| 8 | MEM0_RDY_INT_EN | 0 | R/W | The memory device 0 is ready for the new command. 0: interrupt disabled 1: interrupt enabled For more details see Figure 31.31. |
| 7 | — | 0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 6 | PG_SZ_ERR_INT_EN | 0 | R/W | Data Size error occur. 0: interrupt disabled 1: interrupt enabled |
| 5 | — | 0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 4 | TRANS_ERR_EN | 0 | R/W | The transfer on the slave interface error 0: interrupt disabled 1: interrupt enabled |
| 3 | DMA_INT_EN | 0 | R/W | DMA transfer ended. 0: interrupt disabled 1: interrupt enabled |
| 2 | DATA_REG_INT_EN | 0 | R/W | Data in DATA_REG is available. 0: interrupt disabled 1: interrupt enabled |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|--------------------|---------------|-----|--|
| 1 | CMD_END_ INT_EN | 0 | R/W | Command sequence ended. 0: interrupt disabled 1: interrupt enabled For more details see Figure 31.31, Command Sequence End and Memory-Ready Interrupts. |
| 0 | PROT_ INT_EN | 0 | R/W | Erase/Write protected area interrupt enable 0: interrupt disabled 1: interrupt enabled |

31.2.7 Interrupts status register (INT_STATUS)

INT_STATUS stores the NAND Flash controller interrupt flags. If the given bit is 0, the corresponding interrupt condition is not met. If the given bit is 1, the corresponding interrupt condition is met.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|-----------------|----|------------------|----|--------------|------------|-----------------|----------------|------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | ECC_INT0_FL | — | — | — | — | — | — | — | STAT_ERR_INT0_FL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | MEMO_RDY_INT_FL | — | PG_SZ_ERR_INT_FL | — | TRANS_ERR_FL | DMA_INT_FL | DATA_REG_INT_FL | CMD_END_INT_FL | PROT_INT_FL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 25 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 24 | ECC_INT0_FL | 0 | R/W | Selected flag (source is ECC_UNC_0, ECC_ERROR_0 or ECC_OVER_0) in the ECC module is set. |
| 23 to 17 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | STAT_ERR_INT0_FL | 0 | R/W | Most recently finished operation on the Memory device 0 failed. This applies to PROGRAM PAGE and ERASE BLOCK operations. It is not valid following a READ-series operation. |
| 15 to 9 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | MEMO_RDY_INT_FL | 0 | R/W | The memory device 0 is ready for the new command. |
| 7 | — | 0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 6 | PG_SZ_ERR_INT_FL | 0 | R/W | Data Size error flag When the ECC is enabled, the value written into the DATA_SIZE register has some restrictions. Interrupt condition is met when the value written to the DATA_SIZE register is not correct. |
| 5 | — | 0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 4 | TRANS_ERR_FL | 0 | R/W | The transfer on the slave interface error The flag is set when the access to the FIFO memory has the opposite direction to the current FIFO configuration. |
| 3 | DMA_INT_FL | 0 | R/W | DMA transfer ended flag. |
| 2 | DATA_REG_INT_FL | 0 | R/W | Data in DATA_REG is available. |
| 1 | CMD_END_INT_FL | 0 | R/W | Transfer sequence ended. |
| 0 | PROT_INT_FL | 0 | R/W | Erase/Write protected area interrupt enable |

31.2.8 ECC module control register (ECC_CTRL)

ECC_CTRL stores all configuration parameters required by the ECC.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|--------------------|-----|-----|-----|-----|-----|----|----|----|----|----|--------------|--------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ECC_SEL[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | ERR_THRESHOLD[5:0] | | | | | — | — | — | — | — | — | ECC_CAP[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------|---------------|-----|--|
| 31 to 18 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 17,16 | ECC_SEL[1:0] | H'0 | R/W | The ECC interrupt source select These bits select the ECC module flag that will be used as a source for the interrupt signal: 00: select ECC_ERROR (correctable error) flag as interrupt source. 01: select ECC_UNC (uncorrectable error) flag as interrupt source. 1x: select ECC_OVER (acceptable errors level overflow) flag as interrupt source. The ECC_OVER flag is not set in response to an uncorrectable error (ECC_UNC_0 = 1). |
| 15, 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13 to 8 | ERR_THRESHOLD [5:0] | H'00 | R/W | The acceptable errors level The value of this field contains the number of errors that is acceptable. This field must be initialized by the application program. |
| 7 to 3 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 to 0 | ECC_CAP[2:0] | H'0 | R/W | The ECC module correction ability The correction ability can be changed only when memory devices are ready. 000: 2 001: 4 010: 8 011: 16 100: 24 All others: 32 |

31.2.9 ECC module status register (ECC_STAT)

ECC_STAT stores all ECC module status information.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|-------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ECC_OVER_0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | ECC_UNC_0 | — | — | — | — | — | — | — | ECC_ERROR_0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 17 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | ECC_OVER_0 | 0 | R/W | The Memory device 0 acceptable errors level overflow The bit is set when the number of errors is bigger than the value of declared ERR_THRESHOLD bits. Uncorrectable errors are not counted. |
| 15 to 9 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | ECC_UNC_0 | 0 | R/W | The Memory device 0 uncorrectable error flag The bit is set when the uncorrectable error occur during the read operation. |
| 7 to 1 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | ECC_ERROR_0 | 0 | R/W | The Memory device 0 correctable error flag The bit is set when a correctable or uncorrectable error (ECC_UNC_0 = 1) occurs during reading. |

31.2.10 ECC offset in the spare area register (ECC_OFFSET)

ECC_OFFSET stores the offset value from the beginning of the page to the place where correction words will be stored. The value of the ECC_OFFSET register must be bigger than the value in the DATA_SIZE register.

In small block mode, the value in ECC_OFFSET is ignored and the correction words are located in the NAND Flash memory device just behind the data.

| | | | | | | | | | | | | | | | | |
|----------------|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ECC_OFFSET[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | ECC_OFFSET[15:0] | H'0000 | R/W | Correction words block offset |

31.2.11 ECC error level counter register (ECC_CNT)

ECC_CNT stores number of value detected during last page read operation. This register content is not automatically cleared, it must be done by software. The new page read operation does not overwrite previous register value. Register contain value of the largest error level detected in processed ECC blocks.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|--------------|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | ERR_LVL[5:0] | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|--|
| 31 to 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 to 0 | ERR_LVL[5:0] | H'00 | R/W | Detected error level Uncorrectable errors are not counted. |

31.2.12 Column/row address registers (ADDR[1:0]_COL, ADDR[1:0]_ROW)

ADDR[1:0]_COL and ADDR[1:0]_ROW store the address that will be used by the next command sequence during access to the NAND Flash device.

ADDR [1:0] _COL:

| | | | | | | | | | | | | | | | | |
|----------------|---------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ADDR[1:0]_COL[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | ADDR[1:0]_COL[15:0] | H'0000 | R/W | Column address, A15-A0 address bits |

ADDR [1:0] _ROW:

| | | | | | | | | | | | | | | | | |
|----------------|---------------------|-----|-----|-----|-----|-----|-----|-----|----------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | ADDR[1:0]_ROW[23:16] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ADDR[1:0]_ROW[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 23 to 0 | ADDR[1:0]_ROW[23:0] | H'00 0000 | R/W | Row address, A39-A16 address bits (Page address, Block address and LUN address in the ONFI case) |

Note 1. There is no register that defines the total memory size of the NAND Flash memory chip, thus the controller is not able to determine which address bits in ADDR [1:0]_COL and ADDR[1:0]_ROW are important and which must be zero. For this reason, the software must take special care with the values written to these registers. Incorrect values of unused address bits (none '0' values) can cause errors in memory access.

A relation between address registers and memory device address width is configured by the command sequence field of the COMMAND register. This field determines which command sequence has to be used and how many address bytes are used when addressing a NAND Flash memory device.

(Example: In order to erase blocks, the three address cycles containing the row address are written into the NAND Flash memory device. The NAND Flash Controller automatically writes bits A39-A16 to the NAND Flash device).

Refer to section 31.3.1 (2), Command Sequence Encoding and Table 31.6, Command Sequence Encoding in order to see how many address cycles are written into the NAND Flash memory device by each Command Sequence.

The address written to the address register must be aligned according to the NAND Flash device. Unused bits must be padded with zeros.

Note 2. When the auto increment for the row address register is enabled, the proper value of this register can be read only when the bit CTRL_STAT in STATUS register is clear.

Table 31.3 Address Registers and Address Bytes Relationship

| Address Cycle | I/O 0 | I/O 1 | I/O 2 | I/O 3 | I/O 4 | I/O 5 | I/O 6 | I/O 7 |
|---------------|-------|-------|-------|-------|-------|-------|-------|-------|
| 1st cycle | A0 | A1 | A2 | A3 | A4 | A5 | A6 | A7 |
| 2nd cycle | A8 | A9 | A10 | A11 | A12 | A13 | A14 | A15 |
| 3rd cycle | A16 | A17 | A18 | A19 | A20 | A21 | A22 | A23 |
| 4th cycle | A24 | A25 | A26 | A27 | A28 | A29 | A30 | A31 |
| 5th cycle | A32 | A33 | A34 | A35 | A36 | A37 | A38 | A39 |

31.2.13 Page size value register (DATA_SIZE)

DATA_SIZE stores the value of the data block size. The data size value is remembered as the number of bytes per transferred block, but its size must be declared as the multiple of the chosen NAND Flash word size. The unused bits for the given word size configuration are ignored and replaced with zeros.

| | | | | | | | | | | | | | | | | |
|----------------|----|-----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | DATA_SIZE[14:0] | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 15 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 14 to 0 | DATA_SIZE[14:0] | H'0000 | R/W | Data size The value of this field defines data size. |

Note: Write the proper value to the DATA_SIZE register when ECC is enabled:
 $(\text{ECC_BLOCK_SIZE}) \times m \leq \text{DATA_SIZE} \leq (\text{ECC_BLOCK_SIZE} + 32) \times m$, Where m is 1, 2, 3 ...

Here is an example of correct DATA_SIZE values when ECC_BLOCK_SIZE equals 512 bytes.

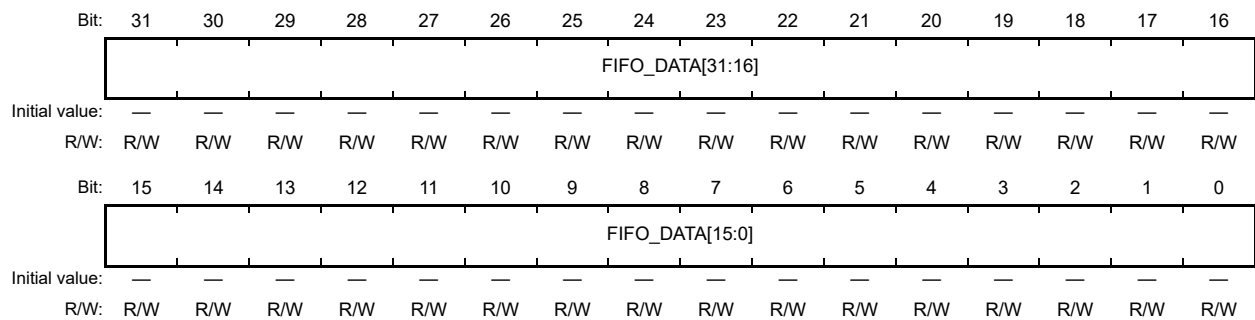

Table 31.4 Example of Correct DATA_SIZE Values

| DATA_SIZE Value | Setting |
|-----------------|-------------|
| H'0000 | Not allowed |
| | |
| H'001F | Not allowed |
| H'0020 | Not allowed |
| H'0021 | Not allowed |
| | |
| H'01FF | Not allowed |
| H'0200 | Allowed |
| H'0201 | Allowed |
| | |
| H'0220 | Allowed |
| H'0221 | Not allowed |
| | |
| H'03FF | Not allowed |
| H'0400 | Allowed |
| H'0401 | Allowed |
| | |
| H'0440 | Allowed |
| H'0441 | Not allowed |
| | |

Note 1. ECC_BLOCK_SIZE equals 512 bytes.

31.2.14 FIFO module interface register (FIFO_DATA)

FIFO_DATA is used as an entry point to the FIFO module. The CPU can access the FIFO module by reading from or writing to FIFO_DATA in the same way as it accesses any other register.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------------|---------------|-----|-------------|
| 31 to 0 | FIFO_DATA [31:0] | Undefined | R/W | FIFO Data |

Note: FIFO_DATA can be accessed after the read or write command is issued.

31.2.15 Bad block management (BBM) control register (BBM_CTRL)

BBM_CTRL stores the BBM specific control parameters.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. |
| 0 | RMP_INIT | 0 | R/W | Remap initial flag If set, this flag forces the BBM module to reread the remapping table after it was updated by software. This flag is set by software and cleared by hardware after the remapping table is re-read. |

31.2.16 Records table pointer register (DEV0_PTR)

The bad block management mechanism uses the tables in the system memory to store the remapping records.

DEV0_PTR stores the table of the remapping record address.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 12 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11 to 2 | PTR_ADDR[11:2] | H'000 | R/W | Remap table pointer The field contains an address of the remap table in the internal memory. |
| 1 to 0 | — | ALL 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

31.2.17 Records table size register (DEV0_SIZE)

The bad block management mechanism implemented in the controller uses the tables in the system memory to store the remapping records. Each table can store a variable number of records depending on the number of bad blocks in the NAND Flash device.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 12 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11 to 0 | DEV_SIZE[11:0] | H'000 | R/W | Number of records |

31.2.18 DMA base address register (DMA_ADDR_L)

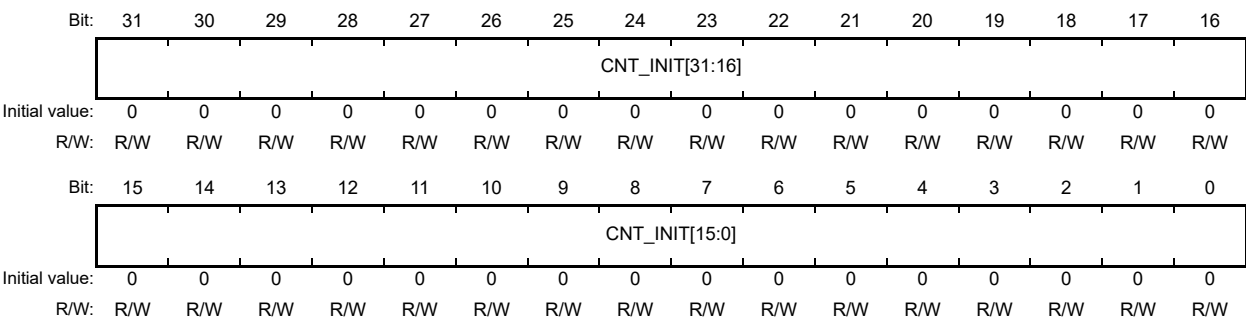

DMA_ADDR_L holds the DMA base address. The register contains the address of the first data in the data block in the system memory, or the address of the first descriptor. The DMA module can read data from the memory location set by DMA_ADDR and write it to the FIFO module, or read data from the FIFO module and write it to the memory, starting from the location indicated by the DMA_ADDR.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------------|---------------|-----|---|
| 31 to 0 | DMA_ADDR_L [31:0] | H'0000 0000 | R/W | DMA base address The two least significant bits are ignored, thus the address must be aligned to 32-bit words. |

31.2.19 DMA counter initial value register (DMA_CNT)

DMA_CNT defines the number of bytes that will be transferred by the DMA module. The register remains unchanged during transfer.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|---|
| 31 to 0 | CNT_INIT [31:0] | H'0000 0000 | R/W | Bytes counter initial value The field contains data page length in bytes (H'0000 0004 to H'FFFF FFFC). Specify a multiple of four as the number of bytes to be transferred. |

31.2.20 DMA control register (DMA_CTRL)

DMA_CTRL is a control register for the DMA channel. This register defines the parameters of the DMA transfer.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|--------------|-----|-------------|----------------|-----|-----|-----|--------------|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | DMA START | — | DMA MODE | DMA_BURST[2:0] | | | — | DMA READY | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|--|
| 31 to 8 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 | DMA_START | 0 | R/W | Set bit DMA_START to start DMA when the command sequence is sent to the NAND Flash memory. For more details see section 31.4.2 (2), DMA Description. |
| 6 | — | 0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 5 | DMA_MODE | 0 | R/W | DMA work mode 0: the registers managed mode 1: the Scatter-Gather mode |
| 4 to 2 | DMA_BURST [2:0] | H'0 | R/W | Burst Type Specify the DMA transfer type. 000: incrementing burst transfer (address increment) Others: Setting prohibited. |
| 1 | — | 0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 0 | DMA_READY | 1 | R | DMA ready flag The flag is set when transfer is completed. |

31.2.21 DMA trigger level value register (DMA_TRIG_TLVL)

DMA_TRIG_TLVL specifies the data FIFO occupancy level that will trigger the DMA module. For more details see section 31.4.2 (2), DMA Description.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | DMA_TRIG_TLVL[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|--|
| 31 to 8 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 to 0 | DMA_TRIG_TLVL[7:0] | H'00 | R/W | DMA trigger level The trigger level is counted using the 32-bit words as entity. |

31.2.22 Mask register for the READ STATUS commands (STATUS_MASK)

The STATE_MASK bits are used to mark the ready/busy bits of the status byte in the NAND Flash device. These bits are used during the internal read status operation. In the ONFI specification, the user must mask all fields except RDY or ARDY (depending on the application).

The ERROR_MASK bits are used to mask unused fields when the controller automatically reads the status of the NAND Flash memory device. In the ONFI specification, the user must mask all fields except FAIL or FAILC (depending on the application).

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|-----|-----|-----|-----|-----|-----------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ERROR_MASK[7:0] | | | | | | | | STATE_MASK[7:0] | | | | | | | |
| Initial value: | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 8 | ER- ROR_MASK[7:0] | H'40 | R/W | Error State Mask Used to mask the error bits if automatic read status feature is enabled. |
| 7 to 0 | STATE_ MASK[7:0] | H'40 | R/W | State Mask Used to mask status bits when the read status command is used to obtain the NAND flash status. |

31.2.23 Command sequence timing configuration register 0 (TIME_SEQ_0)

TIME_SEQ_0 controls the waveform timing parameters. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|-----|-----|-----|-----|-----|-----|----|----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | | | | | | | — | — | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| | — | — | | | | | | | — | — | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31, 30 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 29 to 24 | TWHR[5:0] | H'00 | R/W | NFWE# high to NFRE# low time |
| 23, 22 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 21 to 16 | TRHW[5:0] | H'00 | R/W | NFRE# high to NFWE# low time |
| 15, 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13 to 8 | TADL[5:0] | H'00 | R/W | ALE to data start time |
| 7, 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 to 0 | TCCS[5:0] | H'00 | R/W | Change column setup |

31.2.24 Command sequence timing configuration register 1 (TIME_SEQ_1)

TIME_SEQ_1 controls the waveform timing parameters. All timings are generated from the P1φ clock signal, and delays are added to the timings in clock cycle units.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----------|-----|-----|-----|-----|-----|----|----|----------|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | TRR[5:0] | | | | | | — | — | TWB[5:0] | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13 to 8 | TRR[5:0] | H'00 | R/W | Read High to Read Low Time TRR is the time between a rising edge on the read/busy input line and the assertion of the read enable signal. |
| 7, 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 to 0 | TWB[5:0] | H'00 | R/W | tWB delay The time measured from a rising edge of the NFWE# signal to a falling edge on the RnB line. |

31.2.25 Generic sequence timing configuration register 0 (TIME_GEN_SEQ_0)

TIME_GEN_SEQ_0 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1 ϕ clock signal, and delays are added to the timings in clock cycle units.

| | | | | | | | | | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31, 30 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 29 to 24 | t0_d3[5:0] | H'00 | R/W | Command to Data Time The time between the sending of a command and the data transfer. |
| 23, 22 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 21 to 16 | t0_d2[5:0] | H'00 | R/W | Command to Delay Time The wait time between the sending of a command to the NAND flash memory device and the memory becoming ready. |
| 15, 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13 to 8 | t0_d1[5:0] | H'00 | R/W | Command to Command time The time between two subsequent commands sent to the NAND Flash memory device. |
| 7, 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 to 0 | t0_d0[5:0] | H'00 | R/W | Command to Address time The time between sending a command and sending the address to the NAND Flash memory device. |

31.2.26 Generic sequence timing configuration register 1 (TIME_GEN_SEQ_1)

TIME_GEN_SEQ_1 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1 ϕ clock signal, and delays are added to the timings in clock cycle units.

| | | | | | | | | | | | | | | | | |

| 31, 30 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 29 to 24 | t0_d7[5:0] | H'00 | R/W | Address to Data time The time between sending the address and data transferring. |
| 23, 22 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 21 to 16 | t0_d6[5:0] | H'00 | R/W | Address to Delay Time The wait time after the sending of an address to the NAND flash memory device and the memory becoming ready. |
| 15, 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13 to 8 | t0_d5[5:0] | H'00 | R/W | Address to Address Time The time between the sending of an address to the NAND flash memory device and that of the next address. |
| 7, 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 to 0 | t0_d4[5:0] | H'00 | R/W | Address to Command time The time between sending the address and sending a command to the NAND Flash memory device. |

31.2.27 Generic sequence timing configuration register 2 (TIME_GEN_SEQ_2)

TIME_GEN_SEQ_2 controls the waveform timing parameters for the generic sequence. For more detail see section 31.3.2, Generic Sequence. All timings are generated from the P1 ϕ clock signal, and delays are added to the timings in clock cycle units.

| | | | | | | | | | | | | | | | | |

| 5 to 0 | t0_d12[5:0] | H'00 | R/W | Data to Sequence End Time The time between the data transferring phase and the end of the sequence. The sequence is ended when any other sequence phases are not enabled. |

31.2.29 Timing configuration register (TIMINGS_ASYNC)

TIMINGS_ASYNC controls the timing parameters for two waveforms shown in Figure 31.2 (upper waveform: read; lower waveform: write).

All timings are generated from the P1 ϕ clock signal, and delays are added to the timings in clock cycle units.

| | | | | | | | | | | | | | | | | |

| 3 to 0 | TRWP[3:0] | H'0 | R/W | NFRE# or NFWE# pulse width |

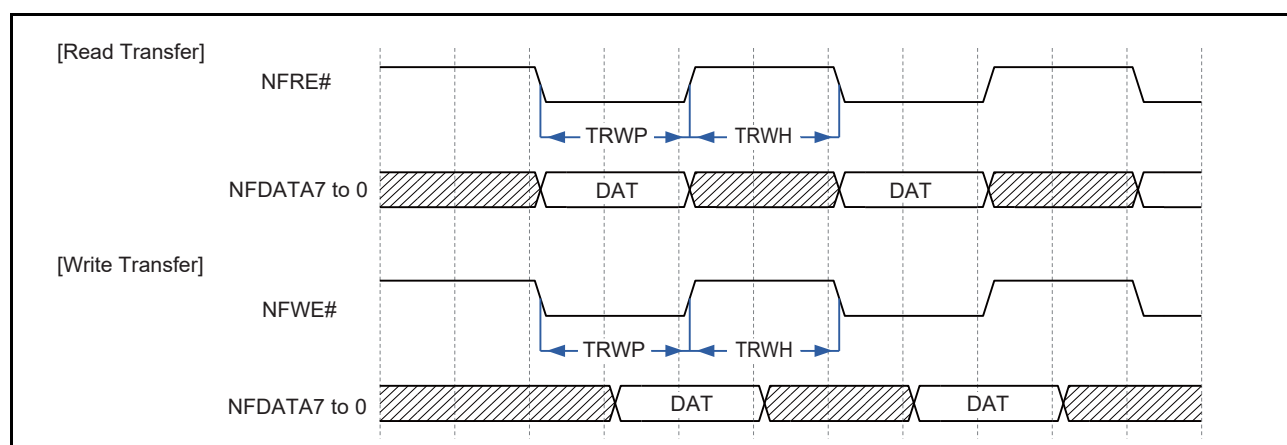

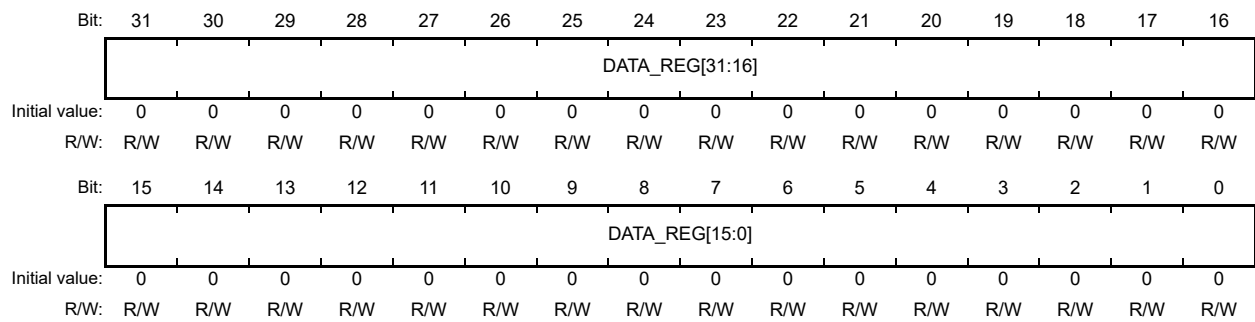

Figure 31.2 Asynchronous Timings

31.2.30 Data register (DATA_REG)

DATA_REG is used for storage of the data that is read in the registered mode. The registered mode is allowed in the read direction only.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|-------------|
| 31 to 0 | DATA_REG [31:0] | H'0000 0000 | R/W | DATA_REG |

31.2.31 Data register size selection register (DATA_REG_SIZE)

DATA_REG_SIZE allows the selection of data size in the registered work mode. The data size in the registered mode is limited to four bytes.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|--------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DATA_REG_SIZE[1:0] |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|--|
| 31 to 2 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1, 0 | DATA_REG_SIZE[1:0] | H'0 | R/W | DATA_REG_SIZE register Allows selection of the number of valid bytes in the DATA register: 00: single byte valid 01: two lower bytes valid 10: three lower bytes valid 11: all four bytes valid |

31.2.32 FIFO control register (FIFO_INIT)

FIFO_INIT is used to clear (flush) the FIFO.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FIFO_INIT |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | FIFO_INIT | 0 | W | FIFO Initialization bit The setting of this bit causes the flushing of FIFO. It is not necessary to set this bit before sending each command to the NAND Flash memory device. This bit is only used when the previous FIFO contents need to be cleared before a new operation. |

31.2.33 FIFO status register (FIFO_STATE)

FIFO_STATE contains the data buffer status.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|------------|-----------|-------------|-------------|---------|----------|-----------|------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | DF_W_EMPTY | DF_R_FULL | CF_ACC_PT_W | CF_ACC_PT_R | CF_FULL | CF_EMPTY | DF_W_FULL | DF_R_EMPTY |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 | DF_W_EMPTY | 1 | R | FIFO empty state bit This bit indicates that there is no data in the FIFO available. This flag is valid for the write direction. |
| 6 | DF_R_FULL | 0 | R | FIFO full state bit This bit indicates that there is no free space for the data in FIFO available. This flag is valid for the read direction. |
| 5 | CF_ACCPT_W | 0 | R | Command FIFO accept flag – write direction If this flag is set, the next write access will finish with an additional delay. |
| 4 | CF_ACCPT_R | 1 | R | Command FIFO accept flag – read direction If this flag is set, the command FIFO will accept a read transfer with a delay. |
| 3 | CF_FULL | 0 | R | Command FIFO full flag This bit indicates the status of the command FIFO. Do not use this bit to check if the FIFO can accept the next transfer. |
| 2 | CF_EMPTY | 1 | R | Command FIFO empty flag This bit indicates the status of the command FIFO. Do not use this bit to check if the FIFO can accept the next transfer. |
| 1 | DF_W_FULL | 0 | R | FIFO full state bit This bit indicates that there is no free space for the data in FIFO available. This flag is valid for the write direction. |
| 0 | DF_R_EMPTY | 1 | R | FIFO empty state bit This bit indicates that there is no data in the FIFO available. This flag is valid for the read direction. |

31.2.34 MLUN register (MLUN)

MLUN contains the LUN address offset bits and number of available LUNs.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|--------------|-----|----|----|----|----|----|---------------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | LUN_SEL[1:0] | — | — | — | — | — | — | MLUN_IDX[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------|---------------|-----|--|
| 31 to 10 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9, 8 | LUN_SEL[1:0] | 00 | R/W | Number of the logical units (LUNs) 00: Two 01: Four 10: Eight |
| 7 to 3 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 to 0 | MLUN_IDX[2:0] | 000 | R/W | LUN address offset These bits hold the offset to the LUN address from bit zero of the last address byte. These bits indicate the bit index for the address that identifies valid LUNs. |

31.2.35 CMD ID initial value register (CMD_MARK)

CMD_MARK allows to write initial value to the command marking generator in the register Slave I/F Unit (SIU).

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | CMD_ID[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|--|
| 31 to 8 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 to 0 | CMD_ID[7:0] | H'00 | W | CMD ID initial value |

31.3 Operation

31.3.1 Command Generation

This NAND flash controller provides parameterized command sequences to support future functional expansion (new commands) of NAND flash devices.

(1) Instruction Encoding

The controller instruction field is constant and has 32 bits. The instruction field contains the command sequence code and optional parameters. Those parameters are:

- The command codes present in the instruction sequence.
- The flag used to select data destination; possible options are data register and FIFO module.
- The flag used to select data source/sink for the command sequence. The possible choices are the registers or the DMA unit.
- The command sequence code.

If the given command sequence does not use all parameter fields, unused fields are ignored. The instruction encoding scheme is presented in the table below:

Table 31.5 Instruction Encoding

| Field Name | Bits | Description |
|--------------|---------|--|
| CMD_2 | [31:24] | Code of the third command in a sequence |
| CMD_1/CMD3*1 | [23:16] | Code of the second or fourth command in a sequence |
| CMD_0 | [15:8] | Code of the first command in a sequence |
| DATA_SEL | [7] | Data register/FIFO select 0 – FIFO selected 1 – DATA register selected |
| INPUT_SEL | [6] | Input module select flag 0 – Select the SIU module as input 1 – Select the DMA module as input |
| CMD_SEQ | [5:0] | Command code. |

Note 1. Depending on the selected command sequence, this field will store the CMD1 or CMD3 code. Both commands are never used in a single sequence.

(2) Command Sequence Encoding

The NAND Flash controller defines the set of commands, addresses and data sequences that allows implementation of all present and many future instructions. The following description of those sequences is adequate to define most of the future NAND Flash device instructions.

Table 31.6 contains the command sequence encoding details. Each sequence is encoded according to the fields defined in `GENERIC_SEQUENCE_CTRL`.

For more details, section 31.2.3, `GENERIC_SEQ` register (`GEN_SEQ_CTRL`).

Table 31.6 Command Sequence Encoding

| Sequence Symbol | Sequence Encoding | CMD0 | CMD1 | CMD2 | CMD3 | COL _A0*2 | COL _A1 | ROW _A0 | ROW _A1 | DATA _EN | DELAY _EN | IMD _SEQ*3 |
|-----------------|-------------------|------|------|------|------|-----------|---------|---------|---------|----------|-----------|------------|
| SEQ_0 | 000000 | √ | — | — | — | — | — | — | — | — | DELAY_1 | — |

| SEQ_24 | 011000 | √ | — | √ | √ | — | — | 3 | 3 | — | DELAY_0 | — |
| SEQ_25 | 111001 | √ | — | √ | √ | 2(1) | 2 | 3 | — | √ | — | — |

Note 1. SEQ_18 and SEQ_19 are the parameterized Generic Sequences. GEN_SEQ_CTRL defines which parts of sequences are executed.

Note 2. The value given in the brackets relates to the small block mode. In this mode, the controller sends only a single byte as the column address.

Note 3. MD_SEQ - The command will be sent immediately.

Note: Gray rows – read from NAND Flash memory;
 White rows – write to NAND Flash memory;
 Blue rows – Non- directional commands

(a) SEQ_0 Sequence

This non-directional sequence is composed from only one command. After the command is written to the NAND Flash device, the controller waits until the device goes into the busy state and drives the RnB line low, or sends the READ STATUS command. When delay time (t_{WB}) passes or the device is ready, the sequence ends. The figure below shows the sequence.

Figure 31.3 SEQ_0 Sequence

(b) SEQ_1 Sequence

This is a read-sequence that is composed from a single command cycle, single address cycle and the single data cycle with a programmable number of read sequences. After the address sequence is finished, the controller measures the standard delay of first data read after the last write (t_{WHR}). Next, the read data words are written to the FIFO module. The input module is selected by the INPUT_SEL field of the COMMAND register, the source for the address is placed in the ADDR0_COL register, and the command code is stored in the CMD_0 field. The figure below shows the sequence execution:

Figure 31.4 SEQ_1 Sequence

(c) SEQ_2 Sequence

This is a read-sequence and it is similar to the SEQ_1 sequence except that after the address cycle the controller expects that device goes to the busy state. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The figure below shows the sequence execution:

Figure 31.5 SEQ_2 Sequence

(d) SEQ_3 Sequence

This is a write-sequence that is composed from a single command cycle, single address cycle and single data cycle with a programmable number of write sequences. After the address sequence is finished, the controller measures the standard delay of first data write after the last address cycle (tADL). The written words are read from the FIFO module.

The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The input module is selected by the INPUT_SEL field of the COMMAND register; the source for the address is placed in the ADDR0_COL register, and the command code is stored in the CMD_0 field. The figure below shows the sequence execution:

Figure 31.6 SEQ_3 Sequence

(e) SEQ_4 Sequence

This is a special read-sequence that is used to implement the read status command sequences. The command is sent immediately. The sequence is composed of a single command cycle and a single data cycle. Between those cycles, the delay is counted (tWHR). The command code is read from the CMD_0 field.

When the DATA register is selected in the COMMAND register, the data is stored in the DATA register. The user defines the number of data in the DATA_REG_SIZE register. The registered mode is allowed only for the read direction.

When the FIFO register is selected in the COMMAND register, the data is stored in the FIFO. Because user has to change DATA_SIZE register, the command will be sent when all memories are ready and the Controller is in the idle state. The figure below shows the sequence execution:

Figure 31.7 SEQ_4 Sequence

(f) SEQ_5 Sequence

This is a read-sequence and it is similar to the SEQ_4 sequence. The command is sent immediately. The only difference is that after the command cycle, an additional address cycle is performed. The ADDR0_ROW register is used in this sequence. The figure below shows the sequence execution:

Figure 31.8 SEQ_5 Sequence

(g) SEQ_6 Sequence

This is a read-sequence. The sequence of command cycle, address cycle, command cycle is executed. After that, the delay from the change column to the next operation (tCCS) is measured. Finally, the read data cycle is executed. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL register is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

Figure 31.9 SEQ_6 Sequence

(h) SEQ_7 Sequence

This read-sequence is similar to the SEQ_6 sequence, differing only because the address cycle in this sequence is composed of five bytes (ADDR0_COL and ADDR0_ROW) instead of two bytes. All else is the same as in the SEQ_6 sequence. The figure below shows the sequence execution:

Figure 31.10 SEQ_7 Sequence

(i) SEQ_8 Sequence

This is a write-sequence. First, the sequence of command cycle and two bytes address cycle is executed. Next, the delay after the column address changes (tCCS) is measured. Finally, the single data cycle with programmable number of write sequences is executed. The first command code is encoded in the CMD_0 instruction field; the ADDR0_COL register is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

Figure 31.11 SEQ_8 Sequence

(j) SEQ_9 Sequence

This is a non-directional sequence. The first step is to execute the five bytes address command cycle. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence. The figure below shows the sequence execution:

Figure 31.12 SEQ_9 Sequence

(k) SEQ_10 Sequence

This is a non-directional sequence. The first step is to execute the five bytes address command cycle. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. Finally data block is read. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence. The figure below shows the sequence execution:

Figure 31.13 SEQ_10 Sequence

(l) SEQ_11 Sequence

This is the read-sequence. The first step is to execute the command cycle. Next, the device goes to the busy state. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. As soon as the device reaches the ready state, the write data cycle with configurable read sequences is executed. The command code is encoded in the CMD_0 instruction field; the input module is selected by the INPUT_SEL field. The number of transferred bytes are configured using the DATA_SIZE register. The figure below shows the sequence execution:

Figure 31.14 SEQ_11 Sequence

(m) SEQ_12 Sequence

This is a write-sequence. The SEQ_12 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL) and, after the second command cycle, another delay is measured (tWB). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

Figure 31.15 SEQ_12 Sequence

(n) SEQ_13 Sequence

This is a write-sequence. The SEQ_13 sequence is a series of command cycle and address cycles, data cycle with a configurable number of write operations. Between the last address cycle and first data cycle, a delay is measured (tADL). The command code is encoded in the CMD_0 instruction field; the ADDR0_COL and ADDR0_ROW registers are used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

Figure 31.16 SEQ_13 Sequence

(o) SEQ_14 Sequence

This is a non-directional sequence. First, the series of command cycle, address cycle, command cycle is executed. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW and ADDR0_COL registers are used in this sequence. The figure below shows the sequence execution:

Figure 31.17 SEQ_14 Sequence

(p) SEQ_15 sequence

This is a read-sequence. First, the series of command cycle, address cycle, second command cycle, second address cycle, third command cycle is executed. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. After the NAND Flash device returns to the ready state, the data sequence, with a configurable number of read operations, is executed. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the third command code is encoded in the CMD_2 instruction field. In this sequence, both address registers are used. The ADDR0_ROW and ADDR0_COL register content is sent after the first command in the sequence, the ADDR1_ROW and ADDR1_COL register content is sent after the second command in the sequence. The figure below shows the sequence execution:

Figure 31.18 SEQ_15 Sequence

(q) SEQ_17 sequence

This is a read-sequence. This sequence is similar to the SEQ_10 sequence, except that the second command cycle is omitted. This sequence is implemented to use small block memories. The controller sends only four bytes of the address when the small block mode is enabled. The figure below shows the sequence execution:

Figure 31.19 SEQ_17 Sequence

(r) SEQ_18 sequence

This generic read sequence is described in detail in section 31.3.2, Generic Sequence.

(s) SEQ_19 sequence

This generic write sequence is described in detail in section 31.3.2, Generic Sequence.

(t) SEQ_20 sequence

This non-directional sequence is composed from one command and three addresses bytes. After the command and addresses are written to the NAND Flash device, the controller waits until the device goes into the busy state and drives the RnB line low, or sends the READ STATUS command. When delay time (tWB) passes or the device is ready, the sequence ends. The figure below shows the sequence execution:

Figure 31.20 SEQ_20 Sequence

(u) SEQ_21 sequence

This non-directional sequence is composed from one command and one addresses byte. After the command and address are written to the NAND Flash device, the sequence ends. The figure below shows the sequence execution:

Figure 31.21 SEQ_21 Sequence

(v) SEQ_22 sequence

This is a read-sequence. The first step is to execute the five bytes address command cycle. The controller checks the state of the RnB line or sends the READ STATUS command as required to obtain the state of the NAND flash device. The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_2 instruction field; the ADDR0_COL, ADDR1_COL and ADDR1_ROW registers are used in this sequence. The figure below shows the sequence execution:

Figure 31.22 SEQ_22 Sequence

(w) SEQ_23 sequence

This is a write-sequence. The SEQ_23 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (t_{ADL}) and, after the second command cycle, another delay is measured (t_{WB}). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW registers is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

Figure 31.23 SEQ_23Sequence

(x) SEQ_24 sequence

This is a write-sequence. It is composed from the three commands cycles and two addresses cycles. Both addresses cycle contain the row address part. After the last command cycle the t_{WB} delay is measured. The figure below shows the sequence execution.

Figure 31.24 SEQ_24 Sequence

(y) SEQ_25 sequence

This is a read-sequence. It is composed from the three commands cycles and two addresses cycles. the first addresses cycle contain the column and row address part. The second address cycle contain only the column address part. After the last command cycle the t_{WHR} delay is measured. The figure below shows the sequence execution.

Figure 31.25 SEQ_25 Sequence

(z) SEQ_26 sequence

This is a write-sequence. The SEQ_26 sequence is a series of command cycle, address cycle, and data cycle with a configurable number of write operations and another command cycle. Between the last address cycle and first data cycle, a delay is measured (tADL). The first command code is encoded in the CMD_0 instruction field; the second command code is encoded in the CMD_1 instruction field; the ADDR0_ROW registers is used in this sequence; the input module is selected by the INPUT_SEL field. The figure below shows the sequence execution:

Figure 31.26 SEQ_26 Sequence

31.3.2 Generic Sequence

There will be cases where the set of predefined sequences above will not be sufficient to handle a new command sequence. If that occurs, the generic sequence feature of the NAND flash controller can be used.

This sequence is designed to mimic almost every available command supported by the NAND Flash devices; however, additional effort required to trigger such commands.

Generic sequence is executed in the following steps:

CMD0 – The first command in the sequence

The value of this command is stored in the CMD_0 field of the COMMAND register, described in section 31.2.1, Controller commands register (COMMAND).

ADDR0 – The first address sequence

This is enabled if the COL_A0 and ROW_A0 fields in the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL) have values other than zero. In this phase, the address is sent to the NAND Flash device and is read from the ADDR0_COL and ADDR0_ROW registers. The number of the bytes in the address cycle is configured by the COL_A0 and ROW_A0 fields of the GEN_SEQ_CTRL register.

CMD1 – The fourth command in the sequence

The value of this command is stored in the CMD_1 field of the COMMAND register, described in section 31.2.1, Controller commands register (COMMAND). This is enabled by the CMD1_EN field in the GEN_SEQ_CTRL register, described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

ADDR1 – The second address in the sequence

This is enabled if the COL_A1 and ROW_A1 fields of the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL) have a value other than zero. In this phase, the address is sent to the NAND Flash device from the ADDR1_COL and ADDR1_ROW registers.

The number of bytes in the address cycle is configured by the COL_A1 and ROW_A1 fields of the GEN_SEQ_CTRL register.

CMD2 – The third command in the sequence

The value of this command is stored in the CMD_2 field of the COMMAND register described in section 31.2.1, Controller commands register (COMMAND). This is enabled by the CMD2_EN field in the GEN_SEQ_CTRL register, described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

DELAY0 – Waiting for the device to return to the ready state and continue the sequence.

This is enabled by the DELAY_EN field in the GEN_SEQ_CTRL register, described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). Only one delay phase can be present in the generic sequence. For more details, see section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL).

DATA – The data phase of the sequence

This is enabled by the DATA_EN field in the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). Additionally, the transfer direction must be selected by the sequence number. Sequence number 18 reads data from the NAND Flash memory, sequence number 19 writes data to the NAND Flash memory. The size of the transferred data block is configured by the DATA_SIZE register value.

CMD3 – The second command in the sequence

This is enabled by the CMD3_EN field in the GEN_SEQ_CTRL register described in the section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). The value of this command is stored in the CMD_3 field of the GEN_SEQ_CTRL register.

DELAY1 – Waiting for the device to return to the ready state and finish the sequence.

This is enabled by the DELAY_EN field in the GEN_SEQ_CTRL register described in section 31.2.3, GENERIC_SEQ register (GEN_SEQ_CTRL). The controller waits for the device to return to the ready state and finish the sequence. Only one delay phase can be present in generic sequence.

The figure below presents the generic sequence composition:

Figure 31.27 Generic Sequence

There are few constraints on the generic sequence usage:

- The DEL0 and DEL1 delay phases cannot both be enabled in a single command sequence.
- The TIMINGS_ASYN register must be set even when the generic sequence is used.

It is possible to force an immediate command sequence execution by enabling the IMD_SEQ bit in the GEN_SEQ_CTRL register. In this case, the triggered command will be executed even if the previously sent command for a selected device is not completed. If both the IMD_SEQ and DATA_EN flags are enabled in a single sequence, then the register must be selected as data source/sink. The IMD_SEQ is valid only for the read direction. This feature is intended to implement all state read operations.

After each step of the generic sequence, the programmable time delay is measured. These delays are configured using the TIME_GEN_SEQ[0-3] registers. Refer to the TIME_GEN_SEQ[0-3] registers description for further information and see figures below.

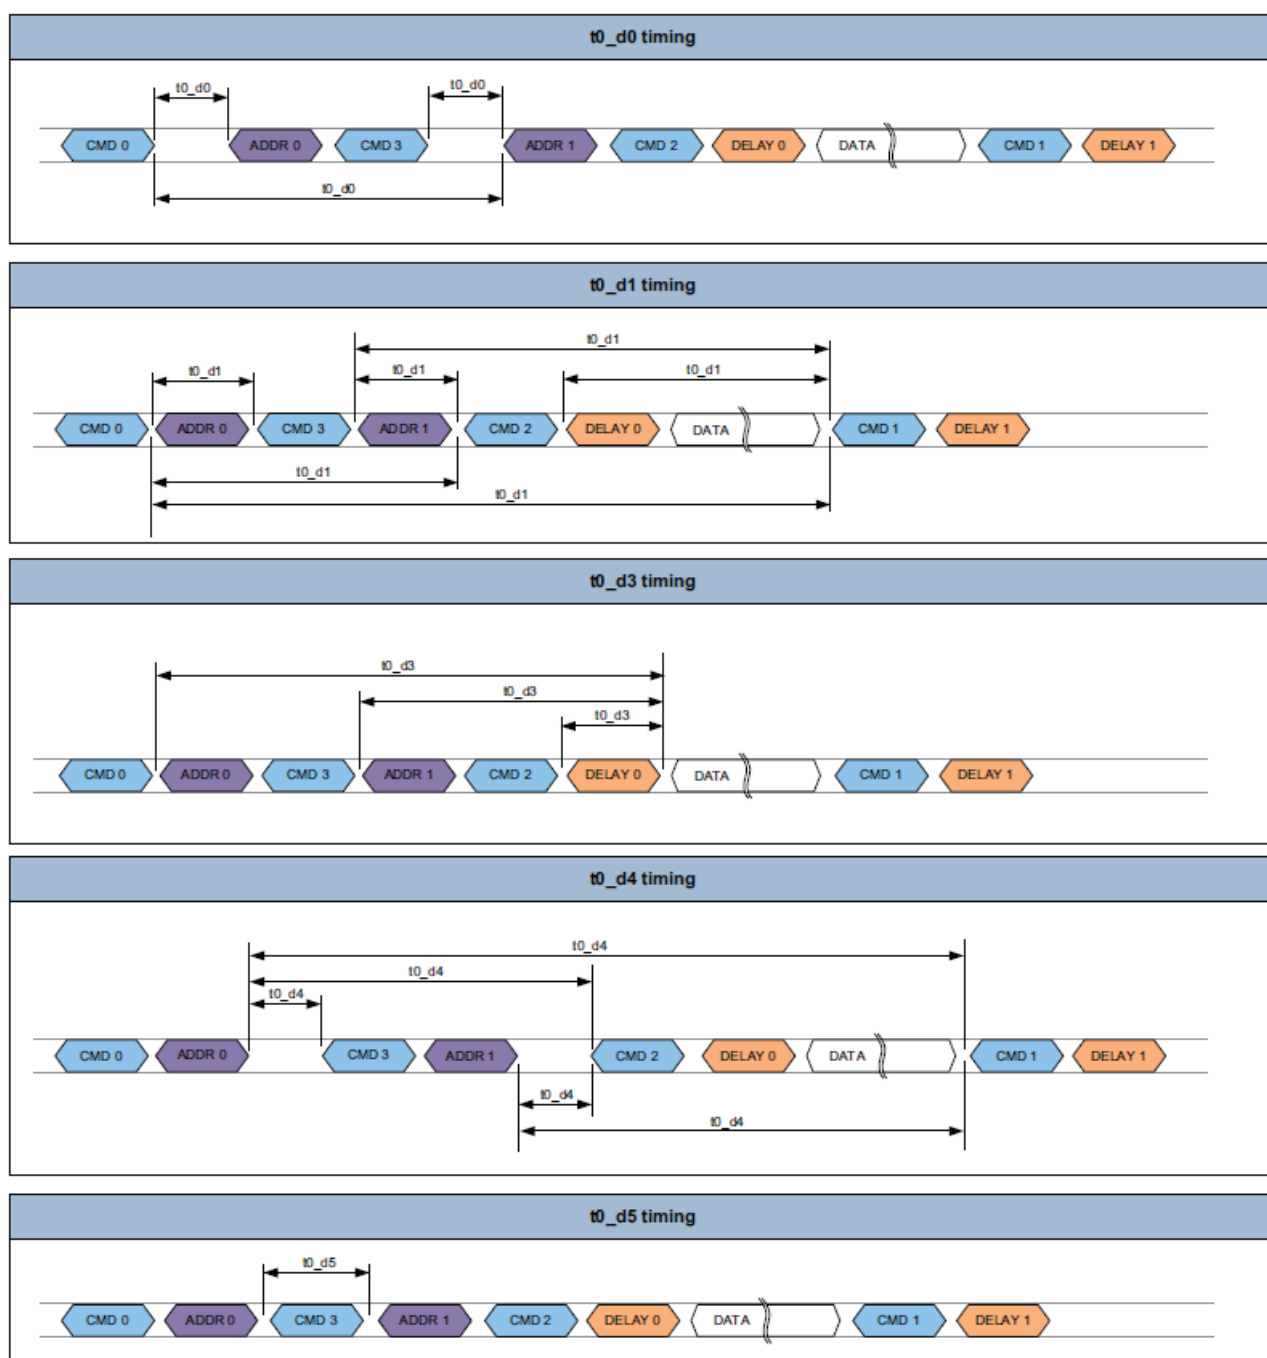

Figure 31.28 Generic Sequence Timing parameters (1)

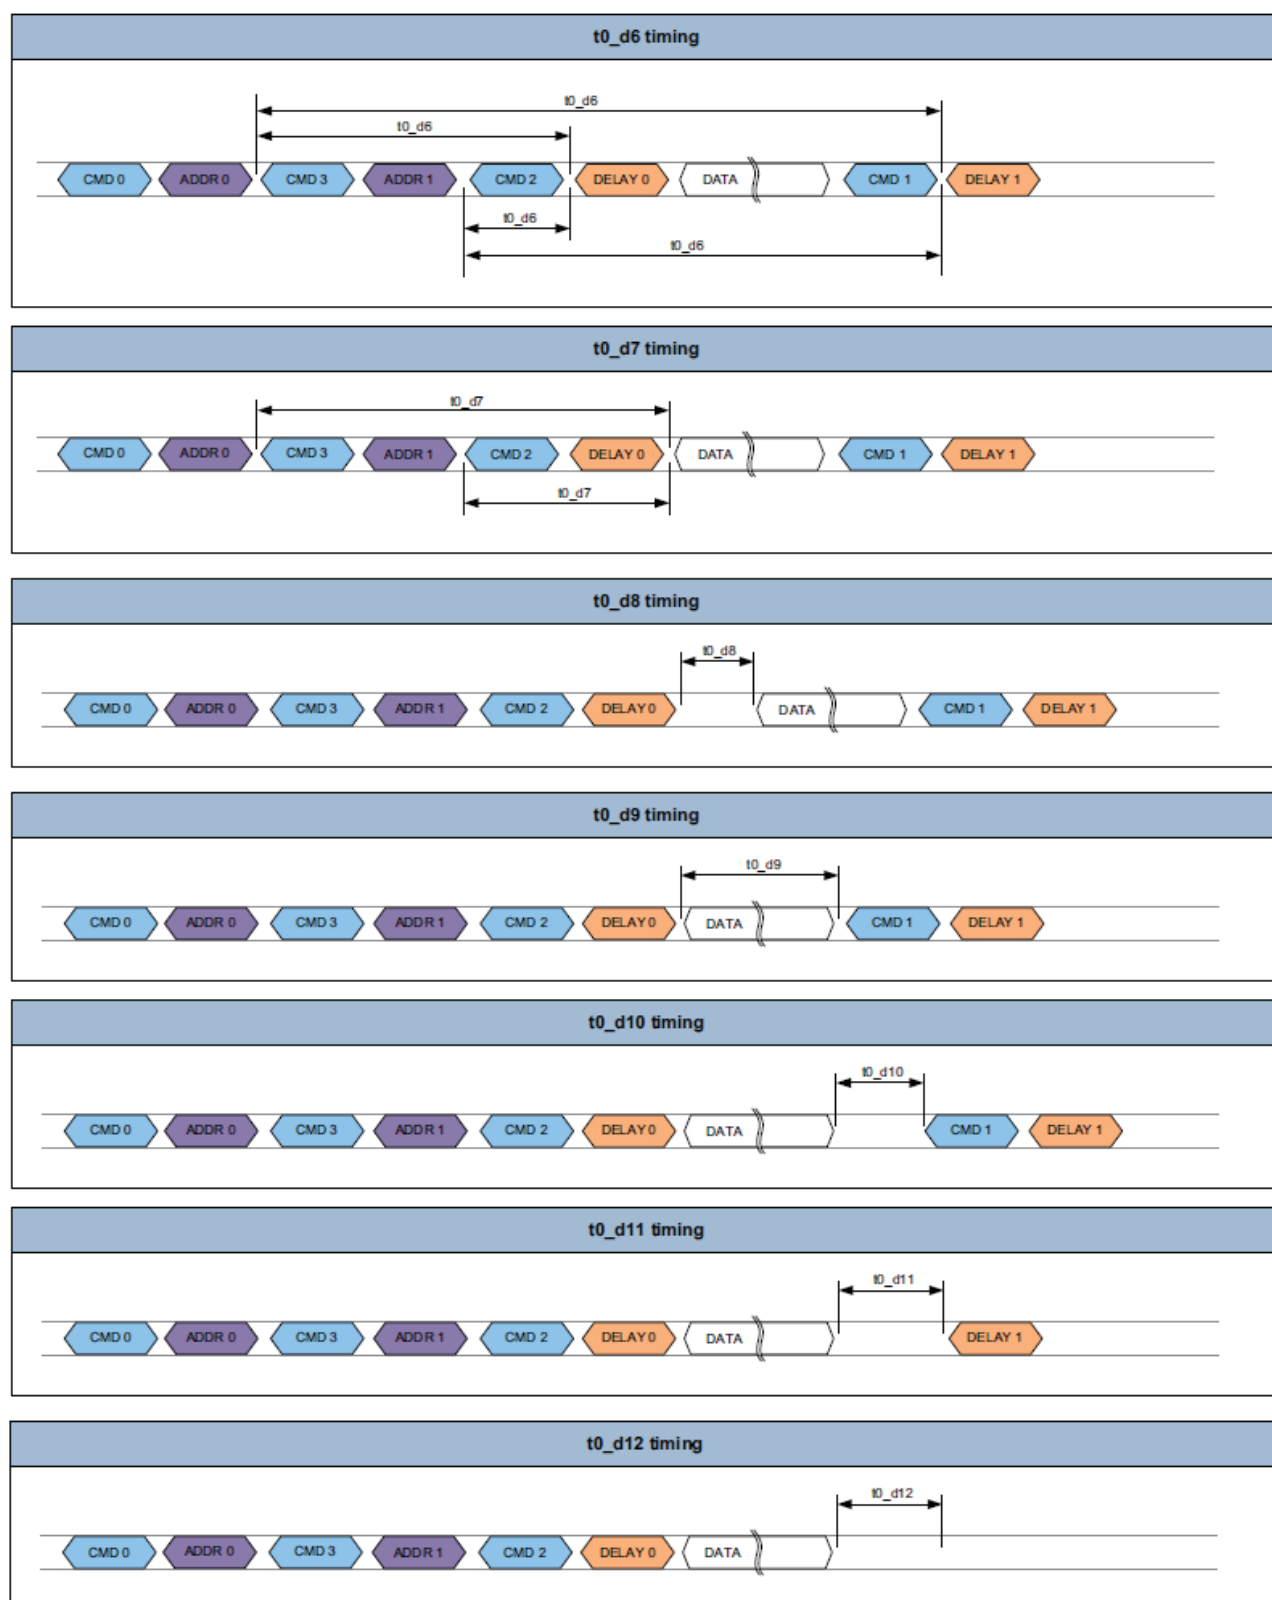

Figure 31.29 Generic Sequence Timing parameters (2)

31.3.3 Instructions

The implementation of the instruction set presented at this point is an example of how to use the instruction encoding scheme presented in section 31.3.1 (1), Instruction Encoding. This chapter and the command sequences presented previously give sufficient information to implement new commands and command sequences for future NAND Flash devices.

(1) Instructions Set

The table below contains the basic instruction defined to implement the all command sequences accessible in the ONFi 1.0 standards.

Table 31.7 Instructions set

| Instruction | CMD_0 | CMD_1/CMD_3 | CMD_2 | CMD_SEQ | Send when Memory is Busy |
|---------------------------|-------|-------------|-------|---------|-----------------------------|
| Reset Commands | | | | | |
| RESET | H'FF | — | — | SEQ_0 | No |
| Identification Operations | | | | | |
| READ ID | H'90 | — | — | SEQ_1 | No |
| READ PARAMETER PAGE | H'EC | — | — | SEQ_2 | No |
| READ UNIQUE ID | H'ED | — | — | SEQ_2 | No |
| Configuration Operations | | | | | |
| GET FEATURES | H'EE | — | — | SEQ_2 | No |
| SET FEATURES | H'EF | — | — | SEQ_3 | No |
| Status Operations | | | | | |
| READ STATUS | H'70 | — | — | SEQ_4 | Yes |
| SELECT LUN WITH STATUS | H'78 | — | — | SEQ_5 | Yes |
| LUN STATUS | H'71 | — | — | SEQ_5 | Yes |
| DEVICE STATUS | H'72 | — | — | SEQ_4 | Yes |
| VOLUME SELECT | H'E1 | — | — | SEQ_21 | Yes |
| Column Address Operations | | | | | |
| CHANGE READ COLUMN | H'05 | — | H'E0 | SEQ_6 | No |
| SELECT CACHE REGISTER | H'06 | — | H'E0 | SEQ_7 | No |
| CHANGE WRITE COLUMN | H'85 | — | — | SEQ_8 | No |
| CHANGE ROW ADDRESS | H'85 | H'11 | — | SEQ_12 | No |
| Read Operations | | | | | |
| READ PAGE | H'00 | — | H'30 | SEQ_10 | No |
| READ PAGE CACHE | H'31 | — | — | SEQ_11 | No |
| READ PAGE CACHE LAST | H'3F | — | — | SEQ_11 | No |
| READ MULTIPLANE | H'00 | H'32 | — | SEQ_9 | No |
| TWO PLANE PAGE READ | H'00 | H'00 | H'30 | SEQ_15 | No |
| QUEUE PAGE READ | H'07 | — | H'37 | SEQ_22 | No |
| Program Operations | | | | | |
| PROGRAM PAGE | H'80 | H'10 | — | SEQ_12 | No |
| PROGRAM PAGE IMD | H'80 | H'10 | — | SEQ_23 | No |
| PROGRAM PAGE DEL | H'80 | H'13 | — | SEQ_23 | No |
| PROGRAM PAGE 1 | H'80 | — | — | SEQ_13 | No |
| PROGRAM PAGE CACHE | H'80 | H'15 | — | SEQ_12 | No |
| PROGRAM MULTIPLATE | H'80 | H'11 | — | SEQ_12 | No |
| WRITE PAGE | H'10 | — | — | SEQ_0 | No |

Table 31.7 Instructions set

| Instruction | CMD_0 | CMD_1/CMD_3 | CMD_2 | CMD_SEQ | Send when Memory is Busy |
|---------------------|-------|-------------|-------|---------|--------------------------|
| WRITE PAGE CACHE | H'15 | — | — | SEQ_0 | No |
| WRITE MULTIPLATE | H'11 | — | — | SEQ_0 | No |
| Erase Operation | | | | | |
| ERASE BLOCK | H'60 | H'D0 | — | SEQ_14 | No |
| ERASE MULTIPLATE | H'60 | H'D1 | — | SEQ_14 | No |
| Copyback Operation | | | | | |
| COPYBACK READ | H'00 | — | H'35 | SEQ_10 | No |
| COPYBACK PROGRAM | H'85 | H'10 | — | SEQ_9 | No |
| COPYBACK PROGRAM1 | H'85 | — | — | SEQ_13 | No |

| PAGE READ OTP | H'AF | — | H'30 | SEQ_10 | No |

(2) RESET Command

(a) Command Description

The RESET command is used to put a target into a known condition and to abort command sequences in progress.

(b) Command Encoding

The RESET instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.8 RESET Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'FF | — | — | SEQ_0_ID |

(3) READ ID Command

(a) Command Description

The READ ID command is used to read identifier codes programmed into the target. This command is accepted by the target only when all LUNs on the target are in the IDLE state.

When the command is followed by an address cycle of H'00, the target returns a 5-byte identifier code that includes the manufacturer's ID, device configuration, and part-specific information.

When the READ ID command is followed by an address cycle of H'20, the target returns the 4-byte ONFI identifier code.

(b) Command Encoding

The READ ID instruction uses the SEQ_1 commands sequence. The command is encoded, as shown in the table below:

Table 31.9 READ ID Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'90 | 0/1 | 0/1 | SEQ_1_ID |

(4) READ PARAMETER PAGE Command

(a) Command Description

The READ PARAMETER PAGE command is used to read the ONFI parameter page programmed into the target. This command is accepted by the target only when all LUNs on the target are idle.

When the command is followed by an address cycle of H'00, the target goes into busy state. After the read process is completed, the controller enables the data output mode to read the parameter page.

(b) Command Encoding

The READ PARAMETER PAGE instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 31.10 READ PARAMETER PAGE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'EC | 0/1 | 0/1 | SEQ_2_ID |

(5) READ UNIQUE ID Command

(a) Command Description

The READ UNIQUE ID instruction is used to read a unique identifier programmed into the target. This command is accepted by the target only when all LUNs on the target are idle.

When the address cycle of H'00 is written to the target, then the target goes into busy state. After the read process is complete, the controller enables the data output mode to read the unique ID. Sixteen copies of the unique ID data are stored in the device. Each copy is 32 bytes. The first 16 bytes are unique data and the second 16 bytes are the complement of the first 16 bytes. The application program will XOR the first 16 bytes with the second 16 bytes. If the result is 16 bytes of H'FF, then that copy of the unique ID data is correct. In the event that there is a non-H'FF result, the application program repeats the XOR operation on a subsequent copy of the unique ID data.

(b) Command Encoding

The READ UNIQUE ID instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 31.11 READ UNIQUE ID Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'ED | 0/1 | 0/1 | SEQ_2_ID |

(6) GET FEATURES Command

(a) Command Description

The GET FEATURES instruction reads the sub-feature parameters (P1-P4) from the specified feature address. This command is accepted by the target only when all LUNs on the target are idle.

When the H'EE command is followed by a feature address, the target goes into busy state. After the target internal read operation completes, the controller enables the data output mode to read the sub-feature parameters.

(b) Command Encoding

The GET FEATURES instruction uses the SEQ_2 commands sequence. The command is encoded, as shown in the table below:

Table 31.12 GET FEATURES Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'EE | 0/1 | 0/1 | SEQ_2_ID |

(7) SET FEATURES Command

(a) Command Description

The SET FEATURES instruction writes the sub-feature parameters (P1-P4) to the specified feature address to enable or disable target-specific features. This command is accepted by the target only when all LUNs on the target are idle.

The H'EF command is followed by a valid feature address. The possible address value depends on the features set implemented in the target device. The address cycle is followed by the configurable number of data cycles. Values of the address and data encoding scheme allowed are found in the device vendor documentation.

(b) Command Encoding

The SET FEATURES instruction uses the SEQ_3 commands sequence. The command is encoded, as shown in the table below:

Table 31.13 SET FEATURES Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'EF | 0/1 | 0/1 | SEQ_3_ID |

(8) READ STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the READ STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7:0] for each data output request.

The READ STATUS command returns the status of the most recently selected LUN.

(b) Command Encoding

The READ STATUS instruction uses the SEQ_4 commands sequence. The command is encoded, as shown in the table below:

Table 31.14 READ STATUS Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'70 | 0/1 | — | SEQ_4_ID |

This instruction has special meaning because it can be executed when the target is in the BUSY state.

The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(9) DEVICE STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the DEVICE STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.

The DEVICE STATUS command returns the status of the most recently selected LUN.

(b) Command Encoding

The DEVICE STATUS instruction uses the SEQ_4 commands sequence. The command is encoded, as shown in the table below:

Table 31.15 DEVICE STATUS Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'72 | 0/1 | — | SEQ_4_ID |

This instruction has special meaning because it can be executed when the target is in the BUSY state.

The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(10) VOLUME SELECT Command**(a) Command Description**

This command is accepted by all initialized devices that share a CE pin. The command may be executed with any volume on the target in any state. When the VOLUME SELECT command is issued, all volumes with unselected volume addresses will be deselected to save power. If the Volume address entered is invalid or does not match any appointed volume address, all volume addresses will be deselected. If the VOLUME SELECT command is not issued after CE high time then all volumes revert to their previous state.

(b) Command Encoding

The VOLUME SELECT instruction uses the SEQ_21 commands sequence. The command is encoded, as shown in the table below:

Table 31.16 VOLUME SELECT Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | — | H'E1 | 0/1 | — | SEQ_21_ID |

(11) SELECT LUN WITH STATUS Command**(a) Command Description**

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the SELECT LUN WITH STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7:0] for each data output request.

The SELECT LUN WITH STATUS command returns the state of the selected LUN.

(b) Command Encoding

The SELECT LUN WITH STATUS instruction uses the SEQ_5 commands sequence. The command is encoded, as shown in the table below:

Table 31.17 SELECT LUN WITH STATUS Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'78 | 0/1 | — | SEQ_5_ID |

This instruction has special meaning because it can be executed when the target is in the BUSY state.

The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(12) LUN STATUS Command

(a) Command Description

Each LUN provides its status independently of other LUNs on the same target through its 8-bit status register. Once the SELECT LUN WITH STATUS instruction is issued, status register output is enabled. The contents of the status register are returned on DQ[7: 0] for each data output request.

The LUN STATUS command returns the status of the selected LUN. revert to their previous state.

(b) Command Encoding

The LUN STATUS instruction uses the SEQ_5 commands sequence. The command is encoded, as shown in the table below:

Table 31.18 LUN STATUS Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'71 | 0/1 | — | SEQ_5_ID |

This instruction has special meaning because it can be executed when the target is in the BUSY state.

The FIFO cannot be used to access the read data because it can be occupied by the operation under execution. For the sequence the data field of command must select the DATA_REG register as data destination. The DATA_REG_SIZE must be select single byte.

(13) CHANGE READ COLUMN Command

(a) Command Description

The CHANGE READ COLUMN command changes the column address of the selected cache register and enables data output of the last selected LUN. This command is accepted by the selected LUN when it is ready. Writing H'05 to the target command register, followed by two column address cycles containing the column address, followed by the H'E0 command puts the selected LUN into data output mode. The selected LUN stays in data output mode until another valid command is issued.

(b) Command Encoding

The CHANGE READ COLUMN instruction uses the SEQ_6 commands sequence. The command is encoded, as shown in the table below:

Table 31.19 CHANGE READ COLUMN Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| H'E0 | — | H'05 | 0/1 | — | SEQ_6_ID |

(14) SELECT CACHE REGISTER Command**(a) Command Description**

The SELECT CACHE REGISTER command enables data output from the addressed LUN and the cache register at the specified column address. This command is accepted by a LUN when it is ready. Writing H'06 to the target command register, followed by two column address cycles, three row address cycles, and finally H'E0 enables data output mode on the addressed LUN and the cache register at the specified column address.

(b) Command Encoding

The SELECT CACHE REGISTER instruction uses the SEQ_7 commands sequence. The command is encoded, as shown in the table below:

Table 31.20 SELECT CACHE REGISTER Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| H'E0 | — | H'06 | 0/1 | — | SEQ_7_ID |

(15) CHANGE WRITE COLUMN Command**(a) Command Description**

The CHANGE WRITE COLUMN command changes the column address of the selected cache register and enables data input on the last selected LUN. Writing the H'85 to the target internal command register, followed by two column address cycles containing the column address puts the selected LUN into data input mode.

(b) Command Encoding

The CHANGE WRITE COLUMN instruction uses the SEQ_8 commands sequence. The command is encoded, as shown in the table below:

Table 31.21 CHANGE WRITE COLUMN Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'85 | — | — | SEQ_8_ID |

(16) CHANGE ROW ADDRESS Command**(a) Command Description**

The CHANGE ROW ADDRESS command changes the row address (block and page) where the cache register contents are to be programmed in the NAND array. It also changes the column address of the selected cache register and enables data input on the specified LUN.

(b) Command Encoding

The CHANGE ROW ADDRESS instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.22 CHANGE ROW ADDRESS Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'11 | H'85 | 0 | — | SEQ_12_ID |

(17) READ PAGE Command

(a) Command Description

The READ PAGE command copies a page from the NAND Flash array to its respective cache register and enables data output. This command is accepted by the LUN when it is ready. To read a page from the NAND Flash array, the controller writes the H'00 command to the target internal command register, then writes 5 address cycles to the address registers, and concludes with the H'30 command. The selected LUN is in the busy state while the data are transferred from the NAND flash array to the corresponding cache register. When the LUN is ready, data output is enabled for the cache register linked to the plane addressed in the READ PAGE command. The controller reads the programmed number of bytes to the FIFO.

(b) Command Encoding

The READ PAGE instruction uses the SEQ_10 commands sequence. The command is encoded, as shown in the table below:

Table 31.23 READ PAGE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| H'30 | — | H'00 | 0/1 | 0/1 | SEQ_10_ID |

(18) READ PAGE CACHE Command

(a) Command Description

The READ PAGE CACHE command reads the next sequential page within a block into the data register, while the previous page is output from the cache register. To issue this command, the controller writes H'31 to the target internal command register. After this command is issued, the R/B# goes LOW and the LUN goes into busy state. After that, the R/B# signal goes high and the LUN becomes busy and enters the cache operation state, in which the cache register is available and the specified page is copied from the NAND flash array to the data register. At this point, data is read from the cache register.

(b) Command Encoding

The READ PAGE CACHE instruction uses the SEQ_11 commands sequence. The command is encoded, as shown in the table below:

Table 31.24 READ PAGE CACHE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | — | H'31 | 0/1 | 0/1 | SEQ_11_ID |

(19) READ PAGE CACHE LAST Command**(a) Command Description**

The READ PAGE CACHE LAST command ends the READ PAGE CACHE sequence and copies a page from the data register to the cache register. This command is accepted by the LUN when it is ready. To issue the READ PAGE CACHE LAST command, the controller writes H'3F to the target internal command register. After this command is issued, R/B# goes LOW and the LUN goes into busy state. Afterwards, the R/B# goes HIGH and the LUN is ready. At this point, data from the targets cache register is read into the FIFO.

(b) Command Encoding

The READ PAGE CACHE LAST instruction uses the SEQ_11 commands sequence. The command is encoded, as shown in the table below:

Table 31.25 READ PAGE CACHE LAST Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | — | H'3F | 0/1 | 0/1 | SEQ_11_ID |

(20) READ MULTIPLANE Command**(a) Command Description**

The READ MULTIPLANE command queues a plane to transfer data from the NAND array to its cache register. This command can be issued one or more times. Each time a new plane address is specified, that plane is also queued for data transfer. To select the final plane and to begin the read operation for all previously queued planes, issue the READ PAGE command. All queued planes will transfer data from the NAND array to their cache registers.

(b) Command Encoding

The READ MULTIPLANE instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.26 READ MULTIPLANE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | H'32 | H'00 | — | — | SEQ_9_ID |

(21) QUEUE PAGE READ Command**(a) Command Description**

The QUEUE PAGE READ operation allows for partial-page reads by using a 7-address cycle. The first two bytes of the address cycle indicate the length of the page to read - those bytes are stored in ADDR0 register, followed by the column and row addresses - those bytes are stored in the ADDR1 register.

This can help overall performance should only a portion of the page data be needed because only the codeword containing the requested data will have ECC decoded. This command is exclusive for the CLEAR NAND devices.

(b) Command Encoding

The QUEUE PAGE READ instruction uses the SEQ_22 commands sequence. The command is encoded, as shown in the table below:

Table 31.27 QUEUE PAGE READ Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| H'37 | — | H'07 | — | — | SEQ_22_ID |

(22) TWO PLANE PAGE READ command**(a) Command Description**

This command was implemented to preserve the compatibility with the ONFi 1.0 and some older devices.

The TWO PLANE PAGE READ (H'00-H'00-H'30) operation is similar to the PAGE READ (H'00-H'30) operation. It transfers two pages of data from the NAND Flash array to the data registers. Each page must be from a different plane on the same die. The software is responsible for generating correct addresses for the requested pages. Both the ADDR0 and ADDR1 address registers are used in this case.

(b) Command Encoding

The TWO PLANE PAGE READ instruction uses the SEQ_15 commands sequence. The command is encoded, as shown in the table below. In this case, both the address registers are used.

Table 31.28 QUEUE PAGE READ Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| H'30 | H'00 | H'00 | 0/1 | 0/1 | SEQ_15_ID |

(23) PROGRAM PAGE Command**(a) Command Description**

The PROGRAM PAGE command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the controller writes H'10 to the target internal command register. The selected LUN goes into the busy state.

(b) Command Encoding

The PROGRAM PAGE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.29 PROGRAM PAGE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'10 | H'80 | 0 | 0/1 | SEQ_12_ID |

(24) PROGRAM PAGE IMMEDIATE Command**(a) Command Description**

The PROGRAM PAGE IMMEDIATE command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the controller writes H'10 to the target internal command register. The selected LUN goes into the busy state. This command writes only the row address to the NAND flash device.

(b) Command Encoding

The PROGRAM PAGE IMMEDIATE instruction uses the SEQ_23 commands sequence. The command is encoded, as shown in the table below:

Table 31.30 PROGRAM PAGE IMMEDIATE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'10 | H'80 | 0 | 0/1 | SEQ_23_ID |

(25) PROGRAM PAGE DELAYED Command**(a) Command Description**

The device's internal controller can automatically manage multi-plane programming. It does this with PROGRAM PAGE DELAYED command. When this command issued, the controller will delay issuing the program operation to the array until the address for the subsequent program operation is examined. If that operation allows the previous operation to complete as part of multi-plane operation, the controller will issue a multi-plane program to the array. Multi-plane operations are only completed if an LUN address from plane 0 is issued prior to a LUN address from plane 1. If the subsequent program operation does not allow the multi-plane operation, the controller will immediately start the previous program. It is presumed that the application program may use this command to initiate all the program operations. In this way the application program does not have to maintain information regarding multi-plane operation usage.

(b) Command Encoding

The PROGRAM PAGE DELAY instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.31 PROGRAM PAGE DELAY Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'13 | H'80 | 0 | 0/1 | SEQ_23_ID |

(26) PROGRAM PAGE 1 Command**(a) Command Description**

The PROGRAM PAGE 1 command allows the application program to input data to a cache register and moves the data from the cache register to the specified block and page address in the array of the selected LUN. This command is accepted by the LUN when it is ready. To input a page to the cache register and move it to the NAND array at the block and page address specified, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, the commands sequence ends.

(b) Command Encoding

The PROGRAM PAGE 1 instruction uses the SEQ_13 commands sequence. The command is encoded, as shown in the table below:

Table 31.32 PROGRAM PAGE 1 Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | — | H'80 | 0 | 0/1 | SEQ_13_ID |

(27) PROGRAM PAGE CACHE Command**(a) Command Description**

The PROGRAM PAGE CACHE command allows the controller to input data to a cache register, copies the data from the cache register to the data register, and then moves the data register contents to the specified block and page address in the array of the selected LUN. After the data is copied to the data register, the cache register is available for additional PROGRAM PAGE CACHE or PROGRAM PAGE commands. The PROGRAM PAGE CACHE command is accepted by the LUN when it is ready.

To input a page to the cache register, the controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input, beginning at the column address specified. When data input is complete, H'15 is written to the command register. The selected LUN becomes busy, data is copied from the cache register to the data register that has become available through a previous program cache operation, and then the contents of the data register begins to be moved to the specified block and page address.

(b) Command Encoding

The PROGRAM PAGE CACHE instruction uses the SEQ_12 commands sequence. Command is encoded as shown in the table below.

Table 31.33 PROGRAM PAGE CACHE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'15 | H'80 | 0 | 0/1 | SEQ_12_ID |

(28) PROGRAM MULTIPLANE Command**(a) Command Description**

The PROGRAM MULTIPLANE command enables the controller to input data to the cache register for the addressed plane and to place the cache register data in the queue to be moved to the NAND array. This command can be issued one or more times. Each time a new plane address is specified that plane is also queued for data transfer. This command is accepted by the LUN when it is ready. The controller writes H'80 to the target internal command register. Then five address cycles containing the column address and row address are written. Data input cycles follow. Serial data is input beginning at the column address specified. When data input is complete, the controller writes H'11 to the target internal command register.

(b) Command Encoding

The PROGRAM PAGE CACHE instruction uses the SEQ_12 commands sequence. Command is encoded as shown in the table below.

Table 31.34 PROGRAM MULTIPLANE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'11 | H'80 | 0 | 0/1 | SEQ_12_ID |

(29) WRITE PAGE Command**(a) Command Description**

The WRITE PAGE command allows the controller to move data from the targets cache register to the NAND array. This command is accepted by the LUN when it is ready. The controller writes H'10 to the target internal command register.

(b) Command Encoding

The WRITE PAGE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.35 WRITE PAGE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'10 | — | — | SEQ_0_ID |

(30) WRITE PAGE CACHE Command**(a) Command Description**

The WRITE PAGE CACHE command allows the controller to move data from the targets cache register to the targets data register. This command is accepted by the LUN when it is ready. The controller writes H'15 to the target internal command register.

(b) Command Encoding

The WRITE PAGE CACHE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.36 WRITE PAGE CACHE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'15 | — | — | SEQ_0_ID |

(31) WRITE MULTIPLANE Command**(a) Command Description**

The WRITE MULTIPLANE command allows the controller to queue data from the targets cache register to the NAND array. This command is accepted by the LUN when it is ready. The controller writes H'11 to the target internal command register.

(b) Command Encoding

The WRITE MULTIPLANE instruction uses the SEQ_0 commands sequence. The command is encoded, as shown in the table below:

Table 31.37 WRITE MULTIPLANE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | — | H'11 | — | — | SEQ_0_ID |

(32) ERASE BLOCK Command

(a) Command Description

The ERASE BLOCK command erases the specified block in the NAND array. This command is accepted by the LUN when it is ready. To erase a block, the controller writes H'60 to the target internal command register. Then three address cycles containing the row address are written; the column address is ignored. Finally, H'D0 is written to the target internal command register.

(b) Command Encoding

The ERASE BLOCK instruction uses the SEQ_14 commands sequence. The command is encoded, as shown in the table below:

Table 31.38 ERASE BLOCK Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'D0 | H'60 | — | — | SEQ_14_ID |

(33) ERASE MULTIPLANE Command

(a) Command Description

The ERASE MULTIPLANE command queues a block in the specified plane to be erased from the NAND array. This command can be issued one or more times. Each time a new plane address is specified, that plane is also queued for a block to be erased. This command is accepted by the LUN when it is ready. To queue a block to be erased, the controller writes H'60 to the command register.

Then three address cycles containing the row address are written; the column address is ignored.

Finally, H'D1 is written to the command register.

(b) Command Encoding

The ERASE MULTIPLANE instruction uses the SEQ_14 commands sequence. The command is encoded, as shown in the table below:

Table 31.39 ERASE MULTIPLANE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'D1 | H'60 | — | — | SEQ_14_ID |

(34) COPYBACK READ Command

(a) Command Description

The COPYBACK READ command is functionally identical to the READ PAGE command, except that H'35 is written to the target internal command register instead of H'30. For more details, see [section 31.3.4 \(17\), READ PAGE Command](#).

(b) Command Encoding

The COPYBACK READ instruction uses the SEQ_10 commands sequence. The command is encoded, as shown in the table below:

Table 31.40 COPYBACK READ Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| H'35 | — | H'00 | 0/1 | 0/1 | SEQ_10_ID |

(35) COPYBACK PROGRAM Command

(a) Command Description

The Copyback function reads a page of data from one location and then moves that data to a second location. The COPYBACK PROGRAM command is functionally identical to the PROGRAM PAGE command, except that when H'85 is written to the target internal command register, the cache register contents are not cleared. The SEQ_9 command sequence does not have the data phase, so the data from the cache register are written into the second location without modification. If data must be written with modification to the second location, the SEQ_12 command sequence, which includes the data phase, is used.

(b) Command Encoding

The COPYBACK PROGRAM instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.41 COPYBACK PROGRAM Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | H'10 | H'85 | — | — | SEQ_9_ID |

(36) COPYBACK PROGRAM 1 Command**(a) Command Description**

The COPYBACK PROGRAM 1 command is functionally identical to the PROGRAM PAGE 1 command, except that when H'85 is written to the target internal command register, the cache register contents are not cleared. See section 31.3.3 (26), PROGRAM PAGE 1 Command for further details.

(b) Command Encoding

The COPYBACK PROGRAM 1 instruction uses the SEQ_13 commands sequence. The command is encoded as shown in the table below:

Table 31.42 COPYBACK PROGRAM 1 Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | — | H'85 | 0 | — | SEQ_13_ID |

(37) COPYBACK MULTIPLANE Command**(a) Command Description**

The COPYBACK MULTIPLANE command is functionally identical to the PROGRAM MULTIPLANE command, except that when H'85 is written to the target internal command register, cache register contents are not cleared. See section 31.3.3 (28), PROGRAM MULTIPLANE Command for further details.

(b) Command Encoding

The COPYBACK MULTIPLANE instruction uses the SEQ_12 commands sequence. The command is encoded, as shown in the table below:

Table 31.43 COPYBACK MULTIPLANE Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'11 | H'85 | 0 | 0/1 | SEQ_12_ID |

(38) PROGRAM OTP Command**(a) Command Description**

The PROGRAM OTP command is used to write data to the pages within the OTP area. An entire page can be programmed at one time, or a page can be partially programmed up to four times. There is no ERASE operation for the OTP pages. To use the PROGRAM OTP command, the controller issues the H'A0 command. Next, 5 address cycles are issued. The address write is followed by a programmable number of data cycles. After data input is complete, the controller issues the H'10 command. The internal control logic automatically executes the proper programming algorithm and controls the necessary timing for programming and verification.

(b) Command Encoding

The PROGRAM OTP instruction uses the SEQ_12 commands sequence. The command is encoded as shown in the table below:

Table 31.44 PROGRAM OTP Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| — | H'10 | H'A0 | 0 | 0/1 | SEQ_12_ID |

(39) DATA PROTECT OTP Command**(a) Command Description**

The DATA PROTECT OTP command is used to protect all the data in the OTP area. After the data is protected, it cannot be further programmed. When the OTP area is protected, the pages within the area are no longer programmable and cannot be unprotected. To use the DATA PROTECT OTP command, the controller issues the H'A5 command. Next, the controller issues the following 5 addresses cycles.

Finally, the H'10 command is issued.

(b) Command Encoding

The DATA PROTECT OTP instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.45 DATA PROTECT OTP Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|----------|
| — | H'10 | H'A5 | — | — | SEQ_9_ID |

(40) PAGE READ OTP Command

(a) Command Description

The PAGE READ OTP command is used to read data from a page within the OTP area. An OTP page within the OTP area is available for reading data whether or not the area is protected. To use the PAGE READ OTP command, the controller issues the H'AF command. Next, 5 address cycles are issued.

Finally, the H'30 command is issued. After internal read from the NAND matrix is ended, the data is copied to the FIFO.

(b) Command Encoding

The PAGE READ OTP instruction uses the SEQ_9 commands sequence. The command is encoded, as shown in the table below:

Table 31.46 PAGE READ OTP Instruction Encoding

| CMD_2 | CMD_1/CMD_3 | CMD_0 | DATA_SEL | INPUT_SEL | CMD_SEQ |
|-------|-------------|-------|----------|-----------|-----------|
| H'30 | — | H'AF | 0/1 | 0/1 | SEQ_10_ID |

31.3.4 Multi LUN Work Mode

The multi LUN work mode is enabled by setting the MLUN_EN bit in the CONTROL register. In this mode, the memory is divided into multiple LUNs, each of which is handled as a separate target. The active LUN number is decoded directly from the address value. The following parameters apply to the multi LUN work mode.

MLUN_IDX field in the MLUN register

This parameter provides the bit index for the last address byte, which contains the LUN selection bits. This parameter must be set according to the datasheet for the NAND Flash device that is in use.

The LUN_SEL bits in the MLUN register are used to set the number of LUNs in the device. The LUN_STATUS_0 register holds indicators of the states of the LUNs. Each effective bit corresponds to the state of a single LUN.

STATE_MASK field in the STATUS_MASK register

This parameter is used to mask parts of the LUN status byte that will be ignored during LUN ready/busy checks.

31.3.5 Remapping Mechanism

The remapping mechanism supports the bad blocks management (BBM) solution. The hardware remapping mechanism relieves software from the time-consuming operations of finding the physical address for the given linear address in the requested operation. The software initializes only the remapping tables for uses in the application of the NAND Flash device. It sorts those tables in ascending order, and then the whole operation of searching tables and substituting addresses is accomplished automatically.

The remapping solution uses two groups of the control registers:

- The pointer register DEV0_PTR. This register stores the address in the internal memory where record tables used by the BBM mechanism are placed.
- The size register DEV0_SIZE. This register stores the number of records in a table.

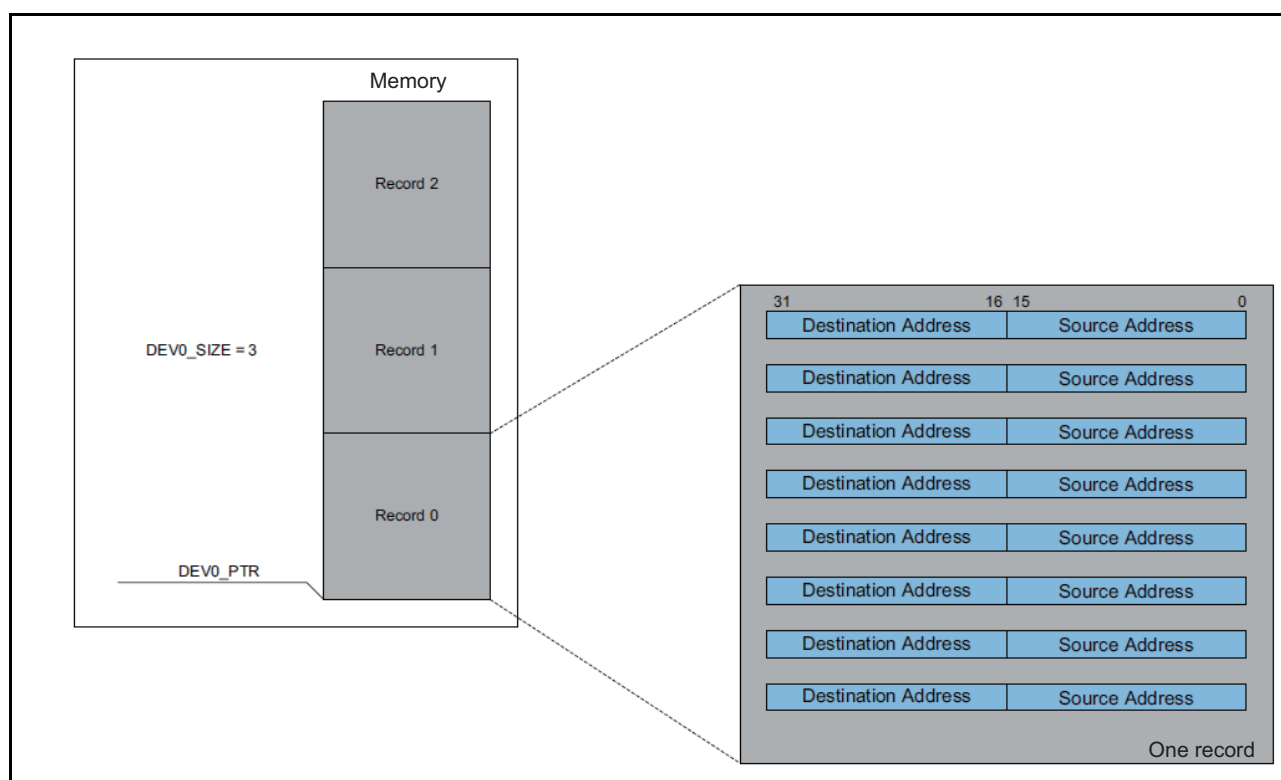

Figure 31.30 Example of BBM Records

Note: Store the block numbers of the destination and source addresses for transfer.
 The source addresses for transfer should be arranged in ascending order in the record tables.
 If some addresses in a record are not to be used, set the values for these addresses to H'FFFF_FFFF.

31.3.6 Interrupts Mechanism

The NAND Flash controller interrupt system uses two control registers:

The interrupt mask register – each bit of this register masks a single interrupt. The register is described in more detail in section 31.2.6, Interrupts mask register (INT_MASK).

The interrupt flag register – each bit of this register is an active flag from the single interrupt source.

The register is described in more detail in section 31.2.7, Interrupts status register (INT_STATUS).

In case an interrupt event occurs, i.e. the respective interrupt flag in INT_STATUS is 1, and its respective mask bit in INT_MASK is 1, the interrupt signal INTNFMA is asserted.

Note that the interrupt mask bits in INT_MASK affects only the interrupt signal INTNFMA, but not the flags in INT_STATUS.

A set flag in INT_STATUS must be cleared by the application program.

The available interrupt sources and their respective INT_STATUS flags are:

INT_STATUS.CMD_END_INT_FL

Command sequence finished interrupt – This interrupt occurs when the previously triggered command sequence is finished and the new one can be started. The command sequence is marked as finished when the full sequence is executed or when the NAND Flash device goes into the busy state.

INT_STATUS.ECC_INT0_FLAG

The ECC module detects an uncorrectable error in the transmitted data.

The ECC module detects when the configured errors threshold level is exceeded.

INT_STATUS.MEM0_RDY_INT_FL

The memory device is ready – This interrupt occurs when the NAND Flash device finishes executing the programmed command sequence and is ready for the new one. Each NAND Flash device has a single interrupt flag. The difference between “command sequence finished” interrupt and “memory device is ready” interrupt is presented in Figure 31.30.

INT_STATUS.TRANS_ERR_FL

The error on the slave interface during access to the controller FIFO – This interrupt occurs if the access to the FIFO memory has the opposite direction to the current FIFO configuration: the FIFO is read when it is configured for write, or the FIFO is write when it is configured for read.

INT_STATUS.STAT_ERR_INT0_FL

Most recently finished operation on the memory device failed. This applies to PROGRAM PAGE and ERASE BLOCK operations. It is not valid following a READ-series operation.

INT_STATUS.PG_SZ_ERR_INT_FL

Data Size error flag

When the ECC is enabled, the value written into the DATA_SIZE register has some restrictions.

Interrupt condition is met when the value written to the DATA_SIZE register is not correct.

INT_STATUS.DMA_INT_FL

DMA transfer ended flag

INT_STATUS.DATA_REG_INT_FL

Data in DATA_REG is available.

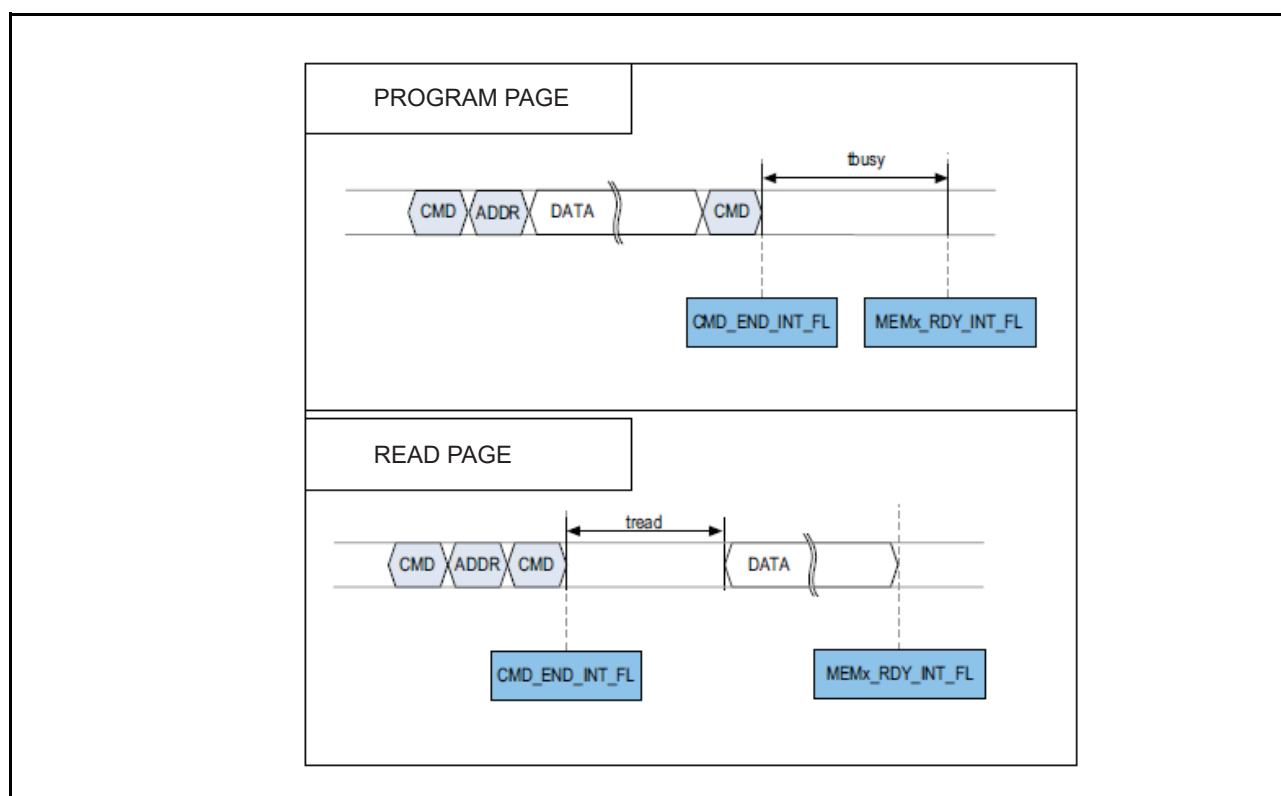

Figure 31.31 Command Sequence End and Memory-Ready Interrupts

31.3.7 Setup and Configuration

The CONTROL register is the main control register in the NAND Flash controller.

The following bits configure basic settings of the controller:

- INT_EN – Bit which enables Global Interrupt.
- ECC_EN – Bit which enables Hardware ECC.
- BLOCK_SIZE – Bits which configure block size.
- BBM_EN – Bit which enables remapping process.
- PROT_EN – Bit which enables Protect mechanism.
- ADDR_x_AUTO_INCR – Addresses auto increment for row address register 0 or 1.
- SMALL_BLOCK_EN – Bit which enables Small Block Mode.
- MLUN_EN – Bit which enables Multi LUN mode.
- AUTO_READ_STAT_EN – Bit which activates automatic read status after the PROGRAM PAGE and ERASE BLOCK commands.
- READ_STATUS_EN – Bit which chooses whether the controller checks RnB lines or sends READ_STATUS commands.
- ECC_BLOCK_SIZE – Bits which define ECC Block Size.

The registers described below are configured according to the settings of other bits in the CONTROL register:

1. If INT_EN bit is set, the software must write the mask into the INT_MASK register, which masks the selected interrupts source in the NAND Flash controller.
2. If ECC_EN bit is set, the software must correctly configure the ECC module by writing the appropriate configuration into the ECC_CTRL. Additionally, the software configures the offset in the ECC_OFFSET register. In small block mode, the value in the ECC_OFFSET is ignored and the correction words are located in the NAND Flash memory device, right behind the data.
3. The write number of the data which will be transferred by the controller (DATA_SIZE). When ECC is enabled, there are some restrictions to the DATA_SIZE value.
4. If the BBM_EN bit is set, the software must initialize the remapping tables (DEV_n_PTR and DEV_n_SIZE registers).
5. Additionally, the software must configure time parameters which can be found in the TIMINGS_ASYN register. Additionally, the software must configure the TIME_SEQ_0 and TIME_SEQ_1 registers.

When the NAND Flash controller uses DMA to transfer data, the software must configure the DMA_ADDR, DMA_CTRL and DMA_CNT registers. The software can modify these registers before any transfer or during the initialization procedure.

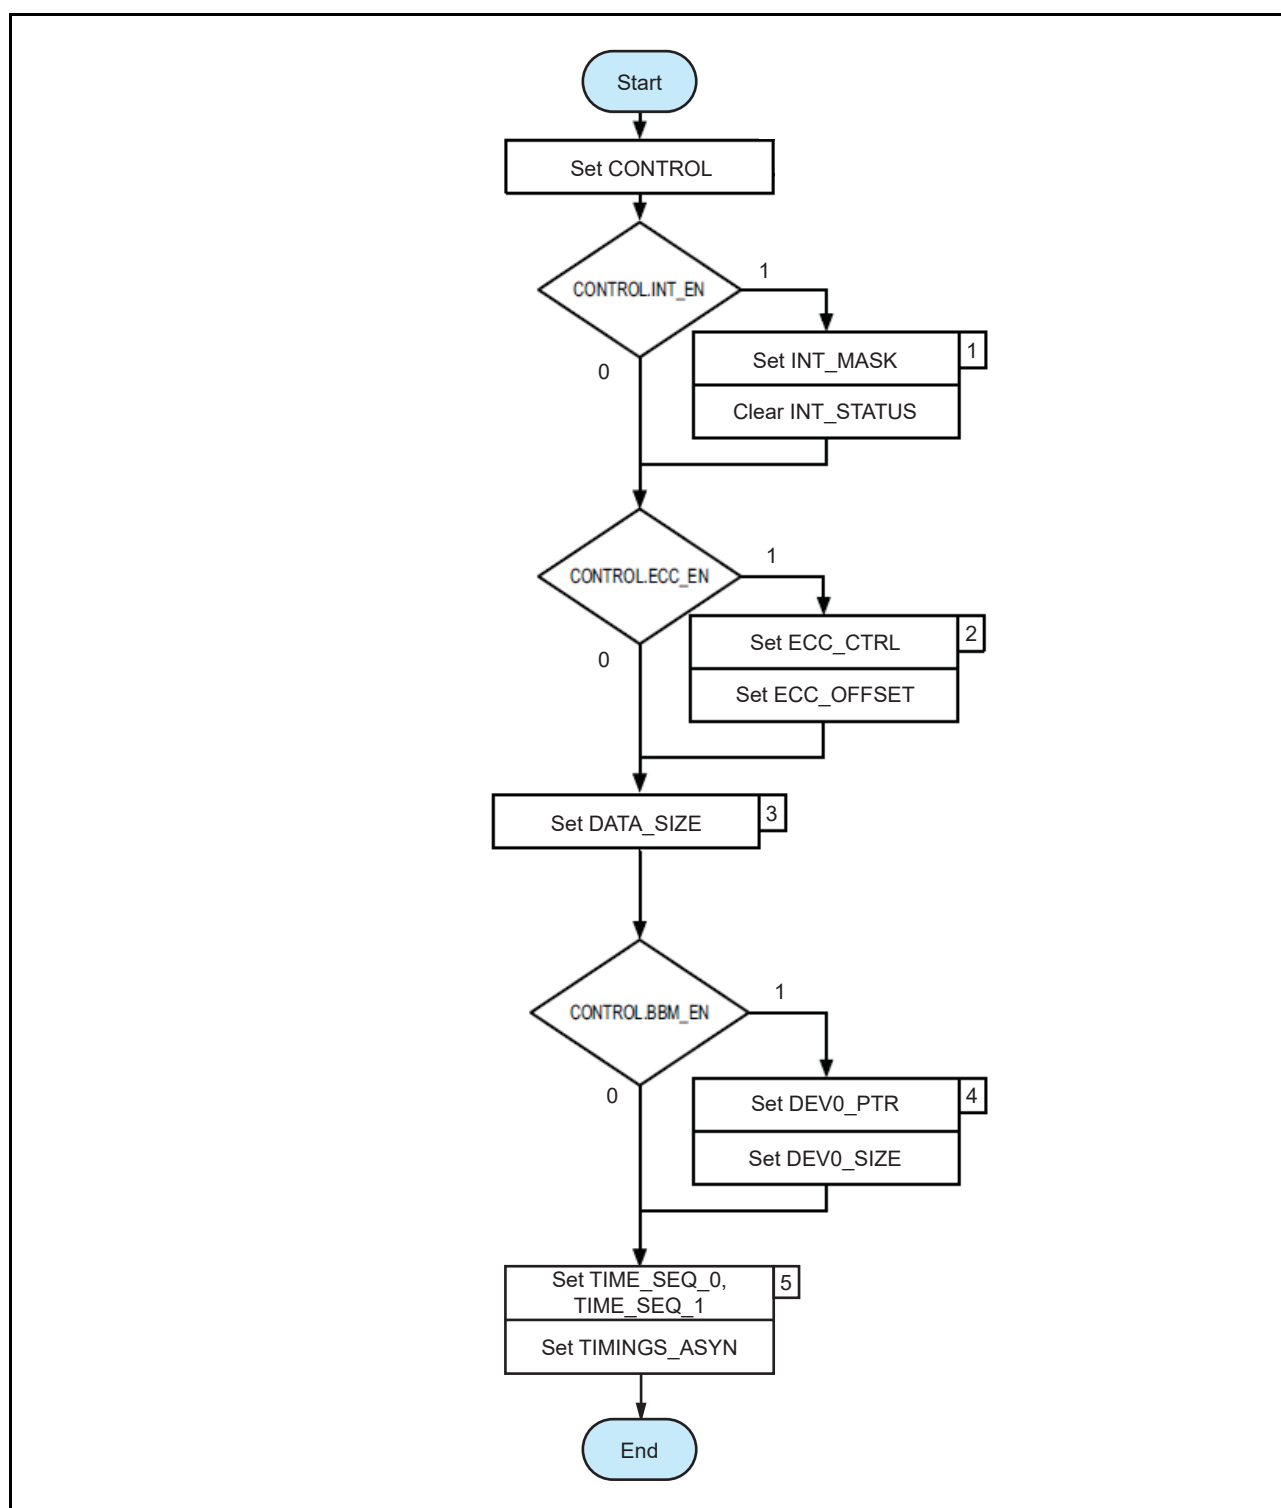

Figure 31.32 Configuration

(1) Send Data to NAND Flash via Slave Interface

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW). Write the number of data which you want to read (DATA_SIZE register).
3. To use the simplest program command, write H'0010 800C to the COMMAND register (PROGRAM PAGE command, FIFO selected, slave interface selected).
4. Write data to the FIFO using the FIFO_DATA register. Data is sent to the NAND Flash memory device.

When the memory is ready for further work, MEM0_ST is set.

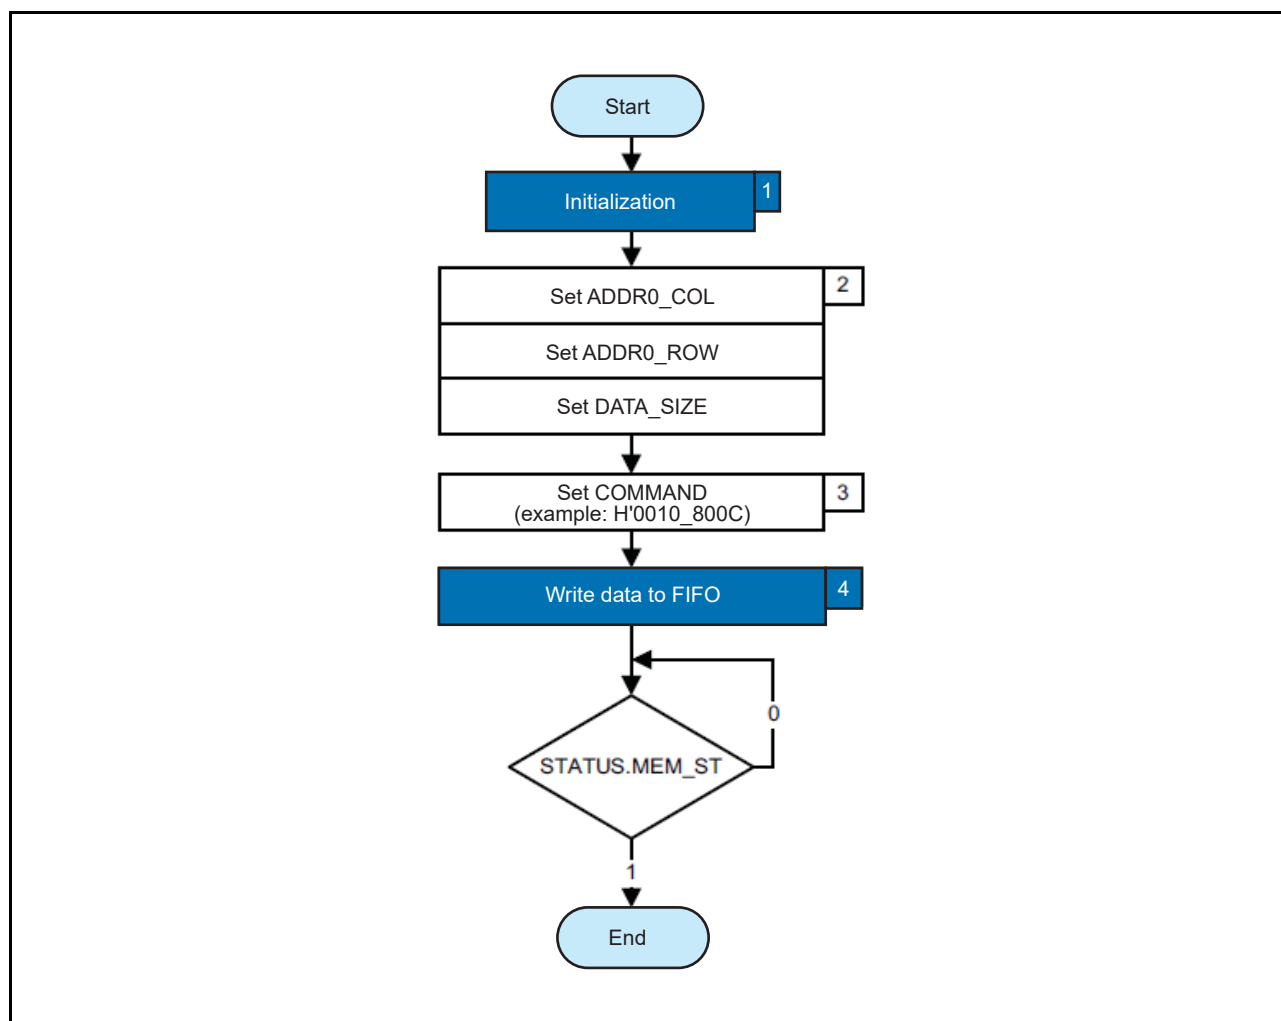

Figure 31.33 Write data to NAND Flash Memory via Slave Interface

(2) Read Data from NAND Flash via Slave Interface

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW).
3. To use the simplest read command, write H'3000 002A to the COMMAND register (READ PAGE command, FIFO selected, slave interface selected).
4. The application program can read data immediately after sending the command but in this case reading will be preceded by a very few WAIT replies from the NAND flash controller.
If this situation shall be avoided the application program must read FIFO_STATE register and wait when CF_EMPTY bit is set. After that wait for the DF_R_EMPTY bit in the FIFO_STATE register to be clear.
5. Read data from the FIFO using the FIFO_DATA register.

When the memory is ready for further work, MEM0_ST is set.

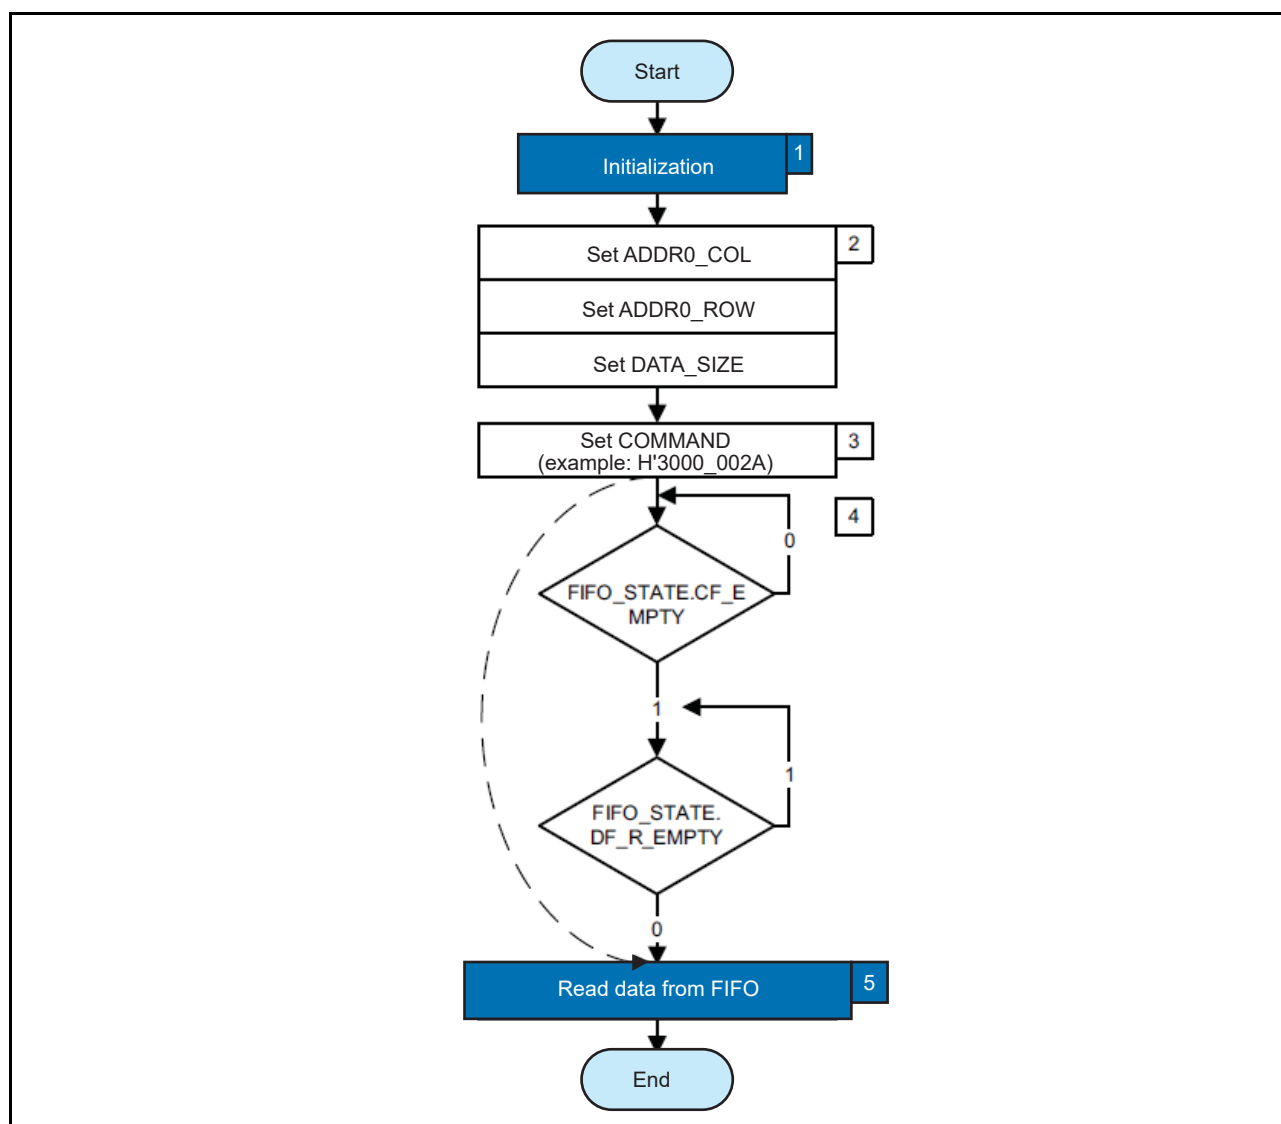

Figure 31.34 Read data from NAND Flash memory via Slave Interface

(3) Send Data to NAND Flash via Master Interface (using DMA)

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in [section 31.3.7, Setup and Configuration](#) and [section 31.2, Register Description](#).
2. Set the INT_EN bit in the CONTROL register to enable global interrupts.
3. Select active interrupt in the INT_MASK register and write H'0000 0000 into the INT_STATUS register to clear all interrupts.
4. Select the DMA work mode to configure the DMA module correctly:
In registers managed mode, the address of the data is written in the system memory (DMA_ADDR_L registers). Write the number of the transferred data into the DMA_CNT register. Set bit DMA_START to start DMA when the command sequence is sent to the NAND Flash memory. Bits ERR_FLAG and DMA_READY are read-only. The ERR_FLAG bit indicates an error on the internal bus while the DMA is transferring data; the DMA_READY bit indicates that the DMA is ready (transfer is completed).
5. Write the address of the data in the NAND Flash memory device into the address register 0.
6. To use the simplest program command, write H'0010 804C to the COMMAND register (PROGRAM PAGE command, FIFO selected, DMA selected).

When the memory is ready for further work, the appropriate MEM0_ST bit is set and interrupt is active. The recommended interrupt is MEM0_RDY_INT.

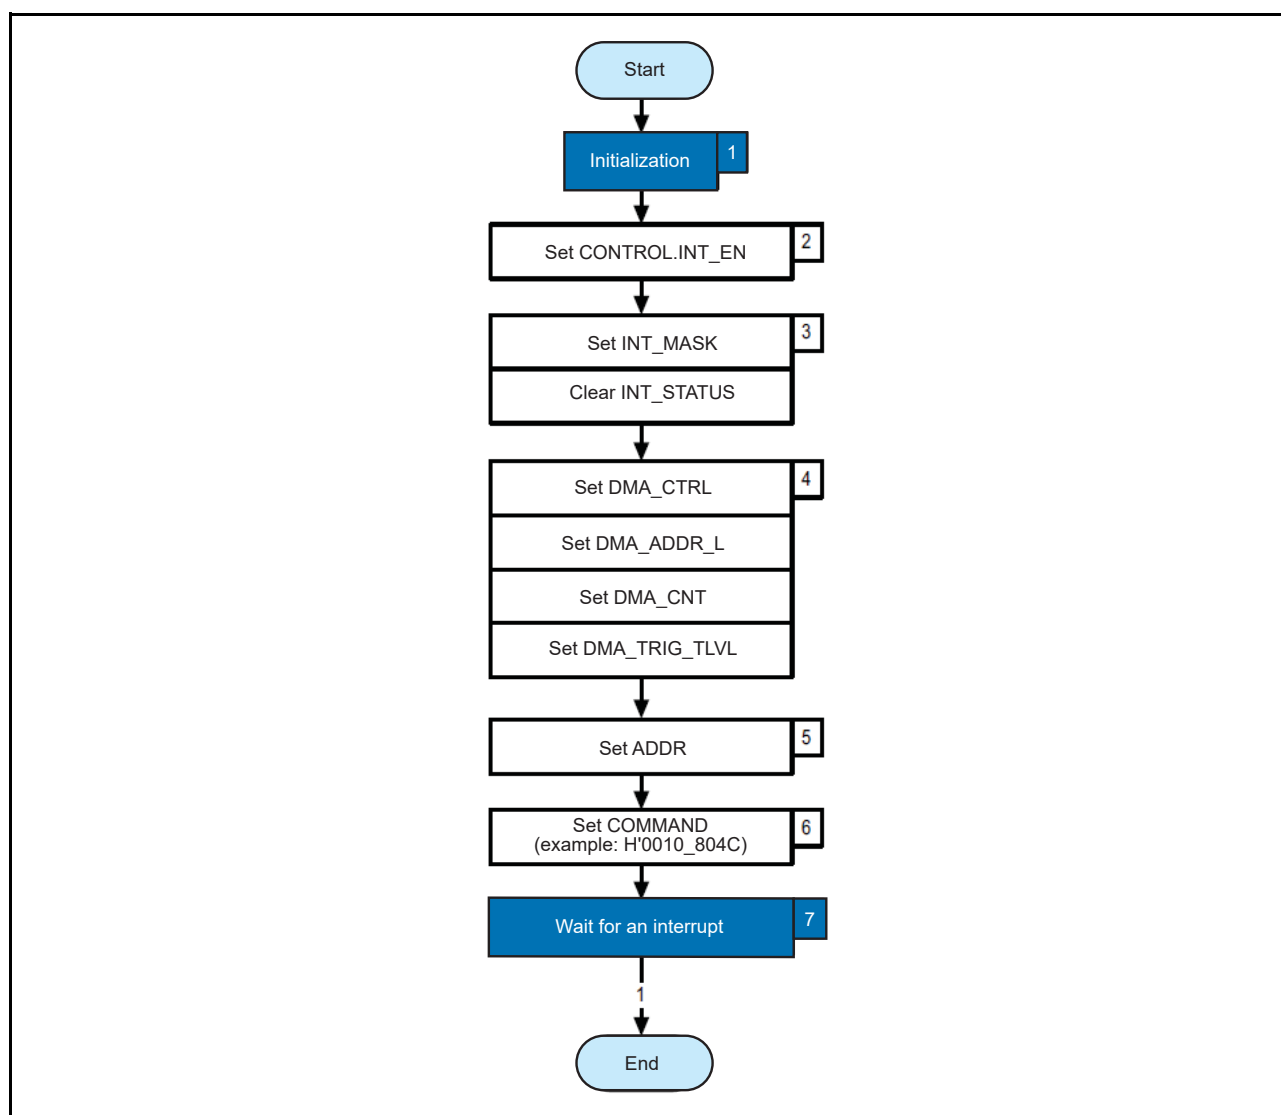

Figure 31.35 Send Data to NAND Flash Using DMA, Interrupt Enable

(4) Fast Writing and Reading of Several Pages from the Memory using DMA

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Set the INT_EN bit in the CONTROL register to enable global interrupts.
3. Select the active interrupt (CMD_END_INT_EN) in the INT_MASK register and write H'0000 0000 into the INT_STATUS register to clear all interrupts.
4. In Scatter-Gather mode, it is necessary to write the descriptors into the system memory. Select the DMA work mode to correctly configure the DMA module. In Scatter-Gather mode, it is not necessary to configure the DMA_CNT register. For more details, see section 31.4.2 (2) (b), Scatter-Gather Mode.
5. Set DMA_START bit to start the DMA when the command sequence is sent to the NAND Flash memory. Bits ERR_FLAG and DMA_READY are read-only. The former indicates the error on the internal bus while DMA is transferring data, the latter indicates when the DMA is ready (transfer is completed).
6. Set the ADDR0_INCR bit to auto increment row address 0 register after each command. Write address of the data in the NAND Flash memory device into the 0 address register.
7. Write H'0000 0000 into the INT_STATUS register to clear all interrupts.
8. Write address of the first descriptor into the DMA_ADDR_L registers.
9. Write PROGRAM PAGE CACHE command to the NAND Flash memory device by writing H'0015 804C into the COMMAND register (DMA selected, FIFO selected). When the controller is ready for further work, the appropriate CMD_END_INT_FL bit is set and the interrupt is activated.
10. When the number of the pages to be transferred does not equal one, go to step 7.
11. Write H'0000 0000 into the INT_STATUS register to clear all interrupts.
Write address of the first descriptor into the DMA_ADDR_L register.
The last command in the sequence of sending data is the PROGRAM PAGE (write H'0010804C) into the COMMAND register (DMA selected, FIFO selected).
12. Wait for interrupts and write H'0000 0000 into the INT_STATUS register to clear all interrupts.
13. Write the new descriptors to the system memory.
14. If DMA should work in the same work mode and burst type do not modify DMA_BURST and DMA_MODE bits.
Set DMA_START bit to start DMA when the command sequence is sent to the NAND Flash memory.
15. Write the READ PAGE command into the NAND Flash memory device by writing H'3000 0069 into the COMMAND register (FIFO selected, DMA selected).
16. Write H'0000 0000 into the INT_STATUS register to clear all interrupts.
17. Write the address of the first descriptor to the DMA_ADDR_L registers.
18. Write READ PAGE CACHE SEQUENTIAL command to the NAND Flash memory device by writing H'0000 316B into the COMMAND register (FIFO selected, DMA selected).
19. When the controller is ready for further work, the appropriate CMD_END_INT_FL bit is set and the interrupt is activated. When the number of the pages to be transferred does not equal zero, go to step 16.
20. Write H'0000 0000 into the INT_STATUS register to clear all interrupts. Write the address of the first descriptor to the DMA_ADDR_L register. The last command in the sequence of reading data is READ PAGE CACHE LAST (write H'0000 3F6B into the COMMAND register).

