14	Set the DMINT.RPTIE bit Set the DMINT.SARIE bit Set the DMINT.DARIE bit Set the DMINT.ESIE bit to 1	To use the transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the transfer escape end interrupt.
15	Set the DMCNT.DTE bit to 1	Enable DMA transfer.
16	Set the DMAST.DMST bit to 1	Enable DMAC operation.*1 Common settings for DMAC
17	Set the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Enable the interrupt trigger for the DMAC
18	Start the peripheral function as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source
19	Enable the IRQn pin as a DMAC trigger source	To use external pin interrupt as a DMAC trigger source
20	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

m: DMAC channel (m = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

Table 18.18 Register Setting Procedure of Repeat-Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the DMAC trigger source.	To use peripheral function interrupts as DMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQn pin as the DMAC trigger source.	To use external pin interrupts as DMAC trigger sources.
3	Clear the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Disable the interrupt trigger for the DMAC
4	Clear the DMCNT.DTE bit to 0	Disable DMA transfer.
5	Set the interrupt source as a DMAC trigger source to the DMRSRm register by using the Interrupt Controller Unit	To use internal peripheral interrupts or external pin interrupts as DMA trigger sources. Enable the interrupt bit for the trigger source. Set the DMAC trigger source.
6	Set the peripheral module as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source. Set the control register for the peripheral function.
7	Set the IRQn pin function by using the Interrupt Controller Unit.	To use external pin interrupt as a DMAC trigger source. Set the IRQn pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DADR bit Set the DMAMD.SADR bit	Set the Destination address update mode select bits Set the Source address update mode select bits Set the Destination address update setting after reload bit Set the Source address update setting after reload bit
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request source select bits Set the Data transfer size bits Set the transfer mode to repeat-block transfer mode Set the Transfer keeping bit
10	Set the DMSAR register Set the DMDAR register Set the DMSRR register Set the DMDRR register Set the DMCRA register Set the DMCRB register	Set the transfer source start address Set the transfer destination start address Set the initial value of source start address Set the initial value of destination start address Set the number of transfer operations Set the number of block transfer operations
11	Set the DMSBS register Set the DMDBS register	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset Set the destination buffer size and access offset
12	Set the DMINT.DTIE bit to 1	To use the transfer end interrupts. Enable the transfer end interrupts.
13	Set the DMCNT.DTE bit to 1	Enable DMA transfer
14	Set the DMAST.DMST bit to 1	Enable DMAC operation.*1
15	Set the ICU.IERi.IENj bit corresponding to the interrupt vector number for the DMAC trigger	Enable the interrupt trigger for the DMAC
16	Start the peripheral function as a DMAC trigger source	To use peripheral function interrupt as a DMAC trigger source
17	Enable the IRQn pin as a DMAC trigger source	To use external pin interrupt as a DMAC trigger source
18	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

m: DMAC channel (m = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

18.3.10 Starting DMA Transfer

To enable the DMA transfer of DMACm (m = 0 to 7), set the DMCNT.DTE bit to 1 (DMA transfer enabled), and then set the DMAST.DMST bit to 1 (DMAC module start). Another transfer request cannot be accepted during the transfer of other DMAC channel or DTC. When the proceeding transfer is completed, channel arbitration is performed where a DMA transfer request of the highest priority channel is accepted and DMA transfer of the channel starts. When DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

18.3.11 Registers during DMA Transfer

The DMACm registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMCNT, and DMSTS.

(1) DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(2) DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(3) DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(4) DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(5) DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(6) DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 18.5 to Table 18.7.

(7) DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically set to 0 by the DMAC according to the DMA transfer state. The conditions for clearing this bit by the DMAC are as follows:

- The specified total volume of data transfer is completed.
- The DMA transfer is stopped by the repeat size end interrupt.
- The DMA transfer is stopped by the extended repeat area overflow interrupt.

- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for the DMCNT register). In this case, writing must be performed after the bit is set to 0.

(8) DMA Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACm is in the idle or active state. This flag is set to 1 when the DMACm starts data transfer, and is set to 0 when data transfer in response to one transfer request is completed. Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

(9) Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed. When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested. This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

(10) Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When both this flag and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested. This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling. Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

18.3.12 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests. When DMCTL.PR = 0, the channel priority is fixed as channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7 (channel 0: Highest) > DTC. When DMCTL.PR = 1, the DMAC determines the priority of channels at round-robin. When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

18.3.13 Channel Security

The security attribute can be set with CPSCU.DMACCHSAR.SADMACn bit for each DMAC channel.
When the CPSCU.DMACCHSAR.SADMACn bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.DMACCHSAR.SADMACn bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Do not change the CPSCU.DMACCHSAR register while DMA transfer.

18.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0.

18.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of the DMCRAL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of the DMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the DMTMD.TKP bit is set to 1 (free-running function), the DMSTS.DTIF flag is set to 1, but the DMCNT.DTE bit does not become 0.

(3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of the DMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the DMTMD.TKP bit is set to 1 (free-running function), the DMSTS.DTIF flag is set to 1, but the DMCNT.DTE bit does not become 0.

(4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of the DMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is set to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the DMTMD.TKP bit is set to 1 (free-running function), the DMSTS.DTIF flag is set to 1, but the DMCNT.DTE bit does not become 0.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

18.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of each single-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested, DMA transfer is terminated regardless of the value of the DMTMD.TKP bit, the DMCNT.DTE bit is set to 0, and the DMSTS.ESIF flag is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit. A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of each single-block size of data is completed. Repeat size end interrupt cannot be requested in repeat-block transfer mode. Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).
For the interrupt outputs, refer to Figure 18.22 and Figure 18.23.

18.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area address occurs while the source address extended repeat area is specified with the DMINT.SARIE bit set to 1 or the destination address extended repeat area is specified with the DMINT.DARIE bit set to 1, an interrupt due to an extended repeat area overflow is requested. When the interrupt is requested, DMA transfer is terminated regardless of the value of the DMTMD.TKP bit, the DMCNT.DTE bit is set to 0, and the DMSTS.ESIF flag is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Even if an interrupt due to an extended repeat area overflow is requested during a read cycle, the subsequent write cycle proceeds. In block transfer mode, even if an interrupt due to an extended repeat area overflow is requested during a single-block transfer, the remaining data in the block are transferred; transfer is terminated after a block transfer. An interrupt due to an extended repeat area overflow is not possible in repeat-block transfer mode. Before interrupt requests can be sent from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM). For the interrupt outputs, see Figure 18.22 and Figure 18.23.

18.5 Processing on DMA Transfer Error

If the DMBWR.BWE bit is 0 and an access error occurs during a DMA transfer, the DMAC will abort the transfer. The IR status flag for the vector number that caused the error and the DMCNT.DTE bit for the channel on which the error occurred are cleared. The DMA transfer setting registers are not written back. Information about the channel that caused the error is set in the DMECHR register. If there is then a transfer request from a source other than the one that started the DMA transfer that caused the error, arbitration will be re-established. For details on bus errors, see section 16.8, Bus Error Monitoring Section.

18.6 Interrupts

18.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request to the CPU or the DTC after transfer in response to one request is completed. The interrupt request is generated after the bus response to the final write of the DMA transfer. The timing of the bus response to a DMA write access depends on the setting of the DMBWR.BWE bit and transfer destination. For details, see section 18.2.19, DMA Bufferable Write Enable Register (DMBWR). In repeat-block transfer mode, do not enable escape transfer end interrupt. Table 18.19 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 18.22 shows the schematic logic diagram of interrupt outputs (DMAC0 to DMAC3). Figure 18.23 shows the schematic logic diagram of interrupt outputs (DMAC4 to DMAC7). Figure 18.24 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 18.19 Relation among Interrupt Sources, Interrupt Status Flags, and Interrupt Enable Bits

Interrupt Sources		Interrupt Enable Bits	Interrupt Status Flags	Request Output Enable Bits
Transfer end		—	DMSTS.DTIF	DMINT.DTIE
Escape transfer end	Repeat size end	DMINT.RPTIE	DMSTS.ESIF	DMINT.ESIE
	Source address extended repeat area overflow	DMINT.SARIE		
	Destination address extended repeat area overflow	DMINT.DARIE		

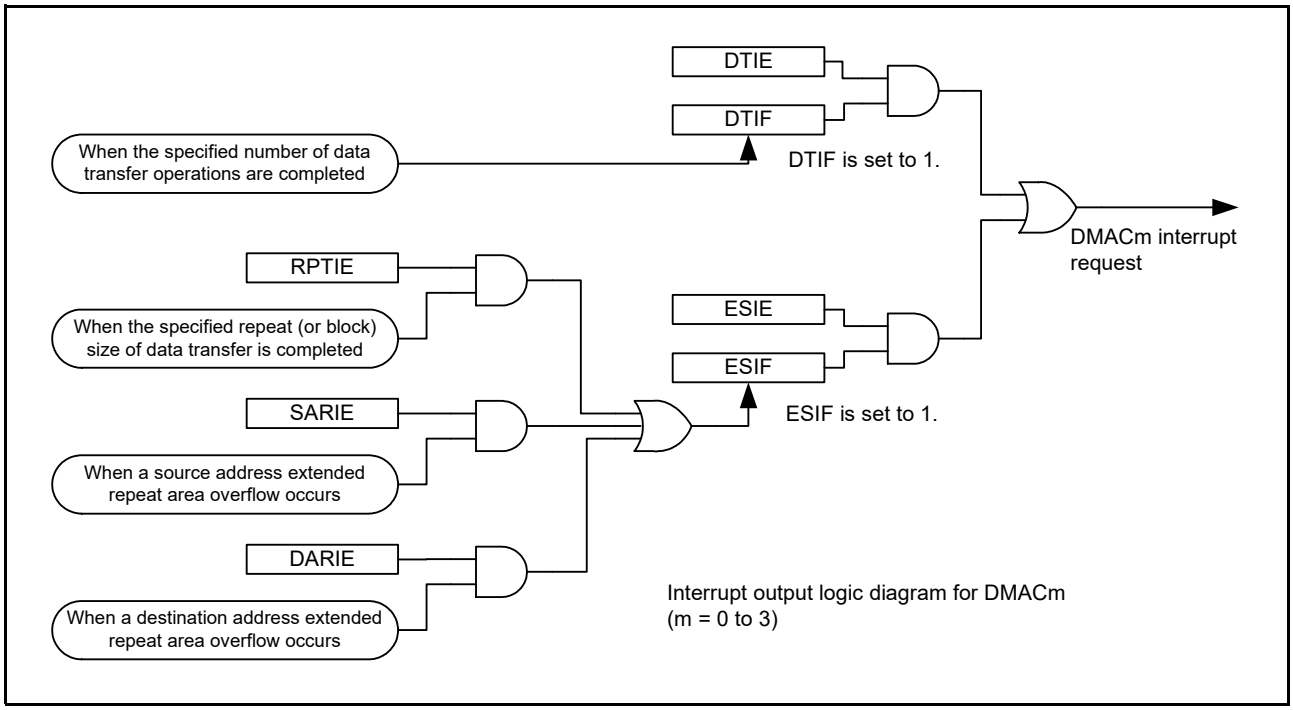

Figure 18.22 Schematic Logic Diagram of Interrupt Outputs (DMAC0 to DMAC3)

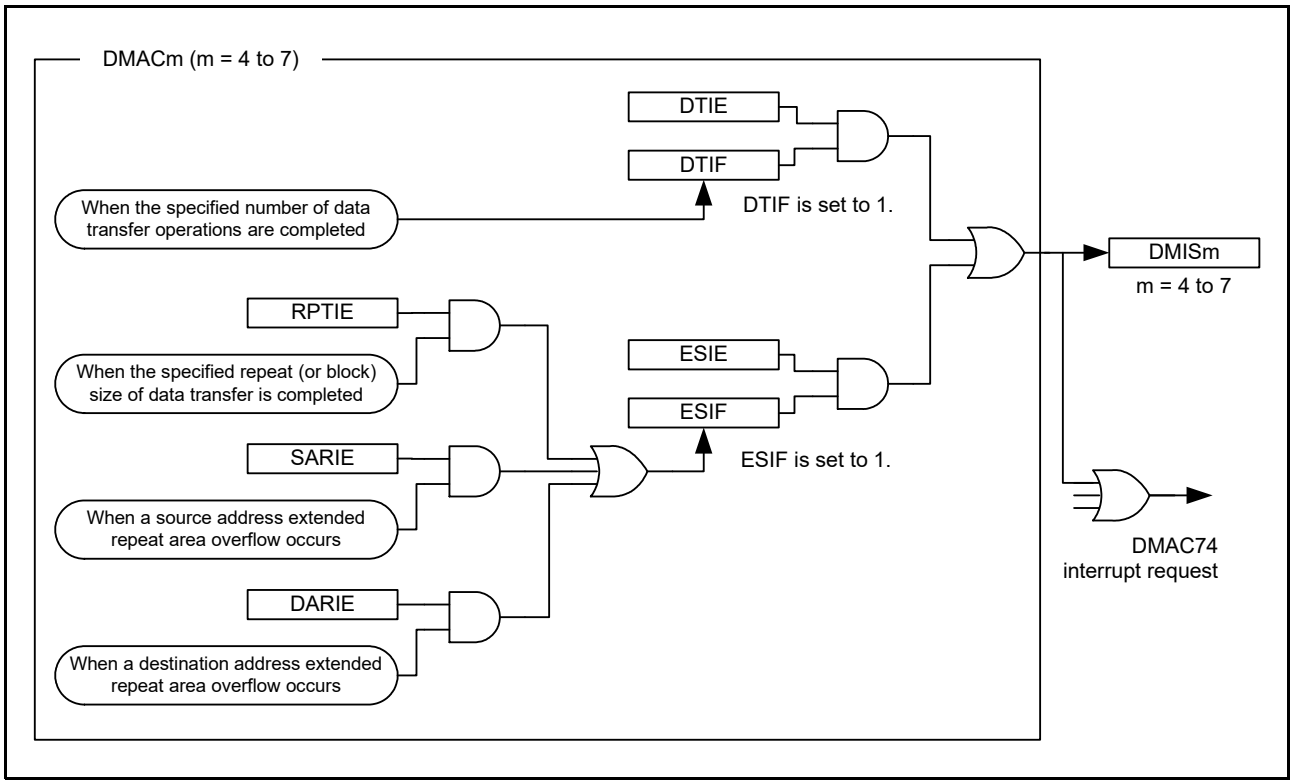

Figure 18.23 Schematic Logic Diagram of Interrupt Outputs (DMAC4 to DMAC7)

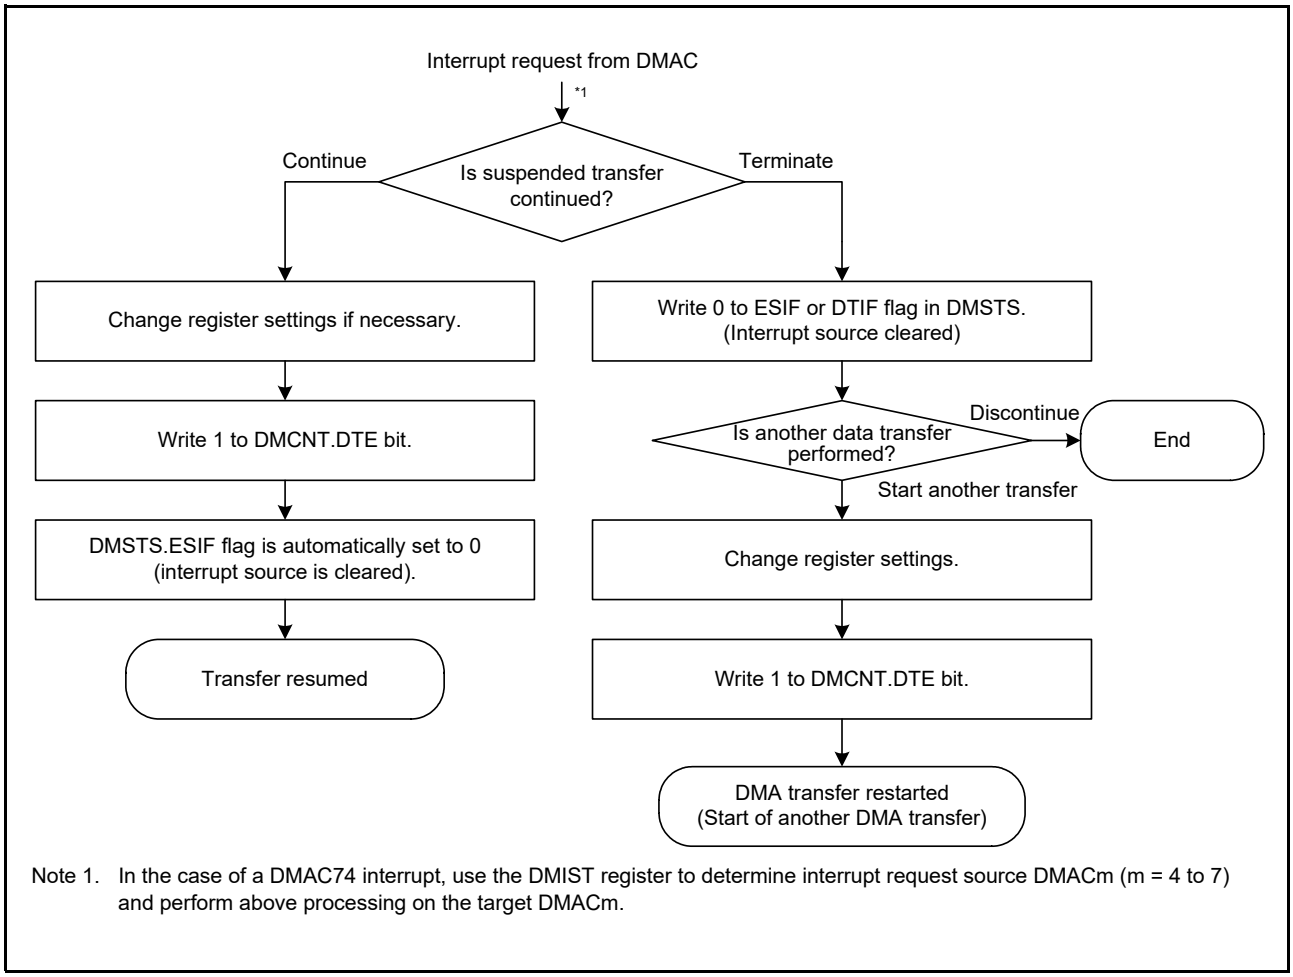

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases: (1) discontinuing or terminating DMA transfer and (2) continuing DMA transfer.

(1) When Discontinuing or Terminating DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACm remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

(2) When Continuing DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically set to 0 (interrupt source cleared), and DMA transfer is resumed.

Note 1. In the case of a DMAC74 interrupt, use the DMIST register to determine interrupt request source DMACm (m = 4 to 7) and perform above processing on the target DMACm.

Figure 18.24 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

18.6.2 Transfer Error Interrupt

A transfer error occurring during DMA transfer is detected as a bus error. For details, see section 16.8, Bus Error Monitoring Section.

Table 18.20 Interrupt and Error Information Due to DMA Transfer Error Cause

Transfer Error Factor	Interrupt/Reset Selection	NMI	Interrupt	Bus Error Status	Error Channel Information
MSAU Error	BUS.MSAOAD.OAD	ICU.NMISR.BUSST	ICU.IR16.IR	BUS.BUSERRSTATDMAC0.MSERRSTAT	DMECHR
Illegal Access Error	BUS.BUSOAD.ILERROAD			BUS.BUSERRSTATDMAC0.ILERRSTAT	
Slave Bus Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATDMAC0.SLERRSTAT	
Protect Zone Access Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATDMAC0.SLERRSTAT	

18.7 Event Link

Each DMAC channel outputs an event link request each time one data transfer is completed or, in block and repeat-block transfer mode, each time one block transfer is completed. The timing of the bus response from the DMA transfer destination depends on the transfer destination and bus configuration. For details, see section 16.2.5, Restrictions in section 16, Buses. Enabling or disabling buffered writing to bufferable areas in DMA transfers can be specified by the DMBWR register. For details, see section 18.2.19, DMA Bufferable Write Enable Register (DMBWR).

For details on the event link function, see section 21, Event Link Controller (ELC).

18.8 Low-Power Consumption Function

Before transition to the module-stop state, software standby mode, or deep software standby mode, set the DMAST.DMST bit to 0 (the DMAC suspended), and then perform the following.

(1) Module-Stop Function

Writing 1 to the module-stop setting bit (transition to the module-stop state) enables the module-stop function of the DMAC. If DMA transfer is in progress at the time a 1 is written to the module-stop setting bit, the transition to the module-stop state proceeds after DMA transfer has ended. While the module-stop setting bit is 1, accessing the DMAC registers are prohibited. Writing 0 to the module-stop setting bit releases the DMAC from the module-stop state.

(2) Software Standby and Deep Software Standby Modes

Make settings in accord with the procedure under section 11.6.2.1, Transitioning to Software Standby Mode or section 11.6.3.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption. If DMA transfer operations are in progress at the time the WAIT instruction is executed, the transition to software standby or deep software standby follows the completion of DMA transfer.

(3) Note on Low-Power Consumption Function

For the WAIT instruction and the register setting procedure, see section 11.8.6, Timing of the WAIT Instruction in section 11, Low Power Consumption. To perform DMA transfer after returning from low-power consumption mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in software standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination in accordance with the settings described in section 15.7.3, Selecting Interrupt Request Destination in section 15, Interrupt Controller (ICUM), and then execute the WAIT instruction.

18.9 Usage Notes

18.9.1 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

18.9.2 Setting of DMAC Trigger Select Register of the Interrupt Controller (ICU.DMRSRm)

The DMAC trigger select register (ICU.DMRSRm) should be set while the DMA transfer enable bit (DMCNT.DTE) is 0 (DMA transfer is disabled). Moreover, the DTC transfer request enable register (ICU.DTCERn) that corresponds to the same vector number that has been set by the ICU.DMRSRm register should not be set to 1. For details on the ICU.DTCERn and ICU.DMRSRm registers, see section 15, Interrupt Controller (ICUM).

18.9.3 Suspending or Restarting DMA Transfer

To suspend a DMA transfer request, write 0 to the interrupt enable bit for the trigger source (ICU.IERi.IENj bit). To restart the DMA transfer, write 1 to the ICU.IERi.IENj bit with the setting shown in section 18.3.9, Activating the DMAC.

19. EXDMA Controller (EXDMACAa)

This MCU incorporates a 2-channel direct memory access controller (EXDMAC) designed exclusively for external bus transfer. The EXDMAC is a module to transfer data without the CPU. When a DMA transfer request is generated, the EXDMAC transfers data stored at the transfer source address to the transfer destination address.

19.1 Overview

Table 19.1 lists the specifications of the EXDMAC, and Figure 19.1 shows a block diagram of the EXDMAC.

Table 19.1 Specifications of EXDMAC

Item		Description EXDMAC
Number of channels		2 (EXDMACn (n = 0, 1))
Transfer space		SRAM0/SRAM1 (Secure: 8200 0000h to 8217 FFFFh, Non-secure: 0200 0000h to 0217 FFFFh) CS0 to CS7/SDRAM (7000 0000h to 7FFF FFFFh) xSPI0/xSPI1 (2000 0000h to 5FFF FFFFh)
Maximum transfer volume		64M data (Maximum number of transfers in block transfer mode: 1024 data × 65536 blocks)
EXDMAC trigger source		• Trigger source selectable for each channel Software trigger Interrupt requests from peripheral modules*1 or trigger input to external interrupt input pins
Channel priority		Selectable from fixed priority or round-robin • Fixed priority: Channel 0 > channel 1 (channel 0: Highest) • Round-robin
Transfer data	Single data	Bit length: 8, 16, 32, 64 bits
	Block size	Number of data: 1 to 1024
Transfer mode	Normal transfer mode	• One data transfer by one DMA transfer request • Free running mode (setting in which total number of data transfers is not specified) settable
	Repeat transfer mode	• One data transfer by one DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. • Maximum settable repeat size: 1024 • Selectable free running function
	Block transfer mode	• One block data transfer by one DMA transfer request • Maximum settable block size: 1024 data • Selectable free running function
	Repeat-block transfer mode	• One block data transfer by one DMA transfer request • Maximum settable block size: 1024 data • Block transfer can be repeated • Maximum settable repeat size: 64K • Selectable free running function
Selective functions	Extended repeat area function	• Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed • Area of 2 bytes to 128 Mbytes separately settable as extended repeat area for transfer source and destination
Processing on DMA transfer error		• When DMA transfer error occurs, the transfer that caused the error is stopped • For clearing requests to the registers for trigger source in the ICU, clearing targets are selectable for each channel or all channels.
CPU interrupt source (EXDMACnI)	Transfer end interrupt	Generated on completion of transferring data volume specified by the transfer counter.
	Transfer escape end interrupt	• Generated when the repeat size of data transfer is completed. • Generated when the source address extended repeat area overflows. • Generated when the destination address extended repeat area overflows.
Power consumption reduction function		Module-stop state can be set.
Protect Zone Filter		Security can be set for each channel.

Note 1. For details on EXDMAC trigger sources, see Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

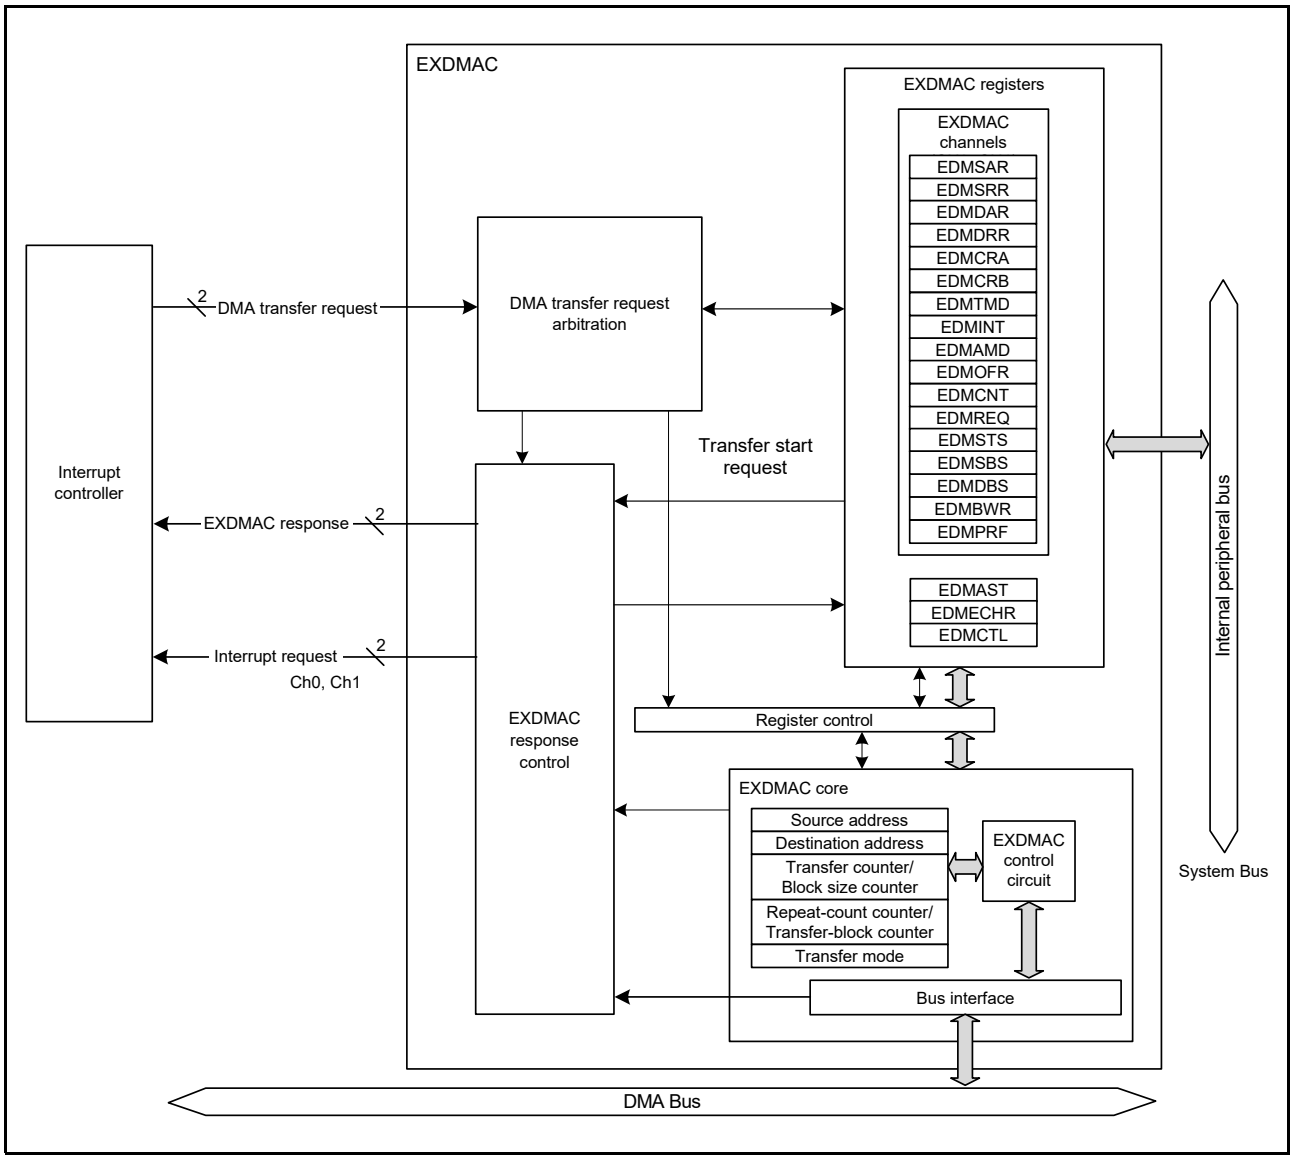

Figure 19.1 Block Diagram of EXDMAC

19.2 Register Descriptions

Security attribution can be set for each register and is used to determine whether the target register is a secure register or a non-secure register. The attribution can be set by the EXDMACCHSAR, EXDMACSAR registers.

19.2.1 EXDMAC Channel Security Attribution Register (EXDMACCHSAR)

Address(es): CPSCU.EXDMACCHSAR 8701 819Ch, CPSCU_NS.EXDMACCHSAR 0701 819Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADMACX1	SADMACX0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SADMACX0	Security Attributes of Output and Registers for EXDMAC Channel 0 Select	0: Secure 1: Non-secure	R/W
b1	SADMACX1	Security Attributes of Output and Registers for EXDMAC Channel 1 Select	0: Secure 1: Non-secure	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

SADMACXn Bits (Security Attributes of Output and Registers for EXDMAC Channel n Select) (n = 0, 1)

Each bit specifies the security attribute of the register for a EXDMAC channel n. For details, see section 19.3.12, Channel Security. The target registers are ICU.SELEXDRn (n = 0, 1), EDMSAR, EDMSRR, EDMDAR, EDMDRR, EDMCRA, EDMCRB, EDMTMD, EDMINT, EDMAMD, EDMOFR, EDMCNT, EDMREQ, EDMSTS, EDMSBS, EDMDBS, EDMBWR, and EDMPRF.

19.2.2 EXDMAC Controller Security Attribution Register (EXDMACSAR)

Address(es): CPSCU.EXDMACSAR 8701 8038h, CPSCU_NS.EXDMACSAR 0701 8038h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAXSTSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DMAXSTSA0	EXDMA EDMAST Security Attribution Setting 0	0: Secure 1: Non-secure	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

For EXDMAC, security attribution is set for each channel. However, security attribution of the EDMAST and EDMCTL registers is set by this register.

DMAXSTSA0 Bit (EXDMA EDMAST Security Attribution Setting 0)

The DMAXSTSA0 bit specifies security attribution of the EDMAST and EDMCTL registers.

19.2.3 EXDMA Source Address Register (EDMSAR)

Address(es): EXDMAC0.EDMSAR 8701 A000h, EXDMAC1.EDMSAR 8701 A040h,
EXDMAC0_NS.EDMSAR 0701 A000h, EXDMAC1_NS.EDMSAR 0701 A040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer source start address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the EDMSAR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0).

19.2.4 EXDMA Source Reload Address Register (EDMSRR)

Address(es): EXDMAC0.EDMSRR 8701 A020h, EXDMAC1.EDMSRR 8701 A060h,
EXDMAC0_NS.EDMSRR 0701 A020h, EXDMAC1_NS.EDMSRR 0701 A060h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer source reload address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

EDMSRR register is used to specify the DMA transfer source start and reload addresses in repeat-block transfer mode. Set EDMSRR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0). Set the same value to EDMSRR register as that of EDMSAR register. For details on the repeat-block transfer mode operation, see section (4), Repeat-Block Transfer Mode. In normal transfer mode, repeat transfer mode and block transfer mode, EDMSRR register is not used. The setting is invalid.

19.2.5 EXDMA Destination Address Register (EDMDAR)

Address(es): EXDMAC0.EDMDAR 8701 A004h, EXDMAC1.EDMDAR 8701 A044h, EXDMAC0_NS.EDMDAR 0701 A004h, EXDMAC1_NS.EDMDAR 0701 A044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer destination start address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the EDMDAR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0).

19.2.6 EXDMA Destination Reload Address Register (EDMDRR)

Address(es): EXDMAC0.EDMDRR 8701 A024h, EXDMAC1.EDMDRR 8701 A064h, EXDMAC0_NS.EDMDRR 0701 A024h, EXDMAC1_NS.EDMDRR 0701 A064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the transfer destination reload address	0000 0000h to FFFF FFFFh (4 Gbytes)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

EDMDRR register is used to specify the DMA transfer destination start and reload addresses in repeat-block transfer mode. Set EDMDRR register while EXDMAC activation is disabled (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0). Set the same value to EDMDRR register as that of EDMDAR register. For details on the repeat-block transfer mode operation, see section (4), Repeat-Block Transfer Mode. In normal transfer mode, repeat transfer mode and block transfer mode, EDMDRR register is not used. The setting is invalid.

19.2.7 EXDMA Transfer Count Register (EDMCRA)

Address(es): EXDMAC0.EDMCRA 8701 A008h, EXDMAC1.EDMCRA 8701 A048h,
EXDMAC0_NS.EDMCRA 0701 A008h, EXDMAC1_NS.EDMCRA 0701 A048h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	EDMCRAH[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDMCRAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMCRAL[15:0]	Lower Bits of Transfer Count	Specifies the number of transfer operations	R/W
b25 to b16	EDMCRAH[9:0]	Upper Bits of Transfer Count		R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note: Set the same value for EDMCRAH[9:0] and EDMCRAL[15:0] bits in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode and block transfer mode.

(1) Normal Transfer Mode (EDMTMD.MD[1:0] Bits = 00b)

The EDMCRAL[15:0] bits function as a 16-bit transfer counter. The number of transfer operations is one when the setting is 0001h, and 65535 when it is FFFFh. The value is decremented by one each time data is transferred. When the setting is 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function). Free running function is not selected by EDMTMD.TKP bit in normal transfer mode. The EDMCRAH[9:0] bits are not used in normal transfer mode. Write 000h to the EDMCRAH[9:0] bits.

(2) Repeat Transfer Mode (EDMTMD.MD[1:0] Bits = 01b)

The EDMCRAH[9:0] bits hold the repeat size and the EDMCRAL[15:0] bits function as a 10-bit transfer counter. The number of transfer operations is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In repeat transfer mode, a value in the range of 000h to 3FFh can be set for the EDMCRAH[9:0] and EDMCRAL[15:0] bits. Setting bits 15 to 10 in the EDMCRAL[15:0] bits is invalid. Write 0 to these bits. The value in the EDMCRAL[15:0] bits is decremented by one each time data is transferred until it reaches 000h, at which the value in the EDMCRAH[9:0] bits is loaded into the EDMCRAL[15:0] bits.

(3) Block Transfer Mode (EDMTMD.MD[1:0] Bits = 10b)

The EDMCRAH[9:0] bits hold the block size and the EDMCRAL[15:0] bits function as a 10-bit block size counter. The block size is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In block transfer mode, a value in the range of 000h to 3FFh can be set for the EDMCRAH[9:0] and EDMCRAL[15:0] bits. Setting bits 15 to 10 in the EDMCRAL[15:0] bits is invalid. Write 0 to these bits. The value in the EDMCRAL[15:0] bits is decremented by one each time data is transferred until it reaches 000h, at which the value in the EDMCRAH[9:0] bits is loaded into the EDMCRAL[15:0] bits.

(4) Repeat-Block Transfer Mode (EDMTMD.MD[1:0] Bits = 11b)

The EDMCRAH[9:0] bits hold the block size and the EDMCRAL[15:0] bits function as a 10-bit block size counter. The block size is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In repeat-block transfer

mode, a value in the range of 000h to 3FFh can be set for the EDMCRAH[9:0] and EDMCRAL[15:0] bits. Setting bits 15 to 10 in the EDMCRAL[15:0] bits is invalid. Write 0 to these bits. The value in the EDMCRAL[15:0] bits is decremented by one each time data is transferred until it reaches 000h, at which the value in the EDMCRAH[9:0] bits is loaded into the EDMCRAL[15:0] bits.

19.2.8 EXDMA Block Transfer Count Register (EDMCRB)

Address(es): EXDMAC0.EDMCRB 8701 A00Ch, EXDMAC1.EDMCRB 8701 A04Ch, EXDMAC0_NS.EDMCRB 0701 A00Ch, EXDMAC1_NS.EDMCRB 0701 A04Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EDMCRBH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDMCRBL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMCRBL[15:0]	Lower Bits of Block Transfer Count	Counts the number of block, repeat or repeat-block transfer operations	R/W
b31 to b16	EDMCRBH[15:0]	Upper Bits of Block Transfer Count		R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the same value for EDMCRBH[15:0] and EDMCRBL[15:0] bits in repeat transfer mode, block transfer mode, and repeat-block transfer mode. EDMCRBH[15:0] and EDMCRBL[15:0] bits specifies and counts, respectively, the number of transfer operations in block, repeat, and repeat-block transfer mode. The number of transfer operations is one when the setting is 0001h, 65535 when it is FFFFh, and 65536 when it is 0000h. In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred. In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final block data is transferred. In normal transfer mode, do not use the EDMCRB register because the setting is invalid. When EDMTMD.TKP bit is 1 and the final data of one repeat size or one block size is transferred, EDMCRBL[15:0] bits are reloaded with the value of EDMCRBH[15:0] bits automatically.

19.2.9 EXDMA Transfer Mode Register (EDMTMD)

Address(es): EXDMAC0.EDMTMD 8701 A010h, EXDMAC1.EDMTMD 8701 A050h, EXDMAC0_NS.EDMTMD 0701 A010h, EXDMAC1_NS.EDMTMD 0701 A050h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MD[1:0]		DTS[1:0]		—	TKP	SZ[1:0]		—	—	—	—	—	—	DCTG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	DCTG[1:0]	Transfer Request Source Select	b1 b0 0 0: Software 0 1: Interrupts*1 from peripheral modules or external interrupt input pins 1 0: Setting prohibited 1 1: Setting prohibited	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	SZ[1:0]	Data Transfer Size	b9 b8 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: 64 bits	R/W
b10	TKP	Transfer Keeping	0: Transfer is stopped by completion of specified total number of transfer operations. 1: Transfer is not stopped by completion of specified total number of transfer operations (free-running).	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b13, b12	DTS[1:0]	Repeat Area Select	b13 b12 0 0: The destination is specified as the repeat area or block area. 0 1: The source is specified as the repeat area or block area. 1 0: The repeat area or block area is not specified. 1 1: Setting prohibited	R/W
b15, b14	MD[1:0]	Transfer Mode Select	b15 b14 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Repeat-block transfer	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. EXDMAC trigger source is selected using the ICU.SELEXDRn registers. For details on EXDMAC trigger sources, see Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

DTS[1:0] Bits (Repeat Area Select)

DTS[1:0] bits select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

TKP Bit (Transfer Keeping)

TKP bit selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

19.2.10 EXDMA Interrupt Setting Register (EDMINT)

Address(es): EXDMAC0.EDMINT 8701 A013h, EXDMAC1.EDMINT 8701 A053h, EXDMAC0_NS.EDMINT 0701 A013h, EXDMAC1_NS.EDMINT 0701 A053h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DTIE	ESIE	RPTIE	SARIE	DARIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DARIE	Destination Address Extended Repeat Area Overflow Interrupt Enable	0: Disables an interrupt request for an extended repeat area overflow on the destination address 1: Enables an interrupt request for an extended repeat area overflow on the destination address	R/W
b1	SARIE	Source Address Extended Repeat Area Overflow Interrupt Enable	0: Disables an interrupt request for an extended repeat area overflow on the source address 1: Enables an interrupt request for an extended repeat area overflow on the source address	R/W
b2	RPTIE	Repeat Size End Interrupt Enable	0: Disables the repeat size end interrupt request. 1: Enables the repeat size end interrupt request.	R/W
b3	ESIE	Transfer Escape End Interrupt Enable	0: Disables the transfer escape end interrupt request. 1: Enables the transfer escape end interrupt request.	R/W
b4	DTIE	Transfer End Interrupt Enable	0: Disables the transfer end interrupt request. 1: Enables the transfer end interrupt request.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DARIE Bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while this bit is set to 1, the EDMCNT.DTE bit is set to 0. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that an interrupt due to an extended repeat area overflow on the destination address is requested. When block transfer mode is used with the extended repeat area function, an interrupt is requested when transfer of each single-block size of data is completed. When you set 1 in the EDMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped. When the extended repeat area is not specified for the destination address, this bit is ignored. When you use repeat-block transfer mode, do not set this bit to 1.

SARIE Bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while this bit is set to 1, the EDMCNT.DTE bit is set to 0. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that an interrupt due to an extended repeat area overflow on the source address is requested. When block transfer mode is used with the extended repeat area function, an interrupt is requested when transfer of each single-block size of data is completed. When you set 1 in the EDMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped. When the extended repeat area is not specified for the source address, this bit is ignored. When you use repeat-block transfer mode, do not set this bit to 1.

RPTIE Bit (Repeat Size End Interrupt Enable)

When this bit is set to 1 in repeat transfer mode, the EDMCNT.DTE bit is set to 0 when transfer of each single-repeat size of data is completed. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the EDMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified). When this bit is set to 1 in block transfer mode, the EDMCNT.DTE bit is set to 0 when transfer of each single-block size of data is completed in the same way as repeat transfer mode. At the same time, the EDMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the EDMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified). When you use repeat-block transfer mode, do not set this bit to 1.

ESIE Bit (Transfer Escape End Interrupt Enable)

This bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and interrupt requests for extended repeat area overflows on the source and destination addresses) that are generated during DMA transfer. The transfer escape end interrupt is generated when the EDMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by setting this bit or the EDMSTS.ESIF flag to 0.

DTIE Bit (Transfer End Interrupt Enable)

This bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers. The transfer end interrupt is generated when the EDMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by setting this bit or the EDMSTS.DTIF flag to 0.

19.2.11 EXDMA Address Mode Register (EDMAMD)

Address(es): EXDMAC0.EDMAMD 8701 A014h, EXDMAC1.EDMAMD 8701 A054h,
EXDMAC0_NS.EDMAMD 0701 A014h, EXDMAC1_NS.EDMAMD 0701 A054h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SM[1:0]		SADR	SARA[4:0]					DM[1:0]		DADR	DARA[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	DARA[4:0]	Destination Address Extended Repeat Area Setting	Specifies the extended repeat area on the destination address. For details on the settings, see Table 19.2.	R/W
b5	DADR	Destination Address Update Setting after Reload	0: Only reloading. 1: Add index after reloading.	R/W
b7, b6	DM[1:0]	Destination Address Update Mode Select	b7 b6 0 0: Destination address is fixed. 0 1: Offset addition 1 0: Destination address is incremented. 1 1: Destination address is decremented.	R/W
b12 to b8	SARA[4:0]	Source Address Extended Repeat Area Setting	Specifies the extended repeat area on the source address. For details on the settings, see Table 19.2.	R/W
b13	SADR	Source Address Update Setting after Reload	0: Only reloading. 1: Add index after reloading.	R/W
b15, b14	SM[1:0]	Source Address Update Mode Select	b15 b14 0 0: Source address is fixed. 0 1: Offset addition 1 0: Source address is incremented. 1 1: Source address is decremented.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DARA[4:0] Bits (Destination Address Extended Repeat Area Setting)

These bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes. That is, the interval between settings is any power of two. When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set. When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when EDMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits. In repeat-block transfer mode, write 00000b in the DARA[4:0] bits. An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the EDMINT.DARIE bit set to 1. Table 19.2 lists the settings and the corresponding extended repeat areas.

Note: When setting the extended repeat area, set the lowest bit or lower bits of EDMDAR as follows according to the setting of EDMTMD.SZ[1:0].
When EDMTMD.SZ[1:0] = 01b (16 bits), set EDMDAR[0] to 0b.
When EDMTMD.SZ[1:0] = 10b (32 bits), set EDMDAR[1:0] to 00b.
When EDMTMD.SZ[1:0] = 11b (64 bits), set EDMDAR[2:0] to 000b.

DADR Bit (Destination Address Update Setting after Reload)

In repeat-block transfer mode, this bit specifies the behavior of EDMDAR register after reloading the value of EDMDRR

register. When this bit is set to 1, an index value ((EDMDBSH – EDMDBSL) × transfer data size) is added to EDMDAR register after reloading the value of EDMDRR register. When this bit is set to 0, EDMDAR register only reloads EDMDRR register. This behavior is described in Table 19.13. In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] Bits (Destination Address Update Mode Select)

These bits select the mode of updating the destination address. When increment is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the destination address is incremented by 1, 2, 4, and 8, respectively. When decrement is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the destination address is decremented by 1, 2, 4, and 8, respectively. When offset addition is selected, the offset specified by the EDMOFR register is added to the address.

SARA[4:0] Bits (Source Address Extended Repeat Area Setting)

These bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes. When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set. When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when EDMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits. In repeat-block transfer mode, write 00000b in the SARA[4:0] bits. An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the EDMINT.SARIE bit set to 1. Table 19.2 lists the settings and the corresponding extended repeat areas.

Note: When setting the extended repeat area, set the lowest bit or lower bits of EDMSAR as follows according to the setting of EDMTMD.SZ[1:0].
When EDMTMD.SZ[1:0] = 01b (16 bits), set EDMSAR[0] to 0b.
When EDMTMD.SZ[1:0] = 10b (32 bits), set EDMSAR[1:0] to 00b.
When EDMTMD.SZ[1:0] = 11b (64 bits), set EDMSAR[2:0] to 000b.

SADR Bit (Source Address Update Setting after Reload)

In repeat-block transfer mode, this bit specifies the behavior of EDMSAR after reloading the value of EDMSRR. When this bit is set to 1, an index value ((EDMSBSH – EDMSBSL) × transfer data size) is added to EDMSAR after reloading the value of EDMSRR. When this bit is set to 0, EDMSAR only reloads EDMSRR. This behavior is described in Table 19.12. In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] Bits (Source Address Update Mode Select)

These bits select the mode of updating the source address. When increment is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the source address is incremented by 1, 2, 4, and 8, respectively. When decrement is selected and the EDMTMD.SZ[1:0] bits are set to 00b, 01b, 10b, and 11b, the source address is decremented by 1, 2, 4, and 8, respectively. When offset addition is selected, the offset specified by the EDMOFR register is added to the address.

Table 19.2 Settings and Corresponding Extended Repeat Areas

SARA[4:0] or DARA[4:0]	Extended Repeat Area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 Kbyte specified as extended repeat area by the lower 10 bits of the address
01011b	2 Kbytes specified as extended repeat area by the lower 11 bits of the address
01100b	4 Kbytes specified as extended repeat area by the lower 12 bits of the address
01101b	8 Kbytes specified as extended repeat area by the lower 13 bits of the address
01110b	16 Kbytes specified as extended repeat area by the lower 14 bits of the address
01111b	32 Kbytes specified as extended repeat area by the lower 15 bits of the address
10000b	64 Kbytes specified as extended repeat area by the lower 16 bits of the address
10001b	128 Kbytes specified as extended repeat area by the lower 17 bits of the address
10010b	256 Kbytes specified as extended repeat area by the lower 18 bits of the address
10011b	512 Kbytes specified as extended repeat area by the lower 19 bits of the address
10100b	1 Mbyte specified as extended repeat area by the lower 20 bits of the address
10101b	2 Mbytes specified as extended repeat area by the lower 21 bits of the address
10110b	4 Mbytes specified as extended repeat area by the lower 22 bits of the address
10111b	8 Mbytes specified as extended repeat area by the lower 23 bits of the address
11000b	16 Mbytes specified as extended repeat area by the lower 24 bits of the address
11001b	32 Mbytes specified as extended repeat area by the lower 25 bits of the address
11010b	64 Mbytes specified as extended repeat area by the lower 26 bits of the address
11011b	128 Mbytes specified as extended repeat area by the lower 27 bits of the address
11100b to 11111b	Setting prohibited.

19.2.12 EXDMA Offset Register (EDMOFR)

Address(es): EXDMAC0.EDMOFR 8701 A018h, EXDMAC1.EDMOFR 8701 A058h,
EXDMAC0_NS.EDMOFR 0701 A018h, EXDMAC1_NS.EDMOFR 0701 A058h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	Setting Range	R/W
b31 to b0	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination.	0000 0000h to 00FF FFFFh (0 bytes to (16 M – 1) bytes) FF00 0000h to FFFF FFFFh (–16 Mbytes to –1 byte)	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Write to this register while the EXDMAC operation is stopped (EDMAST.DMST = 0) or DMA transfer is disabled (EDMCNT.DTE = 0) (not during data transfer). Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading EDMOFR register returns the extended value. In repeat-block transfer mode, the offset cannot be specified by EDMOFR when offset addition is selected, write 0000 0000h to EDMOFR register.

19.2.13 EXDMA Transfer Enable Register (EDMCNT)

Address(es): EXDMAC0.EDMCNT 8701 A01Ch, EXDMAC1.EDMCNT 8701 A05Ch, EXDMAC0_NS.EDMCNT 0701 A01Ch, EXDMAC1_NS.EDMCNT 0701 A05Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DTE	DMA Transfer Enable	0: Disables DMA transfer. 1: Enables DMA transfer.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DTE Bit (DMA Transfer Enable)

When the EDMAST.DMST bit is set to 1 (EXDMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel. If the DTE bit is cleared during DMA transfer, no transfer requests for the corresponding channel will be accepted after the transfer ends.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped due to the occurrence of an access error. See section 19.5, Processing on DMA Transfer Error.

19.2.14 EXDMA Software Start Register (EDMREQ)

Address(es): EXDMAC0.EDMREQ 8701 A01Dh, EXDMAC1.EDMREQ 8701 A05Dh, EXDMAC0_NS.EDMREQ 0701 A01Dh, EXDMAC1_NS.EDMREQ 0701 A05Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SWREQ	DMA Software Start	Writing 1 to this bit triggers the generation of a DMA transfer request, and DMA transfer is started in response to the request	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	CLRS	DMA Software Start Bit Auto Clear Setting	0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

SWREQ Bit (DMA Software Start)

When 1 is written to this bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is set to 0 if the CLRS bit is set to 0. This bit is not set to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer. Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the EDMTMD.DCTG[1:0] bits are set to 00b (EXDMAC trigger source is software). Setting this bit is invalid when the EDMTMD.DCTG[1:0] bits are set to a value other than 00b. To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When DMA transfer is stopped due to the occurrence of an access error. See section 19.5, Processing on DMA Transfer Error.
- When 0 is written to this bit.

CLRS Bit (DMA Software Start Bit Auto Clear Setting)

This bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is set to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not set to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

19.2.15 EXDMA Status Register (EDMSTS)

Address(es): EXDMAC0.EDMSTS 8701 A01Eh, EXDMAC1.EDMSTS 8701 A05Eh, EXDMAC0_NS.EDMSTS 0701 A01Eh, EXDMAC1_NS.EDMSTS 0701 A05Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	DTIF	—	—	—	ESIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ESIF	Transfer Escape End Interrupt Flag	0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated.	R/W*1
b3 to b1	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b4	DTIF	Transfer End Interrupt Flag	0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated.	R/W*1
b6, b5	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	ACT	EXDMA Active Flag	0: EXDMAC operation is suspended. 1: EXDMAC is operating.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. Only 0 can be written to clear the flag.

ESIF Flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- Transfer of each single-repeat size of data is completed in repeat transfer mode with the EDMINT.RPTIE bit set to 1.
- Transfer of each single-block size of data is completed in block transfer mode with the EDMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the EDMINT.SARIE bit is set to 1 and the EDMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address)
- When an extended repeat area overflow on the destination address occurs while the EDMINT.DARIE bit is set to 1 and the EDMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address)

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the EDMCNT.DTE bit.

DTIF Flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of the EDMCRAL[15:0] bits has become 0000h on completion of transfer)
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of the EDMCRBL[15:0] bits has become 0000h on completion of transfer (EDMTMD.TKP = 0), or the EDMCRBL[15:0] bits have been reloaded with the value of the EDMCRBH[15:0] bits (EDMTMD.TKP = 1))
- When the specified number of blocks has been transferred in block transfer mode (the value of the

EDMCRBL[15:0] bits has become 0000h on completion of transfer (EDMTMD.TKP = 0), or the EDMCRBL[15:0] bits have been reloaded with the value of the EDMCRBH[15:0] bits (EDMTMD.TKP = 1))

- When the specified number of blocks has been transferred in repeat-block transfer mode (the value of the EDMCRBL[15:0] bits has become 0000h on completion of transfer (EDMTMD.TKP = 0), or the EDMCRBL[15:0] bits have been reloaded with the value of the EDMCRBH[15:0] bits (EDMTMD.TKP = 1))

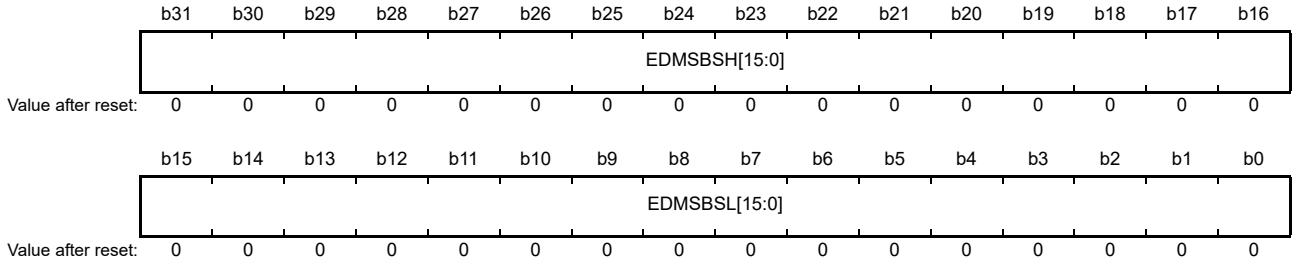
[Clearing conditions]

- When 0 is written to this bit
- When 1 is written to the EDMCNT.DTE bit

ACT Flag (EXDMA Active Flag)

This flag indicates whether the EXDMAC is in the idle or active state.

[Setting condition]



- When the EXDMAC starts data transfer operation

[Clearing condition]

- When data transfer in response to one transfer request is completed

19.2.16 EXDMA Source Buffer Size Register (EDMSBS)

Address(es): EXDMAC0.EDMSBS 8701 A028h, EXDMAC1.EDMSBS 8701 A068h,
EXDMAC0_NS.EDMSBS 0701 A028h, EXDMAC1_NS.EDMSBS 0701 A068h

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMSBSL[15:0]	Lower Bits of Source Buffer Size	Functions as data transfer counter in repeat-block transfer mode	R/W
b31 to b16	EDMSBSH[15:0]	Upper Bits of Source Buffer Size	Specifies the repeat-area size in repeat-block transfer mode	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the same value for the EDMSBSH[15:0] and EDMSBSL[15:0] bits in repeat-block transfer mode. Write 00000000h to the EDMSBS register in normal, repeat and block transfer mode. The EDMSBSH[15:0] bits specify buffer size and the EDMSBSL[15:0] bits function as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by the EDMSBSH[15:0] bits. When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting the EDMSBSH[15:0] and EDMSBSL[15:0] bits to 0000h is prohibited. When final data of one buffer size is transferred, the EDMSBSL[15:0] bits are reloaded with the value of the EDMSBSH[15:0] bits. When address update mode is fixed address, this register is ignored. Table 19.3 lists the setting values of Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 19.3 Available Setting for EDMSBS Register in Repeat-Block Transfer Mode

Source Address Update Mode (EDMAMD.SM)	Transfer Data Size (EDMTMD.SZ)	Available Setting for EDMSBSH[15:0] and EDMSBSL[15:0] Bits
Source address is fixed. (SM = 00b)	Don't care	0000h (EDMSBS is not used)
Offset addition (SM = 01b)	8 bits (SZ = 00b)	0001h to FFFFh (1 to 65535)
	16 bits (SZ = 01b)	0001h to 7FFFh (1 to 32767)
	32 bits (SZ = 10b)	0001h to 3FFFh (1 to 16383)
Source address is incremented or decremented. (SM = 1xb)	Don't care	0000h (infinite) 0001h to FFFFh (1 to 65535)

19.2.17 EXDMA Destination Buffer Size Register (EDMDBS)

Address(es): EXDMAC0.EDMDBS 8701 A02Ch, EXDMAC1.EDMDBS 8701 A06Ch,
EXDMAC0_NS.EDMDBS 0701 A02Ch, EXDMAC1_NS.EDMDBS 0701 A06Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EDMDBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDMDBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EDMDBSL[15:0]	Lower Bits of Destination Buffer Size	Functions as data transfer counter in repeat-block transfer mode	R/W
b31 to b16	EDMDBSH[15:0]	Upper Bits of Destination Buffer Size	Specifies the repeat-area size in repeat-block transfer mode	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Set the same value for the EDMDBSH[15:0] and EDMDBSL[15:0] bits in repeat-block transfer mode. Write 00000000h to the EDMDBS register in normal, repeat and block transfer mode. The EDMDBSH[15:0] bits specify buffer size and the EDMDBSL[15:0] bits function as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by the EDMDBSH[15:0] bits. When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting the EDMDBSH[15:0] and EDMDBSL[15:0] bits to 0000h is prohibited. When final data of one buffer size is transferred, the EDMDBSL[15:0] bits are reloaded with the value of the EDMDBSH[15:0] bits. When address update mode is fixed address, this register is ignored. Table 19.4 lists the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 19.4 Available Setting for EDMDBS Register in Repeat-Block Transfer Mode

Destination Address Update Mode (EDMAMD.DM)	Transfer Data Size (EDMTMD.SZ)	Available Setting for EDMDBSH[15:0] and EDMDBSL[15:0] Bits
Destination address is fixed. (DM = 00b)	Don't care	0000h (EDMDBS is not used)
Offset addition (DM = 01b)	8 bits (SZ = 00b)	0001h to FFFFh (1 to 65535)
	16 bits (SZ = 01b)	0001h to 7FFFh (1 to 32767)
	32 bits (SZ = 10b)	0001h to 3FFFh (1 to 16383)
Destination address is incremented or decremented. (DM = 1xb)	Don't care	0000h (infinite) 0001h to FFFFh (1 to 65535)

19.2.18 EXDMA Bufferable Write Enable Register (EDMBWR)

Address(es): EXDMAC0.EDMBWR 8701 A030h, EXDMAC1.EDMBWR 8701 A070h,
EXDMAC0_NS.EDMBWR 0701 A030h, EXDMAC1_NS.EDMBWR 0701 A070h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BWE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BWE	Bufferable Write Enable	0: Disables bufferable write 1: Enables bufferable write	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

BWE Bit (Bufferable Write Enable)

This bit specifies enabling or disabling of bufferable writing. If this bit is 1, even if the write access as the EXDMAC is completed, the actual slave writing may not have ended. When an error occurs during writing to a bufferable area (area in which a buffer is interposed during writing) of a slave device, the detected error is referred to as a “bufferable write error”. DMA transfer is not terminated at this time. For details, see section 19.8.1, Bus Response to DMA Write Access.

19.2.19 EXDMAC Module Start Register (EDMAST)

Address(es): EXDMAC.EDMAST 8701 A800h,
EXDMAC_NS.EDMAST 0701 A800h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DMST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DMST	EXDMAC Module Start	0: EXDMAC module stop 1: EXDMAC module start	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DMST Bit (EXDMAC Module Start)

When this bit is set to 1, EXDMAC is ready to accept transfer requests for all channels. When 1 is written to the EDMCNT.DTE bit (DMA transfer is enabled) of multiple channels and then this bit is set to 1 (EXDMAC module start), the corresponding multiple channels can be placed in the transfer request acceptable state at the same time. When the DMST bit is set to 0 during DMA transfer, DMA transfer is suspended after completion of the current data transfer corresponding to a single transfer request. DMA transfer can be resumed by setting the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit

[Clearing condition]

- When 0 is written to this bit

19.2.20 EXDMAC Error Channel Register (EDMECHR)

Address(es): EXDMAC.EDMECHR 8701 A840h, EXDMAC_NS.EDMECHR 0701 A840h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	DMERRW	—	—	—	DMECHSAM	—	—	—	—	DMECH[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DMECH[3:0]	EXDMAC Error Channel Flag	Indicates the channel number causing the error 0000: Error occurred on channel 0 0001: Error occurred on channel 1	R
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	DMECHSAM	EXDMAC Error Channel Security Attribution Monitor Flag	Indicates the security attribution of a channel causing the error 0: Secure channel 1: Non-secure channel	R
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	DMERRW	EXDMAC Error Access Read/ Write Attribute Flag	Indicates the read/write attribute of the error access 0: Read access 1: Write access	R
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DMESTA	EXDMAC Error Status Flag	0: No DMA transfer error occurred 1: DMA transfer error occurred	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

When reading this register, it can be accessed from both secure and non-secure access. When writing this register, it depends on the value of the EDMECHR.DMECHSAM flag.

- When the value of the EDMECHR.DMECHSAM flag is 1, it can be accessed from secure and non-secure access.
- When the value of the EDMECHR.DMECHSAM flag is 0, it can be accessed from secure. An error is returned when write access is performed in a non-secure access.

This register is cleared by a reset. On debugging a program, select an interrupt instead of a reset in the corresponding bits of the registers listed in the interrupt/reset selection column of Table 19.18 in section 19.6.2, Transfer Error Interrupt.

DMECH[3:0] Flag (EXDMAC Error Channel Flag)

When a transfer error due to DMA transfer occurs, this flag stores the channel number of the EXDMAC that was violated. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- When the DMA transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA flag.

DMECHSAM Flag (EXDMAC Error Channel Security Attribution Monitor Flag)

When a transfer error due to DMA transfer occurs, this flag indicates the security attribution of the violating EXDMAC channel. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- When the DMA transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA flag.

DMERRW Flag (EXDMAC Error Access Read/Write Attribute Flag)

Indicates the read/write attribute of the error access.

[Setting condition]

- A DMA transfer error occurs when writing data.

[Clearing condition]

- When 1 is written to DMESTA flag.

DMESTA Flag (EXDMAC Error Status Flag)

Indicates whether or not a DMA transfer error occurred. DMECH[3:0] bits, DMECHSAM flag, DMESTA flag are cleared by writing 1 to DMESTA flag. Writing 0 to DMESTA flag is ignored. When reset was selected in BUSMPU.MMPUOAD.OAD and BUS.MSAOAD.OAD bits, this register is also reset. Select NMI when you want to debug the program.

[Setting condition]

- When the DMA transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA flag.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. When DMECHSAM = 0, it cannot be cleared in the non-secure state.

19.2.21 EXDMAC Control Register (EDMCTL)

Address(es): EXDMAC.EDMCTL 8701 A810h,
EXDMAC_NS.EDMCTL 0701 A810h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	PR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PR	Priority Control Select	0: Fixed priority 1: Round-robin	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Write to this register while the EXDMAC operation is stopped or DMA transfer is disabled. Do not write to it during data transfer.

PR Bit (Priority Control Select)

When the EDMCTL.PR bit is set to 0, arbitration is performed in the fixed priority mode of channel 0 > channel 1 (channel 0: highest priority) and DMA transfer is started. When the EDMCTL.PR bit is set to 1, arbitration is performed in the round-robin mode and DMA transfer is started.

19.2.22 EXDMAC Peripheral Module Request Flag Register (EDMPRF)

Address(es): EXDMAC0.EDMPRF 8701 A03Eh, EXDMAC1.EDMPRF 8701 A07Eh, EXDMAC0_NS.EDMPRF 0701 A03Eh, EXDMAC1_NS.EDMPRF 0701 A07Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	PREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PREQ	Peripheral Module Request Flag	0: No request 1: Requested	R/W*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. writing 0 has no effect.

The EDMPRF register detects a DMA transfer request generated by peripheral module.

PREQ Flag (Peripheral Module Request Flag)

The PREQ flag indicates that a DMA transfer request has been detected from a peripheral module.

[Setting condition]

- When a DMA transfer request occurs form a peripheral module.

[Clearing condition]

- When a DMA transfer request is generated from a peripheral module and the DMA transfer starts.
- When 1 is written to the PREQ flag.

19.3 Operation

19.3.1 Transfer Mode

(1) Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the EDMCRAL[15:0] bits. When these bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running mode). Setting the EDMCRB register is invalid in normal transfer mode. Except in free running mode, a transfer end interrupt request can be generated after completion of the specified number of transfer operations. Table 19.5 lists the register update operation in normal transfer mode, and Figure 19.2 shows an operation example in normal transfer mode.

Table 19.5 Register Update Operation in Normal Transfer Mode

Register	Function	Update Operation after Completion of a Transfer by One Transfer Request
EDMSAR	Transfer source address	Increment/decrement/fixed/offset addition
EDMDAR	Transfer destination address	Increment/decrement/fixed/offset addition
EDMCRA.EDMCRAL[15:0]	Transfer counter	Decremented by one/not updated (in free running mode)
EDMCRA.EDMCRAH[9:0]	—	Not updated (Not used in normal transfer mode)
EDMCRB	—	Not updated (Not used in normal transfer mode)

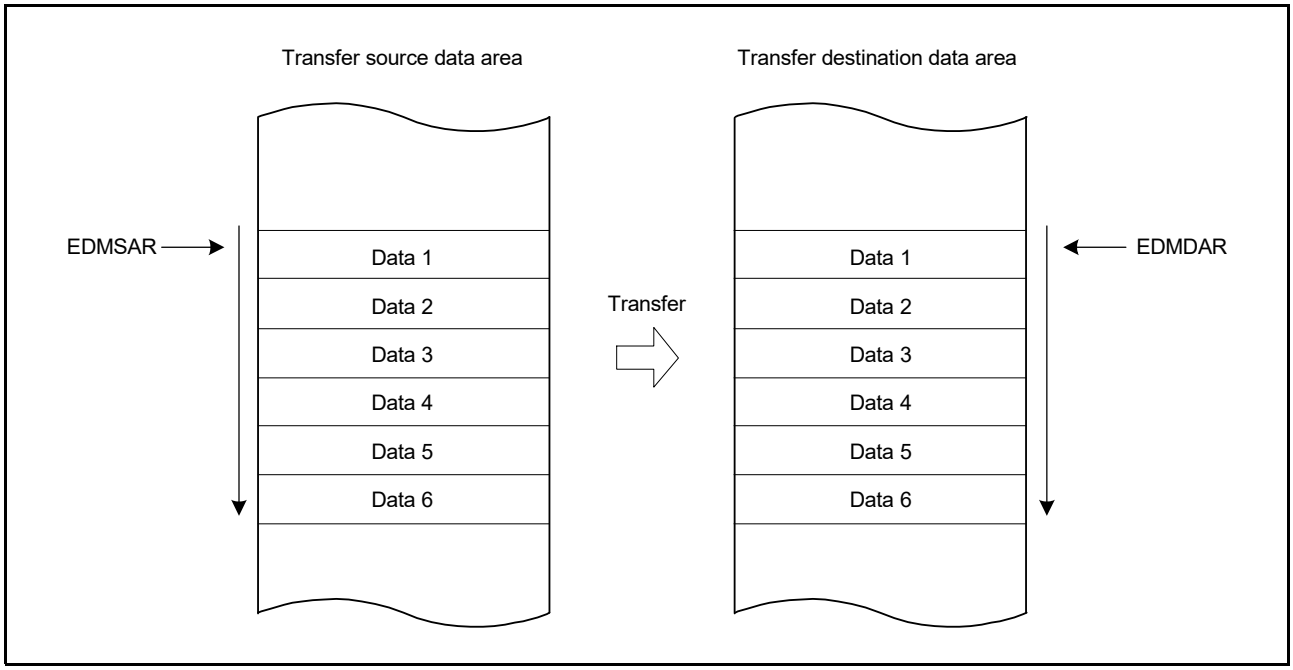


Figure 19.2 Operation Example in Normal Transfer Mode

(2) Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request. A maximum of 1K data can be set as a total repeat transfer size using the EDMCRA register. A maximum of 64K can be set as the number of repeat transfer operations using the EDMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size. Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (EDMSAR or EDMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the EDMCNT.DTE bit in the repeat size end interrupt handling. A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations. Table 19.6 lists the register update operation in repeat transfer mode, and Figure 19.3 shows an operation example in repeat transfer mode.

Table 19.6 Register Update Operation in Repeat Transfer Mode

Register	Function	Update Operation after Completion of a Transfer by One Transfer Request	
		When the EDMCRA.EDMCRAL [15:0] bits are not 1	When the EDMCRA.EDMCRAL[15:0] bits are 1. (Transfer of the Last Data in Repeat Size)
EDMSAR	Transfer source address	Increment/decrement/fixed/ offset addition	• EDMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 01b Initial value of EDMSAR • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMDAR	Transfer destination address	Increment/decrement/fixed/ offset addition	• EDMTMD.DTS[1:0] = 00b Initial value of DMDAR • EDMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMCRA.EDMCRAH [9:0]	Repeat size	Not updated	Not updated
EDMCRA.EDMCRAL [15:0]	Transfer counter	Decremented by one	EDMCRA.EDMCRAH[9:0]
EDMCRB.EDMCRBH [15:0]	Number of repeat transfer operations	Not updated	Not updated
EDMCRB.EDMCRBL [15:0]	Count of repeat transfer operations	Not updated	Decremented by one

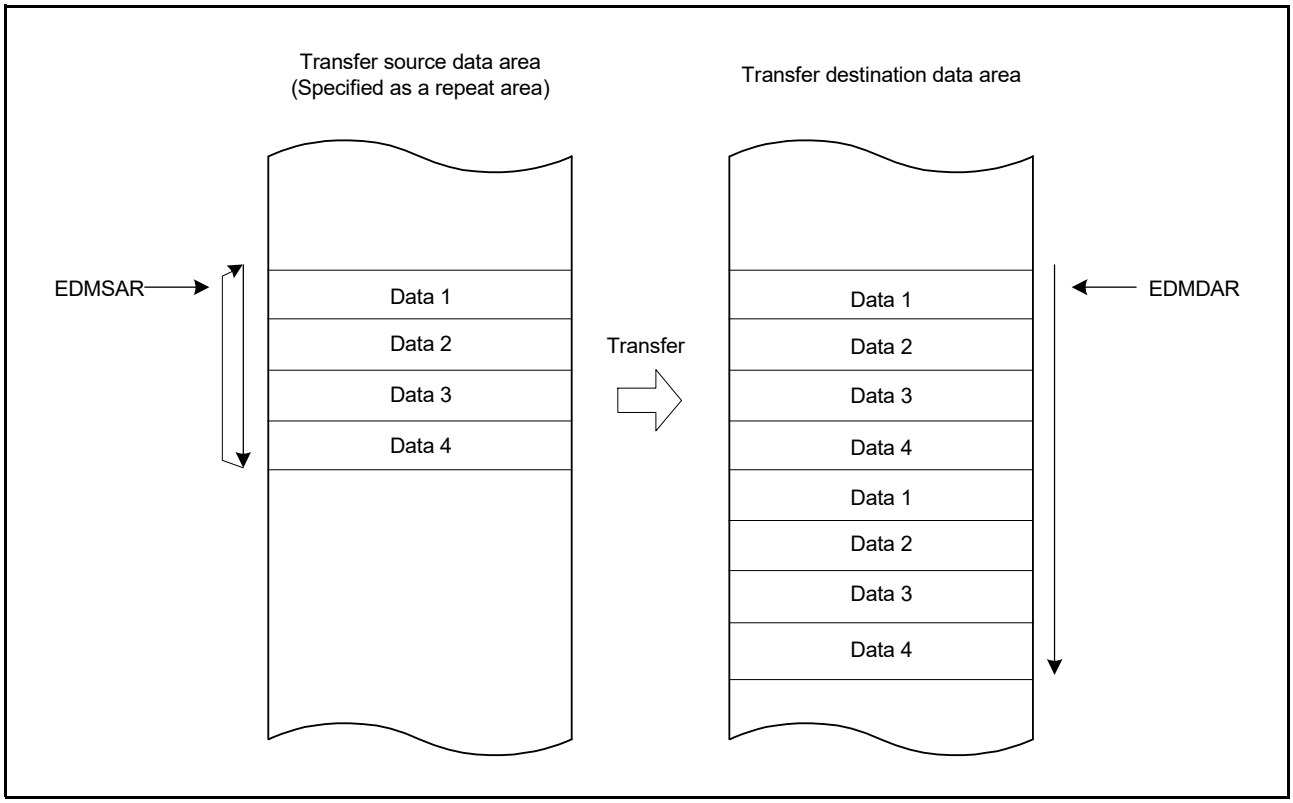

Figure 19.3 Operation Example in Repeat Transfer Mode

(3) Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request. A maximum of 1K data can be set as a total block transfer size using the EDMCRA register. A maximum of 64K can be set as the number of block transfer operations using the EDMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size. Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (EDMSAR or EDMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the EDMCNT.DTE bit in the repeat size end interrupt handling. Transfer end interrupt request can be generated after completion of the specified number of block transfer operations. Table 19.7 lists the register update operation in block transfer mode, and Figure 19.4 shows an operation example in block transfer mode.

Table 19.7 Register Update Operation in Block Transfer Mode

Register	Function	Update Operation after Completion of Single-Block Transfer by One Transfer Request
EDMSAR	Transfer source address	• EDMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 01b Initial value of EDMSAR • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMDAR	Transfer destination address	• EDMTMD.DTS[1:0] = 00b Initial value of EDMDAR • EDMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • EDMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
EDMCRA.EDMCRAH[9:0]	Block size	Not updated
EDMCRA.EDMCRAL[15:0]	Transfer count	EDMCRA.EDMCRAH[9:0]
EDMCRB.EDMCRBH[15:0]	Number of block transfer operations	Not updated
EDMCRB.EDMCRBL[15:0]	Count of block transfer operations	Decremented by one

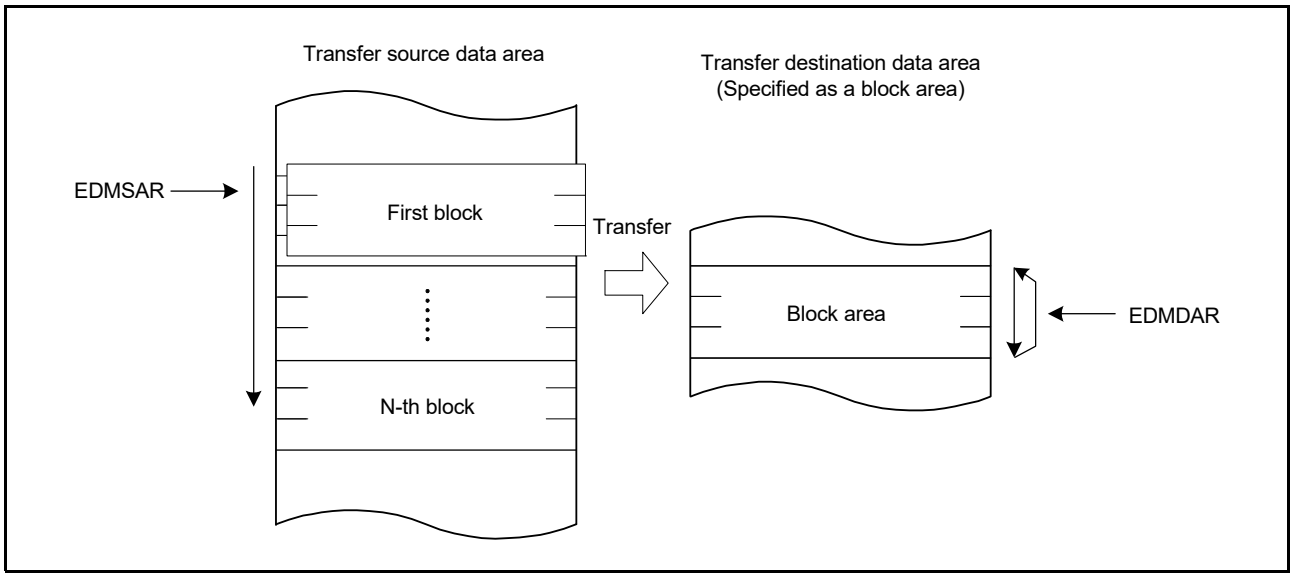

Figure 19.4 Operation Example in Block Transfer Mode

(4) Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.
Repeat function: Added function (ring buffer) to repeat specified address area.
Offset function: Multiple areas with offset can be specified within one block transfer.
The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer. Figure 19.5 shows an example of adding a repeat function to the transfer destination. Figure 19.6 shows repeat-block transfer with an offset to the transfer destination. In repeat-block transfer mode, a single block data is transferred by one transfer request. A maximum of 1K data can be set as a total block transfer size using EDMCRA. A maximum of 64K can be set as the number of block transfer operations using EDMCRB; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.
Generation of a transfer end interrupt request on completion of a specified number of transfer operations is selectable.

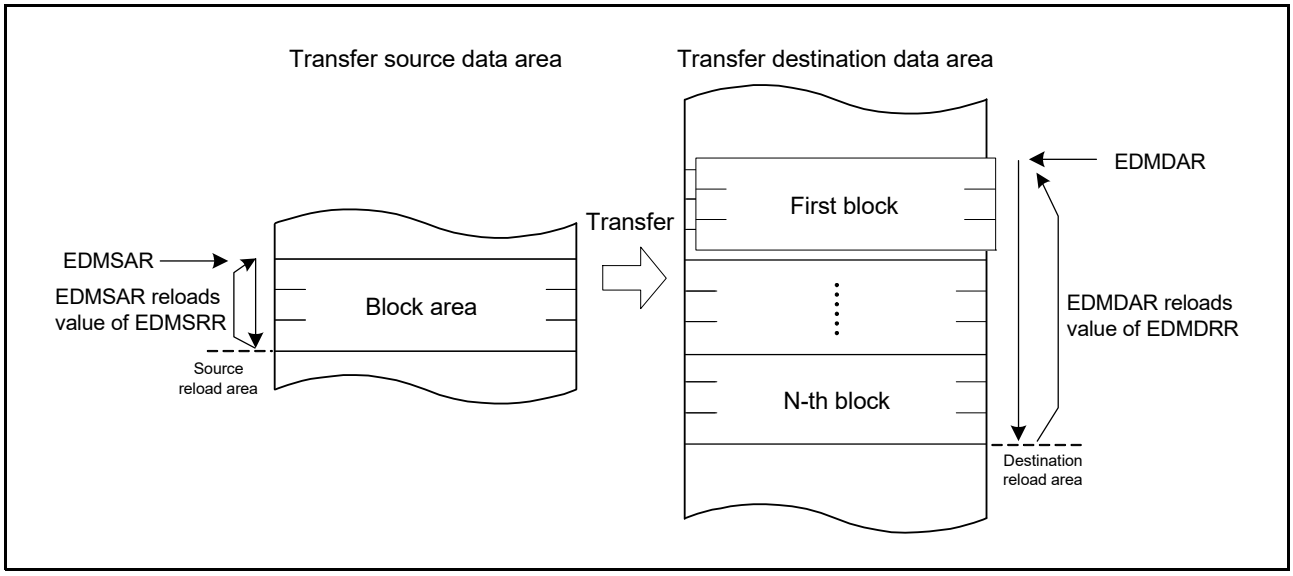

Figure 19.5 Operation Example in Repeat-Block Transfer Mode

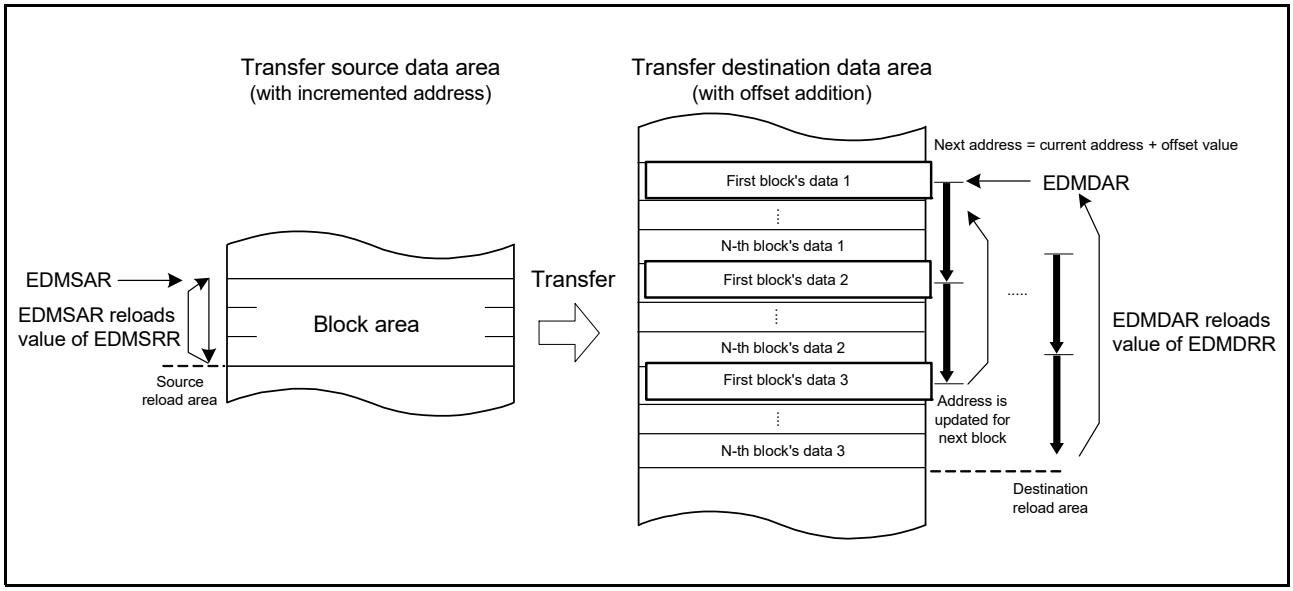

Figure 19.6 Operation Example in Repeat-Block Transfer Mode with Offset Addition

Table 19.8 to Table 19.13 list the register update operations in repeat-block transfer mode.

Table 19.8 Register Update Operation Associated with Source Area in Repeat-Block Transfer Mode (Fixed Address EDMAMD.SM[1:0] = 00b)

For more information about address update operation in repeat-block transfer mode, see section 19.3.5, Address Update Function in Repeat-Block Transfer Mode.

19.3.2 Extended Repeat Area Function

The EXDMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas. The extended repeat areas can be specified separately to the transfer source address register (EDMSAR) and transfer destination address register (EDMDAR). The extended repeat area on the source address is specified by the EDMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the EDMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides. However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area. When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt due to an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the EDMINT.SARIE bit is set to 1, the EDMSTS.ESIF flag is set to 1 and the EDMCNT.DTE bit is set to 0 to stop DMA transfer. At this time, if the EDMINT.ESIE bit is set to 1, an interrupt due to an extended repeat area overflow is requested. When the EDMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the EDMCNT.DTE bit in the interrupt handling. Figure 19.7 shows an example of the extended repeat area operation.

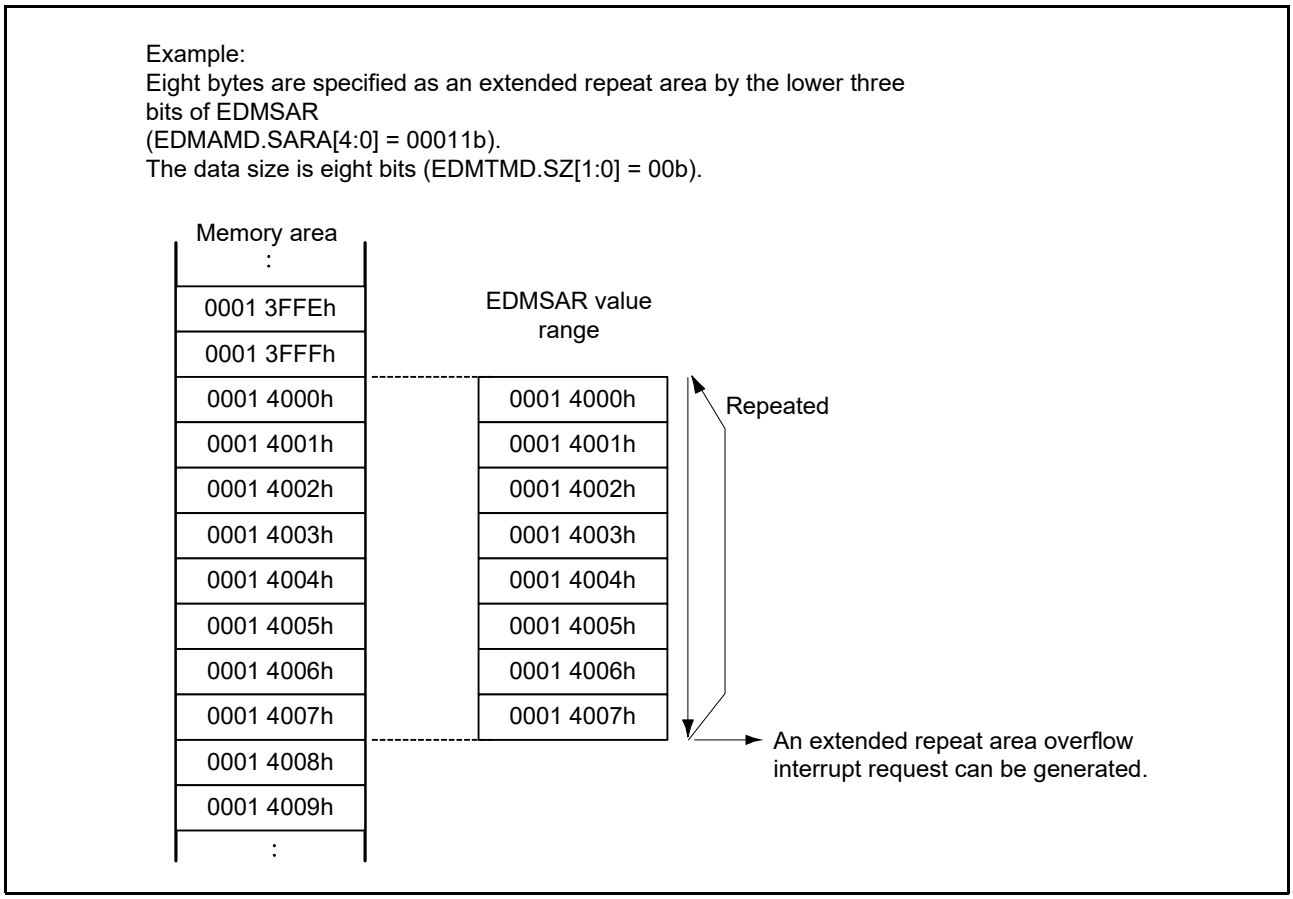

Figure 19.7 Example of Extended Repeat Area Operation

When an interrupt due to an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration. When a transfer is stopped by an interrupt due to an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt due to the overflow is suspended until transfer of the block is completed, and the transfer overruns. Figure 19.8 shows an example when the extended repeat area function is used in block transfer mode.

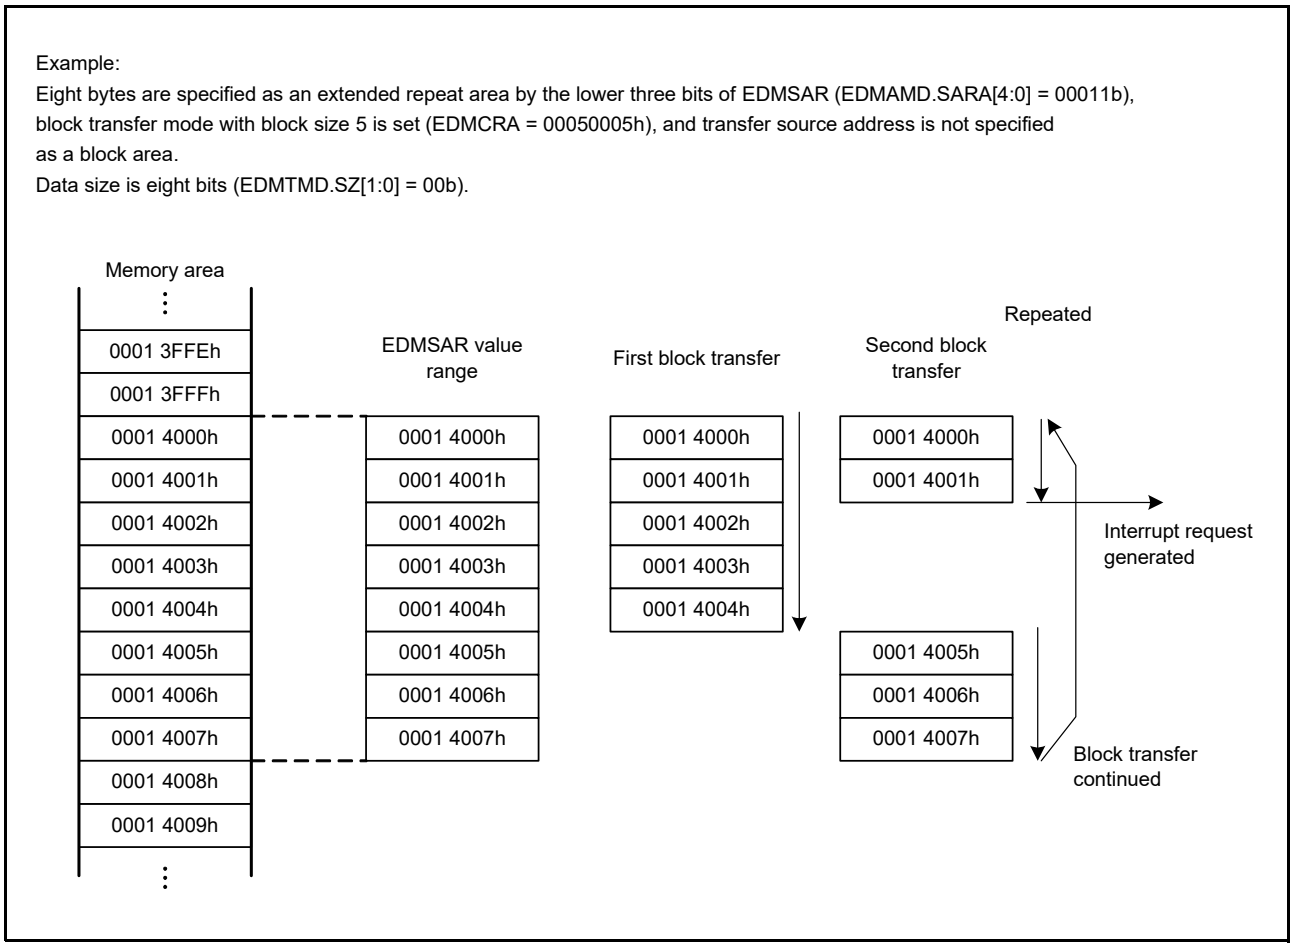

Figure 19.8 Example of Extended Repeat Area Function in Block Transfer Mode

19.3.3 Free-Running Function

The EXDMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

(1) In Normal Transfer Mode

In normal transfer mode, when EDMCRA.EDMCRAL[15:0] bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped. For more information, see section (1), Normal Transfer Mode.

(2) In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the EXDMAC supports free-running function using the EDMTMD.TKP bit. If the EDMTMD.TKP bit is set to 1, the transfer is not stopped by completion of specified total number of transfer operations and the value of the EDMCRBH[9:0] bits is reloaded repeatedly. Figure 19.9 shows an example of block transfer operation without free-running function.

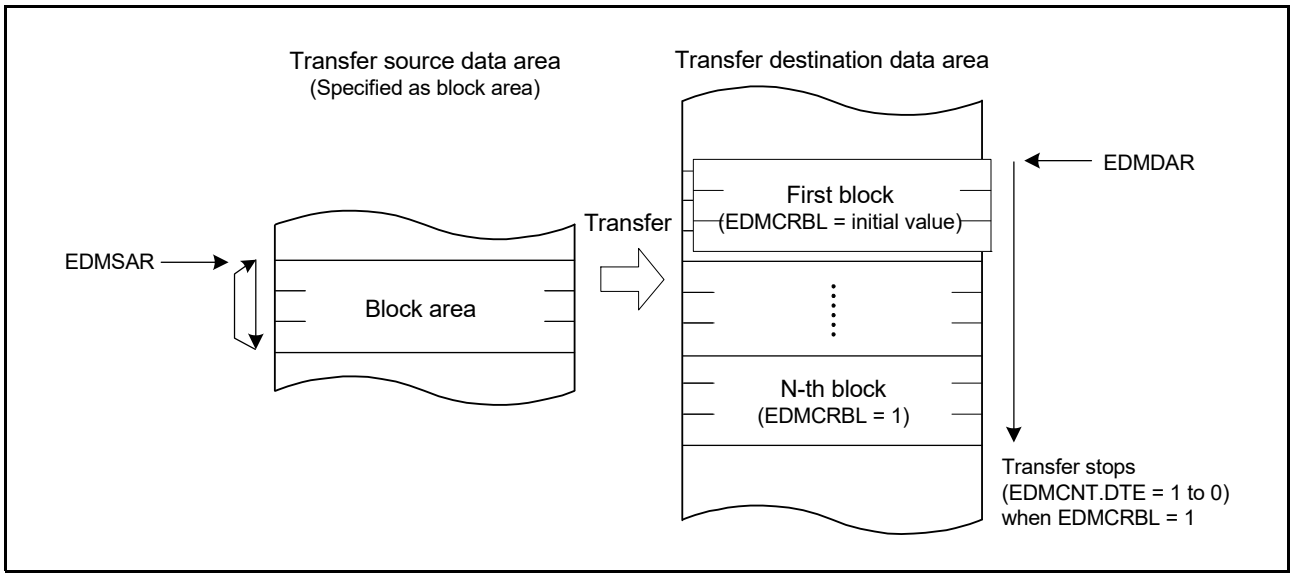

Figure 19.9 Operation in Block Transfer Mode with EDMTMD.TKP = 0

Figure 19.10 shows an example of block transfer operation with free-running function.

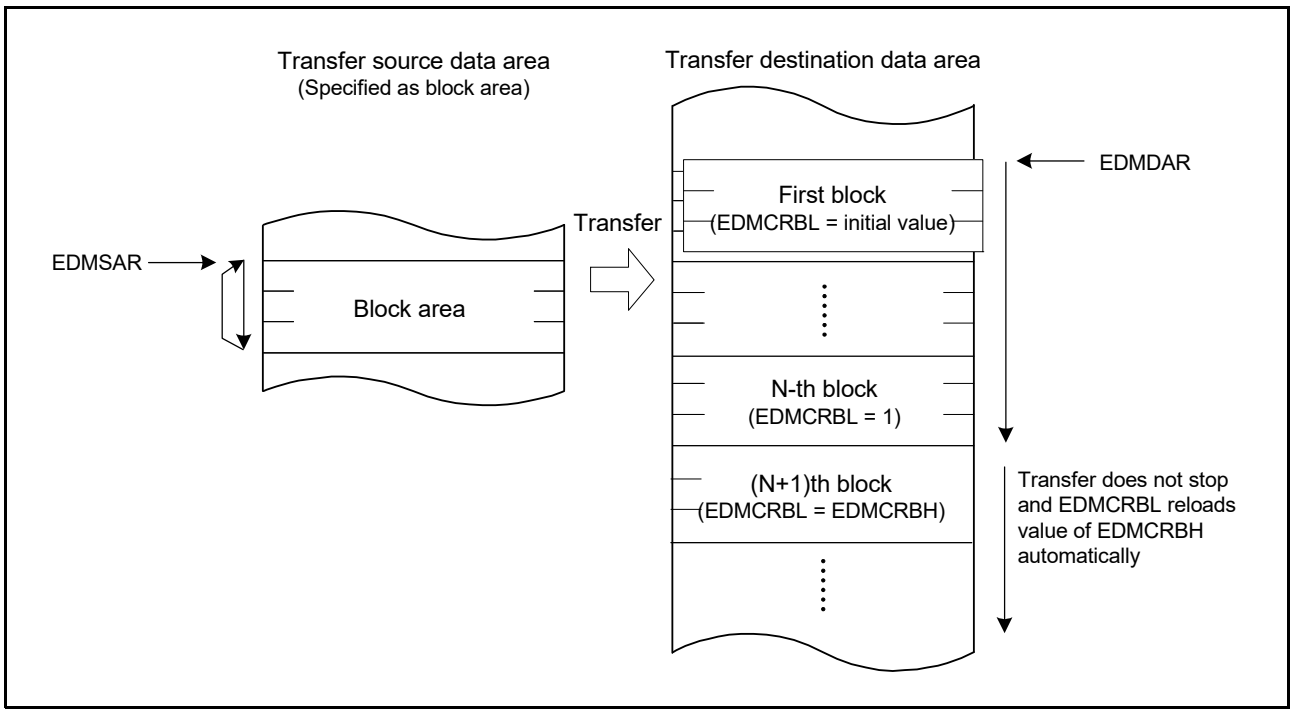

Figure 19.10 Operation in Block Transfer Mode with EDMTMD.TKP = 1

19.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (EDMOFR) is added to the address every time the EXDMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas. Offset subtraction can also be realized by setting a negative value in EDMOFR register. In this case, the negative value must be 2's complement. EDMSBS or EDMDBS registers are used instead of EDMOFR register in repeat-block transfer mode. For more information, see section (4), Repeat-Block Transfer Mode and section 19.3.5, Address Update Function in Repeat-Block Transfer Mode. Table 19.14 lists the address update method in each address update mode.

Table 19.14 Address Update Method in Each Address Update Mode

Address Update Mode	Settings of EDMAMD.SM[1:0] and EDMAMD.DM[1:0] for Address Update Modes	Address Update Method (for Different EDMTMD.SZ[1:0] Settings)			
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b	SZ[1:0] = 11b
Address fixed	00b	Fixed			
Offset addition	01b	+EDMOFR*1			
Increment	10b	+1	+2	+4	+8
Decrement	11b	–1	–2	–4	–8

Note 1. When setting a negative value in the DMA offset register, the value must be 2's complement. The 2's complement is obtained by the following formula.
2's complement of a negative offset value = ~ (offset) + 1 (~: Bit inversion)

(1) Basic Transfer Using Offset Addition

Figure 19.11 shows an example of address updating using offset addition.

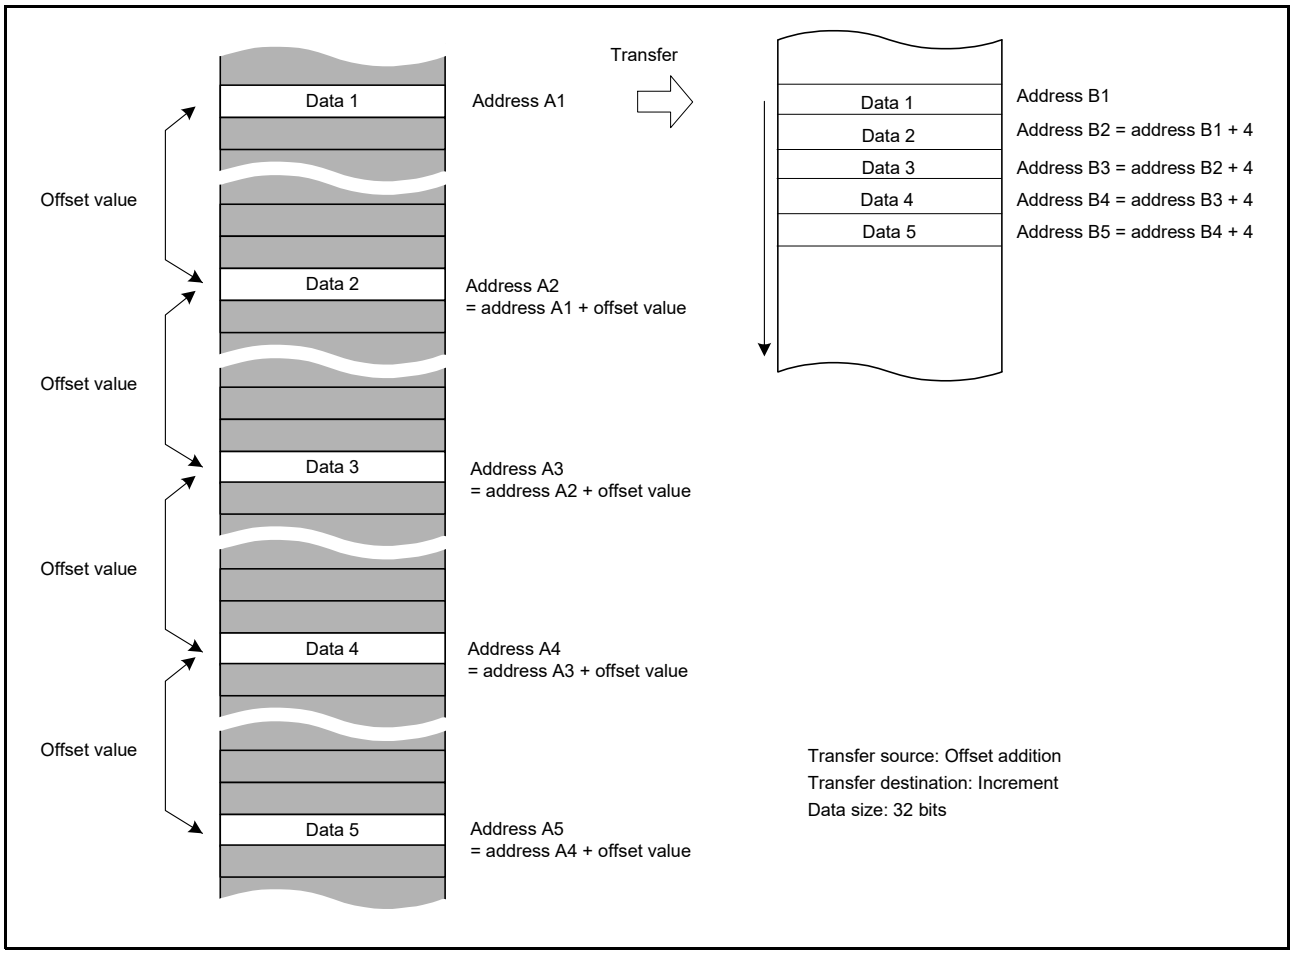

Figure 19.11 Example of Address Updating by Offset Addition

In Figure 19.11, the transfer data is 32 bits long, and offset addition and increment are set as the transfer source address update mode and transfer destination address update mode, respectively. The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

(2) Example of XY Conversion Using Offset Addition

Figure 19.12 shows the XY conversion using offset addition in repeat transfer mode. Settings are as follows:

- EDMAMD.SM[1:0]: Source address update mode select: Offset addition
- EDMAMD.DM[1:0]: Destination address update mode select: Destination address is incremented.
- EDMTMD.SZ[1:0]: Data transfer size: 32 bits
- EDMTMD.MD[1:0]: Transfer mode select: Repeat transfer
- EDMTMD.DTS[1:0]: Repeat area select: The source is specified as the repeat area.
- EDMOFR: Offset address: 10h
- EDMCRA.EDMCRAH[9:0]: Repeat size: 4h
- EDMINT.RPTIE: The repeat size end interrupt is enabled.

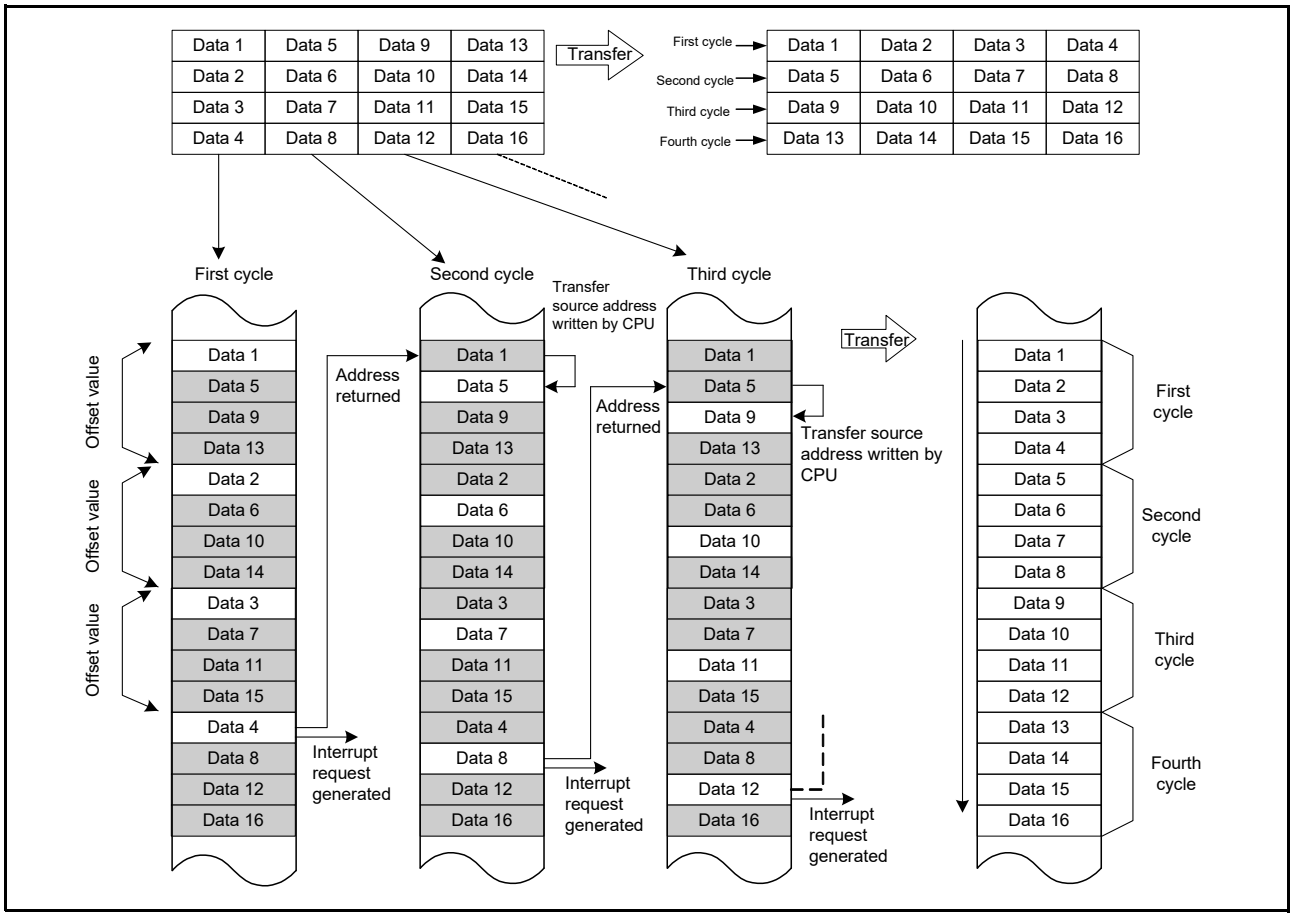

Figure 19.12 XY Conversion Operation Using Offset Addition in Repeat Transfer Mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to the destination continuous addresses. When data 4 is transferred, which means that the repeat size of transfers is completed, the transfer source address returns to the transfer start address (address of data 1 on the transfer source) and a repeat size end interrupt is requested. While this interrupt stops the transfer temporarily, perform the following.

- EDMSAR register: Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- EDMCNT register: Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 19.13 shows a flowchart of the XY conversion.

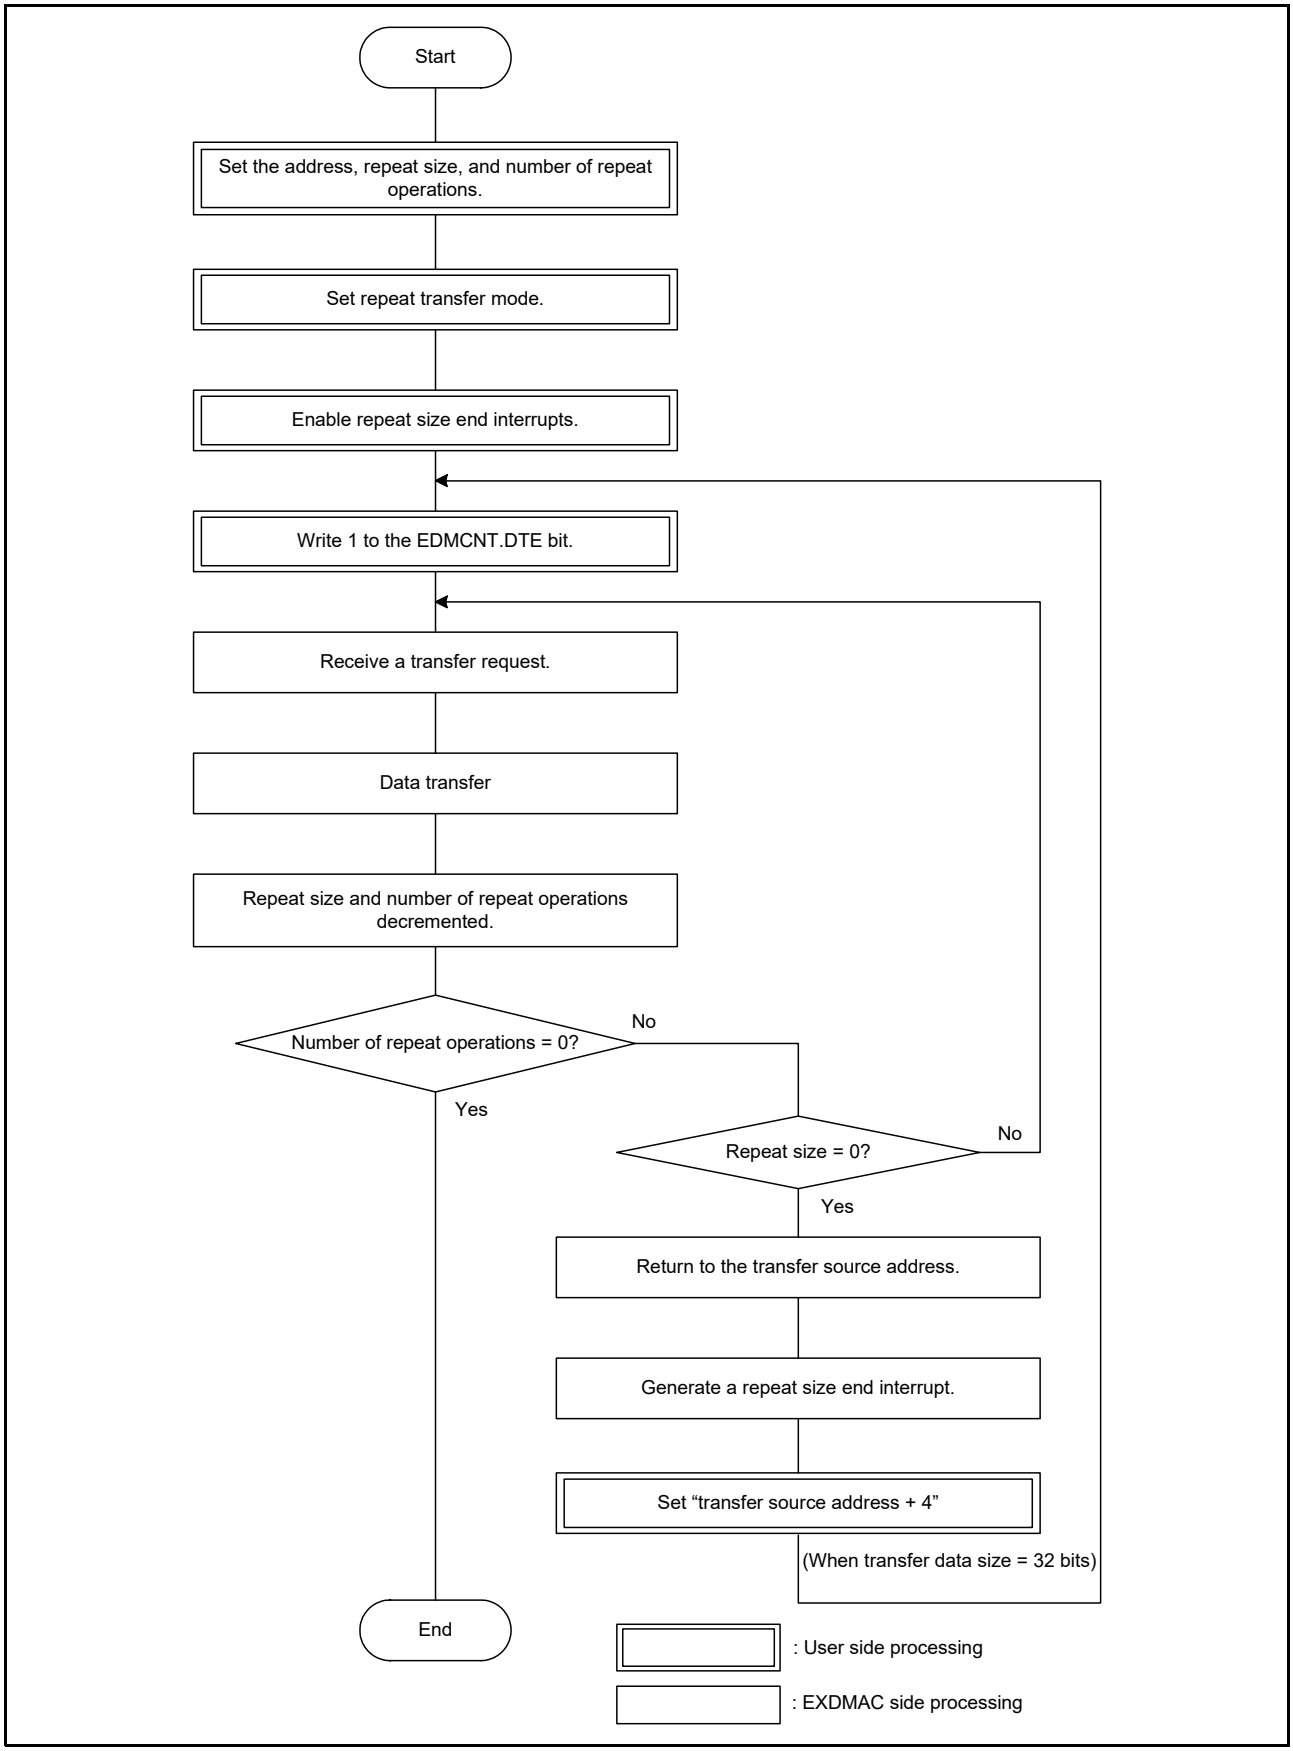

Figure 19.13 XY Conversion Flowchart Using Offset Addition in Repeat Transfer Mode

19.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

(1) Fixed Address Mode

When EDMAMD.SM[1:0] bits is set to 00b, the address update mode of the source is fixed address. And when EDMAMD.DM[1:0] bits is set to 00b, the address update mode of the destination is fixed address. In fixed address, the address is not updated from the initial value of EDMSAR and EDMDAR registers. If the block size (EDMCRA) is larger than 1, the same data will be transferred multiple times for one request. Figure 19.14 shows address update in fixed address.

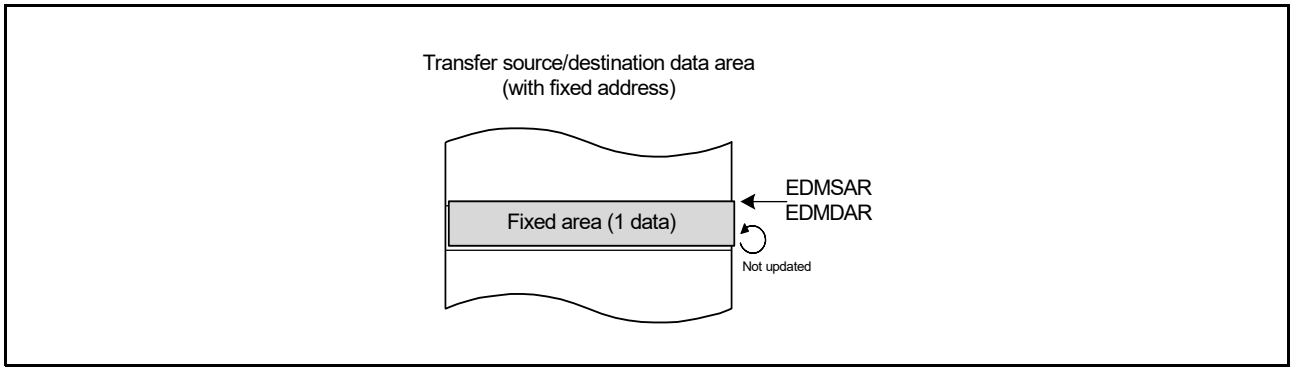

Figure 19.14 Address Update in Fixed Address

(2) Incremental and Decremental Address Mode

When EDMAMD.SM[1:0] bits is set to 10b, the address update mode of the source is incremental address. And when EDMAMD.DM[1:0] bits is set to 10b, the address update mode of the destination is incremental address. When EDMAMD.SM[1:0] bits is set to 11b, the address update mode of the source is decremental address. And when EDMAMD.DM[1:0] bits is set to 11b, the address update mode of the destination is decremental address. In these update modes, the address is incremented or decremented according to the setting of EDMTMD.SZ[1:0] bits. In these update modes EDMSBS and EDMDBS registers indicates a reload area. The unit of EDMSBS and EDMDBS registers is "number of data". At the start of transfer, EDMSBSL and EDMDBSL registers, which is the lower 16 bits of EDMSBS and EDMDBS registers, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, EDMSAR and EDMDAR registers reloads the value of EDMSRR and EDMDRR registers. Figure 19.15 shows address update in incremental address.

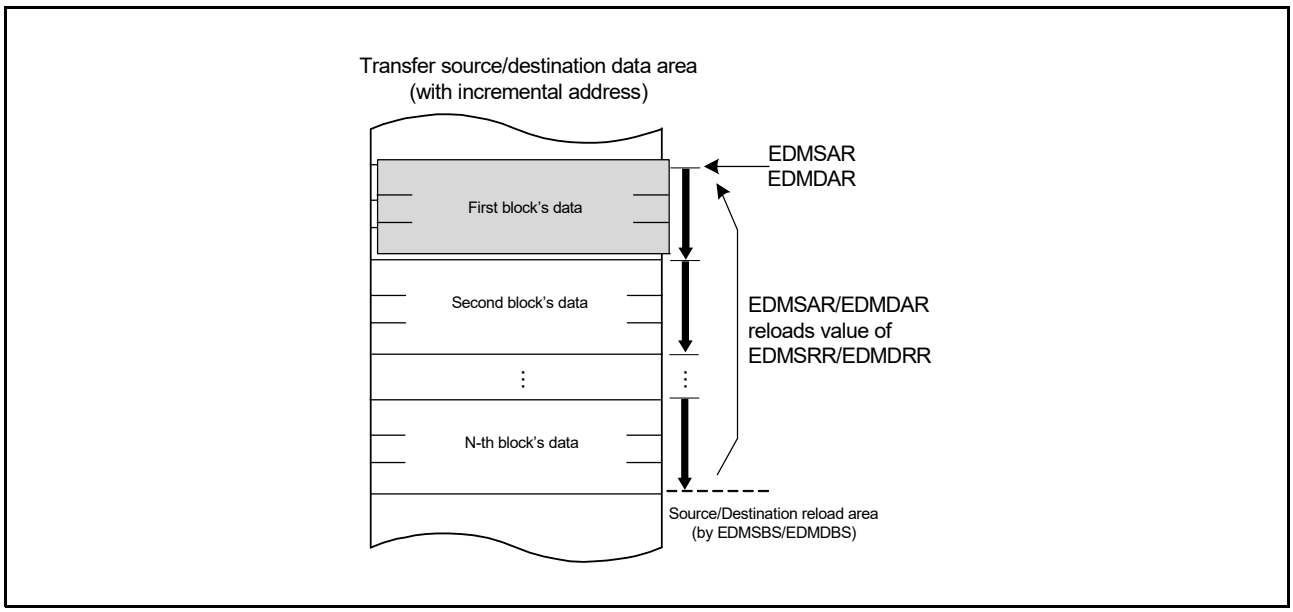

Figure 19.15 Address Update in Incremental Address

(3) Offset Addition Mode

When EDMAMD.SM[1:0] bits is set to 01b, the address update mode of the source is offset addition. And when EDMAMD.DM[1:0] bits is set to 01b, the address update mode of the destination is offset addition. In offset addition, EDMSBS and EDMDBS registers indicates reload area and also works as an access offset value. Unlike other transfer modes, EDMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of EDMSBS and EDMDBS registers is the number of blocks. When the transfer starts, EDMCRAL[15:0] bits operates as a down counter, EDMSAR and EDMDAR registers reloads the value of EDMSRR and EDMDRR registers every time one block is transferred. In addition, EDMSBSL[15:0] and EDMDBSL[15:0] bits, which is the lower 16 bits of EDMSBS and EDMDBS registers, also operates as a down counter and decrements every time one block is transferred. When the EDMSBS and EDMDBS registers value becomes 1, EDMSAR and EDMDAR registers reloads the value of EDMSRR and EDMDRR registers. When EDMAMD.SADR and EDMAMD.DADR bits is set to 0, offset addition operation of the same area is repeated. EDMDAR register only reloads EDMDRR register. Figure 19.16 shows address update in offset addition with EDMAMD.SADR and EDMAMD.DADR = 0.

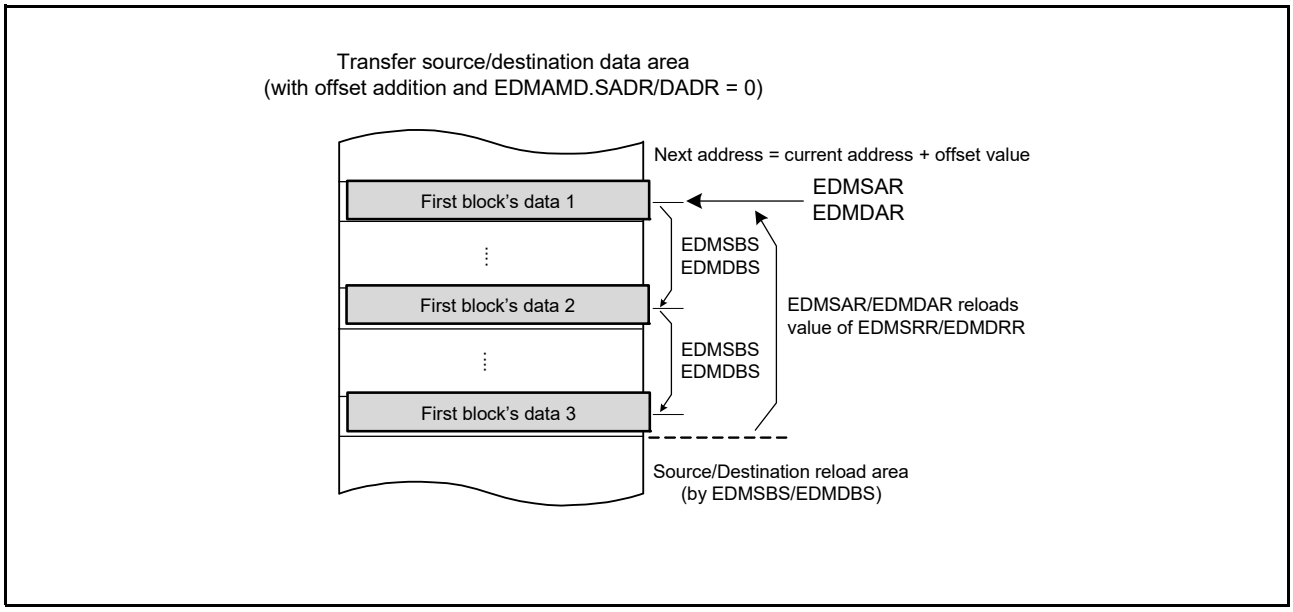

Figure 19.16 Address Update in Offset Addition with EDMAMD.SADR and EDMAMD.DADR = 0

When EDMAMD.SADR and EDMAMD.DADR bits is set to 1, the address is incremented by one data unit after EDMSRR and EDMDRR registers is reloaded by EDMCRAL[15:0] = 1. In other words, an index value ((EDMDBSH – EDMDBSL) × transfer data size) is added to EDMDAR register after EDMDRR register is reloaded. This behavior is used to implement multiple ring buffers. Figure 19.17 shows address update in offset addition with EDMAMD.SADR and EDMAMD.DADR = 1.

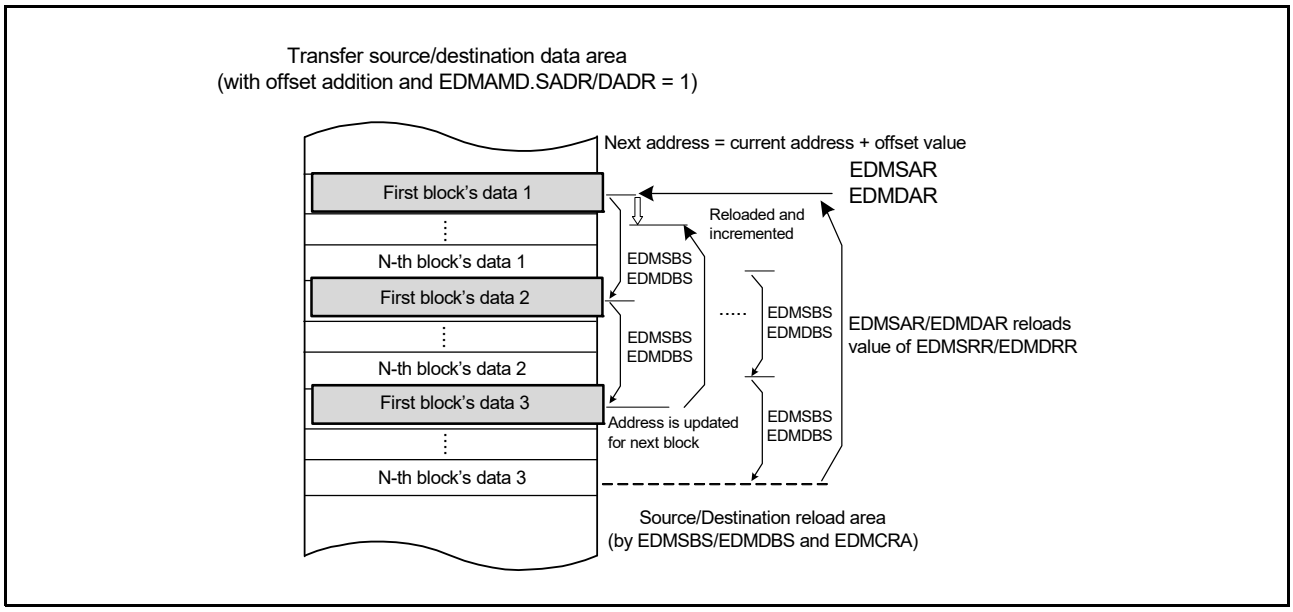

Figure 19.17 Address Update in Offset Addition with EDMAMD.SADR and EDMAMD.DADR = 1

19.3.6 Trigger Sources

Software, the interrupt requests from the peripheral modules, and the external interrupt requests can be specified as the EXDMAC trigger sources. Setting the EDMTMD.DCTG[1:0] bits selects the trigger source.

(1) Trigger by Software

When DMA transfer is started by software, follow below procedure.

1. Set the EDMTMD.DCTG[1:0] bits to 00b.
2. Set the EDMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the EDMAST.DMST bit set to 1 (EXDMAC activation enabled).
4. Set the EDMREQ.SWREQ bit to 1 (DMA requested).

When the EXDMAC is activated by software while the EDMREQ.CLRS bit is 0, the EDMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request. When the EXDMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

(2) Trigger by Interrupt Request

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as EXDMAC trigger sources. The trigger sources can be selected individually for each channel in the ICU.SELEXDRn register (n = 0, 1). To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set the EDMCNT.DTE bit to 0 (disable DMA transfer).
2. Set the ICU.SELEXDRn register (n = 0, 1) to the event number, and then clear the corresponding IR flag.
3. Set the EDMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
4. Set EDMPRF.PREQ bit to 1 to clear the PREQ flag to 0.
5. Set the EDMCNT.DTE bit to 1 (enable DMA transfer).
6. Set the EDMAST.DMST bit to 1 (EXDMAC activation enabled).

For interrupt requests specified as EXDMAC trigger sources, see Table 15.3, Interrupt Sources for Software Configurable Interrupt in section 15, Interrupt Controller (ICUM).

19.3.7 Operation Timing

Figure 19.18 and Figure 19.19 show EXDMAC operation timing examples.

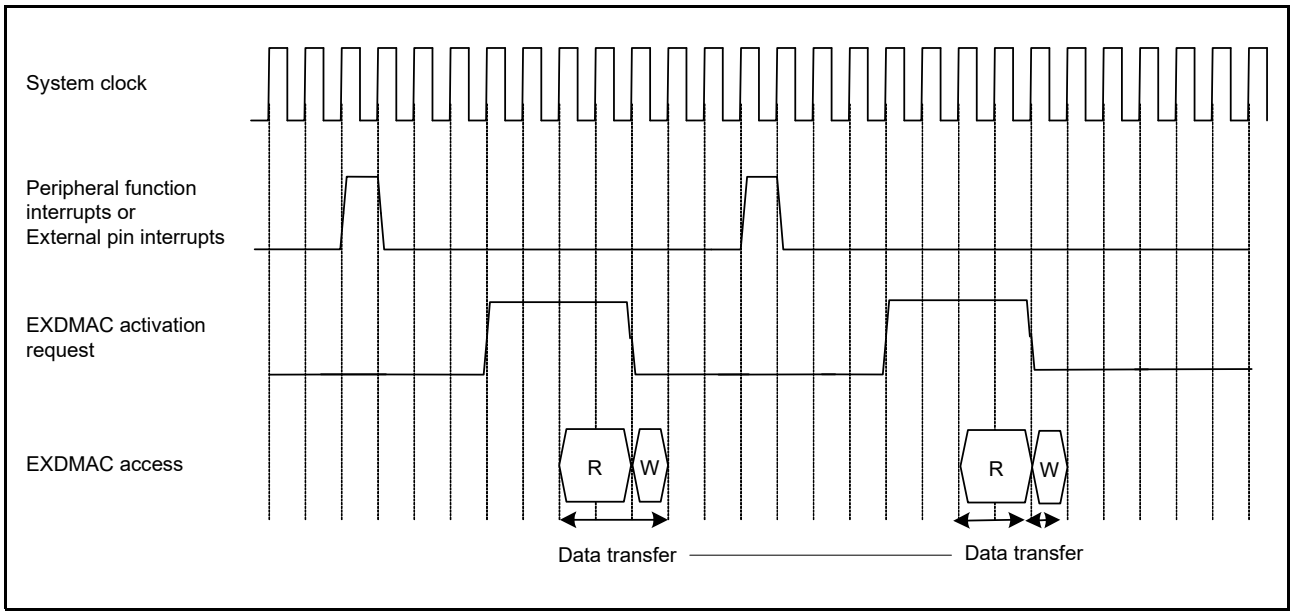

Figure 19.18 EXDMAC Operation Timing Example (1) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Normal Transfer Mode, Repeat Transfer Mode)

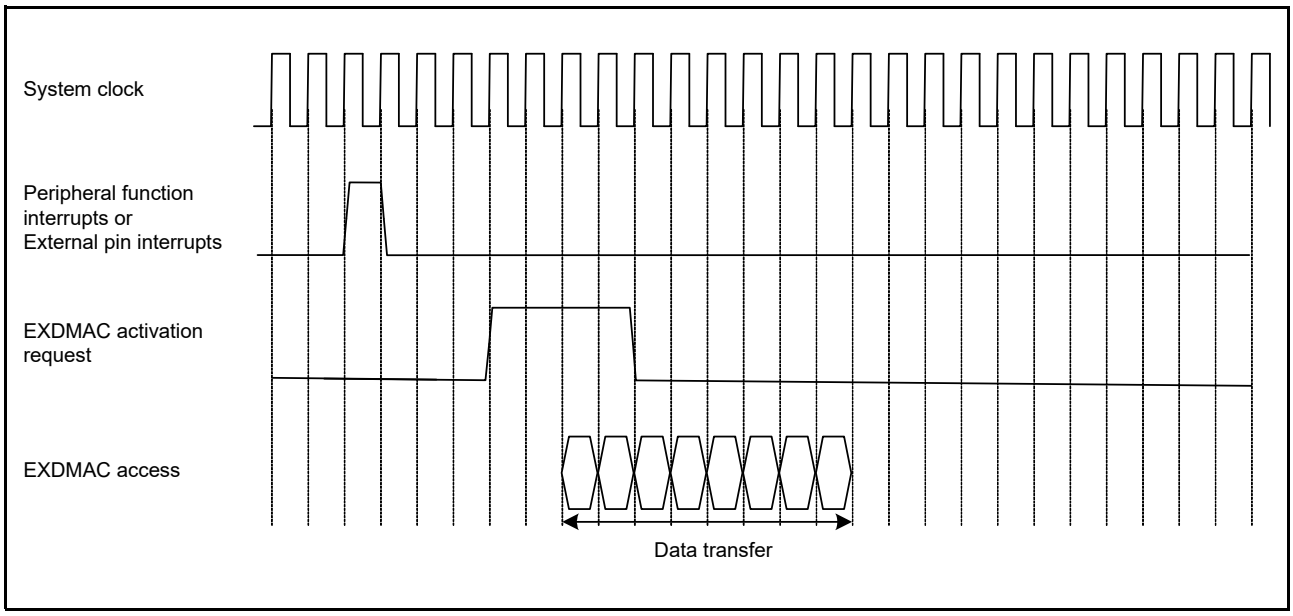

Figure 19.19 EXDMAC Operation Timing Example (2) (Trigger by Interrupt from Peripheral Module/External Interrupt Input Pin, Block Transfer Mode, Block Size = 4)

19.3.8 Activating the EXDMAC

Table 19.15 lists the register setting procedure of normal, repeat and block transfer mode and Table 19.16 lists register setting procedure of repeat-block transfer mode.

Table 19.15 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the EXDMAC trigger source.	To use peripheral function interrupts as EXDMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQi pin as the EXDMAC trigger source.	To use external pin interrupts as EXDMAC trigger sources.
3	Clear the EDMCNT.DTE bit to 0	Disable DMA transfer.
4	Set the SELEXDRn register of the ICU to specify an interrupt source to trigger operation of the EXDMAC.	Select the use of a peripheral function interrupt or external pin interrupt to trigger operation of the EXDMAC. Enable the interrupt bit for the trigger source. Set the EXDMAC trigger source.
5	Set the peripheral module as a EXDMAC trigger source	To use peripheral function interrupt as a EXDMAC trigger source. Set the control register for the peripheral function.
6	Set the IRQi pin function by using the ICU.	To use external pin interrupt as a EXDMAC trigger source. Set the IRQi pin function by using the ICU.
7	Set the EDMAMD.DM[1:0] bits. Set the EDMAMD.SM[1:0] bits. Set the EDMAMD.DARA[4:0] bits. Set the EDMAMD.SARA[4:0] bits.	Set the destination address update mode select bits. Set the source address update mode select bits. Set the destination address extended repeat area setting bits. Set the source address extended repeat area setting bits.
8	Set the EDMTMD.DCTG[1:0] bits. Set the EDMTMD.SZ[1:0] bits. Set the EDMTMD.DTS[1:0] bits. Set the EDMTMD.MD[1:0] bits. Set the EDMTMD.TKP bit.	Set the transfer request source select bits. Set the data transfer size bits. Set the repeat area select bits. Set the transfer mode select bits. Set the transfer keeping bit.
9	Set the EDMSAR register. Set the EDMDAR register. Set the EDMCRA register.	Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations.
10	Set the EDMCRB register.	To use block transfer mode or repeat transfer mode. Set the number of block transfer operations.
11	Set the EDMOFR register.	To use the address update function with offset. Set the offset value.
12	Set the EDMINT.DTIE bit to 1.	To use the transfer end interrupts. Enable transfer end interrupts.
13	Set the EDMINT.RPTIE bit. Set the EDMINT.SARIE bit. Set the EDMINT.DARIE bit. Set the EDMINT.ESIE bit to 1.	To use the transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the transfer escape end interrupt.
14	Write 1 to the EDMPRF.PREQ flag.	Clear the RPEQ flag.
15	Set the EDMCNT.DTE bit to 1.	Enable DMA transfer.
16	Set the EDMAST.DMST bit to 1.	Enable EXDMAC operation.*1 Common settings for EXDMAC
17	Start the peripheral function as a EXDMAC trigger source.	To use peripheral function interrupt as a EXDMAC trigger source
18	Enable the IRQi pin as a EXDMAC trigger source.	To use external pin interrupt as a EXDMAC trigger source
19	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (EDMREQ.SWREQ) starts DMA transfer.

n: EXDMAC channel (n = 0, 1)

Note 1. The EDMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

Table 19.16 Register Setting Procedure of Repeat-Block Transfer Mode

No.	Step Name	Description
1	Disable the peripheral function as the EXDMAC trigger source.	To use peripheral function interrupts as EXDMAC trigger sources. Disable the control register for the peripheral function.
2	Disable the IRQi pin as the EXDMAC trigger source.	To use external pin interrupts as EXDMAC trigger sources.
3	Clear the EDMCNT.DTE bit to 0.	Disable DMA transfer.
4	Set the interrupt source as a EXDMAC trigger source to the SELEXDRn register by using the ICU.	To use internal peripheral interrupts or external pin interrupts as EXDMAC trigger sources. Enable the interrupt bit for the trigger source. Set the EXDMAC trigger source.
5	Set the peripheral module as a EXDMAC request source.	To use peripheral function interrupt as a EXDMAC trigger source. Set the control register for the peripheral function.
6	Set the IRQi pin function by using the ICU.	To use external pin interrupt as a EXDMAC trigger source. Set the IRQi pin function by using the ICU.
7	Set the EDMAMD.DM[1:0] bits. Set the EDMAMD.SM[1:0] bits. Set the EDMAMD.DADR bit. Set the EDMAMD.SADR bit.	Set the destination address update mode select bits. Set the source address update mode select bits. Set the destination address update setting after reload bit. Set the source address update setting after reload bit.
8	Set the EDMTMD.DCTG[1:0] bits. Set the EDMTMD.SZ[1:0] bits. Set the EDMTMD.MD[1:0] bits. Set the EDMTMD.TKP bit.	Set the transfer request source select bits. Set the data transfer size bits. Set the transfer mode to repeat-block transfer mode. Set the transfer keeping bit.
9	Set the EDMSAR register. Set the EDMDAR register. Set the EDMSRR register. Set the EDMDRR register. Set the EDMCRA register. Set the EDMCRB register.	Set the transfer source start address. Set the transfer destination start address. Set the initial value of source start address. Set the initial value of destination start address. Set the number of transfer operations. Set the number of block transfer operations.
10	Set the EDMSBS register. Set the EDMDBS register.	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset. Set the destination buffer size and access offset.
11	Set the EDMINT.DTIE bit to 1.	To use transfer end interrupts. Enable transfer end interrupts.
12	Write 1 to the EDMPRF.PREQ flag.	Clear the PREQ flag.
13	Set the EDMCNT.DTE bit to 1.	Enable DMA transfer.
14	Set the EDMAST.DMST bit to 1.	Enable EXDMAC operation.*1
15	Start the peripheral function as a EXDMAC trigger source.	To use peripheral function interrupt as a DMA trigger source
16	Enable the IRQi pin as a EXDMAC trigger source.	To use external pin interrupt as a DMA trigger source
17	End of initial settings	For trigger by software On completion of the initial settings, writing 1 to the DMA software start bit (EDMREQ.SWREQ) starts DMA transfer.

n: EXDMAC channel (n = 0, 1)

Note 1. The EDMAST.DMST bit setting does not necessarily have to follow the settings for the individual trigger sources.

19.3.9 Starting DMA Transfer

To enable the DMA transfer of EXDMACn (n = 0, 1), set the EDMCNT.DTE bit to 1 (DMA transfer enabled), and then set the EDMAST.DMST bit to 1 (EXDMAC module start). Another transfer request cannot be accepted during the transfer of other EXDMAC channel or DTC. When the proceeding transfer is completed, channel arbitration is performed where a DMA transfer request of the highest priority channel is accepted and DMA transfer of the channel starts. When DMA transfer starts, the EDMSTS.ACT flag is set to 1 (the EXDMAC is in the active state).

19.3.10 Registers during DMA Transfer

The EXDMACn registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are EDMSAR, EDMDAR, EDMCRA, EDMCRB, EDMSBS, EDMCNT, and EDMSTS.

(1) EXDMA Source Address Register (EDMSAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(2) EXDMA Destination Address Register (EDMDAR)

When data has been transferred in response to one transfer request, the contents of this register are updated to the address to be accessed by the next transfer request. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(3) EXDMA Transfer Count Register (EDMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(4) EXDMA Block Transfer Count Register (EDMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(5) EXDMA Source Buffer Size Register (EDMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(6) EXDMA Destination Buffer Size Register (EDMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected. For details on register update operation in each transfer mode, see Table 19.5 to Table 19.7.

(7) EXDMA Transfer Enable Bit (EDMCNT.DTE)

Although the EDMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically set to 0 by the EXDMAC according to the DMA transfer state. The conditions for clearing this bit by the EXDMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt

- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding EDMCNT.DTE bit is set to 1 is prohibited (except for the EDMCNT register). In this case, writing must be performed after the bit is set to 0.

(8) EXDMA Active Flag (EDMSTS.ACT)

The EDMSTS.ACT flag indicates whether the EXDMACn is in the idle or active state. This flag is set to 1 when the EXDMACn starts data transfer, and is set to 0 when data transfer in response to one transfer request is completed. Even when DMA transfer is stopped by writing 0 to the EDMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

(9) Transfer End Interrupt Flag (EDMSTS.DTIF)

The EDMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed. When both this flag and the EDMINT.DTIE bit are set to 1, a transfer end interrupt is requested. This flag is set to 1 when the DMA transfer bus cycle is completed and the EDMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the EDMCNT.DTE bit is set to 1 during the interrupt handling.

(10) Transfer Escape End Interrupt Flag (EDMSTS.ESIF)

The EDMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When both this flag and the EDMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested. This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the EDMSTS.ACT flag is set to 0 indicating the DMA transfer end. This flag is automatically set to 0 when the EDMCNT.DTE bit is set to 1 during an interrupt handling. Before sending an interrupt request from the EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

19.3.11 Channel Priority

When multiple DMA transfer requests are present, the EXDMAC determines the priority of channels that have DMA transfer requests. When EDMCTL.PR = 0, the channel priority is fixed as channel 0 > channel 1 (channel 0: Highest). When EDMCTL.PR = 1, the EXDMAC determines the priority of channels at round-robin. When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

19.3.12 Channel Security

The security attribute can be set with CPSCU.EDMACCHSAR.SADMACXn bit for each EXDMAC channel.
When the CPSCU.EDMACCHSAR.SADMACXn bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.EDMACCHSAR.SADMACXn bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Do not change the CPSCU.EDMACCHSAR bit while DMA transfer.

19.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the EDMCNT.DTE bit and the EDMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

19.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (EDMTMD.MD[1:0] = 00b)

When the value of the EDMCRAL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (EDMTMD.MD[1:0] = 01b)

When the value of the EDMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the EDMTMD.TKP bit is set to 1 (free-running function), the EDMSTS.DTIF flag is set to 1, but the EDMCNT.DTE bit does not become 0.

(3) In Block Transfer Mode (EDMTMD.MD[1:0] = 10b)

When the value of the EDMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.
When the EDMTMD.TKP bit is set to 1 (free-running function), the EDMSTS.DTIF flag is set to 1, but the EDMCNT.DTE bit does not become 0.

(4) In Repeat-Block Transfer Mode (EDMTMD.MD[1:0] = 11b)

When the value of the EDMCRBL[15:0] bits changes from 1 to 0, DMA transfer ends on the corresponding channel, and the EDMCNT.DTE bit is set to 0 and the EDMSTS.DTIF flag is set to 1 at the same time. If the EDMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Before sending an interrupt request from the
When the EDMTMD.TKP bit is set to 1 (free-running function), the EDMSTS.DTIF flag is set to 1, but the EDMCNT.DTE bit does not become 0.
EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).

19.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of each single-repeat size of data is completed while the EDMINT.RPTIE bit is set to 1. When the interrupt is requested, DMA transfer is terminated regardless of the value of the EDMTMD.TKP bit, the EDMCNT.DTE bit is set to 0, and the EDMSTS.ESIF flag is set to 1. If the EDMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the EDMCNT.DTE bit. A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of each single-block size of data is completed. Repeat size end interrupt cannot be requested in repeat-block transfer mode.
Before sending an interrupt request from the EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM).
For the interrupt outputs, refer to Figure 19.20, Schematic Logic Diagram of Interrupt Outputs.

19.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area address occurs while the source address extended repeat area is specified with the EDMINT.SARIE bit set to 1 or the destination address extended repeat area is specified with the EDMINT.DARIE bit set to 1, an interrupt due to an extended repeat area overflow is requested. When the interrupt is requested, DMA transfer is terminated regardless of the value of the EDMTMD.TKP bit, the EDMCNT.DTE bit is set to 0, and the EDMSTS.ESIF flag is set to 1. If the EDMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Even if an interrupt due to an extended repeat area overflow is requested during a read cycle, the subsequent write cycle proceeds. In block transfer mode, even if an interrupt due to an extended repeat area overflow is requested during a single-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer. An interrupt due to an extended repeat area overflow is not possible in repeat-block transfer mode. Before interrupt requests can be sent from the EXDMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 15, Interrupt Controller (ICUM). For the interrupt outputs, see Figure 19.20, Schematic Logic Diagram of Interrupt Outputs.

19.5 Processing on DMA Transfer Error

If an access error occurs during DMA transfer, the EXDMAC stops the transfer.*1 The EXDMAC also clears the EDMCNT.DTE bit of the error causing channel. Write back of the DMA transfer setting to each register is not performed. The information of the channel that caused the error is set in EDMECHR register. For details on bus errors, see section 16.8, Bus Error Monitoring Section.

Note 1. If a bufferable write error occurs, however, the EXDMAC does not stop the transfer.

19.6 Interrupts

19.6.1 Transfer End Interrupt

Each EXDMAC channel can output an interrupt request to the CPU or the DTC after transfer in response to one request is completed. An interrupt request occurs after the bus response to the last write in a DMA transfer. The timing of the bus response to a DMA write access depends on the EDMBWR.BWE bit and the transfer destination. For details, refer to section 19.8.2, Access to the Registers during DMA Transfer. In repeat-block transfer mode, do not enable escape transfer end interrupt. Table 19.17 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 19.20 shows the schematic logic diagram of interrupt outputs . Figure 19.21 shows the EXDMAC interrupt handling routine to resume/terminate DMA transfer.

Table 19.17 Relation among Interrupt Sources, Interrupt Status Flags, and Interrupt Enable Bits

Interrupt Sources		Interrupt Enable Bits	Interrupt Status Flags	Request Output Enable Bits
Transfer end		—	EDMSTS.DTIF	EDMINT.DTIE
Escape transfer end	Repeat size end	EDMINT.RPTIE	EDMSTS.ESIF	EDMINT.ESIE
	Source address extended repeat area overflow	EDMINT.SARIE		
	Destination address extended repeat area overflow	EDMINT.DARIE		

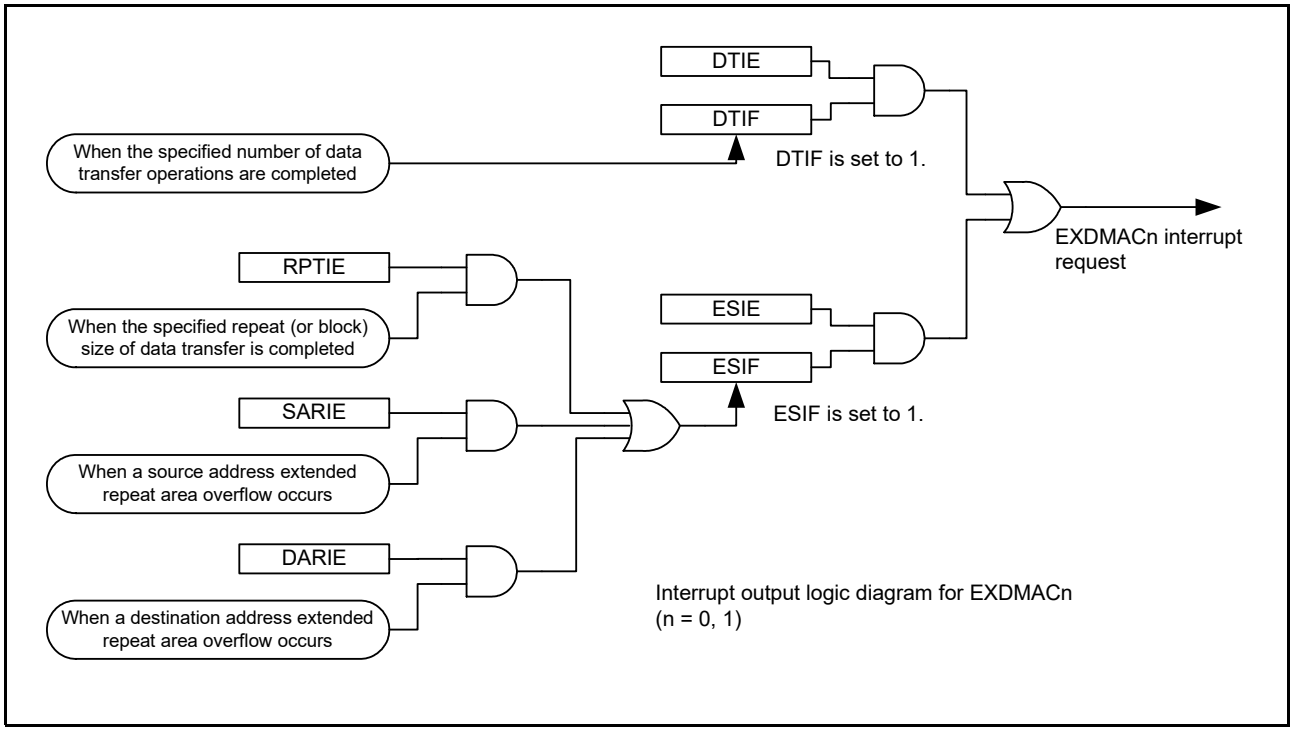

Figure 19.20 Schematic Logic Diagram of Interrupt Outputs

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases: (1) discontinuing or terminating DMA transfer and (2) continuing DMA transfer.

(1) When Discontinuing or Terminating DMA Transfer

Write 0 to the EDMSTS.DTIF flag to clear a transfer end interrupt, and to the EDMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The EXDMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the EDMCNT.DTE bit to 1 (DMA transfer enabled).

(2) When Continuing DMA Transfer

Write 1 to the EDMCNT.DTE bit. The EDMSTS.ESIF flag is automatically set to 0 (interrupt source cleared), and DMA transfer is resumed.

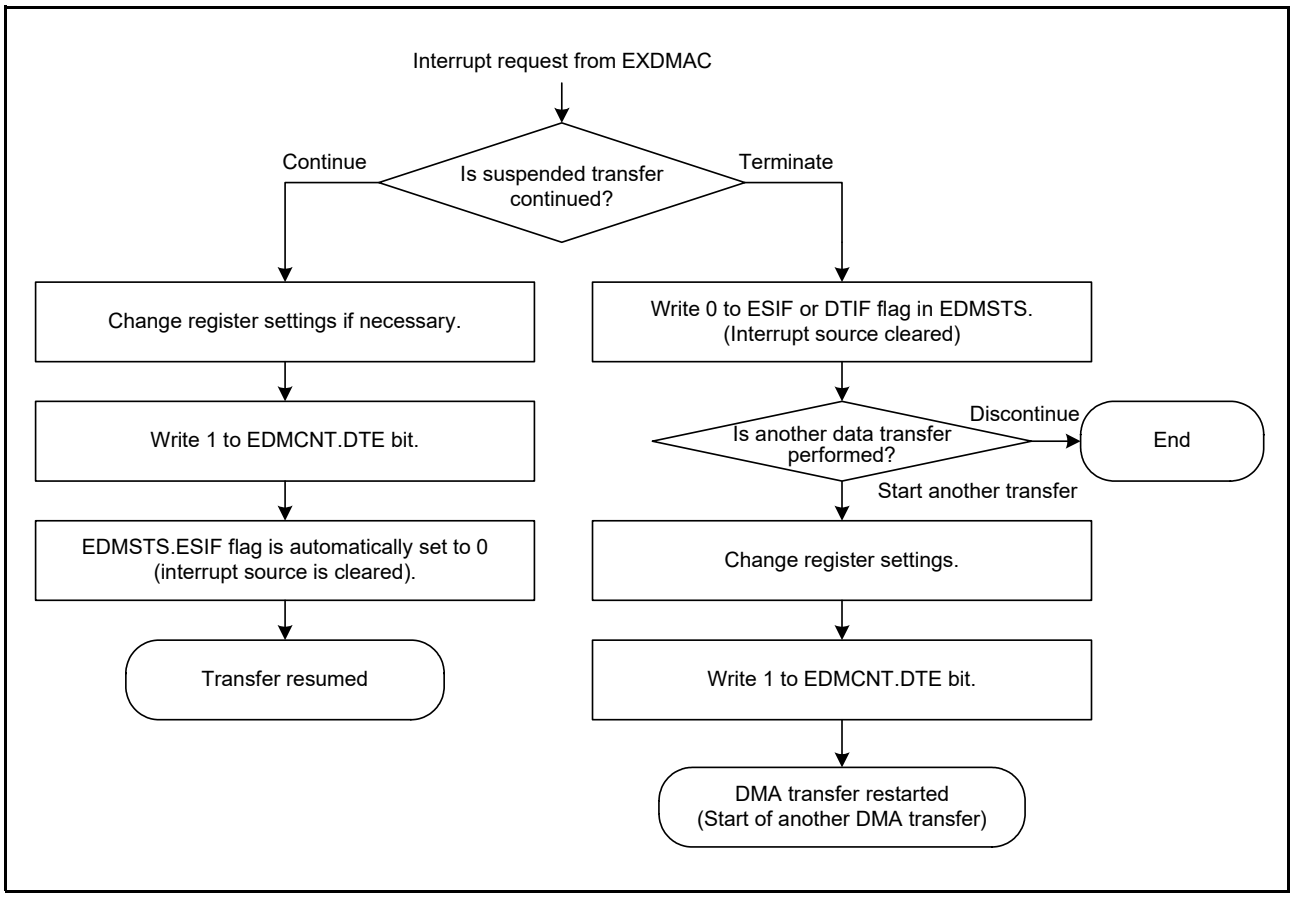

Figure 19.21 EXDMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

19.6.2 Transfer Error Interrupt

A transfer error occurring during DMA transfer is detected as a bus error. For details, see section 16.8, Bus Error Monitoring Section.

Table 19.18 Interrupt and Error Information Due to DMA Transfer Error Cause

Transfer Error Factor	Interrupt/Reset Selection	NMI	Interrupt	Bus Error Status	Error Channel Information
MSAU Error	BUS.MSAOAD.OAD	ICU.NMISR.BUSST	ICU.IR016.IR	BUS.BUSERRSTATEXDMAC.MSERRSTAT	EDMECHR
Illegal Access Error	BUS.BUSOAD.ILERROAD			BUS.BUSERRSTATEXDMAC.ILERRSTAT	
Slave Bus Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATEXDMAC.SLERRSTAT	
Protect Zone Access Error	BUS.BUSOAD.SLERROAD			BUS.BUSERRSTATEXDMAC.SLERRSTAT	

19.7 Low-Power Consumption Function

Before transition to the module-stop state, software standby mode, or deep software standby mode, set the EDMAST.DMST bit to 0 (the EXDMAC suspended), and then perform the following.

(1) Module-Stop Function

Writing 1 to the module-stop setting bit (transition to the module-stop state) enables the module-stop function of the EXDMAC. If DMA transfer is in progress at the time a 1 is written to the module-stop setting bit, the transition to the module-stop state proceeds after DMA transfer has ended. While the module-stop setting bit is 1, accessing the EXDMAC registers are prohibited. Writing 0 to the module-stop setting bit releases the EXDMAC from the module-stop state.

(2) Software Standby and Deep Software Standby Modes

Make settings in accord with the procedure under section 11.6.2.1, Transitioning to Software Standby Mode or section 11.6.3.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption. If DMA transfer operations are in progress at the time the WAIT instruction is executed, the transition to software standby or deep software standby follows the completion of DMA transfer.

(3) Note on Low-Power Consumption Function

For the WAIT instruction and the register setting procedure, see section 11.8.6, Timing of the WAIT Instruction in section 11, Low Power Consumption. To perform DMA transfer after returning from low-power consumption mode, set the EDMAST.DMST bit to 1 again.

19.8 Usage Notes

19.8.1 Bus Response to DMA Write Access

The timing of the bus response to a DMA write access depends on the setting of the EDMBWR.BWE bit and the transfer destination. If the EDMBWR.BWE bit is set to 1, the bus response returns from the intermediate point described in section 16.2.5.2, Bufferable Write. Also, for writes to the destinations described in section 16.2.5.3, Notes on the Timing of Writing Completion, the bus response returns before the write is complete.

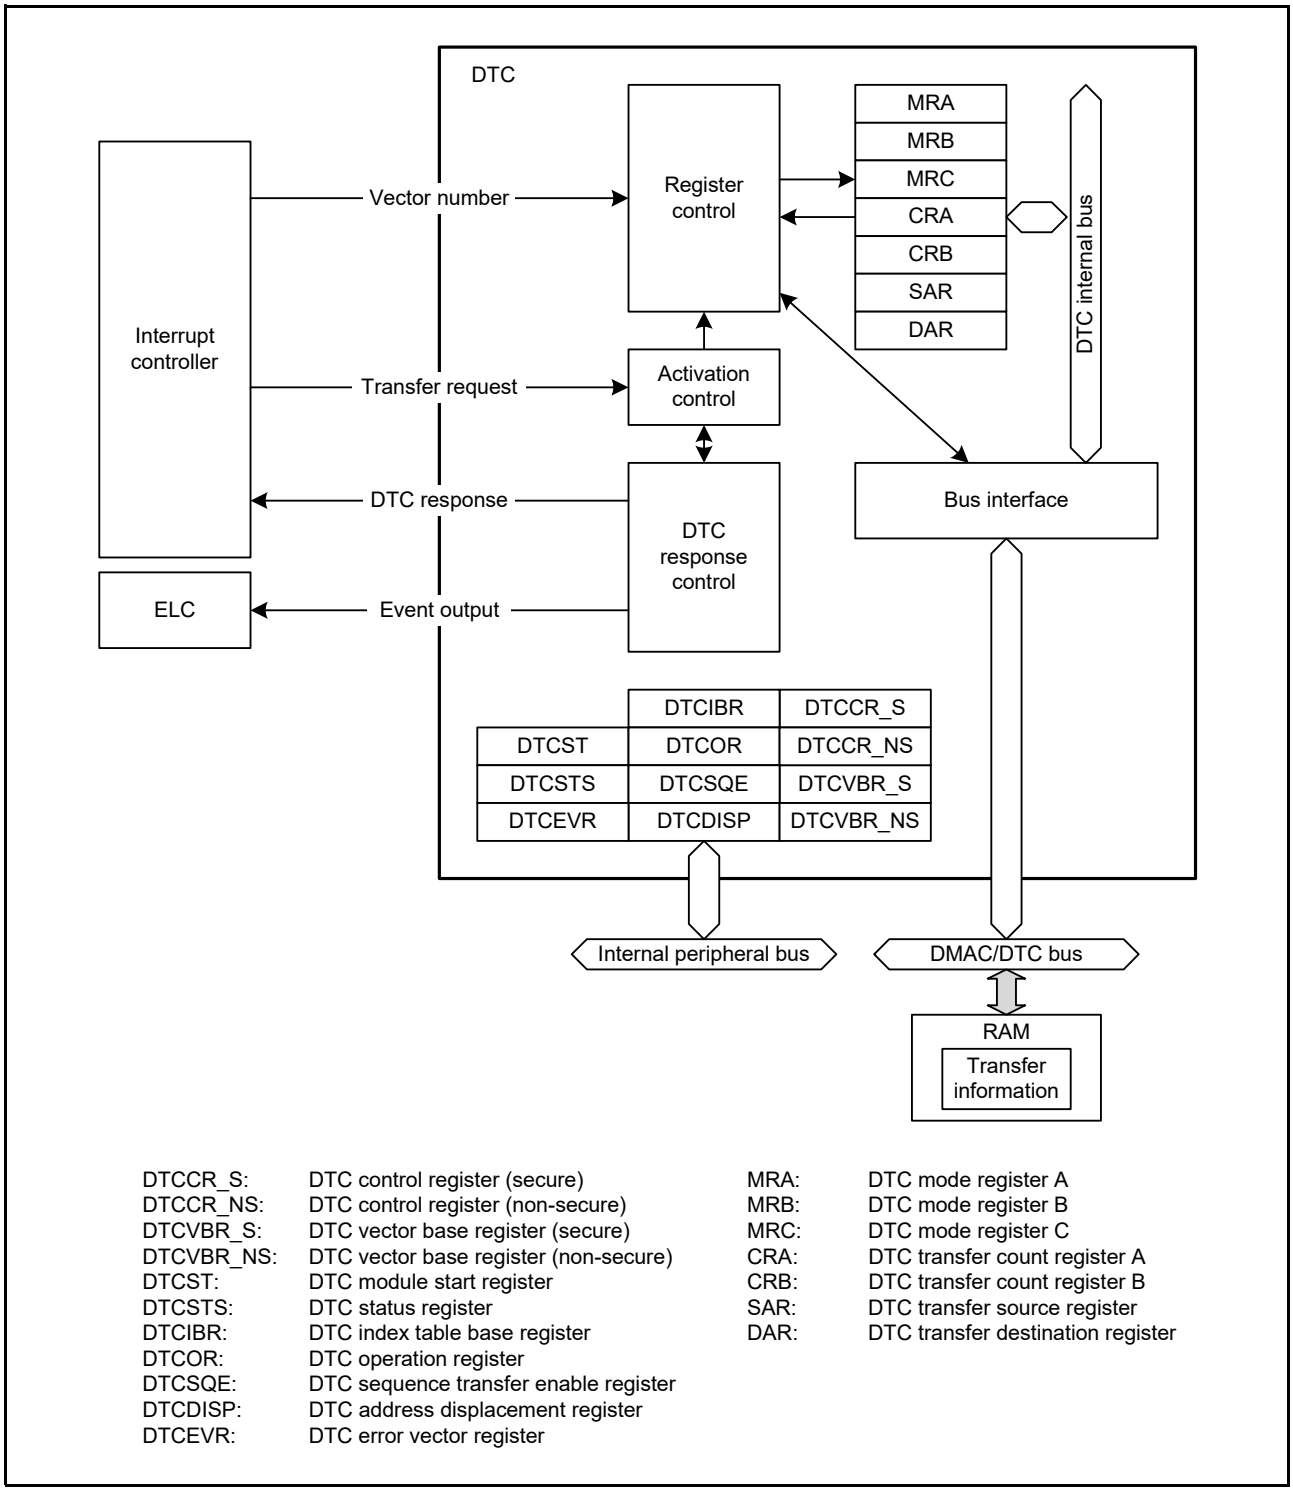
19.8.2 Access to the Registers during DMA Transfer

Do not write to the following registers while the EDMSTS.ACT flag of the same channel is set to 1 (EXDMAC active state) or the EDMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled): EDMSAR, EDMDAR, EDMCRA, EDMCRB, EDMTMD, EDMINT, EDMAMD, EDMOFR, EDMREQ, EDMSBS, EDMDBS, EDMSRR, EDMDRR, EDMBWR, EDMCTL, EDMBAC, and EDMPRF.

19.8.3 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

20. Data Transfer Controller (DTCA)



This MCU incorporates a data transfer controller (DTC).
The DTC is triggered by an interrupt request to perform data transfers.
In addition to the conventional methods of DTC transfer (normal, repeat, block, and chain), DTCA supports sequential transfer, in which it handles a series of transfers made up of a combination of the other methods. In sequential transfer, the data that is initially transferred selects one from possible 256 sequences for execution. The DTCA can divide one sequence into several transfers depending on how the parts of the sequence are combined.

20.1 Overview

Table 20.1 lists the specifications of the DTC, and Figure 20.1 shows a block diagram of the DTC.

Table 20.1 DTC Specifications

Item	Description
Number of transfer channels	• The same number as all interrupt sources that can start the DTC transfer.
Transfer modes	• Normal transfer mode A single transfer request leads to a single data transfer. • Repeat transfer mode A single transfer request leads to a single data transfer. The transfer address is returned to the transfer start address after the number of data transfers corresponding to “repeat size”. The maximum number of repeat transfers is 256, and the maximum data transfer size is 256 × 64 bits, 2048 bytes. • Block transfer mode A single transfer request leads to the transfer of a single block. The maximum block size is 256 × 64 bits = 2048 bytes.
Chain transfer	• Multiple types of data transfers can sequentially be executed in response to a single request. • Either “performed only when the transfer counter becomes 0” or “every time” can be selected.
Sequence transfer	A series of complicated transfers can be registered as a sequence. Any sequence can be selected by the transfer data and executed. • Only one trigger source can be set at a time. • Up to 256 sequences for a single trigger source • The data that is initially transferred in response to a transfer request determines a sequence • The whole sequence can be executed on a single request, or be suspended in the middle of the sequence and resumed on the next transfer request (division of sequence).
Transfer space	• 4 Gbytes (Area from 0000 0000h to FFFF FFFFh except reserved areas)
Data transfer units	• Single data: 1 byte (8 bits), 1 word (16 bits), 1 longword (32 bits), 1 double longword (64 bits) • Single block size: 1 to 256 data
CPU interrupt source	• An interrupt request can be generated to the CPU on a request source for a data transfer. • An interrupt request can be generated to the CPU after a single data transfer. • An interrupt request can be generated to the CPU after data transfer of specified volume.
Transfer error handling	If a transfer error (bus error) occurs, the transfer is aborted and the IR flag of the transfer request source is cleared.
Event link function	An event link request is generated after one data transfer (for block, after one block transfer).
Read skip	Reading of the transfer information can be skipped when the same transfer is repeated.
Write-back skip	Write-back of the transferred data that is not updated can be skipped when the address of the transfer source or destination is fixed.
Write-back disable	Allows disabling the write-back of transfer information.
Displacement addition	The displacement value can be added to the transfer source address (for each transfer information)
Low power consumption function	Module stop state can be set.
Protect Zone filter	Security attributes can be set.

DTCCR_S: DTC control register (secure)
DTCCR_NS: DTC control register (non-secure)
DTCVBR_S: DTC vector base register (secure)
DTCVBR_NS: DTC vector base register (non-secure)
DTCST: DTC module start register
DTCSTS: DTC status register
DTCIBR: DTC index table base register
DTCOR: DTC operation register
DTCSQE: DTC sequence transfer enable register
DTCDISP: DTC address displacement register
DTCEVR: DTC error vector register

MRA: DTC mode register A
MRB: DTC mode register B
MRC: DTC mode register C
CRA: DTC transfer count register A
CRB: DTC transfer count register B
SAR: DTC transfer source register
DAR: DTC transfer destination register

Figure 20.1 DTC Block Diagram

20.2 Register Descriptions

Registers MRA, MRB, MRC, SAR, DAR, CRA, and CRB are DTC internal registers, which cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the RAM area as transfer information. When accepting a transfer request, the DTC reads the transfer information from the RAM area and sets it in the internal registers. After the data transfer ends, the values of the updated internal register are written back to the RAM area as transfer information.

20.2.1 DTC Mode Register A (MRA)

Address(es): (inaccessible directly from the CPU)

	b7	b6	b5	b4	b3	b2	b1	b0
	MD[1:0]		SZ[1:0]		SM[1:0]		—	WBDIS
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	WBDIS	Write-Back Disable	0: Writes back the transfer information on completion of the data transfer 1: Does not write back the transfer information on completion of the data transfer	—
b1	—	Reserved	Set this bit to 0.	—
b3, b2	SM[1:0]	Transfer Source Address Addressing Mode	b3 b2 0 0: The address in the SAR register is fixed. (write-back to SAR is skipped.) 0 1: The address in the SAR register is fixed. (write-back to SAR is skipped.) 1 0: The SAR value is incremented after a data transfer. (+1 when the SZ[1:0] bits are 00b, +2 when 01b, +4 when 10b, +8 when 11b) 1 1: The SAR value is decremented after a data transfer. (–1 when the SZ[1:0] bits are 00b, –2 when 01b, –4 when 10b, –8 when 11b)	—
b5, b4	SZ[1:0]	DTC Data Transfer Size	b5 b4 0 0: Byte (8-bit) transfer 0 1: Word (16-bit) transfer 1 0: Longword (32-bit) transfer 1 1: Double longword (64-bit) transfer	—
b7, b6	MD[1:0]	DTC Transfer Mode Select	b7 b6 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited	—

MRA register is used to select the DTC operating mode and cannot be accessed directly from the CPU.

WBDIS Bit (Write-Back Disable)

The WBDIS bit selects whether to write back the transfer information.

When the bit is 0, updated transfer information is written back.

When the bit is 1, updated transfer information is not written back even with the setting of that address is incremented after a transfer, and the same data transfer is executed every time for each transfer request. The transfer information can be stored in ROM because the transfer information is not written back.

While the WBDIS bit is 1, operation for each transfer mode is as follows:

(1) Normal transfer and repeat transfer modes
1 byte, 1 word, 1 longword, or 1 double longword of data is transferred on a single transfer request. The transfer address and transfer count are not updated so that the same transfer is repeated on each transfer request. When the transfer count is 1, the ICU.DTCERn.DTCE bit is not set to 0, and data transfer continues in response to the next transfer request.

(2) Block transfer mode
1-block of data is transferred on a single transfer request. The transfer address and transfer count are not updated so that the same block transfer is repeated on each transfer request. When the block transfer count is 1, the ICU.DTCERn.DTCE bit is not set to 0, and data transfer continues in response to the next transfer request.

When setting the MRC.DISPE bit to 1, set the WBDIS bit to 1 (does not write back the transfer information). If the value of the WBDIS bit in any transfer information is 1, set the DTCCR.RRS bit to 0 (so that reading of the transfer information is not skipped).

20.2.2 DTC Mode Register B (MRB)

Address(es): (inaccessible directly from the CPU)

	b7	b6	b5	b4	b3	b2	b1	b0
	CHNE	CHNS	DISEL	DTS	DM[1:0]		INDX	SQEND
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	SQEND	Sequence Transfer End	0: Continue the sequence transfer 1: End the sequence transfer	—
b1	INDX	Index Table Reference	0: Does not refer to the index table 1: Refers the index table based on the transferred data*1	—
b3, b2	DM[1:0]	Transfer Destination Address Addressing Mode	b3 b2 0 0: The address in the DAR register is fixed. (Write-back to DAR is skipped.) 0 1: The address in the DAR register is fixed. (Write-back to DAR is skipped.) 1 0: The DAR value is incremented after data transfer. (+1 when the MRA.SZ[1:0] bits are 00b, +2 when 01b, +4 when 10b, +8 when 11b) 1 1: The DAR value is decremented after data transfer. (–1 when the MRA.SZ[1:0] bits are 00b, –2 when 01b, –4 when 10b, –8 when 11b)	—
b4	DTS	DTC Transfer Mode Select	0: Transfer destination side is repeat area or block area. 1: Transfer source side is repeat area or block area.	—
b5	DISEL	DTC Interrupt Select	0: An interrupt request to the CPU is generated on completion of the specified number of data transfers. 1: An interrupt request to the CPU is generated for each data transfer.	—
b6	CHNS	DTC Chain Transfer Select	0: Chain transfer is performed on completion of each transfer. 1: Chain transfer is performed only when the transfer counter is changed from 1 to 0 or 1 to CRAH.	—
b7	CHNE	DTC Chain Transfer Enable	0: Chain transfer is disabled. 1: Chain transfer is enabled.	—

Note 1. Set the MRA.MD[1:0] bits to 00b (normal transfer mode) when setting the INDX bit to 1.

MRB register is used to select the DTC operating mode and cannot be accessed directly from the CPU.

SQEND Bit (Sequence Transfer End)

The SQEND bit selects whether to continue or end sequence transfer. Refer to Table 20.2 for details.
This bit can only be set to 1 for transfer information referred to by the DTC index table. Set this bit to 0 for transfer information referred to by the DTC vector table.

INDX Bit (Index Table Reference)

When the value of the INDX bit in transfer information that is read is 1, a sequence transfer proceeds. Refer to Table 20.2 for details.
Set this bit to 0 for transfer information which is not associated with sequence transfer or is not intended to start sequence transfer. Do not allow transfer requests to be generated by the sources different from that specified in the DTCSQE register but having the INDX bit set to 1.

Table 20.2 Values of Bits CHNE, SQEND, and INDX in the Sequence Transfer and DTC Operation

CHNE Bit	SQEND Bit	INDX Bit	Operation	Usage
0	0	1	Start sequence transfer	Use this setting for the transfer information that is first read in response to a transfer request from the source specified in the DTCSQE register.
1	0	0	Continue sequence transfer	Use this setting for the first or intermediate transfer information in a sequence.
0	0	0	Suspend sequence transfer	Use this setting for the first or intermediate transfer information in a sequence.
0	1	0	End sequence transfer	Use this setting with the last transfer information in a sequence.
0	1	1	End current sequence transfer and start new sequence transfer	Use this setting with the last transfer information in a sequence.

Note: Do not set the values other than listed above.

DTS Bit (DTC Transfer Mode Select)

The DTS bit specifies the side (transfer source or destination) to be a repeat area or block area in repeat transfer mode or block transfer mode.

CHNS Bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition.

When the CHNE bit is 0, setting of the CHNS bit is ignored. For details on the conditions to select the chain transfer, refer to Table 20.4, Chain Transfer Conditions.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the interrupt status flag for the request source is not cleared, and an interrupt request to the CPU is not generated.

CHNE Bit (DTC Chain Transfer Enable)

The CHNE bit enables or disables chain transfer.

The chain transfer condition is selected by the CHNS bit.

For details of chain transfer, refer to section 20.4.6, Chain Transfer.

Refer to Table 20.2 for the setting value to be used in the sequence transfer.

20.2.3 DTC Mode Register C (MRC)

Address(es): (inaccessible directly from the CPU)

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DISPE
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	DISPE	Displacement Addition	0: The displacement value is not added to the transfer source address. 1: The displacement value is added to the transfer source address.	—
b7 to b1	—	Reserved	Set these bits to 0.	—

The MRC register is used to select DTC operating mode and cannot be accessed directly from the CPU.

DISPE Bit (Displacement Addition)

This bit specifies whether to use the SAR + DTCDISP value as the transfer source address.
When setting the DISPE bit to 1, set the MRA.WBDIS bit to 1 (does not write back the transfer information) and set the DTCCR.RRS bit to 0 (transfer information read is not skipped).

20.2.4 DTC Transfer Source Register (SAR)

Address(es): (inaccessible directly from the CPU)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

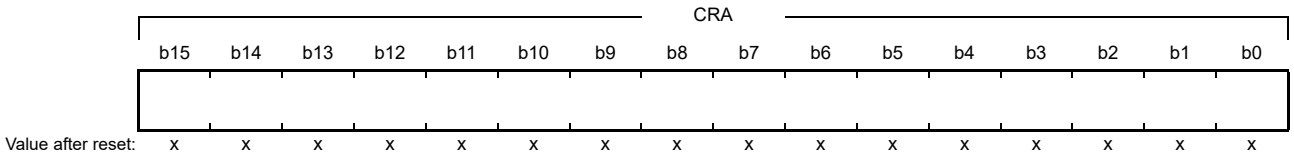
SAR register is used to set the transfer source start address.
SAR register cannot be accessed directly from the CPU.

20.2.5 DTC Transfer Destination Register (DAR)

Address(es): (inaccessible directly from the CPU)

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

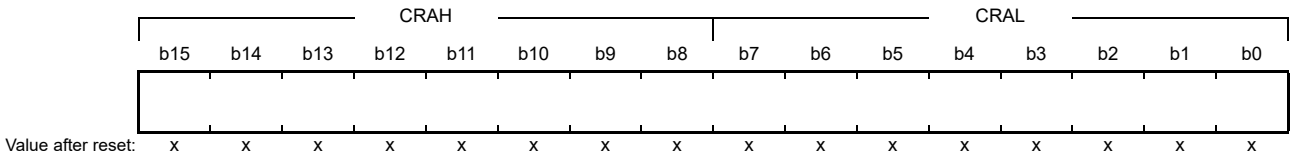


x: Undefined

DAR register is used to set the transfer destination start address.
DAR register cannot be accessed directly from the CPU.

20.2.6 DTC Transfer Count Register A (CRA)

- Normal transfer mode



Address(es): (inaccessible directly from the CPU)

x: Undefined

- Repeat transfer mode/block transfer mode

Address(es): (inaccessible directly from the CPU)

x: Undefined

Symbol	Register Name	Description	R/W
CRAL	Transfer Counter A Lower Register	Set transfer count. This register functions as a transfer counter during data transfer.	—
CRAH	Transfer Counter A Upper Register	Set transfer count. This register functions as a reload register during data transfer.	—

Note: The function depends on transfer mode.
Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

This register is for counting the number of transfers and cannot be accessed directly from the CPU.

(1) Normal transfer mode (MRA.MD[1:0] bits = 00b)

CRA register functions as a 16-bit transfer counter in normal transfer mode.
The transfer count is 1, 65535, and 65536 when the set value is 0001h, FFFFh, and 0000h, respectively.
The CRA value is decremented (–1) at each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] bits = 01b)

The CRAH register retains the transfer count and the CRAL register functions as an 8-bit transfer counter.
The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively.
The CRAL value is decremented (–1) at each data transfer. When it reaches 00h, the CRAH value is reloaded to the CRAL register.

(3) Block transfer mode (MRA.MD[1:0] bits = 10b)

The CRAH register retains the block size and the CRAL register functions as an 8-bit block size counter.
The transfer count is 1, 255, and 256 when the set value is 01h, FFh, and 00h, respectively.
The CRAL value is decremented (–1) at each data transfer. When it reaches 00h, the CRAH value is reloaded to the CRAL register.

20.2.7 DTC Transfer Count Register B (CRB)

Address(es): (inaccessible directly from the CPU)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

CRB register is used to set the block transfer count for block transfer mode and cannot be accessed directly from the CPU.
The transfer count is 1, 65535, and 65536 when the set value is 0001h, FFFFh, and 0000h, respectively.
The CRB value is decremented (–1) when the final data of a single block size is transferred.
When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

20.2.8 DTC Control Register for Secure Application (DTCCR_S), DTC Control Register for Non-secure Application (DTCCR_NS)

Address(es): DTC.DTCCR_S 8700 7C10h*1, DTC_NS.DTCCR_NS 0700 7C00h*2

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b4	RRS	DTC Transfer Information Read Skip Enable*3	0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
Note 2. This register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.
Note 3. Set this bit to 0 when using the sequence transfer.

DTCCR register is used to control the DTC operation. There are two registers: one for secure application developers (DTCCR_S) and one for non-secure application developers (DTCCR_NS).

RRS Bit (DTC Transfer Information Read Skip Enable)

The DTC vector number is compared with the vector number in the previous data transfer.
When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transferred information. However, when the previous transfer was chain transfer, the transferred information is read regardless of the value of the RRS bit.
Furthermore, when the transfer counter (CRA register) became 0 during the previous normal transfer and when the transfer counter (CRB register) became 0 during the previous block transfer, the transferred information is read regardless of the RRS bit value.
If the value of the MRA.WBDIS bit in any transfer information is 1, set the RRS bit to 0. Note that the MRA.WBDIS bit

should be set to 1 when the MRC.DISPE bit is set to 1.
Like chain transfer, sequence transfer handles sequences of multiple types of data transfer. When sequence transfer is to be used, set the RRS bit to 0 so that the previous data transfer will not be repeated.

20.2.9 DTC Vector Base Register for Secure Application (DTCVBR_S), DTC Vector Base Register for Non-secure Application (DTCVBR_NS)

Address(es): DTC.DTCVBR_S 8700 7C14h*1, DTC_NS.DTCVBR_NS 0700 7C04h*2

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. This register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
Note 2. This register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCVBR register is used to set the base address for calculating the address to which the DTC vector is allocated.
The lower 10 bits are reserved and the values are fixed to 0. Write 0 to the lower 10 bits if necessary.
There are two registers: one for Secure application developers (DTCVBR_S) and one for Non-secure application developers (DTCVBR_NS).
The DTCVBR_NS register can be set in the range of 0000 0000h to 7FFF FC00h, and the DTCVBR_S register in the range of 8000 0000h to FFFF FC00h in 1-Kbyte units.

20.2.10 DTC Module Start Register (DTCST)

Address(es): DTC.DTCST 8700 7C0Ch, DTC_NS.DTCST 0700 7C0Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DTCST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DTCST	DTC Module Start	0: DTC module stop 1: DTC module start	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

DTCST Bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted.

If this bit is set to 0 during data transfer, the accepted transfer request is active until the processing is completed.

Set the DTCST bit to 0 before making a transition to the module stop state, software standby mode, or deep software standby mode.

Set the DTCST bit to 1 to resume the data transfer after returning from the module stop state or software standby mode.

For details on transitions to the module stop state, software standby mode, and deep software standby mode, refer to section 20.9, Low Power Consumption Function, and section 11, Low Power Consumption.

20.2.11 DTC Status Register (DTCSTS)

Address(es): DTC.DTCSTS 8700 7C0Eh, DTC_NS.DTCSTS 0700 7C0Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ACT	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	VECN[7:0]	DTC Active Vector Number Monitoring Flag	These bits indicate the vector number for the request source when data transfer is in progress. The value is only valid if data transfer is in progress (the value of the ACT flag is 1).	R
b14 to b8	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b15	ACT	DTC Active Flag	0: Data transfer is not in progress. 1: Data transfer is in progress.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

VECN[7:0] Flags (DTC Active Vector Number Monitoring Flag)

While data transfer is in progress, these bits indicate the vector number corresponding to the request source for the transfer.

When the DTCSTS register is read, the value of the VECN[7:0] flags is valid if the value of the ACT flag was 1 (data transfer is in progress) and invalid if the value of the ACT flag was 0 (data transfer is not in progress).

For the correspondence between the DTC request sources and the vector addresses, refer to Table 15.6, Interrupt Vector Table in section 15, Interrupt Controller (ICUM).

ACT Flag (DTC Active Flag)

This flag indicates the state of data transfer operation.

[Setting condition]

- When the data transfer is started by a transfer request.
- When the sequence transfer is resumed.

[Clearing condition]

- When the data transfer is completed in response to a transfer request.
- When the sequence transfer is suspended.

20.2.12 DTC Index Table Base Register (DTCIBR)

Address(es): DTC.DTCIBR 8700 7C24h, DTC_NS.DTCIBR 0700 7C24h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCIBR register is used to set the base address for calculating the address to which the DTC index is allocated.
Values for the upper 4 bits (b31 to b28) cannot be written but reflect the value written to b27.
The lower 10 bits (b9 to b0) are reserved bits and fixed to 0. When writing this register, set these bits to 0.
It can be set in the range of 0000 0000h to 07FF FC00h and F800 0000h to FFFF FC00h in 1-Kbyte units.

20.2.13 DTC Operation Register (DTCOR)

Address(es): DTC.DTCOR 8700 7C28h, DTC_NS.DTCOR 0700 7C28h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SQTFRL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SQTFRL	Sequence Transfer Terminate	Writing 1 to this bit terminates the sequence transfer in progress. This bit is read as 0.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCOR register sets the operation of the DTC module.

SQTFRL Bit (Sequence Transfer Terminate)

Setting the SQTFRL bit to 1 terminates the sequence transfer in progress.
When the DTCSQE.ESPSEL bit is 1 (Sequence transfer is enabled), follow the procedure shown in Figure 20.2 to terminate the sequence transfer.
Writing 1 to the bit, while no sequence transfer is performed, have no effect.

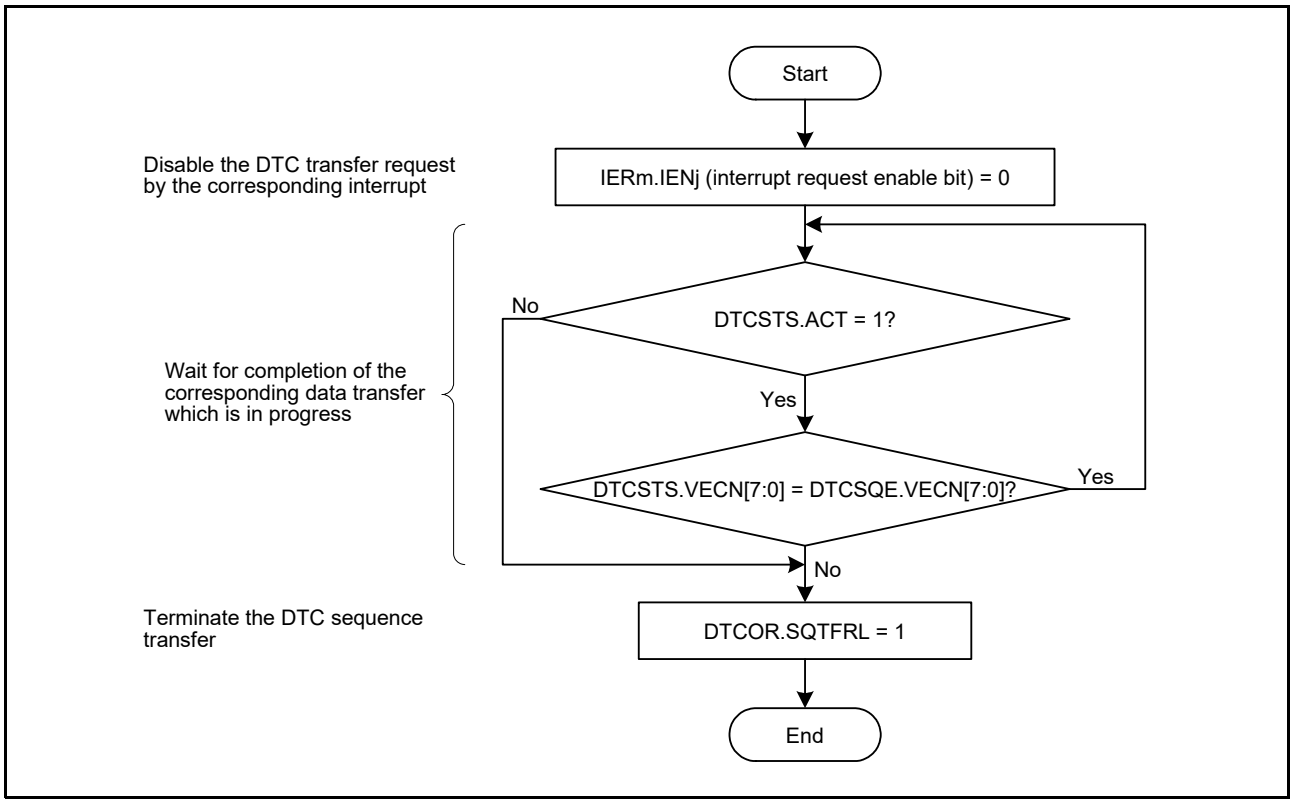


Figure 20.2 Procedure to Terminate Sequence Transfer

20.2.14 DTC Sequence Transfer Enable Register (DTCSQE)

Address(es): DTC.DTCSQE 8700 7C2Ch, DTC_NS.DTCSQE 0700 7C2Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ESPSEL	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	VECN[7:0]	Sequence Transfer Vector Number Setting	Specify the vector number by which a sequence transfer is enabled. The value is only valid when the ESPSEL bit is 1.	R/W
b14 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b15	ESPSEL	Sequence Transfer Enable	0: Sequence transfer is disabled. 1: Sequence transfer is enabled.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCSQE register is used to specify sequence transfer. Follow Figure 20.23 for details on the setting procedure.

VECN[7:0] Bit (Sequence Transfer Vector Number Setting)

This bit is used to specify for which vector number to perform sequence transfer. Sequence transfer can occur only for this trigger source.
Table 15.6, Interrupt Vector Table in section 15, Interrupt Controller (ICUM) shows the relationship between the trigger source and the vector number.

ESPSEL Bit (Sequence Transfer Enable)

The ESPSEL bit specifies whether sequence transfer is used.

20.2.15 DTC Address Displacement Register (DTCDISP)

Address(es): DTC.DTCDISP 8700 7C18h, DTC_NS.DTCDISP 0700 7C18h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The DTCDISP register is used to specify the displacement value to add to the DTC transfer source address.

If MRC.DISPE bit is 1, the value SAR + DTCDISP is used as the transfer source address.

20.2.16 DTC Error Vector Register (DTCEVR)

Address(es): DTC.DTCEVR 8700 7C20h, DTC_NS.DTCEVR 0700 7C20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERRSTS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WBCF	ERRTI[2:0]			—	—	—	ERRSAF	ERRVCT[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	ERRVCT[7:0]	Error Occurrence Vector Number Indication	These bits indicate the vector number for the DTC trigger source when a transfer error occurs.	R*1
b8	ERRSAF	Error Occurrence Vector Security Attribute	0: Secure 1: Non-secure	R*1
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	ERRTI[2:0]	Error Occurrence Timing Indication	b14 b12 0 0 0: When reading the DTC vector 0 0 1: When reading the transfer information 0 1 0: When reading data from the source address 0 1 1: When writing data to the destination address 1 0 0: When writing back the transfer information 1 0 1: When referring the DTC index table Other than above: Reserved	R
b15	WBCF	Write-Back Completion Flag	0: Write-back of transfer information has not been completed. 1: Write-back of transfer information has been completed.	R*1
b16	ERRSTS	Error Status Flag	0: No transfer error 1: Transfer error occurred	R/W*2
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: This register can be read by both secure and non-secure transactions.
When the ERRSAF flag is set to 0 (secure), this register can only be written by secure transactions. Writes by non-secure transactions are ignored, and a Protect Zone access error is generated.
When the ERRSAF flag is set to 1 (non-secure), this register can be written by any transaction.
Note 1. Clearing the ERRSTS flag also clears these flags and bits.
Note 2. Writing 1 to this flag clears it.

The DTCEVR register indicates detailed information when a transfer error occurs. The information in this register is updated only when the ERRSTS flag changes from 0 to 1. It is not updated unless the ERRSTS flag is cleared.

ERRSAF Flag (Error Occurrence Vector Security Attribute)

This flag indicates the security attribute of the DTC trigger source that caused the transfer error. The security attribute of the DTC trigger source is the same as the security attribute of the ICU.DTCERn register.

WBCF Flag (Write-Back Completion Flag)

This flag indicates whether write-back of the transfer information has been completed when a transfer error occurs.

ERRSTS Flag (Error Status Flag)

This flag indicates that a bus error has occurred during DTC transfer.

[Setting condition]

- When a transfer error occurs when this flag is 0.

[Clearing condition]

- When 1 is written to this flag.

20.2.17 DTC Security Attribution Register (DTCSAR)

Address(es): CPSCU.DTCSAR 8701 8030h, CPSCU_NS.DTCSAR 0701 8030h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADTC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SADTC0	DTC Security Attribution 0	0: Secure 1: Non-secure	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is used to set the security attributes for the DTC module.

SADTC0 Bit (DTC Security Attribution 0)

This bit is used to set the security attributes of the DTC registers (DTCST, DTCSTS, DTCIBR, DTCOR, DTCSQE, and DTCDISP), except for the DTCCR, DTCVBR, and DTCEVR registers*1.

Note 1. The DTCCR and DTCVBR registers have two sets of registers, one for secure applications and one for non-secure applications, and their security attributes are fixed. The security attribute of the DTCEVR register is special.

20.3 Request Sources

The DTC data transfer is triggered by an interrupt request. Setting the ICU.DTCERn.DTCE bit (n = interrupt vector number) to 1 selects the corresponding interrupt request as a request source for the DTC. The security attribute of the DTC request source is the same as the security attribute of the ICU.DTCERn register and is set by the CPSCU.ICU0SAR0 to ICU0SAR7 registers.
For the correspondence between the DTC request sources and the vector addresses, refer to Table 15.6, Interrupt Vector Table in section 15, Interrupt Controller (ICUM). For request by software, refer to section 15.2.5, Software Interrupt Generation Register (SWINTR) and section 15.2.6, Software Interrupt 2 Generation Register (SWINT2R) in section 15, Interrupt Controller (ICUM).
Once the DTC has accepted a transfer request, it does not accept another transfer request until transfer for that single request is completed, regardless of the priority of the requests.
When multiple transfer requests are generated during data transfer by the DMAC/DTC, the request with the highest priority on completion of the current transfer is accepted. When multiple transfer requests are generated while the DTCST.DTCST bit is 0 (DTC module stop), the request with the highest priority at the moment when the bit is subsequently set to 1 (DTC module start) is accepted.

The DTC performs the following operations at the start of a single data transfer (or the last of the consecutive transfers in the case of a chain transfer).

- On completion of a specified number of data transfer, the ICU.DTCERn.DTCE bit is set to 0 and an interrupt is requested to the CPU.
- If the MRB.DISEL bit is 1, an interrupt is requested to the CPU on completion of data transfer.
- For the other transfers, the interrupt status flag of the request source is set to 0 at the start of data transfer.

20.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information corresponding to each request source from the vector table and reads the transfer information starting at that address. There is one vector table each in the Secure world and Non-secure world, and the table that matches the security attribute of the request source is used.
The vector table should be located on a 1-Kbyte boundary so that the lower 10 bits of the base address (start address) are 0. Use the DTC vector base register for Secure application (DTCVBR_S) to set the base address of the DTC vector table in the Secure world, and use the DTC vector base register for Non-secure application (DTCVBR_NS) to set the base address of the DTC vector table in the Non-secure world.
Transfer information is allocated in the RAM area. Transfer information can be allocated in the ROM area when the MRA.WBDIS bit is set to 1. The start address of the transfer information n with vector number n should be allocated at DTCVBR + 4n.
Transfer information should be aligned on a 16-byte boundary.
Figure 20.3 shows the relationship between the DTC vector table and transfer information.
Figure 20.4 shows the allocation of transfer information in the RAM area. The lower addresses vary according to the endian of the corresponding allocation area. For details, refer to section 20.10.2, Allocating Transfer Information.

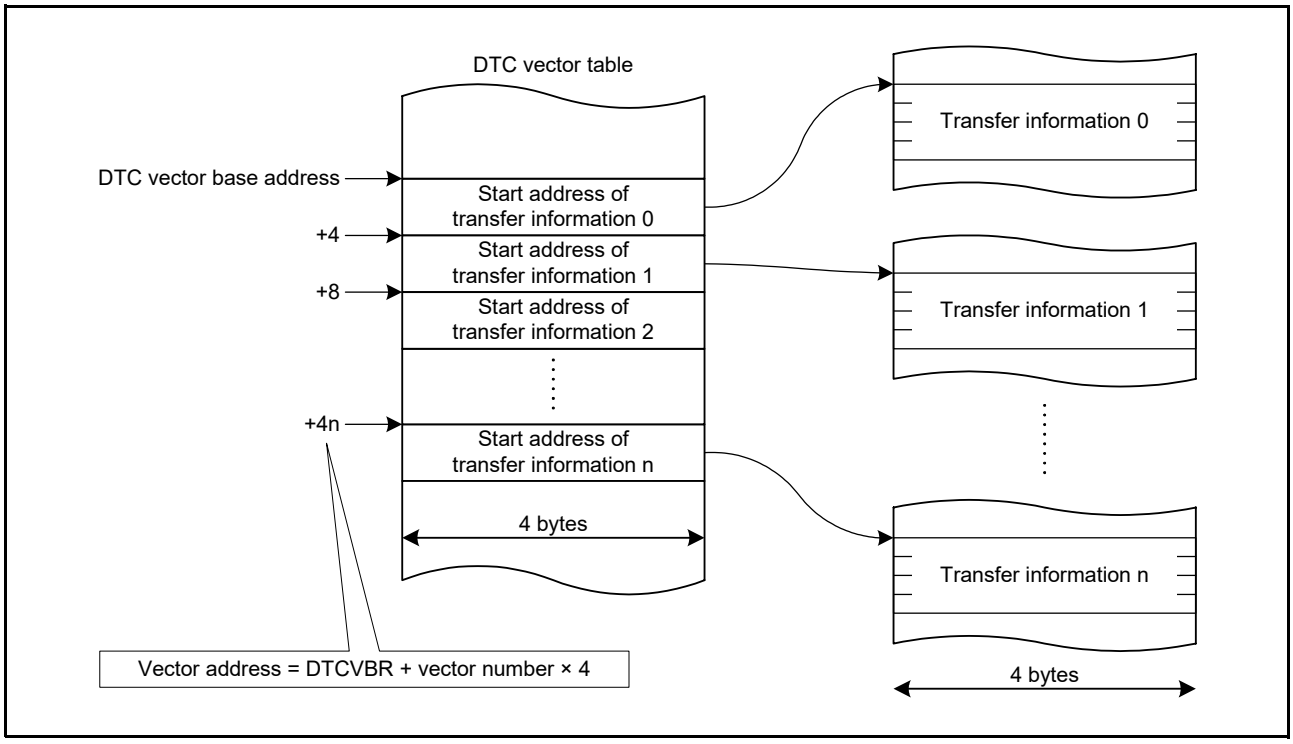

Figure 20.3 DTC Vector Table and Transfer Information

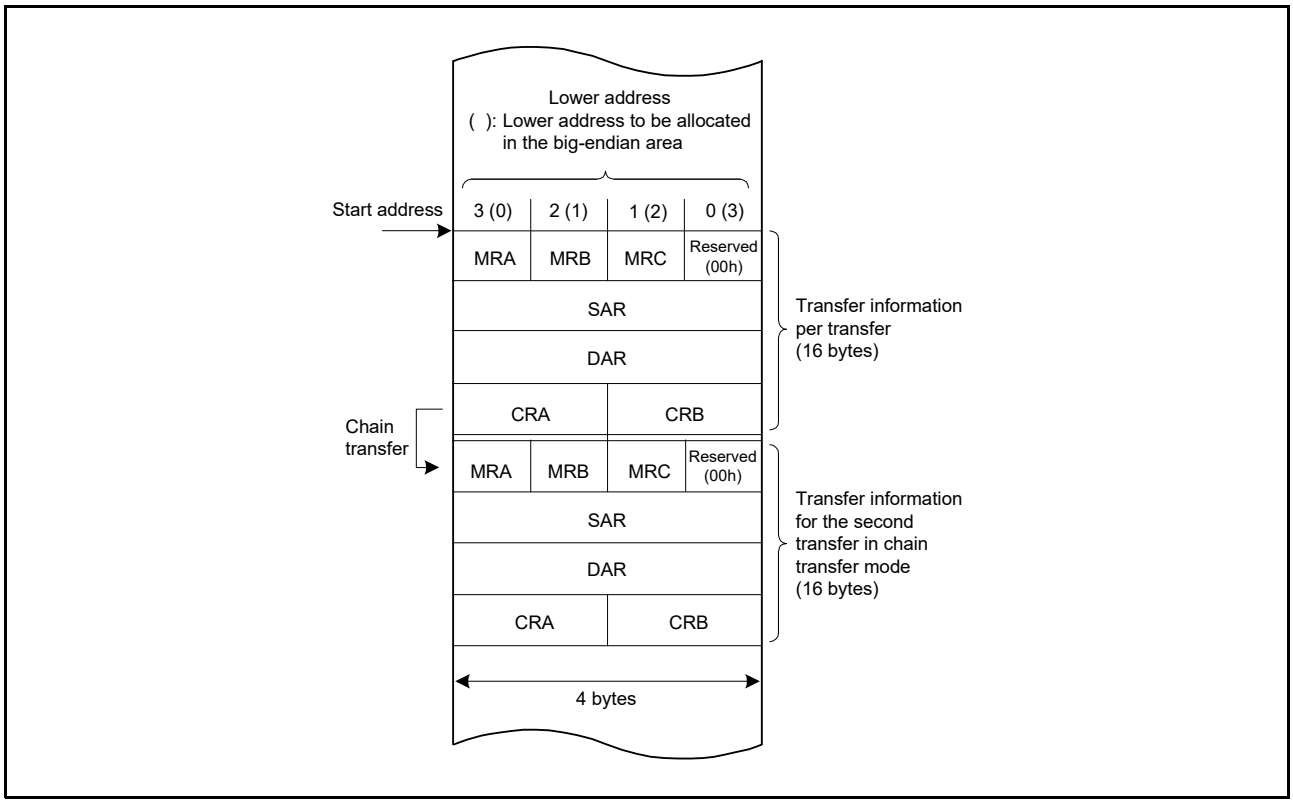

Figure 20.4 Allocation of Transfer Information in the RAM Area

20.4 Operation

The DTC transfers data in accordance with the transfer information. Storage of the transfer information in the RAM area is required before DTC operation.

When the DTC accepts a transfer request, it reads the DTC vector corresponding to the vector number. Next, the DTC reads transfer information from the address pointed by the DTC vector, transfers data, and then writes back the transfer information after the data transfer. Allocating transfer information in the RAM area allows data transfer of arbitrary number of channels.

There are three transfer modes: normal transfer mode, repeat transfer mode, and block transfer mode.

Set a transfer source address in the SAR register and a transfer destination address in the DAR register. The SAR and DAR registers are updated after the transfer according to the respective settings (increment, decrement, or fixed).

Table 20.3 lists transfer modes of the DTC.

Table 20.3 Transfer Modes of the DTC

Transfer Mode	Data Size Transferred on Single Transfer Request	Increment/Decrement of Memory Address	Settable Transfer Count
Normal transfer mode	1 byte/1 word/1 longword/1 double longword	Incremented/decremented by 1, 2, 4, or 8 or address fixed	1 to 65536
Repeat transfer mode*1	1 byte/1 word/1 longword/1 double longword	Incremented/decremented by 1, 2, 4, or 8 or address fixed	1 to 256*3
Block transfer mode*2	Block size specified in CRAH (1 to 256 bytes/1 to 256 words/1 to 256 longwords/1 to 256 double longwords)	Incremented/decremented by 1, 2, 4, or 8 or address fixed	1 to 65536

Note 1. Set transfer source or transfer destination in the repeat area.
Note 2. Set transfer source or transfer destination in the block area.
Note 3. After data transfer of the specified count, the initial state is restored and the operation is continued (repeated).

Setting the MRB.CHNE bit to 1 allows multiple transfers (chain transfer) on a single transfer request. The setting in combination with the MRB.CHNS bit enables a chain transfer when the specified number of data transfers is completed.

Figure 20.5 shows the operation flowchart of the DTC. Table 20.4 lists chain transfer conditions.

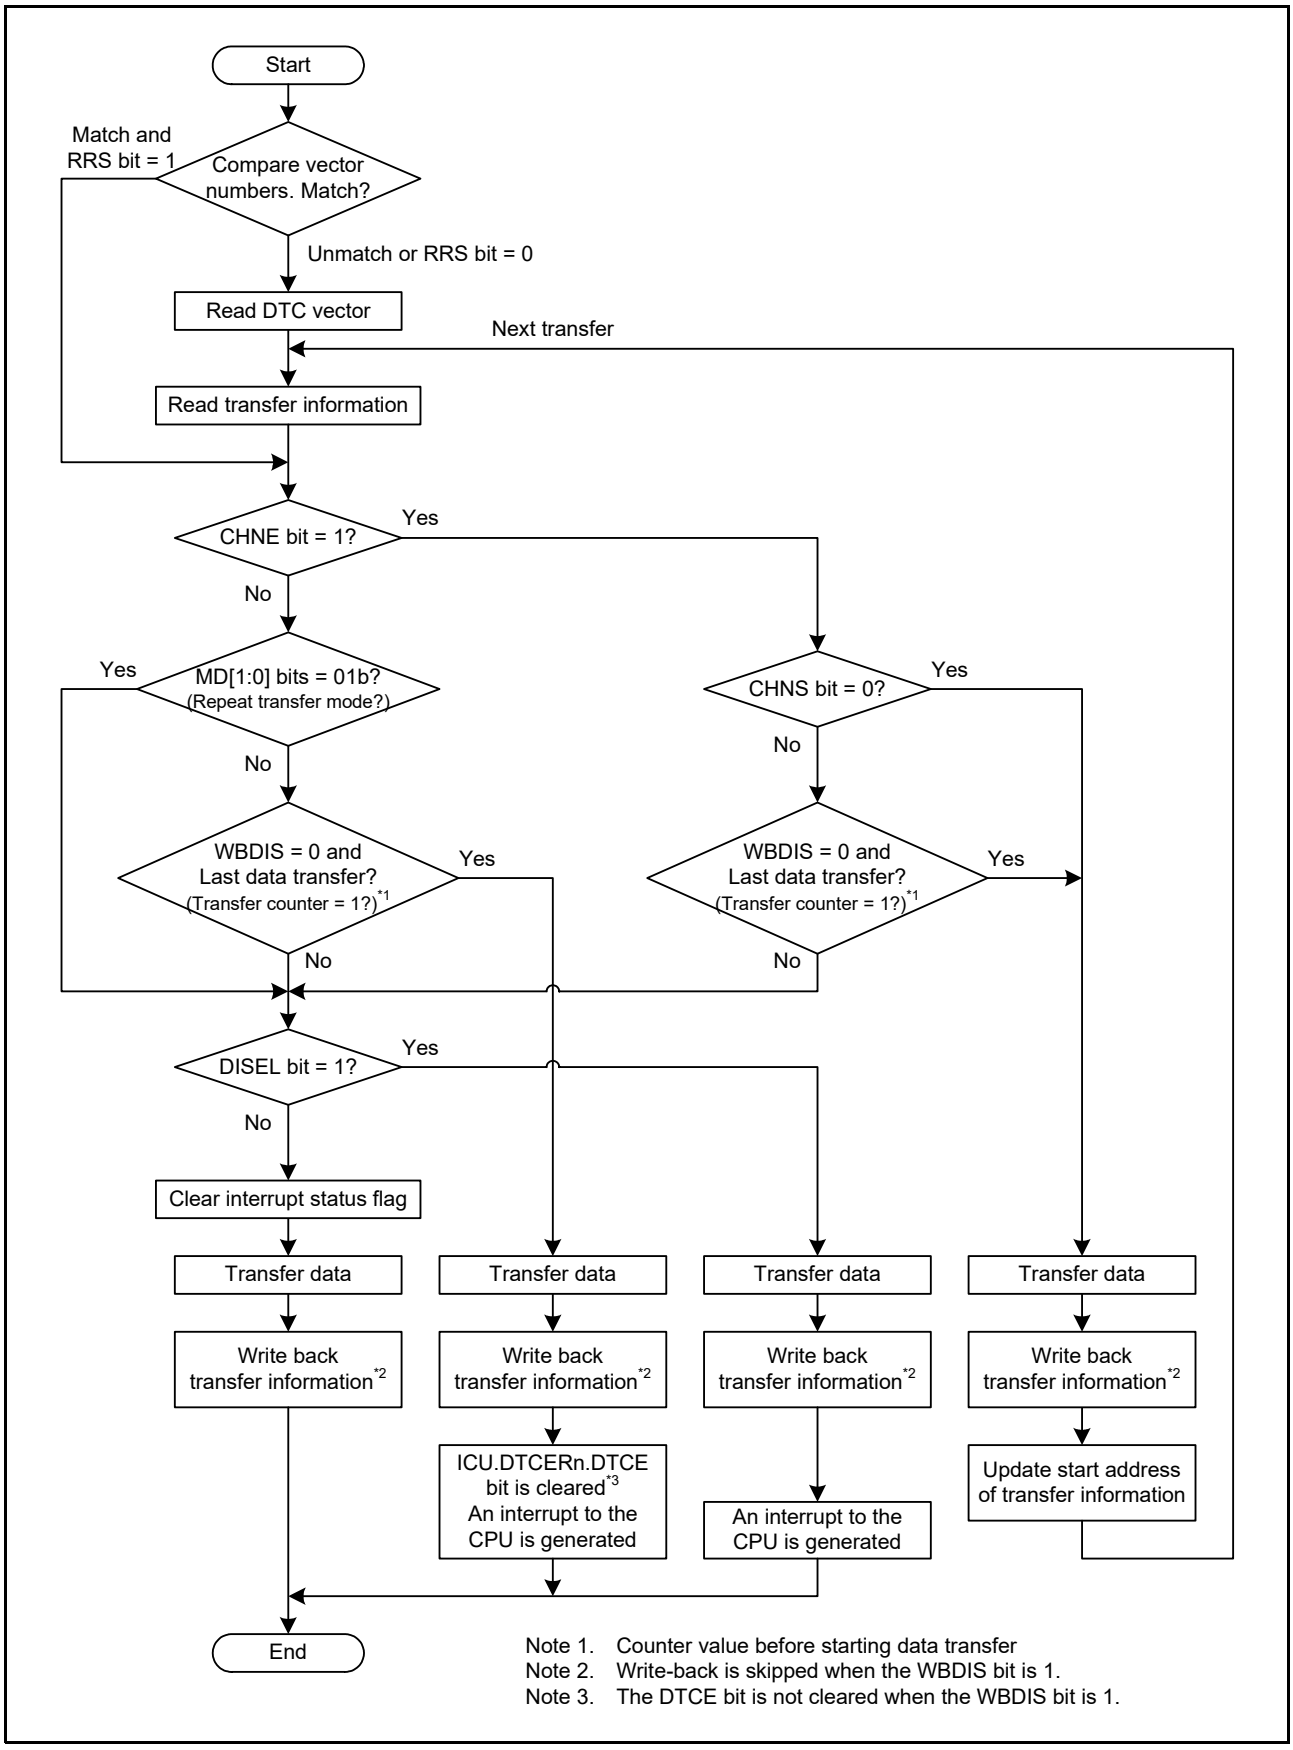

Figure 20.5 Operation Flowchart of the DTC

Table 20.4 Chain Transfer Conditions

First Transfer				Second Transfer*3				
CHNE Bit	CHNS Bit	DISEL Bit	Transfer Counter*1,*2	CHNE Bit	CHNS Bit	DISEL Bit	Transfer Counter*1,*2	Data Transfer
0	—	0	Other than (1 → 0)	—	—	—	—	Ends after the first transfer
0	—	0	(1 → 0)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU
0	—	1	—	—	—	—	—	
1	0	—	—	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	0	Other than (1 → ∗)	—	—	—	—	Ends after the first transfer
1	1	—	(1 → ∗)	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	1	Other than (1 → ∗)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU

Note 1. The transfer counters used depend on transfer modes as follows:
Normal transfer mode: CRA register
Repeat transfer mode: CRAL register
Block transfer mode: CRB register

Note 2. On completion of data transfer, the counters operate as follows:
1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → ∗) in the table indicates both of the two operations above.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The condition combination of “second transfer and the CHNE bit is 1” is omitted.

20.4.1 Transfer Information Read Skip Function

Reading of DTC vector and transfer information can be skipped by the setting of the DTCCR.RRS bit.

When a DTC transfer request is accepted, the current DTC vector number is compared with the DTC vector number in the previous data transfer. When these vector numbers match and the RRS bit is 1, the DTC does not read the DTC vector and transfer information, and transfers data according to the transfer information remained in the DTC.

However, when the previous transfer was chain transfer, the DTC vector and transfer information are read. Furthermore, when the transfer counter (CRA register) became 0 during the previous normal transfer and when the transfer counter (CRB register) became 0 during the previous block transfer, transfer information is read regardless of the value of the RRS bit. Figure 20.13 shows an example of transfer information read skip.

When updating the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, and then set the RRS bit to 1. Setting the RRS bit to 0 discards the vector numbers retained in the DTC. The updated DTC vector table and transfer information are read in the next data transfer.

20.4.2 Transfer Information Write-Back Skip Function

20.4.2.1 Write-Back Skip by Fixing Addresses

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to “address is fixed” (00b or 01b), a part of transfer information is not written back.

Table 20.5 lists transfer information write-back skip conditions and applicable registers. The CRA and CRB registers are written back, but write-back of registers MRA, MRB, and MRC is skipped.

Table 20.5 Transfer Information Write-Back Skip Conditions and Applicable Registers

MRA.SM[1:0] Bits		MRB.DM[1:0] Bits			
b3	b2	b3	b2	**SAR Register**	**DAR Register**
0	0	0	0	Skip	Skip
0	0	0	1		
0	1	0	0		
0	1	0	1		
0	0	1	0	Skip	Write-back
0	0	1	1		
0	1	1	0		
0	1	1	1		
1	0	0	0	Write-back	Skip
1	0	0	1		
1	1	0	0		
1	1	0	1		
1	0	1	0	Write-back	Write-back
1	0	1	1		
1	1	1	0		
1	1	1	1		

20.4.2.2 Write-Back Skip by the MRA.WBDIS Bit

When the MRA.WBDIS bit is 1, the transfer information (SAR, DAR, CRA, and CRB) is not written back regardless of the settings of the transfer information.

The transfer information on the memory is not updated, data can be transferred by the DTC without copying the transfer information from ROM to RAM. Skipping a write-back reduces time for post-processing of the data transfer.

20.4.3 Normal Transfer Mode

This mode allows 1-byte, 1-word, 1-longword, or 1-double-longword data transfer on a single transfer request. The transfer count can be set to 1 to 65536.

Transfer source addresses and transfer destination addresses can be set to increment, decrement, or fixed independently.

This mode enables an interrupt request to the CPU to be generated at the end of specified-count transfer.

Table 20.6 lists register functions in normal transfer mode, and Figure 20.6 shows the memory map of normal transfer mode.

Table 20.6 Register Functions in Normal Transfer Mode

Register	Description	Value Written Back by Writing Transfer Information*1
SAR	Transfer source address	Increment/decrement/fixed*2
DAR	Transfer destination address	Increment/decrement/fixed*2
CRA	Transfer counter A	CRA – 1
CRB	Transfer counter B	Not updated

Note 1. Write-back operation is skipped when the MRA.WBDIS bit is 1.
Note 2. Write-back operation is skipped when address is fixed.

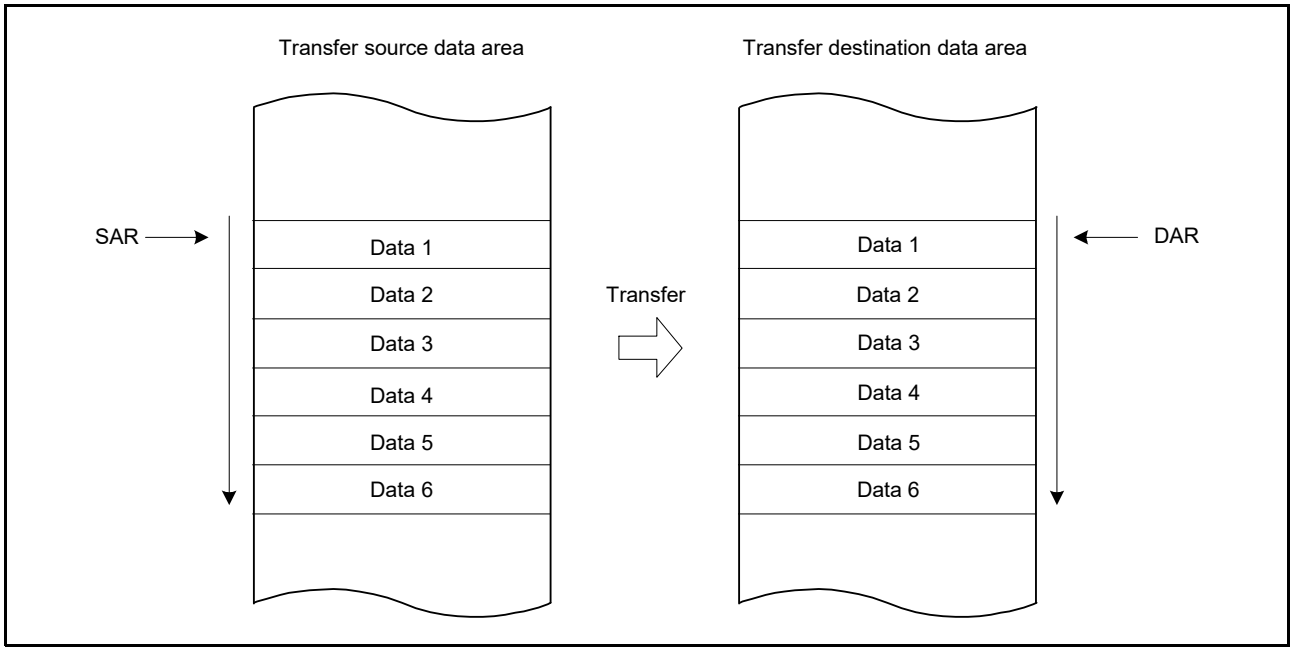

Figure 20.6 Memory Map of Normal Transfer Mode

20.4.4 Repeat Transfer Mode

This mode allows 1-byte, 1-word, 1-longword, or 1-double-longword data transfer on a single transfer request.
Specify either transfer source or transfer destination for the repeat area by the MRB.DTS bit. The transfer count can be set to 1 to 256. When the specified-count transfer is completed, the initial value of the address register specified in the transfer counter and the repeat area is restored and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.
When the transfer counter CRAL is decreased to 00h in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. Thus the transfer counter does not become 00h, which disables an interrupt request to be generated to the CPU when the MRB.DISEL bit is set to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers).
Table 20.7 lists the register functions in repeat transfer mode, and Figure 20.7 shows the memory map of repeat transfer mode.

Table 20.7 Register Functions in Repeat Transfer Mode

		Value Written Back by Writing Transfer Information*1		
			When CRAL = 1	
Register	**Description**	**When CRAL ≠ 1**	**When the MRB.DTS Bit is 0**	**When the MRB.DTS Bit is 1**
SAR	Transfer source address	Increment/decrement/fixed*2	Increment/decrement/fixed*2	SAR register initial value
DAR	Transfer destination address	Increment/decrement/fixed*2	DAR register initial value	Increment/decrement/fixed*2
CRAH	Retains initial value of transfer counter	CRAH	CRAH	
CRAL	Transfer counter A	CRAL – 1	CRAH	
CRB	Transfer counter B	Not updated	Not updated	

Note 1. Write-back operation is skipped when the MRA.WBDIS bit is 1.
Note 2. Write-back operation is skipped when address is fixed.

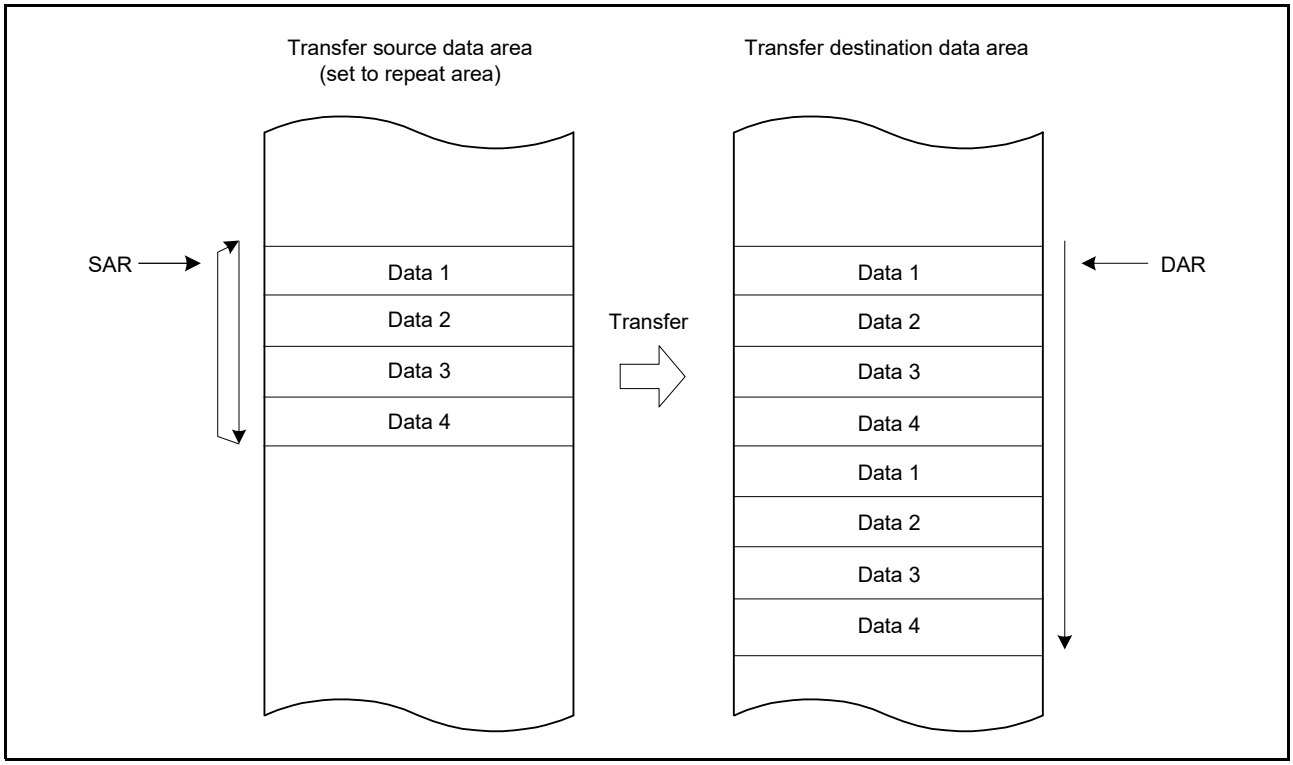

Figure 20.7 Memory Map of Repeat Transfer Mode (Transfer Source: Repeat Area)

20.4.5 Block Transfer Mode

This mode allows single-block data transfer on a single transfer request.
Specify either transfer source or transfer destination for the block area by the MRB.DTS bit. The block size can be set to 1 to 256 bytes, 1 to 256 words, 1 to 256 longwords, or 1 to 256 double longwords.
When transfer of the specified one block is completed, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS bit is 1 or the DAR register when the DTS bit is 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.
The transfer count (block count) can be set to 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of specified-count block transfer.
Table 20.8 lists register functions in block transfer mode, and Figure 20.8 shows the memory map of block transfer mode.

Table 20.8 Register Functions in Block Transfer Mode

		Value Written Back by Writing Transfer Information*1	
Register	**Description**	**When MRB.DTS Bit is 0**	**When MRB.DTS Bit is 1**
SAR	Transfer source address	Increment/decrement/fixed*2	SAR register initial value
DAR	Transfer destination address	DAR register initial value	Increment/decrement/fixed*2
CRAH	Retains initial value of block size	CRAH	
CRAL	Block size counter	CRAH	
CRB	Block transfer counter	CRB – 1	

Note 1. Write-back operation is skipped when the MRA.WBDIS bit is 1.
Note 2. Write-back operation is skipped when address is fixed.

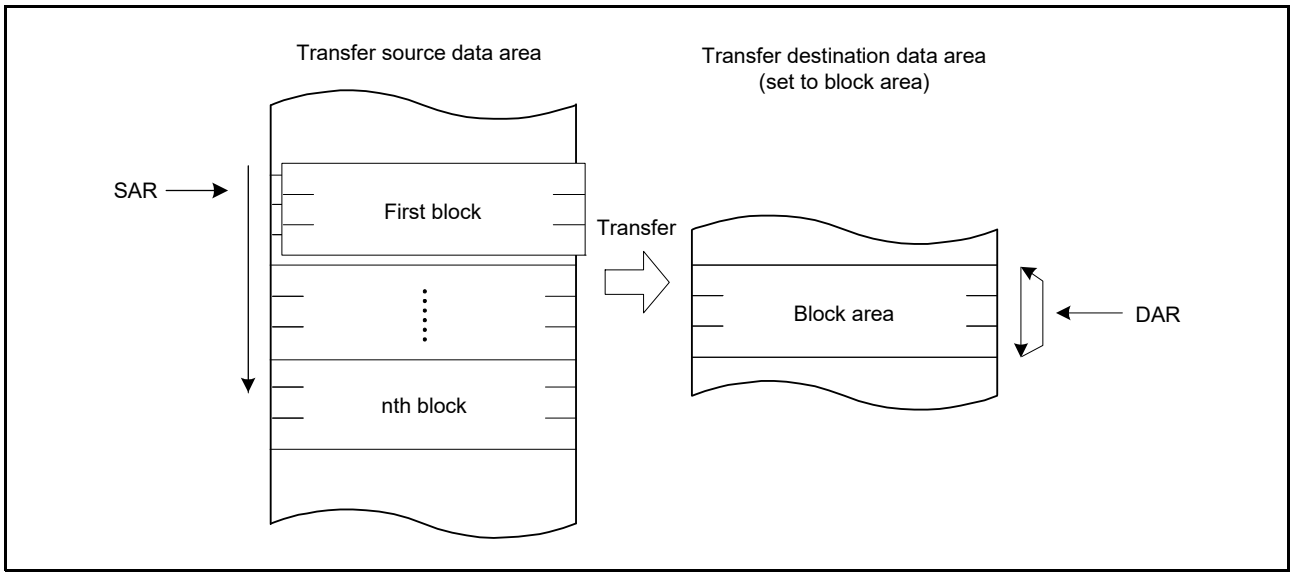

Figure 20.8 Memory Map of Block Transfer Mode (Transfer Destination: Block Area)

20.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single transfer request. If the MRB.CHNE bit is 1 and the MRB.CHNS bit is 0, an interrupt request to the CPU is not generated when the specified number of data transfers is completed, or while the MRB.DISEL bit is 1 (an interrupt request to the CPU is generated for every data transfer). Data transfer has no effect on the interrupt status flag, which is the request source. The transfer information (SAR, DAR, CRA, CRB, MRA, MRB, and MRC) that define a data transfer can be specified independently of each other. Figure 20.9 shows chain transfer operation.

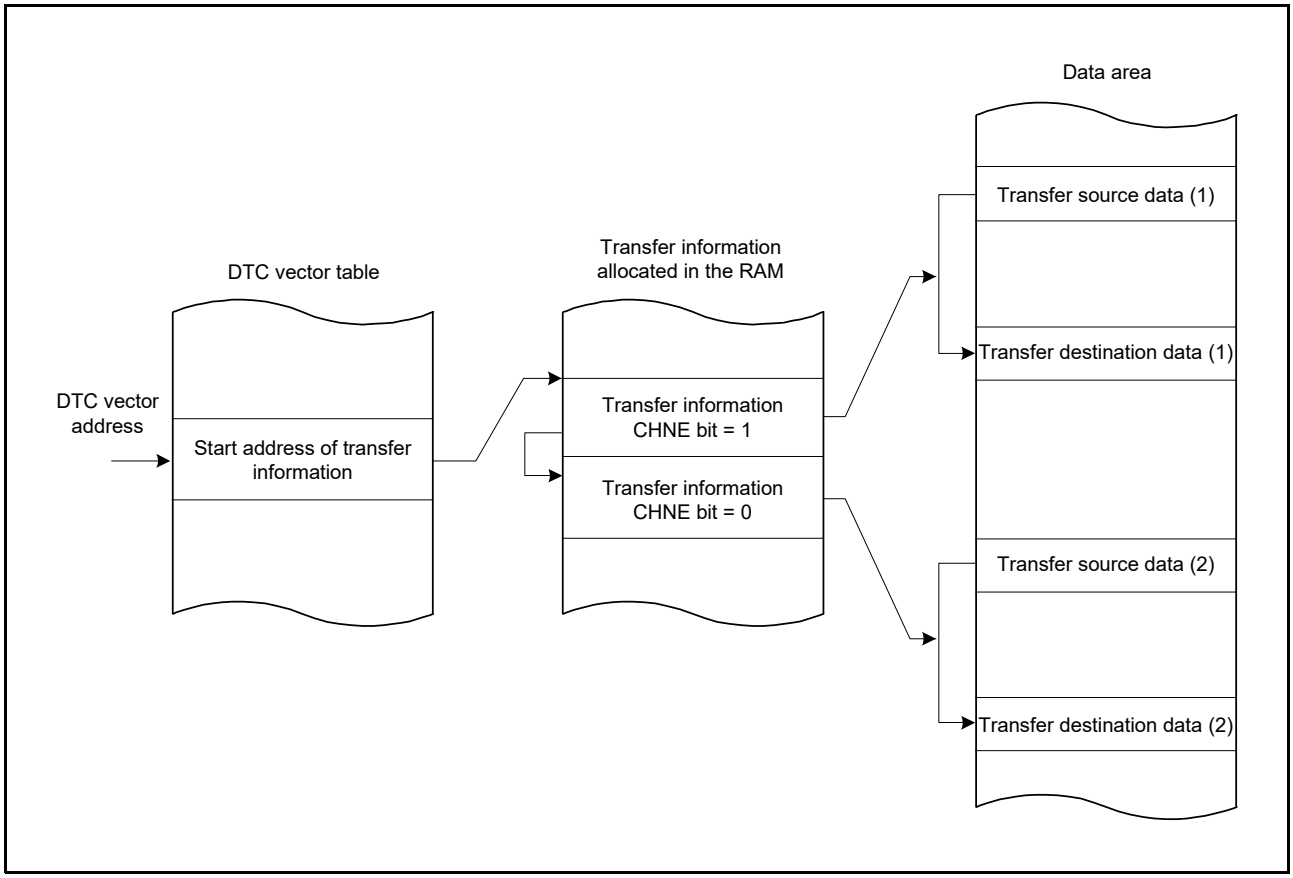

Figure 20.9 Chain Transfer Operation

If the MRB.CHNE bit is 1 and the CHNS bit is 1, chain transfer is performed only after completion of specified number of data transfers. In repeat transfer mode, chain transfer is performed after completion of specified number of data transfers.
For details on chain transfer conditions, refer to Table 20.4, Chain Transfer Conditions.

20.4.7 Operation Timing

Figure 20.10 to Figure 20.13 show examples of DTC operation timing.

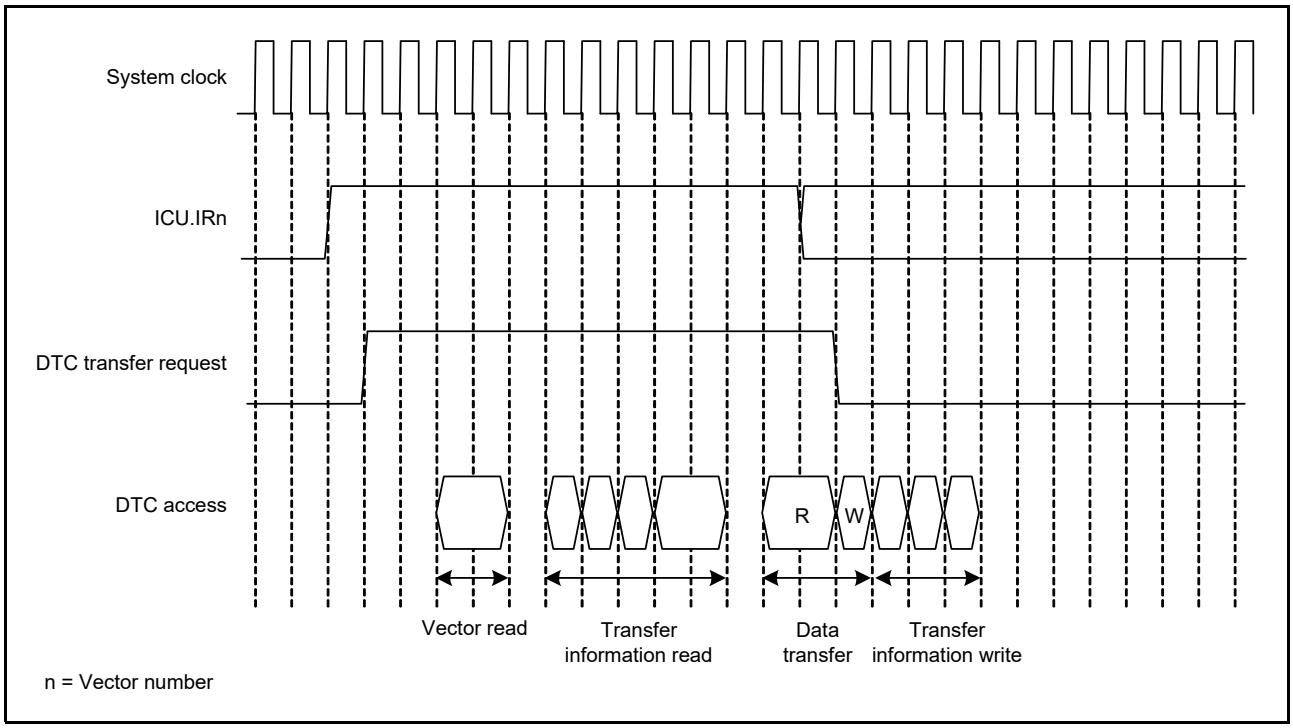

Figure 20.10 Example (1) of DTC Operation Timing (Normal Transfer Mode, Repeat Transfer Mode)

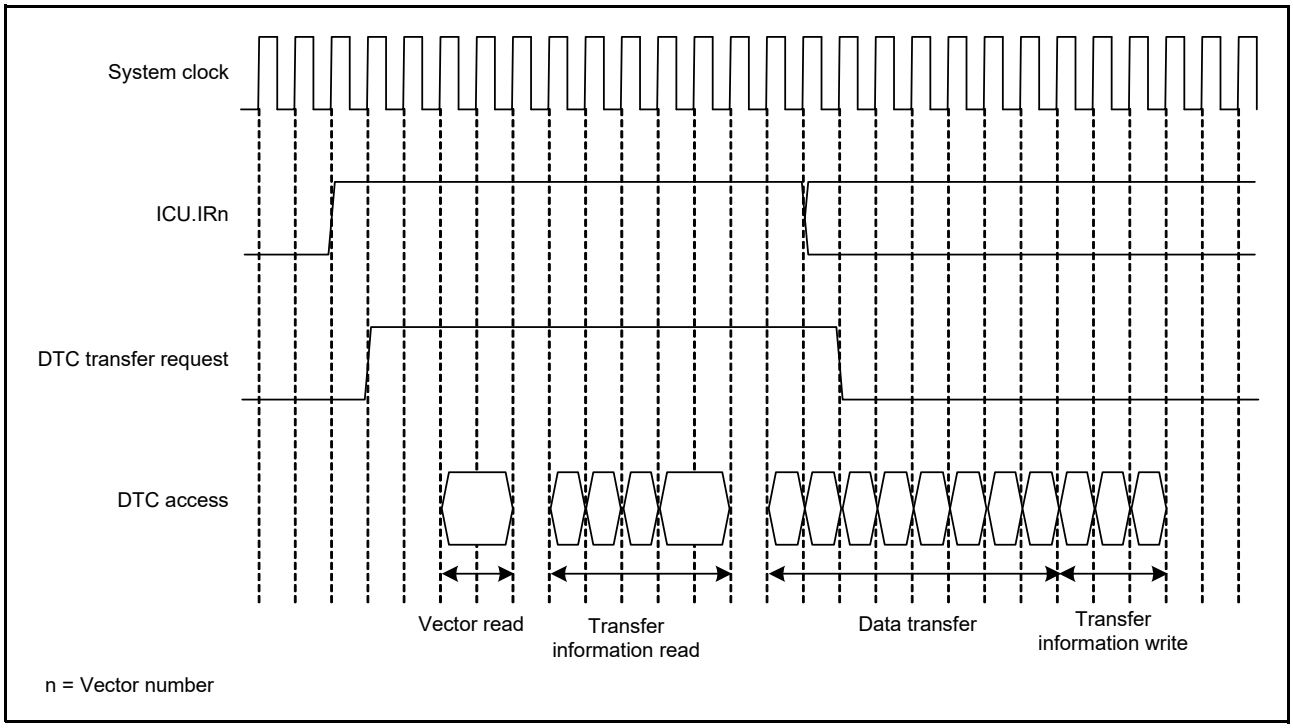

Figure 20.11 Example (2) of DTC Operation Timing (Block Transfer Mode, Block Size = 4)

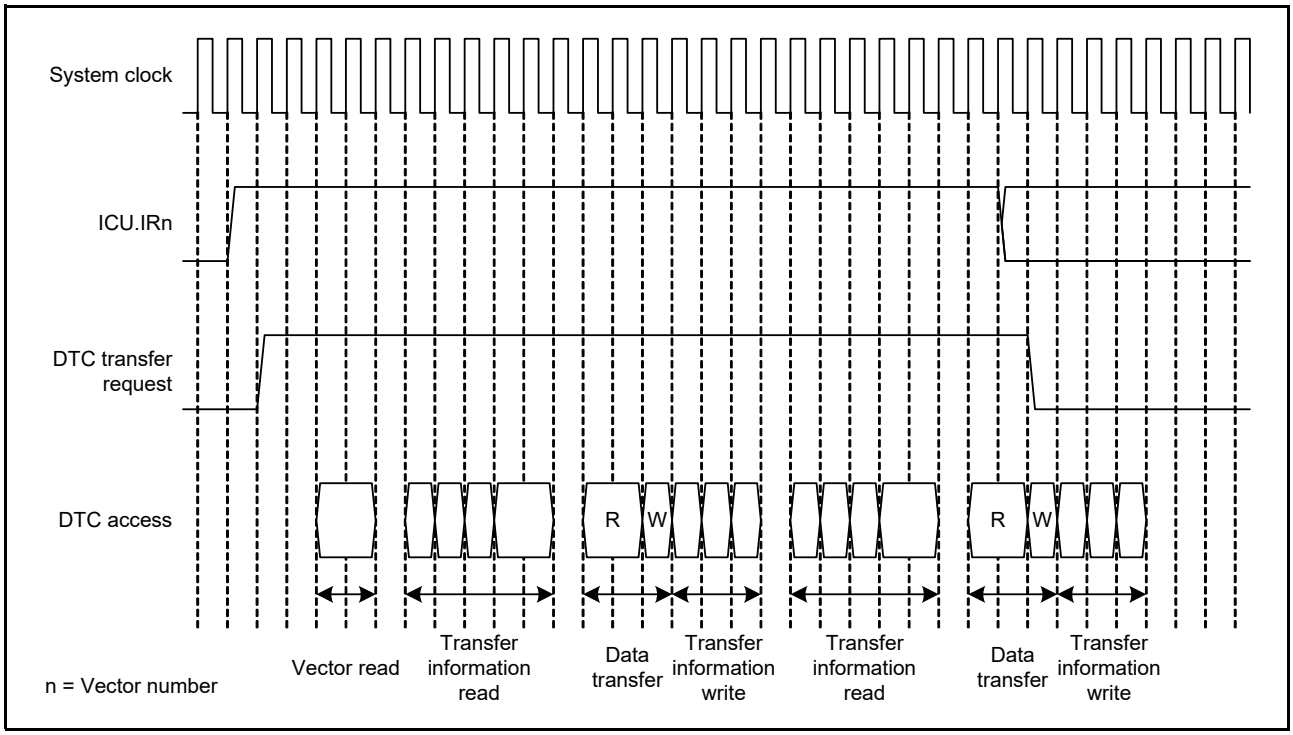

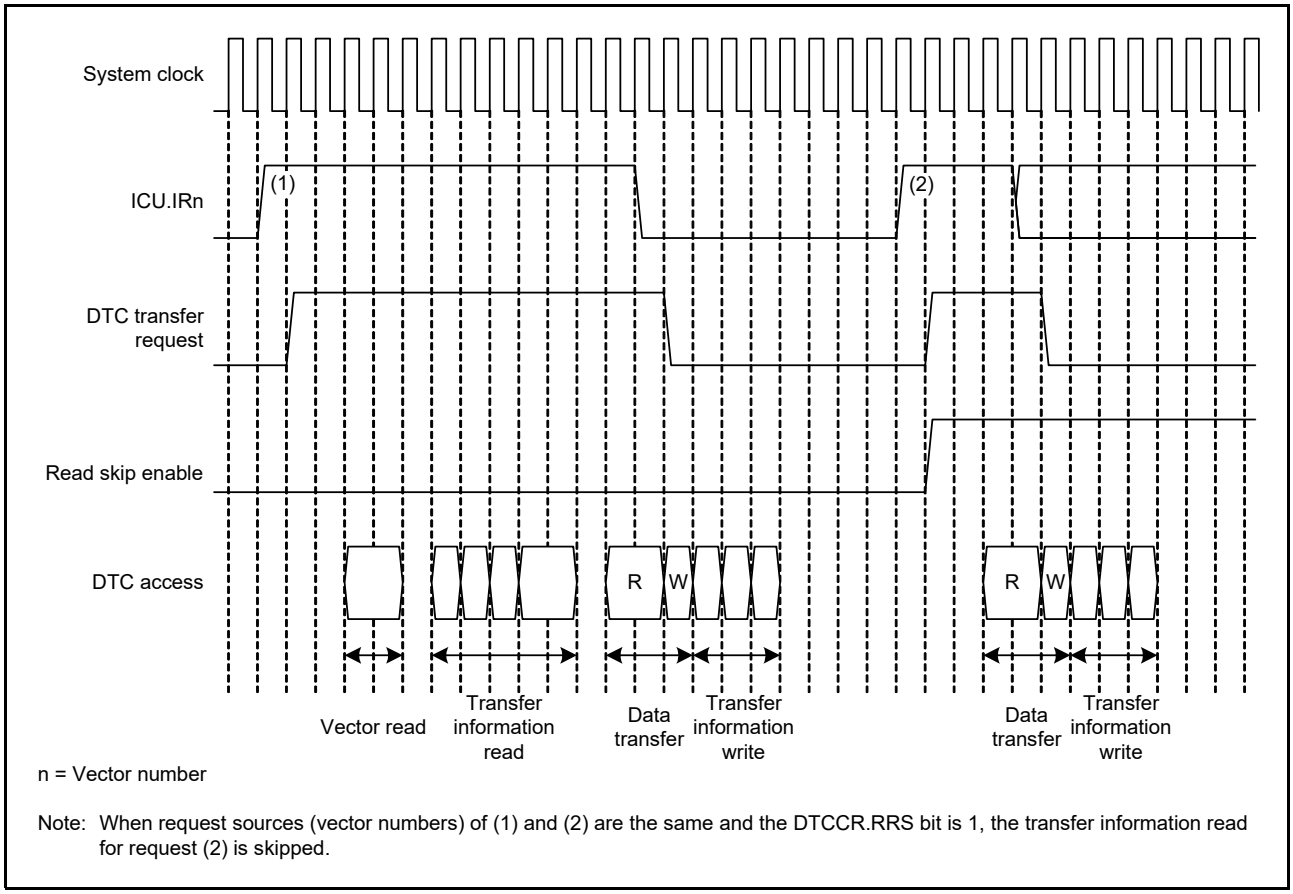

Figure 20.12 Example (3) of DTC Operation Timing (Chain Transfer)

Note: When request sources (vector numbers) of (1) and (2) are the same and the DTCCR.RRS bit is 1, the transfer information read for request (2) is skipped.

Figure 20.13 Example of Operation When Transfer Information Read Skip is Executed (Vector, Transfer Information, and Transfer Destination Data on the RAM, and Transfer Source Data on the Peripheral Module)

20.4.8 Sequence Transfer

A sequence transfer can be executed on the request source that is specified in the DTCSQE register. A sequence transfer is started by setting the MRB.INDX bit to 1 and ended by setting the MRB.SQEND bit to 1. Setting the DTCOR.SQTFRL bit to 1, even during a sequence transfer, forcibly ends the transfer and the next DTC transfer request starts new sequence transfer with reference to the index table.
A sequence transfer includes the following processing.

(1) The first data transfer is executed by referring to the DTC vector table in response to a DTC transfer request from the source specified in the DTCSQE register.
(2) The DTC index table is referred based on the value of the lower 8 bits of the first data transferred data in (1) (sequence number).
(3) The transfer information is read from the address obtained from the DTC index table.
(4) A data transfer is executed in accordance with the transfer information. On completion of the data transfer, either one of the following operations is performed by using the values of bits MRB.CHNE and MRB.SQEND.
- A chain transfer is executed when the CHNE bit is 1. The next transfer information is read. Go to (4).
- The sequence transfer is suspended when the CHNE bit is 0 and the SQEND bit is 0. Go to (5).
- The sequence transfer ends when the CHNE bit is 0 and the SQEND bit is 1.

(5) When a DTC transfer request from the source specified in the DTCSQE register is accepted, the suspended sequence transfer is resumed and the next transfer information is read. Go to (4).

Note 1. When the ICU.DTCERn.DTCE bit becomes 0 based on the result of the data transfer, a DTC transfer request is not generated. Set the DTCE bit to 1 to resume sequence transfer. Refer to Figure 20.5 or section 15, Interrupt Controller (ICUM) for the conditions where the DTCE bit becomes 0.

Figure 20.14 and Figure 20.15 shows a basic sequence transfer operation.

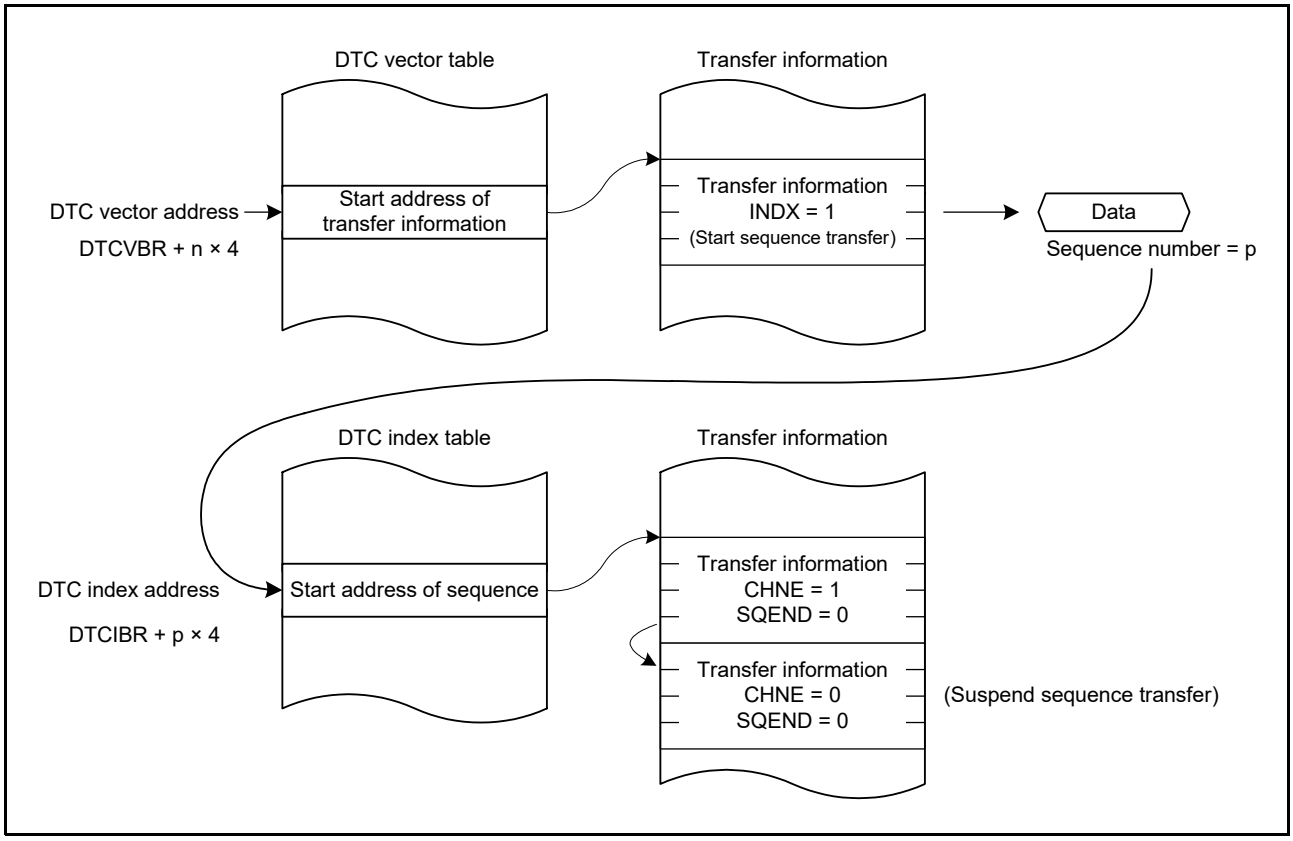

Figure 20.14 Start and Suspension of Sequence Transfer

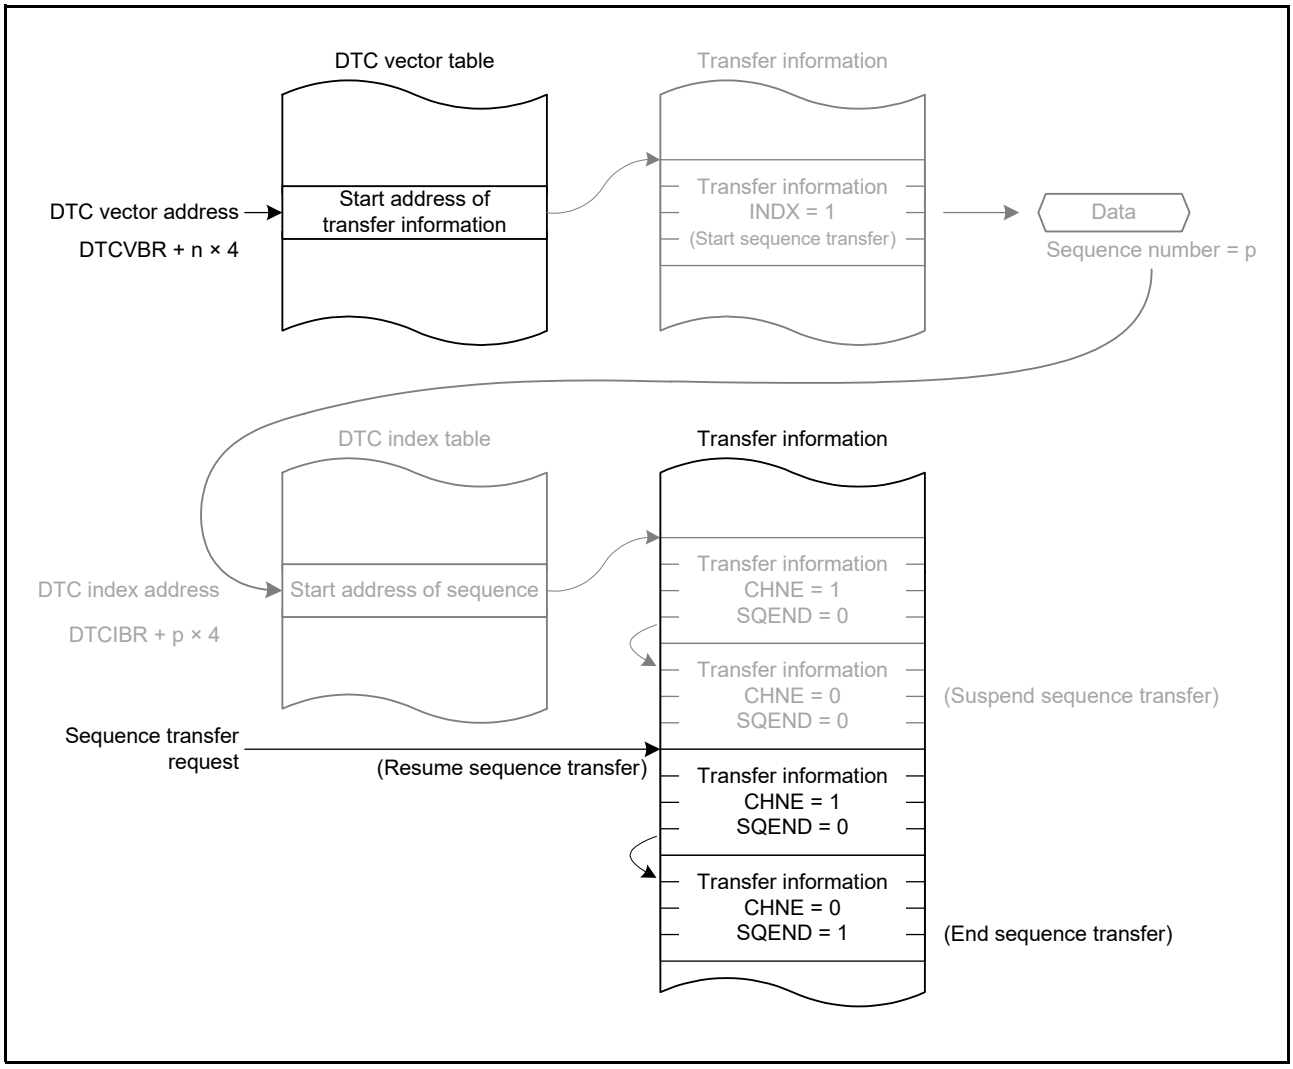

Figure 20.15 Resumption and End of Sequence Transfer

Table 20.9 lists the settings of bits CHNE, SQEND, and INDX during the sequence transfer.

Table 20.9 Sequence Transfer Process and Values of Bits CHNE, SQEND, and INDX

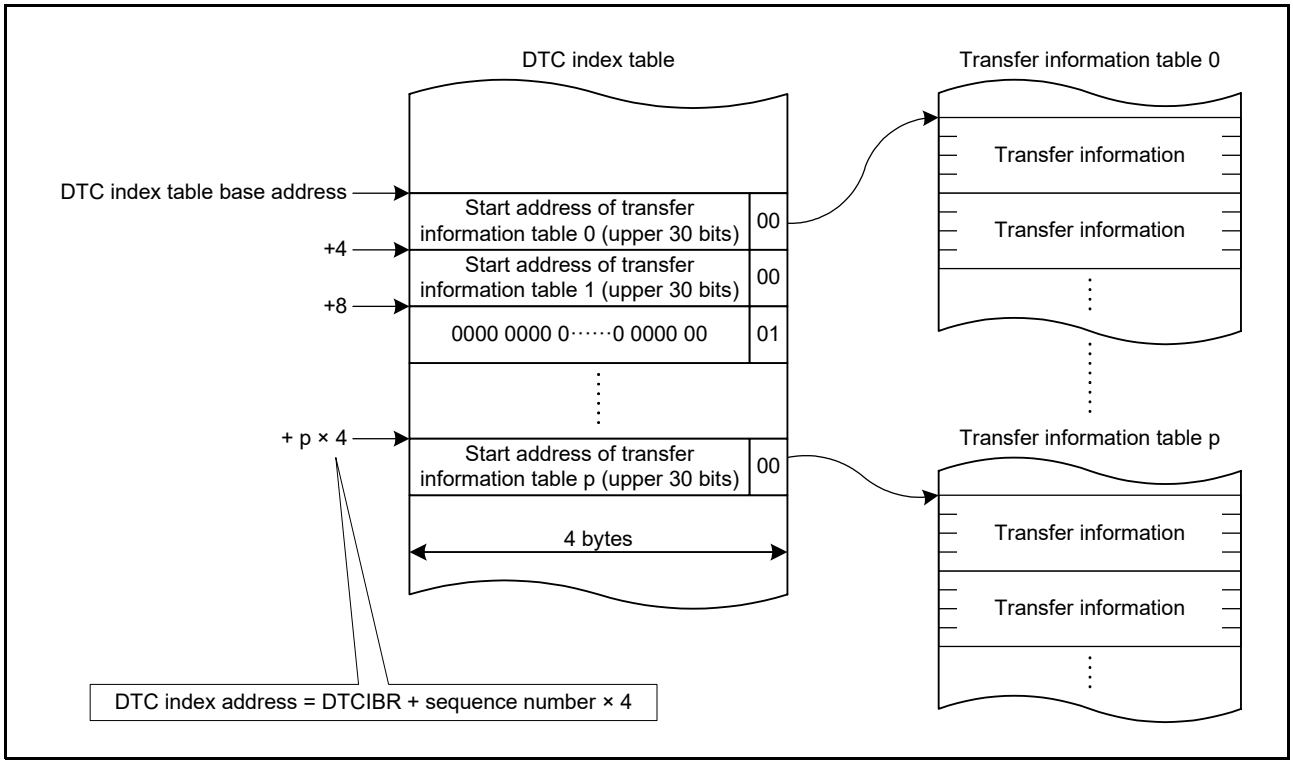
DTC Operations	CHNE Bit	SQEND Bit	INDX Bit
Start sequence transfer	0	0	1*1
Continue sequence transfer	1	0	0
Suspend sequence transfer*2	0	0	0
End sequence transfer	0	1	0
End current sequence transfer and start new sequence transfer	0	1	1*1
Some other transfer (not sequence transfer)	—	0	0

Note: Do not set the values other than listed above.
Note 1. Set MRA.MD[1:0] bits to 00b (normal transfer mode) when setting the INDX bit to 1.
Note 2. When a sequence transfer is suspended, the ICU.DTCERn.DTCE bit may become 0. Set the DTCE bit to 1 to resume sequence transfer.

Even when a sequence transfer is suspended, a new sequence transfer cannot start until the suspended sequence transfer is eventually completed. When a sequence transfer request is received during suspension of the sequence transfer, the suspended sequence transfer is resumed.

20.4.9 DTC Index Table

The DTC index table is allocated to the area where its start address is configured in the DTCIBR register.
Store the start address of transfer information table p for sequence number p in the address of DTCIBR + p × 4.
The upper 30 bits of the start address is set to the upper 30 bits of the DTC index. Set the CPUSEL bit to select either of reading the transfer information and starting the sequence, or output an interrupt request to the CPU without starting the sequence. For a complicated sequence that the DTC cannot handle, set the CPUSEL bit to 1 to allow the CPU to handle such a sequence.



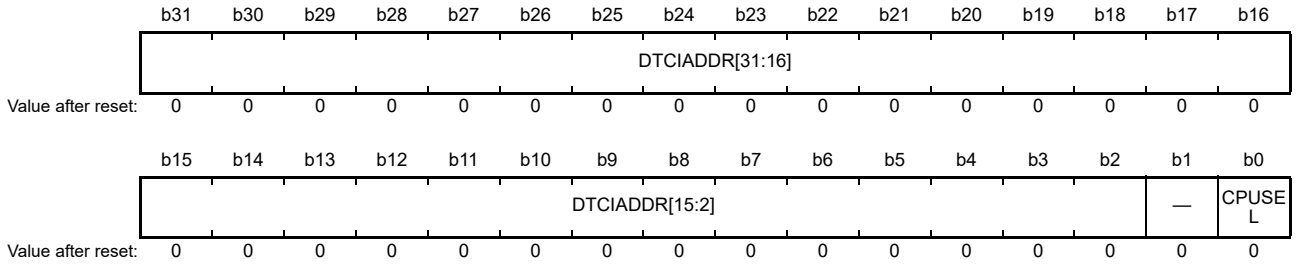


Figure 20.16 DTC Index Table

- DTC Index

Address(es): DTCIBR + p × 4

Bit	Symbol	Bit Name	Description	R/W
b0	CPUSEL	Sequence Transfer/CPU Interrupt Select	0: Continues the sequence transfer (starts the sequence) 1: Ends the sequence transfer and outputs an interrupt request to the CPU	—
b1	—	Reserved	Set this bit to 0.	—
b31 to b2	DTCIADDR[31:2]	Transfer Information Table Address	Set the upper 30 bits of the start address of the transfer information table to these bits. Writing to the upper 4 bits (b31 to b28) is ignored and the values in b31 to b28 become the same value as b27.	—

When the CPUSEL bit in the DTC index that the obtained sequence number indicates is 1, an interrupt request to the CPU is generated. At this time, the ICU.DTCERn.DTCE bit becomes 0. From this point, the interrupt request signal from the request source that is specified in the DTCSQE register is sent to the CPU, but not DTC. After completion of CPU interrupt processing, set the ICU.DTCERn.DTCE bit to 1 to enable DTC transfer request for starting the next sequence transfer.

20.4.10 Example of Sequence Transfer

Figure 20.17 shows a typical examples of a sequence transfer and Figure 20.18 to Figure 20.22 show configurations of the transfer information for the examples of the transfers in the figure.
In these examples, the interrupt source of vector number n is set as the source of the sequence transfer (DTCSQE.VECN[7:0] = n).
Once the DTC transfer request due to the interrupt source of vector number n (hereinafter referred to as “transfer request n”) is input, the DTC refers to the DTC vector table and reads the corresponding transfer information. The lower 8 bits that have been transferred based on the transfer information become a sequence number, selecting one sequence among possible 256 sequences.

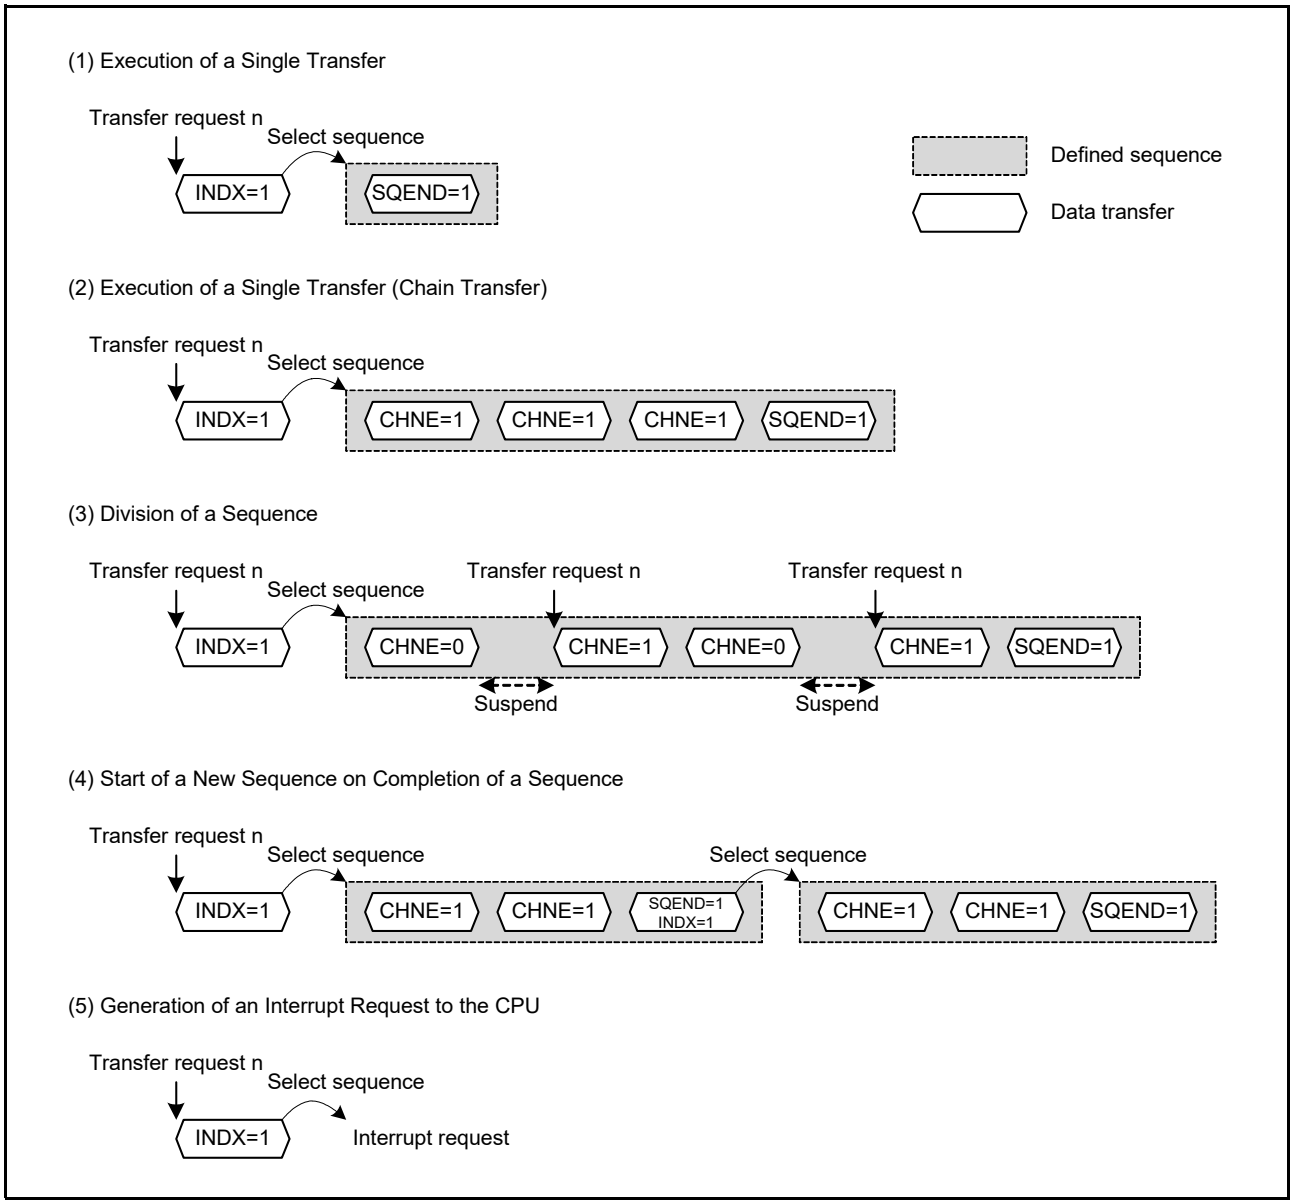

Figure 20.17 Examples of Sequence Transfers

(1) When Executing a Single Transfer

Figure 20.18 shows an example of a single transfer (normal, repeat, or block).
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number p.
Since the values of the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively, the sequence ends after the specified transfer is executed.

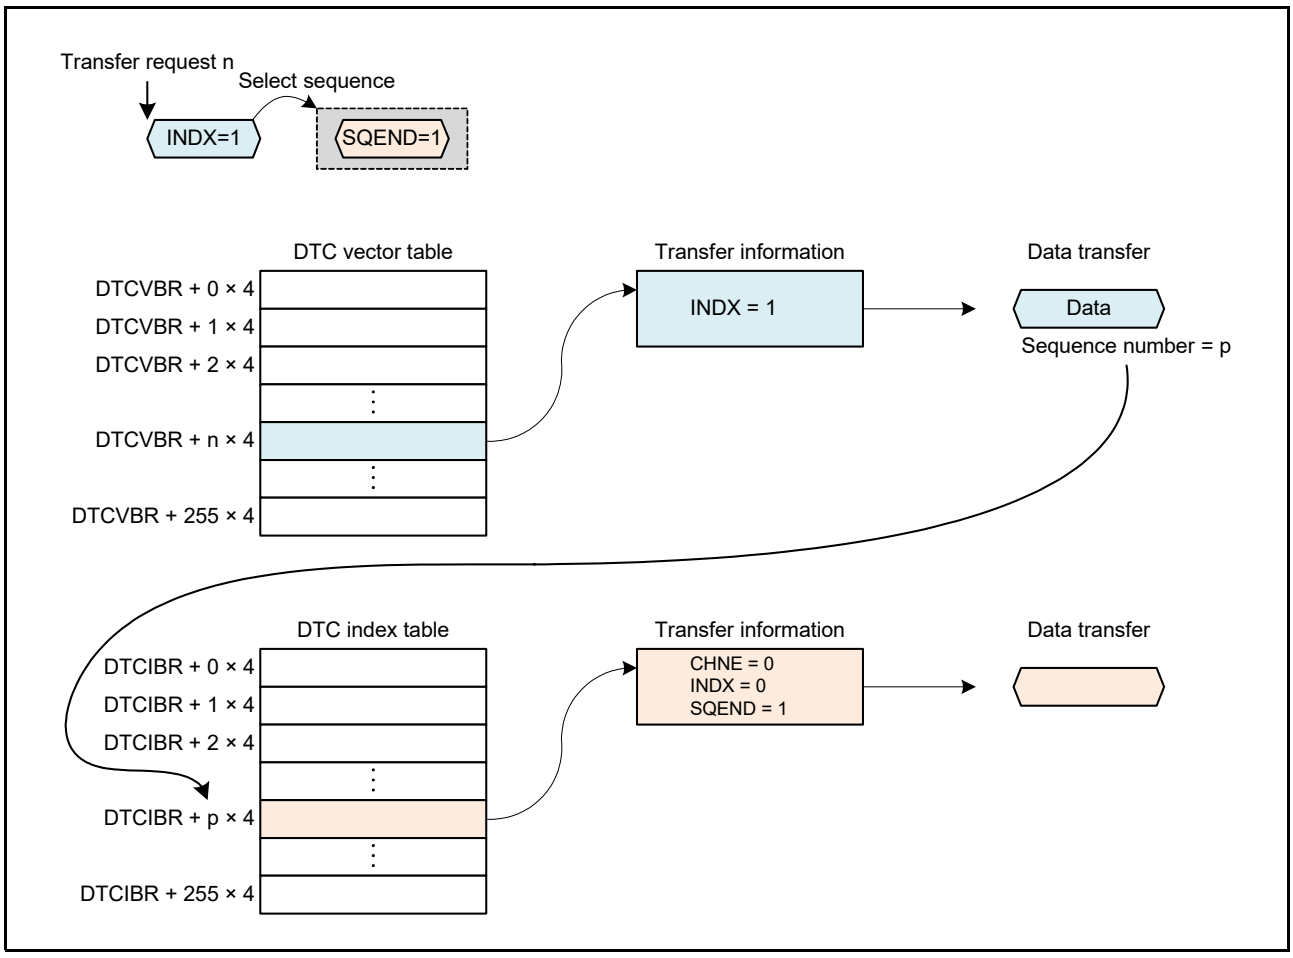

Figure 20.18 Example of a Sequence of Single Transfer

(2) When Executing a Single Chain Transfer

Figure 20.19 is an example of a sequence for a single chain transfer.
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number q.
While the values of the CHNE, INDX, and SQEND bits are 1, 0, and 0 respectively, the specified chain transfer is executed. When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively is read, the sequence ends after the specified transfer is executed.

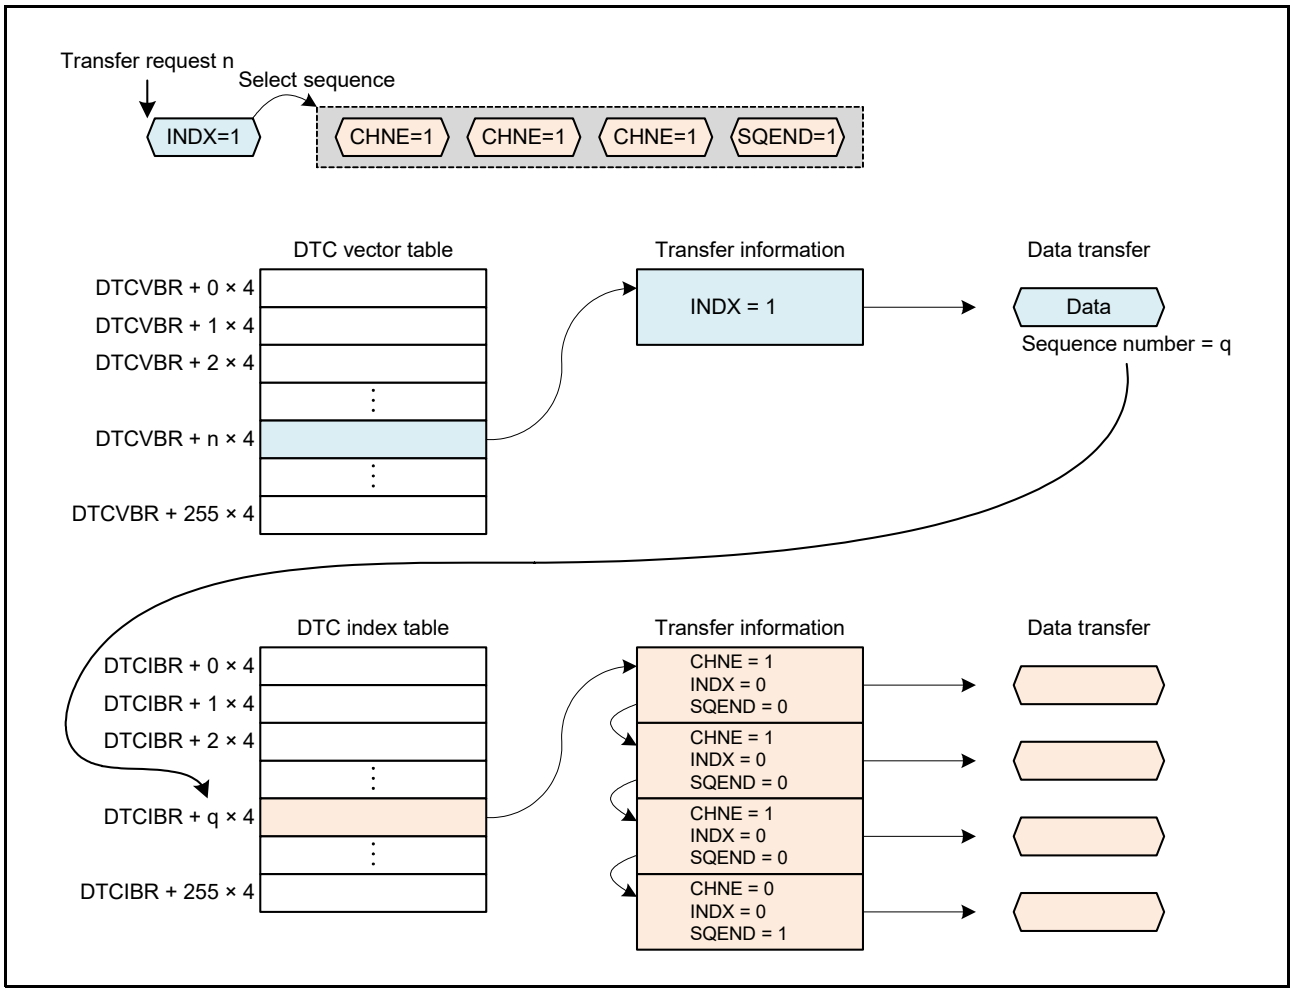

Figure 20.19 Example of Sequence of a Single Chain Transfer

(3) When Dividing a Sequence

Figure 20.20 is an example of the sequence that is divided into 3 parts.
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number r.
Since the values of the CHNE, INDX, and SQEND bits in the transfer information are 0, 0, and 0 respectively, the sequence is suspended after the specified transfer is executed and the DTC waits for the next transfer request n.
When the transfer request n is input during a sequence transfer, the DTC vector table is not referred and the suspended sequence is resumed.
When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively is read, the sequence ends after the specified transfer is executed.

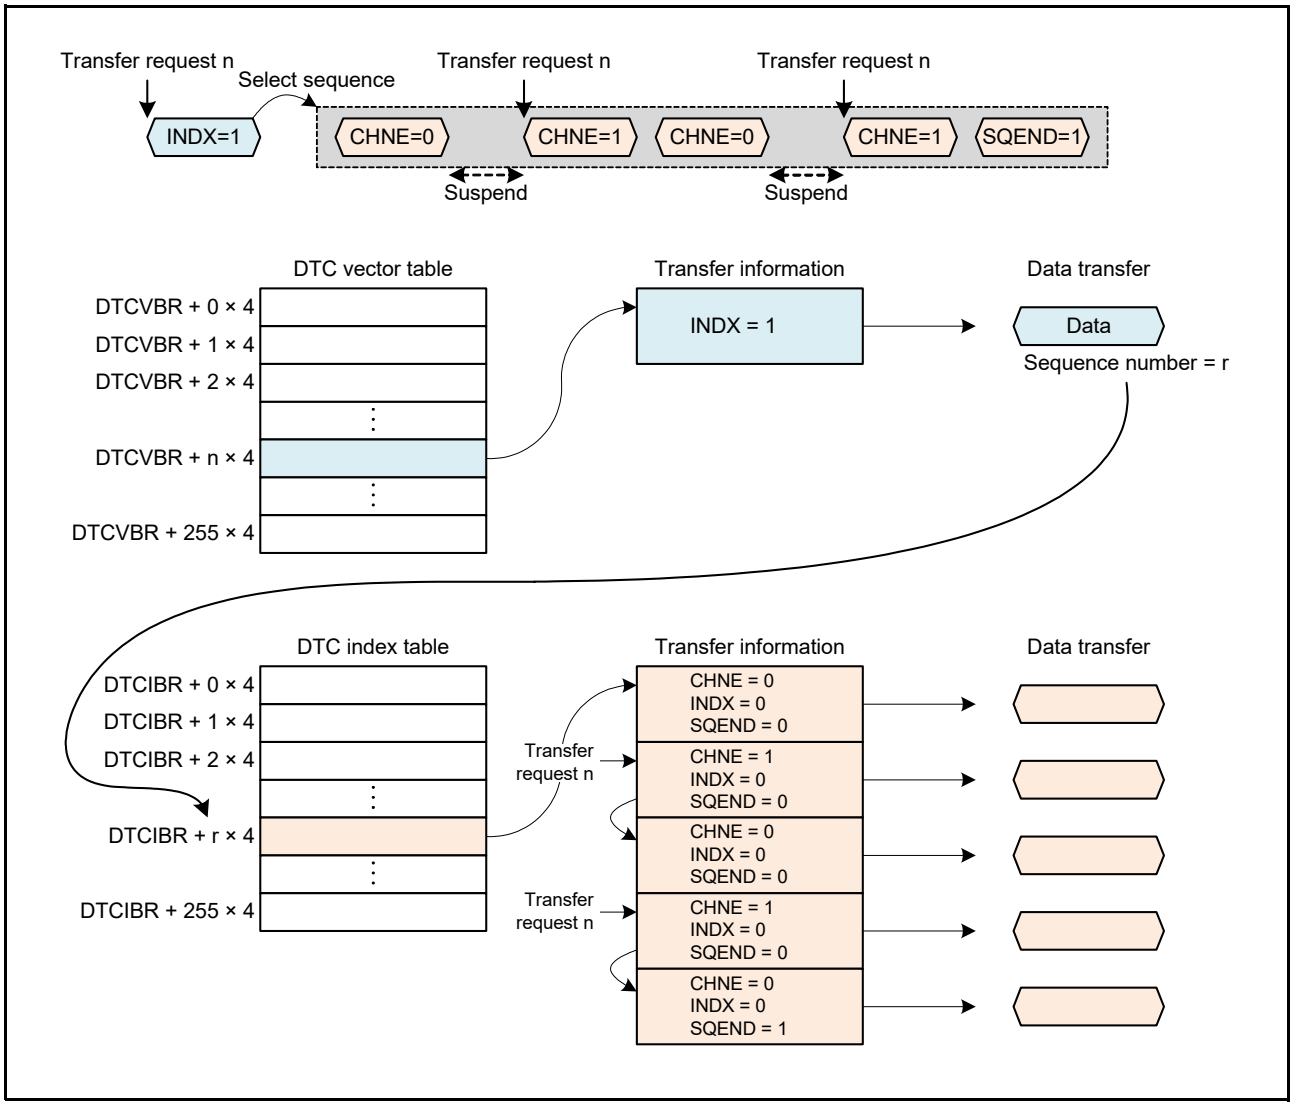

Figure 20.20 Example of Divided Sequence

(4) When Starting a New Sequence on completion of a Sequence

Figure 20.21 is an example for starting the next and new sequence on completion of the first sequence.
The DTC refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number s.
When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 1, and 1 respectively is read, the specified transfer is executed, then a new sequence number is obtained from the lower 8 bits of the transferred data.
The DTC again refers to the DTC index table, and reads the transfer information corresponding to the obtained sequence number k and then starts a new sequence.
When the transfer information in which the CHNE, INDX, and SQEND bits are 0, 0, and 1 respectively is read, the sequence ends after the specified transfer is executed.

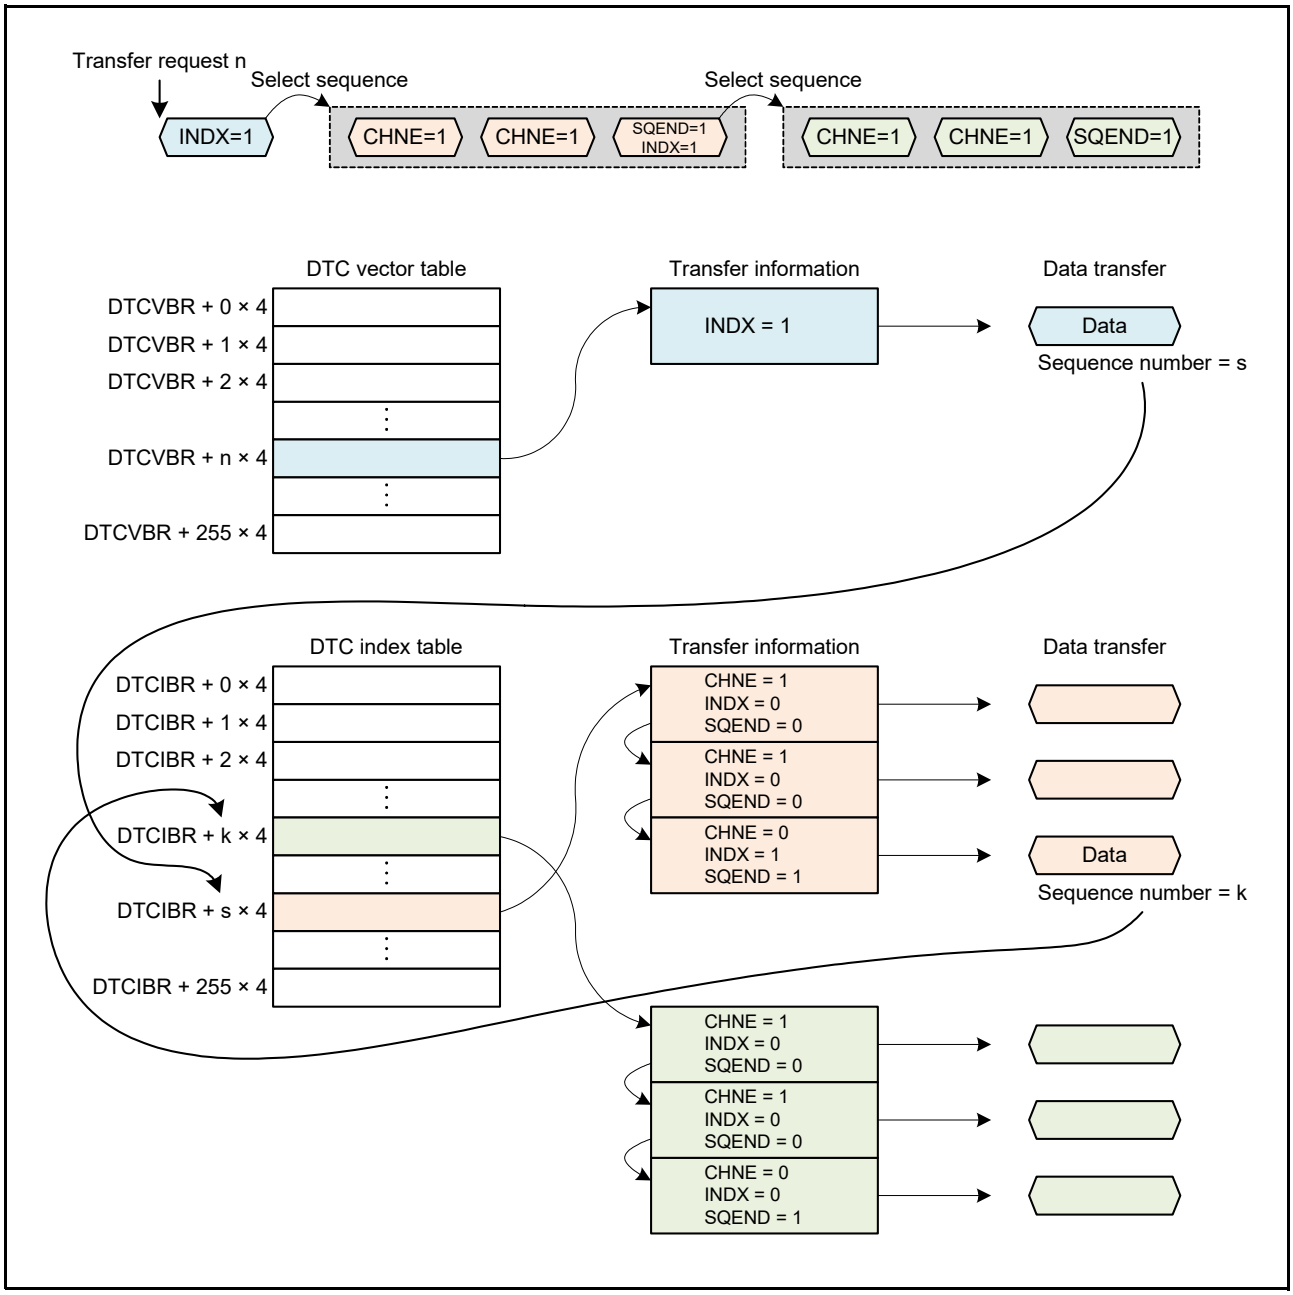

Figure 20.21 Example When Starting a New Sequence on Completion of a Sequence

(5) When Generating an Interrupt Request to the CPU

Figure 20.22 is an example of that an interrupt request is output to the CPU without starting of sequence.
The DTC obtains a DTC index that corresponds to the obtained sequence number t.
When the CPUSEL bit of the obtained DTC index is 1, the DTC ends the sequence transfer without starting the sequence, and then outputs an interrupt request to the CPU.

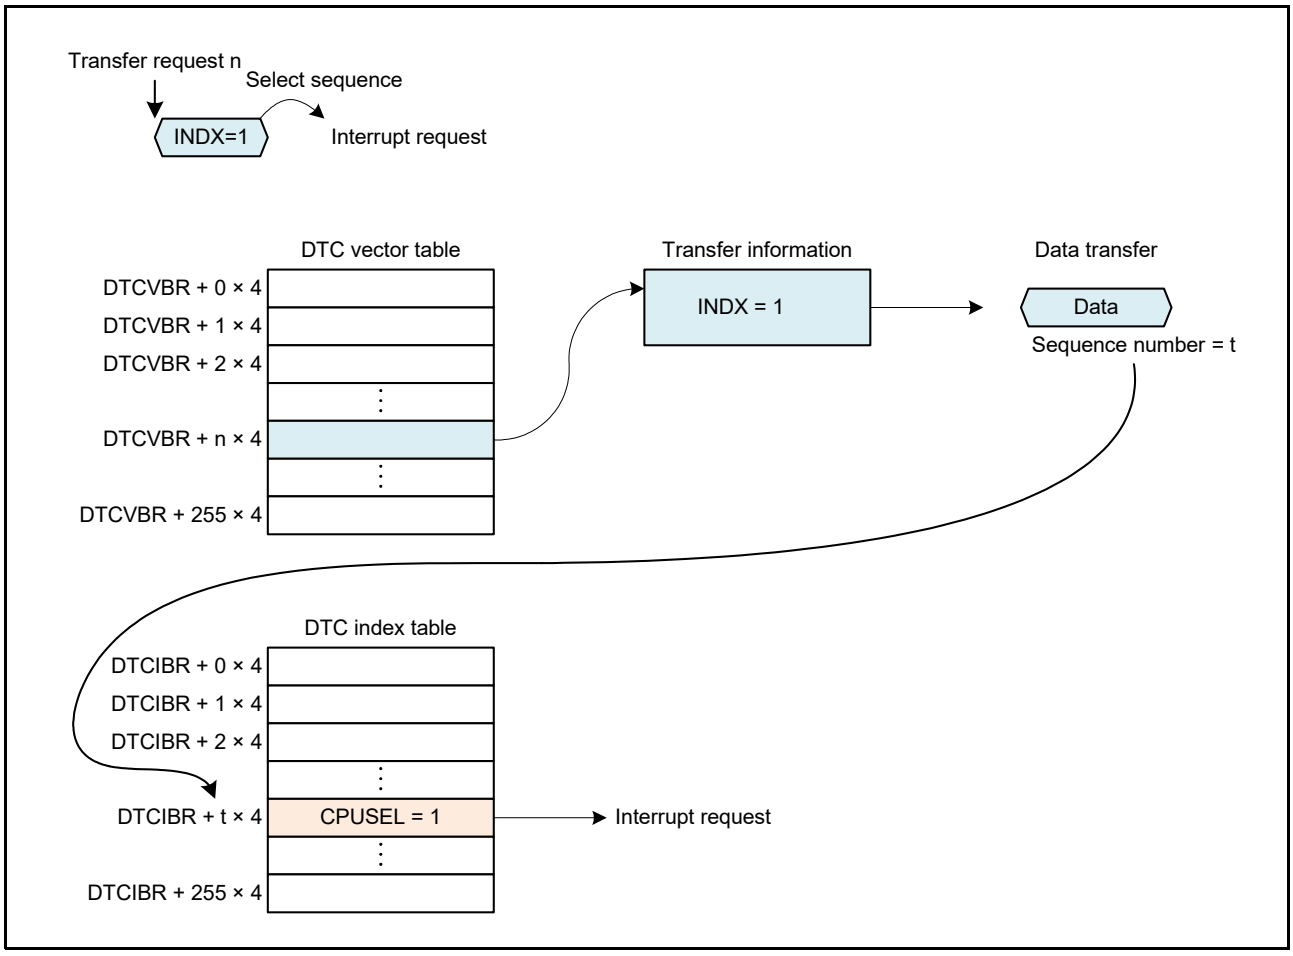

Figure 20.22 Example of Output of an Interrupt Request to the CPU

20.5 DTC Setting Procedure

Before using the DTC, set the DTC vector base register (DTCVBR). When using sequence transfer, also set the DTC index table base register (DTCIBR).

Figure 20.23 shows the procedure to set the DTC.

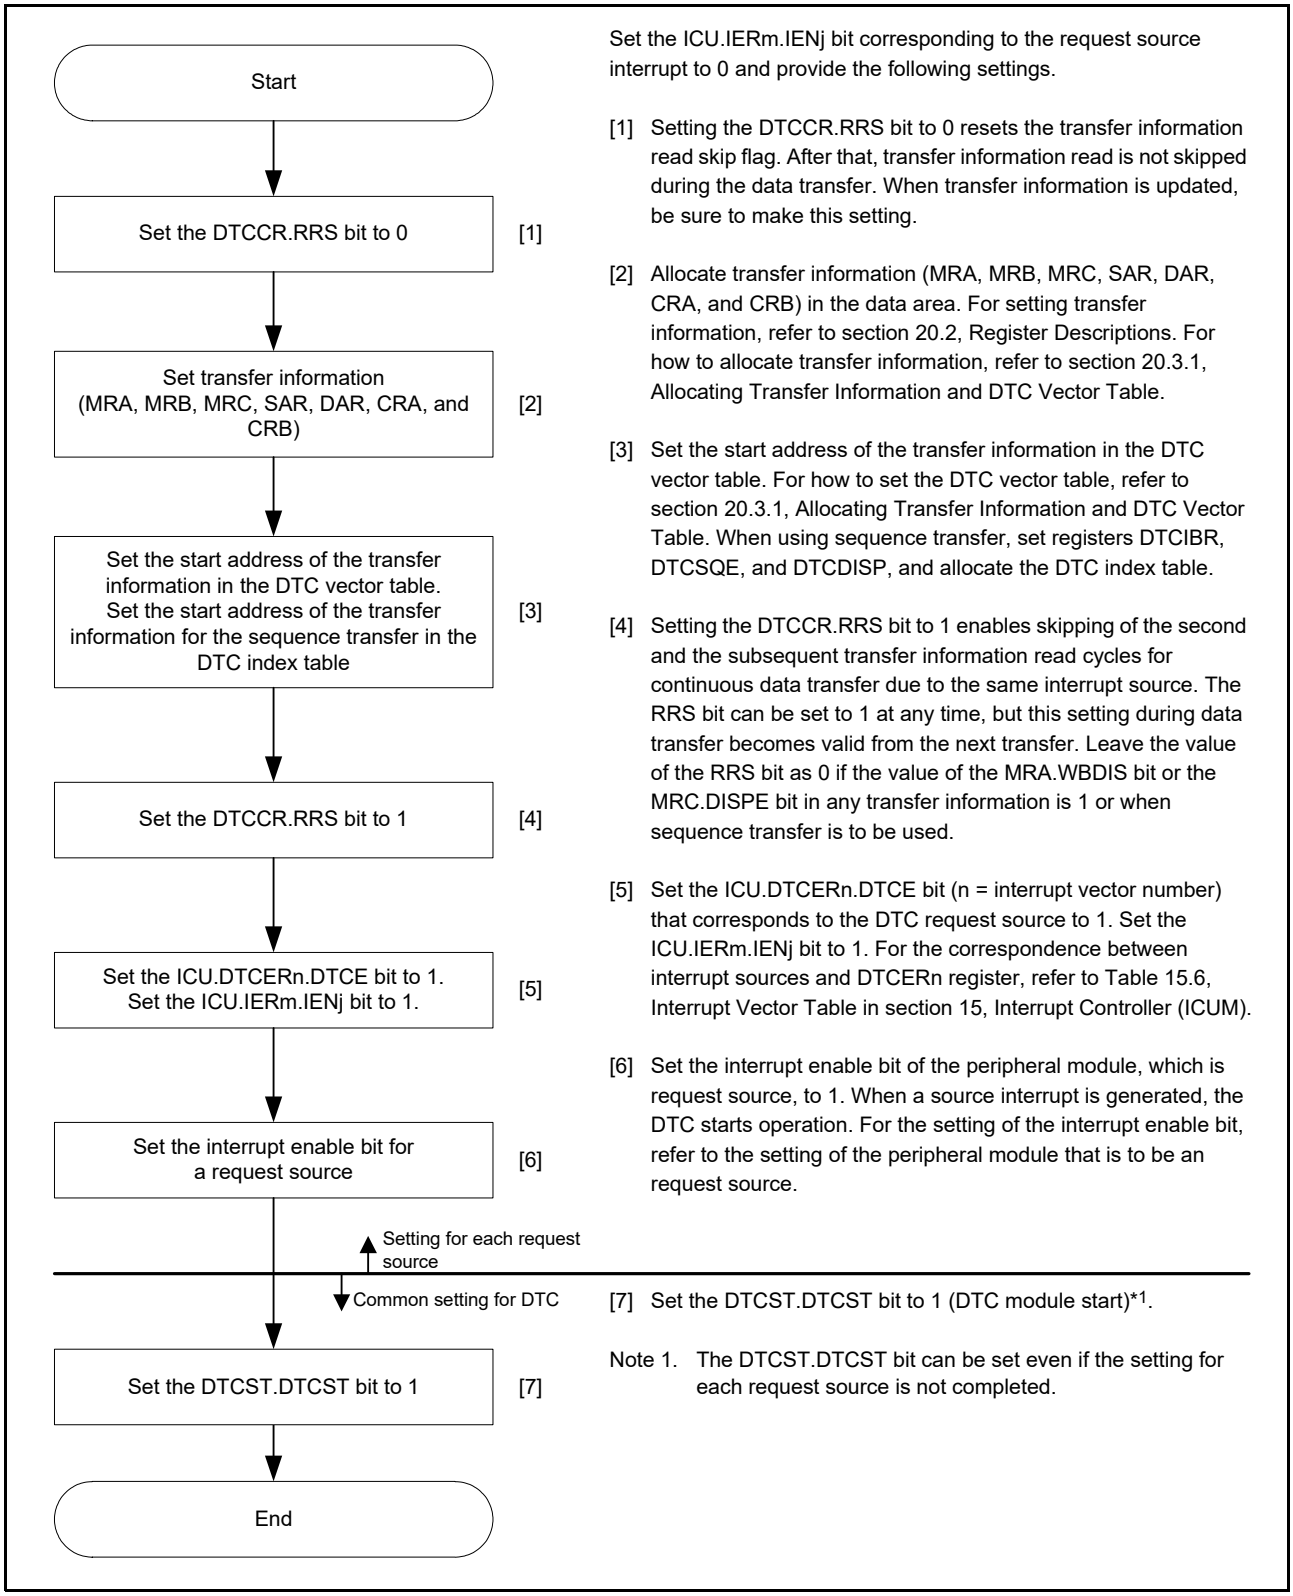

Figure 20.23 Procedure to Set the DTC

20.6 Examples of DTC Usage

20.6.1 Normal Transfer

As an example of DTC usage, its employment in the reception of 128 bytes of data by an RSCI is described below.

(1) Transfer Information Setting

Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 00b (byte transfer), and the MRA.SM[1:0] bits to 00b (source address is fixed). Set the MRB.CHNE bit to 0 (chain transfer is disabled), the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), and the MRB.DM[1:0] bits to 10b (DAR is incremented after data transfer). The MRB.DTS bit can be set to any value. Set the RDR register address of the RSCI in the SAR register, the start address of the RAM area for data storage in the DAR register, and 128 (0080h) in the CRA register. The CRB register can be set to any value.

(2) DTC Vector Table Setting

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU Setting and DTC Module Activation

Set the corresponding ICU.DTCERn.DTCE bit to 1 and the ICU.IERm.IENj bit to 1.
Set the DTCST.DTCST bit to 1.

(4) RSCI Setting

Enable the RXI interrupt by setting the SCR0.RIE bit in the RSCI to 1. If a reception error occurs during the RSCI receive operation, further reception is not performed. Accordingly, make settings so that the CPU can accept receive error interrupts.

(5) DTC Transfer

Every time the reception of 1 byte by the RSCI is completed, an RXI interrupt is generated to start the data transfer. The DTC transfers the received byte from the RDR of the RSCI to RAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt Handling

After 128 times of data transfers have been completed and the value in the CRA register becomes 0, an RXI interrupt request is output to the CPU. Complete the process in the handling routine for this interrupt.

20.6.2 Chain Transfer

As an example of chain transfer by the DTC, its employment in the output of pulses by a GPTW is described below. Chain transfer is used to transfer the compare value and period of the PWM timer and change the duty and period of the PWM timer. For the first chain transfer, specify normal transfer mode for the transfer to the GPTWn.GTCCRC register. For the second chain transfer, specify normal transfer mode for the transfer to the GPTWn.GTCCRE register. For the third chain transfer, specify normal transfer mode for the transfer to the GPTWn.GTPBR register.
An example of using the overflow interrupt of the GPTWn.GTCNT counter as a request source for the DTC is provided below.

(1) First Transfer Information Setting

Settings should be made for transfer to the GPTWn.GTCCRC register. Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 10b (longword transfer), and the MRA.SM[1:0] bits to 10b (SAR is incremented after data transfer). Set the MRB.CHNE bit to 1 (chain transfer is enabled), the MRB.CHNS bit to 0 (chain transfer is performed after each transfer), and the MRB.DM[1:0] bits to 00b (destination address is fixed). Set the SAR to the start address of the data table, the DAR register to the address of the GPTWn.GTCCRC register, and the CRA register to the size of the data table. The CRB register can be set to any value.

(2) Second Transfer Information Setting

Settings should be made for transfer to the GPTWn.GTCCRE register. Make the same settings as (1) except for setting the DAR register to the address of the GPTWn.GTCCRE register.

(3) Third Transfer Information Setting

Settings should be made for transfer to the GPTWn.GTPBR register. Make the same settings as (1) except for setting the MRB.CHNE bit to 0 (chain transfer is disabled), DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), and the DAR register to the address of the GPTWn.GTPBR register.

(4) Transfer Information Assignment

Place the second and third transfer information immediately after the first transfer information.

(5) DTC Vector Table

In the DTC vector table, set the address where the first transfer information starts.

(6) ICU Setting and DTC Module Activation

Set the ICU.DTCERn.DTCE bit corresponding to the GTCIVn interrupt and the ICU.IERm.IENj bit to 1.
Set the DTCST.DTCST bit to 1.

(7) GPTW Setting

Set the GPTWn.GTIOR register so that the output changes on a compare match with the GPTWn.GTCCRA and GTCCRB registers. Set the compare match value for the first cycle in the GTCCRA and GTCCRB registers, and the compare match value for the second cycle in the GTCCRC and GTCCRE registers. Set the period of the first cycle of the PWM waveform in the GTPR register, and the period of the second cycle in the GTPBR register. Enable the output of the GTIOCnA and GTIOCnB pins using the PijPFS registers.

(8) GPTW Activation

Set the GPTWn.GTSTR.CSTARTn bit to 1 to start counting operation of the GPTWn.GTCNT counter.

(9) DTC Transfer

Every time the GPTWn.GTCNT counter overflows, the next compare match values are transferred to the GTCCRC and GTCCRE registers, and the next period value is transferred to the GTPBR register.

(10) Interrupt Handling

When the specified number of data transfers is completed (i.e. when the value of the CRA register for third transfer becomes 0), a GTCIVn interrupt request is issued for the CPU. Complete the process in the handling routine for this interrupt.

20.6.3 Chain Transfer When the Counter is 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second data transfer. Repeating this chain transfer enables transfers to be repeated more than 256 times.
The following shows an example of configuring a 128-Kbyte input buffer to addresses 0200 0000h to 0201 FFFFh (where the input buffer is set so that its lower address starts with 0000h). Figure 20.24 shows a chain transfer when the counter is 0.

(1) Set normal transfer mode for input data for the first data transfer. Set the following:
Transfer source address: Fixed, the CRA register is 0000h (65,536 times), the MRB.CHNE bit is 1 (chain transfer is enabled), the MRB.CHNS bit is 1 (chain transfer is performed only when the transfer counter becomes 0), and the MRB.DISEL bit is 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers).
(2) Prepare the upper 16 bits (in this case, 0201h and 0200h) of the start address at every 65,536 times of the transfer destination address for the first data transfer in another area (such as ROM).
(3) For the second data transfer, set repeat transfer mode (source is repeat area) for rewriting the transfer destination address of the first data transfer. The transfer destination is the address where the upper 16 bits of the DAR register in the first transfer information is allocated. In this case, set the MRB.CHNE bit to 0 (chain transfer is disabled) and the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers). In this case, set the transfer counter to 2.
(4) When a transfer request is accepted, the first data transfer is executed. When transfer is executed 65,536 times and the transfer counter of the first data transfer becomes 0, the second data transfer is started and the upper 16 bits of the transfer destination address of the first data transfer is set to 0201h. At this time, the lower 16 bits of the transfer destination address and the transfer counter of the first data transfer have become 0000h.
(5) In succession, when another transfer request is accepted, the first data transfer is executed. When transfer is executed 65,536 times and the transfer counter of the first data transfer becomes 0, the second data transfer is started and the upper 16 bits of the transfer destination address of the first data transfer is set to 0200h. At this time, the lower 16 bits of the transfer destination address and the transfer counter of the first data transfer have become 0000h.
(6) Steps (4) and (5) above are repeated infinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

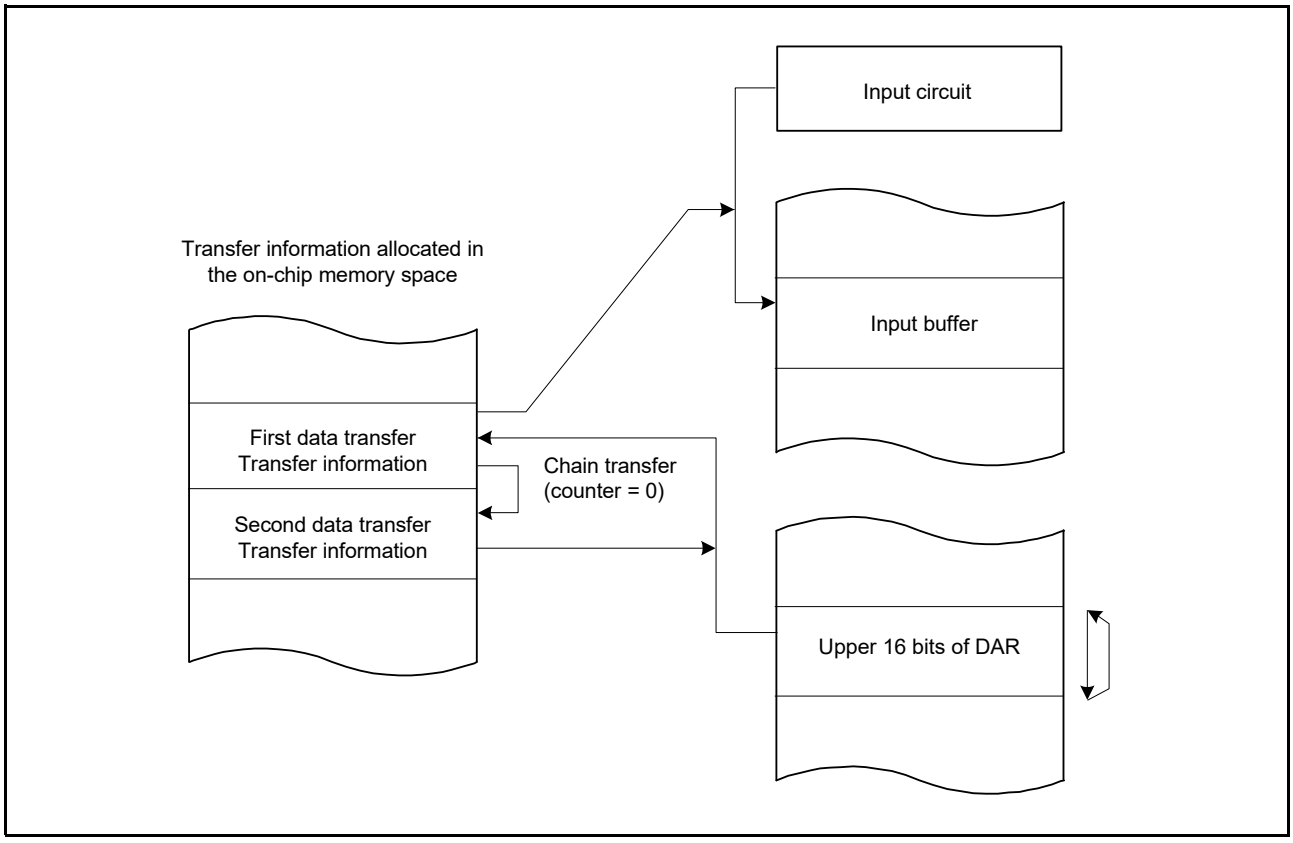

Figure 20.24 Chain Transfer When the Counter is 0

20.6.4 Sequence Transfer

The following is an example of using the RSCI receive interrupt as a request source of sequence transfer.

(1) Transfer Information Settings

Set the MRA.MD[1:0] bits to 00b (normal transfer mode), the MRA.SZ[1:0] bits to 00b (byte transfer), and the MRA.SM[1:0] bits to 00b (source address is fixed). Set the MRB.CHNE bit to 0 (chain transfer is disabled), the MRB.DISEL bit to 0 (an interrupt request to the CPU is generated on completion of the specified number of data transfers), the MRB.DM[1:0] bits to 10b (DAR is incremented after data transfer), the MRB.INDX bit to 1 (start sequence transfer), and the MRB.SQEND bit to 0 (continue the sequence transfer). The MRB.DTS bit can be set to any value. Set the address of the RSCIk.RDR register in the SAR register and set the start address of the RAM area which stores the data in the DAR register.
When the MRA.WBDIS bit is set to 1 (Does not write back the transfer information), the values of registers CRA and CRB are ignored.

(2) DTC Vector Table Setting

Set the start address of the transfer information for the corresponding receive data full interrupt (RXI) in the DTC vector table.

(3) DTC Index Table Setting

Set the start address of the transfer information for each sequence in the DTC index table.

(4) ICU Setting and DTC Module Activation

Set the corresponding ICU.DTCERn.DTCE bit to 1 and the ICU.IERm.IENj bit to 1. Set the DTCST.DTCST bit to 1.

(5) RSCI Setting

Set the RSCIk.SCR0.RIE bit to 1 to enable the RXI interrupt. If a reception error occurs during the RSCI receive operation, subsequent receptions are not performed. Accordingly, make settings so that the CPU can accept receive error interrupts.

(6) Start of the Sequence Transfer

On completion of reception of 1-byte data by the RSCI, an RXI interrupt is generated to start the DTC. The DTC transfers the received data from the RSCIk.RDR register to the RAM. The DTC looks up the DTC index table by using the value from the received data (sequence number) and continues to transfer data corresponding to the that number. When the CPUSEL bit in the DTC index is 1, the DTC does not read the transfer information and sets the ICU.DTCERn.DTCE bit to 0. Then the DTC outputs an interrupt request to the CPU and ends the sequence transfer.

(7) During Suspension of the Sequence Transfer

Set the ICU.DTCERn.DTCE bit to 1 if the bit is 0. The DTC continues to transfer the data for every generation of the DTC transfer request in response to the corresponding RXI interrupt.

(8) End of the Sequence Transfer

Set the MRB.SQEND bit in the last transfer information of the sequence transfer to 1. After execution of this data transfer, the DTC ends the sequence transfer. The DTC starts to refer to the DTC vector table when a DTC transfer request is generated due to the next corresponding RXI interrupt.

20.7 Interrupt Source

When the DTC has finished data transfer of specified count or when data transfer with the MRB.DISEL bit set to 1 (an interrupt request to the CPU is generated each time the data transfer is performed) has been completed, an interrupt to the CPU is generated by the DTC trigger source. Such interrupts to the CPU are controlled according to the PSW.I bit (interrupt enable) of the CPU, the PSW.IPL[4:0] bits (processor interrupt priority level), and the priority level of the interrupt controller.

20.8 Event Link

The DTC outputs an event signal on completing data transfer in response to one request.

20.9 Low Power Consumption Function

Before making a transition to the module stop state, software standby mode, or deep software standby mode, set the DTCST.DTCST bit to 0 (DTC module stop), and then perform the following.

(1) Module Stop Function

Writing 1 (transition to the module-stop state is made) to the MSTPCRA.MSTPA22 bit enables the module stop function of the DTC. If data transfer is in progress at the time 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module stop state proceeds after data transfer has ended. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited.
Writing 0 (release from the module-stop state) to the MSTPCRA.MSTPA22 bit releases the DTC from the module stop state.

(2) Software Standby and Deep Software Standby Modes

Make settings according to the procedure under section 11.6.2.1, Transitioning to Software Standby Mode or section 11.6.3.1, Transition to Deep Software Standby Mode, in section 11, Low Power Consumption.
If any data transfer is in progress at the time the WAIT instruction is executed, the transition to software standby mode or deep software standby mode follows the completion of the data transfer.

(3) Notes on Low Power Consumption Function

For the WAIT instruction and the register setting procedure, refer to section 11.8.6, Timing of the WAIT Instruction in section 11, Low Power Consumption.
To perform data transfer after returning from a low power consumption mode, set the DTCST.DTCST bit to 1 again.
To use a request that is generated in software standby mode as an interrupt request to the CPU but not as a DTC transfer request, specify the CPU as the interrupt request destination according to the description in section 15.7.3.1, Interrupt Request Destination Setting Procedure in section 15, Interrupt Controller (ICUM), and then execute the WAIT instruction.

20.10 Usage Notes

20.10.1 Start Address of Transfer Information

Set multiples of 16 for the start addresses of the transfer information to be specified in the DTC vector table.

20.10.2 Allocating Transfer Information

Allocate transfer information in the memory area according to the endian of the area as shown in Figure 20.25. For example, when writing CRA and CRB settings in 16-bit units in big endian, write the CRA setting to the address plus Ch and the CRB setting to the address plus Eh. In little endian, write the CRB setting to the address plus Ch and the CRA setting to the address plus Eh. When writing CRA and CRB settings in 32-bit units, allocate the CRA setting at the MSB side of the 32 bits and the CRB setting at the LSB side, and write the settings to the address plus Ch, regardless of endian.

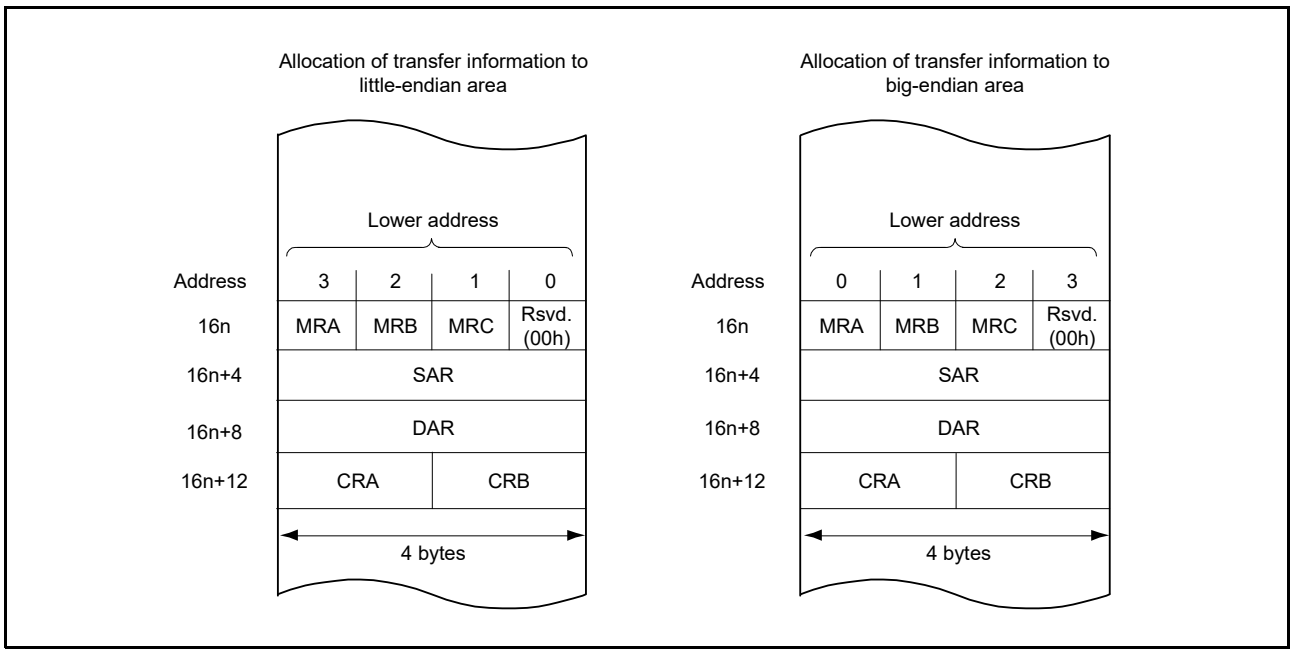

Figure 20.25 Allocation of Transfer Information

20.10.3 Setting the DTC Transfer Request Enable Register in the Interrupt Controller (ICU.DTCERn)

The DMA request should not be issued by setting the DMAC trigger select register (ICU.DMRSRm (m = DMAC channel number)) to the same vector number that has been specified by setting the ICU.DTCERn.DTCE bit to 1 (the corresponding interrupt source is selected as the DTC trigger). For details on the ICU.DTCERn and ICU.DMRSRm registers (m = DMAC channel number), refer to section 15, Interrupt Controller (ICUM).

20.10.4 Notes on Using the Sequence Transfer

When sequence transfer is to be used, make sure that the DTCCR.RRS bit is 0 (transfer information read is not skipped). In addition, set the MRB.CHNE bit to 0 (chain transfer is disabled) when setting the MRB.INDX bit to 1 (start sequence transfer and refer the index table) or the MRB.SQEND bit to 1 (end the sequence transfer).

21. Event Link Controller (ELC)

21.1 Overview

The event link controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals, and interconnects (links) peripheral modules. As a result, peripheral modules can directly perform interlinked operation among them without using software.
Event signals can be output regardless of the settings of the corresponding interrupt request enable bits.

Table 21.1 lists the specifications of the ELC, and Figure 21.1 shows a block diagram of the ELC.

Table 21.1 ELC Specifications

Item	Description
Event link function	• 377 types of event signals can be directly interconnected to modules. • Operation for timer modules when inputting an event signal can be selected.
Low power consumption function	Module stop state can be set.
Protect Zone filter	Security attribute can be set for each register.

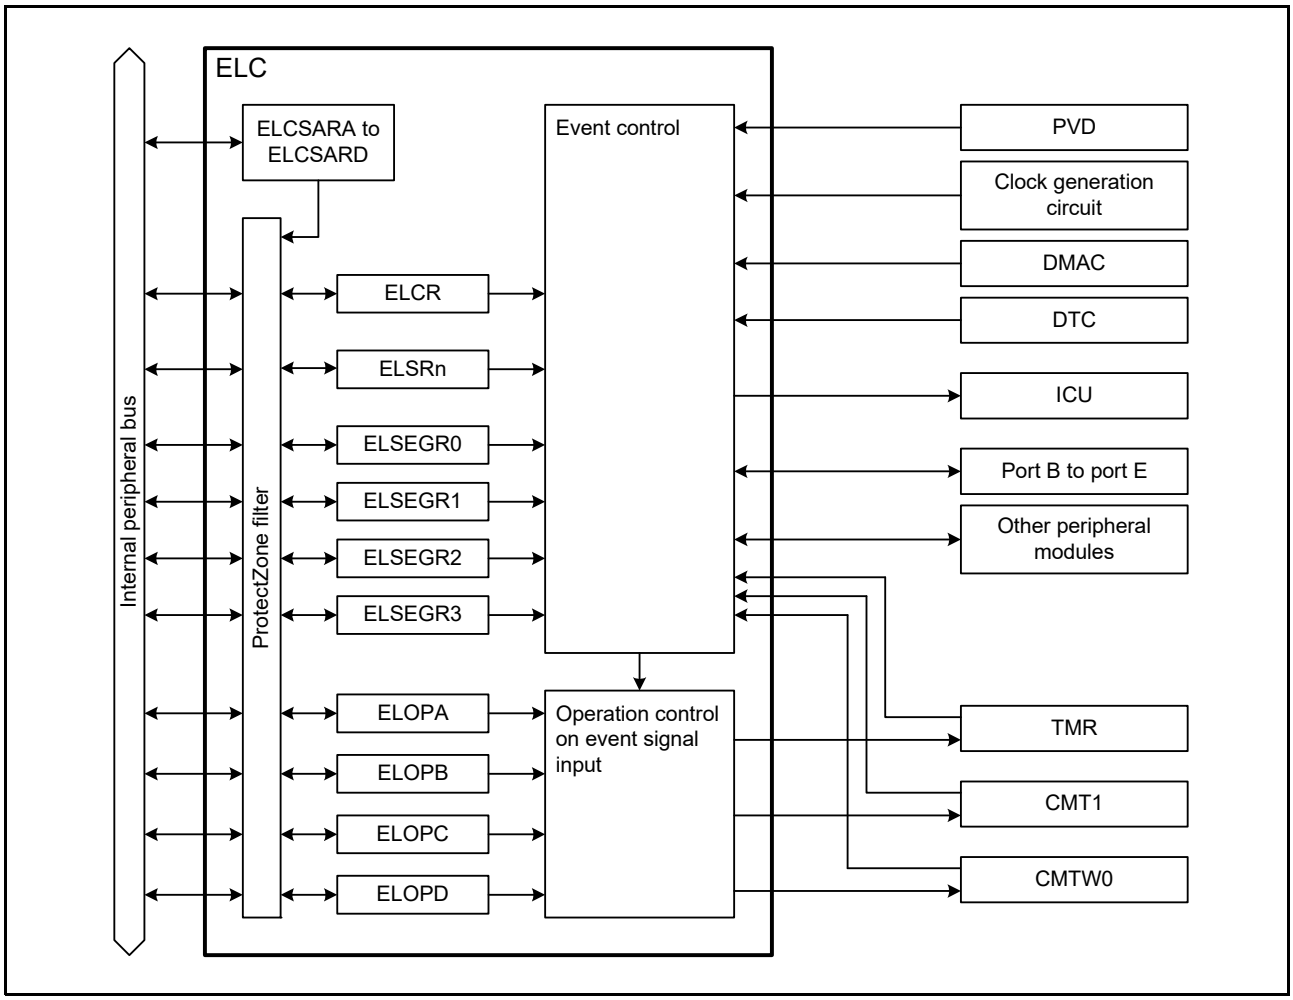

Figure 21.1 ELC Block Diagram

b25	ELSR25	ELSR25 Security Attribution		R/W
b26	ELSR26	ELSR26 Security Attribution		R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is used to set the security attributes for the ELSR0 to ELSR26 registers.

21.2.3 ELC Security Attribution Register C (ELCSARC)

Address(es): ELC.ELCSARC 8780 1038h, ELC_NS.ELCSARC 0780 1038h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	ELSR52	ELSR51	ELSR50	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b13 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	ELSR46	ELSR46 Security Attribution	0: Secure 1: Non-secure	R/W
b15	ELSR47	ELSR47 Security Attribution		R/W
b17 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b18	ELSR50	ELSR50 Security Attribution	0: Secure 1: Non-secure	R/W
b19	ELSR51	ELSR51 Security Attribution		R/W
b20	ELSR52	ELSR52 Security Attribution		R/W
b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is used to set the security attributes for the ELSR46, ELSR47, and ELSR50 to ELSR52 registers.

21.2.4 ELC Security Attribution Register D (ELCSARD)

Address(es): ELC.ELCSARD 8780 103Ch, ELC_NS.ELCSARD 0780 103Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	ELSR91	ELSR90	ELSR89	ELSR88	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	ELSR78	ELSR77	ELSR76	ELSR75	ELSR74	ELSR73	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b8 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9	ELSR73	ELSR73 Security Attribution	0: Secure 1: Non-secure	R/W
b10	ELSR74	ELSR74 Security Attribution		R/W
b11	ELSR75	ELSR75 Security Attribution		R/W
b12	ELSR76	ELSR76 Security Attribution		R/W
b13	ELSR77	ELSR77 Security Attribution		R/W
b14	ELSR78	ELSR78 Security Attribution		R/W
b23 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24	ELSR88	ELSR88 Security Attribution	0: Secure 1: Non-secure	R/W
b25	ELSR89	ELSR89 Security Attribution		R/W
b26	ELSR90	ELSR90 Security Attribution		R/W
b27	ELSR91	ELSR91 Security Attribution		R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is used to set the security attributes for the ELSR73 to ELSR78, and ELSR88 to ELSR91 registers.

21.2.5 Event Link Control Register (ELCR)

Address(es): ELC.ELCR 8780 1000h, ELC_NS.ELCR 0780 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	ELCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	ELCON	All Event Link Enable	0: ELC function is disabled. 1: ELC function is enabled.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELCR register controls operation of the ELC.

21.2.6 Software Event Generation Register m (ELSEGRm) (m = 0 to 3)

Address(es): ELC.ELSEGR0 8780 1004h, ELC.ELSEGR1 8780 1008h, ELC.ELSEGR2 8780 100Ch, ELC.ELSEGR3 8780 1010h, ELC_NS.ELSEGR0 0780 1004h, ELC_NS.ELSEGR1 0780 1008h, ELC_NS.ELSEGR2 0780 100Ch, ELC_NS.ELSEGR3 0780 1010h

	b7	b6	b5	b4	b3	b2	b1	b0
	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SEG	Software Event Generation	Writing 1 to this bit generates a software event. This bit is read as 0.	W
b5 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	WE	SEG Bit Write Enable	0: Write to SEG bit is disabled. 1: Write to SEG bit is enabled.	R/W
b7	WI	ELSEGR Register Write Disable	0: Write to ELSEGR register is enabled. 1: Write to ELSEGR register is disabled.	W*1

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. The written value is not retained. The read value is always 1.

