 3-byte filter has one mode to extract the data from a frame. Figure 34.21 describes this mode using an example.

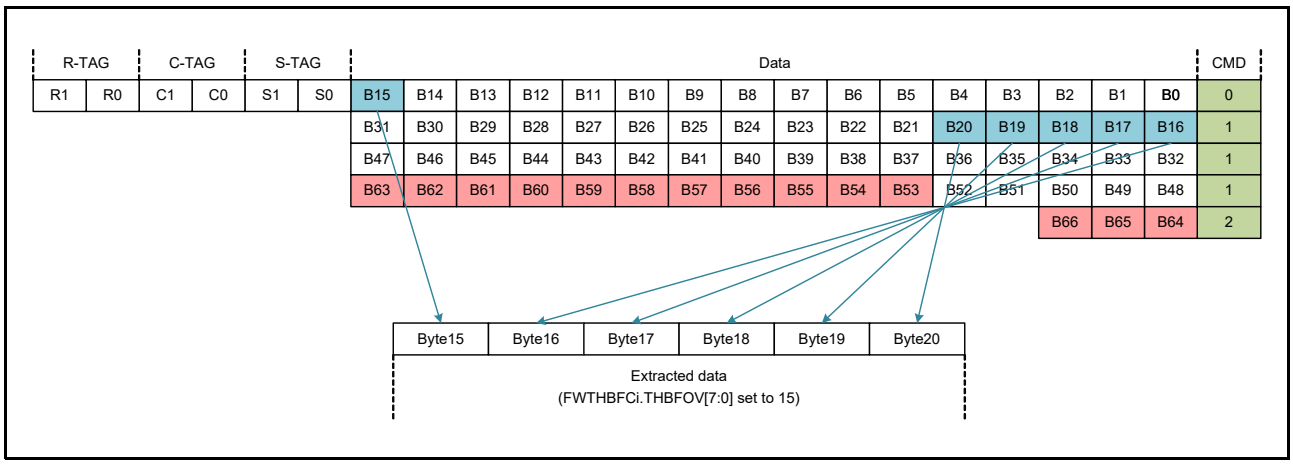

Figure 34.21 3-Byte Filter Data Extraction for Filtering

For 3-byte filters:

- Data bytes from byte FWTHBFCi.THBFOV[7:0] to byte FWTHBFCi.THBFOV[7:0] + 5 are extracted for filtering.

[Restrictions]

- HW: The data for filtering in 3-byte filters can only be extracted until the first five bytes in the penultimate beat of data (first five bytes of the last time CMD is equal to 1. In Figure 34.21, the bytes colored in red are the non-extractible bytes for filtering). I.e. the offset filtering will only be effective if the offset value is set until the last byte of the ante-penultimate beat of data (the last before last time CMD is equal to 1. Byte 47 in Figure 34.21).
- HW: A filter with a setting that should use non-extractible data for filtering will always unmatched.

2. Extracted data filtering

A 3-byte filter has three modes to filter extracted data. Figure 34.22 describes these modes.