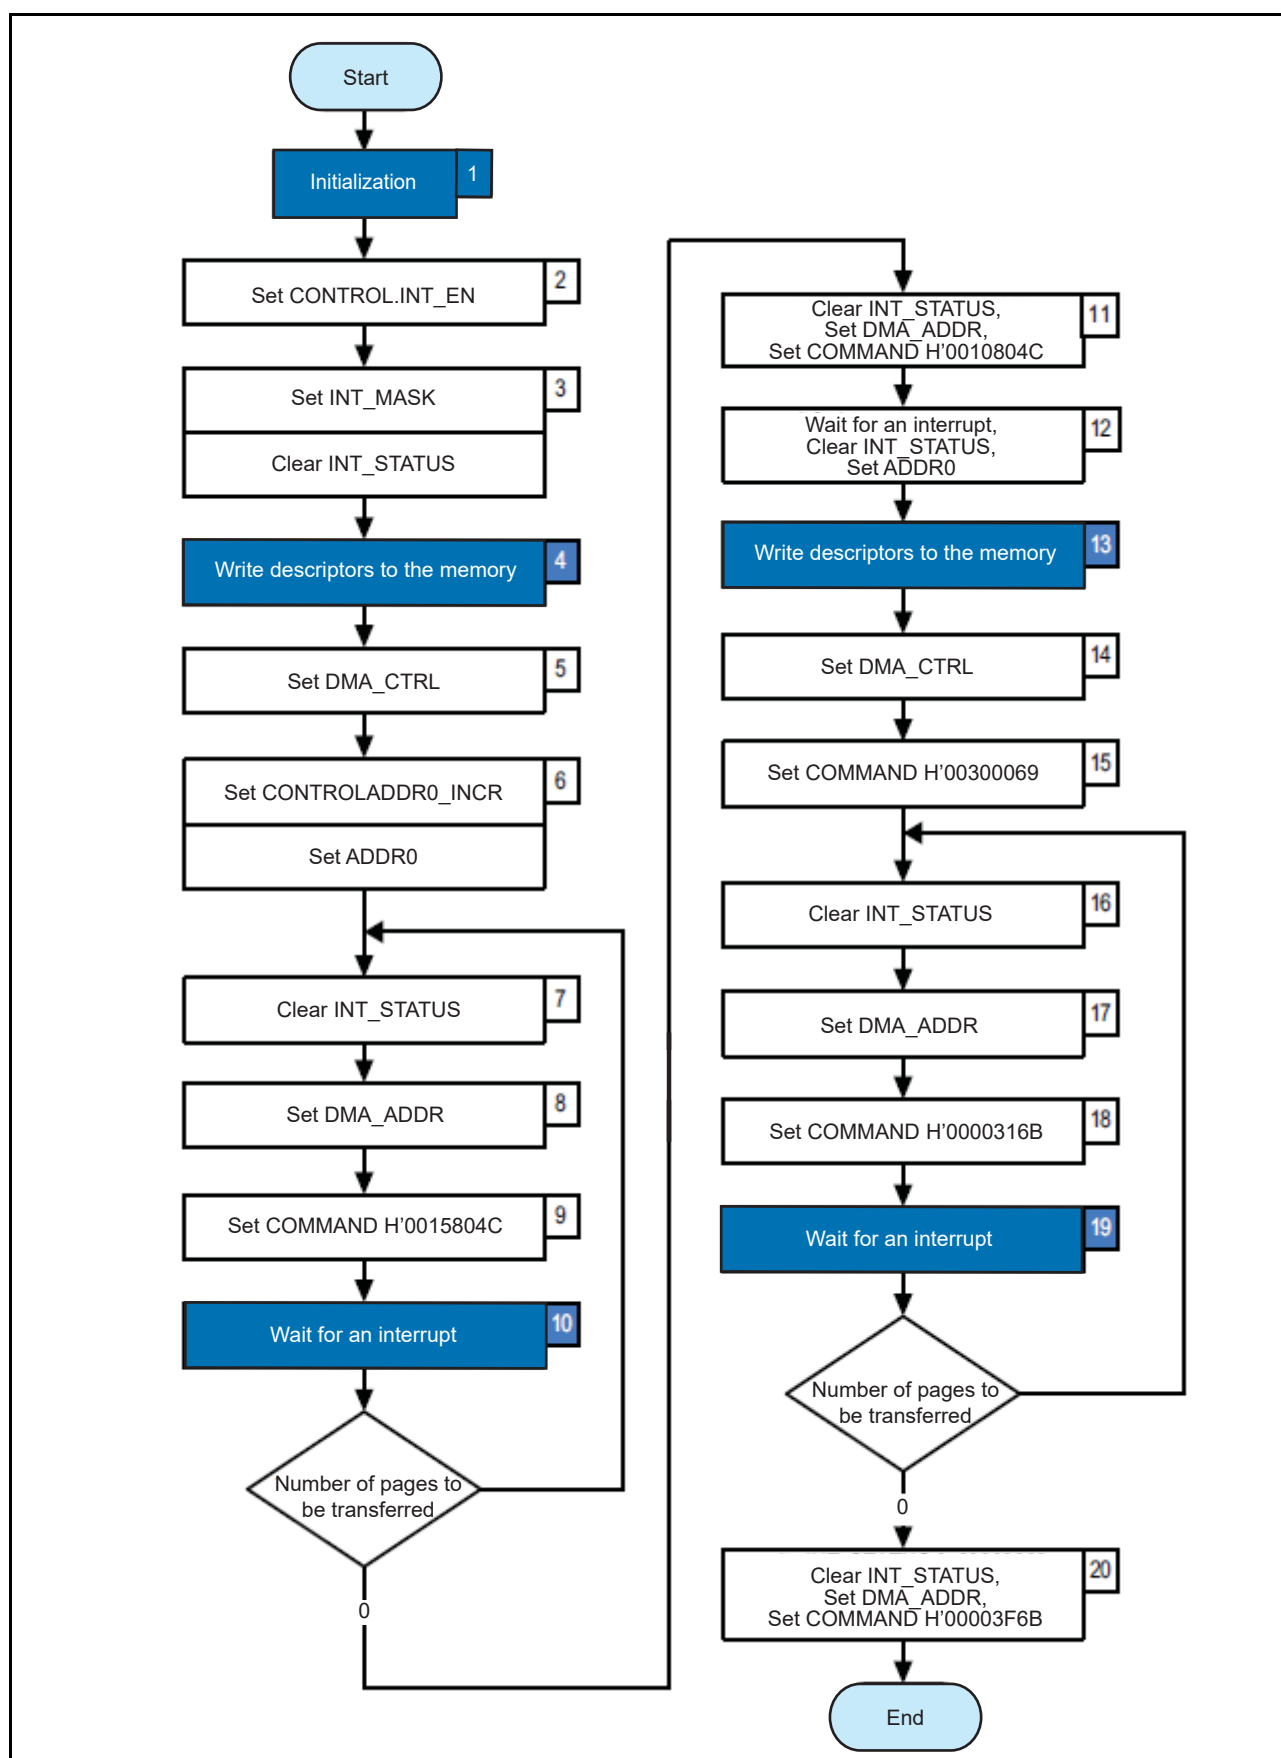

Figure 31.36 Fast Writing and Reading of Several Pages from the Memory Using DMA

(5) Writing to Partial Pages

The following procedure need to be used to write to partial pages with ECC engine enabled:

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW). You need to write the partial page offset into the ADDR0_COL register. Write the number of data that you want to write (DATA_SIZE register) – in this case you need to set the partial sector size. Write the offset value of the ECC data into the ECC_OFFSET register.
3. To use the simplest program command, write H'0010 800C to the COMMAND register (PROGRAM PAGE command, FIFO selected, slave interface selected).
4. Write data to the FIFO using the FIFO_DATA register. Data is sent to the NAND Flash memory device.

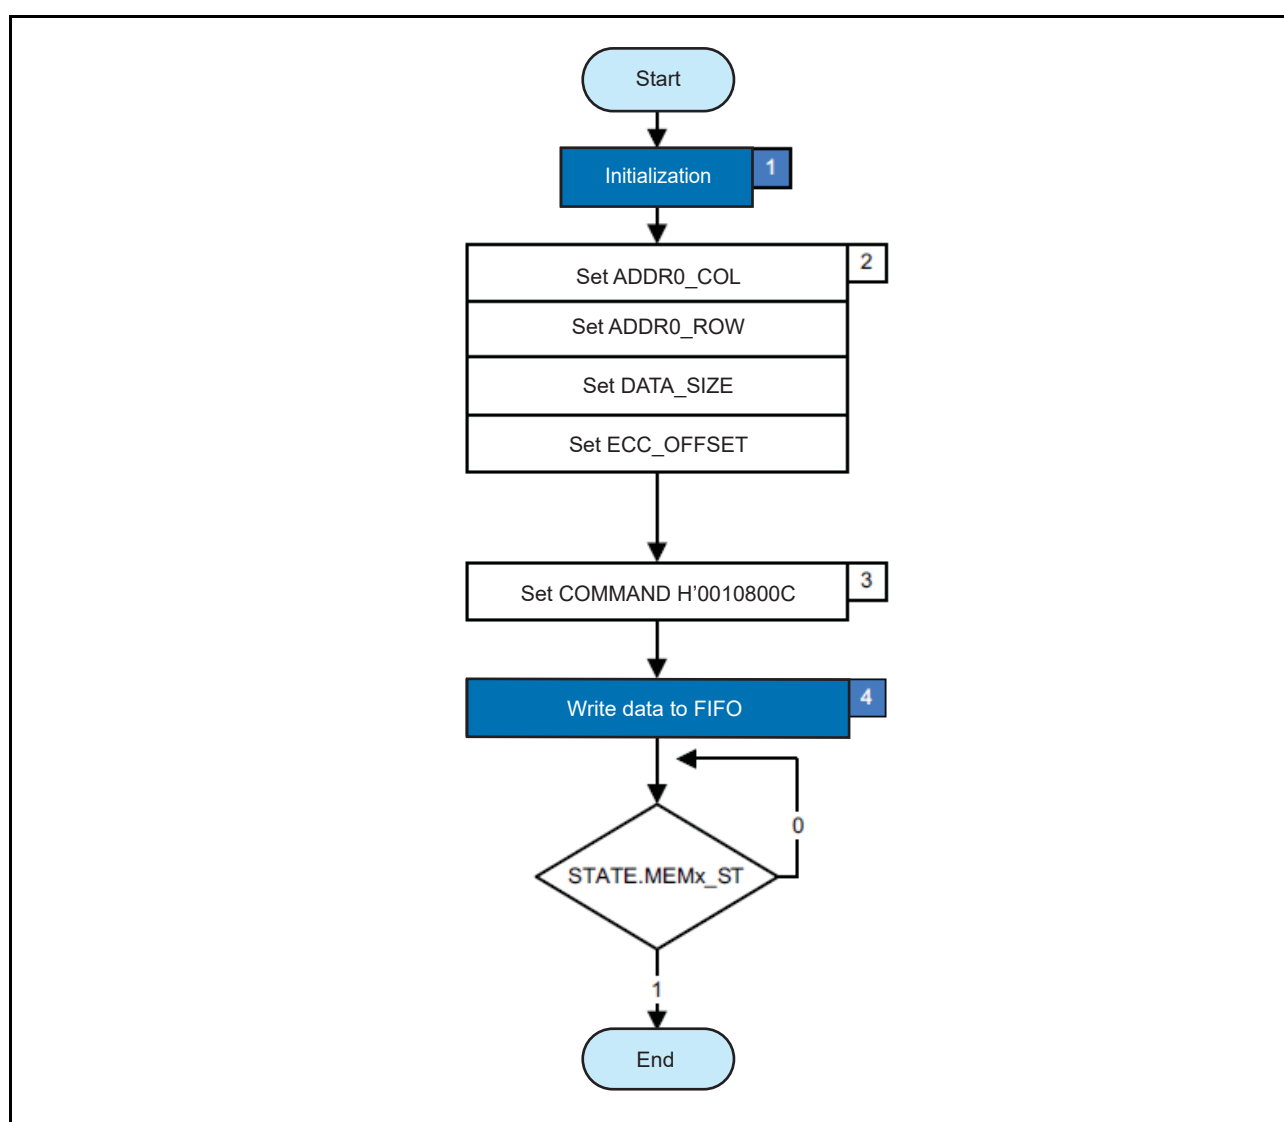

Figure 31.37 Writing to Partial Pages

(6) Reading Partial Pages

1. The NAND Flash controller must be correctly configured before sending data to the NAND Flash memory device. The setup process is described in detail in section 31.3.7, Setup and Configuration and section 31.2, Register Description.
2. Write the address of the data in NAND Flash memory into the address registers 0 (ADDR0_COL and ADDR0_ROW). You need to write the partial page offset into the ADDR0_COL register. Write the number of data that you want to read (DATA_SIZE register) – in this case you need to set the partial page size.
3. To use the simplest read command, write H'3000 002A to the COMMAND register (READ PAGE command, FIFO selected, slave interface selected).
4. The application program can read data immediately after sending the command but in this case reading will be preceded by a very few WAIT replies from the NAND flash controller. If this situation shall be avoided the application program must read FIFO_STATE register and wait when CF_EMPTY bit is set. After that wait for the DF_R_EMPTY bit in the FIFO_STATE register to be clear.
5. Read data from the FIFO using the FIFO_DATA register.

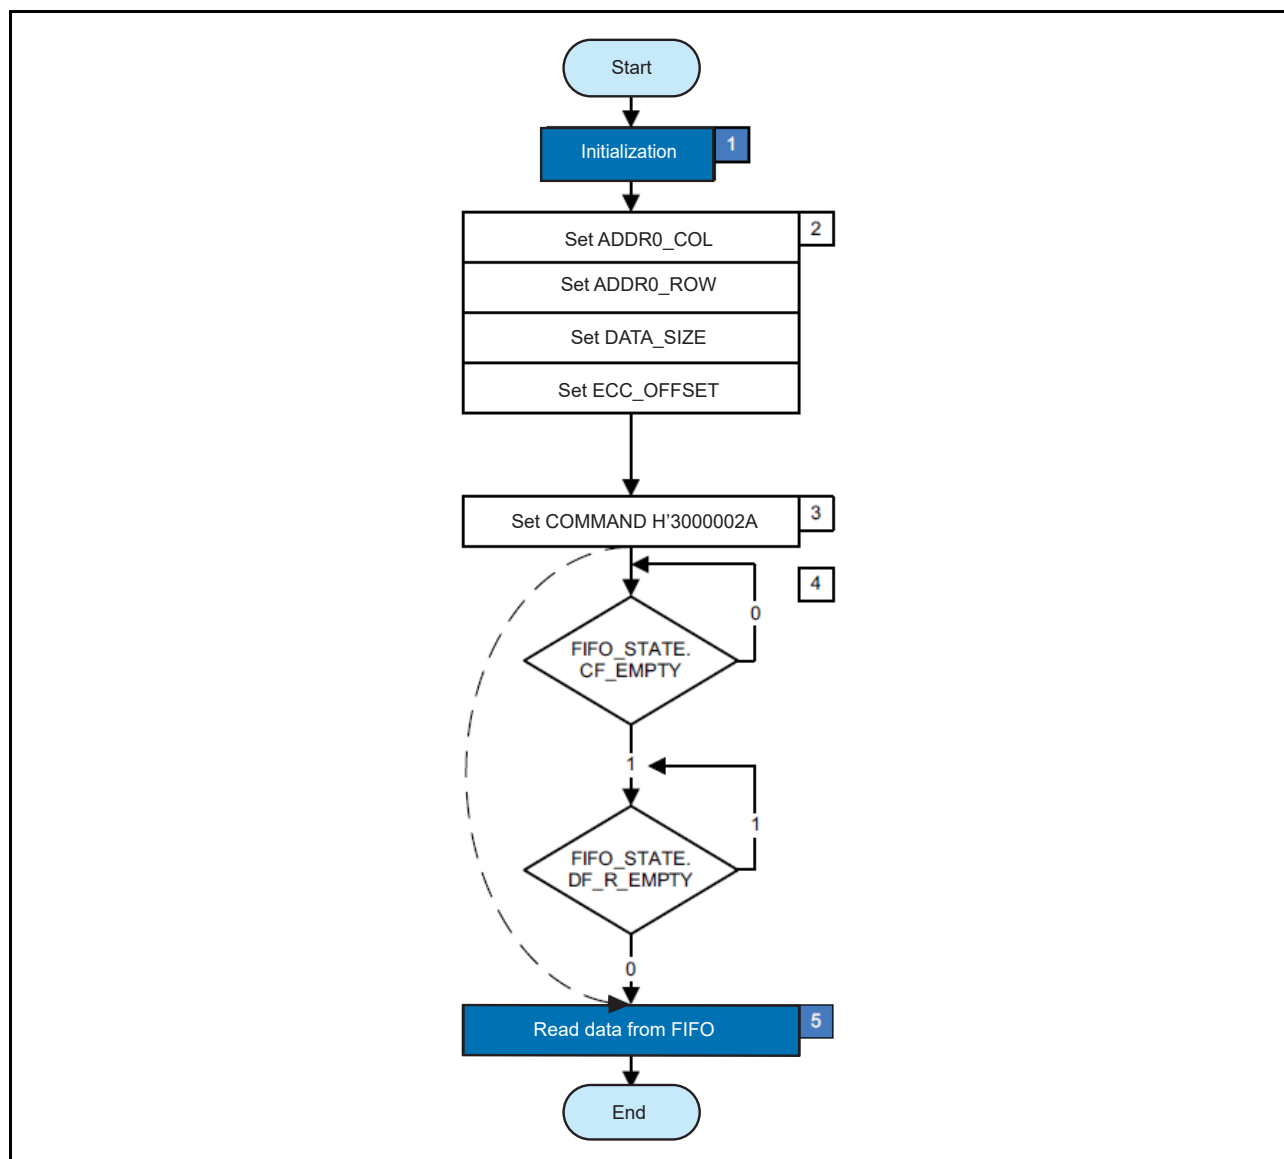

Figure 31.38 Reading Partial Pages

31.4 Functional Details

31.4.1 Block Diagram

The figure below shows the NAND Flash controller block diagram.

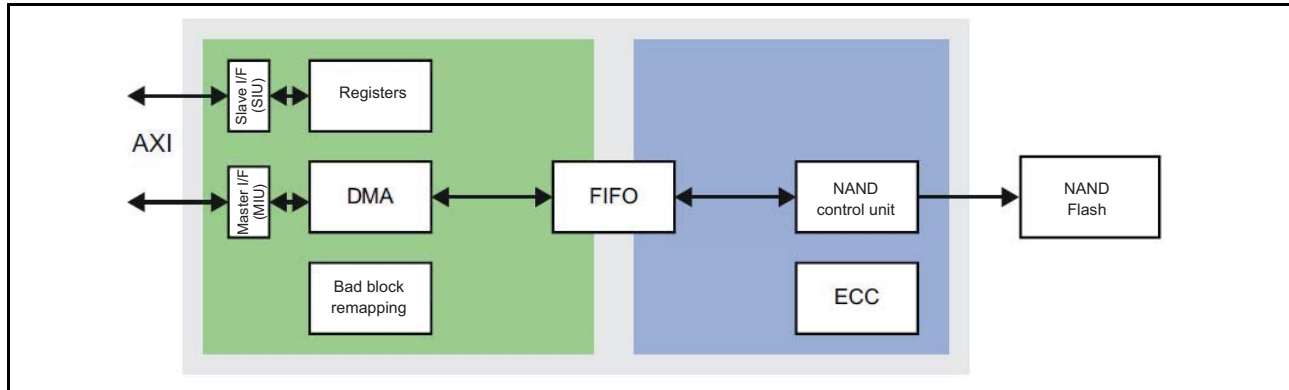

Figure 31.39 Block Diagram

The main blocks and their functions are as follows.

- FIFO provides the FIFO queue interface to other controller modules. Since the FIFO interface keeps control of the read and write pointers within the same module, one module can read and another write at the same time. One side of the queue is connected to the SIU or DMA module depending on the controller software configuration, and the other side of the queue is connected to the NAND control unit.
- DMA is responsible for the fast transfer of data between the external memory location and the controller. The unit can work in two modes: the Scatter-Gather mode and the internally triggered registers managed mode. DMA functions as the master.
- NAND control unit generates NAND Flash device access sequences.
- ECC is an error correction code calculator. A correction word is calculated for each 256B, 512B or 1024B ECC block of the NAND Flash memory page. During the read operation, this block can automatically correct bad bits without any interaction with the CPU. It has a status register, the bits of which signal errors occurring during a read, and then it informs when errors are corrected.
- Bad block remapping remaps blocks excluded from the pool of the usable blocks into the blocks that will be its substitute. Whole process is transparent for the software.

31.4.2 DMA

(1) Overview

The DMA in this module has the following properties:

- Two work modes:
 - The registers managed mode
 - The Scatter-Gather mode
- The DMA module preserves the configuration registers. These are copied into the DMA working registers.
- DMA trigger level enables DMA to send packet data.

(2) DMA Description

DMA supports two modes:

- The registers managed mode – the DMA does one transfer depending on the contents of DMA_ADDR, DMA_CNT, and DMA_CTRL registers.
- The Scatter-Gather mode – new DMA transfer algorithm.

The DMA mode for the current transfer is selected via the DMA_CTRL.DMA_MODE bit and cannot be changed during each consecutive data transfer. The application program can change the DMA mode when the transfer is completed and the DMA_CTRL.DMA_READY bit is set.

In order to begin the transfer, the DMA should be in an IDLE state (DMA_CTRL.DMA_READY = 1).

Setting the DMA_CTRL.DMA_START bit triggers the DMA after the commands are sent to the NAND Flash memory (writing CONTROL register). When the DMA_START bit is clear, sending commands to the NAND Flash memory will not trigger the DMA. This allows the DMA to be programmed to transfer more data than the page size of the NAND Flash memory. (example: the DMA is configured to 32 kB data transfer, the size of the page in NAND Flash memory is 4 kB. In order to send 32 kB of data into the NAND Flash memory, it is necessary to set the DMA_START bit in the register DMA_CTRL, then it is necessary to send the PROGRAM PAGE command to the NAND Flash memory, clear the DMA_START bit in the DMA_CTRL register, and send seven commands to the NAND Flash memory).

In this example, the DMA is set only once at the beginning.

The DMA trigger level enables the DMA to send packet data. It indicates when the DMA has to start transferring data. The application program must set trigger level depending on arbitration type, system and NAND Flash memory performance.

For example:

1. If the DMA trigger level equals 0, the DMA does not wait, but transfers data immediately because the trigger level is always exceeded.
2. For read from the NAND Flash memory: If the DMA trigger level equals H'40 (256 bytes), the DMA waits until data level reaches the previously programmed trigger level (256 bytes). Then the DMA will transfer data until FIFO gets empty status. Next the wait cycle for required data level is repeated as long as remain data size allow to reach programmed trigger level. The trigger level value should be chosen to ensure that only the continuous data block will be transferred and the FIFO will not be overflowed.
3. For write to NAND Flash memory: If the DMA trigger level equals H'40 (256 bytes), the DMA writes data to the FIFO until the FIFO is full. Then, the DMA waits until 256 bytes are written into the NAND Flash memory. Next, again the DMA transfers data until FIFO is full. The trigger level value should be chosen to ensure that only the continuous data block will be transferred.

(a) Registers Managed Mode

When the DMA works in this mode, it transfers only one continuous block (DMA_CNT is block length) to or from the system memory at address DMA_ADDR. Block can be multiple of DATA_SIZE value in the DATA_SIZE register. All the registers which modify this transfer are described in section 31.2.18, DMA base address register (DMA_ADDR_L), section 31.2.19, DMA counter initial value register (DMA_CNT) and section 31.2.20, DMA control register (DMA_CTRL).

The DMA_BURST bit in register DMA_CTRL defines the main transfer type used by the DMA to precede the requested transfer.

(b) Scatter-Gather Mode

The scatter-gather DMA controller implements high-speed DMA transfer from non-contiguous memory locations to a continuous address space, and vice versa.

The DMA in Scatter-Gather mode uses the Descriptors List to describe data transfers. The NAND Flash registers only points to the base address of the Descriptors List. The base address for this list is set in the DMA_ADDR register whether it is a read or write transfer. The base address, sizes of the data blocks, and flags are defined inside the descriptors.

The DMA_BURST bit in register DMA_CTRL defines the main transfer type used by the DMA.

When in Scatter-Gather mode, the DMA transfers data from data blocks. Each descriptor can define only one data block. The DMA adopts the scatter-gather DMA algorithm so that higher data transfer speed is available. The application program can program a list of data transfers between the system memory and NAND Flash to the Descriptor Table before executing Scatter-Gather mode.

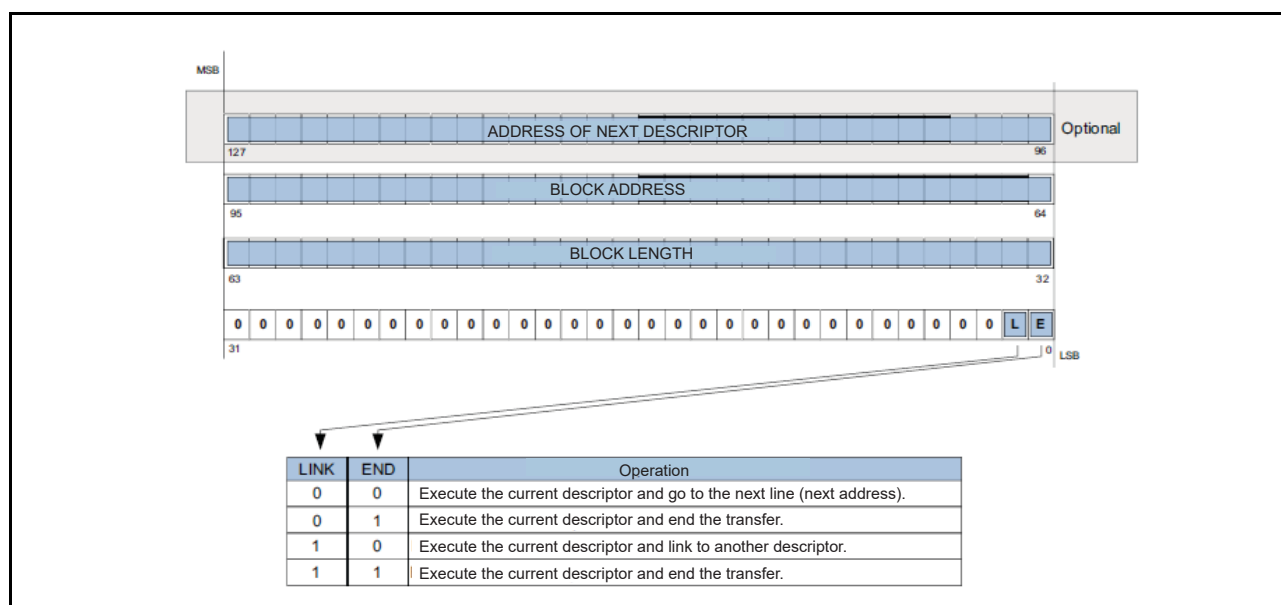

Figure 31.40 Descriptor Fields for Scatter-Gather DMA

The table below defines the Scatter-Gather DMA descriptor fields and their functions:

Table 31.47 Descriptor Fields for Scatter-Gather DMA

| Bit | Symbol | Description | | | | | | | | | |
|----------|---------|--|------|-----|--|---|---|---|---|---|--|
| [127:96] | ADDRESS | Next descriptor address when LINK = 1 and END = 0 | | | | | | | | | |
| [95:64] | ADDRESS | Data block address | | | | | | | | | |
| [63:32] | LENGTH | Data page length (H'0000 0004 to H'FFFF FFFD) Specify a multiple of four as the number of bytes. | | | | | | | | | |
| [31:2] | — | Reserved | | | | | | | | | |
| [1] | LINK | | | | | | | | | | |
| | | <table> <tr> <th>LINK</th><th>END</th><th>Description</th></tr> <tr> <td>0</td><td>0</td><td>Execute the current descriptor and go to the next descriptor on the list.</td></tr> </table> | LINK | END | Description | 0 | 0 | Execute the current descriptor and go to the next descriptor on the list. | | | |
| LINK | END | Description | | | | | | | | | |
| 0 | 0 | Execute the current descriptor and go to the next descriptor on the list. | | | | | | | | | |
| [0] | END | | | | | | | | | | |
| | | <table> <tr> <td>0</td><td>1</td><td>Execute the current descriptor and end the transfer.</td></tr> <tr> <td>1</td><td>0</td><td>Execute the current descriptor and link to another descriptor.</td></tr> <tr> <td>1</td><td>1</td><td>Execute the current descriptor and end the transfer.</td></tr> </table> | 0 | 1 | Execute the current descriptor and end the transfer. | 1 | 0 | Execute the current descriptor and link to another descriptor. | 1 | 1 | Execute the current descriptor and end the transfer. |
| 0 | 1 | Execute the current descriptor and end the transfer. | | | | | | | | | |
| 1 | 0 | Execute the current descriptor and link to another descriptor. | | | | | | | | | |
| 1 | 1 | Execute the current descriptor and end the transfer. | | | | | | | | | |

Table 31.48 DMA Data Counter Length

| LENGTH Value | Counter Length |
|--------------|--------------------|
| H'0000 0000 | Setting prohibited |
| H'0000 0001 | Setting prohibited |
| H'0000 0002 | Setting prohibited |
| H'0000 0003 | Setting prohibited |
| H'0000 0004 | 4 bytes |
| H'0000 0005 | Setting prohibited |
| H'0000 0006 | Setting prohibited |
| H'0000 0007 | Setting prohibited |
| H'0000 0008 | 8 bytes |
| | |

The Descriptor Table is created in system memory by the application program. Each descriptor line (one executable unit) consists of the address, length and flags. The flags specify operation of the descriptor line. The size of each descriptor field is 16 bytes when LINK is 1 and END is 0, while the size is 12 bytes for other combinations.

The figure below shows the example of Scatter-Gather programming:

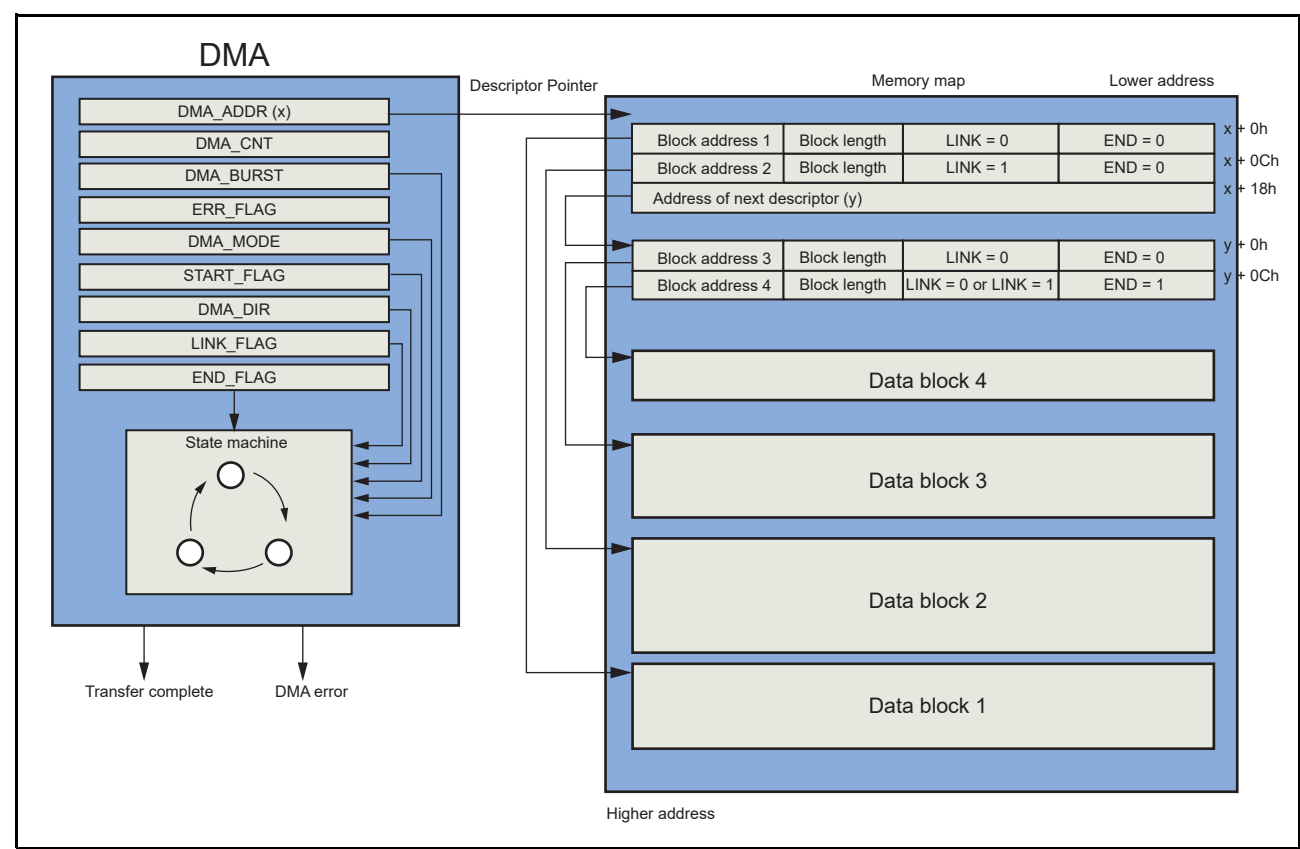

Figure 31.41 Example of Scatter-Gather DMA Data Transfer

31.4.3 ECC

(1) Overview

The built-in ECC of this module is based on one of the BCH algorithms and allows correction of multiple bit errors. The ECC has the following features:

- The encoder and decoder work on the 256, 512, 1024 bytes data blocks.
- Programmable correction capability: 2, 4, 8, 16, 24 or 32 errors.
- The corrected data words are aligned to the 32 bits.
- The correction words are aligned to the 32 bits.
- Correction words are placed after the data.

(2) Block Diagram

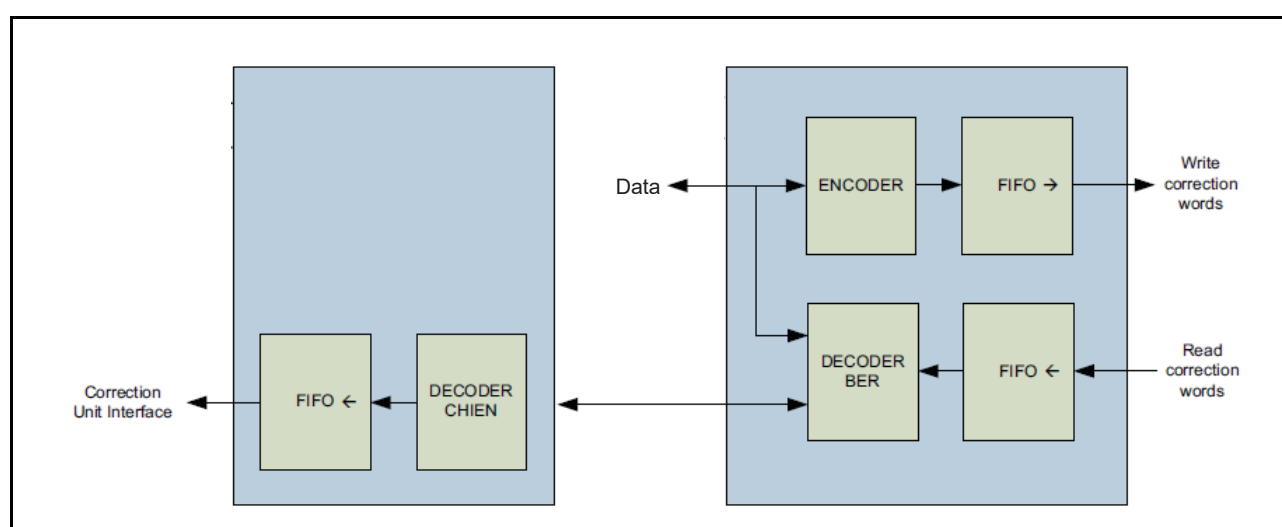

Figure 31.42 Block Diagram of ECC

31.4.4 BCH Algorithm Implementation

- Data block length: 256 (small block memory), 512, or 1024 bytes
- Programmable memory page length, multiple of the block length by any power of 2 (optional).
- Programmable correction capability: 2, 4, 8, 16, 24 or 32 errors.
- Separate encoder and decoder modules.
- Calculation of correction data performed during write to memory.
- Error detection performed during read data from memory.
- Internal pipeline allows the correction of errors in one data block simultaneously with detection of errors in the following data block.

Table 31.49 Size of Correction Bytes

| Correction Capability | ECC Block Size | Size of Correction Bytes per one ECC Block |
|-----------------------|--------------------|--|
| 2 bits | 256/512/1024 bytes | 4 bytes |
| 4 bits | 256/512/1024 bytes | 7 bytes |
| 8 bits | 256/512/1024 bytes | 14 bytes |
| 16 bits | 256/512/1024 bytes | 28 bytes |
| 24 bits | 256/512/1024 bytes | 42 bytes |
| 32 bits | 256/512/1024 bytes | 56 bytes |

32. USB 2.0 Host Module

32.1 Overview

32.1.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

32.1.2 Features

This module has the following features:

| Function | Description |
|-----------------|---|
| Host function | <ul style="list-style-type: none">Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfersCompliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0aCompliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1 |
| Other functions | <ul style="list-style-type: none">Battery charging (compliant with Battery Charging Specification Revision 1.2)*2Dual-role-device function (static switching between the USB host and USB peripheral functions) |

Note 1. Some functions (specifications) are not supported.

Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected.

32.1.2.1 EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.

Note, however, that this module supports only the functions marked with a circle "○" in the table below.

| Function Name | Support |
|-----------------------------|---------|
| Per-Port Change Events | ○ |
| Shorter Periodic Frame List | ○ |
| Hardware Prefetching | — |
| Link Power Management (LPM) | ○ |

Of the three features to support, the registers associated with “Per-Port Change Events” and “Shorter Periodic Frame List” are listed below. For more information on each register, refer to the appropriate register specification of the **section 32.2, Register Descriptions**.

With regard to “Link Power Management (LPM)”, it is described in **section 32.1.2.2, Link Power Management (LPM) function**.

-Per-Port Change Events

| Relevant register | Relevant bit | Attribute | Function |
|-----------------------------|---|-----------|--|
| HCCPARAMS (offset: 108h) | bit 18 Per-Port Change Event Capability | R | This bit indicates to support this function. This bit is fixed to 1b. |
| USBCMD (offset: 120h) | bit 15 Per-Port Change Events Enable | R/W | Per-Port event notification setting. Writing 1b to this bit enables the Per-Port event notification function. |
| USBSTS (offset: 124h) | bit 16 Port-1 Change Detect | R/W(1) | If a port-1 change event is detected, 1b is written to this bit. |
| USBINTR (offset: 128h) | bit 16 Port-1 Change Event Enable | R/W | Enable/Disable setting of the above “port-1 Change Detect” field. To reflect the port event on the above field for the port, set corresponding bit to 1b. |

-Shorter Periodic Frame List

| Relevant register | Relevant bit | Attribute | Function |
|-----------------------------|--|-----------|---|
| HCCPARAMS (offset: 108h) | bit 19 32-Frame Periodic List Capability | R | This bit indicates to support this function. This bit is fixed to 1b. |
| USBCMD (offset: 120h) | bit[3:2] Frame List Size | R/W | This bit determines the Frame List Size. To determine 32 frames, set this field 11b. |

32.1.2.2 Link Power Management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).

When the peripheral device which supports LPM function is connected to this module, the device can be moved to suspend state faster than conventional by using LPM function.

*In using LPM function: 8 to 10 μ s

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in section 32.2, Register Descriptions.

| Relevant register | Relevant bit | | Attribute | Function |
|---------------------------------|--------------|----------------------------------|-----------|--|
| HCCPARAMS (offset: 108h) | bit 17 | Link Power Management Capability | R | This bit indicates to support this function. This bit is fixed to 1b. |
| USBCMD (offset: 120h) | bit[27:24] | Host-Initiated Resume Duration | R/W | The minimum duration time of K-state drive in resume from LPM state. |
| PORTSC1 (offset: 164h) | bit[31:25] | Device Address [7:0] | R/W | The device address of the destination of LPM Token. In using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token. |
| | bit[24:23] | Suspend Status [1:0] | R | The device response to LPM Token. |
| | bit 9 | Suspend using L1 | R/W | In using LPM function, set this bit 1b. |
| | bit 7 | Suspend | R/W | When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = 000h”. |
| PORT_LPM_CTR1 (offset: 320h) | bit[7:4] | NYET_RETRY_CNT_P1[3:0] | R/W | The number of retry for NYET response of device in LPM transaction. |
| | bit 3 | REMOTEWAKE_EN_P1 | R/W | Setting of LPM RemoteWakeup permission. 0b: permitted (default) 1b: not permitted |
| | bit 2 | SLEEP_INT_EN_P1 | R/W | In LPM transaction, setting to generate an interrupt or not when received a response other than ACK. 0b: not to generate an interrupt (default) 1b: to generate an interrupt |
| | bit 1 | RETRY_ENABLE_NYET_P1 | R/W | In LPM transaction, setting to the host behavior when received NYET response from the device. 0b: not to Retry (default) 1b: to Retry |
| | bit 0 | HIRD_SEL_P1 | R/W | Setting the duration time of the K-state drive, in resume of LPM state. |

32.1.2.3 Dual Role Device function

You can switch the role between the host function and the peripheral function via this module register (UCOM).
For details about the UCOM register, see section 32.2.4.5, UCOM Register.

32.1.2.4 Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module.
The detail of the UCOM register, refer to section 32.2.4.5, UCOM Register.

32.1.2.5 Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.

The detail of the register, refer to section 32.2.4.4, (6), Suspend Control Register (offset: 308h).

[Relevant register]

Suspend Control Register (offset: 308h)

[Functional specification]

| Function | Relevant bit |
|---|--------------------------|
| [1] Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register | bit 31 SUSPENDM_ENABLE |
| [2] Function to forcibly assert USBPHY SUSPENDM | bit 0 GLOBAL_SUSPENDM_P1 |

32.1.2.6 Usage Notes

- (1) In the case of disconnection immediately before a frame boundary from a device connected at full speed or low speed, subsequently recognizing the connection to the given device may not be possible.
- (2) When an instruction to suspend the OHCI is executed after disconnection from a device connected at full speed or low speed, subsequently recognizing the connection to the given device may not be possible.

When a device is disconnected or an instruction to suspend the OHCI is executed after device disconnection, follow the procedure described in section 32.11.1, Actions after Device Disconnection.

32.1.3 Support of USB-Related Specifications

o: support
 ×: no support

| USB-Related Specification or Function | | Support | |
|--|---|-------------------------------|---|
| Host function | High Speed | Bulk IN/OUT transfer | ○ |
| | | Control IN/OUT transfer | ○ |
| | | Isochronous IN/OUT transfer | ○ |
| | | Isochronous Highband transfer | ○ |
| | | Interrupt IN/OUT transfer | ○ |
| | Full Speed | Bulk IN/OUT transfer | ○ |
| | | Control IN/OUT transfer | ○ |
| | | Isochronous IN/OUT transfer | ○ |
| | | Interrupt IN/OUT transfer | ○ |
| | Low Speed | Control IN/OUT transfer | ○ |
| | | Interrupt IN/OUTtransfer | ○ |
| | No. of hub connection stages | HS: 5 stages | ○ |
| | | FS: 5 stages | ○ |
| | Support of EHCI V1.1 | Hardware Prefetching | ✕ |
| | | Link Power Management | ○ |
| | | Per-Port Change Events | ○ |
| | | Shorter Periodic Frame List | ○ |
| Battery-charging function (hereafter called the "BC function") | | ○ | |
| Dual role device | * Function to statically switch between the host and peripheral modes | | ○ |

32.1.4 Input/Output Pins

The following table describes the pin alignment.

| Channel | Name | Pin | I/O | Function |
|---------|--|---------------------------------------|--------|--|
| 0 | USB D+ Data | DP0 | I/O | USB built-in transceiver D+ I/O Connect this pin to the USB bus D+ pin. |
| | USB D- Data | DM0 | I/O | USB built-in transceiver D- I/O Connect this pin to the USB bus D- pin. |
| | VBUS Input | VBUSIN0 | Input | USB cable connection monitor pin Before connecting this pin, lower the voltage of VBUS of the USB bus to 3.3 V. This pin can be used to detect connection and disconnection of VBUS. |
| | VBUS Output | VBUSEN0 | Output | VBUS power enable pin |
| | Overcurrent Input | OVRCUR0 | Input | Overcurrent pin |
| | OTG Power IC Control | OTG_EXICEN0 | Output | OTG power IC control pin |
| | OTG Power IC ID | OTG_ID0 | Input | OTG power IC ID pin |
| | CC Input | CC1_Rd0, CC1_Ra0, CC2_Rd0, CC2_Ra0 | Input | CC pin monitor for the Type-C pin Before connecting this pin, detect the status of the resistance value of the CC pin. |
| | Reference Input | RREF0 | Input | Pin for connecting the reference resistance Connect this pin to USBVss via the resistance of $2.2\text{ k}\Omega \pm 1\%$. |
| | Transceiver Section Analog Pin Power | USBAPVcc0 | Input | Power for the pin |
| | Transceiver Section Digital Pin Power | USBDPVcc0 | Input | Power for the pin |
| 1 | USB D+ Data | DP1 | I/O | USB built-in transceiver D+ I/O Connect this pin to the USB bus D+ pin. |
| | USB D- Data | DM1 | I/O | USB built-in transceiver D- I/O Connect this pin to the USB bus D- pin. |
| | VBUS Input | VBUSIN1 | Input | USB cable connection monitor pin Before connecting this pin, lower the voltage of VBUS of the USB bus to 3.3 V. This pin can be used to detect connection and disconnection of VBUS. |
| | VBUS Output | VBUSEN1 | Output | VBUS power enable pin |
| | Overcurrent Input | OVRCUR1 | Input | Overcurrent pin |
| | OTG Power IC Control | OTG_EXICEN1 | Output | OTG power IC control pin |
| | OTG Power IC ID | OTG_ID1 | Input | OTG power IC ID pin |
| | CC Input | CC1_Rd1, CC1_Ra1, CC2_Rd1, CC2_Ra1 | Input | CC pin monitor for the Type-C pin. Before connecting this pin, detect the status of the resistance value of the CC pin. |
| | Reference Input | RREF1 | Input | Pin for connecting the reference resistance. Connect this pin to USBVss via the resistance of $2.2\text{ k}\Omega \pm 1\%$. |
| | Transceiver Section Analog Pin Power | USBAPVcc1 | Input | Power for the pin |
| | Transceiver Section Digital Pin Power | USBDPVcc1 | Input | Power for the pin |
| Common | Quartz Oscillator for USB/External Clock | USB_X1 | Input | Connect this pin to the quartz oscillator for the USB 2.0 host/ function module. USB_X1 pin can be also used for inputting the external clock. |
| | | USB_X2 | Output | |
| | Transceiver Section pin Grand | USBVss | Input | Grand for pins |

32.2 Register Descriptions

32.2.1 Register Attributes

Table 32.1 Register Attributes

| Register Attribute | Description |
|--------------------|---|
| R/W | Register bits can be read and written. |
| R/W(1) | Register bits can be read. A clear bit may be set by writing "1"; writing 0 to R/W(1) bits has no effect. |
| R/W(0) | Register bits can be read. A clear bit may be set by writing "0"; writing 1 to R/W(0) bits has no effect. |
| R | Register bits can only be read. |
| W | Register bits can only be written. |
| Reserved | Reserved bits are Read Only field. |

32.2.2 Base Address

Table 32.2 Base Addresses for Each Channel of the USB Host Module

| Channel | Base Address |
|---------|--------------|
| 0 | E821 8000h |
| 1 | E821 A000h |

32.2.3 Register Overview

| Address Offset | Register Name | Abbreviated Name | Remarks |
|----------------|-----------------------|--------------------|---------------------------|
| 000h | HcRevision | HcRevision | OHCI Operation Registers |
| 004h | HcControl | HcControl | |
| 008h | HcCommandStatus | HcCommandStatus | |
| 00Ch | HcInterruptStatus | HcInterruptStatus | |
| 010h | HcInterruptEnable | HcInterruptEnable | |
| 014h | HcInterruptDisable | HcInterruptDisable | |
| 018h | HcHCCA | HcHCCA | |
| 01Ch | HcPeriodCurrentED | HcPeriodCurrentED | |
| 020h | HcControlHeadED | HcControlHeadED | |
| 024h | HcControlCurrentED | HcControlCurrentED | |
| 028h | HcBulkHeadED | HcBulkHeadED | |
| 02Ch | HcBulkCurrentED | HcBulkCurrentED | |
| 030h | HcDoneHead | HcDoneHead | |
| 034h | HcFmInterval | HcFmInterval | |
| 038h | HcFmRemaining | HcFmRemaining | |
| 03Ch | HcFmNumber | HcFmNumber | |
| 040h | HcPeriodicStart | HcPeriodicStart | |
| 044h | HcLSThreshold | HcLSThreshold | |
| 048h | HcRhDescriptorA | HcRhDescriptorA | |
| 04Ch | HcRhDescriptorB | HcRhDescriptorB | |
| 050h | HcRhStatus | HcRhStatus | |
| 054h | HcRhPortStatus1 | HcRhPortStatus1 | |
| 100h | HCVERSION / CAPLENGTH | CAPL_VERSION | EHCI Capability Registers |
| 104h | HCSPARAMS | HCSPARAMS | |
| 108h | HCCPARAMS | HCCPARAMS | |
| 10Ch | HCSP_PORTROUTE | HCSP_PORTROUTE | |
| 120h | USBCMD | USBCMD | EHCI Operation Registers |
| 124h | USBSTS | USBSTS | |
| 128h | USBINTR | USBINTR | |
| 12Ch | FRINDEX | FRINDEX | |
| 130h | CTRLDSSEGMENT | CTRLDSSEGMENT | |
| 134h | PERIODICLISTBASE | PERIODICLISTBASE | |
| 138h | ASYNCLISTADDR | ASYNCLISTADDR | |
| 160h | CONFIGFLAG | CONFIGFLAG | |
| 164h | PORTSC1 | PORTSC1 | AHB Registers |
| 200h | INT_ENABLE | INT_ENABLE | |
| 204h | INT_STATUS | INT_STATUS | |
| 208h | AHB_BUS_CTR | AHB_BUS_CTR | |
| 20Ch | USBCTR | USBCTR | |

| Address Offset | Register Name | Abbreviated Name | Remarks |
|----------------|---|------------------|--|
| 304h | Register Enable/Clock Gating Control | REGEN_CG_CTRL | Core Defined Registers |
| 308h | Suspend Control | SPD_CTRL | |
| 30Ch | Suspend/Resume Timer Setting | SPD_RSM_TIMSET | |
| 310h | Overcurrent Detection/Sleep Timer Setting | OC_SLP_TIMSET | |

| 844h | PHYCLK CTRL | PHYCLK_CTRL | USBPHY Supply Clock Control Register |
| 848h | PHYIF CTRL | PHYIF_CTRL | Deep Standby Recovery Control Register |

32.2.4 Description of Registers

32.2.4.1 OHCI Operational Register

(1) HcRevision Register (offset: 000h)

Abbreviated name of register: HcRevision

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Address: | 003h | | | | | | | | 002h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 001h | | | | | | | | 000h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Revision | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

Table 32.3 HcRevision Register

| Bit | Symbol | Description |
|---------|----------|---|
| 31 to 8 | | Reserved The write value should always be 0. |
| 7 to 0 | Revision | This field indicates the version of HCI specifications implemented in this host controller module. Because this module conforms to OHCI standard 1.0a, 10h is indicated. |

(2) HcControl Register (offset: 004h)

Abbreviated name of register: HcControl

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|-----|-----|----------|------|-----|-----|-----|-----|------|-----|
| Address: | 007h | | | | | | | | 006h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 005h | | | | | | | | 004h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Symbol: | Reserved | | | | | | | RWC | Reserved | HCFS | BLE | CLE | IE | PLE | CBSR | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.4 HcControl Register

| Bit | Symbol | Description |
|----------|----------------------------------|---|
| 31 to 10 | | Reserved The write value should always be 0. |
| 9 | RWC (Remote Wakeup Connected) | This bit indicates whether the host controller supports remote wakeup signaling. Software should set this bit to 1b in the initialization sequence if it is required to support remote wakeup. Note that this bit can be initialized at hardware reset only. 0b: The remote wakeup is not supported. 1b: The remote wakeup is supported |
| 8 | | Reserved The write value should always be 0. |

Table 32.4 HcControl Register

| Bit | Symbol | Description | | | | | | | | | | |
|------|--|--|------|---|-----|-------|-----|-------|-----|-------|-----|-------|
| 7, 6 | HCFS (Host Controller Functional State) | <p>This field indicates the operating state of the host controller.</p> <p>00b: USB Reset 01b: USB Resume 10b: USB Operational 11b: USB Suspend</p> <p>When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary.</p> <p>This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume.</p> <p>Note that the reset value of this field differs between hardware reset and software reset. Hardware reset: 00b (USB Reset) Software reset: 11b (USB Suspend)</p> | | | | | | | | | | |
| 5 | BLE (BulkList Enable) | <p>This bit sets whether the bulk list processing is performed for the next frame.</p> <p>The setting value of this bit is enabled from the next frame.</p> <p>When you correct the bulk list, this bit must be 0b.</p> <p>0b: The processing of the Bulk list is disabled. 1b: The processing of the Bulk list is enabled</p> | | | | | | | | | | |
| 4 | CLE (ControlList Enable) | <p>This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame.</p> <p>When you correct the control list, this bit must be 0b.</p> <p>0b: The processing of the Control list is disabled. 1b: The processing of the Control list is enabled.</p> | | | | | | | | | | |
| 3 | IE (Isochronous Enable) | <p>This bit sets whether the isochronous ED processing is performed.</p> <p>The setting value of this bit is enabled from the next frame.</p> <p>If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing.</p> <p>1b: The processing of the isochronous ED is continued. 0b: The periodic list processing is stopped, and the bulk/control list processing is started.</p> <p>0b: The processing of the isochronous ED is disabled. 1b: The processing of the isochronous ED is enabled.</p> | | | | | | | | | | |
| 2 | PLE (Periodic List Enable) | <p>This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame.</p> <p>The host controller module checks this bit before starting the periodic list processing.</p> <p>0b: The processing of the periodic list is disabled. 1b: The processing of the periodic list is enabled.</p> | | | | | | | | | | |
| 1, 0 | CBSR (Control Bulk Service Ratio) | <p>This field defines the service ratio of the control transfer and bulk transfer.</p> <p>When the periodic list is processed, the service ratio defined in this field is used for transfer.</p> <table><tr><th>CBSR</th><th>No. of Control EDs Over Bulk EDs Served</th></tr><tr><td>00b</td><td>1 : 1</td></tr><tr><td>01b</td><td>2 : 1</td></tr><tr><td>10b</td><td>3 : 1</td></tr><tr><td>11b</td><td>4 : 1</td></tr></table> | CBSR | No. of Control EDs Over Bulk EDs Served | 00b | 1 : 1 | 01b | 2 : 1 | 10b | 3 : 1 | 11b | 4 : 1 |
| CBSR | No. of Control EDs Over Bulk EDs Served | | | | | | | | | | | |
| 00b | 1 : 1 | | | | | | | | | | | |
| 01b | 2 : 1 | | | | | | | | | | | |
| 10b | 3 : 1 | | | | | | | | | | | |
| 11b | 4 : 1 | | | | | | | | | | | |

(3) HcCommandStatus Register (offset: 008h)

Abbreviated name of register: HcCommandStatus

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|----|----|----|----|-----|-----|----|
| Address: | 00Bh | | | | | | | | 00Ah | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 009h | | | | | | | | 008h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | W |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.5 HcCommandStatus Register

| Bit | Symbol | Description |
|----------|---|---|
| 31 to 18 | | Reserved The write value should always be 0. |
| 17, 16 | SOC (Scheduling Overrun Count) | This field counts the number of scheduling overrun. This field is initialized to 00b, and is counted up every time scheduling overrun is detected. After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected. |
| 15 to 3 | | Reserved The write value should always be 0. |
| 2 | BLF (BulkList Filled) | This bit indicates whether TD exists in the bulk list. To add TD to ED in the bulk list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b. When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the bulk list. 1b: TD exists in the bulk list. |
| 1 | CLF (Controllist Filled) | This bit indicates whether TD exists in the control list. To add TD to ED in the control list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the control list. If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b. When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the control list. 1b: TD exists in the control list. |
| 0 | HCR (Host Controller Reset) | This bit is used to start OHCI software reset for the host controller. When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized. When the software reset finishes, the host controller clears this bit to 0b. |

(4) HcInterruptStatus Register (offset: 00Ch)

Abbreviated name of register: HcInterruptStatus

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|------|-----|-----|-----|-----|-----|-----|
| Address: | 00Fh | | | | | | | | 00Eh | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 00Dh | | | | | | | | 00Ch | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Symbol: | Reserved | | | | | | | | Reserved | RHSC | FNO | UE | RD | SF | WDH | SO |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.6 HcInterruptStatus Register

| Bit | Symbol | Description |
|---------|----------------------------------|--|
| 31 to 7 | | Reserved The write value should always be 0. |
| 6 | RHSC (Root Hub Status Change) | Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed. When the Root Hub status is changed, the host controller sets this bit to 1b. Writing 1b to this bit clears the interrupt. 0b: The status of root hub has not changed. 1b: The status of root hub has changed. |
| 5 | FNO (Frame Number Overflow) | Interrupt bit that indicates that the MSB in the FrameNumber (FN) field of theHcFmNumber register has changed. When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated. Writing this bit to 1b clears the interrupt. 0b: The overflow of frame number has not occurred. 1b: The overflow of frame number has occurred. |
| 4 | UE (Unrecoverable Error) | Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected. Writing this bit to 1b clears the interrupt. 0b: The unrecoverable error has not occurred. 1b: The unrecoverable error has occurred. |
| 3 | RD (Resume Detected) | Interrupt bit that indicates that Resume has been detected. When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b. This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume. Writing this bit to 1b clears the interrupt. 0b: The host controller has not detected resume signaling (RemoteWakeup). 1b: The host controller has detected resume signaling (RemoteWakeup). |
| 2 | SF (Start of Frame) | Interrupt bit that indicates that Hcca Frame Number was updated when each frame started. The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b. Writing this bit to 1b clears the interrupt. 0b: The host controller has not started new frame. 1b: The host controller has started new frame. |
| 1 | WDH (Writeback DoneHead) | Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccaDoneHead. The host controller sets this bit to 1b immediately after it updates HccaDoneHead. Note that HccaDoneHead is not updated until this bit is cleared. Writing this bit to 1b clears the interrupt. This bit must be cleared only after the contents of HccaDoneHead are saved. 0b: The write back to HccaDoneHead has not occurred. 1b: The write back to HccaDoneHead has occurred. |

Table 32.6 HcInterruptStatus Register

| Bit | Symbol | Description |
|-----|-------------------------------|--|
| 0 | SO (Scheduling Overrun) | <p>Interrupt bit that indicates that overrun of the USB schedule occurred.</p> <p>When USB scheduling overrun occurs, the host controller updates HccaFrameNumberI, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented.</p> <p>Writing this bit to 1b clears the interrupt.</p> <p>0b: The scheduling overrun has not occurred.</p> <p>1b: The scheduling overrun has occurred.</p> |

(5) HcInterruptEnable Register (offset: 010h)

Abbreviated name of register: HcInterruptEnable

| | | | | | | | | | | | | | | | | |

Table 32.7 HcInterruptEnable Register

| Bit | Symbol | Description |
|---------|-------------------------------------|---|
| 31 | MIE (Master Interrupt Enable) | This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled. If this bit is set to 0b, all OHCI interrupts are masked. To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b. 0b: All interrupts are disabled. 1b: Interrupts that are set to 1b are enabled. |
| 30 | OCE | OC (Ownership Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange). To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b. 0b: OC (OwnershipChange) interrupt is disabled. 1b: OC (OwnershipChange) interrupt is enabled. |
| 29 to 7 | | Reserved The write value should always be 0. |
| 6 | RHSCE | RHSC (RootHub Status Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RHSC (RootHub Status Change). To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b. 0b: RHSC (RootHub Status Change) interrupt is disabled. 1b: RHSC (RootHub Status Change) interrupt is enabled. |
| 5 | FNOE | FNO (Frame Number Overflow) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow). To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b. 0b: FNO (Frame Number Overflow) interrupt is disabled. 1b: FNO (Frame Number Overflow) interrupt is enabled. |
| 4 | UEE | UE (Unrecoverable Error) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error). To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b. 0b: UE (Unrecoverable Error) interrupt is disabled. 1b: UE (Unrecoverable Error) interrupt is enabled. |
| 3 | RDE | RD (Resume Detect) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RD (Resume Detect). To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b. 0b: RD (Resume Detect) interrupt is disabled. 1b: RD (Resume Detect) interrupt is enabled. |
| 2 | SFE | SF (Start of Frame) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SF (Start of Frame). To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b. 0b: SF (Start of Frame) interrupt is disabled. 1b: SF (Start of Frame) interrupt is enabled. |
| 1 | WDHE | WDH (Writeback DoneHead) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead). To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b. 0b: WDH (Writeback DoneHead) interrupt is disabled. 1b: WDH (Writeback DoneHead) interrupt is enabled. |

Table 32.7 HcInterruptEnable Register

| Bit | Symbol | Description |
|-----|--------|---|
| 0 | SOE | SO (Scheduling Overrun) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun). To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b. 0b: SO (Scheduling Overrun) interrupt is disabled. 1b: SO (Scheduling Overrun) interrupt is enabled. |

(6) HcInterruptDisable Register (offset: 014h)

Abbreviated name of register: HcInterruptDisable

| | | | | | | | | | | | | | | | | |
|--------------|----------|--------|----------|----|----|----|----|----|----------|--------|--------|--------|--------|--------|--------|--------|
| Address: | 017h | | | | | | | | 016h | | | | | | | |

Table 32.8 HcInterruptDisable Register

| Bit | Symbol | Description |
|---------|--------------------------------|---|
| 31 | MID (Master Interrupt Disable) | This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled. If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked. Writing 0b to this bit is ignored. |
| 30 | OCD | OC (Ownership Change) Interrupt Disable bit. If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 29 to 7 | | Reserved The write value should always be 0. |
| 6 | RHSCD | RHSC (RootHub Status Change) Interrupt Disable bit. If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (RootHub Status Change) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 5 | FNOD | FNO (Frame Number Overflow) Interrupt Disable bit. If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 4 | UED | UE (Unrecoverable Error) Interrupt Disable bit. If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 3 | RDD | RD (Resume Detected) Interrupt Disable bit. If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 2 | SFD | SF (Start of Frame) Interrupt Disable bit. If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 1 | WDHD | WDH (Writeback DoneHead) Interrupt Disable bit. If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded from the interrupt source. Writing 0b to this bit is ignored. |
| 0 | SOD | SO (Scheduling Overrun) Interrupt Disable bit. If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source. Writing 0b to this bit is ignored. |

(7) HcHCCA Register (offset: 018h)

Abbreviated name of register: HcHCCA

| | | | | | | | | | | | | | | | | |
|--------------|---------------|-----|-----|-----|-----|-----|-----|-----|---------------|-----|-----|-----|-----|-----|-----|-----|
| Address: | 01Bh | | | | | | | | 01Ah | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Symbol: | HcHCCA[31:24] | | | | | | | | HcHCCA[23:16] | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 019h | | | | | | | | 018h | | | | | | | |

| Symbol: | HcHCCA[15:8] | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.9 HcHCCA Register

| Bit | Symbol | Description |
|---------|----------|--|
| 31 to 8 | HcHCCA | This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area. This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field. |
| 7 to 0 | Reserved | The write value should always be 0. |

(8) HcPeriodicCurrentED Register (offset: 01Ch)

Abbreviated name of register: HcPeriodCurrentED

| | | | | | | | | | | | | | | | | |
|--------------|-------------|----|----|----|----|----|----|----|-------------|----|----|----|----------|----|----|----|
| Address: | 01Fh | | | | | | | | 01Eh | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Symbol: | CHED[15:8] | | | | | | | | CHED[7:4] | | | | Reserved | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.11 HcControlHeadED Register

| Bit | Symbol | Description |
|---------|---------------------------|---|
| 31 to 4 | CHED (Control Head ED) | This field specifies the physical address of the head ED of the control list. These bits must be set for control transfer before the CLE bit of the HcControl register is set. The host controller starts processing of the control list from the HcBulkHeadED pointer. |
| 3 to 0 | | Reserved The write value should always be 0. |

(10) HcControlCurrentED Register (offset: 024h)

Abbreviated name of register: HcControlCurrentED

| | | | | | | | | | | | | | | | | |
|--------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|----------|-----|-----|-----|
| Address: | 027h | | | | | | | | 026h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.12 HcControlCurrentED Register

| Bit | Symbol | Description |
|---------|------------------------------|--|
| 31 to 4 | CCED (Control Current ED) | This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to 0h to indicate the end of the control list. |
| 3 to 0 | | Reserved The write value should always be 0. |

(11) HcBulkHeadED Register (offset: 028h)

Abbreviated name of register: HcBulkHeadED

| | | | | | | | | | | | | | | | | |
|--------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|----------|-----|-----|-----|

Table 32.16 HcFmInterval Register

| Bit | Symbol | Description |
|----------|-----------------------------------|--|
| 31 | FIT (Frame Interval Toggle) | This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register. By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register. |
| 30 to 16 | FSMPS (FS Largest Data Packet) | This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun. The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred. This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field. Note: The maximum setting value for this field is 2778h. Do not set any value that is larger than 2778h. |
| 15, 14 | | Reserved The write value should always be 0. |
| 13 to 0 | FI (Frame Interval) | This field is used to set the length of the frame (bit time) used for Full Speed. Set the value of this field to "2EDFh" so that 1 frame (= 1 ms) of USB standard is satisfied. |

(15) HcFmRemaining Register (offset: 038h)

Register abbreviation: HcFmRemaining

| | | | | | | | | | | | | | | | | |
|--------------|-------------------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Address: | 041h | | | | | | | | 040h | | | | | | | |

Table 32.17 HcFmRemaining Register

| Bit | Symbol | Description |
|----------|---------------------------------|--|
| 31 | FRT (Frame Remaining Toggle) | This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to 0000h, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field. |
| 30 to 14 | | Reserved The write value should always be 0. |
| 13 to 0 | FR (Frame Remaining) | This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes 0000h, the value of FI (Frame Interval) of the HcFmInterval register is loaded. When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF. |

(16) HcFmNumber Register (offset: 03Ch)

Register abbreviation: HcFmNumber

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Address: | 03Fh | | | | | | | | 03Eh | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |

| Address: | 03Dh | | | | | | | | 03Ch | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | FN[15:8] | | | | | | | | FN[7:0] | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.18 HcFmNumber Register

| Bit | Symbol | Description |
|----------|----------------------|--|
| 31 to 16 | | Reserved The write value should always be 0. |
| 15 to 0 | FN (Frame Number) | This field indicates the number of passed frames. When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to FFFFh, the value is rolled over to 0000h. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame. After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register. |

(17) HcPeriodicStart Register (offset: 040h)

Register abbreviation: HcPeriodicStart

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----------|-----|-----|-----|-----|-----|----------|-----|-----|-----|-----|-----|-----|-----|
| Address: | 043h | | | | | | | | 042h | | | | | | | |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.19 HcPeriodicStart Register

| Bit | Symbol | Description |
|----------|------------------------|--|
| 31 to 14 | | Reserved The write value should always be 0. |
| 13 to 0 | PS (Periodic Start) | This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register. The recommended value is 2A2Fh. When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing. Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing. |

(18) HcLSThreshold Register (offset: 044h)

Register abbreviation: HcLSThreshold

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|-----------|-----|-----|-----|----------|-----|-----|-----|-----|-----|-----|-----|
| Address: | 047h | | | | | | | | 046h | | | | | | | |

| Reset value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

Table 32.21 HcRhDescriptorA Register

| Bit | Symbol | Description |
|----------|--|--|
| 31 to 24 | POTPGT (PowerOn To PowerGood Time) | This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port. The unit of time is 2 ms. Therefore, the wait time is POTPGT × 2 ms. |
| 23 to 13 | | Reserved The write value should always be 0. |
| 12 | NOCP (No OverCurrent Protection) | This bit sets whether the overcurrent function of the root hub is supported. If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit. 0b: The overcurrent state is supported. 1b: The overcurrent state is not supported. If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see section 32.9.1, Host/Peripheral Common Setting Sequence. |
| 11 | OCPM (OverCurrent Protection Mode) | This bit sets how to report the overcurrent state of the root hub. If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit. This bit is valid only when the NOCP (NoOverCurrent Protection) bit is cleared (0b). 0b: The overcurrent state is collectively reported for all ports. 1b: The overcurrent state is reported for each port. |
| 10 | DT (Device Type) | This bit indicates that the root hub is not a composite device. This bit is always 0b because the root hub is not allowed to be a composite device. |
| 9 | NPS (No Power Switching) | This bit sets how to control the port power. If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port. 0b: The port power can be switched between on and off. 1b: The power is always on while the host controller is running. |
| 8 | PSM (Power Switching Mode) | This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b. 0b: The power of all ports is collectively controlled. 1b: The power of ports is controlled for each port. If the PPCM (PortPower Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command. |
| 7 to 0 | NDP (Number Down stream Ports) | This field indicates the number of downstream ports supported by the root hub. |

(20) HcRhDescriptorB Register (offset: 04Ch)

Register abbreviation: HcRhDescriptorB

Table 32.22 HcRhDescriptorB Register

| Bit | Symbol | Description |
|----------|----------------------------------|--|
| 31 to 18 | | Reserved The write value should always be 0. |
| 17 | PPCM (PortPower Control Mask) | This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set. If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control. If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control. If the PSM bit is 0b, this bit is ignored. |
| 16 to 2 | | Reserved The write value should always be 0. |
| 1 | DR (Device Removable) | This bit indicates whether each port of the root hub is removable. If this bit is 0b, the connected device is removable. If this bit is 1b, the connected device is not removable. |
| 0 | | Reserved The write value should always be 0. |

(21) HcRhStatus Register (offset: 050h)

Table 32.24 HcRhPortStatus1 Register

| Bit | Symbol | Description |
|----------|---|--|
| 31 to 21 | | Reserved The write value should always be 0. |
| 20 | PRSC (Port Reset Status Change) | This bit indicates that port reset (bus reset) has finished. This bit is set when the host controller sets this bit when 10 ms port reset (bus reset) finishes. 0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed. 1b: Port reset has finished. |
| 19 | OCIC (Port OverCurrent Indicator Change) | This bit is set when the overcurrent state of the port is detected. This bit is set when the host controller changed the POCI bit value. This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b). If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The overcurrent state has not changed. 1b: The overcurrent state has changed (POCI bit changed). |
| 18 | PSSC (Port Suspend Status Change) | This bit indicates that the Resume sequence finished. This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If the PRSC (Port Reset Status Change) bit is set, this bit is cleared. 0b: The Resume sequence has not finished. 1b: The Resume sequence has finished. |
| 17 | PESC (Port Enable Status Change) | This bit indicates that the PES (Port Enable Status) bit was changed. If a hardware event clears the PES bit, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The PES (Port Enable Status) bit has not changed. 1b: The PES (Port Enable Status) bit has changed. |
| 16 | CSC (Connect Status Change) | This bit indicates that the CCS (Current Connect Status) bit was changed. If the Connect/Disconnect event occurs, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation. 0b: The CCS (Current Connect Status) bit has not changed. 1b: The CCS (Current Connect Status) bit has changed. |
| 15 to 10 | | Reserved The write value should always be 0. |

Table 32.24 HcRhPortStatus1 Register

| Bit | Symbol | Description |
|--------|--------|---|
| 9 | LSDA | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Low Speed Device Attached This bit indicates the speed of the device connected to the port. This bit is valid only when the CCS (Current Connect Status) bit is set. 0b: Full Speed device is connected. 1b: Low Speed device is connected.</p> <p>[Write] Clear Port Power This bit is used to turn off the power of the port when the port is power controlled. Writing 1b to this bit turns off the port power. Writing 0b to this bit has no effect.</p> |
| 8 | PPS | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Port Power Status This bit indicates the power status of the port. This bit is cleared when the overcurrent is detected. 0b: Port power is off. 1b: Port power is on.</p> <p>[Write] Set Port Power This bit is used to turn on the power of the port when the port is power controlled. Writing 1b to this bit turns on the port power. Writing 0b has no effect.</p> |
| 7 to 5 | | Reserved The write value should always be 0. |
| 4 | PRS | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Port Reset Status This bit indicates the port reset (bus reset) status. When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set. 0b: Not during port reset 1b: During port reset</p> <p>[Write] Set Port Reset This bit is used to issue a port reset (bus reset) to the downstream port. Writing 1b to this bit starts 10 ms of port reset. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to ports to which no device is connected, that port reset was performed.</p> |
| 3 | POCI | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Port OverCurrent Indicator This bit indicates that the downstream port is in the overcurrent status. This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b). On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b. 0b: The port is in normal status. 1b: The port is in overcurrent status.</p> <p>[Write] Clear Suspend Status This bit is used to finish the Suspend status and start the Resume sequence. Writing 1b to this bit starts the Resume sequence. Writing 0b has no effect. The Resume sequence starts only when PSS (Port Suspend Status) is set.</p> |

Table 32.24 HcRhPortStatus1 Register

| Bit | Symbol | Description |
|-----|--------|--|
| 2 | PSS | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Port Suspend Status</p> <p>This bit indicates that the port status is in Suspend or Resume sequence.</p> <p>0b: The port is not in Suspend status.</p> <p>1b: The port is in Suspend status.</p> <p>When the CCS bit is cleared (when no device is connected), this bit cannot be set.</p> <p>This bit is cleared under the following conditions:</p> <ul style="list-style-type: none"> - When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set - When the port reset finished, and the PRSC (Port Reset Status Change) bit is set - When the host controller is in the USB Resume state <p>[Write] Set Port Suspend</p> <p>This bit is used to change the port status to Suspend.</p> <p>Writing 1b to this bit changes the status to Suspend.</p> <p>Writing 0b to this bit has no effect.</p> <p>If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b.</p> <p>This is performed to report to the ports to which no device is connected that the Suspend command was issued.</p> |
| 1 | PES | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Port Enable Status</p> <p>This bit indicates whether the port status is Enable or Disable.</p> <p>If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (PortEnableStatusChange) bit is set.</p> <p>When the CCS bit is cleared (when no device is connected), this bit cannot be set.</p> <p>This bit is set "when port reset finished and the PRSC bit is set" or "when the port status becomes Suspend and the PRSC bit is set".</p> <p>0b: The port status is Disable.</p> <p>1b: The port status is Enable.</p> <p>[Write] Set Port Enable</p> <p>This bit is used to set the PES bit.</p> <p>Writing 1b to this bit changes the port status to Enable.</p> <p>Writing 0b to this bit has no effect.</p> <p>If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b.</p> <p>This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable.</p> |
| 0 | CCS | <p>The meaning of this bit differs depending on whether the operation is read or write.</p> <p>[Read] Current Connect Status</p> <p>The current connection status of the downstream port is applied to this bit.</p> <p>0b: No device is connected.</p> <p>1b: A device is connected.</p> <p>[Write] Clear Port Enable</p> <p>This bit is used to clear the PES (Port Enable Status) bit.</p> <p>Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect.</p> |

32.2.4.2 EHCI Controller Capability Register

(1) HCIVERSION/CAPLENGTH Register (offset: 102h/100h)

Register abbreviation: CAPL_VERSION

| | | | | | | | | | | | | | | | | |
|--------------|--------------------------------|----|----|----|----|----|----|----|----------------------------------|----|----|----|----|----|----|----|
| Address: | 103h | | | | | | | | 102h | | | | | | | |

Table 32.25 CAPL_VERSION Register

| Bit | Symbol | Description |
|----------|-----------------------------|--|
| 31 to 16 | Interface Version Number | This field indicates the EHCI version supported by the host controller. 0110h is indicated because this host controller supports EHCI Rev1.1. |
| 15 to 8 | | Reserved The write value should always be 0. |
| 7 to 0 | Capability Registers Length | This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register. 20h is indicated because the EHCI Operation register of this module starts from 20h. |

(2) HCSPARAMS Register (offset: 104h)

Register abbreviation: HCSPARAMS

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|-------|----|----|----|-------------------------|----------|----|-----|--------------|----|----|-------------|
| Address: | 107h | | | | | | | | 106h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 32.26 HCSPARAMS Register

| Bit | Symbol | Description |
|----------|---|---|
| 31 to 24 | | Reserved The write value should always be 0. |
| 23 to 20 | Debug Port Number | This field indicates that the host controller port is a debug port. 0000b is indicated because this module does not have a debug port. |
| 19 to 17 | | Reserved The write value should always be 0. |
| 16 | P_INDICATOR (Port Indicators) | This bit indicates whether the host controller supports port indicator control. 0b is indicated because this module does not support port indicator control. |
| 15 to 12 | N_CC (Number of Companion Controller) | This field indicates the number of OHCI host controllers implemented in this module. 1h is indicated because this module has one OHCI host controller. |
| 11 to 8 | N_PCC (Number of Ports per Companion Controller) | This field indicates the number of ports supported by an OHCI host controller. The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field. |
| 7 | Port Routing Rules | This bit indicates how individual ports are mapped to the OHCI host controller. This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method. |
| 6, 5 | | Reserved The write value should always be 0. |
| 4 | PPC (Port Power Control) | This bit indicates how the port power of this module is controlled. 0b: The port power is always on. 1b: The PP bit of the PORTSC register controls the port power. |
| 3 to 0 | N_PORTS | This field indicates the number of physical downstream ports used by this module. 0001b: 1 Port |

(3) HCCPARAMS Register (offset: 108h)

Register abbreviation: HCCPARAMS

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------------------------------|----|----|----|-----------------------------------|---------------------------------------|----------------------------------|------------------------------|
| Address: | 10Bh | | | | | | | | 10Ah | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | 32-Frame Periodic List Capability | Per-Port Change Event Capability | Link Power Management Capability | Hardware Prefetch Capability |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 |
| Address: | 109h | | | | | | | | 108h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | EECP | | | | | | | | Isochronous Scheduling Threshold | | | | Reserved | Asynchronous Schedule Park Capability | Programmable Frame List Flag | 64-bit Addressing Capability |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |

Table 32.27 HCCPARAMS Register

| Bit | Symbol | Description |
|----------|---------------------------------------|---|
| 31 to 20 | | Reserved The write value should always be 0. |
| 19 | 32-Frame Periodic List Capability | This bit indicates 1b because this module supports 32 Frame Periodic List defined in EHCI V1.1. This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32 Frame Periodic List. |
| 18 | Per-Port Change Event Capability | This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1. This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register. If this bit is 0b, the corresponding fields of the above registers are treated as Reserved |
| 17 | Link Power Management Capability | This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1. This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register. If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved. |
| 16 | Hardware Prefetch Capability | This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1. |
| 15 to 8 | EECP | This field indicates the offset address of the EHCI Extend Capabilities Registers. This field indicates 00h because this module does not use EHCI Extend Capabilities Registers. |
| 7 to 4 | Isochronous Scheduling Threshold | This field indicates 0h because this module does not support caches with isochronous data structure for the entire frame. |
| 3 | | Reserved The write value should always be 0. |
| 2 | Asynchronous Schedule Park Capability | This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule. This bit indicates 1b because this module supports the above function. |
| 1 | Programmable Frame List Flag | This bit indicates the setting for the available frame list size. This bit indicates 1b for this module. If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable. |
| 0 | 64-bit addressing Capability | This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer). This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported. |

(4) HCSP-PORTROUTE Register (offset: 10Ch)

Register abbreviation: HCSP_PORTROUTE

| | | | | | | | | | | | | | | | | |

Table 32.29 USBCMD Register

| Bit | Symbol | Description | | | | | | | | | | | | | | | | | | |
|----------|--|---|-------|----------------------------|-----|----------|-----|---------------|-----|----------------|-----|----------------|-----|--|-----|------------------------|-----|------------------------|-----|------------------------|
| 31 to 28 | | Reserved The write value should always be 0. | | | | | | | | | | | | | | | | | | |
| 27 to 24 | Host-Initiated Resume Duration | <p>This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state.</p> <p>The value in this field is sent to the connected device that has the LPM function via the HIRD field in the bmAttributes field of the LPM token.</p> <p>The encoded value of this field is defined as the name of the HIRD field in the LPM Token. Specifically, 0h means 50 μs, and if the value is incremented by 1, 75 μs is incremented. For example, 1h means 125 μs, and 4h means 1175 μs.</p> | | | | | | | | | | | | | | | | | | |
| 23 to 16 | Interrupt Threshold Control | <p>This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed.</p> <table><tr><th>Value</th><th>Maximum Interrupt Interval</th></tr><tr><td>00h</td><td>Reserved</td></tr><tr><td>01h</td><td>1 micro-frame</td></tr><tr><td>02h</td><td>2 micro-frames</td></tr><tr><td>04h</td><td>4 micro-frames</td></tr><tr><td>08h</td><td>8 micro-frames (default, equals to 1 ms)</td></tr><tr><td>10h</td><td>16 micro-frames (2 ms)</td></tr><tr><td>20h</td><td>32 micro-frames (4 ms)</td></tr><tr><td>40h</td><td>64 micro-frames (8 ms)</td></tr></table> <p>Do not set 00h to this field while the Halted bit is 0b.</p> | Value | Maximum Interrupt Interval | 00h | Reserved | 01h | 1 micro-frame | 02h | 2 micro-frames | 04h | 4 micro-frames | 08h | 8 micro-frames (default, equals to 1 ms) | 10h | 16 micro-frames (2 ms) | 20h | 32 micro-frames (4 ms) | 40h | 64 micro-frames (8 ms) |
| Value | Maximum Interrupt Interval | | | | | | | | | | | | | | | | | | | |
| 00h | Reserved | | | | | | | | | | | | | | | | | | | |
| 01h | 1 micro-frame | | | | | | | | | | | | | | | | | | | |
| 02h | 2 micro-frames | | | | | | | | | | | | | | | | | | | |
| 04h | 4 micro-frames | | | | | | | | | | | | | | | | | | | |
| 08h | 8 micro-frames (default, equals to 1 ms) | | | | | | | | | | | | | | | | | | | |
| 10h | 16 micro-frames (2 ms) | | | | | | | | | | | | | | | | | | | |
| 20h | 32 micro-frames (4 ms) | | | | | | | | | | | | | | | | | | | |
| 40h | 64 micro-frames (8 ms) | | | | | | | | | | | | | | | | | | | |
| 15 | Per-Port Change Events Enable | <p>This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register.</p> <p>0b: The event report function of the ports is disabled.</p> <p>1b: The event report function of the ports is enabled.</p> | | | | | | | | | | | | | | | | | | |
| 14 to 12 | | Reserved The write value should always be 0. | | | | | | | | | | | | | | | | | | |
| 11 | Asynchronous Schedule Park Mode Enable | <p>This bit enables or disables the Asynchronous Schedule Park mode.</p> <p>0b: The Park mode is disabled.</p> <p>1b: The Park mode is enabled.</p> | | | | | | | | | | | | | | | | | | |
| 10 | | Reserved The write value should always be 0. | | | | | | | | | | | | | | | | | | |

Table 32.29 USBCMD Register

| Bit | Symbol | Description | | | | | | | | | | |
|-------|---------------------------------------|--|-------|------------------------------------|-----|-----------------------|-----|------------|-----|------------|-----|-----------|
| 9, 8 | Asynchronous Schedule Park Mode Count | This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule. The valid value range is 1h to 3h. This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b. Do not set 0h to this field. | | | | | | | | | | |
| 7 | | Reserved The write value should always be 0. | | | | | | | | | | |
| 6 | Interrupt on Async Advance Doorbell | This bit is used as the doorbell. In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b. After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing. If the asynchronous schedule is disabled, do not write 1b to this bit. | | | | | | | | | | |
| 5 | Asynchronous Schedule Enable | This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing. 0b: The asynchronous list processing is skipped. 1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing. | | | | | | | | | | |
| 4 | Periodic Schedule Enable | This bit sets whether the host controller proceeds or skips the periodic list processing. 0b: The periodic list processing is skipped. 1b: Use the PERIODICLISTBASE register to proceed the periodic list processing. | | | | | | | | | | |
| 3, 2 | Frame List Size | This field specifies the frame list size. The setting value of this field determines the size of the Frame List Current index of the FRINDEX register. <table><tr><th>Value</th><th>the number of frames in Frame List</th></tr><tr><td>00b</td><td>1024 frames (default)</td></tr><tr><td>01b</td><td>512 frames</td></tr><tr><td>10b</td><td>256 frames</td></tr><tr><td>11b</td><td>32 frames</td></tr></table> | Value | the number of frames in Frame List | 00b | 1024 frames (default) | 01b | 512 frames | 10b | 256 frames | 11b | 32 frames |
| Value | the number of frames in Frame List | | | | | | | | | | | |
| 00b | 1024 frames (default) | | | | | | | | | | | |
| 01b | 512 frames | | | | | | | | | | | |
| 10b | 256 frames | | | | | | | | | | | |
| 11b | 32 frames | | | | | | | | | | | |
| 1 | HCRESET (Host Controller Reset) | This bit is used to initialize the EHCI circuit of the host controller. If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports. Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI. Software must be reset to return the host controller to the operational state. When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit. | | | | | | | | | | |
| 0 | RS (Run/Stop) | This bit is used to run or stop the EHCI host controller. If this bit is set to 1b, the host controller starts operation. As long as this bit is set to 1b, the host controller continues running. If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status. If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit. | | | | | | | | | | |

(2) USBSTS Register (offset: 124h)

Register abbreviation: USBSTS

Table 32.30 USBSTS Register

| Bit | Symbol | Description |
|----------|------------------------------|---|
| 31 to 17 | | Reserved The write value should always be 0. |
| 16 | Port-1Change Detect | If this bit is set to 1b, it indicates that a change in the port status was detected. This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b. |
| 15 | Asynchronous Schedule Status | This bit indicates the current status of the asynchronous schedule. 0b: The asynchronous schedule is disabled. 1b: The asynchronous schedule is enabled. If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b). |
| 14 | Periodic Schedule Status | This bit indicates the current status of the periodic schedule. 0b: The periodic schedule is disabled. 1b: The periodic schedule is enabled. If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b). |
| 13 | Reclamation | This bit is used to detect an empty asynchronous schedule. If this bit is 1b, the asynchronous schedule is empty. After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b. Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b. If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode. |
| 12 | HCHalted | If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b. If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit. 0b: The EHCI host controller is running. 1b: The EHCI host controller is stopped. |
| 11 to 6 | | Reserved The write value should always be 0. |
| 5 | Interrupt on Async Advance | This bit indicates the Async Advance Interrupt status. After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINT register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit. If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect. 0b: Async Advance Interrupt not occurred. 1b: Async Advance Interrupt status is detected. |

Table 32.30 USBSTS Register

| Bit | Symbol | Description |
|-----|------------------------------------|---|
| 4 | Host System Error | <p>This bit is set to 1b if a serious error occurs in the host controller.</p> <p>If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> <p>0b: No system error occurred.</p> <p>1b: A system error occurred.</p> |
| 3 | Frame List Rollover | <p>If a frame list rollover occurs, the host controller sets this bit to 1b.</p> <p>Specifically, when the Frame Index field of the FRINDEX register is returned to 000h from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register. For example, if the Frame List Size is 1024 frame, rollover occurs every time FRINDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles. If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> <p>0b: The frame list is not returned to 000h.</p> <p>1b: The frame list is returned to 000h (rollover occurred).</p> |
| 2 | Port Change Detect | <p>This bit indicates that the port status has changed.</p> <p>Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b:</p> <ul style="list-style-type: none"> - Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0 to 1. - A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0 to 1. - The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0 to 1. - J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0 to 1. <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> |
| 1 | USBERRINT (USB Error Interrupt) | <p>This bit indicates that a USB transaction finished with an error.</p> <p>When a USB transaction finishes with an error, the host controller sets this bit to 1b.</p> <p>If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> <p>0b: USB transaction is normal.</p> <p>1b: USB transaction finished with an error.</p> |
| 0 | USBINT (USB Interrupt) | <p>This bit indicates that a USB transfer has finished.</p> <p>The host controller sets this bit to 1b if one of the following conditions is satisfied:</p> <ul style="list-style-type: none"> - A USB transfer has finished. - A short packet is received. <p>Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> <p>0b: A USB transfer has not finished.</p> <p>1b: A USB transfer has finished.</p> |

(3) USBINTR Register (offset: 128h)

Register abbreviation: USBINTR

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.31 USBINTR Register

| Bit | Symbol | Description |
|----------|-----------------------------------|--|
| 31 to 17 | | Reserved The write value should always be 0. |
| 16 | Port-1 Change EventEnable | If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt. |
| 15 to 6 | | Reserved The write value should always be 0. |
| 5 | Interrupt on Async Advance Enable | This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled. If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the IAA bit). |
| 4 | Host System Error Enable | This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the HSE bit). |
| 3 | Frame List Rollover Enable | This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled. If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the FLR bit). |
| 2 | Port Change Detect Enable | This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the PCD bit). |
| 1 | USB Error Interrupt Enable | This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBERRINT bit). |
| 0 | USB Interrupt Enable | This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled. If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBINT bit). |

Table 32.34 PERIODICLISTBASE Register

| Bit | Symbol | Description |
|----------|--------------|---|
| 31 to 12 | Base Address | This field indicates the head address of the periodic frame list on the system memory. The host controller loads the contents of this register before starting the list processing. The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register. Align the address of the periodic frame list by 4 Kbyte. Normal operation is not guaranteed if any of these bits are changed during operation. |
| 11 to 0 | | Reserved The write value should always be 0. |

(7) ASYNCLISTADDR Register (offset: 138h)

Register abbreviation: ASYNCLISTADDR

| | | | | | | | | | | | | | | | | |
|--------------|------------|-----|-----|-----|-----|-----|-----|-----|------------|-----|-----|----------|-----|-----|-----|-----|

| 15, 14 | Reserved | The write value should always be 0. | | | | | | | | | | | | | | | | |

Table 32.37 PORTSC1 Register

| Bit | Symbol | Description | | | | | | | | | | | | | | | | | | | | |
|--------|--------------------|---|---|--------|----------------|-------------|----|--|-----|--|--|----|---------|--|----|----|--------------------------------|---|----|----|-----------|--|
| 13 | Port Owner | <p>This bit indicates which of OHCI or EHCI has the port ownership.</p> <p>0b: EHCI has the port ownership.</p> <p>1b: OHCI has the port ownership.</p> <p>When bit 0 (Configure Flag bit) of the CONFIGFLA register is changed from 0b to 1b, this bit becomes 0b. If bit 0 (Configure Flag bit) of the CONFIGFLA register is 0b, this bit becomes 1b.</p> <p>If the connected device is not a High Speed device, this bit is set to 1b to transfer the port ownership to OHCI.</p> | | | | | | | | | | | | | | | | | | | | |
| 12 | PP (Port Power) | <p>This bit controls power supply to the port.</p> <p>If this bit is 0b, power is not supplied to the port. Therefore, the port does not function, and does not recognize connection and disconnection.</p> <p>If overcurrent is detected while this bit is set to 1b, the host controller clears this bit to 0b, and the power supplied to the port is stopped.</p> <p>Note: As described later, if the PPC bit is 0b, this bit is fixed to 1b, so the power supplied to the port is not stopped.</p> <p>The function of this bit differs depending on the value of bit 4 (PPC [Port Power Control] bit) of the HCSPARAMS register.</p> <table><tr><th>PPC</th><th>PP</th><th>Operation</th></tr><tr><td>0b</td><td>1b</td><td>R This bit is fixed to 1b, and the power is always supplied to the port.</td></tr><tr><td>1b</td><td>0b/1b</td><td>R/W Whether or not power is supplied to the port depends on the setting of this bit.</td></tr><tr><td></td><td>0b</td><td>Power is not supplied to the port.</td></tr><tr><td></td><td>1b</td><td>Power is supplied to the port.</td></tr></table> | PPC | PP | Operation | 0b | 1b | R This bit is fixed to 1b, and the power is always supplied to the port. | 1b | 0b/1b | R/W Whether or not power is supplied to the port depends on the setting of this bit. | | 0b | Power is not supplied to the port. | | 1b | Power is supplied to the port. | | | | | |
| PPC | PP | Operation | | | | | | | | | | | | | | | | | | | | |
| 0b | 1b | R This bit is fixed to 1b, and the power is always supplied to the port. | | | | | | | | | | | | | | | | | | | | |
| 1b | 0b/1b | R/W Whether or not power is supplied to the port depends on the setting of this bit. | | | | | | | | | | | | | | | | | | | | |
| | 0b | Power is not supplied to the port. | | | | | | | | | | | | | | | | | | | | |
| | 1b | Power is supplied to the port. | | | | | | | | | | | | | | | | | | | | |
| 11, 10 | Line Status | <p>This field indicates the logical level of D+/D- lines of the current USB bus. (bit 11: DP / bit 10: DM)</p> <p>This field is used to detect an LS device before starting a sequence for port reset and port enable.</p> <p>Therefore, this bit is valid only when bit 3 (Port Enable/Disable bit) is 0b and bit 0 (Current Connect Status bit) is 1b.</p> <table><tr><th>bit 11</th><th>bit 10</th><th>USB bus status</th><th>Description</th></tr><tr><td>0b</td><td>0b</td><td>SE0</td><td>The device is not an LS device. EHCI port reset is executing.</td></tr><tr><td>1b</td><td>0b</td><td>J-state</td><td>The device is not an LS device. EHCI port reset is executing.</td></tr><tr><td>0b</td><td>1b</td><td>K-state</td><td>An LS device was connected. The port ownership is transferred from EHCI to OHCI.</td></tr><tr><td>1b</td><td>1b</td><td>Undefined</td><td>The device is not an LS device. EHCI port reset is executing.</td></tr></table> | bit 11 | bit 10 | USB bus status | Description | 0b | 0b | SE0 | The device is not an LS device. EHCI port reset is executing. | 1b | 0b | J-state | The device is not an LS device. EHCI port reset is executing. | 0b | 1b | K-state | An LS device was connected. The port ownership is transferred from EHCI to OHCI. | 1b | 1b | Undefined | The device is not an LS device. EHCI port reset is executing. |
| bit 11 | bit 10 | USB bus status | Description | | | | | | | | | | | | | | | | | | | |
| 0b | 0b | SE0 | The device is not an LS device. EHCI port reset is executing. | | | | | | | | | | | | | | | | | | | |
| 1b | 0b | J-state | The device is not an LS device. EHCI port reset is executing. | | | | | | | | | | | | | | | | | | | |
| 0b | 1b | K-state | An LS device was connected. The port ownership is transferred from EHCI to OHCI. | | | | | | | | | | | | | | | | | | | |
| 1b | 1b | Undefined | The device is not an LS device. EHCI port reset is executing. | | | | | | | | | | | | | | | | | | | |
| 9 | Suspend using L1 | <p>Suspend using L1 (LPM) control bit.</p> <p>If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state.</p> <p>Writing to this bit is possible only when the Suspend bit (bit 7) is 0b.</p> <p>0b: Suspend using L2</p> <p>1b: Suspend using L1 (LPM)</p> <p>If this bit is 1b and the Device Address field is other than 0000h, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state.</p> <p>If this bit is 0b, the host controller operates as L2 Suspend.</p> | | | | | | | | | | | | | | | | | | | | |

Table 32.37 PORTSC1 Register

| Bit | Symbol | Description | | | | | | | | | | | | |
|--------------|---------------------|---|--------------|---------|-------------|----|---|---------|----|----|--------|--|----|---------|
| 8 | Port Reset | <p>This bit indicates the reset status of the port.</p> <p>0b: The port is not being reset.</p> <p>1b: The port is being reset.</p> <p>If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete.</p> <p>If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b.</p> <p>If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b.</p> <p>Note: Even if 1b is written to this bit, the bus reset sequence does not start.</p> <ul style="list-style-type: none"> - PP (Port Power) bit = 0b - Port Owner bit = 1b - Current Connect Status bit = 0b | | | | | | | | | | | | |
| 7 | Suspend | <p>This bit indicates the Suspend control and status of the port.</p> <p>This bit and bit 2 (Port Enabled/Disabled bit) indicate the following port status.</p> <table> <tr> <th>Port Enabled</th><th>Suspend</th><th>Port Status</th></tr> <tr> <td>0b</td><td>—</td><td>Disable</td></tr> <tr> <td>1b</td><td>0b</td><td>Enable</td></tr> <tr> <td></td><td>1b</td><td>Suspend</td></tr> </table> <p>To change the port state to L1 or L2 Suspend, set this bit to 1b.</p> <p>Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit.</p> <p>In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes.</p> <p>Writing 0b to this bit has no effect.</p> <p>This bit can be set to 1b only when all the following conditions are satisfied: "PP (Port Power) bit = 1b", "Port Owner bit = 0b", and "Current Connect Status bit = 1b". If any of the following conditions is satisfied, the host controller clears this bit:</p> <ul style="list-style-type: none"> - "Resume is complete" is detected. - The PR bit is set to 1b when PR (Port Reset) bit is 0b. - The port owner is 1b (OHCI). - The PP (Port Power) bit is set to 0b. - The Port Enabled/Disabled bit is set to 0b. | Port Enabled | Suspend | Port Status | 0b | — | Disable | 1b | 0b | Enable | | 1b | Suspend |
| Port Enabled | Suspend | Port Status | | | | | | | | | | | | |
| 0b | — | Disable | | | | | | | | | | | | |
| 1b | 0b | Enable | | | | | | | | | | | | |
| | 1b | Suspend | | | | | | | | | | | | |
| 6 | Force Port Resume | <p>This bit indicates that the Resume state of the port is detected.</p> <p>0b: Resume signal is not detected or output.</p> <p>1b: Resume (K-state) is detected or output.</p> <p>When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b.</p> <p>If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus.</p> <p>For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b.</p> <p>On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register.</p> <p>If the Port Power (PP) bit is 0b, this bit becomes 0b.</p> | | | | | | | | | | | | |
| 5 | Over-current Change | <p>This bit indicates that bit 4 (Over-current Active bit) has changed.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> <p>0b: Over-current Active bit has not changed.</p> <p>1b: Over-current Active bit has changed.</p> | | | | | | | | | | | | |

Table 32.37 PORTSC1 Register

| Bit | Symbol | Description |
|-----|----------------------------|--|
| 4 | Over-current Active | <p>This bit indicates the overcurrent status of the port.</p> <p>If the host controller detects overcurrent, it disables the port, and set this bit to 1b.</p> <p>After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b.</p> <p>0b: The port is not in overcurrent state.</p> <p>1b: The port is in overcurrent state.</p> |
| 3 | Port Enable/Disable Change | <p>This bit indicates that the host controller detected frame babble.</p> <p>If the Host Controller detects frame babble, it disables the port and sets this bit to 1b.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b.</p> <p>0b: Frame babble has not occurred.</p> <p>1b: Frame babble is detected.</p> |
| 2 | Port Enabled/Disabled | <p>This bit indicates the Enable/Disable status of the port.</p> <p>The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b.</p> <p>If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit.</p> <p>If the port is disabled, data transfer to the downstream port is blocked except for port reset.</p> <p>If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b.</p> <p>If the Port Power (PP) bit is 0b, this bit becomes 0b.</p> <p>0b: The port is disabled.</p> <p>1b: The port is enabled.</p> |
| 1 | Connect Status Change | <p>This bit indicates that bit 0 (Current Connect Status bit) has changed.</p> <p>Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.</p> <p>If the Port Power (PP) bit is 0b, this bit becomes 0b.</p> <p>0b: The Current Connect Status bit has no change.</p> <p>1b: The Current Connect Status bit has changed.</p> |
| 0 | Current Connect Status | <p>This bit indicates the connection status of the port.</p> <p>If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected.</p> <p>On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b.</p> <p>If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b.</p> <p>0b: No device is connected to the port.</p> <p>1b: A device is connected to the port.</p> |

Table 32.39 INT_STATUS Register

| Bit | Symbol | Description |
|---------|------------|--|
| 31 to 5 | | Reserved The write value should always be 0. |
| 4 | WAKEON_INT | This bit indicates the state of WAKEON interrupt from the HOST module. Writing 1b to this bit can clear this bit. 0b: No WAKEON interrupt 1b: WAKEON interrupt |
| 3 | UCOM_INT | This bit indicates the state of interrupt from the UCOM register. To clear the interrupt, use the UCOM2 Register. 0b: No UCOM register interrupt 1b: UCOM register interrupt |
| 2 | USBH_INTB | This bit indicates the state of EHCI interrupt. To clear the interrupt, use the USBSTS Register (of the EHCI Operational Register). 0b: No INTB interrupt 1b: INTB interrupt |
| 1 | USBH_INTA | This bit indicates the state of OHCI interrupt. To clear the interrupt, use the HcInterruptStatus Register (of the OHCI Operational Register). 0b: No INTA interrupt 1b: INTA interrupt |
| 0 | AHB_INT | This bit indicates that a BUS Master error occurred. Writing 1b to this bit can clear this bit. 0b: No bus error occurred. 1b: A bus error occurred. |

(3) AHB_BUS_CTR Register (offset: 208h)

Abbreviated name of register: AHB_BUS_CTR

| | | | | | | | | | | | | | | | | |
|--------------|-----------|-----|-----|-----|----------|----|----|-----------|----------|----|---------------|-----|----------|----|---------------|-----|
| Address: | 20Bh | | | | | | | | 20Ah | | | | | | | |

Table 32.40 AHB_BUS_CTR Register

| Bit | Symbol | Description |
|----------|---------------|--|
| 31 to 16 | | Reserved The write value should always be 0. |
| 15 to 12 | PROT_TYPE | This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request. bit 15 0b: Cache disabled. 1b: Cache enabled. bit 14 0b: Buffer disabled. 1b: Buffer enabled. bit 13 0b: User access 1b: Privileged access bit 12 0b: Operation code 1b: Data |
| 11 to 9 | | Reserved The write value should always be 0. |
| 8 | PROT_MODE | This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request. 0b: The value of PROT_TYPE is output as MHPROT [3:0]. 1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed. |
| 7, 6 | | Reserved The write value should always be 0. |
| 5, 4 | ALIGN_ADDRESS | This field sets the address boundary used when the BUS Master interface issues a burst transfer. 00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary. 01b: A burst transfer is issued so that not to exceed 64-byte boundary. 10b: A burst transfer is issued so that not to exceed 32-byte boundary. (The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.) 11b: A burst transfer is issued so that not to exceed 16-byte boundary. (The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.) |
| 3, 2 | | Reserved The write value should always be 0. |
| 1 to 0 | MAX_BURST_LEN | This field selects the maximum burst length used when the BUS Master interface issues a transfer request. 00b: INCR16 01b: INCR8 10b: INCR4 11b: SINGLE |

(4) USBCTR Register (offset: 20Ch)

Abbreviated name of register: USBCTR

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|----|----|----|----|-------|---------|----------|
| Address: | 20Fh | | | | | | | | 20Eh | | | | | | | |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

Table 32.41 USBCTR Register

| Bit | Symbol | Description |
|---------|----------|---|
| 31 to 3 | | Reserved The write value should always be 0. |
| 2 | DIRPD | USBPHY Standby Mode Control 0b: USBPHY normal operating mode 1b: USBPHY standby mode [Note] When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module. Only set it to 1 when the USB module is not in use. In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 μ s before the transition. |
| 1 | PLL_RST | This bit controls resetting of the USBPHY module. 0b: The USBPHY reset is released. 1b: The USBPHY module is reset. |
| 0 | USBH_RST | Software reset to this module. Setting this bit to 1b resets this module entirely. This bit is always read as 0b. [Note] Set this bit only when the BUS Master interface of this module is not running. Access to this module becomes valid 10 CLK (internal bus clock [B ϕ]) after this bit is written. 0b: Nothing occurs. 1b: Reset is issued to this module. |

(5) Register Enable/Clock Gating Control Register (offset: 304h)

Abbreviated name of register: REGEN_CG_CTRL

| | | | | | | | | | | | | | | | | |
|--------------|--------------------------|----------|---------------------|---------------------|----------|----|----|-------------|----------|----|----|----|----|----|----|----|
| Address: | 307h | | | | | | | | 306h | | | | | | | |

Table 32.42 REGEN_CG_CTRL Register

| Bit | Symbol | Description |
|----------|----------------|--|
| 31 | NONUSE_CLK_MSK | This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register. 0b: Do not mask the clock. 1b: Mask the clock. For details, see section 32.3.1.2, Specifications of NONUSE_CLK_MSK operation. |
| 30 | | Reserved The write value should always be 0. |
| 29 | HOST_CLK_MSK | This bit is used to forcibly mask clock supply to the host controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see section 32.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations. |
| 28 | PERI_CLK_MSK | This bit is used to forcibly mask the clock supply to the peripheral controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see section 32.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations. |
| 27 to 25 | | Reserved The write value should always be 0. |
| 24 | RPB_WEN | This is used to enable writing to the U2HC_EXT2 register (offset 360h). 0b: Writing to U2HC_EXT2 is disabled. 1b: Writing to U2HC_EXT2 is enabled. |
| 23 to 0 | | Reserved The write value should always be 0. |

(6) Suspend Control Register (offset: 308h)

Abbreviated name of register: SPD_CTRL

| | | | | | | | | | | | | | | | | |
|--------------|------------------|----------------|----------|----|----|----|----|----|---------------|----------|----|----|----|----|----|---------------------|
| Address: | 30Bh | | | | | | | | 30Ah | | | | | | | |

| Address: | 309h | | | | | | | | 308h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | GLOBAL_SUSPEND_M_P1 |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.43 SPD_CTRL Register

| Bit | Symbol | Description |
|----------|-----------------|---|
| 31 | SUSPENDM_ENABLE | <p>The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode. If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status.</p> <p>[This function is valid for the following OHCI/EHCI Operational registers] EHCI: bit [7] (Suspend bit) of the PORTSC1 register OHCI: bit [2] (PSS bit) of the HcRhPortStatus1 register OHCI: bit [7:6] (HCFS field) of the HcControl register</p> |
| 30 | SLEEP_M_ENABLE | <p>The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.) This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b.</p> <p>[This function is valid for the following OHCI/EHCI Operational register] EHCI: bit [7] (Suspend bit) of the PORTSC1 register</p> |
| 29 to 24 | | Reserved The write value should always be 0. |
| 23 | WKCNTT_ENABLE | <p>The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b). If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released. This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b.</p> <p>[Note] To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30), as the general rule, set this bit to 1b. If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs.</p> |
| 22 to 1 | | Reserved The write value should always be 0. |

Table 32.43 SPD_CTRL Register

| Bit | Symbol | Description |
|-----|------------------------|---|
| 0 | GLOBAL_ SUSPENDM_P1 | <p>The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register.</p> <p>This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped).</p> <p>If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller.</p> <p>Note:</p> <ul style="list-style-type: none">• Do not set this bit to 1b during data transfer.• We recommend that you set this bit to 1b after "stopping the EHCI/OHCI list processing" and "placing the port in the Disable status".• If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b. |

(7) Suspend/Resume Timer Setting Register (offset: 30Ch)

Abbreviated name of register: SPD_RSM_TIMSET

| | | | | | | | | | | | | | | | | |
|--------------|---------------------|-----|-----|-----|-----|-----|-----|-----|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Address: | 30Fh | | | | | | | | 30Eh | | | | | | | |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |

Table 32.44 SPD_RSM_TIMSET Register

| Bit | Symbol | Description |
|----------|-------------------------|--|
| 31 to 16 | TIMER_CONNECT [15:0] | This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (Bφ). According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes at least 2.5 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: At least FAh |
| 15 to 0 | TIMER_RESUME [15:0] | This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (Bφ). According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes at least 5 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: At least 1F4h |

(8) Overcurrent Detection/Sleep Timer Setting Register (offset: 310h)

Abbreviated name of register: OC_SLP_TIMSET

| | | | | | | | | | | | | | | | | |
|--------------|----------------|-----|-----|------------------|-----|-----|-----|-----|------------------|-----|-----|-----|-----------------|-----|-----|-----|
| Address: | 313h | | | | | | | | 312h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Symbol: | Reserved | | | TIMER_SLEEP[8:4] | | | | | TIMER_SLEEP[3:0] | | | | TIMER_OC[19:16] | | | |
| Reset value: | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| Address: | 311h | | | | | | | | 310h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Symbol: | TIMER_OC[15:8] | | | | | | | | TIMER_OC[7:0] | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.45 OC_SLP_TIMSET Register

| Bit | Symbol | Description |
|----------|----------------------|--|
| 31 to 29 | | Reserved The write value should always be 0. |
| 28 to 20 | TIMER_SLEEP [8:0] | This field indicates the timer value used by USBPHY when the SLEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated). When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (Bφ). According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes 1 μs. 1 bit = 1 cycle (μs) (Setting guideline) For 100 MHz: 064h |
| 19 to 0 | TIMER_OC [19:0] | This field indicates the timer value used for overcurrent detection. If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred. According to the internal bus clock (Bφ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (μs). (Setting guideline) For 100 MHz and 1 ms: At least 1_86A0h |

(9) SBRN_FLADJ_PORTWAKECAP Register (offset: 314h)

Abbreviated name of register: SBRN_FLADJ_PW

| | | | | | | | | | | | | | | | | |
|--------------|-------------------|-----|-----|-----|-----|-----|-----|-----|------------------|-----|-----|-----|-----|-----|-----|-----|
| Address: | 317h | | | | | | | | 316h | | | | | | | |

Table 32.47 PORT_LPM_CTRL1 Register

| Bit | Symbol | Description |
|---------|------------------------|---|
| 31 to 8 | | Reserved The write value should always be 0. |
| 7 to 4 | NYET_RETRY_CNT_P1[3:0] | This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b. 0000b: No retry. 0001b to 1111b: Retries the set number of times. (MAX: 15 retries) |
| 3 | REMOTEWAKE_EN_P1 | This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token. 0b: RemoteWakeup is supported. 1b: RemoteWakeup is not supported. |
| 2 | SLEEP_INT_EN_P1 | This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction. The Per-Port Change interrupt can occur. 0b: No interrupt occurs. 1b: An interrupt occurs. |
| 1 | RETRY_ENABLE_NYET_P1 | This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction. 0b: No retry. 1b: Retries are made. |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

Table 32.50 OBINTSTA Register

| Bit | Symbol | Description |
|----------|---------------|--|
| 31 to 18 | | Reserved The write value should always be 0. |
| 17 | DPMONCHG_STA | This bit is set if the DPMON bit of the LINECTRL1 register has changed. 0b: The DPMON bit of the LINECTRL1 register has not changed. 1b: The DPMON bit of the LINECTRL1 register has changed. |
| 16 | DMMONCHG_STA | This bit is set if the DMMON bit of the LINECTRL1 register has changed. 0b: The DMMON bit of the LINECTRL1 register has not changed. 1b: The DMMON bit of the LINECTRL1 register has changed. |
| 15 to 7 | | Reserved The write value should always be 0. |
| 6 | CHGDETCG1_STA | This bit is set if the setting of the CHGDETSTS bit in the BCCTRL1 register has been changed. 0b: The setting of the CHGDETSTS bit in the BCCTRL1 register has not been changed. 1b: The setting of the CHGDETSTS bit in the BCCTRL1 register has been changed. |
| 5 | | Reserved The write value should always be 0. |
| 4 | PDDETCG1_STA | This bit is set if the setting of the PDDETSTS bit in the BCCTRL1 register has been changed. 0b: The setting of the PDDETSTS bit in the BCCTRL1 register has not been changed. 1b: The setting of the PDDETSTS bit in the BCCTRL1 register has been changed. |
| 3 | VBSTAIN_STA | This bit is set if the value of the VBSTA bit of the VBCTRL register is equal to the value set to the VBLVL bit of the VBCTRL register. However, after this bit is set when the VBSTA bit and the VBLVL bit become equal, this bit might be cleared afterward. In such a case, if the value of the VBSTA bit has not changed, this bit is not be set, even if the value of the VBSTA bit is equal to the value of the VBLVL bit. Then, if the value of the VBSTA bit changes and becomes equal to the VBLVL bit again, this bit is set again. 0b: The VBSTA bit of the VBCTRL register is not equal to the value set to the VBLVL bit of the VBCTRL register. 1b: The VBSTA bit of the VBCTRL register becomes equal to the value set to the VBLVL bit of the VBCTRL register. |
| 2 | VBSTACHG_STA | This bit is set if the state of the VBSTA bit of the VBCTRL register has changed. 0b: The VBSTA bit of the VBCTRL register has not changed. 1b: The VBSTA bit of the VBCTRL register has changed. |
| 1 | OCINT_STA | This bit is set if the OVRCUR pin is asserted. 0b: The OVRCUR pin is not asserted (and remains 1b). 1b: The OVRCUR pin is asserted (and became 0b). |
| 0 | IDCHG_STA | This bit is set if the input value from the OTG_ID pin has changed. 0b: There is no change in the OTG_ID pin. 1b: There is a change in the OTG_ID pin. Note: The initial value is 1. Before using this bit, clear the status. |

(3) OTG-BC Interrupt Enable Register (offset: 808h)

Abbreviated name of register: OBINTEN

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|-----------------------|----------|-----------------------|---------------------|---------------------|---------------------|---------------------|
| Address: | 80Bh | | | | | | | | 80Ah | | | | | | | |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.52 VBCTRL Register

| Bit | Symbol | Description |
|----------|--------|---|
| 31, 30 | | Reserved The write value should always be 0. |
| 29 | VBSTA | This bit indicates the voltage level of VBUS. Input level from the VBUSIN pin is indicated as it is. |
| 28 to 22 | | Reserved The write value should always be 0. |
| 21 | VBVLV | This bit is used to detect (by an interrupt) that VBUS reaches a specific level. When the value of the VBUSIN pin becomes equal to the value set to this field, the VBSTAIN_T_STA bit of the OBINTSTA register is set. If the bit is not masked, an interrupt (caused by the VBSTAIN_T_STA bit of the OBINTSTA register) occurs. |
| 20 to 17 | | Reserved The write value should always be 0. |
| 16 | | Reserved The write value should always be 1. |
| 15 to 5 | | Reserved The write value should always be 0. |
| 4 | VGPU0 | The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin. This bit is used, for example, for control of the external power IC. |
| 3 to 1 | | Reserved The write value should always be 0. |
| 0 | VBOUT | This bit is one of the VBUSEN control bits. This bit is used to assert VBUS by controlling the external power IC. 0b: VBUS output disable 1b: VBUS output enable If overcurrent occurs, this bit is automatically cleared to 0. |

(5) Line Control Port 1 Register (offset: 810h)

Abbreviated name of register: LINECTRL1

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|----|-----------|-----|----------|--------|----------|--------|
| Address: | 813h | | | | | | | | 812h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |
| Symbol: | Reserved | | | | | | | | Reserved | | DSDP[1:0] | | DPRPD_EN | DP_RPD | DMRPD_EN | DM_RPD |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 811h | | | | | | | | 810h | | | | | | | |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.53 LINECTRL1 Register

| Bit | Symbol | Description |
|----------|-----------|---|
| 31 to 22 | | Reserved The write value should always be 0. |
| 21, 20 | DSDP[1:0] | These bits are set on transitions to and returning from the deep standby state in the DCP mode. Set the bits by following the procedure described in section 33.9.16.4, Flowchart of resumption from deep standby in response to reception of the resume signal or section 32.6.1.2, When the host controller is to be used in the DCP mode. If you do not so, operation is not guaranteed. |
| 19 | DPRPD_EN | This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resistor. 0b: Control of DP-side 15 kΩ Pulldown resistor by DP_RPD (bit 18) is disabled. 1b: Control of DP-side 15 kΩ Pulldown resistor by DP_RPD (bit 18) is enabled. |
| 18 | DP_RPD | This bit controls USB bus (DP) 15 kΩ Pulldown resistor when DPRPD_EN (bit 19) = 1b. 0b: DP-side 15 kΩ Pulldown resistor is OFF. 1b: DP-side 15 kΩ Pulldown resistor is ON. |
| 17 | DMRPD_EN | This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resistor. 0b: Control of DM-side 15 kΩ Pulldown resistor by DM_RPD (bit 16) is disabled. 1b: Control of DM-side 15 kΩ Pulldown resistor by DM_RPD (bit 16) is enabled. |
| 16 | DM_RPD | This bit controls USB bus (DM) 15 kΩ Pulldown resistor when DMRPD_EN (bit 17) = 1b. 0b: DM-side 15 kΩ Pulldown resistor is OFF. 1b: DM-side 15 kΩ Pulldown resistor is ON. |
| 15 to 4 | | Reserved The write value should always be 0. |
| 3 | DPMON | This bit indicates the value of USB bus DP. |
| 2 | DMMON | This bit indicates the value of USB bus DM. |
| 1 | | Reserved The write value should always be 0. |
| 0 | IDMON | This bit indicates the value of the OTG_ID pin. |

(6) BC Control Port 1 Register (offset: 820h)

Abbreviated name of register: BCCTRL1

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|--------------|---------------|----------|----|-------------|-------------|--------------|-------------|--------------|-------------|
| Address: | 823h | | | | | | | | 822h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.54 BCCTRL1 Register

| Bit | Symbol | Description |
|----------|-----------|--|
| 31 to 26 | | Reserved The write value should always be 0. |
| 25, 24 | | Reserved The write value should always be 1. |
| 23 to 10 | | Reserved The write value should always be 0. |
| 9 | PDDETSTS | This bit indicates the USBPHY Portable Device Detect signal state. |
| 8 | CHGDETSTS | This bit indicates the USBPHY Charging Downstream Port Detect signal state. |
| 7, 6 | | Reserved The write value should always be 0. |
| 5 | DCPMODE | If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b. |
| 4 | VDMSRCE | This bit controls the USBPHY built-in VDM_SRC circuit. If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven. |
| 3 | IDPSINKE | This bit controls the USBPHY built-in Portable Device Detect circuit. If this bit is set to 1b, Portable Device detection is enabled. |
| 2 | VDPSRCE | This bit controls the USBPHY built-in VDP_SRC circuit. If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven. |
| 1 | IDMSINKE | This bit controls the USBPHY built-in Charging Downstream Port Detect circuit. If this bit is set to 1b, Charging Downstream Port detection is enabled. |
| 0 | IDPSRCE | This bit controls the USBPHY built-in IDP_SRC circuit. If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven. |

(7) CC STATUS Register (offset: 840h)

Abbreviated name of register: CC_STATUS

| | | | | | | | | | | | | | | | | |
|--------------|------------|----------|------------|-----------|-----------|-----------|-----------|-----------|----------|----------|-------------|------------|--------|--------|--------|--------|
| Address: | 843h | | | | | | | | 842h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |
| Symbol: | CC_INT_SEL | Reserved | CC_LVL_CLR | CC_LVL[3] | CC_LVL[2] | CC_LVL[1] | CC_LVL[0] | CC_LVL_EN | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 841h | | | | | | | | 840h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | Reserved | CC_PERI_STA | CC_LVL_STA | CC1_RD | CC1_RA | CC2_RD | CC2_RA |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.55 CC_STATUS Register

| Bit | Symbol | Description |
|---------|-------------|--|
| 31 | CC_INT_SEL | This bit specifies the condition for the CC_INT interrupt. 0: The CC_INT interrupt occurs whenever a peripheral device is connected.*1 1: Whether a CC_INT interrupt occurs and its level depend on the settings of the CC_LVL and CC_LVL_EN bits. |
| 30 | | Reserved The write value should always be 0. |
| 29 | CC_LVL_CLR | CC_LVL_STA flag clear 0: Do not clear CC_LVL_STA. 1: Clear CC_LVL_STA.*2 |
| 28 | CC_LVL[3] | If "CC_INT_SEL = 1" is set, this bit specifies the level of interrupt occurrence. Specify the CC1_Rd level. |
| 27 | CC_LVL[2] | If "CC_INT_SEL = 1" is set, this bit specifies the level of interrupt occurrence. Specify the CC1_Ra level. |
| 26 | CC_LVL[1] | If "CC_INT_SEL = 1" is set, this bit specifies the level of interrupt occurrence. Specify the CC2_Rd level. |
| 25 | CC_LVL[0] | If "CC_INT_SEL = 1" is set, this bit specifies the level of interrupt occurrence. Specify the CC2_Ra level. |
| 24 | CC_LVL_EN | CC_LVL enable setting 0: If "CC_INT_SEL = 1" is set, and input state of the CCn_Rd and CCn_Ra (n = 1, 2) pins is equal to the CC_LVL[3:0] value, an interrupt does not occur. 1: If "CC_INT_SEL = 1" is set, and input state of the CCn_Rd and CCn_Ra pins is equal to the CC_LVL[3:0] value, an interrupt occurs. |
| 23 to 7 | | Reserved The write value should always be 0. |
| 6 | | Reserved The read value is not stable. The write value should always be 0. |
| 5 | CC_PERI_STA | This bit indicates whether a peripheral device is connected.*3 0: A peripheral device is not connected. 1: A peripheral device is connected.*1 |
| 4 | CC_LVL_STA | This bit indicates the relationship between the setting value of the CC_LVL bit and the pin status. 0: The status of the CCn_Rd and CCn_Ra pins is not equal to the setting value of CC_LVL[3:0]. 1: The status of the CCn_Rd and CCn_Ra pins is equal to the setting value of CC_LVL[3:0].*4 |
| 3 | CC1_RD | This bit indicates the CC1_Rd pin status. |
| 2 | CC1_RA | This bit indicates the CC1_Ra pin status. |
| 1 | CC2_RD | This bit indicates the CC2_Rd pin status. |
| 0 | CC2_RA | This bit indicates the CC2_Ra pin status. |

Note 1. When the settings of the CC1_Rd, CC1_Ra, CC2_Rd, and CC2_Ra bits are as in Table 32.56, the connection of peripheral devices is detected.
For details about the values to be input to the CCn_Rd and CCn_Ra pins, see section 32.10.1, Notes on Using the CCn_Ra and CCn_Rd Pins.

Note 2. This bit is not automatically cleared from 1 to 0, so write 0 to this bit after CC_LVL_STA clear.

Note 3. Regardless of the CC_INT_SEL setting, if the input of the CCn_Rd and CCn_Ra pins is equal to Table 32.56, 1 is set.

Note 4. Regardless of the CC_INT_SEL setting, if the value set for CC_LVL is equal to the status of the CCn_Rd and CCn_Ra pins, 1 is set.