These registers are used to generate software events 0 to 3, which are respectively assigned to event numbers 050h to 053h.

SEG Bit (Software Event Generation)

When 1 is written to this bit after setting the WE bit to 1, a software event is generated.

WE Bit (SEG Bit Write Enable)

This bit controls writing to the SEG bit. Set this bit to 1 before writing to the SEG bit.

WI Bit (ELSEGR Register Write Disable)

This bit controls writing to this register. Writing to this register is possible only when this register is written in 8-bit units with this bit set to 0.

21.2.7 Event Link Setting Register n (ELSRn) (n = 0 to 26, 46, 47, 50 to 52, 73 to 78, 88 to 91)

Address(es): ELC.ELSR0 8780 1100h, ELC.ELSR1 8780 1104h, ELC.ELSR2 8780 1108h, ELC.ELSR3 8780 110Ch, ELC.ELSR4 8780 1110h, ELC.ELSR5 8780 1114h, ELC.ELSR6 8780 1118h, ELC.ELSR7 8780 111Ch, ELC.ELSR8 8780 1120h, ELC.ELSR9 8780 1124h, ELC.ELSR10 8780 1128h, ELC.ELSR11 8780 112Ch, ELC.ELSR12 8780 1130h, ELC.ELSR13 8780 1134h, ELC.ELSR14 8780 1138h, ELC.ELSR15 8780 113Ch, ELC.ELSR16 8780 1140h, ELC.ELSR17 8780 1144h, ELC.ELSR18 8780 1148h, ELC.ELSR19 8780 114Ch, ELC.ELSR20 8780 1150h, ELC.ELSR21 8780 1154h, ELC.ELSR22 8780 1158h, ELC.ELSR23 8780 115Ch, ELC.ELSR24 8780 1160h, ELC.ELSR25 8780 1164h, ELC.ELSR26 8780 1168h, ELC.ELSR46 8780 11B8h, ELC.ELSR47 8780 11BCh, ELC.ELSR50 8780 11C8h, ELC.ELSR51 8780 11CCh, ELC.ELSR52 8780 11D0h, ELC.ELSR73 8780 1224h, ELC.ELSR74 8780 1228h, ELC.ELSR75 8780 122Ch, ELC.ELSR76 8780 1230h, ELC.ELSR77 8780 1234h, ELC.ELSR78 8780 1238h, ELC.ELSR88 8780 1260h, ELC.ELSR89 8780 1264h, ELC.ELSR90 8780 1268h, ELC.ELSR91 8780 126Ch,
ELC_NS.ELSR0 0780 1100h, ELC_NS.ELSR1 0780 1104h, ELC_NS.ELSR2 0780 1108h, ELC_NS.ELSR3 0780 110Ch, ELC_NS.ELSR4 0780 1110h, ELC_NS.ELSR5 0780 1114h, ELC_NS.ELSR6 0780 1118h, ELC_NS.ELSR7 0780 111Ch, ELC_NS.ELSR8 0780 1120h, ELC_NS.ELSR9 0780 1124h, ELC_NS.ELSR10 0780 1128h, ELC_NS.ELSR11 0780 112Ch, ELC_NS.ELSR12 0780 1130h, ELC_NS.ELSR13 0780 1134h, ELC_NS.ELSR14 0780 1138h, ELC_NS.ELSR15 0780 113Ch, ELC_NS.ELSR16 0780 1140h, ELC_NS.ELSR17 0780 1144h, ELC_NS.ELSR18 0780 1148h, ELC_NS.ELSR19 0780 114Ch, ELC_NS.ELSR20 0780 1150h, ELC_NS.ELSR21 0780 1154h, ELC_NS.ELSR22 0780 1158h, ELC_NS.ELSR23 0780 115Ch, ELC_NS.ELSR24 0780 1160h, ELC_NS.ELSR25 0780 1164h, ELC_NS.ELSR26 0780 1168h, ELC_NS.ELSR46 0780 11B8h, ELC_NS.ELSR47 0780 11BCh, ELC_NS.ELSR50 0780 11C8h, ELC_NS.ELSR51 0780 11CCh, ELC_NS.ELSR52 0780 11D0h, ELC_NS.ELSR73 0780 1224h, ELC_NS.ELSR74 0780 1228h, ELC_NS.ELSR75 0780 122Ch, ELC_NS.ELSR76 0780 1230h, ELC_NS.ELSR77 0780 1234h, ELC_NS.ELSR78 0780 1238h, ELC_NS.ELSR88 0780 1260h, ELC_NS.ELSR89 0780 1264h, ELC_NS.ELSR90 0780 1268h, ELC_NS.ELSR91 0780 126Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	ELS[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	ELS[9:0]	Event Link Select	000h: Event signal output to the corresponding peripheral module is disabled. 021h to 33Bh: Set the number for the event signal to be linked. Settings other than above are prohibited.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, the behavior changes depending on the trusted event route setting.
When the trusted event route is disabled, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.
When the trusted event route is enabled, it can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

The ELSRn register specifies an event signal to be linked to for each peripheral module. Table 21.2 shows the correspondence between the ELSRn register and the peripheral modules. Table 21.3 shows the correspondence between values set in the ELSRn register and event signals.

Table 21.2 Correspondence between the ELSRn Register and the Peripheral Modules

Register Name	Peripheral Module
ELSR0	CMT1
ELSR1	CMTW0
ELSR2	TMR0
ELSR3	TMR1
ELSR4	TMR2
ELSR5	TMR3
ELSR6	GPTW event source A (common to all channels)
ELSR7	GPTW event source B (common to all channels)
ELSR8	GPTW event source C (common to all channels)
ELSR9	GPTW event source D (common to all channels)
ELSR10	GPTW event source E (common to all channels)
ELSR11	GPTW event source F (common to all channels)
ELSR12	GPTW event source G (common to all channels)
ELSR13	GPTW event source H (common to all channels)
ELSR14	Port B
ELSR15	Port C
ELSR16	Port D
ELSR17	Port E
ELSR18	ADC trigger 0 (common to all units)
ELSR19	ADC trigger 1 (common to all units)
ELSR20	ADC trigger 2 (common to all units)
ELSR21	ADC trigger 3 (common to all units)
ELSR22	ADC trigger 4 (common to all units)
ELSR23	ADC trigger 5 (common to all units)
ELSR24	ADC trigger 6 (common to all units)
ELSR25	ADC trigger 7 (common to all units)
ELSR26	ADC trigger 8 (common to all units)
ELSR46	DAC0
ELSR47	DAC1
ELSR50	RI3C0
ELSR51	GPTP (CAPTURE0)
ELSR52	GPTP (CAPTURE1)
ELSR73	PCIF0 (ELC_IN)
ELSR74	PCIF0 (PEK_IN)
ELSR75	PCIF0 (VLY_IN)
ELSR76	PCIF1 (ELC_IN)
ELSR77	PCIF1 (PEK_IN)
ELSR78	PCIF1 (VLY_IN)
ELSR88	ICU (Interrupt 1)*1
ELSR89	ICU (Interrupt 2)*1
ELSR90	ICU (Interrupt 3)*1
ELSR91	ICU (Interrupt 4)*1

Note 1. Specify an event number from among 050h to 053h, and 313h. Do not set other values.

Table 21.3 Correspondence between Values Set in ELSRn.ELS[9:0] Bits and Event Signals (1/9)

ELS[9:0] Bit Value	Peripheral Modules	Event Signal Set in ELSRn
021h	DMA controller	DMAC0 transfer end

21.2.8 Event Link Option Setting Register A (ELOPA)

Address(es): ELC.ELOPA 8780 1090h, ELC_NS.ELOPA 0780 1090h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMT1MD[1:0]		—	—
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b3, b2	CMT1MD[1:0]	CMT1 Operation Select	b3 b2 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPA register specifies the operations of CMT1 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.2.9 Event Link Option Setting Register B (ELOPB)

Address(es): ELC.ELOPB 8780 1094h, ELC_NS.ELOPB 0780 1094h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CMTW0MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CMTW0MD[1:0]	CMTW0 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b2	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPB register specifies the operation of CMTW0 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.2.10 Event Link Option Setting Register C (ELOPC)

Address(es): ELC.ELOPC 8780 1098h, ELC_NS.ELOPC 0780 1098h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	TMR1MD[1:0]		TMR0MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TMR0MD[1:0]	TMR0 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b3, b2	TMR1MD[1:0]	TMR1 Operation Select	b3 b2 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPC register specifies the operations of TMR0 and TMR1 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.2.11 Event Link Option Setting Register D (ELOPD)

Address(es): ELC.ELOPD 8780 109Ch, ELC_NS.ELOPD 0780 109Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	TMR3MD[1:0]		TMR2MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TMR2MD[1:0]	TMR2 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b3, b2	TMR3MD[1:0]	TMR3 Operation Select	b3 b2 0 0: Counting is started. 0 1: Counting is restarted. 1 0: Event counter 1 1: Event output is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The ELOPD register specifies the operations of TMR2 and TMR3 when an event signal is input. Set 11b (event output is disabled) when the ELC function is not used.

21.3 Operation

21.3.1 Relation between Interrupt Handling and Event Linking

The peripheral modules incorporated in the MCU are provided with the interrupt request status flags and the interrupt enable bits to enable/disable these interrupt requests. When an interrupt request is generated in a peripheral module, the corresponding interrupt request status flag becomes 1. If the corresponding interrupt request is enabled then, the interrupt is requested to the CPU.

In contrast, the event link controller (ELC) uses the interrupt requests generated by various peripheral modules as event signals, interconnects (links) peripheral modules, and then, makes peripheral modules perform direct interlinked operation among them without using software. Event signals can be output regardless of the setting of the corresponding interrupt enable bit.

Figure 21.2 shows the relation between the interrupt handling and ELC.

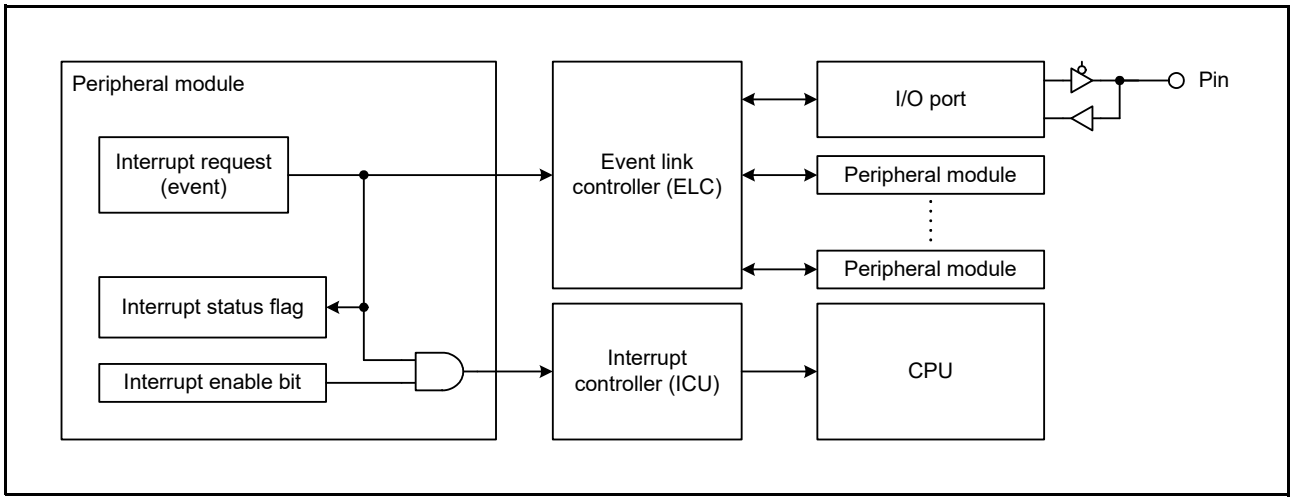

Figure 21.2 Relation between Interrupt Handling and ELC

21.3.2 Event Linkage

When events are specified in the ELSRn registers, the corresponding peripheral modules can be operated at generation of the specified events. A single peripheral module can link only with a single event. Set the ELSRn register after completing the initialization of the peripheral module to operate by an event. Table 21.4 lists the operations of peripheral modules when an event signal is input.

Table 21.4 Operations of Peripheral Modules When Event Signal is Input

Peripheral Module	Operations When Event Signal is Input
CMT CMTW TMR	The following operations can be selected by setting the ELOPA to ELOPD registers: • Starts counting when an event signal is input. • Restarts counting when an event signal is input. • Counts the input events.
GPTW	The following operations can be selected by setting registers in GPTW: • Starts counting when an event signal is input. • Stops counting when an event signal is input. • Clears counter when an event signal is input. • Switches the direction of counting when an event signal is input. • Increments counter when an event signal is input. • Decrements counter when an event signal is input. • Performs input-capture operation when an event signal is input.
RI3C	Captures the T_C1 counter when an event signal is input.
GPTP	Generates the media clock capture event when an event signal is input.
PCIF	The following operations can be selected by setting registers in PCIF: • Event input signal for carrier period • Clears the internal counter when an event signal is input. • Z-phase output signal is generated when an event signal is input.
A/D converter	Starts A/D conversion when an event signal is input.
D/A converter	Starts D/A conversion when an event signal is input.
I/O ports	• Changes the signal levels of the output pins according to the settings of the PORTx.EORR and PORTx.EOSR registers. • Latches the signal levels of the input pins into the PORTx.EIDR register. • Ports B to E can be controlled by the ELC.
Interrupt controller	Request an interrupt to the CPU, starts DMA transfer, or starts DTC transfer when an event signal is input.

21.3.3 Operation of Peripheral Timer Modules When Event Signal is Input

For the timer modules except GPTW, set the ELOPA to ELOPD register to specify the operation for when an event signal is input.

(1) Count Start Operation

When an event signal is input, the timer starts counting and the count start bit*1 in each timer control register becomes 1. An event signal that is input while the count start bit is 1 is ignored.

(2) Count Restart Operation

When an event signal is input, the timer counter is cleared. Since the count start bit*1 in each timer control register is retained, counting is restarted when an event signal is input while the count start bit is 1.

(3) Event Counter Operation

Event signal is selected as the timer count source. When an event signal is input, the timer counter is incremented.

Note 1. Refer to the register descriptions on starting the timer in the relevant peripheral timer module section.

21.3.4 Operation of GPTW When Event Signal is Input

Eight event signals specified by the ELSR6 to ELSR13 registers are connected to every channel of GPTW as GPTW event sources A to H. To set the operation of GPTW when inputting an event signal, enable any of the event sources A to H by a corresponding bit in registers listed in Table 21.5.

Table 21.5 Operations When Event Signal is Input and Corresponding Source Select Registers

Operations on Event	Register Symbol	Register Name
Count start	GTSSR	General PWM Timer Start Source Select Register
Count stop	GTPSR	General PWM Timer Stop Source Select Register
Counter clear	GTCSR	General PWM Timer Clear Source Select Register
Count switch	GTSWSR	General PWM Timer Switch Source Select Register
Count-up	GTUPSR	General PWM Timer Count-Up Source Select Register
Count-down	GTDNSR	General PWM Timer Count-Down Source Select Register
Input capture A	GTICASR	General PWM Timer Input Capture Source Select Register A
Input capture B	GTICBSR	General PWM Timer Input Capture Source Select Register B

21.3.5 Operation of A/D and D/A Converters When Event Signal is Input

When any of the event signal specified by the ELSR18 to ELSR26 registers is input, the A/D converter starts A/D conversion.
When an event signal specified by the ELSR46 or ELSR47 register is input, the D/A converter starts D/A conversion.
Refer to the A/D converter and D/A converter sections for details.

21.3.6 Example of Procedure for Linking Events

The following describes the procedure for linking events.

(1) Initialize the peripheral module (destination) that operates based on an event signal.
(2) Set the number of the event signal to the ELSRn register corresponding to the destination peripheral module.
(3) To link an event to a timer module, set any of the ELOPA to ELOPD registers corresponding to the timer as required.
(4) Set the ELCR.ELCON bit to 1, which enables linkage of all the events.
(5) Set the operation of the peripheral module (source) from which an event signal is output, and activate the module. The preset operation of the destination peripheral module is started by the event signal that is output from the source peripheral module.
(6) To stop event linkage of independent peripheral module, set 00h to the ELSRn register corresponding to the peripheral module. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

Note: If event signal output from the RTC is to be used, make the ELC settings after the RTC settings (initialization, time setting, etc.). Unintended events may be generated if RTC settings are made after the ELC settings.
Note: When using event signal output from the PVD, set the PVD and then the ELC. Set the corresponding ELSRn register to 00h and then disable the PVD.

21.4 Usage Notes

21.4.1 Setting ELSR88, ELSR89, ELSR90, and ELSR91 Registers

Specify an event number from among 050h to 053h, and 313h. Do not set the value other than preceding numbers.

21.4.2 Linking DMA/DTC Transfer End Signal as Event

When linking the DMA/DTC transfer end signal as an event signal, do not set the same peripheral module as the DMA/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMA/DTC transfer to the peripheral module is completed.

21.4.3 Clock Settings

To link events, make sure that the ELC and the related peripheral modules are in an operational condition. The peripheral modules cannot operate if they are in the module stop state or in mode which they stop (software standby mode or deep software standby mode).

21.4.4 Module Stop Function Setting

ELC operation can be disabled or enabled using module stop control register C (MSTPCRC). After reset is released, the ELC function is disabled. Register access is enabled by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

21.4.5 Internal Propagation Delay Times in the ELC

As shown in Figure 21.3, an event signal generated by a source peripheral module is propagated to a destination peripheral module via the ELC. The ELC includes synchronization (clock domain crossing, or CDC) circuits to ensure the transmission of event signals between modules operating with different clocks, and these circuits lead to propagation delays. Table 21.6 lists the internal propagation delay times of the ELC. Table 21.7 lists the clock domains of the peripheral modules.

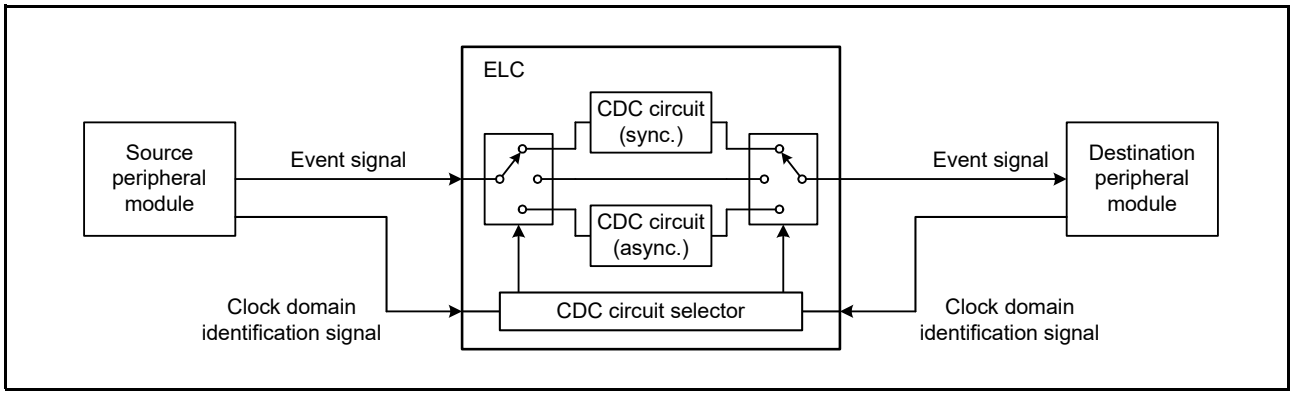

Figure 21.3 Event Signal Synchronization Circuits

Table 21.6 Internal Propagation Delay Times

Operating Clock (Clock Domain)		
Source Peripheral Module	**Destination Peripheral Module**	**Internal Propagation Delay Time**
PCLKA	PCLKA	0 cycles
	PCLKB or PCLKD	1 to 2 cycles of the slower clock of those for the source and destination modules
	Other than PCLK	5 PCLKA cycles + 4 cycles of the operating clock for the destination module
PCLKB	PCLKA or PCLKD	1 to 2 cycles of the slower clock of those for the source and destination modules
	PCLKB	0 cycles
	Other than PCLK	5 PCLKB cycles + 4 cycles of the operating clock for the destination module
PCLKD	PCLKA or PCLKB	1 to 2 cycles of the slower clock of those for the source and destination modules
	PCLKD	0 cycles
	Other than PCLK	5 PCLKD cycles + 4 cycles of the operating clock for the destination module
GPTCLK	PCLK	5 GPTCLK cycles + 4 PCLK cycles
	GPTCLK	0 cycles
	Other than PCLK and GPTCLK	5 GPTCLK cycles + 4 cycles of the operating clock for the destination module

Table 21.7 Clock Domains of Peripheral Modules

Peripheral Module		Clock Domain
Source	RSCI, RSPI, RI3C, ADC, DOC, GPTP, or RIICHS	PCLKA
	DMAC, DTC, PVD, Clock generation circuit, IWDT, WDT, RTC, ELC, I/O ports, CMT, CMTW, or TMR	PCLKB
	GPTW	GPTCLK or PCLKD
Destination	RI3C or GPTP	PCLKA
	I/O ports, DAC, CMT, CMTW, TMR, or ICU	PCLKB
	GPTW	GPTCLK or PCLKD
	ADC	ADCCK, GPTCLK, or PCLKA
	PCIF	GPTCLK or PCLKB

22. I/O Ports

22.1 Overview

The pins of an I/O port may function as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O pins, pins for the ELC port group function, or bus control pins. All pins except P302 (the TDO pin of the JTAG port by default) operate as input pins immediately after a reset and the I/O directions of the pins are switched by register settings. Whether each pin operates as an I/O port or a pin for a peripheral module can be specified by the registers corresponding to the pins. The configuration of the I/O ports depends on the package. Table 22.1 lists the specifications of the I/O ports and Table 22.2 lists the port functions.

Table 22.1 Specifications of I/O Ports

Port Symbol	Package 320-Pin	Number of Pins	Package 224-Pin	Number of Pins	Package 176-Pin	Number of Pins	Package 144-Pin	Number of Pins	Package 100-Pin	Number of Pins
PORT0	P000 to P015	16	P000 to P007	8	P000 to P007	8	P000 to P007	8	P001 to P007	7

Note 1. Specifying a non-supported driving ability is prohibited.
Note 2. When an I3C function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the I3C or I^2C is selected.
Note 3. When an I^2C function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the I^2C is selected.
Note 4. When a JTAG function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the JTAG is selected.
Note 5. When a FINE function is selected, the function for switching the driving ability is disabled and the driving ability specialized for the FINE is selected.

22.2 Configuration of I/O Ports

Note: This figure shows the basic configuration of ports. Details can vary from port to port.

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is readable and writable in 32-bit units and is used to select the input/output direction and output data for the individual pins of the corresponding port when the pins are configured as general I/O port pins.
A bit corresponding to a pin that does not exist is reserved. A reserved bit is read as 0. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the PDR05, PDR08, PDR09, PODR05, PODR08, and PODR09 bits in the PCNTR1 register for PORT3 are also reserved.

22.3.2 Port Direction Register (PDR)

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is used to select the input/output direction for the individual pins of the corresponding port when the pins are configured as general I/O port pins and makes up the 16 lower-order bits of the PCNTR1 register. This register is accessible in 8- or 16-bit units.

A bit corresponding to a pin that does not exist is reserved. Make settings according to the description in section 22.6.11, Initialization of the Port Direction Register (PDR).

As the P305, P308, and P309 pins are input-only, the PORT3.PDR.PDR05, PORT3.PDR.PDR08, and PORT3.PDR.PDR09 bits are also reserved.

22.3.3 Port Output Data Register (PODR)

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is used to select the output data for the individual pins of the corresponding port when the pins are configured as general I/O port pins and makes up the 16 higher-order bits of the PCNTR1 register. This register is accessible in 8- or 16-bit units.

A bit corresponding to a pin that does not exist is reserved. A reserved bit is read as 0. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the PODR05, PODR08, and PODR09 bits in the PODR register for PORT3 are also reserved.

22.3.4 Port Control Register 2 (PCNTR2)

b31 to b24	—	Reserved	These bits are read as 0.	R

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

Note 1. Only ports B to E have this bit.

This register is read-only in 32-bit units and is used to read the input level and port event input data on the Pmn pins (n = 00 to 15). A bit corresponding to a pin that does not exist is reserved. The value read from a reserved bit is undefined.

22.3.5 Port Input Data Register (PIDR)

Address(es): PORT0.PIDR 87C0 0004h, PORT1.PIDR 87C0 0024h, PORT2.PIDR 87C0 0044h, PORT3.PIDR 87C0 0064h, PORT4.PIDR 87C0 0084h, PORT5.PIDR 87C0 00A4h, PORT6.PIDR 87C0 00C4h, PORT7.PIDR 87C0 00E4h, PORT8.PIDR 87C0 0104h, PORT9.PIDR 87C0 0124h, PORTA.PIDR 87C0 0144h, PORTB.PIDR 87C0 0164h, PORTC.PIDR 87C0 0184h, PORTD.PIDR 87C0 01A4h, PORTE.PIDR 87C0 01C4h, PORTF.PIDR 87C0 01E4h, PORTG.PIDR 87C0 0204h, PORT0_NS.PIDR 07C0 0004h, PORT1_NS.PIDR 07C0 0024h, PORT2_NS.PIDR 07C0 0044h, PORT3_NS.PIDR 07C0 0064h, PORT4_NS.PIDR 07C0 0084h, PORT5_NS.PIDR 07C0 00A4h, PORT6_NS.PIDR 07C0 00C4h, PORT7_NS.PIDR 07C0 00E4h, PORT8_NS.PIDR 07C0 0104h, PORT9_NS.PIDR 07C0 0124h, PORTA_NS.PIDR 07C0 0144h, PORTB_NS.PIDR 07C0 0164h, PORTC_NS.PIDR 07C0 0184h, PORTD_NS.PIDR 07C0 01A4h, PORTE_NS.PIDR 07C0 01C4h, PORTF_NS.PIDR 07C0 01E4h, PORTG_NS.PIDR 07C0 0204h

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register reflects the input level on the Pmn pins (n = 00 to 15) and makes up the 16 lower-order bits of the PCNTR2 register. This register is accessible in 8- or 16-bit units. The level on a pin can be read from the corresponding PIDRn bit regardless of the value of the PMR bit in the PmnPFS register or the PDRn bit in the PCNTR1 register for PORTm. If any of the following functions is selected for a pin, the level on the pin is not reflected in the PIDRn bit.

- RTC time capture input (RTCIC0 to RTCIC2) and tamper detection (TAMPI0 to TAMPI2)
- Analog function (the ASEL bit in the PmnPFS register is 1)
- JTAG or SWD interface (TCK or SWCLK, TMS or SWDIO, TDI, or TDO)

22.3.6 Port Event Input Data Register (EIDR)

Address(es): PORTB.EIDR 87C0 0166h, PORTC.EIDR 87C0 0186h, PORTD.EIDR 87C0 01A6h, PORTE.EIDR 87C0 01C6h, PORTB_NS.EIDR 07C0 0166h, PORTC_NS.EIDR 07C0 0186h, PORTD_NS.EIDR 07C0 01A6h, PORTE_NS.EIDR 07C0 01C6h

b5	EIDR05	Port Event Input Data 05		R
b6	EIDR06	Port Event Input Data 06		R
b7	EIDR07	Port Event Input Data 07		R
b15 to b8	—	Reserved	These bits are read as 0.	R

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is used to read the level latched on the individual pins when a corresponding ELC_PORTm event has occurred and makes up the 16 higher-order bits of the PCNTR2 register. This register is accessible in 8- or 16-bit units. An EIDRn bit only reflects the level on the corresponding pin when both the PMR bit in the PmnPFS register (n = 00 to 07) and the PDRn bit in the PDR register for PORTm are set to 0. If the ASEL bit in the PmnPFS register is set to 1, the EIDRn bit does not reflect the level on the corresponding pin. A bit corresponding to a pin that does not exist is reserved. A reserved bit is read as 0.

22.3.7 Port Control Register 3 (PCNTR3)

Address(es): PORT0.PCNTR3 87C0 0008h, PORT1.PCNTR3 87C0 0028h, PORT2.PCNTR3 87C0 0048h, PORT3.PCNTR3 87C0 0068h, PORT4.PCNTR3 87C0 0088h, PORT5.PCNTR3 87C0 00A8h, PORT6.PCNTR3 87C0 00C8h, PORT7.PCNTR3 87C0 00E8h, PORT8.PCNTR3 87C0 0108h, PORT9.PCNTR3 87C0 0128h, PORTA.PCNTR3 87C0 0148h, PORTB.PCNTR3 87C0 0168h, PORTC.PCNTR3 87C0 0188h, PORTD.PCNTR3 87C0 01A8h, PORTE.PCNTR3 87C0 01C8h, PORTF.PCNTR3 87C0 01E8h, PORTG.PCNTR3 87C0 0208h,

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

Note: This register is write-only. It is always read as 0.

This register is writable in 32-bit units and is used to set or reset the data output through the Pmn pins (n = 00 to 15). Do not set both the PORRn and POSRn bits for a single pin to 1. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the POSR05, POSR08, POSR09, PORR05, PORR08, and PORR09 bits in the PCNTR3 register for PORT3 are also reserved.

22.3.8 Port Output Set Register (POSR)

Address(es): PORT0.POSR 87C0 0008h, PORT1.POSR 87C0 0028h, PORT2.POSR 87C0 0048h, PORT3.POSR 87C0 0068h, PORT4.POSR 87C0 0088h, PORT5.POSR 87C0 00A8h, PORT6.POSR 87C0 00C8h, PORT7.POSR 87C0 00E8h, PORT8.POSR 87C0 0108h, PORT9.POSR 87C0 0128h, PORTA.POSR 87C0 0148h, PORTB.POSR 87C0 0168h, PORTC.POSR 87C0 0188h, PORTD.POSR 87C0 01A8h, PORTE.POSR 87C0 01C8h, PORTF.POSR 87C0 01E8h, PORTG.POSR 87C0 0208h,

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is accessible in 8- or 16-bit units and is used to set the corresponding bits in the PODR register to 1. This register is always read as 0. Writing 1 to a POSRn bit (n = 00 to 15) sets the corresponding PODRn bit in the PODR register to 1. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the POSR05, POSR08, and POSR09 bits in the POSR register for PORT3 are also reserved.

m = 0 to 9 or A to G

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is accessible in 8- or 16-bit units and is used to set the corresponding bits in the PODR register to 0. This register is always read as 0. Writing 1 to a PORRn bit (n = 00 to 15) sets the corresponding PODRn bit in the PODR register to 0. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them. As the P305, P308, and P309 pins are input-only, the PORR05, PORR08, and PORR09 bits in the PORR register for PORT3 are also reserved.

22.3.10 Port Control Register 4 (PCNTR4)

Address(es): PORTB.PCNTR4 87C0 016Ch, PORTC.PCNTR4 87C0 018Ch, PORTD.PCNTR4 87C0 01ACh, PORTE.PCNTR4 87C0 01CCh, PORTB_NS.PCNTR4 07C0 016Ch, PORTC_NS.PCNTR4 07C0 018Ch, PORTD_NS.PCNTR4 07C0 01ACh, PORTE_NS.PCNTR4 07C0 01CCh

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

This register is readable and writable in 32-bit units and is used to set or reset the data output through the Pmn pins (n = 00 to 07) when an ELC_PORTm event has occurred. Do not set both the EORRn and EOSRn bits for a single pin to 1.

22.3.11 Event Output Set Register (EOSR)

Address(es): PORTB.EOSR 87C0 016Ch, PORTC.EOSR 87C0 018Ch, PORTD.EOSR 87C0 01ACh, PORTE.EOSR 87C0 01CCh, PORTB_NS.EOSR 07C0 016Ch, PORTC_NS.EOSR 07C0 018Ch, PORTD_NS.EOSR 07C0 01ACh, PORTE_NS.EOSR 07C0 01CCh

b5	EOSR05	Pm05 Event Output Set		R/W
b6	EOSR06	Pm06 Event Output Set		R/W
b7	EOSR07	Pm07 Event Output Set		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

After an EOSRn bit has been set to 1, the corresponding PODRn bit in the PODR register is set to 1 when an ELC_PORTm event occurs (n = 00 to 07). When the EORRn bit for a pin is set to 1 in the EORR register, the EOSRn bit for the pin in this register should be set to 0. This register is accessible in 8- or 16-bit units. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them.

22.3.12 Event Output Reset Register (EORR)

Address(es): PORTB.EORR 87C0 016Eh, PORTC.EORR 87C0 018Eh, PORTD.EORR 87C0 01AEh, PORTE.EORR 87C0 01CEh, PORTB_NS.EORR 07C0 016Eh, PORTC_NS.EORR 07C0 018Eh, PORTD_NS.EORR 07C0 01AEh, PORTE_NS.EORR 07C0 01CEh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b6	EORR06	Pm06 Event Output Reset		R/W
b7	EORR07	Pm07 Event Output Reset		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

m = B to E

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, but no Protect Zone access errors are generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, but no Protect Zone access errors are generated.

After an EORRn bit has been set to 1, the corresponding PODRn bit in the PODR register is set to 0 when an ELC_PORTm event occurs (n = 00 to 07). When the EOSRn bit for a pin is set to 1 in the EOSR register, the EORRn bit for the pin in this register should be set to 0. This register is accessible in 8- or 16-bit units. A bit corresponding to a pin that does not exist is reserved. When writing to such bits, write 0 to them.

22.3.13 Pmn Pin Function Selection Register (PmnPFS) (m = 0 to 9, A to G; n = 00 to 15)

Address(es): PFS.P000PFS 87C0 0800h to PFS.P015PFS 87C0 083Ch,

b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b30 to b24	PSEL[6:0]	Peripheral Function Select	These bits are used to select a peripheral function. For the peripheral functions that are selectable for each pin, see the relevant tables in this section.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. The bits are initialized to the following values.
- PSEL[6:0] bits in the PF00PFS and PF01PFS registers: 0010011b
- PMR bit in the P300PFS, P301PFS, P302PFS, P303PFS, P315PFS, PF00PFS, and PF01PFS registers: 1
- DSCR[3:0] bits in the P300PFS, P302PFS, and P315PFS registers: 0001b
- PCR bit in the P300PFS, P301PFS, P303PFS, and P315PFS registers: 1

Note 2. Specifying a non-supported driving ability is prohibited. For the driving abilities supported by the individual pins, see Table 22.2, Port Functions.

Note 3. Only ports B to E have these bits.

This register is readable and writable in 32-bit, 16-bit, or 8-bit units and is used to specify various functions of the Pmn pin. The PmnPFS register is protected by the PWPR register. Release the protection before modifying the value of this register.

PODR Bit (Port Output Data)

The function of this bit is the same as that of the corresponding PODRn bit in the PODR register for PORTm.

PIDR Bit (Port Input Data)

The function of this bit is the same as that of the corresponding PIDRn bit in the PIDR register for PORTm.

PDR Bit (Port I/O Direction Select)

The function of this bit is the same as that of the corresponding PDRn bit in the PDR register for PORTm.

PCR Bit (Input Pull-up Resistor Control)

This bit enables or disables the input pull-up resistor for the pin. When the pin is set as an input and this bit is set to 1, the pull-up resistor connected to the pin is enabled. When the pin is set as a general output port or an output pin for a peripheral function, the pull-up resistor is disabled regardless of the setting of this bit.

DSCR[3:0] Bits (Driving Ability Select)

These bits switch the driving ability of the output buffer for the pin. Specifying a driving ability that is not supported for the pin is prohibited. For the driving abilities supported by the individual pins, see Table 22.2. These bits are reserved for a pin that has a fixed driving ability. The write value should be 0000b in this case.

EOFR[1:0] Bits (Port Group Input Edge Detection Select)

These bits select the edges to be detected in the input signal for the pin in a port group. Rising edges, falling edges, or both edges can be selected. While these bits are set to 01b, 10b, or 11b, an event pulse is applied to the ELC when the level on the external pin changes in the corresponding way.

ISEL Bit (Interrupt Input Function Select)

This bit specifies the use of the pin as an IRQ input pin. The pin can be set to work as both an IRQ input pin and a peripheral function pin. Note that when a single IRQ signal is assignable to multiple pins, the ISEL bit for only one of the pins should be set to 1. This bit is reserved for a pin to which an IRQ signal is not assigned.

ASEL Bit (Analog Function Select)

This bit specifies the use of the pin as an analog I/O signal pin. When setting this bit to 1, set each of the corresponding PMR, PCR, and PDR bits to 0. This bit is reserved for a pin to which an analog I/O signal is not assigned.

PSEL[6:0] Bits (Peripheral Function Select)

These bits select the signal to be assigned to the pin. When a single peripheral function signal is assignable to multiple pins, the PSEL[6:0] bits for only one of the pins should be set to select the signal. For the settings of the individual signals for peripheral functions, see Table 22.3 to Table 22.28.

Table 22.3 Register Settings for I/O Pin Functions (PORT0, Pins P000 to P007)

PSEL[6:0] Setting	Function	Pin

22.3.14 Non-secure World Write Protection Register (PWPR_NS)

Address(es): PFS_NS.PWPR_NS 07C0 0D0Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PFSWE	PmnPFS Register Write Enable	0: Writing to the PmnPFS registers is disabled. 1: Writing to the PmnPFS registers is enabled.	R/W
b7	B0WI	PFSWE Bit Write Disable	0: Writing to the PFSWE bit is enabled. 1: Writing to the PFSWE bit is disabled.	R/W

m = 0 to 9 or A to G; n = 00 to 15

Note: This register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note: Access to this register is not controlled by any security attribute registers.

This register is used to protect the PmnPFS registers corresponding to the pins placed in the non-secure world by the PmSAR registers.

PFSWE Bit (PmnPFS Register Write Enable)

Writing to the PmnPFS registers is only enabled when this bit is set to 1. Set the B0WI bit to 0 before setting this bit to 1.

B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is only enabled when this bit is set to 0.

22.3.15 Secure World Write Protection Register (PWPR_S)

Address(es): PFS.PWPR_S 87C0 0D14h

	b7	b6	b5	b4	b3	b2	b1	b0
	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PFSWE	PmnPFS Register Write Enable	0: Writing to the PmnPFS registers is disabled. 1: Writing to the PmnPFS registers is enabled.	R/W
b7	B0WI	PFSWE Bit Write Disable	0: Writing to the PFSWE bit is enabled. 1: Writing to the PFSWE bit is disabled.	R/W

m = 0 to 9 or A to G; n = 00 to 15

Note: This register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.

This register is used to protect the PmnPFS registers corresponding to the pins placed in the secure world by the PmSAR registers

PFSWE Bit (PmnPFS Register Write Enable)

Writing to the PmnPFS registers is only enabled when this bit is set to 1. Set the B0WI bit to 0 before setting this bit to 1.

B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is only enabled when this bit is set to 0.

22.3.16 Port m Security Attribute Setting Register (PmSAR) (m = 0 to 9, A to G)

Address(es): PFS.P0SAR 87C0 0D30h, PFS.P1SAR 87C0 0D34h, PFS.P2SAR 87C0 0D38h, PFS.P3SAR 87C0 0D3Ch, PFS.P4SAR 87C0 0D40h, PFS.P5SAR 87C0 0D44h, PFS.P6SAR 87C0 0D48h, PFS.P7SAR 87C0 0D4Ch, PFS.P8SAR 87C0 0D50h, PFS.P9SAR 87C0 0D54h, PFS.PASAR 87C0 0D58h, PFS.PBSAR 87C0 0D5Ch, PFS.PCSAR 87C0 0D60h, PFS.PDSAR 87C0 0D64h, PFS.PESAR 87C0 0D68h, PFS.PFSAR 87C0 0D6Ch, PFS.PGSAR 87C0 0D70h,
PFS_NS.P0SAR 07C0 0D30h, PFS_NS.P1SAR 07C0 0D34h, PFS_NS.P2SAR 07C0 0D38h, PFS_NS.P3SAR 07C0 0D3Ch, PFS_NS.P4SAR 07C0 0D40h, PFS_NS.P5SAR 07C0 0D44h, PFS_NS.P6SAR 07C0 0D48h, PFS_NS.P7SAR 07C0 0D4Ch, PFS_NS.P8SAR 07C0 0D50h, PFS_NS.P9SAR 07C0 0D54h, PFS_NS.PASAR 07C0 0D58h, PFS_NS.PBSAR 07C0 0D5Ch, PFS_NS.PCSAR 07C0 0D60h, PFS_NS.PDSAR 07C0 0D64h, PFS_NS.PESAR 07C0 0D68h, PFS_NS.PFSAR 07C0 0D6Ch, PFS_NS.PGSAR 07C0 0D70h

m = 0 to 9 or A to G

Note: This register can only be written by secure transactions. Writes by non-secure transactions are ignored, but no Protect Zone access errors are generated. It can be read by any transaction.

This register is readable and writable in 8-bit or 16-bit units and is used to specify the security attributes for the individual pins.

22.3.17 Low-Voltage Operating Characteristics Control Register (LVOCR)

Address(es): SYSC.LVOCR 8701 9AB0h, SYSC_NS.LVOCR 0701 9AB0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LVO0E
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b0	LVO0E	Low-Voltage Operating Characteristics Control 0	0: VCC ≥ 2.7 V 1: VCC < 2.7 V	R/W
b1	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: When this register is set to the secure attribute, it is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this register is set to the non-secure attribute, it is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

This register is used to control the operating characteristics of the input/output buffers.

LVO0E Bit (Low-Voltage Operating Characteristics Control 0)

Set this bit to 0 when the VCC voltage to be used is 2.7 V or higher. Leave this bit as 1 when the VCC voltage to be used is below 2.7 V.

22.4 Operation

22.4.1 General-Purpose I/O Port

All pins except P300 to P303, P315, PF00, or PF01 operate as general input port pins after a reset. Each general I/O port consists of 16 pins. The ports can be accessed in port units through the port control registers (PCNTRn, n = 1 to 4) or in pin units through the Pmn pin function selection registers (PmnPFS, m = 0 to 9 or A to G, n = 00 to 15). For details of the registers, refer to section 22.3, Register Descriptions.

22.4.2 Selecting Pin Functions

The following functions can be controlled for the individual pins through register settings.

- The security attribute is selectable per-pin as desired.
- Selection of CMOS or N-channel open-drain output, pull-up resistors, and driving ability can be controlled.
- The I/O directions of port pins can be selected, the data to be output can be specified, and the input data can be read.
- The I/O signals of peripheral functions are assignable to pins.

22.4.3 Port Group Function of the ELC

Ports B to E are assigned to the ELC port group function in this MCU.

22.4.3.1 Operation when the ELC_PORTn (n = B to E) Signal is Input from the ELC

This MCU has the following two functions to be activated in response to the input of an ELC_PORTn (n = B to E) signal from the ELC.

(1) Event input

When the ELC_PORTn (n = B to E) signal is generated by the ELC, the levels on the pins in the corresponding port group are transferred to the EIDR bits if the pins are general input pins (PDR = 0 and PMR = 0 in the PmnPFS register). See Figure 22.2. If the pins are general output pins (PDR = 1) or the I/O pins for peripheral functions (PMR = 1), the corresponding EIDR bits are set to 0 regardless of the levels on the pins.

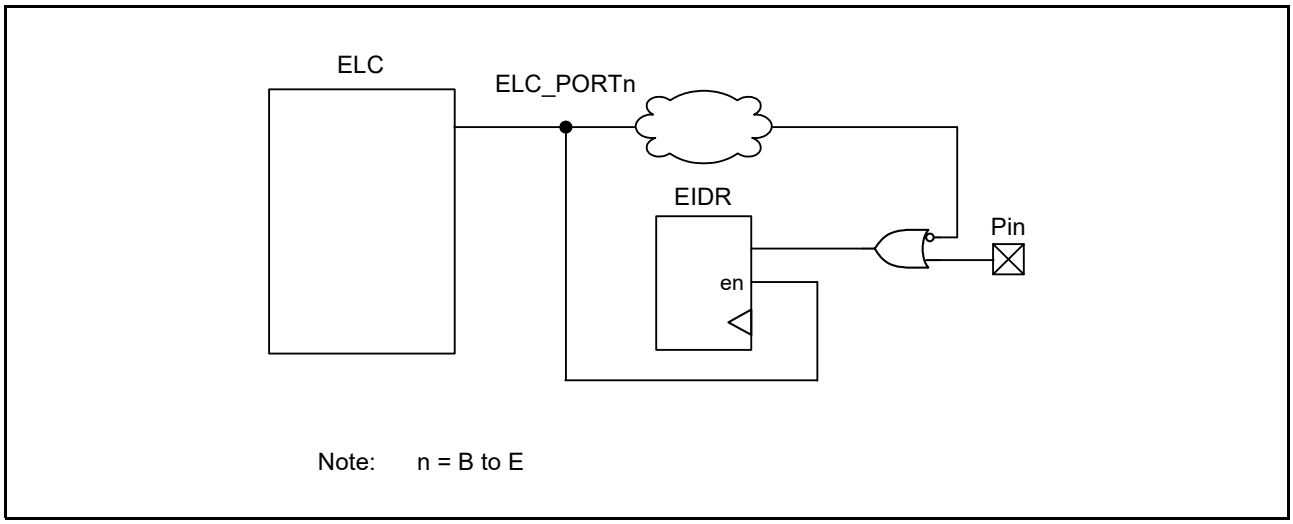

Figure 22.2 Data Input from an Event Port Group

(2) Setting the PODR Register through the EOSR and EORR Registers

When the ELC_PORTn (n = B to E) signal is generated, the PODR register is set according to the settings of the EOSR and EORR registers.

- If a bit in the EOSR register is set to 1, the corresponding bit in the PODR register is set to 1 in response to generation of the ELC_PORTn signal.
  If a bit in the EOSR register is set to 0, the corresponding bit in the PODR register retains its value.
- If a bit in the EORR register is set to 1, the corresponding bit in the PODR register is set to 0 in response to generation of the ELC_PORTn signal.
  If a bit in the EORR register is set to 0, the corresponding bit in the PODR register retains its value.

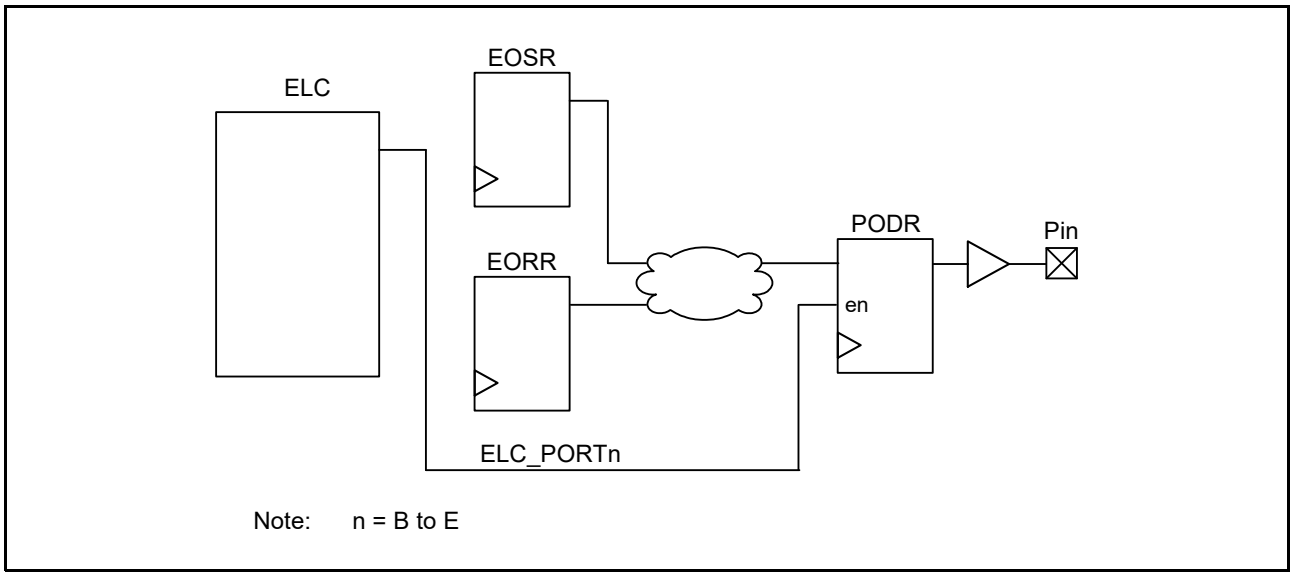

Figure 22.3 Data Output from an Event Port Group

22.4.3.2 Operation when an Event Pulse is Applied to the ELC

Use the EOFR[1:0] bits in the PmnPFS register to apply an event pulse from external pins to the ELC. For details, refer to section 22.3.13, Pmn Pin Function Selection Register (PmnPFS) (m = 0 to 9, A to G; n = 00 to 15). For example, when data are input to port B (PB00 to PB07), the logical OR of the data values from these eight pins are taken and the result is applied to the ELC as an event pulse. Ports C to E operate in the same way. See Figure 22.4.

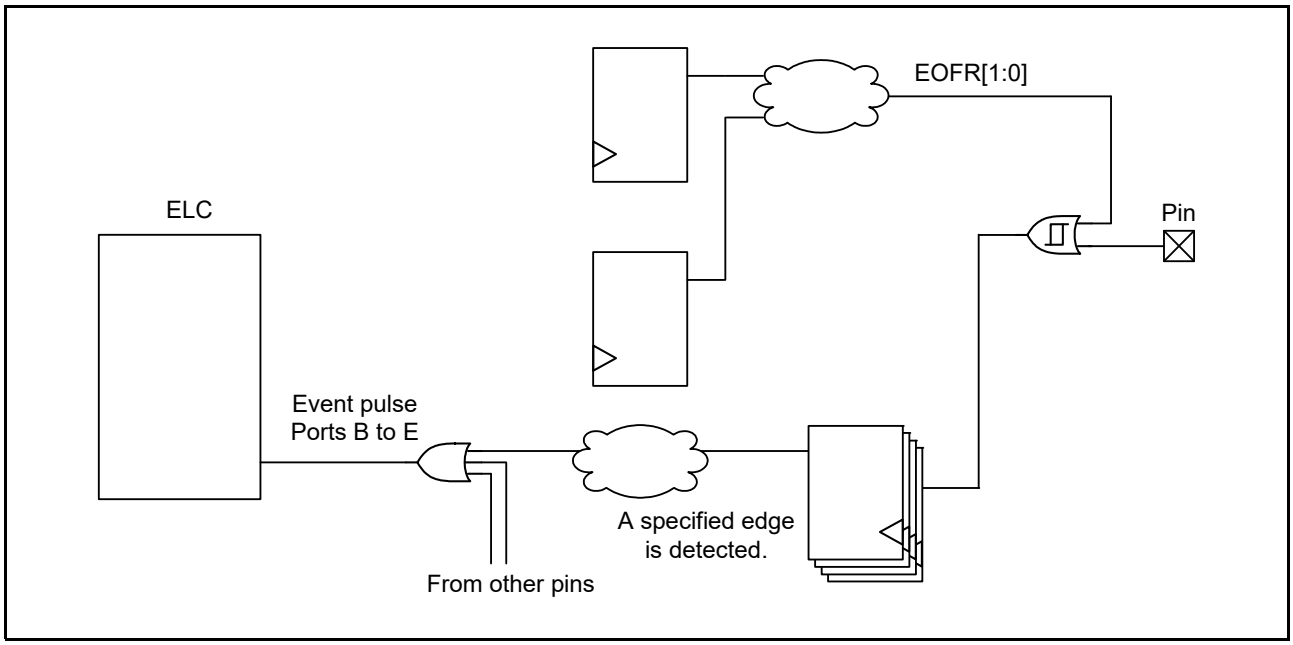

Figure 22.4 Generating an Event Pulse

22.5 Handling of Unused Pins

Details on the handling of unused pins are given in Table 22.29.

Table 22.29 Handling of Unused Pins

Pin Name	Handling
P315/MD	This pin must always be used as the mode pin.
RES#	Pull this pin up to VCC via a resistor.
PF00/USB0_DP, PF01/USB0_DM	Leave these pins open-circuit when the PMR bit is set to 1 in both the PF00PFS and PF01PFS registers. Set these pins as follows when the PMR bit is set to 0 in either the PF00PFS or PF01PFS register. • When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to VCC_USB or VSS via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
P305/NMI	Pull this pin up to VCC via a resistor.
P306/EXTAL	Set the MOSTP bit of the MOSCCR register in the SYSC to 1 (selecting general port pin P306) when the main clock oscillator is not to be used. If this pin is not used either for clock oscillation or as port pin P306, handle it in the way stated for “Other ports” below.
P307/XTAL	Set the MOSTP bit of the MOSCCR register in the SYSC to 1 (selecting general port pin P307) when the main clock oscillator is not to be used. The XTAL pin works as P307 when an external clock is input to the EXTAL pin. If this pin is not used either for clock oscillation or as port pin P307, handle it in the way stated for “Other ports” below.
P309/XCIN/EXCIN	Set the SOSTP bit of the SOSCCR register in the SYSC to 1 (selecting general port pin P309) when the sub-clock oscillator is not to be used. Set the SOSEL bit of the SOMCR register in the SYSC to 0 (selecting general port pin P309) when an external clock is not to be used. If this pin is not used either for clock oscillation or as port pin P309, pull it down to VSS via a resistor.
P308/XCOUT	Set the SOSTP bit of the SOSCCR register in the SYSC to 1 (selecting general port pin P308) when the sub-clock oscillator is not to be used. If this pin is not used either for clock oscillation or as port pin P308, pull it down to VSS via a resistor.
P300, P301, P303	Do not pull these pins down because the input pull-up resistors are enabled (PCR bit in the PmnPFS register = 1) after release from the reset state.
P302	Be careful since this pin operates as an output pin after release from the reset state.
P400 to P415	• When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to AVCC0 or AVSS0 via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
P600 to P607. P900 to P907, PD00 to PD07	• When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to VCC2 or VSS via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
Other ports	• When the I/O direction is set as input (PDRn bit in the PCNTR1 register = 0), connect the corresponding pin to VCC or VSS via a resistor.*1 • When the I/O direction is set as output (PDRn bit in the PCNTR1 register = 1), leave the corresponding pin open-circuit.*1
VREFH0	Connect this pin to AVCC0.
VREFL0	Connect this pin to AVSS0.
USBHS_DP, USBHS_DM, USBHS_RREF	Prerequisites • AVCC_USBHS = VCC_USBHS: Both are connected to VCC. • AVSS_USBHS = VSS_USBHS: Both are connected to VSS. - The USBHS is placed in the module-stop state (MSTPB12 bit in the MSTPCRB register = 1) Handling • Leave the USBHS_DP, USBHS_DM, and USBHS_RREF pins open-circuit.
VLO	Leave this pin open-circuit.*2
VBATT	Connect this pin to VCC.

Note 1. Set the PMR, ISEL, PCR, and ASEL bits in the relevant PmnPFS register to 0.

Note 2. For details, refer to section 66, Internal Voltage Regulator.

22.6 Notes

22.6.1 Procedure for Setting Pin Functions

Use the following procedure to specify the function of an I/O pin.

1. Set the B0WI bit in the PWPR_NS register to 0 to enable writing to the PFSWE bit in the PWPR_NS register.*1
2. Set the PFSWE bit in the PWPR_NS register to 1 to enable writing to the PmnPFS register.*1
3. Set the PMR bit in the PmnPFS register corresponding to the target pin to 0 to set the pin as a general I/O port pin.
4. Set the PSEL[6:0] bits in the PmnPFS register to select the peripheral module function pins.
5. Set the PMR bit in the PmnPFS register to 1 to switch the pin to the selected peripheral function as required.
6. Set the PFSWE bit in the PWPR_NS register to 0 to disable writing to the PmnPFS register.*1
7. Set the B0WI bit in the PWPR_NS register to 1 to disable writing to the PFSWE bit in the PWPR_NS register.*1

Note 1. When the security attribute of the Pmn pin is set to 0 in the PmSAR register, use the PWPR_S register to enable or disable writing to the PmnPFS register.

22.6.2 Procedure for Using the Event Output Function to ELC

Use the following procedure to use changes in the input to a port group (B to E) as an event.

1. Set the ELS[9:0] bits of the ELSRx register in the ELC to 000h to prevent malfunctions due to an unexpected event. Whether an unexpected event may be generated depends on the states of external pins.
2. Use the EOFR[1:0] bits in the PmnPFS register to select the input edges to be detected.
3. Wait for 100 ns.
4. Use the ELS[9:0] bits of the ELSRx register in the ELC to select the target for linking of the port event.

22.6.3 Method of Setting the Port Output Data Register (PODR)

The following methods can be used to specify a value in the PODR register.

- Set the EORR bit in the PCNTR4 register to 1 to set the corresponding bit in the PODR register to 0 when the ELC_PORTn (n = B to E) signal is generated.
- Set the EOSR bit in the PCNTR4 register to 1 to set the corresponding bit in the PODR register to 1 when the ELC_PORTn (n = B to E) signal is generated.
- Set the PORR bit in the PCNTR3 register to 1 to set the corresponding bit in the PODR register to 0.
- Set the POSR bit in the PCNTR3 register 1 to set the corresponding bit in the PODR register to 1.
- Set the PODRn bit in the PCNTR1 register to set the corresponding bit in the PODR register to 0 or 1.
- Set the PODRn bit in the PmnPFS register to set the corresponding bit in the PODR register to 0 or 1.

In case of simultaneous direct writing to and event-driven modification of a register, event-driven modification takes priority.

22.6.4 Note on Using Analog Functions

To use a pin for an analog signal, set both the pin mode select (PMR) bit in the PmnPFS register and the port I/O direction select (PDRn) bit in the PCNTR1 register to 0 to make the pin operate as a general input port pin. After that, set the analog function select (ASEL) bit in the PmnPFS register to 1.

22.6.5 Notes on Using the RTC Time-Capture Event Inputs and Tampering Detection

To use the P310, P311, and P312 pins for RTC time-capture event input and tampering detection, set the TAMPICR1.CHnEN (n = 0 to 2) bits of the SYSC to 1. When the setting of a TAMPICR1.CHnEN bit is 1, the settings of registers related to the P31n pins in this section are ignored. Note, however, that the settings of the P31nPFS.ISEL bits are valid.

The TAMPICR1 register is not initialized by a reset. Therefore, when RTC input and tampering detection are not to be used, the corresponding bits in the TAMPICR1 register require setting to 0 after a reset. For details of the TAMPICR1 register, refer to section 12.2.11, Tamper/RTCIC Input Control Register 1 (TAMPICR1).

22.6.6 Selecting the USB0_DP and USB0_DM Pins

The USB0_DP and USB0_DM pins are respectively multiplexed with the PF00 and PF01 pins. Use the PMR and PSEL[6:0] bits in the PF00PFS register to select the USB0_DP or PF00 pin function and use the PMR and PSEL[6:0] bits in the PF01PFS register to select the USB0_DM or PF01 pin function. Table 22.30 lists the PFS register settings and the corresponding functions selected for the PF00 and PF01 pins.

Table 22.30 Selection of the USB or Port Pins

PFS Register Settings				Pin Function	
PF00PFS		PF01PFS			
PMR	PSEL[6:0]	PMR	PSEL[6:0]	PF00 Pin	PF01 Pin
0	Don't care	0	Don't care	General I/O	General I/O
0	Don't care	1	Other than 0010011b	General I/O	Peripheral function other than USB
0	Don't care	1	0010011b	General I/O	This pin cannot be used.
1	Other than 0010011b	0	Don't care	Peripheral function other than USB	General I/O
1	Other than 0010011b	1	Other than 0010011b	Peripheral function other than USB	Peripheral function other than USB
1	Other than 0010011b	1	0010011b	Peripheral function other than USB	This pin cannot be used.
1	0010011b	0	Don't care	This pin cannot be used.	General I/O
1	0010011b	1	Other than 0010011b	This pin cannot be used.	Peripheral function other than USB
1	0010011b	1	0010011b	USB0_DP	USB0_DM

Note: When the PF00 and PF01 pins are to be used for general I/O signals (the PF00 and PF01 signals) or for a peripheral function other than the USB, use the registers related to the USB with their initial values.
Note: When the PF00 and PF01 pins are to be used for USB signals (the USB0_DP and USB0_DM signals), use the registers related to the PF00 and PF01 general I/O signals with their initial values.
Note: Only set the PF00PFS and PF01PFS registers for selecting the pin functions once after a reset.

22.6.7 Pulling the PF00 and PF01 Pins Used for USB or General I/O Signals Up or Down

When the PF00 and PF01 pins are used for general I/O signals, the pull-up and pull-down functions of the USB affect the PF00 and PF01 pins. Therefore, the pull-up or pull-down functions need to be disabled before the pins are used for general I/O signals. The pull-up and pull-down functions of the USB are controlled by the DPRPU and DRPD bits of the SYSCFG register in USB0.

22.6.8 Note on Using the NMI Pin

To use the P305 pin as an NMI pin, set the NMIER.NMIEN bit of the ICU to 1. Register settings for control of the pin as a port pin are not required. For details on the NMIER register, see section 15.2.11, Non-Maskable Interrupt Enable Register (NMIER).

22.6.9 Note on Using the Main Clock Oscillator

To use a resonator, set the MOMCR.MOSEL bit of the SYSC to 0, and set the P307 and P306 pins for use as general-purpose input port pins. To use the external clock input, set the MOMCR.MOSEL bit to 1, and set the P307 pin for use as a general-purpose input port pin. For details on the MOMCR register, see section 9.2.28, Main Clock Oscillator Mode Oscillation Control Register (MOMCR).

22.6.10 Note on Using the Sub-Clock Oscillator

To use a resonator, set the SOMCR.SOSEL bit of the SYSC to 0, and set the P309 and P308 pins for use as general-purpose input port pins. To use the external clock input, set the SOMCR.SOSEL bit to 1, and set the P309 pin for use as a general-purpose input port pin. For details on the SOMCR register, see section 9.2.29, Sub-Clock Oscillator Mode Control Register (SOMCR).

22.6.11 Initialization of the Port Direction Register (PDR)

Initialize reserved bits in the PDR register according to Table 22.31 to Table 22.35.

- The blank columns in Table 22.31 to Table 22.35 indicate the bits corresponding to the pins listed in Table 22.1, Specifications of I/O Ports.
  The corresponding bits should be set to 1 (output) or 0 (input) depending on the user system. However, the corresponding PORT3.PDR.PDR05, PDR08, and PDR09 bits on the input-only P305, P308, and P309 terminals are reserved bits. These bits should be set to 0 (input).
- The columns other than the blank columns in Table 22.31 to Table 22.35 indicate reserved bits.
  A reserved bit should be set to 0 (input) or 1 (output) according to Table 22.31 to Table 22.35.

23. Software Configurable 32-Bit Programmable I/O Port (PIO)

23.1 Overview

The software configurable 32-bit programmable I/O port module (PIO) allows the selection of up to 32 out of 64 I/O port pins implemented as peripheral functions, and the result is usable just as if the pins were under the control of a general-purpose I/O port with up to 32 effective bits. This allows virtual bundling of the pins, so that simultaneous reflection of the port pin states in a register and simultaneous switching of the output signals on the selected port pins are both possible. Table 23.1 lists the specifications and Figure 23.1 shows a block diagram of the PIO.

Table 23.1 Specifications of the PIO

Items	Description
Operating clock	• PCLKB
Functions	• Of the 64 port pins denoted as PIO_x pins (x = 000 to 063), up to 32 can be selected for simultaneous reflection of the port pin states in a register and simultaneous switching of the output signals. • Input or output can be enabled, and for outputs, the high or low level can be specified through register settings. • The port pin states can be read through a register. • The output from any port pin can respectively be changed to the high or low level by using the port output setting or resetting register.
Protect Zone filter	• Security attribute can be set.

Note 1. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

The PIOOSR register is used to set the data for output from the PIO target port pins.

OSRn Bits (Port Output Setting n) (n = 0 to 31)

Setting an OSRn bit to 1 sets the corresponding ODRn (n = 0 to 31) bit in the PIOODR register to 1. Setting of 0 has no effect on the PIOODR register. Setting of this register is not usable with bits to which port pins have not been assigned by the PIOSELm (m = 0 to 7) registers. All bits are read as 0. For details, see section 23.3.2, Output.

23.2.7 PIO Port Output Resetting Register (PIOORR)

Address(es): PIO.PIOORR 8780 6034h, PIO_NS.PIOORR 0780 6034h

The PIOORR register is used to reset the data for output from the PIO target port pins.

ORRn Bits (Port Output Resetting n) (n = 0 to 31)

Setting an ORRn bit to 1 sets the corresponding ODRn (n = 0 to 31) bit in the PIOODR register to 0. Setting of 0 has no effect on the PIOODR register. Setting of this register is not usable with bits to which port pins have not been assigned by the PIOSELm (m = 0 to 7) registers. All bits are read as 0. For details, see section 23.3.2, Output.

23.2.8 PIO Port Selection Register 0 (PIOSEL0)

Address(es): PIO.PIOSEL0 8780 6040h, PIO_NS.PIOSEL0 0780 6040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DR3SEL[7:0]								DR2SEL[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DR1SEL[7:0]								DR0SEL[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	DR0SEL[7:0]	DR0 I/O Port Selection	Specify the PIO_x pins for allocation for control by each of the bits n of the 32-bit port. The pins are selected from among those with x in the range from 0 to 63. Note that setting a value of or greater than 64 leads to no allocation of port pins.	R/W
b15 to b8	DR1SEL[7:0]	DR1 I/O Port Selection		R/W
b23 to b16	DR2SEL[7:0]	DR2 I/O Port Selection		R/W
b31 to b24	DR3SEL[7:0]	DR3 I/O Port Selection		R/W

The PIOSEL0 register is used to specify the PIO_x pins (x = 000 to 063) to be controlled by bits 3 to 0 of the 32-bit port. Setting the same value in multiple PIOSELm.DRnSEL[7:0] bits (m = 0 to 7, n = 0 to 31) is prohibited.

23.2.9 PIO Port Selection Register 1 (PIOSEL1)

Address(es): PIO.PIOSEL1 8780 6044h, PIO_NS.PIOSEL1 0780 6044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DR5SEL[7:0]								DR4SEL[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	DR4SEL[7:0]	DR4 I/O Port Selection	Specify the PIO_x pins for allocation for control by each of the bits n of the 32-bit port. The pins are selected from among those with x in the range from 0 to 63. Note that setting a value of or greater than 64 leads to no allocation of port pins.	R/W
b15 to b8	DR5SEL[7:0]	DR5 I/O Port Selection		R/W
b23 to b16	DR6SEL[7:0]	DR6 I/O Port Selection		R/W
b31 to b24	DR7SEL[7:0]	DR7 I/O Port Selection		R/W

The PIOSEL1 register is used to specify the PIO_x pins (x = 000 to 063) to be controlled by bits 7 to 4 of the 32-bit port. Setting the same value in multiple PIOSELm.DRnSEL[7:0] bits (m = 0 to 7, n = 0 to 31) is prohibited.

23.2.10 PIO Port Selection Register 2 (PIOSEL2)

Address(es): PIO.PIOSEL2 8780 6048h, PIO_NS.PIOSEL2 0780 6048h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DR11SEL[7:0]								DR10SEL[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DR9SEL[7:0]								DR8SEL[7:0]							
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	DR8SEL[7:0]	DR8 I/O Port Selection	Specify the PIO_x pins for allocation for control by each of the bits n of the 32-bit port. The pins are selected from among those with x in the range from 0 to 63. Note that setting a value of or greater than 64 leads to no allocation of port pins.	R/W
b15 to b8	DR9SEL[7:0]	DR9 I/O Port Selection		R/W
b23 to b16	DR10SEL[7:0]	DR10 I/O Port Selection		R/W
b31 to b24	DR11SEL[7:0]	DR11 I/O Port Selection		R/W

The PIOSEL2 register is used to specify the PIO_x pins (x = 000 to 063) to be controlled by bits 11 to 8 of the 32-bit port. Setting the same value in multiple PIOSELm.DRnSEL[7:0] bits (m = 0 to 7, n = 0 to 31) is prohibited.

23.2.11 PIO Port Selection Register 3 (PIOSEL3)

Address(es): PIO.PIOSEL3 8780 604Ch, PIO_NS.PIOSEL3 0780 604Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b23 to b16	DR30SEL[7:0]	DR30 I/O Port Selection		R/W
b31 to b24	DR31SEL[7:0]	DR31 I/O Port Selection		R/W

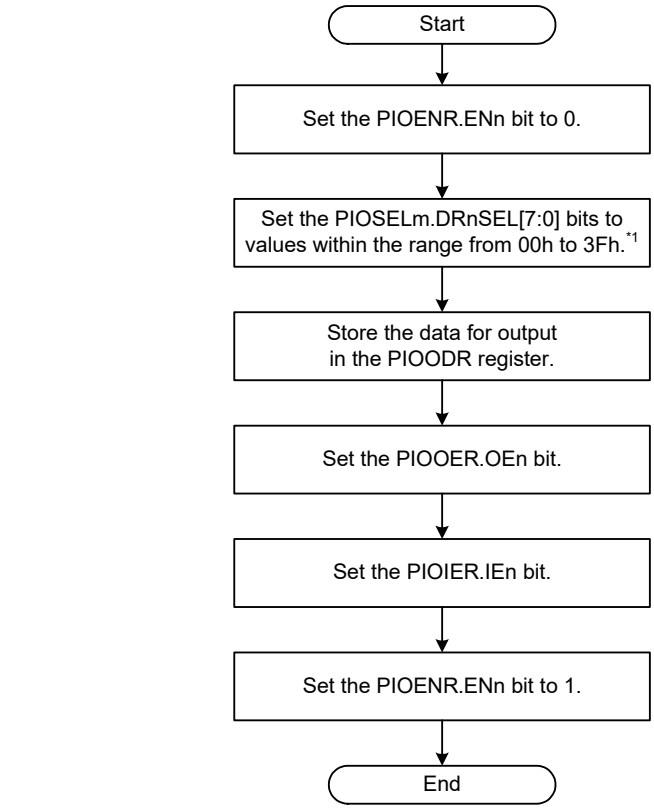
The PIOSEL7 register is used to specify the PIO_x pins (x = 000 to 063) to be controlled by bits 31 to 28 of the 32-bit port. Setting the same value in multiple PIOSELm.DRnSEL[7:0] bits (m = 0 to 7, n = 0 to 31) is prohibited.

23.3 Operation

23.3.1 Input

The states of the PIO target port pins are reflected in the PIOIDR register by making the following settings.

- Set the PIOSELm.DRnSEL[7:0] bits to select the PIO target port pins from among the PIO_x pins (x = 000 to 063).
- Set the PIOENR register to enable the operation of the PIO target port pins.
- Set the PIOIER register to enable input to the PIO target port pins.



23.3.2 Output

The data stored in the PIOODR register are output from the PIO target port pins by making the following settings. The PIOODR register can also be set by using the PIOOSR and PIOORR registers.

- Set the PIOSELm.DRnSEL[7:0] bits to select the PIO target port pins from among the PIO_x pins (x = 000 to 063).
- Set the PIOENR register to enable the operation of the PIO target port pins.
- Set the PIOOER register to enable output from the PIO target port pins.

23.4 Initial Settings

Figure 23.2 shows the procedure for initial settings of PIO pins. The initial settings are required to change the assignment of the PIO target port pins or to change the direction (input/output) of the PIO target port pins.

Note 1. Setting the same value to multiple PIOSELm.DRnSEL[7:0] bits is prohibited.

Figure 23.2 Example Flowchart for PIO Initial Settings

24. General PWM Timer (GPTW)

This MCU has a general PWM timer (GPTW) consisting of sixteen 32-bit timer channels.

24.1 Overview

Table 24.1 lists the specifications for the GPTW, and Table 24.2 shows the functions of the GPTW. Figure 24.1, Figure 24.2 and Figure 24.3 show block diagrams of the GPTW.

Table 24.1 GPTW Specifications

Item	Description
Functions	• 32 bits × 16 channels • Up-counting or down-counting (sawtooth waves) or up/down-counting (triangle waves) for each counter. • Clock sources independently selectable for each channel • Two I/O pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can take place at crests or troughs, enabling the generation of laterally asymmetrical PWM waveforms. • Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) • Generation of dead times in PWM operation • The direction of counting can be switched in triangle-wave PWM mode. • Complementary PWM control with use of the sawtooth-wave one-shot pulse mode or the triangle-wave PWM mode • Generation of high-accuracy duty cycles in the vicinity of 0% and 100% for complementary PWM output in the complementary PWM mode • In output compare operation, setting compare register is immediately used to generate PWM waveform with dead times • Output with 0% or 100% duty cycle • Simultaneous start/stop/clearing/switch of desired channel counters • Operation of count start/count stop/counter clearing/count switch/up-counting/down-counting/input capture by maximum of eight ELC events based on the ELC setting • Operation of count start/count stop/counter clearing/up-counting/down-counting/input capture by detecting two input signal conditions • Operation of count start/count stop/counter clearing/count switch/up-counting/down-counting/input capture by maximum of four external triggers • Function to control output negation by dead time error and requests for disabling of output from the POEG • A/D conversion start trigger generation function • Event signals for compare match A to F and for overflow/underflow can be output to the ELC • Input capture input can select noise filter function • Cycle count function • External pulse width measuring function • Logical operation between the channel output • Synchronous counter clearing/counter setting/input capture among channels • The timer-linked synchronization signal output function enables synchronous operation between channels synchronized with the timer period, and synchronous operation with other IPs synchronized with the timer period. • GTIOCnA/GTIOCnB pin input/output polarity inversion • Bus clock: PCLKA, GPTW count reference clock: GTCLK*1 Frequency ratio between PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64) when the synchronous clock is in use; PCLKA ≤ GPTCLK when the asynchronous clock is in use • Low power consumption function Module stop state can be set. • Protect Zone filter Security attribute can be set for each register*2

Note 1. Selection of the synchronous clock leads to the selection of PCLKD and selection of the asynchronous clock leads to the selection of GPTCLK as the GPTW count reference clock (GTCLK). Refer to Figure 24.5, Select GPTW Count Reference Clock.

Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Figure 24.3 GPTW15 Block Diagram (Sawtooth-wave PWM mode, Sawtooth-wave one-shot pulse mode, and Triangle-wave PWM mode 1/2/3)

In this specification, three consecutive channels to configure complementary PWM mode is defined as complementary PWM mode channel group. The lowest position channel of complementary PWM mode channel group is defined as master channel. The second channel is defined as slave channel 1. The highest position channel is defined as slave channel 2.

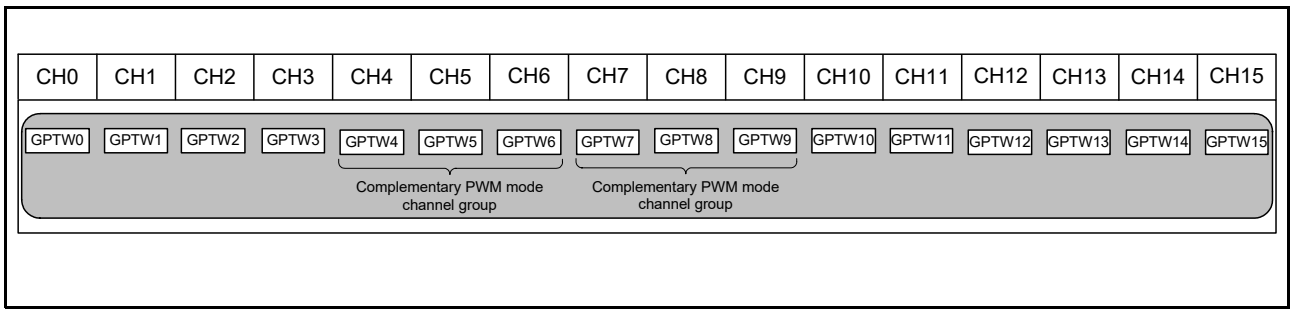

Figure 24.4 Association between GPTW channels and module names

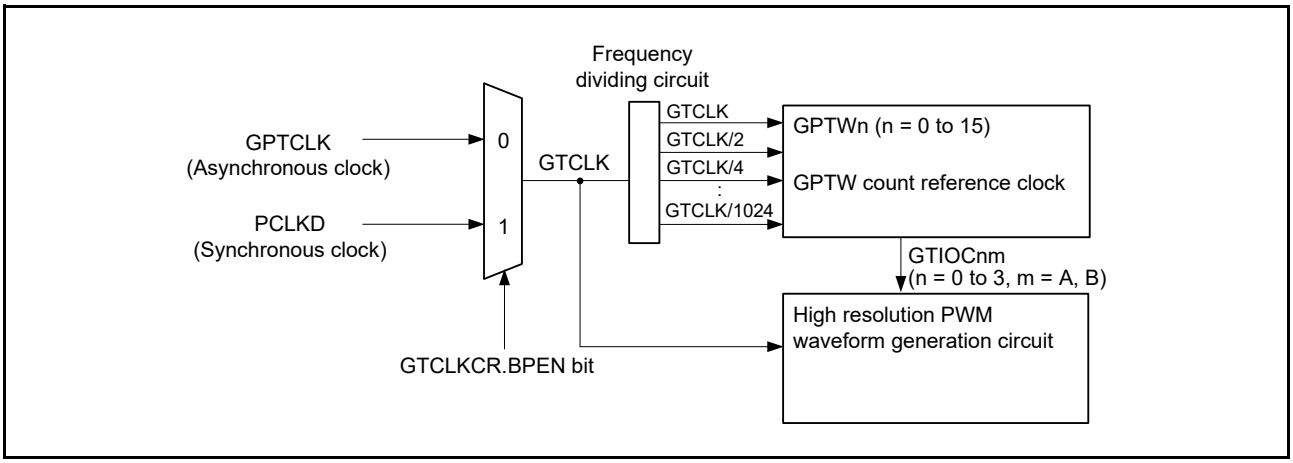

Figure 24.5 Select GPTW Count Reference Clock

Table 24.3 lists the I/O pins used in the GPTW.

Table 24.3 GPTW I/O Pins (n = 0 to 15)

Channel	Pin Name	I/O	Function
GPTW	GTETRGA	Input	External trigger input pin A (input via the POEG)
	GTETRGB	Input	External trigger input pin B (input via the POEG)
	GTETRGC	Input	External trigger input pin C (input via the POEG)
	GTETRGD	Input	External trigger input pin D (input via the POEG)
	GTADSM0	Output	A/D conversion start request monitor 0 output pin
	GTADSM1	Output	A/D conversion start request monitor 1 output pin
GPTWn	GTIOCnA	I/O	GTCCRA register input capture input/output compare output/PWM output pin
	GTIOCnB	I/O	GTCCRB register input capture input/output compare output/PWM output pin
	GTCPPOn	Output	Toggle output synchronized with PWM period*1
OPS	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W
	GTOUUP	Output	3-phase PWM output for BLDC motor control (positive U-phase)
	GTOULO	Output	3-phase PWM output for BLDC motor control (negative U-phase)
	GTOVUP	Output	3-phase PWM output for BLDC motor control (positive V-phase)
	GTOVLO	Output	3-phase PWM output for BLDC motor control (negative V-phase)
	GTOWUP	Output	3-phase PWM output for BLDC motor control (positive W-phase)
	GTOWLO	Output	3-phase PWM output for BLDC motor control (negative W-phase)

Note 1. In complementary PWM mode, only GTCPPO4 and GTCPPO7 are valid.

24.2 Register Descriptions

24.2.1 General PWM Timer Write-Protection Register (GTWP)

Address(es): GPTW0.GTWP 8742 C000h, GPTW1.GTWP 8742 C100h, GPTW2.GTWP 8742 C200h, GPTW3.GTWP 8742 C300h, GPTW4.GTWP 8742 C400h, GPTW5.GTWP 8742 C500h, GPTW6.GTWP 8742 C600h, GPTW7.GTWP 8742 C700h, GPTW8.GTWP 8742 C800h, GPTW9.GTWP 8742 C900h, GPTW10.GTWP 8742 CA00h, GPTW11.GTWP 8742 CB00h, GPTW12.GTWP 8742 CC00h, GPTW13.GTWP 8742 CD00h, GPTW14.GTWP 8742 CE00h, GPTW15.GTWP 8742 CF00h, GPTW0_NS.GTWP 0742 C000h, GPTW1_NS.GTWP 0742 C100h, GPTW2_NS.GTWP 0742 C200h, GPTW3_NS.GTWP 0742 C300h, GPTW4_NS.GTWP 0742 C400h, GPTW5_NS.GTWP 0742 C500h, GPTW6_NS.GTWP 0742 C600h, GPTW7_NS.GTWP 0742 C700h, GPTW8_NS.GTWP 0742 C800h, GPTW9_NS.GTWP 0742 C900h, GPTW10_NS.GTWP 0742 CA00h, GPTW11_NS.GTWP 0742 CB00h, GPTW12_NS.GTWP 0742 CC00h, GPTW13_NS.GTWP 0742 CD00h, GPTW14_NS.GTWP 0742 CE00h, GPTW15_NS.GTWP 0742 CF00h

b3	CLRWP	GTCLR.CCLR Bit Write Disable	0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
b4	CMNWP	Common Register Write Disable	0: Write to the register is enabled 1: Write to the register is disabled	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	PRKEY[7:0]	GTWP Key Code	These bits are read as 0. To modify the WP, STRWP, STPWP, CLRWP, and CMNWP bits, write A5h.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTWP register enables or disables writing to registers to prevent accidental modification.
Protection by the GTWP register only covers the CPU write operation.
Such protection does not cover a register updating generated in coordination with the CPU write.
For registers that are write enabled or disabled depending on the setting of the GTWP register, see section 24.8.1, Write-Protection for Registers.

WP Bit (Register Write Disable)

This bit enables or disables writing to the registers of GPTW.
Registers which are targets of write enable/disable are as follows:
GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC*1, GTADCMSC*1, GTADCMSS, GTSWSR, GTSWOS, GTBER2*1, GTOLBR, GTICCR, GTSYNCFCR, GTSYNCSCR

Note 1. The register write protection constraint applies only to channels GPTW4 to GPTW9.

STRWP Bit (GTSTR.CSTRT Bit Write Disable)

This bit enables or disables starting the update of counter values by writing to the CSTRTn bit corresponding to the channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR registers is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel will not be updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GPTW0.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPTW1.GTSTR.CSTRT0 bit when its current setting is 0 will lead to updating of the value, and the GPTW0.GTCNT counter starts running. When the setting of the GPTW0.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPTW1.GTSTR.CSTRT0 bit when its current setting is 0 will leave the bit with the value 0, and the GPTW0.GTCNT counter will not start running.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

STPWP Bit (GTSTP.CSTOP Bit Write Disable)

This bit enables or disables stopping the counter by writing to the CSTOPn bit corresponding to the channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel will not be updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GPTW0.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPTW1.GTSTP.CSTOP0 bit when its current setting is 0 will lead to updating of the value, and the GPTW0.GTCNT counter is stopped. When the setting of the GPTW0.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPTW1.GTSTP.CSTOP0 bit when its current setting is 0 will leave the bit with the value 0, and the GPTW0.GTCNT counter will not be stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

CLRWP Bit (GTCLR.CCLR Bit Write Disable)

This bit enables or disables updating the value of the CCLRn bit by writing to the bit corresponding to the channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel will not be updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GPTW0.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPTW1.GTCLR.CCLR0 bit when its current setting is 0 will lead to updating of the value, and the GPTW0.GTCNT counter is cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

CMNWP Bit (Common Register Write Disable)

This bit enables or disables updating of values by writing to the SECSELn bit (n = 0 to 15) corresponding to the channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel will not be updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) will be updated.

For example, when the setting of the GPTW0.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPTW1.GTSECSR.SECSEL0 bit will lead to updating of the value of the GPTW0.GTSECSR.SECSEL0 bit. In the same way, writing to the GPTW1.GTSECR register will update the value of the GPTW0.GTSECR register. When the setting of the GPTW0.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPTW1.GTSECSR.SECSEL0 bit will not lead to updating of the value of the GPTW0.GTSECSR.SECSEL0 bit. In the same way, writing to the GPTW1.GTSECR register will not lead to updating of the value of the GPTW0.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

PRKEY[7:0] Bits (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

24.2.2 General PWM Timer Software Start Register (GTSTR)

b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSTR register starts the GTCNT counter operation.

A bit position of the GTSTR register indicates a channel number. The GTSTR register of each channel is a common register, and updating the GTSTR register of any channel by setting bits to 1 starts the operation of the GTCNT counters in all the channels corresponding to those bit positions. No change in counter operation or register value occurs when writing 0 to the bit.

In complementary PWM mode, only writing to the CSTRTn bit of the master channel is valid. The bit on the slave channels reflects the bit value of the master channel.

CSTRTn Bit (Channel n Count Start) (n = 0 to 15)

This bit starts the GTCNT counter for channel n.

A read value indicates the state of the counter operation in a corresponding channel (GTCR.CST bit). The bit with 0 indicates that the counter is stopped, while the bit with 1 indicates that the counter is in operation.

24.2.3 General PWM Timer Software Stop Register (GTSTP)

b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSTP register stops the GTCNT counter operation.

A bit position of the GTSTP register indicates a channel number. The GTSTP register of each channel is a common register, and updating the GTSTP register of any channel by setting bits to 1 stops the operation of the GTCNT counters in all the channels corresponding to those bit positions. No change in counter operation or register value occurs when writing 0 to the bit.

In complementary PWM mode, only writing to the CSTOPn bit of the master channel is valid. The bit on the slave channels reflects the bit value of the master channel.

CSTOPn Bit (Channel n Count Stop) (n = 0 to 15)

This bit stops the GTCNT counter for channel n.

A read value indicates the state of the counter operation in a corresponding channel (inverted GTCR.CST bit). The bit with 0 indicates that the counter is in operation, while the bit with 1 indicates that the counter is stopped.

24.2.4 General PWM Timer Software Clear Register (GTCLR)

b15	CCLR15	Channel 15 Counter Clear		W
b31 to b16	—	Reserved	The write value should be 0.	W

The GTCLR register is a write-only register that clears the GTCNT counter.

A bit position of the GTCLR register indicates a channel number. The GTCLR register of each channel is a common register, and updating the GTCLR register of any channel by setting bits to 1 clears the GTCNT counters to 0 in all the channels corresponding to those bit positions. No change in counter operation or register value occurs when writing 0 to the bit.

In complementary PWM mode, only writing to the CCLRn bit of the master channel is valid. The bit on the slave channels reflects the bit value of the master channel.

CCLRn Bit (Channel n Counter Clear) (n = 0 to 15)

When the counting direction flag is set for decrementation (GTST.TUCF flag = 0) with sawtooth-wave mode selected in the GTCR.MD[2:0] or the GTCR.MD[3:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0000 0000h with other settings.

n = 0 to 15

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. These bits are invalid in complementary PWM mode for GPTW4 to GPTW9.

The GTSSR register sets a count start source for the GTCNT counter.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. These bits are invalid in complementary PWM mode for GPTW4 to GPTW9.

The GTPSR register sets a count stop source for the GTCNT counter.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. These bits are invalid in complementary PWM mode for GPTW4 to GPTW9.

Note 3. This bit in each of GPTW0 to GPTW3 and GPTW10 to GPTW15 is reserved, and is read as 0. When writing, write 0 to the bit.

The GTCSR register sets a counter clear source for the GTCNT counter.

Counter clearing can be executed whether the counter is running (the GTCR.CST bit = 1) or stopped (the GTCR.CST bit = 0).

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

CSCMSC[2:0] Bits (Compare Match/Input Capture/Synchronous Counter Clearing Source Counter Clear Enable)

Select whether to enable or disable for the counter clear of the GTCNT counter by compare match/input capture/ synchronous counter clearing group. When counter clearing in response to a match in comparison or input capture is enabled, either can be used as a source for synchronous clearing by inter channel cooperation as described in section 24.3.9.3, Synchronous Clear Operation by Inter Channel Cooperation.

In addition, an input capture triggered by a source from another channel can be used as a source for counter clearing (by setting the GTICASR.ASOC bit or GTICBSR.BSOC bit to 1). Input capture triggered by a source from another channel cannot be used as the synchronous clearing source in interlinked channel operation but can be used as a counter-clearing source for the channel itself.

Since the compare match by the register that is performing the buffer operation (including the wave mode specific case) does not occur, the counter clear enable setting that makes the target register of the buffer operation the compare match factor is invalid.

In complementary PWM mode, the counter clear enable setting for compare match of the GTCCRB register, GTCCRE register, and GTCCRF register is invalid even when the buffer operation is not performed.

CP1CCE Bit (Complementary PWM Mode 1 Crest Source Counter Clear Enable)

Select enable or disable for the counter clear at the crest of complementary PWM mode 1.

To enable this bit, do not set 1 to the PSYE bit of the GTIOR register.

It is valid only for the master channel in complementary PWM mode. The master channel setting also clears the GTCNT counters of the slave channels 1 and 2 in complementary PWM mode.

n = 0 to 15

The GTUPSR register sets a count-up source for the GTCNT counter.

The GTUPSR register is primarily used as described in 24.3.12, Phase Counting Mode, and 24.3.13, External Pulse Width Measuring Function.

When at least one bit among bits in the GTUPSR register is set as 1, counting of the GTCNT counter by the count clock set by the GTCR.TPCS[3:0] bits becomes invalid, and the count-up by a source set as 1 by the GTUPSR register is executed.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

The GTDNSR register sets a count-down source for the GTCNT counter.

The GTDNSR register is primarily used in 24.3.12 Phase Counting Mode and 24.3.13 External Pulse Width Measuring Function.

When at least one bit among bits in the GTDNSR register is set as 1, counting of the GTCNT counter by the count clock set by the GTCR.TPCS[3:0] bits becomes invalid, and the count-down by a source set as 1 by the GTDNSR register is executed.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

n = 0 to 15

The GTICASR register sets an input capture source for the GTCCRA register.
When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.
Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

ASOC Bit (Other Channel Source GTCCRA Input Capture Enable)

This bit enables or disables triggering of input capture of a timer value by the GTCCRA register through interlinked channel operation with the trigger source specified in the GTICCR register in another channel. Input capture triggered by a source in another channel enabled by this bit cannot be used as a source to trigger input capture in another channel through specification by the ICAFA and ICBFA bits in the GTICCR register in its own channel.

n = 0 to 15

The GTICBSR register sets an input capture source for the GTCCRB register.
When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.
Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTW via the POEG. Set the polarity of these signals with the POEG.

BSOC Bit (Other Channel Source GTCCRB Input Capture Enable)

This bit enables or disables triggering of input capture of a timer value by the GTCCRB register through interlinked channel operation with the trigger source specified in the GTICCR register in another channel. Input capture triggered by a source in another channel enabled by this bit cannot be used as a source to trigger input capture in another channel through specification by the ICAFB and ICBFB bits in the GTICCR register in its own channel.

The GTSWSR register sets a count switch source for the GTCNT counter.
Count switch can be executed whether the counter is running (the GTCR.CST bit = 1) or stopped (the GTCR.CST bit = 0).
Inputs from the GTETRGA, GTETRGB, GTETRGC, and GTETRGD pins are input to the GPTWn via the POEG. Set the polarity of these signals with the POEG.

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTSWOS register is a readable/writable register that sets the offset value of GTCNT counter which is reloaded by count switch operation.

Access in 8-bit or 16-bit units to the GTSWOS register is prohibited, and it should be accessed in 32-bit units.

The GTSWOS register is writable even while the GTCNT counter operation. If the GTSWOS register writing and the event input of count switch occur at the same time, the GTSWOS register setting before writing is reloaded to GTCNT counter. Write the GTSWOS register earlier than the event input of count switch to ensure that the written GTSWOS register value is reloaded by the count switch operation.

The GTCR register controls the GTCNT counter.

CST Bit (Count Start)

This bit controls start or stop for the GTCNT counter.

[Setting conditions]

- When 1 is written to a bit related to a channel number for the GTSTR register while the GTSSR.CSTRT bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input (n = 0 to 3, 10 to 15), which is enabled as a count start source by the GTSSR register, is generated
- 1 is written by software

[Clearing conditions]

- When 1 is written to a bit related to a channel number for the GTSTP register while the GTPSR.CSTOP bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input, which is enabled as a count stop source by the GTPSR register, is generated
- A cycle-counting operation is completed while the GTPC.ASTP bit is 1
- 0 is written by software

AINV Bit (GTIOCnA Input/Output Pin Polarity Reversal Control) (n = 0 to 3, 10 to 15)

This bit selects GTIOCnA input/output pin polarity reversal control.

BINV Bit (GTIOCnB Input/Output Pin Polarity Reversal Control) (n = 0 to 3, 10 to 15)

This bit selects GTIOCnB input/output pin polarity reversal control.

ICDS Bit (Input Capture Operation Select at Count Stop)

This bit selects input capture operation at count stop when the input capture function is selected.

SCGTIOC Bit (GTIOC Input Source Synchronous Clear Enable)

This bit enables or disables the use of counter clearing at the GTIOCnA/GTIOCnB input pin selected by the GTCSR register as a counter clear factor for other channels.

SSCGRP[1:0] Bits (Synchronous Set/Clear Group Select)

This bit selects the synchronization set/clear channel group.

SSCEN Bit (Synchronous Set/Clear Enable)

This bit enables or disables synchronous set/clear.
In complementary PWM mode, slave channels are also controlled by setting the SSCEN bits of the master channel.

MD[2:0] Bits (Mode Select)

These bits select the GPTW operating mode.
Only the MD[2] bit is valid at input capture.
Counting in sawtooth-wave mode is performed with 0 for the MD[2] bit, counting in triangle-wave mode is performed with 1 for the MD[2] bit.
Set the MD[2:0] bits while the GTCNT counter operation is stopped.
During the event count operation (at least one of the bits in the GTUPSR or GTDNSR register is 1), set the MD[2:0] bits to the initial value (000b).

TPCS[3:0] Bits (Timer Prescaler Select)

These bits select a clock for the GTCNT counter. The clock source can be selected independently for each channel.
Set the TPCS[3:0] bits while the GTCNT counter operation is stopped.

CKEG[1:0] Bits (Clock Edge Select)

When GTETRG input is selected by the TPCS[3:0] bits, the CKEG[1:0] bits select the edge of GTETRG input used as the clock of GTCNT counter.
Set the CKEG[1:0] bits only when the GTCNT counter operation is stopped.

SWMD[2:0] Bits (Switch Mode Select)

These bits select the switch mode.
Set the SWMD[2:0] bits while the GTCNT counter operation is stopped.
The setting is invalid except in triangle-wave PWM mode.

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTCR register controls the GTCNT counter.

CST Bit (Count Start)

This bit controls start or stop for the GTCNT counter.

[Setting conditions]

- When 1 is written to a bit related to a channel number for the GTSTR register while the GTSSR.CSTRT bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input (n = 4 to 9), which is enabled as a count start source by the GTSSR register, is generated
- 1 is written by software

[Clearing conditions]

- When 1 is written to a bit related to a channel number for the GTSTP register while the GTPSR.CSTOP bit is set to 1
- When an ELC event input, an external trigger, or a condition for the GTIOCnA pin input and GTIOCnB pin input, which is enabled as a count stop source by the GTPSR register, is generated
- A cycle-counting operation is completed while the GTPC.ASTP bit is 1
- 0 is written by software

AINV Bit (GTIOCnA Input/Output Pin Polarity Reversal Control) (n = 4 to 9)

This bit selects GTIOCnA input/output pin polarity reversal control.

BINV Bit (GTIOCnB Input/Output Pin Polarity Reversal Control) (n = 4 to 9)

This bit selects GTIOCnB input/output pin polarity reversal control.

ICDS Bit (Input Capture Operation Select at Count Stop)

This bit selects input capture operation at count stop when the input capture function is selected.

SCGTIOC Bit (GTIOC Input Source Synchronous Clear Enable)

This bit enables or disables the use of counter clearing at the GTIOCnA/GTIOCnB input pin selected by the GTCSR register as a counter clear factor for other channels.

SSCGRP[1:0] Bits (Synchronous Set/Clear Group Select)

This bit selects the synchronization set/clear channel group.
In complementary PWM mode, slave channels are also controlled by setting the SSCGRP[1:0] bits of the master channel.

SSCEN Bit (Synchronous Set/Clear Enable)

This bit enables or disables synchronous set/clear.
In complementary PWM mode, slave channels are also controlled by setting the SSCEN bits of the master channel.

MD[3:0] Bits (Mode Select)

These bits select the GPTW operating mode.
In complementary PWM mode, the master channel setting of the MD[3:0] bits is also used to control the slave channels.
Only the MD[3:2] bits are valid at input capture.
Counting in sawtooth-wave mode is performed with 00b for the MD[3:2] bits, counting in triangle-wave mode is performed with 01b for the MD[3:2] bits.
Set the MD[3:0] bits while the GTCNT counter operation is stopped.
During the event count operation (at least one of the bits in the GTUPSR or GTDNSR register is 1), set the MD[3:0] bits to the initial value (0000b).

TPCS[3:0] Bits (Timer Prescaler Select)

These bits select a clock for the GTCNT counter. The clock source can be selected independently for each channel.
Set the TPCS[3:0] bits while the GTCNT counter operation is stopped.

CKEG[1:0] Bits (Clock Edge Select)

When GTETRG input is selected by the TPCS[3:0] bits, the CKEG[1:0] bits select the edge of GTETRG input used as the clock of GTCNT counter.
Set the CKEG[1:0] bits only when the GTCNT counter operation is stopped.

SWMD[2:0] Bits (Switch Mode Select)

These bits select the switch mode.
Set the SWMD[2:0] bits while the GTCNT counter operation is stopped.
The setting is invalid except in triangle-wave PWM mode.

24.2.15 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC)

Address(es): GPTW0.GTUDDTYC 8742 C030h, GPTW1.GTUDDTYC 8742 C130h, GPTW2.GTUDDTYC 8742 C230h, GPTW3.GTUDDTYC 8742 C330h, GPTW4.GTUDDTYC 8742 C430h, GPTW5.GTUDDTYC 8742 C530h, GPTW6.GTUDDTYC 8742 C630h, GPTW7.GTUDDTYC 8742 C730h, GPTW8.GTUDDTYC 8742 C830h, GPTW9.GTUDDTYC 8742 C930h, GPTW10.GTUDDTYC 8742 CA30h, GPTW11.GTUDDTYC 8742 CB30h, GPTW12.GTUDDTYC 8742 CC30h, GPTW13.GTUDDTYC 8742 CD30h, GPTW14.GTUDDTYC 8742 CE30h, GPTW15.GTUDDTYC 8742 CF30h,

b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

n = 0 to 15; m = A, B

The GTUDDTYC register sets the count direction (up-counting/down-counting) for the GTCNT counter and configures duty setting for output from the GTIOCnA and GTIOCnB pins.
The setting is invalid during the event count operation, sawtooth-wave PWM mode 2, and complementary PWM mode.

(1) Setting of Count Direction

- In sawtooth-wave mode

When the UD bit value is set to 0 during up-counting, the count direction is changed at an overflow (count clock when the GTCNT counter value is equal to the GTPR register value). When the UD bit value is set to 1 during down-counting, the count direction is changed at an underflow (count clock when the GTCNT counter value is equal to 0000 0000h).
If the UD bit value is changed from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up-counting and the count direction is changed at an overflow (count clock when the GTCNT counter value is equal to the GTPR register value).
If the UD bit value is changed from 0 to 1 with the UDF bit being 0 and while counting is stopped, the counter starts down-counting and the count direction is changed at an underflow (count clock when the GTCNT counter value is equal to 0000 0000h).
When the UDF bit is set to 1 while counting is stopped, the UD bit value at that time is reflected in the count direction when counting starts.

- In triangle-wave mode

Even if the UD bit value is changed during counting, the change will not be reflected in the count direction.
If the UD bit value is modified while the UDF bit is 0 and counting is stopped, the change will not be reflected in the count direction when counting starts. If the UDF bit is set to 1 while counting is stopped, the UD bit value at that time is reflected in the count direction when counting starts.

UD Bit (Count Direction Setting)

This bit sets the count direction (up-counting or down-counting) for the GTCNT counter.

UDF Bit (Forcible Count Direction Setting)

This bit forcibly sets the count direction when the GTCNT counter starts operation as the UD bit value.
Only 0 should be written to this bit during count operation.
When 1 has been written to this bit while counting is stopped, this bit should be returned to 0 before counting starts.

(2) Setting of Output Duty

- In sawtooth-wave mode

When the OADTY[1:0]/OBDTY[1:0] bits are changed during the up-count operation, the updated duty-cycle setting applied at an overflow.
When the OADTY[1:0]/OBDTY[1:0] bits are changed during the down-count operation, the updated duty-cycle setting applied at an underflow.
If the OADTYF/OBDTYF bit is 0 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is not applied in the first count operation, but it is applied at an overflow when counting up and at an underflow when counting down.
If the OADTYF/OBDTYF bit is 1 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is immediately applied in the first count operation.

- In triangle-wave mode

When the OADTY[1:0]/OBDTY[1:0] bits are changed during the count operation, the updated duty-cycle setting is applied at an underflow.
If the OADTYF/OBDTYF bit is 0 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is not applied in the first count operation, but it is applied at an underflow.

If the OADTYF/OBDTYF bit is 1 and the count operation is stopped when the OADTY[1:0]/OBDTY[1:0] bits are changed, the updated duty-cycle setting is immediately applied in the first count operation.

In both sawtooth-wave mode and triangle-wave mode, if the duty of the first cycle after the count starts is configured using the OADTY[1:0]/OBDTY[1:0] bits while the OADTYF/OBDTYF bit is 1 and the count operation is stopped, then even if the OADTYF/OBDTYF bit is changed to 0 and the OADTY[1:0]/OBDTY[1:0] bits are reconfigured, after the count starts the duty for the first and second cycles will remain as the values set during the count stop.

OmDTY[1:0] Bits (GTIOCnm Pin Output Duty Setting) (n = 0 to 15; m = A, B)

These bits set the output of the duty cycle (0%, 100% or compare match control) on the GTIOCnm pin.

OmDTYF Bit (GTIOCnm Pin Output Duty Forced Setting) (n = 0 to 15; m = A, B)

This bit forcibly specifies the duty cycle at the start of the GTCNT counter in the OmDTY[1:0] bits.
Always write 0 to the bit during count operation.
When writing 1 to the bit while the count operation is stopped, reset the bit to 0 by the end of the first cycle after the count operation starts and specify the next cycle setting.

OmDTYR Bit (Output after Release of GTIOCnm Pin Output 0%/100% Duty Cycle Settings) (n = 0 to 15; m = A, B)

When the GTIOCnm pin setting is changed from 0% or 100% duty cycle to compare match and the GTIOR.GTIOm[3:2] bits are set to 00b (output maintained at the end of the cycle) or 11b (output toggled), this bit specifies the value to maintain or toggle.
The GPTW internally continues to perform compare match operation during duty-cycle 0% or 100% operation. If the OmDTYR bit is 1, the value at the end of a cycle of compare match operation is applied to the GTIOm[3:2] bits setting.

OABDTYT Bit (GTIOCnm Pin Output 0%/100% Duty Cycle Setting Reflection Timing) (n = 0 to 15; m = A, B)

Select the timing of reflection of the 0% or 100% duty-cycle setting for the GTIOCnm pin in the triangle-wave mode. When the setting of the OABDTYT bit is 0, a new output duty-cycle setting in the GTUDDTYC.OADTY[1:0] or OBDTY[1:0] bits is reflected in response to an underflow. When the setting of the OABDTYT bit is 1, a new output duty-cycle setting in the GTUDDTYC.OADTY[1:0] or OBDTY[1:0] bits is reflected in response to an underflow or at the peak of the triangle wave.

n = 0 to 15

Note 1. This bit in each of GPTW0 to GPTW3 and GPTW10 to GPTW15 is reserved, and is read as 0. When writing, write 0 to the bit.

The GTIOR register configures the functions of the GTIOCnA, GTIOCnB, and GTCPPOn pins.

GTIOA[4:0] Bits (GTIOCnA Pin Function Select) (n = 0 to 15)

These bits select the GTIOCnA pin function. For details, see Table 24.4.

CPSCIR Bit (Complementary PWM Mode Initial Output at Synchronous Clear Disable)

This bit selects the output waveform to be generated when synchronous clear occurs in complementary PWM mode. The initial output is disabled by this function only when synchronous clear occurs in the trough in complementary PWM mode. If a synchronous clear occurs at any other time, the initial value set by the GTIOA[4]/GTIOB[4] bits is output regardless of the CPSCIR bit setting. In addition, the initial value set by the GTIOA[4]/GTIOB[4] bits is output even when the synchronous clear occurs in the trough immediately after the count starts.

OADFLT Bit (GTIOCnA Pin Output Value Setting at the Count Stop) (n = 0 to 15)

This bit sets whether the GTIOCnA pin outputs high or low when counting is stopped.

OAHLD Bit (GTIOCnA Pin Output Retention at the Start/Stop Count) (n = 0 to 15)

This bit specifies whether the GTIOCnA pin output level is retained or the level depends on the register setting when counting is started or stopped.

[When the OAHLD bit is set to 0]

- The value specified by the GTIOA[4] bit is output when counting starts.
- The value specified by the OADFLT bit is output when counting stops.
- If the OADFLT bit is modified while counting is stopped, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

OAE Bit (GTIOCnA Pin Output Enable) (n = 0 to 15)

This bit enables or disables output on the GTIOCnA pin.
When the GTCCRA register is used as an input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit setting.

OADF[1:0] Bits (GTIOCnA Pin Negate Value Setting) (n = 0 to 15)

These bits specify the value for output from the GTIOCnA pin in response to a request to disable output from the POEG.

OAEOCD Bit (GTCCRA Register Compare Match Cycle End Output Invalidate)

This bit selects whether to disable or enable the GTIOA[3:2] bit setting when the cycle end coincides with the timing of the compare match of the GTCCRA register in sawtooth-wave PWM mode 1 and 2.
If this bit is 1 (setting not applied), the GTIOCnA pin maintains the output level when the cycle end and the GTCCRA compare match timing coincide.

PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables output from GTCPPOn pins synchronized with the PWM cycle. The output signal toggles at crest/trough/GTCNT counter clear in complementary PWM mode or in triangle-wave mode, and at the end of the cycle in sawtooth-wave mode. The initial output of the GTCPPOn pins is low, and changes to high at count start.

NFAEN Bit (GTIOCnA Pin Input Noise Filter Enable) (n = 0 to 15)

This bit sets enable or disable of the noise filter function for the GTIOCnA pin input. Switch these bits while the corresponding pin function for the timer I/O control register is set as the output compare function, because unintended internal edge may be generated when these bits are switched.

NFCSA[1:0] Bits (GTIOCnA Pin Input Noise Filter Sampling Clock Select) (n = 0 to 15)

These bits set a sampling clock for the noise filter to the GTIOCnA pin input. Set the input capture function after waiting two cycles for the sampling clock cycle following the setting of these bits.

GTIOB[4:0] Bits (GTIOCnB Pin Function Select) (n = 0 to 15)

These bits select the GTIOCnB pin function. For details, see Table 24.4.
In sawtooth-wave PWM mode 2, only the GTIOB[1:0] bits take effect, and the GTIOCnA pin output is selected instead of the GTIOCnB pin by the GTCCRB register compare match.

OBDFLT Bit (GTIOCnB Pin Output Value Setting at the Count Stop) (n = 0 to 15)

This bit sets whether the GTIOCnB pin outputs high or low when counting is stopped.

OBHLD Bit (GTIOCnB Pin Output Retention at the Start/Stop Count) (n = 0 to 15)

This bit specifies whether the GTIOCnB pin output level is retained or the level depends on the register setting when counting is started or stopped.
[When the OBHLD bit is set to 0]

- The value specified by the GTIOB[4] bit is output when counting starts.
- The value specified by the OBDFLT bit is output when counting stops.
- If the OBDFLT bit is modified while counting is stopped, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

OBE Bit (GTIOCnB Pin Output Enable) (n = 0 to 15)

This bit enables or disables output on the GTIOCnB pin.
When the GTCCRB register is used as an input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit setting.

OBDF[1:0] Bits (GTIOCnB Pin Negate Value Setting) (n = 0 to 15)

These bits specify the value for output from the GTIOCnB pin in response to a request to disable output from the POEG.

OBEOCD Bit (GTCCRB Register Compare Match Cycle End Output Invalidate)

This bit selects whether to disable or enable the GTIOB[3:2] bit setting for sawtooth-wave PWM mode 1 or the GTIOA[3:2] bit setting for sawtooth-wave PWM mode 2 when the cycle end coincides with the timing of the compare match of the GTCCRB register.
If this bit is 1 (setting not applied), the GTIOCnB pin or GTIOCnA pin maintains the output level when the cycle end and the GTCCRB compare match timing coincide in sawtooth-wave PWM mode 1 or 2 respectively.

NFBEN Bit (GTIOCnB Pin Input Noise Filter Enable) (n = 0 to 15)

This bit sets enable or disable of the noise filter function for the GTIOCnB pin input. Switch these bits while the corresponding pin function for the timer I/O control register is set as the output compare function, because unintended internal edge may be generated when these bits are switched.

NFCSB[1:0] Bits (GTIOCnB Pin Input Noise Filter Sampling Clock Select) (n = 0 to 15)

These bits set a sampling clock for the noise filter to the GTIOCnB pin input. Set the input capture function after waiting two cycles for the sampling clock cycle following the setting of these bits.

Table 24.4 Settings of GTIOA[4:0] Bits (GTIOB[4:0] Bits) (Sawtooth-wave mode, Triangle-wave mode) (1/2)

GTIOA[4:0] (GTIOB[4:0]) Bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	0	0	0	Initial output is Low.	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Table 24.4 Settings of GTIOA[4:0] Bits (GTIOB[4:0] Bits) (Sawtooth-wave mode, Triangle-wave mode) (2/2)

GTIOA[4:0] (GTIOB[4:0]) Bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
1	0	0	0	0	Initial output is High.	Output retained at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at the end of a cycle	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note: In sawtooth-wave mode, “end of a cycle” refers to an overflow (the value of the GTCNT counter changing from that of the GTPR register to 0000 0000h in up-counting), an underflow (the value of the GTCNT counter changing from 0000 0000h to that of the GTPR register in down-counting), or counter clearing. It refers to a trough in triangle-wave mode (the value of the GTCNT counter changing from 0000 0000h to 0000 0001h)).

Note: When the timing of an end of a cycle and the timing of a GTCCRA/GTCCRB register compare match are the same in a compare-match operation, if the OAEOCD and OBEOCD bits are set to 0 and the end of cycle output is enabled, the b3 and b2 settings are given priority in sawtooth-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note: During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), the b3 and b2 settings become invalid.

Note: In sawtooth-wave PWM mode 2, the GTIOB[4:2] bits are invalid. Since only the GTIOCnA pin is the output pin, set the GTIOA[4] bit for the initial output. Set the GTIOA[3:2] bits for output at the end of the cycle.

Table 24.5 Settings of GTIOA[4:0] Bits (GTIOB[4:0] Bits) (Complementary PWM mode)

GTIOA[4:0] (GTIOB[4:0]) Bits					Function		
					Initial Output/Active Level	Compare Match Output (Up-counting)	Compare Match Output (Down-counting)
b4	b3	b2	b1	b0	b4	b3, b2	b1, b0
0	0	1	1	0	Initial output is Low. Active level is High.	Low output	High output
0	1	0	0	1		High output	Low output
1	0	1	1	0	Initial output is High. Active level is Low.	Low output	High output
1	1	0	0	1		High output	Low output

Note: In complementary PWM mode, the only values that can be set in the GTIOA[4:0] bits are 01001b, and 10110b. Setting other values is prohibited.

Note: In complementary PWM mode, the only values that can be set in the GTIOB[4:0] bits are 00110b, and 11001b. Setting other values is prohibited.

Note: In complementary PWM mode, setting the GTIOB[4:0] bits does not use compare match of the GTCCRB register. The combination of counter and register that is the target of compare match depends on the operation period of complementary PWM mode. For details, see section 24.3.3.7, Complementary PWM mode 1, 2, 3.

24.2.17 General PWM Timer Interrupt Output Setting Register (GTINTAD)

The GTINTAD register enables or disables interrupt request, A/D conversion start request, and output stop detection.

GTINTA Bit (GTCCRA Register Compare Match/Input Capture Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRA register compare match/input capture (GTCIA).

GTINTB Bit (GTCCRB Register Compare Match/Input Capture Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRB register compare match/input capture (GTCIB).

GTINTC Bit (GTCCRC Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRC register compare match (GTCIC).

GTINTD Bit (GTCCRD Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRD register compare match (GTCID).

GTINTE Bit (GTCCRE Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRE register compare match (GTCIE).

GTINTF Bit (GTCCRF Register Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by the GTCCRF register compare match (GTCIF).

GTINTPR[1:0] Bits (GTPR Register Compare Match Interrupt Enable)

These bits enable or disable interrupt requests by a GTPR register compare match (GTCNT counter overflow) and those by a GTCNT counter underflow (GTCIV/GTCIU).

SCFA Bit (GTCCRA Register Compare Match/Input Capture Source Synchronous Clear Enable)

This bit enables or disables the GTCCRA register compare match/input capture as a clearing factor for other channels.

SCFB Bit (GTCCRB Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRB register compare match/input capture as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFC Bit (GTCCRC Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRC register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFD Bit (GTCCRD Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRD register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFE Bit (GTCCRE Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRE register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFF Bit (GTCCRF Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables the GTCCRF register compare match as a clearing factor for other channels.
This setting is invalid in complementary PWM mode.

SCFPO Bit (Overflow Source Synchronous Clear Enable)

This bit enables or disables overflow as a clearing factor for other channels.
In complementary PWM mode, this setting is valid only for the master channel.

SCFPU Bit (Underflow Source Synchronous Clear Enable)

This bit enables or disables underflow as a clearing factor for other channels.
In complementary PWM mode, this setting is valid only for the master channel.

ADTRAUEN Bit (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRA register compare matches during GTCNT counter up-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

ADTRADEN Bit (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRA register compare matches during GTCNT counter down-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

ADTRBUEN Bit (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRB register compare matches during GTCNT counter up-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

ADTRBDEN Bit (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by the GTADTRB register compare matches during GTCNT counter down-counting.
The setting is invalid during the event count operation, and the A/D conversion start request is not generated.

GRP[1:0] Bits (Output Stop Group Select)

Select the group to detect disabling of output from the GPTW to the POEG and to request of disabling of output from the POEG to the GPTW.
Each signal indicating detection of disabling in response to a dead-time error or simultaneous driving of outputs to the high or low level is output to the group selected in the GRP[1:0] bits while the respective output stop detection enable bits are 1.
Requests to disabling output from the POEG for the group selected in the GRP[1:0] bits can be monitored with the GTST.ODF flag.
Set the GRP[1:0] bits while both of the OAE and OBE bits in the GTIOR register are set to 0.

GRPDTE Bit (Dead Time Error Output Stop Detection Enable)

This bit enables or disables output stop detection due to a dead time error.
The dead time error output stop detection is not generated during the event count operation.

GRPABH Bit (Simultaneous High Output Stop Detection Enable)

This bit enables or disables output stop detection, which occurs when both GTIOCnA and GTIOCnB pins become high simultaneously.

GRPABL Bit (Simultaneous Low Output Stop Detection Enable)

This bit enables or disables output stop detection, which occurs when both GTIOCnA and GTIOCnB pins become low simultaneously.

GTINTPC Bit (Cycle Count End Interrupt Enable)

This bit enables or disables the request of the cycle count end interrupt (GTCEI).

24.2.18 General PWM Timer Status Register (GTST)

Address(es): GPTW0.GTST 8742 C03Ch, GPTW1.GTST 8742 C13Ch, GPTW2.GTST 8742 C23Ch, GPTW3.GTST 8742 C33Ch, GPTW4.GTST 8742 C43Ch, GPTW5.GTST 8742 C53Ch, GPTW6.GTST 8742 C63Ch, GPTW7.GTST 8742 C73Ch, GPTW8.GTST 8742 C83Ch, GPTW9.GTST 8742 C93Ch, GPTW10.GTST 8742 CA3Ch, GPTW11.GTST 8742 CB3Ch, GPTW12.GTST 8742 CC3Ch, GPTW13.GTST 8742 CD3Ch, GPTW14.GTST 8742 CE3Ch, GPTW15.GTST 8742 CF3Ch, GPTW0_NS.GTST 0742 C03Ch, GPTW1_NS.GTST 0742 C13Ch, GPTW2_NS.GTST 0742 C23Ch, GPTW3_NS.GTST 0742 C33Ch, GPTW4_NS.GTST 0742 C43Ch, GPTW5_NS.GTST 0742 C53Ch, GPTW6_NS.GTST 0742 C63Ch, GPTW7_NS.GTST 0742 C73Ch, GPTW8_NS.GTST 0742 C83Ch, GPTW9_NS.GTST 0742 C93Ch, GPTW10_NS.GTST 0742 CA3Ch, GPTW11_NS.GTST 0742 CB3Ch, GPTW12_NS.GTST 0742 CC3Ch, GPTW13_NS.GTST 0742 CD3Ch, GPTW14_NS.GTST 0742 CE3Ch, GPTW15_NS.GTST 0742 CF3Ch

n = 0 to 15

Note 1. Only 0 can be written to clear the flag. When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.

The GTST register indicates the status of the GPTW.

TCFA Flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of the GTCCRA register.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- The GTCNT counter value is transferred to the GTCCRA register by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB Flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of the GTCCRB register.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- The GTCNT counter value is transferred to the GTCCRB register by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC Flag (Compare Match Flag C)

The TCFC flag indicates the status for the compare match of the GTCCRC register.

When the GTCCRC register performs buffer operation, the GTCCRC register doesn't perform compare match.

[Setting conditions]

- GTCNT = GTCCRC

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)

- GTBER.CCRA[1:0] = 01b, 10b, 11b (the GTCCRC register performs buffer operation).

TCFD Flag (Compare Match Flag D)

The TCFD flag indicates the status for the compare match of the GTCCRD register.
When the GTCCRD register performs buffer operation, the GTCCRD register doesn't perform compare match.
[Setting conditions]

- GTCNT = GTCCRD

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (the GTCCRD register performs buffer operation).

TCFE Flag (Compare Match Flag E)

The TCFE flag indicates the status for the compare match of the GTCCRE register.
When the GTCCRE register performs buffer operation, the GTCCRE register doesn't perform compare match.
[Setting conditions]

- GTCNT = GTCCRE

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (the GTCCRE register performs buffer operation).

TCFF Flag (Compare Match Flag F)

The TCFF flag indicates the status for the compare match of the GTCCRF register.
When the GTCCRF register performs buffer operation, the GTCCRF register doesn't perform compare match.
[Setting conditions]

- GTCNT = GTCCRF

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (sawtooth-wave one-shot pulse mode).
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (the GTCCRF register performs buffer operation).

TCFPO Flag (Overflow Flag)

The TCFPO flag indicates whether an overflow or crest has occurred.
[Setting conditions]

- In sawtooth-wave mode, an overflow (the GTCNT counter changes from the GTPR register value to 0 in up-counting) has occurred.
- In triangle-wave mode, a crest (the GTCNT counter changes from the GTPR register value to GTPR – 1) has occurred.
- In counting by hardware sources, an overflow (the GTCNT counter changes from the GTPR register value to 0 in

up-counting) has occurred.
[Clearing condition]

- 0 is written to this flag.

TCFPU Flag (Underflow Flag)

The TCFPU flag indicates whether an underflow or trough has occurred.
[Setting conditions]

- In sawtooth-wave mode, an underflow (the GTCNT counter changes from 0 to the GTPR register value in down-counting) has occurred.
- In triangle-wave mode, a trough (the GTCNT counter changes from 0 to 1) has occurred.
- In counting by hardware sources, an underflow (the GTCNT counter changes from 0 to the GTPR register value in down-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

ITCNT[2:0] Bits (GTCIV/GTCIU Interrupt Skipping Count Counter)

When the GTCIV/GTCIU interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter is incremented by 1 every time the GTCIV/GTCIU interrupt source is generated.
These bits are operated independently of the extended interrupt skipping by the GTEITC register.
[Clearing conditions]

- The GTCIV/GTCIU interrupt skipping function is not used (the GTITC.IVTT[2:0] bits are 000b when the IVTC[1:0] bits are 00b).
- The GTCIV/GTCIU interrupt skipping count matches the specified count (the ITCNT[2:0] bits match the skipping count specified by the IVTT[2:0] bits).
- When the count operation is stopped.

TUCF Flag (Count Direction Flag)

This flag indicates the count direction of the GTCNT counter.
This flag indicates 1 when in up-counting and indicates 0 when in down-counting during the event count operation.

ADTRAUF Flag (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in up-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRA register in up-counting

[Clearing conditions]

- 0 is written to the ADTRAUF flag

ADTRADF Flag (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in down-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRA register in down-counting

[Clearing conditions]

- 0 is written to the ADTRADF flag

ADTRBUF Flag (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in up-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRB register in up-counting

[Clearing conditions]

- 0 is written to the ADTRBUF flag

ADTRBDF Flag (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in down-counting.
[Setting condition]

- The GTCNT counter matches the GTADTRB register in down-counting

[Clearing conditions]

- 0 is written to the ADTRBDF flag

ODF Flag (Output Stop Request Flag)

This flag monitors the output stop request for the group selected by the GTINTAD.GRP[1:0] bits.
Even if a request to disable output is de-asserted after the request is made, releasing the control of negation on the PWM pins has to wait until the end of the PWM cycle.

DTEF Flag (Dead Time Error Flag)

This flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the count period.
This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is back within the period. This flag can only be read from. (Writing 0 to clear the flag is not allowed.)
When an interrupt by the DTEF flag is enabled (when the GTINTAD.GRPDTE bit is 1), the DTEF flag is output as the output stop detection to the POEG, and an GDTE interrupt is generated whenever the DTEF flag changes from 0 to 1.
[Setting condition]

- When a change point of the waveform after the automatic setting of dead time has exceeded the count period (in the following cases)
  Up-counting in triangle-wave mode: GTCCRA register – GTDVU register ≤ 0
  Down-counting in triangle-wave mode: GTCCRA register – GTDVD register < 0
  Up-counting in sawtooth-wave one-shot pulse mode:
  When GTCCRA register – GTDVU register < 0, or GTCCRA register + GTDVD register > GTPR register
  Down-counting in sawtooth-wave one-shot pulse mode:
  When GTCCRA register + GTDVU register > GTPR register, or GTCCRA register – GTDVD register < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the count period.

OABHF Flag (Simultaneous High Output Flag)

This flag indicates that both the GTIOCnA and GTIOCnB pins output 1 simultaneously.
When either the GTIOCnA or GTIOCnB pin changes to 0, the flag is set to 0.
This flag is read-only. (Writing 0 to clear the flag is not allowed.)
When the output stop detection by the OABHF flag is enabled (the GTINTAD.GRPABH bit is 1), the OABHF flag is output as the output stop detection to the POEG. The GPTW does not have an interrupt triggered by simultaneous High outputs. Use the interrupt function in the POEG if this is required.
[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 simultaneously while both the OAE and OBE bits in the GTIOR register are set to 1.

[Clearing conditions]

- The GTIOCnA and GTIOCnB pins output different values while both the OAE and OBE bits are set to 1.
- The GTIOCnA and GTIOCnB pins output 0 simultaneously while both the OAE and OBE bits are set to 1.
- At least one of the OAE and OBE bits is set to 0.

OABLF Flag (Simultaneous Low Output Flag)

This flag indicates that both the GTIOCnA and GTIOCnB pins output 0 simultaneously.
When either the GTIOCnA or GTIOCnB pin changes to 1, the flag is set to 0.
This flag is read-only. (Writing 0 to clear the flag is not allowed.)
When the output stop detection by the OABLF flag is enabled (the GTINTAD.GRPABL bit is 1), the OABLF flag is output as the output stop detection to the POEG. The GPTW does not have an interrupt triggered by simultaneous Low outputs. Use the interrupt function in the POEG if this is required.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 simultaneously while both the OAE and OBE bits in the GTIOR register are set to 1.

[Clearing conditions]

- The GTIOCnA and GTIOCnB pins output different values while both the OAE and OBE bits are set to 1.
- The GTIOCnA and GTIOCnB pins output 1 simultaneously while both the OAE and OBE bits are set to 1.
- At least one of the OAE and OBE bits is set to 0.

Comparison for the output value to generate the OABHF or OABLF flag uses the value before the compare match output (PWM output) is masked by the output negate function. Even during the output negate condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

PCF Flag (Cycle Count End Flag)

This status flag indicates the end of the cycle count operation.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing conditions]

- 0 is written to the PCF flag

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTBER register makes settings for buffer operation.
Set the GTBER register except the BD[3:0] bits while the GTCNT counter is stopped.

BD[0] Bit (GTCCRA/GTCCRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTCCRA, GTCCRC, and GTCCRD registers together and buffer operation using the GTCCRB, GTCCRE, and GTCCRF registers together.
Even though the BD[0] bit is set to 0, buffer operation in the GTCCRB register is not performed if the GTDTCR.TDE bit is set to 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode. Instead, the compare match value for negative-phase waveform with dead time is set automatically.
In complementary PWM mode, it is valid only for the buffer operation of GTCCRC register and GTCCRE register. The buffer operation of GTCCRA registers cannot be disabled. No buffer transfer to GTCCRB is performed in

complementary PWM mode. Buffer operation of GTCCRE register and GTCCRF register is enabled/disabled by GTBER2.CP3DB bit.
If 1 is written to the SBDCE or SBDCD bit in the GTSECR register, a value can be set for the BD[0] bit of the channel whose corresponding bit in the GTSECSR register is 1.
When the DBRTECm (m = A, B) bit is 1, setting the BD[0] bit to 1 while the mode of operation is sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3 results in transfer from the intermediate buffer to the GTCCRm register.

BD[1] Bit (GTPR Register Buffer Operation Disable)

This bit disables buffer operation using the GTPR, GTPBR, and GTPDBR registers together.
A value for the BD[1] bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDPE or SBDPD bit in the GTSECR register.
In complementary PWM mode, the slave channel is also controlled by setting the BD[1] bit of the master channel.

BD[2] Bit (GTADTRA/GTADTRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTADTRA, GTADTBRA, and GTADTDBRA registers together and buffer operation using the GTADTRB, GTADTBRB, and GTADTDBRB registers together.
The setting is invalid during the event count operation, and the buffer operation using the GTADTRA and GTADTRB registers is not performed.
A value for the BD[2] bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDAE or SBDAD bit in the GTSECR register.

BD[3] Bit (GTDVU/GTDVD Registers Buffer Operation Disable)

In sawtooth-wave PWM mode 1, sawtooth-wave one-shot pulse mode or triangle-wave PWM mode, this bit disables buffer operation using the GTDVU and GTDBU registers together and buffer operation using the GTDVD and GTDBD registers together.
Even though the BD[3] bit is set to 0, buffer operation in the GTDVD register is not performed if the GTDTCR.TDFER bit is set to 1. Instead, the value in the GTDVU register is set automatically.
In sawtooth-wave PWM mode 2 or complementary PWM mode, this bit is invalid and GTDVU and GTDVD registers don’t perform buffer operation.
The setting is invalid during the event count operation, and the buffer operation using the GTDVU and GTDVD registers is not performed.
A value for the BD[3] bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDDE or SBDDD bit in the GTSECR register.

DBRTECm Bit (GTCCRm Register Double Buffer Repeat Operation Enable) (m = A, B)

This setting enables the operation to repeat a transfer to the GTCCRm register from the intermediate buffer by cycle during the buffer transfer disable period when performing the double buffer operation using the GTCCRm register. It is valid in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3.
The disabling period of buffer transfer indicates the period that buffer transfer is stopped by setting of the BD[0] bit (CPU writing or simultaneous buffer operation control by the GTSECSR register) and the period for buffer transfer extended skipping (except the case for skipping by counting both crests and troughs) by the GTEITLB register.
When the DBRTECm bit is 1, writing by the CPU to the GTCCRm register sets the same value in temporary register x (x = C, E). The value of the GTCCRx (x = C, E) register is also transferred to the temporary register x (x = C, E) by forcible buffer transfer.

CCRA[1:0] Bits (GTCCRA Register Buffer Operation)

These bits set buffer operation with the GTCCRA, GTCCRC, and GTCCRD registers combined. When buffer operation is restricted by the operating mode set in the GTCR register, the GTCR register setting is given priority.*1

CCRB[1:0] Bits (GTCCRB Register Buffer Operation)

These bits set buffer operation with the GTCCRB, GTCCRE, and GTCCRF registers combined. When buffer operation is restricted by the operating mode set in the GTCR register, the GTCR register setting is given priority.*1

PR[1:0] Bits (GTPR Register Buffer Operation)

These bits set buffer operation with the GTPR, GTPBR, and GTPDBR registers combined.
The setting is invalid in complementary PWM mode. Buffer operation unique to complementary PWM mode is performed regardless of the setting value of the PR[1:0] bits.

CCRSWT Bit (GTCCRA and GTCCRB Registers Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs buffer transfer of the GTCCRA and GTCCRB registers. This bit automatically returns to 0 after the writing of 1. This bit is read as 0.
This bit is valid only when counting is stopped with compare match operation specified.
The setting is invalid in complementary PWM mode.

ADTTA[1:0] Bits (GTADTRA Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRA, GTADTBRA, and GTADTDBRA registers.
The setting is invalid during the event count operation.

ADTDA Bit (GTADTRA Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.
The setting is invalid during the event count operation.

ADTTB[1:0] Bits (GTADTRB Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRB, GTADTBRB, and GTADTDBRB registers.
The setting is invalid during the event count operation.

ADTDB Bit (GTADTRB Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.
The setting is invalid during the event count operation.

Note 1. The buffer operation mode is fixed in sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3 (64-bit transfer at trough), or complementary PWM mode.

24.2.20 General PWM Timer Buffer Enable Register 2 (GTBER2)

Bit	Symbol	Bit Name	Description	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits in each of GPTW0 to GPTW3, and GPTW10 to GPTW15 are reserved, and are read as 0. When writing, write 0 to the bits.

The GTBER2 register makes settings for buffer operation.
Set the CP3DB bit and OLTTm[1:0] (m = A, B) bits when the GTCNT counter is stopped.

CCTCm Bit (Counter Clear Source GTCCRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by counter clear using the GTCCRm, GTCCRn, and GTCCRx registers together (m = A, B; n = C, E; x = D, F).
This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTCm bit is 0, buffer transfer is not performed by counter clear.
If there is a conflict with the CMTCm bit setting, the CCTCm bit setting has priority.
The setting is invalid during the event count operation.

CCTPR Bit (Counter Clear Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTPR, GTPBR, and GTPDBR registers together.
This bit is effective when the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTPR bit is 0, buffer transfer is not performed by counter clear.
The setting is invalid during the event count operation.

CCTADm Bit (Counter Clear Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by counter clear using the GTADTRm, GTADTBRm and GTADTDBRm registers together.
This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.ADTTm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTADm bit is 0, buffer transfer is not performed by counter clear.
If there is a conflict with the CMTADm bit setting, the CCTADm bit setting has priority.
The setting is invalid during the event count operation.

CCTDV Bit (Counter Clear Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTDVU and GTDBU or GTDVD and GTDBD registers together.
This bit is effective when the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTDV bit is 0, buffer transfer is not performed by counter clear.
The setting is invalid during the event count operation.

CMTCA[1:0] Bits (Compare Match Source GTCCRA Register Buffer Transfer Enable)

These bits enable buffer transfer by compare match of GTCCRA using the GTCCRA, GTCCRC and GTCCRD registers together.
These bits are effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected

by the GTBER.CCRA[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
If there is a conflict with the CCTCA bit setting, the CCTCA bit setting has priority.
The setting is invalid during the event count operation.

CMTCB[1:0] Bits (Compare Match Source GTCCRB Register Buffer Transfer Enable)

These bits enable buffer transfer by compare match of GTCCRB using the GTCCRB, GTCCRE and GTCCRF registers together.
These bits are effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
If there is a conflict with the CCTCB bit setting, the CCTCB bit setting has priority.
The setting is invalid during the event count operation.

CMTADm Bit (Compare Match Source GTADTRm Register Buffer Transfer Enable) (m = A, B)

This bit enables buffer transfer by compare match of the GTADTRm using the GTADTRm, GTADTBRm and GTADTDBRm registers together.
This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.ADTTm[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
If there is a conflict with the CCTADm bit setting, the CCTADm bit setting has priority.
The setting is invalid during the event count operation.

CPTCA Bit (Overflow/Underflow Source GTCCRA Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTCCRA, GTCCRC and GTCCRD registers together.
This bit is effective when the CCTCA bit is 0 (GTCCRA register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTCB Bit (Overflow/Underflow Source GTCCRB Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTCCRB, GTCCRE and GTCCRF registers together.
This bit is effective when the CCTCB bit is 0 (GTCCRB register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTPR Bit (Overflow/Underflow Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTPR, GTPBR and GTPDBR registers together.
This bit is effective when the CCTPR bit is 0 (GTPR register buffer transfer by counter clear is enabled), the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with sawtooth-waves.
The setting is invalid in triangle waves or complementary PWM mode.
The setting is invalid during the event count operation.

CPTADm Bit (Overflow/Underflow Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTADTRm, GTADTBRm and GTADTDBRm registers together.

This bit is effective when the CCTADm bit is 0 (GTADTRm register buffer transfer by counter clear is enabled), the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.ADTTm[1:0] bits with sawtooth-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTDV Bit (Overflow/Underflow Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in sawtooth-waves using the GTDVU and GTDBU or GTDVD and GTDBD registers together.

This bit is effective when the CCTDV bit is 0 (GTDVU/GTDVD register buffer transfer by counter clear is enabled), the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with sawtooth-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CP3DB Bit (Complementary PWM Mode 3,4 Double Buffer Select)

This bit enables buffer transfer using the GTCCRA, GTCCRE and GTCCRF registers together in complementary PWM mode 3,4.

CPBTD Bit (Complementary PWM Mode Buffer Transfer Disable)

This bit disables buffer transfer from temporary register (temporary register A and temporary register P) to the GTCCRC and GTPBR registers during timer counting in complementary PWM mode 1, 2 and 3. When CP3DB bit is 1, the buffer transfer from temporary register B to GTCCRE register is also disabled. The setting is invalid in complementary PWM mode 4.

OLTTm[1:0] Bits (GTIOCnm Output Level Buffer Transfer Timing Select) (m = A, B)

These bits set the timing of buffer transfer from GTOLBR.GTIOmB[4:0] bits to GTIOR.GTIOm[4:0] bits.

The setting is invalid during the event count operation.

24.2.21 General PWM Timer Interrupt and A/D Conversion Start Request Skipping Setting Register (GTITC)

b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This function is not usable with GPTW4 to GPTW9 in the sawtooth-wave PWM mode 2.

The GTITC register configures the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (GTCIV)/underflow interrupt (GTCIU), and determines whether other interrupts and A/D conversion start requests are linked to the GTCIV/GTCIU interrupt skipping function. Note that output stop detection to the POEG and dead-time error interrupts cannot be linked with the GTCIV or GTCIU interrupt skipping function. Additionally, when the interrupt skipping function is performed, the change in the status flag is also skipped.
The setting is invalid during the event count operation.
The setting is operated independently of the extended interrupt skipping by the GTEITC register.

ITLA Bit (GTCCRA Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the GTCIV/GTCIU interrupt skipping function.

ITLB Bit (GTCCRB Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the GTCIV/GTCIU interrupt skipping function.

ITLC Bit (GTCCRC Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the GTCIV/GTCIU interrupt skipping function.

ITLD Bit (GTCCRD Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRD compare match interrupt (GTCID) with the GTCIV/GTCIU interrupt skipping function.

ITLE Bit (GTCCRE Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the GTCIV/GTCIU interrupt skipping function.

ITLF Bit (GTCCRF Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRF compare match interrupt (GTCIF) with the GTCIV/GTCIU interrupt skipping function.

IVTC[1:0] Bits (GTCIV/GTCIU Interrupt Skipping Function Select)

These bits set the skipping function for the GTPR compare match (GTCNT counter overflow) interrupt (GTCIV)/GTCNT counter underflow interrupt (GTCIU).

IVTT[2:0] Bits (GTCIV/GTCIU Interrupt Skipping Count Select)

These bits set the skipping count for the GTPR compare match (GTCNT counter overflow) interrupt (GTCIV)/GTCNT counter underflow interrupt (GTCIU).
When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL Bit (GTADTRA Register A/D Conversion Start Request Link)

This bit specifies whether to link the A/D conversion start request, which is generated in response to a compare match

with the GTCNT counter and the GTADTRA register, with the GTCIV/GTCIU interrupt skipping function.

ADTBL Bit (GTADTRB Register A/D Conversion Start Request Link)

This bit specifies whether to link the A/D conversion start request, which is generated in response to a compare match with the GTCNT counter and the GTADTRB register, with the GTCIV/GTCIU interrupt skipping function.

24.2.22 General PWM Timer Counter (GTCNT)

Address(es): GPTW0.GTCNT 8742 C048h, GPTW1.GTCNT 8742 C148h, GPTW2.GTCNT 8742 C248h, GPTW3.GTCNT 8742 C348h, GPTW4.GTCNT 8742 C448h, GPTW5.GTCNT 8742 C548h, GPTW6.GTCNT 8742 C648h, GPTW7.GTCNT 8742 C748h, GPTW8.GTCNT 8742 C848h, GPTW9.GTCNT 8742 C948h, GPTW10.GTCNT 8742 CA48h, GPTW11.GTCNT 8742 CB48h, GPTW12.GTCNT 8742 CC48h, GPTW13.GTCNT 8742 CD48h, GPTW14.GTCNT 8742 CE48h, GPTW15.GTCNT 8742 CF48h, GPTW0_NS.GTCNT 0742 C048h, GPTW1_NS.GTCNT 0742 C148h, GPTW2_NS.GTCNT 0742 C248h, GPTW3_NS.GTCNT 0742 C348h, GPTW4_NS.GTCNT 0742 C448h, GPTW5_NS.GTCNT 0742 C548h, GPTW6_NS.GTCNT 0742 C648h, GPTW7_NS.GTCNT 0742 C748h, GPTW8_NS.GTCNT 0742 C848h, GPTW9_NS.GTCNT 0742 C948h, GPTW10_NS.GTCNT 0742 CA48h, GPTW11_NS.GTCNT 0742 CB48h, GPTW12_NS.GTCNT 0742 CC48h, GPTW13_NS.GTCNT 0742 CD48h, GPTW14_NS.GTCNT 0742 CE48h, GPTW15_NS.GTCNT 0742 CF48h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The GTCNT counter is a 32-bit readable/writable counter. There is one GTCNT counter for each channel. Writing is available only when counting is stopped, and thus writing is disabled while counting is in progress (when CST = 1). Access in 8-bit or 16-bit units to the GTCNT counter is prohibited, and it should be accessed in 32-bit units.
When the sawtooth or triangle waves are to be used in GPTW4 to GPTW9, set the GTCNT counter within the range from 0 up to the value of the GTPR register.

The GTCCRm register is a 32-bit readable/writable register.

Access in 8-bit or 16-bit units to the GTCCRm register is prohibited, and it should be accessed in 32-bit units.

The GTCCRA and GTCCRB registers are registers used for both output compare and input capture.

The GTCCRC and GTCCRE registers are compare match registers, and can also function as buffer registers for the GTCCRA and GTCCRB registers.

The GTCCRD and GTCCRF registers are compare match registers, and can also function as buffer registers for the GTCCRC and GTCCRE registers (double buffer registers for the GTCCRA and GTCCRB registers).

24.2.24 General PWM Timer Period Setting Register (GTPR)

Address(es): GPTW0.GTPR 8742 C064h, GPTW1.GTPR 8742 C164h, GPTW2.GTPR 8742 C264h, GPTW3.GTPR 8742 C364h, GPTW4.GTPR 8742 C464h, GPTW5.GTPR 8742 C564h, GPTW6.GTPR 8742 C664h, GPTW7.GTPR 8742 C764h, GPTW8.GTPR 8742 C864h, GPTW9.GTPR 8742 C964h, GPTW10.GTPR 8742 CA64h, GPTW11.GTPR 8742 CB64h, GPTW12.GTPR 8742 CC64h, GPTW13.GTPR 8742 CD64h, GPTW14.GTPR 8742 CE64h, GPTW15.GTPR 8742 CF64h, GPTW0_NS.GTPR 0742 C064h, GPTW1_NS.GTPR 0742 C164h, GPTW2_NS.GTPR 0742 C264h, GPTW3_NS.GTPR 0742 C364h, GPTW4_NS.GTPR 0742 C464h, GPTW5_NS.GTPR 0742 C564h, GPTW6_NS.GTPR 0742 C664h, GPTW7_NS.GTPR 0742 C764h, GPTW8_NS.GTPR 0742 C864h, GPTW9_NS.GTPR 0742 C964h, GPTW10_NS.GTPR 0742 CA64h, GPTW11_NS.GTPR 0742 CB64h, GPTW12_NS.GTPR 0742 CC64h, GPTW13_NS.GTPR 0742 CD64h, GPTW14_NS.GTPR 0742 CE64h, GPTW15_NS.GTPR 0742 CF64h

The GTPR register is a 32-bit readable/writable register that sets the maximum count value of the GTCNT counter. Access in 8-bit or 16-bit units to the GTPR register is prohibited, and it should be accessed in 32-bit units.
The setting is invalid in the sawtooth-wave PWM mode 2. In sawtooth-wave mode except the sawtooth-wave PWM mode 2, the value of (GTPR register + 1) is the count period. In triangle-wave mode or complementary PWM mode, the value of (GTPR register value × 2) is the count period.
When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

24.2.25 General PWM Timer Period Setting Buffer Register (GTPBR)

Address(es): GPTW0.GTPBR 8742 C068h, GPTW1.GTPBR 8742 C168h, GPTW2.GTPBR 8742 C268h, GPTW3.GTPBR 8742 C368h, GPTW4.GTPBR 8742 C468h, GPTW5.GTPBR 8742 C568h, GPTW6.GTPBR 8742 C668h, GPTW7.GTPBR 8742 C768h, GPTW8.GTPBR 8742 C868h, GPTW9.GTPBR 8742 C968h, GPTW10.GTPBR 8742 CA68h, GPTW11.GTPBR 8742 CB68h, GPTW12.GTPBR 8742 CC68h, GPTW13.GTPBR 8742 CD68h, GPTW14.GTPBR 8742 CE68h, GPTW15.GTPBR 8742 CF68h, GPTW0_NS.GTPBR 0742 C068h, GPTW1_NS.GTPBR 0742 C168h, GPTW2_NS.GTPBR 0742 C268h, GPTW3_NS.GTPBR 0742 C368h, GPTW4_NS.GTPBR 0742 C468h, GPTW5_NS.GTPBR 0742 C568h, GPTW6_NS.GTPBR 0742 C668h, GPTW7_NS.GTPBR 0742 C768h, GPTW8_NS.GTPBR 0742 C868h, GPTW9_NS.GTPBR 0742 C968h, GPTW10_NS.GTPBR 0742 CA68h, GPTW11_NS.GTPBR 0742 CB68h, GPTW12_NS.GTPBR 0742 CC68h, GPTW13_NS.GTPBR 0742 CD68h, GPTW14_NS.GTPBR 0742 CE68h, GPTW15_NS.GTPBR 0742 CF68h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTPDBR register is a 32-bit readable/writable register that functions as a buffer register for the GTPBR register (a double buffer register for the GTPR register).

Access in 8-bit or 16-bit units to the GTPDBR register is prohibited, and it should be accessed in 32-bit units.

The setting is invalid in the sawtooth-wave PWM mode 2. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTADTRm register is a 32-bit readable/writable register that sets the timing of A/D conversion start request generation.

Access in 8-bit or 16-bit units to the GTADTRm register is prohibited, and it should be accessed in 32-bit units.

When the GTADTRm register value matches the GTCNT counter value, an A/D conversion start request is generated. In complementary PWM mode, A/D conversion start request is generated when the GTCNT counter of the master channel matches this register.

Bit	Symbol	Bit Name	Description	R/W
b0	TDE	Negative-Phase Waveform Setting	0: GTCCRB register is set without using GTDVU and GTDVD registers. 1: GTDVU and GTDVD registers are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB register.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TDBUE	GTDVU Register Buffer Operation Enable	0: GTDVU register buffer operation is disabled 1: GTDVU register buffer operation is enabled	R/W
b5	TDBDE	GTDVD Register Buffer Operation Enable	0: GTDVD register buffer operation is disabled 1: GTDVD register buffer operation is enabled	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TDFER	GTDVD Register Setting	0: GTDVU and GTDVD registers are set separately. 1: The value written to GTDVU register is automatically set to GTDVD register.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTDTCR register enables automatic setting of a compare match value for negative-phase waveform with dead time. The setting is invalid during the event count operation.
This register is invalid in sawtooth-wave PWM mode 1, 2 or complementary PWM mode.

TDE Bit (Negative-Phase Waveform Setting)

This bit sets whether to use the GTDVU and GTDVD registers. When the GTDVU and GTDVD registers are used, the compare match value for a negative-phase waveform with dead time that was obtained by the compare match value of a positive-phase waveform (GTCCRA register) and the dead time value (GTDVU and GTDVD registers) is automatically set in the GTCCRB register.
The TDE bit setting is ignored in sawtooth-wave PWM mode, and the GTCCRB register is not automatic setting.
The automatically set value of the GTCCRB register has the following upper and lower limits:

- Triangle wave PWM mode
  Upper limit: the GTPR register value – 1
  Lower limit: 0000 0001h in up-counting, 0000 0000h in down-counting
- Sawtooth-wave one-shot pulse mode
  Upper limit: the GTPR register value
  Lower limit: 0000 0000h

If the obtained GTCCRB register value is not within the range between the upper and lower limits, the upper or lower limit is set in the GTCCRB register, and the GTST.DTEF flag becomes 1. However, if the obtained GTCCRB register value exceeds the upper limit in triangle-wave PWM mode, the DTEF flag becomes 0.

TDBUE Bit (GTDVU Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVU and GTDBU registers combined.
The timing of buffer transfer is at troughs in triangle-wave mode, and at overflows or underflows in sawtooth-wave mode.

TDBDE Bit (GTDVD Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVD and GTDBD registers combined.
The buffer transfer timing is the trough in triangle-wave mode, and at an overflow or underflow in sawtooth-wave mode.
When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER Bit (GTDVD Register Setting)

This bit specifies whether the value written to the GTDVU register is automatically set to the GTDVD register.

24.2.31 General PWM Timer Dead Time Value Register m (GTDVm) (m = U, D)

Address(es): GPTW0.GTDVU 8742 C08Ch, GPTW1.GTDVU 8742 C18Ch, GPTW2.GTDVU 8742 C28Ch, GPTW3.GTDVU 8742 C38Ch, GPTW4.GTDVU 8742 C48Ch, GPTW5.GTDVU 8742 C58Ch, GPTW6.GTDVU 8742 C68Ch, GPTW7.GTDVU 8742 C78Ch, GPTW8.GTDVU 8742 C88Ch, GPTW9.GTDVU 8742 C98Ch, GPTW10.GTDVU 8742 CA8Ch, GPTW11.GTDVU 8742 CB8Ch, GPTW12.GTDVU 8742 CC8Ch, GPTW13.GTDVU 8742 CD8Ch, GPTW14.GTDVU 8742 CE8Ch, GPTW15.GTDVU 8742 CF8Ch, GPTW0.GTDVD 8742 C090h, GPTW1.GTDVD 8742 C190h, GPTW2.GTDVD 8742 C290h, GPTW3.GTDVD 8742 C390h, GPTW4.GTDVD 8742 C490h, GPTW5.GTDVD 8742 C590h, GPTW6.GTDVD 8742 C690h, GPTW7.GTDVD 8742 C790h, GPTW8.GTDVD 8742 C890h, GPTW9.GTDVD 8742 C990h, GPTW10.GTDVD 8742 CA90h, GPTW11.GTDVD 8742 CB90h, GPTW12.GTDVD 8742 CC90h, GPTW13.GTDVD 8742 CD90h, GPTW14.GTDVD 8742 CE90h, GPTW15.GTDVD 8742 CF90h, GPTW0_NS.GTDVU 0742 C08Ch, GPTW1_NS.GTDVU 0742 C18Ch, GPTW2_NS.GTDVU 0742 C28Ch, GPTW3_NS.GTDVU 0742 C38Ch, GPTW4_NS.GTDVU 0742 C48Ch, GPTW5_NS.GTDVU 0742 C58Ch, GPTW6_NS.GTDVU 0742 C68Ch, GPTW7_NS.GTDVU 0742 C78Ch, GPTW8_NS.GTDVU 0742 C88Ch, GPTW9_NS.GTDVU 0742 C98Ch, GPTW10_NS.GTDVU 0742 CA8Ch, GPTW11_NS.GTDVU 0742 CB8Ch, GPTW12_NS.GTDVU 0742 CC8Ch, GPTW13_NS.GTDVU 0742 CD8Ch, GPTW14_NS.GTDVU 0742 CE8Ch, GPTW15_NS.GTDVU 0742 CF8Ch, GPTW0_NS.GTDVD 0742 C090h, GPTW1_NS.GTDVD 0742 C190h, GPTW2_NS.GTDVD 0742 C290h, GPTW3_NS.GTDVD 0742 C390h, GPTW4_NS.GTDVD 0742 C490h, GPTW5_NS.GTDVD 0742 C590h, GPTW6_NS.GTDVD 0742 C690h, GPTW7_NS.GTDVD 0742 C790h, GPTW8_NS.GTDVD 0742 C890h, GPTW9_NS.GTDVD 0742 C990h, GPTW10_NS.GTDVD 0742 CA90h, GPTW11_NS.GTDVD 0742 CB90h, GPTW12_NS.GTDVD 0742 CC90h, GPTW13_NS.GTDVD 0742 CD90h, GPTW14_NS.GTDVD 0742 CE90h, GPTW15_NS.GTDVD 0742 CF90h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The GTDVm register is a 32-bit readable/writable register that sets the dead time for generating PWM waveforms with dead time.

Access in 8-bit or 16-bit units to the GTDVm register is prohibited, and it should be accessed in 32-bit units.

The setting is invalid in sawtooth-wave PWM mode 1, 2.

In complementary PWM mode, the GTDVD register is invalid and the GTDVU register is used as the dead time value during both up-counting and down-counting. No matter which GTDVU register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

In triangle-wave mode, the GTDVU register is used for up-counting, and the GTDVD register is used for down-counting.

In sawtooth-wave mode, the GTDVU register controls the first-half dead time, and the GTDVD register controls the second-half dead time, both in up-counting and down-counting.

Do not set this register to a value equal to or larger than that of the GTPR register.

- GTDVU > 0
- GTDVU < GTPR/2
- GTDVU + GTPR ≤ FFFF FFFFh

In addition, when using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When using the GTDVm register, writing to the GTCCRB register is prohibited. In modes other than complementary PWM, setting this register to 0 leads to the output of waveforms without dead time.

When the GTDTCR.TDFER bit is 1, writing to the GTDVD register has no effect. In this case, reading the GTDVD register returns the value of the GTDVU register.

24.2.32 General PWM Timer Dead Time Value Buffer Register m (GTDBm) (m = U, D)

Address(es): GPTW0.GTDBU 8742 C094h, GPTW1.GTDBU 8742 C194h, GPTW2.GTDBU 8742 C294h, GPTW3.GTDBU 8742 C394h, GPTW4.GTDBU 8742 C494h, GPTW5.GTDBU 8742 C594h, GPTW6.GTDBU 8742 C694h, GPTW7.GTDBU 8742 C794h, GPTW8.GTDBU 8742 C894h, GPTW9.GTDBU 8742 C994h, GPTW10.GTDBU 8742 CA94h, GPTW11.GTDBU 8742 CB94h, GPTW12.GTDBU 8742 CC94h, GPTW13.GTDBU 8742 CD94h, GPTW14.GTDBU 8742 CE94h, GPTW15.GTDBU 8742 CF94h, GPTW0.GTDBD 8742 C098h, GPTW1.GTDBD 8742 C198h, GPTW2.GTDBD 8742 C298h, GPTW3.GTDBD 8742 C398h, GPTW4.GTDBD 8742 C498h, GPTW5.GTDBD 8742 C598h, GPTW6.GTDBD 8742 C698h, GPTW7.GTDBD 8742 C798h, GPTW8.GTDBD 8742 C898h, GPTW9.GTDBD 8742 C998h, GPTW10.GTDBD 8742 CA98h, GPTW11.GTDBD 8742 CB98h, GPTW12.GTDBD 8742 CC98h, GPTW13.GTDBD 8742 CD98h, GPTW14.GTDBD 8742 CE98h, GPTW15.GTDBD 8742 CF98h, GPTW0_NS.GTDBU 0742 C094h, GPTW1_NS.GTDBU 0742 C194h, GPTW2_NS.GTDBU 0742 C294h, GPTW3_NS.GTDBU 0742 C394h, GPTW4_NS.GTDBU 0742 C494h, GPTW5_NS.GTDBU 0742 C594h, GPTW6_NS.GTDBU 0742 C694h, GPTW7_NS.GTDBU 0742 C794h, GPTW8_NS.GTDBU 0742 C894h, GPTW9_NS.GTDBU 0742 C994h, GPTW10_NS.GTDBU 0742 CA94h, GPTW11_NS.GTDBU 0742 CB94h, GPTW12_NS.GTDBU 0742 CC94h, GPTW13_NS.GTDBU 0742 CD94h, GPTW14_NS.GTDBU 0742 CE94h, GPTW15_NS.GTDBU 0742 CF94h, GPTW0_NS.GTDBD 0742 C098h, GPTW1_NS.GTDBD 0742 C198h, GPTW2_NS.GTDBD 0742 C298h, GPTW3_NS.GTDBD 0742 C398h, GPTW4_NS.GTDBD 0742 C498h, GPTW5_NS.GTDBD 0742 C598h, GPTW6_NS.GTDBD 0742 C698h, GPTW7_NS.GTDBD 0742 C798h, GPTW8_NS.GTDBD 0742 C898h, GPTW9_NS.GTDBD 0742 C998h, GPTW10_NS.GTDBD 0742 CA98h, GPTW11_NS.GTDBD 0742 CB98h, GPTW12_NS.GTDBD 0742 CC98h, GPTW13_NS.GTDBD 0742 CD98h, GPTW14_NS.GTDBD 0742 CE98h, GPTW15_NS.GTDBD 0742 CF98h

The GTDBm register is a 32-bit readable/writable register that functions as a buffer register for the GTDVm register. Access in 8-bit or 16-bit units to the GTDBm register is prohibited, and it should be accessed in 32-bit units.

24.2.33 General PWM Timer Output Protection Function Status Register (GTSOS)

b9, b8	—	Reserved	The read value is undefined.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

The GTSOS register is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (the GTDTCR.TDE bit is 1) in triangle-wave mode.

SOS[1:0] Bits (Output Protection Function Status)

These bits indicate the status of the output protection function in triangle-wave PWM mode. For details of the output protection function, see section 24.8.4, Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B).

24.2.34 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

Address(es): GPTW0.GTSOTR 8742 C0A0h, GPTW1.GTSOTR 8742 C1A0h, GPTW2.GTSOTR 8742 C2A0h, GPTW3.GTSOTR 8742 C3A0h, GPTW4.GTSOTR 8742 C4A0h, GPTW5.GTSOTR 8742 C5A0h, GPTW6.GTSOTR 8742 C6A0h, GPTW7.GTSOTR 8742 C7A0h, GPTW8.GTSOTR 8742 C8A0h, GPTW9.GTSOTR 8742 C9A0h, GPTW10.GTSOTR 8742 CAA0h, GPTW11.GTSOTR 8742 CBA0h, GPTW12.GTSOTR 8742 CCA0h, GPTW13.GTSOTR 8742 CDA0h, GPTW14.GTSOTR 8742 CEA0h, GPTW15.GTSOTR 8742 CFA0h, GPTW0_NS.GTSOTR 0742 C0A0h, GPTW1_NS.GTSOTR 0742 C1A0h, GPTW2_NS.GTSOTR 0742 C2A0h, GPTW3_NS.GTSOTR 0742 C3A0h, GPTW4_NS.GTSOTR 0742 C4A0h, GPTW5_NS.GTSOTR 0742 C5A0h, GPTW6_NS.GTSOTR 0742 C6A0h, GPTW7_NS.GTSOTR 0742 C7A0h, GPTW8_NS.GTSOTR 0742 C8A0h, GPTW9_NS.GTSOTR 0742 C9A0h, GPTW10_NS.GTSOTR 0742 CAA0h, GPTW11_NS.GTSOTR 0742 CBA0h, GPTW12_NS.GTSOTR 0742 CCA0h, GPTW13_NS.GTSOTR 0742 CDA0h, GPTW14_NS.GTSOTR 0742 CEA0h, GPTW15_NS.GTSOTR 0742 CFA0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SOTR	Output Protection Function Temporary Release	0: Protected state is not released 1: Protected state is released	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSOTR register temporarily releases the protected state of GTIOCnB pin output (n = 0 to 15) when output protection has been set.

The protected state can be released only for the case of the GTSOS.SOS[1:0] bits are 10b (protected state in which GTCCRA register ≥ GTPR register has occurred during transfer at trough). The protected state cannot be released for any other case.

SOTR Bit (Output Protection Function Temporary Release)

This bit sets whether to temporarily release the protected state of the GTIOCnB pin output in an output protected state. After the SOTR bit has been set to 1, the output protection function is canceled from the first trough. After the SOTR bit has been set to 0, output protection is resumed from the first trough.

24.2.35 General PWM Timer A/D Conversion Start Request Signal Monitoring Register (GTADSMR)

Address(es): GPTW0.GTADSMR 8742 C0A4h, GPTW1.GTADSMR 8742 C1A4h, GPTW2.GTADSMR 8742 C2A4h, GPTW3.GTADSMR 8742 C3A4h, GPTW4.GTADSMR 8742 C4A4h, GPTW5.GTADSMR 8742 C5A4h, GPTW6.GTADSMR 8742 C6A4h, GPTW7.GTADSMR 8742 C7A4h, GPTW8.GTADSMR 8742 C8A4h, GPTW9.GTADSMR 8742 C9A4h, GPTW10.GTADSMR 8742 CAA4h, GPTW11.GTADSMR 8742 CBA4h, GPTW12.GTADSMR 8742 CCA4h, GPTW13.GTADSMR 8742 CDA4h, GPTW14.GTADSMR 8742 CEA4h, GPTW15.GTADSMR 8742 CFA4h, GPTW0_NS.GTADSMR 0742 C0A4h, GPTW1_NS.GTADSMR 0742 C1A4h, GPTW2_NS.GTADSMR 0742 C2A4h, GPTW3_NS.GTADSMR 0742 C3A4h, GPTW4_NS.GTADSMR 0742 C4A4h, GPTW5_NS.GTADSMR 0742 C5A4h, GPTW6_NS.GTADSMR 0742 C6A4h, GPTW7_NS.GTADSMR 0742 C7A4h, GPTW8_NS.GTADSMR 0742 C8A4h, GPTW9_NS.GTADSMR 0742 C9A4h, GPTW10_NS.GTADSMR 0742 CAA4h, GPTW11_NS.GTADSMR 0742 CBA4h, GPTW12_NS.GTADSMR 0742 CCA4h, GPTW13_NS.GTADSMR 0742 CDA4h, GPTW14_NS.GTADSMR 0742 CEA4h, GPTW15_NS.GTADSMR 0742 CFA4h

b17, b16	ADSMS1[1:0]	A/D Conversion Start Request Signal Monitor 1 Selection	b17b16 0 0: A/D conversion start request signal generated by the GTADTRA register during up-counting 0 1: A/D conversion start request signal generated by the GTADTRA register during down-counting 1 0: A/D conversion start request signal generated by the GTADTRB register during up-counting 1 1: A/D conversion start request signal generated by the GTADTRB register during down-counting	R/W
b23 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24	ADSMEN1	A/D Conversion Start Request Signal Monitor 1 Output Enabling	0: Output of A/D conversion start request signal monitor 1 is disabled. 1: Output of A/D conversion start request signal monitor 1 is enabled.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register configures the monitoring of the A/D conversion start request signal that is synchronized with a frame.

ADSMSk[1:0] Bits (A/D Conversion Start Request Signal Monitor k Selection) (k = 0, 1)

These bits are used to select an A/D conversion start request signal synchronized with a frame to be monitored by the GTADSMk pin.

In triangle-wave PWM mode or complementary PWM mode, the following settings are prohibited:

- Set the ADSMSk[1:0] bits to 00b (A/D conversion start request during up-counting) when GTADTRA = 0
- Set the ADSMSk[1:0] bits to 10b (A/D conversion start request during up-counting) when GTADTRB = 0
- Set the ADSMSk[1:0] bits to 01b (A/D conversion start request during down-counting) when GTADTRA = GTPR
- Set the ADSMSk[1:0] bits to 11b (A/D conversion start request during down-counting) when GTADTRB = GTPR

ADSMENk Bit (A/D Conversion Start Request Signal Monitor k Output Enabling) (k = 0, 1)

This bit enables or disables the monitor output to the GTADSMk pin.
When the output is disabled, the GTADSMk pin goes to the low level.

When this bit is 1, the GTADSMk pin goes high on assertion of the A/D conversion start request signal selected by the ADSMSk[1:0] bits, and returns low at the end of the timer cycle for the channel that generated the request. If the counter stops, the output retains the level at the time the counter stopped. Set the ADSMENk bit to 0 to output a low level.
When a signal to request the start of A/D conversion is generated at the end of a timer period, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next period.
When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPTW.

24.2.36 General PWM Timer Extended Interrupt Skipping Counter Control Register (GTEITC)

Address(es): GPTW0.GTEITC 8742 C0A8h, GPTW1.GTEITC 8742 C1A8h, GPTW2.GTEITC 8742 C2A8h, GPTW3.GTEITC 8742 C3A8h, GPTW4.GTEITC 8742 C4A8h, GPTW5.GTEITC 8742 C5A8h, GPTW6.GTEITC 8742 C6A8h, GPTW7.GTEITC 8742 C7A8h, GPTW8.GTEITC 8742 C8A8h, GPTW9.GTEITC 8742 C9A8h, GPTW10.GTEITC 8742 CAA8h, GPTW11.GTEITC 8742 CBA8h, GPTW12.GTEITC 8742 CCA8h, GPTW13.GTEITC 8742 CDA8h, GPTW14.GTEITC 8742 CEA8h, GPTW15.GTEITC 8742 CFA8h, GPTW0_NS.GTEITC 0742 C0A8h, GPTW1_NS.GTEITC 0742 C1A8h, GPTW2_NS.GTEITC 0742 C2A8h, GPTW3_NS.GTEITC 0742 C3A8h, GPTW4_NS.GTEITC 0742 C4A8h, GPTW5_NS.GTEITC 0742 C5A8h, GPTW6_NS.GTEITC 0742 C6A8h, GPTW7_NS.GTEITC 0742 C7A8h, GPTW8_NS.GTEITC 0742 C8A8h, GPTW9_NS.GTEITC 0742 C9A8h, GPTW10_NS.GTEITC 0742 CAA8h, GPTW11_NS.GTEITC 0742 CBA8h, GPTW12_NS.GTEITC 0742 CCA8h, GPTW13_NS.GTEITC 0742 CDA8h, GPTW14_NS.GTEITC 0742 CEA8h, GPTW15_NS.GTEITC 0742 CFA8h

b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b23 to b20	EIVTT2[3:0]	Extended Interrupt Skipping 2 Skipping Count Setting	Skipping count for the extended interrupt skipping 2	R/W
b27 to b24	EITCNT2IV[3:0]	Extended Interrupt Skipping Counter 2 Initial Value	The extended interrupt skipping counter 2 initial value	R/W *1
b31 to b28	EITCNT2[3:0]	Extended Interrupt Skipping Counter 2	The extended interrupt skipping counter 2	R

Note 1. The EITCNT2IV[3:0] bits are only writable when the value other than 00b is written to the EIVTC2[1:0] bits that have been 00b.

The GTEITC register sets the extended interrupt skipping function to skip the interrupts, A/D conversion start requests, and buffer transfers independently by counting at overflow and underflow in the GTCNT counter.
The setting is operated independently of the interrupt skipping by the GTITC register, or the GTADCMSC register in GPTW4 to GPTW9.
The setting is invalid during the event count operation.
Access in 8-bit units to GTEITC is prohibited.

EIVTCk[1:0] Bits (Extended Interrupt Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the extended interrupt skipping counter k. Setting only with these bits does not skip the interrupts, A/D conversion start requests, and buffer transfers.
Skipping function for the interrupt, A/D conversion start request, and buffer transfer, all of which are a target of skipping, is set individually with the GTEITLI1, GTEITLI2, and GTEITLB registers.

EIVTTk[3:0] Bits (Extended Interrupt Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the EIVTCk[1:0] bits to the next generation of the count source. When the count source is generated while the EIVTTk[3:0] bits match the EITCNTk[3:0] bits, the EITCNTk[3:0] bits are cleared.
When these bits are 0000b, skipping is not performed.

EITCNT1[3:0] Bits (Extended Interrupt Skipping Counter 1)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated.
Counting is performed periodically within the range between 0 and the EIVTT1[3:0] bits.
Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.
[Clearing conditions]

- 00b is written to the EIVTC1[1:0] bits
- 0000b is written to the EIVTT1[3:0] bits
- A count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated when the extended interrupt skipping 1 skipping count set by the EIVTT1[3:0] bits match the value for the EITCNT1[3:0]

EITCNT2IV[3:0] Bits (Extended Interrupt Skipping Counter 2 Initial Value)

These bits are the initial value for the extended interrupt skipping counter 2. Writing to the EITCNT2IV[3:0] is performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the EITCNT2[3:0] bits are set not to count (EIVTC2[1:0] bits are 00b). When the EITCNT2IV[3:0] bits are written, the value written to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits simultaneously.
Writing to the EITCNT2IV[3:0] bits is ignored when the EITCNT2[3:0] bits are set to count (EIVTC2[1:0] bits are other than 00b) or when attempt to write 00b (do not count) to the EIVTC2[1:0] bits.
The EITCNT2IV[3:0] bits are not reset by writing 00b to the EIVTC2[1:0] bits.

EITCNT2[3:0] Bits (Extended Interrupt Skipping Counter 2)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated.
Counting is performed periodically within the range between 0 and the EIVTT2[3:0] bits.
Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.
Setting of the initial value for the EITCNT2[3:0] bits are performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the extended interrupt skipping counter 2 is set as not to count (00b is written to the EIVTC2[1:0] bits).

When the initial value is set, the written value to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits as the initial value.
[Clearing conditions]

- 00b is written to the EIVTC2[1:0] bits
- 0000b is written to the EIVTT2[3:0] bits
- When the EIVTC2[1:0] bits are 00b, a value other than 00b is written to the EIVTC2[1:0] bits and 0000b is written to the EITCNT2IV[3:0] bits at the same time.
- A count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the EIVTT2[3:0] bits match the value for the EITCNT2[3:0]

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

The GTEITLI1 register sets the extended skipping function for interrupts such as compare match/input capture, overflow, and underflow.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding

extended interrupt skipping counter operates the counting.
The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.
The setting is invalid during the event count operation.

EITLm[2:0] Bits (GTCCRm Register Compare Match/Input Capture Interrupt Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip the compare match/input capture interrupt (GTCIm) in the GTCCRm register.
Refer to Table 24.6.

EITLx[2:0] Bits (GTCCRx Register Compare Match Interrupt Extended Skipping Function Select) (x = C, D, E, F)

These bits select the extended interrupt skipping function to skip the compare match interrupt (GTCIx) in the GTCCRx register.
Refer to Table 24.6.

EITLV[2:0] Bits (Overflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at overflow.
Refer to Table 24.6.

EITLU[2:0] Bits (Underflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at underflow.
Refer to Table 24.6.

Table 24.6 Setting the Function Select for the GTEITLI1 Register

EITLy[2:0] Bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An interrupt is output in the period of EITCNT1 bit = 0)
0 1 0	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An interrupt is output in the period of EITCNT2 bit = 0)
0 1 1	Skip an interrupt in the period the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An interrupt is output in the period of EITCNT1 bit = 0 and EITCNT2 bit = 0)
1 0 0	Do not set this value
1 0 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An interrupt is output in the period of EITCNT1 bit = EIVTT1 bit)
1 1 0	Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An interrupt is output in the period of EITCNT2 bit = EIVTT2 bit)
1 1 1	Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An interrupt is output in the period of EITCNT1 bit = EIVTT1 bit and EITCNT2 bit = EIVTT2 bit)

y = A, B, C, D, E, F, V, U; k = 1, 2
Note: When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
Note: When the EITLy[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

24.2.38 General PWM Timer Extended Interrupt Skipping Setting Register 2 (GTEITLI2)

Address(es): GPTW0.GTEITLI2 8742 C0B0h, GPTW1.GTEITLI2 8742 C1B0h, GPTW2.GTEITLI2 8742 C2B0h, GPTW3.GTEITLI2 8742 C3B0h, GPTW4.GTEITLI2 8742 C4B0h, GPTW5.GTEITLI2 8742 C5B0h, GPTW6.GTEITLI2 8742 C6B0h, GPTW7.GTEITLI2 8742 C7B0h, GPTW8.GTEITLI2 8742 C8B0h, GPTW9.GTEITLI2 8742 C9B0h, GPTW10.GTEITLI2 8742 CAB0h, GPTW11.GTEITLI2 8742 CBB0h, GPTW12.GTEITLI2 8742 CCB0h, GPTW13.GTEITLI2 8742 CDB0h, GPTW14.GTEITLI2 8742 CEB0h, GPTW15.GTEITLI2 8742 CFB0h, GPTW0_NS.GTEITLI2 0742 C0B0h, GPTW1_NS.GTEITLI2 0742 C1B0h, GPTW2_NS.GTEITLI2 0742 C2B0h, GPTW3_NS.GTEITLI2 0742 C3B0h, GPTW4_NS.GTEITLI2 0742 C4B0h, GPTW5_NS.GTEITLI2 0742 C5B0h, GPTW6_NS.GTEITLI2 0742 C6B0h, GPTW7_NS.GTEITLI2 0742 C7B0h, GPTW8_NS.GTEITLI2 0742 C8B0h, GPTW9_NS.GTEITLI2 0742 C9B0h, GPTW10_NS.GTEITLI2 0742 CAB0h, GPTW11_NS.GTEITLI2 0742 CBB0h, GPTW12_NS.GTEITLI2 0742 CCB0h, GPTW13_NS.GTEITLI2 0742 CDB0h, GPTW14_NS.GTEITLI2 0742 CEB0h, GPTW15_NS.GTEITLI2 0742 CFB0h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	EADTBL[2:0]			—	EADTAL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	EADTAL[2:0]	GTADTRA A/D Conversion Start Request Extended Skipping Function Select	See Table 24.7.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6 to b4	EADTBL[2:0]	GTADTRB A/D Conversion Start Request Extended Skipping Function Select	See Table 24.7.	R/W
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTEITLI2 register sets the extended skipping function for A/D conversion start requests.
Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.
The setting is operated independently of the interrupt skipping by the GTITC register or the GTADCMSC register.
The setting is invalid during the event count operation.

EADTmL[2:0] Bits (GTADTRm A/D Conversion Start Request Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip A/D conversion start requests for the compare match in the GTADTRm register.
Refer to Table 24.7.

Table 24.7 Setting the Function Select for the GTEITLI2 Register

EADTmL[2:0] Bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An A/D conversion start request is output in the period of EITCNT1 bit = 0)
0 1 0	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An A/D conversion start request is output in the period of EITCNT2 bit = 0)
0 1 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An A/D conversion start request is output in the period of EITCNT1 bit = 0 and EITCNT2 bit = 0)
1 0 0	Do not set this value
1 0 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of EITCNT1 bit = EIVTT1 bit)
1 1 0	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of EITCNT2 bit = EIVTT2 bit)
1 1 1	Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of EITCNT1 bit = EIVTT1 bit and EITCNT2 bit = EIVTT2 bit)

m = A, B; k = 1, 2

Note: When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.

Note: When the EADTmL[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. In the complementary PWM mode, writing to these bits in any of the registers in the master channel, slave channel 1, or slave channel 2 simultaneously applies to all three channels.

The GTEITLB register sets the extended skipping function for buffer transfers.
Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.
The setting is operated independently of the interrupt skipping by the GTITC register.
The buffer transfer from the GTOLBR register to the GTIOR.GTIOA[4:0], GTIOB[4:0] bits is not target of the extended buffer transfer skipping function.
The setting is invalid during the event count operation.

EBTLCA[2:0] Bits (GTCCRA Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRA, GTCCRC, GTCCRD registers and a temporary register A) in the GTCCRA register.
An extended skipping of buffer transfers in the GTCCRA register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRA register should be performed in the condition of not performing the extended buffer transfer skipping.
The buffer transfer between the GTCCRC, GTCCRE register, and GTCCRA register in complementary PWM mode cannot be skipped.

EBTLCB[2:0] Bits (GTCCRB Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRB, GTCCRE, GTCCRF registers and a temporary register B) in the GTCCRB register.
An extended skipping of buffer transfers in the GTCCRB register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRB register should be performed in the condition of not performing the extended buffer transfer skipping.

EBTLPR[2:0] Bits (GTPR Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTPR, GTPBR, and GTPDBR registers) in the GTPR register.
When skipping GTPR buffer transfers in complementary PWM mode, GTEITC register setting of slave channel should be matched to the master channel so that the buffer transfer timing of the slave channel matches the master channel.

EBTLADm[2:0] Bits (GTADTRm Register Buffer Transfer Extended Skipping Function Select) (m = A, B)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTADTRm, GTADTBRm, and GTADTDBRm registers) in the GTADTRm register.

EBTLDVm[2:0] Bits (GTDVm Register Buffer Transfer Extended Skipping Function Select) (m = U, D)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers between the GTDVm and GTDBm registers) in the GTDVm register.

Table 24.8 Setting the Function Select for the GTEITLB Register

EBTLx[2:0] Bits	Function
0 0 0	Do not perform an extended interrupt skipping
0 0 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than 0 (A buffer transfer is output in the period of EITCNT1 bit = 0)
0 1 0	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than 0 (A buffer transfer is output in the period of EITCNT2 bit = 0)
0 1 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (A buffer transfer is output in the period of EITCNT1 bit = 0 and EITCNT2 bit = 0)
1 0 0	Do not set this value
1 0 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (A buffer transfer is output in the period of EITCNT1 bit = EIVTT1 bit)
1 1 0	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (A buffer transfer is output in the period of EITCNT2 bit = EIVTT2 bit)
1 1 1	Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (A buffer transfer is output in the period of EITCNT1 bit = EIVTT1 bit and EITCNT2 bit = EIVTT2 bit)

x = CA, CB, PR, ADA, ADB, DVU, DVD; k = 1, 2

Note: When the intended skipping counter is set as not to count (EIVTCk[1:0]bits = 00b or EIVTTk[3:0] bits = 0000b), skipping is not performed.
Note: When the EBTLx[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

24.2.40 General PWM Timer Inter Channel Logical Operation Function Setting Register (GTICLF)

Address(es): GPTW0.GTICLF 8742 C0B8h, GPTW1.GTICLF 8742 C1B8h, GPTW2.GTICLF 8742 C2B8h, GPTW3.GTICLF 8742 C3B8h, GPTW4.GTICLF 8742 C4B8h, GPTW5.GTICLF 8742 C5B8h, GPTW6.GTICLF 8742 C6B8h, GPTW7.GTICLF 8742 C7B8h, GPTW8.GTICLF 8742 C8B8h, GPTW9.GTICLF 8742 C9B8h, GPTW10.GTICLF 8742 CAB8h, GPTW11.GTICLF 8742 CBB8h, GPTW12.GTICLF 8742 CCB8h, GPTW13.GTICLF 8742 CDB8h, GPTW14.GTICLF 8742 CEB8h, GPTW15.GTICLF 8742 CFB8h, GPTW0_NS.GTICLF 0742 C0B8h, GPTW1_NS.GTICLF 0742 C1B8h, GPTW2_NS.GTICLF 0742 C2B8h, GPTW3_NS.GTICLF 0742 C3B8h, GPTW4_NS.GTICLF 0742 C4B8h, GPTW5_NS.GTICLF 0742 C5B8h, GPTW6_NS.GTICLF 0742 C6B8h, GPTW7_NS.GTICLF 0742 C7B8h, GPTW8_NS.GTICLF 0742 C8B8h, GPTW9_NS.GTICLF 0742 C9B8h, GPTW10_NS.GTICLF 0742 CAB8h, GPTW11_NS.GTICLF 0742 CBB8h, GPTW12_NS.GTICLF 0742 CCB8h, GPTW13_NS.GTICLF 0742 CDB8h, GPTW14_NS.GTICLF 0742 CEB8h, GPTW15_NS.GTICLF 0742 CFB8h

R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The signal before performing output disable control is selected.
Note 2. When channel's own GTIOCnA is selected, C is treated as 1.
Note 3. When channel's own GTIOCnB is selected, D is treated as 1.

The GTICLF register sets the logical operation function between compare match outputs.
The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control.
The output disable control is performed with the signal after logical operation.
Access in 8-bit units to the GTICLF register is prohibited.

ICLFm[2:0] Bits (GTIOCnm Output Logical Operation Function Select) (n = 0 to 15; m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. Logical operations involving the C or D signal take an additional clock cycle of GTCLK. When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as 1.

ICLFSELk[5:0] Bits (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

Bit	Symbol	Bit Name	Description	R/W
b0	PCEN	Cycle Count Function Enable	0: Cycle count function is disabled. 1: Cycle count function is enabled.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	ASTP	Automatic Stop Function Enable	0: Automatic function is disabled. 1: Automatic function is enabled.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b27 to b16	PCNT[11:0]	Cycle Counter	Counter for number of cycles.	R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTPC register counts the number of period.

PCEN Bit (Cycle Count Function Enable)

This bit enables or disables cycle count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

ASTP Bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bis is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

PCNT[11:0] Bits (Cycle Counter)

This counter counts the number of cycles.

When the PCEN bis is 0, writing the number of cycles is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of cycle. In sawtooth-wave mode, the end of cycle refers to overflow, underflow, or GTCNT counter clearing. In triangle-wave mode or complementary PWM mode, it refers to trough.

When the PCNT counter is 1 at the end of cycle, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while cycle count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value. When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

b31 to b28	ADCMSCNT2[3:0]	A/D Conversion Start Request Compare Match Skipping Counter 2	A/D Conversion Start Request Compare Match Skipping Counter 2	R/W

Note 1. Writing is possible only when the ADCMSC1[1:0] bits are 00b and a value other than 00b is written to the ADCMSC1[1:0] bits.
Note 2. Writing is possible only when the ADCMSC2[1:0] bits are 00b and a value other than 00b is written to the ADCMSC2[1:0] bits.

The GTADCMSC register is a register that controls the skipping counter of the A/D conversion start request compare match skipping function that counts compare matches of GTADTRA register and GTADTRB register, and skipping A/D conversion start request and buffer transfer independently.
This register setting is operated independently of the interrupt skipping by the GTITC register or GTEITC register.
The setting is invalid during the event count operation.

Access in 8-bit units to GTADCMSC is prohibited.

ADCMSCk[1:0] Bits (A/D Conversion Start Request Compare Match Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the A/D conversion start request compare match skipping counter k.
Setting only with these bits does not skip the A/D conversion start requests and buffer transfers. Skipping function for the A/D conversion start request and buffer transfer which are a target of skipping is set individually with the GTADCMSS register.

ADCMSTk[3:0] Bits (A/D Conversion Start Request Compare Match Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the ADCMSCk[1:0] bits to the next generation of the count source.
When the count source is generated while the ADCMSTk[3:0] bits match the ADCMSCNTk[3:0] bits, the ADCMSCNTk[3:0] bits are cleared.
When these bits are 0000b, skipping is not performed.

ADCMSCNTkIV[3:0] Bits (A/D Conversion Start Request Compare Match Skipping Counter k Initial Value) (k = 1, 2)

These bits are the value of the initial value for the A/D conversion start request compare match skipping counter k.
Writing to the ADCMSCNTkIV[3:0] is performed only when the writing value to the ADCMSCk[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the ADCMSCNTk[3:0] bits are set not to count (ADCMSCk[1:0] bits are 00b). When the ADCMSCNTkIV[3:0] bits are written, the value written to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits simultaneously.
The writing to the ADCMSCNTkIV[3:0] bits are ignored when the ADCMSCNTk[3:0] bits are set to count (ADCMSCk[1:0] bits are other than 00b) or perform the setting of not to count (00b is written to the ADCMSCk[1:0] bits).
The ADCMSCNTkIV[3:0] bits are not reset by the writing 00b to the ADCMSCk[1:0] bits.

ADCMSCNTk[3:0] Bits (A/D Conversion Start Request Compare Match Skipping Counter k) (k = 1, 2)

The counting is incremented by 1 every time a count source selected by the ADCMSCk[1:0] bits is generated.
Counting is performed periodically within the range between 0 and the ADCMSTk[3:0] bits.
Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.
Setting of the initial value for the ADCMSCNTk[3:0] bits are performed only when the writing value to the ADCMSCk[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the A/D conversion start request compare match skipping counter k is set as not to count (ADCMSCk[1:0] bits are 00b).
When the initial value is set, the written value to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits as the initial value.
[Clearing condition]

- 00b is written to the ADCMSCk[1:0] bits.
- 0000b is written to the ADCMSTk[3:0] bits.
- When the ADCMSCk[1:0] bits are 00b, a value other than 00b is written to the ADCMSCk[1:0] bits and 0000b is written to the ADCMSCNTkIV[3:0] bits at the same time.
- A count source selected by the ADCMSCk[1:0] bits is generated when the extended interrupt skipping k skipping count set by the ADCMSTk[3:0] bits match the value for the ADCMSCNTk[3:0].

b31 to b23	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTADCMSS register is a register that controls the skipping counter of the A/D conversion start request compare match skipping function that counts compare matches of GTADTRA register and GTADTRB register, and skipping A/D conversion start request and buffer transfer independently.
This register setting is operated independently of the interrupt skipping by the GTITC register or GTEITC register.
The setting is invalid during the event count operation.

ADCMSmL[2:0] Bits (GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select) (m = A, B)

These bits select the A/D conversion start request compare match skipping function of the GTADTRm (m = A, B) register.
Refer to Table 24.9.

Table 24.9 Setting of GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select bit

ADCMSmL[2:0] Bits	Function
0 0 0	Do not perform an A/D conversion start request compare match skipping
0 0 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0000b (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0000b)
0 1 0	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0000b (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = 0000b)
0 1 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0000b (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0000b and the ADCMSCNT2[3:0] bits = 0000b)
1 0 0	Setting prohibited
1 0 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits)
1 1 0	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)
1 1 1	Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)

m = A, B

Note: When the intended skipping counter is set as not to count (the ADCMSCk[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0000b), skipping is not performed. (k = 1, 2)

Note: When the ADCMSmL[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

ADCMBSm[2:0] Bits (GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select) (m = A, B)

These bits select the A/D conversion start request comparison match skip function for buffer transfers in the GTADTRm register (transfers between the GTADTRm register, GTADTBRm register, and GTADTDBRm register).
Refer to Table 24.10.

Table 24.10 Setting of the GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select bit

ADCMBSm[2:0] Bits	Function
0 0 0	Do not perform an GTADTRm register buffer transfer by A/D conversion start request compare match skipping
0 0 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0000b)
0 1 0	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = 0000b)
0 1 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0000b and the ADCMSCNT2[3:0] bits = 0000b)
1 0 0	Setting prohibited
1 0 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits)
1 1 0	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)
1 1 1	Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (A Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits)

m = A, B

Note: When the intended skipping counter is set as not to count (the ADCMSCk[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0000b), skipping is not performed. (k = 1, 2)

Note: When the ADCMBSm[2:0] bits are set to 011b or 111b, and when one of the skipping counter1 or the skipping counter 2 is set as not to count, skipping is not performed.

24.2.44 General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register (GTSECSR)

The GTSECSR register selects the channels whose operation enable bit is to be updated using the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.
Access in 8-bit or 16-bit units to the GTSECSR register is prohibited, and it should be accessed in 32-bit units.

SECSELn Bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 15)

This bit enables or disables the simultaneous control of operation enable in channel n.
When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

24.2.45 General PWM Timer Operation Enable Bit Simultaneous Control Register (GTSECR)

Address(es): GPTW0.GTSECR 8742 C0D4h, GPTW1.GTSECR 8742 C1D4h, GPTW2.GTSECR 8742 C2D4h, GPTW3.GTSECR 8742 C3D4h, GPTW4.GTSECR 8742 C4D4h, GPTW5.GTSECR 8742 C5D4h, GPTW6.GTSECR 8742 C6D4h, GPTW7.GTSECR 8742 C7D4h, GPTW8.GTSECR 8742 C8D4h, GPTW9.GTSECR 8742 C9D4h, GPTW10.GTSECR 8742 CAD4h, GPTW11.GTSECR 8742 CBD4h, GPTW12.GTSECR 8742 CCD4h, GPTW13.GTSECR 8742 CDD4h, GPTW14.GTSECR 8742 CED4h, GPTW15.GTSECR 8742 CFD4h, GPTW0_NS.GTSECR 0742 C0D4h, GPTW1_NS.GTSECR 0742 C1D4h, GPTW2_NS.GTSECR 0742 C2D4h, GPTW3_NS.GTSECR 0742 C3D4h, GPTW4_NS.GTSECR 0742 C4D4h, GPTW5_NS.GTSECR 0742 C5D4h, GPTW6_NS.GTSECR 0742 C6D4h, GPTW7_NS.GTSECR 0742 C7D4h, GPTW8_NS.GTSECR 0742 C8D4h, GPTW9_NS.GTSECR 0742 C9D4h, GPTW10_NS.GTSECR 0742 CAD4h, GPTW11_NS.GTSECR 0742 CBD4h, GPTW12_NS.GTSECR 0742 CCD4h, GPTW13_NS.GTSECR 0742 CDD4h, GPTW14_NS.GTSECR 0742 CED4h, GPTW15_NS.GTSECR 0742 CFD4h

b25	SSCD	Synchronous Set/Clear Simultaneous Disable	0: Disable simultaneous disabling synchronous set/clear 1: Disable synchronous set/clear simultaneously	R/W *1
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers. Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.
A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.
Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

SBDCE Bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.
Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPE Bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPBR, and GTPDBR registers are enabled.
Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAE Bit (GTADTR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are enabled.
Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDDE Bit (GTDV Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are enabled.
Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SBDCD Bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.
Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPD Bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPBR, and GTPDBR registers are disabled.
Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAD Bit (GTADTR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are disabled.
Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDDD Bit (GTDV Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR

register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are disabled.
Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SPCE Bit (Cycle Count Function Simultaneous Enable)

Writing 1 to this bit simultaneously sets any GTPC.PCEN bits to 1 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and enables the cycle-counting function.
Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCE Bit (Synchronous Set/Clear Simultaneous Enable)

Writing 1 to this bit simultaneously sets any GTCR.SSCEN bits to 1 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and enables the synchronous set/clear function.
Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

SPCD Bit (Cycle Count Function Simultaneous Disable)

Writing 1 to this bit simultaneously sets any GTPC.PCEN bits to 0 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and disables the cycle-counting function.
Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCD Bit (Synchronous Set/Clear Simultaneous Disable)

Writing 1 to this bit simultaneously sets any GTCR.SSCEN bits to 0 for channels with simultaneous control enabled by the setting 1 in the GTSECSR register and disables the synchronous set/clear function.
Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

24.2.46 General PWM Timer Output Level Buffer Register (GTOLBR)

Address(es): GPTW4.GTOLBR 8742 C4E4h, GPTW5.GTOLBR 8742 C5E4h, GPTW6.GTOLBR 8742 C6E4h, GPTW7.GTOLBR 8742 C7E4h, GPTW8.GTOLBR 8742 C8E4h, GPTW9.GTOLBR 8742 C9E4h, GPTW4_NS.GTOLBR 0742 C4E4h, GPTW5_NS.GTOLBR 0742 C5E4h, GPTW6_NS.GTOLBR 0742 C6E4h, GPTW7_NS.GTOLBR 0742 C7E4h, GPTW8_NS.GTOLBR 0742 C8E4h, GPTW9_NS.GTOLBR 0742 C9E4h

b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTOLBR register is a buffer register for the GTIOR.GTIOA[4:0] bits and GTIOR.GTIOB[4:0] bits.

GTIOmB[4:0] Bits (GTIOm Buffer) (m = A, B)

These bits are buffer bits of GTIOR.GTIOm[4:0] bits.

These bits are transferred to the GTIOR.GTIOm[4:0] bits at the transfer timing selected by the GTBER2.OLTTm[1:0] (m = A, B) bits.

b29 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit Name	Description	R/W
b31, b30	ICBGRP[1:0]	GTCCRB Input Capture Group Select	b31b30 0 0: Group A 0 1: Group B 1 0: Group C 1 1: Group D	R/W

The GTICCR register is a register that controls input capture by inter channel link.
For channels that perform input capture in cooperation, the input capture factor set in the GTCCRA and GTCCRB registers is invalid.

ICAFm Bit (Enable GTCCRm Register Compare Match/Input Capture as Source of Other Channel GTCCRA Input Capture) (m = A, B)

This bit enables or disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRA register.

ICAFn Bit (Enable GTCCRn Register Compare Match as Source of Other Channel GTCCRA Input Capture) (n = C, D, E, F)

This bit enables or disables the use of compare match of GTCCRn register as the input capture source of other channel's GTCCRA register.

ICAFPO Bit (Enable Overflow as Source of Other Channel GTCCRA Input Capture)

This bit enables or disables the use of overflow of sawtooth-waves, the crest of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICAFPU Bit (Enable Underflow as Source of Other Channel GTCCRA Input Capture)

This bit enables or disables the use of underflow of sawtooth-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICACLK Bit (Enable Count Clock as Source of Other Channel GTCCRA Input Capture)

This bit enables or disables the use of count clock as the input capture source of other channel's GTCCRA register.

ICAGRP[1:0] Bits (GTCCRA Input Capture Group Select)

These bits select the group of input capture by inter channel cooperation for GTCCRA register.
For channels that accept input capture of the GTCCRA register due to input capture sources from other channels, set the GTICASR.ASOC bit to 1 and select the group of inter channel cooperation with the ICAGRP[1:0] bits.

ICBFm Bit (Enable GTCCRm Register Compare Match/Input Capture as Source of Other Channel GTCCRB Input Capture) (m = A, B)

This bit enables or disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRB register.

ICBFn Bit (Enable GTCCRn Register Compare Match as Source of Other Channel GTCCRB Input Capture) (n = C, D, E, F)

This bit enables or disables the use of compare match of GTCCRn register as the input capture source of other channel's GTCCRB register.

ICBFPO Bit (Enable Overflow as Source of Other Channel GTCCRB Input Capture)

This bit enables or disables the use of overflow of sawtooth-waves, the crest of triangle-waves or complementary PWM

mode as the input capture source of other channel's GTCCRB register.

ICBFPU Bit (Enable Underflow as Source of Other Channel GTCCRB Input Capture)

This bit enables or disables the use of underflow of sawtooth-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRB register.

ICBCLK Bit (Enable Count Clock as Source of Other Channel GTCCRB Input Capture)

This bit enables or disables the use of count clock as the input capture source of other channel's GTCCRB register.

ICBGRP[1:0] Bits (GTCCRB Input Capture Group Select)

These buts select the group of input capture by inter channel cooperation for GTCCRB register.
For channels that accept input capture of the GTCCRB register due to input capture sources from other channels, set the GTICBSR.BSOC bit to 1 and select the group of inter channel cooperation with the ICBGRP[1:0] bits.

24.2.48 General PWM Timer-linked Synchronization Control Register (GTSYNCFCR)

R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTSYNCSCR register controls enabling and disabling of output of the timer-linked synchronization signal and the timer-internal synchronization signal.
For the timer-linked synchronization signal and the timer-internal synchronization signal, refer to section 24.3.17, Timer-Linked Synchronization Signal Output Function.

SYSG[1:0] Bits (Timer-Linked Synchronization Signal and Timer-Internal Synchronization Signal Output Enable)

These bits enable or disable timer-linked synchronization signal output in response to compare match and timer-internal synchronization signal output on overflow in sawtooth-wave PWM mode 1.

24.2.50 Output Phase Switching Control Register (OPSCR)

Address(es): GPTW.OPSCR 8742 BF00h, GPTW_NS.OPSCR 0742 BF00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	UF	Input Phase Software Setting	These bits set the input phase from software settings. Setting these bits is valid when FB = 1.	R/W
b1	VF			R/W
b2	WF			R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	U	Input U-Phase Monitor	This bit monitors the state of the input phase. • FB = 0 External input that are synchronized by GTCLK • FB = 1 The software settings (UF, VF, WF bit)	R
b5	V	Input V-Phase Monitor		R
b6	W	Input W-Phase Monitor		R
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b8	EN	Output Phase Enable	0: Do not output (Hi-Z external pin) 1: Output*1	R/W
b15-b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	FB	External Feedback Signal Enable	This bit selects the input phase from software settings and external input. 0: The external input 1: The software setting (UF, VF, WF bit)	R/W
b17	P	Positive-Phase Output (P) Control	0: Level signal output 1: PWM signal output (PWM of GPTW0)	R/W
b18	N	Negative-Phase Output (N) Control	0: Level signal output 1: PWM signal output (PWM of GPTW0)	R/W
b19	INV	Output Phase Invert Control	0: Positive logic (active-high) output 1: Negative logic (active-low) output	R/W
b20	RV	Output Phase Rotation Direction Reversal Control	0: Positive rotation 1: Reverse rotation	R/W
b21	ALIGN	Input Phase Alignment	0: Input phase aligned to GTCLK 1: Input phase aligned to the falling edge of PWM	R/W
b23, b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b25, b24	GRP[1:0]	Output Disabled Source Selection	b25b24 0 0: Group A output disable source 0 1: Group B output disable source 1 0: Group C output disable source 1 1: Group D output disable source	R/W
b26	GODF	Group Output Disable Function	0: This bit function is ignored 1: When the signal value of the source selected by the GRP[1:0] bits becomes High, the EN bit is cleared	R/W
b28, b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b29	NFEN	External Input Noise Filter Enable	0: The noise filter for the external input is disabled. 1: The noise filter for the external input is enabled.	R/W

Bit	Symbol	Bit Name	Description	R/W
b31, b30	NFCS[1:0]	External Input Noise Filter Clock Select	b31b30 0 0: GTCLK/1 0 1: GTCLK/4 1 0: GTCLK/16 1 1: GTCLK/64	R/W

Note 1. When the GODF bit is 1 and the signal value of the source selected by the GRP[1:0] bits becomes High, the EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

UF, VF, WF Bits (Input Phase Software Setting)

The UF, VF, and WF bits set the input phase from the software settings. When the FB bit is 1, these bits are valid. The set value of the UF, VF, and WF bit takes the place of the U, V, W external input.

U, V, W Bits (Input m-Phase Monitor) (m = U, V, W)

When the FB bit is 0, external inputs that are synchronized by GTCLK are monitored by these bits. When the FB bit is 1, the U, V, and W bits can read the UF, VF, and WF bits.

EN Bit (Output Phase Enable)

The EN bit controls the output enable signal of output phase (positive phase/negative phase).
When the EN bit is 1, the signal waveform is output.
When the EN bit is 0, first set FB, UF, VF, and WF (software setting is selected), P, N, INV, RV, ALIGN, GRP[1:0], GODF, NFEN, and NFCS[1:0] bits. Then, set this bit to 1. The EN bit should be set when no output disable request is issued by POEG. When the GODF bit is 1 and the signal value selected in the GRP[1:0] bits is high, the EN bit is set to 0. To reenable output, clear the output request in software and then set the EN bit to 1.

- EN bit priority (conflict)

When a conflict occurs between setting the EN bit by software and clearing it due to an output disable request, the EN bit is set to 0.

FB Bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (UF, VF, and WF bits) and external input such as a Hall element.

P Bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output or PWM signal output for the positive-phase output (GTOUUP, GTOVUP and GTOWUP pins).

N Bit (Negative-Phase Output (N) Control)

The P bit selects one of the level signal output or PWM signal output for the negative-phase output (GTOULO, GTOVLO and GTOWLO pins).

INV Bit (Output Phase Invert Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

RV Bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

ALIGN Bit (Input Phase Alignment)

The ALIGN bit selects the GTCLK or PWM for the sampling of the input phase (input phase is specified in the FB bit).

When ALIGN bit is 0, input phase is aligned to GTCLK.

Note: When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

When ALIGN bit is 1, input phase is aligned with the falling edge of PWM.

GRP[1:0] Bits (Output Disabled Source Selection)

The GRP[1:0] bits select the output disable source.

Set the GRP[1:0] bits while the GODF bit is 0.

GODF Bit (Group Output Disable Function)

When the GODF bit is 1 and the signal selected by the GRP[1:0] bits is high, the EN bit is set to 0.

When the GODF bit is 0, this bit is ignored.

Set the GODF bit while there is no output disable request from POEG.

NFEN Bit (External Input Noise Filter Enable)

The NFEN bit enables or disables the external input noise filter.

Note: Set this bit during the EN bit is 0 to avoid generation of unintentional internal edge caused by this bit switching.

NFCS[1:0] Bits (External Input Noise Filter Clock Select)

The NFCS[1:0] bits select the clock for the external input noise filter.

1. Set the NFCS[1:0] bits.
2. Wait for 2 cycles.
3. Set the EN bit to 1.

24.2.51 General PWM Timer Clock Control Register (GTCLKCR)

Address(es): GPTW.GTCLKCR 8742 BF10h, GPTW_NS.GTCLKCR 0742 BF10h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BPEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BPEN	Synchronization Circuit Bypass Enable	0: The bus clock and GPTW counter reference clock are asynchronously in use. 1: The bus clock and GPTW counter reference clock are synchronously in use.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The GTCLKCR register controls supply of the clock to the GPTW module.
Set this register before the GPTW module is released from the module stop state after a reset. Changing the setting of the effective bit in the register is prohibited after release from the module stop state.

BPEN Bit (Synchronization Circuit Bypass Enable)

This bit enables or disables bypassing of the synchronization between the bus clock (PCLKA) and GPTW counter reference clock (GTCLK). Set this bit to 0 or 1 according to whether the asynchronous or synchronous clock is to be used as the GPTW counter reference clock, respectively.

24.3 Operation

24.3.1 Basic Operation

The timer in each channel performs periodic count operation by count clock or hardware source. The GTCNT counter performs up-counting, or down-counting. The timer period is controlled by the GTPR or GTCCRm (m = A to F) registers. When the GTCNT counter value matches the values for GTCCRA or GTCCRB registers, the GTIOCnA or GTIOCnB pin outputs (n = 0 to 15) can be changed respectively. Also, the GTCCRA or GTCCRB registers can be used as the input capture registers by hardware source. The GTCCRC and GTCCRD registers can be performed as buffer registers for GTCCRA register, and the GTCCRE and GTCCRF registers can be performed as buffer registers for GTCCRB register.

24.3.1.1 Counter Operation

(1) Count Start/Count Stop

The counter in each channel starts counting operation when the corresponding GTCR.CST bit is set to 1, and stops counting when the bit is set to 0.
CST bit value can be changed by the following sources:

- Writing to the GTCR register
- Writing 1 to the bit corresponding to the channel number for the GTSTR register while the GTSSR.CSTRT bit is 1
- Writing 1 to the bit corresponding to the channel number for the GTSTP register while the GTPSR.CSTOP bit is 1
- Hardware source specified by the GTSSR register
- Hardware source specified by the GTPSR register
- Completion of the cycle count operation while the GTPC.ASTP bit is 1.

(2) Periodic Count Operation (In Up-Counting by the Count Clock)

The counter in each channel starts up-counting when the corresponding GTCR.CST bit is set to 1 while the GTUPSR register and the GTDNSR register are 0000 0000h. When the value of the GTCNT counter changes from the GTPR register value to 0000 0000h (an overflow), or the GTCCRm (m = A to F) register value selected by the GTCSR.CSCMSC[2:0] bits changes to 0000 0000h in sawtooth-wave PWM mode 2, the GTST.TCFPO flag is set to 1, and if the setting of the GTINTAD.GTINTPR[0] bit is 1, a GTCIV interrupt request is also issued. After the GTCNT counter has overflowed, counting up is resumed from 0000 0000h.
Figure 24.6 shows an example of periodic count operation in up-counting by count clock.

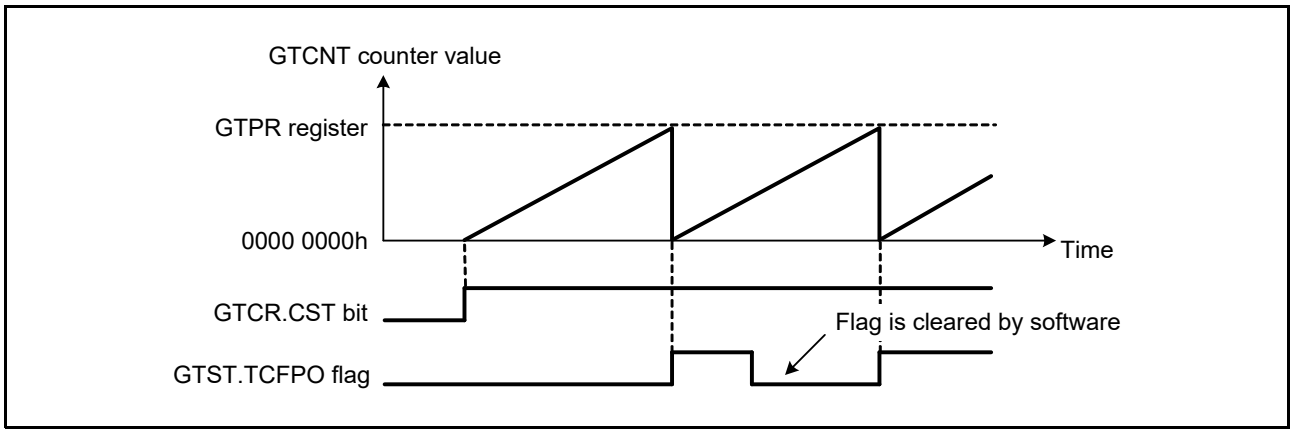

Figure 24.6 Example of Periodic Count Operation (In Up-Counting by the Count Clock)

Figure 24.7 shows an example for setting periodic count operation in up-counting.

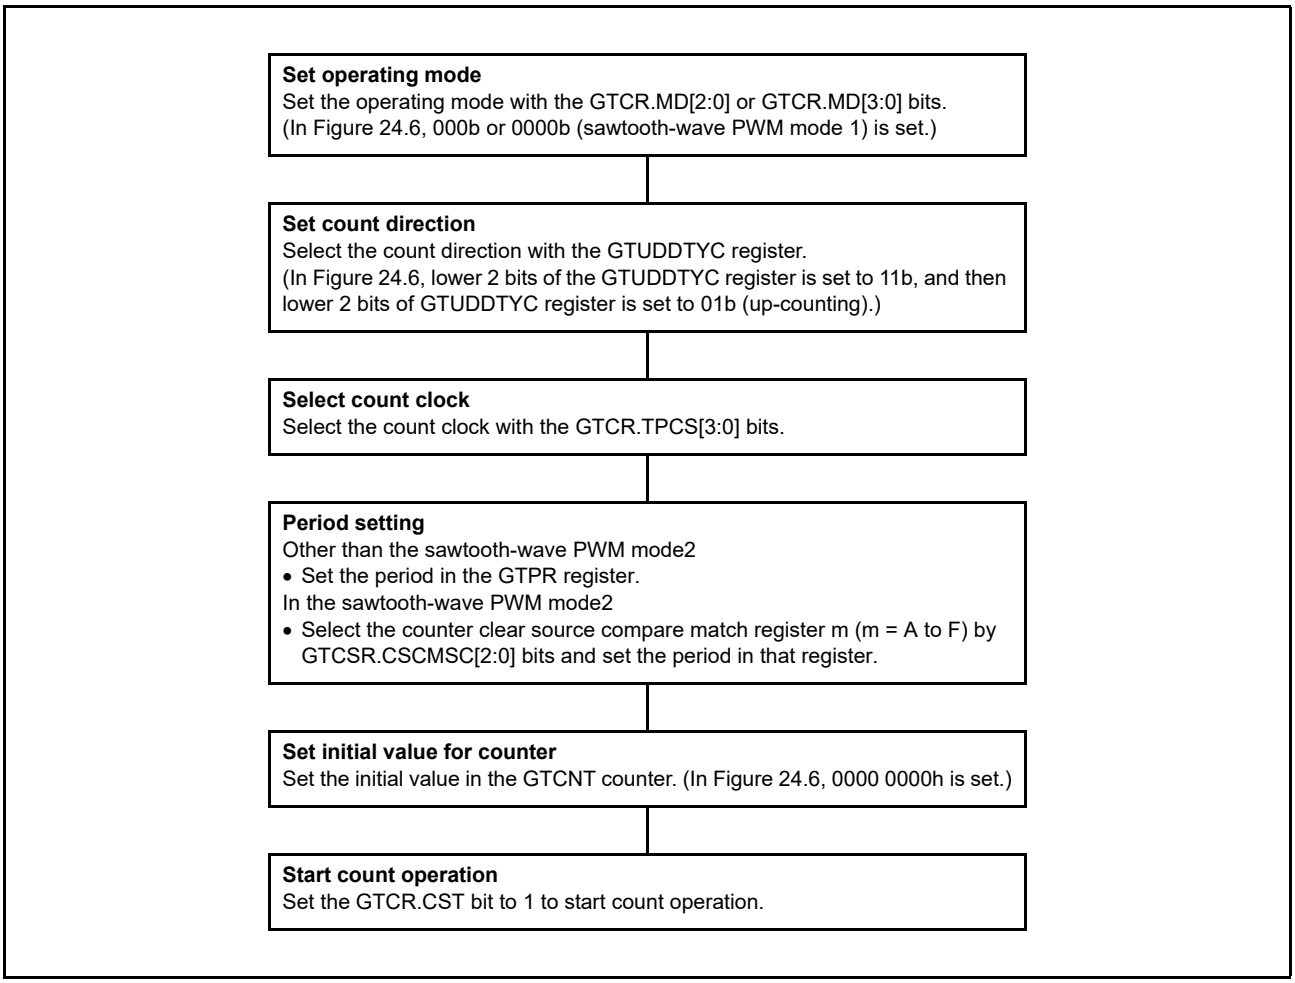

Figure 24.7 Example for Setting Periodic Count Operation (In Up-Counting by the Count Clock)

(3) Periodic Count Operation (In Down-Counting by the Count Clock)

The counter in each channel can start counting down when the corresponding GTUDDTYC.UD bit is set to 0 while the settings of the GTUPSR and GTDNSR registers are both 0000 0000h. When the value of the GTCNT counter changes from that of the GTPR register to 0000 0000h (an underflow), the GTST.TCFPU flag is set to 1, and if the setting of the GTINTAD.GTINTPR[1] bit is 1, a GTCIU interrupt request is also issued. After the GTCNT counter underflows, down-counting is resumed from the GTPR register value.

Figure 24.8 shows an example of periodic count operation in down-counting by count clock.

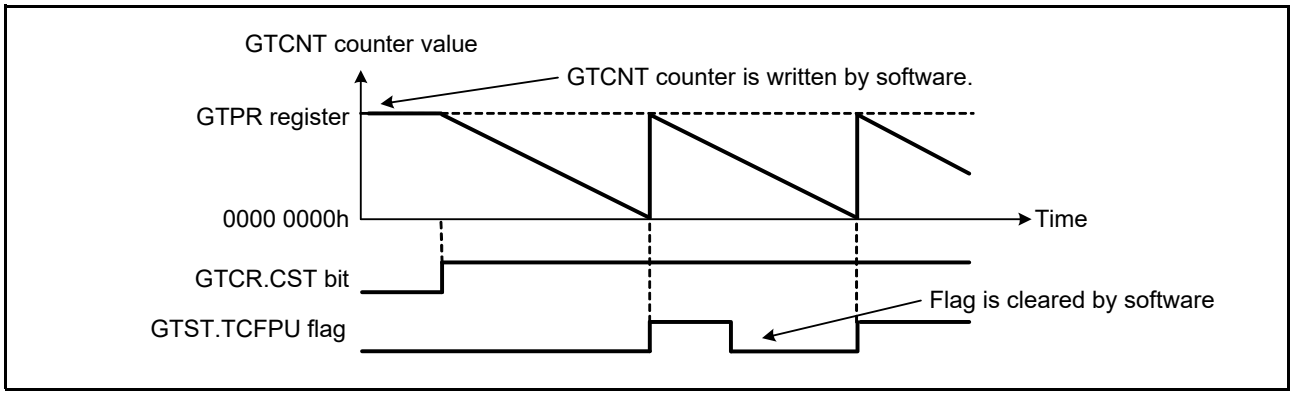

Figure 24.8 Example of Periodic Count Operation (In Down-Counting by the Count Clock)

Figure 24.9 shows an example for setting periodic count operation in down-counting by count clock.

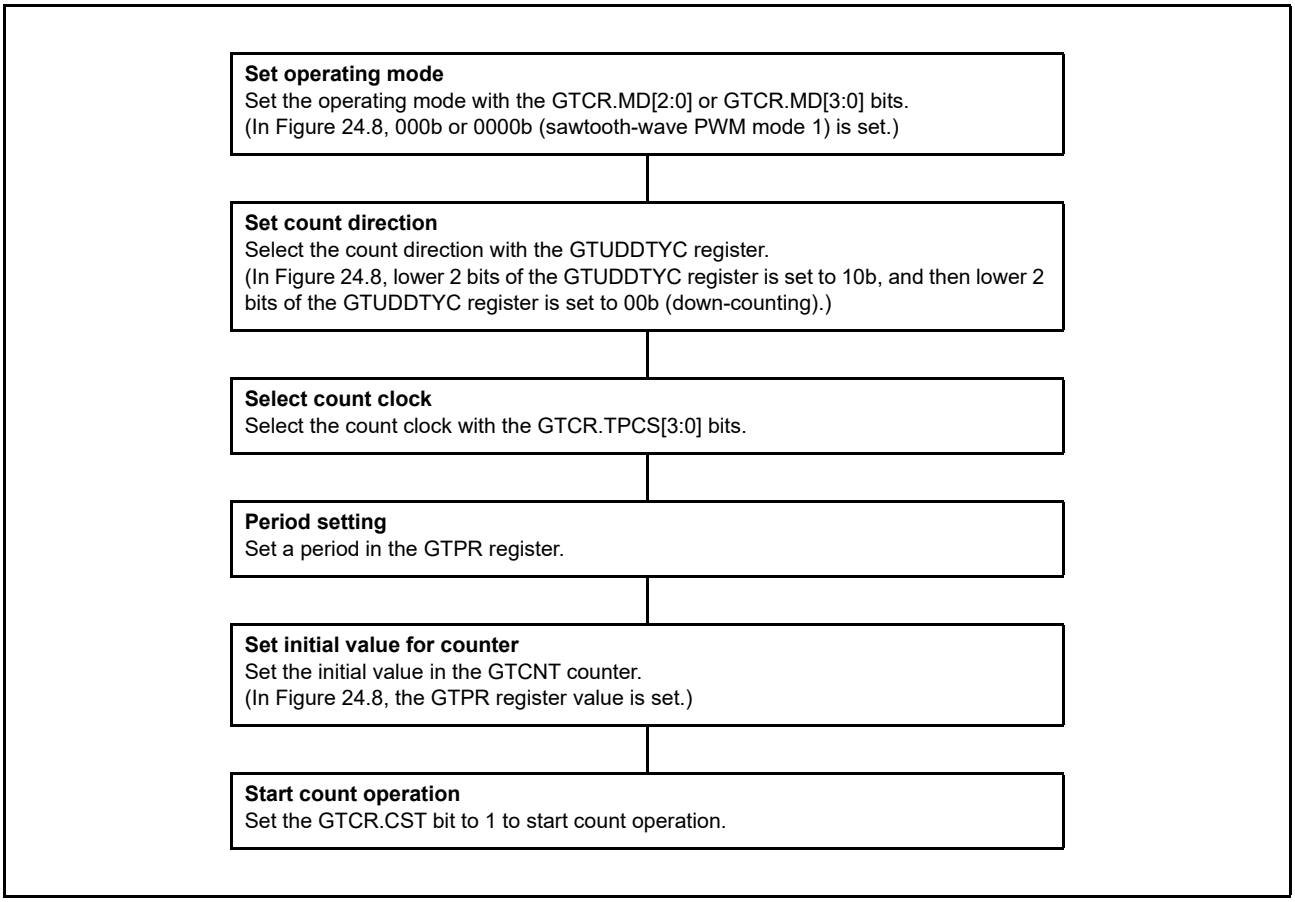

Figure 24.9 Example for Setting Periodic Count Operation (In Down-Counting by the Count Clock)

(4) Event Count Operation (In Up-Counting by Hardware Source)

The counter in each channel can start up-counting by hardware source by setting the GTUPSR register. When the GTUPSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value will not change.

Operation due to overflow in up-counting by hardware source is the same as the periodic count operation by the count clock.

To perform up-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. As the starting the count operation is synchronized with the count clock selected by TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start up-counting operation. To start up-counting after one GTCLK from setting the CST bit to 1, set the TPCS[3:0] bits to 0000b.

Figure 24.10 and Figure 24.11 show examples of up-counting operation by hardware source (the rising edge of GTETRGA pin input and the rising edge of GTIOCnA pin input).

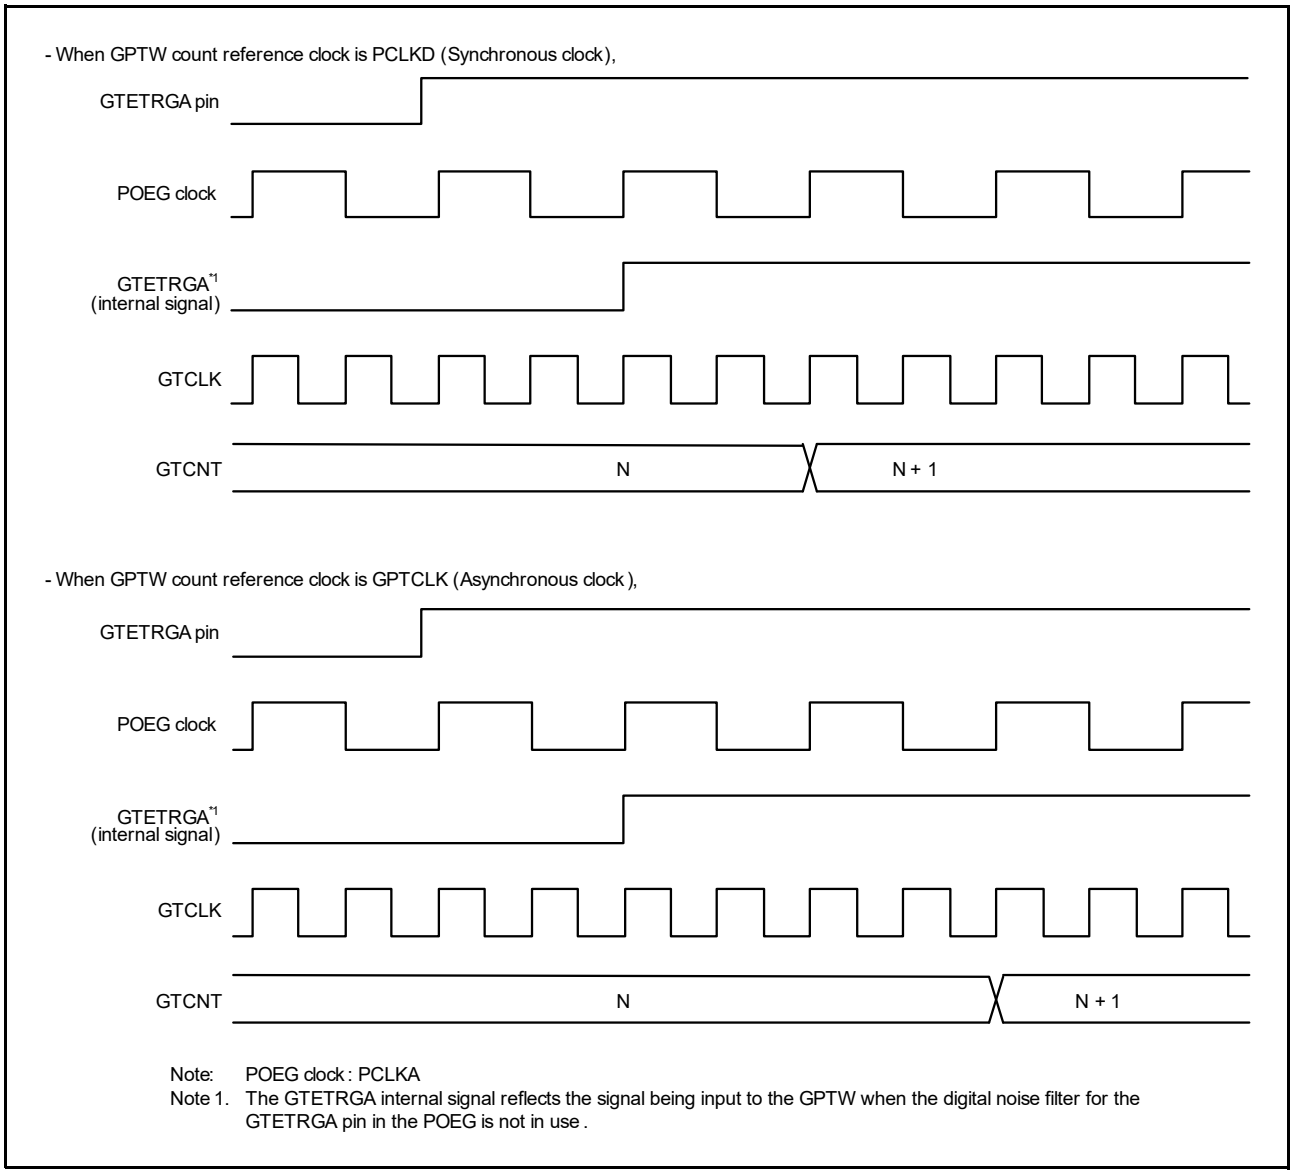

Figure 24.10 Example of Event Count Operation (Up-Counting of Rising Edges of the Input on the GTETRGA Pin)

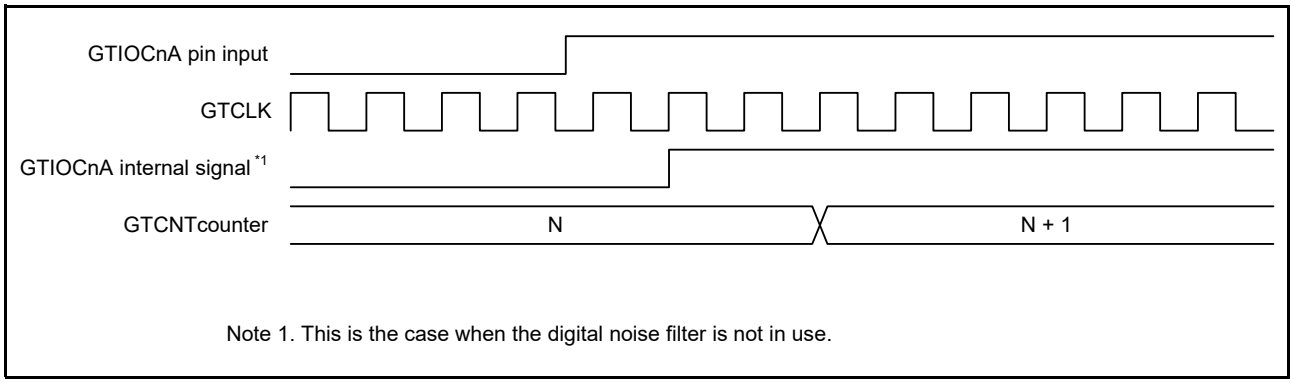

Figure 24.11 Example of Event Count Operation (Up-Counting of Rising Edges of the Input on the GTIOCnA Pin)

Figure 24.12 shows an example of event counting when the hardware source is an ELC event input.
This example shows the following signal flow:

- A compare match with the GPTW0.GTCCRA register outputs an event signal to the ELC.
- The ELC routes this signal to the GPTW as event source A, causing GPTW1.GTCNT to count events.

The ELC receives the GPTW0 compare match A signal, which is synchronized with GTCLK, and re-synchronizes it with PCLKB. After one PCLKB cycle, the ELC outputs the signal as GPTW event source A.

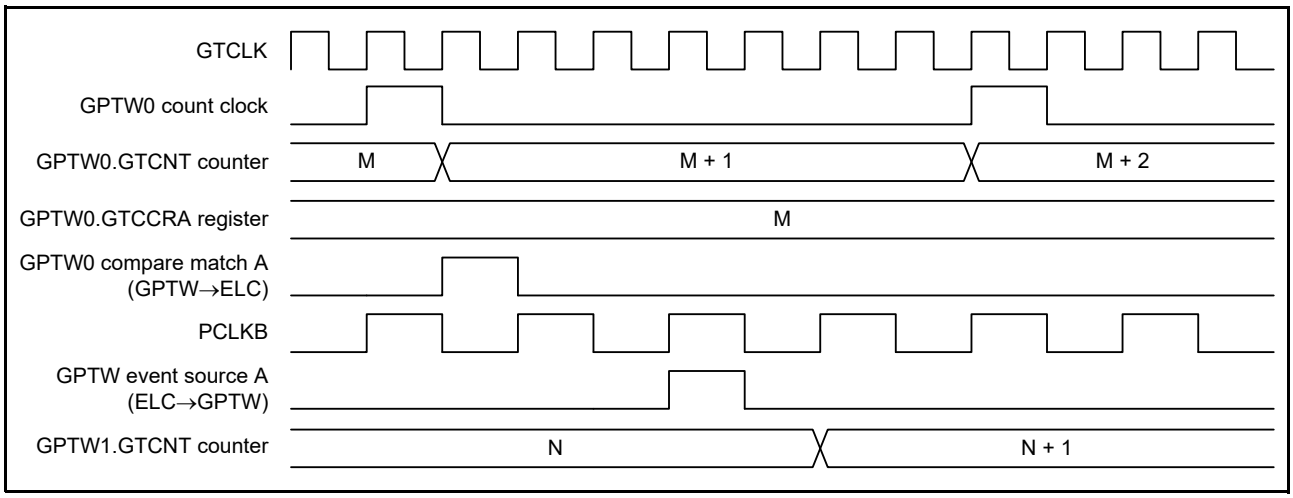

Figure 24.12 Example of Event Count Operation (Up-Counting the Number of Event Signals Input from the ELCA)

Figure 24.13 shows an example for setting event count operation in up-counting by hardware source.

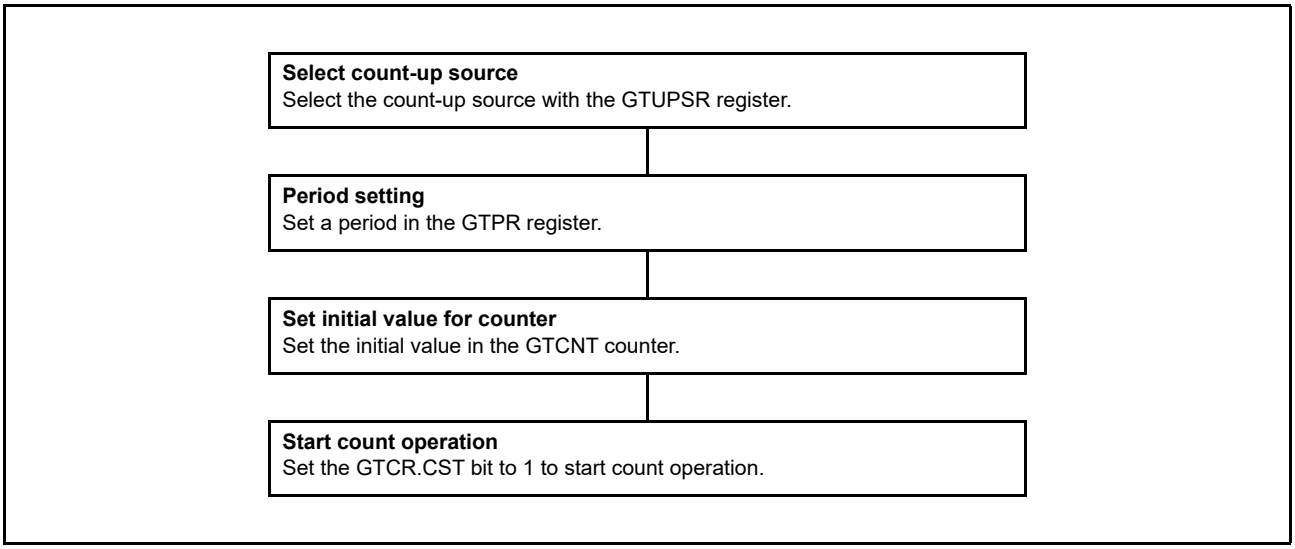

Figure 24.13 Example for Setting Event Count Operation (In Up-Counting by Hardware Source)

(5) Event Count Operation (In Down-Counting by Hardware Source)

The counter in each channel can start down-counting by hardware source by setting the GTDNSR register. When the GTDNSR register is set, the count clock selected by the GTCR.TPCS[3:0] bits and the count direction set by the GTUDDTYC.UD bit are invalid. If the hardware source in up-counting and the hardware source in down-counting are generated at the same time, the GTCNT counter value will not change.

Operation due to underflow in down-counting by hardware source is the same as the periodic count operation by the count clock.

To perform down-counting by hardware source, start count operation by setting the GTCR.CST bit to 1. As the starting the count operation is synchronized with the count clock selected by TPCS[3:0] bits, set the CST bit to 1, and wait until the first cycle of the count clock elapses to start down-counting operation. To start down-counting after one GTCLK from setting the CST bit to 1, set the TPCS[3:0] bits to 0000b.

Figure 24.14 shows an example of down-counting operation by hardware source.

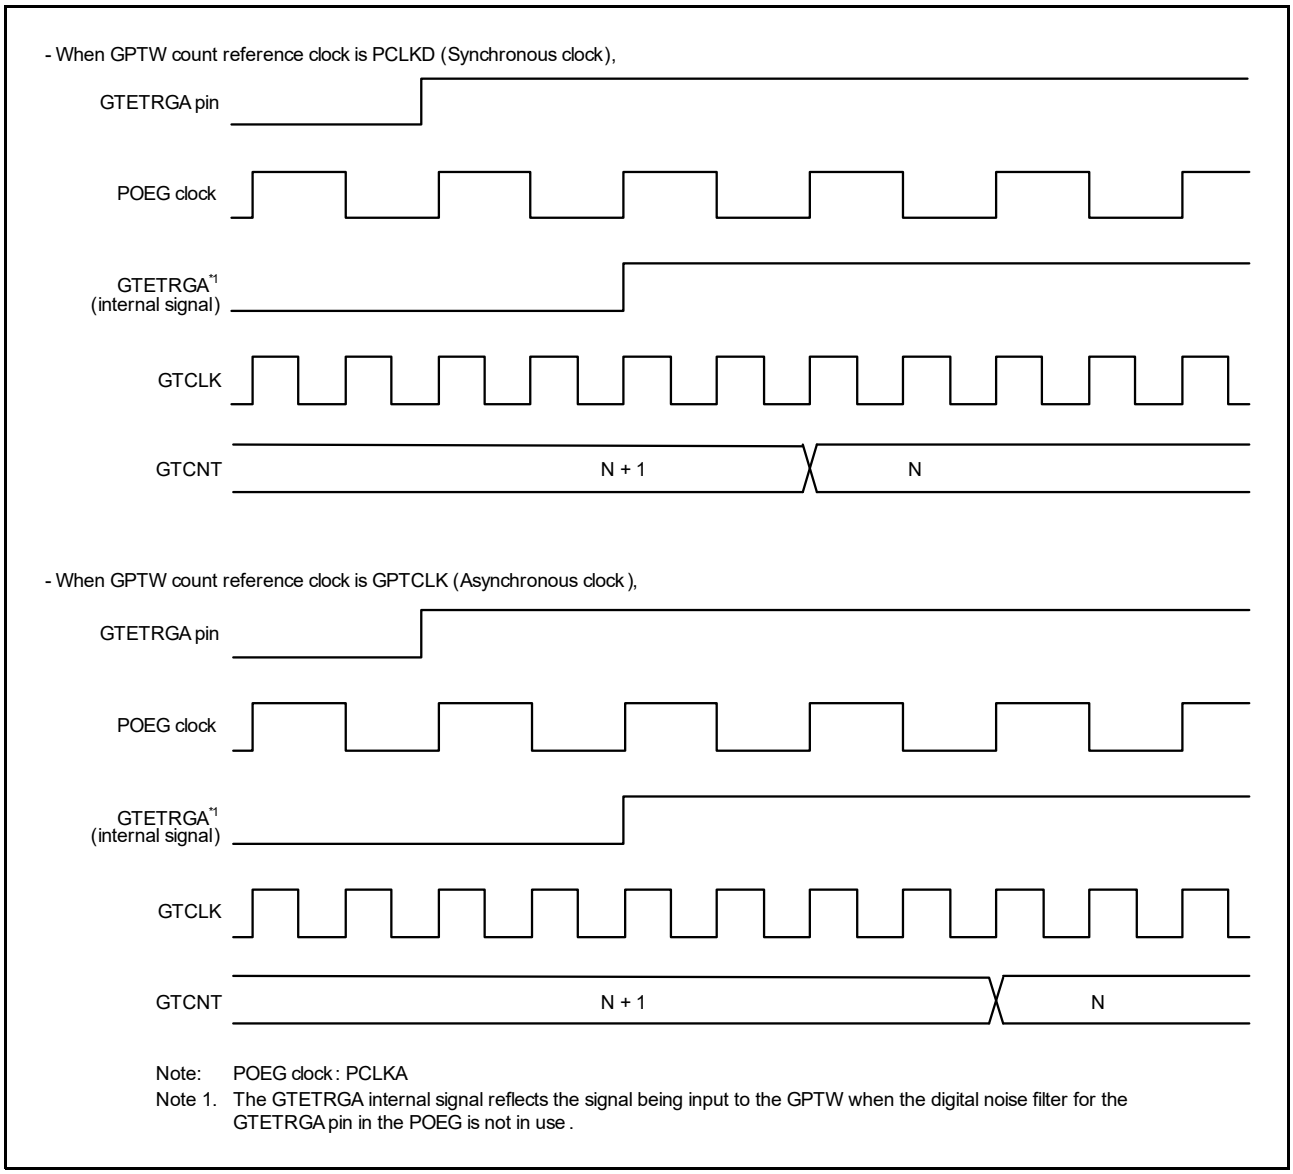

Figure 24.14 Example of Event Count Operation (Down-Counting of Rising Edges of the Input on the GTETRGA Pin)

Figure 24.15 shows an example for setting event count operation in down-counting by hardware source.

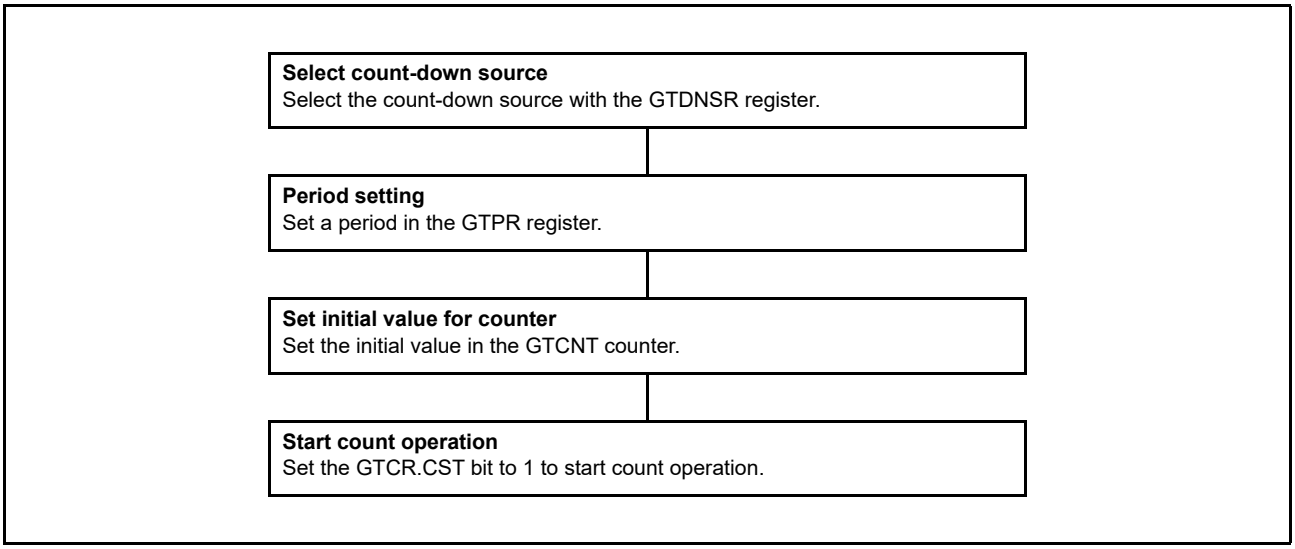

Figure 24.15 Example for Setting Event Count Operation (In Down-Counting by Hardware Source)

(6) Counter Clearing Operation

The counter in each channel can be cleared by the following sources:

- Writing to the GTCNT counter
- Writing 1 to the bit corresponding to the channel number for the GTCLR register while the GTCSR.CCLR bit is 1
- Hardware source specified by the GTCSR register

Do not write to the GTCNT register during counting.
GTCLR register can be written to and cleared by hardware source whether the count operation is performed (GTCR.CST bit = 1) or is stopped (CST bit = 0). When the count direction flag is set as decrement (GTST.TUCF flag = 0) in sawtooth-wave mode (except sawtooth-wave PWM mode 2) selected with GTCR.MD[2:0] or GTCR.MD[3:0] bits, the GTCNT counter value for writing to the GTCLR register and for clearing by hardware source becomes the GTPR register value whether the counter is in operation or is stopped. The GTCNT counter value becomes 0000 0000h for other settings.
When the event count operation is set (at least one of bits for the GTUPSR or the GTDNSR register is set as 1), writing to the GTCLR register and clearing by hardware source are performed right after the clear source is generated (the operation is based on GTCLK). For other settings, clearing operation is synchronized with the count clock selected with the GTCR.TPCS[3:0] bits.

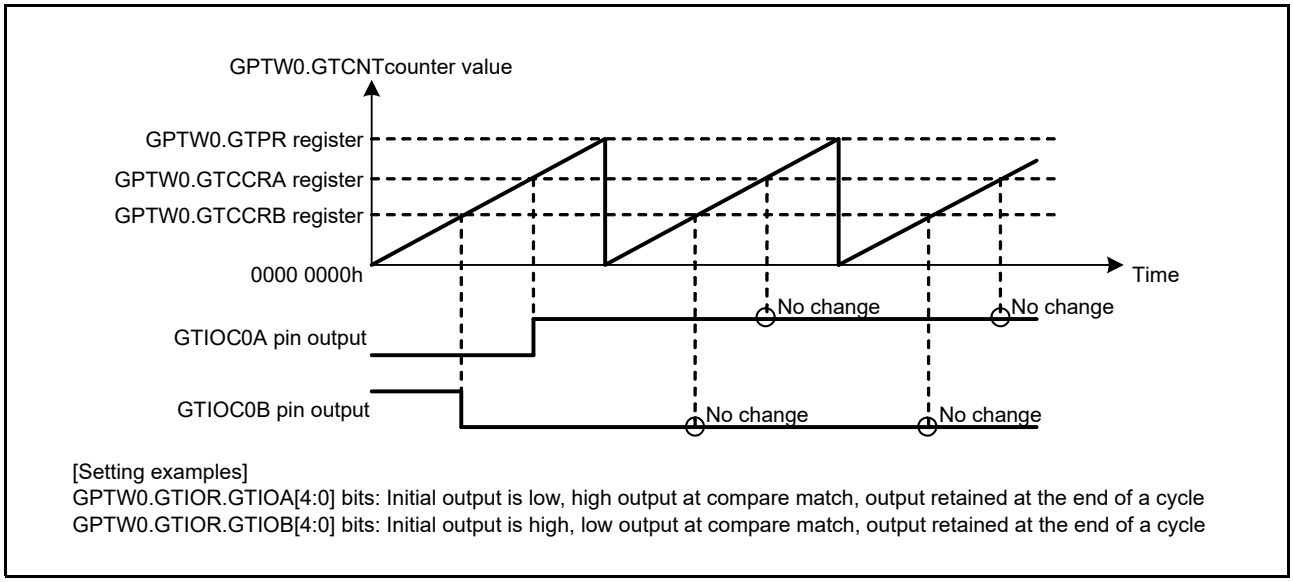
24.3.1.2 Waveform Output by Compare Match

Compare match refers to when the GTCNT counter value matches the GTCCRA or GTCCRB register value. The output of the corresponding GTIOCnA or GTIOCnB pin (n = 0 to 15) can be set to be driven low, high, or toggled in synchronization with the counter clock (including in the case of event counting) after the match.
In addition, the GTIOCnA or GTIOCnB pin output can be driven low, high, or toggled at the “end of the cycle” which is determined by the GTPR register or GTCCRm selected as a counter clear source by the GTCSR.CSCMSC[2:0] bits in sawtooth-wave PWM mode 2 (n = 0 to 7, m = A to F). The end of the cycle is as follows:

- For sawtooth waves (except sawtooth-wave PWM mode 2) in up-counting: When the GTCNT counter value changes from the GTPR register value to 0000 0000h (overflow)
- For sawtooth waves (except sawtooth-wave PWM mode 2) in down-counting: When the GTCNT counter value changes from 0000 0000h to the GTPR register value (underflow)
- For sawtooth-wave PWM mode 2 and GTCCRm register (m = A to F) selected as a counter clear source by the GTCSR.CSCMSC[2:0] bits. When the GTCNT counter value changes from the GTCCRm register value to 0000 0000h
- For sawtooth waves with the GTCNT counter clear
- For triangle waves or complementary PWM mode: When the GTCNT counter value changes from 0000 0000h to 0000 0001h (trough)

(1) Low Output and High Output

Figure 24.16 shows an example of low output and high output operation by a compare match of the GTCNT counter and GTCCRA register and of the GTCNT counter and GTCCRB register.
In this example, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that high is output from the GTIOC0A pin by a GPTW0.GTCCRA register compare match, and low is output from the GTIOC0B pin by a GPTW0.GTCCRB register compare match. The pin level does not change when the specified level and pin level match.



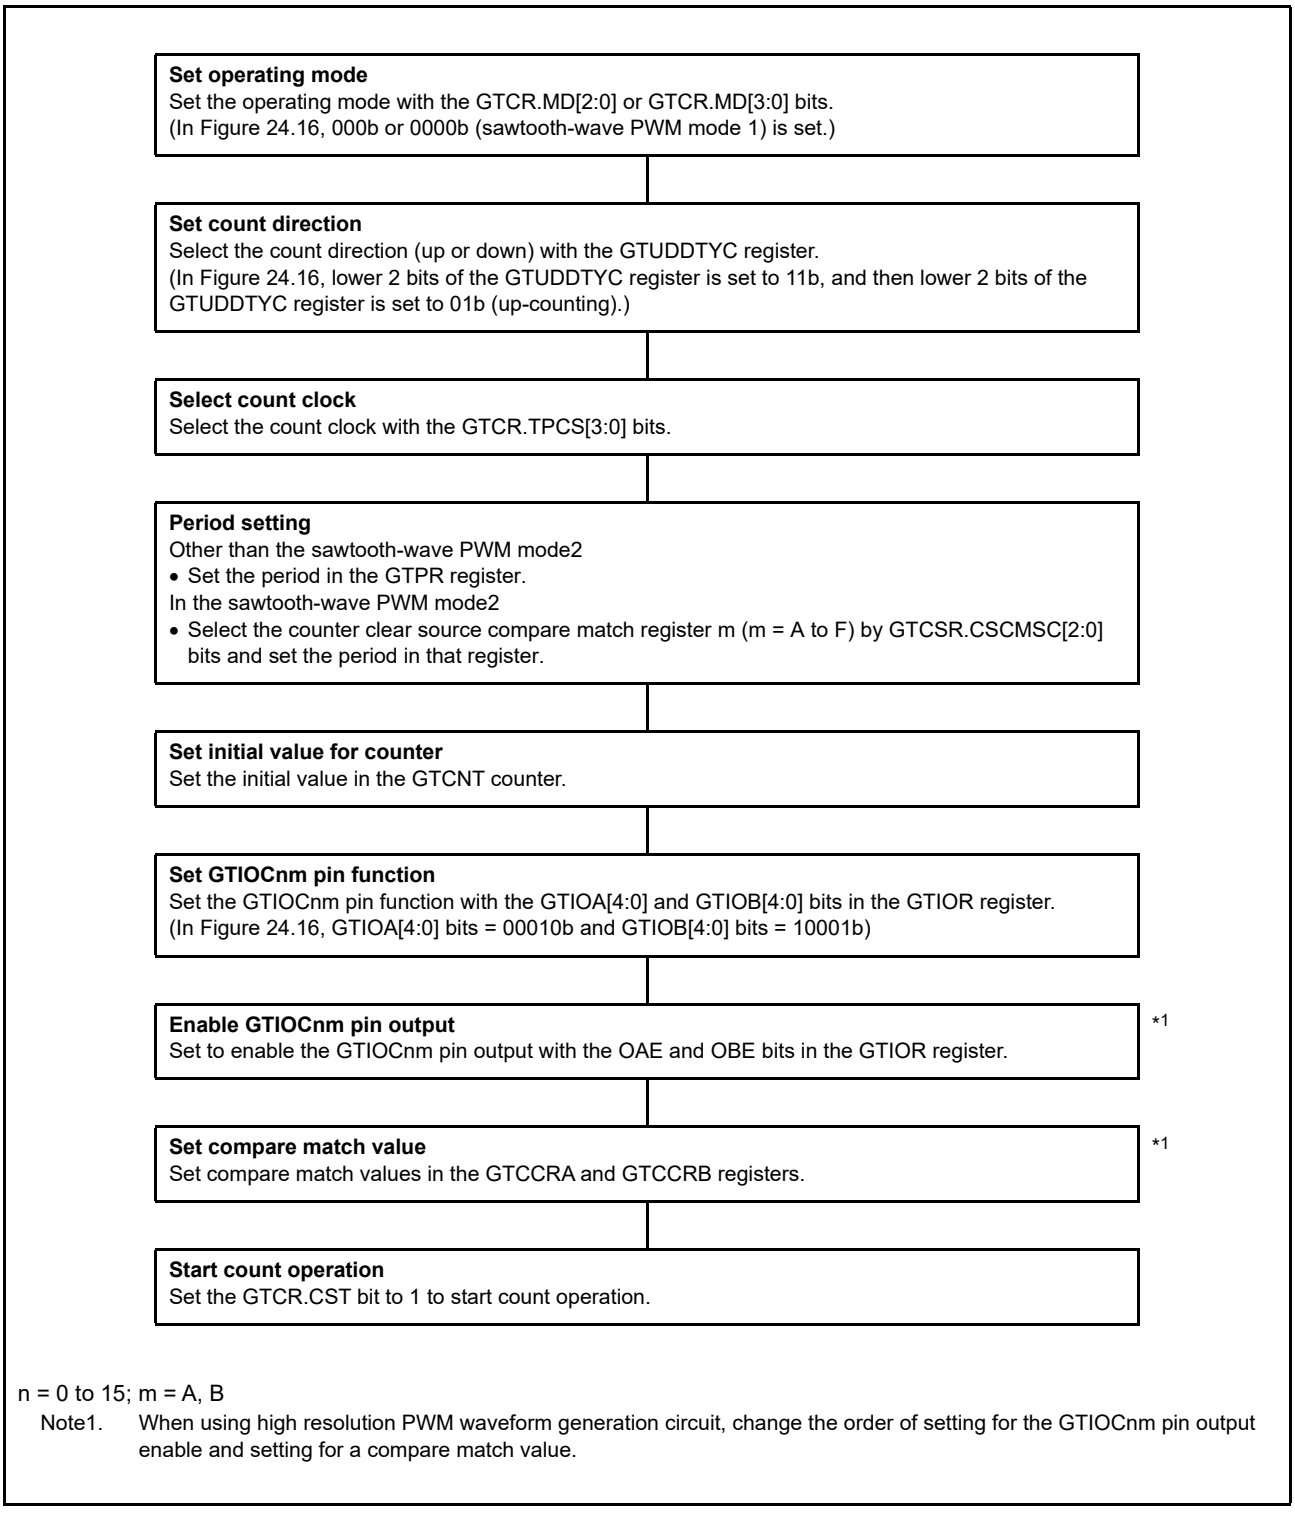


Figure 24.16 Example of Low Output and High Output Operation

Figure 24.17 shows an example for setting Low/High output operation.

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.17 Example for Setting Low/High Output Operation

(2) Toggled Output

Figure 24.18 and Figure 24.19 show examples of toggle output operations by compare match between the GPTW0.GTCNT counter and the GTCCRA and GTCCRB registers.

In Figure 24.18, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that the GTIOC0A pin output by a GPTW0.GTCCRA register compare match and GTIOC0B pin output by a GPTW0.GTCCRB register compare match are toggled.

In Figure 24.19, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that the GTIOC0A pin output is toggled by a compare match of GPTW0.GTCCRA register and the GTIOC0B pin output is toggled at the end of the cycle.

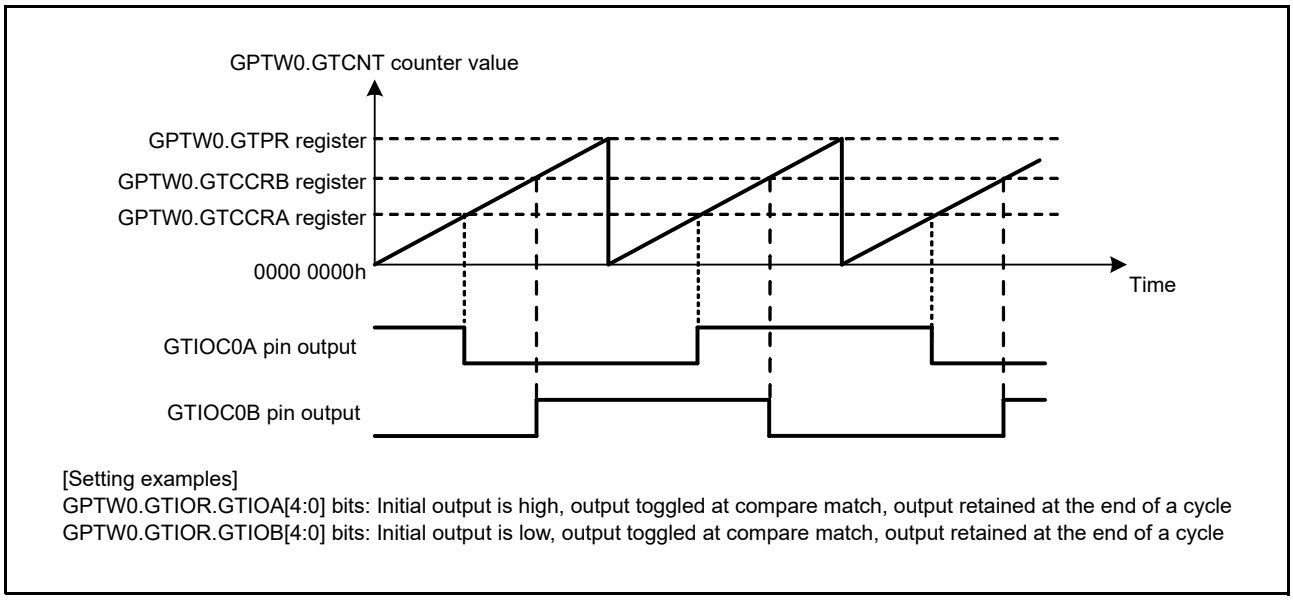

Figure 24.18 Example of Toggled Output Operation (1)

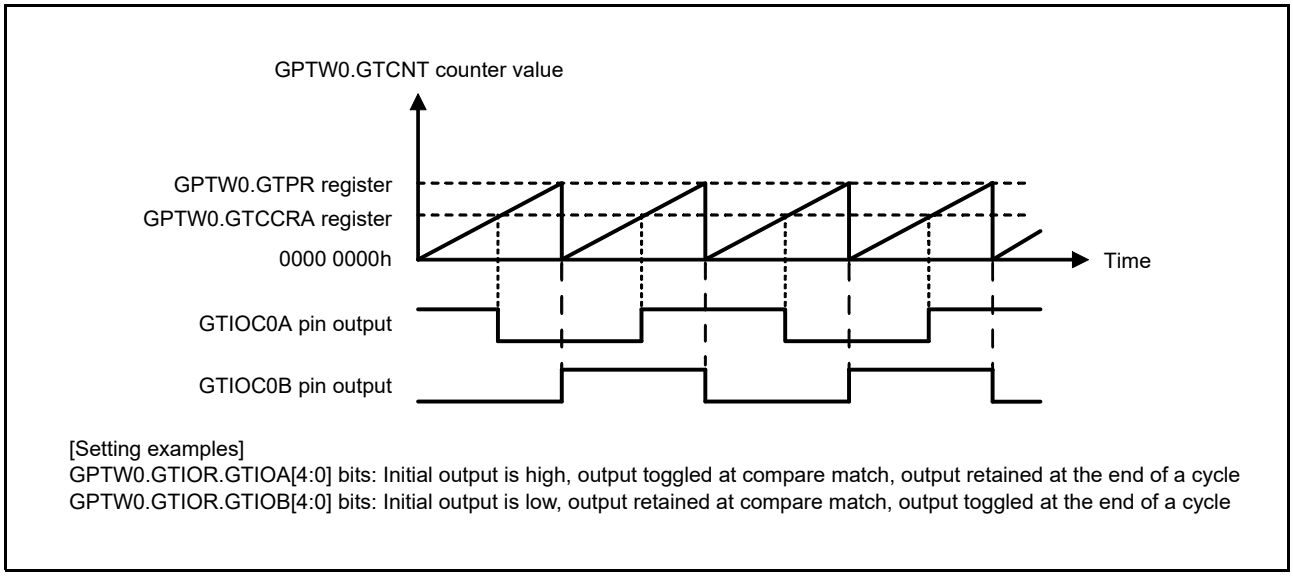

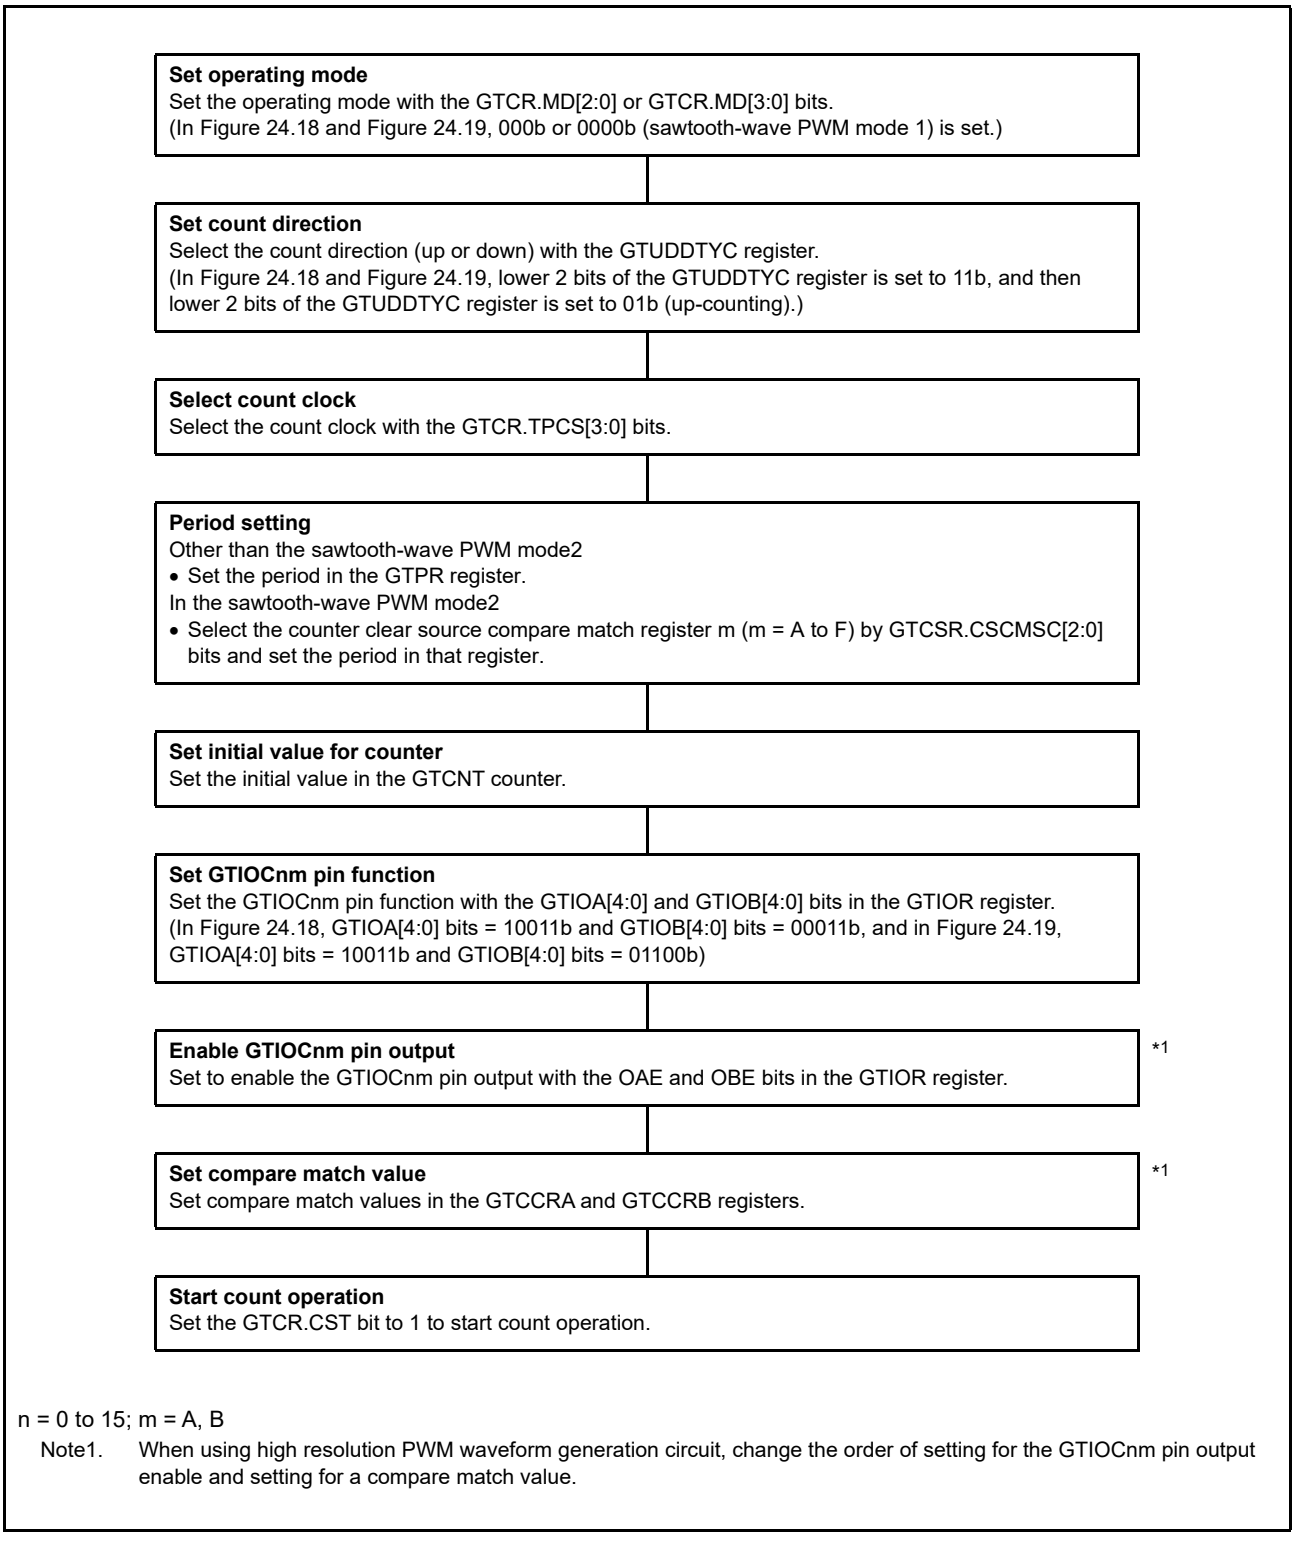

Figure 24.19 Example of Toggled Output Operation (2)

Figure 24.20 shows an example for setting toggled output operation.

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.20 Example for Setting Toggled Output Operation

24.3.1.3 Input Capture Function

Through detecting hardware sources selected by the GTICASR and GTICBSR registers, the GTCNT counter values can be transferred to the GTCCRA and GTCCRB registers respectively.

In complementary PWM mode, the GTCCRA and GTCCRB registers do not function as input capture registers.

Figure 24.21 shows an example of input capture function operation.

In this example, the GPTW0.GTCNT counter performs up-counting, and settings have been made so that an input capture is performed at both edges of the GTIOC0A pin input and at the rising edge of the GTIOC0B pin input.

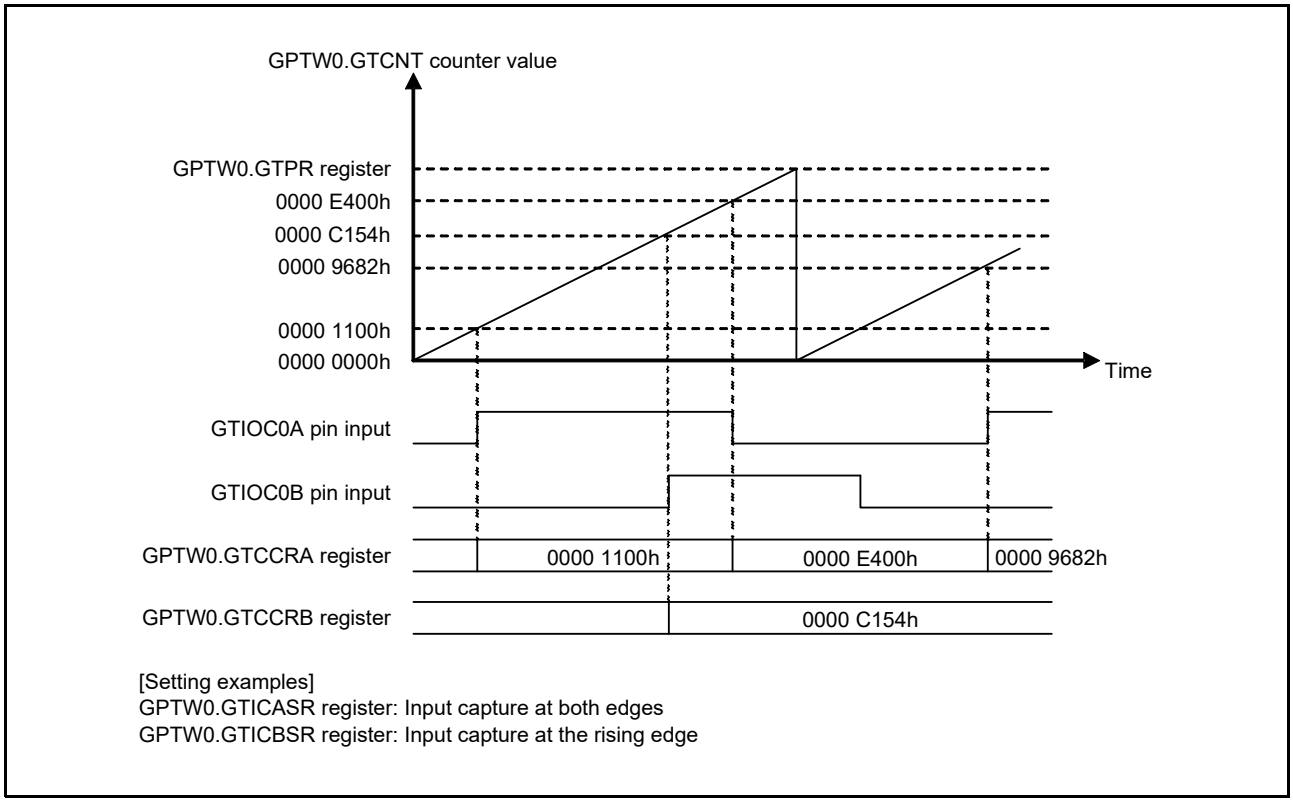

Figure 24.21 Example of Input Capture Operation

Figure 24.22 shows an example for setting input capture operation.

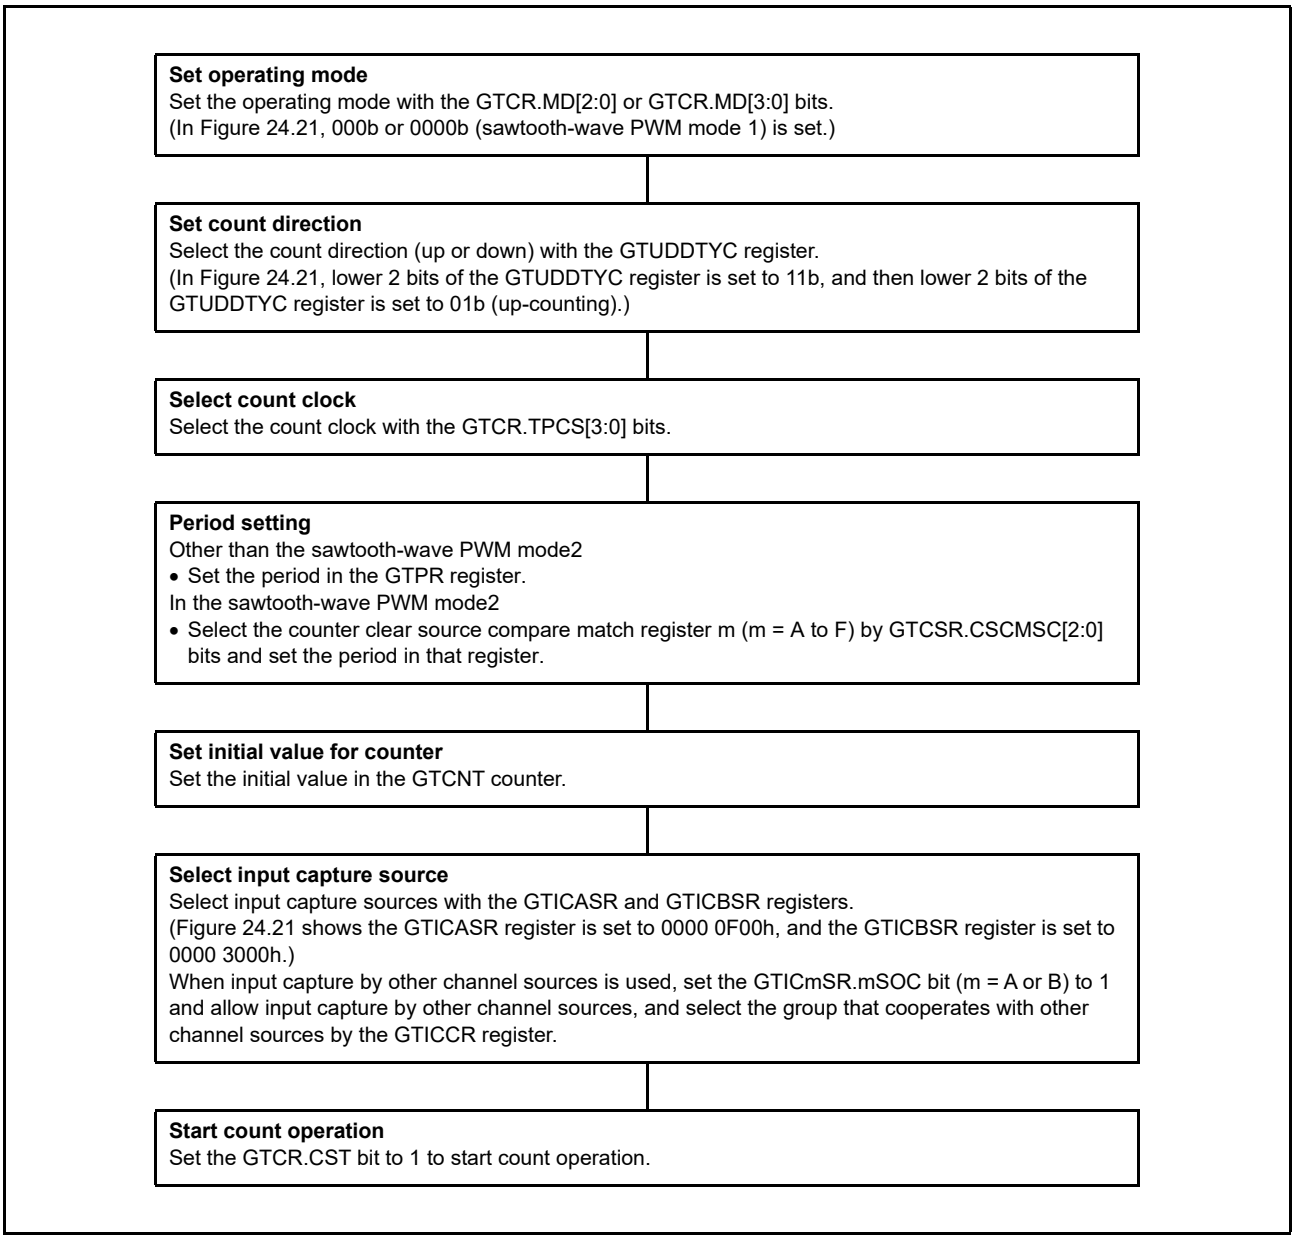

Figure 24.22 Example for Setting Input Capture Operation

Figure 24.23 shows an example of the timing of input capture operation in response to a rising edge of the input on the GTETRGA pin.

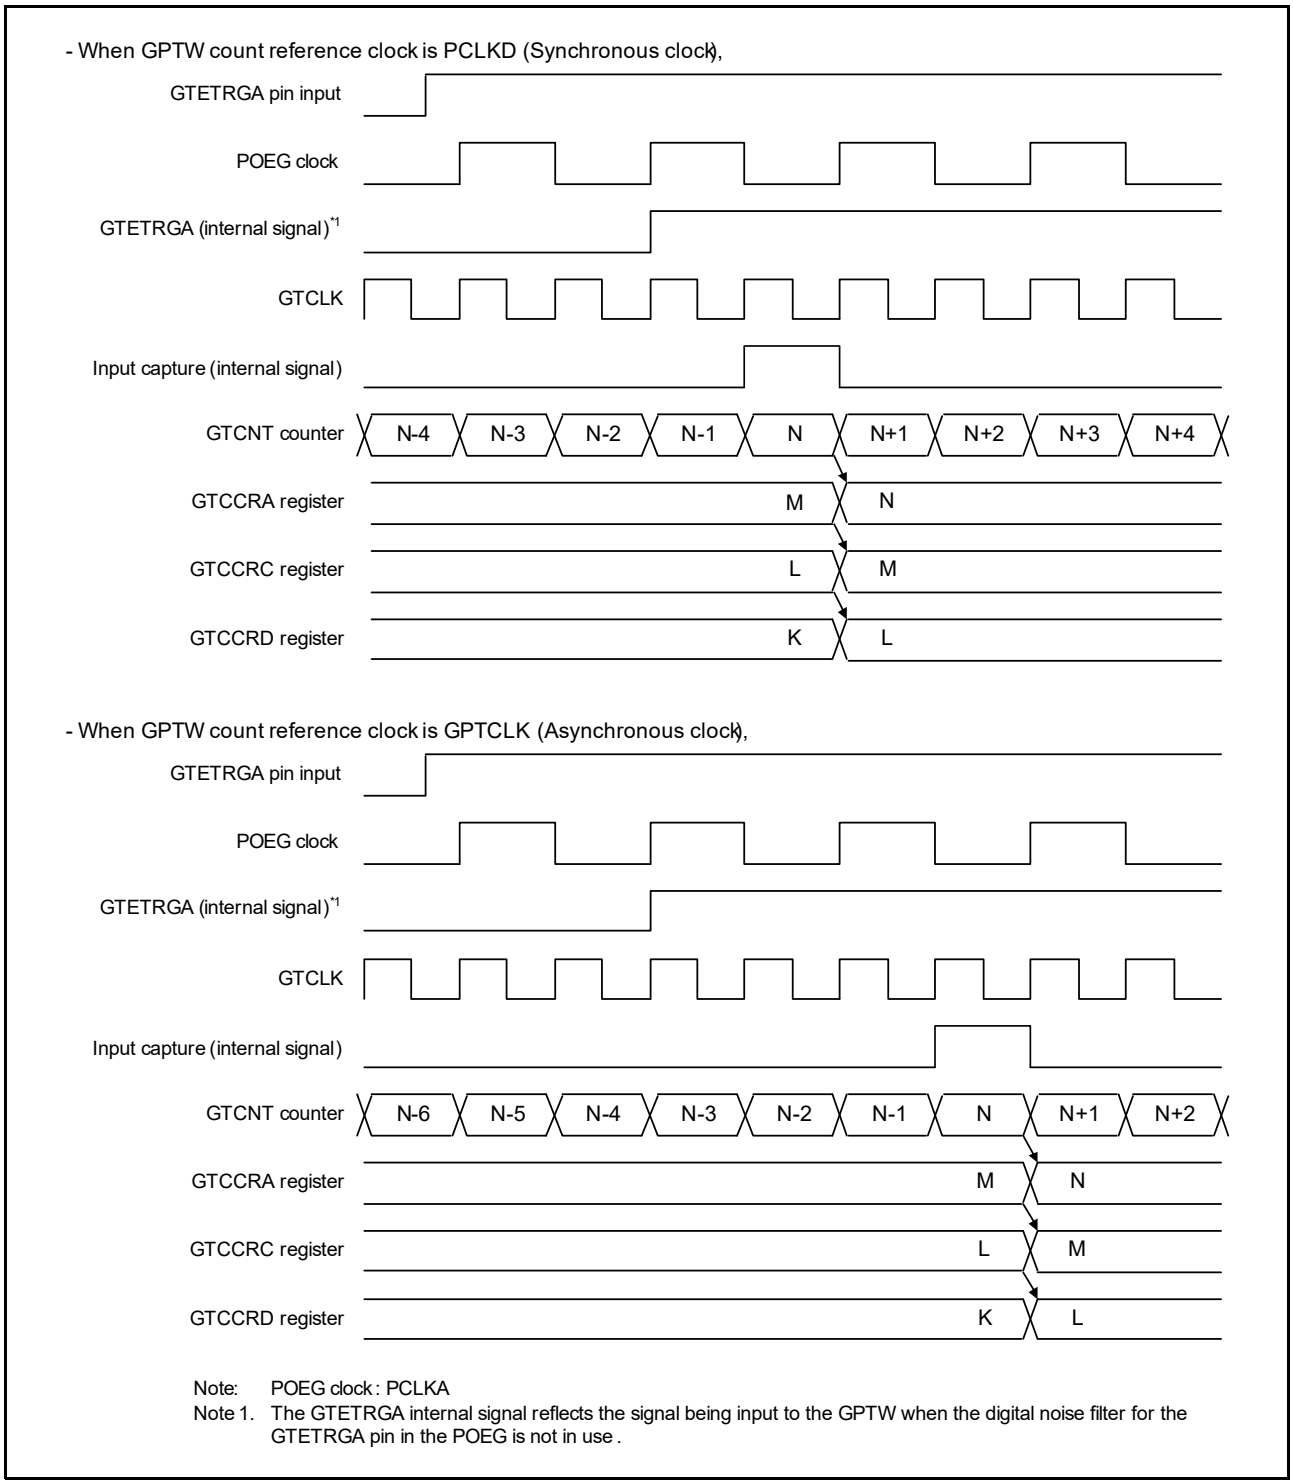

Figure 24.23 Example of the Timing of Input Capture Operation in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 24.24 shows an example of the timing of input capture operation in response to a rising edge of the input on the GTIOCnA pin.

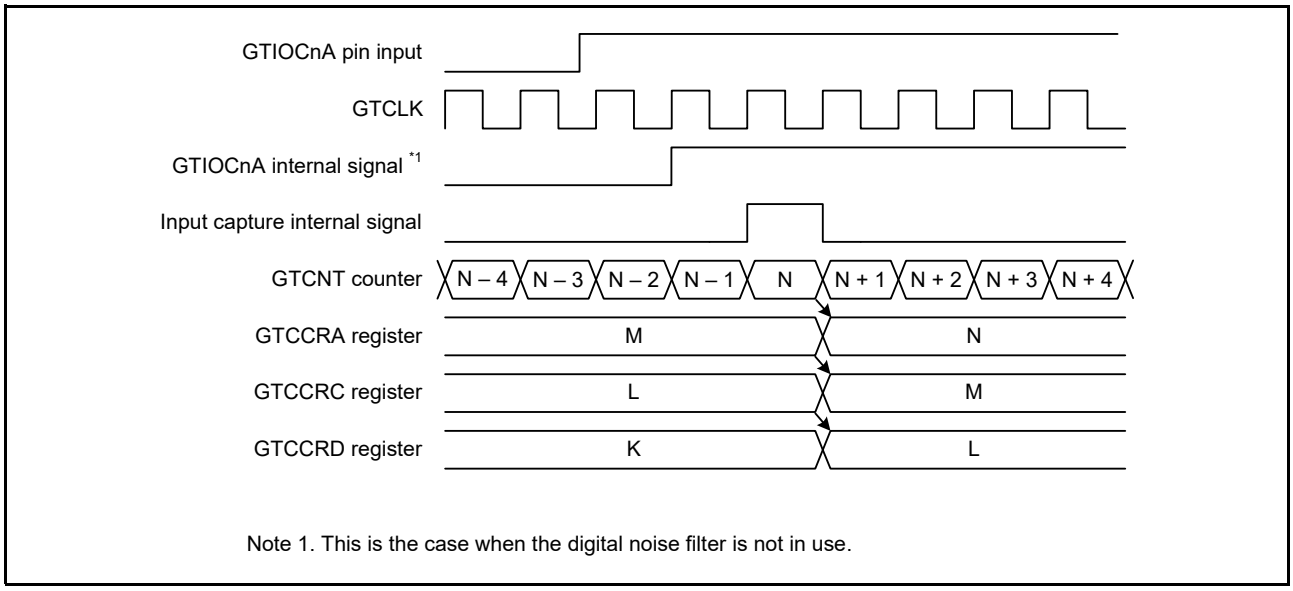

Figure 24.24 Example of the Timing of Input Capture Operation in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 24.25 shows an example of the timing of operations for input capture in response to event input from the ELCA. This is an example of capture of the counter value by the GPTW1.GTCCRA register in response to an input signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A. The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed.

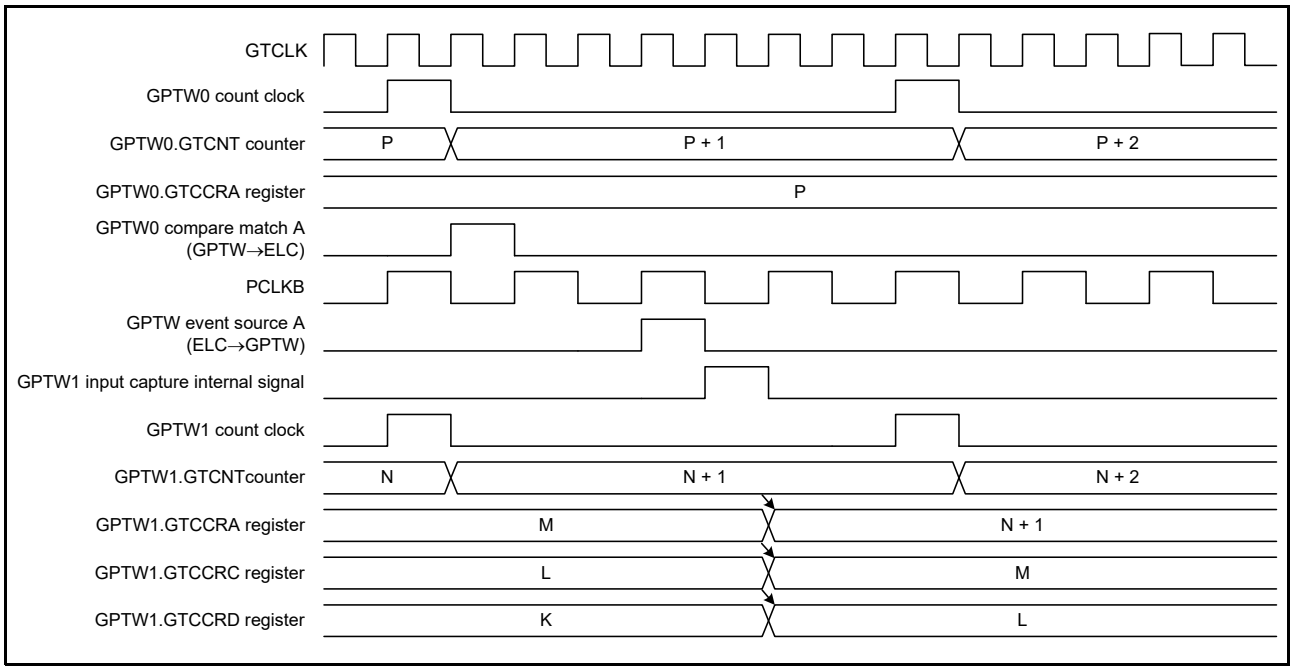

Figure 24.25 Example of the Timing of Operations for Input Capture in Response to Event Input from the ELCA

Figure 24.26 shows the input capture operation timing by the counter clock of other channels.

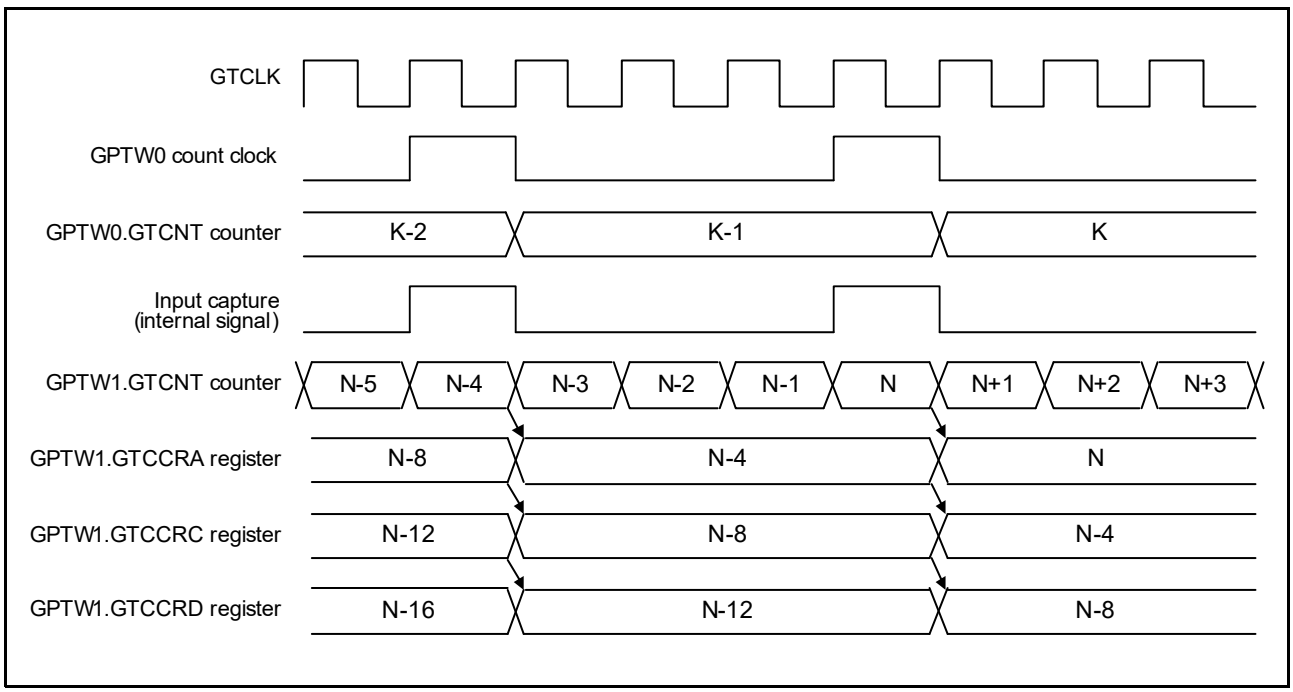

Figure 24.26 Example of the Timing of Input Capture Operation in Response to Count Clock from Other Channel

24.3.2 Buffer Operation

The following buffer operation can be set with the GTBER register.

- Buffer operation with the GTPR, GTPBR, and GTPDBR registers used together
- Buffer operation with the GTCCRA, GTCCRC, and GTCCRD registers used together
- Buffer operation with the GTCCRB, GTCCRE, and GTCCRF registers used together
- Buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers used together
- Buffer operation with the GTADTRB, GTADTBRB, and GTADTDBRB registers used together

The following buffer operation can be set with the GTDTCR register.

- Buffer operation with the GTDVU and GTDBU registers used together
- Buffer operation with the GTDVD and GTDBD registers used together

The following buffer operation can be set with the GTBER2 register.

- Buffer operation with the GTCCRA, GTCCRE, and GTCCRF registers (in complementary PWM mode 3, 4)
- Buffer operation with the GTOLBR.GTIOAB[4:0] bits and GTIOR.GTIOA[4:0] bits
- Buffer operation with the GTOLBR.GTIOBB[4:0] bits and GTIOR.GTIOB[4:0] bits

24.3.2.1 GTPR Register Buffer Operation

The GTPBR register can function as a buffer register for the GTPR register, and the GTPDBR register can function as a buffer register for the GTPBR register (double buffer register for the GTPR register).
In complementary PWM mode, the buffer transfer from the GTPDBR register to the temporary register P is performed only in the master channel (GPTWn). The temporary register P is transferred to each GTPBR register of master channel, slave channel 1 (GPTWn+1), and slave channel 2 (GPTWn+2). Transfer from the GTPBR register to the GTPR register is made concurrently in three channels. Therefore, the same value is stored in the same register of the three channels. The GTPR register of the master channel represents the period of the GTCNT counters of the three channels. In the slave channels, periods are controlled using the GTPR register value and the GTDVU register value.
The setting is invalid in the sawtooth-wave PWM mode 2.
The buffer transfer is performed at an overflow (in up-counting) or underflow (in down-counting) in sawtooth-wave mode or in event counting, or at a trough in triangle-wave mode.
When in sawtooth-wave mode and in event counting, the buffer transfer is performed even when the counter clearing shown below occurs during the counting operation.

- Hardware source clearing

(Clear source selected with GTCSR.CSGTRGAR, CSGTRGAF, CSGTRGBR, CSGTRGBF, CSGTRGCR, CSGTRGCF, CSGTRGDR, CSGTRGDF, CSCARBL, CSCARBH, CSCAFBL, CSCAFBH, CSCBRAL, CSCBRAH, CSCBFAL, CSCBFAH, CSELCA, CSELCB, CSELCC, CSELCD, CSELCE, CSELCF, CSELCG, CSELCH, CSCMSC[2:0], or CP1CCE bit)

- Clearing by software

(When the GTCLR.CCLRn bit is written to 1 during the GTCSR.CCLR bit is set to 1) (n = 0 to 15)
In the case of sawtooth waves, the buffer transfer by clearing counter can be prohibited by the GTBER2.CCTPR bit.
Figure 24.12 shows the buffer transfer timing in the complementary PWM mode.

Table 24.11 The GTPR Buffer Transfer Timing in Complementary PWM Mode

Mode	Complementary PWM mode 1	Complementary PWM mode 2	Complementary PWM mode 3 Complementary PWM mode 4
GTPDBR register ↓ Temporary register P	Counter running • One cycle of GTCLK after writing to the GTCCRD register for slave channel 2 (GPTWn+2) Counter stopped • One cycle of GTCLK after writing to the GTPDBR register	Counter running • One cycle of GTCLK after writing to the GTCCRD register for slave channel 2 (GPTWn+2) Counter stopped • One cycle of GTCLK after writing to the GTPDBR register	Counter running • One cycle of GTCLK after writing to the GTCCRD register for slave channel 2 (GPTWn+2) Counter stopped • One cycle of GTCLK after writing to the GTPDBR register
Temporary register P ↓ GTPBR register	When data is transferred to the temporary register P during up-counting middle • One cycle of GTCLK after transfer of data to the temporary register P When data is transferred to the temporary register P during a section other than up-counting middle • At the end of trough Counter stopped • One cycle of GTCLK after transfer of data to the temporary register P	When data is transferred to the temporary register P during down-counting middle • One cycle of GTCLK after transfer of data to the temporary register P When data is transferred to the temporary register P during a section other than down-counting middle • At the end of crest Counter stopped • One cycle of GTCLK after transfer of data to the temporary register P	When data is transferred to the temporary register P middle • One cycle of GTCLK after transfer of data to the temporary register P When data is transferred to the temporary register P during a section other than middle • At the end of crest/trough Counter stopped • One cycle of GTCLK after transfer of data to the temporary register P
GTPBR register ↓ GTPR register	At the end of crest • Counter clearing in an up-counting middle or crest section, including counter clearing enabled by setting the GTCSR.CP1CCE bit	At the end of trough • Counter clearing in a down-counting middle or trough section	At the end of crest At the end of trough • Counter clearing

To enable double buffer operation for the GTPR register, set the GTBER.PR[1:0] bits to 10b or 11b. For single buffer operation, set 01b. To disable buffering, set 00b.

In complementary PWM mode, complementary PWM mode-specific buffer operation is performed regardless of the GTBER.PR[1:0] bits setting.

Figure 24.27 to Figure 24.29 show examples of the GTPR register buffer operation and Figure 24.33 shows an example for setting the GTPR register buffer operation.

For details of operation settings in complementary PWM mode, refer to section 24.3.3, PWM Output Operating Mode.

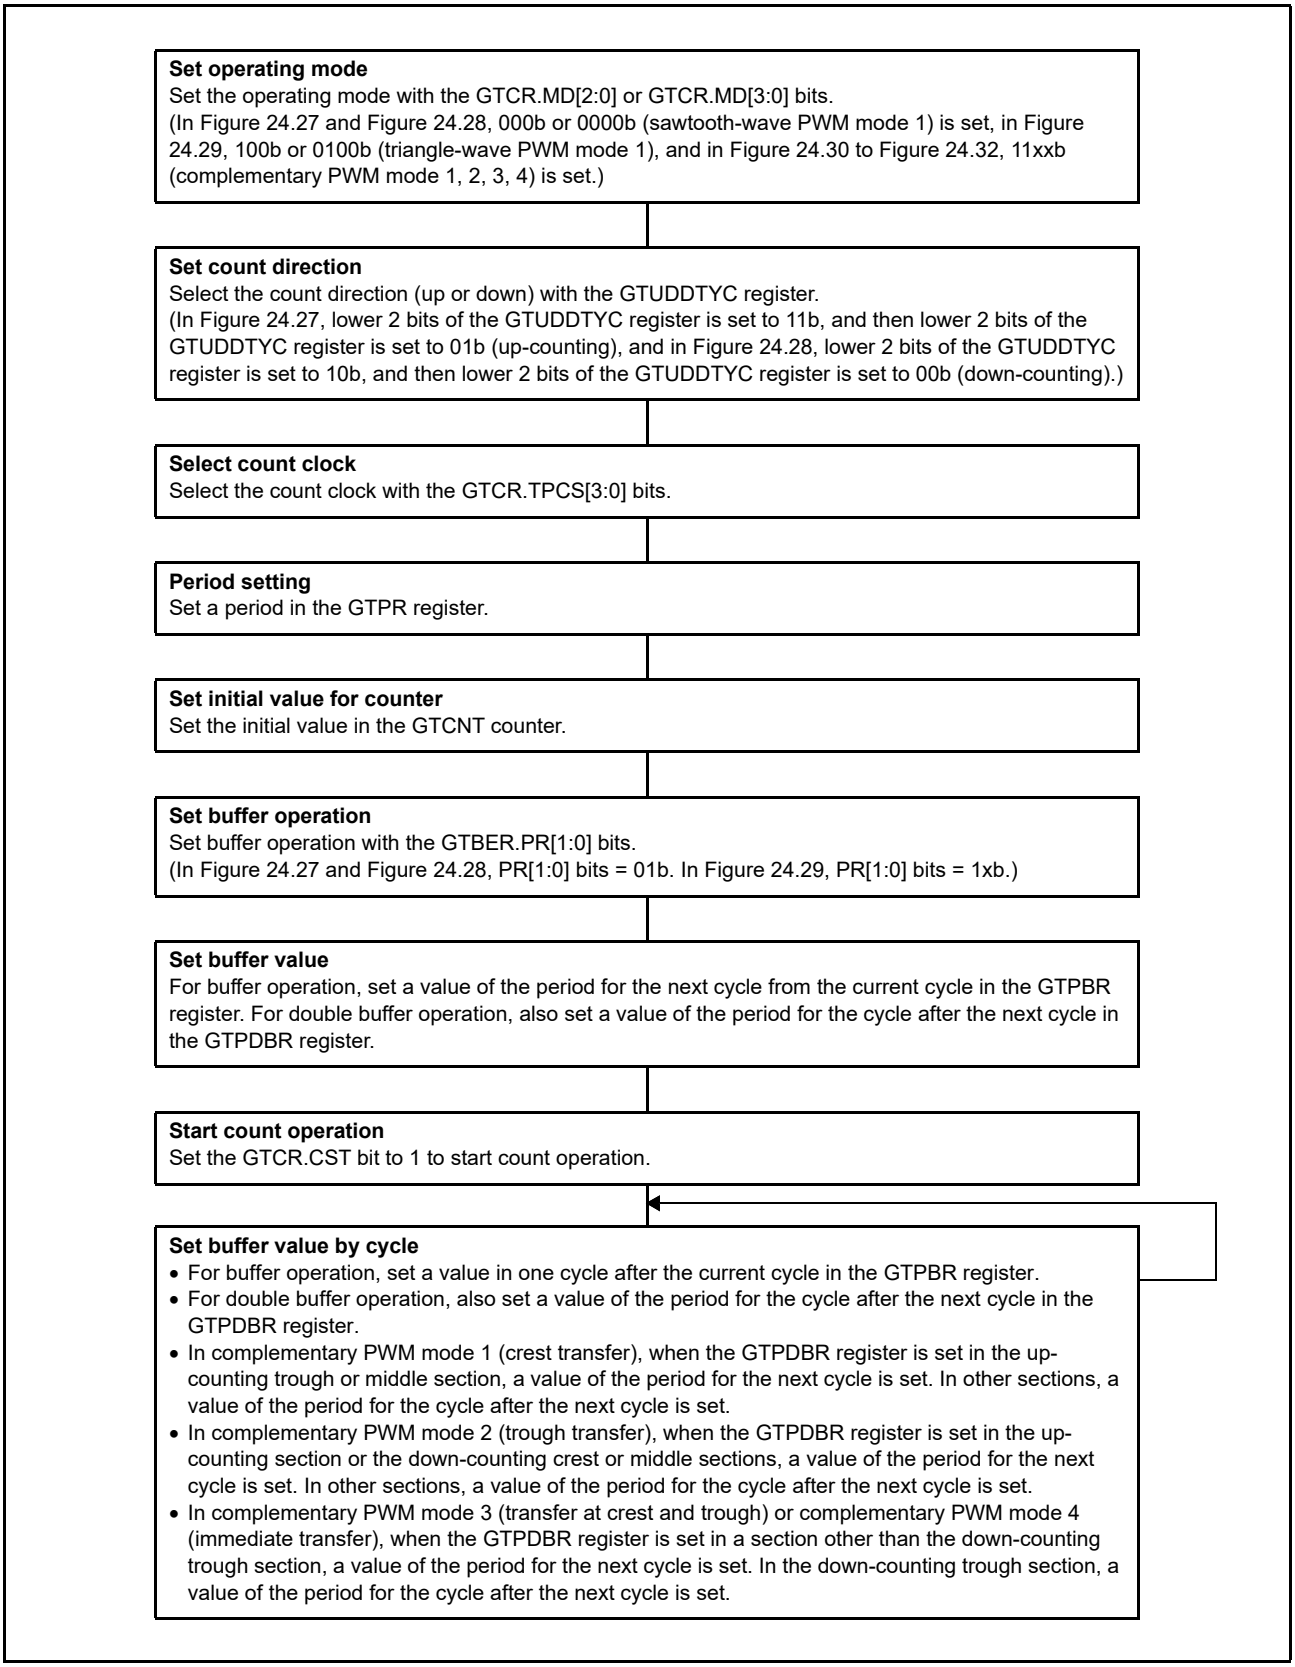

Figure 24.33 Example for Setting the GTPR Register Buffer Operation

24.3.2.2 Buffer Operation for the GTCCRA and GTCCRB Registers

The GTCCRC register can function as the GTCCRA buffer register and the GTCCRD register can function as the GTCCRC buffer register (double buffer register for the GTCCRA register). Similarly, the GTCCRE register can function as the GTCCRB buffer register and the GTCCRF register can function as the GTCCRE buffer register (double buffer register for the GTCCRB register).
To enable double buffer operation for the GTCCRA or GTCCRB register, set the GTBER.CCRA[1:0] or GTBER.CCRB[1:0] bits to 10b or 11b, respectively. For single buffer operation, set 01b. To disable buffering, set 00b.
In sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode, the buffer operations specific to each PWM output operating mode are performed regardless of the settings of the GTBER.CCRA[1:0] and GTBER.CCRB[1:0] bits. For details on the buffer operations in sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, and complementary PWM mode, refer to section 24.3.3, PWM Output Operating Mode.
The following describes buffer operation during output compare and input capture operation.

(1) When the GTCCRA or GTCCRB Register Functions as Output Compare Register

In sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode, the buffer operation is performed as appropriate for the PWM output operating mode regardless of the setting of the GTBER.CCRA[1:0] and GTBER.CCRB[1:0] bits. For details, refer to section 24.3.3, PWM Output Operating Mode. Other than the above PWM output operating mode, buffer transfer is performed in the following four cases:

- Buffer transfer at an overflow (in up-counting) and underflow (in down-counting)
  Buffer transfer is performed at an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode and in event counting, and at a trough (triangle-wave PWM mode 1) or at a crest/trough (triangle-wave PWM mode 2) in triangle-wave mode.
- Buffer transfer by counter clearing
  In sawtooth-wave mode and in event counting, the buffer transfer by the same counter clearing sources described in section 24.3.2.1, GTPR Register Buffer Operation, is performed during counting operation, in the same way as at an overflow (in up-counting) or an underflow (in down-counting).
  In sawtooth-wave, the buffer transfer of GTCCRm register by counter clearing can be disabled with the GTBER2.CCTCm bit (m = A, B).
  In triangle-wave mode, buffer transfer by counter clearing is not performed.
- Buffer transfer by compare match
  In sawtooth-wave, the buffer transfer by the compare match of GTCCRm register enabled by GTBER2.CMTCm (m = A, B) bit is performed.
- Forcible buffer transfer
  In sawtooth-wave mode, triangle-wave mode, and event counting, buffer transfer of the GTCCRA and GTCCRB registers is forcibly performed by writing 1 to the GTBER.CCRSWT bit while the counting is stopped.
  In sawtooth-wave one-shot pulse mode and triangle-wave PWM mode 3, buffer transfer from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B is also performed using the forcible buffer operation.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffers to the GTCCRm (m = A, B) registers is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or buffer transfer extended skipping function (function for repeated double-buffer operation while buffer transfer is disabled). For details, refer to section 24.8.2.2, Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.
Figure 24.34 to Figure 24.37 show examples of the GTCCRA and GTCCRB registers buffer operations, and Figure 24.38 shows an example for setting the GTCCRA and GTCCRB registers buffer operations.

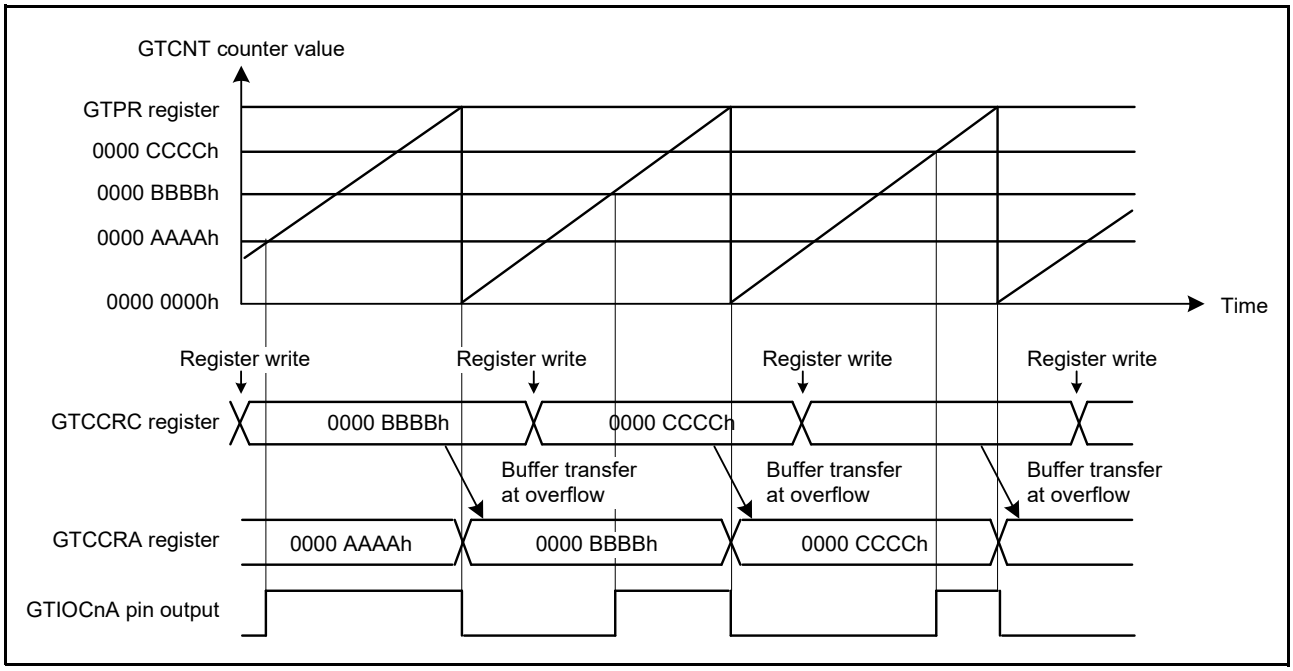

Figure 24.34 Example of GTCCRA and GTCCRB Registers Buffer Operation (Output Compare, Sawtooth-Waves, Sawtooth-Wave PWM mode 1 in Up-Counting, High Output at GTCCRA Register Compare Match, Low Output at the End of the Cycle) (n = 0 to 15)

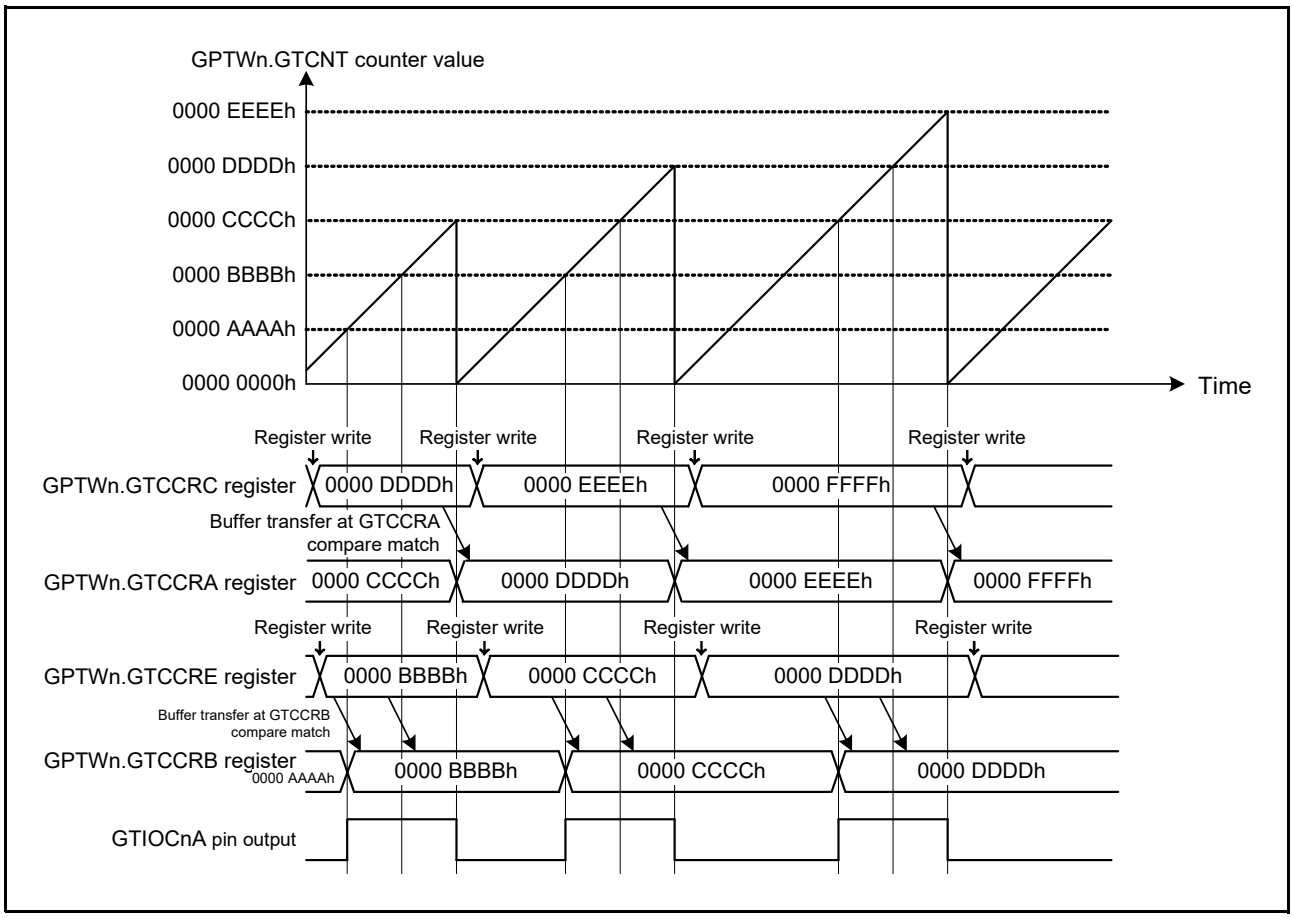

Figure 24.35 Example of GTCCRA and GTCCRB Registers Buffer Operation (Output Compare, Sawtooth-Wave PWM mode 2, Buffer Transfer at GTCCRA Register Compare Match, Counter Clearing, Low Output, Buffer Transfer at GTCCRB Register Compare Match, High Output) (n = 0 to 15)

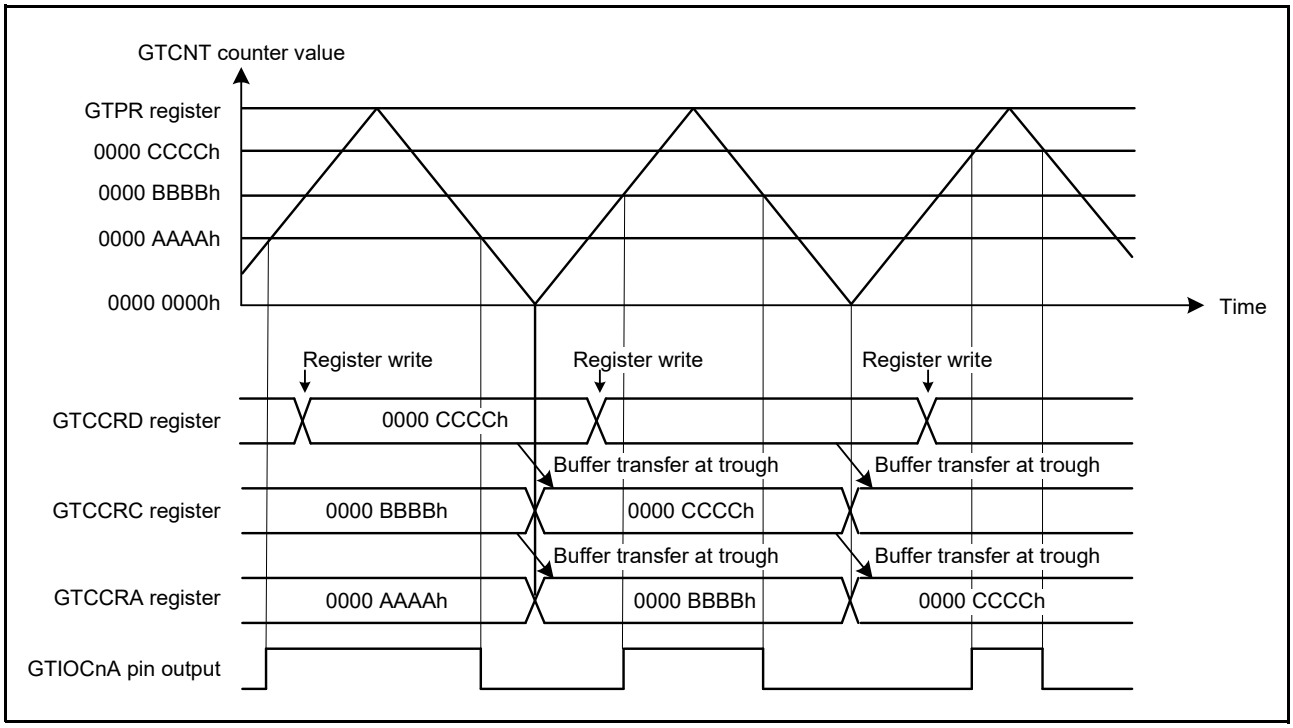

Figure 24.36 Example of GTCCRA and GTCCRB Registers Double Buffer Operation (Output Compare, Triangle Waves, Buffer Operation at Trough, Output Toggled at GTCCRA Register Compare Match, Output Retained at the End of the Cycle) (n = 0 to 15)

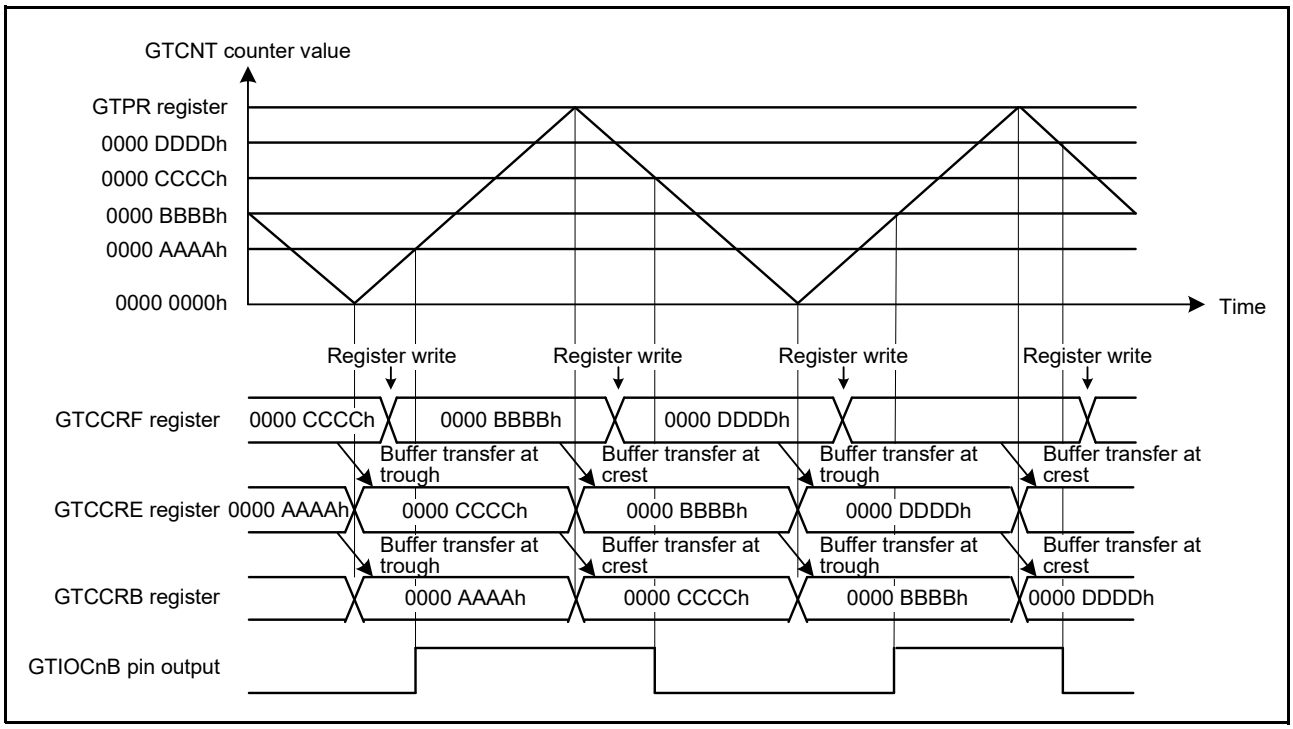

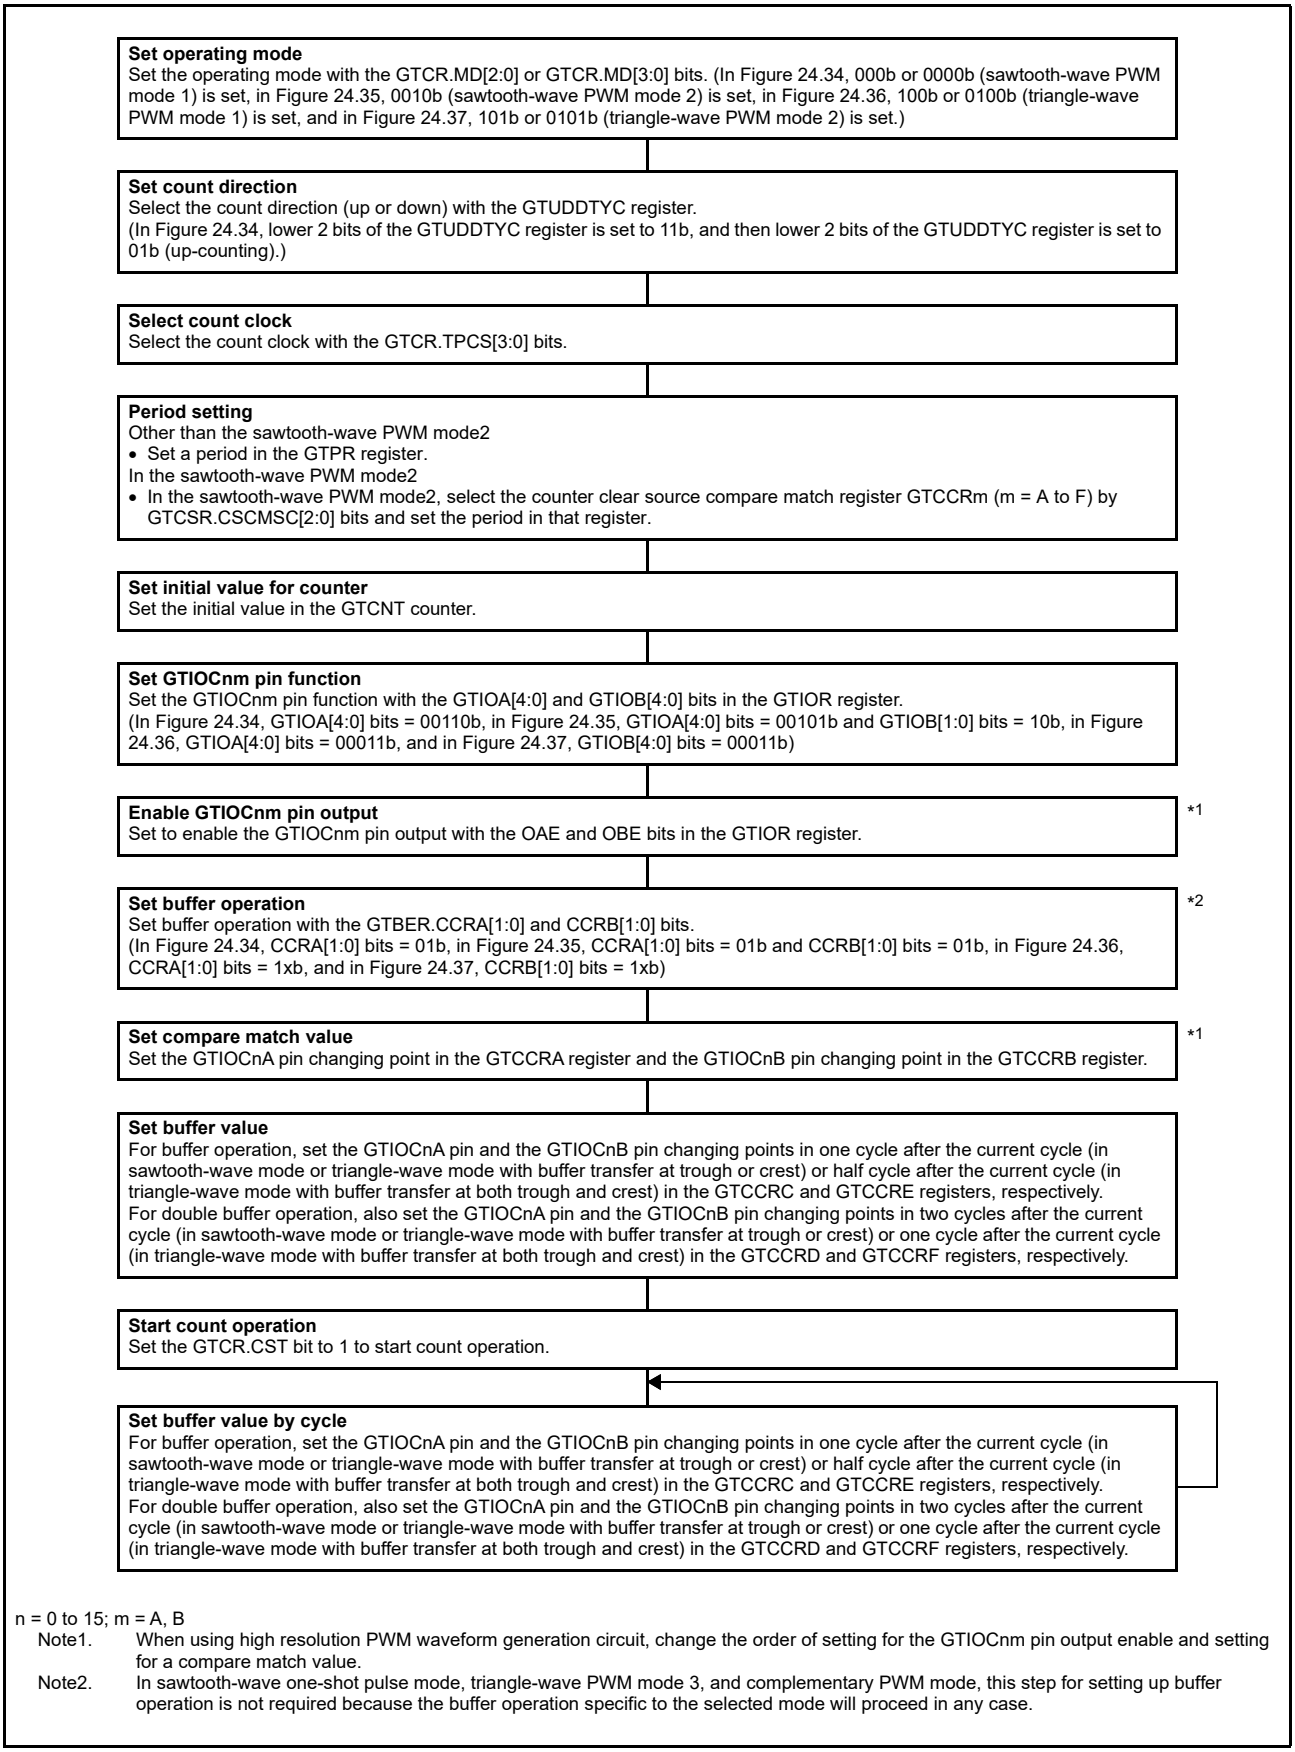

Figure 24.37 Example of GTCCRA and GTCCRB Registers Double Buffer Operation (Output Compare, Triangle Waves, Buffer Operation at Both Troughs and Crests, Output Toggled at GTCCRB Register Compare Match, Output Retained at the End of the Cycle) (n = 0 to 15)

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Note2. In sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, and complementary PWM mode, this step for setting up buffer operation is not required because the buffer operation specific to the selected mode will proceed in any case.

Figure 24.38 Example for Setting Buffer Operation of the GTCCRA and GTCCRB Registers (for Output Compare)

(2) When the GTCCRA or GTCCRB Register Functions as Input Capture Register

The transfer to the buffers is performed when an input capture occurs. Upon input capture, the GTCNT counter value is transferred to the GTCCRA and GTCCRB registers and the values previously stored in the GTCCRA and GTCCRB registers are transferred to the buffer registers. Buffer transfer by counter clearing does not occur when input capture is in use.

Figure 24.39 and Figure 24.40 show examples of buffer operation of the GTCCRA and GTCCRB registers, and Figure 24.41 shows an example for setting buffer operation of the GTCCRA and GTCCRB registers.