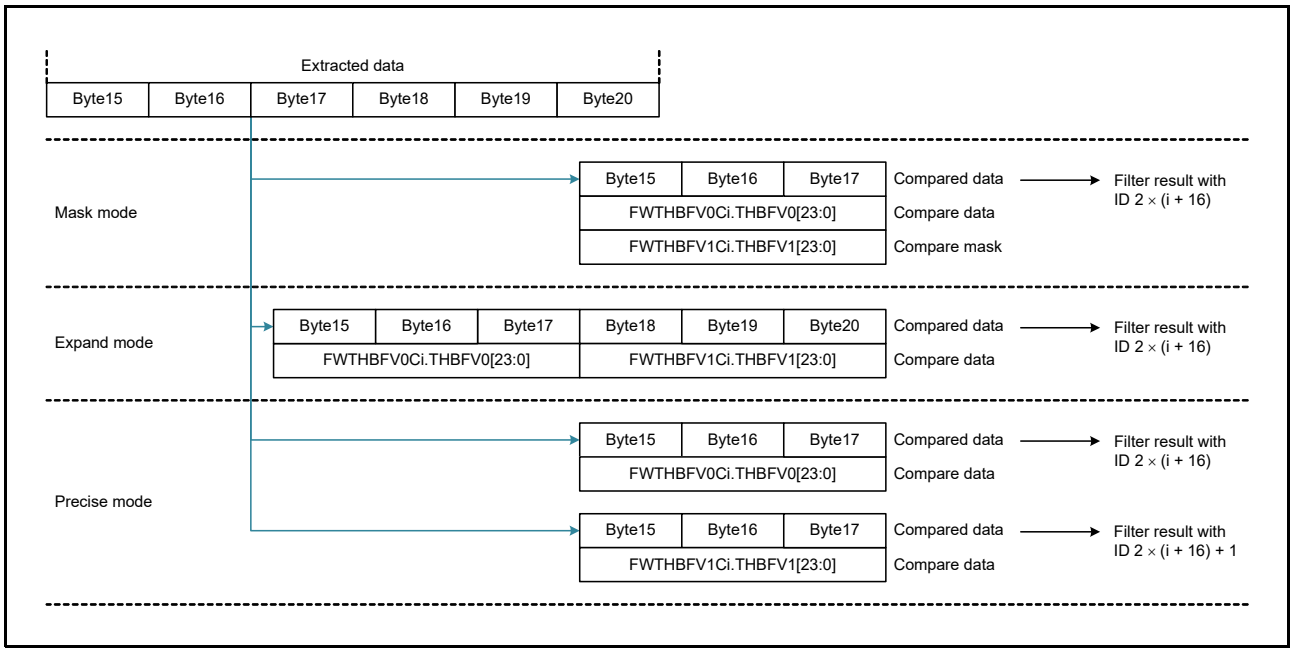

Figure 34.22 3-Byte Filter Data Extraction for Filtering

In mask mode (FWTHBFCi.THBFUM[1:0] == 00b):

- The first three bytes of the extracted data are compared to FWTHBFV0Ci.THBFV0[23:0] using FWTHBFV1Ci.THBFV1[23:0] as a mask (when a bit is set to 1, the corresponding bit is not used for comparison). The result is associated to 2 × (i + 16) filter ID.

In Expand mode (FWTHBFCi.THBFUM[1:0] == 01b):

- The six-byte extracted data is compared to {FWTHBFV0Ci.THBFV0[23:0],FWTHBFV1Ci.THBFV1[23:0]}. The result is associated to 2 × (i + 16) filter ID.

In Precise mode (FWTHBFCi.THBFUM[1:0] == 10b):

- The first three bytes of the extracted data are compared to FWTHBFV0Ci.THBFV0[23:0]. The result is associated to 2 × (i + 16) filter ID.
- The first three bytes of the extracted data are compared to FWTHBFV1Ci.THBFV1[23:0]. The result is associated to 2 × (i + 16) + 1 filter ID.

(c) 4-Byte Filters

A 4-byte filter aims at filtering a specific a portion of a frame and happens in two steps, the data extraction and the filtering.

1. Data extraction for filtering

A 4-byte filter has one mode to extract the data from a frame. Figure 34.23 describes this mode using an example.