Table 32.56 Conditions for Detecting the Connection of a Peripheral Device

| CC1_Rd | CC1_Ra | CC2_Rd | CC2_Ra |
|--------|--------|--------|--------|
| 0 | 1 | 1 | 1 |
| 1 | 1 | 0 | 1 |
| 0 | 1 | 0 | 0 |
| 0 | 0 | 0 | 1 |

(8) PHYCLK_CTRL Register (offset: 844h)

Abbreviated name of register: PHYCLK_CTRL

| | | | | | | | | | | | | | | | | |
|--------------|----------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|-----|
| Address: | 847h | | | | | | | | 846h | | | | | | | |
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| R/W : | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Address: | 845h | | | | | | | | 844h | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Symbol: | Reserved | | | | | | | | Reserved | | | | | | | |
| Reset value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 32.58 PHYIF_CTRL Register

| Bit | Symbol | Description |
|---------|--------|---|
| 31 to 1 | | Reserved The write value should always be 0. |
| 0 | FIXPHY | This bit is to be set when the USB module is not in use or on recovery from the deep standby state. Set the bit by following the descriptions in section 33.9.16.1, Setting at transition to deep standby and section 52.4.3, Usage Notes when USB 2.0 Host/Function Modules are Not to be Used. If you do not so, operation is not guaranteed. |

32.3 Clock Signals

32.3.1 Clock Gating Specifications

32.3.1.1 Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.

Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the "circuits that do not require clock supply temporarily."

The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]

Register Enable/Clock Gating Control Register (offset:304h)

[Functional specification]

| bit | Symbol | Functional specification |
|-----|----------------|--|
| 31 | NONUSE_CLK_MSK | Gating clocks for unused host controller or peripheral controller. |
| 29 | HOST_CLK_MSK | Gating clocks for host controller. |
| 28 | PERI_CLK_MSK | Gating clocks for peripheral controller. |

32.3.1.2 Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.

This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: 800h).

| Clock Gating Register Setting | | | Host/Peripheral Switching Setting | Gating Target | |
|-------------------------------|--------------|--------------|--------------------------------------|-----------------|---------------------|
| NONUSE_CLK_MSK | HOST_CLK_MSK | PERI_CLK_MSK | OTG_PERI | Host Controller | Function Controller |
| 1 | 0 | 0 | 0 | | ○ |
| | | | 1 | ○ | |

[Note on using the NONUSE_CLK_MSK bit]

If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.

If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

32.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.

The following table shows the operating specifications of this function.

| Clock Gating Register Setting | | | Host/Peripheral Switching Setting | Gating Target | |
|-------------------------------|--------------|--------------|--------------------------------------|-----------------|---------------------|
| NONUSE_CLK_MSK | HOST_CLK_MSK | PERI_CLK_MSK | Register | Host Controller | Function Controller |
| 0 | 1 | 0 | — | ○ | |
| | 0 | 1 | — | | ○ |
| | 1 | 1 | 0 | ○ | ○ |

Note: If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set to 1b, the effect of clock gating becomes logical OR of each bit.

32.4 Interrupt Sources

32.4.1 Interrupt Signals

This module has the six interrupt signals listed below. The logical OR of these six interrupt signals is sent to the interrupt controller as USBHIn (n = 0, 1). For details about the occurrence source of USBHIn (n = 0, 1) interrupt, check the corresponding status register.

Use all these interrupt signals as level interrupt signals.

| Interrupt Source Name | Interrupt Type | Pulse/Level | Active Level |
|-----------------------|--|-------------|--------------|
| U2H_INT | BUS Master interrupt signal. This signal is asserted when a bus error occurs in the BUS Master. Interrupt control is performed by the AHB Bridge Register. | Level | H |
| U2H_OHCI_INT | OHCI interrupt signal This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the OHCI Operational Register. | Level | H |
| U2H_EHCI_INT | EHCI interrupt signal. This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the EHCI Operational Register. | Level | H |
| U2H_WAKEON_INT | EHCI Wakeup interrupt signal. This signal is asserted by an EHCI Wakeup event. Interrupt control is performed by the EHCI Operational Register. | Level | H |
| U2H_OBINT | OTG/Battery Charging interrupt signal. This signal is asserted by OTG or Battery Charging related event. Interrupt control is performed by the UCOM2 Register. | Level | H |
| CC_INT | CC pin interrupt signal | Level | H |

32.4.2 Interrupt Sources and Control

32.4.2.1 U2H_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[0] (AHB_INTEN)

[Interrupt source]

A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:204h) bit[0] (AHB_INT)

32.4.2.2 U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset:010h) bit[31], bit[6:0]*

Note: * Enable the bit required as the assertion source.

[Interrupt source]

| Interrupt Source | | Registers That Require Interrupt Enable Setting | | | | | | | |
|------------------|--|---|-------------------|---------|---------|---------|---------|---------|---------|
| | | USBH _INTA EN | HcInterruptEnable | | | | | | |
| | | | bit [31] | bit [6] | bit [5] | bit [3] | bit [2] | bit [1] | bit [0] |
| | | | MIE | RHSCE | FNOE | ROE | SFE | WDHE | SOE |
| 1 | Device connection is detected. | ○ | ○ | ○ | | | | | |
| 2 | Device disconnection is detected. | ○ | ○ | ○ | | | | | |
| 3 | Port power is OFF (excluding overcurrent detection). | ○ | ○ | ○ | | | | | |
| 4 | Babble error is detected during a USB transfer. | ○ | ○ | ○ | | | | | |
| 5 | Resume is complete. | ○ | ○ | ○ | | | | | |
| 6 | Overcurrent is detected. | ○ | ○ | ○ | | | | | |
| 7 | Bus reset is complete. | ○ | ○ | ○ | | | | | |
| 8 | When the HcRhDescriptorB Register DR bit is 1b, OHCI becomes “USB Operational” (HCFS[1:0] bit = 10b) or “USB Suspend” (HCFS[1:0] bit = 11b). | ○ | ○ | ○ | | | | | |
| 9 | When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register. | ○ | ○ | ○ | | | | | |
| 10 | When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register. | ○ | ○ | ○ | | | | | |
| 11 | When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register. | ○ | ○ | ○ | | | | | |
| 12 | When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register. | ○ | ○ | ○ | | | | | |
| 13 | When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register. | ○ | ○ | ○ | | | | | |
| 14 | When no device is connected (CCS bit = 1b), the port power is turned off. | ○ | ○ | ○ | | | | | |
| 15 | The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed. | ○ | ○ | | ○ | | | | |
| 16 | RemoteWakeup signal (Resume signal) is detected from a device. | ○ | ○ | | | ○ | | | |
| 17 | HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.) | ○ | ○ | | | | ○ | | |
| 18 | A transfer finishes (including an error), and the host module updated HccaDoneHead. | ○ | ○ | | | | | ○ | |
| 19 | USB schedule overrun occurred for the frame. | ○ | ○ | | | | | | ○ |

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset:00Ch) bit[6:0]

32.4.2.3 U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset:128h) bit[17:16], bit[5:0]*

* Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset:120h) bit[15], bit[6]

[Interrupt source]

| Interrupt Source | | Registers That Require Interrupt Enable Setting | | | | | | | | |
|------------------|--|---|-----------------------|----------|---------------------|---------------|---------------------|-------------|------------|---------|
| | | USBCMD | | USBINTR | | | | | | |
| | | bit [15] | bit [6] | bit [17] | bit [16] | bit [5] | bit [3] | bit [2] | bit [1] | bit [0] |
| | | USBH_INTB EN | Per-Port Change Event | Doorbell | Port-1 Change Event | Async Advance | Frame List Rollover | Port Change | USB ERRINT | USB INT |
| 1 | Device connection is detected. | ○ | | | | | | ○ | | |
| 2 | Device disconnection is detected. | ○ | | | | | | ○ | | |
| 3 | Overcurrent is detected. | ○ | | | | | | ○ | | |
| 4 | RemoteWakeup signal (Resume Signal) is detected from a device. | ○ | | | | | | ○ | | |
| 5 | Babble status of the USB bus is detected. | ○ | | | | | | ○ | | |
| 6 | USB transfer with "qTD IOC = 1b" normally finishes. | ○ | | | | | | | | ○ |
| 7 | Short packet is received. | ○ | | | | | | | | ○ |
| 8 | USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.) | ○ | | | | | | | ○ | |
| 9 | The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b. | ○ | | ○ | | ○ | | | | |
| 10 | The FRINDEX Register FrameIndex bit returned from the maximum value to 000h (rollover detected). | ○ | | | | | ○ | | | |
| 11 | The Port Change Detect event (interrupt source 1 to 5) was detected. | ○ | ○ | | ○ | | | | | |

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset:124h) bit[17:16], bit[5:0]

32.4.2.4 U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[4] (WAKEON_INTEN)

EHCI Operational Register PORTSC[1:2] Register (offset:164h/168h) bit[22:20]*

Note: * Enable the bit required as the assertion source.

[Interrupt source]

| Interrupt Source | | Registers That Require Interrupt Enable Setting | | | |
|------------------|--|---|--------------------|------------------------|-----------------------|
| | | WAKEON _INTEN | PORTSC | | |
| | | | bit [22] WKOC_E | bit [21] WKDSCNNT_E | bit [20] WKCNTNT_E |
| 1 | Device connection is detected. | ○ | | | ○ |
| 2 | Device disconnection is detected. | ○ | | ○ | |
| 3 | Overcurrent is detected. | ○ | ○ | | |
| 4 | RemoteWakeup signal (Resume Signal) is detected from a device. | ○ | | | |

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:204h) bit[4] (WAKEON_INT)

32.4.2.5 U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:200h) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset:808h) bit[27:24], bit[18:16], bit[12:8], bit[3:0]*

Note: * Enable the bit required as the assertion source.

[Interrupt source]

| Interrupt Source | Registers That Require Interrupt Enable Setting | | |
|---------------------------|---|-------------|-------------|
| | OTG-BC Interrupt Enable | | |
| | | bit [17] | bit [16] |
| | UCOM_INTEN | DPMONCHG_EN | DMMONCHG_EN |
| 1 The DP pin has changed. | ○ | ○ | |
| 2 The DM pin has changed. | ○ | | ○ |

| Interrupt Source | Registers That Require Interrupt Enable Setting | | |
|---|---|--------------|--------------|
| | OTG-BC Interrupt Enable | | |
| | | bit [6] | bit [4] |
| | UCOM_INTEN | CHGDETCG1_EN | PDDETCHG1_EN |
| 1 The portable device detection signal has changed. | ○ | | ○ |
| 2 The charging port detection signal has changed. | ○ | ○ | |

| Interrupt Source | Registers That Require Interrupt Enable Setting | | | | |
|--|---|--------------|-------------|----------|----------|
| | OTG-BC Interrupt Enable | | | | |
| | | bit [3] | bit [2] | bit [1] | bit [0] |
| | UCOM_INTEN | VBSTAIN_T_EN | VBSTACHG_EN | OCINT_EN | IDCHG_EN |
| 1 It is detected that the value of the VBUSIN pin becomes equal to the value set to bit [21] (VBLVL) of the VBUS Control Register. | ○ | ○ | | | |
| 2 The VBUSIN pin has changed. | ○ | | ○ | | |
| 3 Overcurrent is detected. (The change of the OVRCUR pin from 1 to 0b is detected.) | ○ | | | ○ | |
| 4 The OTG_ID pin has changed. | ○ | | | | ○ |

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset:804h) bit[27:24], bit[18:16], bit[12:8], bit[3:0]

32.4.2.6 CC_INT assertion source and control

[Register interrupt enable control and interrupt source]

By the setting of bit [31] of the CC_STATUS register, you can change the interrupt source.

When bit [31] = 0: If the conditions in Table 32.56, Conditions for Detecting the Connection of a Peripheral Device are satisfied, an interrupt occurs.

When bit [31] = 1: According to the setting value of bit [28:24], an interrupt occurs.

Note: An unintended interrupt (CC_INT) might occur because of chattering of the CCn_Rd and CCn_Ra (n = 1, 2) pins. If an interrupt occurs, read the input status of the CCn_Rd and CCn_Ra pins, and confirm that they are preferable values. Then, start the interrupt processing.

[Interrupt clear]

When bit [31] = 0: If the input values of the CCn_Rd and CCn_Ra pins do not satisfy the conditions in Table 32.56, Conditions for Detecting the Connection of a Peripheral Device, an interrupt is cleared.

When bit [31] = 1: An interrupt is cleared by setting bit [29] to 1.

32.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

32.5 Power-Saving Function

This module controls power consumption by using the following two methods:

1. Controlling the SUSPENDM/SLEEPM pin of USBPHY
2. Using clock gating to stop the clock to the host controller or peripheral controller.

32.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USBPHY:

- Reducing the power consumption by the USBPHY
- Reducing the power consumption by the host core by stopping the clocks from the USBPHY

As described at section 32.1.2.5, Suspend extension function, by default, the SUSPENDM and SLEEPM pins of the USBPHY are not asserted even when EHCI and OHCI are put into the Suspended state.

See section 32.2.4.4, (6), Suspend Control Register (offset: 308h) and control the relevant registers appropriately.

32.5.2 Controlling the Clock-Gating Function

See section 32.2.4.4, (5), Register Enable/Clock Gating Control Register (offset: 304h) and section 32.3.1, Clock Gating Specifications”, then control the relevant registers appropriately.

32.6 Battery Charging

32.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.

Charging ports can be generally classified by function as described below.

Table 32.59 Function of Charging Port

| Type | Function |
|-----------------------------------|---|
| CDP (Charging Downstream Port) | Downstream port that can supply power in compliance with the Battery Charging Specification. This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host). |
| DCP (Dedicated Charging Port) | Port that provides only power supply function in compliance with the Battery Charging Specification. This type of charging port does not operate as the usual host. |
| SDP (Standard Downstream Port) | Standard Downstream Port that is not compliant with the Battery Charging Specification. This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host. |

Examples of control when the host controller is to be used as a charging port are described on the following pages.

32.6.1.1 When the host controller is to be used in the CDP mode

An example of the flow of control when the host controller is to be used in the CDP mode is shown below.

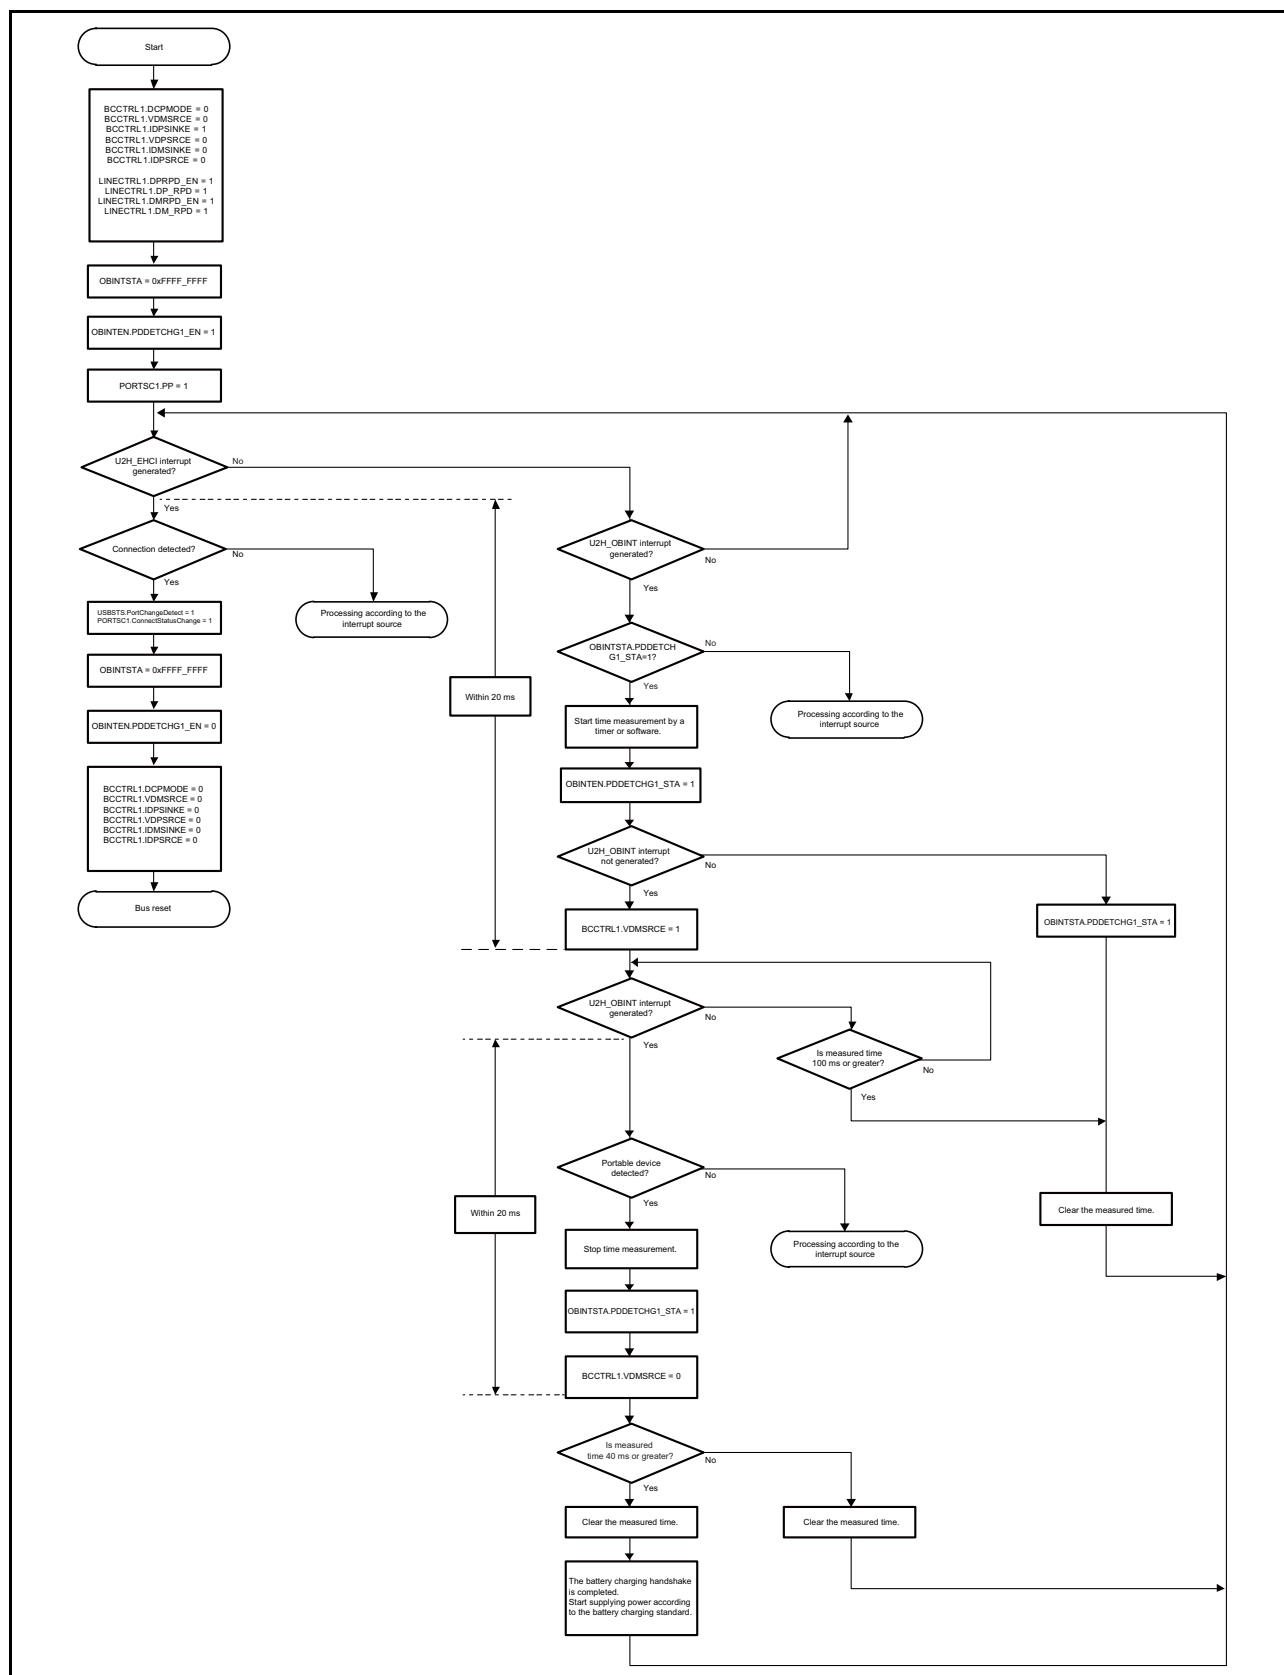

Figure 32.1 Example of the Control Flow in CDP Mode

32.6.1.2 When the host controller is to be used in the DCP mode

When the host controller is to be used in the DCP mode, make the following settings.

BCCTRL1 = 0x0300_0020

LINECTRL1 = 0x002A_0000

32.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.

An example of the flow of control when the peripheral controller is in use as a portable device is shown on the next page.

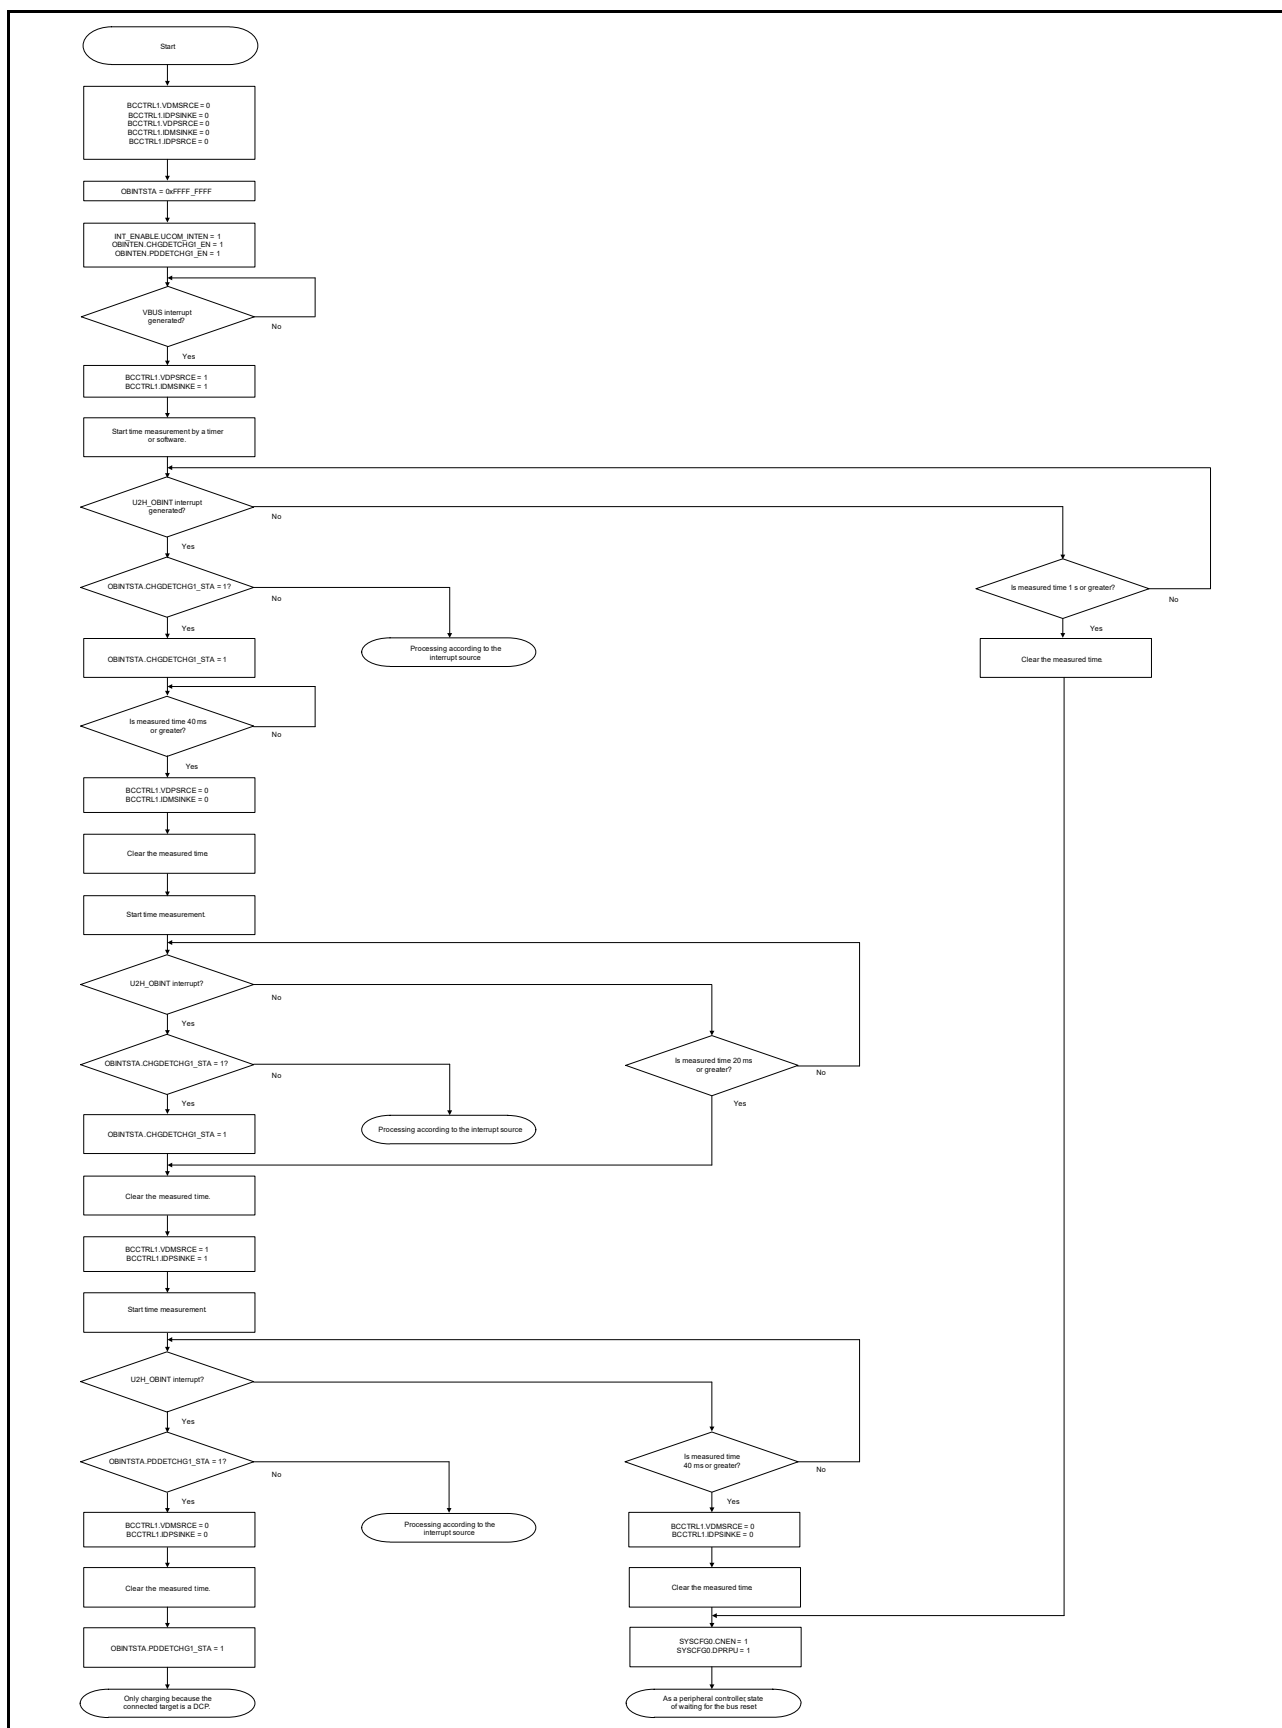

Figure 32.2 Example of the Control Flow for Portable Devices

32.7 Bus Master

32.7.1 Functional specifications of the bus master

32.7.1.1 Supported bus master functions

| Function as the BUS MASTER | Status |
|--|--|
| Residual burst after an error response is received | The transfer is not stopped. |
| 1 Kbyte boundary processing | The fixed length burst (INCRx) across 1 Kbyte boundary is not performed. |

32.7.1.2 Issuing requests for different types of bus transfer

| MHTRANS[1:0] | MHSIZE[2:0] | MHWRITE | MHBURST[2:0] | Reply | Remarks |
|--------------|-------------------------------|---------|------------------------------------|----------------|--|
| IDLE (00b) | — | — | — | — | — |
| BUSY (01b) | — | — | — | — | Not issued. |
| NONSEQ (10b) | 32-bit (010b) | WRITE | SINGLE INCR4 INCR8 INCR16 | OKAY/ ERROR | 32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped. |
| | | READ | | | |
| | | — | | | |
| | 8-bit (000b) 16-bit (001b) | WRITE | SINGLE | OKAY/ ERROR | 8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt. |
| | | — | | | |
| | other than the above | — | | | |
| SEQ (11b) | 32-bit (010b) | WRITE | INCR4 INCR8 INCR16 | OKAY/ ERROR | 32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped. |
| | | READ | | | |
| | | — | | | |
| | other than the above | — | — | — | Not issued. |

32.7.1.3 Supported responses

| Response type | Response | Remarks |
|---------------|----------|---|
| OKAY | Enable | Supported. |
| ERROR | Enable | A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed. |

32.7.1.4 Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: 208h).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

32.7.1.5 Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: 208h). The maximum burst length is common to reading and writing.

32.7.1.6 Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: 208h).

32.7.1.7 Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

| ALIGN_ADDRESS Setting | Fixed length Start Address of INCR Burst | | |
|--|--|--------------------|--------------------|
| | INCR4 | INCR8 | INCR16 |
| 00b (Aligned at the 1-Kbyte boundary) | MHADDR[9:0] = 000h | MHADDR[9:0] = 000h | MHADDR[9:0] = 000h |
| | 004h | 004h | 004h |
| | 008h | 008h | 008h |
| | 00Ch | 00Ch | 00Ch |
| | 010h | 010h | 010h |
| | : | : | : |
| | 3D0h | 3C8h | 3B8h |
| | 3D4h | 3CCh | 3BCh |
| | 3D8h | 3D0h | 3C0h |
| | 3DCh | 3D4h | |
| | 3E0h | 3D8h | |
| | 3E4h | 3DCh | |
| | 3E8h | 3E0h | |
| | 3ECh | | |
| | 3F0h | | |
| 01b (Aligned at the 16-byte boundary) | MHADDR[3:0] = 0h | -- (Not issued) | -- (Not issued) |
| 10b (Aligned at the 32-byte boundary) | MHADDR[4:0] = 00h | MHADDR[4:0] = 00h | -- (Not issued) |
| | 04h | | |
| | 08h | | |
| | 0Ch | | |
| | 10h | | |
| 11b (Aligned at the 64-byte boundary) | MHADDR[5:0] = 00h | MHADDR[5:0] = 00h | MHADDR[5:0] = 00h |
| | 04h | 04h | |
| | 08h | 08h | |
| | 0Ch | 0Ch | |
| | 10h | 10h | |
| | 14h | 14h | |
| | 18h | 18h | |
| | 1Ch | 1Ch | |
| | 20h | 20h | |
| | 24h | | |
| | 28h | | |
| | 2Ch | | |
| | 30h | | |

32.8 Overcurrent Control and VBUS Control

32.8.1 OVRCUR/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

| This module pin | Input/Output | Level | Description |
|-----------------|--------------|-------|--------------------------------------|
| OVRCURI | Input | L | Overcurrent status was detected. |
| | | H | Overcurrent status was not detected. |
| VBUSEN | Output | L | Port Power (VBUS) OFF |
| | | H | Port Power (VBUS) ON |

32.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCUR pin remains asserted (0b) for a set period.

The period over which assertion of the OVRCUR pin is required ("overcurrent detection time") can be set in the following register.

| Register | Overcurrent detection/sleep timer setting register (offset: 310h) |
|---------------|---|
| Bits | TIMER_OC[19:0] |
| Initial value | 3_0D40h |

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (B ϕ) cycle.

Therefore, set the value of the above register at initial configuration, considering "the internal bus clock (B ϕ) frequency to be used" and "the overcurrent detection time you want to specify".

32.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the PMODEPFS register on the general input/output port.

The following table describes control examples by the Port Power bit of the EHCI/OHCI Operational register.

| Situation | Register | | bit |
|--------------|------------------------|-------------|---|
| EHCI control | PORTSC1 (offset: 164h) | | bit 12 (PP) |
| OHCI control | Global control*1 | ON setting | HcRhStatus Register (offset: 050h) |
| | | OFF setting | bit 0 (Clear Port Status) |
| | Selective control*2 | ON setting | HcRhPortStatus1 Register (offset: 054h) |
| | | OFF setting | bit 8 (Set Port Power) |
| | | | bit 9 (Clear Port Power) |

Note 1. Global control refers to the status in which the register settings are as follows:

HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 0b

or

HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 1b and HcRhDescriptorB Register (offset: 04Ch) bit 17 (PPCM[1]) = 0b

Note 2. Selective control refers to the status in which the register settings are as follows:

HcRhDescriptorA Register (offset: 048h) bit 8 (PSM) = 1b and HcRhDescriptorB Register (offset: 04Ch) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCUR pin's status.

Specify the settings as necessary (for example, your system needs that VBUS is always ON).

| EHCI Operational HCSPARAMS (offset: 104h) | OHCI Operational HcRhDescriptorA (offset: 048h) | | | | HcRhDescriptorB (offset: 04Ch) | Pin Operation |
|---|---|-------------|-------------|------------------|-----------------------------------|--------------------------------------|
| PPC (bit 4) | NOCP (bit 12) | NPS (bit 9) | PSM (bit 8) | PPCM[1] (bit 17) | | When the OVRCUR pin is asserted (0b) |
| 0 | — | — | — | — | | Fixed to 1b |
| — | 1 | — | — | — | | Fixed to 1b |
| — | — | 1 | — | — | | Fixed to 1b |
| 1 | 0 | 0 | 0 | — | | 0b |
| | | | 1 | 0 | | |
| | | | | 1 | | |

32.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCUR and VBUSEN pins signals at overcurrent detection and recovery.

Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see section 32.8.3, Port Power (VBUS) control specifications) have not been made.

1. When the OVRCUR pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).
2. After the overcurrent status has been resolved, and de-assertion of the OVRCUR pin (1b) is confirmed, 1b is written to the Port Power bit described in section 32.8.3, Port Power (VBUS) control specifications to turn on the Port Power (Vbus).

Note: Before the Port Power bit is set by firmware, be sure to check that the OVRCUR pin has been deasserted.

32.9 Procedure for Setting this Module

32.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

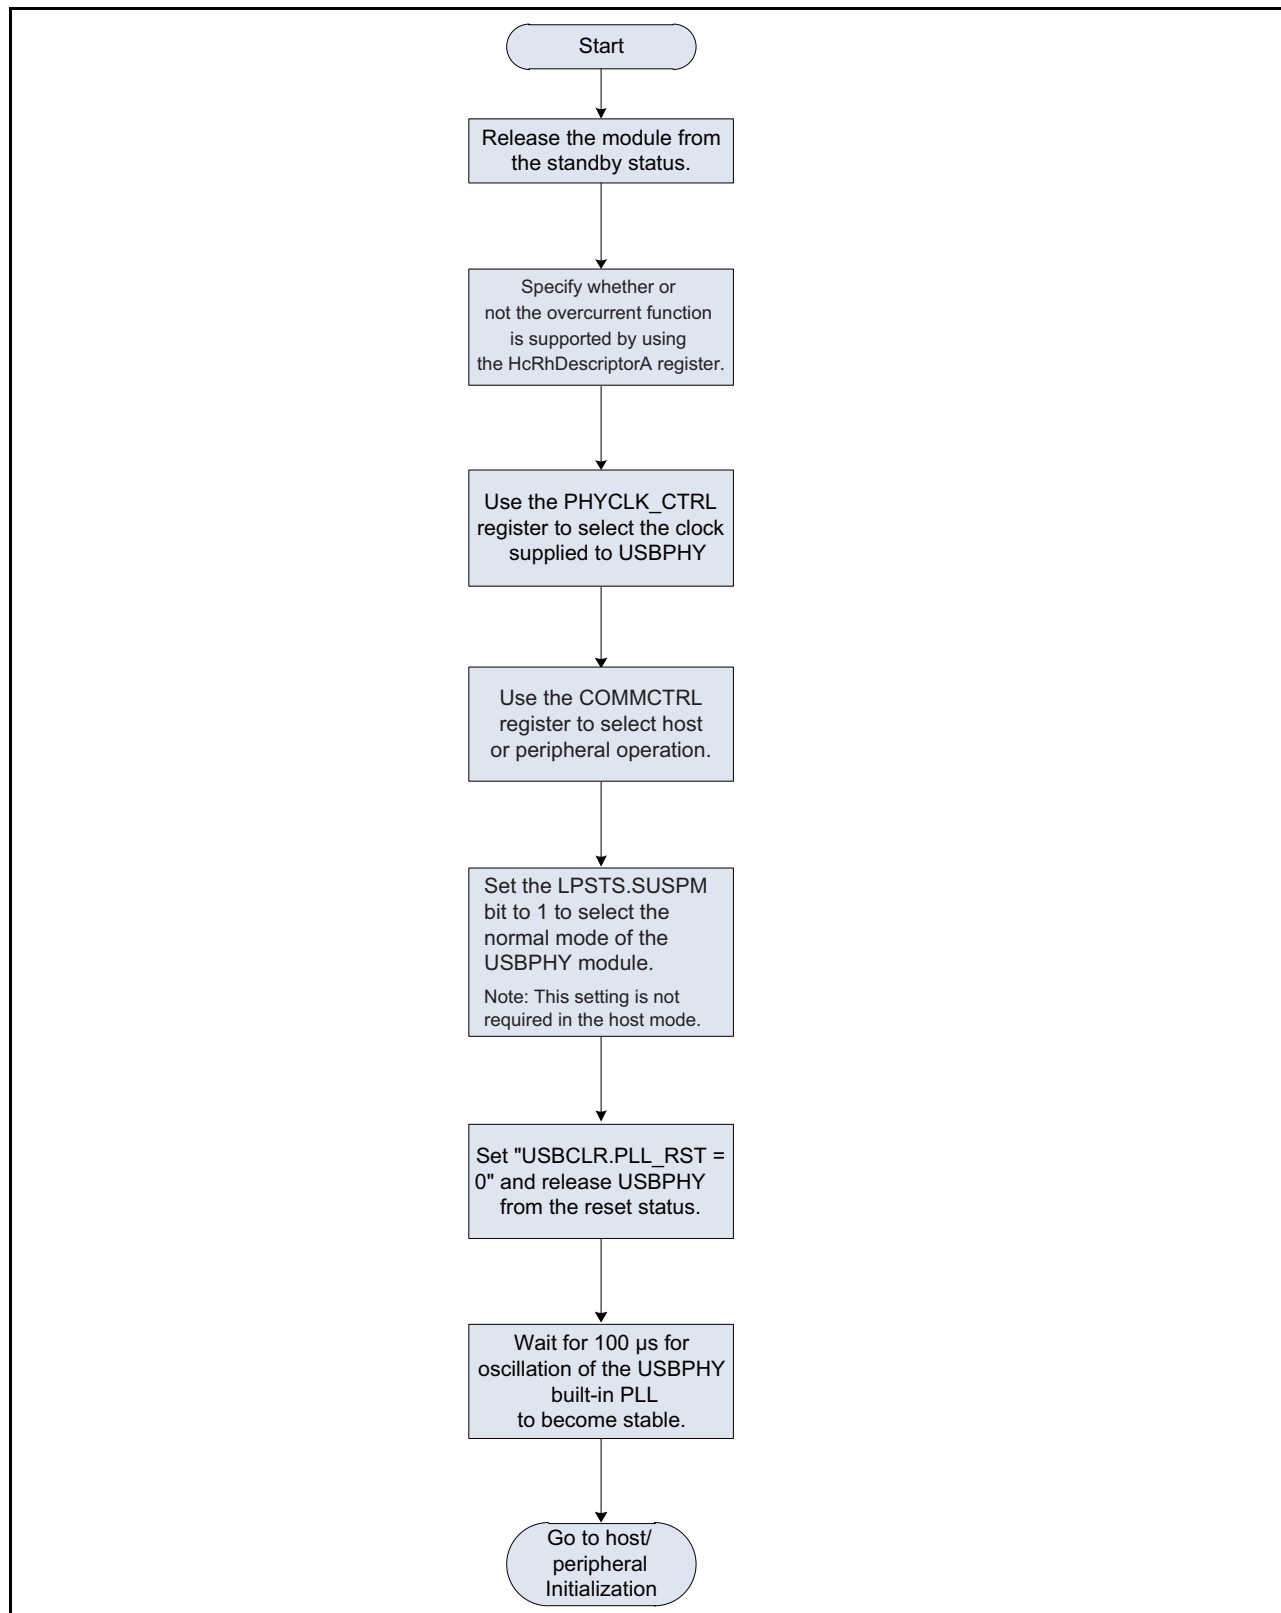

Figure 32.3 Sequence Common to Both Host and Peripheral Modes

32.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

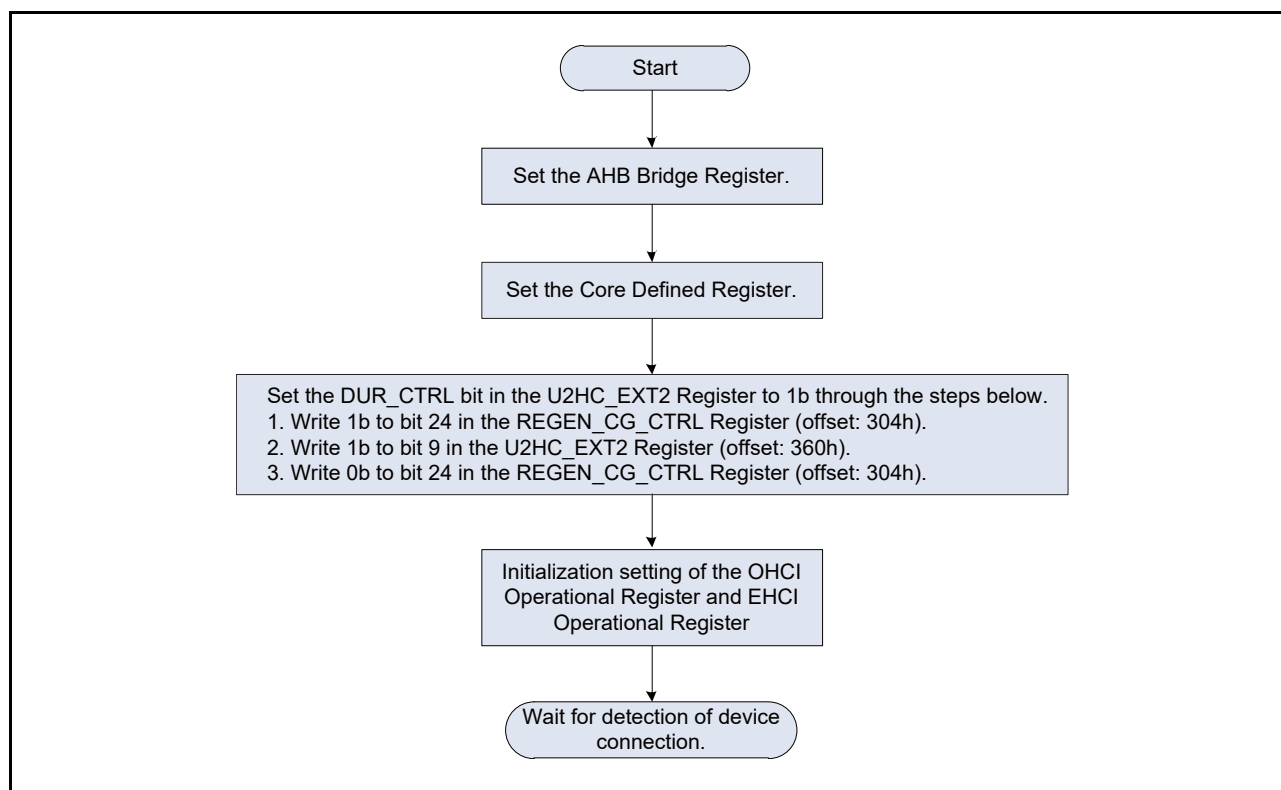

Figure 32.4 Initialization Sequence

32.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: 120h) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: 008h) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

32.10 CCn_Rd and CCn_Ra Pins

32.10.1 Notes on Using the CCn_Ra and CCn_Rd Pins

When the CCn_Ra and CCn_Rd ($n = 1$ or 2) pins are to be used, include a pull-up resistor R_p and pull-down resistor R_d in conformance with the USB specification, and an external circuit for use in checking the state of the resistance (voltage state) on the CC pins of the Type-C connector. After that, input the result of checking through the CCn_Ra and CCn_Rd pins.

The threshold values for use in checking are given in Table 32.60.

Table 32.60 Threshold Values for Use in Checking for Inputs on CCn_Ra and CCn_Rd

| Condition for Supply of USB Type-C VBUS | Threshold Value for CCn_Rd* | Threshold Value for CCn_Ra* |
|---|-----------------------------|-----------------------------|
| Default USB power (500 mA at 5 V) | 1.6 V | 0.2 V |
| 1.5 A at 5 V | 1.6 V | 0.4 V |
| 3.0 A at 5 V | 2.6 V | 0.8 V |

Note: * When the voltage is no less than the threshold, apply a high-level signal to the CCn_Ra and CCn_Rd pins. When the voltage is below the threshold, apply a low-level signal to the CCn_Ra and CCn_Rd pins.

32.11 Points for Caution

32.11.1 Actions after Device Disconnection

When a connected device is disconnected or an instruction to suspend the OHCI is executed after device disconnection, confirm the settings of the NPS (bit 9) and PSM (bit 8) bits in the HcRhDescriptorA register and the setting of the PPCM[1] (bit 17) bit in the HcRhDescriptorB register, and follow the flow that corresponds to the register setting in the list below.

Table 32.61 Register Setting and Corresponding Flows

| Register Setting | | | Corresponding Flows | |
|------------------|-------------|------------------|--|-----------------------------------|
| HcRhDescriptorA | | HcRhDescriptorB | Within 4 ms of device disconnection or OHCI suspension | |
| NPS (bit 9) | PSM (bit 8) | PPCM[1] (bit 17) | When the flow can be completed | When the flow cannot be completed |
| 0 | 1 | 1 | Flow 1 | Flow 5 |
| 0 | 1 | 0 | Flow 2 | Flow 6 |
| 0 | 0 | — | Flow 2 | Flow 6 |
| 1 | 1 | 1 | Flow 3 | Flow 7 |
| 1 | 1 | 0 | Flow 4 | Flow 8 |
| 1 | 0 | — | Flow 4 | Flow 8 |

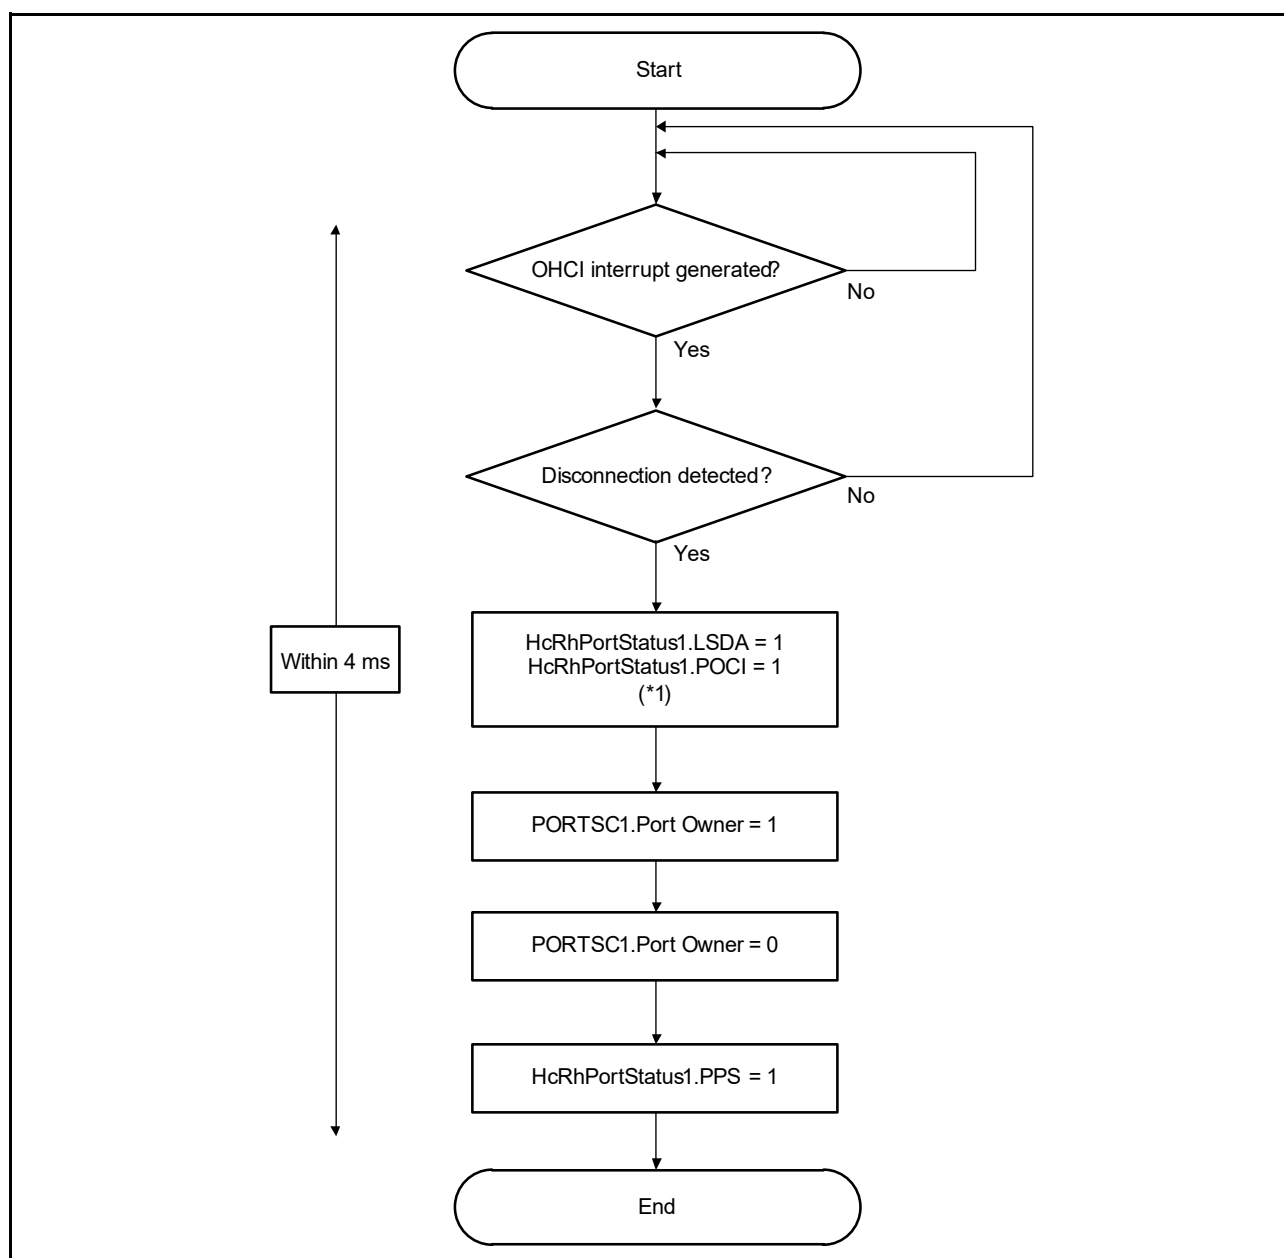

Figure 32.5 Flow 1

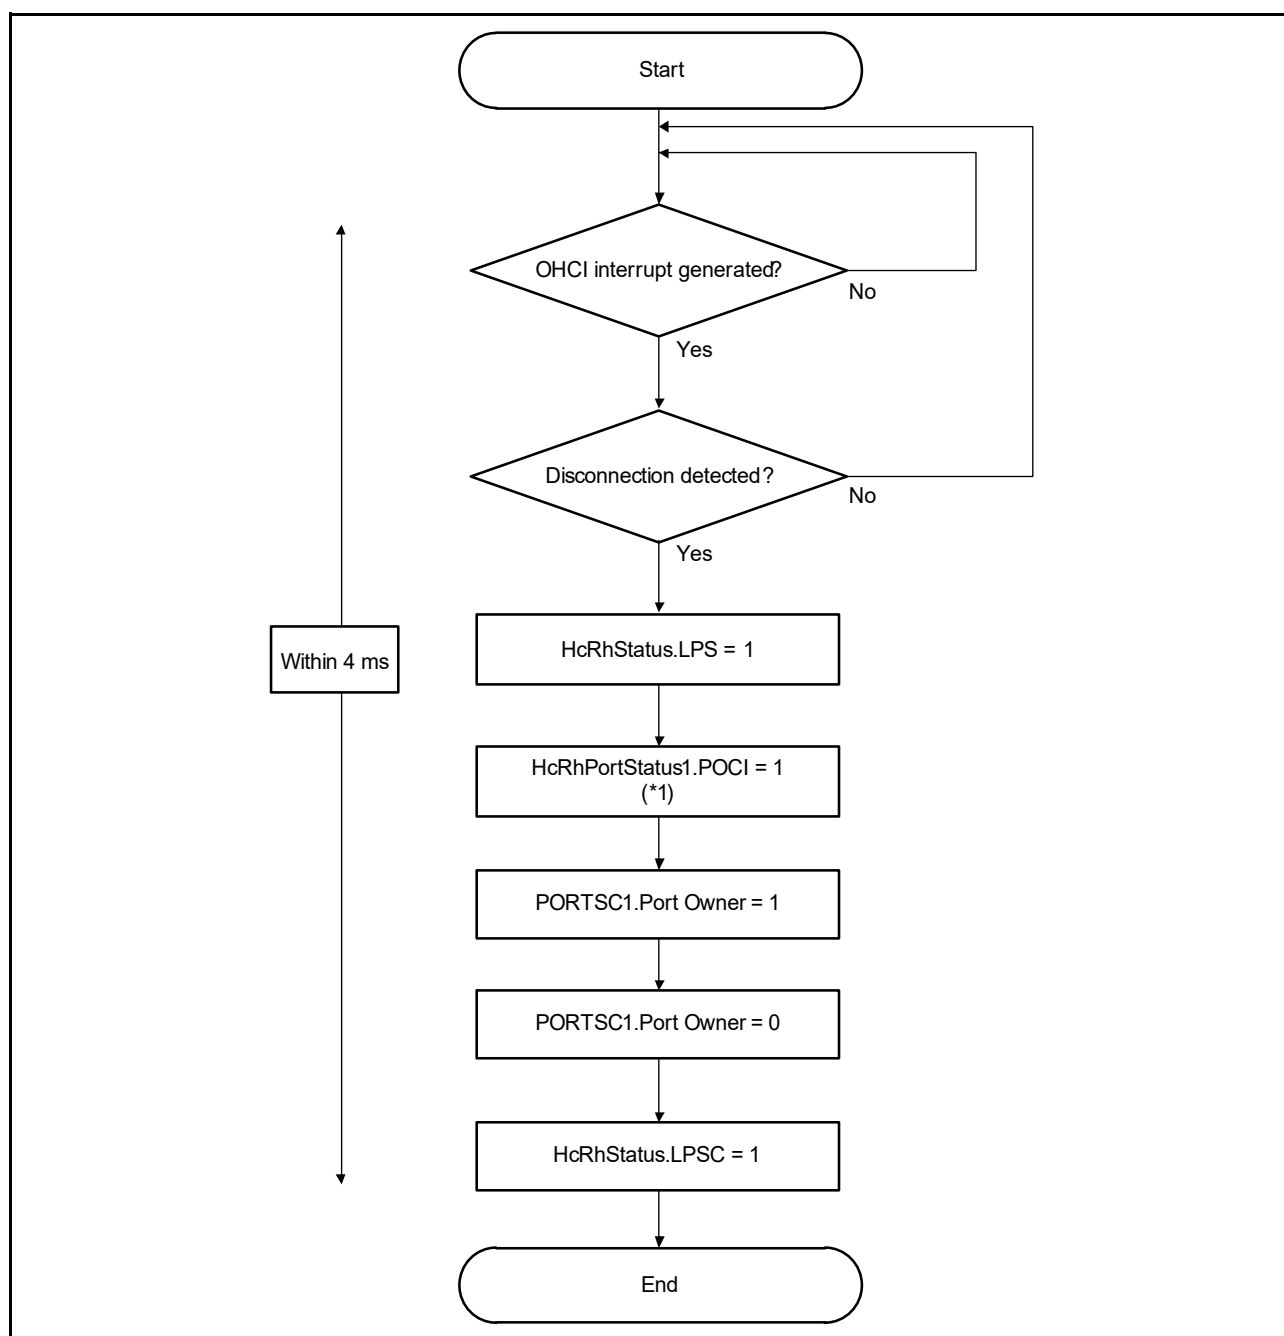

Figure 32.6 Flow 2

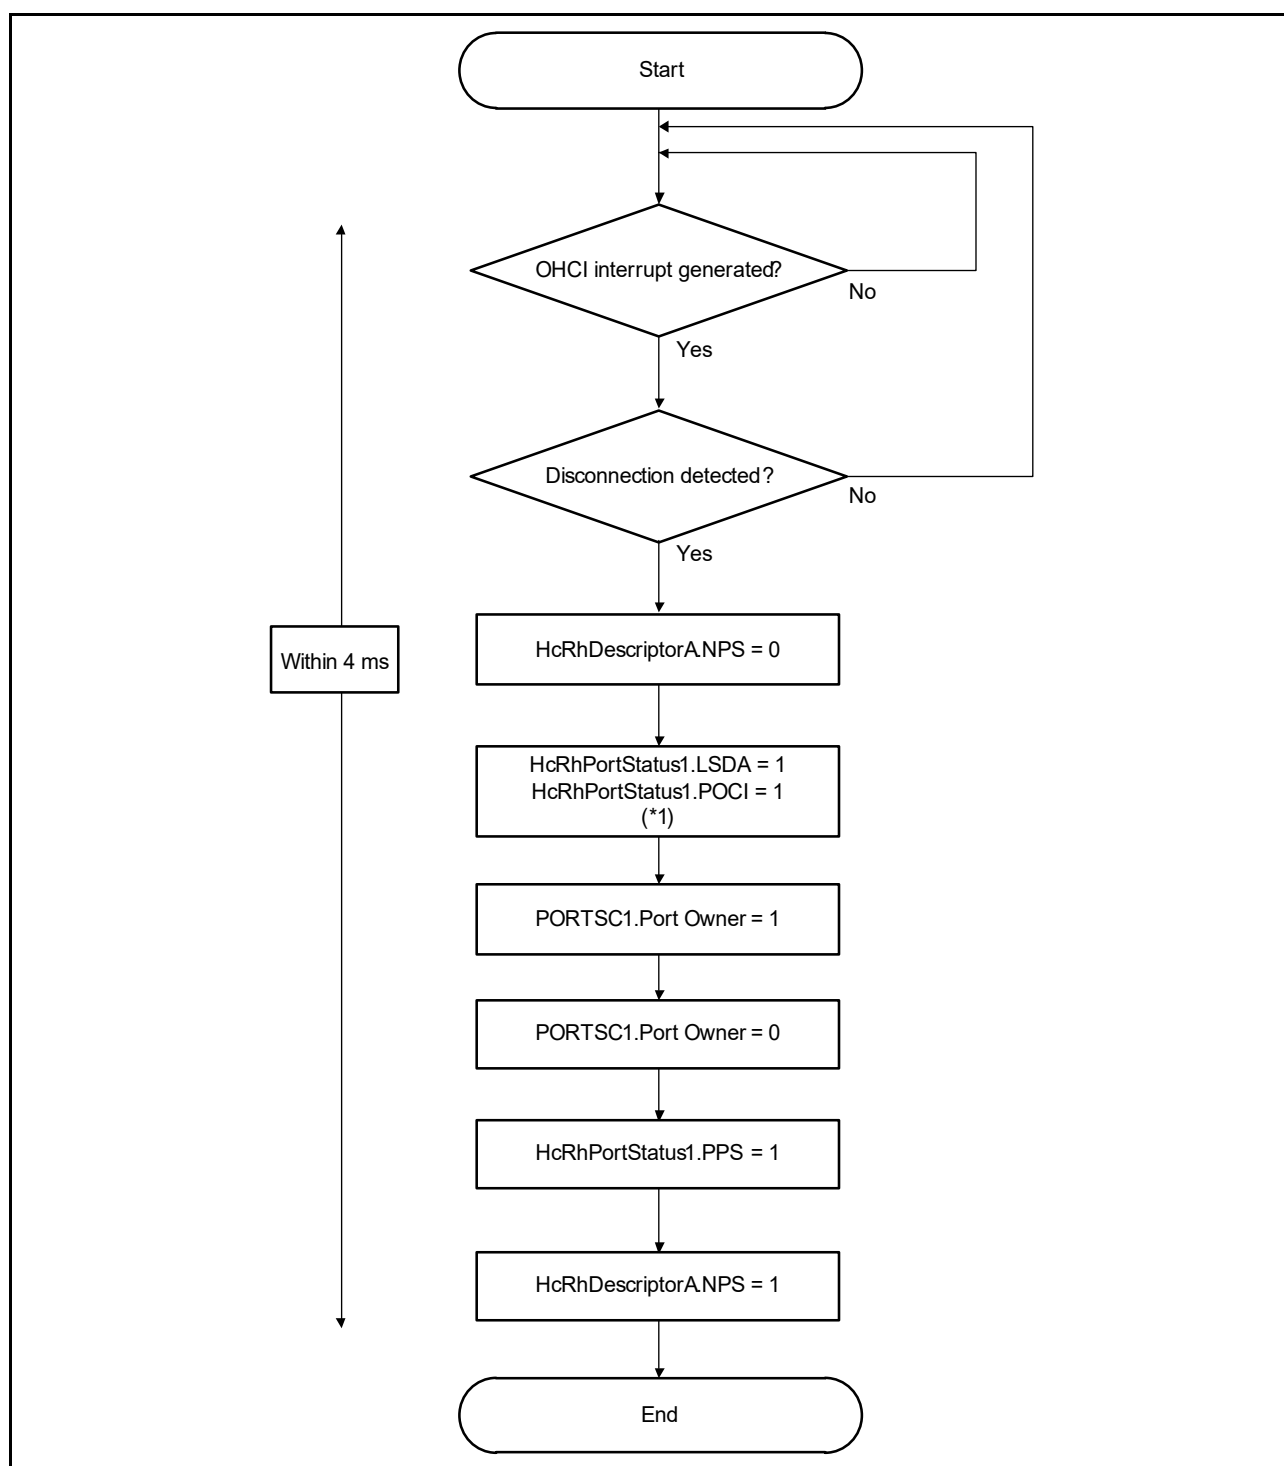

Figure 32.7 Flow 3

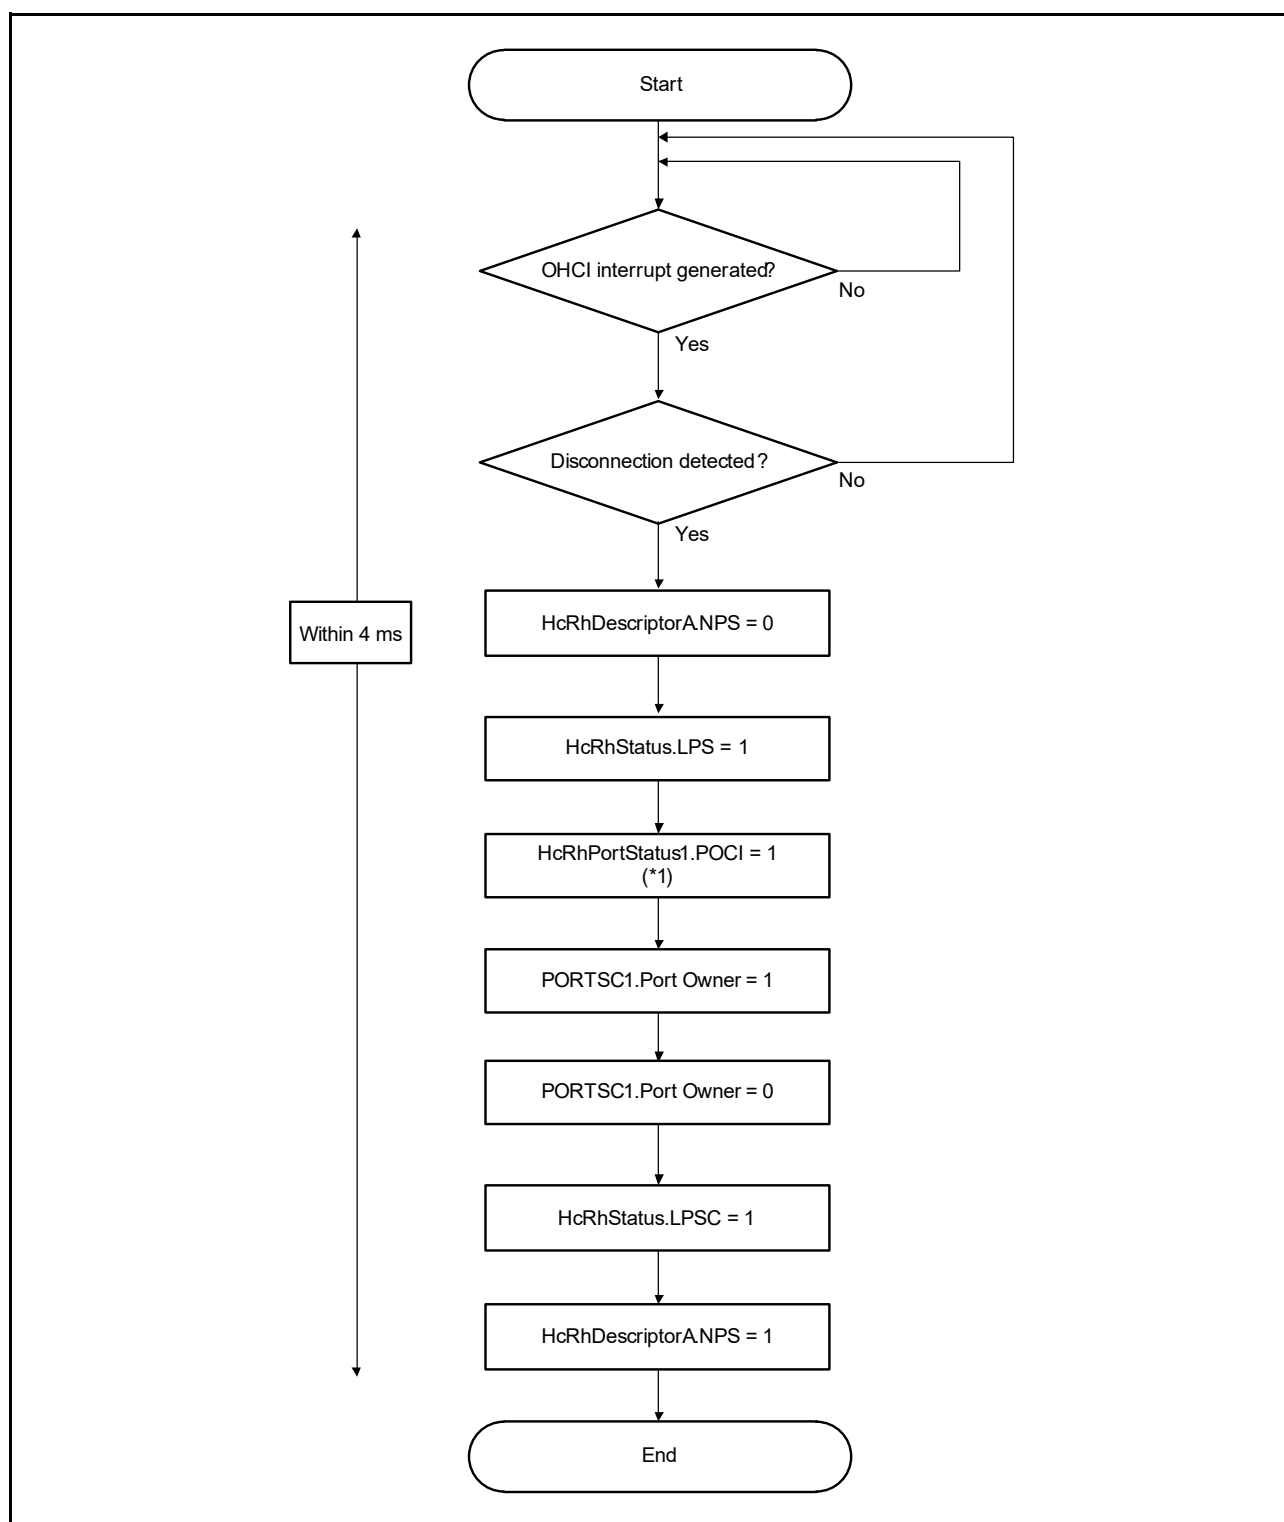

Figure 32.8 Flow 4

Point for caution on flows 1 to 4

Note 1. Making this setting leads to setting of the HcInterruptStatus.RHSC bit to 1, which causes the generation of an OHCI interrupt.

Since this interrupt is unnecessary, only clear the source bits (RHSC and CSC). Do not perform any other processing.

At this time, the settings of the bits in the HcRhPortStatus1 register which indicate the state of the port are as follows.

CCS = 0, PES = 0, CSC = 1, and PESC = 0

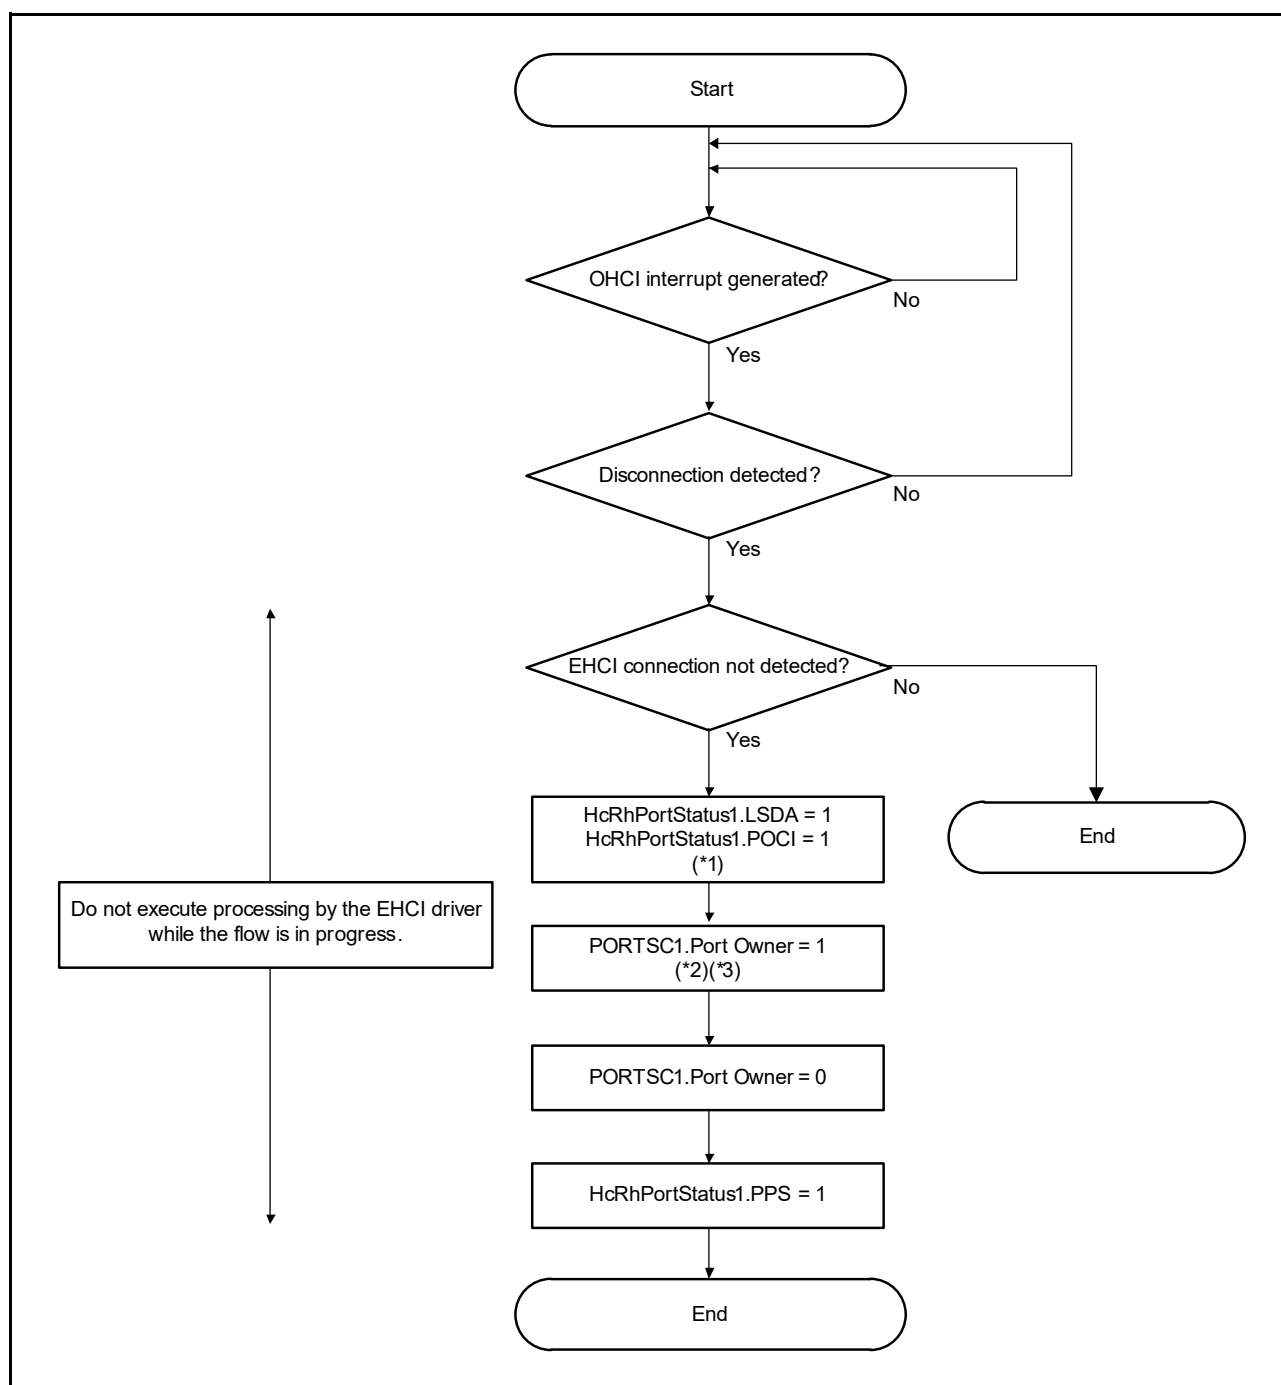

Figure 32.9 Flow 5

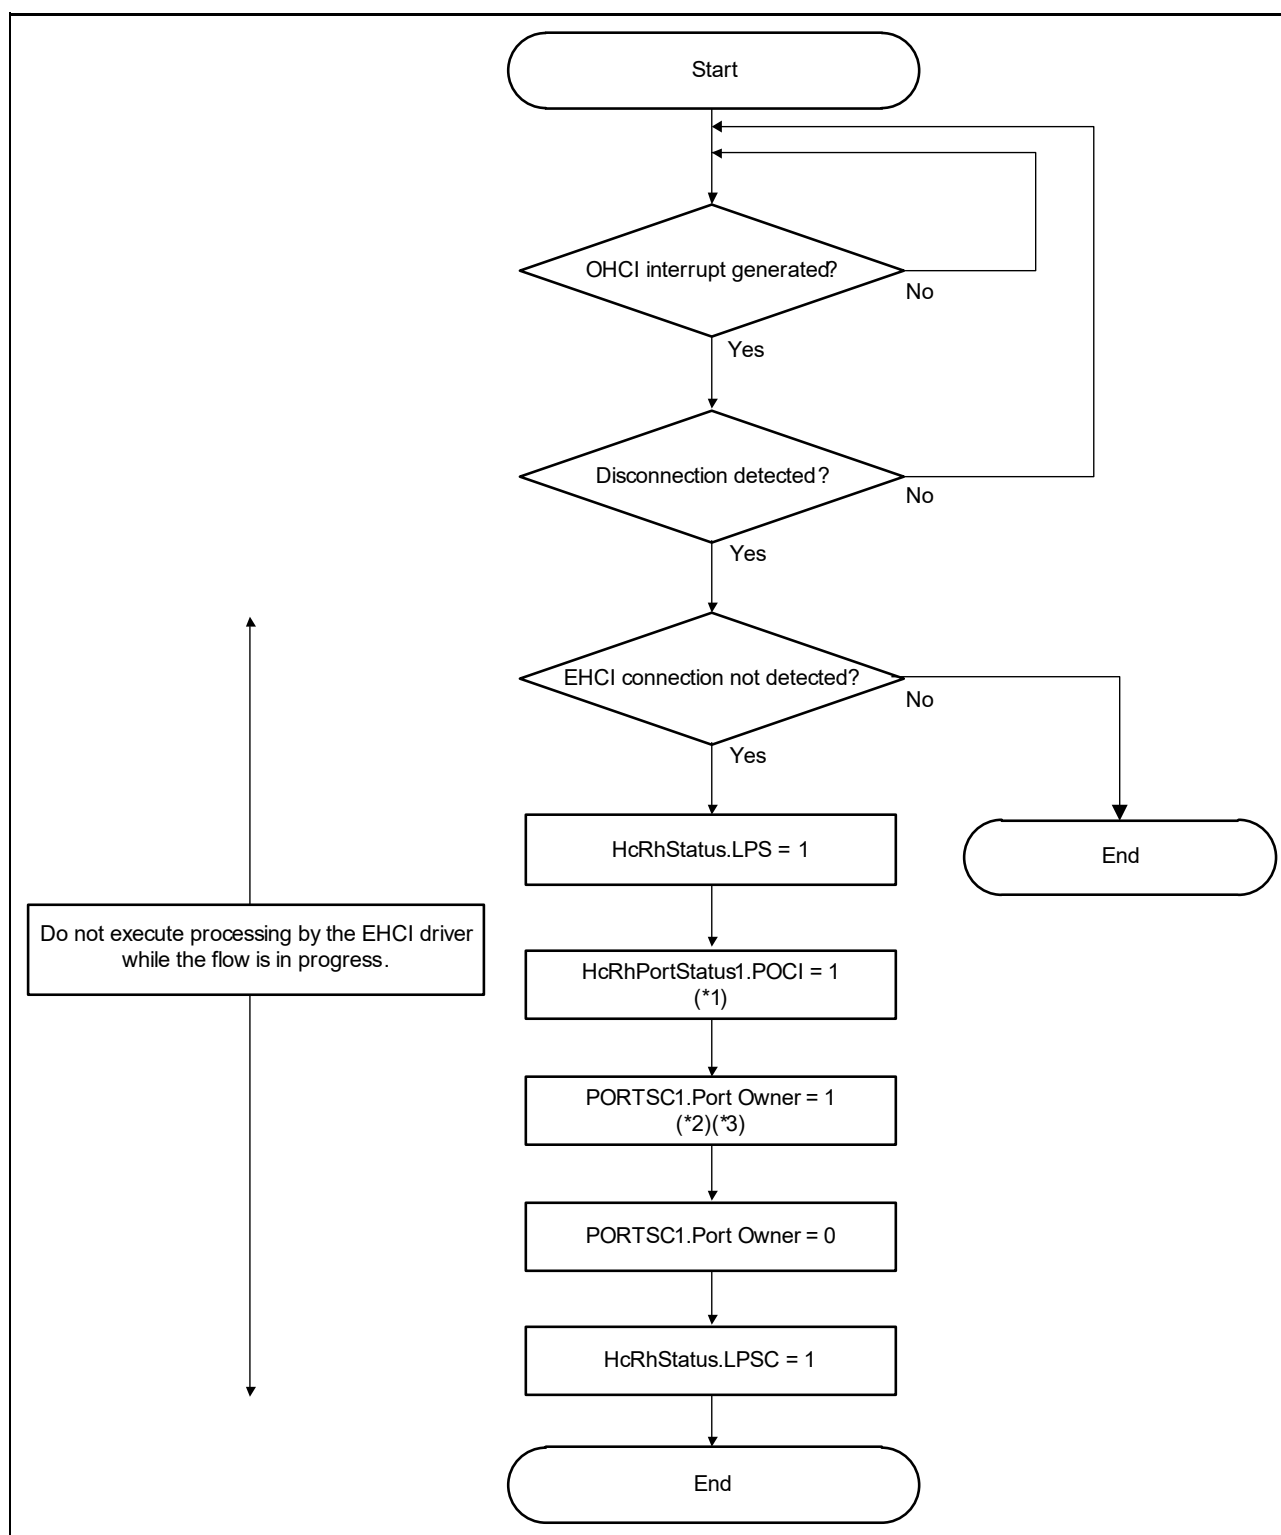

Figure 32.10 Flow 6

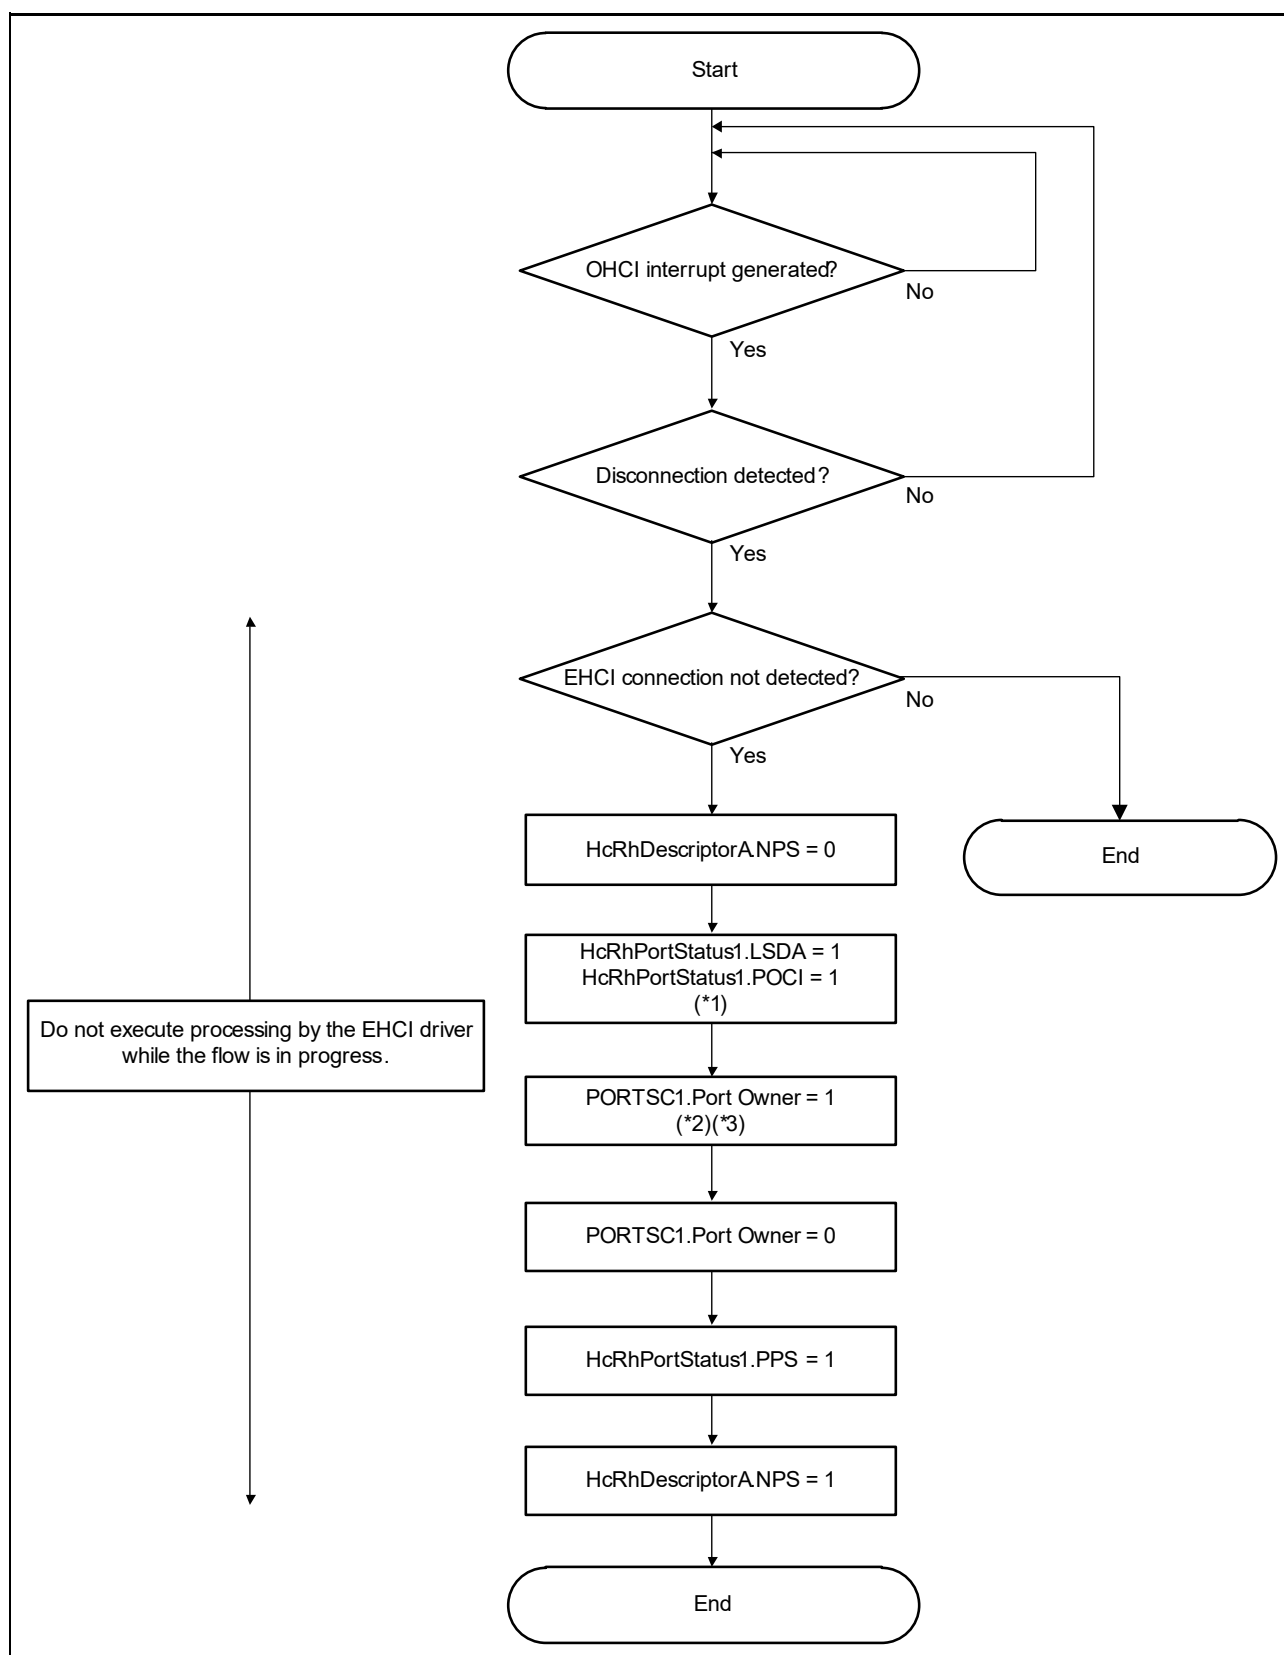

Figure 32.11 Flow 7

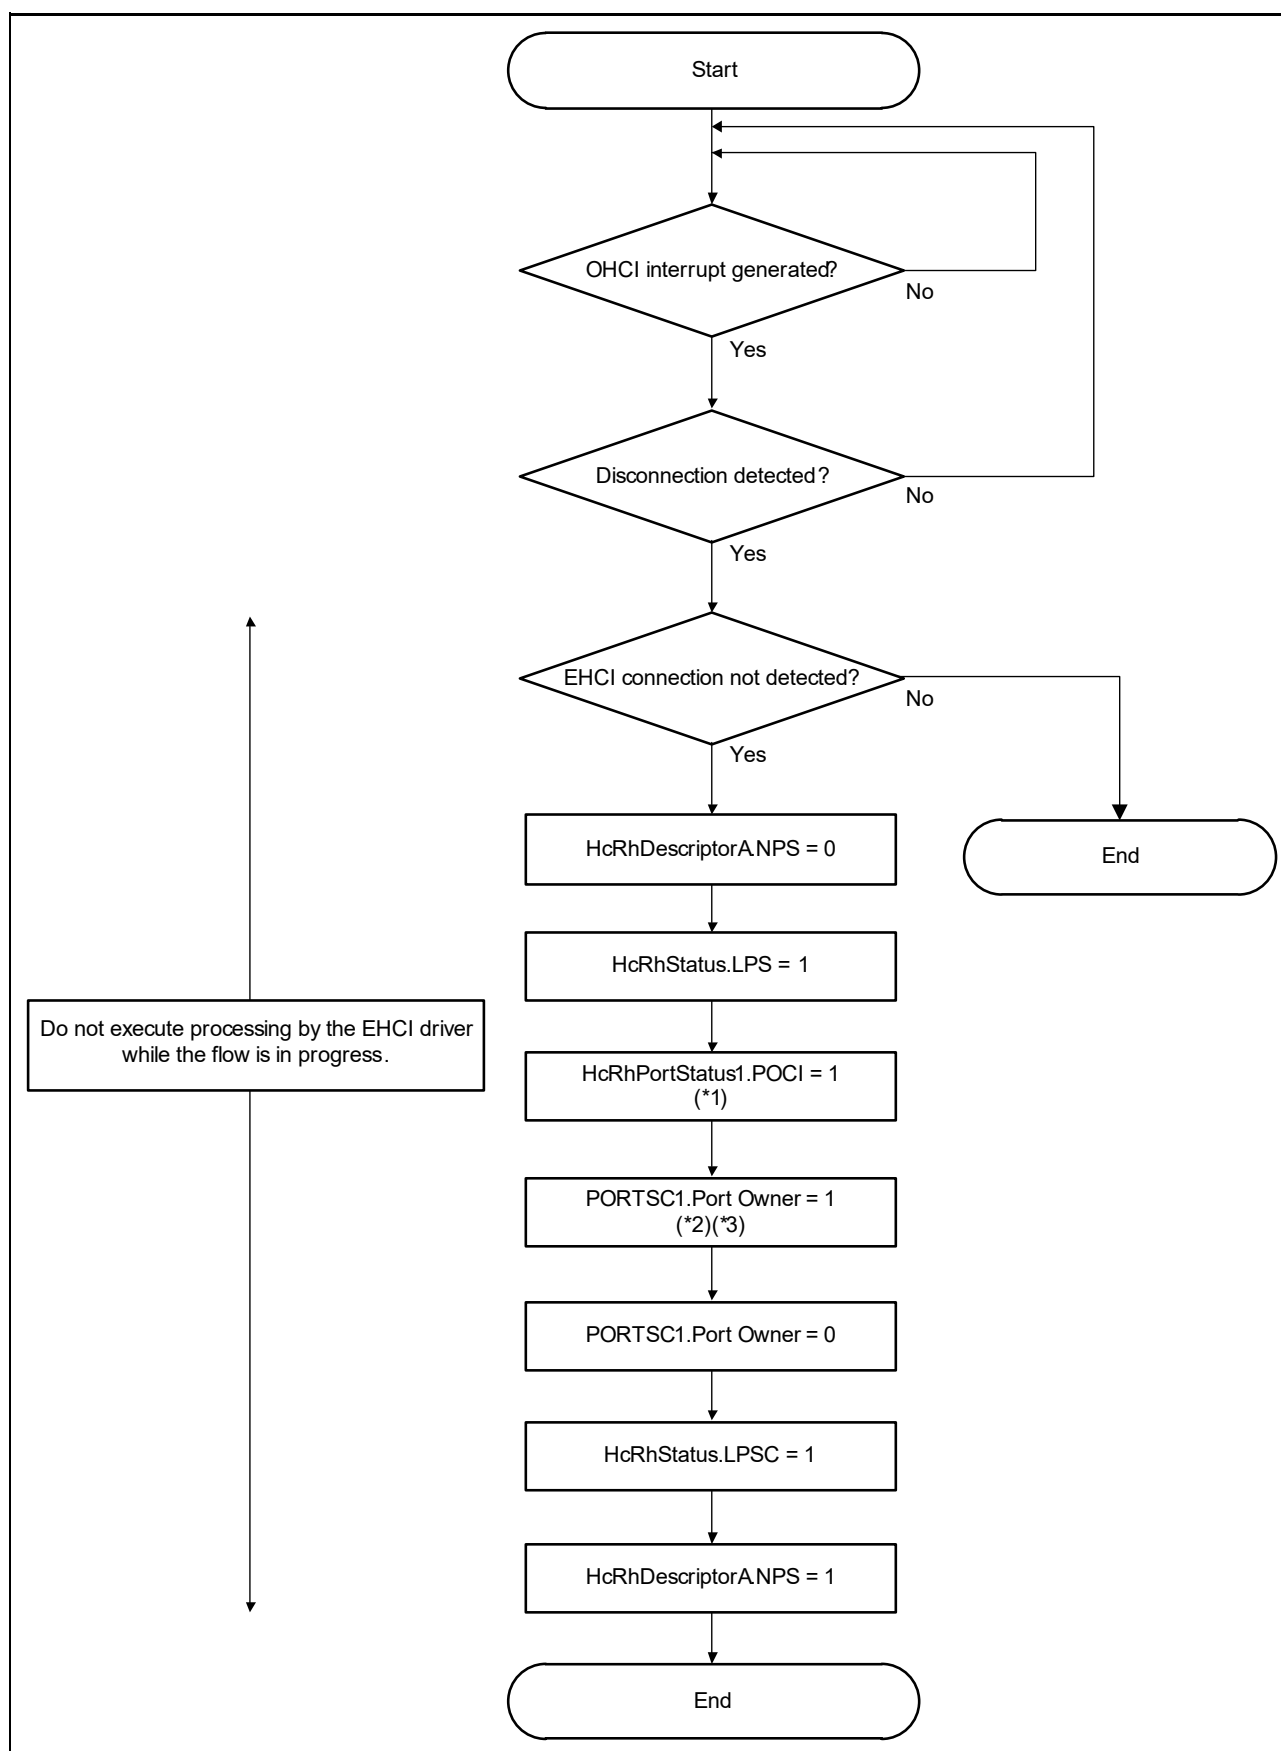

Figure 32.12 Flow 8

Points for caution on flows 5 to 8

- Note 1. Making this setting leads to setting of the HcInterruptStatus.RHSC bit to 1, which causes the generation of an OHCI interrupt.
Since this interrupt is unnecessary, only clear the source bits (RHSC and CSC). Do not perform any other processing.
At this time, the settings of the bits in the HcRhPortStatus1 register which indicate the state of the port are as follows.
CCS = 0, PES = 0, CSC = 1, and PESC = 0
- Note 2. No time constraint applies to these flows and a peripheral device can be reconnected while the flow is in progress.
However, contention between the detection of reconnection and this setting may lead to the HcInterruptStatus.RHSC bit being set to 1, which causes the generation of an OHCI interrupt. Since this interrupt is unnecessary, only clear the source bits (RHSC and CSC). Do not perform any other processing.
At this time, the settings of the bits in the HcRhPortStatus1 register which indicate the state of the port are as follows.
CCS = 0, PES = 0, CSC = 1, and PESC = 0
- Note 3. After reconnection of the peripheral device is detected, changing the port owner to the OHCI leads to setting of the USBSTS.PortChangeDetect bit to 1, which causes the generation of an EHCI interrupt. Note that processing by the EHCI driver must not proceed until this flow is completed.

33. USB 2.0 Function Module

33.1 Overview

33.1.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This chapter describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see [section 32, USB 2.0 Host Module](#).

This module is a universal serial bus (USB) controller that has peripheral functions.

This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 16 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

33.1.2 Features

33.1.2.1 Peripheral controller supporting high-speed USB

- On-chip peripheral USB controller

33.1.2.2 Support of all types of USB transfer

- Supporting all types of USB transfer, including isochronous transfer
- Control transfer
- Bulk transfer
- Interrupt transfer (high-bandwidth transfers not supported)
- Isochronous transfer (high-bandwidth transfers not supported)

33.1.2.3 Bus interface

- Includes a two-channel DMA interface

33.1.2.4 Pipe configuration

- 8 Kbytes of buffer memory for USB communications for each channel
- Up to 16 pipes (including the default control pipe) selectable for each channel
- Programmable pipe configuration
- Any endpoint number assignable to pipes other than pipe 0

Table 33.1 Pipe Settings

| PIPE | Transfer Type | Double buffer | Continuous transfer mode | Buffer size |
|--------|---------------|---------------|--------------------------|---|
| PIPE0 | Control | — | — | Fixed to 64 bytes/ 256 bytes (CNTMD = 1) |
| PIPE1 | Iso/Bulk | √ | √ (Bulk only) | Up to 2 Kbytes |
| PIPE2 | Iso/Bulk | √ | √ (Bulk only) | Up to 2 Kbytes |
| PIPE3 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE4 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE5 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE6 | Int | — | — | Fixed to 64 bytes |
| PIPE7 | Int | — | — | Fixed to 64 bytes |
| PIPE8 | Int | — | — | Fixed to 64 bytes |
| PIPE9 | Int/Bulk | √ (Bulk only) | √ (Bulk only) | Up to 2 Kbytes |
| PIPE10 | Int/Bulk | √ (Bulk only) | √ (Bulk only) | Up to 2 Kbytes |
| PIPE11 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE12 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE13 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE14 | Bulk | √ | √ | Up to 2 Kbytes |
| PIPE15 | Bulk | √ | √ | Up to 2 Kbytes |

33.1.2.5 Features of peripheral functions

- Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)
- Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Automatic response to SET_ADDRESS request
- NAK response interrupt (NRDY)
- SOF interpolation

33.1.2.6 Features of DMA transfer

| | |
|---------------------------------|--|
| DMA transaction mode: | Fetching in both register and link modes are supported. |
| Interrupt: | Level is supported. |
| Transfer size: | A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination. |
| Skip (scatter/gather) function: | The access size and skip size can be specified separately for the transfer source and destination. |
| Suspend function: | A running DMA transaction can be suspended temporarily. |
| Interval function: | The interval of DMA transfers can be specified to control the bus occupancy. |

33.1.2.7 Other functions

- Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)
- Transfer ending function using a transaction counter
- SOF pulse output function
- BRDY interrupt event notification timing change function (BFRE)
- Function (SHTNAK) to set NAK in the response PID when transfer ends
- Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

33.1.3 Overview of Functions

33.1.3.1 Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

(1) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

(a) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

(b) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

33.1.3.2 USB event

This module notifies the event in USB operation by issuing an interrupt.

You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

33.1.3.3 USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:

- (1) One pipe dedicated to control transfer
- (2) Three pipes dedicated to interrupt transfer
- (3) Eight pipes dedicated to bulk transfer
- (4) Two pipes selectively used for bulk or isochronous transfer
- (5) Two pipes selectively used for bulk or interrupt transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

33.1.3.4 SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

33.1.4 Restriction matter and Notes

33.1.4.1 Restriction matter

(1) Restrictions on the USB specifications

It's no support About below of USB 2.0 specification

- HighBandWidth transfer is no support

(2) Restrictions on DMA Master

- DAD = 1 (destination address fixed) and can not use skip transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use skip transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- DAD = 1 (destination address fixed), and can not use the beat unalign transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use beat unalign transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- When REQD = 1, SBE = 1 (sweep mode) and compulsion discharge function can not use.

33.1.4.2 Notes

(1) DMA transfer and passing problem of interrupt signal in DMA Master construction.

(a) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

(b) Plan to avoid

A plan to avoid the above problem is indicated below.

Plan to avoid 1) HPROT is set as non bufferable.

According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

(2) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

33.2 Registers

How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset

"Power on Reset" indicates the initial state at power-on reset.

The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.

Significant points regarding reset operation are indicated in notes.

"-" indicates that a user's setting is retained without this module operation having been performed.

"X" indicates that the value is undefined.

(4) Access condition: The condition to be met when this module accesses the register for an operation.

R: Reading only

W: Writing only

R/W: Reading or writing

R(0): 0-reading only

W(1): 1-writing only

(5) Name: Bit symbol and bit name

(6) Function: Description of functions.

<Example of description>

| | | | | | | | | | | | | | | | | |
|--------------------|----|-------|-------|-------|----|----|---|---|---|---|---|---|---|---|---|---|
| (1) Bit Number | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit Symbol | | A bit | B bit | C bit | | | | | | | | | | | | |
| (2) Power on Reset | X | 0 | 0 | 0 | | | | | | | | | | | | |
| USB Bus Reset | X | 0 | — | — | | | | | | | | | | | | |

| bit | Name | Function | R/W |
|-----|------------------------|---|-----------|
| 15 | — | Nothing is assigned. Fix this bit to 0. | |
| 14 | A bit AAA enable | 0: Disables operation 1: Enables operation | R/W |
| 13 | B bit BBB operation | 0: Outputs low-level signal 1: Outputs high-level signal | R |
| 12 | C bit CCC control | 0: ++++++ 1: ++++++ | R(0)/W(1) |
| | (5) | (6) | (4) |

33.2.1 Base Address

Table 33.2 Base addresses for each channel of the USB function module

| Channel number | Base address |
|----------------|--------------|
| 0 | E821 9000h |
| 1 | E821 B000h |

33.2.2 List of Registers

Table 33.3 lists the registers of this module.

Table 33.3 List of Registers

| Address | Symbol | Name | Access unit |
|---------|-----------|---|---------------|
| 000 | SYSCFG0 | System Configuration Control Register 0 | 16-bit |
| 002 | SYSCFG1 | System Configuration Control Register 1 | 16-bit |

| 720 | DST_SUS | DMA Status SUS Register | 32-bit |

33.2.3 System Configuration Control Registers

33.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: 000H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|------|-----|---|------|-------|---|---|---|------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | CNEN | HSE | — | DRPD | DPRPU | — | — | — | USBE |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-------|---|-----|
| 15 to 9 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 8 | CNEN | This bit prohibits or enables single-ended receiver operation. 0: Single-ended receiver operation prohibited 1: Single-ended receiver operation enabled | R/W |
| 7 | HSE | This bit prohibits or enables High-Speed operation. 0: High-Speed operation prohibited (Full-Speed) 1: High-Speed operation enable(The controller detects the communication speed.) | R/W |
| 6 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 5 | DRPD | D+/D- line resistor control Set this bit to 0 to use this module. For details, see Control of USB Data Bus Resistors. | R/W |
| 4 | DPRPU | D+ line resistor control This bit prohibits or enables D+ line pull-up for the peripheral controller function. For details, see Control of USB Data Bus Resistors. 0: Pull Up prohibited 1: Pull Up enabled | R/W |
| 3 to 1 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 0 | USBE | USB block operation prohibited This bit prohibits or enables USB block operation. 0: USB block operation prohibited 1: USB block operation enabled | R/W |

Note: Data can be written to and read from this register even while the UTMI+PHY clock is stopped.
However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function takes effect after the oscillation of UTMI+PHY clock starts.

(1) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.

Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

(2) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

When the HSE bit is 0, this module performs a full-speed operation.

When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

(3) D+/D- line resistor control (DRPD or DPRPU) bit

Table 33.4 shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 33.4 Control of USB Data Bus Resistors

| Setting | | Control of USB Data Bus Resistors | | |
|---------|-------|-----------------------------------|-----------|---|
| DRPD | DPRPU | D- Line | D+ Line | Remarks |
| 0 | 0 | Open | Open | |
| 0 | 1 | Open | Pull-Up | Specify the settings as shown in the left. |
| 1 | 0 | Pull-Down | Pull-Down | Initial state (When power on reset is canceled) |
| 1 | 1 | Pull-Down | Pull-Up | Setting prohibited |

(a) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V.

Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

(4) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.

When this bit is changed from 1 to 0, this module initializes the bits shown in Table 33.5.

Table 33.5 Register Bits That Are Initialized by Writing 0 to the USBE Bit

| Register Name | Bit Name |
|---------------|---------------------------|
| SYSSTS0 | LNST |
| DVSTCTR0 | RHST |
| INTSTS0 | DVSQ |
| USBADDR | USBADDR |
| USBREQ | bRequest bmRequestType |
| USBVAL | wValue |
| USBINDX | wIndex |
| USBLENG | wLength |

Note: Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

33.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: 002H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|---|---|-------|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | — | — | — | BWAIT | | | | | |
| 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|-------|---|-----|
| 15 to 12 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 11 to 8 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 7, 6 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 5 to 0 | BWAIT | CPU bus access wait specification These bits specify the number of wait cycles for the access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (default) : 111111: 63 wait cycles (65 access cycles) | R/W |

(1) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.

The following restriction is placed on the cycle of the access to the registers at address 04H or after of this module:

Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock ($B\phi$) frequency. The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:

MBW = 10 (32-bit access width): max 60 MBytes/sec

MBW = 01 (16-bit access width): max 30 MBytes/sec

MBW = 00 (8-bit access width): max 15 MBytes/sec

33.2.4 System Configuration Status

33.2.4.1 System Configuration Status Register (SYSSTS0) <Address: 004H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|---|---|---|---|---|---|------|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | LNST | |
| — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|---|-----|
| 15 to 2 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 1, 0 | LNST | USB Line status monitor The USB line status is displayed. Note: See the detailed description. | R |

(1) Line status monitor (LNST) bits

Table 33.6 shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 33.6 Line Status of USB Data Bus

| LNST [1] | LNST [0] | Full-Speed operation | High-Speed operation | Chirp operation |
|----------|----------|----------------------|----------------------|-----------------|
| 0 | 0 | SE0 | Squelch | Squelch |
| 0 | 1 | J State | Unsquelch | Chirp J |
| 1 | 0 | K State | Invalid | Chirp K |
| 1 | 1 | SE1 | Invalid | Invalid |

Note: Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
 Squelch: SE0 or idle state
 Unsquelch: High-speed J or high-speed K state
 Chirp J: Chirp J State
 Chirp K: Chirp K State

33.2.5 USB Signal Control Registers

33.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: 008H>

| | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|---|------|---|---|---|---|---|------|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BRST 1 | — | — | — | — | — | — | WKUP | — | — | — | — | — | RHST | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | 0 | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-------|---|--------|
| 15 | BRST1 | This bit is used in resumption in response to a bus reset. Set this bit according to 33.9.16.3, Flowchart of resumption from deep standby in response to a bus reset. Operation cannot be guaranteed if the procedure in the flowchart is not observed. | R/W |
| 14 to 9 | — | Nothing is assigned to these bits. Fix these bits to 0. | — |
| 8 | WKUP | Remote wakeup output This bit prohibits or enables Remote wakeup (resume signal output). 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output. | R/W(1) |
| 7 to 3 | — | Nothing is assigned to these bits. Fix these bits to 0. | — |
| 2 to 0 | RHST | Reset handshake This bit indicates the reset handshake status. Note: See the detailed description. | R |

(1) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.

This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.

The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.

When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 μ s, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

(2) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. Table 33.7 lists the results of reset handshake.

Table 33.7 Reset Handshake Status

| Bus State | Value of RHST Bit |
|-------------------------------|-------------------|
| Powered or disconnected state | 000 |
| Reset handshake in process | 100 |
| Full-speed connection | 010 |
| High-speed connection | 011 |

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

33.2.6 Test Mode Register

33.2.6.1 USB Test Mode Register [TESTMODE] <Address: 00CH>

| | | | | | | | | | | | | | | | |
|----|-----------|----|----|-----------|----|---|---|---|---|---|---|------|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | BRST 2 | — | — | BRST 3 | — | — | — | — | — | — | — | UTST | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-------|---|-----|
| 15 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 14 | BRST2 | This bit is used in resumption in response to a bus reset. Set this bit according to 33.9.16.3, Flowchart of resumption from deep standby in response to a bus reset. Operation cannot be guaranteed if the procedure in the flowchart is not observed. | R/W |
| 13, 12 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 11 | BRST3 | This bit is used in resumption in response to a bus reset. Set this bit according to 33.9.16.3, Flowchart of resumption from deep standby in response to a bus reset. Operation cannot be guaranteed if the procedure in the flowchart is not observed. | R/W |
| 10 to 4 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 3 to 0 | UTST | Test mode See the detailed description. | R/W |

(1) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.

Table 33.8 lists the test modes of this module.

Table 33.8 List of test mode operation

| Test mode | Value of UTST Bits |
|-------------------|--------------------|
| Normal operation | 0000 |
| Test_J | 0001 |
| Test_K | 0010 |
| Test_SE0_NAK | 0011 |
| Test_Packet | 0100 |
| Test_Force_Enable | — |
| Reserved | 0101 to 0111 |

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication.

When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.

To perform a normal USB communication after setting a test mode, perform Power on reset.

33.2.7 FIFO Port Registers

33.2.7.1 CFIFO Port Register [CFIFO] <Address: 014H>

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| FIFOPORT (Low) | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

33.2.7.2 CFIFO Port Register [CFIFO] <Address: 016H>

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| FIFOPORT (High) | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|----------|---|-----|
| 31 to 0 | FIFOPORT | FIFO port These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer. | R/W |

(1) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

1. The CFIFO port must be used to access the FIFO buffer through the DCP.
2. When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
3. The registers configured for a FIFO port do not affect any other FIFO ports.
4. The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

(2) FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).

The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in Table 33.9 to Table 33.11.

Table 33.9 Endian Operation in 32-Bit Access (When MBW = 10)

| BIGEND | b31 to b24 | b23 to b16 | b15 to b8 | b7 to b0 |
|--------|---------------|---------------|---------------|---------------|
| 0 | N + 3 address | N + 2 address | N + 1 address | N + 0 address |
| 1 | N + 0 address | N + 1 address | N + 2 address | N + 3 address |

Table 33.10 Endian Operation in 16-Bit Access (When MBW = 01)

| BIGEND | b31 to b24 | b23 to b16 | b15 to b8 | b7 to b0 |
|--------|---|----------------------|---|----------------------|
| 0 | Writing: invalid Reading: prohibited*1 | | •even-numbered address | odd-numbered address |
| 1 | even-numbered address | odd-numbered address | Writing: invalid Reading: prohibited*1 | |

Table 33.11 Endian Operation in 8-Bit Access (When MBW = 00)

| BIGEND | b31 to b24 | b23 to b16 | b15 to b8 | b7 to b0 |
|--------|---|---|-----------|----------------------------------|
| 0 | Writing: invalid Reading: prohibited*1 | | | Writing: valid Reading: valid |
| 1 | Writing: valid Reading: valid | Writing: invalid Reading: prohibited*1 | | |

Note: Reading words or bytes from an invalid register is prohibited.

33.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: 020H>

| | | | | | | | | | | | | | | | |
|------|-----|----|----|-----|----|---|--------|---|---|------|---|---------|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RCNT | REW | — | — | MBW | | — | BIGEND | — | — | ISEL | — | CURPIPE | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|--------|---------|---|--------|
| 15 | RCNT | Read count mode This bit specifies DTLN read mode for the CFIFOCTR register. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read. | R/W |
| 14 | REW | Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer. | R(0)/W |
| 13, 12 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 11, 10 | MBW | CFIFO port access bit width This bit specifies the bit width for access to the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited | R/W |
| 9 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 8 | BIGEND | FIFO port byte endian control This bit specifies the byte endian of the CFIFO port. 0: Little endian 1: Big endian | R/W |
| 7, 6 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 5 | ISEL | FIFO port access direction with DCP selected This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits. 0: Selects reading of buffer memory. 1: Selects writing of buffer memory. | R/W |
| 4 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 3 to 0 | CURPIPE | FIFO port access pipe specification This bit specifies the pipe number used for accessing the CFIFO port. 0000: DCP 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15 | R/W |

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.

If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.

Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.

For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.

When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.

Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

(4) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.

For details see section 33.2.7.2 (1), FIFO port control bits (for FIFOPORT).

(5) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

Set this bit simultaneously with setting of the CURPIPE bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

33.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address: 028H> D1FIFO Port Select Register [D1FIFOSEL] <Address: 02CH>

| | | | | | | | | | | | | | | | |
|------|-----|-------|-------|-----|----|---|---|---|---|---|---|---------|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RCNT | REW | DCLRM | DREQE | MBW | | — | — | — | — | — | — | CURPIPE | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|--------|---------|---|--------|
| 15 | RCNT | Read count mode This bit specifies Dx_FIFOCTR DTLN read mode. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read. | R/W |
| 14 | REW | Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer. | R(0)/W |
| 13 | DCLRM | Automatic buffer memory clear mode after reading data through the specified pipe This bit prohibits or enables automatic buffer memory clear after data is read through the specified pipe. 0: Automatic FIFO buffer clear prohibited 1: Automatic FIFO buffer clear enabled | R/W |
| 12 | DREQE | UCL_Dx_DREQ output enable This bit prohibits or enables the output of the UCL_Dx_DREQ signal. 0: Output prohibited 1: Output enabled | R/W |
| 11, 10 | MBW | DxFIFO port access bit width This bit specifies the bit width for access to the DxFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited | R/W |
| 9 to 4 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 3 to 0 | CURPIPE | FIFO port access pipe specification 0000: No specification 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15 | R/W |

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the Dx_FIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the Dx_FIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the "BCLR = 1" processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.

Always clears this bit when you use this module with the BRDYM bit set.

(4) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.

When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits.

When changing the value of the CURPIPE bits, change the value always after clearing this bit.

(5) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port.

For details, see 33.2.7.3, (3), CFIFO port access bit width (MBW) bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

33.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: 022H> D0FIFO Port Control Register [D0FIFOCTR] <Address: 02AH> D1FIFO Port Control Register [D1FIFOCTR] <Address: 02EH>

| | | | | | | | | | | | | | | | |
|------|------|------|----|------|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BVAL | BCLR | FRDY | — | DTLN | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|--|-----------|
| 15 | BVAL | Buffer memory valid flag Specify 1 for this bit when writing to the FIFO buffer on the CPU side through the pipe specified in CURPIPE (current pipe) ends. 0: Invalid 1: Writing complete | R/W(1) |
| 14 | BCLR | CPU buffer clear Specify 1 for this bit to clear the FIFO buffer on the CPU side of the current pipe. 0: Invalid 1: CPU buffer memory clear | R(0)/W(1) |
| 13 | FRDY | FIFO port ready This bit indicates whether the FIFO port can be accessed. 0: The FIFO port cannot be accessed. 1: The FIFO port can be accessed. | R |
| 12 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 11 to 0 | DTLN | Receive data length These bits indicate the length of receive data. | R |

(1) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases described below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

- (1) To send short packets, set this bit when data writing ends.
- (2) To send zero length packets, set this bit before writing data to the FIFO buffer.
- (3) Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.

When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.

Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit. Do not set this bit when the specified pipe is in the receiving direction.

(2) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.

Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and the both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to "NAK".

When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

(3) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.

In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

- (1) A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.
- (2) A short packet has been received and data reading has ended while the BFRE bit is 1.

(4) Receive data length (DTLN) bits

These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

- (1) When the RCNT bit is 0:
This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.
- (2) When the RCNT bit is 1:
This module decrements the value of these bits each time the CPU reads data.
(The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.

When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.

33.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB)

33.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: 030H>

| | | | | | | | | | | | | | | | |
|------|------|------|------|------|-------|-------|-------|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit | Name | Function | R/W |
|--------|-------|--|-----|
| 15 | VBSE | VBUS Interrupt Enable This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 14 | RSME | Frame number update interrupt enable Resume interrupt enable This bit prohibits or enables a USB interrupt when a RESM interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 13 | SOFE | This bit prohibits or enables a USB interrupt when a SOF interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 12 | DVSE | Device state transition interrupt enable This bit prohibits or enables a USB interrupt when a DVST interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 11 | CTRE | Control transfer stage transition interrupt enable This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 10 | BEMPE | Buffer empty interrupt enable This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 9 | NRDYE | Buffer not ready response interrupt enable This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 8 | BRDYE | Buffer ready interrupt enable This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |
| 7 to 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

33.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: 036H>

| | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PIPEBRDYE | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-----------|--|-----|
| 15 to 0 | PIPEBRDYE | Pipe BRDY interrupt enable These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |

Note: * Bit numbers correspond to pipe numbers.

(1) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

33.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: 038H>

| | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PIPENRDYE | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-----------|--|-----|
| 15 to 0 | PIPENRDYE | Pipe NRDY interrupt enable These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |

Note: * Bit numbers correspond to pipe numbers.

(1) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

33.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: 03AH>

| | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PIPEBEMPE | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-----------|---|-----|
| 15 to 0 | PIPEBEMPE | Pipe BEMP interrupt enable These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected 0: Interrupt output prohibited 1: Interrupt output enabled | R/W |

Note: * Bit numbers correspond to pipe numbers.

(1) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

33.2.9 SOF Control Register

33.2.9.1 SOF Pin Configuration Register [SOFCFG] <Address: 03CH>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|---|-------|---|---|------|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | — | — | BRDYM | — | — | SOFM | | — | — |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-------|---|-----|
| 15 to 7 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 6 | BRDYM | PIPEBRDY interrupt status clear timing This bit specifies the timing at which the PIPEBRDY interrupt is to be cleared. 0: Software clears the status. 1: Hardware clears the status by reading from or writing to the FIFO buffer. This bit can be set only during initialization (before communication). The setting cannot be changed after communication. | R/W |
| 5, 4 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 3, 2 | SOFM | SOF function setting These bits are used to select SOF pulse output mode. 00: SOF output disabled 01: SOF output in units of 1 ms 10: μ SOF output in units of 125 μ s 11: Reserved | R/W |
| 1, 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

33.2.10 Interrupt Status

33.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: 040H>

| | | | | | | | | | | | | | | | |
|-------|------|------|------|------|------|------|------|-------|------|---|---|-------|------|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VBINT | RESM | SOFR | DVST | CTRT | BEMP | NRDY | BRDY | VBSTS | DVSQ | | | VALID | CTSQ | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | 1 | — | — | — | — | — | 0 | 0 | 1 | — | — | — | — |

| Bit | Name | Function | R/W |
|--------|-------|--|--------|
| 15 | VBINT | Change detection interrupt status This bit indicates the VBUS change detection interrupt status. 0: No VBUS interrupt is generated. 1: A VBUS interrupt is generated. | R/W(0) |
| 14 | RESM | Resume interrupt status This bit indicates the resume detection interrupt status. 0: No resume interrupt is generated. 1: A resume interrupt is generated. | R/W(0) |
| 13 | SOFR | Frame number update interrupt status This bit indicates the frame number update interrupt status. 0: No SOF interrupt is generated. 1: A SOF interrupt is generated. | R/W(0) |
| 12 | DVST | Device state transition interrupt status This bit indicates the device state transition interrupt. 0: No device state transition interrupt is generated. 1: A device state transition interrupt is generated. | R/W(0) |
| 11 | CTRT | Control transfer stage transition interrupt status This bit indicates the status of a control transfer stage transition interrupt. 0: No control transfer stage transition interrupt is generated. 1: A control transfer stage transition interrupt is generated. | R/W(0) |
| 10 | BEMP | BEMP interrupt status This bit indicates the BEMP interrupt status. 0: No BEMP interrupt is generated. 1: A BEMP interrupt is generated. | R |
| 9 | NRDY | NRDY interrupt status This bit indicates the NRDY interrupt status. 0: No NRDY interrupt is generated. 1: An NRDY interrupt is generated. | R |
| 8 | BRDY | BRDY interrupt status This bit indicates the BRDY interrupt status. 0: No BRDY interrupt is generated. 1: A BRDY interrupt is generated. | R |
| 7 | VBSTS | VBUS input status This bit indicates the VBUS pin input status. 0: The VBUS pin is at the low level. 1: The VBUS pin is at the high level. | R |
| 6 to 4 | DVSQ | Device state These bits indicate the device state. 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state | R |
| 3 | VALID | USB request reception This bit indicates whether USB request reception is detected. 0: Not detected 1: A setup packet is received. | R/W(0) |

| Bit | Name | Function | R/W |
|--------|------|---|-----|
| 2 to 0 | CTSQ | Control transfer stage These bits indicate the control transfer stage. 000: Idle or setup stage 001: Control reading data stage 010: Control reading status stage 011: Control writing data stage 100: Control writing status stage 101: Control writing (No Data) status stage 110: Control transfer sequence error 111: Reserved | R |

Note: * When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 to only the bit to be cleared and 1 to other bits. Do not write 0 to any status bit that is currently 0.

Note: * This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

(1) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

(2) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XX) and detects a falling edge of the signal at the DP pin.

(3) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:

This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)

This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

(4) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

(5) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.

When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

(6) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).

For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.

This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.

Cannot clear this bit even by writing 0.

(7) Buffer not-ready interrupt status (NRDY) bit

This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).

For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.

This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.

Software cannot clear this bit even by writing 0.

(8) Buffer ready interrupt status (BRDY) bit

This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).

For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.

This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.

Software cannot clear this bit even by writing 0.

33.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: 046H>

| | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PIPEBRDY | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|----------|---|--------|
| 15 to 0 | PIPEBRDY | Pipe BRDY interrupt status These bits indicate the BRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated. | R/W(0) |

Note:

- * Bit numbers correspond to pipe numbers.
- * To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0, write 0 to only the bit to be cleared and 1 to other bit.
- * When the BRDYM bit is 0, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

(1) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

(a) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.

Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction

- When the DIR bit changes from 0 to 1
- When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.
- When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.
- When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.
- When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction

- (a) When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
 No request trigger is generated for the transaction that involves a data PID mismatch.
 In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
 If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
 When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
 In that case, the request trigger is generated even if the FIFO buffer has a free space.
- (b) When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
 If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes. Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

(b) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:

1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.