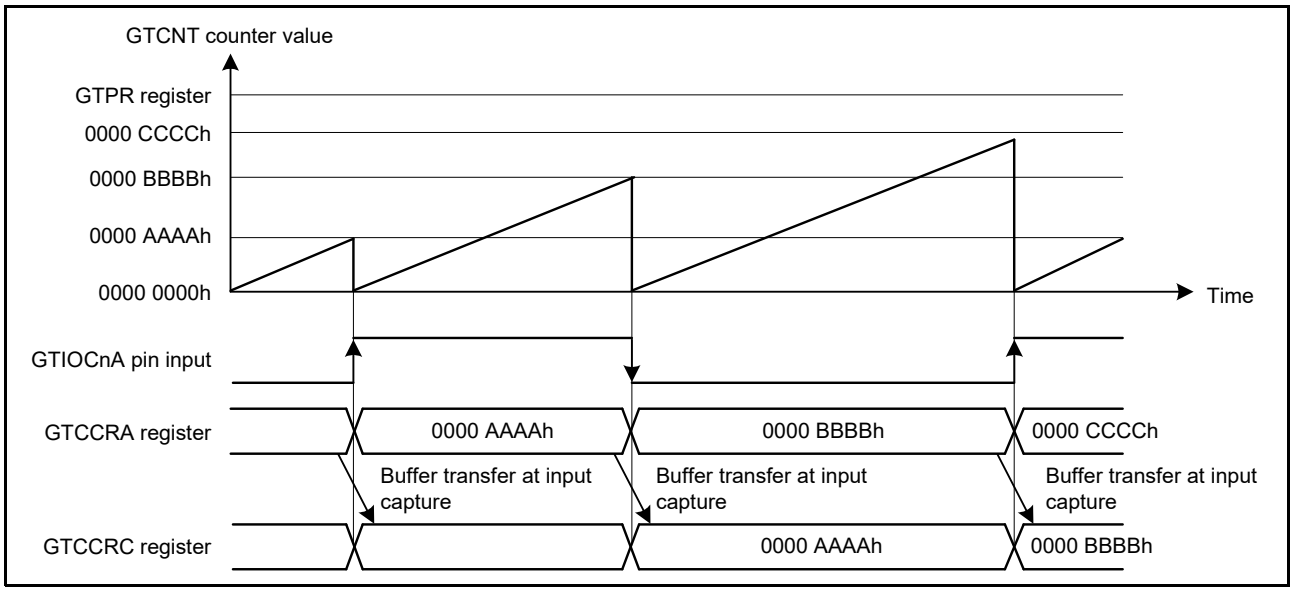

Figure 24.39 Example of Buffer Operation of the GTCCRA and GTCCRB Registers (Counting up to Produce a Sawtooth Wave, and Clearing the GTCNT Counter and Input Capture on Both Edges of the Input on the GTIOCnA Pin) (n = 0 to 15)

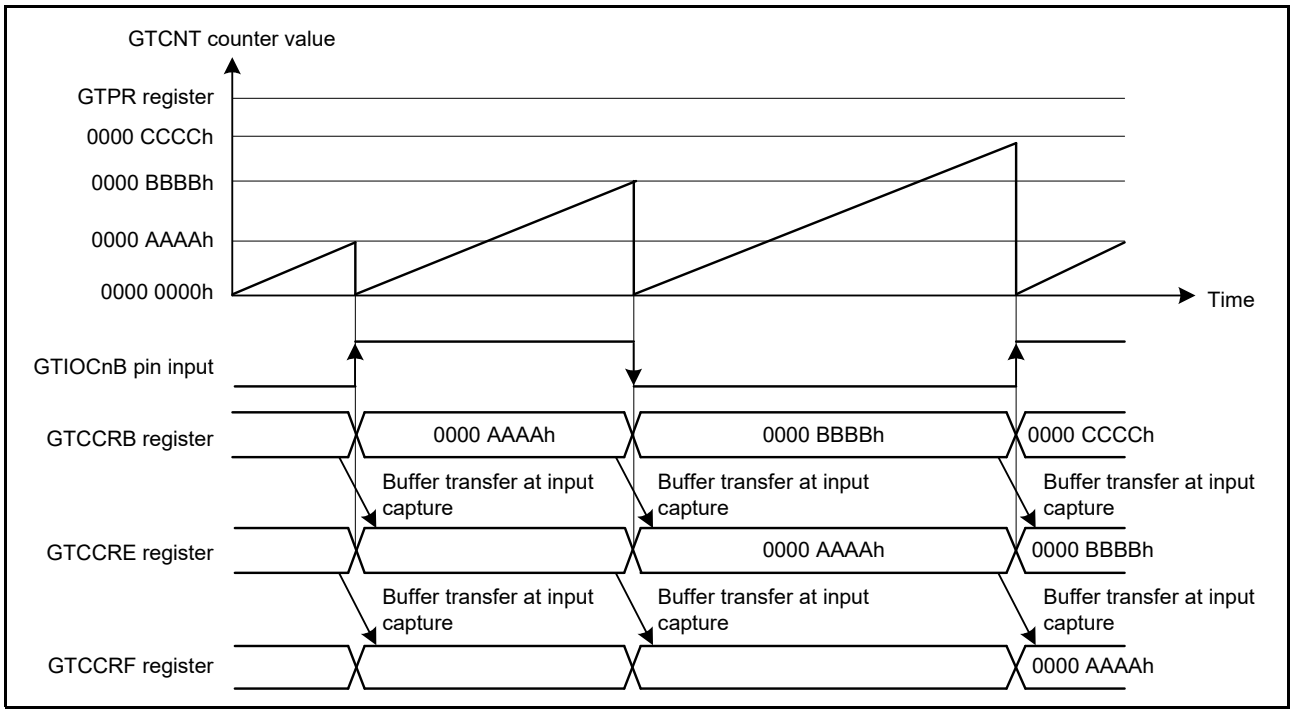

Figure 24.40 Example of Double Buffer Operation of the GTCCRA and GTCCRB Registers (Counting up to Produce a Sawtooth Wave, and Clearing the GTCNT Counter and Input Capture on Both Edges of the Input on the GTIOCnB Pin) (n = 0 to 15)

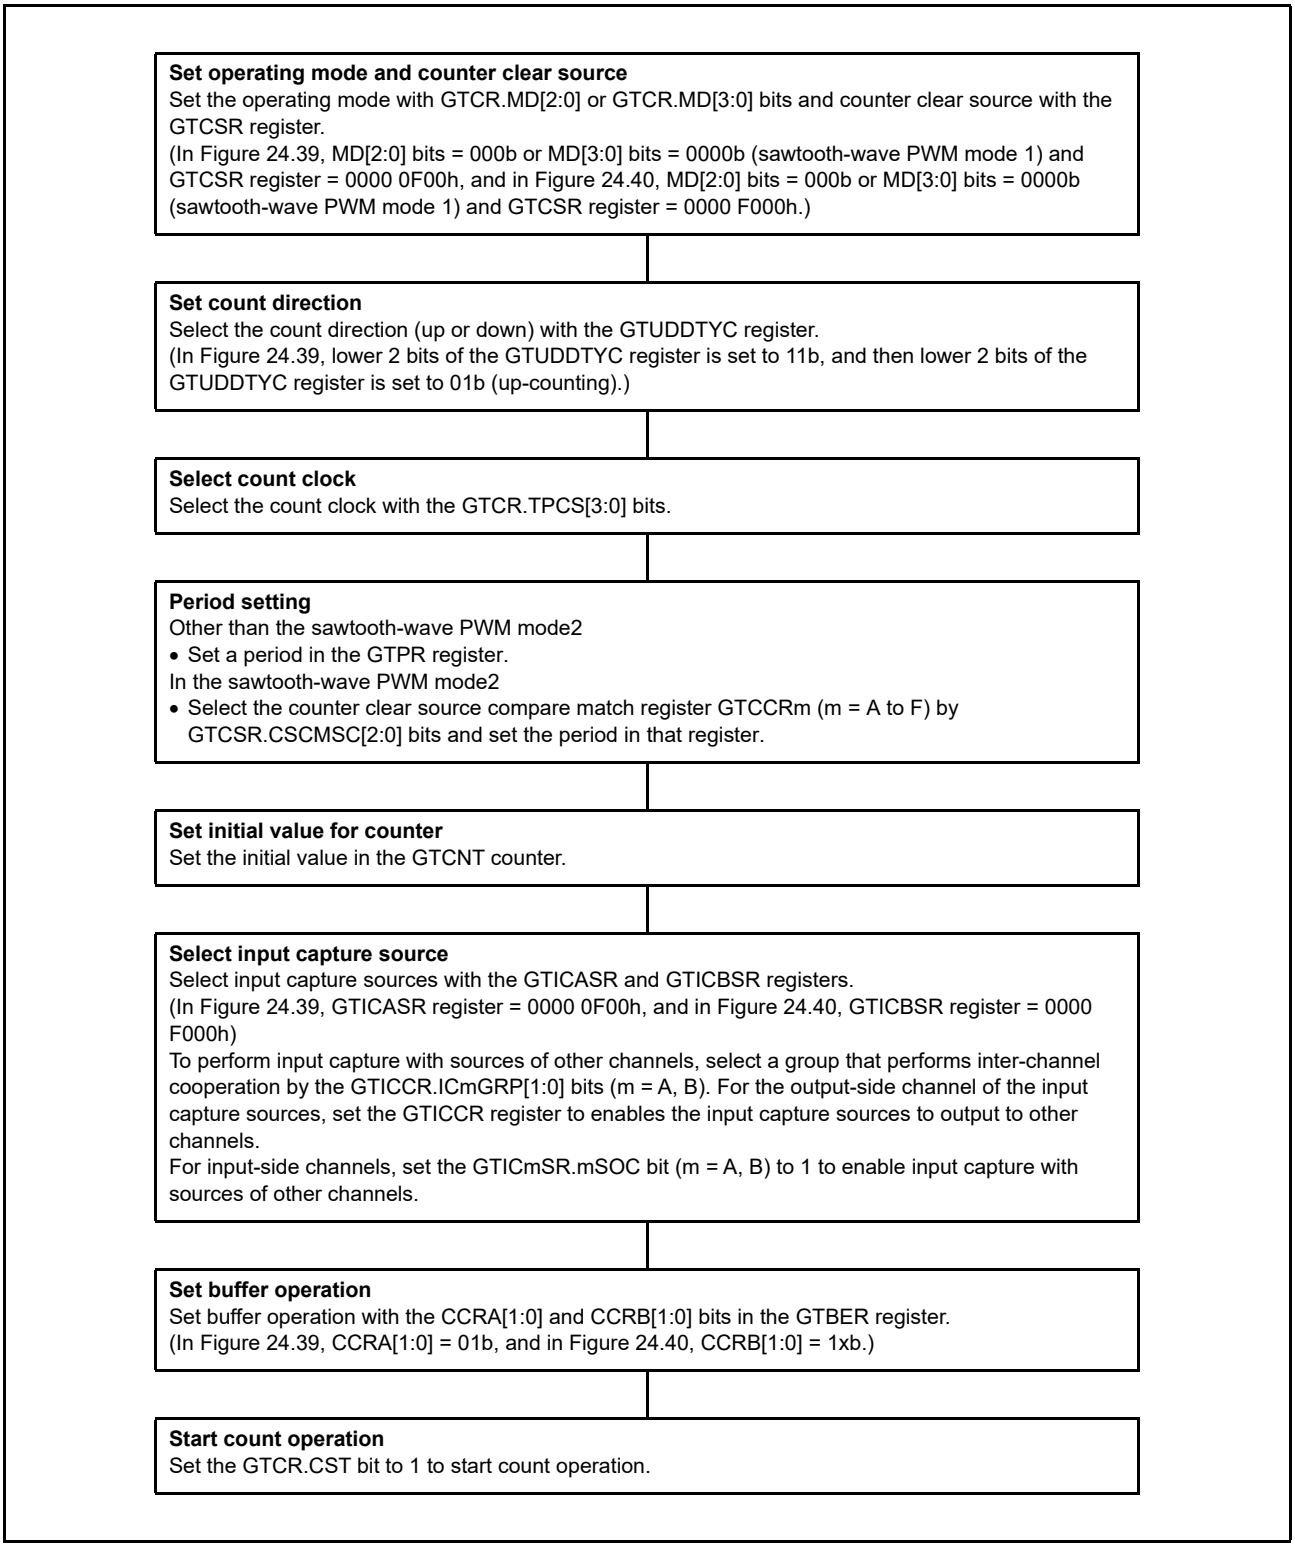

Figure 24.41 Example for Setting Buffer Operation of the GTCCRA and GTCCRB Registers (for Input Capture)

24.3.2.3 Buffer Operation for the GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To enable double buffer operation for the GTADTRA or GTADTRB register, set the GTBER.ADTDA or ADTDB bit to 1, respectively. For single buffer operation, set 0. To disable buffering, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b.

The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in sawtooth-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to11b for both crest and trough in triangle-wave mode or complementary PWM mode.

In sawtooth-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to a value other than 00b and in count operation, the buffer transfer by the same counter clearing sources described in section 24.3.2.1, GTPR Register Buffer Operation, is performed in the same way as at an overflow (in up-counting) or an underflow (in down-counting).

In complementary PWM mode, the buffer transfer is performed after one GTCLK cycle from the GTCCRD register write of slave channel 2.

In sawtooth-wave mode, the buffer transfer of GTADTRm register by counter clearing can be disabled by GTBER2.CCTADm (m = A, B) bit setting.

In sawtooth-wave mode, the buffer transfer of GTADTRm register by its own compare match can be enabled by the GTBER2.CMTADm (m = A, B) bit setting.

Figure 24.42 to Figure 24.46 show examples of buffer operation of the GTADTRA and GTADTRB registers, and Figure 24.47 shows an example for setting buffer operation of the GTADTRA and GTADTRB registers.

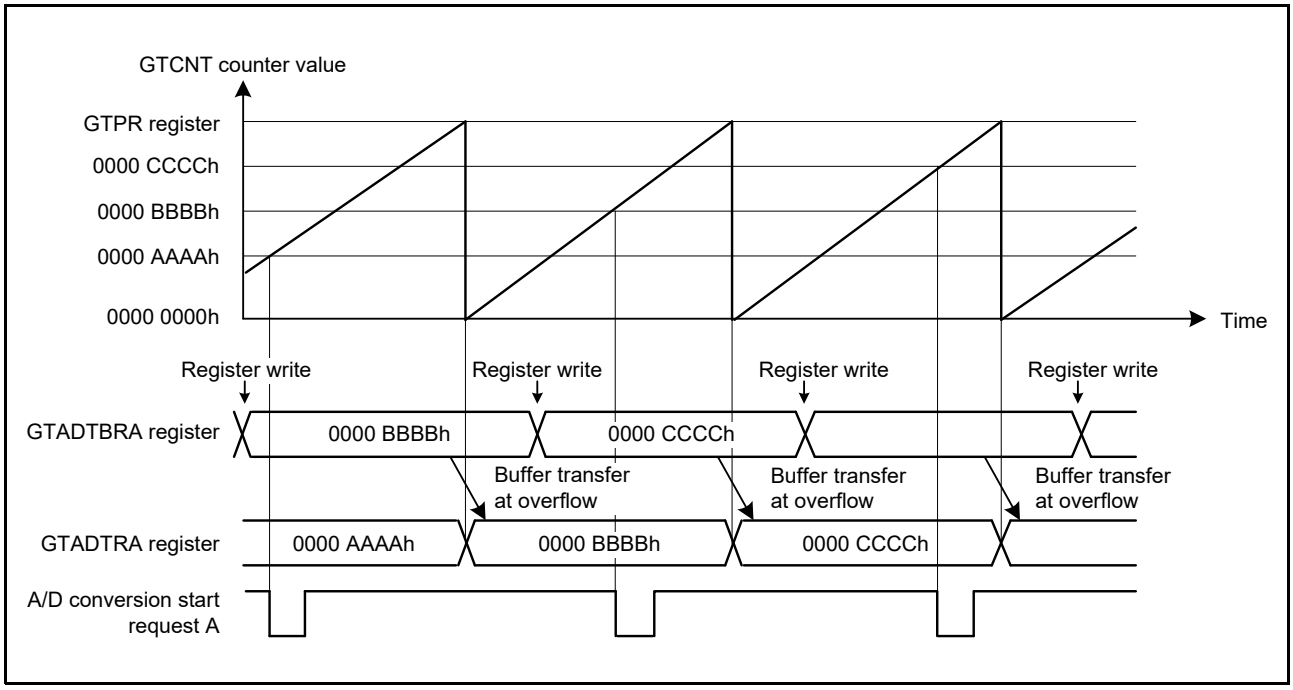

Figure 24.42 Example of Buffer Operation of the GTADTRA and GTADTRB Registers (Sawtooth Waves in Up-Counting, A/D Conversion Start Request Generated by Up-Counting)

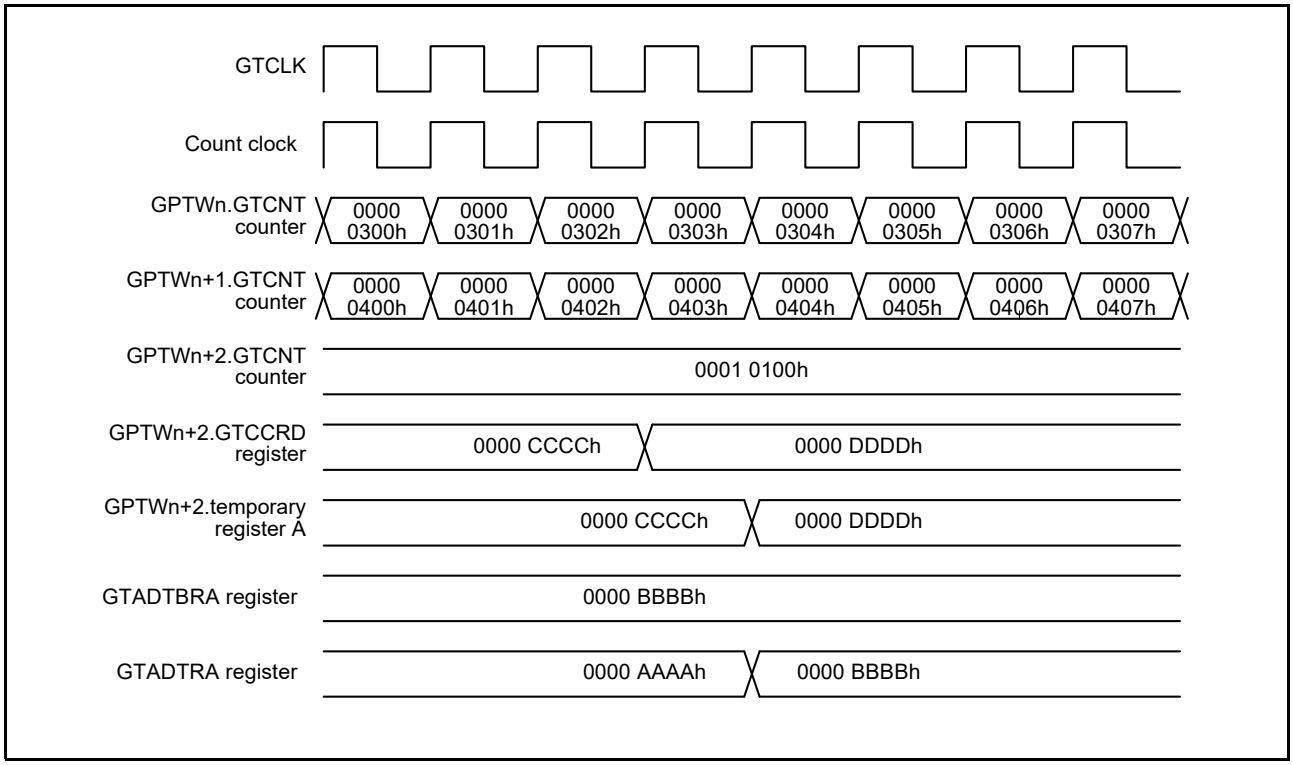

Figure 24.46 Example of Buffer Operation of the GTADTRA and GTADTRB Registers at the GTCCRD Register of Slave Channel 2 Updating in Complementary PWM Mode

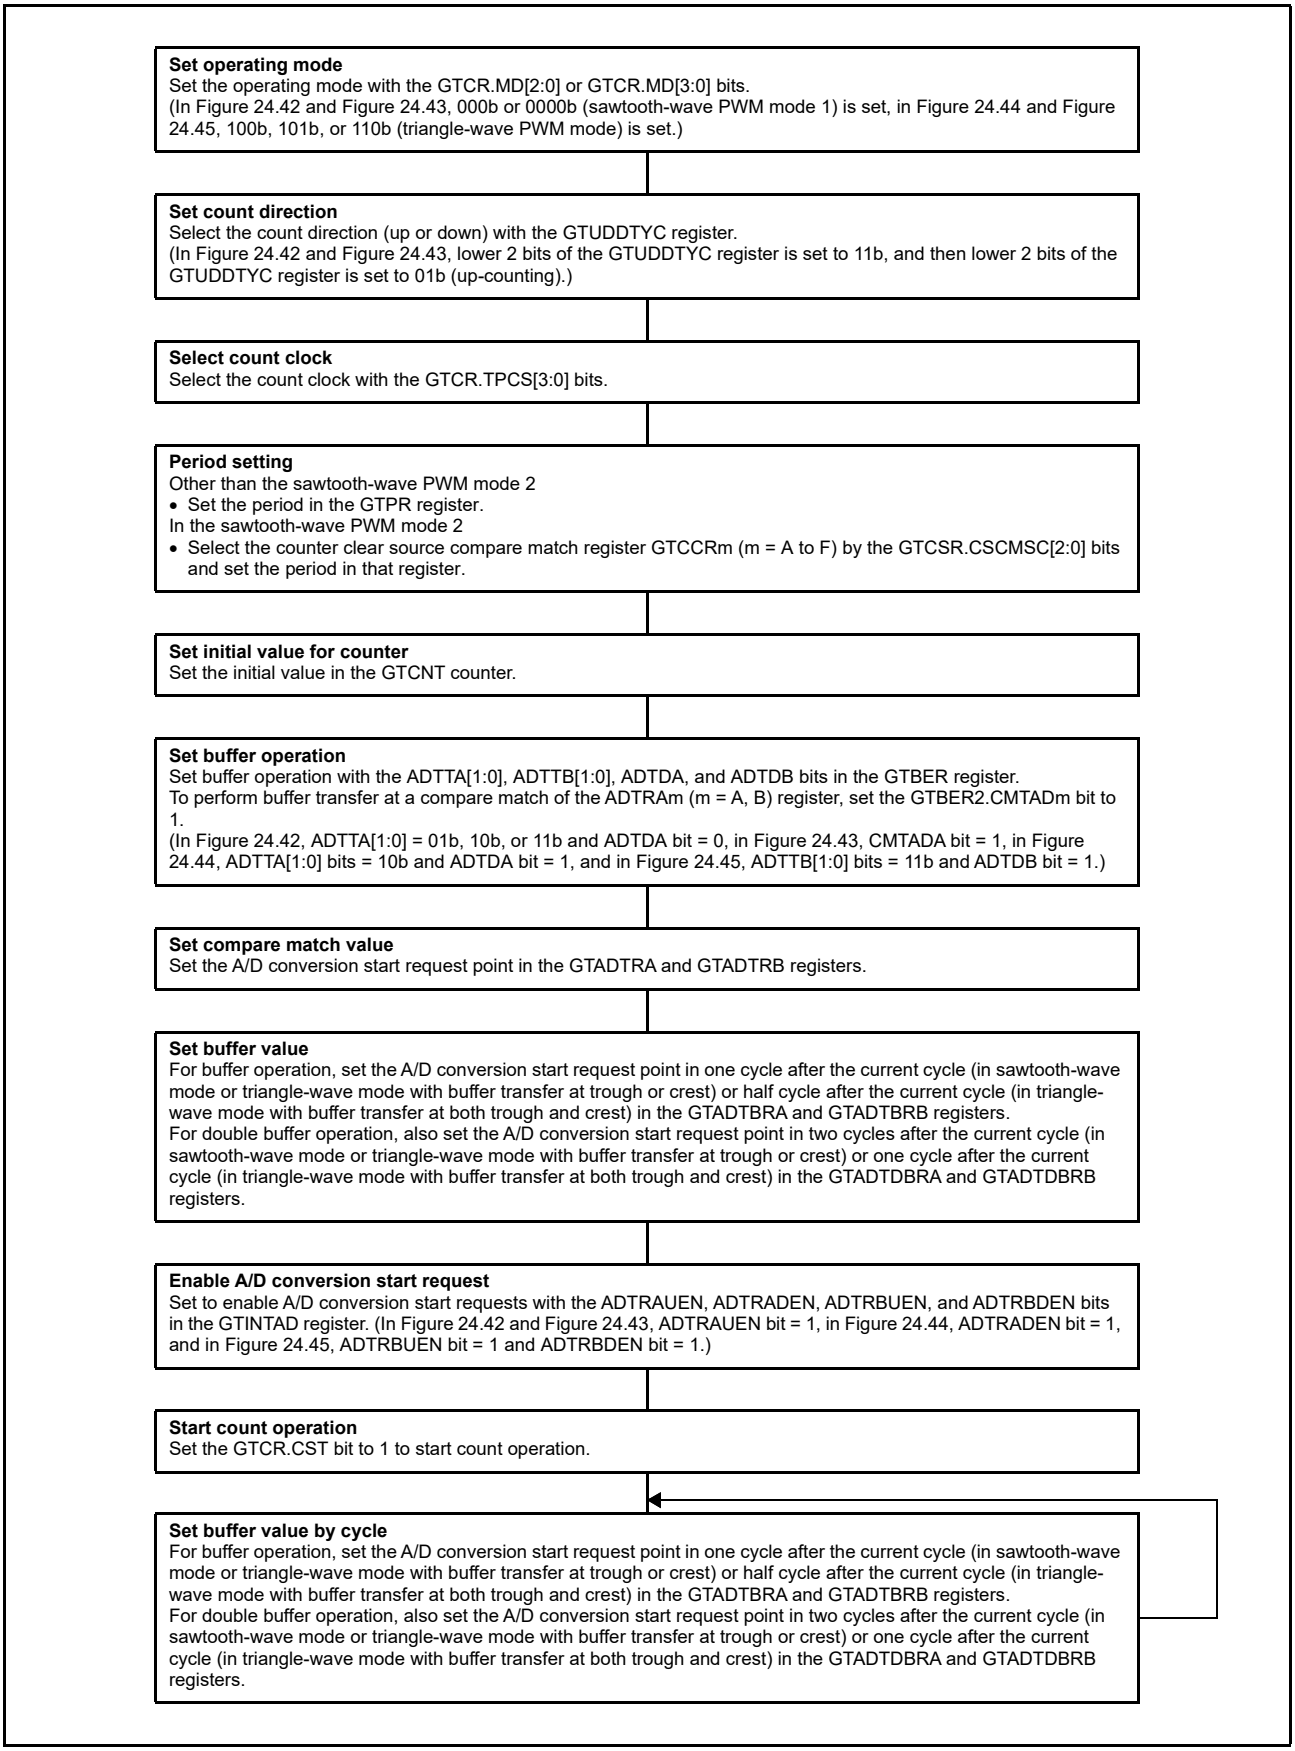

Figure 24.47 Example for Setting Buffer Operation of the GTADTRA and GTADTRB Registers

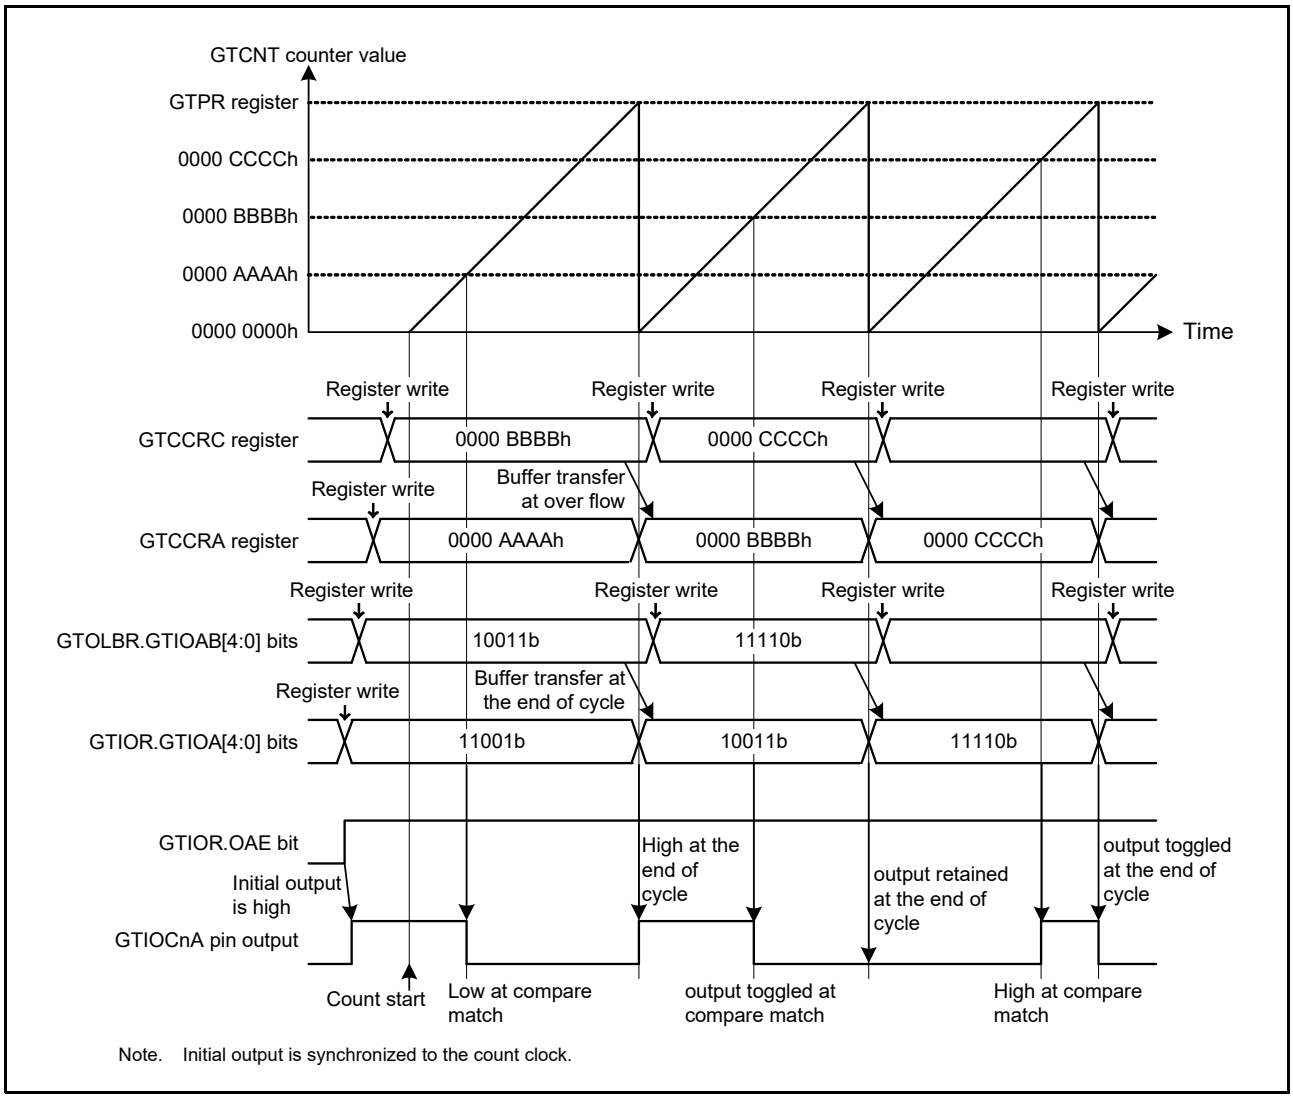
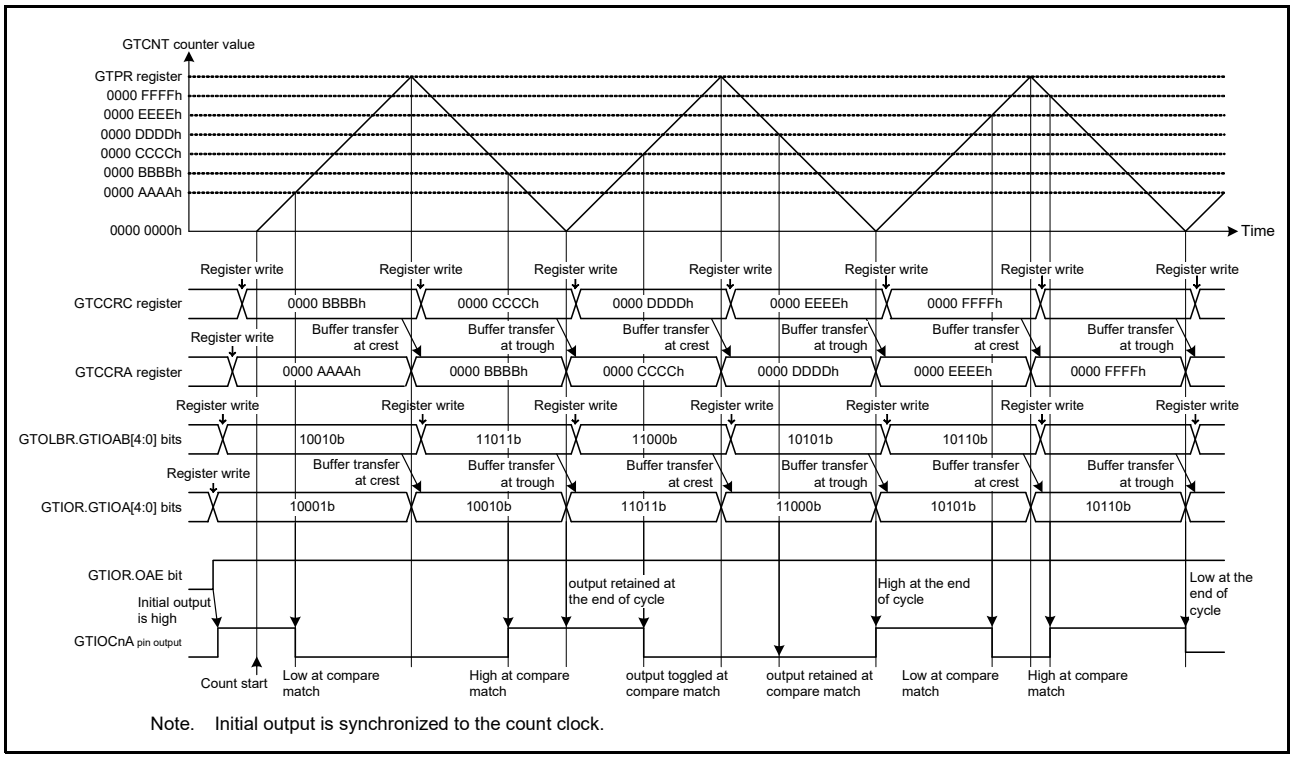
24.3.2.4 Buffer Operation for the GTIOA[4:0] and GTIOB[4:0] Bits

The GTOLBR.GTIOAB[4:0] bits can function as the buffer register of the GTIOR.GTIOA[4:0] bits and the GTOLBR.GTIOBB[4:0] bits can function as the buffer register of the GTIOR.GTIOB[4:0] bits.
Buffer transfer timing can be set with the GTBER2.OLTTm[1:0] bits (m = A, B). It can be selected from the end of cycle or GTCCR register compare match (in sawtooth-wave mode), from crest, trough, or both crest and trough (in triangle-wave mode and complementary PWM mode). In the case that the GTBER2.OLTTm[1:0] bits are 00b, buffer transfer is not performed.
In complementary PWM mode, the setting to change GTIOA and GTIOB by buffer transfer during the dead time of complementary PWM is prohibited. Therefore, when changing the GTIOA[4:0] and GTIOB[4:0] bits by buffer transfer, it is necessary to set the timings of the crest and trough such that they do not overlap with the dead time and change the GTOLBR.GTIOAB[4:0] and GTOLBR.GTIOBB[4:0] bits. When the timing of buffer transfer is at the crest, set the GTCCRm (m = A, C, E) register to satisfy GTCCRm < GTPR. When the timing of buffer transfer is in the trough, set the GTCCRm register to satisfy GTDVU < GTCCRm.
Figure 24.48 to Figure 24.50 show examples of buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits. Figure 24.51 shows an example for setting buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits.





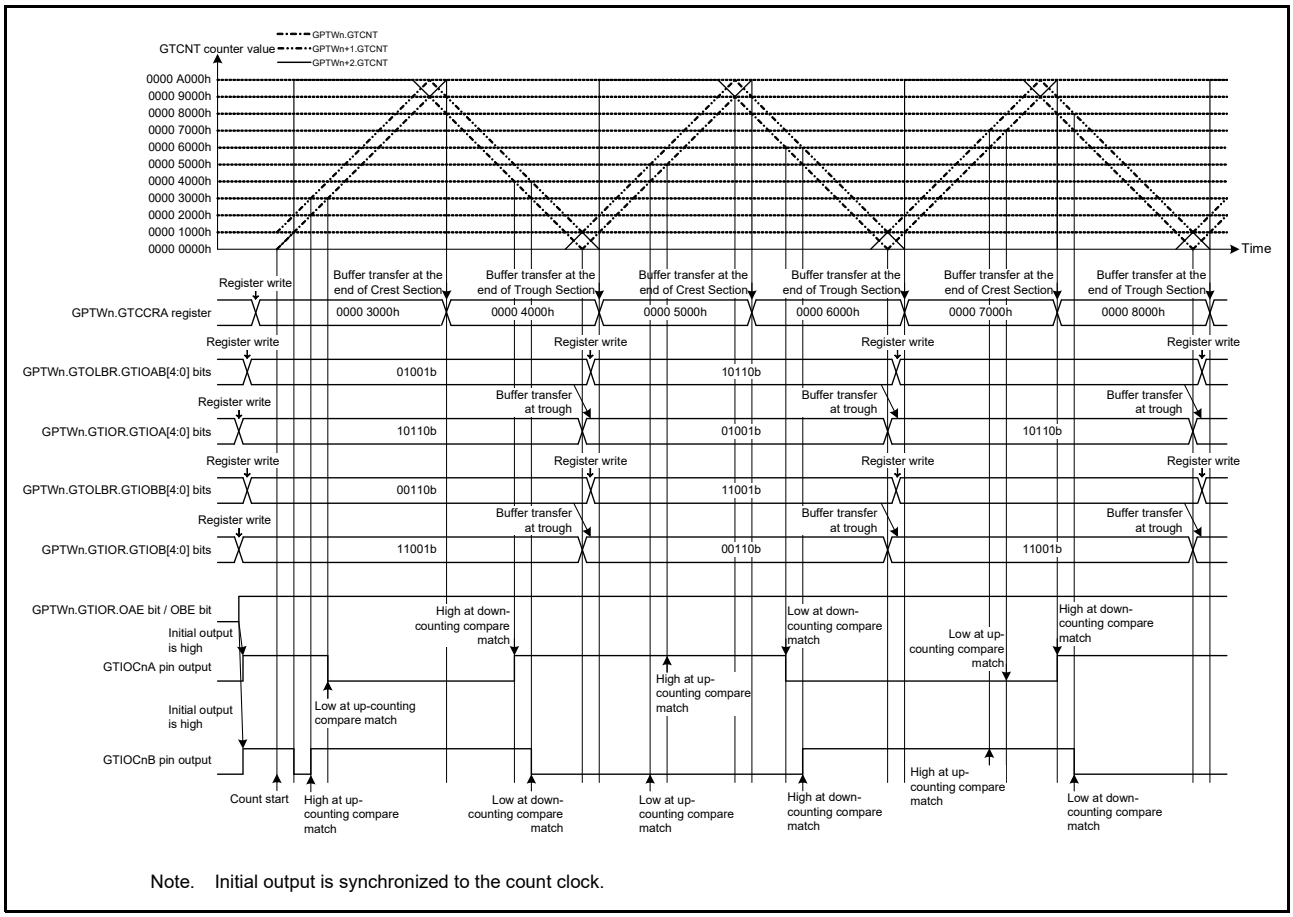


Figure 24.48 Example of Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits (Up-Counting in Sawtooth-Wave PWM Mode 1, Buffer Transfer at the End of Period)

Note. Initial output is synchronized to the count clock.

Figure 24.49 Example of Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits (Triangle-Waves PWM Mode 2, Buffer Transfer at Both Troughs and Crests)

Note. Initial output is synchronized to the count clock.

Figure 24.50 Example of Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits (Complementary PWM Mode 3, Buffer Transfer at Troughs)

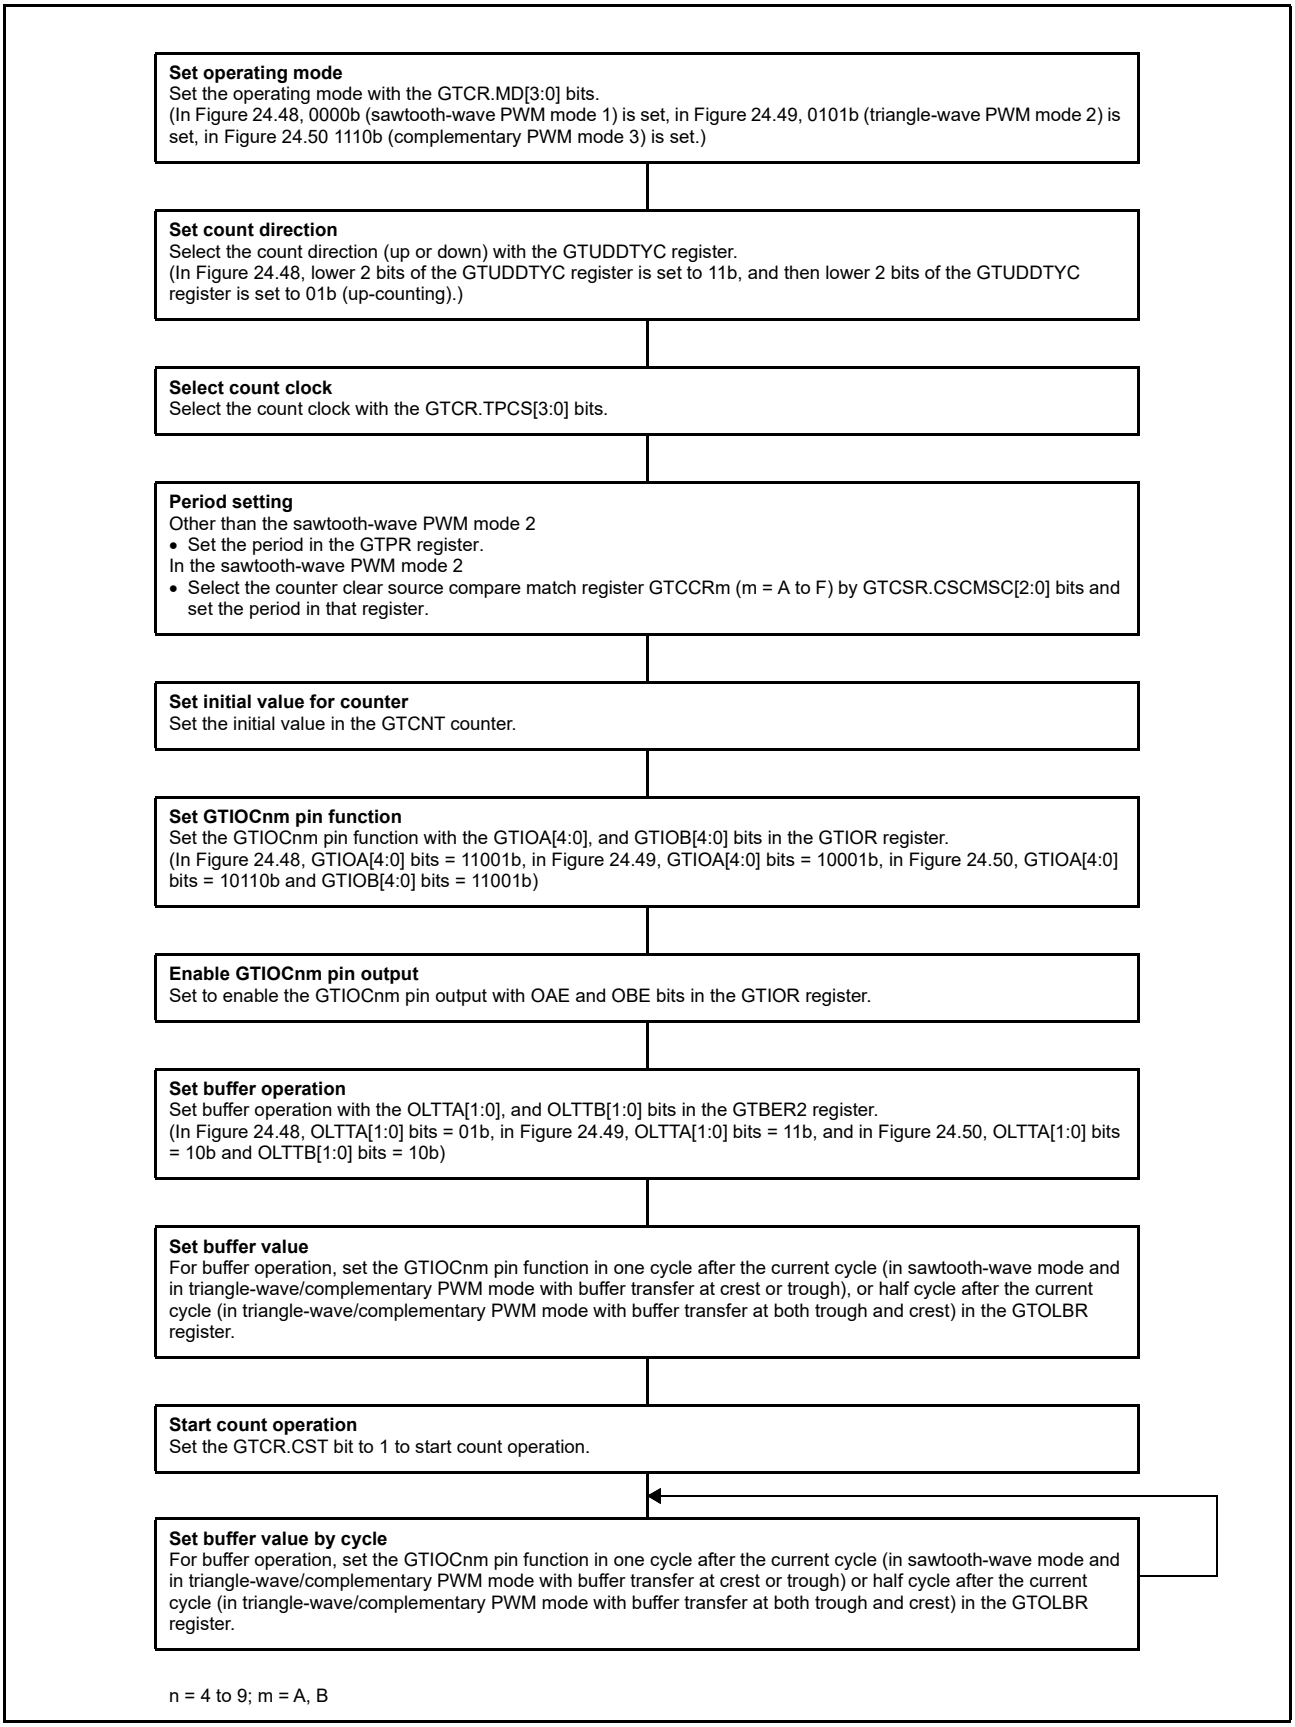

Figure 24.51 Example for Setting Buffer Operation of the GTIOA[4:0] and GTIOB[4:0] Bits

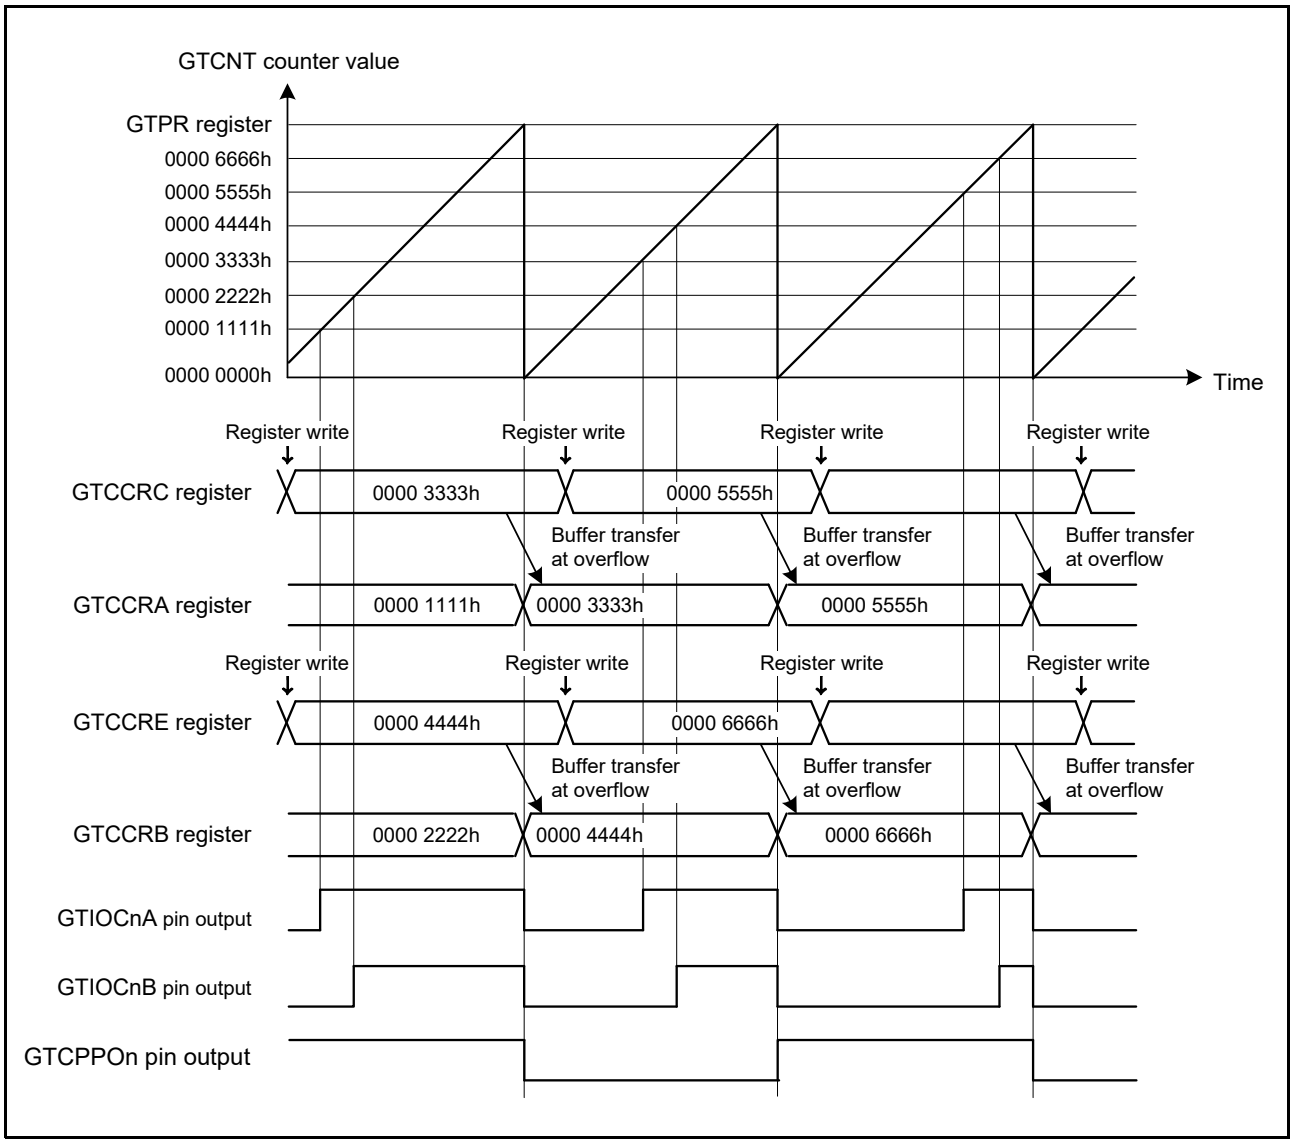
24.3.3 PWM Output Operating Mode

The GPTW can output PWM waveforms to the GTIOCnA pin or GTIOCnB pin (n = 0 to 15) by a compare match between the GTCNT counter and the GTCCRA or GTCCRB register.
By setting the GTDTCR, GTDVU, and GTDVD registers, the compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.
In complementary PWM mode, it is possible to output PWM waveforms (positive phase, negative phase) with dead time that guarantees the linearity of the PWM output pulse width near 0% and 100% duty.
In sawtooth-wave modes other than sawtooth-wave PWM mode 2, in triangle-wave mode, or in the master channel of complementary PWM mode, a signal synchronized with the PWM cycle is output from the GTCPPOn terminal when the GTIOR.PSYE bit is set to 1. The GTCPPOn output is toggled at the end of the cycle in sawtooth-wave mode, or at the crest/trough/GTCNT counter clearing timing in triangle-wave mode or complementary PWM mode. The initial output of GTCPPOn is low, and it becomes high when the count starts.

24.3.3.1 Sawtooth-Wave PWM Mode 1

In sawtooth-wave PWM mode 1, the GTCNT counter performs sawtooth-wave (half-wave) operation by setting the period in the GTPR register and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.
When 0 is set in the GTIOR.OmEOCD (m = A, B) bit and the timing of the end of cycle and the timing of the GTCCRm register compare match are the same time, the output pin performs along the PWM output setting for the end of cycle set by the GTIOR.GTIOm[3:2] bits.
When 1 is set in the GTIOR.OmEOCD bit, GTIOCnm output is retained.
Figure 24.52 shows an example of sawtooth-wave PWM mode 1 operation, and Figure 24.53 shows an example for setting sawtooth-wave PWM mode 1.



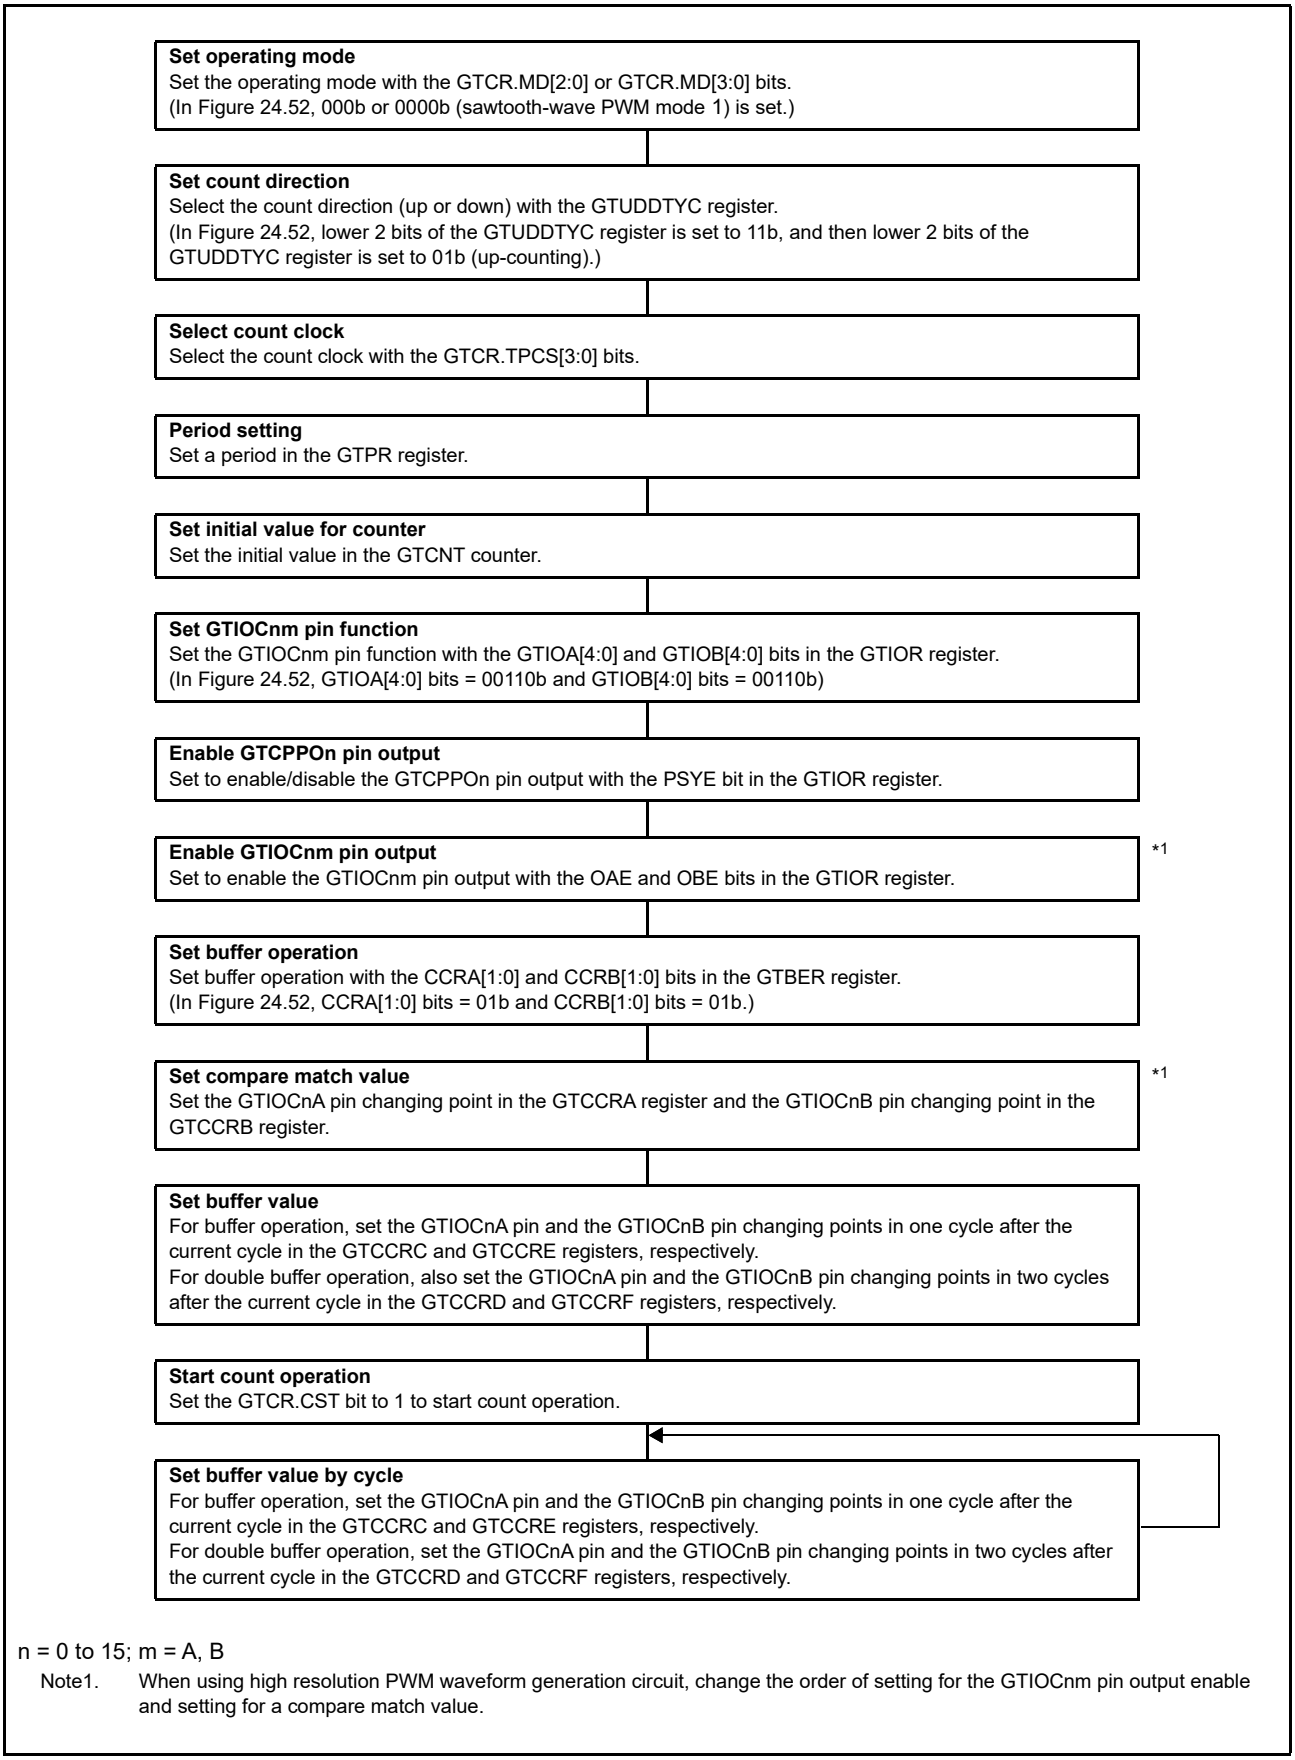


Figure 24.52 Example of Sawtooth-Wave PWM Mode 1 Operation (Up-Counting, Buffer Operation, High Output on Compare Match between the GTCCRA and GTCCRB Registers, Low Output at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.53 Example for Setting Sawtooth-Wave PWM Mode 1

24.3.3.2 Sawtooth-Wave PWM Mode 2

The sawtooth-wave PWM mode 2 is a mode in which the GTCNT counter is operated as a sawtooth wave by up-counting without using the GTPR register, and the PWM waveform is output by the compare match of the GTCCRA and GTCCRB registers.

The pin output level can be selected from low output, high output, or toggle output separately for a compare match according to the GTIOR register setting.

The GTIOCnA (n = 0 to 2, 4 to 6) pin is used as an output pin. Use the GTIOR.GTIOB[1:0] bits for setting the GTIOCnA pin output at a compare match of the GTCCRB register.

When a counter clear occurs due to the GTCNT counter clearing source selected in the GTCSR register, this is handled at the end of cycle and PWM output operation at the end of the cycle selected with the GTIOR.GTIOA[3:2] bits is performed.

If a counter clear (at the end of cycle) conflicts with a PWM output change due to a GTCCRm (m = A, B) register compare match, PWM output operation is performed at the end of cycle (in the case of the GTIOR.OmEOCD bit = 0) or the PWM output is retained (in the case of GTIOR.OmEOCD bit = 1).

Figure 24.54 to Figure 24.56 show examples of sawtooth-wave PWM mode 2 operation. Figure 24.57 shows an example for setting sawtooth-wave PWM mode 2.

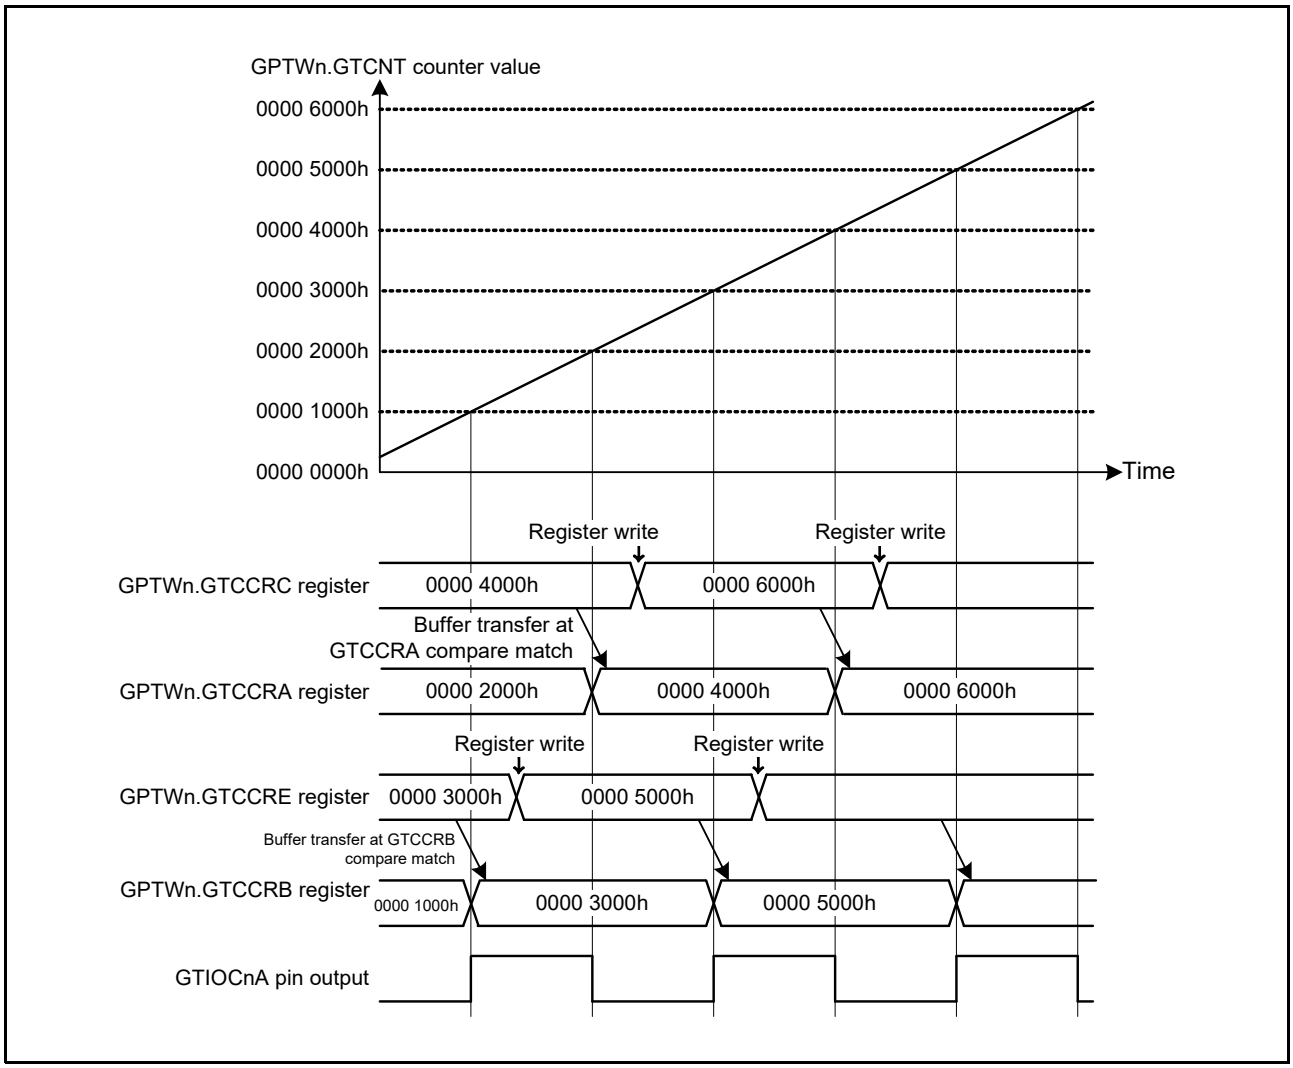

Figure 24.54 Example of Sawtooth-Wave PWM Mode 2 Operation (Low Output GTCCRA Register Compare Match, High Output at the GTCCRB Register Compare Match, Single Buffer Operation, and No Clear Setting) (n = 4 to 9)

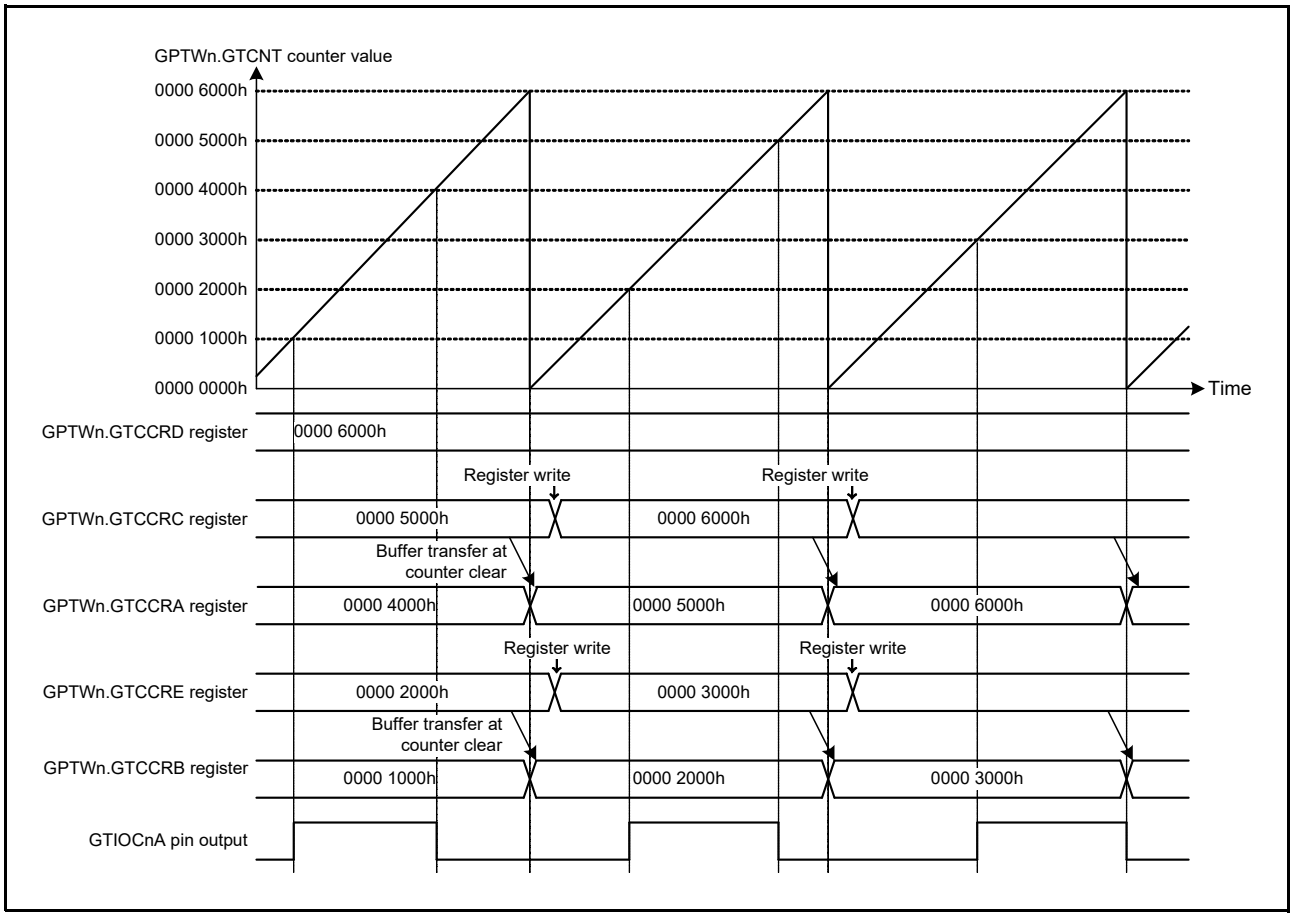

Figure 24.55 Example of Sawtooth-Wave PWM Mode 2 Operation (Low Output at the GTCCRA Register Compare Match, High Output at the GTCCRB Register Compare Match, Low Output at the End of the Cycle, Single Buffer Operation, Cleared at the GTCCRD Register Compare Match, and the GTIOR.OAEOCD Bit = 0) (n = 4 to 9)

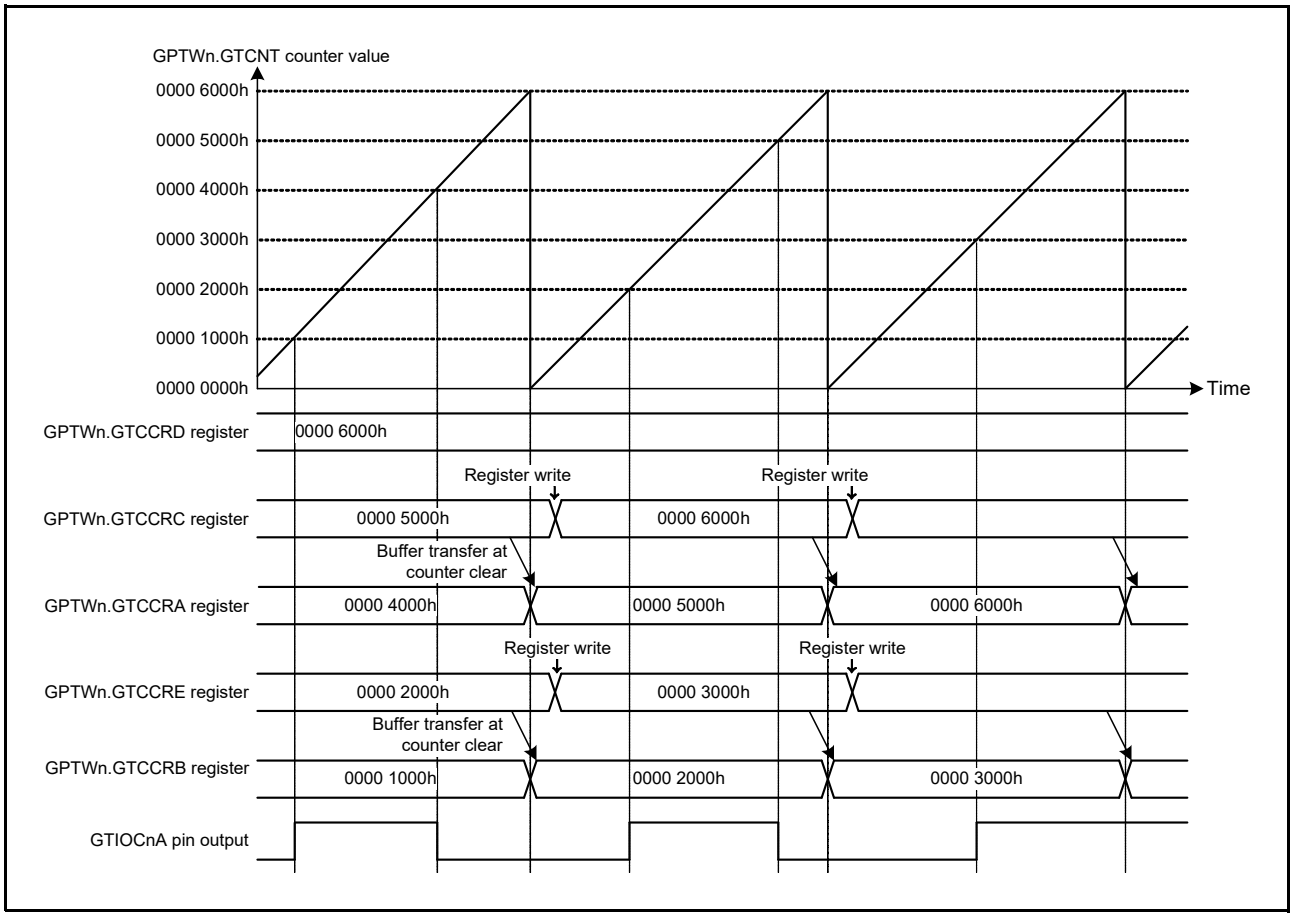

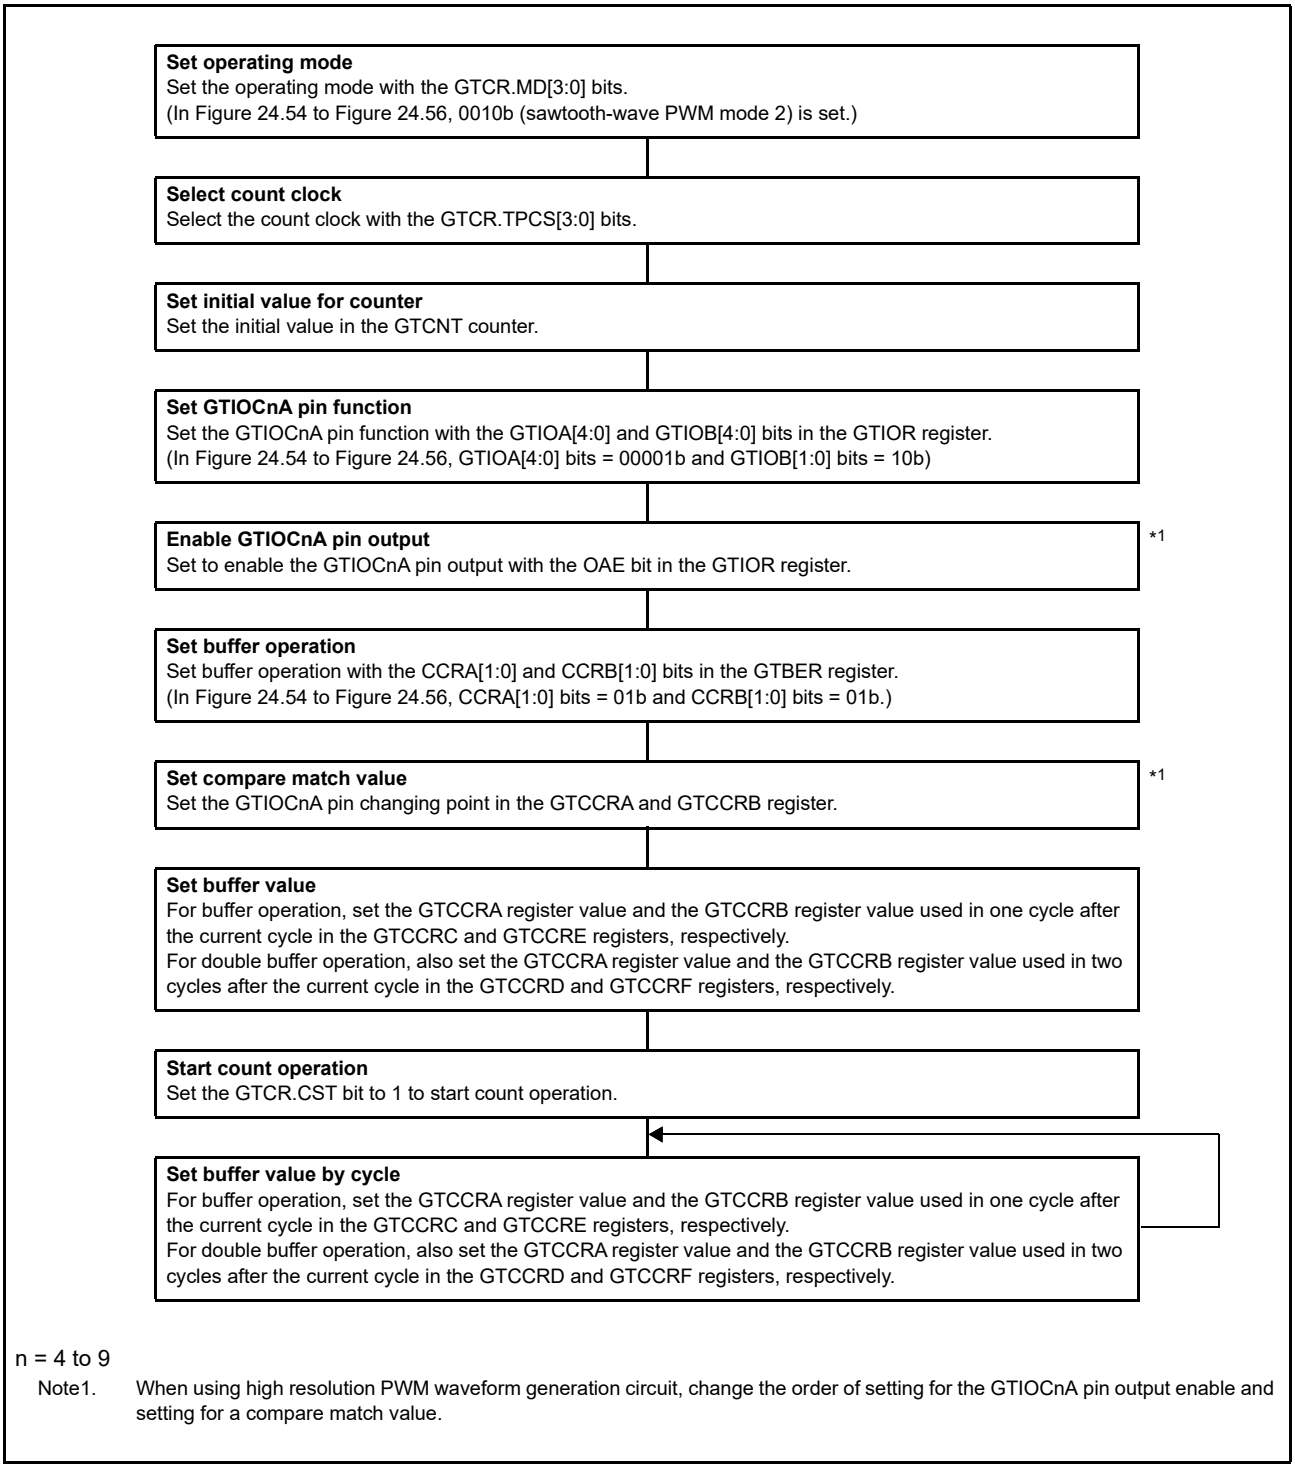

Figure 24.56 Example of Sawtooth-Wave PWM Mode 2 Operation (Low Output at the GTCCRA Register Compare Match, High Output at the GTCCRB Register Compare Match, Low Output at the End of Cycle, Single Buffer Operation, Cleared at the GTCCRD Register Compare Match, and GTIOR.OAEOCD Bit = 1) (n = 4 to 9)

n = 4 to 9

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnA pin output enable and setting for a compare match value.

Figure 24.57 Example for Setting Sawtooth-Wave PWM Mode 2

24.3.3.3 Sawtooth-Wave One-Shot Pulse Mode

The sawtooth-wave one-shot pulse mode is a mode in which the period is set in the GTPR register, the GTCNT counter performs sawtooth-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed (n = 0 to 15).

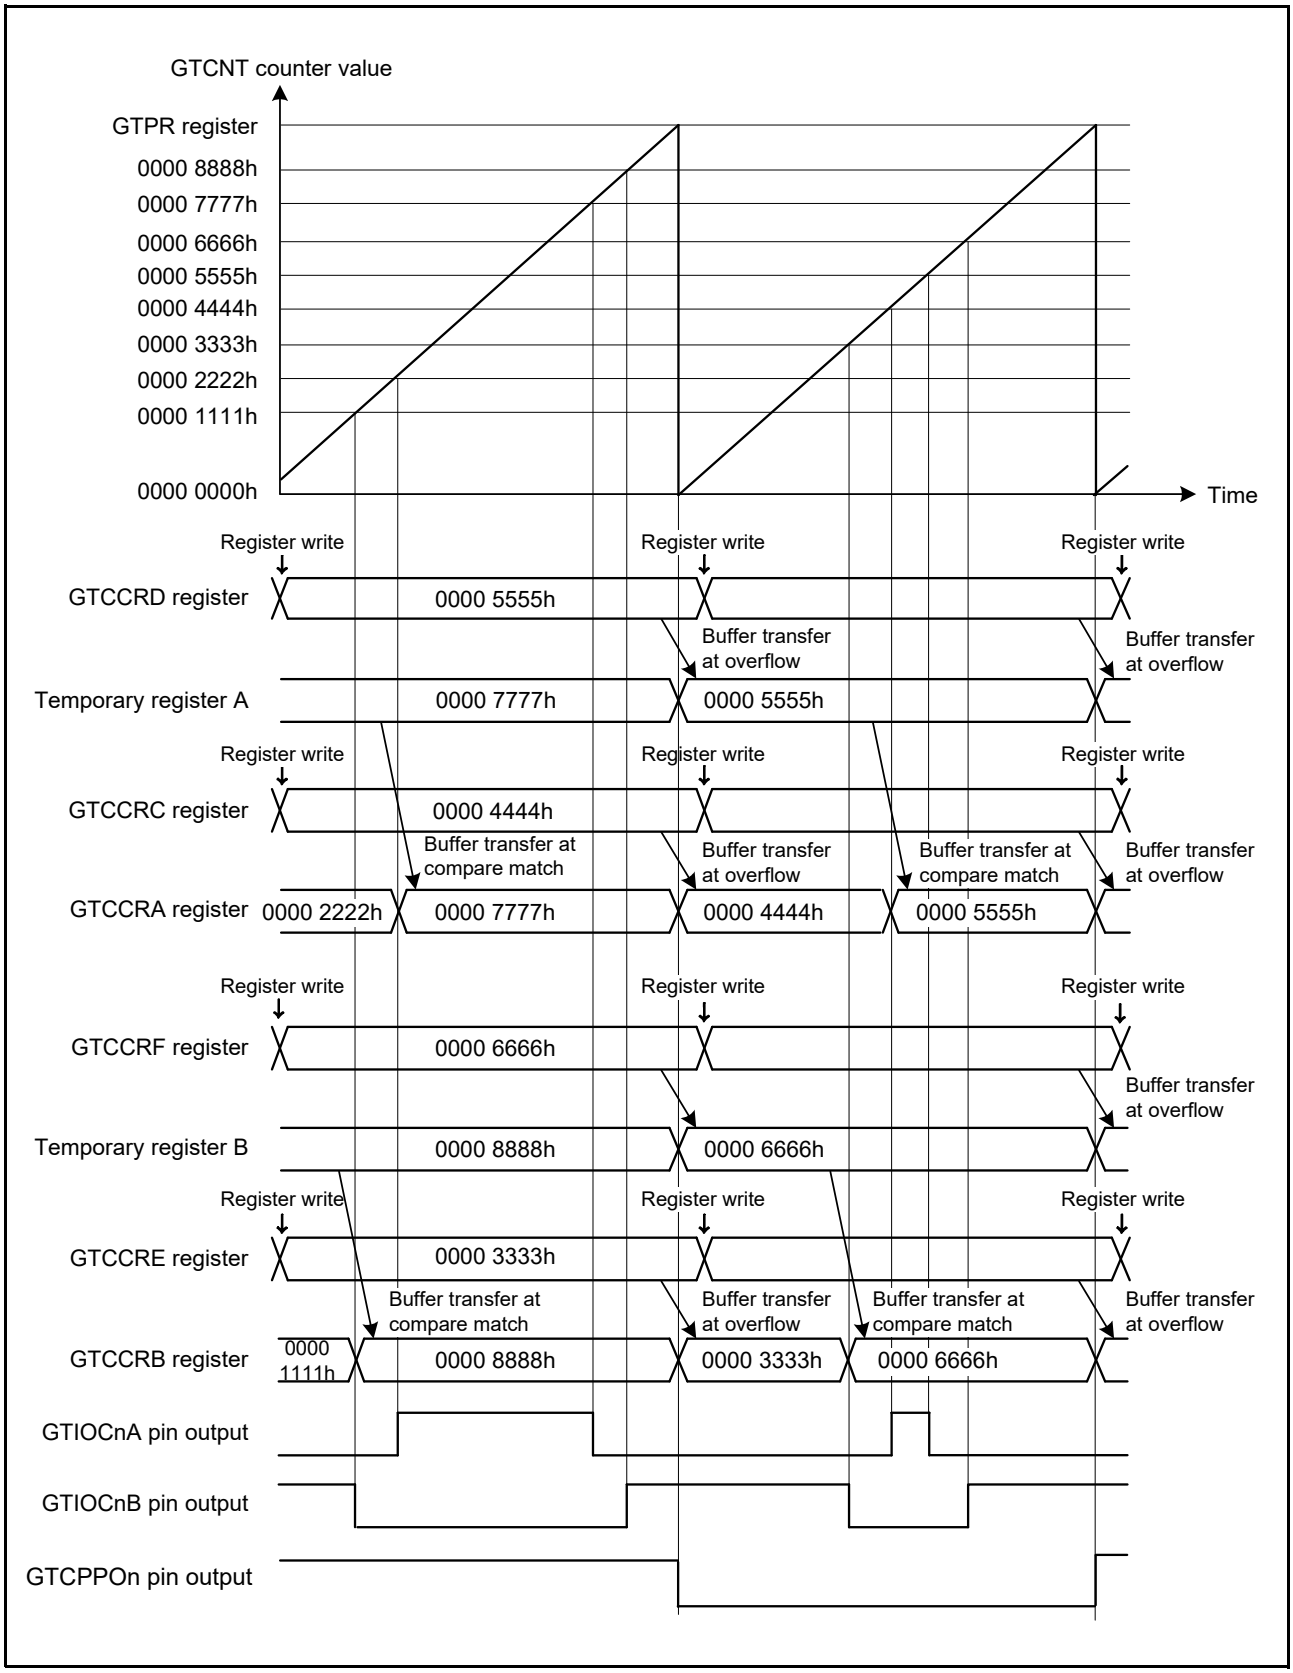
Buffer operation in sawtooth-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from the GTCCRC register to the GTCCRA register, from the GTCCRE register to the GTCCRB register, from the GTCCRD register to the temporary register A, and from the GTCCRF register to the temporary register B at the end of the cycle, and from the temporary register A to the GTCCRA register at a GTCCRA register compare match and from the temporary register B to the GTCCRB register at a GTCCRB register compare match. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the end of the cycle according to the GTIOR register setting.

The temporary register A and the temporary register B can perform forcible buffer transfers from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B respectively by writing 1 to the GTBER.CCRSWT bit while the count is stopped.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis with using the temporary register x (x = C, E) and temporary register m (m = A, B) which operate as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm (m = A, B) registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, refer to section 24.8.2.2, Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 24.58 shows an example of sawtooth-wave one-shot pulse mode operation, and Figure 24.59 shows an example for setting sawtooth-wave one-shot pulse mode.



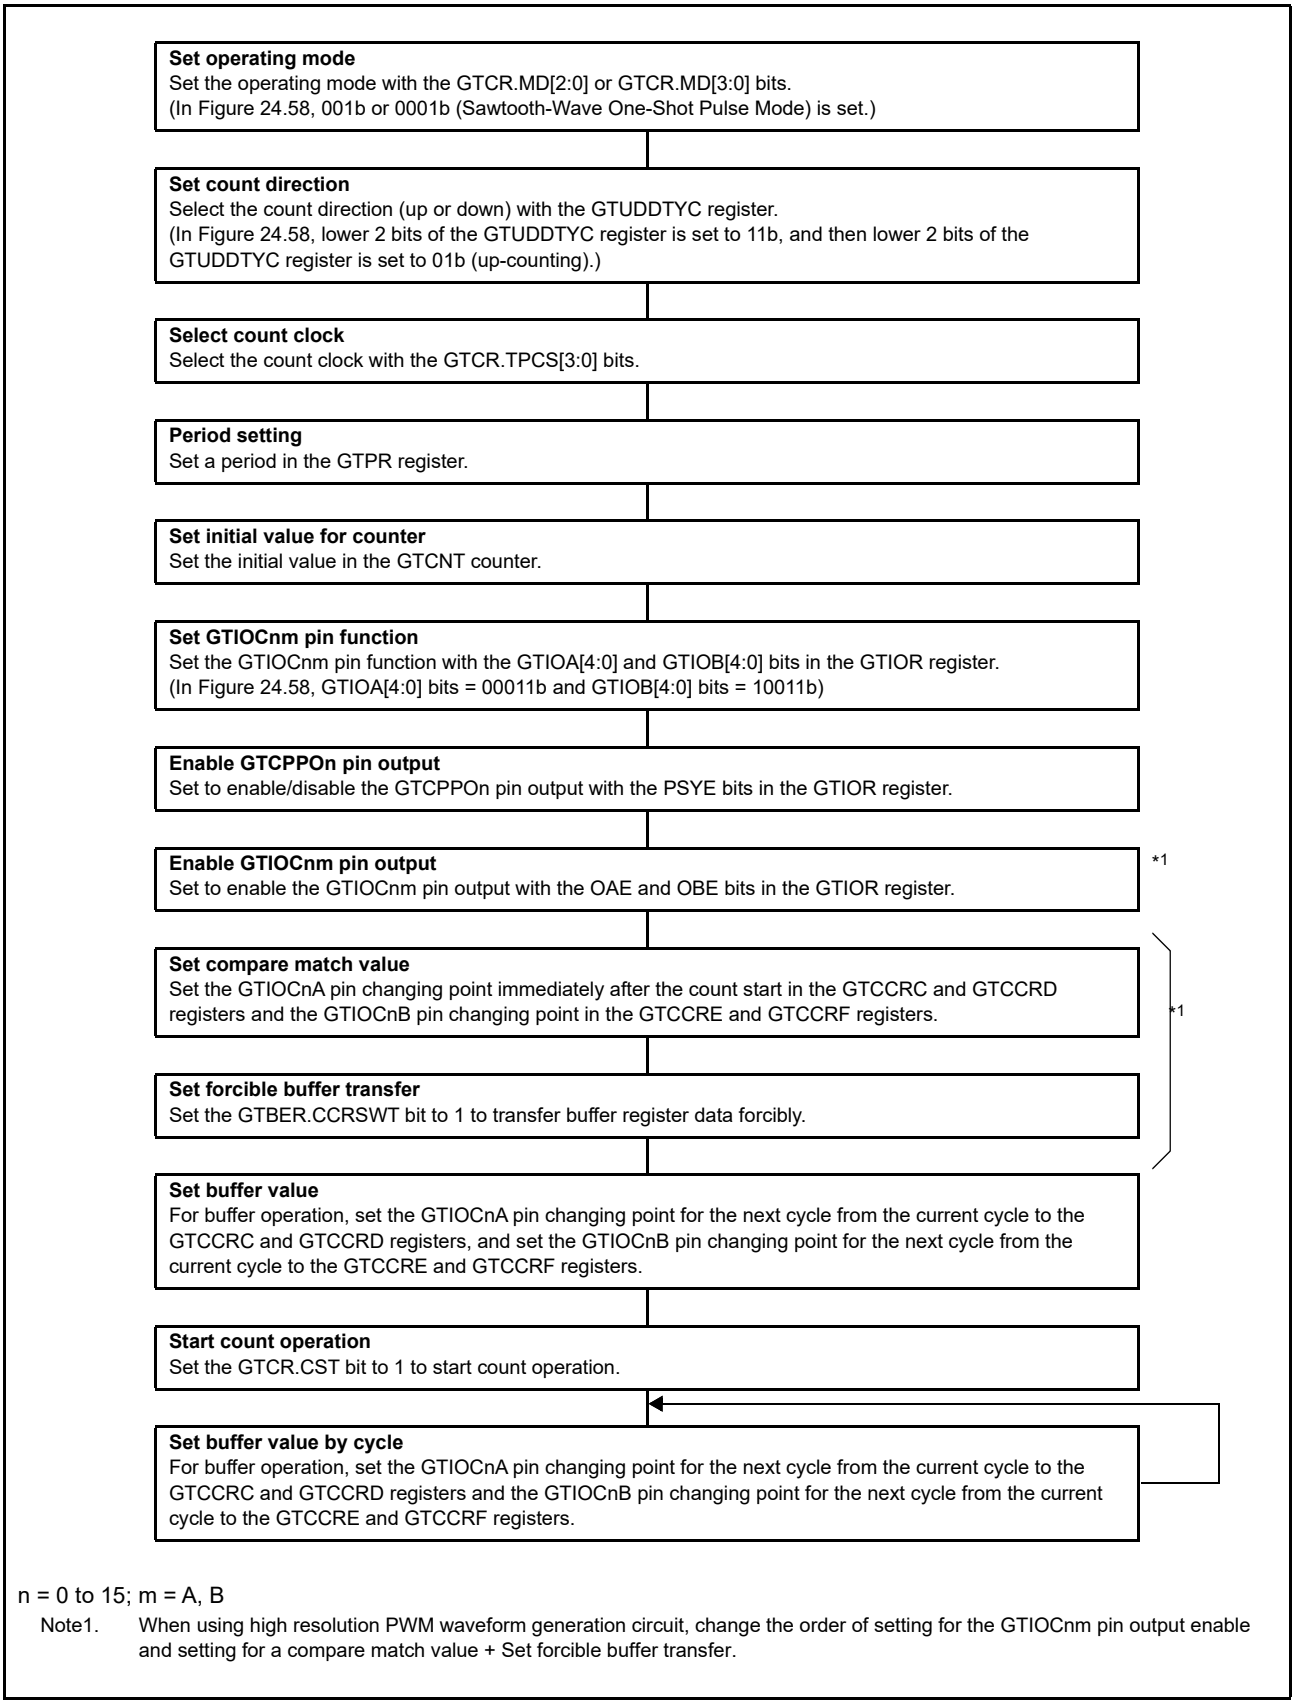


Figure 24.58 Example of Sawtooth-Wave One-Shot Pulse Mode Operation (Up-Counting, Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

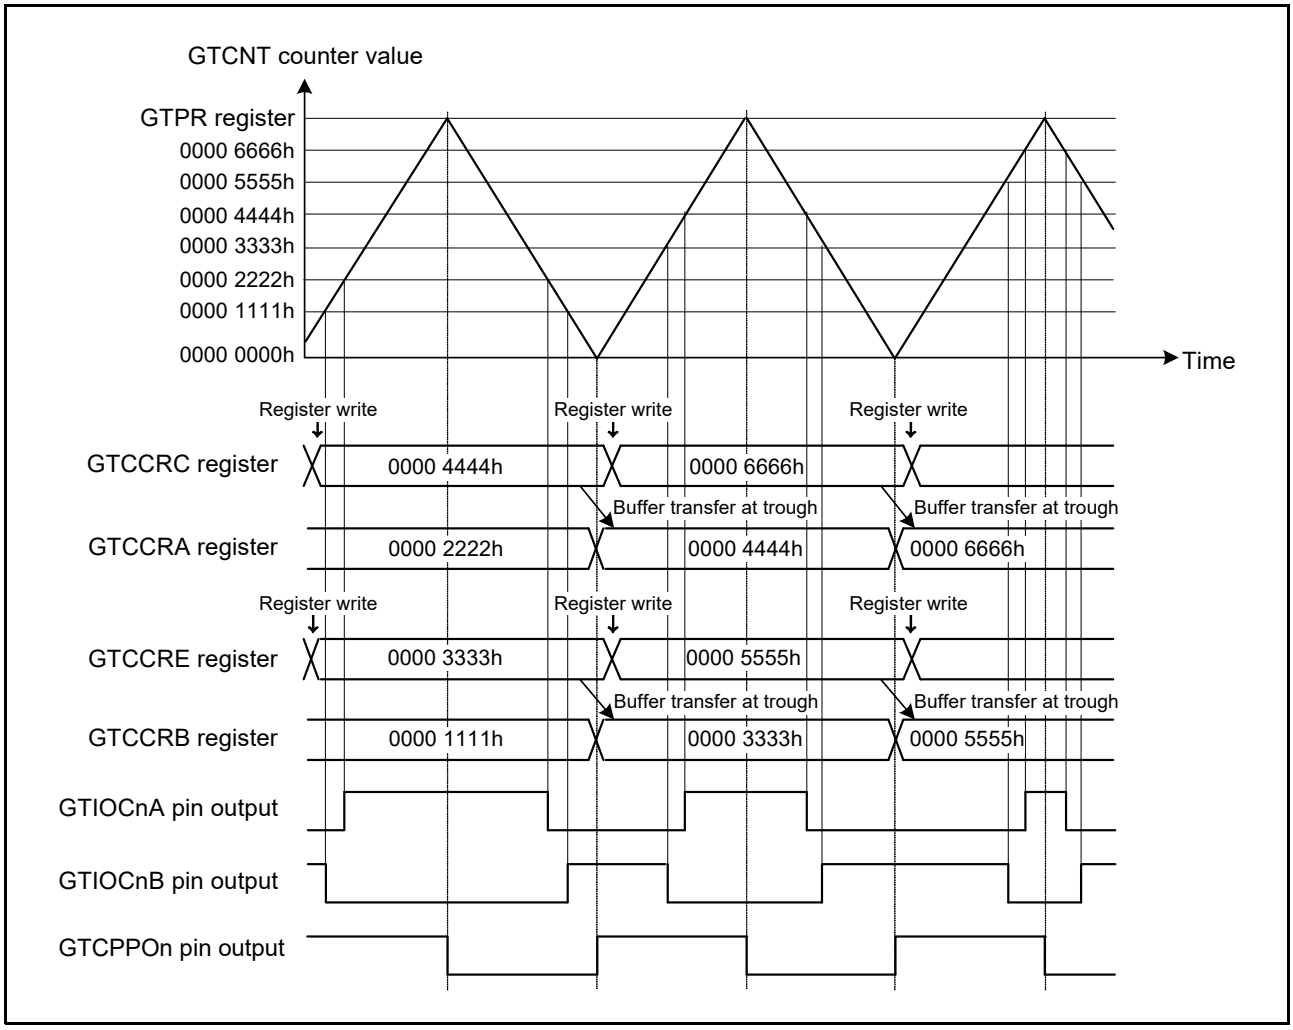
n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value + Set forcible buffer transfer.

Figure 24.59 Example for Setting Sawtooth-Wave One-Shot Pulse Mode

24.3.3.4 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs (n = 0 to 15).
Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.
By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.
Figure 24.60 shows an example of triangle-wave PWM mode 1 operation, and Figure 24.61 shows an example for setting triangle-wave PWM mode 1.



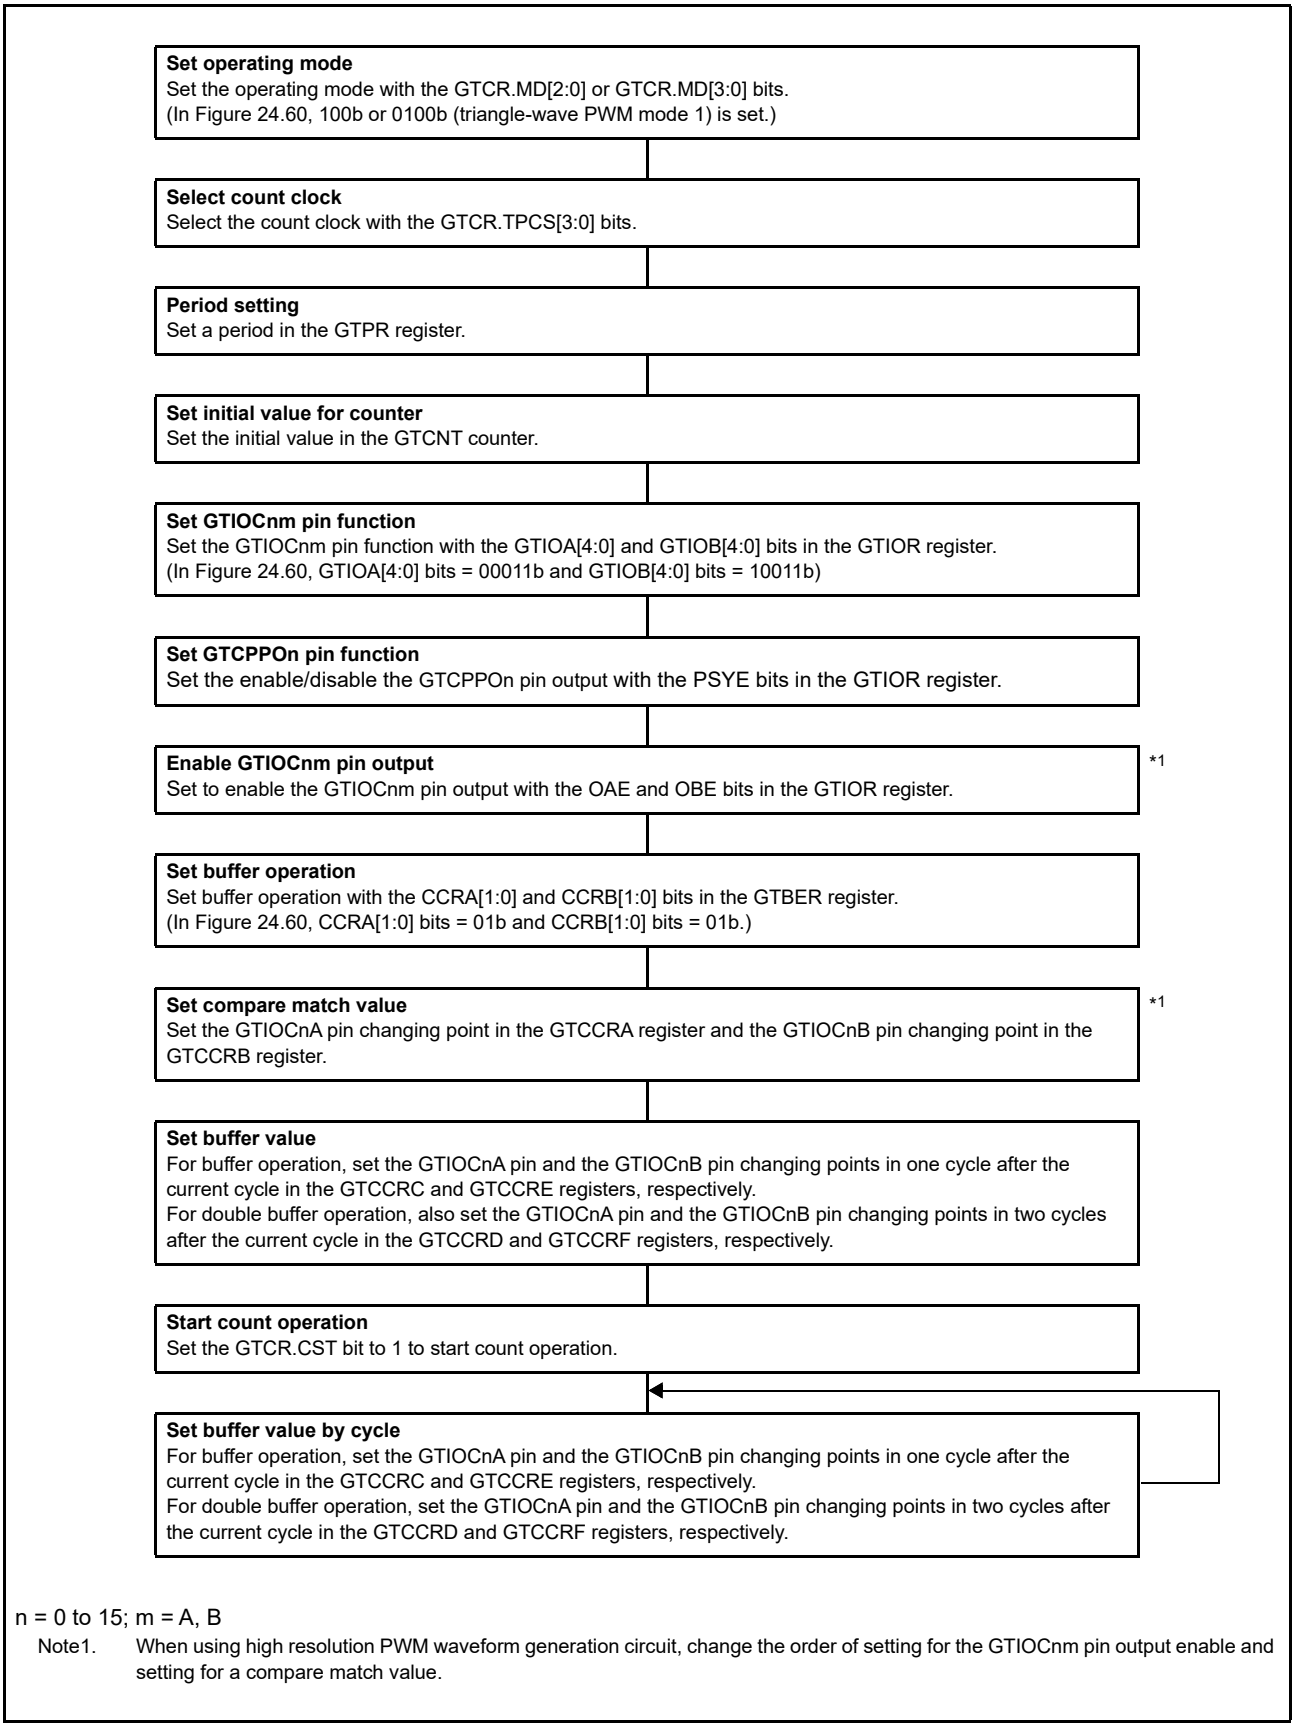


Figure 24.60 Example of Triangle-Wave PWM Mode 1 Operation (Buffer Operation, Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

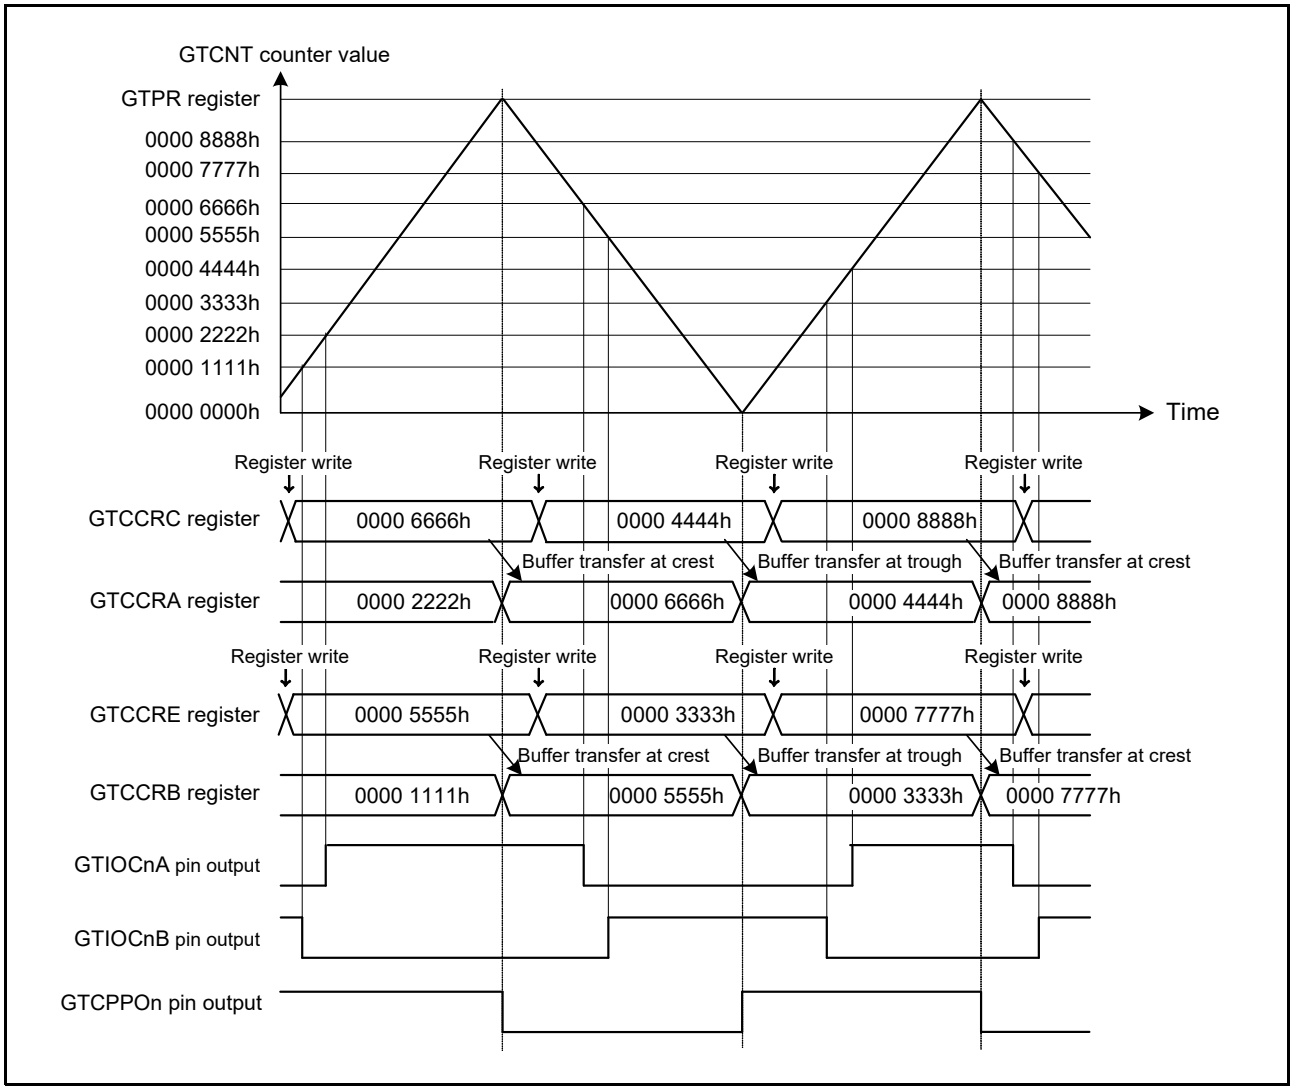
n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.61 Example for Setting Triangle-Wave PWM Mode 1

24.3.3.5 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GTCCRA or GTCCRB register compare match occurs (n = 0 to 15). The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.
By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.
Figure 24.62 shows an example of triangle-wave PWM mode 2 operation, and Figure 24.63 shows an example for setting triangle-wave PWM mode 2.



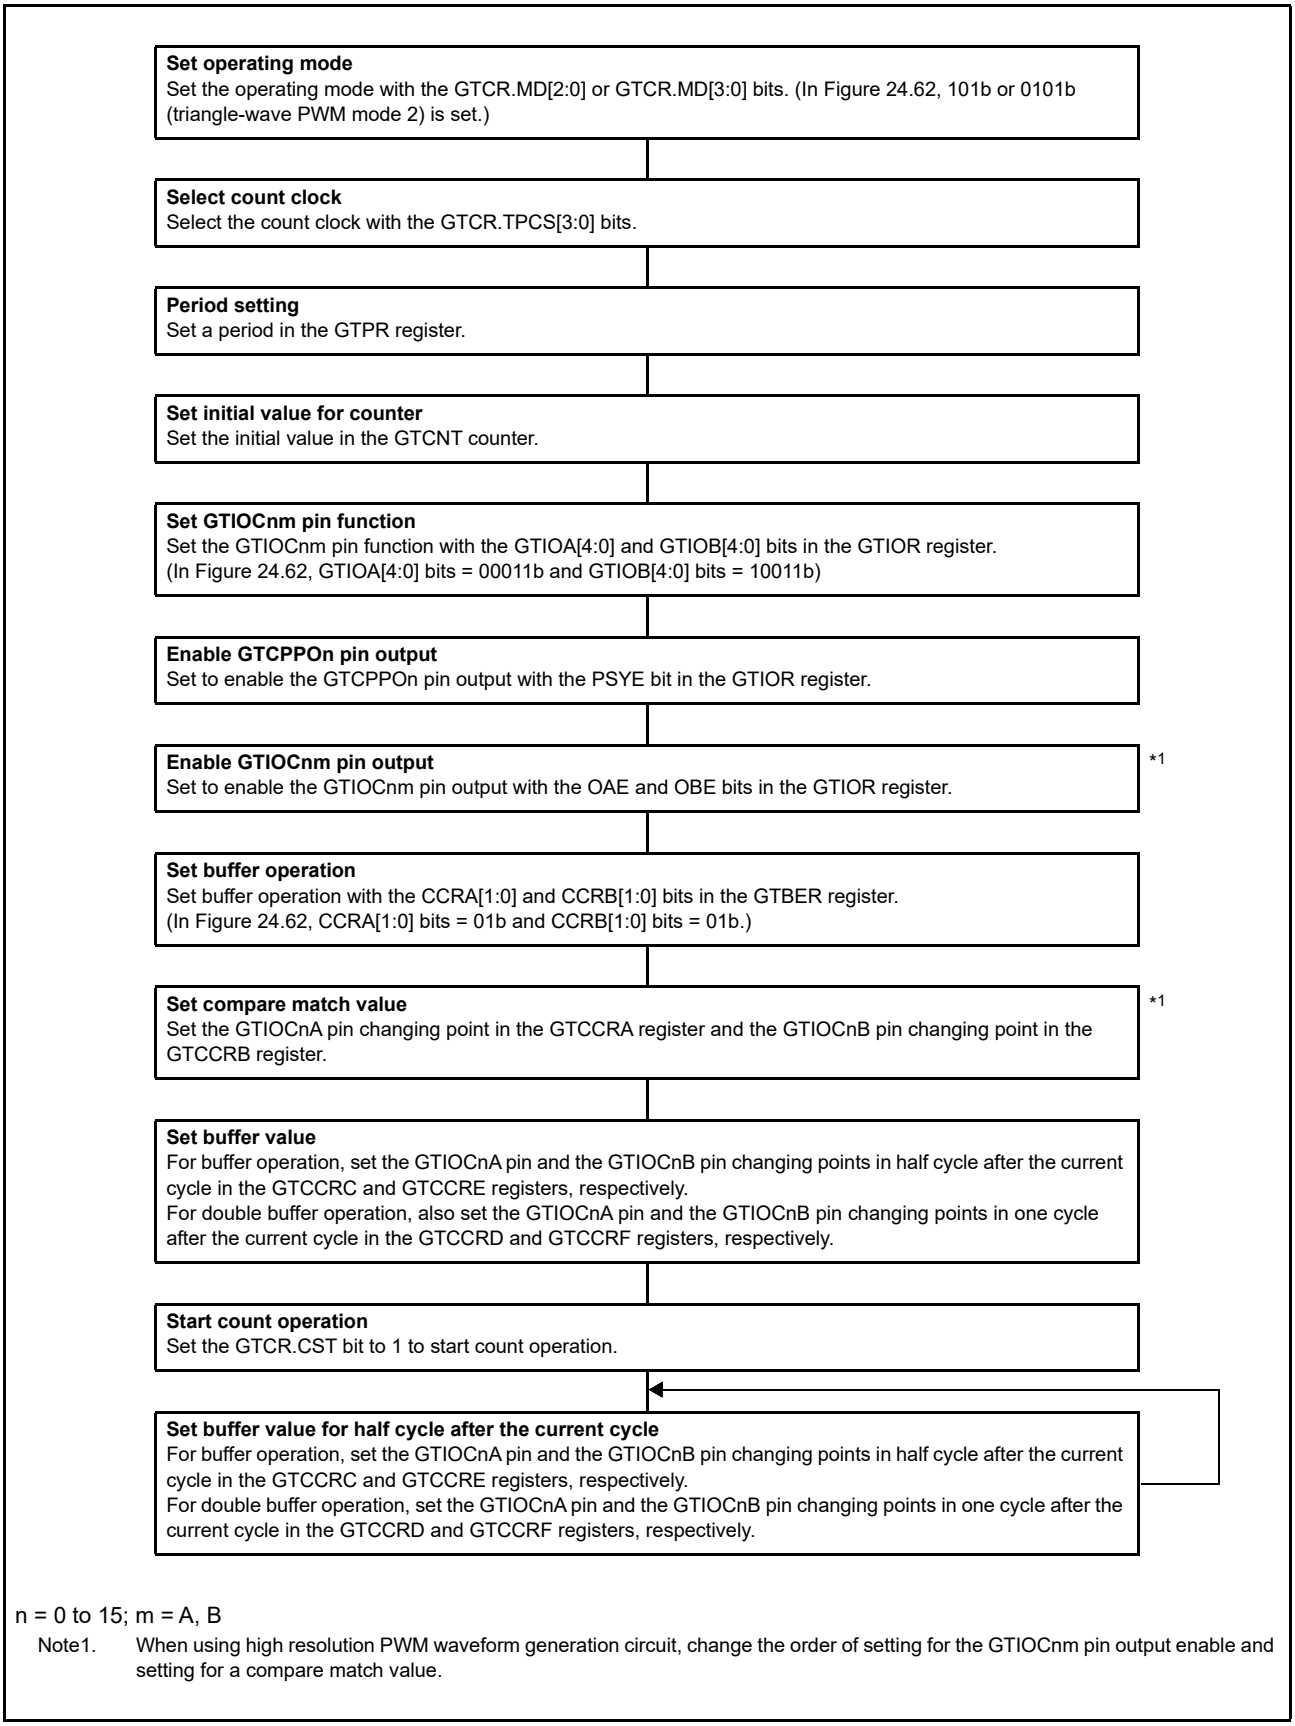


Figure 24.62 Example of Triangle-Wave PWM Mode 2 Operation (Buffer Operation, Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.63 Example for Setting Triangle-Wave PWM Mode 2

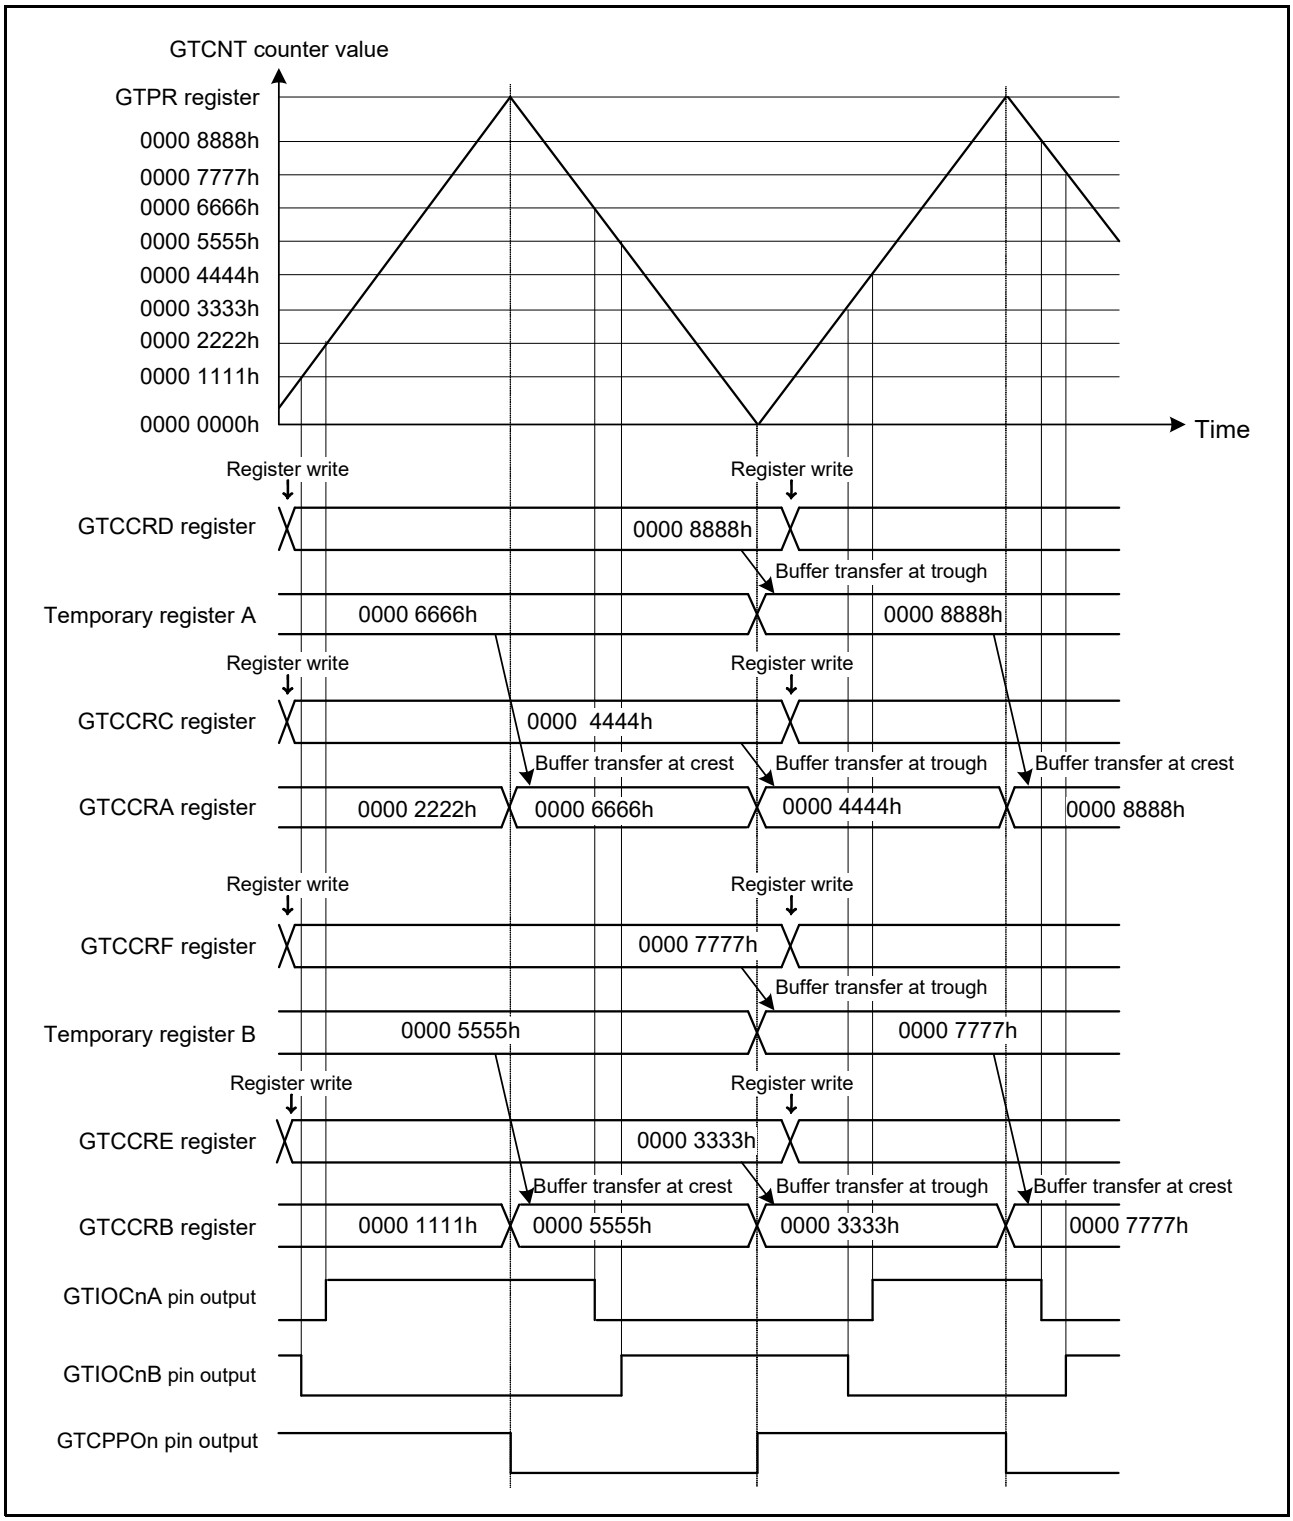
24.3.3.6 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the period is set in the GTPR register, the GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin at a compare match of the GTCCRA or GTCCRB register with buffer operation fixed (n = 0 to 15). Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the GTCCRC register to the GTCCRA register, from the GTCCRE register to the GTCCRB register, from the GTCCRD register to the temporary register A, and from the GTCCRF register to the temporary register B at the trough, and from the temporary register A to the GTCCRA register and from the temporary register B to the GTCCRB register at the crest. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the end of the cycle according to the GTIOR register setting.

By setting the GTDTCR, GTDVU, and GTDVD registers, a compare match value for a negative-phase waveform with dead time can automatically be set to the GTCCRB register.

When the GTBER.DBRTECm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis with using the temporary register x (x = C, E) and temporary register m (m = A, B) which operate as intermediate buffers for the GTCCRx (x = C, E) and GTCCRm (m = A, B) registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, refer to section 24.8.2.2, Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer.

Figure 24.64 shows an example of triangle-wave PWM mode 3 operation, and Figure 24.65 shows an example for setting triangle-wave PWM mode 3.



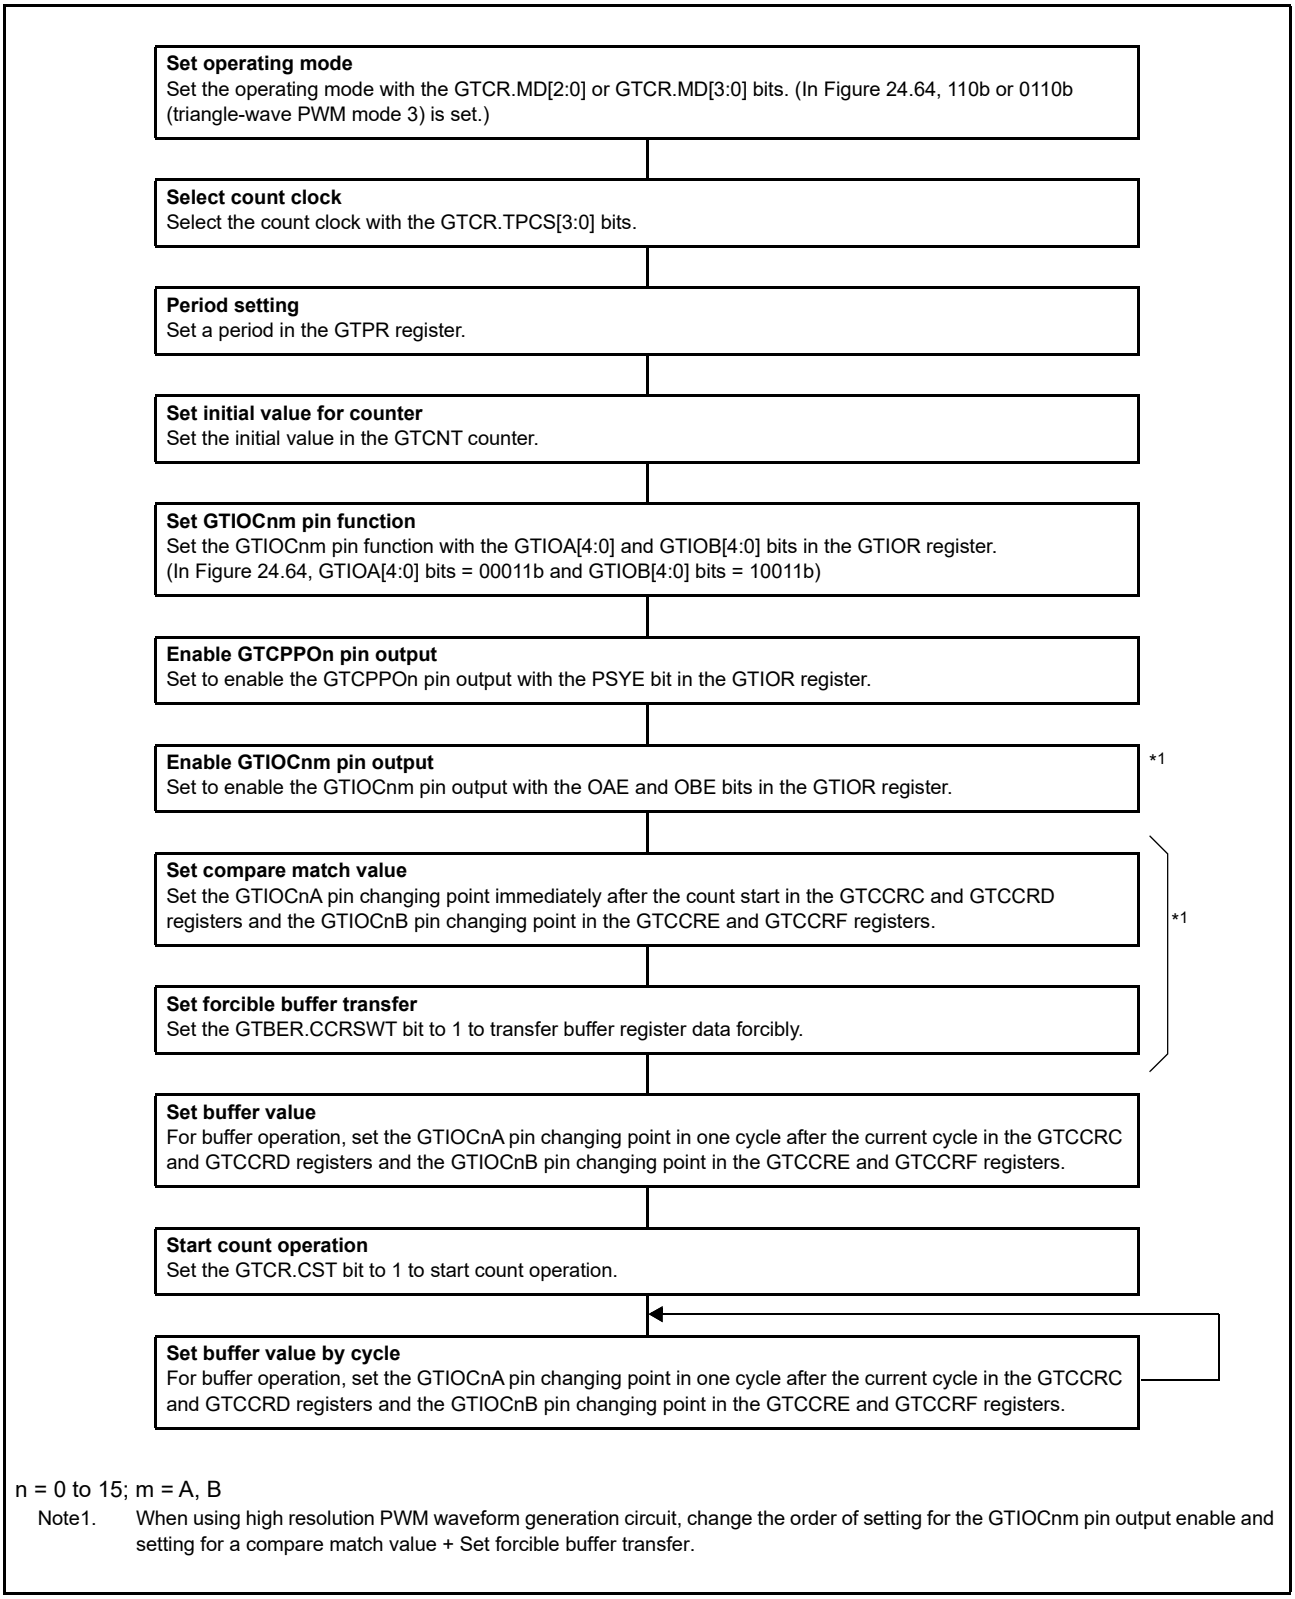


Figure 24.64 Example of Triangle-Wave PWM Mode 3 Operation (Low Output from the GTIOCnA Pin and High Output from the GTIOCnB Pin at Initial Output, Output Toggled at GTCCRA/GTCCRB Register Compare Match, Output Retained at the End of the Cycle, GTIOR.PSYE bit = 1 (n = 0 to 15))

n = 0 to 15; m = A, B

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value + Set forcible buffer transfer.

Figure 24.65 Example for Setting Triangle-Wave PWM Mode 3

24.3.3.7 Complementary PWM mode 1, 2, 3

In complementary PWM mode, a three-phase PWM waveform with dead time that ensures the linearity in the vicinity of duty 0% and 100% can be output using the GTCNT counter of consecutive three channels. There are four modes depending on differences in buffer operation: (1) complementary PWM mode 1 (transfer at crests), (2) complementary PWM mode 2 (transfer at troughs), (3) complementary PWM mode 3 (transfer at crests and troughs), and (4) complementary PWM mode 4 (immediate transfer).

Figure 24.66 shows the block diagram in complementary PWM modes 1 to 3.

Among consecutive three channels, the lowest channel is referred to as master channel, and the adjacent upper two channels are referred to as slave channel 1 (lower) and slave channel 2 (upper).

The GTCNT counter of each channel performs individual count operation under the cycle operation by the master channel.

In each channel, compare match with the GTCCRA register is performed selecting one of the three GTCNT counters in each operation section, and a positive-phase waveform and a negative-phase waveform are output from the GTIOCnA pin (n = 4 to 9) and the GTIOCnB pin (n = 4 to 9) respectively with a non-overlapping section of the dead time value set in the GTDVU register of the master channel.

The GTCCRA register performs buffer operation by the GTCCRC register, temporary register A, and GTCCRD register. In complementary PWM mode 3, setting the GTBER2.CP3DB bit to 1 also enables buffer operation of the GTCCRA register by the GTCCRE register, temporary register B, and GTCCRF register, allowing double buffer operation.

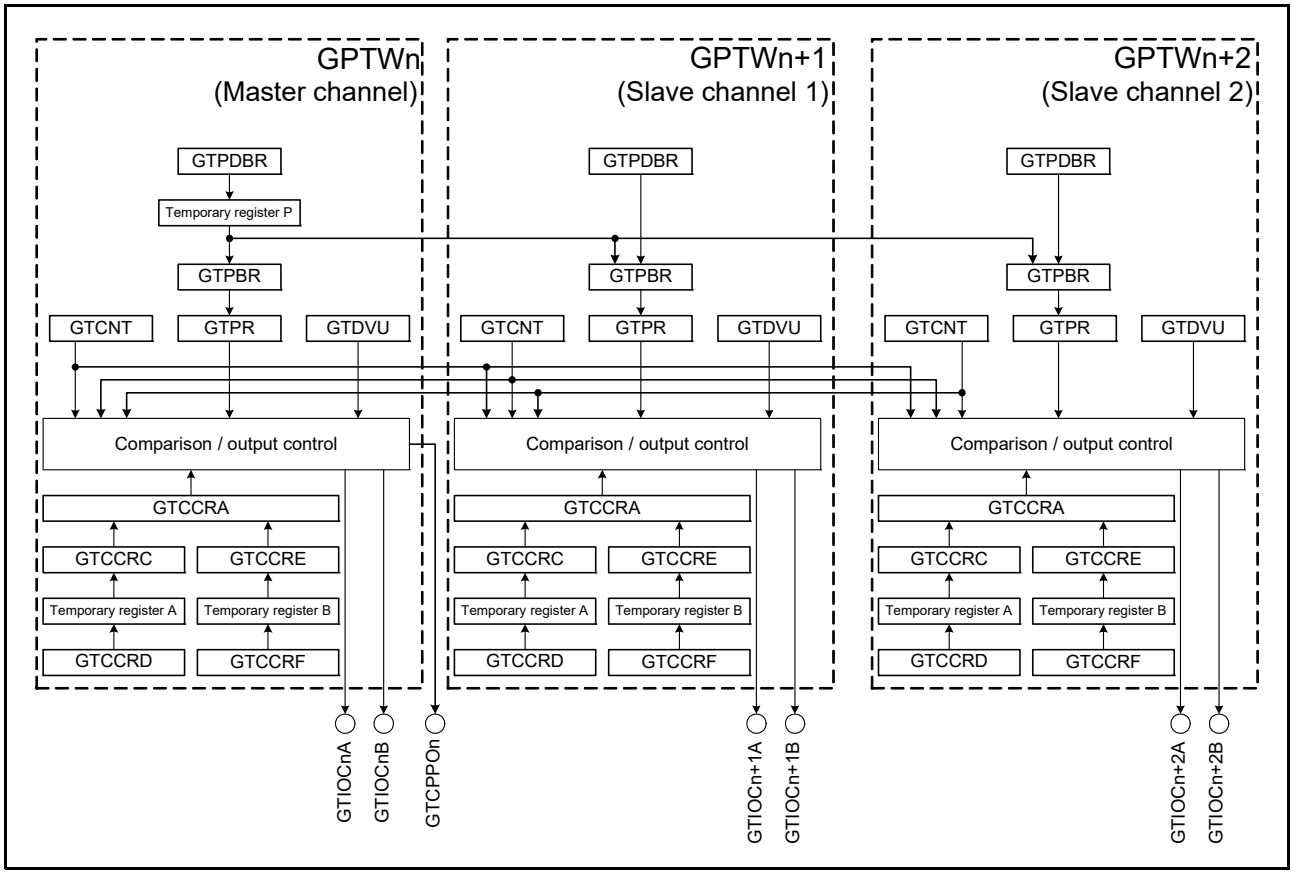

Figure 24.66 Block Diagram in Complementary PWM Mode 1, 2, 3 (n = 4, 7)

The GPTWn.GTCNT counter performs count operation for triangle waves using the GPTWn.GTPR register as a cycle register. A section where the GPTWn.GTCNT counter value is not larger than the dead time value is referred to as trough section.

The GPTWn+1.GTCNT counter performs count operation with the value (GPTWn.GTCNT counter value + dead time value set in the GPTWn.GTDVU register). A section where the GPTWn+1.GTCNT counter value is larger than the

GPTWn.GTPR register value is referred to as crest section.
Crest section and trough section are classified into up-counting crest section, down-counting crest section, up-counting trough section, and down-counting trough section according to counting direction. A section between trough section and crest section is referred to as up-counting middle section or down-counting middle section according to counting direction.
A section equivalent to the up-counting trough section after starting count operation is referred to as initial output section where operation differs partially from other up-counting trough sections.
The GPTWn+2.GTCNT counter functions as a counter to ensure the linearity in the vicinity of duty 0% and 100%. In a crest section, this counter performs count operation for a triangle wave (up-counting after down-counting) with the value (GPTWn.GTPR register value + dead time value) as an initial value and the GPTWn.GTPR register value as a trough. This counter is cleared to 0 at the end of the crest section, and then stops counting until the next trough section. In a trough section, this counter performs count operation for a triangle wave with an initial value of 0 and dead time value as a crest.
This counter becomes the value (GPTWn.GTPR register value + dead time value) at the end of the trough section, and then stops counting until the next crest section. In the initial output section, however, this counter counts up with an initial value of 0 until the dead time value, and then becomes the value (GPTWn.GTPR register value + dead time value).
If the counter stops and then restarts in complementary PWM mode, the counter of each channel returns to the initial value after starting count operation, and then starts counting from the initial output section.
Table 24.12 and Table 24.13 show count operation (counting direction/counting range) in each section. In these tables, registers with no channel identification indicate that the same value is stored in them of the master channel, slave channel 1, and slave channel 2.

Table 24.12 Count Operation in Complementary PWM Mode (1) (n = 4, 7)

Counter	Initial Value	Initial Output Section (After Start)	Up-Counting Middle Section	Up-Counting Crest Section	Down-Counting Crest Section
GPTWn.GTCNT	0	Up-Counting 0 to GTDVU	Up-Counting GTDVU + 1 to GTPR – GTDVU	Up-Counting GTPR – GTDVU + 1 to GTPR	Down-Counting GTPR – 1 to GTPR – GTDVU
GPTWn+1.GTCNT	GTDVU	Up-Counting GTDVU to GTDVU × 2	Up-Counting GTDVU × 2 + 1 to GTPR	Up-Counting GTPR + 1 to GTPR + GTDVU	Down-Counting GTPR + GTDVU – 1 to GTPR
GPTWn+2.GTCNT	0	Up-Counting 0 to GTDVU	Stop GTPR + GTDVU	Down-Counting GTPR + GTDVU – 1 to GTPR	Up-Counting GTPR + 1 to GTPR + GTDVU

Table 24.13 Count Operation in Complementary PWM Mode (2) (n = 4, 7)

Counter	Down-Counting Middle Section	Down-Counting Trough Section	Up-Counting Trough Section
GPTWn.GTCNT	Down-Counting GTPR – GTDVU – 1 to GTDVU	Down-Counting GTDVU – 1 to 0	Up-Counting 1 to GTDVU
GPTWn+1.GTCNT	Down-Counting GTPR – 1 to GTDVU × 2	Down-Counting GTDVU × 2 – 1 to GTDVU	Up-Counting GTDVU + 1 to GTDVU × 2
GPTWn+2.GTCNT	Stop 0	Up-Counting 1 to GTDVU	Down-Counting GTDVU – 1 to 0

In complementary PWM mode, the GTCCRA register buffer operation is different from normal buffer operation.
Data transfers from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B are performed at the same time in three channels by writing a value to the GTCCRD register of the GPTWn+2 channel.
Data transfers from the temporary register A and temporary register B to the GTCCRC and GTCCRE registers vary depending on the transfer timing to the temporary register A and temporary register B. Data transfers from the GTCCRC and GTCCRE registers to the GTCCRA register are performed according to each complementary PWM mode name (crest transfer, trough transfer, and crest/trough transfer).
Buffer operation of the GTPR register in complementary PWM mode is described in section 24.3.2.1, GTPR Register Buffer Operation. Do not perform buffer operation for the GTDVU register in complementary PWM mode.

Table 24.14 shows buffer transfer timing during single buffer operation in complementary PWM modes 1 to 3. Table 24.15 shows buffer transfer timing during double buffer operation in complementary PWM mode 3.

Table 24.14 Single Buffer Transfer Timing in Complementary PWM Mode 1, 2, 3 (n = 4, 7)

Buffer Transfer	Complementary PWM Mode 1	Complementary PWM Mode 2	Complementary PWM Mode 3
GTCCRD ↓ Temporary register A	After one GTCLK cycle from the GTCCRD register write of slave channel 2 (GPTWn+2)	After one GTCLK cycle from the GTCCRD register write of slave channel 2 (GPTWn+2)	After one GTCLK cycle from the GTCCRD register write of slave channel 2 (GPTWn+2)
Temporary register A ↓ GTCCRC	(1) When transferring to the temporary register A at the middle section of the up-count • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring to the temporary register A at other than the middle section of the up-count • The end of the trough (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A	(1) When transferring to the temporary register A at the middle section of the down-count • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring to the temporary register A at other than the middle section of the down-count • The end of the crest (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A	(1) When transferring to the temporary register A at the middle section • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring to the temporary register A at other than the middle section • The end of the crest/trough (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A
GTCCRC ↓ GTCCRA	• The end of the trough • Counter clear in the up-count intermediate section and crest section	• The end of the trough section excluding the initial output section • Counter clear in the down-count intermediate section and trough section	• The end of the trough • The end of the trough section excluding the initial output section • Counter clear

Table 24.15 Double Buffer Transfer Timing in Complementary PWM Mode 3 (n = 4, 7)

Buffer Transfer	Transfer Timing
GTCCRD ↓ Temporary register A	After 1 GTCLK after slave channel 2 (GPTWn+2) writes to the GTCCRD register
Temporary register A ↓ GTCCRC	(1) When transferring data to the temporary register A at the middle section • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A (2) When transferring data to the temporary register A at other than the middle section • At the end of crest and trough sections (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register A
GTCCRC ↓ GTCCRA	• The end of the crest • Counter clear

Buffer Transfer	Transfer Timing
GTCCRF ↓ Temporary register B	After 1 GTCLK after slave channel 2 (GPTWn+2) writes to the GTCCRD register
Temporary register B ↓ GTCCRE	(1) When transferring data to the temporary register B at the middle section • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register B (2) When transferring data to the temporary register B at other than the middle section • At the end of crest and trough sections (3) Counter stopped • One cycle of PCLKCA/GTCLK after transfer of data to the temporary register B
GTCCRE ↓ GTCCRA	• The end of the trough section excluding the initial output section

The change in the output level of the positive phase waveform output from the GTIOCnA pin (n = 4 to 9) and the negative phase waveform output from the GTIOCnB pin (n = 4 to 9) is determined by the compare match by the combination of the counter and register in each operation section. In the middle section, the compare match between the GPTWn.GTCNT counter and the GTCCRA register changes the positive phase waveform output level, and the compare match between the GPTWn+1.GTCNT counter and the GTCCRA register changes the negative phase waveform output level. The crest and trough sections use the GPTWn+2.GTCNT counter, GTCCRC register, and GTCCRE register to

perform a compare match operation to ensure linearity near 0% and 100% duty.
When the compare match value is greater than or equal to the GPTWn.GTPR register value, the duty is 0% (positive phase waveform OFF, negative phase waveform ON). When the compare match value is 0, the duty is 100% (positive phase waveform ON, negative phase waveform OFF).
Table 24.16 shows the counter and register combinations used in the comparative match operation to generate a positive-phase waveform and a negative-phase waveform in each operating section.

Table 24.16 Combinations of Counters and Registers for Compare Match Operation in Complementary PWM Mode

	Up-Counting Middle Section	Up-Counting Crest Section	Down-Counting Crest Section	Down-Counting Middle Section	Down-Counting Trough Section	Up-Counting Trough Section
Negative-Phase OFF	GPTWn+1.GTCNT	GPTWn+1.GTCNT	—	GPTWn+2.GTCNT*1	GPTWn+2.GTCNT	GPTWn+1.GTCNT
	GTCCRA	GTCCRA	—	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)
Positive-Phase ON	GPTWn.GTCNT	GPTWn.GTCNT	GPTWn+2.GTCNT	—	GPTWn+2.GTCNT*1	GPTWn+2.GTCNT
	GTCCRA	GTCCRA	GTCCRA	—	GTCCRC (GTCCRE for double buffer operation)	GTCCRC (GTCCRE for double buffer operation)
Negative-Phase OFF	GPTWn+2.GTCNT*1	GPTWn+2.GTCNT	GPTWn.GTCNT	GPTWn.GTCNT	GPTWn.GTCNT	—
	GTCCRC	GTCCRC	GTCCRC	GTCCRA	GTCCRA	—
Positive-Phase ON	—	GPTWn+1.GTCNT*1	GPTWn+1.GTCNT	GPTWn+1.GTCNT	GPTWn+1.GTCNT	GPTWn+2.GTCNT
	—	GTCCRC	GTCCRC	GTCCRA	GTCCRA	GTCCRA

Note 1. Compare match is performed only at the time of final count in the target section, but is not performed at count values other than the final count.

In the case of normal complementary PWM mode waveform, a PWM waveform change occurs in the order of negative-phase OFF → positive-phase ON → positive-phase OFF → negative-phase ON. However, this order may vary depending on operation section and register values. In this case, OFF takes precedence in trough sections and ON takes precedence in crest sections (for negative-phase waveforms), and ON takes precedence in trough sections and OFF takes precedence in crest sections (for positive-phase waveforms). A lower-priority compare match that occurs at the same time or after a higher-priority compare match is ignored.
In the initial output section, the initial output set in the GTIOR register is retained. In the case that the GTCCRA register value is larger than the GTDVU register value at the end of the initial output section, negative phase is enabled. In the case that the GTCCRA register value is not larger than the GTDVU register value, positive phase is enabled.
As operation examples of normal complementary PWM mode waveform where compare match operation occurs in the middle section, Figure 24.67 and Figure 24.68 show complementary PWM mode 1, Figure 24.69 and Figure 24.70 show complementary PWM mode 2, Figure 24.71 and Figure 24.72 show single buffer complementary PWM mode 3, and Figure 24.73 and Figure 24.74 show double buffer complementary PWM mode 3.

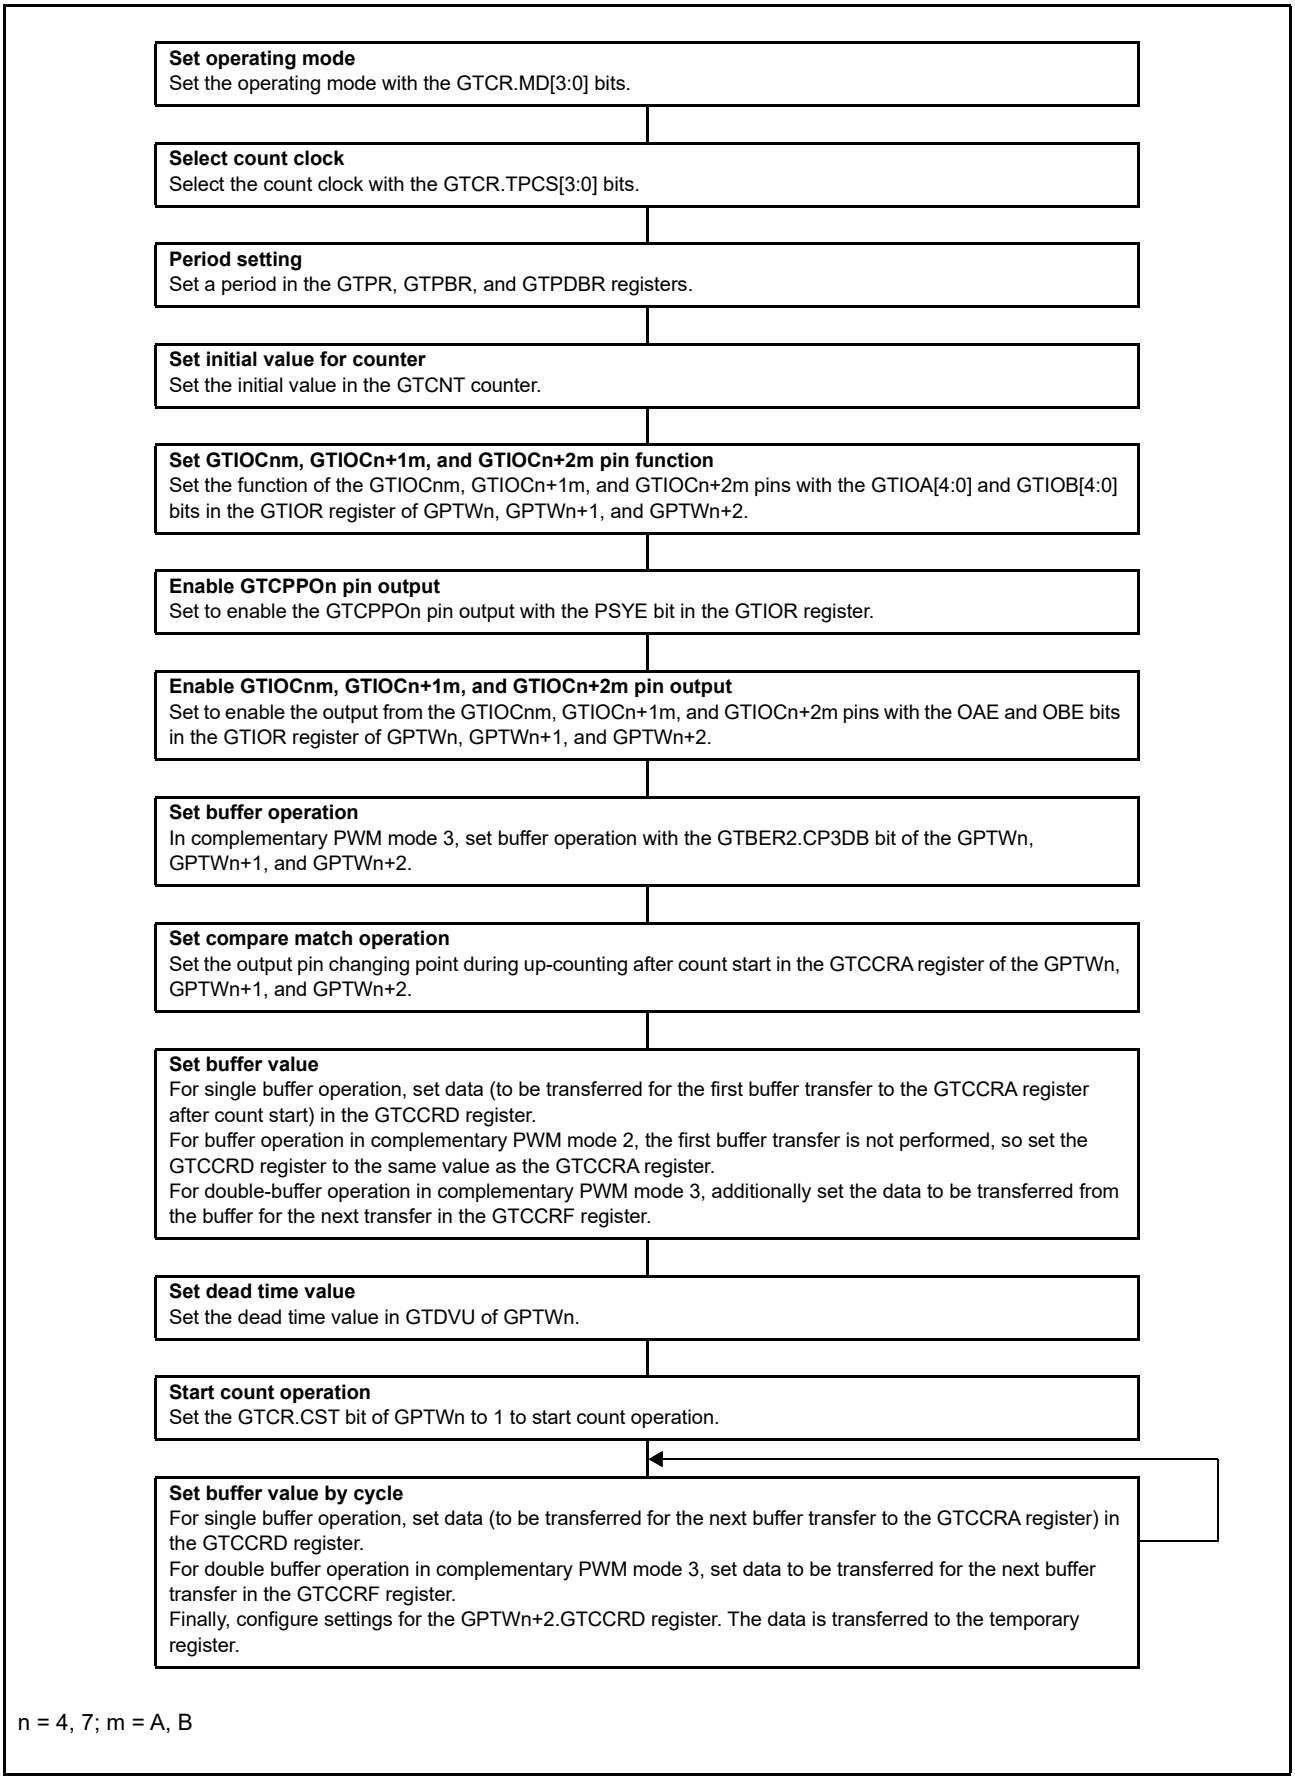

Figure 24.89 Example for Setting Complementary PWM Mode 1, 2, 3

24.3.3.8 Complementary PWM Mode 4

In complementary PWM mode 4, the value written to the GTCCRD and GTCCRF registers is immediately applied to compare match operation by transferring data also to the GTCCRA register during buffer transfer to a temporary register before crest or trough transfer timing.

Figure 24.90 shows the block diagram in complementary PWM mode 4.

In the configuration of complementary PWM mode 4, a buffer transfer path from the GTCCRD register to the GTCCRC and GTCCRA registers and a buffer transfer path from the GTCCRF register to the GTCCRE and GTCCRA registers are added to other complementary PWM modes shown in Figure 24.66.

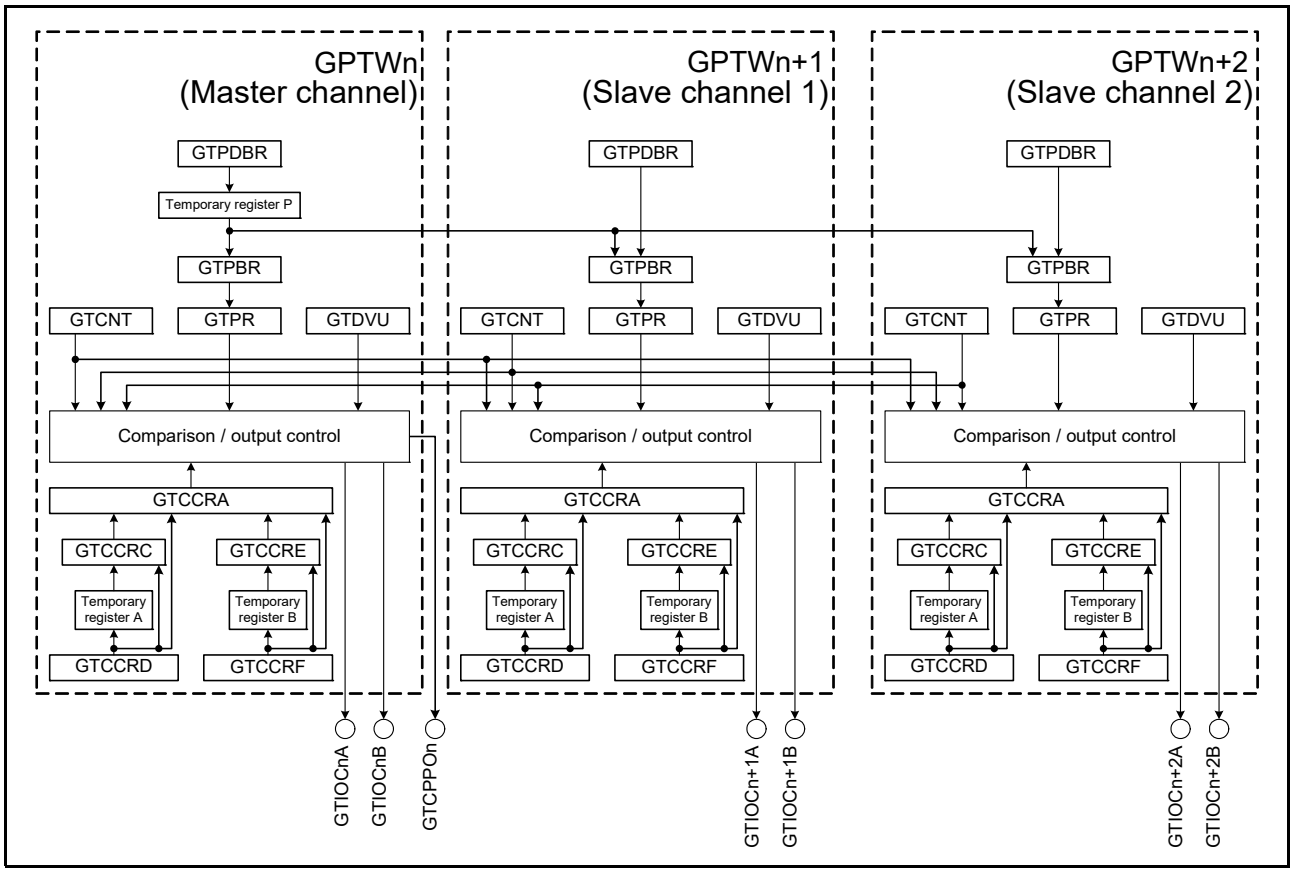

Figure 24.90 Block Diagram in Complementary PWM Mode 4 (n = 4, 7)

Count operation is performed in the same way as complementary PWM modes 1 to 3. See Table 24.12 and Table 24.13.

With respect to buffer operation and PWM waveform changes in complementary PWM mode 4, buffer transfer (shown in Figure 24.90) from the GTCCRD and GTCCRF registers is added based on the complementary PWM mode 3 operation.

Buffer transfer and PWM waveform are controlled according to operation section, state of comparison with the GTCCRA register, and write value.

The double buffer function by writing to the GTCCRF register can be enabled or disabled with the GTBER2.CP3DB bit.

In double buffer operation, the value written to the GTCCRD register is used as a compare match value for positive-phase OFF (negative-phase ON) during down-counting, and the value written to the GTCCRF register is used as a compare match value for negative-phase OFF (positive-phase ON) during up-counting. Transfer register, transfer value, and PWM output changes are controlled by operation section (where the value is written), state of comparison with the GTCCRA register, and write value.

Double buffer operation is guaranteed only in the up-counting middle section and down-counting middle section. Setting a value that is less than or equal to the dead time value, or greater than or equal to the count cycle, is prohibited.

In single buffer operation, a compare match value is written only to the GTCCRD register, and transfer register, transfer value, and PWM output changes are controlled by operation section (where the value is written), state of comparison with the GTCCRA register, and write value.
Transfer from the GTCCRD register to the temporary register A and transfer from the GTCCRF register to the temporary register B are performed in the same way as other complementary PWM modes. Transfers are concurrently performed in three channels by writing a value to the GPTWn+2.GTCCRD register. Transfer from the GTCCRD register to the GTCCRC register, GTCCRA register, temporary register B, and GTCCRE register and transfer from the GTCCRF register to the GTCCRE register and the GTCCRA register are performed at the same time as the above-mentioned transfer to the temporary register.
Table 24.17 and Table 24.18 show immediate buffer transfer (for transfer to the temporary register by writing a value to the GPTWn+2.GTCCRD register) to the GTCCRC and GTCCRA registers by writing a value to the GTCCRD register during single buffer operation in complementary PWM mode 4 for each compare match state in each operation section. Transfers (from the GTCCRD register to the temporary register A, from the temporary register A to the GTCCRC register, and from the GTCCRC register to the GTCCRA register) other than those shown in Table 24.17 and Table 24.18 are the same as single buffer transfer in complementary PWM mode 3 shown in Table 24.14.
Table 24.19 and Table 24.20 show immediate buffer transfer (for transfer to the temporary register by writing a value to the GPTWn+2.GTCCRD register) to each register by writing a value to the GTCCRD and GTCCRF registers during double buffer operation in complementary PWM mode 4 for each compare match state in each operation section.
Transfers (from the GTCCRD register to the temporary register A, from the GTCCRF register to the temporary register B, from the temporary register A to the GTCCRC register, from the temporary register B to the GTCCRE register, and from the GTCCRC and GTCCRE registers to the GTCCRA register) other than those shown in Table 24.19 and Table 24.20 are the same as double buffer transfer in complementary PWM mode 3 shown in Table 24.15.

when writing to the GTCCRD register during the down-counting dead time period) (n = 4, 7)

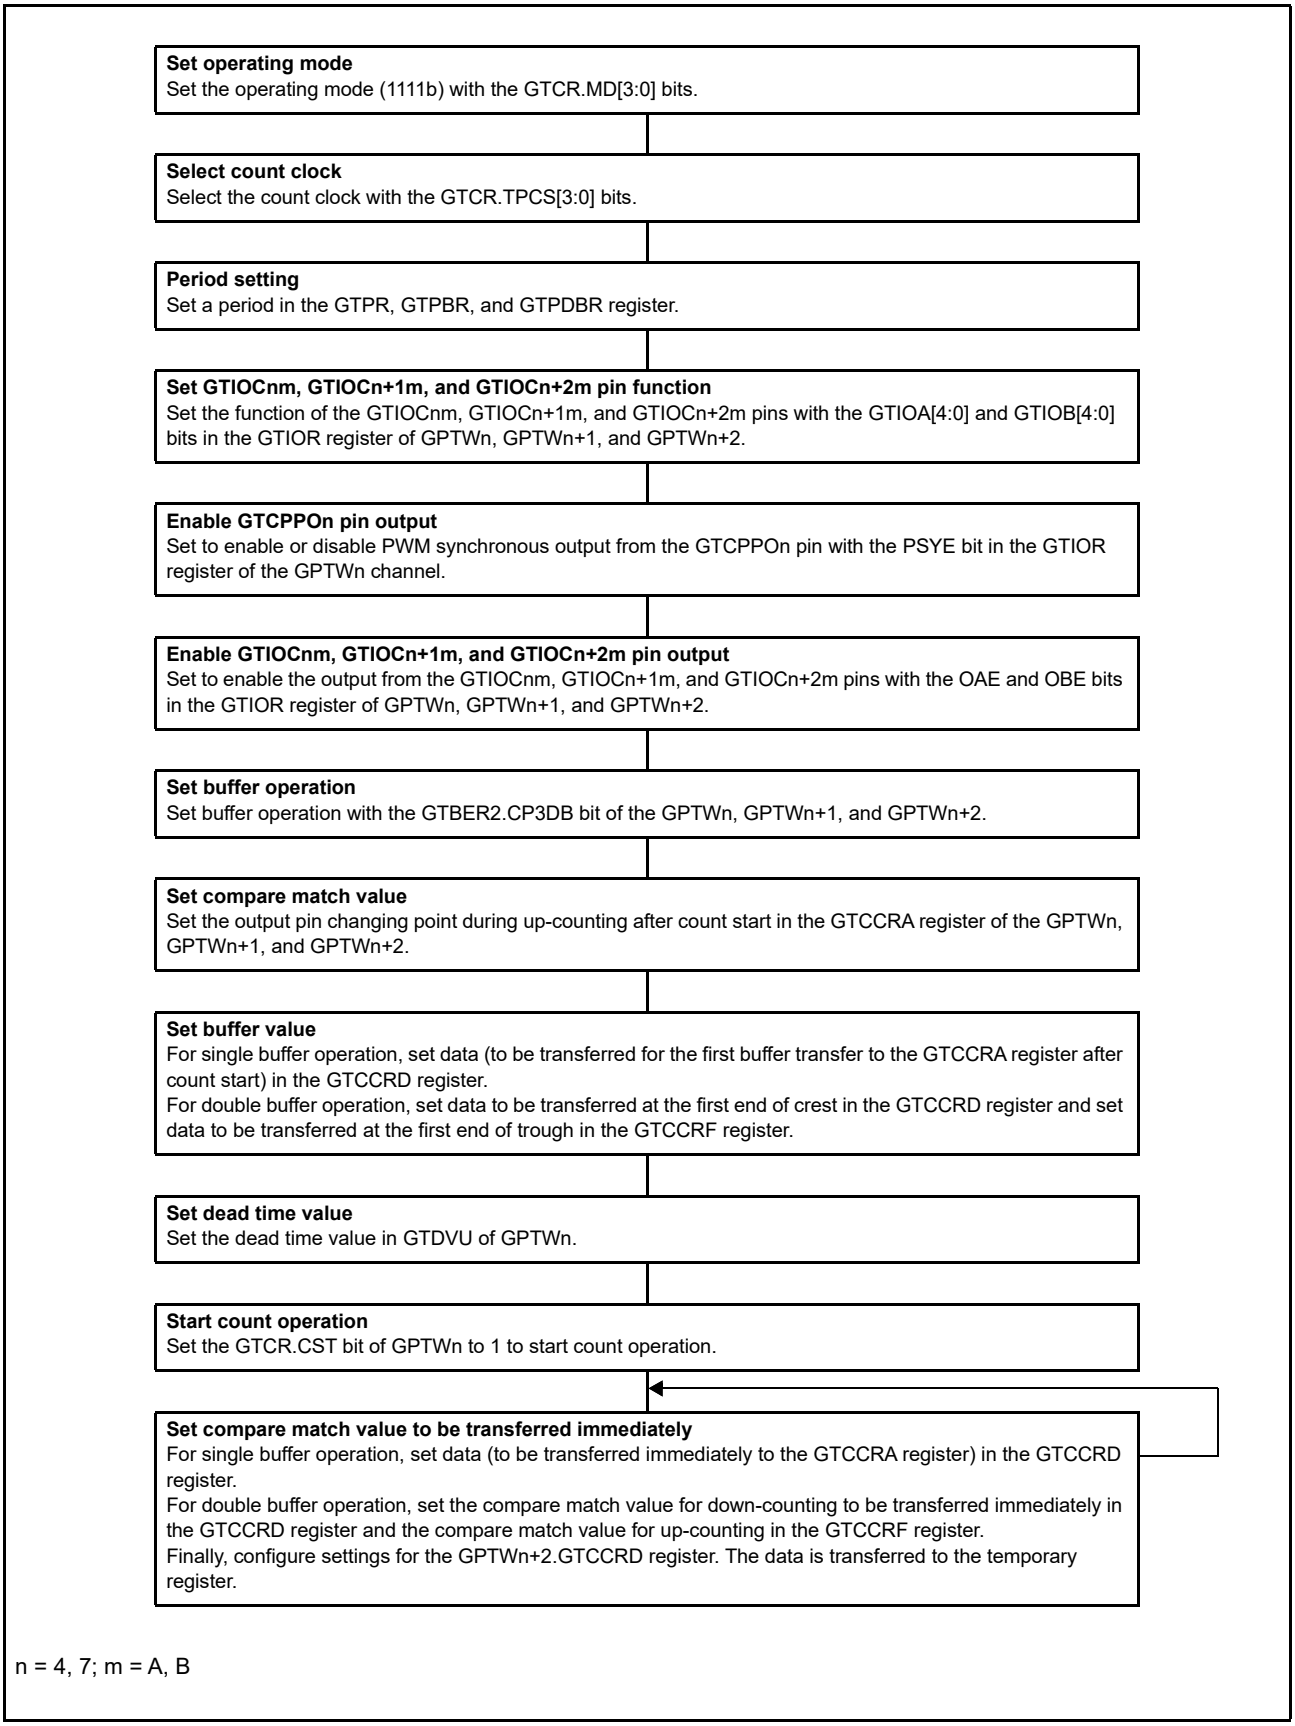

Figure 24.100 Example for Setting Complementary PWM Mode 4

24.3.4 Automatic Dead Time Setting Function

By setting the GTDTCR register, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (the GTCCRA register value) and specified dead time values (the GTDVU and GTDVD registers values) can automatically be set to the GTCCRB register.
The automatic dead time setting function can be used in sawtooth-wave one-shot pulse mode and all the triangle PWM modes.
Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in the GTDVU register and that in the second half is set in the GTDVD register. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.
The GTDBU register can be used as a buffer register of the GTDVU register, and the GTDBD register can be used as a buffer register of the GTDVD register. Buffer transfer is performed at the end of the cycle (in sawtooth-wave mode: either of an overflow of the GTCNT counter (up-counting), an underflow (down-counting), or the GTCNT counter clearing; in triangle-wave mode: a trough).
The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to the GTCCRB register is prohibited when the automatic dead time setting function is used.

Do not set the dead-time that makes the change point of the waveform exceeding the count period. When any dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in Table 24.21. The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to judge the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.
If the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.
If dead-time exceeds the count period by setting 0000 0000h or a value greater than or equal to the setting value of the GTPR register is set in the GTCCRA register in triangle-wave PWM mode, output change is controlled by the output protection function (refer to section 24.8.4, Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)). When GTCCRA register is greater than or equal to [GTPR register + GTDVm register], [GTPR register – 1] is set in the GTCCRB register as the upper limit. (m = U, D)
Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it also can be done at the next count clock from the current crest.

Table 24.21 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs

PWM Output Operating Mode	Count Direction	Period	Condition for Dead-Time Error	Change Point of the Positive-Phase Waveform after Adjustment	Change Point of the Negative-Phase Waveform after Adjustment
Sawtooth-wave one-shot pulse mode	Up-counting	First half	GTCCRA – GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVD > GTPR (GTCCRA + GTDVU > GTPR)*1	GTPR – GTDVD (GTPR – GTDVU)*1	GTPR
	Down-counting	First half	GTCCRA + GTDVU > GTPR	GTPR – GTDVU	GTPR
		Second half	GTCCRA – GTDVD < 0 (GTCCRA – GTDVU < 0)*1	GTDVD (GTDVU)*1	0
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	GTCCRA – GTDVU≤0	GTDVU + 1	1
	Down-counting	(Second half)	GTCCRA – GTDVD < 0 (GTCCRA – GTDVU < 0)*1	GTDVD (GTDVU)*1	0

Note 1. In the case of GTDTCR.TDFER = 1.

Figure 24.101 to Figure 24.104 show examples of automatic dead time setting function operation. Figure 24.105 and Figure 24.106 show the setting examples.

Note1. When using high resolution PWM waveform generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

Figure 24.106 Example for Setting Automatic Dead Time Setting Function (Triangle-Wave PWM Mode 1 or 2)

24.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the GTUDDTYC.UD bit.
In sawtooth-wave mode, if the UD bit is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the UD bit is modified while count operation is stopped and the GTUDDTYC.UDF bit is 0, the UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while count operation is stopped, the UD bit value at that time is reflected at the start of counting.
In triangle-wave mode, changing the value of the GTUDDTYC.UD bit during counting does not switch the direction of counting. Likewise, changing the value of the GTUDDTYC.UD bit while the GTUDDTYC.UDF bit is 0 and counting is stopped does not actually update the value of the bit. If 1 is written to the GTUDDTYC.UDF bit while counting is stopped, the value of the GTUDDTYC.UD bit at that time is reflected from the time counting is started.
When counting direction is switched during count operation in sawtooth-wave mode, the value of the GTPR register after start of up-counting is reflected to the count period in up-counting operation, and the value of the GTPR register after the start of down-counting is reflected to the count period in down-counting operation.
Figure 24.107 shows an example of count direction changing function operation.

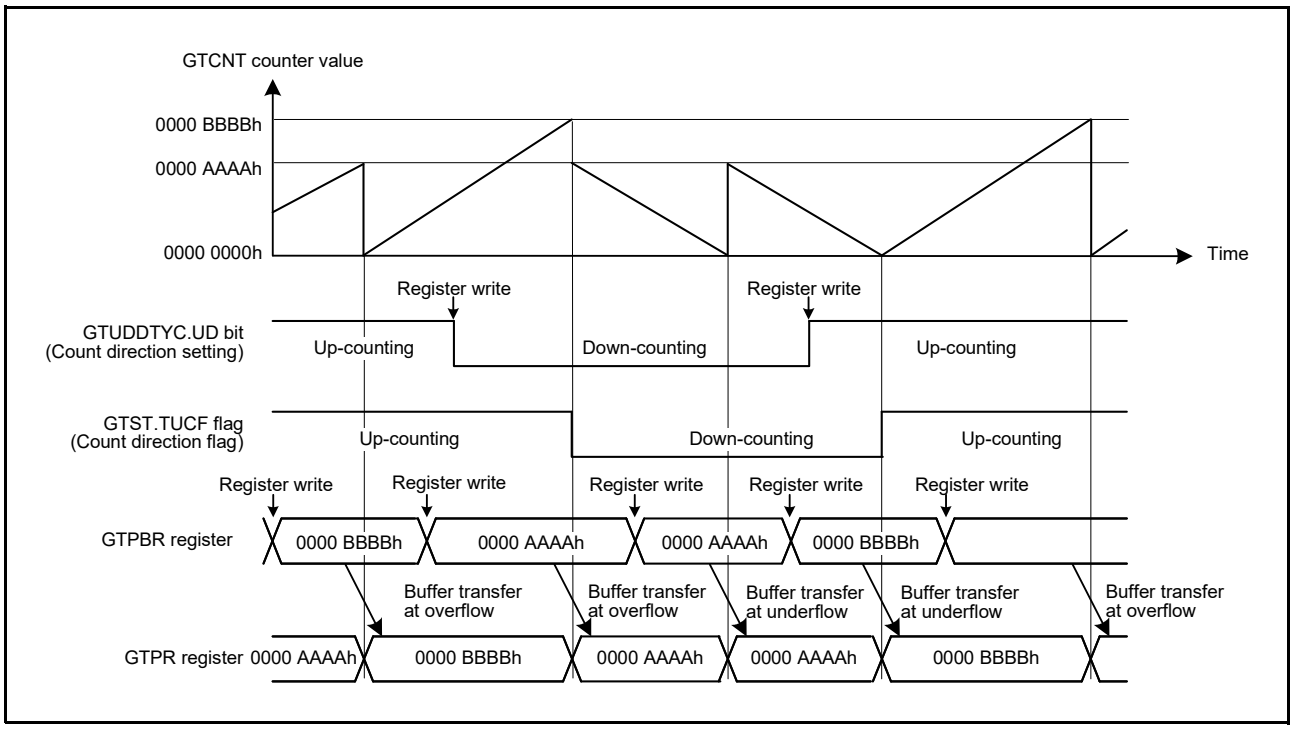

Figure 24.107 Example of Count Direction Changing Function Operation (during Buffer Operation)

24.3.6 Duty Cycle 0%/100% Output Function

Changing the value of the GTUDDTYC.OADTY[1:0] bits and GTUDDTYC.OBDTY[1:0] bits specifies the output duty setting on the GTIOCnA and GTIOCnB pins to 0% or 100%. (n = 0 to 15)

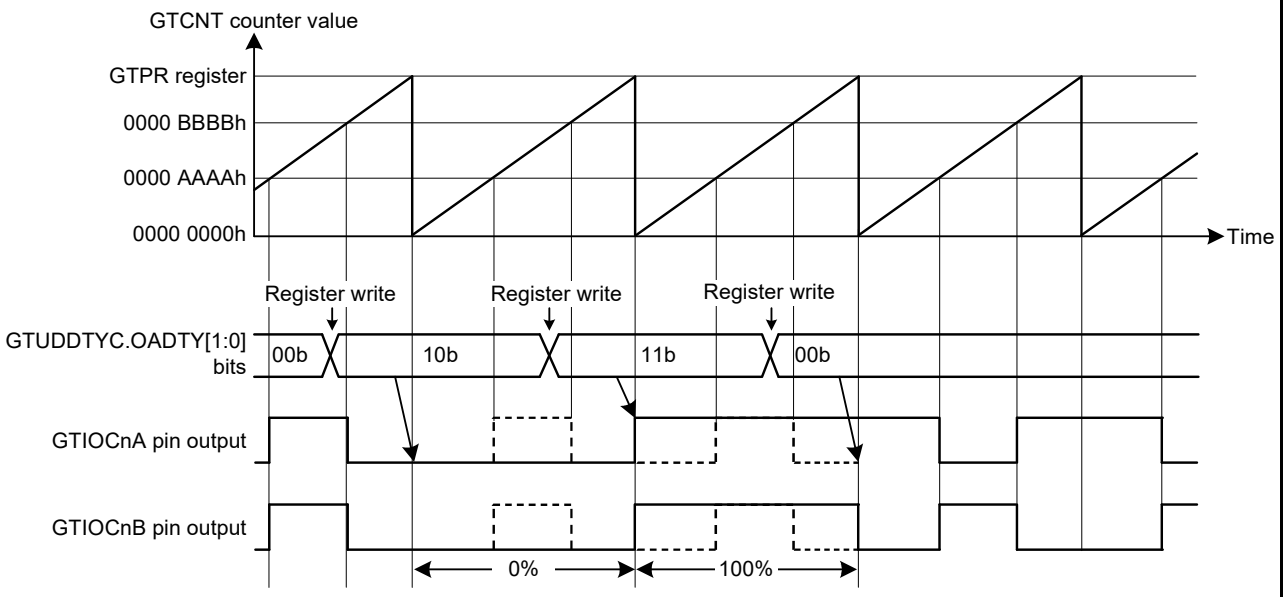
This function is invalid in sawtooth-wave PWM mode 2 or complementary PWM mode. For complementary PWM mode, 0%/100% duty output is possible regardless of the setting of the OADTY[1:0] bits or OBDTY[1:0] bits.

In sawtooth-wave mode, if the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed during the count operation, the output duty-cycle setting is reflected at an overflow (when changed during up-counting) or an underflow (when changed during down-counting). When the GTUDDTYC.OADTYF bit or GTUDDTYC.OBDTYF bit is 0 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the updated output duty-cycle setting is not applied at the count start, but it is applied at an overflow or underflow. When the OADTYF bit or OBDTYF bit is 1 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the value of the OADTY[1:0] bits or OBDTY[1:0] bits at that time is reflected at the start of counting.

In triangle-wave mode, if the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed during count operation, the updated output duty-cycle setting is applied at an underflow when the GTUDDTYC.OABDTYT bit is set to 0. When the GTUDDTYC.OABDTYT bit is set to 1, the updated output duty-cycle setting is applied at an underflow or at the top of the triangle-wave.

When the OADTYF bit or OBDTYF bit is 0 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the updated output duty-cycle setting is not applied at the start of counting, but is applied at an underflow. When the OADTYF bit or OBDTYF bit is 1 while count operation is stopped and the value of the OADTY[1:0] bits or OBDTY[1:0] bits is changed, the updated output duty-cycle setting is applied from the start of counting.

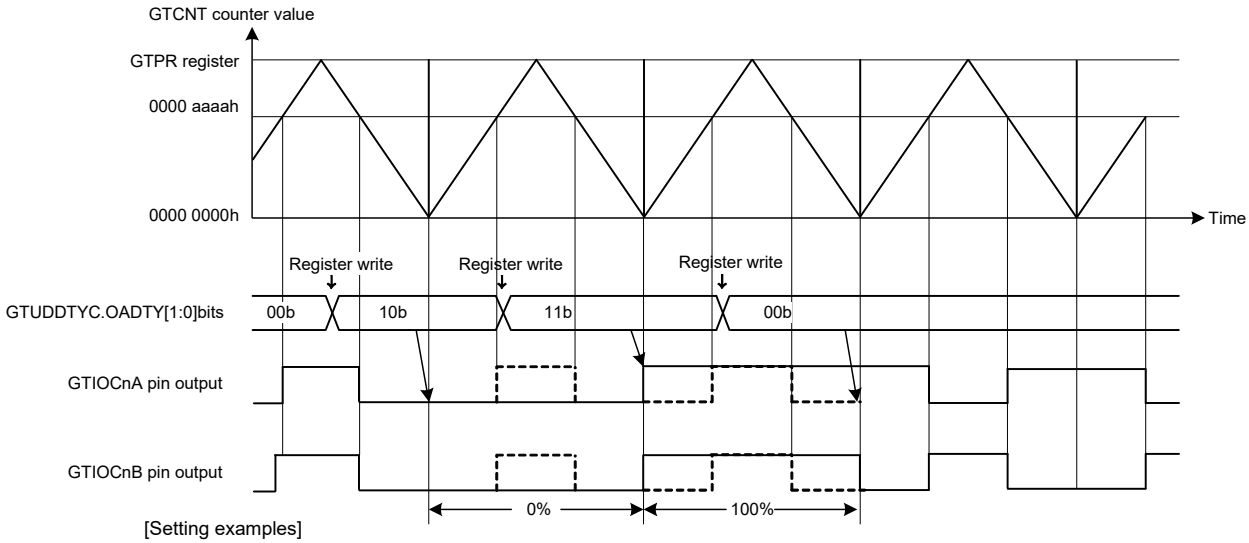
During the operation under the settings of duty cycle for 0%/100%, compare match operation inside the GPTW continues to perform interrupt outputs and buffer operations.



When the output duty setting is changed from 0% or 100% to a compare match, the GTIOR.GTIOA[3:2] bits and the OADTYR bits determine the level output on the GTIOCnA pin and GTIOR.GTIOB[3:2] bits and OBDTYR bits determine the level output on the GTIOCnB pin at the end of the cycle. When the GTIOA[3:2], GTIOB[3:2] bits are set as 01b, output is driven Low at the end of the cycle, and when set as 10b, output is driven High at the end of the cycle. The output is retained at the end of the cycles when the GTIOA[3:2] or GTIOB[3:2] bits are 00b, and toggled at the end of the cycles when the GTIOA[3:2] or GTIOB[3:2] bits are 11b. A value to be output is selectable in the OADTYR or OBDTYR bit when the corresponding GTIOA[3:2] or GTIOB[3:2] bits are either 00b or 11b. Table 24.22 lists the output values at the end of the cycle when the output setting is changed from duty 0% or 100% to compare match.

Table 24.22 Output Value after Release of Duty 0%/100%

GTIOR.GTIOm[3:2]	Value at Compare Match Output at the End of the Cycle in the Case of Masking by a Duty Cycle 0% or 100%	The GTUDDTYC.OmDTYR Bit at Duty 0% Setting		The GTUDDTYC.OmDTYR Bit at Duty 100% Setting	
		0	1	0	1
00b (Output retained at the end of the cycle)	Low	0	0	1	0
	High	0	1	1	1
01b (Low output at the end of the cycle)	—	0	0	0	0
10b (High output at the end of the cycle)	—	1	1	1	1
11b (Toggle output at the end of the cycle)	Low	1	1	0	1
	High	1	0	0	0



m = A, B

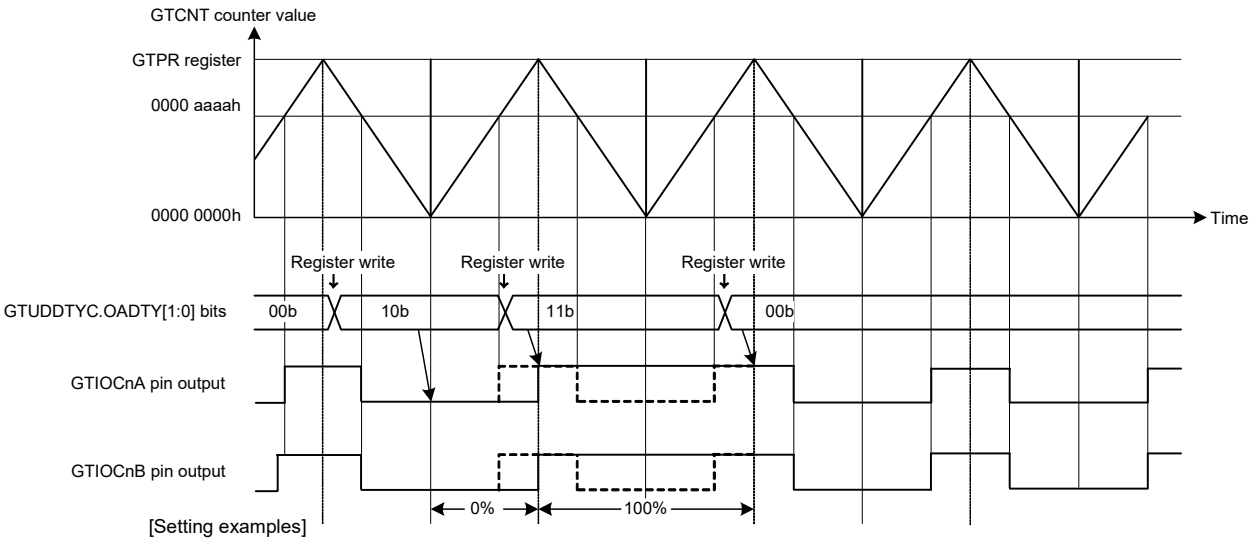
Figure 24.108 to Figure 24.110 shows an example of operation of the output of the duty cycle 0% or 100% (n = 0 to 15).

[Setting examples]
GTIOR.GTIOA[4:0] bits: 00011b
The initial output is Low, the output is toggled on a compare match, and the output is maintained at the end of the period.
GTUDDTYC.OADTYR bit: 0
The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.
GTIOR.GTIOB[4:0] bits: 00011b
The initial output is Low, the output is toggled on a compare match, and the output is maintained at the end of the period.
GTUDDTYC.OBDTYR bit: 1
The function of the GTIOB[3:2] bits is applied to the compare match output value which is masked after 0 or 100% duty setting release.

Figure 24.108 Example of Operation of Output of Duty Cycle 0% or 100% (n = 0 to 15)

[Setting examples]

GTIOR.GTIOA[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.



GTUDDTYC.OADTYR bit: 0
The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.

GTIOR.GTIOB[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.

GTUDDTYC.OBDTYR bit: 1
The function of the GTIOB[3:2] bits is applied to the compare match output value which is masked after 0 or 100% duty setting release.

GTUDDTYC.OABDTYT bit: 0
The activation timing of 0 or 100% duty setting is set to the trough.

Figure 24.109 Example of Operation of Output of Duty Cycle 0% or 100% (Activate at Trough) in Triangle-Wave PWM Mode 1 (n = 0 to 15)

[Setting examples]

GTIOR.GTIOA[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.

GTUDDTYC.OADTYR bit: 0
The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.

GTIOR.GTIOB[4:0] bits: 00011b
The initial output is low, the output is toggled on a compare match, and the output is maintained at the end of the period.

GTUDDTYC.OBDTYR bit: 1
The function of the GTIOB[3:2] bits is applied to the compare match output value which is masked after 0 or 100% duty setting release.

GTUDDTYC.OABDTYT bit: 1
The activation timing of 0 or 100% duty setting is set to the trough and crest.

Figure 24.110 Example of Operation of Output of Duty Cycle 0% or 100% (Activate at Trough, Crest) in Triangle-Wave PWM Mode 1 (n = 0 to 15)

24.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by hardware sources in this MCU. There are 3 types of hardware sources, including external trigger input, ELC event input, and GTIOCnm pin input (n = 0 to 15; m = A, B)

24.3.7.1 Hardware Start Operation

The GTCNT counter can be started by a hardware source. Select a hardware source to start counting using the GTSSR register, and enable to start counting.
Figure 24.111 shows an example of count start operation by a hardware source. Figure 24.112 shows the setting example.

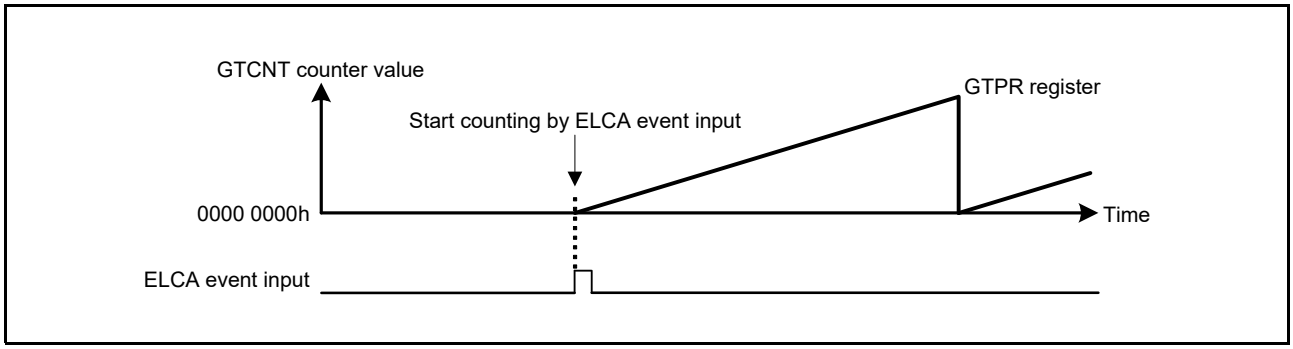


Figure 24.111 Example of Count Start Operation by Hardware Source (At starting by ELCA event)

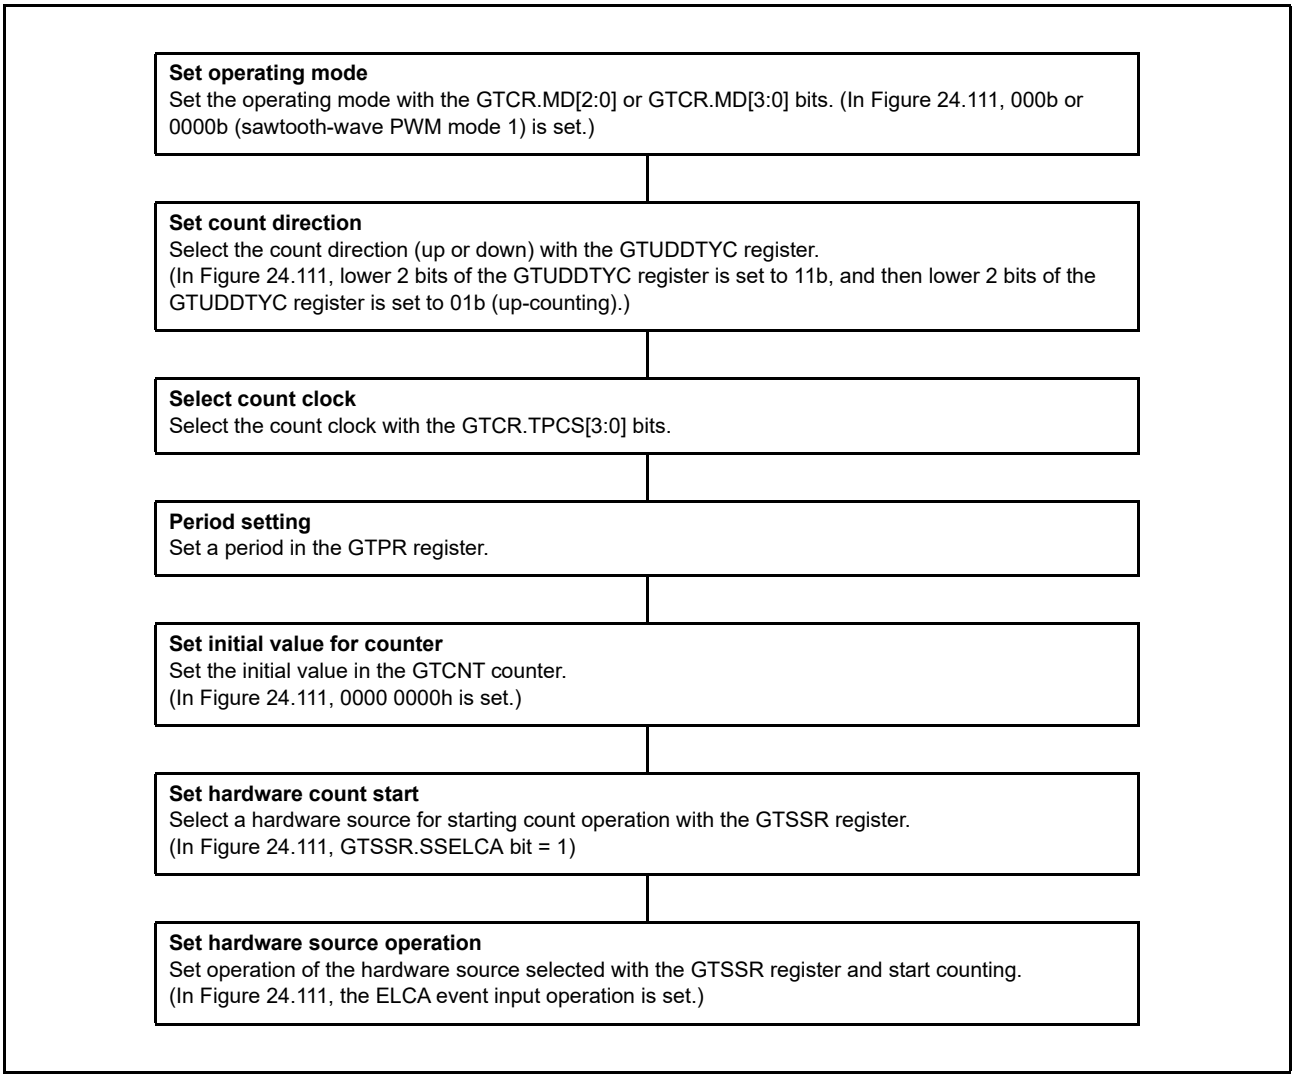

Figure 24.112 Example for Setting Count Start Operation by Hardware Source

Figure 24.113 shows an example of timing of operations to start counting in response to a rising edge of the input on the GTETRGA pin.

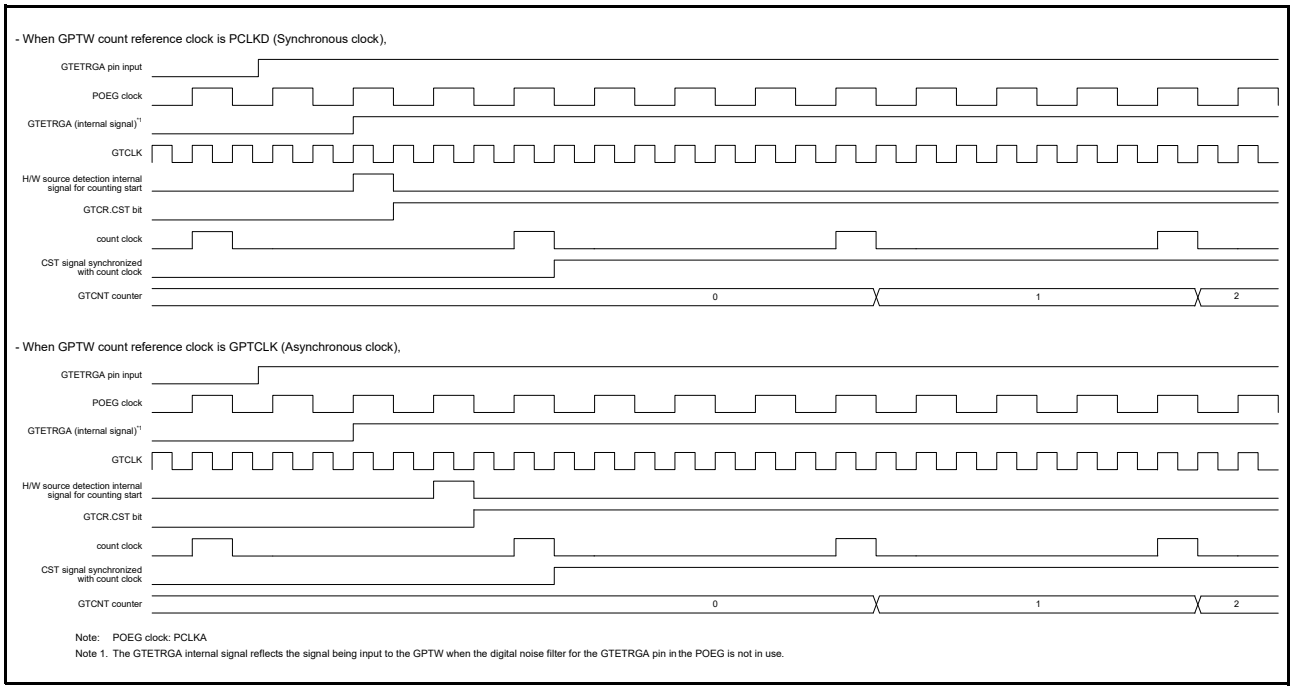

Figure 24.113 Example of Timing of Operations to Start Counting in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 24.114 shows an example of timing of operations to start counting in response to a rising edge of the input on the GTIOCnA pin.

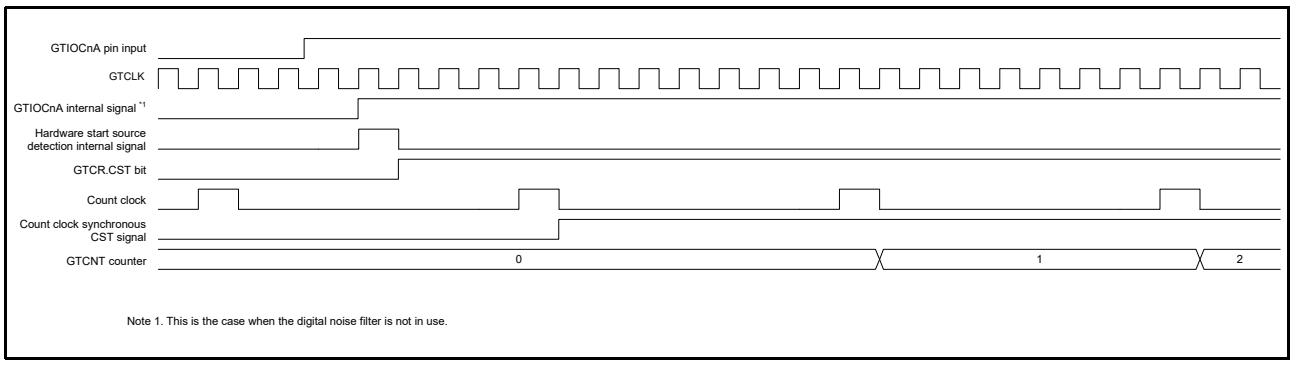

Figure 24.114 Example of Timing of Operations to Start Counting in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 24.115 shows an example of timing of operations to start counting in response to event input from the ELCA. This is an example of operations to start counting by the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A. The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed.

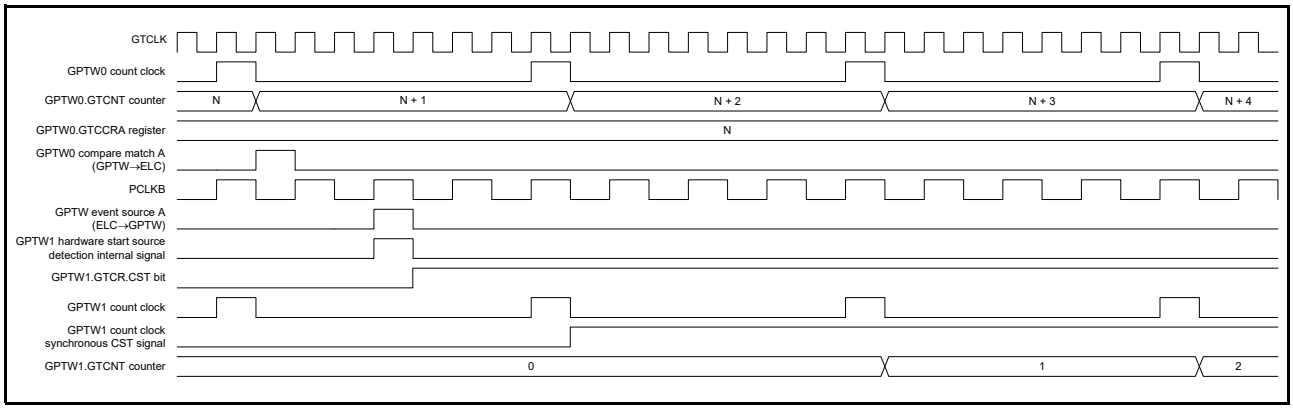

Figure 24.115 Example of Timing of Operations to Start Counting in Response to Event Input from the ELCA

24.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by a hardware source. Select a hardware source to stop counting with the GTPSR register, and enable to stop counting.

Figure 24.116 shows an example of count stop operation by a hardware source. Figure 24.117 shows the setting example. In this example, the count operation is stopped by the ELCA event input, and is restarted by the ELCB event input.

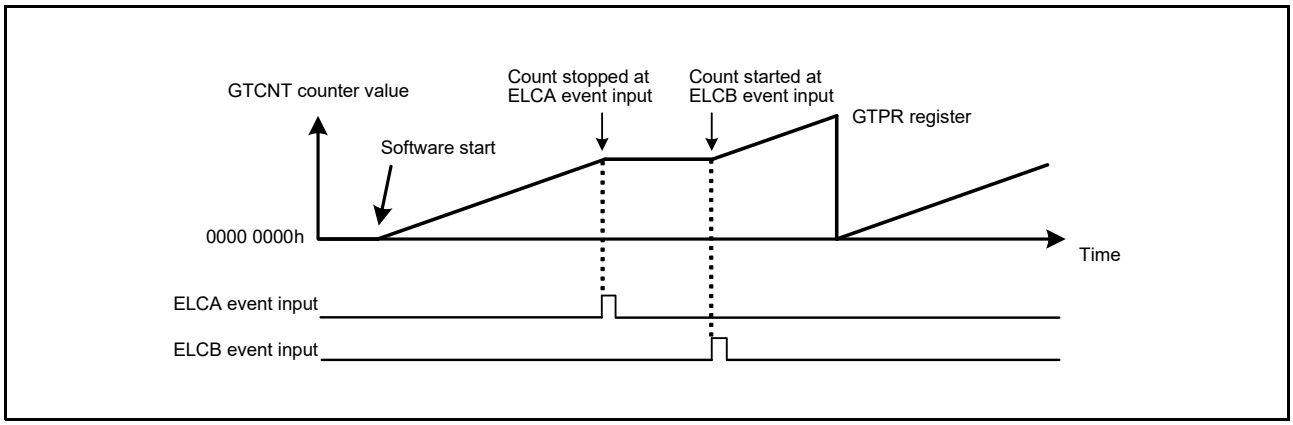

Figure 24.116 Example of Count Stop Operation by Hardware Source (Started by Software, Stopped at ELCA event input, and Restarted at ELCB event input)

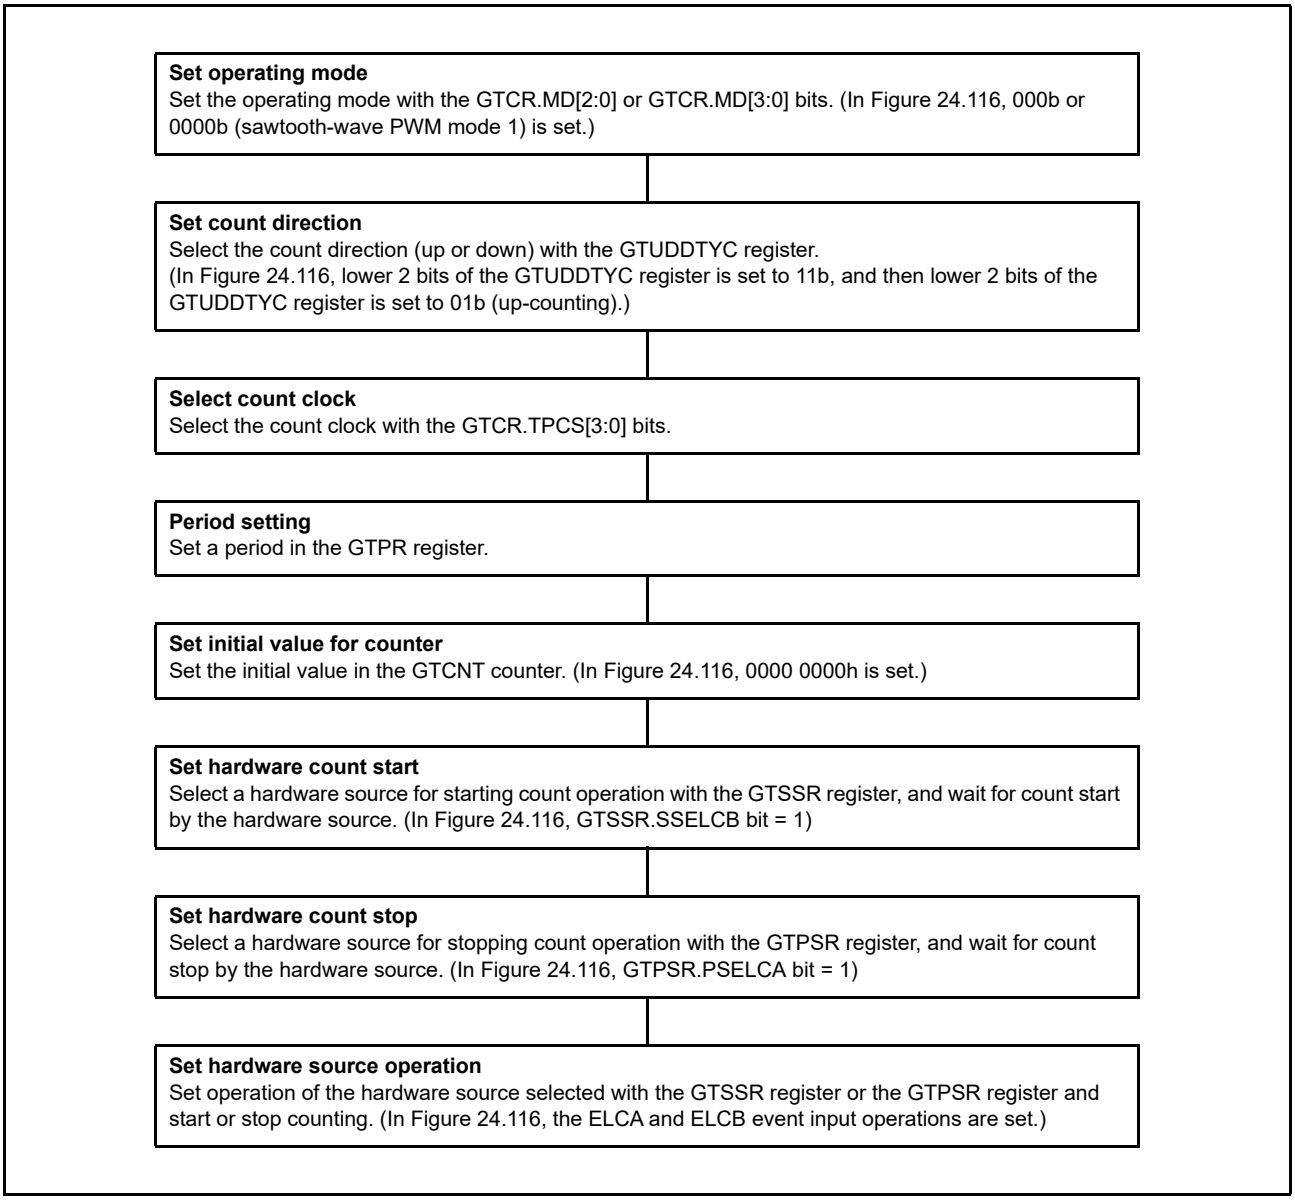

Figure 24.117 Example for Setting Count Stop Operation by Hardware Source

Figure 24.118 shows an example of count start/stop operation by a hardware source. Figure 24.119 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA pin.

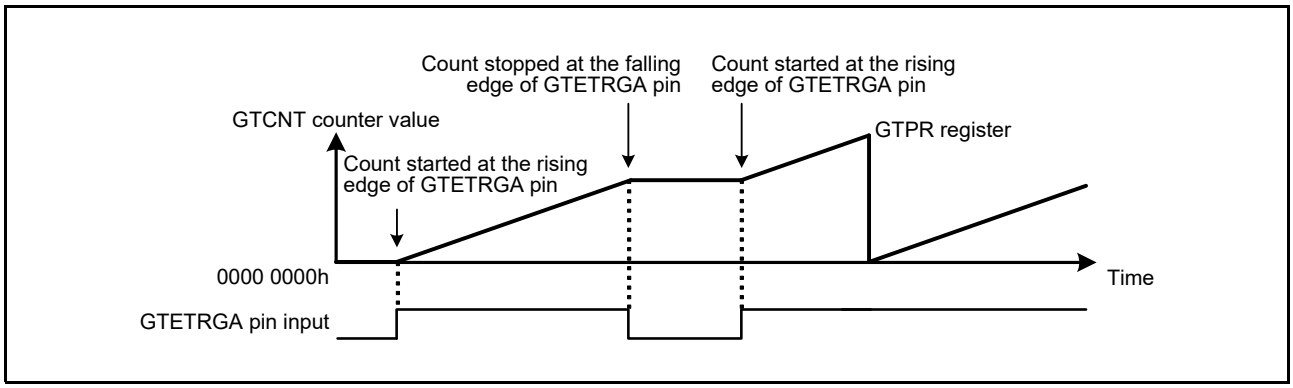

Figure 24.118 Example of Count Start/Stop Operation by Hardware Source (Started at Rising Edge of GTETRGA Pin Input, Stopped at Falling Edge of GTETRGA Pin Input)

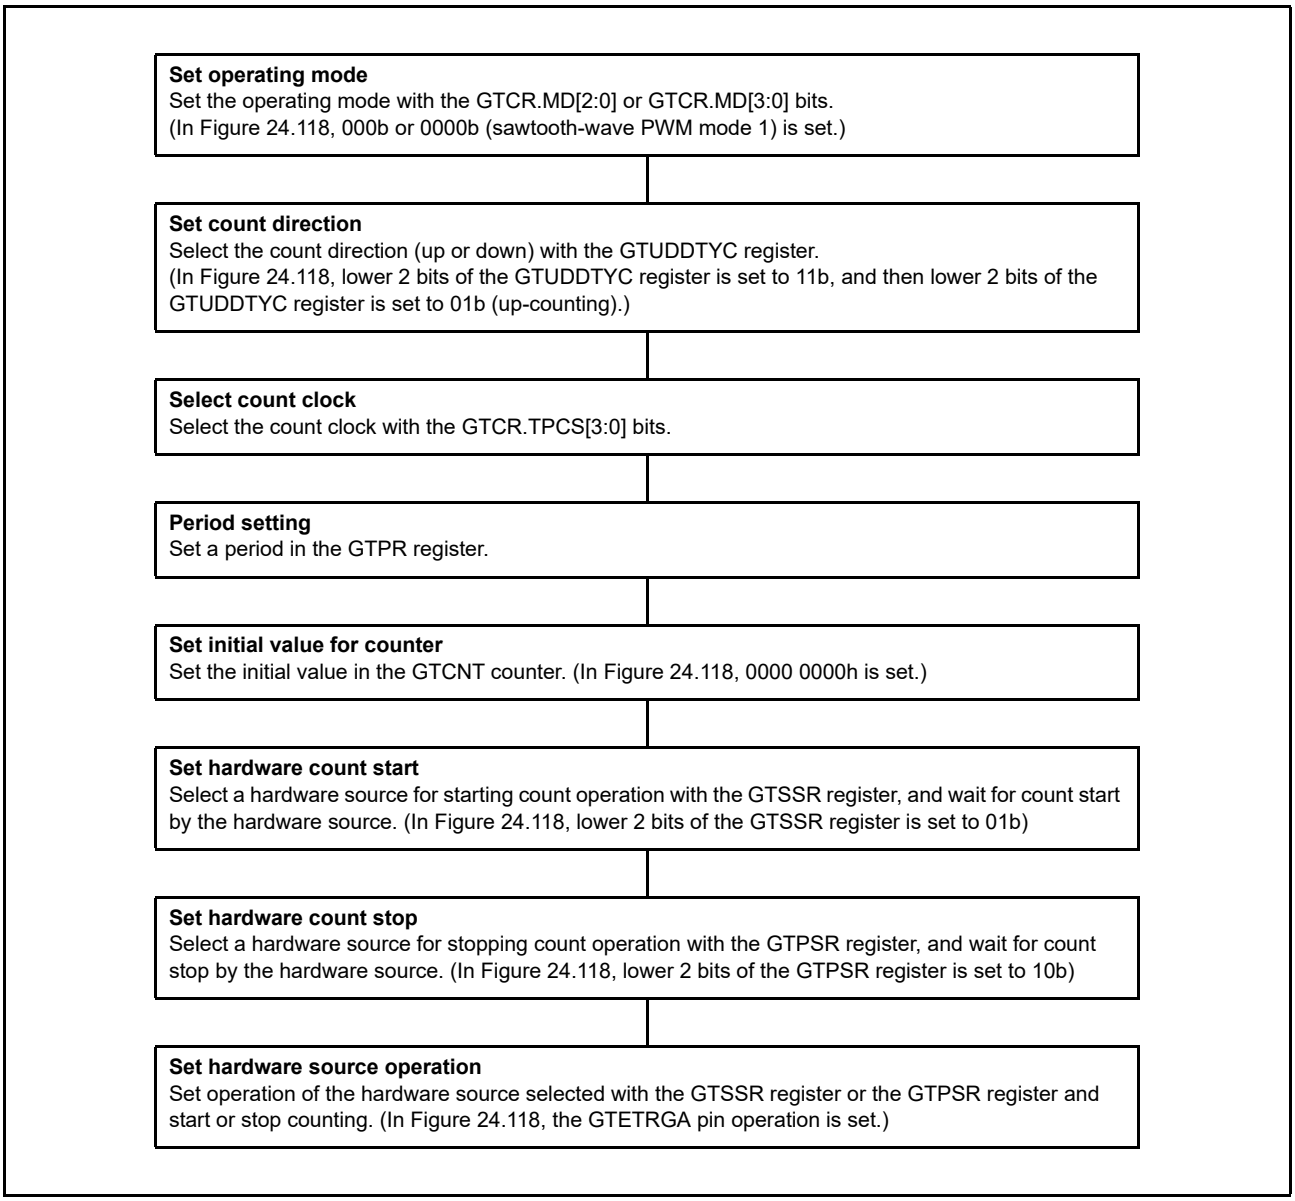

Figure 24.119 Example for Setting Count Start/Stop Operation by Hardware Source

Figure 24.120 shows an example of timing of operations to stop counting in response to a rising edge of the input on the GTETRGA pin.

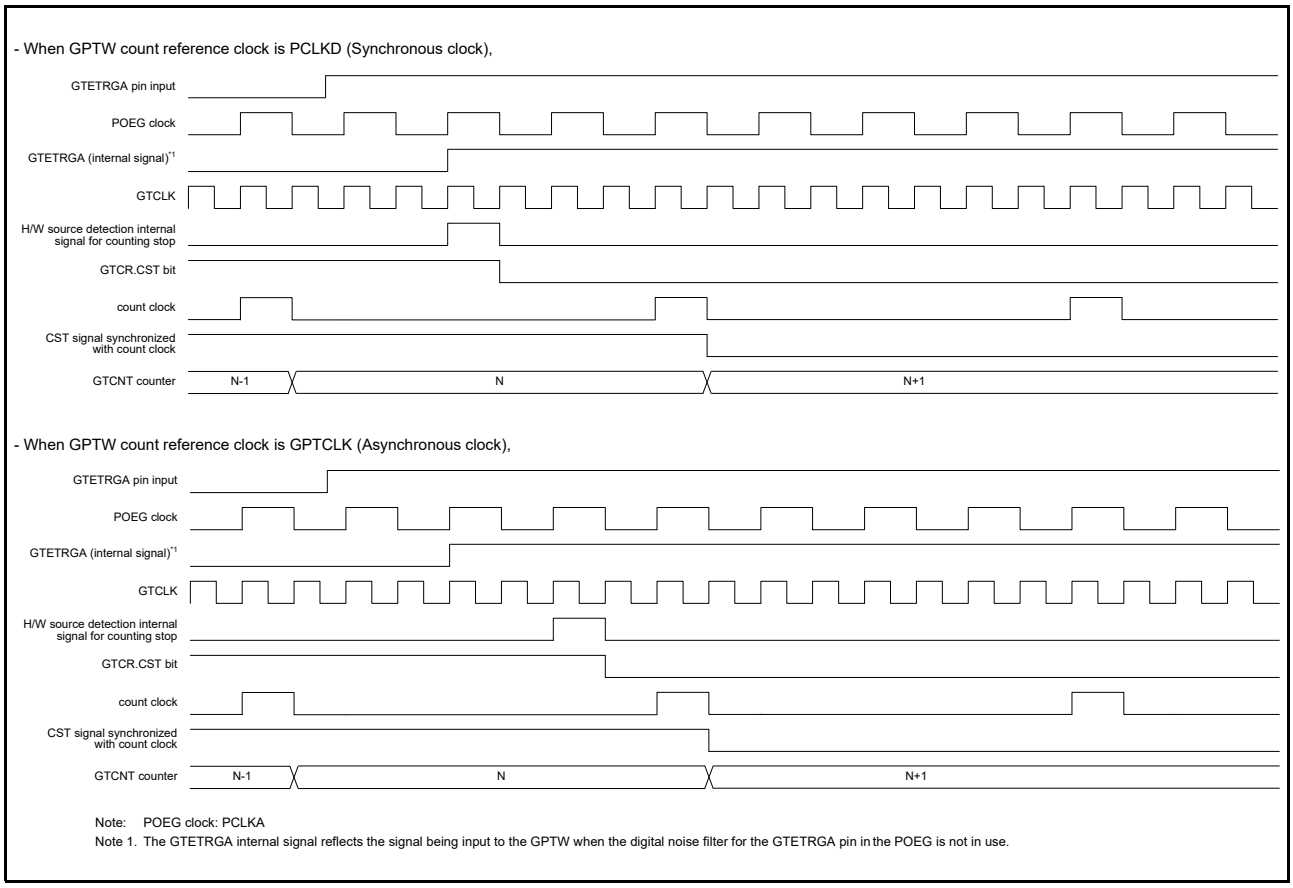

Figure 24.120 Example of Timing of Operations to Stop Counting in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 24.121 shows an example of timing of operations to stop counting in response to a rising edge of the input on the GTIOCnA pin.

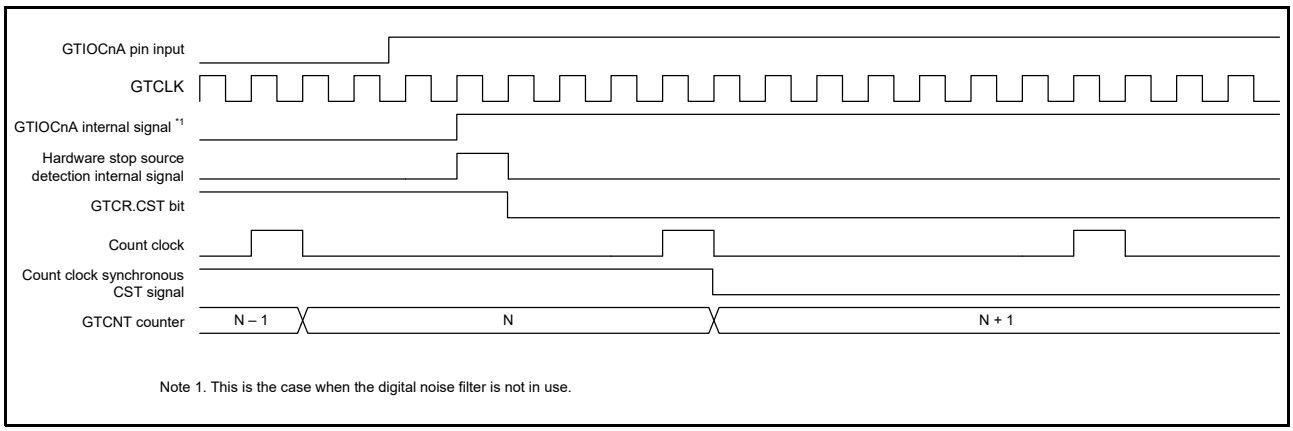

Figure 24.121 Example of Timing of Operations to Stop Counting in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 24.122 shows an example of timing of operations to stop counting in response to event input from the ELCA. This is an example of operations to stop counting by the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A. The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed.

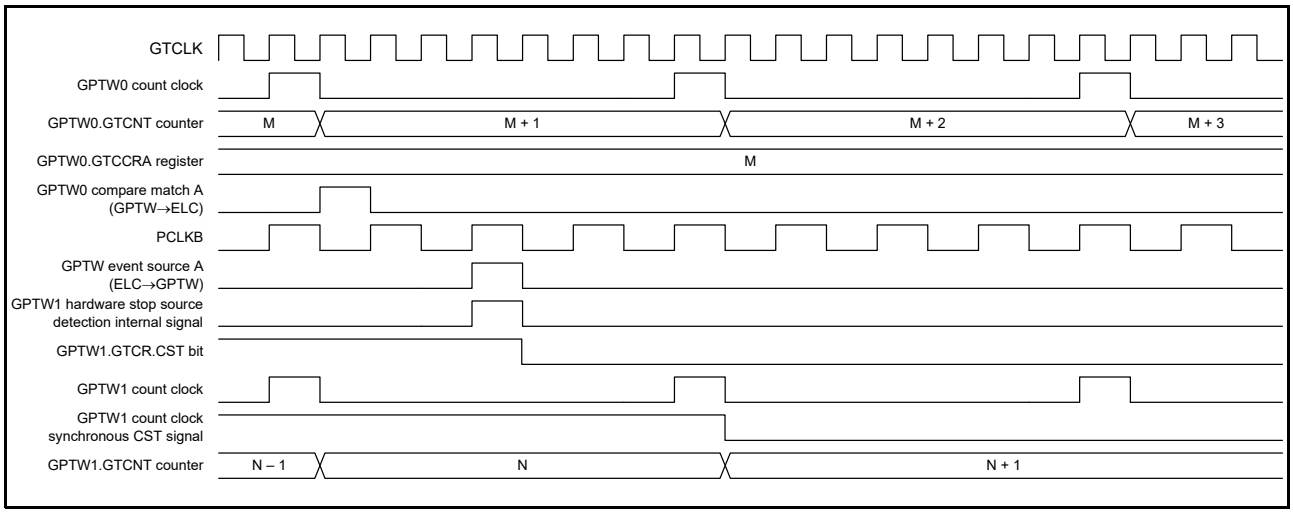

Figure 24.122 Example of Timing of Operations to Stop Counting in Response to Event Input from the ELCA

24.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by a hardware source. Select a hardware source to clear the counter with the GTCSR register, and enable clearing the counter.

Note that the GTCIV/GTCIU interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 24.123 and Figure 24.124 show examples of the GTCNT counter clearing operation by a hardware source. Figure 24.125 shows the setting example. In this example, the GTCNT counter is started at the ELCA event input, and is stopped/cleared at the ELCB event input.

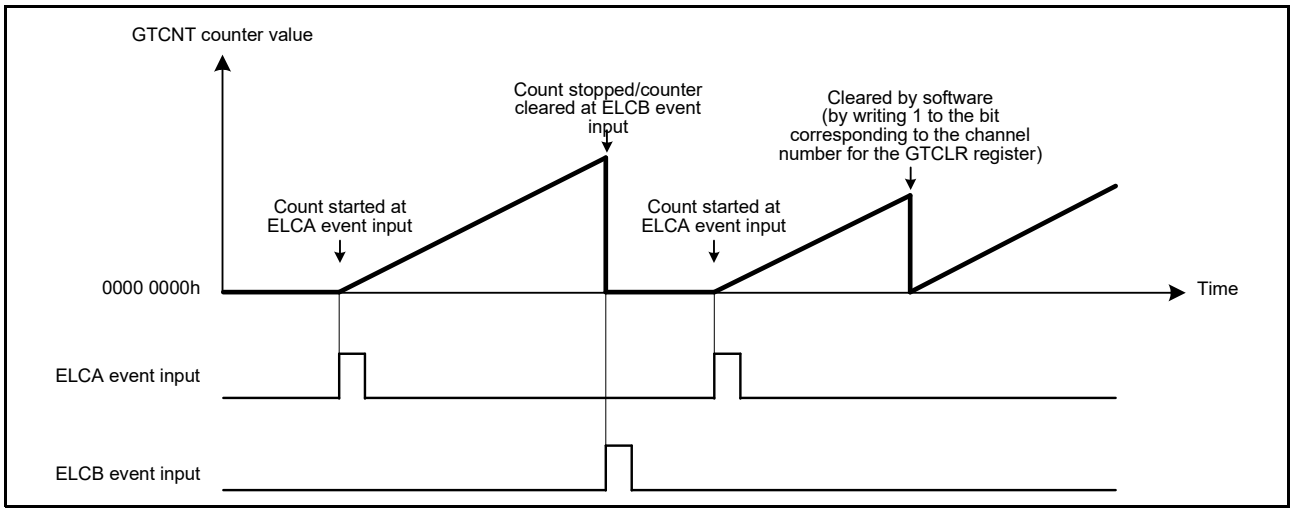

Figure 24.123 Examples of Counter Clearing Operation by Hardware Source (Sawtooth-Wave Up-Counting, Started at ELCA event input, and Count Stopped/Counter Cleared at ELCB event input)

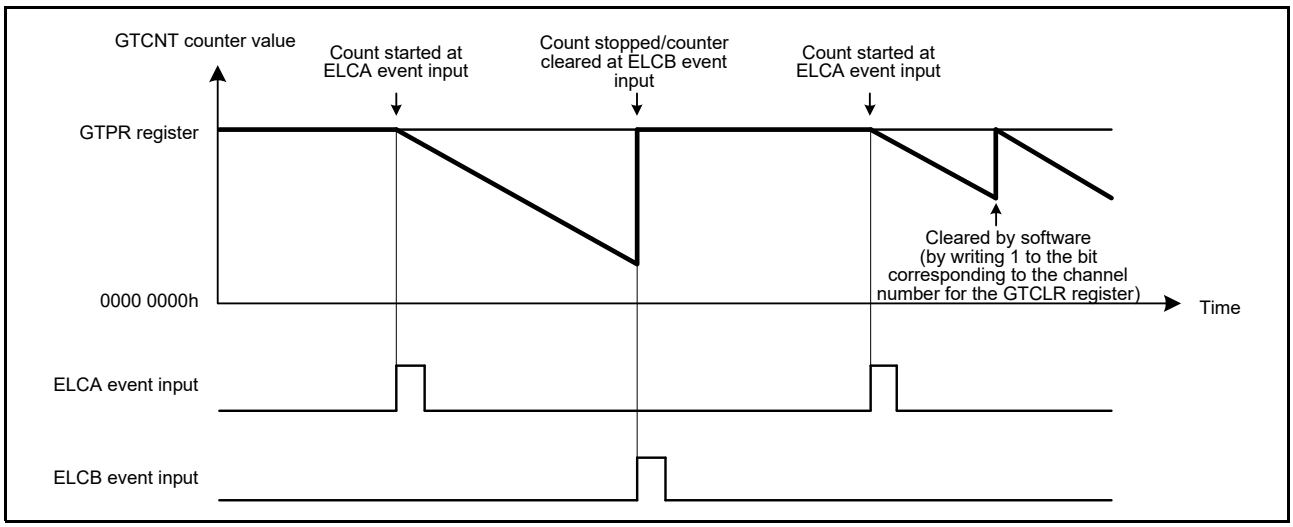

Figure 24.124 Examples of Counter Clearing Operation by Hardware Source (Sawtooth-Wave Down-Counting, Started at ELCA event input, and Count Stopped/Counter Cleared at ELCB event input)

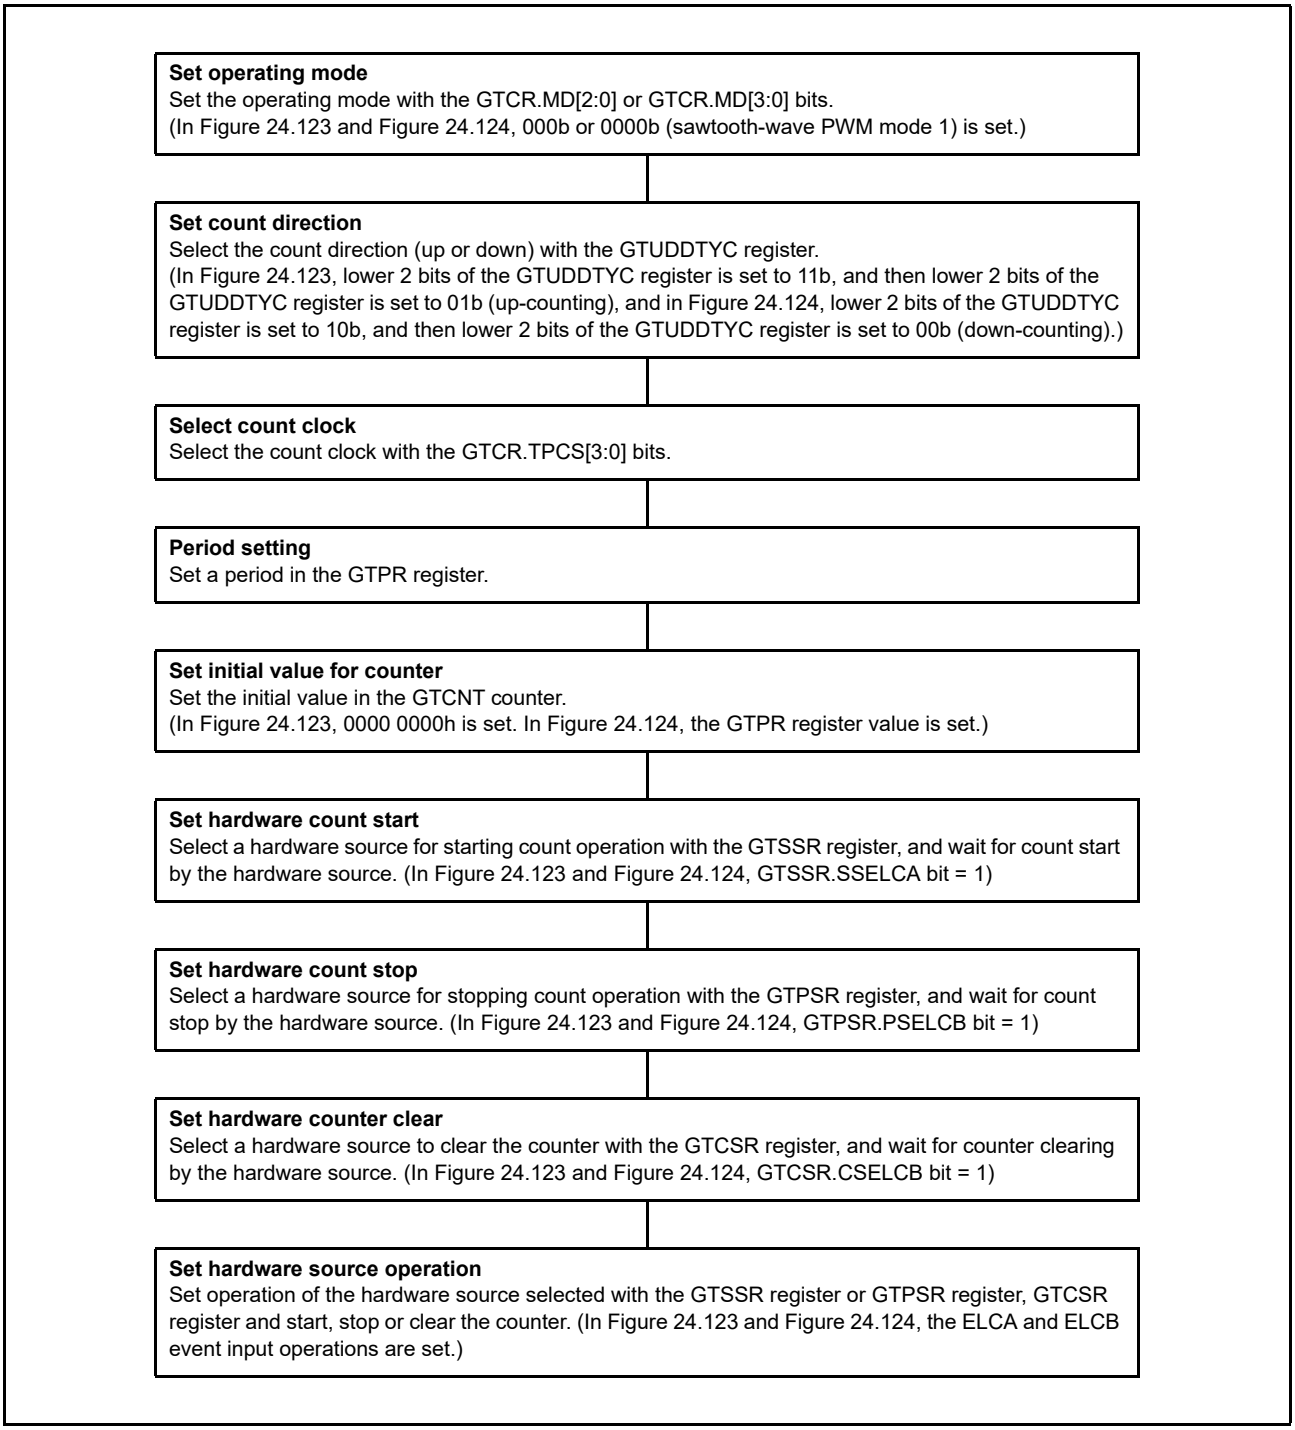

Figure 24.125 Example for Setting Counter Clearing Operation by Hardware Source

The GTCIV/GTCIU interrupt (overflow/underflow interrupt) does not occur when the counter is cleared by a hardware source. In the same way, the GTCIV/GTCIU interrupt does not occur when the counter is cleared by software.
Figure 24.126 shows the relationship between counter clearing by a hardware source and the GTCIV interrupt.

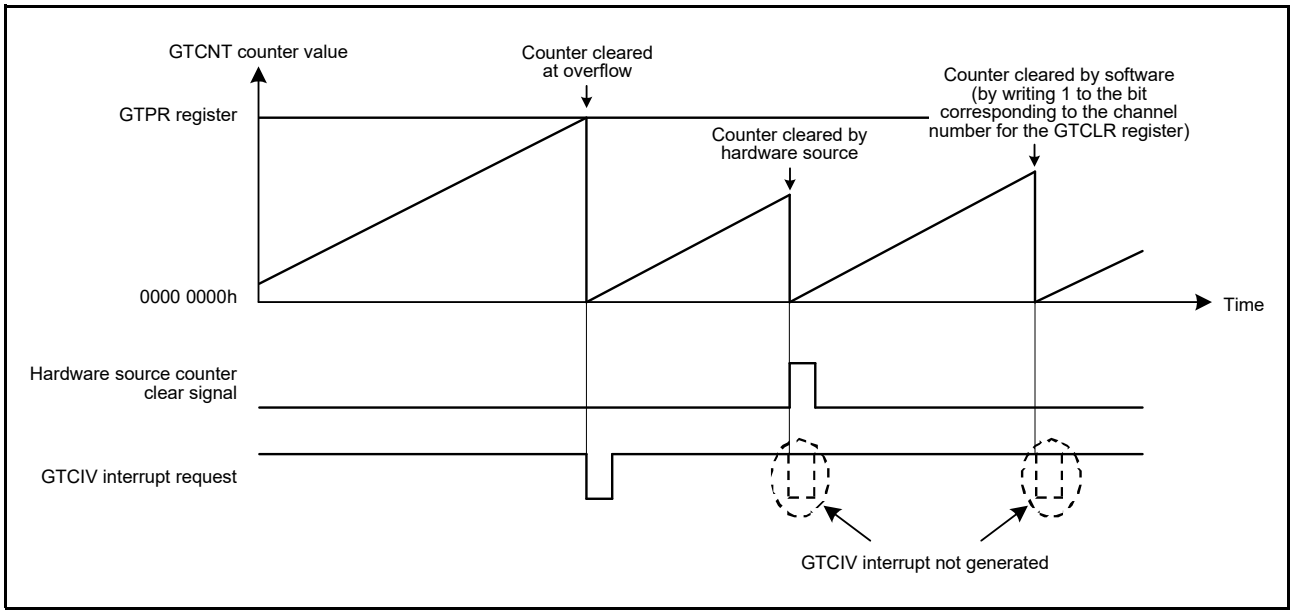

Figure 24.126 Relationship between Counter Clearing by Hardware Source and GTCIV Interrupt

Figure 24.127 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTETRGA pin when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.
The GTCNT counter is cleared at the next counting operation after the GPTW detects the internal clearing signal.

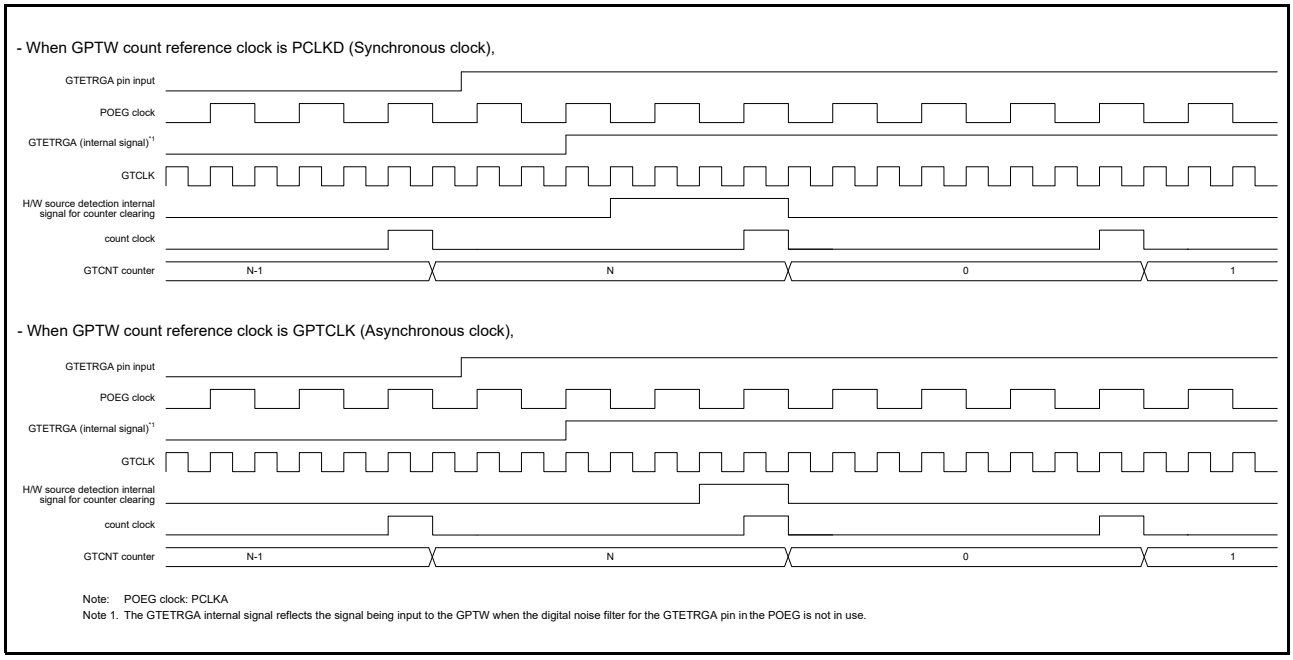

Figure 24.127 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTETRGA Pin (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 24.128 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTIOCnA pin when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.
The GTCNT counter is cleared at the next counting operation after the GPTW detects the internal clearing signal.

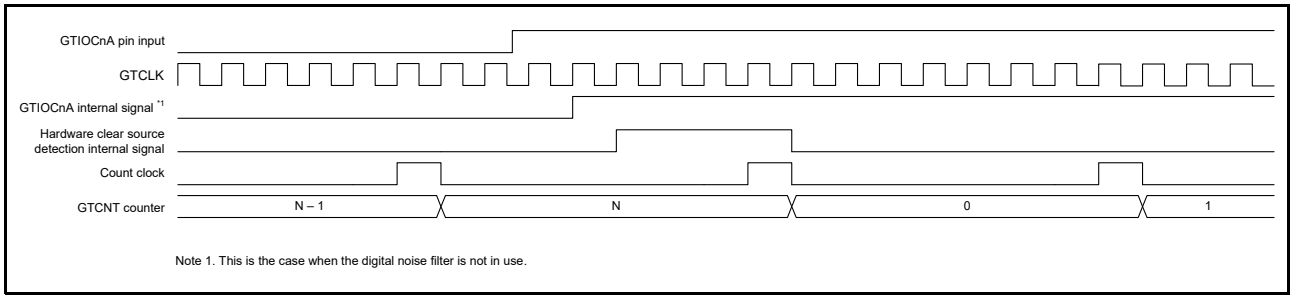

Figure 24.128 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTIOCnA Pin (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 24.129 shows an example of the timing of operations to clear the counter in response to event input from the ELCA when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.
This is an example of operations to clear the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A.
The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed. The GTCNT counter is cleared at the next counting operation after the GPTW detects the internal clearing signal.

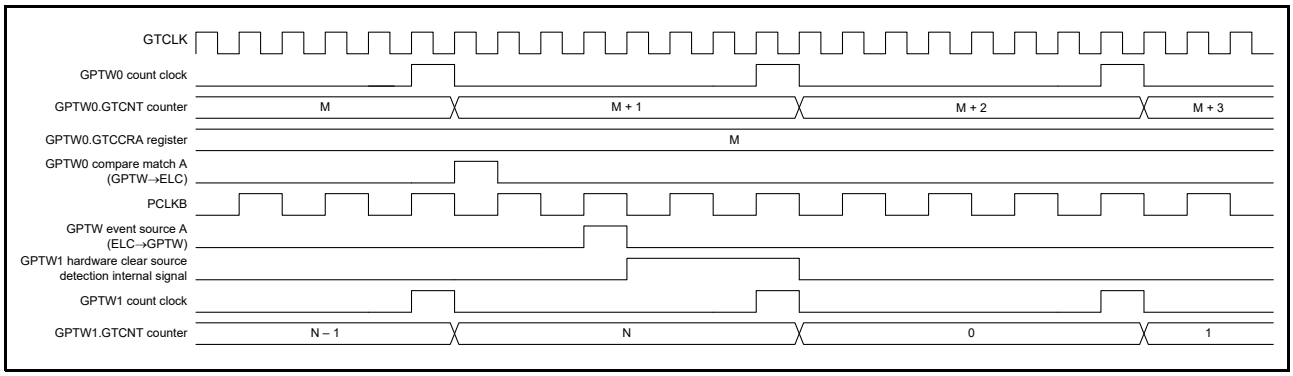

Figure 24.129 Example of the Timing of Operations for Counter Clearing in Response to Event Input from the ELCA (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 24.130 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTETRGA pin input when counting is triggered by a hardware source.
The GTCNT counter is cleared in synchronization with GTCLK after the GPTW has detected the internal clearing signal.

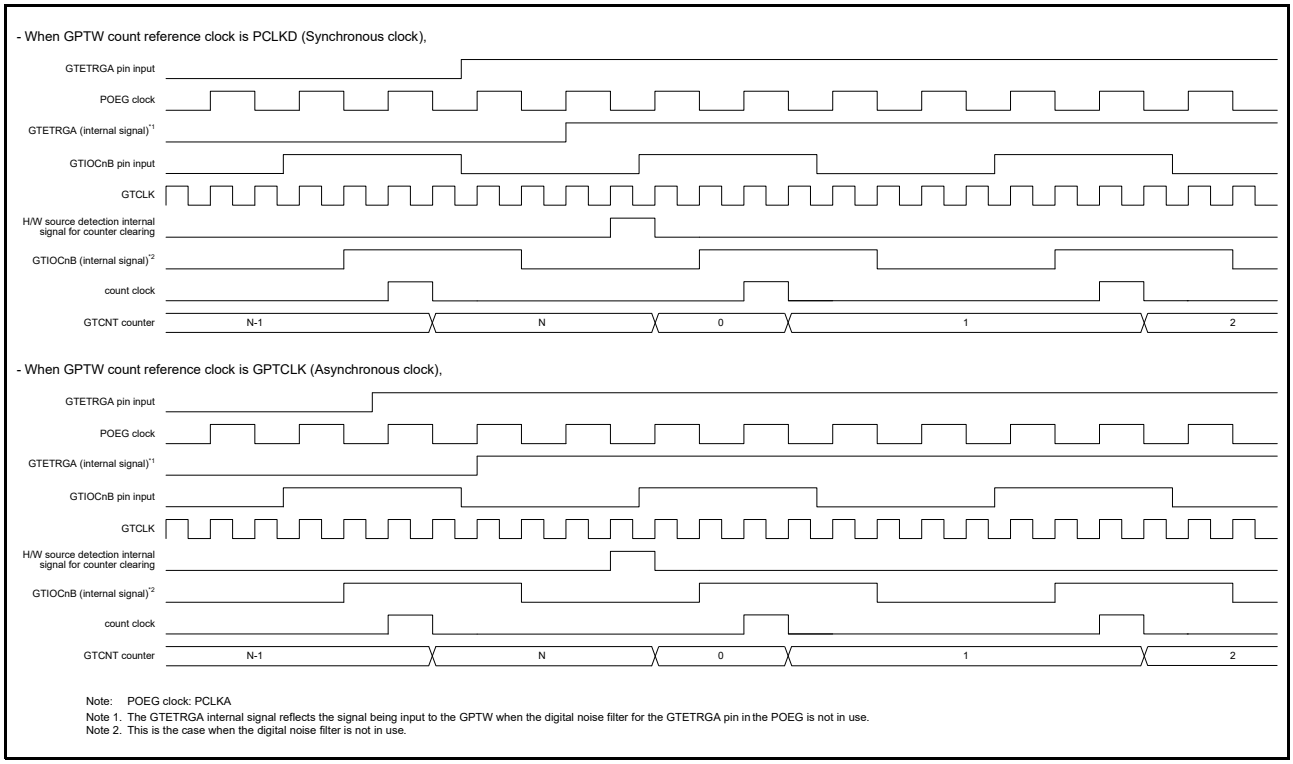

Figure 24.130 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTETRGA Pin (During Counting Triggered by Hardware Source)

Figure 24.131 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTIOCnA pin input when counting is triggered by a hardware source.
The GTCNT counter is cleared in synchronization with GTCLK after the GPTW has detected the internal clearing signal.

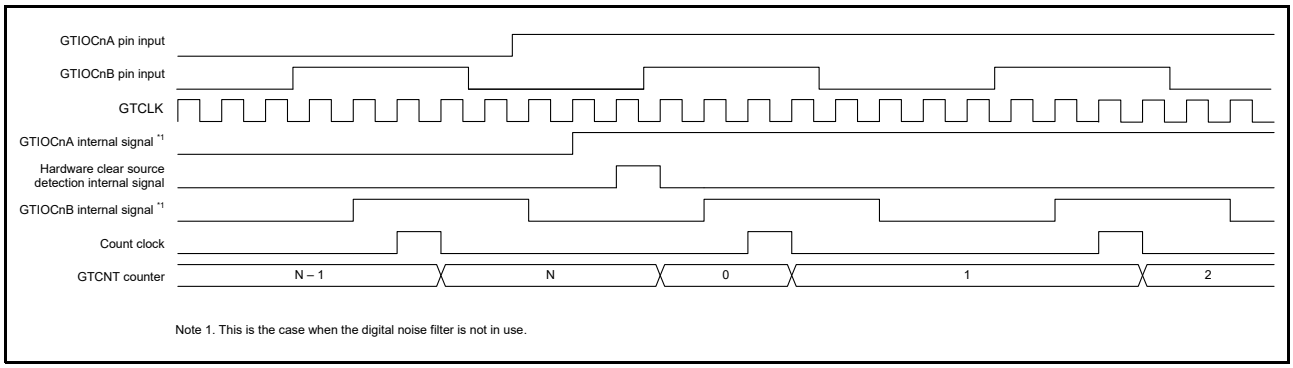

Figure 24.131 Example of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTIOCnA Pin (During Counting Triggered by Hardware Source)

Figure 24.132 shows an example of the timing of operations for clearing the counter in response to the input of an event signal from the ELCA when counting is triggered by a hardware source.
This is an example of operations to clear the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A.
The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed. The GTCNT counter is cleared in synchronization with GTCLK after the GPTW has detected the internal clearing signal.

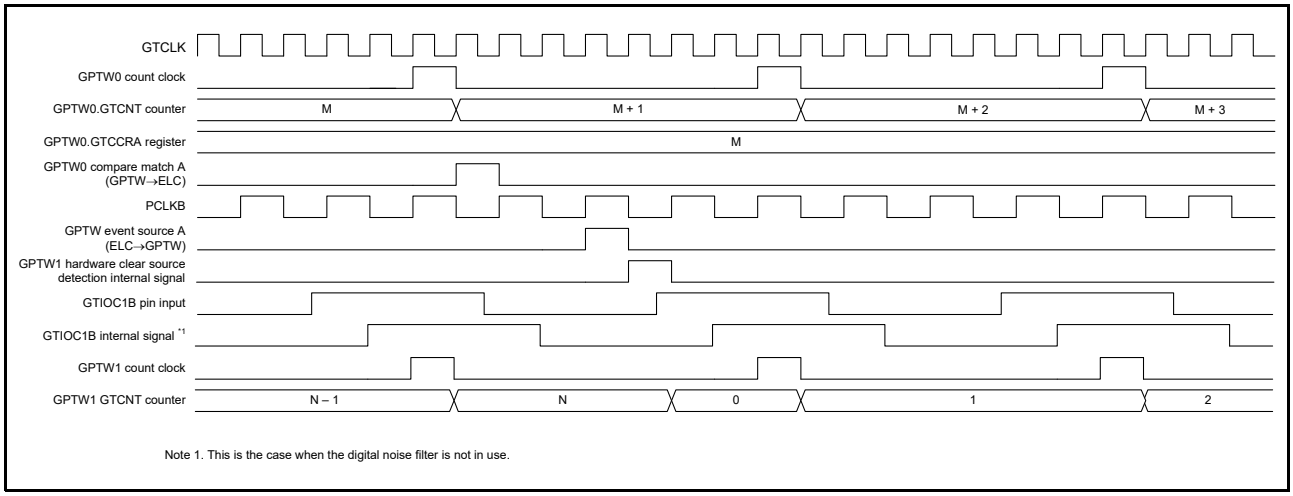

Figure 24.132 Example of the Timing of Operations for Counter Clearing in Response to Event Input from the ELCA (During Counting Triggered by Hardware Source)

24.3.8 Hardware Count Switch Operation

In the triangle-wave PWM mode, the GTCNT counter can be switched by a hardware source. Select the count switch operation with the GTCR.SWMD[2:0] bits and select a hardware source to switch the direction of counting with the GTSWSR register and enable to switch the direction of counting.

When the offset reload is enabled by the GTCR.SWMD[2:0] bits, the offset value of the GTCNT counter reloaded by count switch is set by the GTSWOS register in the range of 0 to GTPR.

If the count switch and counter clear occur at the same time, the counter clear has priority.

Figure 24.133 to Figure 24.136 show examples of the GTCNT count switch operation by a hardware source. Figure 24.137 shows the setting example. In this example, the GTCNT counter is started at the ELCA event input, is stopped/cleared at the ELCB event input, and is switched at the ELCC event input.

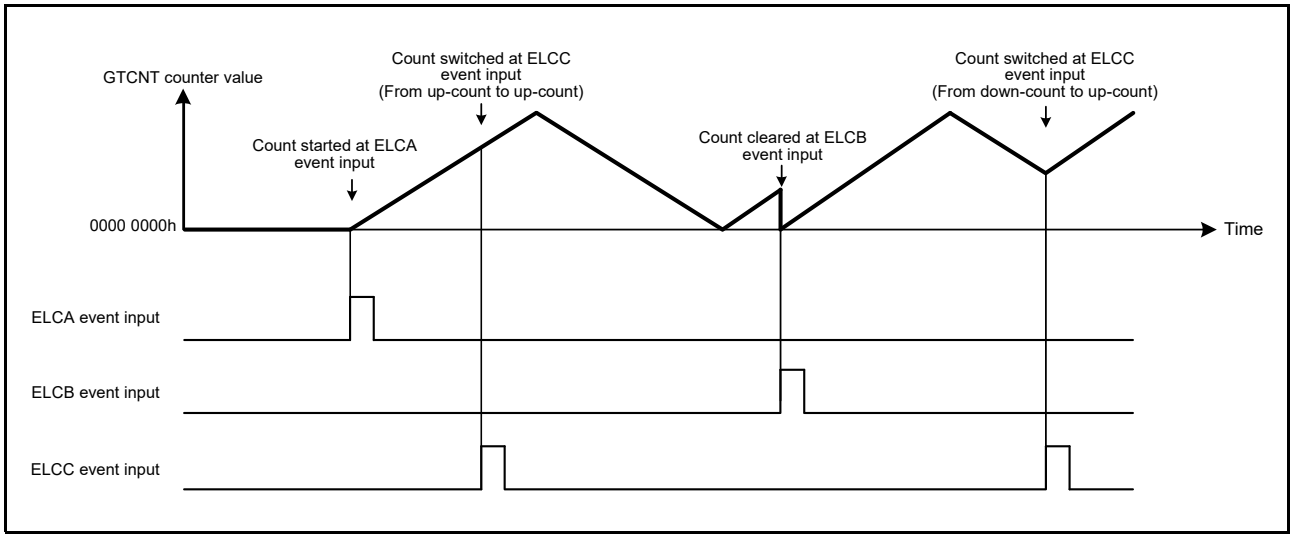

Figure 24.133 Examples of Count Switch Operation by Hardware Source (Switched to Up-count without Reload at ELCC Event Input)

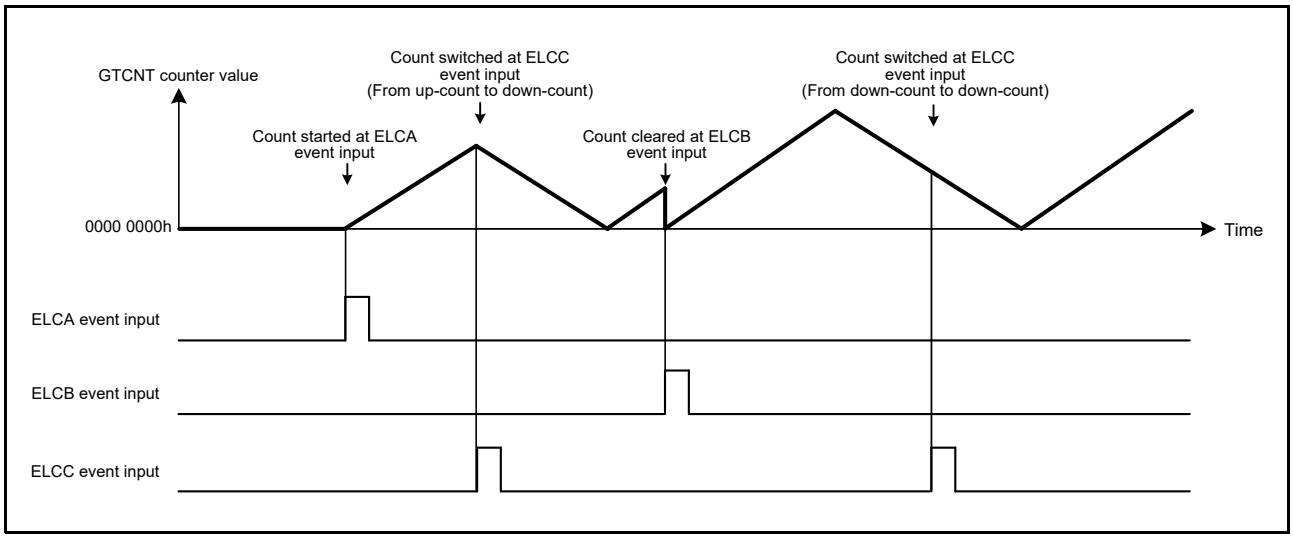

Figure 24.134 Examples of Count Switch Operation by Hardware Source (Switched to Down-count without Reload at ELCC Event Input)

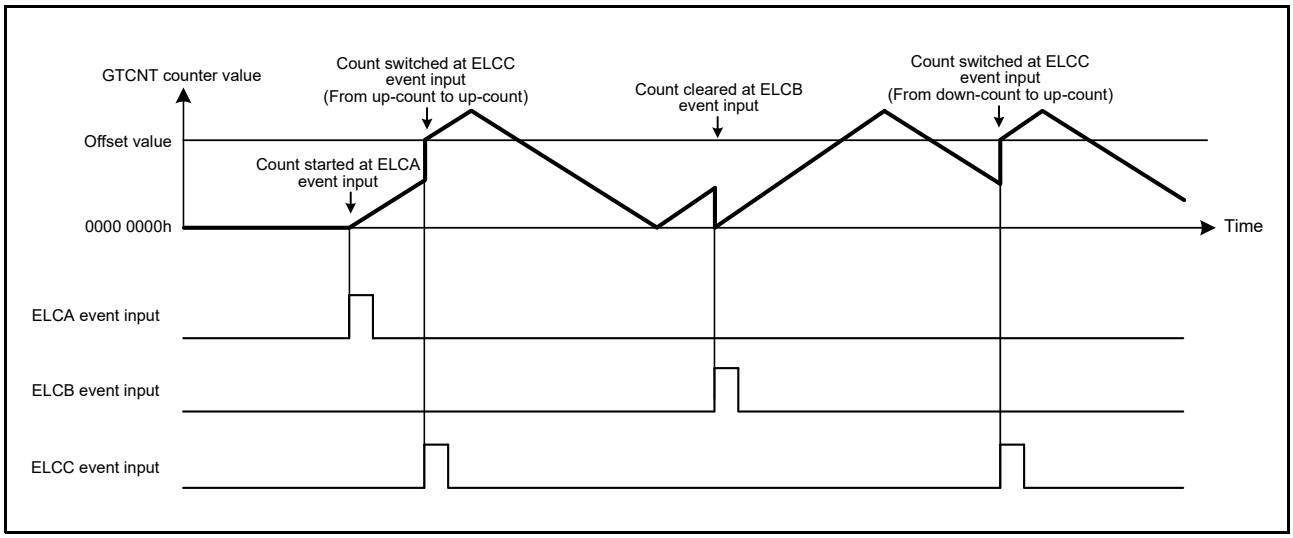

Figure 24.135 Examples of Count Switch Operation by Hardware Source (Switched to Up-count with Reload at ELCC Event Input)

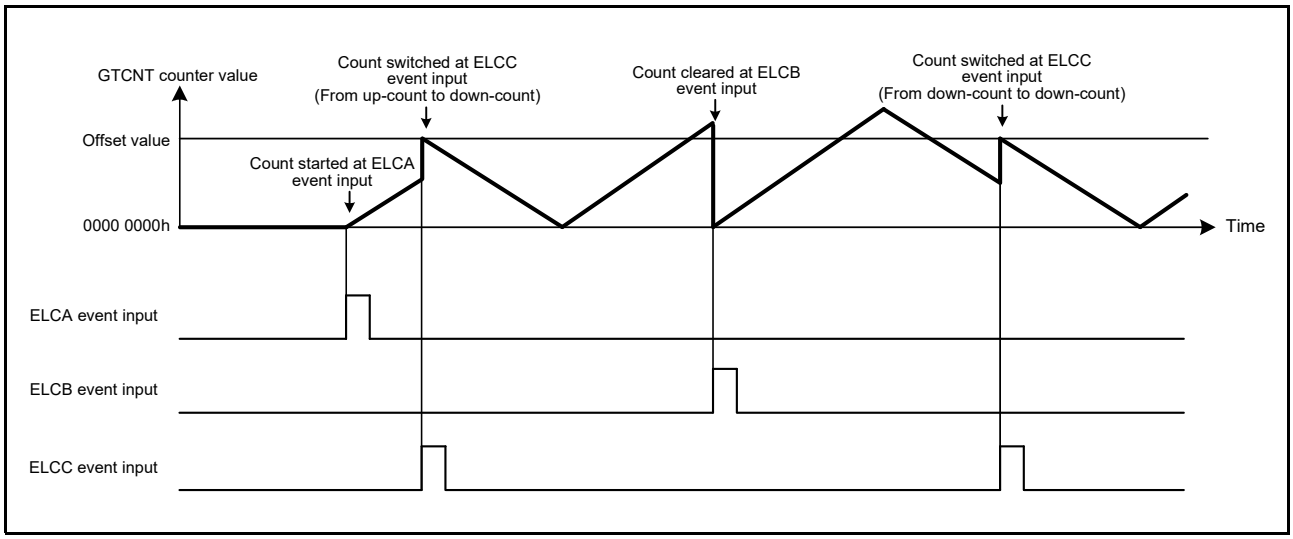

Figure 24.136 Examples of Count Switch Operation by Hardware Source (Switched to Down-count with Reload at ELCC Event Input)

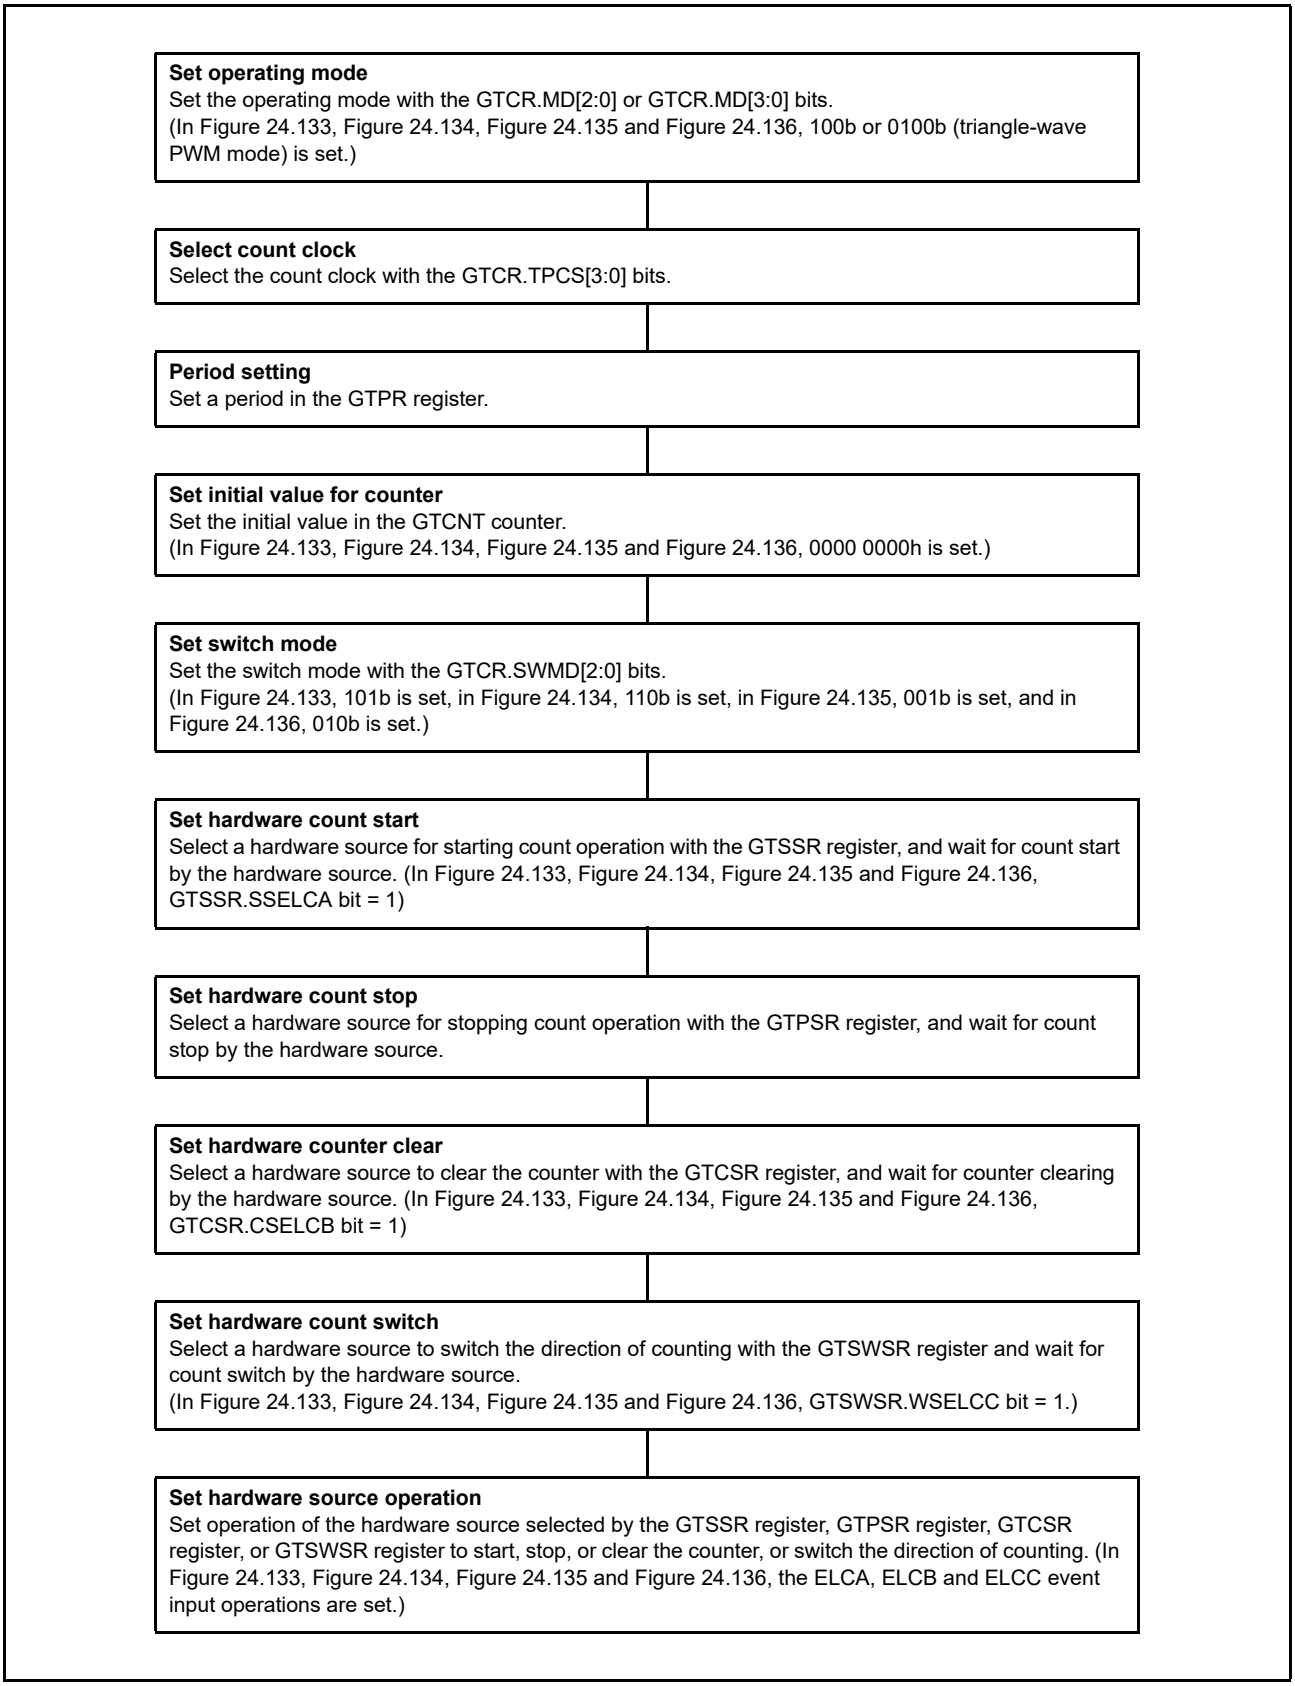

Figure 24.137 Example for Setting Count Switch Operation by Hardware Source

The compare match operation is effective even when the count switch and the compare match occur at the same time. Similarly, even when the count switch occurs at the crest (GTCNT counter matches GTPR register value during up-counting) or trough (GTCNT counter is 0 during down-counting) of triangle-waves, overflow or underflow interrupt is output and the buffer transfer of crest or trough works normally.
If the count switch is required at the crest or trough without the offset reload, the count switch is ignored, and the direction of counting changes to down-count or up-count after the crest or trough. Also, if the count switch is required at the count clear state (GTCNT counter value is 0 during up count) without the offset reload, the count switch is ignored, and the direction of counting continues up-count.
If the switch mode is set to “Switch to up-count with offset reload” with the GTCR.SWMD[2:0] bits and the offset is set to 0 with the GTSWOS register, the count switch works same as the counter clear and the GTCNT counter does not operate as the trough. Also, if the switch mode is set to “Switch to down-count with offset reload” and the offset is set to the GTPR value, the GTCNT counter does not operate as the crest. On the other hand, if the switch mode is set to “Switch to up-count with offset reload” and the offset is set to the GTPR value, the GTCNT counter operate as the crest, if the switch mode is set to “Switch to down-count with offset reload” and the offset is set to 0, the GTCNT counter operate as the trough, and in these cases, the interrupt outputs and the buffer transfers of the crest and the trough works normally. If the crest or the trough due to the count switch occurs at the timing when the GTCNT counter value is the crest or the trough, the buffer transfer and the interrupt output at the crest or trough will occur twice in a row. Table 24.23 shows the triangle-waves condition after the count switch with offset reload.

Table 24.23 The Triangle-Waves Condition After the Count Switch with Offset Reload

Count Direction of Switch Mode (GTCR.SWMD[2:0])	Offset (GTSWOS)	The Triangle-Waves Condition After the Count Switch			
		GTCNT	GTST.TUCF	Triangle-Waves Condition	Buffer Transfer/ Interrupt Output
Up-count	0	GTSWOS register value	1	Counter Clear (Start of Up-count)	Nothing
	1 to GTPR−1			Up-count	Nothing
	GTPR			Crest (End of Up-count)	Buffer Transfer available (Only Triangle-Wave PWM Mode 2)/ GTCIVn Output
Down-count	0		0	Trough (End of Down-count)	Buffer Transfer available/ GTCIUn Output
	1 to GTPR−1			Down-count	Nothing
	GTPR			Start of Down-count	Nothing

Figure 24.138 and Figure 24.139 show examples of the buffer operation due to the count switch when the offset is set to 0 and GTPR. Figure 24.140 shows an example of the buffer operation due to the count switch when the offset is set to values other than the crest and trough.

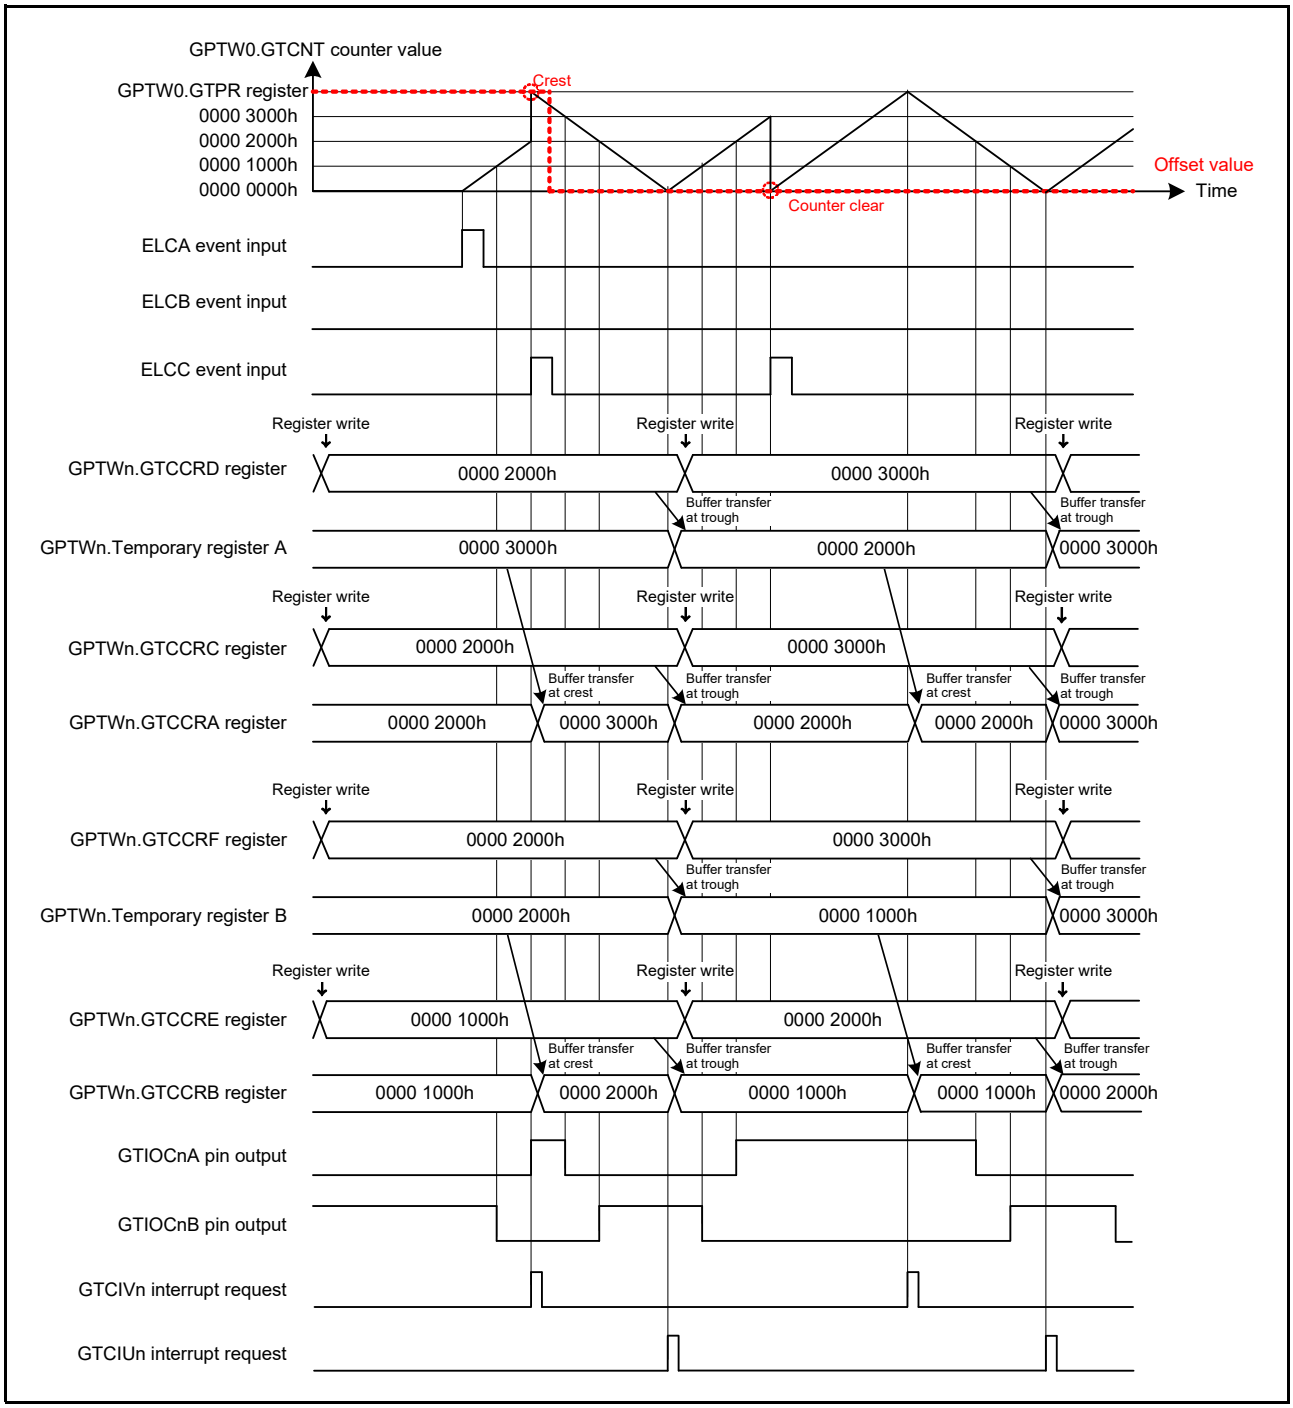

Figure 24.138 Example of the Buffer Operation Due to the Count Switch (Triangle-Wave PWM Mode 3, Offset is Set to 0 and GTPR and Switch to Up-count) (n = 0 to 15)

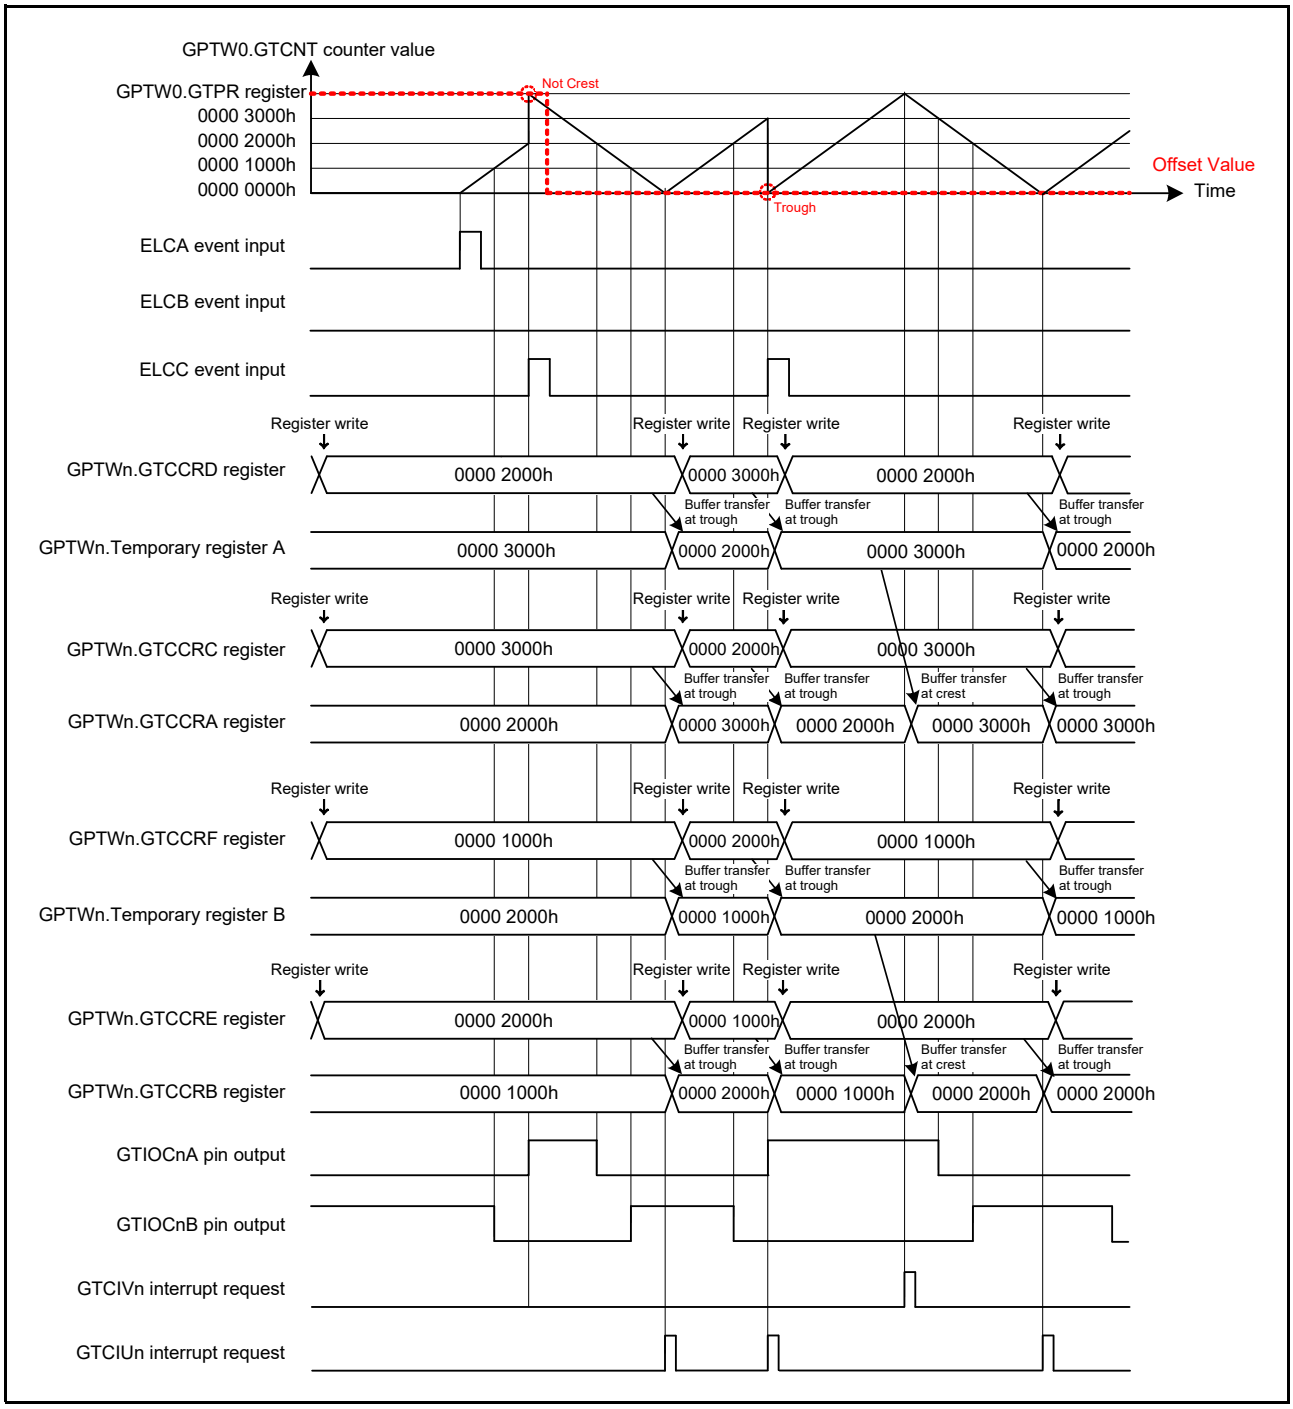

Figure 24.139 Example of the Buffer Operation Due to the Count Switch (Triangle-Wave PWM Mode 3, Offset is Set to 0 and GTPR and Switch to Down-count) (n = 0 to 15)

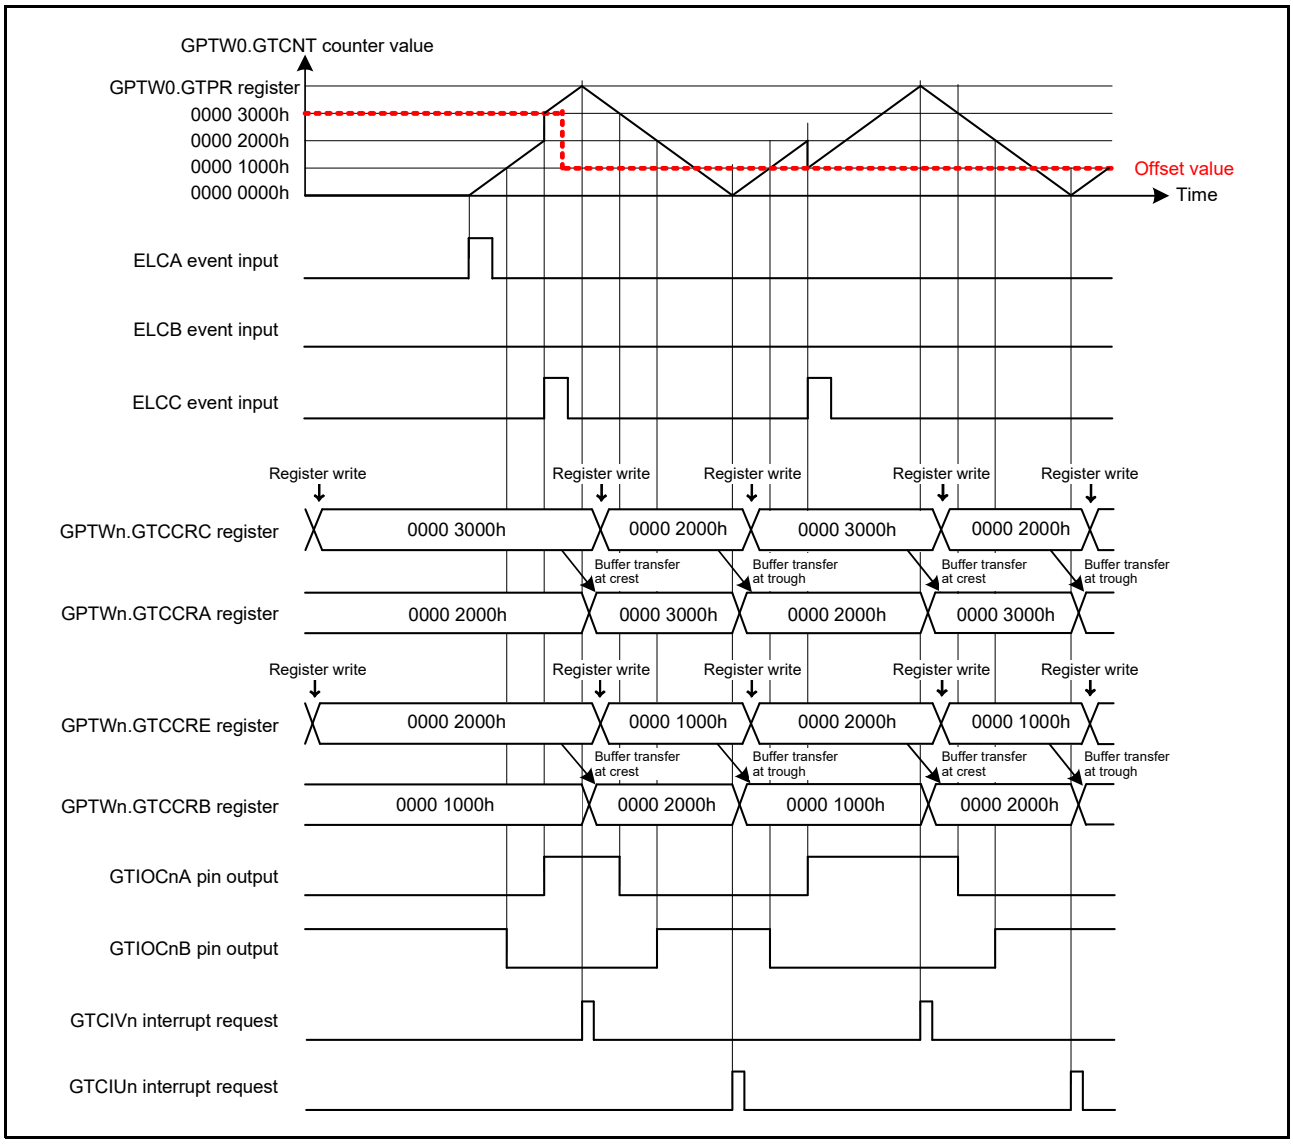

Figure 24.140 Example of the Buffer Operation Due to the Count Switch (Triangle-Wave PWM Mode 2, No Crest and Trough Occurrence Due to the Count Switch) (n = 0 to 15)

When the counter value skips the compare match value by the count switch, no compare match occurs and the GTIOCnm pin output does not change. Figure 24.141 shows an example of the operation when the compare match is skipped by switch operation.

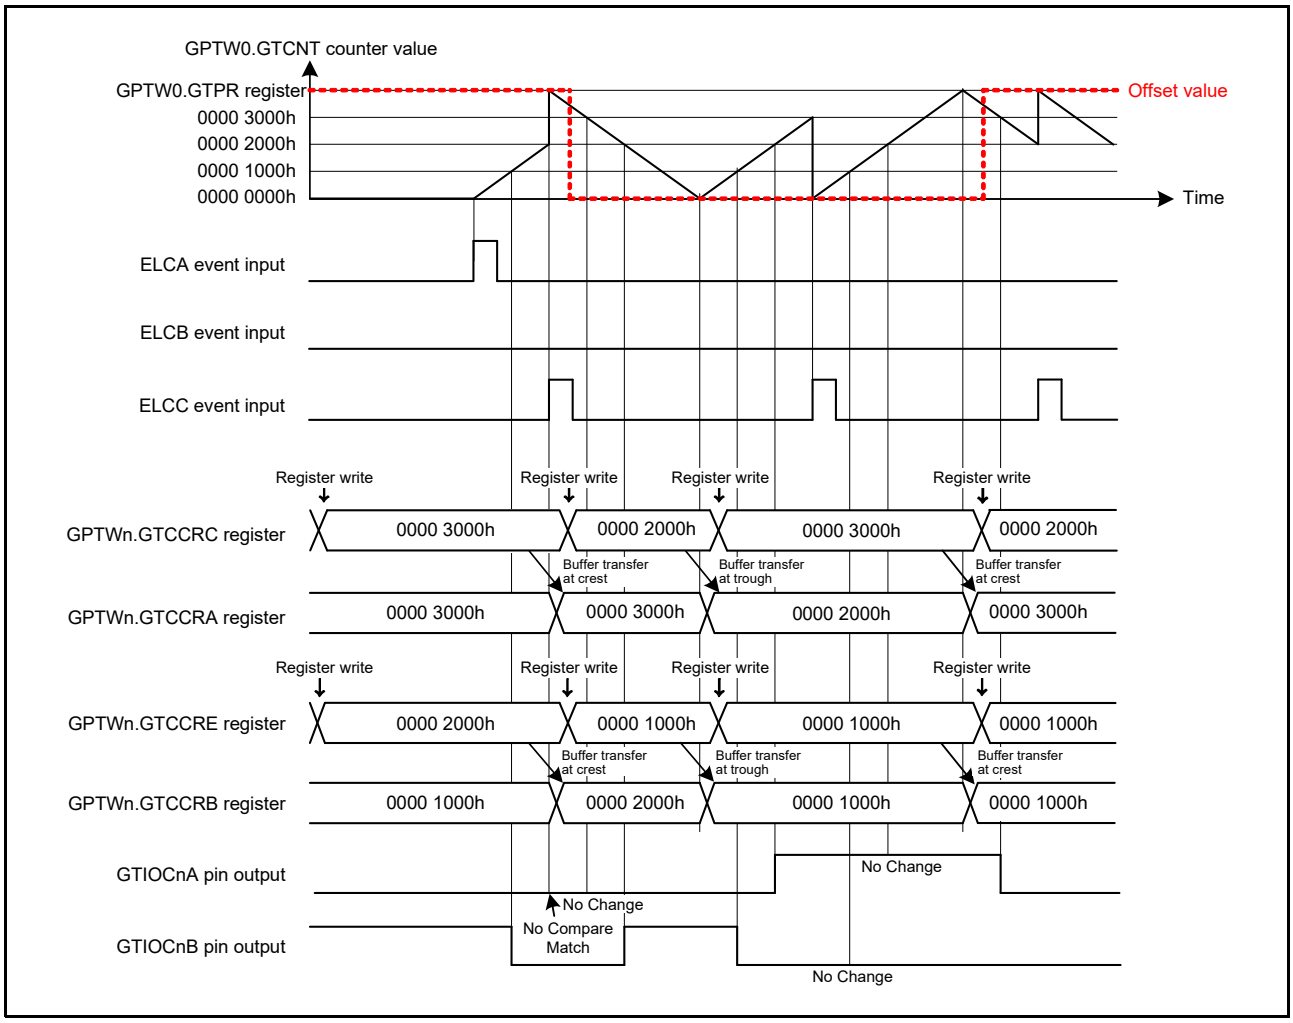

Figure 24.141 Example of the Exception Operation Due to the Count Switch (Switch to Up-count with Offset Reload by ELCC event) (n = 0 to 15)

Figure 24.142 and Figure 24.143 show examples of the timing to switch the direction of counting in response to a rising edge of the input on the GTETRGA pin when a clock signal produced by frequency-dividing the GTCLK signal is in use as the counter clock for the GTCNT counter.
The GTCNT counter is switched at the next counting operation after the GPTW detects the internal switching signal.

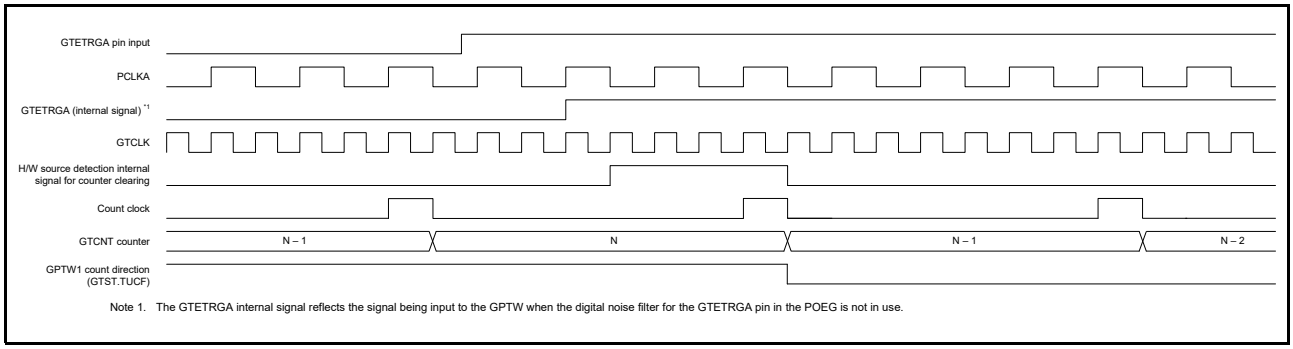

Figure 24.142 Example of the Timing to Switch the Direction of Counting in Response to a Rising Edge of the Input on the GTETRGA Pin: Switch to Counting Down without Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency

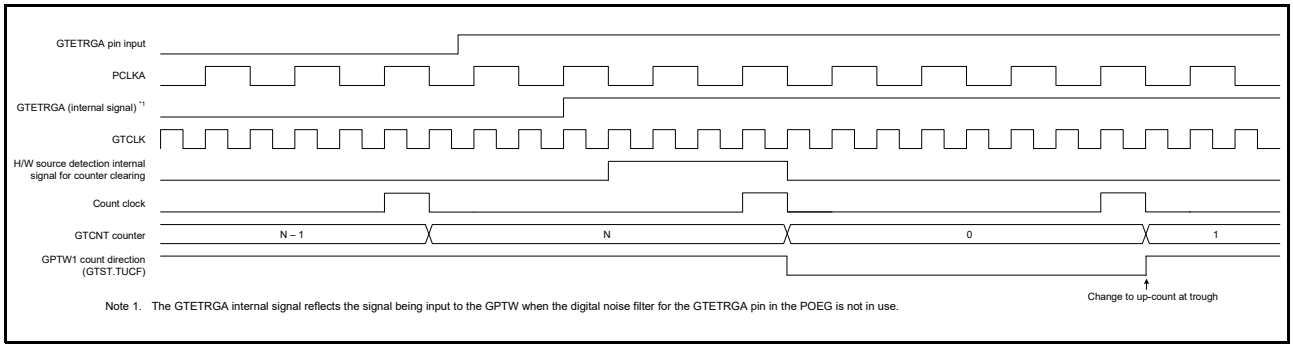

Figure 24.143 Example of the Timing to Switch the Direction of Counting in Response to a Rising Edge of the Input on the GTETRGA Pin: Switch to Counting Down with Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency and Offset Value is 0

Figure 24.144 and Figure 24.145 show examples of the timing to switch the direction of counting in response to ELCA event input when a clock signal produced by frequency-dividing the GTCLK signal is in use as the counter clock for the GTCNT counter, and the frequency of GTCLK is double that of PCLKB.
This is an example of operations to switch the GPTW1.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPTW0.GTCCRA register. This is selected as a trigger for output to the GPTW by the ELC as event source A.
The GPTW0 compare match A signal is synchronized with GTCLK. The ELC receives the signal in synchronization with PCLKB, and outputs the GPTW event source A signal after 1 cycle of PCLKB has elapsed. The GTCNT counter is switched in synchronization with GTCLK after the GPTW has detected the internal switching signal.

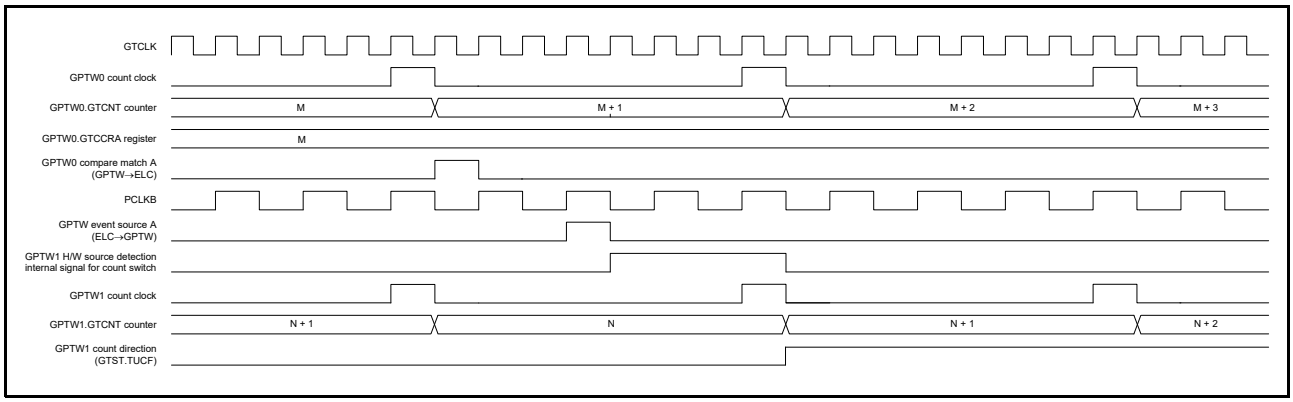

Figure 24.144 Example of the Timing of Count Switch Operations in Response to Event Input from the ELCA: Switch to Counting Up without Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency

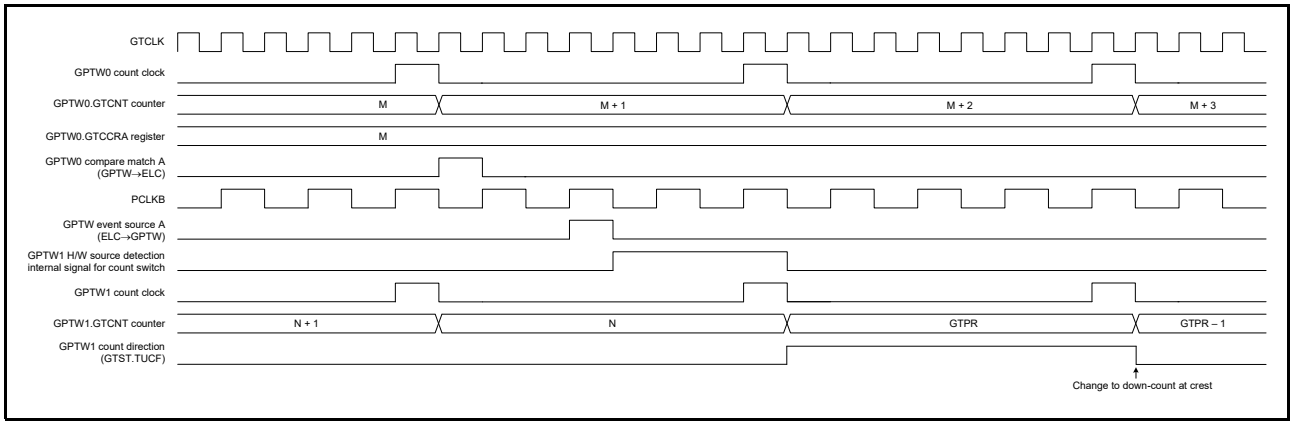

Figure 24.145 Example of the Timing of Count Switch Operations in Response to Event Input from the ELCA: Switch to Counting Up with Reloading During the Counting of Cycles of the Clock Signal Produced by Dividing the GTCLK Frequency and Offset value is GTPR

24.3.9 Inter-Channel Synchronous Operation

Synchronous operation on channels (synchronous start/stop/clear/switch operation) can be performed.

24.3.9.1 Software Control of Inter-Channel Synchronous Operation

The count operations for respective channels can be started, stopped and cleared simultaneously by setting multiple bits of the GTSTR, GTSTP, and GTCLR registers to 1 at the same time.
Count start with phase differences among channels is possible firstly by setting the GTCNT counter value before counting starts, and then, by setting simultaneously multiple bits in the GTSTR register to 1.
The GTCNT counter value settings are synchronized by setting the GTCR.SSCEN bit to 1, and can be written simultaneously to multiple channels set in the same group by the GTCR.SSCGRP[1:0] bits. Synchronous sets are not valid for channels that are set to complementary PWM mode.
When either the SSCE bit or the SSCD bit of the GTSECR register is set to 1, the GTCR.SSCEN bits of the channels for which 1 is set in the GTSECSR register are set to 0 or 1 accordingly, and the GTCNT synchronous set/clear is enabled or disabled on multiple channels at the same time.
As the count operation clock is selected by the GTCR.TPCS[3:0] bits in each channel, if the clock period of channels performing synchronous operation (count start/stop/clear) differ, the synchronous operation timings will not be exactly the same.
The Figure 24.146 shows an example of simultaneous start/stop/clearing of four channels by software, and Figure 24.147 shows an example of phase shift start among four channels by software. Figure 24.148 to Figure 24.150 show examples of simultaneous start/stop/clearing with different count period.

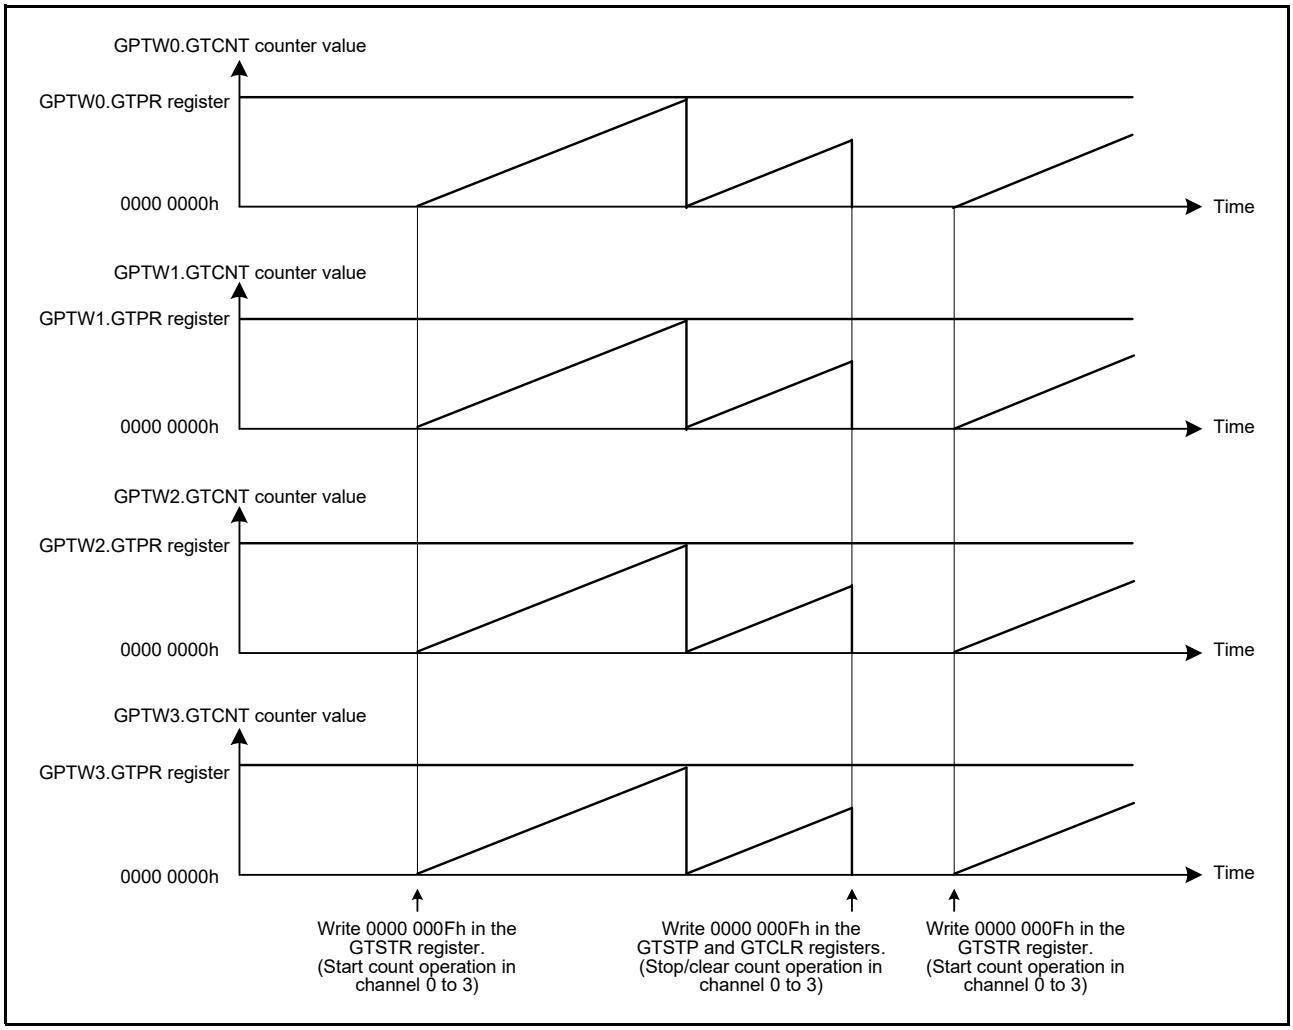

Figure 24.146 Example of Simultaneous Start/Stop/Clearing Operation by Software (with the Same Count Period (GTPR Register Value))

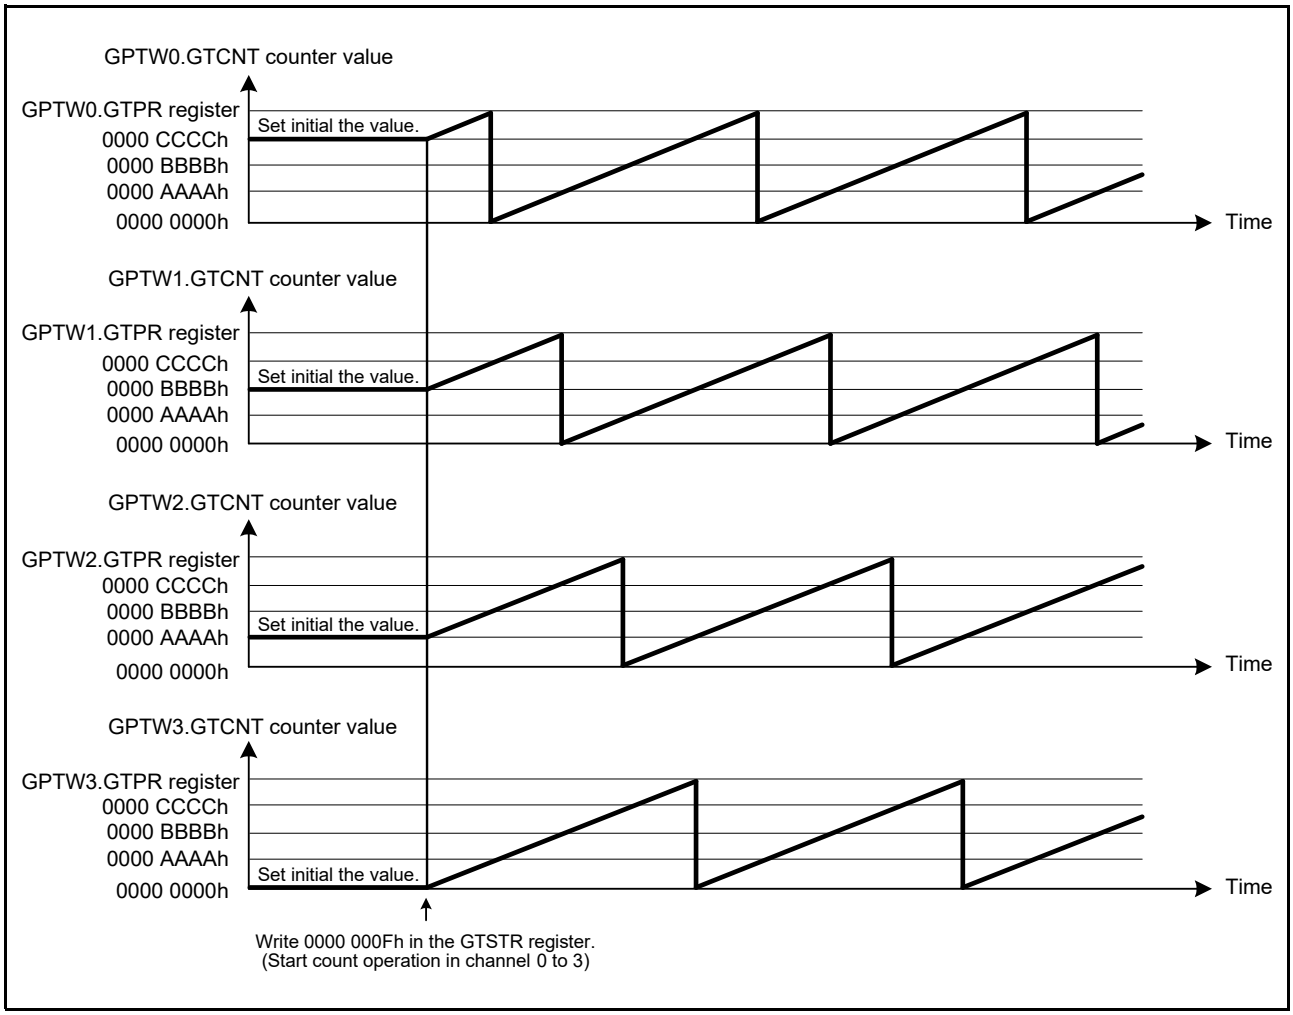

Figure 24.147 Example of Software Phase Shift Start (with Same Count Period (GTPR Register Value))

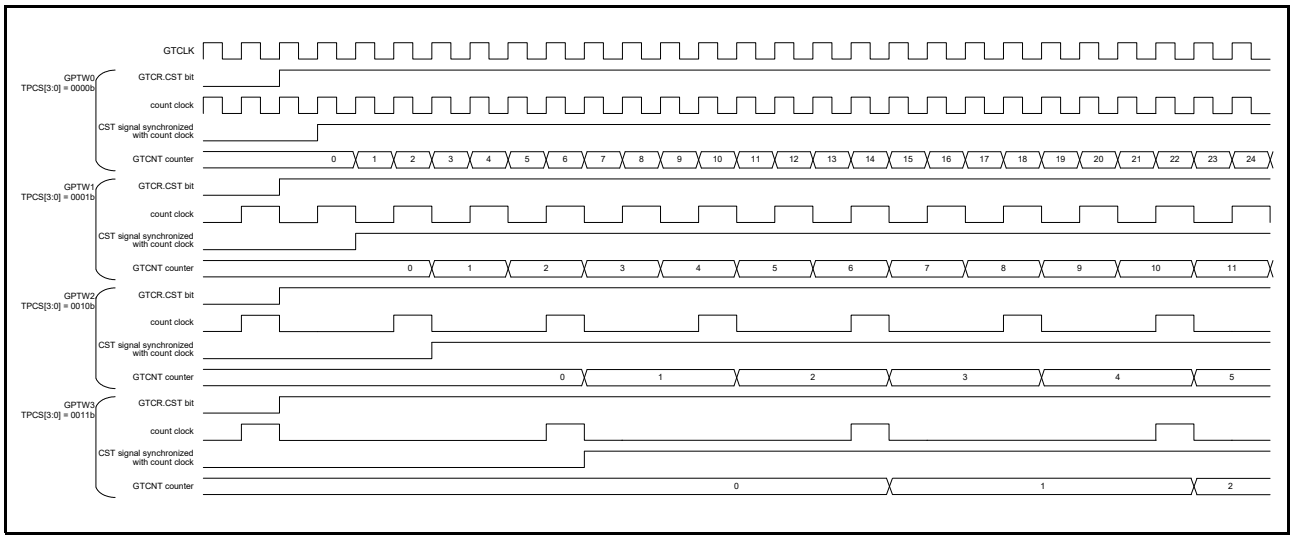

Figure 24.148 Example of Simultaneous Start Operation by Software (with Different Count Period)

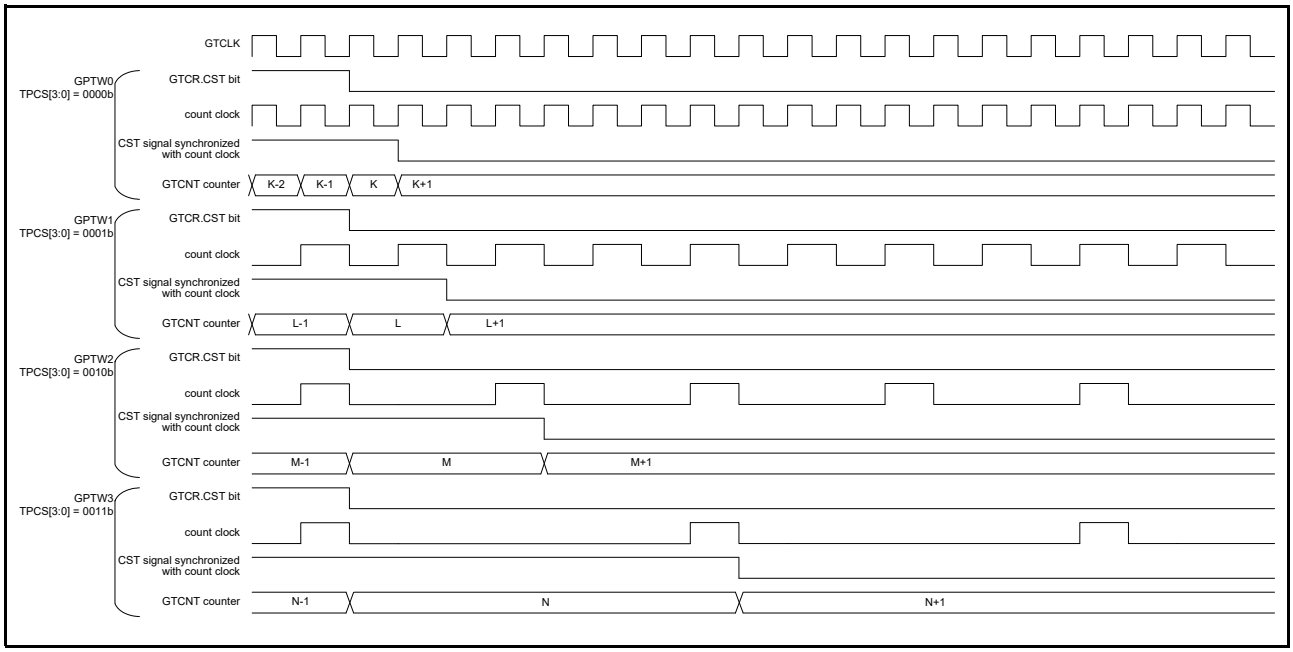

Figure 24.149 Example of Simultaneous Stop Operation by Software (with Different Count Period)

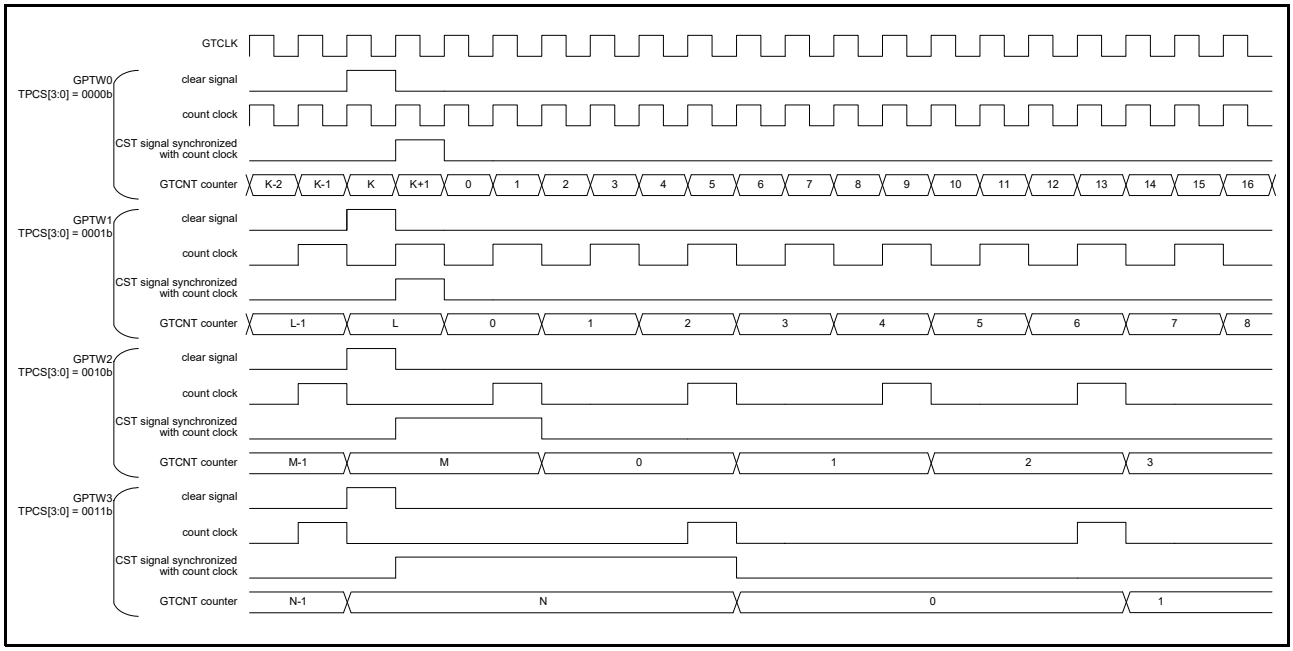

Figure 24.150 Example of Simultaneous Clearing Operation by Software (with Different Count Period)

24.3.9.2 Hardware Source Control of Inter-Channel Synchronous Operation

The count operations for respective channels can be started/stopped/cleared/switched simultaneously by following hardware sources: external trigger input, and ELC event input.

Synchronous operation by the GTIOCnA and GTIOCnB pin inputs (n = 0 to 15) can be performed by setting the ELC event by input capture as a hardware source.

Setting the GTCNT counter values for the respective channels before counting starts makes it possible to start counting with phase differences among the channels.

Figure 24.151 shows an example of simultaneous start/stop/clearing operation of four channels by hardware source, and Figure 24.152 shows an example for setting simultaneous start by hardware source.

Figure 24.153 shows an example of simultaneous start/stop/clearing/switching operation of five channels by hardware source, and Figure 24.154 shows an example for setting simultaneous start by hardware source.