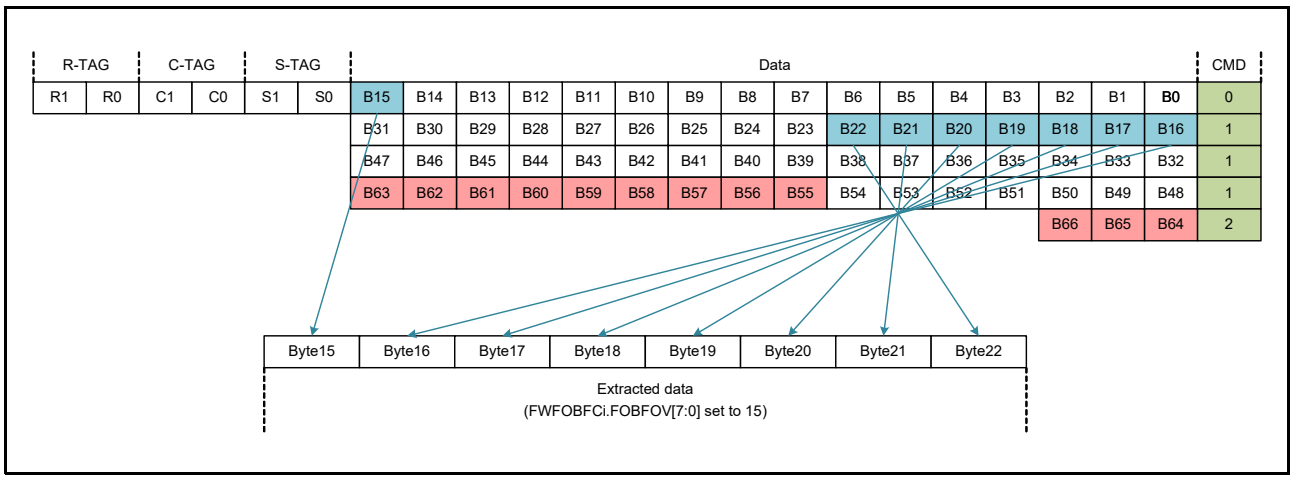

Figure 34.23 4-Byte Filter Data Extraction for Filtering

For 4-byte filters:

- Data bytes from byte FWFOBFCi.FOBFOV[7:0] to byte FWFOBFCi.FOBFOV[7:0] + 7 are extracted for filtering.

[Restrictions]

- HW: The data for filtering in 4-byte filters can only be extracted until the first seven bytes in the penultimate beat of data (first seven bytes of the last time CMD is equal to 1. In Figure 34.23, the bytes colored in red are the non-extractible bytes for filtering). I.e. the offset filtering will only be effective if the offset value is set until the last byte of the ante-penultimate beat of data (the last before last time CMD is equal to 1. Byte 47 in Figure 34.23).
- HW: A filter with a setting that should use non-extractible data for filtering will always unmatched.

2. Extracted data filtering

A 4-byte filter has three modes to filter extracted data. Figure 34.24 describes these modes.

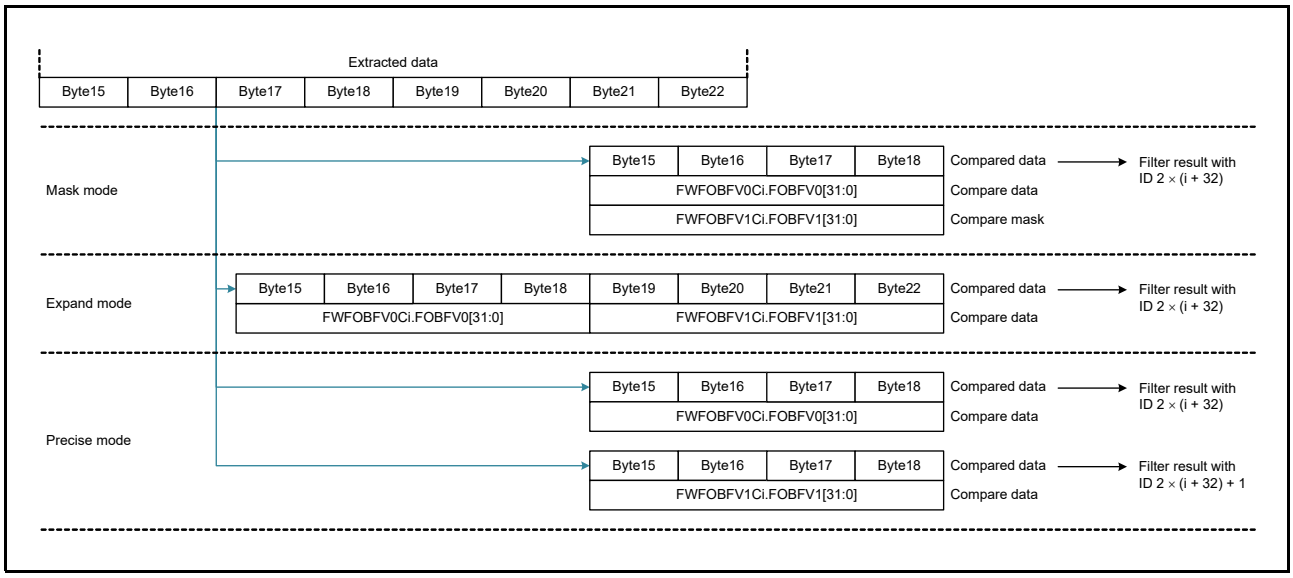

Figure 34.24 4-Byte Filter Data Extraction for Filtering

In mask mode (FWFOBFCi.FOBFUM[1:0] == 00b):