If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

(c) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.

(a) For the pipe in the sending direction

This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.

The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.

(b) For the pipe in the receiving direction

This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).

If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

33.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: 048H>

| | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PIPENRDY | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|----------|---|--------|
| 15 to 0 | PIPENRDY | Pipe NRDY interrupt status These bits indicate the NRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated. | R/W(0) |

<<Remarks>>

* Bit numbers correspond to pipe numbers.

* To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt. This module issues an internal NRDY interrupt request for individual pipes under the conditions described below. This module does not issue any interrupt request at the status stage of a control transfer.

(a) For the pipe in the sending direction

- (1) When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data

When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero-length packet, and sets the OVRN bit.

(b) For the pipe in the receiving direction

- (1) When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full

If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.

If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.

Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).

This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.

- (2) When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full

When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

- (3) When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame

When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

33.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: 04AH>

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| PIPEBEMP | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|----------|---|--------|
| 15 to 0 | PIPEBEMP | Pipe BEMP interrupt status These bits indicate the BEMP interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated. | R/W(0) |

<<Remarks>>

* Bit numbers correspond to pipe numbers.

* To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

- When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty

In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.

Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

- When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends
- When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit
- During an IN transfer (sending zero-length packets) at the status stage of a control transfer

- For the pipe in the receiving direction

When the data larger than the specified maximum packet size has been received normally

In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).

Then, this module returns a STALL packet.

Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

- When a CRC or bit stuff error has been detected in the received data
- When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.

Writing 1 to this bit causes no effect.

33.2.11 Frame Number Registers (FRMNUM, UFRMNUM)

33.2.11.1 Frame Number Register [FRMNUM] <Address: 04CH>

| | | | | | | | | | | | | | | | |
|------|------|----|----|----|------|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| OVRN | CRCE | — | — | — | FRNM | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|------|---|--------|
| 15 | OVRN | Overrun/underrun detection status This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred. | R/W(0) |
| 14 | CRCE | CRC error detection status This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred. | R/W(0) |
| 13 to 11 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 10 to 0 | FRNM | Frame number These bits indicate the latest frame number. | R |

Note: * The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

(1) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.

When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see section 33.2.10.3, (1), Pipe NRDY interrupt status (PIPENRDY) bit.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write 0x40.

When the peripheral controller function is selected

This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

(2) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.

Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write 0x80.

When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see section 33.2.10.3, (1), Pipe NRDY interrupt status (PIPENRDY) bit.

(3) Frame number (FRNM) bits

This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.

When reading these bits, read them twice and check for consistency.

33.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: 04EH>

| | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|---|---|---|---|---|---|---|-------|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DVCHG | — | — | — | — | — | — | — | — | — | — | — | — | UFRNM | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-------|---|-----|
| 15 | DVCHG | 0: Writing to the USBADDR register is disabled 1: Writing to the USBADDR register is enabled This bit is used in resumption in response to reception of the resume signal. Set this bit and the USBADDR register according to 33.9.16.4, Flowchart of resumption from deep standby in response to reception of the resume signal. Operation cannot be guaranteed if the procedure in the flowchart is not observed. | R/W |
| 14 to 3 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 2 to 0 | UFRNM | Micro frame These bits indicate the micro frame number. | R |

(1) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes 0x00 to these bits.

When reading these bits, read them twice and check for consistency.

33.2.12 USB Address

33.2.12.1 USB Address Register [USBADDR] <Address: 050H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|-----------|---|---|---|---------|---|---|---|---|---|---|

| 1 | 1 | 1 | HS configured state | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1 | 0 | 0 | Suspend state | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | Set these bits according to section 33.9.16.4, Flowchart of resumption from deep standby in response to reception of the resume signal. Operation cannot be guaranteed if the procedure in the flowchart is not observed. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 7 | — | Nothing is assigned to this bit. Fix this bit to 0. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 6 to 0 | USBADDR | USB address These bits indicate the USB address allocated by the host. | R | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

(1) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.

When this module detects a USB bus reset, this module writes 0x00 to these bits.

33.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.

These registers store the values set in the received USB requests.

33.2.13.1 USB Request Type Register [USBREQ] <Address: 054H>

| | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|---|---|---------------|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| bRequest | | | | | | | | bmRequestType | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Name | Function | R/W |
|---------|---------------|--|-----|
| 15 to 8 | bRequest | Request Value of USBRequestbRequest | R |
| 7 to 0 | bmRequestType | Request type Value of USBRequestbmRequestType | R |

(1) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(2) USB request type (bmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

33.2.13.2 USB Request Value Register [USBVAL] <Address: 056H>

| | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| wValue | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Name | Function | R/W |
|---------|--------|---|-----|
| 15 to 0 | wValue | Value Value of the wValue field in a USB request | R |

(1) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.

These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

33.2.13.3 USB Request Index Register [USBINDX] <Address: 058H>

| | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| wIndex | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Name | Function | R/W |
|---------|--------|---|-----|
| 15 to 0 | wIndex | Index Value of the wIndex field in a USB request | R |

(1) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.

These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction.
Writing to these bits is ignored.

33.2.13.4 USB Request Length Register [USBLENG] <Address: 05AH>

| | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| wLength | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Name | Function | R/W |
|---------|---------|---|-----|
| 15 to 0 | wLength | Length Value of the wLength field in a USB request | R |

(1) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.

These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction.
Writing to these bits is ignored.

33.2.14 DCP Configuration

When performing a data communication by a control transfer, use the default control pipe (DCP).

33.2.14.1 DCP Configuration Register [DCPCFG] <Address: 05CH>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|-------|--------|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | CNTMD | SHTNAK | — | — | — | — | — | — | — |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|--------|---|-----|
| 15 to 9 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 8 | CNTMD | Continuous transfer mode This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode | R/W |
| 7 | SHTNAK | Pipe disable at transfer end When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends 1: Disables the pipe when the transfer ends | R/W |
| 6 to 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

33.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: 05EH>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|---|------|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | — | — | MXPS | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|--|-----|
| 15 to 7 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 6 to 0 | MXPS | Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the DCP. | R/W |

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.
The default is 0x40 (64 bytes).

The value of the MXPS bits must conform to the USB Specification.

Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits.
If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

33.2.14.3 DCP Control Register [DCPCTR] <Address: 060H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|-------|-------|-------|-------|---|---|------|-----|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BSTS | — | — | — | — | — | — | SQCLR | SQSET | SQMON | PBUSY | — | — | CCPL | PID | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | 0 | 0 | 0 |

| Bit | Name | Function | R/W |
|---------|-------|---|-----------|
| 15 | BSTS | Buffer status This bit indicates the accessibility status of the DCP FIFO buffer. 0: Buffer access is not possible. 1: Buffer access is possible. | R |
| 14 to 9 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 8 | SQCLR | Toggle bit clear This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA0 specified | R(0)/W(1) |
| 7 | SQSET | Toggle bit set This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA1 specified | R(0)/W(1) |
| 6 | SQMON | Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: DATA0 1: DATA1 | R |
| 5 | PBUSY | Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus. | R |
| 4 to 3 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 2 | CCPL | Control transfer end enable Setting this bit permits the status stage of the control transfer to end. 0: Does not permit the control transfer to end. 1: Permits the control transfer to end. | R/W |
| 1, 0 | PID | Response PID These bits control responses from this module in control transfer. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response | R/W |

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

1. When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
2. When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

(2) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(4) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module. When a transaction ends normally, this module toggles this bit.

This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).

This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

(5) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(6) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.

In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.

When a new SETUP packet is received, this module changes this bit from 1 to 0.

When the VALID bit is 1, software cannot set this bit.

(7) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

1. This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
2. When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
3. This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
4. This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

33.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI)

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

33.2.15.1 Pipe Window Select Register [PIPESEL] <Address: 064H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|---|---|---|---|---------|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | PIPESEL | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|---------|---|-----|
| 15 to 4 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 3 to 0 | PIPESEL | Pipe window select These bits specify a pipe for registers at addresses 68H to 6EH. 0000: No selection 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9 1010: PIPE10 1011: PIPE11 1100: PIPE12 1101: PIPE13 1110: PIPE14 1111: PIPE15 | R/W |

* When the PIPESEL bits are 0000, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000, writing to the registers at addresses 68H to 6EH is ignored.

(1) Pipe window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses 68H to 6EH. After a pipe is selected by these bits, the values set in the areas at addresses 68H to 6EH are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses H68 to H6E. Then, writing to the areas at addresses H68 to H6E is ignored.

33.2.15.2 Pipe Configuration Register [PIPECFG] <Address: 068H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|------|------|-------|--------|---|---|-----|-------|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit | Name | Function | R/W |
|----------|--------|--|-----|
| 15, 14 | TYPE | Transfer type These bits specify the transfer type of the pipe specified in the PIPESEL bit. 00: The pipe cannot be used. 01: Bulk transfer 10: Interrupt transfer 11: Isochronous transfer | R/W |
| 13 to 11 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 10 | BFRE | BRDY interrupt operation specification This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe. 0: A BRDY interrupt is notified when data is sent or received. 1: A BRDY interrupt is notified when reading of data is completed. | R/W |
| 9 | DBLB | Double-buffer mode This bit specifies a single or double FIFO buffer to be used by the specified pipe. 0: Single buffer 1: Double buffer | R/W |
| 8 | CNTMD | Continuous transfer mode This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode | R/W |
| 7 | SHTNAK | Pipe disable at transfer end When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends. 1: Disables the pipe when the transfer ends. | R/W |
| 6, 5 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 4 | DIR | Transfer direction This bit specifies the transfer direction of the specified pipe. 0: Receiving direction 1: Sending direction | R/W |
| 3 to 0 | EPNUM | Endpoint number These bits specify the endpoint number of the specified pipe. | R/W |

(1) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.

Table 33.12 lists pipes and the transfer types specifiable in these bits.

Table 33.12 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

| Selected Pipe | TYPE Bits | USB Transfer Type |
|------------------|-----------|------------------------------|
| PIPE1 or PIPE2 | 01 or 11 | Bulk or isochronous transfer |
| PIPE3 to PIPE5 | 01 | Bulk transfer |
| PIPE6 to PIPE8 | 10 | Interrupt transfer |
| PIPE9 | 01 or 10 | Bulk or interrupt transfer |
| PIPE10 | 01 or 10 | Bulk or interrupt transfer |
| PIPE10 to PIPE15 | 01 | Bulk transfer |

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(2) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5 or PIPE9 to PIPE15.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.

If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.

For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

$$(\text{BUFSIZE} + 1) \times 64 \times (\text{DBLB} + 1) \text{ [bytes]}$$

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(4) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15, and the transfer type of the selected pipe is bulk transfer.

This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in Table 33.14.

Table 33.13 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer
According to the Value of the CNTMD Bit

| CNTMD Bit Setting Value | How to Determine Whether Reading or Sending is Enabled |
|----------------------------|--|
| 0 | <p>Condition for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): This module receives one packet</p> <hr/> <p>Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): Either of the following conditions (1) and (2) is met: (1) Data for the maximum packet size is written to the FIFO buffer. (2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.</p> |
| 1 | <p>Conditions for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): (1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes $((\text{BUFSIZE} + 1) \times 64)$. (2) This module receives a short packet other than a zero-length packet. (3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data. (4) Packets are received as many times as the value of the transaction counter set for the selected pipe.</p> <hr/> <p>Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): One of the following conditions (1) to (3) is met: (1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe. (2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. (3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing.</p> |

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Pipe disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15 and is in the receiving direction.

When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

- (1) This module has normally received short packet data (including zero-length packets).
- (2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

(6) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Endpoint number (EPNUM) bits

These bits are used to specify the endpoint number of the endpoint of a selected pipe.

Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting "EPNUM = 000" [the selected pipe is not used] can be duplicated for multiple pipes.)

33.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: 06AH>

| | | | | | | | | | | | | | | | |
|----|---------|----|----|----|----|---|---|--------|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | BUFSIZE | | | | | | | BUFNMB | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|---------|--|-----|
| 15 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 14 to 10 | BUFSIZE | Buffer size These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit. 0x00: 64 bytes 0x01: 128 bytes ... (0x1F: 2 Kbytes) | R/W |
| 9, 8 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 7 to 0 | BUFNMB | Buffer number These bits specify the FIFO buffer number of the specified pipe. (0x4 to 0x7F) | R/W |

Note: * Changing values of these register bits for a selected pipe must be done when sets the PID of the selected pipe to NAK, and specifies no pipe in the CURPIPE bits.

Note: * If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the values of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe.

Specify the FIFO buffer size in units of blocks. One block has 64 bytes.

When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

$$(\text{BUFSIZE} + 1) \times 64 \times (\text{DBLB} + 1) [\text{bytes}]$$

The following value can be specified in these bits:

- (1) Any value from 0x0 to 0x1F when the selected pipe is PIPE1 to PIPE5 or PIPE9 to PIPE15.
- (2) 0x0 only when the selected pipe is PIPE6 to PIPE8.

In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

(2) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe.

This module allocates the following blocks of FIFO buffer to the selected pipe:

Block with block number "BUFNMB" to the block with block number "BUFNMB + (BUFSIZE + 1) × (DBLB + 1) - 1"

The value of these bits must be 0x04 to 0x7F. Note, however, that the following rules must be observed:

Value "0x00" is exclusively used for DCP.

Value "0x04" is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module automatically sets 0x04 in the BUFNMB bits for PIPE6.

Value "0x05" is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module automatically sets 0x05 in the BUFNMB

bits for PIPE7.

Value "0x06" is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module automatically sets 0x06 in the BUFNMB bits for PIPE8.

Value "0x07" is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module automatically sets 0x07 in the BUFNMB bits for PIPE9.

33.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: 06CH>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|------|---|---|---|------|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | MXPS | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0(1) | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|------|---|-----|
| 15 to 11 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 10 to 0 | MXPS | Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the specified pipe. For PIPE6 to PIPE8, a value from 0x1 to 0x40 (bytes) can be set. | R/W |

Note: * The initial value of the MXPS bits is 0x00 when no pipe is specified in the PIPESEL bits in the PIPESEL register or 0x40 when a pipe is specified in the PIPESEL bits.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.
The initial value of these bits is 0x40 (64 bytes).

For PIPE1 and PIPE2, a value from 0x1 (1 byte) to 0x400 (1024 bytes) can be specified.

For PIPE3 to PIPE5, 0x8 (8 bytes), 0x10 (16 bytes), 0x20 (32 bytes), 0x40 (64 bytes), or 0x200 (512 bytes) can be specified. (Bits [2:0] are excluded.)

For PIPE6 to PIPE8, a value from 0x1 (1 byte) to 0x40 (64 bytes) can be specified.

For PIPE9, 0x8 (8 bytes), 0x10 (16 bytes), 0x20 (32 bytes), 0x40 (64 bytes), or 0x200 (512 bytes) can be specified.

For PIPE10 to PIPE15, 0x8 (8 bytes), 0x10 (16 bytes), 0x20 (32 bytes), 0x40 (64 bytes), or 0x200 (512 bytes) can be specified. (Bits [2:0] are excluded.)

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

33.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: 06EH>

| | | | | | | | | | | | | | | | |
|----|----|----|------|----|----|---|---|---|---|---|---|---|------|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | IFIS | — | — | — | — | — | — | — | — | — | IITV | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|------|---|-----|
| 15 to 13 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 12 | IFIS | Isochronous IN buffer flush This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer. 0: Does not perform a buffer flush. 1: Performs a buffer flush. | R/W |
| 11 to 3 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 2 to 0 | IITV | These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2. | R/W |

(1) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.

In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.

This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token has to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

(2) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.

For PIPE3 to PIPE5 and PIPE10 to PIPE15, these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5 and PIPE10 to PIPE15.

You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

(a) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.

This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.

When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

(a) When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

| (Micro) frame | S O F | S O F | S O F | O U T | D A T A 0 | S O F | O U T | D A T A 0 |

| Start of interval counting | | | ↑ | | | | | | | | | | |

Figure 33.2 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

(b) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.

This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.

This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:

- (1) This module is reset (then, also the IITV bits are cleared).
- (2) The ACLRM bit is set.
- (3) This module detects a USB bus reset.

(A zero-length packet response is sent during transmission. For reception, an NAK response is sent and an NRDY interrupt is generated.) | R/W |
| 9 | ACLRM | Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Prohibited 1: Enabled (all buffers are initialized) | R/W |
| 8 | SQCLR | Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Writing disabled 1: DATA0 specified | R(0)/W(1) |
| 7 | SQSET | Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1. 0: Writing disabled 1: DATA1 specified | R(0)/W(1) |
| 6 | SQMON | Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1 | R |

| Bit | Name | Function | R/W |
|--------|-------|---|-----|
| 5 | PBUSY | Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus. | R |
| 4 to 2 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 1, 0 | PID | Response PID These bits specify the response method for the next transaction in the specified pipe. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response | R/W |

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 33.14 BSTS Bit Operations

| DIR bit Setting Value | BFRE bit Setting Value | DCLRM bit Setting Value | Meaning of the BSTS Bit |
|--------------------------|---------------------------|----------------------------|---|
| 0 | 0 | 0 | This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished. |
| | | 1 | Setting prohibited |
| | 1 | 0 | This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished. |
| | | 1 | This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished. |
| 1 | 0 | 0 | This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished. |
| | | 1 | Setting prohibited |
| | 1 | 0 | Setting prohibited |
| | | 1 | Setting prohibited |

(2) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

(3) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.

When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)

When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.

Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA-PID).

This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)

When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

(4) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 33.15 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 33.16 shows the cases that require this processing.

Table 33.15 Buffer Contents This Core Clears When the ACLRM Bit is Set

| No. | Contents to be Cleared by Setting the ACLRM Bit |
|-----|--|
| (1) | Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared) |
| (2) | If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared. |

Table 33.16 Cases Requiring the ACLRM Bit to be Set

| No. | Cases when Data Clear is Required |
|-----|--|
| (1) | The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared. |
| (2) | The interval count value needs to be reset. |
| (3) | The value of the BFRE bit is changed. |
| (4) | The value of the DBLB bit is changed. |
| (5) | Forced termination of the transaction count function is performed. |

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(6) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

(8) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(9) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.

The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting must be changed to BUF. For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see Table 33.17.

If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check, that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

1. When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
2. When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
3. If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits.

To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.

To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits.

To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 33.17 Core Operations Depending on the PID Setting

| PID bit Setting Value | Transfer Type (TYPE Bit Setting Value) | Transfer Direction (DIR Bit Setting Value) | Operation of This Core |
|-----------------------|--|--|--|
| 00 (NAK) | Bulk ("TYPE = 01"), or Interrupt ("TYPE = 10") | Independent of the setting value | Sends a NAK response for a token from the USB host. |
| | | Receiving direction ("DIR = 0") | Does not respond to a token from the USB host. |
| | Isochronous ("TYPE = 11") | Sending direction ("DIR = 1") | Sends a zero-length packet for a token from the USB host. |
| 01 (BUF) | Bulk ("TYPE = 01") | Receiving direction ("DIR = 0") | For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response. |
| | | | For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response. |
| | Interrupt ("TYPE = 10") | Receiving direction ("DIR = 0") | For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response. |
| | Bulk ("TYPE = 01") or Interrupt ("TYPE = 10") | Sending direction ("DIR = 1") | If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response. |
| | | | |
| | Isochronous ("TYPE = 11") | Receiving direction ("DIR = 0") | For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data. |
| | | Sending direction ("DIR = 1") | If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet. |
| 10 (STALL) | Bulk ("TYPE = 01") or Interrupt ("TYPE = 10") | Independent of the setting value | Sends a STALL response for a token from the USB host. |
| 11 (STALL) | | Isochronous ("TYPE = 11") | Does not respond to a token from the USB host. |

33.2.16.2 PIPE6 Control Register [PIPE6CTR] <Address: 07AH> PIPE7 Control Register [PIPE7CTR] <Address: 07CH> PIPE8 Control Register [PIPE8CTR] <Address: 07EH>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|-------|-------|-------|-------|-------|---|---|---|-----|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| BSTS | — | — | — | — | — | ACLRM | SQCLR | SQSET | SQMON | PBUSY | — | — | — | PID | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | 0 | 0 |

| Bit | Name | Function | R/W |
|----------|-------|---|-----------|
| 15 | BSTS | Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0: Buffer access is not possible. 1: Buffer access is possible. | R |
| 14 to 10 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 9 | ACLRM | Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Automatic buffer clear mode prohibited 1: Automatic buffer clear mode enabled (all buffers are initialized) | R/W |
| 8 | SQCLR | Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Disabled 1: DATA0 specified | R(0)/W(1) |
| 7 | SQSET | Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1 0: Disabled 1: DATA1 specified | R(0)/W(1) |
| 6 | SQMON | Toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1 | R |
| 5 | PBUSY | Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus. | R |
| 4 to 2 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 1, 0 | PID | Response PID These bits specifies the response method for the next transaction in the specified pipe 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response | R/W |

(1) Buffer status (BSTS) bit

See section 33.2.16.1, (2), Transmit buffer monitor (INBUFM) bit.

(2) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 33.18 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 33.19 shows the cases that require this processing.

Table 33.18 Buffer Contents This Core Clears when the ACLRM Bit is Set

| No. | Contents Cleared by ACLRM Bit Operation |
|-----|--|
| (1) | All contents of the FIFO buffer allocated to the selected pipe |

Table 33.19 Cases Requiring the ACLRM Bit to be Set

| No. | Contents Cleared by ACLRM Bit Operation |
|-----|--|
| (1) | When clearing contents of the FIFO buffer allocated to the selected pipe |
| (2) | When resetting the interval counter |
| (3) | When the value of the BFRE bit is changed |
| (4) | When the transaction count function is terminated forcibly |

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit clear (SQCLR) bit

See section 33.2.16.1, (5), Sequence toggle bit clear (SQCLR) bit.

(4) Sequence toggle bit set (SQSET) bit

See section 33.2.16.1, (6), Sequence toggle bit set (SQSET) bit.

(5) Sequence toggle bit monitor (SQMON) bit

See section 33.2.16.1, (7), Sequence toggle bit monitor (SQMON) bit.

(6) Pipe busy (PBUSY) bit

See section 33.2.16.1, (8), Pipe busy (PBUSY) bit.

(7) Response PID (PID) bits

See section 33.2.16.1, (9), Response PID (PID) bits.

 PIPE9 Transaction Counter Enable Register [PIPE9TRE] <Address: 0B8H>
 PIPE9 Transaction Counter Enable Register [PIPEATRE] <Address: 0BCH>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|-------|-------|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | TRENB | TRCLR | — | — | — | — | — | — | — | — |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|---|--|-----------|
| 15 to 10 | Nothing is assigned to these bits. Fix these bits to 0. | | |
| 9 | TRENB Transaction counter enable | This bit enables or disables the transaction counter. 0: Disables the transaction counter. 1: Enables the transaction counter. | R/W |
| 8 | TRCLR Transaction counter clear | This bit clears the transaction counter to 0. To clear the counter, write 1 to this bit. 0: Invalid 1: Clears the current transaction counter. | R(0)/W(1) |
| 7 to 0 | Nothing is assigned to these bits. Fix these bits to 0. | | |

Note: * Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is NAK.
 If you change the value of a bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of the bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Transaction counter enable (TRENb) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.

For the pipe in the sending direction, write 0 to this bit (TRENb bit).

When not using the transaction count function, write 0 to this bit.

When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

(2) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

33.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: 092H>

 PIPEA Transaction Counter Register [PIPEATRN] <Address: 0BEH>

| | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TRNCNT | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|--------|---|-----|
| 15 to 0 | TRNCNT | When writing: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When reading: Indicates the specified number of transactions if TRENB is 0. Indicates the number of the currently counted transaction if TRENB is 1. | R/W |

(1) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in section 33.2.17.1 Transaction counter enable (TRENB) bit.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions (a) to (c):

- (a) The TRENB bit is 1.
- (b) When a packet is received, the value of the TRCNT bits is not equal to "current count + 1."
- (c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions (a) to (c) are met:

- (a) The TRENB bit is 1.
- (b) When a packet is received, the value of the TRCNT bits is equal to "current count + 1."
- (c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions (a) and (b) are met:

- (a) The TRENB bit is 1.
- (b) A short packet has been received.

(3) The following condition is met:

- (a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits).

When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENb bit is 0.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENb bit.

33.2.18 Low Power Control Register

33.2.18.1 Low Power Control Register [LPCTRL] <Address: 100H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | — | — | — | — | — | — | — | HWUPM | — | — | — | — | — | — | — |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|----------|---|-----|
| 15 to 8 | Reserved | Nothing is assigned to these bits. Fix these bits to 0. | |
| 7 | HWUPM | 0: Resumes the PHY from the low-power mode while the internal bus clock (Bφ) is operating. 1: Enables resume from the low-power mode while the internal bus clock (Bφ) is stopped. | R/W |
| 6 to 0 | | Nothing is assigned to these bits. Fix these bits to 0. | |

(1) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (Bφ) is stopped.

0: Disables resumption while the internal bus clock (Bφ) is stopped.

1: Enables resumption while the internal bus clock (Bφ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (Bφ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (Bφ) is stopped, set both this bit and the L1EXTMD bit.

33.2.19 Low Power Status Register

33.2.19.1 Low Power Status Register [LPSTS] <Address: 102H>

| | | | | | | | | | | | | | | | |
|----|-------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | SUSPM | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|-------|--|-----|
| 15 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 14 | SUSPM | USBPHY Suspend M control This bit controls the Suspend M signal to the USBPHY. 0: USBPHY suspend mode 1: USBPHY normal mode | R/W |
| 13 to 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

(1) USBPHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USBPHY. By default, the value of this bit is 0 and the USBPHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in Table 33.20.

Table 33.20 Registers That Allow Writing when the SUSPM Bit is 0

| Address | Register Name |
|---------|---------------|
| 000H | SYSCFG0 |
| 002H | BUSWAIT |
| 100H | LPCTRL |
| 102H | SUSPMODE |

Note that the values written to the SYSCFG0 register while the USBPHY clock is stopped (SUSPM = 0) will be applied after the USBPHY clock starts (SUSPM = 1).

When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

33.2.20 PHY Function Control Register

33.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: 104H>

| | | | | | | | | | | | | | | | |
|----|--------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

|----------|---------|---|-----|
| 15 to 11 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 10 | DmPuDwn | Dm Pulldown monitor bit | R |
| 9 | DpPuDwn | Dp Pulldown monitor bit | R |
| 8 to 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

(1) DmPuDwn

DmPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DM side is disabled.

1: 15-kΩ Pulldown resistor control on the DM side is enabled.

(2) DpPuDwn

DpPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DP side is disabled.

1: 15-kΩ Pulldown resistor control on the DP side is enabled.

33.2.22 Peripheral L1 Control Register 1 (PL1CTRL)

33.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: 144H>

| | | | | | | | | | | | | | | | |
|----|---------|----|----|--------------|----|---|---|-----------|---|---|---|----------|---------------|----------|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | L1EXTMD | — | — | HIRDTHR[3:0] | | | | DVSQ[3:0] | | | | L1NEGOMD | L1RESPMD[1:0] | L1RESPEN | |
| 0 | 0 | 0 | 0 | 0 | | | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | | | | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|---------------|--|-----|
| 15 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 14 | L1EXTMD | USBPHY control mode on resumption from the L1 state This bit controls the USBPHY resume operation on resumption from the L1 state. 0: Does not set the Suspend M bit when the Host K signal is received. 1: Sets the Suspend M bit when the Host K signal is received | R/W |
| 13, 12 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 11 to 8 | HIRDTHR[3:0] | L1 response negotiation threshold HIRD threshold to be used for the L1NEGOMD bit The format is the same as the HIRD field of the HL1CTRL register. | R/W |
| 7 | DVSQ[3] | DVSQ extension bit This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state. 4'b 0000: Powered state 4'b 0001: Default state 4'b 0010: Address state 4'b 0011: Configured state 4'b 01xx: Suspended state 4'b 10xx: L1 state | R |
| 6 to 4 | DVSQ[2:0] | These bits mirror the DVSQ[2:0] bits in INTSTS0. | R |
| 3 | L1NEGOMD | L1 response negotiation control This bit sets the negotiation function using for the HIRD value. 0: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. 1: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. This bit is valid only when the value of the L1RESPMD[1:0] bit is 2'b11. | R/W |
| 2, 1 | L1RESPMD[1:0] | L1 response mode These bits specify how to respond to an LPM token. 2'b 00: NYET 2'b 01: ACK 2'b 10: STALL 2'b 11: Response according to the value of the L1NEGOMD bit | R/W |
| 0 | L1RESPEN | L1 response enable This bit enables an L1 response. 0: Does not support LPM. 1: Supports LPM. | R/W |

(1) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USBPHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.

1: Sets the SuspendM bit when this module is resumed from the L1 state.

- Note 1. The Host K period lasts a minimum of 50 μ s. Therefore, the USBPHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
- Note 2. For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.
- Note 3. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

(2) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit. The format of the value is the same as that of the HIRD field in the HL1CTRL register.

(3) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.

4'b 0000: Powered state

4'b 0001: Default state

4'b 0010: Address state

4'b 0011: Configured state

4'b 01xx: Suspended state

4'b 10xx: L1 state

(4) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

(5) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.

0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 2'b11.

(6) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module respond to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.

2'b00: NYET

2'b01: ACK

2'b10: STALL

2'b11: Response according to the value of L1NEGOMD bit

(7) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

33.2.23 Peripheral L1 Control Register 2

33.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: 146H>

| Bit | Name | Function | R/W |
|----------|------------------|--|-----|
| 15 to 13 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 12 | RWEMON | This bit reflects the value of the RWE bit in the LPM token received last. | R/W |
| 11 to 8 | HIRDMON [3:0] | These bits reflect the value of the HIRD field in the LPM token received last. | R/W |
| 7 to 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

(1) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.

This bit reflects the value of the RWE bit in the LPM token received last.

(2) HIRD value monitor (HIRDMON) bits

These bits are referenced to monitor the value of the HIRD field in a received LPM token.

These bits reflect the value of the HIRD field in the LPM token received last.

33.3 Next Register Set

| Bit | Name | Function | R/W |
|-----|------|--|-----|
| 2 | TACT | <p>Transaction Active</p> <p>This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see section 33.9.13.8, Transfer state.</p> <p>0: The DMA in channel_n is stopped.</p> <p>1: The DMA in channel_n is operating.</p> <p>Setting condition:</p> <ul style="list-style-type: none"> - "1" is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request). <p>Clearing condition:</p> <ul style="list-style-type: none"> - The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended). | R |
| 1 | RQST | <p>Request</p> <p>This bit indicates whether a transfer request has been received.</p> <p>0: No DMA transfer request has been received.</p> <p>1: A DMA transfer request has been received.</p> <p>Setting conditions:</p> <ul style="list-style-type: none"> - "1" is written to the STG bit in the CHCTRL_n register. - A DMA transfer request is received from the USB control. <p>Clearing conditions:</p> <ul style="list-style-type: none"> - "1" is written to the SWRST bit in the CHCTRL_n register. - "1" is written to the CLRRQ bit in the CHCTRL_n register. - In single transfer mode (the TM bit in the CHCFG_n register is 0), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register - In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0). - In link mode, the DMA transfer of the last descriptor (LE = 1) ends. - In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). - In link mode, when the DEM bit in the CHCFG_n register is 0, a DMA transaction ends. - The master interface receives a bus error signal. | R |
| 0 | EN | <p>Enable</p> <p>This bit indicates whether the operation of DMA channel n is enabled or stopped.</p> <p>0: Operation is stopped.</p> <p>1: Operation is enabled.</p> <p>Setting conditions:</p> <ul style="list-style-type: none"> - "1" is written to the SETEN bit in the CHCTRL_n register. <p>Clearing conditions:</p> <ul style="list-style-type: none"> - "1" is written to the SWRST bit in the CHCTRL_n register. - "1" is written to the CLREN bit in the CHCTRL_n register. - An error response is received during transfer. - In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0). - In link mode, DMA transfer of the last descriptor (the LE bit is 1) ends (if the WBD bit is 0, write-back to the descriptor ends). - In link mode, reading of a descriptor is stopped (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). | R |

Note 1. When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.

Note 2. To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see section 33.9.13.8, (3), Transfer suspension.)

Note 3. If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that takes effect cannot be identified. Therefore, design the system so that only one type of transfer requests is used.

Note 4. When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

33.5.2 Channel Control Register n

33.5.2.1 Channel Control Register ch0 [CHCTRL_0] <Address: 428H> Channel Control Register ch1 [CHCTRL_1] <Address: 468H>

| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|---------------|---|-----|
| 31 to 20 | — | Reserved area. Write 0 to these bits. When these bits are read, 0 is read | |
| 19 | CLRDMAR QM | Clear DMAREQ Mask Writing 1 to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1 to this bit also clears the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Releases the DNA transfer requests from masking set by using the SETDMARQM bit. 0: Has no effect on operation. | R/W |
| 18 | SETDMAR QM | SET DMAREQ Mask Writing 1 to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1 to this bit also sets the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the DMA transfer requests from the USB control. 0: Has no effect on operation. | R/W |
| 17 | CLRINTM | Clear Interrupt Mask Writing 1 to this bit releases the USBFDMAn interrupt from masking. Writing 1 to this bit also clears the INTM bit in the CHSTATn register. Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1 activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0.) When this bit is read, 0 is read. 1: Releases the pin output from masking set by using the SETINTM bit. 0: Has no effect on operation. | R/W |
| 16 | SETINTM | SETINTMSet Interrupt Mask Writing 1 to this bit temporarily masks the USBFDMAn interrupt. Writing 1 to this bit also sets the INTM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the USBFDMAn interrupt. 0: Has no effect on operation. | R/W |
| 15 | — | Reserved area. Write 0 to this bit. When this bit are read, 0 is read. | |
| 14 | SETSSWP RQ | Set Software Sweep Request Writing 1 to this bit sweeps out the data stored in the buffer to the destination (see section 33.9.13.3, (1), Forced software sweeping request). When this bit is read, 0 is read. 1: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination. 0: Has no effect on operation. If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used. | R/W |
| 13 | — | Reserved area. Write 0 to this bit. When this bit are read, 0 is read. | |

| Bit | Name | Function | R/W |
|--------|--------|---|-----|
| 12 | SETREN | Set Register Set Enable Writing 1 to this bit sets the REN bit in the CHCFG_n register. When this bit is read, 0 is read. 1: Sets the REN bit in the CHCFG_n register. 0: Has no effect on operation. | R/W |
| 11, 10 | — | Reserved area. Write 0 to these bits. When these bits are read, 0 is read. | |
| 9 | CLRSUS | Clear Suspend Writing 1 to this bit when the SUS bit in the CHSTAT_n register is 1 releases the ongoing DMA transfer from the suspended state. When this bit is read, 0 is read. 1: Releases the ongoing DMA transfer from the suspended state. 0: Has no effect on operation. | R/W |
| 8 | SETSUS | Set Suspend Writing 1 to this bit when the EN bit in the CHSTAT_n register is 1 suspends the ongoing DMA transfer. When this bit is read, 0 is read. 1: Suspends the ongoing DMA transfer. 0: Has no effect on operation. | R/W |
| 7 | CLDER | Clear DER Writing 1 to this bit clears the DER bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAm interrupt. When this bit is read, 0 is read. 1: Clears the DER bit. 0: Has no effect on operation. | R/W |
| 6 | CLRTC | Clear TC Writing 1 to this bit clears the TC bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the TC bit. 0: Has no effect on operation. | R/W |
| 5 | CLREND | Clear End Writing 1 to this bit clears the END bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAm interrupt. When this bit is read, 0 is read. 1: Clears the END bit. 0: Has no effect on operation. | R/W |
| 4 | CLRRQ | Clear Request Writing 1 to this bit clears the RQST bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the RQST bit in the CHSTAT_n register. 0: Has no effect on operation. | R/W |
| 3 | SWRST | Software Reset Writing 1 to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0. When this bit is read, 0 is read. 1: Clears individual bits in the CHSTAT_n register. 0: Has no effect on operation. | R/W |
| 2 | STG | Software Trigger Writing 1 to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority. When this bit is read, 0 is read. 1: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register). 0: Has no effect on operation. | R/W |
| 1 | CLREN | Clear Enable Writing 1 to this bit clears the EN bit in the CHSTAT_n register (for details, see 4.13.8.3). When this bit is read, 0 is read. 1: Disables DMA transfers (clears the EN bit in the CHSTAT_n register). 0: Has no effect on operation. | R/W |
| 0 | SETEN | Set Enable Writing 1 to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start. When this bit is read, 0 is read. 1: Enables DMA transfers (sets the EN bit in the CHSTAT_n register). 0: Has no effect on operation. | R/W |

Note: Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

33.5.3 Channel Configuration Register

33.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: 42CH> Channel Configuration Register ch1 [CHCFG_1] <Address: 46CH>

| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|-----|------|---|-----|
| 31 | DMS | DMA Mode Select This bit specifies the DMA mode to be used. 0: Register mode (default) 1: Link mode | R/W |
| 30 | REN | Register Set Enable This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode. 0: Does not perform the DMA transaction successively. 1: Performs the DMA transaction successively. Setting conditions: - "1" is written to this bit. - "1" is written to the SETREN bit in the CHCTRL_n register. Clearing conditions: - "0" is written to this bit. - The REN bit is 1, and a DMA transaction ends. To re-set the REN bit during a transaction, we recommend you to use the SETREN bit in the CHCTRL_n register. | R/W |
| 29 | RSW | Register Select Switch This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode. 0: Does not invert the RSEL bit after a DMA transaction ends. (Default) 1: Inverts the RSEL bit after a DMA transaction ends. | R/W |
| 28 | RSEL | Register Set Select This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode. When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction. 0: Uses the Next0 Register Set. (Default) 1: Uses the Next1 Register Set. Transition condition: A DMA transaction ends with the RSW bit set. | R/W |
| 27 | SBE | Sweep Buffer Enable This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction. The sweep mode can be used only when the REQD bit is 0. 0: Stops transfer without sweeping out the buffer. (Default) 1: Stops transfer after sweeping out the buffer. | R/W |
| 26 | DIM | Descriptor Interrupt Mask This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Mask the USBFDMAmn interrupt. | R/W |

| Bit | Name | Function | R/W |
|----------|----------|---|-----|
| 25 | TCM | DMATC Mask This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control. When this bit is 1 at the time the DMATC signal is to be output, the DMATC signal is not asserted. Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically. Use this bit when you control DMA transfers by software. 0: Does not mask the DMATC signal. (Default) 1: Masks the DMATC signal. Clearing condition: A DMA transaction ends with the TCM bit set. | R/W |
| 24 | DEM | USBFDMAmn Mask When this bit is 1 at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Masks the USBFDMAmn interrupt. Clearing condition: A DMA transaction ends with the DEM bit set. | R/W |
| 23 | WONLY | Write Only Mode This bit is used to switch the transfer operation mode to the write-only mode (see section 33.9.12.2, Write only mode). 0: Normal operation (default) 1: Write-only mode | R/W |
| 22 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 21 | DAD | Destination Address Direction This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit. | R/W |
| 20 | SAD | Source Address Direction This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer source uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit. | R/W |
| 19 to 16 | DDS[3:0] | Destination Data Size These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see Table 33.21.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited | R/W |

| Bit | Name | Function | R/W |
|----------|----------|--|-----|
| 15 to 12 | SDS[3:0] | Source Data Size These bits specify the size of DMA transfer data. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see Table 33.29.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited | R/W |
| 11 | DRRP | Descriptor Read Repeat This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0. (See section 33.9.12.2, (a), Operation flow of link mode.) 0: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default) 1: This module keeps reading the same descriptor until the LV value changes to 1, and, when the LV value becomes 1, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register. | R/W |
| 10 to 7 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 6, 5 | — | Nothing is assigned to these bits. Fix these bits to 1. | |
| 4 | — | Nothing is assigned to this bit. Fix this bit to 0. | |
| 3 | REQD | Request Direction This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side. 0: The USB control is on the transfer source side. (Default) 1: The USB control is on the transfer destination side. | R/W |
| 2, 1 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 0 | SEL | Terminal Select This bit selects the FIFO channel to be used on the USB control side. 0: D0FIFO 1: D1FIFO | R/W |

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 33.21 Range of Sizes That Can Be Specified in SDS and DDS Bits

| Transfer Address | REQD | SDS[2:0] | DDS[2:0] |
|------------------|------|---|---|
| Beat aligned | 0 | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. | 8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110) |
| | 1 | 8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110) | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. |
| Beat unaligned | 0 | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. | 8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101) |
| | 1 | 8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101) | This data size should be equal to that of the MBW bits in the DxFIFOSEL register. |

Note: When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits. Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned. If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

33.5.4 Channel Interval Register n

For details, see section 33.9.13.6, Interval Count Function.

33.5.4.1 Channel Interval Register ch0 [CHITVL_0] <Address: 430H> Channel Interval Register ch1 [CHITVL_1] <Address: 470H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| — | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ITVL | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|------|---|-----|
| 31 to 16 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 15 to 0 | ITVL | Interval These bits specify the DMA transfer interval. | R/W |

33.5.5 Channel Extension Register n

33.5.5.1 Channel Extension Register ch0 [CHEXT_0] <Address: 434H>

Channel Extension Register ch1 [CHEXT_1] <Address: 474H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|-----|----|----|----|----|----|----|----|-----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| — | | | | | | | | | | | | — | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | | | | DPR | | | | — | | | | SPR | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|------|---|-----|
| 31 to 12 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 11 to 8 | DPR | Destination PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer. The initial value of these bits is 0H. | R/W |
| 7 to 4 | — | Nothing is assigned to these bits. Fix these bits to 0. | R/W |
| 3 to 0 | SPR | Source PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer. The initial value of these bits is 0H. | R/W |

33.6 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

33.6.1 Next Link Address Register n (NXLA_n)

33.6.1.1 Next Link Address Register ch0 [NXLA_0] <Address: 438H> Next Link Address Register ch1 [NXLA_1] <Address: 478H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| NXLA | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NXLA | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|--|---------------------------------|
| 31 to 0 | NXLA | Next Link Address These bits specify the link-destination address. Upper two bits are fixed to 0, and only the address aligned with a word boundary can be set. | Bit 31 to 2: R/W Bit 1, 0: R |

33.6.2 Current Link Address Register n (CRLA_n)

33.6.2.1 Current Link Address Register ch0 [CRLA_0] <Address: 43CH> Current Link Address Register ch1 [CRLA_1] <Address: 47CH>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CRLA | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CRLA | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|---|-----|
| 31 to 0 | CRLA | Current Link Address These bits indicate the address of the descriptor being used for current transaction. | R |

33.7 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

33.7.1 Source Continuous Register n

33.7.1.1 Source Continuous Register ch0 [SCNT_0] <Address: 600H>

Source Continuous Register ch1 [SCNT_1] <Address: 620H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SCNT | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SCNT | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|--|-----|
| 31 to 0 | SCNT | Source Continuous These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte) | R/W |

Note: This register is used in pair with the SSKP_n register (see Figure 33.3). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the SCNT bits set to 0.

33.7.2 Source Skip Register n

33.7.2.1 Source Skip Register ch0 [SSKP_0] <Address: 604H>

Source Skip Register ch1 [SSKP_1] <Address: 624H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SSKP | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SSKP | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|--|-----|
| 31 to 0 | SSKP | Source Skip These bits specify the size of area to be skipped in a source address access. (Unit: byte) | R/W |

Note: This register is used in pair with the SCNT_n register (see Figure 33.3). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1 (Fixed).

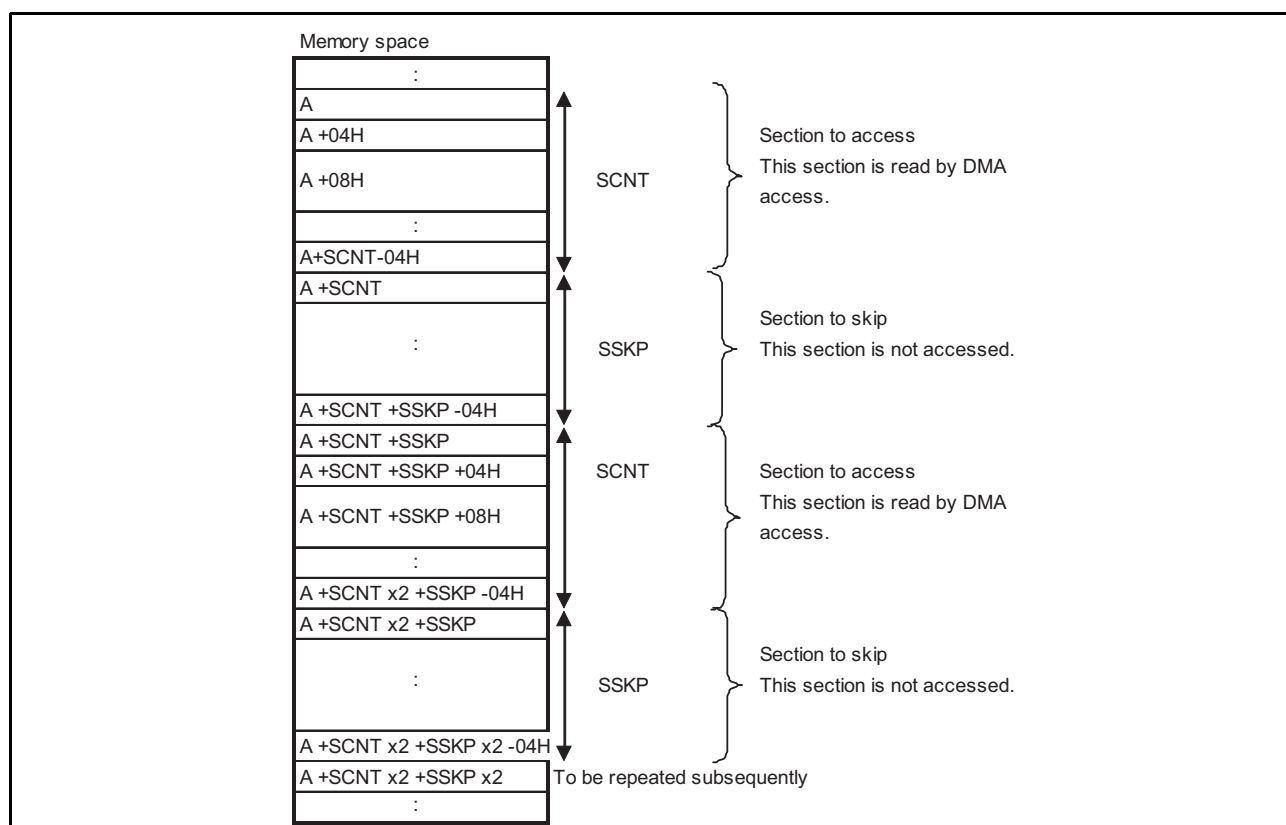

Figure 33.3 Relationship between SSKP and SCNT

You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see section 33.9.14.1, (1), Read access).

33.7.3 Destination Continuous Register n

33.7.3.1 Destination Continuous Register ch0 [DCNT_0] <Address: 608H> Destination Continuous Register ch1 [DCNT_1] <Address: 628H>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DCNT | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DCNT | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|---|-----|
| 31 to 0 | DCNT | Destination Continuous These bits specify the size of the space to be accessed continuously by destination address access. (Unit: byte) | R/W |

Note: This register is used in pair with the DSKP_n register (see Figure 33.4). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the DCNT bits set to 0.

33.7.4 Destination Skip Register n

33.7.4.1 Destination Skip Register ch0 [DSKP_0] <Address: 60CH> Destination Skip Register ch1 [DSKP_1] <Address: 62CH>

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DSKP | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DSKP | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|--|-----|
| 31 to 0 | DSKP | Destination Skip These bits specify the size of area to be skipped in a destination address access. (Unit: byte) | R/W |

Note: This register is used in pair with the DCNT_n register (see Figure 33.4). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed).

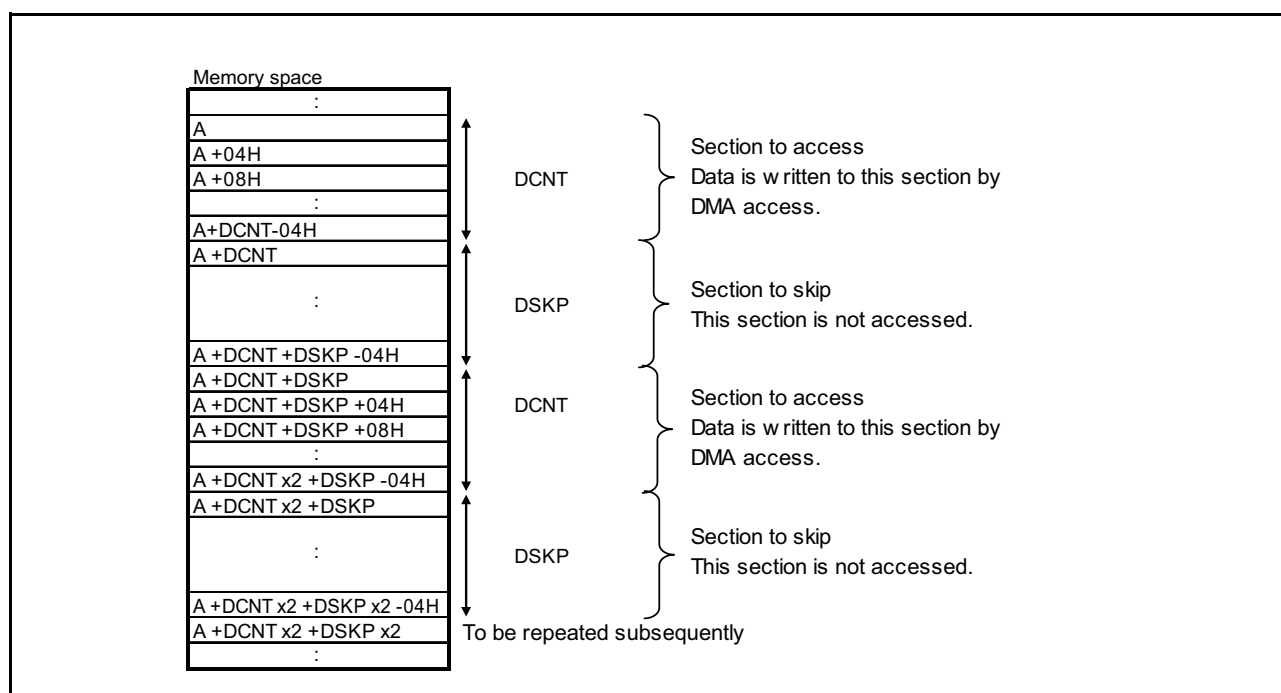

Figure 33.4 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see section 33.9.14.1, (1), Read access).

33.8 DMA Register Set

The registers described below are shared by all channels.

33.8.1 DMA Control Register

33.8.1.1 DMA Control Register [DCTRL] <Address: 700H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|------|----|----|----|----|----|----|----|------|----|-------|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| — | | | | LWPR | | | | — | | | | LDPR | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | | | | | | | | | | | | | | LVINT | PR |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|-------|---|-----|
| 31 to 28 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 27 to 24 | LWPR | Link WriteBack PROT These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode. | R/W |
| 23 to 20 | | Nothing is assigned to these bits. Fix these bits to 0. | |
| 19 to 16 | LDPR | Link Descriptor PROT These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode. | R/W |
| 15 to 2 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 1 | LVINT | Level Interrupt To use this module, be sure to set this bit to 1. | R/W |
| 0 | PR | Priority This bit specifies the transfer priority control mode (see section 33.9.13.2, DMA channel priority control). 0: Fixed priority mode 1: Round-robin mode | R/W |

33.8.2 Descriptor Interval Register n

33.8.2.1 Descriptor Interval Register [DSCITVL] <Address: 704H>

| | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| — | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DITVL | | | | | | | | — | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|----------|-------|---|-----|
| 31 to 16 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 15 to 8 | DITVL | Descriptor Interval These bits specify the interval of descriptor read operation. The descriptor will be re-read at intervals of "value of DITVL x 256." | R/W |
| 7 to 0 | — | Nothing is assigned to these bits. Fix these bits to 0. | |

33.8.3 DMA Control Register

33.8.3.1 DMA Status EN Register [DSTAT_EN] <Address: 710H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| — | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| — | | | | | | | | | | | | | | EN1 | EN0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Name | Function | R/W |
|---------|------|---|-----|
| 31 to 2 | — | Nothing is assigned to these bits. Fix these bits to 0. | |
| 1 | EN1 | This bit indicates the state of the EN bit for DMA channel 1. | R |
| 0 | EN0 | This bit indicates the state of the EN bit for DMA channel 0. | R |

33.8.4 DMA Status ER Register

33.8.4.1 DMA Status ER Register [DSTAT_ER] <Address: 714H>

| | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| — | | | | | | | | | | | | | | | |

33.9 Functions

33.9.1 System Control and Oscillation Control

This chapter describes register manipulations required to perform initial setup of this module. This chapter also describes the registers required to control power consumption.

For the parts of the sequence that are required in both host and peripheral modes, see section 32.9.1, Host/Peripheral Common Setting Sequence.

33.9.1.1 USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USBPHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.

Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

33.9.2 Interrupt Function

33.9.2.1 Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as USBFIm ($m = 0, 1$). Check the status register to identify the interrupt factor.

Table 33.22 List of Interrupt functions

| Bit | Interrupt name | Interrupt factor | Related status |
|-------|---|---|----------------|
| VBINT | VBUS interrupt | The status change of the VBUS input pin is detected. (Changes from L to H and from H to L are detected.) | VBSTS |
| RESM | Resume interrupt | In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0). | — |
| SOFR | Frame number update interrupt | If SOFRM is 0: An SOF packet with a different frame number is received. If SOFRM is 1: An SOF with μ frame number 0 cannot be received due to a problem such as packet corruption. | — |
| DVST | Device state transition interrupt | A transition of a device state is detected. USB bus reset detected Suspended state detected Set Address request received Set Configuration request received | DVSQ |
| CTRT | Control transfer stage transition interrupt | A transition of a control transfer stage is detected. Setup stage completed ControlWrite transfer status stage transition ControlRead transfer status stage transition Control transfer completed Control transfer sequence error | CTSQ |
| BEMP | Buffer empty interrupt | All data in the buffer memory is sent and the buffer becomes empty. A packet exceeding the maximum packet size is received. | PIPEBEMP |
| NRDY | Buffer not ready interrupt | A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data. A CRC error or bit stuff error occurs when data is received in isochronous transfer. An interval error occurs when data is received in isochronous transfer. | PIPENRDY |
| BRDY | Buffer ready interrupt | The buffer becomes ready (available for reading or writing data). | PIPEBRDY |

The following shows the relationship between interrupts of this module.

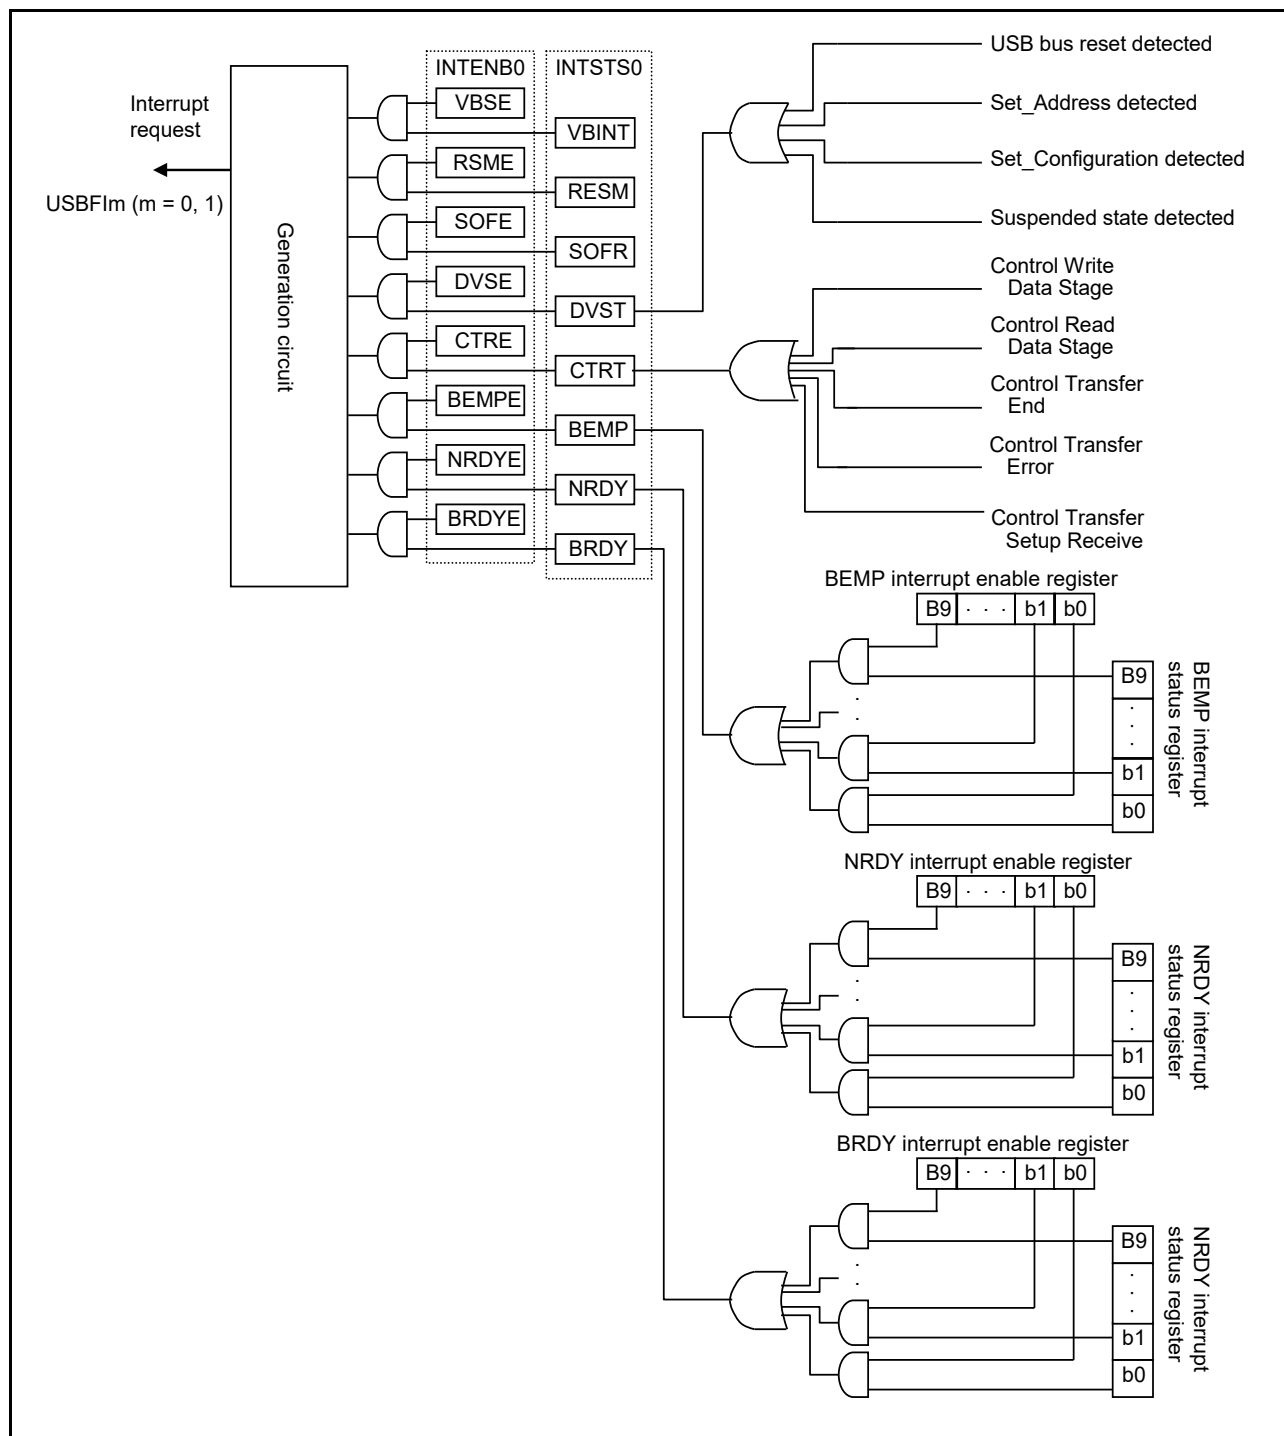

Figure 33.5 Interrupt Association Diagram

33.9.2.2 Device State Transition Interrupts

Figure 33.6 shows the device state transition diagram of this module.

This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.

To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.

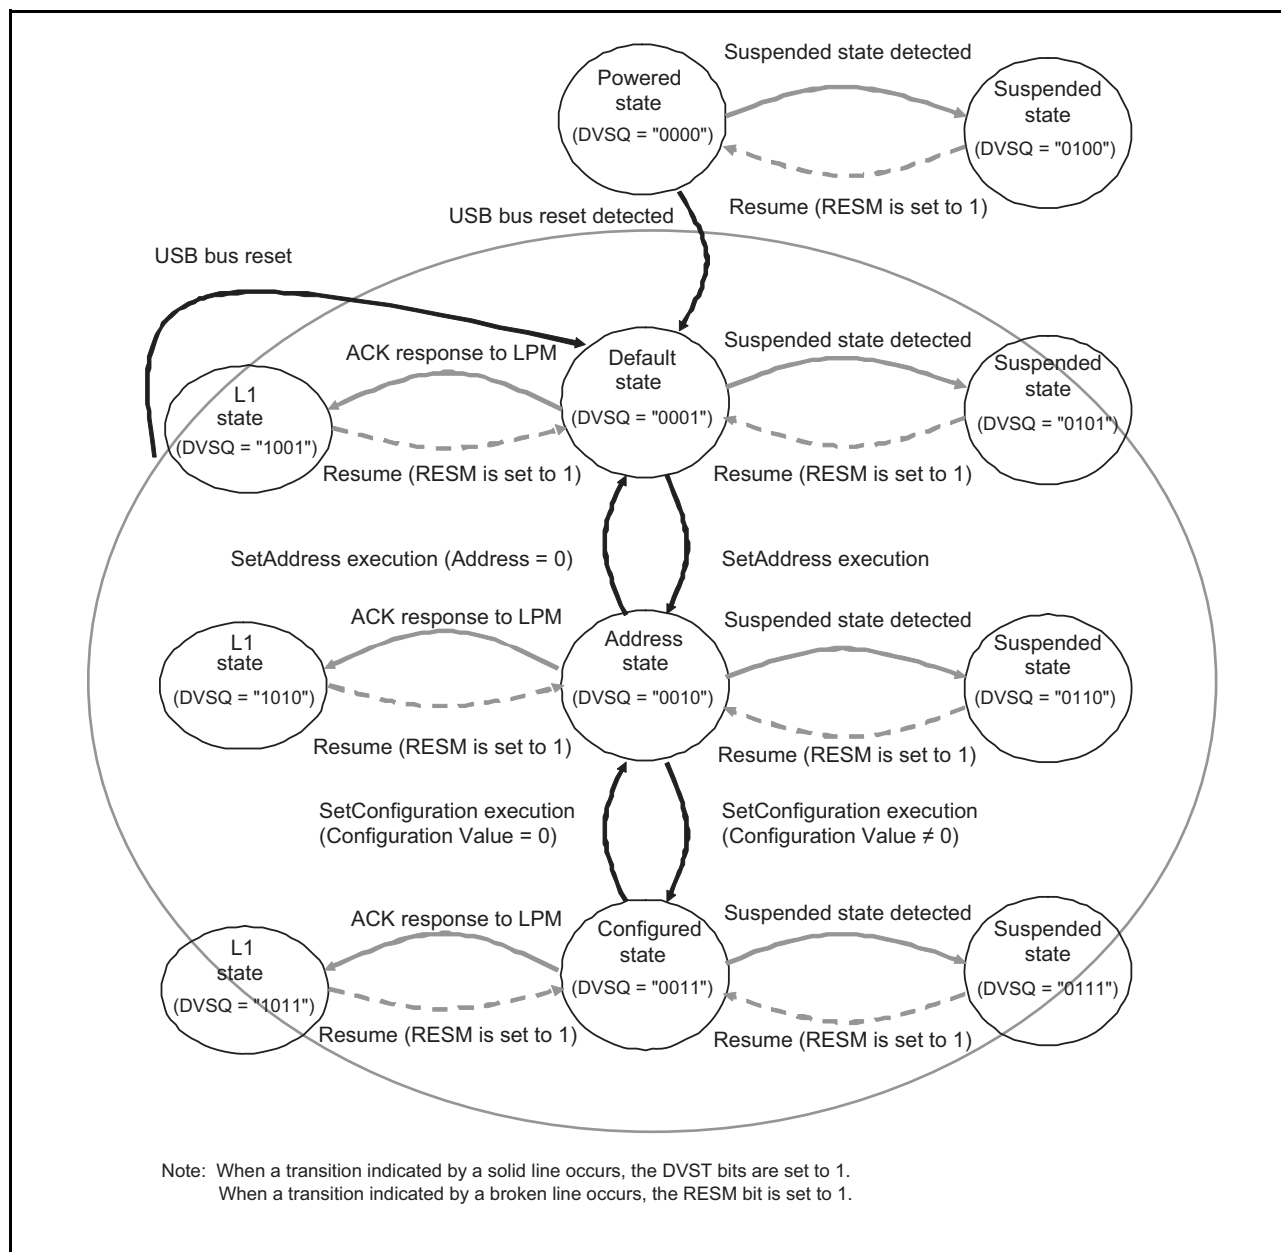

Figure 33.6 Device State Transition Diagram

33.9.2.3 Control Transfer Stage Transition Interrupts

Figure 33.7 shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer.
If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

(1) For Control Read transfer

- (a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.
- (b) An IN token is received in the status stage.
- (c) A data packet "DATAPID = DATA0" is received in the status stage.

(2) For Control Write transfer

- (a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.
- (b) The first data packet "DATAPID = DATA0" is received in the data stage.
- (c) An OUT or PING token is received in the status stage.

(3) For Nodata Control transfer

- (a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.

Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)

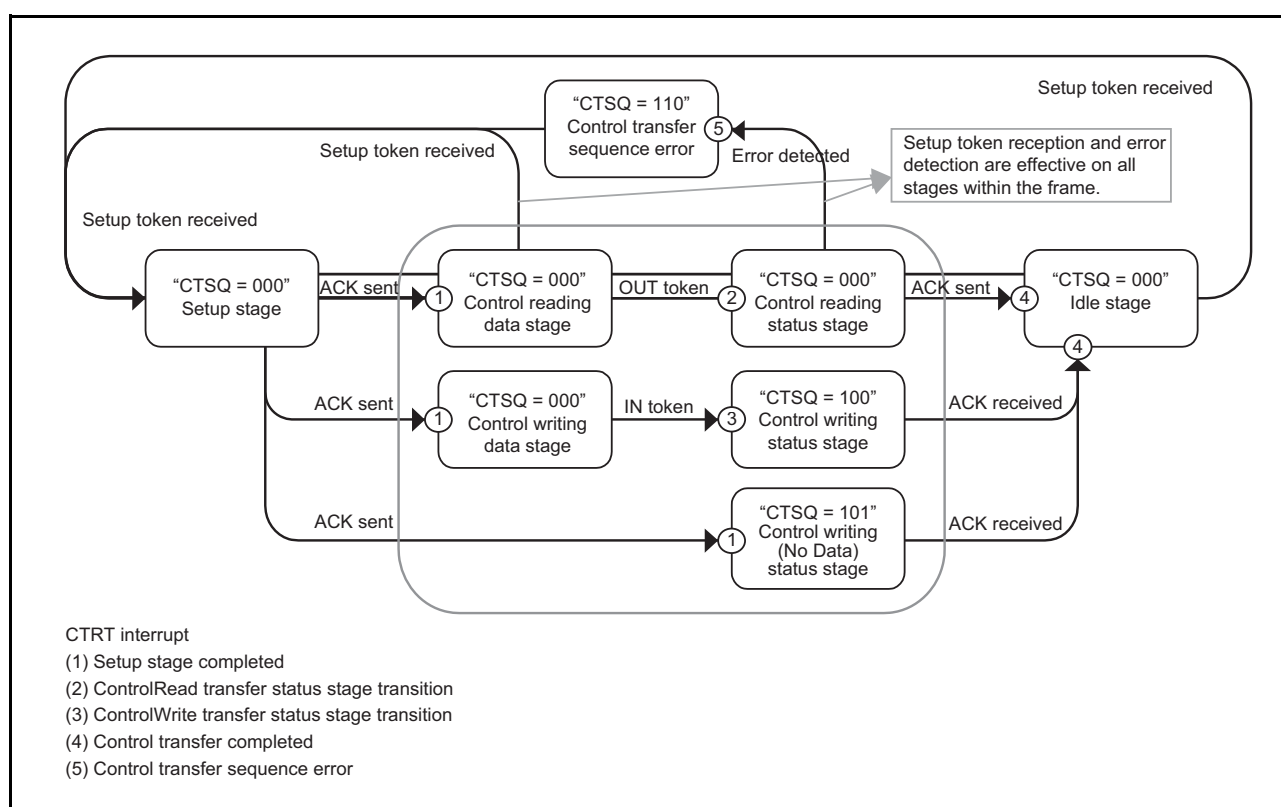

Figure 33.7 Control Transfer Stage Transition Diagram

33.9.2.4 Interrupts Relating to DMA Master

Table 33.23 List of Interrupts

| Interrupt Name | Interrupt Type |
|---------------------------|--|
| USBFDMAm (m, n = 0, 1) | A DMA transaction ends. An invalid descriptor is read in link mode. |
| USBFDMAERRm (m = 0, 1) | An error response is returned for a transfer issued by the master interface. |

This module has two types of DMA interrupts USBFDMAm and USBFDMAERRm.

- USBFDMAm interrupt (m, n = 0, 1)

This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.

An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

- USBFDMAERRm interrupt

This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAm interrupt output can be temporarily masked by setting a register.

Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.

On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

33.9.3 Pipe Control

Table 33.24 lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 33.24 PIPE Settings

| Register Name | Bit Name | Setting | Comment |
|---------------------|----------|---|---|
| DCPCFG PIPECFG | TYPE | Specifies the transfer type. | Pipes 1 to 15: Settable |
| | BFRE | Selects BRDY interrupt mode. | Pipes 1 to 5, 11 to 15: Settable |
| | DBLB | Selects double-buffer configuration. | Pipes 1 to 5, 11 to 15: Settable Pipes 9, 10: Settable only in bulk transfers |
| | CNTMD | Selects continuous transfer or non-continuous transfer. | DCP: Settable Pipes 1, 2, 9, 10: Settable only in bulk transfers Pipes 3 to 5, 11 to 15: Settable |
| | DIR | Selects transfer direction. | Settable to IN or OUT |
| | EPNUM | Endpoint number | Pipes 1 to 15: Settable Set to a value other than "0000" when a pipe is in use. |
| | SHTNAK | Disables pipes when transfer is completed. | DCP: Settable Pipes 1, 2, 9, 10: Settable only in bulk transfers Pipes 3 to 5, 11 to 15: Settable |
| PIPEBUF | BUFSIZE | Buffer memory size | DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes) Pipes 1 to 5, 9 to 15: Settable (up to 2 Kbytes specifiable) Pipes 6 to 8: Unsettable (fixed to 64 bytes) |
| | BUFNMB | Buffer memory number | DCP: Unsettable (fixed to area 0 to 3 hex) Pipes 1 to 5, 9 to 15: Settable (area 7 to 7F hex specifiable) Pipes 6 to 8: Unsettable (fixed to area 4 to 6 hex) |
| DCPMAXP PIPEMAXP | MXPS | Maximum packet size | Setting conforming to the USB specification. |
| PIPEPERI | IFIS | Buffer flush | Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 15: Unsettable |
| | IITV | Interval counter | Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 15: Unsettable |
| DCPCTR PIPEXCTR | BSTS | Buffer status | DCP state switched between receive and transmit buffer by ISEL bit |
| | INBUFM | IN buffer monitor | Available only for pipes 3 to 5, 9 to 15 |
| | ACLRM | Auto buffer clear | Pipes 1 to 15: Settable |
| | SQCLR | Sequence clear | Clears data toggle bit. |
| | SQSET | Sequence set | Sets data toggle bit. |
| | SQMON | Sequence monitor | Monitors data toggle bit. |
| | PBUSY | Pipe busy monitor | |
| DCPCTR PIPEXCTR | PID | Response PID | |
| | ATREPM | Auto response mode | Pipes 1 to 5, 9 to 15: Settable |
| PIPEXTRE | TRENB | Transaction count enable | Pipes 1 to 5, 9 to 15: Settable |
| | TRCLR | Current transaction counter clear | Pipes 1 to 5, 9 to 15: Settable |
| PIPEXTRN | TRNCNT | Transaction counter | Pipes 1 to 5, 9 to 15: Settable |

33.9.3.1 Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting "PID = BUF").

DCP: Set 64 for high-speed operation.

DCP: Set 8, 16, 32, or 64 for full-speed operation.

Pipes 1 to 5: Set 512 for high-speed bulk transfer.

Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.

Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.

Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.

Pipes 6 to 8: Set 64.

Pipe 9:

For interrupt transfer, set a value from 1 to 64.

For high-speed bulk transfer, set 512.

For full-speed bulk transfer, set 8, 16, 32, or 64.

Pipe 10:

For interrupt transfer, set a value from 1 to 64.

For high-speed bulk transfer, set 512.

For full-speed bulk transfer, set 8, 16, 32, or 64.

Pipes 11 to 15:

For high-speed bulk transfer, set 512.

For full-speed bulk transfer, set 8, 16, 32, or 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

33.9.3.2 Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPEXCTR registers.

- Response PID setting

The response PID specifies the response to a transaction from the host.

- (a) NAK: Always sends a NAK response to a generated transaction.
- (b) BUF: Responds to a transaction in accordance with the buffer memory state.
- (c) STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result.

This module writes data to the PID bits in the following cases:

- (a) NAK:

- (A) The SETUP token is received normally (for the DCP only).
- (B) If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.
- (C) If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.

- (b) BUF:

This module does not write "BUF".

- (c) STALL:

- (A) When a maximum packet size over error is detected in a received data packet
- (B) When a control transfer sequence error is detected

33.9.3.3 Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK). Figure 33.8 shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registers that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:

- All bits in the DCPCFG and DCPMAXP registers
- SQCLR and SQSET bits in the DCPCTR register
- All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers
- ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register
- All bits in the PIPExTRE and PIPExTRN registers

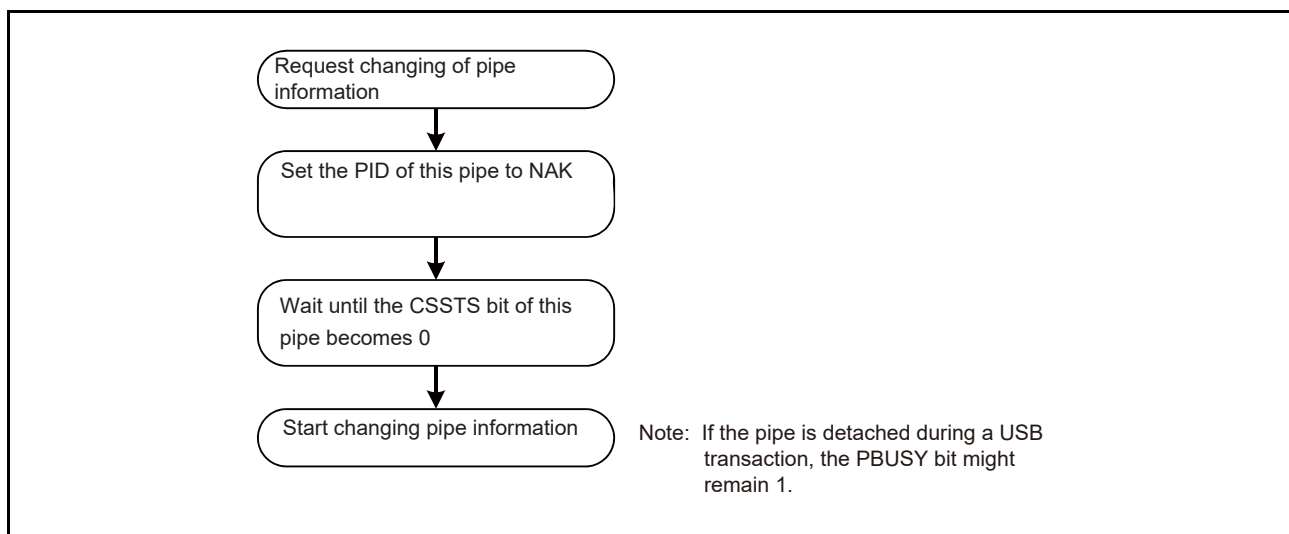

Figure 33.8 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

- All bits in the DCPCFG and DCPMAXP registers
- All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers
- ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

33.9.3.4 Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with "PID = DATA1" without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

33.9.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.

33.9.4.1 FIFO buffer allocation

Figure 33.9 shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPECFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPECFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPECTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/DxFIFOCTR register.

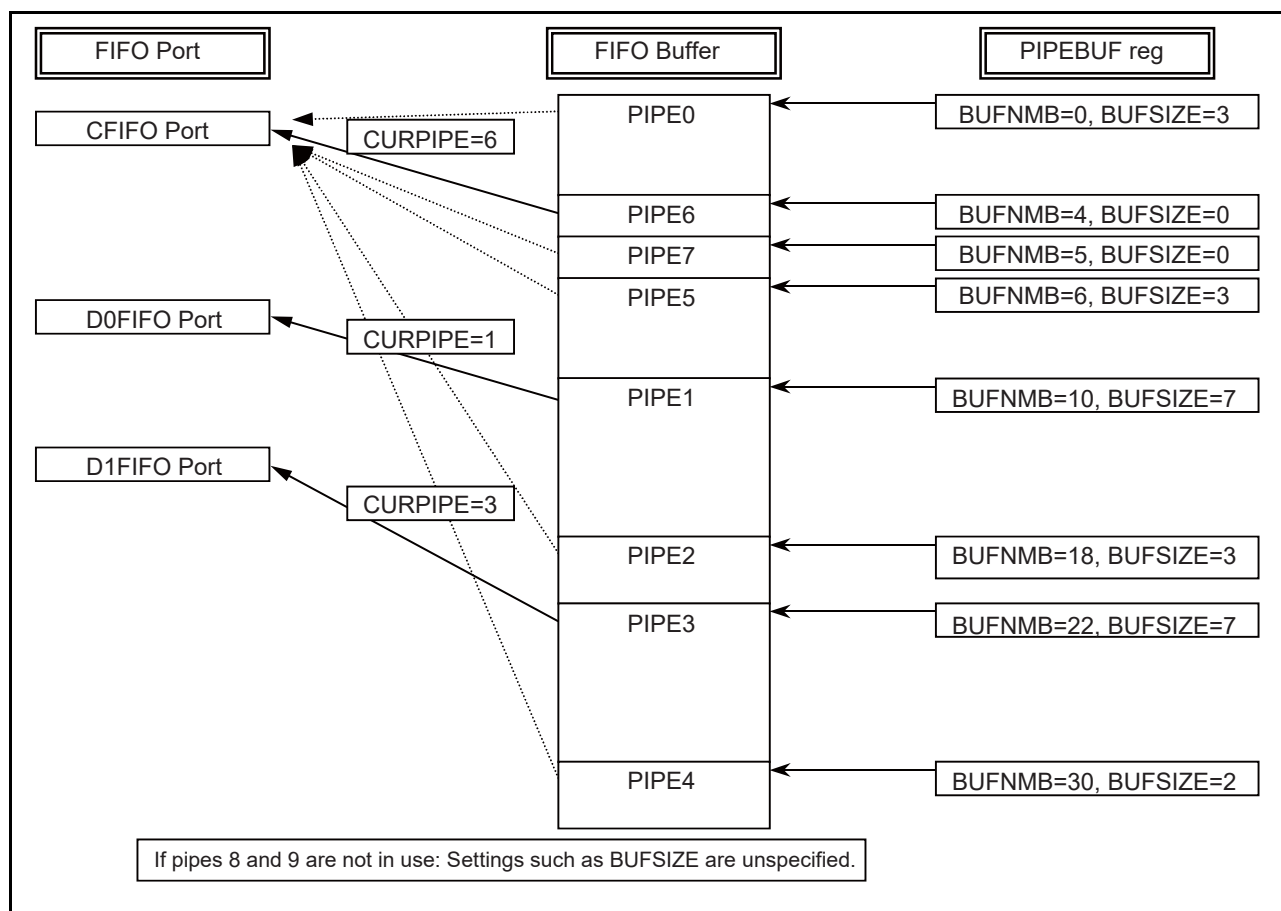

Figure 33.9 Example of FIFO Buffer Memory Mapping

33.9.4.2 Clearing FIFO buffers

Table 33.25 lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 33.25 List of FIFO Buffer Clearing Modes

| Bit Name | BCLR | DCLRM | ACLRM |
|-----------------|---|--|--|
| Register | CFIFOCTR register DxFIFOCTR register | DxFIFOSEL register | PIPEXCTR register |
| Function | The FIFO buffer on the CPU side is cleared. | The FIFO buffer is automatically cleared after the data is read from the specified pipe. | The buffer is automatically cleared to discard all the received packets. |
| Clearing method | Write "1" to clear. | 1: Mode enabled 0: Mode disabled | 1: Mode enabled 0: Mode disabled |

33.9.5 FIFO Port Functions

This section describes FIFO port functions. Table 33.26 shows the FIFO port function settings for this module.

If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/DxFIFOCTR register must be used to set write end.

To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.

When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.

The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 33.26 FIFO Port Function Settings

| Register Name | Bit Name | Function | Note |
|---------------|----------|--|-------------|
| C/DxFIFOSEL | RCNT | Selects DTLN read mode | |
| | REW | Rewinds buffer memory (re-read, re-write) | |
| | DCLRM | Reads received data of the specified pipe, and then automatically clears the received data | DxFIFO only |
| | DREQE | Asserts DREQ signal | DxFIFO only |
| | MBW | Specifies FIFO port access bit width | |
| | BIGEND | Selects FIFO port endian | CFIFO only |
| | ISEL | Specifies FIFO port access direction | DCP only |
| | CURPIPE | Selects current pipe | |
| C/DxFIFOCTR | BVAL | Finishes buffer memory write | |
| | BCLR | Clears CPU-side buffer memory | |
| | FRDY | Monitors FIFO port ready | |
| | DTLN | Confirms received data length | |

33.9.5.1 FIFO port selection

Table 33.27 lists pipes that can be selected for each FIFO port.

Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

Figure 33.10 shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pipe (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPECFG register determines the buffer memory access direction.

Table 33.27 FIFO Port Access for Each Pipe

| Pipe | Access Method | Usable Port |
|---------------|---------------|----------------------|
| DCP | CPU access | CFIFO port register |
| Pipes 1 to 15 | CPU access | CFIFO port register |
| | DMA access | DxFIFO port register |

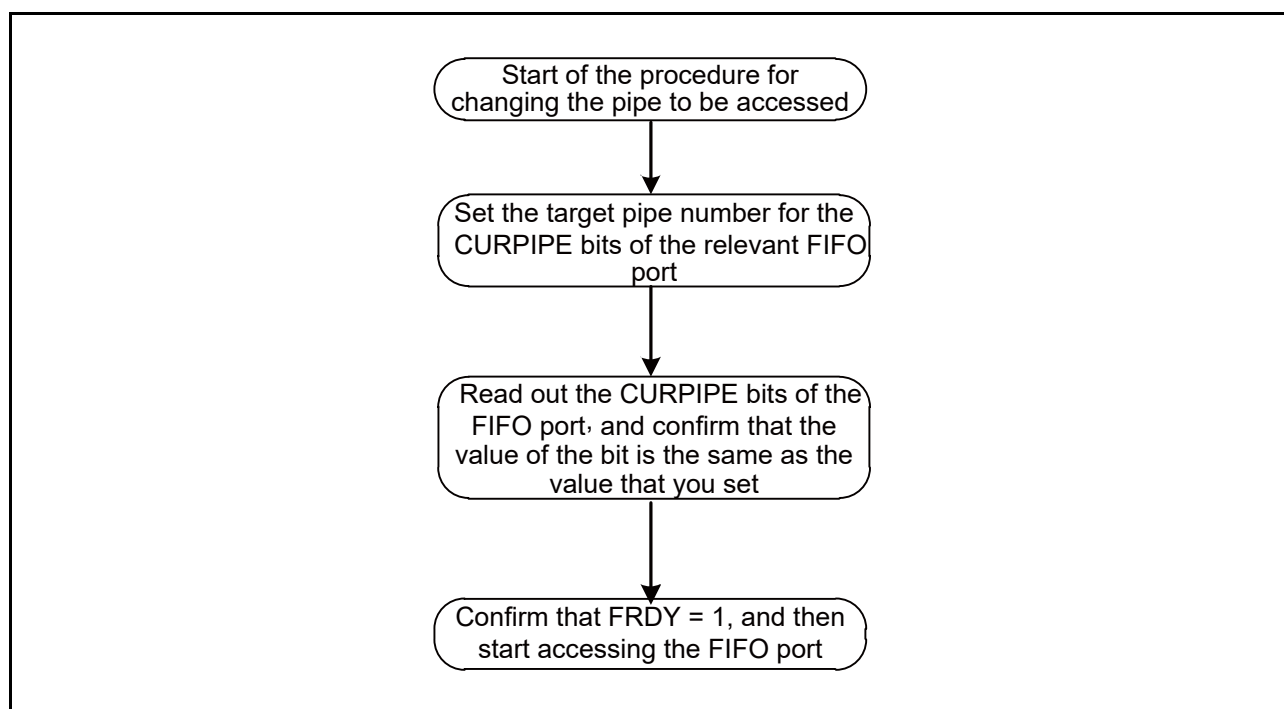

Figure 33.10 Pipe Switching Procedure for FIFO Port Access

33.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

Table 33.28 shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.

As shown in Table 33.28, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 33.28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

| | Register Setting | | | |
|--------------------------------------|----------------------|--------------------|----------------------|----------|
| | DCLRM = 0 | | DCLRM = 1 | |
| Buffer State during Packet Reception | BFRE = 0 | BFRE = 1 | BFRE = 0 | BFRE = 1 |
| Buffer full | Clearing unnecessary | | Clearing unnecessary | |
| Zero-length packet received | Clearing necessary | | | |
| Normal short packet received | Clearing unnecessary | Clearing necessary | | |
| Transaction count end | | | | |

33.9.5.3 BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The "last data" here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

Table 33.29 shows when this module generates a BRDY interrupt.

Table 33.29 BRDY Interrupt Generation Timing

| Buffer State during Packet Reception | Register Setting | |
|--------------------------------------|-------------------------|---|
| | BFRE = 0 | BFRE = 1 |
| Buffer full (normal packet received) | When packet is received | No interrupt generated |
| Zero-length packet received | When packet is received | When packet is received |
| Normal short packet received | When packet is received | When received data has been read from the buffer memory |
| Transaction count end | When packet is received | When received data has been read from the buffer memory |

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

33.9.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

33.9.6.1 Control transfer

(1) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
 - (a) VALID bit in the INTSTS0 register: 1
 - (b) PID bit in the DCPCTR register: NAK
 - (c) CCPL bit in the DCPCTR register: 0
2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.

By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (ControlRead, ControlWrite, or NodataControl) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see Figure 33.7.

(2) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.

A transaction is executed by setting the PID bit in the DCPCTR register to BUF.

The end of data transfer is detected with a BRDY or BEMP interrupt. For ControlWrite transfer, use a BRDY interrupt. For ControlRead transfer, use a BEMP interrupt.

For ControlWrite transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

(3) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.

After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

(a) For ControlRead transfer

Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

(b) For ControlWrite or NodataControl transfer

This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

(4) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

- (a) bmRequestType \neq "0x00"
- (b) wIndex \neq "0x00"
- (c) wLength \neq "0x00"
- (d) wValue $>$ "0x7F"
- (e) DVSQ = "011 (Configured)"

Software must respond to all requests other than SET_ADDRESS.

33.9.7 Bulk Transfer (Pipes 1 to 5 and 9 to 15)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

33.9.7.1 NYET handshake control

Table 33.30 lists responses to tokens received in a bulk or control transfer.

When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 33.30 List of Responses to Received Tokens

| PID bit value | Buffer memory state*1 | Received token | Response | Note |
|---------------|-----------------------|----------------|-----------|--|
| NAK/STALL | - | SETUP | ACK | - |
| | - | IN/OUT/PING | NAK/STALL | - |
| BUF | - | SETUP | ACK | - |
| | RCV-BRDY | OUT/PING | ACK | Receives data packet when OUT token is received *1 |
| | RCV-BRDY | OUT | NYET | Receives data packet *2 |
| | RCV-BRDY | OUT (Short) | ACK | Receives data packet *2 |
| | RCV-BRDY | PING | ACK | *2 |
| | RCV-NRDY | OUT/PING | NAK | |
| | TRN-BRDY | IN | DATA0/1 | Sends data packet |
| | TRN-NRDY | IN | NAK | |

Note: Details are described below.

RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.

RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.

RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.

TRN-BRDY: Buffer memory has send data when an IN token is received.

TRN-NRDY: Buffer memory has no send data when an IN token is received.

33.9.8 Interrupt Transfer (Pipes 6 to 9 and 10)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.

Note that this module does not support high-bandwidth interrupt transfers.

33.9.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

1. Notification of error information about isochronous transfers
2. Interval counter (IITV bit)
3. Data setup control for isochronous IN transfers (IDLY function)
4. Buffer flush function for isochronous IN transfers (IFIS bit)
5. SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

33.9.9.1 Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.

Table 33.31 and Table 33.32 describe the error checking procedure and interrupts that are generated.

1. PID error
The PID of the received packet is invalid.
2. CRC error and bit stuffing error
The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
 - (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
 - (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
An interval error occurs in the following cases:
 - (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
 - (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 33.31 Error Detection during Transmission/Reception of Token

| Error Detection Priority | Error Type | Interrupt Generated at Error Detection and Status |
|--------------------------|-------------------------------|--|
| 1 | PID error | No interrupt is generated (ignored as a corrupted packet). |
| 2 | CRC error, bit stuffing error | No interrupt is generated (ignored as a corrupted packet). |
| 3 | Overrun error, underrun error | An NRDY interrupt is generated and the OVRN bit is set. A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token. |
| 4 | Interval error | An NRDY interrupt is not generated. |

Table 33.32 Error Detection during Reception of Data Packet

| Error Detection Priority | Error Type | Interrupt Generated at Error Detection and Status |
|--------------------------|--------------------------------------|--|
| 1 | PID error | No interrupt is generated (ignored as a corrupted packet). |
| 2 | CRC error, bit stuffing error | An NRDY interrupt is generated and the CRCE bit is set. |
| 3 | Packet size error (too large packet) | A BEMP interrupt is generated and the PID bit is set to STALL. |

33.9.9.2 DATA-PID

This module does not support high-bandwidth transfers.

The following shows actions that can be taken in response to a received PID.

1. IN direction:
 - (a) DATA0: Used to send packets.
 - (b) DATA1: Not used to send packets.
 - (c) DATA2: Not used to send packets.
 - (d) mDATA: Not used to send packets.
2. OUT direction (in full-speed operation):
 - (a) DATA0: Packets are received normally.
 - (b) DATA1: Packets are received normally.
 - (c) DATA2: Packets are ignored.
 - (d) mDATA: Packets are ignored.
3. OUT direction (in high-speed operation):
 - (a) DATA0: Packets are received normally.
 - (b) DATA1: Packets are received normally.
 - (c) DATA2: Packets are received normally.
 - (d) mDATA: Packets are received normally.

33.9.9.3 Interval counter

(1) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer.

The interval counter enables the functions listed in Table 33.33.

Table 33.33 Functions of the Interval Counter

| Transfer Direction | Function | Detecting Condition |
|--------------------|----------------------------------|---|
| IN | Transmit buffer flush function | An IN token cannot successfully be received within the interval frame during isochronous IN transfer. |
| OUT | Notification of unreceived token | An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer. |

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2^n (micro) frames, where n is the value of the IITV bit.

(2) Interval counter initialization

This module initializes the interval counter under the following conditions:

- (a) Power on reset
The IITV bit is initialized.
- (b) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.
- (c) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:

- 1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.
- 2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

- (a) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.
- (b) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

33.9.9.4 Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called "send data setup for isochronous transfer".

This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

Figure 33.11 shows examples of sending using the send data setup function for isochronous transfer by setting "IITV = 0" (each frame) in this module.

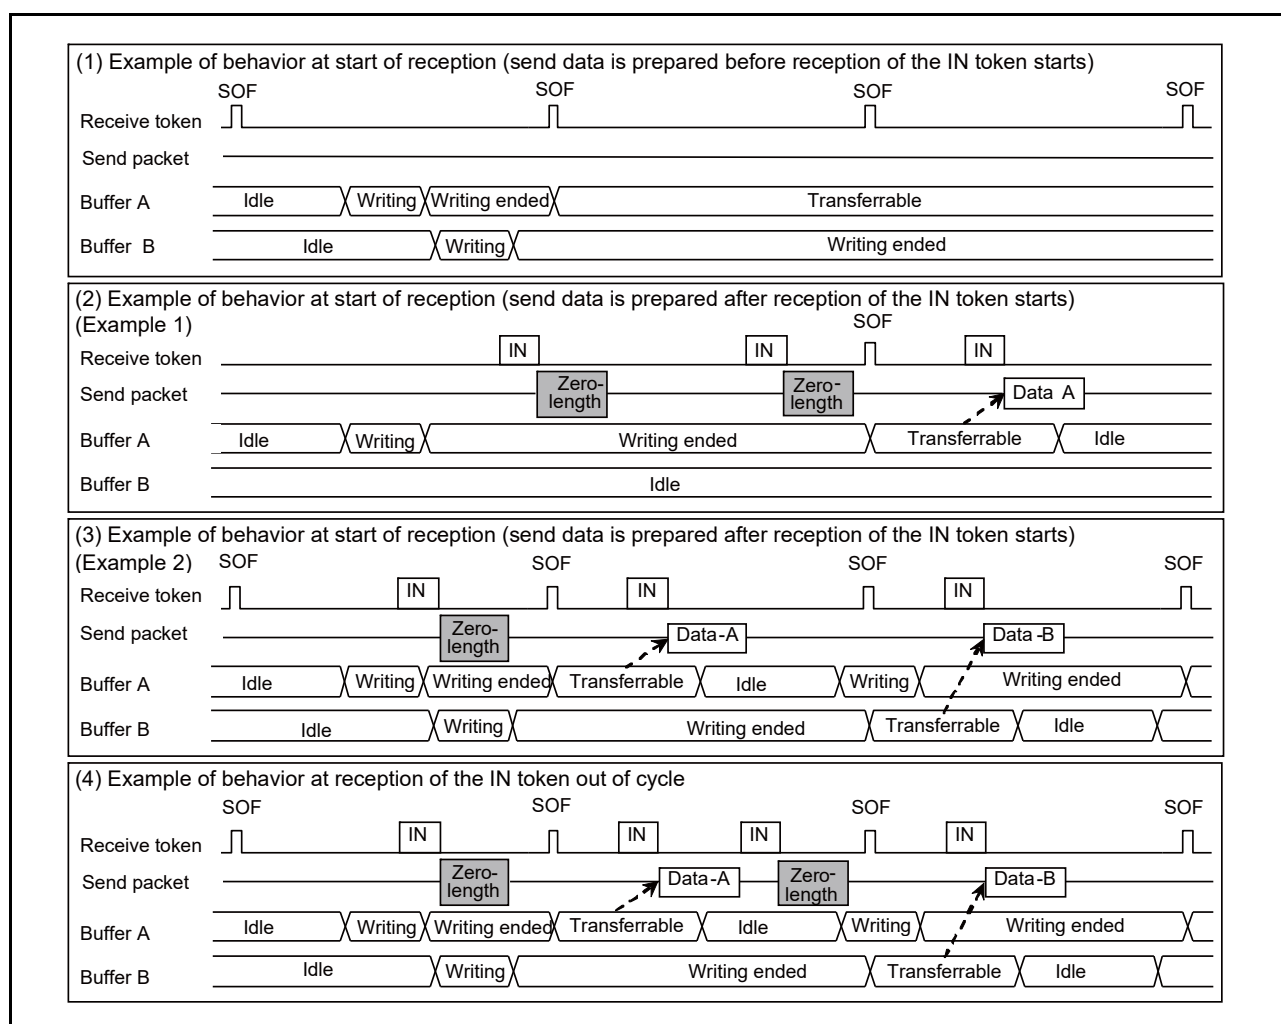

Figure 33.11 Examples of Data Setup Function Behavior

33.9.9.5 Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.

At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

1. If IITV is 0
Buffer flush operation is performed from the first frame after the pipe is enabled.
2. If IITV is not 0
Buffer flush operation is performed after the first successful transaction.

Figure 33.12 shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

Figure 33.12 Example of Buffer Flush Function Behavior

Figure 33.13 shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.

If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.

Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.

In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

1. IN direction:

- (a) If the buffer is ready to transfer data, data is transferred and a normal response is returned.
- (b) If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.

2. OUT direction:

- (a) If the buffer is ready to receive data, data is received and a normal response is returned.
- (b) If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

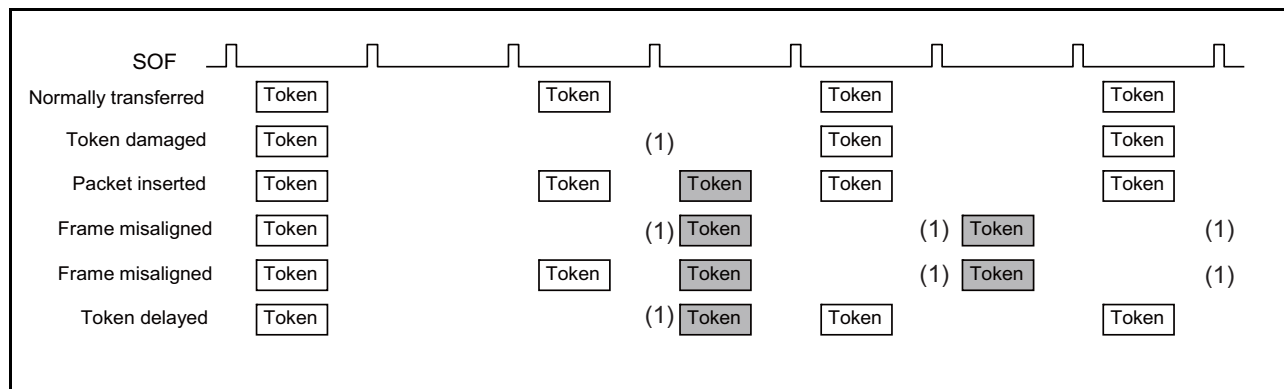

Figure 33.13 Example of Occurrence of Interval Error (when IITV is 1)

33.9.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 μ s (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:

- (1) Power on reset
- (2) USB bus reset
- (3) Suspended state detected

The SOF interpolation operates according to the following specifications:

- (1) Frame interval (125 μ s or 1 ms) is based on the results of the reset handshake protocol.
- (2) The interpolation function does not operate until an SOF packet is received.
- (3) After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 μ s or 1 ms.
- (4) After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.
- (5) Interpolation is not performed in the suspended state or while a USB bus reset is being received.
(If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:

- (1) Updating of frame number or micro-frame number
- (2) SOFR interrupt and micro SOF lock
- (3) SOF pulse output
- (4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.

If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.

However, if a micro SOF packet for which "micro-FRNM = 000" is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which "micro-FRNM = 000" is not set are successfully received.

33.9.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.

The table below compares the features of the L2 (suspend) state and L1 state.

Table 33.34 Comparison Between Suspend (L2) State and L1 State

| Item | L1 | Suspend (L2) |
|-----------------------------|---|-----------------------------------|
| Transition | LPM Transaction | 3-ms idle period |
| Host-activated resumption | (Host) Minimum drive period specifiable by the host. Specified between 75 μ s to 1.175 ms | (Host) Min. 20-ms K drive |
| | (Device) 10- μ s K drive | (Device) 10-ms K drive |
| Device-activated resumption | (Device) 50- μ s K drive | (Device) 1-ms to 15-ms K drive |
| | (Host) 60- to 990- μ s K drive | (Host) Min. 20-ms K drive |
| | (Device) 10- μ s K drive | (Device) 10-ms K drive |
| | | |
| Signaling | Low and Full Speed Idle | Low and Full Speed Idle |

The following describes the processing for transition to and resumption from the L1 state.

33.9.11.1 Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.

Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 33.35 Relationship between LPM Response and Descriptor

| LPM Response | bcdUSB | Presence of USB 2.0 Ex. Desc | USB 2.0 Ex. Desc LPM | Response When LPM Is Received | Remarks |
|--------------|--------|------------------------------|----------------------|-------------------------------|---|
| Not respond | 0200 | Not present | -- | Not Respond | Standard action in the case where this module does not respond to LPM |
| | 0201 | Present | LPM = 0 | STALL | This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response. |
| Respond | 0201 | Present | LPM = 1 | ACK or NYET | Standard action in the case where this module responds to LPM |

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.

When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.

When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.

When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

33.9.11.2 Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with "No response", "ACK", "NYET", or "STALL" according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 μ s after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.

For 2, both retransmission control and transition to the L1 state are processed by the hardware.

Transition to the L1 state can be identified through a DVST interrupt.

For 3, a RESM interrupt occurs on detection of host K in the L1 state.

For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software.

The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

33.9.11.3 HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

Note: This HIRD value negotiation function must also be supported on the host side.

33.9.12 DMA Mode

33.9.12.1 Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 33.36 DMA mode settings

| DMS (CHCFG) | Mode | Description |
|-------------|---------------|--|
| 0 | Register mode | Performs DMA transfer based on the values set by Next Register Set. |
| 1 | Link mode | Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing. |

(1) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.

Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

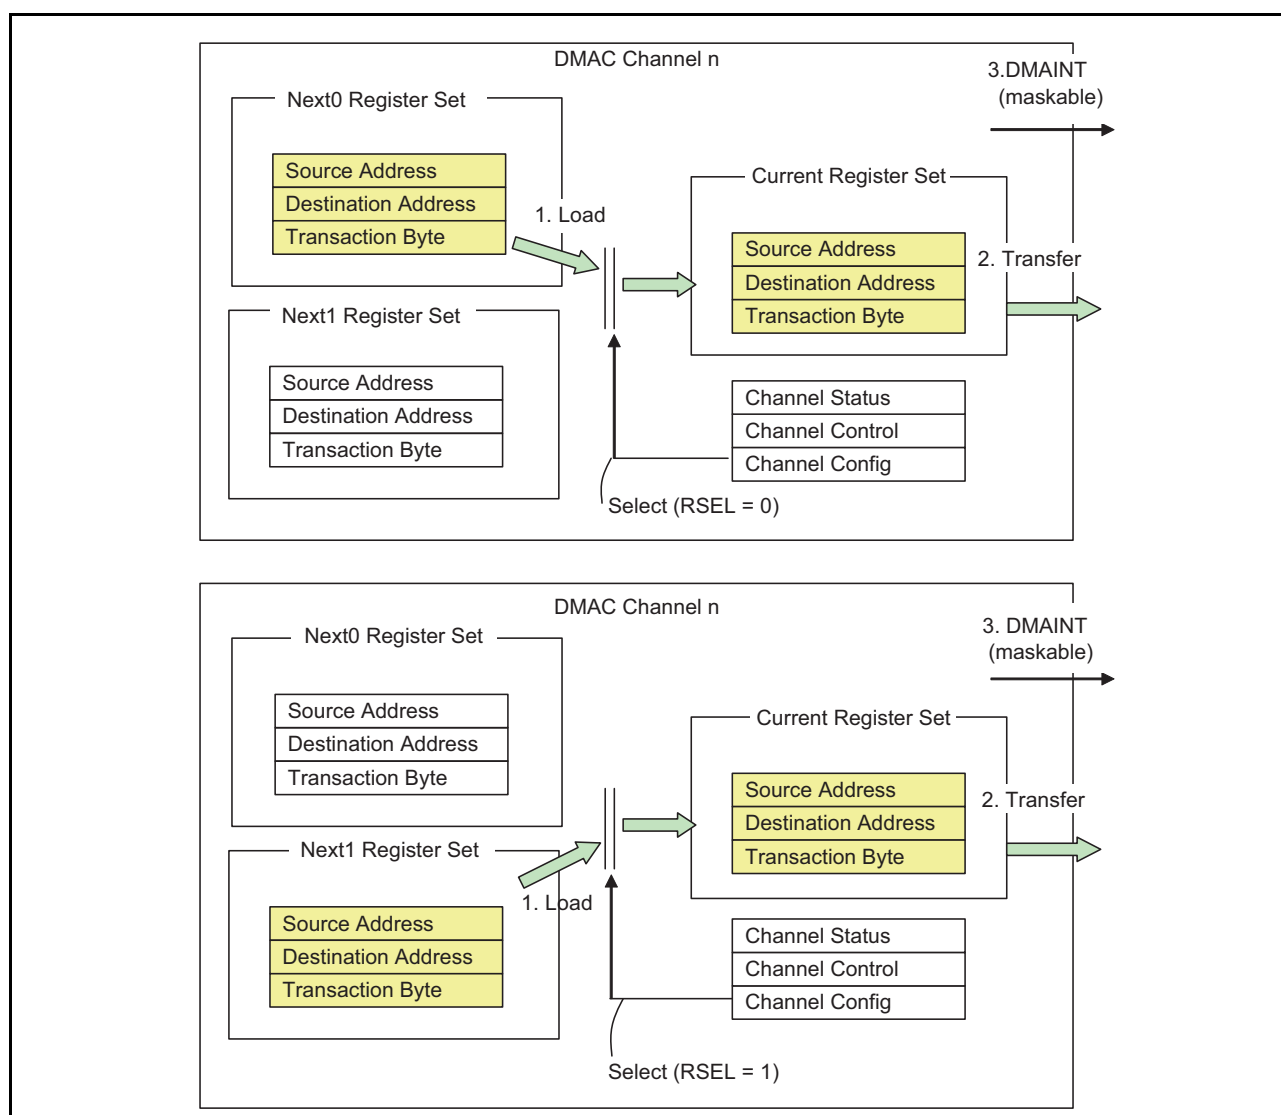

Figure 33.14 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

(a) Operation flow of register mode

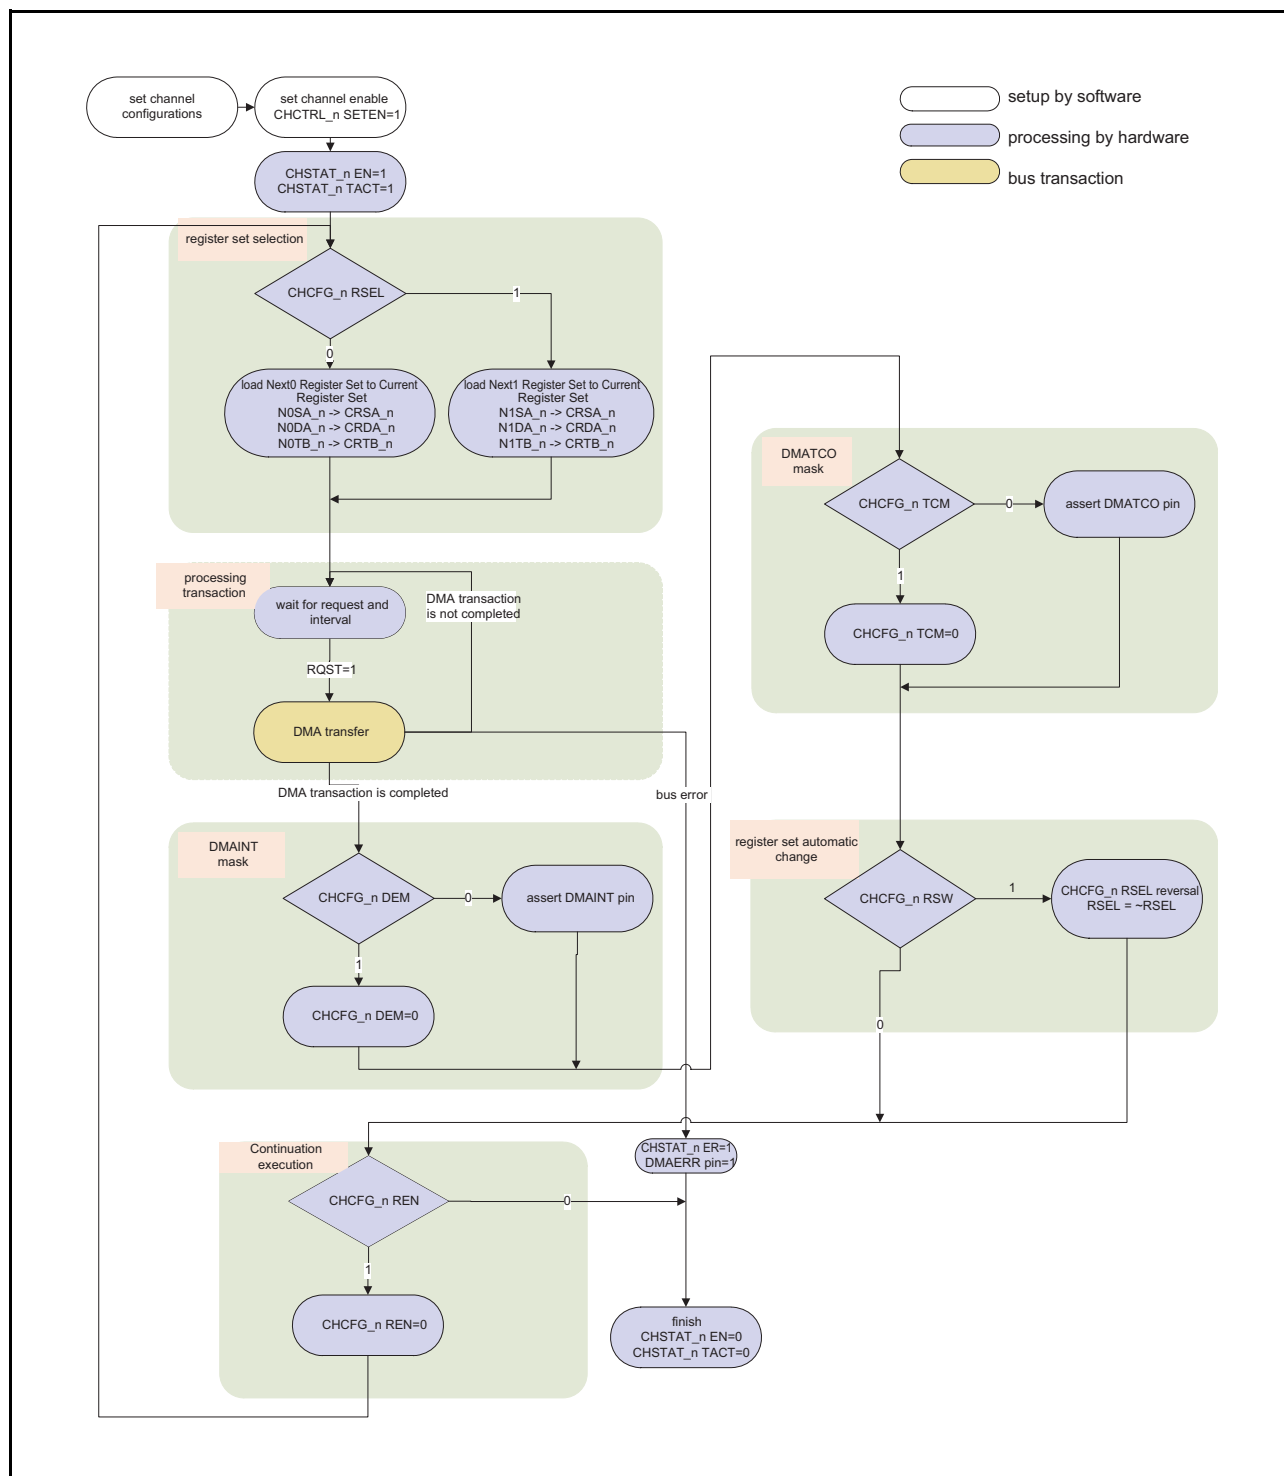

Figure 33.15 Register Mode Operation Flow

Description of the register mode operation flow:

1. Channel setting

The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

(see section 33, DMA Transfer).

2. Register set selection

When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.

3. DMA transaction

A DMA transaction is executed based on the values that are set. For details about transfer, section 33.9.13, DMA Transfer.

4. The USBFDMAmn masking

The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.

5. DMATC masking

DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.

6. Automatic register set switchover

Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.

7. Continuation of execution

Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

(b) Register mode setting

- Register mode setting

The register set to be processed is selected.

Table 33.37 Register Mode Setting

| DMS (CHCFG_n) | RSEL (CHCFG_n) | Description |
|---------------|----------------|-------------------------------|
| 0 | 0 | Processes Next0 Register Set. |
| | 1 | Processes Next1 Register Set. |

- USBFDMAmn masking

The USBFDMAmn interrupt can be masked.

Table 33.38 USBFDMAmn Mask Setting

| DEM (CHCFG_n) | Description |
|---------------|--|
| 0 | Asserts the USBFDMAmn interrupt when the DMA transaction is completed. |
| 1 | Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed. After the DMA transaction is completed, the DEM bit is cleared to 0. |

- DMATC mask setting

DMATC from DMAC control to USB control can be masked.

Table 33.39 DMATC Mask Setting

| DEM (CHCFG_n) | Description |
|---------------|--|
| 0 | Asserts DMATC when the DMA transaction is completed. |
| 1 | Does not assert DMATC even when the DMA transaction is completed. After the DMA transaction is completed, the TCM bit is cleared to 0. |

- Automatic transaction execution for a register set

After a DMA transaction finishes, another DMA transaction can be executed.

Table 33.40 Automatic Execution Setting for a Register Set

| REN (CHCFG_n) | Behavior | Remarks |
|---------------|--|---|
| 0 | The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes. | Use this setting to execute a DMA transaction only once. |
| 1 | After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful. | Use this setting to continue processing of register set contents. |

- Automatic register set switchover setting

After a DMA transaction finishes, the next register set to be processed can be switched.