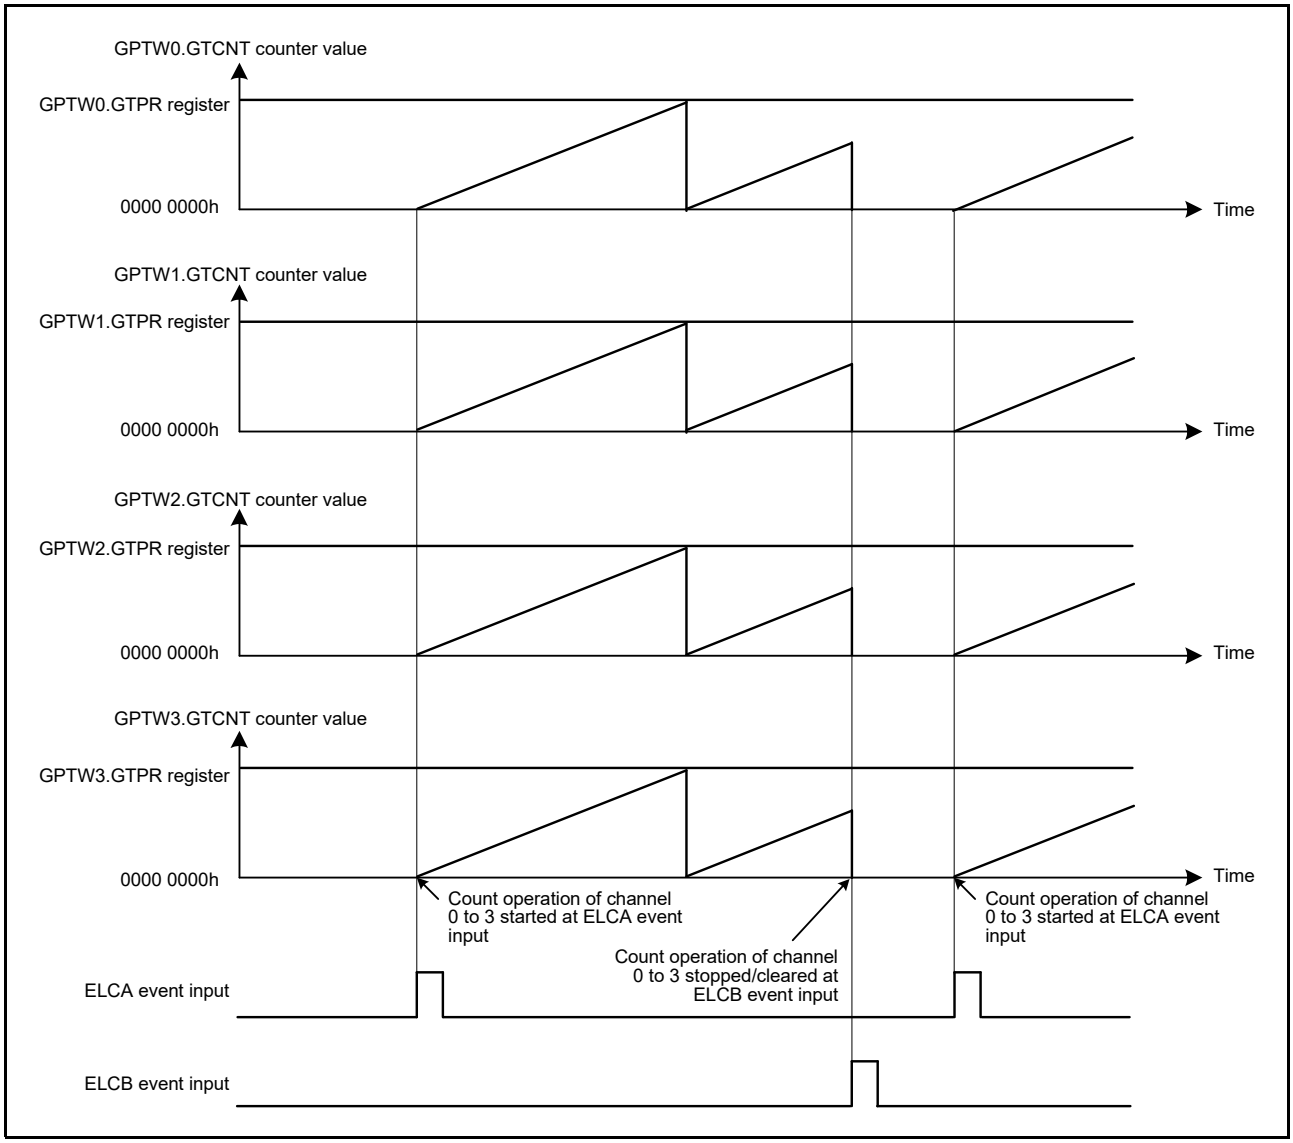

Figure 24.151 Example of Simultaneous Start/Stop/Clearing Operation by Hardware Source (with Same Count Period (GTPR Register Value))

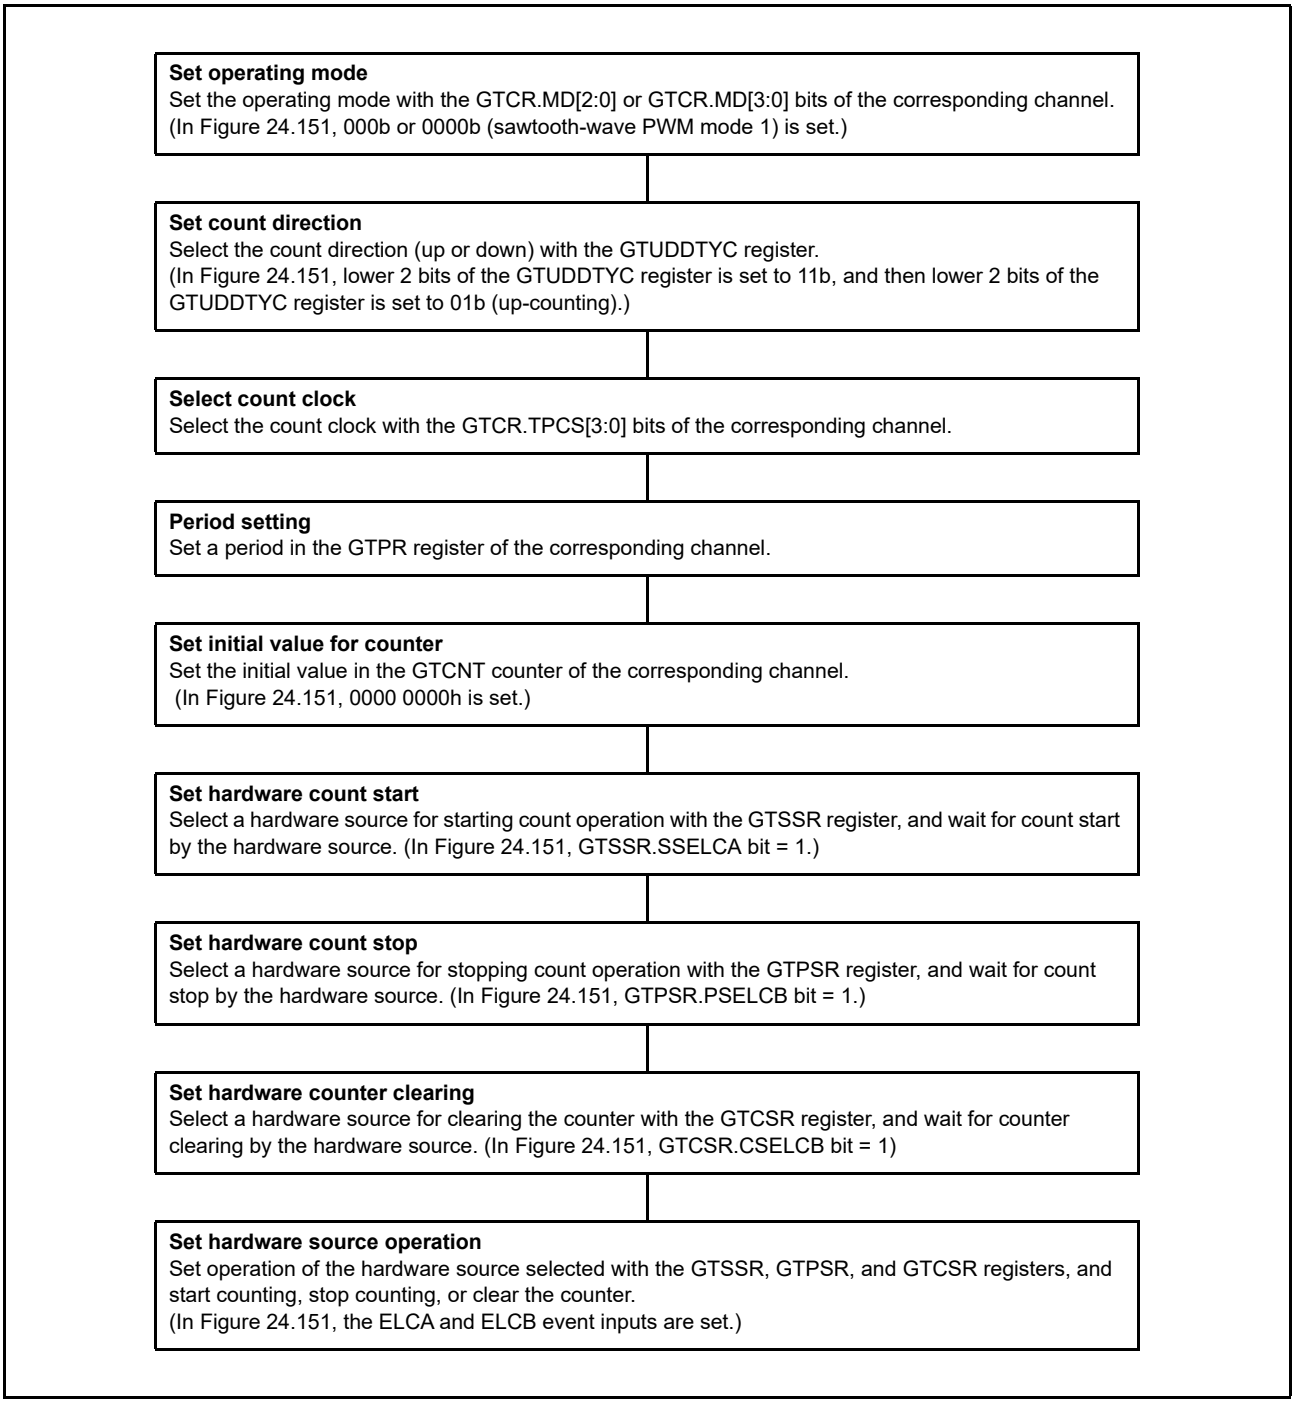

Figure 24.152 Example for Setting Simultaneous Start by Hardware Source

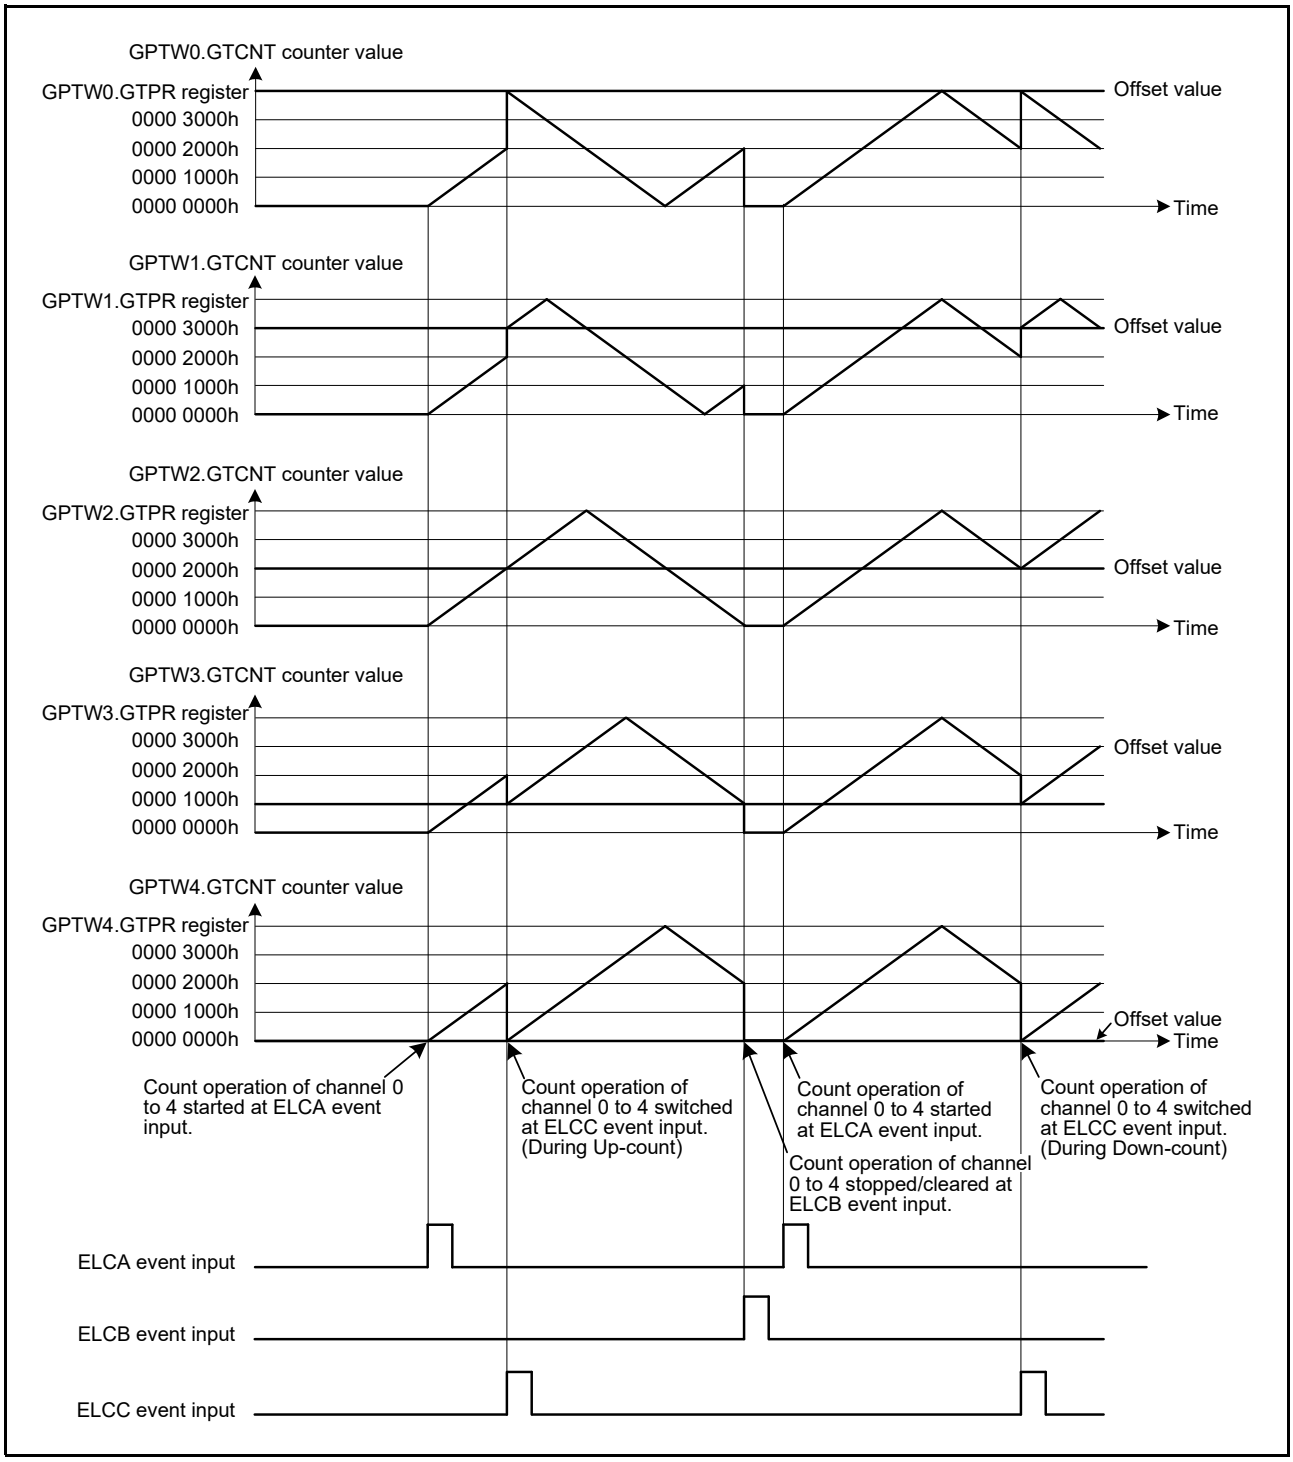

Figure 24.153 Example of Simultaneous Start/Stop/Clearing/Switch Operation by Hardware Source (Switch to Up-count with Offset Reload by ELCC Event, with Same Count Period (GTPR Register Value))

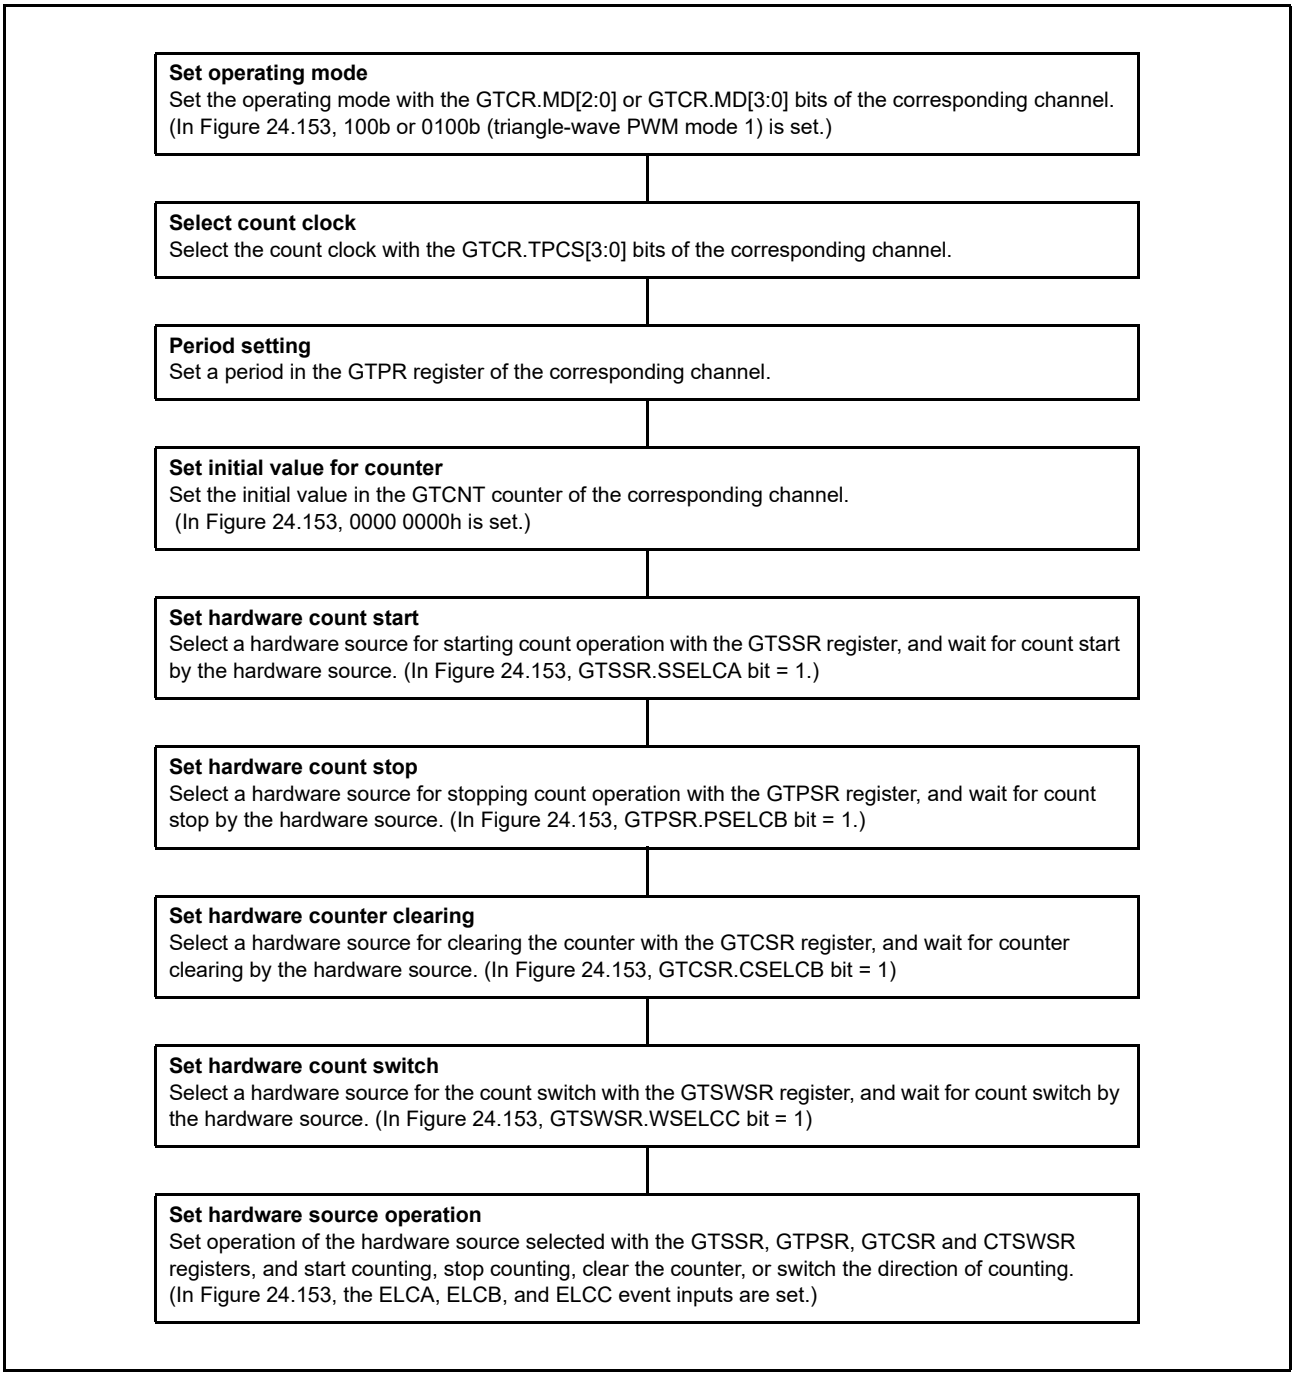

Figure 24.154 Example for Setting Simultaneous Start by Hardware Source (with Count Switch)

24.3.9.3 Synchronous Clear Operation by Inter Channel Cooperation

The counters of other channels can be cleared at the same time with the counter clear of some channel caused by the compare match, input capture, sawtooth wave up-count overflow, sawtooth wave down-count underflow, and the GTIOCnA/GTIOCnB pin input selected in the GTCSR register.

The counter clear caused by GTCLR register, external trigger input and the ELC input can perform as synchronous clear when the same counter clear factor is set to target channels of synchronous clear. Therefore, these factors are not prepared for the synchronous clear operation by inter channel cooperation.

Set the channel that generates the synchronous clear source and the channel that is synchronously cleared in the same synchronous set/clear group using the GTCR.SSCGRP[1:0] bits.

Similar to the synchronous operation in section 24.3.9.1, Software Control of Inter-Channel Synchronous Operation, if the count clock selected by the GTCR.TPCS[3:0] bits differs between channels, the synchronous clear operation cannot be performed at exactly the same timing. Similar to the example of simultaneous clearing operation by software in Figure 24.150, if the count clock differs between channels, the synchronous clear factor is synchronized with the count clock of each channel before counter clearing.

When either the SSCE bit or the SSCD bit of the GTSECR register is set to 1, the GTCR.SSCEN bits of the channels for which 1 is set in the GTSECSR register are set to 0 or 1 accordingly, and the GTCNT synchronous set/clear is enabled or disabled on multiple channels at the same time.

Table 24.24 lists the settings of the registers used to set sources for synchronous clearing. Figure 24.155 shows an example of synchronous clear operation by inter channel cooperation and Figure 24.156 shows an example for setting synchronous clear operation by inter channel cooperation.

Table 24.24 Settings of the Registers Used to Set Sources for Synchronous Clearing

Sources for Synchronous Clearing by Inter Channel Cooperation	Register.Bit(s)	Value
GTCCRA register compare match/input capture	GTINTAD.SCFA	1b
	GTCSR.CSCMSC[2:0]	001b
GTCCRB register compare match/input capture	GTINTAD.SCFB	1b
	GTCSR.CSCMSC[2:0]	010b
GTCCRC register compare match	GTINTAD.SCFC	1b
	GTCSR.CSCMSC[2:0]	011b
GTCCRD register compare match	GTINTAD.SCFD	1b
	GTCSR.CSCMSC[2:0]	100b
GTCCRE register compare match	GTINTAD.SCFE	1b
	GTCSR.CSCMSC[2:0]	101b
GTCCRF register compare match	GTINTAD.SCFF	1b
	GTCSR.CSCMSC[2:0]	110b
Sawtooth wave up-count overflow	GTINTAD.SCFPO	1b
Sawtooth wave down-count underflow	GTINTAD.SCFPU	1b
Clearing due to input on the GTIOCnA or GTIOCnB pin	GTCR.SCGTIOC	1b

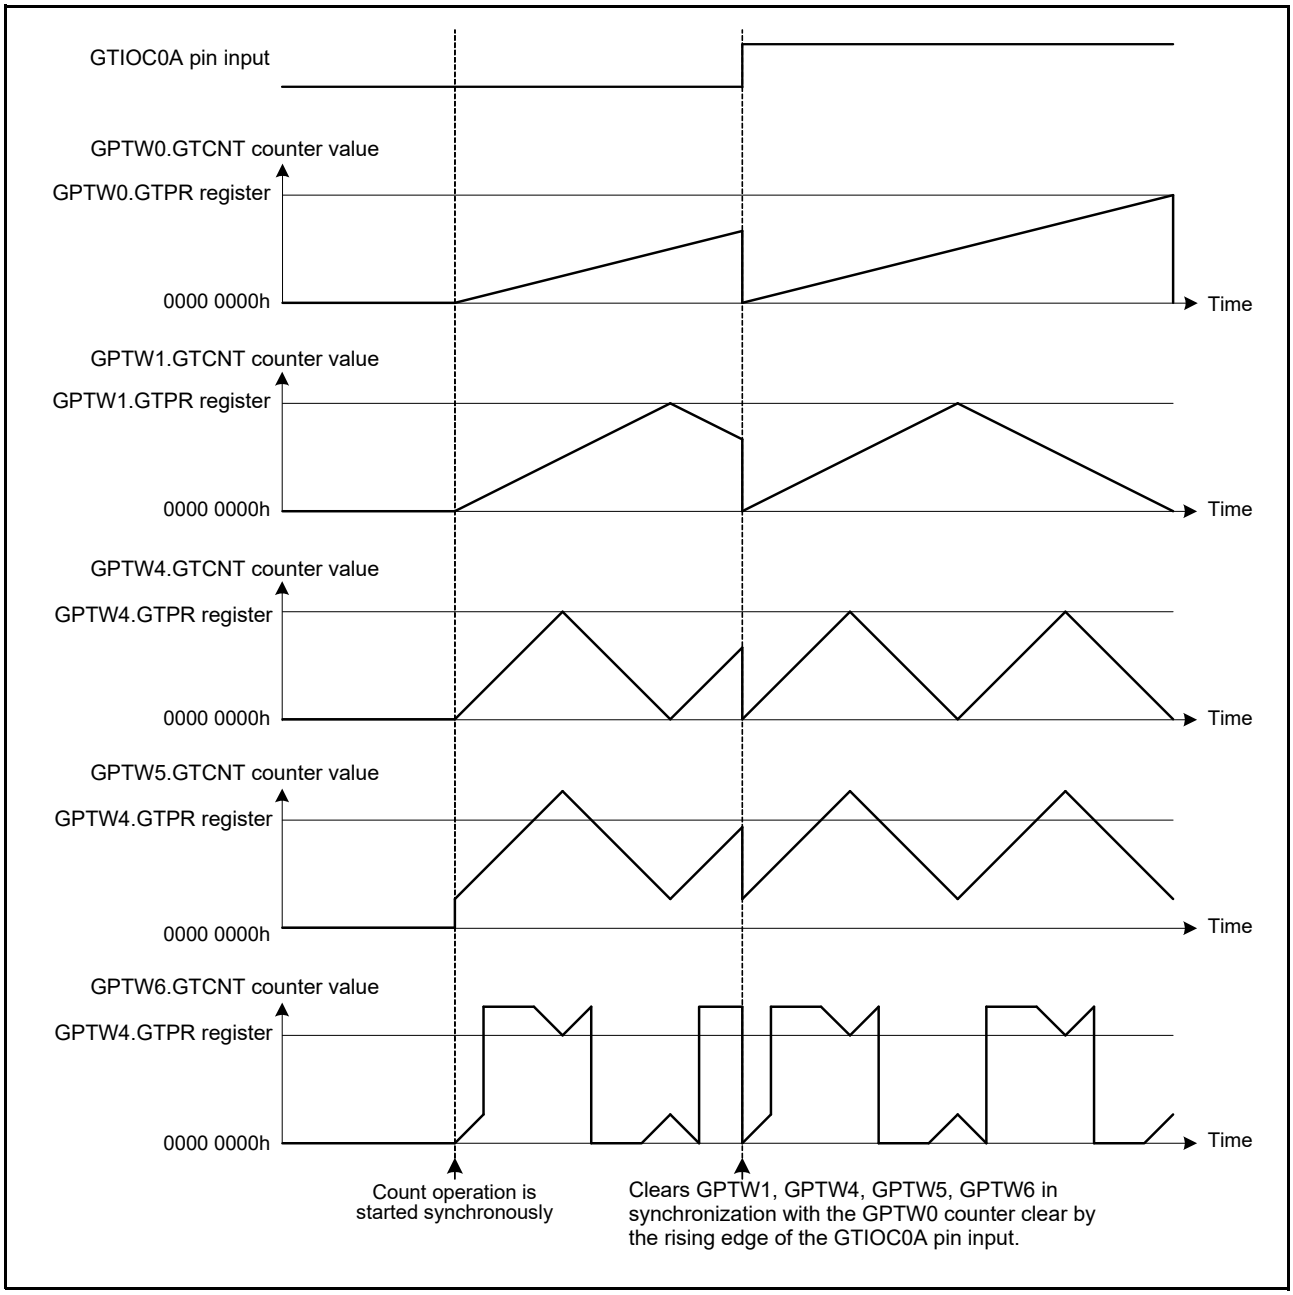

Figure 24.155 Example of Synchronous Clear Operation by Inter Channel Cooperation (Clear Caused by GTIOCnA/GTIOCnB Pin)
(GPTW0 is sawtooth wave and counter is cleared by the rising edge of the GTIOC0A,
GPTW1 is triangle wave,
GPTW4, GPTW5, GPTW6 are complementary PWM mode.
GPTW0, GPTW1, GPTW4, GPTW5, GPTW6 are the same synchronous set/clear group)

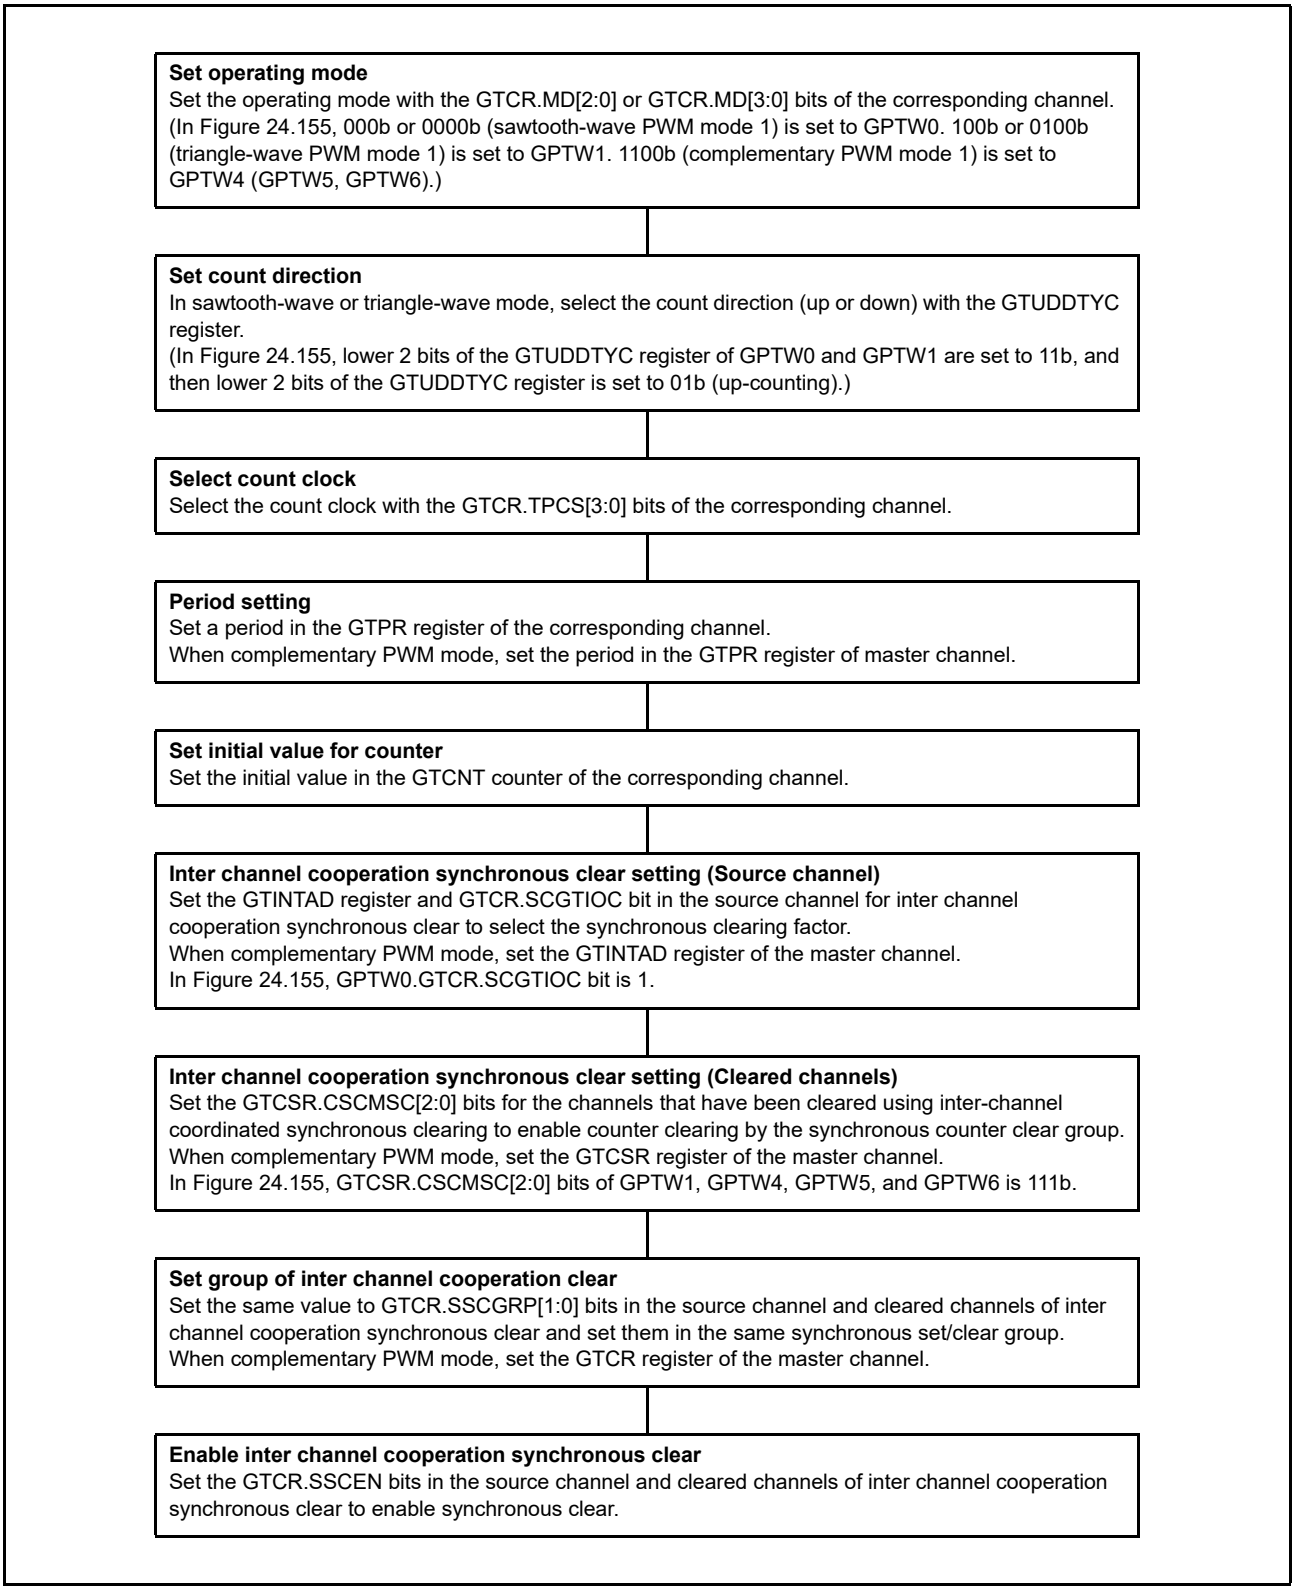

Figure 24.156 Example for Setting Synchronous Clear Operation by Inter Channel Cooperation (Clear Caused by GTIOCnA/GTIOCnB Pin)

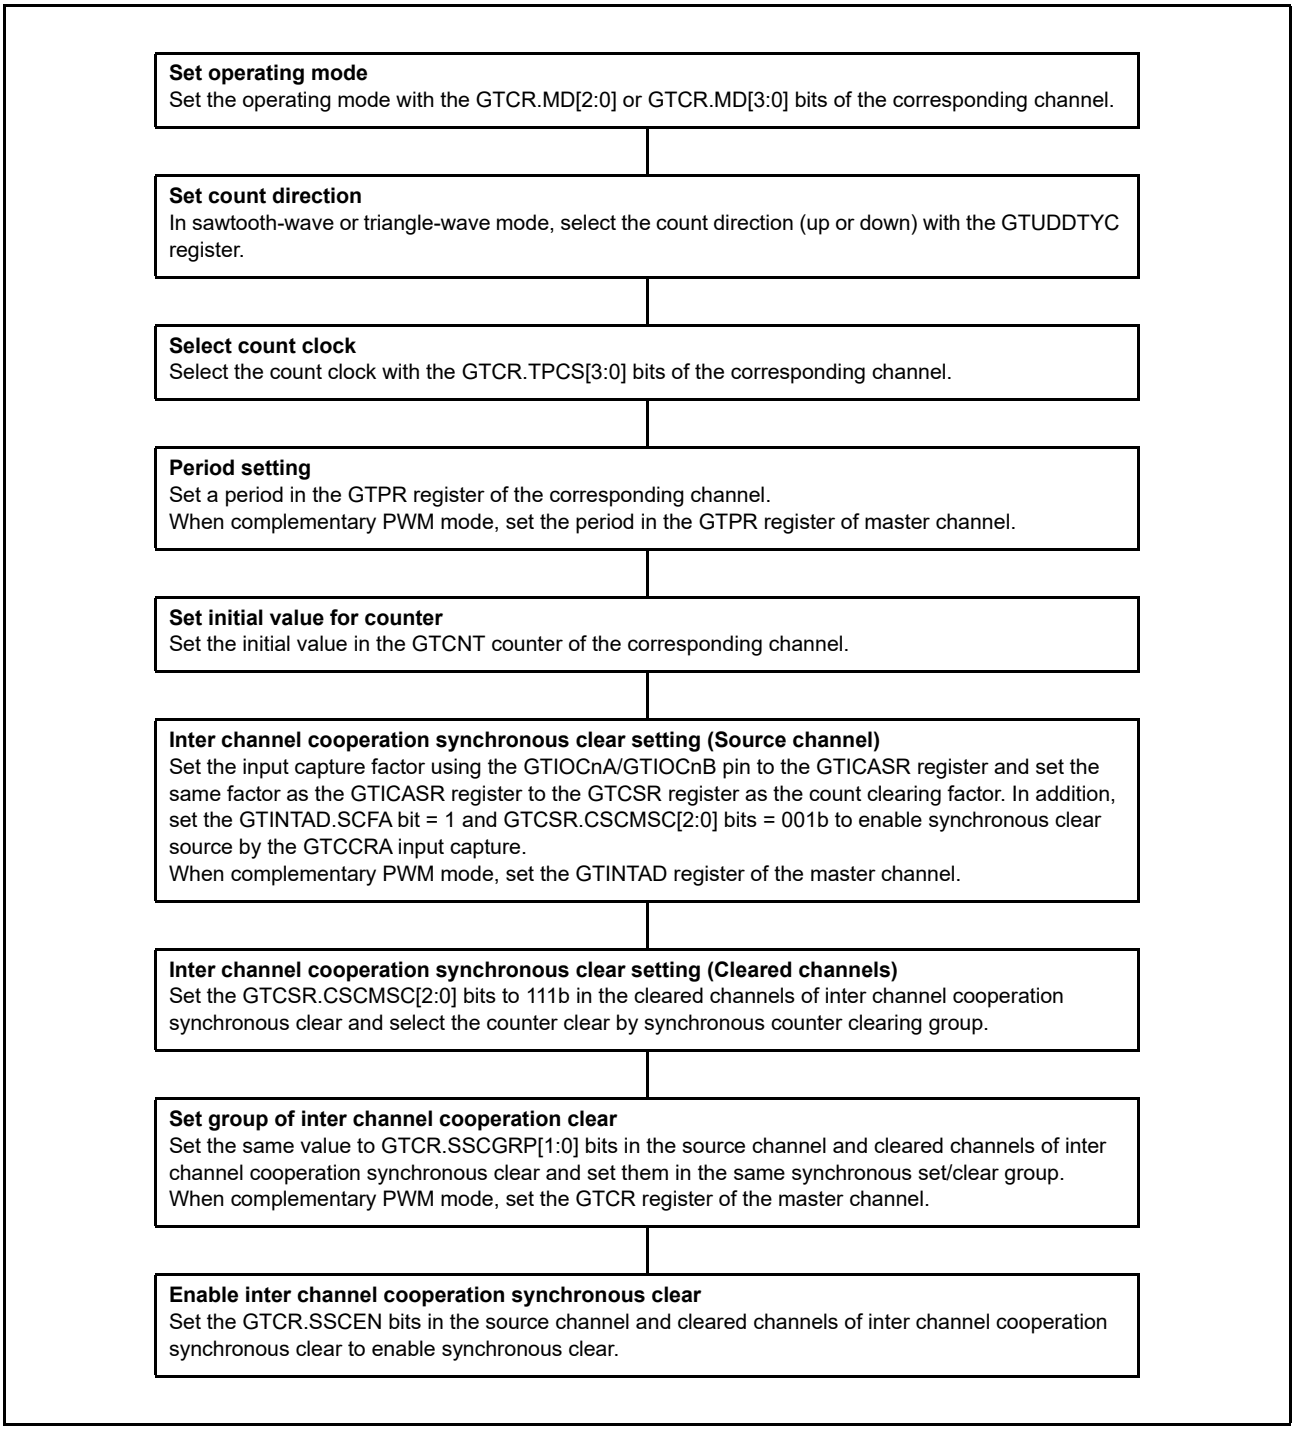

Figure 24.157 Example for Setting Synchronous Clear Operation by Inter Channel Cooperation (Clear Caused by the GTCCRA input capture using the GTIOCnA/GTIOCnB Pin)

24.3.9.4 Input Capture Operation by Inter Channel Cooperation

The events of compare match, input capture, sawtooth wave up-count overflow, sawtooth wave down-count underflow, the crest and trough of triangle wave and complementary PWM mode and the count clock can be used as the input capture factor for the GTCCRm register (m = A or B) of other channels.

The input capture factor by inter channel cooperation can be set by the GTICCR register of the channel that generates the input capture factor. The input capture by the factors of other channels is enabled by the GTICmSR.mSOC bit (m = A or B) in the channels to be captured. Set the channels that generate input capture factors and the channels to be captured to the same input capture group using the GTICCR.ICmGRP[1:0] bits (m = A or B).

Figure 24.158 shows an example of input capture operation by inter channel cooperation and Figure 24.159 shows an example for setting input capture operation by inter channel cooperation.

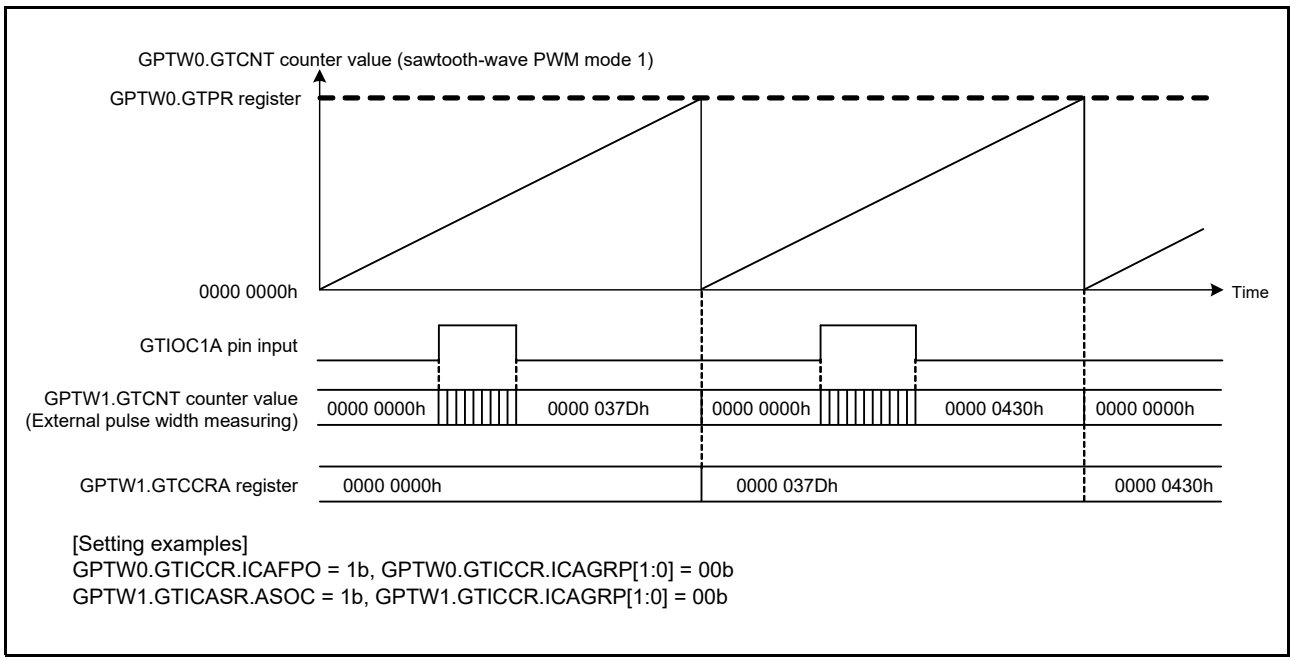

Figure 24.158 Example of Input Capture Operation by Inter Channel Cooperation (Channel 1 is captured by the overflow of Channel 0)

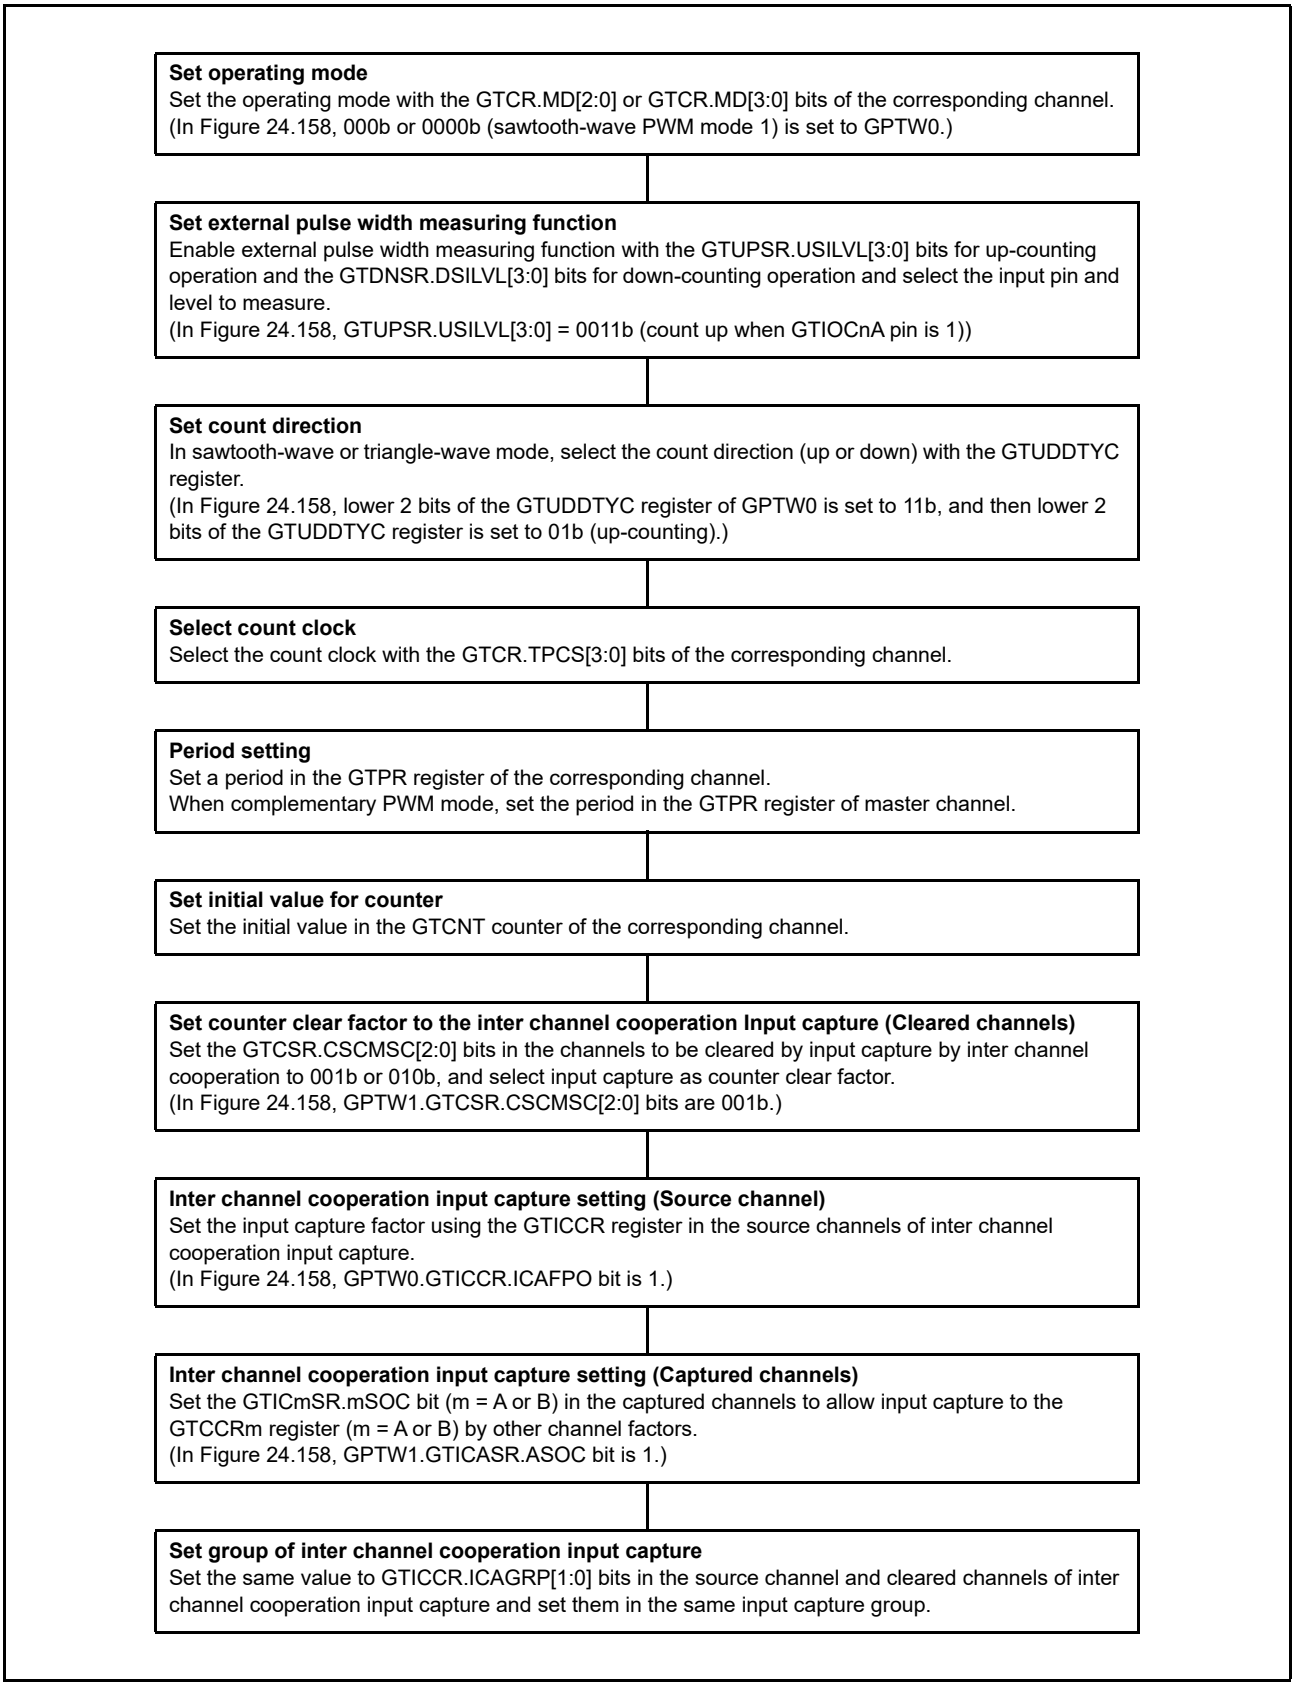

Figure 24.159 Example for Setting Input Capture Operation by Inter Channel Cooperation

24.3.10 PWM Output Operation Examples

(1) Synchronous PWM Output

The GPTW can output two phases of linked PWM waveforms for one channel, or 32 phases of linked PWM waveforms for a maximum of 16 channels by synchronizing operation of the channels.

Figure 24.160 shows an example in which four channels perform synchronous operation in sawtooth-wave PWM mode 1 and eight phases of PWM waveforms are output. The GTIOCnA pin (n = 0 to 3) is set so that it will output low as the initial output, high at a GTCCRA register compare match, and low at the end of the cycle. The GTIOCnB pin is set so that it will output low as the initial output, high at a GTCCRB register compare match, and low at the end of the cycle.

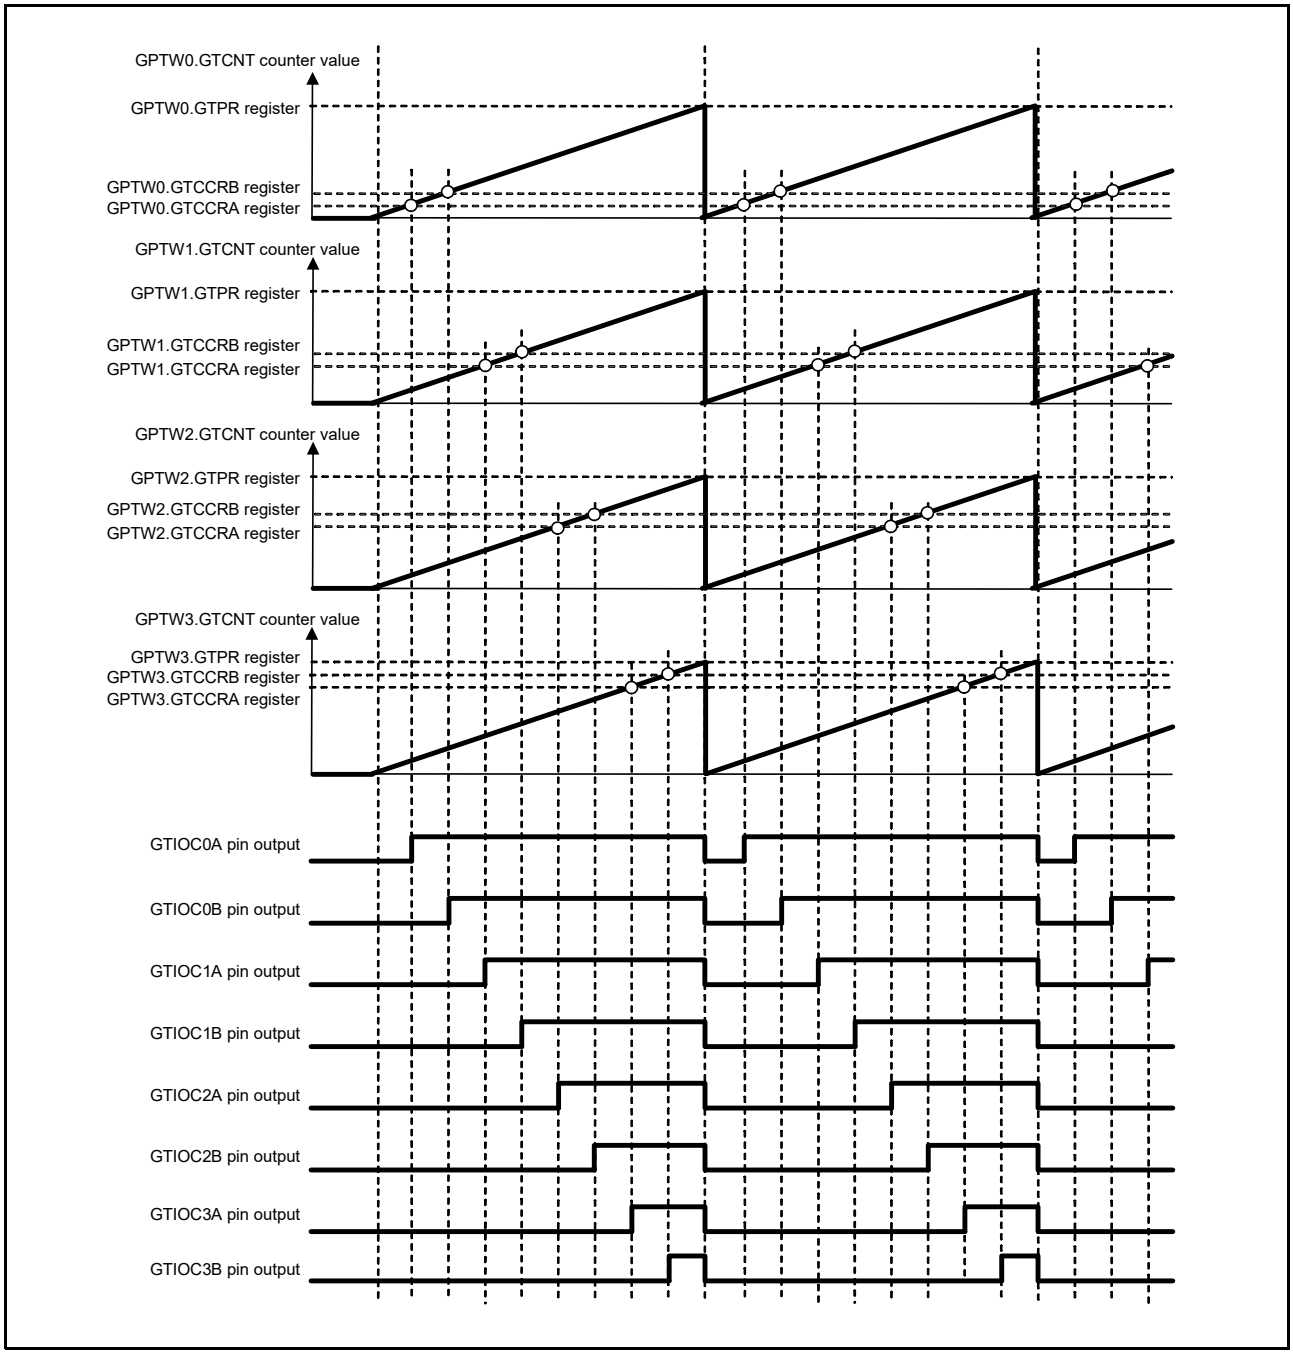

Figure 24.160 Example of Synchronous PWM Output

(2) Three-Phase Sawtooth-Wave Complementary PWM Output

Figure 24.161 shows an example in which three channels perform synchronous operation in sawtooth-wave PWM mode 1 and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, high at a GTCCRA register compare match, and low at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, low at a GTCCRB register compare match, and high at the end of the cycle.

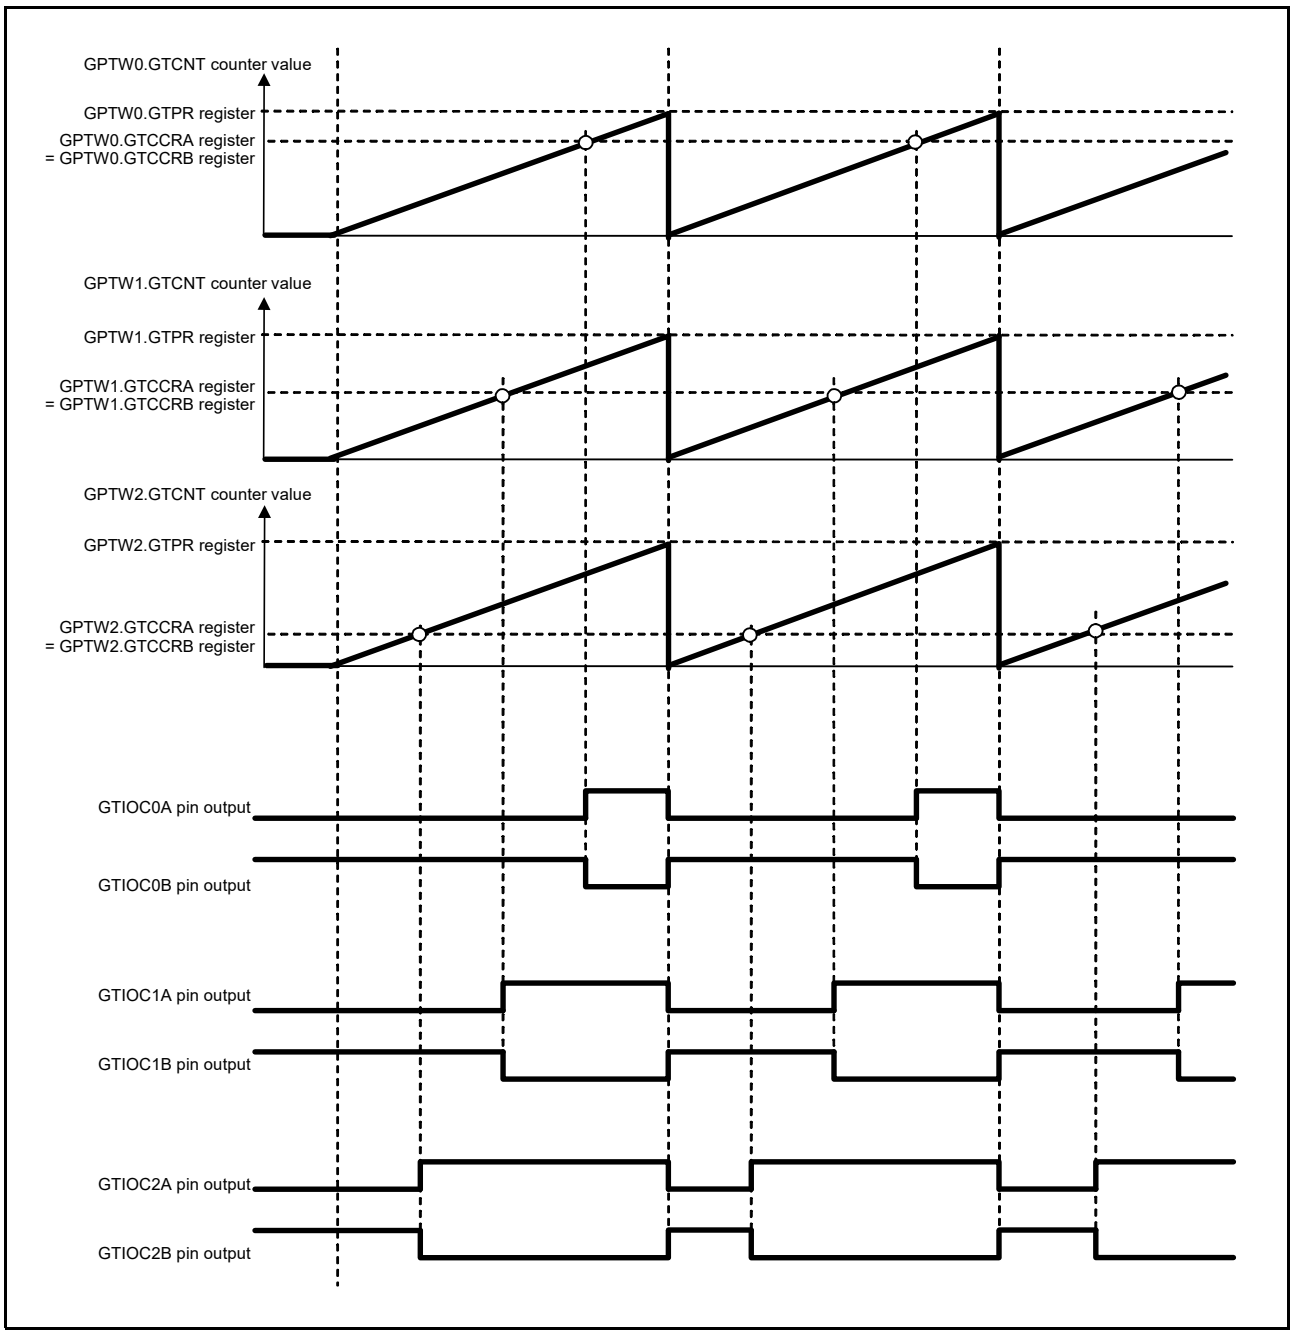

Figure 24.161 Example of Three-Phase Sawtooth-Wave Complementary PWM Output

(3) Three-Phase Sawtooth-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 24.162 shows an example in which three channels perform synchronous operation in sawtooth-wave one-shot pulse mode with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

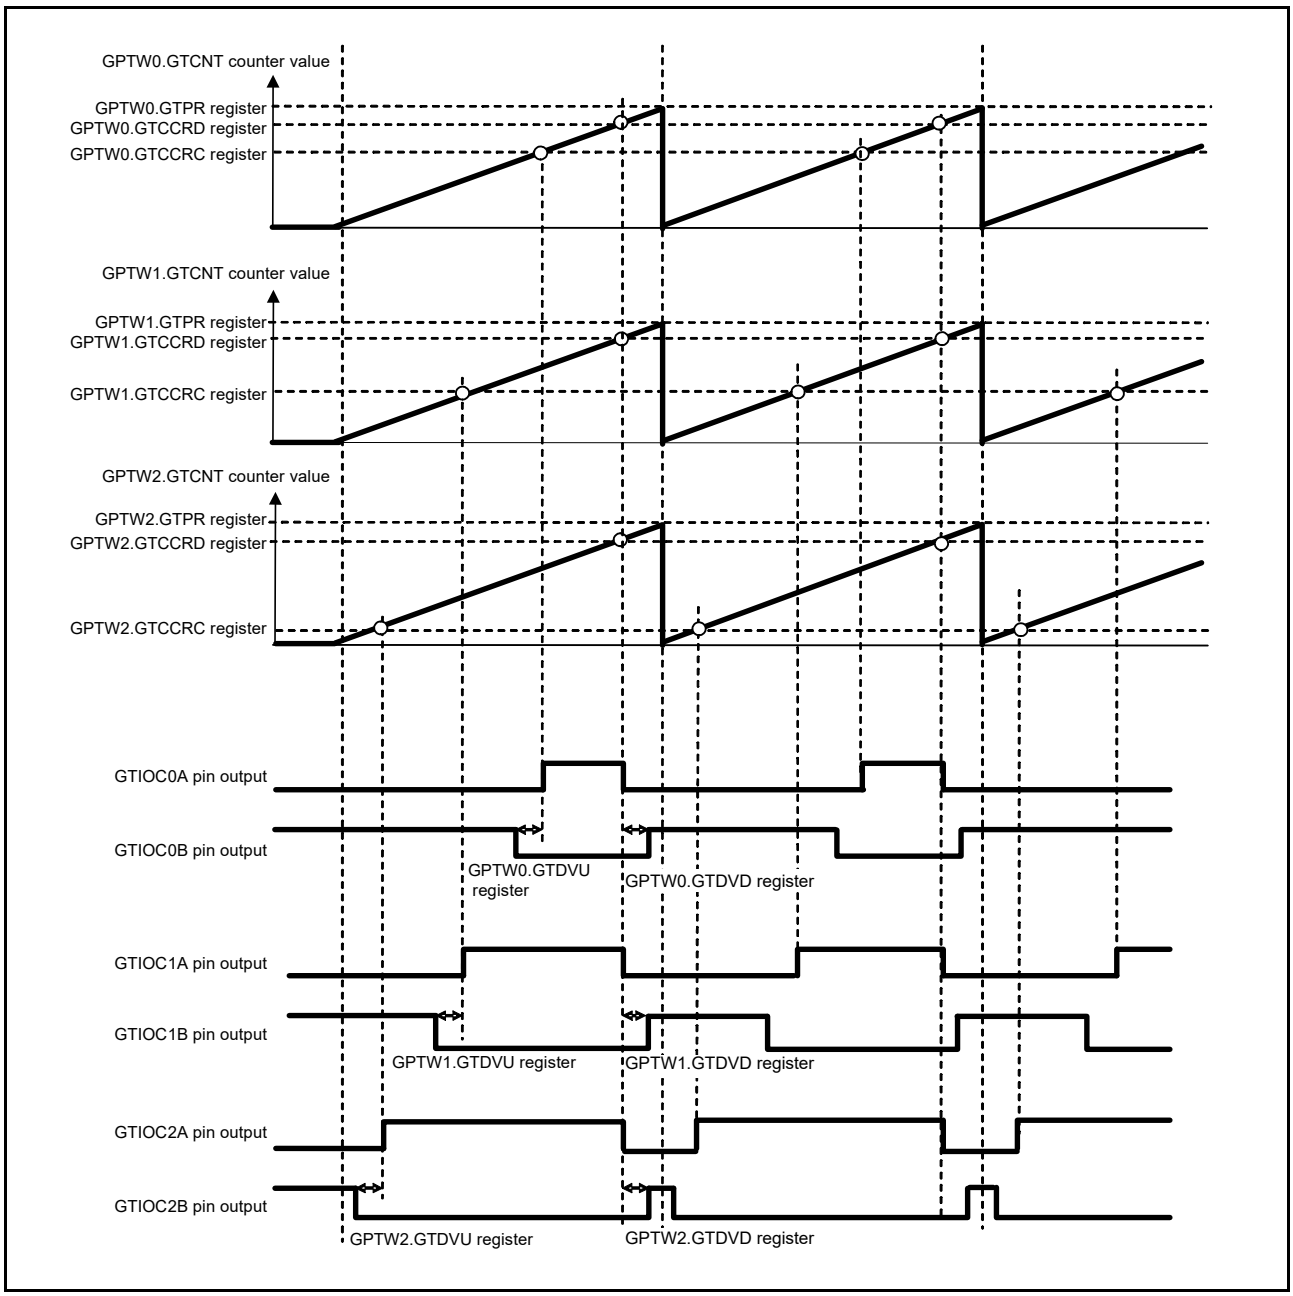

Figure 24.162 Example of Three-Phase Sawtooth-Wave Complementary PWM Output with Automatic Dead Time Setting

(4) Three-Phase Triangle-Wave Complementary PWM Output

Figure 24.163 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 1 and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

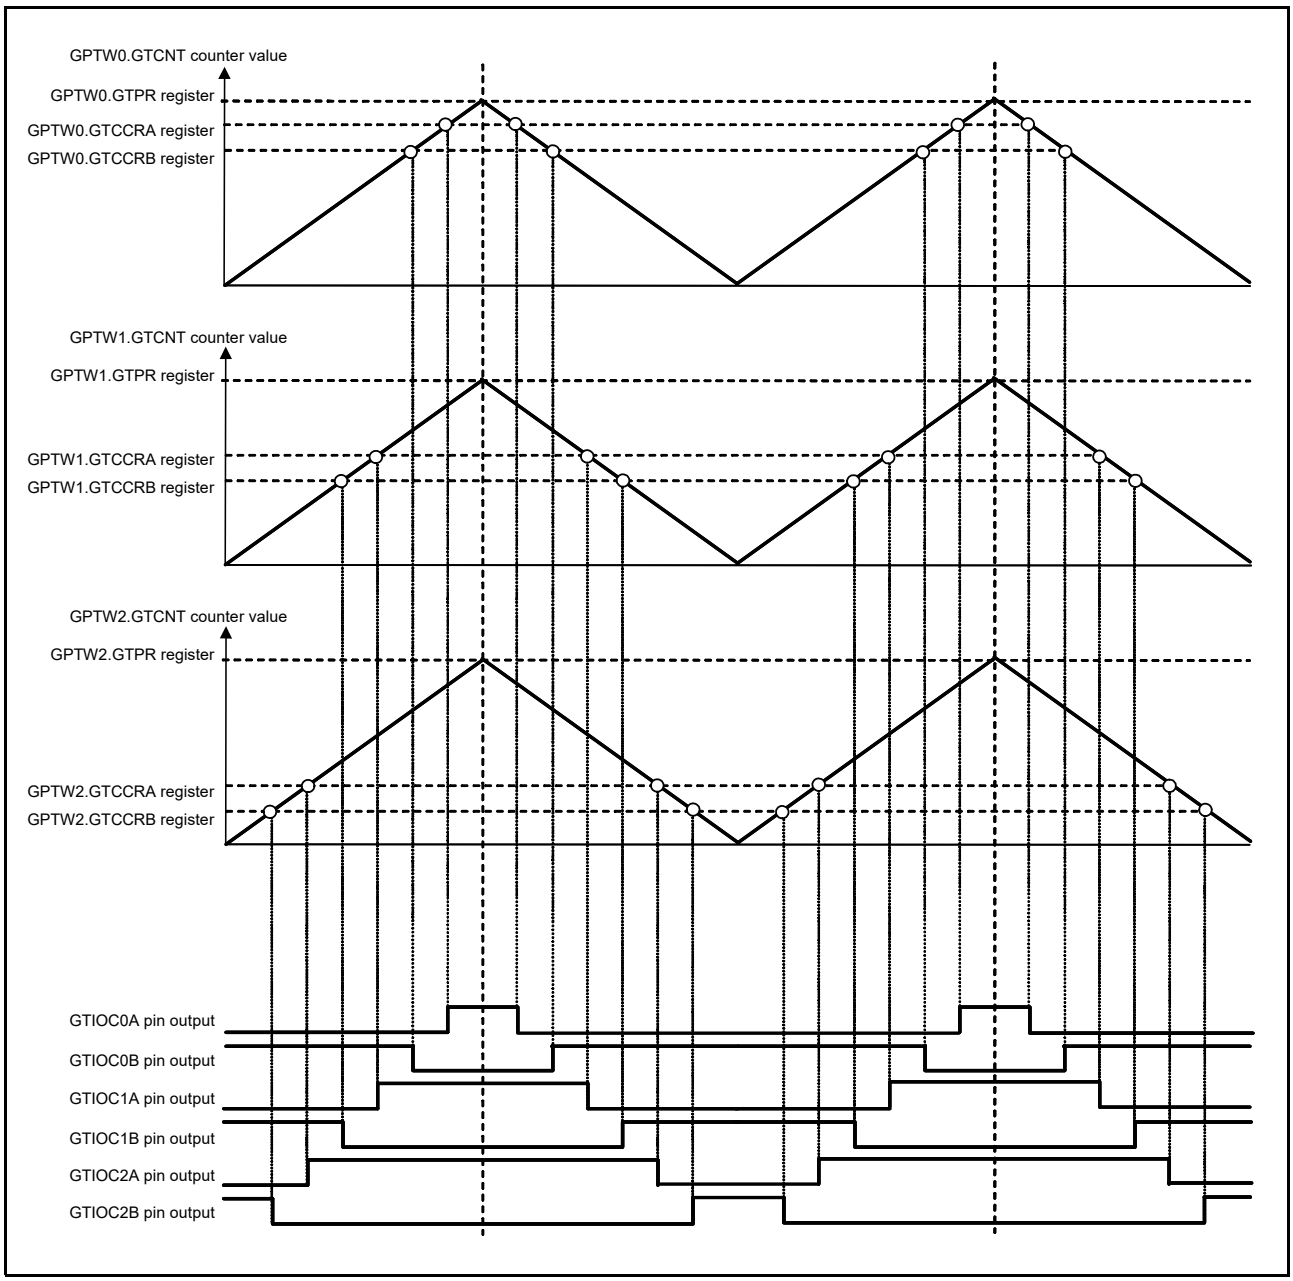

Figure 24.163 Example of Three-Phase Triangle-Wave Complementary PWM Output

(5) Three-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 24.164 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 1 with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

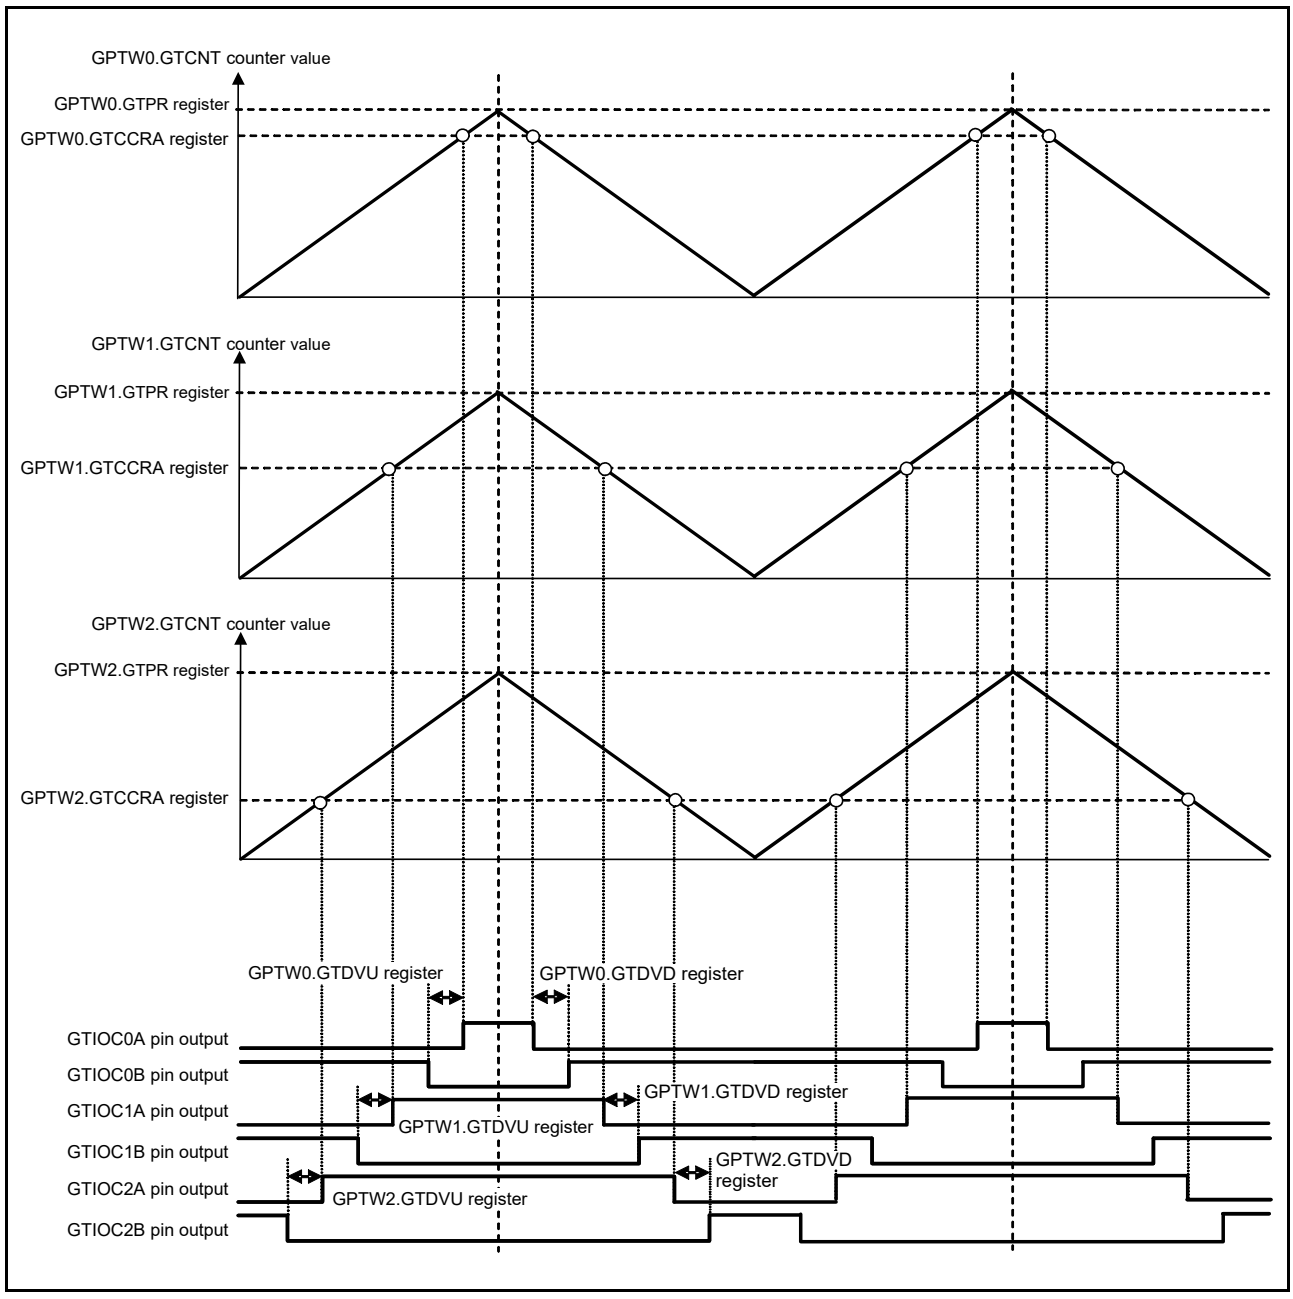

Figure 24.164 Example of Three-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

(6) Three-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 24.165 shows an example in which three channels perform synchronous operation in triangle-wave PWM mode 3 with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA pin (n = 0 to 2) is set so that it will output low as the initial output, toggle the output at a GTCCRA register compare match, and retain the output at the end of the cycle. The GTIOCnB pin is set so that it will output high as the initial output, toggle the output at a GTCCRB register compare match, and retain the output at the end of the cycle.

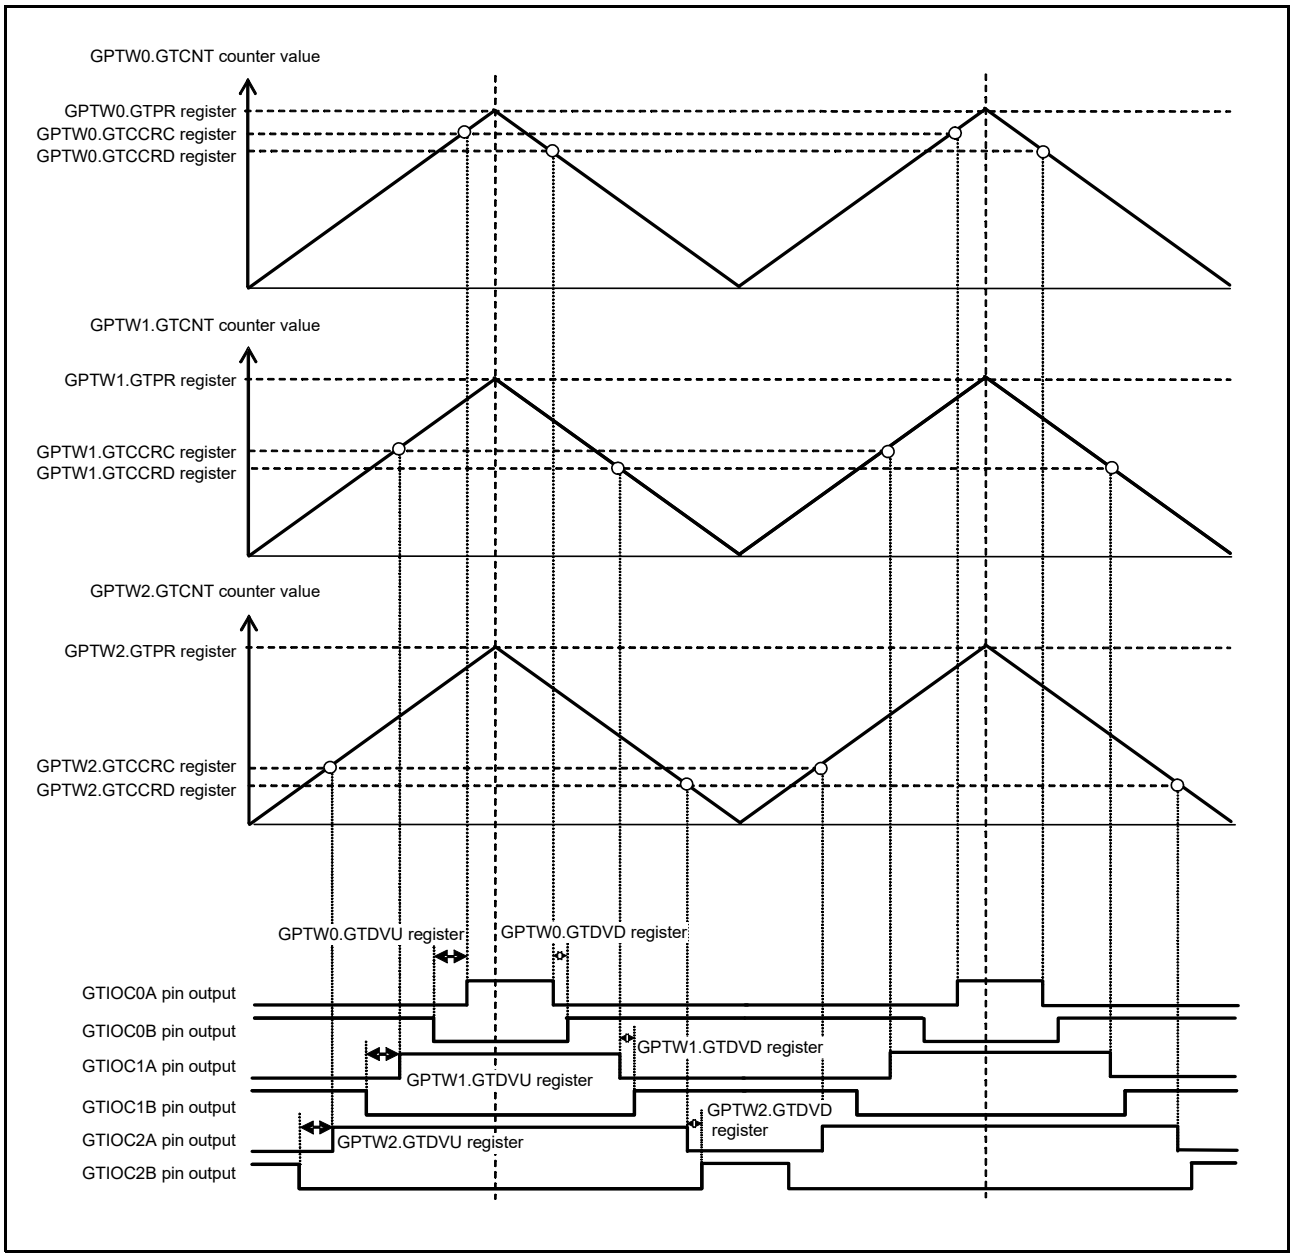

Figure 24.165 Example of Three-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

24.3.11 Cycle Count Function

By setting the GTPC register, the end of cycle can be counted.

The number of cycle to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of cycle. When the PCNT counter is 1 at the end of cycle, it becomes 0 and counting is stopped to finish the cycle count operation. At that time, the GTST.PCF flag is set, and a cycle count end interrupt request (GTCEIn) is generated if the setting of the GTINTAD.GTINTPC bit is 1. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the cycle count operation is finished.

When the GTCNT counter is stopped while cycle count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value. When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the cycle count function for multiple channels.

Figure 24.166 and Figure 24.167 show examples of PWM cycle count function.

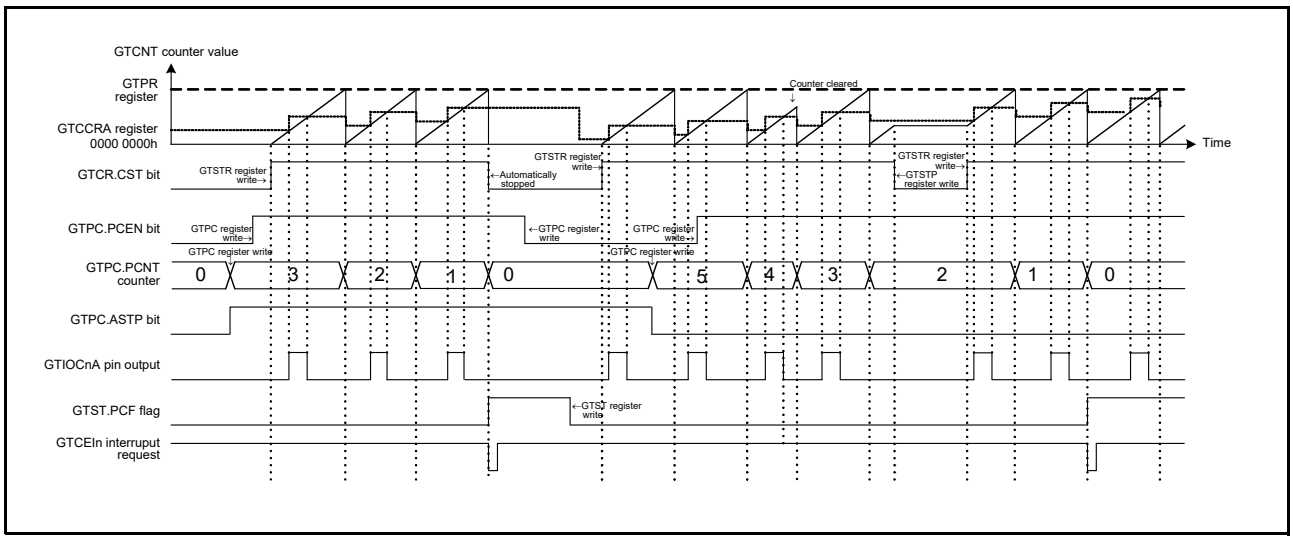

Figure 24.166 Example of PWM Cycle Count Function (Sawtooth-Wave One-Shot Pulse Mode) (n = 0 to 15)

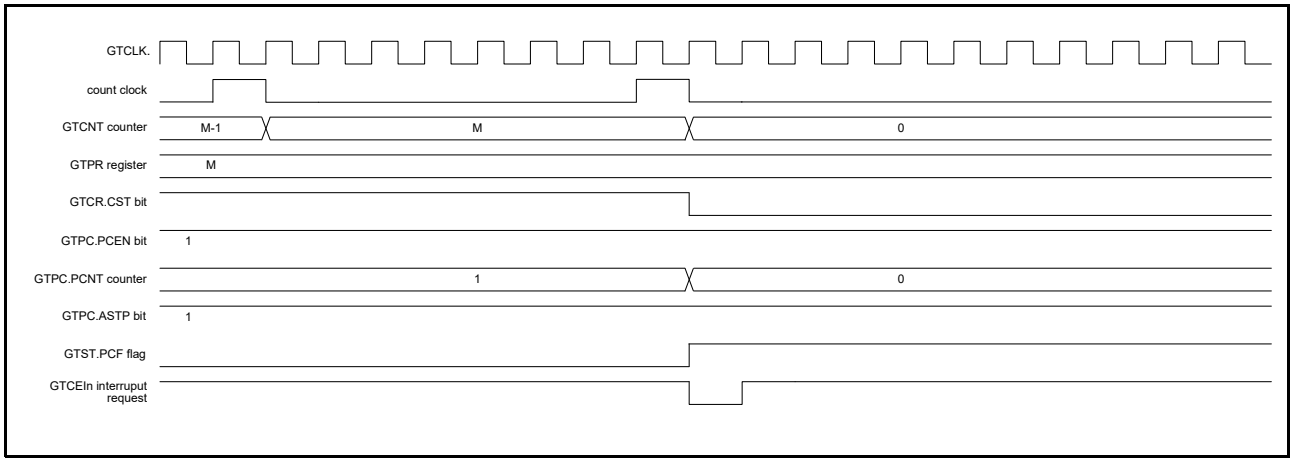

Figure 24.167 Example of the Timing of Operations for PWM Cycle Count Function (Sawtooth-Wave, Up-Counting) (n = 0 to 15)

24.3.12 Phase Counting Mode

The GTCNT counter can be up-counting or down-counting by detecting the phase difference between the GTIOCnA pin input (n = 0 to 15) and the GTIOCnB pin input.

Detection of the phase difference can be performed by setting the relationship between the edge and the level of the GTIOCnA pin input and the GTIOCnB pin input using the GTUPSR and GTDNSR registers for input combination. Refer to section 24.3.1.1, Counter Operation for count operation.

Figure 24.168 to Figure 24.177 show the examples of setting procedure for the phase counting mode 1 to 5, and the Table 24.25 to Table 24.34 show the setting of the GTUPSR and GTDNSR registers and up-counting and down-counting conditions.

24.3.13 External Pulse Width Measuring Function

The pulse width of GTIOCnA pin input (n = 0 to 15), GTIOCnB pin input, and GTETRGA/GTETRGB/GTETRGC/GTETRGD pin inputs can be measured.

The setting to enable or disable count-up of the GTCNT counter and the input pin and level which measured pulse width are selected by the USILVL[3:0] bits of the GTUPSR register.

The setting to enable or disable count-down of the GTCNT counter and the input pin and level which measured pulse width are selected by the DSILVL[3:0] bits of the GTDNSR register.

The setting to enable both count-up and count-down of the GTCNT counter at the same time is prohibited.

The counting operation performs periodic counting with the period of the GTPR register.

If the phase counting function and the pulse width measuring function are enabled at the same time, the pulse width measuring function does not work and the phase counting function works.

Figure 24.178 and Figure 24.179 show examples of external pulse width measuring function and Figure 24.180 shows an example for setting external pulse width measuring function.

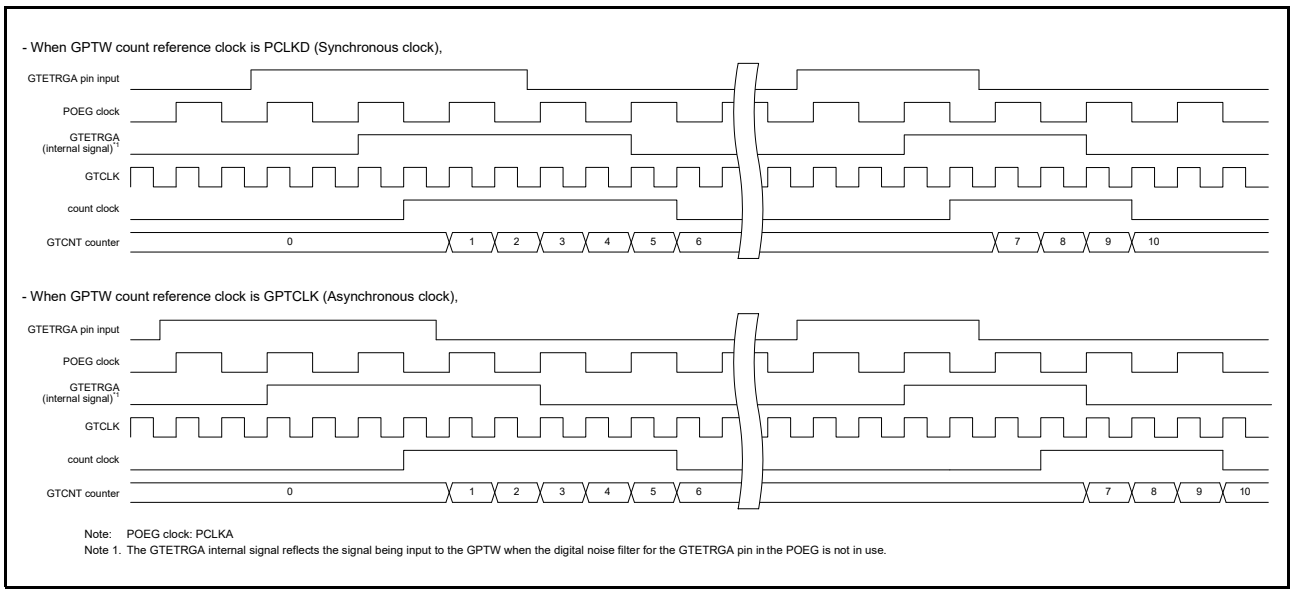

Figure 24.178 Example of External Pulse Width Measuring Function (Up-Counting)

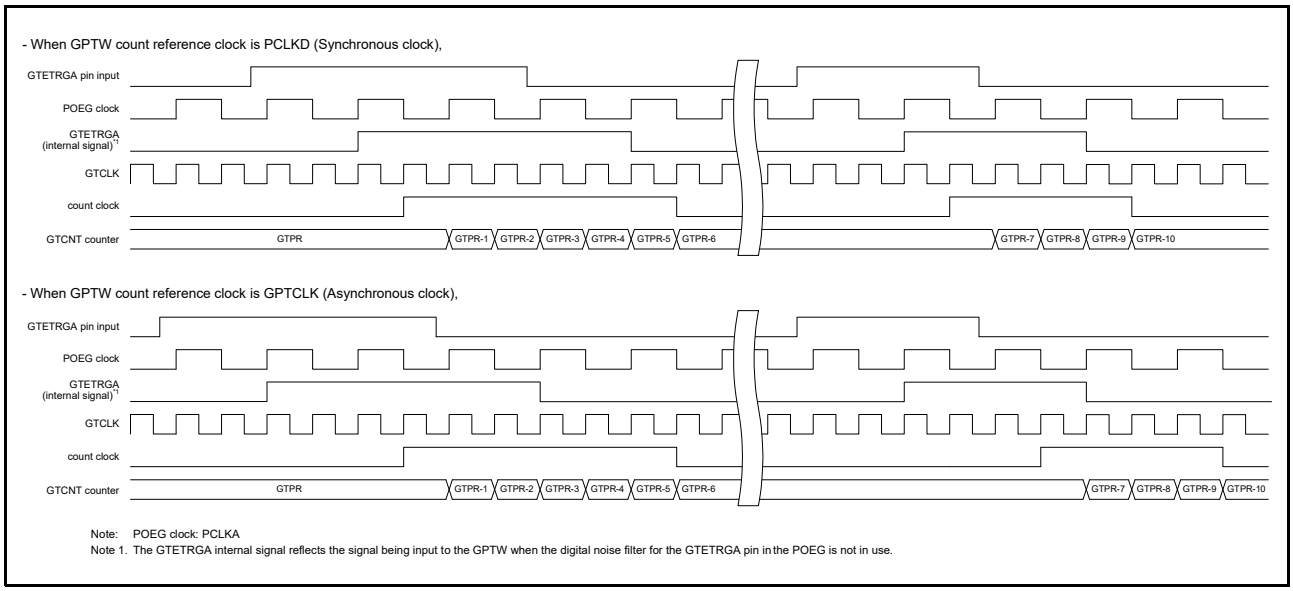

Figure 24.179 Example of External Pulse Width Measuring Function (Down-Counting)

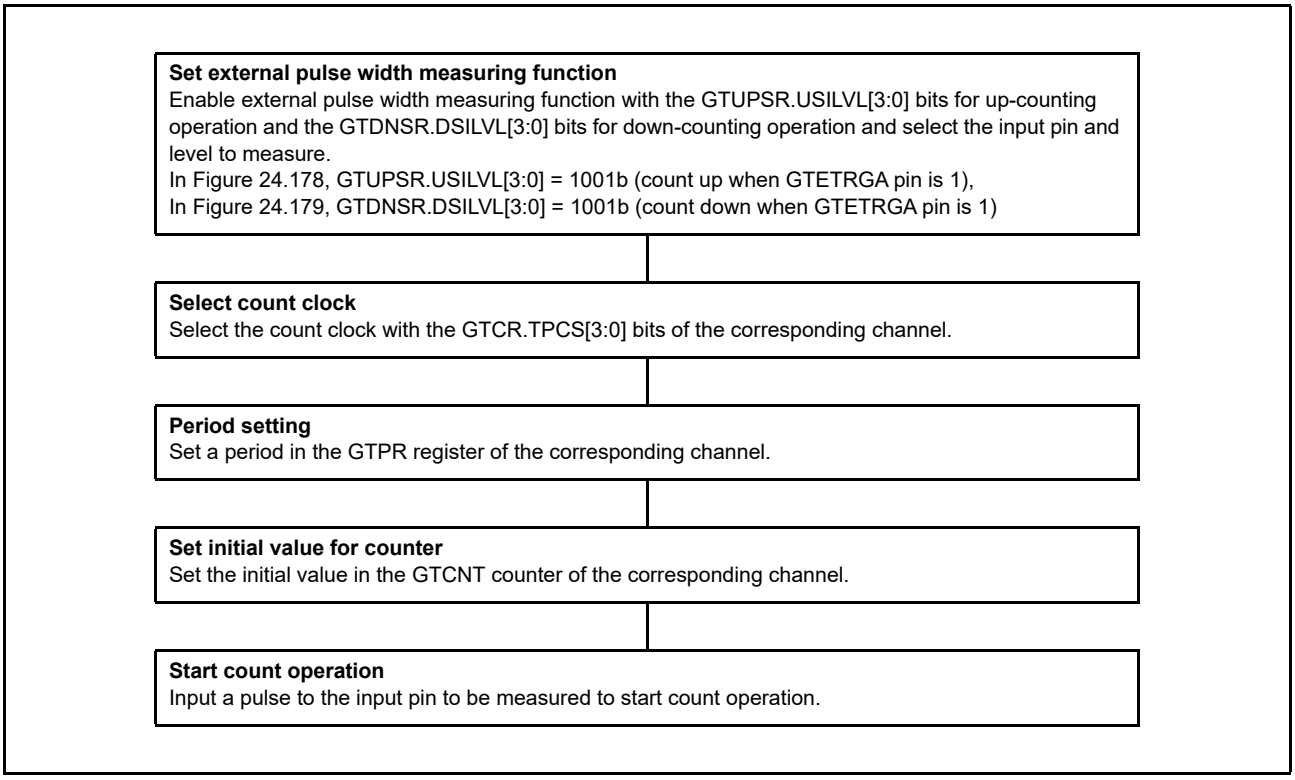

Figure 24.180 Example for Setting External Pulse Width Measuring Function

24.3.14 Output Phase Switching Control Function (OPS)

OPS can easily control Brushless DC motor using Output Phase Switching Control Register (OPSCR).
OPS uses S/W setting value (OPSCR.UF, VF, WF bits) or external signals detected by the Hall element as input signals.
OPS outputs either level signals or chopped signals by GPTW0's PWM as the 6-phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) signals to control motor.
Figure 24.181 shows the block diagram of OPS.
The GPT_UVWEDGE signal is output signal to ELC generated by detecting the edge of input signal.

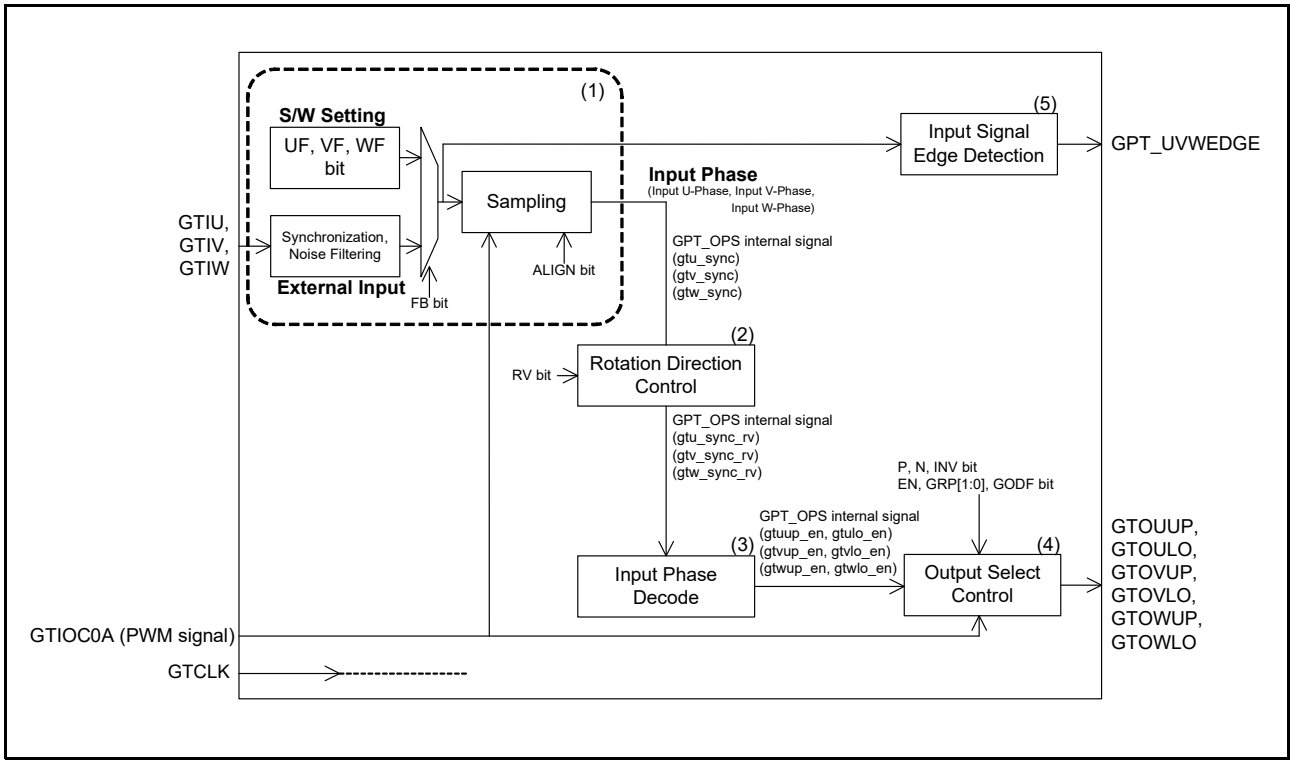

Figure 24.181 OPS Block Diagram

Figure 24.182 and Figure 24.183 show examples of OPS level output operation.

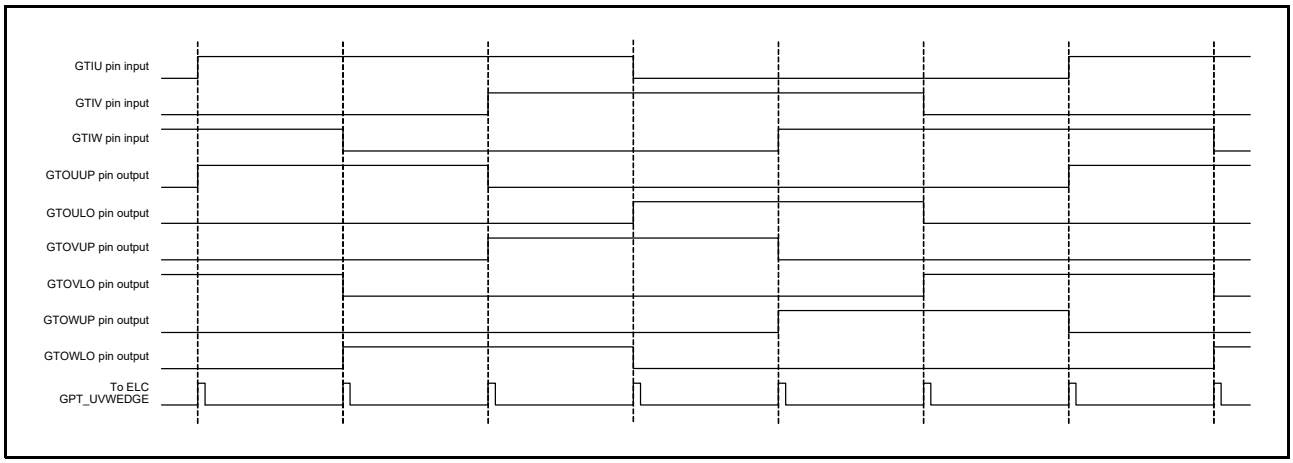

Figure 24.182 Example of OPS Level Output Operation (Forward Rotation) (FB = 0, RV = 0, P = 0, N = 0, INV = 0)

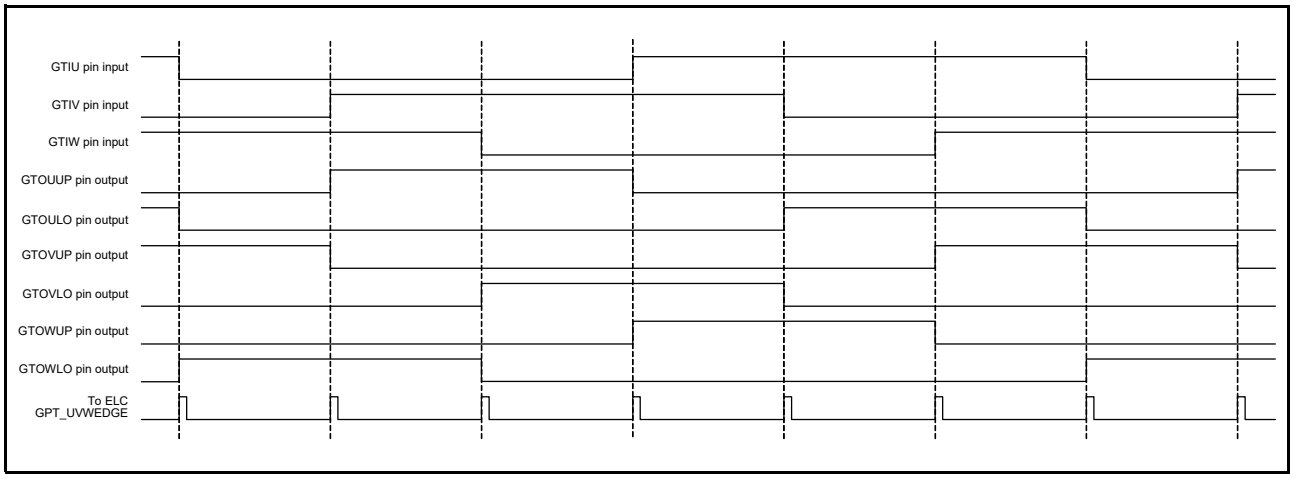

Figure 24.183 Example of OPS Level Output Operation (Reverse Rotation) (FB = 0, RV = 1, P = 0, N = 0, INV = 0)

Figure 24.184 and Figure 24.185 show examples of OPS chopped output operation.

Figure 24.186 shows an example of OPS output disable control operation.

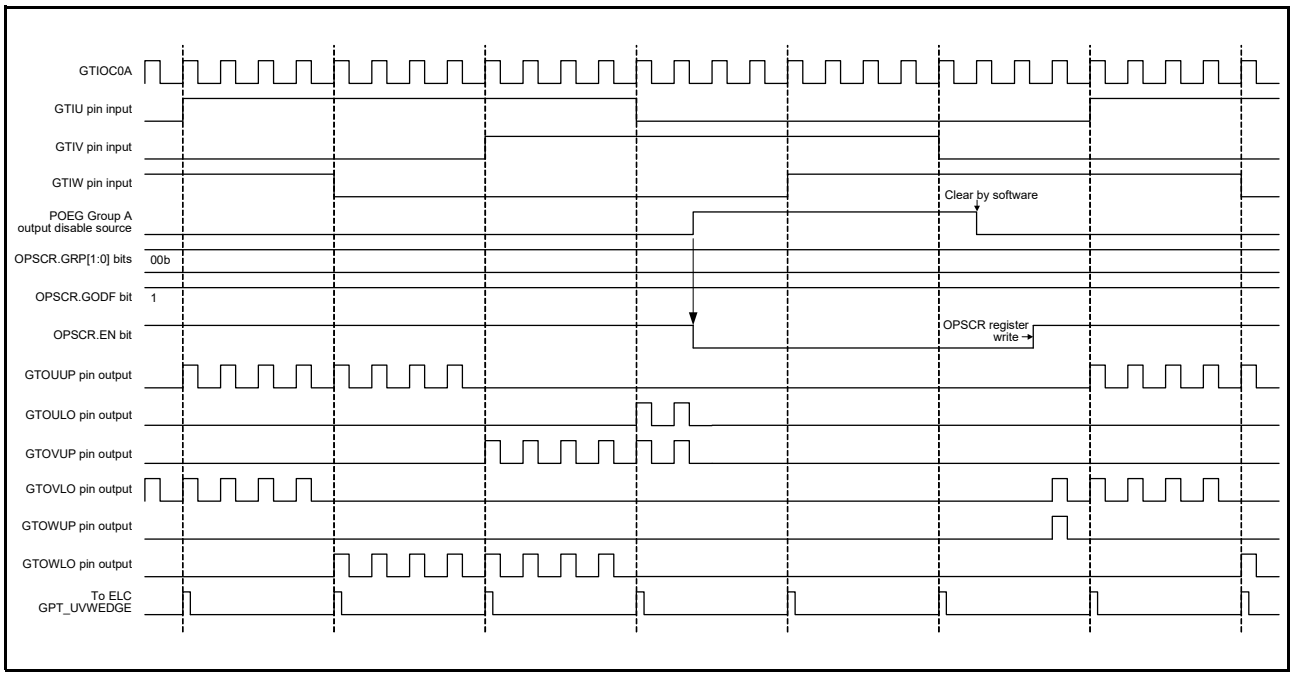

Figure 24.186 Example of OPS Output Disable Control Operation (FB = 0, RV = 0, P = 1, N = 1, INV = 0)

24.3.14.1 Input Selection and Sampling

The FB bit selects either the software setting value or external input for the input signal.
When the FB bit is 0, the GTIU, GTIV, GTIW external input are selected for the input signal to OPS after synchronization with the GPTW count reference clock (GTCLK) and noise filtering.
When the FB bit is 1, the software setting value (UF, VF, WF bits) are selected for the input signal to OPS.
The selected input signals are sampled by the method selected by the ALIGN bit, and they are treated as input phase of OPS.
When the ALIGN bit is 0, the input signals are sampled by GTCLK.
When the ALIGN bit is 1, the input signals are sampled by the falling edge of GTIOC0A pin output.
The signals after sampling can be read by the U, V, W bits.
Table 24.35 shows the input selection by the FB bit and sampling method by the ALIGN bit.

Table 24.35 Input Selection and Sampling Method

OPSCR Register		Input Selection Sampling Method	Interrupt Phase (OPS internal signal)
FB bit	ALIGN bit		
0	0	GTIU, GTIV, GTIW external input GTCLK sampling	Input U-phase (gtu_sync) Input V-phase (gtv_sync) Input W-phase (gtw_sync)
	1	GTIU, GTIV, GTIW external input GTIOC0A falling edge sampling	
1	0	Software setting value UF, VF, WF bit GTCLK sampling	
	1	Software setting value UF, VF, WF bit GTIOC0A falling edge sampling	

24.3.14.2 Rotation Direction Control

When the rotation direction is reverse (RV = 1), the input phase is inverted.

24.3.14.3 Input Phase Decode

The 6-phase signals by decoding input phase after rotation direction control are generated.
Table 24.36 and Table 24.37 show the decode tables of input phase to rotate motor in forward (RV = 0) and reverse (RV = 1).

Table 24.36 The Decode Table of Input Phase (Forward Rotation)

Input Phase			Input Phase after Rotation Direction Control			6-Phase Signals					
U-phase	V-phase	W-phase	U-phase	V-phase	W-phase	Positive U-phase	Negative U-phase	Positive V-phase	Negative V-phase	Positive W-phase	Negative W-phase
gtu_sync	**gtv_sync**	**gtw_sync**	**gtu_sync_rv**	**gtv_sync_rv**	**gtw_sync_rv**	**gtuup_en**	**gtulo_en**	**gtvup_en**	**gtvlo_en**	**gtwup_en**	**gtwlo_en**

0	1	0	1	0	1	1	0	0	1	0	0
0	1	1	1	0	0	1	0	0	0	0	1
0	0	1	1	1	0	0	0	1	0	0	1
0	0	0	0	0	0	0	0	0	0	0	0
1	1	1	1	1	1	0	0	0	0	0	0

24.3.14.4 Output Selection Control

The EN, P, N, INV bits select the output wave.
The EN bit enables output of the 6-phase output. When the EN bit is 1, output of the 6-phase output is enabled. When the EN bit is 0, the external pin output is Hi-Z.
The P, N bits select whether chopping positive and negative phase are performed or not. When P, N bits are 1, chopping is performed by GTIOC0A pin output.
When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.
The INV bit selects the polarity (either positive logic or negative logic) of phase output.
Table 24.38 and Table 24.39 show the output selection control method for positive and negative phase output.

Table 24.38 Output Selection Control Method (Positive Phase)

EN bit	P bit	INV bit	GTOnUP
0	—	—	0 (External pin output Hi-z)
1	0	0	Positive logic level output (gtmup_en)
1	0	1	Negative logic level output (~gtmup_en)
1	1	0	Positive logic chopped output (GTIOC0A & gtmup_en)
1	1	1	Negative logic chopped output (~(GTIOC0A & gtmup_en))

n = U, V, W
m = u, v, w

Table 24.39 Output Selection Control Method (Negative Phase)

EN bit	P bit	INV bit	GTOnLO
0	—	—	0 (External pin output Hi-z)
1	0	0	Positive logic level output (gtmlo_en)
1	0	1	Negative logic level output (~gtmlo_en)
1	1	0	Positive logic chopped output (GTIOC0A & gtmlo_en)
1	1	1	Negative logic chopped output (~(GTIOC0A & gtmlo_en))

n = U, V, W
m = u, v, w

24.3.14.5 Output Selection Control (Group Output Disable Function)

When the GODF bit is 1 and signal value selected by the GRP[1:0] bits is High (Output Disable Request), OPS's output pins are changed to Hi-Z asynchronously and the OPSCR.EN bit is cleared by the output disable request signal synchronized with GTCLK.
For the return, after clearing the Output Disable Request by software, set the EN bit to 1.
The timing of EN bit cleared is 3 GTCLK cycles after generating the output disable request. In order to perform the output disable control surely, the output disable request flag in POEG should be cleared in the timing that terminating the output disable request is at least 4 GTCLK cycles after generating the output disable request.
The example of the operation of the group output disable control, see the above-mentioned Figure 24.186.

24.3.14.6 Event Link Controller (ELC) Output

The logical sum of the pulse detected by rising and falling edge of U, V, W phase input is output to the event link controller (ELC). When the high level period of input phase is short, there are cases that the detected edge is not transmitted to the ELC correctly because of the logical sum.

24.3.14.7 OPS Start Operation Setting Flow

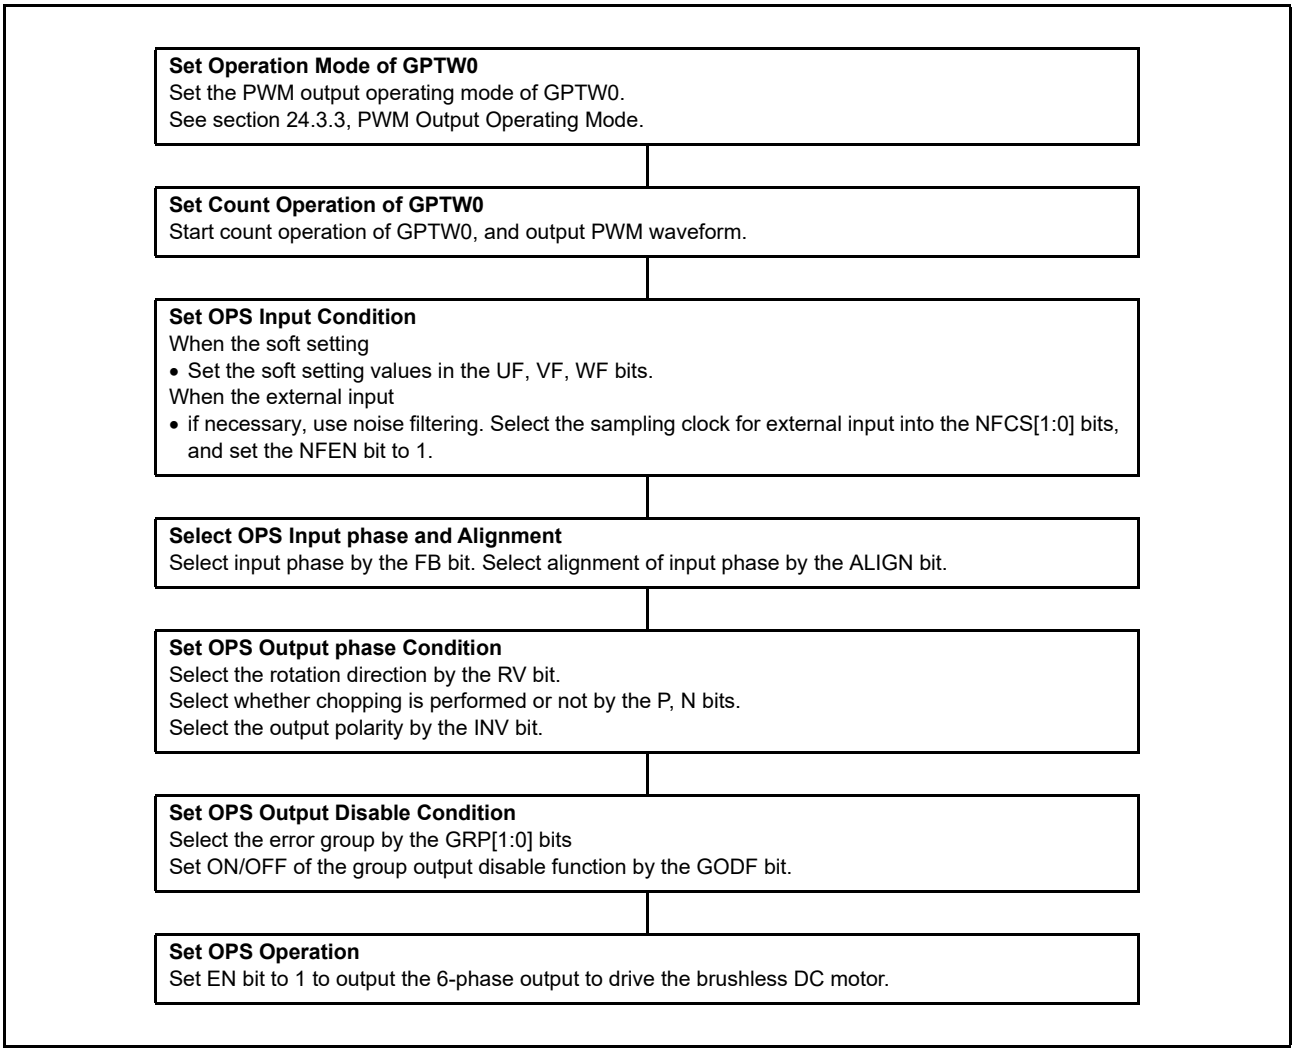

Figure 24.187 Example for Setting OPS Start Operation

24.3.15 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

Figure 24.188 shows the block diagram of inter channel logical operation.

To prevent hazard to the this function output, the signal after logical operation is latched with GTCLK. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 GTCLK is selected, the output enable signal is also delayed with 1 GTCLK and input to the output disable control. The execution of a logical operation does not delay the interrupts, A/D conversion start requests, and event signal output to the ELC.

When the same signal (C = A or D = B) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

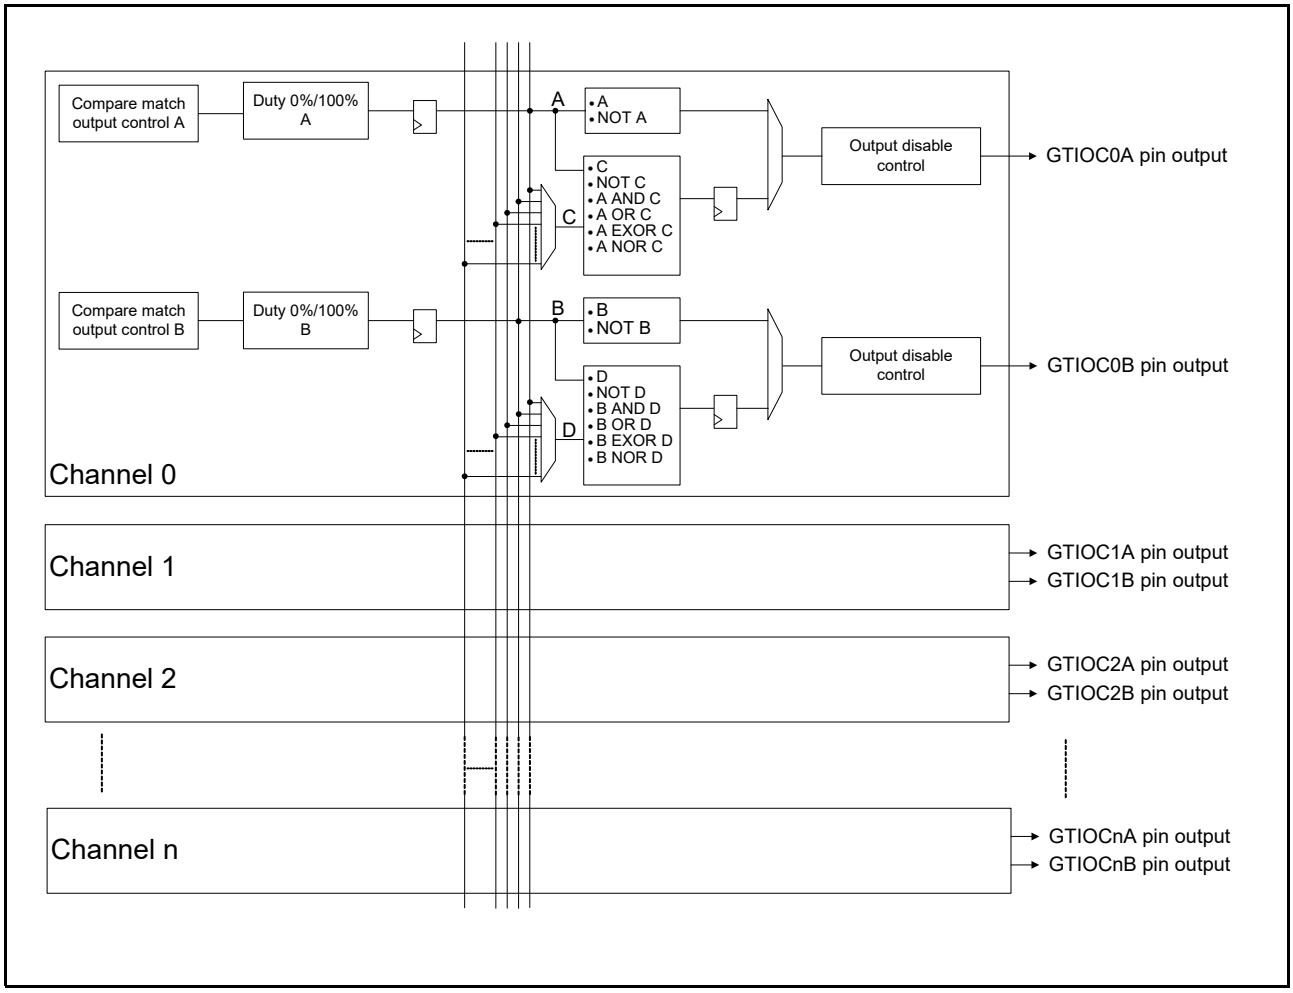

Figure 24.188 Block Diagram of Inter Channel Logical Operation

Figure 24.189 shows an example of inter channel logical operation.

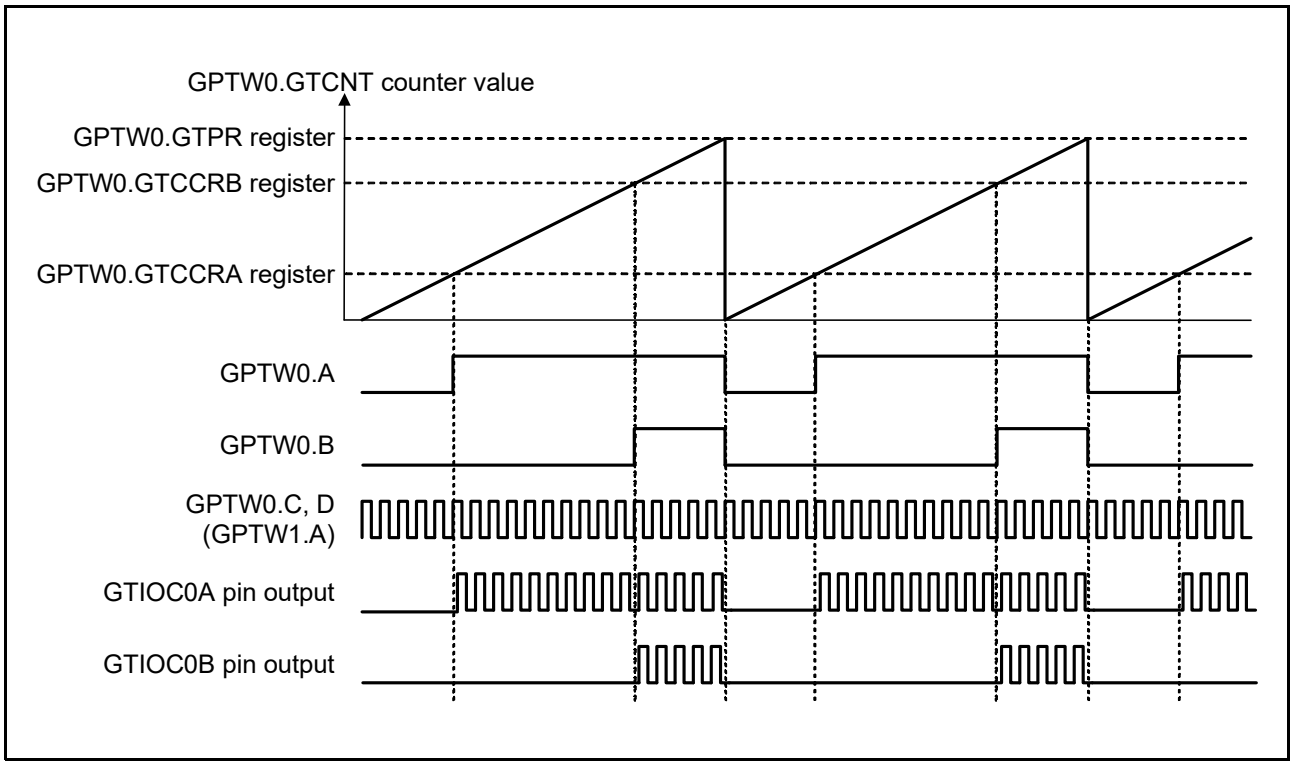

Figure 24.189 Example of Inter Channel Logical Operation (When GPTW0.GTICLF.ICLFA[2:0] = 100b, ICLFB[2:0] = 100b, GPTW0.GTICLF.ICLFSELC[5:0] = 000010b, ICLFSELD[5:0] = 000010b)

24.3.16 GTIOCnA/GTIOCnB Input/Output Pin Polarity Reversal Function

The polarity of the GTIOCnA, GTIOCnB input pins and the GTIOCnA, GTIOCnB output pins can be inverted according to the polarity of the external device.

When the GTCR.AINV bit is 1, the input and output of GTIOCnA are inverted. When the GTCR.BINV bit is 1, the input and output of GTIOCnB are inverted.

The input and output of GTIOCnA and GTIOCnB are inverted immediately after input and at the final output stage, respectively. Configure the settings considering that the external input and output signals are inverted, especially when GTIOCnA and GTIOCnB are used as factors for count start/stop/clear, count-down/count-up, or input capture, or when low/high/toggle output is used as PWM output.

Set GTCR.AINV and BINV after setting the GTIOCnm pin functions during initial settings.

24.3.17 Timer-Linked Synchronization Signal Output Function

The pulse signal (timer-linked synchronization signal) GTSYNC0A can be output to synchronize the A/D converter (ADC16H) and the timer operation of the GPTW upon compare match of the GTCNT counter value and the GTCCRA register value.
It is also possible to output a pulse signal (timer-internal synchronization signal) GTSYNCIN0 for synchronous operation between channels in the GPTW when an overflow (during up-count operation) occurs in sawtooth-wave PWM mode 1.
The SYSG[1:0] bits of the GTSYNCSCR register can be used to select whether to enable or disable output of the timer-linked synchronization signal and the timer-internal synchronization signal.
When GTSYNCSCR.SYSG[1:0] is 01b, the timer-linked synchronization signal pulse is output in response to a compare match with GTCCRA register, and the timer-internal synchronization signal pulse is output when an overflow (during counting up) occurs in sawtooth-wave PWM mode 1.
The SYST bit of the GTSYNCFCR register can be used to select the channel to be synchronized with the timer-internal synchronization signal for the count start/stop/clear operations.
Refer to section 60, 16-Bit A/D Converter (ADC16H) for the control method for synchronously operating ADC16H using the timer-linked synchronization signal.
Set the sawtooth wave PWM mode 1 for the channel that outputs the timer-linked synchronization signal and the timer-internal synchronization signal.
Set the GTSYNCFCR and GTSYNCSCR register before starting the count during initial setting.
Set the GTPR values of the synchronization control channel and synchronization target channel according to the synchronization period cycle of ADC16H to be synchronized with the timer of GPTW.
Set the GTPR value of the synchronization control channel to the same count cycle as the synchronization period of ADC16H. Setting the GTPR value of the synchronization control channel to 0 is prohibited.
Set the GTPR value of the synchronization target channel to a period that is an integral multiple of the GTPR value of the synchronization control channel. Figure 24.194 shows an example of the relationship between ADC16H, synchronization control channel, and synchronization target channel count cycles.
The specifications for the synchronization control channel are as follows.

- Only sawtooth PWM mode 1 is available.
- Only up-counting is possible for the counting direction.
- Synchronization control channel is prohibited from using a frequency-divided clock. Set the GTCR.TPCS[3:0] bits to 0000b.
- The GPTW's own frequency-divided clock is also synchronized with the timer-internal synchronization signal. If the synchronization control channel is stopped, the divided clock is resynchronized when the synchronization control channel is restarted.
- Start counting while all GPTW channels and ADC16H are stopped.
- Always operate the synchronization control channel while GPTW and ADC16H are operating.
- Always operate the synchronization control channel except when resetting.
- Stop the counter when changing the GTCCRA register value and the GTPR value of the synchronization control channel.
- Buffer setting is prohibited for synchronization control channel.
- Clear the counter when stop the synchronization control channel counter and start counting again.

The specifications for the synchronization target channel are as follows.

- Supports all PWM modes. (When using complementary PWM mode as a synchronization target, not only the master channel but also the slave channel must be set as a synchronization target.)
- Synchronization target channel can use divided clock.
- The count start/stop/clear is synchronized with the timer-internal synchronization signal.

- When performing synchronous clearing by inter channel cooperation, the GTSYNCFCR.SYST bit setting must match the opposite channel setting.

Figure 24.190 and Figure 24.191 show examples of synchronization control channel settings.

24.4 Interrupt Sources

24.4.1 Interrupt Sources and Priorities

There are four kinds of interrupt sources; GTCCRm register (m = A to F) input capture/compare match GTCNT counter overflow (GTPR register compare match)/underflow, cycle count finish, and dead time error.
Each interrupt source has its own status flag and control bit for generating interrupt request signals, where the generation of interrupt request signals can be enabled or disabled individually.
When an interrupt source condition is satisfied, the corresponding status flag in the GTST register is set to 1, and an interrupt request is generated if the corresponding interrupt request enable or disable bit in the GTINTAD register is 1.
The corresponding status flag in the GTST register can be cleared by writing to it. If a flag set and a flag clear occur simultaneously, clearing has priority over setting.
For details, refer to section 15, Interrupt Controller (ICUM). Table 24.40 shows a list of GPTW interrupt sources.

Table 24.40 GPTW Interrupt Sources (n = 0 to 15)

Channel	Name	Interrupt Source	Interrupt Flag
GPTWn	GTCIAn	GTCCRA register input capture/compare match	GPTWn.GTST.TCFA
	GTCIBn	GTCCRB register input capture/compare match	GPTWn.GTST.TCFB
	GTCICn	GTCCRC register compare match	GPTWn.GTST.TCFC
	GTCIDn	GTCCRD register compare match	GPTWn.GTST.TCFD
	GDTEn	Dead time error	GPTWn.GTST.DTEF
	GTCEIn	Cycle count end	GPTWn.GTST.PCF
	GTCIEn	GTCCRE register compare match	GPTWn.GTST.TCFE
	GTCIFn	GTCCRF register compare match	GPTWn.GTST.TCFF
	GTCIVn	GTCNT counter overflow (GTPR register compare match)	GPTWn.GTST.TCFPO
	GTCIUn	GTCNT counter underflow	GPTWn.GTST.TCFPU

(1) GTCIAn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTA bit is 1, an interrupt request is generated under the following conditions.

- When the GTCCRA register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the input-capture signal has caused transfer of the GTCNT counter value to the GTCCRA register. In complementary PWM mode, GTCCRA register does not function as an input capture register.

(2) GTCIBn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTB bit is 1, an interrupt request is generated under the following conditions.

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches the GTCCRB register.In complementary PWM mode, GTCCRB register does not function as a compare match register.
- When the GTCCRB register functions as an input capture register, the input-capture signal has caused transfer of the GTCNT counter value to the GTCCRB register. In complementary PWM mode, GTCCRB register does not function as an input capture register.

(3) GTCICn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTC bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRC register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRC register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] bits = 01b, 10b, 11b (buffer operation with the GTCCRC register)

(4) GTCIDn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTD bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRD register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRD register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] bits = 10b, 11b (buffer operation with the GTCCRD register)

(5) GTCIEn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTE bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRE register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] bits = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(6) GTCIFn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTF bit is 1, an interrupt request is generated under the following condition.

- When the GTCCRF register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches the GTCCRF register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] bits = 001b, GTCR.MD[3:0] bits = 0001b (sawtooth-wave one-shot pulse mode)
- GTCR.MD[2:0] bits = 110b, GTCR.MD[3:0] bits = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] bits = 10b, 11b (buffer operation with the GTCCRF register)

(7) GTCIVn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTPR[0] bit is 1, an interrupt request is generated under the following conditions.

- In sawtooth-wave mode, interrupt requests are enabled at overflows (the GTCNT counter value changes from the GTPR register value to 0 during up-counting).
- In sawtooth-wave PWM mode 1 and sawtooth-wave one-shot pulse mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from the GTPR register value to 0 during up-counting).
- In sawtooth-wave PWM mode 2, interrupt requests are enabled at overflows (the GTCNT counter value changes

from GTCCRm (m = A to F) register value selected with GTCSR.CSCMSC[2:0] bits to 0000 0000h) or the time when GTCNT counter value matches GTPR register value.

- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT counter value changes from the GTPR register value to the GTPR register value minus 1).
- In complementary PWM mode, interrupt requests are enabled at crests (the GTCNT counter value of master channel changes from the GTPR register value to the GTPR register value minus 1).
- In counting driven by a hardware source, including counting for the external pulse width measuring function, interrupt requests are enabled on overflows (that is, when the GTCNT counter value changes from the GTPR register value to 0 during up-counting).

(8) GTCIUn Interrupt (n = 0 to 15)

When the GTINTAD.GTINTPR[1] bit is 1, an interrupt request is generated under the following conditions.

- In sawtooth-wave mode, interrupt requests are enabled at underflows (the GTCNT counter value changes from 0 to the GTPR register value during down-counting).
- In sawtooth-wave PWM mode 1 and sawtooth-wave one-shot pulse mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from the GTPR register to 0 during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT counter value changes from 0 to 1).
- In complementary PWM mode, interrupt requests are enabled at troughs (the GTCNT counter value of master channel changes from 0 to 1).
- In count operation by a hardware source (include external pulse width measuring function), interrupt requests are enabled at underflows (the GTCNT counter value changes from 0 to the GTPR register value during down-counting).

(9) GDTEn Interrupt (n = 0 to 15)

When automatic dead time setting has been made, the GTST.DTEF flag becomes 1 when the timer output toggle point with dead time added exceeds the count period. If the GTINTAD.GRPDTE bit is 1 at this time, a dead time error interrupt request (GDTE) is generated.
In addition, when the timer output toggle point with dead time added is back within the count period, the GTST.DTEF flag changes from 1 to 0.

(10) GTCEIn Interrupt (n = 0 to 15)

When the GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1, and the end of the cycle is reached, if the GTINTAD.GTINTPC bit is 1, a cycle count end interrupt (GTCEI) request is generated.

Table 24.41 shows relationships between interrupt signals and interrupt enable bits.

Table 24.41 Relationship between Interrupt Signals and Interrupt Enable Bits (n = 0 to 15)

Interrupt Signal	Interrupt Enable Bit	Status Flag
GTCIAn	GTINTAD.GTINTA bit	GTST.TCFA Flag
GTCIBn	GTINTAD.GTINTB bit	GTST.TCFB Flag
GTCICn	GTINTAD.GTINTC bit	GTST.TCFC Flag
GTCIDn	GTINTAD.GTINTD bit	GTST.TCFD Flag
GDTEn	GTINTAD.GRPDTE	GTST.DTEF Flag
GTCEIn	GTINTAD.GTINTPC	GTST.PCF Flag
GTCIEn	GTINTAD.GTINTE bit	GTST.TCFE Flag
GTCIFn	GTINTAD.GTINTF bit	GTST.TCFF Flag
GTCIVn	GTINTAD.GTINTPR[1:0] bits	GTST.TCFPO Flag
GTCIUn		GTST.TCFPU Flag

24.4.2 DMAC/DTC Activation

The DMAC and DTC can be triggered by the interrupt request in each channel. For details, see section 15, Interrupt Controller (ICUM), section 18, DMA Controller (DMACAa), section 20, Data Transfer Controller (DTCA).

24.4.3 Interrupt and A/D Conversion Start Request Skipping Function

24.4.3.1 Interrupt Skipping Function by GTITC Register

By setting the GTITC register, the GTCNT counter overflow (GTPR register compare match) interrupt (GTCIV) and underflow interrupt (GTCIU) can be skipped. Other interrupts and A/D conversion start request signals can be skipped in coordination with the GTCIV/GTCIU skipping function. However, the dead time error interrupts cannot be linked with the GTCIV/GTCIU skipping function.

When the interrupt is skipped, the updating of relevant status flag is also skipped. The interrupt skipping is continued even if the status flag is set to 1.

The interrupt skipping function is related only to the GTITC register setting, and is not related to setting of the GTINTAD register interrupt enable bit. The interrupt enable bit is used only to control the output of the interrupt signal after thinning out.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GTCIV/GTCIU interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. Therefore, in order to count both troughs and crests and generate the GTCIV/GTCIU interrupts at troughs only or crests only in triangle-wave mode, the number of times of skipping should be even.

Similarly, in sawtooth-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GTCIV/GTCIU interrupt requests cannot be generated at overflows only or at underflows only. Therefore, in order to count both overflows and underflows with the count direction changed and generate the GTCIV/GTCIU interrupts at overflows only or underflows only in sawtooth-wave mode, the skipping state should be carefully checked before using.

When changing the skipping count, be sure to release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 24.195 to Figure 24.200 show examples of skipping function operation.

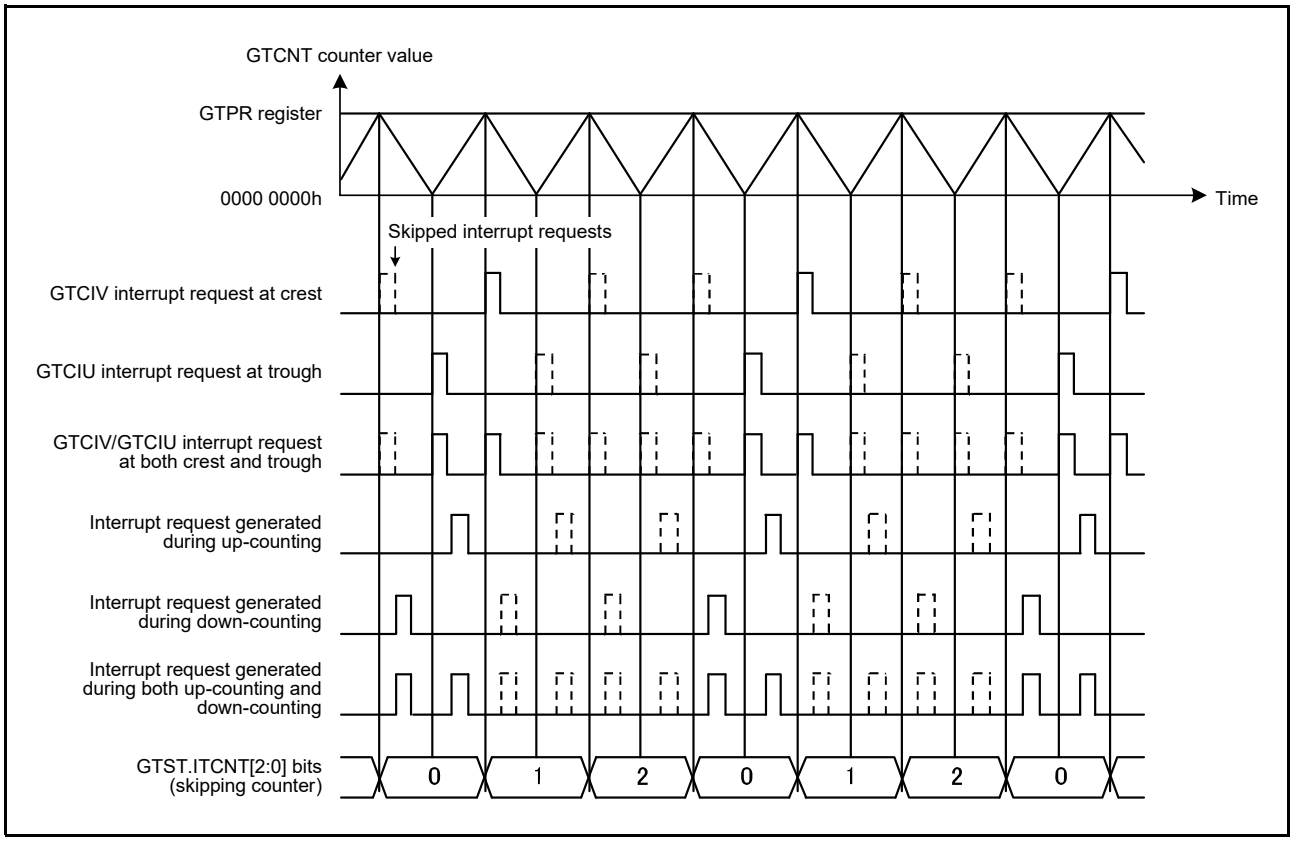

Figure 24.195 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Crests, Skipping Count: 2)

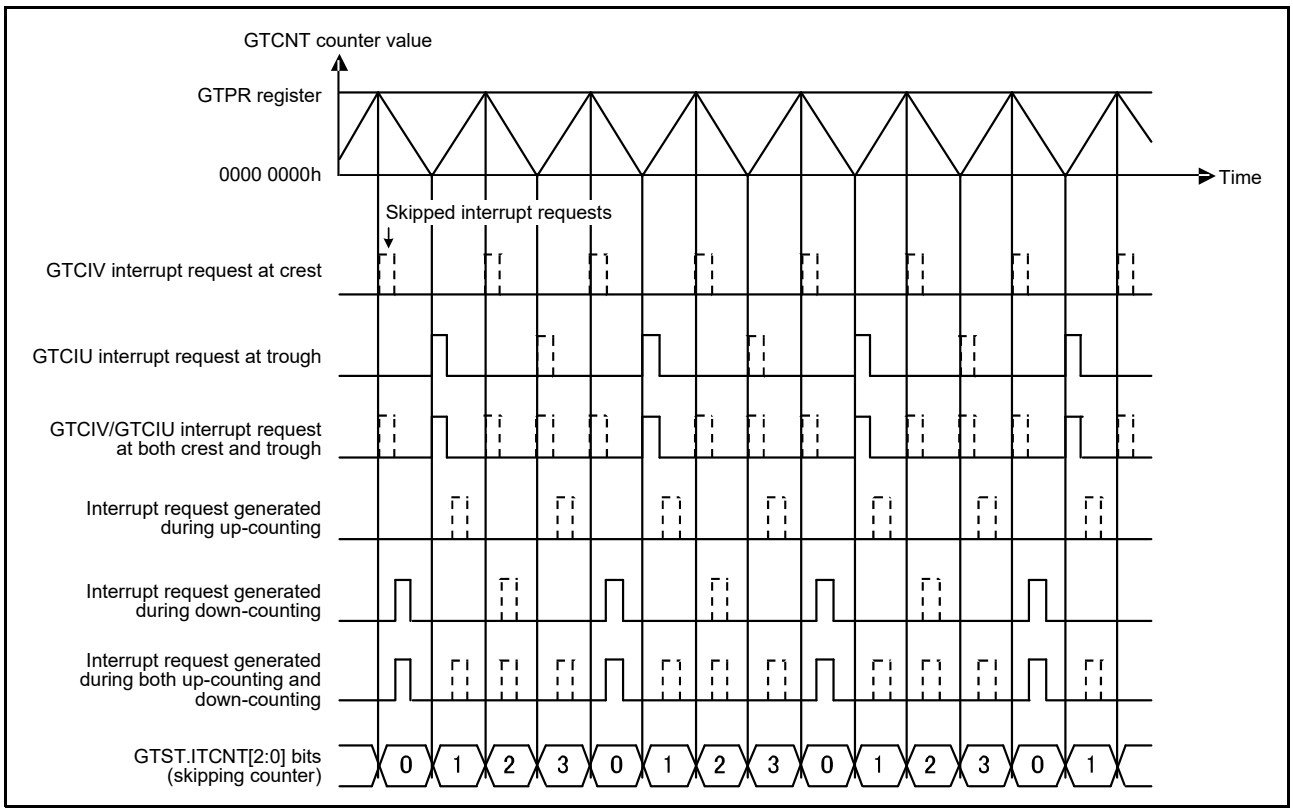

Figure 24.198 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Up-Counting)

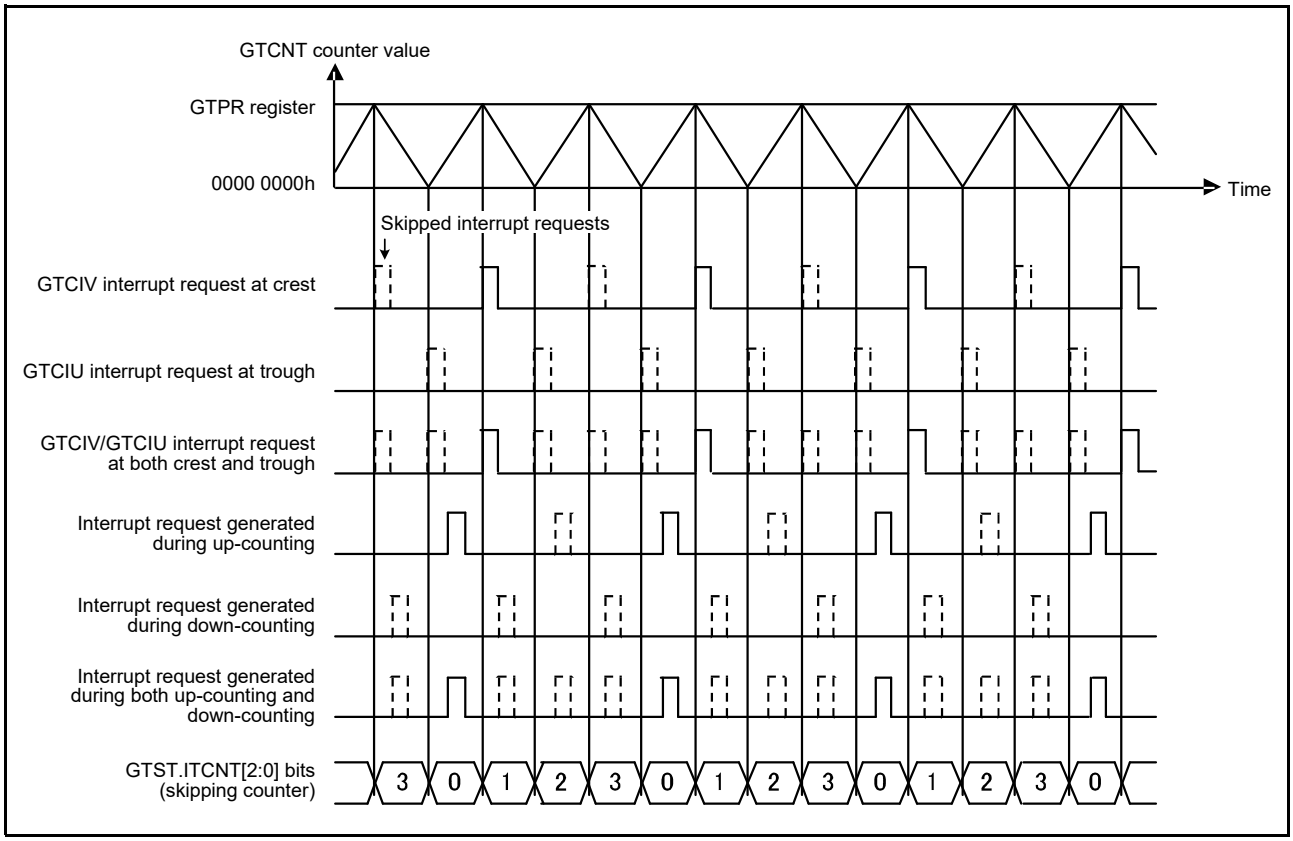

Figure 24.199 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Down-Counting)

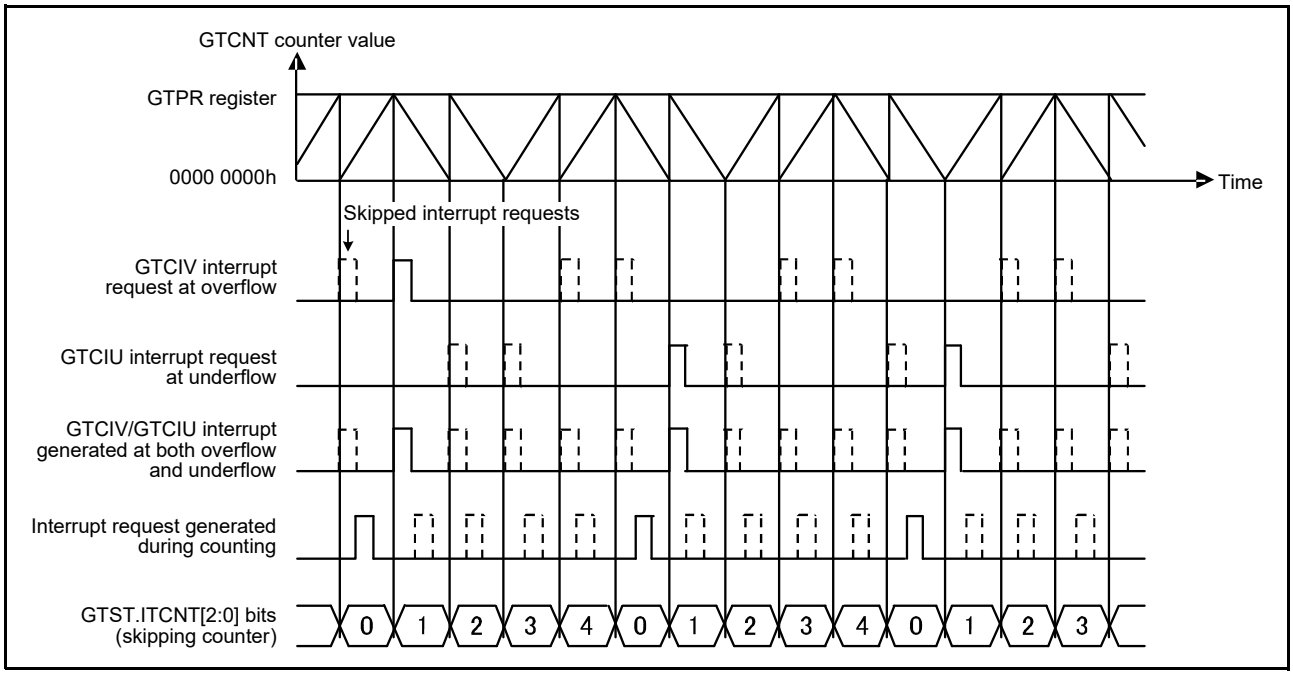

Figure 24.200 Example of Interrupt Skipping Function Operation (Sawtooth Waves, Operation with Count Direction Changed, Counting and Skipping Both Overflows and Underflows, Skipping Count: 4)

24.4.3.2 Extended Interrupt Skipping Function

Overflow/underflow interrupt, compare match/input capture interrupt, A/D conversion start request, and buffer transfer can be skipped by counting the GTCNT counter overflow or underflow based on settings of the GTEITC, GTEITLI1, GTEITLI2 and GTEITLB registers. The dead time error interrupt cannot be skipped.

The skipping enable setting and the skipping period can be individually configured using the GTEITLI1, GTEITLI2, and GTEITLB registers for overflow/underflow interrupt, compare match/input capture interrupt, A/D conversion start request, and buffer transfer.

The skipping period is configured based on the values of the two independent extended interrupt skipping counters (the EITCNT1[3:0] and EITCNT2[3:0] bits in the GTEITC registers). It can be specified during the period in which either skipping counter value is other than 0 or other than the skipping count. It can also be specified during the period in which both skipping counters are other than 0 or other than the skipping count.

Figure 24.201 shows the counter operation for interrupt skipping by the GTITC register and extended interrupt skipping.

The counter operation for extended interrupt skipping is set by the GTEITC register.

The EITCNT1[3:0] bits count the count source (in Figure 24.201, a crest is selected) selected by the extended interrupt counter 1 count source select bit (the EIVTC1[1:0] bits) from the initial value of 0. It returns to 0 when the counter reaches the skipping count (in Figure 24.201, count is 2) set by the extended interrupt skipping 1 skipping count setting bit (the EIVTT1[3:0] bits), and then repeats the counting operation.

The EITCNT2[3:0] bits can set the initial value, count the count source (in Figure 24.201, a trough is selected) selected by the extended interrupt counter 2 count source select bit (the EIVTC2[1:0] bits), and repeat the count operation which return to 0 when the skipping count (in Figure 24.201, count is 2) set by the EIVTT2[3:0] bits is achieved. The initial value is set when the GTEITC register is written by the access of upper 16 bits or 32 bits and when the written value to the EIVTC2[1:0] bits is other than 00b, while the setting for the extended interrupt skipping counter 2 is not in counting (the EIVTC2[1:0] bits are 00b).

When the initial value is set, the written value to the extended interrupt skipping counter 2 initial value bit (the EITCNT2IV[3:0] bits) is set as the initial value for the EITCNT2[3:0] bits.

The extended interrupt skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The interrupt skipping count counter (the GTST.ITCNT[2:0] bits) by the GTITC register is reset to 000b when the GTCNT counter operation is stopped: however, the EITCNT1[3:0] and EITCNT2[3:0] bits which are an extended interrupt skipping function retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped. When values for the EITCNT1[3:0] and EITCNT2[3:0] bits are to be reset (0000b), set the EIVTC1[1:0] and EIVTC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the EIVTC1[1:0] bits or the EIVTC2[1:0] bits to 00b).

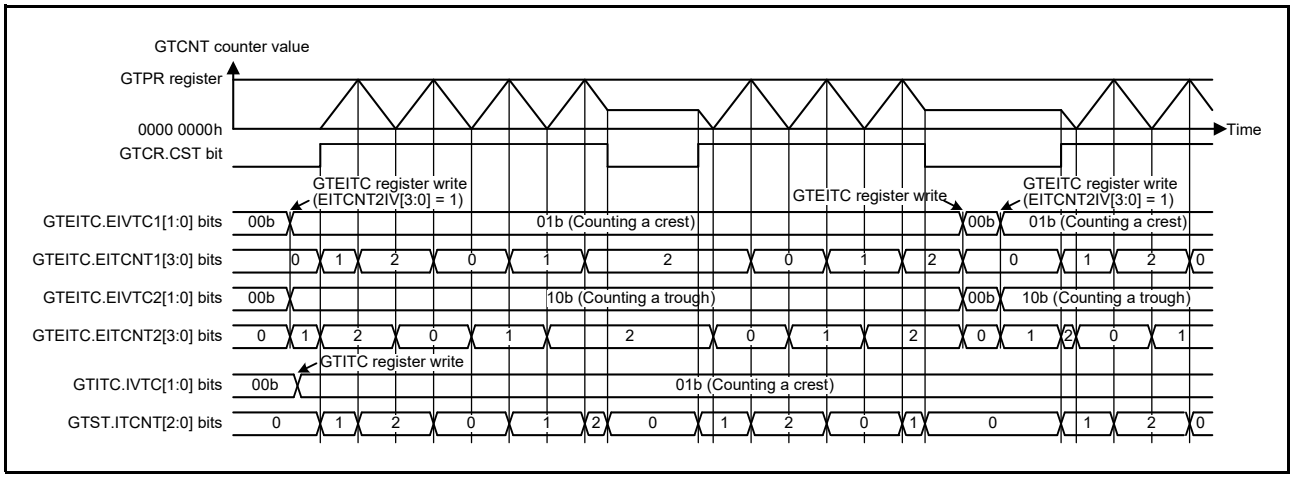

Figure 24.201 Counter Operation for Interrupt Skipping

Interrupt skipping by the GTEITLI1 register and A/D conversion start request skipping by the GTEITLI2 register can be performed simultaneously with interrupt skipping by the GTITC register or GTADCMSC register. A skipping period at this time is represented by ORed skipping periods of respective registers.
Figure 24.202 shows an example of simultaneous interrupt skipping operations by different registers.

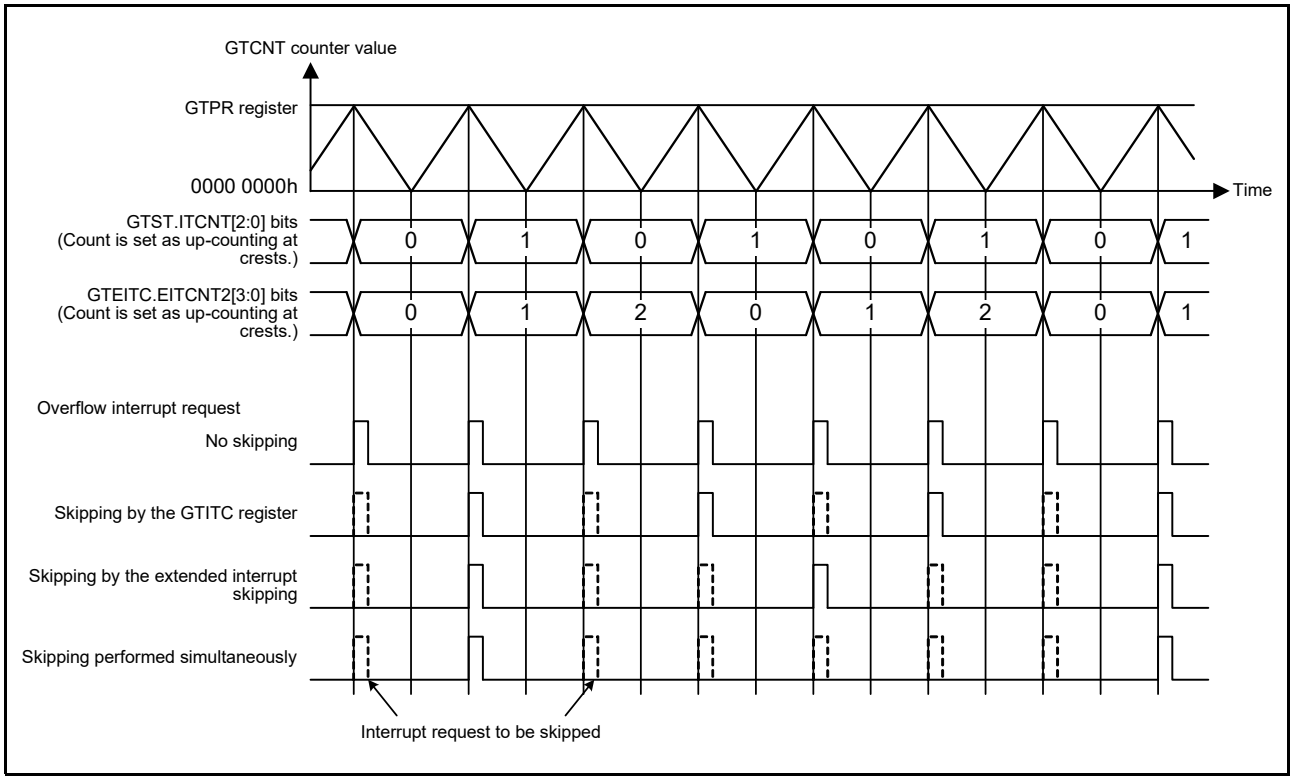

Figure 24.202 Example of Interrupt Skipping Operation (Skipping by the GTITC Register: Counting Crests, Extended Interrupt Skipping: EIVTC1[1:0] bits = 00b, EIVTC2[1:0] bits = 01b, EITLV[2:0] bits = 010b)

When the extended interrupt skipping selected by the GTEITLI1 register is performed, the relevant status flag is also skipped. The skipping function is continued even if the status flag is set to 1.
When an A/D conversion start request is skipped by the GTEITLI2 register, skipping of the corresponding status flag update and ELC event source outputs is controlled by the GTITC register and the extended interrupt skipping register, and the setting of A/D conversion start request enable bit in the GTINTAD register has no effect. The A/D conversion start request enable bit is used only for A/D conversion start request output (ELC event source output) after skipping.
Skipping of buffer transfer by the GTEITLB register applies to buffer operations enabled by the GTBER, GTDTCR, and GTBER2 registers, as well as all buffer operations performed by sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode (except for buffer transfer from GTCCRC, GTCCRE to GTCCRA).
Interrupt skipping and buffer transfer skipping operate independently. For a buffer transfer accompanied by an interrupt output, it is possible to output an interrupt without performing a buffer transfer, or to perform a buffer transfer without outputting an interrupt.
Figure 24.203 to Figure 24.210 show examples of skipping function operation.

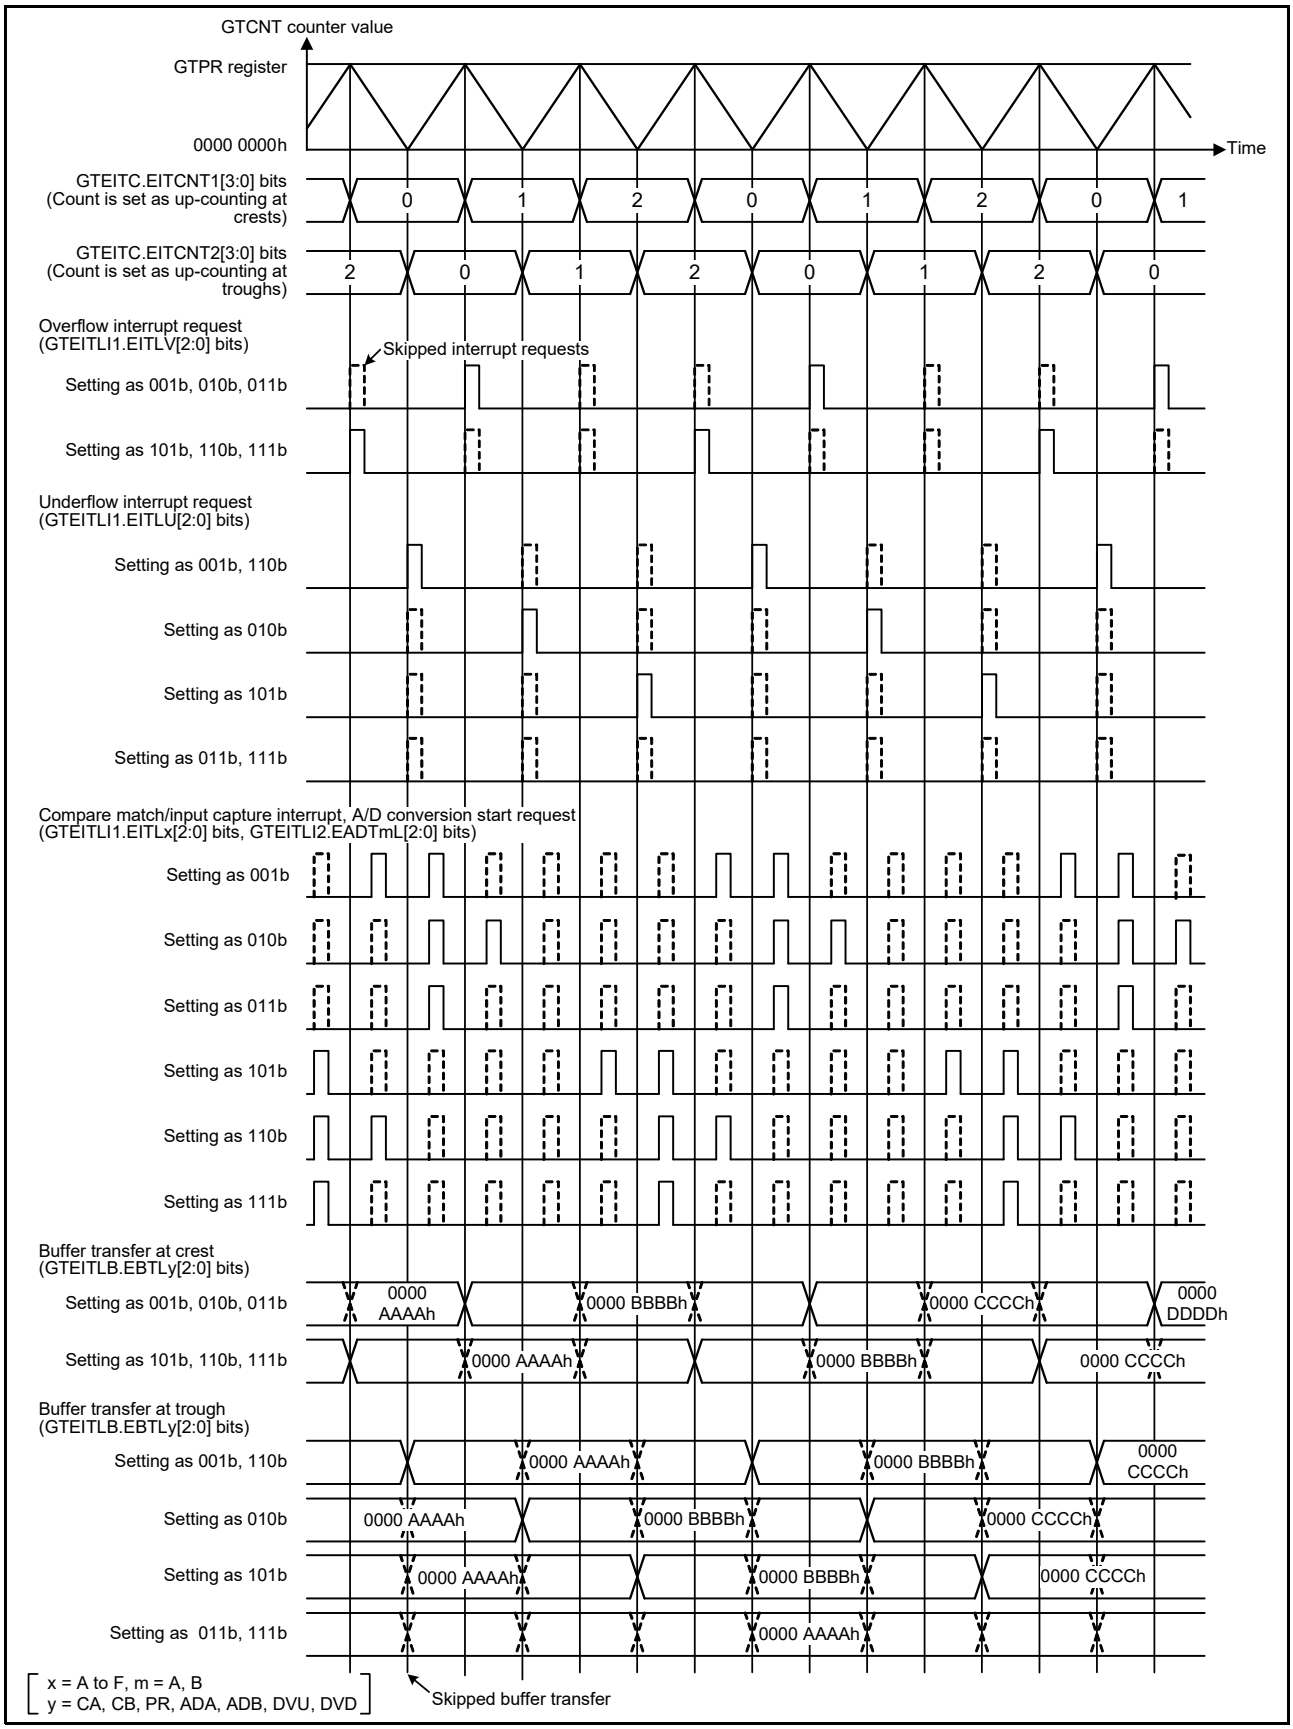

Figure 24.203 Example of Extended Interrupt Skipping Function (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Troughs, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0)

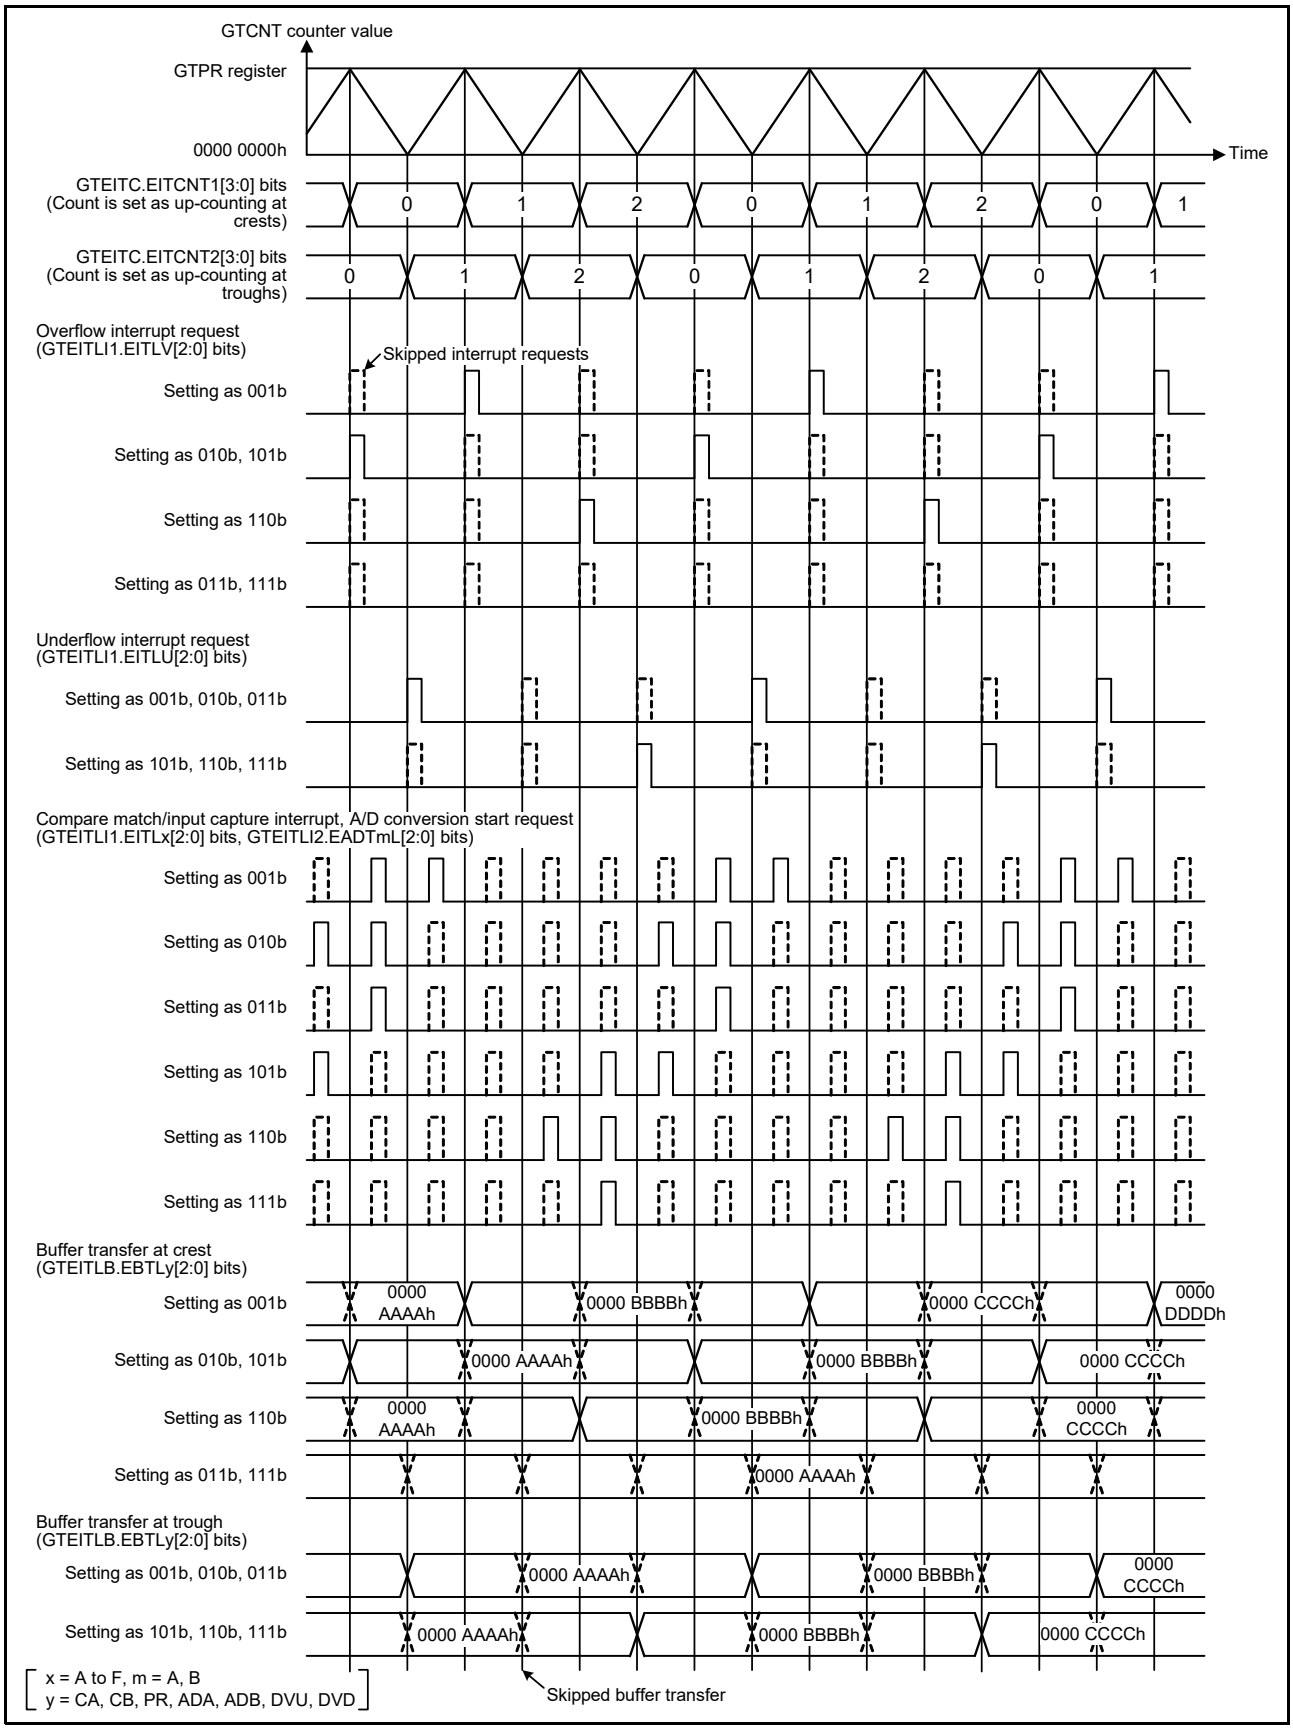

Figure 24.204 Example of Extended Interrupt Skipping Function (Triangle Waves, Count Crests by the Extended Interrupt Skipping 1 with Skipping Count: 2, Count Troughs by the Extended Interrupt Skipping 2 with Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 1)

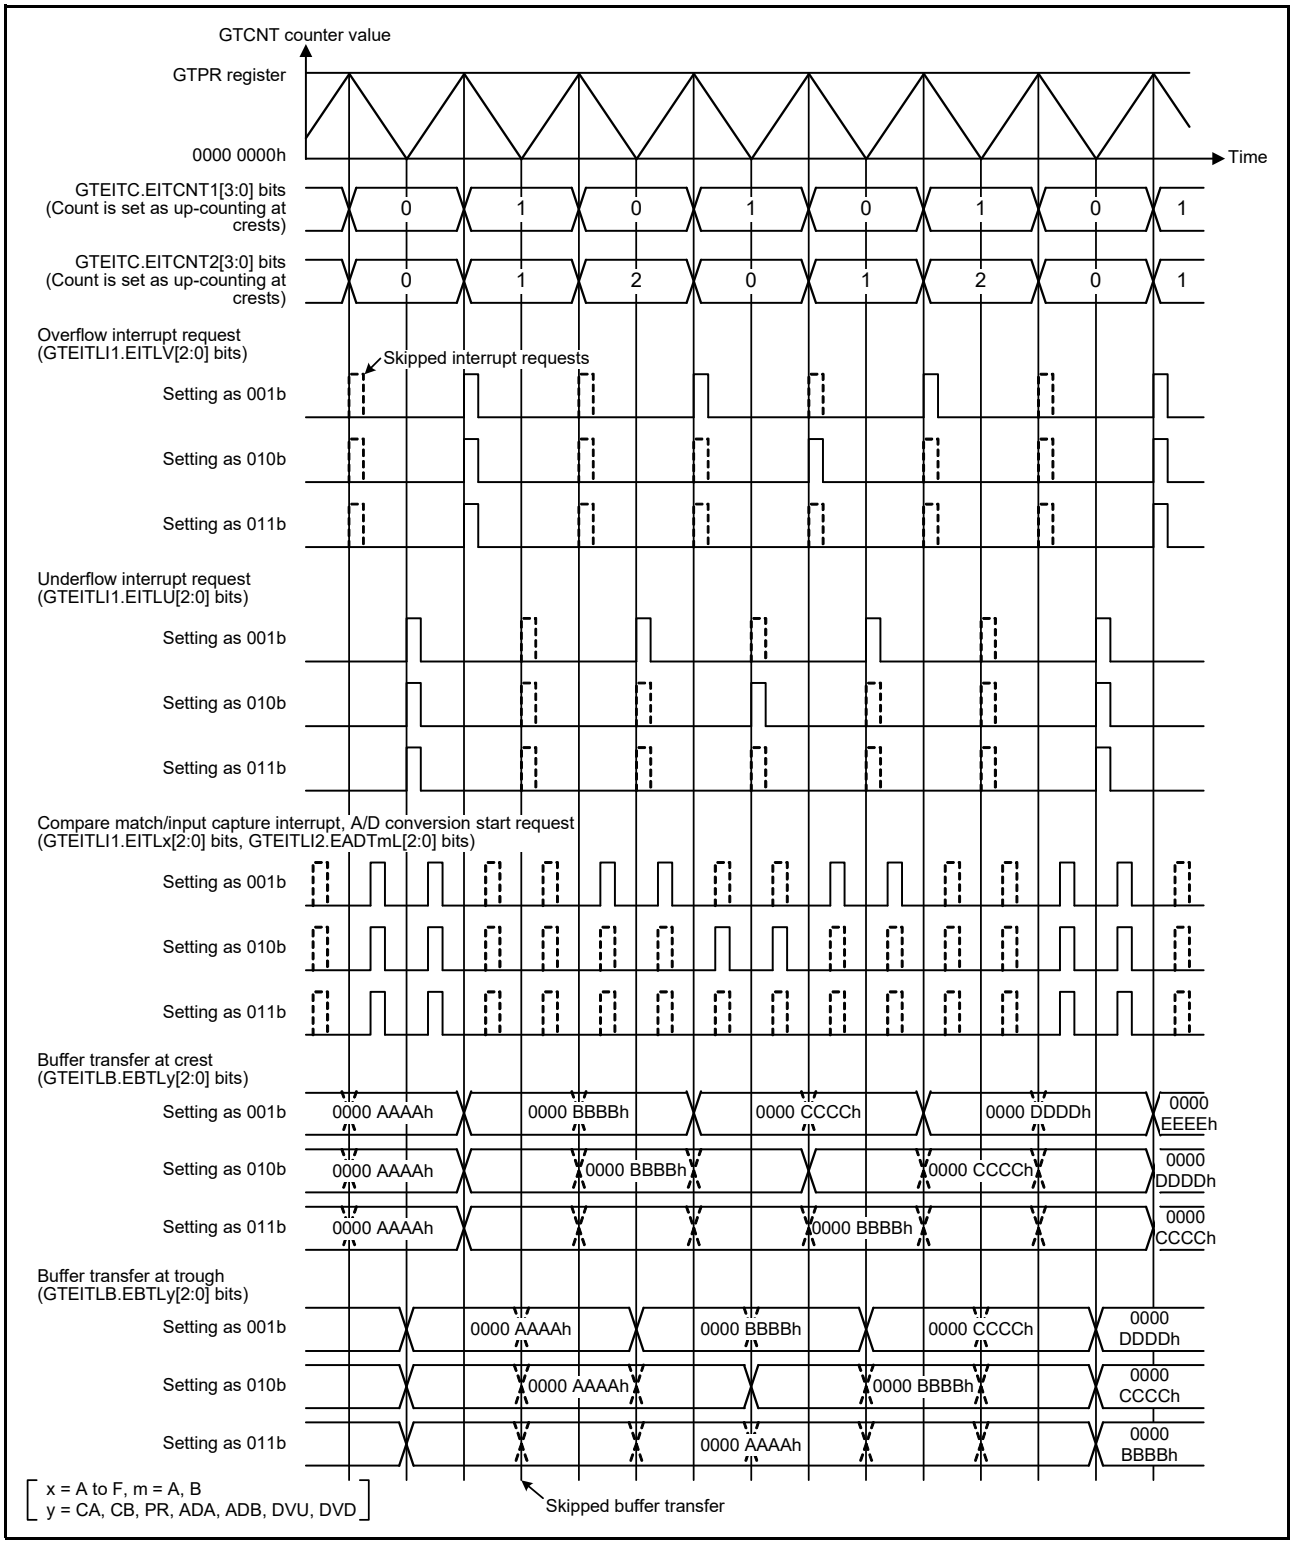

Figure 24.205 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 1, Counting Crests, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

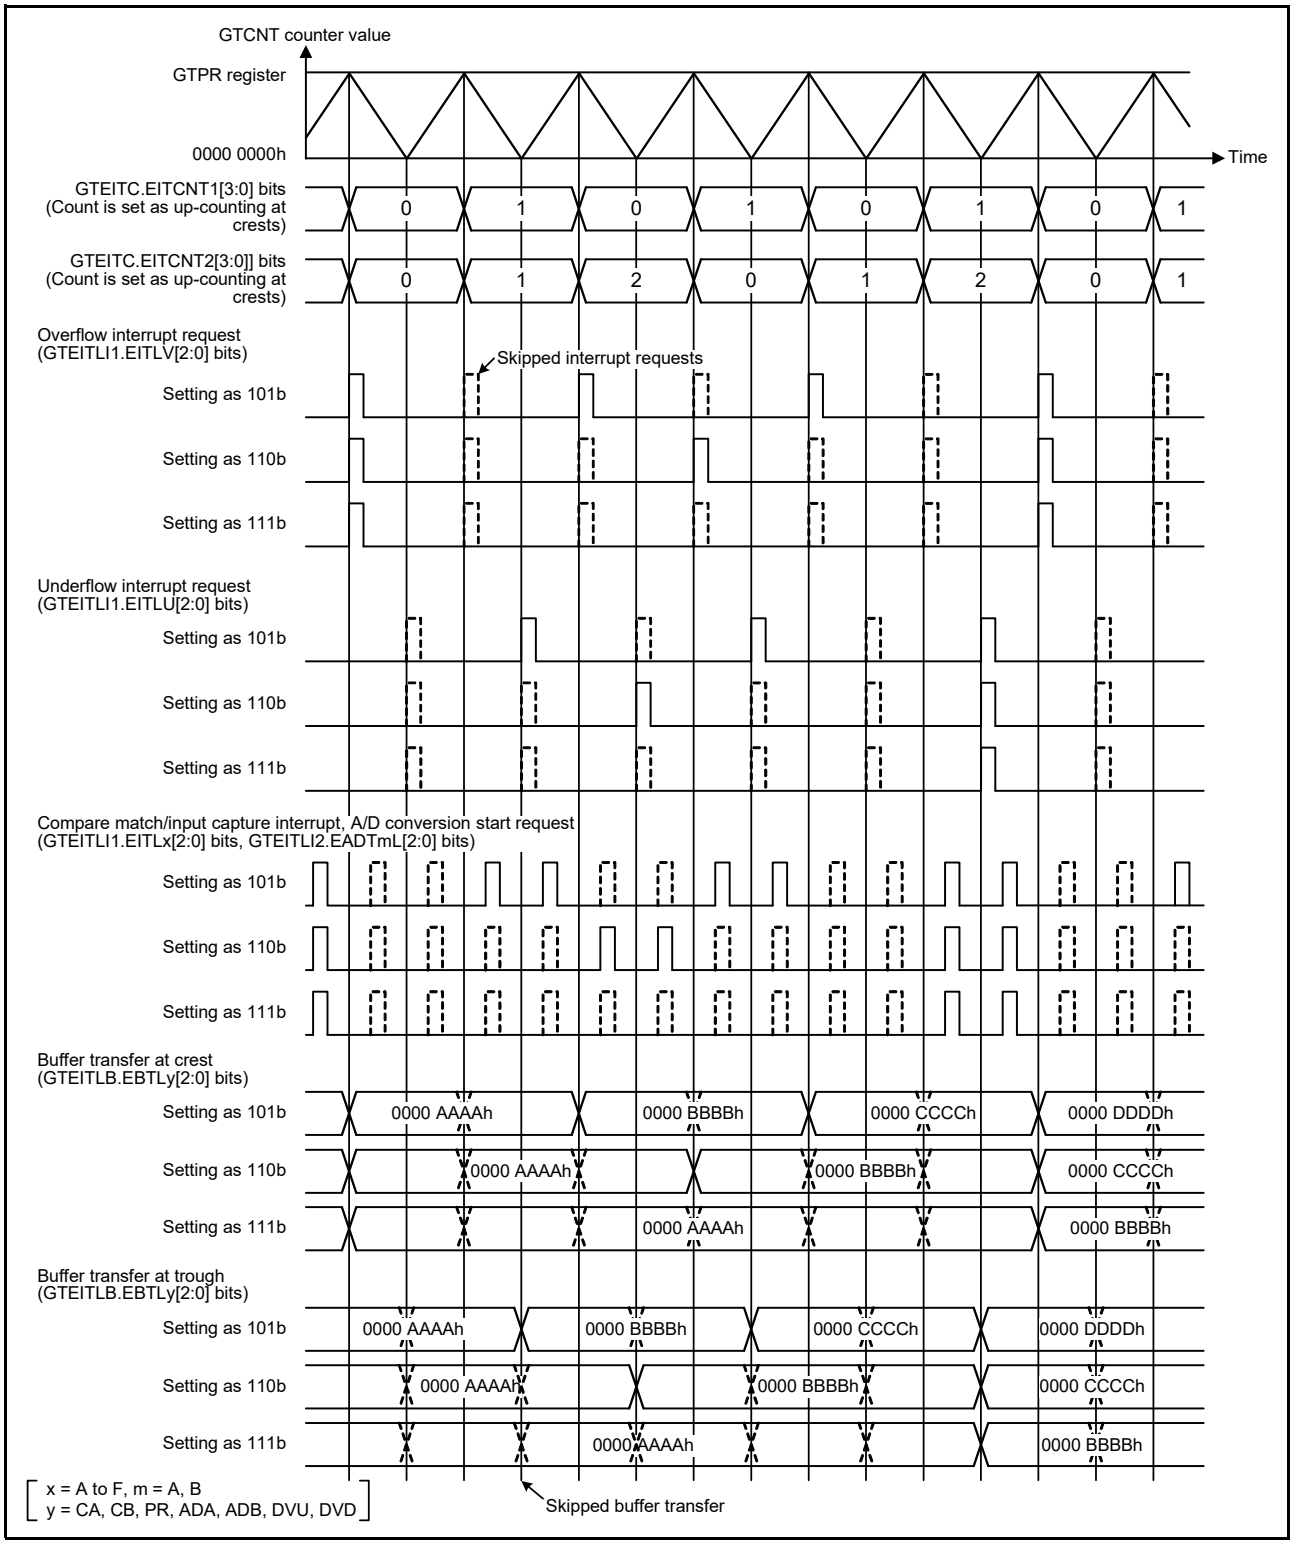

Figure 24.206 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 1, Counting Crests, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

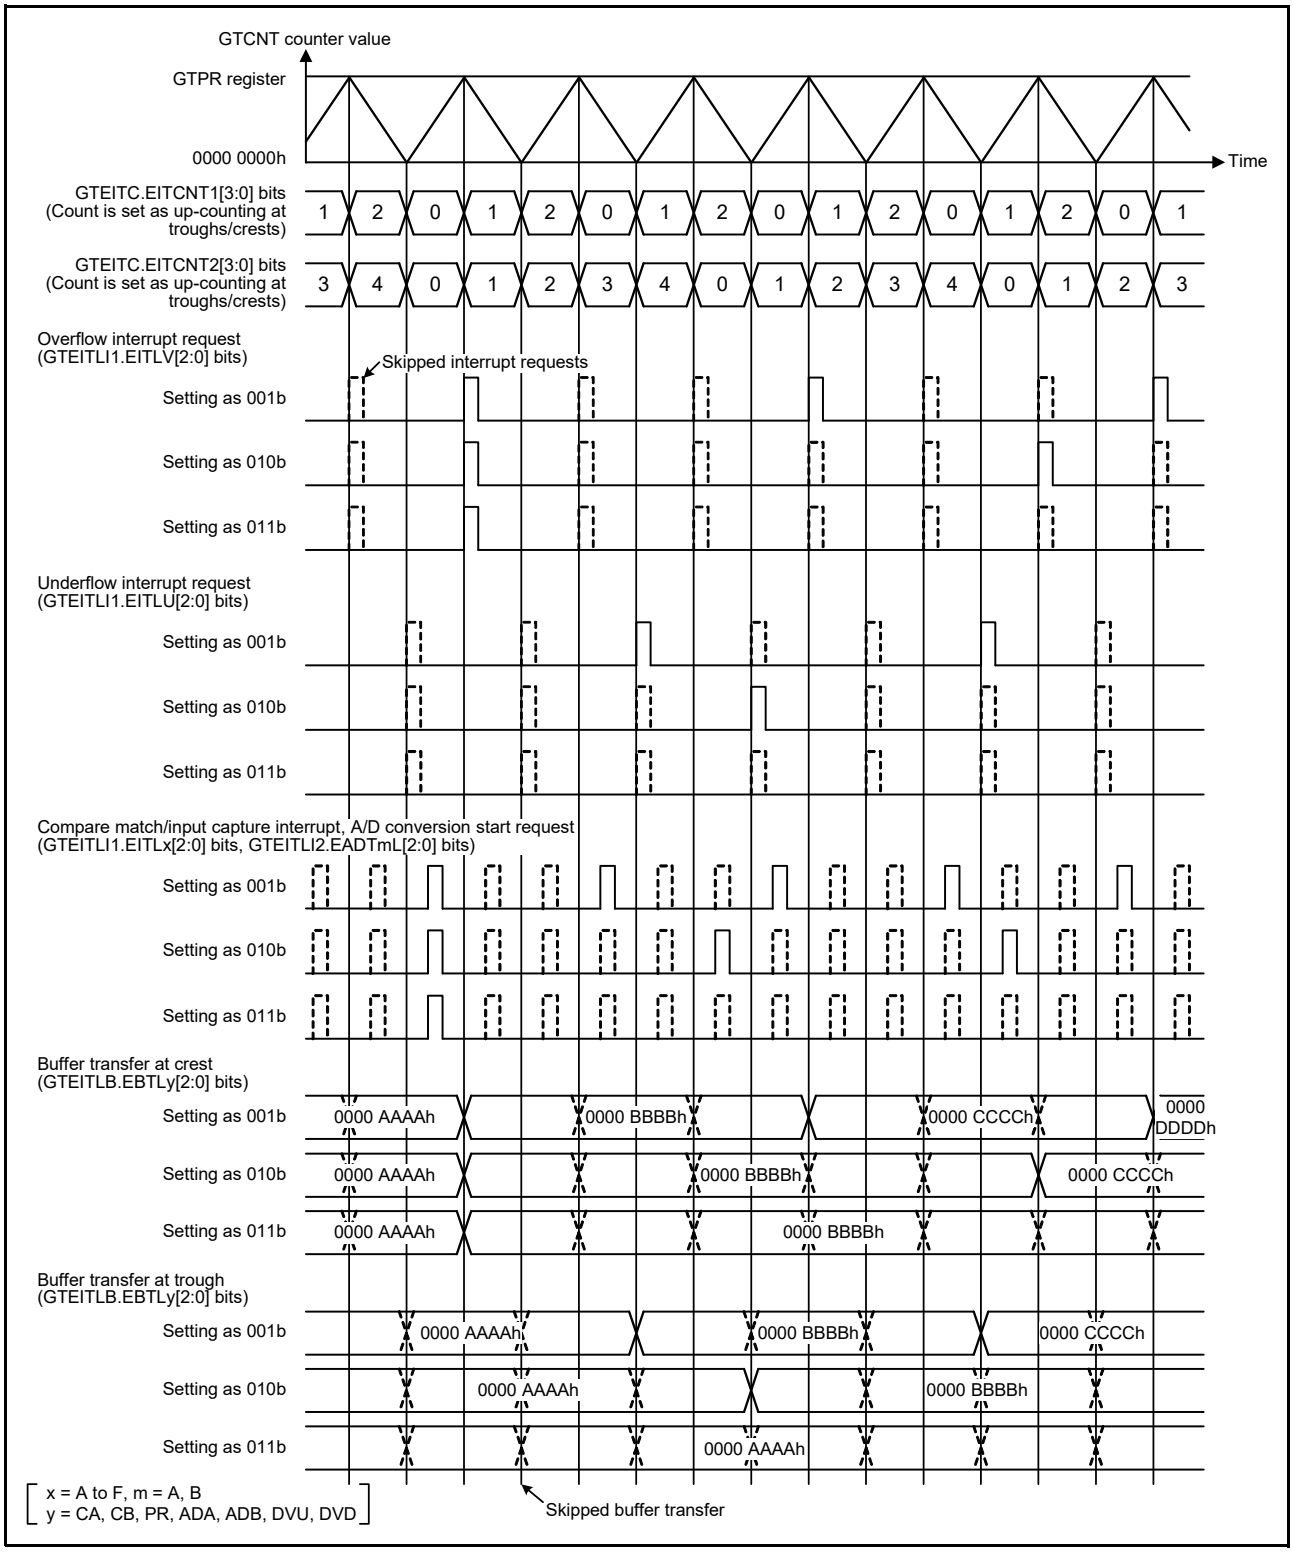

Figure 24.207 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting both Crests and Troughs, Extended Interrupt Skipping 1 Skipping Count: 2, Counting both Crests and Troughs, Extended Interrupt Skipping 2 Skipping Count: 4, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

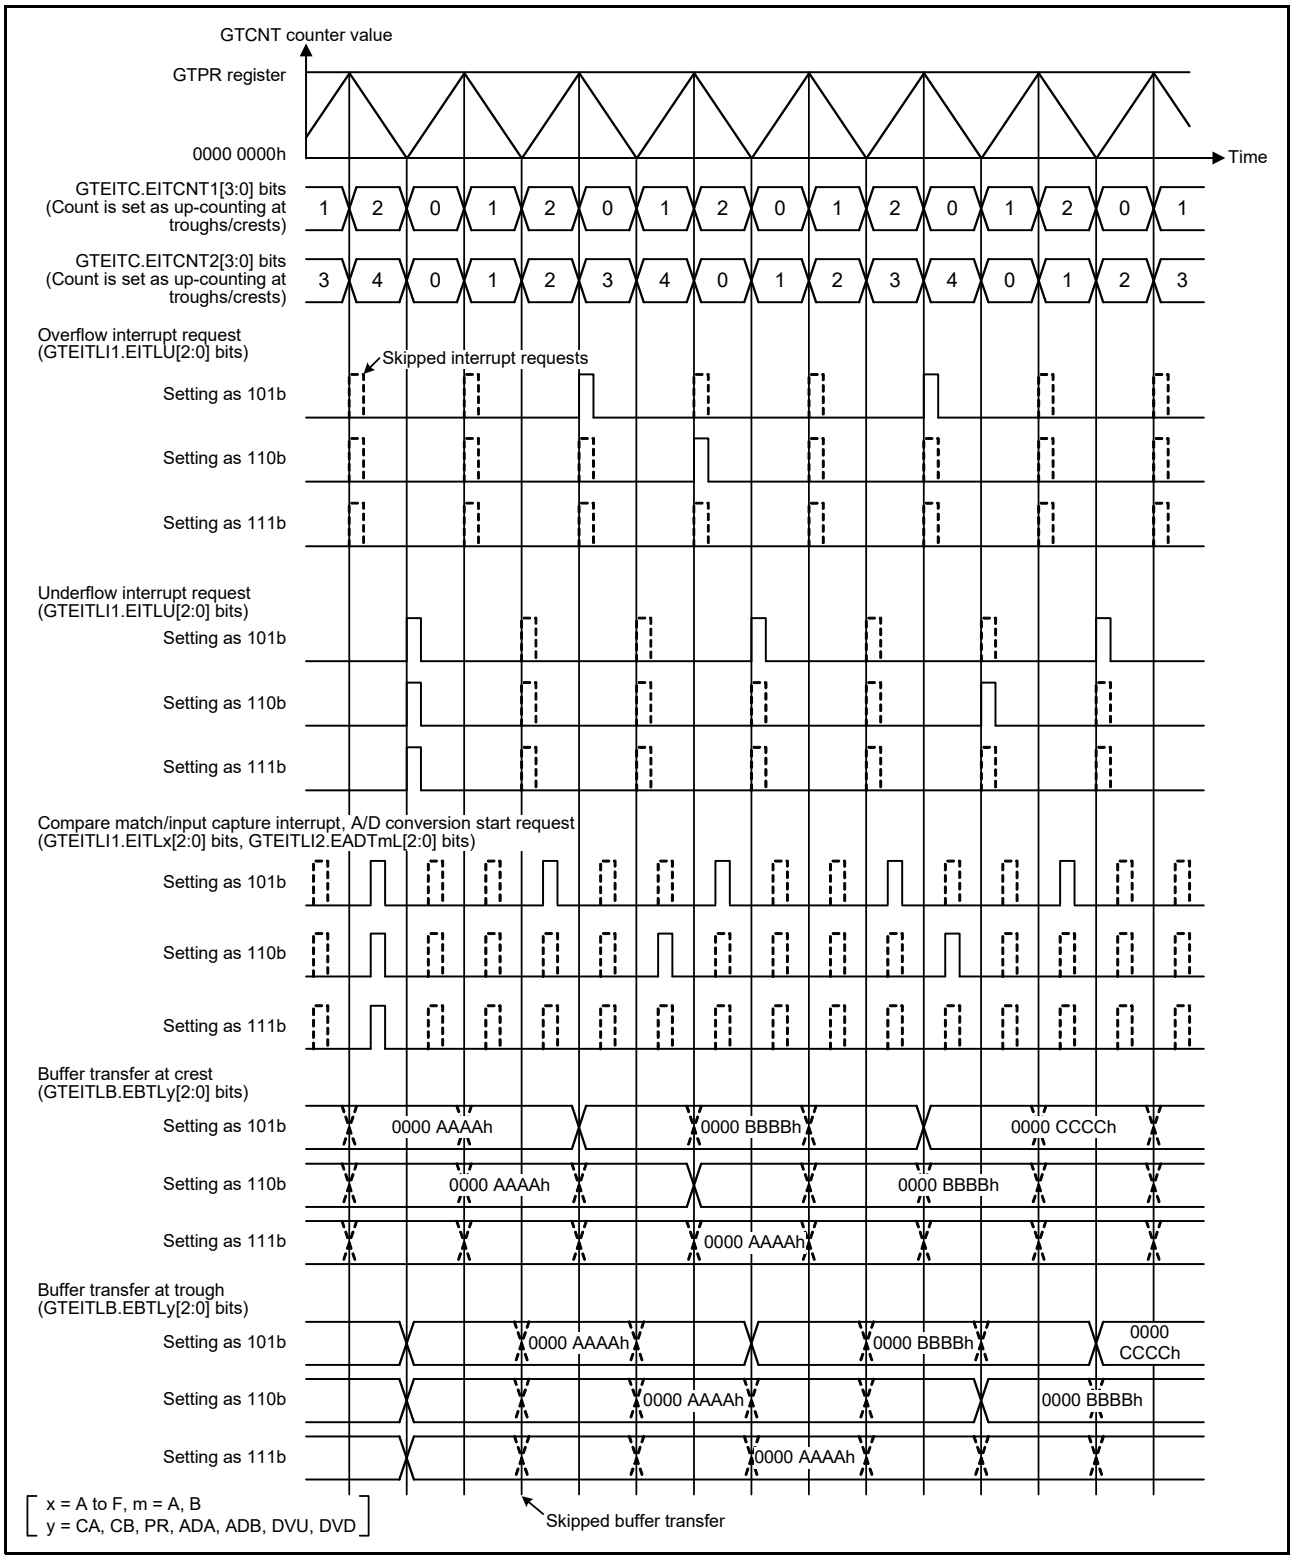

Figure 24.208 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting both Crests and Troughs, Extended Interrupt Skipping 1 Skipping Count: 2, Counting both Crests and Troughs, Extended Interrupt Skipping 2 Skipping Count: 4, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

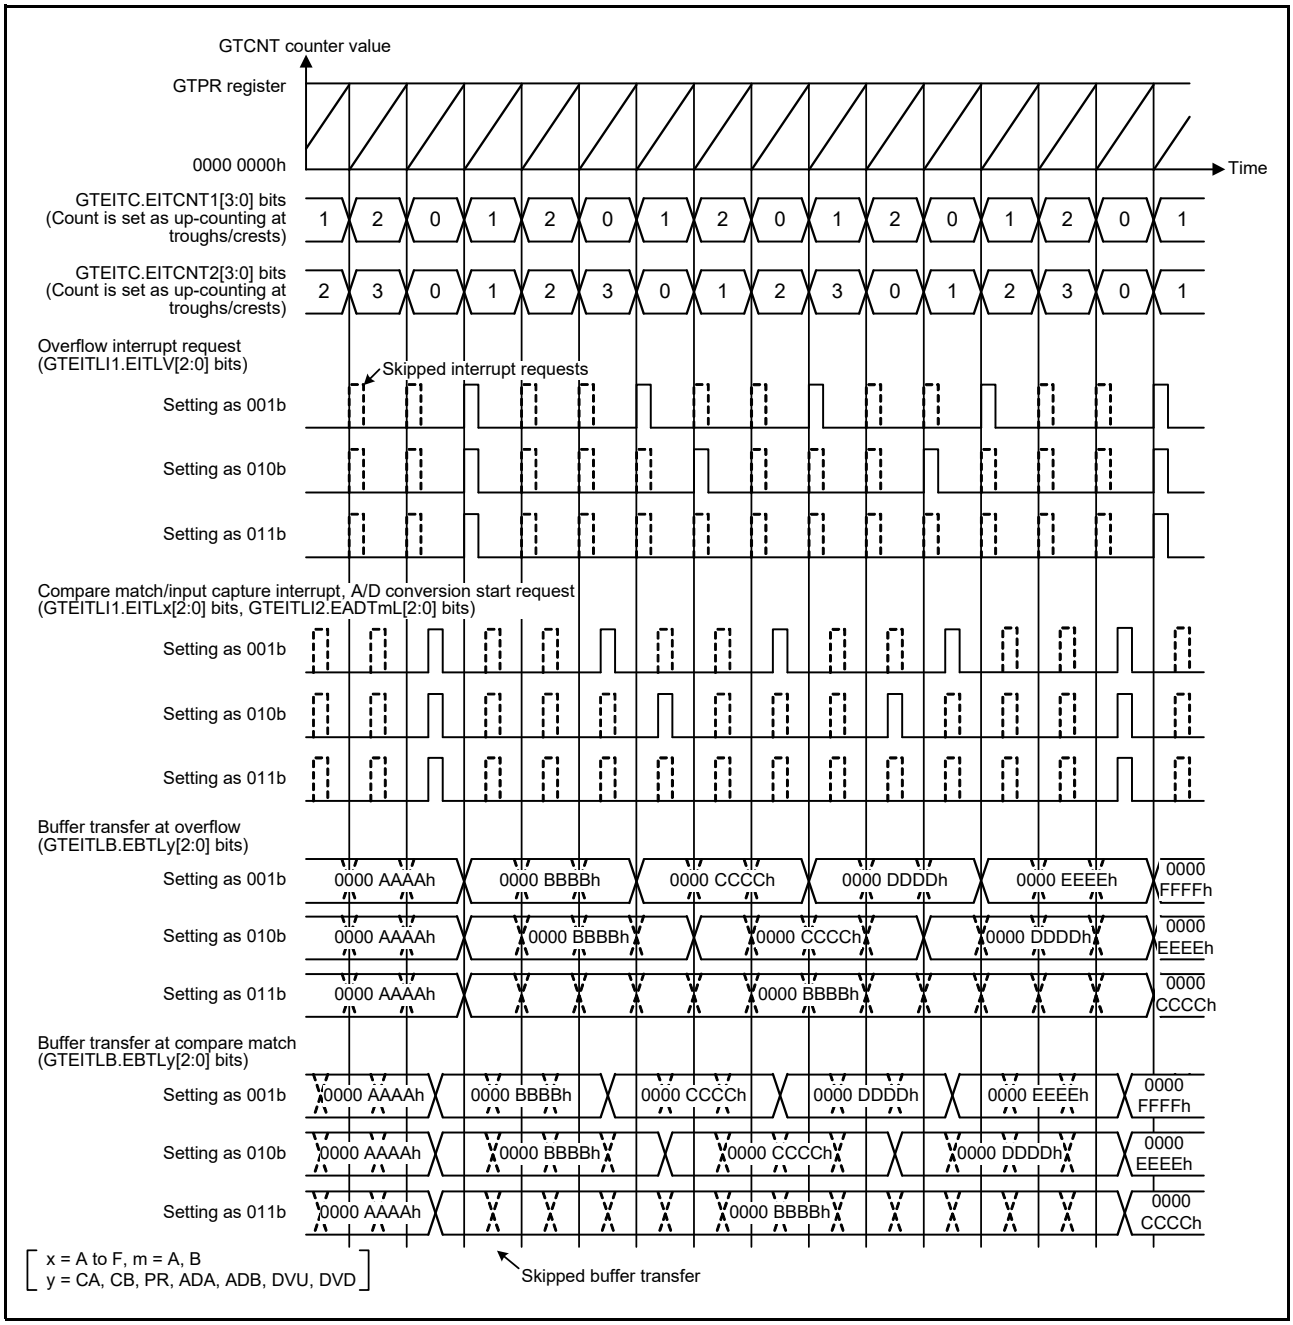

Figure 24.209 Example of Extended Interrupt Skipping Function Operation (Up-Counting in Sawtooth Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Overflow, Extended Interrupt Skipping 2 Skipping Count: 3, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

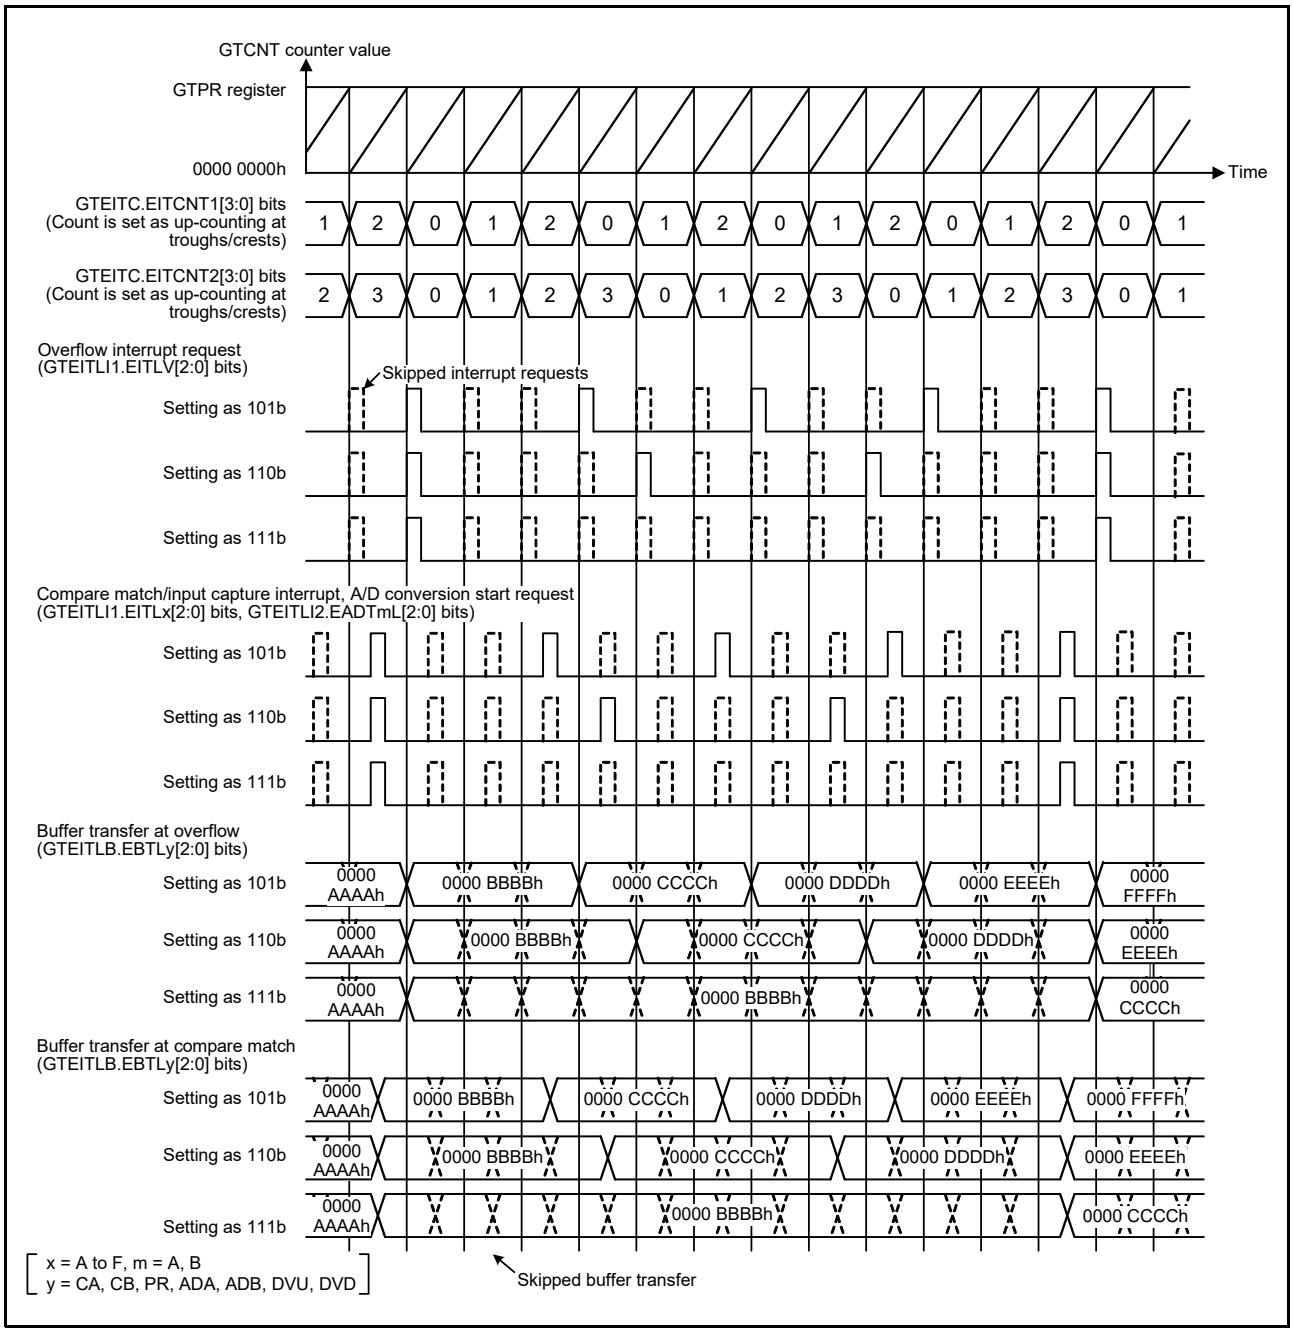

Figure 24.210 Example of Extended Interrupt Skipping Function Operation (Up-Counting Sawtooth Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Overflow, Extended Interrupt Skipping 2 Skipping Count: 3, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

Figure 24.211 shows an example of the extended interrupt skipping operation on the input capture. When the setting is for the input capture operation setting (GTCR.ICDS bit = 0) at count stop of the GTCNT counter, the interrupt by the input capture and the extended skipping on buffer transfer is enabled even at count stop of the GTCNT counter.
When the input capture is generated at count stop of the GTCNT counter by setting the ICDS bit as 0, an interrupt and a buffer transfer are skipped if the skipping counter value is the same with the skipping period set in a corresponding interrupt function select bit.

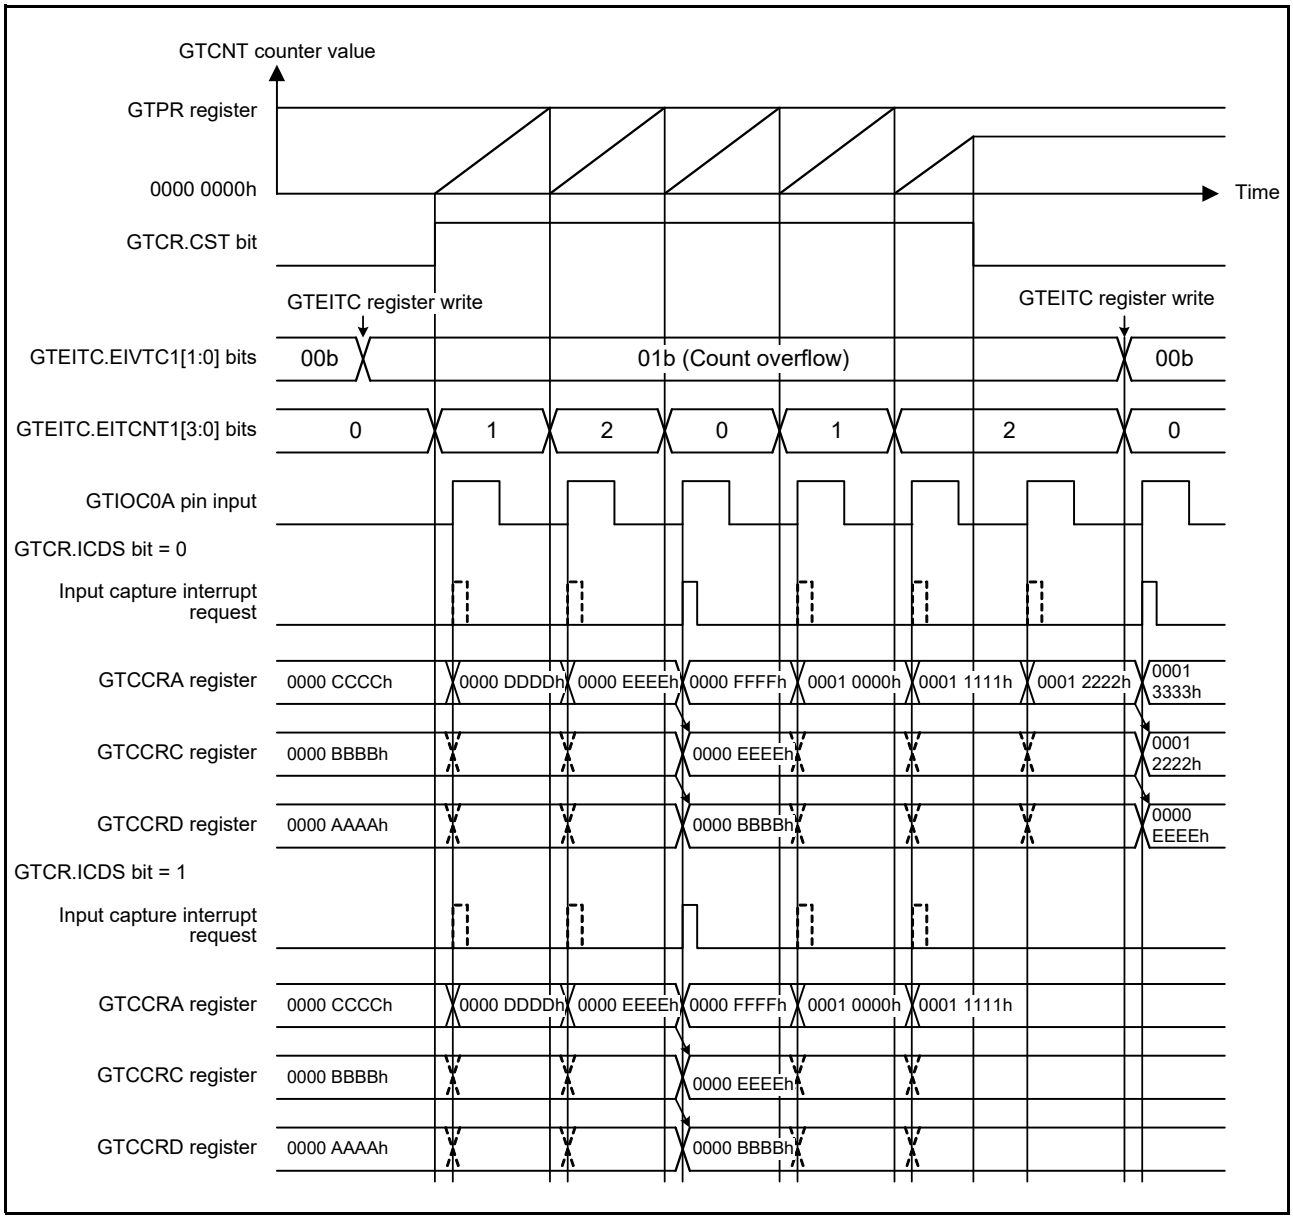

Figure 24.211 Example of Input Capture Operation in the Extended Interrupt Skipping Function Operation (Up-Counting Sawtooth Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Skipped in the Period other than the EITCNT1 as 0, Input Capture at the Input Rising)

Figure 24.212 shows an example for setting the extended interrupt skipping.
The initial value of the extended interrupt skipping counter 2 is set by the value written to the GTEITC.ETICNT2IV[3:0] bits. The initial value setting is applied when the setting of the extended interrupt skipping counter source is changed from “not counting” (GTEITC.EIVTC2[1:0] bits = 00b) to “counting” (GTEITC.EIVTC2[1:0] bits = other than 00b). Values written to the ETICNT2IV[3:0] bits are applied only in this condition.

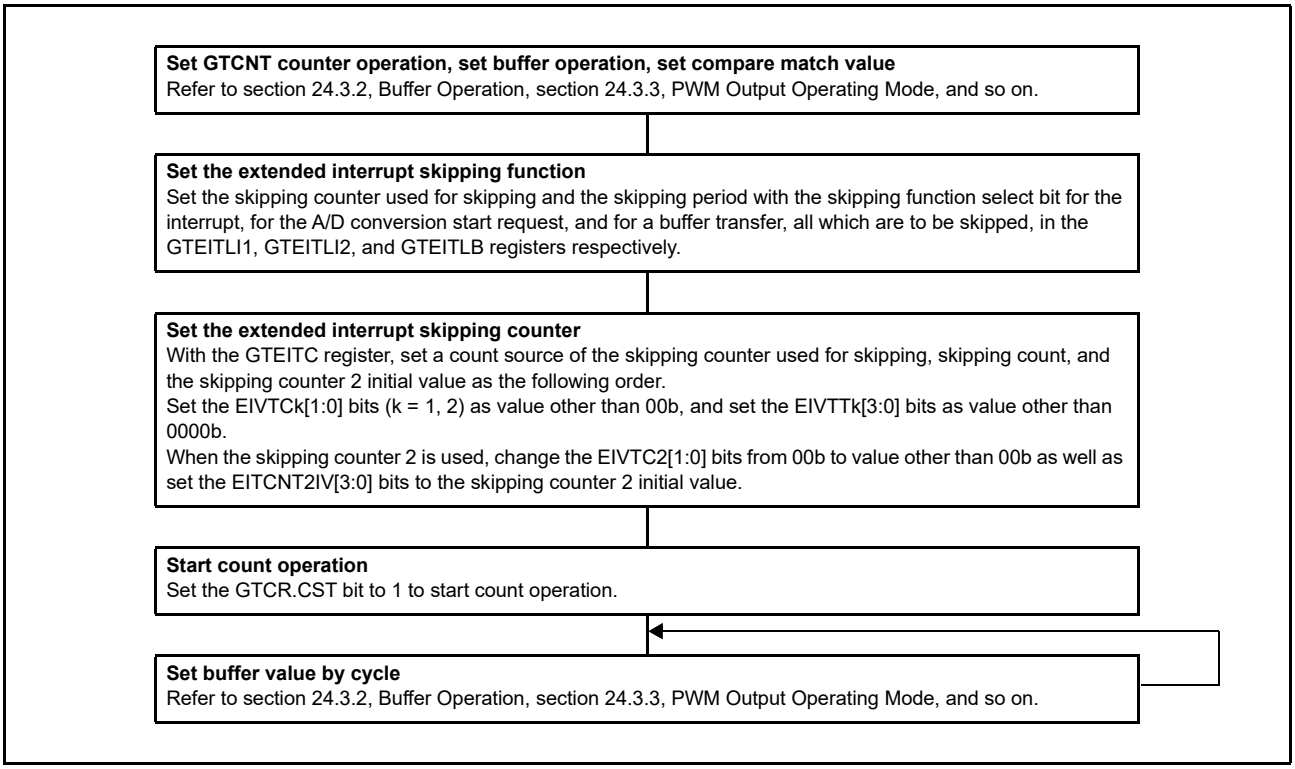

Figure 24.212 Example for Setting the Extended Interrupt Skipping

24.4.3.3 A/D conversion Start Request Compare Match Skipping Function

The A/D conversion start request and GTADTR register buffer transfer can be skipped by counting the compare matches of GTADTRA register and GTADTRB register based on settings of the GTADCMSC register and GTADCMSS register. The skipping period is set, related to the operation of the two independent A/D conversion start request compare match skipping counters (the ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits in the GTADCMSC register), as a period that either of the counter value for such skipping counters is other than 0 or other than the skipping count. The skipping period can also be set as a period that the both skipping counters are set as other than 0 or other than the skipping count for the counter value.

Figure 24.213 shows the counter operation for A/D conversion start request compare match skipping.

The counter operation for A/D conversion start request compare match skipping is set by the GTADCMSC register.

The ADCMSCNT1[3:0] bits count the count source (in Figure 24.213, a crest is selected) selected by the A/D conversion start request compare match skipping counter 1 count source select bit (the GTADCMSC.ADCMSC1[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in Figure 24.213, count is 2) set by the A/D conversion start request compare match skipping 1 skipping count setting bit (the ADCMST1[3:0] bits) is achieved.

The ADCMSCNT2[3:0] bits count the count source (in Figure 24.213, a trough is selected) selected by the A/D conversion start request compare match skipping counter 2 count source select bit (the GTADCMSC.ADCMSC2[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in Figure 24.213, count is 2) set by the A/D conversion start request compare match skipping 2 skipping count setting bit (the ADCMST2[3:0] bits) is achieved.

The ADCMSCNTk[3:0] bits (k = 1, 2) can be set for the initial value. The initial value is set when the GTADCMSC register is written by the access of 16 bits or 32 bits while the setting for the A/D conversion start request compare match skipping counter k is not counted (the ADCMSCk[1:0] bits are 00b) and the write value to the ADCMSCk[1:0] bits is other than 00b. When setting the initial value, the write value to the A/D conversion start request compare match skipping counter k initial value bits (the ADCMSCNTkIV[3:0] bits) are set as the initial value for the ADCMSCNTk[3:0] bits.

The A/D conversion start request compare match skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits for the A/D conversion start request compare match skipping function retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped.

When values for the ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits are to be reset (0000b), set the ADCMSC1[1:0] and ADCMSC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the ADCMSC1[1:0] bits or the ADCMSC2[1:0] bits to 00b).

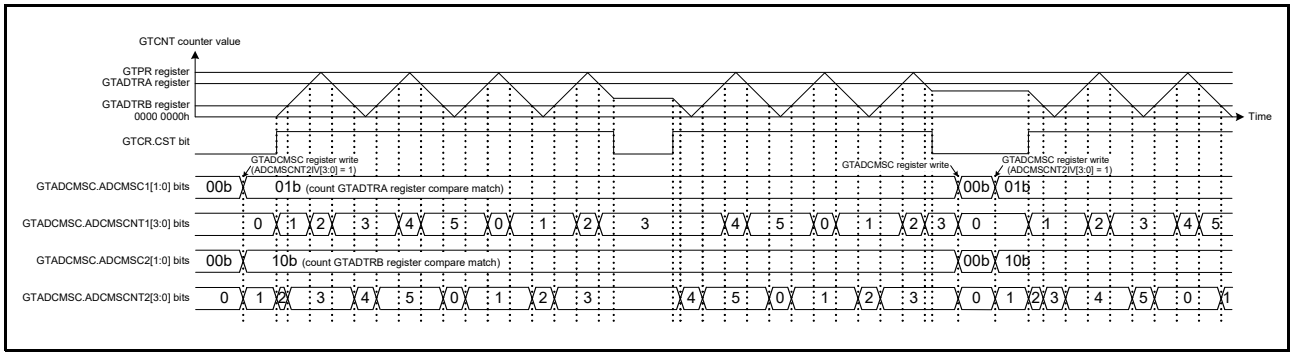

Figure 24.213 Example of A/D Conversion Start Request Compare Match Skipping Function Operation

A/D conversion start request skipping by the ADCMSC register can be performed simultaneously with skipping by the GTITC register or GTEITC register. A skipping period in this case is represented by ORed skipping periods of respective registers.

Figure 24.214 shows an example of simultaneous interrupt skipping operations by different registers.

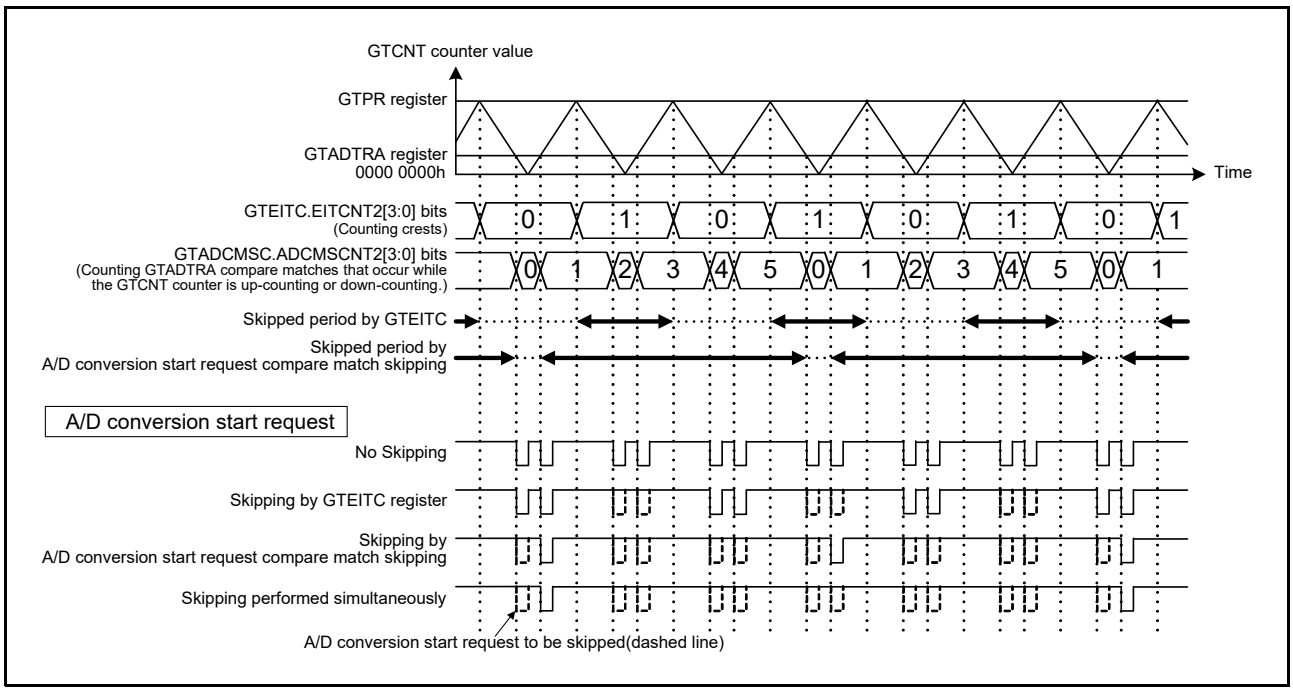

Figure 24.214 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (GTADTRA register compare match: GTINTAD.ADTRAUEN = 1, ADTRADEN = 1, Extended Interrupt Skipping: GTEITC.EIVTT2[3:0] = 001b, EIVTC2[1:0] = 01b, GTEITLI2.EADTAL[2:0] = 010b, A/D Conversion Start Request Compare Match Skipping: GTADCMSC.ADCMST2[3:0] = 101b, ADCMSC2[1:0] = 01b, ADCMSAL[2:0] = 010b)

When an A/D conversion start request is skipped by the GTADCMSS register, updating of the corresponding status flag and ELC event output are controlled by the A/D conversion start request enable bit in the GTINTAD register. All operations triggered by A/D conversion start request that are disabled by the GTINTAD register are not performed. Skipping of buffer transfer by the GTADCMSS register applies to all buffer operations enabled by the GTBER and GTBER2 registers, as well as all buffer operations performed in sawtooth-wave one-shot pulse mode, triangle-wave PWM mode 3, or complementary PWM mode (except for buffer transfer from GTCCRC, GTCCRE to GTCCRA). The skipping of an A/D conversion start request and the skipping of buffer transfer operate independently. Figure 24.215 and Figure 24.216 show examples of extended skipping function operation.

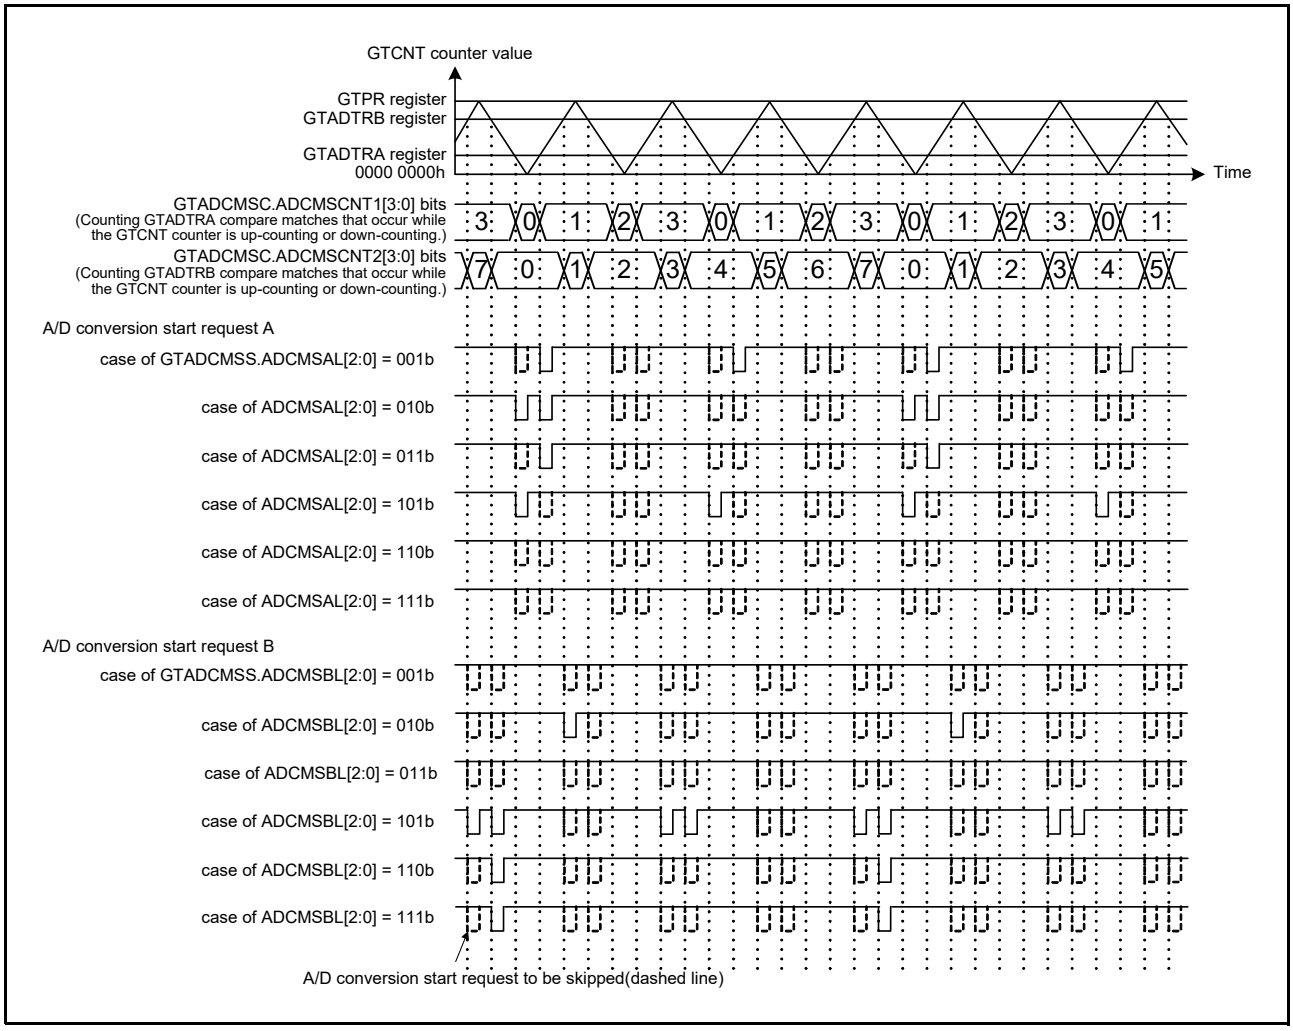

Figure 24.215 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (Triangle wave, A/D Conversion Start Request Compare Match Skipping 1 Skipping Count: 3 Counting GTADTRA compare match: GTINTAD.ADTRAUEN = 1, ADTRADEN = 1, GTADCMSS.ADCMSC1[1:0] = 01b, ADCMST1[3:0] = 011b, A/D Conversion Start Request Compare Match Skipping 2 Skipping Count: 7 Counting GTADTRB compare match: GTINTAD.ADTRBUEN = 1, ADTRBDEN = 1, GTADCMSS.ADCMSC2[1:0] = 10b, ADCMST2[3:0] = 111b)

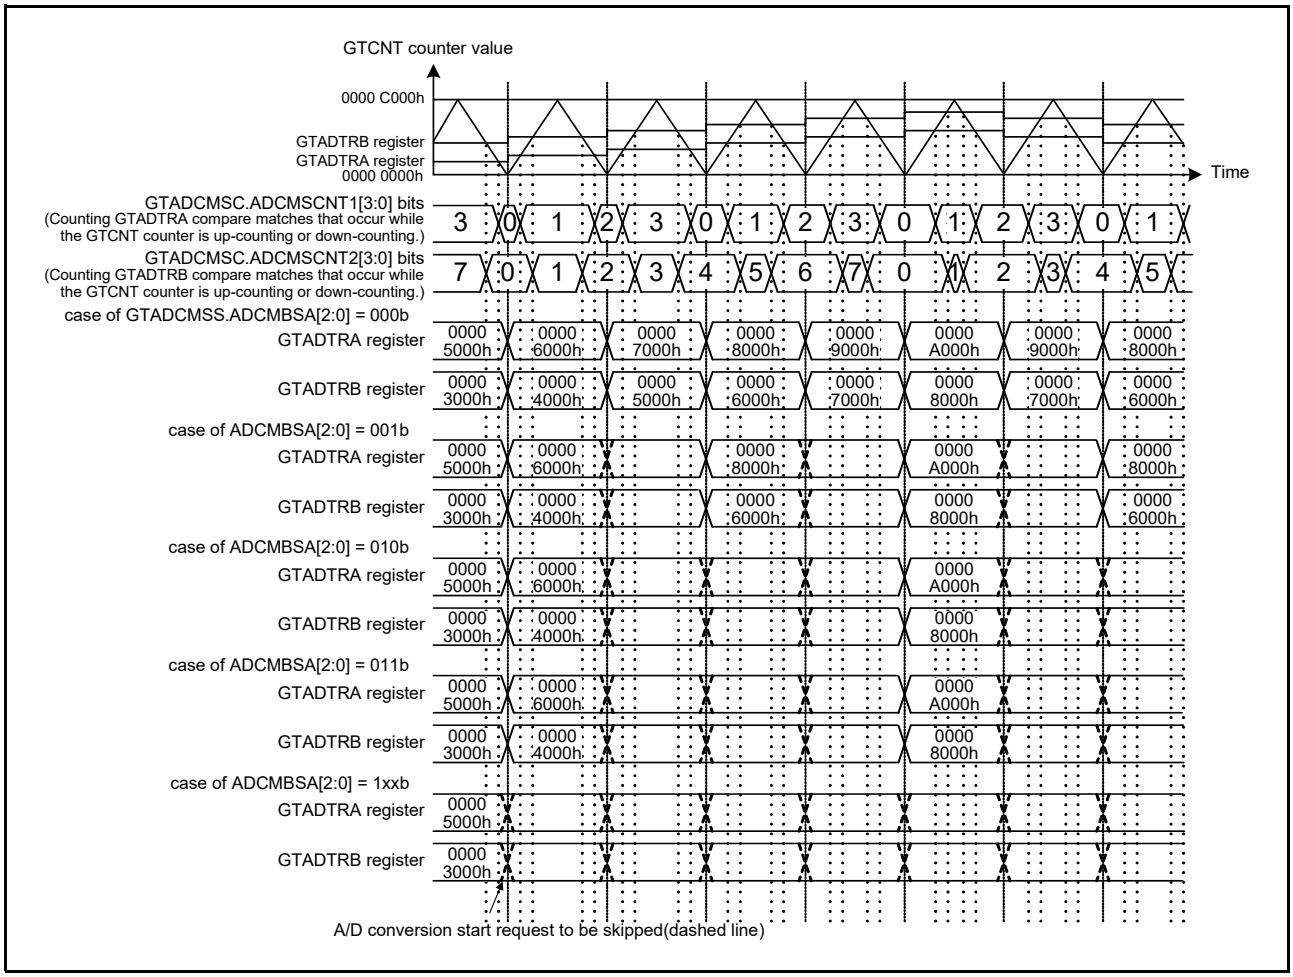

Figure 24.216 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (Triangle wave, A/D Conversion Start Request Compare Match Skipping 1 Skipping Count: 3 Counting GTADTRA compare match: GTINTAD.ADTRAUEN = 1, ADTRADEN = 1, GTADCMSS.ADCMSC1[1:0] = 01b, ADCMST1[3:0] = 011b, A/D Conversion Start Request Compare Match Skipping 2 Skipping Count: 7 Counting GTADTRB compare match: GTINTAD.ADTRBUEN = 1, ADTRBDEN = 1, GTADCMSS.ADCMSC2[1:0] = 10b, ADCMST2[3:0] = 111b, Buffer transfer of GTADTRA and GTADTRB at trough: GTBER.BD[2] = 1, ADTTA[1:0] = 10b)

Figure 24.217 shows an example of setting the A/D conversion start request compare match skipping.
The initial value of the A/D conversion start request compare match skipping counter 2 is set by the value written to the GTADCMSC.ADCMSCNT2IV[3:0] bits. The initial value setting is applied when the setting of the extended interrupt skipping counter 2 count source is changed from “not counting” (the GTADCMSC.ADCMSC2[1:0] bits = 00b) to “counting” (the GTADCMSC.ADCMSC2[1:0] bits = other than 00b). Value written to the ADCMSCNT2IV[3:0] bits are applied only in this condition.

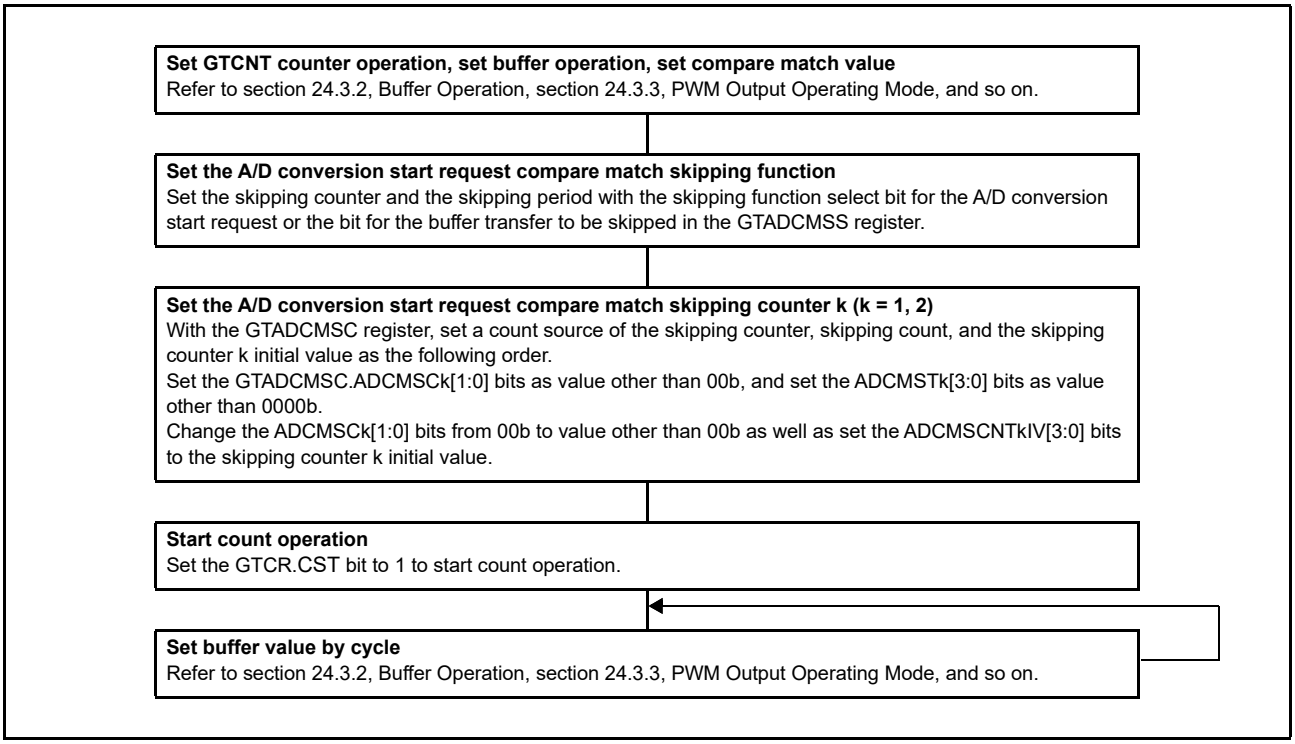

Figure 24.217 Example for Setting the A/D Conversion Start Request Compare Match Skipping

24.5 A/D Conversion Start Request

An A/D conversion start request can be issued at a compare match between the GTCNT counter and the GTADTRA or GTADTRB register, up-counting only, down-counting only, or both up-counting and down-counting can be specified by setting the GTINTAD register.

In complementary PWM mode, the A/D conversion start request can be issued at a compare match with the GTCNT counter of master channel.

During event count operation, the A/D conversion start request cannot be generated.

The request can be directly output to the A/D converter or output as an event signal to the ELC.

Each of the GTADTRA and GTADTRB registers has two buffer registers. Buffer operation with the GTADTRA register used together with the GTADTBRA and GTADTDBRA registers, and buffer operation with the GTADTRB register used together with the GTADTBRB and GTADTDBRB registers can be performed.

The generation timing of the A/D conversion start request can be monitored by an external pin. When the A/D conversion start request signal to be monitored is selected using the GTADSMR.ADSMSk bit (k = 0, 1) and the output is enabled by the ADSMENk bit, a signal is output on the GTADSMk pin synchronized with a cycle frame of the timer used to generate the A/D conversion start request signal. The output is driven high at the generation of the A/D conversion start request signal, and is driven low at the end of the cycle. When a signal to request the start of A/D conversion is generated at the end of the cycle, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next cycle. The registers (GTADTRA and GTADTRB) that are sources of generating the A/D conversion start request signals and their counting directions can be checked by the A/D conversion start request flags (ADTRAUF, ADTRADF, ADTRBUF, and ADTRBDF) in the GTST register. When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPTW.

Figure 24.218 shows an example of A/D conversion start request operation, Figure 24.219 shows an example for setting A/D conversion start request operation, and Figure 24.220 shows an example for A/D conversion start request timing operation.

Figure 24.220 shows an example of outputting A/D conversion start request A generated by a compare match with the GTADTRA register directly to the A/D converter. When the GPTW operates with the PCLKD clock and the A/D converter operates with the PCLKA clock, A/D conversion start request A is output to the A/D converter at the next rising edge of PCLKA. When both the GPTW and A/D converter operate with the GPTCLK clock, the request is output to the A/D converter without delay. With the other combinations of clocks, the request is output to the A/D converter in synchronization with the operating clock for the A/D converter.

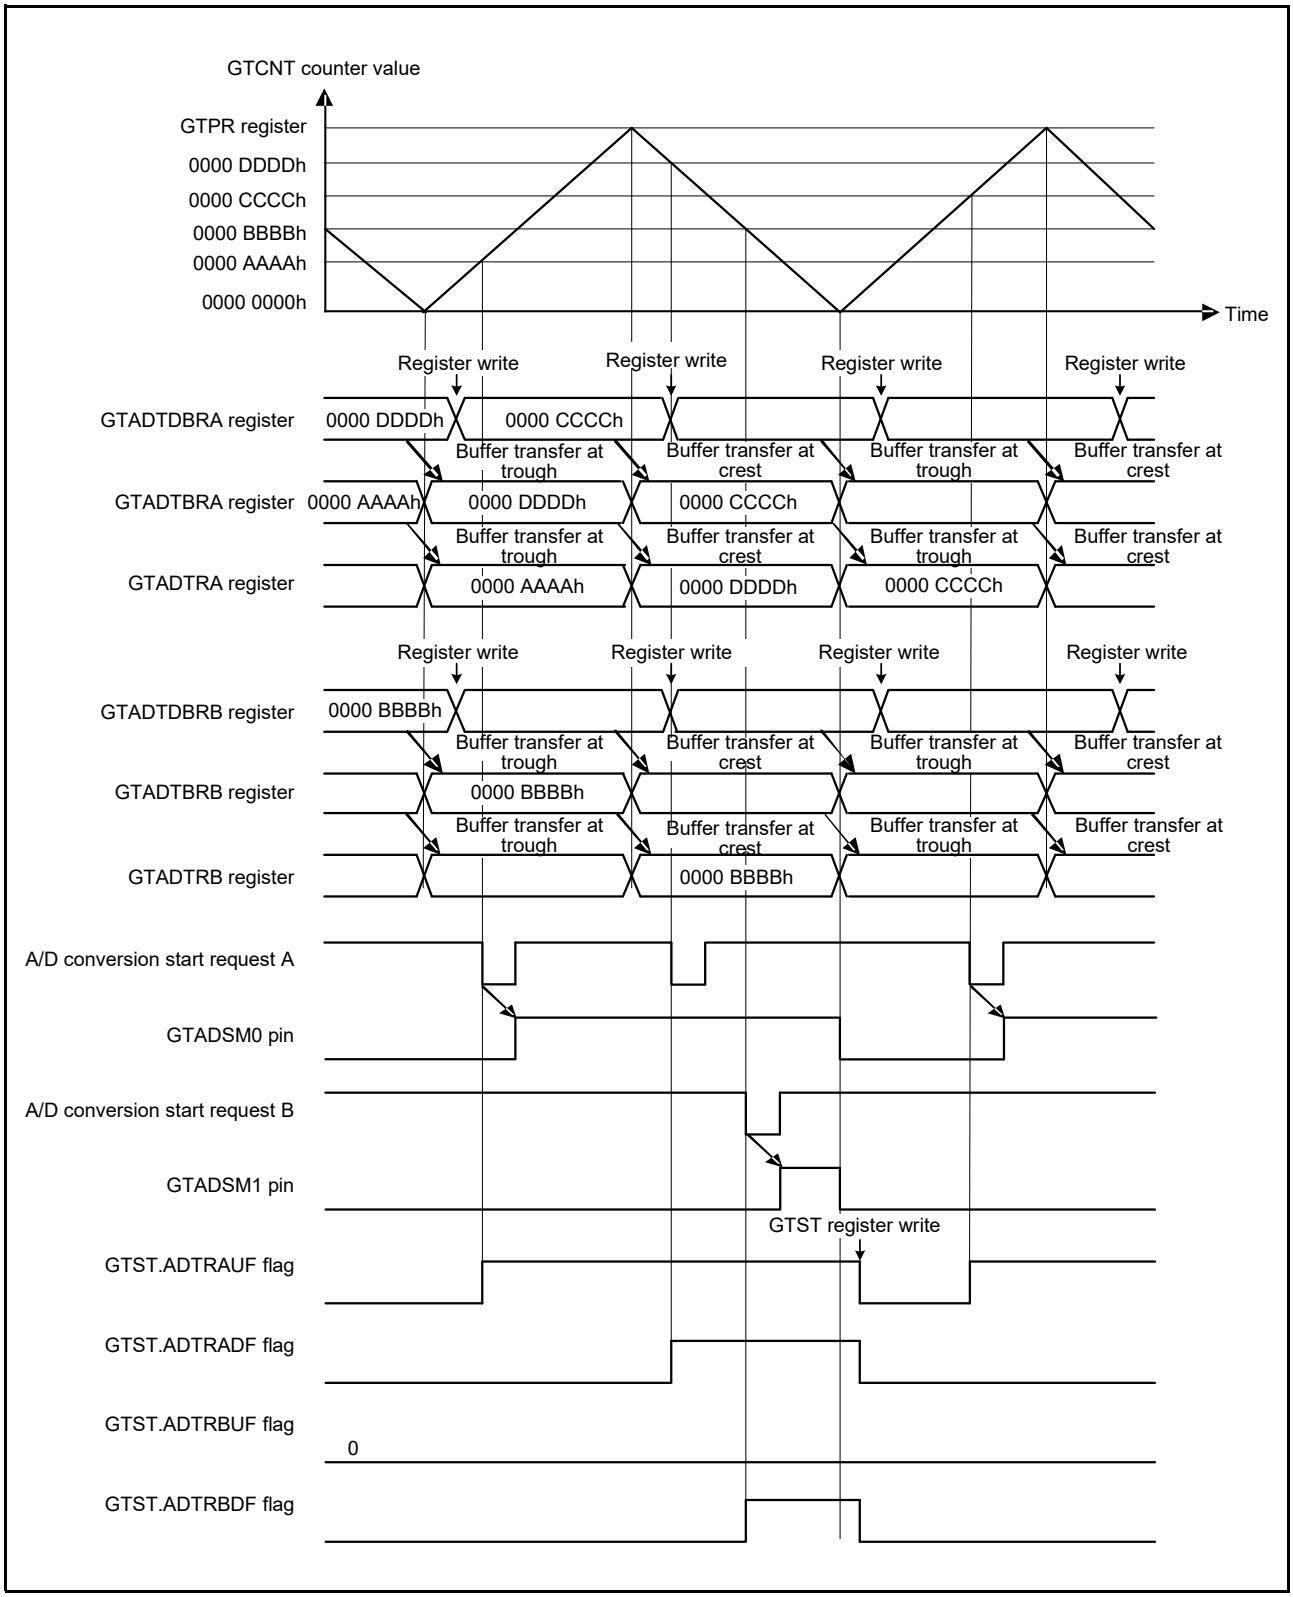

Figure 24.218 Example of A/D Conversion Start Request Timing Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Requested by GTADTRA Register at Both Up-Counting and Down-Counting, A/D Conversion Start Requested by GTADTRB Register at Down-Counting, Monitoring of the GTADTRA Register Up-Counting by the GTADSM0 Pin, Monitoring of the GTADTRB Register Down-Counting by the GTADSM1 Pin)

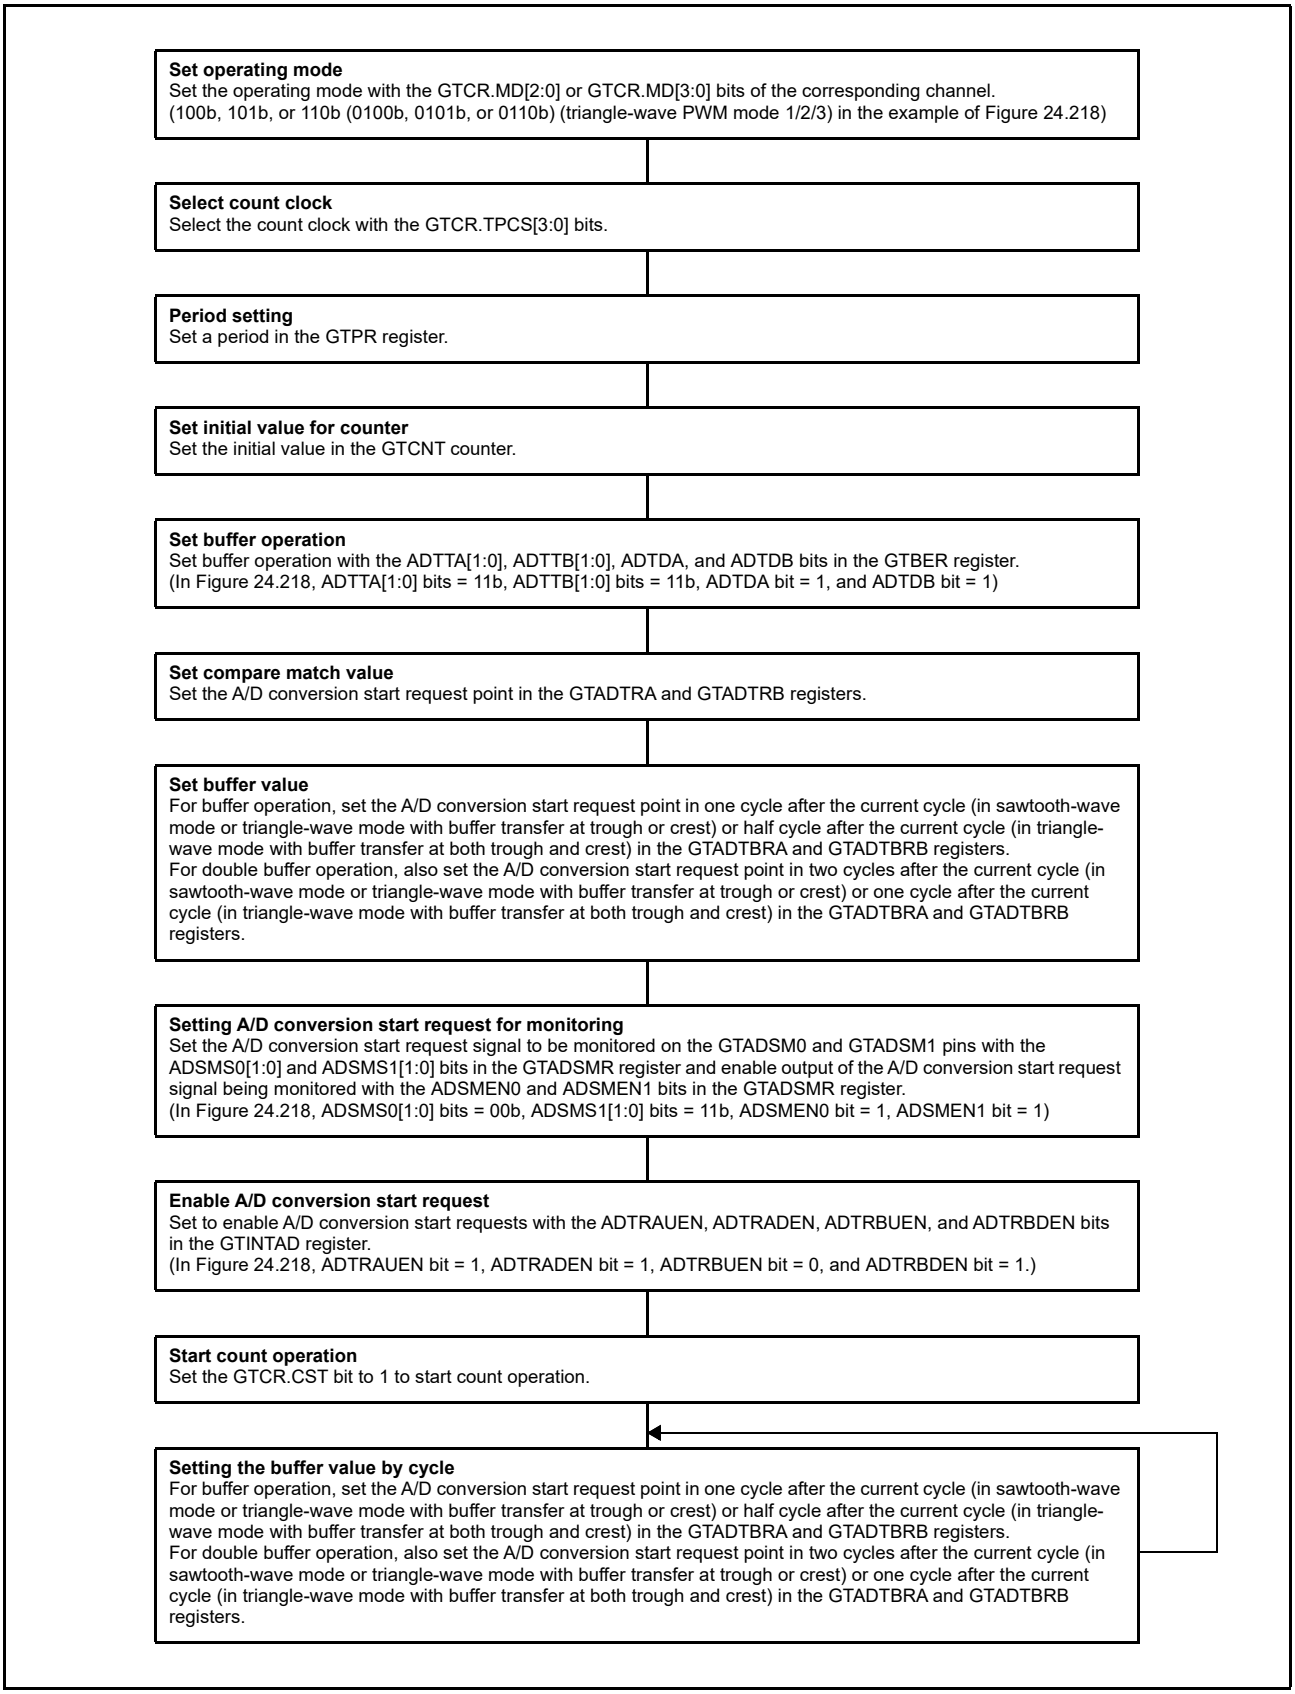

Figure 24.219 Example for Setting A/D Conversion Start Request Operation

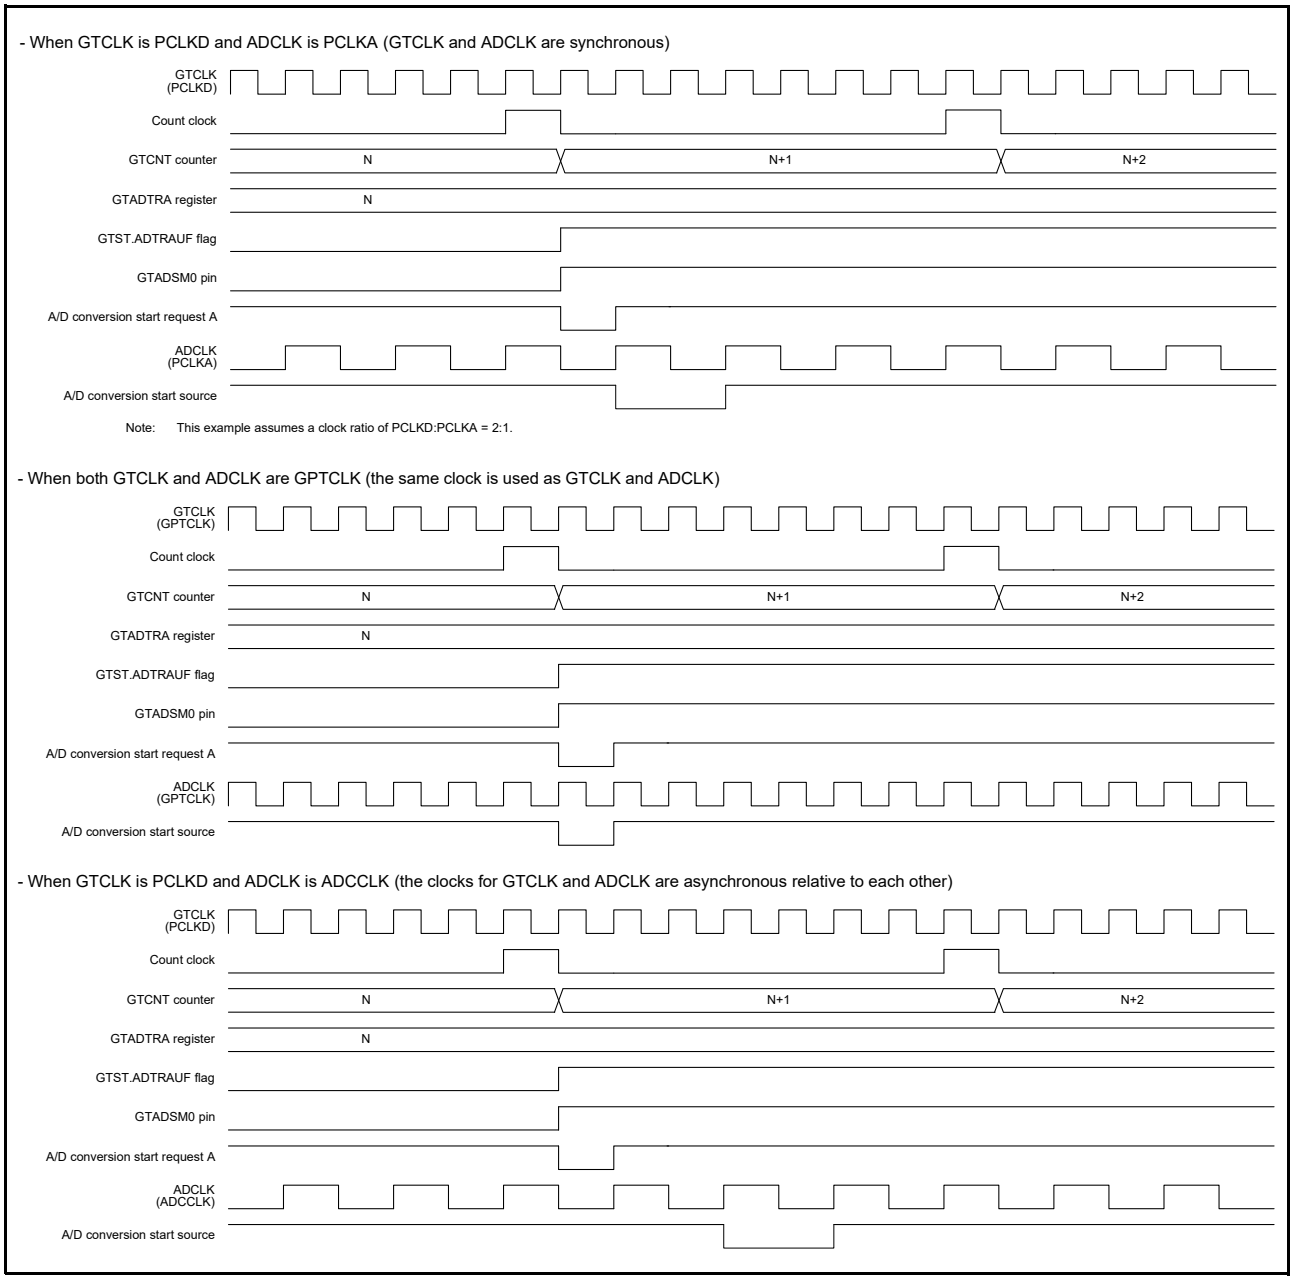

Figure 24.220 Examples of Timing of Operations with an A/D Conversion Start Request

24.6 Operations Linked by the ELC

24.6.1 Event Signal Output to the ELC

GPTW is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).
The event signal can be output regardless of the setting of the corresponding interrupt request enable bits except the A/D conversion start request.
The A/D conversion start request during up-counting/down-counting can be enabled/disabled individually with the A/D conversion start request enable bit to output to the ELC.
The following is a list of the event signals output by the GPTW to the ELC. Each GPTW channel has the first 11 event signals. The last of the listed event signals is common to all channels. A dead time error interrupt does not have a corresponding event signal.

- Generation of compare match A interrupt
- Generation of compare match B interrupt
- Generation of compare match C interrupt
- Generation of compare match D interrupt
- Generation of compare match E interrupt
- Generation of compare match F interrupt
- Generation of overflow interrupt
- Generation of underflow interrupt
- Generation of A/D conversion start request A
- Generation of A/D conversion start request B
- End of the cycle count operation
- GPTW (OPS) U-/V-/W-phase input edge detected

24.6.2 GPTW Operations in Response to Receiving Event Signals from the ELC

The GPTW can perform the following operations by the signals for sources A to H which are output from the ELC. Each signal is provided to all channels. Select an event source for a desired operation by a relevant source select register in a channel.

- Operation of count start/count stop/counter clearing/count switch
- Operation of up-counting/down-counting
- Operation of input capture A and B

Refer to operation by hardware sources in section 24.3.1.1, Counter Operation for respective operations.

24.7 Noise Filter Function

Each pin for use in input capture to the GPTW is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses of which length is less than three sampling periods.
The noise filter functionality includes enabling and disabling of the noise filter for each pin and setting of the sampling clock for each channel.
Figure 24.221 shows the timing of noise filtering.

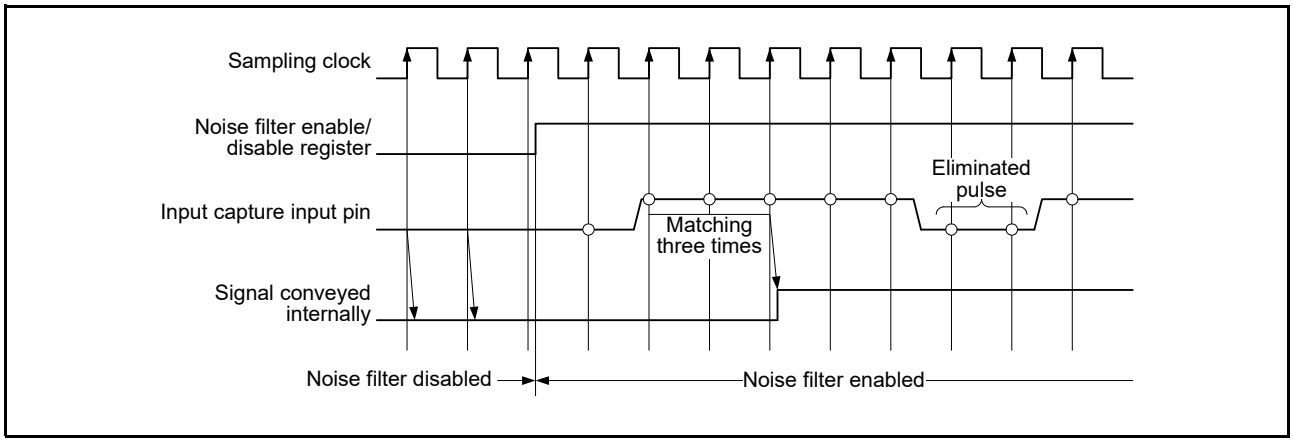

Figure 24.221 Timing of Noise Filtering

If noise filtering is enabled, input capture operation is performed on the edges of noise-filtered signal after a minimum delay of (sampling interval × 2 + GTCLK) due to noise filtering for the input capture input.

24.8 Protection Function

24.8.1 Write-Protection for Registers

In order to avoid incorrect writing to registers, write access to registers can be enabled or disabled per channel by setting the GTWP.WP bit for the given channel.
The WP bits enable or disable writing to the registers listed below.
GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC, GTADCMSC, GTADCMSS, GTSWSR, GTSWOS, GTBER2, GTOLBR, GTICCR, GTSYNCFCR, GTSYNCSCR
The GTSTR, GTSTP, and GTCLR registers, which can control all channels by updating the registers of any channel, can be protected from accidental writes by enabling or disabling writes to the bit corresponding to each channel using the GTWP.STRWP, STPWP, and CLRWP bits on a per-channel basis.
Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels, can be enabled or disabled for each channel by the setting of the GTWP.CMNWP bit.
Protection by the GTWP register only targets writing operation by the CPU. Register updates that occur with CPU writes are not protected.

24.8.2 Disabling of Buffer Operation

If the timing of buffer register write is too late for the buffer transfer timing, buffer operation can be suspended with setting the BD[0], BD[1], BD[2], and BD[3] bits in the GTBER register.
Specifically, buffer transfer can be temporarily disabled, even when a buffer transfer condition is satisfied during buffer register write, by setting the corresponding BD[0], BD[1], BD[2], and BD[3] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.
The BD[0], BD[1], BD[2], and BD[3] bits can be set on a per-channel basis by writing directly to the GTBER register or they can be set simultaneously for multiple channels specified by the GTSECSR register using the GTSECR register.
Figure 24.222 shows an example of operation for disabling buffer operation.

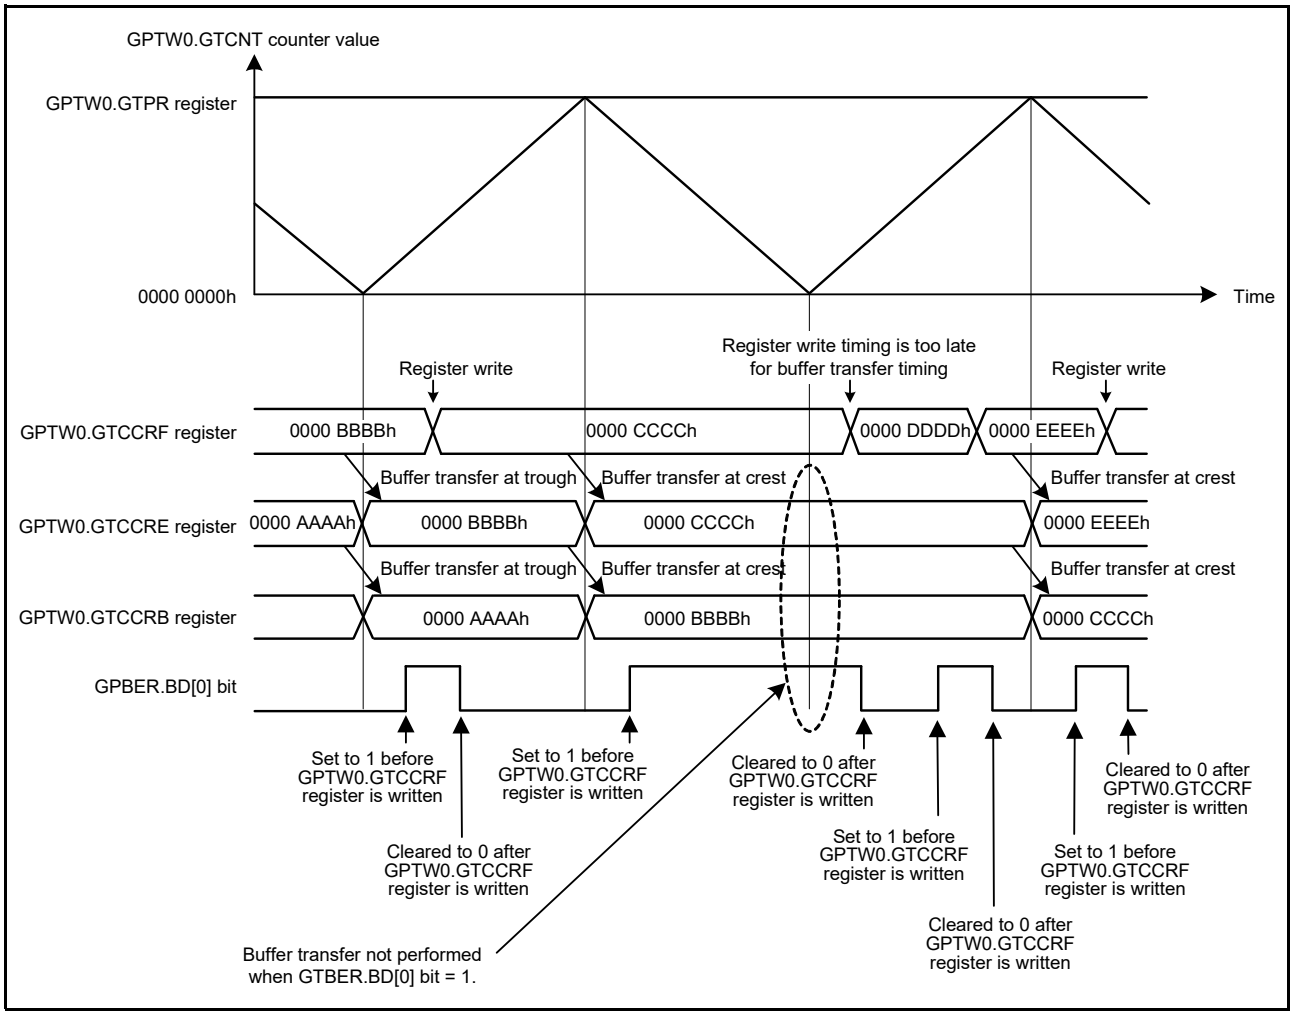

Figure 24.222 Example of Operation for Disabling Buffer Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests)

24.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.
Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

(1) Select the channels for simultaneously setting of the GTSECSR register

Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.

(2) Simultaneously set the GTBER.BD bits by updating the GTSECR register

In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register. Figure 24.223 and Figure 24.224 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

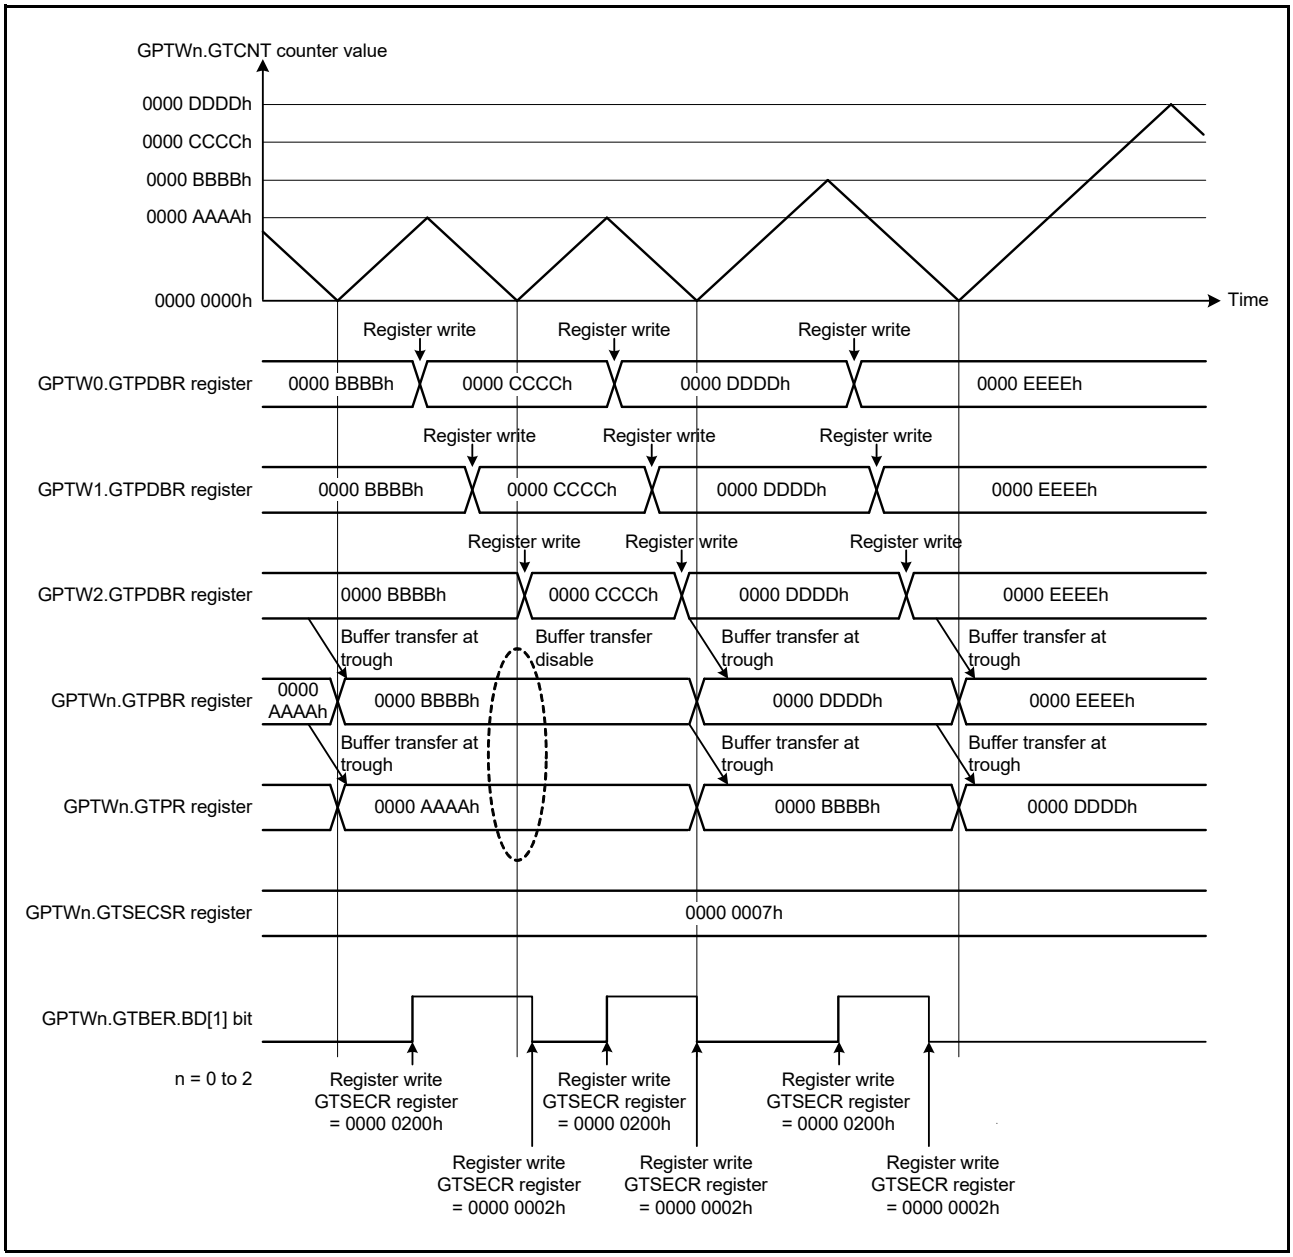

Figure 24.223 Example of Multiple Channel Operation for Simultaneous Control of Buffer Operation (Triangle Waves, Double Buffer Operation)

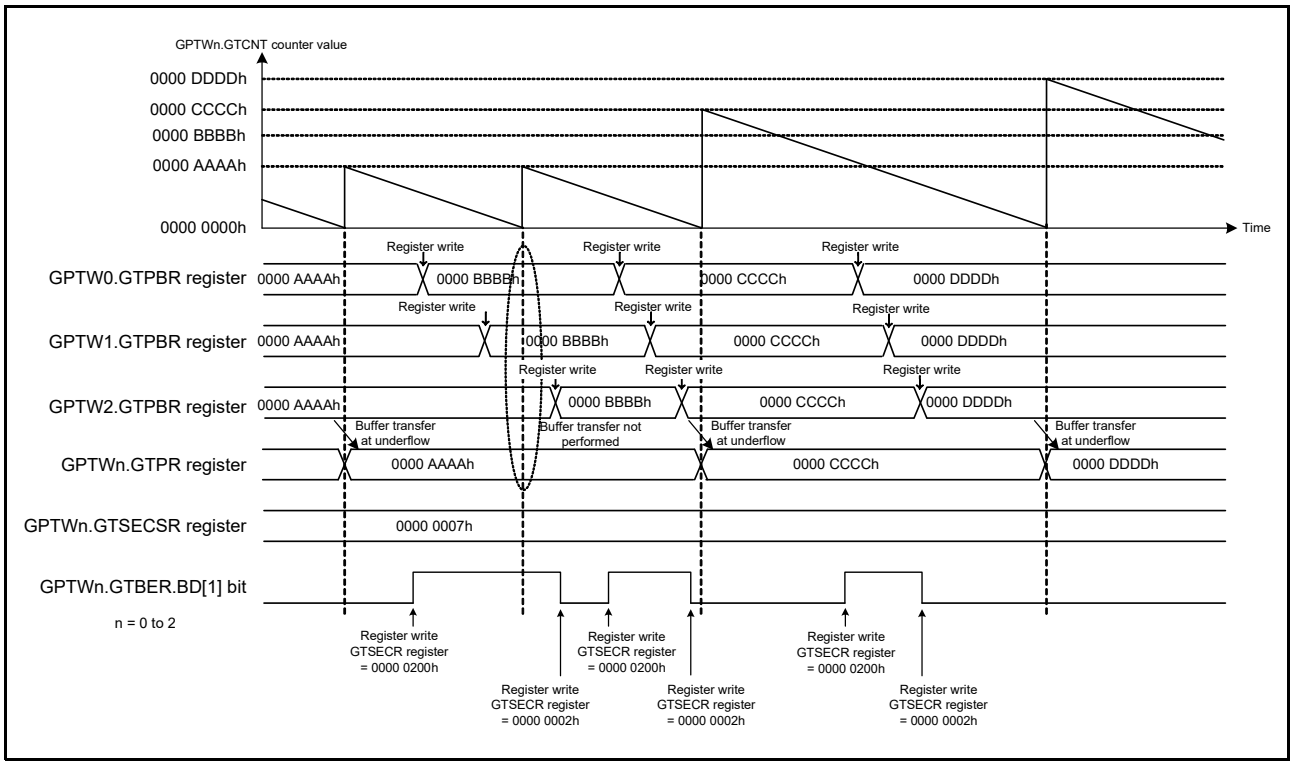

Figure 24.224 Example of Multiple Channel Operation for Simultaneous Control of Buffer Operation (Sawtooth Waves, Single Buffer Operation)

24.8.2.2 Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer

When a GTBER.DBRTECm (m = A, B) bit is set to 1 in sawtooth-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffer to the GTCCRm (m = A, B) register is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or by the buffer transfer extended skipping function.

(1) In sawtooth-wave one-shot pulse mode

In sawtooth-wave one-shot pulse mode, the compare match value for the first half of a waveform is stored in temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRm (m = A, B) registers.

Table 24.42 lists the types of buffer transfer of the GTCCR register during counting in sawtooth-wave one-shot pulse mode. While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer.

In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is 1, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 24.42 GTCCR Buffer Operation in Sawtooth-Wave One-Shot Pulse Mode

GTBER.DBRTECm	Buffer transfer	Timing of transfer				
		GTCCRx ↓ GTCCRm	GTCCRx ↓ Temporary register x	Temporary register x ↓ GTCCRm	GTCCRy ↓ Temporary register m	Temporary register m ↓ GTCCRm
0	Transfer-enabled period	Overflow or underflow	No transfer	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer-disabled period	No transfer	No transfer	No transfer	No transfer	No transfer
1	Transfer-enabled period	Overflow or underflow	Overflow or underflow	No transfer	Overflow or underflow	GTCCRm compare match
	Transfer-disabled period	No transfer	No transfer	Overflow or underflow	No transfer	GTCCRm compare match

Figure 24.225 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer disabled in sawtooth-wave one-shot pulse mode.

Figure 24.226 shows the operation of generating transfer-disabled period by updating the GTBER.BD[0] bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in sawtooth-wave one-shot pulse mode.

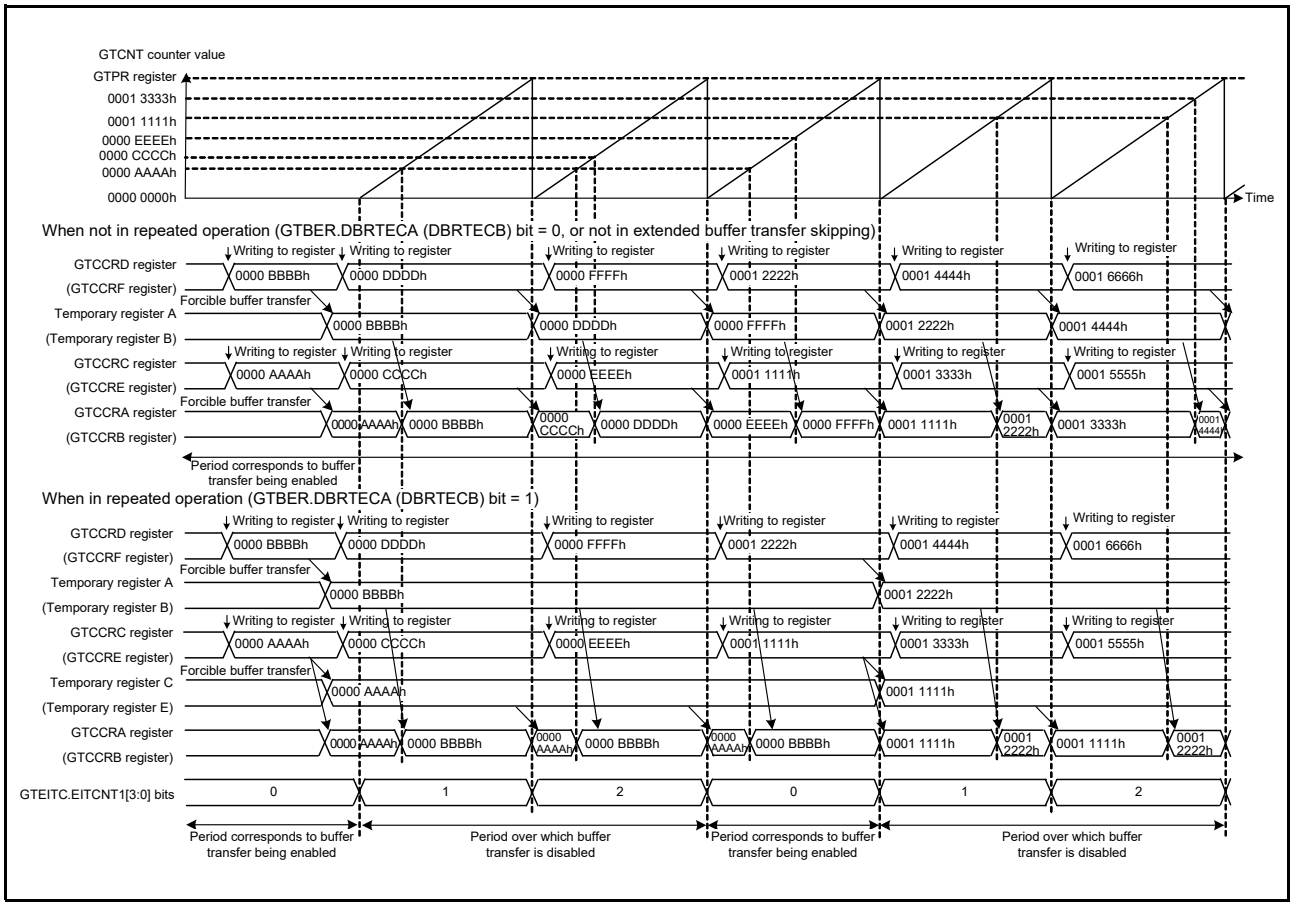

Figure 24.225 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Sawtooth-Wave One-Shot Pulse Mode, Using Extended Buffer Transfer Skipping, GTBER.BD[0] is Constantly 0)

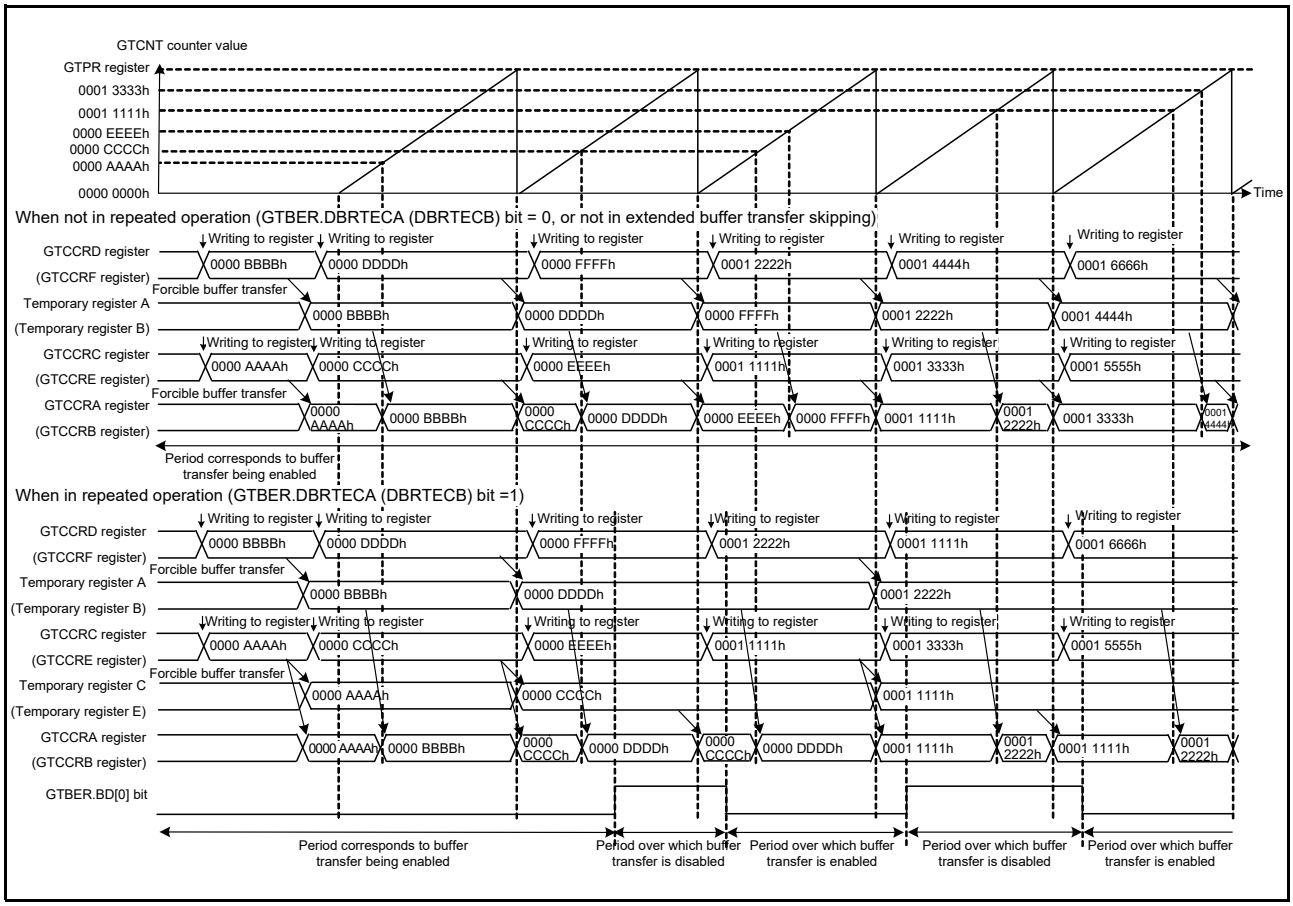

Figure 24.226 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Sawtooth-Wave One-Shot Pulse Mode, Updating the GTBER.BD[0] Bit)

(2) In triangle-wave PWM mode 3

In triangle-wave PWM mode 3, the compare match value for the first half of a waveform is stored in the temporary register x (x = C, E) as the intermediate buffer for the GTCCRx (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCRy (y = D, F) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRm (m = A, B) register.

Table 24.43 lists the types of buffer transfer of the GTCCR register during counting operation in triangle-wave PWM mode 3.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCRy (y = D, F) registers are transferred to temporary registers m (m = A, B), and the values of the GTCCRx (x = C, E) are transferred to temporary registers x (x = C, E), when the setting of the corresponding GTBER.DBRTECm (m = A, B) bit is 1, respectively.

When the setting of the GTBER.DBRTECm (m = A, B) bit is set to 1, values written by the CPU to the GTCCRm (m = A, B) registers are reflected as the values of temporary registers x (x = C, E).

Table 24.43 GTCCR Buffer Operation in Triangle-Wave PWM Mode 3

		Timing of transfer				
GTBER.DBRTECm	**Buffer transfer**	**GTCCRx ↓ GTCCRm**	**GTCCRx ↓ Temporary register x**	**Temporary register x ↓ GTCCRm**	**GTCCRy ↓ Temporary register m**	**Temporary register m ↓ GTCCRm**
0	Transfer-enabled period	Trough	No transfer	No transfer	Trough	Crest
	Transfer-disabled period	No transfer	No transfer	No transfer	No transfer	No transfer
1	Transfer-enabled period	Trough	Trough	No transfer	Trough	Crest
	Transfer-disabled period	No transfer	No transfer	Trough	No transfer	Crest

Figure 24.227 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer disabled in triangle-wave PWM mode 3.

Figure 24.228 shows the operation of generating transfer-disabled period by updating the GTBER.BD[0] bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in triangle-wave PWM mode 3.

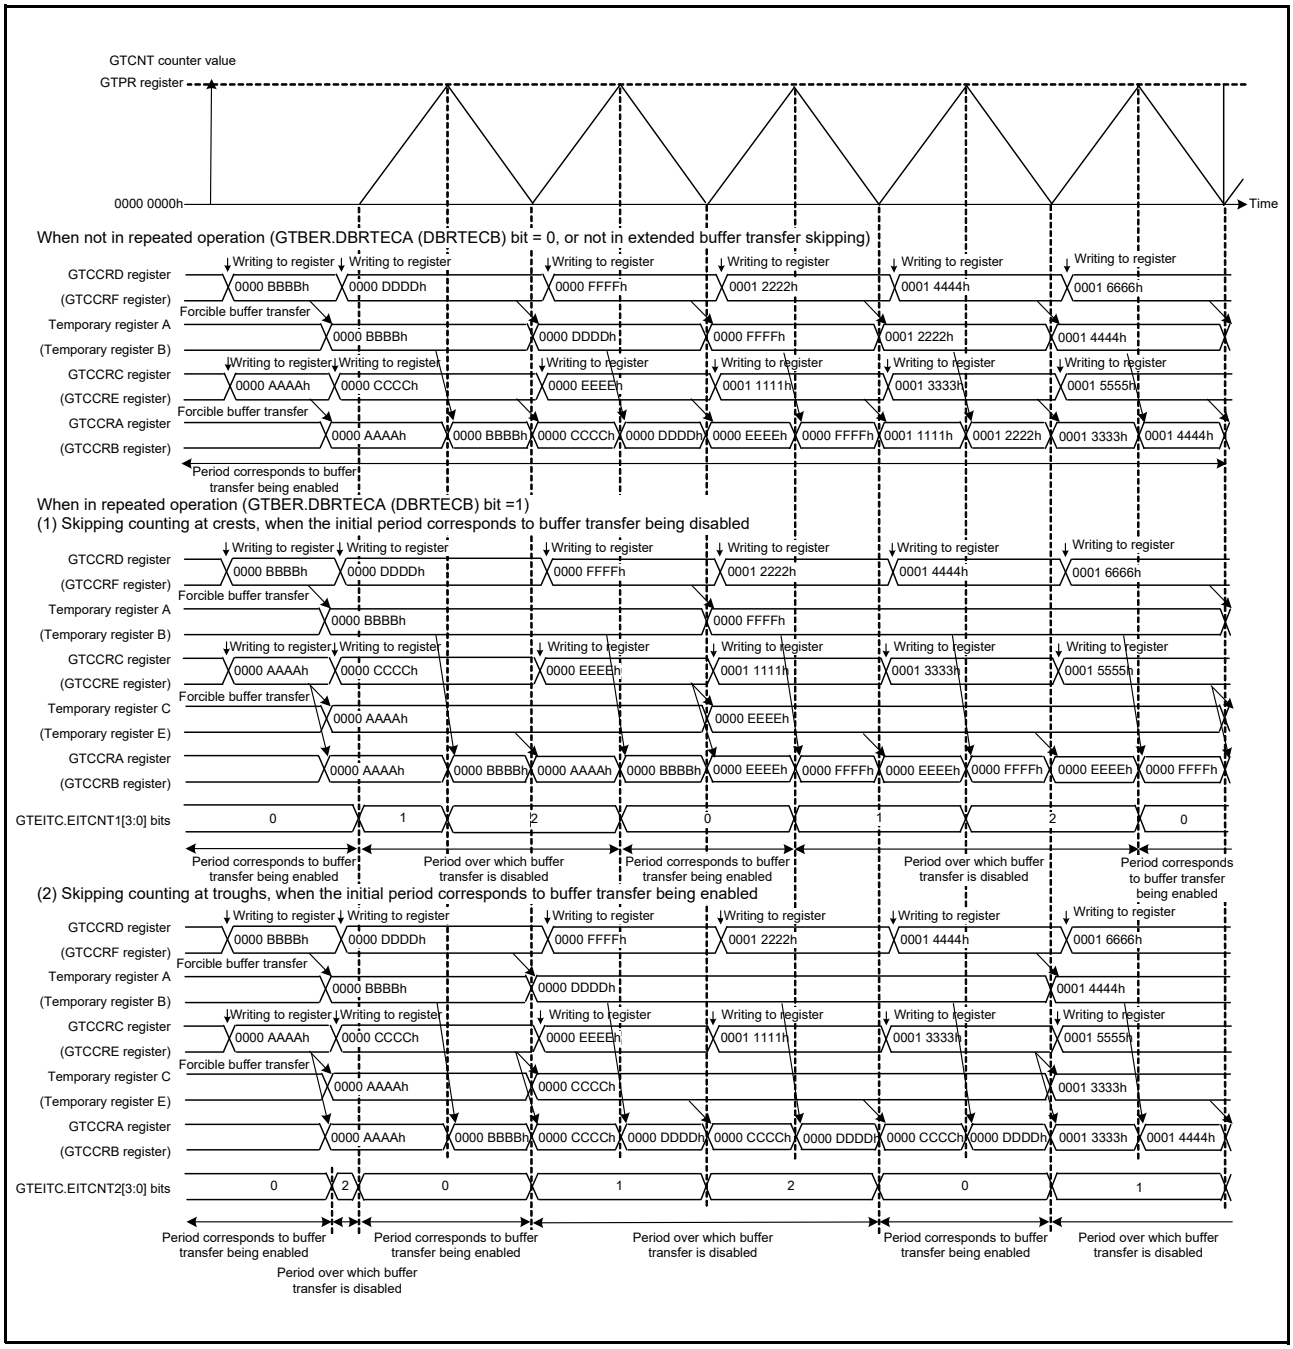

Figure 24.227 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Triangle-Wave PWM Mode 3, Using Extended Buffer Transfer Skipping, GTBER.BD[0] is Constantly 0)

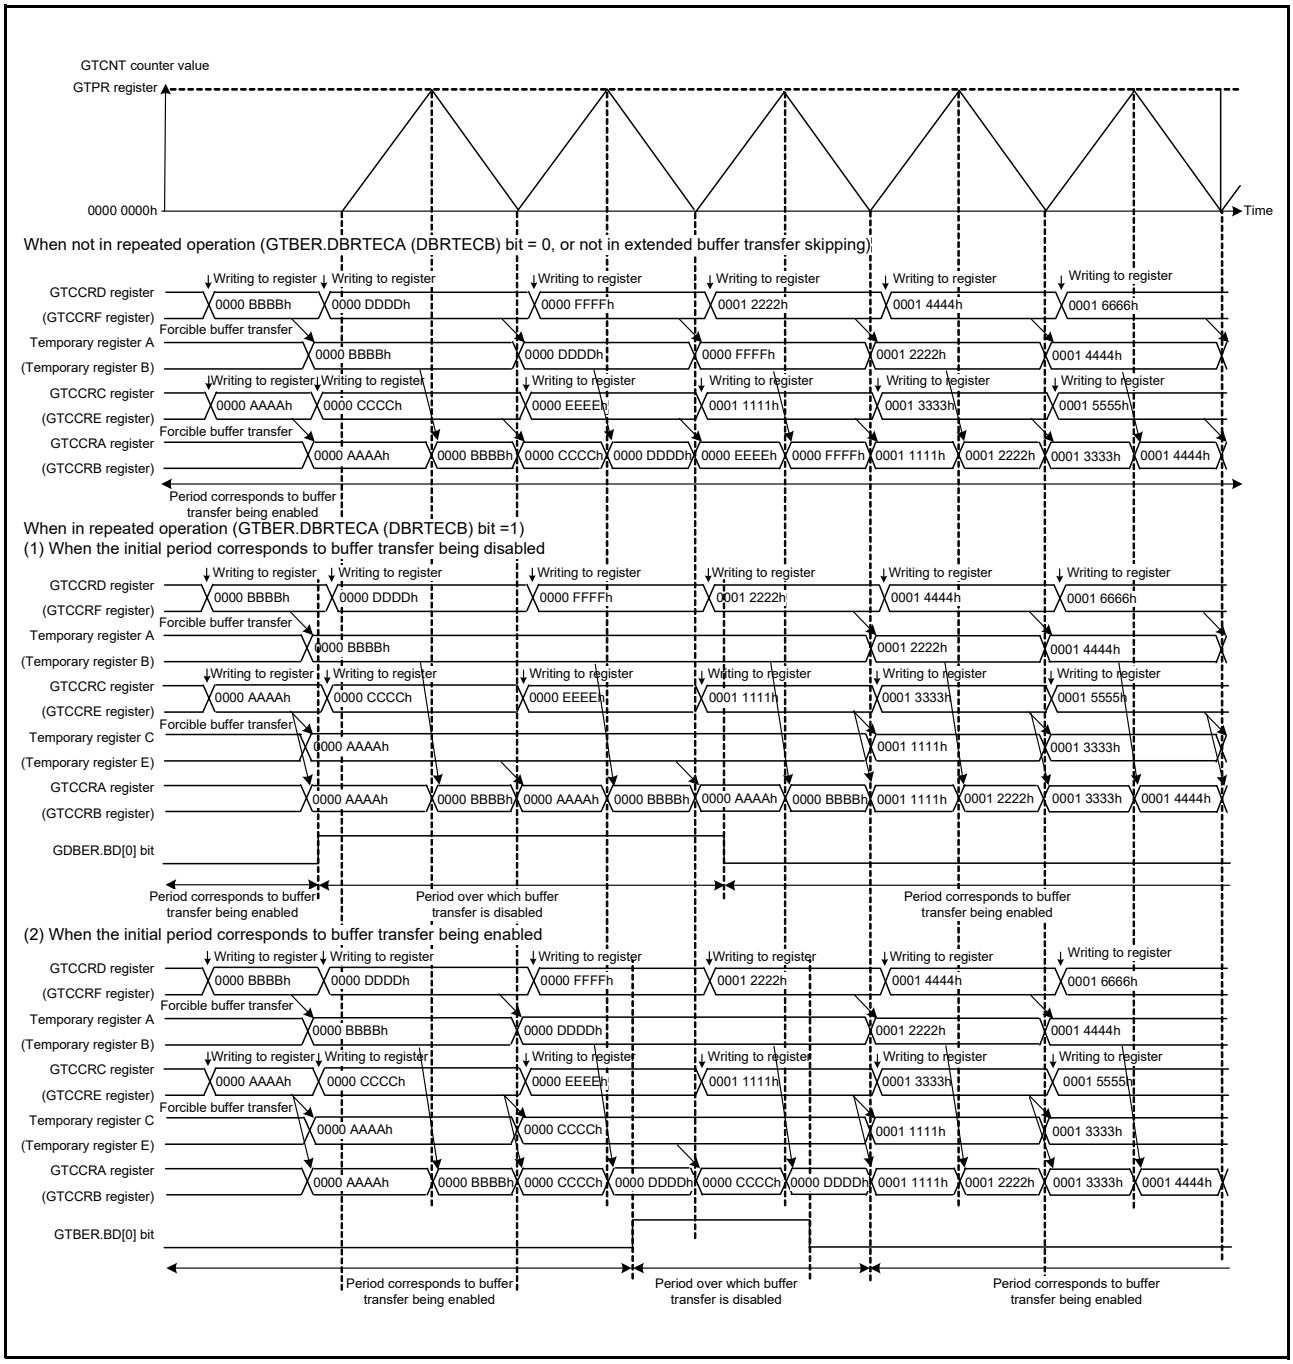

Figure 24.228 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Triangle-Wave PWM Mode 3, Updating the GTBER.BD[0] Bit)

24.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 15; m = A, B)

For protection from system failure, the output negate control which changes the GTIOCnm pin output forcibly by the output stop request from the POEG is provided.

Output protection is required when a dead-time error or the same output level being on the GTIOCnA and GTIOCnB pins is detected. At that time, the detection of disabling of output is output to the group of the POEG set in the GTINTAD.GRP[1:0] bits based on the setting of the output stop detection enable bits, i.e. the GRPDTE, GRPABH, and GRPABL bits in the GTINTAD register. The POEG takes the logical OR of detection of the types described above and other forms of detection of the disabling of output, and outputs requests for the disabling of output to the GPTW.

By setting the GTINTAD.GRP[1:0] bits, one output stop request can be selected out of four output stop requests which are input from the POEG as output stop request signal common in the GTIOCnA and GTIOCnB pins. Selected output stop request can be checked by reading the GTST.ODF flag.

The states of outputs at the time of control for their negation can be set with the GTIOR.OADF[1:0] bits for the GTIOCnA pin and with the GTIOR.OBDF[1:0] bits for the GTIOCnB pin.

Transition to the output negate condition by generating the output stop request from the POEG is performed asynchronously, while a release from the output negate condition by making the output stop request no longer satisfied is performed at the end of the cycle. The output negate condition is released no sooner than 3 GTCLK cycles after the output stop request is cleared. To reliably control output negation, clear the flag of POEG so that the output disable request is terminated at least 4 GTCLK cycles after it is generated.

To release the output stop condition during event count operation, in sawtooth-wave PWM mode 2, or without waiting the end of the cycle, set the OADF[1:0] bits to 00b for the GTIOCnA pin, and set the OBDF[1:0] bits to 00b for the GTIOCnB pin.

Figure 24.229 shows the output negate control operation for the GTIOCnm pin output.

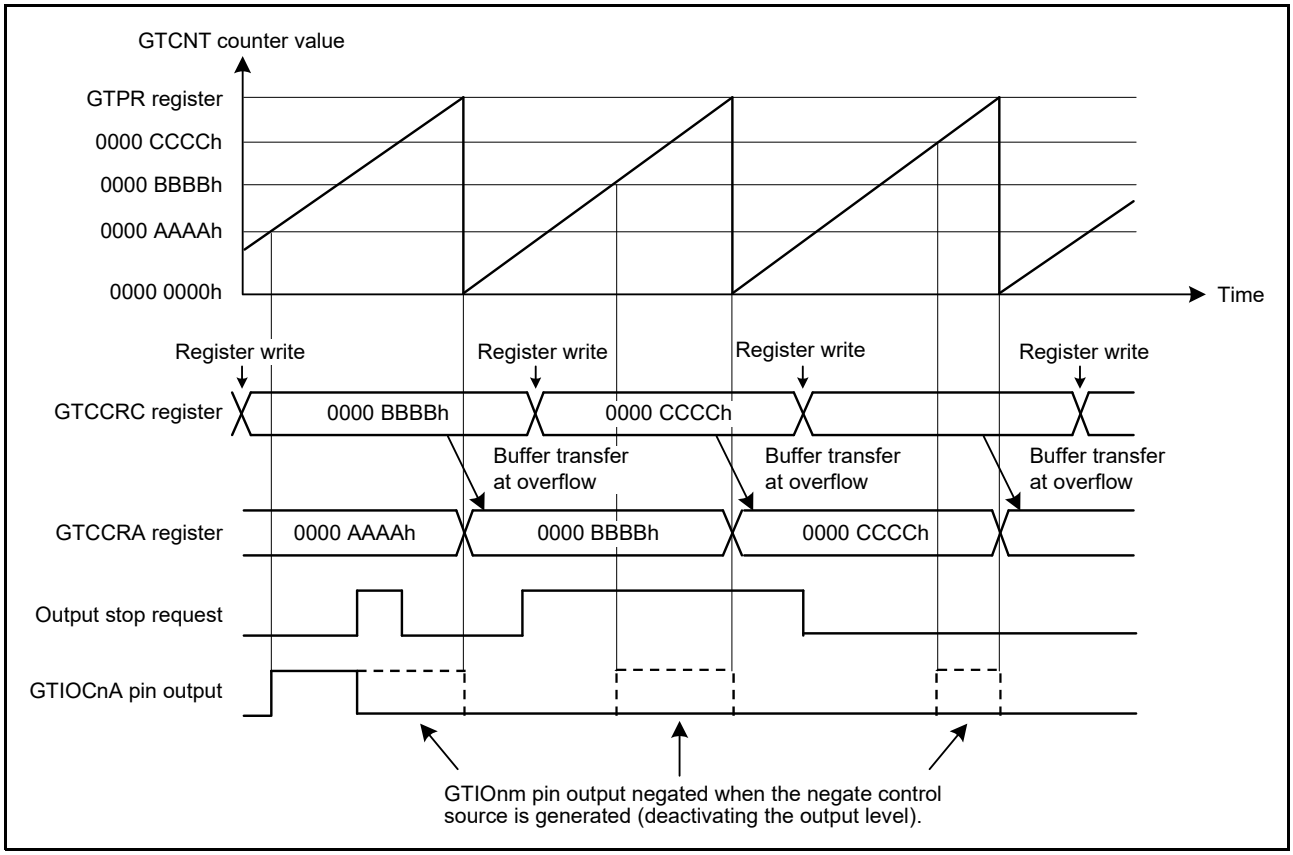

Figure 24.229 Example of Operation for GTIOCnm Pin Output Negate Control (Sawtooth-Wave Up-Counting, Buffer Operation, Active Level: High Output at GTCCRA Register Compare Match, Low Output at the End of the Cycle) and Low Output at Output Negate) (n = 0 to 15; m = A, B)

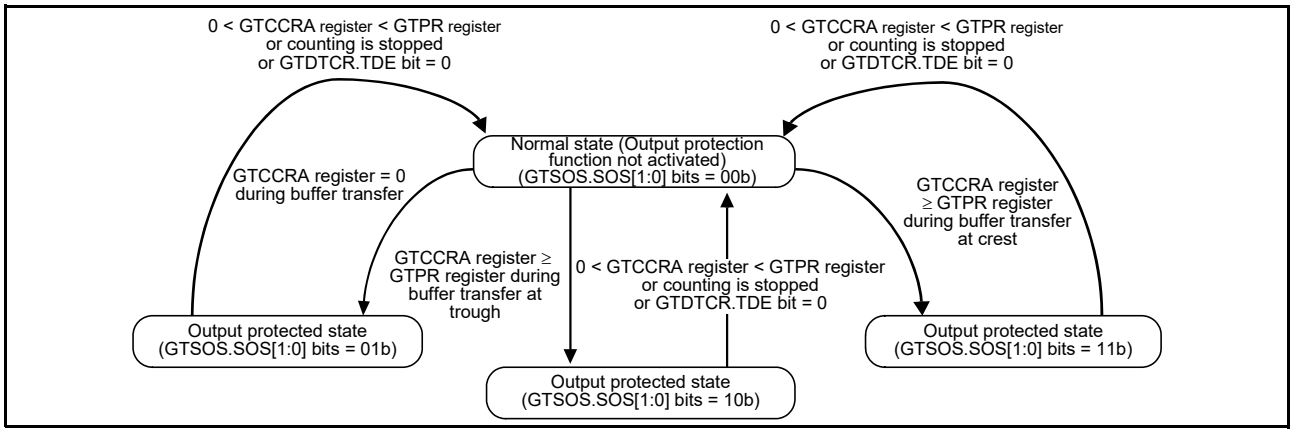
24.8.4 Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B)

To prepare for a case when an incorrect value (0000 0000h or a value greater than or equal to the GTPR register value) is set in the GTCCRA register, the output protection function for the GTIOCnm pin output (disabling function) is activated when the automatic dead time is set (GTDTCR.TDE bit = 1) in triangle-wave PWM mode.
The status of the output protection function can be read from the GTSOS.SOS[1:0] bits.
Figure 24.230 shows the output protection function state transition.



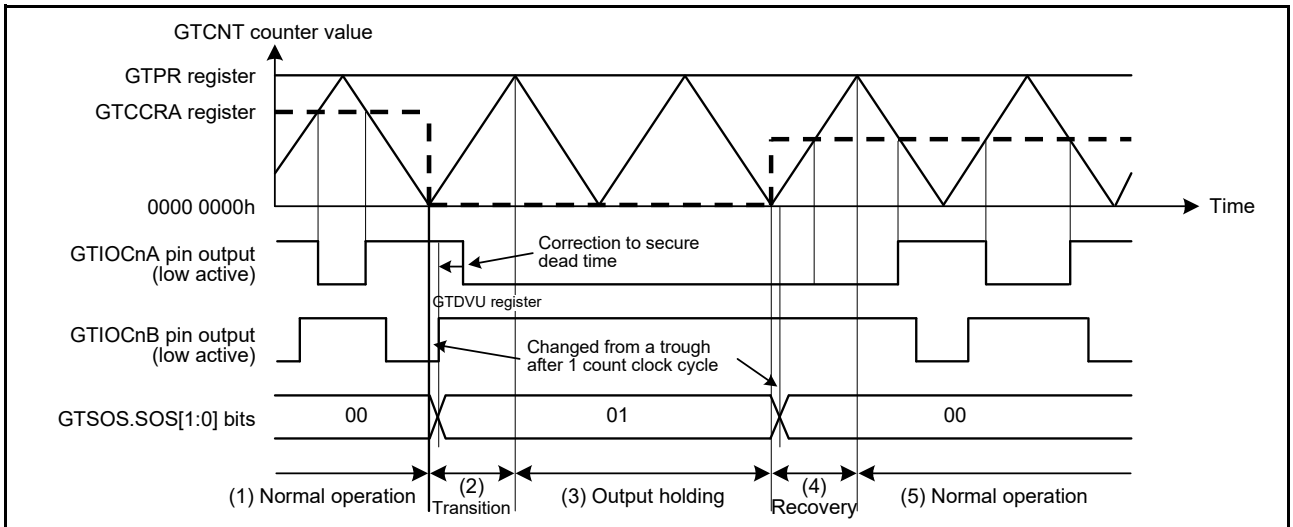


Figure 24.230 Output Protection Function

(1) Output Protection Function when the GTCCRA Register is Set to 0000 0000h during Buffer Transfer

Figure 24.231 and Figure 24.232 show examples of output protection function operation when the GTCCRA register is set to 0000 0000h during buffer transfer at troughs, and Figure 24.233 and Figure 24.234 show examples when the GTCCRA register is set to 0000 0000h during buffer transfer at crests.

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA register = 0 is detected in the trough, the output protection status changes to SOS[1:0] bits = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA register = 0.
(4) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 24.231 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

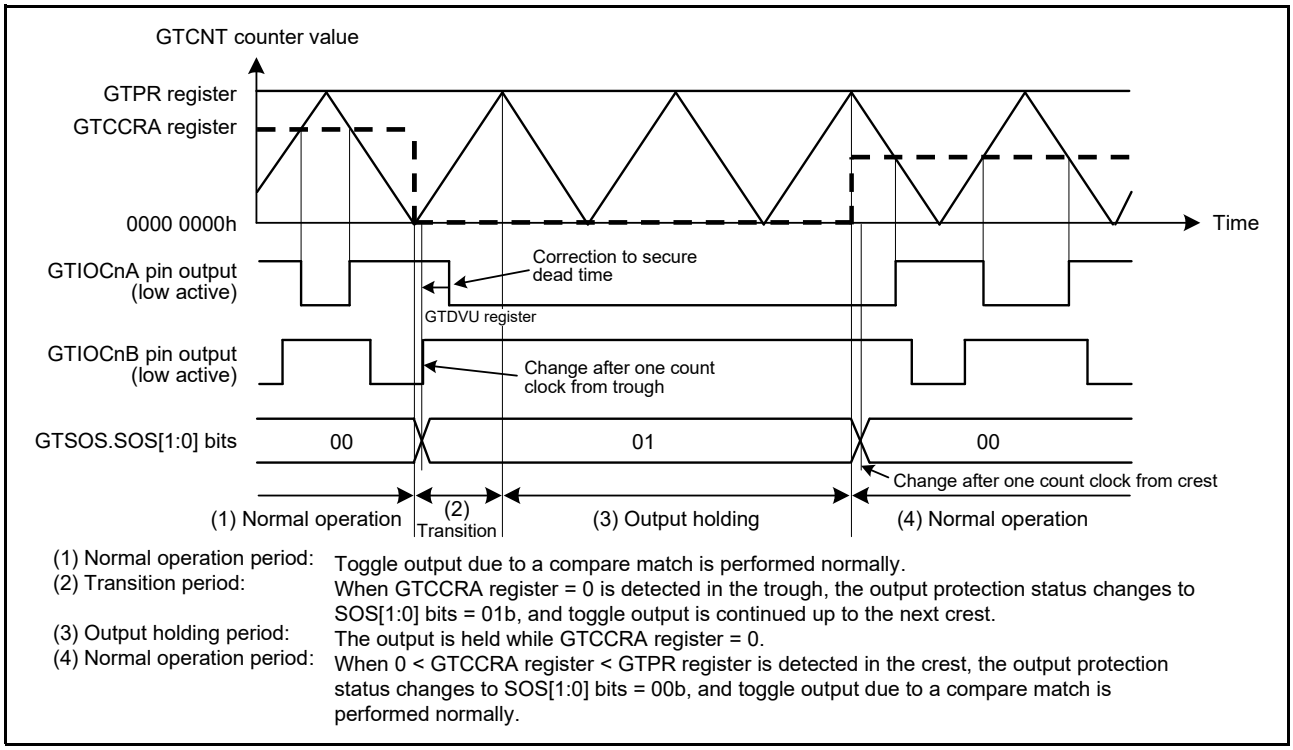

Figure 24.232 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

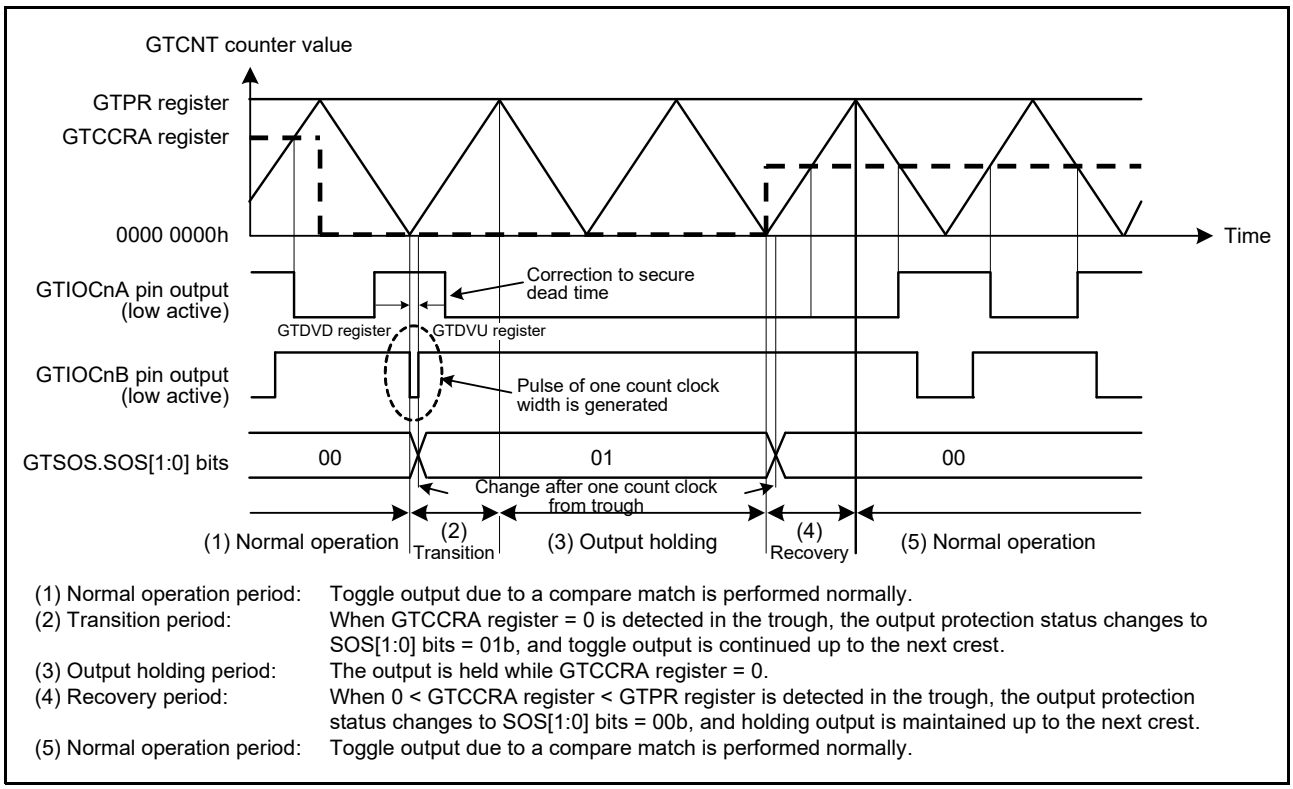

Figure 24.233 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

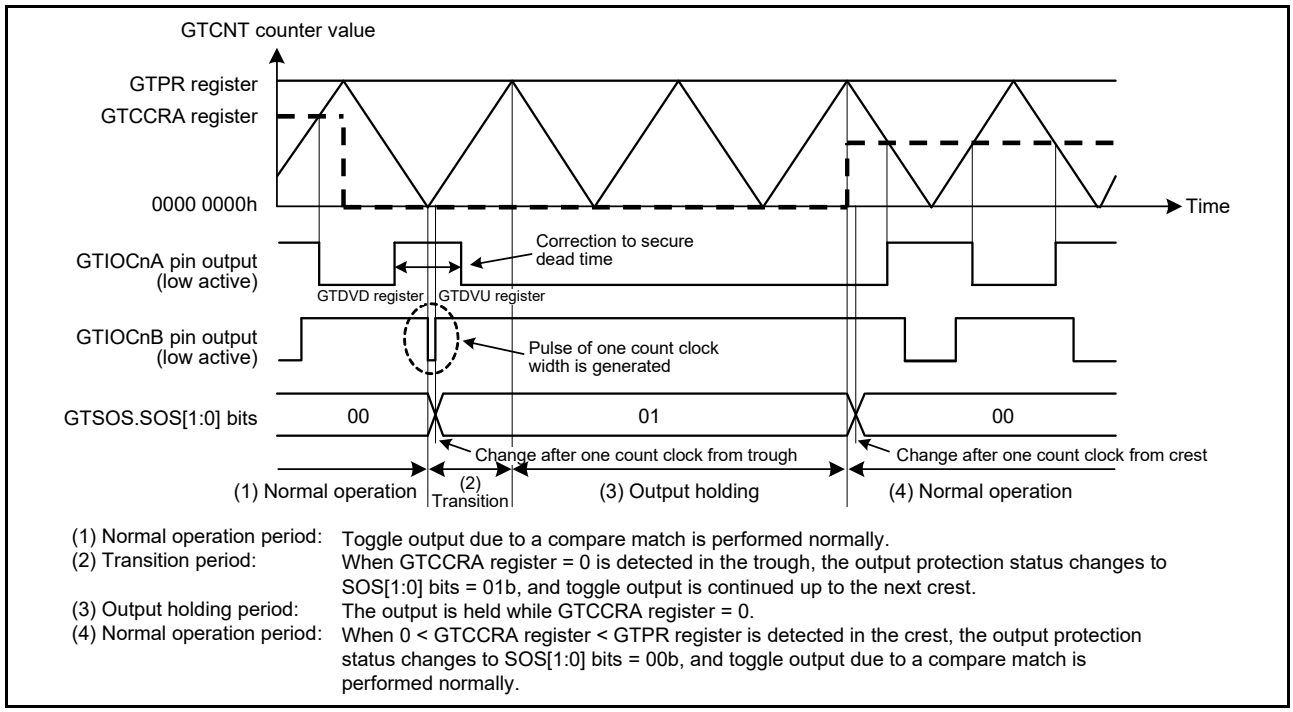

Figure 24.234 Example of Output Protection Function Operation When the GTCCRA Register is Set to 0000 0000h during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

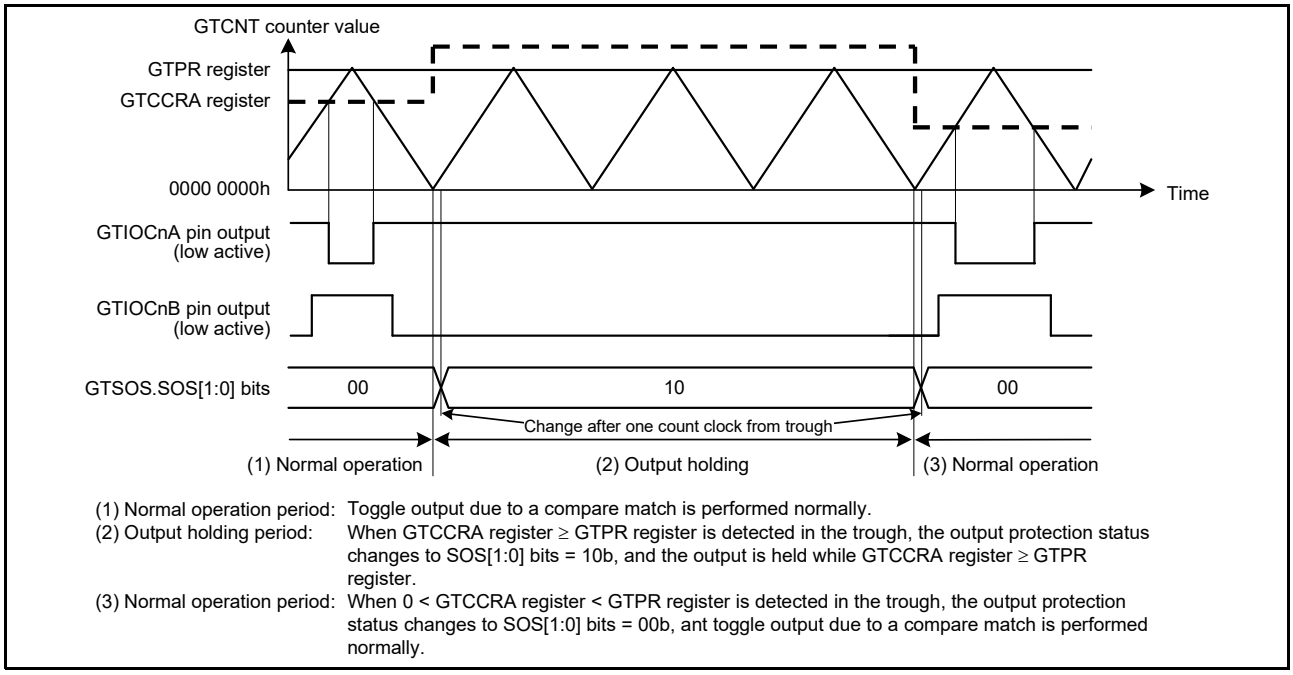
(2) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs

Figure 24.235 and Figure 24.236 show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at troughs.