- The first four bytes of the extracted data are compared to FWFOBFV0Ci.FOBFV0[31:0] using FWFOBFV1Ci.FOBFV1[31:0] as a mask (when a bit is set to 1, the corresponding bit is not used for comparison). The result is associated to 2 × (i + 32) filter ID.

In Expand mode (FWFOBFCi.FOBFUM[1:0] == 01b):

- The eight-byte extracted data is compared to {FWFOBFV0Ci.FOBFV0[31:0],FWFOBFV1Ci.FOBFV1[31:0]}. The result is associated to 2 × (i + 32) filter ID.

In Precise mode (FWFOBFCi.FOBFUM[1:0] == 10b):

- The first three bytes of the extracted data are compared to FWFOBFV0Ci.FOBFV0[31:0]. The result is associated to 2 × (i + 32) filter ID.
- The first three bytes of the extracted data are compared to FWFOBFV1Ci.FOBFV1[31:0]. The result is associated to 2 × (i + 32) + 1 filter ID.

(d) Range Filters

A Range filter aims at filtering a specific a portion of a frame and happens in two steps, the data extraction and the filtering.

1. Data extraction for filtering

A Range filter has two modes to extract the data from a frame. Figure 34.25 describes these modes using examples.

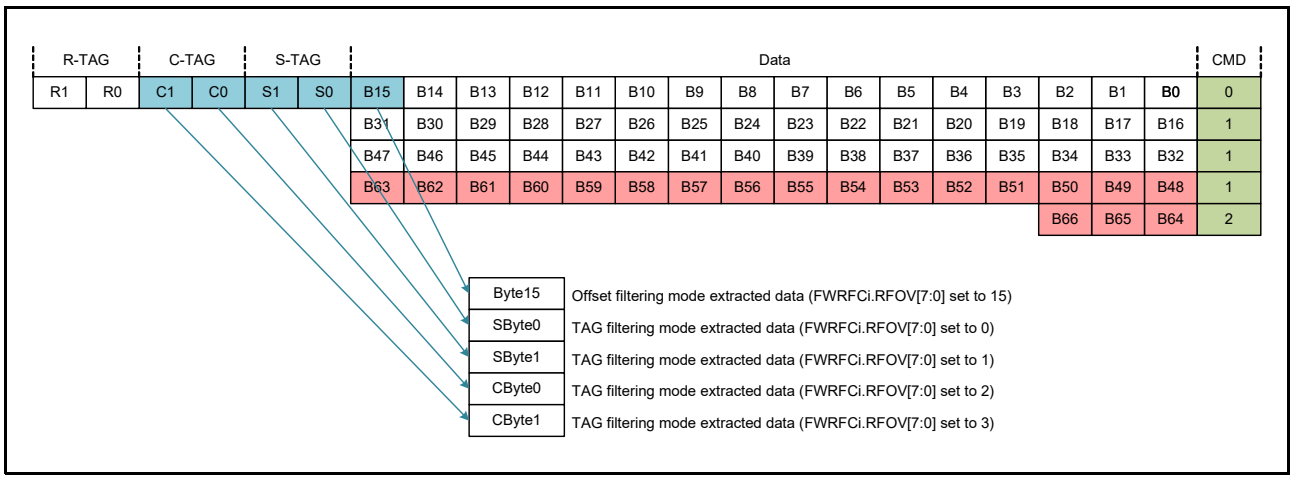

Figure 34.25 Range Filter Data Extraction for Filtering

In Offset filtering mode (FWRFCi.RFM == 0):

- Data byte FWRFCi.RFOV[7:0] is extracted for filtering.