Table 33.41 Automatic Execution Setting for a Register Set

| RSW (CHCFG_n) | Behavior | Remarks |
|---------------|---|--|
| 0 | The register set is not switched when a DMA transaction finishes. | Use this setting to use only one register set. |
| 1 | When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set. | Use this setting to switch the register set. |

(c) Example of setting the register mode

- Example of setting the register mode when using only the Next0 register set

Table 33.42 Register Mode Setting Example

| DMS (CHCFG_n) | RSEL (CHCFG_n) | DEM (CHCFG_n) | TCM (CHCFG_n) | RSW (CHCFG_n) | REN (CHCFG_n) |
|----------------------|----------------|-------------------|-------------------|---------------------|--------------------------------------|
| 0 (register mode) | 0 (Next0) | 0 (not masked) | 0 (not masked) | 0 (not switched) | 0 (continuous execution disabled) |

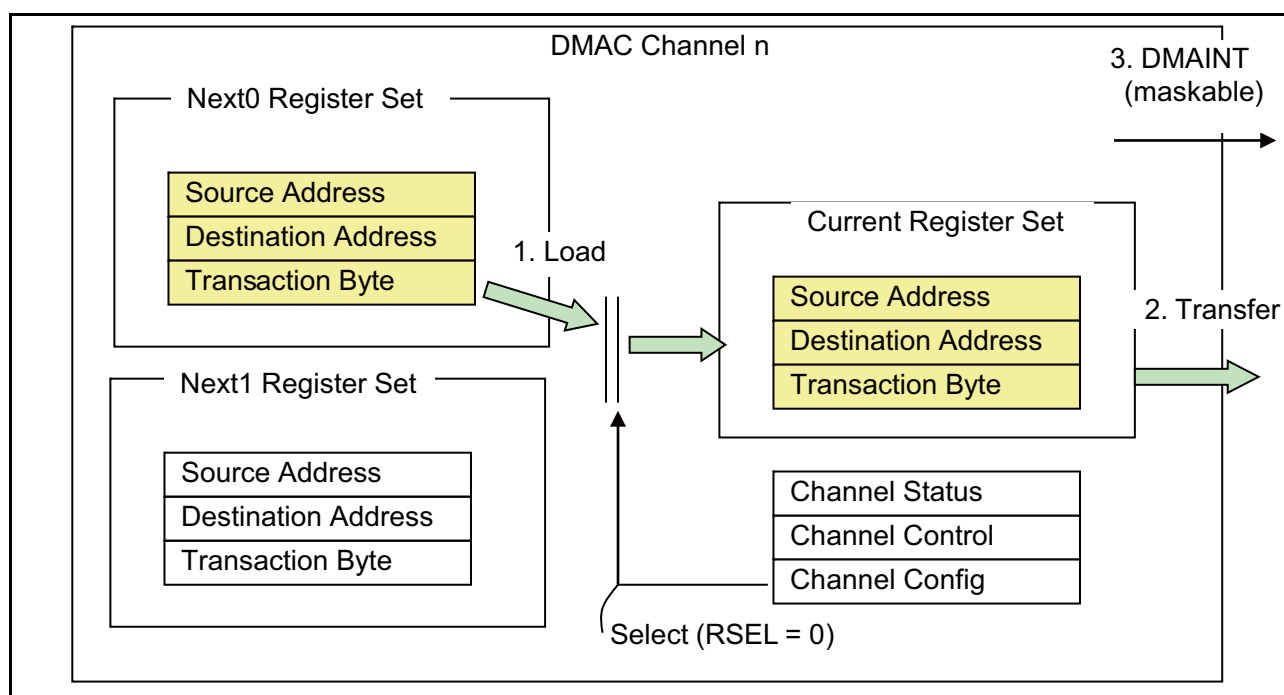

Figure 33.16 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAMn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Example of setting the register mode when using two register sets continuously

Table 33.43 Automatic Register Set processing Setting

| DMS (CHCFG_n) | RSEL (CHCFG_n) | DEM (CHCFG_n) | TCM (CHCFG_n) | RSW (CHCFG_n) | REN (CHCFG_n) |
|----------------------|----------------|---------------|-------------------|-----------------|-------------------------------------|
| 0 (register mode) | 0 (Next0) | 1 (masked) | 0 (not masked) | 1 (switched) | 1 (continuous execution enabled) |

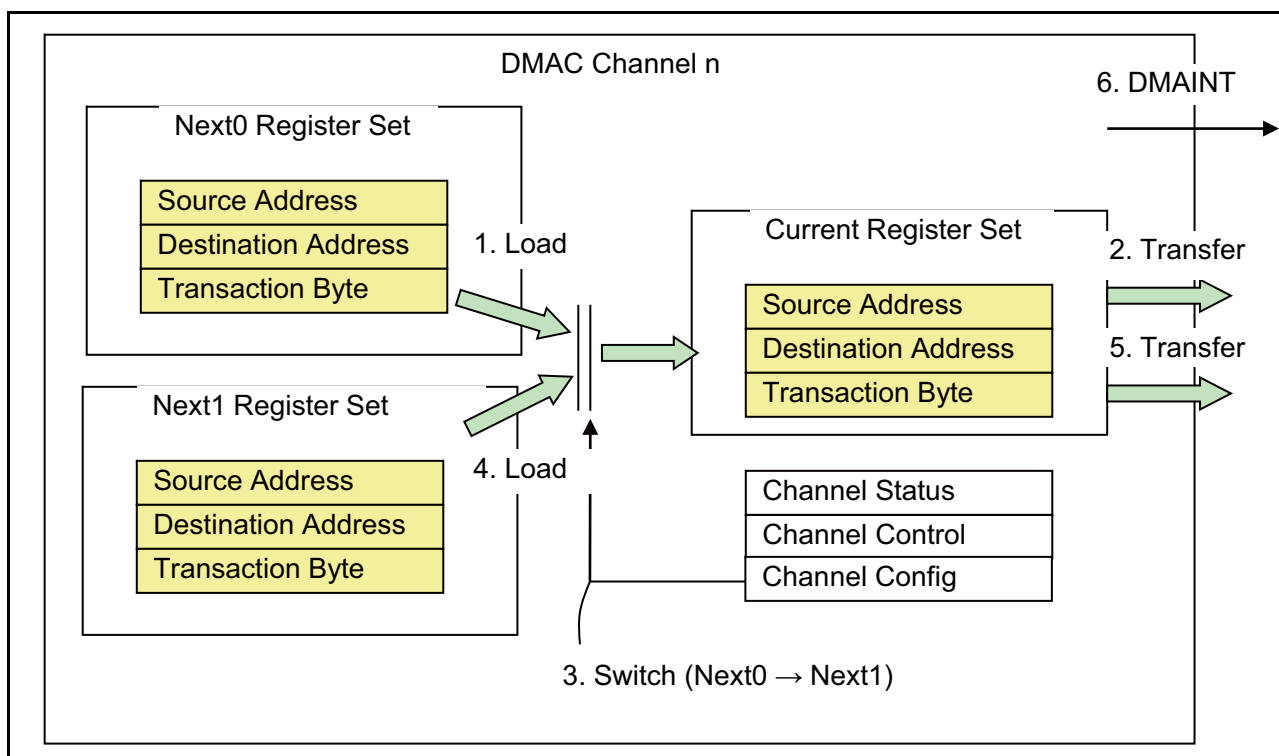

Figure 33.17 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAMn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAMn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(2) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

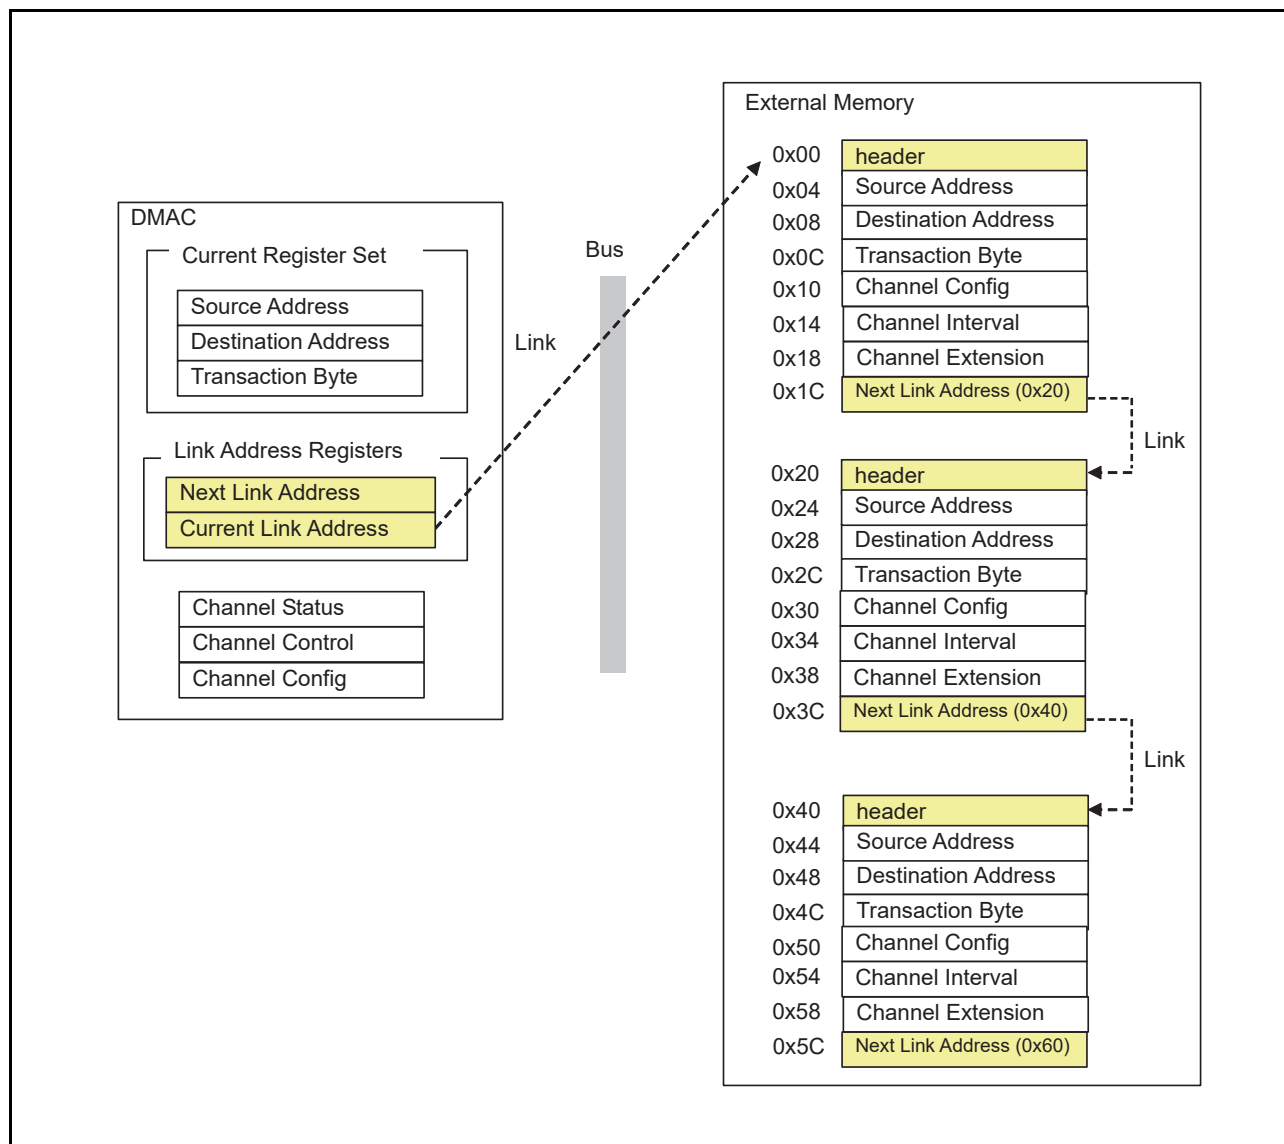

Figure 33.18 Overview of Link Mode

(a) Operation flow of link mode

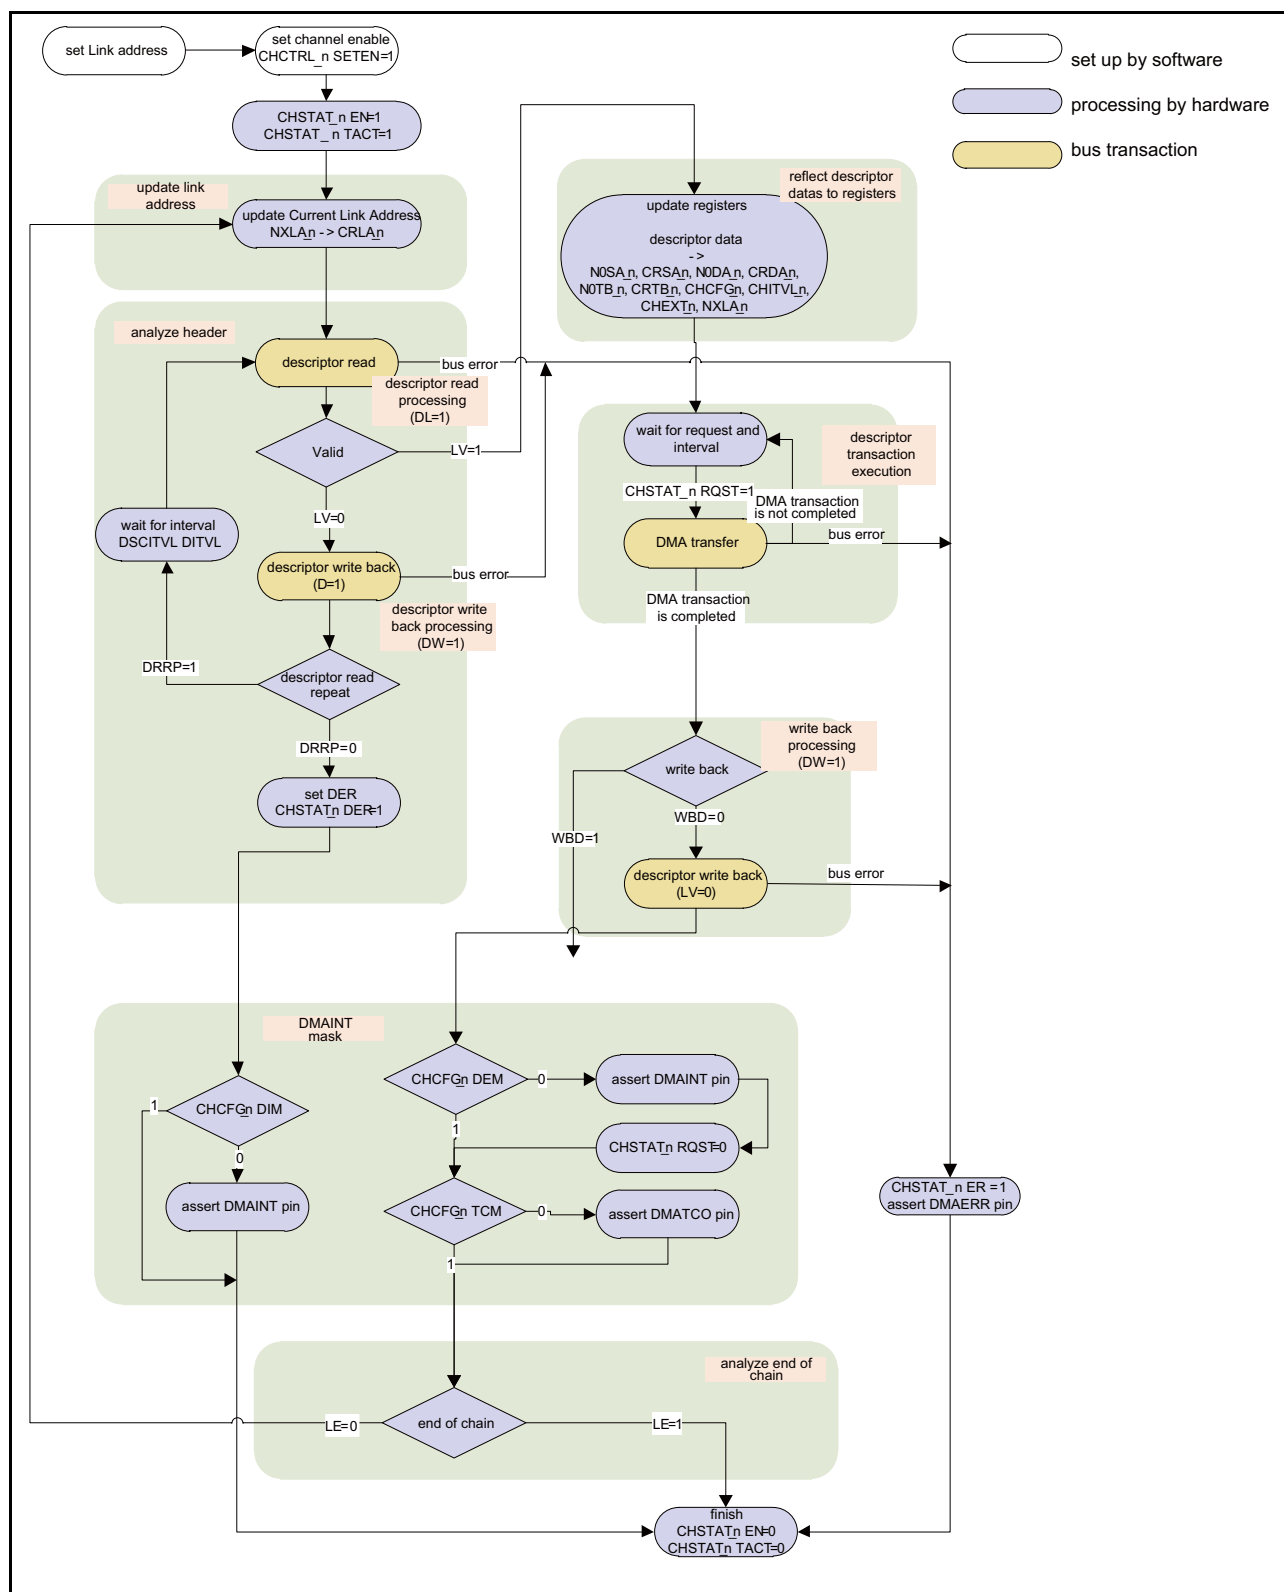

Figure 33.19 Link Mode Operation Flow

Description of the link mode operation flow:

1. Channel setting
The beginning address of the link destination is set in the NXLA_n register.
2. Link address updating
If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.
3. Descriptor reading and header judgment
A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.
4. Descriptor setting
If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.
5. DMA transaction
A DMA transaction is executed based on the values that are set. For details about transfer, see section 33.9.13, DMA Transfer.
6. Header write-back
If WBD of header is 0, DMAC writes LV = 0 to the header area.
7. USBFDMAmn masking
If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.
8. DMATC masking
If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.
9. Link end judgment
If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

(b) Register setting

- Link mode setting

To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 33.44 Link Mode Setting

| DMS (CHCFG_n) | Description |
|---------------|---|
| 1 | This module operates in link mode. The setting of this bit cannot be changed by using a descriptor. |

- Link address setting

The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target.

Before starting link mode, set the link target in the NXLA_n register.

After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 33.45 Link Address Register Set

| Register | Description |
|--|--|
| Next Link Address Register (NXLA_n) | This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register. |
| Current Link Address Register (CRLA_n) | This register is used to display the link target that is being executed. This is a read-only register. |

(c) Descriptor setting

DMAC supports multiple descriptor formats.

A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.

The following table shows the relationship between DSCFM values and descriptor formats.

Table 33.46 Descriptor Formats

| DSCFM | Descriptor Size | Next Link Address | Channel Extension | Channel Interval | Channel Config | Transaction Size | Destination Address | Source Address | header |
|----------------------|--|-------------------|-------------------|------------------|----------------|------------------|---------------------|----------------|--------------|
| 3 | 4 words | √ | — (reload) | — (reload) | — (reload) | — (header) | √ | √ | √ (with STS) |
| 1 | 8 words | √ | √ | √ | √ | √ | √ | √ | √ (no STS) |
| Other than the above | If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3. | | | | | | | | |

Table 33.47 Explanation of the Marks in Table 33.46

| Field | Mark | Description | Remarks |
|---|--------------|---|--|
| Header | √ (with STS) | The STS field of bits [15:0] in the header is valid. The value set in the STS field is used as the total number of transfer bytes (Transaction Size). | — |
| | √ (no STS) | The STS field of bits [15:0] in the header is invalid. The value of "Transaction Size" in the descriptor is used as the total number of bytes. | — |
| Source Address | √ | Specify the source address. | — |
| Destination Address | √ | Specify the destination address. | — |
| Transaction Size | √ | Specify the transaction size. | — |
| | — (header) | Omit the transaction size. The value set in the STS field is used as the total number of transfer bytes (Transaction Size) | Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set. |
| Channel Config Channel Interval Channel Extension | √ | Specify Channel Config, Channel Interval, and Channel Extension. | — |
| | — (reload) | Omit Channel Config, Channel Interval, and Channel Extension. The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited. | — |
| Next Link Address | √ | Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor. | — |

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by “√” in Table 33.46 on memory.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 33.48 Example of Placing Descriptors

| DSCFM | Address | | | | | | | |
|-------|--------------------|--------------------|--------------------|--------------------|--------------------|---------------------|--------------------|--------------------|
| | Link Address + 1CH | Link Address + 18H | Link Address + 14H | Link Address + 10H | Link Address + 0CH | Link Address + 08H | Link Address + 04H | Link Address + 00H |
| 3H | — | — | — | — | Next Link Address | Destination Address | Source Address | header |
| 1H | Next Link Address | Extension | Interval | Config | Transaction Byte | Destination Address | Source Address | header |

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

| | | | | | | | | | | | | | | | |
|--|----|----|----|----|-----|----|----|--|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DSCFM | | | | — | WBD | LE | LV | D | — | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| If the WBD bit is 0 when DMAC reads the header, DMAC writes data back to this 1-byte area after the DMA transaction in accordance with the descriptor ends. At this time, DMAC writes 0 back to the LV bit. For other bits, DMAC writes the values read from the header. | | | | | | | | If the LV bit in the header is 0 when DMAC reads the header, DMAC writes 80H back to this 1-byte area. | | | | | | | |
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| STS | | | | | | | | | | | | | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | | | | | | | | | | | | | | | |

Figure 33.20 Header Area

Table 33.49 Header Area

| Bit position | Bit name | Meaning |
|--------------|----------|---|
| 31 to 28 | DSCFM | Descriptor Format Specifies the descriptor format (length and combination of descriptors). For details see Table 33.46 |
| 27 | — | Reserved area. Set 0. |
| 26 | WBD | Wrazite Back Disable Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation. 0: Writes 0 back to the LV bit. 1: Does not perform a write-back operation for the LV bit. |
| 25 | LE | Link End Indicates that the link will end with the DMA transaction for this descriptor. Set this bit to 1 to indicate the end of link. 0: The link continues. 1: The link ends. |
| 24 | LV | Link Valid Indicates that this descriptor is valid. If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit. 0: This descriptor is invalid. 1: This descriptor is enable. |
| 23 | D | Descriptor Error Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit. 0: A descriptor error has not occurred. 1: LV was 0 when the descriptor was read. |
| 22 to 16 | — | Reserved area. Set 0. |
| 15 to 0 | STS | Short Transaction Size If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535. If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed. |

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are

different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

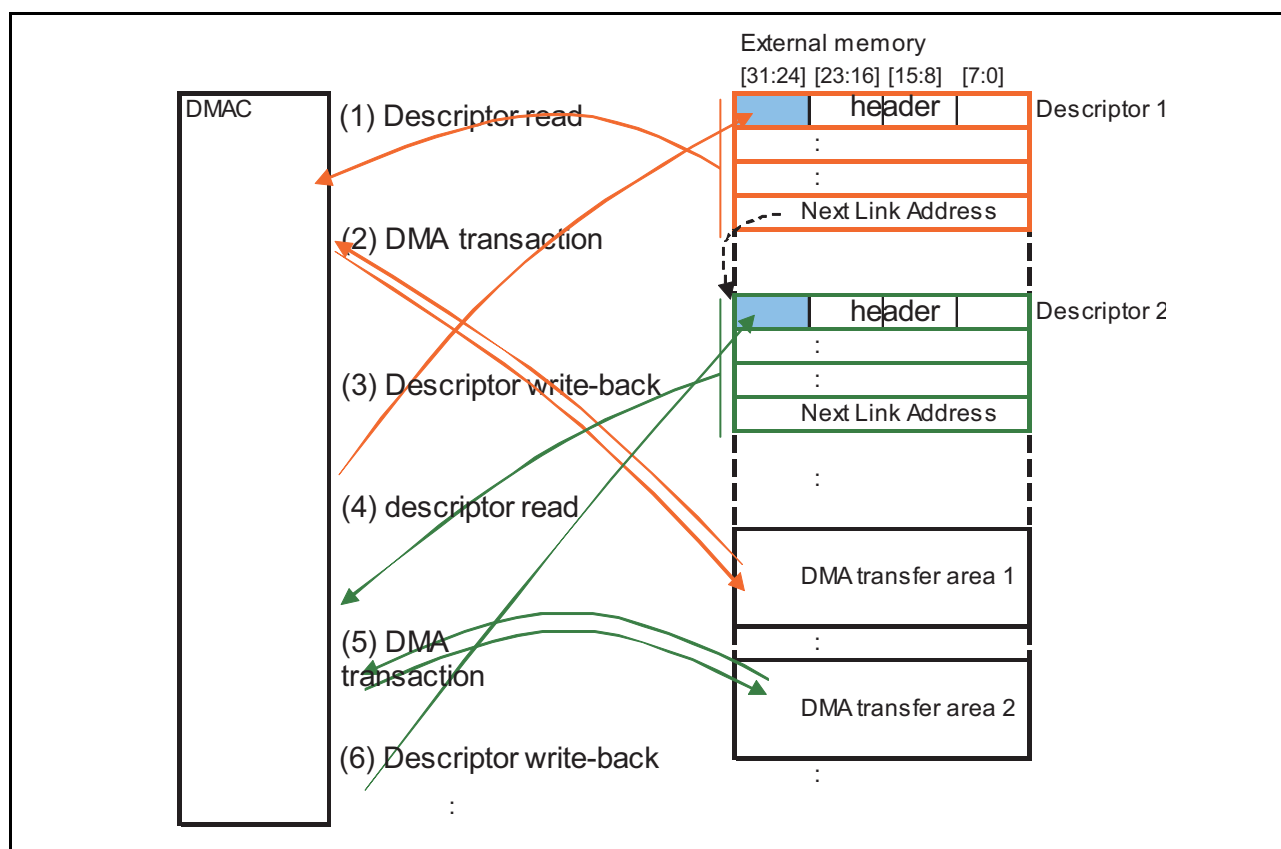

Figure 33.21 Overview of Descriptor Areas and DMA Transfer Areas

- (1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).
 - (2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.
 - (3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte-size basis.
 - (4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.
 - (5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.
 - (6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte-size basis.
- (Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.

If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).

If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors
 - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
 - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
 - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
 - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
 - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

(d) Link configuration example

In link mode, descriptors can be configured as shown below.

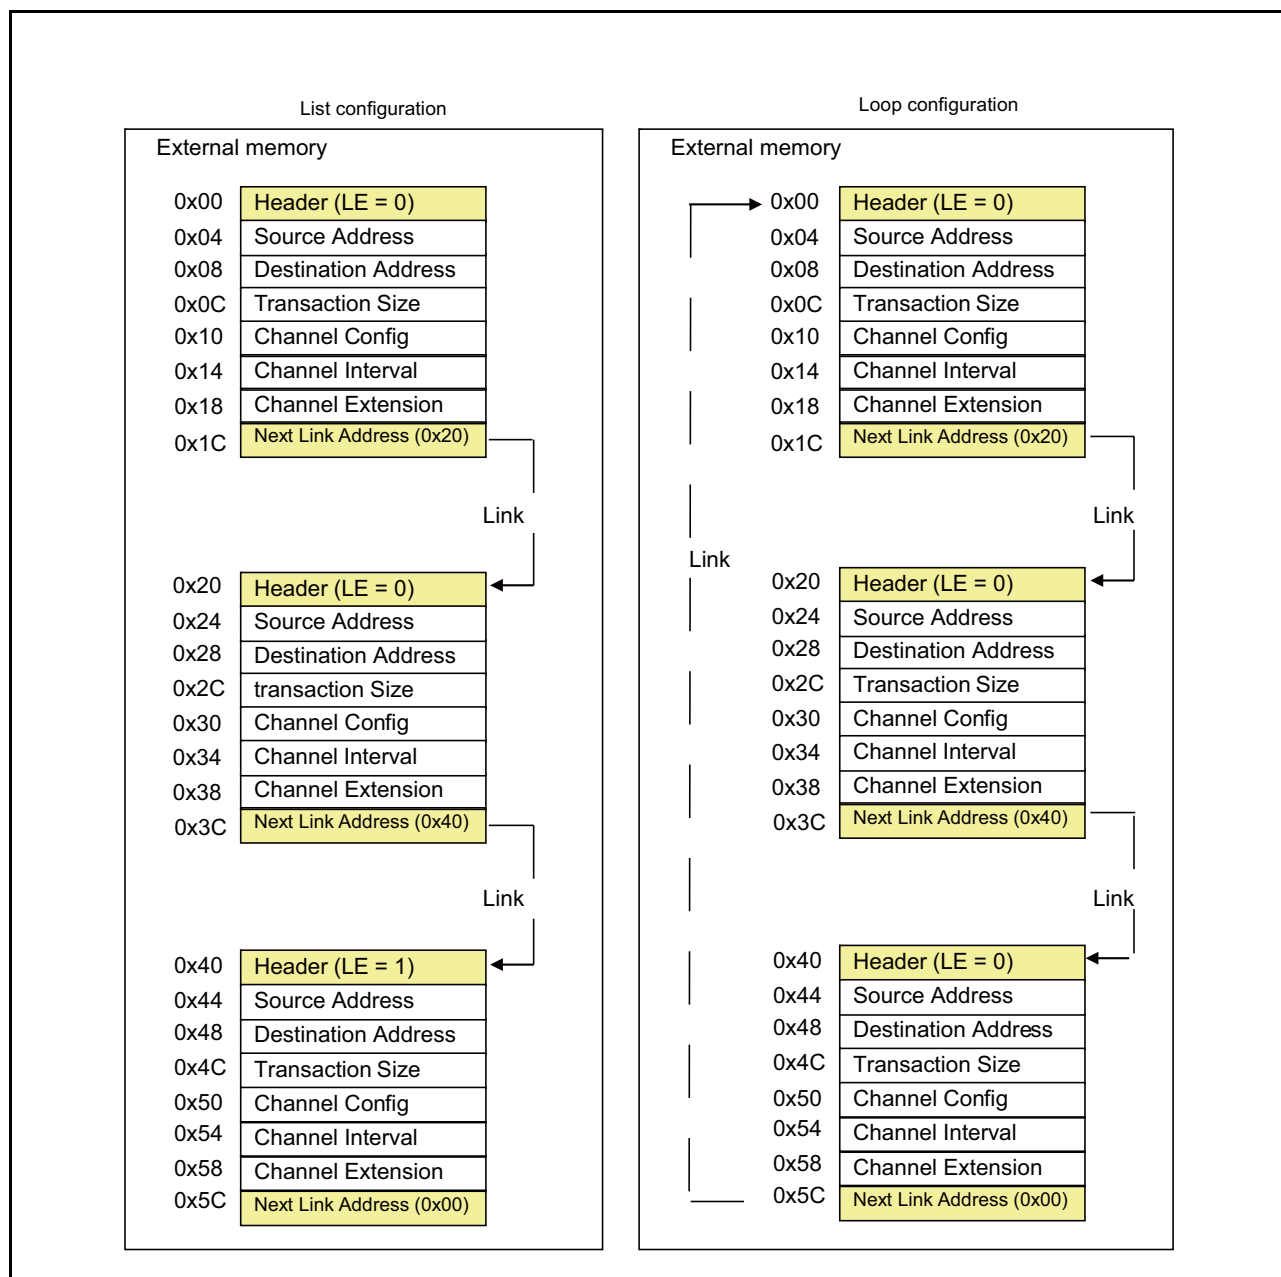

Figure 33.22 Link Mode Configuration Example

- List configuration

The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

33.9.12.2 Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 33.50 Write-Only Mode Setting

| WONLY (CHCFG) | Mode | Description |
|---------------|-----------------|---|
| 0 | Normal mode | A DMA transfer is performed using the values set in Next Register Set. |
| 1 | Write-only mode | A DMA write transfer is performed without performing a DMA read transfer. |

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.

Use this mode to, for example, initialize the memory area.

33.9.13 DMA Transfer

This chapter describes the basic operation of DMA transfer.

33.9.13.1 Transfer modes

DMAC supports only single transfer mode.

Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).

The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see 33.9.13.7, Operational difference depending on the transfer size.

Figure 33.23 Single Transfer Mode (REQD = 1, SDS > DDS)

33.9.13.2 DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 33.51 Priority Control Setting

| Mode | PR (DCTRL) | Description | Remarks |
|----------------|------------|--|--|
| Fixed-priority | 0 | Controls requests based on fixed priority (CH0 > CH1 > ...). | Use this mode if channels have priority. |
| Round-robin | 1 | Controls requests in a round-robin manner. | Use this mode to execute requests equally. |

(1) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

(2) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.

In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

Figure 33.24 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

33.9.13.3 Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

- If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.
- If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.
- The difference from ordinary sweeping mode described in section 33.9.13.8 (3) (b), Transfer suspension (buffer sweeping enabled: SBE = 1) (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

(1) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

33.9.13.4 DMA transfer completion interrupt (USBFDMAm_n)

USBFDMAm_n (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAm_n (m, n = 0, 1) interrupt.

(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAm_n interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 33.52 USBFDMAm_n Assertion Conditions

| Cause | Condition | INT_DMA[n] mask signal |
|------------------------|--|--|
| DMA transaction ended | A transfer of data by the number of transfer bytes loaded to the CRTB _n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes) | DEM bit in the CHCFG _n register |
| Descriptor was invalid | LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG _n register are both 0 in link mode | DIM bit in the CHCFG _n register |

33.9.13.5 DMA error interrupt (USBFDMAERR_m)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERR_m interrupt is asserted.

The USBFDMAERR_m signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

33.9.13.6 Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.

The following shows an operation example.

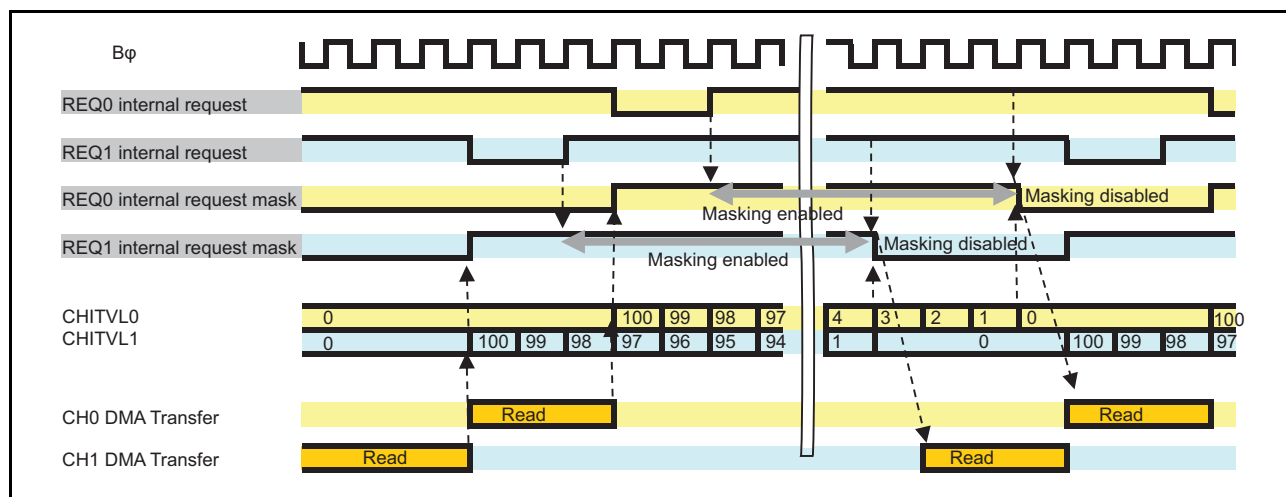

Figure 33.25 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

Figure 33.26 DMA Transfer Settings and Interval Count

33.9.13.7 Operational difference depending on the transfer size

(1) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.

The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

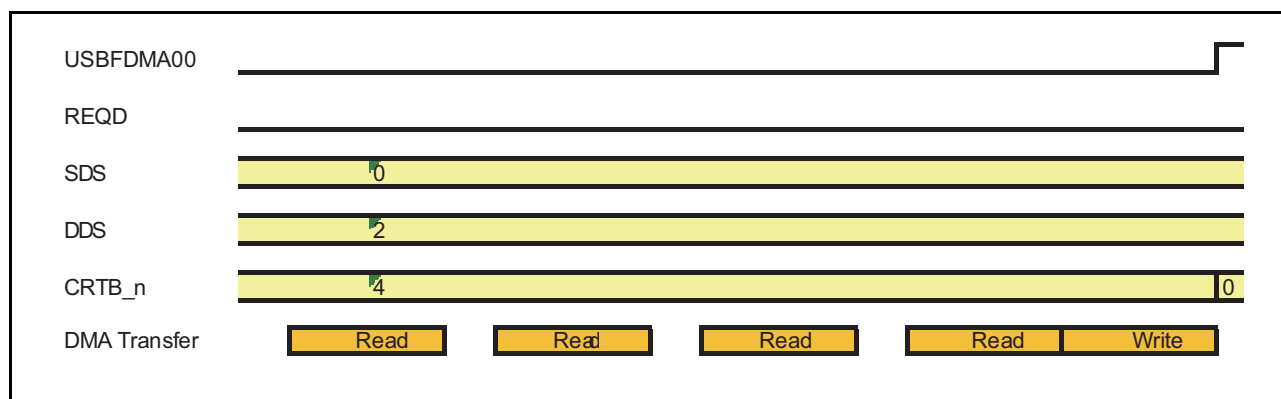

Figure 33.27 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

(2) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

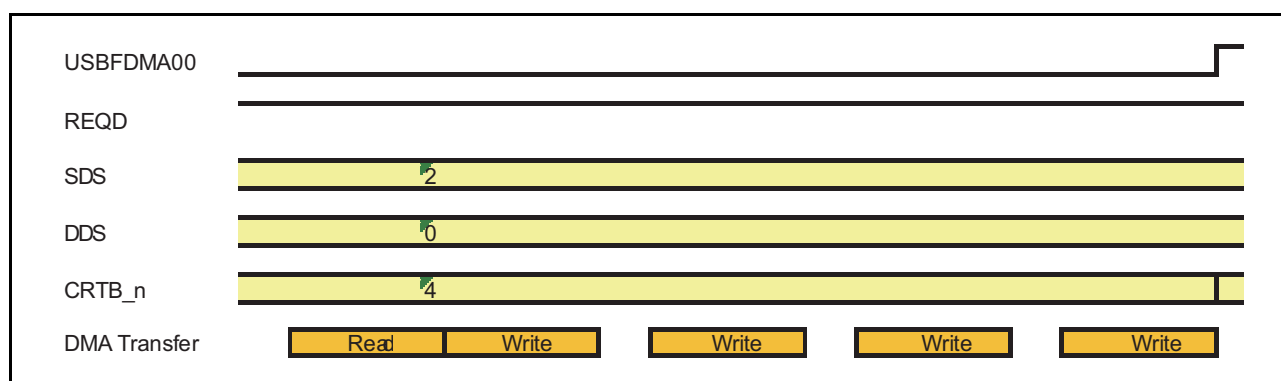

Figure 33.28 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

(3) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.

The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

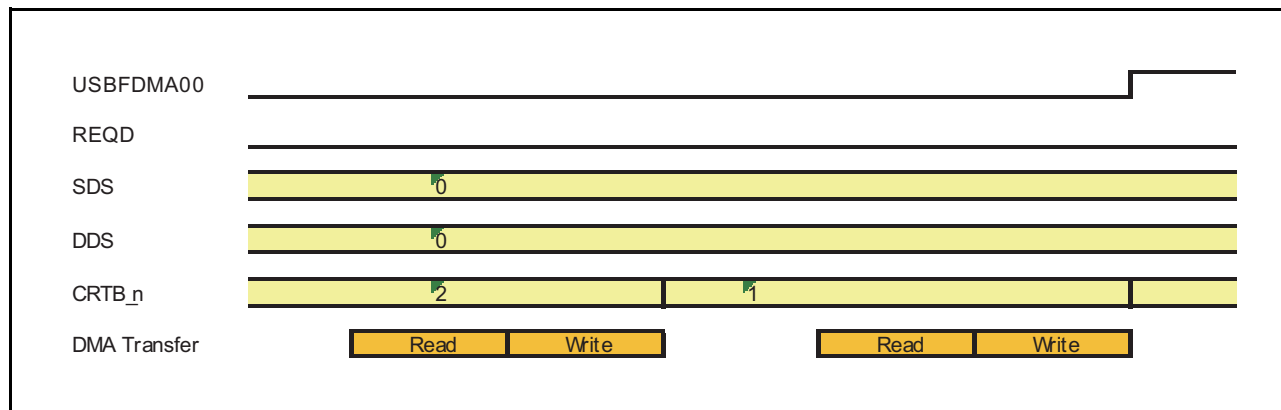

Figure 33.29 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

33.9.13.8 Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

(1) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see 33.4.1, Current Source Address Register) and the DMA transfer ends.

If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

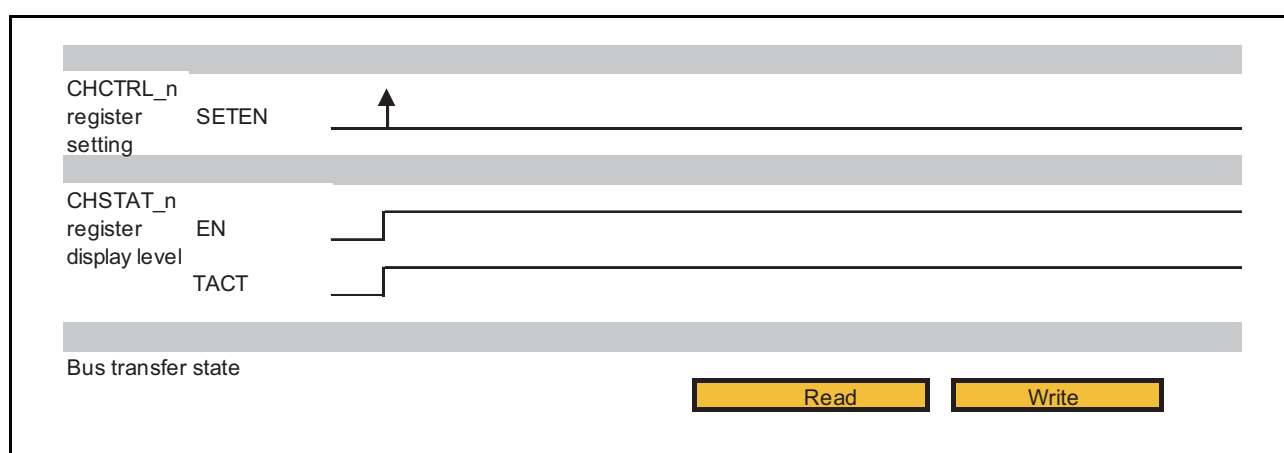

Figure 33.30 DMAC State Example 1 (Hardware Request)

(2) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

(3) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).

If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

(a) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.

If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.

If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

(b) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.

After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

(c) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

(d) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

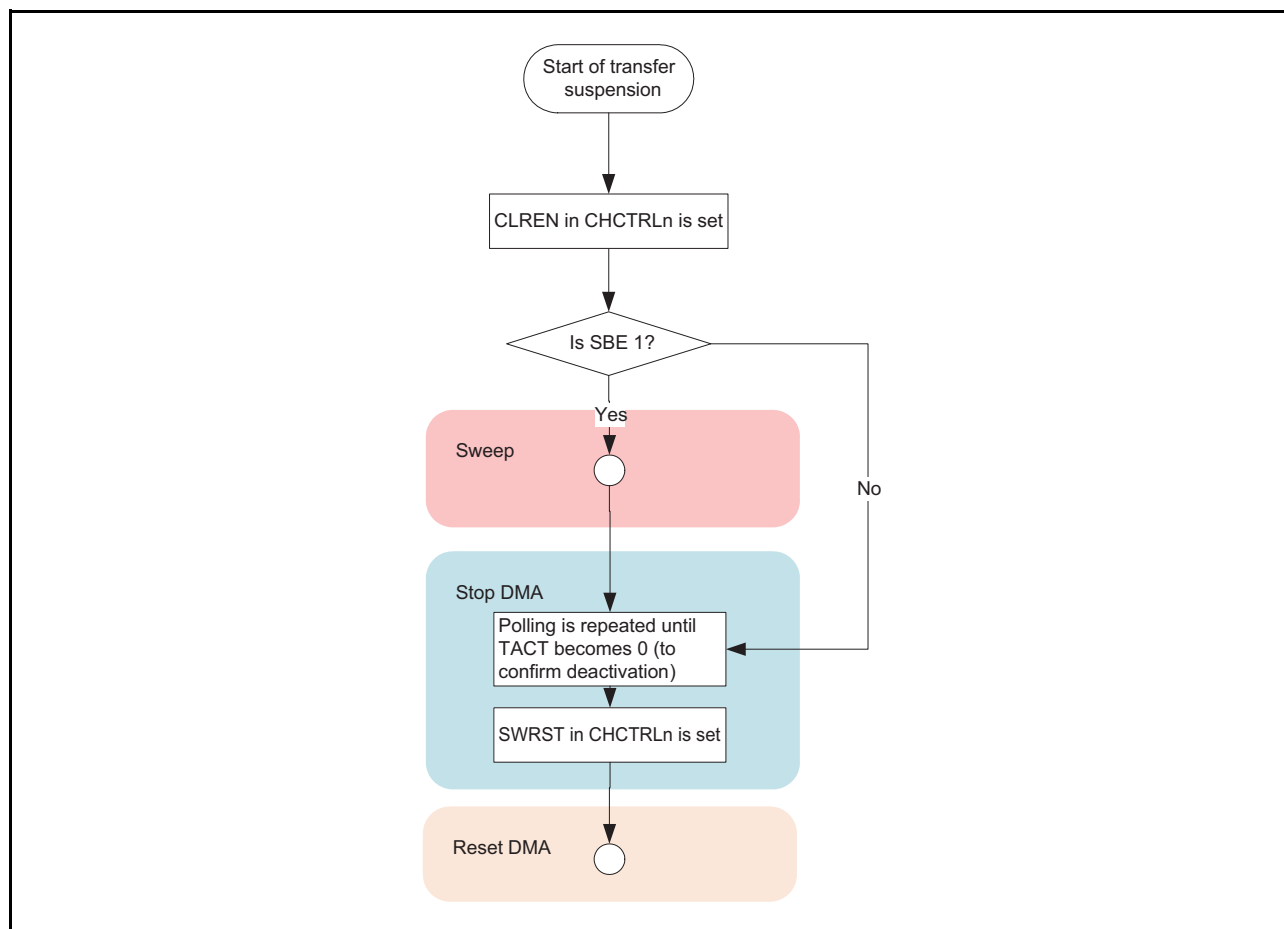

Figure 33.31 Transfer Suspension Flowchart

33.9.14 Access Type

33.9.14.1 DMA master transfer combination list

(1) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.
- The size and burst length are determined based on the value set in the SDS[2:0] field.
If the value set in the SDS[2:0] field is equal to or less than the bus width
Size: Value set in SDS[2:0]
Burst type: SINGLE
If the value set in the SDS[2:0] field is larger than the bus width
Size: Bus width
Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 33.53 DMA Read Transfer Combination List

| SDS | Source Address | AHB transfer | | | | | |
|--------------|-----------------|-------------------|-----------|------------|-------------------------|-----------|------------|
| | | First transfer | | | Second transfer | | |
| | | Address | Data Size | Burst Type | Address | Data Size | Burst Type |
| 0 (8 bits) | - | addr | 8 | SINGLE | | | |
| 1 (16 bits) | 2 byte align | {addr[31:1], 0B} | 16 | SINGLE | | | |
| | 2 byte unalign | | | | {addr[31:1], 0B} + 2H | 16 | SINGLE |
| 2 (32 bits) | 4 byte align | {addr[31:2], 00B} | 32 | SINGLE | | | |
| | 4 byte unalign | | | | {addr[31:2], 00B} + 4H | 32 | SINGLE |
| 4 (128 bits) | 16 byte align | {addr[31:4], 0H} | 32 | INCR4 | | | |
| | 16 byte unalign | | | | {addr[31:4], 0H} + 10H | 32 | INCR4 |
| 5 (256 bits) | 32 byte align | {addr[31:5], 00H} | 32 | INCR8 | | | |
| | 32 byte unalign | | | | {addr[31:5], 00H} + 20H | 32 | INCR8 |
| 6 (512 bits) | 64 byte align | {addr[31:6], 00H} | 32 | INCR16 | | | |
| | 64 byte unalign | | | | {addr[31:6], 00H} + 40H | 32 | INCR16 |

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.
- The size and burst length are determined based on the value set in the DDS[2:0] field.
If the value set in the DDS[2:0] field is equal to or less than the bus width
Size: Value set in DDS[2:0]
Burst type: SINGLE
If the value set in the DDS[2:0] field is greater than the bus width
Size: Bus width
Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)
- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.
 - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
 - An access specified in the DDS field will be across the SKIP boundary.
 - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

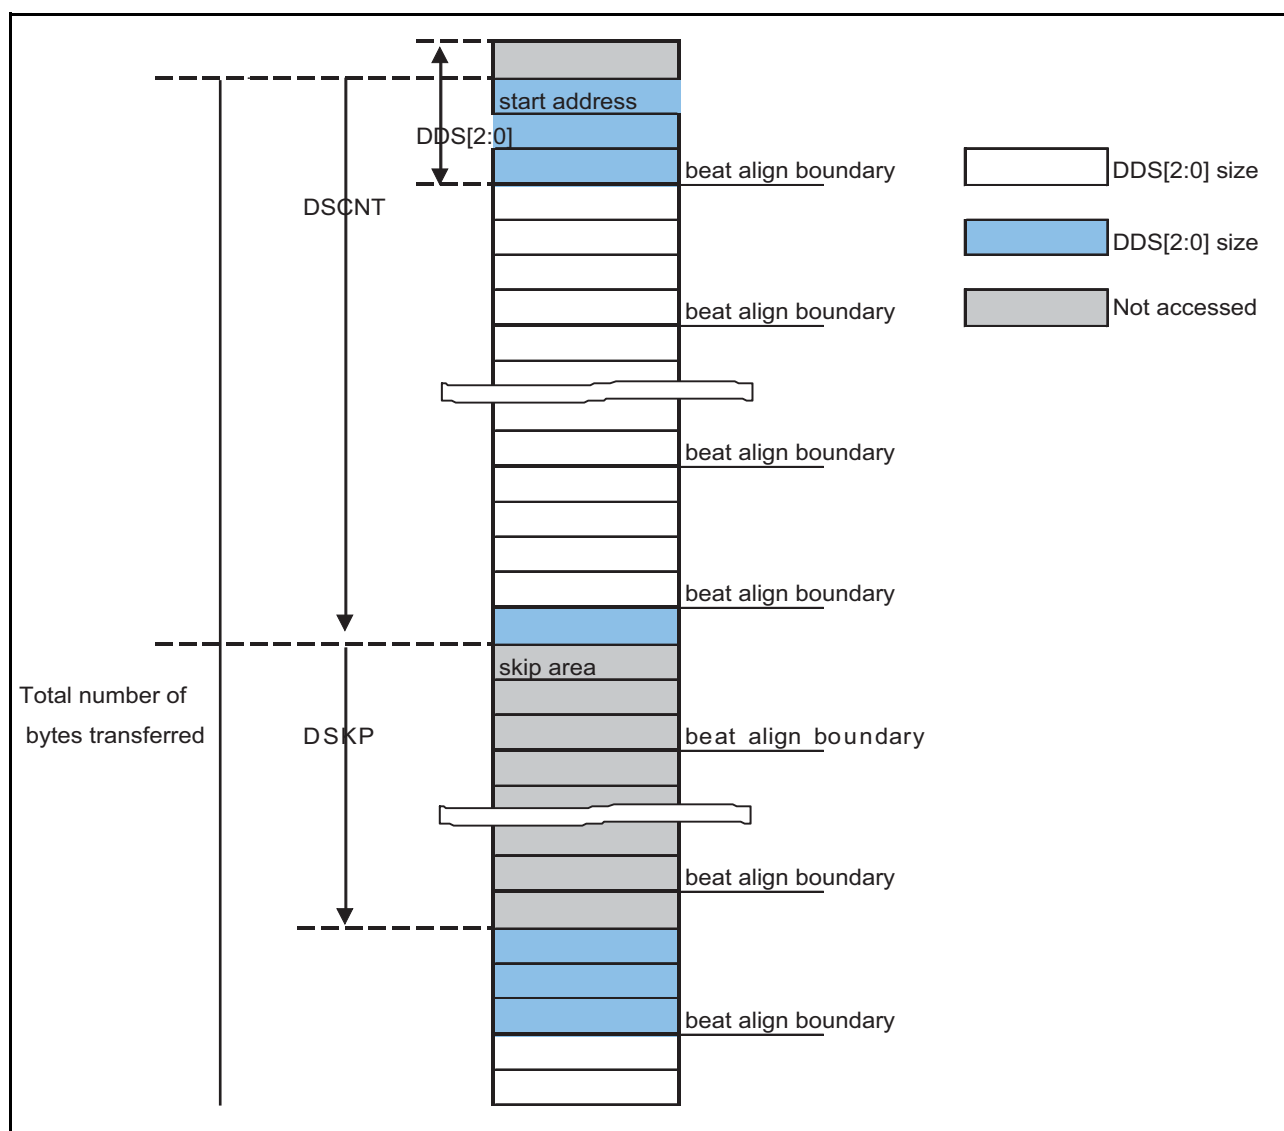

Figure 33.32 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 33.54 DMA Write Transfer Combination List

| DDS[2:0] | AHB transfer | | |
|--------------|-------------------|-----------|------------|
| | First transfer | | |
| DDS[2:0] | Address | Data Size | Burst Type |
| 0 (8 bits) | addr | 8 | SINGLE |
| 1 (16 bits) | {addr[31:1], 0B} | 16 | SINGLE |
| 2 (32 bits) | {addr[31:2], 00B} | 32 | SINGLE |
| 4 (128 bits) | {addr[31:4], 0H} | 32 | INCR4 |
| 5 (256 bits) | {addr[31:5], 00H} | 32 | INCR8 |
| 6 (512 bits) | {addr[31:6], 00H} | 32 | INCR16 |

33.9.14.2 DMA master descriptor combination list

(1) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 33.55 Descriptor Read Transfer Combination List

| Descriptor Format | Address AHB Transfer | | | | | | |
|-------------------|----------------------|--------------------|------|-------|-----------------|------|-------|
| | addr[4:0] | First Transfer | | | Second Transfer | | |
| | | Address | Size | Burst | Address | Size | Burst |
| 4 words | 00H | {addr[31:4], 4'b0} | 32 | INCR8 | | | |
| | 04H | | | | | | |
| | 08H | | | | | | |
| | 0CH | | | | | | |
| | 10H | | | | | | |
| | 14H | | | | | | |
| | 18H | | | | | | |
| | 1CH | | | | | | |
| 8 words | 00H | {addr[31:4], 4'b0} | 32 | INCR8 | | | |
| | 04H | | | | | | |
| | 08H | | | | | | |
| | 0CH | | | | | | |
| | 10H | | | | | | |
| | 14H | | | | | | |
| | 18H | | | | | | |
| | 1CH | | | | | | |

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 33.56 Descriptor Write Transfer Combination List

| Type | AHB transfer | | |
|------------------------------------|-------------------------|------|--------|
| | Address | Size | Burst |
| Write-back in normal mode | {addr[31:2], 2'b0} + 3H | 8 | SINGLE |
| Write-back in the case of an error | {addr[31:2], 2'b0} + 2H | 8 | SINGLE |

33.9.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.

In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 33.57 Priority of a transfer request for DMACs that are performing transfer

| Current DMAC | Next DMAC | |
|--------------|-----------|-------|
| | DMAC0 | DMAC1 |
| DMAC0 | 2 | 1 |
| DMAC1 | 1 | 2 |

Priority: 1 (high), 2 (low)

33.9.16 Flowcharts of Transitions to Deep Standby and Resumption from Deep Standby

33.9.16.1 Setting at transition to deep standby

The following is the flowchart for transitions to deep standby. After having completed the procedure in the following flowchart, proceed with that in the flowchart in section 52.3.4 (1), Transition to Deep Standby Mode.

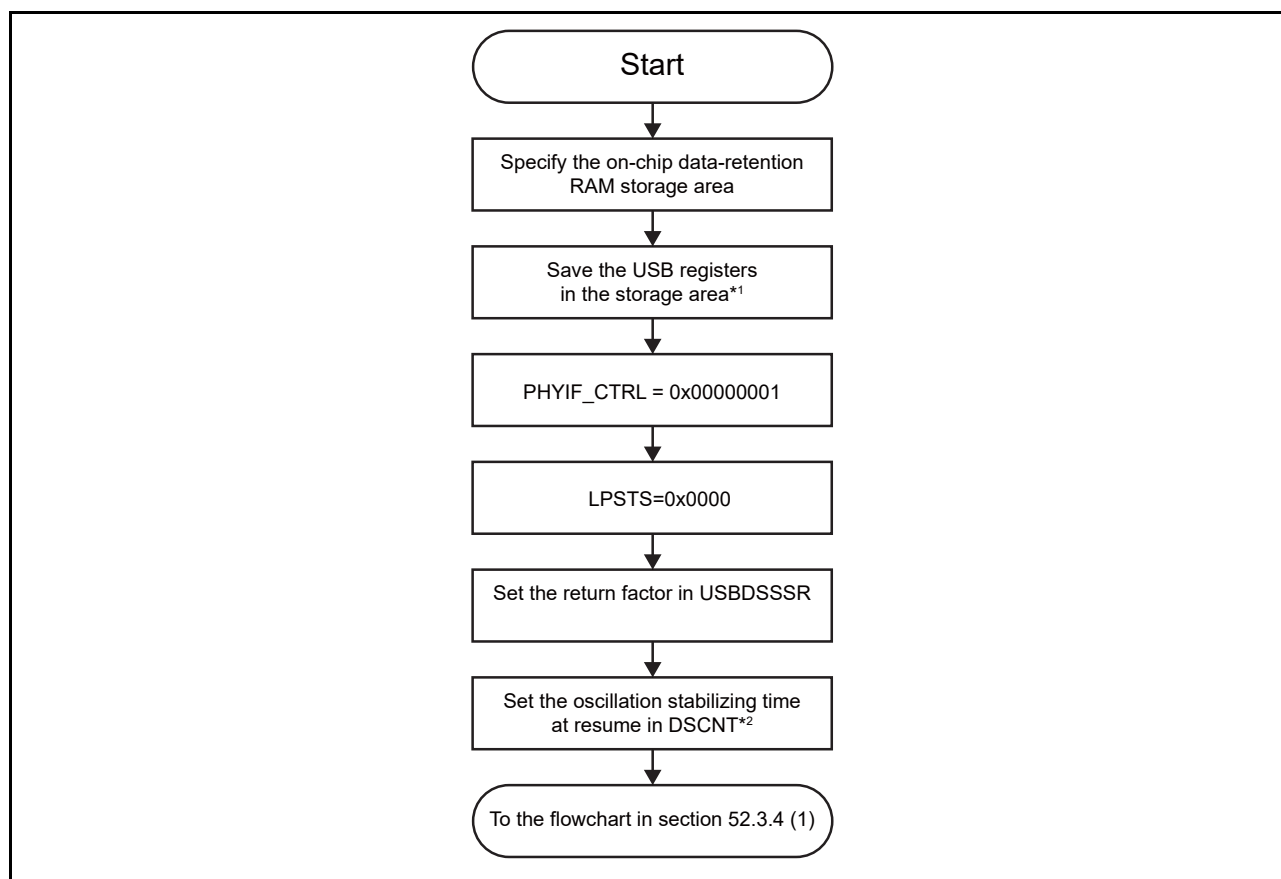

Figure 33.33 Flowchart of Transition to Deep Standby

Note 1. The registers listed in Table 33.58 must be saved.
Add registers to be saved as required even if they are not listed in the table.

Table 33.58 List of Registers to be Saved

| Register Name | Abbreviation | Register Name | Abbreviation |
|--------------------------------|--------------|---|--------------|
| Common Control Register | COMMCTRL | DCP control register | DCPCTR |
| CFIFO port select register | CFIFOSEL | Pipe configuration register * | PIPECFG |
| Interrupt enable register 0 | INTENB0 | Pipe maximum packet size register * | PIPEMAXP |
| BRDY interrupt enable register | BRDYENB | Pipe cycle control register* | PIPEPERI |
| NRDY interrupt enable register | NRDYENB | Pipe buffer setting register* | PIPEBUF |
| BEMP interrupt enable register | BEMPENB | System configuration control register 0 | SYSCFG0 |
| Interrupt status register 0 | INTSTS0 | System configuration control register 1 | SYSCFG1 |
| USB address register | USBADDR | Pipe control registers (x = 1 to F) | PIPExCTR |
| DCP max. packet size register | DCPMAXP | | |

Note: * After the pipe numbers have been specified in the PIPESEL register, save the number of pipes used and their values.

Note 2. For details, see section 52.2.34, Deep standby cancel Oscillation stability count register (DSCNT).

33.9.16.2 Flowchart of determining the cancel factor of deep standby

The following shows the flowchart of determining the cancel factor, which should be proceeded after deep standby is canceled.

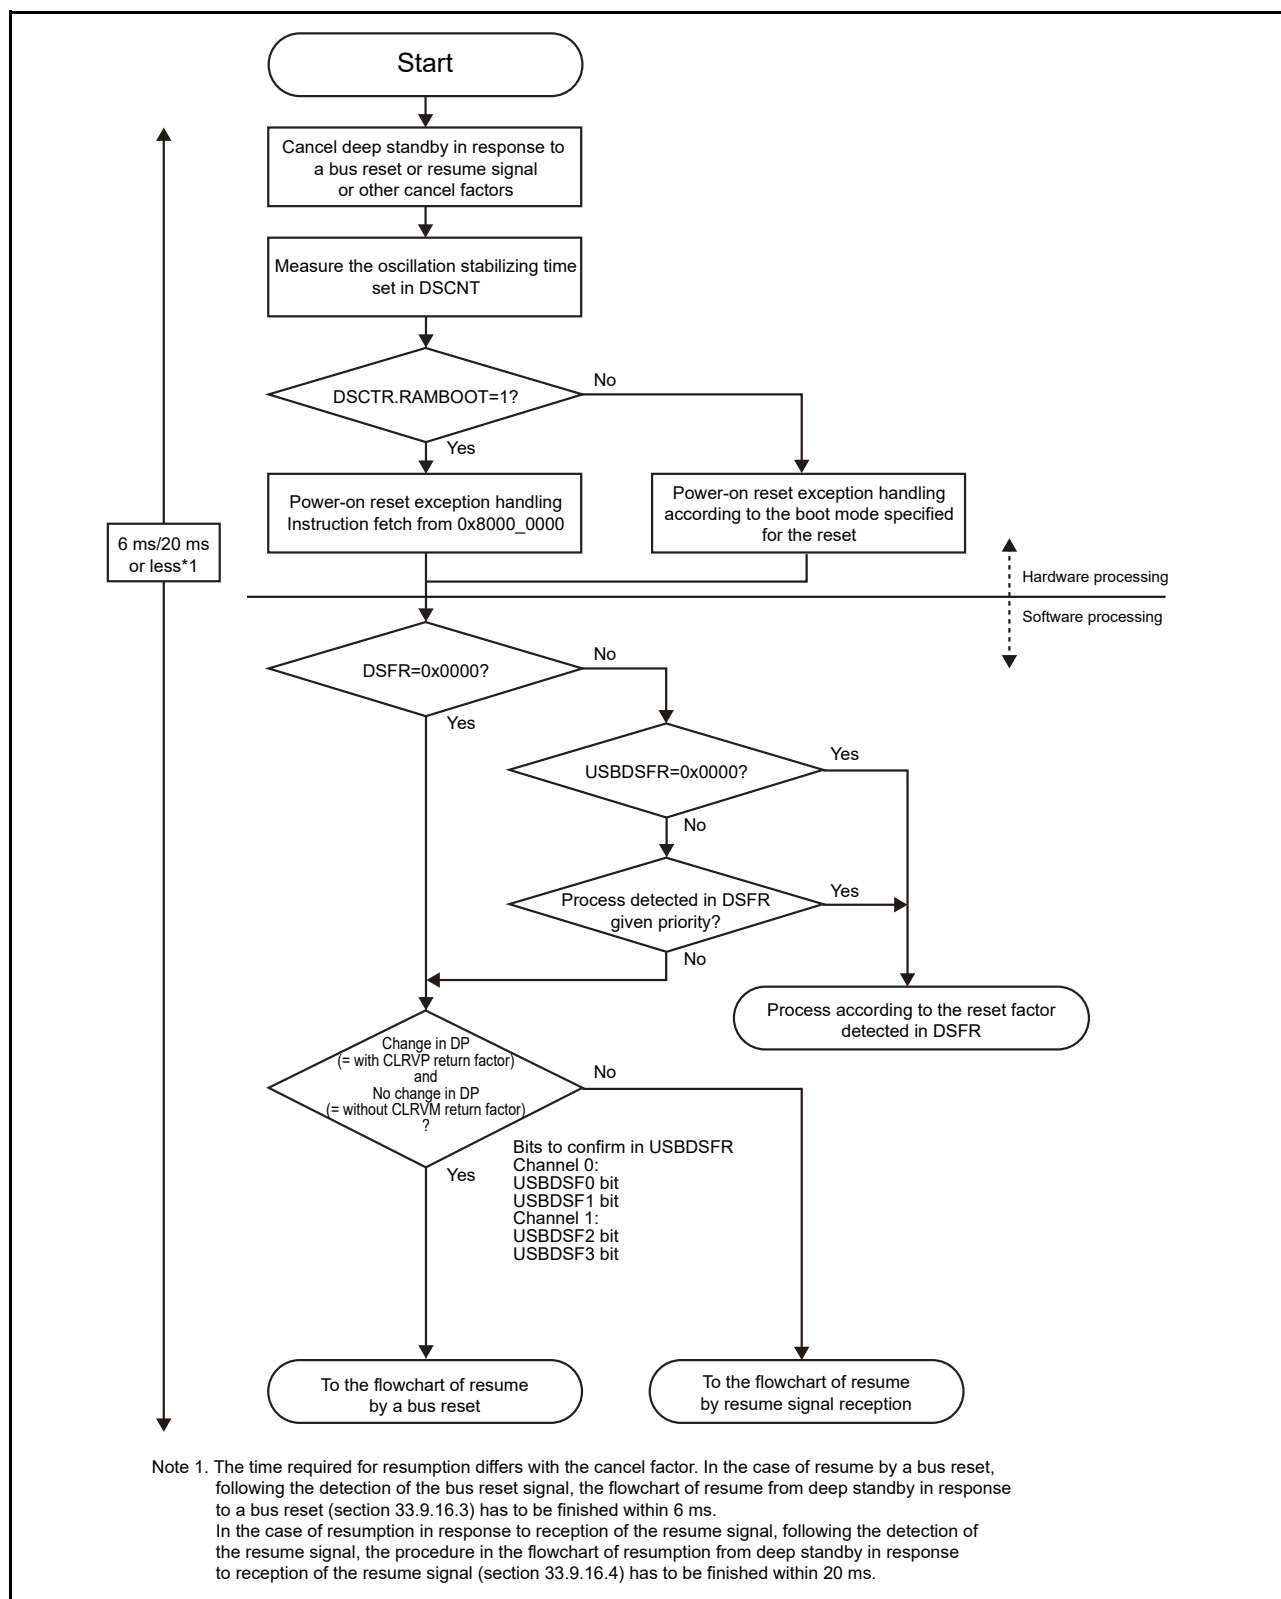

Figure 33.34 Flowchart of Determining the Cancel Factor of Deep Standby

33.9.16.3 Flowchart of resumption from deep standby in response to a bus reset

The following shows the flowchart of resumption from deep standby in response a bus reset.

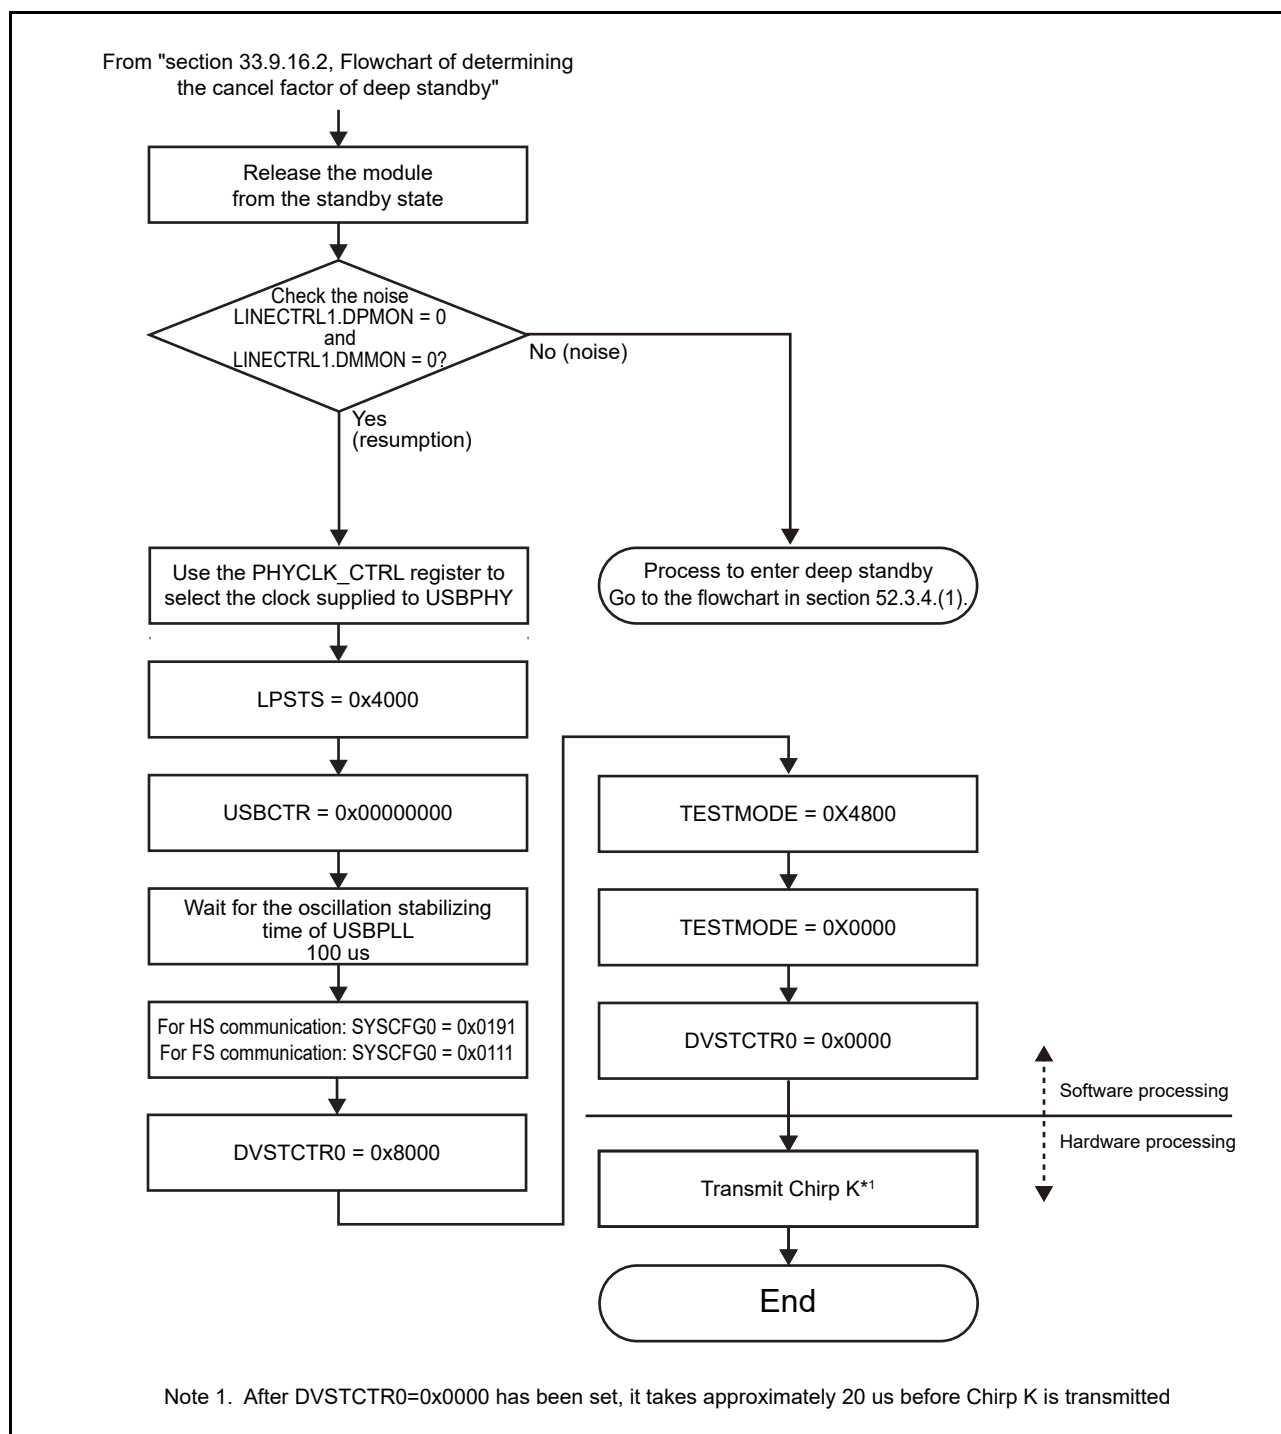

Figure 33.35 Flowchart of Resume from Deep Standby in Response to a Bus Reset

33.9.16.4 Flowchart of resumption from deep standby in response to reception of the resume signal

The following shows the flowchart of resumption from deep standby in response to reception of the resume signal.

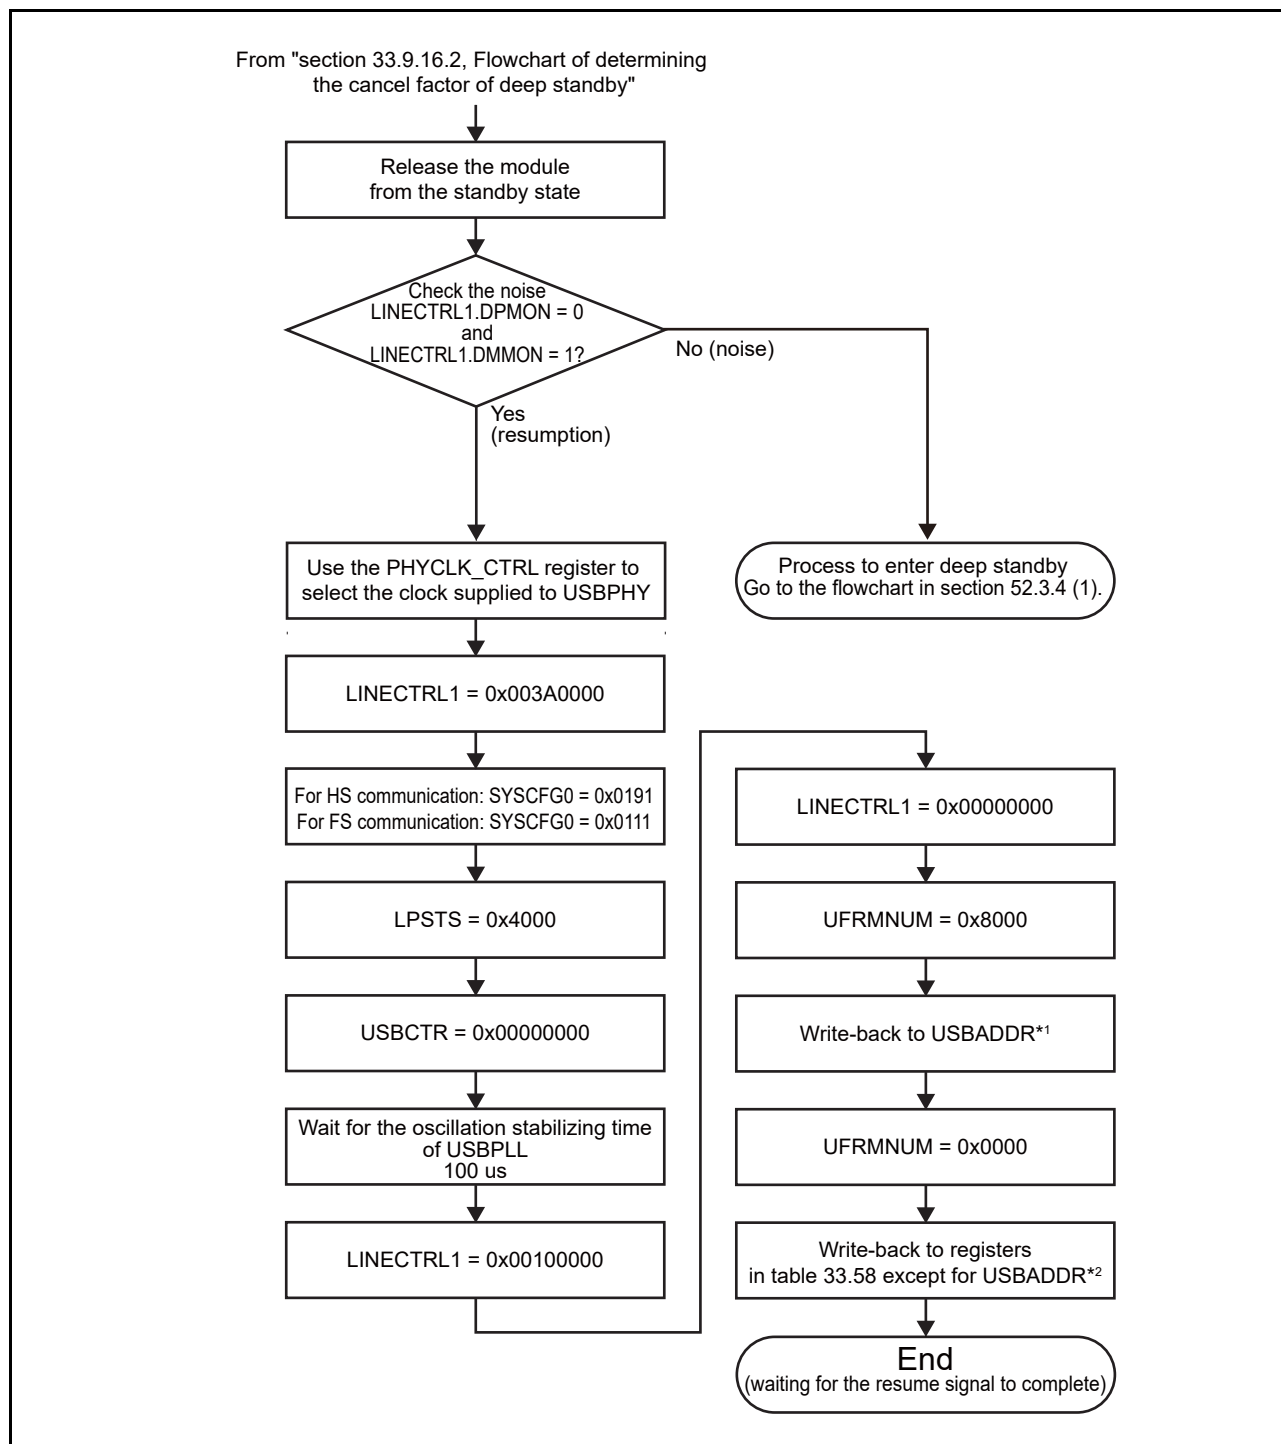

Figure 33.36 Flowchart of Resumption from Deep Standby in Response to Reception of the Resume Signal

Note 1. Writing back to the USBADDR register

Write back the USBADDR.USBADDR[6:0] value that was saved in the storage RAM area before entering deep standby to the USBADDR.USBADDR[6:0] bits.

Write back the INTSTS0.DVSQ[5:4] value that was saved in the storage RAM area before entering deep standby to the STSRECOV0[9:8] bits.

Write back 0 to the STSRECOV0[10] bit in FS operation and 1 in HS operation.

Note 2. Writing back to registers in Table 33.58 other than the USBADDR register

For the method of writing-back to the PIPECFG, PIPEMAXP, PIPEPERI, and PIPEBUF registers, see section 33.2.15, Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI).

The value to be written back to PIPEXCTR depends on the value of PIPEXCTR.SQMON.

When SQMON is 0, write back 1 to the SQCLR bit and write back the values that were saved in the storage RAM area before entering deep standby to the bits other than SQCLR.

When SQMON is 1, write back 1 to the SQSET bit and write back the values that were saved in the storage RAM area before entering deep standby to the bits other than SQSET.

33.9.17 Notes

33.9.17.1 Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is 0000_1038H and SDS is 5 (256-bit), read starts from area 0000_1020H, not from address 0000_1038H. At this time, if the area from 0000_1020H to 0000_1037H contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

33.9.17.2 Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAm (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.

To use peripheral module interrupt USBFDMAm or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

34. Video Display Controller 6 (1): Overview

34.1 Features

The video display controller 6 consists of the following six blocks. For the image synthesis, one plane of video image + two graphics planes, or three graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up, scale down, and rotation of input video images using the frame buffer, and repeated recording of the specified number of fields in the frame buffer
3. Image quality improver: Black stretch, LTI/sharpness, and YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of one plane of video image + two graphics planes, or three graphics planes
5. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
6. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of video display controller 6 are listed in Table 34.1.

Table 34.1 Features of video display controller 6

| Item | Function |
|---|---|
| Operating frequency | Video input clock: 87 MHz or less (for RGB/YCbCr video image) Panel clock: 87 MHz or less (depends on the panel specifications) |
| Input video image specification | <ul style="list-style-type: none"> • 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (54 MHz, progressive signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (54 MHz, progressive signal) *1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal) *1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set *2: 1920 pixels × 1080 lines (horizontal × vertical) <p>Note 1. The ITU-R BT.656 and 601 standards do not include the description regarding the progressive signal. The ITU-R BT.601 standard does not include the description regarding the connection interface.</p> <p>Note 2. Depends on the AC characteristics of the connected device.</p> <ul style="list-style-type: none"> • Examples of input video image size: XGA (1024 × 768), SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA in landscape (320 × 240), QVGA in portrait (240 × 320) |

34.2 Block Diagram

Figure 34.1 to Figure 34.3 show the entire block diagram of this module.

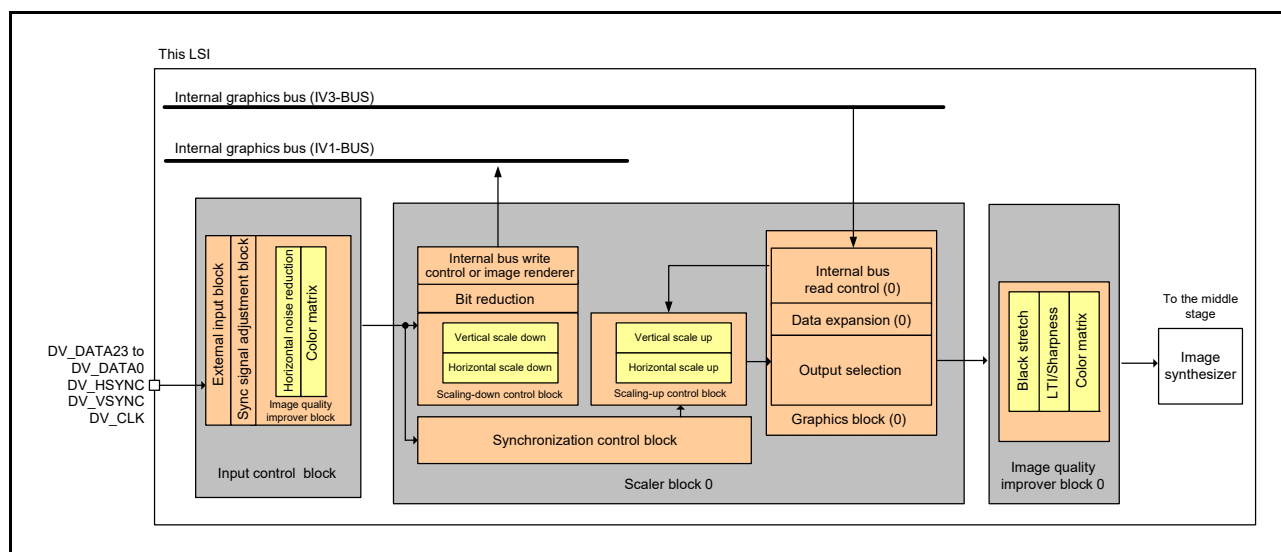

Figure 34.1 Video Display Controller 6 Former Stage Block Diagram

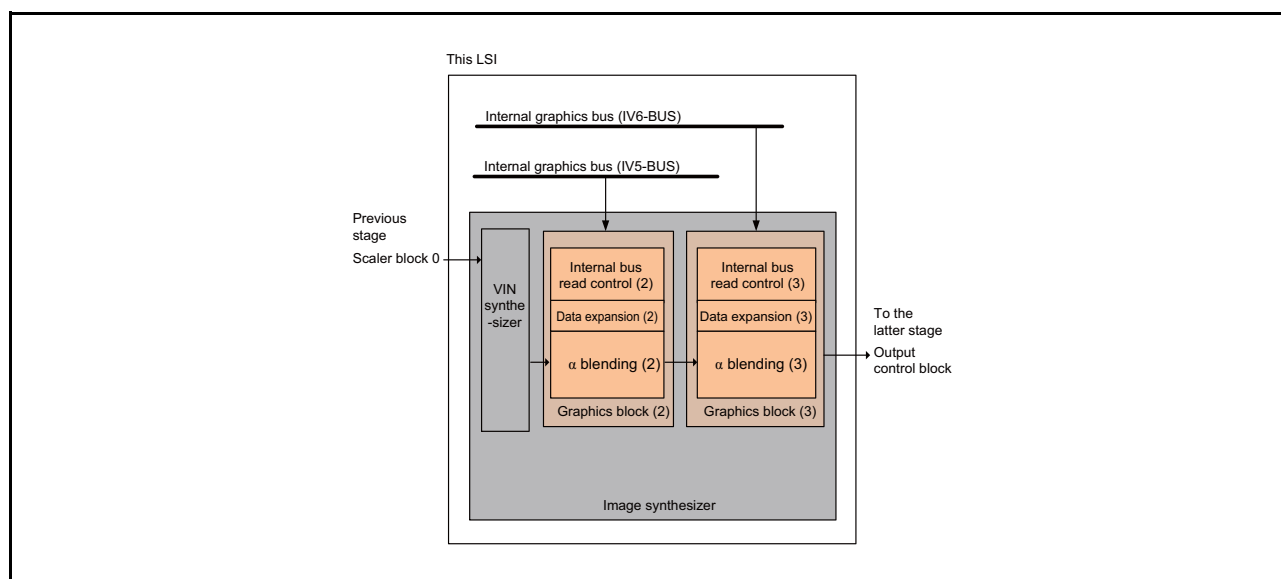

Figure 34.2 Video Display Controller 6 Middle Stage Block Diagram

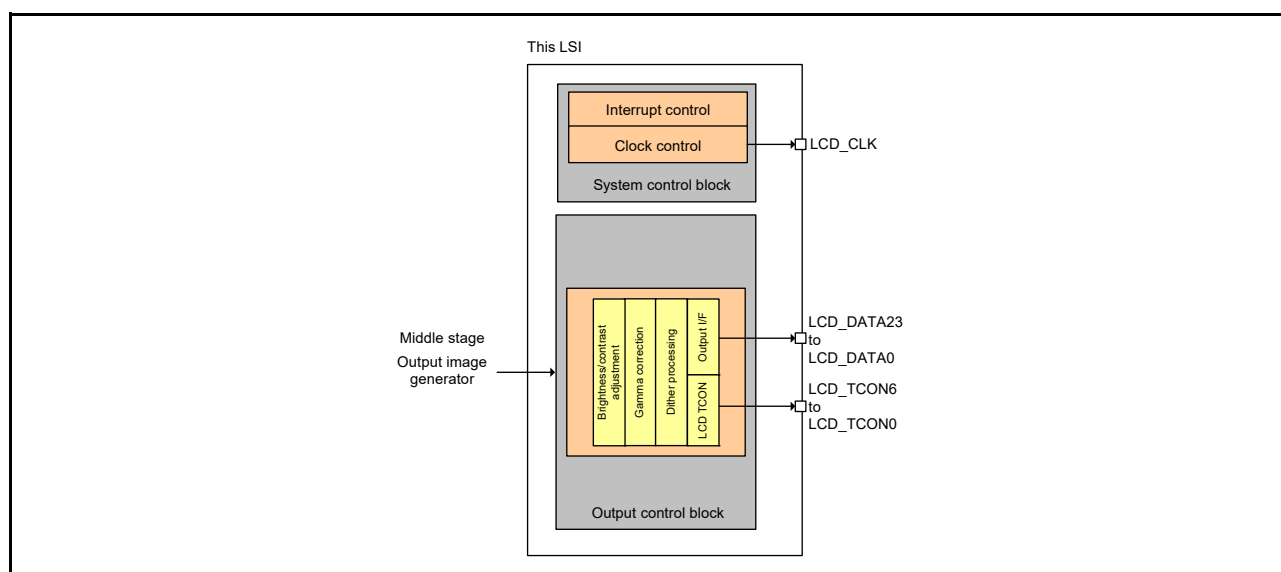

Figure 34.3 Video Display Controller 6 Latter Stage Block Diagram

34.3 Input/Output Pins

Table 34.2 shows the pin configuration.

Table 34.2 Input/Output Pins

| Symbol | I/O | Pin Name | Function |
|---------------------------|--------|-----------------------------------|---------------------------------------|
| DV0_CLK | Input | External input clock 0 | External input 0 clock pin |
| DV0_VSYNC | Input | External input Vsync 0 | External input 0 Vsync signal pin |
| DV0_HSYNC | Input | External input Hsync 0 | External input 0 Hsync signal pin |
| DV0_DATA23 to DV0_DATA0 | Input | External input video image data 0 | External input 0 video image data pin |
| LCD0_CLK | Output | Panel clock 0 | Panel output 0 clock pin |
| LCD0_DATA23 to LCD0_DATA0 | Output | Video image data 0 for panel | Panel output 0 video image data pin |
| LCD0_TCON6 to LCD0_TCON0 | Output | Control signal 0 for panel | Panel output 0 timing control pin |
| LCD0_EXTCLK | Input | Panel clock source 0 | Panel clock source 0 input pin |

34.4 Clocks

There are two clocks to be mainly used by the video display controller 6: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control). The DV_CLK clock is used as the video image clock.

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. When the parallel RGB output is selected in the output controller, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same. The panel clock can be selected from the video clock, LCD0_EXTCLK peripheral bus clock 1 (P1φ), and LVDS PLL output clock*¹ with SYSCNT_PANEL_CLK.PANEL_ICKSEL[1:0] and SYSCNT_PANEL_CLK.PANEL_OCKSEL[1:0] of the system controller. When the serial RGB output (3/4 speed mode) is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 the panel clock (LCD_CLK) frequency.

Note 1. For details of LVDS PLL, refer to section 41, LVDS Output Interface.

34.5 Hsync and Vsync Signals

Hsync and Vsync signals to be used in the logic stage following the scale-up control block of the scaler are generated by the synchronization control block of the scaler. Since the Hsync and Vsync signals are used as the reference signals for the LCD TCON, which generates various panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the panel.

The output Hsync signal always operates at a free-running frequency, and the horizontal period is set with SC_SCL0_FRC4.SC_RES_FH[10:0]. On the other hand, the output Vsync signal is selected from the external input and free-running Vsync signals with SC_SCL0_FRC3.SC_RES_VS_SEL of the scaler.

34.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. When displaying video image input from a digital pin on the panel and the pointer buffer is not in use, always use this mode. However, the output Hsync signal is free running even in this mode. Figure 34.4 shows the timing of external input Vsync signal.

Figure 34.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

Figure 34.5 Detailed Timing Chart for Generation of the Output Vsync Signal

34.5.2 Free-Running Vsync

(1) Operation Outline

In this mode, the Vsync signal is generated according to the pixel clock (free running). The vertical period is selected with `SC_SCL0_FRC4.SC_RES_FV[10:0]`. The output Hsync signal is also free running. Figure 34.6 shows the timing.

Figure 34.6 Free Running Vsync Timing

(2) Pointer Buffers

In free-running vertical synchronization mode, output of the input video image to a panel may lead to flicker in the output video image. This occurs when the input and output vertical sync signals are not in synchronization. To prevent this, use the pointer buffers to adjust the timing between the input and output video images in frame units. If the input Vsync signal is faster than the output Vsync signal, frames from the input video image are skipped in the output image for display. On the other hand, when the input Vsync signal is slower than the output Vsync signal, frames from the input video image are repeated. However, when the difference in timing between the input and output Vsync signals is too large, the pointer buffers cannot deal with the difference, so flicker may occur. As more buffers are used, the pointer buffers can deal with larger differences in frequency.

Figure 34.7 Timing when the Input Vsync Signal is Faster than the Output Vsync Signal

Figure 34.8 Timing when the Input Vsync Signal is Slower than the Output Vsync Signal

34.5.3 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

35. Video Display Controller 6 (2): Input Controller

35.1 Input Controller Functions

35.1.1 Overview of Functions

The input controller performs the on/off control of input supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

The functional block diagram of the input controller is shown below.

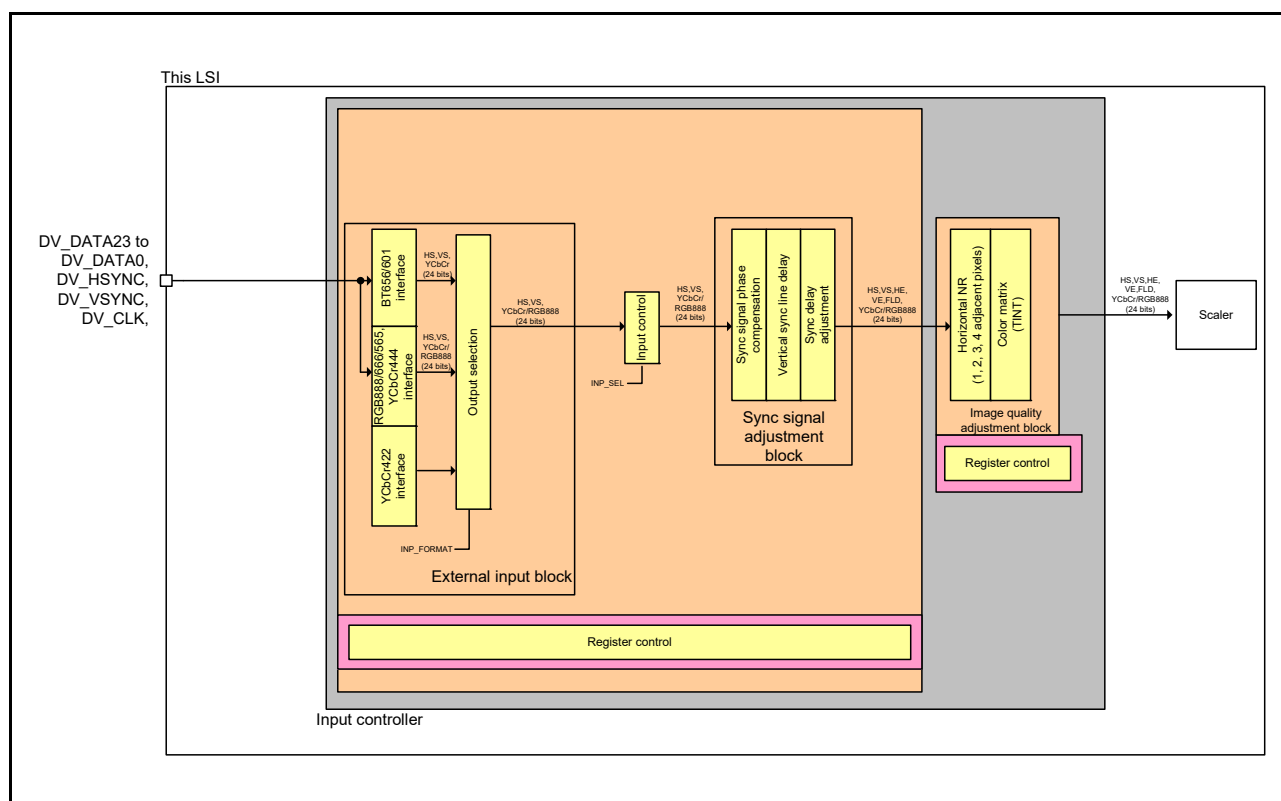

Figure 35.1 Functional Block Diagram of Input Controller

35.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMGCNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 35.1 Register Update Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------------|---------------|---|
| INP_UPDATE | INP_EXT_UPDATE | 0 | External Input Block Register Update 0: Registers are not updated. 1: Registers are updated. |
| INP_UPDATE | INP_IMG_UPDATE | 0 | Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated. |
| IMGCNT_UPDATE | IMGCNT_VEN | 0 | Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal. |

35.1.3 Controlling Input

The input controller performs the on/off control of input supplied via the external input pins.

Table 35.2 Input Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------|---------------|--|
| INP_SEL_CNT | INP_SEL | 0 | On/Off Control of Input Supplied via External Input Pin 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on. |

35.1.4 Controlling Externally Input Video Signals

The externally input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (the 16-bit data format of the BT601 standard) formats can be handled.

The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) extended progressive signals.

The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601 interlace signals.

The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 35.3 Externally Input Video Signal Control

| Register Name | Bit Name | Initial Value | Description |
|------------------|-----------------|---------------|--|
| INP_SEL_CNT | INP_FORMAT[2:0] | 000 | External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited |
| INP_EXT_SYNC_CNT | INP_ENDIAN_ON | 0 | External Input Bit Endian Change On/Off Control 0: Off 1: On |
| INP_EXT_SYNC_CNT | INP_SWAP_ON | 0 | External Input B/R Signal Swap On/Off Control 0: Off 1: On |

35.1.5 Selecting Clock Edge for Externally Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 35.4 Externally Input Clock Edge Selection

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------|---------------|---|
| INP_SEL_CNT | INP_PXD_EDGE | 0 | Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge |
| INP_SEL_CNT | INP_VS_EDGE | 0 | Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge |
| INP_SEL_CNT | INP_HS_EDGE | 0 | Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge |

Figure 35.2 shows the typical input timing of externally input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE bits are 0.

Figure 35.2 Typical Input Timing of Externally Input Signals (Clock Phase)

35.1.6 Externally Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 35.5 Sync Signal Inversion Control

| Register Name | Bit Name | Initial Value | Description |
|------------------|------------|---------------|--|
| INP_EXT_SYNC_CNT | INP_VS_INV | 0 | External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity) |
| INP_EXT_SYNC_CNT | INP_HS_INV | 0 | External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity) |

35.1.7 Bit Allocation of Externally Input Video Image Signals

Allocation of the externally input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in Table 35.6.

Table 35.6 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

| | | | | |
|-----------------|------------|------------|------------|------------|
| INP_FORMAT[2:0] | 0 | 0 | 0 | 0 |
| INP_ENDIAN_ON | 0 | 0 | 1 | 1 |
| INP_SWAP_ON | 0 | 1 | 0 | 1 |
| DV_DATA23 | Cr/ROUT[7] | Cb/BOUT[7] | Cr/ROUT[0] | Cb/BOUT[0] |
| DV_DATA22 | Cr/ROUT[6] | Cb/BOUT[6] | Cr/ROUT[1] | Cb/BOUT[1] |
| DV_DATA21 | Cr/ROUT[5] | Cb/BOUT[5] | Cr/ROUT[2] | Cb/BOUT[2] |
| DV_DATA20 | Cr/ROUT[4] | Cb/BOUT[4] | Cr/ROUT[3] | Cb/BOUT[3] |
| DV_DATA19 | Cr/ROUT[3] | Cb/BOUT[3] | Cr/ROUT[4] | Cb/BOUT[4] |
| DV_DATA18 | Cr/ROUT[2] | Cb/BOUT[2] | Cr/ROUT[5] | Cb/BOUT[5] |
| DV_DATA17 | Cr/ROUT[1] | Cb/BOUT[1] | Cr/ROUT[6] | Cb/BOUT[6] |
| DV_DATA16 | Cr/ROUT[0] | Cb/BOUT[0] | Cr/ROUT[7] | Cb/BOUT[7] |
| DV_DATA15 | Y/GOUT[7] | Y/GOUT[7] | Y/GOUT[0] | Y/GOUT[0] |
| DV_DATA14 | Y/GOUT[6] | Y/GOUT[6] | Y/GOUT[1] | Y/GOUT[1] |
| DV_DATA13 | Y/GOUT[5] | Y/GOUT[5] | Y/GOUT[2] | Y/GOUT[2] |
| DV_DATA12 | Y/GOUT[4] | Y/GOUT[4] | Y/GOUT[3] | Y/GOUT[3] |
| DV_DATA11 | Y/GOUT[3] | Y/GOUT[3] | Y/GOUT[4] | Y/GOUT[4] |
| DV_DATA10 | Y/GOUT[2] | Y/GOUT[2] | Y/GOUT[5] | Y/GOUT[5] |
| DV_DATA9 | Y/GOUT[1] | Y/GOUT[1] | Y/GOUT[6] | Y/GOUT[6] |
| DV_DATA8 | Y/GOUT[0] | Y/GOUT[0] | Y/GOUT[7] | Y/GOUT[7] |
| DV_DATA7 | Cb/BOUT[7] | Cr/ROUT[7] | Cb/BOUT[0] | Cr/ROUT[0] |
| DV_DATA6 | Cb/BOUT[6] | Cr/ROUT[6] | Cb/BOUT[1] | Cr/ROUT[1] |
| DV_DATA5 | Cb/BOUT[5] | Cr/ROUT[5] | Cb/BOUT[2] | Cr/ROUT[2] |
| DV_DATA4 | Cb/BOUT[4] | Cr/ROUT[4] | Cb/BOUT[3] | Cr/ROUT[3] |
| DV_DATA3 | Cb/BOUT[3] | Cr/ROUT[3] | Cb/BOUT[4] | Cr/ROUT[4] |
| DV_DATA2 | Cb/BOUT[2] | Cr/ROUT[2] | Cb/BOUT[5] | Cr/ROUT[5] |
| DV_DATA1 | Cb/BOUT[1] | Cr/ROUT[1] | Cb/BOUT[6] | Cr/ROUT[6] |
| DV_DATA0 | Cb/BOUT[0] | Cr/ROUT[0] | Cb/BOUT[7] | Cr/ROUT[7] |

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 35.7.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

$$G[7:0] = GOUT[7:2] \times 255 \div 63$$

$$B[7:0] = BOUT[7:2] \times 255 \div 63$$

$$R[7:0] = ROUT[7:2] \times 255 \div 63$$

Table 35.7 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB666

| | | | | |
|-----------------|---------|---------|---------|---------|
| INP_FORMAT[2:0] | 1 | 1 | 1 | 1 |
| INP_ENDIAN_ON | 0 | 0 | 1 | 1 |
| INP_SWAP_ON | 0 | 1 | 0 | 1 |
| DV_DATA17 | ROUT[7] | BOUT[7] | ROUT[2] | BOUT[2] |
| DV_DATA16 | ROUT[6] | BOUT[6] | ROUT[3] | BOUT[3] |
| DV_DATA15 | ROUT[5] | BOUT[5] | ROUT[4] | BOUT[4] |
| DV_DATA14 | ROUT[4] | BOUT[4] | ROUT[5] | BOUT[5] |
| DV_DATA13 | ROUT[3] | BOUT[3] | ROUT[6] | BOUT[6] |

| DV_DATA7 | GOUT[3] | GOUT[3] | GOUT[6] | GOUT[6] |
| DV_DATA6 | GOUT[2] | GOUT[2] | GOUT[7] | GOUT[7] |
| DV_DATA5 | BOUT[7] | ROUT[7] | BOUT[2] | ROUT[2] |
| DV_DATA4 | BOUT[6] | ROUT[6] | BOUT[3] | ROUT[3] |
| DV_DATA3 | BOUT[5] | ROUT[5] | BOUT[4] | ROUT[4] |
| DV_DATA2 | BOUT[4] | ROUT[4] | BOUT[5] | ROUT[5] |
| DV_DATA1 | BOUT[3] | ROUT[3] | BOUT[6] | ROUT[6] |
| DV_DATA0 | BOUT[2] | ROUT[2] | BOUT[7] | ROUT[7] |

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 35.8.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

$$G[7:0] = GOUT[7:2] \times 255 \div 63$$

$$B[7:0] = BOUT[7:3] \times 255 \div 31$$

$$R[7:0] = ROUT[7:3] \times 255 \div 31$$

Table 35.8 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB565

| | | | | |
|-----------------|---------|---------|---------|---------|
| INP_FORMAT[2:0] | 2 | 2 | 2 | 2 |
| INP_ENDIAN_ON | 0 | 0 | 1 | 1 |
| INP_SWAP_ON | 0 | 1 | 0 | 1 |
| DV_DATA15 | ROUT[7] | BOUT[7] | ROUT[3] | BOUT[3] |
| DV_DATA14 | ROUT[6] | BOUT[6] | ROUT[4] | BOUT[4] |
| DV_DATA13 | ROUT[5] | BOUT[5] | ROUT[5] | BOUT[5] |
| DV_DATA12 | ROUT[4] | BOUT[4] | ROUT[6] | BOUT[6] |
| DV_DATA11 | ROUT[3] | BOUT[3] | ROUT[7] | BOUT[7] |
| DV_DATA10 | GOUT[7] | GOUT[7] | GOUT[2] | GOUT[2] |
| DV_DATA9 | GOUT[6] | GOUT[6] | GOUT[3] | GOUT[3] |
| DV_DATA8 | GOUT[5] | GOUT[5] | GOUT[4] | GOUT[4] |

| DV_DATA6 | GOUT[3] | GOUT[3] | GOUT[6] | GOUT[6] |
| DV_DATA5 | GOUT[2] | GOUT[2] | GOUT[7] | GOUT[7] |
| DV_DATA4 | BOUT[7] | ROUT[7] | BOUT[3] | ROUT[3] |
| DV_DATA3 | BOUT[6] | ROUT[6] | BOUT[4] | ROUT[4] |
| DV_DATA2 | BOUT[5] | ROUT[5] | BOUT[5] | ROUT[5] |
| DV_DATA1 | BOUT[4] | ROUT[4] | BOUT[6] | ROUT[6] |
| DV_DATA0 | BOUT[3] | ROUT[3] | BOUT[7] | ROUT[7] |

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in Table 35.9.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see section 35.1.12, BT656/BT601/YCbCr422 Format Setting.

Table 35.9 Bit Allocation of DV_DATA Pin Inputs When the External Input is of BT656 or BT601

| INP_FORMAT[2:0] | 3, 4 | 3, 4 |
|-----------------|----------|----------|
| INP_ENDIAN_ON | 0 | 1 |
| INP_SWAP_ON | 0 | 0 |
| DV_DATA7 | BTOUT[7] | BTOUT[0] |
| DV_DATA6 | BTOUT[6] | BTOUT[1] |
| DV_DATA5 | BTOUT[5] | BTOUT[2] |
| DV_DATA4 | BTOUT[4] | BTOUT[3] |
| DV_DATA3 | BTOUT[3] | BTOUT[4] |
| DV_DATA2 | BTOUT[2] | BTOUT[5] |
| DV_DATA1 | BTOUT[1] | BTOUT[6] |
| DV_DATA0 | BTOUT[0] | BTOUT[7] |

(5) YCbCr422 Input

When the external input is of YCbCr422 format, the video image signal pins DV_DATA are allocated to the internal signals Y and Cb/Cr, as shown in Table 35.10.

Table 35.10 Bit Allocation of DV_DATA Pin Inputs When the External Input is of YCbCr422

| INP_FORMAT[2:0] | 5 | 5 | 5 | 5 |
|-----------------|----------|----------|----------|----------|
| INP_ENDIAN_ON | 0 | 0 | 1 | 1 |
| INP_SWAP_ON | 0 | 1 | 0 | 1 |
| DV_DATA15 | Y[7] | Cb/Cr[7] | Y[0] | Cb/Cr[0] |
| DV_DATA14 | Y[6] | Cb/Cr[6] | Y[1] | Cb/Cr[1] |
| DV_DATA13 | Y[5] | Cb/Cr[5] | Y[2] | Cb/Cr[2] |
| DV_DATA12 | Y[4] | Cb/Cr[4] | Y[3] | Cb/Cr[3] |
| DV_DATA11 | Y[3] | Cb/Cr[3] | Y[4] | Cb/Cr[4] |
| DV_DATA10 | Y[2] | Cb/Cr[2] | Y[5] | Cb/Cr[5] |
| DV_DATA9 | Y[1] | Cb/Cr[1] | Y[6] | Cb/Cr[6] |
| DV_DATA8 | Y[0] | Cb/Cr[0] | Y[7] | Cb/Cr[7] |
| DV_DATA7 | Cb/Cr[7] | Y[7] | Cb/Cr[0] | Y[0] |
| DV_DATA6 | Cb/Cr[6] | Y[6] | Cb/Cr[1] | Y[1] |
| DV_DATA5 | Cb/Cr[5] | Y[5] | Cb/Cr[2] | Y[2] |
| DV_DATA4 | Cb/Cr[4] | Y[4] | Cb/Cr[3] | Y[3] |
| DV_DATA3 | Cb/Cr[3] | Y[3] | Cb/Cr[4] | Y[4] |
| DV_DATA2 | Cb/Cr[2] | Y[2] | Cb/Cr[5] | Y[5] |
| DV_DATA1 | Cb/Cr[1] | Y[1] | Cb/Cr[6] | Y[6] |
| DV_DATA0 | Cb/Cr[0] | Y[0] | Cb/Cr[7] | Y[7] |

35.1.8 Typical Signal Timing of BT601 Format

Figure 35.3 and Figure 35.4 show the horizontal timings and Figure 35.5 and Figure 35.6 show the vertical timings of the BT601 format.

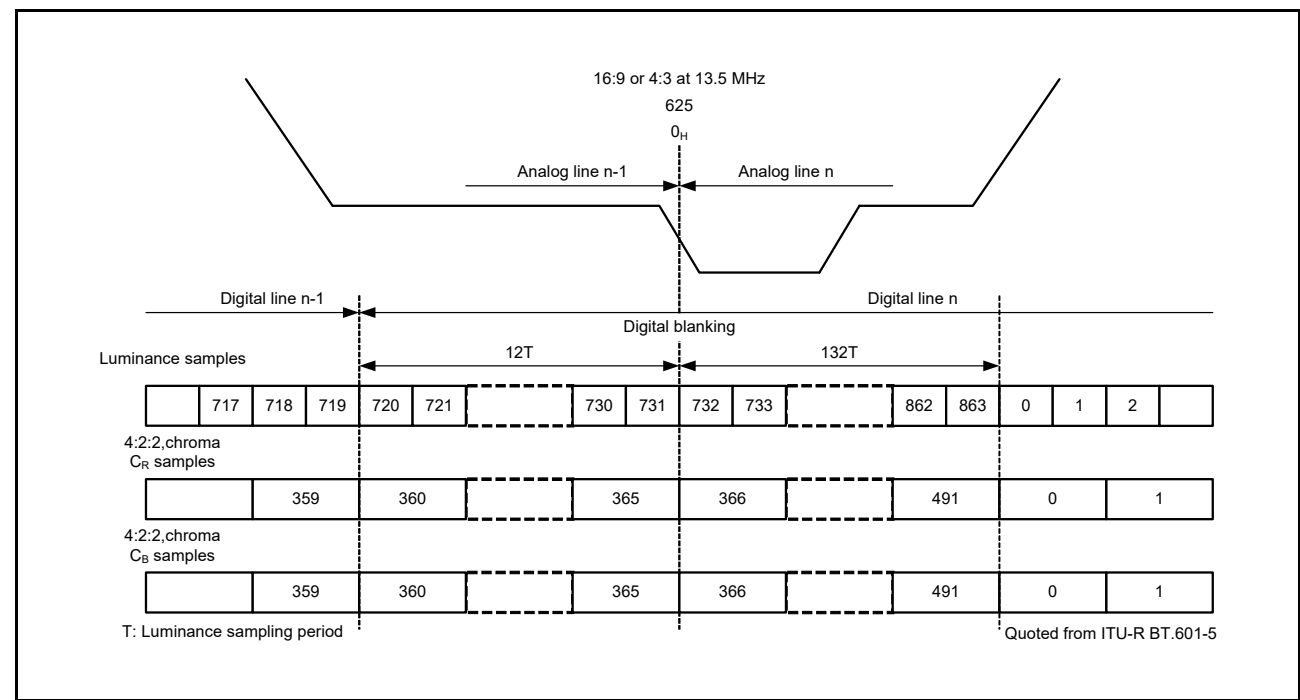

Figure 35.3 BT601 Horizontal Timing (625 Lines/50.00 Hz)

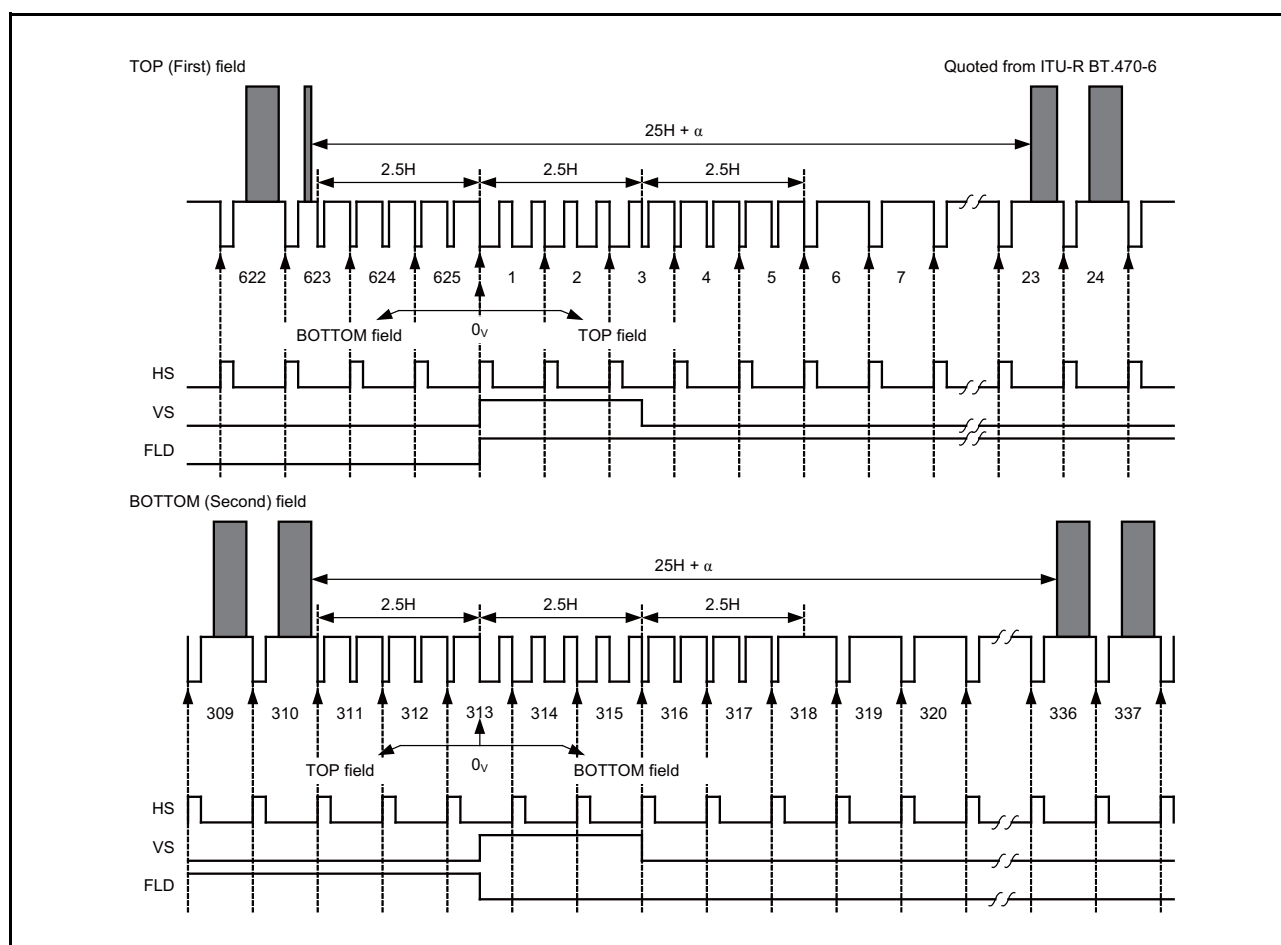

Figure 35.5 BT601 Vertical Timing (625 Lines/50.00 Hz)

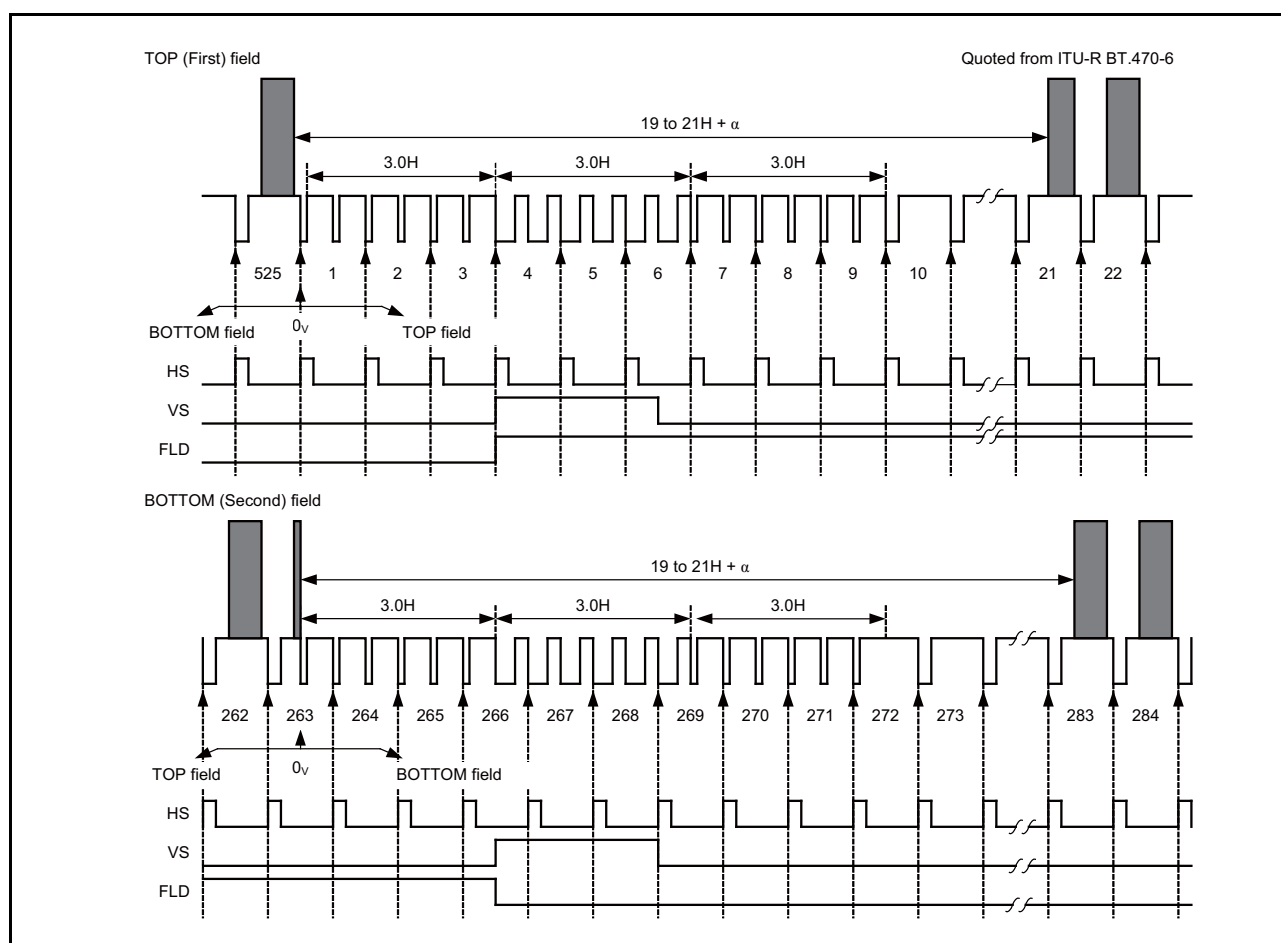

Figure 35.6 BT601 Vertical Timing (525 Lines/59.94 Hz)

35.1.9 Typical Signal Timing of BT656 Format

Figure 35.7 and Figure 35.8 show the horizontal timings of the BT656 format.

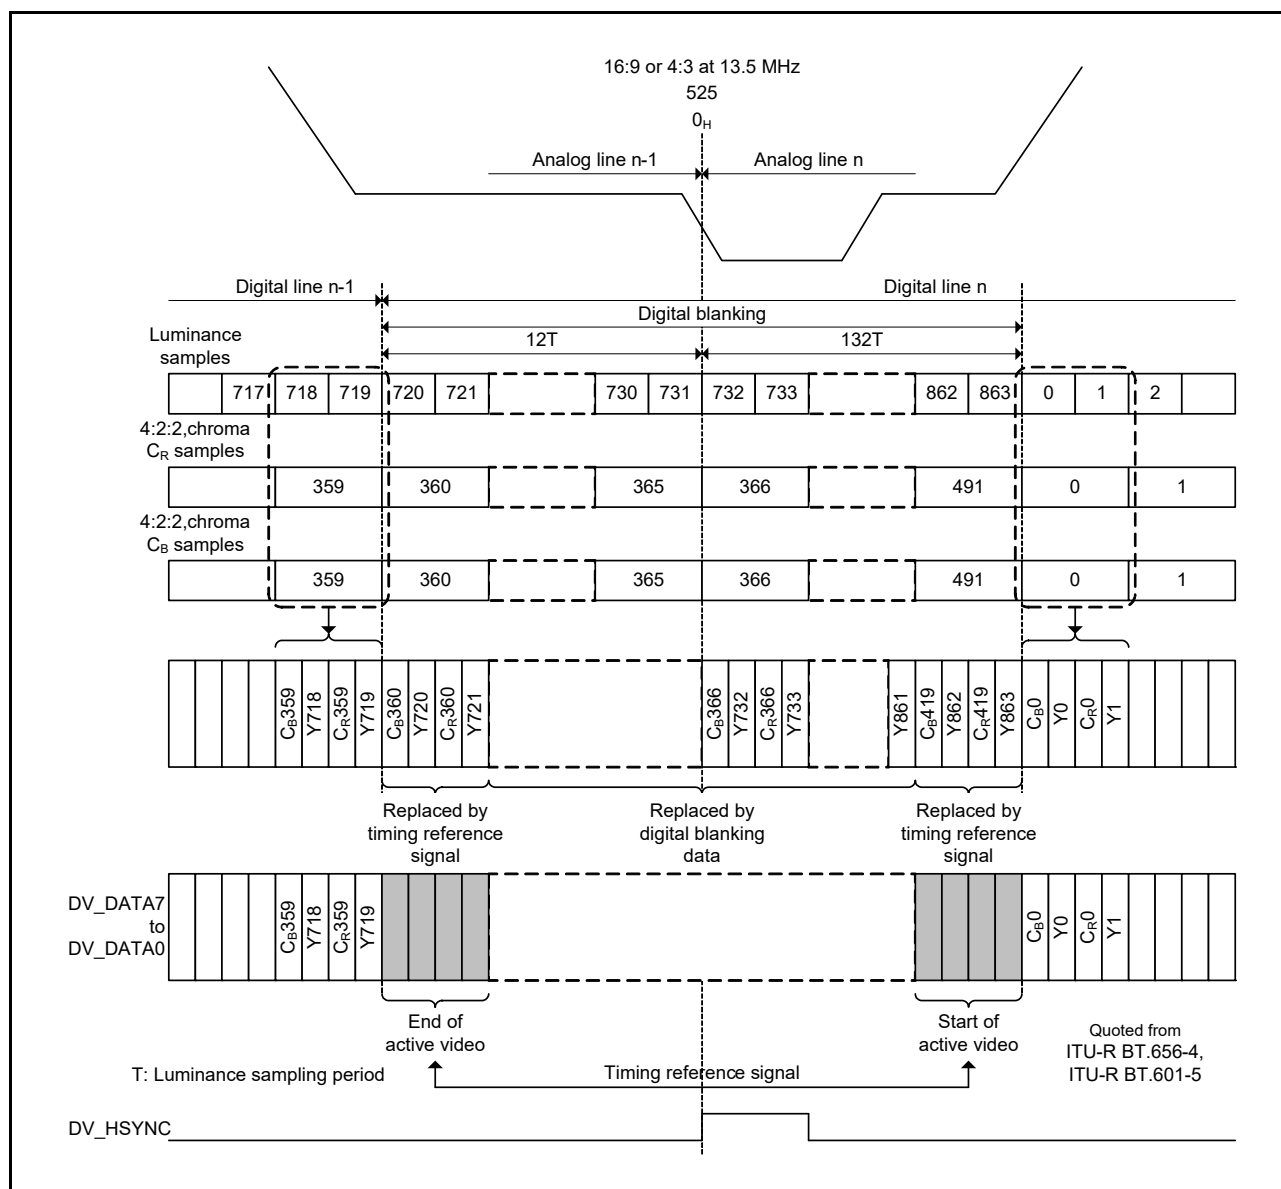

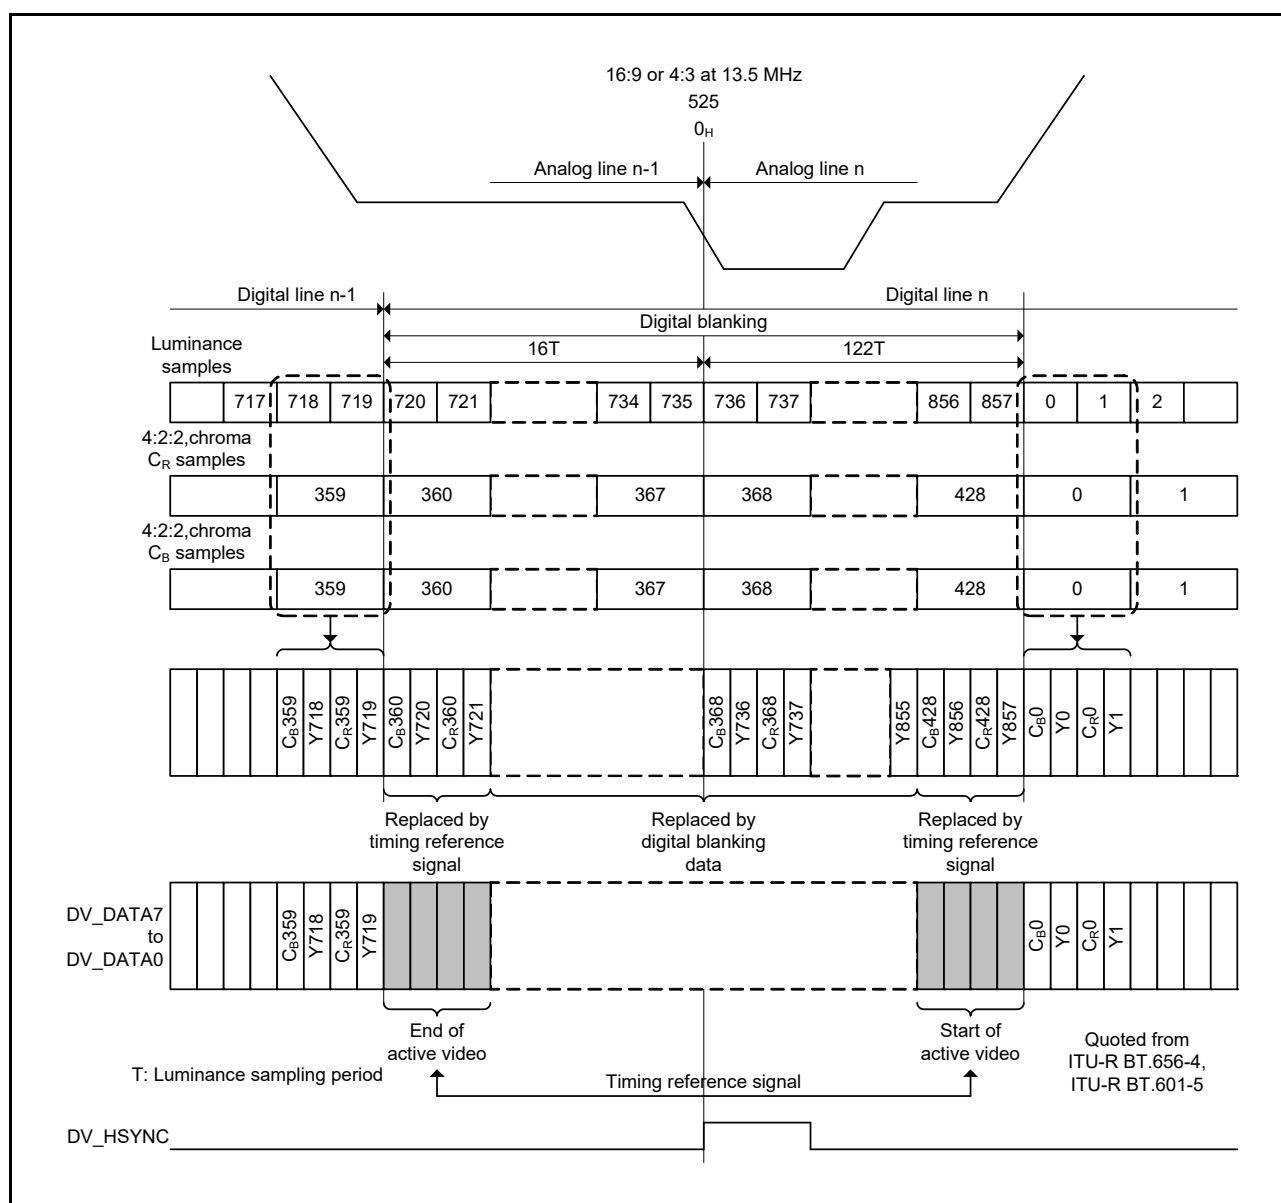

Figure 35.7 BT656 Horizontal Timing (625 Lines/50.00 Hz)

35.1.10 SAV/EAV Code in BT656 Format

Table 35.11 shows the timing of inserting the SAV/EAV code in the BT656 format. Bit information is shown in Table 35.12 and Table 35.13. This module does not refer to the parity bits P3 to P0 shown in Table 35.13.