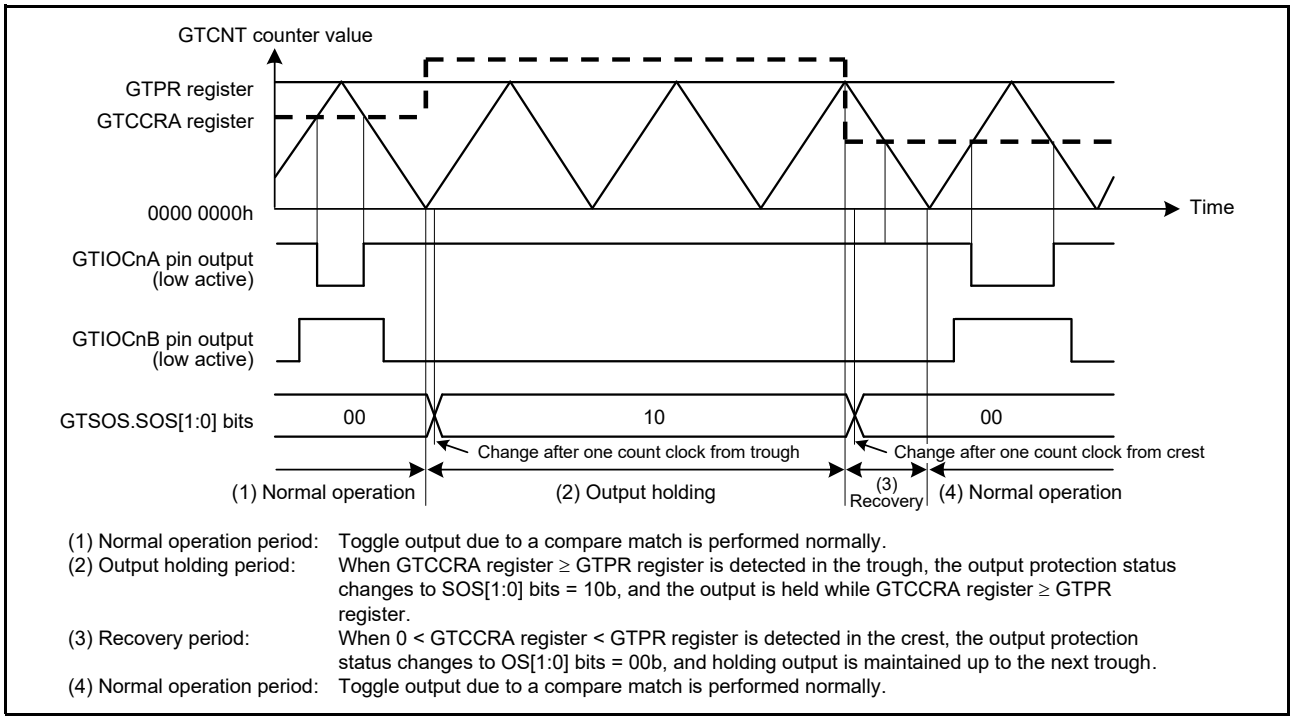


Figure 24.235 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

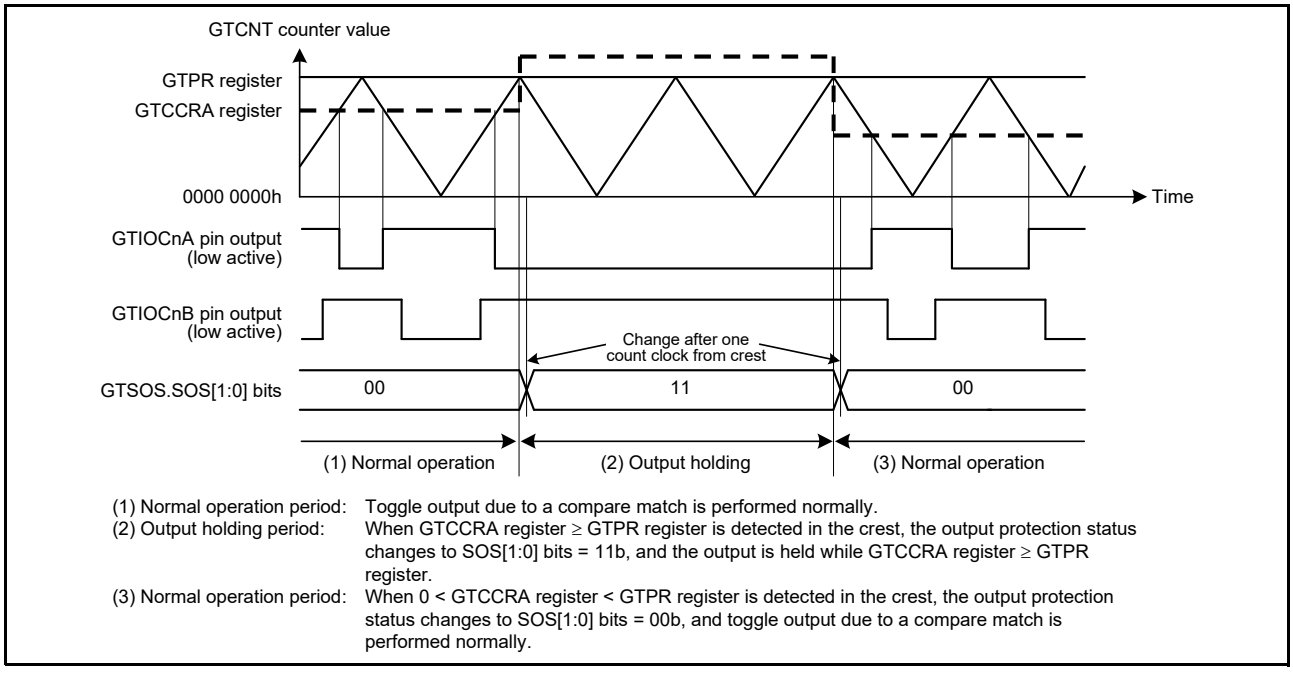

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Recovery period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to OS[1:0] bits = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 24.236 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

(3) Output Protection Function when GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests

Figure 24.237 and Figure 24.238 show examples of output protection function operation when GTCCRA register ≥ GTPR register is set during buffer transfer at crests.

(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA register ≥ GTPR register is detected in the crest, the output protection status changes to SOS[1:0] bits = 11b, and the output is held while GTCCRA register ≥ GTPR register.
(3) Normal operation period: When 0 < GTCCRA register < GTPR register is detected in the crest, the output protection status changes to SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 24.237 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 15)

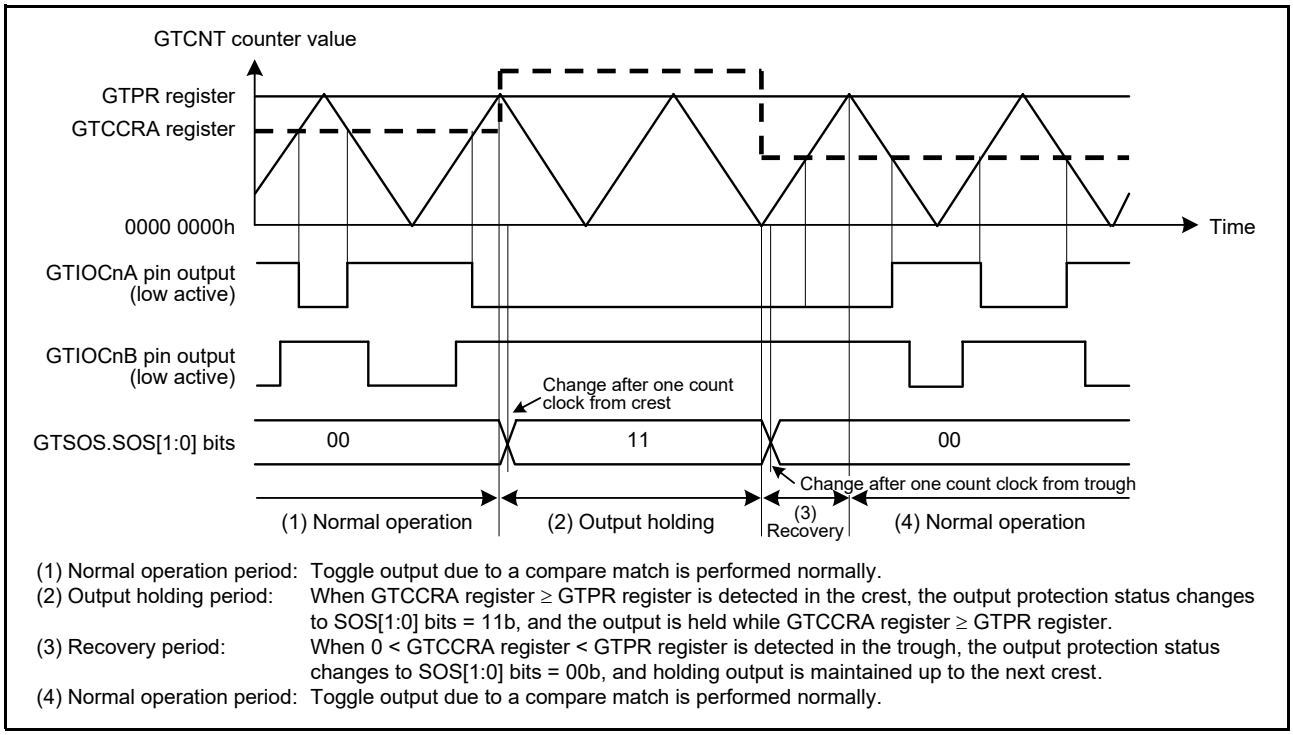

Figure 24.238 Example of Output Protection Function Operation When GTCCRA Register ≥ GTPR Register is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

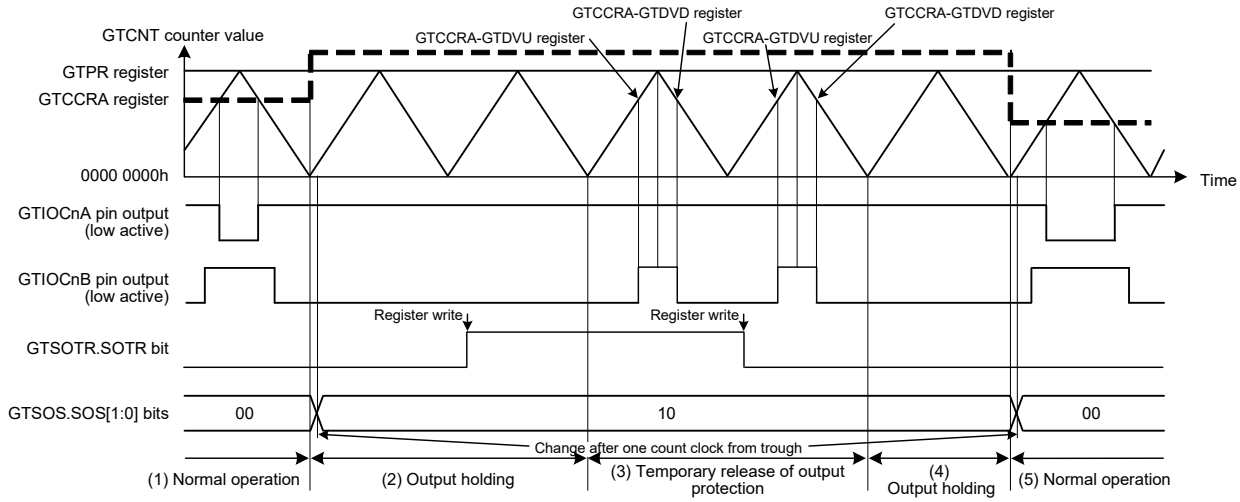

(4) Restricted Specification of Output Protection Function

Even if an incorrect value (0000 0000h or a value greater than or equal to the GTPR register value) is set in the GTCCRA register during count operation, the output protection functions in a specific way such that one of the positive- and negative-phase outputs becomes non-active. However, if the following condition is not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of count operation is greater than 0000 0000h, and less than the setting value of the GTPR register

(5) Temporary Release of Output Protection Function

When the GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA register ≥ GTPR register has occurred during transfer at trough), the protected state of the GTIOCnB pin output can be temporarily released by setting the GTSOTR.SOTR bit to 1. The SOS[1:0] bits retain 10b even if the output protection function is released.
When the SOTR bit is set to 0, the GTIOCnB pin output protection can be restarted.
Figure 24.239 shows an example of the operation of temporary release of output protection when the setting of the GTCCRA register ≥ GTPR register during buffer transfer at troughs.

(1) Normal operation period:	Toggle output due to a compare match is performed normally.
(2) Output holding period:	When GTCCRA register ≥ GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 10b, and the output is held while GTCCRA register ≥ GTPR register. Even when the SOTR bit is set to 1, the GTIOCnB pin output is held until the first trough.
(3) Output protection temporary release period:	After the SOTR bit is set to 1, the GTIOCnB pin output is performed normally from the first trough. Even after the SOTR bit is set to 0, temporary release of output protection for the GTIOCnB pin continues until the next trough.
(4) Output holding period:	The output is held until 0 < GTCCRA register < GTPR register is detected in the tough.
(5) Normal operation period:	When 0 < GTCCRA register < GTPR register is detected in the trough, the output protection status changes to SOS[1:0] bits = 00b, and toggle output due to a compare match is performed normally.

Figure 24.239 Example of the Operation of Temporary Release of Output Protection When the Setting of the GTCCRA Register ≥ GTPR Register during Buffer Transfer at Troughs (Restored to 0 < GTCCRA Register < GTPR Register during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 15)

24.9 Initialization Method of Output Pins

24.9.1 Pin Settings after Reset

The GPTW registers are initialized at a reset. Initialize the GPTW for output to the external pins by making the port mode settings and setting the OAE and OBE bits in the GTIOR register, and then start the counter counting.

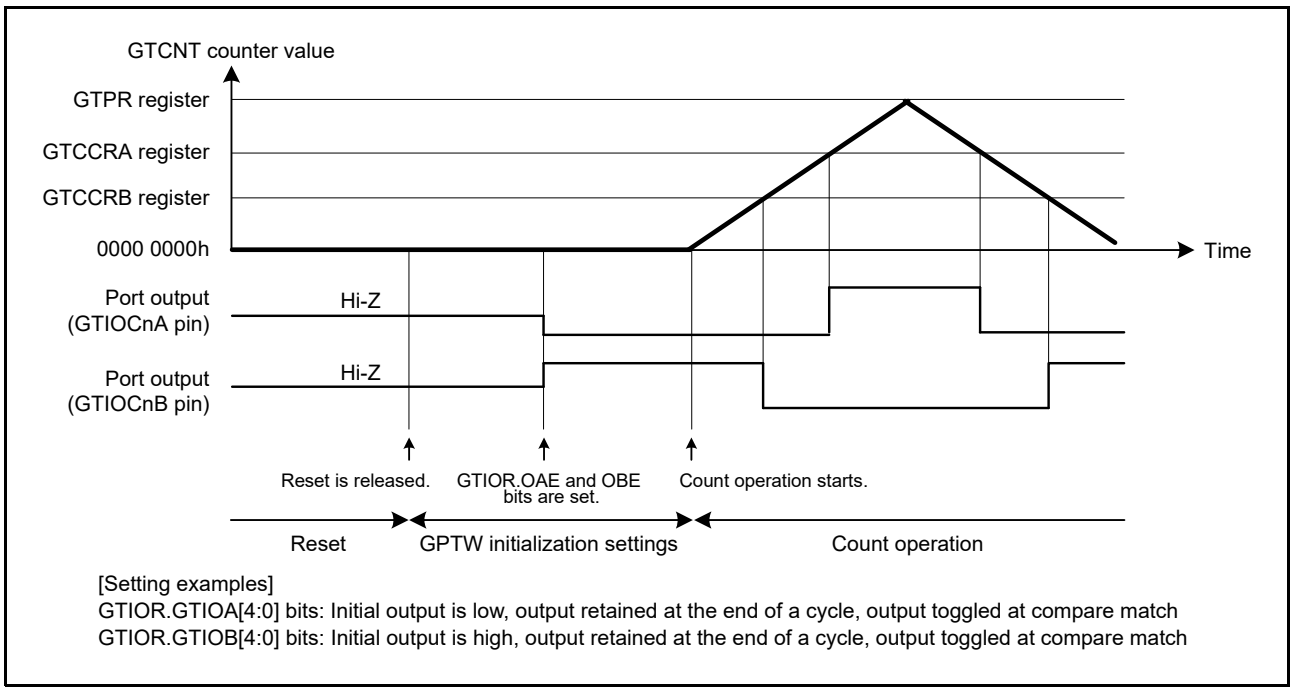

Figure 24.240 Example of Pin Settings after Reset (n = 0 to 15)

24.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPTW operation, the following four types of pin processing can be performed before pin initialization.

(1) Set OAHLD and OBHLD bits in the GTIOR register to 1 and retain the outputs at count stop.
(2) Set OAHLD and OBHLD bits to 0, specify arbitrary output values at OADFLT and OBDFLT bits in the GTIOR register, and output the arbitrary values at count stop.
(3) Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR, and PMR registers of the I/O port in advance. Set the OAE and OBE bits in the GTIOR register to 0 and the control bit in PMR register that corresponds to the pin to 0 to allow the arbitrary values to be output from the pin set as a general output port when an error occurs.
(4) Drive the output to a high impedance state using the POEG function.

When automatic dead time setting is enabled, set the GTDTCR.TDE bit to 0 once after counting is stopped.
When counting is stopped, only the values of registers that are changed by a GPTW external source will change. If counting is resumed, operation will carry on from where it was stopped.
If counting is stopped, registers should be initialized before restarting the count operation.

24.10 Usage Notes

24.10.1 Module Stop Function Setting

Operation of the GPTW can be disabled or enabled by the module stop control register. The initial setting is for operation of the GPTW to be halted. Register access is enabled by clearing module stop state. For details, see section 11, Low Power Consumption.

24.10.2 Settings of the GTCCRm Register during Compare Match Operation (m = A to F)

(1) When Automatic Dead Time Setting has been Made in Triangle-Wave PWM Mode

The GTCCRA register should satisfy the following conditions:

GTCCRA register > GTDVU register,
GTCCRA register > GTDVD register, and
GTCCRA register < GTPR register.

When the GTCCRA register is set to 0000 0000h or a value greater than or equal to the GTPR register value during count operation, the output protection function is activated.
However, if the following conditions are not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of count operation is 0000 0001h or greater, and less than the setting value of the GTPR register

For details, refer to section 24.8.4, Output Protection Function for GTIOCnm Pin Output (n = 0 to 15; m = A, B).

(2) When Automatic Dead Time Setting has not been Made in Triangle-Wave PWM Mode

Set a value greater than 0000 0000h, and less than the setting value of the GTPR register in the GTCCRA register. When 0000 0000h or the same value as that of the GTPR register is set in the GTCCRA register, compare match is generated in one cycle only when [GTCCRA register = 0000 0000h] or [GTCCRA register = GTPR register] is met. Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRA register, compare match does not occur. Similarly, set a value greater than 0000 0000h, and less than the setting value of the GTPR register in the GTCCRB register. When 0000 0000h or the same value as that of the GTPR register is set in the GTCCRB register, compare match is generated in one cycle only when [GTCCRB register = 0000 0000h] or [GTCCRB register = GTPR register] is met. Furthermore, a value exceeding the setting value of the GTPR register is set in the GTCCRB register, compare match does not occur.

(3) When Automatic Dead Time Setting has been Made in Sawtooth-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers should be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time may not be obtained.

- In up-counting:
  GTCCRC register < GTCCRD register
  GTCCRC register > GTDVU register
  GTCCRD register < GTPR register – GTDVD register
- In down-counting:
  GTCCRC register > GTCCRD register
  GTCCRC register < GTPR register – GTDVU register
  GTCCRD register > GTDVD register

(4) When Automatic Dead Time Setting has not been Made in Sawtooth-Wave One-Shot Pulse Mode

The GTCCRC and GTCCRD registers should be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC register < GTCCRD register < GTPR register
- In down-counting: GTPR register > GTCCRC register > GTCCRD register > 0

Similarly, GTCCRE and GTCCRF registers should be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE register < GTCCRF register < GTPR register
- In down-counting: GTPR register > GTCCRE register > GTCCRF register > 0

(5) In Sawtooth-Wave PWM Mode 1

The GTCCRA register should be set with the range of 0000 0000h < GTCCRA register < GTPR register. If GTCCRA register = 0000 0000h or GTCCRA register = GTPR register is set, a compare match occurs within the cycle only when GTCCRA register = 0000 0000h or GTCCRA register = GTPR register is satisfied. If GTCCRA register > GTPR register is set, no compare match occurs.
Similarly, GTCCRB register should be set with the range of 0000 0000h < GTCCRB register < GTPR register. If GTCCRB register = 0000 0000h or GTCCRB register = GTPR register is set, a compare match occurs within the cycle only when GTCCRB register = 0000 0000h or GTCCRB register = GTPR register is satisfied. If GTCCRB register > GTPR register is set, no compare match occurs.

(6) In Complementary PWM mode 1, 2, 3

The GTCCRn register must be set with the range of 0 ≤ GTCCRn ≤ GTPR + GTDVU.

(7) In Complementary PWM mode 4

In single buffer operation, the GTCCRn register must be set with the range of 0 ≤ GTCCRn ≤ GTPR + GTDVU.
In double buffer operation, the GTCCRn register must be set with the range of GTDVU < GTCCRn < GTPR.

24.10.3 Range of Settings for the GTPBR and GTPDBR Registers in the Complementary PWM Mode

When buffer transfer with the use of the GTPR register is to proceed at the end of a crest section in complementary PWM mode 1, 3, or 4, set the GTPBR and GTPDBR registers so that the GTPR register is within the following range after the transfer.
The range consists of values no less than the GTCNT counter value of the master channel at the end of a crest section, that is, the GTPR register before the transfer – the GTDVU register (GTPBR register ≥ GTPR register – GTDVU register, GTPDBR register ≥ GTPR register – GTDVU register)
When buffer transfer with the use of the GTPR register is to proceed at the end of a trough section or on counter clearing, no restriction applies to the ranges of settings for the GTPBR and GTPDBR registers.

24.10.4 Setting Range of the GTCNT Counter

Other than the sawtooth-wave PWM mode 2 and complementary PWM mode, set the range of the GTCNT counter within the range of 0 ≤ GTCNT counter ≤ GTPR register.

24.10.5 The GTCNT Counter Start/Stop

The GTCNT counter start/stop control by the GTCR.CST bit is synchronized with the count clock selected by the GTCR.TPCS[3:0] bits. Since the GTCNT counter starts or stops after one count clock cycle selected by the TPCS[3:0] bits following the CST bit updating, events until the GTCNT counter actually starts are ignored, and events may be generated after the CST bit becomes 0.
Similarly, when synchronizing with the timer-internal synchronization signal of the timer-linked synchronization signal output function, since the GTCNT counter starts or stops after timer-internal synchronization signal selected by the GTSYNCFCR.SYST bits, events until the GTCNT counter actually starts are ignored, and events may be accepted and the interrupt may be generated after the GTCR.CST bit becomes 0.

24.10.6 Order of Priority in Events

(1) GTCNT Counter

Order of priority in events to update the GTCNT counter is shown below.

Table 24.44 Order of Priority in Updating GTCNT Counter

The GTCNT counter updating source	Order of priority
CPU writing (GTCNT counter writing/GTCLR register writing)	High
Clearing by a hardware source set by the GTCSR register	↑
Up-counting/down-counting by a hardware source set by the GTUPSR and GTDNSR registers	↑
Count operation	Low

In case of contention between up-counting by the GTUPSR register and down-counting by the GTDNSR register, the counter value is not updated.
When updating of the GTCNT counter conflicts with reading by the CPU, the value before updating is reflected.

(2) The GTCR.CST Bit

In case that start/stop by a hardware source set by the GTSSR and GTPSR registers conflicts with the CPU writing (GTCR register writing/GTSTR register writing /GTSTP register writing), the CPU writing takes priority.
In case that stop by the cycle count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the cycle count operation is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.
In case of contention between start by a hardware source set by the GTSSR register and stop by a hardware source set by the GTPSR register, the state of the CST bit does not change.
In case of contention between the CST bit updating and the CPU reading (GTCR register reading/GTSTR register reading /GTSTP register reading), data before updating is read.

(3) GTCCRm Register (m = A to F)

In case of contention between the GTCCRm register writing and an input capture/buffer transfer, the GTCCRm register writing takes priority over an input capture/buffer transfer.
In case that an input capture conflicts with the CPU writing or the counter updating by a hardware source, the counter value before updating is captured.
In case of contention between the GTCCRm register updating and the CPU reading, data before updating is read.

(4) GTPR Register

In case of contention between a buffer transfer and the GTPR register writing, the GTPR register writing takes priority over a buffer transfer.
In case of contention between the GTPR register updating and the CPU reading, data before updating is read.

(5) GTADTRm Register (m = A, B)

In case of contention between a buffer transfer and the GTADTRm register writing, the GTADTRm register writing takes priority over a buffer transfer.
In case of contention between the GTADTRm register updating and the CPU reading, data before updating is read.

(6) GTDVm Register (m = U, D)

In case of contention between a buffer transfer and the GTDVm register writing, the GTDVm register writing takes priority over a buffer transfer.
In case of contention between the GTDVm register updating and the CPU reading, data before updating is read.

(7) GTIOR.GTIOm bit (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTIOR.GTIOm bit, writing to GTIOR.GTIOm bit has priority over buffer transfer operation.
When there is a conflict between updating the GTIOR.GTIOm bit and reading by the CPU, pre-update data is read.

24.10.7 Note on Counter Clearing in the Complementary PWM Mode

Counter clearing at the end of a trough section or the end of the initial output section must be avoided in the complementary PWM mode. This can be achieved by using synchronous clearing in response to a match in comparison in another channel set as the source of the trigger, as described in section 24.3.9.3, Synchronous Clear Operation by Inter Channel Cooperation. When using counter clearing other than as stated above, adjust the timing of the operations to avoid counter clearing at the end of a trough section or the end of the initial output section.

24.10.8 Note on Disabling PWM Initial Output After Synchronous Clearing in the Complementary PWM Mode

When initial output on the GTIOCnA and GTIOCnB pins after synchronous clearing in a trough section in the complementary PWM mode has been disabled by setting the GTIOR.CPSCIR bit to 1, the respective values set in the compare match registers (the GTCCRA, GTCCRC, GTCCRD,GTCCRE, and GTCCRF registers) must be more than twice that of the GTDVU register.

24.10.9 Correspondence to Count Switch Operation of Each Function

Some functions cannot be used at the same time as the count switch operation. Table 24.45 shows the availability of each function at the same time as the count switch operation.

Table 24.45 Availability of Each Function at the Same Time as the Count Switch Operation (1/2)

Function	Availability at the same time as the count switch operation
Counter Start/Count Stop	Available
Periodic Count Operation	Available
Event Count Operation	Not available
Counter Clear Operation	Available
Compare Match Function	Available
Input Capture Function	Available
GTIOCnA/B input/output pin polarity reversal function	Available
Buffer Operation	Available
Sawtooth-Wave PWM Mode 1	Not available
Sawtooth-Wave PWM Mode 2	Not available

Table 24.45 Availability of Each Function at the Same Time as the Count Switch Operation (2/2)

Function	Availability at the same time as the count switch operation
Sawtooth-Wave One-Shot Pulse Mode	Not available
Triangle-Wave PWM Mode 1	Available
Triangle-Wave PWM Mode 2	Available
Triangle-Wave PWM Mode 3	Available
Complementary PWM Mode 1	Not available
Complementary PWM Mode 2	Not available
Complementary PWM Mode 3	Not available
Complementary PWM Mode 4	Not available
Automatic Dead Time Setting Function	Not available
Count Direction Changing Function	Not available
Function of Output Duty 0% and 100%	Not available
Hardware Count Start/Count Stop and Clear Operation	Available
Synchronous Operation	Available
PWM Output Operation	Available
Cycle Count Function	Not available
Phase Counting Mode	Not available
External pulse width measuring function	Not available
Output Phase Switching (OPS)	Not available
Inter Channel Logical Operation Function	Available
Timer-linked synchronization signal output function	Not available
Interrupt Sources	Available
DMAC/DTC Activation	Available
Interrupt Skipping Function	Not available
A/D Conversion Start Request	Available
Operations Linked by the ELC	Available
Noise Filter Function	Available
Write-Protection for Registers	Available
Simultaneous Control of Buffer Operations of Multiple Channels	Available
Repeated Double-Buffered Operation	Not available
GTIOCnm Pin Output Negate Control	Available
Output Protection Function for GTIOCnm Pin Output	Not available
Initialization Method of Output Pins	Available

24.10.10 Note on Transitions to Software Standby Mode

Only place the MCU in software standby mode after having ensured that no counter start source events will be generated and then stopped counting by setting the GTCR.CST bit to 0.

24.10.11 Interval between Interrupt Requests

When GPTCLK is selected as the GPTW counter reference clock (GTCLK), interrupts may be lost if the interval between the interrupt signals from the same source is shorter than the value obtained from the equation below. Note that this restriction does not apply to interrupt signals from different sources.

Interrupt interval (ns) = GPTCLK period (ns) × 6 + PCLKA period (ns) × 4

In addition, when the combination of the selected GPTW and ADC clocks is any of those indicated in Table 24.46, A/D conversion start requests may be lost if the interval between the A/D conversion start requests due to the same event is shorter than the value obtained from the equation below. Note that this restriction does not apply to requests due to different events.

Event interval (ns) = GPTCLK period (ns) × 6 + ADCLK period (ns) × 4

Table 24.46 Clock Combinations that Impose a Restriction on the Event Interval

GTCLK	ADCLK
GPTCLK	PCLKA or ADCCLK
PCLKD	ADCCLK or GPTCLK

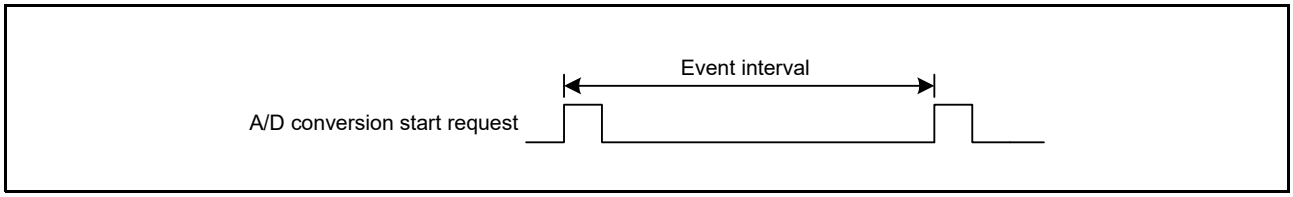

Figure 24.241 Example of an Interval between A/D Conversion Start Request Events

25. High Resolution PWM Waveform Generation Circuit (HRPWMb)

25.1 Overview

This MCU has a high resolution PWM waveform generation circuit (HRPWM0) which finely adjusts a PWM waveform generated by GPTW0 to GPTW3 with a resolution of at least around 49 ps. Using the HRPWM, a digital power supply control with high conversion efficiency can be realized. Table 25.1 lists the specifications of the HRPWM, Figure 25.1 shows a block diagram, and Table 25.2 lists the I/O pins.

Table 25.1 Specifications of the HRPWM

Item	Description
Function	• A maximum of four channels of complementary PWM waveforms are finely adjusted at high resolution. • Using a delay locked loop (DLL) circuit, a high resolution of 1/64 or 1/128 times of a GTCLK period (minimum of around 49 ps) is achieved. • Timing for rising and falling of the PWM waveform can be adjusted individually.*1 • A waveform generated by the GPTW can be output directly by bypassing the HRPWM.
Operating clock (GTCLK)	Either PCLKD or GPTCLK can be selected by setting the GPTW register.
Operating frequency (f(GTCLK))	80 to 200 MHz
Protect Zone filter	Security attribute can be set.*2

Note 1. Adjustment of timing for rising and falling of PWM signals which are output from the GPTW0 to GPTW3 is realized by a delay of a resolution of 1/64 or 1/128 times of a GTCLK period.

Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

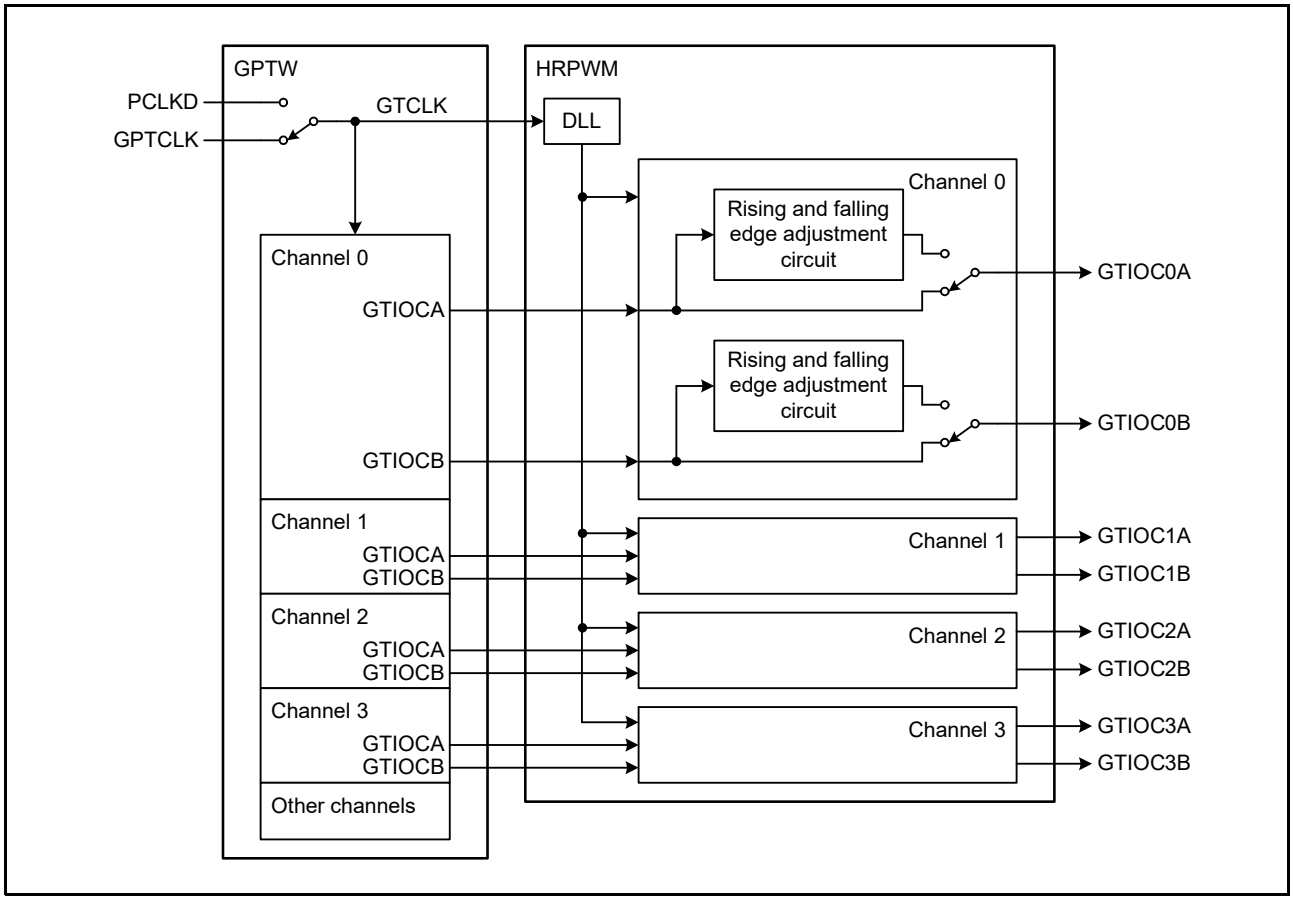

Figure 25.1 Block Diagram of the HRPWM

Table 25.2 I/O Pins of the HRPWM

Pin Name	I/O	Function
GTIOC0A	Output	High resolution output of a PWM waveform generated by the GPTW0
GTIOC0B	Output	High resolution output of a PWM waveform generated by the GPTW0
GTIOC1A	Output	High resolution output of a PWM waveform generated by the GPTW1
GTIOC1B	Output	High resolution output of a PWM waveform generated by the GPTW1
GTIOC2A	Output	High resolution output of a PWM waveform generated by the GPTW2
GTIOC2B	Output	High resolution output of a PWM waveform generated by the GPTW2
GTIOC3A	Output	High resolution output of a PWM waveform generated by the GPTW3
GTIOC3B	Output	High resolution output of a PWM waveform generated by the GPTW3

25.2 Register Descriptions

25.2.1 HRPWM Operation Control Register (HROCR)

Address(es): HRPWM0.HROCR 8742 4000h, HRPWM0_NS.HROCR 0742 4000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	FRANGE	—	—	—	—	—	—	HRRST	DLLEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DLLEN	DLL Operation Enable	0: DLL operation is disabled 1: DLL operation is enabled	R/W
b1	HRRST	High Resolution PWM Waveform Generation Circuit Reset	0: Release from reset 1: Reset	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	FRANGE	Operating Clock Frequency Range Setting	0: 80 to 160 MHz (resolution: 1/128 times of the period) 1: 155 to 200 MHz (resolution: 1/64 times of the period)	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register controls the operation of the entire HRPWM module. The register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTW0.GTWP.WP = 0).

DLLEN Bit (DLL Operation Enable)

This bit selects whether the internal DLL in the HRPWM is activated or not. After activation, wait for 20 µs until the output of the DLL becomes stable.

HRRST Bit (High Resolution PWM Waveform Generation Circuit Reset)

This bit resets the internal state of the HRPWM. After releasing from reset, wait for five cycles of GTCLK. When resetting during operation, the PWM output is fixed to low after five cycles of GTCLK.

FRANGE Bit (Operating Clock Frequency Range Setting)

This bit is used to set the frequency range of the HRPWM operating clock. Set this bit when the DLLEN bit is 0. The resolution of the delay time is determined by the setting of this bit.

25.2.2 HRPWM Operation Control Register 2 (HROCR2)

Address(es): HRPWM0.HROCR2 8742 4002h, HRPWM0_NS.HROCR2 0742 4002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	HRDIS3	HRDIS2	HRDIS1	HRDIS0	—	—	—	—	HRSEL3	HRSEL2	HRSEL1	HRSEL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	HRSEL0	Channel 0 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW0 from the GTIOC0A and GTIOC0B pins 1: Output a high resolution PWM waveform from the GTIOC0A and GTIOC0B pins	R/W
b1	HRSEL1	Channel 1 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW1 from the GTIOC1A and GTIOC1B pins 1: Output a high resolution PWM waveform from the GTIOC1A and GTIOC1B pins	R/W
b2	HRSEL2	Channel 2 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW2 from the GTIOC2A and GTIOC2B pins 1: Output a high resolution PWM waveform from the GTIOC2A and GTIOC2B pins	R/W
b3	HRSEL3	Channel 3 High Resolution PWM Waveform Output Select	0: Output an original PWM waveform generated by the GPTW3 from the GTIOC3A and GTIOC3B pins 1: Output a high resolution PWM waveform from the GTIOC3A and GTIOC3B pins	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	HRDIS0	Channel 0 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 0 rising and falling edge adjustment circuit 1: Disable operation of Channel 0 rising and falling edge adjustment circuit	R/W
b9	HRDIS1	Channel 1 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 1 rising and falling edge adjustment circuit 1: Disable operation of Channel 1 rising and falling edge adjustment circuit	R/W
b10	HRDIS2	Channel 2 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 2 rising and falling edge adjustment circuit 1: Disable operation of Channel 2 rising and falling edge adjustment circuit	R/W
b11	HRDIS3	Channel 3 Rising and Falling Edge Adjustment Circuit Disable	0: Enable operation of Channel 3 rising and falling edge adjustment circuit 1: Disable operation of Channel 3 rising and falling edge adjustment circuit	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register controls the HRPWM module by channel. The register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTW0.GTWP.WP = 0).

HRSELn Bit (Channel n High Resolution PWM Waveform Output Select) (n = 0 to 3)

This bit allows to select whether to output a waveform generated by the HRPWM from the GTIOCnA and GTIOCnB pins or to output an original waveform of the GPTW by bypassing the circuit.
The PWM waveform generated by the HRPWM is output with a delay of three full cycles of GTCLK from the output when the circuit is bypassed, even if the setting for the amount of delay is 0.

HRDISn Bit (Channel n Rising and Falling Edge Adjustment Circuit Disable) (n = 0 to 3)

This bit enables/disables the operation of the rising and falling edge adjustment circuit by relevant channel in the GPTW.

Set this bit to 1 for a channel which will not be used.

25.2.3 GTIOCnA Pin Rising Edge Adjustment Register (HRREARnA) (n = 0 to 3)

Address(es): HRPWM0.HRREAR0A 8742 4018h, HRPWM0.HRREAR1A 8742 401Ch, HRPWM0.HRREAR2A 8742 4020h, HRPWM0.HRREAR3A 8742 4024h,
HRPWM0_NS.HRREAR0A 0742 4018h, HRPWM0_NS.HRREAR1A 0742 401Ch, HRPWM0_NS.HRREAR2A 0742 4020h, HRPWM0_NS.HRREAR3A 0742 4024h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DLY[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to rising edge of a PWM waveform output from the GTIOCnA pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).
This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.2.4 GTIOCnA Pin Falling Edge Adjustment Register (HRFEARnA) (n = 0 to 3)

Address(es): HRPWM0.HRFEAR0A 8742 4028h, HRPWM0.HRFEAR1A 8742 402Ch, HRPWM0.HRFEAR2A 8742 4030h, HRPWM0.HRFEAR3A 8742 4034h,
HRPWM0_NS.HRFEAR0A 0742 4028h, HRPWM0_NS.HRFEAR1A 0742 402Ch, HRPWM0_NS.HRFEAR2A 0742 4030h, HRPWM0_NS.HRFEAR3A 0742 4034h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DLY[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to falling edge of a PWM waveform output from the GTIOCnA pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.2.5 GTIOCnB Pin Rising Edge Adjustment Register (HRREARnB) (n = 0 to 3)

Address(es): HRPWM0.HRREAR0B 8742 401Ah, HRPWM0.HRREAR1B 8742 401Eh, HRPWM0.HRREAR2B 8742 4022h, HRPWM0.HRREAR3B 8742 4026h,
HRPWM0_NS.HRREAR0B 0742 401Ah, HRPWM0_NS.HRREAR1B 0742 401Eh, HRPWM0_NS.HRREAR2B 0742 4022h, HRPWM0_NS.HRREAR3B 0742 4026h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	DLY[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to rising edge of a PWM waveform output from the GTIOCnB pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.2.6 GTIOCnB Pin Falling Edge Adjustment Register (HRFEARnB) (n = 0 to 3)

Address(es): HRPWM0.HRFEAR0B 8742 402Ah, HRPWM0.HRFEAR1B 8742 402Eh, HRPWM0.HRFEAR2B 8742 4032h, HRPWM0.HRFEAR3B 8742 4036h, HRPWM0_NS.HRFEAR0B 0742 402Ah, HRPWM0_NS.HRFEAR1B 0742 402Eh, HRPWM0_NS.HRFEAR2B 0742 4032h, HRPWM0_NS.HRFEAR3B 0742 4036h

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	DLY[6:0]	Amount of Delay Select	• When the HROCR.FRANGE bit is 0 b6 b0 0000000: Apply delay of 0/128 times GTCLK period 0000001: Apply delay of 1/128 times GTCLK period 0000010: Apply delay of 2/128 times GTCLK period : : 1111110: Apply delay of 126/128 times GTCLK period 1111111: Apply delay of 127/128 times GTCLK period • When the HROCR.FRANGE bit is 1 b6 b0 0000000: Apply delay of 0/64 times GTCLK period 0000010: Apply delay of 1/64 times GTCLK period 0000100: Apply delay of 2/64 times GTCLK period : : 1111100: Apply delay of 62/64 times GTCLK period 1111110: Apply delay of 63/64 times GTCLK period xxxxxx1: Setting prohibited	R/W
b15 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register specifies the amount of delay to apply to falling edge of a PWM waveform output from the GTIOCnB pin. For the transfer timing of register settings, refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

This register can be written when the register write disable bit in the GPTW write-protection register is enabled (GPTWn.GTWP.WP = 0). After writing this register, confirm that the value has actually changed before proceeding with further processing.

25.3 Operation

25.3.1 Adjustment to the Timing of Rising and Falling Edges in PWM Waveforms

The HRPWM delays timing for rising and falling of the PWM signals which are output from the GPTW with a resolution of 1/64 or 1/128 times (at least around 49 ps) of a GTCLK period (tC(GTCLK)) based on the delay locked loop (DLL) operating with GTCLK as a reference clock. The PWM signal which was delayed is output from the GTIOCnA and GTIOCnB pins (n = 0 to 3).

The amount of delay can be adjusted within a range of 0/64 to 63/64 or 0/128 to 127/128 of tC(GTCLK). The amount of delay out of this range cannot be specified. When setting the amount of delay with the value out of such range, change the setting in the general PWM timer compare capture register x (GTCCRx) in the GPTW.

The HRPWM is required to set the HROCR.DLLEN bit to 1 before operation and wait for stabilization time as it has the DLL. In addition, wait for five cycles of GTCLK after setting the HROCR.HRRST bit to 0 in order to output the reliable PWM waveform. Refer to Figure 25.2 for the detailed procedures.

Specify the amount of delay by the HRREARnA and HRFEARnA registers for the GTIOCnA pin and by the HRREARnB and HRFEARnB registers for the GTIOCnB pin. The PWM waveform has specific setting registers for delay at rising and at falling respectively, which allows fine adjustments for the width of high and low. Refer to Table 25.3 for the correspondence between pins and registers.

The amount of delay specified by a relevant register is reflected to the pin via a temporary register. Timing for reflecting the setting differs by PWM output operation mode in the general PWM timer. Refer to section 25.3.2, Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3).

In the HRPWM, setting of DLL enabling/disabling and reset setting/releasing is common for all channels; however, the rest of settings can be specified individually by channel.

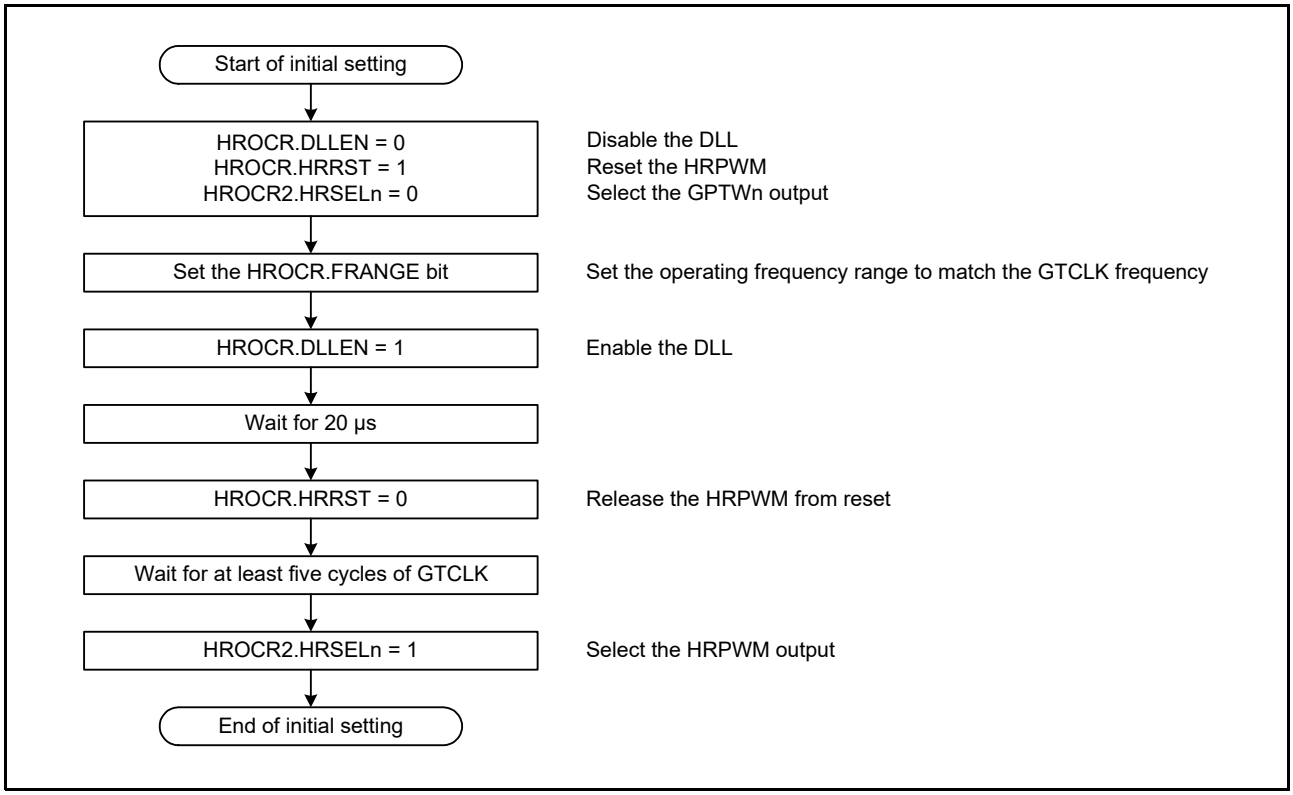

Figure 25.2 Initialization flow for the HRPWM (n = 0 to 3)

Table 25.3 Correspondence between PWM Waveform Output Pins and Delay Setting Registers

PWM Waveform Output Pin	Rising Edge Adjustment Register	Falling Edge Adjustment Register
GTIOC0A	HRREAR0A	HRFEAR0A
GTIOC0B	HRREAR0B	HRFEAR0B
GTIOC1A	HRREAR1A	HRFEAR1A
GTIOC1B	HRREAR1B	HRFEAR1B
GTIOC2A	HRREAR2A	HRFEAR2A
GTIOC2B	HRREAR2B	HRFEAR2B
GTIOC3A	HRREAR3A	HRFEAR3A
GTIOC3B	HRREAR3B	HRFEAR3B

25.3.2 Transfer Timing of HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB Register Settings (n = 0 to 3)

Settings of the HRREARnA, HRREARnB, HRFEARnA, and HRFEARnB registers are transferred to a temporary register first, and reflected to the amount of delay for the PWM waveform in the GTIOCnA and GTIOCnB pins then. Such settings are transferred to a temporary register at the end of PWM period (at an overflow (during up-count operation) or an underflow (during down-count operation) in sawtooth wave mode, and at a trough in triangle wave mode).

Figure 25.3 and Figure 25.4 show examples of the operation of the HRREAR0A and HRFEAR0A registers.

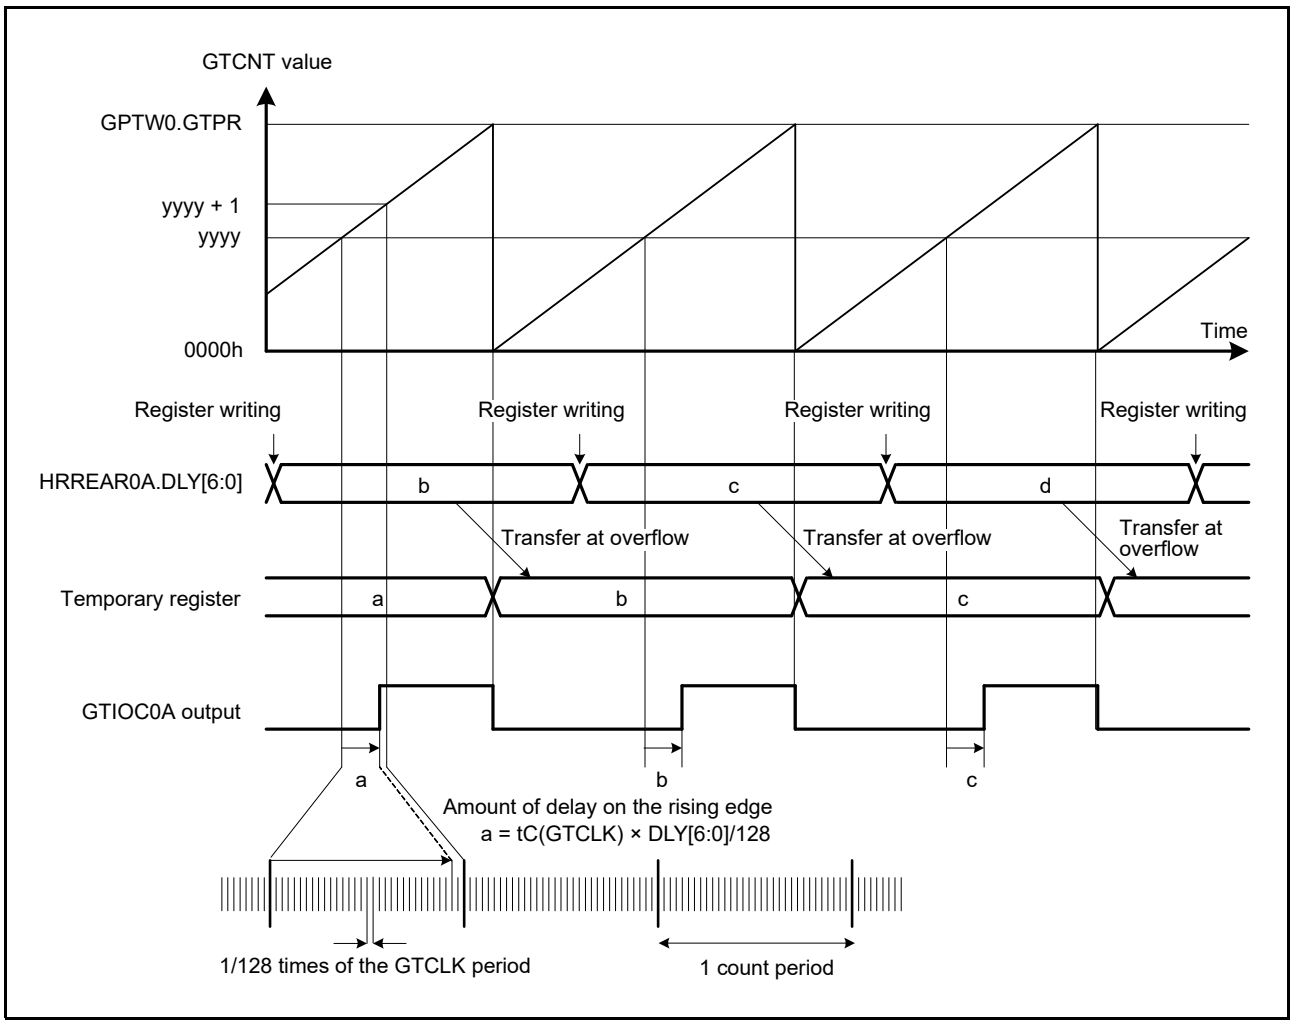

Figure 25.3 Operation Example When Changing the HRREAR0A Register Setting (in Sawtooth Wave Mode)

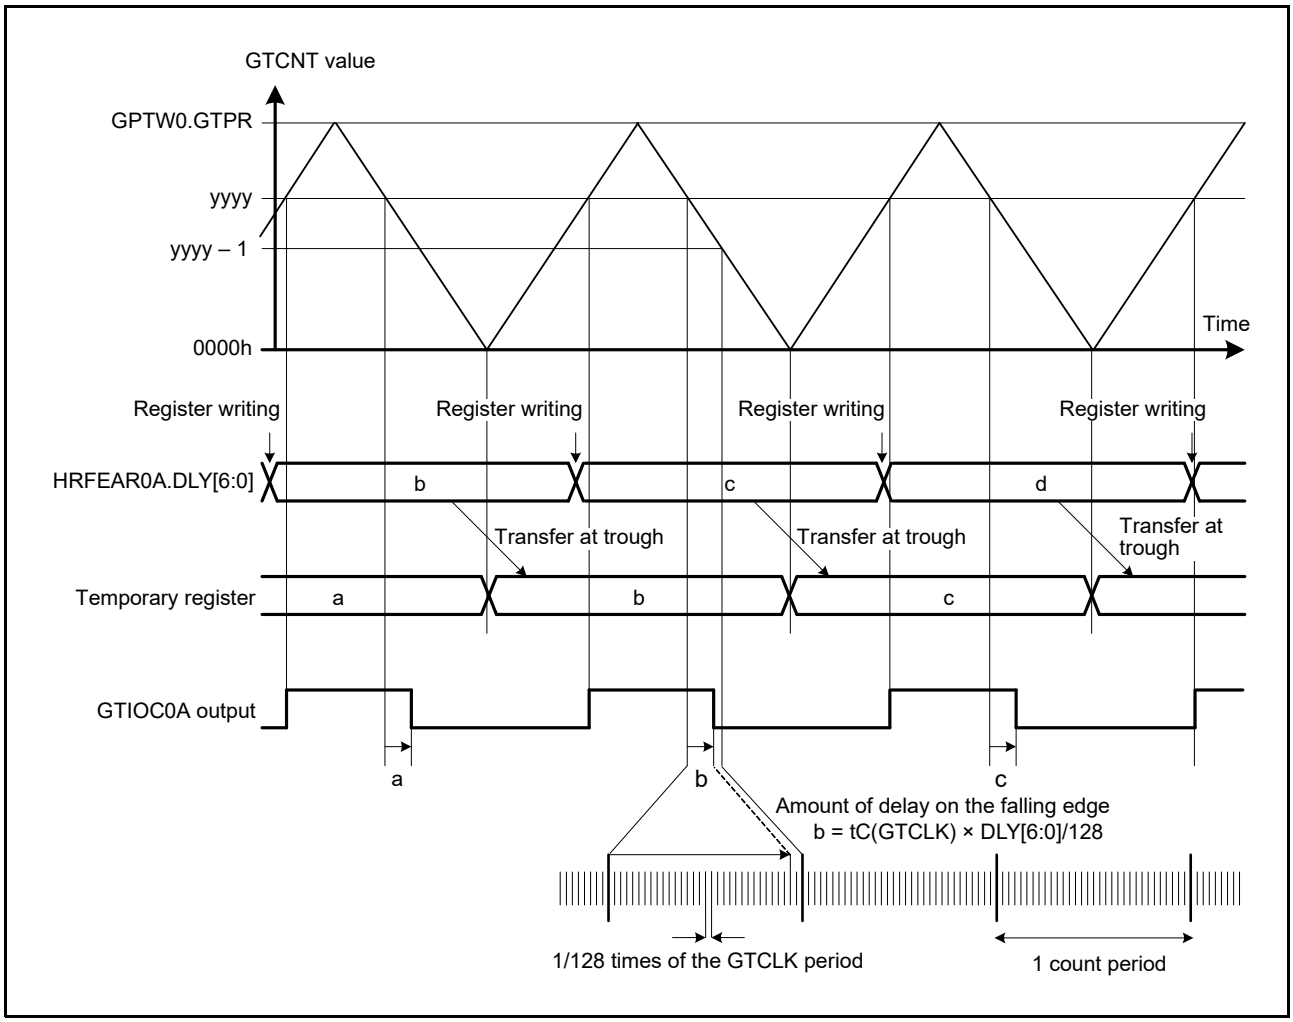

Figure 25.4 Operation Example When Changing the HRFEAR0A Register Setting (in Triangle Wave Mode)

25.4 Usage Notes

25.4.1 Settings for the Module-Stop Function

Operation of the HRPWM can be disabled or enabled using Module Stop Control Register (MSTPCRD). The HRPWM is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, refer to section 11, Low Power Consumption.

25.4.2 Note on Selecting Timer Prescaler in the GTCNT Counter While Using the HRPWM

The PWM signals output from the GPTW are generated based on the GTCNT counter operating at resolution equivalent to one clock period which is set by the GPTWn.GTCR.TPCS[3:0] bits (n = 0 to 3). Note that a delay at resolution of 0/128 × tC(GTCLK) to 127/128 × tC(GTCLK) is applied to edges of the PWM signals at low resolution generated based on a selected clock when a setting for the GPTWn.GTCCRx register (x = A to F) is changed while the TPCS[3:0] bits are specified to the setting other than 0000b (GTCLK/1).

25.4.3 Notes on Delay Settings for HRPWM

Within three cycles of GTCLK from the end of the PWM period, do not change the settings for the HRFEARnA, HRREARnA, HRFEARnB, and HRREARnB registers. Any changes made during the above period will be reflected with a delay of one cycle of the PWM waveform.

26. GPTW Port Output Enable (POEGd)

26.1 Overview

The POEG issues requests to disable output from output pins of the general PWM timer (GPTW). The combination of output pins of the POEG to be disabled can be specified from any channel of the GPTW.
Select the method of detection for disabling the output from the list below.

- Input level detection on the GTETRGx pin (x = A to D)
- Detection of input level or input edge on the POEGx pin (x = A to D)
- Output disabling condition detection by the GPTW
- Detection of stopping of oscillation by the oscillation stop detection circuit for the main clock
- Register setting

The GTETRGx pins can also be used as the external trigger input pins for the GPTW.
Table 26.1 shows specifications, Figure 26.1 shows a system block diagram around the POEG, Figure 26.2 shows a block diagram of the POEG, and Table 26.2 shows input pins.

Table 26.1 POEG Specifications (x = A to D)

Item	Description
Output disabling request by input level detection on the GTETRGx pin	• The output disabling request is issued to the GPTW when a POEGGx.PIDF flag is set to 1 by the detection of input of the selected level on the GTETRGx pin.
Output disabling request by detection of input level or edge on the POEGx pin	• The output disabling request is issued to the GPTW when a POEGPICRx.PIDF flag is set to 1 by the detection of either input of the selected level or the selected edge on the POEGx pin.
Output disabling request by output disabling condition detection signal from the GPTW	• The output disabling request is issued to the GPTW when the GPTW detects a simultaneous active level (high or low) on the GTIOCA and GTIOCB pins and the POEGGx.IOCF flag is set to 1. • The output disabling request is issued to the GPTW when the GPTW detects a dead-time error and the POEGGx.IOCF flag is set to 1.
Output disabling request in response to detecting the stopping of oscillation	The output disabling request is issued to the GPTW when the oscillation stop detection circuit for the main clock detects the oscillation stop and the POEGGx.OSTPF flag is set to 1.
Output disabling request by software	The output disabling request is issued to the GPTW when the software sets the POEGGx.SSF bit to 1.
Interrupt	• An interrupt is generated by an output disabling request via the POEGGx.PIDF flag. • An interrupt is generated by an output disabling request via the POEGGx.IOCF flag. • An interrupt is generated by an output disabling request via the POEGPICRx.PIDF flag.
External trigger output to the GPTW	The input signal from the GTETRGx pin is output to the GPTW as an external trigger.
Noise removal	Each GTETRGx pin has a digital noise filter. • Four types of sampling clock are selectable for the filter. Each POEGx pin has a digital noise filter. • Six types of sampling clock are selectable for the filter. • Match detection conditions can be selected from two to 64 consecutive samples with the same level.
Protect Zone filter	Security attribute can be set for each group of the POEG.*1

Note 1. When each group is set to the secure attribute, registers in the group are accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When each group is set to the non-secure attribute, registers in the group are accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Note 1. Only 0 can be written to clear the flag.
Note 2. This bit can be written only once after reset.

The POEGGx register controls output disabling requests and an external trigger for the GPTW in response to the various detection signals.

SSF Bit (Software Output Disabling Request)

Writing 1 to this bit leads to an output disabling request being issued to the GPTW, and writing 0 to the bit releases the GPTW from the output disabling request.

26.2.2 POEGx Pin Input Control Register (POEGPICRx) (x = A to D)

Address(es): POEG.POEGPICRA 8741 2030h, POEG.POEGPICRB 8741 2130h, POEG.POEGPICRC 8741 2230h, POEG.POEGPICRD 8741 2330h, POEG_NS.POEGPICRA 0741 2030h, POEG_NS.POEGPICRB 0741 2130h, POEG_NS.POEGPICRC 0741 2230h, POEG_NS.POEGPICRD 0741 2330h

R/W*2
b28	NFEN	Noise Filter Enable	0: Digital noise filter on the POEGx pin is disabled. 1: Digital noise filter on the POEGx pin is enabled.	R/W*2
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the flag.
Note 2. This bit can be written only once after reset.

26.3 Operation

The POEG has four groups (A to D), all of which operate the same and are independent of each other.
The output signal of each channel of the GPTW is connected to all groups of the POEG, and the output signal of each group of the POEG is connected to all channels of the GPTW. Use the GPTW register to configure which group the GPTW channel is controlled by.

26.3.1 Output Disabling Request by Detection of Input Level on the GTETRGx Pin (x = A to D)

The output disabling requests using the GTETRGx pin are issued via the POEGGx.PIDF flag.
When the input level set by the POEGGx.NFCS[1:0], NFEN, and INV bits is detected while the POEGGx.PIDE bit is 1, the PIDF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the PIDF flag. For details, refer to section 26.3.6.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.

26.3.1.1 Digital Noise Filter

Each GTETRGx pin has a digital noise filter (x = A to D). Figure 26.3 shows an example of the noise filter operation. This example assumes that the POEGGx.INV bit is 0 (no inversion, i.e., high level detection) and NFEN bit is 1 (noise filter enabled).
The signal level on the GTETRGx pin is sampled with the sampling clock selected by the POEGGx.NFCS[1:0] bits, and when last three consecutive samples are high, the POEG determines that high is input and issues an output disabling request to the GPTW.
At this time, if low is detected even once, the POEG does not determine that high is input. Note that changes in the GTETRGx pin level that occur between sampling timings are ignored.
The output of the digital noise filter is used for two purposes: output disabling request via the POEGGx.PIDF flags and an external trigger output to the GPTW.

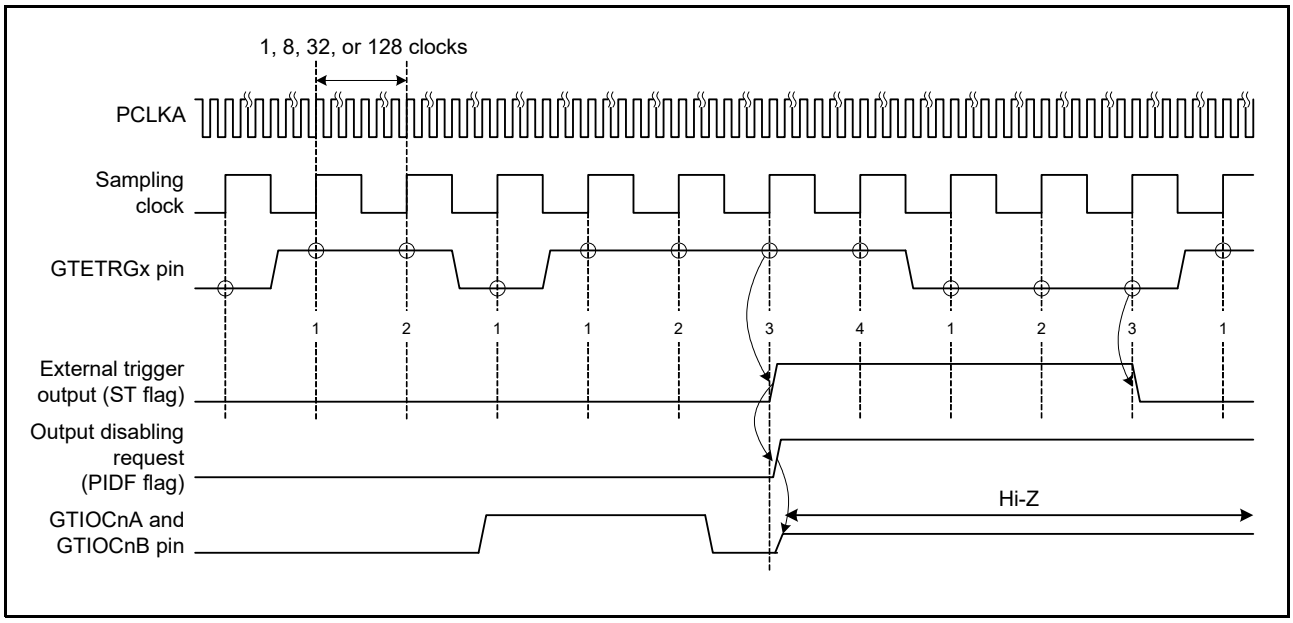

Figure 26.3 Example for Operation of Digital Noise Filter

26.3.2 Output Disabling Request by Detection of Input Level or Input Edge on the POEGx Pin (x = A to D)

The output disabling requests using the POEGx pin are issued via the POEGPICRx.PIDF flag.
When the input level or edge set by the POEGPICRx.NFEN, NFCS[3:0], PIDM[1:0], NFSCS[3:0], and INV bits is detected while the POEGPICRx.PIDE bit is 1, the PIDF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the PIDF flag. For details, refer to section 26.3.6.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.

26.3.2.1 Digital Noise Filter

Each POEGx pin has a digital noise filter (x = A to D). Figure 26.4 shows an example of the noise filter operation. This example assumes that the POEGPICRx.INV bit is 0 (no inversion, i.e., high level detection), NFSCS[3:0] bits are 0001b (three times), and NFEN bit is 1 (noise filter enabled).
The signal level on the POEGx pin is sampled with the sampling clock selected by the POEGPICRx.NFCS[3:0] bits, and when last consecutive samples for the number of times set by the NFSCS[3:0] bits (three times in this example) are high, the POEG determines that high is input and issues an output disabling request to the GPTW.
At this time, if low is detected even once, the POEG does not determine that high is input. Note that changes in the POEGx pin level that occur between sampling timings are ignored.

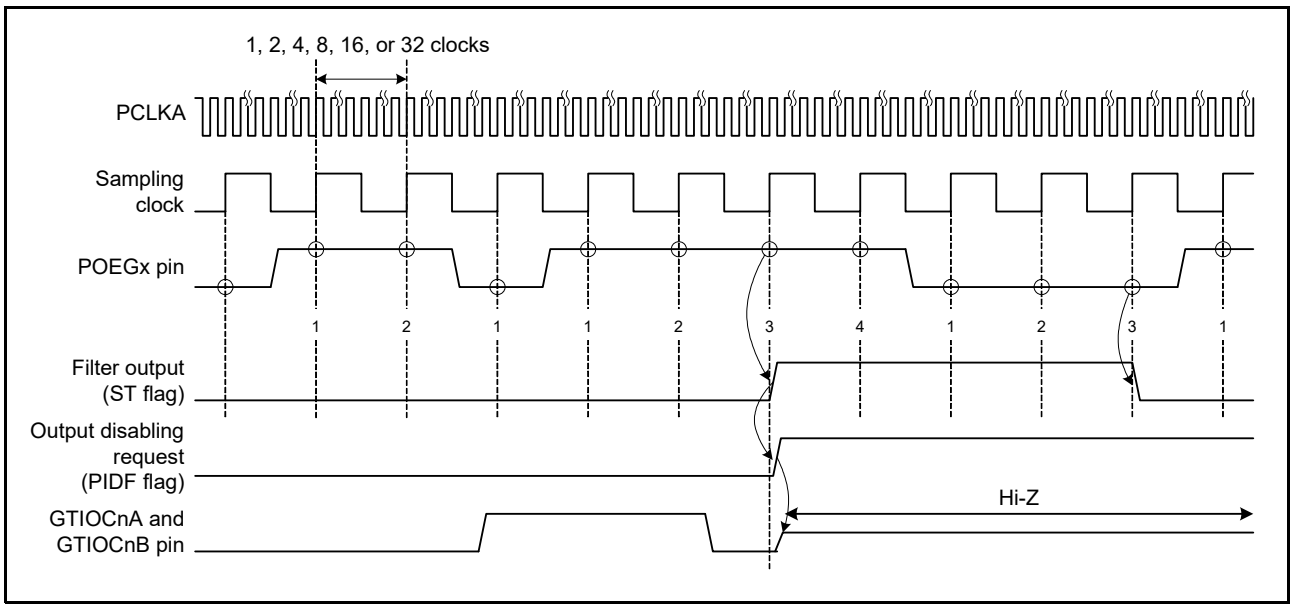

Figure 26.4 Example for Operation of Digital Noise Filter

26.3.3 Output Disabling Request by Output Disabling Condition Detection Signal from GPTW

When the GPTW detects a dead-time error or simultaneous high or low output while the POEGGx.IOCE bit is 1, the IOCF flag is set to 1 and an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, clear the IOCF flag. For details, refer to section 26.3.6.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.
To detect a dead-time error, simultaneous high output, or simultaneous low output in the GPTW, set the GPTWn.GTINTAD.GRPDTE, GRPABH, or GRPABL bit to 1, respectively. The output disabling condition detection signal generated by each GPTW channel is output only to the POEG group selected by the GPTWn.GTINTAD.GRP[1:0] bits. For details, refer to section 24.2.17, General PWM Timer Interrupt Output Setting Register (GTINTAD).

26.3.4 Output Disabling Request by Oscillation Stop Detection Signal

When the oscillation stop detection circuit in the clock generation circuit detects the oscillation stop while the POEGGx.OSTPE bit is 1, the OSTPF flag is set to 1 and an output disabling request is issued to all GPTW channels. To cancel the output disabling request, clear the OSTPF flag. For details, refer to section 26.3.6.2, Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register.

26.3.5 Output Disabling Request by a Register

When the POEGGx.SSF bit is set to 1, an output disabling request is issued to all GPTW channels.
To cancel the output disabling request, set the SSF bit to 0. For details, refer to section 26.3.6, Canceling Output Disabling Request.

26.3.6 Canceling Output Disabling Request

There are two ways to cancel an output disabling request as follows.

- Reset (return to the initial state)
- Clearing the flags in the POEGGx or POEGPICRx register

26.3.6.1 Cancellation of Output Disabling Request by Reset

Any type of reset can cancel an output disabling request. For details on resets, refer to section 6, Resets.

26.3.6.2 Cancellation of Output Disabling Request by Clearing Flags in the POEGGx or POEGPICRx Register

An output disabling request is canceled by setting all of the following flags and bit that are set to 1 to 0.

- POEGGx.PIDF flag
- POEGGx.IOCF flag
- POEGGx.OSTPF flag
- POEGGx.SSF bit
- POEGPICRx.PIDF flag

When the output disabling request is canceled, the GPTW captures this signal at the end of the next PWM cycle and releases the PWM outputs from the disabled state after three GTCLK cycles at the earliest. Figure 26.5 shows the timing for releasing the output disabled state.
To clear the flag, make sure that the detection signals that set the flag to 1 is 0 before writing 0 to the flag. Writing 0 to the flag when the detection signal is 1 does not clear the flag.
The status of the level detection signals can be monitored using the following status flags.

- GTETRGx pin input signal: POEGGx.ST flag (GTETRGx signal status flag)
- Output disabling condition detection signals: GPTWn.GTST.DTEF flag (dead time error flag)
  GPTWn.GTST.OABLF flag (simultaneous low output flag)
  GPTWn.GTST.OABHF flag (simultaneous high output flag)
- Oscillation stop detection signal: OSTDSR.OSTDF flag (oscillation stop detection flag)
- POEGx pin input signal: POEGPICRx.ST flag (POEGx signal status flag)

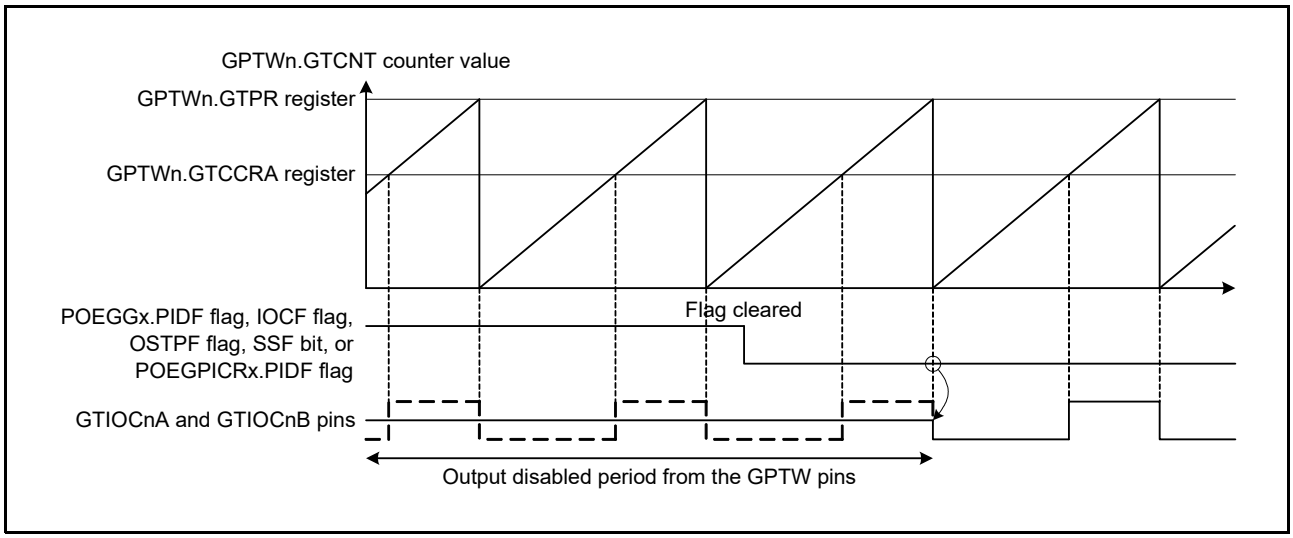

Figure 26.5 Timing for Releasing the Output Disabled State of the GPTW Pins by Canceling the Output Disabling Request

26.4 Interrupt Sources

The POEG has the following interrupt sources for each group.

- Detection of input level on the GTETRGx pin (x = A to D)
- Detection of output disabling condition detection signal from the GPTW
- Detection of input level or input edge on the POEGx pin (x = A to D)

Table 26.3 lists the interrupt sources.

Table 26.3 Interrupt sources

Interrupt Name	Symbol	Corresponding Flag	Interrupt Source
Group A Interrupt	POEGGAI	POEGGA.PIDF	Input signal from the GTETRGA pin
		POEGGA.IOCF	Output disabling condition detection signal from the GPTW
		POEGPICRA.PIDF	Input signal from the POEGA pin
Group B Interrupt	POEGGBI	POEGGB.PIDF	Input signal from the GTETRGB pin
		POEGGB.IOCF	Output disabling condition detection signal from the GPTW
		POEGPICRB.PIDF	Input signal from the POEGB pin
Group C Interrupt	POEGGCI	POEGGC.PIDF	Input signal from the GTETRGC pin
		POEGGC.IOCF	Output disabling condition detection signal from the GPTW
		POEGPICRC.PIDF	Input signal from the POEGC pin
Group D Interrupt	POEGGDI	POEGGD.PIDF	Input signal from the GTETRGD pin
		POEGGD.IOCF	Output disabling condition detection signal from the GPTW
		POEGPICRD.PIDF	Input signal from the POEGD pin

26.5 External Trigger Output to GPTW

The POEG outputs the input signals on the GTETRGx pin (x = A to D) to the GPTW as external trigger signals via polarity conversion and a digital noise filter. The external trigger signal can be monitored by the POEGGx.ST flag. The GPTW can perform the following operations with the external trigger signal.

- Count start
- Count stop
- Counter clear
- Count up
- Count down
- Input capture

For details, refer to section 24, General PWM Timer (GPTW).

26.6 Usage Notes

26.6.1 Transitions to Low-Power Consumption Mode

When using the POEG, do not enter software standby mode 1 or 2 or deep software standby mode 1, 2, or 3. In this mode, the POEG is stopped and output disabling request cannot be issued.

26.6.2 Setting the Function for Stopping the Module

Operation of the POEG can be disabled or enabled using the module stop control register D (MSTPCRD). After reset is released, the POEG function is disabled. Register access is enabled by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

26.6.3 Duplication of Output Disabling Request

The output disabling request via flags is a logical OR of the POEGGx.PIDF, IOCF, OSTPF flags, the SSF bit, and the POEGPICRx.PIDF flag. Therefore, note that the output disabling request will not be canceled if any one of the flags/bit is set to 1.

27. 8-Bit Timer (TMRa)

This MCU has two units (unit 0, unit 1) of an on-chip 8-bit timer (TMR) module that comprise two 8-bit counter channels, totaling four channels. The 8-bit timer module can be used to count external events and also be used as a multi-function timer in a variety of applications, such as generation of counter reset signal, interrupt requests, and pulse output with a desired duty cycle using a compare-match signal with two registers.
Unit 0 and unit 1 have the same functions, and can generate a base clock for the RSCI.
In this section, “PCLK” is used to refer to PCLKB.

27.1 Overview

Table 27.1 lists the specifications of the TMR. Table 27.2 lists the TMR functions.
Figure 27.1 shows a block diagram of the 8-bit timer module (unit 0), and Figure 27.2 shows that of the 8-bit timer module (unit 1).

Table 27.1 Specifications of TMR

Item	Description
Count clock	• Internal clock: PCLK/1, PCLK/2, PCLK/8, PCLK/32, PCLK/64, PCLK/1024, PCLK/8192 • External clock: external count clock
Number of channels	(8 bits × 2 channels) × 2 units
Compare match	• 8-bit mode (compare match A, compare match B) • 16-bit mode (compare match A, compare match B)
Counter clear	Selected by compare match A or B, or an external counter reset signal.
Timer output	Output pulses with a desired duty cycle or PWM output
Cascading of two channels	• 16-bit count mode 16-bit timer using TMR0 for the upper 8 bits and TMR1 for the lower 8 bits (TMR2 for the upper 8 bits and TMR3 for the lower 8 bits) • Compare match count mode TMR1 can be used to count TMR0 compare matches (TMR3 can be used to count TMR2 compare matches).
Interrupt sources	Compare match A, compare match B, and overflow
Event link function (Output)	Compare match A, compare match B, and overflow (TMR0 to TMR3)
Event link function (Input)	One of the following three operations proceeds in response to an event reception: (1) Counting start operation (TMR0 to TMR3) (2) Event counting operation (TMR0 to TMR3) (3) Counting restart operation (TMR0 to TMR3)
DTC activation	DTC can be activated by compare match A interrupts or compare match B interrupts.
Capable of generating base clock for RSCI	Generates base clock for RSCI.*1
Low power consumption function	Each unit can be placed in a module stop state
Protect Zone filter	Security attribute can be set for each unit.*2

Note 1. For details, refer to section 42, Serial Communications Interface (RSCI).
Note 2. When each unit is set to the secure attribute, registers in the unit are accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When each unit is set to the non-secure attribute, registers in the unit are accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Table 27.2 TMR Functions

Item		Unit 0			Unit 1		
Counter mode		**8 Bits**		**16 Bits**	**8 Bits**		**16 Bits**
Channel		**TMR0**	**TMR1**	**TMR0 + TMR1**	**TMR2**	**TMR3**	**TMR2 + TMR3**
Count clock		PCLK/1 PCLK/2 PCLK/8 PCLK/32 PCLK/64 PCLK/1024 PCLK/8192 TMCI0	PCLK/1 PCLK/2 PCLK/8 PCLK/32 PCLK/64 PCLK/1024 PCLK/8192 TMCI1	PCLK/1 PCLK/2 PCLK/8 PCLK/32 PCLK/64 PCLK/1024 PCLK/8192 TMCI1	PCLK/1 PCLK/2 PCLK/8 PCLK/32 PCLK/64 PCLK/1024 PCLK/8192 TMCI2	PCLK/1 PCLK/2 PCLK/8 PCLK/32 PCLK/64 PCLK/1024 PCLK/8192 TMCI3	PCLK/1 PCLK/2 PCLK/8 PCLK/32 PCLK/64 PCLK/1024 PCLK/8192 TMCI3

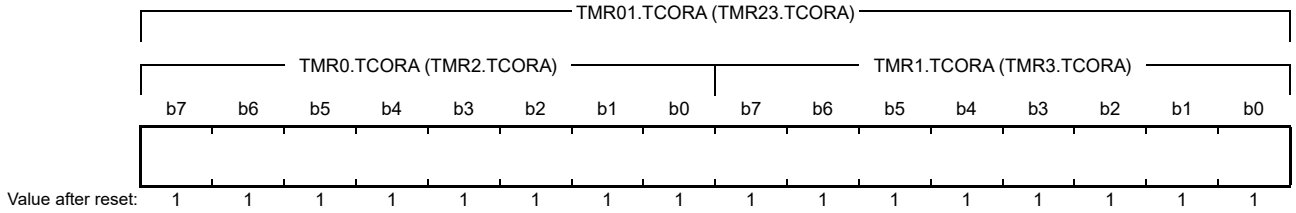
27.2.1 Timer Counter (TCNT)

Address(es): TMR0.TCNT 8782 5008h, TMR1.TCNT 8782 5009h, TMR2.TCNT 8782 5018h, TMR3.TCNT 8782 5019h, TMR01.TCNT 8782 5008h, TMR23.TCNT 8782 5018h, TMR0_NS.TCNT 0782 5008h, TMR1_NS.TCNT 0782 5009h, TMR2_NS.TCNT 0782 5018h, TMR3_NS.TCNT 0782 5019h, TMR01_NS.TCNT 0782 5008h, TMR23_NS.TCNT 0782 5018h

TCNT is an 8-bit readable/writable up-counter.

TMR0.TCNT and TMR1.TCNT (TMR2.TCNT and TMR3.TCNT) comprise a single 16-bit counter (TMR01.TCNT, TMR23.TCNT) so they can be accessed together in 16-bit units.

The TCCR.CSS[1:0] and CKS[2:0] bits are used to select a count clock.



TCNT can be cleared by an external counter reset signal, compare match A, or compare match B. Which compare match to be used for clearing is selected by the TCR.CCLR[1:0] bits.

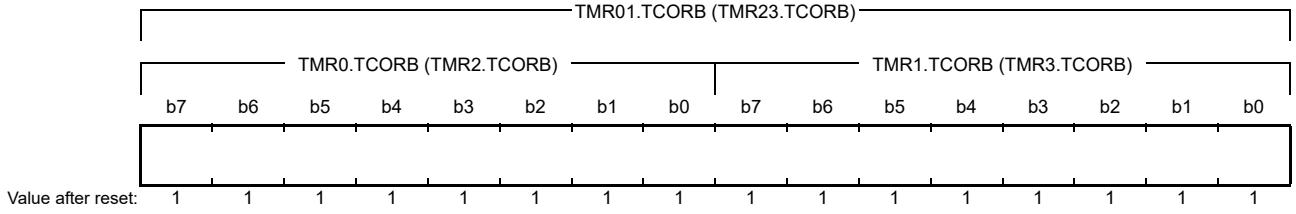
When TCNT overflows (its value changes from FFh to 00h), an overflow interrupt is output provided the interrupt request is enabled by the TCR.OVIE bit.

For details on the corresponding interrupt vector number, refer to section 15, Interrupt Controller (ICUM), and Table 27.6, TMR Interrupt Sources.

27.2.2 Time Constant Register A (TCORA)

Address(es): TMR0.TCORA 8782 5004h, TMR1.TCORA 8782 5005h, TMR2.TCORA 8782 5014h, TMR3.TCORA 8782 5015h, TMR01.TCORA 8782 5004h, TMR23.TCORA 8782 5014h, TMR0_NS.TCORA 0782 5004h, TMR1_NS.TCORA 0782 5005h, TMR2_NS.TCORA 0782 5014h, TMR3_NS.TCORA 0782 5015h, TMR01_NS.TCORA 0782 5004h, TMR23_NS.TCORA 0782 5014h

TCORA is an 8-bit readable/writable register.



TMR0.TCORA and TMR1.TCORA (TMR2.TCORA and TMR3.TCORA) comprise a single 16-bit register (TMR01.TCORA, TMR23.TCORA) so they can be accessed together in 16-bit units.

The value in TCORA is continually compared with the value in TCNT. When a match is detected, the corresponding compare match A is generated, and a compare match A interrupt is output provided the interrupt request is enabled by the TCR.CMIEA bit.

However, comparison is not performed during writing to TCORA. The timer output from the TMOn pin can be freely controlled by this compare match A and the settings of the TCSR.OSA[1:0] bits.

27.2.3 Time Constant Register B (TCORB)

Address(es): TMR0.TCORB 8782 5006h, TMR1.TCORB 8782 5007h, TMR2.TCORB 8782 5016h, TMR3.TCORB 8782 5017h, TMR01.TCORB 8782 5006h, TMR23.TCORB 8782 5016h, TMR0_NS.TCORB 0782 5006h, TMR1_NS.TCORB 0782 5007h, TMR2_NS.TCORB 0782 5016h, TMR3_NS.TCORB 0782 5017h, TMR01_NS.TCORB 0782 5006h, TMR23_NS.TCORB 0782 5016h

TCORB is an 8-bit readable/writable register.

TMR0.TCORB and TMR1.TCORB (TMR2.TCORB and TMR3.TCORB) comprise a single 16-bit register (TMR01.TCORB, TMR23.TCORB) so they can be accessed together in 16-bit units.

The value in TCORB is continually compared with the value in TCNT. When a match is detected, the corresponding compare match B is generated, and a compare match B interrupt is output provided the interrupt request is enabled by the TCR.CMIEB bit.

However, comparison is not performed during writing to TCORB. The timer output from the TMOn pin can be freely controlled by this compare match B and the settings of the TCSR.OSB[1:0] bits.

27.2.4 Timer Control Register (TCR)

Address(es): TMR0.TCR 8782 5000h, TMR1.TCR 8782 5001h, TMR2.TCR 8782 5010h, TMR3.TCR 8782 5011h, TMR0_NS.TCR 0782 5000h, TMR1_NS.TCR 0782 5001h, TMR2_NS.TCR 0782 5010h, TMR3_NS.TCR 0782 5011h

	b7	b6	b5	b4	b3	b2	b1	b0
	CMIEB	CMIEA	OVIE	CCLR[1:0]		—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4, b3	CCLR[1:0]	Counter Clear	b4 b3 0 0: Clearing is disabled 0 1: Cleared by compare match A 1 0: Cleared by compare match B 1 1: Cleared by the external counter reset signal*1 (Select edge or level by the TMRIS bit in TCCR.)	R/W
b5	OVIE	Overflow Interrupt Enable	0: Overflow interrupt requests (OVIn) are disabled 1: Overflow interrupt requests (OVIn) are enabled	R/W
b6	CMIEA	Compare Match A Interrupt Enable	0: Compare match A interrupt requests (CMIAn) are disabled 1: Compare match A interrupt requests (CMIAn) are enabled	R/W
b7	CMIEB	Compare Match B Interrupt Enable	0: Compare match B interrupt requests (CMIBn) are disabled 1: Compare match B interrupt requests (CMIBn) are enabled	R/W

Note 1. To use an external counter reset signal, set the corresponding pin function. For details, refer to section 22, I/O Ports.

CCLR[1:0] Bits (Counter Clear)

Select the condition by which TCNT is cleared.

OVIE Bit (Overflow Interrupt Enable)

Selects whether overflow interrupt requests (OVIn) issued by TCNT are enabled or disabled.

CMIEA Bit (Compare Match A Interrupt Enable)

Selects whether compare match A interrupt requests (CMIAn) that are issued when the value of TCORA corresponds to that of TCNT are enabled or disabled.

CMIEB Bit (Compare Match B Interrupt Enable)

Selects whether compare match B interrupt requests (CMIBn) that are issued when the value of TCORB corresponds to that of TCNT are enabled or disabled.

27.2.5 Timer Counter Control Register (TCCR)

Address(es): TMR0.TCCR 8782 500Ah, TMR1.TCCR 8782 500Bh, TMR2.TCCR 8782 501Ah, TMR3.TCCR 8782 501Bh, TMR01.TCCR 8782 500Ah, TMR23.TCCR 8782 501Ah, TMR0_NS.TCCR 0782 500Ah, TMR1_NS.TCCR 0782 500Bh, TMR2_NS.TCCR 0782 501Ah, TMR3_NS.TCCR 0782 501Bh, TMR01_NS.TCCR 0782 500Ah, TMR23_NS.TCCR 0782 501Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	TMRIS	—	—	CSS[1:0]		CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	CKS[2:0]	Clock Select*1	See Table 27.5.	R/W
b4, b3	CSS[1:0]	Clock Source Select	See Table 27.5.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TMRIS	Timer Reset Detection Condition Select	0: Cleared at rising edge of the external counter reset signal 1: Cleared when the external counter reset signal is high	R/W

Note 1. To use an external count clock, set the corresponding pin function. For details, refer to section 22, I/O Ports.

TCCR register is a 8-bit register used to configure the basic operation of the counter. Two TCCR registers can be accessed simultaneously by accessing the address of the even channel TCCR register in 16-bit units.

CKS[2:0] Bits (Clock Select)

CSS[1:0] Bits (Clock Source Select)

The CKS[2:0] and CSS[1:0] bits select a clock. For details, see Table 27.5.

TMRIS Bit (Timer Reset Detection Condition Select)

This bit is enabled when the TCR.CCLR[1:0] bits are 11b (cleared by external counter reset signal) and selects the condition for detecting counter reset (level or edge).

Table 27.5 Clock Input to TCNT and Count Condition

Channel	TCCR Register					Description
	CSS[1:0]		CKS[2:0]			
	b4	b3	b2	b1	b0	
TMR0 (TMR2)	0	0	—	0	0	Clock input prohibited
					1	Uses external count clock. Counts at rising edge*1.
				1	0	Uses external count clock. Counts at falling edge*1.
					1	Uses external count clock. Counts at both rising and falling edges*1.
	0	1	0	0	0	Uses internal clock. Counts at PCLK.
					1	Uses internal clock. Counts at PCLK/2.
				1	0	Uses internal clock. Counts at PCLK/8.
					1	Uses internal clock. Counts at PCLK/32.
			1	0	0	Uses internal clock. Counts at PCLK/64.
					1	Uses internal clock. Counts at PCLK/1024.
				1	0	Uses internal clock. Counts at PCLK/8192.
					1	Clock input prohibited
	1	0	—	—	—	Setting prohibited
	1	1	—	—	—	Counts at TMR1.TCNT (TMR3.TCNT) overflow signal*2.
TMR1 (TMR3)	0	0	—	0	0	Clock input prohibited
					1	Uses external count clock. Counts at rising edge*1.
				1	0	Uses external count clock. Counts at falling edge*1.
					1	Uses external count clock. Counts at both rising and falling edges*1.
	0	1	0	0	0	Uses internal clock. Counts at PCLK.
					1	Uses internal clock. Counts at PCLK/2.
				1	0	Uses internal clock. Counts at PCLK/8.
					1	Uses internal clock. Counts at PCLK/32.
			1	0	0	Uses internal clock. Counts at PCLK/64.
					1	Uses internal clock. Counts at PCLK/1024.
				1	0	Uses internal clock. Counts at PCLK/8192.
					1	Clock input prohibited
	1	0	—	—	—	Setting prohibited
	1	1	—	—	—	Counts at TMR0.TCNT (TMR2.TCNT) compare match A*2.

Note 1. To use an external count clock, set the corresponding pin function. For details, refer to section 22, I/O Ports.
Note 2. If the clock input of TMR0 (TMR2) is the overflow signal of the TMR1.TCNT (TMR3.TCNT) counter and that of TMR1 (TMR3) is the compare match signal of the TMR0.TCNT (TMR2.TCNT) counter, no TCNT count clock is generated. Do not use this setting.

27.2.6 Timer Control/Status Register (TCSR)

- TMR0.TCSR, TMR2.TCSR

Address(es): TMR0.TCSR 8782 5002h, TMR2.TCSR 8782 5012h, TMR0_NS.TCSR 0782 5002h, TMR2_NS.TCSR 0782 5012h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	OSB[1:0]		OSA[1:0]	
Value after reset:	x	x	x	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	OSA[1:0]	Output Select A*1	b1 b0 0 0: No change 0 1: Low is output 1 0: High is output 1 1: Output is inverted (toggle output)	R/W
b3, b2	OSB[1:0]	Output Select B*1	b3 b2 0 0: No change 0 1: Low is output 1 0: High is output 1 1: Output is inverted (toggle output)	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b5	—	Reserved	These bits are read as an undefined value. The write value should be 1.	R/W

Note 1. When all OSA[1:0] and OSB[1:0] bits are 0, the output enable signal corresponding to the TMOn pin is negated and a request for high-impedance output is issued to the I/O port. Timer output pin is driven low until the first compare-match occurs after a reset when at least one of the OSA[1:0] and OSB[1:0] bits is 1.

OSA[1:0] Bits (Output Select A)

These bits select a method of TMOn pin output when compare match A of TCORA and TCNT occurs.

OSB[1:0] Bits (Output Select B)

These bits select a method of TMOn pin output when compare match B of TCORB and TCNT occurs.

- TMR1.TCSR, TMR3.TCSR

Address(es): TMR1.TCSR 8782 5003h, TMR3.TCSR 8782 5013h, TMR1_NS.TCSR 0782 5003h, TMR3_NS.TCSR 0782 5013h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	OSB[1:0]		OSA[1:0]	
Value after reset:	x	x	x	1	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	OSA[1:0]	Output Select A*1	b1 b0 0 0: No change 0 1: Low is output 1 0: High is output 1 1: Output is inverted (toggle output)	R/W
b3, b2	OSB[1:0]	Output Select B*1	b3 b2 0 0: No change 0 1: Low is output 1 0: High is output 1 1: Output is inverted (toggle output)	R/W
b4	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7 to b5	—	Reserved	These bits are read as an undefined value. The write value should be 1.	R/W

Note 1. When all OSA[1:0] and OSB[1:0] bits are 0, the output enable signal corresponding to the TMOn pin is negated and a request for high-impedance output is issued to the I/O port. Timer output pin is driven low until the first compare match occurs after a reset when at least one of the OSA[1:0] and OSB[1:0] bits is 1.

OSA[1:0] Bits (Output Select A)

These bits select a method of TMOn pin output when compare match A of TCORA and TCNT occurs.

OSB[1:0] Bits (Output Select B)

These bits select a method of TMOn pin output when compare match B of TCORB and TCNT occurs.

27.2.7 Timer Counter Start Register (TCSTR)

Address(es): TMR0.TCSTR 8782 500Ch, TMR1.TCSTR 8782 500Dh, TMR2.TCSTR 8782 501Ch, TMR3.TCSTR 8782 501Dh, TMR0_NS.TCSTR 0782 500Ch, TMR1_NS.TCSTR 0782 500Dh, TMR2_NS.TCSTR 0782 501Ch, TMR3_NS.TCSTR 0782 501Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TCS
Value after reset:	x	x	x	x	x	x	x	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	TCS	Timer Counter Status	0: Count stopped state in response to ELC. 1: Count start state in response to ELC.	R/W
b7 to b1	—	Reserved	These bits are read as an undefined value. The write value should be 0.	R/W

TCS Bit (Timer Counter Status)

The TCS bit is used to check the state of the timer count in response to ELC.

When this bit is read as 1, it shows the timer start state in response to ELC. When this bit is read as 0, it shows the timer stopped state in response to ELC.

This bit is cleared by writing 0. Do not write 1 to this bit.

The TCS bit is valid only when the count start operation is selected by the ELOPC or ELOPD register of the event controller (ELC).

For details, refer to section 27.7, Link Operation by ELC, or section 21, Event Link Controller (ELC).

27.3 Operation

27.3.1 Pulse Output

Figure 27.3 shows an example of the 8-bit timer being used to generate a pulse output with a desired duty cycle.

1. Set the TCR.CCLR[1:0] bits to 01b (cleared by compare match A) so that TCNT is cleared at a compare match of TCORA.
2. Set the TCSR.OSA[1:0] bits to 10b (high is output) and TCSR.OSB[1:0] bits to 01b (low is output), causing the output to change to high at a compare match of TCORA and to low at a compare match of TCORB.

With these settings, the 8-bit timer provides pulses output at a cycle determined by TCORA with a pulse width determined by TCORB. No software intervention is required.
The timer output pin is low after the TCSR.OSA[1:0] or TCSR.OSB[1:0] bits are set until the first compare match occurs after a reset.

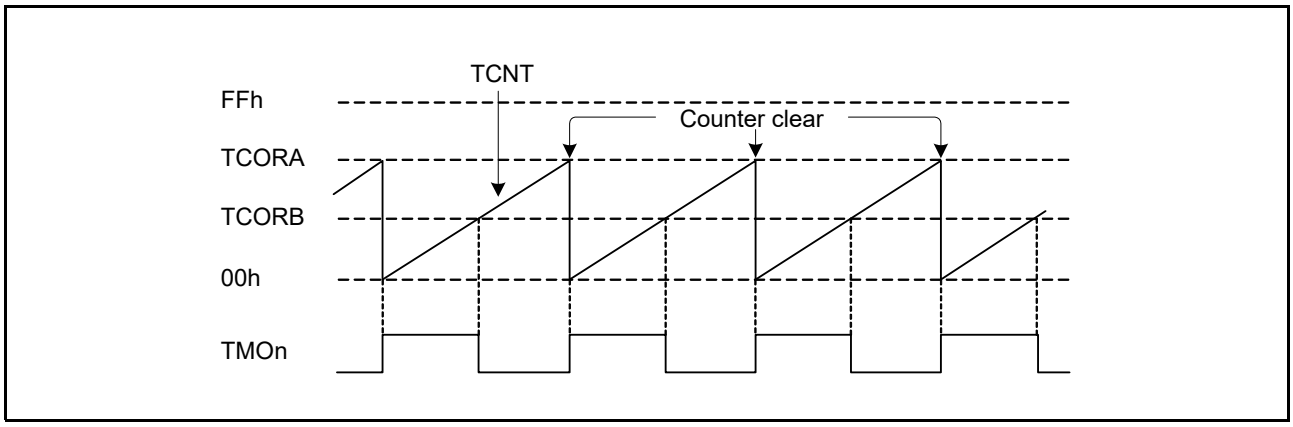


Figure 27.3 Example of Pulse Output (n = 0 to 3)

27.3.2 External Counter Reset Input

Figure 27.4 shows an example of the 8-bit timer being used to generate a pulse which is output after a desired delay time from a TMRIn input.

1. Set the TCR.CCLR[1:0] bits to 11b (cleared by external counter reset signal) and set the TMRIS bit in TCCR to 1 (cleared when the external counter reset signal is high) so that TCNT is cleared at the high level input of the TMRIn signal.
2. Set the TCSR.OSA[1:0] bits to 10b (high output) and the TCSR.OSB[1:0] bits to 01b (low output), causing the output to change to high at a compare match of TCORA and to low at a compare match of TCORB.

With these settings, the 8-bit timer provides pulses output at a desired delay time from a TMRIn input determined by TCORA and with a pulse width determined by TCORB and TCORA.

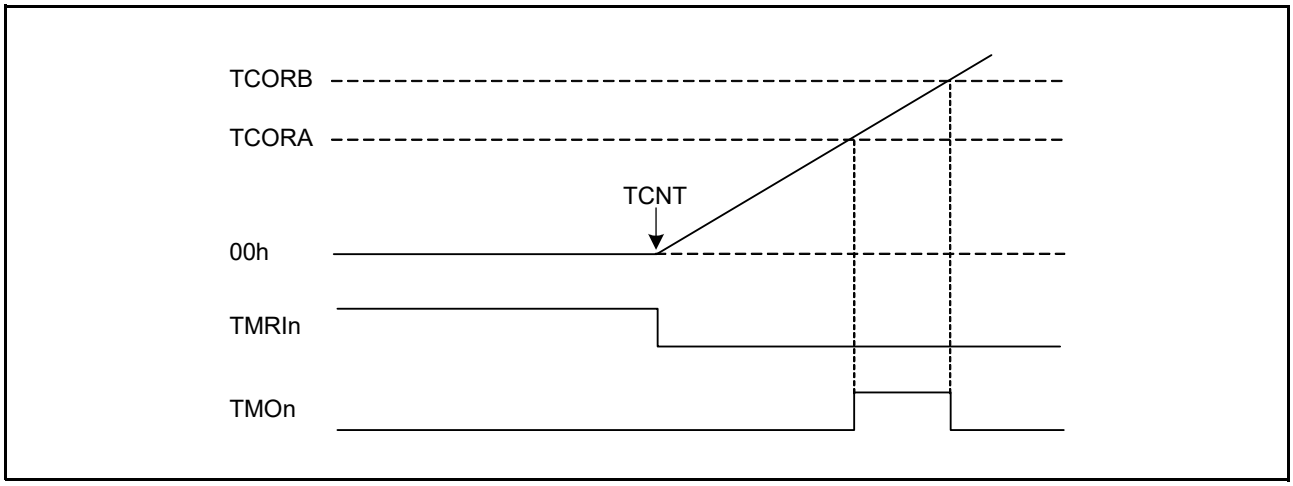

Figure 27.4 Example of External Counter Reset Signal Input (n = 0 to 3)

27.4 Operation Timing

27.4.1 TCNT Count Timing

Figure 27.5 shows the count timing of TCNT for internal clock. Figure 27.6 shows the count timing of TCNT for external clock.

Note that the external clock pulse width must be at least 1.5 PCLK cycles for increment at a single edge, and at least 2.5 PCLK cycles for increment at both edges. The counter will not increment correctly if the pulse width is less than these values.

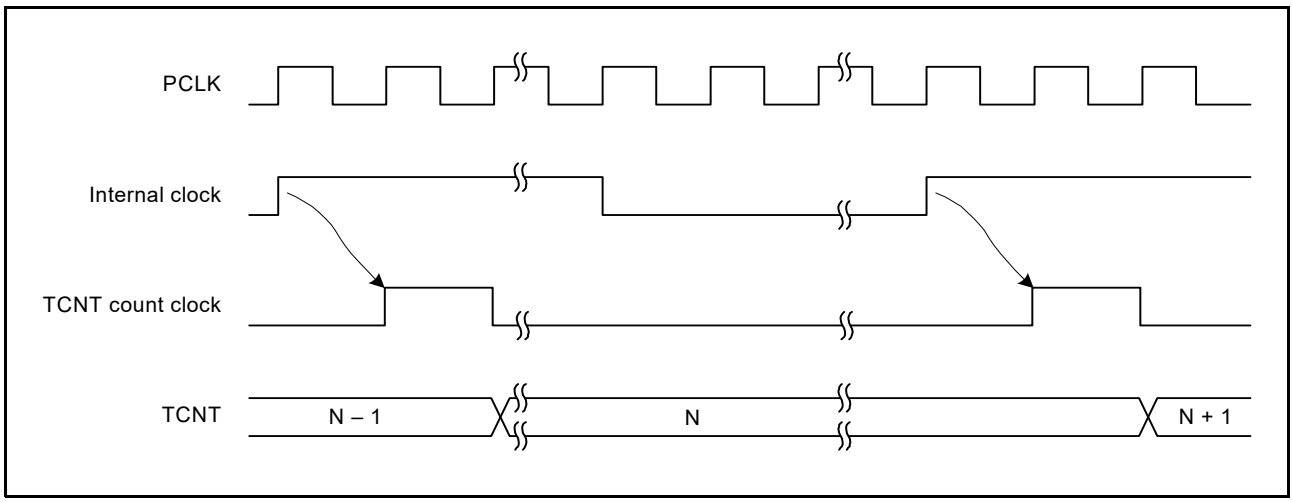

Figure 27.5 Count Timing for Internal Clock

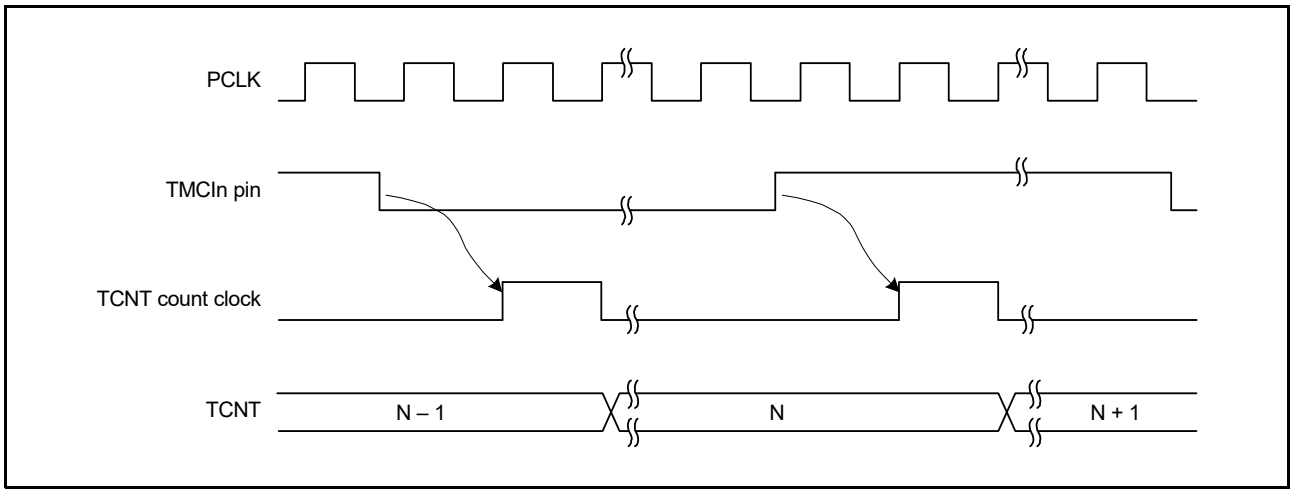

Figure 27.6 Count Timing for External Clock (at Both Edges)

27.4.2 Timing of Interrupt Signal Output on a Compare Match

A compare match refers to a match between the value of the TCORA or TCORB register and the TCNT, and a compare match interrupt signal is output at this time if the interrupt request is enabled. The compare match is generated in the last cycle in which the values match (at the time at which the value counted by TCNT to produce the match is updated). Accordingly, after a match between TCNT and the TCORA or TCORB register is detected, the compare match is not actually generated until the next cycle of the TCNT count clock. Figure 27.7 shows the timing of output of the interrupt signal.
For the corresponding interrupt vector number, refer to section 15, Interrupt Controller (ICUM) and Table 27.6.

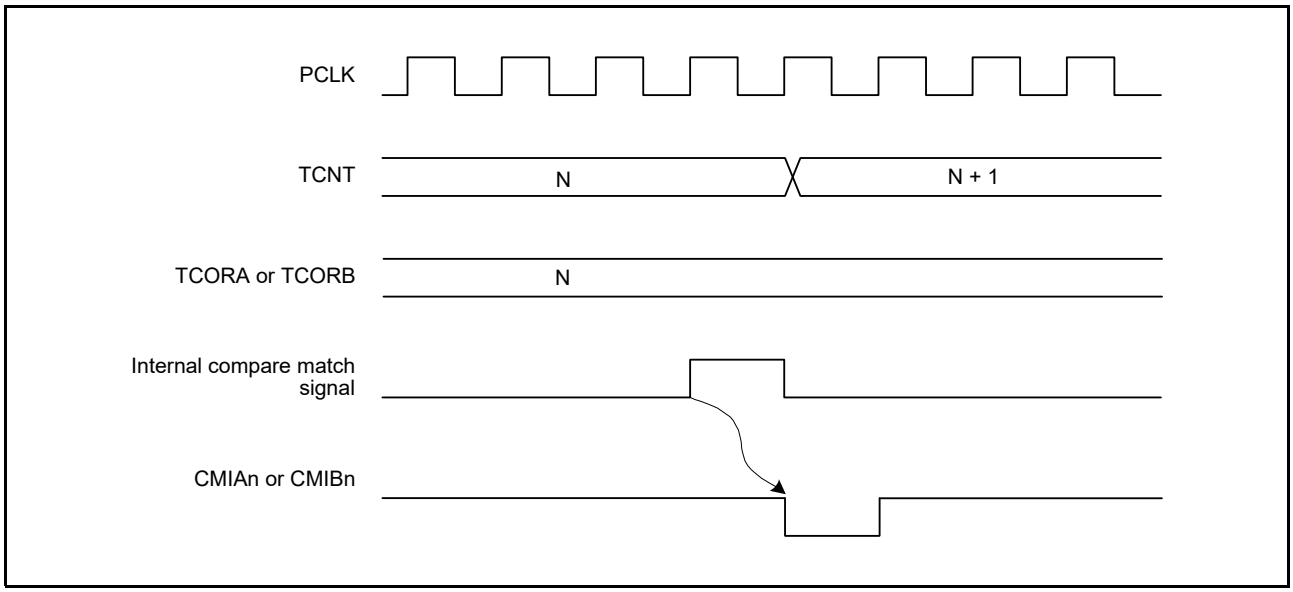

Figure 27.7 Timing of Interrupt Flag Setting to 1 at Compare Match (n = 0 to 3)

27.4.3 Timing of Timer Output Signal at Compare Match

When a compare match signal is generated, the output value specified by the TCSR.OSA[1:0] and OSB[1:0] bits is output on the timer output pin (TMOn).
Figure 27.8 shows the timing when the timer output is toggled by the compare match A signal.

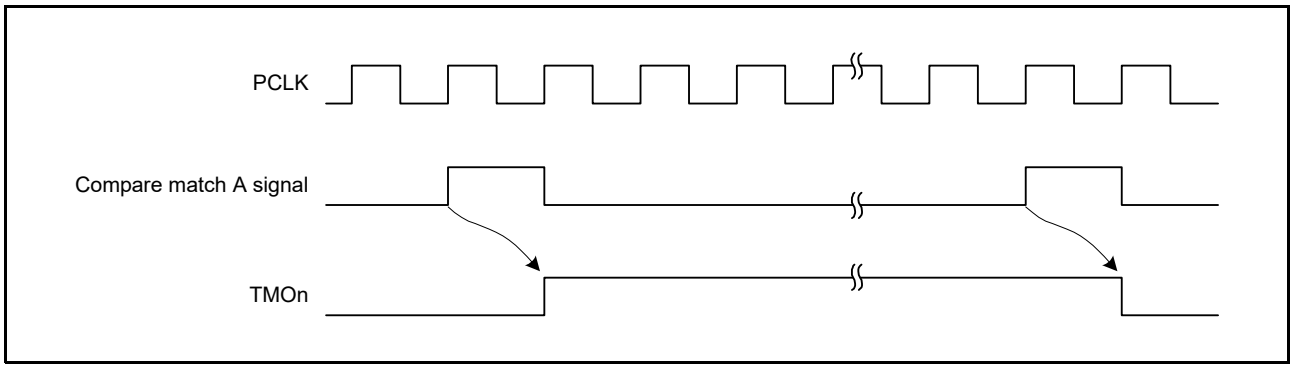

Figure 27.8 Timing of Timer Output Signal at Compare Match A Signal (n = 0 to 3)

27.4.4 Timing of Counter Clear by Compare Match

TCNT is cleared when compare match A or B occurs, depending on the settings of the TCR.CCLR[1:0] bits.
Figure 27.9 shows the timing of this operation.

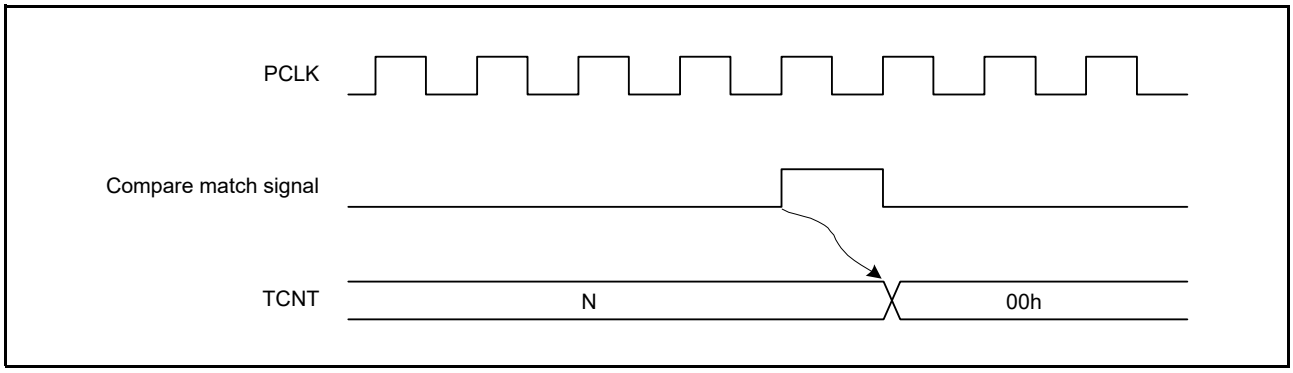

Figure 27.9 Timing of Counter Clear by Compare Match

27.4.5 Timing of the External Reset for TCNT

TCNT is cleared at the rising edge or high level of an external counter reset signal, depending on the settings of the TCR.CCLR[1:0] bits. At least 2 PCLK cycles are required from a reset input to clearing of TCNT.
Figure 27.10 and Figure 27.11 show the timing of this operation.

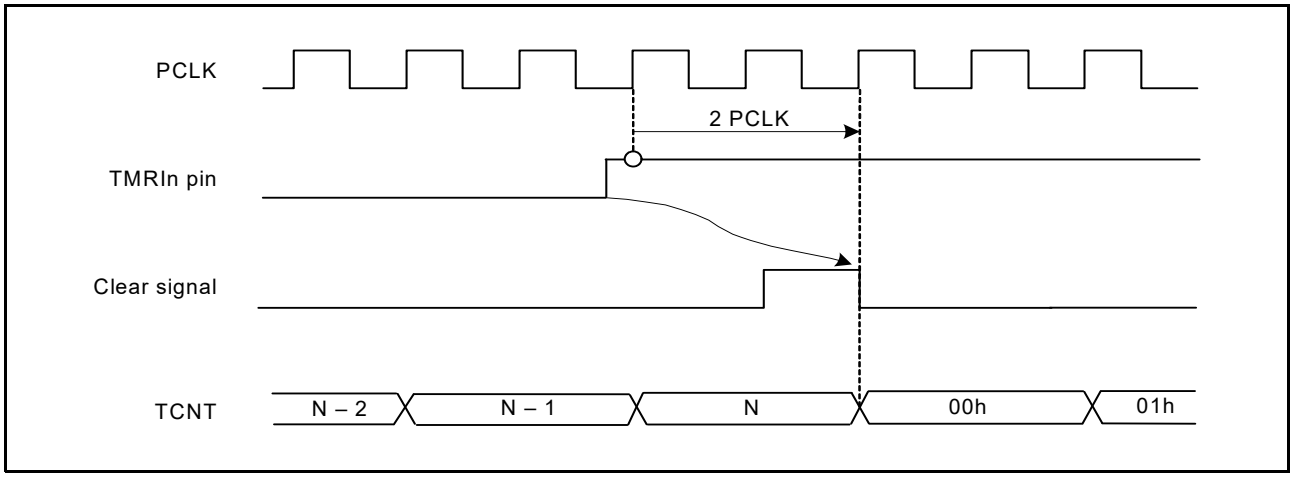

Figure 27.10 Clear Timing by External Counter Reset Signal (Rising Edge)

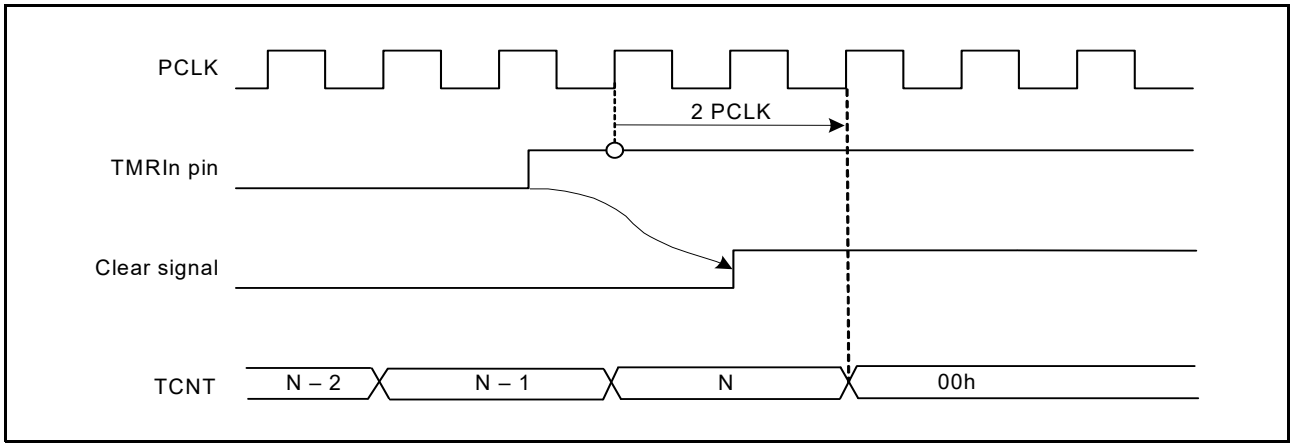

Figure 27.11 Clear Timing by External Counter Reset Signal (High Level)

27.4.6 Timing of Interrupt Signal Output on an Overflow

When TCNT overflows (changes from FFh to 00h), an overflow interrupt signal is output if this interrupt request is enabled.

Figure 27.12 shows the timing of output of the interrupt signal.

For the corresponding interrupt vector number, refer to section 15, Interrupt Controller (ICUM) and Table 27.6.

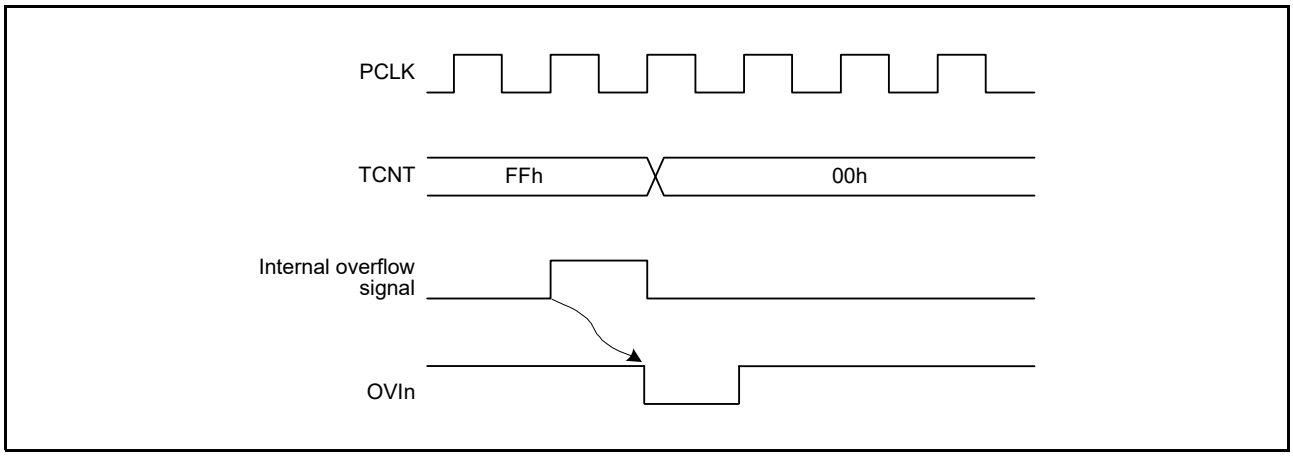

Figure 27.12 Timing of Overflow Interrupt Flag Setting to 1 (n = 0 to 3)

27.5 Operation with Cascaded Connection

If the CSS[1:0] bits in either TMR0.TCCR or TMR1.TCCR are set to 11b, the TMR of the two channels are cascaded. With this configuration, a single 16-bit timer could be used (16-bit counter mode) or compare matches of TMR0 could be counted by TMR1 (compare match count mode).
This section describes unit 0. The operation of unit 1 with cascaded connection is the same as unit 0.

27.5.1 16-Bit Count Mode

When the TMR0.TCCR.CSS[1:0] bits are set to 11b, the timer functions as a single 16-bit timer with TMR0 occupying the upper 8 bits and TMR1 occupying the lower 8 bits.

(1) Counter Clear Specification

- The settings of the TMR0.TCR.CCLR[1:0] bits become effective for the 16-bit counter. If the TMR0.TCR.CCLR[1:0] bits have been set for counter clear at compare match, the 16-bit counter (TMR0.TCNT and TMR1.TCNT together) is cleared when a 16-bit compare match event occurs. The 16-bit counter (TMR0.TCNT and TMR1.TCNT together) is cleared even if counter clear by the TMRI0 pin has been set.
- The settings of the TMR1.TCR.CCLR[1:0] bits are ignored.

(2) Pin Output

- Control of output from the TMO0 pin by the TMR0.TCSR.OSA[1:0] and OSB[1:0] bits is in accordance with the 16-bit compare match conditions.
- Control of output from the TMO1 pin by the TMR1.TCSR.OSA[1:0] and OSB[1:0] bits is in accordance with the lower 8-bit compare match conditions.

27.5.2 Compare Match Count Mode

When the TMR1.TCCR.CSS[1:0] bits are set to 11b, TMR1.TCNT counts the number of occurrences of compare match A for TMR0. TMR0 and TMR1 are controlled independently. Conditions such as generation of interrupts, output from the TMOn pin (n = 0, 1), and counter clear are in accordance with the settings for each channel.

27.6 Interrupt Sources

27.6.1 Interrupt Sources and DTC Activation

There are three interrupt sources for TMRn: CMIAn, CMIBn, and OVIn. Their interrupt sources and priorities are listed in Table 27.6.
It is also possible to activate the DTC by means of CMIAn and CMIBn interrupts.

Table 27.6 TMR Interrupt Sources

Name	Interrupt Sources	DTC Activation
CMIA0	TMR0.TCORA compare match	Possible
CMIB0	TMR0.TCORB compare match	Possible
OVI0	TMR0.TCNT overflow	Not possible
CMIA1	TMR1.TCORA compare match	Possible
CMIB1	TMR1.TCORB compare match	Possible
OVI1	TMR1.TCNT overflow	Not possible
CMIA2	TMR2.TCORA compare match	Possible
CMIB2	TMR2.TCORB compare match	Possible
OVI2	TMR2.TCNT overflow	Not possible
CMIA3	TMR3.TCORA compare match	Possible
CMIB3	TMR3.TCORB compare match	Possible
OVI3	TMR3.TCNT overflow	Not possible

27.7 Link Operation by ELC

27.7.1 Event Signal Output to ELC

The TMR uses the event link controller (ELC) to perform link operation to the previously specified module using the interrupt request signal as the event signal. The TMR outputs compare match A, compare match B, and overflow signals as event signals. Channels that can be used in this way are TMR0 to TMR3.
The event signal can be output regardless of the setting of the corresponding interrupt request enable bits (TMRn.TCR.OVIE, TMRn.TCR.CMIEA, and TMRn.TCR.CMIEB (n = 0 to 3)). For details, refer to section 21, Event Link Controller (ELC).
The event output function can be used for the cascaded operation.

27.7.2 TMR Operation when Receiving an Event Signal from ELC

The TMR can perform either of the following operations upon the event previously specified by the ELSRn register of the ELC. However, the ELC does not support the cascaded operation.

(1) Count Start

When the TMR count start operation is selected by the ELOPC or ELOPD register of the ELC and the event specified by ELSRn occurs, the TCSTR.TCS bit is set to 1, starting the TMR count operation. After the TMR count start operation is selected by the ELOPC or ELOPD register of the ELC, use the TCCR.CKS[2:0] and CSS[1:0] bits to select the count source.
If the specified event occurs while the TCS bit is 1, the event is ignored.
Write 0 to the TCSTR.TCS bit to stop counting.
When the count start event is input in the count stopped state, the TMR starts counting again according to the CKS[2:0] and CSS[1:0] bits.
The TCS bit is valid only when the ELOPC.TMR0MD[1:0], ELOPC.TMR1MD[1:0], ELOPD.TMR2MD[1:0], or ELOPD.TMR3MD[1:0] bits of the ELC select the count start operation.

(2) Event Count

When the TMR event count operation is selected by the ELOPC or ELOPD register of the ELC and the event specified by ELSRn occurs, the events are counted as the count source regardless of the TCCR.CKS[2:0] and CSS[1:0] bit settings. Reading the counter value returns the number of events that have been actually input.

(3) Count Restart

When the TMR count restart operation is selected by the ELOPC or ELOPD register of the ELC and the event specified by ELSRn occurs, the TCNT counter value is modified to the initial value. If the CKS[2:0] and CSS[1:0] bit settings are not disabling the clock input, the count operation is continued.

27.7.3 Notes on Operating TMR According to an Event Signal from ELC

The following describes the notes on operating the TMR using the event link feature.

(1) Count Start

When the event specified by ELSRn occurs during the write cycle to the TCSTR.TCS bit, the cycle is not completed; setting 1 according to the event occurrence takes priority.

(2) Event Count

When the event specified by ELSRn occurs during the write cycle to the TCNT, the cycle is not completed; event count operation according to the event occurrence takes priority.

(3) Count Restart

When the event specified by ELSRn occurs during the write cycle to the TCNT, the cycle is not completed; count value initialization according to the event occurrence takes priority.

27.8 Usage Notes

27.8.1 Module Stop State Setting

Operation of the TMR can be disabled or enabled by using the module stop control registers. The initial setting is for halting of TMR operation. Register access becomes possible after release from the module stop state. For details, refer to section 11, Low Power Consumption.

27.8.2 Notes on Setting Cycle

If the compare match is selected for counter clear, TCNT is cleared at the last PCLK in the cycle in which the value of TCNT matches with that of TCORA or TCORB. TCNT updates the counter value at this last state. Therefore, the counter frequency is obtained by the following formula (f: Counter frequency, PCLK: Operating frequency, N: TCORA and TCORB register setting value).

$$f = PCLK / (N + 1)$$

27.8.3 Conflict between TCNT Write and Counter Clear

If a counter clear signal is generated concurrently with CPU write to TCNT, the clear takes priority and the write is not performed as shown in Figure 27.13.

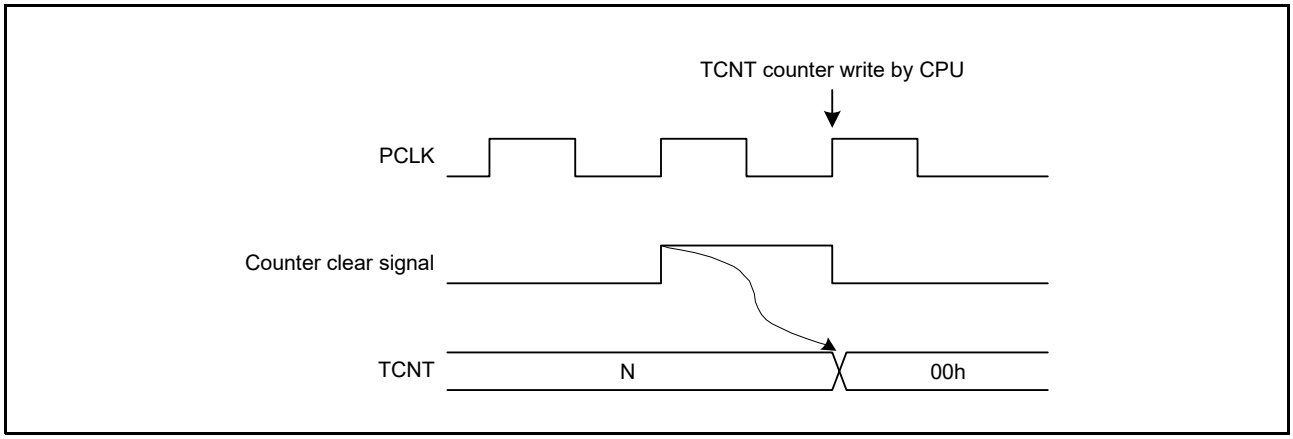

Figure 27.13 Conflict between TCNT Write and Counter Clear

27.8.4 Conflict between TCNT Write and Increment

Even if a counting-up signal is generated concurrently with CPU write to TCNT, the counting-up is not performed and the write takes priority as shown in Figure 27.14.

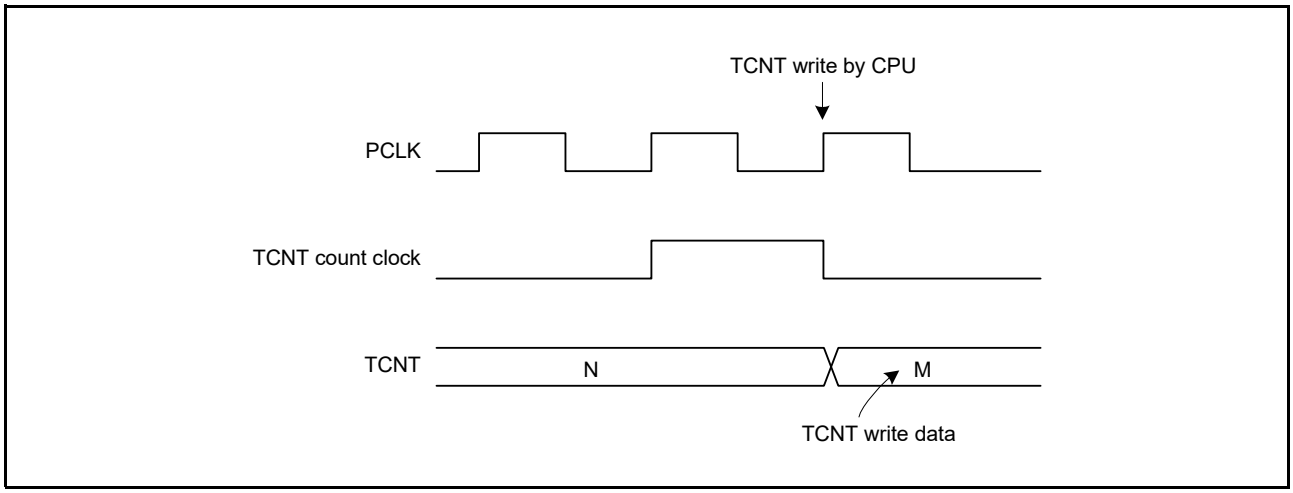

Figure 27.14 Conflict between TCNT Write and Increment

27.8.5 Conflict between TCORA or TCORB Write and Compare Match

Even if a compare match signal is generated simultaneously with CPU write to TCORA or TCORB as shown in Figure 27.15, the write takes priority and the compare match signal does not reach High level.

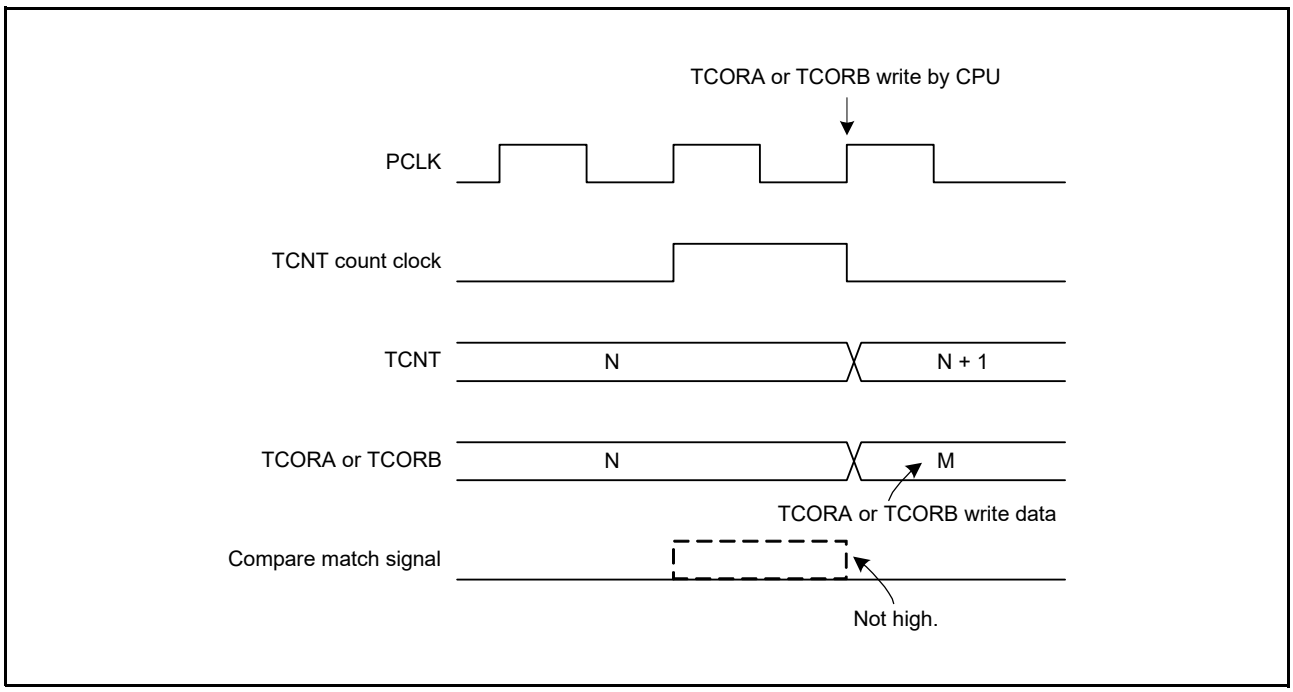

Figure 27.15 Conflict between TCORA or TCORB Write and Compare Match

27.8.6 Conflict between Compare Matches A and B

If compare match events A and B occur at the same time, the 8-bit timer operates in accordance with the priorities for the output methods high for compare match A and compare match B, as listed in Table 27.7.

Table 27.7 Timer Output Priorities

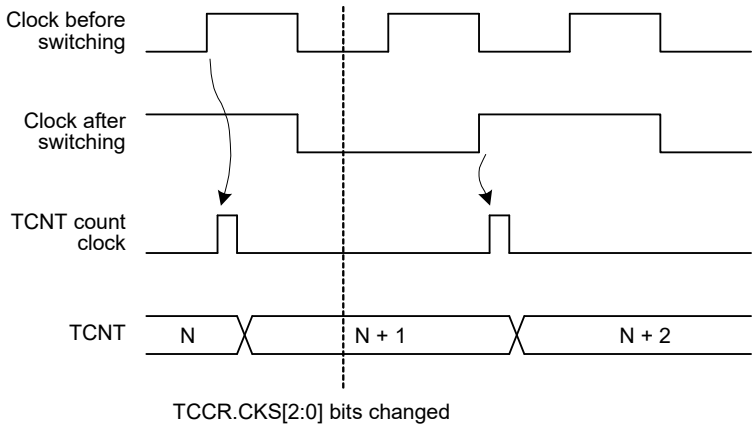
Output Setting	Priority
Toggle output	High
High output	↑
Low output	
No change	Low

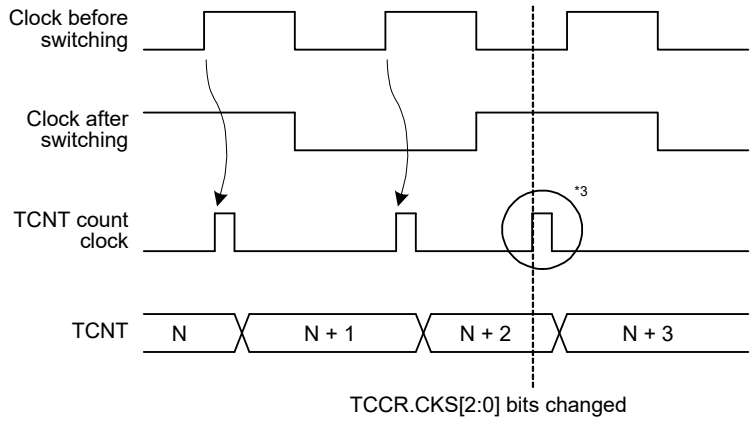
27.8.7 Switching of Internal Clocks and TCNT Operation

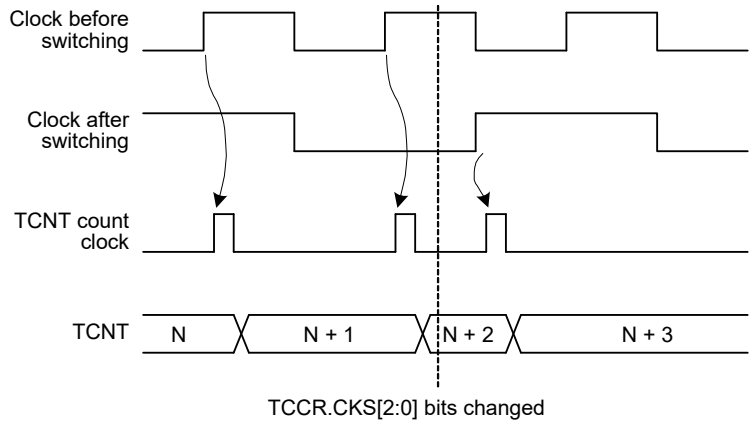
TCNT may be incremented erroneously depending on when the internal clock is switched. Table 27.8 lists the relationship between the timing at which the internal clock is switched (by writing to the TCCR.CKS[2:0] bits) and the operation of TCNT.

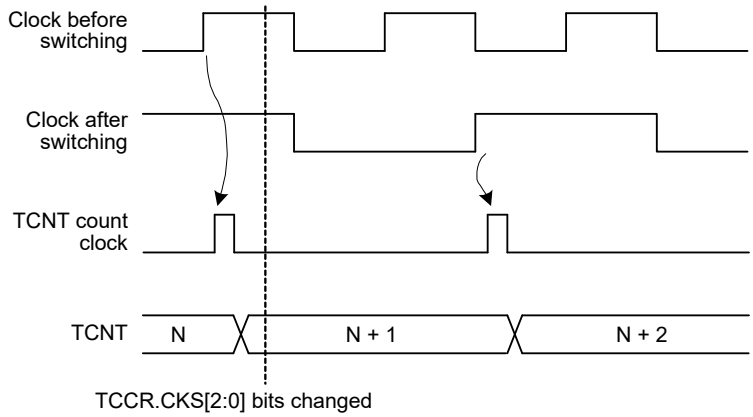
When TCNT count clock is generated from an internal clock, the rising edge of the internal clock pulse are always monitored. If the signal levels of the clocks before and after switching change from low to high as shown in No. 2 in Table 27.8, the change is considered as an edge. Therefore, a TCNT count clock is generated and TCNT is incremented. The erroneous increment of TCNT can also happen when switching between internal and internal clocks.

Table 27.8 Switching of Internal Clocks and TCNT Operation (1/2)









No.	Timing to Change the TCCR.CKS[2:0] Bits	TCNT Counter Operation
1	Switching from low to low*1	
2	Switching from low to high*2	

Table 27.8 Switching of Internal Clocks and TCNT Operation (2/2)

No.	Timing to Change the TCCR.CKS[2:0] Bits	TCNT Counter Operation
3	Switching from high to low*4	
4	Switching from high to high	

Note 1. Includes switching from low to stop, and from stop to low.
Note 2. Includes switching from stop to high.
Note 3. Generated because the change of the signal levels is considered as an edge; TCNT counter is incremented.
Note 4. Includes switching from high to stop.

27.8.8 Clock Source Setting with Cascaded Connection

If 16-bit counter mode and compare match count mode are specified at the same time, count clocks for TMR0.TCNT and TMR1.TCNT (TMR2.TCNT and TMR3.TCNT) are not generated, and the counter stops. Do not specify 16-bit counter mode and compare match count mode simultaneously.

27.8.9 Continuous Output of Compare Match Interrupt Signal

When TCORA or TCORB is set to 00h, PCLK/1 is set as the internal clock, and compare match is set as the counter clear source, the TCNT counter remains 00h and is not updated, and a compare match interrupt signal is output continuously to form a flat signal level.
At this time, the interrupt controller cannot detect the second and subsequent interrupts.
Figure 27.16 shows operation timing when the compare match interrupt signal is continuously output.

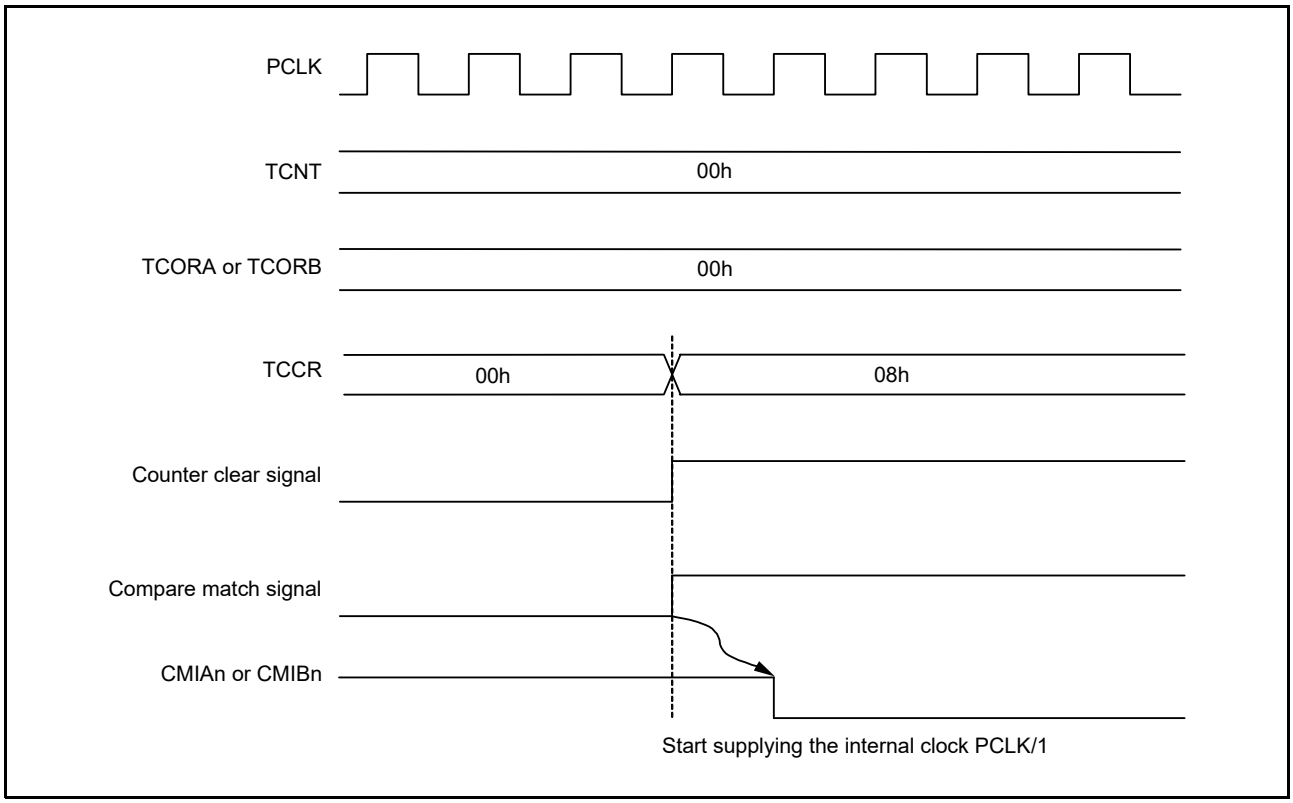


Figure 27.16 Continuous Output of Compare Match Interrupt Signal (n = 0 to 3)

27.8.10 Transition to Software Standby Mode

Before transitioning to software standby mode, set the TCCR.CSS[1:0] bits to 00b and the TCCR.CKS[2:0] bits to 000b for all channels to stop the clock supply to the counters. After returning from software standby mode, restoring the TCCR.CSS[1:0] and the TCCR.CKS[2:0] bits to their original values will resume counting from the value held prior to the transition.

28. Compare Match Timer (CMT)

This MCU has two on-chip compare match timer (CMT) units (unit 0 and unit 1), each consisting of a two-channel 16-bit timer (i.e., a total of four channels). The CMT has a 16-bit counter, and can generate interrupts at set intervals.
In this section, “PCLK” is used to refer to PCLKB.

28.1 Overview

Table 28.1 lists the specifications for the CMT.
Figure 28.1 shows a block diagram of the CMT (unit 0). A two-channel CMT constitutes a unit. Unit 0 and unit 1 are the same in terms of specifications. Compare match timer start register 0 (CMSTR0) and compare match interrupts (CMI0 and CMI1) of unit 0 correspond to compare match timer start register 1 (CMSTR1) and compare match interrupts (CMI2 and CMI3) of unit 1.

Table 28.1 CMT Specifications

Item	Description
Count clocks	• Four frequency dividing clocks One clock from PCLK/8, PCLK/32, PCLK/128, and PCLK/512 can be selected for each channel.
Interrupt	A compare match interrupt can be requested for each channel.
Event link function (output)	An event signal is output upon a CMT1 compare match.
Event link function (input)	Linking to the specified module is possible. CMT1 count start, event counter, or count restart operation is possible.
Low power consumption function	Each unit can be placed in a module stop state.
Protect Zone filter	Security attributes can be set for each unit.*1

Note 1. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

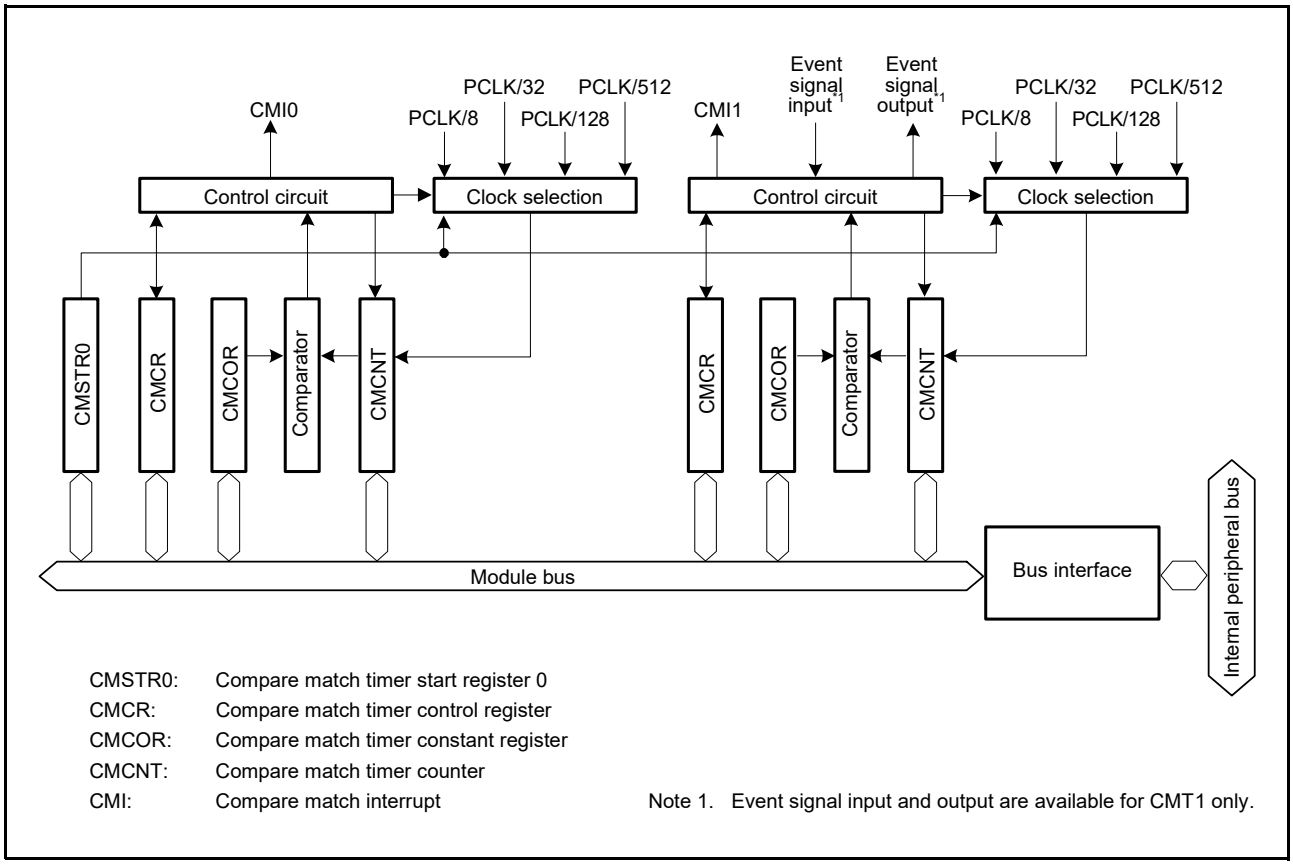

Figure 28.1 CMT (Unit 0) Block Diagram

28.2 Register Descriptions

28.2.1 Compare Match Timer Start Register 0 (CMSTR0)

Address(es): CMT.CMSTR0 8782 6000h, CMT_NS.CMSTR0 0782 6000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR1	STR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR0	Count Start 0	0: CMT0.CMCNT count is stopped. 1: CMT0.CMCNT count is started.	R/W
b1	STR1	Count Start 1	0: CMT1.CMCNT count is stopped. 1: CMT1.CMCNT count is started.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

28.2.2 Compare Match Timer Start Register 1 (CMSTR1)

Address(es): CMT.CMSTR1 8782 6010h, CMT_NS.CMSTR1 0782 6010h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR3	STR2
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR2	Count Start 2	0: CMT2.CMCNT count is stopped. 1: CMT2.CMCNT count is started.	R/W
b1	STR3	Count Start 3	0: CMT3.CMCNT count is stopped. 1: CMT3.CMCNT count is started.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

28.2.3 Compare Match Timer Control Register (CMCR)

Address(es): CMT0.CMCR 8782 6002h, CMT1.CMCR 8782 6008h, CMT2.CMCR 8782 6012h, CMT3.CMCR 8782 6018h, CMT0_NS.CMCR 0782 6002h, CMT1_NS.CMCR 0782 6008h, CMT2_NS.CMCR 0782 6012h, CMT3_NS.CMCR 0782 6018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	CMIE	—	—	—	—	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: PCLK/8 0 1: PCLK/32 1 0: PCLK/128 1 1: PCLK/512	R/W
b5 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CMIE	Compare Match Interrupt Enable	0: Compare match interrupt (CMIn) disabled 1: Compare match interrupt (CMIn) enabled	R/W
b7	—	Reserved	This bit is read as undefined. The write value should be 1.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CKS[1:0] Bits (Clock Select)

These bits select the count source from four frequency dividing clocks obtained by dividing the peripheral module clock (PCLK).

When the CMSTRm.STRn (m = 0, 1; n = 0 to 3) bit is set to 1, the CMCNT counter starts counting up on the clock selected with the CKS[1:0] bits.

CMIE Bit (Compare Match Interrupt Enable)

The CMIE bit enables or disables compare match interrupt (CMIn) (n = 0 to 3) generation when the CMCNT counter and the CMCOR register values match.

28.2.4 Compare Match Counter (CMCNT)

Address(es): CMT0.CMCNT 8782 6004h, CMT1.CMCNT 8782 600Ah, CMT2.CMCNT 8782 6014h, CMT3.CMCNT 8782 601Ah, CMT0_NS.CMCNT 0782 6004h, CMT1_NS.CMCNT 0782 600Ah, CMT2_NS.CMCNT 0782 6014h, CMT3_NS.CMCNT 0782 601Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMCNT counter is a readable/writable up-counter.
When an frequency dividing clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0, 1; n = 0 to 3) bit is set to 1, the CMCNT counter starts counting up using the selected clock.
When the value in the CMCNT counter and the value in the CMCOR register match, the CMCNT counter is set to 0000h. At the same time, a compare match interrupt (CMIn) (n = 0 to 3) is generated.

28.2.5 Compare Match Constant Register (CMCOR)

Address(es): CMT0.CMCOR 8782 6006h, CMT1.CMCOR 8782 600Ch, CMT2.CMCOR 8782 6016h, CMT3.CMCOR 8782 601Ch, CMT0_NS.CMCOR 0782 6006h, CMT1_NS.CMCOR 0782 600Ch, CMT2_NS.CMCOR 0782 6016h, CMT3_NS.CMCOR 0782 601Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The CMCOR register is a readable/writable register to set a value for compare match with the CMCNT counter.

28.3 Operation

28.3.1 Cyclic Count Operation

When an frequency dividing clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0, 1; n = 0 to 3) bit is set to 1, the CMCNT counter starts counting up using the selected clock.
When the value in the counter and the value in the register match, a compare match interrupt (CMIn) (n = 0 to 3) is generated. The CMCNT counter then starts counting up again from 0000h. Figure 28.2 shows the operation of the CMCNT counter.

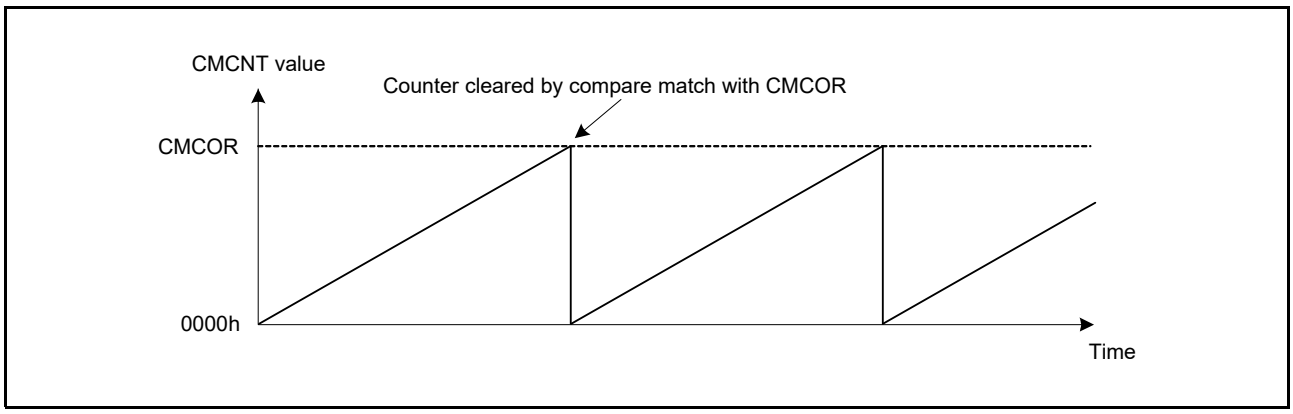

Figure 28.2 CMCNT Counter Operation

28.3.2 CMCNT Count Timing

As the count clock to be input to the CMCNT counter, one of four frequency dividing clocks (PCLK/8, PCLK/32, PCLK/128, and PCLK/512) obtained by dividing the peripheral module clock (PCLK) can be selected with the CMCR.CKS[1:0] bits. Figure 28.3 shows the timing of the CMCNT counter.

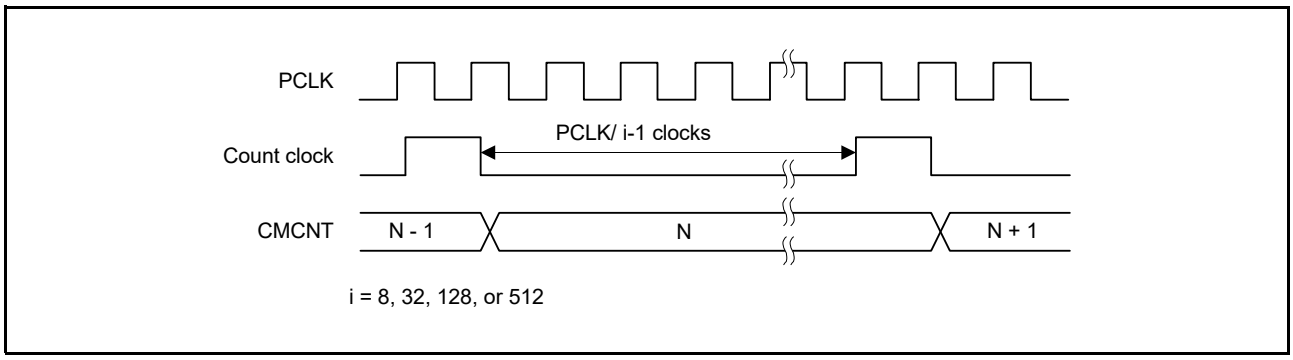

Figure 28.3 CMCNT Count Timing

28.4 Interrupts

28.4.1 Interrupt Sources

The CMT has channels and each of them to which a different vector address is allocated has a compare match interrupt (CMIn) (n = 0 to 3). When a compare match interrupt occurs, the corresponding interrupt request is output.
When the interrupt request is used to generate a CPU interrupt, the priority of channels can be changed by the interrupt controller settings. For details, see section 15, Interrupt Controller (ICUM).

Table 28.2 CMT Interrupt Sources

Name	Interrupt Sources	DTC Activation	DMAC Activation
CMI0	Compare match in CMT0	Possible	Possible
CMI1	Compare match in CMT1	Possible	Possible
CMI2	Compare match in CMT2	Possible	Possible
CMI3	Compare match in CMT3	Possible	Possible

28.4.2 Timing of Compare Match Interrupt Generation

When the CMCNT counter and the CMCOR register match, a compare match interrupt (CMIn) (n = 0 to 3) is generated. A compare match signal is generated at the last state in which the values match (the timing when the CMCNT counter updates the matched count value). That is, after a match between the CMCOR register and the CMCNT counter, the compare match signal is not generated until the next the CMCNT counter input clock.
Figure 28.4 shows the timing of a compare match interrupt.

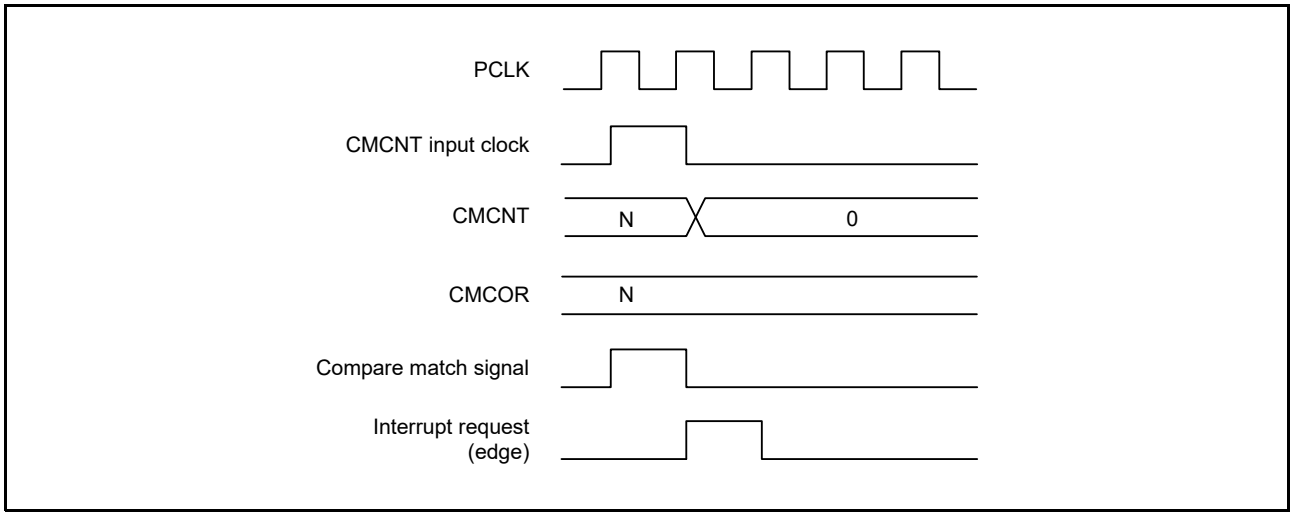

Figure 28.4 Timing of a Compare Match Interrupt

28.5 Link Operations by ELC

28.5.1 Event Signal Output to ELC

The CMT uses the event link controller (ELC) to perform link operation to a preset module using the interrupt request signal as the event signal. The CMT outputs the event signal upon a CMT1 compare match.
The event signal can be output regardless of the setting of the corresponding interrupt request enable bit (CMTn.CMCR.CMIE).

28.5.2 CMT Operation When Receiving an Event Signal from ELC

The CMT can perform either of the following operations upon the event preset by the ELSR0 register of the ELC.

(1) Count Start

When the CMT count start operation is selected by the ELOPA register of the ELC and the event specified by ELSR0 occurs, the CMSTR0.STR1 bit is set to 1, starting the CMT count operation.
However, if the specified event occurs while the CMSTR0.STR1 bit is 1, the event is ignored.

(2) Event Count

When the CMT event count operation is selected by the ELOPA register of the ELC and the event specified by ELSR0 occurs with the CMSTR0.STR1 bit being 1, the events are counted as the count source regardless of the CMT1.CMCR.CKS[1:0] bit setting. Reading the counter value returns the number of events that have been actually input.

(3) Count Restart

When the CMT count restart operation is selected by the ELOPA register of the ELC and the event specified by ELSR0 occurs, the CMT1.CMCNT counter value is modified to the initial value. If the CMSTR0.STR1 bit is 1 here, the count operation can be continued.

28.5.3 Notes on Operating CMT According to an Event Signal from ELC

The following describes the notes on operating the CMT using the event link feature.

(1) Count Start

When the event specified by ELSR0 occurs during the write cycle to the CMSTR0.STR1 bit, the cycle is not completed; setting 1 according to the event occurrence takes priority.

(2) Event Count

When the event specified by ELSR0 occurs during the write cycle to the CMT1.CMCNT, the cycle is not completed; event count operation according to the event occurrence takes priority.

(3) Count Restart

When the event specified by ELSR0 occurs during the write cycle to the CMT1.CMCNT, the cycle is not completed; count value initialization according to the event occurrence takes priority.

28.6 Usage Notes

28.6.1 Setting the Module Stop Function

The CMT can be enabled or disabled using the module stop control register. After a reset, the CMT is in the module stop state. The registers can be accessed by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

28.6.2 Conflict between CMCNT Counter Writing and Compare Match

When the compare match signal is generated while writing to the CMCNT counter, clearing the CMCNT counter has priority over writing to it. In this case, the CMCNT counter is not written to. Figure 28.5 shows the timing to clear the CMCNT counter.

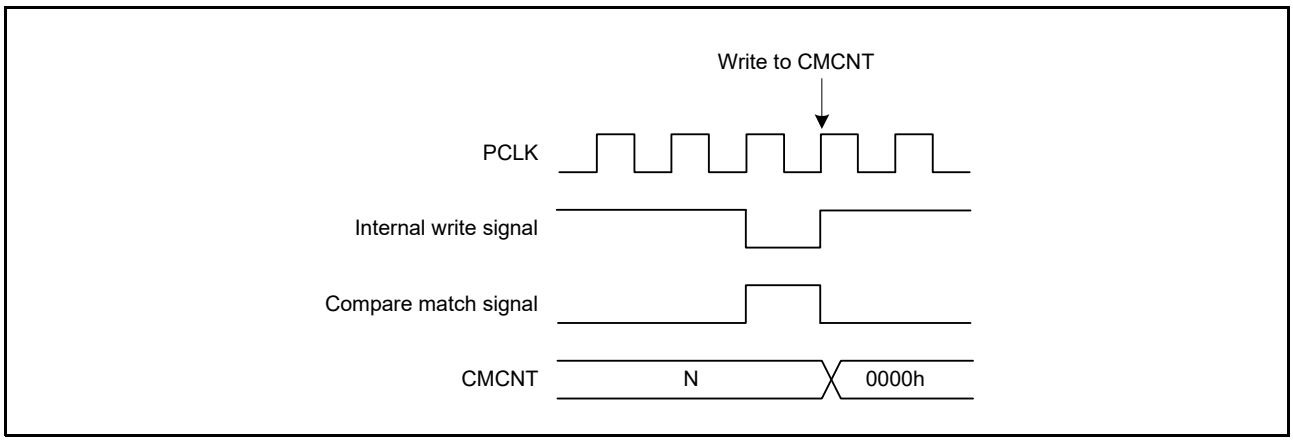

Figure 28.5 Conflict between CMCNT Counter Writing and Compare Match

28.6.3 Conflict between CMCNT Counter Writing and Incrementing

If writing to the counter and the incrementing conflict, the writing has priority over the incrementing. Figure 28.6 shows the timing to write the CMCNT counter.

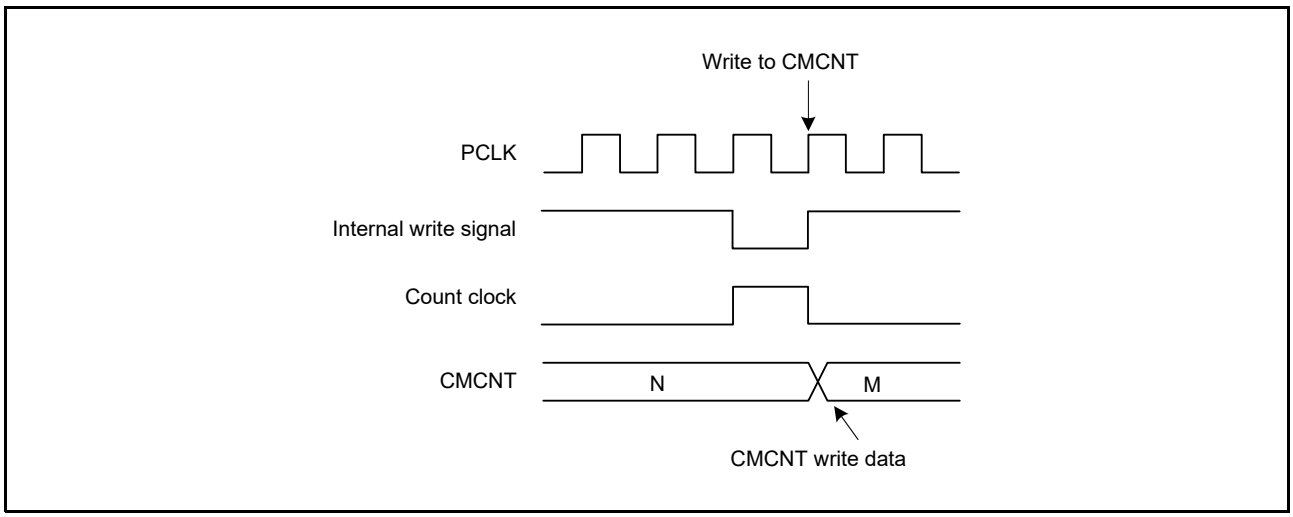

Figure 28.6 Conflict between CMCNT Counter Writing and Incrementing

28.6.4 Transition to Software Standby Mode

Before transitioning to software standby mode, set the CMSTR0 and CMSTR1 registers to 00h to stop all counters. After returning from software standby mode, setting the CMSTRm.STRn bit (m = 0, 1; n = 0 to 3) to 1 will resume counting from the value held prior to the transition.

29. Compare Match Timer W (CMTW)

This MCU includes two units (unit 0 and unit 1) with one channel of 32-bit compare match timer W (CMTW).
CMTW has a 32-bit counter and can generate interrupts each time a set period elapses.
In this section, “PCLK” is used to refer to PCLKB.

29.1 Overview

Table 29.1 shows the specifications of the CMTW.
Figure 29.1 shows a block diagram of the CMTW0 and Figure 29.2 shows a block diagram of the CMTW1.

Table 29.1 CMTW Specifications

Item	Function
Number of channels	Two channels (unit 0, unit 1)
Timer counter	16-bit/32-bit selectable up-counter The counter returns to 0000 0000h after a compare match.
Prescaler	Four dividing clocks are output. Selectable from any of PCLK/8, PCLK/32, PCLK/128, and PCLK/512
Input capture	Up to two input capture input signals available.
Output compare	Up to two output compare output signals available.
Compare match	One compare match available (no output compare output pin used).
Interrupts	Compare match interrupt Input capture 0 and 1 interrupts Output compare 0 and 1 interrupts
Event link function (output) (Unit 0)	Compare match
Event link function (input) (Unit 0)	One of the following operations is enabled after an event is accepted: • Count start operation • Event count operation • Count restart operation
Low power consumption function	Each unit can be placed in the module stop state.
Protect Zone filter	Security attributes can be set for each unit.*1

Note 1. When each unit is set to the secure attribute, registers in the unit are accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When each unit is set to the non-secure attribute, registers in the unit are accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

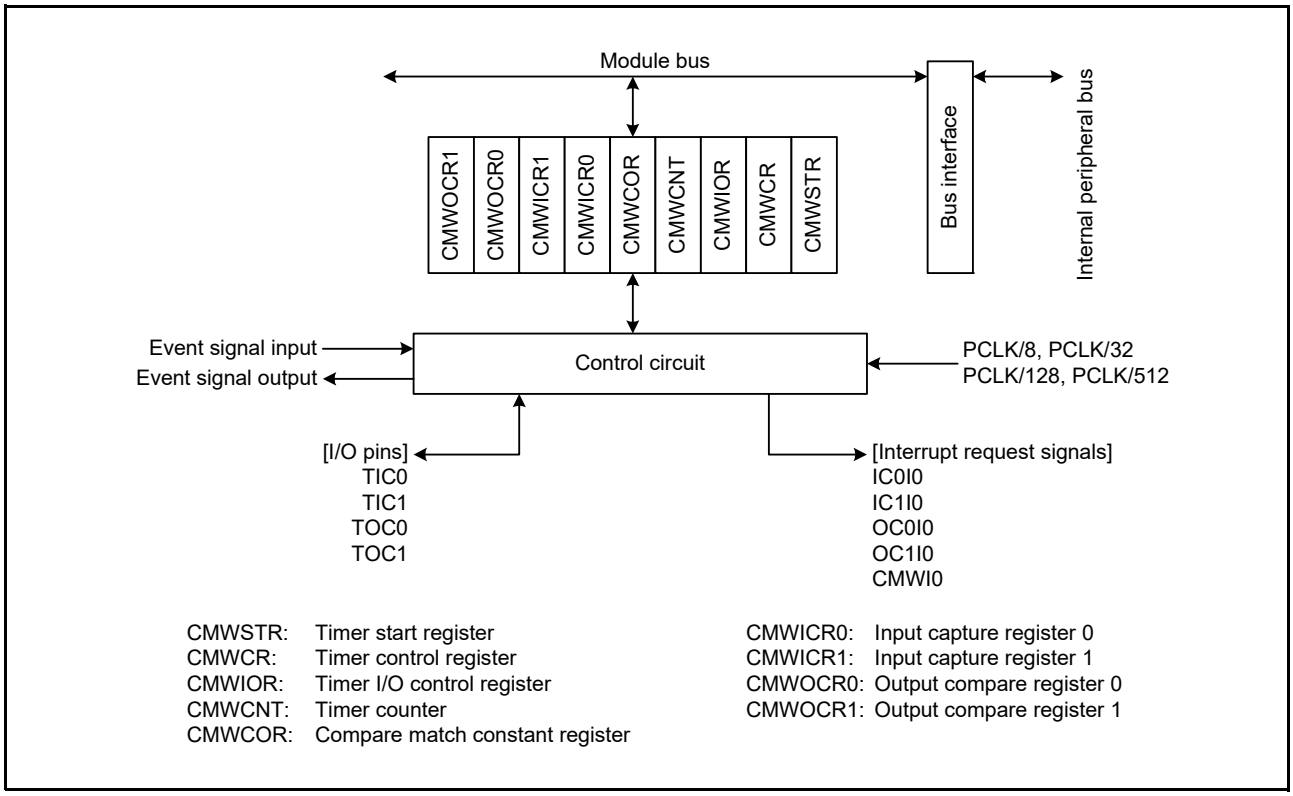

Figure 29.1 CMTW0 Block Diagram

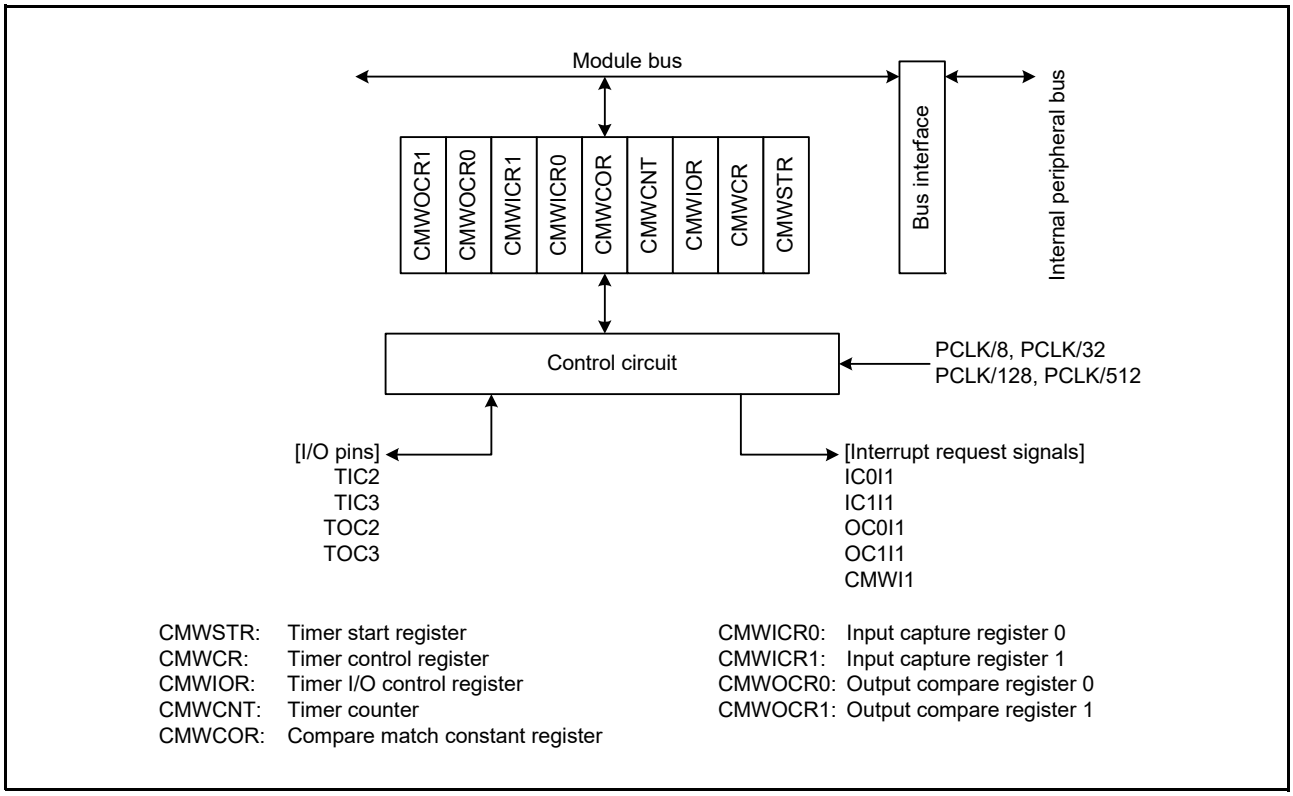

Figure 29.2 CMTW1 Block Diagram

Table 29.2 shows the CMTW pin configuration.

Table 29.2 CMTW Pin Configuration

Unit	Pin Name	I/O	Description
CMTW0	TIC0	Input	Input capture input for the CMTW0.CMWICR0 register
	TIC1	Input	Input capture input for the CMTW0.CMWICR1 register
	TOC0	Output	Output compare output for the CMTW0.CMWOCR0 register
	TOC1	Output	Output compare output for the CMTW0.CMWOCR1 register
CMTW1	TIC2	Input	Input capture input for the CMTW1.CMWICR0 register
	TIC3	Input	Input capture input for the CMTW1.CMWICR1 register
	TOC2	Output	Output compare output for the CMTW1.CMWOCR0 register
	TOC3	Output	Output compare output for the CMTW1.CMWOCR1 register

29.2 Register Descriptions

29.2.1 Timer Start Register (CMWSTR)

Address(es): CMTW0.CMWSTR 8782 6100h, CMTW1.CMWSTR 8782 6140h,
CMTW0_NS.CMWSTR 0782 6100h, CMTW1_NS.CMWSTR 0782 6140h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR	Counter Start	0: CMWCNT counter count is stopped. (The value immediately before count operation stops is retained and the count operation is stopped.) 1: CMWCNT counter count is started.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

STR Bit (Counter Start)

Specifies whether the timer counter operates or is stopped. The relevant prescaler operates or is stopped according to the settings of the STR bit.

29.2.2 Timer Control Register (CMWCR)

Address(es): CMTW0.CMWCR 8782 6104h, CMTW1.CMWCR 8782 6144h,
CMTW0_NS.CMWCR 0782 6104h, CMTW1_NS.CMWCR 0782 6144h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CCLR[2:0]			—	—	—	CMS	—	OC1IE	OC0IE	IC1IE	IC0IE	CMWIE	—	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: PCLK/8 0 1: PCLK/32 1 0: PCLK/128 1 1: PCLK/512	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	CMWIE	Compare Match Interrupt Request Enable	0: Interrupt request (CMWI) disabled 1: Interrupt request (CMWI) enabled	R/W
b4	IC0IE	Input Capture 0 Interrupt Request Enable	0: Interrupt request (IC0I) disabled 1: Interrupt request (IC0I) enabled	R/W

b8	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b9	CMS	Timer Counter Size	0: 32 bits 1: 16 bits	R/W
b12 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b13	CCLR[2:0]	Counter Clear	b15 b13 0 0 0: CMWCNT counter cleared by CMWCOR register compare match 0 0 1: Clearing of CMWCNT counter disabled 0 1 0: Clearing of CMWCNT counter disabled 0 1 1: Clearing of CMWCNT counter disabled 1 0 0: CMWCNT counter cleared by CMWICR0 register input capture 1 0 1: CMWCNT counter cleared by CMWICR1 register input capture 1 1 0: CMWCNT counter cleared by CMWOCR0 register compare match 1 1 1: CMWCNT counter cleared by CMWOCR1 register compare match	R/W

The CMWCR register should be set while the timer counter (CMWCNT) operation is stopped.

CKS[1:0] Bits (Clock Select)

Select the clock to be input to the CMWCNT counter among four internal clocks obtained by dividing the peripheral module clock (PCLK). When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting based on the clock selected with the CMWCR.CKS[1:0] bits.

CMWIE Bit (Compare Match Interrupt Request Enable)

Enables or disables compare match interrupt request (CMWI) generation when the CMWCNT counter and the CMWCOR register values match.

IC0IE Bit (Input Capture 0 Interrupt Request Enable)

Enables or disables input capture 0 interrupt request (IC0I) generation when input capture is generated in the CMWICR0 register.

IC1IE Bit (Input Capture 1 Interrupt Request Enable)

Enables or disables input capture 1 interrupt request (IC1I) generation when input capture is generated in the CMWICR1 register.

OC0IE Bit (Output Compare 0 Interrupt Request Enable)

Enables or disables output compare 0 interrupt request (OC0I) generation when the CMWCNT counter and the CMWOCR0 register values match.

OC1IE Bit (Output Compare 1 Interrupt Request Enable)

Enables or disables output compare 1 interrupt request (OC1I) generation when the CMWCNT counter and CMWOCR1 register values match.

CMS Bit (Timer Counter Size)

Selects either 16 or 32 bits as the size of the timer counter (CMWCNT). The size selected with the CMS bit is valid in the CMWCOR, CMWICR0, CMWICR1, CMWOCR0, and CMWOCR1 registers.

CCLR[2:0] Bits (Counter Clear)

Select the CMWCNT counter clearing source.

29.2.3 Timer I/O Control Register (CMWIOR)

Address(es): CMTW0.CMWIOR 8782 6108h, CMTW1.CMWIOR 8782 6148h,
CMTW0_NS.CMWIOR 0782 6108h, CMTW1_NS.CMWIOR 0782 6148h

	CMWE	—	OC1E	OC0E	OC1[1:0]		OC0[1:0]		—	—	IC1E	IC0E	IC1[1:0]		IC0[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	IC0[1:0]	Input Capture 0 Control	b1 b0 0 0: Input capture at the rising edge 0 1: Input capture at the falling edge 1 0: Input capture at both edges 1 1: Setting prohibited	R/W
b3, b2	IC1[1:0]	Input Capture 1 Control	b3 b2 0 0: Input capture at the rising edge 0 1: Input capture at the falling edge 1 0: Input capture at both edges 1 1: Setting prohibited	R/W
b4	IC0E	Input Capture 0 Enable	0: Input capture 0 operation disabled 1: Input capture 0 operation enabled	R/W
b5	IC1E	Input Capture 1 Enable	0: Input capture 1 operation disabled 1: Input capture 1 operation enabled	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	OC0[1:0]	Output Compare 0 Control	b9 b8 0 0: Retains the output value.*1 0 1: Initially outputs low and toggles the output value upon compare match. 1 0: Initially outputs high and toggles the output value upon compare match. 1 1: Setting prohibited	R/W
b11, b10	OC1[1:0]	Output Compare 1 Control	b11 b10 0 0: Retains the output value.*1 0 1: Initially outputs low and toggles the output value upon compare match. 1 0: Initially outputs high and toggles the output value upon compare match. 1 1: Setting prohibited	R/W
b12	OC0E	Output Compare 0 Enable	0: Output compare 0 operation disabled 1: Output compare 0 operation enabled	R/W
b13	OC1E	Output Compare 1 Enable	0: Output compare 1 operation disabled 1: Output compare 1 operation enabled	R/W
b14	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15	CMWE	Compare Match Enable	0: Compare match operation disabled 1: Compare match operation enabled	R/W

Note 1. After reset, low is output until the CMWIOR register is set.

29.2.4 Timer Counter (CMWCNT)

Address(es): CMTW0.CMWCNT 8782 6110h, CMTW1.CMWCNT 8782 6150h,
CMTW0_NS.CMWCNT 0782 6110h, CMTW1_NS.CMWCNT 0782 6150h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMWCNT counter is a readable/writable up-counter.
Before starting count operation, the timer control register (CMWCR) should be set. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in this register are valid. When writing to the CMWCNT counter, write data in 32-bit units with the upper bits set to 0000h. The CMWCNT counter can only be accessed in longword units.
When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting. When the CMWSTR.STR bit is set to 0, the CMWCNT counter retains the value immediately before a stop of counting and stops counting.

29.2.5 Compare Match Constant Register (CMWCOR)

Address(es): CMTW0.CMWCOR 8782 6114h, CMTW1.CMWCOR 8782 6154h,
CMTW0_NS.CMWCOR 0782 6114h, CMTW1_NS.CMWCOR 0782 6154h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The CMWCOR register is a readable/writable register that specifies the time up to a compare match between the timer counter (CMWCNT) value and CMWCOR value. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in this register are valid. When writing to the CMWCOR register, write data in 32-bit units with the upper bits set to 0000h. The CMWCOR register can only be accessed in longword units. To detect an overflow, set the CMWCOR register value to FFFF FFFFh (32-bit count operation) or 0000 FFFFh (16-bit count operation). When the CMWCNT counter is set to 0, a compare match interrupt request (CMWI) can be used as an overflow detection signal.

29.2.6 Input Capture Register n (CMWICRn) (n = 0, 1)

Address(es): CMTW0.CMWICR0 8782 6118h, CMTW0.CMWICR1 8782 611Ch, CMTW1.CMWICR0 8782 6158h, CMTW1.CMWICR1 8782 615Ch, CMTW0_NS.CMWICR0 0782 6118h, CMTW0_NS.CMWICR1 0782 611Ch, CMTW1_NS.CMWICR0 0782 6158h, CMTW1_NS.CMWICR1 0782 615Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The CMWICRn register is a read-only register in which the CMWCNT value is stored when an input capture is generated.

When the 16-bit counter size is selected with the CMWCR.CMS bit, bits 15 to 0 in these registers are valid. Writing to these registers is invalid. The CMWICRn register can only be accessed in longword units.

29.2.7 Output Compare Register n (CMWOCRn) (n = 0, 1)

Address(es): CMTW0.CMWOCR0 8782 6120h, CMTW0.CMWOCR1 8782 6124h, CMTW1.CMWOCR0 8782 6160h, CMTW1.CMWOCR1 8782 6164h, CMTW0_NS.CMWOCR0 0782 6120h, CMTW0_NS.CMWOCR1 0782 6124h, CMTW1_NS.CMWOCR0 0782 6160h, CMTW1_NS.CMWOCR1 0782 6164h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

The CMWOCRn register is a readable/writable register that set the value to be compared when an output compare is generated.

When the 16-bit counter size is selected with the CMWCR.CMS bit, bits 15 to 0 of these registers become valid. When writing to these registers, write data in 32-bit units with the upper bits set to 0000h.

The CMWOCRn register can only be accessed in longword units. The initial value of CMWOCR0 and CMWOCR1 registers is FFFF FFFFh.

29.3 Operation

When the CMWCR register is set and then the STR bit in CMWSTR is set to 1, the CMTW starts count operation. Setting the CMWSTR.STR bit to 0 enables the CMWCNT counter to retain the value immediately before a stop of counting and stop counting. Setting the CMWIOR register enables using the compare match function, input capture input function, and output compare output function.

29.3.1 Cyclic Count Operation

When the counter clock is selected by using the CMWCR.CKS[1:0] bits and the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting cycles of the selected clock. When clearing of the counter is selected by the CMWCR.CCLR[2:0] bits and the counter clearing source is generated, the CMWCNT counter becomes 0000 0000h and continues counting. When clearing of the counter is not selected, an overflow is generated when FFFF FFFFh changes to 0000 0000h during 32-bit count operation and 0000 FFFFh changes to 0000 0000h during 16-bit count operation, and the CMWCNT counter continues counting.

29.3.2 Compare Match Function

When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter becomes 0000 0000h. At this time, a compare match interrupt request (CMWI) is generated. The CMWCNT counter restarts counting from 0000 0000h.

To enable overflow detection, the CMWCOR register value should be set to FFFF FFFFh (when the counter size is 32 bits) or 0000 FFFFh (when the counter size is 16 bits). When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter becomes 0000 0000h. In this case, the compare match interrupt request (CMWI) is generated. The CMWCNT counter then restarts counting from 0000 0000h.

Figure 29.3 shows an example of procedure for setting compare match operation.

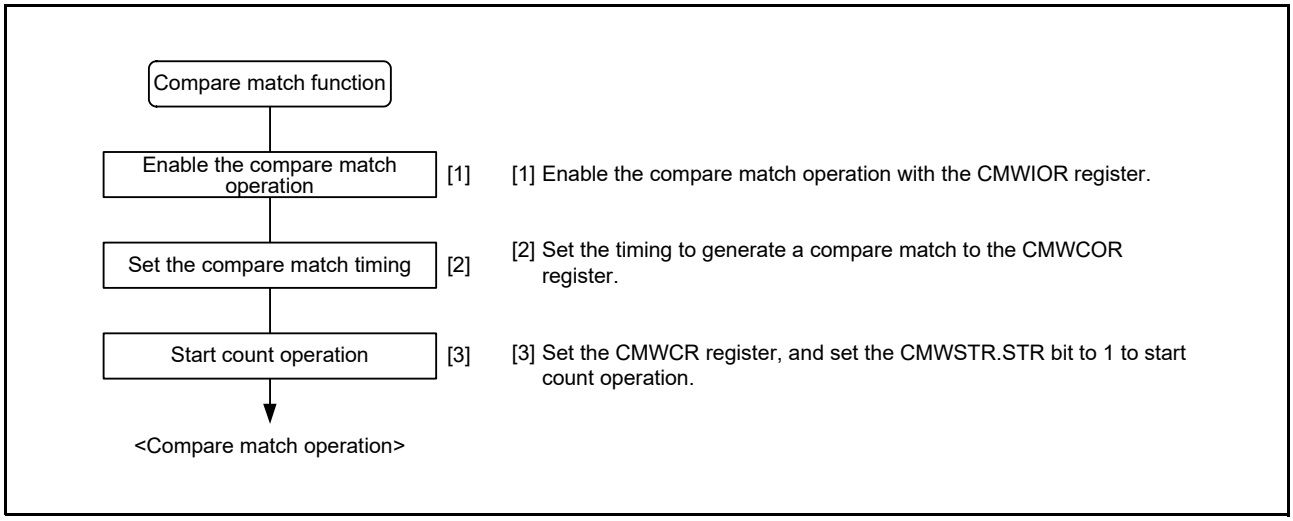

Figure 29.3 Procedure for Setting Compare Match Operation

Figure 29.4 shows an example when compare match with CMWCOR is set as a counter clearing source.

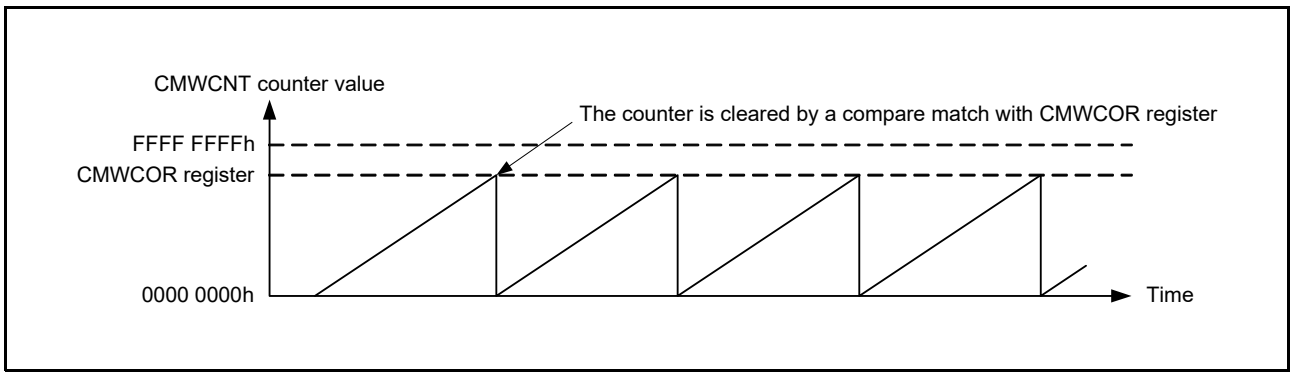

Figure 29.4 Example of Compare Match Operation

Figure 29.5 shows an example when CMWCOR is set to FFFF FFFFh and an overflow is detected.

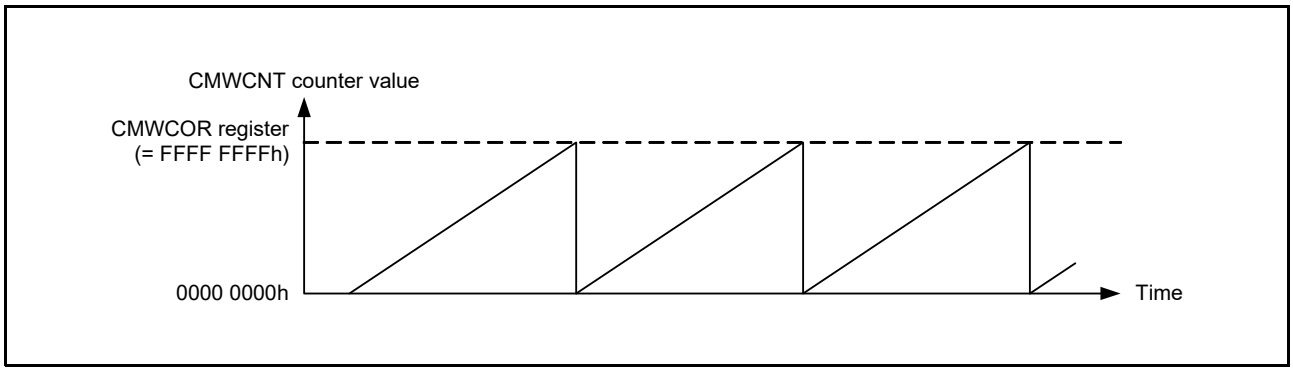

Figure 29.5 Example of Compare Match Operation (Overflow Detected)

29.3.3 Output Compare Function

The output compare function can be used for toggle waveform output. When the CMWCNT counter value matches either of the values of the CMWOCR0 or CMWOCR1 register, the output compare interrupt request (OC0I or OC1I) is generated. Figure 29.6 shows an example of procedure for setting output compare operation.

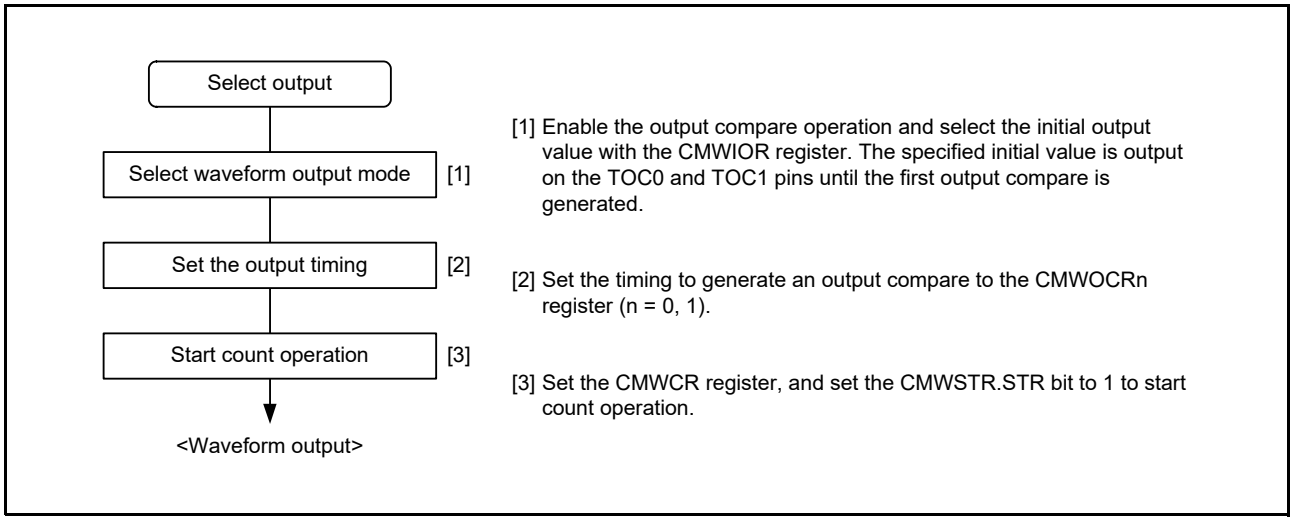

Figure 29.6 Procedure for Setting Output Compare Operation

Figure 29.7 shows an example of toggle waveform output from the TOC0 and TOC1 pins when the counter is set to be cleared by compare match with the CMWOCR1 register.

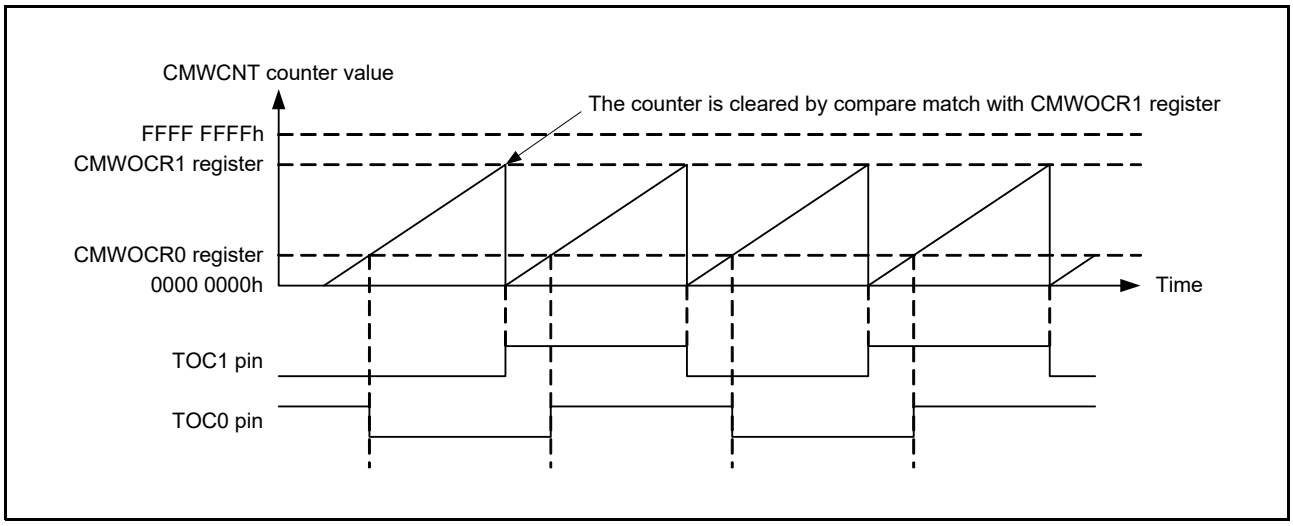

Figure 29.7 Example of Output Compare Operation (Unit 0)

29.3.4 Input Capture Function

Through detecting the edge on the TIC0 and TIC1 pin input, the CMWCNT counter value can be transferred to the CMWICR0 and CMWICR1 registers, respectively. The edges to be detected can be selected from among the rising edge alone, falling edge alone, and both the rising and falling edges. When the CMWCNT counter value is transferred to the CMWICR0 or CMWICR1 register using the input capture operation, an input capture interrupt request (IC0I or IC1I) is generated. Figure 29.8 shows an example of procedure for setting input capture operation.

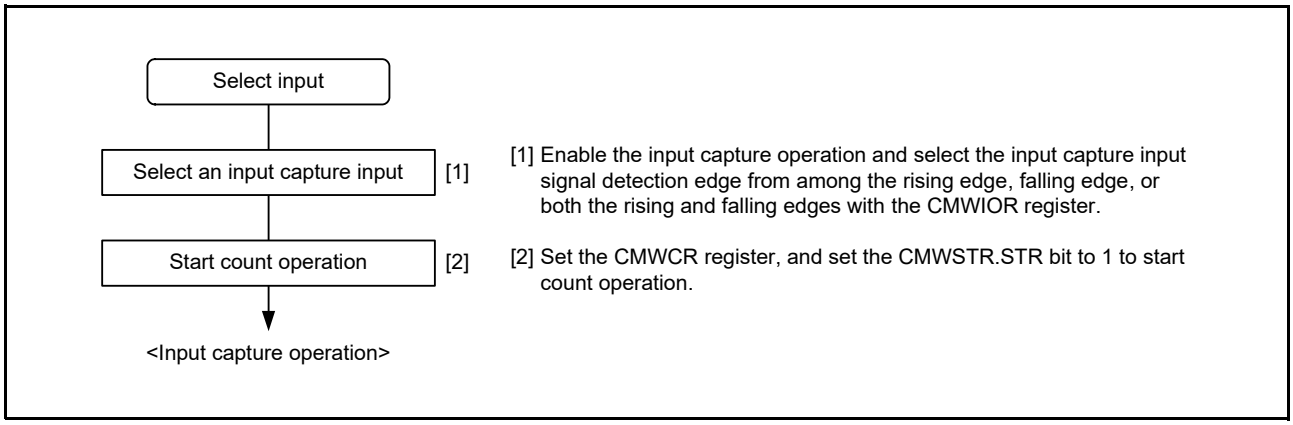

Figure 29.8 Procedure for Setting Input Capture Operation

Figure 29.9 shows an example in which both edges are selected for the TIC0 pin input capture detection edge and the falling edge for the TIC1 pin, and the CMWCNT counter is cleared by a CMWICR1 register input capture.

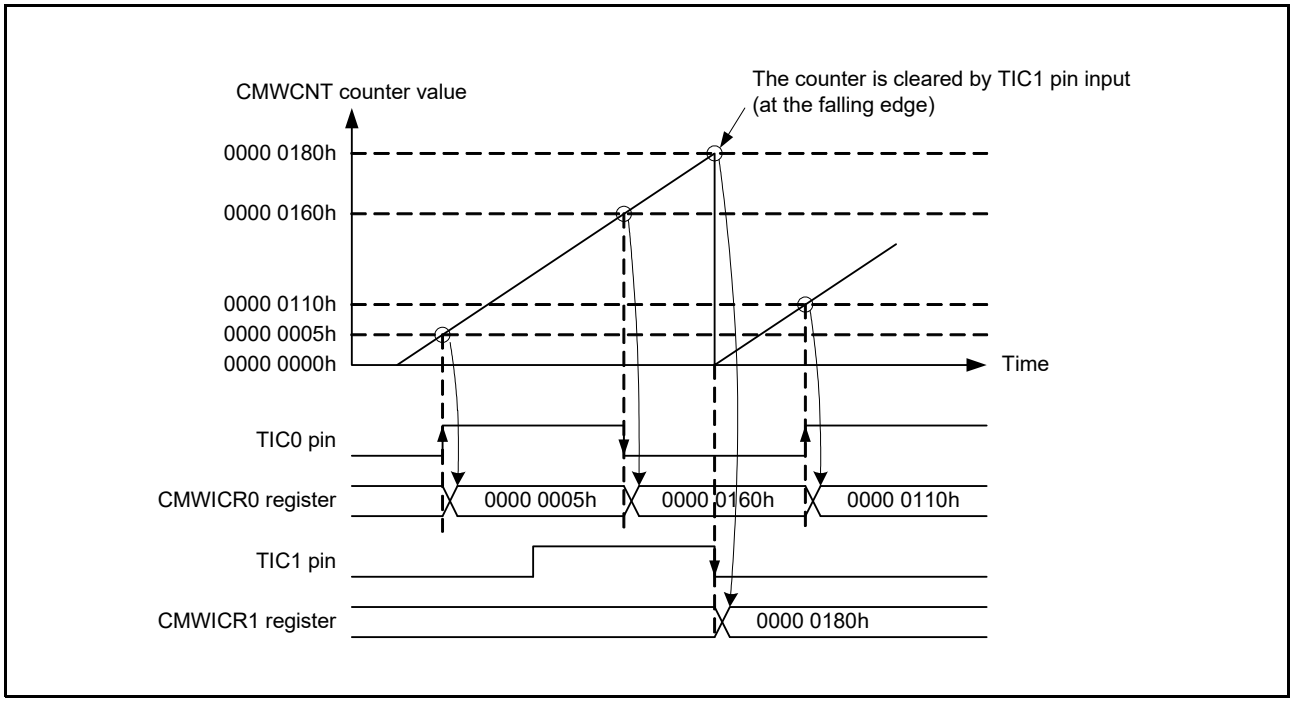

Figure 29.9 Example of Input Capture Operation (Unit 0)

29.3.5 Counter Size

With the CMTW, either 16 or 32 bits can be selected as the counter size by using the CMWCR.CMS bit.
When the counter is used as a 16-bit counter, set the value of the CMWCOR register in 32-bit units with the upper 16 bits set to 0000h. 0000 FFFFh should be set to detect an overflow. Similarly, set the values of the CMWOCR0 and CMWOCR1 registers in 32-bit units with the upper 16 bits set to 0000h. Read the CMWOCR0 and CMWOCR1 registers in 32-bit units. The upper 16 bits can be read as 0000h.

29.3.6 Count Timing of CMWCNT Counter

By setting the CMWCR.CKS[1:0] bits, one of four clocks (PCLK/8, PCLK/32, PCLK/128, and PCLK/512) obtained by dividing the peripheral module clock (PCLK) can be selected as the counter clock to be input to the CMWCNT counter.
Figure 29.10 shows the timing.

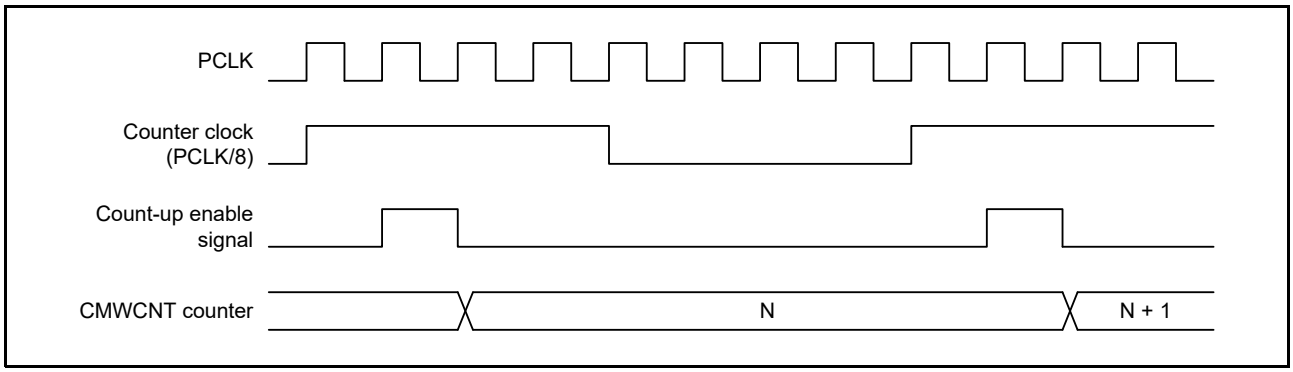

Figure 29.10 Count Timing (PCLK/8)

29.3.7 Output Compare Output Timing

A compare match signal is generated in the last state in which the CMWOCRn register (n = 0, 1) and CMWCNT counter values match (the CMWCNT counter value is updated immediately after the state). The compare match signal is generated if the CMWCNT count-up enable signal is input after a match between the CMWOCRn register and CMWCNT counter values. When a compare match signal is generated, output of the output compare pin (TOC pin) is toggled.
Figure 29.11 shows output compare output timing.

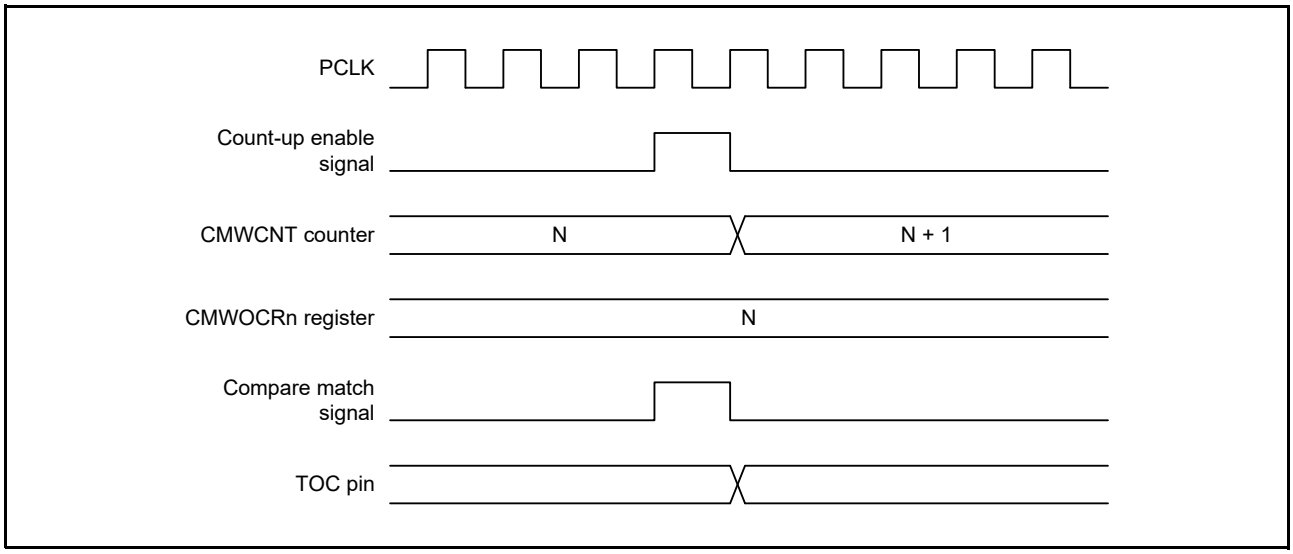

Figure 29.11 Output Compare Output Timing

29.3.8 Input Capture Timing

Figure 29.12 shows the timing of input capture operation at both edges.
When the edge of the TIC0 and TIC1 pins is detected, the CMWCNT counter value is transferred to the CMWICR0 and CMWICR1 registers, respectively.

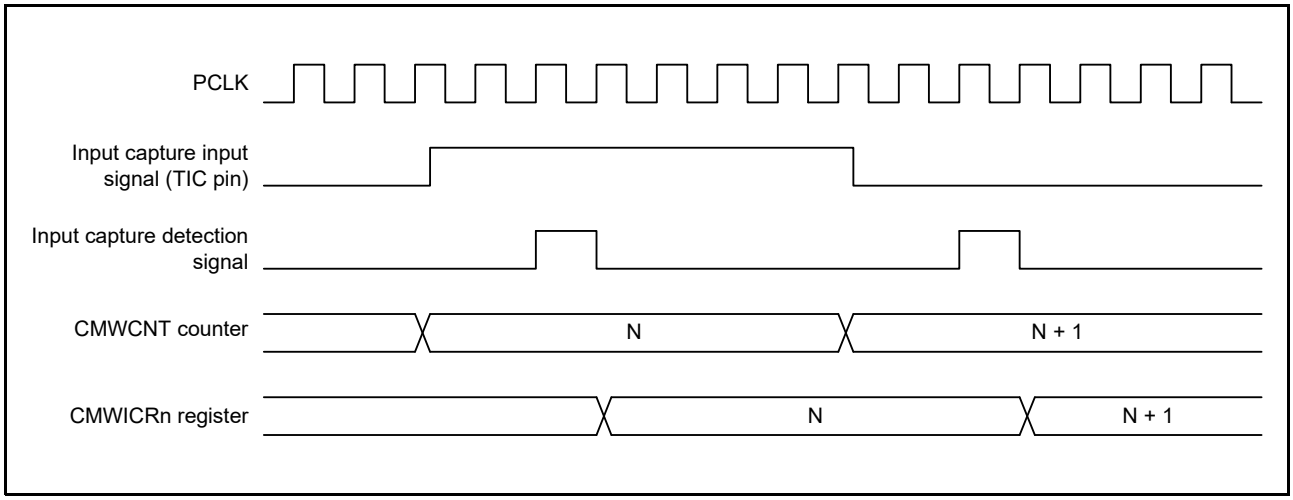

Figure 29.12 Input Capture Timing (Unit 0, Both-Edge Detection) (n = 0, 1)

29.4 Interrupts

29.4.1 CMTW Interrupt Sources and DTC/DMAC Transfer Requests

The CMTW has five interrupt sources: two input capture interrupt requests (IC0I and IC1I), two output compare interrupt requests (OC0I and OC1I), and a compare match interrupt request (CMWI).
Table 29.3 shows the interrupt sources. The interrupt sources can be enabled or disabled using the IC0IE, IC1IE, OC0IE, OC1IE, and CMWIE bits in CMWCR and are separately generated to the interrupt controller.
Each interrupt request can activate the DMAC or DTC. When the DMAC is used for data transfer, an interrupt request is not generated to the CPU. For generating an interrupt request to the CPU during data transfer using the DTC, refer to section 20, Data Transfer Controller (DTCA).

Table 29.3 CMTW Interrupt Sources

Unit	Name	Interrupt Request	Interrupt Request Enable Bit	DMAC/DTC Activation
CMTW0	CMWI0	Compare match of CMTW0.CMWCOR register	CMTW0.CMWCR.CMWIE	Possible
	IC0I0	Input capture of CMTW0.CMWICR0 register	CMTW0.CMWCR.IC0IE	Possible
	IC1I0	Input capture of CMTW0.CMWICR1 register	CMTW0.CMWCR.IC1IE	Possible
	OC0I0	Output compare of CMTW0.CMWOCR0 register	CMTW0.CMWCR.OC0IE	Possible
	OC1I0	Output compare of CMTW0.CMWOCR1 register	CMTW0.CMWCR.OC1IE	Possible
CMTW1	CMWI1	Compare match of CMTW1.CMWCOR register	CMTW1.CMWCR.CMWIE	Possible
	IC0I1	Input capture of CMTW1.CMWICR0 register	CMTW1.CMWCR.IC0IE	Possible
	IC1I1	Input capture of CMTW1.CMWICR1 register	CMTW1.CMWCR.IC1IE	Possible
	OC0I1	Output compare of CMTW1.CMWOCR0 register	CMTW1.CMWCR.OC0IE	Possible
	OC1I1	Output compare of CMTW1.CMWOCR1 register	CMTW1.CMWCR.OC1IE	Possible

29.4.2 Timing of Compare Match Interrupt Generation

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt request (CMWI) is generated. The compare match signal is generated at the end of the cycle where the values matched (i.e. when the CMWCNT counter is updated from the matching counter value).The compare match signal, therefore, is not generated until a count-up enable signal is generated after the values of the CMWCNT counter and CMWCOR register have matched. Figure 29.13 shows the timing of compare match interrupt generation.

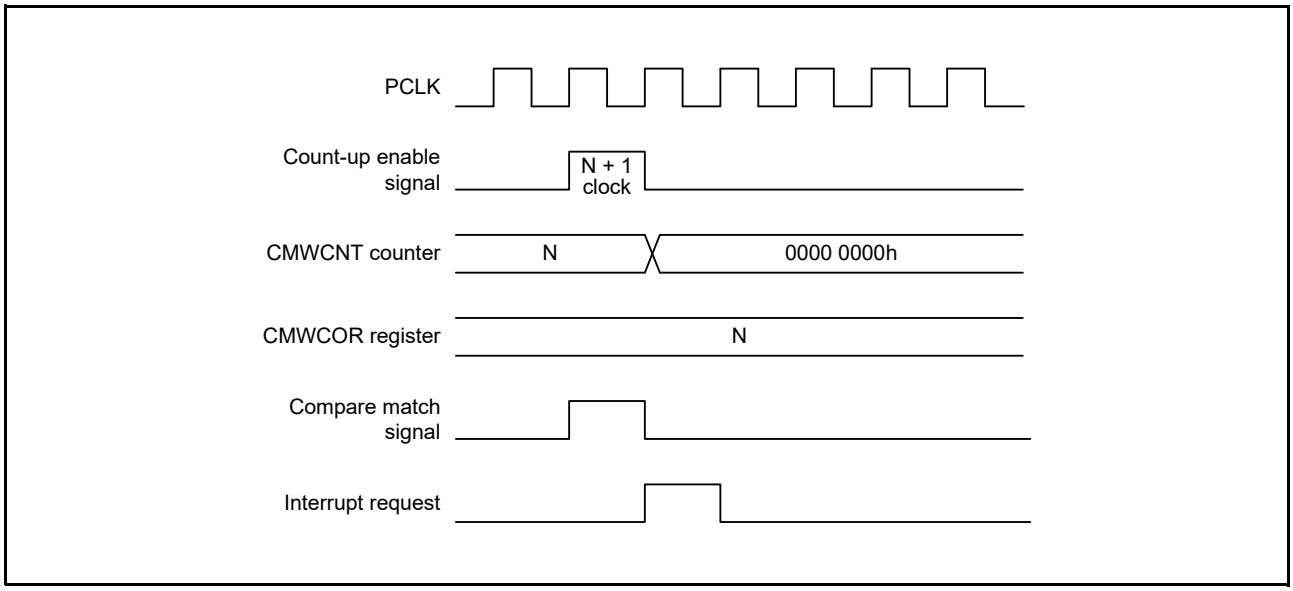

Figure 29.13 Timing of Compare Match Interrupt Generation

(a) Timing of Output Compare Interrupt Generation

Figure 29.14 shows the timing of output compare interrupt generation.

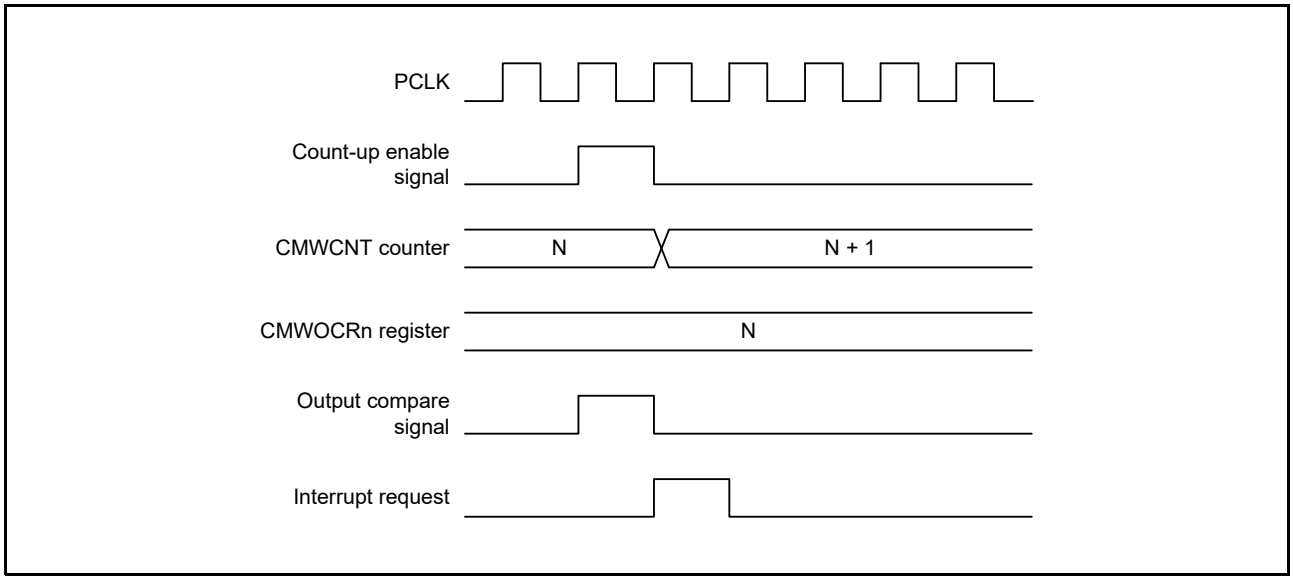

Figure 29.14 Timing of Output Compare Interrupt Generation (n = 0, 1)

(b) Timing of Input Capture Interrupt Generation

Figure 29.15 shows the timing of input capture interrupt generation.

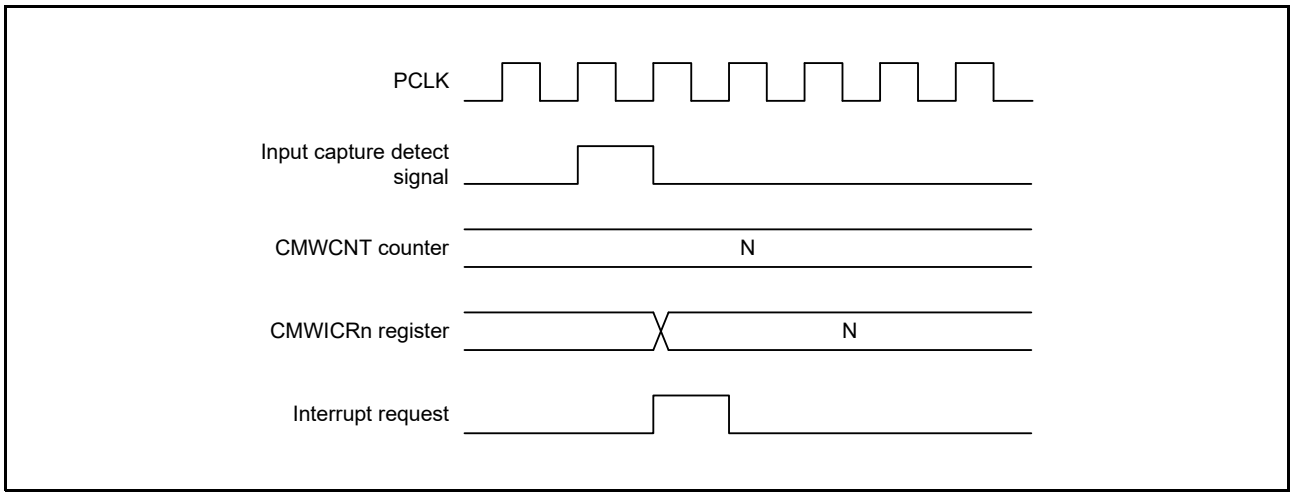

Figure 29.15 Timing of Input Capture Interrupt Generation (n = 0, 1)

29.5 Link Operations by ELC

29.5.1 Event Signal Output to ELC

The CMTW uses the event link controller (ELC) to perform link operation to a preset module using the interrupt request signal as the event signal.
The CMTW outputs the event signal upon a compare match. The corresponding channel is channel 0. The event signal can be output regardless of the corresponding interrupt request enable bit (CMWCR.CMWIE).
For details, refer to section 21, Event Link Controller (ELC).

(1) Compare Match Event

In response to a compare match, the CMTW simultaneously issues an interrupt request and a compare match event signal to the ELC. The event signal is issued regardless of the settings of the corresponding interrupt request enable bit (CMWCR.CMWIE bit).

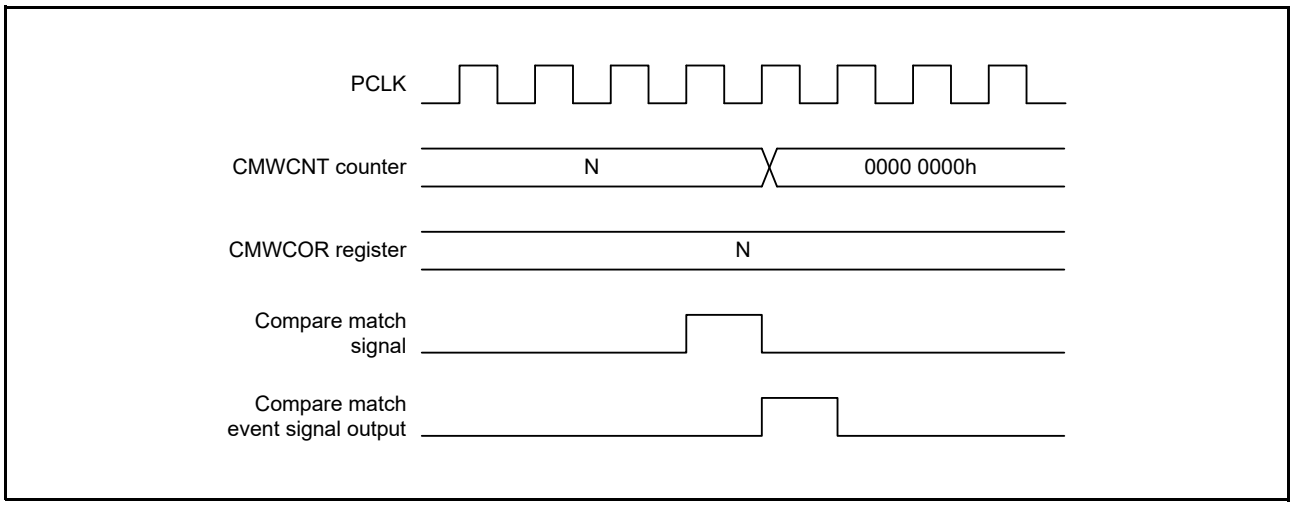

Figure 29.16 Timing of Issuing a Compare Match Event Signal

29.5.2 CMTW Operation When Receiving an Event Signal from ELC

The CMTW can perform any of the following operations according to the event preset by the ELSRn register of the ELC.

(1) Count Start

The CMTW count start operation is selected by the ELOPB register of the ELC. If the event specified by the ELSRn register occurs, the CMWSTR.STR bit is set to 1, starting the CMTW count operation.
However, if the specified event occurs while the CMWSTR.STR bit is 1, the event is ignored.

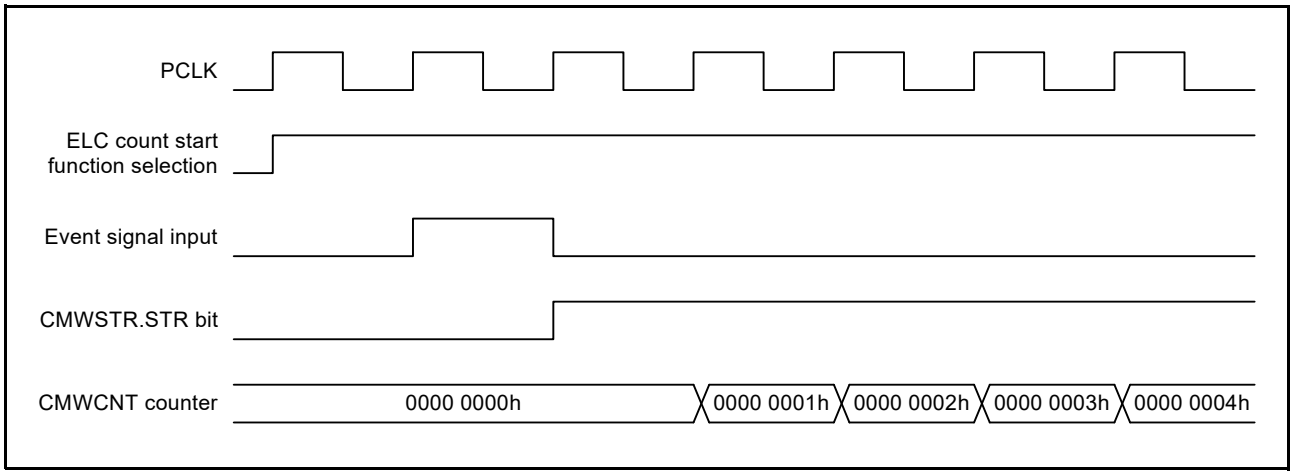

Figure 29.17 Count Start Operation on Acceptance of the Event Signal

(2) Event Count

The CMTW event count operation is selected by the ELOPB register of the ELC. If the event specified by the ELSRn register occurs when the CMWSTR.STR bit is 1, the event is counted as the count source regardless of the CMWCR.CKS[1:0] bit setting.
Reading the counter value returns the number of events that have been actually input.

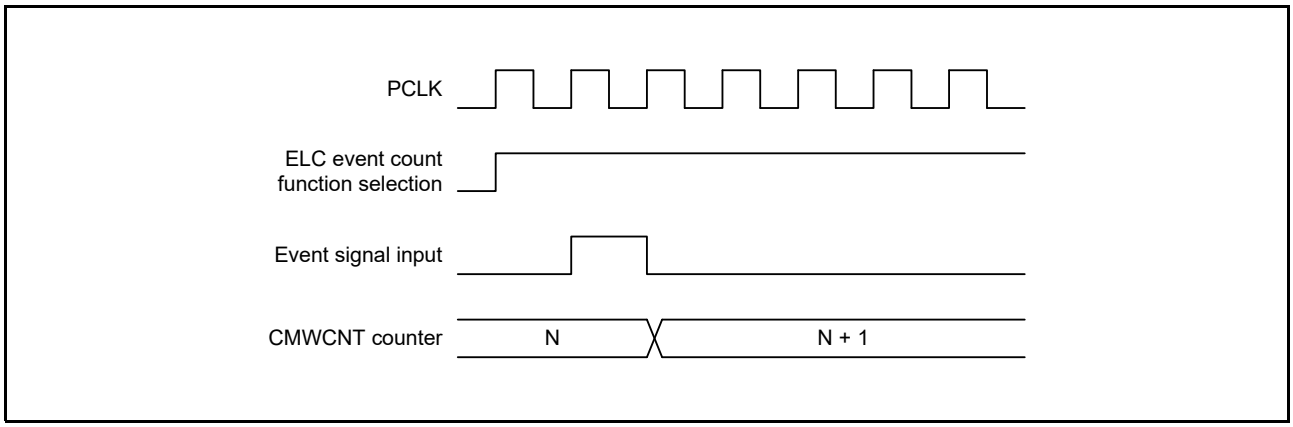

Figure 29.18 Event Count Operation on Acceptance of the Event Signal

(3) Count Restart

The CMTW count restart operation is selected by the ELOPB register of the ELC. If the event specified by the ELSRn register occurs, the CMWCNT counter value becomes 0000 0000h. If the CMWSTR.STR bit is 1, the count operation can be continued.

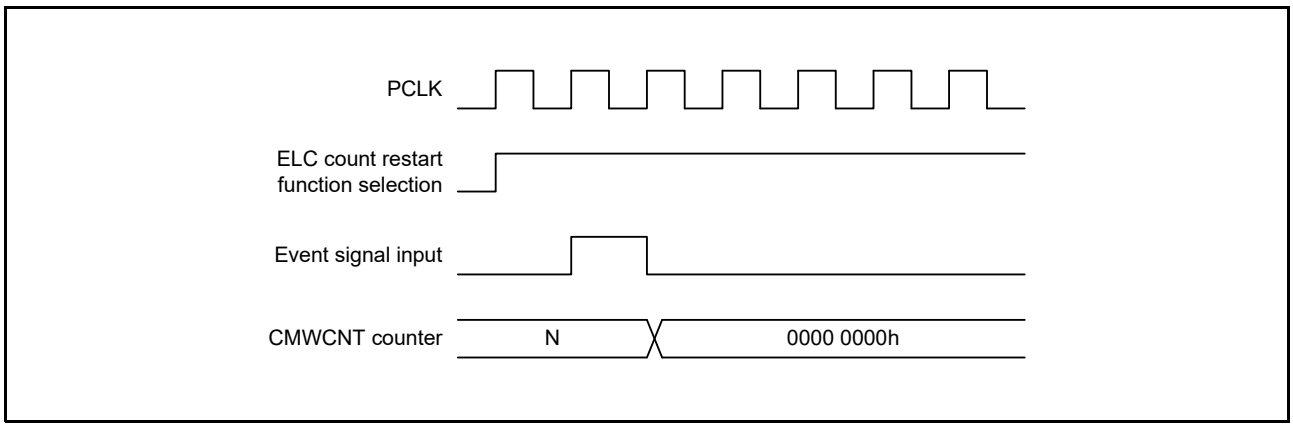

Figure 29.19 Count Restart Operation on Acceptance of the Event Signal

29.5.3 Conflict between Event Link Operation and Register Access

The followings are the notes on using CMTW for event link operations.
Table 29.4 lists count operations when event link operation and register access conflict.

Table 29.4 Count Operations When Event Link Operation and Register Access Conflict (n = 0, 1)

Event Link Operation	Register Access	CMWCNT Counter Status	Operation to be Performed
Count start	Writing to the CMWSTR.STR bit	Stopped state	Count start
		Compare match	Count start
		Counting up	Count start
Event count	Writing to CMWCNT counter	—	Event count
	Writing to CMWCOR register	Compare match	Compare match
Count restart	Writing to CMWCNT counter	Other than compare match	Count restart
	Writing to CMWCNT counter	Compare match	Compare match
	(No access to registers)	Compare match	Compare match
(No events)	Writing to CMWCNT counter	Compare match	Output of compare match interrupt request Writing to CMWCNT counter
		Counting up	Writing to CMWCNT counter
	Writing to CMWCOR register	Compare match	Compare match
	Writing to CMWOCRn register	Compare match	Compare match
	Reading from CMWCNT counter	Counting up	Counting up and reading of the previous value

(1) Count Start

When writing to the STR bit in the CMWSTR register and acceptance of the event signal are in contention, writing to the STR bit does not proceed since setting of the STR bit to 1 in response to the event takes priority.

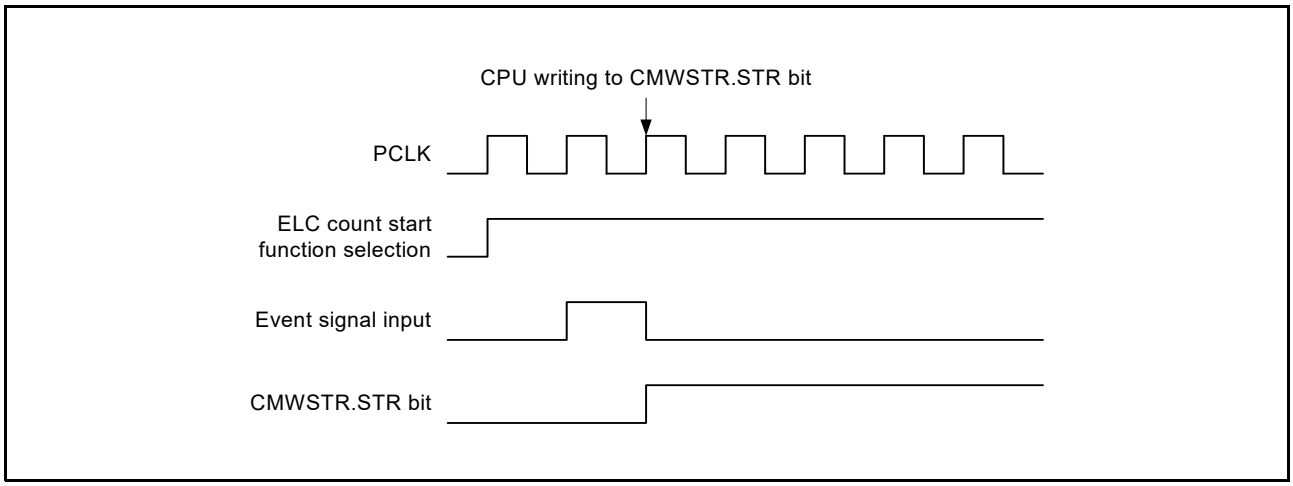

Figure 29.20 Conflict between Event Acceptance and Register Access in Count Start Operation

(2) Event Count

When writing to the CMWCNT counter and acceptance of the event signal are in contention, writing to the CMWCNT counter does not proceed since the count operation in response to the event takes priority.

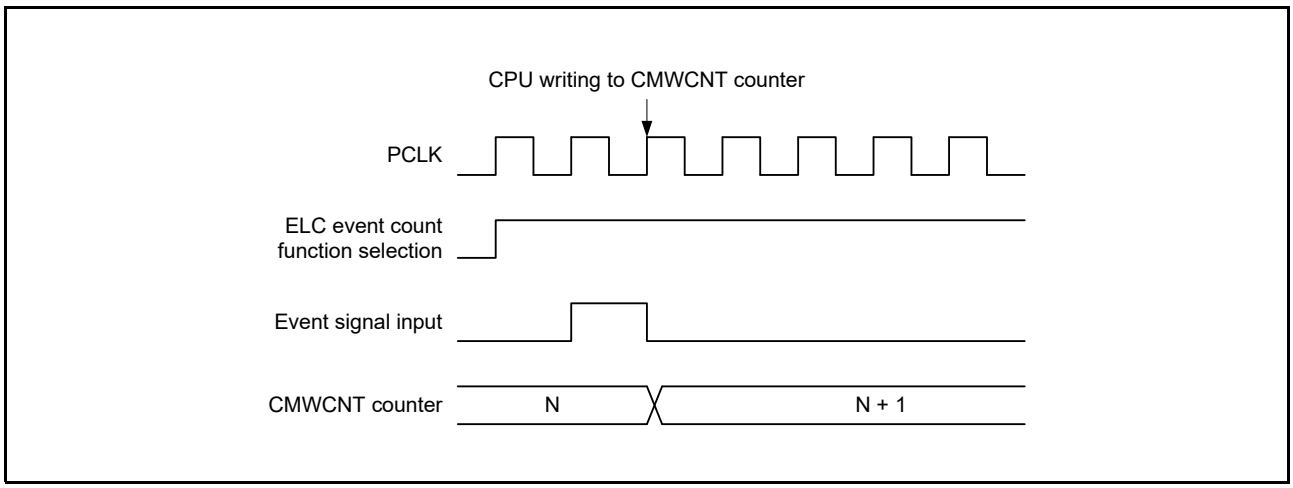

Figure 29.21 Conflict between Event Acceptance and Register Access in Event Counting Operation

(3) Count Restart

When writing to the CMWCNT counter and acceptance of the event signal are in contention, writing to the CMWCNT counter does not proceed since the counter value initialization in response to the event occurrence takes priority.

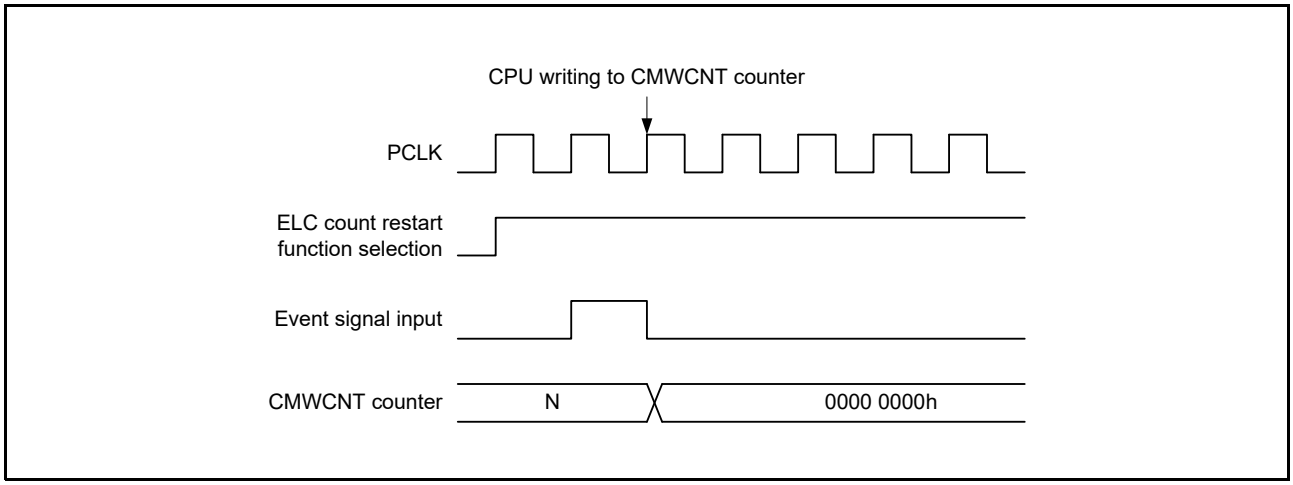

Figure 29.22 Conflict between Event Acceptance and Register Access in Count Restart Operation

29.6 Usage Notes

29.6.1 Setting the Module Stop Function

The CMTW operation can be enabled or disabled using the MSTPCRF register. The CMTW0 and CMTW1 are initially disabled after a reset. Register access is enabled by releasing the module stop state. For details, refer to section 11, Low Power Consumption.

29.6.2 Conflict between CMWCNT Counter Writing and Compare Match

If the compare match signal is generated during writing to the CMWCNT counter, the compare match request is output but the counter is not cleared since writing to the counter takes priority.
Figure 29.23 shows the timing of conflict between CMWCNT counter writing and compare match.

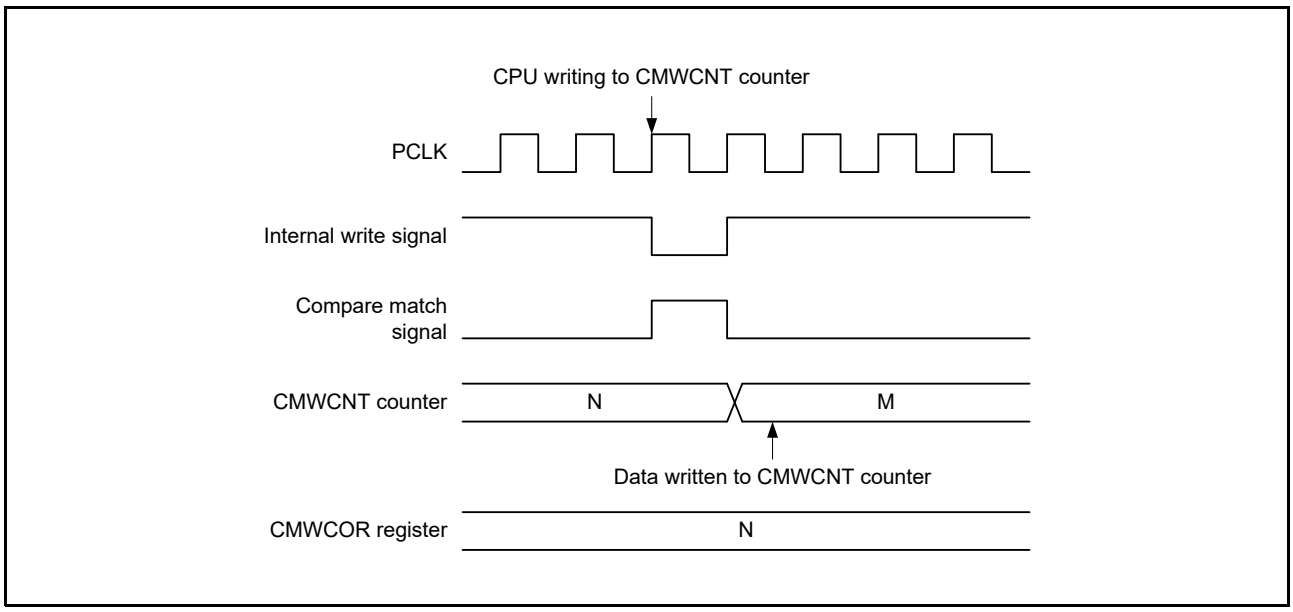

Figure 29.23 Conflict between CMWCNT Counter Writing and Compare Match

29.6.3 Conflict between CMWCNT Counter Writing and Incrementing or Clearing

In case of conflict between incrementation or clearing of the CMWCNT counter and writing to the CMWCNT counter, the counter is not actually incremented or cleared since writing to the CMWCNT counter takes priority.
Figure 29.24 shows the timing in the case of contention between writing to the CMWCNT counter and incrementation or clearing.

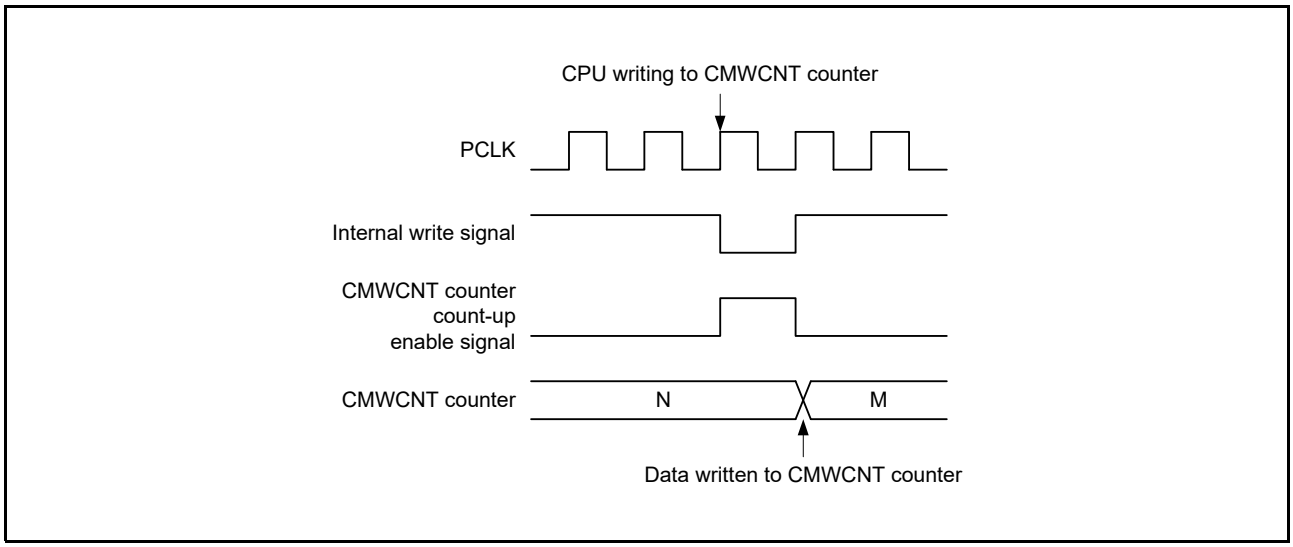

Figure 29.24 Conflict between CMWCNT Counter Writing and Incrementing

29.6.4 Conflict between CMWCOR Register Writing and Compare Match

If the compare match is generated during the CMWCOR register write cycle, the writing to the CMWCOR register takes priority and also the compare match signal is output.
Figure 29.25 shows the timing of conflict between CMWCOR register writing and compare match.

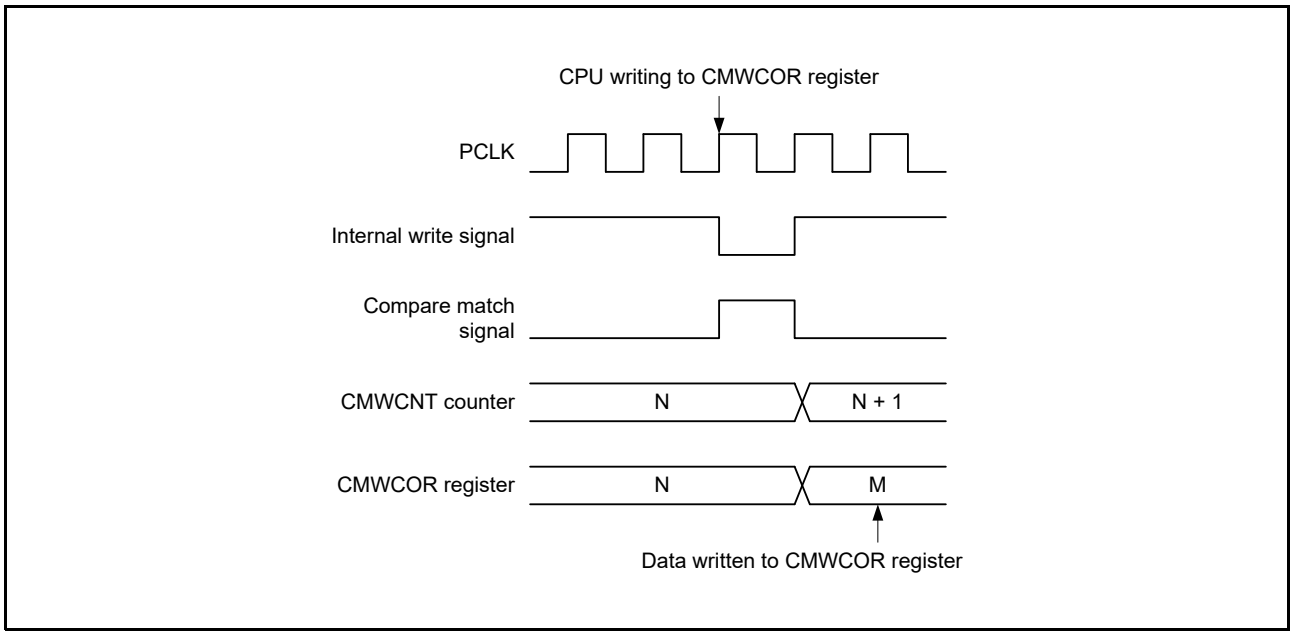

Figure 29.25 Conflict between CMWCOR Register Writing and Compare Match

29.6.5 Conflict between CMWOCRn Register Writing and Compare Match (n = 0, 1)

If the compare match is generated during the CMWOCRn register write cycle, the writing to the CMWOCRn register takes priority and also the compare match signal is output.
Figure 29.26 shows the timing of conflict between CMWOCRn register writing and compare match.

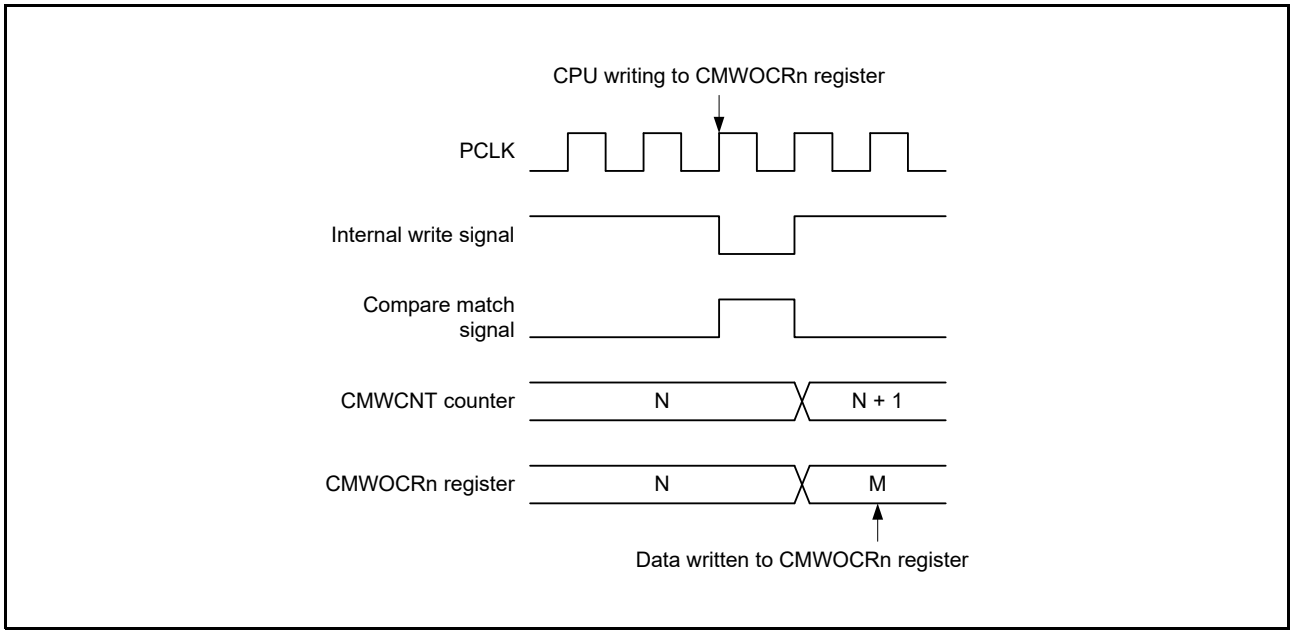

Figure 29.26 Conflict between CMWOCRn Register Writing and Compare Match

29.6.6 Conflict between CMWCNT Counter Reading and Incrementing or Clearing

If the CMWCNT counter incrementing or clearing process occurs at the same time that the data of the CMWCNT counter is read, the value having been in the CMWCNT counter before incremented or cleared is read.
Figure 29.27 shows the timing of conflict between CMWCNT counter reading and incrementing.

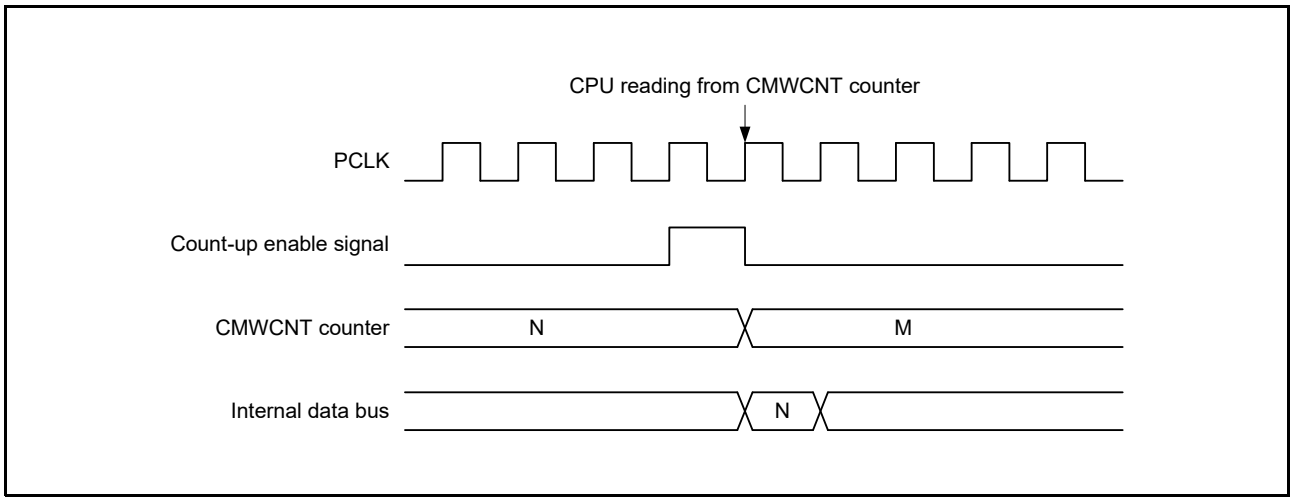

Figure 29.27 Conflict between CMWCNT Counter Reading and Incrementing

29.6.7 Conflict between CMWICRn Register Reading and Input Capture (n = 0, 1)

If the input capture detection signal is generated at the same time that the data of the CMWICRn register is read, the value having been in the CMWICRn register before updated by input capture transfer is read.
Figure 29.28 shows the timing of conflict between CMWICRn register reading and input capture.

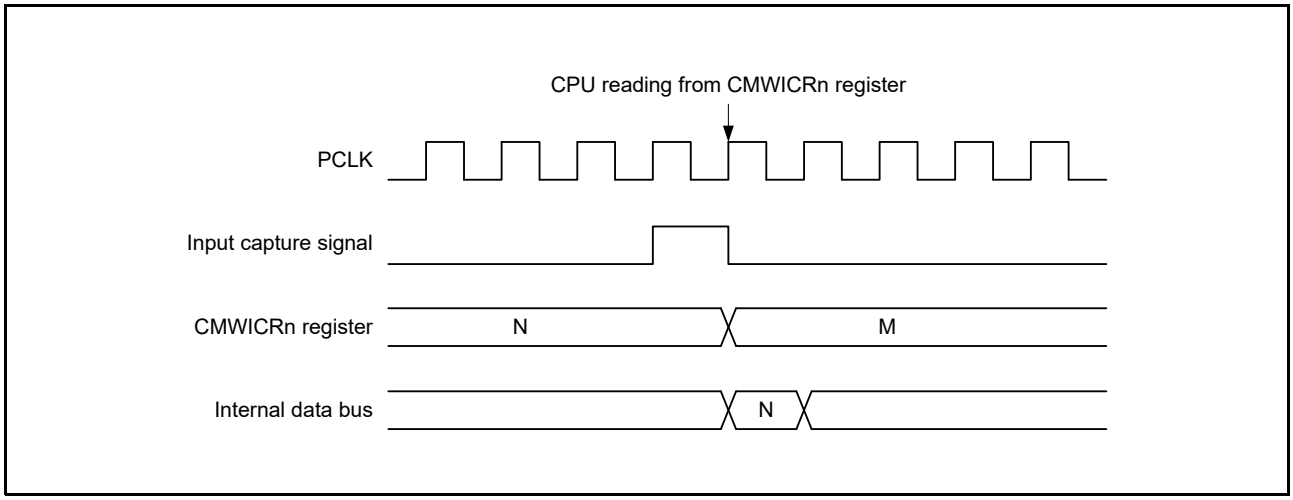

Figure 29.28 Conflict between CMWICRn Register Reading and Input Capture

29.6.8 Transition to Software Standby Mode

Before transitioning to software standby mode, set the CMWSTR.STR bits to 0 for all channels to stop the counters. After returning from software standby mode, setting the CMWSTR.STR bit to 1 will resume counting from the value held prior to the transition.

30. Realtime Clock (RTCBb)

30.1 Overview

The RTC has two types of counting modes: calendar count mode and binary count mode. They are used by switching the register settings.

For calendar count mode, the RTC has a 100 year calendar from 2000 to 2099 and automatically adjusts dates for leap years.

For binary count mode, the RTC does not count in terms of years, months, dates, day-of-week, hours, or minutes; it counts seconds, and retains the information as a serial value. This mode can be used for calendars other than the Gregorian calendar.

The clock source of the time counters is selectable as the sub-clock or LOCO clock.

The RTC uses the 128-Hz clock which is acquired by the clock source divided by the prescaler as the reference clock.

Year, month, date, day-of-week, a.m./p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted in 1/128 second units.

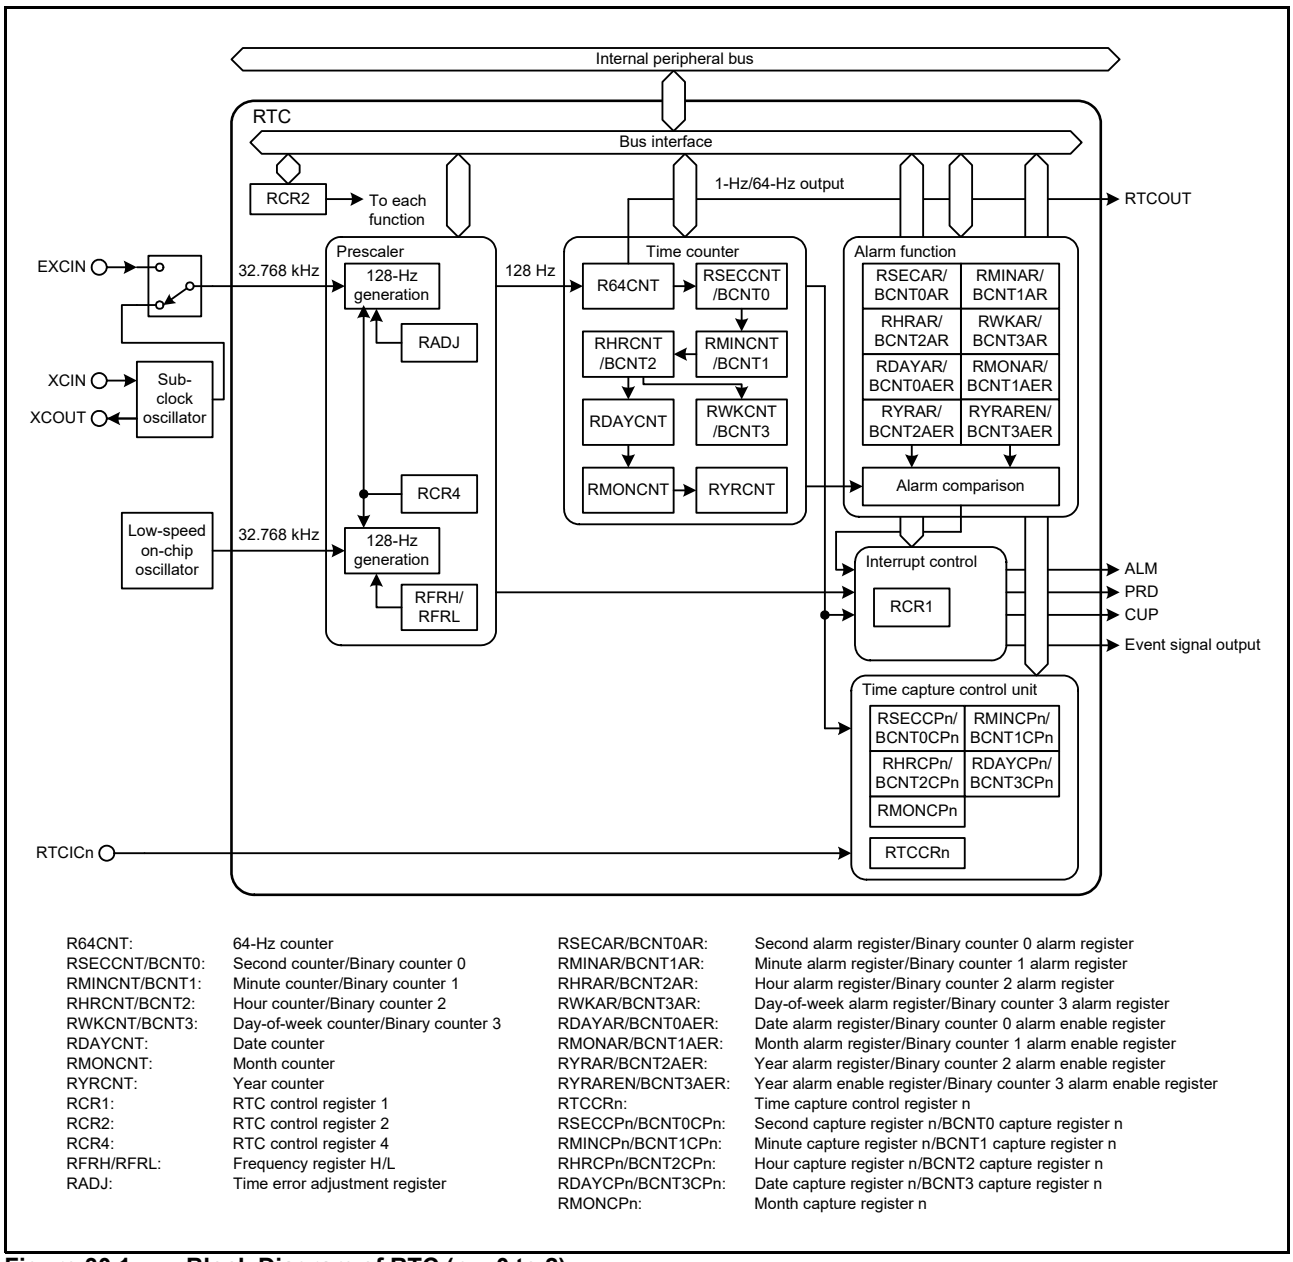

Table 30.1 lists the specifications of the RTC, Figure 30.1 shows a block diagram of the RTC, and Table 30.2 shows the pin configuration of the RTC.

Table 30.1 RTC Specifications

Item	Description
Count mode	Calendar count mode/binary count mode
Clock source*1	Sub-clock (XCIN or EXCIN) or LOCO clock
Clock and calendar functions	• Calendar count mode Year, month, date, day-of-week, hour, minute, second are counted, BCD display 12 hours/24 hours mode switching function 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to one minute) Automatic adjustment function for leap years • Binary count mode Count seconds in 32 bits, binary display • Common to both modes Start/stop function The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz). Clock error correction function Clock (1 Hz/64 Hz) output
Interrupts	• Alarm interrupt (ALM) As an alarm interrupt condition, selectable which of the below is compared with: - Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected - Binary count mode: Each bit of the 32-bit binary counter • Periodic interrupt (PRD) 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. • Carry interrupt (CUP) An interrupt is generated at either of the following timings: - When a carry from the 64-Hz counter to the second counter is generated. - When the 64-Hz counter is changed and the R64CNT register is read at the same time. • Recovery from software standby mode or deep software standby mode can be performed by an alarm interrupt or periodic interrupt
Time capture function	• Times can be captured when the edge of the time capture event input pin is detected. For every event input, month, date, hour, minute, and second are captured or 32-bit binary counter value is captured.
Event link function	Periodic event output
Protect Zone filter	Security attribute can be set.*2

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the clock source.

Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

30.2 Register Descriptions

When writing to or reading from RTC registers, do so in accordance with section 30.6.5, Notes on Writing to and Reading from Registers.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power consumption state during counting operations (i.e. while the RCR2.START bit is 1), the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate. Note that a reset generated during writing to or updating of a register might destroy the register value. In addition, do not allow the chip to enter software standby mode or deep software standby mode immediately after setting any of these registers. For details, refer to section 30.6.4, Transitions to Low Power Consumption Modes after Setting Registers.

30.2.1 64-Hz Counter (R64CNT)

Address(es): RTC.R64CNT 8780 2000h, RTC_NS.R64CNT 0780 2000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Value after reset:	0	x	x	x	x	x	x	x

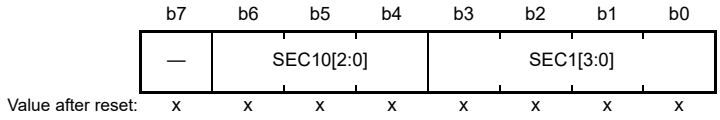
x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	F64HZ	64 Hz	Indicate the state between 1 Hz and 64 Hz of the sub-second digit.	R
b1	F32HZ	32 Hz		R
b2	F16HZ	16 Hz		R
b3	F8HZ	8 Hz		R
b4	F4HZ	4 Hz		R
b5	F2HZ	2 Hz		R
b6	F1HZ	1 Hz		R
b7	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R

The R64CNT counter is used in both calendar count mode and in binary count mode.

The 64-Hz counter (R64CNT) generates a period of one second by counting the 128-Hz reference clock.

The state in the sub-second range can be confirmed by reading this counter.



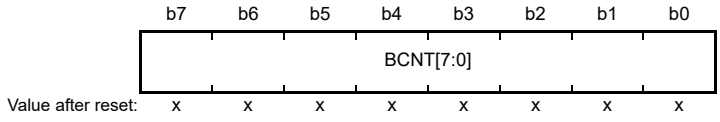
This counter is set to 00h by an RTC software reset or executing 30-second adjustment.

To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.2 Second Counter (RSECCNT)/Binary Counter 0 (BCNT0)

(1) In calendar count mode:

Address(es): RTC.RSECCNT 8780 2002h, RTC_NS.RSECCNT 0780 2002h



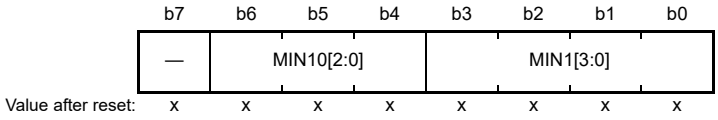
x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Count	Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	SEC10[2:0]	10-Second Count	Counts from 0 to 5 for 60-second counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RSECCNT counter is used for setting and counting the BCD-coded second value. It counts carries generated once per second in the 64-Hz counter.
The setting range is decimal 00 to 59. The RTC will not operate normally if any other value is set. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RSECCNT register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT0 8780 2002h, RTC_NS.BCNT0 0780 2002h



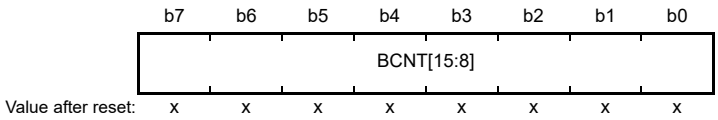
x: Undefined

The BCNT0 counter is a readable/writable 32-bit binary counter b7 to b0.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.3 Minute Counter (RMINCNT)/Binary Counter 1 (BCNT1)

(1) In calendar count mode:

Address(es): RTC.RMINCNT 8780 2004h, RTC_NS.RMINCNT 0780 2004h



x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Count	Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.	R/W
b6 to b4	MIN10[2:0]	10-Minute Count	Counts from 0 to 5 for 60-minute counting.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RMINCNT counter is used for setting and counting the BCD-coded minute value. It counts carries generated once per minute in the second counter.
A value from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RMINCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT1 8780 2004h, RTC_NS.BCNT1 0780 2004h

x: Undefined

The BCNT1 counter is a readable/writable 32-bit binary counter b15 to b8.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.4 Hour Counter (RHRCNT)/Binary Counter 2 (BCNT2)

(1) In calendar count mode:

Address(es): RTC.RHRCNT 8780 2006h, RTC_NS.RHRCNT 0780 2006h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	HR1[3:0]	1-Hour Count	Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	HR10[1:0]	10-Hour Count	Counts from 0 to 2 once per carry from the ones place.	R/W
b6	PM	PM	Time Counter Setting for a.m./p.m. 0: a.m. 1: p.m.	R/W
b7	—	Reserved	Set this bit to 0. It is read as the set value.	R/W

The RHRCNT counter is used for setting and counting the BCD-coded hour value. It counts carries generated once per hour in the minute counter.
The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).
When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)
If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
The PM bit is only enabled when the RCR2.HR24 bit is 0. Otherwise, the setting in the PM bit has no effect.
After writing to the RHRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT2 8780 2006h, RTC_NS.BCNT2 0780 2006h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2 counter is a readable/writable 32-bit binary counter b23 to b16.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.5 Day-of-Week Counter (RWKCNT)/Binary Counter 3 (BCNT3)

(1) In calendar count mode:

Address(es): RTC.RWKCNT 8780 2008h, RTC_NS.RWKCNT 0780 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Counting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting Prohibited	R/W
b7 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W

The RWKCNT counter is used for setting and counting in the coded day-of-week value. It counts carries generated once per day in the hour counter.
A value from 0 through 6 can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

(2) In binary count mode:

Address(es): RTC.BCNT3 8780 2008h, RTC_NS.BCNT3 0780 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNT[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3 counter is a readable/writable 32-bit binary counter b31 to b24.
The 32-bit binary counter performs count operation by a carry generating for each second of the 64-Hz counter.
Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
To read this counter, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.

30.2.6 Date Counter (RDAYCNT)

Address(es): RTC.RDAYCNT 8780 200Ah, RTC_NS.RDAYCNT 0780 200Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	0	0	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DATE1[3:0]	1-Day Count	Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.	R/W
b5, b4	DATE10[1:0]	10-Day Count	Counts from 0 to 3 once per carry from the ones place.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RDAYCNT counter is used in calendar count mode.
The RDAYCNT counter is used for setting and counting the BCD-coded date value. It counts carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year.
Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.
A value from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. (When specifying a value, note that the range of specifiable days depends on the month and whether the year is a leap year.) Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RHRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

30.2.7 Month Counter (RMONCNT)

Address(es): RTC.RMONCNT 8780 200Ch, RTC_NS.RMONCNT 0780 200Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Count	Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.	R/W
b4	MON10	10-Month Count	Counts from 0 to 1 once per carry from the ones place.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RMONCNT counter is used in calendar count mode.
The RMONCNT counter is used for setting and counting the BCD-coded month value. It counts carries generated once per month in the date counter.
A value from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RMONCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

30.2.8 Year Counter (RYRCNT)

Address(es): RTC.RYRCNT 8780 200Eh, RTC_NS.RYRCNT 0780 200Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	YR1[3:0]	1-Year Count	Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.	R/W
b7 to b4	YR10[3:0]	10-Year Count	Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RYRCNT counter is used in calendar count mode.
The RYRCNT counter is used for setting and counting the BCD-coded year value. It counts carries generated once per year in the month counter.
A value from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2.
After writing to the RYRCNT counter, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

30.2.9 Second Alarm Register (RSECAR)/ Binary Counter 0 Alarm Register (BCNT0AR)

(1) In calendar count mode:

Address(es): RTC.RSECAR 8780 2010h, RTC_NS.RSECAR 0780 2010h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	SEC1[3:0]	1 Second	Value for the ones place of seconds	R/W
b6 to b4	SEC10[2:0]	10 Seconds	Value for the tens place of seconds	R/W
b7	ENB	ENB	0: The register value is not compared with the RSECCNT counter value. 1: The register value is compared with the RSECCNT counter value.	R/W

The RSECAR register is an alarm register corresponding to the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RSECAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RSECAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT0AR 8780 2010h, RTC_NS.BCNT0AR 0780 2010h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT0AR register is a readable/writable alarm register corresponding to 32-bit binary counter b7 to b0.
This register is set to 00h by an RTC software reset.

30.2.10 Minute Alarm Register (RMINAR)/ Binary Counter 1 Alarm Register (BCNT1AR)

(1) In calendar count mode:

Address(es): RTC.RMINAR 8780 2012h, RTC_NS.RMINAR 0780 2012h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MIN1[3:0]	1 Minute	Value for the ones place of minutes	R/W
b6 to b4	MIN10[2:0]	10 Minutes	Value for the tens place of minutes	R/W
b7	ENB	ENB	0: The register value is not compared with the RMINCNT counter value. 1: The register value is compared with the RMINCNT counter value.	R/W

The RMINAR register is an alarm register corresponding to the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RMINAR values from 00 through 59 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RMINAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT1AR 8780 2012h, RTC_NS.BCNT1AR 0780 2012h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT1AR register is a readable/writable alarm register corresponding to 32-bit binary counter b15 to b8.
This register is set to 00h by an RTC software reset.

30.2.11 Hour Alarm Register (RHRAR)/ Binary Counter 2 Alarm Register (BCNT2AR)

(1) In calendar count mode:

Address(es): RTC.RHRAR 8780 2014h, RTC_NS.RHRAR 0780 2014h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	HR1[3:0]	1 Hour	Value for the ones place of hours	R/W
b5, b4	HR10[1:0]	10 Hours	Value for the tens place of hours	R/W
b6	PM	PM	Time Alarm Setting for a.m./p.m. 0: a.m. 1: p.m.	R/W
b7	ENB	ENB	0: The register value is not compared with the RHRCNT counter value. 1: The register value is compared with the RHRCNT counter value.	R/W

The RHRAR register is an alarm register corresponding to the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24).
When the RCR2.HR24 bit is 0: From 00 to 11 (in BCD)
When the RCR2.HR24 bit is 1: From 00 to 23 (in BCD)
If a value outside of this range is specified, the RTC does not operate correctly.
When the RCR2.HR24 bit is 0, be sure to set the PM bit.
When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect.
After writing to the RHRAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT2AR 8780 2014h, RTC_NS.BCNT2AR 0780 2014h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[23:16]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2AR register is a readable/writable alarm register corresponding to 32-bit binary counter b23 to b16.
This register is set to 00h by an RTC software reset.

30.2.12 Day-of-Week Alarm Register (RWKAR)/ Binary Counter 3 Alarm Register (BCNT3AR)

(1) In calendar count mode:

Address(es): RTC.RWKAR 8780 2016h, RTC_NS.RWKAR 0780 2016h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	DAYW[2:0]	Day-of-Week Setting	b2 b0 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting Prohibited	R/W
b6 to b3	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RWKCNT counter value. 1: The register value is compared with the RWKCNT counter value.	R/W

The RWKAR register is an alarm register corresponding to the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.

RWKAR values from 0 through 6 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RWKAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT3AR 8780 2016h, RTC_NS.BCNT3AR 0780 2016h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCNTAR[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3AR register is a readable/writable alarm register corresponding to 32-bit binary counter b31 to b24.

This register is set to 00h by an RTC software reset.

30.2.13 Date Alarm Register (RDAYAR)/ Binary Counter 0 Alarm Enable Register (BCNT0AER)

(1) In calendar count mode:

Address(es): RTC.RDAYAR 8780 2018h, RTC_NS.RDAYAR 0780 2018h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DATE1[3:0]	1 Day	Value for the ones place of days	R/W
b5, b4	DATE10[1:0]	10 Days	Value for the tens place of days	R/W
b6	—	Reserved	Set this bit to 0. It is read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RDAYCNT counter value. 1: The register value is compared with the RDAYCNT counter value.	R/W

The RDAYAR register is an alarm register corresponding to the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.

RDAYAR values from 01 through 31 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.

After writing to the RDAYAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.

This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT0AER 8780 2018h, RTC_NS.BCNT0AER 0780 2018h

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT0AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b7 to b0. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.

This register is set to 00h by an RTC software reset.

30.2.14 Month Alarm Register (RMONAR)/ Binary Counter 1 Alarm Enable Register (BCNT1AER)

(1) In calendar count mode:

Address(es): RTC.RMONAR 8780 201Ah, RTC_NS.RMONAR 0780 201Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	MON10	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MON1[3:0]	1 Month	Value for the ones place of months	R/W
b4	MON10	10 Months	Value for the tens place of months	R/W
b6, b5	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RMONCNT counter value. 1: The register value is compared with the RMONCNT counter value.	R/W

The RMONAR register is an alarm register corresponding to the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
RMONAR values from 01 through 12 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RMONAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT1AER 8780 201Ah, RTC_NS.BCNT1AER 0780 201Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[15:8]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT1AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b15 to b8. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 00h by an RTC software reset.

30.2.15 Year Alarm Register (RYRAR)/ Binary Counter 2 Alarm Enable Register (BCNT2AER)

(1) In calendar count mode:

Address(es): RTC.RYRAR 8780 201Ch, RTC_NS.RYRAR 0780 201Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	YR1[3:0]	1 Year	Value for the ones place of years	R/W
b7 to b4	YR10[3:0]	10 Years	Value for the tens place of years	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RYRAR register is an alarm register corresponding to the BCD-coded year counter RYRCNT.
RYRAR values from 00 through 99 (in BCD) can be specified; if a value outside of this range is specified, the RTC does not operate correctly.
After writing to the RYRAR register, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers for notes on accessing registers.
This register is set to 0000h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT2AER 8780 201Ch, RTC_NS.BCNT2AER 0780 201Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ENB[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

The BCNT2AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b23 to b16. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 0000h by an RTC software reset.

30.2.16 Year Alarm Enable Register (RYRAREN)/ Binary Counter 3 Alarm Enable Register (BCNT3AER)

(1) In calendar count mode:

Address(es): RTC.RYRAREN 8780 201Eh, RTC_NS.RYRAREN 0780 201Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	Set these bits to 0. They are read as the set value.	R/W
b7	ENB	ENB	0: The register value is not compared with the RYRCNT counter value. 1: The register value is compared with the RYRCNT counter value.	R/W

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From among the alarm registers (RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, and RYRAREN), only those selected with the ENB bits set to 1 are compared with the corresponding counters. When the respective values all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1.
This register is set to 00h by an RTC software reset.

(2) In binary count mode:

Address(es): RTC.BCNT3AER 8780 201Eh, RTC_NS.BCNT3AER 0780 201Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	ENB[31:24]							
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

The BCNT3AER register is a readable/writable register for setting the alarm enable corresponding to 32-bit binary counter b31 to b24. Among the ENB[31:0] bits, the binary counter (BCNT[31:0]) corresponding to the bits which are set to 1 and the binary alarm register (BCNTAR[31:0]) are compared, and when all match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) becomes 1.
This register is set to 00h by an RTC software reset.

30.2.17 RTC Control Register 1 (RCR1)

Address(es): RTC.RCR1 8780 2022h, RTC_NS.RCR1 0780 2022h

	b7	b6	b5	b4	b3	b2	b1	b0
	PES[3:0]				RTCOS	PIE	CIE	AIE
Value after reset:	x	x	x	x	0	x	0	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	AIE	Alarm Interrupt Enable	0: An alarm interrupt request is disabled. 1: An alarm interrupt request is enabled.	R/W
b1	CIE	Carry Interrupt Enable	0: A carry interrupt request is disabled. 1: A carry interrupt request is enabled.	R/W
b2	PIE	Periodic Interrupt Enable	0: A periodic interrupt request is disabled. 1: A periodic interrupt request is enabled.	R/W
b3	RTCOS	RTCOUT Output Select	0: RTCOUT outputs 1 Hz. 1: RTCOUT outputs 64 Hz.	R/W
b7 to b4	PES[3:0]	Periodic Interrupt Select	b7 b4 0 1 1 0: A periodic interrupt is generated every 1/256 second.*1 0 1 1 1: A periodic interrupt is generated every 1/128 second. 1 0 0 0: A periodic interrupt is generated every 1/64 second. 1 0 0 1: A periodic interrupt is generated every 1/32 second. 1 0 1 0: A periodic interrupt is generated every 1/16 second. 1 0 1 1: A periodic interrupt is generated every 1/8 second. 1 1 0 0: A periodic interrupt is generated every 1/4 second. 1 1 0 1: A periodic interrupt is generated every 1/2 second. 1 1 1 0: A periodic interrupt is generated every 1 second. 1 1 1 1: A periodic interrupt is generated every 2 seconds. Other than above: No periodic interrupts are generated.	R/W

Note 1. When the LOCO clock is selected (RCR4.RCKSEL bit = 1) while the PES[3:0] bits are 0110b, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and in binary count mode.
Bits AIE, PIE, and PES[3:0] are updated synchronously with the clock source. When the RCR1 register is modified, check that all the bits have been updated before proceeding to the next processing.

AIE Bit (Alarm Interrupt Enable)

This bit enables or disables alarm interrupt requests.
If the times indicated by the counters and alarm settings match in deep software standby mode, the MCU returns from the mode regardless of the value of the AIE bit.

CIE Bit (Carry Interrupt Enable)

This bit enables and disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE Bit (Periodic Interrupt Enable)

This bit enables or disabled a periodic interrupt.
If the periods indicated by the counters and PES[3:0] settings match in deep software standby mode, the MCU returns from the mode regardless of the value of the PIE bit.

RTCOS Bit (RTCOUT Output Select)

This bit selects the RTCOUT output period. The RTCOS bit must be rewritten while count operation is stopped (the RCR2.START bit is 0) and RTCOUT output is disabled (the RCR2.RTCOE bit is 0). When the RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

PES[3:0] Bits (Periodic Interrupt Select)

These bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified by these bits.

30.2.18 RTC Control Register 2 (RCR2)

Address(es): RTC.RCR2 8780 2024h, RTC_NS.RCR2 0780 2024h

	b7	b6	b5	b4	b3	b2	b1	b0
	CNTMD	HR24	AADJP	AADJE	RTCOE	ADJ30	RESET	START

R/W
b6	HR24	Hours Mode*2, *4	0: The RTC operates in 12-hour mode. 1: The RTC operates in 24-hour mode.	R/W
b7	CNTMD	Count Mode Select*4	0: The calendar count mode. 1: The binary count mode.	R/W

Note 1. R64CNT, RSECAR/BCNT0AR, RMINAR/BCNT1AR, RHRAR/BCNT2AR, RWKAR/BCNT3AR, RDAYAR/BCNT0AER, RMONAR/BCNT1AER, RYRAR/BCNT2AER, RYRAREN/BCNT3AER, RADJ, RTCCRn, RSECCPn/BCNT0CPn, RMINCPn/BCNT1CPn, RHRCPn/BCNT2CPn, RDAYCPn/BCNT3CPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP
Note 2. This bit is reserved in binary counter mode. The write value should be 0.
Note 3. When the LOCO clock is selected, the setting of this bit is disabled.
Note 4. After writing to this bit, confirm that its value has actually changed before proceeding with further processing. Refer to section 30.6.5, Notes on Writing to and Reading from Registers regarding changes to the values of the AADJE, AADJP, and HR24 bits.

The RCR2 register is related to hours mode, automatic adjustment function, enabling the RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

START Bit (Start)

This bit stops or restarts the prescaler or counter (clock) operation.
The START bit is updated in synchronization with the clock source. When the START bit is modified, check that the bit is updated before proceeding to the next processing.

RESET Bit (RTC Software Reset)

This bit initializes the prescaler and registers to be reset by RTC software reset.
When 1 is written to the RESET bit, the initialization starts in synchronization with the clock source. When the initialization is completed, the RESET bit is automatically set to 0.
When 1 is written to the RESET bit, check that the bit is set to 0, and then make next settings.

ADJ30 Bit (30-Second Adjustment)

This bit is for 30-second adjustment.
When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.
The 30-second adjustment is performed in synchronization with the clock source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment is completed. In case when 1 is written to the ADJ30 bit, check that the bit is set to 0, and then make next settings.
When the 30-second adjustment is performed, the prescaler and R64CNT are also reset.
The ADJ30 bit is set to 0 by an RTC software reset.
This bit is reserved in binary counter mode. The write value should be 0.

RTCOE Bit (RTCOUT Output Enable)

This bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.
Use the START bit to stop counting by the counters before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.
When RTCOUT signal is to be output from an external pin, set the RTCOE bit to 1 and set up the port control for the pin.

AADJE Bit (Automatic Adjustment Enable)

This bit controls (enables or disables) automatic adjustment.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.
The AADJE bit is set to 0 by an RTC software reset.

AADJP Bit (Automatic Adjustment Period Select)

This bit selects the automatic-adjustment period.
Set the plus–minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.
The AADJP bit is set to 0 by an RTC software reset.

HR24 Bit (Hours Mode)

This bit specifies whether the RTC will operate in 12- or 24-hour mode.
Use the START bit to stop counting by the counters before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.
This bit is reserved in binary counter mode. The write value should be 0.

CNTMD Bit (Count Mode Select)

This bit specifies whether the RTC count mode is operated in calendar count mode or in binary count mode.
After setting the count mode, execute an RTC software reset and start again from the initial settings.
The CNTMD bit is updated in synchronization with the clock source, so when the value of the CNTMD bit has been changed, check that the value of the bit has actually been updated before applying the RTC software reset. The count mode changes to that which was specified beforehand in the CNTMD bit after the RTC software reset is applied.
For details on initial settings, refer to section 30.3.1, Outline of Initial Settings of Registers after Power On.

30.2.19 RTC Control Register 4 (RCR4)

Address(es): RTC.RCR4 8780 2028h, RTC_NS.RCR4 0780 2028h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RCKSEL
Value after reset:	0	0	0	0	0	0	0	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	RCKSEL	Clock Source Select	0: Sub-clock is selected. 1: LOCO clock is selected.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The RCR4 register is used for selecting the clock source. This function is used in both calendar count mode and binary count mode.
When the RCKSEL bit is set to 0, the time is counted with the sub-clock. When the bit is set to 1, the time is counted with the LOCO clock.

RCKSEL Bit (Clock Source Select)

This bit selects the clock source from the sub-clock and the LOCO clock.
The clock source should be selected only once before the initial settings of the RTC registers at power on.

30.2.20 Frequency Register H/L (RFRH/RFRL)

Address(es): RTC.RFRH 8780 202Ah, RTC_NS.RFRH 0780 202Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Address(es): RTC.RFRL 8780 202Ch, RTC_NS.RFRL 0780 202Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFC[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

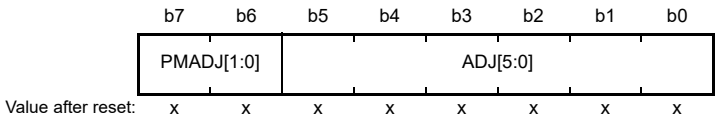
- RFRH register

Bit	Symbol	Bit Name	Description	R/W
b0	RFC[16]	Frequency Divide Ratio Setting	Set the divide ratio of the LOCO clock to generate the reference clock of 128 Hz. If the setting value in the RFC[16:0] bits is n, the prescaler divides the LOCO clock by n + 1.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

- RFRL register

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RFC[15:0]	Frequency Divide Ratio Setting	Set the divide ratio of the LOCO clock to generate the reference clock of 128 Hz. If the setting value in the RFC[16:0] bits is n, the prescaler divides the LOCO clock by n + 1.	R/W

RFRH/RFRL is a register for controlling the prescaler when the LOCO clock is selected.
The RTC time counter operates on a 128-Hz clock signal as the reference clock. Therefore, when the main clock is selected, the LOCO clock is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency divide ratio in the RFC[16:0] bits to generate a 128-Hz clock from the LOCO clock frequency. As for the calculation method, refer to the formula below.



A value from 0 00D9h through 0 0127h can be specified in the RFC[16:0] bits; if a value outside of this range is specified, the RTC does not operate correctly. Rewrite this register while the RCR2.START bit is 0 (counter is stopped). The frequency of the peripheral module clock and the LOCO clock should be in the relationship that the peripheral module clock ≥ the LOCO clock.

- Calculation method of frequency comparison value

RFC[16:0] = (LOCO clock frequency) ÷ 128 – 1

30.2.21 Time Error Adjustment Register (RADJ)

Address(es): RTC.RADJ 8780 202Eh, RTC_NS.RADJ 0780 202Eh

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	ADJ[5:0]	Adjustment Value	These bits specify the adjustment value from the prescaler.	R/W
b7, b6	PMADJ[1:0]	Plus–Minus	b7 b6 0 0: Adjustment is not performed. 0 1: Adjustment is performed by the addition to the prescaler. 1 0: Adjustment is performed by the subtraction from the prescaler. 1 1: Setting prohibited	R/W

Adjustment is performed by the addition to or subtraction from the prescaler.
In case when the automatic adjustment enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ.
In case when the RCR2.AADJE bit is 1, adjustment is performed in the interval specified by the automatic adjustment period select (RCR2.AADJP) bit.
The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the clock source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the clock source after the register setting and then specify the next adjustment value.
RADJ is updated in synchronization with the clock source. When RADJ is modified, check that all the bits have been updated before continuing with further processing.
This register is set to 00h by an RTC software reset.
The setting of this register is enabled only when the sub-clock is selected.
When the LOCO clock is selected, adjustment is not performed.

ADJ[5:0] Bits (Adjustment Value)

These bits specify the adjustment value (the number of sub-clock cycles) from the prescaler.

PMADJ[1:0] Bits (Plus–Minus)

These bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

30.2.22 Time Capture Control Register n (RTCCRn) (n = 0 to 2)

Address(es): RTC.RTCCR0 8780 2040h, RTC.RTCCR1 8780 2042h, RTC.RTCCR2 8780 2044h, RTC_NS.RTCCR0 0780 2040h, RTC_NS.RTCCR1 0780 2042h, RTC_NS.RTCCR2 0780 2044h

	b7	b6	b5	b4	b3	b2	b1	b0
	TCEN	—	TCNF[1:0]		—	TCST	TCCT[1:0]	
Value after reset:	x	0	x	x	0	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TCCT[1:0]	Time Capture Control	b1 b0 0 0: No event is detected. 0 1: Rising edge is detected. 1 0: Falling edge is detected. 1 1: Both edges are detected.	R/W
b2	TCST	Time Capture Status Flag	0: No event is detected. 1: An event is detected.	R/(W) *1
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5, b4	TCNF[1:0]	Time Capture Noise Filter Control	b5 b4 0 0: The noise filter is off. 0 1: Setting prohibited 1 0: The noise filter is on (clock source). 1 1: The noise filter is on (clock source by divided by 32).	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	TCEN	Time Capture Event Input Pin Enable	0: The RTCICn pin is disabled as the time capture event input. 1: The RTCICn pin is enabled as the time capture event input.	R/W

Note 1. Writing 1 has no effect. This flag is cleared by writing 0.

The RTCCRn register is used both in calendar count mode and in binary count mode.
RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.
RTCCRn is updated in synchronization with the clock source. When RTCCRn is modified, check that all the bits except for the TCST flag have been updated before continuing with further processing.
This register is set to 00h by an RTC software reset.

TCCT[1:0] Bits (Time Capture Control)

These bits control the edge detection of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2). The detection edge is selectable. The TCCT[1:0] bits should be set while the RCR2.START and TCEN bits are 1.

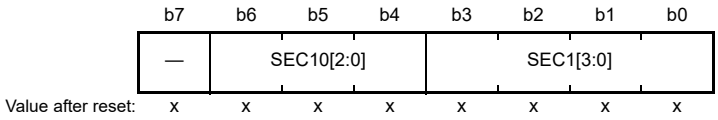
TCST Flag (Time Capture Status Flag)

This flag indicates that an event of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2) has been detected.
When the TCST flag is 0, no event is detected.
When the TCST flag is 1, this flag indicates that an event of the corresponding pin has been detected and the capture register is valid. When multiple events have been detected, the capture time for the first event is retained.
Writing 0 sets the TCST flag to 0. In addition, writing any other value except 0 has no effect.
Set the TCST flag while the TCCT[1:0] bits are 00b (no event is detected).
The TCST flag is set to 0 in synchronization with the clock source. When the TCST flag is set to 0, check that the flag has been updated before continuing with further processing.

TCNF[1:0] Bits (Time Capture Noise Filter Control)

These bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).
When the noise filter is on, the clock source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.
Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCEN bit to 1, set the TCNF[1:0] bits, wait for three cycles of the specified sampling period, and then set the TCCT[1:0] bits.

TCEN Bit (Time Capture Event Input Pin Enable)



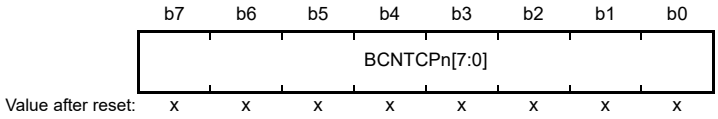
This bit enables or disables the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).
When the time capture event input pin functions (RTCIC0, RTCIC1, and RTCIC2) are allocated to the same pins as other multiplexed functions, make the general input port pin settings for the corresponding pins, set the corresponding TAMPICR1.CHnEN bit*1 (n = 0 to 2) to 1, and then set this bit to 1. If the TCEN bit is set to 0, set also the TCCT[1:0] bits to 00b.

Note 1. For details, refer to section 12, Battery Backup Function (VBATTBa).

30.2.23 Second Capture Register n (RSECCPn) (n = 0 to 2)/ BCNT0 Capture Register n (BCNT0CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RSECCP0 8780 2052h, RTC.RSECCP1 8780 2062h, RTC.RSECCP2 8780 2072h, RTC_NS.RSECCP0 0780 2052h, RTC_NS.RSECCP1 0780 2062h, RTC_NS.RSECCP2 0780 2072h



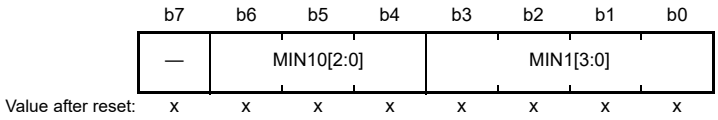
x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	SEC1[3:0]	1-Second Capture	Capture value for the ones place of seconds	R
b6 to b4	SEC10[2:0]	10-Second Capture	Capture value for the tens place of seconds	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

The RSECCPn register is a read-only register that captures the RSECCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT0CP0 8780 2052h, RTC.BCNT0CP1 8780 2062h, RTC.BCNT0CP2 8780 2072h, RTC_NS.BCNT0CP0 0780 2052h, RTC_NS.BCNT0CP1 0780 2062h, RTC_NS.BCNT0CP2 0780 2072h



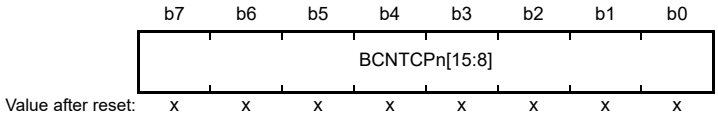
x: Undefined

The BCNT0CPn register is a read-only register that captures the BCNT0 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT0CP0, BCNT0CP1, and BCNT0CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.24 Minute Capture Register n (RMINCPn) (n = 0 to 2)/ BCNT1 Capture Register n (BCNT1CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RMINCP0 8780 2054h, RTC.RMINCP1 8780 2064h, RTC.RMINCP2 8780 2074h, RTC_NS.RMINCP0 0780 2054h, RTC_NS.RMINCP1 0780 2064h, RTC_NS.RMINCP2 0780 2074h



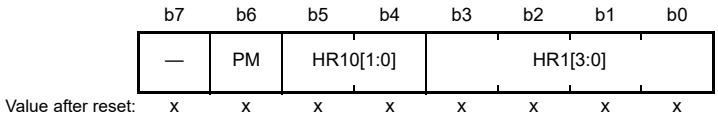
x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MIN1[3:0]	1-Minute Capture	Capture value for the ones place of minutes	R
b6 to b4	MIN10[2:0]	10-Minute Capture	Capture value for the tens place of minutes	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

The RMINCPn register is a read-only register that captures the RMINCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT1CP0 8780 2054h, RTC.BCNT1CP1 8780 2064h, RTC.BCNT1CP2 8780 2074h, RTC_NS.BCNT1CP0 0780 2054h, RTC_NS.BCNT1CP1 0780 2064h, RTC_NS.BCNT1CP2 0780 2074h



x: Undefined

The BCNT1CPn register is a read-only register that captures the BCNT1 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT1CP0, BCNT1CP1, and BCNT1CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.25 Hour Capture Register n (RHRCPn) (n = 0 to 2)/ BCNT2 Capture Register n (BCNT2CPn) (n = 0 to 2)

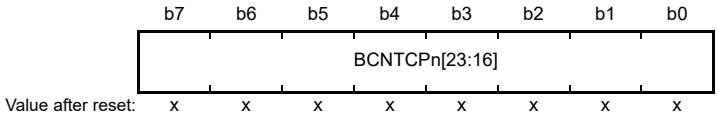
(1) In calendar count mode:

Address(es): RTC.RHRCP0 8780 2056h, RTC.RHRCP1 8780 2066h, RTC.RHRCP2 8780 2076h, RTC_NS.RHRCP0 0780 2056h, RTC_NS.RHRCP1 0780 2066h, RTC_NS.RHRCP2 0780 2076h

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	HR1[3:0]	1-Hour Capture	Capture value for the ones place of hours	R
b5, b4	HR10[1:0]	10-Hour Capture	Capture value for the tens place of hours	R
b6	PM	PM	0: a.m. 1: p.m.	R
b7	—	Reserved	This bit is read as 0 after an RTC software reset.	R

The RHRCPn register is a read-only register that captures the RHRCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively.



The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is set to 00h by an RTC software reset.

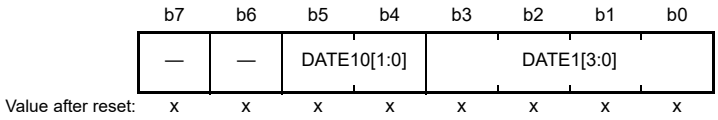
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT2CP0 8780 2056h, RTC.BCNT2CP1 8780 2066h, RTC.BCNT2CP2 8780 2076h, RTC_NS.BCNT2CP0 0780 2056h, RTC_NS.BCNT2CP1 0780 2066h, RTC_NS.BCNT2CP2 0780 2076h

x: Undefined

The BCNT2CPn register is a read-only register that captures the BCNT2 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT2CP0, BCNT2CP1, and BCNT2CP2 registers, respectively.



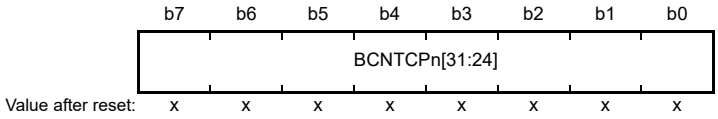
This register is set to 00h by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.26 Date Capture Register n (RDAYCPn) (n = 0 to 2)/ BCNT3 Capture Register n (BCNT3CPn) (n = 0 to 2)

(1) In calendar count mode:

Address(es): RTC.RDAYCP0 8780 205Ah, RTC.RDAYCP1 8780 206Ah, RTC.RDAYCP2 8780 207Ah, RTC_NS.RDAYCP0 0780 205Ah, RTC_NS.RDAYCP1 0780 206Ah, RTC_NS.RDAYCP2 0780 207Ah



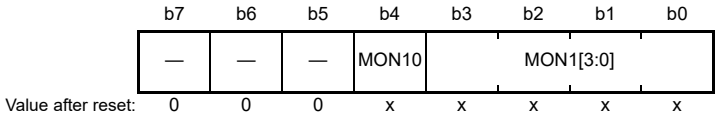
x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	DATE1[3:0]	1-Day Capture	Capture value for the ones place of days	R
b5, b4	DATE10[1:0]	10-Day Capture	Capture value for the tens place of days	R
b7, b6	—	Reserved	These bits are read as 0 after an RTC software reset.	R

The RDAYCPn register is a read-only register that captures the RDAYCNT value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

(2) In binary count mode:

Address(es): RTC.BCNT3CP0 8780 205Ah, RTC.BCNT3CP1 8780 206Ah, RTC.BCNT3CP2 8780 207Ah, RTC_NS.BCNT3CP0 0780 205Ah, RTC_NS.BCNT3CP1 0780 206Ah, RTC_NS.BCNT3CP2 0780 207Ah



x: Undefined

The BCNT3CPn register is a read-only register that captures the BCNT3 value when a time capture event is detected. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNT3CP0, BCNT3CP1, and BCNT3CP2 registers, respectively.
This register is set to 00h by an RTC software reset.
Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.2.27 Month Capture Register n (RMONCPn) (n = 0 to 2)

Address(es): RTC.RMONCP0 8780 205Ch, RTC.RMONCP1 8780 206Ch, RTC.RMONCP2 8780 207Ch, RTC_NS.RMONCP0 0780 205Ch, RTC_NS.RMONCP1 0780 206Ch, RTC_NS.RMONCP2 0780 207Ch

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MON1[3:0]	1-Month Capture	Capture value for the ones place of months	R
b4	MON10	10-Month Capture	Capture value for the tens place of months	R
b7 to b5	—	Reserved	These bits are read as 0	R

The RMONCPn register is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

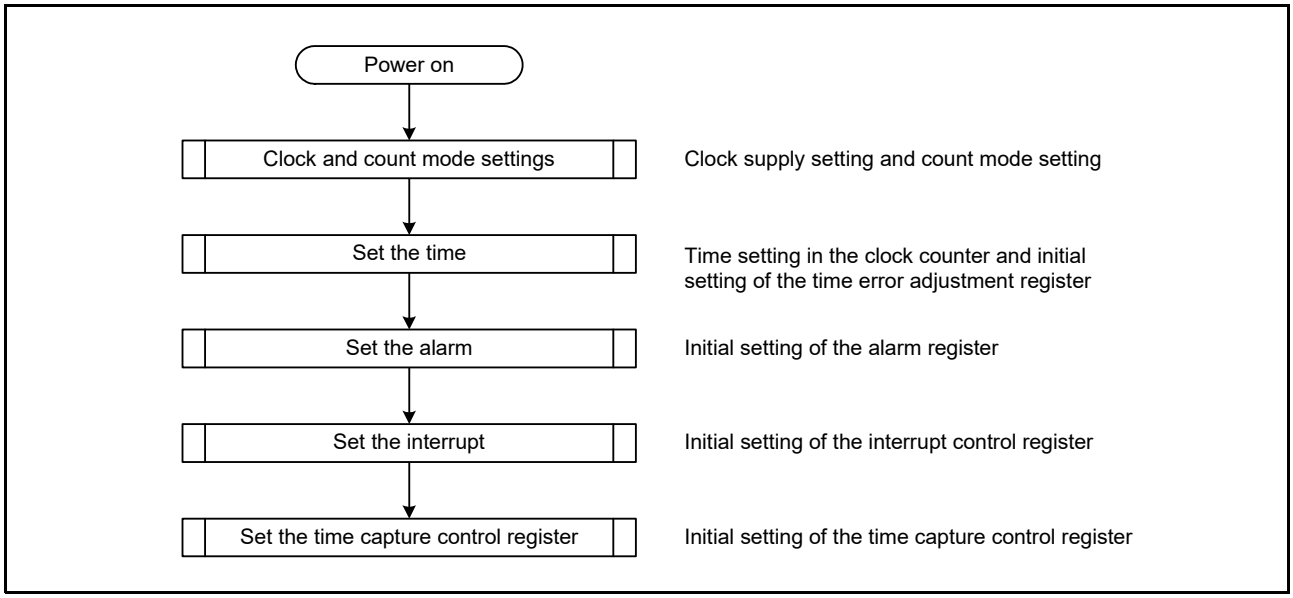
This register is set to 00h by an RTC software reset.

Before reading from this register, be sure to stop the time capture event detection through the setting of the RTCCRn.TCCT[1:0] bits.

30.3 Operation

30.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, the initial settings for the clock setting, count mode setting, time error adjustment, time setting, alarm, interrupt, and time capture control register should be performed.



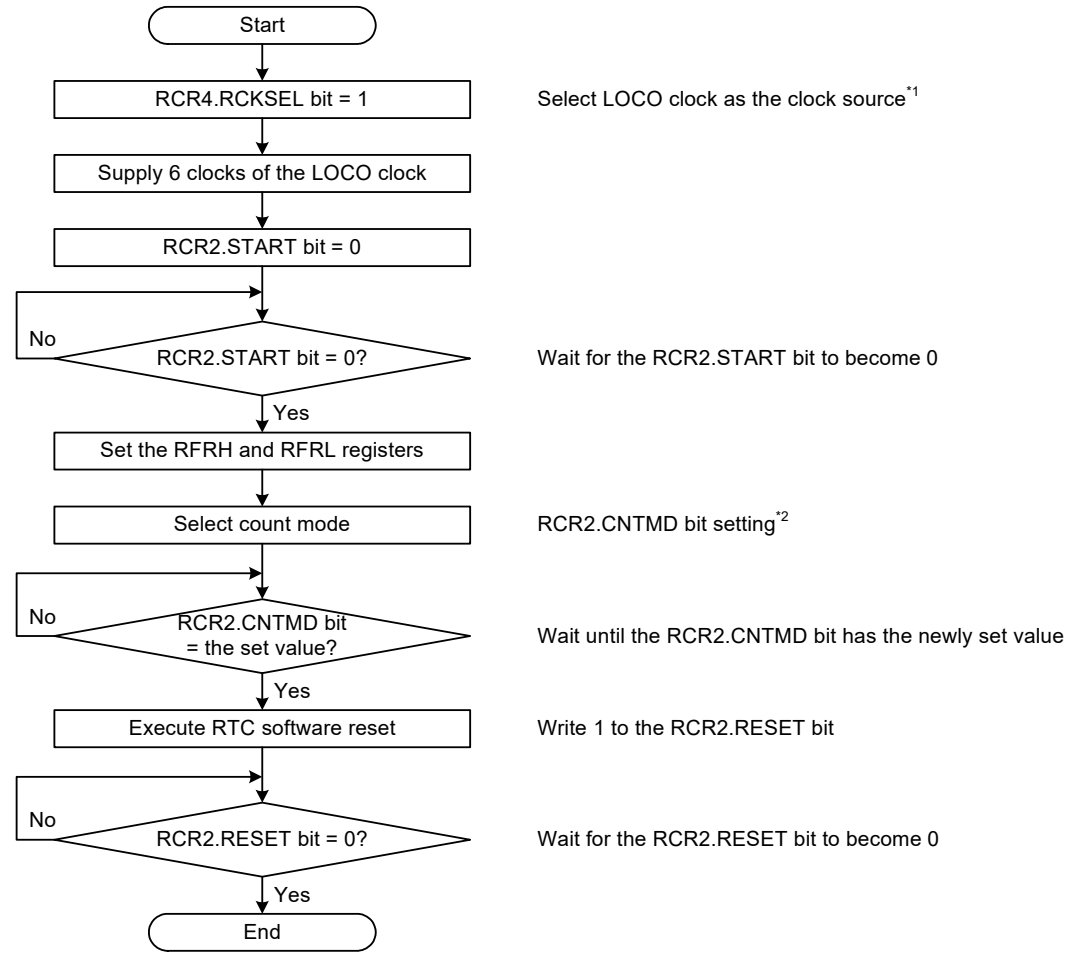


Figure 30.2 Outline of Initial Settings after Power On

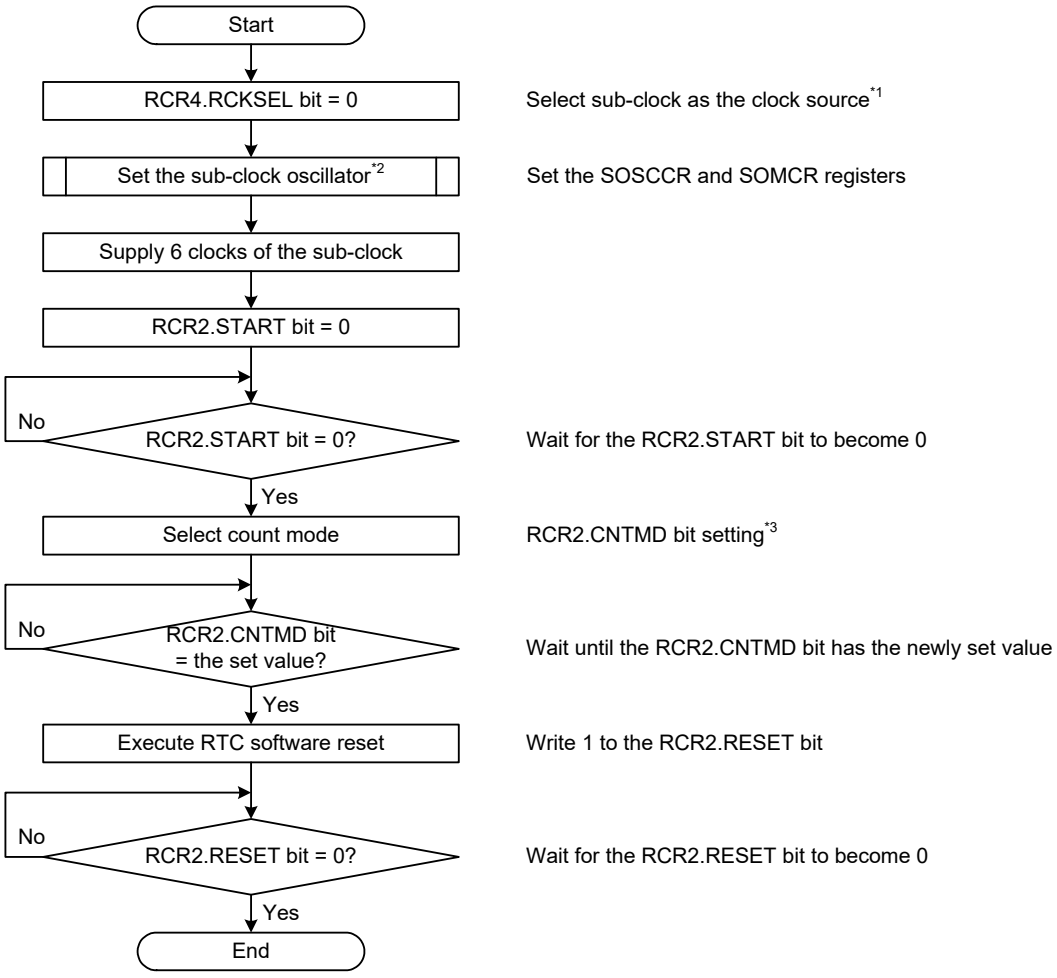
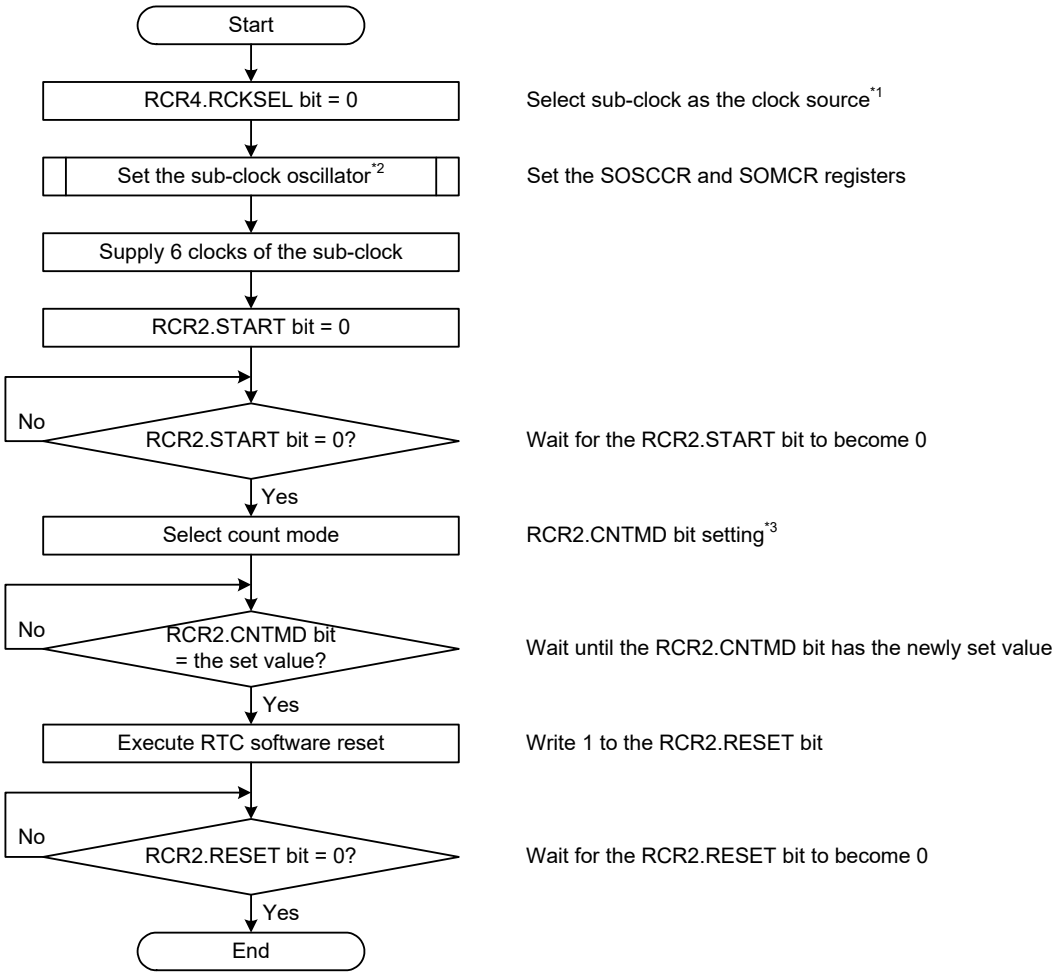


30.3.2 Clock and Count Mode Setting Procedure

Figure 30.3, Figure 30.4, and Figure 30.5 show how to set the clock and the count mode.

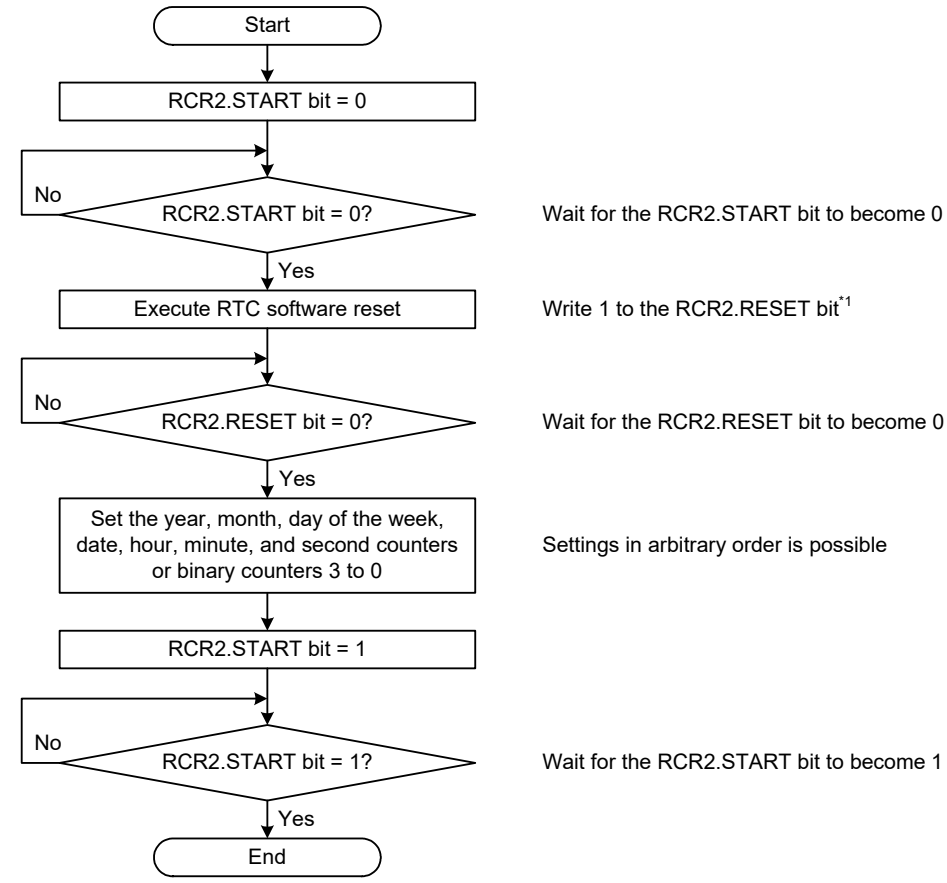


Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. This step is not necessary if the count mode has been set concurrently with setting the RCR2.START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 30.3 Clock and Count Mode Setting Procedure (When Using LOCO Clock)

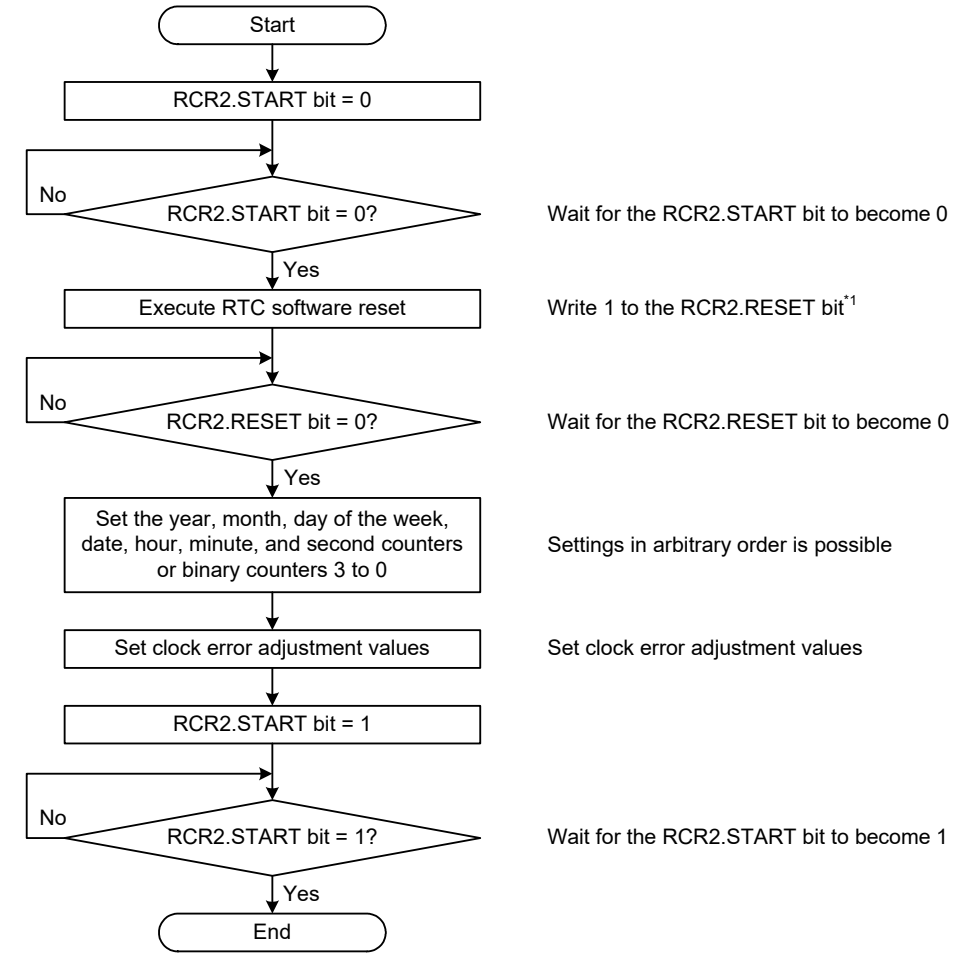
Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. For the procedure for setting up a sub-clock oscillator, refer to section 9, Clock Generation Circuit.
Note 3. This step is not necessary if the count mode has been set concurrently with setting the RCR2.START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 30.4 Clock and Count Mode Setting Procedure (When Using Sub-Clock Oscillator)



Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. For the procedure for setting up a sub-clock oscillator, refer to section 9, Clock Generation Circuit.
Note 3. This step is not necessary if the count mode has been set concurrently with setting the RCR2.START bit to 0. A value corresponding to the count mode setting must be written to the RCR2.CNTMD bit.