In TAG filtering mode (FWRFCi.RFM == 1):

- If FWRFCi.RFOV[7:0] is set to 0, VLAN S-TAG VID upper 4 bits are extracted for filtering (PCP and DEI are fixed to 0).
- If FWRFCi.RFOV[7:0] is set to 1, VLAN S-TAG VID lower 8 bits are extracted for filtering.
- If FWRFCi.RFOV[7:0] is set to 2, VLAN C-TAG VID upper 4 bits are extracted for filtering (PCP and DEI are fixed to 0).
- If FWRFCi.RFOV[7:0] is set to 3, VLAN C-TAG VID lower 8 bits are extracted for filtering.

[Restrictions]

- HW: PCP and DEI values in C-TAGs and S-TAGs are ignored by the range filter (Set to 0).
- HW: The data for filtering in range filters can only be extracted until the last byte of ante-penultimate beat of data (the last before last time CMD is equal to 1. In Figure 34.25, the bytes colored in red are the non-extractible bytes for filtering). I.e. the offset filtering will only be effective if the offset value is set until the last byte of the ante-penultimate beat of data (the last before last time CMD is equal to 1. Byte 47 in Figure 34.25).
- HW: A filter with a setting that should use non-extractible data for filtering will always unmatched.

2. Extracted data filtering

A Range filter has one mode to filter extracted data. Figure 34.26 describes this mode.

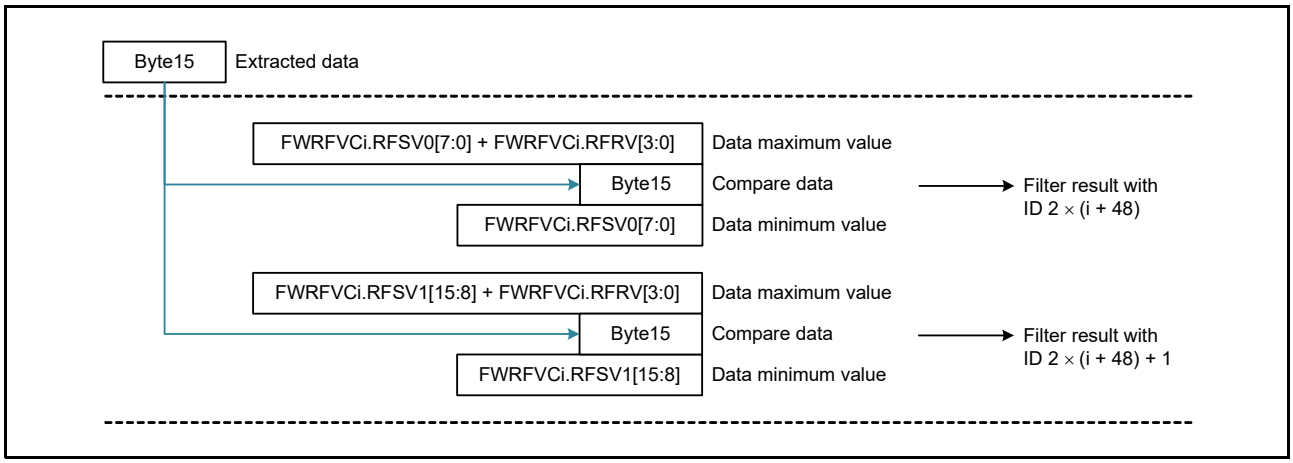

Figure 34.26 Range Filter Data Extraction for Filtering

For Range filters:

- The one-byte extracted data is checked to be included in [FWRFVCi.RFSV0[7:0]: FWRFVCi.RFSV0[7:0] + FWRFVCi.RFRV[3:0]]. The result is associated to 2 × (i + 48) filter ID.
- The one-byte extracted data is checked to be included in [FWRFVCi.RFSV1[15:8]: FWRFVCi.RFSV1[15:8] + FWRFVCi.RFRV[3:0]]. The result is associated to 2 × (i + 48) + 1 filter ID.

(e) Cascade Filters

A Cascade filter aims at gathering several filter results (from 2-byte, 3-byte, 4byte and Range filters) to regroup them to create a stream ID. The number of cascade filters defines the number of possible stream IDs in the perfect filter (16).