Table 35.11 SAV/EAV Code Insertion Timing (Line)

| | | 625 | 525 |
|--------------------------|-------------------|----------|----------|
| V-digital field blanking | | | |
| Field 1 | Start (V = 1) | Line 624 | Line 1 |
| | Finish (V = 0) | Line 23 | Line 20 |
| Field 2 | Start (V = 1) | Line 311 | Line 264 |
| | Finish (V = 0) | Line 336 | Line 283 |
| V-digital field blanking | | | |
| Field 1 | F = 0 | Line 1 | Line 4 |
| Field 2 | F = 1 | Line 313 | Line 266 |

Table 35.12 SAV/EAV Code Bit Information (1)

| Data Bit Number | 1st Word (FF) | 2nd Word (00) | 3rd Word (00) | 4th Word (XY) |
|-----------------|---------------|---------------|---------------|---------------|
| 7 (MSB) | 1 | 0 | 0 | 1 |
| 6 | 1 | 0 | 0 | F |
| 5 | 1 | 0 | 0 | V |
| 4 | 1 | 0 | 0 | H |
| 3 | 1 | 0 | 0 | P3 |
| 2 | 1 | 0 | 0 | P2 |
| 1 | 1 | 0 | 0 | P1 |
| 0 | 1 | 0 | 0 | P0 |

[Legend]

F = 0 during field 1

F = 1 during field 2

V = 0 elsewhere

V = 1 during field blanking

H = 0 is SAV

H = 1 is EAV

Table 35.13 SAV/EAV Code Bit Information (2)

| F | V | H | P3 | P2 | P1 | P0 |
|---|---|---|----|----|----|----|
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Figure 35.10 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz)

35.1.11 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devices which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY).

For bit information, see Table 35.12 in section 35.1.10, SAV/EAV Code in BT656 Format. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

Table 35.14 lists the timing.

Table 35.14 Timing of Delay for Output of Vertical Synchronization Signal

| INP_EXT_SYNC_CNT. INP_F525_625 | F Bit in BT656 Format | Output Timing | Remark |
|-----------------------------------|-----------------------|---|--|
| 0: 525 lines | 0 (Field 1) | 2.5 lines after setting of V bit to 1 is detected | 525 lines, vertical synchronization signal for field 2 |
| | 1 (Field 2) | 3 lines after setting of V bit to 1 is detected | 525 lines, vertical synchronization signal for field 1 |
| 1: 625 lines | 0 (Field 1) | 2.5 lines after setting of V bit to 1 is detected | 625 lines, vertical synchronization signal for field 2 |
| | 1 (Field 2) | 2 lines after setting of V bit to 1 is detected | 625 lines, vertical synchronization signal for field 1 |

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(c) Timing Example of 525-Line Interface Input in BT656 Format

Figure 35.11 and Figure 35.12 show examples of the timing of vertical/horizontal synchronization signal extracted from 525-line interlaced input in the BT656 format.

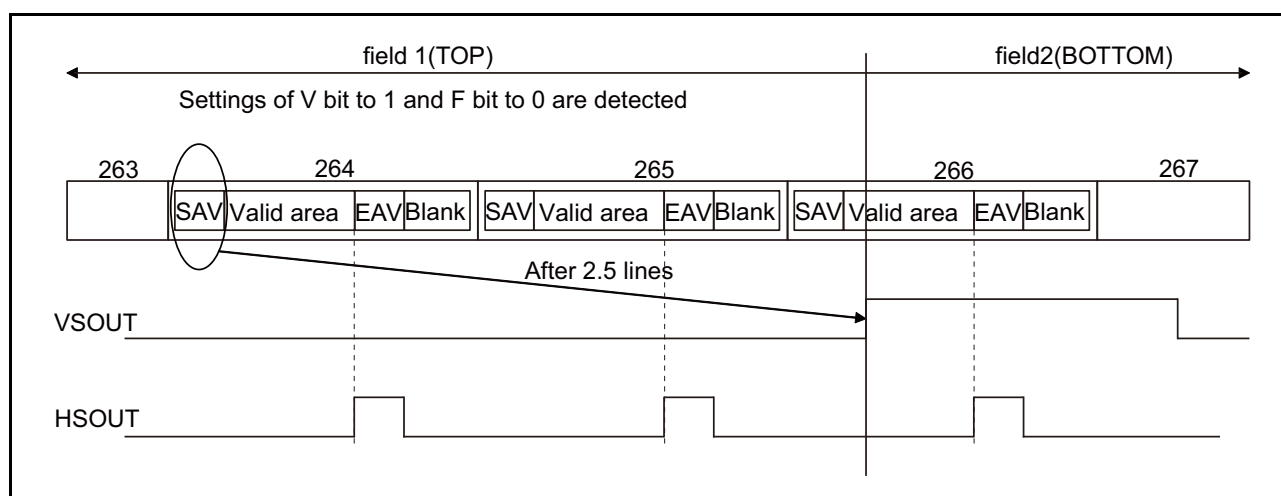

Figure 35.11 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom)

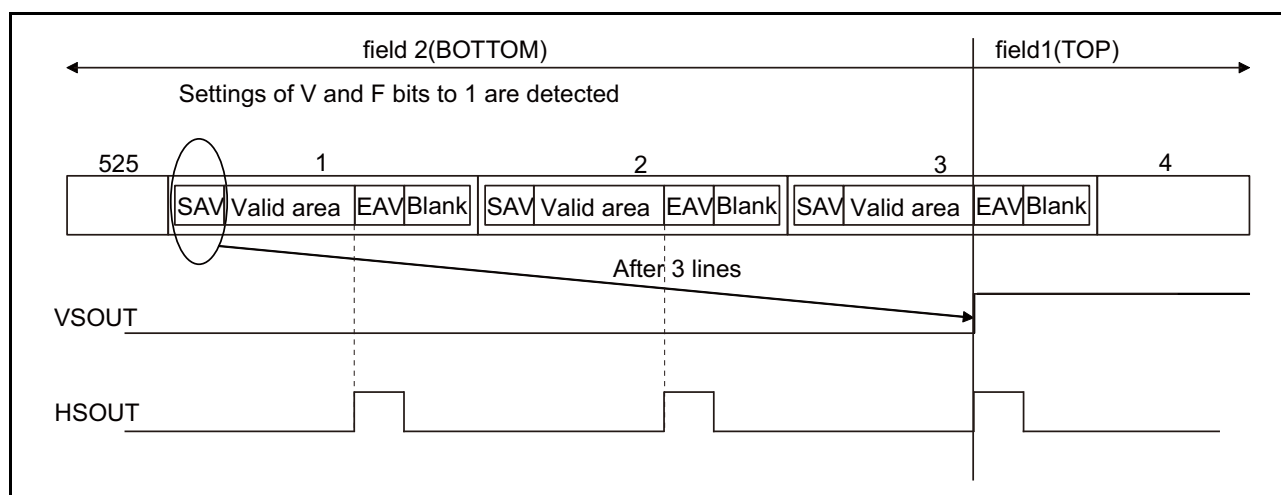

Figure 35.12 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top)

(3) Example of Timing for Progressive Input in BT656 Format

Figure 35.13 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format. Figure 35.14 shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The field is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

| | | One Horizontal Period | | | | | | | | | | | | | | | | | | |
|-----------------|-----|-----------------------|----|----|----|---------|-----|-----|-----|-----|-----------------------|-----------------------|-----|-----|-----|-------|------|-------|------|---|

Figure 35.13 SAV/EAV Code in BT656 Progressive Format (525 Lines, 59.94 Hz)

Figure 35.14 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

35.1.12 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The BT601 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 35.15 Operating Mode Setting for BT656 Format

| Register Name | Bit Name | Initial Value | Description |
|------------------|--------------|---------------|--|
| INP_EXT_SYNC_CNT | INP_F525_625 | 0 | Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines |

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[11:0] bits.

The INP_FH50[11:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see Table 35.20.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 35.16 Hsync Signal Reference Selection for BT656 Format

| Register Name | Bit Name | Initial Value | Description |
|------------------|----------------|---------------|---|
| INP_EXT_SYNC_CNT | INP_H_EDGE_SEL | 0 | Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV |

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

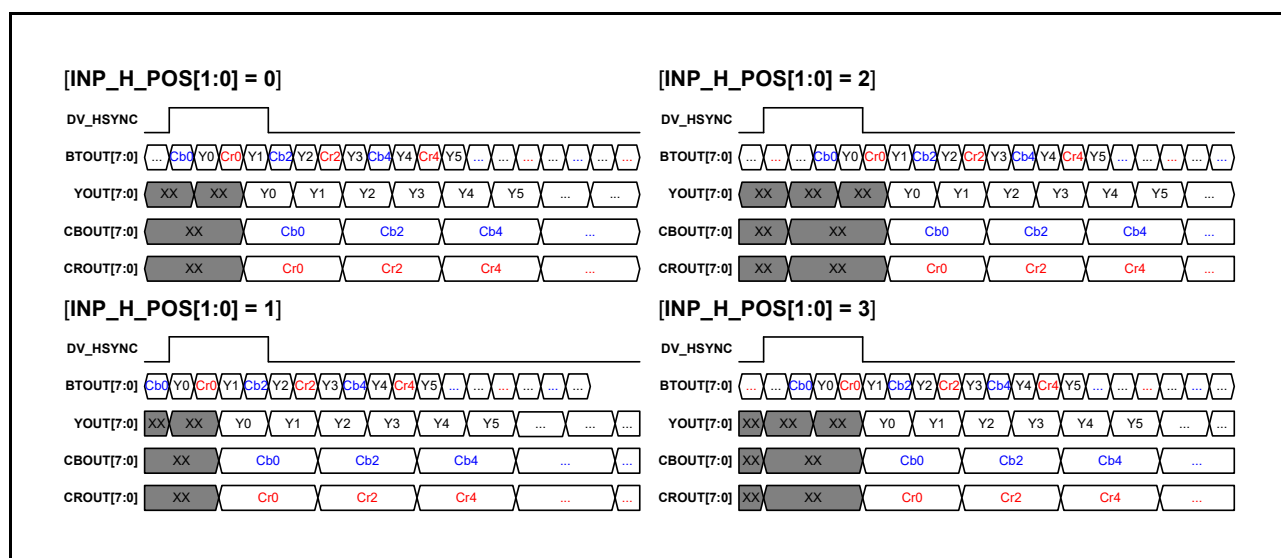

Figure 35.15 YCbCr Data Expansion for BT656/BT601 Input

Table 35.17 Data String Start Timing Selection for BT656/BT601 Input

| Register Name | Bit Name | Initial Value | Description |
|------------------|----------------|---------------|--|
| INP_EXT_SYNC_CNT | INP_H_POS[1:0] | 0 | Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr |

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

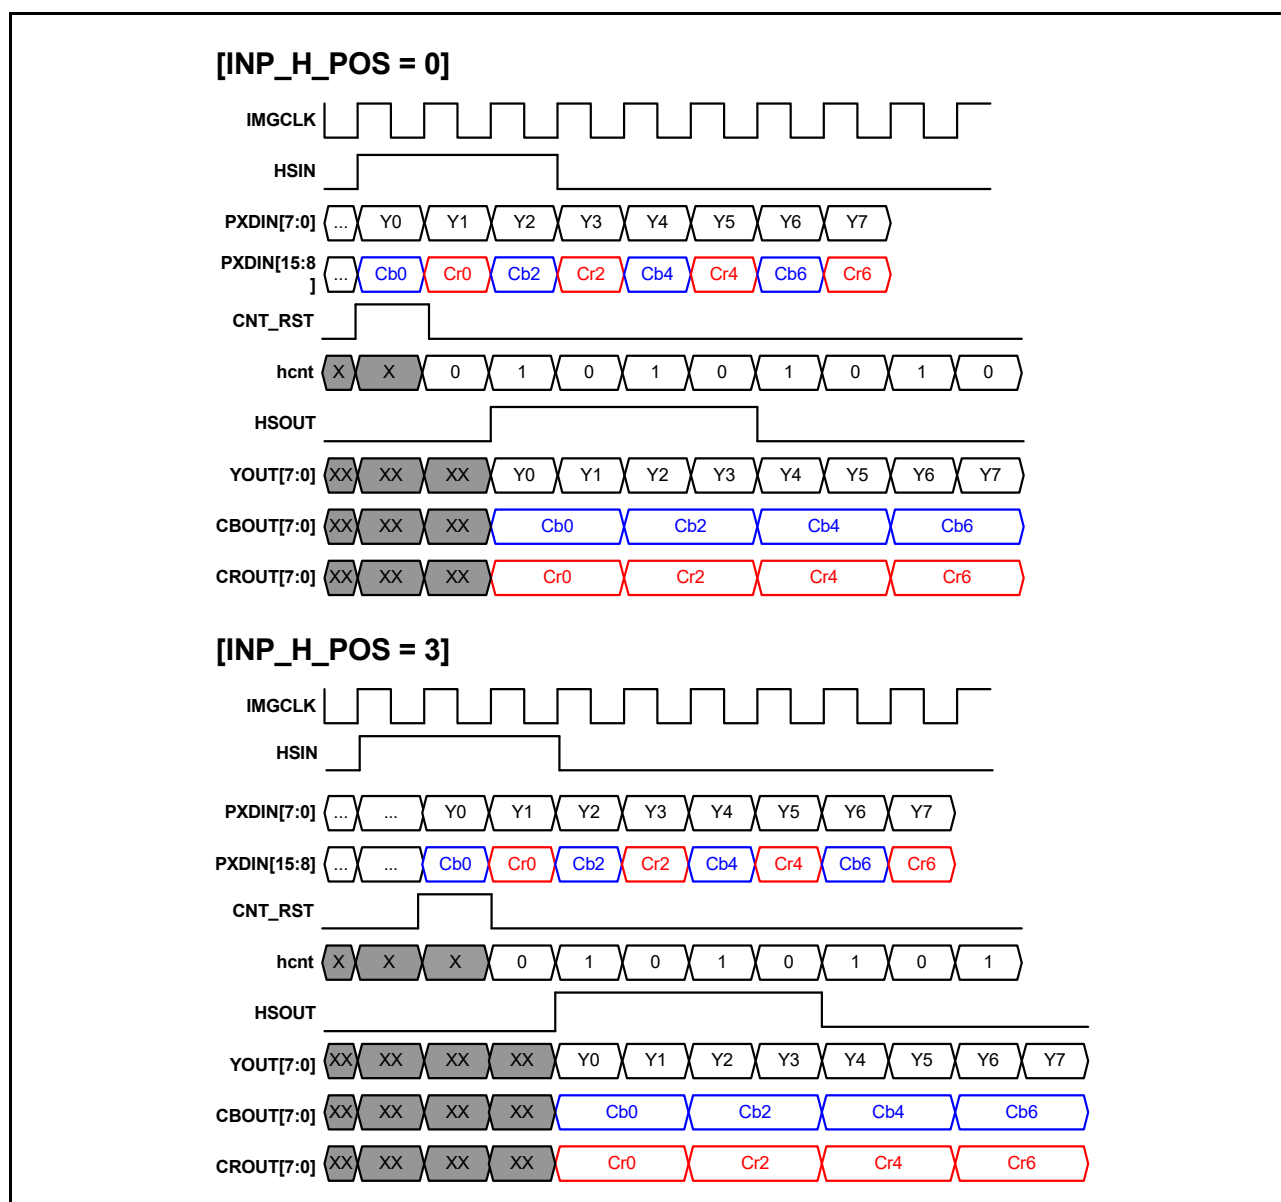

Figure 35.16 YCbCr Data Expansion for YCbCr422 Input

Table 35.18 Data String Start Timing Selection for YCbCr422 Input

| Register Name | Bit Name | Initial Value | Description |
|------------------|----------------|---------------|--|
| INP_EXT_SYNC_CNT | INP_H_POS[1:0] | 0 | Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited |

35.1.13 YCbCr444/RGB888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in Table 35.19.

Table 35.19 YCbCr/RGB Signal Reception Timing

| Item | Description |
|--|--|
| External input clock | Maximum external input clock frequency: 87.00 MHz |
| Vsync signal width (V_SYNC) | Minimum Vsync signal width: 1 CLK |
| Vsync signal polarity (V_POL) | Positive or negative polarity is selected by the relevant registers. |
| Vertical valid period start position (V_BP) | From Vsync reference to the head of the video image: 5 lines or more |
| Vertical valid period video width (V_ACTIVE) | Maximum vertical valid period: 1080lines |
| Vertical valid period end position (V_FP) | From the end of the video image to the Vsync reference: 4 lines or more *1 |
| Hsync signal width (H_SYNC) | Minimum Hsync signal width: 1 CLK |
| Hsync signal polarity (H_POL) | Positive or negative polarity is selected by the relevant registers. |
| Horizontal valid period start position (H_BP) | From Hsync reference to the head of the video image: 16 CLK or more |
| Horizontal valid period video width (H_ACTIVE) | Maximum horizontal valid period: 1920 pixels |
| Horizontal valid period end position (H_FP) | From the end of the video image to the Hsync reference: 16 CLK or more *2 |
| Number of vertical lines (V_BP+V_ACTIVE+V_FP) | Between vertical synchronization signals: 2047 lines or less |
| Number of horizontal pixels (H_BP+H_ACTIVE+H_FP) | Between horizontal synchronization signals: 4095 CLK or less |

Note 1. When V_FP is below four lines, the setting of INP_DLY_ADJ.INP_VS_DLY_L[2:0] should be adjusted so that V_FP is at least four lines.

Note 2. When H_FP is below 16 cycles, the settings of INP_DLY_ADJ.INP_VS_DLY[7:0], INP_HS_DLY[7:0], and INP_FLD_DLY[7:0] should be adjusted so that H_FP is at least 16 cycles of the pixel clock.

Figure 35.17 YCbCr/RGB Signal Reception Timing

35.1.14 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ± 0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ± 0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

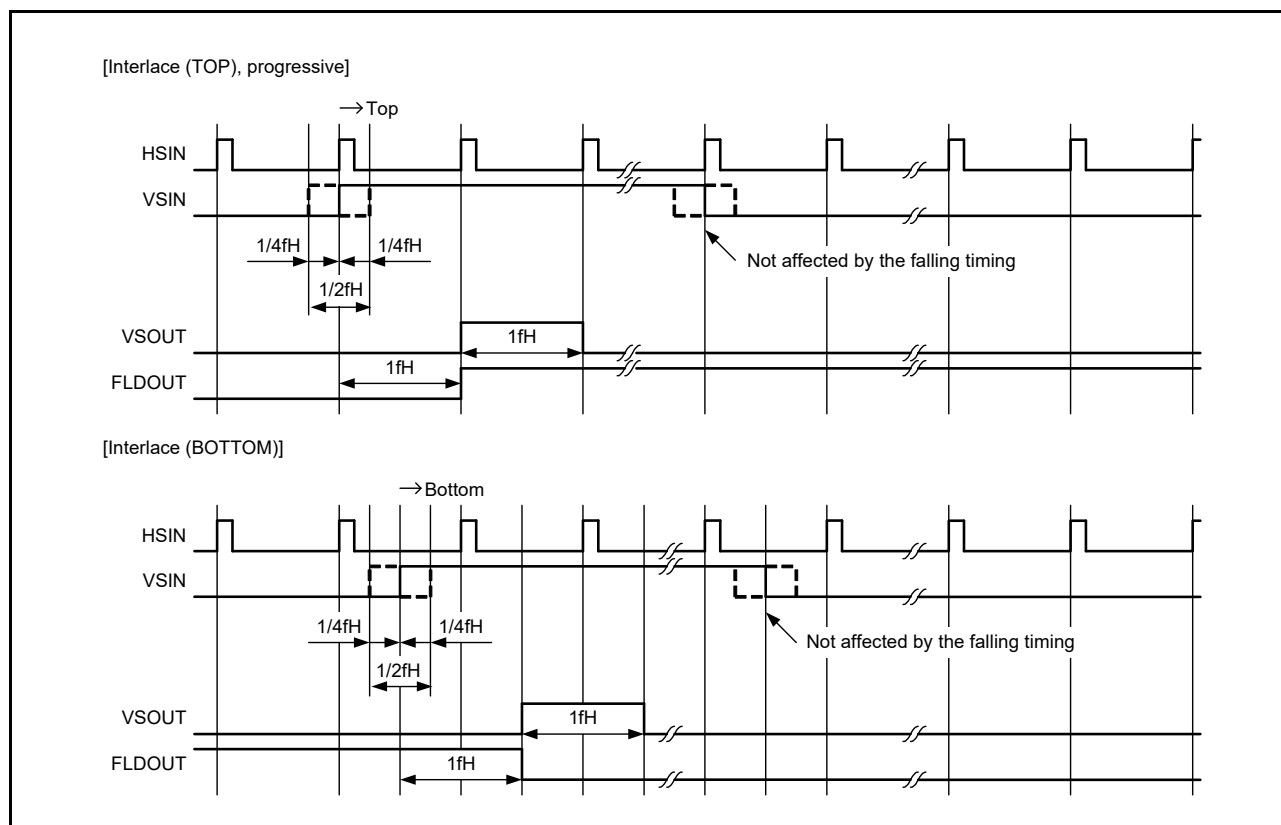

Figure 35.18 Vsync Signal Phase Adjustment

The timings of $1/2fH$ Vsync signal phase and $1/4fH$ Vsync signal phase are set with INP_FH50[11:0] and INP_FH25[11:0], respectively.

Table 35.20 Vsync Signal Phase Timing Setting

| Register Name | Bit Name | Initial Value | Description |
|------------------|----------------|---------------|--|
| INP_VSYNC_PH_ADJ | INP_FH50[11:0] | 858 | Vsync Signal $1/2fH$ Phase Timing Should be $1/2$ the horizontal cycle. |
| INP_VSYNC_PH_ADJ | INP_FH25[11:0] | 429 | Vsync Signal $1/4fH$ Phase Timing Should be $1/4$ the horizontal cycle. |

35.1.15 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

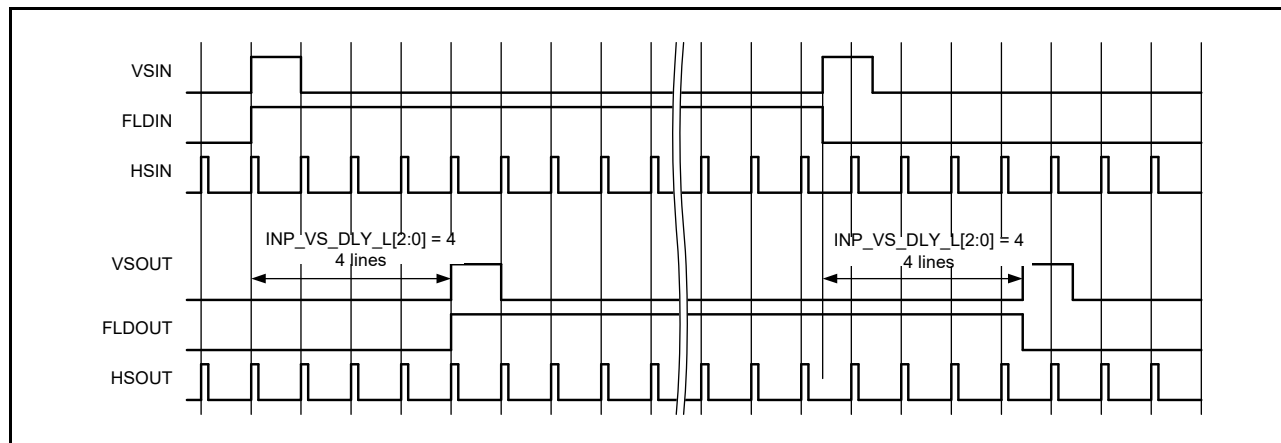

Figure 35.19 Timing of Vsync Signal Delay in Line Units

Table 35.21 Adjustment of Vsync Signal Delay in Line Units

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|--|
| INP_DLY_ADJ | INP_VS_DLY_L[2:0] | 0 | Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines) |

35.1.16 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 35.22 Sync Signal Delay Adjustment

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|--|
| INP_DLY_ADJ | INP_VS_DLY[7:0] | 0 | Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles) |
| INP_DLY_ADJ | INP_HS_DLY[7:0] | 0 | Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles) |
| INP_DLY_ADJ | INP_FLD_DLY[7:0] | 0 | Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles) |

35.1.17 Horizontal Noise Reduction

Noise can be reduced according to horizontal pixel reference.

Noise reduction is controlled through noise component frequency band (TAP), noise level (threshold), and noise reduction intensity (gain).

(1) Frequency Band (TAP) Setting for Noise Component

The noise frequency band can be selected independently from the following four types by using the NR1D_Y_TAP[1:0], NR1D_CB_TAP[1:0], and NR1D_CR_TAP[1:0] bits.

When the number of adjacent pixels is one (noise reduction NR1D_Y/CB/CR_TAP is 0):

$$\text{BPF}_{(1)} = \frac{1}{4} (-1 \times Z_{(-1)}, 2 \times Z_{(0)}, -1 \times Z_{(+1)})$$

When the number of adjacent pixels is two (noise reduction NR1D_Y/CB/CR_TAP is 1):

$$\text{BPF}_{(2)} = \frac{1}{4} (-1 \times Z_{(-2)}, 2 \times Z_{(0)}, -1 \times Z_{(+2)})$$

When the number of adjacent pixels is three (noise reduction NR1D_Y/CB/CR_TAP is 2):

$$\text{BPF}_{(3)} = \frac{1}{4} (-1 \times Z_{(-3)}, 2 \times Z_{(0)}, -1 \times Z_{(+3)})$$

When the number of adjacent pixels is four (noise reduction NR1D_Y/CB/CR_TAP is 3):

$$\text{BPF}_{(4)} = \frac{1}{4} (-1 \times Z_{(-4)}, 2 \times Z_{(0)}, -1 \times Z_{(+4)})$$

Note: $Z_{(0)}$ indicates the target pixel for noise reduction and $Z_{(N)}$ indicates the pixel that is n pixels off from $Z_{(0)}$ in the horizontal direction.

(2) Setting Noise Level (Threshold)

The absolute value of the detected noise amount (BPF output value) is compared with the values of the NR1D_Y_TH[6:0], NR1D_CB_TH[6:0], and NR1D_CR_TH[6:0] bits. When the detected noise amount is greater than NR1D_Y/CB/CR_TH, the absolute value of the detected noise amount is considered as NR1D_Y/CB/CR_TH (fixed value).

$\text{ABS}(\text{BPF}(n)) \leq \text{absolute value of detected noise amount when } \text{ABS}(\text{BPF}(n)) \leq \text{NR1D_Y/CB/CR_TH}:$

$$\text{NOISE_ABS} = \text{ABS}(\text{BPF}(n))$$

$\text{ABS}(\text{BPF}(n)) > \text{absolute value of detected noise amount when } \text{ABS}(\text{BPF}(n)) > \text{NR1D_Y/CB/CR_TH}:$

$$\text{NOISE_ABS} = \text{NR1D_Y/CB/CR_TH}$$

(3) Setting Noise Reduction Intensity (Gain)

The absolute value of the detected noise amount is multiplied by the value of gain specified by the NR1D_Y_GAIN[1:0], NR1D_CB_GAIN[1:0], and NR1D_CR_GAIN[1:0] bits, and the feedback is calculated for the original signal.

Computation when the amount of detected noise (BPF(n)) is negative (-):

$$\text{DOUT} = \text{DIN} + \text{NOISE_ABS} \div 2^{(\text{NR1D_Y/CB/CR_GAIN}+1)}$$

Computation when the amount of detected noise (BPF(n)) is positive (+):

$$\text{DOUT} = \text{DIN} - \text{NOISE_ABS} \div 2^{(\text{NR1D_Y/CB/CR_GAIN}+1)}$$

Table 35.23 Horizontal Noise Reduction

| Register Name | Bit Name | Initial Value | Description |
|----------------|-------------------|---------------|--|
| IMGCNT_NR_CNT0 | NR1D_MD | 1 | Horizontal Noise Reduction Operating Mode 0: R/G/B mode 1: Y/Cb/Cr mode |
| IMGCNT_NR_CNT0 | NR1D_ON | 0 | Noise Reduction On/Off Control 0: Noise Reduction Off 1: Noise Reduction On |
| IMGCNT_NR_CNT0 | NR1D_Y_TAP[1:0] | 0 | Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels |
| IMGCNT_NR_CNT0 | NR1D_Y_TH[6:0] | 8 | Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value \leq NR1D_Y_TH. Unsigned: 0 to 127 [LSB] |
| IMGCNT_NR_CNT0 | NR1D_Y_GAIN[1:0] | 3 | Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16 |
| IMGCNT_NR_CNT1 | NR1D_CB_TAP[1:0] | 0 | Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels |
| IMGCNT_NR_CNT1 | NR1D_CB_TH[6:0] | 8 | Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value \leq NR1D_C_TH. Unsigned: 0 to 127 [LSB] |
| IMGCNT_NR_CNT1 | NR1D_CB_GAIN[1:0] | 3 | Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16 |
| IMGCNT_NR_CNT1 | NR1D_CR_TAP[1:0] | 0 | Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels |
| IMGCNT_NR_CNT1 | NR1D_CR_TH[6:0] | 8 | Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value \leq NR1D_C_TH. Unsigned: 0 to 127 [LSB] |
| IMGCNT_NR_CNT1 | NR1D_CR_GAIN[1:0] | 3 | Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16 |

35.1.18 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN + IMGCNT_MTX_B - 128$$

$$CRRIN_A = CRRIN + IMGCNT_MTX_R - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256$$

(2) GBR to YCbCr Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN + IMGCNT_MTX_B - 128$$

$$CRRIN_A = CRRIN + IMGCNT_MTX_R - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256 + 128$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256 + 128$$

Table 35.24 Matrix Coefficient (Typical Value) for SMPTE 293M

| | YGIN | | CBBIN | | CRRIN | |
|--------|-------------|----------------------|-------------|----------------------|-------------|----------------------|
| | Coefficient | Set Value | Coefficient | Set Value | Coefficient | Set Value |
| YGOUT | 0.587 | IMGCNT_MTX_GG = 150 | 0.114 | IMGCNT_MTX_GB = 29 | 0.299 | IMGCNT_MTX_GR = 77 |
| CBBOUT | -0.331 | IMGCNT_MTX_BG = 1963 | 0.500 | IMGCNT_MTX_BB = 128 | -0.169 | IMGCNT_MTX_BR = 2005 |
| CRROUT | -0.419 | IMGCNT_MTX_RG = 1941 | -0.081 | IMGCNT_MTX_RB = 2027 | 0.500 | IMGCNT_MTX_RR = 128 |

(3) YCbCr to GBR Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256$$

Table 35.25 Matrix Coefficient (Typical Value) for SMPTE 293M

| | YGIN | | CBBIN | | CRRIN | |
|--------|-------------|-------------------------|-------------|-------------------------|-------------|-------------------------|
| | Coefficient | Set Value | Coefficient | Set Value | Coefficient | Set Value |
| YGOUT | 1.000 | IMGCNT_ MTX_GG = 256 | -0.344 | IMGCNT_MTX_GB = 1960 | -0.714 | IMGCNT_MTX_GR = 1865 |

| CRROUT | 1.000 | IMGCNT_ MTX_RG = 256 | 0.000 | IMGCNT_MTX_RB = 0 | 1.402 | IMGCNT_MTX_RR = 359 |

(4) YCbCr to YCbCr Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256 + 128$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256 + 128$$

Table 35.26 YCbCr to GBR Conversion

| Register Name | Bit Name | Initial Value | Description |
|---------------------|----------------------|---------------|---|
| IMGCNT_MTX_MODE | IMGCNT_MTX_MD [1:0] | 3 | Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr |
| IMGCNT_MTX_YG_ADJ0 | IMGCNT_MTX_YG [7:0] | 128 | Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB], 512 [LSB]) |
| IMGCNT_MTX_CBB_ADJ0 | IMGCNT_MTX_B [7:0] | 128 | Offset (DC) Adjustment of B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB]) |
| IMGCNT_MTX_CRR_ADJ0 | IMGCNT_MTX_R [7:0] | 128 | Offset (DC) Adjustment of R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB]) |
| IMGCNT_MTX_YG_ADJ0 | IMGCNT_MTX_GG [10:0] | 256 | Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_YG_ADJ1 | IMGCNT_MTX_GB [10:0] | 0 | Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_YG_ADJ1 | IMGCNT_MTX_GR [10:0] | 0 | Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_CBB_ADJ0 | IMGCNT_MTX_BG [10:0] | 0 | Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_CBB_ADJ1 | IMGCNT_MTX_BB [10:0] | 256 | Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_CBB_ADJ1 | IMGCNT_MTX_BR [10:0] | 0 | Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_CRR_ADJ0 | IMGCNT_MTX_RG [10:0] | 0 | Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_CRR_ADJ1 | IMGCNT_MTX_RB [10:0] | 0 | Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| IMGCNT_MTX_CRR_ADJ1 | IMGCNT_MTX_RR [10:0] | 256 | Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

35.2 Register Descriptions

Table 35.27 and Table 35.28 show register Configuration.

- Symbols used in Register Description:

Initial value: Register value after a power-on reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 35.27 Register Configuration of Input Controller

| Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|------------------|-------|---------------|-------------|-------------|
| External input block register update control register | INP_UPDATE | R/WC1 | H'0000 0000 | H'FCFF 7400 | 32 |
| Input select control register | INP_SEL_CNT | R/W | H'0000 0000 | H'FCFF 7404 | 32 |
| External input sync signal control register | INP_EXT_SYNC_CNT | R/W | H'0000 0000 | H'FCFF 7408 | 32 |
| Vsync signal phase adjustment register | INP_VSYNC_PH_ADJ | R/W | H'035A 01AD | H'FCFF 740C | 32 |
| Sync signal delay adjustment register | INP_DLY_ADJ | R/W | H'0000 0000 | H'FCFF 7410 | 32 |

Table 35.28 Register Configuration of Image Quality Adjustment Block

| Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|---------------------|-------|---------------|-------------|-------------|
| Image quality adjustment block register update control register | IMGCNT_UPDATE | R/WC1 | H'0000 0000 | H'FCFF 7480 | 32 |
| NR control register 0 | IMGCNT_NR_CNT0 | R/W | H'0010 0803 | H'FCFF 7484 | 32 |
| NR control register 1 | IMGCNT_NR_CNT1 | R/W | H'0803 0803 | H'FCFF 7488 | 32 |
| Image quality adjustment block matrix mode register | IMGCNT_MTX_MODE | R/W | H'0000 0003 | H'FCFF 74A0 | 32 |
| Image quality adjustment block matrix YG adjustment register 0 | IMGCNT_MTX_YG_ADJ0 | R/W | H'0080 0100 | H'FCFF 74A4 | 32 |
| Image quality adjustment block matrix YG adjustment register 1 | IMGCNT_MTX_YG_ADJ1 | R/W | H'0000 0000 | H'FCFF 74A8 | 32 |
| Image quality adjustment block matrix CBB adjustment register 0 | IMGCNT_MTX_CBB_ADJ0 | R/W | H'0080 0000 | H'FCFF 74AC | 32 |
| Image quality adjustment block matrix CBB adjustment register 1 | IMGCNT_MTX_CBB_ADJ1 | R/W | H'0100 0000 | H'FCFF 74B0 | 32 |
| Image quality adjustment block matrix CRR adjustment register 0 | IMGCNT_MTX_CRR_ADJ0 | R/W | H'0080 0000 | H'FCFF 74B4 | 32 |
| Image quality adjustment block matrix CRR adjustment register 1 | IMGCNT_MTX_CRR_ADJ1 | R/W | H'0000 0100 | H'FCFF 74B8 | 32 |

35.2.1 External Input Block Register Update Control Register (INP_UPDATE)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----------------|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | INP_EXT_UPDATE | — | — | — | INP_IMG_UPDATE |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/WC1 | R | R | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-------|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | INP_EXT_UPDATE | 0 | R/WC1 | External Input Block Register Update 0: Registers are not updated. 1: Registers are updated. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INP_IMG_UPDATE | 0 | R/WC1 | Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated. |

35.2.2 Input Select Control Register (INP_SEL_CNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|-----------------|-----|-----|----|----|----|--------------|----|----|----|-------------|----|----|----|-------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | INP_SEL | — | — | — | — |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | INP_FORMAT[2:0] | | | — | — | — | INP_PXD_EDGE | — | — | — | INP_VS_EDGE | — | — | — | INP_HS_EDGE |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 | INP_SEL | 0 | R/W | Input Select 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on. |
| 19 to 15 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 14 to 12 | INP_FORMAT[2:0] | 0 | R/W | External Input Format Select 0: YcbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited |
| 11 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | INP_PXD_EDGE | 0 | R/W | Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | INP_VS_EDGE | 0 | R/W | Clock Edge Select for Capturing External Input Vsync Signals DV_VSYNC 0: Rising edge 1: Falling edge |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INP_HS_EDGE | 0 | R/W | Clock Edge Select for Capturing External Input Hsync Signals DV_HSYNC 0: Rising edge 1: Falling edge |

Note: INP_FORMAT, INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE are updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1. INP_SEL is updated when set.

35.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|-------------------|----|----|----|-------------------|----|----|----|------------------|----|----|-----|--------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | INP_EN DIAN_ON | — | — | — | INP_S WAP_ON | — | — | — | INP_V S_INV | — | — | — | INP_H S_INV |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | INP_H EDGE_SEL | — | — | — | INP_F5 25_625 | — | — | — | INP_H_POS [1:0] |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | INP_EN ENDIAN_ON | 0 | R/W | External Input Bit Endian Change On/Off Control 0: Off 1: On |
| 27 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | INP_SWAP_ON | 0 | R/W | External Input B/R Signal Swap On/Off Control 0: Off 1: On |
| 23 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 | INP_VS_INV | 0 | R/W | External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity) |
| 19 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | INP_HS_INV | 0 | R/W | External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity) |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | INP_H_EDGE_SEL | 0 | R/W | Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | INP_F525_625 | 0 | R/W | Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | INP_H_POS[1:0] | 0 | R/W | Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422) |

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

35.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | INP_FH50[11:0] | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | INP_FH25[11:0] | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 1 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 28 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 27 to 16 | INP_FH50 [11:0] | 858 | R/W | Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set. |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 0 | INP_FH25 [11:0] | 429 | R/W | Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set. |

Note: The INP_FH50[11:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The INP_FH25[11:0] bits are updated when the INP_IMG_UPDATE bit is 1.

35.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|-----|-----|-------------------|-----|-----|------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | INP_VS_DLY_L[2:0] | | | INP_FLD_DLY[7:0] | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | INP_VS_DLY[7:0] | | | | | | | | INP_HS_DLY[7:0] | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 24 | INP_VS_ DLY_L[2:0] | 0 | R/W | Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines) |
| 23 to 16 | INP_FLD_ DLY[7:0] | 0 | R/W | Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles) |
| 15 to 8 | INP_VS_ DLY[7:0] | 0 | R/W | Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles) |
| 7 to 0 | INP_HS_ DLY[7:0] | 0 | R/W | Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles) |

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

35.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IMGCN T_VEN |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-------|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | IMGCNT_VEN | 0 | R/WC1 | Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal. |

35.2.7 NR Control Register 0 (IMGCNT_NR_CNT0)

| | | | | | | | | | | | | | | | | |
|----------------|----|----------------|-----|-----|-----|-----|-----|-----|----|-----------------|-----|---------|----|------------------|-----|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | NR1D_MD | — | — | — | NR1D_ON |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | NR1D_Y_TH[6:0] | | | | | | — | — | NR1D_Y_TAP[1:0] | | — | — | NR1D_Y_GAIN[1:0] | | |
| Initial Value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 | NR1D_MD | 1 | R/W | Horizontal Noise Reduction Operating Mode 0: G/B/R mode 1: Y/Cb/Cr mode |
| 19 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | NR1D_ON | 0 | R/W | Noise Reduction On/Off Control 0: Noise reduction Off 1: Noise reduction On |
| 15 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 14 to 8 | NR1D_Y_TH[6:0] | 8 | R/W | Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB] |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5, 4 | NR1D_Y_TAP[1:0] | 0 | R/W | Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | NR1D_Y_GAIN[1:0] | 3 | R/W | Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16 |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.8 NR Control Register 1 (IMGCNT_NR_CNT1)

| | | | | | | | | | | | | | | | | |
|----------------|----|-----------------|-----|-----|-----|-----|-----|-----|----|----|-----|-----------------------|----|----|-------------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | NR1D_CB_TH[6:0] | | | | | | | | — | — | NR1D_CB_TAP [1:0] | — | — | NR1D_CB_GAIN[1:0] | |
| Initial Value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Initial Value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 24 | NR1D_CB_TH[6:0] | 8 | R/W | Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CB_TH. Unsigned: 0 to 127 [LSB] |
| 23, 22 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 21, 20 | NR1D_CB_TAP[1:0] | 0 | R/W | Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels |
| 19, 18 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 17, 16 | NR1D_CB_GAIN[1:0] | 3 | R/W | Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16 |
| 15 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 14 to 8 | NR1D_CR_TH[6:0] | 8 | R/W | Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CR_TH. Unsigned: 0 to 127 [LSB] |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5, 4 | NR1D_CR_TAP[1:0] | 0 | R/W | Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | NR1D_CR_GAIN[1:0] | 3 | R/W | Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16 |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.9 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IMGCNT_MTX_MD[1:0] | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|--|
| 31 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | IMGCNT_MTX_MD[1:0] | 3 | R/W | Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.10 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|---------------------|-----|-----|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | IMGCNT_MTX_YG[7:0] | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | IMGCNT_MTX_GG[10:0] | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | IMGCNT_MTX_YG[7:0] | 128 | R/W | Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | IMGCNT_MTX_GG[10:0] | 256 | R/W | Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | IMGCNT_MTX_GB[10:0] | 0 | R/W | Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | IMGCNT_MTX_GR[10:0] | 0 | R/W | Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.12 Image Quality Adjustment Block Matrix CBB Adjustment Register 0 (IMGCNT_MTX_CBB_ADJ0)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | IMGCNT_MTX_B[7:0] | 128 | R/W | Offset (DC) Adjustment of Cb/B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | IMGCNT_MTX_BG[10:0] | 0 | R/W | Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.13 Image Quality Adjustment Block Matrix CBB Adjustment Register 1 (IMGCNT_MTX_CBB_ADJ1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | IMGCNT_MTX_BB[10:0] | 256 | R/W | Cb/B Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | IMGCNT_MTX_BR[10:0] | 0 | R/W | Cr/R Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.14 Image Quality Adjustment Block Matrix CRR Adjustment Register 0 (IMGCNT_MTX_CRR_ADJ0)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | IMGCNT_MTX_R[7:0] | 128 | R/W | Offset (DC) Adjustment of Cr/R Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | IMGCNT_MTX_RG[10:0] | 0 | R/W | Y/G Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.2.15 Image Quality Adjustment Block Matrix CRR Adjustment Register 1 (IMGCNT_MTX_CRR_ADJ1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|---------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | IMGCNT_MTX_RB[10:0] | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | IMGCNT_MTX_RR[10:0] | | | | | | | | | | |
| Initial Value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | IMGCNT_MTX_RB[10:0] | 0 | R/W | Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | IMGCNT_MTX_RR[10:0] | 256 | R/W | Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

35.3 Usage Methods

35.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 35.29 External Input (BT656, 525i) Setting Example

| Register Name | Bit Name | Description | Setting Value |
|------------------|-------------------|--|---------------|
| INP_SEL_CNT | INP_SEL | Performs the on/off control of input supplied via the external input pins. | 1 |
| INP_SEL_CNT | INP_FORMAT[2:0] | Selects the externally input format. | 3 |
| INP_SEL_CNT | INP_PXD_EDGE | Selects the clock edge for capturing the externally input video signals. | 0 |
| INP_SEL_CNT | INP_VS_EDGE | Selects the clock edge for capturing the externally input Vsync signals. | 0 |
| INP_SEL_CNT | INP_HS_EDGE | Selects the clock edge for capturing the externally input Hsync signals. | 0 |
| INP_EXT_SYNC_CNT | INP_ENDIAN_ON | Changes the bit endian of the external input. | 0 |
| INP_EXT_SYNC_CNT | INP_SWAP_ON | Enables or disables the B/R signal swap of the external input. | 0 |
| INP_EXT_SYNC_CNT | INP_HS_INV | Enables or disables the Hsync signal inversion of the external input. | 1 |
| INP_EXT_SYNC_CNT | INP_VS_INV | Enables or disables the Hsync signal inversion of the external input. | 1 |
| INP_EXT_SYNC_CNT | INP_H_EDGE_SEL | Selects the Hsync reference for BT656 input. | 0 |
| INP_EXT_SYNC_CNT | INP_F525_625 | Sets the number of lines for BT656 input. | 0 |
| INP_EXT_SYNC_CNT | INP_H_POS[1:0] | Sets the data start timing with respect to the Hsync in the BT656/601 format. | 0 |
| INP_VSYNC_PH_ADJ | INP_FH50[11:0] | Sets the 1/2fH phase in clock cycle units. | 858 |
| INP_VSYNC_PH_ADJ | INP_FH25[11:0] | Sets the 1/4fH phase in clock cycle units. | 429 |
| INP_DLY_ADJ | INP_VS_DLY_L[2:0] | Sets the number of lines for delaying the Vsync signal and field differentiation signal. | 0 |
| INP_DLY_ADJ | INP_VS_DLY[7:0] | Sets the amount of delay of the Vsync signal in clock cycle units. | 0 |
| INP_DLY_ADJ | INP_HS_DLY[7:0] | Sets the amount of delay of the Hsync signal in clock cycle units. | 0 |
| INP_DLY_ADJ | INP_FLD_DLY[7:0] | Sets the amount of delay of the field differentiation signal in clock units. | 0 |

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 35.30 External Input (BT601, 525i) Setting Example

| Register Name | Bit Name | Description | Setting Value |
|------------------|-------------------|--|---------------|
| INP_SEL_CNT | INP_SEL | Performs the on/off control of input supplied via the external input pins. | 1 |
| INP_SEL_CNT | INP_FORMAT[2:0] | Selects the externally input format. | 4 |
| INP_SEL_CNT | INP_PXD_EDGE | Selects the clock edge for capturing the externally input video signals. | 0 |
| INP_SEL_CNT | INP_VS_EDGE | Selects the clock edge for capturing the externally input Vsync signals. | 0 |
| INP_SEL_CNT | INP_HS_EDGE | Selects the clock edge for capturing the externally input Hsync signals. | 0 |
| INP_EXT_SYNC_CNT | INP_ENDIAN_ON | Changes the bit endian of the external input. | 0 |
| INP_EXT_SYNC_CNT | INP_SWAP_ON | Enables or disables the B/R signal swap of the external input. | 0 |
| INP_EXT_SYNC_CNT | INP_HS_INV | Enables or disables the Hsync signal inversion of the external input. | 1 |
| INP_EXT_SYNC_CNT | INP_VS_INV | Enables or disables the Hsync signal inversion of the external input. | 1 |
| INP_EXT_SYNC_CNT | INP_H_EDGE_SEL | Selects the Hsync reference for BT656 input. | 0 |
| INP_EXT_SYNC_CNT | INP_F525_625 | Sets the number of lines for BT656 input. | 0 |
| INP_EXT_SYNC_CNT | INP_H_POS[1:0] | Sets the data start timing with respect to the Hsync in the BT656/601 format. | 0 |
| INP_VSYNC_PH_ADJ | INP_FH50[11:0] | Sets the 1/2fH phase in clock cycle units. | 858 |
| INP_VSYNC_PH_ADJ | INP_FH25[11:0] | Sets the 1/4fH phase in clock cycle units. | 429 |
| INP_DLY_ADJ | INP_VS_DLY_L[2:0] | Sets the number of lines for delaying the Vsync signal and field differentiation signal. | 0 |
| INP_DLY_ADJ | INP_VS_DLY[7:0] | Sets the amount of delay of the Vsync signal in clock cycle units. | 0 |
| INP_DLY_ADJ | INP_HS_DLY[7:0] | Sets the amount of delay of the Hsync signal in clock cycle units. | 0 |
| INP_DLY_ADJ | INP_FLD_DLY[7:0] | Sets the amount of delay of the field differentiation signal in clock units. | 0 |

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

35.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 35.31 Conversion Color Matrix

| Register Name | Bit Name | GBR to GBR | GBR to YCbCr | YCbCr to GBR | YCbCr to YCbCr |
|---------------------|---------------------|------------|--------------|--------------|----------------|
| IMGCNT_MTX_MODE | IMGCNT_MTX_MD[1:0] | 0 | 1 | 2 | 3 |
| IMGCNT_MTX_YG_ADJ0 | IMGCNT_MTX_YG[7:0] | 128 | 128 | 128 | 128 |
| IMGCNT_MTX_YG_ADJ0 | IMGCNT_MTX_GG[10:0] | 256 | 150 | 256 | 256 |
| IMGCNT_MTX_YG_ADJ1 | IMGCNT_MTX_GB[10:0] | 0 | 29 | 1960 | 0 |
| IMGCNT_MTX_YG_ADJ1 | IMGCNT_MTX_GR[10:0] | 0 | 77 | 1865 | 0 |
| IMGCNT_MTX_CBB_ADJ0 | IMGCNT_MTX_B[7:0] | 128 | 128 | 128 | 128 |
| IMGCNT_MTX_CBB_ADJ0 | IMGCNT_MTX_BG[10:0] | 0 | 1963 | 256 | 0 |
| IMGCNT_MTX_CBB_ADJ1 | IMGCNT_MTX_BB[10:0] | 256 | 128 | 454 | 256 |
| IMGCNT_MTX_CBB_ADJ1 | IMGCNT_MTX_BR[10:0] | 0 | 2005 | 0 | 0 |
| IMGCNT_MTX_CRR_ADJ0 | IMGCNT_MTX_R[7:0] | 128 | 128 | 128 | 128 |
| IMGCNT_MTX_CRR_ADJ0 | IMGCNT_MTX_RG[10:0] | 0 | 1941 | 256 | 0 |
| IMGCNT_MTX_CRR_ADJ1 | IMGCNT_MTX_RB[10:0] | 0 | 2027 | 0 | 0 |
| IMGCNT_MTX_CRR_ADJ1 | IMGCNT_MTX_RR[10:0] | 256 | 128 | 359 | 256 |

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

36. Video Display Controller 6 (3): Scaler

36.1 Scaler

36.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction, enlargement, and rotation of the images.

The scaler also records video image in the frame buffer.

In scaler 0, either enlargement process or graphics 0 process can be used.

The functional block diagram of scaler 0 is shown below.

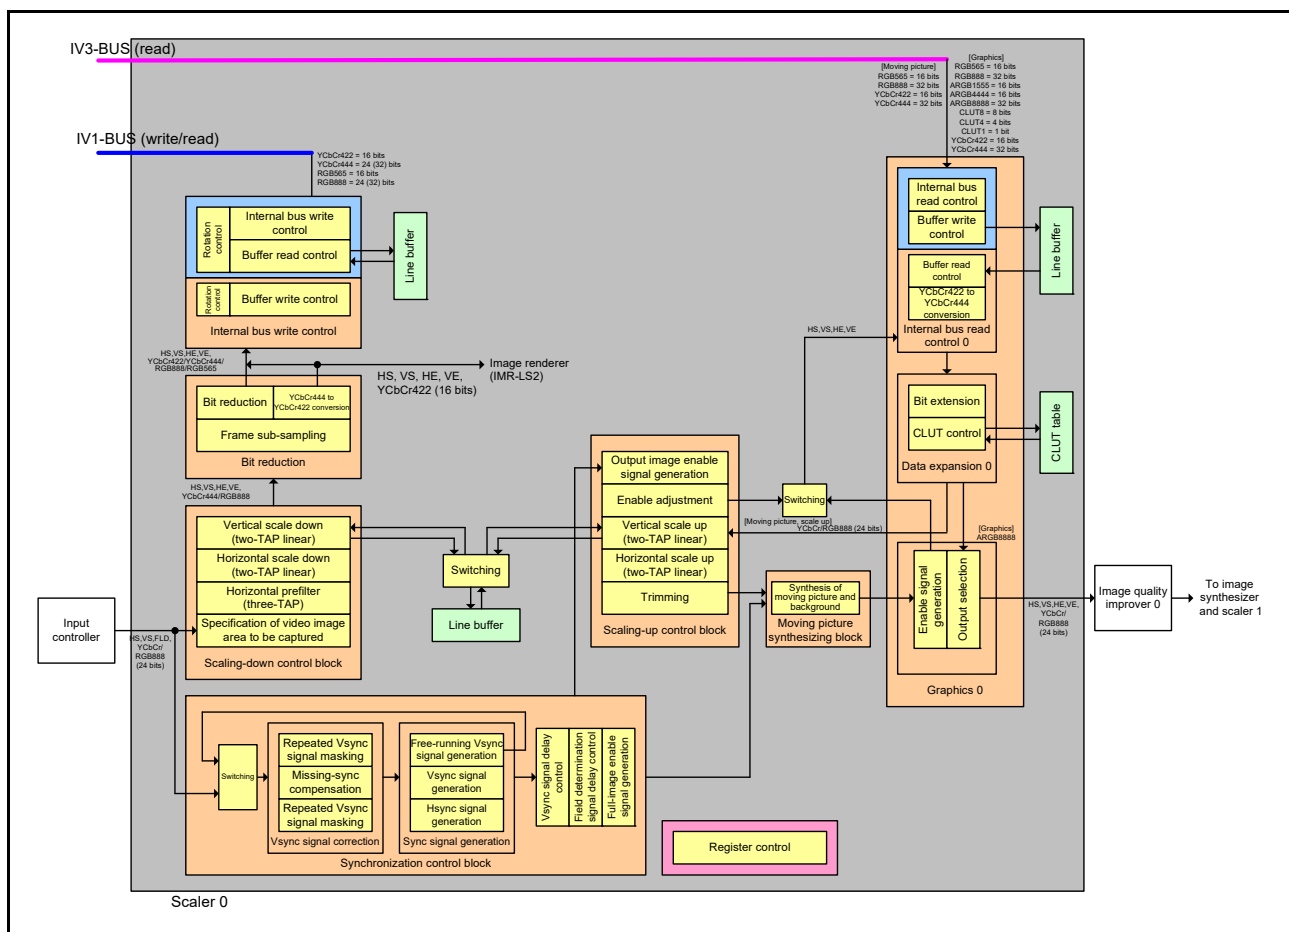

Figure 36.1 Functional Block Diagram of Scaler 0

The registers and bits in the scaler are named SC0_xxxx and those in the graphics blocks are named GR0_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

36.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 36.1 Register Update Control

| Register Name | Bit Name | Initial Value | Description |
|----------------|------------------|---------------|--|
| SC_SCL0_UPDATE | SC_SCL0_UPDATE | 0 | SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| SC_SCL0_UPDATE | SC_SCL0_VEN_D | 0 | Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| SC_SCL0_UPDATE | SC_SCL0_VEN_C | 0 | Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| SC_SCL0_UPDATE | SC_SCL0_VEN_B | 0 | Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| SC_SCL0_UPDATE | SC_SCL0_VEN_A | 0 | Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| SC_SCL1_UPDATE | SC_SCL1_UPDATE_B | 0 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| SC_SCL1_UPDATE | SC_SCL1_UPDATE_A | 0 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| SC_SCL1_UPDATE | SC_SCL1_VEN_B | 0 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| SC_SCL1_UPDATE | SC_SCL1_VEN_A | 0 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| GR_UPDATE | GR_UPDATE | 0 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| GR_UPDATE | GR_P_VEN | 0 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| GR_UPDATE | GR_IBUS_VEN | 0 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

36.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 36.2 Vsync Signal Selection Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|---------------|---------------|---|
| SC_SCL0_FRC3 | SC_RES_VS_SEL | 1 | Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal |

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

$$\text{Masking period [usec]} = \text{SC_RES_VMASK} \times 128 \div \text{pixel clock frequency [MHz]}$$

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

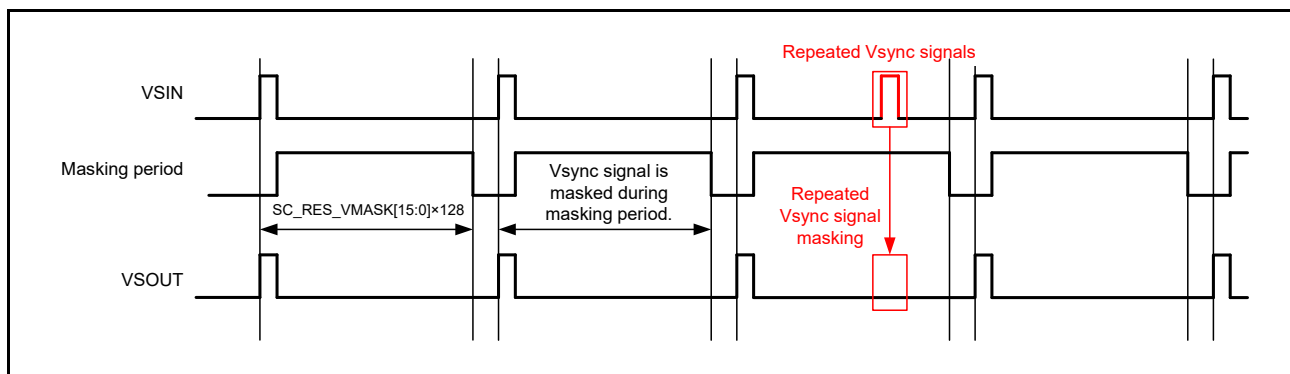

Figure 36.2 Timing for Masking Repeated Vsync Signals

Table 36.3 Repeated Vsync Signal Mask Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------|---------------|--|
| SC_SCL0_FRC1 | SC_RES_VMASK_ON | 1 | Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled. |
| SC_SCL0_FRC1 | SC_RES_VMASK[15:0] | 2800 | Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz] |

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

$$\text{Wait time [usec]} = \text{SC_RES_VLACK} \times 128 \div \text{pixel clock frequency [MHz]}$$

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

Figure 36.3 Compensation of Missing Vsync Signals

Table 36.4 Missing Vsync Compensation Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------|---------------|---|
| SC_SCL0_FRC2 | SC_RES_VLACK_ON | 1 | Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled. |
| SC_SCL0_FRC2 | SC_RES_VLACK[15:0] | 3600 | Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz] |
| SC_SCL0_FRC9 | SC_RES_QVLACK | — | Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected. |
| SC_SCL0_FRC9 | SC_RES_QVLOCK | — | Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected. |

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

Figure 36.4 Repeated-Vsync Masking and Missing-Vsync Compensation

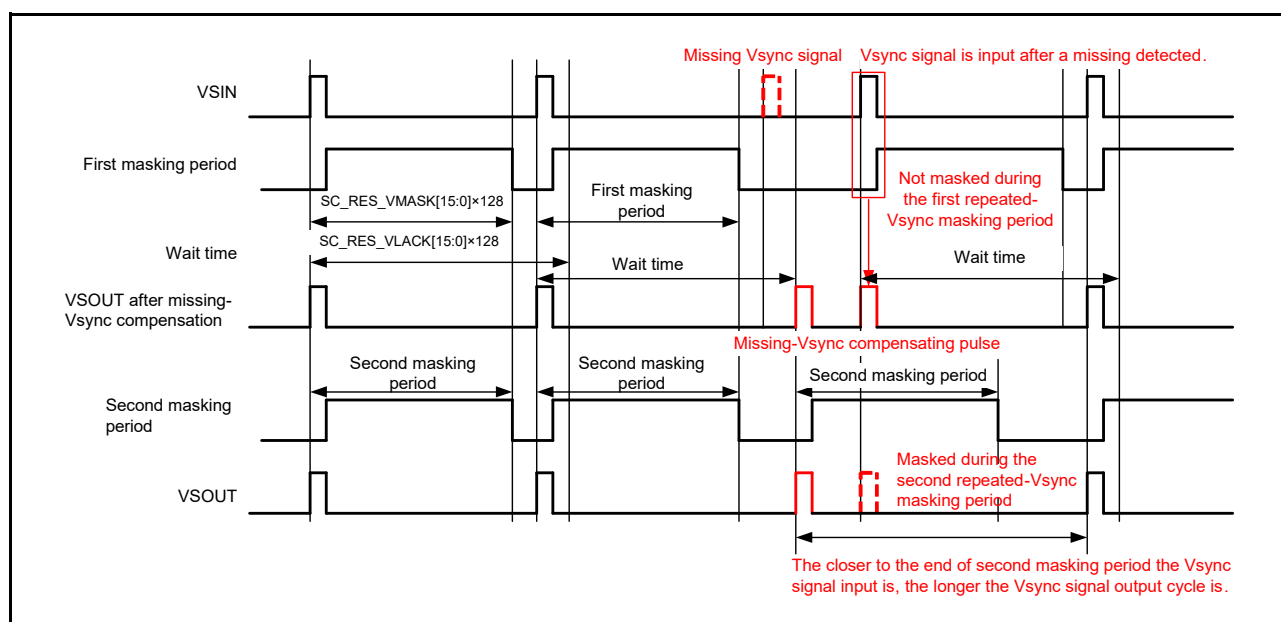

Figure 36.5 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

$$\text{Hsync period [usec]} = (\text{SC_RES_FH} + 1) \div \text{pixel clock frequency [MHz]}$$

$$\text{Vsync period [usec]} = \text{horizontal period [usec]} \times (\text{SC_RES_FV} + 1)$$

Table 36.5 Free-Running Period Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| SC_SCL0_FRC4 | SC_RES_FV[10:0] | 524 | Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec] |
| SC_SCL0_FRC4 | SC_RES_FH[10:0] | 799 | Hsync Period Setting Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz] |

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 36.6 Vsync Output Delay Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|--|
| SC_SCL0_FRC5 | SC_RES_VSDLY[7:0] | 1 | Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: $SC_RES_VSDLY \times \text{output Hsync period [usec]}$ |

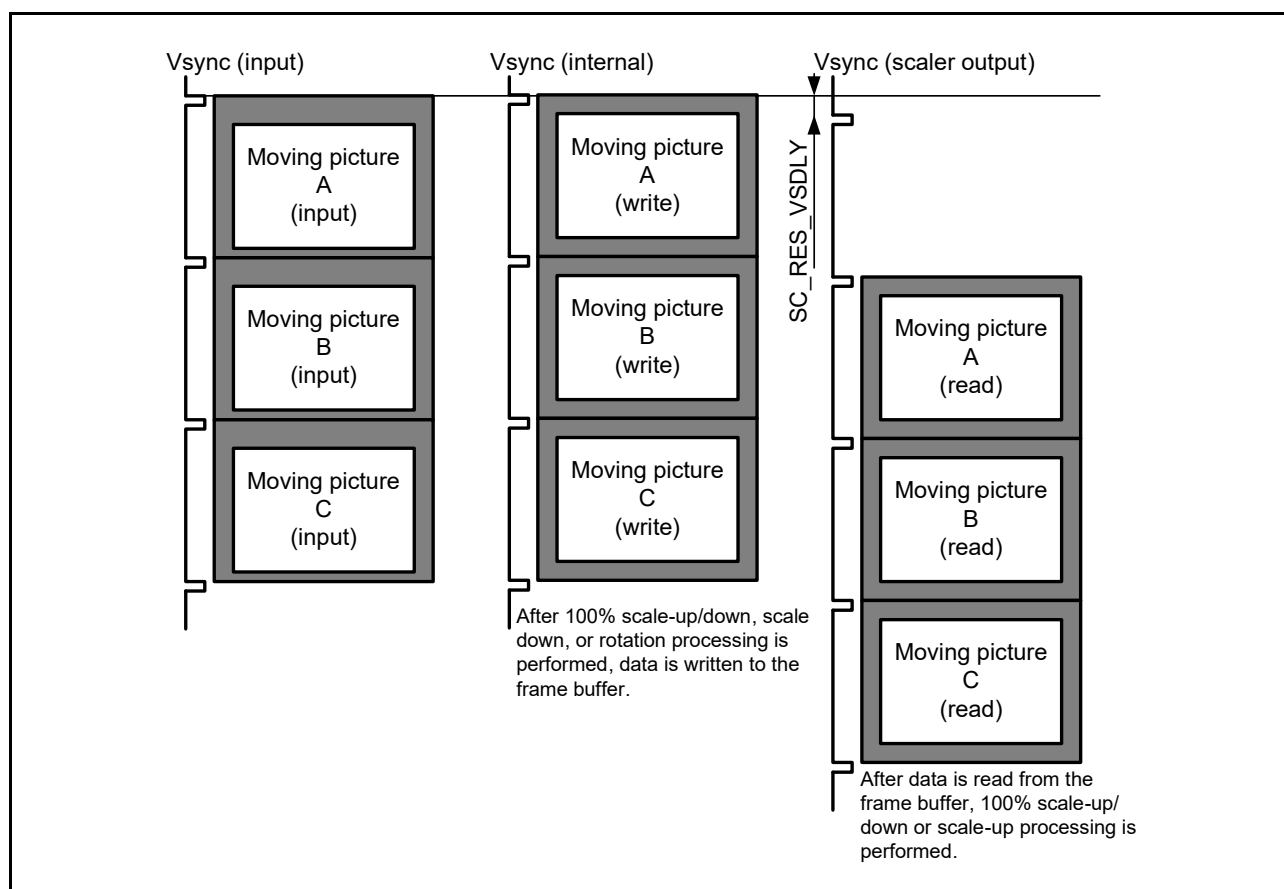

Figure 36.6 Vsync Signal Phases (Two Frame-Buffer Planes Used)

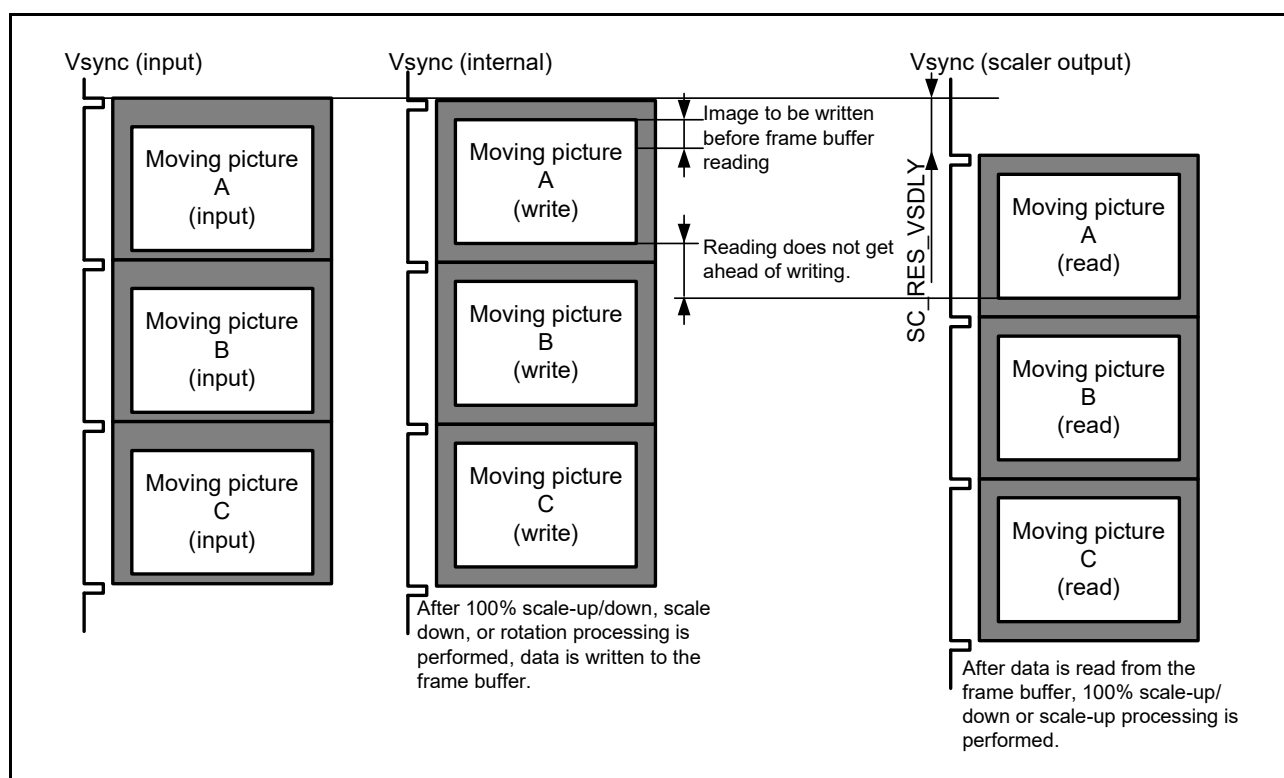

Figure 36.7 Vsync Signal Phases (One Frame-Buffer Plane Used)

36.1.4 Setting Angle of View

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 36.7 Control of Image Area to be Captured

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| SC_SCL0_DS2 | SC_RES_VS[10:0] | 18 | Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines). |
| SC_SCL0_DS2 | SC_RES_VW[10:0] | 240 | Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines). |
| SC_SCL0_DS3 | SC_RES_HS[10:0] | 244 | Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 4063 (clock cycles). |
| SC_SCL0_DS3 | SC_RES_HW[11:0] | 1440 | Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 4063 (clock cycles). |

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 36.8 Full-Screen Enable Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|---|
| SC_SCL0_FRC6 | SC_RES_F_VS[10:0] | 35 | Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines). |
| SC_SCL0_FRC6 | SC_RES_F_VW[10:0] | 480 | Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines). |
| SC_SCL0_FRC7 | SC_RES_F_HS[10:0] | 144 | Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). |
| SC_SCL0_FRC7 | SC_RES_F_HW[10:0] | 640 | Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal. |

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 36.9 Image Output Enable Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|---|
| SC_SCL0_US2 | SC_RES_P_VS[10:0] | 35 | Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines). |
| SC_SCL0_US2 | SC_RES_P_VW[10:0] | 480 | Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines). |
| SC_SCL0_US3 | SC_RES_P_HS[10:0] | 144 | Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles). |
| SC_SCL0_US3 | SC_RES_P_HW[10:0] | 640 | Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles). |

Figure 36.8 Enable Settings

36.1.5 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

When rotation is required, the scaling-down control block first scales down the image and then rotates it before writing it into the frame buffer.

The scaling-up control block reads the rotated image from the frame buffer and scales it up.

When the image input from the input controller has a vertical valid period greater than 1024 lines or a horizontal valid period greater than 1440 clock cycles, be sure to scale down the image so that the vertical valid period is no greater than 1024 lines and the horizontal valid period is no greater than 1440 clock cycles by using the scaling-down control block.

Table 36.10 Rotation and Scaling Process

| Rotation | Horizontal Scaling | Vertical Scaling | Scaling-Down Control Block | Scaling-Up Control Block |
|----------------------|---|---|---|---|
| Normal | Horizontal scale down | Vertical scale down | Horizontal scale down/ vertical scale down | Horizontal 100% scale up/ vertical 100% scale up |
| | Horizontal scale down | Vertical scale up | Horizontal scale down/ vertical 100% scale up | Horizontal 100% scale up/ vertical scale up |
| | Horizontal scale up | Vertical scale down | Horizontal 100% scale up/ vertical scale down | Horizontal scale up/ vertical 100% scale up |
| | Horizontal scale up | Vertical scale up | Horizontal 100% scale up/ vertical 100% scale up | Horizontal scale up/ vertical scale up |
| Horizontal mirroring | Horizontal scale down | Vertical scale down | Horizontal scale down/ vertical scale down | Horizontal 100% scale up/ vertical 100% scale up |
| | Horizontal scale down | Vertical scale up | Horizontal scale down/ vertical 100% scale up | Horizontal 100% scale up/ vertical scale-up |
| | Horizontal scale up | Vertical scale down | Horizontal 100% scale up/ vertical scale down | Horizontal scale up/ vertical 100% scale up |
| | Horizontal scale up | Vertical scale up | Horizontal 100% scale up/ vertical 100% scale up | Horizontal scale up/ vertical scale up |
| 90° rotation | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale down | Horizontal scale down/ vertical scale down | Horizontal 100% scale up/ vertical 100% scale up |
| | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale up | Horizontal scale down/ vertical 100% scale up | Horizontal scale up/ vertical 100% scale up |
| | (Horizontal input → vertical output) scale up | (Vertical input → horizontal output) scale up | Horizontal 100% scale up/ vertical 100% scale up | Horizontal scale up/ vertical scale up |
| 180° rotation | Horizontal scale down | Vertical scale down | Horizontal scale down/ vertical scale down | Horizontal 100% scale up/ vertical 100% scale up |
| | Horizontal scale down | Vertical scale up | Horizontal scale down/ vertical 100% scale up | Horizontal 100% scale up/ vertical scale up |
| | Horizontal scale up | Vertical scale down | Horizontal 100% scale up/ vertical scale down | Horizontal scale up/ vertical 100% scale up |
| | Horizontal scale up | Vertical scale up | Horizontal 100% scale up/ vertical 100% scale up | Horizontal scale up/ vertical scale up |

Table 36.10 Rotation and Scaling Process

| Rotation | Horizontal Scaling | Vertical Scaling | Scaling-Down Control Block | Scaling-Up Control Block |
|---------------|---|---|---|---|
| 270° rotation | (Horizontal input→vertical output) scale down | (Vertical input→horizontal output) scale down | Horizontal scale down/ vertical scale down | Horizontal 100% scale up/ vertical 100% scale up |
| | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale up | Horizontal scale down/ vertical 100% scale up | Horizontal scale up/ vertical 100% scale up |
| | (Horizontal input → vertical output) scale up | (Vertical input → horizontal output) scale up | Horizontal 100% scale up/ vertical 100% scale up | Horizontal scale up/ vertical scale up |

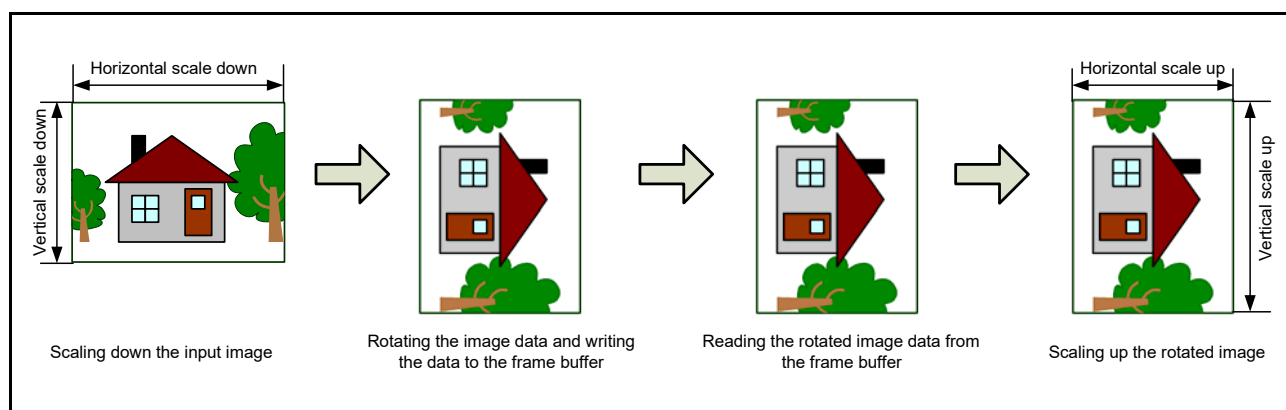

Figure 36.9 Rotation and Scaling Process

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive. Thus, the following scaling processes cannot be performed with 90° rotation or 270° rotation.

Table 36.11 Impossible Scaling Process

| Rotation | Horizontal Scaling | Vertical Scaling | Scaling-Down Control Block | Scaling-Up Control Block |
|---------------|--|---|--|--|
| 90° rotation | (Horizontal input → vertical output) scale up | (Vertical input → horizontal output) scale down | Horizontal 100% scale up/ vertical scale down | Horizontal 100% scale up/ vertical scale up |
| 270° rotation | | | | |

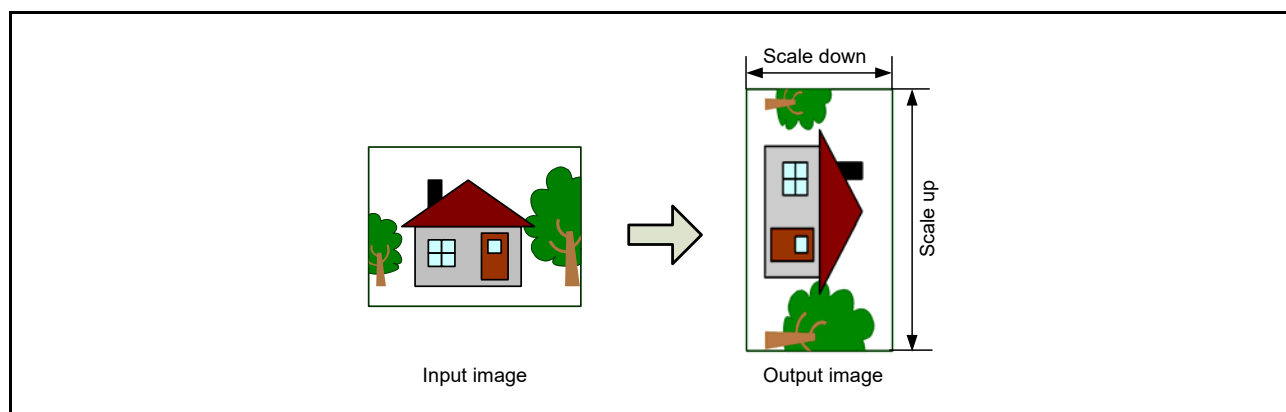

Figure 36.10 Impossible Scaling Process

36.1.6 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 36.12 Horizontal Prefilter Settings

| Input Format | SC_RES_PFIL_SEL | Operation |
|--------------|-----------------|---|
| YCbCr input | 1 | Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal. |
| | 0 | Turns off the horizontal prefilter. |
| RGB input | 1 | Turns on the horizontal prefilter for RGB signal. |
| | 0 | Turns off the horizontal prefilter. |

Table 36.13 Horizontal Prefilter Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| SC_SCL0_DS4 | SC_RES_PFIL_SEL | 0 | Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. ($1/4 + 1/2 + 1/4$) |

36.1.7 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

$$\text{SC_RES_DS_H_RATIO} = \text{round} (\text{SC_RES_HW} \div \text{SC_RES_OUT_HW} \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-down ratio SC_RES_DS_H_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_HW} \div \text{SC_RES_OUT_HW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_OUT_HW} - 1) - (\text{SC_RES_HW} - 1) \times 4096) \div (\text{SC_RES_OUT_HW} - 1)$$

$$\text{SC_RES_DS_H_RATIO} = \text{roundup} (\text{RATIO_org} - \sigma)$$

Table 36.14 Horizontal Scale Down Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------------|---------------|--|
| SC_SCL0_DS1 | SC_RES_DS_H_ON | 1 | Horizontal Scale Down On/Off 0: Off 1: On |
| SC_SCL0_DS7 | SC_RES_OUT_HW[10:0] | 640 | Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles) |
| SC_SCL0_DS4 | SC_RES_DS_H_INTERPOTYP | 1 | Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| SC_SCL0_DS4 | SC_RES_DS_H_RATIO[15:0] | 9224 | Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC_RES_HW} \div \text{SC_RES_OUT_HW} \times 4096)$ SC_RES_DS_H_RATIO < 4096: Setting prohibited SC_RES_DS_H_RATIO = 4096: 100% scale up SC_RES_DS_H_RATIO > 4096: Scale down |

Note: The SC_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

36.1.8 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

$$\text{SC_RES_V_RATIO} = \text{round} (\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$$

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-down ratio SC_RES_V_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_OUT_VW} - 1) - (\text{SC_RES_VW} - 1) \times 4096) \div (\text{SC_RES_OUT_VW} - 1)$$

$$\text{SC_RES_V_RATIO} = \text{round} (\text{RATIO_org} - \sigma)$$

Table 36.15 Vertical Scale Down Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------------|---------------|--|
| SC_SCL0_DS1 | SC_RES_DS_V_ON | 1 | Vertical Scale Down On/Off 0: Off 1: On |
| SC_SCL0_DS7 | SC_RES_OUT_VW [10:0] | 240 | Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration. |
| SC_SCL0_DS5 | SC_RES_V_INTERPOTYP | 1 | Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| SC_SCL0_DS6 | SC_RES_V_RATIO [15:0] | 2044 | Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$ For scale up: $\text{round}(\text{SC_RES_IN_VW} \div \text{SC_RES_P_VW} \times 4096)$ SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down |

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.

It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

36.1.9 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

$$\text{SC_RES_US_H_RATIO} = \text{round} (\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-up ratio SC_RES_US_H_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_P_HW} - 1) - (\text{SC_RES_IN_HW} - 1) \times 4096 \div (\text{SC_RES_P_HW} - 1))$$

$$\text{SC_RES_US_H_RATIO} = \text{round} (\text{RATIO_org} - \sigma)$$

Table 36.16 Horizontal Scale Up Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------------|---------------|--|
| SC_SCL0_US1 | SC_RES_US_H_ON | 1 | Horizontal Scale Up On/Off 0: Off 1: On |
| SC_SCL0_US4 | SC_RES_IN_HW[10:0] | 640 | Number of Valid Horizontal Pixels Input to Scaling-up Control Block (Pixel-clock cycles) |
| SC_SCL0_US6 | SC_RES_US_H_INTERPOTYP | 1 | Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| SC_SCL0_US5 | SC_RES_US_H_RATIO [15:0] | 9224 | Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$ SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited |

36.1.10 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

$$\text{SC_RES_V_RATIO} = \text{round}(\text{SC_RES_IN_VW} \div \text{SC_RES_P_VW} \times 4096)$$

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio $RATIO_org$ should be calculated first to find adjustment value σ , and then scale-up ratio $SC_RES_V_RATIO$ should be determined.

$$RATIO_org = \text{round} (SC_RES_IN_VW \div SC_RES_P_VW \times 4096)$$

$$\sigma = (RATIO_org \times (SC_RES_P_VW - 1) - (SC_RES_IN_VW - 1) \times 4096) \div (SC_RES_P_VW - 1)$$

$$SC_RES_V_RATIO = \text{round} (RATIO_org - \sigma)$$

Table 36.17 Vertical Scale Up Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------------------|---------------|--|
| SC_SCL0_US1 | SC_RES_US_V_ON | 1 | Vertical Scale Up On/Off 0: Off 1: On |
| SC_SCL0_US4 | SC_RES_IN_VW[10:0] | 240 | Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (Lines) |
| SC_SCL0_DS5 | SC_RES_V_INTERPOTYP | 1 | Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| SC_SCL0_DS6 | SC_RES_V_RATIO[15:0] | 2044 | Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(SC_RES_VW \div SC_RES_OUT_VW \times 4096)$ For scale up: $\text{round}(SC_RES_IN_VW \div SC_RES_P_VW \times 4096)$ $SC_RES_V_RATIO < 4096$: Scale up $SC_RES_V_RATIO = 4096$: 100% scale up $SC_RES_V_RATIO > 4096$: Scale down |

Note: $SC_RES_V_RATIO$ and $SC_RES_V_INTERPOTYP$ are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

36.1.11 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in Table 36.18.

Table 36.18 Initial Scaling Phase Settings (Standard Values) for IP Conversion

| Rotation | Horizontal Scaling | Vertical Scaling | Reference Bit (Setting) |
|----------------------|---|---|------------------------------|
| Normal | Horizontal scale down | Vertical scale down | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale down | Vertical scale up | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale up | Vertical scale down | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale up | Vertical scale up | SC_RES_TOP_INIPHASE = 2048 |
| Horizontal mirroring | Horizontal scale down | Vertical scale down | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale down | Vertical scale up | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale up | Vertical scale down | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale up | Vertical scale up | SC_RES_TOP_INIPHASE = 2048 |
| 90° rotation | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale down | SC_RES_TOP_INIPHASE = 2048 |
| | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale up | SC_RES_TOP_INIPHASE = 2048 |
| | (Horizontal input → vertical output) scale up | (Vertical input → horizontal output) scale up | SC_RES_US_HB_INIPHASE = 2048 |
| 180° rotation | Horizontal scale down | Vertical scale down | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale down | Vertical scale up | SC_RES_BTM_INIPHASE = 2048 |
| | Horizontal scale up | Vertical scale down | SC_RES_TOP_INIPHASE = 2048 |
| | Horizontal scale up | Vertical scale up | SC_RES_BTM_INIPHASE = 2048 |
| 270° rotation | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale down | SC_RES_TOP_INIPHASE = 2048 |
| | (Horizontal input → vertical output) scale down | (Vertical input → horizontal output) scale up | SC_RES_TOP_INIPHASE = 2048 |
| | (Horizontal input → vertical output) scale up | (Vertical input → horizontal output) scale up | SC_RES_US_HT_INIPHASE = 2048 |

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 36.19 Initial Scaling Phase Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------------------|---------------|---|
| SC_SCL0_DS5 | SC_RES_BTM_INIPHASE [11:0] | 0 | Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0) |
| SC_SCL0_DS5 | SC_RES_TOP_INIPHASE [11:0] | 2048 | Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0) |
| SC_SCL0_US6 | SC_RES_US_HB_INIPHASE [11:0] | 0 | Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0) |
| SC_SCL0_US6 | SC_RES_US_HT_INIPHASE [11:0] | 0 | Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0) |

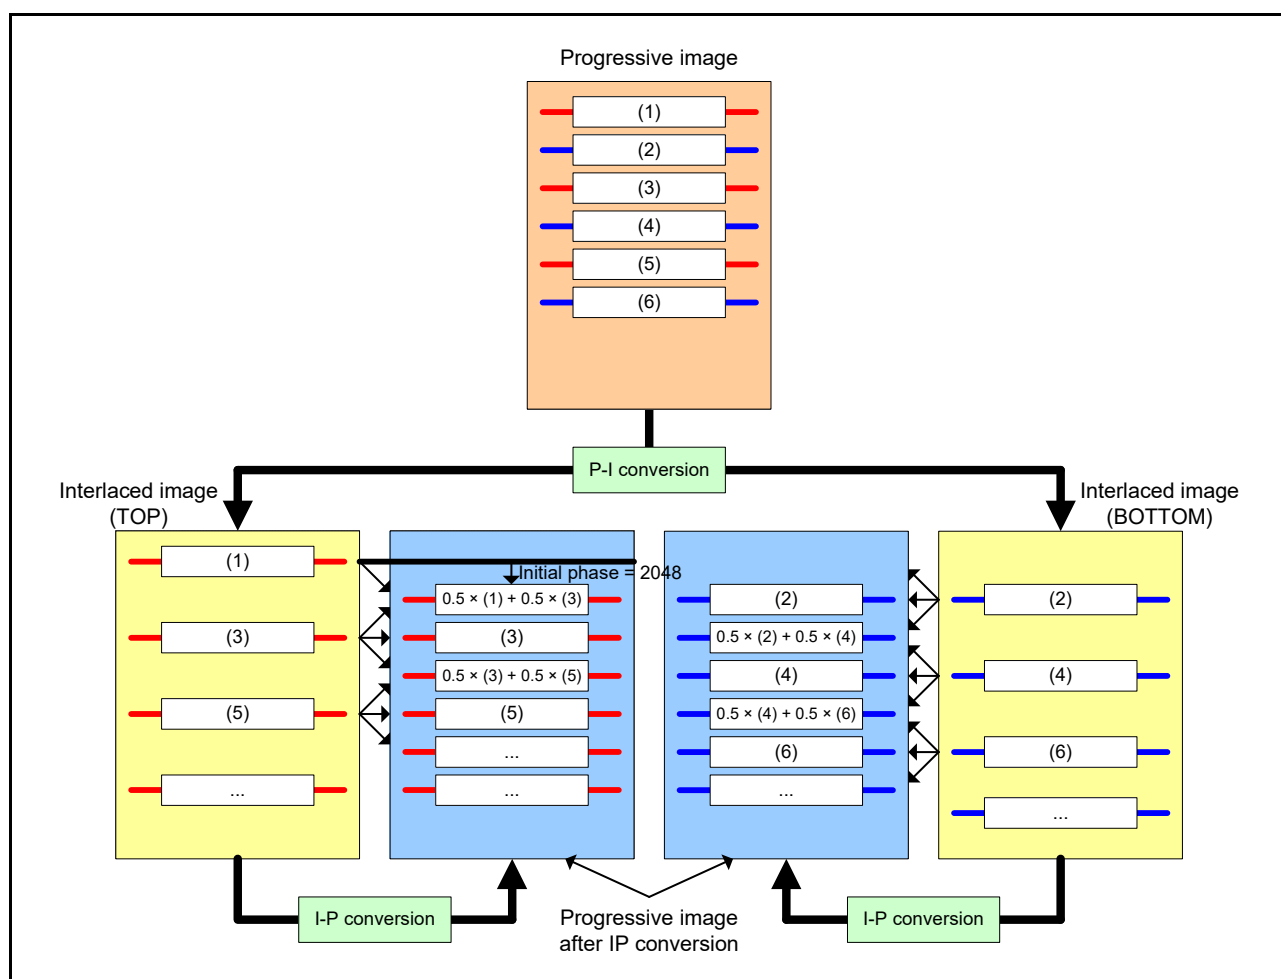

Figure 36.11 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 36.20 Settings for Field Determination Signal Control

| Input Signal | Rotation | Vertical Processing | Frame Buffer | SC_RES_FLD_DLY_SEL |
|--------------|---|---|--------------------|--------------------|
| Progressive | — | — | — | — |
| Interlace | Normal Horizontal mirroring 180° rotation | Vertical scale down | — | — |
| | | Vertical scale up | One plane or less | 0 |
| | | | Two planes or more | 1 |
| | 90° rotation 270° rotation | (Horizontal input → vertical output) scale down | — | — |
| | | (Horizontal input → vertical output) scale up | Two planes or more | 1 |

Table 36.21 Field Determination Signal Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------|---------------|---|
| SC_SCL0_FRC5 | SC_RES_FLD_DLY_SEL | 1 | Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle |

36.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 36.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------------|---------------|---|
| SC_SCL0_INT | SC_RES_LINE[10:0] | All 0 | Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output. However, setting this is prohibited in this product. |
| SC_SCL0_MON0 | SC_RES_LIN_STAT[10:0] | All 0 | Current Location of Image Line Input to Scaling-down Control Block |

36.1.13 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_V CUT and SC_RES_H CUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

Figure 36.12 Area Relationship for Trimming (Frame Lines Displayed)

Table 36.23 Trimming Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|--|
| SC_SCL0_US7 | SC_RES_H CUT[7:0] | 0 | Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles. |
| SC_SCL0_US7 | SC_RES_V CUT[7:0] | 0 | Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines. |
| SC_SCL0_US8 | SC_RES_DISP_ON | 0 | Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off |

36.1.14 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 36.24 Screen Synthesis Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------------|---------------|--|
| SC_SCL0_OVR1 | SC_RES_BK_COL_R [7:0] | 128 | Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB]) |
| SC_SCL0_OVR1 | SC_RES_BK_COL_B [7:0] | 128 | Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB]) |
| SC_SCL0_OVR1 | SC_RES_BK_COL_G [7:0] | 0 | Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB]) |

Figure 36.13 Area Relationship with Output Image Size Smaller than a Full Screen

36.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2×2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see section 39.1.7, Dither Process in section 39, Video Display Controller 6 (7): Output Controller.

Input YCbCr signals are converted into YCbCr422 signals and output to the image renderer. For distortion correction, refer to section 42, Image Renderer (IMR-LS2).

Table 36.25 Frame Buffer Writing Mode Setting

| RES_BITDEC_ON | SC_RES_MD[1:0] | Writing Mode |
|---------------|----------------|---|
| 0 | 3 | YCbCr444 (normal, horizontal mirroring) |
| 0 | 2 | RGB888 (normal, horizontal mirroring) |
| 1 | 1 | RGB565 (normal, horizontal mirroring, rotation) |
| * | 0 | YCbCr422 (normal, horizontal mirroring, rotation), YCbCr422 (image renderer) |

Table 36.26 Video Signal Writing Format Selection Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|--|
| SC_SCL1_WR1 | SC_RES_MD[1:0] | 0 | Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits) |
| SC_SCL1_WR6 | SC_RES_BITDEC_ON | 0 | Bit Reduction On/Off 0: Off 1: On |
| SC_SCL1_WR6 | SC_RES_DTH_ON | 0 | Dither Correction On/Off 0: Off (rounded off) 1: On (2×2 pattern dither) |

36.1.16 Horizontal Mirroring and Rotation

Horizontal mirroring and rotation can be carried out for scaled-down images before being written to the frame buffer.

Table 36.27 and Table 36.28 show the relationship between various writing modes for image processing and video signals.

Table 36.27 Relationship between Writing Modes and Video Signals

| RES_DS_WR_MD[2:0] | Writing Modes | YCbCr444 | YCbCr422 | RGB565 | RGB888 |
|-------------------|----------------------|----------|----------|---------|----------|
| 0 | Normal writing | Enabled | Enabled | Enabled | Enabled |
| 1 | Horizontal mirroring | Enabled | Enabled | Enabled | Enabled |
| 2 | 90° rotation | Disabled | Enabled | Enabled | Disabled |
| 3 | 180° rotation | Disabled | Enabled | Enabled | Disabled |
| 4 | 270° rotation | Disabled | Enabled | Enabled | Disabled |
| 5 to 7 | Setting prohibited | — | — | — | — |

Table 36.28 Horizontal Mirroring and Rotation Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------------|---------------|---|
| SC_SCL1_WR1 | SC_RES_DS_WR_MD [2:0] | 0 | Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited |

36.1.17 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 36.29 Frame Buffer Transfer Mode

| Register Name | Bit Name | Initial Value | Description |
|---------------|---------------|---------------|---|
| SC_SCL1_WR1 | SC_RES_BST_MD | 0 | Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte |

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 36.30 Frame Buffer Writing Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------|---------------|---|
| SC_SCL1_WR5 | SC_RES_WENB | 0 | Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled. |

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 36.31 Frame Buffer Write Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------------|---------------|--|
| SC_SCL1_WR5 | SC_RES_FS_RATE [1:0] | 0 | Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal |
| SC_SCL1_WR5 | SC_RES_FLD_SEL | 0 | Write Field Select 0: Top field 1: Bottom field |
| SC_SCL1_WR5 | SC_RES_INTER | 1 | Field Operating Mode Select 0: Progressive 1: Interlace |

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 36.32 Frame Buffer Write Address Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------------|---------------|---|
| SC_SCL1_WR1 | SC_RES_TB_ADD_MOD | 0 | Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data. |
| SC_SCL1_WR2 | SC_RES_BASE [31:0] | 0 | Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |
| SC_SCL1_WR8 | SC_RES_BASE_B [31:0] | 0 | Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |
| SC_SCL1_WR3 | SC_RES_LN_OFF [14:0] | 2048 | Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |
| SC_SCL1_WR9 | SC_RES_LN_OFF_B [14:0] | 2048 | Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B + SC_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |
| SC_SCL1_WR4 | SC_RES_FLM_OFF [22:0] | 524288 | Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |

Table 36.32 Frame Buffer Write Address Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------------|---------------|---|
| SC_SCL1_WR10 | SC_RES_FLM_OFF_B [22:0] | 524288 | <p>Frame Buffer Frame Offset Address for Bottom</p> <p>Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1.</p> <p>Buffer 0: SC_RES_BASE_B</p> <p>Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1</p> <p>⋮</p> <p>Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n</p> <p>For 32-byte transfer: The lower five bits should be fixed to 0_0000.</p> <p>For 128-byte transfer: The lower seven bits should be fixed to 000_0000.</p> |

Figure 36.14 Data Arrangement in Frame Buffer

Figure 36.15 Data Arrangement in Frame Buffer in Various Writing Modes

(5) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

For rotation, the SC_RES_FLM_NUM bits should be set to two or more frames.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 36.33 Frame Buffer Write Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------------|---------------|--|
| SC_SCL1_WR3 | SC_RES_FLM_NUM[9:0] | 1 | Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used. |
| SC_SCL1_WR9 | SC_RES_FLM_NUM_B[9:0] | 1 | Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used. |
| SC_SCL1_WR1 | SC_RES_LOOP | 0 | Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer) |
| SC_SCL1_WR7 | SC_RES_FLM_CNT[9:0] | — | Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0. |
| SC_SCL1_WR11 | SC_RES_FLM_CNT_B[9:0] | — | Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1. |

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 36.34 Buffer Overflow Detection

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| SC_SCL1_WR7 | SC_RES_OVERFLOW | — | Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed. |

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

36.1.18 Selecting a Scaling-up Process or Graphics 0 Process

Scaling-up process and graphics 0 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 36.35 Selection of Scaling-Up Process and Graphics 0 Process

| Type of Output Scaling Display | SC_RES_IBUS_SYNC_SEL | Sync Signals for Frame Buffer Read | Frame Buffer Read Size Setting Bits | Display Enabling Bits |
|---|----------------------|---|-------------------------------------|--|
| Input video signal display Enlarged graphics display | 0 | Output from scaling-up control block | SC_RES_IN_VW SC_RES_IN_HW | SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW |
| Graphics display | 1 | Output from graphics 0 processing block | GR_FLM_LNUM* GR_HW* | GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW |

Note: * The value set to the register + 1 is the actual read size.

Figure 36.16 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display

Figure 36.17 Area Setting for Graphics Display

Table 36.36 Scaling-Up Process or Graphics 0 Process Selection

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------------------|---------------|---|
| SC_SCL0_US8 | SC_RES_IBUS_SYNC_SEL | 0 | Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block |

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to section 38, Video Display Controller 6 (5): Image Synthesizer.

36.1.19 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 36.37 Field Specification for Frame Buffer Reading

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------|---------------|---|
| GR_FLM1 | GR_FLD_SEL | 0 | Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected. |
| GR_FLM3 | GR_FLD_NXT | 0 | Selects the top or bottom field for the next frame buffer. 0: Bottom 1: Top |

36.1.20 Pointer Buffer and Frame Buffer Reading Processing

(1) Pointer Buffers

The pointer buffers can be used to control the frame buffer for the input video image. They are mainly used to prevent flicker in the output video image, which occurs when the input and output vertical sync signals are asynchronous.

Four pointer buffers are provided and each pointer buffer has a start address register that shows the start location of the frame buffer and a field information register that shows the current field is the top or bottom field. The four pointer buffers are arranged in a ring structure and a write pointer is provided to indicate the pointer buffer corresponding to the location currently being written to. The location pointed to by the write pointer is being written to, and the corresponding pointer buffer value is undetermined. The value in the pointer buffer corresponding to the location being written to and the value in the write pointer are automatically updated when frame data writing is completed.

When the frame buffer address setting signal is linked with the pointer buffer ($GR_FLM_SEL = 3$), frame buffer reading can be controlled by using the read pointer that indicates the pointer buffer corresponding to the location being read; the start address and field information of the next frame buffer to be read should be read from the pointer buffer and they should be set in the frame buffer base address and field information. The read pointer value is automatically updated at the rising edge of the vertical sync signal on the reading side.

(2) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(3) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(A) When $(\text{write pointer value}) - (\text{read pointer value}) \leq 1$

The read pointer value is not updated (the same frame is displayed continuously).

(B) When $(\text{write pointer value}) - (\text{read pointer value}) = 2$

The read pointer is incremented by one with the next updating timing.

(C) When $(\text{write pointer value}) - (\text{read pointer value}) \geq 3$

The read pointer is incremented by two with the next updating timing.

(One frame is skipped.)

(4) Frame Buffer Read Control**(A) When SC_RES_WENB = 0**

Frame data is not written to the frame buffer, and the frame buffer is not read.

(B) When frame data writing is terminated with SC_RES_WENB = 1

As the pointer buffer value is determined, the frame buffer is read.

Table 36.38 Frame Buffer Control

| Register Name | Bit Name | Initial Value | Description |
|------------------|-------------|---------------|---|
| SC_SCL1_PBUF0 | SC_BUF0_ADD | 0 | Start address of the write buffer pointed to by pointer buffer 0 |
| SC_SCL1_PBUF1 | SC_BUF1_ADD | 0 | Start address of the write buffer pointed to by pointer buffer 1 |
| SC_SCL1_PBUF2 | SC_BUF2_ADD | 0 | Start address of the write buffer pointed to by pointer buffer 2 |
| SC_SCL1_PBUF3 | SC_BUF3_ADD | 0 | Start address of the write buffer pointed to by pointer buffer 3 |
| SC_SCL1_PBUF_FLD | SC_FLD_INF0 | 0 | Top or bottom field information pointed to by pointer buffer 0 0: Bottom 1: Top |
| SC_SCL1_PBUF_FLD | SC_FLD_INF1 | 0 | Top or bottom field information pointed to by pointer buffer 1 0: Bottom 1: Top |
| SC_SCL1_PBUF_FLD | SC_FLD_INF2 | 0 | Top or bottom field information pointed to by pointer buffer 2 0: Bottom 1: Top |
| SC_SCL1_PBUF_FLD | SC_FLD_INF3 | 0 | Top or bottom field information pointed to by pointer buffer 3 0: Bottom 1: Top |
| SC_SCL1_PBUF_CNT | SC_PBUF_RST | 0 | Reset Control for the Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset. |
| SC_SCL1_MON1 | SC_PBUF_NUM | 0 | Write pointer indicating the pointer buffer number corresponding to the location currently being written to. |
| SC_SCL1_WR5 | SC_RES_WENB | 0 | Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Writing is disabled. 1: Writing is enabled. |
| GR_FLM1 | GR_FLM_SEL | 0 | Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC_RES_TB_ADD_MOD = 1 in SC_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Links to distortion correction. 3: Links to pointer buffer. |
| GR_FLM2 | GR_BASE | 0 | Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000. |

For other frame buffer read operation and graphics processing, refer to **section 38, Video Display Controller 6 (5): Image Synthesizer**.

36.2 Register Descriptions

Table 36.39 shows the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|---|
| 31 to 16 | SC0_RES_VMASK [15:0] | 2800 | R/W | Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC0_RES_VMASK × 128 ÷ pixel clock frequency [MHz] |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_VMASK_ON | 1 | R/W | Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled. |

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2)

| | | | | | | | | | | | | | | | | |
|----------------|---------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SC0_RES_VLACK[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_VLACK_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 16 | SC0_RES_VLACK [15:0] | 3600 | R/W | Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK × 128 ÷ pixel clock frequency [MHz] |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_VLACK_ON | 1 | R/W | Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled. |

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.4 Output Sync Select Register (SC0_SCL0_FRC3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_VS_SEL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_VS_SEL | 1 | R/W | Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal |

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_FV[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_FH[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_FV [10:0] | 524 | R/W | Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV + 1) × horizontal period [usec] |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_FH [10:0] | 799 | R/W | Hsync Period Setting Hsync period [usec] = (SC0_RES_FH + 1) ÷ pixel clock frequency [MHz] |

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.6 Output Delay Control Register (SC0_SCL0_FRC5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|---------------------|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | SC0_RES_FLD_DLY_SEL | SC0_RES_VSDLY[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------------|---------------|-----|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | SC0_RES_FLD_DLY_SEL | 1 | R/W | Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle |
| 7 to 0 | SC0_RES_VSDLY[7:0] | 1 | R/W | Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY × output Hsync period [usec] |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_F_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_F_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_F_VS[10:0] | 35 | R/W | Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_F_VW[10:0] | 480 | R/W | Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines). |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_F_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_F_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_F_HS[10:0] | 144 | R/W | Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_F_HW[10:0] | 640 | R/W | Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal. |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.9 Vsync Detection Register (SC0_SCL0_FRC9)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----------------|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_QVLOCK | — | — | — | SC0_RES_QVLACK |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_RES_QVLOCK | 0 | R | Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_QVLACK | 0 | R | Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected. |

36.2.10 Status Monitor 0 Register (SC0_SCL0_MON0)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------------|---|---|---|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_LIN_STAT[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------|---------------|-----|--|
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_LIN_STAT[10:0] | All 0 | R | Current location of the image line input to the scaling-down control block. |

36.2.11 Interrupt Control Register (SC0_SCL0_INT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_LINE[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_LINE[10:0] | All 0 | R/W | Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE setting, an interrupt signal is output. However, setting this is prohibited in this product. |

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.12 Scaling-Down Control Register (SC0_SCL0_DS1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----------------|----|----|----|-----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_DS_V_ON | — | — | — | SC0_RES_DS_H_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_RES_DS_V_ON | 1 | R/W | Vertical Scale Down On/Off 0: Off 1: On |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_DS_H_ON | 1 | R/W | Horizontal Scale Down On/Off 0: Off 1: On |

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.13 Vertical Capture Size Register (SC0_SCL0_DS2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_VS [10:0] | 18 | R/W | Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_VW [10:0] | 240 | R/W | Vertical Width of Video Signal to be Captured (Lines) Note: SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines). |

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.14 Horizontal Capture Size Register (SC0_SCL0_DS3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|-----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial value: | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------------|---------------|-----|---|
| 31, 30 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 29 | SC0_RES_DS_H_INTERPOTYP | 0 | R/W | Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. ($1/4 + 1/2 + 1/4$) |
| 28 | SC0_RES_DS_H_RATIO[15:0] | 1 | R/W | Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| 27 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | SC0_RES_DS_H_RATIO[15:0] | 9224 | R/W | Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC0_RES_HW} \div \text{SC0_RES_OUT_HW} \times 4096)$ SC0_RES_DS_H_RATIO < 4096: Setting prohibited SC0_RES_DS_H_RATIO = 4096: 100% scale up SC0_RES_DS_H_RATIO > 4096: Scale down |

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----------------------|----------------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | SC0_RES_V_INTERPOTYP | SC0_RES_TOP_INIPHASE[11:0] | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | SC0_RES_BTM_INIPHASE[11:0] | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------------|---------------|-----|--|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | SC0_RES_V_INTERPOTYP | 1 | R/W | Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| 27 to 16 | SC0_RES_TOP_INIPHASE [11:0] | 2048 | R/W | Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0) |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 0 | SC0_RES_BTM_INIPHASE [11:0] | 0 | R/W | Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0) |

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

36.2.17 Vertical Scaling Register (SC0_SCL0_DS6)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_RES_V_RATIO[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | SC0_RES_V_RATIO [15:0] | 2044 | R/W | Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(\text{SC0_RES_VW} \div \text{SC0_RES_OUT_VW} \times 4096)$ For scale up: $\text{round}(\text{SC0_RES_IN_VW} \div \text{SC0_RES_P_VW} \times 4096)$ SC0_RES_V_RATIO < 4096: Scale up SC0_RES_V_RATIO = 4096: 100% scale up SC0_RES_V_RATIO > 4096: Scale down |

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

36.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_OUT_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_OUT_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_OUT_VW [10:0] | 240 | R/W | Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW value. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_OUT_HW [10:0] | 640 | R/W | Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW value. |

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

36.2.19 Scaling-Up Control Register (SC0_SCL0_US1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----------------|----|----|----|-----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_US_V_ON | — | — | — | SC0_RES_US_H_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_RES_US_V_ON | 1 | R/W | Vertical Scale Up On/Off 0: Off 1: On |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_US_H_ON | 1 | R/W | Horizontal Scale Up On/Off 0: Off 1: On |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.20 Output Image Vertical Size Register (SC0_SCL0_US2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_P_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_P_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_P_VS[10:0] | 35 | R/W | Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_P_VW[10:0] | 480 | R/W | Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines). |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_P_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_P_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_P_HS[10:0] | 144 | R/W | Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_P_HW[10:0] | 640 | R/W | Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles). |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|---------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | SC0_RES_IN_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SC0_RES_IN_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | SC0_RES_IN_VW[10:0] | 240 | R/W | Number of Valid Lines in Vertical Direction Input to Scaling-up Control Block (lines) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SC0_RES_IN_HW[10:0] | 640 | R/W | Number of Valid Horizontal Pixels Input to Scaling-up Control Block (pixel-clock cycles) |

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

36.2.23 Horizontal Scale Up Register (SC0_SCL0_US5)

| | | | | | | | | | | | | | | | | |
|----------------|--------------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | SC0_RES_US_H_RATIO[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | SC0_RES_US_H_RATIO[15:0] | 9224 | R/W | Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW ÷ SC0_RES_P_HW × 4096) SC0_RES_US_H_RATIO < 4096: Scale up SC0_RES_US_H_RATIO = 4096: 100% scale up SC0_RES_US_H_RATIO > 4096: Setting prohibited |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|-------------------------|------------------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | SC0_RES_US_H_INTERPOTYP | SC0_RES_US_HT_INIPHASE[11:0] | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | SC0_RES_US_HB_INIPHASE[11:0] | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------------|---------------|-----|--|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | SC0_RES_US_H_INTERPOTYP | 1 | R/W | Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation |
| 27 to 16 | SC0_RES_US_HT_INIPHASE[11:0] | 0 | R/W | Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0) |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 0 | SC0_RES_US_HB_INIPHASE[11:0] | 0 | R/W | Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0) |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.25 Trimming Register (SC0_SCL0_US7)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------|-----|-----|-----|-----|-----|-----|-----|-------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_RES_HCUT[7:0] | | | | | | | | SC0_RES_VCUT[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 8 | SC0_RES_HCUT[7:0] | 0 | R/W | Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles. |
| 7 to 0 | SC0_RES_VCUT[7:0] | 0 | R/W | Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines. |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----------------------|----|----|----|-----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_IBUS_SYNC_SEL | — | — | — | SC0_RES_DISP_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_RES_IBUS_SYNC_SEL | 0 | R/W | Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_DISP_ON | 0 | R/W | Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off |

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.
SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.27 Background Color Register (SC0_SCL0_OVR1)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------------|-----|-----|-----|-----|-----|-----|-----|-----------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | SC0_RES_BK_COL_R[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_RES_BK_COL_G[7:0] | | | | | | | | SC0_RES_BK_COL_B[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | SC0_RES_BK_COL_R[7:0] | 128 | R/W | Background Color Setting R/Cr Signal R:8 bits; unsigned (0 to 255 [LSB]) Cr:8 bits; 128 offset binary; unsigned (0 to 255 [LSB]) |
| 15 to 8 | SC0_RES_BK_COL_G[7:0] | 0 | R/W | Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB]) |
| 7 to 0 | SC0_RES_BK_COL_B[7:0] | 128 | R/W | Background Color Setting B/Cb Signal B:8 bits; unsigned (0 to 255 [LSB]) Cb:8 bits; 128 offset binary; unsigned (0 to 255 [LSB]) |

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

36.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-------------------|----|----|----|-------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_SCL1_UPDATE_B | — | — | — | SC0_SCL1_UPDATE_A |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/WC1 | R | R | R | R/WC1 |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_SCL1_VEN_B | — | — | — | SC0_SCL1_VEN_A |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/WC1 | R | R | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-------|--|
| 31 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 | SC0_SCL1_UPDATE_B | 0 | R/WC1 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| 19 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | SC0_SCL1_UPDATE_A | 0 | R/WC1 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| 15 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_SCL1_VEN_B | 0 | R/WC1 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_SCL1_VEN_A | 0 | R/WC1 | Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

36.2.29 Writing Mode Register (SC0_SCL1_WR1)

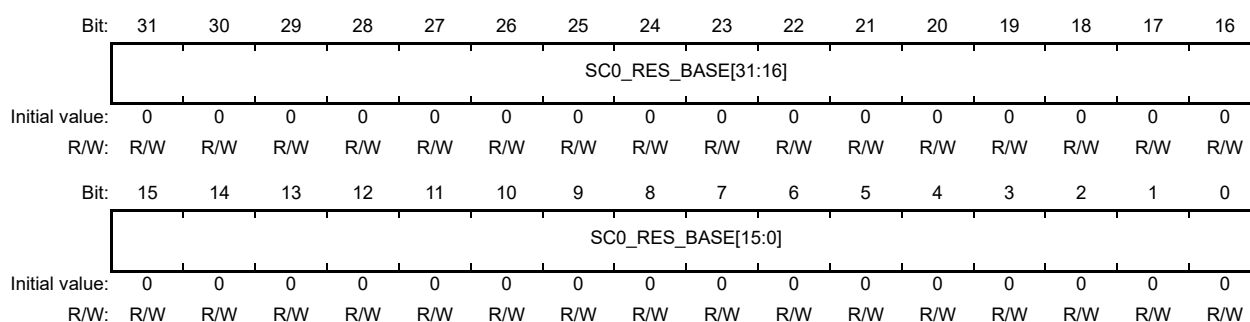

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|--------------------|-----------------------|-----|-----------------|--------------------|--------------|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_WRSWA[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | SC0_RES_TB_ADD_MOD | SC0_RES_DS_WR_MD[2:0] | | SC0_RES_MD[1:0] | | SC0_RES_LOOP | SC0_RES_BST_MD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 19 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 18 to 16 | SC0_RES_WRSWA[2:0] | All 0 | R/W | 8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped]. |
| 15 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 | SC0_RES_TB_ADD_MOD | 0 | R/W | Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data. |
| 6 to 4 | SC0_RES_DS_WR_MD[2:0] | 0 | R/W | Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|---------------------|---------------|-----|--|
| 3, 2 | SC0_RES_MD [1:0] | 0 | R/W | Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits) |
| 1 | SC0_RES_LOOP | 0 | R/W | Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer) |
| 0 | SC0_RES_BST_MD | 0 | R/W | Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte |

Note: SC0_RES_LOOP and SC0_RES_BST_MD are updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
 SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD, and SC0_RES_MD are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.
 SC0_RES_WRSWA is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.30 Write Address Register 1T (SC0_SCL1_WR2)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------------------|---------------|-----|--|
| 31 to 0 | SC0_RES_BASE [31:0] | 0 | R/W | Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000. |

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.31 Write Address Register 2T (SC0_SCL1_WR3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----------------------|-----|-----|-----|-----|----------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | SC0_RES_LN_OFF[14:0] | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | SC0_RES_FLM_NUM[9:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------------|---------------|-----|---|
| 31 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 16 | SC0_RES_LN_OFF [14:0] | 2048 | R/W | Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE Line 1: SC0_RES_BASE + SC0_RES_LN_OFF × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | SC0_RES_FLM_NUM [9:0] | 1 | R/W | Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM + 1 are used. |

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.32 Write Address Register 3T (SC0_SCL1_WR4)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------------|-----|-----|-----|-----|-----|-----|-----|-----|------------------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | SC0_RES_FLM_OFF[22:16] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_RES_FLM_OFF[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------|---------------|-----|--|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 0 | SC0_RES_FLM_OFF [22:0] | 524288 | R/W | Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE Buffer 1: SC0_RES_BASE + SC0_RES_FLM_OFF × 1 : Buffer n: SC0_RES_BASE + SC0_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000. |

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|---------------|----|----|----------------------|-----|----|----|-----------------|-----|----|----|--------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | SC0_RES_INTER | — | — | SC0_RES_FS_RATE[1:0] | — | — | — | SC0_RES_FLD_SEL | — | — | — | SC0_RES_WENB | — |
| Initial value: | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R/W | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|---|
| 31 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 | SC0_RES_INTER | 1 | R/W | Field Operating Mode Select 0: Progressive 1: Interlace |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | SC0_RES_FS_RATE[1:0] | 0 | R/W | Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_RES_FLD_SEL | 0 | R/W | Write Field Select 0: Top field 1: Bottom field |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_WENB | 0 | R/W | Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled. |

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

36.2.34 Bit Reduction Register (SC0_SCL1_WR6)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----------------|----|----|----|-------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_DTH_ON | — | — | — | SC0_RES_BITDEC_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | SC0_RES_DTH_ON | 0 | R/W | Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern) |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_RES_BITDEC_ON | 0 | R/W | Bit Reduction On/Off 0: Off 1: On |

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.35 Write Detection Register (SC0_SCL1_WR7)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----------------------|----|----|----|----|----|----|----|----|------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SC0_RES_OVERFLOW |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | SC0_RES_FLM_CNT[9:0] | | | | | | | | | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|---|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | SC0_RES_OVERFLOW | 0 | R | Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | SC0_RES_FLM_CNT[9:0] | 0 | R | Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. |

36.2.36 Write Address Register 1B (SC0_SCL1_WR8)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SC0_RES_BASE_B[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_RES_BASE_B[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------------|---------------|-----|---|
| 31 to 0 | SC0_RES_BASE_B[31:0] | 0 | R/W | Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.37 Write Address Register 2B (SC0_SCL1_WR9)

| | | | | | | | | | | | | | | | | |
|----------------|----|------------------------|-----|-----|-----|-----|------------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | SC0_RES_LN_OFF_B[14:0] | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | SC0_RES_FLM_NUM_B[9:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------|---------------|-----|--|
| 31 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 16 | SC0_RES_LN_OFF_B[14:0] | 2048 | R/W | Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B Line 1: SC0_RES_BASE_B + SC0_RES_LN_OFF_B × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | SC0_RES_FLM_NUM_B[9:0] | 1 | R/W | Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. |

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.38 Write Address Register 3B (SC0_SCL1_WR10)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------------|-----|-----|-----|-----|-----|-----|-----|-----|--------------------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | SC0_RES_FLM_OFF_B[22:16] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_RES_FLM_OFF_B[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------------|---------------|-----|---|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 0 | SC0_RES_FLM_OFF_B[22:0] | 524288 | R/W | Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Buffer 0: SC0_RES_BASE_B Buffer 1: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × 1 : Buffer n: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000. |

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.39 Write Detection Register B (SC0_SCL1_WR11)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|------------------------|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | SC0_RES_FLM_CNT_B[9:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------|---------------|-----|--|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | SC0_RES_FLM_CNT_B[9:0] | 0 | R | Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. |

36.2.40 Status Monitor 1 Register (SC0_SCL1_MON1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-------------------|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | SC0_PBUF_NUM[1:0] | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | SC0_PBUF_NUM[1:0] | All 0 | R | Write pointer indicating the pointer buffer number corresponding to the location currently being written to. |
| 7 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

36.2.41 Pointer Buffer 0 Register (SC0_SCL1_PBUF0)

| | | | | | | | | | | | | | | | | |
|----------------|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SC0_PBUF0_ADD[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_PBUF0_ADD[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------------|---------------|-----|---|
| 31 to 0 | SC0_PBUF0_ADD[31:0] | All 0 | R | Start address of the write buffer pointed to by pointer buffer 0. |

36.2.42 Pointer Buffer 1 Register (SC0_SCL1_PBUF1)

| | | | | | | | | | | | | | | | | |
|----------------|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SC0_PBUF1_ADD[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_PBUF1_ADD[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------------|---------------|-----|---|
| 31 to 0 | SC0_PBUF1_ADD[31:0] | All 0 | R | Start address of the write buffer pointed to by pointer buffer 1. |

36.2.43 Pointer Buffer 2 Register (SC0_SCL1_PBUF2)

| | | | | | | | | | | | | | | | | |
|----------------|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SC0_PBUF2_ADD[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | SC0_PBUF2_ADD[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------------|---------------|-----|---|
| 31 to 0 | SC0_PBUF2_ADD[31:0] | All 0 | R | Start address of the write buffer pointed to by pointer buffer 2. |

36.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3)

| | | | | | | | | | | | | | | | | |
|----------------|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SC0_PBUF3_ADD[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SC0_PBUF3_ADD[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------------|---------------|-----|---|
| 31 to 0 | SC0_PBUF3_ADD[31:0] | All 0 | R | Start address of the write buffer pointed to by pointer buffer 3. |

36.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|--------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | SC0_FLD_INF3 | — | — | — | — | — | — | — | SC0_FLD_INF2 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | SC0_FLD_INF1 | — | — | — | — | — | — | — | SC0_FLD_INF0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|--|
| 31 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | SC0_FLD_INF3 | 0 | R | Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Bottom 1: Top |
| 23 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | SC0_FLD_INF2 | 0 | R | Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Bottom 1: Top |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | SC0_FLD_INF1 | 0 | R | Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Bottom 1: Top |
| 7 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SC0_FLD_INF0 | 0 | R | Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Bottom 1: Top |

36.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SC0_PBUF_RST |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | SC0_PBUF_RST | 0 | R/W | Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset. |
| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

Note: This register is updated when the SC0_SCL1_UPDATE_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

36.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|------------|----|----|----|-----------|----|----|----|--------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | GR0_UPDATE | — | — | — | GR0_P_VEN | — | — | — | GR0_IBUS_VEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/WC1 | R | R | R | R/WC1 | R | R | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-------|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | GR0_UPDATE | 0 | R/WC1 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR0_P_VEN | 0 | R/WC1 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR0_IBUS_VEN | 0 | R/WC1 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

36.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR0_R_ENB |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR0_R_ENB | 0 | R/W | Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled. |

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|----|----|----|----|----|------------------|-----|----|----|----|-----------------|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_FLD_SEL | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR0_LN_OFF_DIR |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | GR0_FLM_SEL[1:0] | — | — | — | — | GR0_IMR_FLM_INV | — | — | — | GR0_BST_MD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|---|
| 31 | GR0_FLD_SEL | 0 | R/W | Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected. |
| 30 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | GR0_LN_OFF_DIR | 0 | R/W | Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | GR0_FLM_SEL [1:0] | 0 | R/W | Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Links to distortion correction. 2: Links to distortion correction. 3: Links to pointer buffer. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR0_IMR_FLM_INV | 0 | R/W | Sets the frame buffer number for distortion correction. 0: Does not replace the numbers of the frames to be read. 1: Replaces the numbers of the frames to be read. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR0_BST_MD | 0 | R/W | Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128-byte transfer |

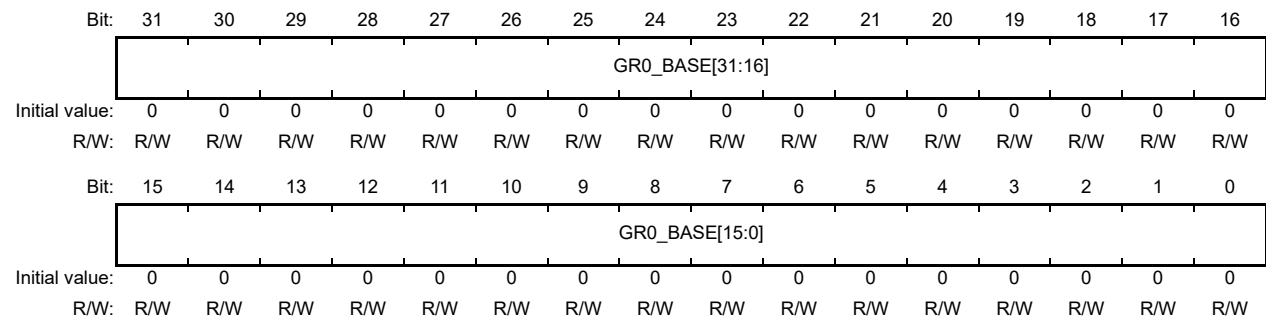

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_LN_OFF_DIR and GR0_IMR_FLM_INV are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FLM_SEL is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

GR0_BST_MD is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

36.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|--|
| 31 to 0 | GR0_BASE [31:0] | 0 | R/W | Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR0_BASE[4:3] and GR0_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000. |

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

36.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|-----|------------------|-----|-----|-----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_FLD_NXT | | GR0_LN_OFF[14:0] | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | | | | | | GR0_FLM_NUM[9:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 | GR0_FLD_NXT | 0 | R/W | Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top |
| 30 to 16 | GR0_LN_OFF[14:0] | 2048 | R/W | Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE Line 1: GR0_BASE + GR0_LN_OFF × 1 : Line n: GR0_BASE + GR0_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | GR0_FLM_NUM[9:0] | 1 | R/W | Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL = 1. |

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|--------------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | GR0_FLM_OFF[22:16] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR0_FLM_OFF[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|---|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 0 | GR0_FLM_OFF[22:0] | 524288 | R/W | Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE Buffer 1: GR0_BASE + GR0_FLM_OFF × 1 : Buffer n: GR0_BASE + GR0_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000. |

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR0_FLM_LNUM[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR0_FLM_LOOP[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR0_FLM_LNUM[10:0] | 0 | R/W | Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM + 1). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR0_FLM_LOOP[10:0] | 1023 | R/W | Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP + 1) lines are read. |

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------|-----|-----|----------------|-----|--------------|-----|------------------------------|-----|-----|------------------|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_FORMAT[3:0] | | | | — | GR0_HW[10:0] | | | | | | | | | | |
| Initial value: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR0_YCC_SWAP[2:0] | | | GR0_RDSWA[2:0] | | | — | GR0_CNV44 4 ^{MD} | — | — | GR0_STA_POS[5:0] | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|---|
| 31 to 28 | GR0_FORMAT[3:0] | 8 | R/W | Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited |
| 27 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 26 to 16 | GR0_HW[10:0] | 0 | R/W | Sets the width of the horizontal valid period. The width is (GR0_HW + 1) pixels. Note: The set value should be equal to or more than two. |
| 15 to 13 | GR0_YCC_SWAP[2:0] | 0 | R/W | Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------|---------------|-----|---|
| 12 to 10 | GR0_ RDSWA [2:0] | 0 | R/W | <p>8-Bit, 16-Bit, or 32-Bit Swap Setting</p> <p>These bits control swapping in frame buffer reading as follows.</p> <p>Bit 0</p> <p>0: Swapped in 8-bit units. 1: Not swapped in 8-bit units.</p> <p>Bit 1</p> <p>0: Swapped in 16-bit units. 1: Not swapped in 16-bit units.</p> <p>Bit 2</p> <p>0: Swapped in 32-bit units. 1: Not swapped in 32-bit units.</p> <p>According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data.</p> <p>000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped]</p> <p>001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units]</p> <p>010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units]</p> <p>011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units]</p> <p>100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units]</p> <p>101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units]</p> <p>110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units]</p> <p>111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]</p> |
| 9 | — | 0 | R | <p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p> |
| 8 | GR0_ CNV444_ MD | 0 | R/W | <p>Sets the interpolation mode for YCbCr422 to YCbCr444 conversion.</p> <p>0: Hold interpolation 1: Average interpolation</p> |
| 7, 6 | — | All 0 | R | <p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p> |
| 5 to 0 | GR0_STA_ POS[5:0] | 0 | R/W | <p>Sets the amount of data to be skipped through.</p> <p>Specifically data amount equal to the amount indicated by GR0_STA_POS is skipped from the start of the line.</p> |

Note: GR0_YCC_SWAP, GR0_CNV444, and GR0_STA_POS are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
 GR0_RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
 GR0_FORMAT and GR0_HW are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

36.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----------------|----|----|-------------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | GR0_GRC_DISP_ON | — | — | GR0_DISP_SEL[1:0] | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR0_GRC_DISP_ON | 0 | R/W | Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | GR0_DISP_SEL[1:0] | 0 | R/W | Selects the graphics display mode. 0: Background color display (GR0_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255. |

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR0_GRC_VS[10:0] | 0 | R/W | Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR0_GRC_VS + GR0_GRC_VW should be equal to or less than 2039 (lines). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR0_GRC_VW[10:0] | 0 | R/W | Vertical Width of Graphics Image Area. |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.57 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR0_GRC_HS[10:0] | 0 | R/W | Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR0_GRC_HS + GR0_GRC_HW should be equal to or less than 2015 (clock cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR0_GRC_HW[10:0] | 0 | R/W | Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR0_HW to 2 and GR0_GRC_HW to 1 (1 pixel) or 2 (2 pixels). |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.58 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR0_CK_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR0_CK_ON | 0 | R/W | CLUT-Index/RGB-Index Chroma-Key Processing On/Off 0: Off 1: On |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.59 Alpha Blending Control Register 8 (Graphics 0) (GR0_AB8)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------|-----|-----|-----|-----|-----|-----|-----|----------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_CK_KCLUT[7:0] | | | | | | | | GR0_CK_KG[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR0_CK_KB[7:0] | | | | | | | | GR0_CK_KR[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 24 | GR0_CK_KCLUT[7:0] | 0 | R/W | CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB]) |
| 23 to 16 | GR0_CK_KG[7:0] | 0 | R/W | G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR0_CK_KB[7:0] | 0 | R/W | B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR0_CK_KR[7:0] | 0 | R/W | R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.60 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9)

| | | | | | | | | | | | | | | | | |
|----------------|---------------|-----|-----|-----|-----|-----|-----|-----|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_CK_A[7:0] | | | | | | | | GR0_CK_G[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR0_CK_B[7:0] | | | | | | | | GR0_CK_R[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 24 | GR0_CK_A [7:0] | 0 | R/W | Replaced Alpha Signal after RGB-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only. |
| 23 to 16 | GR0_CK_G [7:0] | 0 | R/W | Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR0_CK_B [7:0] | 0 | R/W | Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR0_CK_R [7:0] | 0 | R/W | Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.61 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_A0[7:0] | | | | | | | | GR0_G0[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR0_B0[7:0] | | | | | | | | GR0_R0[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|---|
| 31 to 24 | GR0_A0 [7:0] | 0 | R/W | CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555/RGB α 5551 format and α = 0. Note: These bits should always be set to 255 to display the current graphics only. |
| 23 to 16 | GR0_G0 [7:0] | 0 | R/W | CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0. |
| 15 to 8 | GR0_B0 [7:0] | 0 | R/W | CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0. |
| 7 to 0 | GR0_R0 [7:0] | 0 | R/W | CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0. |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.62 Alpha Blending Control Register 11 (Graphics 0) (GR0_AB11)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR0_A1[7:0] | | | | | | | | GR0_G1[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR0_B1[7:0] | | | | | | | | GR0_R1[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|---|
| 31 to 24 | GR0_A1 [7:0] | 0 | R/W | CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555/RGB α 5551 format and α = 1. Note: These bits should always be set to 255 to display the current graphics only. |
| 23 to 16 | GR0_G1 [7:0] | 0 | R/W | CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1. |
| 15 to 8 | GR0_B1 [7:0] | 0 | R/W | CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1. |
| 7 to 0 | GR0_R1 [7:0] | 0 | R/W | CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1. |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.2.63 Background Color Control Register (Graphics 0) (GR0_BASE)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|-----|-----|-----|-----|-----|-----------------|-----|-----|-----|-----|-----|-----|-----|

Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0. |
| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

36.3 Usage Method

36.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 36.40.