Figure 30.5 Clock and Count Mode Setting Procedure (When Using External Sub-Clock Input)



30.3.3 Setting the Time

Figure 30.6 and Figure 30.7 show how to set the time.

Note 1. This step is not required in the initial settings after power is supplied because an RTC software reset is applied in the clock setting procedure within the initial settings.

Figure 30.6 Setting the Time (When Using LOCO Clock)

Note 1. This step is not required in the initial settings after power is supplied because an RTC software reset is applied in the clock setting procedure within the initial settings.

Figure 30.7 Setting the Time (When Using Sub-Clock)

30.3.4 30-Second Adjustment

Figure 30.8 shows how to execute 30-second adjustment.

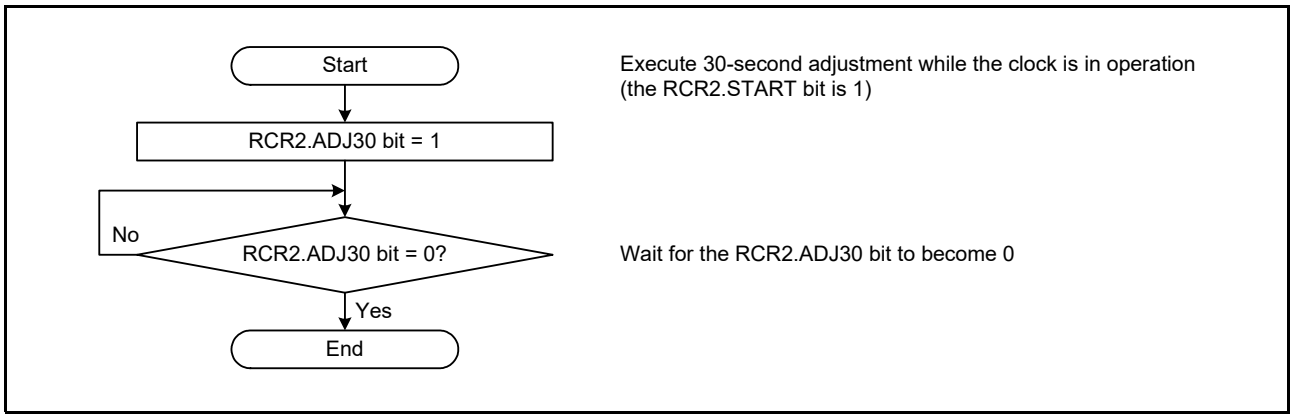


Figure 30.8 30-Second Adjustment

30.3.5 Reading 64-Hz Counter and Time

Figure 30.9 shows how to read the 64-Hz counter and time.
If a carry occurs while the 64-Hz counter and time are being read, the correct time will not be obtained, so they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 30.9, and the procedure using carry interrupts in (b). To keep the program simple, method (a) should be used in most cases.

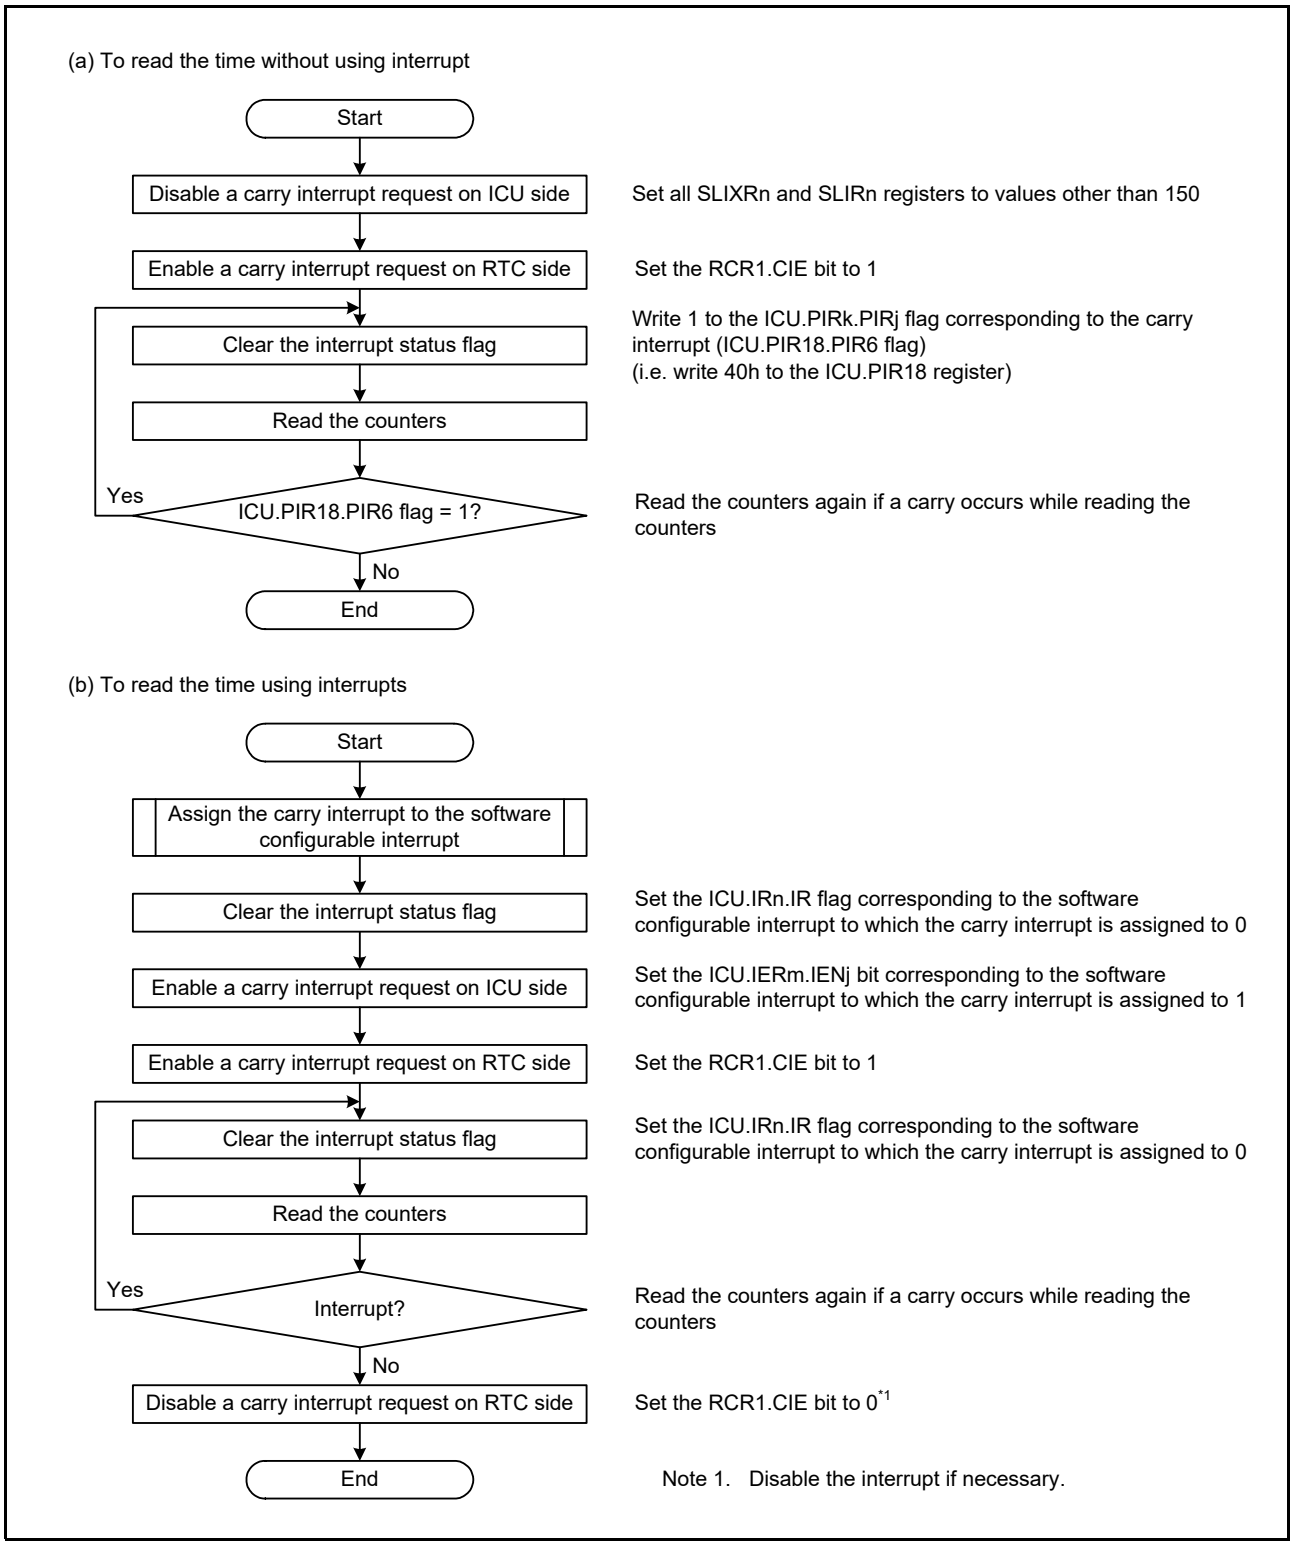

Figure 30.9 Reading Time

30.3.6 Alarm Function

Figure 30.10 shows how to use the alarm function.

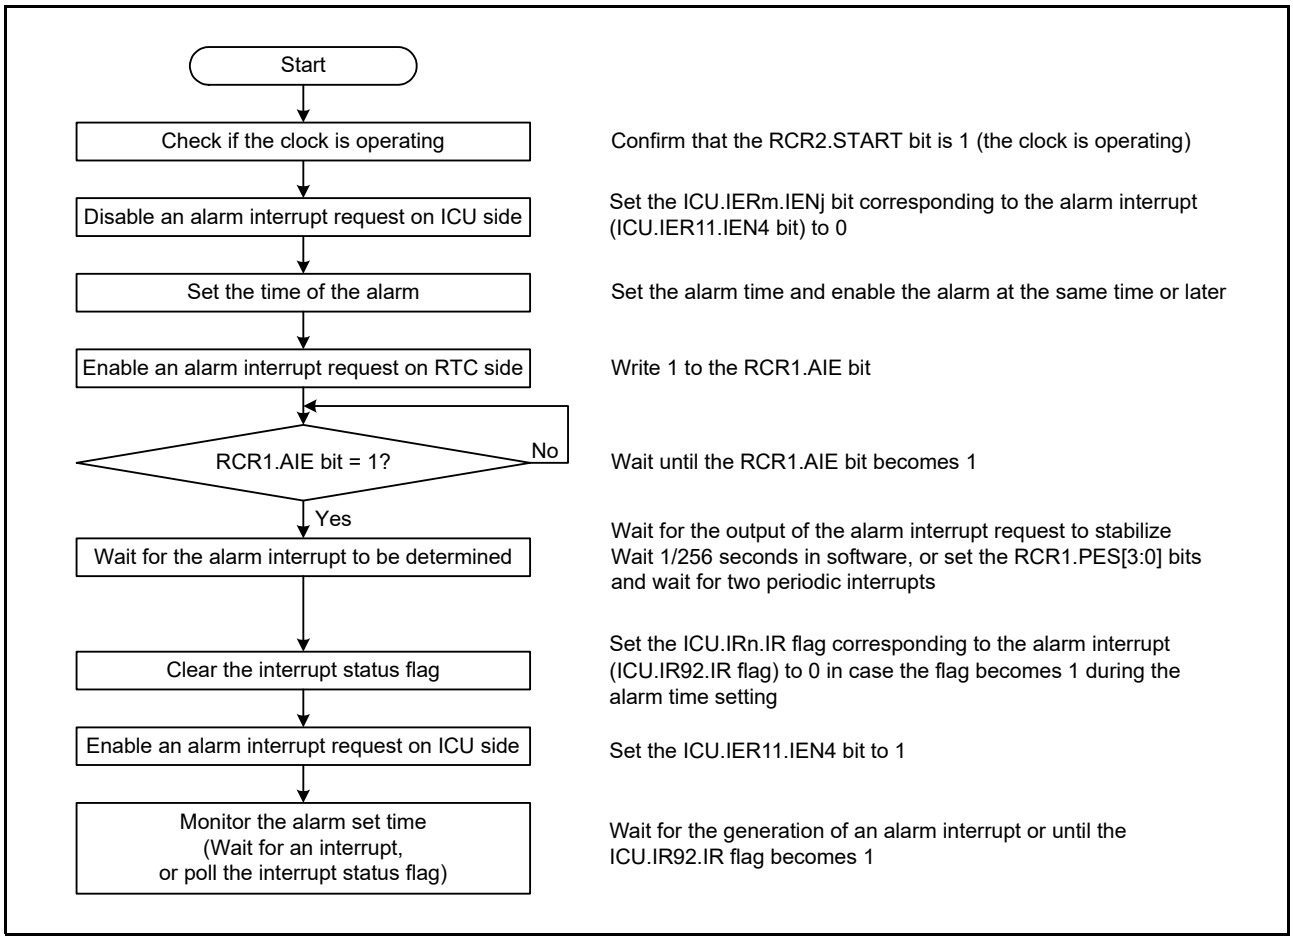

Figure 30.10 Using Alarm Function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the alarm enable register corresponding to the target bit of the alarm, and set the alarm time to the alarm register. For bits that are not target of the alarm, write 0 to the ENB bit of the alarm enable register.

When the counter and the alarm time match, the IR flag corresponding to the alarm interrupt (ICU.IR92.IR flag) is set to 1. Alarm detection can be confirmed by reading this bit, but an interrupt should be used in most cases. If 1 has been set in the interrupt request enable bit corresponding to the alarm interrupt (ICU.IER11.IEN4 bit), an alarm interrupt is generated in the event of alarm, enabling the alarm to be detected.

Writing 0 sets the ICU.IR92.IR flag to 0.

When the counter and the alarm time match in a low power consumption state, the MCU returns from the low power consumption state. In deep software standby mode, the MCU returns from the deep software standby mode even when the alarm interrupt request is disabled.

30.3.7 Procedure for Disabling Alarm Interrupt

Figure 30.11 shows the procedure for disabling the enabled alarm interrupt request.

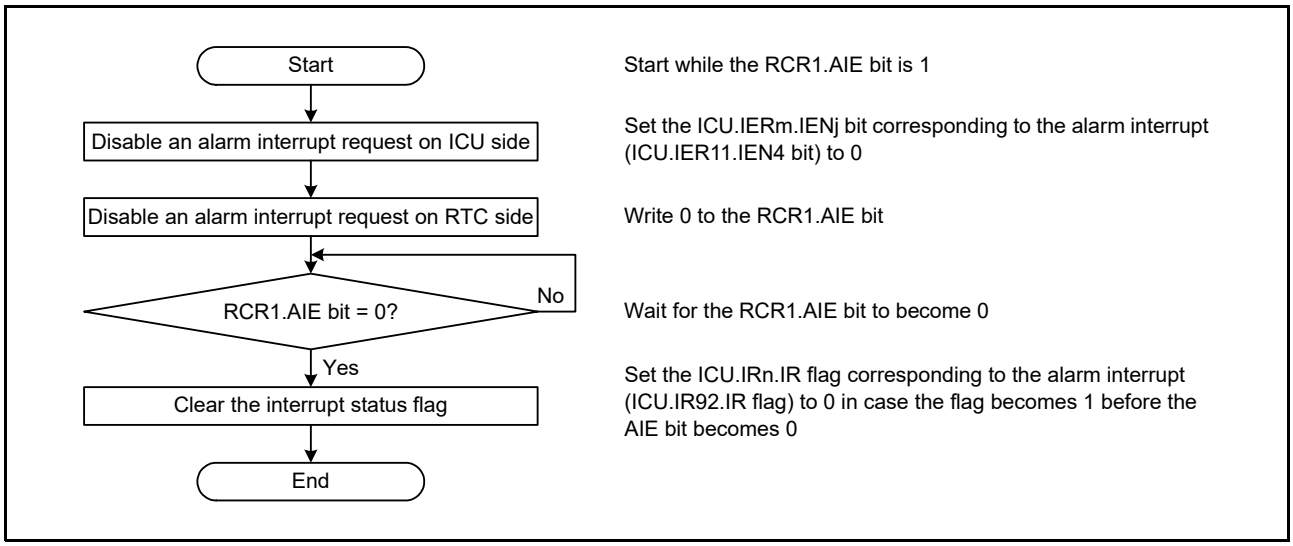

Figure 30.11 Procedure for Disabling Alarm Interrupt Request

30.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors (running fast or slow) in the time due to the precision of oscillation by the sub-clock. Since 32,768 cycles of the sub-clock constitute 1 second of operation when the sub-clock is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. This function can be used to correct errors due to the clock running fast or slow.
Two types of time error adjustment functions are provided: automatic adjustment and adjustment by software.
Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

30.3.8.1 Automatic Adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.
Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJE bit elapses.
Examples are shown below.

[Example 1] Sub-clock running at 32.769 kHz
Adjustment procedure:
When the sub-clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler.)
- RADJ.ADJ[5:0] = 60 (3Ch)

[Example 2] Sub-clock running at 32.766 kHz
Adjustment procedure:
When the sub-clock is running at 32.766 kHz, 1 second elapses every 32,766 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs slow by two clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings: (when RCR2.CNTMD = 0)

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 20 (14h)

[Example 3] Sub-clock running at 32.764 kHz
Adjustment procedure:
At 32.764 kHz, 1 second elapses on 32,764 clock cycles. Since the RTC operates for 32,768 clock cycles as 1 second, the clock is delayed for four clock cycles per second. In 8 seconds, the delay is 32 clock cycles, so correction can be made by proceeding the clock for 32 clock cycles every 8 seconds.

Register settings when the RCR2.CNTMD bit is 1

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler.)
- RADJ.ADJ[5:0] = 32 (20h)

30.3.8.2 Adjustment by Software

Enable adjustment by software by setting the RCR2.AADJE bit to 0.
Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register at the time of execution of an instruction for writing to the RADJ register.
An example is shown below.

[Example 1] Sub-clock running at 32.769 kHz
Adjustment procedure:
When the sub-clock is running at 32.769 kHz, 1 second elapses every 32,769 clock cycles. The RTC is meant to run at 32,768 clock cycles, so the clock runs fast by one clock cycle every second. The time on the clock is fast by one clock cycle per second, so adjustment can take the form of setting the clock back by one cycle every second.

Register settings:

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler.)
- RADJ.ADJ[5:0] = 1 (01h)
  This is written to the RADJ register once per 1-second interrupt.

30.3.8.3 Procedure for Changing the Mode of Adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
(2) Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
(3) Use the RCR2.AADJP bit to select the period of adjustment.
(4) In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

Changing from adjustment by software to automatic adjustment:

(1) Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
(2) Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
(3) Proceed with adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the desired time. After that, the time is adjusted every time a value is written to the RADJ register.

30.3.8.4 Procedure for Stopping Adjustment

Stop adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

30.3.9 Time Capture Function

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the TCST flag is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Operation when the noise filter is off is shown in Figure 30.12 and operation when the noise filter is on is shown in Figure 30.13.

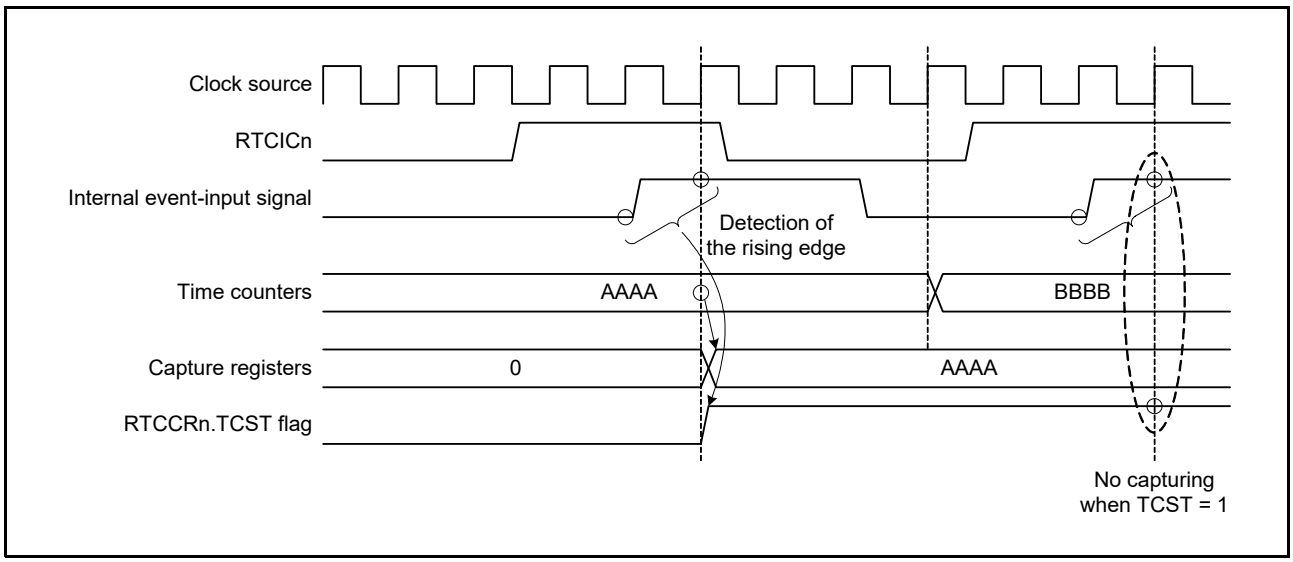

Figure 30.12 Timing of a Time Capture Operation (with the Filter Off) (n = 0 to 2)

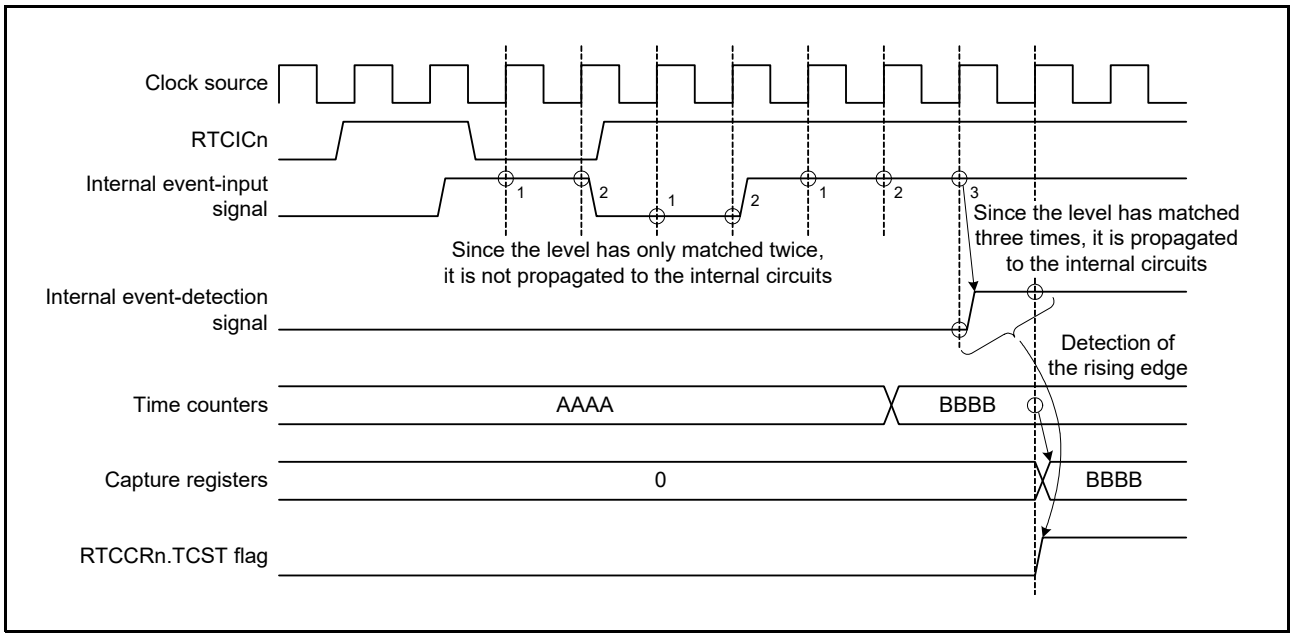

Figure 30.13 Timing of a Time Capture Operation (with the Filter On) (n = 0 to 2)

30.4 Interrupt Sources

There are three interrupt sources in the realtime clock. Table 30.3 lists interrupt sources for the RTC.

Table 30.3 RTC Interrupt Sources

Name	Interrupt Sources	Interrupt Status Flag	Interrupt Request Enable Bit
ALM	Alarm interrupt	IR92.IR	IER11.IEN4
PRD	Periodic interrupt	IR93.IR	IER11.IEN5
CUP	Carry interrupt	PIR18.PIR6	— (software configurable interrupt)

(1) Alarm interrupt (ALM)

This interrupt is generated according to the result of comparison between the alarm registers and realtime clock counters (for details, refer to section 30.3.6, Alarm Function).

Since there is a possibility that the interrupt flag may be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and set the ICU.IR92.IR flag to 0 again after modifying values of the alarm registers. Once the interrupt flag for the alarm interrupt has been set to 1 and the state has returned to non-matching of the alarm registers and clock counters, the flag will not be set again until there is a further match or the values of the alarm registers are modified again.

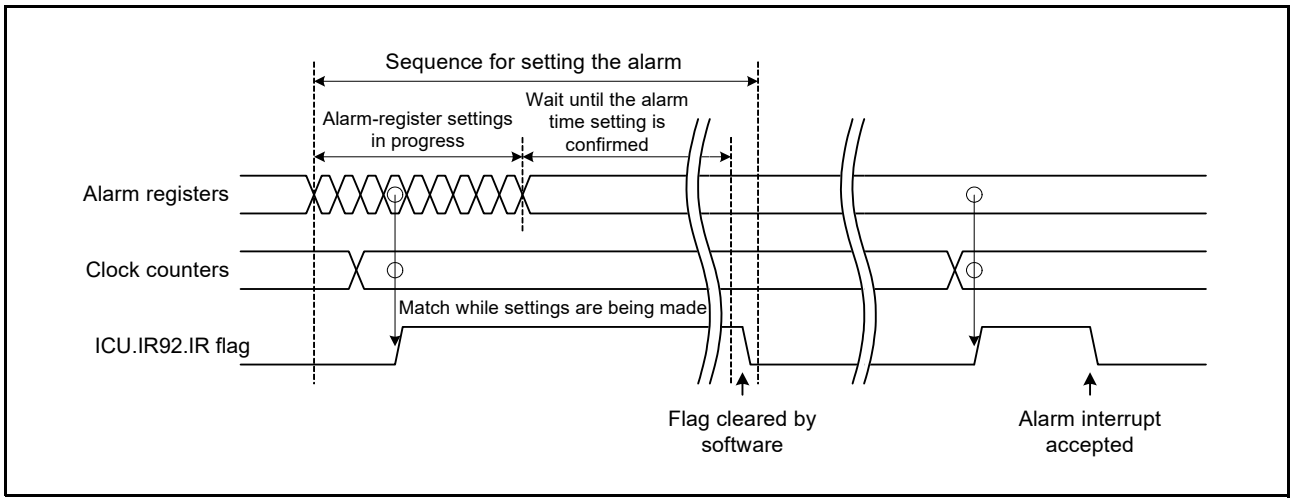

Figure 30.14 Timing Chart for the Alarm Interrupt

(2) Periodic interrupt (PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected through the RCR1.PES[3:0] bits.

(3) Carry interrupt (CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

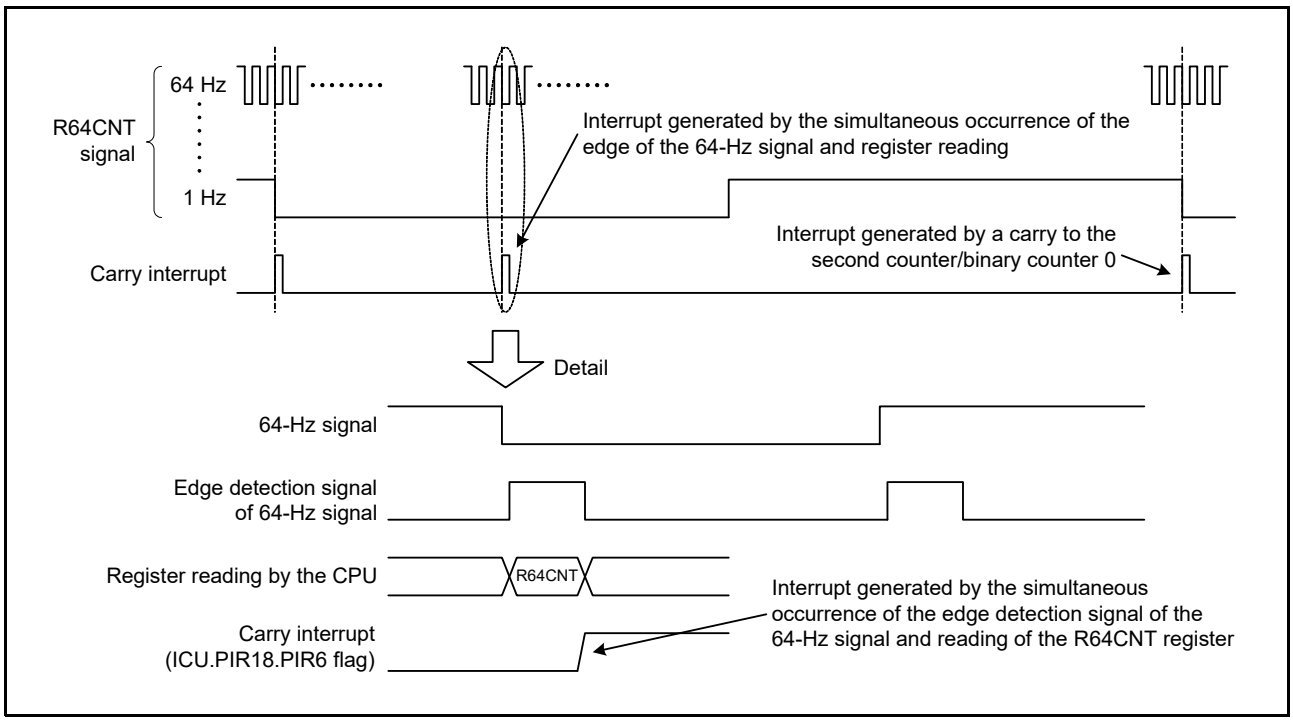

Figure 30.15 Carry Interrupt Timing Chart

30.5 Event Link Output

The RTC outputs the following event signals for the event link controller (ELC), and these can be used to initiate operations by other modules selected in advance.

(1) Periodic event output

The periodic event signal is output at the interval selected from among 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by the setting of the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is to be used, only make the ELC settings after making the RTC settings (initialization, time settings, etc.). Making the RTC settings after the ELC settings can lead to the output of unexpected event signals.

30.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output for the CPU when an interrupt source is generated while the corresponding enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal via the ELC when an interrupt source is generated, regardless of the setting of the corresponding interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during software standby mode or deep software standby mode, the periodic event signals for the ELC are not output.

30.6 Usage Notes

30.6.1 Register Writing during Counting

The following registers should not be written to during counting (while the RCR2.START bit = 1).

RSECCNT/BCNT0, RMINCNT/BCNT1, RHRCNT/BCNT2, RDAYCNT, RWKCNT/BCNT3, RMONCNT, RYRCNT, RCR1.RTCOS, RCR2.RTCOE, RCR2.HR24, RFRH, RFRL

The counter must be stopped before writing to any of the above registers.

30.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in Figure 30.16.
The generation and period of the periodic interrupt can be changed by the setting of the RCR1.PES[3:0] bits. However, since the prescaler, R64CNT, and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting of the RCR1.PES[3:0] bits.
Furthermore, stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the interrupt period. When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted according to the adjustment value.

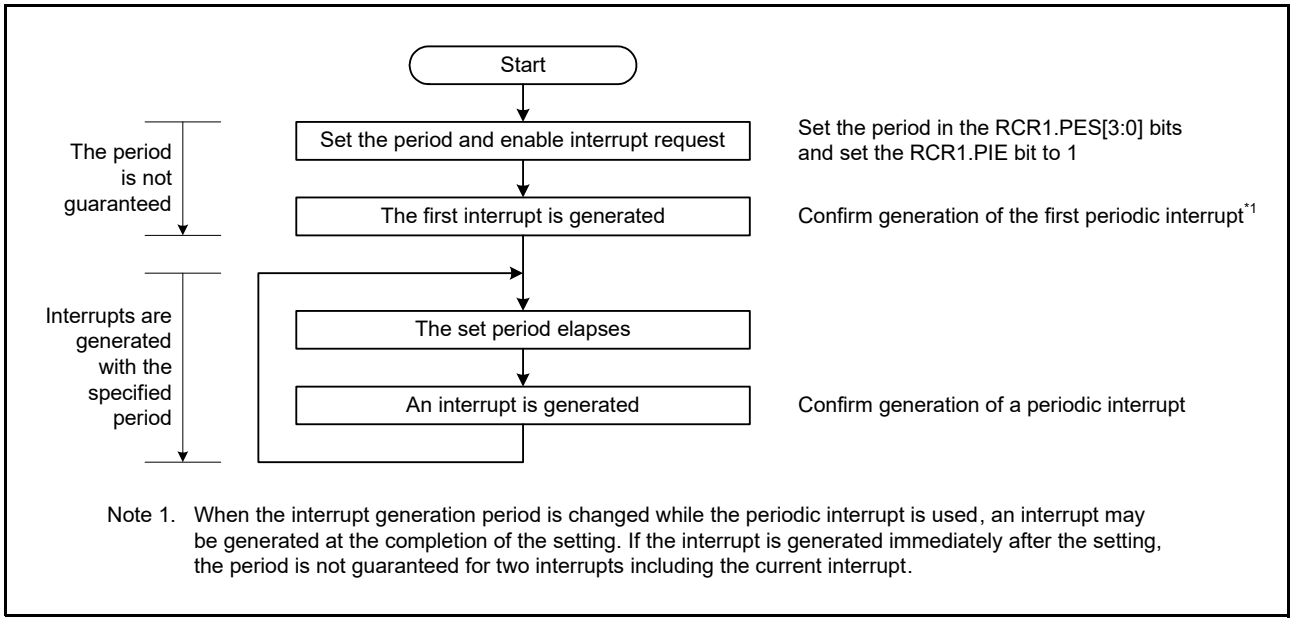

Figure 30.16 Using Periodic Interrupt Function

30.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted according to the adjustment value.

30.6.4 Transitions to Low Power Consumption Modes after Setting Registers

A transition to a low power consumption state (software standby mode, deep software standby mode, or battery backup) during writing to or updating of an RTC register might destroy the register's value. After setting a register, confirm that the setting is in place before initiating a transition to a low power consumption state.

30.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter/binary counter 0 after having written to the counter register, follow the procedure in section 30.3.5, Reading 64-Hz Counter and Time.
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4, RFRH, or RFRL register is reflected when four read operations are performed after writing.
- The values written to the RCR1.CIE, RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after return from a reset, deep software standby mode, software standby mode, or the battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register when six cycles of the clock source have elapsed.

30.6.6 Changing the Count Mode

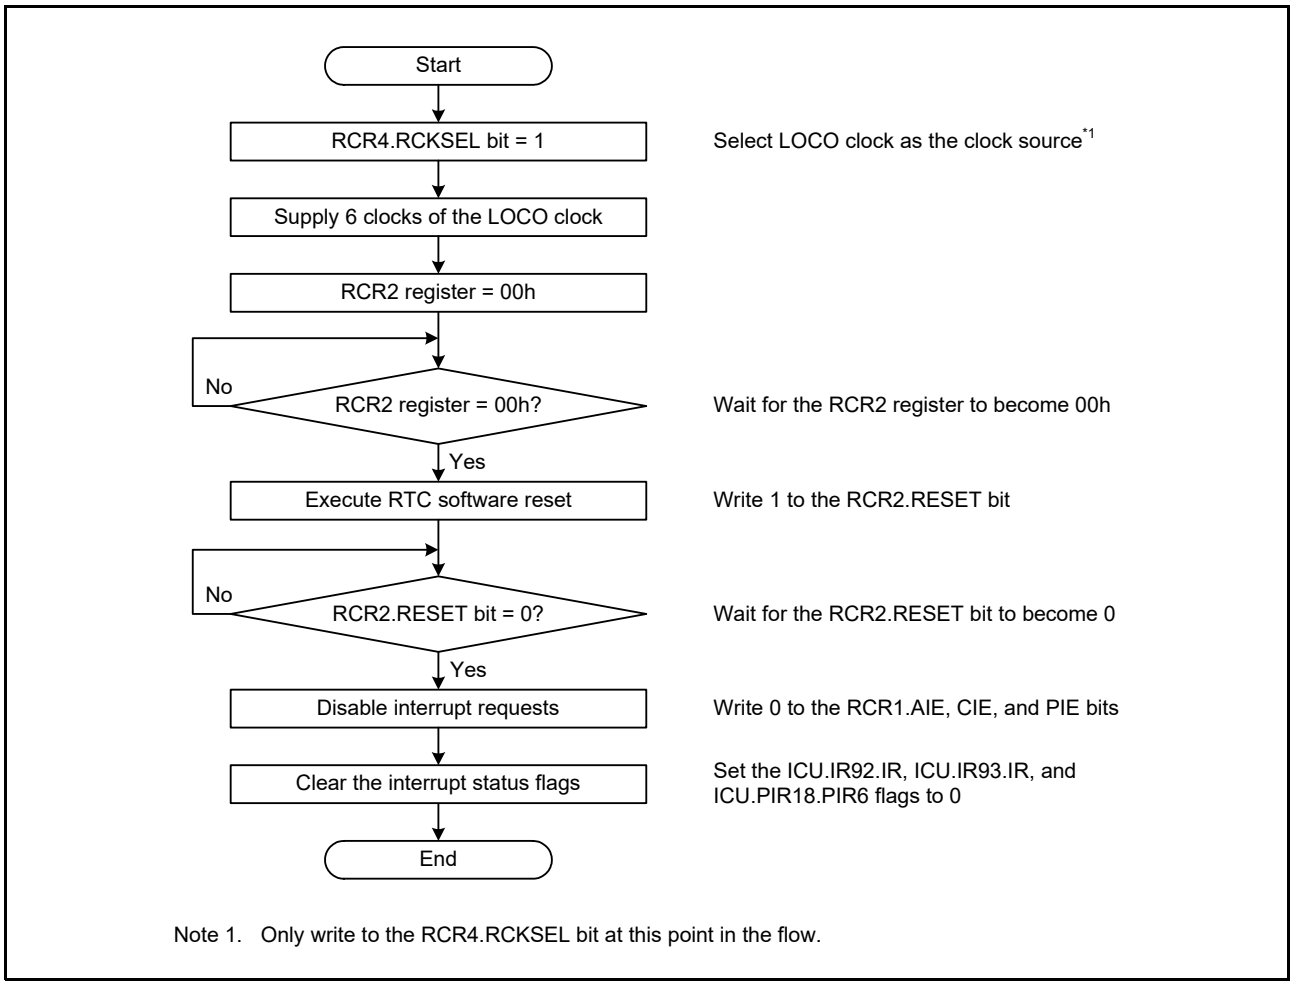
When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop counting operation, then start again from the initial setting. For details on initial setting, refer to section 30.3.1, Outline of Initial Settings of Registers after Power On.

30.6.7 Notes on Using the Time Capture Function

When the time capture function is to be used, set both the RTCCRn.TCEN and TAMPICR1.CHnEN bits (n = 0 to 2) to 1. When tampering is not to be detected, leave the TAMPCR, TCECR, and TAMPICR2 registers in the tamper detector at their initial values.
When the time capture function is to be used to obtain the time stamps in response to the detection of tampering, use the noise filter in the tamper detector and set the RTCCRn.TCNF[1:0] bits to 00b (switch the noise filter of the RTC off).

30.6.8 Initialization Procedure When the Realtime Clock is Not to be Used

Registers in the RTC are not initialized by a reset. Accordingly, depending on the initial state, the generation of an unintentional interrupt request or operation of the counter may lead to increased power consumption.
For products that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 30.17 or Figure 30.18.



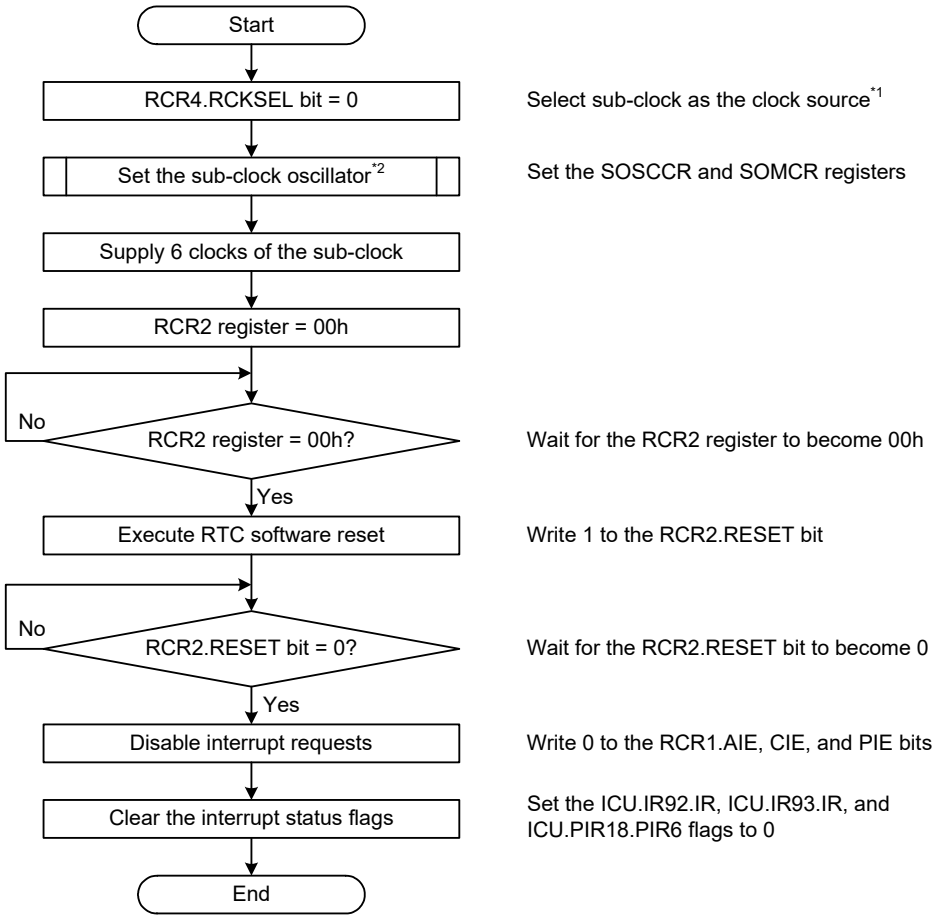


Figure 30.17 Initialization Procedure (When Using LOCO Clock)

Note 1. Only write to the RCR4.RCKSEL bit at this point in the flow.
Note 2. For the procedure for setting up a sub-clock oscillator, refer to section 9, Clock Generation Circuit.

Figure 30.18 Initialization Procedure (When Using Sub-Clock)

31. Watchdog Timer (WDTA)

The watchdog timer (WDT) is a 14-bit down-counter. It can be used to reset this MCU when the counter underflows because its value cannot be refreshed due to the system being out of control.
In addition, a non-maskable or maskable interrupt can be generated on an underflow.
The refresh-permitted period can be set to refresh the counter and used as the condition to detect when the system runs out of control.

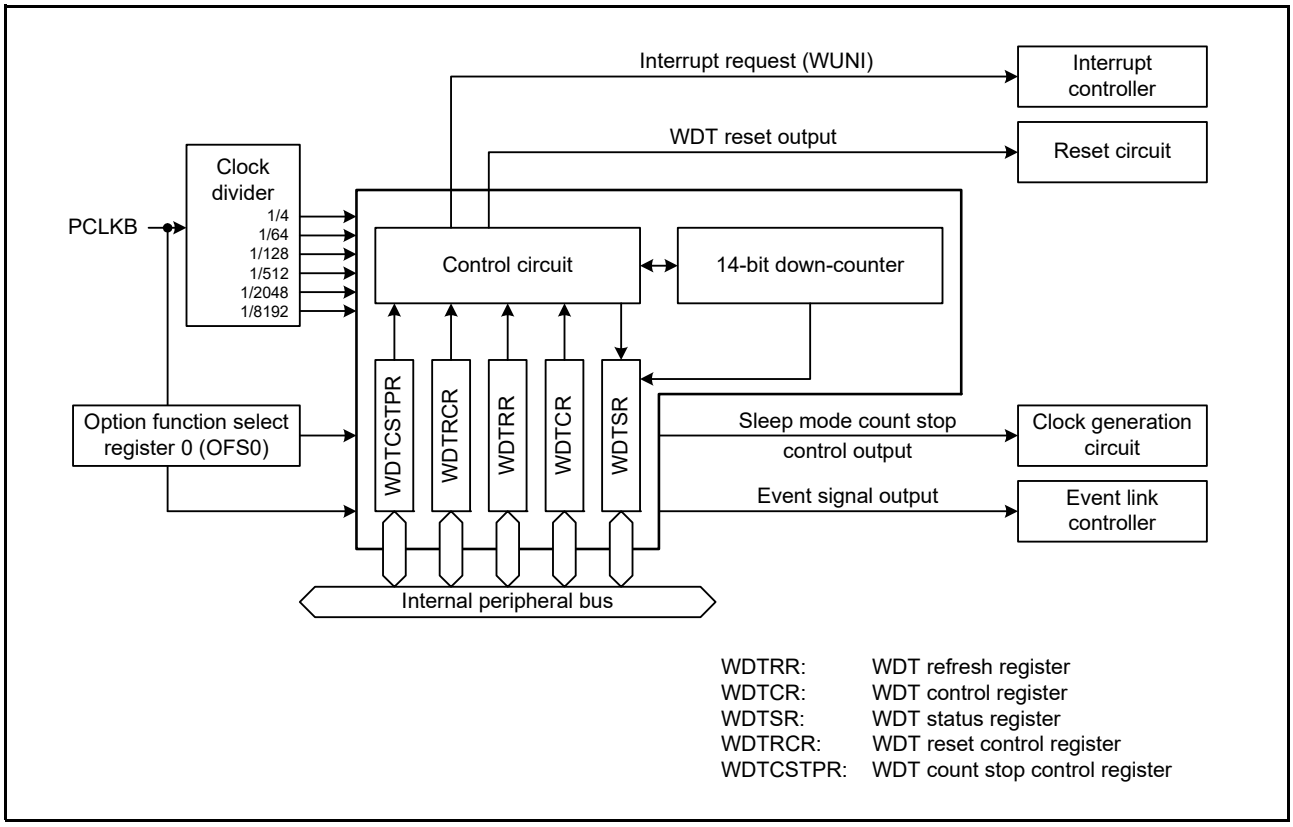
31.1 Overview

Table 31.1 lists the specifications of the WDT and Figure 31.1 shows a block diagram of the WDT.

Table 31.1 WDT Specifications

Item	Description
Count source	Peripheral module clock (PCLKB)
Clock divide ratio	Divide by 4, 64, 128, 512, 2048, or 8192
Counter operation	Counting down using a 14-bit counter
Conditions for starting the counter	• Auto-start mode: Counting automatically starts after a reset is released • Register start mode: Counting is started by refresh operation (writing 00h and then FFh to the WDTRR register)
Conditions for stopping the counter	• Reset • In low power consumption modes (depends on the register setting*1) • A counter underflows or a refresh error occurs (only in register start mode)
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Reset output sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/ maskable interrupt sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading the counter value	The counter value can be read by the WDTSR register.
Event link function (output)	• Counter underflow event output • Refresh error event output
ProtectZone filter	Security attribute can be set.*2

Note 1. When the OFS0.WDT0SLCSTP bit is 1 in auto-start mode, and when the WDTCSTPR.SLCSTP bit is 1 in register start mode.
Note 2. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.



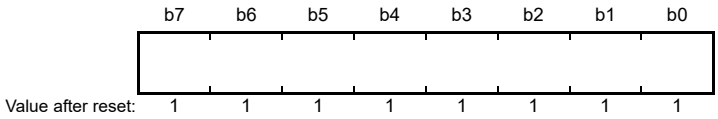


Figure 31.1 WDT Block Diagram

31.2 Register Descriptions

31.2.1 WDT Refresh Register (WDTRR)

Address(es): WDT0.WDTRR 8780 2600h, WDT0_NS.WDTRR 0780 2600h

Bit	Description	R/W
b7 to b0	The counter is refreshed by writing 00h and then writing FFh to this register	R/W

The WDTRR register is used to refresh the counter of the WDT.
The counter of the WDT is refreshed by writing 00h and then writing FFh to the WDTRR register (refresh operation) within the refresh-permitted period.
After the counter has been refreshed, it starts counting down from the value selected by setting the WDT0TOPS[1:0] bits in option function select register 0 (OFS0) in auto-start mode. In register start mode, counting down starts from the value selected by setting the WDTCR.TOPS[1:0] bits.
When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh.
For details of the refresh operation, refer to section 31.3.2, Refresh Operation.

31.2.2 WDT Control Register (WDTCR)

Address(es): WDT0.WDTCR 8780 2602h, WDT0_NS.WDTCR 0780 2602h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15, b14	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the time until a timeout occurs and the refresh-permitted period when using register start mode.

In auto-start mode, the settings in the WDTCR register are disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the WDTCR register can also be made in the OFS0 register. For details, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

TOPS[1:0] Bits (Timeout Period Select)

These bits select the timeout period (period until the counter underflows) from among 1024, 4096, 8192, and 16384 cycles of the count clock.

After the counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of PCLKB cycles) until the counter underflows.

Relations between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles are listed in Table 31.2.

Table 31.2 Timeout Period Settings

CKS[3:0] Bits				TOPS[1:0] Bits				
b7	b6	b5	b4	b1	b0	Clock Divide Ratio	Timeout Period (Number of Cycles)	Cycles of PCLKB
0	0	0	1	0	0	Divide-by-4	1024	4096
				0	1		4096	16384
				1	0		8192	32768
				1	1		16384	65536
0	1	0	0	0	0	Divide-by-64	1024	65536
				0	1		4096	262144
				1	0		8192	524288
				1	1		16384	1048576
1	1	1	1	0	0	Divide-by-128	1024	131072
				0	1		4096	524288
				1	0		8192	1048576
				1	1		16384	2097152
0	1	1	0	0	0	Divide-by-512	1024	524288
				0	1		4096	2097152
				1	0		8192	4194304
				1	1		16384	8388608
0	1	1	1	0	0	Divide-by-2048	1024	2097152
				0	1		4096	8388608
				1	0		8192	16777216
				1	1		16384	33554432
1	0	0	0	0	0	Divide-by-8192	1024	8388608
				0	1		4096	33554432
				1	0		8192	67108864
				1	1		16384	134217728

CKS[3:0] Bits (Clock Divide Ratio Select)

These bits specify the frequency of the clock used for the counter (count clock). The count clock frequency can be selected from among the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, a count period between 4,096 and 134,217,728 cycles of the PCLKB can be selected for the WDT.

RPES[1:0] Bits (Window End Position Select)

These bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. The selected window end position should be a value smaller than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

RPSS[1:0] Bits (Window Start Position Select)

These bits specify the window start position that indicates the refresh-permitted period. 25%, 50%, 75%, or 100% of the timeout period can be selected for the window end position. The window start position should be set to a value greater the window end position. If the window start position is set to a value smaller than or equal to the window end position, the window end position is set to 0%.

Table 31.3 lists the counter values for the window start and end positions and Figure 31.2 shows the refresh-permitted period set by the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 31.3 Relationship between Timeout Period and Window Start and End Counter Values

TOPS[1:0] Bits		Timeout Period		Window Start and End Counter Value			
		Cycles	Counter Value	100%	75%	50%	25%
0	0	1024	03FFh	03FFh	02FFh	01FFh	00FFh
0	1	4096	0FFFh	0FFFh	0BFFh	07FFh	03FFh
1	0	8192	1FFFh	1FFFh	17FFh	0FFFh	07FFh
1	1	16384	3FFFh	3FFFh	2FFFh	1FFFh	0FFFh

RPSS[1:0] Bits		RPES[1:0] Bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note. If the window end setting is greater than or equal to the window start setting, the window end position is set to 0%.

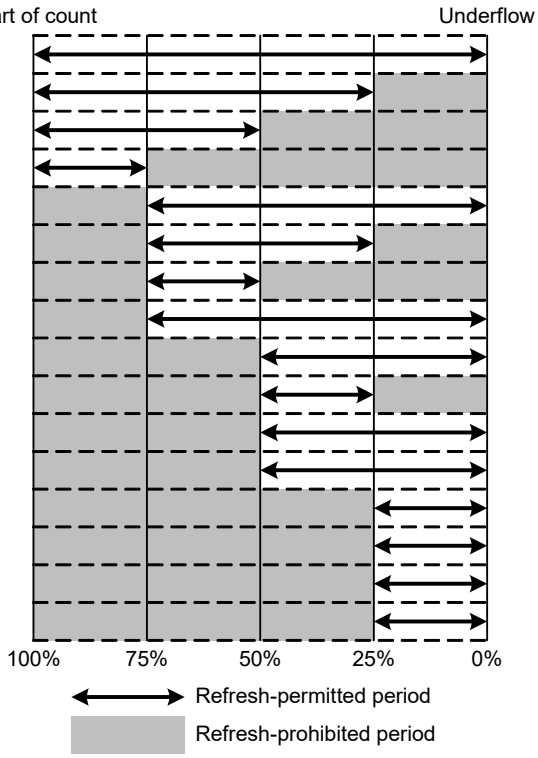

Figure 31.2 RPSS[1:0] and RPES[1:0] Bit Settings and the Refresh-Permitted Period

31.2.3 WDT Status Register (WDTSR)

Address(es): WDT0.WDTSR 8780 2604h, WDT0_NS.WDTSR 0780 2604h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b13 to b0	CNTVAL[13:0]	Counter Value	Value counted by the counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred	R/(W) *1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred	R/(W) *1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] Bits (Counter Value)

These bits are used to confirm the value of the counter, but note that the read value may differ from the actual count by a value of one count.

UNDFF Flag (Underflow Flag)

This flag is used to confirm whether or not an underflow has occurred in the counter.
The value 1 indicates that the counter has underflowed. The value 0 indicates that the counter has not underflowed.
To clear the flag, write 0 to the UNDFF flag. The flag will be cleared five PCLKB cycles after writing 0.
Note that after an underflow occurs, the flag cannot be cleared for a period of one count clock cycle and two PCLKB cycles. Wait for the period before clearing the flag.

REFEF Flag (Refresh Error Flag)

This flag is used to confirm whether or not a refresh error (performing a refresh operation during a refresh-prohibited period) has occurred.
The value 1 indicates that a refresh error has occurred. The value 0 indicates that no refresh error has occurred.
To clear the flag, write 0 to the REFEF flag. The flag will be cleared five PCLKB cycles after writing 0.
Note that after a refresh error occurs, the flag cannot be cleared for a period of one count clock cycle and two PCLKB cycles. Wait for the period before clearing the flag.

31.2.4 WDT Reset Control Register (WDTRCR)

Address(es): WDT0.WDTRCR 8780 2606h, WDT0_NS.WDTRCR 0780 2606h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	RSTIRQS	Reset Interrupt Request Select	0: Non-maskable interrupt request or maskable interrupt request is output. 1: Reset signal is output.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the behavior when a timeout or refresh error occurs when using register start mode. In auto-start mode, the WDTRCR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the WDTRCR register can also be made in the OFS0 register. For details, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

31.2.5 WDT Count Stop Control Register (WDTCSTPR)

Address(es): WDT0.WDTCSTPR 8780 2608h, WDT0_NS.WDTCSTPR 0780 2608h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	SLCSTP	Sleep Mode Count Stop Control	0: Counter continues counting in sleep mode or deep sleep mode. 1: Counter stops in low power consumption mode.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify whether the counter operates in sleep mode or deep sleep mode when using register start mode.

In auto-start mode, the WDTCSTPR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting mode to the WDTCSTPR register can also be made in the OFS0 register. For details, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

SLCSTP Bit (Sleep Mode Count Stop Control)

This bit selects whether the counter continues or stops counting in sleep mode or deep sleep mode.

31.2.6 Option Function Select Register 0 (OFS0)

For details on the OFS0 register, refer to section 31.3.6, Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers.

31.3 Operation

31.3.1 Count Operation in Each Start Mode

The WDT has two start modes: auto-start mode, in which counting automatically starts after a reset is released, and register start mode, in which counting is started by refresh operation (writing to the register).
In auto-start mode, counting automatically starts after a reset is released in accordance with the settings in option function select register 0 (OFS0).
In register start mode, counting is started by refresh operation (writing to the register) after the respective registers are set after a reset is released.
Select auto-start mode or register start mode by setting the OFS0.WDT0STRT bit.
When the auto-start mode is selected, the settings in the WDTCR, WDTRCR, and WDTCSTPR registers are disabled, and the settings in the OFS0 register are enabled.
On the other hand, when the register start mode is selected, the setting of the OFS0 register is disabled, and the settings of the WDTCR, WDTRCR, and WDTCSTPR registers are enabled.

31.3.1.1 Register Start Mode

When the OFS0.WDT0STRT bit is 1, register start mode is selected, and the WDTCR, WDTRCR, and WDTCSTPR registers are enabled.
After a reset is released, set the clock divide ratio, window start and end positions, and timeout period in the WDTCR register, the reset output or interrupt request output in the WDTRCR register, and the counter operation/stop in sleep mode or deep sleep mode in the WDTCSTPR register. Then, refresh the counter to start counting down from the value set by the WDTCR.TOPS[1:0] bits.
Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The WDT does not output the reset signal as long as this continues. However, if the counter underflows because the counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs a reset signal or an interrupt request (WUNI). Reset signal output or interrupt request output can be selected by setting the WDTRCR.RSTIRQS bit.

Figure 31.3 shows an example of operation under the following conditions.

- Register start mode (OFS0.WDT0STRT = 1)
- Reset output is enabled (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

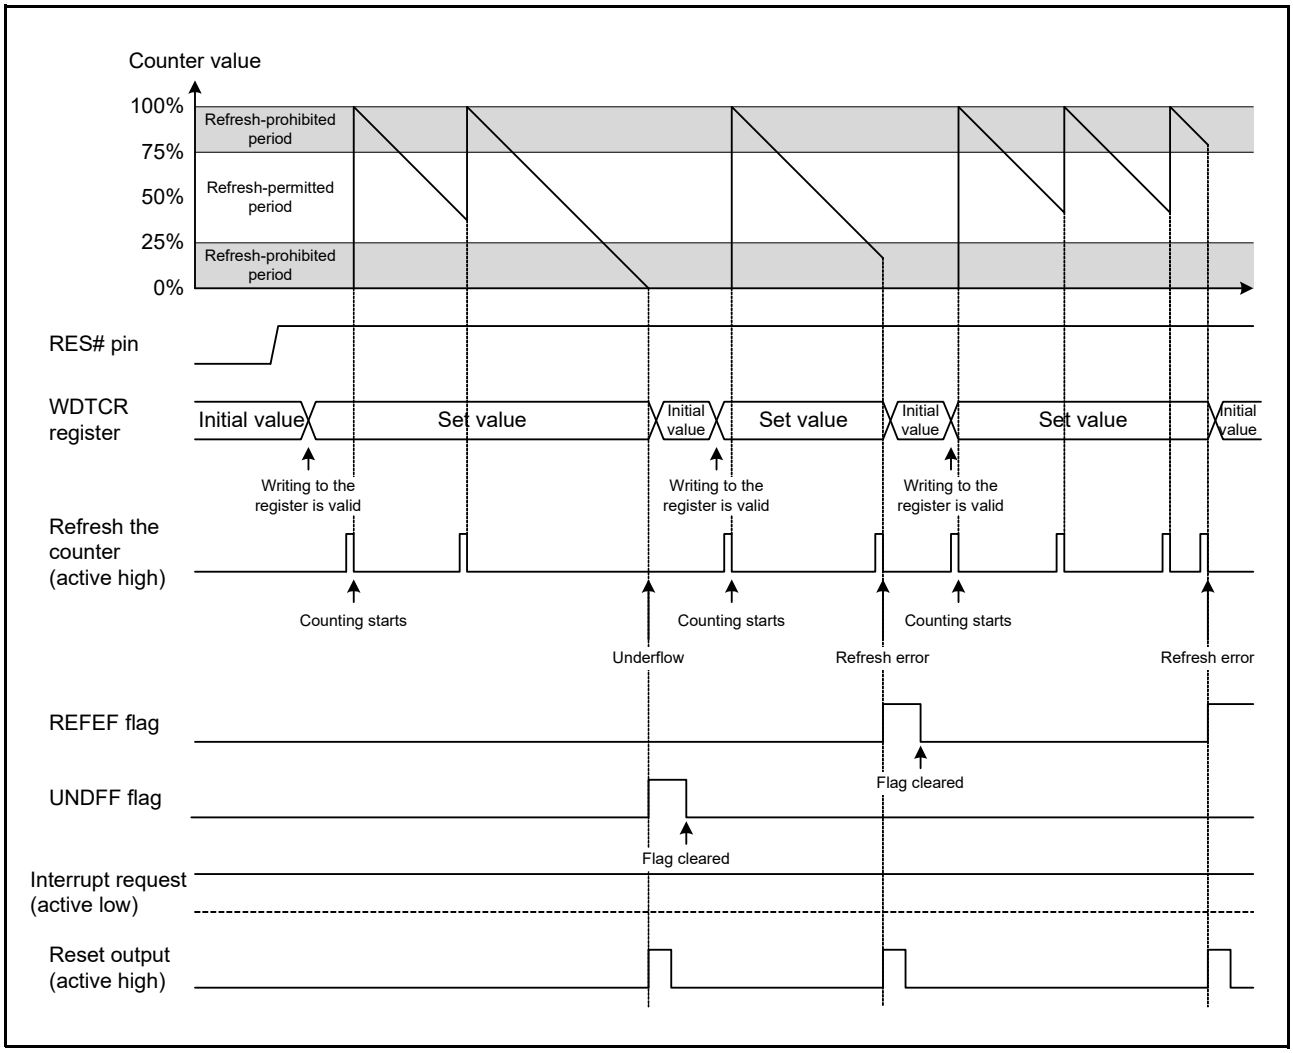

Figure 31.3 Operation Example in Register Start Mode

31.3.1.2 Auto-Start Mode

When the WDT0STRT bit in option function select register 0 (OFS0) is 0, auto-start mode is selected, the WDTCR, WDTRCR, and WDTCSTPR registers are disabled, and the settings in the OFS0 register are enabled.
During the reset state, the setting values (clock divide ratio, window start and end positions, timeout period, reset output or interrupt request output, and counter operation/stop in sleep mode or deep sleep mode) of the OFS0 register are set in the WDT registers. When the reset is released, the counter automatically starts counting down from the value set by the OFS0.WDT0TOPS[1:0] bits.
After that, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The WDT does not output the reset signal as long as this continues. However, if the counter underflows because refreshing of the counter is not possible due to the program having entered crashed execution or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or interrupt request (WUNI).
After the reset signal or interrupt request is output of for one cycle of counting, the value of the timeout period is set in the counter counting is restarted.
Reset signal output or interrupt request output can be selected by setting the OFS0.WDT0RSTIRQS bit.

Figure 31.4 shows an example of operation under the following conditions.

- Auto-start mode (OFS0.WDT0STRT = 0)
- Interrupt request output is enabled (OFS0.WDT0RSTIRQS = 0)
- The window start position is 75% (OFS0.WDT0RPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDT0RPES[1:0] = 10b)

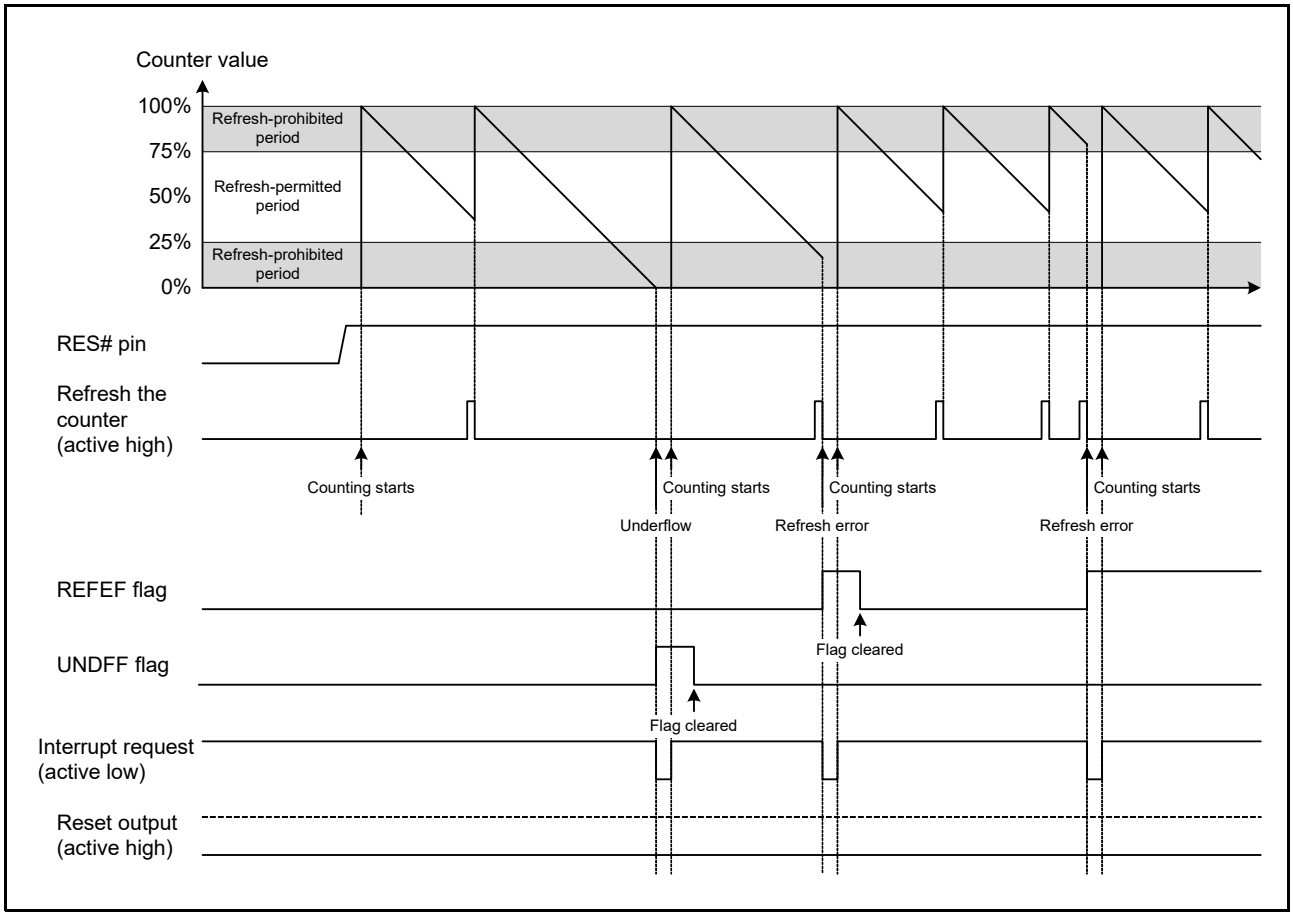

Figure 31.4 Operation Example in Auto-Start Mode

31.3.2 Refresh Operation

The counter is refreshed by writing the values 00h and then FFh to the WDTRR register. If a value other than FFh is written after 00h, the counter is not refreshed. After such invalid writing, correct refreshing is performed by again writing to 00h and then FFh to the WDTRR register.
Even if a register other than the WDTRR register is accessed or the WDTRR register is read between writing 00h and writing FFh to the WDTRR register, correct refreshing will be done.
Writing to refresh the counter must be performed within the refresh-permitted period. Whether writing is done within the refresh-permitted period is determined when writing FFh. For this reason, correct refreshing will be done even if 00h is written outside the refresh-permitted period.

[Sample sequences of writing that are valid for refreshing the counter]

- 00h → FFh
- 00h (n–1-th time) → 00h (nth time) → FFh
- 00h → access to another register or read from the WDTRR register → FFh

[Sample sequences of writing that are not valid for refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h→ AAh (00h and a value other than FFh) → FFh

After FFh is written to the WDTRR register, refreshing the counter requires up to four cycles of the signal for counting. Therefore, writing FFh to the WDTRR register should be completed four-count cycles before the counter underflows.

Figure 31.5 shows the WDT refresh operation waveforms when the count clock is PCLKB/64.

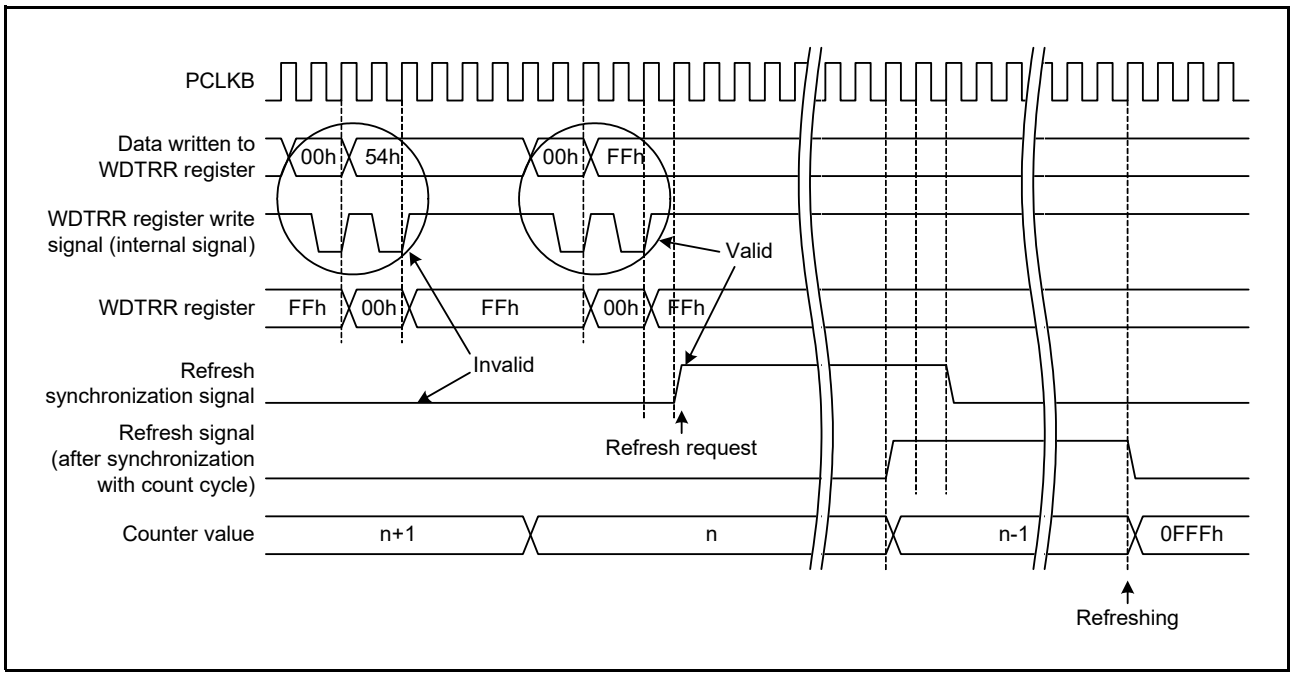

Figure 31.5 WDT Refresh Operation Waveforms (WDTCR.CKS[3:0] = 0100b, WDTCR.TOPS[1:0] = 01b)

31.3.3 Reset Output

When the WDTRCR.RSTIRQS bit is set to 1 in register start mode or when the WDT0RSTIRQS bit in option function select register 0 (OFS0) is set to 1 in auto-start mode, a reset signal is output when an underflow in the counter or a refresh error occurs.
In register start mode, all registers are initialized after output of the reset signal. To start down-counting, set the registers again after the reset is released and then perform a refresh operation.
In auto-start mode, counting down automatically starts after the reset output.

31.3.4 Interrupt Source

When the WDTRCR.RSTIRQS bit is set to 0 in register start mode or when the OFS0.WDT0RSTIRQS bit is set to 0 in auto-start mode, an interrupt (WUNI) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or a maskable interrupt. For details, refer to section 15, Interrupt Controller (ICUM).

Table 31.4 WDT Interrupt Source

Name	Interrupt Source	DTC Activation	DMAC Activation
WUNI	Counter underflow Refresh error	Not possible	Not possible

31.3.5 Reading the Counter Value

The WDT stores the counter value in the WDTSR.CNTVAL[13:0] bits. Thus, the counter value can be checked through the WDTSR.CNTVAL[13:0] bits.
Figure 31.6 shows the processing for reading the WDT counter value when the count clock is PCLKB/64.

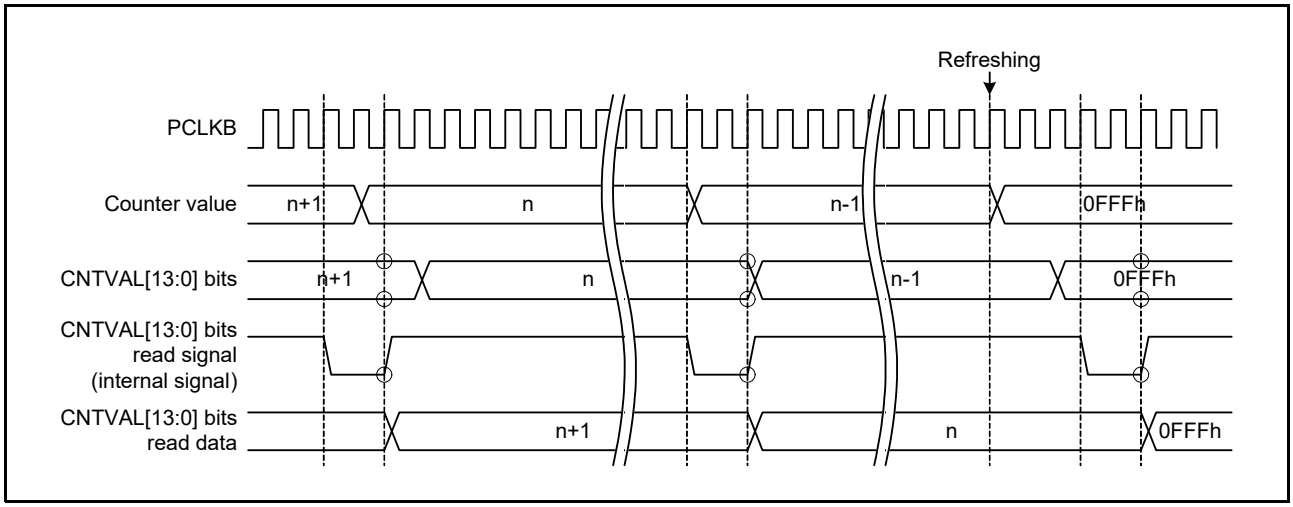

Figure 31.6 Processing for Reading WDT Counter Value (WDTCR.CKS[3:0] = 0100b, WDTCR.TOPS[1:0] = 01b)

31.3.6 Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers

Table 31.5 lists the correspondence between option function select register 0 (OFS0) used in auto-start mode and the registers used in register start mode.
For details on the OFS0 register, refer to section 7.2.2, Option Function Select Register 0 (OFS0).

Table 31.5 Correspondence between Option Function Select Register 0 (OFS0) and WDT Registers

Target of Control	Function	OFS0 Register (Enabled in Auto-Start Mode) OFS0.WDT0STRT = 0	WDT Registers (Enabled in Register Start Mode) OFS0.WDT0STRT = 1
Counter	Timeout period selection	OFS0.WDT0TOPS[1:0]	WDTCR.TOPS[1:0]
	Clock divide ratio selection	OFS0.WDT0CKS[3:0]	WDTCR.CKS[3:0]
	Window start position selection	OFS0.WDT0RPSS[1:0]	WDTCR.RPSS[1:0]
	Window end position selection	OFS0.WDT0RPES[1:0]	WDTCR.RPES[1:0]
Reset output or interrupt request output	Reset output or interrupt request output selection	OFS0.WDT0RSTIRQS	WDTRCR.RSTIRQS
Count stop	Sleep mode count stop control	OFS0.WDT0SLCSTP	WDTCSTPR.SLCSTP

31.4 Link Operation by ELC

The event link controller (ELC) can use the interrupt request signal generated by the WDT as the event signal. Therefore, the ELC generates an event to the module specified previously when the WDT outputs an interrupt request. The event signal is output by the counter underflow and refresh error.
An event signal is output regardless of the setting of the WDTRCR.RSTIRQS bit in register start mode or the OFS0.WDT0RSTIRQS bit in auto-start mode. An event signal can also be output upon generation of the next interrupt source while the WDTSR.REFEF or WDTSR.UNDFF flag is 1.
For details, see section 21, Event Link Controller (ELC).

32. Independent Watchdog Timer (IWDTa)

The independent watchdog timer (IWDT) can be used to detect programs being out of control.
The user can detect when a program runs out of control if an underflow occurs, by creating a program that refreshes the IWDT counter before it underflows.
The functions of the IWDT are different from those of the WDT in the following respects.

- The divided IWDT clock (IWDTCLK) is used as the count clock (not affected by the peripheral module clock).
- The IWDTCSTPR.SLCSTP bit or the OFS0.IWDTSLCSTP bit can be used to select not to stop the counter not only in sleep mode and deep sleep mode but also in software standby mode and deep software standby mode 1.

32.1 Overview

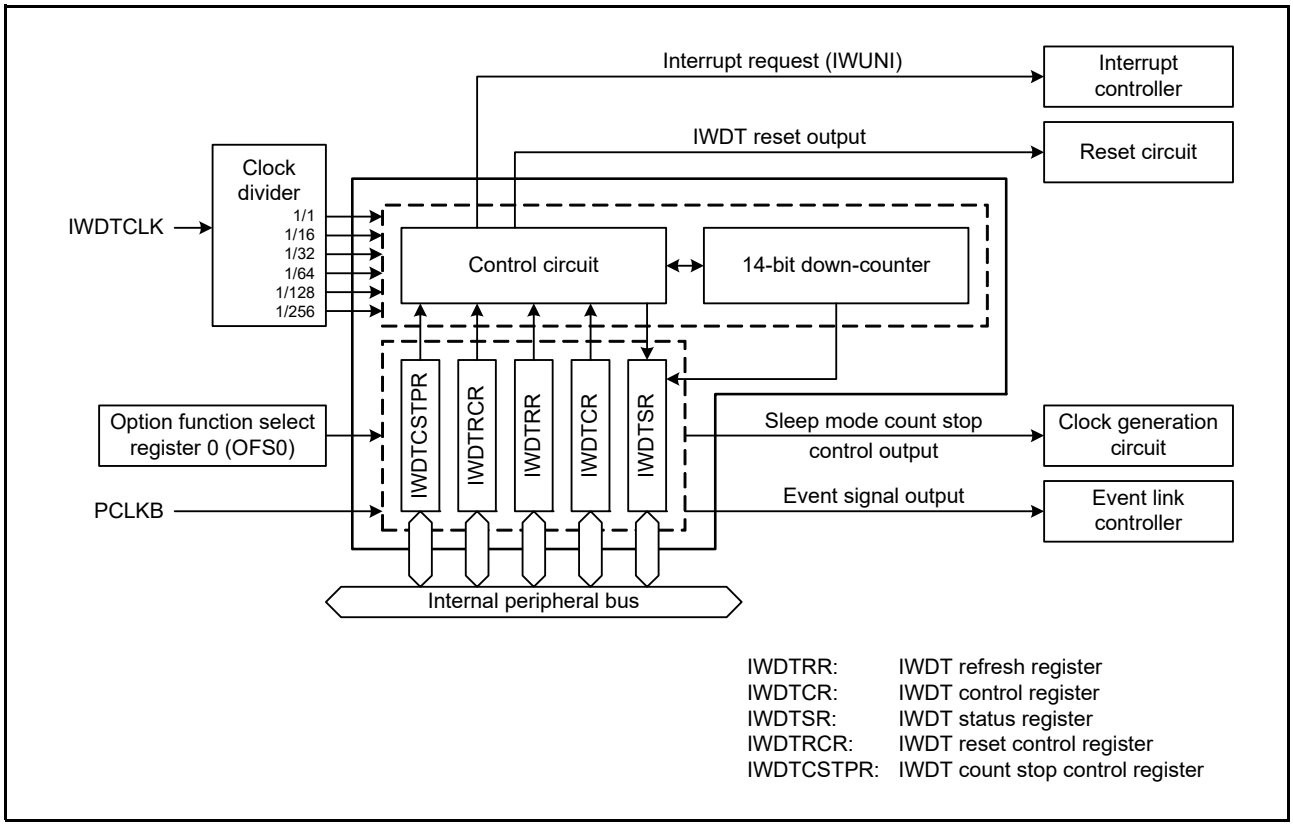
Table 32.1 lists the specifications of the IWDT.

Table 32.1 IWDT Specifications

Item	Description
Count source*1	IWDT clock (IWDTCLK)
Clock divide ratio	Divide by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit counter
Conditions for starting the counter	• Auto-start mode: Counting automatically starts after a reset is released • Register start mode: Counting is started by refresh operation (writing 00h and then FFh to the IWDTRR register).
Conditions for stopping the counter	• Reset • In low power consumption modes (depends on the register setting*2) • A counter underflows or a refresh error occurs (only in register start mode)
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Reset output sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/ maskable interrupt sources	• Counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading the counter value	The counter value can be read by the IWDTSR register.
Event link function (output)	• Counter underflow event output • Refresh error event output
Auto-start mode (controlled by option function select register 0 (OFS0))	• Selecting the clock frequency divide ratio after a reset (OFS0.IWDTCKS[3:0] bits) • Selecting the timeout period of the independent watchdog timer (OFS0.IWDTTOPS[1:0] bits) • Selecting the window start position in the independent watchdog timer (OFS0.IWDTRPSS[1:0] bits) • Selecting the window end position in the independent watchdog timer (OFS0.IWDTRPES[1:0] bits) • Selecting the reset output or interrupt request output (OFS0.IWDTRSTIRQS bit) • Selecting the counter operation/stop in low power consumption mode (OFS0.IWDTSLCSTP bit)
Register start mode (controlled by the IWDT registers)	• Selecting the clock frequency divide ratio after refreshing (IWDTCR.CKS[3:0] bits) • Selecting the timeout period of the independent watchdog timer (IWDTCR.TOPS[1:0] bits) • Selecting the window start position in the independent watchdog timer (IWDTCR.RPSS[1:0] bits) • Selecting the window end position in the independent watchdog timer (IWDTCR.RPES[1:0] bits) • Selecting the reset output or interrupt request output (IWDTRCR.RSTIRQS bit) • Selecting the counter operation/stop in low power consumption mode (IWDTCSTPR.SLCSTP bit)
ProtectZone filter	Security attribute can be set.*3

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 32 × (the frequency of the count clock).
Note 2. When the OFS0.IWDTSLCSTP bit is 1 in auto-start mode, and when the IWDTCSTPR.SLCSTP bit is 1 in register start mode.
Note 3. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

Figure 32.1 is a block diagram of the IWDT.
In IWDT, the bus interface and registers operate with the peripheral module clock (PCLKB), while the 14-bit down-counter and control circuits operate with IWDTCLK.



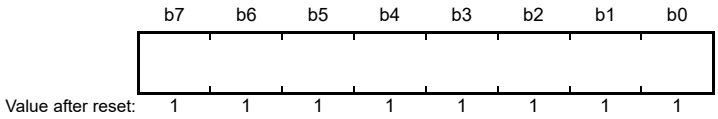


Figure 32.1 IWDT Block Diagram

32.2 Register Descriptions

32.2.1 IWDT Refresh Register (IWDTRR)

Address(es): IWDT.IWDTRR 8780 2200h, IWDT_NS.IWDTRR 0780 2200h

Bit	Description	R/W
b7 to b0	The counter is refreshed by writing 00h and then writing FFh to this register.	R/W

The IWDTRR register is used to refresh the counter of the IWDT.
The counter of the IWDT is refreshed by writing 00h and then writing FFh to the IWDTRR register (refresh operation) within the refresh-permitted period.
After the counter has been refreshed, it starts counting down from the value selected by the IWDTTOPS[1:0] bits in option function select register 0 (OFS0) in auto-start mode. In register start mode, counting down starts from the value selected by setting the IWDTCR.TOPS[1:0] bits in the first refresh operation after a reset is released.
When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh.
For details of the refresh operation, refer to section 32.3.2, Refresh Operation.

32.2.2 IWDT Control Register (IWDTCR)

Address(es): IWDT.IWDTCR 8780 2202h, IWDT_NS.IWDTCR 0780 2202h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	RPSS[1:0]		—	—	RPES[1:0]		CKS[3:0]				—	—	TOPS[1:0]

b15, b14	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the time until a timeout occurs and the refresh-permitted period when using register start mode.

In auto-start mode, the settings in the IWDTCR register are disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the IWDTCR register can also be made in the OFS0 register. For details, refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

TOPS[1:0] Bits (Timeout Period Select)

These bits select the timeout period (period until the counter underflows) from among 128, 512, 1024, or 2048 cycles of the count clock.

After the counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of IWDTCLK cycles) until the counter underflows.

Relations between the CKS[3:0] and TOPS[1:0] bit setting, the timeout period, and the number of IWDTCLK cycles are listed in Table 32.2.

Table 32.2 Settings and Timeout Periods

CKS[3:0] Bits				TOPS[1:0] Bits				
b7	b6	b5	b4	b1	b0	Clock Divide Ratio	Timeout Period (Number of Cycles)	Cycles of IWDTCLK
0	0	0	0	0	0	No division	128	128
				0	1		512	512
				1	0		1024	1024
				1	1		2048	2048
0	0	1	0	0	0	Divide-by-16	128	2048
				0	1		512	8192
				1	0		1024	16384
				1	1		2048	32768
0	0	1	1	0	0	Divide-by-32	128	4096
				0	1		512	16384
				1	0		1024	32768
				1	1		2048	65536
0	1	0	0	0	0	Divide-by-64	128	8192
				0	1		512	32768
				1	0		1024	65536
				1	1		2048	131072
1	1	1	1	0	0	Divide-by-128	128	16384
				0	1		512	65536
				1	0		1024	131072
				1	1		2048	262144
0	1	0	1	0	0	Divide-by-256	128	32768
				0	1		512	131072
				1	0		1024	262144
				1	1		2048	524288

CKS[3:0] Bits (Clock Divide Ratio Select)

These bits specify the frequency of the clock used for the counter (count clock). The count clock frequency can be selected from among the IWDTCLK divided by 1, 16, 32, 64, 128, and 256. Combination with the TOPS[1:0] bit setting, a count period between 128 and 524288 cycles of the IWDTCLK can be selected for the IWDT.

RPES[1:0] Bits (Window End Position Select)

These bits select 75%, 50%, 25% or 0% of the count period for the window end position of the counter. The window end position should be a value smaller than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.
The counter values for the window start and end positions selected by setting the RPSS[1:0] and RPES[1:0] bits change depending on the TOPS[1:0] bit setting.
Table 32.3 lists the counter values for the window start and end positions corresponding to TOPS[1:0] bit values.

Table 32.3 Relationship between Timeout Period and Window Start and End Counter Values

TOPS[1:0] Bits		Timeout Period		Window Start and End Counter Value			
b1	b0	Cycles	Counter Value	100%	75%	50%	25%
0	0	128	007Fh	007Fh	005Fh	003Fh	001Fh
0	1	512	01FFh	01FFh	017Fh	00FFh	007Fh
1	0	1024	03FFh	03FFh	02FFh	01FFh	00FFh
1	1	2048	07FFh	07FFh	05FFh	03FFh	01FFh

RPSS[1:0] Bits (Window Start Position Select)

These bits select a counter window start position from 100%, 75%, 50%, or 25% of the count period (100% when the count starts and 0% when the counter underflows). The interval between the window start position and window end position is the refresh-permitted period and the other periods are refresh-prohibited periods.
Figure 32.2 shows the relationship between of the RPSS[1:0] and RPES[1:0] bit setting and the refresh-permitted and refresh-prohibited periods.

RPSS[1:0] Bits		RPES[1:0] Bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note. If the window end setting is greater than or equal to the window start setting, the window end position is set to 0%.

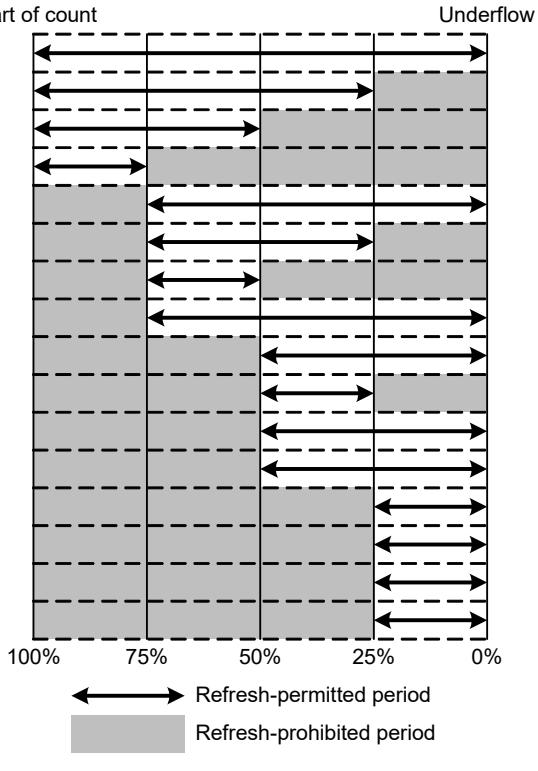

Figure 32.2 RPSS[1:0] and RPES[1:0] Bit Settings and the Refresh-Permitted Period

32.2.3 IWDT Status Register (IWDTSR)

Address(es): IWDT.IWDTSR 8780 2204h, IWDT_NS.IWDTSR 0780 2204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b13 to b0	CNTVAL[13:0]	Counter Value	Value counted by the counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred	R/(W) *1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred	R/(W) *1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] Bits (Counter Value)

These bits are used to confirm the value of the counter, but note that the read value may differ from the actual count by a value of one count.

UNDFF Flag (Underflow Flag)

This flag is used to confirm whether or not an underflow has occurred in the counter.
The value 1 indicates that the counter has underflowed. The value 0 indicates that the counter has not underflowed.
To clear the flag, write 0 to the UNDFF flag. The flag will be cleared three IWDTCLK cycles and 32 PCLKB cycles after writing 0.
Note that after an underflow occurs, the flag cannot be cleared for a period of one count clock cycle and two IWDTCLK cycles. Wait for the period before clearing the flag.

REFEF Flag (Refresh Error Flag)

This flag is used to confirm whether or not a refresh error (performing a refresh operation during a refresh-prohibited period) has occurred.
The value 1 indicates that a refresh error has occurred. The value 0 indicates that no refresh error has occurred.
To clear the flag, write 0 to the REFEF flag. The flag will be cleared three IWDTCLK cycles and 32 PCLKB cycles after writing 0.
Note that after a refresh error occurs, the flag cannot be cleared for a period of one count clock cycle and two IWDTCLK cycles. Wait for the period before clearing the flag.

32.2.4 IWDT Reset Control Register (IWDTRCR)

Address(es): IWDT.IWDTRCR 8780 2206h, IWDT_NS.IWDTRCR 0780 2206h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	RSTIRQS	Reset Interrupt Request Select	0: Non-maskable interrupt request or maskable interrupt request is output. 1: Reset signal is output.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.

This register is used to specify the behavior when a timeout or refresh error occurs when using register start mode. In auto-start mode, the IWDTRCR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting made to the IWDTRCR register can also be made in the OFS0 register. For details, refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

32.2.5 IWDT Count Stop Control Register (IWDTCSTPR)

Address(es): IWDT.IWDTCSTPR 8780 2208h, IWDT_NS.IWDTCSTPR 0780 2208h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b7	SLCSTP	Sleep Mode Count Stop Control	0: Counter continues counting even in low power consumption mode.*1 1: Counter stops in low power consumption mode.	R/W

Note: This register can be written only once after a reset, and cannot be written after the counter starts counting.
Note 1. The counter continues counting in sleep mode, deep sleep mode, software standby mode, or deep software standby mode 1. The MCU does not enter deep software standby mode 2 or 3.

This register is used to specify whether the counter operates in low power consumption mode when using register start mode.
In auto-start mode, the IWDTCSTPR register setting is disabled, and the settings in option function select register 0 (OFS0) are enabled. The bit setting mode to the IWDTCSTPR register can also be made in the OFS0 register. For details, refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

SLCSTP Bit (Sleep Mode Count Stop Control)

This bit selects whether the counter continues or stops counting in low power consumption mode.

32.2.6 Option Function Select Register 0 (OFS0)

For option function select register 0 (OFS0), refer to section 32.3.7, Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

32.3 Operation

32.3.1 Count Operation in Each Start Mode

Select the IWDT start mode by setting the IWDTSTRT bit in option function select register 0 (OFS0).
When the OFS0.IWDTSTRT bit is 1 (register start mode), the IWDTCR, IWDTRCR, and IWDTCSTPR registers are enabled, and counting is started by refresh operation (writing) to the IWDTRR register. When the OFS0.IWDTSTRT bit is 0 (auto-start mode), the setting of the OFS0 register is enabled, and counting automatically starts after reset.

32.3.1.1 Register Start Mode

When the OFS0.IWDTSTRT bit in option function select register 0 is 1, register start mode is selected, and the IWDTCR, IWDTRCR, and IWDTCSTPR registers are enabled.
After a reset is released, set the clock divide ratio, window start and end positions, and timeout period in the IWDTCR register, the reset output or interrupt request output in the IWDTRCR register, and counter operation/stop in low power consumption mode in the IWDTCSTPR register. Then, refresh the counter to start counting down from the value selected by setting the IWDTCR.TOPS[1:0] bits.
Thereafter, as long as the program continues normal operation and the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The IWDT does not output the reset signal as long as this continues. However, if the counter underflows because the counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the IWDT outputs a reset signal or an interrupt request (IWUNI). Set the IWDTRCR.RSTIRQS bit to select either reset signal output or interrupt request output.

Figure 32.3 shows an example of operation under the following conditions.

- Register start mode (OFS0.IWDTSTRT = 1)
- Reset output is enabled (IWDTRCR.RSTIRQS = 1)
- The window start position is 75% (IWDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (IWDTCR.RPES[1:0] = 10b)

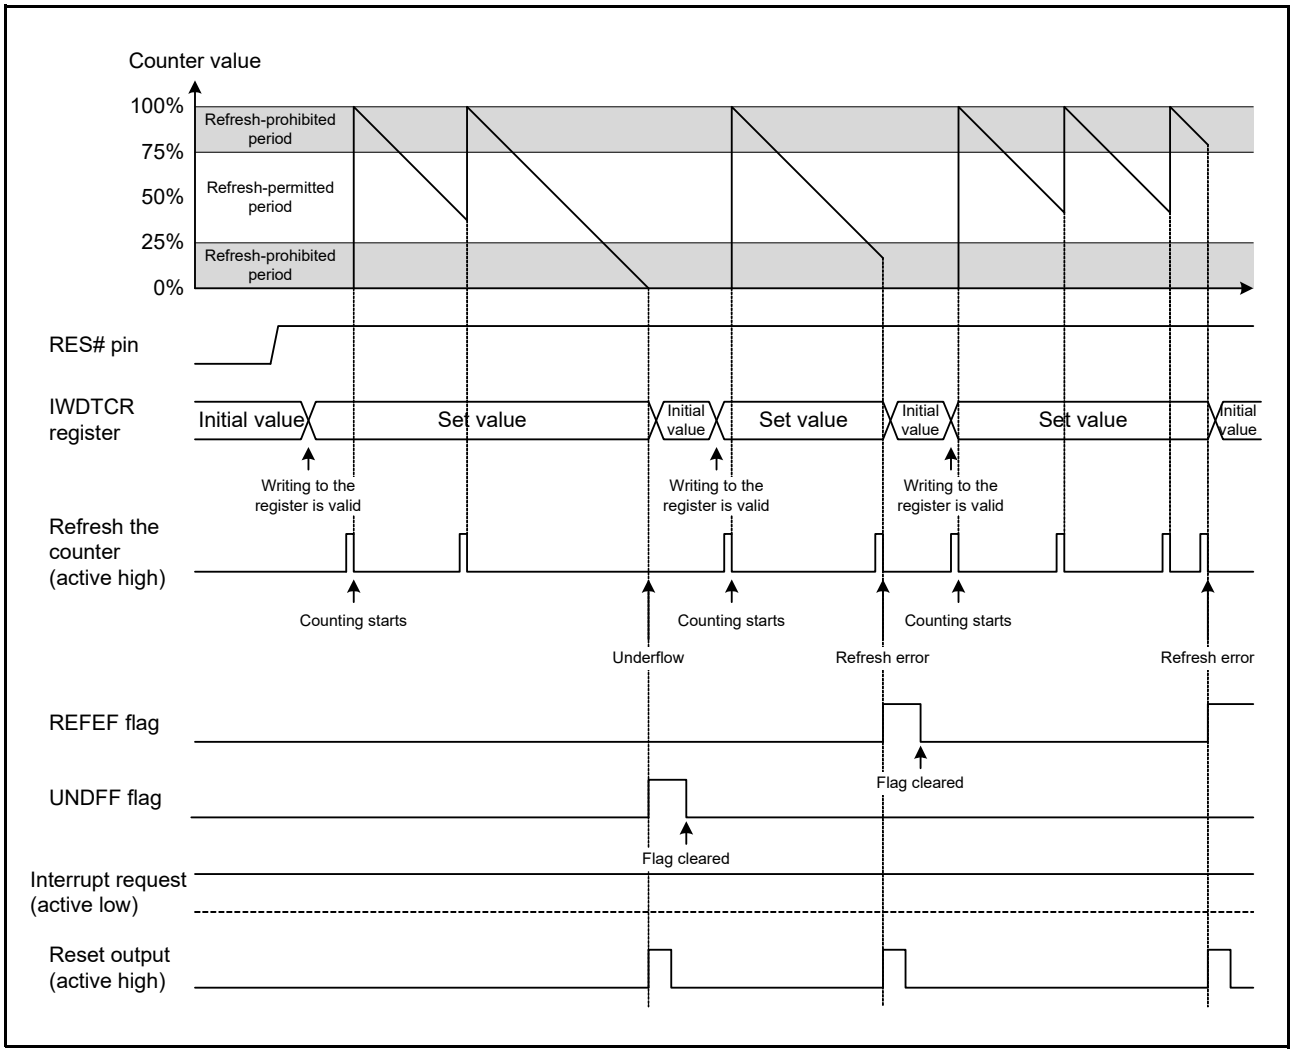

Figure 32.3 Operation Example in Register Start Mode

32.3.1.2 Auto-Start Mode

When the IWDTSTRT bit in option function select register 0 (OFS0) is 0, auto-start mode is selected, and the IWDTCR, IWDTRCR, and IWDTCSTPR registers are disabled.

During the reset state, the clock divide ratio, window start and end positions, timeout period, reset output or interrupt request output, and counter operation/stop in low power consumption mode are set using the values specified in the OFS0 register. When the reset is released, the counter automatically starts counting down from the value selected by the OFS0.IWDTTOPS[1:0] bits.

After that, as long as the program continues normal operation and the counter is refreshed in the refresh-permitted period, the value in the counter is re-set each time the counter is refreshed and counting down continues. The IWDT does not output the reset signal as long as this continues. However, if the counter underflows because refreshing of the counter is not possible due to the program having entered crashed execution or if a refresh error occurs due to refreshing outside the refresh-permitted period, the IWDT outputs the reset signal or an interrupt request (IWUNI). After the reset signal or interrupt request (IWUNI) is generated, the counter reloads the timeout period after counting for one cycle, and restarts counting. Set the OFS0.IWDTRSTIRQS bit to select either reset signal output or interrupt request output.

Figure 32.4 shows an example of operation under the following conditions.

- Auto-start mode (OFS0.IWDTSTRT = 0)
- Interrupt request output is enabled (OFS0.IWDTRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDTRPES[1:0] = 10b)

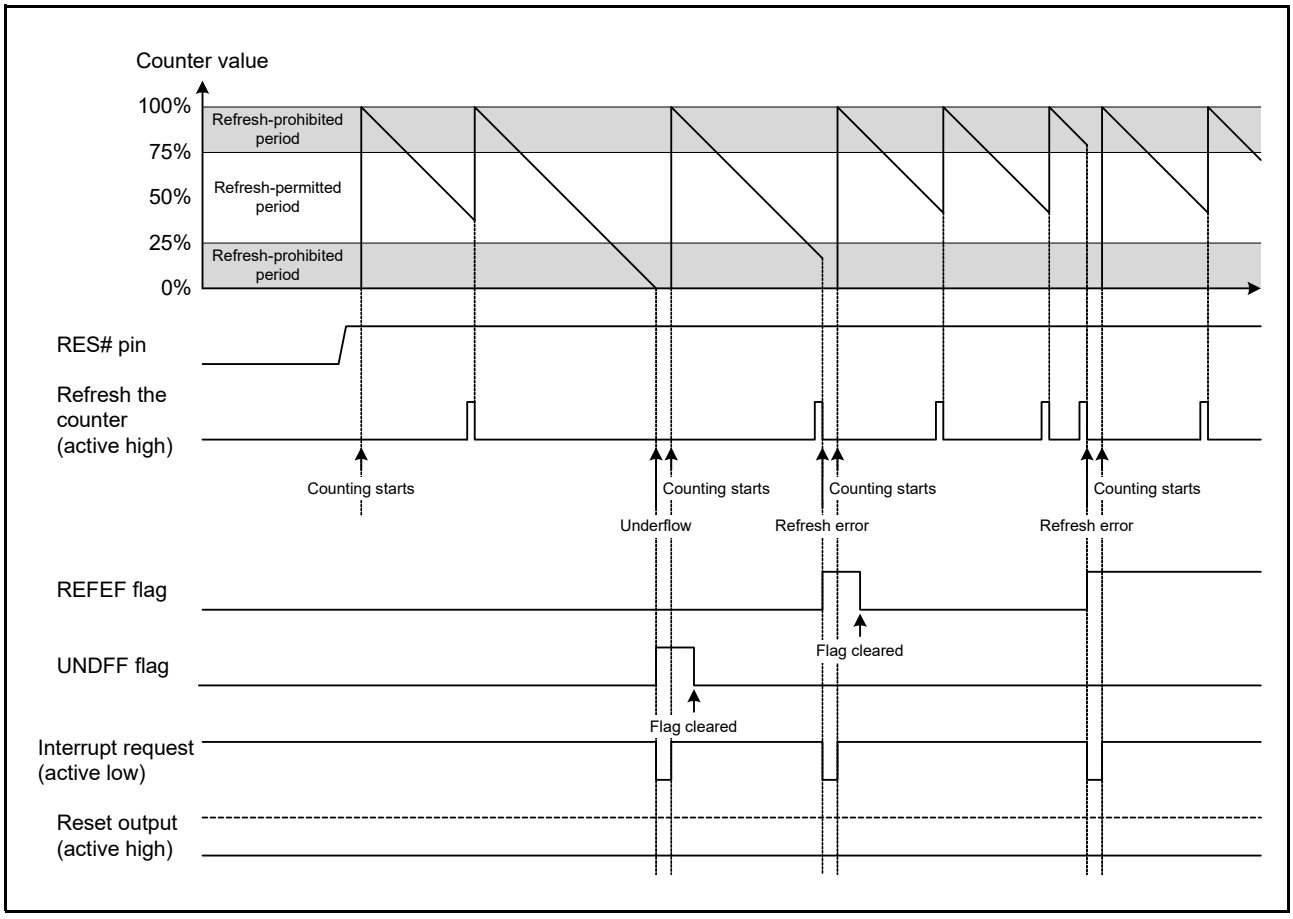

Figure 32.4 Operation Example in Auto-Start Mode

32.3.2 Refresh Operation

The counter is refreshed and starts operation (counting is started by refreshing) by writing the values 00h and then FFh to the IWDTRR register. If a value other than FFh is written after 00h, the counter is not refreshed. After such invalid writing, correct refreshing is performed by again writing 00h and then FFh to the IWDTRR register.
When writing is done in the order of 00h (first time) → 00h (second time), and if FFh is written after that, the writing order 00h → FFh is satisfied; writing 00h (n–1-th time) → 00h (nth time) → FFh is valid and correct refreshing will be done. Even when the first value written before 00h is not 00h, correct refreshing will be done if the operation contains the set of writing 00h → FFh. Moreover, even if a register other than the IWDTRR register is accessed or the IWDTRR register is read between writing 00h and writing FFh to the IWDTRR register, correct refreshing will be done.

[Sample sequences of writing that are valid for refreshing the counter]

- 00h → FFh
- 00h (n–1-th time) → 00h (nth time) → FFh
- 00h → access to another register or read from the IWDTRR register → FFh

[Sample sequences of writing that are not valid for refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h → AAh (00h and a value other than FFh) → FFh

Even when 00h is written to the IWDTRR register outside the refresh-permitted period, if FFh is written to the IWDTRR register in the refresh-permitted period, the writing sequence is valid and refreshing will be done.
After FFh is written to the IWDTRR register, refreshing the counter requires up to four cycles of the signal for counting (the IWDTCR.CKS[3:0] bits determine how many cycles of the IWDTCLK make up one cycle for counting). Therefore, writing FFh to the IWDTRR register should be completed four-count cycles before the end position of the refresh-permitted period or a counter underflow. The value of the counter can be checked by the IWDTSR.CNTVAL[13:0] bits.

[Sample refreshing timings]

- When the window start position is set to 01FFh, even if 00h is written to the IWDTRR register before 01FFh is reached (0202h, for example), refreshing is done if FFh is written to the IWDTRR register after the value of the IWDTSR.CNTVAL[13:0] bits has reached 01FFh.
- When the window end position is set to 01FFh, refreshing is done if 0203h (four-count cycles before 01FFh) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 00h → FFh to the IWDTRR register.
- When the refresh-permitted period continues until count 0000h, refreshing can be done immediately before an underflow. In this case, if 0003h (four-count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 00h → FFh to the IWDTRR register, no underflow occurs and refreshing is done.

Figure 32.5 shows the IWDT refresh operation waveforms when PCLKB > IWDTCLK and the count clock is IWDTCLK/1.

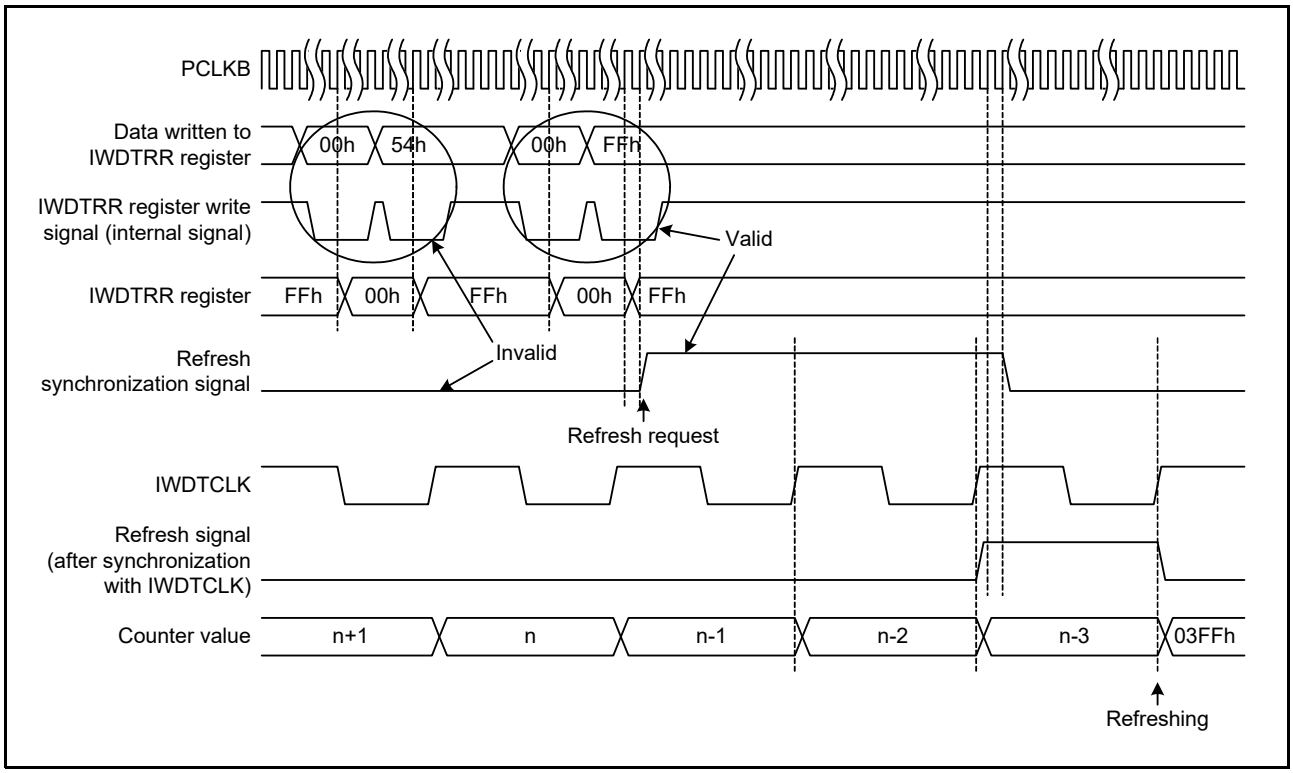

Figure 32.5 IWDT Refresh Operation Waveforms (IWDTCR.CKS[3:0] = 0000b, IWDTCR.TOPS[1:0] = 10b)

32.3.3 Status Flags

The IWDTSR.REFEF and IWDTSR.UNDFF flags retain the source of the interrupt request from the IWDT.
Thus, after interrupt request generation, read the IWDTSR.REFEF and IWDTSR.UNDFF flags to check for the interrupt source.
For each flag, writing 0 clears the bit and writing 1 has no effect.
Leaving the status flags unchanged does not affect operation. If the flags are not cleared, at the time of the next interrupt request from the IWDT, the earlier interrupt source is cleared and the new interrupt source is written.

32.3.4 Reset Output

When the IWDTRCR.RSTIRQS bit is set to 1 in register start mode or when the IWDTRSTIRQS bit in option function select register 0 (OFS0) is set to 1 in auto-start mode, a reset signal is output when an underflow in the counter or a refresh error occurs.
In register start mode, all registers are initialized after output of the reset signal. To start down-counting, set the registers again after the reset is released and then perform a refresh operation.
In auto-start mode, counting down automatically starts after the reset output.

32.3.5 Interrupt Sources

When the IWDTRCR.RSTIRQS bit is set to 0 in register start mode or when the OFS0.IWDTRSTIRQS bit is set to 0 in auto-start mode, an interrupt (IWUNI) signal is output when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or a maskable interrupt. For details, refer to section 15, Interrupt Controller (ICUM).

Table 32.4 IWDT Interrupt Source

Name	Interrupt Source	DTC Activation	DMAC Activation
IWUNI	Counter underflow Refresh error	Not possible	Not possible

32.3.6 Reading the Counter Value

As the counter in IWDTCLK, the counter value cannot be read directly. The IWDT synchronizes the counter value with the PCLKB and stores it in the IWDTSR.CNTVAL[13:0] bits. Thus, the counter value can be checked indirectly through the IWDTSR.CNTVAL[13:0] bits.

Reading the counter value requires multiple PCLKB clock cycles (up to four clock cycles), and the read counter value may differ from the actual counter value by a value of one count.

Figure 32.6 shows the processing for reading the IWDT counter value when PCLKB > IWDTCLK and the count clock is IWDTCLK/1.

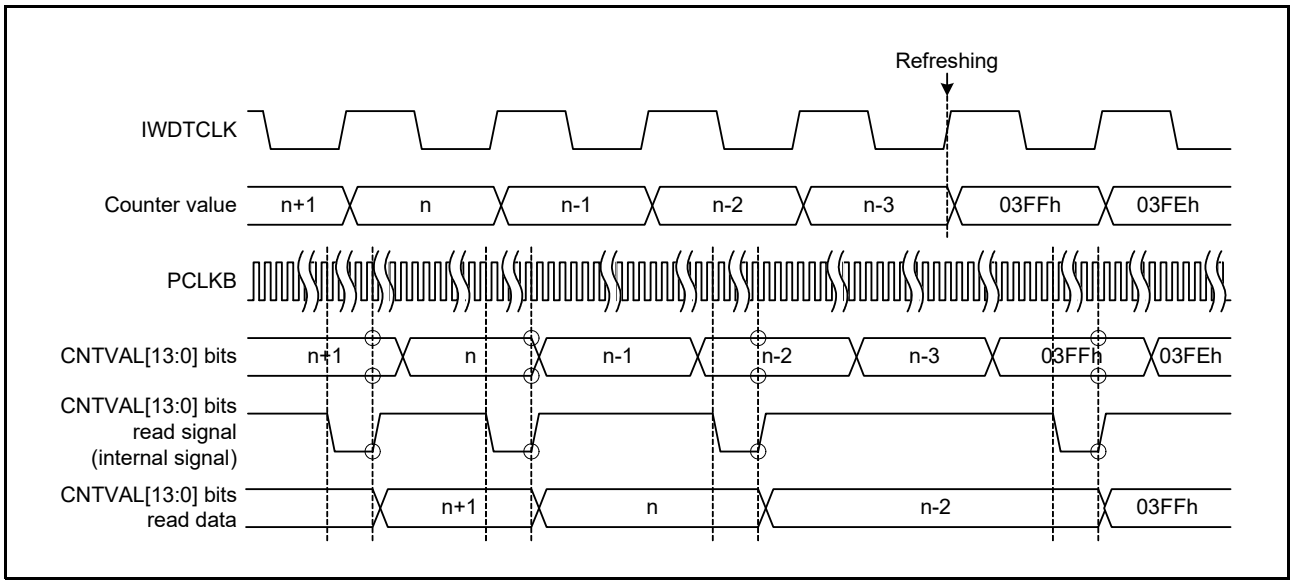

Figure 32.6 Processing for Reading IWDT Counter Value (IWDTCR.CKS[3:0] = 0000b, IWDTCR.TOPS[1:0] = 10b)

32.3.7 Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers

Table 32.5 lists the correspondence between option function select register 0 (OFS0) used in auto-start mode and the registers used in register start mode.
For details on the OFS0 register, refer to section 7.2.2, Option Function Select Register 0 (OFS0).

Table 32.5 Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers

Target of Control	Function	OFS0 Register (Enabled in Auto-Start Mode) OFS0.IWDTSTRT = 0	IWDT Registers (Enabled in Register Start Mode) OFS0.IWDTSTRT = 1
Counter	Timeout period selection	OFS0.IWDTTOPS[1:0]	IWDTCR.TOPS[1:0]
	Clock divide ratio selection	OFS0.IWDTCKS[3:0]	IWDTCR.CKS[3:0]
	Window start position selection	OFS0.IWDTRPSS[1:0]	IWDTCR.RPSS[1:0]
	Window end position selection	OFS0.IWDTRPES[1:0]	IWDTCR.RPES[1:0]
Reset output or interrupt request output	Reset output or interrupt request output selection	OFS0.IWDTRSTIRQS	IWDTRCR.RSTIRQS
Count stop	Sleep mode count stop control	OFS0.IWDTSLCSTP	IWDTCSTPR.SLCSTP

32.4 Link Operation by ELC

The event link controller (ELC) can use the interrupt request signal generated by the IWDT as the event signal. Therefore, the ELC generates an event to the module specified previously when the IWDT outputs an interrupt request. The event signal is output by the counter underflow and refresh error.
An event signal is output regardless of the setting of the IWDTRCR.RSTIRQS bit in register start mode or the OFS0.IWDTRSTIRQS bit in auto-start mode. An event signal can also be output upon generation of the next interrupt source while the IWDTSR.REFEF or IWDTSR.UNDFF flag is 1.
For details, see section 21, Event Link Controller (ELC).

32.5 Usage Notes

32.5.1 Refresh Operations

When making the settings to control the timing of refreshing, consider variations in the range of errors due to the accuracy of the PCLKB and IWDTCLK and set values which ensure that refreshing is possible.

32.5.2 Count Clock Frequency Setting

Satisfy the frequency of the PCLKB ≥ 32 × (the frequency of the count clock).

32.5.3 Reading Counter after Returning from Deep Software Standby Mode 1

After returning from deep software standby mode 1, the value of the IWDTSR.CNTVAL[13:0] bits will be 0000h until the first count clock is supplied. To obtain the down counter value, use one of the following methods:

- Continue reading the CNTVAL[13:0] bits until a value other than 0000h is read.
- Wait until the count clock is supplied, then read the CNTVAL[13:0] bits.
- If the entire period is set as the refresh-permitted period, refresh the counter and then read the CNTVAL[13:0] bits.

32.5.4 Transitions to Low Power Consumption Mode

If the timer-refresh procedure is started immediately before entry to low power consumption mode, complete the procedure, confirm that FFh has been written to the IWDTRR register, and then execute a WAIT instruction.

33. Ethernet Module

33.1 Overview

The Ethernet module (ESWM) system consists of the following six modules.

- Ethernet message forwarding engine (MFWD)
- Ethernet common agent (COMA)
- Ethernet agent (ETHA)
- Ethernet MAC (RMAC)
- Ethernet CPU agent (GWCA)
- Ethernet generalized PTP timer (GPTP)

This MCU has one Ethernet port compliant with the IEEE 802.3 Media Access Control (MAC) layer protocol.
Table 33.1 lists the specifications of ESWM. Figure 33.1 shows the block diagram of the ESWM system. Table 33.2 lists the I/O pins of ESWM.

Table 33.1 ESWM Specifications

Item		Description
MAC	Number or ports	1 port
	Supported standard	IEEE 802.3
	Supported PHY interfaces	MII, RMII, GMII, RGMII
	Data rate	10 Mbps, 100 Mbps, 1000 Mbps
	Mode	Full duplex Half duplex (10 Mbps or 100 Mbps only)
	Jumbo frame support	Up to 64 Kbytes
	Management interface	MDIO
	MAC-to-MAC connection	Full-duplex communication at 10 Mbps or 100 Mbps is possible by connecting MII to MII.
	Power reduction	Supports Energy Efficient Ethernet (IEEE 802.3az)
	Wake-on-LAN	Magic Packet™ detection, WOL signal output
Generalized PTP timer	Number of channels	1
	Media clock capture input	2
	Media clock recovery output	2
	PTP pulse generator	two output timers
Protect Zone filter	Security attribute can be set.*1	

Note 1. When this module is set to the secure attribute, every register is accessible by secure transactions. Any access by non-secure transaction is ignored, and a Protect Zone access error is generated.
When this module is set to the non-secure attribute, every register is accessible by non-secure transactions. Any access by secure transaction is ignored, and a Protect Zone access error is generated.

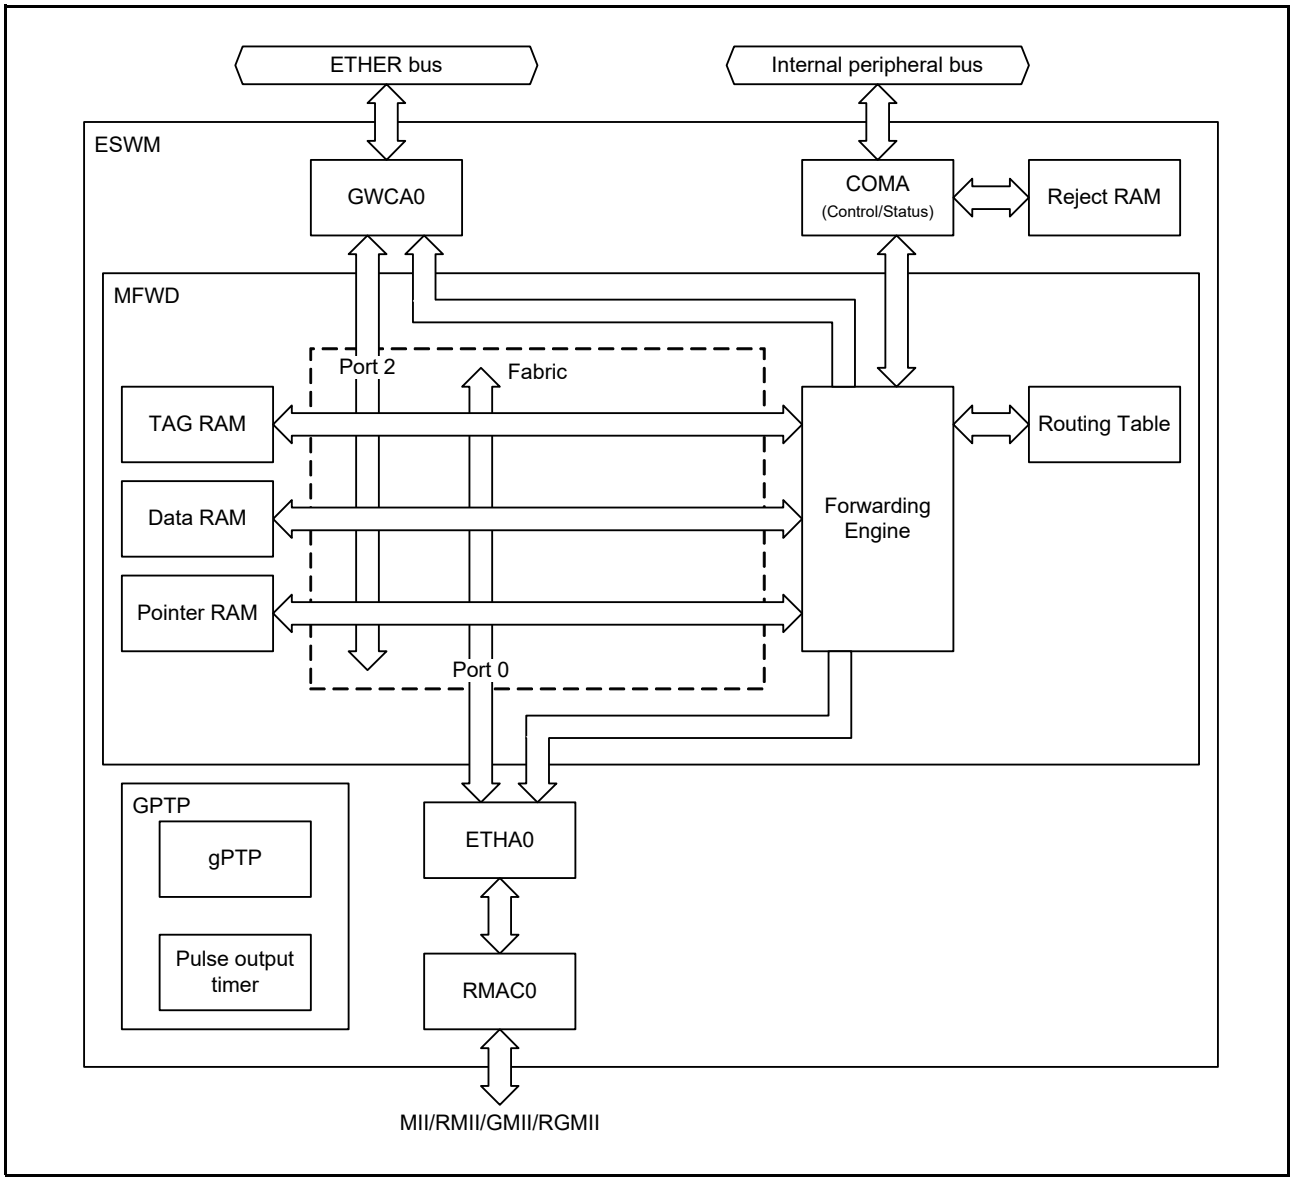

Figure 33.1 ESWM Block Diagram

Table 33.2 ESWM I/O Pins

Interface	Pin Name	I/O	Description
MII/GMII	ET0_GTX_CLK	Output	1000 Mbps transmit clock
	ET0_TX_CLK	I/O	100 Mbps, 10 Mbps transmit clock
	ET0_RX_CLK	I/O	Receive clock
	ET0_TX_EN	Output	Transmit enable
	ET0_TXD7 to ET0_TXD0	Output	Transmit data
	ET0_TX_ER	Output	Transmit coding error
	ET0_RX_DV	Input	Receive data valid
	ET0_RXD7 to ET0_RXD0	Input	Receive data
	ET0_RX_ER	Input	Receive error
	ET0_MDC	Output	Management data clock
	ET0_MDIO	I/O	Management data input/output
	ET0_CRS	Input	Receive Carrier Sense for MII Half Duplex
	ET0_COL	Input	Receive Collision detection for MII Half Duplex
RGMII	RGMII0_TXC	Output	Transmit clock
	RGMII0_RXC	Input	Receive clock
	RGMII0_TX_CTL	Output	Transmit control
	RGMII0_TXD3 to RGMII0_TXD0	Output	Transmit data
	RGMII0_RX_CTL	Input	Receive control
	RGMII0_RXD3 to RGMII0_RXD0	Input	Receive data
RMII	RMII0_REF50CK	Input	Synchronous clock reference
	RMII0_TX_EN	Output	Transmit enable
	RMII0_TXD1, RMII0_TXD0	Output	Transmit data
	RMII0_CRS_DV	Input	Carrier sense/Receive data valid
	RMII0_RXD1, RMII0_RXD0	Input	Receive data
	RMII0_RX_ER	Input	Receive error
Common	ET0_LINKSTA	Input	PHY link status
	ET0_INT	Input	PHY interrupt
	ET0_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received.
GPTP	GPTP_CAPTURE0, GPTP_CAPTURE1	Input	Media clock capture input
	GPTP_MATCH0, GPTP_MATCH1	Output	Media clock recovery output
	GPTP0_PPS	Output	PPS signal
	GPTP_PTPOUT0, GPTP_PTPOUT1	Output	PTP Pulse generator signal

Table 33.3 lists an overview of each modules that configures the ESWM system.

Table 33.3 ESWM Functional Blocks

Module	Function	Operating Clock*1	Address
ESWM	Top module	—	874C 8000h to 874C 8FFFh, 874E 1400h to 874E 1FFFh
MFWD	Core module of the ESWM system. Forwards descriptors received from a port (GWCA or ETHA) to other ports based on the destination MAC address, VLAN code, IP address, port number, etc.	ESWCLK	874C 0000h to 874C 7FFFh
COMA	Interface module between CPU and ESWM system. Access control of ESWM internal registers, pointer control of ESWM local RAM.	PCLKA ESWCLK	874C 9000h to 874C 9FFFh
ETHA	Ethernet frame generation module. Transmission: Generates Ethernet frames based on the descriptors received from MFWD. Reception: Forwards frames received from RMAC to MFWD.	ESWCLK	874C A000h to 874C AFFFh
RMAC	IEEE 802.3 compliant media access controller. Interfaces physical layer LSI chip (PHY-LSI) with ETHA and performs message filtering.	ESWCLK ESWPHYCLK (RGMII)	874C B000h to 874C BFFFh
GWCA	Interface module with ETHER bus (bus master). Transmission: Transfers descriptors and frame data read from CPU memory to MFWD. Reception: Transfers descriptors and frame data received from MFWD to CPU memory.	ICLK ESWCLK	874C E000h to 874C EFFFh
GPTP	gPTP timer module Pulse output timer	PCLKA ESWCLK	874E 0000h to 874E 13FFh

Note 1. Refer to section 33.3.1, Operating Clocks for the frequency of each clock.

33.2 Register Description

33.2.1 ESWM Interface Control Registers

33.2.1.1 Media Interface Reset Register (MIIRR)

Address(es): ESWM.MIIRR 874E 1400h, ESWM_NS.MIIRR 074E 1400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	TXCIDE	RGMII TXC Internal Delay Enable	0: TXC Internal delay is disabled. 1: TXC Internal delay is enabled.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Refer to section 33.3.2, Interface Modes for the M2MCS[1:0] bit settings.

M2MEN Bit (MAC-to-MAC Connection Enable)

Set this bit to 1 when connecting to the MAC interface of another LSI. When this bit is set to 1, the ET0_TX_CLK and ET0_RX_CLK pins become outputs. If connecting ESWM modules together, set this bit to 1 for only one of the ESWM modules.

M2MCS[1:0] Bits (ESWPHYCLK Select for MAC-to-MAC Connection)

Set the frequency of the ESWPHYCLK generated by the clock generation circuit to these bits. These bits are valid when the M2MEN bit is set to 1.

DIVSTP Bit (Clock Divider Stop)

This bit is used to stop the frequency divider that generates each transmit clock from the ESWPHYCLK. this bit can be used in Low Power Idle (LPI) mode of Energy Efficient Ethernet.

33.2.1.3 Media Clock Capture Event Select Register (MCCESR)

Address(es): ESWM.MCCESR 874E 1410h, ESWM_NS.MCCESR 074E 1410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ENDIAN	Bus Endian Select	0: Little endian 1: Big endian	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ENDIAN Bit (Bus Endian Select)

This bit is used to set the endian of the ESWM bus interface. Set this bit to the same endian as the CPU.

33.2.2 Interrupt Mapping Function Registers

33.2.2.1 Error and Status Interrupt Mapping Register 1 (TPEMIMC1)

Address(es): ESWM.TPEMIMC1 874C 8004h, ESWM_NS.TPEMIMC1 074C 8004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	CSICM[2:0]			—	—	CSIGM	CSIM	—	CEICM[2:0]			—	—	CEIGM	CEIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	FSICM[2:0]			—	—	FSIGM	FSIM	—	FEICM[2:0]			—	—	FEIGM	FEIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	FEIM	MFWD Error Interrupt Mapping	0: Generates an FWEI interrupt. 1: Follows the setting of the FEIGM and FEICM[2:0] bits. MFWD error interrupt includes the following sources: • MFWD.FWEIS0i (i = 0, 2)	R/W
b1	FEIGM	MFWD Error Interrupt GWCA Mapping	This bit is valid only when the FEIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the FEICM[2:0] bits. 1: Does not output MFWD error interrupt.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b6 to b4	FEICM[2:0]	MFWD Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	FSIM	MFWD Status Interrupt Mapping	0: Generates an FWSI interrupt. 1: Follows the setting of the FSIGM and FSICM[2:0] bits. MFWD status interrupt includes the following sources: • MFWD.FWMIS0	R/W
b9	FSIGM	MFWD Status Interrupt GWCA Mapping	This bit is valid only when the FSIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the FSICM[2:0] bits. 1: Does not output MFWD status interrupt.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	FSICM[2:0]	MFWD Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b16	CEIM	COMA Error Interrupt Mapping	0: Generates a CAEI interrupt. 1: Follows the setting of the CEIGM and CEICM[2:0] bits. COMA error interrupt includes the following sources: • COMA.CAEIS0 • COMA.CAEIS1	R/W
b17	CEIGM	COMA Error Interrupt GWCA Mapping	This bit is valid only when the CEIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the CEICM[2:0] bits. 1: Does not output COMA error interrupt.	R/W
b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R
b22 to b20	CEICM[2:0]	COMA Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b24	CSIM	COMA Status Interrupt Mapping	0: Generates a CASI interrupt. 1: Follows the setting of the CSIGM and CSICM[2:0] bits. COMA status interrupt includes the following sources: • COMA.CAMIS0 • COMA.CAMIS1	R/W
b25	CSIGM	COMA Status Interrupt GWCA Mapping	This bit is valid only when the CSIM bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the CSICM[2:0] bits. 1: Does not output COMA status interrupt.	R/W
b27, b26	—	Reserved	These bits are read as 0. The write value should be 0.	R
b30 to b28	CSICM[2:0]	COMA Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

33.2.2.2 Error and Status Interrupt Mapping Register 2 (TPEMIMC2)

Address(es): ESWM.TPEMIMC2 874C 8008h, ESWM_NS.TPEMIMC2 074C 8008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	GEIM0	GWCA0 Error Interrupt Mapping	0: Generates a GWEI0 interrupt. 1: Follows the setting of the GEIGM0 and GEICM0[2:0] bits. GWCA0 error interrupt includes the following sources: • GWCA0.GWEIS0 (excluding the TDFES flag) • GWCA0.GWEIS1 • GWCA0.GWEIS4 • GWCA0.GWEIS5	R/W
b1	GEIGM0	GWCA0 Error Interrupt GWCA Mapping	This bit is valid only when the GEIM0 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the GEICM0[2:0] bits. 1: Does not output GWCA0 error interrupt.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b6 to b4	GEICM0[2:0]	GWCA0 Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.2.3 Error and Status Interrupt Mapping Register 3 (TPEMIMC3)

Address(es): ESWM.TPEMIMC3 874C 800Ch, ESWM_NS.TPEMIMC3 074C 800Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	ESICM0[2:0]			—	—	ESIGM0	ESIM0	—	EEICM0[2:0]			—	—	EEIGM0	EEIM0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EEIM0	ETHA0 Error Interrupt Mapping	0: Generates an EAEI0 interrupt. 1: Follows the setting of the EEIGM0 and EEICM0[2:0] bits. ETHA0 error interrupt includes the following sources: • ETHA0.EAEIS0 • ETHA0.EAEIS1 • ETHA0.EAEIS2 • RMAC0.MEIS	R/W
b1	EEIGM0	ETHA0 Error Interrupt GWCA Mapping	This bit is valid only when the EEIM0 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the EEICM0[2:0] bits. 1: Does not output ETHA0 error interrupt.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b6 to b4	EEICM0[2:0]	ETHA0 Error Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	ESIM0	ETHA0 Status Interrupt Mapping	0: Generates an EASI0 interrupt. 1: Follows the setting of the ESIGM0 and ESICM0[2:0] bits. ETHA0 status interrupt includes the following sources: • RMAC0.MMIS0	R/W
b9	ESIGM0	ETHA0 Status Interrupt GWCA Mapping	This bit is valid only when the ESIM0 bit is 1. 0: Generates a GWDI0m interrupt. The value of m is specified by the ESICM0[2:0] bits. 1: Does not output ETHA0 status interrupt.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	ESICM0[2:0]	ETHA0 Status Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.2.4 Error and Status Interrupt Mapping Register 6n (TPEMIMC6n) (n = 0, 1)

Address(es): ESWM.TPEMIMC60 874C 8080h, ESWM.TPEMIMC61 874C 8084h,
ESWM_NS.TPEMIMC60 074C 8080h, ESWM_NS.TPEMIMC61 074C 8084h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	GTSICM0[2:0]			GTSIM0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	GTSIM0	GWCA0 Timestamp Interrupt Mapping	0: Generates a TSDI0n interrupt. 1: Generates a GWDI0m interrupt. The value of m is specified by the GTSICM0[2:0] bits. GWCA0 timestamp interrupt n includes the following sources: • GWCA0.GWTSDIS.TSDISn • GWCA0.GWEIS0.TDFESn	R/W
b3 to b1	GTSICM0[2:0]	GWCA0 Timestamp Interrupt Core Mapping	These bits specify the value of m for the GWDI0m interrupt.	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.2.5 Error and Status Interrupt Mapping Register 7n (TPEMIMC7n) (n = 0 to 63)

Address(es): ESWM.TPEMIMC70 874C 8100h, ESWM.TPEMIMC71 874C 8104h, ESWM.TPEMIMC72 874C 8108h, ESWM.TPEMIMC73 874C 810Ch, ESWM.TPEMIMC74 874C 8110h, ESWM.TPEMIMC75 874C 8114h, ESWM.TPEMIMC76 874C 8118h, ESWM.TPEMIMC77 874C 811Ch, ESWM.TPEMIMC78 874C 8120h, ESWM.TPEMIMC79 874C 8124h, ESWM.TPEMIMC710 874C 8128h, ESWM.TPEMIMC711 874C 812Ch, ESWM.TPEMIMC712 874C 8130h, ESWM.TPEMIMC713 874C 8134h, ESWM.TPEMIMC714 874C 8138h, ESWM.TPEMIMC715 874C 813Ch, ESWM.TPEMIMC716 874C 8140h, ESWM.TPEMIMC717 874C 8144h, ESWM.TPEMIMC718 874C 8148h, ESWM.TPEMIMC719 874C 814Ch, ESWM.TPEMIMC720 874C 8150h, ESWM.TPEMIMC721 874C 8154h, ESWM.TPEMIMC722 874C 8158h, ESWM.TPEMIMC723 874C 815Ch, ESWM.TPEMIMC724 874C 8160h, ESWM.TPEMIMC725 874C 8164h, ESWM.TPEMIMC726 874C 8168h, ESWM.TPEMIMC727 874C 816Ch, ESWM.TPEMIMC728 874C 8170h, ESWM.TPEMIMC729 874C 8174h, ESWM.TPEMIMC730 874C 8178h, ESWM.TPEMIMC731 874C 817Ch, ESWM.TPEMIMC732 874C 8180h, ESWM.TPEMIMC733 874C 8184h, ESWM.TPEMIMC734 874C 8188h, ESWM.TPEMIMC735 874C 818Ch, ESWM.TPEMIMC736 874C 8190h, ESWM.TPEMIMC737 874C 8194h, ESWM.TPEMIMC738 874C 8198h, ESWM.TPEMIMC739 874C 819Ch, ESWM.TPEMIMC740 874C 81A0h, ESWM.TPEMIMC741 874C 81A4h, ESWM.TPEMIMC742 874C 81A8h, ESWM.TPEMIMC743 874C 81ACh, ESWM.TPEMIMC744 874C 81B0h, ESWM.TPEMIMC745 874C 81B4h, ESWM.TPEMIMC746 874C 81B8h, ESWM.TPEMIMC747 874C 81BCh, ESWM.TPEMIMC748 874C 81C0h, ESWM.TPEMIMC749 874C 81C4h, ESWM.TPEMIMC750 874C 81C8h, ESWM.TPEMIMC751 874C 81CCh, ESWM.TPEMIMC752 874C 81D0h, ESWM.TPEMIMC753 874C 81D4h, ESWM.TPEMIMC754 874C 81D8h, ESWM.TPEMIMC755 874C 81DCh, ESWM.TPEMIMC756 874C 81E0h, ESWM.TPEMIMC757 874C 81E4h, ESWM.TPEMIMC758 874C 81E8h, ESWM.TPEMIMC759 874C 81ECh, ESWM.TPEMIMC760 874C 81F0h, ESWM.TPEMIMC761 874C 81F4h, ESWM.TPEMIMC762 874C 81F8h, ESWM.TPEMIMC763 874C 81FCh,

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	GDICM0[2:0]	GWCA0 Data Interrupt Core Mapping	GWCA0 data interrupt n is output as a GWDI0m interrupt. These bits specify the value of m. GWCA0 data interrupt n includes the following sources: • GWCA0.GWDISi.DISn (i = 0, 1) • GWCA0.GWEIS2i.DFESn (i = 0, 1) • GWCA0.GWEIS3.IAOESk (k = 0 to 3)	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

33.2.3 Interrupt Mirroring Registers

33.2.3.1 ESWM Interrupt Mirroring Register (TSIM)

Address(es): ESWM.TSIM 874C 8700h, ESWM_NS.TSIM 074C 8700h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EAEISIM0	EAEIS0 Interrupt Mirroring Flag	0: All flags in the ETHA0.EAEIS0 register are set to 0. 1: Any flag in the ETHA0.EAEIS0 register is set to 1.	R
b1	EAEISIM1	EAEIS1 Interrupt Mirroring Flag	0: All flags in the ETHA0.EAEIS1 register are set to 0. 1: Any flag in the ETHA0.EAEIS1 register is set to 1.	R
b2	EAEISIM2	EAEIS2 Interrupt Mirroring Flag	0: All flags in the ETHA0.EAEIS2 register are set to 0. 1: Any flag in the ETHA0.EAEIS2 register is set to 1.	R
b3	MEISIM	MEIS Interrupt Mirroring Flag	0: All flags in the RMAC0.MEIS register are set to 0. 1: Any flag in the RMAC0.MEIS register is set to 1.	R
b4	MMISIM	MMIS0 Interrupt Mirroring Flag	0: All flags in the RMAC0.MMIS0 register are set to 0. 1: Any flag in the RMAC0.MMIS0 register is set to 1.	R
b5	EAEISIM3	EAEIS3 Interrupt Mirroring Flag	0: All flags in the ETHA0.EAEIS3 register are set to 0. 1: Any flag in the ETHA0.EAEIS3 register is set to 1.	R
b31 to b6	—	Reserved	These bits are read as 0.	R

33.3 Operation

33.3.1 Operating Clocks

Table 33.4 lists the operating clocks for the ESWM system. These clocks are supplied by Clock Generation Circuit. Set the clock before starting operation of ESWM.

Table 33.4 Configurable Range of Clocks

Interface Mode	Operating Speed	ICLK	PCLKA	ESWCLK	ESWPHYCLK
GMII/RGMII	1000 Mbps	150 to 300 MHz	Up to 150 MHz, < ESWCLK, < ICLK	150 to 250 MHz, ≤ ICLK × 1.5	500 MHz
MII/RMII/RGMII	100/10 Mbps	50 to 300 MHz	Up to 150 MHz, < ESWCLK, < ICLK	50 to 250 MHz, ≤ ICLK × 1.5	500 MHz (RGMII only)
MAC-to-MAC connection	100/10 Mbps	50 to 300 MHz	Up to 150 MHz, < ESWCLK, < ICLK	50 to 250 MHz, ≤ ICLK × 1.5	100/200/500 MHz

33.3.2 Interface Modes

Table 33.5 lists the interface modes and their register settings. Set the MIICR0 register before setting the RMAC0.MPIC register.

Table 33.5 Interface Modes and Register Settings

		MIICR0 Register			RMAC0.MPIC Register	
Interface Mode	Speed	MIISEL[1:0] Bits	M2MEN Bit	M2MCS[1:0] Bits	LSC[2:0] Bits	PIS[2:0] Bits
MII	10 Mbps	00b	0	00b (not used)	000b	000b (MII)
MII	100 Mbps	00b	0	00b (not used)	001b	000b (MII)
GMII	1000 Mbps	00b	0	00b (500 MHz)	010b	010b (GMII)
RGMII	10 Mbps	01b	0	00b (500 MHz)	000b	000b (MII)
RGMII	100 Mbps	01b	0	00b (500 MHz)	001b	000b (MII)
RGMII	1000 Mbps	01b	0	00b (500 MHz)	010b	010b (GMII)
RMII	10 Mbps	10b	0	00b (not used)	000b	000b (MII)
RMII	100 Mbps	10b	0	00b (not used)	001b	000b (MII)
MAC-to-MAC	10 Mbps	00b	1	00b (500 MHz)	000b	000b (MII)
MAC-to-MAC	10 Mbps	00b	1	01b (200 MHz)	000b	000b (MII)
MAC-to-MAC	10 Mbps	00b	1	10b (100 MHz)	000b	000b (MII)
MAC-to-MAC	100 Mbps	00b	1	00b (500 MHz)	001b	000b (MII)
MAC-to-MAC	100 Mbps	00b	1	01b (200 MHz)	001b	000b (MII)
MAC-to-MAC	100 Mbps	00b	1	10b (100 MHz)	001b	000b (MII)

33.3.2.1 MII/GMII Interface

When the MIICR0.MIISEL[1:0] bits are set to 00b, MII/GMII interface is selected.
When using GMII, set the frequency of the ESWPHYCLK to 500 MHz. In this case, the ESWPHYCLK is divided by 4 to generate a 125 MHz GTX_CLK.

33.3.2.2 RGMII Interface

When the MIICR0.MIISEL[1:0] bits are set to 01b, RGMII interface is selected.
When using RGMII, set the frequency of the ESWPHYCLK to 500 MHz. In this case, the ESWPHYCLK is divided by 4 to generate a 125 MHz TXC.
The RGMII interface remains reset after the MCU reset is released. The RGMII interface can be enabled by setting the MIICR0.MIISEL[1:0] bits to 01b and then setting the MIIRR.RGRST0 bit to 1.

(1) RGMII Internal Delay Mode

The RGMII interface support internal delay mode for RGMII0_TXC.

33.3.2.3 RMII Interface

When the MIICR0.MIISEL[1:0] bits are set to 10b, RMII interface is selected.
The RMII interface remains reset after the MCU reset is released. The RMII interface can be enabled by setting the MIICR0.MIISEL[1:0] bits to 10b and then setting the MIIRR.RMRST0 bit to 1.

33.3.2.4 MAC-to-MAC Connection

ESWM has a function to directly connect and communicate between the MAC of this MCU and the MAC of another LSI. MAC-to-MAC connection only supports 10 Mbps or 100 Mbps full-duplex communication using MII. This function is enabled by setting the MIICR0.M2MEN bit to 1.
When using the MAC-to-MAC connection, set the frequency of the ESWPHYCLK to 100, 200, or 500 MHz and set the MIICR0.M2MCS[1:0] bits to match the frequency. At this time, the ESWPHYCLK is divided according to the settings of each bit to generate RX_CLK and TX_CLK. The generated clocks are output from the ET0_RX_CLK pin and ET0_TX_CLK pins.
Figure 33.2 shows an example of the MAC-to-MAC connection.

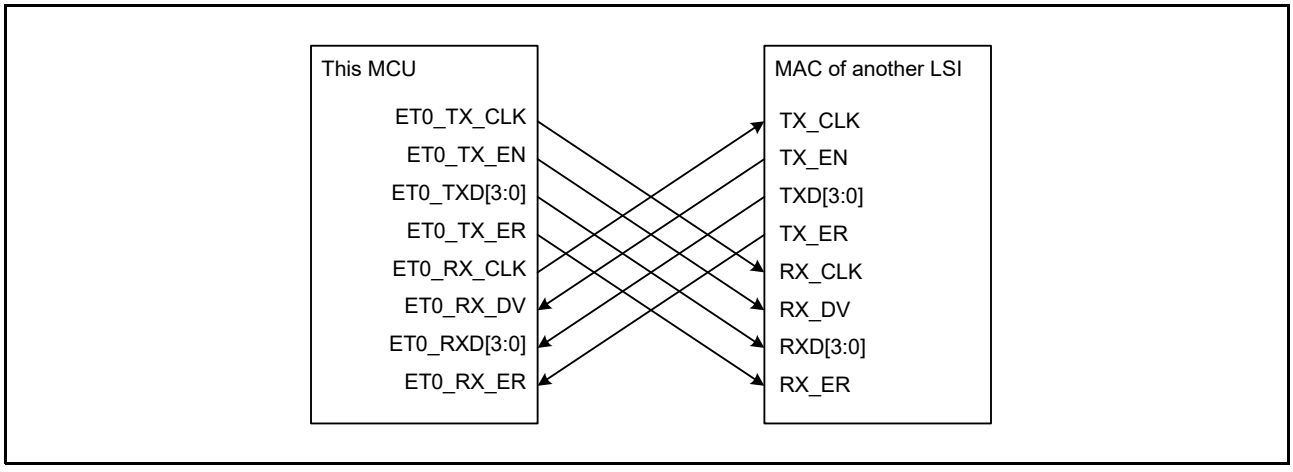

Figure 33.2 MAC-to-MAC Connection

33.3.3 Software Flows

33.3.3.1 Initialization Flow

Figure 33.3 shows the initialization flow for ESWM.

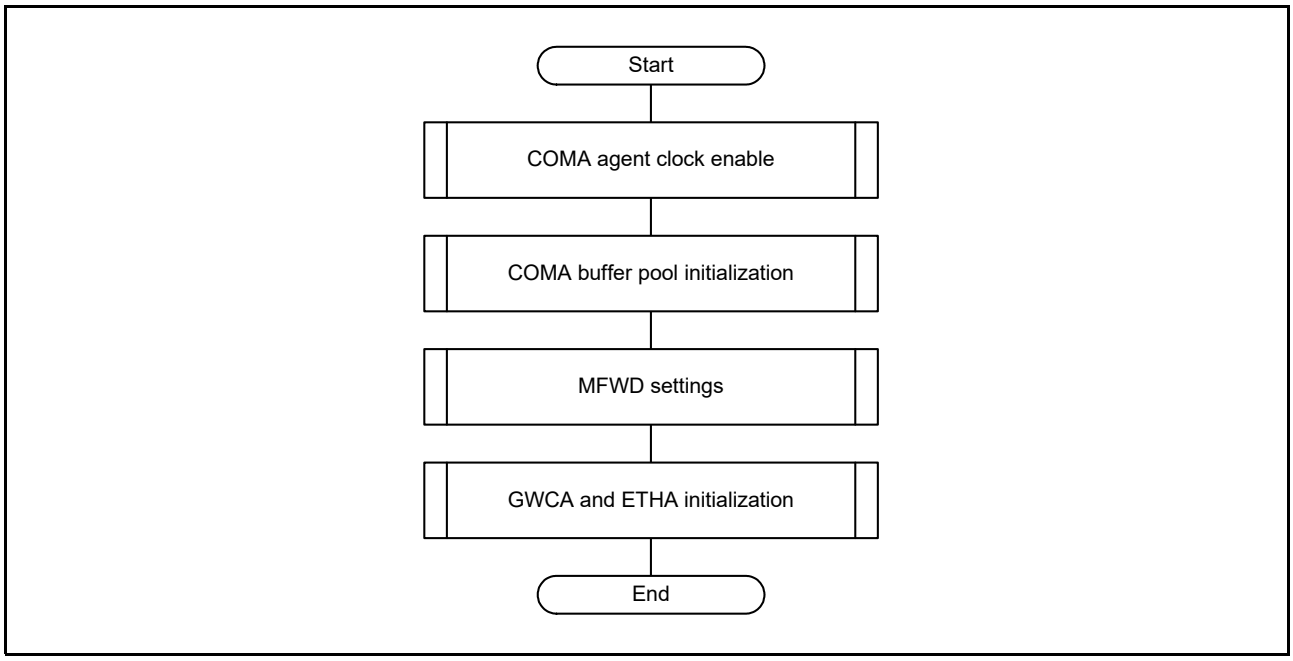

Figure 33.3 ESWM Initialization Flow

33.3.3.2 Disable Flow

Figure 33.4 shows the disable flow for ESWM.

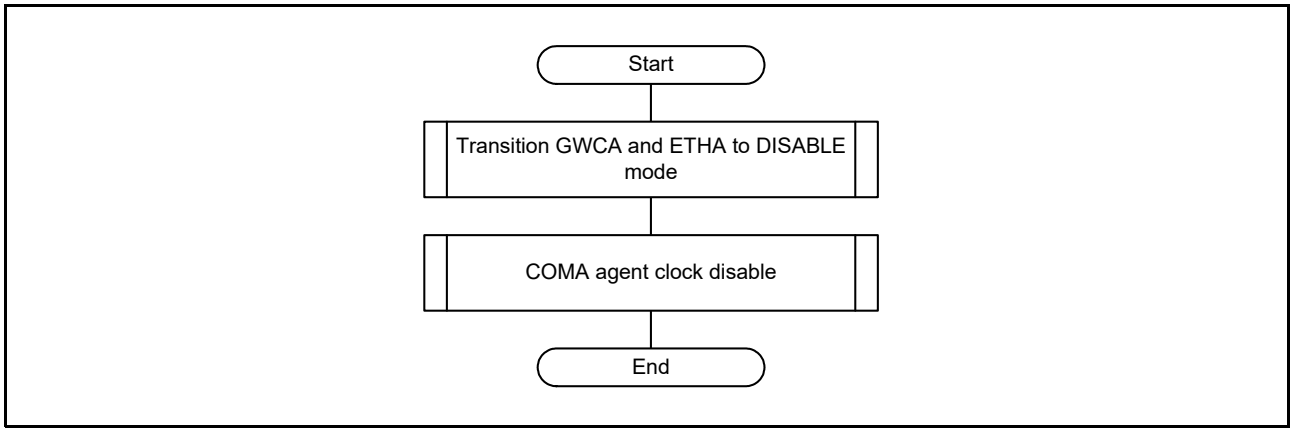

Figure 33.4 ESWM Disable Flow

33.3.3.3 Reset Flow

Figure 33.5 shows the reset flow for ESWM.

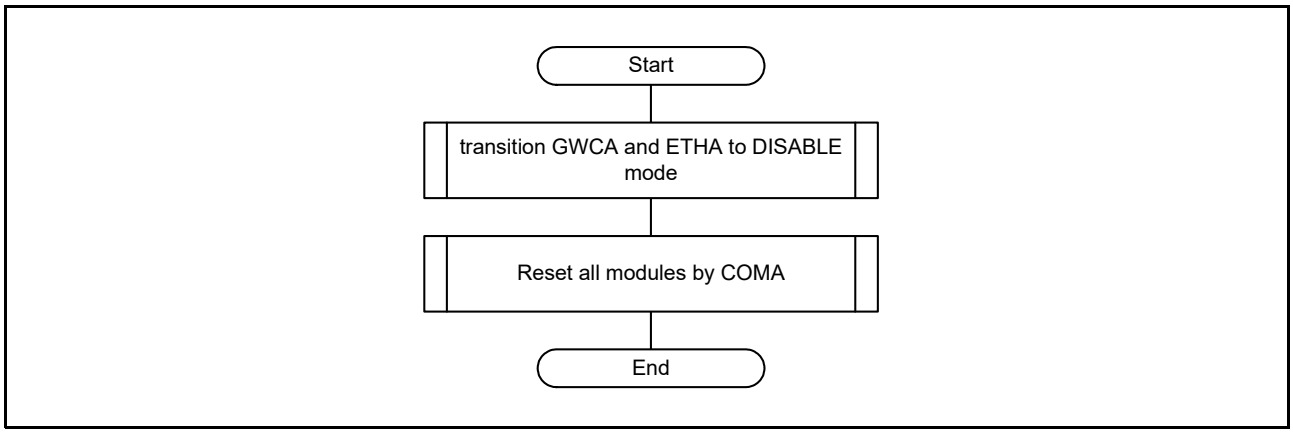

Figure 33.5 ESWM Reset Flow

33.3.3.4 Emergency Reset Flow

Figure 33.6 shows the emergency reset flow for ESWM.
This is used when ETHA is locked.
For example, when using MII, if an error occurs in the PHY-LSI and the transmit clock (ET0_TX_CLK) stops, ESWM cannot transmit data and cannot release the pointer (ETHA is locked in operation mode). This state will be resolved when the transmit clock resumes, but use an emergency reset if necessary.

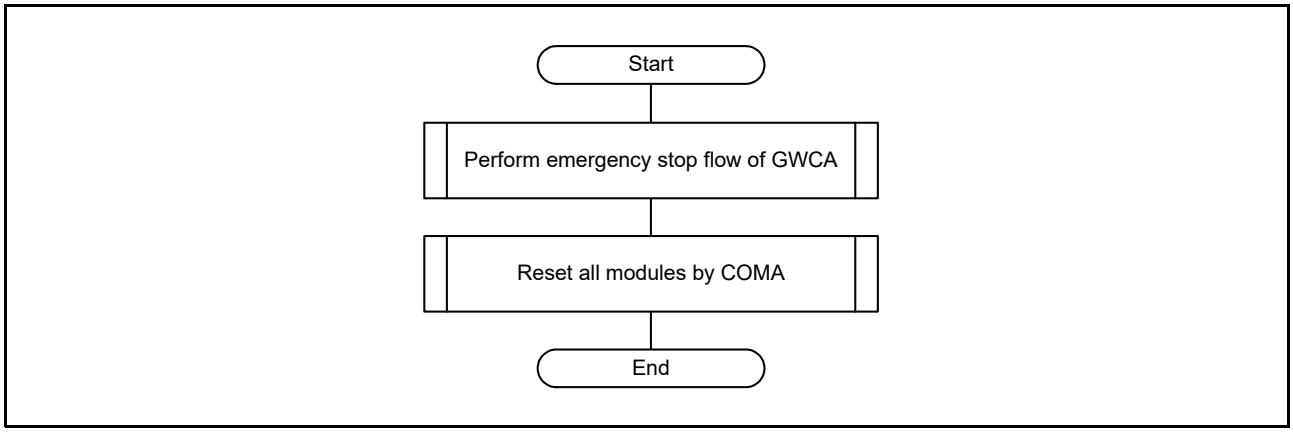

Figure 33.6 ESWM Emergency Reset Flow

33.4 Interrupts and Events

Table 33.6 Interrupt and Event Outputs

Module	Symbol	Name	Interrupt Source	Interrupt Detection
ESWM	FWEI	MFWD error interrupt	MFWD.FWEIS0i (i = 0, 2)	Level
	CAEI	COMA error interrupt	COMA.CAEIS0, COMA.CAEIS1	Level
	GWEI0	GWCA0 error interrupt	GWCA0.GWEIS0 (excluding TDFES), GWCA0.GWEIS1, GWCA0.GWEIS4, GWCA0.GWEIS5	Level
	EAEI0	ETHA0 error interrupt	ETHA0.EAEIS0, ETHA0.EAEIS1, ETHA0.EAEIS2, ETHA0.EAEIS3, RMAC0.MEIS	Level
	PTPSI0	gPTP status interrupt 0	GPTP.PTPIS0	Level
	PTPSI1	gPTP status interrupt 1	GPTP.PTPIS1	Level
	FWSI	MFWD status interrupt	MFWD.FWMIS0	Level
	CASI	COMA status interrupt	COMA.CAMIS0, COMA.CAMIS1	Level
	EASI0	ETHA0 status interrupt	RMAC0.MMIS0	Level
	GWDI00	GWCA0 data interrupt 0	GWCA0.GWDIS0, GWCA0.GWDIS1, GWCA0.GWEIS20, GWCA0.GWEIS21, GWCA0.GWEIS3	Level
	GWDI01	GWCA0 data interrupt 1		Level
	GWDI02	GWCA0 data interrupt 2		Level
	GWDI03	GWCA0 data interrupt 3		Level
	GWDI04	GWCA0 data interrupt 4		Level
	GWDI05	GWCA0 data interrupt 5		Level
	GWDI06	GWCA0 data interrupt 6		Level
	GWDI07	GWCA0 data interrupt 7		Level
	TSDI00	GWCA0 timestamp interrupt 0	GWCA0.GWTSDIS.TSDIS0, GWCA0.GWEIS0.TDFES0	Level
	TSDI01	GWCA0 timestamp interrupt 1	GWCA0.GWTSDIS.TSDIS1, GWCA0.GWEIS0.TDFES1	Level
	MDIO0	ETHA0 MDIO interrupt	RMAC0.MMIS1	Level
	RMPI0	RMAC0 PHY interrupt	RMAC0.MMIS2	Level
GPTP	MATCH0	Media clock 0 recovery interrupt/event	—	Edge
	MATCH1	Media clock 1 recovery interrupt/event	—	Edge
	PTPOUT0	Pulse output 0 interrupt/event	—	Edge
	PTPOUT1	Pulse output 1 interrupt/event	—	Edge

Table 33.7 Event Inputs

Module	Symbol	Name	Event Source
GPTP	CAPTURE0	gPTP media clock capture event 0	An event selected by the ELC.ELSR51 register
	CAPTURE1	gPTP media clock capture event 1	An event selected by the ELC.ELSR52 register

33.5 Usage Notes

33.5.1 Module-Stop Function Setting

Operation of the ESWM module can be disabled or enabled by setting a bit in the module stop control register C (MSTPCRC). The ESWM is initially disabled after a reset. Registers in the ESWM only become accessible after it has been released from the module-stop state. For details, refer to section 11., Low Power Consumption.

33.5.2 Transition to Software Standby Mode

Before transitioning to software standby mode, stop ESWM operation as described in section 33.3.3.2, Disable Flow. If RGMII or RMII interface is selected, it must be reset by the MIIRR register after the above procedure.

33.5.3 Return from Software Standby Mode

After returning from software standby mode, ESWM must be initialized as described in section 33.3.3.1, Initialization Flow.

33.5.4 Notes on Cutting Off the Power Supply to ESWM

Before cutting off the power supply to the ESWM power domain, stop the operation of ESWM as described in section 33.3.3.2, Disable Flow. If RGMII or RMII interface is selected, it must be reset by the MIIRR register after the above procedure.

33.5.5 Note on Resuming Power Supply to ESWM

After resuming power supply to the ESWM power domain, ESWM must be initialized as described in section 33.3.3.1, Initialization Flow.

33.5.6 Notes on Using Half-Duplex Mode

Notes on using half-duplex mode are listed below.

- The size of the transmit and receive frames must comply with IEEE 802.3.
- Do not use loopback mode.
- Do not use cut-through mode.
- Do not use with GMII or RGMII interface.
- The LPI function is disabled.

34. Ethernet Message Forwarding Engine (MFWD)

34.1 Overview

Ethernet message forwarding engine (MFWD) is part of ESWM system and aims at filtering, forwarding and routing the switch frames.
It snoops the frame information from Fabric to redistribute them to the agent after filtering, forwarding and routing mechanisms.

Table 34.1 shows the specifications of the MFWD, and Table 34.2 shows the specifications of the Fabric.

Table 34.1 MFWD Specifications

Function		Details
Overall function	Cut-through	Forwarding frames while receiving them depending on Layer 2
	Direct forwarding	Forwarding frames coming from GWCA by bypassing the MFWD
	Port based forwarding	Forwarding frames depending on source port

Table 34.2 Fabric Specifications

Function		Details
Overall function	Data transfer	• Function to transfer data and access to RAMs
Data provision		• Data for Fabric • Initial frame data + Intermediate data + Last frame data + Frame Descriptor • Data width: 185 bits
Control function	Time arbiter	• Arbitration between Time-critical agents [ETHA] for data bus. Arbitration scheme depends on each Time critical agents [ETHA] PHY link/Internal speed
	Arbitration	• LRU for Time critical-agents [ETHA], Slow agents [GWCA], and Common Agent (COMA) error read requests arbitration. • LRU between Slow agents [GWCA] for read/write bus arbitration. • Strict priority like arbitration between time arbiter, Error LRU, and slow LRU. Priority: time arbiter > slow LRU > Error LRU
	RAM access	• Function that writes and reads to RAM
	Transfer write request to MFWD	• Function to transfer write request sent from Ethernet Agents (ETHA) or GWCA to MFWD

Figure 34.1 shows MFWD block diagram. Figure 34.2 shows Fabric block diagram.

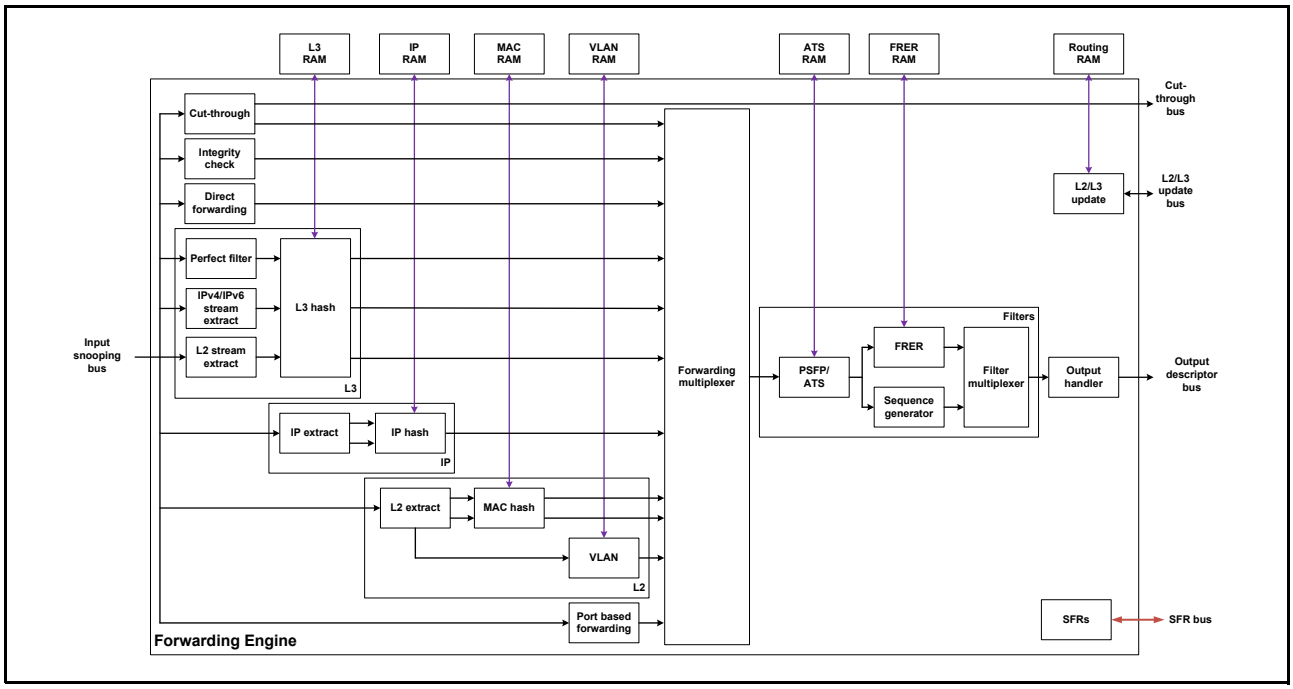

Figure 34.1 MFWD Block Diagram

Table 34.3 MFWD Functional Blocks

Block name	Function
Direct forwarding	Forward frames coming from a CPU with the forwarding information already present.
Port based forwarding	Source port-based forwarding
Forwarding multiplexer	Arbitrate between all the forwarding/ routing mechanisms
Filter multiplexer	Arbitrate between forwarding results and filtering results.
Output handler	Copy and send descriptors to targets. Manage overflow and security error recovery.

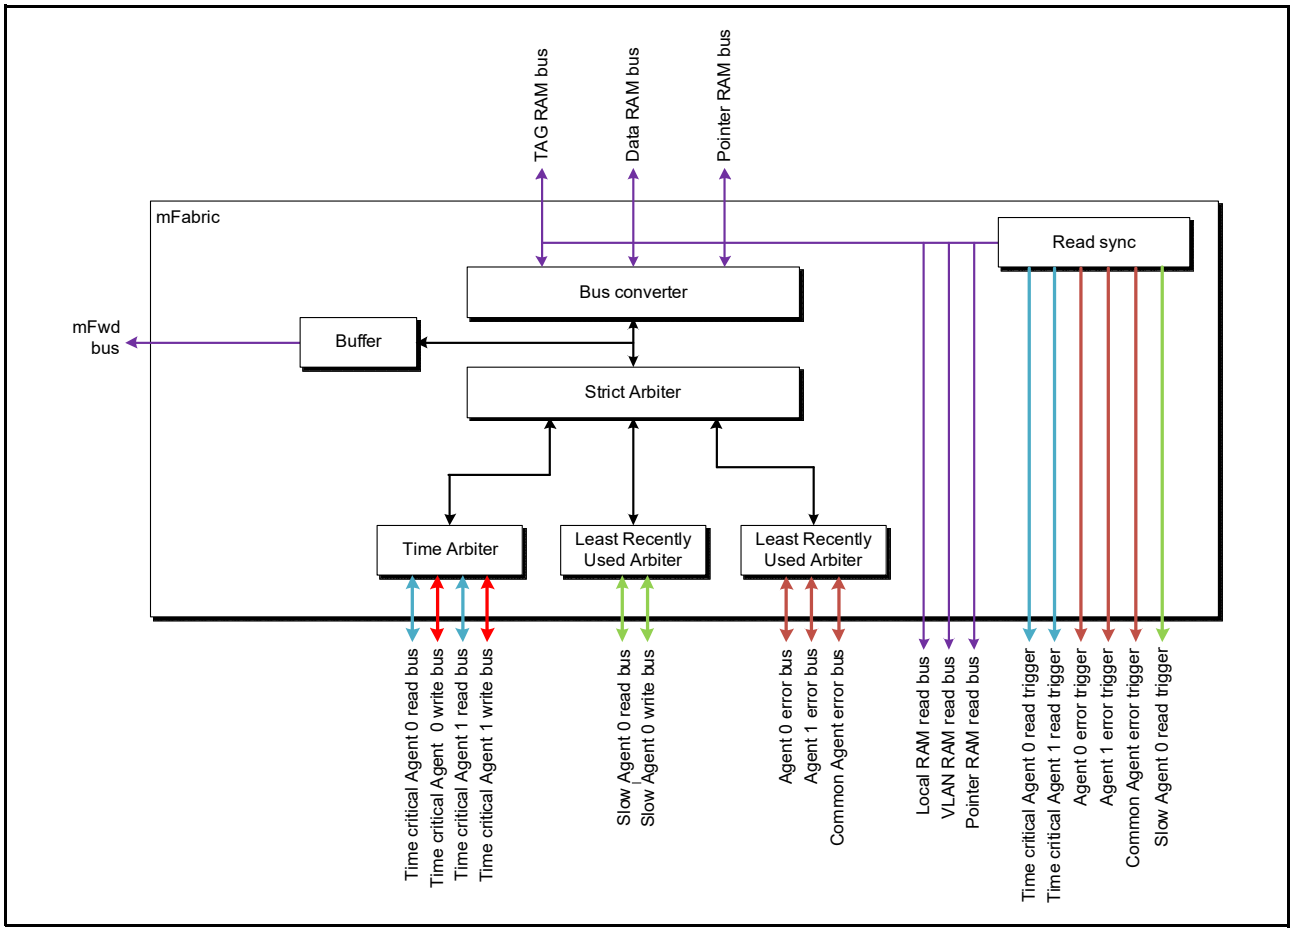

Figure 34.2 Fabric Block Diagram

Table 34.4 Fabric Functional Blocks

Block name	Function
Time arbiter	Function to share the Fabric throughput per agent depending on agent modes and PHY speed.
Least Recently Used arbiter	Arbiter between several buses. (LRU) If multiple error read requests collide, LRU arbitration is executed on a cycle by cycle basis.
Strict arbiter	Arbiter between several buses. If requests from Time arbiter, Round robin arbiter and GWCA collide, the higher priority request will be processed first. Priority ordering: Time-critical Write/Read request > Slow Write/Read request > Agent Error Read request
Read sync	Module that generates a signal indicating whether data read from RAM is valid or invalid.
Bus converter	Module that converts the internal access request in RAM protocol
Buffer	Register slices to meet design timings.

34.2 Register Descriptions

34.2.1 General Function Registers

34.2.1.1 General Configuration Register (FWGC)

Address(es): MFWD.FWGC 874C 0000h, MFWD_NS.FWGC 074C 0000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SVM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	SVM[1:0]	Switch VLAN Mode	b1 b0 0 0: No VLAN mode (VLAN not used for forwarding) 0 1: C-TAG mode (C-TAG used for forwarding) 1 0: SC-TAG mode (S-TAG used for forwarding) 1 1: Reserved	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

SVM[1:0] Bits (Switch VLAN Mode)

[Functions]

- For more details, refer to section 33, Ethernet Module.
- HW: If FWGC.SVM[1:0] are set to 00b, incoming packet PCP and DEI fields will be considered as 0 by MFWD.
- For more details, refer to section 34.3.1.2, ESWM Modes.

34.2.1.2 TAG TPID Configuration Register 0 (FWTTC0)

Address(es): MFWD.FWTTC0 874C 0010h, MFWD_NS.FWTTC0 074C 0010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	STT[15:0]															
Value after reset:	1	0	0	0	1	0	0	0	1	0	1	0	1	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTT[15:0]															
Value after reset:	1	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	CTT[15:0]	C-TAG TPID [801.2Q]	Configure the C-TAG TPID.	R/W
b31 to b16	STT[15:0]	S-TAG TPID [801.2Q]	Configure the S-TAG TPID.	R/W

CTT[15:0] Bits (C-TAG TPID [801.2Q])

[Restrictions]

- SW: The FWTTC0.CTT[15:0], FWTTC0.STT[15:0] and FWTTC1.RTT[15:0] bits should always be set to different values.
- SW: These bits cannot be set to 0000h to 05FFh, 0800h nor 86DDh

STT[15:0] Bits (S-TAG TPID [801.2Q])

[Restrictions]

- SW: The FWTTC0.CTT[15:0], FWTTC0.STT[15:0] and FWTTC1.RTT[15:0] bits should always be set to different values.
- SW: These bits cannot be set to 0000h to 05FFh, 0800h nor 86DDh

34.2.1.3 TAG TPID Configuration Register 1 (FWTTC1)

Address(es): MFWD.FWTTC1 874C 0014h, MFWD_NS.FWTTC1 074C 0014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RTT[15:0]															
Value after reset:	1	1	1	1	0	0	0	1	1	1	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RTT[15:0]	R-TAG TPID [801.2CB]	Configure the R-TAG TPID.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

RTT[15:0] Bits (R-TAG TPID [801.2CB])

[Restrictions]

- SW: The FWTTC0.CTT[15:0], FWTTC0.STT[15:0] and FWTTC1.RTT[15:0] bits should always be set to different values.
- SW: These bits cannot be set to 0000h to 05FFh, 0800h nor 86DDh

34.2.1.4 CPU Exceptional Path Target Configuration Register (FWCEPTC)

Address(es): MFWD.FWCEPTC 874C 0020h, MFWD_NS.FWCEPTC 074C 0020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	EPSL	—	—	—	—	—	—	—	EPCS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	EPIPV[2:0]			—	—	—	—	—	—	EPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	EPCSD[5:0]	Exceptional Path CPU Sub Destination	Configures the CPU sub destination to which exceptional frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	EPIPV[2:0]	Exceptional Path Internal Priority Value	Configures the priority to which exceptional frames will be sent.	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b16	EPCS	Exceptional Path CPU Select	Configures CPU to which exceptional frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	EPSL	Exceptional Path Security Level	Configures descriptor security level for exceptional path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

EPCS Bit (Exceptional Path CPU Select)

Refer to Table 34.25 for port mapping.

[Restriction]

- This bit should be set to 0.

34.2.1.5 CPU Exceptional Path Reason Configuration Register 0 (FWCEPRC0)

Address(es): MFWD.FWCEPRC0 874C 0024h, MFWD_NS.FWCEPRC0 074C 0024h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	DDFSFEF	—	DDEEF	—	—	GDNEEF	GTFEF	—	GSEQEEF	GAXEEF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	ETFEF	EOEEF	EUEEF	EBOEEF	ERPOOEF	ERFFEF	—	—	—	EFCSEEF	ENIBEEF	—	EPHYEEF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EPHYEEF	Ethernet PHY Error Exceptional Forwarding	0: Frames received with PHY Error are discarded. 1: Frames received with PHY Error are forwarded to exceptional path.	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	ENIBEEF	Ethernet Nibble Error Exceptional Forwarding	0: Frames received with Nibble Error are discarded. 1: Frames received with Nibble Error are forwarded to exceptional path.	R/W
b3	EFCSEEF	Ethernet FCS Error Exceptional Forwarding	0: Frames received with FCS Error are discarded. 1: Frames received with FCS Error are forwarded to exceptional path.	R/W
b6 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R
b7	ERFFEF	Ethernet RMAC Frame Filtered Exceptional Forwarding	0: Frames received with RMAC Frame Filtered flag are discarded. 1: Frames received with RMAC Frame Filtered flag are forwarded to exceptional path.	R/W
b8	ERPOOEF	Ethernet Reception Partially Out of Operation Exceptional Forwarding	0: Frames received with Reception Partially Out of Operation flag are discarded. 1: Frames received with Reception Partially Out of Operation flag are forwarded to exceptional path.	R/W
b9	EBOEEF	Ethernet Buffer Overflow Error Exceptional Forwarding	0: Frames received with Buffer Overflow Error are discarded. 1: Frames received with Buffer Overflow Error are forwarded to exceptional path.	R/W
b10	EUEEF	Ethernet Undersize Error Exceptional Forwarding	0: Frames received with Undersize Error are discarded. 1: Frames received with Undersize Error are forwarded to exceptional path.	R/W
b11	EOEEF	Ethernet Oversize Error Exceptional Forwarding	0: Frames received with Oversize Error are discarded. 1: Frames received with Oversize Error are forwarded to exceptional path.	R/W
b12	ETFEF	Ethernet TAG Filtering Exceptional Forwarding	0: Frames received with TAG Filtering flag are discarded. 1: Frames received with TAG Filtering flag are forwarded to exceptional path.	R/W
b16 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17	GAXEEF	GWCA AXI Error Exceptional Forwarding	0: Frames received with AXI Error are discarded. 1: Frames received with AXI Error are forwarded to exceptional path.	R/W
b18	GSEQEEF	GWCA Sequence Error Exceptional Forwarding	0: Frames received with Sequence Error are discarded. 1: Frames received with Sequence Error are forwarded to exceptional path.	R/W
b19	—	Reserved	This bit is read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b20	GTFEF	GWCA TAG Filtering Exceptional Forwarding	0: Frames received with TAG Filtering flag are discarded. 1: Frames received with TAG Filtering flag are forwarded to exceptional path.	R/W
b21	GDNEEF	GWCA Descriptor Number Error Exceptional Forwarding	0: Frames received with Descriptor Number Error are discarded. 1: Frames received with Descriptor Number Error are forwarded to exceptional path.	R/W
b23, b22	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	DDEEF	Direct Descriptor Error Exceptional Forwarding	0: Frames with Direct Descriptor Error are discarded. 1: Frames with Direct Descriptor Error are forwarded to exceptional path.	R/W
b25	—	Reserved	This bit is read as 0. The write value should be 0.	R
b26	DDFSFEF	Direct Descriptor Format Security Filtering Exceptional Forwarding	0: Frames with Direct Descriptor Format Security Error are discarded. 1: Frames with Direct Descriptor Format Security Error are forwarded to exceptional path.	R/W
b31 to b27	—	Reserved	This bit is read as 0. The write value should be 0.	R

Note: For Ethernet error/flag explanations, refer to section 36, Ethernet Agent (ETHA).
Note: For GWCA error/flag explanations, refer to section 38, Ethernet CPU Agent (GWCA).

34.2.1.6 CPU Exceptional Path Reason Configuration Register 2 (FWCEPRC2)

Address(es): MFWD.FWCEPRC2 874C 002Ch, MFWD_NS.FWCEPRC2 074C 002Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	FWMFEF	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	FPBNTFEF	—	—	—	FDDNTFEF	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	FDDNTFEF	Direct Descriptor No Target Filtering Exceptional Forwarding	0: Frames filtered because no target during direct forwarding is detected are discarded. 1: Frames filtered because no target during direct forwarding is detected are forwarded to exceptional path.	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12	FPBNTFEF	Port Based No Target Filtering Exceptional Forwarding	0: Frames filtered because no target during Port Based forwarding is detected are discarded. 1: Frames filtered because no target during Port Based forwarding is detected are forwarded to exceptional path.	R/W
b25 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b26	FWMFEF	Watermark Filtering Exceptional Forwarding	0: Frames filtered because of watermark are discarded. 1: Frames filtered because of watermark are forwarded to exceptional path.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.1.7 CPU Mirroring Path Target Configuration Register (FWCMPTC)

Address(es): MFWD.FWCMPTC 874C 0040h, MFWD_NS.FWCMPTC 074C 0040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	CMPSL	—	—	—	—	—	—	—	CMPCS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMPIPU	CMPIPV[2:0]			—	—	—	—	—	—	CMPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	CMPCSD[5:0]	CPU Mirroring Path CPU Sub Destination	Configures the CPU sub destination to which CPU mirroring frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	CMPIPV[2:0]	CPU Mirroring Path Internal Priority Value	CPU Mirroring Path Internal Priority Value	R/W

Bit	Symbol	Bit Name	Description	R/W
b15	CMPIPU	CPU Mirroring Path Internal Priority Update	0: Frames mirrored to CPU path are sent with the same priority as for forwarding. 1: Frames mirrored to CPU path are sent with FWCMPTC.CMPIPV[2:0] priority.	R/W
b16	CMPCS	CPU Mirroring Path CPU Select	Configures CPU to which CPU mirroring frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	CMPSL	CPU Mirroring Path Security Level	Configures descriptor security level for CPU mirroring path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

CMPCS Bit (CPU Mirroring Path CPU Select)

Refer to Table 34.25 for port mapping.

[Restriction]

- Set this bit to 0.

34.2.1.8 Ethernet Mirroring Path Target Configuration Register (FWEMPTC)

Address(es): MFWD.FWEMPTC 874C 0044h, MFWD_NS.FWEMPTC 074C 0044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	EMPSL	—	—	—	—	—	—	—	EMPPS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EMPIPU	EMPIPV[2:0]			—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	EMPIPV[2:0]	Ethernet Mirroring Path Internal Priority Value	Ethernet Mirroring Path Internal Priority Value	R/W
b15	EMPIPU	Ethernet Mirroring Path Internal Priority Update	0: Frames mirrored to Ethernet path are sent with the same priority as for forwarding. 1: Frames mirrored to Ethernet path are sent with FWEMPTC.EMPIPV[2:0] priority.	R/W
b16	EMPPS	Ethernet Mirroring Path Port Select	Configures port to which Ethernet mirroring frames will be sent.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	EMPSL	Ethernet Mirroring Path Security Level	Configures descriptor security level for Ethernet mirroring path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

EMPPS Bit (Ethernet Mirroring Path Port Select)

Refer to Table 34.25 for port mapping.

[Restriction]

- Set this bit to 0.

34.2.1.9 Source-Destination Mirroring Path Target Configuration Register (FWSDMPTC)

Address(es): MFWD.FWSDMPTC 874C 0050h, MFWD_NS.FWSDMPTC 074C 0050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	SDMPSL	—	—	—	—	—	—	SDMPPS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SDMPIPU	SDMPIPV[2:0]			—	—	—	—	—	—	SDMPCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	SDMPCSD[5:0]	Source-Destination Mirroring Path CPU Sub Destination	Configures the CPU sub destination to which Source-Destination mirroring frames will be sent.	R/W
b11 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b14 to b12	SDMPIPV[2:0]	Source-Destination Mirroring Path Internal Priority Value	Source-Destination Mirroring Path Internal Priority Value	R/W
b15	SDMPIPU	Source-Destination Mirroring Path Internal Priority Update	0: Frames mirrored to Source-Destination path are sent with the same priority as for forwarding. 1: Frames mirrored to Source-Destination path are sent with FWSDMPTC.SDMPIPV[2:0] priority.	R/W
b17, b16	SDMPPS[1:0]	Source-Destination Mirroring Path Port Select	Configures Port to which Source-Destination mirroring frames will be sent.	R/W
b23 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	SDMPSL	Source-Destination Mirroring Path Security Level	Configures descriptor security level for Source-Destination mirroring path.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

SDMPPS[1:0] Bits (Source-Destination Mirroring Path Port Select)

Refer to Table 34.25 for port mapping.

[Restriction]

- SW: These bits should not be set to a value larger than 2.

34.2.1.10 Source-Destination Mirroring Path Vector Configuration Register (FWSDMPVC)

Address(es): MFWD.FWSDMPVC 874C 0054h, MFWD_NS.FWSDMPVC 074C 0054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SDMSV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	SDMDV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	SDMDV[2:0]	Source-Destination Mirroring Destination Vector		R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	SDMSV[2:0]	Source-Destination Mirroring Source Vector		R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

SDMDV[2:0] Bits (Source-Destination Mirroring Destination Vector)

Frames coming from a port set in the FWSDMPVC.SDMSV[2:0] bits and sent to a port set in the FWSDMPVC.SDMDV[2:0] bits are also duplicated to Source-Destination mirroring path.
Setting these bits to 000b disable Source-Destination mirroring path.
Set the SDMDV[1] bit to 0.

SDMSV[2:0] Bits (Source-Destination Mirroring Source Vector)

Frames coming from a port set in the FWSDMPVC.SDMSV[2:0] bits and sent to a port set in the FWSDMPVC.SDMDV[2:0] bits are also duplicated to Source-Destination mirroring path.
Setting these bits to 000b disable Source-Destination mirroring path.
Set the SDMSV[1] bit to 0.

34.2.1.11 Port i Level Based Watermark Configuration Register (FWLBWMCi) (i = 0, 2)

Address(es): MFWD.FWLBWMC0 874C 0080h, MFWD.FWLBWMC2 874C 0088h,
MFWD_NS.FWLBWMC0 074C 0080h, MFWD_NS.FWLBWMC2 074C 0088h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	WMFL PR15	WMFL PR14	WMFL PR13	WMFL PR12	WMFL PR11	WMFL PR10	WMFL PR9	WMFL PR8	WMFL PR7	WMFL PR6	WMFL PR5	WMFL PR4	WMFL PR3	WMFL PR2	WMFL PR1	WMFL PR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WMCL PR15	WMCL PR14	WMCL PR13	WMCL PR12	WMCL PR11	WMCL PR10	WMCL PR9	WMCL PR8	WMCL PR7	WMCL PR6	WMCL PR5	WMCL PR4	WMCL PR3	WMCL PR2	WMCL PR1	WMCL PR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	WMCLPR0	Watermark Critical Level Priority 0 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b1	WMCLPR1	Watermark Critical Level Priority 1 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b2	WMCLPR2	Watermark Critical Level Priority 2 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b3	WMCLPR3	Watermark Critical Level Priority 3 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b4	WMCLPR4	Watermark Critical Level Priority 4 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b5	WMCLPR5	Watermark Critical Level Priority 5 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b6	WMCLPR6	Watermark Critical Level Priority 6 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W

Bit	Symbol	Bit Name	Description	R/W
b7	WMCLPR7	Watermark Critical Level Priority 7 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b8	WMCLPR8	Watermark Critical Level Priority 8 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b9	WMCLPR9	Watermark Critical Level Priority 9 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b10	WMCLPR10	Watermark Critical Level Priority 10 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b11	WMCLPR11	Watermark Critical Level Priority 11 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b12	WMCLPR12	Watermark Critical Level Priority 12 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b13	WMCLPR13	Watermark Critical Level Priority 13 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b14	WMCLPR14	Watermark Critical Level Priority 14 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b15	WMCLPR15	Watermark Critical Level Priority 15 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are discarded when watermark critical level is set for port i (the CABPPWMLCi.PWMCL[9:0] bits are set [COMA]).	R/W
b16	WMFLPR0	Watermark Flush Level Priority 0 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 0 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W

Bit	Symbol	Bit Name	Description	R/W
b17	WMFLPR1	Watermark Flush Level Priority 1 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 1 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b18	WMFLPR2	Watermark Flush Level Priority 2 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 2 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b19	WMFLPR3	Watermark Flush Level Priority 3 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 3 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b20	WMFLPR4	Watermark Flush Level Priority 4 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 4 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b21	WMFLPR5	Watermark Flush Level Priority 5 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 5 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b22	WMFLPR6	Watermark Flush Level Priority 6 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 6 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b23	WMFLPR7	Watermark Flush Level Priority 7 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 7 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b24	WMFLPR8	Watermark Flush Level Priority 8 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 8 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b25	WMFLPR9	Watermark Flush Level Priority 9 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 9 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b26	WMFLPR10	Watermark Flush Level Priority 10 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 10 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W

Bit	Symbol	Bit Name	Description	R/W
b27	WMFLPR11	Watermark Flush Level Priority 11 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 11 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b28	WMFLPR12	Watermark Flush Level Priority 12 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 12 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b29	WMFLPR13	Watermark Flush Level Priority 13 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 13 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b30	WMFLPR14	Watermark Flush Level Priority 14 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 14 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W
b31	WMFLPR15	Watermark Flush Level Priority 15 Reject	0: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are forwarded. 1: Frames coming for port i and that should be forwarded with {DEI,IPV} equal to 15 are discarded when watermark flush level is set for port i (the CABPPWMLCi.PWMFL[9:0] bits are set [COMA]).	R/W

Note: {DEI,IPV} refers to the bit association {DEI,IPV[2:0]}, so in decimal it can be written 8 × DEI + IPV.

34.2.1.12 Port i Configuration Register 1 (FWPCi1) (i = 0, 2)

Address(es): MFWD.FWPC01 874C 0104h, MFWD.FWPC21 874C 0124h,
MFWD_NS.FWPC01 074C 0104h, MFWD_NS.FWPC21 074C 0124h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0*1	0	0*2

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DDSL	DDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DDE	Direct Descriptor Enable*3	0: Direct Descriptor disabled for port i 1: Direct Descriptor enabled for port i	R/W
b1	DDSL	Direct Descriptor Security Level*3	0: Secured Direct Descriptor discarded for port i. 1: Secured Direct Descriptor forwarded for port i.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. The value after reset is 1 for the FWPC21 register.
Note 2. The value after reset is 1 for the FWPC01 register.
Note 3. This bit is only valid for i = 2.

34.2.2 Port Based Forwarding Function Registers

34.2.2.1 Port Based Forwarding Configuration Register i (FWPBFCi) (i = 0, 2)

Address(es): MFWD.FWPBFC0 874C 4A00h, MFWD.FWPBFC2 874C 4A20h,
MFWD_NS.FWPBFC0 074C 4A00h, MFWD_NS.FWPBFC2 074C 4A20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	FAIFP	IP6PDE	IP4PDM	IP4PDE	PBSL	PBCME	PBEME	PBIPU	PBIPV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PBDV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	PBDV[2:0]	Port Based Destination Vector	Destination vector for port i port-based forwarding. Set the PBDV[1] bit to 0.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	PBIPV[2:0]	Port Based Internal Priority Value	Internal priority value for port i port-based forwarding.	R/W
b19	PBIPU	Port Based Internal Priority Update	Enables frame priority update to internal priority value (FWPBFCi.PBIPV[2:0]) for port i.	R/W
b20	PBEME	Port Based Ethernet Mirroring Enabled	Enables Ethernet mirroring for port i.	R/W
b21	PBCME	Port Based CPU Mirroring Enabled	Enables CPU mirroring for port i.	R/W
b22	PBSL	Port Based Security Level	Set descriptor security level for port i.	R/W
b23	IP4PDE	IPv4 Priority Decode Enable	0: For port i, Input frame priority is taken from VLAN TAGs for port i. 1: For port i, If an IPv4 frame is detected, input frame priority is taken from precedence ToS. Else Input frame priority is taken from VLAN TAGs.	R/W
b24	IP4PDM	IPv4 Priority Decode Mode	0: For port i, Input frame priority is taken from precedence field in ToS. 1: For port i, Input frame priority is decoded from DSCP field in ToS.	R/W
b25	IP6PDE	IPv6 Priority Decode Enable	0: For port i, Input frame priority is taken from VLAN TAGs. 1: For port i, If an IPv6 frame is detected, input frame priority is decoded from DSCP field in ToS. Else Input frame priority is taken from VLAN TAGs.	R/W
b26	FAIFP	Force All Input Frame Priority Enable	0: For port i, Input frame priority is given by frame decoding. 1: For port i, Input frame priority is forced to FWPBFCi.PBIPV[2:0]	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.2.2 Port i Port Based Forwarding CSD Configuration Register 0 (FWPBFCSDCi0) (i = 0, 2)

Address(es): MFWD.FWPBFCSDC00 874C 4A04h, MFWD.FWPBFCSDC20 874C 4A24h, MFWD_NS.FWPBFCSDC00 074C 4A04h, MFWD_NS.FWPBFCSDC20 074C 4A24h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	PBCSD[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PBCSD[5:0]	Port Based CPU Sub Destination	CPU Sub Destination for GWCA0 for port i port-based forwarding.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.2.3 MFWD Counter Registers

34.2.3.1 Port 2 Direct Descriptor Forwarded Descriptor Counter Register (FWDDFDCN2)

Address(es): MFWD.FWDDFDCN2 874C 6340h, MFWD_NS.FWDDFDCN2 074C 6340h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DDFDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DDFDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	DDFDN[31:0]	Direct Descriptor Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Direct Descriptor forwarding for port 2.	R

DDFDN[31:0] Bits (Direct Descriptor Forwarded Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port 2 is forwarded by Direct Descriptor Forwarding and if these bits have a value different than FFFF FFFFh.

34.2.3.2 Port i Port Based Forwarded Descriptor Counter Register (FWPBFDCNi) (i = 0, 2)

Address(es): MFWD.FWPBFDCN0 874C 6310h, MFWD.FWPBFDCN2 874C 6350h,
MFWD_NS.FWPBFDCN0 074C 6310h, MFWD_NS.FWPBFDCN2 074C 6350h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PBFDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PBFDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	PBFDN[31:0]	Port Based Forwarded Descriptor Number	These bits count the number of descriptors forwarded by Port Based forwarding for port i.	R

PBFDN[31:0] Bits (Port Based Forwarded Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is forwarded by Port Based Forwarding and if these bits have a value different than FFFF FFFFh.

34.2.3.3 Port i Watermark Rejected Descriptor Counter Register (FWWMRDCNi) (i = 0 to 2)

Address(es): MFWD.FWWMRDCN0 874C 6504h, MFWD.FWWMRDCN2 874C 6544h, MFWD_NS.FWWMRDCN0 074C 6504h, MFWD_NS.FWWMRDCN2 074C 6544h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WMRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	WMRDN[15:0]	Watermark Rejected Descriptor Number	These bits count the number of descriptors rejected by Watermark for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

WMRDN[15:0] Bits (Watermark Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is rejected by Watermark and if these bits have a value different than FFFFh.

34.2.3.4 Port 2 Direct Descriptor Rejected Descriptor Counter Register (FWDDRDCN2)

Address(es): MFWD.FWDDRDCN2 874C 6548h, MFWD_NS.FWDDRDCN2 074C 6548h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DDRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DDRDN[15:0]	Direct Descriptor Rejected Descriptor Number	These bits count the number of descriptors rejected by Direct Descriptor forwarding for port 2.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DDRDN[15:0] Bits (Direct Descriptor Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port 2 is rejected by Direct Descriptor forwarding and if these bits have a value different than FFFFh.

34.2.3.5 Port i Port Based Rejected Descriptor Counter Register (FWPBRDCNi) (i = 0, 2)

Address(es): MFWD.FWPBRDCN0 874C 6518h, MFWD.FWPBRDCN2 874C 6558h, MFWD_NS.FWPBRDCN0 074C 6518h, MFWD_NS.FWPBRDCN2 074C 6558h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PBRDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PBRDN[15:0]	Port Based Rejected Descriptor Number	These bits count the number of descriptors rejected by Port Based forwarding for port i.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

PBRDN[15:0] Bits (Port Based Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a frame coming from port i is rejected by Port Based forwarding and if these bits have a value different than FFFFh.

34.2.4 MFWD Interrupt Registers

34.2.4.1 Port i Error Interrupt Status Register 0 (FWEIS0i) (i = 0, 2)

Address(es): MFWD.FWEIS00 874C 7900h, MFWD.FWEIS02 874C 7920h,
MFWD_NS.FWEIS00 074C 7900h, MFWD_NS.FWEIS02 074C 7920h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

PBNTFS Flag (Port Based No Target Filtering Status Flag)

[Setting Conditions]

- HW: When forwarding flow for a frame coming from port i goes until “Port based forwarding secure error” block in Figure 34.9 and FWPBFCi.PBDV[2:0] is null.
- HW: When forwarding flow for a frame coming from port i goes until “Port based forwarding unsecure error” block in Figure 34.10 and FWPBFCi.PBDV[2:0] is null.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMCFS Flag (Watermark Critical Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and the FWLBWMCi.WMCLPRi bit {DEI,IPV} is set and coa_watermark_critical[i] pin is set (where DEI is set to input frame C-TAG DEI if the FWGC.SVM[1:0] bits are set to 01b, input frame S-TAG DEI if the FWGC.SVM[1:0] bits are set to 10b and set to 0 if the FWGC.SVM[1:0] bits are set to 00b and IPV is the Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.IPV value).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMFFS Flag (Watermark Flush Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and the FWLBWMCi.WMFLPRi bit {DEI,IPV} is set and coa_watermark_flush[i] pin is set (where DEI is set to input frame C-TAG DEI if the FWGC.SVM[1:0] bits are set to 01b, input frame S-TAG DEI if the FWGC.SVM[1:0] bits are set to 10b and set to 0 if the FWGC.SVM[1:0] bits are set to 00b and IPV is the Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.IPV value).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMISFS Flag (Watermark IPV Secure Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and corresponding IPV is rejected by IPV based unsecure watermark [COMA] (where IPV is Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.IPV value before filtering).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

WMIUFS Flag (Watermark IPV Unsecure Filtering Status Flag)

[Setting Condition]

- HW: A frame coming from port i is forwarded with a Layer 3/IP/Layer 2/Port based normal descriptor and SEC is not set and corresponding IPV is rejected by IPV based secure watermark [COMA] (where SEC and IPV are respectively Frame corresponding normal descriptor, selected by the forwarding flow, FDESCR.SEC and FDESCR.IPV values before filtering).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

DDES Flag (Direct Descriptor Error Status Flag)

[Setting Condition]

- HW: When a direct descriptor (LDESCR.FMT [GWCA] set to 1) is received from port 2 + i and FWPCi1.DDE is not set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

[Restriction]

- HW: This flag is only valid for i = 2.

DDSES Flag (Direct Descriptor Security Error Status Flag)

[Setting Condition]

- HW: When a secure direct descriptor (LDESCR.FMT [GWCA] and LDESCR.SEC [GWCA] are both set to 1) is received from port 2 + i, FWPCi1.DDE is set and FWPCi1.DDSL is not set.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

[Restriction]

- HW: This flag is only valid for i = 2.

DDNTFS Flag (Direct Descriptor No Target Filtering Status Flag)

[Setting Condition]

- HW: HW: When a directed descriptor (LDESCR.FMT [GWCA] set to 1) is received from port 2 + i and LDESCR.DV [GWCA] is set to ALL0.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- HW: Descriptor corresponding frame is rejected.

[Restriction]

- HW: This flag is only valid for i = 2.

34.2.4.2 Port i Error Interrupt Enable Register 0 (FWEIE0i) (i = 0, 2)

Address(es): MFWD.FWEIE00 874C 7904h, MFWD.FWEIE02 874C 7924h,

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b16 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17	PBNTFE	Port Based No Target Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b21 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R
b22	WMCFE	Watermark Critical Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b23	WMFFE	Watermark Flush Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b24	WMISFE	Watermark IPV Secure Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b25	WMIUFE	Watermark IPV Unsecure Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b26	DDEE	Direct Descriptor Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b27	—	Reserved	This bit is read as 0.	R
b28	DDSEE	Direct Descriptor Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b29	DDNTFE	Direct Descriptor No Target Filtering Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the FWEID0i register.

PBNTFE Bit (Port Based No Target Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.PBNTFD bit will clear this bit.

WMCFE Bit (Watermark Critical Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMCFD bit will clear this bit.

WMFFE Bit (Watermark Flush Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMFFD bit will clear this bit.

WMISFE Bit (Watermark IPV Secure Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMISFD bit will clear this bit.

WMIUFE Bit (Watermark IPV Unsecure Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.WMIUFD bit will clear this bit.

DDEE Bit (Direct Descriptor Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDED bit will clear this bit.

DDSEE Bit (Direct Descriptor Security Error Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDSED bit will clear this bit.

DDNTFE Bit (Direct Descriptor No Target Filtering Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the FWEID0i.DDNTFD bit will clear this bit.

34.2.4.3 Port i Error Interrupt Disable Register 0 (FWEID0i) (i = 0, 2)

Address(es): MFWD.FWEID00 874C 7908h, MFWD.FWEID02 874C 7928h,

b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

34.3 Operations

34.3.1 General Functionalities

General functionalities are separated in several types:

- Descriptors
- ESWM modes.
- ESWM TPIDs.
- ESWM debug functions.
- ESWM watermark.

34.3.1.1 Descriptors

To forward a frame to one or several port, the MFWD emits descriptors through the descriptor bus. All descriptor emitted by the MFWD shall follow the descriptor format described in Table 34.5. In following sections the format when a function emits a descriptor will be explained using the field name. Only fields that are not determined by the input local descriptor or the input frame will be explained.

Table 34.5 Descriptor Field

Field name FDESCR.	Bit width	Field explanation	Values
DV	3	Bit i set to 0: Descriptor not valid for port i Bit i set to 1: Descriptor valid for port i	Depends on descriptor. Will be explained per descriptor in following sections.
SEC	1	0: Descriptor is unsecure 1: Descriptor is secure	Depends on descriptor. Will be explained per descriptor in following sections.
CSD	6	FDESCR.CSD0 defines the CPU Sub destination for GWCA0 (CPU Sub destination is equivalent to AXI descriptor queue number)	Depends on descriptor. Will be explained per descriptor in following sections.
IPV	3	Internal priority value before agent internal priority remapping	Depends on descriptor. Will be explained per descriptor in following sections.
SPN	2	Port number from which the frame came from	Set to the source agent port number given by mfw_spn_fwd pin
TPL	16	Input frame total payload length.	Set to the TPL value given by agent through local descriptors
MINFO	24	Meta-information associated to a frame for CPU forwarding	Depends on descriptor. Will be explained per descriptor in following sections.
RV	1	Routing valid. Informs agents that routing rules should be fetched to MFWD through L23 update bus to update frame information	Depends on descriptor. Will be explained per descriptor in following sections.
RN	8	Routing number. Informs agents that routing number should be used when FDESCR.RV is set	Depends on descriptor. Will be explained per descriptor in following sections.
VCTRL	3	VLAN control information.	Set to the VCTRL value given by agent through local descriptors
RTGI	1	R-TAG in	Set to the RTGI value given by agent through local descriptors
SEQN	16	Frame sequence number	Depends on descriptor. Will be explained per descriptor in following sections.
FI	1	0: Input frame does not contain its FCS 1: Input frame contains its FCS	Set to the FI value given by agent through local descriptors
FW	1	0: If input frame contains its FCS, it was correct when given to the switch 1: If input frame contains its FCS, it was incorrect when given to the switch	Set to the FW value given by agent through local descriptors

34.3.1.2 ESWM Modes

ESWM modes define the general behavior of the ESWM module using FWGC registers.
[Function]

- FWGC register sets the VLAN format that will be used by the MFWD. Depending on this setting all the agents should convert Ethernet frames in the required format (for format conversion refer to section 38, Ethernet CPU Agent (GWCA)).

34.3.1.3 ESWM TPIDs

ESWM TPIDs for C-TAG, S-TAG and R-TAG [801.2Q] [801.2CB] can be set by the user using FWTTC0 and FWTTC1 registers.

[Functions]

- FWTTC0 register sets the S-TAG and C-TAG TPIDs [801.2Q].
- FWTTC1 register sets the R-TAG TPID [801.2CB].
- FWTTC0 and FWTTC1 registers reset values are as per defined in IEEE standards [801.2Q] [801.2CB].

34.3.1.4 ESWM Frame Input Priority

Any incoming frame will have an input priority given by MFWD depending on switch mode FWGC.SVM[1:0], and the incoming priority settings in FWPBFCi register and the frame format. Figure 34.3 describes frame input priority assignment for a frame coming from port i (the ToS DSCP field decoding is fixed in hardware and described in Table 34.6).

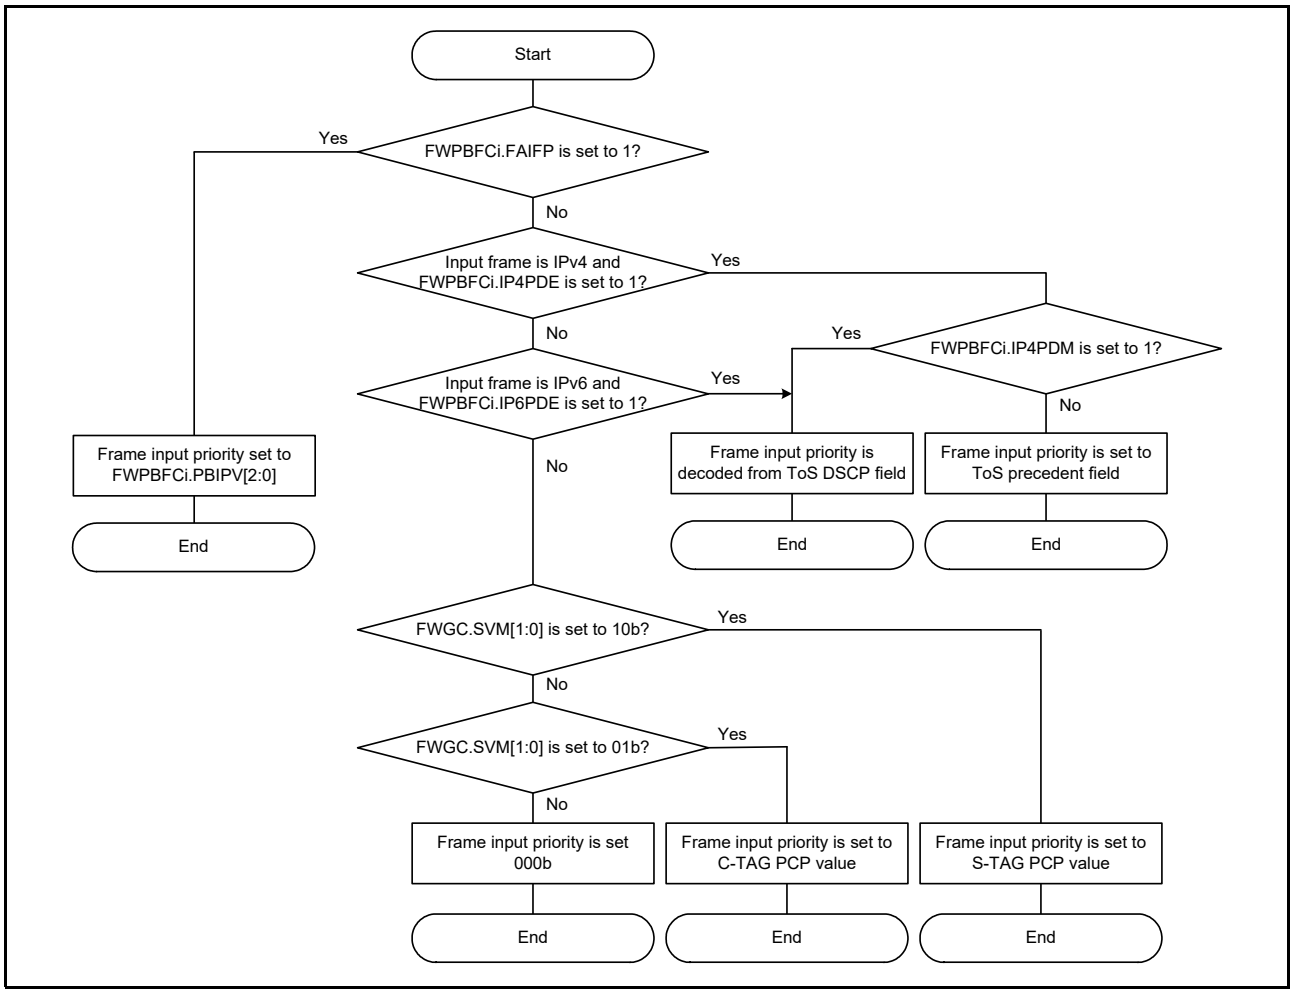

Figure 34.3 Frame Input Priority Assignment for Port i

[Restriction]

- HW: For cut-through forwarding, ToS and DSCP are not considered as frame input priority. Frame input priority is always extracted from S-TAG or set to 0.

Table 34.6 DSCP to Priority Mapping

DSCP values in decimal	Frame input priority
56	7
48	6
40, 46	5
32, 34, 36, 38	4
24, 26, 28, 30	3
16, 18, 20, 22	2
8, 10, 12, 14	1
Others	0

34.3.1.5 ESWM Debug Functions

(1) CPU Exceptional Path

Exceptional path is used to forward faulty frames to CPU for diagnosis using FWCEPTC, FWCEPRC0, FWCEPRC1, and FWCEPRC2 registers. When a frame is selected by exceptional path an exceptional descriptor is emitted.

[Functions]

- FWCEPTC register sets the target to which type of faulty frames will be forwarded.
- FWCEPRC0, FWCEPRC1, and FWCEPRC2 registers set which error frame will be forwarded to the exceptional path.

Note: For exceptional path descriptor formats and associated error details, refer to section 34.3.2.1 (3) Direct Exceptional Descriptor and section 34.3.2.2 (3) Port Based Exceptional Descriptor.

(2) Mirroring Paths

MFWD contains 3 mirroring paths:

- CPU mirroring path
- Ethernet mirroring path
- Source-destination mirroring path

(a) CPU Mirroring Path

CPU Mirroring path is used to copy frames to a CPU for monitoring purpose using FWCMPTC register. Table 34.7 describes CPU mirroring selection conditions depending on the forwarding mechanism selected by forwarding flow. When a frame is selected for CPU mirroring, a mirroring descriptor is emitted (refer to section 34.3.1.5 (2) (d) Mirroring Descriptor).

[Function]

- FWCMPTC register sets the target to which mirrored frames will be forwarded.

Table 34.7 CPU Mirroring Selection Conditions

Descriptor selected by forwarding flow	Mirroring selection conditions
Port based normal descriptor (Figure 34.9, Figure 34.10)	If FWPBFCi.PBCME is set for incoming frame source port.

(b) Ethernet Mirroring Path

Ethernet Mirroring path is used to copy frames to an Ethernet agent for monitoring purpose using FWEMPTC register. Table 34.8 describes Ethernet mirroring selection conditions depending on the forwarding mechanism selected by forwarding flow. When a frame is selected for Ethernet mirroring, a mirroring descriptor is emitted (refer to section 34.3.1.5 (2) (d) Mirroring Descriptor).

[Function]

- FWEMPTC register sets the target to which mirrored frames will be forwarded.

Table 34.8 Ethernet Mirroring Selection Conditions

Descriptor selected by forwarding flow	Mirroring selection conditions
Port based normal descriptor (Figure 34.9, Figure 34.10)	If FWPBFCi.PBEME is set for incoming frame source port.

(c) Source-Destination Mirroring Path

Mirroring path is used to copy frames to an Ethernet port or a CPU for monitoring purpose using FWSDMPTC and FWSDMPVC registers. When a frame is selected for Source-destination mirroring, a mirroring descriptor is emitted (refer to section 34.3.1.5 (2) (d) Mirroring Descriptor).

[Functions]

- FWSDMPTC register sets the target to which mirrored frames will be forwarded.
- FWSDMPVC register sets the source from which should come and the destination where should go a frame to be mirrored.
- A frame is selected for source-destination mirroring if the descriptor selected by forwarding flow is Port based normal descriptor (Figure 34.9, Figure 34.10)}, if the frame source port is set in FWSDMPVC.SDMSV[2:0] bits and if FDESCR.DV & FWSDMPVC.SDMDV[2:0] is not 000b.

(d) Mirroring Descriptor

Mirroring descriptor fields are described in Table 34.9.

Table 34.9 Mirroring Descriptor Fields

Field name FDESCR.	Values for CPU mirroring	Values for Ethernet mirroring	Values for Source-destination mirroring
DV	Mirroring descriptors are forwarded to GWCA number FWCMPTC.CMPCS (port number 2 + FWCMPTC.CMPCS)	Mirroring descriptors are forwarded to ETHA number FWEMPTC.EMPPS (port number FWEMPTC.EMPPS)	Mirroring descriptors are forwarded to port number FWSDMPTC.SDMPPS[1:0]
SEC	FWCMPTC.CMPSL	FWEMPTC.EMPSL	FWSDMPTC.SDMPSL
CSDj	FWCMPTC.CMPCSD[5:0]	ALL0	ALL0
IPV	If FWCMPTC.CMPIPU is set, FWCMPTC.CMPIPV[2:0] If FWCMPTC.CMPIPU is not set, same IPV as normal descriptor	If FWEMPTC.EMPIPU is set, FWEMPTC.EMPIPV[2:0] If FWEMPTC.EMPIPU is not set, same IPV as normal descriptor	If FWSDMPTC.SDMPIPU is set, FWSDMPTC.SDMPIPV[2:0] If FWSDMPTC.SDMPIPU is not set, same IPV as normal descriptor
MINFO	Refer to Figure 34.4 and Table 34.10.	Refer to Figure 34.4 and Table 34.10.	Refer to Figure 34.4 and Table 34.10.
RV	0	0	0

FWDC	4	ForWarDing Code Present in all descriptors, allows to identify the type of forwarding	Fixed to 14 for Mirroring descriptors
NDFB	8	Normal Descriptor First Byte	Set to mirrored frame corresponding normal descriptor FDESCR.MINFO[7:0] value

34.3.1.6 Watermark

ESWM watermark defines the switch behavior in case of overflow using FWLBWMCi and FWCEPRC2 registers and can be monitored using FWEIS0i register.

[Functions]

- FWLBWMCi is used to set which frame should be discarded by level-based watermark [COMA].
- FWCEPRC2 register enables exceptional path for error descriptors.
- FWEIS0i register notifies that a frame coming from port i has been rejected because of watermark.
- Watermark uses as frame priority the IPV value given by forwarding mechanism before filtering. This correspond to the FDESCR.IPV in the normal descriptor emitted by the selected forwarding.
- Watermark uses as DEI value the value extracted from the input frame which is the S-TAG DEI value when FWGC.SVM[1:0] is set to 10b, the C-TAG DEI value when FWGC.SVM[1:0] is set to 01b, and 0 when FWGC.SVM[1:0] is set to 00b.

[Caution]

- SW: The watermark is an indispensable functionality for switch QoS behavior definition, it is not advised to disable it.

Note: Error frames are not going through watermark.

(1) Watermark Errors

Table 34.11 describes the Watermark errors. Instead of being discarded by MFWD, an error frame can be forwarded to exceptional path using Watermark exceptional descriptor described in section 34.3.1.6 (2) Watermark Exceptional Descriptor by setting corresponding error exceptional bit. For error set conditions, refer to corresponding error interrupt register explanations.

Table 34.11 Watermark Errors

Error	Error name	Error interrupt	Error exceptional bit
WMCF	WaterMark Critical Filtering	FWEIS0i.WMCFS	FWCEPRC2.FWMFEF
WMFF	WaterMark Flush Filtering	FWEIS0i.WMFFS	FWCEPRC2.FWMFEF
WMISF	WaterMark IPV Secure Filtering	FWEIS0i.WMISFS	FWCEPRC2.FWMFEF
WMIUF	WaterMark IPV Unsecure Filtering	FWEIS0i.WMIUFS	FWCEPRC2.FWMFEF

(2) Watermark Exceptional Descriptor

Watermark exceptional descriptor fields are described in Table 34.12.

Table 34.12 Watermark Exceptional Descriptor Fields

Field name FDESCR.	Values
DV	Exceptional descriptors are forwarded to GWCA number FWCEPTC.EPCS (port number 2 + FWCEPTC.EPCS)
SEC	FWCEPTC.EPSL
CSDj	FWCEPTC.EPCSD[5:0]
IPV	FWCEPTC.EPIPV[2:0]

Figure 34.5 Watermark Exceptional Descriptor MINFO Format

Table 34.13 Watermark Exceptional Descriptor MINFO Field Explanation

Field name FDESCR.	Bit width	Field explanation	Values
FWDC	4	ForWarDing Code Present in all descriptors, allows to identify the type of forwarding	Fixed to 4 for Watermark exceptional descriptors
WMCF	1	WaterMark Critical Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.
WMFF	1	WaterMark Flush Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.
WMISF	1	WaterMark IPV Secure Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.
WMIUF	1	WaterMark IPV Unsecure Filtering	Refer to section 34.3.1.6 (1) Watermark Errors.

34.3.2 Forwarding/Routing

MFWD contains different types of forwarding which are:

- Direct descriptor forwarding
- Port based forwarding

34.3.2.1 Direct Descriptor Forwarding

Direct descriptor forwarding is used to forward local direct descriptors (LDESCR.FMT [GWCA] set to 1) received from a slow interface [GWCA] using FWPCi1 and FWCEPRC0 registers and can be monitored using FWEIS0i register. Direct descriptor forwarding flow is described in Figure 34.6.

[Functions]

- FWPCi1.DDE bit is used to enable direct descriptor reception from port i.
- FWPCi1.DDSL bit is used to enable secure direct descriptor reception from port i when direct descriptor reception from port i is enabled.
- FWCEPRC0 register enables exceptional path for error descriptors.
- FWEIS0i register notifies that a direct descriptor has been rejected.

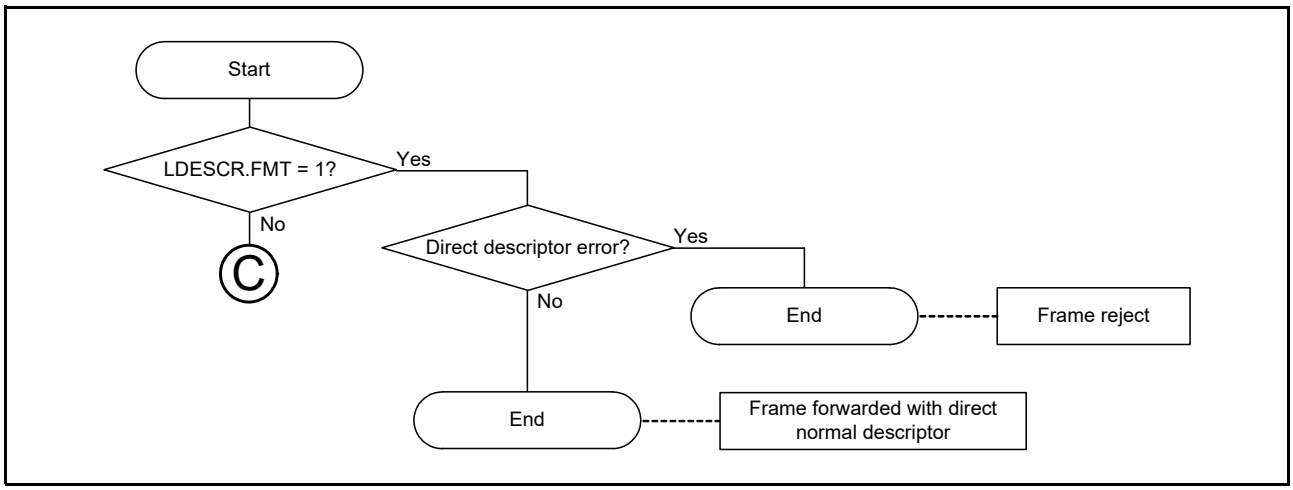

Figure 34.6 Direct Descriptor Forwarding Flow

Note: Direct descriptor errors are described in section 34.3.2.1 (1) Direct Descriptor Forwarding Errors.
Note: Direct normal descriptor format is described in section 34.3.2.1 (2) Direct Normal Descriptor.
Note: Link C links to Figure 34.41.

(1) Direct Descriptor Forwarding Errors

Table 34.14 describes the Direct descriptor forwarding errors. Instead of being discarded by MFWD, an error frame can be forwarded to exceptional path using Direct exceptional descriptor described in section 34.3.2.1 (3) Direct Exceptional Descriptor by setting corresponding error exceptional bit. For error set conditions, refer to corresponding error interrupt register explanations.

Table 34.14 Direct Descriptor Errors

Error	Error name	Error interrupt	Error exceptional bit
DDE	Direct Descriptor Error	FWEIS0i.DDES	FWCEPRC0.DDEEF
DDSF	Direct Descriptor Security Filtering	FWEIS0i.DDSES	FWCEPRC0.DDFSFEF
NTF	No Target Filtering	FWEIS0i.DDNTFS	FWCEPRC2.DDNTFEF

(2) Direct Normal Descriptor

Direct normal descriptor fields are described in Table 34.15. For LDESCR explanation, refer to section 38, Ethernet CPU Agent (GWCA).

DDSF	1	Direct Descriptor Security Filtered	Refer to section 34.3.2.1 (1) Direct Descriptor Forwarding Errors.
DDFF	1	Direct Descriptor Format Filtered	Refer to section 34.3.2.1 (1) Direct Descriptor Forwarding Errors.
NTF	1	No Target Filtered	Refer to section 34.3.2.1 (1) Direct Descriptor Forwarding Errors.

34.3.2.2 Port Based Forwarding

Port based forwarding aims at forwarding all frames from a port to other ones. It used FWPBFCi and FWPBFCSDCi0 registers. Port based forwarding will forward frames following Port based forwarding secure flow in Figure 34.9 and Port based forwarding unsecure flow in Figure 34.10.

[Functions]

- FWPBFCi and FWPBFCSDCi0 registers are used to set forwarding information for frames coming from port i.

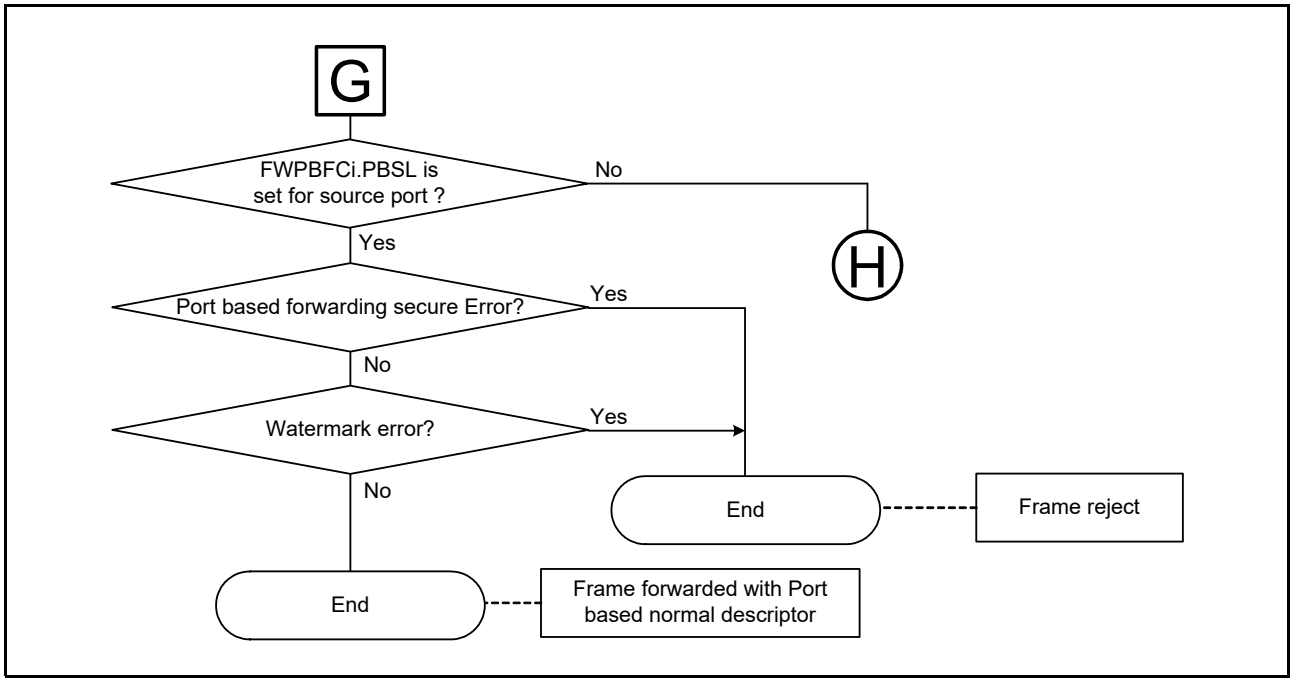

Figure 34.9 Port Based Forwarding Secure Flow

Note: Port based forwarding secure errors are described in section 34.3.2.2 (1) Port Based Forwarding Errors.
Note: Watermark errors are described in section 34.3.1.6 (1) Watermark Errors.
Note: Link G is linked from Figure 34.51.
Note: Link H links to Figure 34.42.

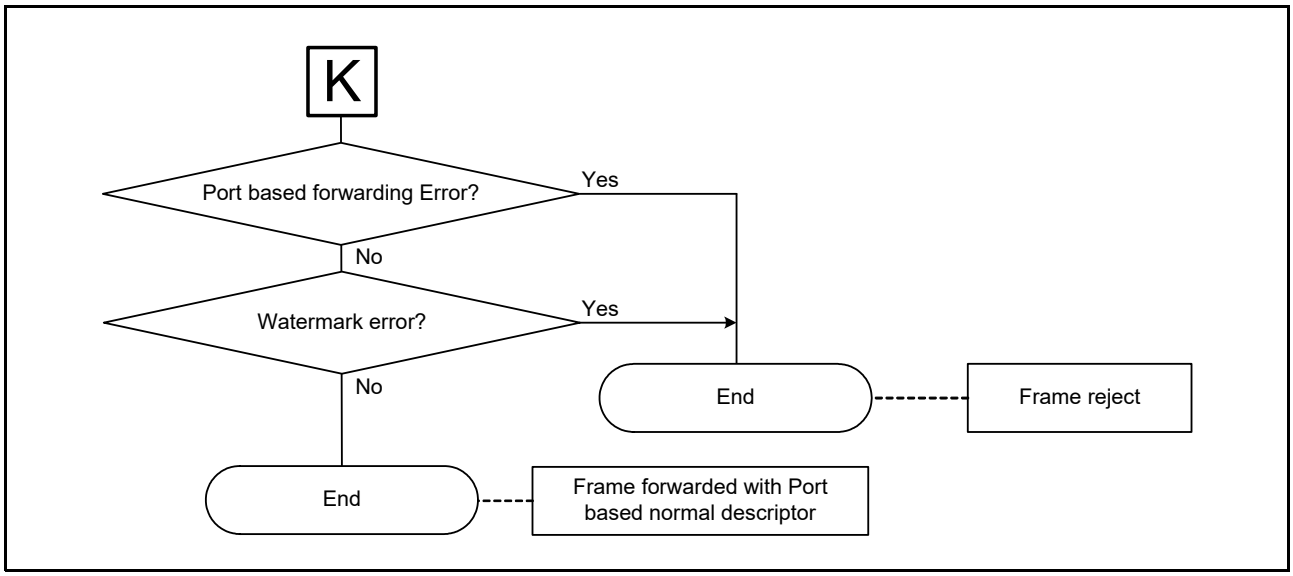

Figure 34.10 Port Based Forwarding Unsecure Flow

Note: Port based forwarding errors are described in section 34.3.2.2 (1) Port Based Forwarding Errors.
Note: Watermark errors are described in section 34.3.1.6 (1) Watermark Errors.
Note: Link G is linked from Figure 34.52.

(1) Port Based Forwarding Errors

Table 34.19 describes the Port based forwarding errors. Instead of being discarded by MFWD, an error frame can be forwarded to exceptional path using Port based exceptional descriptor described in section 34.3.2.2 (3) Port Based Exceptional Descriptor by setting corresponding error exceptional bit. For error set conditions, refer to corresponding error interrupt register explanations.

Table 34.19 Port Based Forwarding Errors

Error	Error name	Error interrupt	Error exceptional bit
Port based forwarding secure errors			
SNTF	Secure No Target Filtering	FWEIS0i.PBNTFS	FWCEPRC2.FPBNTFEF
Port based forwarding errors			
NTF	No Target Filtering	FWEIS0i.PBNTFS	FWCEPRC2.FPBNTFEF

(2) Port Based Normal Descriptor

Port based normal descriptor fields are described in Table 34.20.

Table 34.20 Port Based Normal Descriptor Fields

Field name FDESCR.	Values
DV	FWPBFCi.PBDV[2:0]
SEC	FWPBFCi.PBSL
CSDj	FWPBFCSDCi0.PBCSD[5:0]
IPV	If FWPBFCi.PBIPU is set, set to FWPBFCi.PBIPV[2:0] If FWPBFCi.PBIPU is not set, set to the frame input priority (refer to section 34.3.1.4, ESWM Frame Input Priority)

34.3.3 Data Representation in RAMs

Agents connected to Fabric will use TAG, Pointer and Data RAM to store their data. Because of peripheral IPs such as MFWD, the data saving/fetching patterns described in this section should be respected by Agents.

34.3.3.1 RAM Address Dependencies

When an agent access to Fabric, it can decide to access to one, two or all the RAMs in one access (thanks to*_den_*,*_pen_*and*_ten_*signals) but since it can only give one address. The address at which RAMs will be accessed will be calculated from the address given to the Fabric. The address calculation for Data, TAG and Pointer RAMs are respectively described in equations (1), (2) and (3). Figure 34.13 describes the first addresses mapping to RAMs.

(1) *dataAddress = fabricAddress*
(2) *tagAddress = fabricAddress[11:3]*
(3) *pointerAddress = fabricAddress[11:3]*

[Where]

- *fabricAddress* is the address given by any agent to Fabric.

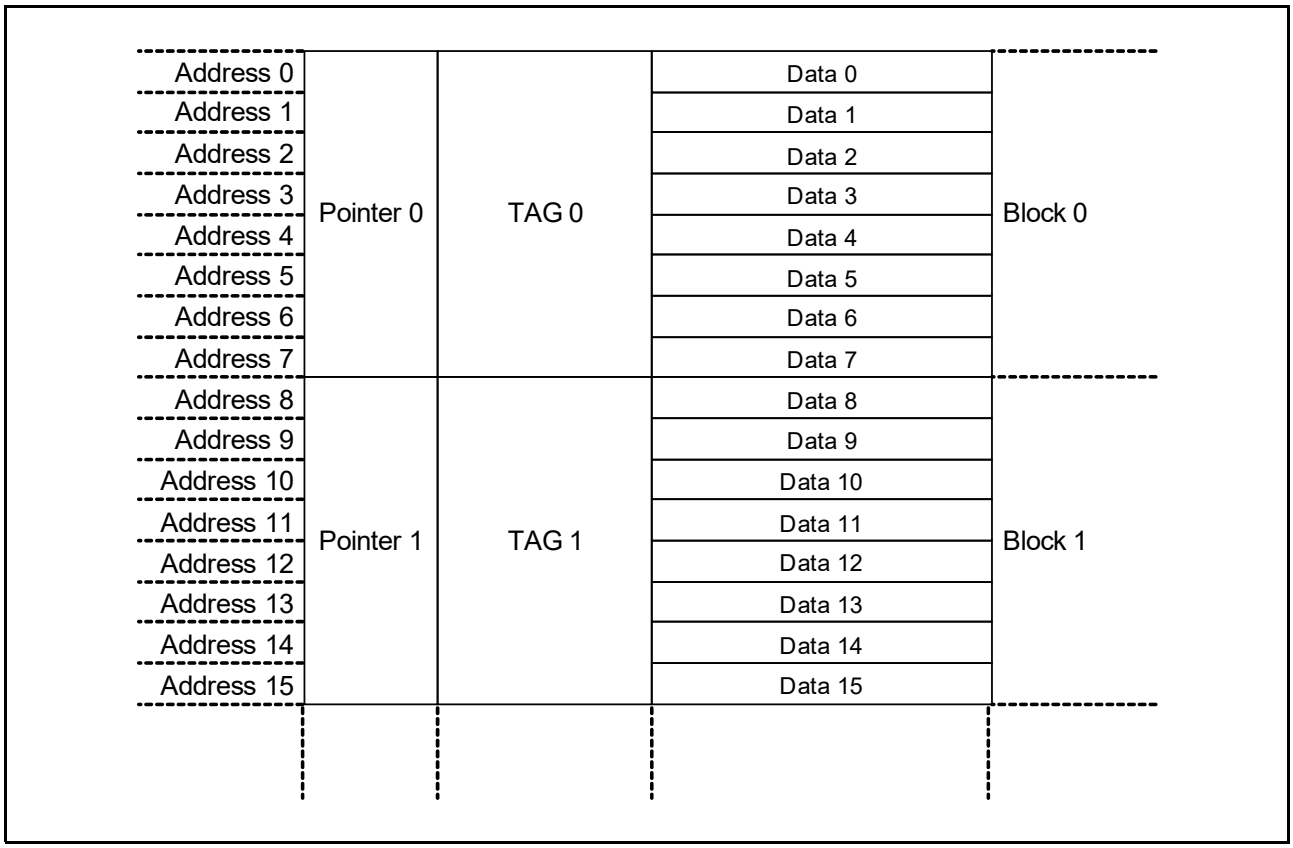

Figure 34.13 RAM First Address Representation

34.3.3.2 RAM Access by Agents

While written in RAMs, the Agents should respect a given structure defined by the following rules and described in Figure 34.14, Figure 34.15 and Figure 34.16.

[Restrictions]

- HW: A frame data should be written in a block in order and from smallest address to biggest address.
- HW: When a frame is contained in several blocks, the next block pointer should be written in the previous block pointer RAM to create a block chain.
- HW: In any block containing the first part of a frame, the frame data should be written from beat 1 address. The beat 0 address is reserved to write the descriptor.
- HW: While writing in a frame first block, the TAGs should be written with the first beat of data.
- HW: A pointer should always been written/read while accessing a block for the first time if needed.
- HW: The descriptor should always be written last and read first.
- HW: Type signals should be constant inside a frame. Value 0 is used for E-frames and 1 for P-frames.
- HW: Size signal can only be used for the last beat of data.
- HW: Cmd signals is used to signal what is being written to the RAMs. Value 0 is used for start-of-frame, Value 2 for end-of-frame and Value 3 for descriptor. All other accesses are done with value 1.

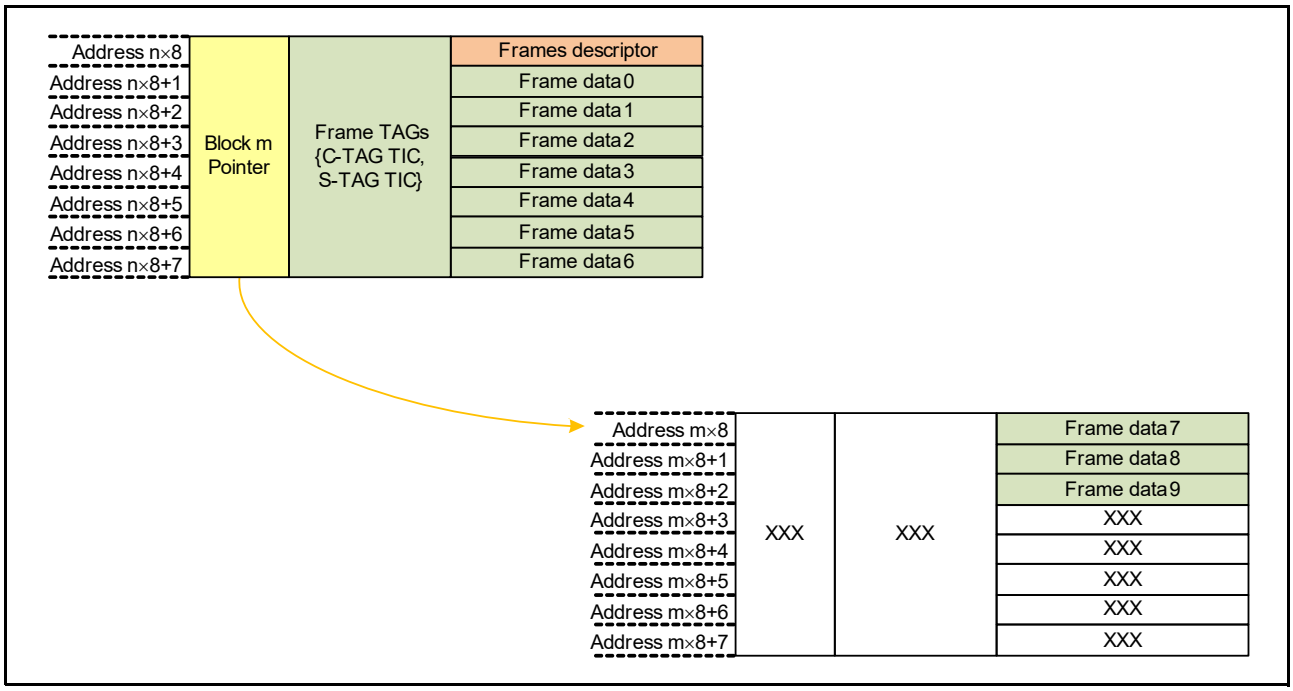

Figure 34.14 Fabric Data Structure

Note: Only S-TAGs and C-TAGs will be saved in the TAG RAM. The R-TAG will be taken by MFWD and saved in the agent descriptor RAM [GWCA][ETHA].

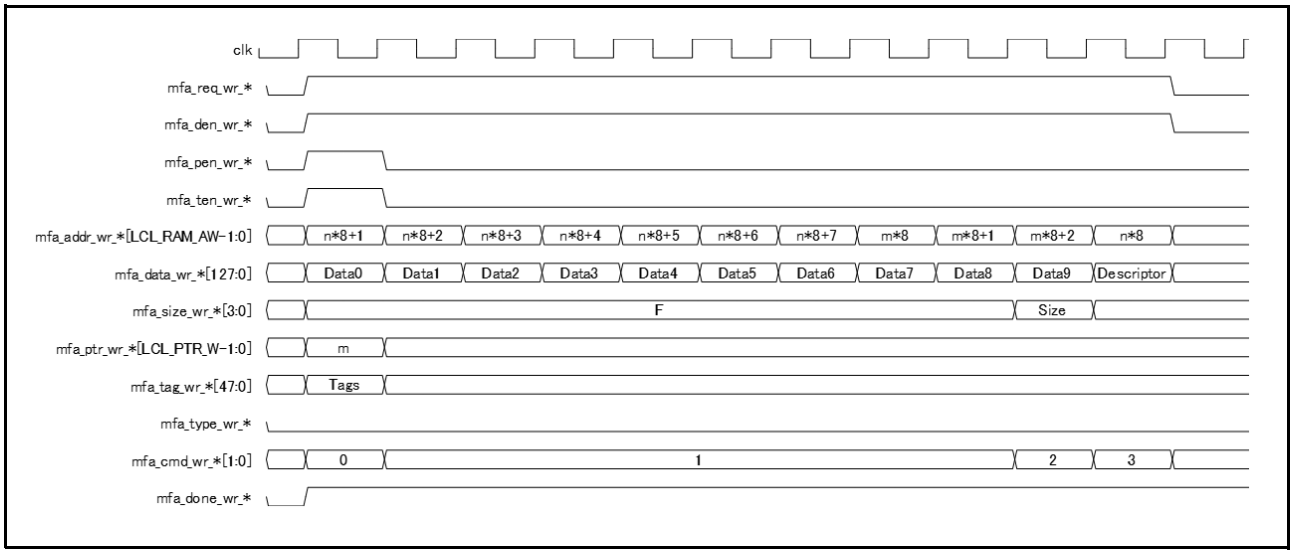

Figure 34.15 Frame Corresponding Fabric Write Accesses

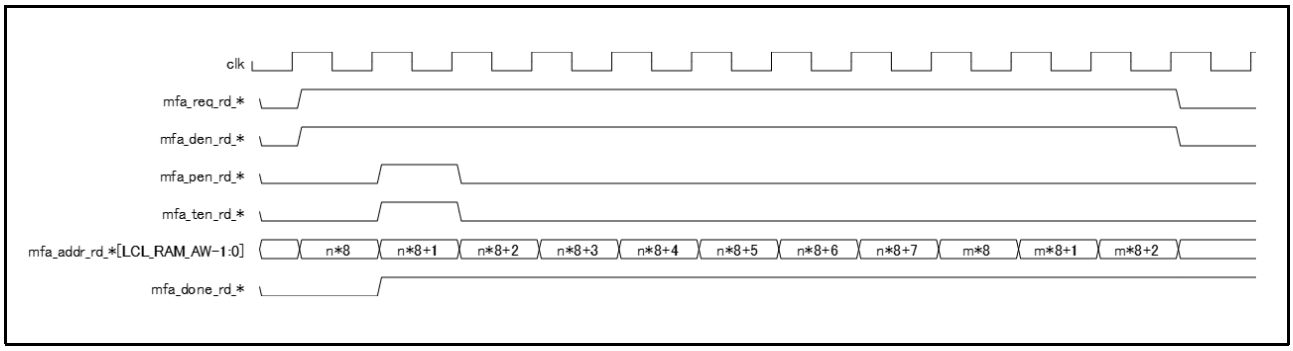

Figure 34.16 Frame Corresponding Fabric Read Accesses

34.3.4 Fabric Time Arbiter

Time arbiter controls done signal of Ethernet Agent [ETHA] Write and Read buses depending on link speed.
The faster a link is the more the corresponding agent will be able access to the local RAM.

34.3.4.1 Agents Done Signal Distribution

The Table 34.24 shows done signal distribution depending on PHY link speed possible combinations. Any disabled agent has a *doneSignalDistributionValue* equal to 0.

Table 34.24 Done Signal Output Ratio by Combination of PHY Link Speed

PHY link speeds of time-critical agents in OPERATION mode [ETHA]	*doneSignalDistributionValue* **[cycle]**
Only one Agent enabled	1
PHY link speed of all Agents is the same	1
100 Mbps : 1 Gbps	1 : 10

34.3.4.2 Done Signal Patterns

Figure 34.17 shows a done signal pattern example where time-critical port 0 has a 100 Mbps link and time-critical port 1 has a 1 Gbps link. When a request signals is not asserted at the timing when the corresponding done signal should have been asserted the done signals is not asserted and the handshake does not happen. In Figure 34.17 the request signals are always asserted to make the done pattern visible but, in a real system, request signals can be asserted anytime.

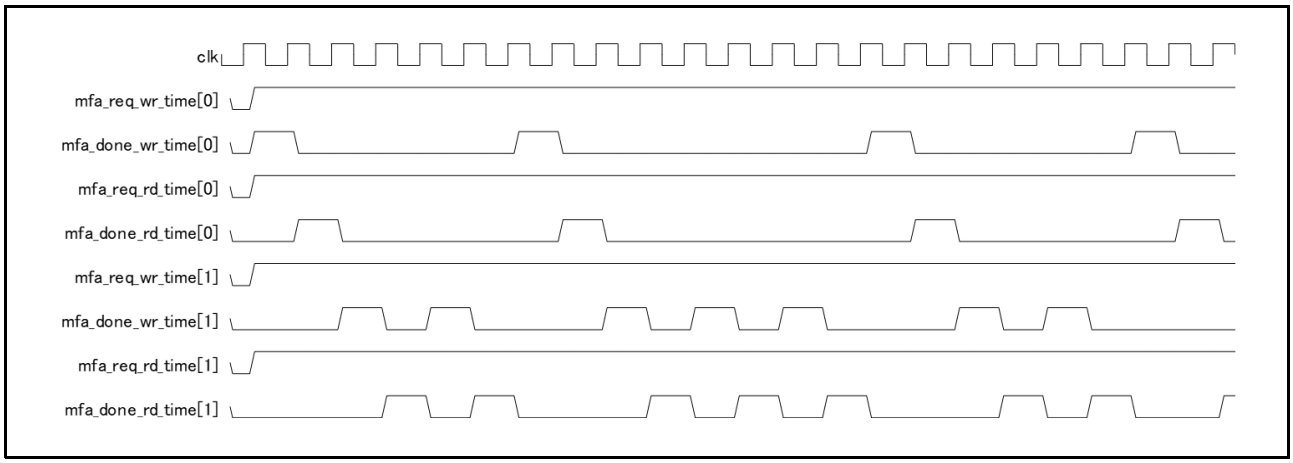

Figure 34.17 Done Signal Pattern Example

The done signal pattern has inherent properties that are always respected:

- For a static configuration the done pattern is cyclic with a constant cycle time *doneCycleClk* described in equation (4).
- During a period of *doneCycleClk* clocks starting from anywhere, a time-critical agent receives for both read and write buses a number of done signals equal to its associated done signal distribution value (Table 34.24).

(4) $doneCycleClk[cycle] = (\Sigma_2\ doneSignalDistributionValue[cycle]) \times 2$

[Where]

- Σ_2 *doneSignalDistributionValue* is the sum of all time-critical agents in OPERATION mode *doneSignalDistributionValue* (Table 34.24).

[Restriction]

- HW: Done signals are only given to Ethernet agents in OPERATION mode [ETHA].
- HW: If an unknown link speed is set for time-critical port i [ETHA] (mfa_xmii_speed[3 × (i + 1) – 1:3 × i] > 101b [RMAC]), Fabric will consider port i as disabled and port i will not be able to access the time arbiter.

34.3.4.3 Fabric Jitter

When an Ethernet Agent reads data using Fabric time arbiter, some jitter is induced in the reading process by Fabric and it should be taken in account while using TAS [802.1Qbv] or PSFP [802.1Qci]. The fabric jitter can be calculated for an agent using equation (6).

(6) $fabricJitter[ns] = (\lceil doneCycleClk[cycle] / doneSignalDistributionValue[cycle] \rceil + (PortTimeOperation[number] - 1) \times 2) \times clk_period[ns]$

[Where]

- *doneCycleClk* is detailed in section 34.3.4.2, Done Signal Patterns.
- *doneSignalDistributionValue* is corresponding agent value detailed in section 34.3.4.1, Agents Done Signal Distribution
- *PortTimeOperation* is the number of Ethernet Agents in OPERATION mode.
- *clk_period* is the ESWCLK clock period.

[Restrictions]

- SW: The *fabricJitter* equation takes in account the number of Ethernet Agents [ETHA] in OPERATION mode and also *doneCycleClk*. In fact, enabling/disabling an agent or changing an agent PHY speed will indeed affect the fabric jitter value. However, reconfiguration of TAS [802.1Qbv] or PSFP [802.1Qci] jitter in OPERATION is not a recommended option so, the maximum number of Ethernet Agents in OPERATION mode and their corresponding maximum PHY speed should be determined to calculate the worst *fabricJitter* per agent and it should be kept to the same value all the time.

34.3.4.4 Fabric Minimum Latency

When an Ethernet Agent reads data using Fabric time arbiter, some latency is induced in the reading process by Fabric and it should be taken in account while using TAS [802.1Qbv] or PSFP [802.1Qci]. The fabric minimum latency can be calculated for an agent using equation (7).

(7) $fabricLatency[ns] = (\lfloor doneCycleClk[cycle] / doneSignalDistributionValue[cycle] \rfloor - 1) \times clk_period[ns]$

[Where]

- *doneCycleClk* is detailed in section 34.3.4.2, Done Signal Patterns.
- *doneSignalDistributionValue* is corresponding agent value detailed in section 34.3.4.1, Agents Done Signal Distribution.
- *clk_period* is the ESWCLK clock period.

[Restrictions]

- SW: The *fabricLatency* equation takes in account *doneCycleClk*. In fact, enabling/disabling an agent or changing an agent PHY speed will indeed affect the fabric latency value. However, reconfiguration of TAS [802.1Qbv] or PSFP [802.1Qci] latency in OPERATION is not a recommended option so, if Ethernet agent are disabled or PHY speed is changed during OPERATION, it is recommended to set the *fabricLatency* to 2 × *clk_period[ns]* and add the *fabricLatency* calculated value in the worst case to *fabricJitter*.
- SW: When preemption is enabled for a port, *fabricLatency* should be set to 0ns and *fabricLatency* calculated value when all agents are enabled should be added to *fabricJitter*.

34.3.5 Source Port Generation

Fabric gives automatically a source port number to each Agent depending on the bus they are accessing to. Table 34.25 shows the relation between the Bus accessed by an agent and its source port number.

Table 34.25 Source Port Number Assignment

Bus from which agent access the Fabric	Source port number
ETHA0	0
ETHA1	1
GWCA0	2

34.3.6 Software Flows

[Restrictions]

- The registers within MFWD can only be written using the flows specified in this section.
- All software flows described in this section should be used in sequence.

34.3.6.1 Interrupt Handling Flow

Interrupt handling flow can be used in any mode except RESET mode.
The interrupt handling flow is described in Figure 34.18.

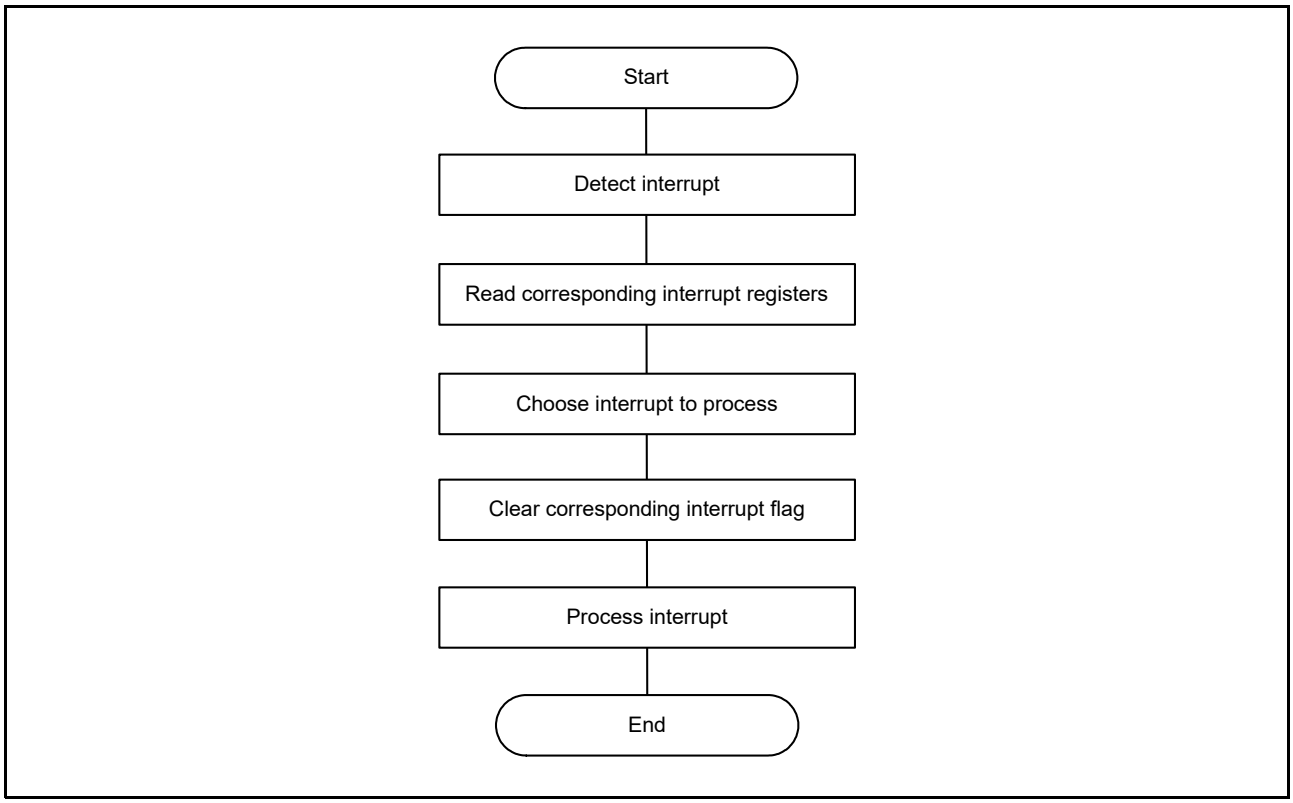

Figure 34.18 Interrupt Handling Flow

34.3.6.2 Port i Setting Flow

Port i setting flow is described in Figure 34.19.

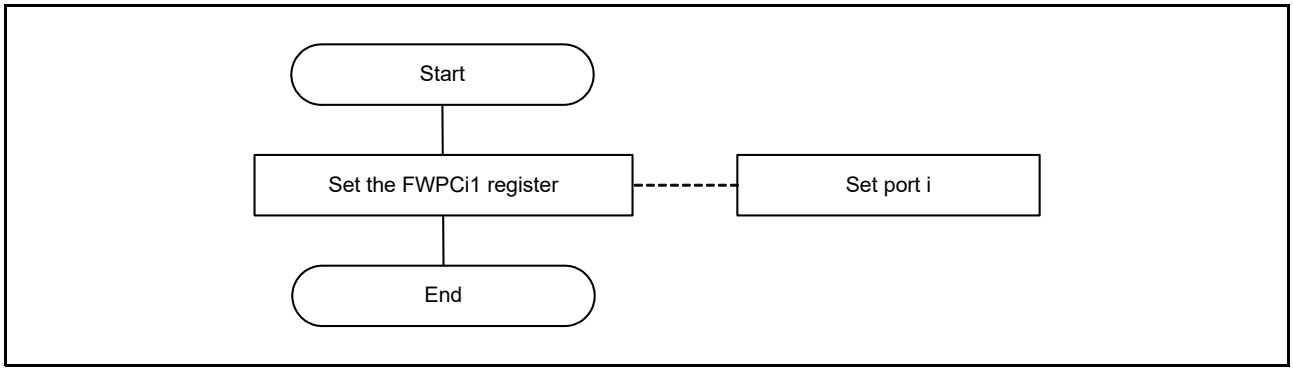

Figure 34.19 Port i Setting Flow (i = 0, 2)

34.3.6.3 Port Based Forwarding Flows

(1) Port i Port-Based Setting Flow

Port i port-based setting flow is described in Figure 34.20.

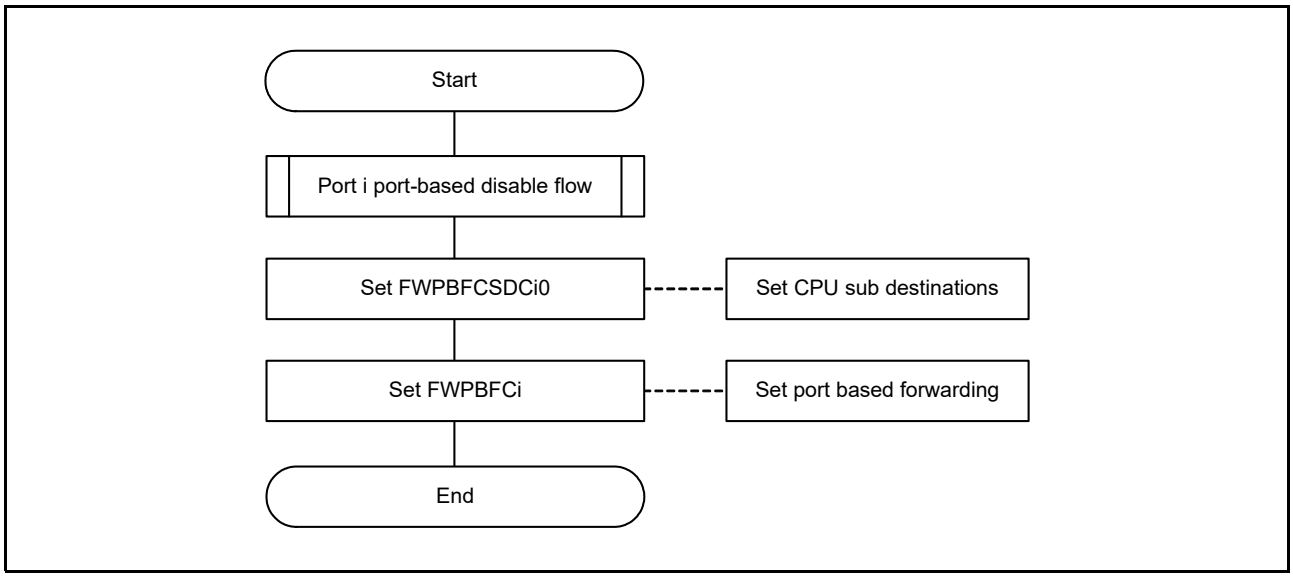

Figure 34.20 Port i Port-Based Setting Flow

(2) Port i Port-Based Disable Flow

Port i port-based disable flow is described in Figure 34.21.

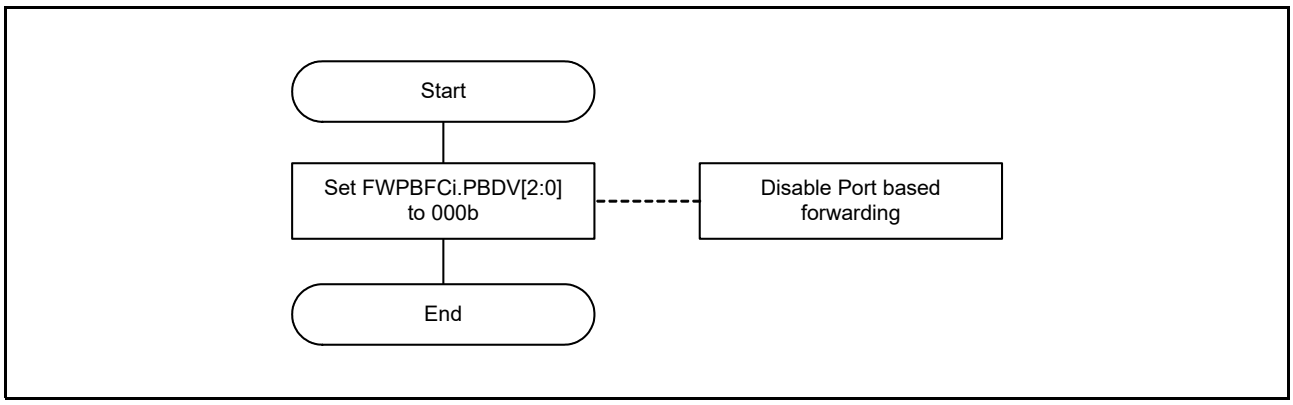

Figure 34.21 Port i Port-Based Disable Flow

34.3.6.4 Called Software Flows

The flows described in this section can only be called from other flows and cannot be used alone.

(1) Overall Setting Flow

Overall setting flow is described in Figure 34.22.

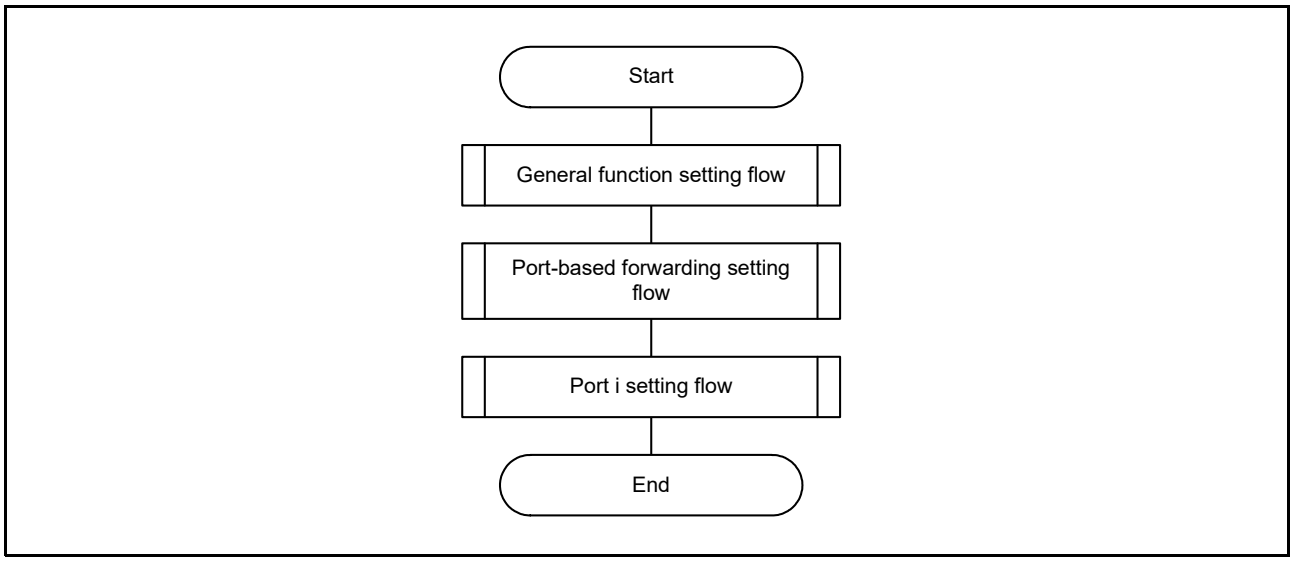

Figure 34.22 Overall Setting Flow (i = 0, 2)

(2) General Function Setting Flow

General function setting flow is described in Figure 34.23.

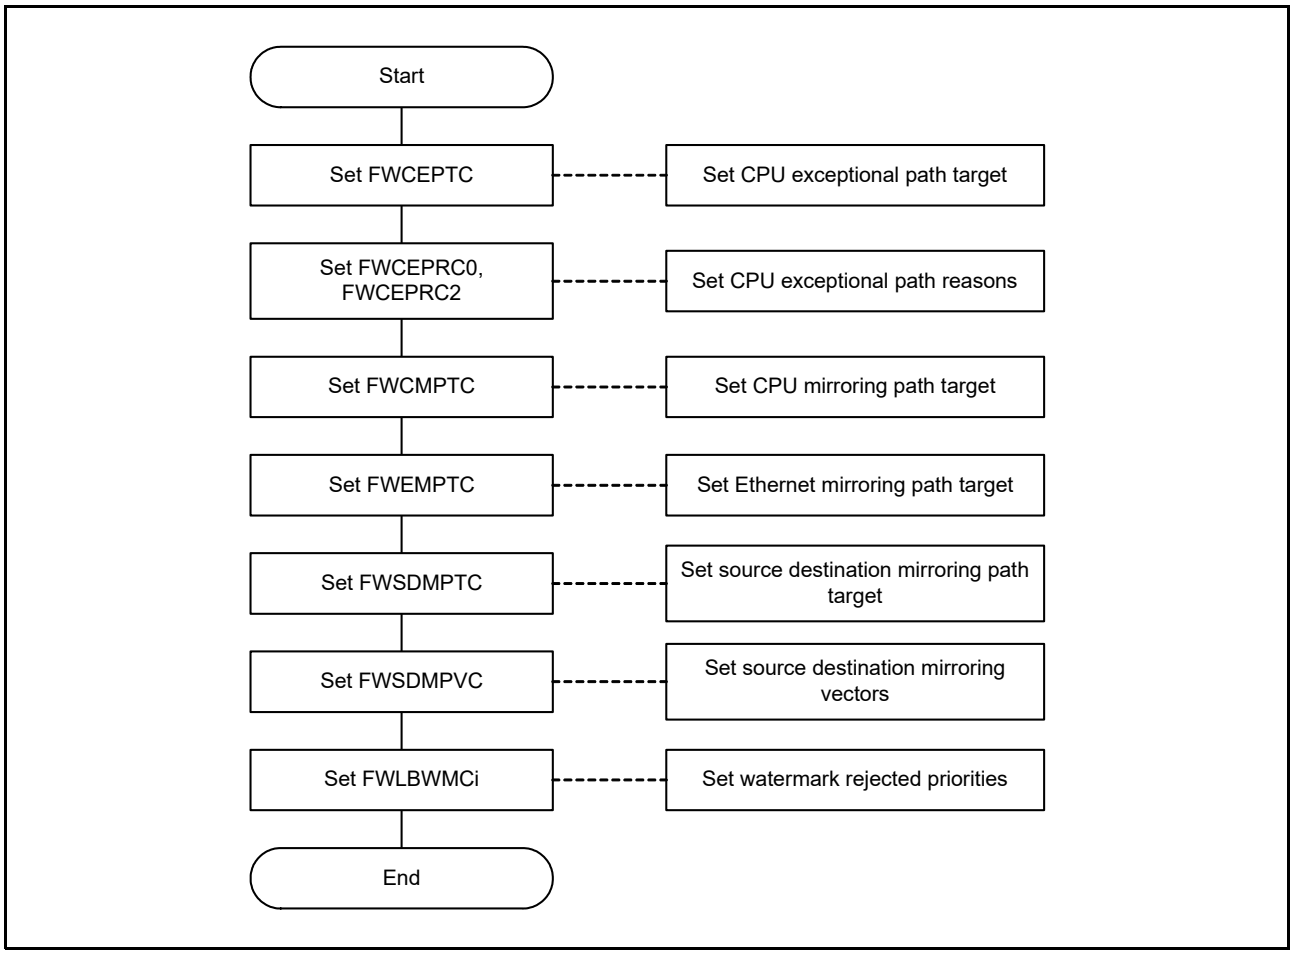

Figure 34.23 General Function Setting Flow

(3) Port-Based Forwarding Setting Flow

Port-based forwarding setting flow is described in Figure 34.24.

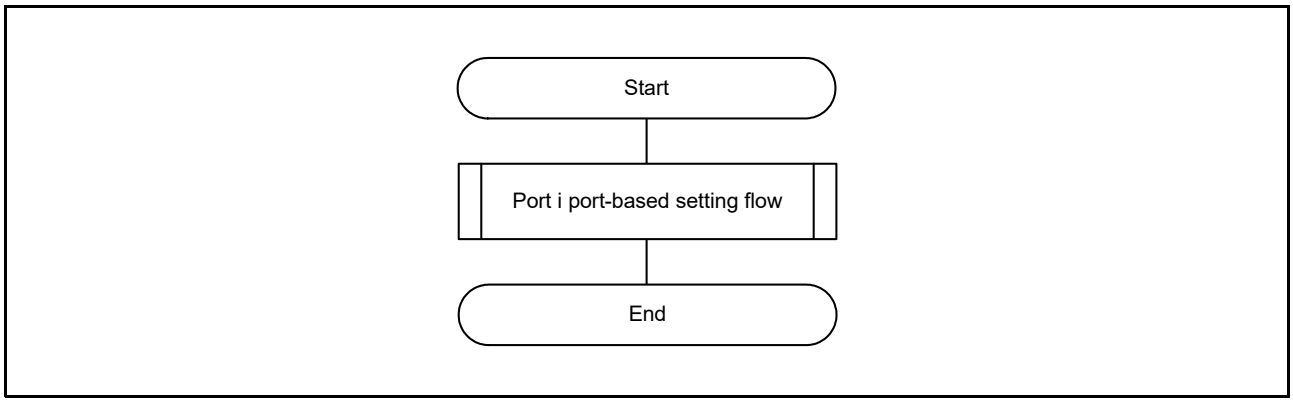

Figure 34.24 Port-Based Forwarding Setting Flow (i = 0, 2)

34.3.6.5 Register Writable Without Software Flow After Initialization

The table below describes the registers writable without software flow and in which mode they can be written without software flow.

Table 34.26 Writable Without Software Flow Registers

Register name	Writable anytime
FWCEPTC	✓
FWCEPRC0, FWCEPRC2	✓
FWCMPTC	✓
FWEMPTC	✓
FWSDMPTC	✓
FWSDMPVC	✓
FWLBWMCi	✓
FWPCi1	✓

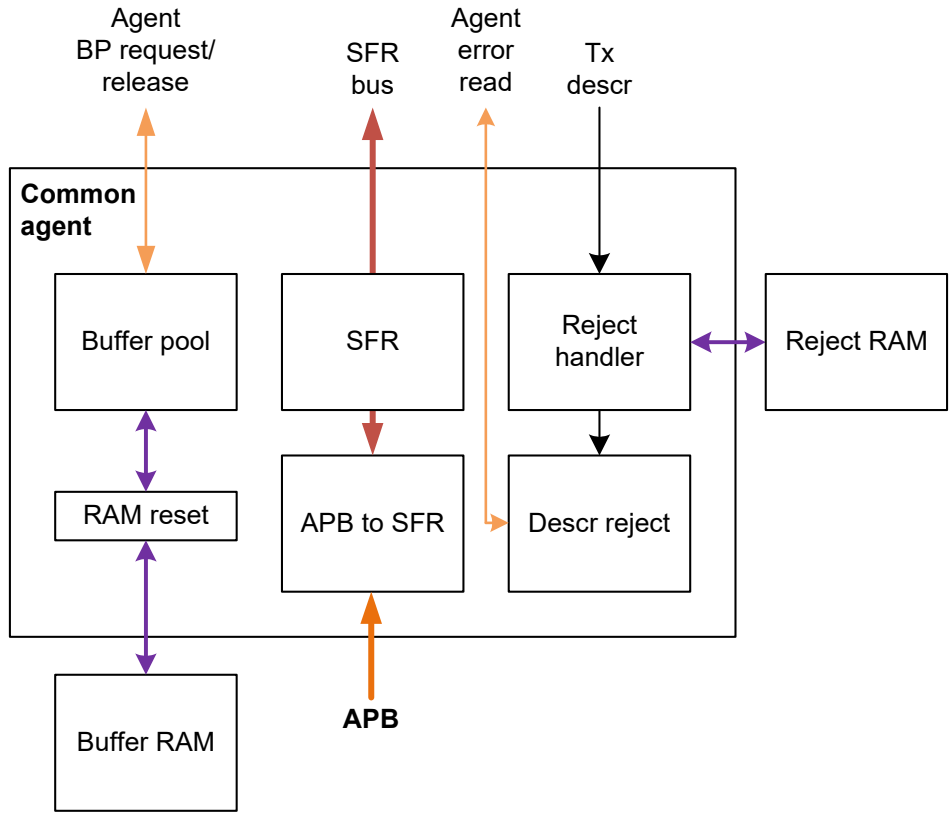
✓ = Writable, × = not Writable

35. Ethernet Common Agent (COMA)

35.1 Overview

Ethernet common agent (COMA) is an agent of ESWM system which aims at gathering common functionalities for other agents.
It handles the APB to SFR bus conversion, the buffer pointer release for rejected frames and the pointer handling for Local RAM. Software involvement required for common agent configuration.

35.1.1 Features



COMA features are described in Table 35.1.

Table 35.1 COMA Feature List

Function		Details
Overall function	Pointer management	• Manage the Local RAM pointers and their distribution
	APB to SFR	• Convert APB protocol in SFR bus • Distribute SFR access among other Ethernet-related modules
	Descriptor reject	• Reject the descriptors unused by agents for transmission
Data provision	Fabric error bus	• Pointer received from fabric through error bus
	Descriptor bus	• Descriptor received from forwarding engine (MFWD) for rejection
Control function	RAM access	• Function that writes and reads to RAM

35.1.2 COMA Block Diagram

Figure 35.1 shows common agent block diagram.

APB to SFR : Convert APB bus to SFR bus for every IP in ESWM system
SFR : COMA SFR
Reject handler : Receive descriptors to be rejected from forwarding engine and save them in reject RAM
Descr reject : Reject the descriptors
Free Buffer pool : Handle the free buffer pointers
RAM reset : Handle RAM reset

Figure 35.1 COMA Block Diagram

35.2 Register Description

35.2.1 Global Registers

35.2.1.1 IP Version Register (RIPV)

Address(es): COMA.RIPV 874C 9000h, COMA_NS.RIPV 074C 9000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	TIPV[3:0]	Top Module IP Version Number		R
b7 to b4	GWIPV[3:0]	Gateway CPU Agent IP Version Number		R
b11 to b8	FWIPV[3:0]	Forwarding Engine IP Version Number		R
b15 to b12	EAIPV[3:0]	Ethernet Agent IP Version Number		R
b19 to b16	FBIPV[3:0]	Fabric Bus IP Version Number		R
b23 to b20	CAIPV[3:0]	Common Agent IP Version Number		R
b31 to b24	—	Reserved	These bits are read as 0.	R

35.2.1.2 Reset Configuration Register (RRC)

Address(es): COMA.RRC 874C 9004h, COMA_NS.RRC 074C 9004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RR	Software Reset*1	0: Release ESWM reset. 1: Initiate ESWM reset.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. After writing “1”, change the value back to “0” as soon as possible.

RR Bit (Software Reset)

When this bit is set to 1, the entire ESWM system is reset.

A synchronous reset with this bit consumes a lot of power, so it is only asserted internally for seven clock cycles. The synchronous reset is also asserted internally for seven clock cycles after the hardware reset is released.

35.2.1.3 Clock Enable Configuration Register (RCEC)

Address(es): COMA.RCEC 874C 9008h, COMA_NS.RCEC 074C 9008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ACE2	ACE1	ACE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ACE0	Agent 0 Clock Enable	0: Agent 0 (ETHA0) clock is disabled. 1: Agent 0 (ETHA0) clock is enabled.	R/(W) *1
b1	ACE1	Agent 1 Clock Enable	0: Agent 1 (ETHA1) clock is disabled. 1: Agent 1 (ETHA1) clock is enabled.	R/(W) *1
b2	ACE2	Agent 2 Clock Enable	0: Agent 2 (GWCA0) clock is disabled. 1: Agent 2 (GWCA0) clock is enabled.	R/(W) *1
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RCE	Clock Enable	0: ESWCLK is disabled. 1: ESWCLK is enabled.	R/(W) *1
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the RCDC register.

The COMA registers are controlled by PCLKA, so register read and write operations are possible regardless of the setting of this register. Each agent (ETHA, GWCA) is controlled by the agent clock, so when the ACEi bit is 0, register read operations are possible but write operations are not. Also, MFWD is controlled by ESWCLK, so when the RCE bit is 0, register read operations are possible but write operations are not.

ACEi Bit (Agent i Clock Enable) (i = 0 to 2)

This bit enables agent i clock.

When the RRC.RR bit is set to 1, all agent clocks are internally enabled to allow software reset even if the ACEi bits are not set to 1.

When the RCEC.RCE bit is not set to 1, agent clocks are internally disabled even if the ACEi bits are set to 1.

RCE Bit (Clock Enable)

This bit enables ESWCLK.

When the RRC.RR bit is set to 1, ESWCLK is internally enabled to allow software reset even if the RCE bit is not set to 1.

35.2.1.4 Clock Disable Configuration Register (RCDC)

Address(es): COMA.RCDC 874C 900Ch, COMA_NS.RCDC 074C 900Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	ACD2	ACD1	ACD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ACD0	Agent 0 Clock Disable	Writing 1 to this bit clears the RCEC.ACE0 bit. Writing 0 to this bit has no effect. The read value is 0.	R/W
b1	ACD1	Agent 1 Clock Disable	Writing 1 to this bit clears the RCEC.ACE1 bit. Writing 0 to this bit has no effect. The read value is 0.	R/W
b2	ACD2	Agent 2 Clock Disable	Writing 1 to this bit clears the RCEC.ACE2 bit. Writing 0 to this bit has no effect. The read value is 0.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RCD	Clock Disable*1	Writing 1 to this bit clears the RCEC.RCE bit. Writing 0 to this bit has no effect. The read value is 0.	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Write 1 to this bit when all agents are disabled and the CABPPCM.RPC[9:0] bits are equal to 512.

35.2.2 Buffer Pool Function Registers

35.2.2.1 Buffer Pool IPV Based Watermark Configuration Register i (CABPIBWMCi) (i = 0 to 7)

Address(es): COMA.CABPIBWMC0 874C 9020h, COMA.CABPIBWMC1 874C 9024h, COMA.CABPIBWMC2 874C 9028h, COMA.CABPIBWMC3 874C 902Ch, COMA.CABPIBWMC4 874C 9030h, COMA.CABPIBWMC5 874C 9034h, COMA.CABPIBWMC6 874C 9038h, COMA.CABPIBWMC7 874C 903Ch, COMA_NS.CABPIBWMC0 074C 9020h, COMA_NS.CABPIBWMC1 074C 9024h, COMA_NS.CABPIBWMC2 074C 9028h, COMA_NS.CABPIBWMC3 074C 902Ch, COMA_NS.CABPIBWMC4 074C 9030h, COMA_NS.CABPIBWMC5 074C 9034h, COMA_NS.CABPIBWMC6 074C 9038h, COMA_NS.CABPIBWMC7 074C 903Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	IBSWMPN[9:0]									
Value after reset:	0	0	0	0	0	0	*1									

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	IBUWMPN[9:0]									
Value after reset:	0	0	0	0	0	0	*1									

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	IBUWMPN[9:0]	IPV Based Unsecure Watermark Pointer Number	• CABPIBWMC7 register: Set a value of 512 or less. Note that setting these bits to 512 disables the IPV-based watermark function for IPV 7. • CABPIBWMCi register (i = 0 to 6): Set a value equal to or less than the CABPIBWMC[i+1].IBUWMPN[9:0] bits. Note that setting these bits to the same value as the CABPIBWMC[i+1].IBUWMPN[9:0] bits disables the IPV-based watermark function for IPV i.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	IBSWMPN[9:0]	IPV Based Secure Watermark Pointer Number	• CABPIBWMC7 register: Set a value of 512 or less. Note that setting these bits to 512 disables the IPV-based watermark function for IPV 7. • CABPIBWMCi register (i = 0 to 6): Set a value equal to or less than the CABPIBWMC[i+1].IBSWMPN[9:0] bits. Note that setting these bits to the same value as the CABPIBWMC[i+1].IBSWMPN[9:0] bits disables the IPV-based watermark function for IPV i.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. The value after reset of the IBUWMPN[9:0] and IBSWMPN[9:0] bits is the same; and the value for the CABPIBWMCi register is 430 + 8 × i.

These registers are used to set watermarks based on the Internal Priority Value (IPV) assigned by the MFWD. The CABPIBWMCi register corresponds to IPV i.

Refer to section 35.3.1.1, IPV Based Watermark for details.

35.2.2.2 Buffer Pool Watermark Level Configuration Register (CABPWMLC)

Address(es): COMA.CABPWMLC 874C 9040h, COMA_NS.CABPWMLC 074C 9040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	WMCL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	WMFL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	WMFL[9:0]	Watermark Flush Level	Set a value of 512 or less. Note that setting these bits to 512 disables the watermark flush level function.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	WMCL[9:0]	Watermark Critical Level	Set a value equal to or less than the WMFL[9:0] bits. Setting these bits to 512 disables the watermark critical level function.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

This register is used to set a watermark based on the global level.
Refer to section 35.3.1.2, Global Level-Based Watermark for details.

35.2.2.3 Buffer Pointer Pause Frame Level i Configuration Register (CABPPFLCi) (i = 0, 1)

Address(es): COMA.CABPPFLC0 874C 9050h, COMA.CABPPFLC1 874C 9054h, COMA_NS.CABPPFLC0 074C 9050h, COMA_NS.CABPPFLC1 074C 9054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	PAL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PDL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	PDL[9:0]	Pause De-assertion Level		R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	PAL[9:0]	Pause Assertion Level	Setting this register to 512 will disable pause frames.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

PDL[9:0] Bits (Pause De-assertion Level)

Refer to section 35.3.2.1, Global Pause Function for details.

[Restrictions]

- SW: The value of these bits should always be less than or equal to the CABPPFLCi.PAL[9:0] bits.
- SW: These bits should not be set to a value greater than 512.
- SW: These bits should not be set to a value less than 24.

[Precautions]

- If CABPPFLCi.PAL[9:0] value is too close to CABPPFLCi.PDL[9:0] value, corresponding PAUSE signals will change state rapidly and if zero automatic pause frames are activated [RMAC], it can result on a succession of pause frames on RMAC TX side which will decrease the link performance.

PAL[9:0] Bits (Pause Assertion Level)

Refer to section 35.3.2.1, Global Pause Function for details.

[Restrictions]

- SW: These bits should not be set to a value greater than 512.
- SW: These bits should not be set to a value less than 24.

35.2.2.4 Port i Buffer Pool Watermark Level Configuration Register (CABPPWMLCi) (i = 0 to 2)

Address(es): COMA.CABPPWMLC0 874C 9060h, COMA.CABPPWMLC1 874C 9064h, COMA.CABPPWMLC2 874C 9068h, COMA_NS.CABPPWMLC0 074C 9060h, COMA_NS.CABPPWMLC1 074C 9064h, COMA_NS.CABPPWMLC2 074C 9068h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	PWMCL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PWMFL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	PWMFL[9:0]	Watermark Flush Level	Setting these bits to 512 disables the watermark flush level function.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	PWMCL[9:0]	Watermark Critical Level	Setting these bits to 512 disables the watermark critical level function.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

PWMFL[9:0] Bits (Watermark Flush Level)

Refer to section 35.3.1.3, Per-Port Level-Based Watermark for details.

[Restrictions]

- SW: These bits should not be set to a value greater than 512.

PWMCL[9:0] Bits (Watermark Critical Level)

Refer to section 35.3.1.3, Per-Port Level-Based Watermark for details.

[Restrictions]

- SW: The value of these bits should always be less than or equal to the CABPPWMLCi.PWMFL[9:0] bits.
- SW: These bits should not be set to a value greater than 512.

35.2.2.5 Port i Buffer Pointer Pause Frame Level j Configuration Register (CABPPPFLCij) (i = 0 to 2; j = 0, 1)

Address(es): COMA.CABPPPFLC00 874C 90A0h, COMA.CABPPPFLC01 874C 90A4h, COMA.CABPPPFLC10 874C 90A8h, COMA.CABPPPFLC11 874C 90ACh, COMA.CABPPPFLC20 874C 90B0h, COMA.CABPPPFLC21 874C 90B4h, COMA_NS.CABPPPFLC00 074C 90A0h, COMA_NS.CABPPPFLC01 074C 90A4h, COMA_NS.CABPPPFLC10 074C 90A8h, COMA_NS.CABPPPFLC11 074C 90ACh, COMA_NS.CABPPPFLC20 074C 90B0h, COMA_NS.CABPPPFLC21 074C 90B4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	PPAL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PPDL[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	PPDL[9:0]	Pause De-Assertion Level		R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	PPAL[9:0]	Pause Assertion Level	Setting these bits to 512 will disable pause frames.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

PPDL[9:0] Bits (Pause De-Assertion Level)

Refer to section 35.3.2.2, Per-Port Pause Function for details.

[Restrictions]

- SW: The value of these bits should always be less than or equal to the CABPPPFLCij.PPAL[9:0] bits.
- SW: These bits should not be set to a value greater than 512.
- SW: These bits should not be set to a value less than 6.

[Precautions]

- If CABPPFLCi.PAL[9:0] value is too close to CABPPFLCi.PDL[9:0] value, corresponding PAUSE signals will change state rapidly and if zero automatic pause frames are activated [RMAC], it can result on a succession of pause frames on RMAC TX side which will decrease the link performance.

PPAL[9:0] Bits (Pause Assertion Level)

Refer to section 35.3.2.2, Per-Port Pause Function for details.

[Restrictions]

- SW: These bits should not be set to a value greater than 512.
- SW: These bits should not be set to a value less than 6.

35.2.2.6 Port i Buffer Pointer Utilization Level Configuration Register (CABPULCi) (i = 0 to 2)

Address(es): COMA.CABPULC0 874C 9100h, COMA.CABPULC1 874C 9104h, COMA.CABPULC2 874C 9108h, COMA_NS.CABPULC0 074C 9100h, COMA_NS.CABPULC1 074C 9104h, COMA_NS.CABPULC2 074C 9108h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	MNNPN[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MXNPN[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	MXNPN[9:0]	Maximum Number of Pointer	Maximum number of pointers that can be used by port i.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b25 to b16	MNNPN[9:0]	Minimum Number of Pointer	Minimum number of pointers that can be used by port i.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: If CABPULCi.MNNPN[9:0] of port i is changed (reconfigured) from its default value, then it restricts the reception maximum frame size of other ports(i.e. ports other than port i). The restricted reception maximum frame size of ports other than port i in such case is given by below expression.
Restricted reception maximum frame size = ((512 – CABPULCi.MNNPN[9:0])/2) × 128 bytes. This is because other ports (ports other than port i) have to share remaining pointers (512 – CABPULCi.MNNPN[9:0]).
If this restriction is not followed, then the consumed buffer pointers will not be released by other ports and the frame will be stuck inside ESWM. Because the total buffer pointers are insufficient for the port in the middle of reception. To resolve this, reconfigure CABPULCi.MNNPN[9:0] value to a smaller value.

MXNPN[9:0] Bits (Maximum Number of Pointer)

If the value of the CABPCPMi.RPCP[9:0] bits is equal to the value of these bits, port i will not receive pointer anymore.
Refer to section 35.3.3, Per Port Memory Allocation Function for details.
[Restrictions]

- SW: The maximum number of pointers should be set to a value big enough to save 2 frames with a size equal to RMAC reception maximum frame size (set in RMAC [RMAC]).

MNNPN[9:0] Bits (Minimum Number of Pointer)

If SUM(CABPULCi.MNNPN[9:0]) ≥ CABPPCM.RPC[9:0] + SUM(CABPCPMi.RPCP[9:0]) only ports for which CABPCPMi.RPCP[9:0] < CABPULCi.MNNPN[9:0] will be able to receive pointers.
Refer to section 35.3.3, Per Port Memory Allocation Function for details.
[Restrictions]

- SW: The sum of all CABPULCi.MNNPN[9:0] bits should be less than or equal to 512.
- SW: These bits should always be less than or equal to the CABPULCi.MXNPN[9:0] bits.

35.2.2.7 Buffer Pool Initialization Register Monitoring Register (CABPIRM)

Address(es): COMA.CABPIRM 874C 9140h, COMA_NS.CABPIRM 074C 9140h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BPR	BPIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	BPIOG	Buffer Pool Initialization Ongoing		R/W
b1	BPR	Buffer Pool Ready	0: Buffer pool cannot be used. 1: Buffer pool can be used. The write value should be 0.	R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

BPIOG Bit (Buffer Pool Initialization Ongoing)

[Setting Condition]

- SW: By writing 1 to this bit.

[Clearing Condition]

- HW: This bit is cleared when buffer pool initialization is finished.

[Restriction]

- HW: CPU cannot write 1 to this bit when the CABPIRM.BPR bit is set.

BPR Bit (Buffer Pool Ready)

[Setting Condition]

- When the CABPIRM.BPIOG bit is getting cleared.
- HW: This bit is set at “clk_period[ns]*512” time from buffer pool initialization starting.

35.2.2.8 Buffer Pool Pointer Count Monitoring Register (CABPPCM)

Address(es): COMA.CABPPCM 874C 9144h, COMA_NS.CABPPCM 074C 9144h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	TPC[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	RPC[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	RPC[9:0]	Remaining Pointer Count		R
b15 to b10	—	Reserved	These bits are read as 0.	R
b25 to b16	TPC[9:0]	Total Pointer Count	The value of these bits is fixed to 512.	R
b31 to b26	—	Reserved	These bits are read as 0.	R

RPC[9:0] Bits (Remaining Pointer Count)

[Increment Condition]

- HW: Incremented by 1 when a pointer is released.

[Decrement Condition]

- HW: Decremented by 1 when a pointer is given to an agent.

TPC[9:0] Bits (Total Pointer Count)

Reading these bits gives the number of pointers contained in the buffer pool. The ESWM local data RAM size will be equal to 128 × CABPPCM.TPC[9:0] bytes.

35.2.2.9 Buffer Pool Pointer Least Count Monitoring Register (CABPLCM)

Address(es): COMA.CABPLCM 874C 9148h, COMA_NS.CABPLCM 074C 9148h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	LRC[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	LRC[9:0]	Least Remaining Pointer Count	These bits store the minimum value taken by the pointer remaining counter.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

RPC[9:0] Bits (Least Remaining Pointer Count)

[Update Condition]

- HW: These bits are updated to the CABPPCM.RPC[9:0] bits when CABPPCM.RPC[9:0] < CABPLCM.LRC[9:0].

[Clearing Condition]

- Reading these bits clears it to CABPPCM.RPC[9:0] value.

35.2.2.10 Port i Buffer Pointer Count Monitoring Register (CABPCPMi) (i = 0 to 2)

Address(es): COMA.CABPCPM0 874C 9180h, COMA.CABPCPM1 874C 9184h, COMA.CABPCPM2 874C 9188h, COMA_NS.CABPCPM0 074C 9180h, COMA_NS.CABPCPM1 074C 9184h, COMA_NS.CABPCPM2 074C 9188h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	RPCP[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	RPCP[9:0]	Received Pointer Count	These bits show the number of pointers that are used by agent i to store data.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

RPCP[9:0] Bits (Received Pointer Count)

[Increment Condition]

- HW: Incremented by 1 when a pointer is given to port i.

[Decrement Condition]

- HW: Decremented by 1 when a pointer which has been given to port i is being released.

35.2.2.11 Port i Buffer Pointer Maximum Count Monitoring Register (CABPMCPMi) (i = 0 to 2)

Address(es): COMA.CABPMCPM0 874C 9200h, COMA.CABPMCPM1 874C 9204h, COMA.CABPMCPM2 874C 9208h, COMA_NS.CABPMCPM0 074C 9200h, COMA_NS.CABPMCPM1 074C 9204h, COMA_NS.CABPMCPM2 074C 9208h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	RPMCP[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	RPMCP[9:0]	Received Pointer Maximum Count	These bits store the maximum value taken by the CABPCPMi.RPCP[9:0] bits since last read access.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

RPMCP[9:0] Bits (Received Pointer Maximum Count)

[Update Condition]

- HW: These bits are updated to the CABPCPMi.RPCP[9:0] bits when CABPCPMi.RPCP[9:0] > CABPMCPMi.RPMCP[9:0].

[Clearing Condition]

- Reading these bits clears it to CABPCPMi.RPCP[9:0] value.

[Restrictions]

- It may momentarily exceed several upper and lower limit settings.

35.2.3 Reject RAM Function Registers

35.2.3.1 Rejected Descriptor Number Monitoring Register (CARDNM)

Address(es): COMA.CARDNM 874C 9300h, COMA_NS.CARDNM 074C 9300h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	RDNRR[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	RDNRR[9:0]	Rejected Descriptor Number in Reject RAM	These bits show the number of descriptors currently contained in the reject RAM.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

RDNRR[9:0] Bits (Rejected Descriptor Number in Reject RAM)

[Increment Condition]

- HW: Incremented by 1 a descriptor is received from forwarding engine.

[Decrement Condition]

- HW: Decremented by 1 when a descriptor is read from reject RAM.

35.2.3.2 Rejected Descriptor Maximum Number Monitoring Register (CARDMNM)

Address(es): COMA.CARDMNM 874C 9304h, COMA_NS.CARDMNM 074C 9304h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	RDMNRR[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	RDMNRR[9:0]	Rejected Descriptor Maximum Number in Reject RAM	These bits store the maximum value taken by the CARDNM.RDNRR[9:0] bits since last read access.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

RDMNRR[9:0] Bits (Rejected Descriptor Maximum Number in Reject RAM)

[Update Condition]

- Set to the CARDNM.RDNRR[9:0] bits when CARDNM.RDNRR[9:0] > CARDMNM.RDMNRR[9:0].

[Clearing Condition]

- Reading these bits clears it to CARDNM.RDNRR[9:0] value.

35.2.4 Reject RAM Counter Registers

35.2.4.1 Rejected Descriptor Counter Register (CARDCN)

Address(es): COMA.CARDCN 874C 9310h, COMA_NS.CARDCN 074C 9310h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RDN[31:0]	Rejected Descriptor Number	These bits count the number of descriptors that have been rejected since the last read.	R

RDN[31:0] Bits (Rejected Descriptor Number)

[Clearing Condition]

- SW: Reading these bits clears it.

[Increment Condition]

- HW: Incremented by 1 when a rejected descriptor is received from forwarding engine [MFWD] and if this register has a value different than FFFF FFFFh.

35.2.5 Error Interrupt Registers

35.2.5.1 Error Interrupt Status Register 0 (CAEIS0)

Address(es): COMA.CAEIS0 874C 9400h, COMA_NS.CAEIS0 074C 9400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	WMFLOS	WMCLOS	BPOPS	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	BPOPS	Buffer Pool Out of Pointer Status Flag	0: No Buffer Pool Out of Pointer 1: Buffer Pool Out of Pointer occurred.	R/W
b9	WMCLOS	Watermark Critical Level Overtook Status Flag	0: No Watermark Critical Level Overtook 1: Watermark Critical Level Overtook occurred.	R/W
b10	WMFLOS	Watermark Flush Level Overtook Status Flag	0: No Watermark Flush Level Overtook 1: Watermark Flush Level Overtook occurred.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

BPOPS Flag (Buffer Pool Out of Pointer Status Flag)

[Setting Condition]

- HW: When the CABPPCM.RPC[9:0] bits become null.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- SW: No recovery, ESWM could overflow [RMAC]
  When using cut through, please use the watermark function so that this status does not occur. If get this error (it may get hung-up in the transmit state [ETHA and RMAC]), initialize the state with Emergency reset flow [ESWM].

WMCLOS Flag (Watermark Critical Level Overtook Status Flag)

[Setting Condition]

- HW: When watermark critical level (WM.CRITICAL) gets asserted to All1 because of global level-based watermark (refer to Figure 35.3).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- SW: No recovery, data can be lost [MFWD].

WMFLOS Flag (Watermark Flush Level Overtook Status Flag)

[Setting Condition]

- HW: When watermark flush level (WM.FLUSH) gets asserted to All1 because of global level-based watermark (refer to Figure 35.3).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- SW: No recovery, data can be lost [MFWD].

35.2.5.2 Error Interrupt Enable Register 0 (CAEIE0)

Address(es): COMA.CAEIE0 874C 9404h, COMA_NS.CAEIE0 074C 9404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	WMFLOE	WMCLOE	BPOPE	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	BPOPE	Buffer Pool Out of Pointer Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b9	WMCLOE	Watermark Critical Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b10	WMFLOE	Watermark Flush Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the CAEID0 register.

BPOPE Bit (Buffer Pool Out of Pointer Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the CAEID0.BPOPD bit will clear this bit.

WMCLOE Bit (Watermark Critical Level Overtook Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the CAEID0.WMCLOD bit will clear this bit.

WMFLOE Bit (Watermark Flush Level Overtook Enable)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- Writing 1 to the CAEID0.WMFLOD bit will clear this bit.

35.2.5.3 Error Interrupt Disable Register 0 (CAEID0)

Address(es): COMA.CAEID0 874C 9408h, COMA_NS.CAEID0 074C 9408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	WMFLOD	WMCLOD	BPOPD	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	BPOPD	Buffer Pool Out of Pointer Disable	0: Has no effects. 1: Sets the CAEIE0.BPOPE bit to 0.	R/W
b9	WMCLOD	Watermark Critical Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE0.WMCLOE bit to 0.	R/W
b10	WMFLOD	Watermark Flush Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE0.WMFLOE bit to 0.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

35.2.5.4 Error Interrupt Status Register 1 (CAEIS1)

Address(es): COMA.CAEIS1 874C 9410h, COMA_NS.CAEIS1 074C 9410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMFLOS2	PWMFLOS1	PWMFLOS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMCLOS2	PWMCLOS1	PWMCLOS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PWMCLOS0	Port 0 Watermark Critical Level Overtook Status Flag	0: No Port 0 Watermark Critical Level Overtook 1: Port 0 Watermark Critical Level Overtook occurred.	R/W
b1	PWMCLOS1	Port 1 Watermark Critical Level Overtook Status Flag	0: No Port 1 Watermark Critical Level Overtook 1: Port 1 Watermark Critical Level Overtook occurred.	R/W
b2	PWMCLOS2	Port 2 Watermark Critical Level Overtook Status Flag	0: No Port 2 Watermark Critical Level Overtook 1: Port 2 Watermark Critical Level Overtook occurred.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	PWMFLOS0	Port 0 Watermark Flush Level Overtook Status Flag	0: No Port 0 Watermark Flush Level Overtook 1: Port 0 Watermark Flush Level Overtook occurred.	R/W
b17	PWMFLOS1	Port 1 Watermark Flush Level Overtook Status Flag	0: No Port 1 Watermark Flush Level Overtook 1: Port 1 Watermark Flush Level Overtook occurred.	R/W
b18	PWMFLOS2	Port 2 Watermark Flush Level Overtook Status Flag	0: No Port 2 Watermark Flush Level Overtook 1: Port 2 Watermark Flush Level Overtook occurred.	R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

PWMCLOSi Flag (Port i Watermark Critical Level Overtook Status Flag) (i = 0 to 2)

[Setting Condition]

- HW: When watermark critical level for port i (WM.CRITICAL[i]) gets asserted to 1 because of per-port level-based watermark (refer to Figure 35.4).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- No recovery, data can be lost [MFWD].

PWMFLOSi Flag (Port i Watermark Flush Level Overtook Status Flag) (i = 0 to 2)

[Setting Condition]

- HW: When watermark flush level for port i (WM.FLUSH[i]) gets asserted to 1 because of per-port level-based watermark (refer to Figure 35.4).

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

[Error Recovery]

- No recovery, data can be lost [MFWD].

35.2.5.5 Error Interrupt Enable Register 1 (CAEIE1)

Address(es): COMA.CAEIE1 874C 9414h, COMA_NS.CAEIE1 074C 9414h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMFLOE2	PWMFLOE1	PWMFLOE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMCLOE2	PWMCLOE1	PWMCLOE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PWMCLOE0	Port 0 Watermark Critical Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	PWMCLOE1	Port 1 Watermark Critical Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b2	PWMCLOE2	Port 2 Watermark Critical Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	PWMFLOE0	Port 0 Watermark Flush Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b17	PWMFLOE1	Port 1 Watermark Flush Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b18	PWMFLOE2	Port 2 Watermark Flush Level Overtook Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the CAEID1 register.

PWMCLOEi Bit (Port i Watermark Critical Level Overtook Enable) (i = 0 to 2)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- SW: Writing 1 to the CAEID1.PWMCLODi bit will clear this bit.

PWMFLOEi Bit (Port i Watermark Flush Level Overtook Enable) (i = 0 to 2)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- SW: Writing 1 to the CAEID1.PWMFLODi bit will clear this bit.

35.2.5.6 Error Interrupt Disable Register 1 (CAEID1)

Address(es): COMA.CAEID1 874C 9418h, COMA_NS.CAEID1 074C 9418h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMFLOD2	PWMFLOD1	PWMFLOD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PWMCLOD2	PWMCLOD1	PWMCLOD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PWMCLOD0	Port 0 Watermark Critical Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE1.PWMCLOE0 bit to 0.	R/W
b1	PWMCLOD1	Port 1 Watermark Critical Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE1.PWMCLOE1 bit to 0.	R/W
b2	PWMCLOD2	Port 2 Watermark Critical Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE1.PWMCLOE2 bit to 0.	R/W
b15 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	PWMFLOD0	Port 0 Watermark Flush Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE1.PWMFLOE0 bit to 0.	R/W
b17	PWMFLOD1	Port 1 Watermark Flush Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE1.PWMFLOE1 bit to 0.	R/W
b18	PWMFLOD2	Port 2 Watermark Flush Level Overtook Disable	0: Has no effects. 1: Sets the CAEIE1.PWMFLOE2 bit to 0.	R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

35.2.6 Monitoring Interrupt Registers

35.2.6.1 Monitoring Interrupt Status Register 0 (CAMIS0)

Address(es): COMA.CAMIS0 874C 9440h, COMA_NS.CAMIS0 074C 9440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PFS1	PFS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PFS0	Pause Frame Status Flag 0	0: No Pause Frame 0 1: Pause Frame 0 occurred.	R/W
b1	PFS1	Pause Frame Status Flag 1	0: No Pause Frame 1 1: Pause Frame 1 occurred.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

PFSi Flag (Pause Frame Status Flag i) (i = 0, 1)

[Setting Condition]

- HW: When pause frame i starts to happen (pause assertion timing). Refer to section 35.3.2, Pause Function.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

35.2.6.2 Monitoring Interrupt Enable Register 0 (CAMIE0)

Address(es): COMA.CAMIE0 874C 9444h, COMA_NS.CAMIE0 074C 9444h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PFE1	PFE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PFE0	Pause Frame Enable 0	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	PFE1	Pause Frame Enable 1	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the CAMID0 register.

PFEi Bit (Pause Frame Enable i) (i = 0, 1)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- SW: Writing 1 to the CAMID0.PFDi bit will clear this bit.

35.2.6.3 Monitoring Interrupt Disable Register 0 (CAMID0)

Address(es): COMA.CAMID0 874C 9448h, COMA_NS.CAMID0 074C 9448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PFD1	PFD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PFD0	Pause Frame Disable 0	0: Has no effects. 1: Sets the CAMIE0.PFE0 bit to 0.	R/W
b1	PFD1	Pause Frame Disable 1	0: Has no effects. 1: Sets the CAMIE0.PFE1 bit to 0.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

35.2.6.4 Monitoring Interrupt Status Register 1 (CAMIS1)

Address(es): COMA.CAMIS1 874C 9450h, COMA_NS.CAMIS1 074C 9450h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	PPFS21	PPFS20	PPFS11	PPFS10	PPFS01	PPFS00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PPFS00	Port 0 Pause Frame Status Flag 0	0: No Port 0 Pause Frame 0 1: Port 0 Pause Frame 0 occurred.	R/W
b1	PPFS01	Port 0 Pause Frame Status Flag 1	0: No Port 0 Pause Frame 1 1: Port 0 Pause Frame 1 occurred.	R/W
b2	PPFS10	Port 1 Pause Frame Status Flag 0	0: No Port 1 Pause Frame 0 1: Port 1 Pause Frame 0 occurred.	R/W
b3	PPFS11	Port 1 Pause Frame Status Flag 1	0: No Port 1 Pause Frame 1 1: Port 1 Pause Frame 1 occurred.	R/W
b4	PPFS20	Port 2 Pause Frame Status Flag 0	0: No Port 2 Pause Frame 0 1: Port 2 Pause Frame 0 occurred.	R/W
b5	PPFS21	Port 2 Pause Frame Status Flag 1	0: No Port 2 Pause Frame 1 1: Port 2 Pause Frame 1 occurred.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

PPFSij Flag (Port i Pause Frame Status Flag j) (i = 0 to 2) (j = 0, 1)

[Setting Condition]

- HW: When the port i pause frame j starts to happen (pause assertion timing). Refer to section 35.3.2, Pause Function.

[Clearing Condition]

- SW: Writing 1 to this flag will clear it.

35.2.6.5 Monitoring Interrupt Enable Register 1 (CAMIE1)

Address(es): COMA.CAMIE1 874C 9454h, COMA_NS.CAMIE1 074C 9454h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	PPFE21	PPFE20	PPFE11	PPFE10	PPFE01	PPFE00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PPFE00	Port 0 Pause Frame Enable 0	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	PPFE01	Port 0 Pause Frame Enable 1	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b2	PPFE10	Port 1 Pause Frame Enable 0	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b3	PPFE11	Port 1 Pause Frame Enable 1	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b4	PPFE20	Port 2 Pause Frame Enable 0	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b5	PPFE21	Port 2 Pause Frame Enable 1	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the CAMID1 register.

PPFEij Bit (Port i Pause Frame Enable j) (i = 0 to 2) (j = 0, 1)

[Setting Condition]

- Writing 1 to this bit will set it.

[Clearing Condition]

- SW: Writing 1 to the CAMID1.PPFDij bit will clear this bit.

35.2.6.6 Monitoring Interrupt Disable Register 1 (CAMID1)

Address(es): COMA.CAMID1 874C 9458h, COMA_NS.CAMID1 074C 9458h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

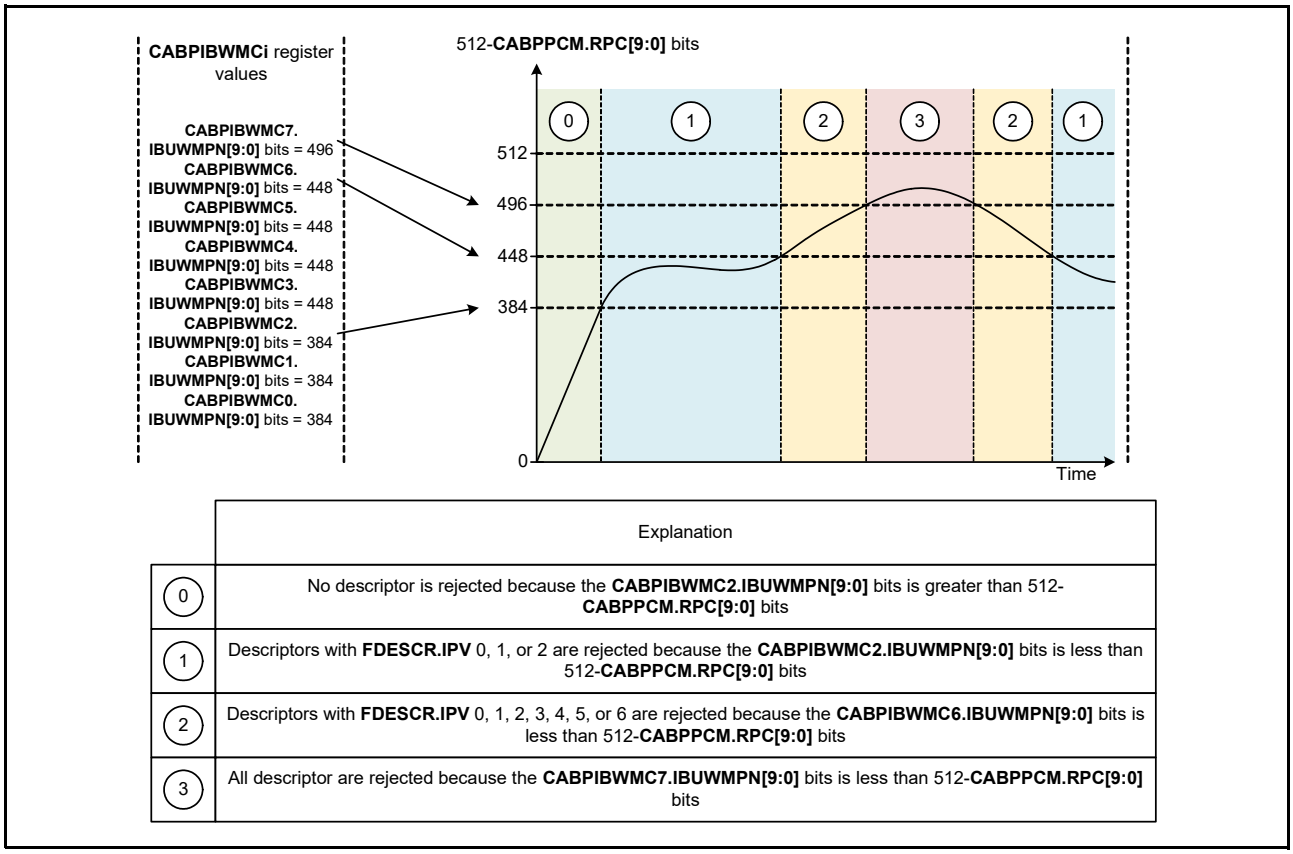
Bit	Symbol	Bit Name	Description	R/W
b0	PPFD00	Port 0 Pause Frame Disable 0	0: Has no effects. 1: Sets the CAMIE1.PPFE00 bit to 0.	R/W
b1	PPFD01	Port 0 Pause Frame Disable 1	0: Has no effects. 1: Sets the CAMIE1.PPFE01 bit to 0.	R/W
b2	PPFD10	Port 1 Pause Frame Disable 0	0: Has no effects. 1: Sets the CAMIE1.PPFE10 bit to 0.	R/W
b3	PPFD11	Port 1 Pause Frame Disable 1	0: Has no effects. 1: Sets the CAMIE1.PPFE11 bit to 0.	R/W
b4	PPFD20	Port 2 Pause Frame Disable 0	0: Has no effects. 1: Sets the CAMIE1.PPFE20 bit to 0.	R/W
b5	PPFD21	Port 2 Pause Frame Disable 1	0: Has no effects. 1: Sets the CAMIE1.PPFE21 bit to 0.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

35.3 Operations



35.3.1 Watermark Function

If a ESWM overflow occurs, frames in the ESWM will be loss at the ingress part of agents [GWCA] [ETHA]. It will result in a random loss of data independently from the actual priority of frames. To avoid so, the watermark function allows to selectively reject frames in forwarding engine [MFWD] before a ESWM overflow occurs.

COMA includes three watermark functions, the IPV based watermark, the global level-based watermark and the per-port level-based watermark. The watermark functions aim at controlling the ESWM behavior in case of overflow by generating data loss. All watermark functions are running in parallel and a frame will be rejected if one or more of the watermark functions decide so.

35.3.1.1 IPV Based Watermark

The IPV based watermark ensure the minimum QoS requirement for a ESWM. It is enabled by the default configurations for a ESWM maximum frame size of 256 bytes. This function is controlled by the common agent, however, the data loss is performed by the forwarding engine [MFWD]. Depending on the combination with other functions, “IPV based watermark” is affected by “Queue pause” regardless of “Frame size(256)”.
Figure 35.2 gives an example for IPV based unsecure watermark setting (The IPV based secure watermark works the same way but using the CABPIBWMCi.IBSWMPN[9:0] bits). Note that 512 – CABPPCM.RPC[9:0] bits variations in Figure 35.2 are arbitrary and do not correspond to anything relevant.

	Explanation
0	No descriptor is rejected because the **CABPIBWMC2.IBUWMPN[9:0]** bits is greater than 512-**CABPPCM.RPC[9:0]** bits
1	Descriptors with **FDESCR.IPV** 0, 1, or 2 are rejected because the **CABPIBWMC2.IBUWMPN[9:0]** bits is less than 512-**CABPPCM.RPC[9:0]** bits
2	Descriptors with **FDESCR.IPV** 0, 1, 2, 3, 4, 5, or 6 are rejected because the **CABPIBWMC6.IBUWMPN[9:0]** bits is less than 512-**CABPPCM.RPC[9:0]** bits
3	All descriptor are rejected because the **CABPIBWMC7.IBUWMPN[9:0]** bits is less than 512-**CABPPCM.RPC[9:0]** bits

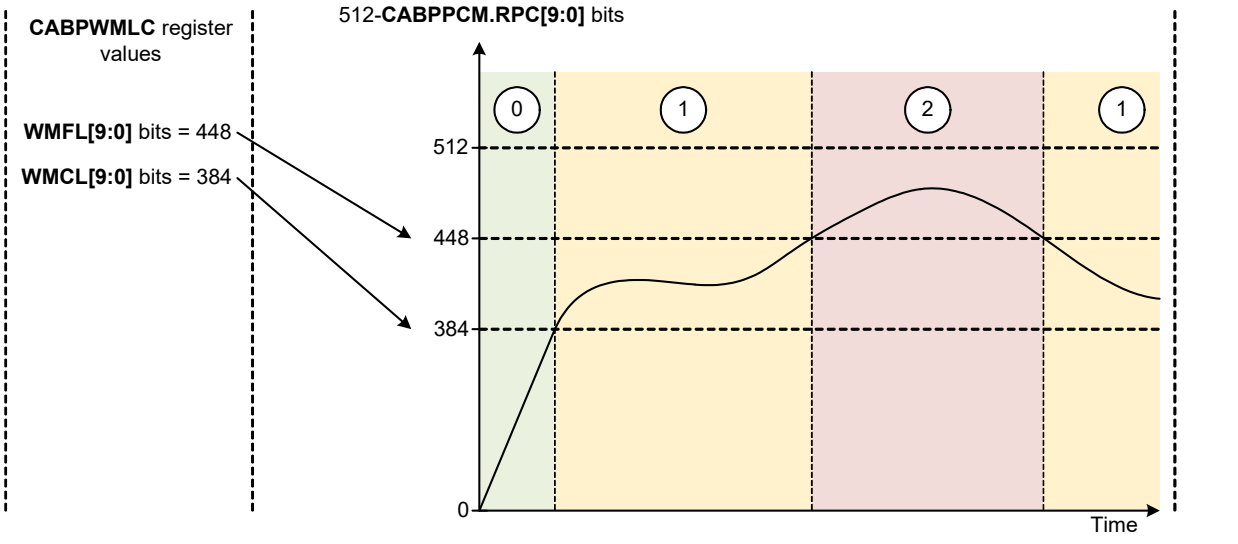


Figure 35.2 Example for IPV Based Watermark Setting

Note: FDESCR.IPV refers to the internal priority value given to a frame by forwarding engine in the forwarding descriptor but before filtering. For more details, refer to forwarding engine specification document [MFWD].

35.3.1.2 Global Level-Based Watermark

The global level-based watermark aims at rejecting frames with targeted IPVs depending on the number of pointers are currently used by the ESWM (the CABPPCM.RPC[9:0] bits). This function is controlled by the common agent (through WM.CRITICAL[2:0] and WM.FLUSH[2:0]), however, the data loss is performed by the forwarding engine [MFWD]. Note that WM.CRITICAL[2:0] and WM.FLUSH[2:0] interfaces can also be set by the per-port level-based watermark (one of these pins will be set if the per-port level-based watermark OR the global level-based watermark is in the required conditions to set it).

Figure 35.3 gives an example for global level-based watermark setting. Note that 512-CABPPCM.RPC[9:0] bits variations in Figure 35.3 are arbitrary and do not correspond to anything relevant.

	Explanation	WM.CRITICAL[i]/ WM.FLUSH[i] values
0	No descriptor is rejected because the **CABPWMLC.WMCL[9:0]** bits are greater than 512-**CABPPCM.RPC[9:0]** bits	All0/All0
1	Descriptors associated to all the port critical level are rejected because 512-**CABPPCM.RPC[9:0]** bits are greater than the **CABPWMLC.WMCL[9:0]** bits	All1/All0
2	Descriptors associated to all the port critical/flush level are rejected because 512-**CABPPCM.RPC[9:0]** bits are greater than the **CABPWMLC.WMFL[9:0]** bits	All1/All1

Figure 35.3 Example for Global Level-Based Watermark Setting

35.3.1.3 Per-Port Level-Based Watermark

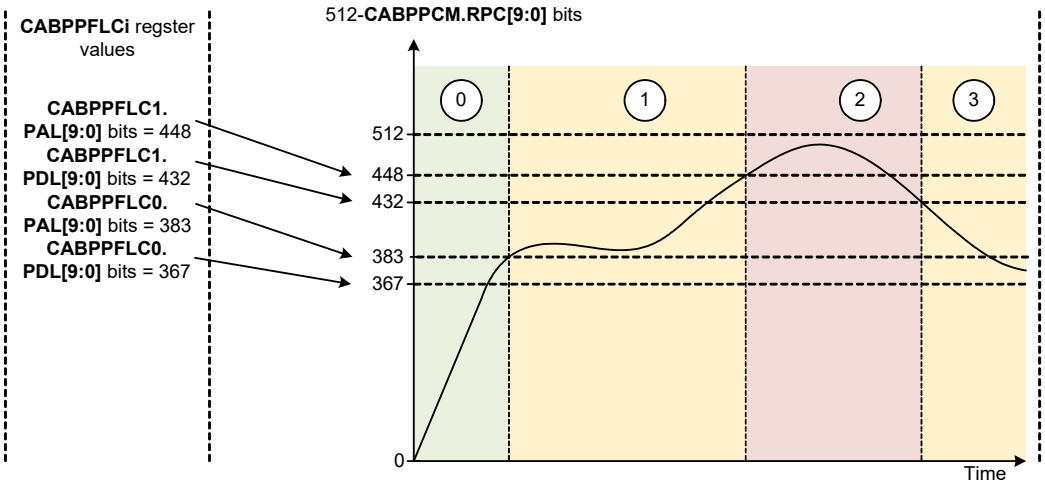
The per-port level-based watermark aims at rejecting frames with targeted IPVs depending on the CABPPWMLCi.PWMCL[9:0] bits. This function is controlled by the common agent (through WM.CRITICAL[i] and WM.FLUSH[i]), however, the data loss is performed by the forwarding engine [MFWD]. Note that WM.CRITICAL[i] and WM.FLUSH[i] interfaces can also be set by the Global level-based watermark (one of these pins will be set if the per-port level-based watermark OR the global level-based watermark is in the required conditions to set it).

Figure 35.4 gives an example for per-port level-based watermark setting for port i. Note that the CABPCPMi.RPCP[9:0] bits variations in Figure 35.4 are arbitrary and do not correspond to anything relevant.

	Explanation	WM.CRITICAL[i]/ WM.FLUSH[i] values
0	No descriptor is rejected because the **CABPPWMLCi.PWMCL[9:0]** bits are greater than the **CABPCPMi.RPCP[9:0]** bits	0/0
1	Descriptors associated to all the port critical level are rejected the **CABPPWMLCi.PWMCL[9:0]** bits are less than the **CABPCPMi.RPCP[9:0]** bits	1/0
2	Descriptors associated to all the port critical/flush level are rejected the **CABPPWMLCi.PWMFL[9:0]** bits are less than the **CABPCPMi.RPCP[9:0]** bits	1/1

Figure 35.4 Example for Per-Port Level-Based Watermark Setting for Port i

35.3.2 Pause Function



If the ESWM overflow occurs, frames in the ESWM will be loss at the ingress part of agents [GWCA] [ETHA]. It will result in a random loss of data independently from the actual priority of frames. To avoid so, the pause function allows to selectively pause frame injection by agents [GWCA] [ETHA].

COMA includes two pause functions, the global pause function and the per-port pause. The pause functions aim at controlling the ESWM behavior in case of overflow by generating backpressure. All pause functions are running in parallel and backpressure will be applied if one or more of the pause functions decide so.

35.3.2.1 Global Pause Function

The global pause function aims at applying backpressure on agents for targeted IPVs depending on the CABPPCM.RPC [9:0] bits. The pause function can pause agents with 2 combinations of IPVs.
This function is controlled by the common agent PAUSE[2:0][1:0] interface, however, the back pressure is performed by the agents [ETHA] [GWCA]. Note that PAUSE interface can also be set by the per-port pause function (one of these pins will be set if the per-port pause function OR the global pause function is in the required conditions to set it).

Figure 35.5 gives an example for global pause function setting. Note that 512-CABPPCM.RPC[9:0] bits variations in Figure 35.5 are arbitrary and do not correspond to anything relevant.

	Explanation	PAUSE[i][0]/ PAUSE[i][1] values (for all I = 1..PORT_N-1)
0	No agent paused because 512-**CABPPCM.RPC[9:0]** bits never exceeded the **CABPPFLC0.PAL[9:0]** bits level nor the **CABPPFLC1.PAL[9:0]** bits level	0/0
1	Agents are paused with level 0 because 512-**CABPPCM.RPC[9:0]** bits exceeded the **CABPPFLC0.PAL[9:0]** bits level and not the **CABPPFLC1.PAL[9:0]** bits level	1/0
2	Agents are paused with level 0 and 1 because 512-**CABPPCM.RPC[9:0]** bits exceeded the **CABPPFLC0.PAL[9:0]** bits level and the **CABPPFLC1.PAL[9:0]** bits level	1/1
3	Agents are paused with level 0 because 512-**CABPPCM.RPC[9:0]** bits exceeded the **CABPPFLC0.PAL[9:0]** bits and dropped under the **CABPPFLC1.PDL[9:0]** bits	1/0

Figure 35.5 Example for Global Pause Function Setting

35.3.2.2 Per-Port Pause Function

The per-port function aims at applying backpressure on agents for targeted IPVs depending on the CABPPPFLCij.PPAL[9:0] bits and PPDL[9:0] bits. The pause function can pause agents with 2 combinations of IPVs. This function is controlled by the common agent PAUSE[i] interface, however, the back pressure is performed by the agents [ETHA] [GWCA]. Note that PAUSE interface can also be set by the global pause function (one of these pins will be set if the per-port pause function OR the global pause function is in the required conditions to set it).

Figure 35.6 gives an example for per-port pause function setting for port i. Note that the CABPCPMi.RPCP[9:0] bits variations in Figure 35.6 are arbitrary and do not correspond to anything relevant.

	Explanation	PAUSE[i][0]/ PAUSE[i][0] values
0	No agent paused because the **CABPCPMi.RPCP[9:0]** bits never exceeded the **CABPPPFLCi0.PPAL[9:0]** bits level nor the **CABPPPFLCi1.PPAL[9:0]** bits level	0/0
1	Agents are paused with level 0 because the **CABPCPMi.RPCP[9:0]** bits exceeded the **CABPPPFLCi0.PPAL[9:0]** bits level and not the **CABPPPFLCi1.PPAL[9:0]** bits level	1/0
2	Agents are paused with level 0 and level 1 because the **CABPCPMi.RPCP[9:0]** bits exceeded the **CABPPPFLCi0.PPAL[9:0]** bits level and the **CABPPPFLCi1.PPAL[9:0]** bits level	1/1
3	Agents are paused with level 0 because the **CABPCPMi.RPCP[9:0]** bits exceeded the **CABPPPFLCi0.PPAL[9:0]** bits and dropped under the **CABPPPFLCi1.PPDL[9:0]** bits	1/0

Figure 35.6 Example for Per-Port Pause Function Setting for Port i

35.3.3 Per Port Memory Allocation Function

It is possible to control the maximum and the minimum number of pointers that can be used per port thanks to the CABPULCi.MNNPN[9:0] bits and the CABPULCi.MXNPN[9:0] bits. Any agent will be able to use at least its minimum of pointers and at most its maximum number of pointers. In this section are given some setting examples for the memory allocation function.

35.3.3.1 Shared Memory Setting

In shared memory, the data RAM is shared by all the ports. It is the reset state of the common agent.
Figure 35.7 describes the shared memory setting.