[Functions]

- FWCFMCij register is used to map until 7 filters results to cascade filter i.
- FWCFCi register is used to select from which port the stream is expected and with which type of frame (p or e)
- If several cascade filters match the same frame, the cascade filter with the highest number will be selected.
- If a cascade filter matches a frame, a frame format code of 3 bits equal to 0 is associated to the frame.

Cascade filter stream ID:

- When cascade filter i matches a frame, the stream ID associated to this frame will be a 131-bit stream ID equal to {frame format code,128’di}.

(f) Perfect Filter Utilization Example

Figure 34.27 contains an example of perfect filter utilization. In this example, the user wants to filter a frame which:

- Has a stream ID based on MAC destination address, and VLAN C-TAG.
- Has a MAC destination address equal to AABBCCDDEEFFh.
- Has a VLAN C-TAG equal to ABCD.
- Is known to be as IPv4 frame (IPv4 type is added in filtering for security).

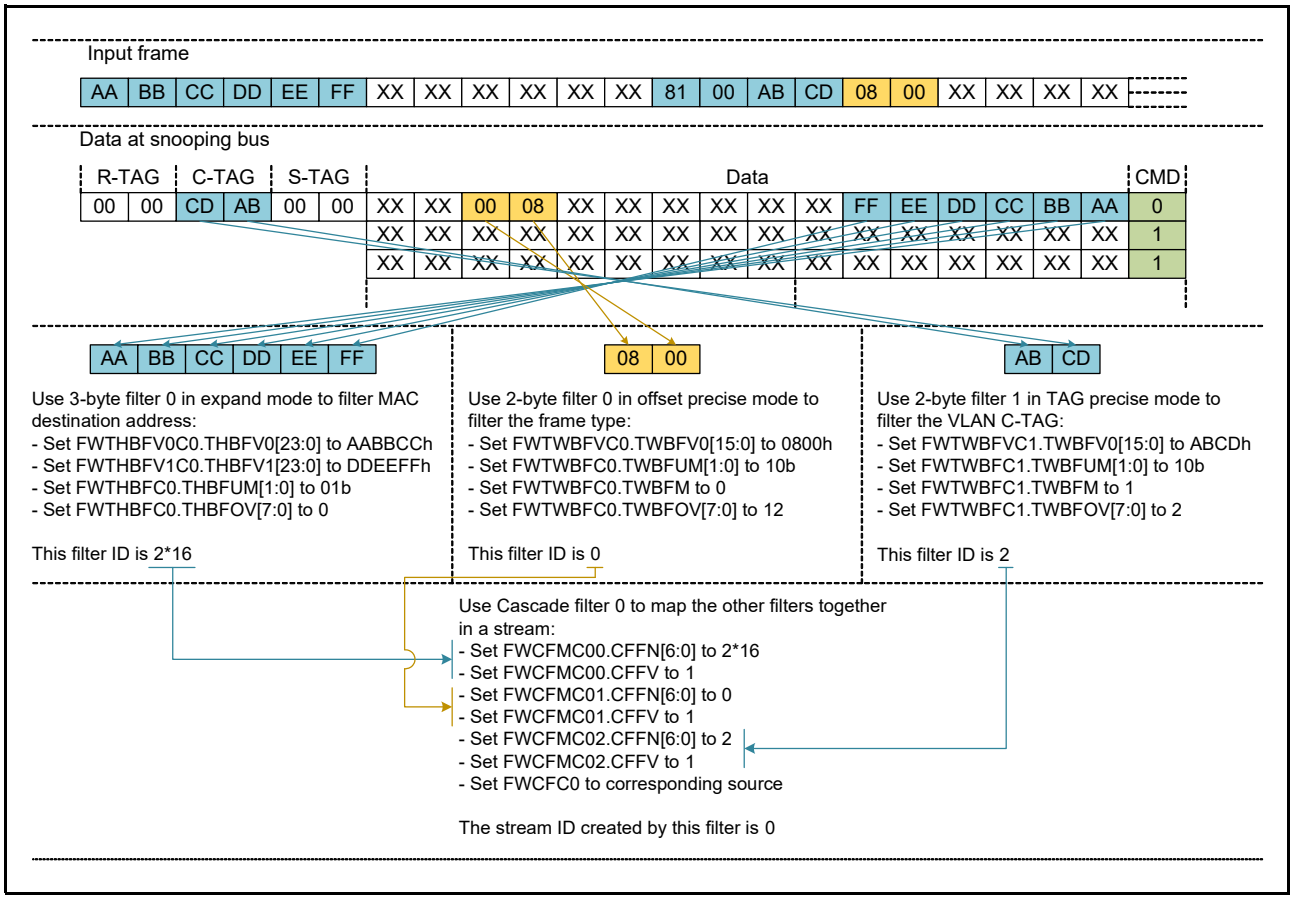

Figure 34.27 Perfect Filter Utilization Example

(2) IPv4/IPv6 Hash Stream Filter

The Hash filter is used to identify streams. This filter has the advantage to be able to generate a big number of streams but, because of the use of hash, can have some stream ID collision problem (that should be resolved using the perfect filter).