Here, the over-scan rate is assumed to be 100%.

Table 36.40 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output

| Input Signal | Output Signal | Signal Format | Rotation | Buffer Planes | Scaling Filter |
|--------------|---------------|---------------|----------|---------------|----------------|
| 1440 × 240 | 640 × 480 | YCbCr | Normal | Two planes | 2-tap linear |

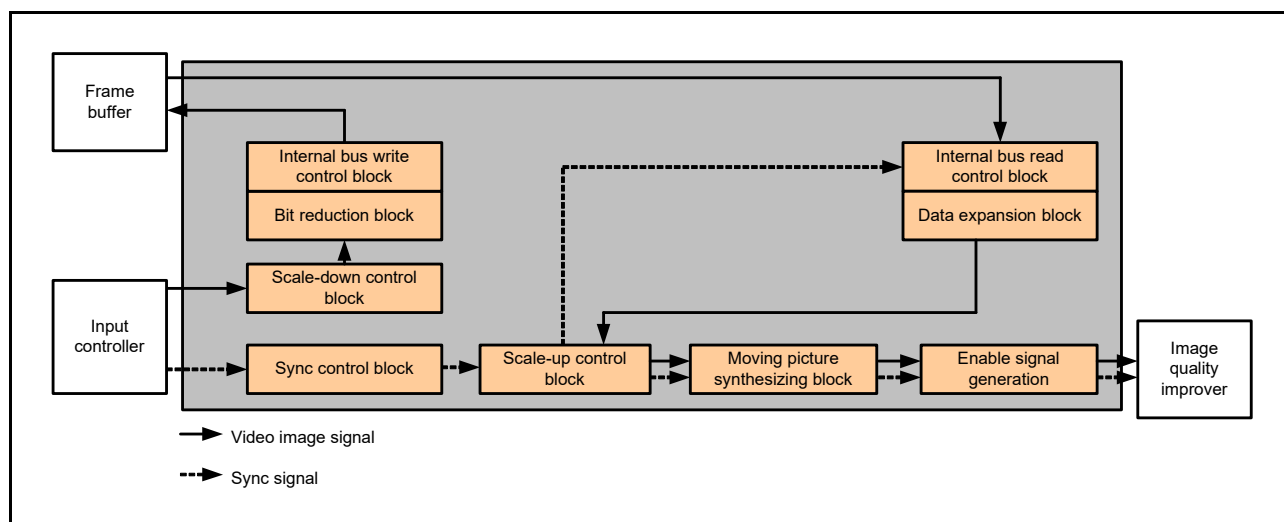

Figure 36.18 Signal Paths for Displaying Input Video Image

(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(1440 \div 640 \times 4096) = 9216$$

$$\sigma = (9216 \times (640 - 1) - (1440 - 1) \times 4096) \div (640 - 1) = -8.01$$

$$\text{Horizontal scaling ratio} = \text{roundup}(9216 - (-8.01)) = 9225$$

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(240 \div 480 \times 4096) = 2048$$

$$\sigma = (2048 \times (480 - 1) - (240 - 1) \times 4096) \div (480 - 1) = 4.27$$

$$\text{Vertical scaling ratio} = \text{round}(2048 - (4.07)) = 2044$$

(4) Setting Frame Buffer Access Area

Since video data is written to the frame buffer after scaled down, the write size is 640×240 pixels.

The frame buffer area required is 640 pixels or more for line offset and line offset $\times 240$ pixels or more for frame offset.

Here, the frame buffer work area is assumed to be 1024×256 pixels.

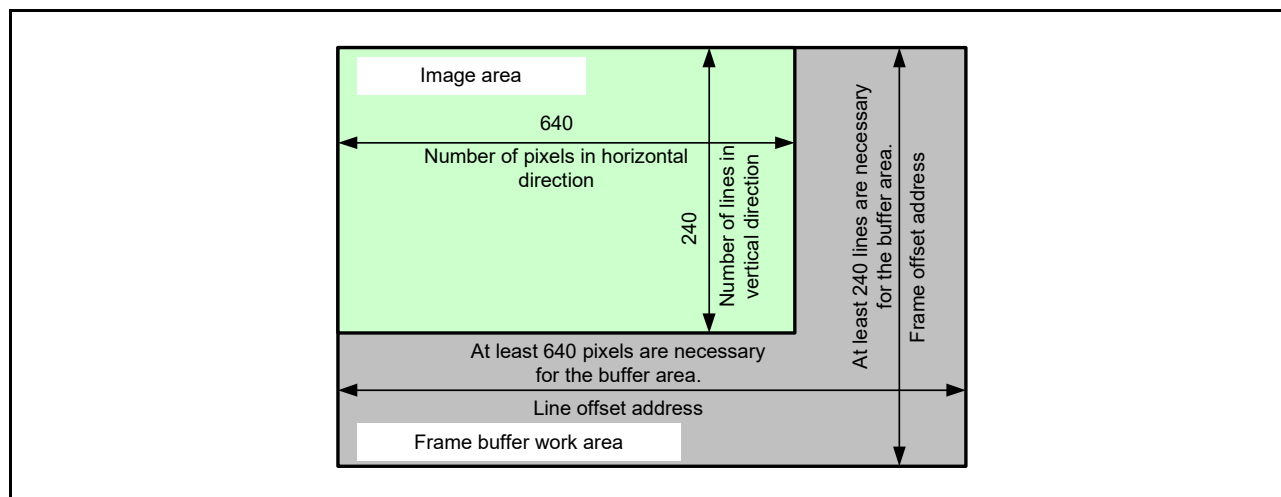

Figure 36.19 Frame Buffer Access Area Setting

Since the frame buffer is accessed in 64-bit units, YCbCr422 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

$$\text{SC_RES_LN_OFF}[14:0] = 1024 \times 2 = 2048$$

$$\text{GR_LN_OFF}[14:0] = 1024 \times 2 = 2048$$

The frame offset address values to be set are:

$$\text{SC_RES_FLM_OFF}[22:0] = \text{SC_RES_LN_OFF}[14:0] \times 256 = 524288$$

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 256 = 524288$$

(5) Register Setting Example

Table 36.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

| Register Name | Bit Name | Settings | Remarks |
|----------------------------|-------------------------------|----------|--|
| Synchronization Control | | | |
| SC_SCL0_FRC3 | SC_RES_VS_SEL | 0 | External Vsync selected |
| SC_SCL0_FRC4 | SC_RES_FH[10:0] | 799 | Horizontal period width of output signal (period width = set value + 1) |
| Size of Angle of View | | | |
| SC_SCL0_DS2 | SC_RES_VS[10:0] | 15 | Vertical capture start position of input signal |
| SC_SCL0_DS2 | SC_RES_VW[10:0] | 240 | Vertical capture width of input signal |
| SC_SCL0_DS3 | SC_RES_HS[10:0] | 244 | Horizontal capture start position of input signal |
| SC_SCL0_DS3 | SC_RES_HW[11:0] | 1440 | Horizontal capture width of input signal |
| SC_SCL0_FRC6 | SC_RES_F_VS[10:0] | 35 | Vertical valid start position of full screen |
| SC_SCL0_FRC6 | SC_RES_F_VW[10:0] | 480 | Vertical valid width of full screen |
| SC_SCL0_FRC7 | SC_RES_F_HS[10:0] | 144 | Horizontal valid start position of full screen |
| SC_SCL0_FRC7 | SC_RES_F_HW[10:0] | 640 | Horizontal valid width of full screen |
| SC_SCL0_US2 | SC_RES_P_VS[10:0] | 35 | Vertical valid start position of output image |
| SC_SCL0_US2 | SC_RES_P_VW[10:0] | 480 | Vertical valid width of output image |
| SC_SCL0_US3 | SC_RES_P_HS[10:0] | 144 | Horizontal valid start position of output image |
| SC_SCL0_US3 | SC_RES_P_HW[10:0] | 640 | Horizontal valid width of output image |
| Scaling Setting | | | |
| SC_SCL0_DS4 | SC_RES_DS_H_RATIO [15:0] | 9224 | Horizontal scaling-down because SC_RES_DS_H_RATIO is equal to or larger than 4096 |
| SC_SCL0_DS1 | SC_RES_DS_H_ON | 1 | Horizontal scaling-down on |
| SC_SCL0_US1 | SC_RES_US_H_ON | 0 | Horizontal scaling-up off |
| SC_SCL0_US5 | SC_RES_US_H_RATIO [15:0] | 4096 | Horizontal scaling-up off because SC_RES_US_H_RATIO is equal to or larger than 4096 |
| SC_SCL0_DS1 | SC_RES_DS_V_ON | 0 | Vertical scaling-down off |
| SC_SCL0_US1 | SC_RES_US_V_ON | 1 | Vertical scaling-up on |
| SC_SCL0_DS6 | SC_RES_V_RATIO[15:0] | 2044 | Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096 |
| SC_SCL0_DS7 | SC_RES_OUT_VW[10:0] | 240 | Vertical valid input width because the vertical scaling-down function is off |
| SC_SCL0_DS7 | SC_RES_OUT_HW[10:0] | 640 | Horizontal image size after horizontal scaling-down |
| SC_SCL0_US4 | SC_RES_IN_VW[10:0] | 240 | Vertical width of frame buffer read |
| SC_SCL0_US4 | SC_RES_IN_HW[10:0] | 640 | Horizontal width of frame buffer read |
| IP Conversion Setting | | | |
| SC_SCL0_DS5 | SC_RES_TOP_ INIPHASE[11:0] | 2048 | Top field adjusted by 0.5-line phase |
| SC_SCL0_DS5 | SC_RES_BTM_ INIPHASE[11:0] | 0 | No phase adjustment for bottom field |
| SC_SCL0_FRC5 | SC_RES_FLD_DLY_SEL | 1 | IP conversion with two planes of frame buffer used for vertical scaling-up |
| Frame Buffer Write Setting | | | |
| SC_SCL1_WR1 | SC_RES_DS_WR_MD [2:0] | 0 | Normal write mode for rotation control |
| SC_SCL1_WR1 | SC_RES_MD[1:0] | 0 | Frame buffer write format YCbCr422 (16 bits) |
| SC_SCL1_WR2 | SC_RES_BASE[31:0] | 0 | Frame buffer write start address (0 in setting example) |
| SC_SCL1_WR3 | SC_RES_LN_OFF[14:0] | 2048 | Frame buffer write line offset |

Table 36.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

| Register Name | Bit Name | Settings | Remarks |
|---------------------------|----------------------|----------|--|
| SC_SCL1_WR3 | SC_RES_FLM_NUM[9:0] | 1 | Two planes of frame buffer used |
| SC_SCL1_WR4 | SC_RES_FLN_OFF[22:0] | 524288 | Frame buffer write frame offset |
| SC_SCL1_WR5 | SC_RES_WENB | 1 | Frame buffer write enabled |
| Frame Buffer Read Setting | | | |
| GR_FLM1 | GR_FLM_SEL[1:0] | 0 | Frame number for frame buffer write output |
| GR_FLM2 | GR_BASE[31:0] | 0 | Conforming to frame buffer write setting |
| GR_FLM3 | GR_LN_OFF[14:0] | 2048 | Conforming to frame buffer write setting |
| GR_FLM4 | GR_FLM_OFF[22:0] | 524288 | Conforming to frame buffer write setting |
| GR_FLM6 | GR_FORMAT[3:0] | 8 | Frame buffer read format YCbCr422 |
| GR_FLM_RD | GR_R_ENB | 1 | Frame buffer read enabled |
| GR_FLM6 | GR_CNV444_MD | 1 | Mean value interpolation in YCbCr422→YCbCr444 conversion |
| Scaling-up Selection | | | |
| SC_SCL0_US8 | SC_RES_IBUS_SYNC_SEL | 0 | Scaled-up video signal displayed |
| GR_AB1 | GR_DISP_SEL[1:0] | 1 | Scaling display selected |

36.3.2 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in Table 36.42.

Table 36.42 Input and Output Angles of View for Graphics Display

| Graphics Size | Output Signal | Graphics Signal Format |
|---------------|---------------|------------------------|
| 640 × 480 | 640 × 480 | RGB888 |

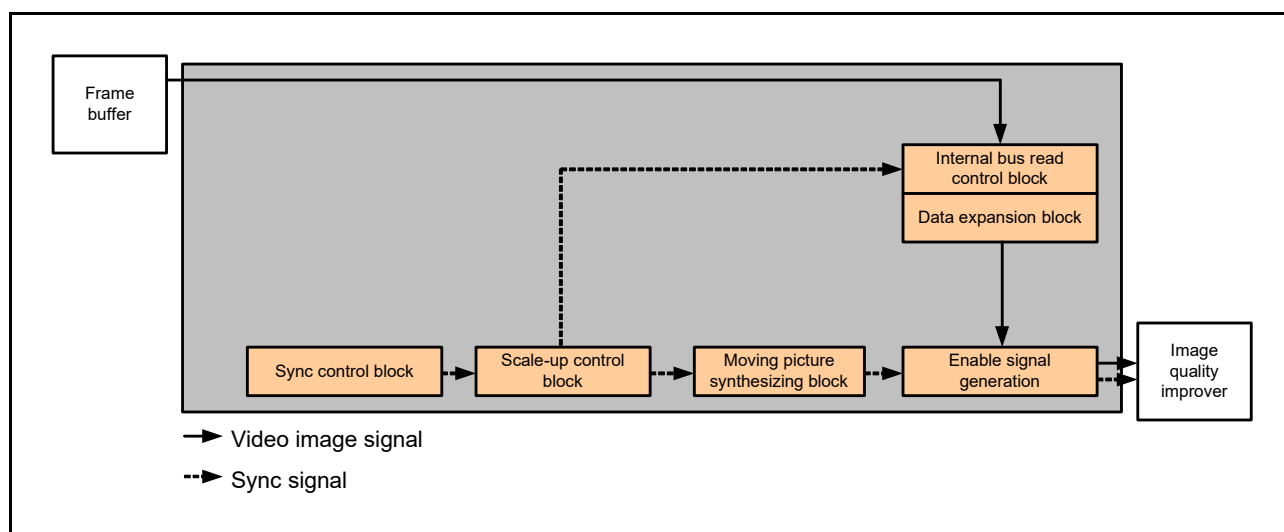

Figure 36.20 Signal Paths for Graphics Display

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

$$\text{GR_LN_OFF}[14:0] = 640 \times 4 = 2560$$

The frame offset address values to be set are:

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 480 = 1228800$$

(3) Register Setting Example

Table 36.43 Register Setting Example for Graphics Display

| Register Name | Bit Name | Settings | Remarks |
|---------------------------|----------------------|----------|---|
| Synchronization Control | | | |
| SC_SCL0_FRC3 | SC_RES_VS_SEL | 1 | Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected) |
| SC_SCL0_FRC4 | SC_RES_FV[10:0] | 524 | Vertical period width of output signal (period width = set value + 1) |
| SC_SCL0_FRC4 | SC_RES_FH[10:0] | 799 | Horizontal period width of output signal (period width = set value + 1) |
| Size of Angle of View | | | |
| SC_SCL0_FRC6 | SC_RES_F_VS[10:0] | 35 | Vertical valid start position of full screen |
| SC_SCL0_FRC6 | SC_RES_F_VW[10:0] | 480 | Vertical valid width of full screen |
| SC_SCL0_FRC7 | SC_RES_F_HS[10:0] | 144 | Horizontal valid start position of full screen |
| SC_SCL0_FRC7 | SC_RES_F_HW[10:0] | 640 | Horizontal valid width of full screen |
| GR_AB2 | GR_GRC_VS[10:0] | 35 | Vertical valid start position of graphics output |
| GR_AB2 | GR_GRC_VW[10:0] | 480 | Vertical valid width of graphics output |
| GR_AB3 | GR_GRC_HS[10:0] | 144 | Horizontal valid start position of graphics output |
| GR_AB3 | GR_GRC_HW[10:0] | 640 | Horizontal valid width of graphics output |
| Frame Buffer Read Setting | | | |
| GR_FLM1 | GR_FLM_SEL[1:0] | 1 | Frame number setting with register |
| GR_FLM3 | GR_FLM_NUM[9:0] | 0 | Frame number of frame buffer (0 in setting example) |
| GR_FLM5 | GR_FLM_LNUM[9:0] | 479 | Number of graphics lines (number of lines = set value + 1) |
| GR_FLM6 | GR_HW[9:0] | 639 | Horizontal valid width of graphics (valid width = set value + 1) |
| GR_FLM2 | GR_BASE[31:0] | 0 | Conforming to graphics expansion setting (0 in setting example) |
| GR_FLM3 | GR_LN_OFF[14:0] | 2560 | Conforming to graphics expansion setting |
| Frame Buffer Read Setting | | | |
| GR_FLM4 | GR_FLM_OFF[22:0] | 1228800 | Conforming to graphics expansion setting |
| GR_FLM6 | GR_FORMAT[3:0] | 1 | Frame buffer read format RGB888 |
| GR_FLM_RD | GR_R_ENB | 1 | Frame buffer read enabled |
| Scaling-up Selection | | | |
| SC_SCL0_US8 | SC_RES_IBUS_SYNC_SEL | 1 | Graphics output displayed |
| GR_AB1 | GR_DISP_SEL[1:0] | 2 | Graphics display selected |

36.3.3 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 36.44.

Table 36.44 Input and Output Angles of View for Scaled-up Graphics Display

| Graphics Size | Output Signal | Graphics Signal Format |
|---------------|---------------|------------------------|
| 640 × 480 | 800 × 600 | RGB565 |

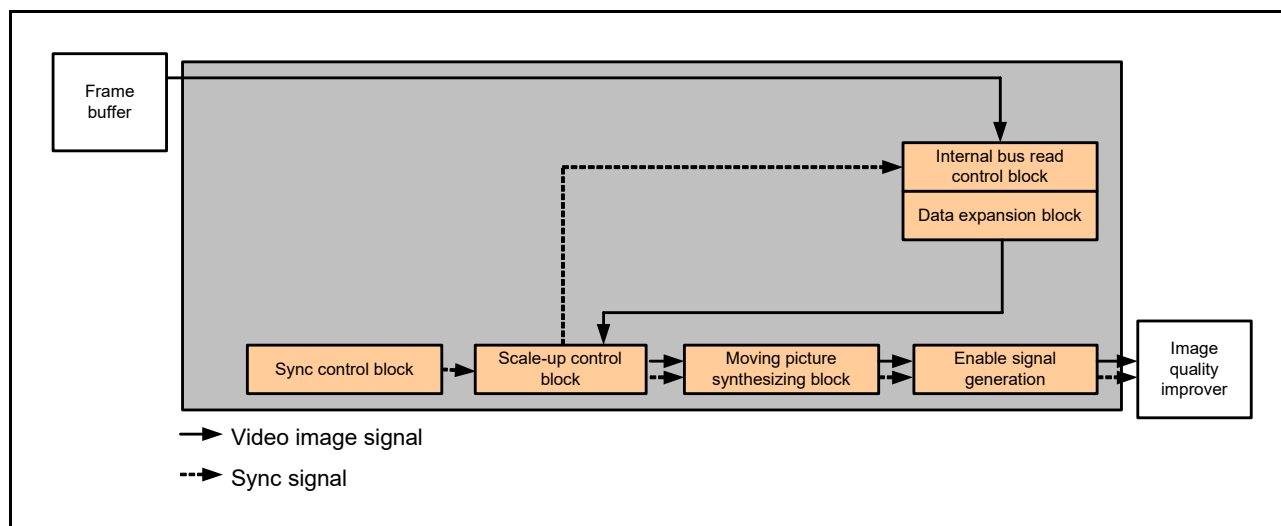

Figure 36.21 Signal Paths for Scaled-up Graphics Display

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(640 \div 800 \times 4096) = 3277$$

$$\sigma = (3277 \times (800 - 1) - (640 - 1) \times 4096) \div (800 - 1) = 1.23$$

$$\text{Horizontal scaling ratio} = \text{round}(3277 - (1.23)) = 3276$$

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(480 \div 600 \times 4096) = 3277$$

$$\sigma = (3277 \times (600 - 1) - (480 - 1) \times 4096) \div (600 - 1) = 1.57$$

$$\text{Vertical scaling ratio} = \text{round}(3277 - (1.57)) = 3275$$

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640×480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640×480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

$$\text{GR_LN_OFF}[14:0] = 640 \times 2 = 1280$$

The frame offset address values to be set are:

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 480 = 614400$$

(5) Register Setting Example

Table 36.45 Register Setting Example for Scaled-up Graphics Display

| Register Name | Bit Name | Settings | Remarks |
|---------------------------|-------------------------|----------|---|
| Synchronization Control | | | |
| SC_SCL0_FRC3 | SC_RES_VS_SEL | 1 | Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected) |
| SC_SCL0_FRC4 | SC_RES_FV[10:0] | 668 | Vertical period width of output signal (period width = set value + 1) |
| SC_SCL0_FRC4 | SC_RES_FH[10:0] | 1040 | Horizontal period width of output signal (period width = set value + 1) |
| Size of Angle of View | | | |
| SC_SCL0_FRC6 | SC_RES_F_VS[10:0] | 27 | Vertical valid start position of full screen |
| SC_SCL0_FRC6 | SC_RES_F_VW[10:0] | 600 | Vertical valid width of full screen |
| SC_SCL0_FRC7 | SC_RES_F_HS[10:0] | 216 | Horizontal valid start position of full screen |
| SC_SCL0_FRC7 | SC_RES_F_HW[10:0] | 800 | Horizontal valid width of full screen |
| SC_SCL0_US2 | SC_RES_P_VS[10:0] | 27 | Vertical valid start position of image output |
| SC_SCL0_US2 | SC_RES_P_VW[10:0] | 600 | Vertical valid width of image output |
| SC_SCL0_US3 | SC_RES_P_HS[10:0] | 216 | Horizontal valid start position of image output |
| SC_SCL0_US3 | SC_RES_P_HW[10:0] | 800 | Horizontal valid width of image output |
| Scaling Setting | | | |
| SC_SCL0_US5 | SC_RES_US_H_RATIO[15:0] | 3276 | Horizontal scaling-up because SC_RES_US_H_RATIO is smaller than 4096 |
| SC_SCL0_DS6 | SC_RES_V_RATIO[15:0] | 3275 | Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096 |
| SC_SCL0_US1 | SC_RES_US_H_ON | 1 | Horizontal scaling-up on |
| SC_SCL0_US1 | SC_RES_US_V_ON | 1 | Vertical scaling-up on |
| SC_SCL0_US4 | SC_RES_IN_VW[10:0] | 480 | Vertical width of frame buffer read |
| SC_SCL0_US4 | SC_RES_IN_HW[10:0] | 640 | Horizontal width of frame buffer read |
| Frame Buffer Read Setting | | | |
| GR_FLM1 | GR_FLM_SEL[1:0] | 1 | Frame number setting with register |
| GR_FLM3 | GR_FLM_NUM[9:0] | 0 | Frame number of frame buffer (0 in setting example) |
| GR_FLM2 | GR_BASE[31:0] | 0 | Conforming to graphics expansion setting (0 in setting example) |
| GR_FLM3 | GR_LN_OFF[14:0] | 1280 | Conforming to graphics expansion setting |
| GR_FLM4 | GR_FLM_OFF[22:0] | 614400 | Conforming to graphics expansion setting |
| GR_FLM6 | GR_FORMAT[3:0] | 0 | Frame buffer read format RGB565 |
| GR_FLM_RD | GR_R_ENB | 1 | Frame buffer read enabled |
| Scaling-up Selection | | | |
| SC_SCL0_US8 | SC_RES_IBUS_SYNC_SEL | 0 | Scaled-up video signal displayed |
| GR_AB1 | GR_DISP_SEL[1:0] | 1 | Scaling display selected |

37. Video Display Controller 6 (4): Image Quality Improver

37.1 Image Quality Improver

37.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to black stretching, LTI/sharpness processing, and GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 37.1 is a functional block diagram of the image quality improver. Image quality improver 0 is connected to scaler 0.

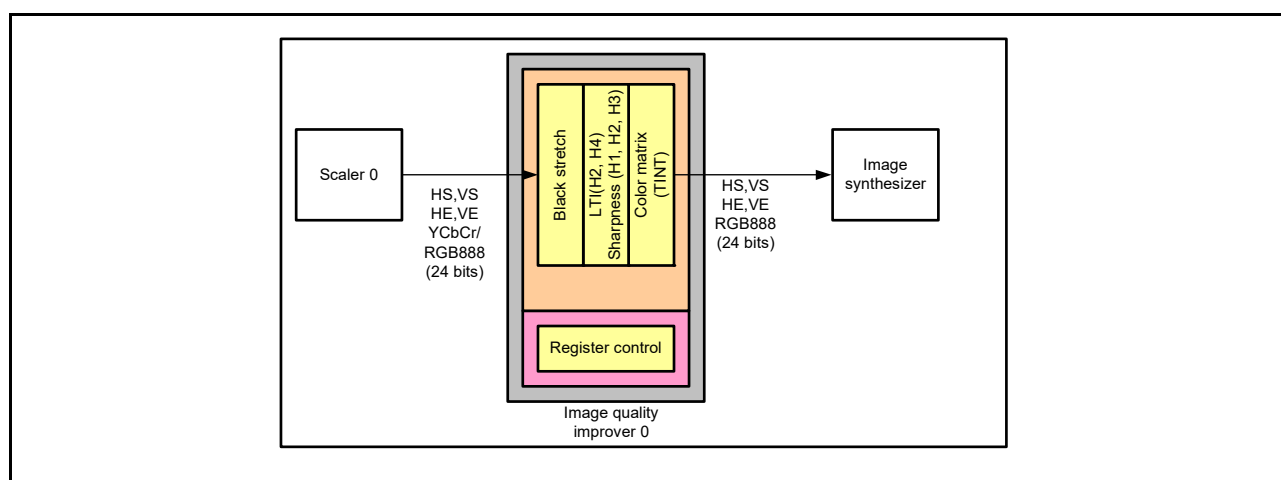

Figure 37.1 Functional Block Diagram of Image Quality Improver

37.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that registers for the improver can be identified by the number in the register name like ADJ0_XXXX. In the sections except for Register Description, however, the number is omitted like ADJ_XXXX for convenience sake.

Table 37.1 Register Update Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------|---------------|---|
| ADJ_UPDATE | ADJ_VEN | 0 | Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal. |

37.1.3 Black Stretch

Black stretch refers to the black stretch correction of the Y signal of the input video signal of YCbCr format.

Correction of the Y signal is done by adjusting the time constant, depth (gain), and start point.

Figure 37.2 is a drawing illustrating black stretch correction.

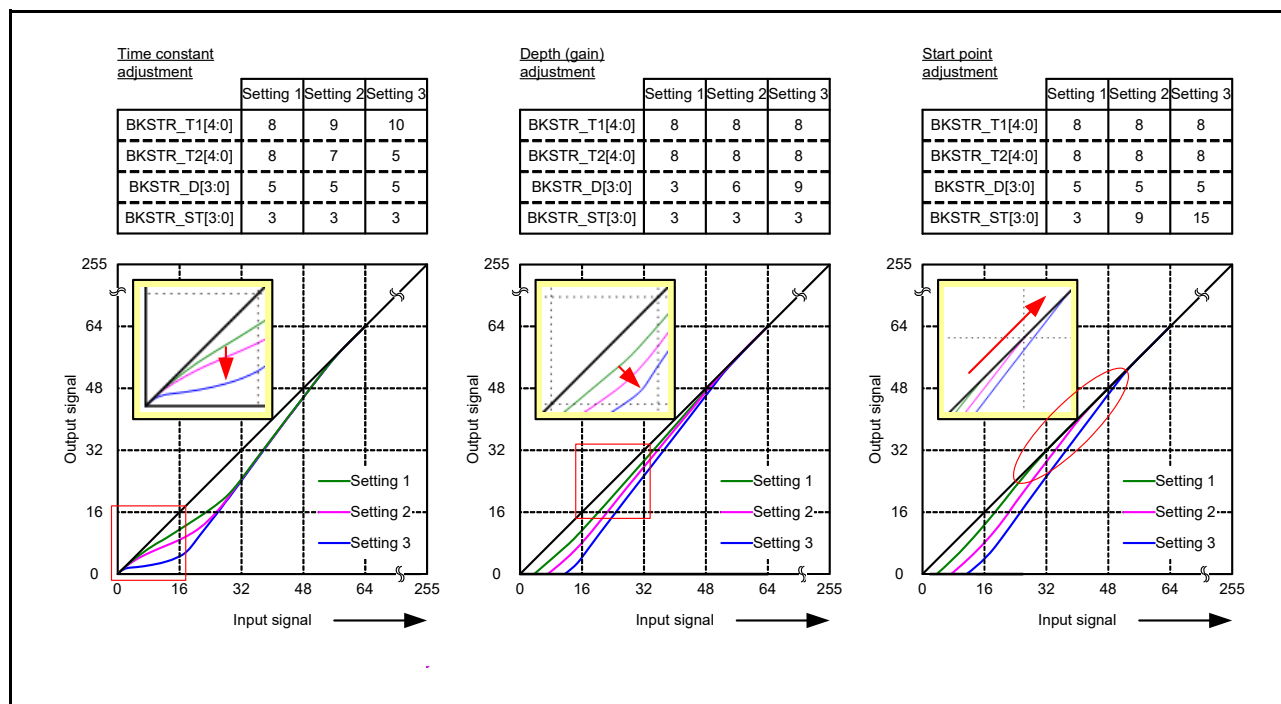

Figure 37.2 Black Stretch Correction (With Sample Settings)

Table 37.2 Black Stretch Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|---------------|---------------|--|
| ADJ_BKSTR_SET | BKSTR_ON | 0 | Black Stretch On/Off Control 0: Black Stretch Off 1: Black Stretch On |
| ADJ_BKSTR_SET | BKSTR_ST[3:0] | 0 | Black Stretch Start Point 0 (low) to 15 (high) |
| ADJ_BKSTR_SET | BKSTR_T1[4:0] | 0 | Black Stretch Time Constant (T1) 0 (small) to 31 (large) |
| ADJ_BKSTR_SET | BKSTR_T2[4:0] | 0 | Black Stretch Time Constant (T2) 0 (small) to 30 (large), 31: Setting prohibited |
| ADJ_BKSTR_SET | BKSTR_D[3:0] | 0 | Black Stretch Depth 0 (shallow) to 15 (deep) |

37.1.4 Enhancer

The enhancer subjects the scaled Y signal input to transient improvement (LTI) and sharpness processing in the horizontal direction.

(1) Enhancer Area Specification

The operating area of the enhancer is specified with reference to the rising edges of the Hsync signal and Vsync signal. ENH_HS should be set to four or greater clocks, and ENH_VS should be set to two or greater lines. Figure 37.3 shows enhancer area setting.

Figure 37.3 Period when Enhancer is Enabled

Setting ENH_DISP_ON to 1 displays the enhancer-enabled area with frame lines.

Table 37.3 Enhancer Area Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------|---------------|---|
| ADJ_ENH_TIM1 | ENH_MD | 1 | Operating Mode 0: RGB mode 1: YCbCr mode |
| ADJ_ENH_TIM2 | ENH_VS[10:0] | 0 | Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines. |

(2) LTI (Luminance Transient Improvement)

The enhancer subjects the Y signal input to transient improvement in the horizontal direction.

Transient improvement of the blanking signal is turned off.

Figure 37.4 LTI Correction

After edge detection of the image, the LTI can be independently controlled in the two horizontal bands.

In LTI, the median filter is inserted after edge detection of the image.

In LTI (H4), the reference pixels of the median filter can be selected.

However, under normal operations, half the tap data (second adjacent pixel) at edge detection is used as reference.

Table 37.4 Reference Pixel Table for LTI

| LTI Band | Reference Pixel for Edge Detection | LPF Application | Median Filter Reference Pixels |
|---------------------|---|--------------------------------|---|
| Horizontal LTI (H2) | Second adjacent pixel used as reference | LPF not applied or LPF (1,2,1) | Adjacent pixel used as reference |
| Horizontal LTI (H4) | Fourth adjacent pixel used as reference | LPF (1,2,1) | Adjacent pixel or second adjacent pixel used as reference |

In LTI, the detection result can be subjected to a coring process.

The core value set in the register is subtracted from the edge detection result, and LTI correction is performed on the coring output after subtraction.

Figure 37.5 LTI Coring

Table 37.5 LTI Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------------|---------------|--|
| ADJ_ENH_LTI1 | LTI_H_ON | 0 | LTI On/Off Control 0: LTI off 1: LTI on |
| ADJ_ENH_LTI1 | LTI_H2_INC_ZERO [7:0] | 10 | Median Filter LTI Correction Threshold LTI correction is disabled when: $ \text{right TAP value} - \text{center TAP value} < \text{LTI1_H2_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI1_H2_INC_ZERO}$. |
| ADJ_ENH_LTI1 | LTI_H2_LPF_SEL | 0 | LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected |
| ADJ_ENH_LTI1 | LTI_H2_GAIN[7:0] | 0 | LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) |
| ADJ_ENH_LTI1 | LTI_H2_CORE[7:0] | 0 | LTI Coring (Maximum core value of 255) Amplitude smaller than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.) |
| ADJ_ENH_LTI2 | LTI_H4_INC_ZERO[7:0] | 10 | Median Filter LTI Correction Threshold LTI correction is disabled when: $ \text{right TAP value} - \text{center TAP value} < \text{LTI1_H4_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI1_H4_INC_ZERO}$. |

Table 37.5 LTI Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------------|---------------|--|
| ADJ_ENH_LTI2 | LTI_H4_MEDIAN_TAP_SEL | 0 | Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference |
| ADJ_ENH_LTI2 | LTI_H4_GAIN[7:0] | 0 | LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) |
| ADJ_ENH_LTI2 | LTI_H4_CORE[7:0] | 0 | LTI Coring (Maximum core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.) |

(3) Sharpness Process

The enhancer performs edge enhancement on the Y signal input by adding overshoot and undershoot to the original signal. Edge enhancement of the blanking signal is turned off.

Figure 37.6 Sharpness Correction

After edge detection of the image, the sharpness can be independently controlled in the three horizontal bands.

In horizontal sharpness, a 3-tap low-pass filter (LPF) is inserted before edge detection to prevent folding. The LPF can be turned on or off by register setting.

Table 37.6 Reference Pixel Table for Sharpness

| Sharpness Band | Reference Pixel for Edge Detection | LPF Application |
|---------------------------|---|--------------------------------|
| Horizontal sharpness (H1) | Adjacent pixel used as reference | LPF not applied |
| Horizontal sharpness (H2) | Second adjacent pixel used as reference | LPF not applied or LPF (1,2,1) |
| Horizontal sharpness (H3) | Third adjacent pixel used as reference | LPF (1,2,1) |

The edge amplitude of the edge to be enhanced is adjusted according to the value of SHP_CORE.

Edge enhancement is accomplished when the edge detection result of the image is greater than the value of SHP_CORE.

In edge enhancement, a correction value is output by multiplying (edge amplitude value - SHP_CORE) by sharpness gain.

Sharpness is turned off when the edge detection result of the image is smaller than the value of SHP_CORE.

Figure 37.7 Sharpness Characteristics

Table 37.7 Sharpness Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------------|---------------|---|
| ADJ_ENH_SHP1 | SHP_H_ON | 0 | Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on |
| ADJ_ENH_SHP3 | SHP_H2_LPF_SEL | 0 | LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected |
| ADJ_ENH_SHP2 | SHP_H1_CLIP_O[7:0] | 0 | Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O |

| ADJ_ENH_SHP4 | SHP_H2_GAIN_O[7:0] | 0 | Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE) |
| ADJ_ENH_SHP4 | SHP_H2_GAIN_U[7:0] | 0 | Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE) |
| ADJ_ENH_SHP3 | SHP_H2_CORE[6:0] | 0 | Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater. |
| ADJ_ENH_SHP6 | SHP_H3_CLIP_O[7:0] | 0 | Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O |
| ADJ_ENH_SHP6 | SHP_H3_CLIP_U[7:0] | 0 | Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U |
| ADJ_ENH_SHP6 | SHP_H3_GAIN_O[7:0] | 0 | Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (edge amplitude value – SHP_H3_CORE) |
| ADJ_ENH_SHP6 | SHP_H3_GAIN_U[7:0] | 0 | Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (edge amplitude value – SHP_H3_CORE) |
| ADJ_ENH_SHP5 | SHP_H3_CORE[6:0] | 0 | Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater. |

37.1.5 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

$$YGIN_A = YGIN + ADJ_MTX_YG - 128$$

$$CBBIN_A = CBBIN + ADJ_MTX_B - 128$$

$$CRRIN_A = CRRIN + ADJ_MTX_R - 128$$

$$YGOUT = (ADJ_MTX_GG \times YGIN_A + ADJ_MTX_GB \times CBBIN_A + ADJ_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (ADJ_MTX_BG \times YGIN_A + ADJ_MTX_BB \times CBBIN_A + ADJ_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (ADJ_MTX_RG \times YGIN_A + ADJ_MTX_RB \times CBBIN_A + ADJ_MTX_RR \times CRRIN_A) \div 256$$

(2) YCbCr to GBR Conversion

$$YGIN_A = YGIN + ADJ_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (ADJ_MTX_GG \times YGIN_A + ADJ_MTX_GB \times CBBIN_A + ADJ_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (ADJ_MTX_BG \times YGIN_A + ADJ_MTX_BB \times CBBIN_A + ADJ_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (ADJ_MTX_RG \times YGIN_A + ADJ_MTX_RB \times CBBIN_A + ADJ_MTX_RR \times CRRIN_A) \div 256$$

Table 37.8 Matrix Coefficients (Standard Values) of SMPTE 293M

| | YGIN | | CBBIN | | CRRIN | |
|--------|-------------|------------------|-------------|-------------------|-------------|-------------------|
| | Coefficient | Bit Setting | Coefficient | Bit Setting | Coefficient | Bit Setting |
| YGOUT | 1.000 | ADJ_MTX_GG = 256 | -0.344 | ADJ_MTX_GB = 1960 | -0.714 | ADJ_MTX_GR = 1865 |

37.2 Register Description

Table 37.10 shows the register configuration.

[Symbols used in Register Description]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.

R/WC1: Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.

R: Read-only. The write value should always be 0.

—/W: Write-only. Read value is undefined.

Table 37.10 Image Quality Improver Register Configuration

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | ENH_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | ENH_HS[10:0] | 145 | R/W | Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | ENH_HW[10:0] | 640 | R/W | Width of Horizontal Valid Image Area in Enhancer-Enabled Area |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SHP_H_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | SHP_H1_CORE[6:0] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | SHP_H_ON | 0 | R/W | Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on |
| 15 to 7 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 6 to 0 | SHP_H1_CORE[6:0] | 0 | R/W | Active Sharpness Range Edge amplitude value \geq SHP_H1_CORE: Sharpness processing on Edge amplitude value $<$ SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater. |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2)

| | | | | | | | | | | | | | | | | |
|----------------|--------------------|-----|-----|-----|-----|-----|-----|-----|--------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | SHP_H1_CLIP_O[7:0] | | | | | | | | SHP_H1_CLIP_U[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | SHP_H1_GAIN_O[7:0] | | | | | | | | SHP_H1_GAIN_U[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 24 | SHP_H1_CLIP_O [7:0] | 0 | R/W | Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O |
| 23 to 16 | SHP_H1_CLIP_U [7:0] | 0 | R/W | Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U |
| 15 to 8 | SHP_H1_GAIN_O [7:0] | 0 | R/W | Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE) |
| 7 to 0 | SHP_H1_GAIN_U [7:0] | 0 | R/W | Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE) |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SHP_H2_LPF_SEL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | SHP_H2_CORE[6:0] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | SHP_H2_LPF_SEL | 0 | R/W | LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected |
| 15 to 7 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 6 to 0 | SHP_H2_CORE[6:0] | 0 | R/W | Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater. |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.9 Enhancer Sharpness Register 4 (ADJ0_ENH_SHP4)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|--|
| 31 to 24 | SHP_H2_CLIP_O[7:0] | 0 | R/W | Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O |
| 23 to 16 | SHP_H2_CLIP_U[7:0] | 0 | R/W | Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U |
| 15 to 8 | SHP_H2_GAIN_O[7:0] | 0 | R/W | Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE) |
| 7 to 0 | SHP_H2_GAIN_U[7:0] | 0 | R/W | Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE) |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.10 Enhancer Sharpness Register 5 (ADJ0_ENH_SHP5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | SHP_H3_GAIN_O[7:0] | | | | | | | | SHP_H3_GAIN_U[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 24 | SHP_H3_CLIP_O[7:0] | 0 | R/W | Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O |
| 23 to 16 | SHP_H3_CLIP_U[7:0] | 0 | R/W | Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U |
| 15 to 8 | SHP_H3_GAIN_O[7:0] | 0 | R/W | Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O \times (Edge amplitude value – SHP_H3_CORE) |
| 7 to 0 | SHP_H3_GAIN_U[7:0] | 0 | R/W | Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U \times (Edge amplitude value – SHP_H3_CORE) |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1)

| | | | | | | | | | | | | | | | | |
|----------------|------------------|-----|-----|-----|-----|-----|-----|----------------|----------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | LTI_H_ON | — | — | — | — | — | — | LTI_H2_LPF_SEL | LTI_H2_INC_ZERO[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LTI_H2_GAIN[7:0] | | | | | | | | LTI_H2_CORE[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|---|
| 31 | LTI_H_ON | 0 | R/W | LTI On/Off Control 0: LTI off 1: LTI on |
| 30 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | LTI_H2_LPF_SEL | 0 | R/W | LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected |
| 23 to 16 | LTI_H2_INC_ZERO[7:0] | 10 | R/W | Median Filter LTI Correction Threshold LTI correction is disabled when right TAP value – center TAP value < LTI_H2_INC_ZERO or left TAP value – center TAP value < LTI_H2_INC_ZERO |
| 15 to 8 | LTI_H2_GAIN[7:0] | 0 | R/W | LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times) |
| 7 to 0 | LTI_H2_CORE[7:0] | 0 | R/W | LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged) |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2)

| | | | | | | | | | | | | | | | | |
|----------------|------------------|-----|-----|-----|-----|-----|-----|-----------------------|----------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | LTI_H4_MEDIAN_TAP_SEL | LTI_H4_INC_ZERO[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | ADJ0_MTX_R [7:0] | 128 | R/W | R Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | ADJ0_MTX_RG [10:0] | 256 | R/W | Gain Adjustment of Y/G Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.2.20 Matrix CRR Control Register 1 in Image Quality Improver (ADJ0_MTX_CRR_ADJ1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | ADJ0_MTX_RB[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | ADJ0_MTX_RR[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | ADJ0_MTX_RB [10:0] | 0 | R/W | Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | ADJ0_MTX_RR [10:0] | 359 | R/W | Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times]) |

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

37.3 Usage Method

37.3.1 Black Stretch Usage Method

The degree of black stretch can be adjusted by setting the depth (BKSTR_D[3:0]) and the start point (BKSTR_ST[3:0]) of the black stretch. The variation in the black stretch time axis can be adjusted by setting the time constant (BKSTR_T1[4:0] and BKSTR_T2[4:0]). By setting the time constant, changes that occur abruptly due to swapping of the scene can be controlled.

Table 37.11 Black Stretch Setting Register

| Register Name | Bit Name | Set Value |
|---------------|---------------|---|
| ADJ_BKSTR_SET | BKSTR_ON | When black stretch is on: 1 |
| ADJ_BKSTR_SET | BKSTR_D[3:0] | Set the depth of black stretch. The depth increases as the value becomes larger. |
| ADJ_BKSTR_SET | BKSTR_ST[3:0] | Set the start point of black stretch. The stretching area becomes larger as the value becomes larger. |
| ADJ_BKSTR_SET | BKSTR_T1[4:0] | Set the time constant of black stretch in the positive direction. The changes are more delayed as the value becomes larger. |
| ADJ_BKSTR_SET | BKSTR_T2[4:0] | Set the time constant of black stretch in the negative direction. The changes are more delayed as the value becomes larger. |

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

37.3.2 LTI Processing of Enhancer

Figure 37.8 shows an example of LTI adjustment.

Figure 37.8 Example of LTI Adjustment

37.3.3 Sharpness Processing of Enhancer

Figure 37.9 shows an example of sharpness adjustment.

Figure 37.9 Example of Sharpness Adjustment

37.3.4 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 37.12 shows an example of GBR conversion setting.

Table 37.12 Recommended Setting Values for Matrix Conversion

| Register Name | Bit Name | GBR to GBR Conversion | YCBCR to GBR Conversion |
|------------------|------------------|-----------------------|-------------------------|
| | | Recommended Values | Recommended Values |
| ADJ_MTX_MODE | ADJ_MTX_MD[1:0] | 0 | 2 |
| ADJ_MTX_YG_ADJ0 | ADJ_MTX_YG[7:0] | 128 | 128 |
| ADJ_MTX_CBB_ADJ0 | ADJ_MTX_B[7:0] | 128 | 128 |
| ADJ_MTX_CRR_ADJ0 | ADJ_MTX_R[7:0] | 128 | 128 |
| ADJ_MTX_YG_ADJ0 | ADJ_MTX_GG[10:0] | 256 | 256 |
| ADJ_MTX_YG_ADJ1 | ADJ_MTX_GB[10:0] | 0 | 1960 |
| ADJ_MTX_YG_ADJ1 | ADJ_MTX_GR[10:0] | 0 | 1865 |
| ADJ_MTX_CBB_ADJ0 | ADJ_MTX_BG[10:0] | 0 | 256 |
| ADJ_MTX_CBB_ADJ1 | ADJ_MTX_BB[10:0] | 256 | 454 |
| ADJ_MTX_CBB_ADJ1 | ADJ_MTX_BR[10:0] | 0 | 0 |
| ADJ_MTX_CRR_ADJ0 | ADJ_MTX_RG[10:0] | 0 | 256 |
| ADJ_MTX_CRR_ADJ1 | ADJ_MTX_RB[10:0] | 0 | 0 |
| ADJ_MTX_CRR_ADJ1 | ADJ_MTX_RR[10:0] | 256 | 359 |

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

38. Video Display Controller 6 (5): Image Synthesizer

38.1 Image Synthesizer

38.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

One video plane + two graphics planes, or three graphics planes can be selected for synthesis.

RGB565, RGB888, α RGB1555, α RGB4444, α RGB8888, RGB α 5551, RGB α 8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 process), and YCbCr444 (for the graphics 0 process) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 2 and 3 processes) of lower-layer graphics and current graphics can be displayed.

It is recommend that the frame buffer is placed in the on-chip large-capacity RAM. Both the on-chip large-capacity RAM and an external SDRAM can be used for the frame buffer, but the bus bandwidth might become short and display might not be possible if an external SDRAM is used for the frame buffer.

The functional block diagram of the image synthesizer is shown below.

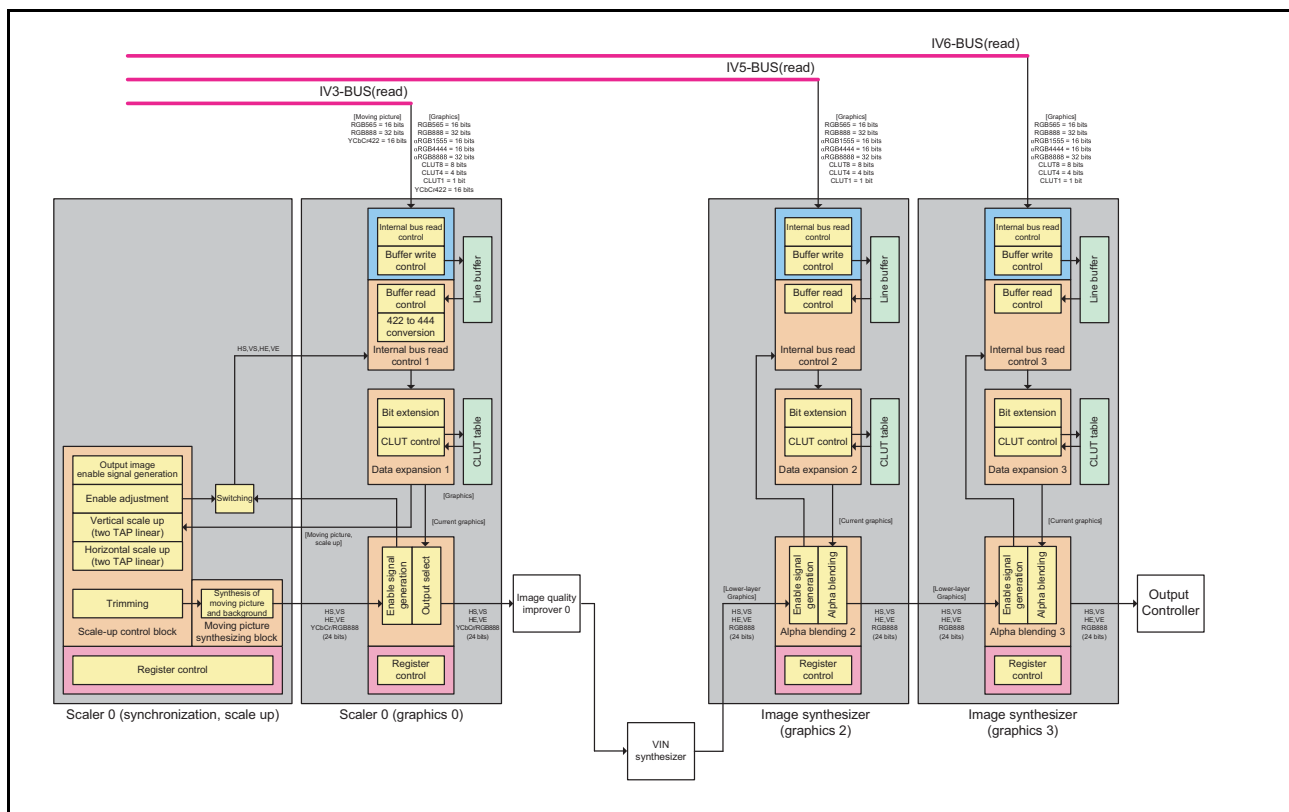

Figure 38.1 Functional Block Diagram of Image Synthesizer

38.1.2 Graphics Data Read Control

Graphics data read can be controlled for the three processes: the graphics 0 process in the scaler 0, and the graphics 2 and 3 processes in the image synthesizer.

The register bits of each process can be identified by the number in the register name like GR0_XXXX, GR2_XXXX, and GR3_XXXX, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_XXXX for convenience sake.

In the VIN synthesizer, graphics data read is not controlled. In this manual, the name is omitted like GR_XXXX for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 38.1 Register Update Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------|---------------|---|
| GR_UPDATE | GR_UPDATE | 0 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| GR_UPDATE | GR_P_VEN | 0 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| GR_UPDATE | GR_IBUS_VEN | 0 | Frame Buffer Read Register Update * 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

Note: * This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Burst Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video data and graphics data are stored.

Table 38.2 Frame Buffer Burst Transfer Mode

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------|---------------|--|
| GR_FLM1 | GR_BST_MD | 0 | Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer |

(3) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 38.3 Frame Buffer Control Mode

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|--|
| GR_FLM1 | GR_FLM_SEL[1:0] | 0 | Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected.* ¹ 1: Register GR_FLM_NUM selected. 2: Control linked to distortion correction, or frame 0 selected.* ² 3: Control linked to pointer buffer, or setting prohibited.* ³ |
| GR_FLM3 | GR_FLM_NUM[9:0] | 0 | Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1. |

Note 1. For the graphics 0 process, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.

Note 2. For the graphics 0 process, frame buffer control links to distortion correction. For the graphics 2 and 3 processes, frame 0 is selected.

Note 3. For the graphics 0 process, frame buffer control links to the pointer buffer. For the graphics 2 and 3 processes, setting is prohibited.

(4) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 38.4 Frame Buffer Read Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------|---------------|---|
| GR_FLM_RD | GR_R_ENB | 0 | Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer. |

(5) Distortion Correction Frame Buffer Control

Two frames (frames 0 and 1) are used for distortion correction, and the frame numbers to be read by the image renderer are set.

The frame numbers to be read (frames 0 and 1) can be switched by setting the GR_IMR_FLM_INV bit.

This bit is enabled only when the GR_FLM_SEL bits are set to 2.

Table 38.5 Frame Buffer Size

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| GR1_FLM1 | GR1_IMR_FLM_INV | 0 | Sets the frame buffer number for distortion correction.* 0: Does not switch the frame numbers to be read. 1: Switches the frame numbers to be read. |

Note: * This function is supported for the graphics 0 process only.

(6) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 38.6 Frame Buffer Size

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|--|
| GR_FLM6 | GR_HW[10:0] | 0 | Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater. |
| GR_FLM5 | GR_FLM_LNUM[10:0] | 0 | Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1). |

(7) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 32/128 bytes (the lower 5/7 bits should be fixed to 0).

The GR_BASE[31:0] bits should be set in units of 64 bytes to set the display data start position (the lower three bits should be fixed).

Figure 38.2 Data Arrangement in Frame Buffer

Table 38.7 Calculation of Addresses in Frame Buffer

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|--|
| GR_FLM2 | GR_BASE[31:0] | 0 | <p>Frame Buffer Base Address</p> <p>Sets the start address of the frame buffer where frame data is to be stored.</p> <p>GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data.</p> <p>The lower 3 bits should be set to 000.</p> |
| GR_FLM3 | GR_LN_OFF[14:0] | 0 | <p>Frame Buffer Line Offset Address</p> <p>Sets the line offset address for calculating the start address of each line.</p> <p>Line 0: GR_BASE</p> <p>Line 1: $GR_BASE + GR_LN_OFF \times 1$</p> <p>:</p> <p>Line n: $GR_BASE + GR_LN_OFF \times n$</p> <p>For 32-byte transfer, the lower 5 bits should be fixed to 0_0000.</p> <p>For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.</p> |
| GR_FLM4 | GR_FLM_OFF[22:0] | 0 | <p>Frame Buffer Frame Offset Address (lower)</p> <p>Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used.</p> <p>Buffer 0: GR_BASE</p> <p>Buffer 1: $GR_BASE + GR_FLM_OFF \times 1$</p> <p>:</p> <p>Buffer n: $GR_BASE + GR_FLM_OFF \times n$</p> <p>For 32-byte transfer, the lower 5 bits should be fixed to 0_0000.</p> <p>For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.</p> |

(8) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 38.8 Setting of Frame Buffer Size Smaller than One Frame

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|---|
| GR_FLM5 | GR_FLM_LOOP[10:0] | 1023 | <p>Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address.</p> <p>The number of lines is (GR_FLM_LOOP + 1).</p> |

(9) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 38.9 Line Offset Address Direction Control for Frame Buffer

| Register Name | Bit Name | Initial Value | Description |
|---------------|---------------|---------------|--|
| GR_FLM1 | GR_LN_OFF_DIR | 0 | Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address. |

Figure 38.3 Data Arrangement with Line Offset and Decrement Control

(10) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, α RGB1555, α RGB4444, α RGB8888, RGB α 5551, RGB α 8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 2, and 3 processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 process.

The GR_FORMAT[3:0] bits select a signal format.

Table 38.10 Format Selection for Frame Buffer Read Signal

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------------|---------------|---|
| GR_FLM6 | GR_FORMAT[3:0] | 0 | Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited * 9: YCbCr444 or setting prohibited * 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited |

Note: * Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 process, and is prohibited for the graphics 2 and 3 processes.

(11) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

Figure 38.4 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

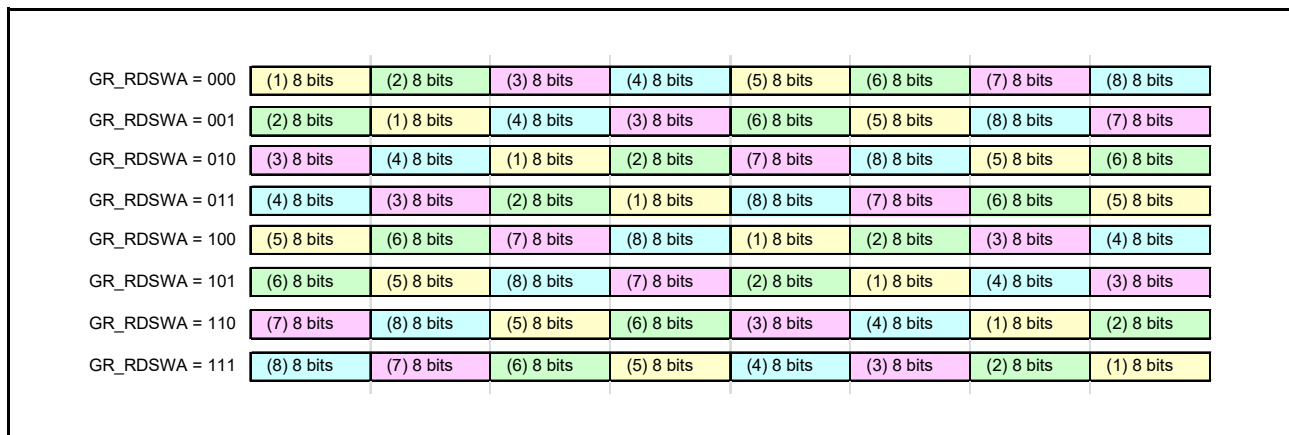

Figure 38.5 Data Arrangement with Endian Control Enabled

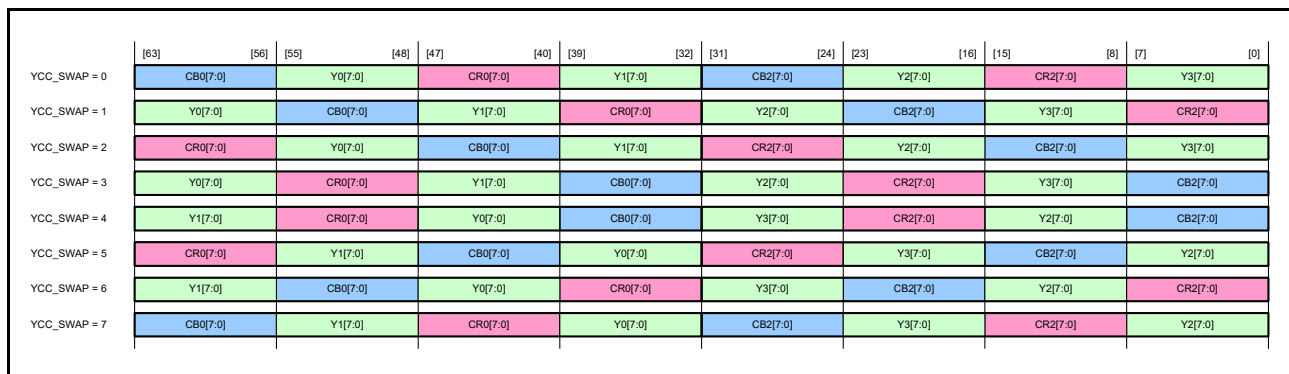

Figure 38.6 YCbCr422 Data Arrangement with Swapping Enabled

Table 38.11 Endian Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|--|
| GR_FLM6 | GR_RDSWA[2:0] | 0 | <p>Sets 8-, 16-, and 32-bit swap.</p> <p>These three bits specify the method for swapping the bits of frame buffer read data as follows.</p> <p>Bit 0</p> <p>0: 8 bits are not swapped.</p> <p>1: 8 bits are swapped.</p> <p>Bit 1</p> <p>0: 16 bits are not swapped.</p> <p>1: 16 bits are swapped.</p> <p>Bit 2</p> <p>0: 32 bits are not swapped.</p> <p>1: 32 bits are swapped.</p> <p>When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data.</p> <p>000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap]</p> <p>001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap]</p> <p>010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap]</p> <p>011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap]</p> <p>100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap]</p> <p>101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap]</p> <p>110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap]</p> <p>111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]</p> |
| GR_FLM6 | GR_YCC_SWAP [2:0] | 0 | <p>Controls swapping of data read from buffer in the YCbCr422 format. *</p> <p>0: Cb/Y0/Cr/Y1</p> <p>1: Y0/Cb/Y1/Cr</p> <p>2: Cr/Y0/Cb/Y1</p> <p>3: Y0/Cr/Y1/Cb</p> <p>4: Y1/Cr/Y0/Cb</p> <p>5: Cr/Y1/Cb/Y0</p> <p>6: Y1/Cb/Y0/Cr</p> <p>7: Cb/Y1/Cr/Y0</p> |

Note: * These bits are supported for the graphics 0 process only.

(12) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 38.12 Calculation of Display Start Position for Various Signal Formats

| Signal Format of Video/Graphics | Number of Bits per Pixel | Calculation Formula *1 |
|---|--------------------------|--|
| RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3 | 32 | GR_BASE[31:3] = t (H_OFF ÷ 2) GR_STA_POS[5:0] = mod (H_OFF ÷ 2) |
| RGB565 αRGB1555, RGBα5551 αRGB4444 | 16 | GR_BASE[31:3] = int (H_OFF ÷ 4) GR_STA_POS[5:0] = mod (H_OFF ÷ 4) |
| CLUT8 | 8 | GR_BASE[31:3] = int (H_OFF ÷ 8) GR_STA_POS[5:0] = mod (H_OFF ÷ 8) |
| CLUT4 | 4 | GR_BASE[31:3] = int (H_OFF ÷ 16) GR_STA_POS[5:0] = mod (H_OFF ÷ 16) |
| CLUT1 | 1 | GR_BASE[31:3] = int (H_OFF ÷ 64) GR_STA_POS[5:0] = mod (H_OFF ÷ 64) |

Note 1. The functions int() and mod() output a quotient and a remainder, respectively.

Note 2. The YCbCr422 format is not supported for the graphics 2 and 3 processes.

In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.

Note 3. The YCbCr444 format is not supported for the graphics 2 and 3 processes.

Table 38.13 Setting of Display Start Pixel of Read Data

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|--|
| GR_FLM6 | GR_STA_POS[5:0] | 0 | Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line. |
| GR_FLM2 | GR_BASE[31:0] | 0 | Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000. |

(13) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 process is converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2 and 3 processes.

Table 38.14 YCbCr422 to YCbCr444 Conversion

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------|---------------|---|
| GR_FLM6 | GR_CNV444_MD | 0 | Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. * 0: Hold interpolation 1: Average interpolation |

Note: * This bit is not provided for the graphics 2 and 3 processes, for which the YCbCr422 format is not supported.

(14) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, α RGB1555, and α RGB4444 formats are converted to the α RGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGB α 5551 format is converted to the RGB α 8888 format. The RGB α 5551 to RGB α 8888 format conversion is omitted because it differs from the α RGB5551 to α RGB8888 format conversion only in the position of α .

- RGB565 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is fixed to 255.

After conversion, $R[7:0] = R[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#R[4:0] \times 255 \div 31$

After conversion $G[7:0] = G[5:0] \times 259 \div 64$ (round off to an integer), approximation of $\#G[5:0] \times 255 \div 63$

After conversion, $B[7:0] = B[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#B[4:0] \times 255 \div 31$

- RGB888 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is fixed to 255.

- α RGB1555 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is GR_A1 when α input is 1, and GR_A0 when 0.

After conversion, $R[7:0] = R[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#R[4:0] \times 255 \div 31$

After conversion, $G[7:0] = G[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#G[4:0] \times 255 \div 31$

After conversion, $B[7:0] = B[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#B[4:0] \times 255 \div 31$

- α RGB4444 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0] = \alpha[3:0] \times 17$

After conversion, $R[7:0] = R[3:0] \times 17$

After conversion, $G[7:0] = G[3:0] \times 17$

After conversion, $B[7:0] = B[3:0] \times 17$

(15) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

38.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 38.7 shows the graphics display area.

Figure 38.7 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 38.15 Graphics Image Area Setting

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| GR_AB3 | GR_GRC_HS[10:0] | 0 | Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks. |
| GR_AB3 | GR_GRC_HW[10:0] | 0 | Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel). |
| GR_AB2 | GR_GRC_VS[10:0] | 0 | Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines. |
| GR_AB2 | GR_GRC_VW[10:0] | 0 | Sets the vertical width of the graphics image area. |
| GR_AB1 | GR_GRC_DISP_ON | 0 | Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on |

38.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 38.16 Interrupt Generation at Specified Line

| Register Name | Bit Name | Initial Value | Description |
|---------------|---------------|---------------|--|
| GR_CLUT_INT | GR_LINE[10:0] | 0 | Line Interrupt Set * When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 process only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used. |

Note: * This function is supported for the graphics 3 process only; these bits are not supported for the graphics 0 and 2 processes.

38.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 38.17 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 38.17 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

| GR_FORMAT[3:0] | Signal Format | Alpha Blending in Rectangular Area | RGB-Index Chroma-Key Processing | CLUT-Index Chroma-Key Processing | Alpha Blending in Pixel Units |
|----------------|-------------------|------------------------------------|---------------------------------|----------------------------------|-------------------------------|
| 0 | RGB565 | Supported | Supported *1 | Not supported | Not supported *2 |
| 1 | RGB888 | Supported | Supported | Not supported | Not supported *2 |
| 2 | α RGB1555 | Supported | Supported *1*3 | Not supported | Supported *3 |
| 3 | α RGB4444 | Supported | Supported *1 | Not supported | Supported |
| 4 | α RGB8888 | Supported | Supported | Not supported | Supported |
| 5 | CLUT8 | Supported | Not supported | Supported | Supported |
| 6 | CLUT4 | Supported | Not supported | Supported | Supported |
| 7 | CLUT1 | Supported *4 | Not supported | Supported *4 | Supported *4 |
| 8 | YCbCr422 | Not supported *5 | Not supported *5 | Not supported *5 | Not supported *5 |
| 9 | YCbCr444 | Not supported *5 | Not supported *5 | Not supported *5 | Not supported *5 |
| 10 | RGB α 5551 | Supported | Supported *1*3 | Not supported | Supported *3 |
| 11 | RGB α 8888 | Supported | Supported | Not supported | Supported |

Note 1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See section 38.1.2 (14) Bit Extension.)

Note 2. Since α value is 255, the current graphics is always displayed.

Note 3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.

Note 4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α , G, B, and R values (8 bits for each value). The CLUT table is not referenced.

Note 5. YCbCr422 and YCbCr444 are supported for the graphics 0 process, but any type of blending and chroma-key processing cannot be used.

38.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected.

This function is not supported for the VIN synthesizer.

Table 38.18 shows the settings for various display types.

Table 38.18 Settings for Various Display Types

| GR_DISP_SEL [1:0] | GR_ARC_ON | GR_CK_ON | GR_ARC_MUL | GR_ACALC_MD | Processing for Graphics Area | Processing for the Area outside the Graphics Area |
|----------------------|-----------|----------|------------|-------------|--|---|
| 0 | — | — | — | — | Background color | Background color |
| 1 | — | — | — | — | Lower-layer graphics | Lower-layer graphics |
| 2 | — | — | — | — | Current graphics | Background color |
| 3 | 1 | — | 0 | 0 | Alpha blending in a rectangular area*1 | Lower-layer graphics |
| 3 | 1 | — | 0 | 1 | Setting prohibited | |
| 3 | 1 | — | 1 | 0 | Multiplication with current alpha at alpha blending in a rectangular area*2 | Lower-layer graphics |
| 3 | 1 | — | 1 | 1 | Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2 | Lower-layer graphics |
| 3 | 0 | 1 | — | — | RGB-index or CLUT-index chroma-key processing | Lower-layer graphics |
| 3 | 0 | 0 | — | 0 | Alpha blending in one-pixel units*2 | Lower-layer graphics |
| 3 | 0 | 0 | — | 1 | Premultiplication at alpha blending in one-pixel units*2 | Lower-layer graphics |

Note 1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler.

Note 2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 2 and 3 processes only.

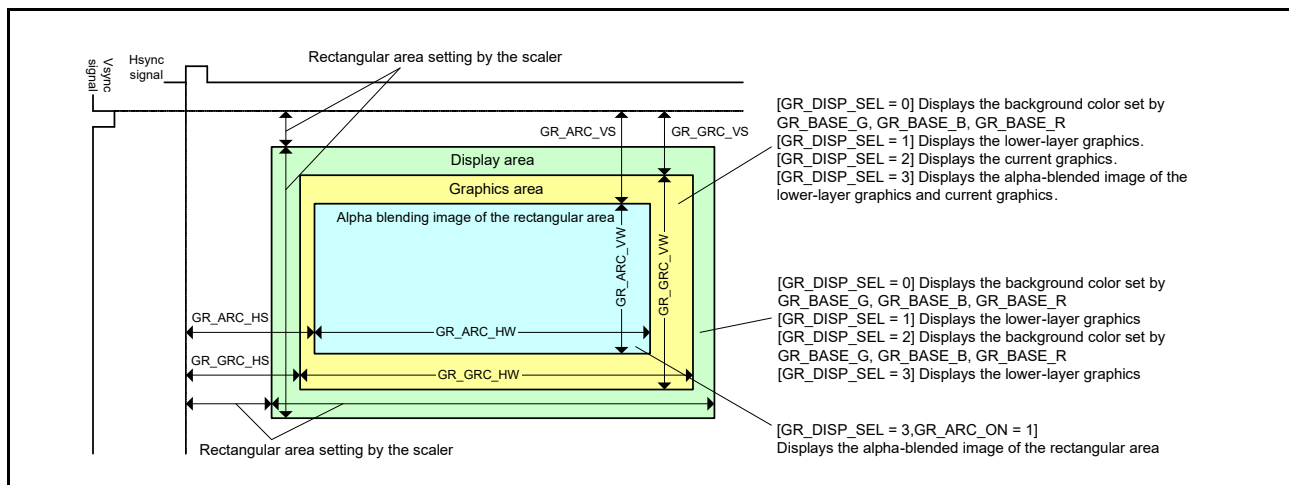

Figure 38.8 Graphic Display Types

Figure 38.9 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see Figure 38.1.

Figure 38.9 Graphics Planes with GR_DISP_SEL Set to 3

Table 38.19 Alpha Blending Setting

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|--|
| GR_AB1 | GR_DISP_SEL [1:0] | 0 | Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics*1 |
| GR_AB1 | GR_ARC_ON | 0 | Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On |
| GR_AB1 | GR_ARC_MUL | 0 | Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area.*3 0: Off 1: On |
| GR_AB1 | GR_ACALC_MD | 0 | Turns on/off premultiplication processing at alpha blending in one-pixel units.*3 0: Off 1: On |
| GR_AB7 | GR_CK_ON | 0 | Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On |

Note 1. The graphics 0 process supports the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only.

Note 2. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.

Note 3. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.

38.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 38.20 Background Color Setting

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------------|---------------|---|
| GR_BASE | GR_BASE_G[7:0] | 0 | Background color G signal G: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_BASE | GR_BASE_B[7:0] | 0 | Background color B signal B: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_BASE | GR_BASE_R[7:0] | 0 | Background color R signal R: 8 bits; unsigned (0 to 255 [LSB]) |

38.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

38.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

38.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 process.

Figure 38.10 shows the rectangular area setting for alpha blending.

Figure 38.10 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

Table 38.21 Setting of Rectangular Area for Alpha Blending

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|--|
| GR_AB5 | GR_ARC_HS[10:0] | 0 | Sets the horizontal start position of the valid image area for alpha blending in a rectangular area. |
| GR_AB5 | GR_ARC_HW[10:0] | 0 | Sets the horizontal width of the valid image area for alpha blending in a rectangular area. |
| GR_AB4 | GR_ARC_VS[10:0] | 0 | Sets the vertical start position of the valid image area for alpha blending in a rectangular area. |
| GR_AB4 | GR_ARC_VW[10:0] | 0 | Sets the vertical width of the valid image area for alpha blending in a rectangular area. |
| GR_AB1 | GR_ARC_DISP_ON | 0 | Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on |

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

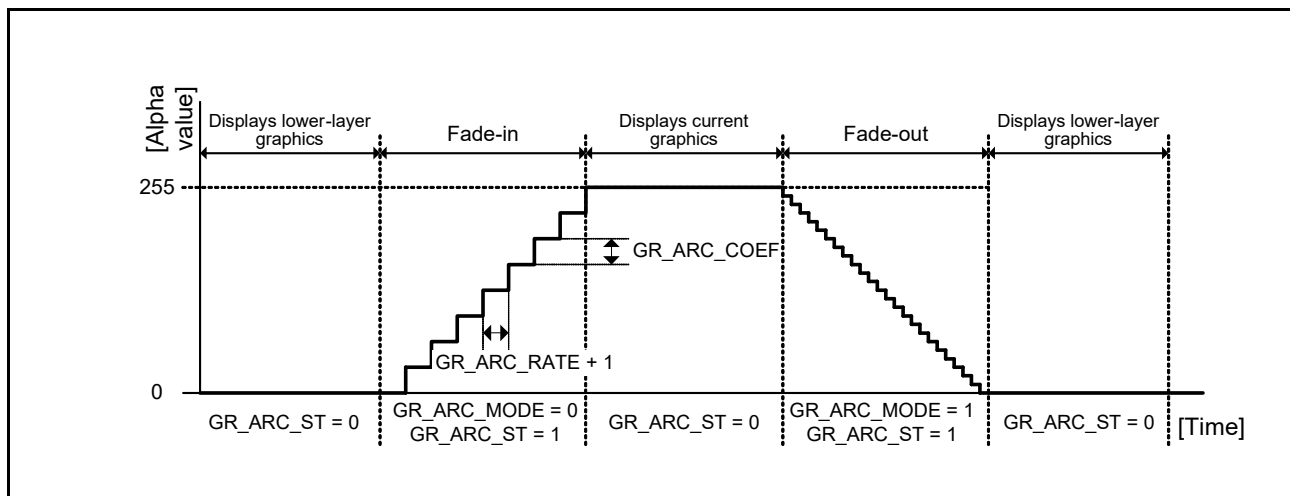

Figure 38.11 Fade In and Fade Out

Table 38.22 Setting for Alpha Blending in a Rectangular Area

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|--|
| GR_AB7 | GR_ARC_DEF[7:0] | 0 | Sets the initial alpha value for alpha blending in a rectangular area. |
| GR_AB6 | GR_ARC_MODE | 0 | Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction |
| GR_AB6 | GR_ARC_COEF[7:0] | 0 | Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value) |
| GR_AB6 | GR_ARC_RATE[7:0] | 0 | Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area. |
| GR_MON | GR_ARC_ST | — | Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress. |

The values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 38.23 Setting for RGB-Index Chroma-Key Processing

| Register Name | Bit Name | Initial Value | Description |
|---------------|---------------|---------------|---|
| GR_AB8 | GR_CK_KG[7:0] | 0 | G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB8 | GR_CK_KB[7:0] | 0 | B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB8 | GR_CK_KR[7:0] | 0 | R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB9 | GR_CK_A[7:0] | 0 | Replaced Alpha Signal after RGB-Index Chroma-Key Processing * α : 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB9 | GR_CK_G[7:0] | 0 | Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB9 | GR_CK_B[7:0] | 0 | Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB9 | GR_CK_R[7:0] | 0 | Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB]) |

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

38.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

CLUT input of the current graphics = GR_CK_KCLUT

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 38.24 Setting for CLUT-Index Chroma-Key Processing

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|--|
| GR_AB8 | GR_CK_KCLUT[7:0] | 0 | CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: 8 bits; unsigned (0 to 255 [LSB]) |
| GR_AB10 | GR_A0[7:0] | 0 | CLUT1 $\alpha 0$ Signal * Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 format and $\alpha = 0$. |
| GR_AB10 | GR_G0[7:0] | 0 | CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0. |
| GR_AB10 | GR_B0[7:0] | 0 | CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0. |
| GR_AB10 | GR_R0[7:0] | 0 | CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0. |
| GR_AB11 | GR_A1[7:0] | 0 | CLUT1 $\alpha 1$ Signal * Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 format and $\alpha = 1$. |
| GR_AB11 | GR_G1[7:0] | 0 | CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1. |
| GR_AB11 | GR_B1[7:0] | 0 | CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1. |
| GR_AB11 | GR_R1[7:0] | 0 | CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1. |

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

38.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 process and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below (rounded up if the result includes a decimal fraction).

[GR_ACALC_MD = 0]

G output = (G value \times α value + G input of the lower-layer graphics \times (255 - α value)) \div 256

B output = (B value \times α value + B input of the lower-layer graphics \times (255 - α value)) \div 256

R output = (R value \times α value + R input of the lower-layer graphics \times (255 - α value)) \div 256

[GR_ACALC_MD = 1 (premultiplication)]

G output = (G value + G input of the lower-layer graphics \times (255 - α value)) \div 256

B output = (B value + B input of the lower-layer graphics \times (255 - α value)) \div 256

R output = (R value + R input of the lower-layer graphics \times (255 - α value)) \div 256

38.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to α RGB8888 based on the CLUT table. When the format is CLUT1, it is converted to α RGB8888 based on the register value.

Figure 38.12 shows data arrangement in the CLUT table.

Figure 38.12 Data Arrangement in CLUT Table

The CLUT tables are arranged in the following addresses:

- Graphics 0 CLUT table: H'FCFF6000 to H'FCFF63FF
(For CLUT4, addresses H'FCFF6000 to H'FCFF603F are valid.)
- Graphics 2 CLUT table: H'FCFF6800 to H'FCFF6BFF
(For CLUT4, addresses H'FCFF6800 to H'FCFF683F are valid.)
- Graphics 3 CLUT table: H'FCFF6C00 to H'FCFF6FFF
(For CLUT4, addresses H'FCFF6C00 to H'FCFF6C3F are valid.)

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table. To switch the CLUT tables after having written to one, execute a dummy read from any location in the address space of the given CLUT table before switching them.

Table 38.25 CLUT Table Selection

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------|---------------|--|
| GR_CLUT | GR_CLT_SEL | 0 | CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to α RGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to α RGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU. |

38.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in section 38.1.14, Alpha Blending Calculation.

[GR_ARC_MUL=0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ARC_MUL=1 (premultiplication)]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

38.1.17 Selection of Lower-Layer Graphics in VIN Synthesizer

Graphics 0 is allocated to the lower-layer graphics in the VIN synthesizer.

Table 38.26 Selection of Lower-Layer Plane in Scaler

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------------|---------------|---|
| GR_VIN_AB1 | GR_VIN_SCL_ UND_SEL | 0 | Specifies lower-layer plane in the scaler. 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited |

38.2 Register Descriptions

Table 38.27 to Table 38.30 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 38.27 shows the register configuration for the graphics 2 process.

Table 38.28 shows the register configuration for the graphics 3 process.

Table 38.29 shows the CLUT table configuration.

Table 38.30 shows the register configuration for the VIN synthesizer.

The register configuration for the graphics 0 process is described in section 36, Video Display Controller 6 (3): Scaler.

Table 38.27 Register Configuration of the Image Synthesizer (Graphics 2 Process)

| Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|--------------|-------|---------------|-------------|-------------|
| Graphics 2 register update control register | GR2_UPDATE | R/WC1 | H'0000 0000 | H'FCFF 7700 | 32 |
| Frame buffer read control register (Graphics 2) | GR2_FLM_RD | R/W | H'0000 0000 | H'FCFF 7704 | 32 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-------|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | GR2_UPDATE | 0 | R/WC1 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR2_P_VEN | 0 | R/WC1 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR2_IBUS_VEN | 0 | R/WC1 | Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

38.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR2_R_ENB |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR2_R_ENB | 0 | R/W | Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled. |

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

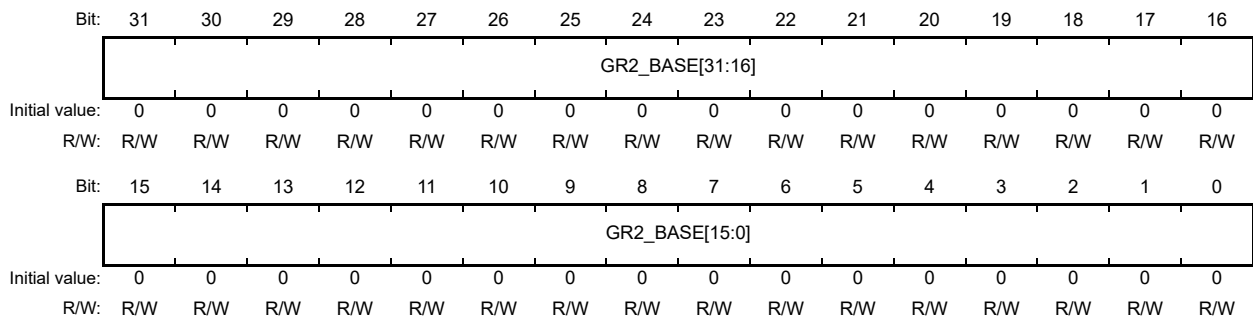

38.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-------------------|-----|----|----|----|----|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR2_LN_OFF_DIR |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | GR2_FLM_SEL [1:0] | | — | — | — | — | — | — | — | GR2_BST_MD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | GR2_LN_OFF_DIR | 0 | R/W | Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | GR2_FLM_SEL [1:0] | 0 | R/W | Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited |
| 7 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR2_BST_MD | 0 | R/W | Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer |

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.
GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|--|
| 31 to 0 | GR2_BASE [31:0] | 0 | R/W | Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000. |

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 16 | GR2_LN_OFF[14:0] | 0 | R/W | Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE Line 1: GR2_BASE + GR2_LN_OFF × 1 : Line n: GR2_BASE + GR2_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | GR2_FLM_NUM[9:0] | 0 | R/W | Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL = 1. |

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|--------------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | GR2_FLM_OFF[22:16] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR2_FLM_OFF[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 0 | GR2_FLM_OFF[22:0] | 0 | R/W | Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE Buffer 1: GR2_BASE + GR2_FLM_OFF × 1 : Buffer n: GR2_BASE + GR2_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000. |

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR2_FLM_LNUM[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR2_FLM_LOOP[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR2_FLM_LNUM[10:0] | 0 | R/W | Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM + 1). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR2_FLM_LOOP[10:0] | 1023 | R/W | Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP + 1). |

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

38.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|----------------|-----|--------------|-----|-----|-----|-----|------------------|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR2_FORMAT[3:0] | | | | — | GR2_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | GR2_RDSWA[2:0] | | | — | — | — | — | GR2_STA_POS[5:0] | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 28 | GR2_FORMAT[3:0] | 0 | R/W | Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited |
| 27 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 26 to 16 | GR2_HW[10:0] | 0 | R/W | Sets the width of the horizontal valid period. The width is (GR2_HW + 1) pixels. Note: Set to 2 or greater. |
| 15 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 to 10 | GR2_RDSWA[2:0] | 0 | R/W | Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap] |
| 9 to 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5 to 0 | GR2_STA_POS[5:0] | 0 | R/W | Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR2_STA_POS is skipped from the start of the line. |

Note: GR2_STA_POS is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA is updated when GR2_UPDATE in GR2_UPDATE is 1.
GR2_FORMAT and GR2_HW are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

38.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|--------------|----|------------|----|----|----|-----------------|----|----|----|-----------------|----|----|--------------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR2_ARC_MUL | GR2_ACALC_MD | — | GR2_ARC_ON | — | — | — | GR2_ARC_DISP_ON | — | — | — | GR2_GRC_DISP_ON | — | — | GR2_DISP_SEL [1:0] | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 | GR2_ARC_MUL | 0 | R/W | Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On |
| 14 | GR2_ACALC_MD | 0 | R/W | Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On |
| 13 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 12 | GR2_ARC_ON | 0 | R/W | Turns on/off alpha blending in a rectangular area. 0: Off 1: On |
| 11 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | GR2_ARC_DISP_ON | 0 | R/W | Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR2_GRC_DISP_ON | 0 | R/W | Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | GR2_DISP_SEL[1:0] | 0 | R/W | Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR2_GRC_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR2_GRC_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR2_GRC_VS[10:0] | 0 | R/W | Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR2_GRC_VS + GR2_GRC_VW should be smaller than or equal to 2039 lines. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR2_GRC_VW[10:0] | 0 | R/W | Sets the vertical width of the graphics image area. |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR2_GRC_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR2_GRC_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR2_GRC_HS[10:0] | 0 | R/W | Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR2_GRC_HS + GR2_GRC_HW should be smaller than or equal to 2015 clocks. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR2_GRC_HW[10:0] | 0 | R/W | Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW to 2 and GR2_GRC_HW to 1 (1-pixel) or 2 (2-pixel). |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR2_ARC_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR2_ARC_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR2_ARC_VS[10:0] | 0 | R/W | Sets the vertical start position of the valid image area for alpha blending in a rectangular area. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR2_ARC_VW[10:0] | 0 | R/W | Sets the vertical width of the valid image area for alpha blending in a rectangular area. |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR2_ARC_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR2_ARC_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR2_ARC_HS[10:0] | 0 | R/W | Sets the horizontal start position of the valid image area for alpha blending in a rectangular area. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR2_ARC_HW[10:0] | 0 | R/W | Sets the horizontal width of the valid image area for alpha blending in a rectangular area. |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|--------------|-------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | GR2_ARC_MODE | GR2_ARC_COEF[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | GR2_ARC_RATE[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | GR2_ARC_MODE | 0 | R/W | Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction |
| 23 to 16 | GR2_ARC_COEF[7:0] | 0 | R/W | Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value) |
| 15 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | GR2_ARC_RATE[7:0] | 0 | R/W | Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area. |

Note: This bit is updated when GR2_P_VEN in GR2_UPDATE is 1.

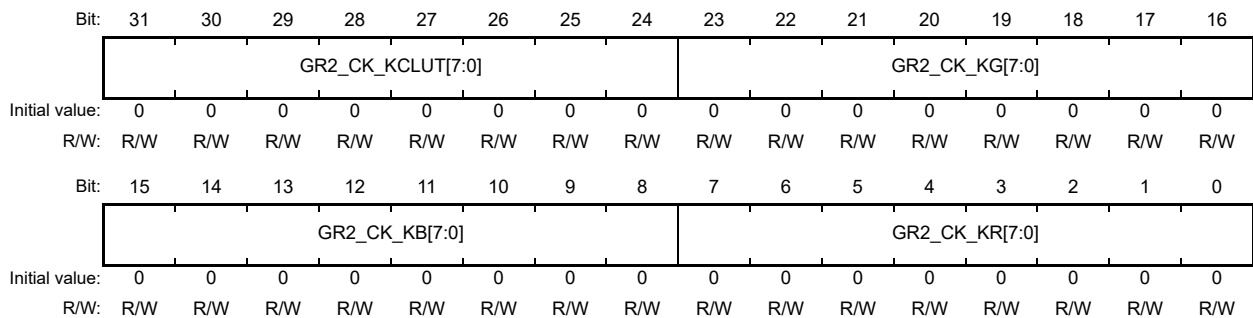

38.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | GR2_ARC_DEF[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR2_CK_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | GR2_ARC_DEF[7:0] | 255 | R/W | Sets the initial alpha value for alpha blending in a rectangular area. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR2_CK_ON | 0 | R/W | Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 24 | GR2_CK_KCLUT[7:0] | 0 | R/W | CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB]) |
| 23 to 16 | GR2_CK_KG[7:0] | 0 | R/W | G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR2_CK_KB[7:0] | 0 | R/W | B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR2_CK_KR[7:0] | 0 | R/W | R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------|---------------|-----|---|
| 31 to 24 | GR2_CK_A[7:0] | 0 | R/W | Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB]) |
| 23 to 16 | GR2_CK_G[7:0] | 0 | R/W | Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR2_CK_B[7:0] | 0 | R/W | Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR2_CK_R[7:0] | 0 | R/W | Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR2_A0[7:0] | | | | | | | | GR2_G0[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR2_B0[7:0] | | | | | | | | GR2_R0[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 24 | GR2_A0 [7:0] | 0 | R/W | CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 0. |
| 23 to 16 | GR2_G0 [7:0] | 0 | R/W | CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0. |
| 15 to 8 | GR2_B0 [7:0] | 0 | R/W | CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0. |
| 7 to 0 | GR2_R0 [7:0] | 0 | R/W | CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0. |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR2_A1[7:0] | | | | | | | | GR2_G1[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR2_B1[7:0] | | | | | | | | GR2_R1[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 24 | GR2_A1 [7:0] | 0 | R/W | CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 1. |
| 23 to 16 | GR2_G1 [7:0] | 0 | R/W | CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1. |
| 15 to 8 | GR2_B1 [7:0] | 0 | R/W | CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1. |
| 7 to 0 | GR2_R1 [7:0] | 0 | R/W | CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1. |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|-----|-----|-----|-----|-----|-----------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | GR2_BASE_G[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR2_BASE_B[7:0] | | | | | | | | GR2_BASE_R[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | GR2_BASE_G [7:0] | 0 | R/W | Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR2_BASE_B [7:0] | 0 | R/W | Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR2_BASE_R [7:0] | 0 | R/W | Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR2_C LT_SEL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | GR2_CLT_ SEL | 0 | R/W | CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU. |
| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

38.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR2_ARC_ST |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR2_ARC_ST | 0 | R | Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress. |

38.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|---------------|----|----|----|---------------|----|----|----|------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | GR3UP DATE | — | — | — | GR3_P _VEN | — | — | — | GR3_IBUS_ VEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/WC1 | R | R | R | R/WC1 | R | R | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-------|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | GR3_UPDATE | 0 | R/WC1 | Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR3_P_VEN | 0 | R/WC1 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR3_IBUS_VEN | 0 | R/WC1 | Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

38.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR3_R_ENB |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR3_R_ENB | 0 | R/W | Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled. |

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

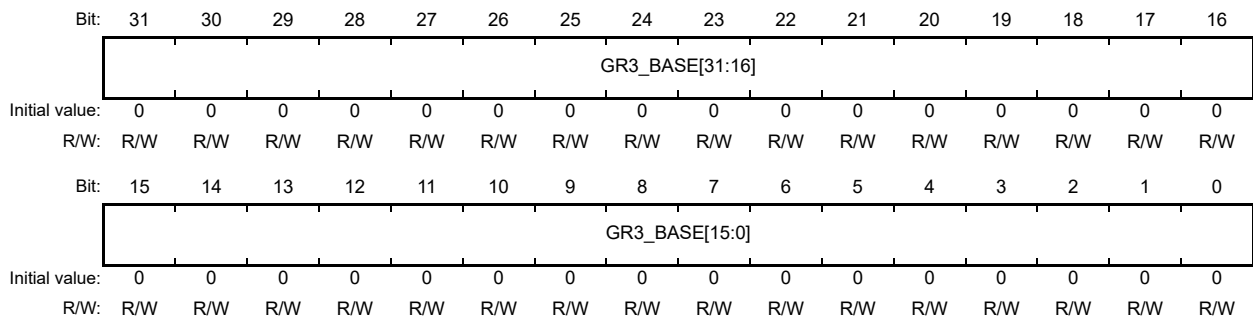

38.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|------------------|-----|----|----|----|----|----|----|----|----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR3_LN_OFF_DIR |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | GR3_FLM_SEL[1:0] | — | — | — | — | — | — | — | — | GR3_BST_MD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | GR3_LN_OFF_DIR | 0 | R/W | Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | GR3_FLM_SEL[1:0] | 0 | R/W | Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited |
| 7 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR3_BST_MD | 0 | R/W | Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128-byte transfer |

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.
GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|--|
| 31 to 0 | GR3_BASE [31:0] | 0 | R/W | Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000. |

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 16 | GR3_LN_OFF[14:0] | 0 | R/W | Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE Line 1: GR3_BASE + GR3_LN_OFF × 1 : Line n: GR3_BASE + GR3_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | GR3_FLM_NUM[9:0] | 0 | R/W | Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL = 1. |

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

| | | | | | | | | | | | | | | | | |
|----------------|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|--------------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | GR3_FLM_OFF[22:16] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR3_FLM_OFF[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 0 | GR3_FLM_OFF[22:0] | 0 | R/W | Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE Buffer 1: GR3_BASE + GR3_FLM_OFF × 1 : Buffer n: GR3_BASE + GR3_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000. |

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR3_FLM_LNUM[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR3_FLM_LOOP[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR3_FLM_LNUM[10:0] | 0 | R/W | Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM + 1). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR3_FLM_LOOP[10:0] | 1023 | R/W | Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP + 1). |

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

38.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|----------------|-----|--------------|-----|-----|-----|-----|------------------|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GR3_FORMAT[3:0] | | | | — | GR3_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | GR3_RDSWA[2:0] | | | — | — | — | — | GR3_STA_POS[5:0] | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 28 | GR3_FORMAT [3:0] | 0 | R/W | Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited |
| 27 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 26 to 16 | GR3_HW[10:0] | 0 | R/W | Sets the width of the horizontal valid period. The width is (GR3_HW + 1) pixels. Note: Set to 2 or greater. |
| 15 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 to 10 | GR3_RDSWA [2:0] | 0 | R/W | Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap] |
| 9 to 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5 to 0 | GR3_STA_POS[5:0] | 0 | R/W | Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS is skipped from the start of the line. |

Note: GR3_STA_POS is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA is updated when GR3_UPDATE in GR3_UPDATE is 1.
GR3_FORMAT and GR3_HW are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

38.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|--------------|----|------------|----|----|----|-----------------|----|----|----|-----------------|----|----|-------------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GR3_ARC_MUL | GR3_ACALC_MD | — | GR3_ARC_ON | — | — | — | GR3_ARC_DISP_ON | — | — | — | GR3_GRC_DISP_ON | — | — | GR3_DISP_SEL[1:0] | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 | GR3_ARC_MUL | 0 | R/W | Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On |
| 14 | GR3_ACALC_MD | 0 | R/W | Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On |
| 13 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 12 | GR3_ARC_ON | 0 | R/W | Turns on/off alpha blending in a rectangular area. 0: Off 1: On |
| 11 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | GR3_ARC_DISP_ON | 0 | R/W | Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR3_GRC_DISP_ON | 0 | R/W | Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | GR3_DISP_SEL[1:0] | 0 | R/W | Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR3_GRC_VS[10:0] | 0 | R/W | Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS + GR3_GRC_VW should be smaller than or equal to 2039 lines. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR3_GRC_VW[10:0] | 0 | R/W | Sets the vertical width of the graphics image area. |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR3_GRC_HS[10:0] | 0 | R/W | Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS + GR3_GRC_HW should be smaller than or equal to 2015 clocks. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR3_GRC_HW[10:0] | 0 | R/W | Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW to 2 and GR3_GRC_HW to 1 (1-pixel) or 2 (2-pixel). |

Note: All the bits assigned to this address are updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR3_ARC_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR3_ARC_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR3_ARC_VS[10:0] | 0 | R/W | Sets the vertical start position of the valid image area for alpha blending in a rectangular area. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR3_ARC_VW[10:0] | 0 | R/W | Sets the vertical width of the valid image area for alpha blending in a rectangular area. |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | GR3_ARC_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | GR3_ARC_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | GR3_ARC_HS[10:0] | 0 | R/W | Sets the horizontal start position of the valid image area for alpha blending in a rectangular area. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | GR3_ARC_HW[10:0] | 0 | R/W | Sets the horizontal width of the valid image area for alpha blending in a rectangular area. |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|--------------|-------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | GR3_CK_ON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | GR3_ARC_DEF[7:0] | 255 | R/W | Sets the initial alpha value for alpha blending in a rectangular area. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GR3_CK_ON | 0 | R/W | Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 24 | GR3_CK_KCLUT[7:0] | 0 | R/W | CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB]) |
| 23 to 16 | GR3_CK_KG[7:0] | 0 | R/W | G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR3_CK_KB[7:0] | 0 | R/W | B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR3_CK_KR[7:0] | 0 | R/W | R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------|---------------|-----|---|
| 31 to 24 | GR3_CK_A[7:0] | 0 | R/W | Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB]) |
| 23 to 16 | GR3_CK_G[7:0] | 0 | R/W | Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB]) |
| 15 to 8 | GR3_CK_B[7:0] | 0 | R/W | Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB]) |
| 7 to 0 | GR3_CK_R[7:0] | 0 | R/W | Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB]) |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 24 | GR3_A0 [7:0] | 0 | R/W | CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 0. |
| 23 to 16 | GR3_G0 [7:0] | 0 | R/W | CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0. |
| 15 to 8 | GR3_B0 [7:0] | 0 | R/W | CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0. |
| 7 to 0 | GR3_R0 [7:0] | 0 | R/W | CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0. |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|--|
| 31 to 24 | GR3_A1 [7:0] | 0 | R/W | CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 1. |
| 23 to 16 | GR3_G1 [7:0] | 0 | R/W | CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1. |
| 15 to 8 | GR3_B1 [7:0] | 0 | R/W | CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1. |
| 7 to 0 | GR3_R1 [7:0] | 0 | R/W | CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1. |

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

38.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|-----|-----|-----|-----|-----|-----|-----|-----------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | GR3_BASE_G[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/WC1 | R | R | R | R/WC1 | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------|---------------|-------|--|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | GR_VIN_UPDATE | 0 | R/WC1 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | GR_VIN_P_VEN | 0 | R/WC1 | Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| 3 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

38.2.46 Alpha Blending Control Register 1 (VIN Synthesizer) (GR_VIN_AB1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------------|----------------------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | GR_VIN_SCL_UND_SEL | GR_VIN_DISP_SEL[1:0] | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------------|---------------|-----|---|
| 31 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 | GR_VIN_SCL_UND_SEL | 0 | R/W | Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited |
| 1, 0 | GR_VIN_DISP_SEL[1:0] | 0 | R/W | Selects the graphics display mode. 0: Background color display (fixed to black) 1: Lower-layer graphics display 2: Setting prohibited 3: Setting prohibited |

Note: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

38.3 Usage Method

38.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], and GR_VIN_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 2, and 3 processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state. Note that the background color for the VIN synthesizer is fixed to black.

38.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

39. Video Display Controller 6 (7): Output Controller

39.1 Output Controller

39.1.1 Overview of Functions

The output controller subjects RGB signals output from the image synthesizer to brightness adjustment, contrast adjustment, gamma correction of individual RGB, dither process, and output format conversion.

RGB signals can be output from the LVDS. For output from the LVDS, see section 41, LVDS Output Interface.

Figure 39.1 shows the function block diagram of the output controller.

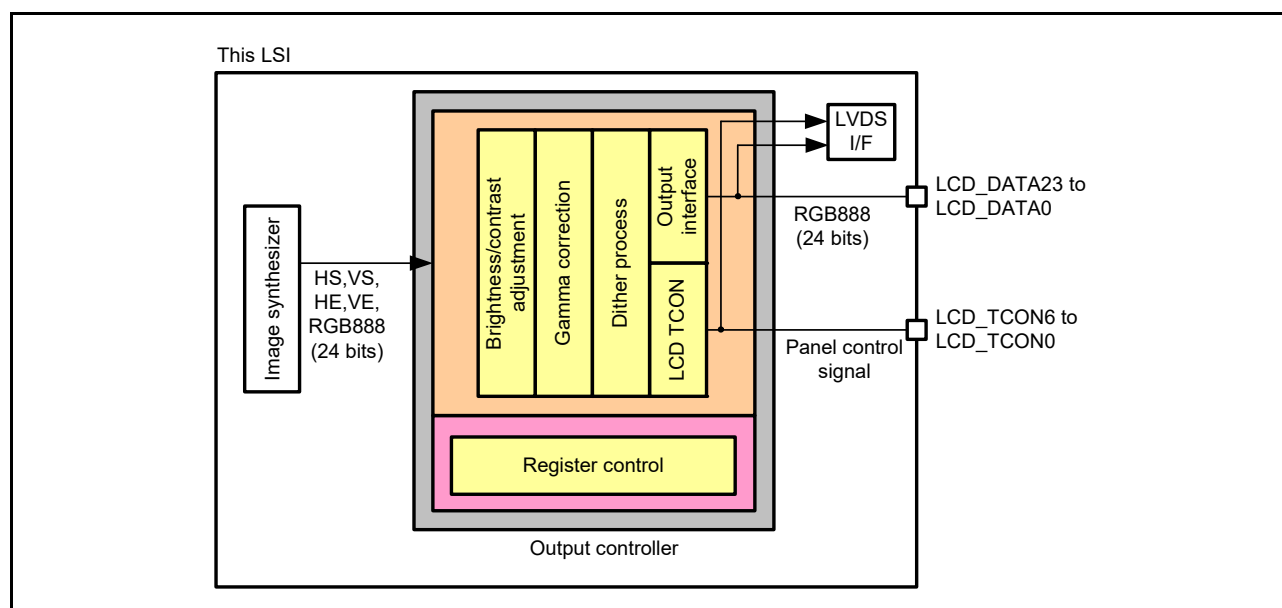

Figure 39.1 Functional Block Diagram of Output Controller

39.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 39.1 Register Update Control

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------|---------------|---|
| OUT_UPDATE | OUTCNT_VEN | 0 | Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| GAM_G_UPDATE | GAM_G_VEN | 0 | Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| GAM_B_UPDATE | GAM_B_VEN | 0 | Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| GAM_R_UPDATE | GAM_R_VEN | 0 | Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |
| TCON_UPDATE | TCON_VEN | 0 | LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

39.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 39.2 Route Selection

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|---|
| OUT_CLK_PHASE | OUTCNT_FRONT_GAM | 0 | Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast |

39.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from the image synthesizer.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

$$\text{BRT_GOUT} = \text{GIN} + \text{PBRT_G} - 512$$

$$\text{BRT_BOUT} = \text{BIN} + \text{PBRT_B} - 512$$

$$\text{BRT_ROUT} = \text{RIN} + \text{PBRT_R} - 512$$

Table 39.3 Brightness (DC) Adjustment

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------|---------------|--|
| OUT_BRIGHT1 | PBRT_G[9:0] | 512 | Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset) |
| OUT_BRIGHT2 | PBRT_B[9:0] | 512 | Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset) |
| OUT_BRIGHT2 | PBRT_R[9:0] | 512 | Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset) |

39.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

$$\text{GOUT} = \text{BRT_GOUT} \times \text{CONT_G}/128$$

$$\text{BOUT} = \text{BRT_BOUT} \times \text{CONT_B}/128$$

$$\text{ROUT} = \text{BRT_ROUT} \times \text{CONT_R}/128$$

Table 39.4 Contrast (Gain) Adjustment

| Register Name | Bit Name | Initial Value | Description |
|---------------|--------------|---------------|---|
| OUT_CONTRAST | CONT_G [7:0] | 128 | Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times) |
| OUT_CONTRAST | CONT_B [7:0] | 128 | Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times) |
| OUT_CONTRAST | CONT_R [7:0] | 128 | Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times) |

39.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$$

DIN: Input signal (8-bit)

DOUT: Output signal (10-bit)

$TH_{(n)}$: Threshold (8-bit)

$OFFSET_{(n)}$: Offset value (19-bit)

$GAIN_{(n)}$: Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF_O_{(n)} \text{ (When } n = 0, OFFSET_{(0)} = 0.)$$

$$DEF_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)} \text{ (When } n = 0, OFFSET_{(0)} = 0.)$$

$OFFSET_{(n)}$: Offset value of current area (19-bit)

$OFFSET_{(n-1)}$: Offset value of previous area (19-bit)

$DEF_O_{(n)}$: Difference in offset value of Current and previous area (19-bit)

$TH_{(n)}$: Threshold of current area (8-bit)

$TH_{(n-1)}$: Threshold of previous area (8-bit)

$GAIN_{(n-1)}$: Gain coefficient of previous area (11-bit)

39.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2×2 pattern dither mode and random pattern dither mode.

Figure 39.4 Operation Specification of 2×2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

(a) 10 bits to 8 bits

$$\text{Output RGB data}[7:0] = \text{Input RGB data}[9:0] \div 4 \text{ (truncate the number below the decimal point)}$$

(b) 10 bits to 6 bits

$$\text{Output RGB data}[7:2] = \text{Input RGB data}[9:0] \div 16 \text{ (truncate the number below the decimal point)}$$

(c) 10 bits to 5 bits

$$\text{Output RGB data}[7:3] = \text{Input RGB data}[9:0] \div 32 \text{ (truncate the number below the decimal point)}$$

[Round-off mode]

- (a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

- (b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

- (c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

- (a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

- (b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

- (c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 39.6 Panel Dither Correction

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|---|
| OUT_PDTHA | PDTH_SEL[1:0] | 0 | Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither |
| OUT_PDTHA | PDTH_FORMAT[1:0] | 0 | Panel Dither Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Setting prohibited |
| OUT_PDTHA | PDTH_PA[1:0] | 3 | Pattern Value (A) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB]) |
| OUT_PDTHA | PDTH_PB[1:0] | 0 | Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB]) |
| OUT_PDTHA | PDTH_PC[1:0] | 2 | Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB]) |
| OUT_PDTHA | PDTH_PD[1:0] | 1 | Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB]) |

39.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 39.7 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

Table 39.7 Bit Allocation of RGB Signal Input for RGB888 Output

| OUT_FORMAT | 0 | 0 | 0 | 0 |
|---------------|--------|--------|--------|--------|
| OUT_ENDIAN_ON | 0 | 0 | 1 | 1 |
| OUT_SWAP_ON | 0 | 1 | 0 | 1 |

| LCD_DATA0 | BIN[3] | RIN[3] | BIN[7] | RIN[7] |

(4) Bit Allocation of LCD Signal for Serial RGB Output

For serial RGB output, RGB signal input shown Table 39.10 is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

Table 39.10 Bit Allocation of RGB Signal Input for Serial RGB Output

| | | | | |
|---------------|--------|--------|--------|--------|
| OUT_FORMAT | 3 | 3 | 3 | 3 |

| b[0] | BIN[0] | RIN[0] | BIN[7] | RIN[7] |

(5) Parallel to Serial Conversion

As shown in Table 39.11, four types of parallel to serial conversions are possible by controlling clock speed mode and selecting the scan direction ('n' in the table are natural numbers).

Table 39.11 Specifications of Serial RGB Output

| | | | | |
|-------------|-------------------------|-------------------------|-----------------------------|-----------------------------|
| OUT_FRQ_SEL | 1 | 1 | 2 | 2 |
| OUT_DIR_SEL | 0 | 1 | 0 | 1 |
| Line (2n-1) | Repeated (r → g → b) | Repeated (b → g → r) | Repeated (r → g → b → X) | Repeated (X → b → g → r) |
| Line 2n | Repeated (g → b → r) | Repeated (r → b → g) | Repeated (r → g → b → X) | Repeated (X → b → g → r) |

Figure 39.5 and Figure 39.6 show the timing of parallel to serial conversion in triple speed and quadruple speed modes, respectively.

Figure 39.5 Timing of Parallel to Serial Conversion in Triple Speed Mode

Figure 39.6 Timing of Parallel to Serial Conversion in Quadruple Speed Mode

During serial output, the phase timing with the HE signal can be adjusted by OUT_PHASE[0:1].

Figure 39.7 shows the timing of the clock phases of the serial RGB output (triple speed mode).

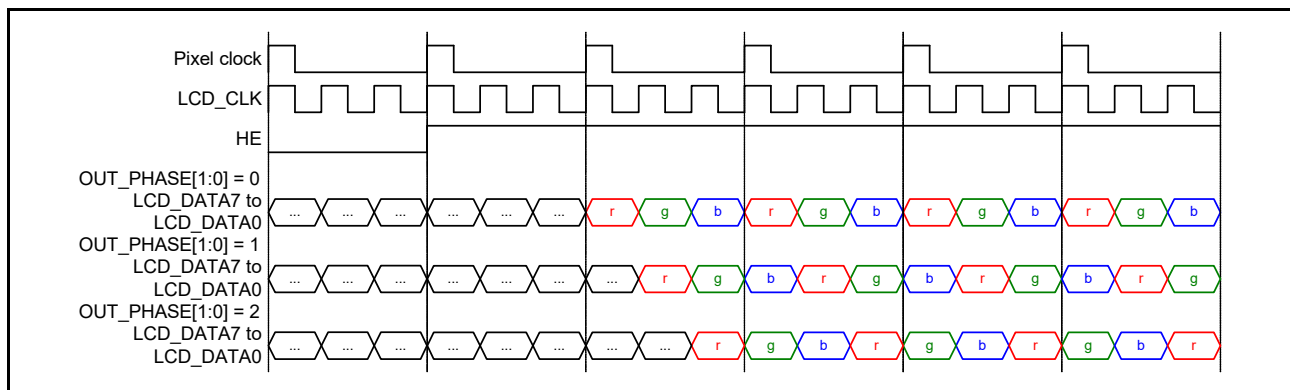

Figure 39.7 Timing of Clock Phases of Serial RGB Output (Triple Speed Mode)

Figure 39.8 shows the timing of the clock phases of the serial RGB output (quadruple speed mode).