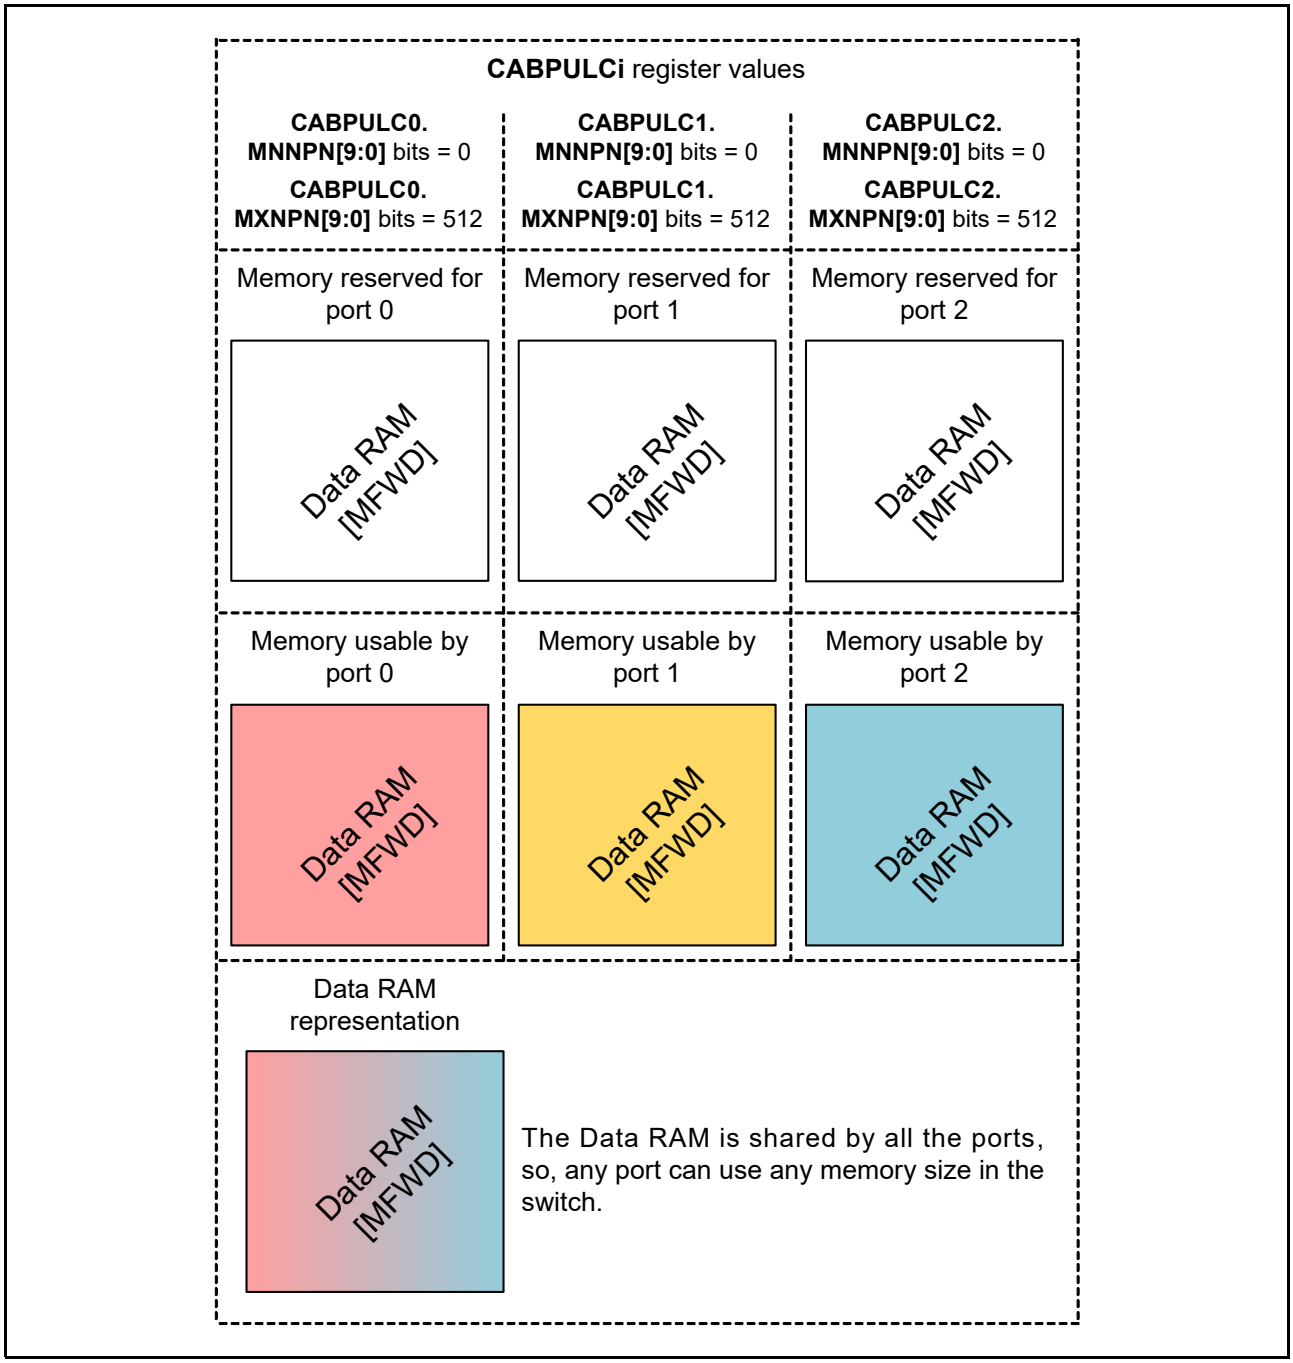


Figure 35.7 Shared Memory Setting

35.3.3.2 Reduced Memory Setting 1

In reduced memory, the data RAM is shared by all agents but some of them are not able to use all the memory because they are able to make the ESWM overflow (especially for CPU ports [GWCA]). To set this mode, the CABPULCi.MXNPN[9:0] bits should be used.
Follow figure describes one example of reduced memory setting. For example, if port 2 is a fast CPU port, the CABPULCi.MXNPN[9:0] bits can limit the number of reception frames.

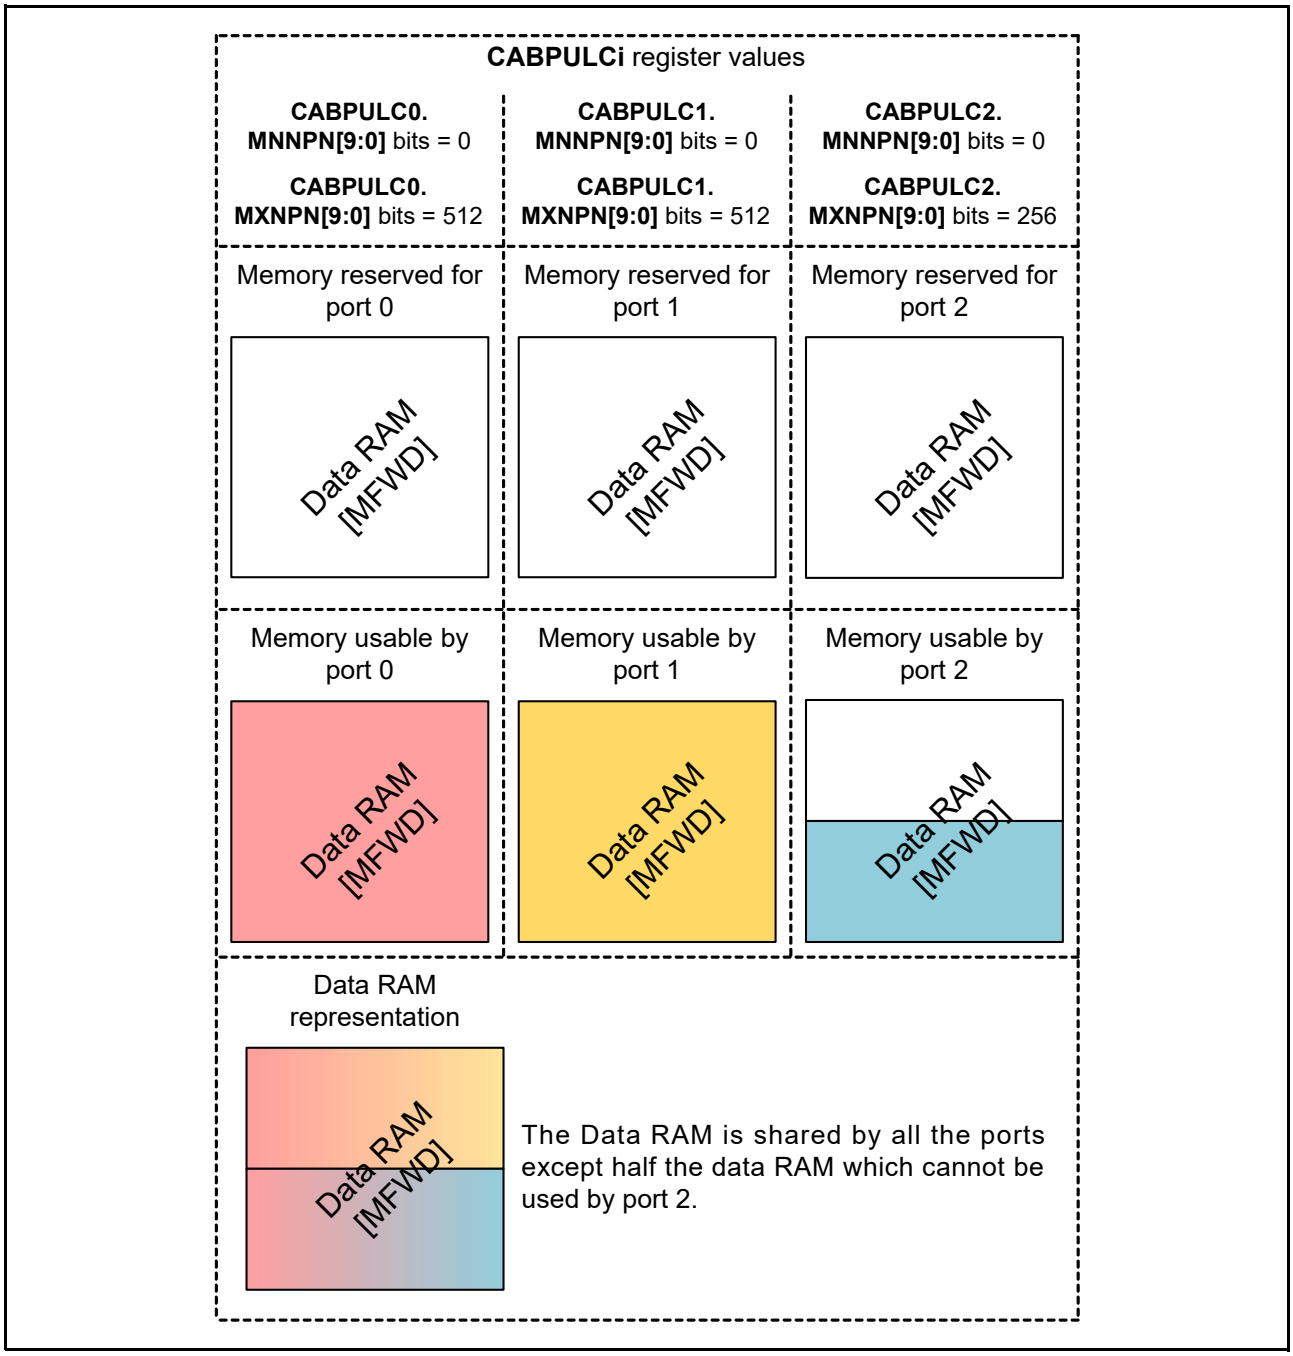

Figure 35.8 Reduced Memory Setting Example (1)

35.3.3.3 Reduced Memory Setting 2

In reduced memory, the data RAM is shared by all agents but some of them are not able to use all the memory because they are able to make the ESWM overflow (especially for CPU ports [GWCA]). To set this mode, the CABPULCi.MNNPN[9:0] bits should be used.
Follow figure describes one example of reduced memory setting. For example, if port 0 and 1 are a slow ether port, the CABPULCi.MNNPN[9:0] bits can protect the number of frame buffer.

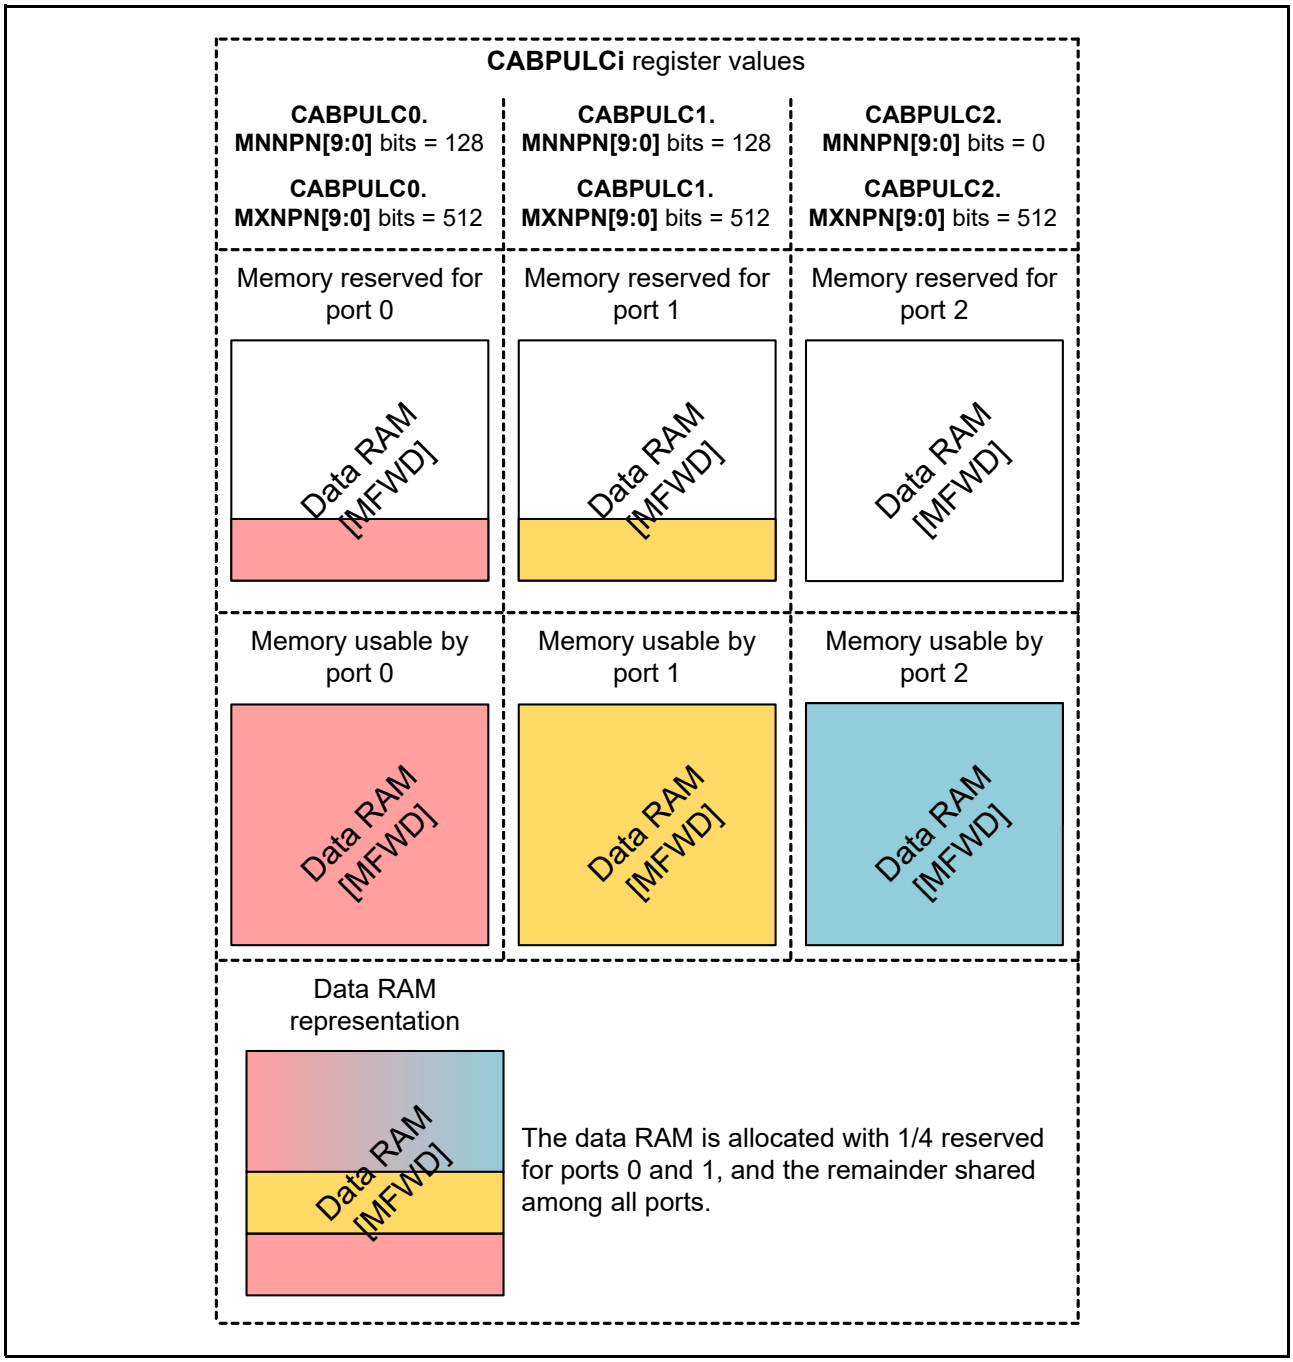

Figure 35.9 Reduced Memory Setting Example (2)

35.3.3.4 Hybrid Memory Setting

All the setting described in section 35.3.3.1 and 35.3.3.2 can be used together to elaborate a complex memory. It is the hybrid memory setting.

Figure 35.10 describes one example of hybrid memory setting.

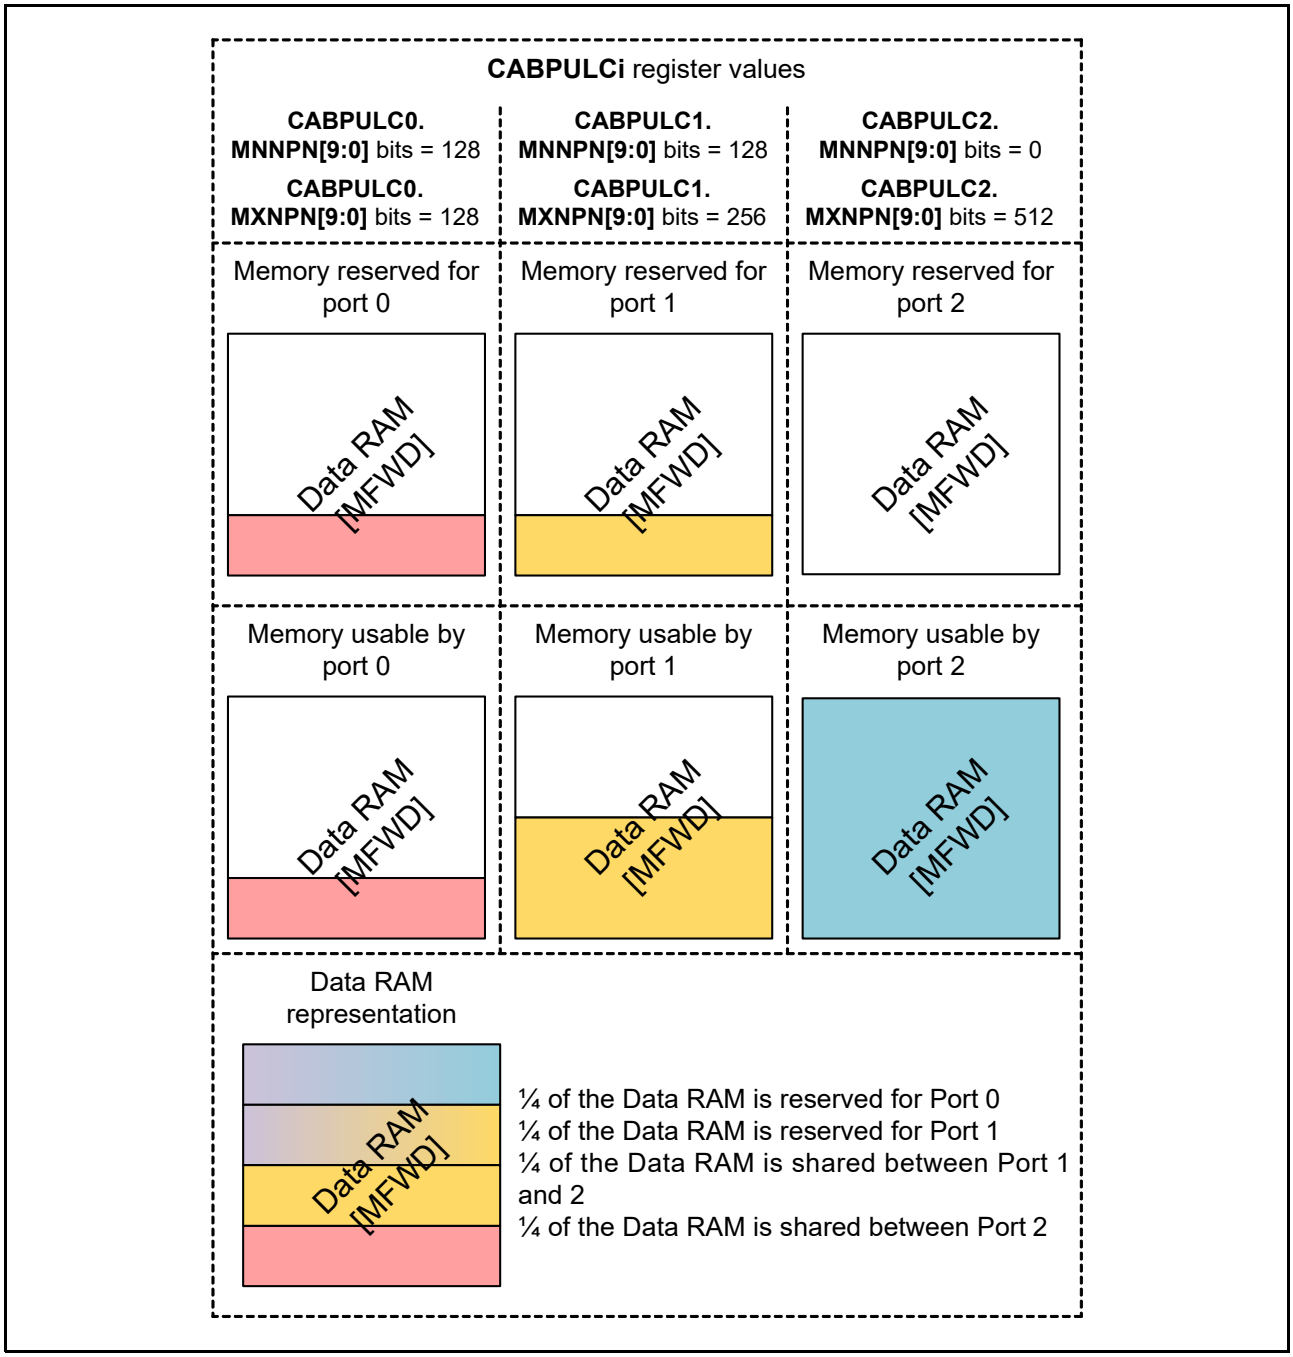

Figure 35.10 Hybrid Memory Setting Example

35.3.4 Software Flows

35.3.4.1 Interrupt Handling Flow

Interrupt handling flow can be used in any mode except RESET mode.
The interrupt handling flow is described in Figure 35.11.

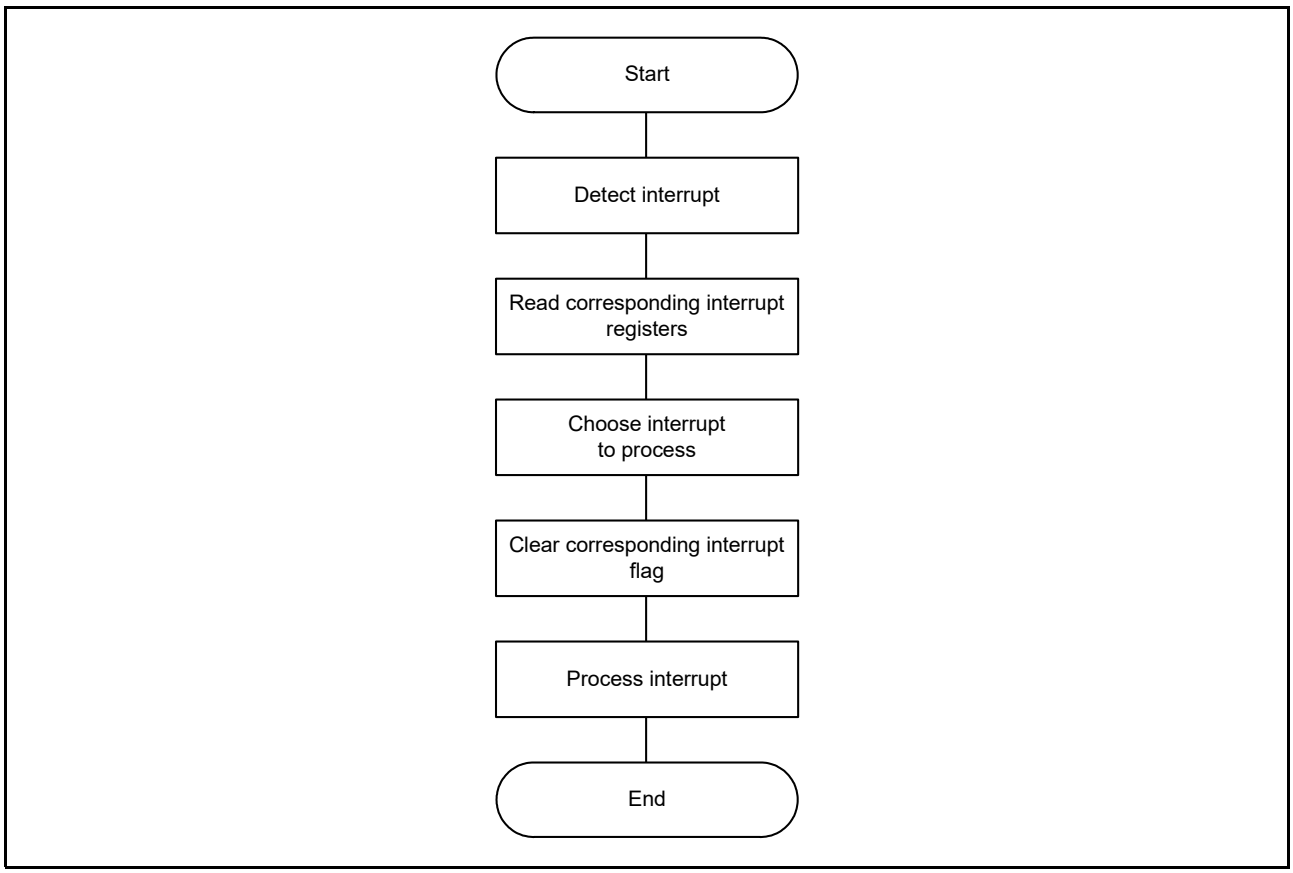

Figure 35.11 Interrupt Handling Flow

35.3.4.2 Called Software Flows

The flows described in this section can only be called from other flows and cannot be used alone.

(1) Buffer Pool Initialization Flow

The buffer pool initialization flow is described in Figure 35.12.

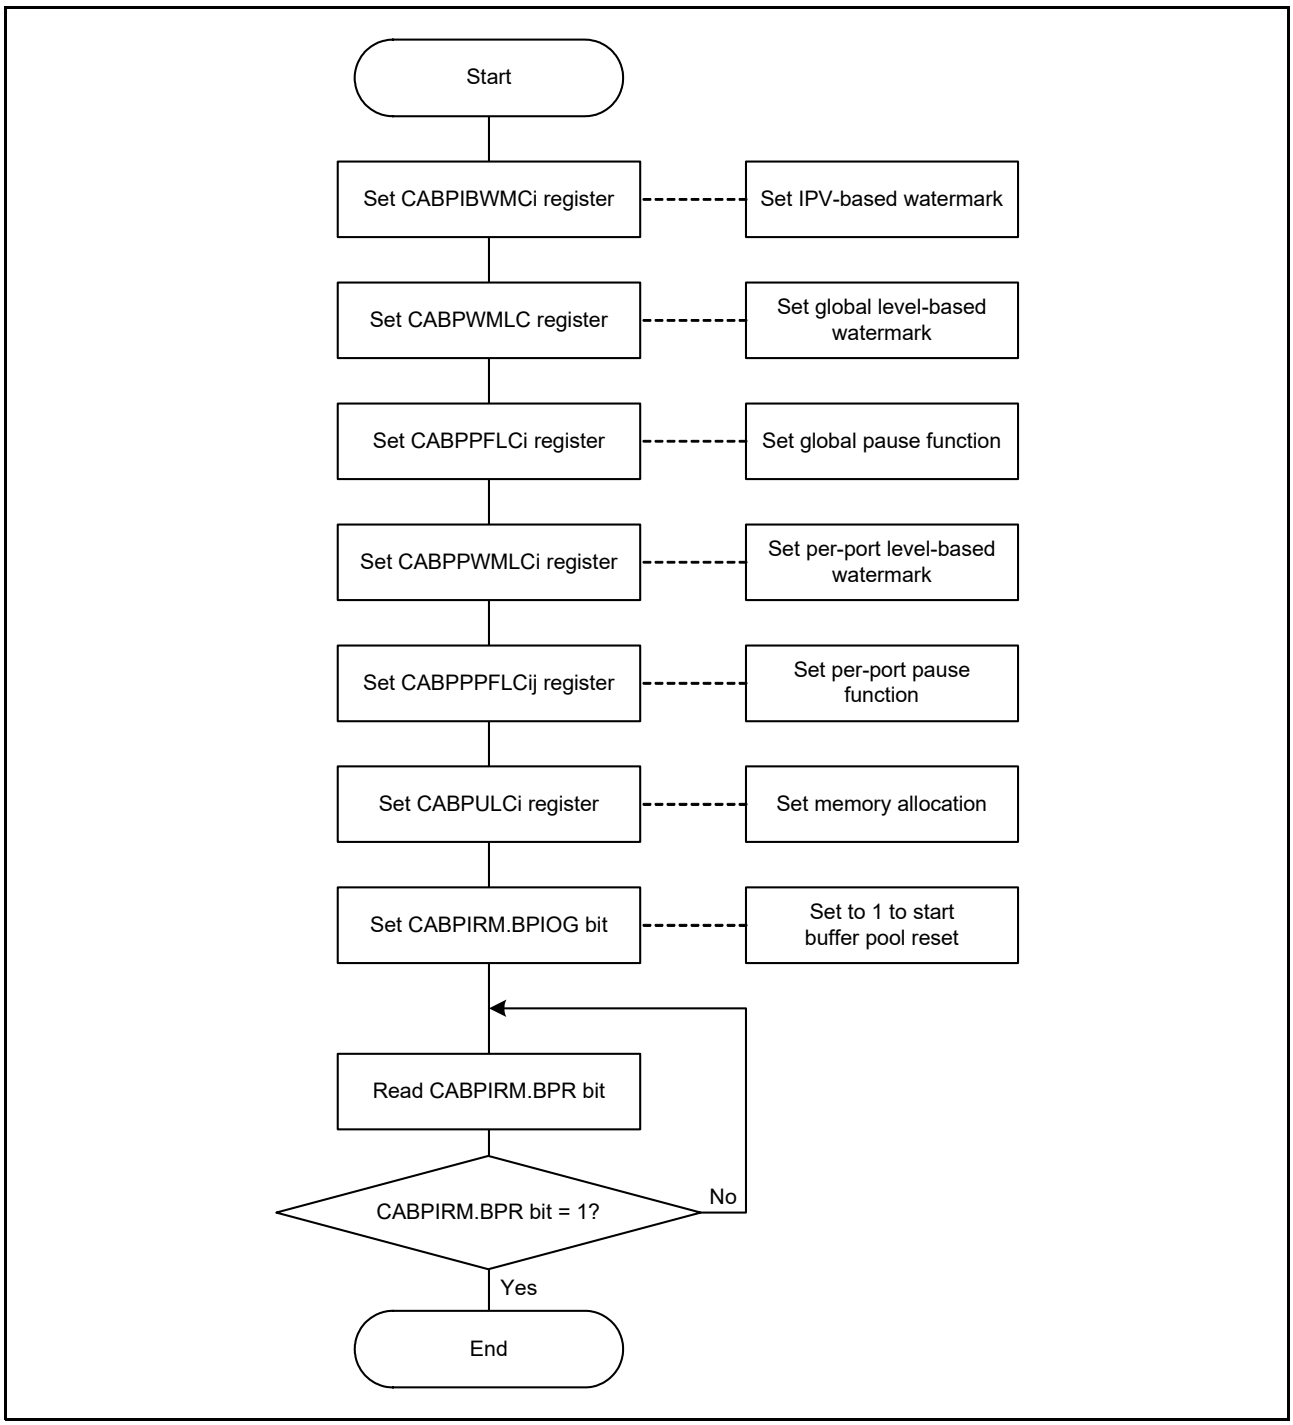

Figure 35.12 Buffer Pool Initialization Flow

(2) Software Reset Flow

The ESWM reset flow is described in Figure 35.13.

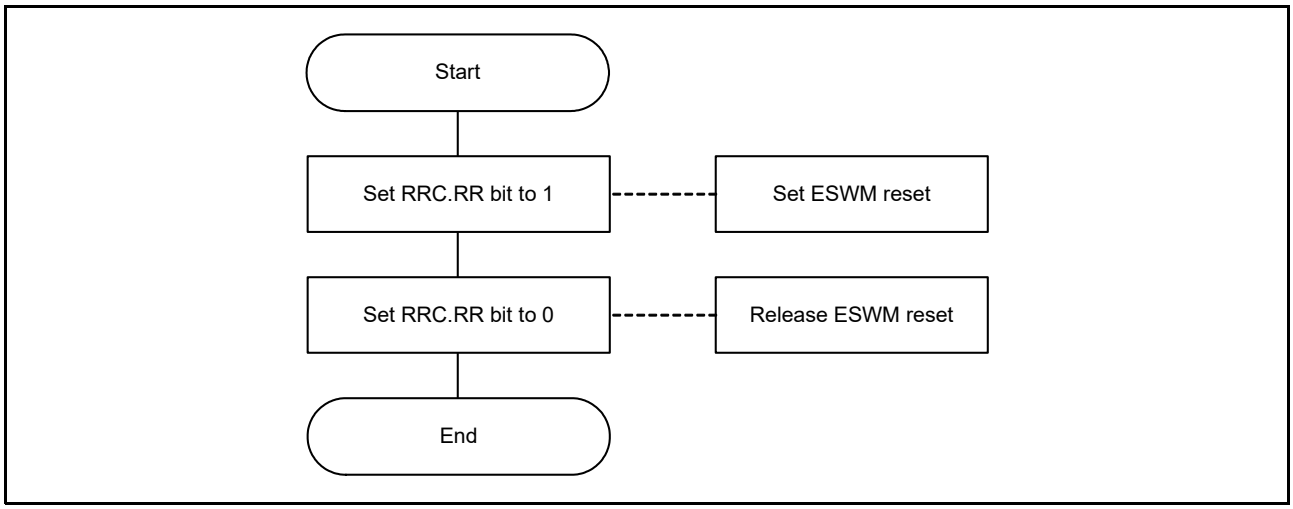

Figure 35.13 ESWM Reset Flow

(3) Agent i Clock Control Flows (i = 0 to 2)

The agent i clock flows are described in Figure 35.14, Figure 35.15, and Figure 35.16.

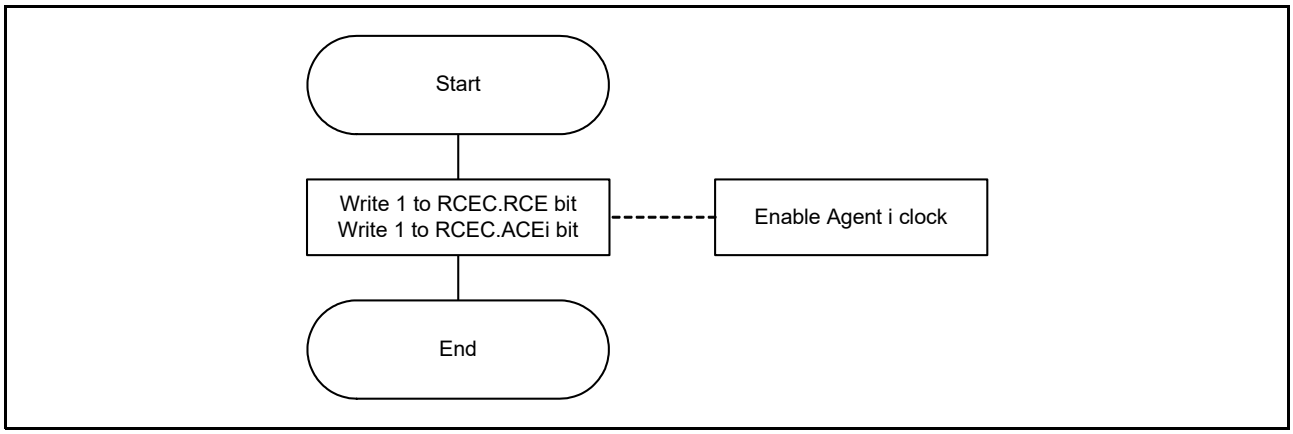

Figure 35.14 Agent i Clock Enable Flow

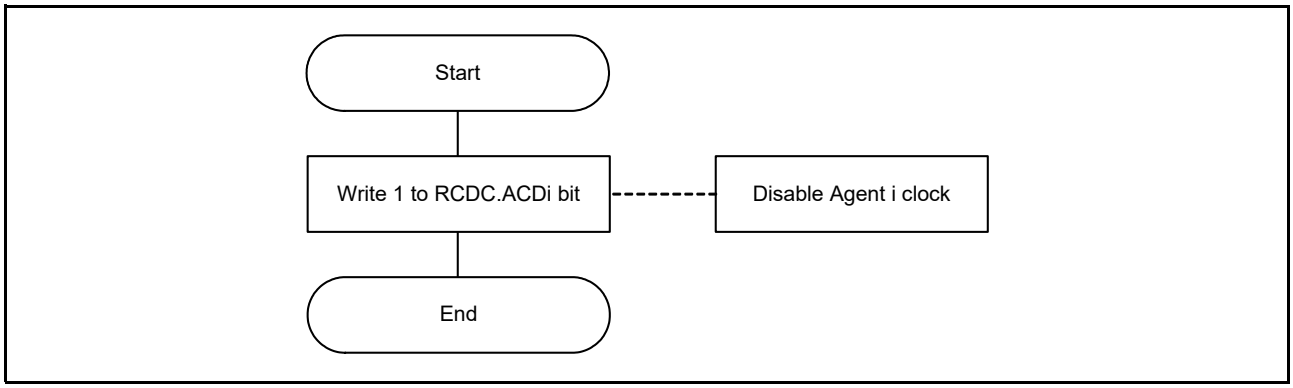

Figure 35.15 Agent i Clock Disable Flow

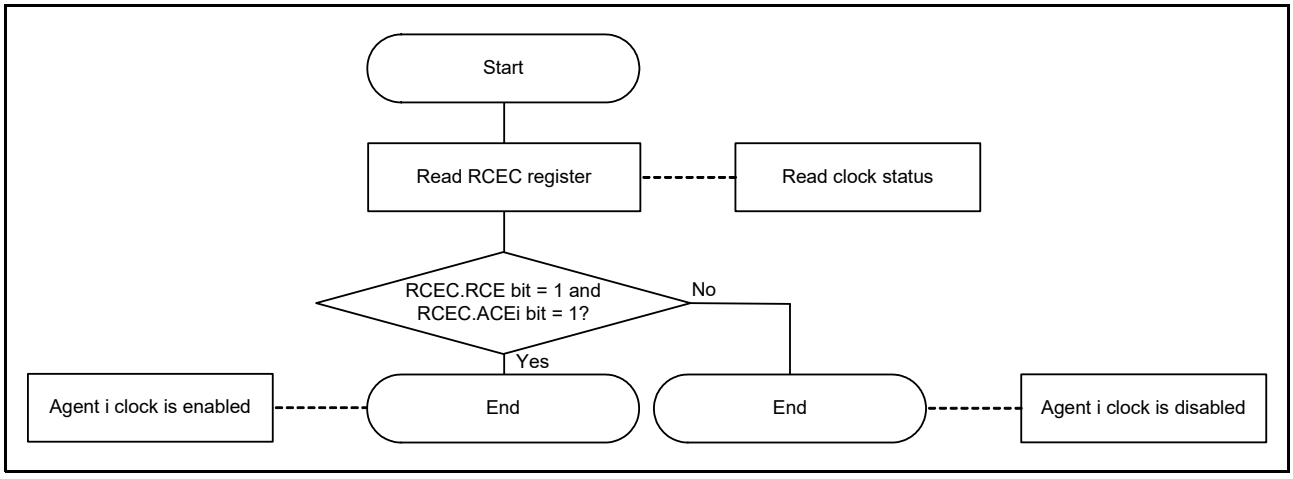

Figure 35.16 Agent i Clock Status Check Flow

(4) ESWCLK Clock Control Flows

The ESWCLK clock flows are described in Figure 35.17 and Figure 35.18.

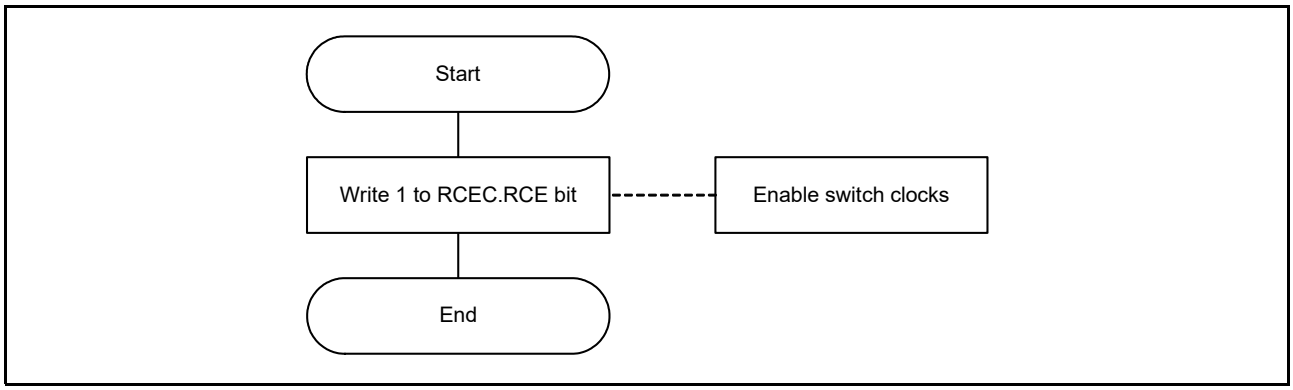

Figure 35.17 ESWCLK Clock Enable Flow

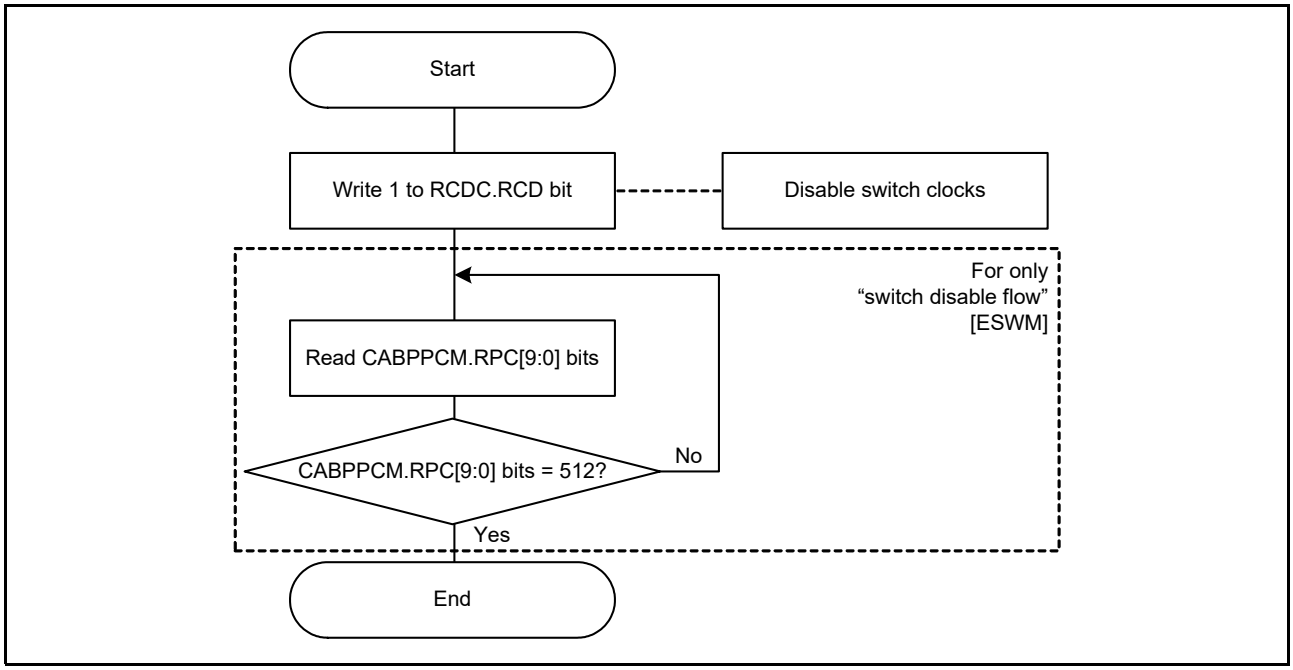

Figure 35.18 ESWCLK Clock Disable Flow

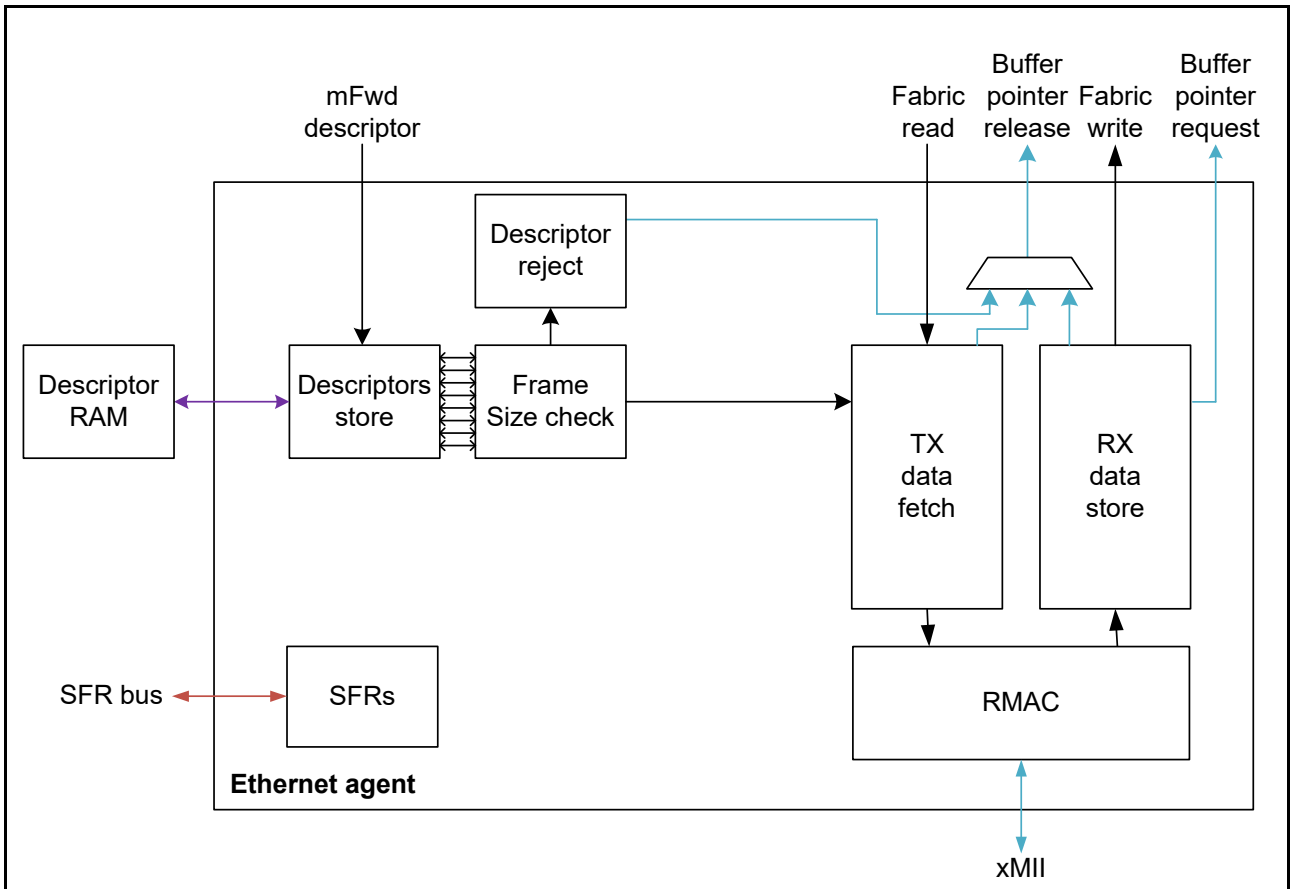
36. Ethernet Agent (ETHA)

36.1 Overview

The ethernet agent consists of an agent interface module to allowing communication within the ESWM. It handles the data exchange between the ESWM and an Ethernet PHY.

36.1.1 Features



Ethernet agent Features are described Table 36.1.

Table 36.1 Ethernet Agent Feature List

Function		Details
Interfaces	Clock/Reset interface	Clock/Reset interface [ESWM]
	Scan interface	Scan interface [ESWM]
	Switch mode	Interface to receive the switch mode [MFWD]
	Pause interface (PAUSE)	Interface to pause TX queues [COMA]
	xMII	GMII 100 Mbps, 1 Gbps [RMAC]
	SFR interface	Interface to access GWCA SFRs [COMA]
	Interrupts	GWCA interrupt to CPU
	Fabric interface	Interface to communicate with the data, TAG and pointer RAM [MFWD].
	Descriptor bus	Interface to receive frame information to send them to CPU [MFWD].
	BP Request	Interface to receive BPs to store frames in the data, TAG and pointer RAM [COMA].
	BP Release	Interface to release the BPs that has been used [COMA].
	TX Timestamp Capture interface	Interface to send TX timestamps to CPU [RMAC].
	RAM interfaces	Interface to communication with RAMs [ESWM]

36.1.2 Ethernet Agent Block Diagram

Figure 36.1 shows ethernet agent block diagram.

RX data store : Transmits frames from RMAC to the local RAM
TX data fetch : Transmits frame from local RAM to RMAC
Descriptor store : Receives the descriptors from forwarding engine and controls the priority between descriptors
Frame size check : Check the frame size
Descriptor reject : Reject descriptors
RMAC : Mac interface [RMAC]
SFRs : ETHA SFRs

Figure 36.1 Ethernet Agent Block Diagram

36.2 Register Description

36.2.1 ETHA Mode Function Registers

36.2.1.1 Mode Configuration Register (EAMC)

Address(es): ETHA0.EAMC 874C A000h, ETHA0_NS.EAMC 074C A000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OPS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	OPS[1:0]	Operating Mode Status Flag	b1 b0 0 0: RESET mode 0 1: DISABLE mode 1 0: CONFIG mode 1 1: OPERATION mode	R
b31 to b2	—	Reserved	These bits are read as 0.	R

OPS[1:0] Flag (Operating Mode Status Flag)

Indicates the current ETHA mode.

[Update conditions]

- HW: Mode change completed.
- HW: This register is changed at “Maximum frame communication time (exp: 64 Kbyte/100 Mbps = 5.12 ms)” from OPERATION to DISABLE.

36.2.2 Transmission Function Registers

36.2.2.1 IPV Remapping Configuration Register [802.1Q] (EAIRC)

Address(es): ETHA0.EAIRC 874C A010h, ETHA0_NS.EAIRC 074C A010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	IPVR7[2:0]			—	IPVR6[2:0]			—	IPVR5[2:0]			—	IPVR4[2:0]		
Value after reset:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0

Value after reset:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	IPVR0[2:0]	IPV Remapping 0	Configure to which descriptor queue descriptor received with IPV 0 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 0).	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R
b6 to b4	IPVR1[2:0]	IPV Remapping 1	Configure to which descriptor queue descriptor received with IPV 1 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 1).	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b10 to b8	IPVR2[2:0]	IPV Remapping 2	Configure to which descriptor queue descriptor received with IPV 2 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 2).	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R
b14 to b12	IPVR3[2:0]	IPV Remapping 3	Configure to which descriptor queue descriptor received with IPV 3 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 3).	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b18 to b16	IPVR4[2:0]	IPV Remapping 4	Configure to which descriptor queue descriptor received with IPV 4 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 4).	R/W
b19	—	Reserved	This bit is read as 0. The write value should be 0.	R
b22 to b20	IPVR5[2:0]	IPV Remapping 5	Configure to which descriptor queue descriptor received with IPV 5 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 5).	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R
b26 to b24	IPVR6[2:0]	IPV Remapping 6	Configure to which descriptor queue descriptor received with IPV 6 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 6).	R/W
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R
b30 to b28	IPVR7[2:0]	IPV Remapping 7	Configure to which descriptor queue descriptor received with IPV 7 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 7).	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

36.2.2.2 TX Descriptor Queue Security Configuration Register (EATDQSC)

Address(es): ETHA0.EATDQSC 874C A014h, ETHA0_NS.EATDQSC 074C A014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TDQSL7	TDQSL6	TDQSL5	TDQSL4	TDQSL3	TDQSL2	TDQSL1	TDQSL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TDQSL0	TX Descriptor Queue 0 Security Level	0: Queue i unsecure 1: Queue i secure (i = 0 to 7)	R/W
b1	TDQSL1	TX Descriptor Queue 1 Security Level		R/W
b2	TDQSL2	TX Descriptor Queue 2 Security Level		R/W
b3	TDQSL3	TX Descriptor Queue 3 Security Level		R/W
b4	TDQSL4	TX Descriptor Queue 4 Security Level		R/W
b5	TDQSL5	TX Descriptor Queue 5 Security Level		R/W
b6	TDQSL6	TX Descriptor Queue 6 Security Level		R/W
b7	TDQSL7	TX Descriptor Queue 7 Security Level		R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

TDQSLi Bit (TX Descriptor Queue i Security Level) (i = 0 to 7)

When a queue is secured, an unsecure descriptor cannot enter it (when a descriptor is received through Descriptor Bus [MFWD] with eha_descr_sec from forwarding engine with FDESCR.SEC [MFWD] equal to 0).

36.2.2.3 TX Descriptor Queue Configuration Register (EATDQC)

Address(es): ETHA0.EATDQC 874C A018h, ETHA0_NS.EATDQC 074C A018h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	TDQP7	TDQP6	TDQP5	TDQP4	TDQP3	TDQP2	TDQP1	TDQP0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TDQD7	TDQD6	TDQD5	TDQD4	TDQD3	TDQD2	TDQD1	TDQD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TDQD0	TX Descriptor Queue 0 Disable	0: Queue n enabled 1: Queue n disabled (n = 0 to 7)	R/W
b1	TDQD1	TX Descriptor Queue 1 Disable		R/W
b2	TDQD2	TX Descriptor Queue 2 Disable		R/W
b3	TDQD3	TX Descriptor Queue 3 Disable		R/W
b4	TDQD4	TX Descriptor Queue 4 Disable		R/W
b5	TDQD5	TX Descriptor Queue 5 Disable		R/W
b6	TDQD6	TX Descriptor Queue 6 Disable		R/W
b7	TDQD7	TX Descriptor Queue 7 Disable		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	TDQP0	TX Descriptor Queue 0 Pause	0: Queue m active 1: Queue m paused (m = 0 to 7)	R/W
b17	TDQP1	TX Descriptor Queue 1 Pause		R/W
b18	TDQP2	TX Descriptor Queue 2 Pause		R/W
b19	TDQP3	TX Descriptor Queue 3 Pause		R/W
b20	TDQP4	TX Descriptor Queue 4 Pause		R/W
b21	TDQP5	TX Descriptor Queue 5 Pause		R/W
b22	TDQP6	TX Descriptor Queue 6 Pause		R/W
b23	TDQP7	TX Descriptor Queue 7 Pause		R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

TDQDn Bit (TX Descriptor Queue n Disable) (n = 0 to 7)

Avoid descriptor from forwarding engine [MFWD] to enter the corresponding queue. The Forwarding Engine will reject the corresponding descriptor.

If disabled queue data is not needed anymore, the EATMFSCn.MFS[15:0] bits can be set to 0 in order to avoid more frames to go to the RMAC.

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing conditions]

- SW: Writing 0 to this bit will clear it.
- HW: Going out of OPERATION mode will clear this bit (EAMC.OPC[1:0] ≠ 11b).

TDQPm Bit (TX Descriptor Queue m Pause) (m = 0 to 7)

Avoid frames to be sent to the RMAC by stopping descriptor fetching from the descriptor RAM.

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing conditions]

- SW: Writing 0 to this bit will clear it.
- HW: Going out of OPERATION mode will clear this bit (EAMC.OPC[1:0] ≠ 11b).

[Restriction]

- SW: Pausing a queue during a long time could result in switch overflow. In case of switch overflow [COMA] this register should be set to 0.

[Cautions]

- This register is used to stop a queue but forwarding engine [MFWD] will not stop sending descriptor to the corresponding queue. In this case the queue might overflow.

36.2.2.4 TX Descriptor Queue Arbitration Configuration Register (EATDQAC)

Address(es): ETHA0.EATDQAC 874C A01Ch, ETHA0_NS.EATDQAC 074C A01Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TDQA7[3:0]				TDQA6[3:0]				TDQA5[3:0]				TDQA4[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TDQA3[3:0]				TDQA2[3:0]				TDQA1[3:0]				TDQA0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0 to b3	TDQA0[3:0]	TX Descriptor Queue 0 Arbitration	b3 b0 0 0 0 0: Queue 0 strict arbitration Others: Queue 0 WRR arbitration	R/W
b7 to b4	TDQA1[3:0]	TX Descriptor Queue 1 Arbitration	b7 b4 0 0 0 0: Queue 1 strict arbitration Others: Queue 1 WRR arbitration	R/W
b11 to b8	TDQA2[3:0]	TX Descriptor Queue 2 Arbitration	b11 b8 0 0 0 0: Queue 2 strict arbitration Others: Queue 2 WRR arbitration	R/W
b15 to b12	TDQA3[3:0]	TX Descriptor Queue 3 Arbitration	b15 b12 0 0 0 0: Queue 3 strict arbitration Others: Queue 3 WRR arbitration	R/W
b19 to b16	TDQA4[3:0]	TX Descriptor Queue 4 Arbitration	b19 b16 0 0 0 0: Queue 4 strict arbitration Others: Queue 4 WRR arbitration	R/W
b23 to b20	TDQA5[3:0]	TX Descriptor Queue 5 Arbitration	b23 b20 0 0 0 0: Queue 5 strict arbitration Others: Queue 5 WRR arbitration	R/W
b27 to b24	TDQA6[3:0]	TX Descriptor Queue 6 Arbitration	b27 b24 0 0 0 0: Queue 6 strict arbitration Others: Queue 6 WRR arbitration	R/W
b31 to b28	TDQA7[3:0]	TX Descriptor Queue 7 Arbitration	b31 b28 0 0 0 0: Queue 7 strict arbitration Others: Queue 7 WRR arbitration	R/W

TDQAi[3:0] Bits (TX Descriptor Queue i Arbitration) (i = 0 to 7)

For details, refer to section 38.2.2.4, RX Descriptor Queue Arbitration Control Register (GWRDQAC).

[Restrictions]

- SW: In hybrid arbitration mode, all the queues with an EATDQAC.TDQAi[3:0] value different than 0 should have a consecutive priority.
- SW: In all arbitration mode except strict priority arbitration mode, at least two queues should have an EATDQAC.TDQAi[3:0] different than 0000b.

36.2.2.5 Transmission Maximum Frame Size Configuration Register q (EATMFSCq) (q = 0 to 7)

Address(es): ETHA0.EATMFSC0 874C A040h, ETHA0.EATMFSC1 874C A044h, ETHA0.EATMFSC2 874C A048h, ETHA0.EATMFSC3 874C A04Ch, ETHA0.EATMFSC4 874C A050h, ETHA0.EATMFSC5 874C A054h, ETHA0.EATMFSC6 874C A058h, ETHA0.EATMFSC7 874C A05Ch, ETHA0_NS.EATMFSC0 074C A040h, ETHA0_NS.EATMFSC1 074C A044h, ETHA0_NS.EATMFSC2 074C A048h, ETHA0_NS.EATMFSC3 074C A04Ch, ETHA0_NS.EATMFSC4 074C A050h, ETHA0_NS.EATMFSC5 074C A054h, ETHA0_NS.EATMFSC6 074C A058h, ETHA0_NS.EATMFSC7 074C A05Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MFS[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MFS[15:0]	Maximum Frame Size	Maximum frame size for descriptor queue q.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

MFS[15:0] Bits (Maximum Frame Size)

All bigger frames will be rejected.

[Restriction]

- HW: The MFS[15:0] size comparison takes the frame size on the PHY interface.

36.2.2.6 Transmission Descriptor Queue Depth Configuration Register q (EATDQDCq) (q = 0 to 7)

Address(es): ETHA0.EATDQDC0 874C A060h, ETHA0.EATDQDC1 874C A064h, ETHA0.EATDQDC2 874C A068h, ETHA0.EATDQDC3 874C A06Ch, ETHA0.EATDQDC4 874C A070h, ETHA0.EATDQDC5 874C A074h, ETHA0.EATDQDC6 874C A078h, ETHA0.EATDQDC7 874C A07Ch, ETHA0_NS.EATDQDC0 074C A060h, ETHA0_NS.EATDQDC1 074C A064h, ETHA0_NS.EATDQDC2 074C A068h, ETHA0_NS.EATDQDC3 074C A06Ch, ETHA0_NS.EATDQDC4 074C A070h, ETHA0_NS.EATDQDC5 074C A074h, ETHA0_NS.EATDQDC6 074C A078h, ETHA0_NS.EATDQDC7 074C A07Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	DQD[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	DQD[9:0]	Descriptor Queue Depth	Set the number of descriptors that can be contained in descriptor queue q.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

DQD[9:0] Bits (Descriptor Queue Depth)

For details, refer to section 38.2.2.7, Reception Descriptor Queue q Depth Configuration Register (GWRDQDCq) (q = 0 to 7).

[Restriction]

- SW: The sum of DQD[9:0] fields should always be smaller or equal to 512.

36.2.2.7 Transmission Descriptor Queue q Monitoring Register (EATDQMq) (q = 0 to 7)

Address(es): ETHA0.EATDQM0 874C A080h, ETHA0.EATDQM1 874C A084h, ETHA0.EATDQM2 874C A088h, ETHA0.EATDQM3 874C A08Ch, ETHA0.EATDQM4 874C A090h, ETHA0.EATDQM5 874C A094h, ETHA0.EATDQM6 874C A098h, ETHA0.EATDQM7 874C A09Ch, ETHA0_NS.EATDQM0 074C A080h, ETHA0_NS.EATDQM1 074C A084h, ETHA0_NS.EATDQM2 074C A088h, ETHA0_NS.EATDQM3 074C A08Ch, ETHA0_NS.EATDQM4 074C A090h, ETHA0_NS.EATDQM5 074C A094h, ETHA0_NS.EATDQM6 074C A098h, ETHA0_NS.EATDQM7 074C A09Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

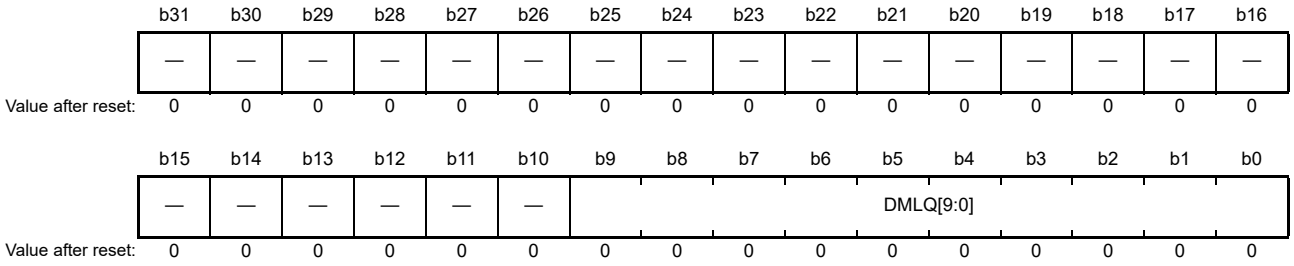
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	DNQ[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	DNQ[9:0]	Descriptor Number in Queue	These bits indicate the current number of descriptors stored in TX Descriptor Queue q.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

DNQ[9:0] Bits (Descriptor Number in Queue)

All descriptor stored here will be rejected/dropped at the out of OPERATION.

[Increment condition]



- HW: Incremented by 1 when a descriptor is received from the forwarding engine [MFWD] for the corresponding queue and, the queue is not full and there is no descriptor security error.

[Decrement condition]

- HW: Decremented by 1 when a descriptor is read by Ethernet Agent to send data to RMAC or to reject data.

36.2.2.8 Transmission Descriptor Queue q Max Level Monitoring Register (EATDQMLMq) (q = 0 to 7)

Address(es): ETHA0.EATDQMLM0 874C A0A0h, ETHA0.EATDQMLM1 874C A0A4h, ETHA0.EATDQMLM2 874C A0A8h, ETHA0.EATDQMLM3 874C A0ACh, ETHA0.EATDQMLM4 874C A0B0h, ETHA0.EATDQMLM5 874C A0B4h, ETHA0.EATDQMLM6 874C A0B8h, ETHA0.EATDQMLM7 874C A0BCh, ETHA0_NS.EATDQMLM0 074C A0A0h, ETHA0_NS.EATDQMLM1 074C A0A4h, ETHA0_NS.EATDQMLM2 074C A0A8h, ETHA0_NS.EATDQMLM3 074C A0ACh, ETHA0_NS.EATDQMLM4 074C A0B0h, ETHA0_NS.EATDQMLM5 074C A0B4h, ETHA0_NS.EATDQMLM6 074C A0B8h, ETHA0_NS.EATDQMLM7 074C A0BCh

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	DMLQ[9:0]	Descriptor Max Level in Queue	These bits indicate the maximum number of descriptors that has been stored in TX Descriptor Queue q.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

DMLQ[9:0] Bits (Descriptor Max Level in Queue)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits (EAMC.OPS[1:0] = 00b).
- SW: By reading these bits, it is cleared to EATDQMq.DNQ[9:0].

[Increment condition]

- HW: Increments to EATDQMq.DNQ[9:0] value when smaller than EATDQMq.DNQ[9:0].

36.2.3 TAG Function Registers

36.2.3.1 VLAN Control Configuration Register (EAVCC)

Address(es): ETHA0.EAVCC 874C A130h, ETHA0_NS.EAVCC 074C A130h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	VEM[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

b8	UT	Unknown TAG	0: Unknown Tag frame passed 1: Unknown Tag frame rejected	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R

36.2.4 ETHA Counter Registers

36.2.4.1 Under Minimum Frame Size Error Counter Register (EAUSMFSECN)

Address(es): ETHA0.EAUSMFSECN 874C A400h, ETHA0_NS.EAUSMFSECN 074C A400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	USMFSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	USMFSEN[15:0]	Under Minimum Frame Size Error Number	These bits count the number of received data lost because of under switch minimum size error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

USMFSEN[15:0] Bits (Under Minimum Frame Size Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading this register clears it.

[Increment condition]

- HW: Incremented by 1 when a Under Switch Minimum Frame Size Error happens and if this register has a value different than FFFFh.

36.2.4.2 TAG Filtering Error Counter Register (EATFECN)

Address(es): ETHA0.EATFECN 874C A404h, ETHA0_NS.EATFECN 074C A404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TFEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TFEN[15:0]	TAG Filtering Error Number	These bits count the number of received data lost because of TAG filtering.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

TFEN[15:0] Bits (TAG Filtering Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a TAG filter error happens and if these bits have a value different than FFFFh.

36.2.4.3 Frame Size Error Counter Register (EAFSECN)

Address(es): ETHA0.EAFSECN 874C A408h, ETHA0_NS.EAFSECN 074C A408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	FSEN[15:0]	Frame Size Error Number	These bits count the number of received data lost because of a Frame Size Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

FSEN[15:0] Bits (Frame Size Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Frame Size Error happens and if these bits has a value different than FFFFh.

36.2.4.4 Descriptor Queue Overflow Error Counter Register (EADQOECN)

Address(es): ETHA0.EADQOECN 874C A40Ch, ETHA0_NS.EADQOECN 074C A40Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DQOEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DQOEN[15:0]	Descriptor Queue Overflow Error Number	These bits count the number of transmit data lost because of a Descriptor Queue Overflow Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DQOEN[15:0] Bits (Descriptor Queue Overflow Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Queue Overflow Error happens and if these bits have a value different than FFFFh.

36.2.4.5 Descriptor Queue Security Error Counter Register (EADQSECN)

Address(es): ETHA0.EADQSECN 874C A410h, ETHA0_NS.EADQSECN 074C A410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DQSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DQSEN[15:0]	Descriptor Queue Security Error Number	These bits count the number of transmit data lost because of a Descriptor Queue Security Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DQSEN[15:0] Bits (Descriptor Queue Security Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Queue Security Error happens and if these bits have a value different than FFFFh.

36.2.5 Error Interrupt Registers

36.2.5.1 Error Interrupt Status Register 0 (EAEIS0)

Address(es): ETHA0.EAEIS0 874C A500h, ETHA0_NS.EAEIS0 074C A500h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FSES7	FSES6	FSES5	FSES4	FSES3	FSES2	FSES1	FSES0	—	TFES	USMFSES	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b5	USMFSES	Under Switch Minimum Frame Size Error Status Flag	0: No Under Switch Minimum Frame Size Error 1: Under Switch Minimum Frame Size Error occurred.	R/W
b6	TFES	TAG Filtering Error Status Flag	0: No TAG Filtering Error 1: TAG Filtering Error occurred.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	FSES0	Frame Size Error Status Flag 0	0: No Frame Size Error 0 1: Frame Size Error 0 occurred.	R/W
b9	FSES1	Frame Size Error Status Flag 1	0: No Frame Size Error 1 1: Frame Size Error 1 occurred.	R/W
b10	FSES2	Frame Size Error Status Flag 2	0: No Frame Size Error 2 1: Frame Size Error 2 occurred.	R/W
b11	FSES3	Frame Size Error Status Flag 3	0: No Frame Size Error 3 1: Frame Size Error 3 occurred.	R/W
b12	FSES4	Frame Size Error Status Flag 4	0: No Frame Size Error 4 1: Frame Size Error 4 occurred.	R/W
b13	FSES5	Frame Size Error Status Flag 5	0: No Frame Size Error 5 1: Frame Size Error 5 occurred.	R/W
b14	FSES6	Frame Size Error Status Flag 6	0: No Frame Size Error 6 1: Frame Size Error 6 occurred.	R/W
b15	FSES7	Frame Size Error Status Flag 7	0: No Frame Size Error 7 1: Frame Size Error 7 occurred.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

USMFSES Flag (Under Switch Minimum Frame Size Error Status Flag)

[Setting condition]

- HW: A frame smaller than 32 bytes has been received from RMAC.
  This error will happen with [RMAC] MEIS.RPOES.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to one of this flag will clear it.

[Error recovery]

- HW: The frame is discarded.
- SW: System dependent, cannot be defined here.

TFES Flag (TAG Filtering Error Status Flag)

[Setting condition]

- HW: An unauthorized TAG format has been detected. (Refer to section 36.3.2.1, RX Data Store).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to one of this flag will clear it.

[Error recovery]

- HW: Frame is sent to Forwarding Engine [MFWD] with local descriptor DESCR.TFE bit set (Refer to section 36.3.2.1, RX Data Store).
- SW: System dependent, cannot be defined here.

FSESq Flag (Frame Size Error Status Flag q) (q = 0 to 7)

[Setting condition]

- HW: FSESq is set when a frame bigger than EATMFSCq.MFS[15:0] has been received for descriptor queue q.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: The current frame will be lost. Following data will be processed normally.
- SW: System dependent, cannot be defined here.

36.2.5.2 Error Interrupt Enable Register 0 (EAEIE0)

Address(es): ETHA0.EAEIE0 874C A504h, ETHA0_NS.EAEIE0 074C A504h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FSEE7	FSEE6	FSEE5	FSEE4	FSEE3	FSEE2	FSEE1	FSEE0	—	TFEE	USMFSEE	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b5	USMFSEE	Under Switch Minimum Frame Size Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b6	TFEE	TAG Filtering Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	FSEE0	Frame Size Error Enable 0	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b9	FSEE1	Frame Size Error Enable 1	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b10	FSEE2	Frame Size Error Enable 2	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b11	FSEE3	Frame Size Error Enable 3	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b12	FSEE4	Frame Size Error Enable 4	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b13	FSEE5	Frame Size Error Enable 5	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b14	FSEE6	Frame Size Error Enable 6	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b15	FSEE7	Frame Size Error Enable 7	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the EAEID0 register.

USMFSEE Bit (Under Switch Minimum Frame Size Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID0.USMFSED bit will clear this bit.

TFEE Bit (TAG Filtering Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID0.TFED bit will clear this bit.

FSEEi Bit (Frame Size Error Enable i) (i = 0 to 7)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID0.FSEDi bit will clear this bit.

36.2.5.3 Error Interrupt Disable Register 0 (EAEID0)

Address(es): ETHA0.EAEID0 874C A508h, ETHA0_NS.EAEID0 074C A508h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FSED7	FSED6	FSED5	FSED4	FSED3	FSED2	FSED1	FSED0	—	TFED	USMFSED	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R
b5	USMFSED	Under Switch Minimum Frame Size Error Disable	0: Has no effects. 1: Sets the EAEIE0.USMFSEE bit to 0.	R/W
b6	TFED	TAG Filtering Error Disable	0: Has no effects. 1: Sets the EAEIE0.TFEE bit to 0.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b8	FSED0	Frame Size Error Disable 0	0: Has no effects. 1: Sets the EAEIE0.FSEE0 bit to 0.	R/W
b9	FSED1	Frame Size Error Disable 1	0: Has no effects. 1: Sets the EAEIE0.FSEE1 bit to 0.	R/W
b10	FSED2	Frame Size Error Disable 2	0: Has no effects. 1: Sets the EAEIE0.FSEE2 bit to 0.	R/W
b11	FSED3	Frame Size Error Disable 3	0: Has no effects. 1: Sets the EAEIE0.FSEE3 bit to 0.	R/W
b12	FSED4	Frame Size Error Disable 4	0: Has no effects. 1: Sets the EAEIE0.FSEE4 bit to 0.	R/W
b13	FSED5	Frame Size Error Disable 5	0: Has no effects. 1: Sets the EAEIE0.FSEE5 bit to 0.	R/W
b14	FSED6	Frame Size Error Disable 6	0: Has no effects. 1: Sets the EAEIE0.FSEE6 bit to 0.	R/W
b15	FSED7	Frame Size Error Disable 7	0: Has no effects. 1: Sets the EAEIE0.FSEE7 bit to 0.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

36.2.5.4 Error Interrupt Status Register 2 (EAEIS2)

Address(es): ETHA0.EAEIS2 874C A520h, ETHA0_NS.EAEIS2 074C A520h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b23	DQSES7	Descriptor Queue 7 Security Error Status Flag	0: No Descriptor Queue 7 Security Error 1: Descriptor Queue 7 Security Error occurred.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

DQOESq Flag (Descriptor Queue q Overflow Error Status Flag) (q = 0 to 7)

[Setting condition]

- HW: This flag is set...

[ETHA is ongoing] (EAMC.OPC[1:0] = 11b and EAMC.OPS[1:0] = 11b)
Descriptor queue is “full (EATDQDC0.DQD[9:0] = EATDQM0.DNQ[9:0])” or “not disabled (EATDQC.TDQDq is not set)” when a descriptor is received for queue q.
[ETHA is going out] (EAMC.OPC[1:0] ≠ 11b and EAMC.OPS[1:0] = 11b)
When a descriptor is received for queue q.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Any descriptor received for a full Descriptor queue will not be accepted by ETHA and will not be forwarded to RMAC.
- SW: Too many descriptors are received for the corresponding queue. EATDQDC0.DQD[9:0] setting should be reviewed.

DQSESq Flag (Descriptor Queue q Security Error Status Flag) (q = 0 to 7)

[Setting condition]

- HW: DQSESq is set when a non-Secure descriptor is received (FDESCR.SEC is not set [MFWD]) and queue q is a secure queue (EATDQSC.TDQSLq is set)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Any non-Secure descriptor received for secure Descriptor queue will not be accepted by ETHA and will not be forwarded to CPU.
- SW: System dependent, cannot be defined here.

36.2.5.5 Error Interrupt Enable Register 2 (EAEIE2)

Address(es): ETHA0.EAEIE2 874C A524h, ETHA0_NS.EAEIE2 074C A524h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b6	DQOEE6	Descriptor Queue 6 Overflow Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b7	DQOEE7	Descriptor Queue 7 Overflow Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DQSEE0	Descriptor Queue 0 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b17	DQSEE1	Descriptor Queue 1 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b18	DQSEE2	Descriptor Queue 2 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b19	DQSEE3	Descriptor Queue 3 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b20	DQSEE4	Descriptor Queue 4 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b21	DQSEE5	Descriptor Queue 5 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b22	DQSEE6	Descriptor Queue 6 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b23	DQSEE7	Descriptor Queue 7 Security Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the EAEID2 register.

DQOEEi Bit (Descriptor Queue i Security Error Enable) (i = 0 to 7)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID2.DQOEDi bit will clear this bit.

DQSEEi Bit (Descriptor Queue i Security Error Enable) (i = 0 to 7)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID2.DQSEDi bit will clear this bit.

36.2.5.6 Error Interrupt Disable Register 2 (EAEID2)

Address(es): ETHA0.EAEID2 874C A528h, ETHA0_NS.EAEID2 074C A528h

Bit	Symbol	Bit Name	Description	R/W
b0	DQOED0	Descriptor Queue 0 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE0 bit to 0.	R/W
b1	DQOED1	Descriptor Queue 1 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE1 bit to 0.	R/W
b2	DQOED2	Descriptor Queue 2 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE2 bit to 0.	R/W
b3	DQOED3	Descriptor Queue 3 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE3 bit to 0.	R/W
b4	DQOED4	Descriptor Queue 4 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE4 bit to 0.	R/W
b5	DQOED5	Descriptor Queue 5 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE5 bit to 0.	R/W
b6	DQOED6	Descriptor Queue 6 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE6 bit to 0.	R/W
b7	DQOED7	Descriptor Queue 7 Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQOEE7 bit to 0.	R/W
b8	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DQSED0	Descriptor Queue 0 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE0 bit to 0.	R/W
b17	DQSED1	Descriptor Queue 1 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE1 bit to 0.	R/W
b18	DQSED2	Descriptor Queue 2 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE2 bit to 0.	R/W
b19	DQSED3	Descriptor Queue 3 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE3 bit to 0.	R/W
b20	DQSED4	Descriptor Queue 4 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE4 bit to 0.	R/W
b21	DQSED5	Descriptor Queue 5 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE5 bit to 0.	R/W
b22	DQSED6	Descriptor Queue 6 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE6 bit to 0.	R/W
b23	DQSED7	Descriptor Queue 7 Security Error Disable	0: Has no effects. 1: Sets the EAEIE2.DQSEE7 bit to 0.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

36.2.5.7 Error Interrupt Status Register 3 (EAEIS3)

Address(es): ETHA0.EAEIS3 874C A530h, ETHA0_NS.EAEIS3 074C A530h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	PROVES	—	—	—	—	—	—	—	EXCES
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LATCES	—	—	—	—	—	—	—	CLSES
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CLSES	Carrier Loss Error Status Flag	0: No Carrier Loss Error 1: Carrier Loss Error occurred	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	LATCES	Late Collision Error Status Flag	0: No Late Collision Error 1: Late Collision Error occurred	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	EXCES	Excessive Collision Error Status Flag	0: No Excessive Collision Error 1: Excessive Collision Error occurred	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	PROVES	Pointer Release Overflow Error Status Flag	0: No Pointer Release Overflow Error 1: Pointer Release Overflow Error occurred	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

CLSES Flag (Carrier Loss Error Status Flag)

[Setting condition]

- HW: This flag is set when a carrier loss error occurred.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: The frame being sent that caused the error is discarded.
- SW: System dependent, cannot be defined here.

LATCES Flag (Late Collision Error Status Flag)

[Setting condition]

- HW: This flag is set when an late collision error occurred.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: The frame being sent that caused the error is discarded.
- SW: System dependent, cannot be defined here.

EXCES Flag (Excessive Collision Error Status Flag)

[Setting condition]

- HW: This flag is set when an excessive collision error occurred.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: The frame being sent that caused the error is discarded.
- SW: System dependent, cannot be defined here.

PROVES Flag (Pointer Release Overflow Error Status Flag)

[Setting condition]

- HW: This flag is set when the transmitted frame size is greater than 2048 bytes.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: None
- SW: Reset ESWM by COMA.RRC.RR bit. Don’t transmit the frame whose size is greater than 2048 bytes.

36.2.5.8 Error Interrupt Enable Register 3 (EAEIE3)

Address(es): ETHA0.EAEIE3 874C A534h, ETHA0_NS.EAEIE3 074C A534h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	PROVEE	—	—	—	—	—	—	—	EXCEE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LATCEE	—	—	—	—	—	—	—	CLSEE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CLSEE	Carrier Loss Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	LATCEE	Late Collision Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	EXCEE	Excessive Collision Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	PROVEE	Pointer Release Overflow Error Enable	0: Interrupt disabled 1: Interrupt Enabled	R/(W) *1
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the EAEID3 register.

CLSEE Bit (Carrier Loss Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID3.CLSED bit will clear this bit.

LATCEE Bit (Late Collision Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID3.LATCED bit will clear this bit.

EXCEE Bit (Excessive Collision Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID3.EXCED bit will clear this bit.

PROVEE Bit (Pointer Release Overflow Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the EAEID3.PROVED bit will clear this bit.

36.2.5.9 Error Interrupt Disable Register 3 (EAEID3)

Address(es): ETHA0.EAEID3 874C A538h, ETHA0_NS.EAEID3 074C A538h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	PROVED	—	—	—	—	—	—	—	EXCED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	LATCED	—	—	—	—	—	—	—	CLSED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CLSED	Carrier Loss Error Disable	0: Has no effects. 1: Sets the EAEIE3.CLSEE bit to 0.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	LATCED	Late Collision Error Disable	0: Has no effects. 1: Sets the EAEIE3.LATCEE bit to 0.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	EXCED	Excessive Collision Error Disable	0: Has no effects. 1: Sets the EAEIE3.EXCEE bit to 0.	R/W
b23 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	PROVED	Pointer Release Overflow Error Disable	0: Has no effects. 1: Sets the EAEIE3.PROVEE bit to 0.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R

36.3 Operation

36.3.1 Data Transmission

Ethernet Agent allows data transmission through the ETHA TX data path, The TX data path is described in Figure 36.2.

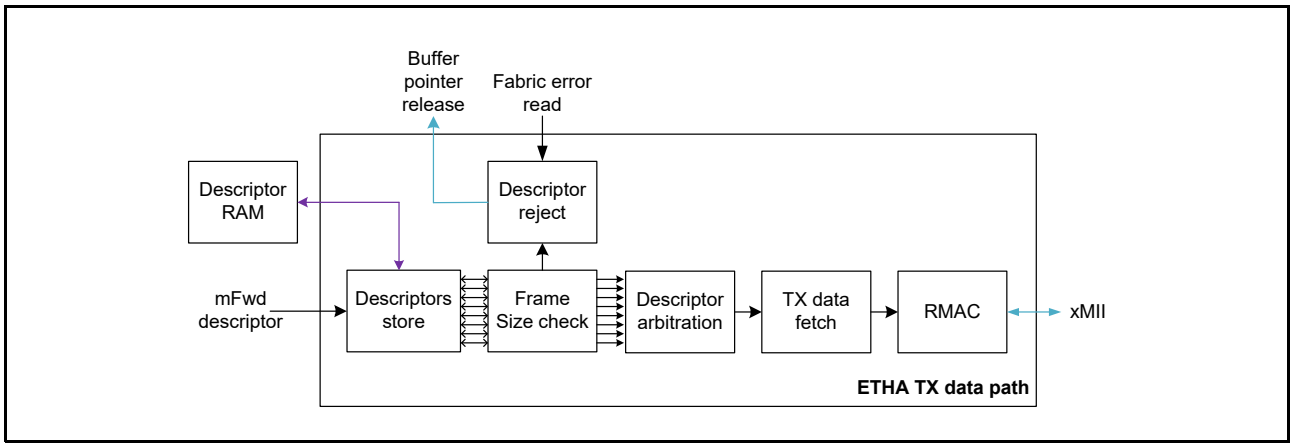

Figure 36.2 ETHA TX Data Path Block Diagram

The TX data path is separated in eleven blocks:

- Descriptor store: This block aims are storing the descriptor received from the Forwarding Engine [MFWD] in the Descriptor RAM.
- Frame size check: This block checks the frame size and decide to forward or discard frames.
- Descriptor reject: This block aims at releasing the pointer of the frames rejected by Frame size control block. This block is here for switch hardware purpose and its description is not required for switch utilization so it will not be described.
- Descriptor arbitration: Arbitrate between descriptors based on their descriptor queue using strict priority and/or WRR arbitration.
- TX data fetch: This block fetches the frame data from the local RAM, update it depending on the information obtained by L2/L3 update module and on VLAN control information and release the frame pointers. The pointer release is here for switch hardware purpose and its description is not required for switch utilization so it will not be described.
- RMAC: This block handles the data exchange with the Ethernet PHY. This block functionalities are described in the RMAC specification document [RMAC] so it will not be described.

36.3.1.1 Descriptor Store

Descriptor store aims at storing the descriptors coming from the descriptor bus [MFWD] in the descriptor RAM. This function is the same as the “Descriptor storage” function in the “Descriptor store” block in GWCA. Refer to GWCA specification for more details [GWCA] (The correspondence between ETHA and GWCA registers is described in Table 36.2).

Table 36.2 Descriptor Store ETHA/GWCA Register Correspondence (1/2)

Register name in GWCA	Register name in ETHA
GWIRC.IPVRi[2:0] (i = 0 to 7)	EAIRC.IPVRi[2:0] (i = 0 to 7)
GWRDQSC.RDQSLq (q = 0 to 7)	EATDQSC.TDQSLi (i = 0 to 7)
GWRDQC.RDQDq (q = 0 to 7)	EATDQC.TDQDn (n = 0 to 7)
GWRDQC.RDQPq (q = 0 to 7)	EATDQC.TDQPn (n = 0 to 7)

Table 36.2 Descriptor Store ETHA/GWCA Register Correspondence (2/2)

Register name in GWCA	Register name in ETHA
GWRDQDCq.DQD[9:0] (q = 0 to 7)	EATDQDCq.DQD[9:0] (q = 0 to 7)
GWRDQMq.DNQ[9:0] (q = 0 to 7)	EATDQMq.DNQ[9:0] (q = 0 to 7)
GWRDQMLMq.DMLQ[9:0] (q = 0 to 7)	EATDQMLMq.DMLQ[9:0] (q = 0 to 7)
GWEIS1.DQOESq (q = 0 to 7)	EAEIS2.DQOESq (q = 0 to 7)
GWEIS1.DQSESq (q = 0 to 7)	EAEIS2.DQSESq (q = 0 to 7)

36.3.1.2 Frame Size Check

Frame size check aims at checking if a frame has the right properties to be received by CPU using EATMFSCq (q = 0 to 7) registers.

[Function]

- EATMFSCq (q = 0 to 7) registers are used to set the maximum frame size accepted for each descriptor queue. Any frame received for queue q with a size bigger than EATMFSCq.MFS[15:0] will be discarded and EAEIS0.FSESq flag will be set. The frame size considered is the size of frame on the PHY.

(1) Maximum Interference Size Calculation

The maximum interface *maxInterferenceSize* size can be calculated for a queue q using per equation (1).
Each interference size includes preamble and inter frame gap (IFG).

(1) maxInterferenceSize = queueInterferenceSizeLow + queueInterfereSize + Σi (queueInterferenceSizeHigh[i])

[Where]

- *queueInterferenceSizeLow* is the interference created by all the queues which have a priority smaller than q. This interference size is equal to (*queueLowMaxSize*+20)*8 where *queueLowMaxSize* is EATMFSCi.MFS[15:0] maximum values for all i smaller than q.
- *queueInterfereSize* is the interference created by queue q and is equal to (EATMFSCq.MFS[15:0]+20)*8
- *queueInterferenceSizeHigh*[i] is the interference created by queue i with a higher priority than q. *queueInterferenceSizeHigh*[i] is equal to (*MaxFrameBurst**EATMFSCi.MFS[15:0] + *queueLowMaxSize* + 40)*8 where *queueLowMaxSize* is EATMFSCj.MFS[15:0] maximum values for all j smaller than i and where *MaxFrameBurst* is the maximum number of frames that can be expected in a burst. *MaxFrameBurst* is a variable which is system dependent and cannot be defined here.

36.3.1.3 TX Data Fetch

TX data fetch is the same as “RX data fetch” in the GWCA except that it can handle pre-emption and that it also handles the data fetching for cut-through queues. Refer to GWCA specification for more details [GWCA] about data update in case of none-cut-through frames (The correspondence between ETHA and GWCA registers is described in Table 36.2).

Table 36.3 TX Data Fetch ETHA/GWCA Register Correspondence

Register name in GWCA	Register name in ETHA
GWVCC.VEM	EAVCC.VEM
{GWMAC0.MAU[15:0], GWMAC1.MAL[31:0]}	{MRMAC0.MAU[15:0], MRMAC1.MAL[31:0]} [RMAC]
GWRGC.RCPT	Fixed to 1 (RMAC will add an FCS to all frames sent without it)

36.3.1.4 RMAC TX Interface Control

After TX data fetch, data is sent to the RMAC through ETHA TX interface [RMAC]. Table 36.4 shows how ETHA TX interface status information are provided to the RMAC.

Table 36.4 ETHA TX Interface Status Provided by ETHA to RMAC

Signal name in RMAC	Bus width	Value provided by ETHA
FCS in	1	Set to 1 if corresponding transmit frames have an FCS (descriptor is received from forwarding engine with FDESCR.FI equal to 1) and if the frame has not been modified by the switch (No update due to VLAN tagging/un-tagging and no update requested by L3 routing [MFWD]).
Timestamp capture	1	Set to LDESCR.TXC
Insert egress timestamp	1	Set to LDESCR.IET
Calculate residence time	1	Set to LDESCR.CRT
Timer number	1	Set to LDESCR.TN
Timestamp unique number	8+PTP_TUNES = 10	Set to {SPN,LDESCR.TSUN} where SPN is the source port number of the corresponding frame.

36.3.2 Data Reception

Ethernet Agent allows data reception through the ETHA RX data path, The RX data path is described in Figure 36.3.

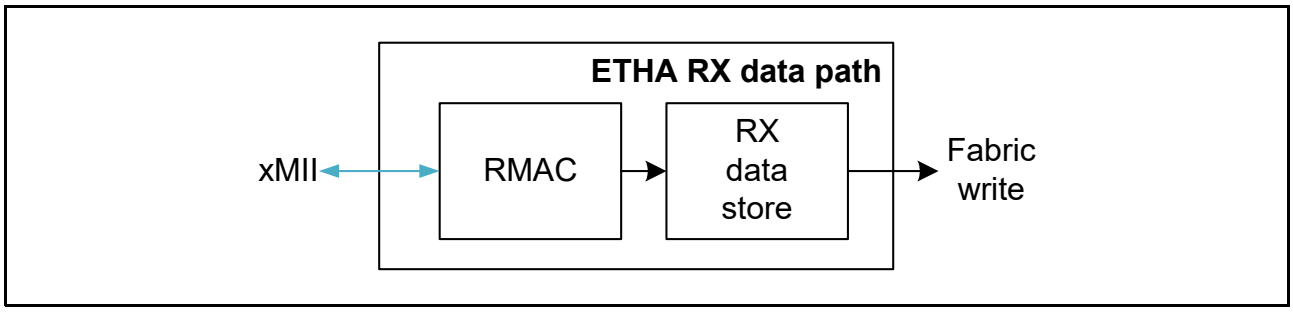

Figure 36.3 ETHA RX Data Path Block Diagram

The RX data path is separated in two blocks:

- RMAC: This block handles the data exchange with the Ethernet PHY. This block functionalities are described in the RMAC specification document [RMAC] so it will not described.
- RX data store: This block extracts TAG information for frames, applies VLAN tagging and save the frames in the local RAM. This block can also release pointers while going out of OPERATION mode. The pointer release is here for switch hardware purpose and its description is not required for switch utilization so it will not be described.

[Restriction]

- SW: The switch maximum input frame size is 60 Kbytes. RMAC should be set so it does not send frames bigger than 60 Kbytes (MRFSCE.EMXS and MRFSCP.PMXS[15:0] should be set to a value smaller or equal to 61440 [RMAC]).

36.3.2.1 RX Data Store

RX data store has follow functions, it extracts TAG information for frames, applies VLAN tagging, and save the frames in the local RAM. This function is the same as the “TX data store” function in GWCA except for the local descriptor format. Refer to GWCA specification for more details [GWCA] (The correspondence between ETHA and GWCA registers is described in Figure 36.5).

Table 36.5 Data Store ETHA/GWCA Register Correspondence

Register name in GWCA	Register name in ETHA
GWTTFC	EARTFC
GWVCC.VIM	EAVCC.VIM
GWVTC	EAVTC
GWEIS0.USMFSES	EAEIS0.USMFSES

As local descriptor format, ETHA can only use ethernet local descriptors. Ethernet local descriptor is explained in GWCA specification and the field corresponding values for ethernet agent is described in Table 36.6.

Table 36.6 Ethernet Local Descriptor Field Description (1/2)

Field name	Bit width	Value for ETHA
FI	1	Set to RMAC ETHA Rx Interface “FCS included” field [RMAC]
FMT	1	Set to 0 for ethernet descriptors
TXC	1	Set to RMAC ETHA Rx Interface “Timestamp capture at TX side” field [RMAC]

Table 36.6 Ethernet Local Descriptor Field Description (2/2)

Field name	Bit width	Value for ETHA
IET	1	Set to 0
CRT	1	Set to 0
TN	1	Set to RMAC ETHA Rx Interface “Time domain number” field [RMAC]
TSUN	8	Set to RMAC ETHA Rx Interface “Timestamp unique number” field [RMAC]
SAEF	8	Refer to Figure 36.4 and Table 36.7
VCTRL	3	VCTRL[2] values: • Set to EAVCC.VIM. VCTRL[1:0] values 00b: For No TAG, R-TAG and Unknown TAG frames. 01b: For C-TAG and CR-TAG frames. 10b: For SC-TAG and SCR-TAG frames. 11b: For CoS-TAG and CoSR-TAG frames.
RTGI	1	Values: 0: For No TAG, CoS-TAG, C-TAG, SC-TAG and Unknown TAG frames. 1: For R-TAG, CoSR-TAG, CR-TAG and SCR-TAG frames.
TPL	16	Payload length of frame. It only includes the data saved in the data RAM [MFWD].
TSV	1	Values: 0: Timestamp has not been received along with the frame from RMAC 1: Timestamp has been received along with the frame from RMAC
TSD	1	Set to RMAC ETHA Rx Interface “Timestamp is a default timestamp” field [RMAC]
TSNS	30	Set to 00000000h if timestamp has not been received. Set to timestamps nanosecond part if timestamp has not been received
TSS	32	Set to 00000000h if timestamp has not been received. Set to timestamps second part if timestamp has not been received
RSV	—	Set to 0

Byte	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0	EC1[1:0]		EC0[3:0]				RSV	TFE

Figure 36.4 Source Agent Error Flag Format

Table 36.7 Source Agent Error Flag Field Description

Field name	Bit width	Description
TFE	1	TAG Filtering Error [Setting conditions] HW: When a frame does not fit the required TAG ingress format. Refer to EARTFC register explanation.
EC0	4	Error Code 0 [RMAC] Values: 0 0 0 0: No error 0 0 0 1: Frame received from RMAC with “PHY error” bit set 0 0 1 1: Frame received from RMAC with “Nibble error” bit set 0 1 0 0: Frame received from RMAC with “FCS (mCRC) error” bit set 0 1 0 1: Frame received from RMAC with “Final fragment missing error” bit set 0 1 1 0: Frame received from RMAC with “C Fragment SMD Error” bit set 0 1 1 1: Frame received from RMAC with “C Fragment FRAG_COUNT Error” bit set 1 0 0 0: Frame received from RMAC with “RMAC Frame filtered” bit set 1 0 0 1: Frame received from RMAC with “Reception partially out of operation” bit set Others: Reserved Restrictions: • HW: Because of the coding mechanism only one error can be flagged in this field. • HW: If several errors happen for the same frame, the error with the smallest EC0 value will be flagged.
EC1	2	Error Code 1 [RMAC] Values: 0 0: No error 0 1: Frame received from RMAC with “Buffer overflow error” bit set 1 0: Frame received from RMAC with “Undersize error” bit set 1 1: Frame received from RMAC with “Oversize error” bit set Restrictions: • HW: Because of the coding mechanism only one error can be flagged in this field. • HW: If several errors happen for the same frame, the error with the smallest EC0 value will be flagged.
RSV	—	Reserved Set to 0

36.3.3 Operating Modes

Table 36.8 describes ETHA operation modes.

Table 36.8 ETHA Operation Modes

Operation mode	GWMS.OPS[1:0] value	Description
DISABLE	0 1	• No transaction is ongoing. • Only status registers are accessible for writing when the agent clock is enabled.
RESET	0 0	• No transaction is ongoing. • An internal Reset is asserted to reset ETHA logic with status registers (When a register is reset in RESET mode, it is mentioned in its description). • No register is accessible for writing. • RAM values are held.
CONFIG	1 0	• No transaction is ongoing. • Static and some dynamic registers are accessible for writing.
OPERATION	1 1	• Transactions are ongoing. • Dynamic registers are accessible for writing.

36.3.3.1 Operating Mode Transitions

Figure 36.5 shows the operating mode transitions.
A mode transition can be trigger by:

- Hardware reset.
- Software reset.
- Configuration of EAMC.OPC[1:0]. In that case, mode transition will be confirmed by EAMS.OPS[1:0].

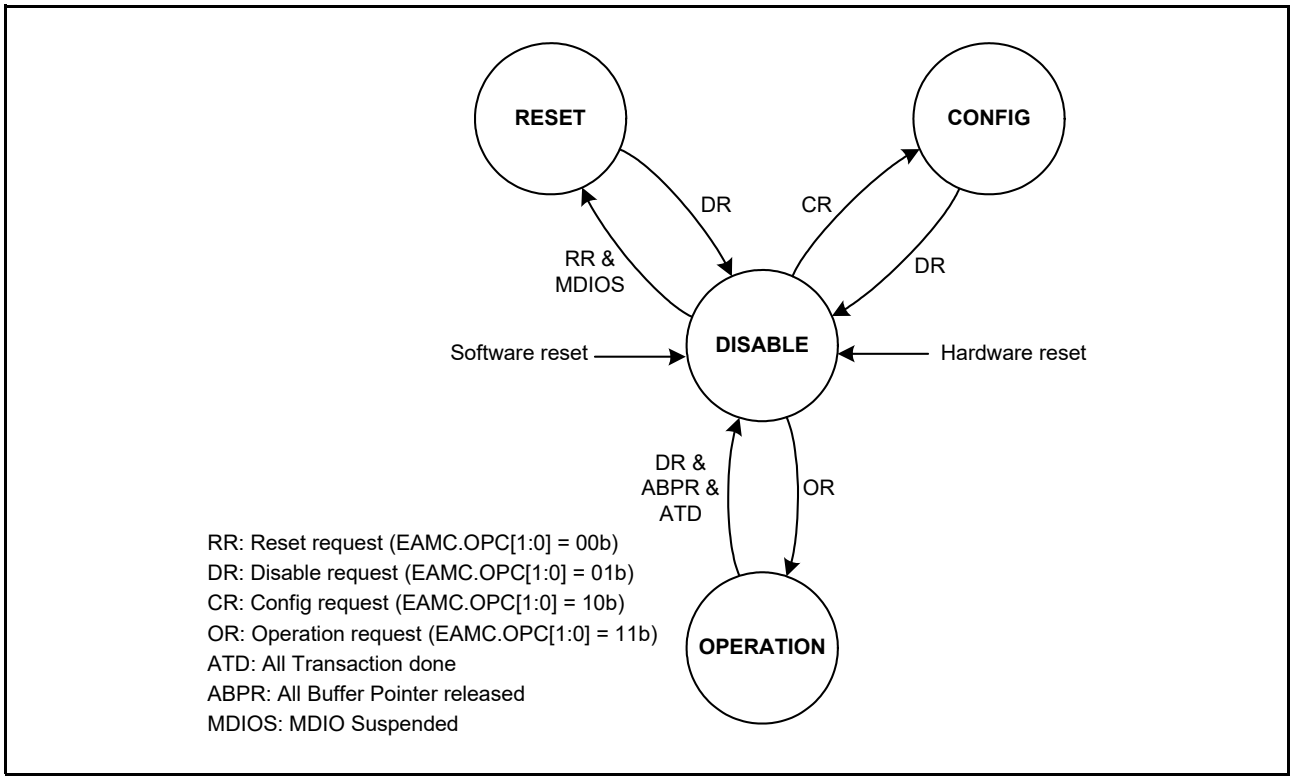

Figure 36.5 Operating Mode Transitions

Complementary information on transition conditions
ABPR:

- All the buffer pointers contained in the ETHA are release to the forwarding engine [MFWD].

ATD:

- All the descriptors already received are processed and corresponding frames are transmitted to the Ethernet PHY.
- All ongoing reception frames are fully sent to the forwarding engine [MFWD].

MDIOS:

- MDIO has no ongoing access.

[Restrictions]

- Software shall only trigger transitions shown to Figure 36.5.
  Exp: Do not directly transition from OPERATION to CONFIG.

36.3.4 Software Flows

[Restriction]

- SW: Please follow to the flow in this section.

36.3.4.1 Mode Transition Flow

The mode transition flow is described in Figure 36.6.

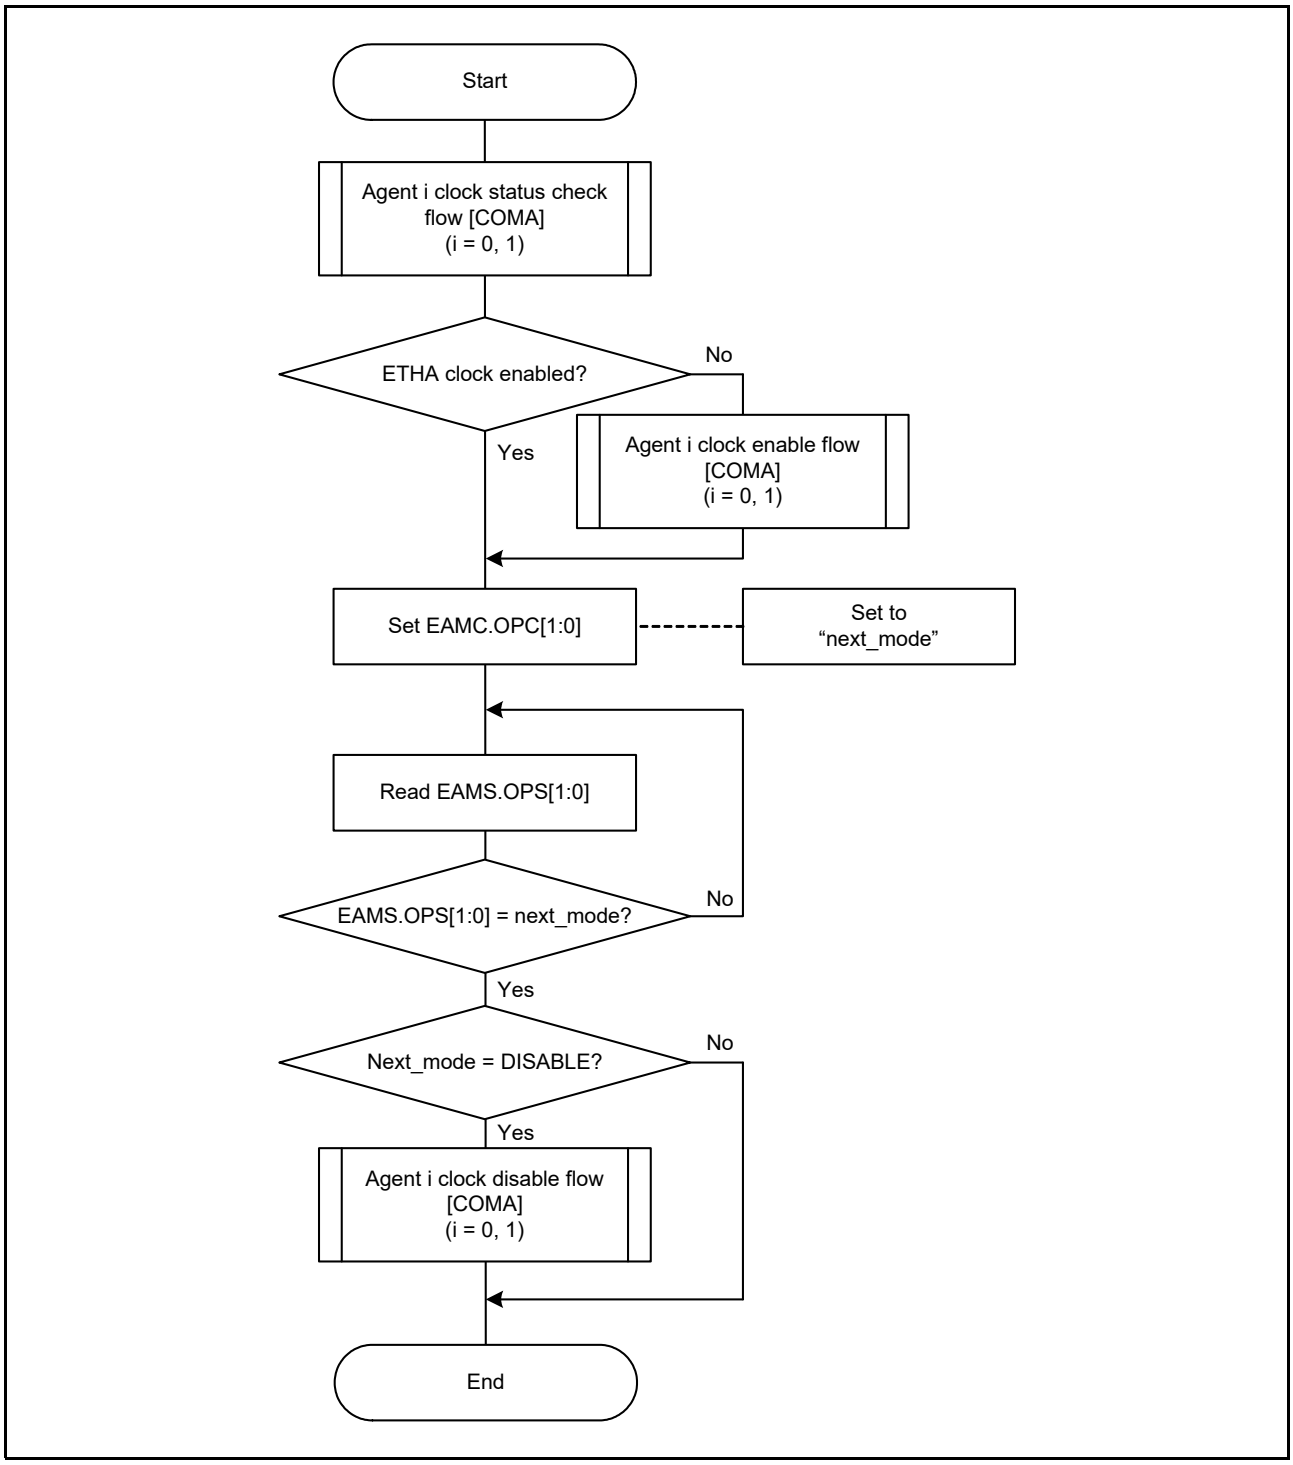

Figure 36.6 Mode Transition Flow

Note: If SW already know that the clock is enabled, clock status check step can be skipped.
Note: If SW does not need to disable the agent clock in DISABLE mode (because it will go directly to another mode or because the clock never needs to be disabled), clock disable step can be skipped.

36.3.4.2 Reset Flow

The reset flow is described in Figure 36.7.

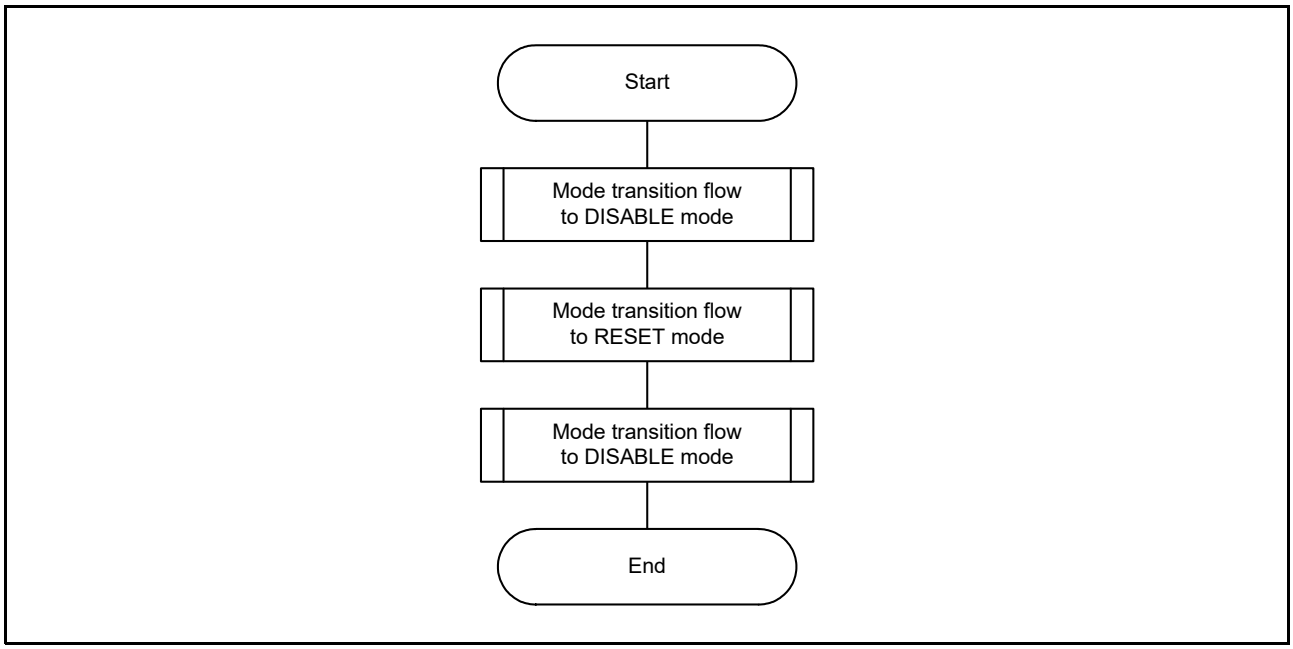

Figure 36.7 Reset Flow

36.3.4.3 Initialization Flow

The initialization flow is described in Figure 36.8.

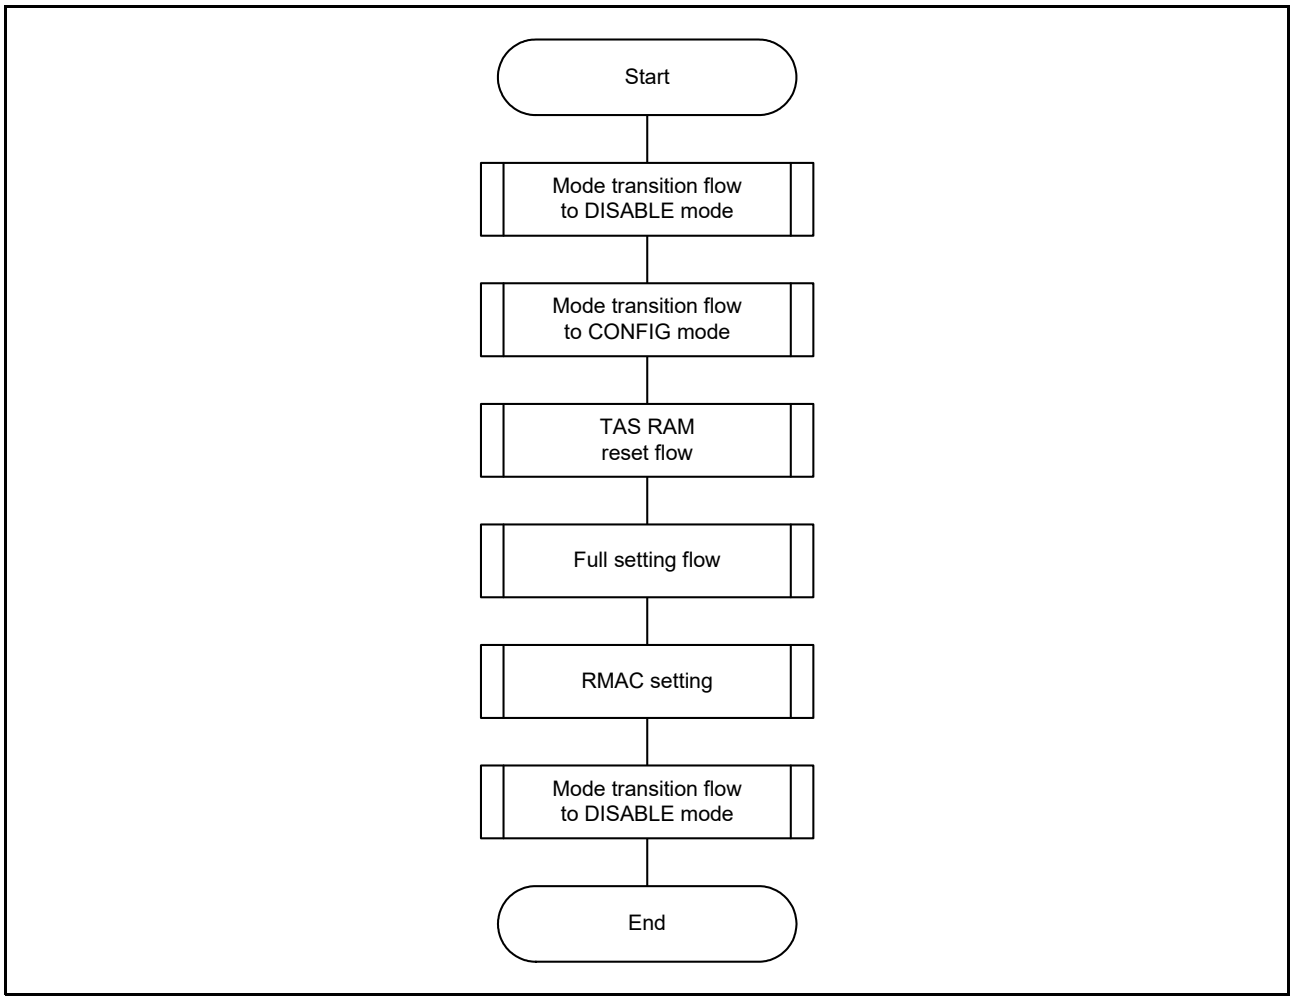

Figure 36.8 Initialization Flow

Note: For RMAC setting refer to section 37, Ethernet MAC (RMAC)

36.3.4.4 Reinitialization Flow

The reinitialization flow is described in Figure 36.9.

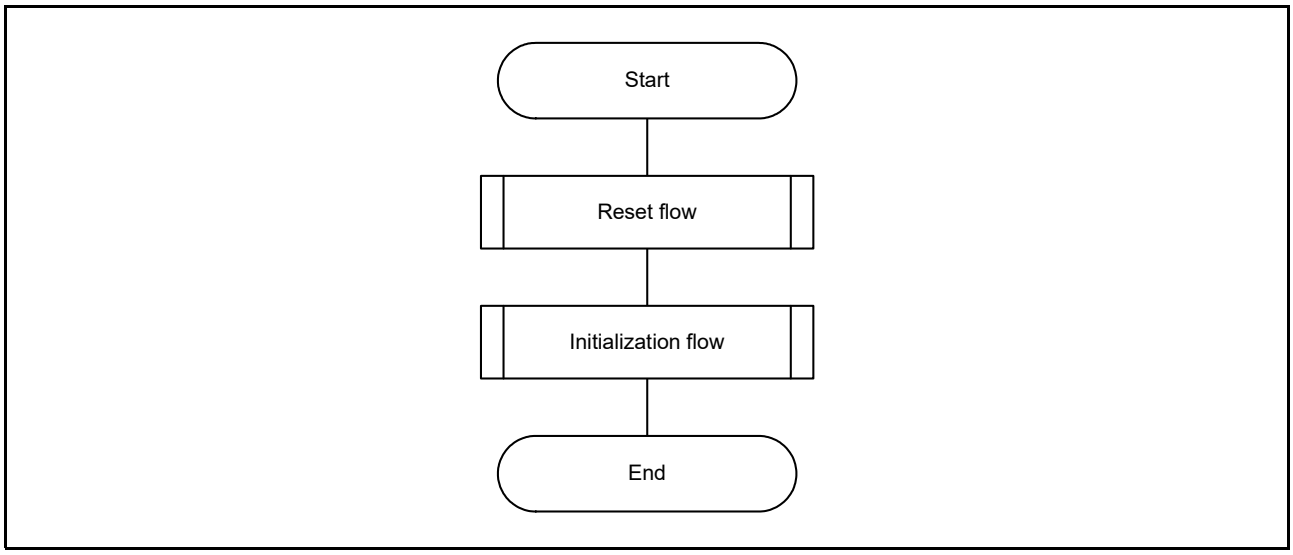

Figure 36.9 Reinitialization Flow

36.3.4.5 Interrupt Handling Flow

The interrupt handling flow is described in Figure 36.10.
[Restriction]

- This flow is not usable in RESET mode.

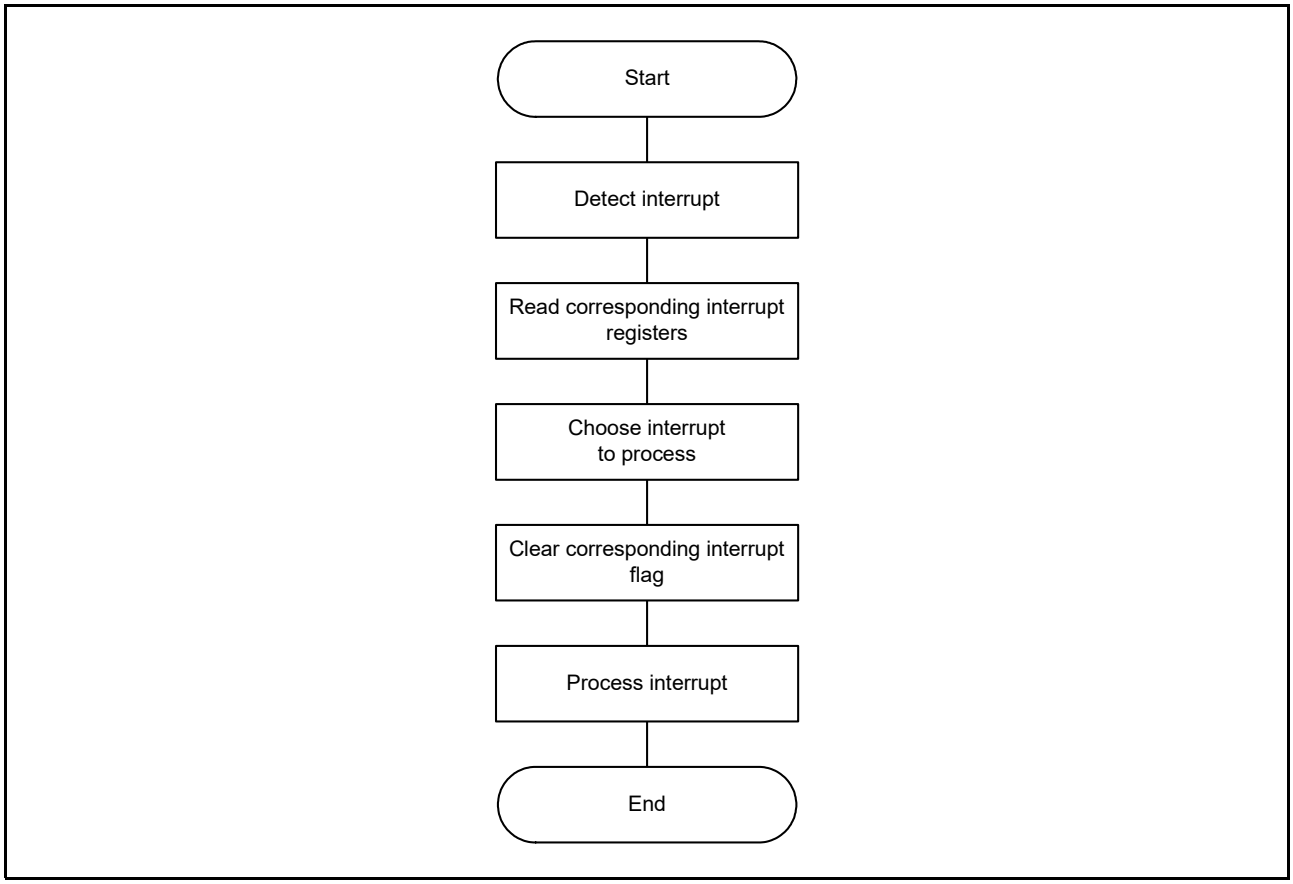

Figure 36.10 Interrupt Handling Flow

36.3.4.6 Called Software Flows

The flows described in this section can only be called from other flows thanks to a “flow link” box (Figure 36.xx) and cannot be used alone.

(1) Full Setting Flow

The full setting flow is described in Figure 36.11.

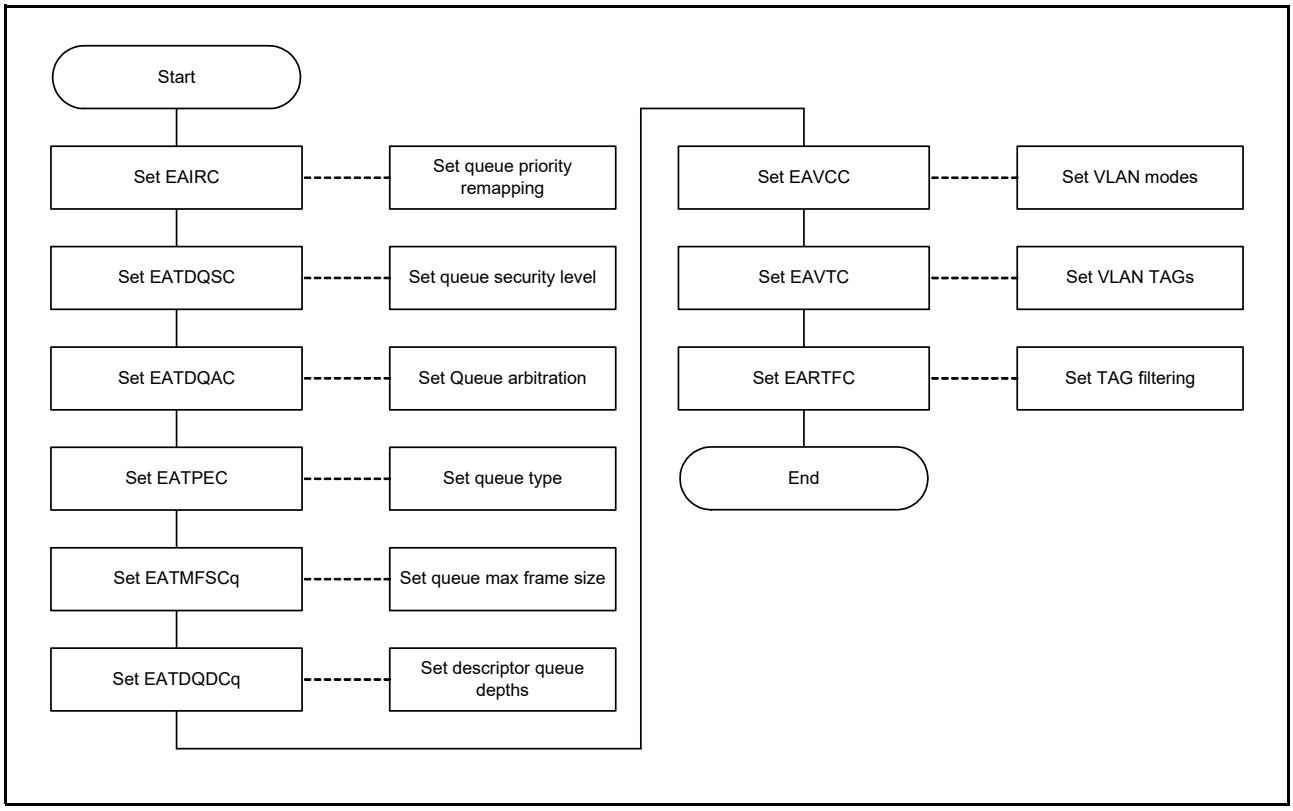

Figure 36.11 Full Setting Flow

37. Ethernet MAC (RMAC)

37.1 Overview

This IP is an Ethernet controller that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.
When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, it is able to transmit and receive Ethernet (IEEE 802.3) frames. It has a single MAC layer interface.

37.1.1 Features

Table 37.1 lists the specifications.

Table 37.1 Specifications (Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
	Priority-based Flow Control with 802.1Qbb
	Support for IEEE 1588 time synchronization, Support for IEEE AS and IEEE AS-Rev acceleration
Transfer speed	Supports transfer at 10,100,1000 Mbps
Mode	Full-duplex mode
	Energy Efficient Ethernet (Low Power Idle)
Interface	Supports the IEEE 802.3 standard MII (Media Independent Interface) and GMII (Gigabit Media Independent Interface)
	PHY MDIO programming Interface
	Supports internal register interface (32bit data width) Supports internal data interface (64bit data width)
Original function	Configurable frame data padding A variety of flexible receive address filtering modes Configurable CRC pass through for transmit and receive Network statistic counter (IEEE 802.3, ROMN RFC2819)
Magic Packet™	Detection of Magic Packets™*1 and output of a detected signal

Note 1. Magic Packet™ is a trademark of Advanced Micro Devices, Inc.

37.1.2 RMAC Block Diagram

Figure 37.1 represents RMAC block diagram.

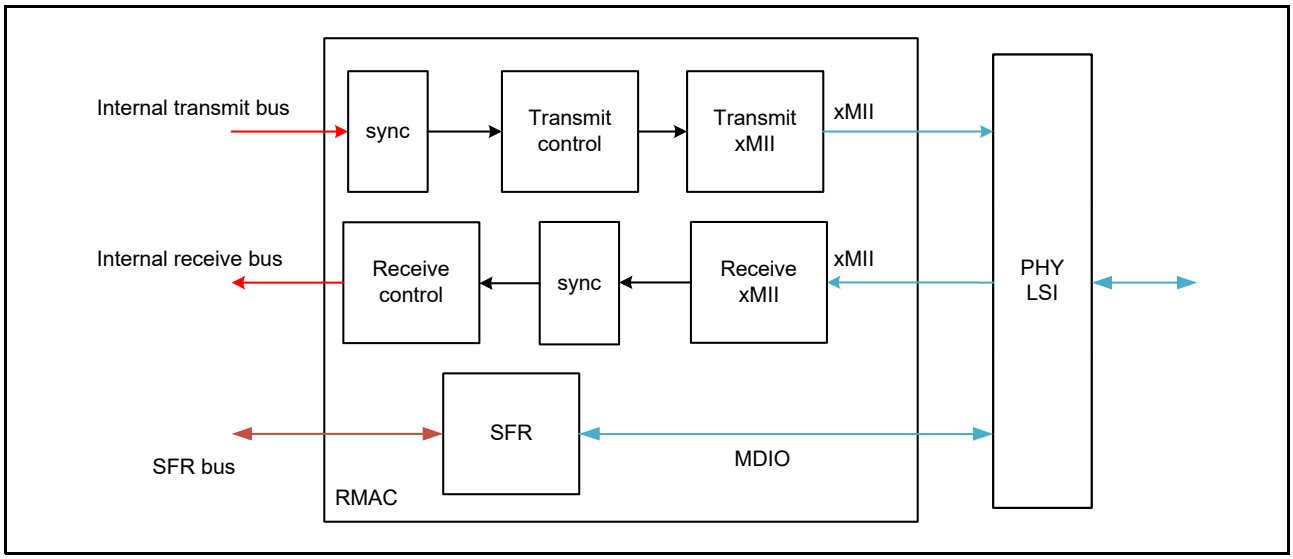

Figure 37.1 Block Diagram

Block	Function
SFR	Contains all the RMAC SFRs and the bridging system to access PHY registers. RMAC registers are on clk.
Receive control	Consists of the receive FSM and Data path logic, which disassembles the received Ethernet frame. It controls functions like checking and removing FCS, Destination Address filtering, Flow Control etc.
Transmit control	Consists of the transmission FSM and Data path logic, which facilitates the transmitted Ethernet frame. It controls functions like adding the Preamble and SFD, adding PAD bytes, calculating the FCS etc.
Receive xMII/ Transmit xMII	Provides the connectivity to the PHY. It supports several types of xMII (MII, GMII, XGMII).
RMAC	IP described in this documentation.
Sync	Synchronized between bus clock domain and mii clock domain.

37.2 Register Description

37.2.1 Function Registers

37.2.1.1 PHY Station Management Register (MPSM)

Address(es): RMAC0.MPSM 874C B000h, RMAC0_NS.MPSM 074C B000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PRD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	POP[1:0]		PRA[4:0]					PDA[4:0]					MFF	—	PSME
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PSME	PHY Station Management Enable	Set this bit to access PHY registers. 0: PHY register access is not on progress. 1: PHY register access is requested and on progress.	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	MFF	Management Frame Format	0: Normal management frame format defined in Clause 22 of IEEE802.3 describe “MDIO” in this document. 1: Extension management frame format defined in Clause 45 of IEEE802.3 describe “eMDIO” in this document.	R/W
b7 to b3	PDA[4:0]	PHY Device Address	MPSM.MFF = 0: The PHY Address field MPSM.MFF = 1: Port address field	R/W
b12 to b8	PRA[4:0]	PHY Register Address	MPSM.MFF = 0: Register address MPSM.MFF = 1: Device address	R/W
b14, b13	POP[1:0]	PHY Operation Code	These bits specify following value according to MPSM.MFF. • MPSM.MFF = 0 10 Read Frame 01 Write Frame Others reserved • MPSM.MFF = 1 00 Address Frame 01 Write Frame 11 Read Frame 10 Post-read-increment-address frame	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b31 to b16	PRD[15:0]	PHY Register Data	MPSM.MFF = 0: Data field of the PHY register MPSM.MFF = 1: Data/Address field of the PHY register	R/W

Provides an access to the PHY-LSI internal registers via the MDIO.

PSME Bit (PHY Station Management Enable)

[Setting condition]

- SW: By writing 1 to this bit. It starts phy access.

[Clearing condition]

- HW: When PHY register access is completed, this bit returns automatically to 0.

[Restrictions]

- SW: Accessing to MPSM register while this bit is asserted has no effect.
- SW: This bit cannot be set when MPIC.PSMCS[6:0] = 0.
- SW: Before resetting RMAC, this bit should always be checked. If this bit is set, no reset should be performed.

MFF Bit (Management Frame Format)

This bit selects the format of management frame.

PDA[4:0] Bits (PHY Device Address)

These bits specify following value according to MPSM.MFF.
Refer to section 37.3.4, Energy Efficient Ethernet for more details.

PRA[4:0] Bits (PHY Register Address)

These bits specify following value according to MPSM.MFF.
Refer to section 37.3.4, Energy Efficient Ethernet for more details.

POP[1:0] Bits (PHY Operation Code)

These bits specify the operation code.
Refer to section 37.3.4, Energy Efficient Ethernet for more details.
[Restriction]

- SW: Value 00 or 11 should not be set when MPSM.MFF = 0.

PRD[15:0] Bits (PHY Register Data)

These bits specify following value according to MPSM.MFF.
Refer to section 37.3.4, Energy Efficient Ethernet for more details.
[Functions]

- Write operation: HW send these bits value to PHY in write operation.
- Read operation: HW write read data to these bits from PHY in read operation.

37.2.1.2 PHY Interfaces Configuration Register (MPIC)

Address(es): RMAC0.MPIC 874C B004h, RMAC0_NS.MPIC 074C B004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	PSMCT[2:0]			—	PSMHT[2:0]			PSMDP	PSMCS[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	PLSPP	PIPP	PIP	FHDM	—	LSC[2:0]			PIS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	PIS[2:0]	PHY Interface Select	b2 b0 0 0 0: MII 0 1 0: GMII Settings other than above are prohibited.	R/W
b5 to b3	LSC[2:0]	Link Speed Configuration	b5 b3 0 0 0: 10 Mbps 0 0 1: 100 Mbps 0 1 0: 1 Gbps Settings other than above are prohibited.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R
b7	FHDM	Full/Half-Duplex Mode Select	0: Full-Duplex mode (default) 1: Half-Duplex mode	R/W
b8	PIP	PHY Interrupt Polarity	0: PHY interrupt is active low (default). 1: PHY interrupt is active high.	R/W
b9	PIPP	PHY Interrupt Pin Plugged	0: Unplugged 1: Plugged	R/W
b10	PLSPP	PHY Link Status Pin Plugged	0: Unplugged 1: Plugged	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R
b22 to b16	PSMCS[6:0]	PHY Station Management Clock Selection	b22 b16 0 0 0 0 0 0 0: MDC clock is off 0 0 0 0 0 0 1: clk/4 0 0 0 0 0 1 0: clk/6 : : 1 1 1 1 1 1 0: clk/254 1 1 1 1 1 1 1: clk/256	R/W
b23	PSMDP	PHY Station Management Disable Preamble	0: PHY Station Management Preamble enabled 1: PHY Station Management Preamble disabled	R/W
b26 to b24	PSMHT[2:0]	PHY Station Management Hold Time Adjustment	b26 b24 0 0 0: No adjusted hold time (i.e. change MDO at the rising edge of MDC) 0 0 1: 1 clk cycle extra hold time : : 1 1 1: 7 clk cycle extra hold time	R/W
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R
b30 to b28	PSMCT[2:0]	PHY Station Management Capture Time Adjustment	b30 b28 0 0 0: No adjusted capture time (i.e. capture MDI at the rising edge of MDC) 0 0 1: Capture before 1 clk cycle : : 1 1 1: Capture before 7 clk cycle	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

This register configures MDIO and xMII interface.

PIS[2:0] Bits (PHY Interface Select)

These bits select the xMII interface connected to the PHY.

[Notes]

- The value for LSC and PIS are only available shown in Table 33.5, Interface Modes and Register Settings.

LSC[2:0] Bits (Link Speed Configuration)

[Note]

- The value for LSC and PIS are only available shown in Table 33.5, Interface Modes and Register Settings.

FHDM Bit (Full/Half-Duplex Mode Select)

[Note]

- Half-duplex mode supports 10/100Mbps@MII/RMII.
- In half-duplex mode, should not use all TSN features (TAS, CBS, Qci, 802.1as (Time stamp), Frame Preemption), LPI mode, Pause/PFC frame, Loop back mode, Cut-through mode.

PIP Bit (PHY Interrupt Polarity)

This bit sets the active level of the PHY interrupt pin (rmc_phy_int).

[Note]

- For the active level, refer to the specifications of PHY-LSI to be connected.

PSMCS[6:0] Bits (PHY Station Management Clock Selection)

These bits configure the cycle of MDC clock. MDC clock is divided from clk clock. The duty cycle of MDC clock is 50%. Refer to section 37.3.3, Station Management for details.

[Restriction]

- SW: These bits cannot be set if MPSM.PSME is set.

PSMDP Bit (PHY Station Management Disable Preamble)

This bit could cut the preamble pattern (sequence of 32 contiguous one bits). When it is asserted, the preamble pattern is skipped and the management frame starts with the ST (Start of Frame) pattern.

[Restriction]

- SW: This bit cannot be set if MPSM.PSME is set.

PSMHT[2:0] Bits (PHY Station Management Hold Time Adjustment)

The configured value will shift the data change timing of MDO with respect to the rising edge of MDC clock.

[Restrictions]

- SW: These bits cannot be set if MPSM.PSME is set.
- SW: The configured value must be less than MDC clock cycle (less than MPIC.PSMCS[6:0]*2).

PSMCT[2:0] Bits (PHY Station Management Capture Time Adjustment)

The configured value will shift the data capture timing of MDI with respect to the rising edge of MDC clock.

[Restrictions]

- SW: These bits cannot be set if MPSM.PSME is set.
- SW: The configured value must be less than MDC clock cycle (less than MPIC.PSMCS[6:0]*2).

37.2.1.3 PHY Interfaces Monitoring Register (MPIM)

Address(es): RMAC0.MPIM 874C B008h, RMAC0_NS.MPIM 074C B008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LPIA	PLS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PLS	PHY Link Status Flag	0: PHY link signal is at the low level. 1: PHY link signal is at the high level.	R
b1	LPIA	LPI Active	0: No LPI 1: LPI active	R
b31 to b2	—	Reserved	These bits are read as 0.	R

PLS Flag (PHY Link Status Flag)

This flag indicates PHY link state. It could be used only when the link status pin (rmc_phy_link) is connected to the link signal from PHY-LSI.

For the active level, refer to the specifications of PHY-LSI to be connected.

LPIA Bit (LPI Active)

This bit indicates that LPI is active on receive side.

[Setting condition]

- HW: When LPI code is appeared on detected on xMII receive data signals (rmc_rx_data_valid_in, rmc_rx_data_data_in[31:0], rmc_rx_data_err_in). Refer xMII specification for more details.

[Clearing condition]

- HW: When LPI code is not appeared on detected on xMII receive data signals.

37.2.1.4 I/O Configuration Register (MIOC)

Address(es): RMAC0.MIOC 874C B010h, RMAC0_NS.MIOC 074C B010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MIOC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MIOC0	I/O Configuration 0 (ETn_TX_CLK/ETn_RX_CLK mode)	clk_phy_tx / clk_phy_rx mode for mii phy. 0: Normal mode. clk_phy_tx and clk_phy_rx are provided. 1: Emergency clock recovery mode. clk_phy_tx and clk_phy_rx are provided free-run clock(clk_common). (So transmission is not possible in this state.)	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

MIOC0 Bit (I/O Configuration 0 (ETn_TX_CLK/ETn_RX_CLK mode))

[Restriction]

- SW can write 1 to MIOC0 bit when clock derivation from PHY is unexpectedly stopped. In this case, write 1 to this bit to flush all internal condition in RMAC. After waiting to flush and change DISABLE mode, write 0 to this bit and change RESET mode.

37.2.1.5 Transmission Frame Format Configuration Register (MTFFC)

Address(es): RMAC0.MTFFC 874C B020h, RMAC0_NS.MTFFC 074C B020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCM	DPAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DPAD	Data Padding Disable	0: Padding is inserted. 1: Padding is not inserted.	R/W
b1	FCM	Flow Control Mode	0: PAUSE 1: PFC	R/W
b30 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

The register is used to configure the frame format to be transmitted.

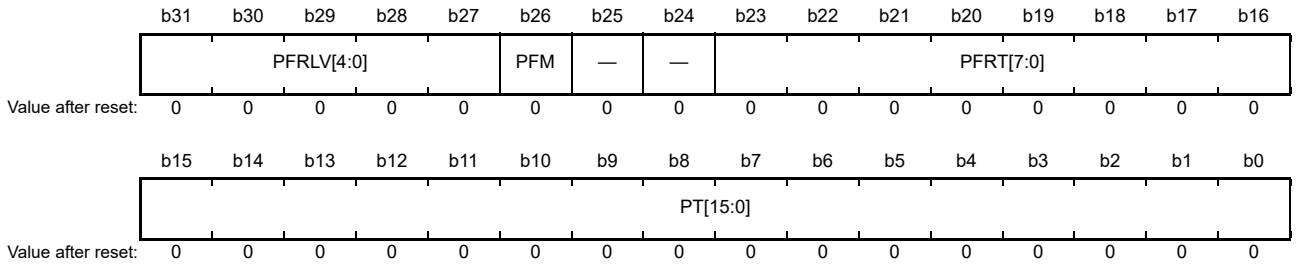
DPAD Bit (Data Padding Disable)

Disables the automatic padding of too small transmit frames (less than 60 bytes) with no FCS.

[Note]

- If a too small transmit frame (less than 60 bytes) with no FCS is received when this bit is set, RMAC adds FCS and sends such a frame.
- When half-duplex mode, set 0 (padding is inserted) to keep slot time to detect collision.

[Restrictions]



- HW: A Verify frame, a Pause frame and a PFC frame are not affected by this bit.
- HW: Padding is not executed when “fcs included (FI = 1)” indication is applied by upper layer.

FCM Bit (Flow Control Mode)

This bit specifies the flow control mode.

37.2.1.6 Transmission Pause or PFC Frame Configuration Register (MTPFC)

Address(es): RMAC0.MTPFC 874C B024h, RMAC0_NS.MTPFC 074C B024h

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PT[15:0]	Pause Time*1, *2	b15 b0 0000h: Pause frame disable 0001h: 512 × 1 bit-time : : FFFFh: 512 × 65,535 bit-time	R/W
b23 to b16	PFRT[7:0]	Pause Frame Retransmission Time *1, *2	b23 b16 00h: 512 × 0 bit-time 01h: 512 × 1 bit-time : : FFh: 512 × 255 bit-time	R/W
b25, b24	—	Reserved	These bits are read as 0. The write value should be 0.	R
b26	PFM	Pause Frame Mode*2	0: Automatic pause frame. Sending a pause frame will be triggered by a hardware pause request. 1: Manual pause frame. Sending a pause frame will be triggered by MTPFC2.MPFR, MTPFC2.MPFCFR0, or MTPFC2.MPFCFR1.	R/W
b31 to b27	PFRLV[4:0]	Pause or PFC Frame Retry Limit Value*2	b31 b27 00h: No interrupt 01h: Interrupt at 1 pause frame : : 1Fh: Interrupt at 31 pause frames	R/W

Note 1. The unit for the setting is 512 bit-time. 1 bit-time is equal to 1 ns in 1000 Mbps, 10 ns in 100 Mbps, 100 ns in 10 Mbps.
Note 2. These bits are common bit for PAUSE and PFC.

The register is used to configure the TIME parameter value for pause frames.

PT[15:0] Bits (Pause Time)

These bits set the TIME parameter value for pause frames.
The value of these bits is set to Time field of a PAUSE or PFC frame. If the value of these bits is 0, PAUSE of PFC is not sent.
[Restriction]

- SW: These bits are only writable in CONFIG mode.

PFRT[7:0] Bits (Pause Frame Retransmission Time)

These bits set the TIME parameter value of pause frame retransmission.
A pause frame will be retransmitted when the previous frame has been sent more than (PT[15:0] - PFRT[7:0]) ± 10 cycles bit-time ago.
[Restrictions]

- SW: These bits should be set to a smaller value than one of MTPFC.PT[15:0].
- SW: These bits are only writable in CONFIG mode.

PFM Bit (Pause Frame Mode)

[Restriction]

- SW: These bits are only writable in CONFIG mode.

PFRLV[4:0] Bits (Pause or PFC Frame Retry Limit Value)

Value of pause frame sent without pause frame request signal de-assertion from which at which RMAC will emit an interrupt.

[Restriction]

- SW: These bits are only writable in CONFIG mode.

[Note]

- The number of pause (pfc) frames in this field indicates the total number of transmission attempt.

37.2.1.7 Transmission Pause or PFC Frame Configuration Register 2 (MTPFC2)

Address(es): RMAC0.MTPFC2 874C B028h, RMAC0_NS.MTPFC2 074C B028h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MPFR	PFTTZ
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MPFCFR1	MPFCFR0	—	—	—	—	—	—	PFCTTZ1	PFCTTZ0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PFCTTZ0	PFC Frame 0 Transmission with TIME = 0	0: The transmission of PFC frames with TIME value zero is disabled. 1: The transmission of PFC frames with TIME value zero is enabled	R/W
b1	PFCTTZ1	PFC Frame 1 Transmission with TIME = 0		
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	MPFCFR0	Manual PFC Frame 0 Request	Writing 1 to this bit request manual pfc frame.	R/W
b9	MPFCFR1	Manual PFC Frame 1 Request		R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	PFTTZ	Pause Frame Transmission with TIME = 0	0: The transmission of Pause frames with TIME value zero is disabled. 1: The transmission of Pause frames with TIME value zero is enabled	R/W
b17	MPFR	Manual Pause Frame Request	Writing 1 to this bit requests a manual pause frame.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

The register is used to set the TIME parameter value for PFC frames.

PFCTTZn Bit (PFC Frame n Transmission with TIME = 0) (n = 0, 1)

This bit enables the transmission of automatic PFC frames with TIME value zero. It is transmitted when the ETHA negated the PFC request in automatic PFC frame mode or when the software negate the MTPFC2.MPFCFRn bit in manual PFC frame mode and the remaining PFC time is more than PFRT.

[Restrictions]

- SW: This bit has no effect for Manual PFC frame transmission.
- SW: This bit is only writable in CONFIG mode

MPFCFRn Bit (Manual PFC Frame n Request) (n = 0, 1)

If a pfc frame is requested so fast that the hardware did not have time to send the previous one (because a long frame is ongoing or because the software requests too many pfc frames), the hardware will ignore the pfc frame requests.
After completion of non-pause frame transmission the next attempt for PFC frame will be only when timer expires if request for PFC frame is still high.

[Setting condition]

- SW: Writing 1 to this bit will set.

[Clearing conditions]

- SW: Writing 0 to this bit will clear.
- HW: Going out of OPERATION mode will clear this bit.

[Restriction]

- SW: This bit is only writable in OPERATION mode.

PFTTZ Bit (Pause Frame Transmission with TIME = 0)

This bit enables the transmission of automatic Pause frames with TIME value zero. It is transmitted when the ETHA negates the pause request in automatic pause frame mode or when the software negates the MTPFC2.MPFR bit in manual pause frame mode and the remaining pause time is more than PFRT.
This bit has no effect for Manual Pause frame transmission.
[Restriction]

- SW: This bit is only writable in CONFIG mode.

[Note]

- This bit is used for PAUSE frame only.

MPFR Bit (Manual Pause Frame Request)

If a pause frame is requested so fast that the hardware has have time to send the previous one (because a long frame is ongoing or because the software requests too many pause frames), the hardware will ignore the pause frame requests.
[Setting condition]

- SW: Writing 1 to this bit will set the bit.

[Clearing conditions]

- SW: Writing 0 to this bit will clear the bit.
- HW: Going out of OPERATION mode will clear this bit.

[Restriction]

- SW: This bit is only writable in OPERATION mode.

[Note]

- This bit is used for a PAUSE frame only.

37.2.1.8 Transmission Pause or PFC Frame Configuration Register 3t (MTPFC3t) (t = 0, 1)

Address(es): RMAC0.MTPFC30 874C B030h, RMAC0.MTPFC31 874C B034h, RMAC0_NS.MTPFC30 074C B030h, RMAC0_NS.MTPFC31 074C B034h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PFCPG[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	PFCPG[7:0]	PFC Priority Group	0: Priority x is not assigned to priority group t. 1: Priority x is assigned to group t.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

The register is used to set the TIME parameter value for PFC frames.

PFCPG[7:0] Bits (PFC Priority Group)

[When MTFFC.FCM = 1 (PFC)]

- When PFC frame transmission request (hardware request for automatic request, MTPFC2.MPFCFR for manual request) is set, PFC frame is generated. Then, the Field of Class-Enable vector is set to these bits value.
- When all bits of PFCPG[7:0] = 00h, the transmission request is ignored.

[When MTFFC.FCM = 0 (PAUSE)]

- PAUSE frame transmission request is set by hardware pause request or MTPFC2.MPFR.
- When PFCPG[0] = 0, the transmission request is ignored.

[Restriction]

- SW: These bits are only writable in CONFIG mode.

37.2.1.9 Transmission Flow Control JAM Configuration Register (MTFCJC)

Address(es): RMAC0.MTFCJC 874C B070h, RMAC0_NS.MTFCJC 074C B070h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MJOE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	JM	—	—	—	—	—	—	—	JE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	JE	JAM Enable	0: JAM disabled 1: JAM enabled	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	JM	JAM Mode Select	0: Automatic JAM 1: Manual JAM	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	MJOE	Manual JAM Output Enable	0: Transmission disabled 1: Transmission enabled	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

The register is used to set jam output configuration for back pressure for flow control on half-duplex mode.

JE Bit (JAM Enable)

[Restrictions]

- SW: This bit is only writable in CONFIG mode.

[Note]

- This bit should be used only half-duplex mode.

JM Bit (JAM Mode Select)

[Restriction]

- SW: This bit is only writable in CONFIG mode.

[Note]

- This bit should be used only half-duplex mode.
- Assertion/De-assertion levels are set by CABPPFLC and CABPPPFLC registers. In manual mode, CABPPFLC and CABPPPFLC are ignored.

MJOE Bit (Manual JAM Output Enable)

[Restriction]

- SW: This bit is only writable in OPERATION mode.

[Note]

- This bit should be used only half-duplex mode.

37.2.1.10 Reception General Configuration Register (MRGC)

Address(es): RMAC0.MRGC 874C B080h, RMAC0_NS.MRGC 074C B080h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	PFCRC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	RFCFE	MPDE	PFRTZ	PFRC	RCPT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RCPT	Receive CRC Pass Through	0: Correct FCS is not passed to the ETHA. Incorrect FCS is passed to the ETHA. 1: Both Correct and Incorrect FCS are passed to the ETHA.	R/W
b1	PFRC	Pause Frame Reception Control	0: Flow control for the receiving port is disabled. 1: Flow control for the receiving port is enabled.	R/W
b2	PFRTZ	Pause or PFC Frame Reception with Time = 0	0: Reception of Pause or PFC frames with the TIME value 0 is disabled. 1: Reception of Pause or PFC frames with the TIME value 0 is enabled.	R/W
b3	MPDE	Magic Packet Detection Enable	0: Magic Packet detection is disabled. 1: Magic Packet detection is enabled.	R/W
b4	RFCFE	Reception Flow Control Forwarding Enable	0: Flow Control Frame (PAUSE or PFC frame) is not forward to receive ETHA interface. 1: Flow Control Frame (PAUSE or PFC frame) is forward to receive ETHA interface.	R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R
b23 to b16	PFCRC[7:0]	PFC Frame Reception Control	0: Flow control for the receiving priority level x(7:0) is disabled. 1: Flow control for the receiving priority level x(7:0) is enabled.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

The register is used to configure the frame reception.

RCPT Bit (Receive CRC Pass Through)

This bit selects to pass FCS field of the received frame. The CRC is checked regardless of this configuration.

PFRC Bit (Pause Frame Reception Control)

This bit enables the Flow Control (Pause frame detection) function.

[Restrictions]

- HW: Only for e-frames
- SW: When any bits of MRGC.PFCRC[7:0] is set, SW should not set this bit.

PFRTZ Bit (Pause or PFC Frame Reception with Time = 0)

When this bit is set to 1, the reception of Pause or PFC frame with the Timer value 0 releases the transmission wait state.

MPDE Bit (Magic Packet Detection Enable)

This bit enables Magic Packet detection by hardware to allow activation via the Ethernet connection.
[Restriction]

- HW: Only for e-frames

RFCFE Bit (Reception Flow Control Forwarding Enable)

This bit enables the Flow Control Frame (PAUSE or PFC frame) forwarding function.

PFCRC[7:0] Bits (PFC Frame Reception Control)

This bit enables the Flow Control (Pause frame detection) function.
[Restrictions]

- HW: Only for e-frames
- SW: When MRGC.PFRC is set, SW should not set this bit.

37.2.1.11 Reception MAC Address Configuration Register 0 (MRMAC0)

Address(es): RMAC0.MRMAC0 874C B084h, RMAC0_NS.MRMAC0 074C B084h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MAU[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MAU[15:0]	MAC Address Upper Part	These bits are used to set the upper 16 bits of the MAC address. For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 0123h in this register.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

Specifies the upper 16 bits of the 48-bit unicast MAC address. This register is also used as source address field when the IP transmits a Pause frame or a PFC frame.

37.2.1.12 Reception MAC Address Configuration Register 1 (MRMAC1)

Address(es): RMAC0.MRMAC1 874C B088h, RMAC0_NS.MRMAC1 074C B088h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MAL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	MAL[31:0]	MAC Address Lower Part	These bits are used to set the lower 32 bits of the MAC address. For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 456789ABh in this register.	R/W

The register is to use to specify the lower 32 bits of the 48-bit unicast MAC address. This register is also used as source address field when the IP transmits a Pause frame or a PFC frame.

37.2.1.13 Reception Address Filter Configuration Register (MRAFC)

Address(es): RMAC0.MRAFC 874C B08Ch, RMAC0_NS.MRAFC 074C B08Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b0	UCENE	Unicast Reception Enable E-Frames	0: Unicast reception disabled 1: Unicast reception enabled	R/W
b1	MCENE	Multicast Reception Enable E-Frames	0: Multicast reception disabled 1: Multicast reception enabled	R/W
b2	BCENE	Broadcast Reception Enable E-Frames	0: Broadcast reception disabled 1: Broadcast reception enabled	R/W
b3	MSTENE	Multicast Storm Filter Reception Enable E-Frames	0: Multicast storm filter reception disabled 1: Multicast storm filter reception enabled	R/W
b4	BSTENE	Broadcast Storm Filter Reception Enable E-Frames	0: Broadcast storm filter reception disabled 1: Broadcast storm filter reception enabled	R/W
b5	MCACE	Multicast Storm Autoclear E-Frames	0: Multicast Storm AutoClear disabled 1: Multicast Storm AutoClear enabled	R/W
b6	BCACE	Broadcast Storm Autoclear E-Frames	0: Broadcast Storm AutoClear disabled 1: Broadcast Storm AutoClear enabled	R/W
b7	NDAREE	Null Destination Address Reception Enable E-Frames	0: Disable 1: Enable	R/W
b8	SDSFREE	Same DA and SA Frames Reception Enable E-Frames	0: Disable 1: Enable	R/W
b9	NSAREE	Null Source Address Reception Enable E-Frames	0: Disable 1: Enable	R/W
b10	MSAREE	Multicast Source Address Reception Enable E-Frames	0: Disable 1: Enable	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R
b26 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R

UCENE Bit (Unicast Reception Enable E-Frames)

This bit enables the unicast filtering based on MAC address (MRMAC0, MRMAC1).

MCENE Bit (Multicast Reception Enable E-Frames)

This bit enables the multicast filtering.

BCENE Bit (Broadcast Reception Enable E-Frames)

This bit enables the broadcast filtering.

MSTENE Bit (Multicast Storm Filter Reception Enable E-Frames)

This bit enables the multicast storm filtering. When it is asserted, Multicast frames are rejected after the number of received multicast e-frames reaches the configured threshold (MRSCE.CMFE[15:0]).

[Restriction]

- SW: It is valid only when Multicast reception is enabled (MRAFC.MCENE = 1).

BSTENE Bit (Broadcast Storm Filter Reception Enable E-Frames)

This bit enables the broadcast storm filtering. When it is asserted, Broadcast frames are rejected after the number of received broadcast e-frames reaches to the configured threshold (MRSCE.CBFE[15:0]).

[Restriction]

- SW: It is valid only when Broadcast reception is enabled (MRAFC.BCENE = 1).

MCACE Bit (Multicast Storm Autoclear E-Frames)

This bit enables auto-clear of multicast frame storm counter. When it is asserted, multicast frame storm counter is cleared by detecting a frame with non-multicast destination address. After the counter is cleared, the IP can receive multicast frame again.

[Restriction]

- HW: Broadcast frames are not taken in account by multicast storm counter.

BCACE Bit (Broadcast Storm Autoclear E-Frames)

This bit enables auto-clear of broadcast frame storm counter. When it is asserted, broadcast frames storm counter is cleared by detecting a frame with non-broadcast destination address. After the counter is cleared, the IP can receive Broadcast frame again.

NDAREE Bit (Null Destination Address Reception Enable E-Frames)

This bit enables the reception of e-frames with destination MAC address null.

SDSFREE Bit (Same DA and SA Frames Reception Enable E-Frames)

This bit enables the reception of e-frame with equal destination address and source address.

NSAREE Bit (Null Source Address Reception Enable E-Frames)

This bit enables the reception of e-frames with source MAC address null.

MSAREE Bit (Multicast Source Address Reception Enable E-Frames)

This bit enables the reception of e-frame with multicast and broadcast source address.

37.2.1.14 Reception Storm Configuration for E-Frames Register (MRSCE)

Address(es): RMAC0.MRSCE 874C B090h, RMAC0_NS.MRSCE 074C B090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CBFE[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMFE[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	CMFE[15:0]	Consecutive Multicast Frame Reception Count Setting for E-Frames	b15 b0 0000h: 1 Multicast frame accepted until multicast frame counter reset. 0001h: 2 Multicast frames accepted until multicast frame counter reset. : : FFFEh: 65535 Multicast frames accepted until multicast frame counter reset. Settings other than above are prohibited.	R/W
b31 to b16	CBFE[15:0]	Consecutive Broadcast Frame Reception Count Setting for E-Frames	b31 b16 0000h: 1 Broadcast frame accepted until broadcast frame counter reset. 0001h: 2 Broadcast frames accepted until broadcast frame counter reset. : : FFFEh: 65535 Broadcast frames accepted until broadcast frame counter reset. Settings other than above are prohibited.	R/W

This register configures the number of times how many broadcast/multicast frames can be received consecutively.

CMFE[15:0] Bits (Consecutive Multicast Frame Reception Count Setting for E-Frames)

These bits specify the upper-limitation of received consecutive multicast frames. After the number of received consecutive multicast frames reaches the set value, the subsequent multicast frames are discarded.

CBFE[15:0] Bits (Consecutive Broadcast Frame Reception Count Setting for E-Frames)

These bits specify the upper-limitation of received consecutive broadcast frames. After the number of received consecutive broadcast frames reaches the set value, the subsequent broadcast frames are discarded.

37.2.1.15 Reception Storm Counter Configuration Register (MRSCC)

Address(es): RMAC0.MRSCC 874C B098h, RMAC0_NS.MRSCC 074C B098h

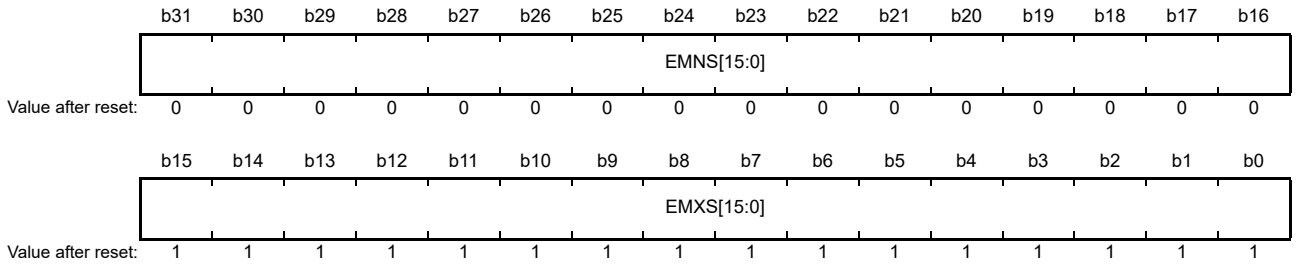
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BSCCE	MSCCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MSCCE	Multicast Storm Counter Clear E-Frames	Writing 1 to this bit clears the multicast storm counter. This bit is read as 0.	R/W
b1	BSCCE	Broadcast Storm Counter Clear E-Frames	Writing 1 to this bit clears the broadcast storm counter. This bit is read as 0.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17, b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

Register to clear Broadcast and Multicast Storm Counters.

MSCCE Bit (Multicast Storm Counter Clear E-Frames)



This bit requests to clear the multicast frames storm counter.
After the counter is cleared, the IP can receive multicast frames again until the upper-limitation of received consecutive multicast frames (MRSCE.CMFE[15:0]).
It should be used with multicast Storm AutoClear disabled (MRAFC.MCACE = 0).

BSCCE Bit (Broadcast Storm Counter Clear E-Frames)

This bit requests to clear the broadcast frames storm counter.
After the counter is cleared, the IP can receive Broadcast frames again until the upper-limitation of received consecutive Broadcast frames (MRSCE.CBFE[15:0]).
It should be used with Broadcast Storm AutoClear disabled (MRAFC.BCACE = 0).

37.2.1.16 Reception Frame Size Configuration for E-Frames Register (MRFSCE)

Address(es): RMAC0.MRFSCE 874C B09Ch, RMAC0_NS.MRFSCE 074C B09Ch

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EMXS[15:0]	E-Frame Maximum Size	E-Frame maximum size	R/W
b31 to b16	EMNS[15:0]	E-Frame Minimum Size	E-Frame minimum size	R/W

Note: The size limitations concern the frame size RMAC outputs to an upper layer (e.g. ETHA), and so the FCS removal impacts the register values.

EMXS[15:0] Bits (E-Frame Maximum Size)

A part of received frame which exceeds the set value are truncated.

Do not set a value under 16 bytes

37.2.1.17 Timestamp Reception Configuration Register (MTRC)

Address(es): RMAC0.MTRC 874C B0A4h,RMAC0_NS.MTRC 074C B0A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	DTN	—	TCTSE	—	TRDDE	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRHFME1	TRHFME0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TRHFME0	Timestamp Reception Hardware Filter Match Enable 0	0: Disable 1: Enable	R/W
b1	TRHFME1	Timestamp Reception Hardware Filter Match Enable 1	0: Disable 1: Enable	R/W
b23 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	TRDDE	Timestamp Reception Default Disable E-Frame	0: Enable 1: Disable	R/W
b25	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b26	TCTSE	Timestamp Capture on Transmit Side E-Frame	0: Disable 1: Enable	R/W
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b28	DTN	Default timer number	The bit set Timer used for timestamp forwarding on receive ETHA interface when no timer is detected.	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R

TRHFME0 Bit (Timestamp Reception Hardware Filter Match Enable 0)

Setting this bit to 1 will enable hardware filtering for timer 0.
When this bit is set to 1, at least one of the in the MPFCt.TEF0 bits (t = 0 to 15) should be set to 1.
When hardware filter matches, the timestamp from the matched timer will be sent along with the frame.

TRHFME1 Bit (Timestamp Reception Hardware Filter Match Enable 1)

Setting this bit to 1 will enable hardware filtering for timer 1.
When this bit is set to 1, at least one of the in the MPFCt.TEF1 bits (t = 0 to 15) should be set to 1.
When hardware filter matches, the timestamp from the matched timer will be sent along with the frame.

TRDDE Bit (Timestamp Reception Default Disable E-Frame)

A timestamp for every frame will be transmitted to the ETHA. This timestamp will be taken on the default timer except when TRHFMEn is set and the hardware filter matches.

TCTSE Bit (Timestamp Capture on Transmit Side E-Frame)

The bit enables the timestamp capture on transmit side for e-frames

37.2.1.18 Reception Pause or PFC Frame Monitoring Register (MRPFM)

Address(es): RMAC0.MRPFM 874C B0ACh, RMAC0_NS.MRPFM 074C B0ACh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	PFCTCA[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PTCA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PTCA	Pause Time Counting Active	0: No pause state 1: Pause state	R
b15 to b1	—	Reserved	These bits are read as 0.	R
b23 to b16	PFCTCA[7:0]	PFC Time Counting Active	0: No pause state 1: Pause state	R
b31 to b24	—	Reserved	These bits are read as 0.	R

PTCA Bit (Pause Time Counting Active)

This bit indicates that the Pause time of a received Pause frame has not been completed.

PFCTCA[7:0] Bits (PFC Time Counting Active)

This bit indicates that the Pause time of a received PFC frame has not been completed.

37.2.1.19 PTP Filtering Register Configuration Register t (MPFCt) (t = 0 to 15)

Address(es): RMAC0.MPFC0 874C B100h, RMAC0.MPFC1 874C B104h, RMAC0.MPFC2 874C B108h, RMAC0.MPFC3 874C B10Ch, RMAC0.MPFC4 874C B110h, RMAC0.MPFC5 874C B114h, RMAC0.MPFC6 874C B118h, RMAC0.MPFC7 874C B11Ch, RMAC0.MPFC8 874C B120h, RMAC0.MPFC9 874C B124h, RMAC0.MPFC10 874C B128h, RMAC0.MPFC11 874C B12Ch, RMAC0.MPFC12 874C B130h, RMAC0.MPFC13 874C B134h, RMAC0.MPFC14 874C B138h, RMAC0.MPFC15 874C B13Ch, RMAC0_NS.MPFC0 074C B100h, RMAC0_NS.MPFC1 074C B104h, RMAC0_NS.MPFC2 074C B108h, RMAC0_NS.MPFC3 074C B10Ch, RMAC0_NS.MPFC4 074C B110h, RMAC0_NS.MPFC5 074C B114h, RMAC0_NS.MPFC6 074C B118h, RMAC0_NS.MPFC7 074C B11Ch, RMAC0_NS.MPFC8 074C B120h, RMAC0_NS.MPFC9 074C B124h, RMAC0_NS.MPFC10 074C B128h, RMAC0_NS.MPFC11 074C B12Ch, RMAC0_NS.MPFC12 074C B130h, RMAC0_NS.MPFC13 074C B134h, RMAC0_NS.MPFC14 074C B138h, RMAC0_NS.MPFC15 074C B13Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TEF1	TEF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PFBV[7:0]								PFBN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	PFBN[7:0]	PTP Filtering Byte Number	0: Byte number 0 will be filtered : 255: Byte number 255 will be filtered	R/W
b15 to b8	PFBV[7:0]	PTP Filtering Byte Value	When the filtered byte has a value equal to these bits, the byte will be eligible for the corresponding timers	R/W
b16	TEF0	Timer Enable for Filtering 0	Setting this bit to 1 will apply the filter to timer 0.	R/W
b17	TEF1	Timer Enable for Filtering 1	Setting this bit to 1 will apply the filter to timer 1.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

The register is used to configure the PTP frame filtering for time domain selection.

Note: This register is used for receive time domain selection.
When an overlapping configuration is done, HW will always choose the timer with the smaller number.

37.2.1.20 Energy Efficient Ethernet Configuration Register (MEEEC)

Address(es): RMAC0.MEEEC 874C B184h, RMAC0_NS.MEEEC 074C B184h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LPITR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LPITR	LPI Transmit Request	0: LPI mode is not requested 1: LPI mode is requested	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

LPITR Bit (LPI Transmit Request)

This bit requests to enter Low Power Idle (LPI) mode. RMAC enters to LPI state after all ongoing transmissions have been completed. When this bit is negated, this IP leaves LPI state.
LPI signal should be transmitted only when transmit is disabled.
[Restriction]

- SW: LPITR bit can only be set when transmission request to RMAC is stopped, and transmission request can only be allowed after LPITR is cleared. It is prohibited to request transmission from ETHA when LPITR bit is set.

Going out of OPERATION mode will clear this register.

37.2.1.21 Loopback Configuration Register (MLBC)

Address(es): RMAC0.MLBC 874C B188h, RMAC0_NS.MLBC 074C B188h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LBME
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	LBME	Loopback Mode Enable	0: Disable 1: Enable	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

LBME Bit (Loopback Mode Enable)

Transmit xMII signals are connected to reception xMII signals internally.

[Restrictions]

- When loopback mode is enabled, frame received by external PHY Interface are ignored.
- If this bit is set, clk_phy_tx and clk_phy_rx must be synchronized with each other.

37.2.2 Counter Registers

Note: All counter registers in RMAC are read clear registers.
When counters reach their own maximum value, they stop.

37.2.2.1 Manual Pause Frame Transmit Counter Register (MMPFTCT)

Address(es): RMAC0.MMPFTCT 874C B300h, RMAC0_NS.MMPFTCT 074C B300h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MPFTC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MPFTC[15:0]	Manual Pause Frame Transmit Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

MPFTC[15:0] Bits (Manual Pause Frame Transmit Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when manual Pause frame is transmitted.

37.2.2.2 Automatic Pause Frame Transmit Counter Register (MAPFTCT)

Address(es): RMAC0.MAPFTCT 874C B304h, RMAC0_NS.MAPFTCT 074C B304h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	APFTC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	APFTC[15:0]	Automatic Pause Frame Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

APFTC[15:0] Bits (Automatic Pause Frame Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when automatic Pause frame is transmitted.

37.2.2.3 Pause Frame Receive Counter Register (MPFRCT)

Address(es): RMAC0.MPFRCT 874C B308h, RMAC0_NS.MPFRCT 074C B308h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PFRC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PFRC[15:0]	Pause Frame Receive Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

PFRC[15:0] Bits (Pause Frame Receive Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when automatic Pause frame is received.

[Restriction]

- SW: Set condition is only available when Flow Control is enabled in reception (MRGC.PFRC = 1).

37.2.2.4 False Carrier Indication Counter Register (MFCICT)

Address(es): RMAC0.MFCICT 874C B30Ch, RMAC0_NS.MFCICT 074C B30Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FCIC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	FCIC[15:0]	False Carrier Indication Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

Note: This register is counter of “False Carrier Indication” event. This event goes through the synchronizer between clk and clk_phy_rx. If the event occurs continuously, there is a possibility of miss counting.

FCIC[15:0] Bits (False Carrier Indication Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when False Carrier Indication pattern is detected.

37.2.2.5 Energy Efficient Ethernet Counter Register (MEEECT)

Address(es): RMAC0.MEEECT 874C B310h, RMAC0_NS.MEEECT 074C B310h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EEERC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	EEERC[15:0]	Energy Efficient Ethernet Receive Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

EEERC[15:0] Bit (Energy Efficient Ethernet Receive Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when LPI signal is detected on xMII reception bus.

37.2.2.6 Manual PFC Frame Transmit Counter Register t (MMPCFTCTt) (t = 0, 1)

Address(es): RMAC0.MMPCFTCT0 874C B320h, RMAC0.MMPCFTCT1 874C B324h, RMAC0_NS.MMPCFTCT0 074C B320h, RMAC0_NS.MMPCFTCT1 074C B324h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MPCFCTC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MPCFCTC[15:0]	Manual PFC Frame Transmit Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

MPCFCTC[15:0] Bits (Manual PFC Frame Transmit Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when manual PFC frames is transmitted.

37.2.2.7 Automatic PFC Frame Transmit Counter Register t (MAPCFTCTt) (t = 0, 1)

Address(es): RMAC0.MAPCFTCT0 874C B330h, RMAC0.MAPCFTCT1 874C B334h, RMAC0_NS.MAPCFTCT0 074C B330h, RMAC0_NS.MAPCFTCT1 074C B334h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	APCFCTC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	APCFCTC[15:0]	Automatic PFC Frame Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

APCFCTC[15:0] Bits (Automatic PFC Frame Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when automatic PFC frames is transmitted.

37.2.2.8 PFC Frame Receive Counter Register t (MPCFRCTt) (t = 0 to 7)

Address(es): RMAC0.MPCFRCT0 874C B340h, RMAC0.MPCFRCT1 874C B344h, RMAC0.MPCFRCT2 874C B348h, RMAC0.MPCFRCT3 874C B34Ch, RMAC0.MPCFRCT4 874C B350h, RMAC0.MPCFRCT5 874C B354h, RMAC0.MPCFRCT6 874C B358h, RMAC0.MPCFRCT7 874C B35Ch,
RMAC0_NS.MPCFRCT0 074C B340h, RMAC0_NS.MPCFRCT1 074C B344h, RMAC0_NS.MPCFRCT2 074C B348h, RMAC0_NS.MPCFRCT3 074C B34Ch, RMAC0_NS.MPCFRCT4 074C B350h, RMAC0_NS.MPCFRCT5 074C B354h, RMAC0_NS.MPCFRCT6 074C B358h, RMAC0_NS.MPCFRCT7 074C B35Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PCFCRC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PCFCRC[15:0]	PFC Frame Receive Counter		R
b31 to b16	—	Reserved	These bits are read as 0.	R

PCFCRC[15:0] Bits (PFC Frame Receive Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when PFC frames is received.

[Restriction]

- SW: Set condition is only available when Flow Control is enabled in reception (MRGC.PFRC = 1).

37.2.2.9 Receive Overflow Counter Register (MROVFC)

Address(es): RMAC0.MROVFC 874C B360h, RMAC0_NS.MROVFC 074C B360h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	ROVFC[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ROVFC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	ROVFC[31:0]	Receive Overflow Counter		R

ROVFC[31:0] Bits (Receive Overflow Counter)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- HW: Incremented by 1 when frame receive overflow occurred (when set condition for MEIS.REOES or MEIS.RPOES are met).

37.2.2.10 Received Byte Counter E-Frames Upper Side Register (MRXBCEU)

Address(es): RMAC0.MRXBCEU 874C B44Ch, RMAC0_NS.MRXBCEU 074C B44Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RBNEU[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RBNEU[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

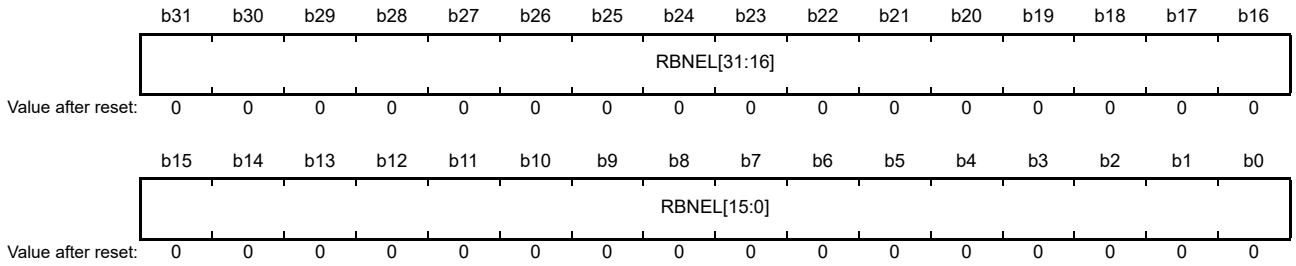
Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RBNEU[31:0]	Received Byte Number E-Frames Upper Side		R

RBNEU[31:0] Bits (Received Byte Number E-Frames Upper Side)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]



- Incremented each time the received data of e-Frame is sent to the receive ETHA interface regardless error is detected.

[Notes]

- When the RMAC does not pass the FCS to the upper layer, FCS is not taken in account in total byte calculation.
- Read before reading MRXBCEL.

37.2.2.11 Received Byte Counter E-Frames Lower Side Register (MRXBCEL)

Address(es): RMAC0.MRXBCEL 874C B450h, RMAC0_NS.MRXBCEL 074C B450h

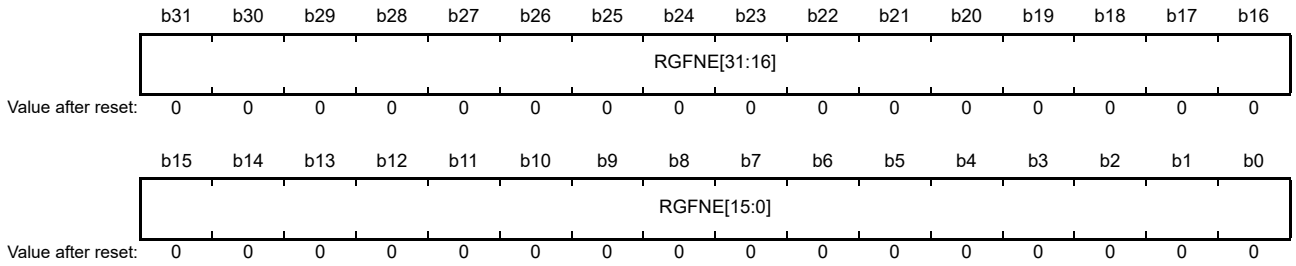
Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RBNEL[31:0]	Received Byte Number E-Frames Lower Side		R

RBNEL[31:0] Bits (Received Byte Number E-Frames Lower Side)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.
- SW: None. (Reading MRXBCEL register holds it.)

[Increment condition]



- Incremented each time the received data of e-frame is sent to the receive ETHA interface regardless the error detection.

[Notes]

- When the RMAC does not pass the FCS to the upper layer, FCS is not taken in account in total byte calculation.
- Read after reading MRXBCEU.

37.2.2.12 Received Good Frame Counter E-Frames Register (MRGFCE)

Address(es): RMAC0.MRGFCE 874C B408h, RMAC0_NS.MRGFCE 074C B408h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RGFNE[31:0]	Received Good Frame Number E-Frames		R

RGFNE[31:0] Bits (Received Good Frame Number E-Frames)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when the reception of e-frame is completed without error.

37.2.2.13 Received Good Broadcast Frame Counter Register (MRBFC)

Address(es): RMAC0.MRBFC 874C B410h, RMAC0_NS.MRBFC 074C B410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RBFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RBFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RBFN[31:0]	Received Good Broadcast Frame Number		R

RBFN[31:0] Bits (Received Good Broadcast Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when destination address field of broadcast frame is sent to receive ETHA interface without error.

37.2.2.14 Received Good Multicast Frame Counter Register (MRMFC)

Address(es): RMAC0.MRMFC 874C B414h, RMAC0_NS.MRMFC 074C B414h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RMFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RMFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RMFN[31:0]	Received Good Multicast Frame Number		R

RMFN[31:0] Bits (Received Good Multicast Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when destination address field of multicast frame is sent to receive ETHA interface without error.

37.2.2.15 Received Good Unicast Frame Counter Register (MRUFC)

Address(es): RMAC0.MRUFC 874C B418h, RMAC0_NS.MRUFC 074C B418h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RUFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RUFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RUFN[31:0]	Received Good Unicast Frame Number		R

RUFN[31:0] Bits (Received Good Unicast Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when destination address field of unicast frame is sent to receive ETHA interface without error.

37.2.2.16 Received PHY Error Frame Count Register (MRPEFC)

Address(es): RMAC0.MRPEFC 874C B41Ch, RMAC0_NS.MRPEFC 074C B41Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RPEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RPEFN[15:0]	Received PHY Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

RPEFN[15:0] Bits (Received PHY Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with phy error.

37.2.2.17 Received Nibble Error Frame Count Register (MRNEFC)

Address(es): RMAC0.MRNEFC 874C B420h, RMAC0_NS.MRNEFC 074C B420h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RNEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RNEFN[15:0]	Received Nibble Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

RNEFN[15:0] Bits (Received Nibble Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with nibble error.

37.2.2.18 Received FCS/mCRC Error Frame Count Register (MRFMEFC)

Address(es): RMAC0.MRFMEFC 874C B424h, RMAC0_NS.MRFMEFC 074C B424h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RFMEFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFMEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RFMEFN[31:0]	Received FCS/mCRC Error Frame Number		R

RFMEFN[31:0] Bits (Received FCS/mCRC Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with FCS/mCRC error.

37.2.2.19 Received Final Fragment Missing Error Frame Count Register (MRFFMEFC)

Address(es): RMAC0.MRFFMEFC 874C B428h, RMAC0_NS.MRFFMEFC 074C B428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFFMEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RFFMEFN[15:0]	Received Final Fragment Missing Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

RFFMEFN[15:0] Bits (Received Final Fragment Missing Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with final fragment error.

37.2.2.20 Received C-Fragment Count Error Frame Count Register (MRCFCEFC)

Address(es): RMAC0.MRCFCEFC 874C B42Ch, RMAC0_NS.MRCFCEFC 074C B42Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RCFCEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RCFCEFN[15:0]	Received C-Fragment Count Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

RCFCEFN[15:0] Bits (Received C-Fragment Count Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with C-fragment count error.

37.2.2.21 Received Fragment Count Error Frame Count Register (MRFCEFC)

Address(es): RMAC0.MRFCEFC 874C B430h, RMAC0_NS.MRFCEFC 074C B430h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFCEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RFCEFN[15:0]	Received Fragment Count Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

RFCEFN[15:0] Bits (Received Fragment Count Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with fragment count error.

37.2.2.22 Received MAC Filter Error Frame Count Register (MRRCFEFC)

Address(es): RMAC0.MRRCFEFC 874C B434h, RMAC0_NS.MRRCFEFC 074C B434h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RRCFEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RRCFEFN[15:0]	Received RMAC Filter Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

RRCFEFN[15:0] Bits (Received RMAC Filter Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with RMAC filtered.

37.2.2.23 Received Frame Count Register (MRFC)

Address(es): RMAC0.MRFC 874C B438h, RMAC0_NS.MRFC 074C B438h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RFN[31:0]	Received Frame Number		R

RFN[31:0] Bits (Received Frame Number)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received frame is sent to receive ETHA interface.

37.2.2.24 Received Good Undersize Error Frame Count Register (MRGUEFC)

Address(es): RMAC0.MRGUEFC 874C B43Ch, RMAC0_NS.MRGUEFC 074C B43Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RGUEFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RGUEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RUEFN[31:0]	Received Good Undersize Error Frame Number		R

RUEFN[31:0] Bits (Received Good Undersize Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with undersize error but without fcs/mcrc error.

37.2.2.25 Received Bad Undersize Error Frame Count Register (MRBUEFC)

Address(es): RMAC0.MRBUEFC 874C B440h, RMAC0_NS.MRBUEFC 074C B440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RBUEFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RBUEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RBUEFN[31:0]	Received Bad Undersize Error Frame Number		R

RBUEFN[31:0] Bits (Received Bad Undersize Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when received data is sent to receive ETHA interface with undersize error and fcs/mcrc error.

37.2.2.26 Received Good Oversize Error Frame Count Register (MRGOEFC)

Address(es): RMAC0.MRGOEFC 874C B444h, RMAC0_NS.MRGOEFC 074C B444h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RGOEFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RGOEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RGOEFN[31:0]	Received Good Oversize Error Frame Number		R

RGOEFN[31:0] Bits (Received Good Oversize Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with oversize error, but without fcs/mcrc error.

37.2.2.27 Received Bad Oversize Error Frame Count Register (MRBOEFC)

Address(es): RMAC0.MRBOEFC 874C B448h, RMAC0_NS.MRBOEFC 074C B448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RBOEFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RBOEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RBOEFN[31:0]	Received Bad Oversize Error Frame Number		R

RBOEFN[31:0] Bits (Received Bad Oversize Error Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Incremented when received data is sent to receive ETHA interface with oversize error and fcs/mcrc error.

37.2.2.28 Transmitted Byte Counter E-Frames Upper Side Register (MTXBCEU)

Address(es): RMAC0.MTXBCEU 874C B520h, RMAC0_NS.MTXBCEU 074C B520h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TBNEU[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TBNEU[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TBNEU[31:0]	Transmitted Byte Number E-Frames Upper Side		R

Note: If the FCS is not passed to the upper layer FCS is not taken in account in total byte calculation.

TBNEU[31:0] Bits (Transmitted Byte Number E-Frames Upper Side)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment conditions]

- Increment every time transmit data for e-frame is received on transmit ETHA interface.
- Read before reading MTXBCEL.

37.2.2.29 Transmitted Byte Counter E-Frames Lower Side Register (MTXBCEL)

Address(es): RMAC0.MTXBCEL 874C B524h, RMAC0_NS.MTXBCEL 074C B524h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TBNEL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TBNEL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TBNEL[31:0]	Transmitted Byte Number E-Frames Lower Side		R

Note: If the FCS is not passed to the upper layer FCS is not taken in account in total byte calculation.

TBNEL[31:0] Bits (Transmitted Byte Number E-Frames Lower Side)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: None. (Reading MTXBCEL register holds it.)

[Increment conditions]

- Increment every time transmit data for e-frame is received on transmit ETHA interface.
- Read after reading MTXBCEU.

37.2.2.30 Transmitted Good Frame Counter E-Frames Register (MTGFCE)

Address(es): RMAC0.MTGFCE 874C B508h, RMAC0_NS.MTGFCE 074C B508h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TGFNE[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TGFNE[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TGFNE[31:0]	Transmitted Good Frame Number E-Frames		R

TGFNE[31:0] Bits (Transmitted Good Frame Number E-Frames)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when transmission of e-frame is completed on transmit ETHA interface without error.

37.2.2.31 Transmitted Broadcast Frame Counter Register (MTBFC)

Address(es): RMAC0.MTBFC 874C B510h, RMAC0_NS.MTBFC 074C B510h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TBFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TBFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TBFN[31:0]	Transmitted Broadcast Frame Number		R

TBFN[31:0] Bits (Transmitted Broadcast Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when destination address field of broadcast frame is sent on transmit ETHA interface.

37.2.2.32 Transmitted Multicast Frame Counter Register (MTMFC)

Address(es): RMAC0.MTMFC 874C B514h, RMAC0_NS.MTMFC 074C B514h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TMFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TMFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TMFN[31:0]	Transmitted Multicast Frame Number		R

TMFN[31:0] Bits (Transmitted Multicast Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when destination address field of multicast frame is sent on transmit ETHA interface.

37.2.2.33 Transmitted Unicast Frame Counter Register (MTUFC)

Address(es): RMAC0.MTUFC 874C B518h, RMAC0_NS.MTUFC 074C B518h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TUFN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TUFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TUFN[31:0]	Transmitted Unicast Frame Number		R

TUFN[31:0] Bits (Transmitted Unicast Frame Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when destination address field of unicast frame is sent on transmit ETHA interface.

37.2.2.34 Transmitted Error Frame Counter Register (MTEFC)

Address(es): RMAC0.MTEFC 874C B51Ch, RMAC0_NS.MTEFC 074C B51Ch

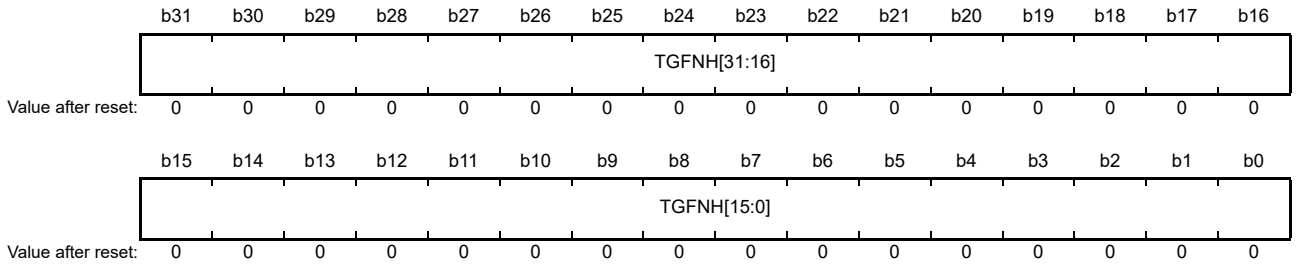
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TEFN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TEFN[15:0]	Transmitted Error Frame Number		R
b31 to b16	—	Reserved	These bits are read as 0.	R

TEFN[15:0] Bits (Transmitted Error Frame Number)

[Clearing conditions]



- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when frame transmission is completed on transmit ETHA interface with error.

37.2.2.35 Transmitted Half Duplex Good Frame Counter Register (MTHDGFC)

Address(es): RMAC0.MTHDGFC 874C B530h, RMAC0_NS.MTHDGFC 074C B530h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TGFNH[31:0]	Transmitted Good Frame Number		R

Note: The good frame is a successfully transmitted frame without collisions or carrier loss.

TGFNH[31:0] Bits

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears them.

[Increment condition]

- Increment when transmission of half-duplex-frame is completed on transmit ETHA interface without error.

37.2.3 Interrupt Registers

37.2.3.1 Error Interrupt Status Register (MEIS)

Address(es): RMAC0.MEIS 874C B200h, RMAC0_NS.MEIS 074C B200h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b0	TSLS	Transmission Stream Lost Status Flag	0: No Transmission Stream Lost 1: Transmission Stream Lost occurred.	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b2	PRES	Pause or PFC Frame Reception Error Status Flag	0: No Pause or PFC Frame Reception Error 1: Pause or PFC Frame Reception Error occurred.	R/W
b3	PFRROS	Pause or PFC Frame Retransmit Retry Over Status Flag	0: No Pause or PFC Frame Retransmit Retry Over 1: Pause or PFC Frame Retransmit Retry Over occurred.	R/W
b4	FCDS	False Carrier Detection Status Flag	0: No False Carrier Detection 1: False Carrier Detection occurred.	R/W
b5	TCES	Transmit CRC Error Status Flag	0: No Transmit CRC Error 1: Transmit CRC Error occurred.	R/W
b6	TBCIS	Transmit Bad CRC Insertion Status Flag	0: No Transmit Bad CRC Insertion 1: Transmit Bad CRC Insertion occurred.	R/W
b7	BFES	Bad Fragment Error Status Flag	0: No Bad Fragment Error 1: Bad Fragment Error occurred.	R/W
b8	FCES	Frame Count Error Status Flag	0: No Frame Count Error 1: Frame Count Error occurred.	R/W
b9	REOES	E-Frame Overflow Error Status Flag	0: No overflow error 1: Overflow error occurred during e-frame reception.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	CTLES0	Captured Timestamp Lost Error Status Flag 0	0: No Captured Timestamp Lost Error 1: Captured Timestamp Lost Error occurred.	R/W
b13	CTLES1	Captured Timestamp Lost Error Status Flag 1	0: No Captured Timestamp Lost Error 1: Captured Timestamp Lost Error occurred.	R/W
b19 to b14	—	Reserved	These bits are read as 0. The write value should be 0.	R
b20	PDES	PHY Data Error Status Flag	0: No PHY Data Error 1: PHY Data Error occurred.	R/W
b21	PNAES	PHY Nibble Alignment Error Status Flag	0: No PHY Nibble Alignment Error 1: PHY Nibble Alignment Error occurred.	R/W
b22	FCMCES	FCS/mCRC Error Status Flag	0: No FCS/mCRC Error 1: FCS/mCRC Error occurred.	R/W
b23	FFMES	Final Fragment Missing Error Status Flag	0: No Final Fragment Missing Error 1: Final Fragment Missing Error occurred.	R/W
b24	CFCES	C Fragment Count Error Status Flag	0: No C Fragment Count Error 1: C Fragment Count Error occurred.	R/W
b25	FRCES	Fragment Count Error Status Flag	0: No Fragment Count Error 1: Fragment Count Error occurred.	R/W

Bit	Symbol	Bit Name	Description	R/W
b26	RPOOMS	Reception Partially out of Operation Mode Status Flag	0: No Reception Partially out of Operation Mode 1: Reception Partially out of Operation Mode occurred.	R/W
b27	FFS	Frame Filtered Status Flag	0: No Frame Filtered 1: Frame Filtered occurred.	R/W
b28	FUES	Undersize Error Status Flag	0: No Undersize Error 1: Undersize Error occurred.	R/W
b29	FOES	Oversize Error Status Flag	0: No Oversize Error 1:Oversize Error occurred.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: This interrupt register is mapped to rmc_meis_int interrupt wire.

TSLS Flag (Transmission Stream Lost Status Flag)

[Setting condition]

- HW: When ETHA do not provide the transmitted data timely. In this case an invalid FCS is transmitted. (only for e-frames)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Note and Restriction]

- When using Cut through, this flag set condition may be due to the state ([COMA] CAEIS0.BPOPS) where all Buffer pointer are used. Please use the Watermark function so that Buffer Pool Out of Pointer Status does not occur. If get this error with Buffer Pool Out of Pointer Status using Cut through (it may get hung-up in the transmit state), initialize the state with Emergency reset flow [ESWM].

PRES Flag (Pause or PFC Frame Reception Error Status Flag)

[Setting conditions]

- HW: When Pause or PFC frame is received with lower than minimum pause/pfc frame length.
- Minimum PAUSE Length: 18 byte (MRGC.RCPT = 0) or 22 byte ((MRGC.RCPT = 1)
- Minimum PFC Length: 34 byte (MRGC.RCPT = 0) or 38 byte ((MRGC.RCPT = 1)
- HW: When PAUSE/PFC frame is received with fcs error in MRGC.RFCFE = 0.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

PFRROS Flag (Pause or PFC Frame Retransmit Retry Over Status Flag)

[Setting condition]

- HW: When the total number of Pause (pfc) transmit count reaches the configured upper limit and Pause time expires.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

FCDS Flag (False Carrier Detection Status Flag)

[Setting condition]

- HW: When PHY-LSI has detected a false carrier on the line in case of MII and GMII.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.

- SW: Writing 1 to this flag will clear it.

TCES Flag (Transmit CRC Error Status Flag)

[Setting condition]

- HW: When CRC error occurred

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

TBCIS Flag (Transmit Bad CRC Insertion Status Flag)

[Setting condition]

- HW: A bad CRC is inserted from the upper layer (e.g. ETHA).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

BFES Flag (Bad Fragment Error Status Flag)

[Setting condition]

- HW: C fragment has been detected without receiving S fragment.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Note]

- When C-fragment is received at very first time before any valid S-fragment is received or C-fragment is received after frame termination is occurred before any valid S-fragment is received, then RMAC will discard the fragment and this error status flag will not be set. For Error status flag to get set, RMAC should have received one valid S-fragment before error condition (bad fragment error) has occurred.

FCES Flag (Frame Count Error Status Flag)

[Setting condition]

- When S fragment has been received in the wrong order.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Note]

- When C-fragment is received at very first time before any valid S-fragment is received or C-fragment is received after frame termination is occurred before any valid S-fragment is received, then RMAC will discard the fragment and this error status flag will not be set. For Error status flag to get set, RMAC should have received one valid S-fragment before error condition (frame count error) has occurred.

REOES Flag (E-Frame Overflow Error Status Flag)

[Setting condition]

- HW: The acknowledge signal was not received successfully from an upper layer (e.g. ETHA) during e-frame reception.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.

- SW: Writing 1 to this flag will clear it.

[Restriction]

- HW: Pulse is generated per 1 frame although multiple de-assertion is generated.

[Notes]

- When frame reception is already ongoing and buffer overflow occurs i.e CABPPCM.RPC = 0, RMAC adds one byte padding to the reception error Frames to terminate the protocol internally.
- When new frame is received, during buffer overflow i.e CABPPCM.RPC = 0, the incoming frame will be rejected completely.

CTLES0 Flag (Captured Timestamp Lost Error Status Flag 0)

[Setting condition]

- HW: When captured timestamp is lost.
  This flag is fixed to 0.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- No recovery. Timestamp is lost.

CTLES1 Flag (Captured Timestamp Lost Error Status Flag 1)

[Setting condition]

- HW: When captured timestamp is lost.
  This bit is fixed to 0.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- No recovery. Timestamp is lost.

PDES Flag (PHY Data Error Status Flag)

[Setting condition]

- HW: When frame is received with error.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

PNAES Flag (PHY Nibble Alignment Error Status Flag)

[Setting condition]

- HW: When residual-bit is received.

[Clearing conditions]

- SW: Writing 1 to this flag will clear it.

FCMCES Flag (FCS/mCRC Error Status Flag)

[Setting condition]

- HW: When unexpected FCS/mCRC are received.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

FFMES Flag (Final Fragment Missing Error Status Flag)

[Setting condition]

- HW: When a S-fragment is received even though the previous fragment has been terminated by a mCRC.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

CFCES Flag (C Fragment Count Error Status Flag)

[Setting condition]

- HW: When a C fragment not corresponding to the current frame is received
  For example: S0-C0-C0-C1

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

FRCES Flag (Fragment Count Error Status Flag)

[Setting condition]

- HW: When a C-fragment is received with a bad fragment count field

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

RPOOMS Flag (Reception Partially out of Operation Mode Status Flag)

[Setting condition]

- HW: When a frame is being received while RMAC is moving out of operation mode (suspending).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Note]

- This error has nothing to do with partial rejection due to buffer overflow. E-Frames can only be fragmented/ partialized by buffer overflows and it is not affected by partial out of operation.

FFS Flag (Frame Filtered Status Flag)

[Setting condition]

- HW: When frame did not pass the RMAC filters

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

FUES Flag (Undersize Error Status Flag)

[Setting condition]

- HW: When too short frame is received. (when the received frame size is shorter than the setting in

MRFSCE.EMNS[15:0])

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

FOES Flag (Oversize Error Status Flag)

[Setting condition]

- HW: When too big frame is received. (when the received frame size is bigger than the setting in MRFSCE.EMXS[15:0])

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

Table 37.3 Transmission Error List

Error type	Event	Status Bit
Transmit bad CRC insertion status	A packet has been received for transmission by RMAC with an error and a wrong FCS has been inserted.	MEIS.TBCIS
Transmit CRC error status	A packet which included a presupposed valid FCS had a faulty FCS	MEIS.TCES
Pause frame Retransmit Retry Over Status	A Pause or PFC retransmit count reaches the configured upper limit(MTPFC.PFRLV[4:0]) and Pause time expires.	MEIS.PFRROS
Transmission Stream Lost Status	An e-frame data has not been provided on time to RMAC.	MEIS.TSLS

Table 37.4 Reception Error List

No	Error type	Event	Frame status bit	Status register
1	PHY data error	Received a data with error.	Bit 0	MEIS.PDES
2	PHY nibble alignment error	Received residual-bit.	Bit 1	MEIS.PNAES
3	FCS/mCRC error	Received unexpected FCS field value.	Bit 2	MEIS.FCMCES
4	Final fragment missing error	Occurs when a S-fragment is received even though the previous fragment has been terminated by a MCRC	Bit 3	MEIS.FFMES
5	C fragment count error	Occurs when a C fragment not corresponding to the current frame is received. For example: S0-C0-C0-C1	Bit 4	MEIS.CFCES
6	Fragment count error	Occurs when a C-fragment is received with a bad fragment count field	Bit 5	MEIS.FRCES
7	Reception partially out of operation mode	Occurs when a frame is being received while RMAC is moving out of operation mode	Bit 6	MEIS.RPOOMS
8	Frame filtered	The frame did not pass the RMAC filters	Bit 7	MEIS.FFS
9	Undersize error	The frame is too small	Bit 8	MEIS.FUES
10	Oversize error	The frame is too big	Bit 9	MEIS.FOES
11	Buffer overflow error	Occurs when the rx done signal has been de-asserted during frame reception	Bit 12	MEIS.REOES MEIS.RPOES
12	Frame count error status	Occurs when a wrong S-frame order is received. For example: S0-S1-S2-S1	—	MEIS.FCES
13	Bad fragment error status	Occurs when a C fragment has been detected without receiving S fragment	—	MEIS.BFES
14	False carrier detection status	Occurs when PHY-LSI has detected a false carrier on the line.	—	MEIS.FCDS

37.2.3.2 Error Interrupt Enable Register (MEIE)

Address(es): RMAC0.MEIE 874C B204h, RMAC0_NS.MEIE 074C B204h

b29	FOEE	Oversize Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the MEID register.

TSLE Bit (Transmission Stream Lost Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.TSLD will clear this bit.

PREE Bit (Pause or PFC Frame Reception Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.PRED will clear this bit.

PFRROE Bit (Pause or PFC Frame Retransmit Retry Over Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.PFRROD will clear this bit.

FCDE Bit (False Carrier Detection Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FCDD will clear this bit.

TCEE Bit (Transmit CRC Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.TCED will clear this bit.

TBCIE Bit (Transmit Bad CRC Insertion Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.TBCID will clear this bit.

BFEE Bit (Bad Fragment Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.BFED will clear this bit.

FCEE Bit (Frame Count Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FCED will clear this bit.

REOEE Bit (E-Frame Overflow Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.REOED will clear this bit.

RPOEE Bit (P-Frame Overflow Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.RPOED will clear this bit.

CTLEE0 Bit (Captured Timestamp Lost Error Enable 0)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.CTLED0 will clear this bit.

CTLEE1 Bit (Captured Timestamp Lost Error Enable 1)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.CTLED1 will clear this bit.

PDEE Bit (PHY Data Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.PDED will clear this bit.

PNAEE Bit (PHY Nibble Alignment Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.PNAED will clear this bit.

FCMCEE Bit (FCS/mCRC Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FCMCED will clear this bit.

FFMEE Bit (Final Fragment Missing Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FFMED will clear this bit.

CFCEE Bit (C Fragment Count Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.CFCED will clear this bit.

FRCEE Bit (Fragment Count Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FRCED will clear this bit.

RPOOME Bit (Reception Partially out of Operation Mode Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.RPOOMD will clear this bit.

FFE Bit (Frame Filtered Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FFD will clear this bit.

FUEE Bit (Undersize Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to MEID.FUED will clear this bit.

FOEE Bit (Oversize Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- SW: Writing 1 to MEID.FOED will clear this bit.

37.2.3.3 Error Interrupt Disable Register (MEID)

Address(es): RMAC0.MEID 874C B208h, RMAC0_NS.MEID 074C B208h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b0	PLSCS	PHY Link Signal Change Status Flag	0: No PHY Link Signal Change 1: PHY Link Signal Change occurred.	R/W
b1	PIDS	PHY Interrupt Detection Status Flag	0: No PHY Interrupt Detection 1: PHY Interrupt Detection occurred.	R/W
b2	LVSS	Link Verification Succeed Status Flag	0: No Link Verification Succeed 1: Link Verification Succeed occurred.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	VFRS	Verify Frame Reception Status Flag	0: No Verify Frame Reception 1: Verify Frame Reception occurred.	R/W
b31 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: This interrupt register is mapped to rmc_mmis0_int interrupt wire.

PLSCS Flag (PHY Link Signal Change Status Flag)

[Setting condition]

- HW: When the value of link status pin (rmc_phy_link port) is changed.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has not effect.
- SW: To check the current link state, refer to the link status pin state bit in the PHY link status register (MPIC.PLSPP).

PIDS Flag (PHY Interrupt Detection Status Flag)

[Setting condition]

- HW: PHY interrupt pin (rmc_phy_int port) is active level.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has not effect.
- HW: This flag could be asserted unintentionally before configuring PHY interrupt polarity (MPIC.PIP) into the right value. In the phase, this flag should be ignored.

LVSS Flag (Link Verification Succeed Status Flag)

[Setting condition]

- HW: When Link Verification process succeed.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has not effect.
- It’s no effect when suspending, e.g. an upper layer (e.g. ETHA) is not in OPERATION state.

VFRS Flag (Verify Frame Reception Status Flag)

[Setting condition]

- HW: When valid verify frame has been received.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has not effect.
- It’s no effect when suspending, e.g. an upper layer (e.g. ETHA) is not in OPERATION state.

37.2.3.5 Monitoring Interrupt Enable Register 0 (MMIE0)

Address(es): RMAC0.MMIE0 874C B214h, RMAC0_NS.MMIE0 074C B214h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

b3	PPRACS	PHY Post-Read Access Completed Status Flag	0: No PHY Post-Read Access Completed 1: PHY Post-Read Access Completed occurred.	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: This interrupt register is mapped to rmc_mdio_int interrupt wire.

PRACS Flag (PHY Read Access Completed Status Flag)

[Setting condition]

- HW: When PHY read access has completed. Refer to section 37.3.3, Station Management.

[Clearing conditions]

- HW: Being in RESET mode will clear this bit.
- SW: Writing 1 to this bit will clear it.

[Restriction]

- Writing 0 to this bit has no effect.

PWACS Flag (PHY Write Access Completed Status Flag)

[Setting condition]

- HW: When PHY write access has completed. Refer to section 37.3.3, Station Management.

[Clearing conditions]

- HW: Being in RESET mode will clear this bit.
- SW: Writing 1 to this bit will clear it.

[Restriction]

- Writing 0 to this bit has no effect.

PAACS Flag (PHY Address Access Completed Status Flag)

[Setting condition]

- HW: When PHY address access has completed. Refer to section 37.3.3, Station Management.

[Clearing conditions]

- HW: Being in RESET mode will clear this bit.
- SW: Writing 1 to this bit will clear it.

[Restriction]

- Writing 0 to this bit has no effect.

PPRACS Flag (PHY Post-Read Access Completed Status Flag)

[Setting condition]

- HW: When PHY post-read access has completed. Refer to section 37.3.3, Station Management.

[Clearing conditions]

- HW: Being in RESET mode will clear this bit.
- SW: Writing 1 to this bit will clear it.

37.2.3.8 Monitoring Interrupt Enable Register 1 (MMIE1)

Address(es): RMAC0.MMIE1 874C B224h, RMAC0_NS.MMIE1 074C B224h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PRACE	PHY Read Access Completed Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	PWACE	PHY Write Access Completed Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b2	PAACE	PHY Address Access Completed Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b3	PPRACE	PHY Post-Read Access Completed Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the MMID1 register.

PRACE Bit (PHY Read Access Completed Enable)

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing condition]

- HW: Writing 1 to the MMID1.PRACD bit will clear this bit.

[Restriction]

- SW: Writing 0 to this bit has no effect.

PWACE Bit (PHY Write Access Completed Enable)

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing condition]

- HW: Writing 1 to the MMID1.PWACD bit will clear this bit.

[Restriction]

- SW: Writing 0 to this bit has no effect.

PAACE Bit (PHY Address Access Completed Enable)

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing condition]

- HW: Writing 1 to the MMID1.PAACD bit will clear this bit.

[Restriction]

- SW: Writing 0 to this bit has no effect.

PPRACE Bit (PHY Post-Read Access Completed Enable)

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing condition]

- HW: Writing 1 to the MMID1.PPRACD bit will clear this bit.

[Restriction]

- SW: Writing 0 to this bit has no effect.

37.2.3.9 Monitoring Interrupt Disable Register 1 (MMID1)

Address(es): RMAC0.MMID1 874C B228h, RMAC0_NS.MMID1 074C B228h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LPIDIS	LPIAIS	MPDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MPDIS	Magic Packet Detection Interrupt Status Flag	0: No Magic Packet Detection Interrupt 1: Magic Packet Detection Interrupt occurred.	R/W
b1	LPIAIS	LPI Assertion Interrupt Status Flag	0: No LPI Assertion Interrupt 1: LPI Assertion Interrupt occurred.	R/W
b2	LPIDIS	LPI De-Assertion Interrupt Status Flag	0: No LPI De-Assertion Interrupt 1: LPI De-Assertion Interrupt occurred.	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note: This interrupt register is mapped to rmc_mp_int, rmc_lpi_start_int, and rmc_lpi_stop_int interrupt wire.
Note: This register's value goes through the synchronizer between clk and clk_phy_rx.
The result of write access is reflected to each SFR bit after "5clk + 4clk_phy_rx" in worst case in RMAC.
Do not make write access continuously. Please wait following time for re-write access.

MPDIS Flag (Magic Packet Detection Interrupt Status Flag)

[Setting condition]

- HW: When a Magic Packet has been detected.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has no effect.
- HW: CRC of magic packet is not checked.
- HW: It's no effect when suspending

LPIAIS Flag (LPI Assertion Interrupt Status Flag)

[Setting condition]

- HW: When LPI request is detected. This flag is continuously asserted when LPI request continues.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has no effect.
- HW: It's no effect when suspending.

LPIDIS Flag (LPI De-Assertion Interrupt Status Flag)

[Setting condition]

- HW: When LPI request de-assertion.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restrictions]

- SW: Writing 0 to this flag has no effect.

HW: It’s no effect when suspending.

37.2.3.11 Monitoring Interrupt Enable Register 2 (MMIE2)

Address(es): RMAC0.MMIE2 874C B234h, RMAC0_NS.MMIE2 074C B234h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MPDID	Magic Packet Detection Interrupt Disable	0: Has no effects. 1: Sets MMIE2.MPDIE bit to 0.	W
b1	LPIAID	LPI Assertion Interrupt Disable	0: Has no effects. 1: Sets MMIE2.LPIAIE bit to 0.	W
b2	LPIDID	LPI De-Assertion Interrupt Disable	0: Has no effects. 1: Sets MMIE2.LPIDIE bit to 0.	W
b31 to b3	—	Reserved	The write value should be 0.	W

Note: This register's value goes through the synchronizer between clk and clk_phy_rx.
The result of write access is reflected to each SFR bit after "5clk + 4clk_phy_rx" in worst case in RMAC.
Do not make write access continuously. Please wait following time for re-write access.

37.3 Operation

37.3.1 Flow Control

This IP supports the following two types of Flow Control functions.

1. Flow Control specified in IEEE 802.3 for a full-duplex operation using a PAUSE frame.
2. Priority Based Flow Control specified in IEEE 802.1Qbb for a full-duplex operation using a PFC frame.

37.3.1.1 Flow Control by PAUSE Frame

This Flow Control is only for a full-duplex operation and this consists of Transmission and Reception of a PAUSE frame.

Transmission of PAUSE frame

(1) During MTFFC.FCM = 0 and MTPFC.PT[15:0] ≠ 0, the transmission function of a PAUSE frame is enabled. This IP transmits a PAUSE frame as described in Figure 37.2 by asserting a transmission request. The value of MTPFC.PT[15:0] is used for “PAUSE_TIME” field. And MRMAC0 and MRMAC1 are used for “SA” field.

Figure 37.2 PAUSE Frame Format

- Auto PAUSE Frame
  In MTPFC.PFM = 0, this IP uses a hardware pause transmission requests a transmit request. After transmitting the PAUSE Frame, MAPFTCT is incremented.
- Manual PAUSE Frame
  In MTPFC.PFM = 1, this IP uses MTPFC2.MPFR as a transmit request. After transmitting the PAUSE Frame, MMPFTCT is incremented.
  When the transmit request of the PAUSE frame is asserted while the IP is transmitting the other frame, the PAUSE frame is transmitted after the transmitting frame.

(2) While the transmit request is asserted, a PAUSE frame is continuously re-transmitted at a fixed interval of time configured by MTPFC.PFRT[7:0]. If the number of re-transmission reaches the value of MTPFC.PFRLV[4:0], this IP sets MEIS.PFRROS to 1 for an interrupt. Even if the interrupt is detected, this IP continues re-transmission of a PAUSE frame while the transmit request is asserted.

(3) After de-asserting the transmission request, this IP stops a transmission of PAUSE frame. At that time, when MTPFC2.PFTTZ = 1 and an internal counter to count a pausing-period exceeds the value of MTPFC.PFRT[7:0] (*), this IP transmits one more a PAUSE frame with “PAUSE_TIME” field as 0.

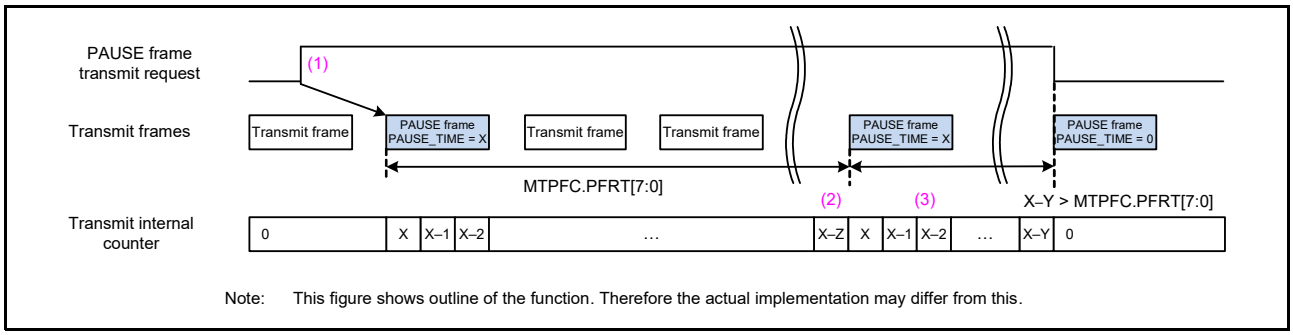

Figure 37.3 Transmission of PAUSE Frame

Reception of PAUSE frame

1. During MRGC.PFRC = 1, this IP receives a PAUSE frame and it starts internally counting a pausing-period specified by “PAUSE_TIME” field of a received PAUSE frame. While counting the pausing-period, notification of pause frame reception to an upper layer (e.g. ETHA) and MRPFM.PTCA is asserted. And any transmissions except for a Verify_packet, a Respond_packet and a PAUSE frame are inhibited. When this IP receives a PAUSE frame while transmitting any frames, transmissions are inhibited after the transmission completion.
2. When a PAUSE frame with “PAUSE_TIME ≠ 0” is received again before expiring the internal pausing-period, the internal counter is updated to that value.
3. When the internal pausing-period is expired, notification of pause frame reception to an upper layer (e.g. ETHA) and MRPFM.PTCA is de-asserted.
4. When MRGC.PFRTZ = 1 and PAUSE frame with “PAUSE_TIME = 0” is received before expiring the internal pause-period, the internal counter is cleared. Then notification of pause frame reception to an upper layer (e.g. ETHA) and MRPFM.PTCA is de-asserted.

In any case, MPFRCT is incremented after receiving a PAUSE frame in MRGC.PFRC = 1. And the received PAUSE frames are discarded internally.

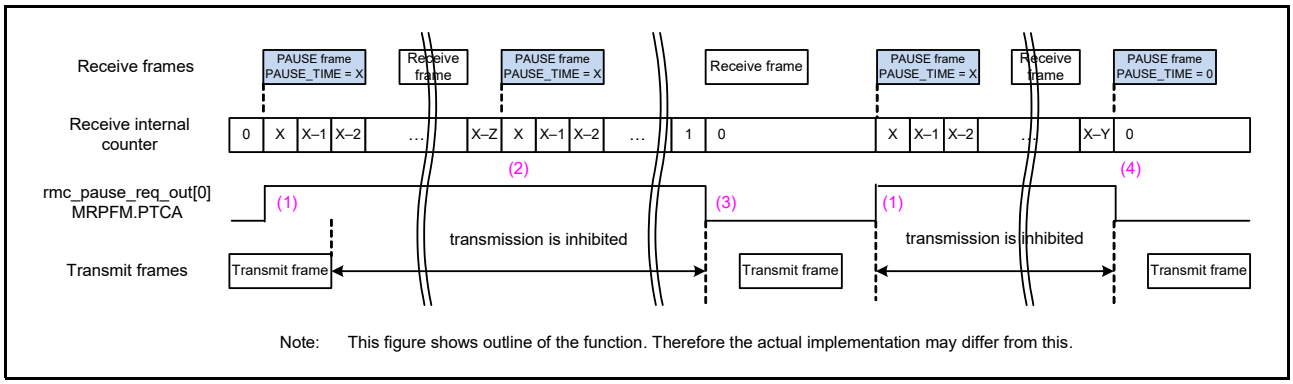

Figure 37.4 Reception of PAUSE Frame

37.3.1.2 Flow Control by PFC Frame

This Flow Control is for a full-duplex operation and this consists of Transmission and Reception of a PFC frame.

Transmission of PFC frame

InMTFFC.FCM = 1 and MTPFC.PT[15:0] ≠ 0, the transmission function of a PFC frame is enabled.
This IP treats several priorities as one priority-group to transmission of the PFC frame. The number of priority-group is configured by hardware parameter 2 and all descriptions in this section are written as 2 = 2. Each priority-group is configured by MTPFC30 and MTPFC31.

This IP transmits a PFC frame as described in Figure 37.5 for each priority-group by asserting a transmission request. The value of MTPFC.PT[15:0] is used for all “PAUSE_TIME” fields. “Priority_Enable” field value is different for each priority-group and the value of MTPFC30.PFCPG[7:0] and MTPFC31.PFCPG[7:0] are used for these. And MRMAC0 and MRMAC1 are used for “SA” field. When MTPFC30.PFCPG[7:0] (or MTPFC31.PFCPG[7:0]) is set to all 0,this IP does not transmit a PFC frame for the priority-group0 (or priority-group1) even when a transmission request is asserted.

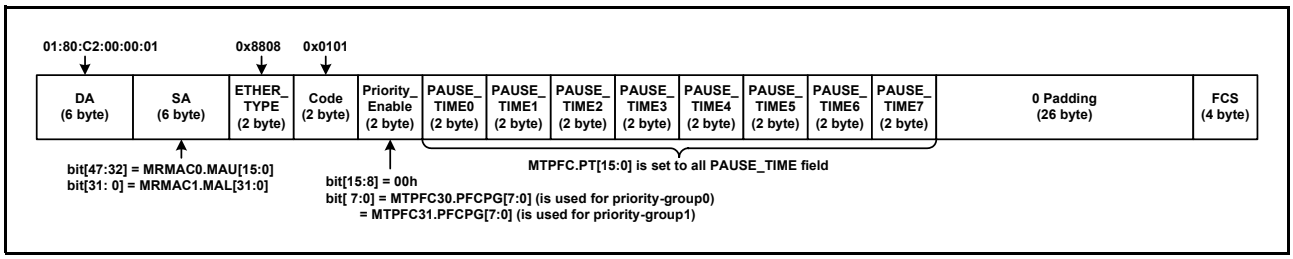

Figure 37.5 PFC Frame Format

- Auto PFC Frame
  InMTPFC.PFM = 0, this IP uses a hardware pause transmission request as a transmit request. The bit[0] is for priority-group0 and the bit[1] is for priority-group1. MAPCFTCT0 and MAPCFTCT1 are incremented respectively after transmitting a PFC Frame of each priority-group.
- Manual PFC Frame
  InMTPFC.PFM = 1, this IP uses MTPFC2.MPFCFR1, MPFCFR0 as a transmit request. The bit[0] is for priority-group0 and the bit[1] is for priority-group1. MMPCFTCT0 and MMPCFTCT1 are incremented respectively after transmitting a PFC Frame of each priority-group.

If several transmit requests are asserted at same time, one PFC frame which has merged priority_enable information is transmitted.
If several transmit requests are asserted while transmitting other frames, an internal counter is cleared and one PFC frame which has merged priority_enable information is transferred.

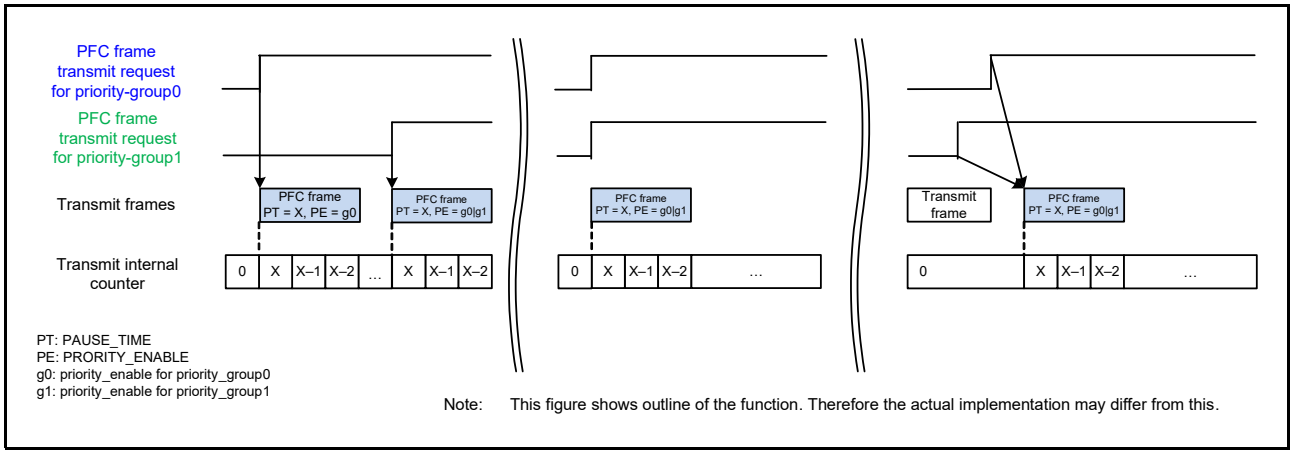

Figure 37.6 Transmitting PFC Frame (part1)

While the transmit request is asserted, a PFC frame corresponding to that request is continuously re-transmitted at a fixed interval configured by MTPFC.PFRT[7:0]. When the number of re-transmissions for one of priority-groups reaches the value of MTPFC.PFRLV[4:0], this IP sets MEIS.PFRROS to 1 for an interrupt. Even when the interrupt is detected, this IP continues re-transmission of a PFC frame while the transmit request is asserted.

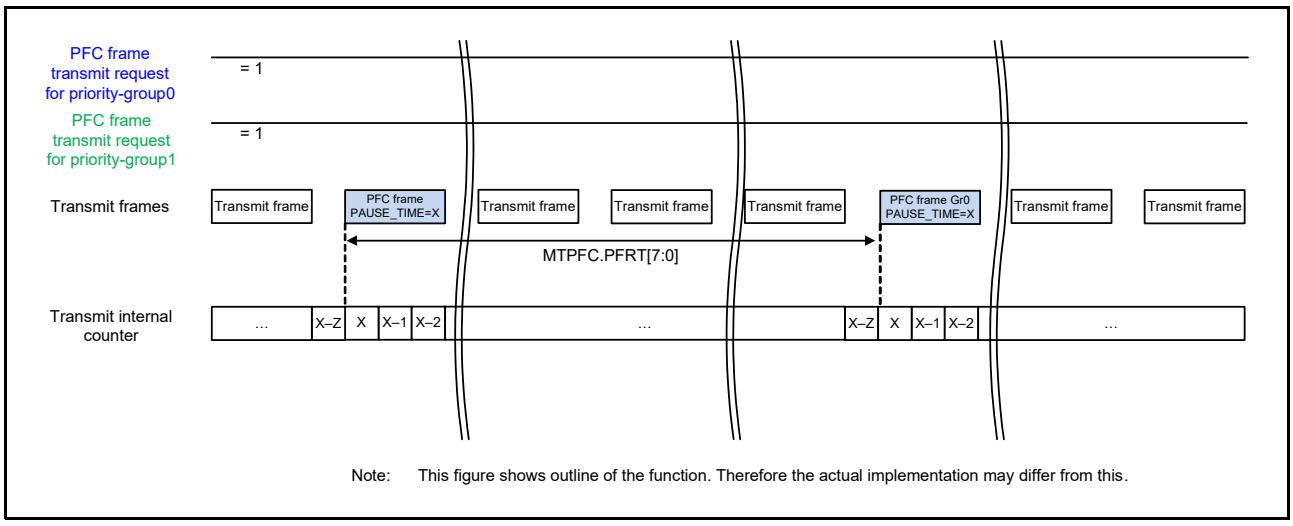

Figure 37.7 Transmitting PFC Frame (part2)

After de-asserting the transmission request, this IP stops the transmission of the PFC frame corresponding to that request. At that time, if the corresponding bit of MTPFC2.PFCTTZ1, PFCTTZ0 for de-asserted priority-group request is 1 and an internal counter to count the pausing-period exceeds MTPFC.PFRT[7:0], this IP transmits one more PFC frame with all “PAUSE_TIME” fields as 0 for that priority-group.

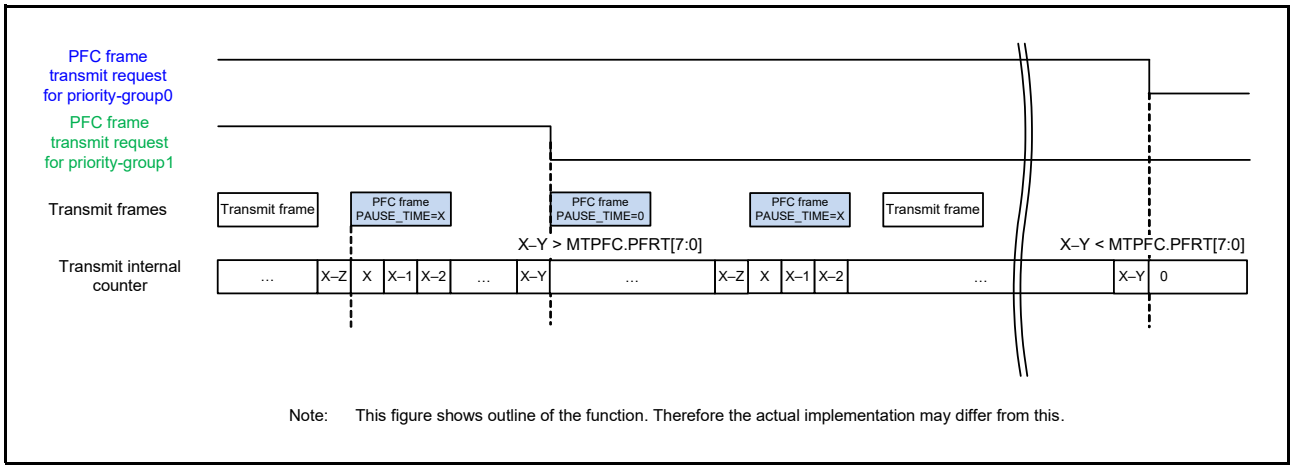

Figure 37.8 Transmitting PFC Frame (part3)

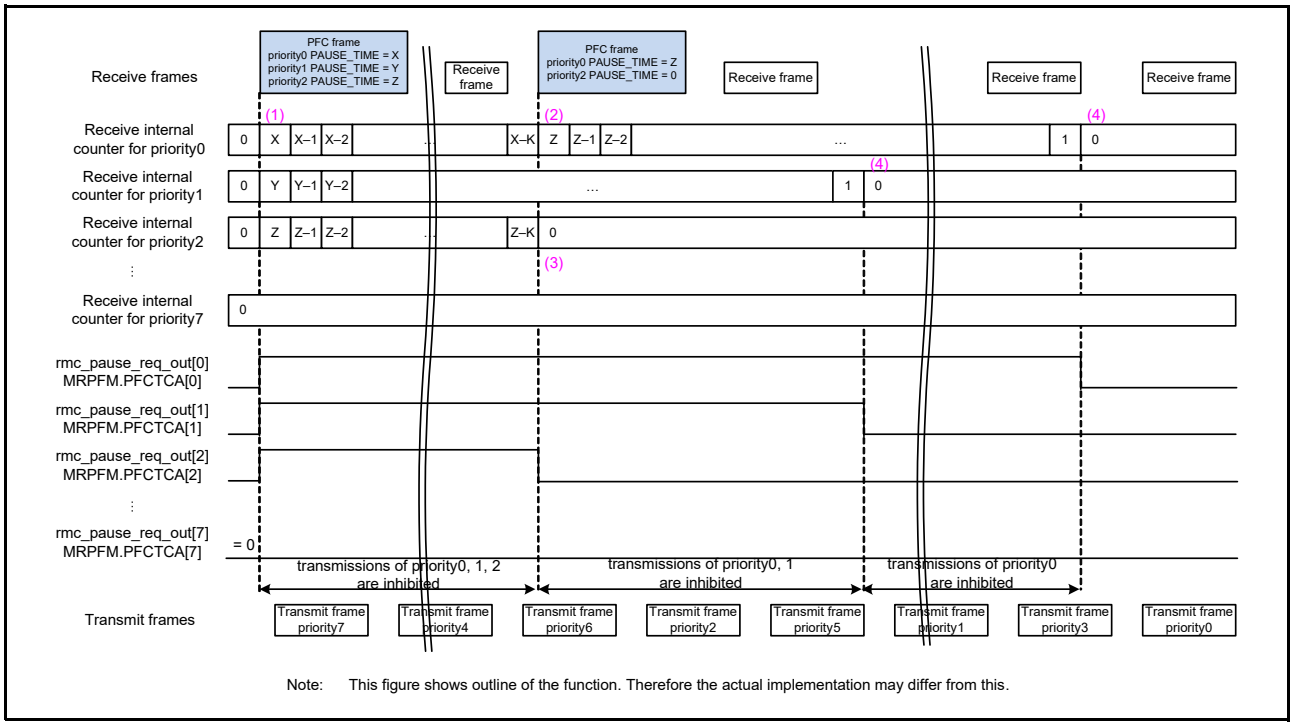

Reception of PFC frame

This IP treats several priorities specified in received PFC frames. The number of supported priorities is configured by hardware parameter 8 and all descriptions in this section are written as 8 = 8.

(1) When this IP receives a PFC frame with a priority-enable field which is corresponding to apriority configured by MRGC.PFCRC[7:0], it starts internally counting a pausing-period for each priority respectively specified by each “PAUSE_TIME” fields of a received PFC frame. During counting the pausing-period, notification of PFC frame reception to an upper layer (e.g. ETHA) and MRPFM.PFCTCA[7:0] corresponding to each priority are asserted. The bit number is corresponding to priority number.

(2) When PFC frame with “PAUSE_TIME≠0” with corresponding to valid “priority_enable” field is received again before expiring the internal pausing-period, the internal counter for that priority is updated to that value.
(3) When MRGC.PFRTZ = 1 and PFC frame with “PAUSE_TIME = 0” with corresponding to valid “priority_enable” field is received before expiring the internal pause-period, the internal counter for that priority is cleared and notification of pause frame reception to an upper layer (e.g. ETHA) and MRPFM.PFCTCA[7:0] for that priority is de-asserted.
(4) When the internal pausing-period is expired, notification of pause frame reception to an upper layer (e.g. ETHA) and MRPFM.PFCTCA[7:0] for that priority are de-asserted.

In any case, MPCFRCT0 to MPCFRCT7 are incremented respectively after receiving a PFC frame for enabled priority by MRGC.PFCRC[7:0]. And all received PFC frames are discarded internally.

Note: This figure shows outline of the function. Therefore the actual implementation may differ from this.

Figure 37.9 Reception of PAUSE Frame

37.3.1.3 Flow Control by JAM

This flow control is only for a half-duplex operation and this consists of transmission of a JAM data.

Transmission of JAM data

(1) During MTFCJC.JE = 1, the transmission function of a JAM data is enabled.
This IP transmits a JAM data as described in Figure 37.10 with preamble by asserting a transmission request.

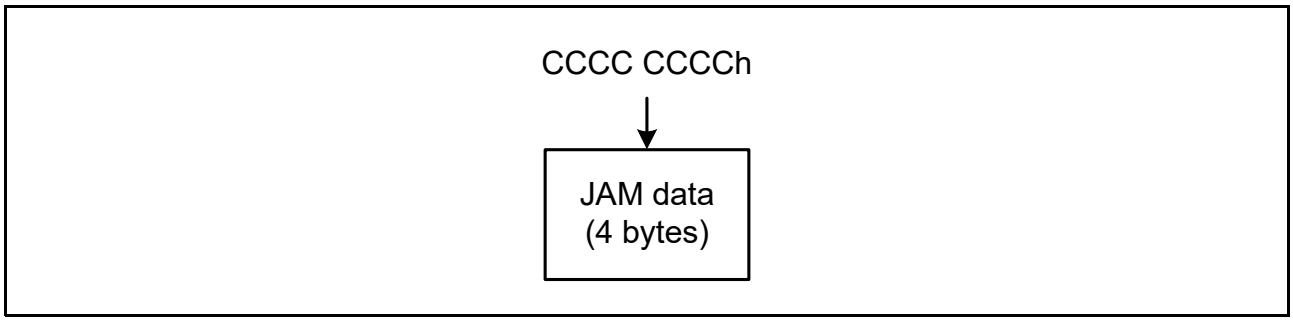

Figure 37.10 JAM Data

- Auto JAM Data
  In MTFCJC.JM = 0, this IP uses a hardware JAM data transmission request as a transmit request.
- Manual JAM Data
  In MTFCJC.JM = 1, this IP uses MTFCJC.MJOE as a transmit request.

(1) When the transmit request of the JAM data is asserted while the IP is transmitting the other frame, the JAM data is transmitted after the transmitting frame.
(2) While the transmit request is asserted, a JAM data is continuously re-transmitted at a fixed interval of time (IPG). After that, while this bit is asserted, the transmission of JAM data is prioritized and normal frames are not transmitted.

37.3.2 Timestamping

This IP supports time synchronization for IEEE 1588. It supports time synchronization accuracy in the sub-microsecond range.

37.3.2.1 Timestamp Capture

This IP can capture timestamps on both transmit and receive side. gPTP timer value includes two 62bit timers, bit[61:0] is a Timer0, bit[123:62] is a Timer1.

[Timestamp capture on transmit side]

“Timestamp capture” and “Timer number” fields in Table 36.4 control this function for both e-frame and p-frame. These are configured by a transmit descriptor. If “Timestamp capture” = 1, the timer specified by “Timer number” field is captured.

The captured timestamp is sent to an upper module(e.g. ETHA) with “Timestamp unique number” in Table 36.4 via ETHA transmit timestamp capture interface.

Note: On the transmit side, the timestamp capture function by this IP and PHY can be enabled at same time.

[Timestamp capture on receive side]

MTRC.TRDDE, MTRC.TRDDP, and MTRC.TRHFME1, TRHFME0 control this function.
The configuration of the timestamp capture is following.

- MTRC.TRDDE controls this function for e-frames.
  MTRC.TRDDE = 0
  the default timer configured by MTRC.DTN is captured for a received e-frame.

- MTRC.TRDDP controls this function for p-frames.
  MTRC.TRDDP = 0
  the default timer configured by MTRC.DTN is captured for a received p-frame.

- MTRC.TRHFME1, TRHFME0 controls this function for e-frames using the HW PTP message filtering.
  The TRHFME0 is for Timer0 and TRHFME1 is for Timer1.
  MTRC.TRHFME0 = 1 and the received e-frame matched the HW PTP messaged filter for Timer0
  The Timer0 is captured for that received e-frames.

  MTRC.TRHFME1 = 1 and MTRC.TRHFME0 = 0 and the received e-frame matched the HW PTP messaged filter for Timer1
  The Timer1 is captured for that received e-frames.

  MTRC.TRHFME1 = 1 and MTRC.TRHFME0 = 1 and the received e-frame matches the HW PTP messaged filter for Timer0 and 1
  The Timer0 is captured for that received e-frames.

A captured timestamp is outputted from this IP with the received frame.

.

37.3.3 Station Management

The Station Management controls the access to Management registers in PHY.
rmc_mdi, rmc_mdo, rmc_mde, rmc_mdc, and rmc_mdio_int are used for this function.

37.3.3.1 Management Register Access

This IP has two types of access methods, one is specified by clause 22 the other is specified by clause 45 in IEEE802.3.

Access Method specified in clause 22

To write or read of Management register of PHY which supports this access method using management frame format, execute the following steps.

[Write access]

Set MPSM as following.

PRD[15:0] = “Write Data”
POP[1:0] = 01b
PRA[4:0] = “Register Address”
PDA[4:0] = “PHY Address”
MFF = 0
PSME = 1

After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PWACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, when MMIE1.PWACE is set to 1, the interrupt appears on rmc_mdio_int.
Set MMIS1.PWACS to 0 to clear the interrupt.

[Read access]

Set MPSM as following.

PRD[15:0] = 0000h
POP[1:0] = 10b
PRA[4:0] = “Register Address”
PDA[4:0] = “PHY Address”
MFF = 0
PSME = 1

After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PRACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, when MMIE1.PRACE is set to 1, the interrupt appears on rmc_mdio_int.
After the completion of read access, the read data is stored in MPSM.PRD[15:0]. So read it.
Set MMIS1.PRACS to 0 to clear the interrupt.

Note: When MPSM.PSME is set to 1, this IP outputs preamble code of fixed length specified in standard on rmc_mdo before write or read access. IEEE802.3 clause 22 allows skipping preamble code. When the preamble code is not needed and PHY also supports to skip the preamble code, this IP does not output the preamble code by setting MPIC.PSMDP to 1.

Access Method specified in clause 45

To write or read Management register of PHY which supports this access method using extended management frame format, execute the following steps.

[Write access]

(1) Set MPSM as following. (“Register Address” is set to a PHY)
PRD[15:0] = “Register Address”
POP[1:0] = 00b
PRA[4:0] = “Device Address”
PDA[4:0] = “Port Address”
MFF = 1
PSME = 1
After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PAACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, when MMIE1.PAACE is set to 1, the interrupt appears on rmc_mdio_int.
Set MMIS1.PWACS to 0 to clear interrupt.

(2) Set MPSM as following. (“Write Data” is set to the “Register Address” which was configured by step 1)
PRD[15:0] = “Write Data”
POP[1:0] = 01b
PRA[4:0] = “Device Address”
PDA[4:0] = “Port Address”
MFF = 1
PSME = 1
After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PWACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, if MMIE1.PWACE is set to 1, the interrupt appears on rmc_mdio_int.
Set MMIS1.PWACS to 0 to clear interrupt.

[Read access]

(1) Set MPSM as following. (“Register Address” is set to a PHY)
PRD[15:0] = “Register Address”
POP[1:0] = 00b
PRA[4:0] = “Device Address”
PDA[4:0] = “Port Address”
MFF = 1
PSME = 1
After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PAACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, when MMIE1.PAACE is set to 1, the interrupt appears on rmc_mdio_int.
Set MMIS1.PWACS to 0 to clear interrupt.

(2) Set MPSM as following. (Read access of the Register Address which was pointed by previous step)
PRD[15:0] = 0000h
POP[1:0] = 11b
PRA[4:0] = “Device Address”
PDA[4:0] = “Port Address”
MFF = 1
PSME = 1
After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PRACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.

At this time, when MMIE1.PRACE is set to 1, the interrupt appears on rmc_mdio_int.
After the completion of read access, the read data is stored in MPSM.PRD[15:0]. So read it.
Set MMIS1.PRACS to 0 to clear interrupt.

[Post read incremental access]

Read access needs setting “Register Address” every time. Only when continuous Register Address fields are read continuously, using this access (POP[1:0] = 10) is efficient.

(1) Set MPSM as following. (“Register Address” is set to a PHY)
PRD[15:0] = “Register Address”
POP[1:0] = 00b
PRA[4:0] = “Device Address”
PDA[4:0] = “Port Address”
MFF = 1
PSME = 1

After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PAACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, when MMIE1.PAACE is set to 1, the interrupt appears on rmc_mdio_int.
Set MMIS1.PWACS to 0 to clear the interrupt.

(2) Set MPSM as following. (Read access of the Register Address which was pointed by previous step)
PRD[15:0] = 0000h
POP[1:0] = 10b
PRA[4:0] = “Device Address”
PDA[4:0] = “Port Address”
MFF = 1
PSME = 1

After setting MPSM, PSME is kept to 1 during the access. Wait an interrupt is detected (MMIS1.PPRACS = 1) or MPSM.PSME turns to 0 as a sign of an access completion.
At this time, when MMIE1.PPRACE is set to 1, the interrupt appears on rmc_mdio_int.
After the completion of read access, the read data is stored in MPSM.PRD[15:0]. So read it. And “Register Address” set by step 1) is automatically changed in the PHY to point a next register address field. So do not need to re-configuration of “Register Address” for next read access.
Set MMIS1.PPRACS to 0 to clear the interrupt.

(3) Repeat step (2) for the read access from the Next Register Address field.

Note: When MPSM.PSME set to 1, this IP outputs preamble code of fixed length specified in standard on rmc_mdo before write or read access. IEEE802.3 clause 45 does not allow skipping the preamble code. But skipping preamble code is also supported in this access method by setting MPIC.PSMDP to 1. To use this function, check a PHY specification.

37.3.3.2 Management Data Clock (MDC) Setting

To access Management registers in PHY, this IP outputs MDC. This is generated by dividing CHI clock (clk) in this IP and outputted from rmc_mdc. The division ratio can be set by the MPIC.PSMCS[6:0].
The following table shows the programmed MDC frequency depending on MPIC.PSMCS[6:0]. MDC frequency is calculated by clk[MHz] / ((MPIC.PSMCS[6:0] +1)*2).

Table 37.5 Programming Example for MPIC.PSMCS[6:0]

clk frequency	MPIC.PSMCS[6:0]	MDC frequency
100 MHz	13h	2.5 MHz
200 MHz	27h	2.5 MHz

Note: IEEE 802.3 specifies as the clock should be slower than 2.5 MHz. But some PHY could operate with a higher frequency. Refer to the PHY specification for detail.

37.3.3.3 Management Data Timing Adjustment

This IP can adjust the drive timing of MDO (rmc_mdo and rmc_mde) and the capture timing of MDI (rmc_mdi). It may be used for the propagation delay on the PCB.
The drive timing could be adjusted by PHY Station Management Hold time adjustment (MPIC.PSMHT[2:0]). The capture timing could be adjusted by PHY Station Management Capture time adjustment (MPIC.PSMCT[2:0]). The figure below is an example shifted by 2clk cycles.

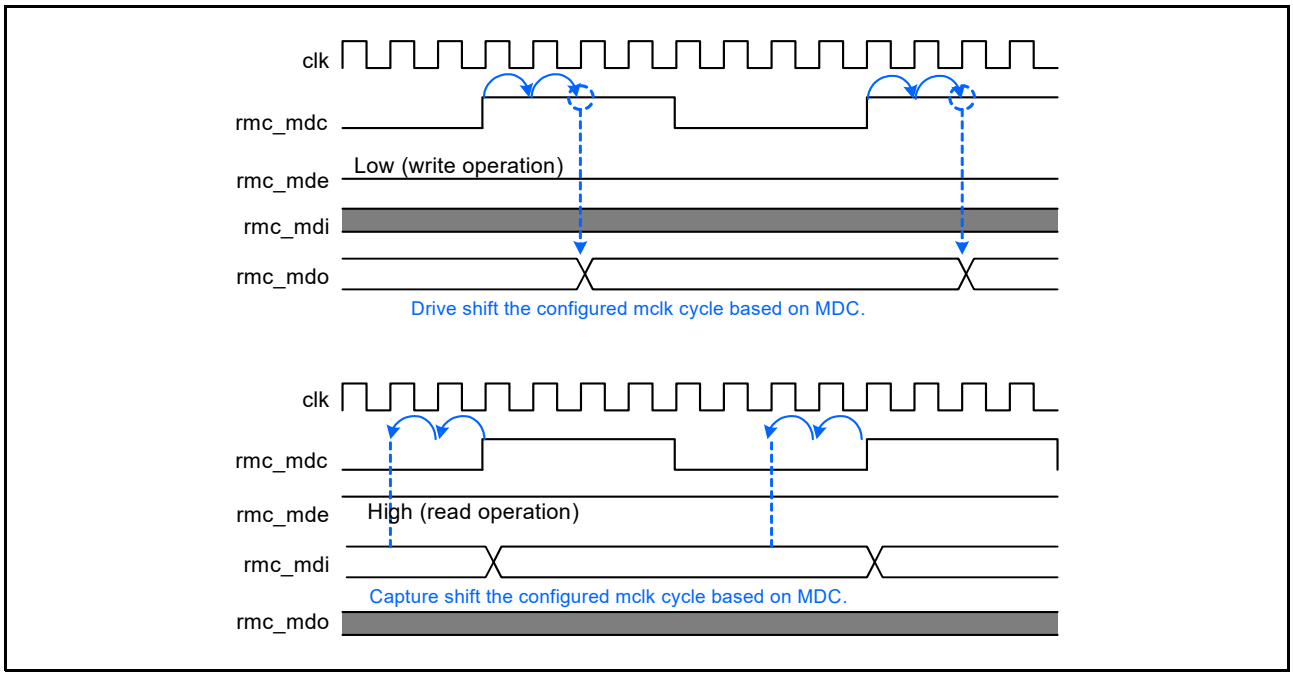

Figure 37.11 Management Data Timing Adjustment

37.3.4 Energy Efficient Ethernet

This IP supports Energy Efficient Ethernet (EEE) which is standardized inIEEE 802.3. Transmit-LPI mode and receive-LPI mode can be activated independently.

37.3.4.1 LPI Control

This IP can request LPI mode for transmit port to the PHY when the LPI request bit (MEEEC.LPITR) is asserted. LPI mode is released when the bit is negated. The operation flow is showed in section 37.3.7.4, LPI Transition for Transmit Port in detail.

And LPI mode for receive port can be recognized by the reception LPI interrupt status bit (MMIS2.LPIAIS). When the bit (MMIS2.LPIDIS) is asserted, it means RMAC detected de-assertion of LPI.
The table below is LPI specification on each xMII interface. The specification for MII or GMII is specified.

Table 37.6 Receive LPI Specification on Each xMII Interface

PHY IF	RX_DV	RX_ER	RXD
MII	rmc_rx_valid_gmii = 0	rmc_rx_err_gmii = 1	rmc_rx_data_gmii[3:0] = 0001
GMII	rmc_rx_valid_gmii = 0	rmc_rx_err_gmii = 1	rmc_rx_data_gmii[7:0] = 00000001

Table 37.7 Transmit LPI Specification on Each xMII Interface

PHY IF	TX_EN	TX_ER	TXD
MII	rmc_tx_valid_gmii = 0	rmc_tx_err_gmii = 1	rmc_tx_data_gmii [3:0] = 0001
GMII	rmc_tx_valid_gmii = 0	rmc_tx_err_gmii = 1	rmc_tx_data_gmii [7:0] = 00000001

37.3.5 MAC Address Filtering on Reception

This IP supports the frame reception in a full-duplex operation mode.
This IP can pass all received Ethernet frames data to an upper layer via xMII Interface.
This IP strips off automatically SFDs/SMDs, preambles, FRAG_COUNTs and mCRCs from all the frames.
The FCS reception by the upper layer can be set though MRGC.RCPT register.
This IP identifies the frames with the special format and informs to the upper layer. It is indicated with the dedicated flag in status information followed payload data. The table below indicates the frames with the special format.

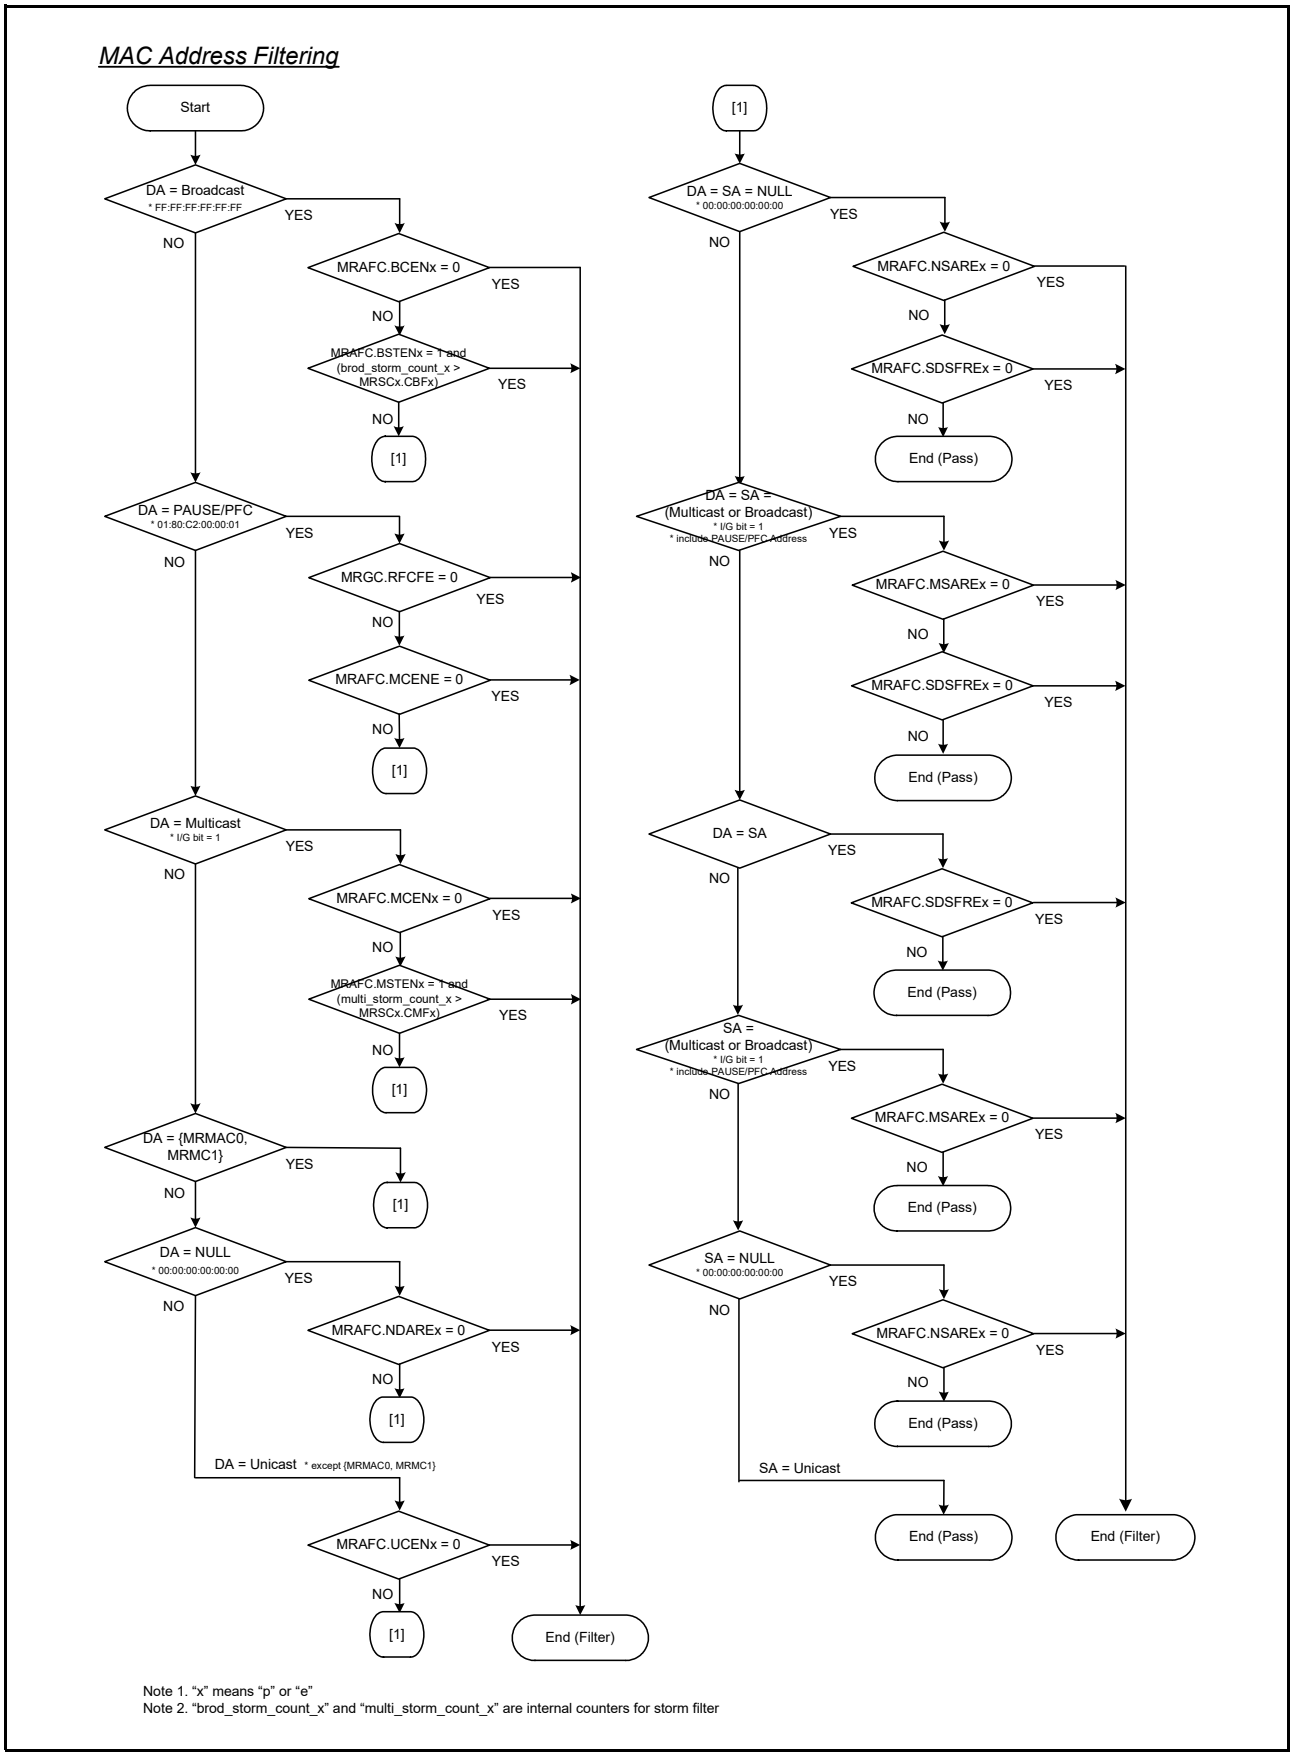

Table 37.8 Operation for Special Format Frame

Frame	Format	Operation
Broadcast frame	DA: FF_FF_FF_FF_FF_FF	Filtering possible.
Multicast frame	DA: B'xxxx_xxx1_xxxx_xxxx_xxxx_xxxx_xxxx_xxxx_xxxx_xxxx_xxxx_xxxx	Filtering possible.
Pause frame	DA: 01_80_C2_00_00_01 TYPE: 88_08 OPCODE: 00_01	This IP handles Flow Control, refer to section 37.3.1, Flow Control. Pause information is not sent to upper layer.
PFC frame	DA: 01_80_C2_00_00_01 TYPE: 88_08 OPCODE: 01_01	This IP handles Flow Control, refer to section 37.3.1, Flow Control. Pause information is not sent to upper layer.
Magic packet	When the MAC address (MRMAC0.MAU[15:0], MRMAC1.MAL[31:0]) is 00-11-22-33-44-55h, this IP would scan for the data sequence: Destination-Address Source-Address .....MISC..... FF FF FF FF FF FF 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 00 11 22 33 44 55 .....MISC..... FCS This sequence can be located anywhere in the Magic Packet payload. The Magic Packet is formed with a standard Ethernet header and FCS.	Interrupt. Provide information to upper layer. Provide magic packet interrupt (MMIS2.MPDIS). Magic packets are only detected as E-frame.

This IP supports the MAC address filtering for Unicast, Multicast, Broadcast, Broadcast storm (continuous Broadcast frame reception) and Multicast storm (continuous Multicast frame reception). It uses the destination address (DA) and source Address (SA) of a received frame for the address filtering. When the filter condition is satisfied, the received frames are transferred to an upper layer. If not satisfied, the received frames are transferred to the upper layer with the error flag of "Frame filtered".
The filter condition is configured in Reception filter configuration register (MRAFC). It can be individually configured for Unicast address, Multicast address, and Broadcast address.
And this IP also supports Promiscuous mode.
When MRAFC.UCENx, MCENx, BCENx, NDAREx, SDSFREx, NSAREx and MSAREx (x = P, N) are set to 1, all frames are transferred to the upper layer without error flag of "Frame filtered".

Note: Regardless of MRAFC configuration, Verify and Respond are not transferred to the upper layer.

The flow of next page shows the MAC Address filtering.

Note 1. “x” means “p” or “e”
Note 2. “brod_storm_count_x” and “multi_storm_count_x” are internal counters for storm filter

Figure 37.12 MAC Address Filtering

37.3.6 Operation Modes

Operational mode is controlled. Please refer to IPS. RMAC received a mode control signal for controlling operational mode of RMAC.

37.3.6.1 Frame Handling

In transmission, this IP transmits all frames from an upper module (e.g. ETHA) when this IP is in operation state,e.g. when ETHA is in OPERATION state.
In reception, this IP only receives frames from PHY when this IP is in operation state, e.g. when ETHA is in OPERATION state, and outputs them to the upper module(e.g. ETHA). In other modes, this IP discards all received frames from PHY internally, and does not output them to the upper module.

37.3.7 Software Flows

Restrictions:

- SW: Please follow to the flow in this section.

37.3.7.1 Initialization Flow

The figure below shows the initialization flow.

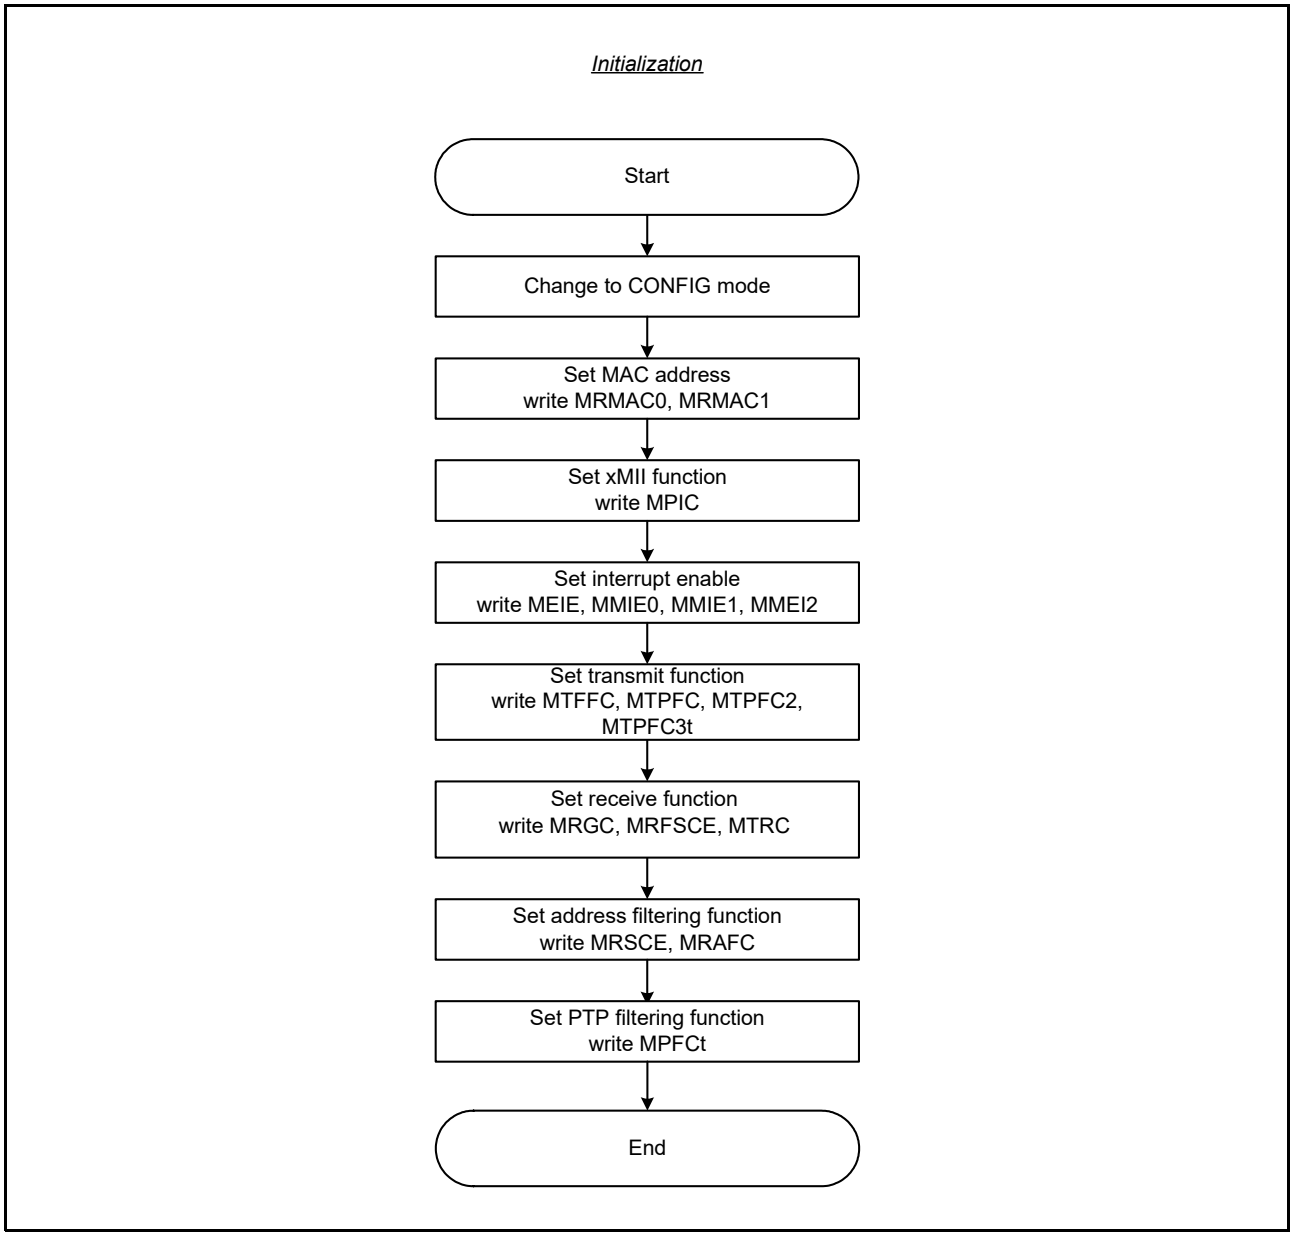

Figure 37.13 Initialization Flow

37.3.7.2 Interrupt Handling Flow

Interrupt handling flow can be used in any mode except RESET mode.
The figure below shows the interrupt handling flow.

Restrictions:

- This flow is not usable in RESET modes.

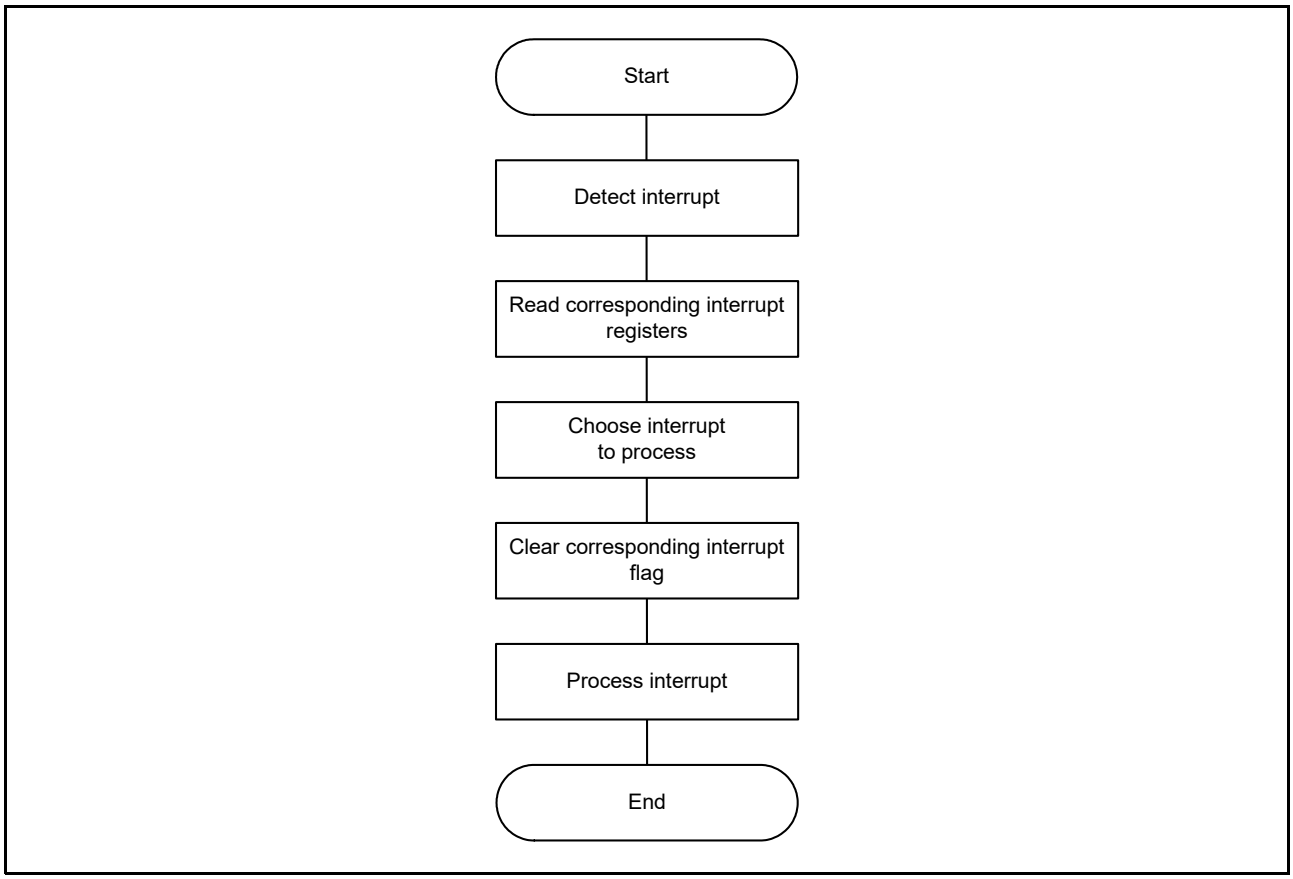

Figure 37.14 Interrupt Handling Flow

37.3.7.3 PHY MDIO and eMDIO Access Flows

The figure below shows the PHY MDIO and eMDIO access flow.

Restrictions:

- This flow is not usable in RESET modes.

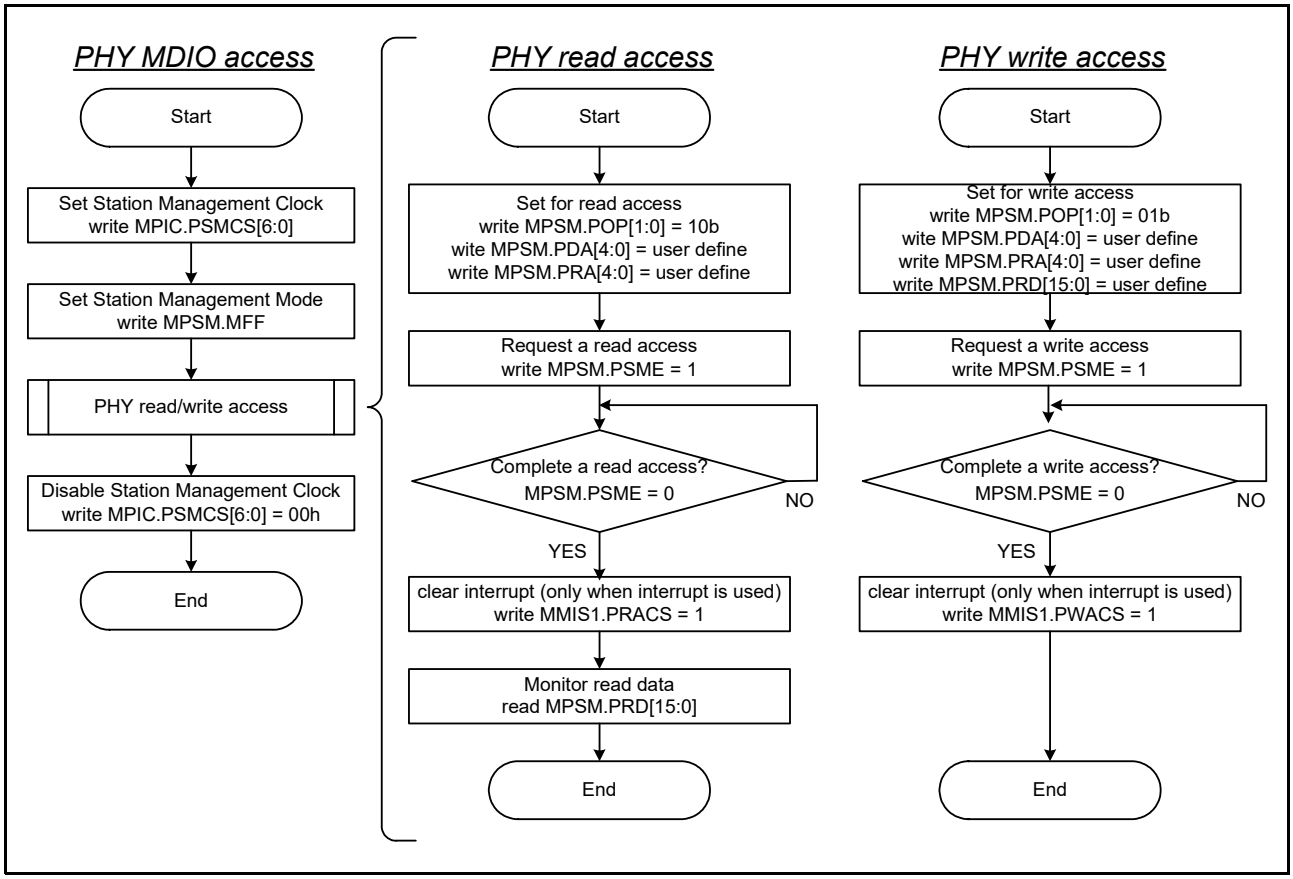

Figure 37.15 PHY MDIO Access Flow

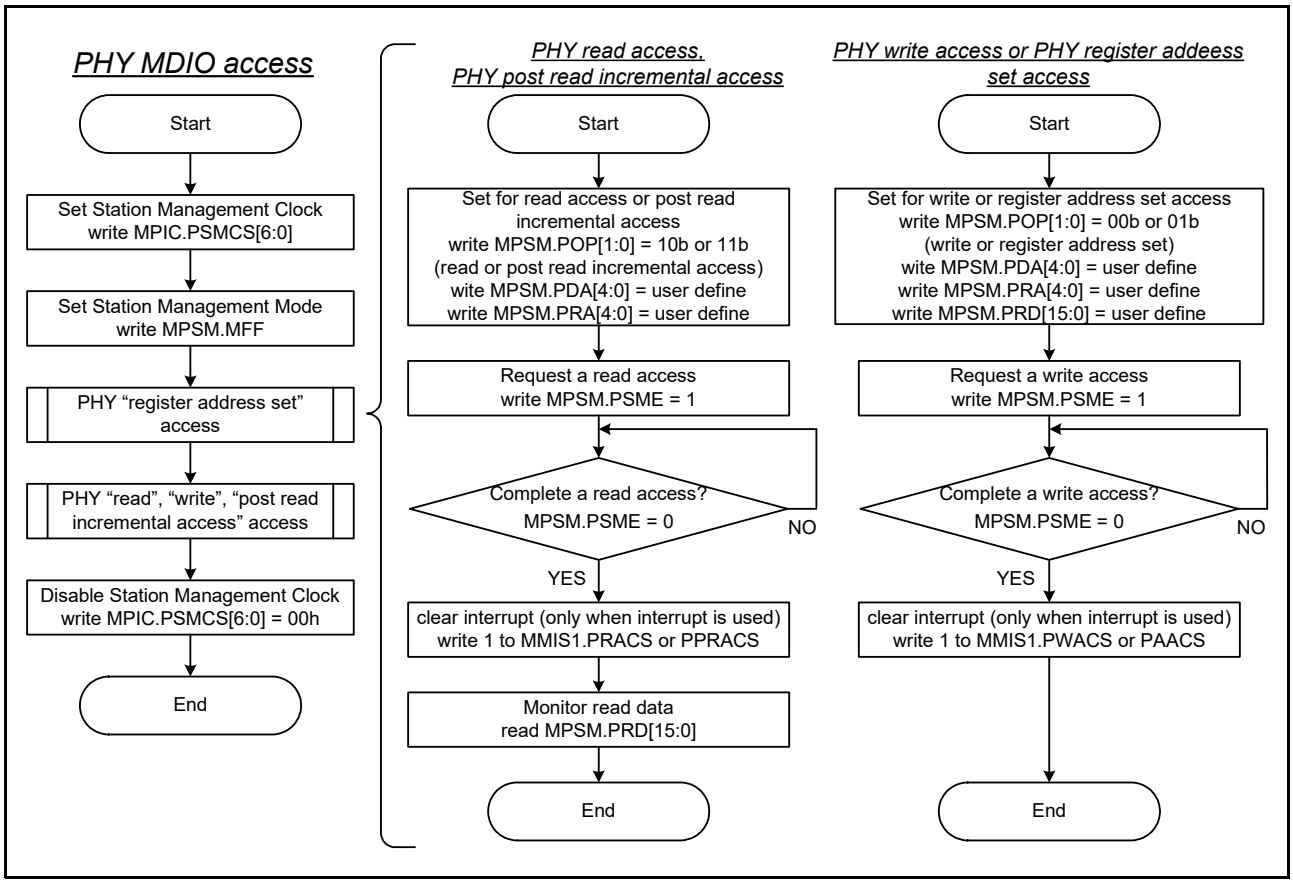

Figure 37.16 PHY eMDIO Access Flow

37.3.7.4 LPI Transition for Transmit Port

The figure below shows the LPI transition flow. In case of resumed from LPI, the transmission should be requested until PHY wake-up completed.

Restrictions:

- This flow is not usable in RESET modes.

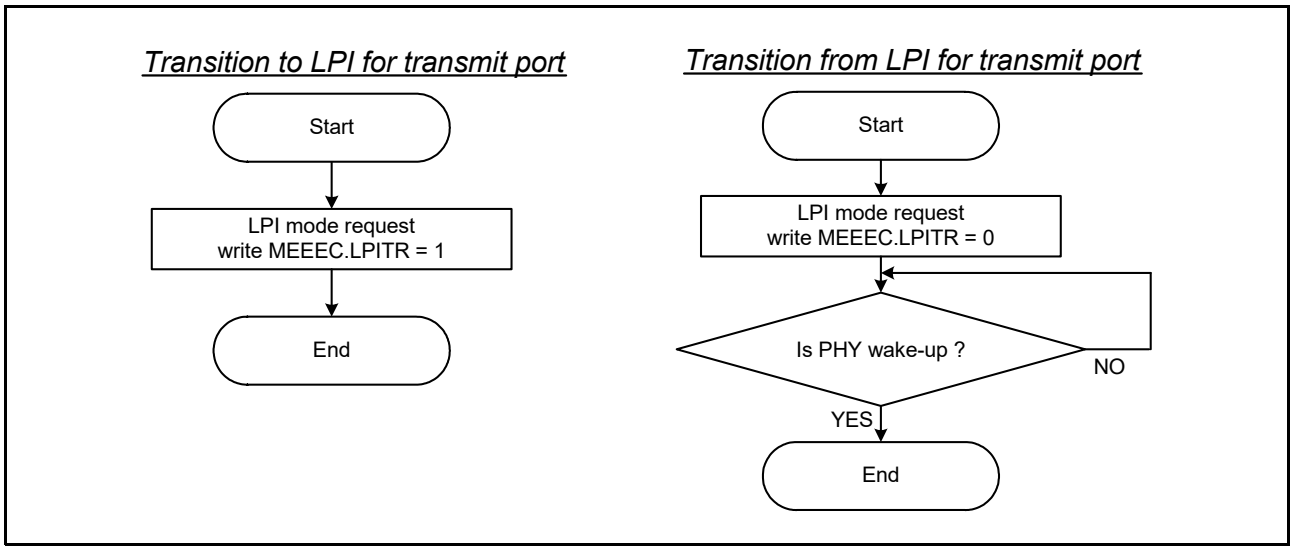

Figure 37.17 LPI Transition for Transmit Port

37.3.7.5 LINK Verification

The figure below shows Link Verification flow.

Restrictions:

- This flow is usable in OPERATIONAL mode.

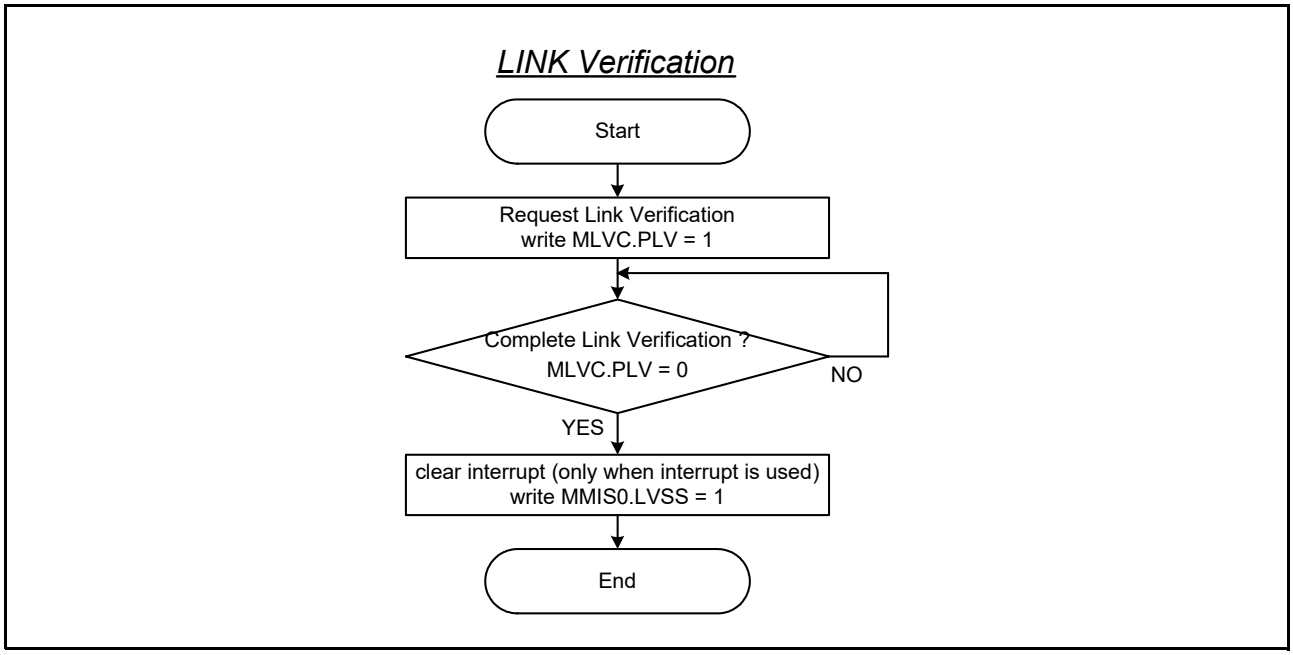

Figure 37.18 Link Verification Flow

38. Ethernet CPU Agent (GWCA)

38.1 Overview

GWCA (Ethernet CPU Agent) is a CPU interface.
The GWCA consists of an agent interface module allowing communication within the ESWM [ESWM]. It handles the data exchange between the ESWM and the GWCPU subsystem. SW involvement is required for configuration of the GateWay AXI bus interface.

38.1.1 Features

GWCA features are described Table 38.1.

Table 38.1 GWCA Feature List

Function		Details
Interfaces	Switch mode	Interface to receive the switch mode [MFWD]
	Pause interface	Interface to pause TX queues [COMA]
	AXI Master interface	Master interface conforming to AXI 3 AMBA protocol. It is used for data transfer between GWCPU and GWCA. • Data bit width: 128 bits • Number of outstanding read: 8 • Number of outstanding write: 8 • Number of ID read: 8 (from 0 to 7) • Number of ID write: 8 (from 0 to 7) • Incremental Access only • Supports unaligned transactions • Supports out of order • Supports interleave on read bus
	SFR interface	Interface to access GWCA SFRs [COMA]
	Interrupts	GWCA interrupt to CPU
	Fabric interface	Interface to communicate with the data, TAG and pointer RAM [MFWD].
	Descriptor bus	Interface to receive frame information to send them to CPU [MFWD].
	BP Request	Interface to receive BPs to store frames in the data, TAG and pointer RAM [COMA].
	BP Release	Interface to release the BPs that has been used [COMA].
	TX Timestamp Capture interface	Interface to receive TX timestamps and send it to CPU [RMAC].
	RAM interfaces	Interface to communication with RAMs [ESWM]
Data provision	Timestamp	TX timestamp for transmission to CPU RAM [RMAC]

38.1.2 GWCA Block Diagram

Figure 38.1 shows GWCA block diagram.

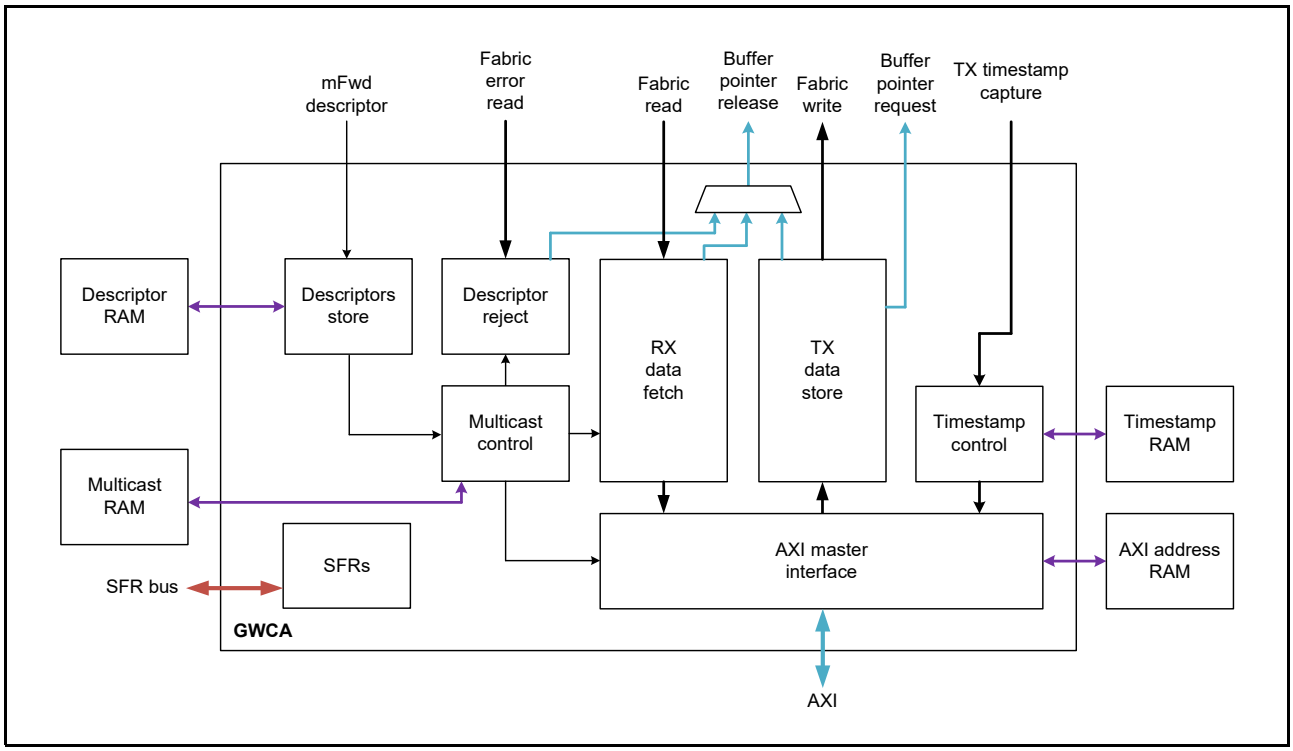

Figure 38.1 GWCA Block Diagram

Table 38.2 GWCA Functional Blocks

Block Name	Function
TX data store	Transmits frames from AXI master to the local RAM
RX data fetch	Transmits frame from local RAM to AXI master
Descriptor store	Receives the descriptors from forwarding engine and controls the priority between descriptors
Descriptor reject	Reject descriptors
Multicast control	Controls multicast transactions
Timestamp control	Receives timestamps for Ethernet agents, saves them and transmits them to the AXI master
AXI master interface	AXI master for data exchange with the CPU
SFRs	GWCA SFRs

38.2 Register Descriptions

38.2.1 GWCA Mode Function Registers

38.2.1.1 Mode Configuration Register (GWMC)

Address(es): GWCA0.GWMC 874C E000h, GWCA0_NS.GWMC 074C E000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OPC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	OPC[1:0]	Operating Mode Command	b1 b0 0 0: Enter RESET mode 0 1: Enter DISABLE mode 1 0: Enter CONFIG mode 1 1: Enter OPERATION mode	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

OPC[1:0] Bits (Operating Mode Command)

Used to set GWCA mode. For more details, refer to section 38.3.7, Operation Modes.

[Restriction]

- HW: These bits are not writable if its value is different than GWMS.OPS[1:0].

38.2.1.2 Mode Status Register (GWMS)

Address(es): GWCA0.GWMS 874C E004h, GWCA0_NS.GWMS 074C E004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OPS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	OPS[1:0]	Operating Mode Status	b1 b0 0 0: RESET mode 0 1: DISABLE mode 1 0: CONFIG mode 1 1: OPERATION mode	R
b31 to b2	—	Reserved	These bits are read as 0.	R

OPS[1:0] Bits (Operating Mode Status)

Indicates the current GWCA mode. For more details, refer to section 38.3.7, Operation Modes.

[Update conditions]

- HW: Mode change completed.
- These bits are change at “Maximum frame communication time (exp: 64 Kbyte/100 Mbps = 5.12 ms)” from OPERATION to DISABLE.

38.2.2 Reception Function Registers

38.2.2.1 IPV Remapping Configuration Register [802.1Q] (GWIRC)

Address(es): GWCA0.GWIRC 874C E010h, GWCA0_NS.GWIRC 074C E010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	IPVR7[2:0]			—	IPVR6[2:0]			—	IPVR5[2:0]			—	IPVR4[2:0]		
Value after reset:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	IPVR0[2:0]	IPV Remapping 0	Configure to which descriptor queue descriptor received with IPV 0 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 0).	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R
b6 to b4	IPVR1[2:0]	IPV Remapping 1	Configure to which descriptor queue descriptor received with IPV 1 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 1).	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R
b10 to b8	IPVR2[2:0]	IPV Remapping 2	Configure to which descriptor queue descriptor received with IPV 2 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 2).	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R
b14 to b12	IPVR3[2:0]	IPV Remapping 3	Configure to which descriptor queue descriptor received with IPV 3 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 3).	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R
b18 to b16	IPVR4[2:0]	IPV Remapping 4	Configure to which descriptor queue descriptor received with IPV 4 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 4).	R/W
b19	—	Reserved	This bit is read as 0. The write value should be 0.	R
b22 to b20	IPVR5[2:0]	IPV Remapping 5	Configure to which descriptor queue descriptor received with IPV 5 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 5).	R/W
b23	—	Reserved	This bit is read as 0. The write value should be 0.	R
b26 to b24	IPVR6[2:0]	IPV Remapping 6	Configure to which descriptor queue descriptor received with IPV 6 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 6).	R/W
b27	—	Reserved	This bit is read as 0. The write value should be 0.	R
b30 to b28	IPVR7[2:0]	IPV Remapping 7	Configure to which descriptor queue descriptor received with IPV 7 will be stored (when a descriptor is received from forwarding engine with FDESCR.IPV [MFWD] equal to 7).	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

38.2.2.2 RX Descriptor Queue Security Configuration Register (GWRDQSC)

Address(es): GWCA0.GWRDQSC 874C E014h, GWCA0_NS.GWRDQSC 074C E014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RDQSL7	RDQSL6	RDQSL5	RDQSL4	RDQSL3	RDQSL2	RDQSL1	RDQSL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RDQSL0	RX Descriptor Queue 0 Security Level	0: Queue q unsecure 1: Queue q secure (q = 0 to 7)	R/W
b1	RDQSL1	RX Descriptor Queue 1 Security Level		R/W
b2	RDQSL2	RX Descriptor Queue 2 Security Level		R/W
b3	RDQSL3	RX Descriptor Queue 3 Security Level		R/W
b4	RDQSL4	RX Descriptor Queue 4 Security Level		R/W
b5	RDQSL5	RX Descriptor Queue 5 Security Level		R/W
b6	RDQSL6	RX Descriptor Queue 6 Security Level		R/W
b7	RDQSL7	RX Descriptor Queue 7 Security Level		R/W
b31 to b8	—	Reserved	This bit is read as 0. The write value should be 0.	R

RDQSLq Bit (RX Descriptor Queue q Security Level) (q = 0 to 7)

When a queue is secured, an unsecure descriptor cannot enter it (when a descriptor is received from forwarding engine with FDESCR.SEC [MFWD] equal to 0).

38.2.2.3 RX Descriptor Queue Control Register (GWRDQC)

Address(es): GWCA0.GWRDQC 874C E018h, GWCA0_NS.GWRDQC 074C E018h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	RDQP7	RDQP6	RDQP5	RDQP4	RDQP3	RDQP2	RDQP1	RDQP0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	RDQD7	RDQD6	RDQD5	RDQD4	RDQD3	RDQD2	RDQD1	RDQD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RDQD0	RX Descriptor Queue 0 Disable	0: Queue q enabled 1: Queue q disabled (q = 0 to 7)	R/W
b1	RDQD1	RX Descriptor Queue 1 Disable		R/W
b2	RDQD2	RX Descriptor Queue 2 Disable		R/W
b3	RDQD3	RX Descriptor Queue 3 Disable		R/W
b4	RDQD4	RX Descriptor Queue 4 Disable		R/W
b5	RDQD5	RX Descriptor Queue 5 Disable		R/W
b6	RDQD6	RX Descriptor Queue 6 Disable		R/W
b7	RDQD7	RX Descriptor Queue 7 Disable		R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RDQP0	RX Descriptor Queue 0 Pause	0: Queue q active 1: Queue q paused (q = 0 to 7)	R/W
b17	RDQP1	RX Descriptor Queue 1 Pause		R/W
b18	RDQP2	RX Descriptor Queue 2 Pause		R/W
b19	RDQP3	RX Descriptor Queue 3 Pause		R/W
b20	RDQP4	RX Descriptor Queue 4 Pause		R/W
b21	RDQP5	RX Descriptor Queue 5 Pause		R/W
b22	RDQP6	RX Descriptor Queue 6 Pause		R/W
b23	RDQP7	RX Descriptor Queue 7 Pause		R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

RDQDq Bit (RX Descriptor Queue q Disable) (q = 0 to 7)

Avoid descriptor from forwarding engine [MFWD] to enter the corresponding queue. The Forwarding Engine will reject the corresponding descriptor.

If disabled queue data is not needed anymore, the GWRMFSCq.MFS[15:0] bits can be set to 0 in order to avoid more frames to go to the CPU RAM.

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing conditions]

- SW: Writing 0 to this bit will clear it.
- HW: Going out of OPERATION mode will clear this register (GWMC.OPC[1:0] ≠ 11b).

RDQPq Bit (RX Descriptor Queue q Pause) (q = 0 to 7)

Avoid frames to be sent to the CPU by stopping descriptor fetching from the descriptor RAM.

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing conditions]

- SW: Writing 0 to this bit will clear it.
- HW: Going out of OPERATION mode will clear this bit (GWMC.OPC[1:0] ≠ 11b).

[Restriction]

- SW: Pausing a queue during a long time could result in switch overflow. In case of switch overflow [COMA] this bit should be set to 0.

[Caution]

- This bit is used to stop a queue but forwarding engine [MFWD] will not stop sending descriptor to the corresponding queue. In this case the queue might overflow.

38.2.2.4 RX Descriptor Queue Arbitration Control Register (GWRDQAC)

Address(es): GWCA0.GWRDQAC 874C E01Ch, GWCA0_NS.GWRDQAC 074C E01Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RDQA7[3:0]				RDQA6[3:0]				RDQA5[3:0]				RDQA4[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RDQA3[3:0]				RDQA2[3:0]				RDQA1[3:0]				RDQA0[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	RDQA0[3:0]	RX Descriptor Queue 0 Arbitration	0 0 0 0: Queue i strict arbitration Others: Queue i WRR arbitration (i = 0 to 7)	R/W
b7 to b4	RDQA1[3:0]	RX Descriptor Queue 1 Arbitration		R/W
b11 to b8	RDQA2[3:0]	RX Descriptor Queue 2 Arbitration		R/W
b15 to b12	RDQA3[3:0]	RX Descriptor Queue 3 Arbitration		R/W
b19 to b16	RDQA4[3:0]	RX Descriptor Queue 4 Arbitration		R/W
b23 to b20	RDQA5[3:0]	RX Descriptor Queue 5 Arbitration		R/W
b27 to b24	RDQA6[3:0]	RX Descriptor Queue 6 Arbitration		R/W
b31 to b28	RDQA7[3:0]	RX Descriptor Queue 7 Arbitration		R/W

RDQAi[3:0] Bits (RX Descriptor Queue i Arbitration) (i = 0 to 7)

For more details, refer to (2) Descriptor Arbitration.

[Restrictions]

- SW: In hybrid arbitration mode, all the queues with a GWRDQAC.RDQAi[3:0] value different than 0 should have a consecutive priority (priority refers to the queue number i).
- SW: In all arbitration mode except strict priority arbitration mode, at least two queues should have a GWRDQAC.RDQAi[3:0] different than 0.

38.2.2.5 RX General Configuration Register (GWRGC)

Address(es): GWCA0.GWRGC 874C E020h, GWCA0_NS.GWRGC 074C E020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCPT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	RCPT	Receive CRC Pass Through [802.3]	0: FCS is not passed to GWCPU. If a descriptor and is received from forwarding engine with FDESCR.FI equal to 1, GWCA remove the last 4 bytes of the Frame Data (FCS). 1: FCS is passed to GWCPU. GWCA do not remove FCS from the Frame which has one (a descriptor and is received from forwarding engine with FDESCR.FI equal to 1) if the frame has not been modified by the switch (No update due to VLAN tagging/un-tagging and no update requested by L3 routing [MFWD]).	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R

RCPT Bit (Receive CRC Pass Through [802.3])

This bit selects to pass FCS field on the reception frame.

[Restriction]

- HW: GWCA does not check FCS integrity.

38.2.2.6 Reception Maximum Frame Size Configuration Register q (GWRMFSCq) (q = 0 to 7)

Address(es): GWCA0.GWRMFSC0 874C E040h, GWCA0.GWRMFSC1 874C E044h, GWCA0.GWRMFSC2 874C E048h, GWCA0.GWRMFSC3 874C E04Ch, GWCA0.GWRMFSC4 874C E050h, GWCA0.GWRMFSC5 874C E054h, GWCA0.GWRMFSC6 874C E058h, GWCA0.GWRMFSC7 874C E05Ch, GWCA0_NS.GWRMFSC0 074C E040h, GWCA0_NS.GWRMFSC1 074C E044h, GWCA0_NS.GWRMFSC2 074C E048h, GWCA0_NS.GWRMFSC3 074C E04Ch, GWCA0_NS.GWRMFSC4 074C E050h, GWCA0_NS.GWRMFSC5 074C E054h, GWCA0_NS.GWRMFSC6 074C E058h, GWCA0_NS.GWRMFSC7 074C E05Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MFS[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MFS[15:0]	Maximum Frame Size	Maximum frame size for descriptor queue q. All bigger frames will be rejected.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

MFS[15:0] Bits (Maximum Frame Size)

[Restriction]

- HW: The maximum frame size comparison takes in account the frame size which will actually be written by the AXI master (after VLAN un-tagging, R-TAG insertion and L23 update) but always counts in this size FCS even if not received by CPU.

38.2.2.7 Reception Descriptor Queue q Depth Configuration Register (GWRDQDCq) (q = 0 to 7)

Address(es): GWCA0.GWRDQDC0 874C E060h, GWCA0.GWRDQDC1 874C E064h, GWCA0.GWRDQDC2 874C E068h, GWCA0.GWRDQDC3 874C E06Ch, GWCA0.GWRDQDC4 874C E070h, GWCA0.GWRDQDC5 874C E074h, GWCA0.GWRDQDC6 874C E078h, GWCA0.GWRDQDC7 874C E07Ch, GWCA0_NS.GWRDQDC0 074C E060h, GWCA0_NS.GWRDQDC1 074C E064h, GWCA0_NS.GWRDQDC2 074C E068h, GWCA0_NS.GWRDQDC3 074C E06Ch, GWCA0_NS.GWRDQDC4 074C E070h, GWCA0_NS.GWRDQDC5 074C E074h, GWCA0_NS.GWRDQDC6 074C E078h, GWCA0_NS.GWRDQDC7 074C E07Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	DQD[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	DQD[9:0]	Descriptor Queue Depth	Number of descriptors that can be contained in descriptor queue q.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

DQD[9:0] Bits (Descriptor Queue Depth)

For details refer to (1) Descriptor Storage.

[Restriction]

- SW: The sum of DQD[9:0] fields should always be less or equal to 512.

38.2.2.8 RX Descriptor Queue q Monitoring Register (GWRDQMq) (q = 0 to 7)

Address(es): GWCA0.GWRDQM0 874C E080h, GWCA0.GWRDQM1 874C E084h, GWCA0.GWRDQM2 874C E088h, GWCA0.GWRDQM3 874C E08Ch, GWCA0.GWRDQM4 874C E090h, GWCA0.GWRDQM5 874C E094h, GWCA0.GWRDQM6 874C E098h, GWCA0.GWRDQM7 874C E09Ch, GWCA0_NS.GWRDQM0 074C E080h, GWCA0_NS.GWRDQM1 074C E084h, GWCA0_NS.GWRDQM2 074C E088h, GWCA0_NS.GWRDQM3 074C E08Ch, GWCA0_NS.GWRDQM4 074C E090h, GWCA0_NS.GWRDQM5 074C E094h, GWCA0_NS.GWRDQM6 074C E098h, GWCA0_NS.GWRDQM7 074C E09Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	DNQ[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	DNQ[9:0]	Descriptor Number in Queue	Indicate the current number of descriptors stored in RX Descriptor Queue q.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

DNQ[9:0] Bits (Descriptor Number in Queue)

[Increment condition]

- HW: Incremented by 1 when a descriptor is received from the forwarding engine [MFWD] for the corresponding queue and, the queue is not full, there is no descriptor security error and the queue is not disabled.

[Decrement condition]

- HW: Decremented by 1 when a descriptor is read by GWCA to send data to AXI Master Interface or to reject data.

38.2.2.9 RX Descriptor Queue q Max Level Monitoring Register (GWRDQMLMq) (q = 0 to 7)

Address(es): GWCA0.GWRDQMLM0 874C E0A0h, GWCA0.GWRDQMLM1 874C E0A4h, GWCA0.GWRDQMLM2 874C E0A8h, GWCA0.GWRDQMLM3 874C E0ACh, GWCA0.GWRDQMLM4 874C E0B0h, GWCA0.GWRDQMLM5 874C E0B4h, GWCA0.GWRDQMLM6 874C E0B8h, GWCA0.GWRDQMLM7 874C E0BCh, GWCA0_NS.GWRDQMLM0 074C E0A0h, GWCA0_NS.GWRDQMLM1 074C E0A4h, GWCA0_NS.GWRDQMLM2 074C E0A8h, GWCA0_NS.GWRDQMLM3 074C E0ACh, GWCA0_NS.GWRDQMLM4 074C E0B0h, GWCA0_NS.GWRDQMLM5 074C E0B4h, GWCA0_NS.GWRDQMLM6 074C E0B8h, GWCA0_NS.GWRDQMLM7 074C E0BCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	DMLQ[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b9 to b0	DMLQ[9:0]	Descriptor Max Level in Queue	Indicates the maximum number of descriptors that has been stored in RX Descriptor Queue q.	R
b31 to b10	—	Reserved	These bits are read as 0.	R

DMLQ[9:0] Bits (Descriptor Max Level in Queue)

[Clearing conditions]

- HW: Being in RESET mode will clear this register (GWMC.OPC[1:0] = 00b).
- SW: By reading this register, it is cleared to GWRDQMq.DNQ[9:0].

[Increment condition]

- HW: Increment to GWRDQMq.DNQ[9:0] value when smaller than GWRDQMq.DNQ[9:0].

38.2.3 Reception Multicast Function Registers

38.2.3.1 Multicast Table Initialization Register Monitoring Register (GWMTIRM)

Address(es): GWCA0.GWMTIRM 874C E100h, GWCA0_NS.GWMTIRM 074C E100h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MTR	MTIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MTIOG	Multicast Table Initialization Ongoing		R/W
b1	MTR	Multicast Table Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

MTIOG Bit (Multicast Table Initialization Ongoing)

[Setting condition]

- SW: By writing 1 to this bit. It starts Multicast Table initialization.

[Clearing condition]

- HW: This bit is cleared when Multicast Table initialization is finished.
  Min clk_period*64 = [exp] (3.125)*128 = 400 ns

MTR Bit (Multicast Table Ready)

[Setting condition]

- When GWMTIRM.MTIOG is getting cleared.

[Clearing condition]

- By writing 1 to GWMTIRM.MTIOG.

38.2.3.2 Multicast Table Learning Setting Register (GWMSTLS)

Address(es): GWCA0.GWMSTLS 874C E104h, GWCA0_NS.GWMSTLS 074C E104h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	MNRCNL[5:0]	Multicast Next Descriptor Chain Number Learn		R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R
b10 to b8	MNL[2:0]	Multicast Number Learn	b10 b8 0 0 0: multicast 0 (1 target, no multicast) 0 0 1: multicast 1 (2 targets) : 1 1 1: multicast 7 (8 targets)	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R
b21 to b16	MSENL[5:0]	Multicast Setting Entry Number Learn		R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R

MNRCNL[5:0] Bits (Multicast Next Descriptor Chain Number Learn)

These bits are used to set the next address in the multicast table to be learnt in GWMSTLS.MSENL[5:0] multicast table entry, refer to (3) Multicast Learning.

MNL[2:0] Bits (Multicast Number Learn)

These bits are used to set the multicast number that should be learnt in GWMSTLS.MSENL[5:0] multicast table entry.

MSENL[5:0] Bits (Multicast Setting Entry Number Learn)

These bits are used to set in which address the current learning should happen.

38.2.3.3 Multicast Table Learning Result Register (GWMSTLR)

Address(es): GWCA0.GWMSTLR 874C E108h, GWCA0_NS.GWMSTLS 074C E108h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MTL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MTLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MTLF	Multicast Table Learning Fail	0: Entry learning did not fail because the Multicast table is not ready. 1: Entry learning failed because the Multicast table is not ready.	R
b30 to b1	—	Reserved	This bit is read as 0.	R
b31	MTL	Multicast Table Learning		R

MTLF Bit (Multicast Table Learning Fail)

[Update condition]

- HW: GWMSTLR.MTL clear event.

MTL Bit (Multicast Table Learning)

[Setting condition]

- SW: Writing GWMSTLS register will set this bit.

[Clearing condition]

- HW: This bit will be de-asserted when the Multicast RAM write is completed.

38.2.3.4 Multicast Table Searching Setting Register (GWMSTSS)

Address(es): GWCA0.GWMSTSS 874C E10Ch, GWCA0_NS.GWMSTSS 074C E10Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	MSENS[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	MSENS[5:0]	Multicast Setting Entry Number Search	This register is used to read multicast table.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

38.2.3.5 Multicast Table Searching Result Register (GWMSTSR)

Address(es): GWCA0.GWMSTSR 874C E110h, GWCA0_NS.GWMSTSR 074C E110h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MTS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	MNR[2:0]			—	—	MNRCNR[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	MNRCNR[5:0]	Multicast Next RX Descriptor Chain Number Result		R
b7, b6	—	Reserved	These bits are read as 0.	R
b10 to b8	MNR[2:0]	Multicast Number Result		R
b30 to b11	—	Reserved	These bits are read as 0.	R
b31	MTS	Multicast Table Searching		R

MNRCNR[5:0] Bits (Multicast Next RX Descriptor Chain Number Result)

These bits are used to read multicast table.

[Update condition]

- HW: GWMSTSR.MTS clear event.

MNR[2:0] Bits (Multicast Number Result)

These bits are used to read multicast table.

[Update condition]

- HW: GWMSTSR.MTS clear event.

MTS Bit (Multicast Table Searching)

This bit is used to read multicast table.

[Setting condition]

- SW: Writing GWMSTSS register will set this bit.

[Clearing condition]

- HW: This bit will be de-asserted when the Multicast RAM read is completed.

38.2.4 MAC Function Registers

38.2.4.1 MAC Address Configuration Register 0 (GWMAC0)

Address(es): GWCA0.GWMAC0 874C E120h, GWCA0_NS.GWMAC0 074C E120h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MAU[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	MAU[15:0]	MAC Address Upper Part	These bits are used to set the upper 16 bits of the MAC address. For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 0123h in this register.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

38.2.4.2 MAC Address Configuration Register 1 (GWMAC1)

Address(es): GWCA0.GWMAC1 874C E124h, GWCA0_NS.GWMAC1 074C E124h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MAL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	MAL[31:0]	MAC Address Lower Part	These bits are used to set the lower 32 bits of the MAC address. For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set 456789ABh in this register.	R/W

38.2.5 TAG Function Registers

38.2.5.1 VLAN Control Configuration Register (GWVCC)

Address(es): GWCA0.GWVCC 874C E130h, GWCA0_NS.GWVCC 074C E130h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	VEM[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VIM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	VIM	VLAN Ingress Mode	0: Incoming VLAN mode 1: Port based VLAN mode	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b18 to b16	VEM[2:0]	VLAN Egress Mode	b18 b16 0 0 0: No VLAN mode, frames are transmitted with no VLAN. 0 0 1: C-TAG VLAN mode, frames are transmitted with ingress C-TAG if there is one stored in the Local RAM. 0 1 0: HW C-TAG VLAN mode, frames are transmitted with the C-TAG stored in local RAM. 0 1 1: SC-TAG VLAN mode, frames are transmitted with ingress C-TAG and ingress S-TAG if they were stored in the Local RAM. 1 0 0: HW SC-TAG VLAN mode, frames are transmitted with the C-TAG and S-TAG stored in local RAM. Settings other than above are prohibited.	R/W
b31 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R

VIM Bit (VLAN Ingress Mode)

[Restriction]

- SW: This bit should not be set to 1 if the switch is in no VLAN mode (In forwarding engine, FWGC.SVM is set to 00b [MFWD])

38.2.5.2 VLAN TAG Configuration Register (GWVTC)

Address(es): GWCA0.GWVTC 874C E134h, GWCA0_NS.GWVTC 074C E134h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTD	CTP[2:0]			CTV[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	CTV[11:0]	C-TAG VLAN		R/W
b14 to b12	CTP[2:0]	C-TAG PCP		R/W
b15	CTD	C-TAG DEI		R/W
b27 to b16	STV[11:0]	S-TAG VLAN		R/W
b30 to b28	STP[2:0]	S-TAG PCP		R/W
b31	STD	S-TAG DEI		R/W

38.2.5.3 Transmission TAG Filtering Configuration Register (GWTTFC)

Address(es): GWCA0.GWTTFC 874C E138h, GWCA0_NS.GWTTFC 074C E138h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	UT	SCRT	SCT	CRT	CT	CSRT	CST	RT	NT
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NT	No Tag	0: No Tag frame passed 1: No Tag frame rejected	R/W
b1	RT	R-TAG	0: R-TAG frame passed 1: R-TAG frame rejected	R/W
b2	CST	CoS-TAG	0: CoS-TAG frame passed 1: CoS-TAG frame rejected	R/W
b3	CSRT	CoSR-TAG	0: CoSR-TAG frame passed 1: CoSR-TAG frame rejected	R/W
b4	CT	C-TAG	0: C-TAG frame passed 1: C-TAG frame rejected	R/W
b5	CRT	CR-TAG	0: CR-TAG frame passed 1: CR-TAG frame rejected	R/W
b6	SCT	SC-TAG	0: SC-TAG frame passed 1: SC-TAG frame rejected	R/W
b7	SCRT	SCR-TAG	0: SCR-TAG frame passed 1: SCR-TAG frame rejected	R/W
b8	UT	Unknown TAG	0: Unknown Tag frame passed 1: Unknown Tag frame rejected	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R

38.2.6 Timestamp Function Registers

38.2.6.1 Timestamp Descriptor Chain s Address Configuration Register 0 (GWTDCACs0) (s = 0, 1)

Address(es): GWCA0.GWTDCAC00 874C E140h, GWCA0.GWTDCAC10 874C E148h, GWCA0_NS.GWTDCAC00 074C E140h, GWCA0_NS.GWTDCAC10 074C E148h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	TSCCAU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	TSCCAU[7:0]	TS Descriptor Chain s Current Address Upper Part		R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

TSCCAU[7:0] Bits (TS Descriptor Chain s Current Address Upper Part)

[Update conditions]

- SW: Writing to this field with update it to the write value.
- HW: When an FEMPTY_ND descriptor is read for descriptor queue s, this field value is automatically updated to the next descriptor address upper part.
- HW: When a LINK or LINKFIX descriptor is read, this register value is updated to DESCR.PTR[39:32].

[Restriction]

- SW: To overwrite the current address, GWTDCACs0 and GWTDCACs1 should always both be written starting by GWTDCACs1 and finishing by GWTDCACs0.

38.2.6.2 Timestamp Descriptor Chain s Address Configuration Register 1 (GWTDCACs1) (s = 0, 1)

Address(es): GWCA0.GWTDCAC01 874C E144h, GWCA0.GWTDCAC11 874C E14Ch, GWCA0_NS.GWTDCAC01 074C E144h, GWCA0_NS.GWTDCAC11 074C E14Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TSCCAL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSCCAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TSCCAL[31:0]	TS Descriptor Chain s Current Address Lower Part		R/W

TSCCAL[31:0] Bits (TS Descriptor Chain s Current Address Lower Part)

[Update conditions]

- SW: Writing GWTDCACs0 register with update this field to the previous value written on it by the same APB.
- HW: When an FEMPTY_ND descriptor is read for descriptor queue s, this field value is automatically updated to the next descriptor address lower part.
- HW: When a LINK or LINKFIX descriptor is read, this register value is updated to DESCR.PTR[31:0].

[Restriction]

- SW: To overwrite the current address, GWTDCACs0 and GWTDCACs1 should always both be written starting by GWTDCACs1 and finishing by GWTDCACs0.

38.2.6.3 Timestamp Descriptor Chain s Configuration Register (GWTSDCCs) (s = 0, 1)

Address(es): GWCA0.GWTSDCC0 874C E160h, GWCA0.GWTSDCC1 874C E164h, GWCA0_NS.GWTSDCC0 074C E160h, GWCA0_NS.GWTSDCC1 074C E164h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	OSID[2:0]			—	—	—	—	—	—	DCS	TE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TE	Timer Enable	Enable timestamp reception for timestamps taken with timer s.	R/W
b1	DCS	Descriptor Chain Select	Select to which chain timestamps taken with timer s will be received.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b10 to b8	OSID[2:0]	OS ID	When a memory access is done for timer number s, the OSID set in this register will be used.	R/W
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R

TE Bit (Timer Enable)

[Restriction]

- HW: If a timestamp is received from RMAC for a timer which is disabled for timestamp reception, the timestamp will be ignored and lost. This is a valid setting (another GWCA could have taken the timestamp) so there is no flag to monitor this event.

38.2.6.4 Timestamp Number Monitoring Register (GWTSNM)

Address(es): GWCA0.GWTSNM 874C E180h, GWCA0_NS.GWTSNM 074C E180h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	TNTR[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	TNTR[4:0]	Timestamp Number in Timestamp RAM		R
b31 to b5	—	Reserved	These bits are read as 0.	R

TNTR[4:0] Bits (Timestamp Number in Timestamp RAM)

[Increment condition]

- HW: Incremented by 1 when a timestamp is received from an Ethernet Agent.

[Decrement condition]

- HW: Decremented by 1 when a timestamp is read from timestamp RAM.

38.2.6.5 Timestamp Maximum Number Monitoring Register (GWTSMNM)

Address(es): GWCA0.GWTSMNM 874C E184h, GWCA0_NS.GWTSMNM 074C E184h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	TMNTR[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	TMNTR[4:0]	Timestamp Maximum Number in Timestamp RAM		R
b31 to b5	—	Reserved	These bits are read as 0.	R

TMNTR[4:0] Bits (Timestamp Maximum Number in Timestamp RAM)

[Update condition]

- HW: Set to GWTSNM.TNTR[4:0] when GWTSNM.TNTR[4:0] > GWTSNM.TMNTR[4:0].

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clear it to GWTSNM.TNTR[4:0] value.

38.2.7 AXI Master Registers

38.2.7.1 AXI Control Register (GWAC)

Address(es): GWCA0.GWAC 874C E190h, GWCA0_NS.GWAC 074C E190h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AMP	AMPR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	AMPR	AXI Master Pause Request	0: AXI master pause not requested 1: AXI master pause requested	R/W
b1	AMP	AXI Master Paused	0: AXI master not paused (transaction ongoing) 1: AXI master paused (no transaction ongoing)	R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

AMPR Bit (AXI Master Pause Request)

This register blocks the AXI master from making new accesses (because the AXI master has register slices for timing purpose few AXI accesses can be emitted before stopping).

AMP Bit (AXI Master Paused)

“AXI Master Pause” stop only the final processing of the AXI interface. (Internal processing cannot be stopped.) For example, the AXI address for chain [i] is loaded immediately before “AXI Master Paused”. This address will used after “AXI Master not paused” regardless of AXI address re-configuration (by GWDCCi) during “AXI Master Pause”.

[Setting condition]

- HW: When GWAC.AMPR is set to 1 and all ongoing AXI transactions are completed, this bit will be set.

[Clearing condition]

- HW: When GWAC.AMPR is set to 0, this bit will be set to 0 (it can take time because of asynchronous modules).

38.2.7.2 Descriptor Chain Base Address Configuration Register 0 (GWDCBAC0)

Address(es): GWCA0.GWDCBAC0 874C E194h, GWCA0_NS.GWDCBAC0 074C E194h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	DCBAU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	DCBAU[7:0]	Descriptor Chain Base Address Upper Part		R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R

DCBAU[7:0] Bits (Descriptor Chain Base Address Upper Part)

For further setting information, refer to (1) LINKFIX Table Initialization in section 38.3.1.3, LINKFIX Table.

38.2.7.3 Descriptor Chain Base Address Configuration Register 1 (GWDCBAC1)

Address(es): GWCA0.GWDCBAC1 874C E198h, GWCA0_NS.GWDCBAC1 074C E198h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DCBAL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DCBAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	DCBAL[31:0]	Descriptor Chain Base Address Lower Part		R/W

DCBAL[30:0] Bits (Descriptor Chain Base Address Lower Part)

For further setting information, refer to (1) LINKFIX Table Initialization in section 38.3.1.3, LINKFIX Table.

38.2.7.4 Maximum Descriptor Number Configuration Register (GWMDNC)

Address(es): GWCA0.GWMDNC 874C E1A0h, GWCA0_NS.GWMDNC 074C E1A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSDMN[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TXDMN[4:0]					—	—	—	RXDMN[4:0]				
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b4 to b0	RXDMN[4:0]	RX Descriptor Maximum Number	Configures the maximum number of descriptors that can be processed at once for an RX queue (it limits to GWMDNC.RXDMN[4:0] + 1 the number of descriptors read that can be done for an RX frame). Refer to the GWEIS5.RXDNES flag explanation.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R
b12 to b8	TXDMN[4:0]	TX Descriptor Maximum Number	Configures the maximum number of descriptors that can be processed at once for a TX queue (it limits to GWMDNC.TXDMN[4:0] + 1 the number of descriptors read that can be done for a TX frame). Refer to the GWEIS0.TXDNES flag explanation.	R/W
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R
b17, b16	TSDMN[1:0]	Timestamp Descriptor Maximum Number	Configures the maximum number of descriptors that can be processed at once for a TS queue (it limits to GWMDNC.TSDMN[1:0] + 1 the number of descriptors read that can be done for a timestamp). Refer to the GWEIS0.TSDNESi (i = 0, 1) flag explanation.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

RXDMN[4:0] Bits (RX Descriptor Maximum Number)

[Caution]

- SW: This maximum descriptor number takes in account all descriptors including LINK, LINKFIX descriptors and descriptors remaining from a previous error frame like FMID_EMPTY and FEND_EMPTY descriptors. It should be taken in account while setting this register.

TXDMN[4:0] Bits (TX Descriptor Maximum Number)

[Restriction]

- SW: The switch maximum input frame size is 60 Kbytes so this register should be set to a value less than or equal to 30. To avoid any unexpected frame loss due to this register, any software sending frames larger than 58 Kbytes should avoid having more than one consecutive LINK/LINKFIX descriptor in a descriptor chain.

[Caution]

- SW: This maximum descriptor number takes in account all descriptors including LINK, LINKFIX descriptors and descriptors remaining from a previous error frame like FMID and FEND descriptors. It should be taken in account while setting this register.

38.2.7.5 Transmission Request Configuration Register i (GWTRCi) (i = 0, 1)

- GWCA0.GWTRC0

Address(es): GWCA0.GWTRC0 874C E200h, GWCA0_NS.GWTRC0 074C E200h

TSRt Bit (Transmission Start Request t) (t = 0 to 63)

This bit is used to start transfer from CPU to switch for its corresponding TX queue.

[Setting conditions (only for TX queues)]

- SW: Writing 1 to this bit will set this bit set if queue t is a transmission queue (GWDCCi.DQT is set).
- HW: A transmission request received through INTER_TX[t] interface will set this bit if queue t is a transmission queue (GWDCCi.DQT is set).

[Clearing conditions]

- HW: When HW read a descriptor other than FSINGLE, FSTART, FMID, FEND, LINK and LINKFIX.
- HW: When an AXI error occurs while reading a descriptor in the corresponding AXI descriptor queue.
- When a descriptor number error occurs while reading the corresponding AXI descriptor queue.
- HW: Going out of OPERATION mode will clear this register.

[Restriction]

- HW: For RX queues, this bit cannot be set.

38.2.7.6 Transmission Pause Configuration Register p (GWTPCp) (p = 0, 1)

Address(es): GWCA0.GWTPC0 874C E300h, GWCA0.GWTPC1 874C E304h,
GWCA0_NS.GWTPC0 074C E300h, GWCA0_NS.GWTPC1 074C E304h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	PPPL7	PPPL6	PPPL5	PPPL4	PPPL3	PPPL2	PPPL1	PPPL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PPPL0	Per Priority Pause Level 0	0: Transmission queues with their priority GWDCCi.DCP[2:0] set to i are not paused when pause level p is set (PAUSE[2 for GWCA0][p] is set [COMA]) 1: Transmission queues with the priority GWDCCi.DCP[2:0] set to i are paused when pause level p is set (PAUSE[2 for GWCA0][p] is set [COMA]) (i = 0 to 7) (p = 0, 1)	R/W
b1	PPPL1	Per Priority Pause Level 1		R/W
b2	PPPL2	Per Priority Pause Level 2		R/W
b3	PPPL3	Per Priority Pause Level 3		R/W
b4	PPPL4	Per Priority Pause Level 4		R/W
b5	PPPL5	Per Priority Pause Level 5		R/W
b6	PPPL6	Per Priority Pause Level 6		R/W
b7	PPPL7	Per Priority Pause Level 7		R/W
b31 to b8	—	Reserved	This bit is read as 0. The write value should be 0.	R

38.2.7.7 AXI RAM Initialization Register Monitoring Register (GWARIRM)

Address(es): GWCA0.GWARIRM 874C E380h, GWCA0_NS.GWARIRM 074C E380h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARR	ARIOG
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	ARIOG	AXI RAM Initialization Ongoing		R/W
b1	ARR	AXI RAM Ready		R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

ARIOG Bit (AXI RAM Initialization Ongoing)

[Setting condition]

- SW: By writing 1 to this bit. It starts AXI RAM initialization.

[Clearing condition]

- HW: This bit is cleared when AXI RAM initialization is finished.
  Min clk_period × 64 = [exp] 4 × 64 = 256 ns

ARR Bit (AXI RAM Ready)

[Setting condition]

- When GWARIRM.ARIOG is getting cleared.

[Clearing condition]

- By writing 1 to GWARIRM.ARIOG.

38.2.7.8 Descriptor Chain i Configuration Register (GWDCCi) (i = 0 to 63)

Address(es): GWCA0.GWDCC0 874C E400h, GWCA0.GWDCC1 874C E404h, GWCA0.GWDCC2 874C E408h, GWCA0.GWDCC3 874C E40Ch, GWCA0.GWDCC4 874C E410h, GWCA0.GWDCC5 874C E414h, GWCA0.GWDCC6 874C E418h, GWCA0.GWDCC7 874C E41Ch, GWCA0.GWDCC8 874C E420h, GWCA0.GWDCC9 874C E424h, GWCA0.GWDCC10 874C E428h, GWCA0.GWDCC11 874C E42Ch, GWCA0.GWDCC12 874C E430h, GWCA0.GWDCC13 874C E434h, GWCA0.GWDCC14 874C E438h, GWCA0.GWDCC15 874C E43Ch, GWCA0.GWDCC16 874C E440h, GWCA0.GWDCC17 874C E444h, GWCA0.GWDCC18 874C E448h, GWCA0.GWDCC19 874C E44Ch, GWCA0.GWDCC20 874C E450h, GWCA0.GWDCC21 874C E454h, GWCA0.GWDCC22 874C E458h, GWCA0.GWDCC23 874C E45Ch, GWCA0.GWDCC24 874C E460h, GWCA0.GWDCC25 874C E464h, GWCA0.GWDCC26 874C E468h, GWCA0.GWDCC27 874C E46Ch, GWCA0.GWDCC28 874C E470h, GWCA0.GWDCC29 874C E474h, GWCA0.GWDCC30 874C E478h, GWCA0.GWDCC31 874C E47Ch, GWCA0.GWDCC32 874C E480h, GWCA0.GWDCC33 874C E484h, GWCA0.GWDCC34 874C E488h, GWCA0.GWDCC35 874C E48Ch, GWCA0.GWDCC36 874C E490h, GWCA0.GWDCC37 874C E494h, GWCA0.GWDCC38 874C E498h, GWCA0.GWDCC39 874C E49Ch, GWCA0.GWDCC40 874C E4A0h, GWCA0.GWDCC41 874C E4A4h, GWCA0.GWDCC42 874C E4A8h, GWCA0.GWDCC43 874C E4ACh, GWCA0.GWDCC44 874C E4B0h, GWCA0.GWDCC45 874C E4B4h, GWCA0.GWDCC46 874C E4B8h, GWCA0.GWDCC47 874C E4BCh, GWCA0.GWDCC48 874C E4C0h, GWCA0.GWDCC49 874C E4C4h, GWCA0.GWDCC50 874C E4C8h, GWCA0.GWDCC51 874C E4CCh, GWCA0.GWDCC52 874C E4D0h, GWCA0.GWDCC53 874C E4D4h, GWCA0.GWDCC54 874C E4D8h, GWCA0.GWDCC55 874C E4DCh, GWCA0.GWDCC56 874C E4E0h, GWCA0.GWDCC57 874C E4E4h, GWCA0.GWDCC58 874C E4E8h, GWCA0.GWDCC59 874C E4ECh, GWCA0.GWDCC60 874C E4F0h, GWCA0.GWDCC61 874C E4F4h, GWCA0.GWDCC62 874C E4F8h, GWCA0.GWDCC63 874C E4FCh,
GWCA0_NS.GWDCC0 074C E400h, GWCA0_NS.GWDCC1 074C E404h, GWCA0_NS.GWDCC2 074C E408h, GWCA0_NS.GWDCC3 074C E40Ch, GWCA0_NS.GWDCC4 074C E410h, GWCA0_NS.GWDCC5 074C E414h, GWCA0_NS.GWDCC6 074C E418h, GWCA0_NS.GWDCC7 074C E41Ch, GWCA0_NS.GWDCC8 074C E420h, GWCA0_NS.GWDCC9 074C E424h, GWCA0_NS.GWDCC10 074C E428h, GWCA0_NS.GWDCC11 074C E42Ch, GWCA0_NS.GWDCC12 074C E430h, GWCA0_NS.GWDCC13 074C E434h, GWCA0_NS.GWDCC14 074C E438h, GWCA0_NS.GWDCC15 074C E43Ch, GWCA0_NS.GWDCC16 074C E440h, GWCA0_NS.GWDCC17 074C E444h, GWCA0_NS.GWDCC18 074C E448h, GWCA0_NS.GWDCC19 074C E44Ch, GWCA0_NS.GWDCC20 074C E450h, GWCA0_NS.GWDCC21 074C E454h, GWCA0_NS.GWDCC22 074C E458h, GWCA0_NS.GWDCC23 074C E45Ch, GWCA0_NS.GWDCC24 074C E460h, GWCA0_NS.GWDCC25 074C E464h, GWCA0_NS.GWDCC26 074C E468h, GWCA0_NS.GWDCC27 074C E46Ch, GWCA0_NS.GWDCC28 074C E470h, GWCA0_NS.GWDCC29 074C E474h, GWCA0_NS.GWDCC30 074C E478h, GWCA0_NS.GWDCC31 074C E47Ch, GWCA0_NS.GWDCC32 074C E480h, GWCA0_NS.GWDCC33 074C E484h, GWCA0_NS.GWDCC34 074C E488h, GWCA0_NS.GWDCC35 074C E48Ch, GWCA0_NS.GWDCC36 074C E490h, GWCA0_NS.GWDCC37 074C E494h, GWCA0_NS.GWDCC38 074C E498h, GWCA0_NS.GWDCC39 074C E49Ch, GWCA0_NS.GWDCC40 074C E4A0h, GWCA0_NS.GWDCC41 074C E4A4h, GWCA0_NS.GWDCC42 074C E4A8h, GWCA0_NS.GWDCC43 074C E4ACh, GWCA0_NS.GWDCC44 074C E4B0h, GWCA0_NS.GWDCC45 074C E4B4h, GWCA0_NS.GWDCC46 074C E4B8h, GWCA0_NS.GWDCC47 074C E4BCh, GWCA0_NS.GWDCC48 074C E4C0h, GWCA0_NS.GWDCC49 074C E4C4h, GWCA0_NS.GWDCC50 074C E4C8h, GWCA0_NS.GWDCC51 074C E4CCh, GWCA0_NS.GWDCC52 074C E4D0h, GWCA0_NS.GWDCC53 074C E4D4h, GWCA0_NS.GWDCC54 074C E4D8h, GWCA0_NS.GWDCC55 074C E4DCh, GWCA0_NS.GWDCC56 074C E4E0h, GWCA0_NS.GWDCC57 074C E4E4h, GWCA0_NS.GWDCC58 074C E4E8h, GWCA0_NS.GWDCC59 074C E4ECh, GWCA0_NS.GWDCC60 074C E4F0h, GWCA0_NS.GWDCC61 074C E4F4h, GWCA0_NS.GWDCC62 074C E4F8h, GWCA0_NS.GWDCC63 074C E4FCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	OSID[2:0]			—	—	—	BALR	—	—	—	—	—	DCP[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	DQT	SL	ETS	EDE	—	—	—	—	—	—	SM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	SM[1:0]	Synchronization Mode	b1 b0 0 0: Normal mode (full descriptor write back) 0 1: No-write-back mode (no descriptor write back) 1 0: Keep-DT mode (no update of DT field at descriptor write back) 1 1: Reserved	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b8	EDE	Extended Descriptor Enable	0: Basic Descriptor 1: Extended Descriptor	R/W
b9	ETS	Enable Timestamp Storage	0: Timestamp is not added in the Descriptor. 1: Timestamp is added in the Descriptor.	R/W
b10	SL	Security Level	0: Chain i unsecure 1: Chain i secure	R/W
b11	DQT	Descriptor Queue Type	0: Descriptor queue i is a reception queue. 1: Descriptor queue i is a transmission queue.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b18 to b16	DCP[2:0]	Descriptor Chain Priority	b18 b16 0 0 0: lowest priority : 1 1 1: highest priority	R/W
b23 to b19	—	Reserved	These bits are read as 0. The write value should be 0.	R
b24	BALR	Base Address Load Request	This bit is used to reset current_address field in the AXI address RAM to {{GWDCBAC0.DCBAU[7:0], GWDCBAC1.DCBAL[31:0]} + i*8}	R/W
b27 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R
b30 to b28	OSID[2:0]	OS ID	When a memory access is done for descriptor queue number i the OSID set in this register will be used.	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R

ETS Bit (Enable Timestamp Storage)

[Restriction]

- HW: This bit is only valid for RX queues.