The Hash filter block diagram is represented in Figure 34.28.

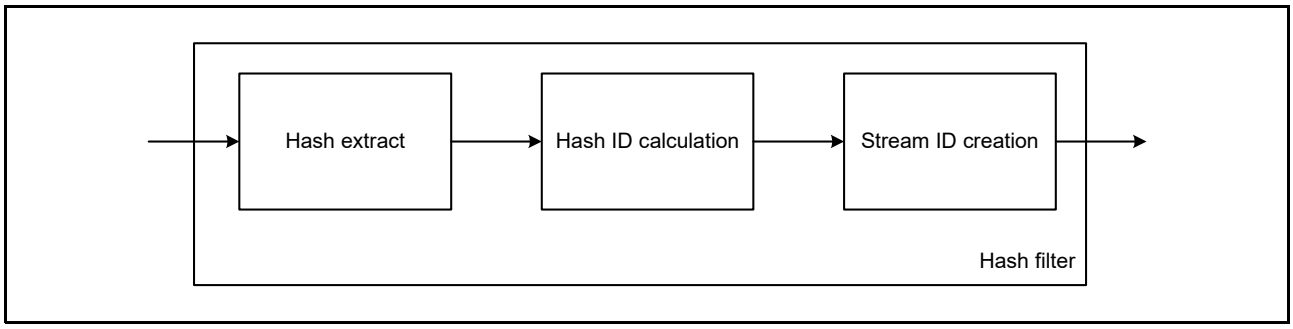

Figure 34.28 Hash Filter Block Diagram

The Hash filtering happens in Three steps:

- The first step is done by Hash extract. It consists in extracting all the possible field for the IPv4/IPv6 stream ID creation.
- The second step is done by Hash ID calculation. It consists in calculating the hash ID associated to each frame depending on the extracted data and the fields chosen by user for Hash.
- The third step is done by Stream ID creation. It consists in the stream ID assembling depending on the fields chosen by user.

(a) Hash Extract

The Hash extract is used to extract the Stream IDs from IPv4 and IPv6 frames to create their associated stream ID. The extraction happens on six formats which are IPv4, IPv4/TCP, IPv4/UDP, IPv6, IPv6/TCP and IPv6/UDP.
[Restrictions]

- HW: Hash extract will ignore any data received from Fabric with command 2.

1. IPv4 detection and data extraction

Figure 34.29 describes how IPv4 detection and data extraction happens. This data extraction happens only if the frame did not match a cascade filter, if the frame format decode condition are satisfied and if FWPCi0.IP4OE is set for the corresponding source port. In this case, a frame format code of 3 bits equal to 1 is associated to the frame.