SL Bit (Security Level)

When a chain is secured, an unsecure descriptor cannot enter it (when a descriptor is received from forwarding engine [MFWD] with FDESCR.SEC equal to 0).

[Restriction]

- HW: This bit is only valid for RX queues.

DCP[2:0] Bits (Descriptor Chain Priority)

[Restrictions]

- HW: These bits are only valid for TX queues.
- SW: These bits value should not be changed for a TX queue when GWTRCi.TSRj is set. (When transmission is ongoing for the corresponding queue.)

BALR Bit (Base Address Load Request)

[Setting condition]

- SW: Writing 1 to this bit will set it.

[Clearing condition]

- HW: This bit will be cleared when the current_address field in the AXI address RAM is reset.

38.2.7.9 AXI Address RAM Searching Setting Register (GWAARSS)

Address(es): GWCA0.GWAARSS 874C E800h, GWCA0_NS.GWAARSS 074C E800h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	AARA[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	AARA[5:0]	AXI Address RAM Address	This register is used to read the current address used in AXI master for GWAARSS.AARA[5:0] descriptor queue.	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R

AARA[5:0] Bits (AXI Address RAM Address)

[Restriction]

- HW: Due to the pipeline architecture of the AXI master, the AXI read can just give an idea of which address is processing the AXI master and is not precise enough to be used for HW/SW synchronization. This register is only here for debug purpose.

38.2.7.10 AXI Address RAM Searching Result Register 0 (GWAARSR0)

Address(es): GWCA0.GWAARSR0 874C E804h, GWCA0_NS.GWAARSR0 074C E804h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	AARS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ACARU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	ACARU[7:0]	AXI Current Address Result Upper Part	Displays AXI address read value.	R
b30 to b8	—	Reserved	These bits are read as 0.	R
b31	AARS	AXI Address RAM Searching	This bit is used to read an AXI address RAM.	R

ACARU[7:0] Bits (AXI Current Address Result Upper Part)

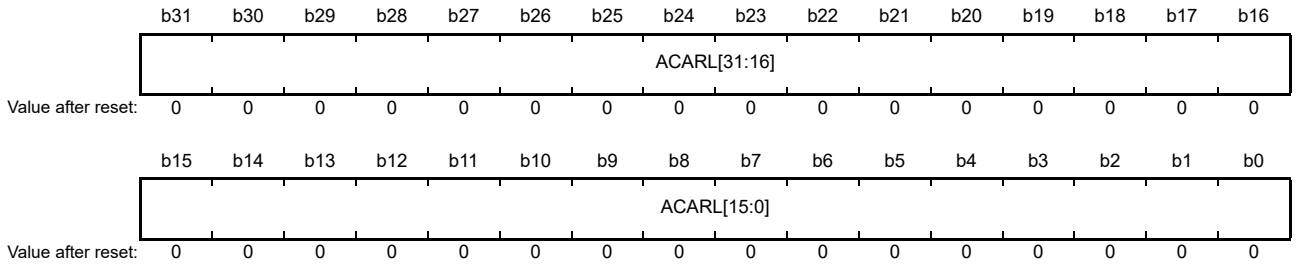
[Update condition]

- HW: GWAARSR0.AARS clear event.

Note: AXI address read will not restart from the base address of chain after RESET mode (because being in RESET mode will not clear this register).

AARS Bit (AXI Address RAM Searching)

[Setting condition]



- SW: Writing GWAARSS will set this bit.

[Clearing condition]

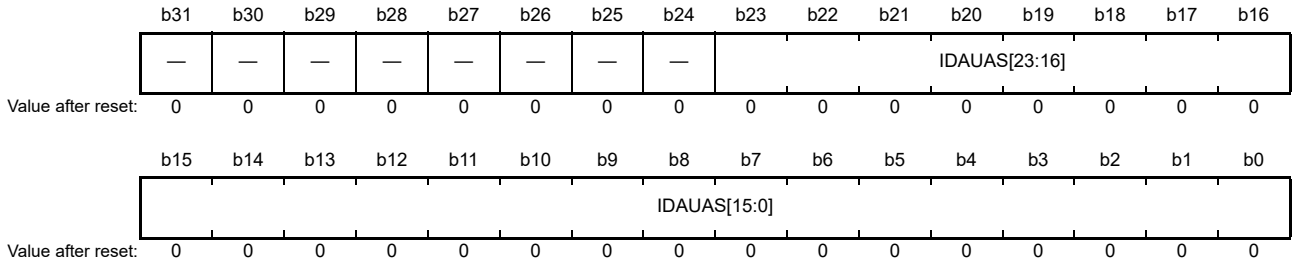
- HW: This bit will be de-asserted when the AXI address RAM search is completed.

38.2.7.11 AXI Address RAM Searching Result Register 1 (GWAARSR1)

Address(es): GWCA0.GWAARSR1 874C E808h, GWCA0_NS.GWAARSR1 074C E808h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	ACARL[31:0]	AXI Current Address Result Lower Part	Displays AXI address read value.	R

ACARL[31:0] Bits (AXI Current Address Result Lower Part)



[Update condition]

- HW: GWAARSR0.AARS clear event.

Note: AXI address read will not restart from the base address of chain after RESET mode (because being in RESET mode will not clear this register).

38.2.7.12 Incremental Data Area i Used Area Size Register (GWIDAUASi) (i = 0 to 3)

Address(es): GWCA0.GWIDAUAS0 874C E840h, GWCA0.GWIDAUAS1 874C E844h, GWCA0.GWIDAUAS2 874C E848h, GWCA0.GWIDAUAS3 874C E84Ch,
GWCA0_NS.GWIDAUAS0 074C E840h, GWCA0_NS.GWIDAUAS1 074C E844h, GWCA0_NS.GWIDAUAS2 074C E848h, GWCA0_NS.GWIDAUAS3 074C E84Ch

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	IDAUAS[23:0]	Incremental Data Area Used Size of RX Descriptor Chain i	Represents the byte numbers that have been used in the corresponding incremental area.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

IDAUAS[23:0] Bits (Incremental Data Area Used Size of RX Descriptor Chain i)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- HW: When a FEMPTY_IS descriptor is read in the corresponding descriptor queue, these bits get cleared.

[Increment condition]

- HW: When a frame has been stored in the corresponding incremental area, these bits are incremented by the frame size.

[Decrement condition]

- SW: By writing a value, SW will decrement these bits by this value.

[Restriction]

- SW: These bits should always write a value smaller than the current register value.

38.2.7.13 Incremental Data Area i Size Monitoring Register (GWIDASMi) (i = 0 to 3)

Address(es): GWCA0.GWIDASM0 874C E880h, GWCA0.GWIDASM1 874C E884h, GWCA0.GWIDASM2 874C E888h, GWCA0.GWIDASM3 874C E88Ch,
GWCA0_NS.GWIDASM0 074C E880h, GWCA0_NS.GWIDASM1 074C E884h, GWCA0_NS.GWIDASM2 074C E888h, GWCA0_NS.GWIDASM3 074C E88Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	IDAS[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	IDAS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	IDAS[23:0]	Incremental Data Area Size of RX Descriptor Chain i	This register indicates the size of RX descriptor chain i incremental area in bytes.	R
b31 to b24	—	Reserved	These bits are read as 0.	R

IDAS[23:0] Bits (Incremental Data Area Size of RX Descriptor Chain i)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.

[Update condition]

- HW: When a FEMPTY_IS descriptor is read in the corresponding descriptor queue, these bits are update to DESCR.DS*4096.

38.2.7.14 Incremental Data Area i Start Address Monitoring Register 0 (GWIDASAMi0) (i = 0 to 3)

Address(es): GWCA0.GWIDASAM00 874C E900h, GWCA0.GWIDASAM10 874C E908h, GWCA0.GWIDASAM20 874C E910h, GWCA0.GWIDASAM30 874C E918h,
GWCA0_NS.GWIDASAM00 074C E900h, GWCA0_NS.GWIDASAM10 074C E908h, GWCA0_NS.GWIDASAM20 074C E910h, GWCA0_NS.GWIDASAM30 074C E918h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	IDASAU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	IDASAU[7:0]	Incremental Data Area Start Address Upper Part of RX Descriptor Chain i		R
b31 to b8	—	Reserved	These bits are read as 0.	R

IDASAU[7:0] Bits (Incremental Data Area Start Address Upper Part of RX Descriptor Chain i)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.

[Update condition]

- HW: When a FEMPTY_IS descriptor is read in the corresponding descriptor queue, these bits are update to DESCR.PTR[39:32].

38.2.7.15 Incremental Data Area i Start Address Monitoring Register 1 (GWIDASAMi1) (i = 0 to 3)

Address(es): GWCA0.GWIDASAM01 874C E904h, GWCA0.GWIDASAM11 874C E90Ch, GWCA0.GWIDASAM21 874C E914h, GWCA0.GWIDASAM31 874C E91Ch, GWCA0_NS.GWIDASAM01 074C E904h, GWCA0_NS.GWIDASAM11 074C E90Ch, GWCA0_NS.GWIDASAM21 074C E914h, GWCA0_NS.GWIDASAM31 074C E91Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	IDASAL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	IDASAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	IDASAL[31:0]	Incremental Data Area Start Address Lower Part of RX Descriptor Chain i		R

IDASAL[31:0] Bits (Incremental Data Area Start Address Lower Part of RX Descriptor Chain i)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.

[Update condition]

- HW: When a FEMPTY_IS descriptor is read in the corresponding descriptor queue, these bits are update to DESCR.PTR[31:0].

38.2.7.16 Incremental Data Area i Current Address Monitoring Register 0 (GWIDACAMi0) (i = 0 to 3)

Address(es): GWCA0.GWIDACAM00 874C E980h, GWCA0.GWIDACAM10 874C E988h, GWCA0.GWIDACAM20 874C E990h, GWCA0.GWIDACAM30 874C E998h,
GWCA0_NS.GWIDACAM00 074C E980h, GWCA0_NS.GWIDACAM10 074C E988h, GWCA0_NS.GWIDACAM20 074C E990h, GWCA0_NS.GWIDACAM30 074C E998h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	IDACAU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	IDACAU[7:0]	Incremental Data Area Current Address Upper Part of RX Descriptor Chain i		R
b31 to b8	—	Reserved	These bits are read as 0.	R

IDACAU[7:0] Bits (Incremental Data Area Current Address Upper Part of RX Descriptor Chain i)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.

[Update conditions]

- HW: When a FEMPTY_IS descriptor is read in the corresponding descriptor queue, these bits are update to DESCR.PTR[39:32].
- HW: When a burst is decided to be sent in the incremental area, {GWIDACAMi0.IDACAU[7:0], GWIDACAMi1.IDACAL[31:0]} is incremented by the burst size.
- HW: {GWIDACAMi0.IDACAU[7:0], GWIDACAMi1.IDACAL[31:0]} overflows at {GWIDASAMi0.IDASAU[7:0], GWIDASAMi1.IDASAL[31:0]} + GWIDASMi.IDAS[23:0] – 1.

38.2.7.17 Incremental Data Area i Current Address Monitoring Register 1 (GWIDACAMi1) (i = 0 to 3)

Address(es): GWCA0.GWIDACAM01 874C E984h, GWCA0.GWIDACAM11 874C E98Ch, GWCA0.GWIDACAM21 874C E994h, GWCA0.GWIDACAM31 874C E99Ch,
GWCA0_NS.GWIDACAM01 074C E984h, GWCA0_NS.GWIDACAM11 074C E98Ch, GWCA0_NS.GWIDACAM21 074C E994h, GWCA0_NS.GWIDACAM31 074C E99Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	IDACAL[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	IDACAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	IDACAL[31:0]	Incremental Data Area Current Address Lower Part of RX Descriptor Chain i		R

IDACAL[31:0] Bits (Incremental Data Area Current Address Lower Part of RX Descriptor Chain i)

[Clearing condition]

- HW: Being in RESET mode will clear this register.

[Update conditions]

- HW: When a FEMPTY_IS descriptor is read in the corresponding descriptor queue, this register is update to DESCR.PTR[31:0].
- HW: When a burst is decided to be sent in the incremental area, {GWIDACAMi0.IDACAU[7:0], GWIDACAMi1.IDACAL[31:0]} is incremented by the burst size.
- HW: {GWIDACAMi0.IDACAU[7:0], GWIDACAMi1.IDACAL[31:0]} overflows at {GWIDASAMi0.IDASAU[7:0], GWIDASAMi1.IDASAL[31:0]} + GWIDASMi.IDAS[23:0] – 1.

38.2.8 Rate Limiter Function Registers

38.2.8.1 Global Rate Limiter Configuration Register (GWGRLC)

Address(es): GWCA0.GWGRLC 874C EA00h, GWCA0_NS.GWGRLC 074C EA00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GRLULRS	GRLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GRLIV[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	GRLIV[15:0]	Global Rate Limiter Incremental Value		R/W
b16	GRLE	Global Rate Limiter Enable	0: Global Rate limiter disabled 1: Global Rate limiter enabled	R/W
b17	GRLULRS	Global Rate Limiter Upper Limit Reached Status Flag		R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

GRLIV[15:0] Bits (Global Rate Limiter Incremental Value)

For further setting information refer to (2) Rate Limiters in section 38.3.2.1, TX Queue Arbitration.

[Caution]

- SW: Setting this register to 0 or a value close to 0 would set GWCA to a very low throughput or could stuck GWCA in transmission.

GRLE Bit (Global Rate Limiter Enable)

The global rate limiter limits the throughput through all TX queues to avoid the switch to take in too much data at once.

GRLULRS Flag (Global Rate Limiter Upper Limit Reached Status Flag)

If this flag gets set when only the global rate limiter is enabled (per port rate limiters disabled), it means that the AXI master is too slow to provide the throughput set in the global rate limiter or that the AXI latency has been underestimated.

This flag can get set while using per port rate limiters. In this case it should be ignored.

[Setting condition]

- HW: When the global rate limit reaches its upper limit GWGRLULC.GRLUL[23:0], this flag gets set.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it

38.2.8.2 Global Rate Limiter Upper Limit Configuration Register (GWGRLULC)

Address(es): GWCA0.GWGRLULC 874C EA04h, GWCA0_NS.GWGRLULC 074C EA04h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	GRLUL[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GRLUL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	GRLUL[23:0]	Global Rate Limiter Upper Limit	Set the maximum number of credits in bit rate limiter that can accumulate before stopping.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

GRLUL[23:0] Bits (Global Rate Limiter Upper Limit)

For further setting information refer to (2) Rate Limiters in section 38.3.2.1, TX Queue Arbitration.

[Restriction]

- SW: These bits should not be set to a value bigger than 800000h.

38.2.8.3 Rate Limiter i Configuration Register (GWRLCi) (i = 0 to 7)

Address(es): GWCA0.GWRLC0 874C EA80h, GWCA0.GWRLC1 874C EA88h, GWCA0.GWRLC2 874C EA90h, GWCA0.GWRLC3 874C EA98h, GWCA0.GWRLC4 874C EAA0h, GWCA0.GWRLC5 874C EAA8h, GWCA0.GWRLC6 874C EAB0h, GWCA0.GWRLC7 874C EAB8h, GWCA0_NS.GWRLC0 074C EA80h, GWCA0_NS.GWRLC1 074C EA88h, GWCA0_NS.GWRLC2 074C EA90h, GWCA0_NS.GWRLC3 074C EA98h, GWCA0_NS.GWRLC4 074C EAA0h, GWCA0_NS.GWRLC5 074C EAA8h, GWCA0_NS.GWRLC6 074C EAB0h, GWCA0_NS.GWRLC7 074C EAB8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	RLIV[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	RLIV[11:0]	Rate Limiter Incremental Value		R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RLE	Rate Limiter Enable	0: Rate limiter i disabled 1: Rate limiter i enabled	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R

GRLUL[23:0] Bits (Rate Limiter Incremental Value)

For further setting information refer to (2) Rate Limiters in section 38.3.2.1, TX Queue Arbitration.

[Caution]

- SW: Setting these bits to 0 or a value close to 0 would set corresponding queue to a very low throughput or could stuck the corresponding queue.

RLE Bit (Rate Limiter Enable)

Rate limiter i limit the through put for AXI descriptor queue number 63-I. For details, refer to section 38.3.1.1, AXI Descriptor Queue Mapping.

38.2.8.4 Rate Limiter i Upper Limit Configuration Register (GWRLULCi) (i = 0 to 7)

Address(es): GWCA0.GWRLULC0 874C EA84h, GWCA0.GWRLULC1 874C EA8Ch, GWCA0.GWRLULC2 874C EA94h, GWCA0.GWRLULC3 874C EA9Ch, GWCA0.GWRLULC4 874C EAA4h, GWCA0.GWRLULC5 874C EAACh, GWCA0.GWRLULC6 874C EAB4h, GWCA0.GWRLULC7 874C EABCh, GWCA0_NS.GWRLULC0 074C EA84h, GWCA0_NS.GWRLULC1 074C EA8Ch, GWCA0_NS.GWRLULC2 074C EA94h, GWCA0_NS.GWRLULC3 074C EA9Ch, GWCA0_NS.GWRLULC4 074C EAA4h, GWCA0_NS.GWRLULC5 074C EAACh, GWCA0_NS.GWRLULC6 074C EAB4h, GWCA0_NS.GWRLULC7 074C EABCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	RLUL[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RLUL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b23 to b0	RLUL[23:0]	Rate Limiter Upper Limit	Set the maximum number of credits in bit rate limiter i can accumulate before stopping.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

RLUL[23:0] Bits (Rate Limiter Upper Limit)

These bits can be used if a lot of traffic happens on the AXI bus so burst on queues i make the switch overflow. If not required, set this register to 800000h.

For further setting information refer to (2) Rate Limiters in section 38.3.2.1, TX Queue Arbitration.

[Restriction]

- SW: These bits should not be set to a value bigger than 800000h.

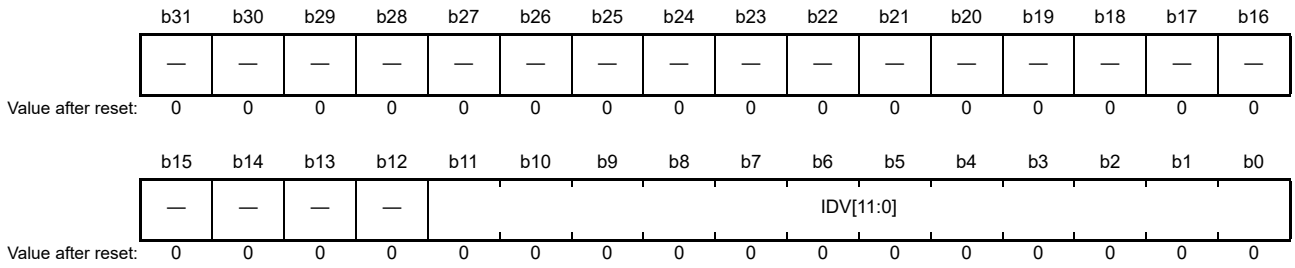
38.2.9 Interrupt Function Registers

38.2.9.1 Interrupt Delay Prescaler Configuration Register (GWIDPC)

Address(es): GWCA0.GWIDPC 874C EB80h, GWCA0_NS.GWIDPC 074C EB80h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	IDPV[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



Bit	Symbol	Bit Name	Description	R/W
b9 to b0	IDPV[9:0]	Interrupt Delay Prescaler Value	This register is used to create an internal clock.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

IDPV[9:0] Bits (Interrupt Delay Prescaler Value)

This internal clock period will be clk_delay_period = clk_period*(GWIDPC.IDPV[9:0] + 1) where clk_period is the period of clk. For further information, refer to section 38.3.6, Interrupt Delay Function.

38.2.9.2 Interrupt Delay Configuration Register (GWIDCi) (i = 0 to 63)

Address(es): GWCA0.GWIDC0 874C EC00h, GWCA0.GWIDC1 874C EC04h, GWCA0.GWIDC2 874C EC08h, GWCA0.GWIDC3 874C EC0Ch, GWCA0.GWIDC4 874C EC10h, GWCA0.GWIDC5 874C EC14h, GWCA0.GWIDC6 874C EC18h, GWCA0.GWIDC7 874C EC1Ch, GWCA0.GWIDC8 874C EC20h, GWCA0.GWIDC9 874C EC24h, GWCA0.GWIDC10 874C EC28h, GWCA0.GWIDC11 874C EC2Ch, GWCA0.GWIDC12 874C EC30h, GWCA0.GWIDC13 874C EC34h, GWCA0.GWIDC14 874C EC38h, GWCA0.GWIDC15 874C EC3Ch, GWCA0.GWIDC16 874C EC40h, GWCA0.GWIDC17 874C EC44h, GWCA0.GWIDC18 874C EC48h, GWCA0.GWIDC19 874C EC4Ch, GWCA0.GWIDC20 874C EC50h, GWCA0.GWIDC21 874C EC54h, GWCA0.GWIDC22 874C EC58h, GWCA0.GWIDC23 874C EC5Ch, GWCA0.GWIDC24 874C EC60h, GWCA0.GWIDC25 874C EC64h, GWCA0.GWIDC26 874C EC68h, GWCA0.GWIDC27 874C EC6Ch, GWCA0.GWIDC28 874C EC70h, GWCA0.GWIDC29 874C EC74h, GWCA0.GWIDC30 874C EC78h, GWCA0.GWIDC31 874C EC7Ch, GWCA0.GWIDC32 874C EC80h, GWCA0.GWIDC33 874C EC84h, GWCA0.GWIDC34 874C EC88h, GWCA0.GWIDC35 874C EC8Ch, GWCA0.GWIDC36 874C EC90h, GWCA0.GWIDC37 874C EC94h, GWCA0.GWIDC38 874C EC98h, GWCA0.GWIDC39 874C EC9Ch, GWCA0.GWIDC40 874C ECA0h, GWCA0.GWIDC41 874C ECA4h, GWCA0.GWIDC42 874C ECA8h, GWCA0.GWIDC43 874C ECACh, GWCA0.GWIDC44 874C ECB0h, GWCA0.GWIDC45 874C ECB4h, GWCA0.GWIDC46 874C ECB8h, GWCA0.GWIDC47 874C ECBCh, GWCA0.GWIDC48 874C ECC0h, GWCA0.GWIDC49 874C ECC4h, GWCA0.GWIDC50 874C ECC8h, GWCA0.GWIDC51 874C ECCCh, GWCA0.GWIDC52 874C ECD0h, GWCA0.GWIDC53 874C ECD4h, GWCA0.GWIDC54 874C ECD8h, GWCA0.GWIDC55 874C ECDCh, GWCA0.GWIDC56 874C ECE0h, GWCA0.GWIDC57 874C ECE4h, GWCA0.GWIDC58 874C ECE8h, GWCA0.GWIDC59 874C ECECh, GWCA0.GWIDC60 874C ECF0h, GWCA0.GWIDC61 874C ECF4h, GWCA0.GWIDC62 874C ECF8h, GWCA0.GWIDC63 874C ECFCh, GWCA0_NS.GWIDC0 074C EC00h, GWCA0_NS.GWIDC1 074C EC04h, GWCA0_NS.GWIDC2 074C EC08h, GWCA0_NS.GWIDC3 074C EC0Ch, GWCA0_NS.GWIDC4 074C EC10h, GWCA0_NS.GWIDC5 074C EC14h, GWCA0_NS.GWIDC6 074C EC18h, GWCA0_NS.GWIDC7 074C EC1Ch, GWCA0_NS.GWIDC8 074C EC20h, GWCA0_NS.GWIDC9 074C EC24h, GWCA0_NS.GWIDC10 074C EC28h, GWCA0_NS.GWIDC11 074C EC2Ch, GWCA0_NS.GWIDC12 074C EC30h, GWCA0_NS.GWIDC13 074C EC34h, GWCA0_NS.GWIDC14 074C EC38h, GWCA0_NS.GWIDC15 074C EC3Ch, GWCA0_NS.GWIDC16 074C EC40h, GWCA0_NS.GWIDC17 074C EC44h, GWCA0_NS.GWIDC18 074C EC48h, GWCA0_NS.GWIDC19 074C EC4Ch, GWCA0_NS.GWIDC20 074C EC50h, GWCA0_NS.GWIDC21 074C EC54h, GWCA0_NS.GWIDC22 074C EC58h, GWCA0_NS.GWIDC23 074C EC5Ch, GWCA0_NS.GWIDC24 074C EC60h, GWCA0_NS.GWIDC25 074C EC64h, GWCA0_NS.GWIDC26 074C EC68h, GWCA0_NS.GWIDC27 074C EC6Ch, GWCA0_NS.GWIDC28 074C EC70h, GWCA0_NS.GWIDC29 074C EC74h, GWCA0_NS.GWIDC30 074C EC78h, GWCA0_NS.GWIDC31 074C EC7Ch, GWCA0_NS.GWIDC32 074C EC80h, GWCA0_NS.GWIDC33 074C EC84h, GWCA0_NS.GWIDC34 074C EC88h, GWCA0_NS.GWIDC35 074C EC8Ch, GWCA0_NS.GWIDC36 074C EC90h, GWCA0_NS.GWIDC37 074C EC94h, GWCA0_NS.GWIDC38 074C EC98h, GWCA0_NS.GWIDC39 074C EC9Ch, GWCA0_NS.GWIDC40 074C ECA0h, GWCA0_NS.GWIDC41 074C ECA4h, GWCA0_NS.GWIDC42 074C ECA8h, GWCA0_NS.GWIDC43 074C ECACh, GWCA0_NS.GWIDC44 074C ECB0h, GWCA0_NS.GWIDC45 074C ECB4h, GWCA0_NS.GWIDC46 074C ECB8h, GWCA0_NS.GWIDC47 074C ECBCh, GWCA0_NS.GWIDC48 074C ECC0h, GWCA0_NS.GWIDC49 074C ECC4h, GWCA0_NS.GWIDC50 074C ECC8h, GWCA0_NS.GWIDC51 074C ECCCh, GWCA0_NS.GWIDC52 074C ECD0h, GWCA0_NS.GWIDC53 074C ECD4h, GWCA0_NS.GWIDC54 074C ECD8h, GWCA0_NS.GWIDC55 074C ECDCh, GWCA0_NS.GWIDC56 074C ECE0h, GWCA0_NS.GWIDC57 074C ECE4h, GWCA0_NS.GWIDC58 074C ECE8h, GWCA0_NS.GWIDC59 074C ECECh, GWCA0_NS.GWIDC60 074C ECF0h, GWCA0_NS.GWIDC61 074C ECF4h, GWCA0_NS.GWIDC62 074C ECF8h, GWCA0_NS.GWIDC63 074C ECFCh

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	IDV[11:0]	Interrupt Delay Value	Configures the delay between the interrupt status flag GWDISi.DISt setting and the actual interrupt event in µs.	R/W
b31 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R

IDV[11:0] Bits (Interrupt Delay Value)

If these bits are set to 0, data interrupt will occur without delay.

If value X is set to this register, the interrupt will be delayed by a time between X-1*clk_delay_period µs and X*clk_delay_period µs where clk_delay_period is the internal clock created using GWIDPC register period.

For further information, refer to section 38.3.6, Interrupt Delay Function.

38.2.10 Counter Registers

38.2.10.1 Received Data Counter Register (GWRDCN)

Address(es): GWCA0.GWRDCN 874C F000h, GWCA0_NS.GWRDCN 074C F000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	RDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	RDN[31:0]	Received Data Number	These bits counts data that has been received by GWCA (data aborted by AXI error are accounted here).	R

RDN[31:0] Bits (Received Data Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a frame is passed from multicast control to AXI master interface and if these bits have a value different than FFFF FFFFh.

38.2.10.2 Transmitted Data Counter Register (GWTDCN)

Address(es): GWCA0.GWTDCN 874C F004h, GWCA0_NS.GWTDCN 074C F004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TDN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TDN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TDN[31:0]	Transmitted Data Number	These bits count data that has been transmit by GWCA (this includes data transmitted with an error and frames smaller than 32 bytes).	R

TDN[31:0] Bits (Transmitted Data Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a frame is passed from AXI master interface to TX data store and if these bits have a value different than FFFF FFFFh.

38.2.10.3 Timestamp Counter Register (GWTSCN)

Address(es): GWCA0.GWTSCN 874C F008h, GWCA0_NS.GWTSCN 074C F008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TN[31:0]	Timestamp Number	These bits count timestamp processed by GWCA (TS lost because of AXI errors are accounted here)	R

TN[31:0] Bits (Timestamp Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Timestamp is saved in timestamp RAM and if these bits have a value different than FFFF FFFFh.

38.2.10.4 Timestamp Overflow Error Counter Register (GWTSOVFECN)

Address(es): GWCA0.GWTSOVFECN 874C F00Ch, GWCA0_NS.GWTSOVFECN 074C F00Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSOVFEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TSOVFEN[15:0]	Timestamp Overflow Error Number	These bits count the number of timestamps lost because of timestamp RAM overflow.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

TSOVFEN[15:0] Bits (Timestamp Overflow Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a timestamp overflow error happens and if these bits have a value different than FFFFh.

38.2.10.5 Under Minimum Frame Size Error Counter Register (GWUSMFSECN)

Address(es): GWCA0.GWUSMFSECN 874C F010h, GWCA0_NS.GWUSMFSECN 074C F010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	USMFSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	USMFSEN[15:0]	Under Minimum Frame Size Error Number	These bits count the number of transmit data lost because of under switch minimum size error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

USMFSEN[15:0] Bits (Under Minimum Frame Size Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Under Switch Minimum Frame Size Error happens and if these bits have a value different than FFFFh.

38.2.10.6 TAG Filtering Error Counter Register (GWTFECN)

Address(es): GWCA0.GWTFECN 874C F014h, GWCA0_NS.GWTFECN 074C F014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TFEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TFEN[15:0]	TAG Filtering Error Number	These bits count the number of transmit data lost because of TAG filtering.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

TFEN[15:0] Bits (TAG Filtering Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a TAG filter error happens and if these bits have a value different than FFFFh.

38.2.10.7 Sequence Error Counter Register (GWSEQECN)

Address(es): GWCA0.GWSEQECN 874C F018h, GWCA0_NS.GWSEQECN 074C F018h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SEQEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	SEQEN[15:0]	Sequence Error Number	These bits count the number of transmit data lost because of a sequence error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

SEQEN[15:0] Bits (Sequence Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a sequence error happens and if these bits have a value different than FFFFh.

38.2.10.8 TX Descriptor Number Error Counter Register (GWTXDNECN)

Address(es): GWCA0.GWTXDNECN 874C F020h, GWCA0_NS.GWTXDNECN 074C F020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TXDNEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TXDNEN[15:0]	TX Descriptor Number Error Number	These bits count the number of transmit data lost because of a TX Descriptor Number Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

TXDNEN[15:0] Bits (TX Descriptor Number Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a TX Descriptor Number Error happens and if these bits have a value different than FFFFh.

38.2.10.9 Frame Size Error Counter Register (GWFSECN)

Address(es): GWCA0.GWFSECN 874C F024h, GWCA0_NS.GWFSECN 074C F024h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	FSEN[15:0]	Frame Size Error Number	These bits count the number of receive data lost because of a Frame Size Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

FSEN[15:0] Bits (Frame Size Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Frame Size Error happens and if these bits have a value different than FFFFh.

38.2.10.10 Timestamp Descriptor Full Error Counter Register (GWTDFECN)

Address(es): GWCA0.GWTDFECN 874C F028h, GWCA0_NS.GWTDFECN 074C F028h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TDFEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TDFEN[15:0]	Timestamp Descriptor Full Error Number	These bits count the number of timestamps lost because of a Timestamp Descriptor Full Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

TDFEN[15:0] Bits (Timestamp Descriptor Full Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Timestamp Descriptor Full Error happens and if these bits have a value different than FFFFh.

38.2.10.11 Timestamp Descriptor Number Error Counter Register (GWTSDNECN)

Address(es): GWCA0.GWTSDNECN 874C F02Ch, GWCA0_NS.GWTSDNECN 074C F02Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSDNEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	TSDNEN[15:0]	Timestamp Descriptor Number Error Number	These bits count the number of timestamps lost because of a Timestamp Descriptor Number Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

TSDNEN[15:0] Bits (Timestamp Descriptor Number Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Timestamp Descriptor Number Error happens and if these bits have a value different than FFFFh.

38.2.10.12 Descriptor Queue Overflow Error Counter Register (GWDQOECN)

Address(es): GWCA0.GWDQOECN 874C F030h, GWCA0_NS.GWDQOECN 074C F030h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DQOEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DQOEN[15:0]	Descriptor Queue Overflow Error Number	These bits count the number of receive data lost because of a Descriptor Queue Overflow Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DQOEN[15:0] Bits (Descriptor Queue Overflow Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Queue Overflow Error happens and if these bits have a value different than FFFFh.

38.2.10.13 Descriptor Queue Security Error Counter Register (GWDQSECN)

Address(es): GWCA0.GWDQSECN 874C F034h, GWCA0_NS.GWDQSECN 074C F034h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DQSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DQSEN[15:0]	Descriptor Queue Security Error Number	These bits count the number of receive data lost because of a Descriptor Queue Security Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DQSEN[15:0] Bits (Descriptor Queue Security Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Queue Security Error happens and if these bits have a value different than FFFFh.

38.2.10.14 Descriptor Full Error Counter Register (GWDFECN)

Address(es): GWCA0.GWDFECN 874C F038h, GWCA0_NS.GWDFECN 074C F038h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DFEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DFEN[15:0]	Descriptor Full Error Number	These bits count the number of receive data lost because of a Descriptor Full Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DFEN[15:0] Bits (Descriptor Full Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Full Error happens and if these bits have a value different than FFFFh.

38.2.10.15 Descriptor Security Error Counter Register (GWDSECN)

Address(es): GWCA0.GWDSECN 874C F03Ch, GWCA0_NS.GWDSECN 074C F03Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DSEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DSEN[15:0]	Descriptor Security Error Number	These bits count the number of receive data lost because of a Descriptor Security Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DSEN[15:0] Bits (Descriptor Security Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Security Error happens and if these bits have a value different than FFFFh.

38.2.10.16 Data Size Error Counter Register (GWDSZECN)

Address(es): GWCA0.GWDSZECN 874C F040h, GWCA0_NS.GWDSZECN 074C F040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DSZEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DSZEN[15:0]	Data Size Error Number	These bits count the number of receive data lost because of a Data Size Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DSZEN[15:0] Bits (Data Size Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Data Size Error happens and if these bits have a value different than FFFFh.

38.2.10.17 Descriptor Chain Type Error Counter Register (GWDCTECN)

Address(es): GWCA0.GWDCTECN 874C F044h, GWCA0_NS.GWDCTECN 074C F044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DCTEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	DCTEN[15:0]	Descriptor Chain Type Error Number	These bits count the number of receive data lost because of a Descriptor Chain Type Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

DCTEN[15:0] Bits (Descriptor Chain Type Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a Descriptor Chain Type Error happens and if these bits have a value different than FFFFh.

38.2.10.18 RX Descriptor Number Error Counter Register (GWRXDNECN)

Address(es): GWCA0.GWRXDNECN 874C F048h, GWCA0_NS.GWRXDNECN 074C F048h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RXDNEN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	RXDNEN[15:0]	RX Descriptor Number Error Number	These bits count the number of receive data lost because of a RX Descriptor Number Error.	R
b31 to b16	—	Reserved	These bits are read as 0.	R

RXDNEN[15:0] Bits (RX Descriptor Number Error Number)

[Clearing conditions]

- HW: Being in RESET mode will clear these bits.
- SW: Reading these bits clears it.

[Increment condition]

- HW: Incremented by 1 when a RX Descriptor Number Error happens and if these bits have a value different than FFFFh.

38.2.11 Data Interrupt Registers

38.2.11.1 Data Interrupt Status Register i (GWDISi) (i = 0, 1)

- GWCA0.GWDIS0

Address(es): GWCA0.GWDIS0 874C F100h, GWCA0_NS.GWDIS0 074C F100h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DIS31	DIS30	DIS29	DIS28	DIS27	DIS26	DIS25	DIS24	DIS23	DIS22	DIS21	DIS20	DIS19	DIS18	DIS17	DIS16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DIS15	DIS14	DIS13	DIS12	DIS11	DIS10	DIS9	DIS8	DIS7	DIS6	DIS5	DIS4	DIS3	DIS2	DIS1	DIS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DIS0	Data 0 Interrupt Status Flag	0: No Data 0 Interrupt 1: Data 0 Interrupt occurred.	R/W
b1	DIS1	Data 1 Interrupt Status Flag	0: No data 1 Interrupt 1: Data 1 Interrupt occurred.	R/W
b2	DIS2	Data 2 Interrupt Status Flag	0: No data 2 Interrupt 1: Data 2 Interrupt occurred.	R/W
b3	DIS3	Data 3 Interrupt Status Flag	0: No data 3 Interrupt 1: Data 3 Interrupt occurred.	R/W
b4	DIS4	Data 4 Interrupt Status Flag	0: No data 4 Interrupt 1: Data 4 Interrupt occurred.	R/W
b5	DIS5	Data 5 Interrupt Status Flag	0: No data 5 Interrupt 1: Data 5 Interrupt occurred.	R/W
b6	DIS6	Data 6 Interrupt Status Flag	0: No data 6 Interrupt 1: Data 6 Interrupt occurred.	R/W
b7	DIS7	Data 7 Interrupt Status Flag	0: No data 7 Interrupt 1: Data 7 Interrupt occurred.	R/W
b8	DIS8	Data 8 Interrupt Status Flag	0: No data 8 Interrupt 1: Data 8 Interrupt occurred.	R/W
b9	DIS9	Data 9 Interrupt Status Flag	0: No data 9 Interrupt 1: Data 9 Interrupt occurred.	R/W
b10	DIS10	Data 10 Interrupt Status Flag	0: No data 10 Interrupt 1: Data 10 Interrupt occurred.	R/W

DISt Flag (Data t Interrupt Status Flag) (t = 0 to 63)

[Setting condition TX]

- HW: A descriptor has been processed in the corresponding queue and DESCR.DIE was set in the corresponding read descriptor.
  [About set timing information for normal TX]
  A descriptor is considered as processed when written back. All descriptor which are not written back are considered as processed at the timing it should have been written back so that SW can know that all the previous at the actual descriptor has been fully processed.

[Setting condition RX]

- HW: A frame has been processed in the corresponding queue and DESCR.DIE was set in at least one of the corresponding read descriptors.
  [About set timing information for normal RX]
  A frame is considered as processed when frame FSTART or FSINGLE descriptor is processed. A descriptor is considered as processed when written back. All descriptor which are not written back are considered as processed at the timing it should have been written back so that SW can know that all the previous at the actual descriptor has been fully processed.
  All unknown descriptors are never considered as processed (refer to GWEIS2i.DFESt).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

38.2.11.2 Data Interrupt Enable Register i (GWDIEi) (i = 0, 1)

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWDID1 register.

DIEt Bit (Data t Interrupt Enable) (t = 0 to 63)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to GWDIDi.DIDt bit will clear this bit.

38.2.11.5 Timestamp Data Interrupt Status Register (GWTSDIS)

Address(es): GWCA0.GWTSDIS 874C F180h, GWCA0_NS.GWTSDIS 074C F180h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSDIS1	TSDIS0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TSDIS0	Timestamp Data 0 Interrupt Status Flag	0: No Timestamp Data 0 Interrupt 1: Timestamp Data 0 Interrupt occurred.	R/W
b1	TSDIS1	Timestamp Data 1 Interrupt Status Flag	0: No Timestamp Data 1 Interrupt 1: Timestamp Data 1 Interrupt occurred.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

TSDISt Flag (Timestamp Data t Interrupt Status Flag) (t = 0, 1)

[Setting condition]

- HW: A descriptor is processed in the corresponding queue and DESCR.DIE was set in the corresponding read descriptor. A descriptor is considered as processed when written back. All descriptor which are not written back are considered as processed at the timing it should have been written back so that SW can know that all the previous at the actual descriptor has been fully processed. All unknown descriptors are never considered as processed (refer to GWEIS0.TDFES).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

38.2.11.6 Timestamp Data Interrupt Enable Register (GWTSDIE)

Address(es): GWCA0.GWTSDIE 874C F184h, GWCA0_NS.GWTSDIE 074C F184h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSDIE1	TSDIE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TSDIE0	Timestamp Data 0 Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	TSDIE1	Timestamp Data 1 Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWTSDID register.

TSDIEt Bit (Timestamp Data Interrupt Enable t) (t = 0, 1)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWTSDID.TSDIDt bit will clear this bit.

38.2.11.7 Timestamp Data Interrupt Disable Register (GWTSDID)

Address(es): GWCA0.GWTSDID 874C F188h, GWCA0_NS.GWTSDID 074C F188h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSDID1	TSDID0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TSDID0	Timestamp Data 0 Interrupt Disable	0: Has no effects. 1: Sets GWTSDIE.TSDIE0 bit to 0.	R/W
b1	TSDID1	Timestamp Data 1 Interrupt Disable	0: Has no effects. 1: Sets GWTSDIE.TSDIE1 bit to 0.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

38.2.12 Error Interrupt Registers

38.2.12.1 Error Interrupt Status Register 0 (GWEIS0)

Address(es): GWCA0.GWEIS0 874C F190h, GWCA0_NS.GWEIS0 074C F190h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	TSHES	TXDNES	—	SEQES	TFES	USMFSES	TSOVFES	—	—	—	—	—	—	—	—	AES
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	AES	AXI Error Status Flag	0: No AXI Error 1: AXI Error occurred.	R/W
b8 to b1	—	Reserved	This bit is read as 0. The write value should be 0.	R
b9	TSOVFES	Timestamp Overflow Error Status Flag	0: No Timestamp Overflow Error 1: Timestamp Overflow Error occurred.	R/W
b10	USMFSES	Under Minimum Frame Size Error Status Flag	0: No Under Minimum Frame Size Error 1: Under Minimum Frame Size Error occurred.	R/W
b11	TFES	TAG Filtering Error Status Flag	0: No TAG Filtering Error 1: TAG Filtering Error occurred.	R/W
b12	SEQES	Sequence Error Status Flag	0: No Sequence Error 1: Sequence Error occurred.	R/W
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R
b14	TXDNES	TX Descriptor Number Error Status Flag	0: No TX Descriptor Number Error 1: TX Descriptor Number Error occurred.	R/W
b15	TSHES	Timestamp Hardware Error Status Flag	0: No Timestamp Hardware Error 1: Timestamp Hardware Error occurred.	R/W
b16	FSES0	Frame Size Error Status Flag 0	0: No Frame Size Error 0 1: Frame Size Error 0 occurred.	R/W
b17	FSES1	Frame Size Error Status Flag 1	0: No Frame Size Error 1 1: Frame Size Error 1 occurred.	R/W
b18	FSES2	Frame Size Error Status Flag 2	0: No Frame Size Error 2 1: Frame Size Error 2 occurred.	R/W
b19	FSES3	Frame Size Error Status Flag 3	0: No Frame Size Error 3 1: Frame Size Error 3 occurred.	R/W
b20	FSES4	Frame Size Error Status Flag 4	0: No Frame Size Error 4 1: Frame Size Error 4 occurred.	R/W
b21	FSES5	Frame Size Error Status Flag 5	0: No Frame Size Error 5 1: Frame Size Error 5 occurred.	R/W
b22	FSES6	Frame Size Error Status Flag 6	0: No Frame Size Error 6 1: Frame Size Error 6 occurred.	R/W
b23	FSES7	Frame Size Error Status Flag 7	0: No Frame Size Error 7 1: Frame Size Error 7 occurred.	R/W
b24	TDFES0	Timestamp Descriptor 0 Full Error Status Flag	0: No Timestamp Descriptor 0 Full Error 1: Timestamp Descriptor 0 Full Error occurred.	R/W
b25	TDFES1	Timestamp Descriptor 1 Full Error Status Flag	0: No Timestamp Descriptor 1 Full Error 1: Timestamp Descriptor 1 Full Error occurred.	R/W
b27, b26	—	Reserved	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Bit Name	Description	R/W
b28	TSDNES0	Timestamp Descriptor 0 Number Error Status Flag	0: No Timestamp Descriptor 0 Number Error 1: Timestamp Descriptor 0 Number Error occurred.	R/W
b29	TSDNES1	Timestamp Descriptor 1 Number Error Status Flag	0: No Timestamp Descriptor 1 Number Error 1: Timestamp Descriptor 1 Number Error occurred.	R/W
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

AES Flag (AXI Error Status Flag)

[Setting condition]

- HW: When an error is detected on an AXI access (xRESP ≠ 00b)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: For reception, if an AXI error happens during descriptor read before a frame/timestamp transfer started, the frame/timestamp is rejected.
- HW: For reception, if an AXI error happens during descriptor read after a frame transfer started, the remaining part of the frame is rejected and DESCR.AXIE is set in the frame corresponding first written back data descriptor, which is FSTART in normal synchronization mode (for GWDCCi.SM[1:0] = 00b).
- HW: For reception, if an AXI error happens during data write, DESCR.AXIE is set in the frame corresponding first written back data descriptor, which is a FSTART or a FSINGLE descriptor in normal synchronization mode (for GWDCCi.SM[1:0] = 00b).
- HW: For reception, if an AXI error happens during RX/TS descriptor write, nothing happens.
- HW: For transmission, if an AXI error happens during descriptor read and no frame is ongoing, corresponding GWTRCi.TSRt bit is cleared and no frame is transmitted.
- HW: For transmission, if an AXI error happens during descriptor read and a frame is ongoing, the ongoing frame is padded with 0h, sent to Forwarding Engine [MFWD] with AXE error set (refer to (c) SAEF Format) and corresponding GWTRCi.TSRt bit is cleared.
- HW: For transmission, if an AXI error happens during data read, the ongoing frame is sent to Forwarding Engine [MFWD] with AXE error set (refer to (c) SAEF Format).
- HW: For transmission, if an AXI error happens during descriptor write, nothing happens.
- SW: System reset.

TSOVFES Bit (Timestamp Overflow Error Status Flag)

[Setting condition]

- HW: When a timestamp is received when the timestamp RAM is full.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: A timestamp is lost.
- SW: Nothing if it is acceptable to lose a timestamp else switch reset.

USMFSES Flag (Under Minimum Frame Size Error Status Flag)

[Setting condition]

- HW: A frame smaller than 32 bytes has been received from CPU for transmission.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: The frame is discarded.
- SW: Software error, software should be reviewed.

TFES Flag (TAG Filtering Error Status Flag)

[Setting condition]

- HW: An unauthorized TAG format has been detected. (Refer to (1) TAG Information Extraction).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Frame is sent to Forwarding Engine [MFWD] with local descriptor DESCR.TFE bit set (refer to (3) Frame Saving in Local RAM).
- SW: Software error, software should be reviewed.

SEQES Flag (Sequence Error Status Flag)

[Setting conditions]

- HW: A FMID, FEND has been received before a frame transfer started.
- HW: A descriptor different than FMID, FEND, LINK, and LINKFIX has been received after a frame transfer started.
- HW: An FSTART, FMID, FEND, or FSINGLE descriptor has been received with DESCR.DS set to 0.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restriction]

- HW: This flag is only available for TX descriptor queues.

[Error recovery]

- HW: If a Sequence Error happens before a frame transfer started, nothing happens.
- HW: If a Sequence Error happens after a frame transfer started, the ongoing frame is padded with 0h and sent to Forwarding Engine [MFWD] with SEQE error set (refer to (c) SAEF Format).
- SW: Software error, software should be reviewed.

TXDNES Flag (TX Descriptor Number Error Status Flag)

[Setting condition]

- HW: GWMDNC.TXDMN[4:0] + 1 descriptor has already been used to process one frame and the frame processing is not finished.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restriction]

- HW: This flag is only available for TX descriptor queues.

[Error recovery]

- HW: If a TX Descriptor Number Error happens before a frame transfer started, GWTRCi.TSRt bit is cleared.
- HW: If a TX Descriptor Number Error happens after a frame transfer started, the ongoing frame is padded with 0h,

sent to Forwarding Engine [MFWD] with DNE error set (refer to (c) SAEF Format)) and corresponding GWTRCi.TSRt bit is cleared.

- SW: Software error, software should be reviewed.

TSHES Flag (Timestamp Hardware Error Status Flag)

[Setting condition]

- HW: This error happens when timestamps are coming too fast to GWCA to be stored in time, so timestamp are lost even if the timestamp RAM is not full. This error should never happen and tells that the number of captured timestamps is too high or the bus clock clk has a too low frequency.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Timestamp lost.
- SW: No recovery, this error should not happen.

FSESq Flag (Frame Size Error Status Flag q) (q = 0 to 7)

[Setting condition]

- HW: This flag is set when a frame larger than GWRMFSCq.MFS[15:0] has been received for descriptor queue q.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: The current frame will be lost. Following data will be processed normally.
- SW: System dependent, cannot be defined here.

TDFESi Flag (Timestamp Descriptor i Full Error Status Flag) (i = 0, 1)

[Setting condition]

- HW: This flag sets when a timestamp has been received for descriptor chain i which is full (read any other descriptor than a FEMPTY_ND, LINKFIX or LINK descriptor).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Timestamp lost.
- SW: Nothing if it is acceptable to lose a timestamp else switch reset.
- SW: AXI is too slow to save all timestamps in the CPU RAM. Less timestamps should be captured or more bandwidth on AXI should be reserved for ESWM.

TSDNESi Flag (Timestamp Descriptor i Number Error Status Flag) (i = 0, 1)

[Setting condition]

- HW: This flag sets when GWMDNC.TSDMN[1:0] + 1 descriptor has already been used to process one timestamp for descriptor chain i and the timestamp processing is not finished.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Timestamp lost
- SW: Software error, software should be reviewed.

38.2.12.2 Error Interrupt Enable Register 0 (GWEIE0)

Address(es): GWCA0.GWEIE0 874C F194h, GWCA0_NS.GWEIE0 074C F194h

b27, b26	—	Reserved	These bits are read as 0. The write value should be 0.	R
b28	TSDNEE0	Timestamp Descriptor 0 Number Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1

Bit	Symbol	Bit Name	Description	R/W
b29	TSDNEE1	Timestamp Descriptor 1 Number Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31, b30	—	Reserved	This bit is read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWEID0 register.

AEE Bit (AXI Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.AED bit will clear this bit.

TSOVFEE Bit (Timestamp Overflow Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.TSOVFED bit will clear this bit.

USMFSEE Bit (Under Minimum Frame Size Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.USMFSED bit will clear this bit.

TFEE Bit (TAG Filtering Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.TFED bit will clear this bit.

SEQEE Bit (Sequence Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.SEQED bit will clear this bit.

TXDNEE Bit (TX Descriptor Number Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.TXDNED bit will clear this bit.

TSHEE Bit (Timestamp Hardware Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.TSHED bit will clear this bit.

FSEEq Bit (Frame Size Error Enable q) (q = 0 to 7)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.FSEDq bit will clear this bit.

TDFEEi Bit (Timestamp Descriptor i Full Error Enable) (i = 0, 1)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.TDFEDi bit will clear this bit.

TSDNEEi Bit (Timestamp Descriptor i Number Error Enable) (i = 0, 1)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID0.TSDNEDi bit will clear this bit.

38.2.12.3 Error Interrupt Disable Register 0 (GWEID0)

Address(es): GWCA0.GWEID0 874C F198h, GWCA0_NS.GWEID0 074C F198h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b23	DQSES7	Descriptor Queue 7 Security Error Status Flag	0: No Descriptor Queue 7 Security Error 1: Descriptor Queue 7 Security Error occurred.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

DQOESq Flag (Descriptor Queue q Overflow Error Status Flag) (q = 0 to 7)

[Setting condition]

- HW: DQOESq is set when a descriptor is received for queue q when it is full (GWRDQDCq.DQD[9:0] = GWRDQMq.DNQ[9:0]), not disabled (GWRDQC.RDQDq is not set) and GWCA is not going out or out of

OPERATION mode (GWMC.OPC[1:0] = 11b).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Any descriptor received for a full Descriptor queue will not be accepted by GWCA and will not be forwarded to CPU.
- SW: Too many descriptors are received for the corresponding queue. GWRDQDCq.DQD[9:0] setting should be reviewed.

DQSESq Flag (Descriptor Queue q Security Error Status Flag) (q = 0 to 7)

[Setting condition]

- HW: DQSESq is set when a non-secure descriptor is received (FDESCR.SEC is not set [MFWD]) and queue q is a secure queue (GWRDQSC.RDQSLq is set).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Any non-secure descriptor received for secure Descriptor queue will not be accepted by GWCA and will not be forwarded to CPU.
- SW: System dependent, cannot be defined here.

38.2.12.5 Error Interrupt Enable Register 1 (GWEIE1)

Address(es): GWCA0.GWEIE1 874C F1A4h, GWCA0_NS.GWEIE1 074C F1A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DQOEE0	Descriptor Queue 0 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	DQOEE1	Descriptor Queue 1 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b2	DQOEE2	Descriptor Queue 2 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b3	DQOEE3	Descriptor Queue 3 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b4	DQOEE4	Descriptor Queue 4 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b5	DQOEE5	Descriptor Queue 5 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b6	DQOEE6	Descriptor Queue 6 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b7	DQOEE7	Descriptor Queue 7 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DQSEE0	Descriptor Queue 0 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b17	DQSEE1	Descriptor Queue 1 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b18	DQSEE2	Descriptor Queue 2 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b19	DQSEE3	Descriptor Queue 3 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b20	DQSEE4	Descriptor Queue 4 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b21	DQSEE5	Descriptor Queue 5 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b22	DQSEE6	Descriptor Queue 6 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b23	DQSEE7	Descriptor Queue 7 Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWEID1 register.

DQOEEq Bit (Descriptor Queue q Overflow Error Enable) (q = 0 to 7)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID1.DQOEDq bit will clear the DQOEEq bit.

DQSEEq Bit (Descriptor Queue q Security Error Enable) (q = 0 to 7)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID1.DQSEDq bit will clear the DQSEEq bit.

38.2.12.6 Error Interrupt Disable Register 1 (GWEID1)

Address(es): GWCA0.GWEID1 874C F1A8h, GWCA0_NS.GWEID1 074C F1A8h

DFESt Flag (Descriptor t Full Error Status Flag) (t = 0 to 63)

[Setting condition]

- HW: When a frame has been received for descriptor queue t which is full (read a descriptor different than FEMPTY, FEMPTY_IS, FEMPTY_IC, FEMPTY_ND, FEMPTY_START, FEMPTY_MID, FEMPTY_END, LINKFIX and LINK). This flag is set at the timing the frame last descriptor write-back should have been completed.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restriction]

- This flag is only valid for RX queues.

[Error recovery]

- HW: Set of DESCR.ERR bit in RX descriptor if a part of the frame has been already sent.
- HW: Current frame or remaining part of the frame will be discarded, and next frames will be processed normally (as long as software does not insert new descriptors for reception the queue will continue overflowing).
- SW: Discard data which have DESCR.ERR bit set.

38.2.12.8 Error Interrupt Enable Register 2i (GWEIE2i) (i = 0, 1)

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWEID21 register.

DFEEt Bit (Descriptor t Full Error Enable) (t = 0 to 63)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to GWEID2i.DFEDt bit will clear this bit.

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	IAOES0	Incremental Area 0 Overflow Error Status Flag	0: No Incremental Area 0 Overflow Error 1: Incremental Area 0 Overflow Error occurred.	R/W
b1	IAOES1	Incremental Area 1 Overflow Error Status Flag	0: No Incremental Area 1 Overflow Error 1: Incremental Area 1 Overflow Error occurred.	R/W
b2	IAOES2	Incremental Area 2 Overflow Error Status Flag	0: No Incremental Area 2 Overflow Error 1: Incremental Area 2 Overflow Error occurred.	R/W
b3	IAOES3	Incremental Area 3 Overflow Error Status Flag	0: No Incremental Area 3 Overflow Error 1: Incremental Area 3 Overflow Error occurred.	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R

IAOESt Flag (Incremental Area t Overflow Error Status Flag) (t = 0 to 3)

[Setting condition]

- HW: When incremental area t overflows, for further information refer to section (3), Single Page Incremental Data Reception. This flag is only set when GWIDAUASt.IDAUAS[23:0] crosses GWIDASMi.IDAS[23:0] value (if incremental area is already overflowing this flag would not be set again except if GWIDAUASt.IDAUAS[23:0] overflows).

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restriction]

- HW: This register is only valid for RX incremental queues.

[Error recovery]

- HW: The data coming for this incremental area will still be written.
- SW: Set a new incremental area.

38.2.12.11 Error Interrupt Enable Register 3 (GWEIE3)

Address(es): GWCA0.GWEIE3 874C F284h, GWCA0_NS.GWEIE3 074C F284h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	IAOEE3	IAOEE2	IAOEE1	IAOEE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	IAOEE0	Incremental Area 0 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	IAOEE1	Incremental Area 1 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b2	IAOEE2	Incremental Area 2 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b3	IAOEE3	Incremental Area 3 Overflow Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWEID3 register.

IAOEEt Bit (Incremental Area t Overflow Error Enable) (t = 0 to 3)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID3.IAOEDt bit will clear this bit.

38.2.12.12 Error Interrupt Disable Register 3 (GWEID3)

Address(es): GWCA0.GWEID3 874C F288h, GWCA0_NS.GWEID3 074C F288h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DSSES	Descriptor Security Error Status Flag	0: No Descriptor Security Error 1: Descriptor Security Error occurred.	R/W
b1	DSSEIOS	Descriptor Security Error Interrupt Overflow Status Flag	0: No Descriptor Security Error Interrupt Overflow 1: Descriptor Security Error Interrupt Overflow occurred.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b13 to b8	DSSECN[5:0]	Descriptor Security Error Chain Number		R
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DSES	Data Size Error Status Flag	0: No Data Size Error 1: Data Size Error occurred.	R/W
b17	DSEIOS	Data Size Error Interrupt Overflow Status Flag	0: No Data Size Error Interrupt Overflow 1: Data Size Error Interrupt Overflow occurred.	R/W
b23 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R
b29 to b24	DSECN[5:0]	Data Size Error Chain Number		R
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

DSSES Flag (Descriptor Security Error Status Flag)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Setting condition]

- HW: During reception, when an unsecure descriptor has been received for a secure queue (GWDCCi.SL set).

[Error recovery]

- HW: During reception, the current frame will be lost. Following data will be processed normally.
- SW: Secure CPU should read the unsecure forwarding engine registers to find which entry is trying to use a secure queue for unsecure traffic and suppress it.
- SW: Secure CPU could block access to switch from unsecure CPU.

DSSEIOS Flag (Descriptor Security Error Interrupt Overflow Status Flag)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Setting condition]

- When a Descriptor Security Error occurs and GWEIS4.DSSES is already set to one. In this case, the descriptor

chain number in which the new error occurred is lost.

[Restriction]

- HW: This flag is only valid for RX queues.

[Error recovery]

- SW: Switch reset.

DSSECN[5:0] Bits (Descriptor Security Error Chain Number)

[Restriction]

- HW: This flag is only valid for RX queues.

[Clearing condition]

- HW: Being in RESET mode will clear this flag.

[Update condition]

- This field is update to the descriptor chain number in which a Descriptor Security Error occurred when GWEIS4.DSSES is being set.

DSES Flag (Data Size Error Status Flag)

[Setting condition]

- HW: When a frame has been received with an unexpected size, for more information refer to section (2), Size-Controlled Data Reception. This flag is set after the frame last descriptor write back is completed.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restriction]

- HW: This flag is only valid for RX queues.

[Error recovery]

- HW: Set of DESCR.DSE bit in FSTART RX descriptor.
- HW: If the frame was an undersized frame the frame is written with the normal descriptor sequence (FSINGLE or FSTART/ FEND or FSTART/n*FMID/ FEND)
- HW: If the frame was an undersized frame, when a new frame comes for the corresponding queue, the AXI master will skip all following descriptors until a empty descriptor which is not FEMPTY_MID or FEMPTY_END (at start of a frame, FEMPTY_MID and FEMPTY_END descriptors are always ignored).
- If the frame is an oversized frame, the frame will be truncated.
- SW: Discard data which have DESCR.DSE bit set.
- SW: Because DESCR.DSE is set in RX descriptors with a size error, it is not mandatory to read this flag for error recovery.

DSEIOS Flag (Data Size Error Interrupt Overflow Status Flag)

[Setting condition]

- When a Data Size Error occurs and GWEIS4.DSES is already set to one. In this case, the descriptor chain number in which the new error occurred is lost.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Restriction]

- HW: This flag is only valid for RX queues.

[Error recovery]

- SW: Switch reset.

DSECN[5:0] Bits (Data Size Error Chain Number)

[Clearing condition]

- HW: Being in RESET mode will clear this flag.

[Update condition]

- This field is update to the descriptor chain number in which a Data Size Error occurred when GWEIS4.DSES is being set.

[Restriction]

- HW: These bits are only valid for RX queues.

38.2.12.14 Error Interrupt Enable Register 4 (GWEIE4)

Address(es): GWCA0.GWEIE4 874C F294h, GWCA0_NS.GWEIE4 074C F294h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DSEIOE	DSEE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DSSEE	Descriptor Security Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	DSSEIOE	Descriptor Security Error Interrupt Overflow Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DSEE	Data Size Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b17	DSEIOE	Data Size Error Interrupt Overflow Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWEID4 register.

DSSEE Bit (Descriptor Security Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID4.DSSED bit will clear this bit.

DSSEIOE Bit (Descriptor Security Error Interrupt Overflow Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID4.DSSEIOD bit will clear this bit.

DSEE Bit (Data Size Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID4.DSED bit will clear this bit.

DSEIOE Bit (Data Size Error Interrupt Overflow Interrupt Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID4.DSEIOD bit will clear this bit.

38.2.12.15 Error Interrupt Disable Register 4 (GWEID4)

Address(es): GWCA0.GWEID4 874C F298h, GWCA0_NS.GWEID4 074C F298h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DSEIOD	DSED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DSSEIOD	DSSED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DSSED	Descriptor Security Error Disable	0: Has no effects. 1: Sets GWEIE4.DSSEE bit to 0.	R/W
b1	DSSEIOD	Descriptor Security Error Interrupt Overflow Disable	0: Has no effects. 1: Sets GWEIE4.DSSEIOE bit to 0.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	DSED	Data Size Error Disable	0: Has no effects. 1: Sets GWEIE4.DSEE bit to 0.	R/W
b17	DSEIOD	Data Size Error Interrupt Overflow Disable	0: Has no effects. 1: Sets GWEIE4.DSEIOE bit to 0.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

38.2.12.16 Error Interrupt Status Register 5 (GWEIS5)

Address(es): GWCA0.GWEIS5 874C F2A0h, GWCA0_NS.GWEIS5 074C F2A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	RXDNECN[5:0]						—	—	—	—	—	—	RXDNEIOS	RXDNES
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	DCTECN[5:0]						—	—	—	—	—	—	DCTEIOS	DCTES
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DCTES	Descriptor Chain Type Error Status Flag	0: No Descriptor Chain Type Error 1: Descriptor Chain Type Error occurred.	R/W
b1	DCTEIOS	Descriptor Chain Type Error Interrupt Overflow Status Flag	0: No Descriptor Chain Type Error Interrupt Overflow 1: Descriptor Chain Type Error Interrupt Overflow occurred.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b13 to b8	DCTECN[5:0]	Descriptor Chain Type Error Chain Number		R
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RXDNES	RX Descriptor Number Error Status Flag	0: No RX Descriptor Number Error 1: RX Descriptor Number Error occurred.	R/W
b17	RXDNEIOS	RX Descriptor Number Error Interrupt Overflow Status Flag	0: No RX Descriptor Number Error Interrupt Overflow 1: RX Descriptor Number Error Interrupt Overflow occurred.	R/W
b23 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R
b29 to b24	RXDNECN[5:0]	RX Descriptor Number Error Chain Number		R
b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R

DCTES Flag (Descriptor Chain Type Error Status Flag)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Setting condition]

- HW: When a descriptor is received for a transmission descriptor queue (GWDCCt.DQT set).

[Error recovery]

- HW: When a descriptor is received for a transmission descriptor queue, the corresponding frame is discarded.
- SW: It is a software error. Software should be reviewed.

DCTEIOS Flag (Descriptor Chain Type Error Interrupt Overflow Status Flag)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Setting condition]

- Descriptor Chain Type Error occurs and GWEIS5.DCTES is already set to one. In this case, the descriptor chain number in which the new error occurred is lost.

[Error recovery]

- SW: Switch reset.

DCTECN[5:0] Bits (Descriptor Chain Type Error Chain Number)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.

[Update condition]

- This field is update to the descriptor chain number in which a Descriptor Chain Type Error occurred when GWEIS5.DCTES is being set.

RXDNES Flag (RX Descriptor Number Error Status Flag)

[Setting condition]

- HW: GWMDNC.RXDMN[4:0] + 1 descriptor has already been used to process one frame and the frame processing is not finished.

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Error recovery]

- HW: Set of DESCR.ERR bit in RX descriptor if a part of the frame has been already sent.
- HW: Current frame or remaining part of the frame will be discarded, and next frames will be processed normally.
- SW: Discard data which have DESCR.ERR bit set.
- SW: Software error, software should be reviewed.

RXDNEIOS Flag (RX Descriptor Number Error Interrupt Overflow Status Flag)

[Clearing conditions]

- HW: Being in RESET mode will clear this flag.
- SW: Writing 1 to this flag will clear it.

[Setting condition]

- RX Descriptor Number Error occurs and GWEIS5.RXDNES is already set to one. In this case, the descriptor chain number in which the new error occurred is lost.

[Error recovery]

- SW: Switch reset.

RXDNECN[5:0] Bits (RX Descriptor Number Error Chain Number)

[Clearing condition]

- HW: Being in RESET mode will clear these bits.

[Update condition]

- This field is update to the descriptor chain number in which a RX Descriptor Number Error occurred when GWEIS5.RXDNES is being set.

38.2.12.17 Error Interrupt Enable Register 5 (GWEIE5)

Address(es): GWCA0.GWEIE5 874C F2A4h, GWCA0_NS.GWEIE5 074C F2A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXDNEIOE	RXDNEE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCTEIOE	DCTEE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DCTEE	Descriptor Chain Type Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b1	DCTEIOE	Descriptor Chain Type Error Interrupt Overflow Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RXDNEE	RX Descriptor Number Error Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b17	RXDNEIOE	RX Descriptor Number Error Interrupt Overflow Enable	0: Interrupt disabled 1: Interrupt enabled	R/(W) *1
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 1 can be written. To set this bit to 0, write 1 to the corresponding bit in the GWEID5 register.

DCTEE Bit (Descriptor Chain Type Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID5.DCTED bit will clear this bit.

DCTEIOE Bit (Descriptor Chain Type Error Interrupt Overflow Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID5.DCTEIOD bit will clear this bit.

RXDNEE Bit (RX Descriptor Number Error Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID5.RXDNED bit will clear this bit.

RXDNEIOE Bit (RX Descriptor Number Error Interrupt Overflow Enable)

[Setting condition]

- Writing 1 to this bit will set it.

[Clearing condition]

- Writing 1 to the GWEID5.RXDNEIOD bit will clear this bit.

38.2.12.18 Error Interrupt Disable Register 5 (GWEID5)

Address(es): GWCA0.GWEID5 874C F2A8h, GWCA0_NS.GWEID5 074C F2A8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXDNEIOD	RXDNED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCTEIOD	DCTED
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DCTED	Descriptor Chain Type Error Disable	0: Has no effects. 1: Sets GWEIE5.DCTEE bit to 0.	R/W
b1	DCTEIOD	Descriptor Chain Type Error Interrupt Overflow Disable	0: Has no effects. 1: Sets GWEIE5.DCTEIOE bit to 0.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R
b16	RXDNED	RX Descriptor Number Error Disable	0: Has no effects. 1: Sets GWEIE5.RXDNEE bit to 0.	R/W
b17	RXDNEIOD	RX Descriptor Number Error Interrupt Overflow Disable	0: Has no effects. 1: Sets GWEIE5.RXDNEIOE bit to 0.	R/W
b31 to b18	—	Reserved	These bits are read as 0. The write value should be 0.	R

38.3 Operations

38.3.1 AXI Master General Information

In this section is described the knowledge required to utilize the GWCA AXI master. It contains the AXI address table handling, the AXI descriptor general description, and the AXI IDs utilization description.

38.3.1.1 AXI Descriptor Queue Mapping

The AXI descriptor queue mapping is described along with its mapping to the INTER_TX interface, the incremental queues and the rate limiters in Figure 38.2. The global rate limiter is not represented because it limits throughput for all the TX queues.

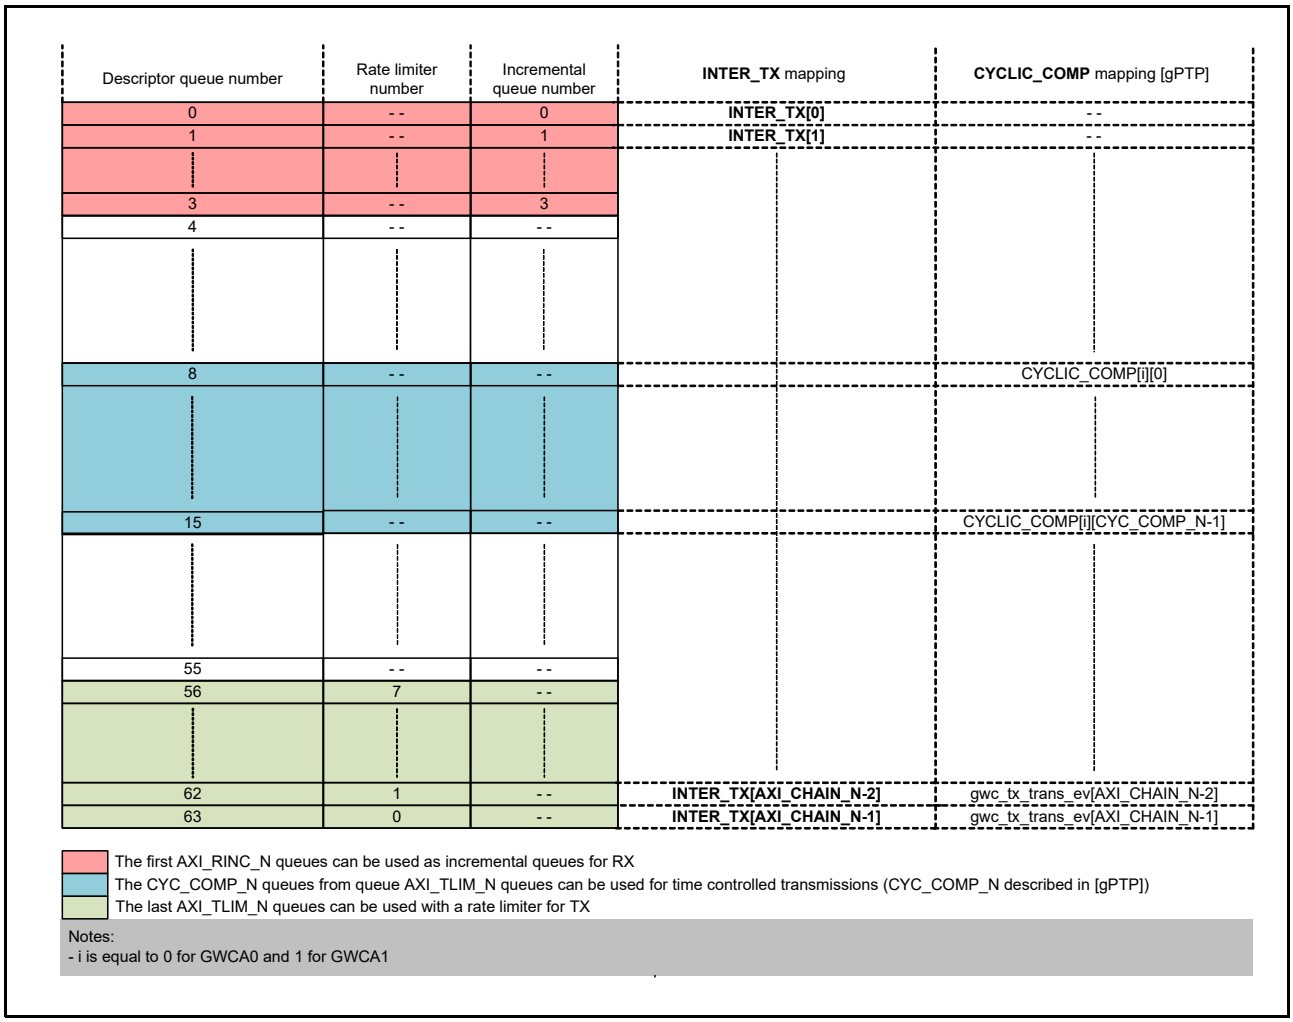

Figure 38.2 AXI Descriptor Queue Mapping

38.3.1.2 AXI Descriptor General Description

(1) General Formats

AXI descriptor general formats are described in Figure 38.3, Figure 38.4, Figure 38.5 and Figure 38.6. The fields are explained in Table 38.3. The fields utilization will be explained per transaction type (Data reception, Data transmission and Timestamp reception).

Table 38.3 General Format Descriptor Field Explanation

Field name	Bit width	Description
DS	12	Descriptor size. Restrictions: • SW: DS field maximum value is 2048. • SW: For other descriptors than LINKFIX, LEMPTY, EEMPTY, LINK and EOS, DS should not be set to 0.
INFO0	4	Information 0.
ERR	1	Error
DSE	1	Data Size Error.
AXIE	1	AXI Bus Error
DIE	1	Descriptor Interrupt Enable This (DESCR.DIE) field should not be set for LINK/LINKFIX descriptors in Rx chain.
DT	4	Descriptor Type, refer to (2) Descriptor Types.
PTR	40	Pointer
INFO1	64	Information 1.
TS	64	Timestamp.

Note: General format descriptor field utilization is described per use-case later in the following sections.

(2) Descriptor Types

The table below gives an overview of all descriptor types used by GWCA. The first column shows the descriptor type name and the second column the 4-bit number to be written to DESCR.DT.

Table 38.4 Descriptor Type

Name	DT	Description
Empty data descriptors		
FEMPTY_IS	1	**Frame Empty Incremental Start** Frame data related descriptor without valid frame data. Used to set an incremental area.
FEMPTY_IC	2	**Frame Empty Incremental Continue** Frame data related descriptor without valid frame data. Used to continue using an incremental area.
FEMPTY_ND	3	**Frame Empty No Data Storage** Frame data related descriptor without valid frame data. Used to reject data.
FEMPTY	4	**Frame Empty** Frame complete data related descriptor without valid frame data. Used to save frame data.
FEMPTY_START	5	**Frame Empty start** Frame start data related descriptor without valid frame data. Used to save first part of a frame.
FEMPTY_MID	6	**Frame Empty Middle** Frame continues data related descriptor without valid frame data. Used to save middle part of a frame.
FEMPTY_END	7	**Frame Empty End** Frame end data related descriptor without valid frame data. Used to save end part of a frame.
Data descriptors		
FSINGLE	8	**Frame Single** Storage Element has valid frame data of a complete frame.
FSTART	9	**Frame Start** Storage Element has valid frame data. Frame starts with this descriptor and continues in next descriptor.
FMID	10	**Frame Middle** Storage Element has valid frame data. Frame has started with a previous descriptor and continues in next descriptor.
FEND	11	**Frame End** Storage Element has valid frame data. Frame has started with a previous descriptor and ends with this descriptor.
Chain control/HW/SW arbitration		
LINKFIX	0	**Linkfix** Control element pointing to next descriptor in chain.
LEMPTY	12	**Link Empty** Used control element pointing to next descriptor in chain.
EEMPTY	13	**EOS Empty** Used control element pausing a transmit chain.
LINK	14	**Link** Control element pointing to next descriptor in chain.
EOS	15	**End Of Set** Control element pausing a transmit chain.

38.3.1.3 LINKFIX Table

(1) LINKFIX Table Initialization

The usage of AXI address table requires the setting of a LINKFIX table in the CPU USER RAM at {GWDCBAC0.DCBAU[7:0], GWDCBAC1.DCBAL[31:0]} location. This table will be used to set the first address of descriptor chains. It can be used any time to change a chain base address or to return to the previous base address. The LINKFIX table setting is described in Figure 38.7 through an example. Note that SW and HW initialization are happening simultaneously.

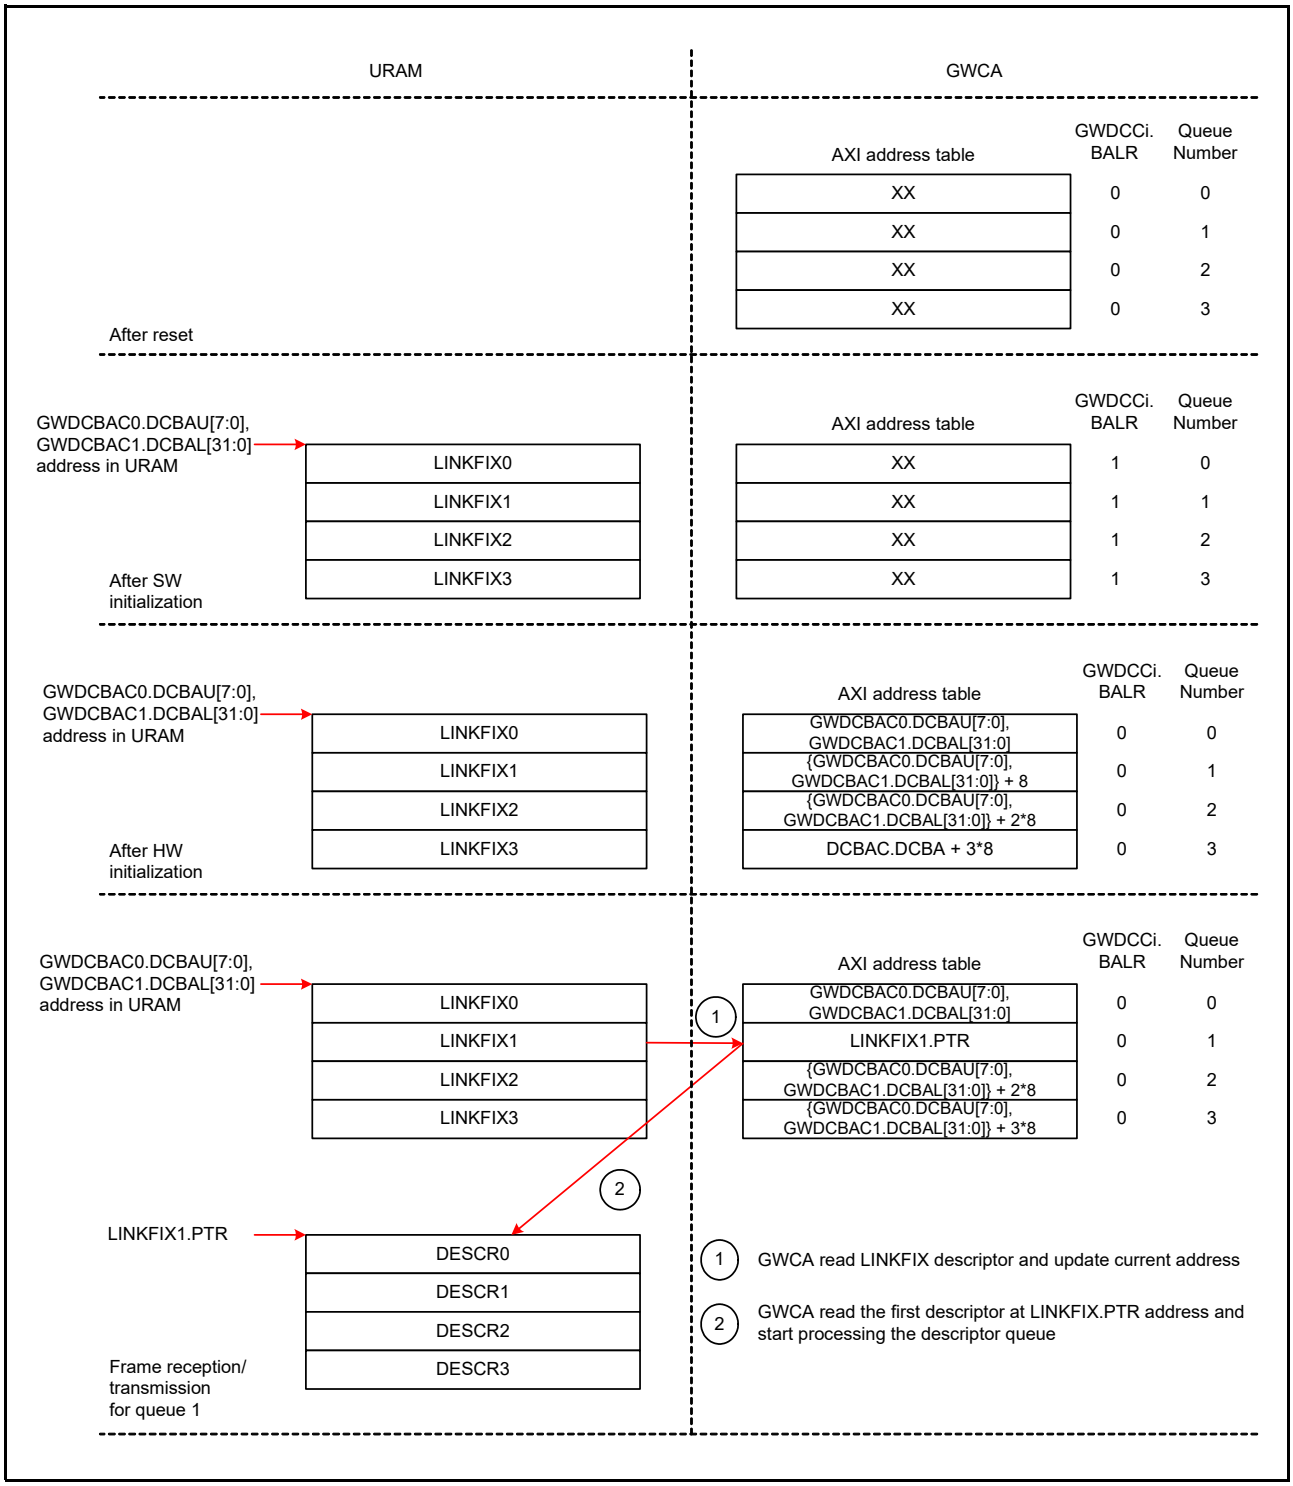

Figure 38.7 LINKFIX Table Setting Example

[Restrictions]

- SW: A LEMPTY descriptor queues must be written for preventing them from starting.
- HW: Add descriptors in LINKFIX table are 8 byte-descriptors independently from GWDCCi.EDE and GWDCCi.ETS bits settings.

Note: LINKFIX and LINK descriptors are interchangeable. The only difference is that the LINK descriptor can be written back by HW.

(2) LINKFIX Table Descriptors

For the LINKFIX table, a LINKFIX descriptor is used to start a descriptor queue, a LEMPTY descriptor is used to disable a TX queues (GWDCCi.DQT = 1) and a LEMPTY descriptor is used to disable a RX queues (GWDCCi.DQT = 0). In the LINKFIX table, only basic descriptors can be used (refer to (1) General Formats). The descriptor formats for LINKFIX table are describes in Table 38.5 and Table 38.6. If a reception disabled queue is started despite being disabled in the LINKFIX table, the descriptor queue be considered as full (refer to register GWEIS2i explanation).

Table 38.5 LINKFIX Table Descriptor Formats

LINKFIX for LINKFIX Table								
Byte	**Bit7**	**Bit6**	**Bit5**	**Bit4**	**Bit3**	**Bit2**	**Bit1**	**Bit0**
0	00000000b							
1	0000b				0000b			
2	0				0b	0b	0b	0b
3	PTR[39:32]

Field name	LINKFIX	LEMPTY
PTR	PTR Pointer pointing to the first descriptor of the descriptor chain	0000000000h
INFO1 (GWDCCi.EDE = 1)	NA for LINKFIX table	NA for LINKFIX table
TS (GWDCCi.ETS = 1)	NA for LINKFIX table	NA for LINKFIX table

38.3.1.4 AXI Common Descriptor Utilization

AXI common descriptors are the descriptors which are not reserved to a special use-case and can be inserted in any descriptor chain at any time. It includes LINKFIX and LINK descriptors.

(1) LINKFIX Descriptor Utilization

A LINKFIX descriptor is used to change a descriptor queue pointer in the GWCA to move it to another place and is described in Figure 38.8. The LINKFIX descriptor is never written back to decrease the AXI load.
The LINKFIX descriptor format is described in Table 38.7 and Table 38.8.

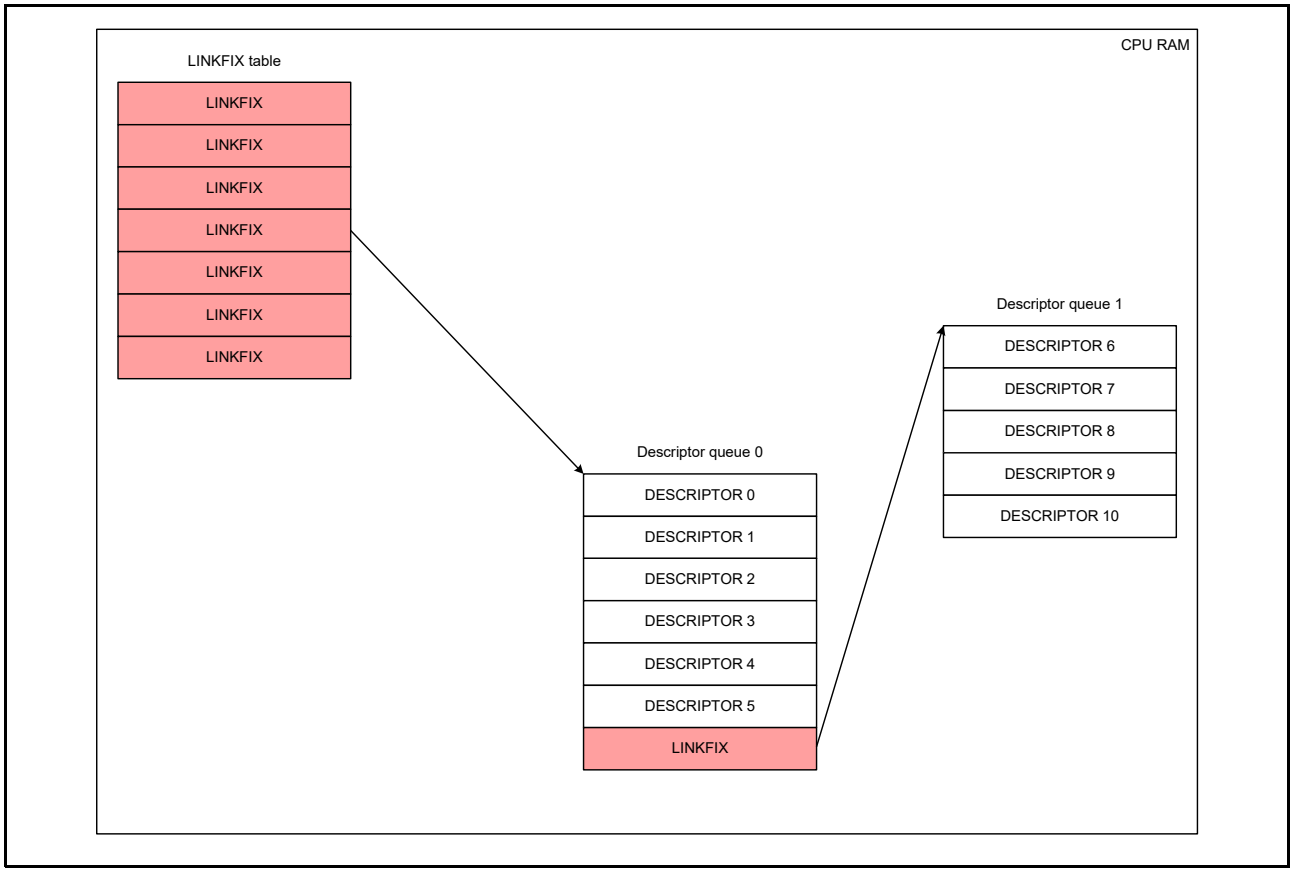

Figure 38.8 LINKFIX Descriptor Utilization

Note: The LINKFIX table is described in section 38.3.1.3, LINKFIX Table.
Note: A LINKFIX descriptor can be placed anywhere in a descriptor queue.
Note: LINKFIX and LINK descriptors are interchangeable. The only difference is that the LINK descriptor can be written back by HW.

Table 38.7 LINKFIX Utilization Format (for Basic Descriptor, refer to (1) General Formats)

LINKFIX Written by SW								
Byte	**Bit7**	**Bit6**	**Bit5**	**Bit4**	**Bit3**	**Bit2**	**Bit1**	**Bit0**
0	00000000b							
1	0000b				0000b			
2	0				0b	0b	0b	0b
3	PTR[39:32]							
4	PTR[31:0]							
5								
6								
7								

Table 38.8 LINKFIX Utilization Field Description

Field name	Field description written by SW	Field description after HW write-back
DS	000h	NA: LINKFIX descriptors are never written back
INFO0	0000b	NA: LINKFIX descriptors are never written back
ERR	0	NA: LINKFIX descriptors are never written back
DSE	0	NA: LINKFIX descriptors are never written back
AXIE	0	NA: LINKFIX descriptors are never written back
DIE	0	NA: LINKFIX descriptors are never written back
DT	0	NA: LINKFIX descriptors are never written back
PTR	PTR Pointer pointing to the new descriptor queue	NA: LINKFIX descriptors are never written back
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	NA: LINKFIX descriptors are never written back
TS (GWDCCi.ETS = 1)	0000000000000000h	NA: LINKFIX descriptors are never written back

(2) LINK Descriptor Utilization

A LINK descriptor has the same usage as a LINKFIX descriptor (refer to (1) LINKFIX Descriptor Utilization). Contrary to the LINKFIX descriptor the LINK descriptor can be written back by HW. The LINK descriptor format is described in Figure 38.9 and Table 38.9.

Note: LINKFIX and LINK descriptors are interchangeable. The only difference is that the LINK descriptor can be written back by HW.

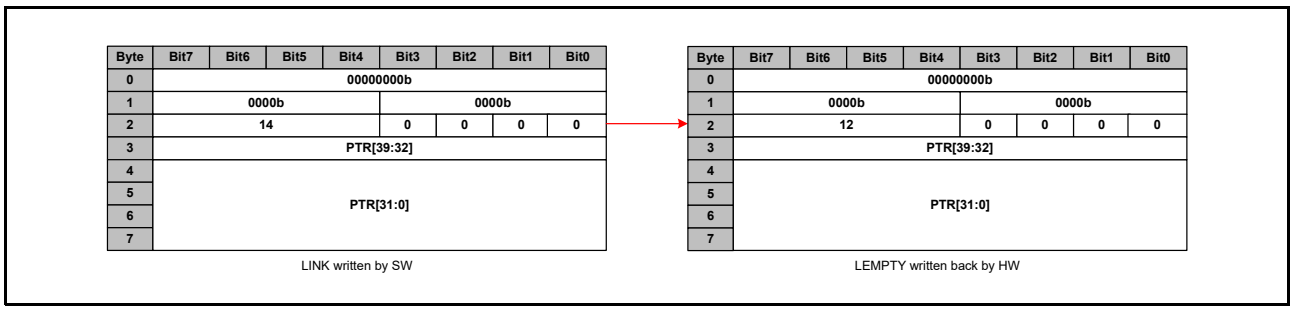

Figure 38.9 LINK Utilization Format (for Basic Descriptor, refer to (1) General Formats)

Table 38.9 LINK Utilization Field Description

Field name	Field description written by SW	Field description after HW write-back
DS	000h	000h (Value is copied from read descriptor)
INFO0	0000b	0000b (Value is copied from read descriptor)
ERR	0	0 (Value is copied from read descriptor)
DSE	0	0 (Value is copied from read descriptor)
AXIE	0	0 (Value is copied from read descriptor)
DIE	0	0 (Value is copied from read descriptor)
DT	14	12 (Value is copied from read descriptor)
PTR	PTR (user setting) Pointer pointing to the new descriptor queue	PTR (Value is copied from read descriptor)
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	NA: INFO1 not written back for LINK descriptors
TS (GWDCCi.ETS = 1)	0000000000000000h	NA: TS not written back for LINK descriptors

38.3.1.5 AXI Descriptor Queue Format

The AXI master accepts two kinds of descriptor queues: linear descriptor queues and cyclic descriptor queues. A linear descriptor queue is a queue which is ended by a terminate descriptor. A linear descriptor queue example is described in Figure 38.10. A cyclic descriptor queue is a queue which is looping on itself. A cyclic descriptor queue example is described in Figure 38.11.

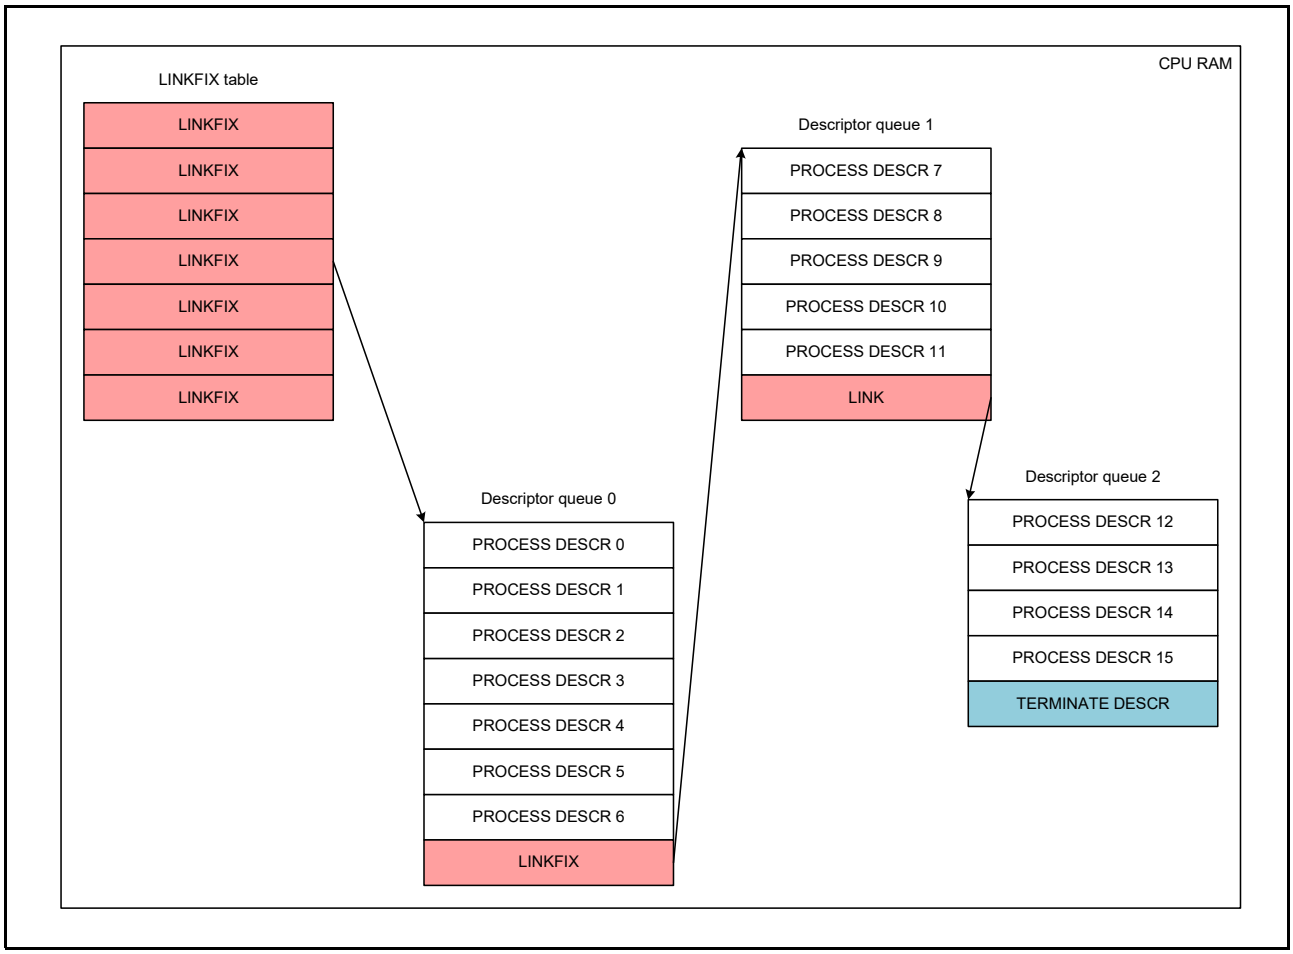

Figure 38.10 Linear Descriptor Queue Example

[Restriction]

- SW: To add data to a linear queue, the SW should write the data and process/terminate descriptor and overwrite the previous terminate descriptor with a LINK/LINKFIX descriptor pointing to the new descriptor chain.

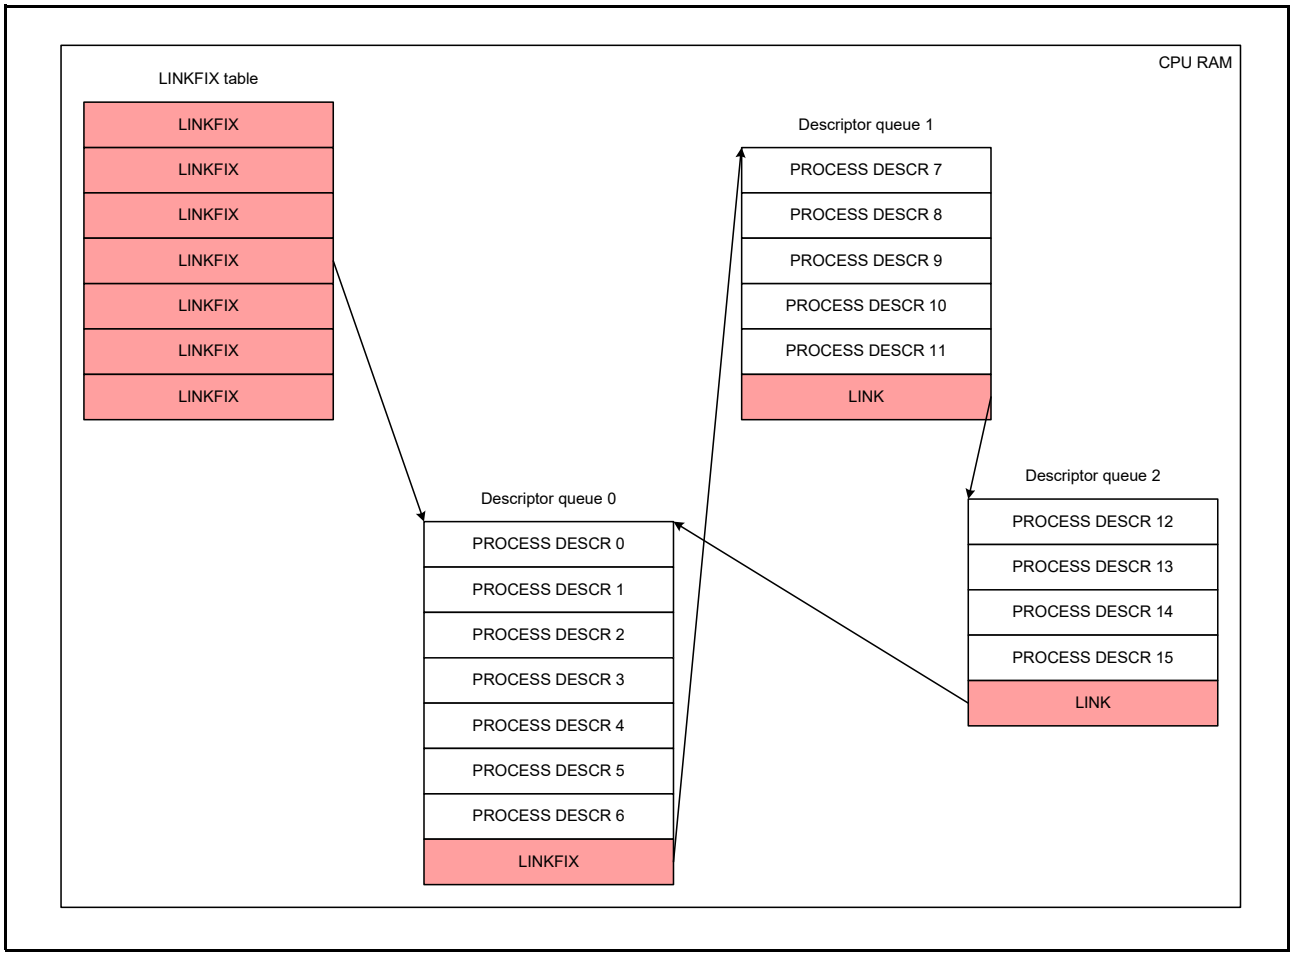

Figure 38.11 Cyclic Descriptor Queue Example

Note: The LINKFIX table is described in section 38.3.1.3, LINKFIX Table.

Note: The LINK, LINKFIX utilization is described in section 38.3.1.4, AXI Common Descriptor Utilization.

Note: A terminate descriptor (TERMINATE DESCR in Figure 38.10) correspond to a FSINGLE or a LEMPTY descriptor for an RX queue, a FEMPTY or a LEMPTY descriptor for a TX queue and a FSINGLE or a LEMPTY descriptor for a TS queue.

Note: A process descriptor (PROCESS DESCR in Figure 38.10 and Figure 38.11) correspond to a FEMPTY_IS, FEMPTY_IC, FEMPTY_ND, FEMPTY, FEMPTY_START, FEMPTY_MID or FEMPTY_END descriptor for an RX queue (refer to section 38.3.3.4, AXI Master Interface), to a FSINGLE, FSTART, FMID, FEND or EOS descriptor for a TX queue (refer to section 38.3.2.2, AXI Master Interface) and to a FEMPTY_ND descriptor for a TS queue (refer to section 38.3.4.2, AXI Master Interface).

38.3.1.6 AXI Address RAM Searching

Searching functions is used to read entries in the AXI address RAM. Table 38.10 describes register used to read an entry in the TAS RAM. Table 38.11 describes the read results.

Table 38.10 AXI Address Read Registers

Register name	Field name/corresponding field in MAC table	Field explanation
GWAARSS.AARA	Entry address Set the descriptor queue number from which AXU address should be read	Not present in AXI address RAM, entry will be read from this address

Table 38.11 AXI Address Read Result

Register name	Field name/corresponding field in MAC table	Field explanation
{GWAARSR0.ACARU[7:0], GWAARSR1.ACARL[31:0]}	AXI address value	Address of the next descriptor to be processed for AXI descriptor queue number GWAARSS.AARA[5:0]

[Caution]

- {GWAARSR0.ACARU[7:0], GWAARSR1.ACARL[31:0]} indicates the address of the next descriptor to be processed for AXI descriptor queue number but it does not mean that the previous descriptor process is completed. That's why this register only has debugging purpose and not HW/SW synchronization purposes.

38.3.2 Data Transmission

GWCA allows data transmission through the GWCA TX data path, The TX data path is described in Figure 38.12.

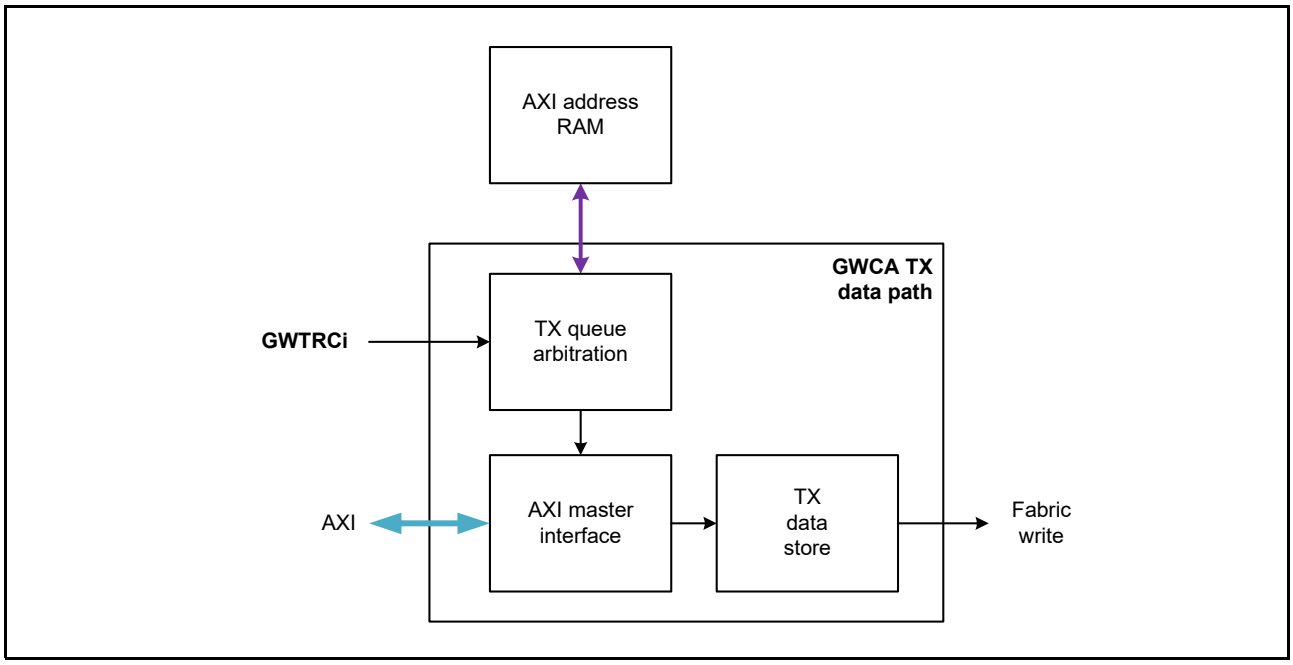

Figure 38.12 GWCA TX Data Path Block Diagram

The TX data path is separated in three blocks:

- TX queue arbitration: This block arbitrates between TX queues when several queues are requesting for transmission.
- AXI master interface: This block handles the data/AXI descriptor exchange with the CPU.
- TX data store: This block extracts TAG information for frames, applies VLAN tagging and save the frames in the local RAM. This block can also release pointers while going out of OPERATION mode. The pointer release is here for switch hardware purpose and its description is not required for switch utilization so it will not be described.

38.3.2.1 TX Queue Arbitration

TX queue arbitration has four functions. Pausing certain queues when switch is about to overflow, limiting TX queue data rates, arbitrating between TX descriptor queue with a strict priority algorithm and arbitrating between same priority queues with a round robin algorithm.

(1) Per Priority Pause

Per priority pause aims at pausing descriptor queue transmission depending on their priority using PAUSE[2 for GWCA0] values [COMA] and GWTPCp register. It avoids the AXI master to inject uncritical data in the switch when it is about to overflow.

[Function]

- GWTPCp sets the priorities that should be paused when PAUSE[2 for GWCA0][p] is set.

(2) Rate Limiters

Rate limiters are controlling the input flow of the switch. Using these limiters could prevent the switch from overflowing. GWCA has two types of rate limiters, a global rate limiter and 8 per-queue rate limiters. By setting the rate limiter configurations correctly, expected bandwidth with a tolerance value of less than ± 2% can be achieved.

(a) Per-Queue Rate-Limiter

A per-queue rate-limiter aims at limiter the data throughput per one descriptor queue using GWRLCi.RLE, GWRLCi.RLIV[11:0] and GWRLULCi.RLUL[23:0] bits. For per-port rate limiter/descriptor queue mapping information refer to section 38.3.1.1, AXI Descriptor Queue Mapping.

[Function]

- GWRLCi.RLE bit enables rate-limiter number i.
- GWRLCi.RLIV[11:0] bits sets the maximum throughput accepted by rate limiter number i and should be set respecting equation (1).
- GWRLULCi.RLUL[23:0] bits sets the maximum collision time accepted by rate limiter number i and should be set respecting equation (2).

(1) GWRLCi.RLIV[11:0] = 256 × ACLK_period[ns] × maxBandwidth[Gbps]
(2) GWRLULCi.RLUL[23:0] = maximumBurst[bit]

[Where]

- ACLK_period is ACLK clock period.
- maxBandwidth is the expected maximum throughput accepted by rate limiter number i.
- maximumBurst is the maximum burst in bit accepted for corresponding queue.

(b) Global Rate Limiter

The global rate limiter aims at limiting all AXI data transmission throughput using GWGRLC.GRLE, GWGRLC.GRLIV[15:0] and GWGRLULC.GRLUL[23:0] bits and can be monitored using GWGRLC.GRLULRS.

[Functions]

- GWGRLC.GRLE bit enables the global rate limiter.
- GWGRLC.GRLIV[15:0] bits set the maximum throughput accepted by AXI data transmission and should be set respecting equation (1).
- GWGRLULC.GRLUL[23:0] bits set the maximum number of credits that the global rate limiter can stack and should be set respecting equation (2).
- GWGRLC.GRLULRS flag shows if some credit has been lost because of a too high AXI latency or because of a too slow AXI.

(1) GWGRLC.GRLIV[15:0] = 256 × ACLK_period[ns] × max_bandwidth[Gbps]
(2) GWGRLULC.GRLUL[23:0] = ACLK_period[ns] × max_bandwidth[Gbps] × 2*maximum_axi_latency[cycle]

[Where]

- ACLK_period is ACLK clock period in ns.
- max_bandwidth is the expected maximum throughput accepted by GWCA.
- maximum_axi_latency is the AXI maximum latency in ACLK clock number.

[Restriction]

- SW: The sum of all GWRLCi.RLIV[11:0] bits should always be smaller or equal to GWGRLC.GRLIV[15:0].

(3) Strict Priority

Strict priority arbitrates between TX queue which are authorized by rate limiters to transmit using GWDCCi.DCP[2:0]. The strict priority algorithm operates as the one in the data reception descriptor store. Refer to (a) Strict priority (SP) in (2) Descriptor Arbitration for more information.

[Functions]

- GWDCCi.DCP[2:0] bits set descriptor queue i priority. The highest priority is the biggest value.

(4) Round Robin

Round robin arbitrates between the highest priority queues selected by the strict arbiter. The round robin operates as the one in the data reception descriptor store. Refer to (b) Round Robin (RR) in (2) Descriptor Arbitration for more information.

38.3.2.2 AXI Master Interface

The AXI master interface handles the data/AXI descriptor exchange with the CPU. It receives the queue number of the descriptor queue number authorised to transmit by the TX queue arbitration, read the corresponding data from the CPU RAM and send the data to TS data store. To do so, it uses GWTRCi.TSRt, GWDCCi.EDE, GWDCCi.ETS, GWDCCi.SM[1:0] bits and can be monitored using GWAARSS, GWAARSR0, and GWAARSR1 registers.

[Functions]

- GWTRCi.TSRt bit is used to start transmission when a descriptor queue is ready.
- GWDCCi.EDE and GWDCCi.ETS bits set the descriptor format that will be used for descriptor queue number i refer to (1) General Formats.
- GWDCCi.SM[1:0] bits sets how GWCA will write back descriptors. In this section all explanation will use GWDCCi.SM[1:0] equal to 00b. For GWDCCi.SM[1:0] equal to 01b or 10b refer to the register explanation.
- For GWAARSS, GWAARSR0 and GWAARSR1 registers refer to section 38.3.1.6, AXI Address RAM Searching.

[Restriction]

- SW: Only basic descriptors and extended descriptors are authorized for data transmission, refer to (1) General Formats.

Data transmission can be done using linear or cyclic descriptor queues (refer to section 38.3.1.5, AXI Descriptor Queue Format). Data transmission process descriptors can be set two different ways, through the basic data transmission descriptor chain (refer to (1) Basic Data Transmission) and the time-controlled data transmission descriptor chain (refer to (2) Time-Controlled Data Transmission).

(1) Basic Data Transmission

Basic data transmission process descriptor utilization is described in Figure 38.13. Basic data transmission process descriptor format is described in Figure 38.14 and Table 38.12.

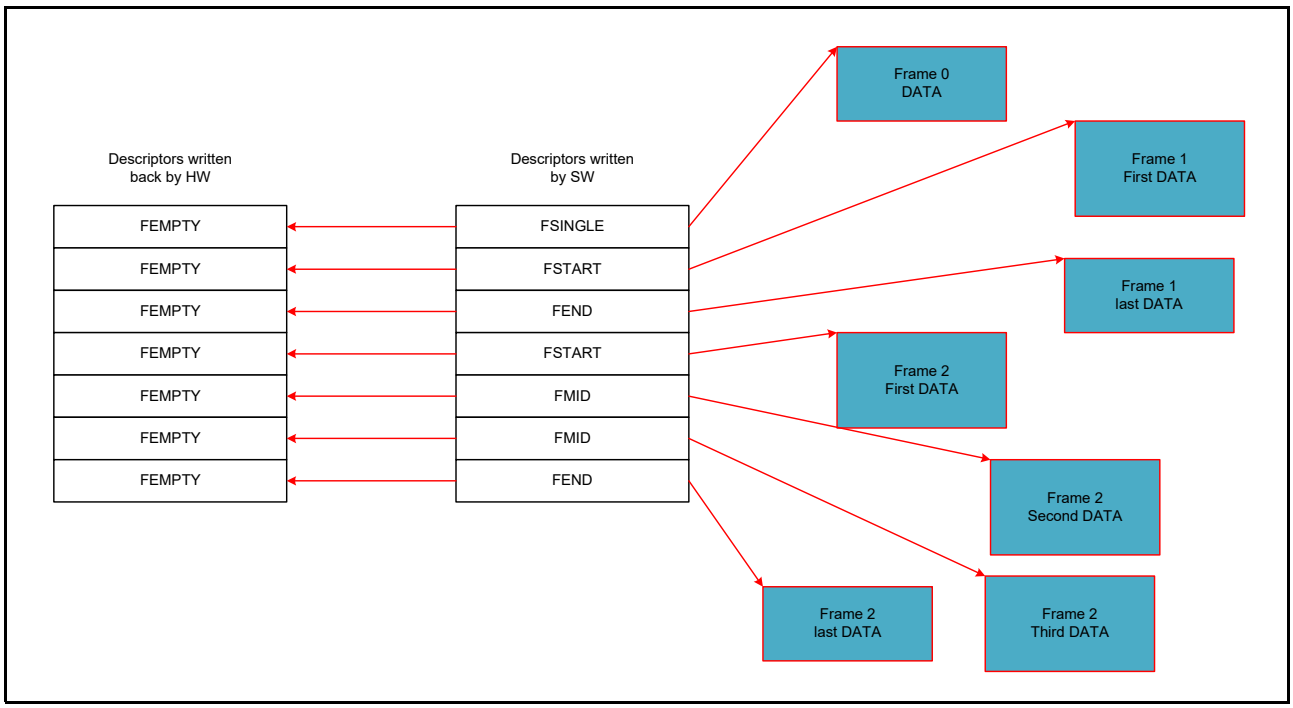

Figure 38.13 Basic Data Transmission Process Descriptor Utilization

Note: If needed, the SW can split a frame between several descriptors. The first descriptor should be a FSTART descriptor, the last descriptor should be a FEND descriptor and all other descriptors should be FMID descriptors.

Note: When data is ready, CPU should set the corresponding GWTRCi.TSRt bit to start transfer. Refer to GWTRCi.TSRt description.

Note: GWTRCi.TSRt can be set anytime even if data is not available. The GWCA will in this case read the terminate descriptor and clear GWTRCi.TSRt bit.

[Restriction]

- SW: When a frame is split, the FSTART descriptor should be written after FMIDs and FEND descriptor for a given frame.

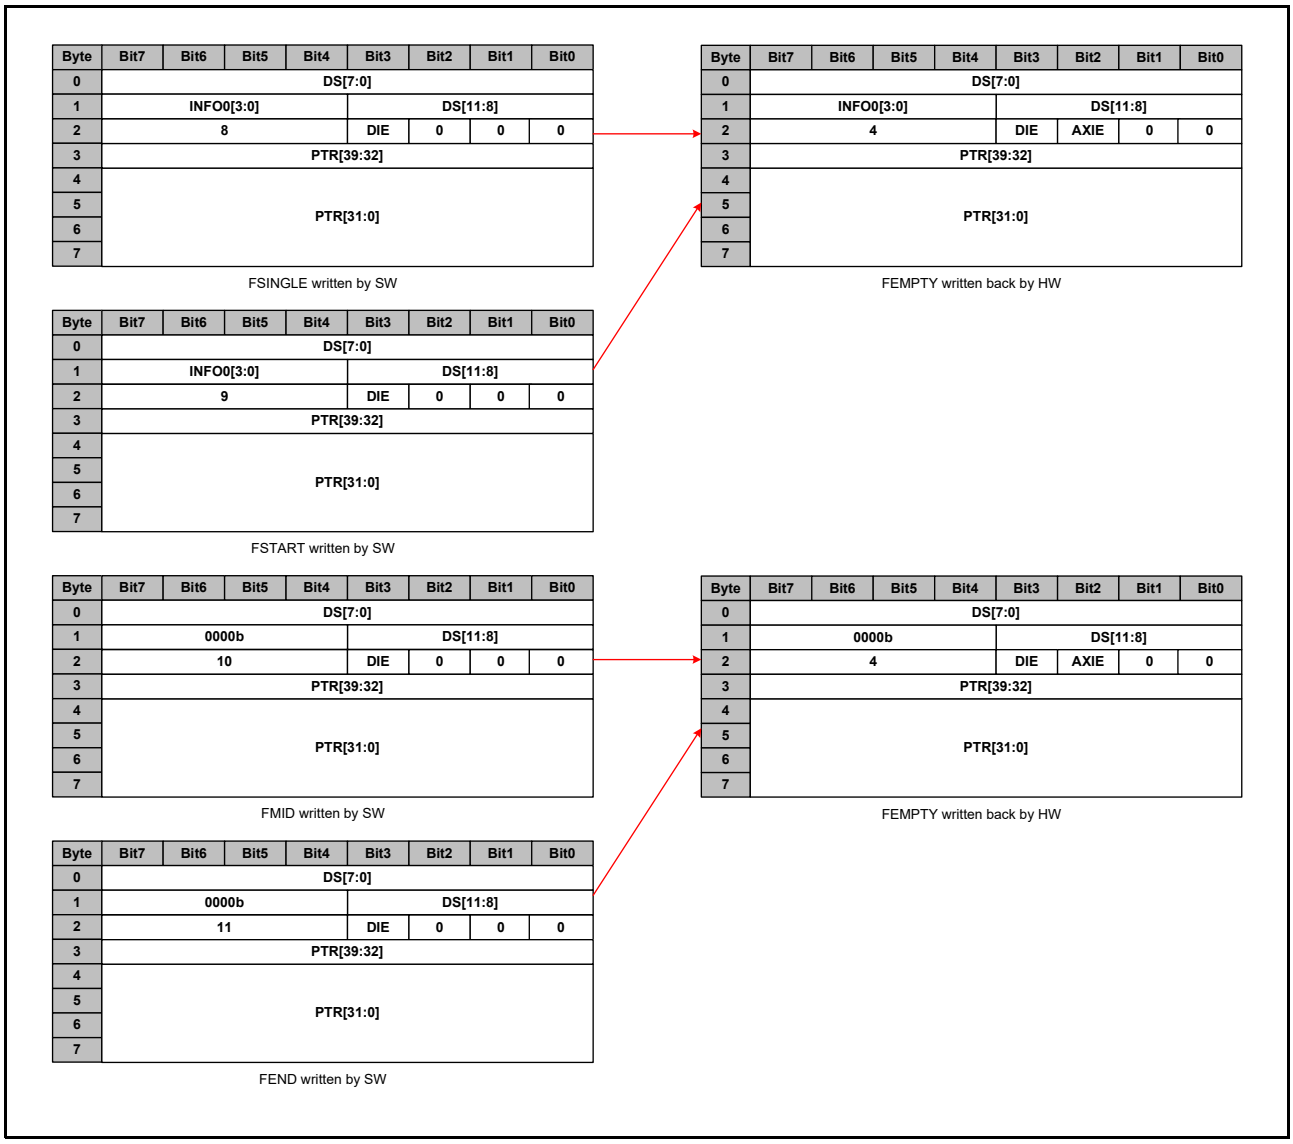

Figure 38.14 Basic Data Transmission Process Descriptor Utilization Format (for Basic Descriptor, Refer to (1) General Formats)

Table 38.12 Basic Data transmission Process Descriptor Utilization Field Description

Field name	Field description written by SW	Field description after HW write-back
DS	Data what has been written to the URAM by SW	DS (Value is copied from read descriptor)
INFO0	For FSINGLE and FSTART refer to (3) Data Transmission Common Descriptor Format 0000b for FMID and FEND.	INFO0 (Value is copied from read descriptor)
ERR	0	0
DSE	0	0
AXIE	0	[Setting conditions] HW: An AXI error happened while reading a data (RRESP ≠ 00b).
DIE	DIE	DIE (Value is copied from read descriptor)
DT	8 for FSINGLE 9 for FSTART 10 for FMID 11 for FEND	4 for FEMPTY
PTR	Address where data is written in the URAM	PTR (Value is copied from read descriptor)
INFO1 (GWDCCi.EDE = 1)	For FSINGLE and FSTART refer to (3) Data Transmission Common Descriptor Format 0000b for FMID and FEND.	NA: INFO1 not written back for transmission
TS (GWDCCi.ETS = 1)	NA: No timestamp descriptor for transmission	NA: No timestamp descriptor for transmission

(2) Time-Controlled Data Transmission

Time-controlled data transmission process descriptor utilization is described in Figure 38.15. Time-controlled data transmission process descriptor format is described in Figure 38.16 and Table 38.13. FSINGLE, FSTART, FMID, FEND and FEMPTY formats are not described in this section, for their description refer to Figure 38.14 and Table 38.12.

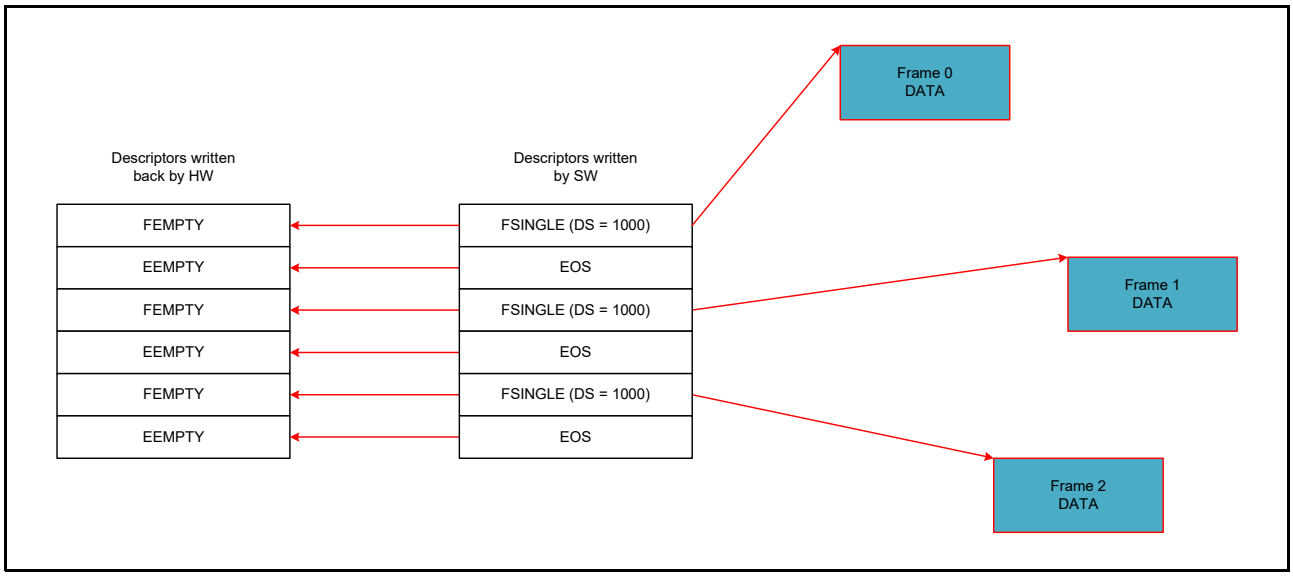

Figure 38.15 Time-Controlled Data Transmission Process Descriptor Utilization

Note: If needed, the SW can split a frame between several descriptors. The first descriptor should be a FSTART descriptor, the last descriptor should be a FEND descriptor and all other descriptors should be FMID descriptors.

Note: When data is ready, CPU should set the corresponding GWTRCi.TSRt bit to start transfer. Refer to GWTRCi.TSRt description.

Note: Reading an EOS descriptor will have per effect to clear GWTRCi.TSRt bit. So, if the CPU set GWTRCi.TSRt bit at a cyclic timing, CPU can control the data throughput (If TSR is already set when the CPU tries to set it the next time, only one frame will be sent so a decrease in throughput can happen).

Note: GWTRCi.TSRt bit can be set automatically using gPTP timer [GPTP]. Refer to section 38.3.5, gPTP Triggered Transmission.

Note: GWTRCi.TSRt can be set anytime even if data is not available. The GWCA will in this case read the terminate descriptor and clear GWTRCi.TSRt bit.

[Restriction]

- SW: When a frame is split, the FSTART descriptor should be written after FMIDs and FEND descriptor for a given frame.

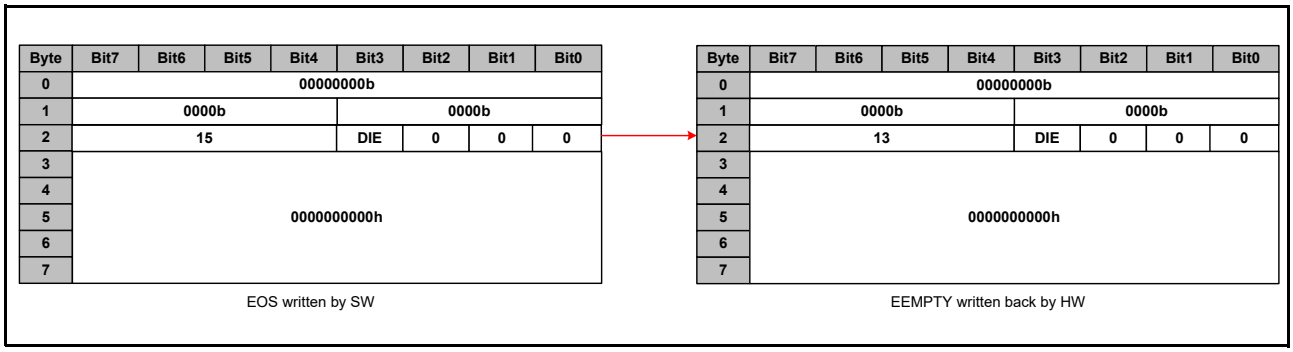

Figure 38.16 Time-Controlled Data Transmission Process Descriptor Utilization Format (for Basic Descriptor, Refer to (1) General Formats)

Table 38.13 Time-Controlled Data Transmission Process Descriptor Utilization Field Description

Field name	Field description written by SW	Field description after HW write-back
DS	000h	DS (Value is copied from read descriptor)
INFO0	0000b	INFO0 (Value is copied from read descriptor)
ERR	0	0
DSE	0	0
AXIE	0	0
DIE	DIE	DIE (Value is copied from read descriptor)
DT	15	13
PTR	0000000000h	PTR (Value is copied from read descriptor)
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	NA: INFO1 not written back for EOS descriptors
TS (GWDCCi.ETS = 1)	NA: No timestamp descriptor for transmission	NA: No timestamp descriptor for transmission

(3) Data Transmission Common Descriptor Format

In this section are described the fields which are common for any data transmission (INFO0 and INFO1). There are two types of formats, the transmission direct descriptor and the transmission ethernet descriptor formats. the transmission direct descriptor could be used, for example, for non-routable protocol forwarding (network control) or for CPU-CPU communication and the transmission ethernet descriptor could be used for all normal ethernet transmissions. All the fields contained in AXI descriptors, if quoted, will be written ADESCR.{Field name}.

(a) Transmission Direct Descriptor

Transmission direct descriptor is used by a CPU to send frames by deciding their target directly (Forwarding engine processing will be by-passed [MFWD]). Transmission direct descriptor INFO formats are described in Figure 38.17 and Table 38.14.

[Restriction]

- SW: The Transmission direct descriptor can only be and extended descriptor, refer to (1) General Formats.

INFO0

Byte	Bit3	Bit2	Bit1	Bit0
0	RSV		SEC	FI

INFO1

Byte	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0	RSV	TN	CRT	IET	TXC	FMT	SEC	FI
1	TSUN[7:0]							
2	RN[7:0]							
3	FW	IPV[2:0]			RV	RSV		
4	RSV	CSD0[6:0]						
5	RSV							
6	RSV	DV[6:0]						
7	RSV							

Figure 38.17 Transmission Direct Descriptor INFO Formats

Table 38.14 Transmission Direct Descriptor INFO Field Descriptions

Field name	Bit width	Description
FI	1	FCS in.
SEC	1	Secure descriptor
FMT	1	Descriptor format Restrictions: • SW: Fixed to 1 for Direct descriptor.
TXC	1	TX Timestamp capture [RMAC]. Used to set corresponding bit in RMAC TX interface.
IET	1	Timestamp insertion request [RMAC]. Used to set corresponding bit in RMAC TX interface.
CRT	1	Residence time calculation request [RMAC]. Used to set corresponding bit in RMAC TX interface.
TN	1	Timer utilized for capture/insertion [RMAC]. Used to set corresponding bit in RMAC TX interface.
TSUN	8	Timestamp unique number [RMAC]. Used to set corresponding bit in RMAC TX interface.
RV	1	
RN	8	
IPV	3	Internal priority value Target priority of the frame.
FW	1	The FCS contained in the frame is wrong (It will be corrected in the switch)
CSD0	6	CPU sub destination for GWCA0
DV	4	Destination vector [MFWD]
RSV	—	Reserved area Restrictions: • SW: these fields should be set to 0.

(b) Transmission Ethernet Descriptor

Transmission ethernet descriptor is used by a CPU to send frames that will be forwarded by the Forwarding engine [MFWD]. Transmission ethernet descriptor INFO formats are described in Figure 38.18 and Table 38.15.

[Restriction]

- SW: Because FW field (refer to (a) Transmission Direct Descriptor) is not present in an Ethernet descriptor. Any transmit frame should have either a correct FCS or no FCS.

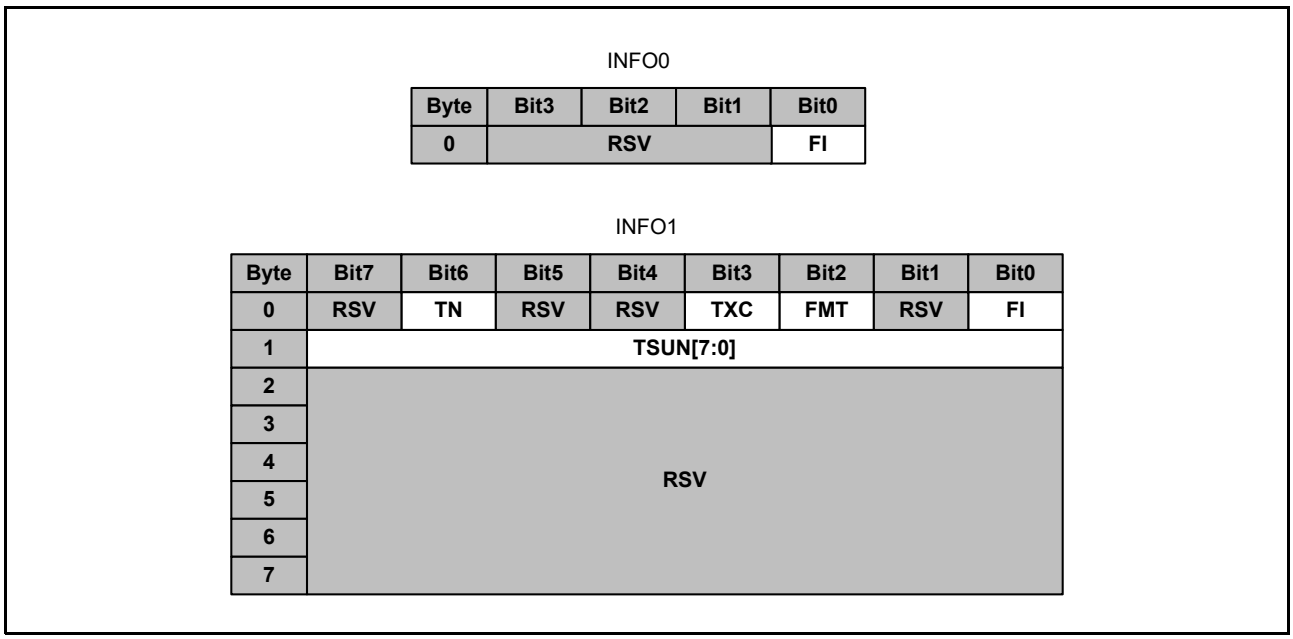

Figure 38.18 Transmission Ethernet Descriptor INFO Formats

Table 38.15 Transmission Ethernet Descriptor INFO Field Descriptions

Field name	Bit width	Description
FI	1	FCS in.
FMT	1	Descriptor format Restrictions: • SW: Fixed to 0 for Ethernet descriptors.
TXC	1	TX Timestamp capture [RMAC]. Used to set corresponding bit in RMAC TX interface.
TN	1	Timer utilized for capture/insertion [RMAC]. Used to set corresponding bit in RMAC TX interface.
TSUN	8	Timestamp unique number [RMAC]. Used to set corresponding bit in RMAC TX interface.
RSV	—	Reserved Restrictions: • SW: these fields should be set to 0.

38.3.2.3 TX Data Store

TX data store has follow functions, it extracts TAG information for frames, applies VLAN tagging, and save the frames in the local RAM. These functions are applied to all frames independently from their descriptor format.

(1) TAG Information Extraction

TAG information extraction is done in HW without setting intervention. The extracted format can be filtered using GWTTFC register. TAG information extraction is described in Figure 38.19 along with GWTTFC register bit explanation for TAG filtering. The extracted fields are SN, CoS-TCI, C-TCI and S-TCI.

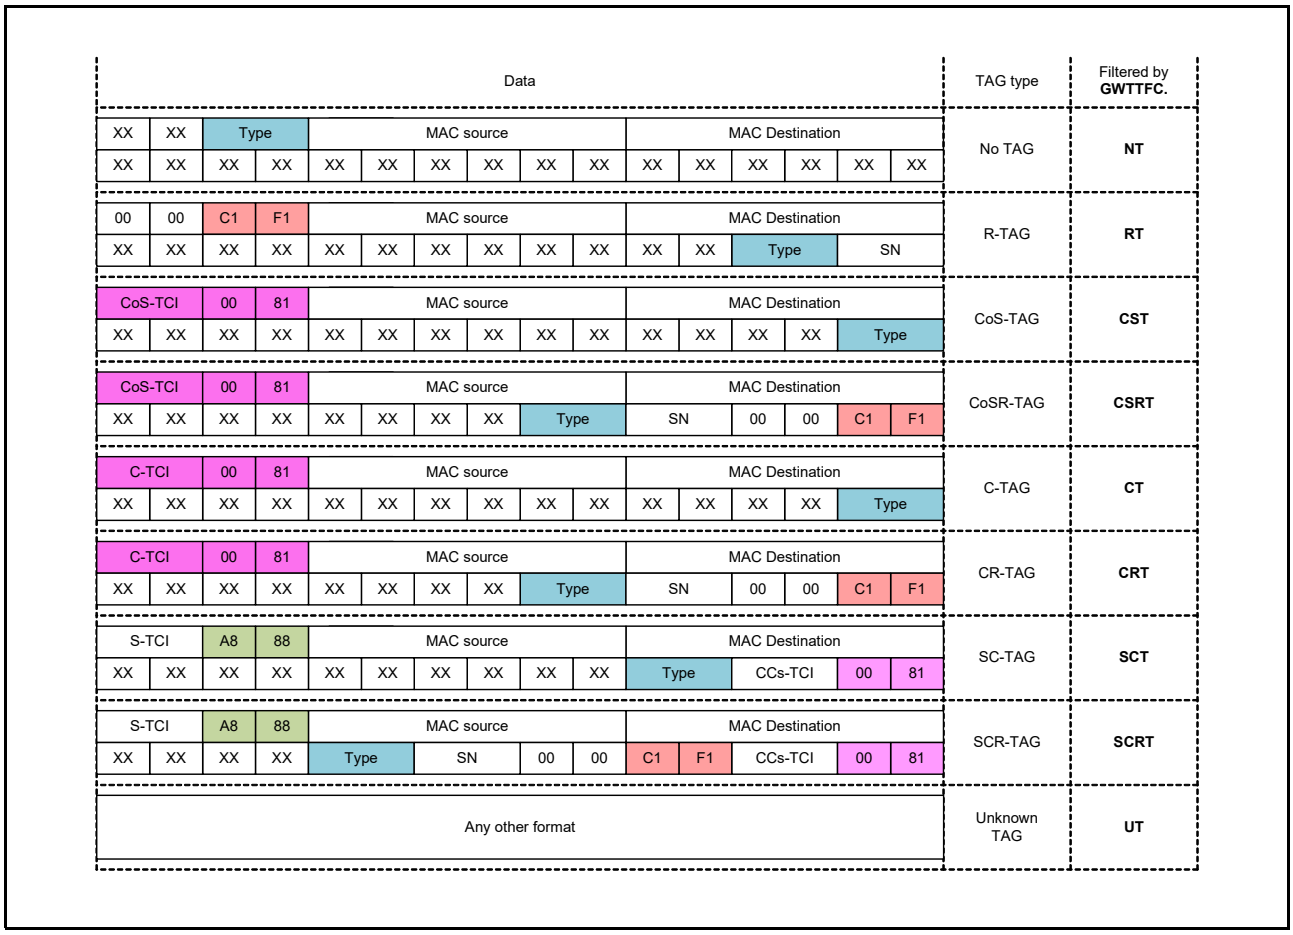

Figure 38.19 TAG Information Extraction

Note: Only colored part in Figure 38.19 are considered for TAG information extraction.
Note: HF1C1 corresponds to R-TAG TPID and SN correspond to R-TAG sequence number [802.1CB].
Note: H8100 corresponds to C-TAG TPID, C-TCI corresponds to a C-TAG TCI with a non-null VID, CoS-TCI corresponds to a C-TAG TCI with a null VID and CCs-TCI corresponds to C-TCI or CoS-TCI [802.1Q].
Note: H88A8 corresponds to S-TAG TPID and S-TCI corresponds to a S-TAG TCI [802.1Q].
Note: Type corresponds to any Ethernet type value which is not HF1C1, H88A8 or H8100.
Note: TPID values can be configured in Forwarding Engine [MFWD]. Values for TPIDs can be set in forwarding engine (in FWTTC0 and FWTTC1 registers).

[Restriction]

- HW: Because 32 bytes are needed for TAG extraction, GWCA will reject transmit frames smaller than 32 bytes and set GWEIS0.USMFSES bit.
- SW: In R-TAG, the reserved part should always be set to 0. If the reserved part is not set to 0 and corresponding

frame contains an FCS, the frame could be forwarded with an error.

(2) VLAN Tagging

VLAN tagging replaces or overwrites present TAGs in a frame using the format given by TAG information extraction (refer to (1) TAG Information Extraction), switch VLAN mode (FWGC.SVM[1:0] bits in forwarding engine [MFWD]) and, GWVCC and GWVTC registers. After VLAN tagging, any frame has three TAGs, one R-TAG, one C-TAG and one S-TAG which will be directly saved in the TAG RAM [MFWD].

Functions:

- GWVCC.VIM bit sets the TX data path in Port based VLAN (all incoming frames are sent to the forwarding engine with the same VLAN ID). GWVCC.VIM setting is ignored when the switch in is No VLAN mode (FWGC.SVM bit in forwarding engine set to 00b) [MFWD].
- GWVTC register is used to set the HW TAGs. There are three possible HW TAGs. The HW C-TAG made from GWVTC.CTV[11:0] as VID, GWVTC.CTP[2:0] as PCP and GWVTC.CTD as DEI. The HW S-TAG made from GWVTC.STV[11:0] as VID, GWVTC.STP[2:0] as PCP and GWVTC.STD as DEI. The HW CoS-TAG made from GWVTC.CTV[11:0] as VID, the incoming frame PCP as PCP and the incoming frame DEI as DEI.

TAGs after VLAN tagging are described in Figure 38.20, Figure 38.21 and Figure 38.22 depending on Switch VLAN mode (FWGC.SVM bit in forwarding engine [MFWD]) and the type of frame given by TAG information extraction (refer to (1) TAG Information Extraction). In the figures, the data extracted from the incoming frames are in blue and the added HW TAGs are in red.

TAG type	R-TAG	C-TAG	S-TAG
No TAG	0	0	0
R-TAG	SN	0	0
CoS-TAG	0	CoS-TCI	0
CoSR-TAG	SN	CoS-TCI	0
C-TAG	0	C-TCI	0
CR-TAG	SN	C-TCI	0
SC-TAG	0	C-TCI	S-TCI
SCR-TAG	SN	C-TCI	S-TCI
Unknown TAG	0	0	0

Figure 38.22 TAGs after VLAN Tagging: Switch in SC-TAG Mode [MFWD]

(3) Frame Saving in Local RAM

For frame saving in the local RAM, refer to Fabric specification document [MFWD], section “Data representation in RAMs”. Only the frame descriptor mentioned in Fabric specification document [MFWD] will be described in this section.

There are two types of Local RAM descriptors, direct local descriptors and the ethernet local descriptors. They are respectively created from direct descriptors and ethernet descriptors, refer to (3) Data Transmission Common Descriptor Format.

All the fields in these descriptors, if quoted, will be written LDESCR.{Field name}.

(a) Direct Local Descriptor

Direct local descriptor format is described in Figure 38.23 and Table 38.16.

RTGI	1	R-TAG in	0: For No TAG, CoS-TAG, C-TAG, SC-TAG and Unknown TAG frames, refer to (1) TAG Information Extraction. 1: For R-TAG, CoSR-TAG, CR-TAG and SCR-TAG frames, refer to (1) TAG Information Extraction.
TPL	16	Total payload length	Payload length of frame. It only includes the data saved in the data RAM [MFWD].
TSV	1	Timestamp valid	Set to 0. Unused in GWCA.
TSD	1	Timestamp default	Set to 0. Unused in GWCA.
TSNS	30	Timestamp nanosecond [GPTP]	Set to 00000000h. Unused in GWCA.
TSS	32	Timestamp second [GPTP] Restrictions: • HW: The 16-upper bits of the gPTP [GPTP] second part are truncated.	Set to 00000000h. Unused in GWCA.
RSV	—	Reserved area	Set to 0

(c) SAEF Format

Source agent error flag format is described in Figure 38.25 and Table 38.18.

Byte	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0	RSV	DNE	RSV	SEQE	AXE	RSV	RSV	TFE

Figure 38.25 Source Agent Error Flag Format

Table 38.18 Source Agent Error Flag Field Description

Field name	Bit width	Description
TFE	1	TAG Filtering Error [Setting conditions] • HW: When a frame does not fit the required TAG ingress format. Refer to GWTTFC register explanation.
AXE	1	AXI Error [Setting conditions] • HW: When an AXIE error happened during a split frame, the frame is sent incomplete.
SEQE	1	Sequence Error [Setting conditions] • HW: When a FSINGLE, FSTART, EOS or unknown descriptor is received during a split frame, the frame is sent incomplete.
DNE	1	Descriptor Number Error • HW: When a number GWMDNC.TXDMN[4:0]+1 of descriptor has been already read to fetch a frame during a spit frame and the frame is not finished. The frame is sent incomplete.
RSV	—	Reserved Set to 0

38.3.3 Data Reception

GWCA allows data reception through the GWCA RX data path, The RX data path is described in Figure 38.26.

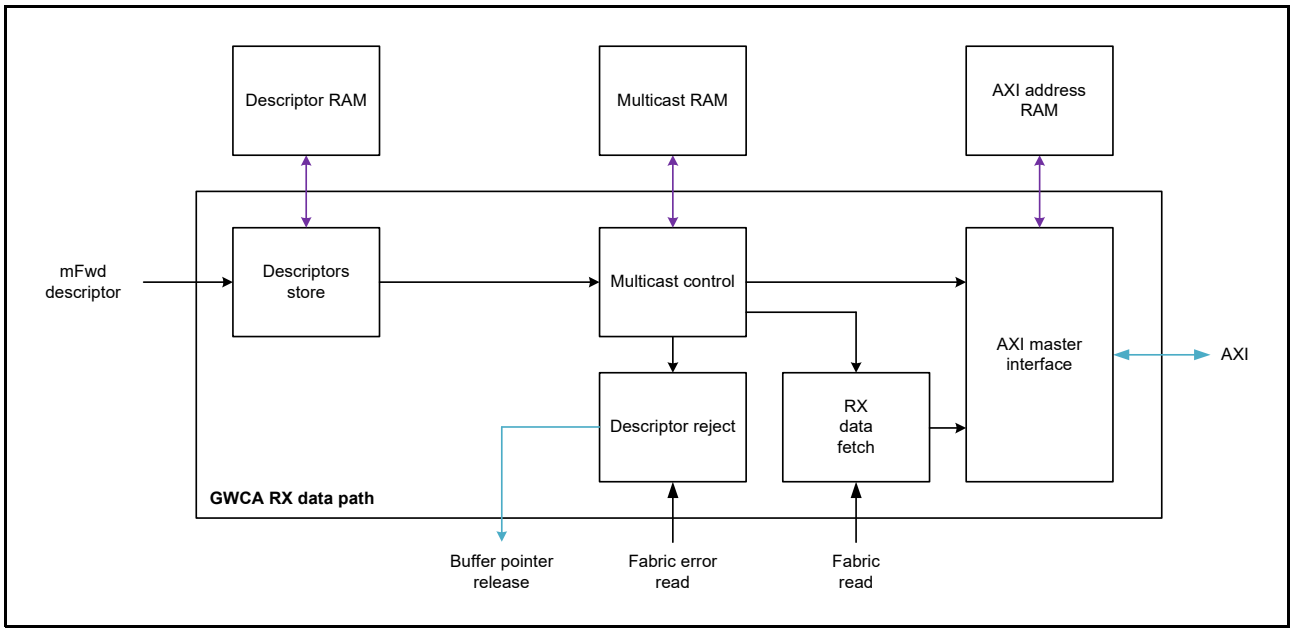

Figure 38.26 GWCA RX Data Path Block Diagram

The RX data path is separated in five blocks:

- Descriptor store: This block aims at storing the descriptor received from the Forwarding Engine [MFWD] in the Descriptor RAM and controls the arbitration between descriptors.
- Multicast control: This block aims at checking the frame size and security level and decide to forward or discard frames and at copying the descriptors to be able to send the data at several CPU sub-destinations.
- Descriptor reject: This block aims at releasing the pointer of the frames rejected by Frame size control block. This block is here for switch hardware purpose and its description is not required for switch utilization so it will not be described.
- RX data fetch: This block fetches frames data from the local RAM, update frames depending on the information obtained by L2/L3 update module, on VLAN control information and the R-TAG information, can remove frame FCSs, and release frame pointers. The pointer release is here for switch hardware purpose and its description is not required for switch utilization so it will not be described.
- AXI master interface: This block handles the data/AXI descriptor exchange with the CPU.

38.3.3.1 Descriptor Store

Descriptor store has two functions. Storing the descriptors coming from the descriptor bus [MFWD] in the descriptor RAM and arbitrating descriptor read from the descriptor RAM to decide in which order the descriptors will be sent to the CPU.

(1) Descriptor Storage

Descriptor storage controls the descriptor storage using GWIRC.IPVRi[2:0], GWRDQSC.RDQSLq, GWRDQC.RDQDq, GWRDQC.RDQPq and GWRDQDCq.DQD[9:0] bits and can be monitored using GWRDQMq.DNQ[9:0] and GWRDQMLMq.DMLQ[9:0] bits and GWEIS1.DQOESq and GWEIS1.DQSESq flags. Figure 38.27 describes an example for Descriptor storage setting.

[Functions]

- GWIRC.IPVRi[2:0] bits are used to map descriptor received from forwarding engine with a given FDESCR.IPV [MFWD] value to a determined descriptor queue. For example, by setting GWIRC.IPVR6[2:0] to 1 all the descriptors received with FDESCR.IPV equal to 6 will be stored in descriptor queue number 1.
- GWRDQSC.RDQSLq is used to set a queues security level. If a queue is secure (GWRDQSC.RDQSLq is set) and a non-secure descriptor is received (FDESCR.SEC [MFWD] is not set) for this queue, the descriptor will not be stored and GWEIS1.DQSESq flag will be set.
- GWRDQC.RDQPq bit is used to pause descriptor queues. For paused descriptor queues, the descriptor transmission to CPU will stop but the descriptor storage in the descriptor RAM will continue.
- GWRDQC.RDQDq bit is used to disable descriptor queues. For disabled descriptor queues and no descriptor will be stored in the Descriptor RAM.
- GWRDQDCq.DQD[9:0] bits are used to set the maximum number of descriptors that can be stored in each descriptor queue. If a descriptor is received for descriptor q while queue q is full (GWRDQDCq.DQD[9:0] = GWRDQMq.DNQ[9:0]), the descriptor will not be stored and GWEIS1.DQOESq flag will be set.
- GWRDQMq.DNQ[9:0] bits are used to monitor the current number of descriptors in each descriptor queue.
- GWRDQMLMq.DMLQ[9:0] bits are used to monitor the maximum number of descriptors that has been held in each queue since the previous reset or the previous time corresponding register has been read.
- GWEIS1.DQOESq flag signals that descriptors have been discarded because of a descriptor queue overflow.
- GWEIS1.DQSESq flag signals that descriptors have been discarded because of a descriptor queue security error.

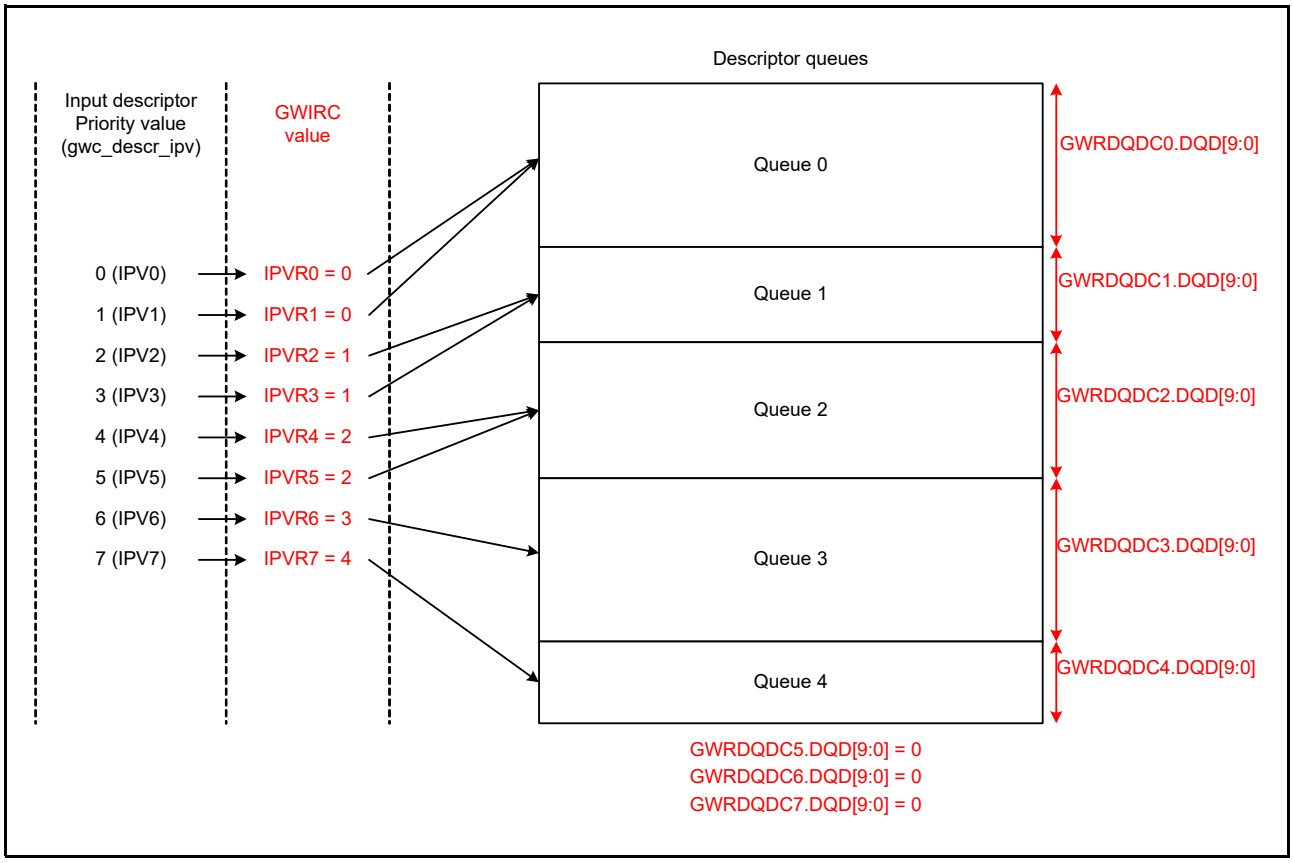

Figure 38.27 Descriptor Storage Setting Example8 == 8

(2) Descriptor Arbitration

Descriptor arbitration controls the descriptor reading order for reception using GWRDQAC register. It has 4 modes. The Strict Priority, the Round Robin, the Weight Round Robin and the Hybrid mode. This function is used to ensure QoS when the AXI access allows a throughput which is too small to allow all the data to be stored in the user RAM.

(a) Strict priority (SP)

To set the descriptor arbitration in strict priority mode, all the GWRDQAC.RDQAi[3:0] (i = 0 to 7) bits should be set to 0000b. In this case a strict priority algorithm will be applied for descriptor arbitration. The strict priority algorithm is described through an example in Figure 38.28.

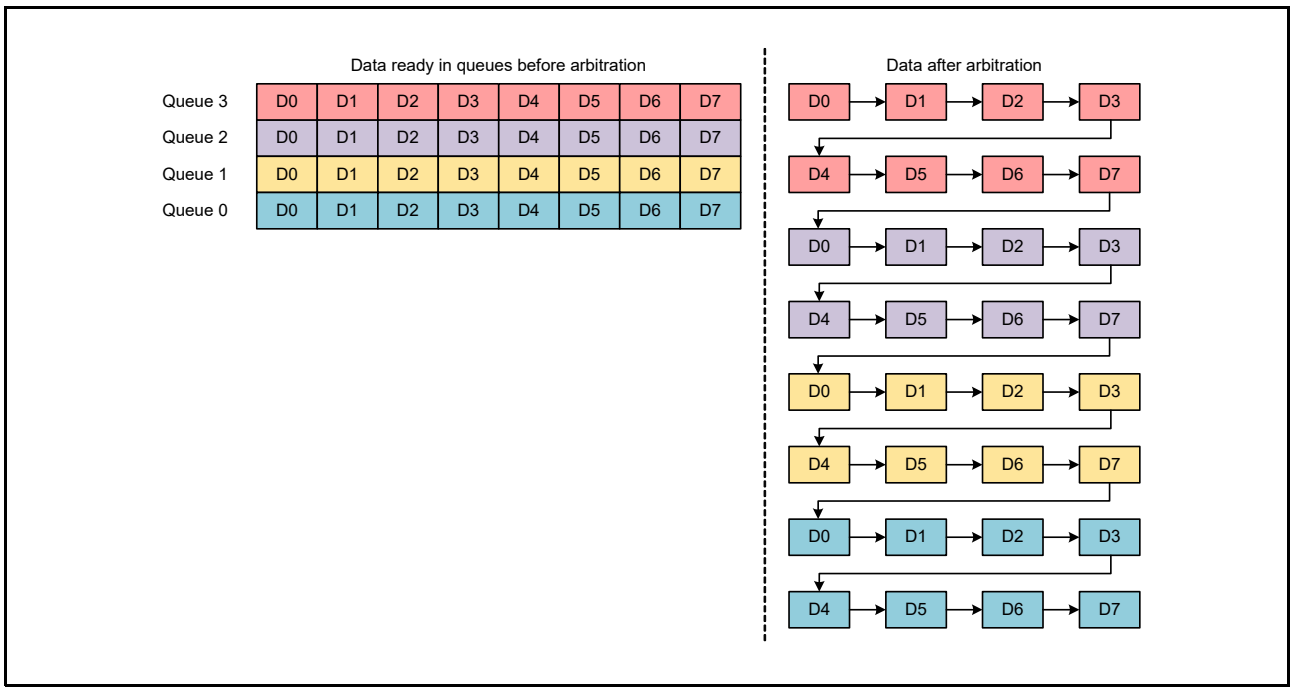

Figure 38.28 Strict Priority Arbitration Example

(b) Round Robin (RR)

To set the descriptor arbitration in round robin mode, all the GWRDQAC.RDQAi[3:0] (i = 0 to 7) bits should be set to 1111b. In this case a round robin algorithm will be applied for descriptor arbitration. The round robin algorithm is described through an example in Figure 38.29.

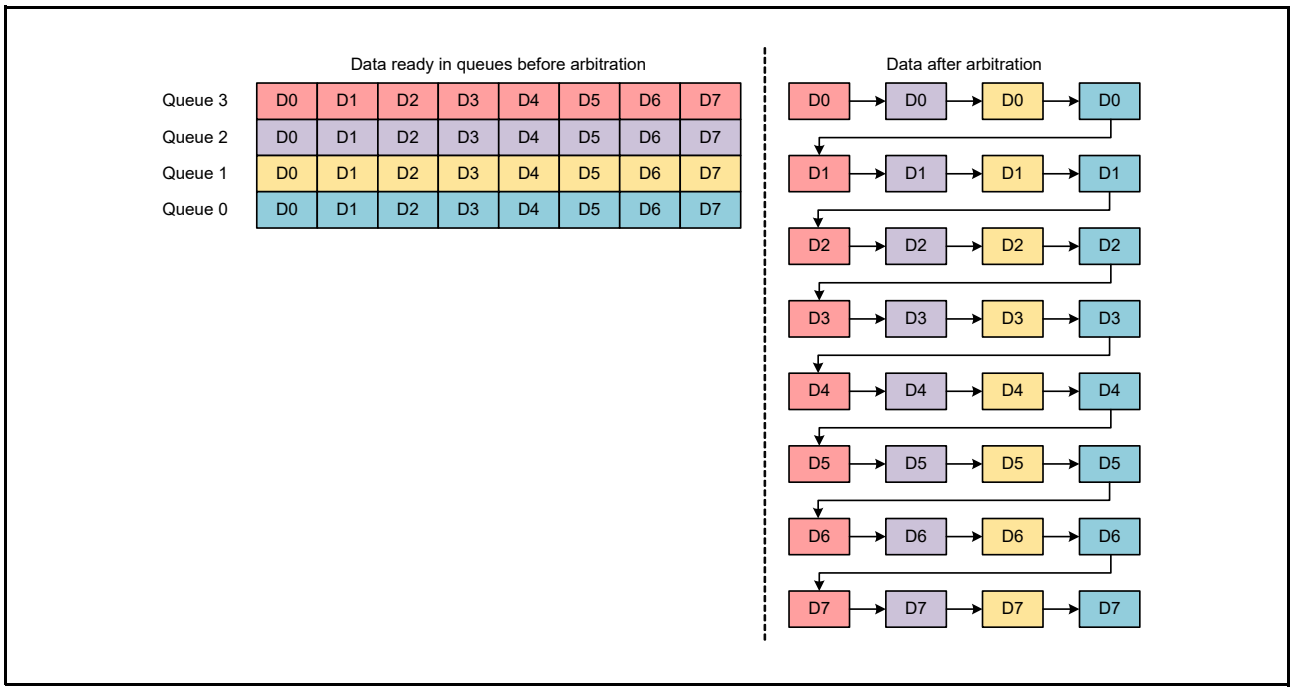

Figure 38.29 Round Robin Arbitration Example

(c) Weight Round Robin (WRR)

To set the descriptor arbitration in weight round robin mode, all the GWRDQAC.RDQAi[3:0] (i = 0 to 7) bits should be set to a value different than 0 with at least one queue set to a value different than 1. In this case a weight round robin algorithm will be applied for descriptor arbitration. The weight round robin algorithm is described through an example in Figure 38.30 (RDQA0 = 2, RDQA1 = 1, RDQA2 = 3 and RDQA3 = 4). In this arbitration GWRDQAC.RDQAi[3:0] bits represents the weight of queue i. The heavier a queue is the more chance it will have to transmit data.

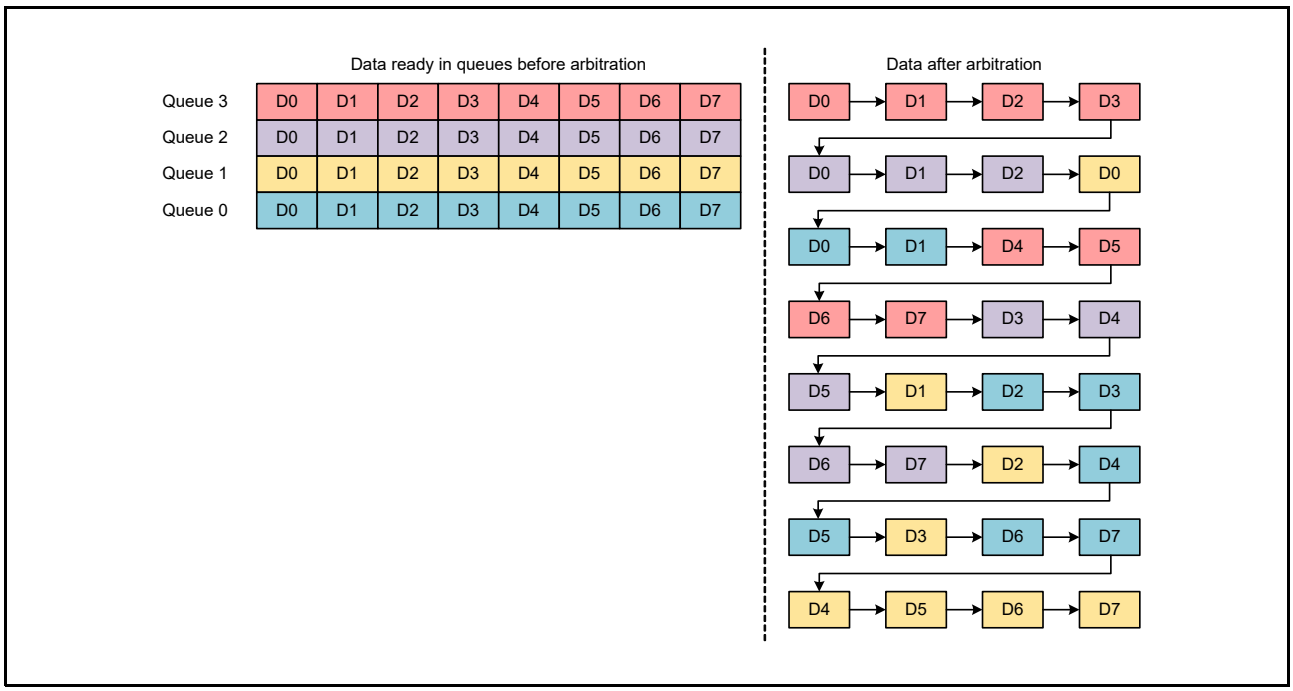

Figure 38.30 Weight Round Robin Arbitration Example

(d) Hybrid arbitration

It is allowed to use at the same time SP and RR or SP and WRR. This mode is called the hybrid arbitration mode. To set the descriptor arbitration in hybrid arbitration mode, some of the GWRDQAC.RDQAi[3:0] (i = 0 to 7) bits should be set to 0 and some others to a value different than 0 (For restrictions refer to GWRDQAC.RDQAi[3:0] bits explanation). The hybrid arbitration algorithm is described through an example in Figure 38.31 (RDQA0[3:0] = 0, RDQA1[3:0] = 1, RDQA2[3:0] = 2 and RDQA3[3:0] = 0).

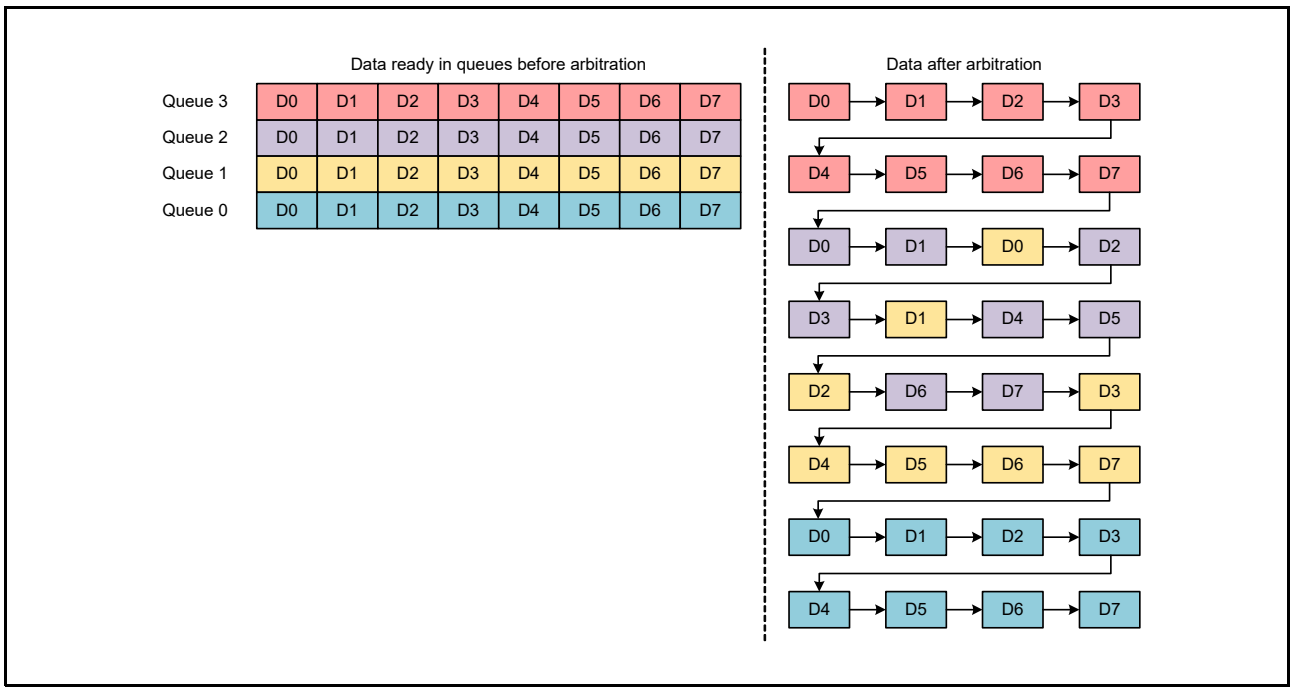

Figure 38.31 Hybrid Arbitration Example

38.3.3.2 Multicast Control

Multicast function aims at copying the same frame to several AXI descriptor queue. It allows different CPU to process same frames at the same time without interfering with each other. If nothing is set, all the descriptor queues are initialized as unicast queues.
Multicast control has three functions. Checking the frame size, security level and queue type (TX or RX), modifying the multicast table using multicast learning and reading the multicast table using multicast searching.

(1) Frame Check

Frame check aims at checking if a frame has the right properties to be received by CPU using GWRMFSCq.MFS[15:0], GWDCCi.SL, GWDCCi.DQT bits and can be monitored using GWEIS0.FSESq, GWEIS4.DSSES, GWEIS4.DSSEIOS, GWEIS4.DSSECN[5:0], GWEIS5.DCTES, GWEIS5.DCTEIOS, GWEIS5.DCTECN[5:0] flags.
[Functions]

- GWRMFSCq.MFS[15:0] bits are used to set the maximum frame size accepted for each descriptor queue. Any frame received for queue q with a size bigger than GWRMFSCq.MFS[15:0] will be discarded and GWEIS0.FSESq flag will be set. The frame size considered is the size after VLAN update and with FCS. In this case multicast would not happen and the frame will totally be discarded.
- GWDCCi.SL bit is used to set the security level of a CPU sub destination. Any frame received unsecure (FDESCR.SEC [MFWD] is not set) for a secure CPU sub destination (GWDCCi.SL is set) discarded and GWEIS4.DSSES flag will be set (during multicast, for all CPU sub destination for which GWDCCi.SL is set frame will be discarded and for all CPU sub destination for which GWDCCi.SL is not set, frame will be received).
- GWDCCi.DQT is used to control is the received frame is going to a reception descriptor queue. Any frame received for a transmission descriptor queue will be discarded and GWEIS5.DCTES flag will be set. In case of multicast, only the targeted transmission queue will see their data lost.
- GWEIS0.FSESq flag signals that a descriptor has been rejected because the corresponding frame where oversized.
- GWEIS4.DSSES, GWEIS4.DSSEIOS and GWEIS4.DSSECN[5:0] flag signal that a descriptor has been rejected because of an AXI descriptor queue security error.
- GWEIS5.DCTES, GWEIS5.DCTEIOS, GWEIS5.DCTECN[5:0] flag signal that a descriptor has been rejected because of a descriptor chain type error.

(2) Descriptor Copy

Descriptor copy aims at multicasting descriptor to send them to the AXI master interface and the RX data fetch using the multicast table.

The multicast table is divided in two fields, MUL.MN[2:0] which is the multicast number and MUL.MNRCN[5:0] which is the next descriptor chain and is used to link AXI descriptor chains together. AXI descriptor chains linked together form a multicast chain to which a frame will be multicast.
Because the multicast table is based on links all the multicast patterns are not possible.

The multicast table utilization is described in Figure 38.32 through an example.

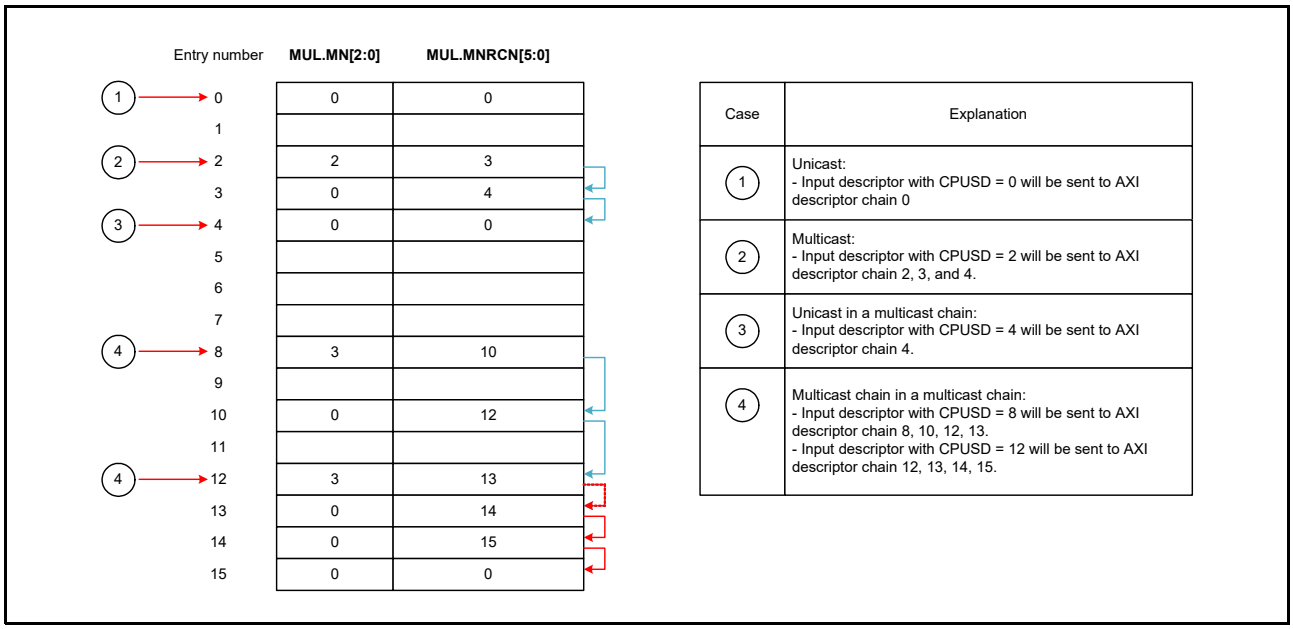

Figure 38.32 Multicast Table Utilization Example

(3) Multicast Learning

Multicast learning aims at updating entries in the multicast table using GWMSTLS and GWMSTLR registers. Table 38.19 describes mapping between learning registers and fields in multicast table. Table 38.20 describes the learn results, their mapping with the multicast table and how to handle them. It is possible to multicast a frame to 8 AXI descriptor chains.

[Functions]

- GWMSTLS register is used to set the information needed to overwrite an entry.
- GWMSTLR register is used to check if the previously set entry has been overwritten.
- To set entries in the multicast table, refer to software flow in section 38.3.8.6, Multicast Table Setting Flow.
- If GWAC.AMP = 1 (the AXI transaction is pending), learning will not complete. Release the AXI master pause.

Table 38.19 Learn Registers/Multicast Table Mapping Registers

Register name	Field name in L3 table
GWMSTLS.MSENL[5:0]	Not present in multicast table, used to indicate which entry should be overwritten.
GWMSTLS.MNL[2:0]	MUL.MN, refer to (2) Descriptor Copy
GWMSTLS.MNRCNL[5:0]	MUL.MNRCN, refer to (2) Descriptor Copy

Table 38.20 Learn Result

Register name	Field name	Field explanation
GWMSTLR.MTLF	Learning fail	Learning fail will happen in one of the following conditions: When an APB tries to learn a multicast entry and the multicast table is not ready (GWMTIRM.MTR is not set)

(a) Static Learning

When a system aims at using the multicast table in a static way (set in CONFIG mode only) there is no restriction regarding the entry format, the entry link pointers and the learning order of entries.

(b) Dynamic Learning

When a system aims at using the multicast table in a dynamic way (set in OPERATION mode), the restrictions described in Figure 38.33 should be respected.

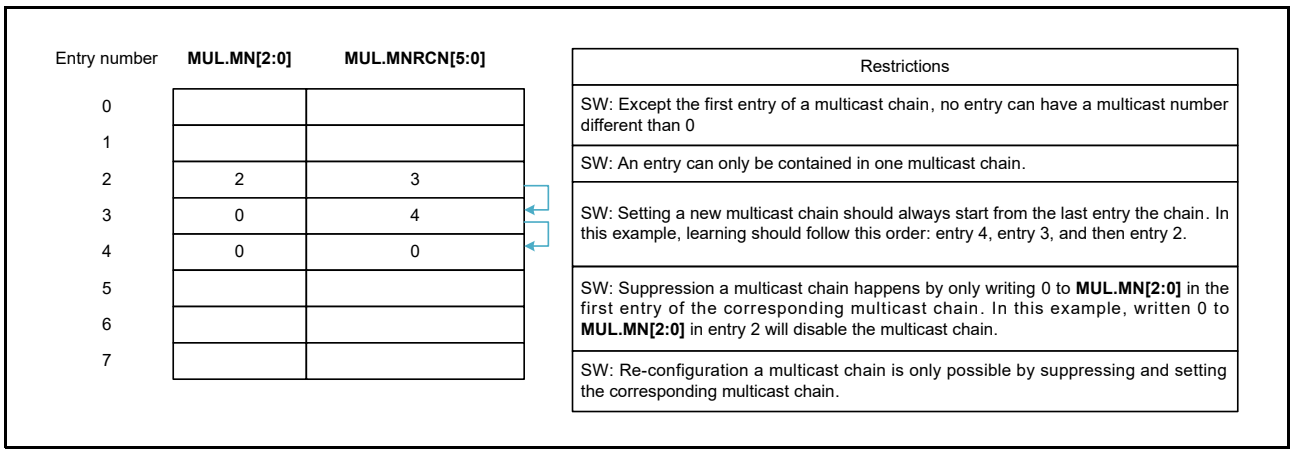

Figure 38.33 Multicast Table Dynamic Utilization Restrictions

(4) Multicast Searching

Multicast searching aims at reading entries in the multicast table using GWMSTSS and GWMSTSR registers. Table 38.21 describes mapping between learning registers and fields in multicast table.

[Functions]

- GWMSTSS register is used to set the entry that should be read.
- GWMSTSR register is used to read the read result.
- To read an entry in the multicast table, refer to software flow in section 38.3.8.7, Multicast Table Read Flow.

Table 38.21 Search Registers/Multicast Table Mapping Registers

Register name	Field name in L3 table
GWMSTSS.MSENS[5:0]	Not present in multicast table, used to indicate which entry should be read.

Table 38.22 Search Result

Register name	Field name/ corresponding field in multicast table	Field explanation
GWMSTSR.MNR[2:0]	MUL.MN	Multicast table read value
GWMSTSR.MNRCNR[5:0]	MUL.MNRCN	Multicast table read value

38.3.3.3 RX Data Fetch

RX data fetch has follow functions. Fetching the data from the Local RAM, un-tagging/VLANs depending on VLAN settings, handling FCS, sending the data the AXI master interface and releasing the buffer pointer of the read frames. The data fetching from Local RAM, the data sending to the AXI master interface and the pointer release are here for switch hardware purpose and its description is not required for switch utilization so it will not be described.

(1) VLAN(SC-TAG)

Fetching the data from the Local RAM, updating the data depending on “L23 update” and “TAG function registers”. Updating VLANs data path is described in Figure 38.34, VLAN Data Path.

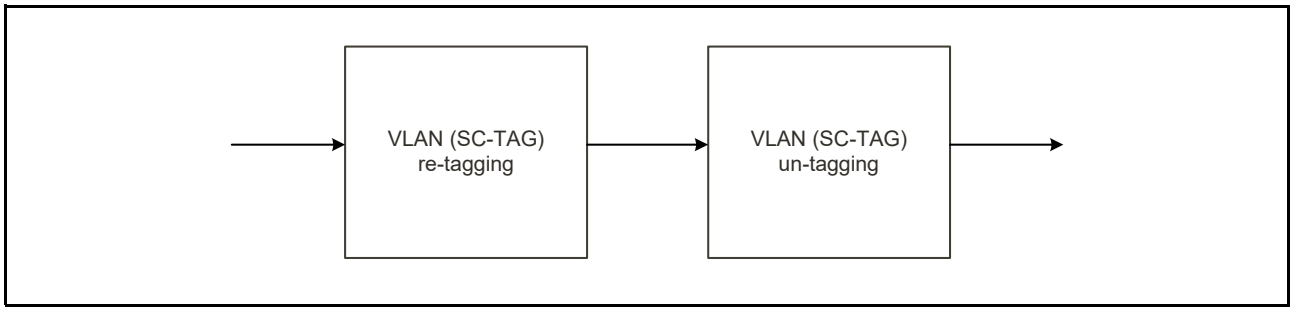

Figure 38.34 VLAN Data Path

(a) VLAN(SC-TAG) Re-Tagging

Layer 2 update can happen for the following fields:

- Destination MAC address updated to L23U.MDA when L23U.MDAU set.
- Source MAC address is updated to {GWMAC0.MAU[15:0], GWMAC1.MAL[31:0]} when L23U.MSAU set.
- C-TAG VID is updated to L23U.CVID when L23U.CVIDU set.
- C-TAG PCP is updated to L23U.CPCP when L23U.CPCPU set.
- C-TAG VID is updated to L23U.CDEI when L23U.CDEIU set.
- S-TAG VID is updated to L23U.SVID when L23U.SVIDU set.
- S-TAG PCP is updated to L23U.SPCP when L23U.SPCPU set.
- S-TAG VID is updated to L23U.SDEI when L23U.SDEIU set.

[Restriction]

- HW: To update the C-TAG/S-TAG fields, the C-TAG/S-TAG should be present in the frame after VLAN un-tagging (refer to (1) VLAN(SC-TAG)). If not preset, the update will not happen (e.g. L2 update does not change the frame format and does not permit TAG insertion).

(b) VLAN(SC-TAG) Un-Tagging

VLAN update aims at modifying VLAN frame format depending on switch VLAN mode (FWGC.SVM[1:0] bits in forwarding engine [MFWD]), the VLAN control information given by the forwarding engine descriptor (FDESCR.VCTRL [MFWD]) and GWVCC.VEM[2:0] bits.

[Function]

- GWVCC.VEM[2:0] bits set the VLAN reception mode.

The frames format after VLAN un-tagging are described in Table 38.23, Table 38.24 and Table 38.25 per Switch VLAN mode (FWGC.SVM[1:0] bits in forwarding engine [MFWD]) and VLAN control information. The conversion between the frame stored in the Local RAM and the frame format after VLAN un-tagging is described in Figure 38.35.

Table 38.23 Frame Format After VLAN Un-Tagging: Switch in No-VLAN Mode [MFWD]

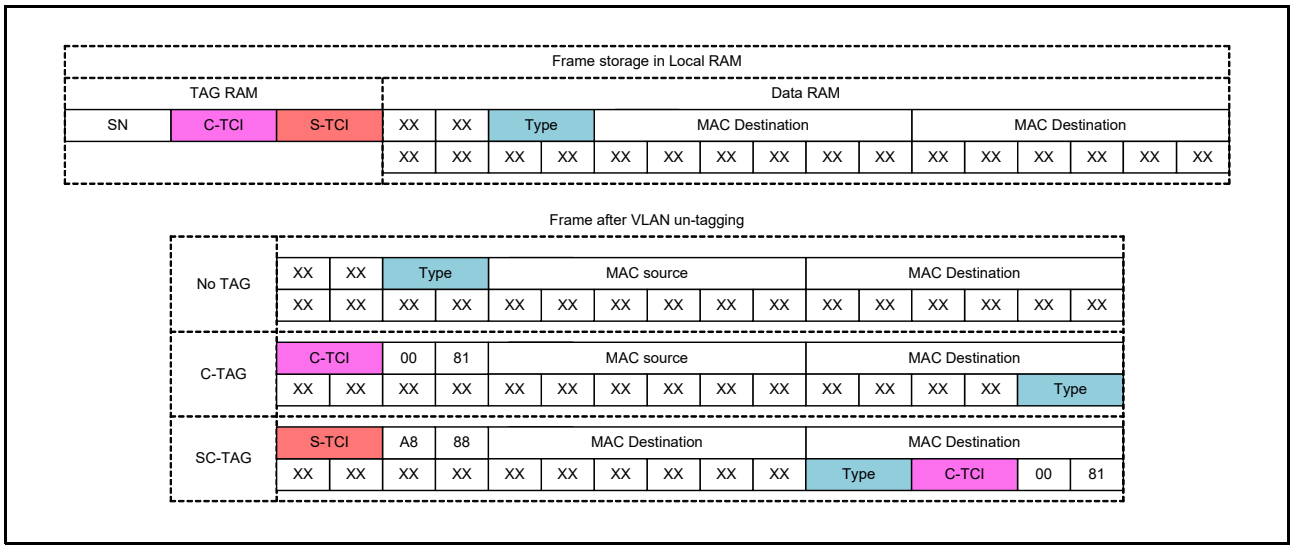

Figure 38.35 Local RAM Frame to Frame Format after VLAN Un-Tagging Conversion

Note: The Local RAM frame to frame format after VLAN un-tagging conversion for CoS-TAG is not described because it is the same than for C-TAG except that the VID in the C-TCI will be fixed to 0.

Note: 8100h corresponds to C-TAG TPID, C-TCI corresponds to a C-TAG TCI with a non-null VID, CoS-TCI corresponds to a C-TAG TCI with a null VID and CCs-TCI corresponds to C-TCI or CoS-TCI [802.1Q].

Note: 88A8h corresponds to S-TAG TPID and S-TCI corresponds to a S-TAG TCI [802.1Q].

Note: Type corresponds to any Ethernet type value which is not F1C1h, 88A8h or 8100h.

Note: TPID values can be changed in Forwarding Engine [MFWD]. Values for TPIDs can be set in forwarding engine (in FWTTC0 and FWTTC1 registers).

(2) R-TAG Insertion

The R-TAG insertion happens for the following cases:

- For frames received with an R-TAG (LDESCR.RTGI was set during reception, refer to (3) Frame Saving in Local RAM, so, in descriptor received for forwarding, FDESCR.RTGI was also set) and for which routing is not requested.

The R-TAG sequence number (SN in Figure 38.36) will be set to the sequence number FDESCR.SEQN [MFWD] received in received descriptor.

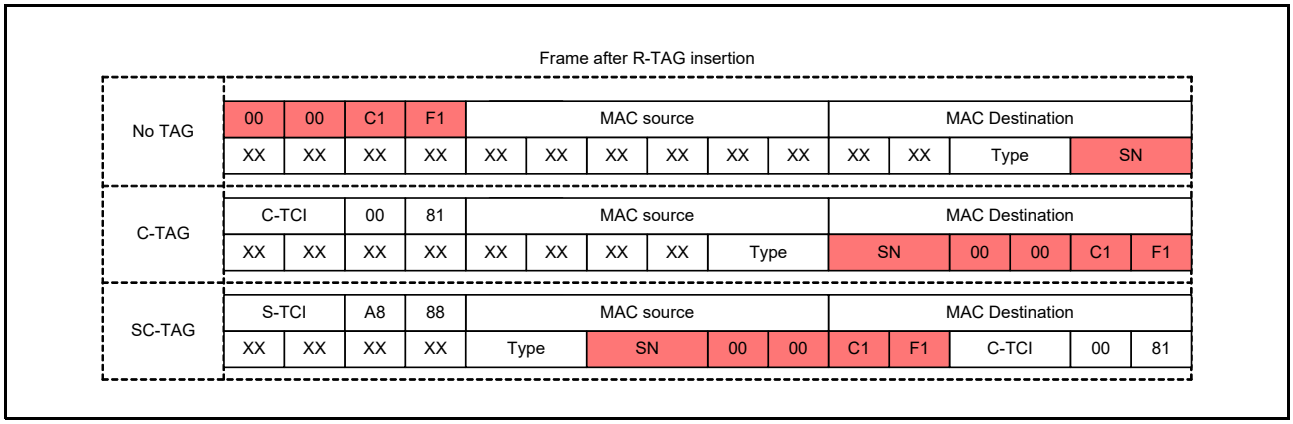

Figure 38.36 R-TAG inserted frame format

Note: F1C1h corresponds to R-TAG TPID and SN correspond to R-TAG sequence number[802.1CB].
Note: 8100h corresponds to C-TAG TPID, C-TCI corresponds to a C-TAG TCI with a non-null VID, CoS-TCI corresponds to a C-TAG TCI with a null VID and CCs-TCI corresponds to C-TCI or CoS-TCI [802.1Q].
Note: 88A8h corresponds to S-TAG TPID and S-TCI corresponds to a S-TAG TCI [802.1Q].
Note: Type corresponds to any Ethernet type value which is not F1C1h, 88A8h or 8100h.
Note: TPID values can be changed in Forwarding Engine [MFWD]. Values for TPIDs can be set in forwarding engine (in FWTTC0 and FWTTC1 registers).

(3) FCS Handling

Ethernet frame FCS can be forwarded to the CPU using GWRGC.RCPT bit.

[Function]

- GWRGC.RCPT is used to pass frame FCSs to the CPU.

However, following conditions should be met for GWCA to forward a frame FCS to the CPU:

- For Ethernet agent [ETHA], RMAC should not have removed the FCS [RMAC] at the input port.
- For GWCA, the FCS should be present in the ingress frame and valid (FI set and FW not set in input descriptor, refer to (3) Data Transmission Common Descriptor Format).
- The VLANs should be the same at the egress than at the ingress port.
- The frame should not be a routed frame (received descriptor FDESCR.RV field not set [MFWD])

Note: If one of the above conditions is not met by a frame, the FCS will be removed from it even if GWRGC.RCPT bit is set to 1.

Note: If a frame is received by CPU with an FCS, FI flag will be set in the reception descriptor. If not, it will not be set.

38.3.3.4 AXI Master Interface

The AXI master interface handles the data/AXI descriptor exchange with the CPU. It will receive the updated data and the information related to the data for RX data fetch block and store them in the CPU RAM. To do so, it uses GWDCCi.EDE, GWDCCi.ETS, GWDCCi.SM[1:0] bits, and can be monitored using GWAARSS, GWAARSR0 and GWAARSR1, GWIDAUASi, GWIDASMi, GWIDASAMi0, GWIDASAMi1, GWIDACAMi0, GWIDACAMi1 registers and GWEIS2i.DFESt, GWEIS3.IAOESi, GWEIS4.DSES, GWEIS4.DSEIOS, GWEIS4.DSECN[5:0] flags.

[Functions]

- GWDCCi.EDE and GWDCCi.ETS bits set the descriptor format that will be used for descriptor queue number i refer to (1) General Formats.
- GWDCCi.SM[1:0] bits set how GWCA will write back descriptors. In this section all explanation will use GWDCCi.SM[1:0] equal to 00b. For GWDCCi.SM[1:0] equal to 01b or 10b refer to the register explanation.
- For GWAARSS, GWAARSR0 and GWAARSR1 registers refer to section 38.3.1.6, AXI Address RAM Searching.
- GWIDAUASi, GWIDASMi, GWIDASAMi0, GWIDASAMi1, GWIDACAMi0, GWIDACAMi1 registers and GWEIS3.IAOESi interrupt register are used for incremental area monitoring, refer to (3) Single Page Incremental Data Reception.
- GWEIS2i.DFESt flag signals that frames have been lost because a full descriptor queue.
- GWEIS4.DSES, GWEIS4.DSEIOS, GWEIS4.DSECN[5:0] flags signal that frames have been received with an unexpected size, refer to(2) Size-Controlled Data Reception.

Data reception can be done using linear or cyclic descriptor queues (refer to section 38.3.1.5, AXI Descriptor Queue Format). Data reception process descriptors can be set six different ways, through the basic data reception descriptor chain (refer to (1) Basic Data Reception), the Size-controlled data reception descriptor chain (refer to (2) Size-Controlled Data Reception), the Single page incremental data reception descriptor chain (refer to (3) Single Page Incremental Data Reception), the Interrupt based multi-page incremental data reception descriptor chain (refer to (4) Interrupt Based Multi-Page Incremental Data Reception), the Header removal incremental data reception descriptor chain (refer to (5) Header Removal Incremental Data Reception).

(1) Basic Data Reception

Basic data reception process descriptor utilization is described in Figure 38.37. Basic data reception process descriptor format is described in Figure 38.38 and Table 38.26.

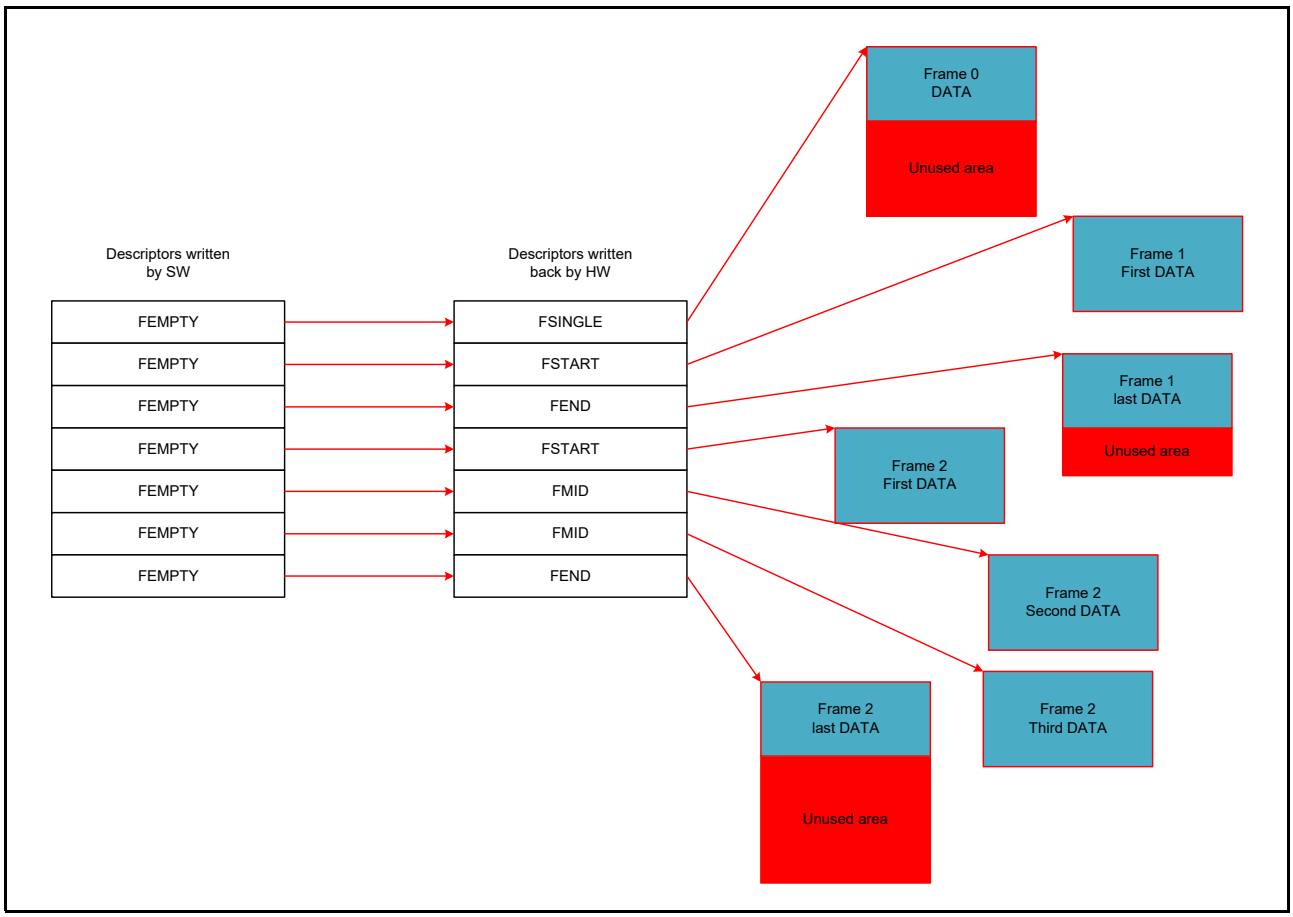

Figure 38.37 Basic Data Reception Process Descriptor Utilization

Note: If a frame is too big to fit in an area reserved by one descriptor, it will be automatically split. The first descriptor will be FSTART, the last descriptor will be FEND and all other descriptors will be FMID.

Note: When a frame is split the hardware will write back the FSTART descriptor last. Even if the queue is set in keep DT mode, this order is kept.

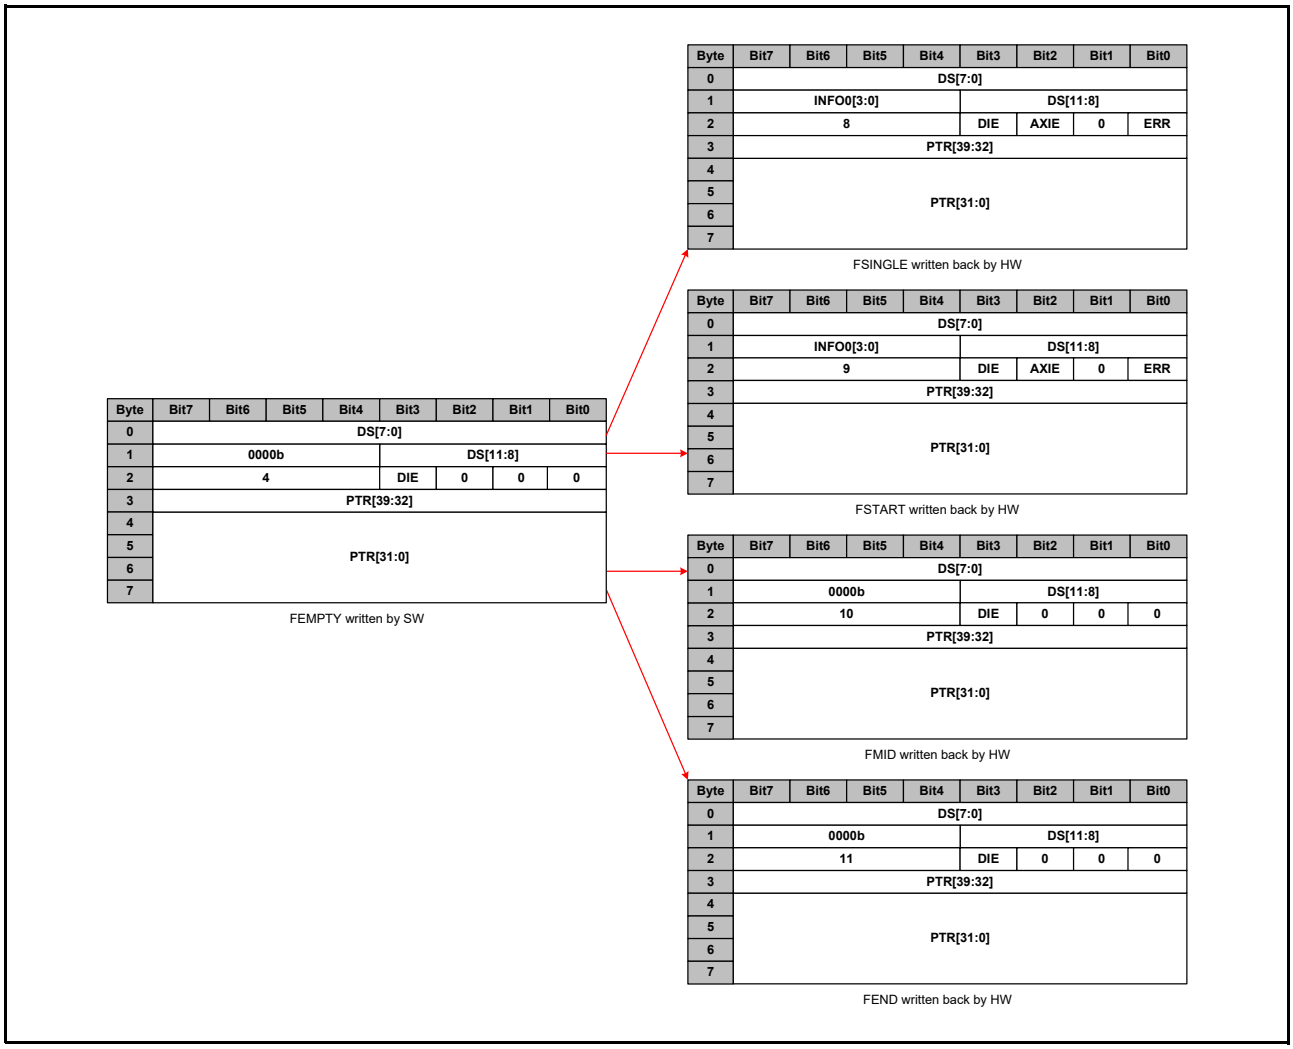

Figure 38.38 Basic Data Reception Process Descriptor Utilization Format (for Basic Descriptor, Refer to (1) General Formats)

Table 38.26 Basic data reception process descriptor utilization field description

Field name	Field description before write-back	Field description after write-back
DS	Size of available URAM memory associated to the pointer for data storage	Actual size that has been written by the AXIBMI in the URAM.
INFO0	0000b	0000b for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
ERR	0	[Setting conditions] • HW: A descriptor queue full error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back. • HW: A descriptor number error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame will not be written) and a FSINGLE or a FSTART descriptor written back.
DSE	0	0
AXIE	0	[Setting conditions] • HW: An AXI error happened while writing a data (BRESP ≠ 00b) and a FSINGLE or a FSTART descriptor written back. • HW: An AXI error happened while reading a descriptor during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back.
DIE	DIE	DIE (Value is copied from read descriptor).
DT	4 for FEMPTY	8 for FSINGLE 9 for FSTART 10 for FMID 11 for FEND
PTR	Address where data should be written in the URAM	PTR (Value is copied from read descriptor).
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
TS (GWDCCi.ETS = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.

(2) Size-Controlled Data Reception

Size-controlled data reception aims at controlling the frame size at reception while purposely splitting the header and the payload of a frame. By size-controlled data reception the SW ensure that descriptor order is maintained even if a too short or too long frame is received. Size-controlled data reception process descriptor utilization is described in Figure 38.39. Size-controlled data reception process descriptor format is described in Figure 38.40 and Table 38.27. Size-controlled data reception can be monitored using GWEIS4.DSES, GWEIS4.DSEIOS, GWEIS4.DSECN[5:0] flags.

[Function]

- GWEIS4.DSES, GWEIS4.DSEIOS, GWEIS4.DSECN[5:0] flags signal a frame received with un unexpected size.

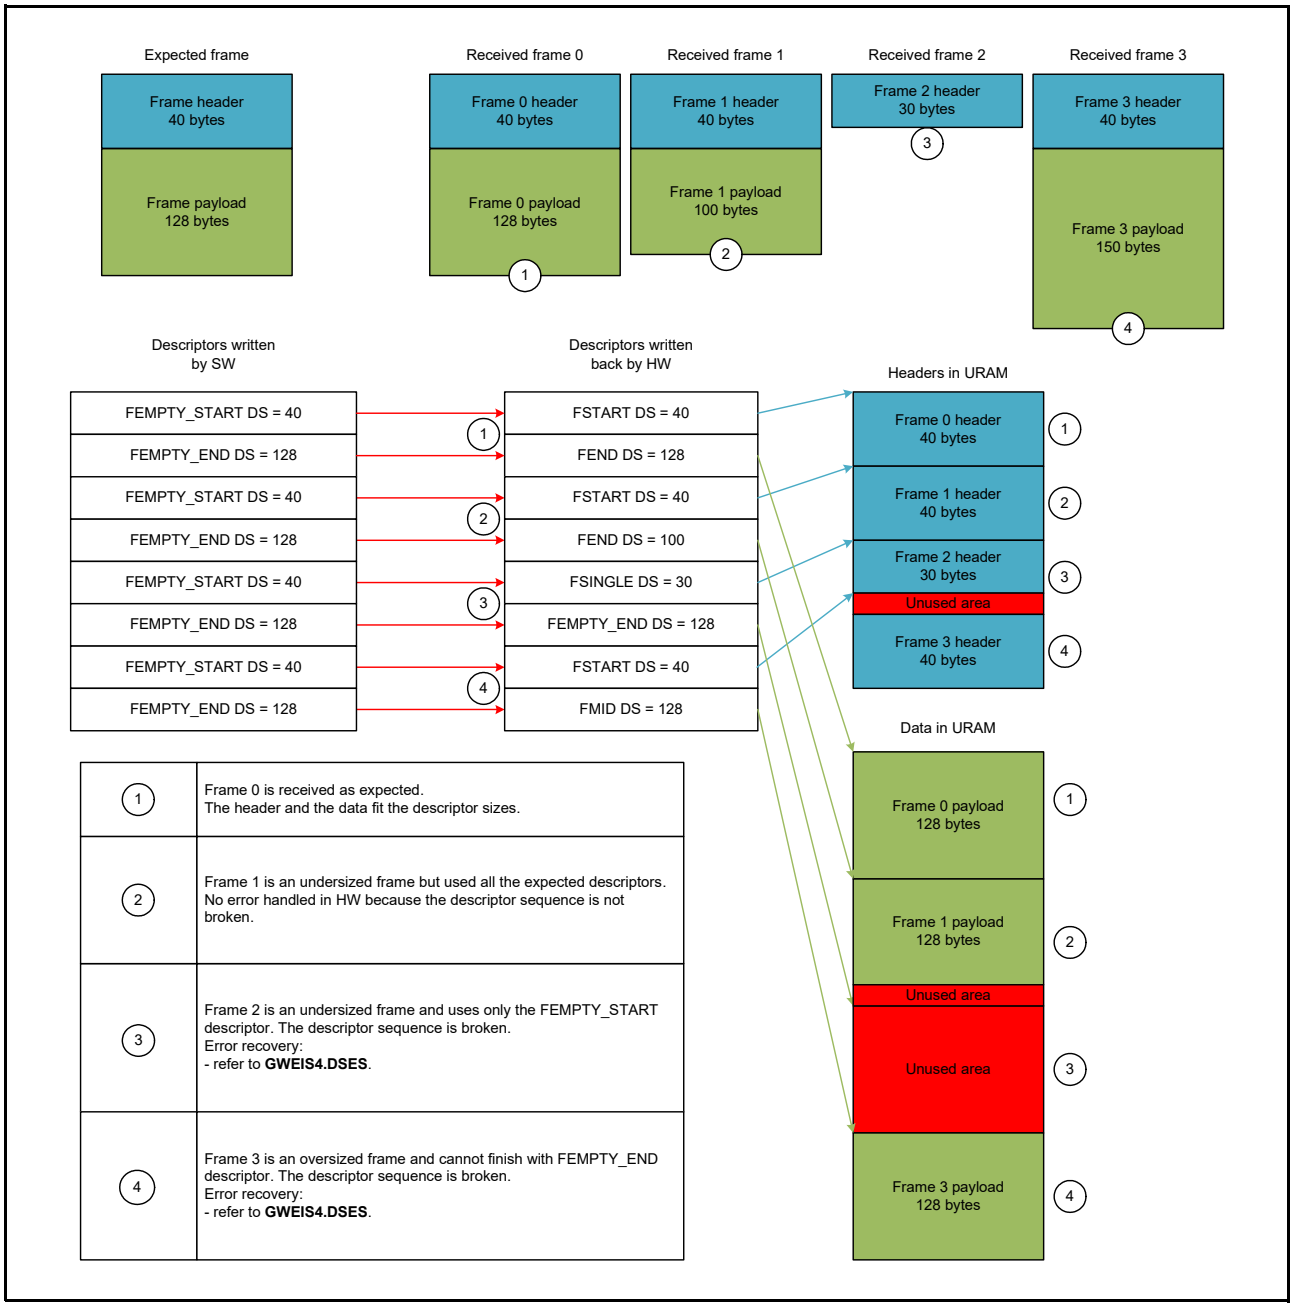

Figure 38.39 Size-Controlled Data Reception Process Descriptor Utilization

Note: When a frame is split the hardware will write back the FSTART descriptor last. Even if the queue is set in keep DT mode, this order is kept.

Note: A frame can be split in more than two descriptors by adding FEMPTY_MID descriptors between

FEMPTY_START and FEMPTY_END descriptors.

[Restriction]

- SW: The process descriptor queue should always repeat the pattern of the same descriptors from the first descriptor to the descriptor before the termination descriptor. This pattern should start with an FEMPTY_START descriptor, finish by a FEMPTY_END descriptor and in between be only composed by FEMPTY_MID descriptors. If this is violated (for example, FEMPTY_START is detected in the middle), the frame will be discarded/rejected without notification.

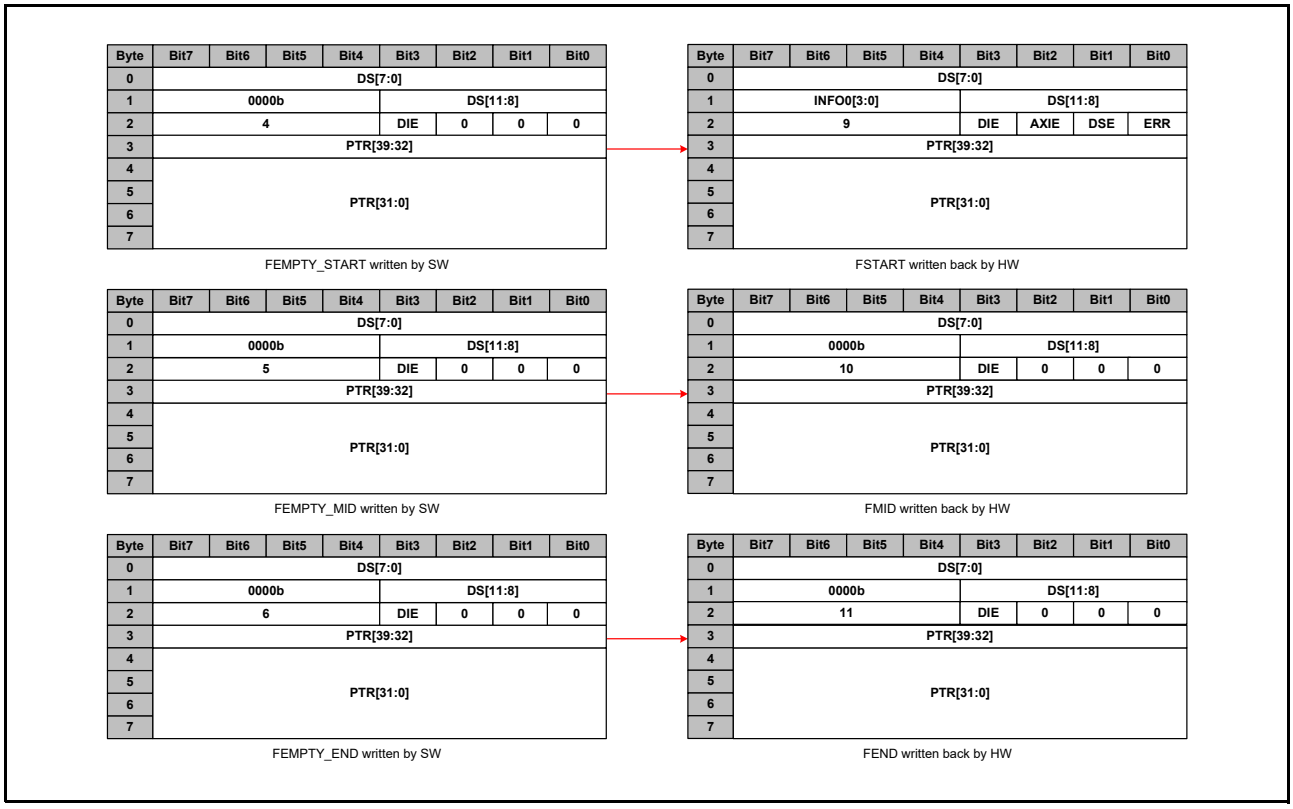

Figure 38.40 Size-controlled Data Reception Process Descriptor Utilization Format (for Basic Descriptor, Refer to (1) General Formats)

Table 38.27 Size-controlled data reception process descriptor utilization field description

Field name	Field description before write-back	Field description after write-back
DS	Size of available URAM memory associated to the pointer for data storage	Actual size that has been written by the AXIBMI in the URAM.
INFO0	0000b	0000b for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
ERR	0	[Setting conditions] • HW: A descriptor queue full error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back. (This case should not happen due to the process descriptor order) • HW: A descriptor number error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame will not be written) and a FSINGLE or a FSTART descriptor written back.
DSE	0	[Setting conditions] • HW: The frame has been finished with a FEMPTY_START or a FEMPTY_MID descriptor (undersized frame) • HW: The frame is too big to finish with a FEMPTY_END descriptor (oversized frame)
AXIE	0	[Setting conditions] • HW: An AXI error happened while writing a data (BRESP ≠ 00b) and a FSINGLE or a FSTART descriptor written back. • HW: An AXI error happened while reading a descriptor during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back.
DIE	DIE	DIE (Value is copied from read descriptor).
DT	5 for FEMPTY_START 6 for FEMPTY_MID 7 for FEMPTY_END	9 for FSTART 10 for FMID 11 for FEND
PTR	Address where data should be written in the URAM	PTR (Value is copied from read descriptor).
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
TS (GWDCCi.ETS = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.

(3) Single Page Incremental Data Reception

Single page incremental data reception aims at saving the received frames back to back in a given memory area. By single page incremental data reception, the SW avoid wasting CPU power to stack data together. Single page incremental data reception process descriptor utilization is described in Figure 38.41. Single page incremental data reception process descriptor format is described Figure 38.42, Table 38.28, Figure 38.43 and Table 38.29. Single page incremental data reception HW/SW synchronization should be done by GWIDAUASi register and can be monitored by GWIDASMi, GWIDASAMi0, GWIDASAMi1, GWIDACAMi0, GWIDACAMi1 registers and GWEIS3.IAOESi flag.

[Functions]

- GWIDAUASi register shows the number of bytes that has been written in the incremental area. After reading the data from the CPU RAM, SW should write to this register the quantity of data that has been read. The CPU data handling can be done, either based on the written back descriptor in the corresponding descriptor queue, or on the byte value contained in the increment area that can be read in GWIDAUASi register.
- GWIDASMi register is used to monitor the total size of the incremental area.
- {GWIDASAMi0.IDASAU[7:0], GWIDASAMi1.IDASAL[31:0]} bit array is used to monitor the start address of the incremental area.
- {GWIDACAMi0.IDASAU[7:0], GWIDACAMi1.IDASAL[31:0]} bit array is used to monitor the next used address in the incremental area.
- GWEIS3.IAOESi flag signals data loss due to incremental area overflow.

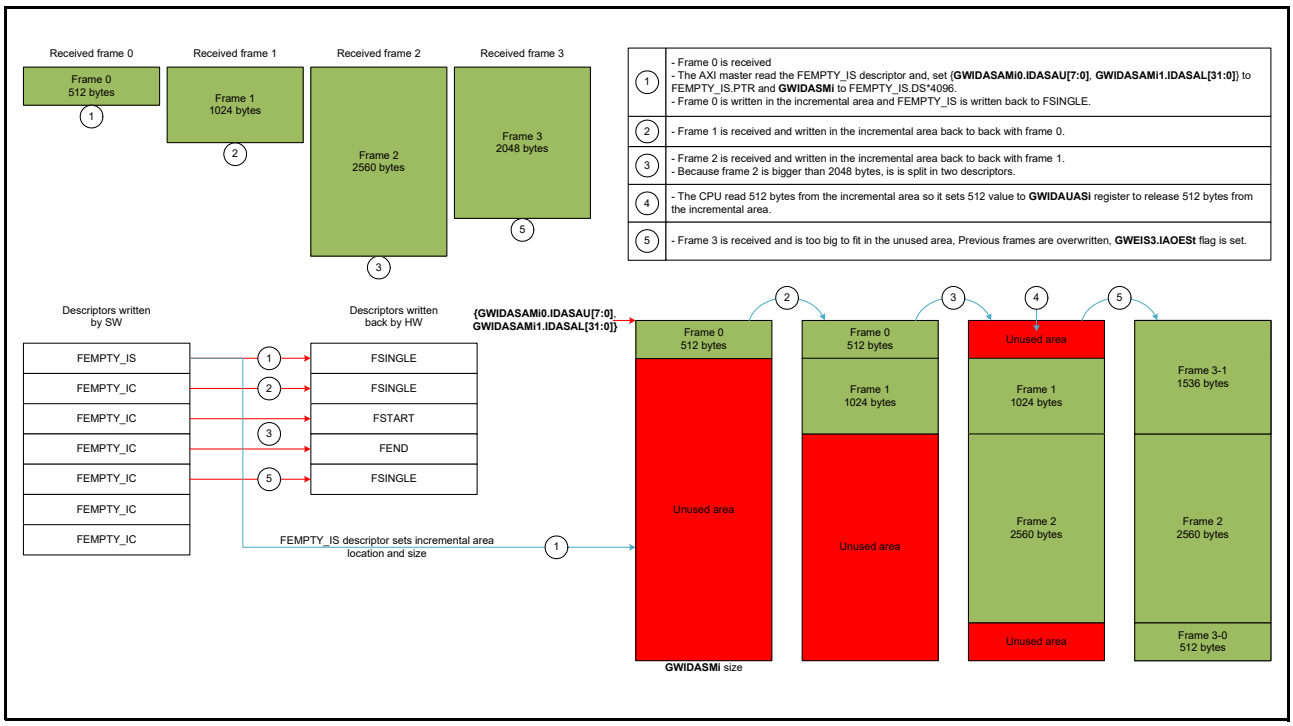

Figure 38.41 Single Page Incremental Data Reception Process Descriptor Utilization (for Basic Descriptor, Refer to (1) General Formats)

[Restriction]

- SW: This reception type can only be used for the first 4 RX chains, refer to section 38.3.1.1, AXI Descriptor Queue Mapping.

Note: If a frame is too big to fit in an area reserved by one descriptor, it will be automatically split. The first descriptor will be FSTART, the last descriptor will be FEND and all other descriptors will be FMID.

Note: When a frame is split the hardware will write back the FSTART descriptor last. Even if the queue is set in keep

DT mode, this order is kept.

Note: When GWCA reset has been applied (GWMS.OPS[1:0] set to 00b), all the incremental registers (i.e incremental page start address, current address, page size and used page size) were cleared. Therefore, when the GWCA has moved back again to OPERATION mode (GWMS.OPS[1:0] set to 11b) and a frame has been received by GWCA incremental chain, it's not be able to write frame using FEMPTY_IC descriptor. Descriptor of AXI current address have to be(set up) a FEMPTY_IS.

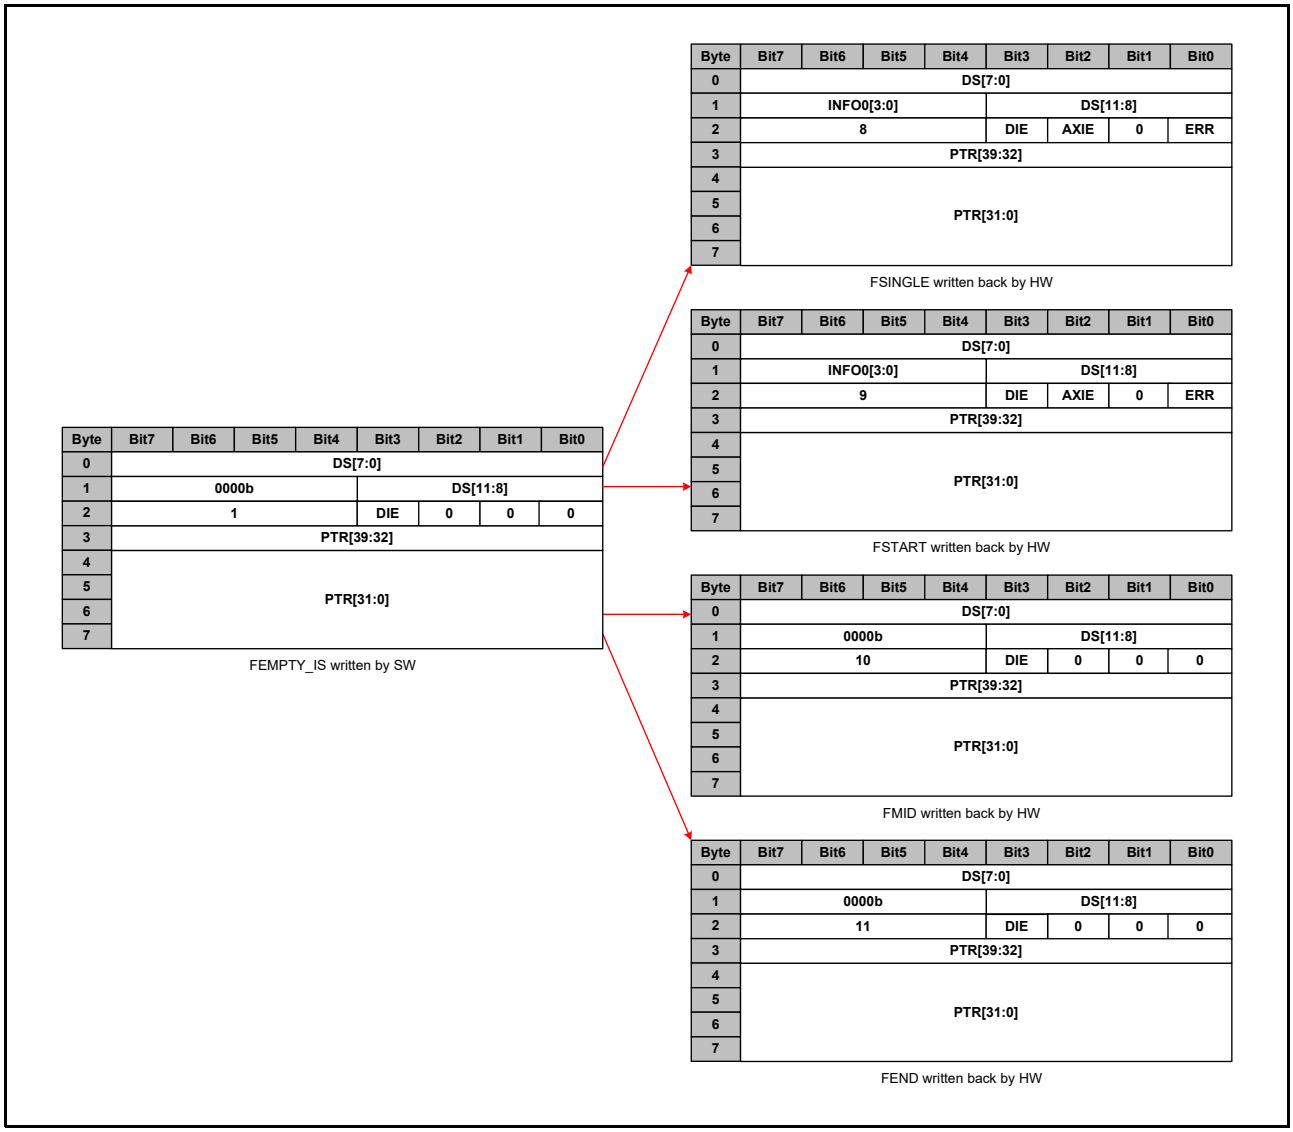

Figure 38.42 Single Page Incremental Data Reception FEMPTY_IS Process Descriptor Utilization Format

Table 38.28 Single Page Incremental Data Reception FEMPTY_IS Process Descriptor Utilization Field Description

Field name	Field description before write-back	Field description after write-back
DS	Size of the incremental area in 4 Kbytes unity.	Size of the data stored in the URAM associated to the descriptor.
INFO0	0000b	0000b for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
ERR	0	[Setting conditions] • HW: A descriptor queue full error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back. • HW: A descriptor number error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame will not be written) and a FSINGLE or a FSTART descriptor written back.
DSE	0	0
AXIE	0	[Setting conditions] • HW: An AXI error happened while writing a data (BRESP ≠ 00b) and a FSINGLE or a FSTART descriptor written back. • HW: An AXI error happened while reading a descriptor during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back.
DIE	DIE	DIE (Value is copied from read descriptor).
DT	1 for FEMPTY_IS	8 for FSINGLE 9 for FSTART 10 for FMID 11 for FEND

AXIE	0	[Setting conditions] • HW: An AXI error happened while writing a data (BRESP ≠ 00b) and a FSINGLE or a FSTART descriptor written back. • HW: An AXI error happened while reading a descriptor for a split frame and the descriptor was not the first.
DIE	DIE	DIE (Value is copied from read descriptor).
DT	2 for FEMPTY_IC	8 for FSINGLE 9 for FSTART 10 for FMID 11 for FEND
PTR	0000000000h	Address where the data corresponding to the descriptor has been written in the URAM
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
TS (GWDCCi.ETS = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.

(4) Interrupt Based Multi-Page Incremental Data Reception

Interrupt based multi-page incremental data reception aims at saving the received frames back to back in a given memory area. By Interrupt based multi-page incremental data reception, the SW avoid wasting CPU power to stack data together. Interrupt based multi-page incremental data reception process descriptor utilization is described in Figure 38.44. Interrupt based multi-page incremental data reception process descriptor format are the same than for single page incremental data reception, refer to (3) Single Page Incremental Data Reception.

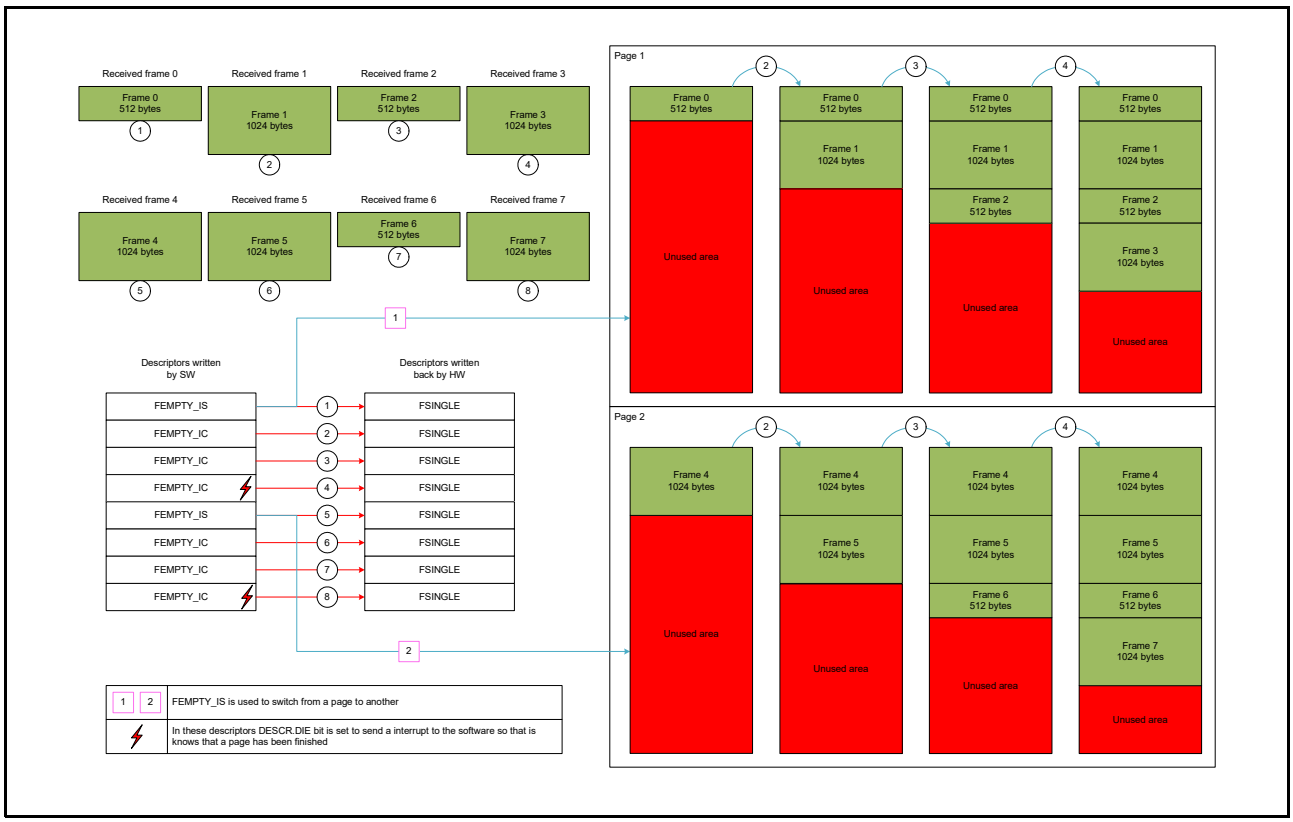

Figure 38.44 Interrupt Based Multi-page Incremental Data Reception Process Descriptor Utilization

[Restrictions]

- SW: It should be ensured that, knowing the expected data and/or controlling page sizes and the number of descriptors for a page, a page cannot overflow.
- SW: This reception type can only be used for the first 4 RX chains.

Note: If a frame is too big to fit in an area reserved by one descriptor, it will be automatically split. The first descriptor will be FSTART, the last descriptor will be FEND and all other descriptors will be FMID.

Note: When a frame is split the hardware will write back the FSTART descriptor last. Even if the queue is set in keep DT mode, this order is kept.

Note: Interrupt based multi-page incremental data reception allows to use any number of pages.

Note: When GWCA reset has been applied (GWMS.OPS[1:0] set to 00b), all the incremental registers (i.e incremental page start address, current address, page size and used page size) were cleared. Therefore, when the GWCA has moved back again to OPERATION mode (GWMS.OPS[1:0] set to 11b) and a frame has been received by GWCA incremental chain, it is not be able to write frame using FEMPTY_IC descriptor. Descriptor of AXI current address have to be(set up) a FEMPTY_IS.

(5) Header Removal Incremental Data Reception

Header removal incremental data reception aims at suppressing header from incremental data. It is an update of single page incremental data reception (refer to (3) Single Page Incremental Data Reception) and interrupt based multi-page incremental data reception (refer to (4) Interrupt Based Multi-Page Incremental Data Reception) by adding a FEMPTY_ND between each incremental descriptor. Header removal incremental data reception process descriptor utilization is described in Figure 38.45. Header removal process descriptor format is described in Figure 38.46 and Table 38.30.

[Restriction]

- SW: A FEMPTY_IS/FEMPTY_IC descriptor can only contain 2048 bytes. It should be taken in account when setting the descriptor in the descriptor queue because the HW does not ensure that the descriptor sequence is correct.

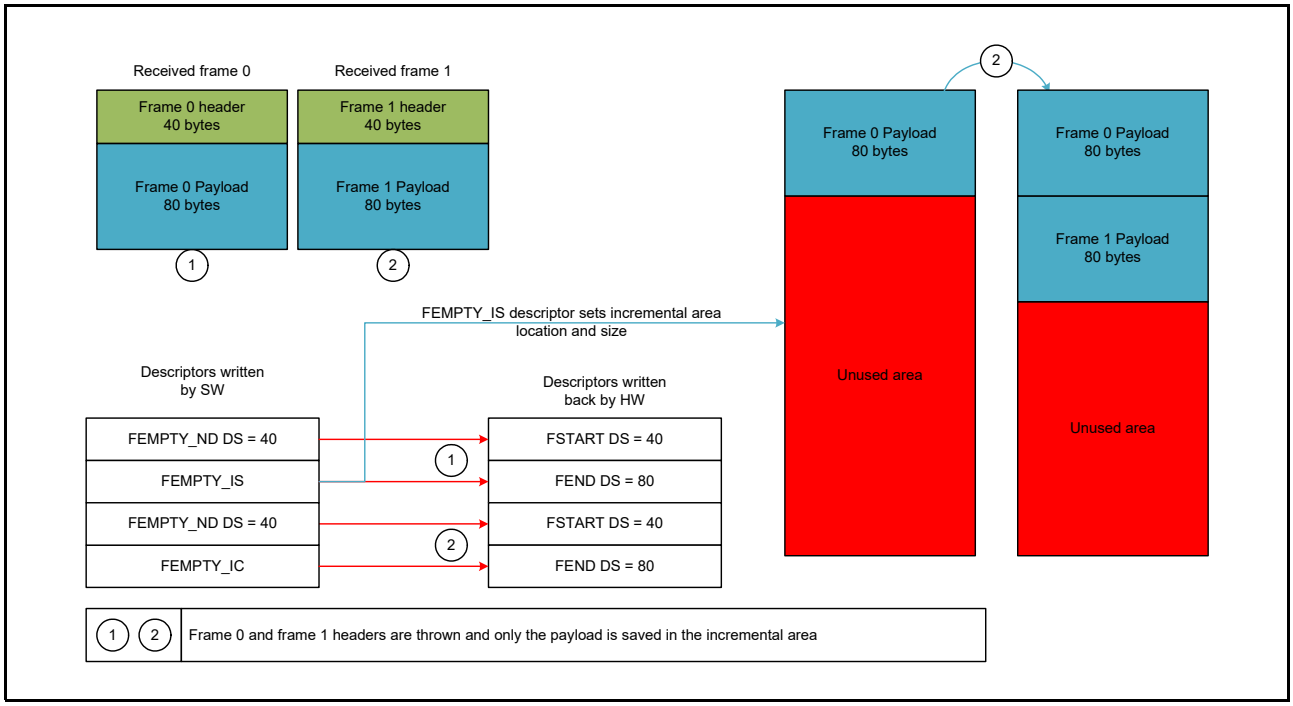

Figure 38.45 Header Removal Incremental Data Reception Process Descriptor Utilization

Note: When using Size controlled data reception, to get rid of the header part of a frame and still keep the descriptor order, it is possible to start every frame with a FEMPTY_START descriptor always pointing toward the same memory address (by setting always the same pointer).

Note: When GWCA reset has been applied (GWMS.OPS[1:0] set to 00b), all the incremental registers (i.e incremental page start address, current address, page size and used page size) were cleared. Therefore, when the GWCA has moved back again to OPERATION mode (GWMS.OPS[1:0] set to 11b) and a frame has been received by GWCA incremental chain, it is not be able to write frame using FEMPTY_IC descriptor. Descriptor of AXI current address have to be(set up) a FEMPTY_IS.

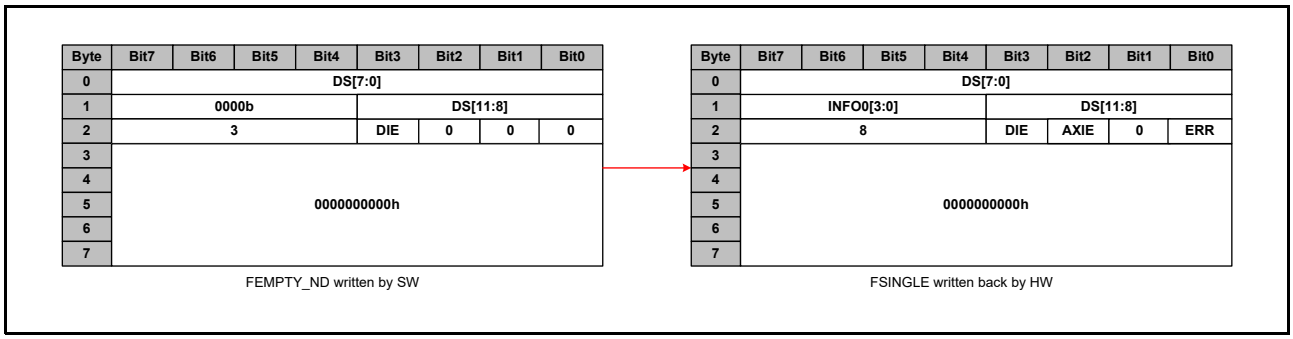

Figure 38.46 Header Removal Utilization Format (for Basic Descriptor, refer to (1) General Formats)

Table 38.30 Header Removal Process Descriptor Utilization Field Description

Field name	Field description before write-back	Field description after write-back
DS	Size to be rejected	Actual size that has been rejected (it should be the same as DS before write-back).
INFO0	0000b	0000b for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
ERR	0	[Setting conditions] • HW: A descriptor queue full error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back. • HW: A descriptor number error happened while reading an AXI address during a split frame (The first descriptor has been processed normally but the last part of the frame will not be written) and a FSINGLE or a FSTART descriptor written back.
DSE	0	0
AXIE	0	[Setting conditions] • HW: An AXI error happened while writing a data (BRESP ≠ 00b) and a FSINGLE or a FSTART descriptor written back. • HW: An AXI error happened while reading a descriptor during a split frame (The first descriptor has been processed normally but the last part of the frame has no descriptor to be written) and a FSINGLE or a FSTART descriptor written back.
DIE	DIE	DIE (Value is copied from read descriptor).
DT	3 for FEMPTY_ND	8 for FSINGLE 9 for FSTART 10 for FMID 11 for FEND Restrictions: • SW: Because the HW turns a FEMPTY_ND descriptor in a FSINGLE, FSTART, FMID or FEND descriptor, by reading the descriptor it is impossible to know that is contains no data. Consequently, SW should remember where the FEMPTY_ND descriptors have been written.
PTR	00000000h	00000000h
INFO1 (GWDCCi.EDE = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE, refer to (6) Data Reception Common Descriptor Format.
TS (GWDCCi.ETS = 1)	0000000000000000h	0000000000000000h for FEND and FMID. For FSTART and FSINGLE refer to (6) Data Reception Common Descriptor Format.

(6) Data Reception Common Descriptor Format

In this section are described the fields which are common for any data transmission (INFO0, INFO1 and TS). There are two types of formats, the reception direct descriptor and the reception ethernet descriptor formats. They are respectively created from direct local descriptors and ethernet local descriptors, refer to (3) Frame Saving in Local RAM. All the fields contained in AXI descriptors, if quoted, will be written ADESCR.{Field name}.

(a) Reception Direct Descriptor

Reception direct descriptor corresponds to frames sent by a CPU and by deciding their target directly (Forwarding engine processing has been by-passed [MFWD]). Reception direct descriptor INFO and TS formats are described in Figure 38.47 and Table 38.31.

TSS	32	Timestamp second [GPTP] Restrictions: • HW: The 16-upper bits of the gPTP [GPTP] second part are truncated.	Copied from ethernet local descriptor from [GWCA Data transmission] or [ETHA Data reception]
RSV	—	Reserved area	Set to 0

38.3.4 Timestamp Reception [GPTP]

GWCA allows TimeStamp reception through the GWCA TS path, The TS path is described in Figure 38.49. Timestamps received through this function are only Ethernet agent TX timestamps. Ethernet agent RX timestamps are stored in the local RAM along with their corresponding data and can only be received by CPU through RX data path with the corresponding data.

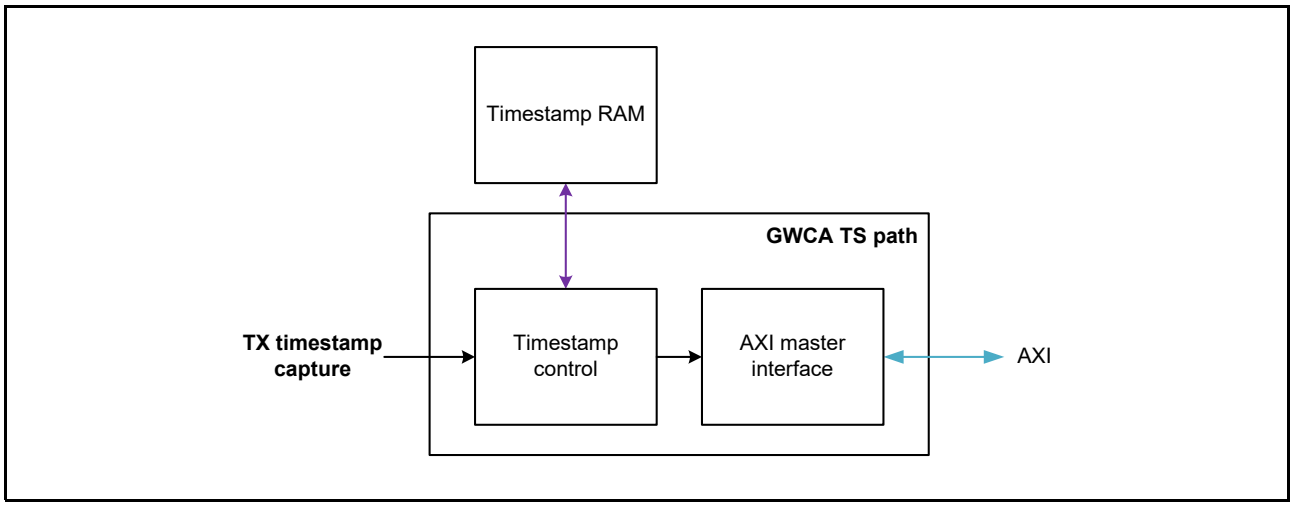

Figure 38.49 GWCA TS Path Block Diagram

The TS path is separated in two blocks:

- Timestamp control: This block aims at receiving the timestamps from TX Timestamp Capture interface [RMAC], storing them in the Timestamp RAM and sending them to the AXI master interface.
- AXI master interface: This block handles the timestamp/AXI descriptor exchange with the CPU.

38.3.4.1 Timestamp Control

Timestamp control controls the descriptor storage/fetching to/from the Timestamp RAM using GWTSDCCs.TE bit and can be monitored using GWTSNM and GWTSMNM registers and GWEIS0.TSOVFES flags.

[Functions]

- GWTSDCCs.TE is used to enable timestamp reception for timer s. If enabled, all timestamps received from TX Timestamp Capture interfaces [RMAC] for timer s will be stored in the timestamp RAM and later given to the AXI master interface.
- GWTSNM register is used to monitor the current number of timestamps present in the timestamp RAM.
- GWTSMNM register is used to monitor the maximum number of timestamps that has been held in the timestamp RAM since the previous reset or the previous time corresponding register has been read.
- GWEIS0.TSOVFES flag is used to flag a timestamp loss because of Timestamp RAM overflow.

38.3.4.2 AXI Master Interface

The AXI master interface handles the timestamp/AXI descriptor exchange with the CPU. It will receive the timestamps and the information related to the timestamps and store them in the CPU RAM. To do so, it uses GWTDCACs0, GWTDCACs1 registers and GWTSDCCs.DCS bit and it can be monitored using GWTSDIS.TSDISs and GWEIS0.TDFESs flags.

[Functions]

- GWTDCACs0 and GWTDCACs1 registers form the AXI address {GWTDCACs0.TSCCAU[7:0], GWTDCACs1.TSCCAL[31:0]} with correspond to the current address being processed by the GWCA for TS descriptor queue s. It can be used to set the first address of the descriptor queue during GWCA initialization, move an under-use TS descriptor queue to another location in the CPU RAM or monitor the currently processed descriptor address.
- GWTSDCCs.DCS bit is used to map timer s timestamps to a TS descriptor queue number.
- GWTSDIS.TSDISs flag is used to flag some timestamps are ready in the CPU RAM.
- GWEIS0.TDFES flag is used to flag a timestamp loss because the timestamp descriptor queue is full.

Timestamp reception can be done using linear or cyclic descriptor queues (refer to section 38.3.1.5, AXI Descriptor Queue Format). Timestamp reception process descriptor utilization is described in Figure 38.50. Timestamp reception process descriptor format is described in Figure 38.51 and Table 38.33.

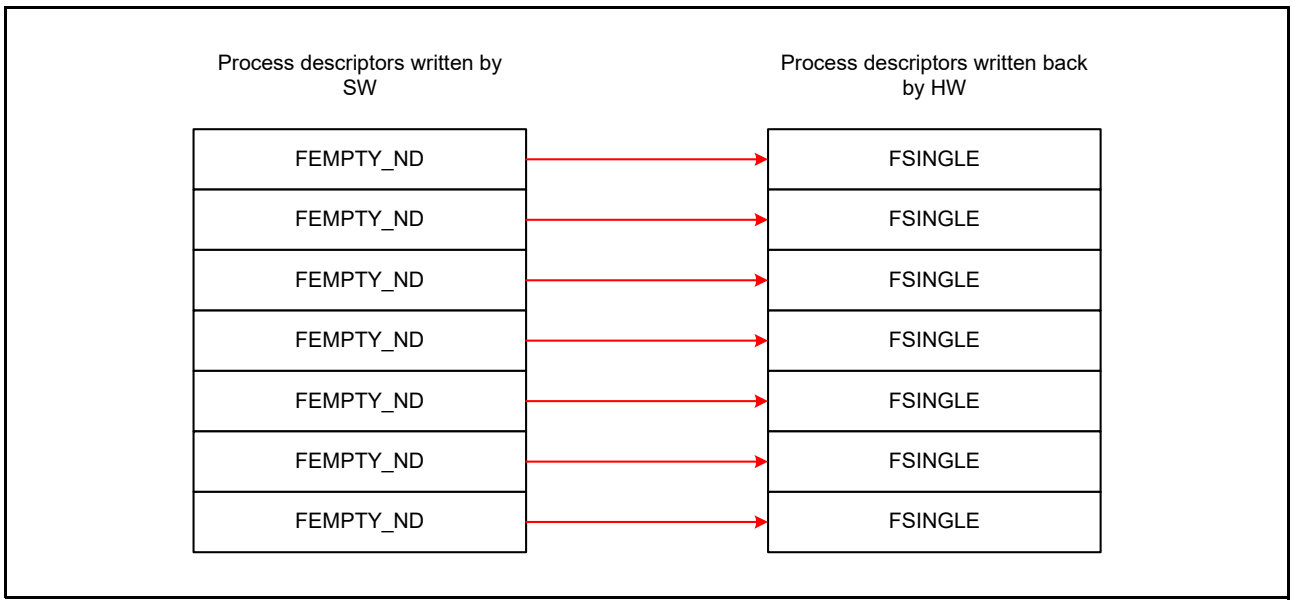

Figure 38.50 TS Reception Process Descriptor Utilization

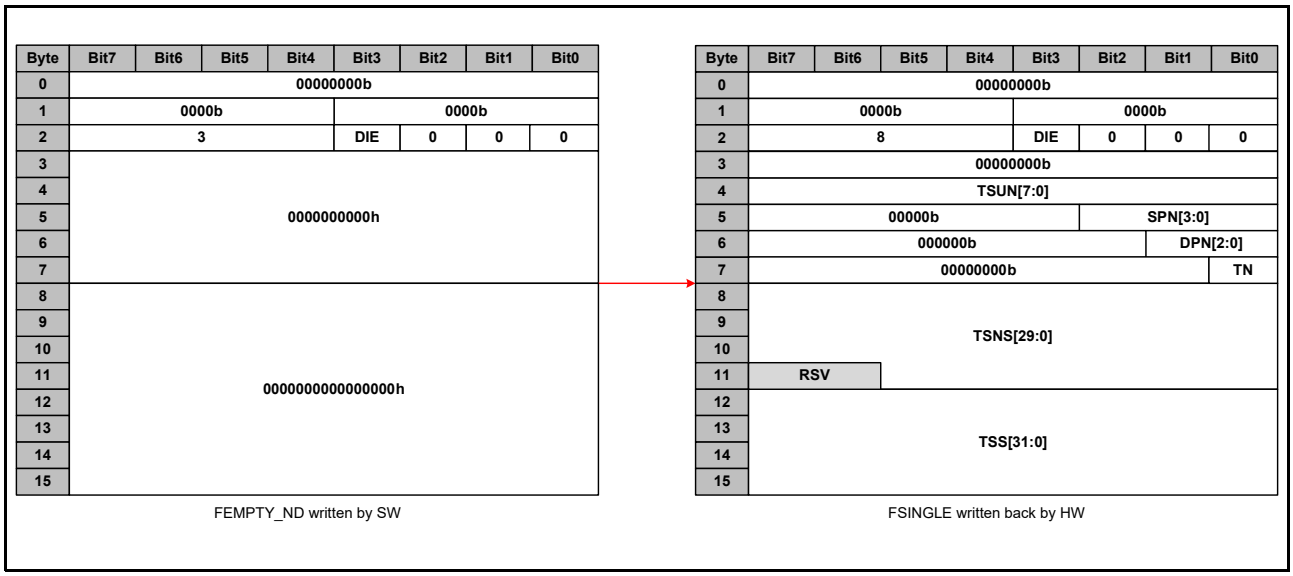

Figure 38.51 TS Reception Process Descriptor Utilization Format (only Timestamp Descriptor, Refer to (1) General Formats)

Table 38.33 TS Reception Process Descriptor Utilization Field Description

Field name	Field description written by SW	Field description after HW write-back

TS	0000000000000000h	Refer to Table 38.35

Table 38.34 TS Reception Process Descriptor PTR Field Explanation

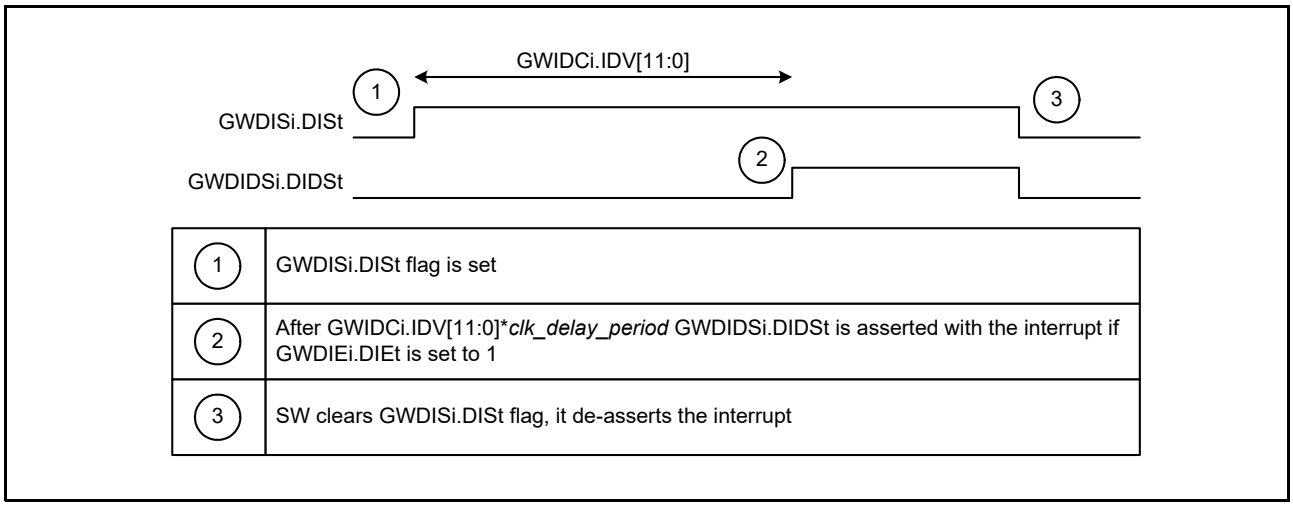
Field name	Bit width	Description
TSUN	8	Timestamp unique number [RMAC]
SPN	2	Port number from which the timestamp corresponding frame entered the switch [MFWD]
DPN	1	Port number by which the timestamp has been taken
TN	1	Timer Number

Table 38.35 TS Reception Process Descriptor TS Field Explanation

Field name	Bit width	Description
TSNS	30	Timestamp nanosecond [GPTP]
TSS	32	Timestamp second [GPTP] Restrictions: • HW: The 16-upper bits of the gPTP [GPTP] second part are truncated.

38.3.5 gPTP Triggered Transmission

It is possible to use gPTP timer to trigger a periodic transmission start using time-controlled data transmission (refer to Table 38.13). To do so, CYCLIC_COMP[i][c] functional interface is linked to INTER_TX[8+c] (refer to Figure 38.2).



For CYC_COMP_N parameter explanation, refer to gPTP specification [GPTP].

38.3.6 Interrupt Delay Function

Interrupt delay function aims at delaying data interrupts (GWDISi.DISt) to accumulate data during a certain among of time before requesting software to process the data. As a result, software load is diminished, and data latency is still guaranteed. To operate, interrupt delay function uses GWIDPC and GWIDCi registers and can be monitored using GWDIDSi register. Interrupt delay function is described in Figure 38.52.

[Functions]

- GWIDPC register sets an internal clock of period clk_delay_period used as base clock for interrupt delay function.
- GWIDCi register sets the delay time for descriptor queue i in clk_delay_period.
- GWDIDSi.DIDSt flag is the delayed GWDISi.DISt flag and triggers the interrupt gwc_gwdis_int[t].
- For interrupt handling, software can decide to read GWDIDSi registers and to process only interrupts that has set until their corresponding delay time is archived (allows to be sure a certain amount of data came before processing) or can decide to read GWDISi to process all the interrupts even the ones which did not reached their delay time (allows to be sure a certain amount of data came before processing at least for one queue can diminish the interrupt load).

1	GWDISi.DISt flag is set
2	After GWIDCi.IDV[11:0]**clk_delay_period* GWDIDSi.DIDSt is asserted with the interrupt if GWDIEi.DIEt is set to 1
3	SW clears GWDISi.DISt flag, it de-asserts the interrupt

Figure 38.52 Interrupt Delay Function

[Restrictions]

- HW: The maximum delay achievable by the interrupt delay function is clk_period*4194304. For example, it will be around 10ms for a clock clk with a frequency of 400MHz.

38.3.7 Operation Modes

Table 38.36 describes GWCA operation modes.

Table 38.36 GWCA Operation Modes

Operation mode	GWMS.OPS value	Description
DISABLE	1	• No transaction is ongoing. But there can be tolerance (left behind) of transactions*from GWCA when the agent has moved from OPERATION to DISABLE. (*: max 8 read transactions or max 8 write transactions) • Only status registers are accessible for writing when the agent clock is enabled.
RESET	0	• No transaction is ongoing. • An internal Reset is asserted to reset GWCA logic with status registers (When a register is reset in RESET mode, it is mentioned in its description). • No register is accessible for writing. • RAM values are held.
CONFIG	2	• No transaction is ongoing. • Static and some dynamic registers are accessible for writing.
OPERATION	3	• Transactions are ongoing. • Dynamic registers are accessible for writing.

38.3.7.1 Operation Mode Transitions

Figure 38.53 shows the operating mode transitions.
A mode transition can be trigger by:

- Hardware reset.
- Software reset.
- Configuration of GWMC.OPC[1:0]. In that case, mode transition will be confirmed by GWMS.OPS[1:0].

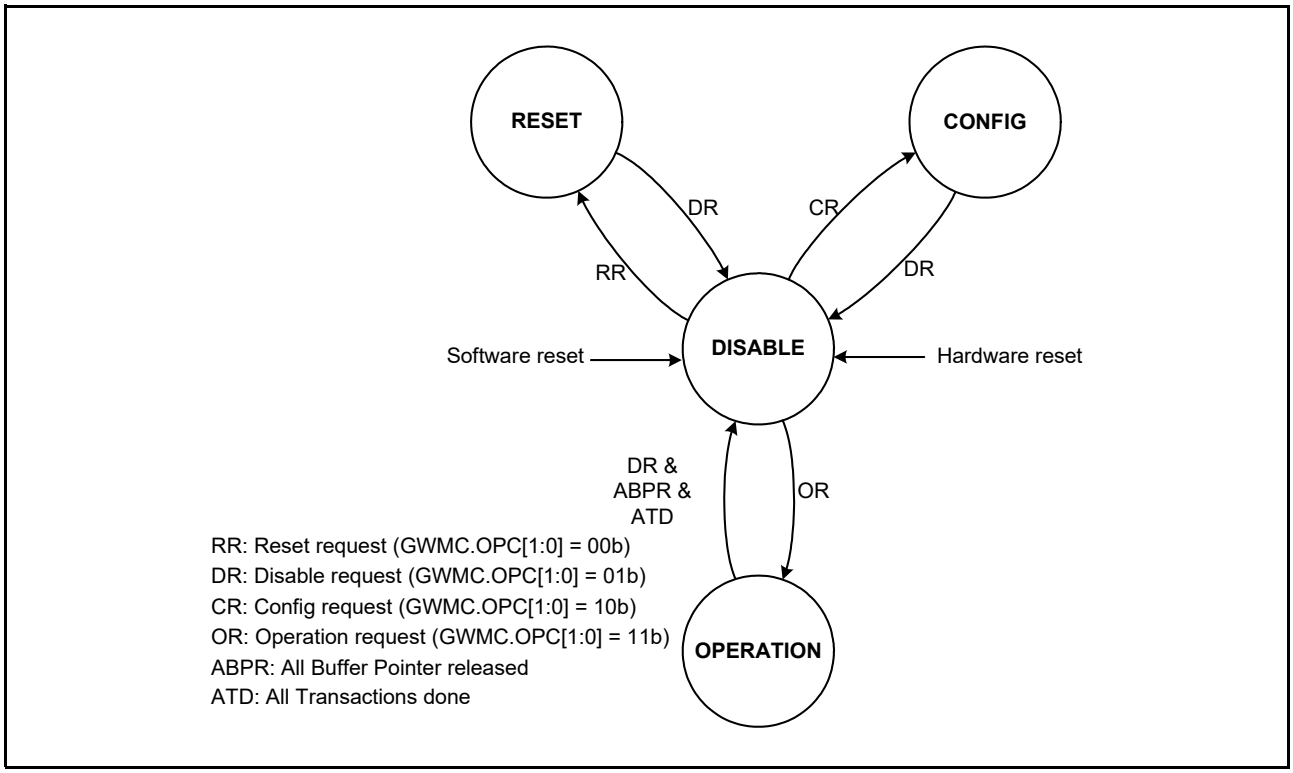


Figure 38.53 Operating Mode Transitions

Complementary information on transition conditions
ABPR:

- All the buffer pointers contained in the GWCA are release to the forwarding engine [MFWD].

ATD:

- All the descriptors already received are processed and corresponding frames are sent to CPU and AXI descriptors are written back.

All ongoing transmit frames are fully sent to the forwarding engine [MFWD] and AXI descriptors are written back.

[Restriction]

- Software shall only trigger transitions shown to Figure 38.53.
  Exp: Do not directory transition from OPERATION to CONFIG.

38.3.8 Software Flows

38.3.8.1 Mode Transition Flow

The mode transition flow is described in Figure 38.54.

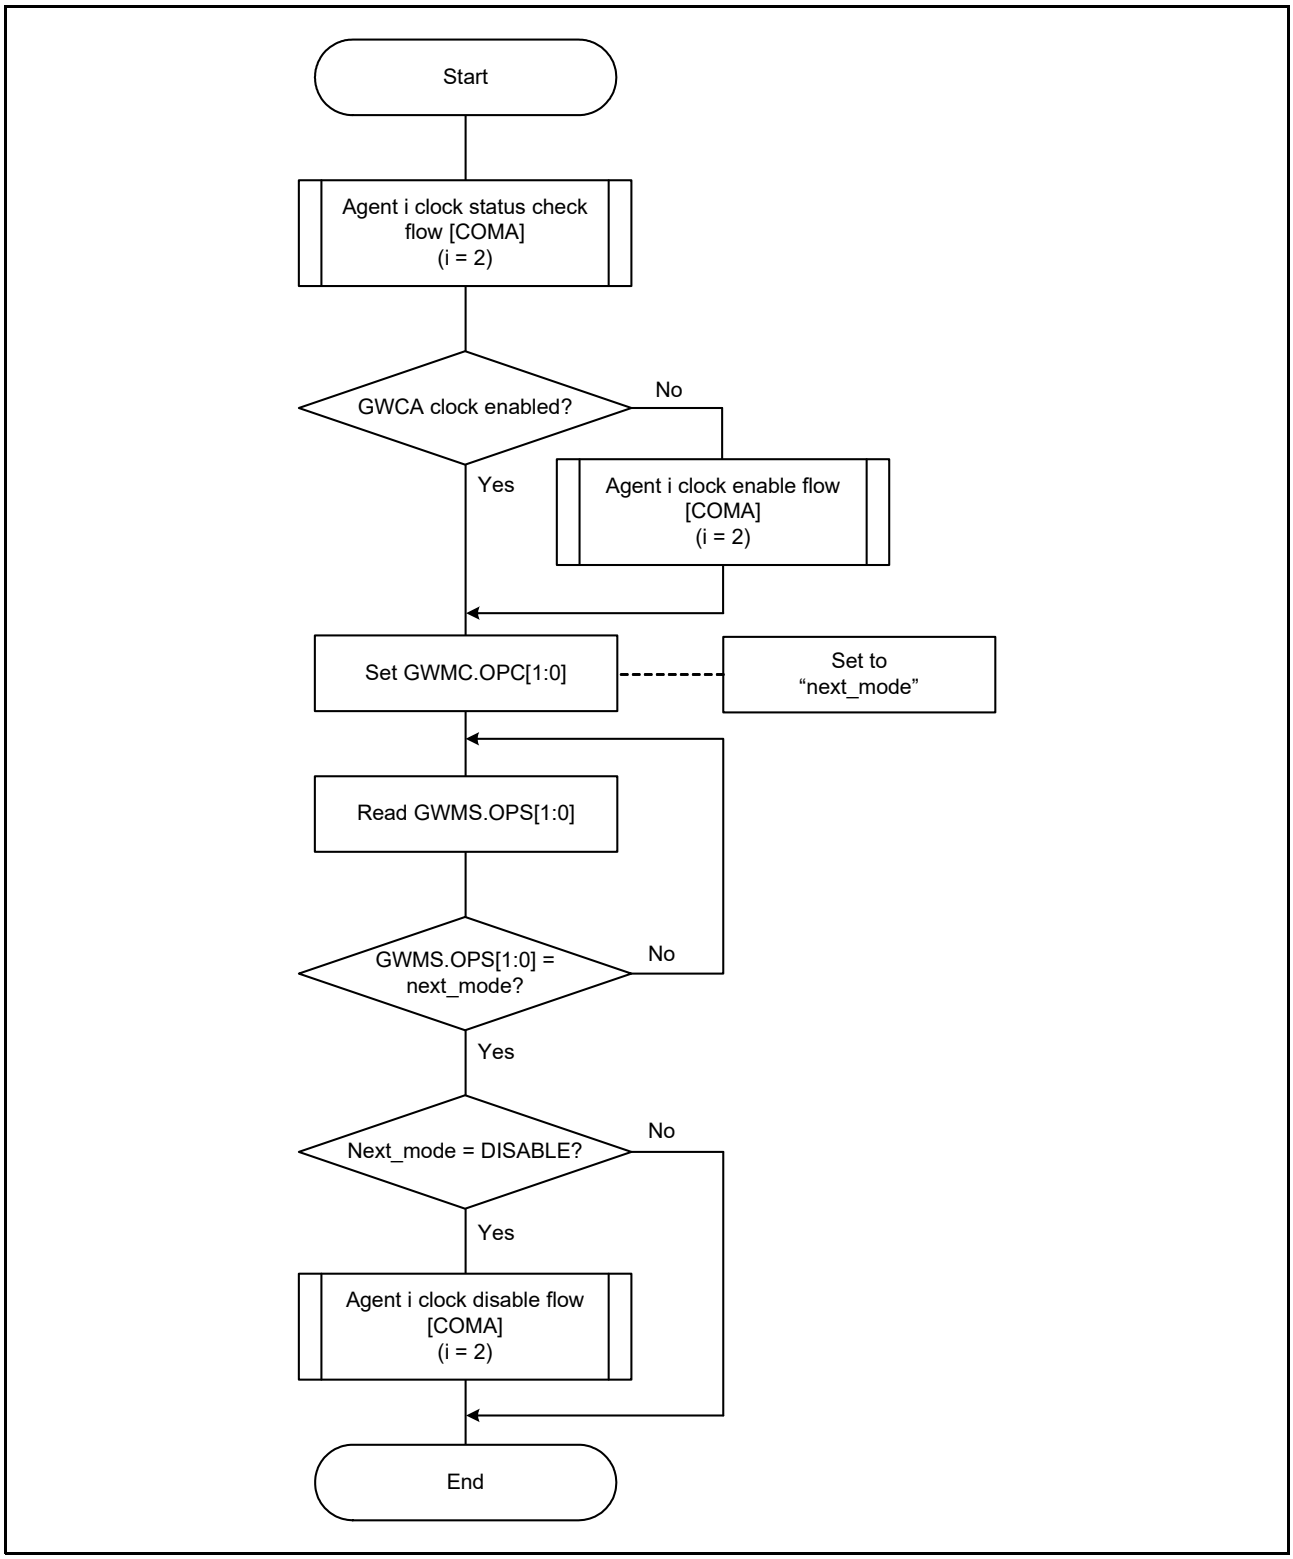

Figure 38.54 Mode Transition Flow

Note: If SW already know that the clock is enabled, clock status check step can be skipped.

Note: If SW does not need to disable the agent clock in DISABLE mode (because it will go directly to another mode or because the clock never needs to be disabled), clock disable step can be skipped.

38.3.8.2 Reset Flow

The reset flow is described in Figure 38.55.

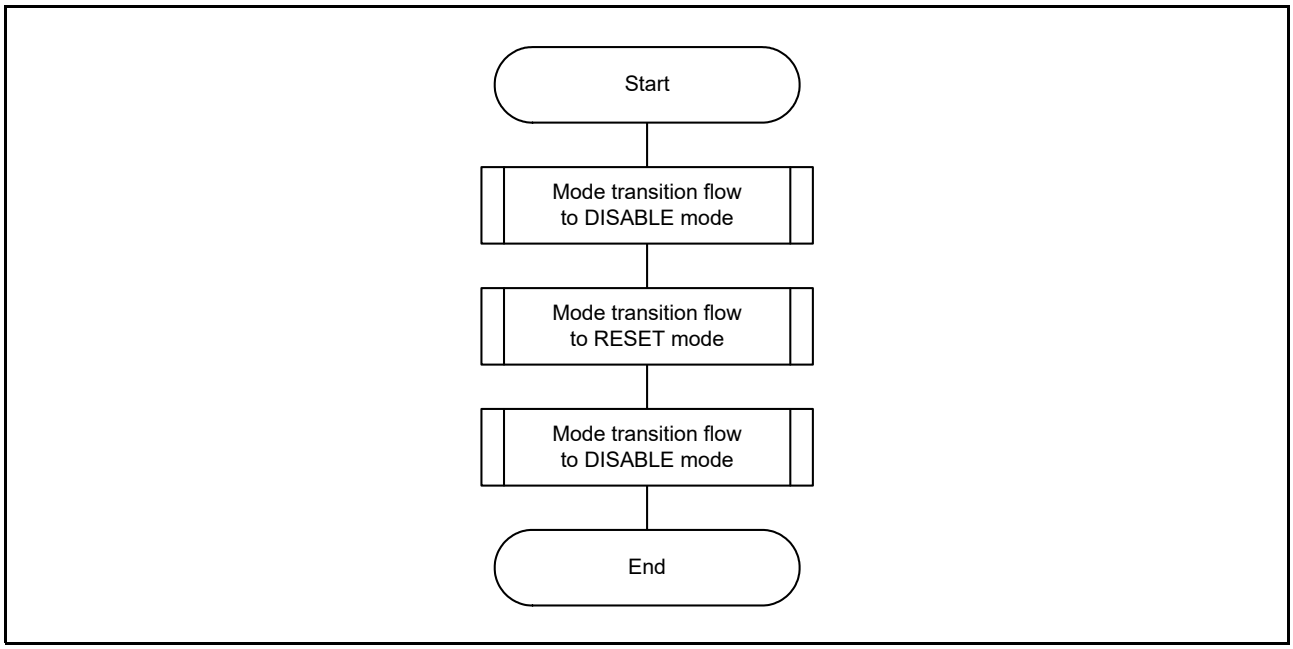

Figure 38.55 Reset Flow

38.3.8.3 Initialization Flow

The initialization flow is described in Figure 38.56.

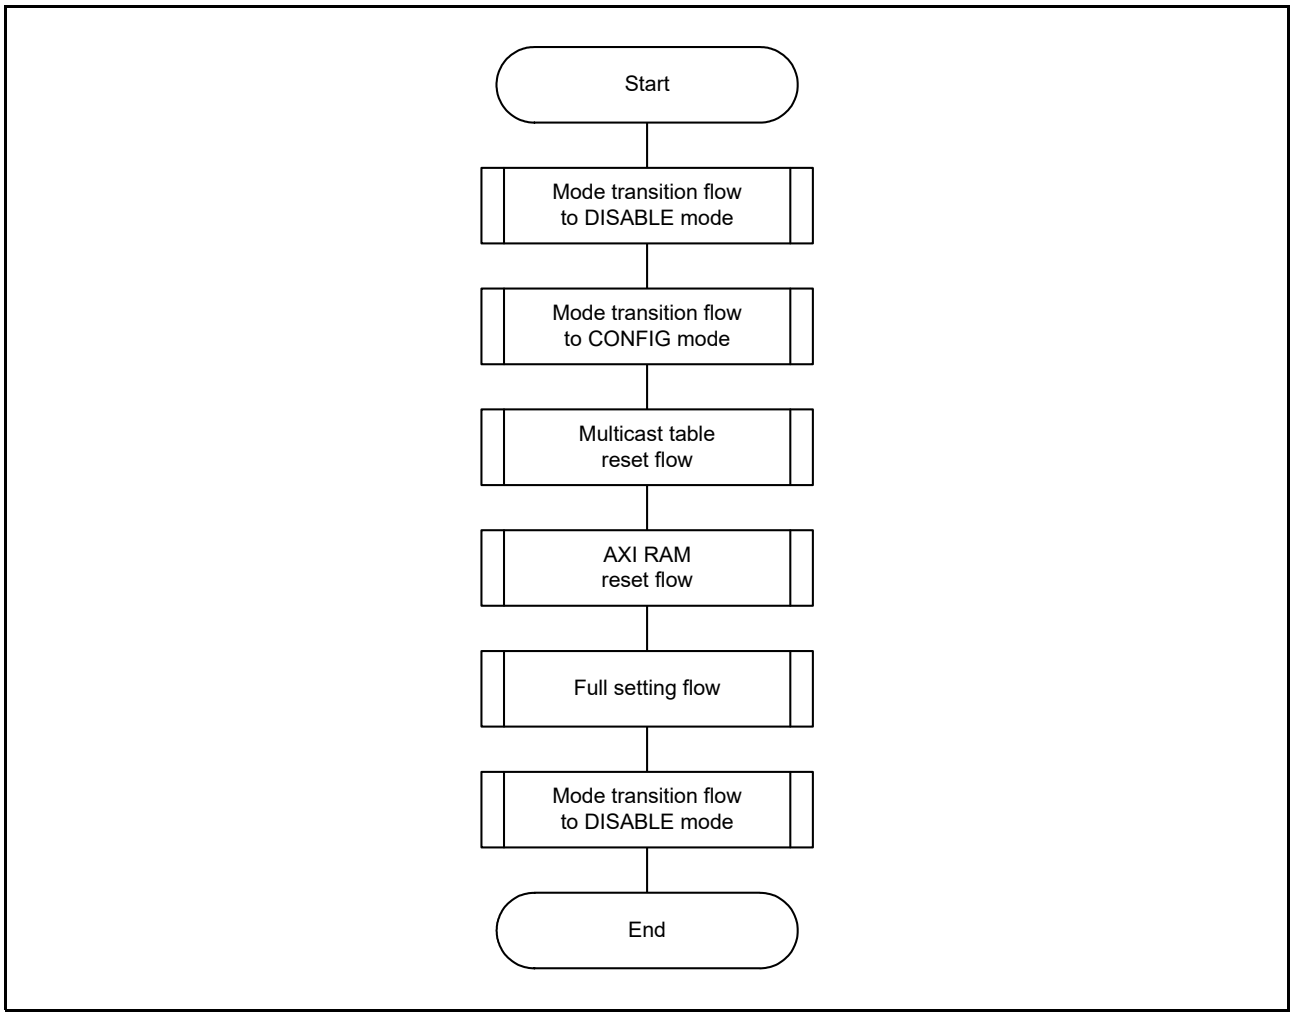

Figure 38.56 Initialization Flow

38.3.8.4 Reinitialization Flow

The reinitialization flow is described in Figure 38.57.

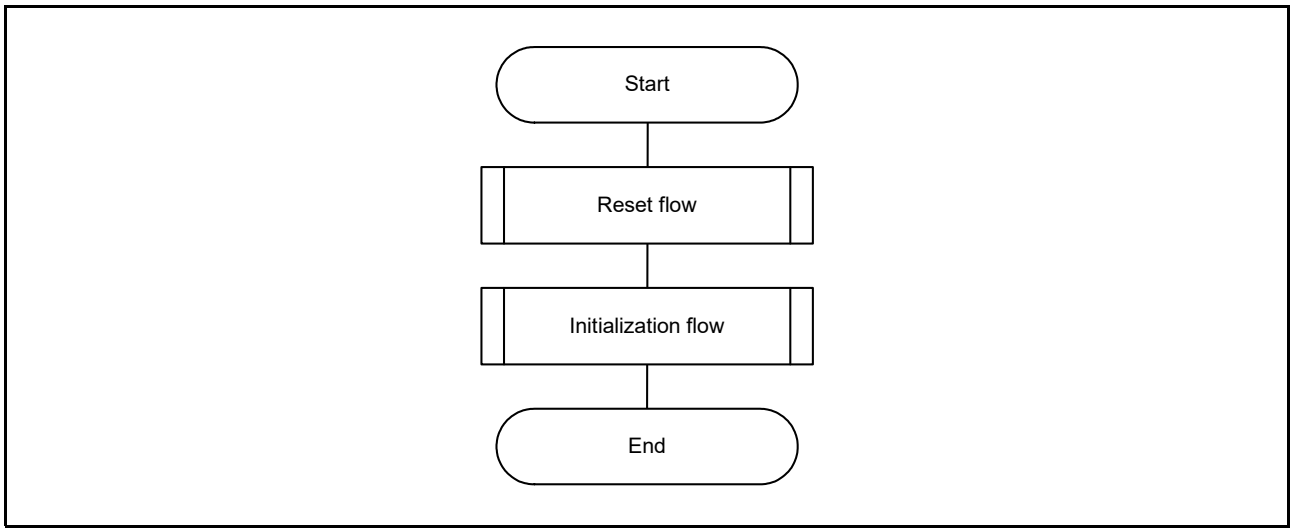

Figure 38.57 Reinitialization Flow

38.3.8.5 Multicast Table Reset Flow

The multicast table reset flow is described in Figure 38.58.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

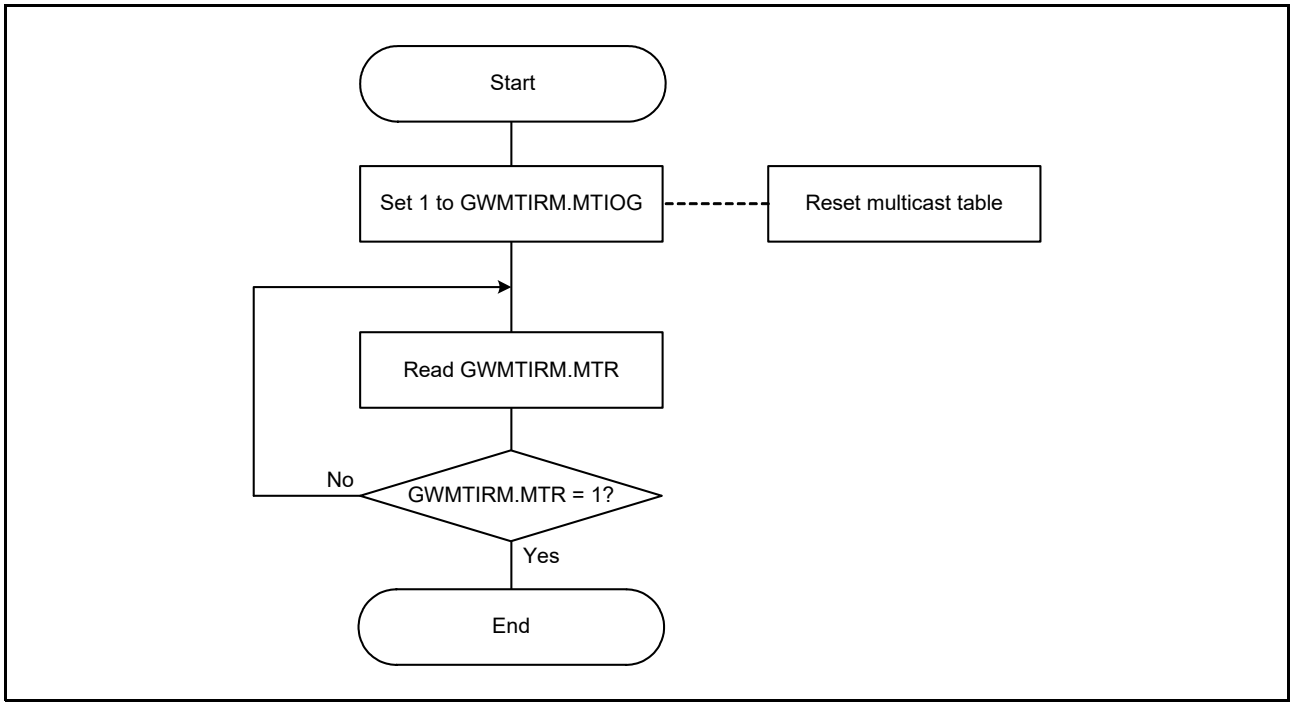

Figure 38.58 Multicast table Reset Flow

38.3.8.6 Multicast Table Setting Flow

The multicast table setting flow is described in Figure 38.59.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

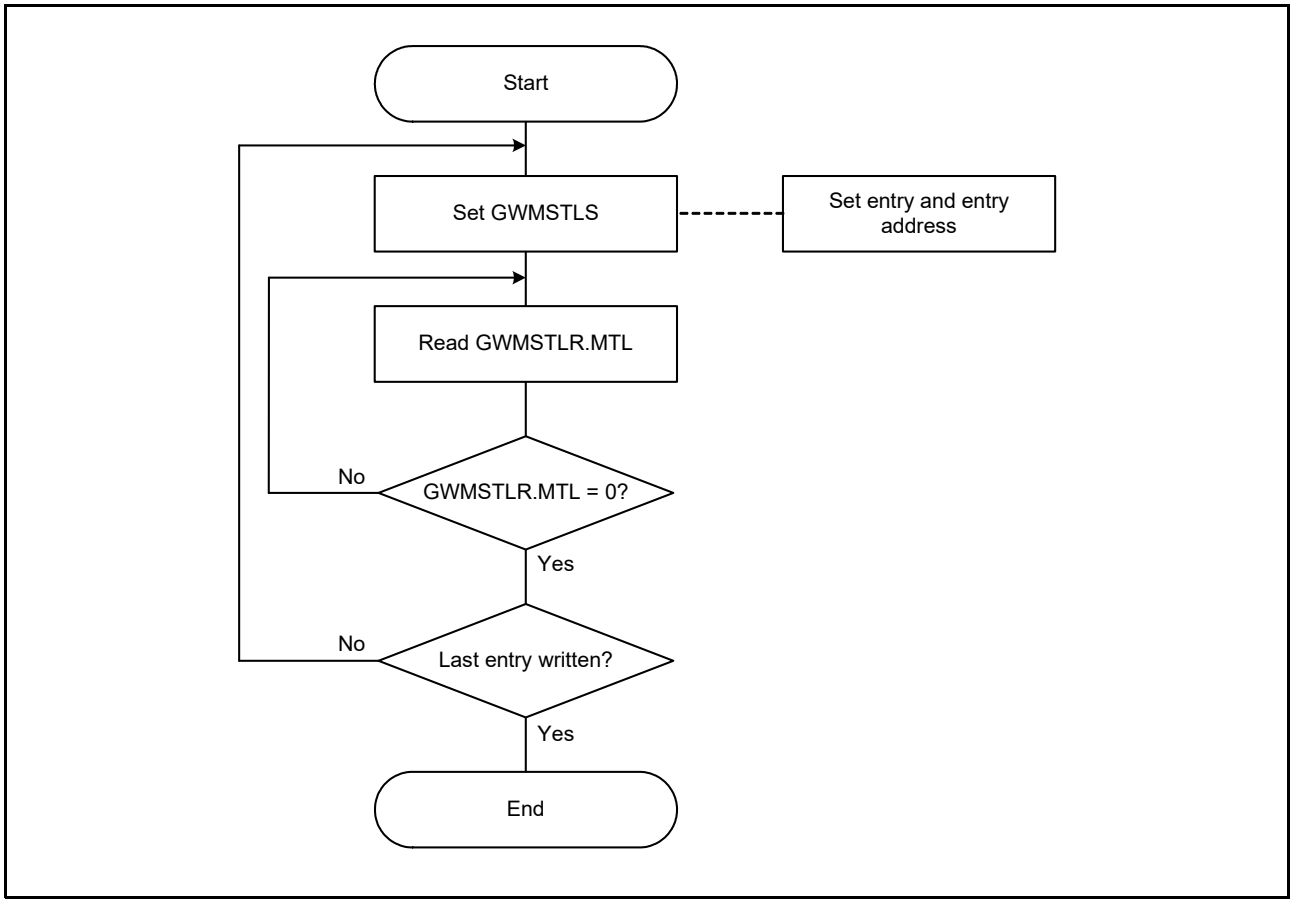

Figure 38.59 Multicast Table Setting Flow

38.3.8.7 Multicast Table Read Flow

The multicast table read flow is described in Figure 38.60.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

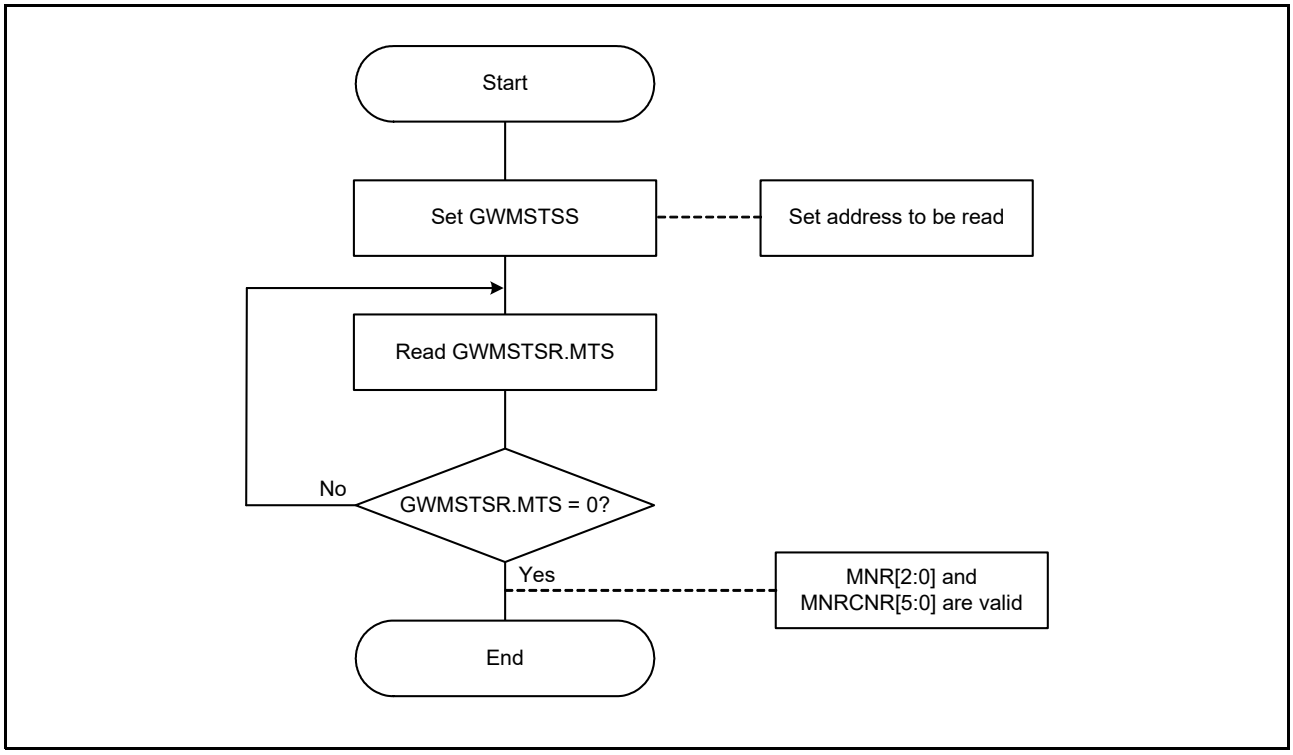

Figure 38.60 Multicast Table Read Flow

38.3.8.8 AXI RAM Reset Flow

The AXI RAM reset flow is described in Figure 38.61.
[Restriction]

- This flow is not usable in RESET, DISABLE and OPERATION modes.

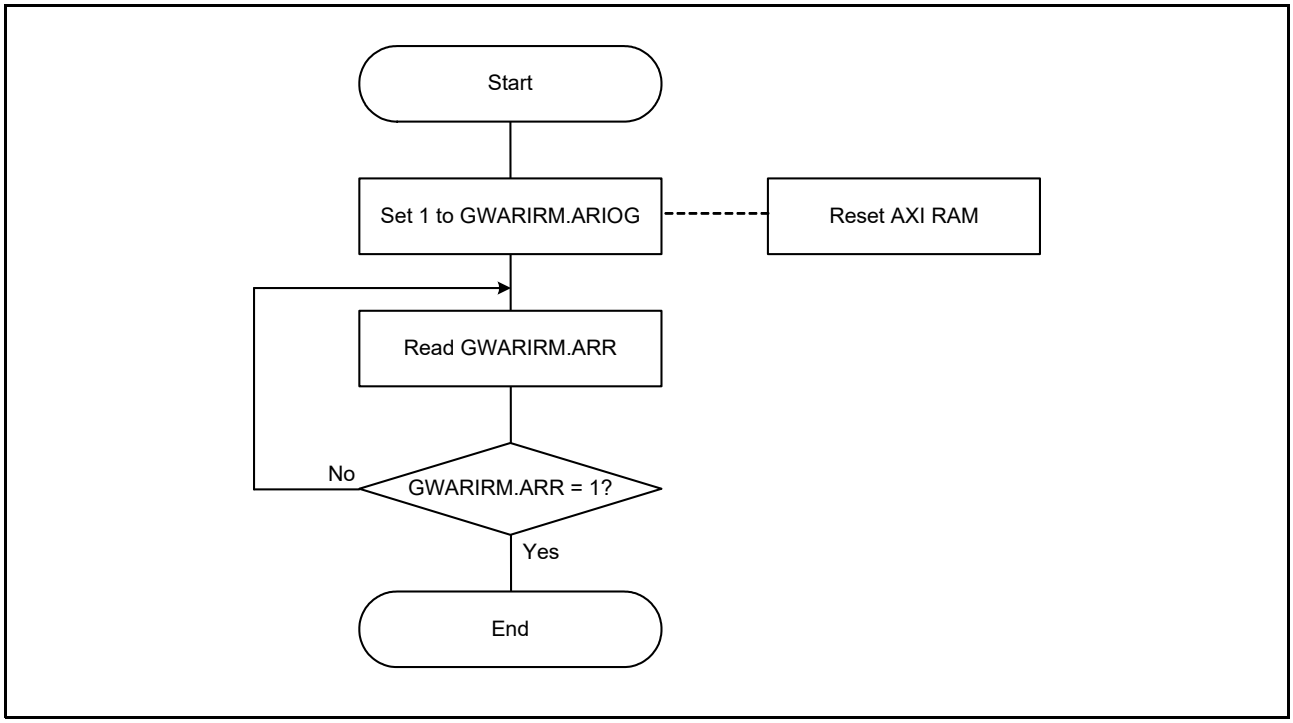

Figure 38.61 AXI RAM Reset Flow

38.3.8.9 AXI RAM Read Flow

The AXI RAM read flow is described in Figure 38.62.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

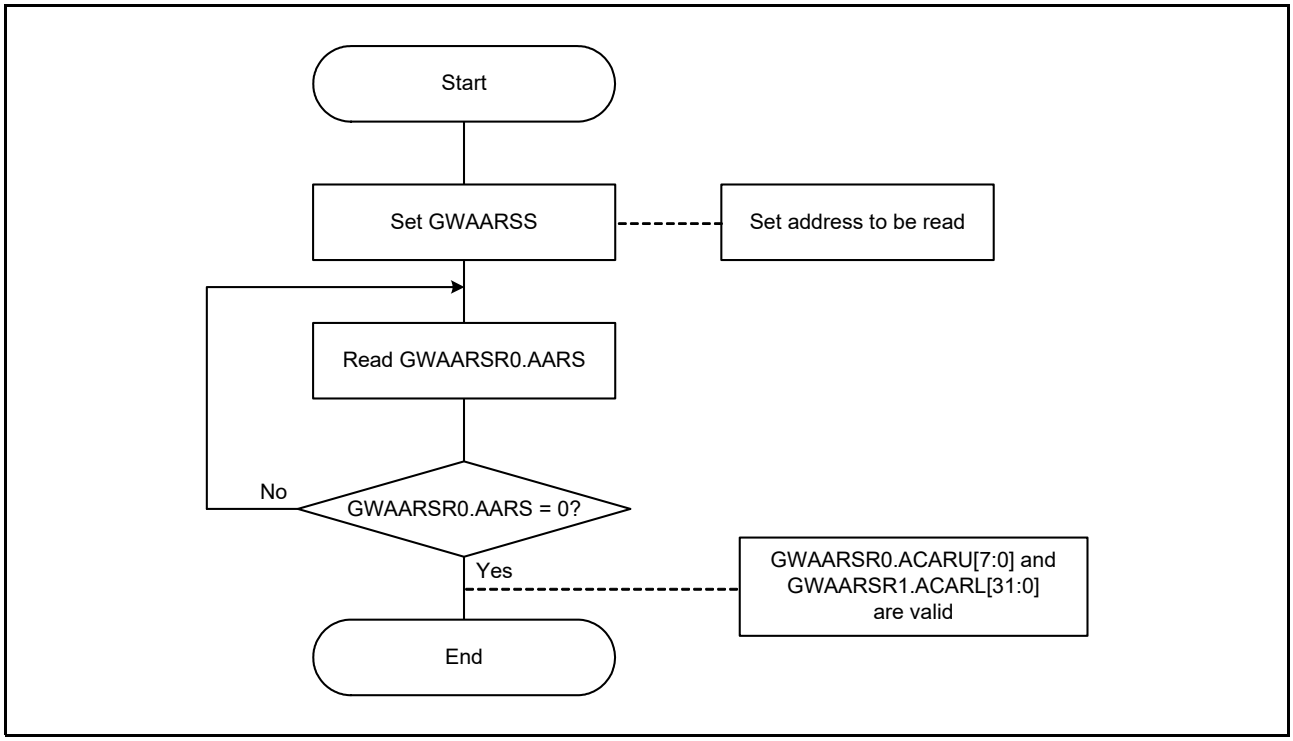

Figure 38.62 AXI RAM Read Flow

38.3.8.10 Global Rate Limiter Setting Flow

The global rate limiter setting flow is described in Figure 38.63.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

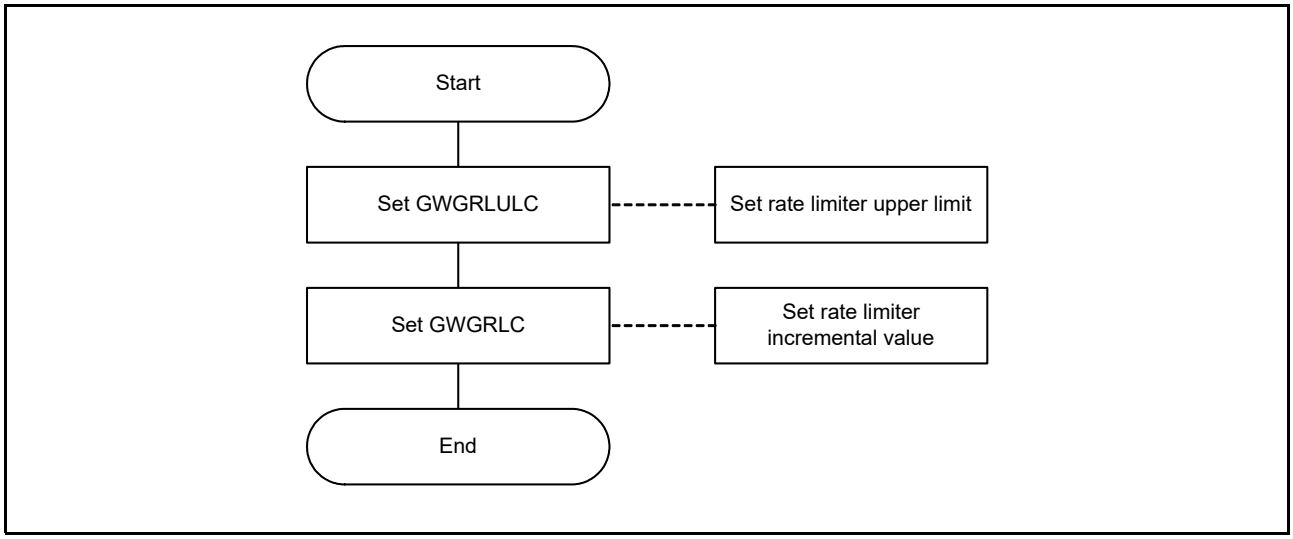

Figure 38.63 Global Rate Limiter Setting Flow

38.3.8.11 Global Rate Limiter Disabling Flow

The global rate limiter disabling flow is described in Figure 38.64.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

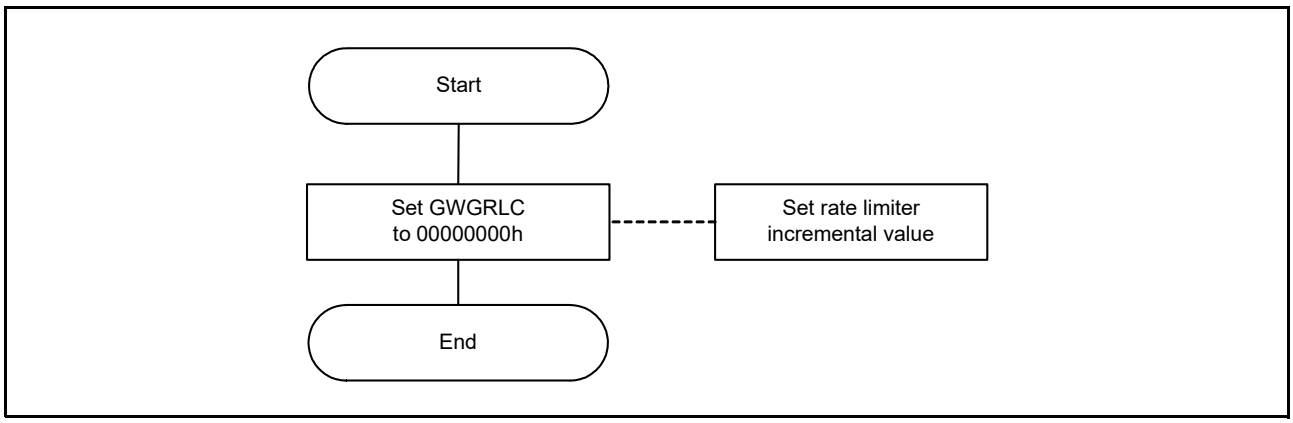

Figure 38.64 Global Rate Limiter Disabling Flow

38.3.8.12 Rate Limiter i Setting Flow

The rate limiter i setting flow is described in Figure 38.65.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

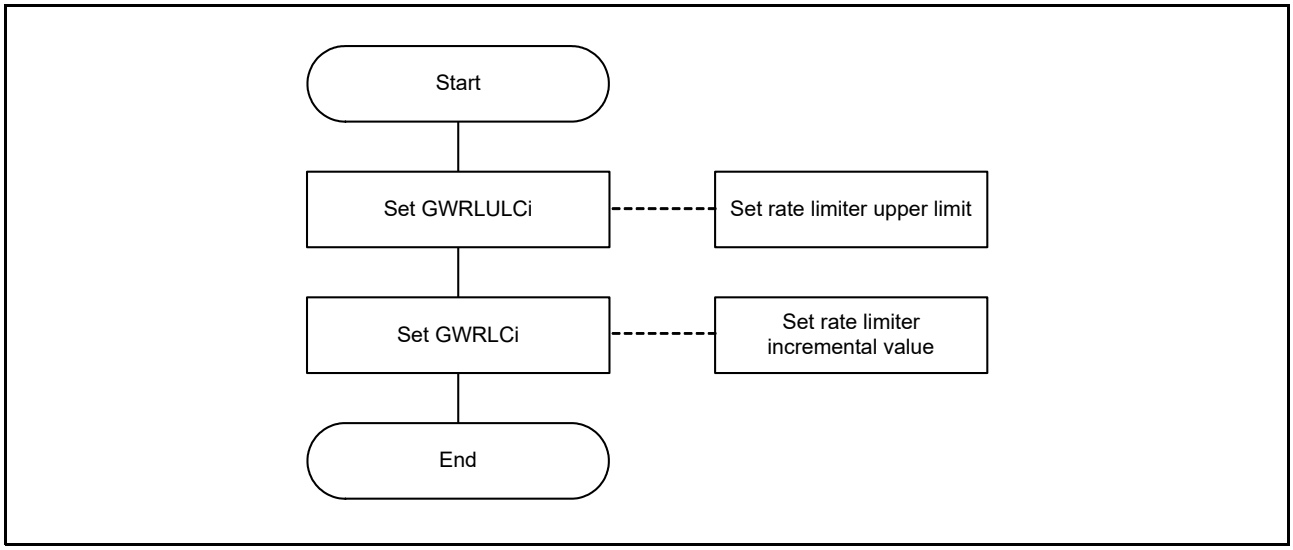

Figure 38.65 Rate Limiter i Setting Flow

38.3.8.13 Rate Limiter i Disabling Flow

The rate limiter i disabling flow is described in Figure 38.66.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

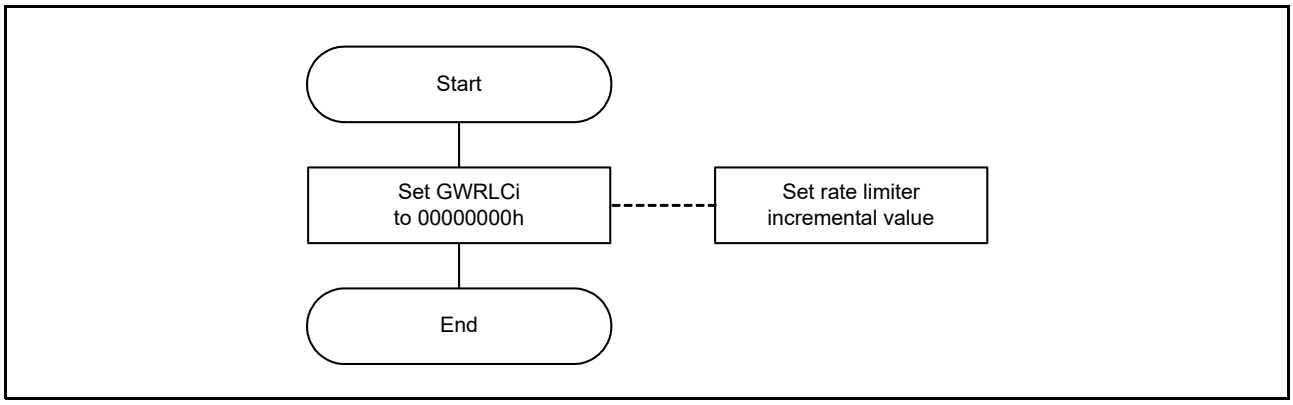

Figure 38.66 Rate Limiter i Disabling Flow

38.3.8.14 AXI Table Read Flow

The AXI table read flow is described in Figure 38.67.
[Restriction]

- This flow is not usable in RESET and DISABLE modes.

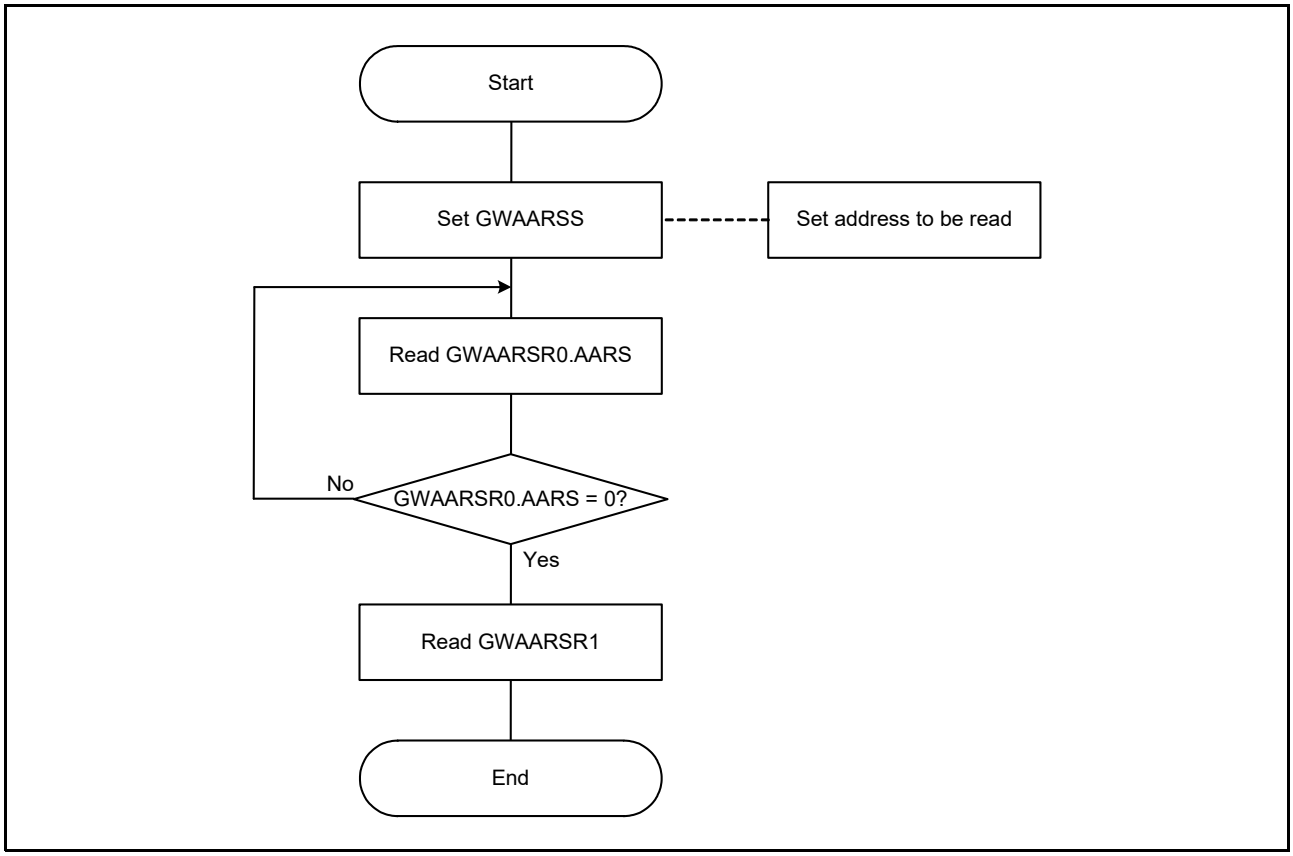

Figure 38.67 AXI Table Read Flow

38.3.8.15 Interrupt Handling Flow

The interrupt handling flow is described in Figure 38.68.
[Restriction]

- This flow is not usable in RESET mode.

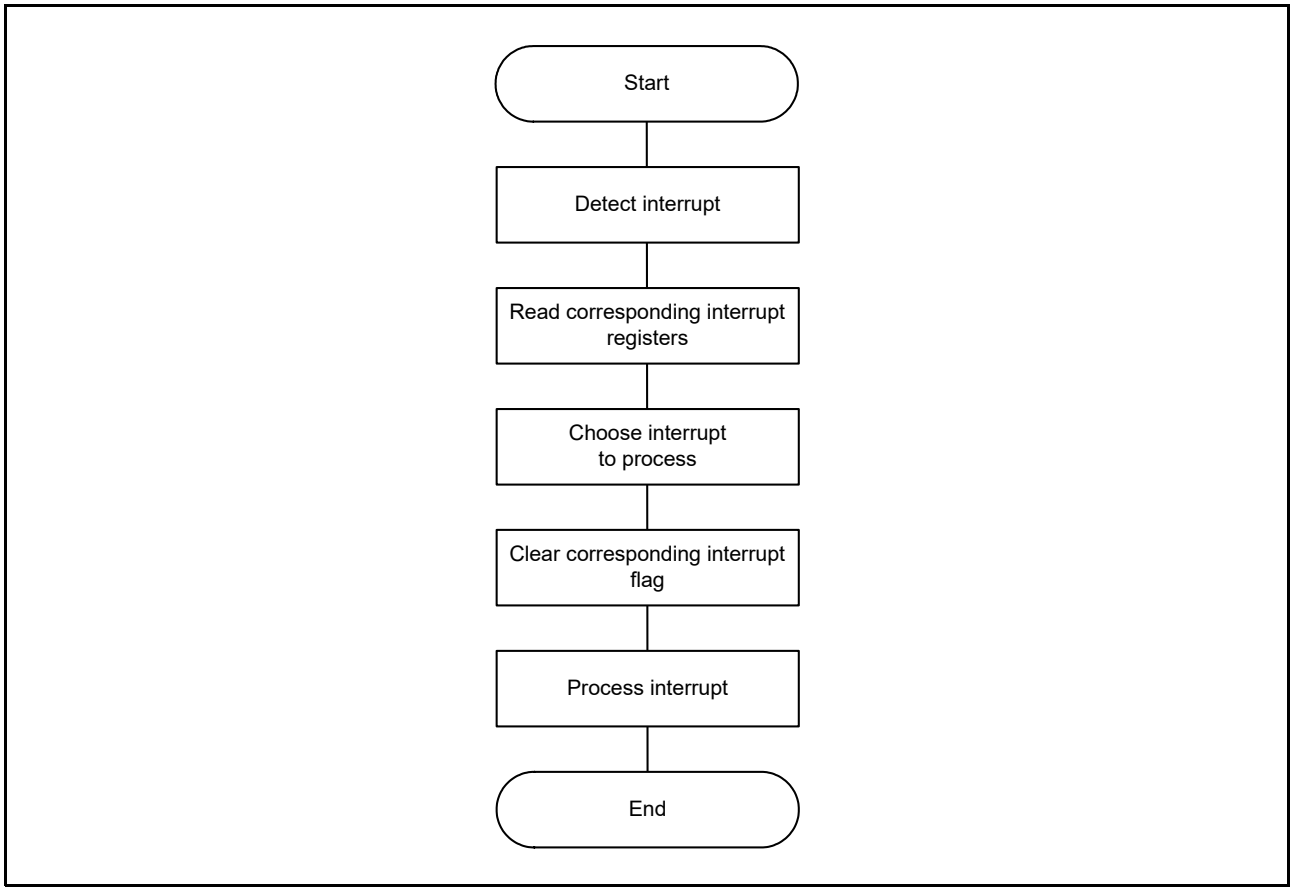

Figure 38.68 Interrupt Handling Flow

38.3.8.16 Called Software Flows

The flows described in this section can only be called from other flows thanks to a “flow link” box (Figure 38.xx) and cannot be used alone.

(1) Full Setting Flow

The full setting flow is described in Figure 38.69.
For LINKFIX table setting refer to (1) LINKFIX Table Initialization.

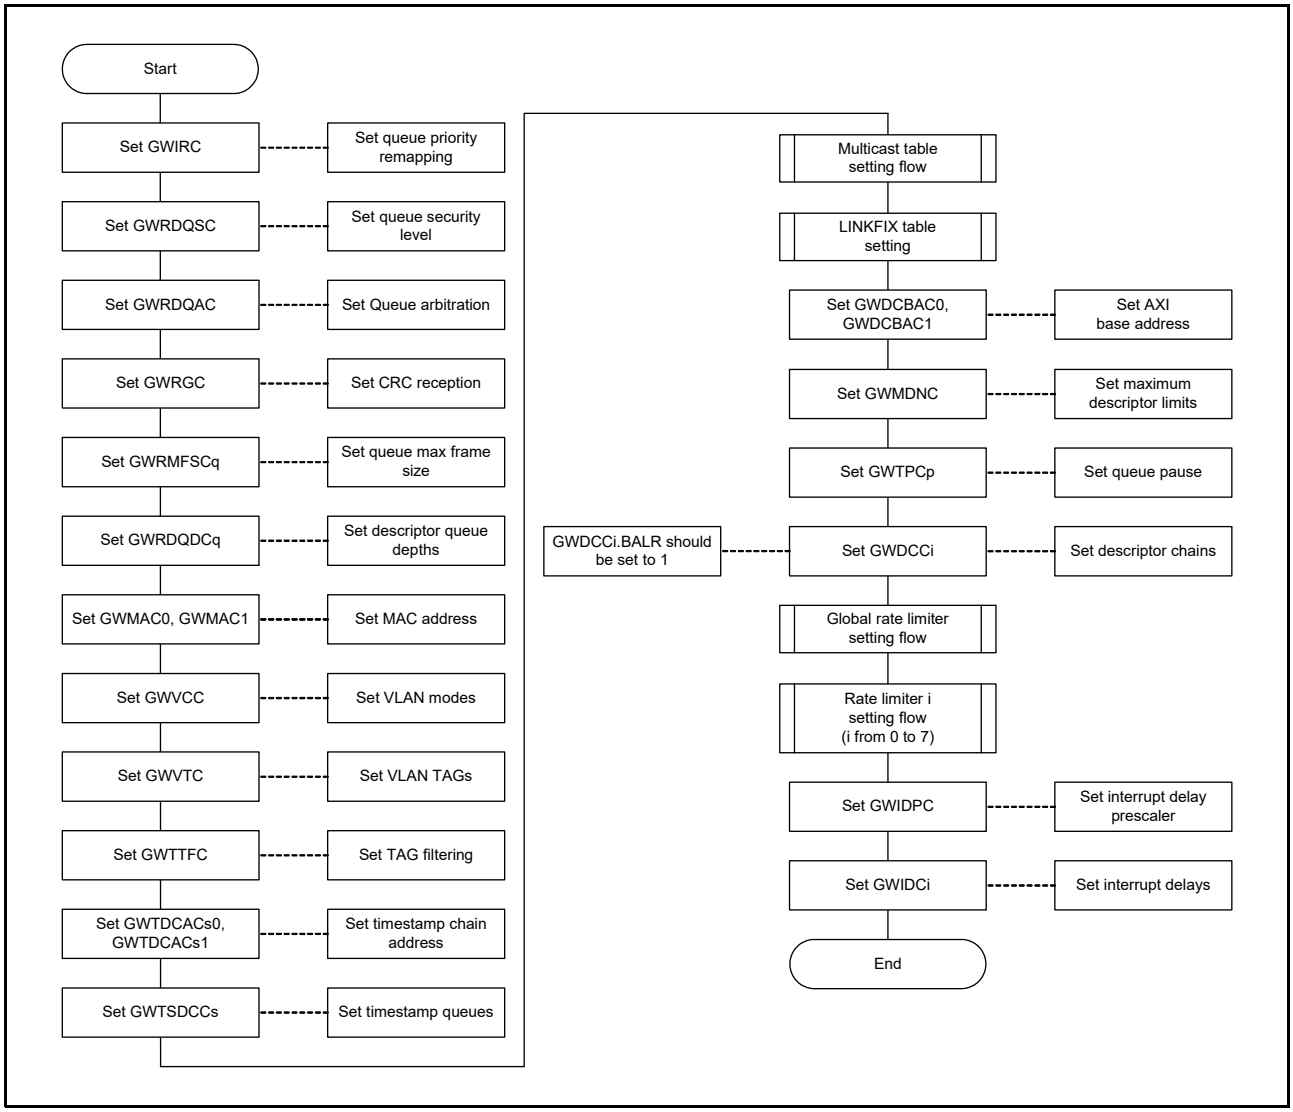

Figure 38.69 Full Setting Flow

(2) AXI Emergency Stop Flow

The AXI emergency stop flow is described in Figure 38.70.

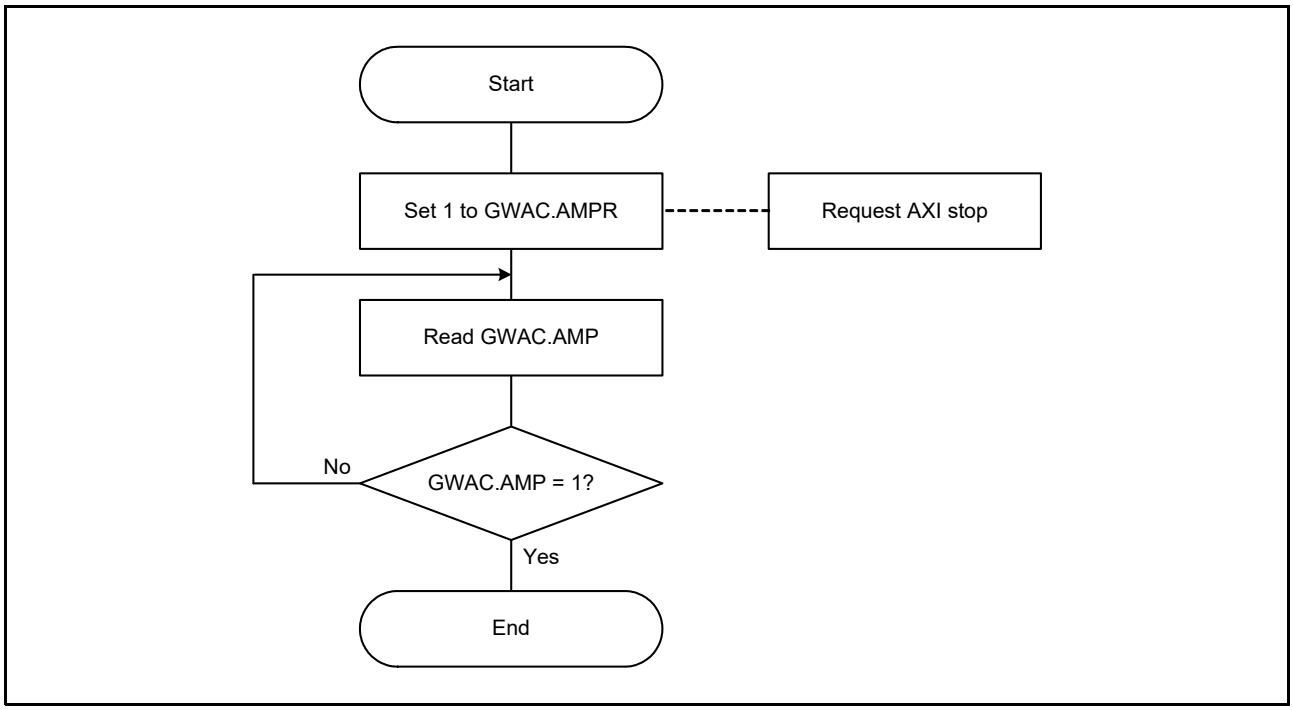

Figure 38.70 AXI Emergency Stop Flow

38.3.8.17 Register Writable Without Software Flow

This section describes registers that have not been described so far. These registers can be changed dynamically. (However, it is necessary that the initial settings such as the clock enabling have been completed.)

Note: When a frame has reached GWCA and before the frame has been written into URAM by AXI BMI if GWDCCi register configurations of target chain is reconfigured by the user then the frame will be handled using the GWDCCi register settings before reconfiguration and not using the reconfigured GWDCCi register settings.

39. Ethernet Generic PTP Timer (GPTP)

39.1 Overview

The gPTP timer enables accurate synchronization of the clock in the control system. The pulse output timer can generate arbitrary pulses based on the gPTP timer.

39.1.1 Features

The gPTP features are described in Table 39.1. The pulse output timer features are described in Table 39.2.

Table 39.1 gPTP Feature List

Function		Details
Overall function	Timer	• gPTP and AVTP timer
Data provision	—	• gPTP timer Data width: 78bit ([77:30] = second, [29:0] = nanosecond) • AVTP timer Data width: 64bit/32bit
Functions	Timer control	• gPTP timer increment value control • gPTP timer offset control • Generation of gPTP and AVTP timer
	PPS	• PPS signal generation
	Media clock	• Media clock capture • Media clock recovery
	Cyclic compare	• cyclic comparison to emit pulses

Table 39.2 Pulse Output Timer Feature List

Function		Details
Overall function	Pulse Generator	• Pulse generation timer, pulsed output and interrupt output.
Data provision	—	• Pulsed output channel: 2ch The pulse period: 80bit ([79:32] = second and [31:0] = ns) Pulse width: 20bit ([19:0] = Counter) • Interrupt output channel: 2ch
Functions	PTP pulse generation	• Uses the reference time of the gPTP timer to generate pulse outputs of any period and any pulse width.
	Interrupt pulse output	• The rising edge of the pulse output is detected and the interrupt pulse is output.

39.1.2 Block Diagram

Figure 39.1 shows gPTP timer the block diagram.

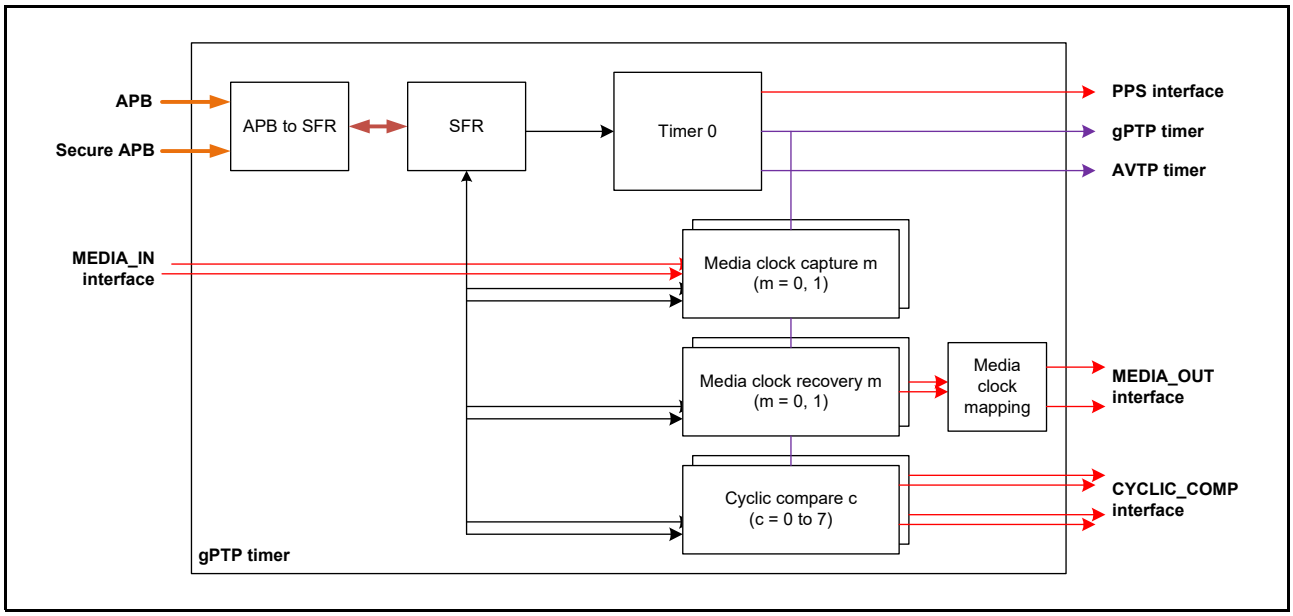

Figure 39.1 gPTP Timer Block Diagram

Table 39.3 gPTP Timer Functional Blocks

Block name	Function
APB to SFR	Handle SFR accesses
SFR	gPTP SFRs
Timer	Generate gPTP an AVTP timers
Media clock capture	Capture input media clocks
Media clock recovery	Recover output media clocks
Cyclic compare	Generate a cyclic pulse

Figure 39.2 shows a block diagram of the pulse output timer.

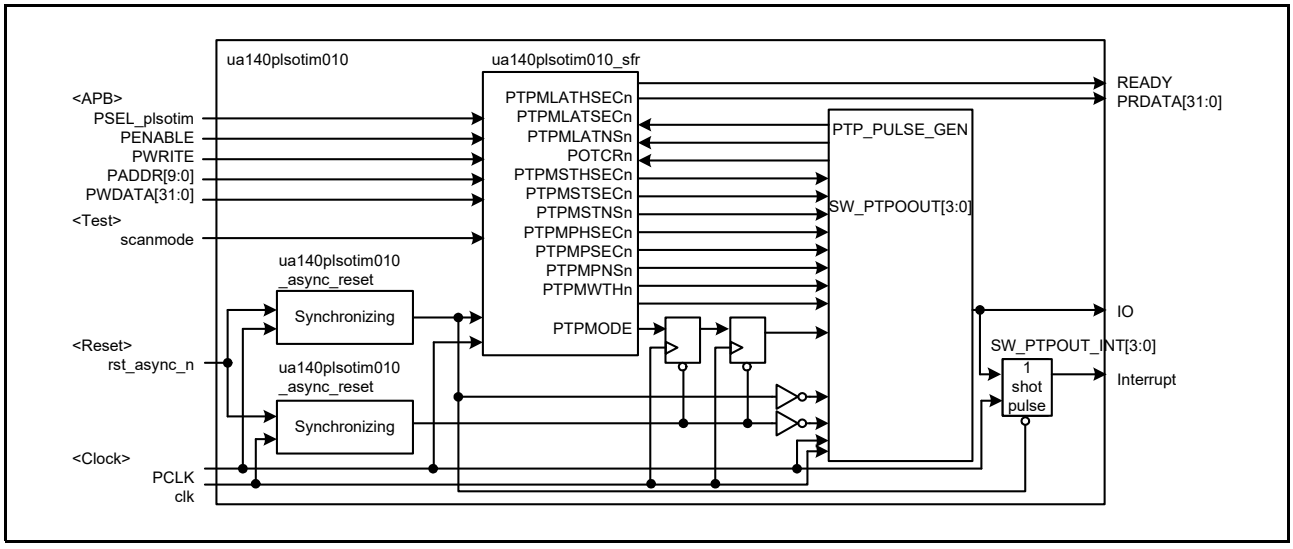

Figure 39.2 Pulse Output Timer Block Diagram (n = 0, 1)

Table 39.4 Pulse Output Timer Functional Blocks

Block name	Function
Reset rise async to ESWCLK	Synchronize the rising edge of an asynchronous reset to ESWCLK.
Reset rise async to PCLKA	Synchronize the rising edge of an asynchronous reset to PCLKA.
SFR	SFR access processing from the pulse output timer registers and APB.
PTP_PULSE_GEN	Pulse generation and pulsed output.
Interrupt output	Interruption generation and interrupt output.

39.2 Register Descriptions

39.2.1 Version Register

39.2.1.1 IP Version Register (PTPIPV)

Address(es): GPTP.PTPIPV 874E 0000h, GPTP_NS.PTPIPV 074E 0000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	IPV[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	IPV[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	IPV[31:0]	IP Version		R

39.2.2 Timer Configuration Registers

39.2.2.1 Timer Enable Configuration Register (PTPTMEC)

Address(es): GPTP.PTPTMEC 874E 0010h, GPTP_NS.PTPTMEC 074E 0010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TE0	Timer 0 Enable	0: Timer 0 disabled 1: Timer 0 enabled	R/W
b31 to b1	—	Reserved	These bits are read as 0.	R

TE0 Bit (Timer 0 Enable)

When timer 0 is disabled, all counters are fixed to 0.

[Setting Condition]

- SW: Writing 1 to the TE0 bit will set it.

[Clearing Conditions]

- SW: Writing 1 to the PTPTMDC.TDn bit will clear the TE0 bit.

39.2.2.2 Timer Disable Configuration Register (PTPTMDC)

Address(es): GPTP.PTPTMDC 874E 0014h, GPTP_NS.PTPTMDC 074E 0014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TD0	Timer 0 Disable	Writing 1 to this bit will clear the PTPTMEC.TE0 bit.	R/W
b31 to b1	—	Reserved	These bits are read as 0.	R

39.2.2.3 Timer 0 Increment Value Configuration Register (PTPTIVC0)

Address(es): GPTP.PTPTIVC0 874E 0020h, GPTP_NS.PTPTIVC0 074E 0020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TIV[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TIV[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TIV[31:0]	Timer Increment Value	Timer increment value in ns per the ESWCLK.	R/W

TIV[31:0] Bits (Timer Increment Value)