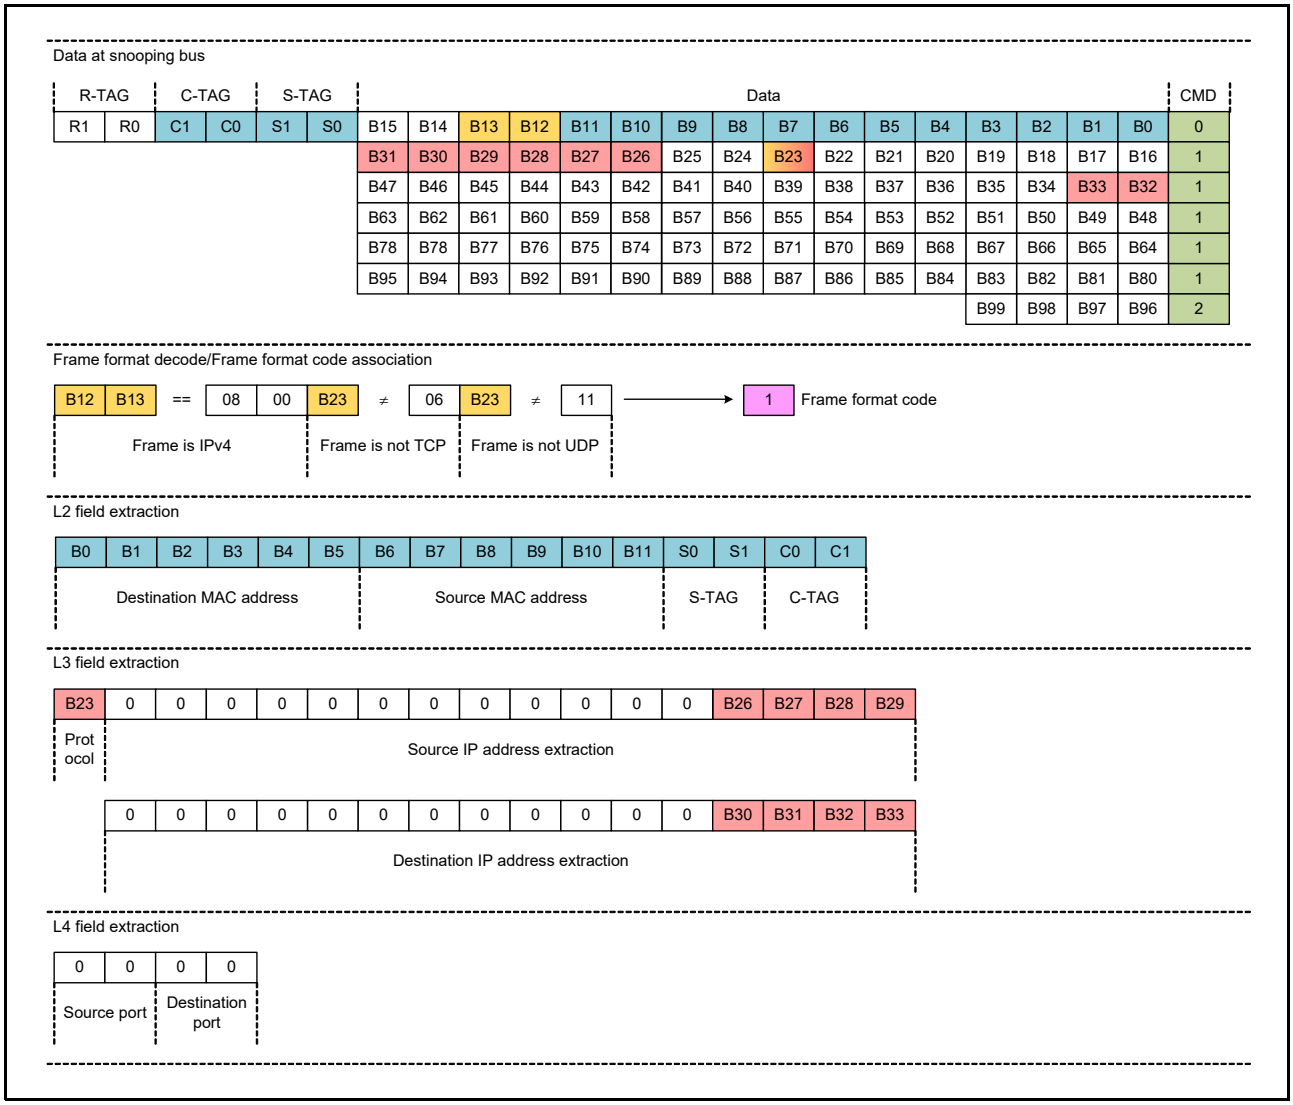

Figure 34.29 IPv4 Detection and Data Extraction