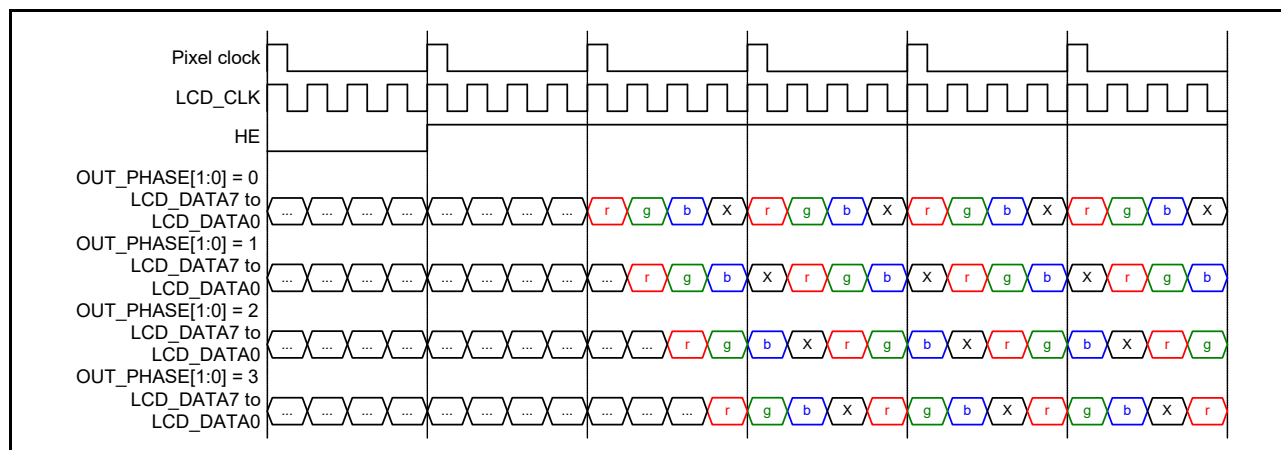

Figure 39.8 Timing of Clock Phases of Serial RGB Output (Quadruple Speed Mode)

Table 39.12 Output Format Conversion

| Register Name | Bit Name | Initial Value | Description |

39.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. Table 39.13 lists the timing signals that are generated by LCD TCON

Table 39.13 Signals Generated by LCD TCON

| Signal Name | Type | Description |
|-------------|---------------------|---|
| STVA/VS | Vertical | <ul style="list-style-type: none"> Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Vsync signal The width, position, and polarity of the sync signal can be controlled. |
| STVB/VE | Vertical | <ul style="list-style-type: none"> Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Vertical enable signal The width, position, and polarity of the sync signal can be controlled. |
| STH/SP/HS | Horizontal | <ul style="list-style-type: none"> Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Hsync signal The width, position, and polarity of the sync signal can be controlled. |
| STB/LP/HE | Horizontal | <ul style="list-style-type: none"> Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Horizontal enable signal The width, position, and polarity of the enable signal can be controlled. |

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

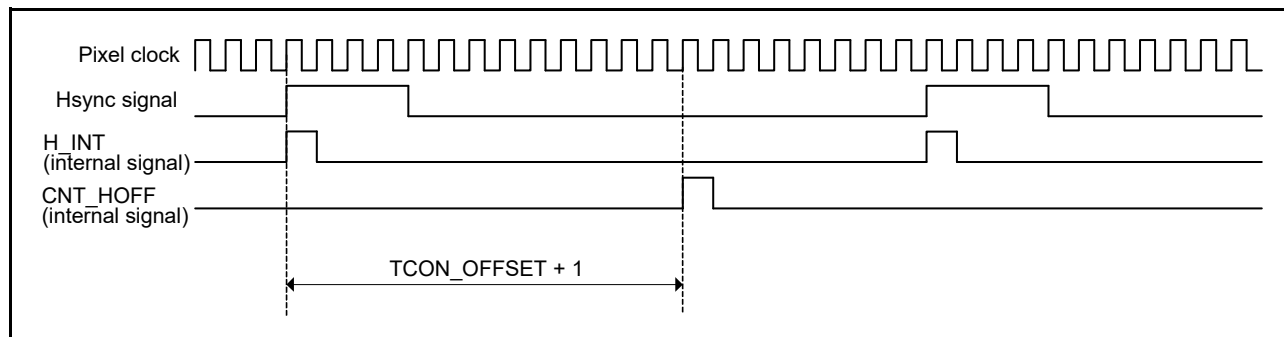

Figure 39.9 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 39.14 Horizontal Reference Signal Selection

| Signal Name | Bit Name | Initial Value | Description |
|----------------|-------------------|---------------|---|
| TCON_TIM | TCON_OFFSET[10:0] | 0 | Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal. |
| TCON_TIM_STH2 | TCON_STH_HS_SEL | 0 | STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| TCON_TIM_STB2 | TCON_STB_HS_SEL | 0 | STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| TCON_TIM_CPV2 | TCON_CPV_HS_SEL | 0 | CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| TCON_TIM_POLA2 | TCON_POLA_HS_SEL | 0 | POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| TCON_TIM_POLB2 | TCON_POLB_HS_SEL | 0 | POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

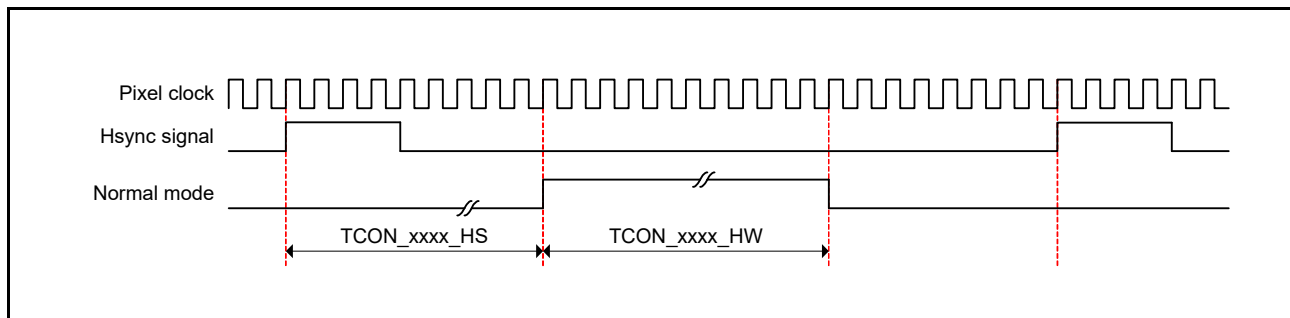

Figure 39.10 Horizontal Panel Driver Signal (in Normal Mode)

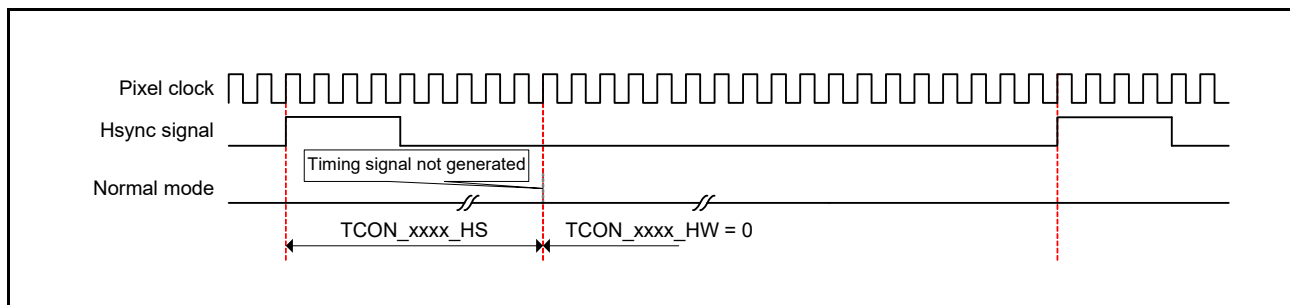

Figure 39.11 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW = 0)

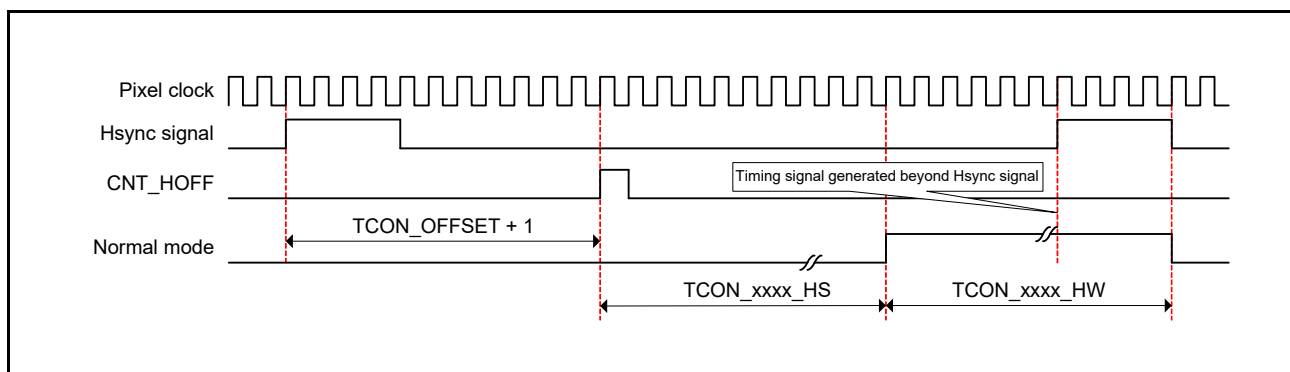

Figure 39.12 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 39.15 Settings for Horizontal Panel Driver Signal Generation (A)

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------------|---------------|---|
| TCON_TIM_STH1 | TCON_STH_HS[10:0] | 0 | STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS from the rising edge of the Hsync signal (clock cycles) |
| TCON_TIM_STH1 | TCON_STH_HW[10:0] | 96 | STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles) |
| TCON_TIM_STB1 | TCON_STB_HS[10:0] | 144 | STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS from the rising edge of the Hsync signal (clock cycles) |
| TCON_TIM_STB1 | TCON_STB_HW[10:0] | 640 | STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles) |
| TCON_TIM_CPV1 | TCON_CPV_HS[10:0] | 0 | CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS from the rising edge of the Hsync signal (clock cycles) |
| TCON_TIM_CPV1 | TCON_CPV_HW[10:0] | 0 | CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles) |

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every horizontal period. The following three reverse modes are selectable for polarity inversion operation.

Table 39.16 Horizontal Panel Driver Signal Generation Modes

| Register Name | Bit Name | Initial Value | Description |
|----------------|-----------------------|---------------|---|
| TCON_TIM_POLA2 | TCON_POLA_MD [1:0] | 1 | POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods. |

Table 39.16 Horizontal Panel Driver Signal Generation Modes

| Register Name | Bit Name | Initial Value | Description |
|----------------|-----------------------|---------------|--|
| TCON_TIM_POLB2 | TCON_POLB_MD [1:0] | 1 | POLB Signal Generation Mode Select |
| | | | 0: Normal mode Generates the signal that changes twice a horizontal period. |
| | | | 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. |
| | | | 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. |
| | | | 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods. |

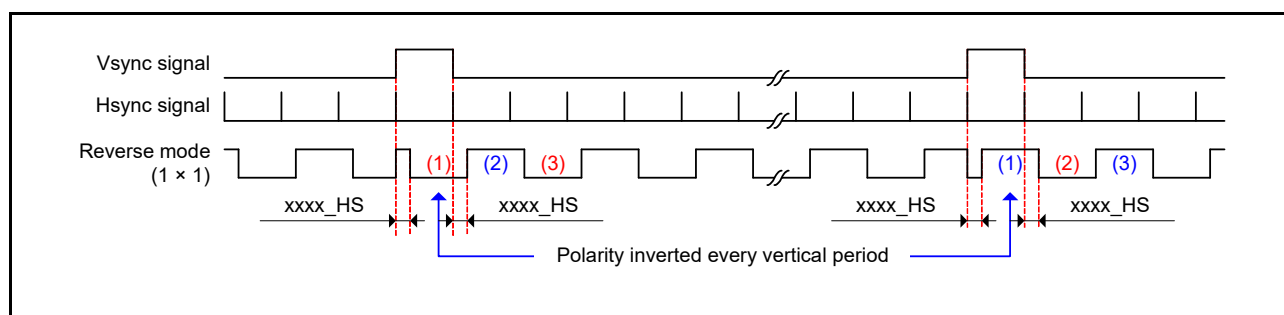

Figure 39.13 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

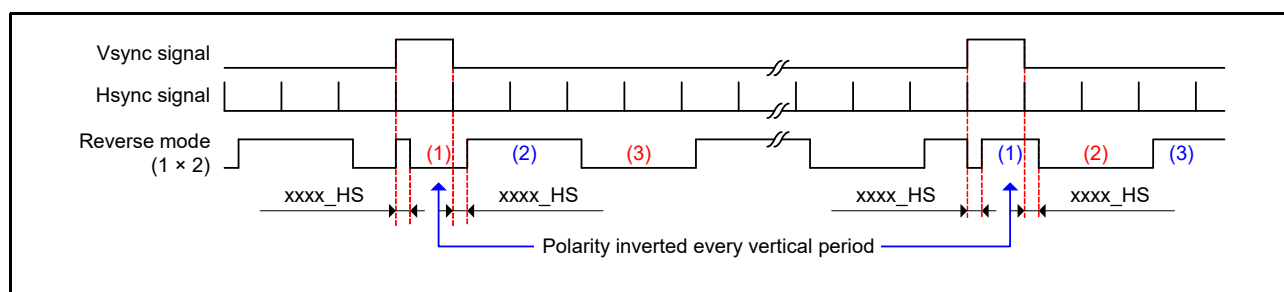

Figure 39.14 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

Figure 39.15 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 39.17 Settings of Horizontal Panel Driver Signal Generation (B)

| Register Name | Bit Name | Initial Value | Description |
|----------------|---------------------|---------------|---|
| TCON_TIM_POLA1 | TCON_POLA_HS [10:0] | 0 | POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater. |
| TCON_TIM_POLA1 | TCON_POLA_HW [10:0] | 0 | POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles) |
| TCON_TIM_POLB1 | TCON_POLB_HS [10:0] | 0 | POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater. |
| TCON_TIM_POLB1 | TCON_POLB_HW [10:0] | 0 | POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles) |

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

Figure 39.16 1/2 Pulse (H_HALF) Signal Generation

Table 39.18 Settings of 1/2 Pulse (H_HALF) Signal Generation

| Register Name | Bit Name | Initial Value | Description |
|---------------|-----------------|---------------|---|
| TCON_TIM | TCON_HALF[10:0] | 400 | 1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter |

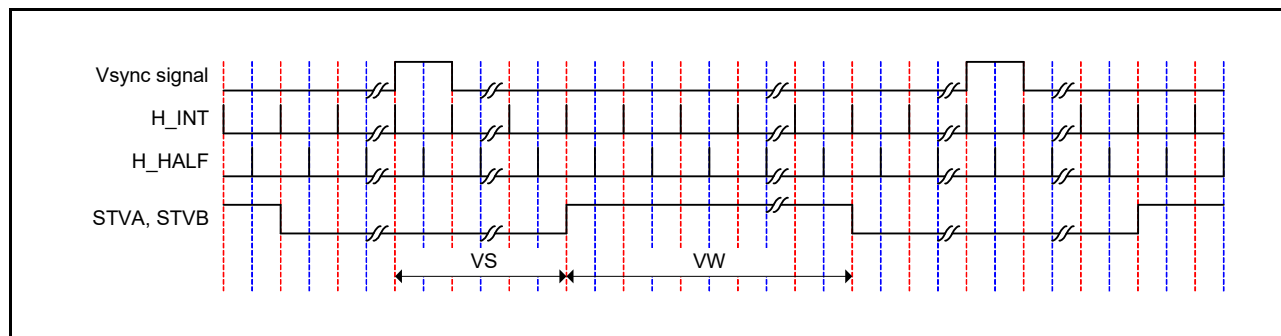

Figure 39.17 Vertical Panel Driver Signal (H_INT Reference Operation)

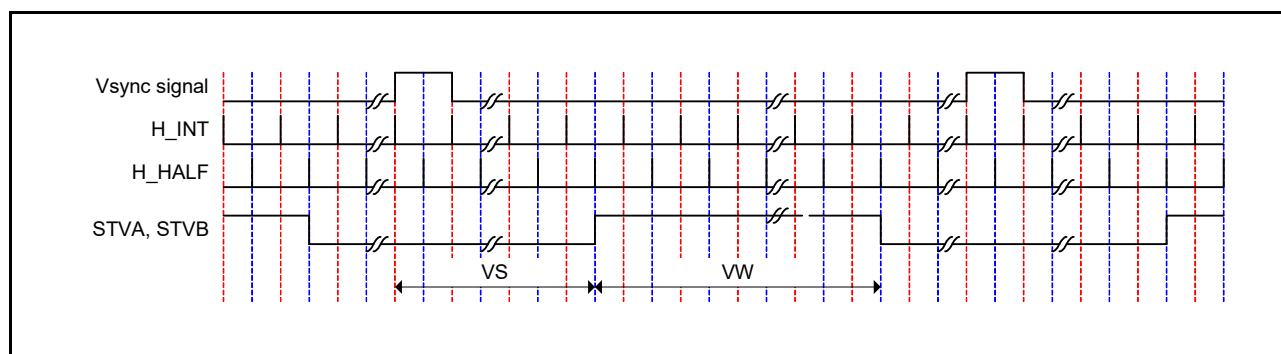

Figure 39.18 Vertical Panel Driver Signal (H_HALF Reference Operation)

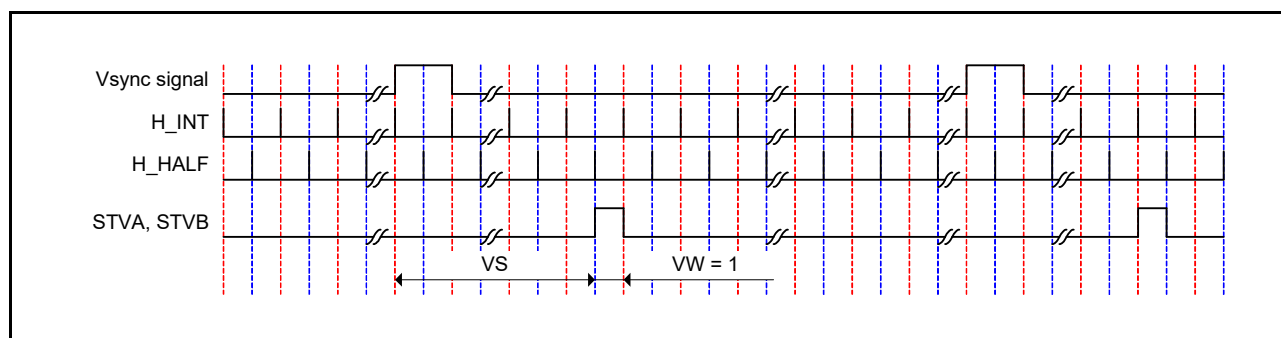

Figure 39.19 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 39.19 Vertical Panel Driver Signal Generation

| Register Name | Bit Name | Initial Value | Description |
|----------------|--------------------|---------------|---|
| TCON_TIM_STVA1 | TCON_STVA_VS[10:0] | 0 | STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_HS from the rising edge of the Vsync signal (1/2fH cycles) |
| TCON_TIM_STVA1 | TCON_STVA_VW[10:0] | 4 | STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_HW (1/2fH cycles) |
| TCON_TIM_STVB1 | TCON_STVB_VS[10:0] | 70 | STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_HS from the rising edge of the Vsync signal (1/2fH cycles) |
| TCON_TIM_STVB1 | TCON_STVB_VW[10:0] | 960 | STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_HW (1/2fH cycles) |

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

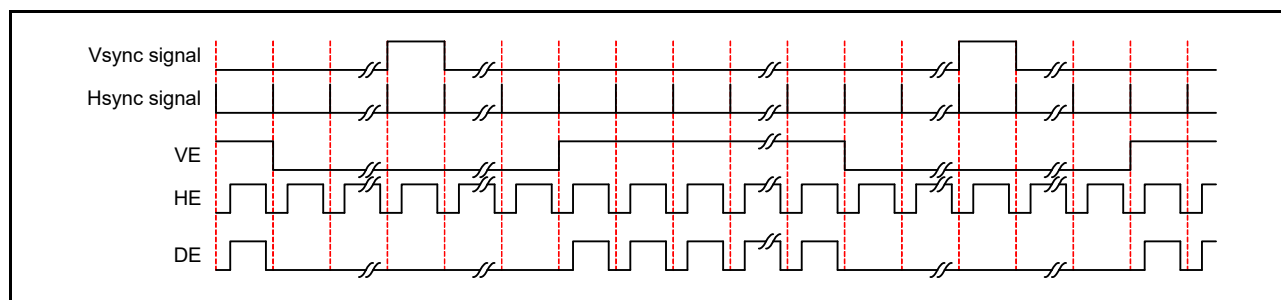

Figure 39.20 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 39.20 Panel Driver Signal Polarity Inversion Control

| Register Name | Bit Name | Initial Value | Description |
|----------------|---------------|---------------|---|
| TCON_TIM_STVA2 | TCON_STVA_INV | 1 | Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted |
| TCON_TIM_STVB2 | TCON_STVB_INV | 0 | Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted |
| TCON_TIM_STH2 | TCON_STH_INV | 1 | Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted |
| TCON_TIM_STB2 | TCON_STB_INV | 0 | Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted |
| TCON_TIM_CPV2 | TCON_CPV_INV | 0 | Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted |
| TCON_TIM_POLA2 | TCON_POLA_INV | 0 | Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted |
| TCON_TIM_POLB2 | TCON_POLB_INV | 0 | Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted |
| TCON_TIM_DE | TCON_DE_INV | 0 | Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted |

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 39.21 Panel Driver Signal Output Selection

| Register Name | Bit Name | Initial Value | Description |
|----------------|------------------------|---------------|---|
| TCON_TIM_STVA2 | TCON_STVA_SEL [2:0] | 0 | Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |
| TCON_TIM_STVB2 | TCON_STVB_SEL [2:0] | 1 | Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

Table 39.21 Panel Driver Signal Output Selection

| Register Name | Bit Name | Initial Value | Description |
|----------------|------------------------|---------------|---|
| TCON_TIM_STH2 | TCON_STH_SEL [2:0] | 2 | Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |
| TCON_TIM_STB2 | TCON_STB_SEL [2:0] | 7 | Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |
| TCON_TIM_CPV2 | TCON_CPV_SEL [2:0] | 4 | Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |
| TCON_TIM_POLA2 | TCON_POLA_SEL [2:0] | 5 | Output Signal Select for LCD_TCON5 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |
| TCON_TIM_POLB2 | TCON_POLB_SEL [2:0] | 6 | Output Signal Select for LCD_TCON6 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 39.22 Panel Output Signal Phase Selection

| Register Name | Bit Name | Initial Value | Description |
|---------------|------------------|---------------|--|
| OUT_CLK_PHASE | OUTCNT_LCD_EDGE | 0 | Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_STVA_EDGE | 0 | Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_STVB_EDGE | 0 | Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_STH_EDGE | 0 | Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_STB_EDGE | 0 | Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_CPV_EDGE | 0 | Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_POLA_EDGE | 0 | Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| OUT_CLK_PHASE | OUTCNT_POLB_EDGE | 0 | Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |

39.2 Register Descriptions

Table 39.23 to Table 39.25 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | GAM_G_TH_01[7:0] | 8 | R/W | Start Threshold of Area 1 of G Signal Unsigned (0 to 255 [LSB]) 0 < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_02[7:0] | 16 | R/W | Start Threshold of Area 2 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_03[7:0] | 24 | R/W | Start Threshold of Area 3 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.5 Area Setting Register G2 in Gamma Correction Block (GAM_G_AREA2)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 24 | GAM_G_TH_04[7:0] | 32 | R/W | Start Threshold of Area 4 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_05[7:0] | 40 | R/W | Start Threshold of Area 5 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_06[7:0] | 48 | R/W | Start Threshold of Area 6 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_07[7:0] | 56 | R/W | Start Threshold of Area 7 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.6 Area Setting Register G3 in Gamma Correction Block (GAM_G_AREA3)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_G_TH_08[7:0] | 64 | R/W | Start Threshold of Area 8 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_09[7:0] | 72 | R/W | Start Threshold of Area 9 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_10[7:0] | 80 | R/W | Start Threshold of Area 10 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_11[7:0] | 88 | R/W | Start Threshold of Area 11 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.7 Area Setting Register G4 in Gamma Correction Block (GAM_G_AREA4)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_G_TH_12[7:0] | 96 | R/W | Start Threshold of Area 12 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_13[7:0] | 104 | R/W | Start Threshold of Area 13 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_14[7:0] | 112 | R/W | Start Threshold of Area 14 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_15[7:0] | 120 | R/W | Start Threshold of Area 15 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

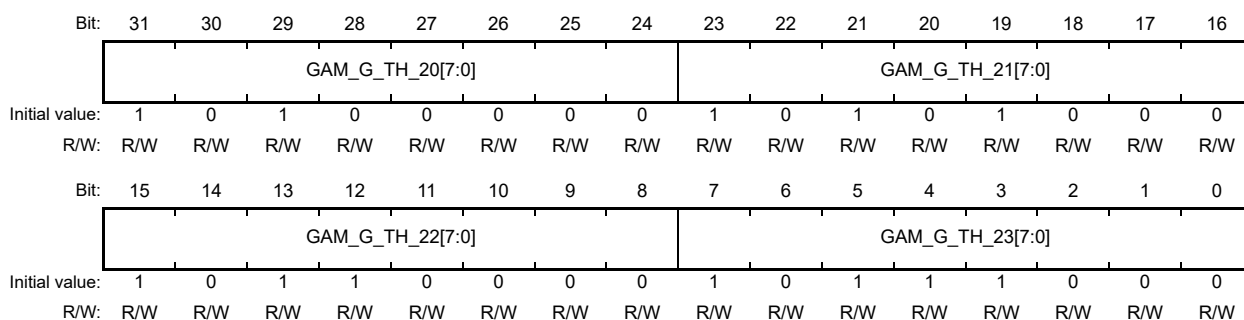

39.2.8 Area Setting Register G5 in Gamma Correction Block (GAM_G_AREA5)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 24 | GAM_G_TH_16 [7:0] | 128 | R/W | Start Threshold of Area 16 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_17 [7:0] | 136 | R/W | Start Threshold of Area 17 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_18 [7:0] | 144 | R/W | Start Threshold of Area 18 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_19 [7:0] | 152 | R/W | Start Threshold of Area 19 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

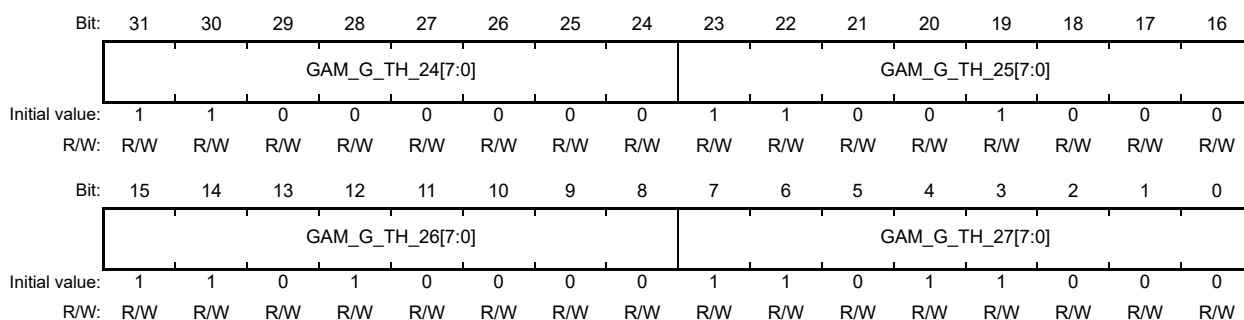

39.2.9 Area Setting Register G6 in Gamma Correction Block (GAM_G_AREA6)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 24 | GAM_G_TH_20 [7:0] | 160 | R/W | Start Threshold of Area 20 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_21 [7:0] | 168 | R/W | Start Threshold of Area 21 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_22 [7:0] | 176 | R/W | Start Threshold of Area 22 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_23 [7:0] | 184 | R/W | Start Threshold of Area 23 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

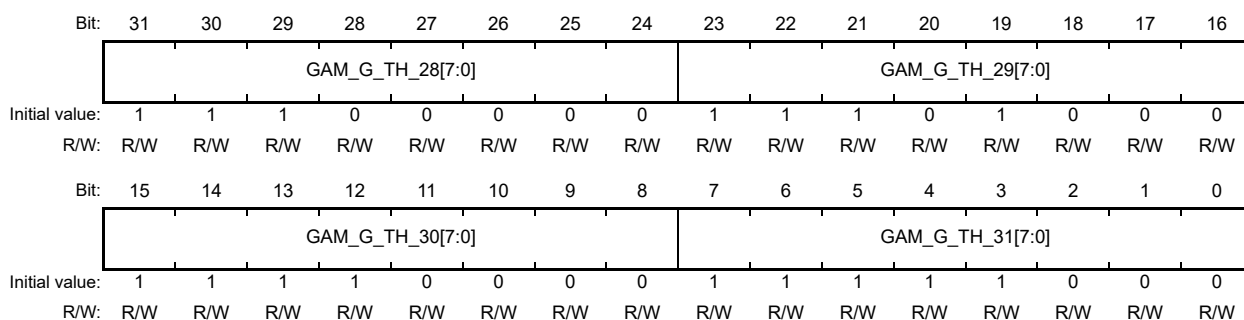

39.2.10 Area Setting Register G7 in Gamma Correction Block (GAM_G_AREA7)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 24 | GAM_G_TH_24 [7:0] | 192 | R/W | Start Threshold of Area 24 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_25 [7:0] | 200 | R/W | Start Threshold of Area 25 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_26 [7:0] | 208 | R/W | Start Threshold of Area 26 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_27 [7:0] | 216 | R/W | Start Threshold of Area 27 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 24 | GAM_G_TH_28 [7:0] | 224 | R/W | Start Threshold of Area 28 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_G_TH_29 [7:0] | 232 | R/W | Start Threshold of Area 29 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_G_TH_30 [7:0] | 240 | R/W | Start Threshold of Area 30 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_G_TH_31 [7:0] | 248 | R/W | Start Threshold of Area 31 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255 |

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

39.2.12 Register Update Control Register B in Gamma Correction Block
(GAM_B_UPDATE)

|----------|------------------|---------------|-----|---|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | GAM_B_TH_01[7:0] | 8 | R/W | Start Threshold of Area 1 of B Signal Unsigned (0 to 255 [LSB]) 0 < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_02[7:0] | 16 | R/W | Start Threshold of Area 2 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_03[7:0] | 24 | R/W | Start Threshold of Area 3 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

39.2.15 Area Setting Register B2 in Gamma Correction Block (GAM_B_AREA2)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 24 | GAM_B_TH_04[7:0] | 32 | R/W | Start Threshold of Area 4 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_05[7:0] | 40 | R/W | Start Threshold of Area 5 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_06[7:0] | 48 | R/W | Start Threshold of Area 6 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_07[7:0] | 56 | R/W | Start Threshold of Area 7 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

39.2.16 Area Setting Register B3 in Gamma Correction Block (GAM_B_AREA3)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_B_TH_08[7:0] | 64 | R/W | Start Threshold of Area 8 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_09[7:0] | 72 | R/W | Start Threshold of Area 9 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_10[7:0] | 80 | R/W | Start Threshold of Area 10 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_11[7:0] | 88 | R/W | Start Threshold of Area 11 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

39.2.17 Area Setting Register B4 in Gamma Correction Block (GAM_B_AREA4)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_B_TH_12[7:0] | 96 | R/W | Start Threshold of Area 12 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_13[7:0] | 104 | R/W | Start Threshold of Area 13 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_14[7:0] | 112 | R/W | Start Threshold of Area 14 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_15[7:0] | 120 | R/W | Start Threshold of Area 15 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

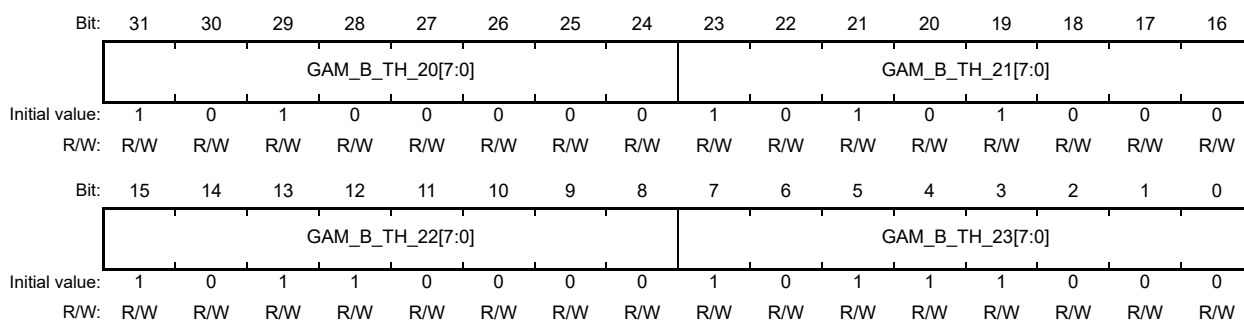

39.2.18 Area Setting Register B5 in Gamma Correction Block (GAM_B_AREA5)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_B_TH_16[7:0] | 128 | R/W | Start Threshold of Area 16 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_17[7:0] | 136 | R/W | Start Threshold of Area 17 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_18[7:0] | 144 | R/W | Start Threshold of Area 18 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_19[7:0] | 152 | R/W | Start Threshold of Area 19 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

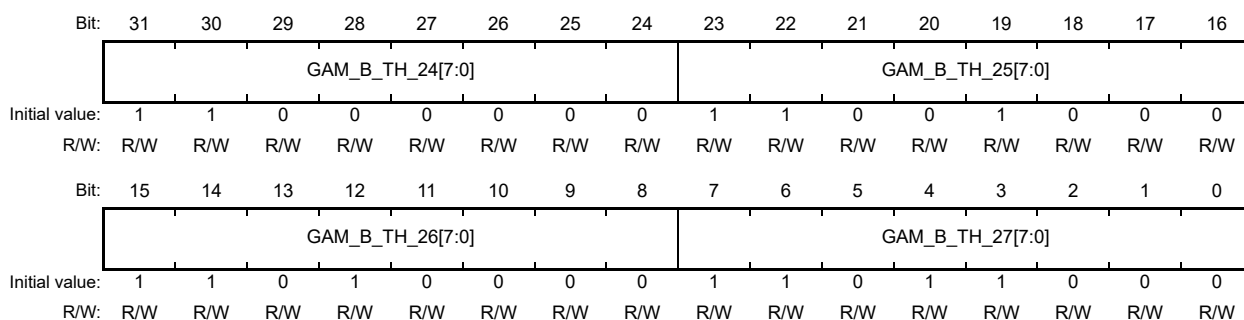

39.2.19 Area Setting Register B6 in Gamma Correction Block (GAM_B_AREA6)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_B_TH_20[7:0] | 160 | R/W | Start Threshold of Area 20 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_21[7:0] | 168 | R/W | Start Threshold of Area 21 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_22[7:0] | 176 | R/W | Start Threshold of Area 22 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_23[7:0] | 184 | R/W | Start Threshold of Area 23 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

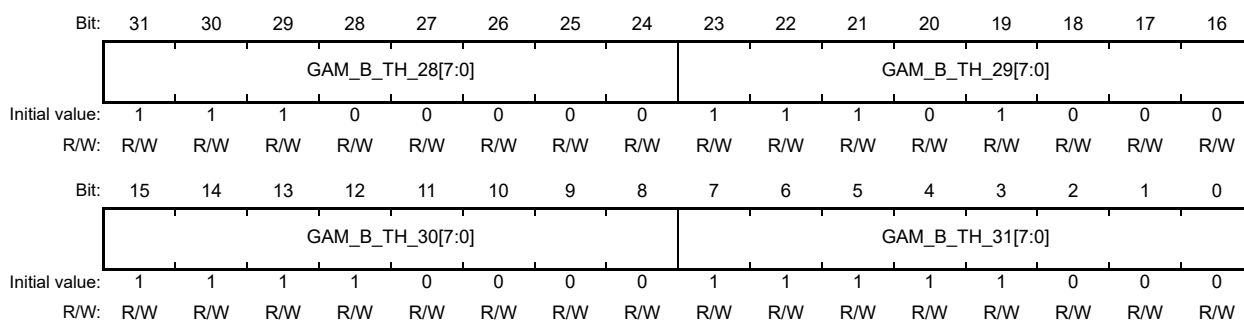

39.2.20 Area Setting Register B7 in Gamma Correction Block (GAM_B_AREA7)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_B_TH_24[7:0] | 192 | R/W | Start Threshold of Area 24 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_25[7:0] | 200 | R/W | Start Threshold of Area 25 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_26[7:0] | 208 | R/W | Start Threshold of Area 26 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_27[7:0] | 216 | R/W | Start Threshold of Area 27 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

39.2.21 Area Setting Register B8 in Gamma Correction Block (GAM_B_AREA8)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_B_TH_28[7:0] | 224 | R/W | Start Threshold of Area 28 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_B_TH_29[7:0] | 232 | R/W | Start Threshold of Area 29 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_B_TH_30[7:0] | 240 | R/W | Start Threshold of Area 30 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_B_TH_31[7:0] | 248 | R/W | Start Threshold of Area 31 of B Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255 |

Note: This register is updated when GAM_B_VEN in GAM_B_UPDATE is 1.

39.2.22 Register Update Control Register R in Gamma Correction Block (GAM_R_UPDATE)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-------|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GAM_R_VEN | 0 | R/WC1 | Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | GAM_R_TH_01[7:0] | 8 | R/W | Start Threshold of Area 1 of R Signal Unsigned (0 to 255 [LSB]) 0 < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_02[7:0] | 16 | R/W | Start Threshold of Area 2 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_03[7:0] | 24 | R/W | Start Threshold of Area 3 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.25 Area Setting Register R2 in Gamma Correction Block (GAM_R_AREA2)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|---|
| 31 to 24 | GAM_R_TH_04[7:0] | 32 | R/W | Start Threshold of Area 4 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_R_TH_05[7:0] | 40 | R/W | Start Threshold of Area 5 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_06[7:0] | 48 | R/W | Start Threshold of Area 6 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_07[7:0] | 56 | R/W | Start Threshold of Area 7 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.26 Area Setting Register R3 in Gamma Correction Block (GAM_R_AREA3)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_R_TH_08[7:0] | 64 | R/W | Start Threshold of Area 8 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_R_TH_09[7:0] | 72 | R/W | Start Threshold of Area 9 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_10[7:0] | 80 | R/W | Start Threshold of Area 10 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_11[7:0] | 88 | R/W | Start Threshold of Area 11 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.27 Area Setting Register R4 in Gamma Correction Block (GAM_R_AREA4)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_R_TH_12[7:0] | 96 | R/W | Start Threshold of Area 12 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_R_TH_13[7:0] | 104 | R/W | Start Threshold of Area 13 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_14[7:0] | 112 | R/W | Start Threshold of Area 14 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_15[7:0] | 120 | R/W | Start Threshold of Area 15 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.28 Area Setting Register R5 in Gamma Correction Block (GAM_R_AREA5)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_R_TH_16[7:0] | 128 | R/W | Start Threshold of Area 16 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_R_TH_17[7:0] | 136 | R/W | Start Threshold of Area 17 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_18[7:0] | 144 | R/W | Start Threshold of Area 18 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_19[7:0] | 152 | R/W | Start Threshold of Area 19 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

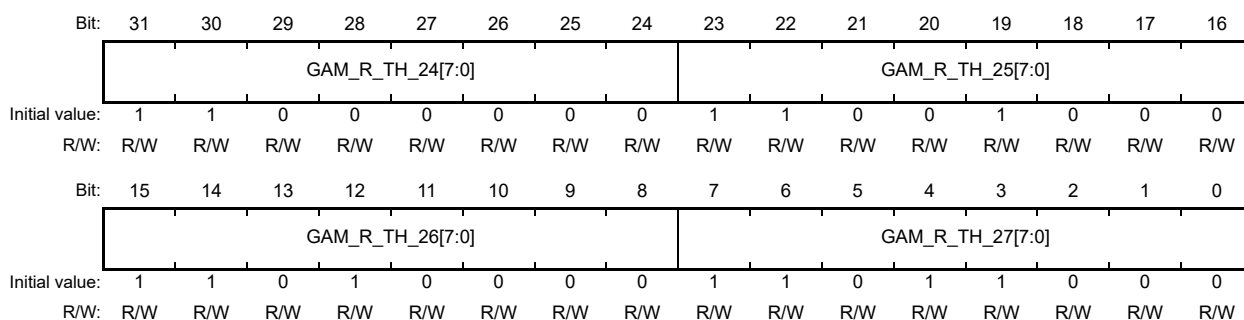

39.2.29 Area Setting Register R6 in Gamma Correction Block (GAM_R_AREA6)

| | | | | | | | | | | | | | | | | |
|----------------|------------------|-----|-----|-----|-----|-----|-----|-----|------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GAM_R_TH_20[7:0] | | | | | | | | GAM_R_TH_21[7:0] | | | | | | | |
| Initial value: | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GAM_R_TH_22[7:0] | | | | | | | | GAM_R_TH_23[7:0] | | | | | | | |
| Initial value: | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_R_TH_20[7:0] | 160 | R/W | Start Threshold of Area 20 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_R_TH_21[7:0] | 168 | R/W | Start Threshold of Area 21 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_22[7:0] | 176 | R/W | Start Threshold of Area 22 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_23[7:0] | 184 | R/W | Start Threshold of Area 23 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.30 Area Setting Register R7 in Gamma Correction Block (GAM_R_AREA7)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------|---------------|-----|--|
| 31 to 24 | GAM_R_TH_24[7:0] | 192 | R/W | Start Threshold of Area 24 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 23 to 16 | GAM_R_TH_25[7:0] | 200 | R/W | Start Threshold of Area 25 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 15 to 8 | GAM_R_TH_26[7:0] | 208 | R/W | Start Threshold of Area 26 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |
| 7 to 0 | GAM_R_TH_27[7:0] | 216 | R/W | Start Threshold of Area 27 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area |

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

39.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8)

| | | | | | | | | | | | | | | | | |
|----------------|------------------|-----|-----|-----|-----|-----|-----|-----|------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | GAM_R_TH_28[7:0] | | | | | | | | GAM_R_TH_29[7:0] | | | | | | | |
| Initial value: | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | GAM_R_TH_30[7:0] | | | | | | | | GAM_R_TH_31[7:0] | | | | | | | |
| Initial value: | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TCON_VEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-------|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | TCON_VEN | 0 | R/WC1 | LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync. |

39.2.33 TCON Reference Timing Setting Register (TCON_TIM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | TCON_HALF[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TCON_OFFSET[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | TCON_HALF[10:0] | 400 | R/W | 1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | TCON_OFFSET[10:0] | 0 | R/W | Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal. |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | TCON_STVA_VS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TCON_STVA_VW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | TCON_STVA_VS [10:0] | 0 | R/W | STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS from the rising edge of the Vsync signal (1/2fH cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | TCON_STVA_VW [10:0] | 4 | R/W | STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW (1/2fH cycles). |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|---------------|----|---------------------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | — | — | — | — | — | — | — | — | — | TCON_STVB_INV | — | TCON_STVB_SEL[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | TCON_STVB_INV | 0 | R/W | Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | TCON_STVB_SEL [2:0] | 1 | R/W | Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | TCON_STH_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TCON_STH_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | TCON_STH_HS [10:0] | 0 | R/W | STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS + 1 from the rising edge of the Hsync signal (clock cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | TCON_STH_HW [10:0] | 96 | R/W | STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles). |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|-----------------|----|----|----|--------------|----|-------------------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | TCON_STH_HS_SEL | — | — | — | TCON_STH_INV | — | TCON_STH_SEL[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | TCON_STH_HS_SEL | 0 | R/W | STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | TCON_STH_INV | 1 | R/W | Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | TCON_STH_SEL [2:0] | 2 | R/W | Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | TCON_STB_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TCON_STB_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | TCON_STB_HS [10:0] | 144 | R/W | STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS + 1 from the rising edge of the Hsync signal (clock cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | TCON_STB_HW [10:0] | 640 | R/W | STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles). |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|-----------------|----|----|----|--------------|----|-------------------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | TCON_STB_HS_SEL | — | — | — | TCON_STB_INV | — | TCON_STB_SEL[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | TCON_STB_HS_SEL | 0 | R/W | STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | TCON_STB_INV | 0 | R/W | Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | TCON_STB_SEL [2:0] | 7 | R/W | Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | TCON_CPV_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TCON_CPV_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | TCON_CPV_HS [10:0] | 0 | R/W | CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS + 1 from the rising edge of the Hsync signal (clock cycles). |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | TCON_CPV_HW [10:0] | 0 | R/W | CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles). |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|------------------------|----|----|----|-----------------|----|-------------------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | TCON CPV_HS_ SEL | — | — | — | TCON CPV_INV | — | TCON_CPV_SEL[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------------|---------------|-----|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | TCON_CPV_HS_S EL | 0 | R/W | CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | TCON_CPV_INV | 0 | R/W | Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | TCON_CPV_SEL [2:0] | 4 | R/W | Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | TCON_POLA_HS[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TCON_POLA_HW[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 26 to 16 | TCON_POLA_HS [10:0] | 0 | R/W | POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | TCON_POLA_HW [10:0] | 0 | R/W | POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles). |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|-------------------|-----|----|----|------------------|-----|----|----|---------------|-----|--------------------|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | TCON_POLA_MD[1:0] | — | — | — | TCON_POLA_HS_SEL | — | — | — | TCON_POLA_INV | — | TCON_POLA_SEL[2:0] | — | — | — |
| Initial value: | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W: | R | R | R/W | R/W | R | R | R | R/W | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13, 12 | TCON_POLA_MD[1:0] | 1 | R/W | POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods. |
| 11 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | TCON_POLA_HS_SEL | 0 | R/W | POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | TCON_POLA_INV | 0 | R/W | Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | TCON_POLA_SEL[2:0] | 5 | R/W | Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE |

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

39.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 | OUTCNT_ | 0 | R/W | Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast |
| 11 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 7 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 5 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 4 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 3 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 2 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 1 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |
| 0 | OUTCNT_ | 0 | R/W | Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin |

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

39.3 Usage Methods

39.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

39.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 39.26 Dither Settings

| Bit Name | Setting Value |
|------------------|--|
| PDTH_FORMAT[1:0] | Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2 |
| PDTH_SEL[1:0] | When 2 × 2 pattern dither is to be used: 2 |
| PDTH_PA[1:0] | Normally 3 (initial value) |
| PDTH_PB[1:0] | Normally 0 (initial value) |
| PDTH_PC[1:0] | Normally 2 (initial value) |
| PDTH_PD[1:0] | Normally 1 (initial value) |

39.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in Table 39.27 and Table 39.28.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 39.27 Setting Example of Synchronizing Signal

| Register Name | Bit Name | VGA | SVGA | Description |
|--------------------------|--------------------|-----|------|---|
| TCON_TIM | TCON_HALF[10:0] | 400 | 528 | Sets the half value of 1H time period in clock units. |
| Vsync signal | | | | |
| TCON_TIM_STVA1 | TCON_STVA_VS[10:0] | 0 | 0 | Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1. |
| TCON_TIM_STVA1 | TCON_STVA_VW[10:0] | 4 | 8 | Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1. |
| TCON_TIM_STVA2 | TCON_STVA_INV | 0 | 0 | Sets the output polarity of the above pulse. For inverted output: 1 |
| TCON_TIM_STVA2 | TCON_STVA_SEL[2:0] | 0 | 0 | For STVA output selection: 0 |
| Vertical enable signal | | | | |
| TCON_TIM_STVB1 | TCON_STVB_VS[10:0] | 68 | 44 | Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1. |
| TCON_TIM_STVB1 | TCON_STVB_VW[10:0] | 960 | 1200 | Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1. |
| TCON_TIM_STVB2 | TCON_STVB_INV | 0 | 0 | Sets the output polarity of the above pulse. For inverted output: 1 |
| TCON_TIM_STVB2 | TCON_STVB_SEL[2:0] | 1 | 1 | For STVB output selection: 1 |
| Hsync signal | | | | |
| TCON_TIM_STH1 | TCON_STH_HS[10:0] | 0 | 0 | Sets the pulse generation start position from the rising edge of the internal Hsync signal. |
| TCON_TIM_STH1 | TCON_STH_HW[10:0] | 96 | 128 | Sets the changing point from the above pulse generation start position. |
| TCON_TIM_STH2 | TCON_STH_INV | 0 | 0 | Sets the output polarity of the above pulse. For inverted output: 1 |
| TCON_TIM_STH2 | TCON_STH_SEL[2:0] | 2 | 2 | For STH output selection: 2 |
| Horizontal enable signal | | | | |
| TCON_TIM_STB1 | TCON_STB_HS[10:0] | 128 | 192 | Sets the pulse generation start position from the rising edge of the internal Hsync signal. |
| TCON_TIM_STB1 | TCON_STB_HW[10:0] | 640 | 800 | Sets the changing point from the above pulse generation start position. |
| TCON_TIM_STB2 | TCON_STB_INV | 0 | 0 | Sets the output polarity of the above pulse. For inverted output: 1 |
| TCON_TIM_STB2 | TCON_STB_SEL[2:0] | 3 | 3 | For STB output selection: 3 |

Table 39.28 Setting Example of Data System

| Register Name | Bit Name | RGB888 | Serial RGB (Triple Speed) | Description |
|---------------|------------------|--------|------------------------------|---|
| OUT_SET | OUT_ENDIAN_ON | 0 | 0 | When bit endian is changed: 1 |
| OUT_SET | OUT_SWAP_ON | 0 | 0 | When B/R is to be swapped: 1 |
| OUT_SET | OUT_FORMAT[1:0] | 0 | 3 | Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3 |
| OUT_SET | OUT_FRQ_SEL[1:0] | 0 | 1 | Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2 |
| OUT_SET | OUT_DIR_SEL | 0 | 0 | When data arrangement of the serial RGB output is to be reversed: 1 |
| OUT_SET | OUT_PHASE[1:0] | 0 | 0 | Sets when output phase of the serial RGB is shifted. Not delayed Delayed by one clock cycle: 1 Delayed by two clock cycles: 2 Delayed by three clock cycles: 3 (applicable only for quadruple speed mode) |

40. Video Display Controller 6 (8): System Controller

40.1 System Controller

40.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

40.1.2 Interrupt Control

Ten interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

Table 40.1 Interrupt Signals

| Request Source Name | Bit Name | Function |
|---------------------|-----------|---|
| S0_VI_VSYNC | INT_STA 0 | Vsync signal input to scaler 0 |
| S0_LO_VSYNC | INT_STA 1 | Vsync signal output from scaler 0 |
| S0_VSYNCERR | INT_STA 2 | Missing Vsync signal for scaler 0 |
| GR3_VLINE | INT_STA 3 | Specified line signal for panel output in graphics 3 |
| S0_VFIELD | INT_STA 4 | Field end signal for recording function in scaler 0 |
| IV1_VBUFERR | INT_STA 5 | Frame buffer write overflow signal for scaler 0 |
| IV3_VBUFERR | INT_STA 6 | Frame buffer read underflow signal for graphics 0 |
| IV5_VBUFERR | INT_STA 7 | Frame buffer read underflow signal for graphics 2 |
| IV6_VBUFERR | INT_STA 8 | Frame buffer read underflow signal for graphics 3 |
| S0_WLINE | INT_STA 9 | Write specification line signal input to scaling-down control block in scaler 0 (not usable in this product) |

Table 40.2 Interrupt Clear/Hold Settings

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------|---------------|--|
| SYSCNT_INT1 | INT_STA0 | 0 | S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA1 | 0 | S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA2 | 0 | S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA3 | 0 | GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA4 | 0 | S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA5 | 0 | IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA6 | 0 | IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT1 | INT_STA7 | 0 | IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT2 | INT_STA8 | 0 | IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| SYSCNT_INT2 | INT_STA9 | 0 | S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (prohibited setting in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |

Table 40.3 Interrupt Output On/Off Settings

| Register Name | Bit Name | Initial Value | Description |
|---------------|-------------|---------------|--|
| SYSCNT_INT4 | INT_OUT0_ON | 0 | S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT1_ON | 0 | S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT2_ON | 0 | S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT3_ON | 0 | GR3_VLINE Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT4_ON | 0 | S0_VFIELD Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT5_ON | 0 | IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT6_ON | 0 | IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT4 | INT_OUT7_ON | 0 | IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT5 | INT_OUT8_ON | 0 | IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On |
| SYSCNT_INT5 | INT_OUT9_ON | 0 | S0_WLINE Interrupt Output On/Off 0: Off 1: On (prohibited setting in this product) |

40.1.3 Panel Clock Control

The video image clock, external clock, or peripheral clock 1 is selectable as the source of the panel clock for supply to this module. The module is also equipped with a divider for scaling the frequency by factors from 1/1 to 1/32. The bits listed in Table 40.4 control the panel clock.

Table 40.4 Panel Clock Control

| Register Name | Bit Name | Initial Value | Description |
|------------------|-----------------------|---------------|---|
| SYSCNT_PANEL_CLK | PANEL_ICKSEL [1:0] | 0 | Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ) |
| SYSCNT_PANEL_CLK | PANEL_OCKSEL [1:0] | 0 | Panel Clock Output Select 0: Divided clock generated from clock source selected by PANEL_CLK[1:0] 1: LVDS PLL clock 2: LVDS PLL clock divided by 7 3: Setting prohibited |
| SYSCNT_PANEL_CLK | PANEL_ICKEN | 0 | Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.* |
| SYSCNT_PANEL_CLK | PANEL_DCDR [5:0] | 1 | Clock Frequency Division Ratio Refer to Table 40.5 for details on the settings. Note: Settings other than those in Table 40.5 are prohibited. |

Note: * Set this bit to 0 before changing the value of the LVDS_CLK_EN bit in LVDS_CLKSELR.

Table 40.5 I/O Clock Frequency and Divisors

| DCDR[5:0] | Clock Ratio | I/O Clock Frequency (MHz) | | |
|-----------|-------------|---------------------------|-------|-------|
| | | 27.00 | 54.00 | 66.67 |
| 000001 | 1/1 | 27.00 | 54.00 | 66.67 |
| 000010 | 1/2 | 13.50 | 27.00 | 33.33 |
| 000011 | 1/3 | 9.00 | 18.00 | 22.22 |
| 000100 | 1/4 | 6.75 | 13.50 | 16.67 |
| 000101 | 1/5 | 5.40 | 10.80 | 13.33 |
| 000110 | 1/6 | 4.50 | 9.00 | 11.11 |
| 000111 | 1/7 | 3.86 | 7.71 | 9.52 |
| 001000 | 1/8 | 3.38 | 6.75 | 8.33 |
| 001001 | 1/9 | 3.00 | 6.00 | 7.41 |
| 001100 | 1/12 | 2.25 | 4.50 | 5.56 |
| 010000 | 1/16 | 1.69 | 3.38 | 4.17 |
| 011000 | 1/24 | 1.13 | 2.25 | 2.78 |
| 100000 | 1/32 | 0.84 | 1.69 | 2.08 |

40.1.4 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in Table 40.6.

Table 40.6 CLUT Table Read Select Signal Status Flags

| Register Name | Bit Name | Initial Value | Description |
|---------------|----------------|---------------|--|
| SYSCNT_CLUT | GR0_CLT_SEL_ST | — | Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out. |
| SYSCNT_CLUT | GR2_CLT_SEL_ST | — | Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out. |
| SYSCNT_CLUT | GR3_CLT_SEL_ST | — | Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out. |

40.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 40.7 Register Configuration of System Controller (CH0)

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---|------------------|-----|---------------|-------------|-------------|
| Interrupt control register 1 | SYSCNT_INT1 | R/W | H'0000 0000 | H'FCFF 7A80 | 32 |
| Interrupt control register 2 | SYSCNT_INT2 | R/W | H'0000 0000 | H'FCFF 7A84 | 32 |
| Interrupt control register 4 | SYSCNT_INT4 | R/W | H'0000 0000 | H'FCFF 7A8C | 32 |
| Interrupt control register 5 | SYSCNT_INT5 | R/W | H'0000 0000 | H'FCFF 7A90 | 32 |
| Panel clock control register | SYSCNT_PANEL_CLK | R/W | H'0001 | H'FCFF 7A98 | 16 |
| CLUT table read select signal status register | SYSCNT_CLUT | R | H'0000 | H'FCFF 7A9A | 16 |

40.2.1 Interrupt Control Register 1 (SYSCNT_INT1)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----------|----|----|----|----------|----|----|----|----------|----|----|----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | INT_STA7 | — | — | — | INT_STA6 | — | — | — | INT_STA5 | — | — | — | INT_STA4 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | INT_STA3 | — | — | — | INT_STA2 | — | — | — | INT_STA1 | — | — | — | INT_STA0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | INT_STA7 | 0 | R/W | IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 27 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | INT_STA6 | 0 | R/W | IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 23 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 | INT_STA5 | 0 | R/W | IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 19 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | INT_STA4 | 0 | R/W | S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 15 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 | INT_STA3 | 0 | R/W | GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 11 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | INT_STA2 | 0 | R/W | S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 4 | INT_STA1 | 0 | R/W | S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INT_STA0 | 0 | R/W | S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |

40.2.2 Interrupt Control Register 2 (SYSCNT_INT2)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | INT_STA9 | — | — | — | INT_STA8 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | INT_STA9 | 0 | R/W | S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (prohibited setting in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INT_STA8 | 0 | R/W | IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred. |

40.2.3 Interrupt Control Register 4 (SYSCNT_INT4)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|-------------|----|----|----|-------------|----|----|----|-------------|----|----|----|-------------|

| 0 | GR0_CLT_SEL_ST | — | R | Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out. |

41. LVDS Output Interface

This LSI has a module for providing a low voltage differential signaling (LVDS) output interface. This module converts the RGB signals output from video display controller 6 to the LVDS format that has six bits each for R, G, and B signals, and outputs the converted signals. It has a dedicated phase-locked loop (PLL) circuit, which can generate a clock with a desired frequency by dividing or multiplying the input clock frequency.

The clock output from this PLL can be used as the panel clock for video display controller 6 even when LVDS output is not used. This PLL is called LVDS PLL in this section.

41.1 Features

- Four pairs of differential output conforming to the TIA/EIA-644 standard (three pairs for data and one pair for the clock)
- When LVDS output is not used, the LVDS pins can be used as CMOS input/output pins.
- LVDS PLL for generating a clock with a desired frequency
- LVDS PLL power-down function

41.2 Block Diagram

Figure 41.1 shows a block diagram of the LVDS output interface configuration.

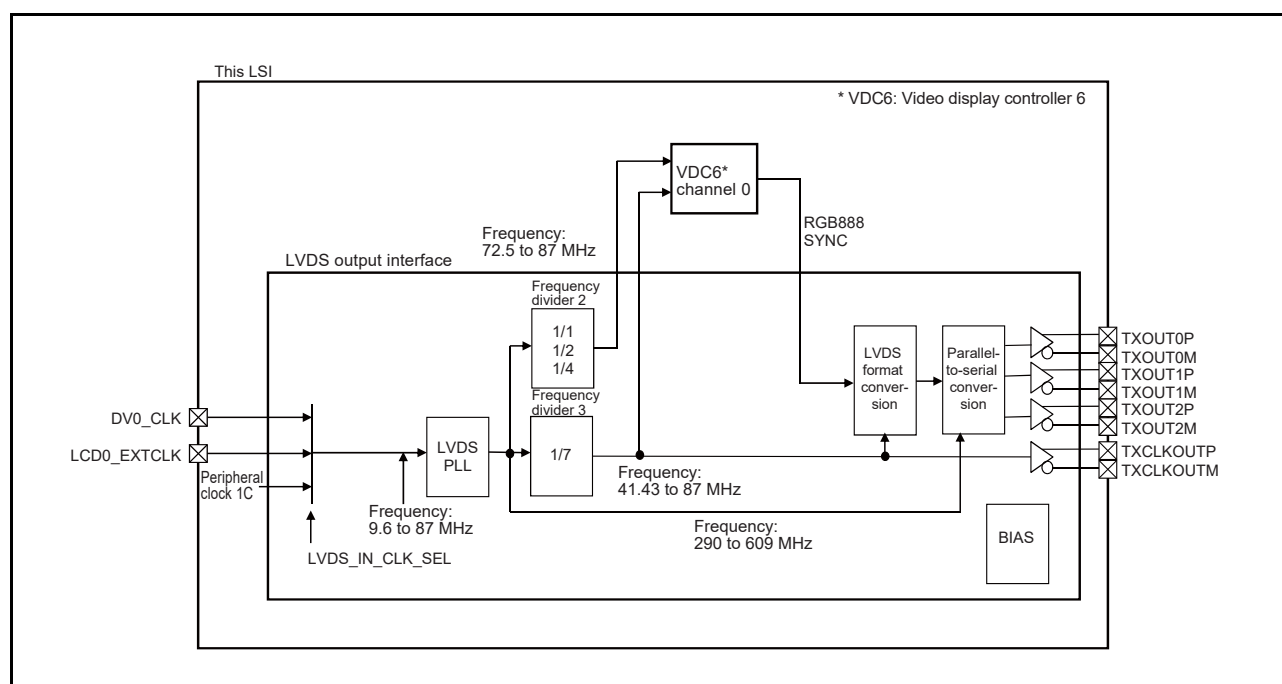

Figure 41.1 Block Diagram of LVDS Output Interface Configuration

Figure 41.2 shows a block diagram of the LVDS PLL circuit.

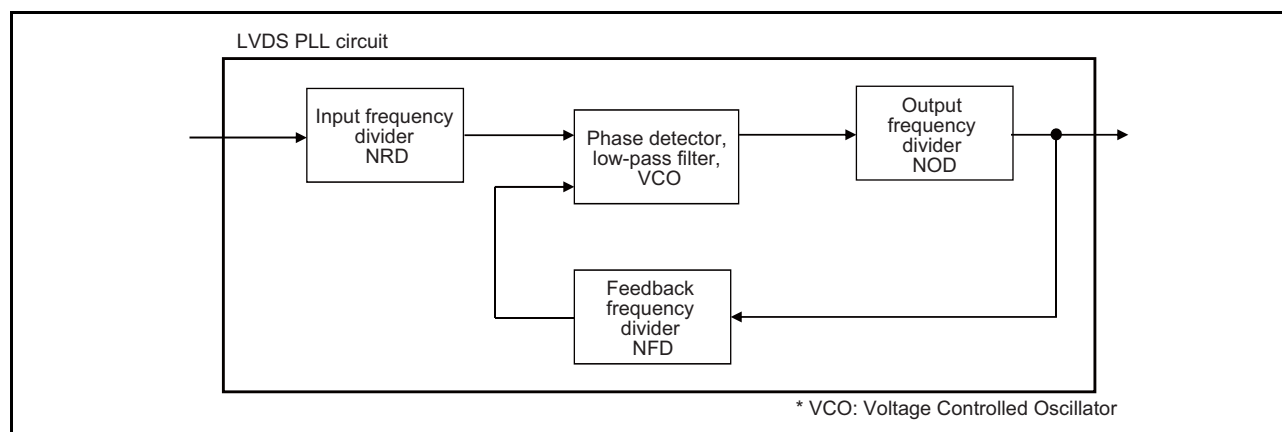

Figure 41.2 Block Diagram of LVDS PLL Circuit

41.3 Input/Output Pins

Table 41.1 shows the pin configuration.

Table 41.1 Pin Configuration

| Pin Name | Symbol | I/O | Function |
|------------------------------|------------|--------|----------------------------------|
| LVDS analog power supply pin | LVDSAPVcc | Input | Power supply pin for LVDS output |
| LVDS PLL power supply pin | LVDSPLLVcc | Input | Power supply pin for LVDS PLL |
| LVDS data output pin 0P | TXOUT0P | Output | LVDS data output pins |
| LVDS data output pin 0M | TXOUT0M | Output | |
| LVDS data output pin 1P | TXOUT1P | Output | |
| LVDS data output pin 1M | TXOUT1M | Output | |
| LVDS data output pin 2P | TXOUT2P | Output | |
| LVDS data output pin 2M | TXOUT2M | Output | |
| LVDS clock output pin CP | TXCLKOUTP | Output | LVDS clock output pins |
| LVDS clock output pin CM | TXCLKOUTM | Output | |

41.4 Register Descriptions

Table 41.2 shows the register configuration.

Table 41.2 Register Configuration

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|---------------------------------------|--------------|-----|---------------|------------|-------------|
| LVDS register update control register | LVDS_UPDATE | R/W | H'00000000 | H'FCFF7A30 | 32 |
| LVDS format conversion register L | LVDSFCL | R/W | H'00000321 | H'FCFF7A34 | 32 |
| LVDS clock select register | LCLKSELR | R/W | H'00000000 | H'FCFF7A50 | 32 |
| LVDSPLL setting register | LPLLSETR | R/W | H'00000001 | H'FCFF7A54 | 32 |

41.4.1 LVDS Register Update Control Register (LVDS_UPDATE)

LVDS_UPDATE controls the timing for updating LVDS registers.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LVDS_UPDATE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | LVDS_UPDATE | 0 | R/W | LVDS Register Update 0: Registers are not updated. 1: Registers are updated. |
| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

41.4.2 LVDS Format Conversion Register L (LVDSFCL)

LVDSFCL is used to make necessary settings for conversion of the RGB signals output from video display controller 6 to the LVDS format.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|--------------|----------------|-----|-----|-----|----------------|-----|-----|-----|----------------|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | SYNC MODE | — | — | — | — | SYNC_POL[1:0] | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R | R/W | R/W | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | LVDS_SEL2[3:0] | | | | LVDS_SEL1[3:0] | | | | LVDS_SEL0[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | SYNC_MODE | 0 | R/W | SYNC Mode Switch Switches the SYNC mode. 0: LVDS_TCON0 and LVDS_TCON2 are transmitted through LVDS signals. 1: Fixed values are transmitted as LVDS_TCON0 and LVDS_TCON2 through LVDS signals. The fixed values are specified in the SYNC_POL bits. |
| 27 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23, 22 | SYNC_POL [1:0] | 00 | R/W | LVDS_TCON0 and LVDS_TCON2 Value The values specified in these bits are output as the LVDS_TCON0 and LVDS_TCON2 values through LVDS signals when the SYNC_MODE bit is set to 1. SYNC_POL[1]: Specifies the LVDS_TCON0 output value. SYNC_POL[0]: Specifies the LVDS_TCON2 output value. |
| 21 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | LVDS_SEL2 [3:0] | 0011 | R/W | TXOUT2P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT2P and TXOUT2M pins. Be sure to set these bits to 3 in this LSI. |
| 7 to 4 | LVDS_SEL1 [3:0] | 0010 | R/W | TXOUT1P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT1P and TXOUT1M pins. Be sure to set these bits to 2 in this LSI. |
| 3 to 0 | LVDS_SEL0 [3:0] | 0001 | R/W | TXOUT0P/M Data Format Setting These bits specify the format of the data to be output through the TXOUT0P and TXOUT0M pins. Be sure to set these bits to 1 in this LSI. |

Note: This register is updated by setting the LVDS_UPDATE bit in the LVDS register update control register (LVDS_UPDATE) to 1.

41.4.3 LVDS Clock Select Register (LCLKSELR)

LCLKSELR specifies the input clock and the frequency dividing values for frequency divider 2.

| | | | | | | | | | | | | | | | | |
|----------------|------------------|-----|-----|-----|-----|--------------------|----------------------|-----|----|----|----|-------------|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | LVDS_IN_CLK_SEL[1:0] | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LVDSPLL_TST[5:0] | | | | | LVDS_ODIV_SET[1:0] | | — | — | — | — | LVDS_CLK_EN | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R/W | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------------|---------------|-----|--|
| 31 to 26 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 25 to 24 | LVDS_IN_CLK_SEL[1:0] | All 0 | R/W | These bits select the clock input to LVDSPLL. 0: DV0_CLK 1: LCD0_EXTCLK 2: Peripheral clock 1C (P1φ) 3: Setting prohibited |
| 23 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 10 | LVDSPLL_TST[5:0] | All 0 | R/W | Internal Parameter Setting for LVDS PLL These bits specify the internal parameters for the LVDS PLL (the resistance of the LPF circuit and the current through the charge pump circuit). Note: Do not rewrite from 000000 in this LSI. |
| 9, 8 | LVDS_ODIV_SET[1:0] | All 0 | R/W | These bits specify the frequency dividing value (NODIV) for frequency divider 2. NODIV = 1, 2, or 4 0: NODIV = 1 1: NODIV = 2 2: NODIV = 4 3: Setting prohibited |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | LVDS_CLK_EN | 0 | R/W | Enables the LVDS PLL output. 0: Output from the PLL is disabled. 1: Output from the PLL is enabled. Note: Be sure to clear this bit to 0 before making settings in any other register described in this section. In addition, before modifying this bit, be sure to clear the PANEL_IKEN bits in SYSCNT_PANEL_CLK in video display controller 6 to 0. |
| 3 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

41.4.4 LVDS PLL Setting Register (LPLLSETR)

LPLLSETR specifies the frequency dividing value and controls power-down in the LVDS PLL.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-----------------|-----|-----|----|-----------------|-----------------|-----|-----|-----|-----|------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | LVDSPLL_FD[6:0] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | LVDSPLL_RD[2:0] | | | — | — | LVDSPLL_OD[1:0] | | — | — | — | LVDSPLL_PD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R | R | R/W | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|---|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 16 | LVDSPLL_FD[6:0] | All 0 | R/W | These bits specify the frequency dividing value (NFD) for the feedback frequency in the LVDS PLL. NFD = 23 to 63 22 to 62: NFD = LVDSPLL_FD value + 1 0 to 21 and 63 to 127: Setting prohibited |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 8 | LVDSPLL_RD[2:0] | All 0 | R/W | These bits specify the frequency dividing value (NRD) for the input frequency in the LVDS PLL. NRD = 1 to 8 0 to 7: NRD = LVDSPLL_RD value + 1 |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5, 4 | LVDSPLL_OD[1:0] | All 0 | R/W | These bits specify the frequency dividing value (NOD) for the output frequency in the LVDS PLL. NOD = 1, 2, 4, or 8 0 to 3: NOD = 2 ^ LVDSPLL_OD value Note: Be sure to set this bit to 1 in this LSI. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | LVDSPLL_PD | 1 | R/W | Controls power-down for the LVDS PLL. 0: Normal operation 1: Power-down state |

41.5 Operation

This module receives the RGB888 signals output from video display controller 6 and the SYNC signal, converts the video signals to the LVDS format, and outputs them. The precision of the RGB signals is reduced to six bits each. The operating clock is generated in the LVDS PLL.

41.5.1 LVDS PLL Settings

The input clock select circuit, frequency dividers 2 and 3, and LVDS PLL circuit are used to generate operating clocks. For input and output of each circuit, allowable frequency ranges are determined; be sure to make appropriate settings to generate input and output frequencies within the ranges.

Before modifying various setting registers, check that the panel clock operation in video display controller 6 is disabled (SYSCNT_PANEL_CLK.PANEL_ICKEN = 0) and the LVDS PLL output is disabled (LPLLSETR.LVDS_CLK_EN = 0).

Figure 41.3 shows a block diagram of the LVDS PLL and its peripheral circuits.

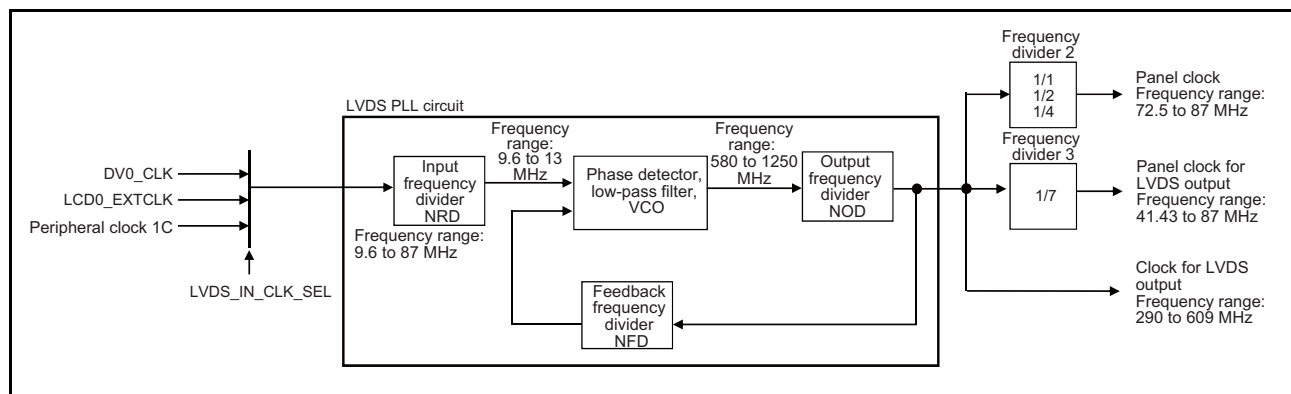

Figure 41.3 Block Diagram of LVDS PLL and Peripheral Circuits

(1) Clock Input to LVDS PLL

The clock input to the LVDS PLL can be selected from among DV0_CLK, LCD0_EXTCLK, and peripheral clock 1C (P1φ) clocks through the LVDS_IN_CLK_SEL bit setting in LVDS_CLKSELR.

The frequency of this input clock should be within the range from 9.6 to 87 MHz.

(2) LVDS PLL Frequency Setting

The LVDS PLL has three internal frequency dividers: input frequency divider NRD, feedback frequency divider NFD, and output frequency divider NOD.

The frequency of the clock output from the LVDS PLL is calculated by the following equations. Note that the reference frequency, VCO output frequency, LVDS PLL input frequency, and LVDS PLL output frequency should be within the respective ranges shown below the equations.

$$F_{REF} = F_{IN} / NRD \text{ (Reference frequency)}$$

$$F_{VCO} = F_{IN} \times NFD \times NOD / NRD \text{ (VCO output frequency)}$$

$$F_{OUT} = F_{IN} \times NFD / NRD \text{ (LVDS PLL output frequency)}$$

Note: FREF: Reference frequency. Frequency range = 9.6 MHz to 13 MHz
 FVCO: VCO output frequency. Frequency range = 580 MHz to 1250 MHz
 FIN: LVDS PLL input frequency. Frequency range = 9.6 MHz to 87 MHz
 FOUT: LVDS PLL output frequency. Frequency range = 609 MHz max.

(3) LVDS PLL Frequency Setting Timing

Before making settings for each frequency divider in the PLL circuit described in (2), place the PLL in the power-down state ($PD = 1$) and wait for at least $0.5\ \mu\text{s}$. After making frequency divider settings, wait for a retention period of at least $0.5\ \mu\text{s}$ and release the power-down state ($PD = 0$).

Figure 41.4 shows this timing.

Figure 41.4 PLL Setting Timing

(4) LVDS PLL Output Enable Timing

Output of the clock from the LVDS PLL can be enabled or disabled through the LVDS_CLK_EN bit setting in LCLKSELR.

To allow time for stabilization of oscillation by the PLL, wait for at least $200\ \mu\text{s}$ after release from the power-down state before enabling the LVDS PLL output. The LVDS_CLK_EN bit in LCLKSELR should be modified only while the panel clock operation in video display controller 6 is disabled ($\text{SYSCNT_PANEL_CLK.PANEL_ICKEN} = 0$).

(5) LVDS PLL Output Clock Frequency Setting

When using the clock output from the LVDS PLL as the clock for the LVDS output interface, select the clock from frequency divider 3 (divided by 7) as the panel clock for video display controller 6.

When using the clock output from the LVDS PLL as the clock for digital RGB output, select the clock from frequency divider 2 as the panel clock for video display controller 6. In addition, make appropriate settings so that the clock frequency after frequency division is 87 MHz or lower. This limitation on the frequency is not applied when the clock is used for the LVDS output interface.

The panel clock can be selected through the PANEL_OCKSEL bits in SYSCNT_PANEL_CLK in video display controller 6.

41.5.2 LVDS Output Format

This module converts and then outputs the LCD data output from video display controller 6 and the timing signals generated by the LCD TCON.

(1) LVDS Output Format

(a) LCD data

After converted into the LVDS format, LCD data is output from LCD_DATA23 to LCD_DATA18, LCD_DATA15 to LCD_DATA10, and LCD_DATA7 to LCD_DATA2 pins.

(b) Timing signals generated by LCD TCON

After converted into the LVDS format, the timing signals are output from the LCD_TCON0, LCD_TCON2, and LCD_TCON3 pins.

Figure 41.5 shows the bit alignment in the LVDS output format.

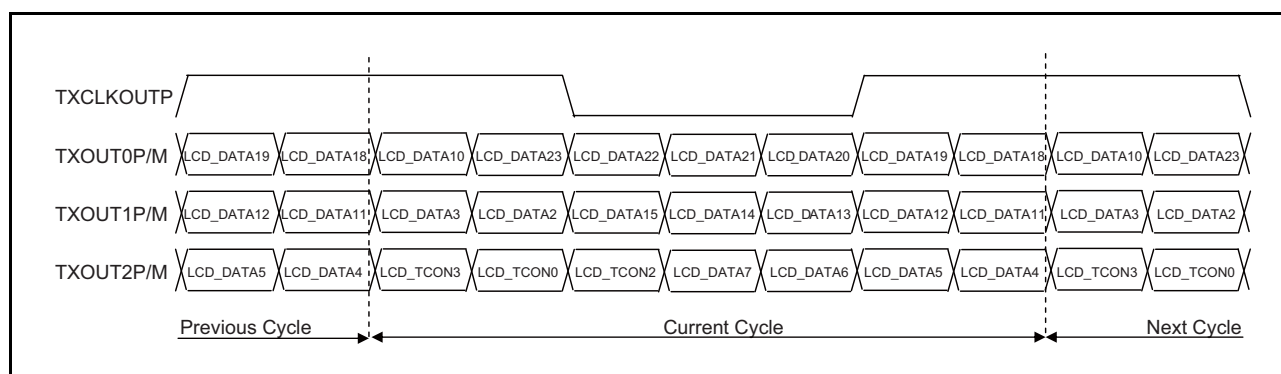

Figure 41.5 Data Map of LVDS Output Format

(2) Setting Example

The following is the setting example of the LVDS output format. The register the setting is applied is register in video display controller 6. For the details of the register, see section 39, Video Display Controller 6 (7): Output Controller.

Table 41.3 Setting Example of LVDS Output Format

| Register | Bit | Value | Remark |
|----------------|--------------------|-----------|---|
| OUT_SET | OUT_ENDIAN_ON | 0 | Bit endian change is off. |
| | OUT_SWAP_ON | 0 | B/R signal swap is off. |
| | OUT_FORMAT[1:0] | 0 | RGB888 is selected as an output format (the upper six-bit data is output in the LVDS format). |
| TCON_TIM_STVA2 | TCON_TIM_STVA2 | 0 | The VS signal is selected for the LCD_TCON0 pin. |
| TCON_TIM_STVA1 | TCON_STVA_VS[10:0] | Arbitrary | The VS signal timing is set. |
| | TCON_STVA_VW[10:0] | Arbitrary | The VS signal timing is set. |
| TCON_TIM_STH2 | TCON_STH_SEL[2:0] | 2 | The HS signal is selected for the LCD_TCON2 pin. |
| TCON_TIM_STH1 | TCON_STH_HS[10:0] | Arbitrary | The HS signal timing is set. |
| | TCON_STH_VS[10:0] | Arbitrary | The HS signal timing is set. |
| TCON_TIM_STB2 | TCON_STB_SEL[2:0] | 7 | The DE signal is selected for the LCD_TCON3 pin. |
| TCON_TIM_STVB1 | TCON_STVB_VS[10:0] | Arbitrary | The DE signal timing is set. |
| | TCON_STVB_VW[10:0] | Arbitrary | The DE signal timing is set. |
| TCON_TIM_STB1 | TCON_STB_HS[10:0] | Arbitrary | The DE signal timing is set. |
| | TCON_STB_HW[10:0] | Arbitrary | The DE signal timing is set. |

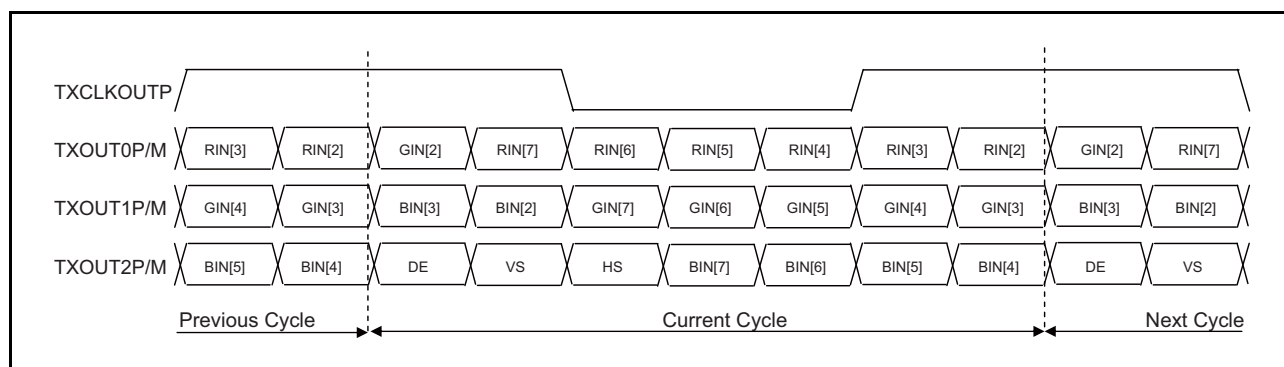

Figure 41.6 Data Map of Setting Example of LVDS Output Format

41.5.3 Procedures for Register Settings

(1) Initial Settings after Power-on Reset

The following shows an example of initial settings after a power-on reset.

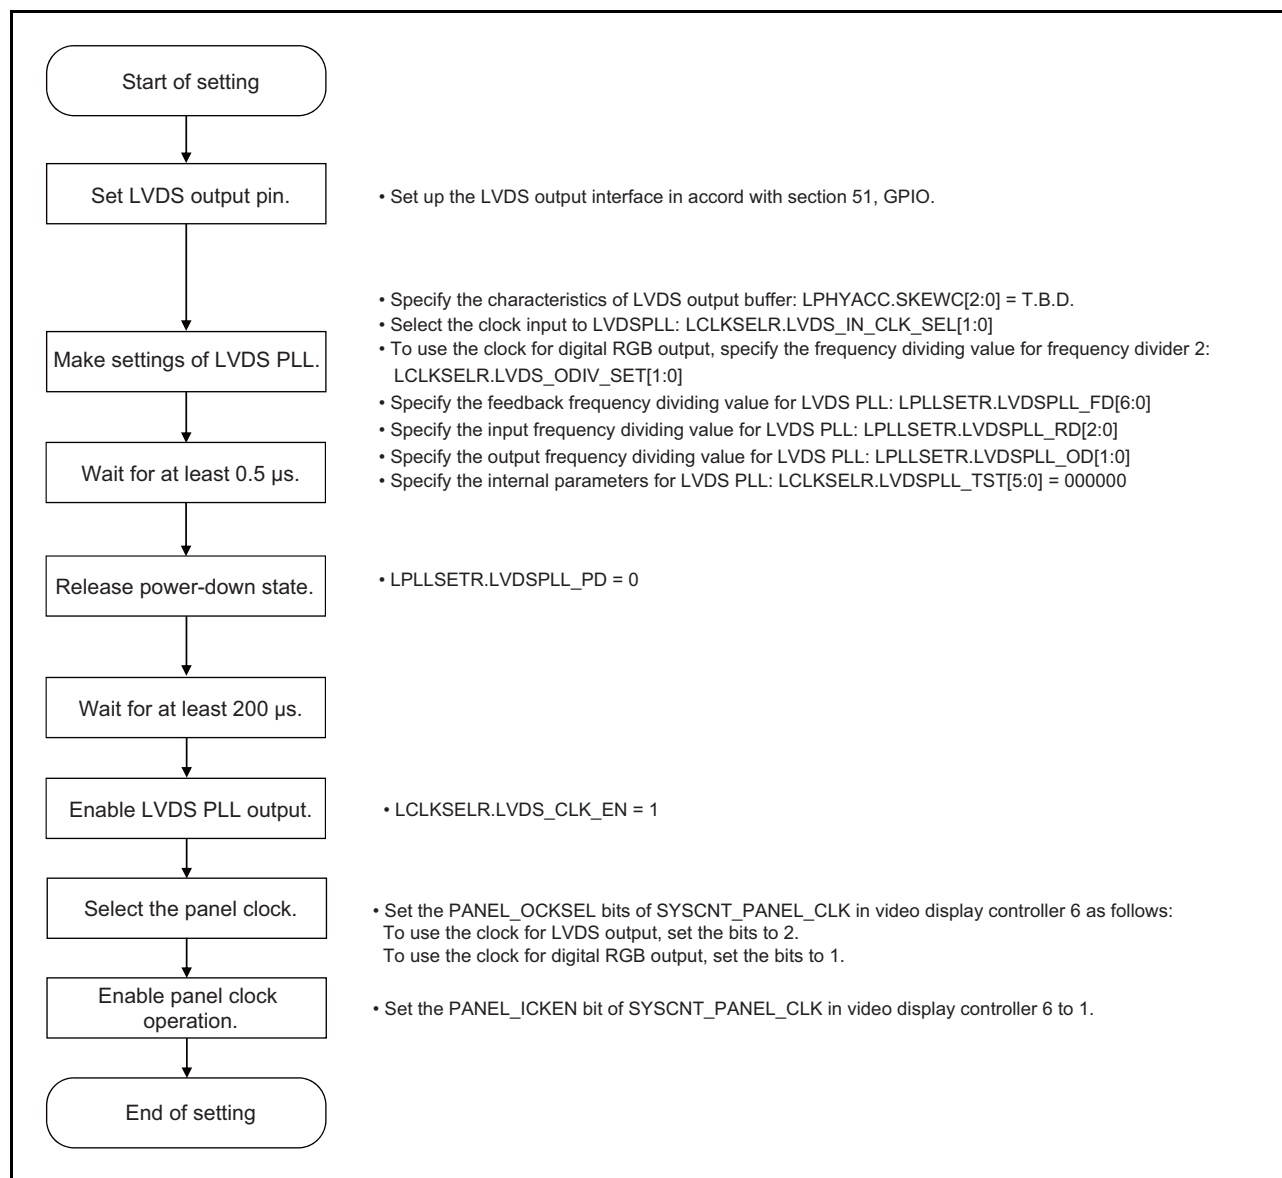

Figure 41.7 Example of Initial Settings after Power-On Reset

(2) Frequency Modification Settings

The following shows an example of modifying frequencies.

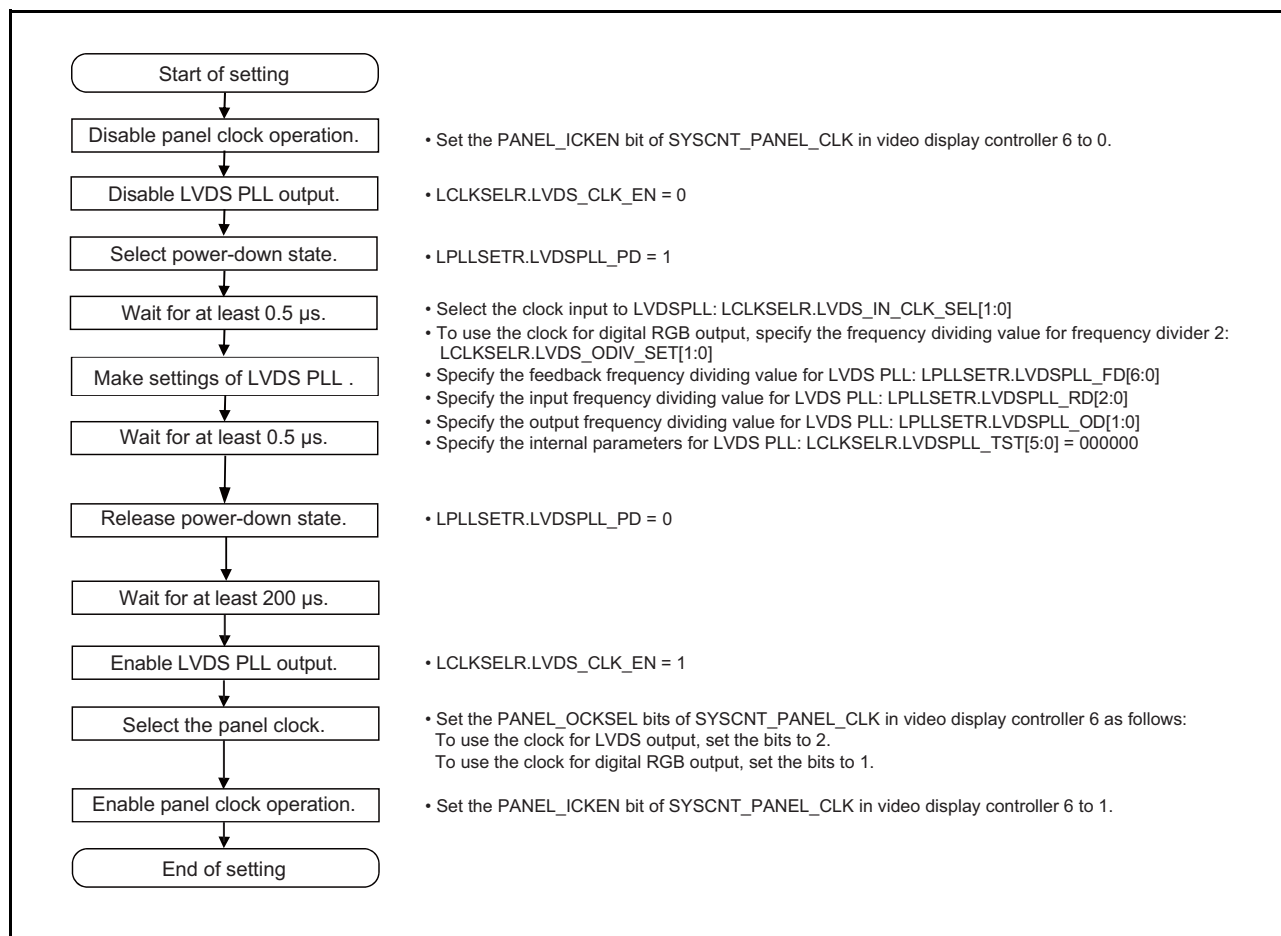

Figure 41.8 Example of Modifying Frequencies for LVDS Output

41.6 Notes

41.6.1 LVDS Output Pin Settings

The LVDS output buffers enter a low power consumption state, even if one of the eight differential output pins is set up other than for an LVDS output interface in accordance with **section 51, GPIO**. Although the LVDS output buffers return from the low power consumption state after pins are set to operate as an LVDS output interface, this requires up to 0.5 μ s. Accordingly, at least 0.5 μ s are required before actual LVDS output starts after pins have been set to operate as an LVDS output interface.

42. Image Renderer (IMR-LS2)

The distortion correction engine, image render-light SRAM 2 (IMR-LS2) is a drawing processor with a simple instruction system. The IMR-LS2 refers to captured video data as two-dimensional texture data and draws shapes by performing texture mapping to desired shapes divided into triangular objects. The IMR-LS2 is also capable of working with the video input interface in drawing in real time. Accordingly, the IMR-LS2 is usable in handling various functions such as for flattening the distortion of images from a camera with a fish-eye lens by processing the shape of the images and for correcting other desired types of images.

Details are available upon entry into a non-disclosure agreement.

43. 2D Drawing Engine (DRW)

43.1 Overview

The 2D Drawing Engine (DRW) provides flexible functions that can support almost any object geometry, rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or anti-aliased.

Rasterization is executed on the bounding box of an object from left to right and top to bottom at a rate of one pixel per clock cycle. The 2D Drawing Engine can also raster from bottom to top in certain cases, to optimize the performance. In addition, optimization methods are provided to avoid rasterization of many empty pixels of the bounding box.

The distances to the edges of the object are calculated by a set of edge equations for every pixel of the bounding box.

These edge equations can be combined to describe the entire object. If a pixel is inside the object, it is selected for rendering, and if it is outside it is discarded. If a pixel is on an edge, an alpha value for anti-aliasing is chosen proportional to the distance between the pixel (the edge) and another pixel nearest to the edge. Every pixel that is selected for rendering can be textured. The resulting aRGB quadruple can be modified by a general raster operation approach independently for each of the four channels. The aRGB quadruple can then be blended with one of the multiple blend modes of the module.

The 2D Drawing Engine provides two inputs (texture read and framebuffer read) and one output (framebuffer write). The internal color format is always aRGB (8888). The color formats from the inputs are converted to the internal format on read and converted back on write.

Figure 43.1 shows examples of objects that can be drawn in hardware with the 2D Drawing Engine, Figure 43.2 shows a simplified rendering pipeline setup, and Figure 43.3 shows the block diagram of the module.

Figure 43.1 Examples of drawing objects

The 2D Drawing Engine also supports a display list mode, which efficiently decouples the CPU and graphics controller to enable rendering in parallel with other CPU activities.

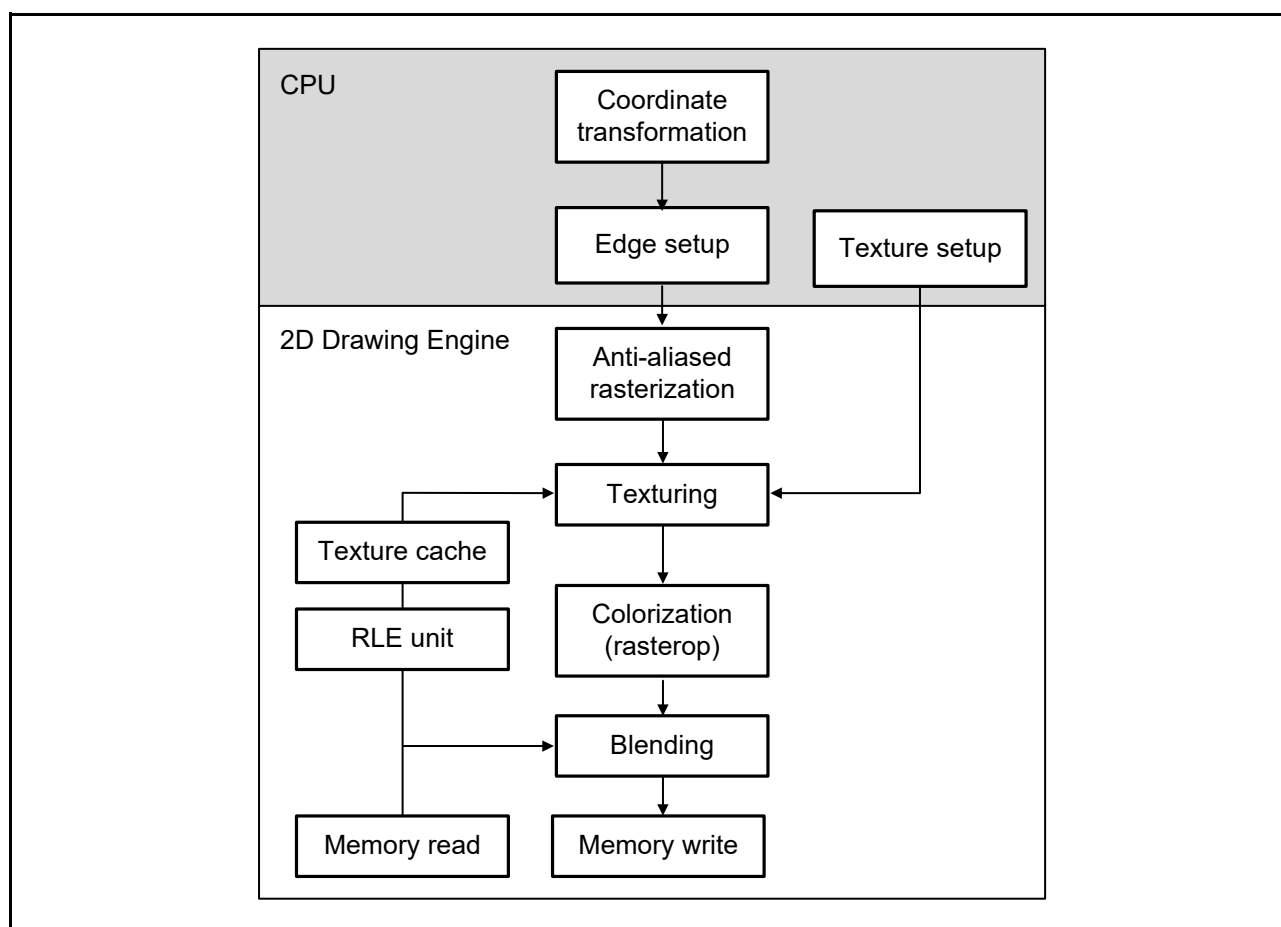

Figure 43.2 Simplified rendering pipeline setup

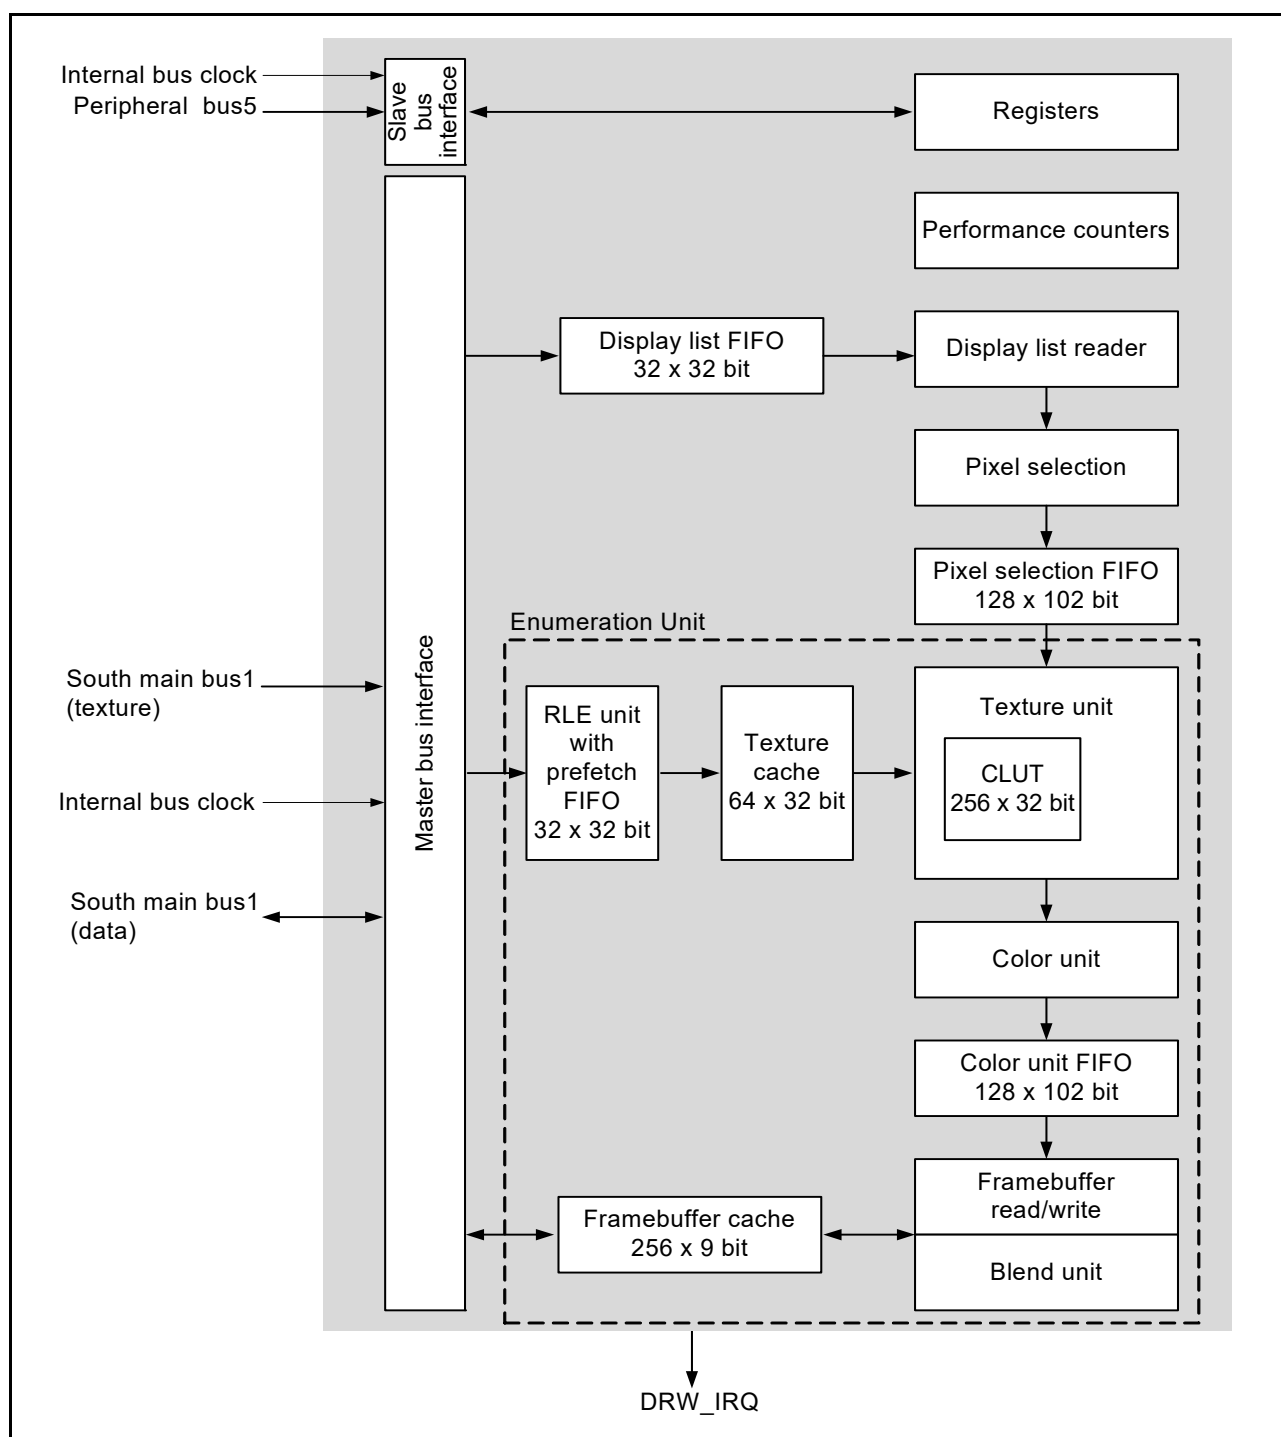

Figure 43.3 Block diagram of the 2D Drawing Engine

The 2D Drawing Engine accesses the South main bus1 as bus master through separate caches for:

- Reading and writing pixel data from and to the framebuffer
- Reading textures
- Reading display lists.

The control registers are accessed through the internal peripheral bus interface.

43.2 Register Descriptions

Symbols used in Register Descriptions:

Initial value: Register value after a power-on reset.

R/W: Readable/writable. The written value can be read.

R: Read-only.

W: Write-only.

| Register Name | Abbreviation | R/W | Address | Initial value | Access Size |
|--|--------------|-----|------------|---------------|-------------|
| Geometry control register* | CONTROL | W | E820 A000h | 0000 0000h | 32 |
| Status control register* | STATUS | R | E820 A000h | 0000 0000h | 32 |
| Surface control register* | CONTROL2 | W | E820 A004h | 0000 0000h | 32 |
| Hardware version and feature set ID register* | HWREVISION | R | E820 A004h | 0FBE 0107h | 32 |
| Limiter 1 start value register | L1START | W | E820 A010h | 0000 0000h | 32 |
| Limiter 2 start value register | L2START | W | E820 A014h | 0000 0000h | 32 |
| Limiter 3 start value register | L3START | W | E820 A018h | 0000 0000h | 32 |
| Limiter 4 start value register | L4START | W | E820 A01Ch | 0000 0000h | 32 |

| Bit | Symbol | Bit name | Description | R/W |
|--------|----------------------|---|---|-----|
| b0 | PATTERN ENABLE | Pattern Color Enable for Pixel Source | Pixel source is a pattern color (blend of COLOR1 and COLOR2 depending on PATTERN and pattern index). 0: Disable pattern 1: Enable pattern. When patterns are used to fill a primitive an index into the pattern bit mask is generated for each pixel with the U limiter. Depending on the pattern bits the color is selected from COLOR1 and COLOR2 registers. Fractional indices can be interpolated between those two values by using TEXTUREFILTERX = 1. The pattern can be wrapped by using TEXTURECLAMPX = 0, and the mask must be set in the TEXMASK register using the mask for u. | W |
| b1 | TEXTURE ENABLE | Texture Enable for Pixel Source | Pixel source is read from texture and used as an alpha to blend between COLOR1 and COLOR2. 0: Disable texture 1: Enable texture. | W |
| b2 | PATTERN SOURCE[5] | Limiter 5 Enable for Pattern Index | Limiter 5 is used as pattern index instead of the default U limiter. Limiter 5 can be combined with limiter 6 to form a quadratic limiter that can be used to make quadratic pattern functions to draw radial patterns. | W |
| b3 | USEACB | Alpha Blend Mode | 0: Use WRITEALPHA[1:0] mode 1: Use full alpha channel blending mode. | W |
| b5, b4 | READ FORMAT[3:2] | Texture Format Descriptor | Bits [3] and [2] of the texture buffer format. See the detailed description of the READFORMAT[1:0] bit in this section. | W |
| b6 | BSFA | Blend Source Factor for Alpha Channel | Valid in alpha channel blending mode (USEACB = 1). 0: Use 1.0 as blend source factor for alpha channel 1: Use alpha as blend source factor for alpha channel. | W |
| b7 | BDFA | Blend Destination Factor for Alpha Channel | Valid in alpha channel blending mode (USEACB = 1). 0: Use 1.0 as blend destination factor for alpha channel 1: Use alpha as blend destination factor for alpha channel. | W |
| b8 | WRITE FORMAT[2] | Writeback Framebuffer Format | Bit [2] of framebuffer pixel format. See the description of WRITEFORMAT[1:0] in this section. | W |
| b9 | BSF | Blend Source Factor | Source factor is alpha (factor is 1 per default). 0: Use 1.0 as blend source factor 1: Use alpha as blend source factor. | W |
| b10 | BDF | Blend Destination Factor | Destination factor is alpha (factor is 1 per default). 0: Use 1.0 as blend destination factor 1: Use alpha as blend destination factor. | W |
| b11 | BSI | Blend Source Factor Inverted | Source factor is inverted (meaning 1-a or 1-1 depending on BSF). 0: Use blend factor as specified through BSF 1: Invert blend source factor (1-x). | W |
| b12 | BDI | Blend Destination Factor Inverted | Destination factor is inverted (meaning 1-a or 1-1 depending on BDF). 0: Use blend factor as specified through BDF 1: Invert blend destination factor (1-x). | W |

| Bit | Symbol | Bit name | Description | R/W |
|----------|----------------------|---|---|-----|
| b13 | BC2 | Blend color 2 | Select of blend color 2 instead of framebuffer pixel. 0: Use pixel from framebuffer as destination (DST) 1: Use color 2 as destination (DST). | W |
| b14 | TEXTURE CLAMPX | Calculating U Limiter Outside Used Texture | This bit describes what happens when the U limiter (x direction in texture space) calculates a u value outside of the used texture. 0: Texture wrap mode: Integer part of the calculated value from the U limiter is AND gated with TEXUMASK, resulting in a repetition of texture in the x/u direction 1: Texture clamp mode: Texture color at the border of the texture is taken, resulting in a repetition of texture border color in the x/u direction. | W |
| b15 | TEXTURE CLAMPY | Calculating V Limiter Outside Used Texture | This bit describes what happens when the V limiter (y direction in texture space) calculates a v value outside of the used texture. 0: Texture wrap mode: Integer part of the calculated value from the V limiter is AND gated with TEXVMASK, resulting in a repetition of texture in the y/v direction. 1: Texture clamp mode: Texture color at the border of the texture is taken, resulting in a repetition of texture border color in the y/v direction. | W |
| b16 | TEXTURE FILTERX | Linear Filtering on Texture U Axis | 0: No filtering on texture u axis 1: Linear filtering on texture u axis. | W |
| b17 | TEXTURE FILTERY | Linear Filtering on Texture V Axis | 0: No filtering on texture V axis 1: Linear filtering on texture V axis. | W |
| b19, b18 | READ FORMAT[1:0] | Texture Format Descriptor | Pixel format of the texture buffer. b5 b4 b19 b18 0 0 0 0: 8 bpp a (8) 0 0 0 1: 16 bpp RGB (565) 0 0 1 0: 32 bpp aRGB (8888) 0 0 1 1: 16 bpp aRGB (4444) 0 1 0 0: 16 bpp aRGB (1555) 0 1 0 1: 8 bpp aCLUT (44), 4 bit alpha and 4 bit indexed color 1 0 0 1: 8 bpp CLUT (8)/I (8), 8 bit indexed color/luminance 1 0 1 0: 4 bpp CLUT (4)/I (4), 4 bit indexed color/luminance 1 0 1 1: 2 bpp CLUT (2)/I (2), 2 bit indexed color/luminance 1 1 0 0: 1 bpp CLUT (1)/I (1), 1 bit indexed color/luminance. Other settings are prohibited. | W |
| b21, b20 | WRITE FORMAT[1:0] | Writeback Framebuffer Format | Pixel format of the framebuffer. b8 b21 b20 0 0 0: 8 bpp a (8) 0 0 1: 16 bpp RGB (565) 0 1 0: 32 bpp aRGB (8888) 0 1 1: 16 bpp aRGB (4444). Other settings are prohibited. | W |
| b23, b22 | WRITE ALPHA[1:0] | Writeback Alpha Source for Framebuffer | <ul style="list-style-type: none"> In non-alpha channel blending mode (USEACB = 0): Sets the alpha source for the framebuffer. b23 b22 0 0: Use alpha from color 2 0 1: Use source alpha (pixel coverage) 1 0: Use 0.0 as alpha 1 1: Use alpha from framebuffer. In alpha channel blending mode (USEACB = 1): Blends alpha in color 2 instead of framebuffer alpha. b23 b22 00: BC2A = 1: Use alpha in color 2 as destination (DST_A). else: BC2A = 0: Use alpha from framebuffer as destination (DST_A) | W |
| b24 | RLEENABLE | RLE Enable | 0: Disable RLE 1: Enable RLE. | W |
| b25 | CLUTENABLE | CLUT Enable | 0: Disable CLUT 1: Enable CLUT. If CLUTENABLE = 0 (CLUT disabled), the index is directly put on the RGB channels. | W |
| b26 | COLKEY ENABLE | Color Keying Enable | 0: Disable color keying 1: Enable color keying. | W |

| Bit | Symbol | Bit name | Description | R/W |
|----------|------------------------|---|---|-----|
| b27 | CLUTFORMAT | CLUT Format | 0: Format CLUT as aRGB (8888) 1: Format CLUT as RGB (565). | W |
| b28 | BSIA | Blend Source Factor Inverted in Alpha Channel | <ul style="list-style-type: none"> In alpha channel blending mode (USEACB = 1): 0: Use blend factor as specified through BSFA 1: Invert blend source factor (1-x). | W |
| b29 | BDIA | Blend Destination Factor Inverted in Alpha Channel | <ul style="list-style-type: none"> In alpha channel blending mode (USEACB = 1): 0: Use blend factor as specified through BDFA 1: Invert destination blend factor (1-x). | W |
| b31, b30 | RLEPIXEL WIDTH[1:0] | Texel Width for RLE Unit | b31 b30 0 0: 1 byte per texel 0 1: 2 bytes per texel 1 0: 3 bytes per texel 1 1: 4 bytes per texel. | W |

43.2.3 Interrupt Control Register (IRQCTL)

Address(es): DRW.IRQCTL E820 A0C0h

| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|--------------------|-----|-----|-----|-----|-----|-----|----|----|----|----|-----------|----------|-------------|------------|------------|-----------|
| | — | — | — | — | — | — | — | — | — | — | BUSIRQCLR | BUSIRQEN | DLISTIRQCLR | ENUMIRQCLR | DLISTIRQEN | ENUMIRQEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-------------|--------------------------------|--|-----|
| b0 | ENUMIRQEN | ENUMIRQ Interrupt Mask Enable | 0: Disable (mask) ENUMIRQ enumeration interrupt 1: Enable (unmask) ENUMIRQ enumeration interrupt. | W |
| b1 | DLISTIRQEN | DLISTIRQ Interrupt Mask Enable | 0: Disable (mask) DLISTIRQ display list interrupt 1: Enable (unmask) DLISTIRQ display list interrupt. | W |
| b2 | ENUMIRQCLR | Clear ENUMIRQ | 0: Do not clear ENUMIRQ enumeration interrupt 1: Clear ENUMIRQ enumeration interrupt. | W |
| b3 | DLISTIRQCLR | Clear DLISTIRQ | 0: Do not clear DLISTIRQ display list interrupt 1: Clear DLISTIRQ display list interrupt. | W |
| b4 | BUSIRQEN | BUSIRQ Interrupt Mask Enable | 0: Disable (mask) BUSIRQ bus error interrupt 1: Enable (unmask) BUSIRQ bus error interrupt. | W |
| b5 | BUSIRQCLR | Clear BUSIRQ | 0: Do not clear BUSIRQ bus error interrupt 1: Clear BUSIRQ bus error interrupt. | W |
| b31 to b6 | — | Reserved | The write value should be 0. | W |

43.2.4 Cache Control Register (CACHECTL)

Address(es): DRW.CACHECTL E820 A0C4h

| | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|--------------|---------------|--------------|---------------|
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | CFLUS HTX | CENAB LETX | CFLUS HFX | CENAB LEFX |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-----------|--------------------------|--|-----|
| b0 | CENABLEFX | Framebuffer Cache Enable | 0: Disable the framebuffer cache 1: Enable the framebuffer cache. | W |
| b1 | CFLUSHFX | Flush Framebuffer Cache | 0: Do not flush the framebuffer cache 1: Flush the framebuffer cache. | W |
| b2 | CENABLETX | Texture Cache Enable | 0: Disable the texture cache 1: Enable the texture cache. | W |
| b3 | CFLUSHTX | Flush Texture Cache | 0: Do not flush the texture cache 1: Flush the texture cache. | W |
| b31 to b4 | — | Reserved | The write value should be 0. | W |

43.2.5 Status Control Register (STATUS)

Address(es): DRW.STATUS E820 A000h

| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|--------------------|-----|-----|-----|-----|-----|---------------|------------------|---------------|----|------------|--------------|-------------|-----------------|----------------|---------------|--------------|
| | — | — | — | — | — | BUSER RMDL | BUSERR MTXMRL | BUSER RMFB | — | BUSIR Q | DLISTI RQ | ENUMI RQ | DLISTA CTIVE | CACHE DIRTY | BUSY WRITE | BUSYE NUM |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|------------|--------------|--|---|-----|
| b0 | BUSYENUM | Enumeration Unit Status | 0: Enumeration unit idle 1: Enumeration unit busy, new primitive cannot be started. | R |
| b1 | BUSYWRITE | Framebuffer Writeback Status | 0: Framebuffer writeback finished 1: Framebuffer writeback busy, framebuffer type cannot be changed. | R |
| b2 | CACHEDIRTY | Framebuffer Cache Status | 0: Framebuffer cache is not dirty 1: Framebuffer cache is dirty, and frame should not be flipped. | R |
| b3 | DLISTACTIVE | Display List Reader Status | 0: Display list reader is idle 1: Display list reader busy, and no direct write access to registers allowed. | R |
| b4 | ENUMIRQ | Enumeration Interrupt Triggered | 0: Enumeration not finished or interrupt disabled 1: Enumeration finished interrupt triggered. | R |
| b5 | DLISTIRQ | Display List Interrupt Triggered | 0: Display list not finished or interrupt disabled 1: Display list finished interrupt triggered. | R |
| b6 | BUSIRQ | Bus Error Interrupt Triggered | 0: No bus error occurred or interrupt disabled 1: Bus error interrupt triggered. | R |
| b7 | — | Reserved | This bit is read as 0. | R |
| b8 | BUSERRMFB | Framebuffer Bus Error Interrupt Triggered | 0: No framebuffer bus error occurred or interrupt disabled 1: Framebuffer bus error interrupt triggered. | R |
| b9 | BUSERRMTXMRL | Texture Bus Error Interrupt Triggered | 0: No texture bus error occurred or interrupt disabled 1: Texture bus error interrupt triggered*1. | R |
| b10 | BUSERRMDL | Display List Bus Error Interrupt Triggered | 0: No display list bus error occurred or interrupt disabled 1: Display list bus error interrupt triggered. | R |
| b31 to b11 | — | Reserved | These bits are read as 0. | R |

Note 1. Because the RLE unit is also reading data through the texture bus, an error during RLE data access is also reflected in this bit.

43.2.6 Hardware Version and Feature Set ID Register (HWREVISION)

Address(es): DRW.HWREVISION E820 A004h

| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
|--------------------|-----|-----|-----|-----|---------|-----|----------|------------|---------|-----|--------|-----------|---------|---------|-----|-----|
| | — | — | — | — | ACBLEND | — | COLORKEY | TEXCLUT256 | RLEUNIT | — | TEXCLU | PERFCOUNT | TXCACHE | FBCACHE | DLR | — |
| Value after reset: | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 0 |

| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|--------------------|-----|-----|-----|-----|-----------|-----|----|----|----|----|----|----|----|----|----|----|
| | — | — | — | — | REV[11:0] | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

| Bit | Symbol | Bit name | Description | R/W |
|------------|------------|---|---|-----|
| b11 to b0 | REV[11:0] | Revision Number | Revision number. | R |
| b16 to b12 | — | Reserved | These bits are read as 0. | R |
| b17 | DLR | Display List Reader Available | Display list reader is available. | R |
| b18 | FBCACHE | Framebuffer Cache Available | Framebuffer cache is available. | R |
| b19 | TXCACHE | Texture Cache Available | Texture cache is available. | R |
| b20 | PERFCOUNT | Two Performance Counter Available | Two performance counter is available. | R |
| b21 | TECLUT | Texture CLUT with 16 or 256 Entries Available | Texture CLUT with 16 or 256 entries is available. | R |
| b22 | — | Reserved | This bit is read as 0. | R |
| b23 | RLEUNIT | RLE Unit Available | RLE unit is available. | R |
| b24 | TEXCLUT256 | Texture CLUT Available | Texture CLUT is available. | R |
| b25 | COLORKEY | Color Key Available | Color key is available. | R |
| b26 | — | Reserved | This bit is read as 1. | R |
| b27 | ACBLEND | Alpha Channel Blending Available | Alpha channel blending is available. | R |
| b31 to b28 | — | Reserved | These bits are read as 0. | R |

43.2.7 Base Color Register (COLOR1)

Address(es): DRW.COLOR1 E820 A064h

| Bit | Symbol | Bit name | Description | R/W |
|------------|--------------|--------------------------|--|-----|
| b7 to b0 | COLOR1B[7:0] | Blue Channel of Color 1 | Specifies blue channel of color 1. | W |
| b15 to b8 | COLOR1G[7:0] | Green Channel of Color 1 | Specifies green channel of color 1. | W |
| b23 to b16 | COLOR1R[7:0] | Red Channel of Color 1 | Specifies red channel of color 1. | W |
| b31 to b24 | COLOR1A[7:0] | Alpha Channel of Color 1 | Specifies alpha channel of color 1. 00h: Transparent ... FFh: Opaque. | W |

43.2.8 Secondary Color Register (COLOR2)

Address(es): DRW.COLOR2 E820 A068h

| Bit | Symbol | Bit name | Description | R/W |
|------------|--------------|--------------------------|--|-----|
| b7 to b0 | COLOR2B[7:0] | Blue Channel of Color 2 | Specifies blue channel of color 2. | W |
| b15 to b8 | COLOR2G[7:0] | Green Channel of Color 2 | Specifies green channel of color 2. | W |
| b23 to b16 | COLOR2R[7:0] | Red Channel of Color 2 | Specifies red channel of color 2. | W |
| b31 to b24 | COLOR2A[7:0] | Alpha Channel of Color 2 | Specifies alpha channel of color 2. 00h: Transparent ... FFh: Opaque. | W |

43.2.9 Pattern Register (PATTERN)

Address(es): DRW.PATTERN E820 A074h

| | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|----|----|--------------|----|----|----|----|----|----|----|
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| | — | — | — | — | — | — | — | — | PATTERN[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|-----------|--------------|-----------------------|----------------------------------|-----|
| b7 to b0 | PATTERN[7:0] | Bitmap of the Pattern | Specifies bitmap of the pattern. | W |
| b31 to b8 | — | Reserved | The write value should be 0. | W |

43.2.10 Limiter N Start Value Register (LnSTART)

Address(es): DRW.L1START E820 A010h, DRW.L2START E820 A014h, DRW.L3START E820 A018h, DRW.L4START E820 A01Ch, DRW.L5START E820 A020h, DRW.L6START E820 A024h

| | | | | | | | | | | | | | | | | |
|--------------------|---------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| | LSTART[31:16] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|--------------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| | LSTART[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|-----------|--------------|--------------------------------|---|-----|
| b31 to b0 | LSTART[31:0] | Start Value of the nth Limiter | Specifies start value of the nth limiter. | W |

43.2.11 Limiter N X-Axis Increment Register (LnXADD)

Address(es): DRW.L1XADD E820 A028h, DRW.L2XADD E820 A02Ch, DRW.L3XADD E820 A030h, DRW.L4XADD E820 A034h, DRW.L5XADD E820 A038h, DRW.L6XADD E820 A03Ch

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-------------|------------------|-----------------------------|-----|
| b31 to b0 | LXADD[31:0] | X-Axis Increment | Specifies x-axis increment. | W |

43.2.12 Limiter N Y-Axis Increment Register (LnYADD)

Address(es): DRW.L1YADD E820 A040h, DRW.L2YADD E820 A044h, DRW.L3YADD E820 A048h, DRW.L4YADD E820 A04Ch, DRW.L5YADD E820 A050h, DRW.L6YADD E820 A054h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-------------|------------------|-----------------------------|-----|
| b31 to b0 | LYADD[31:0] | Y-Axis Increment | Specifies y-axis increment. | W |

43.2.13 Limiter M Bandwidth Parameter Register (LmBAND)

Address(es): DRW.L1BAND E820 A058h, DRW.L2BAND E820 A05Ch

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-------------|-------------------------------|--|-----|
| b31 to b0 | LBAND[31:0] | Limiter m Bandwidth Parameter | Specifies limiter m bandwidth parameter. | W |

43.2.14 Texture Base Address Register (TEXORIGIN)

Address(es): DRW.TEXORIGIN E820 A0BCh

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-----------------|----------------------|---------------------------------|-----|
| b31 to b0 | TEXORIGIN[31:0] | Texture Base Address | Specifies texture base address. | W |

43.2.15 Texels Per Texture Line Register (TEXPITCH)

Address(es): DRW.TEXPITCH E820 A0B4h

| Bit | Symbol | Bit name | Description | R/W |
|------------|----------------|-------------------------|------------------------------------|-----|
| b10 to b0 | TEXPITCH[10:0] | Texels Per Texture Line | Specifies texels per texture line. | W |
| b31 to b11 | — | Reserved | The write value should be 0. | W |

43.2.16 Texture Size or Texture Address Mask Register (TEXMASK)

Address(es): DRW.TEXMASK E820 A0B8h

| Bit | Symbol | Bit name | Description | R/W |
|------------|----------------|------------------------|---|-----|
| b10 to b0 | TEXUMASK[10:0] | U Mask in Texture Mode | Specifies the U mask. Set to texture_width-1. <ul style="list-style-type: none"> In texture wrapping mode (CONTROL2.TEXTURECLAMPX = 0): Texture_width must be a power of 2 In texture clamping mode (CONTROL2.TEXTURECLAMPX = 1): All widths up to 2048 are allowed. | W |
| b31 to b11 | TEXVMASK[20:0] | V Mask in Texture Mode | Specifies the V mask. Set to TEXTPITCH × (texture_height - 1) <ul style="list-style-type: none"> In texture wrapping mode (CONTROL2.TEXTURECLAMPY = 0): Texture_height must be a power of 2 In texture clamping mode (CONTROL2.TEXTURECLAMPY = 1): All heights up to 1024 are allowed. | W |

43.2.17 U Limiter Start Value Register (LUSTART)

Address(es): DRW.LUSTART E820 A090h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|---------------|-----------------------|----------------------------------|-----|
| b31 to b0 | LUSTART[31:0] | U Limiter Start Value | Specifies U limiter start value. | W |

43.2.18 U Limiter X-Axis Increment Register (LUXADD)

Address(es): DRW.LUXADD E820 A094h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|--------------|----------------------------|---------------------------------------|-----|
| b31 to b0 | LUXADD[31:0] | U Limiter X-Axis Increment | Specifies U limiter x-axis increment. | W |

43.2.19 U Limiter Y-Axis Increment Register (LUYADD)

Address(es): DRW.LUYADD E820 A098h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|--------------|----------------------------|---------------------------------------|-----|
| b31 to b0 | LUYADD[31:0] | U Limiter Y-Axis Increment | Specifies U limiter y-axis increment. | W |

43.2.20 V Limiter Start Value Integer Part Register (LVSTARTI)

Address(es): DRW.LVSTARTI E820 A09Ch

| Bit | Symbol | Bit name | Description | R/W |
|-----------|----------------|------------------------------------|--|-----|
| b31 to b0 | LVSTARTI[31:0] | V Limiter Start Value Integer Part | Specifies integer part of V limiter start value. | W |

43.2.21 V Limiter Start Value Fractional Part Register (LVSTARTF)

Address(es): DRW.LVSTARTF E820 A0A0h

| Bit | Symbol | Bit name | Description | R/W |
|------------|----------------|---------------------------------------|---|-----|
| b15 to b0 | LVSTARTF[15:0] | V Limiter Start Value Fractional Part | Specifies fractional part of V limiter start value. | W |
| b31 to b16 | — | Reserved | The write value should be 0. | W |

43.2.22 V Limiter X-Axis Increment Integer Part Register (LVXADDI)

Address(es): DRW.LVXADDI E820 A0A4h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|---------------|---|---|-----|
| b31 to b0 | LVXADDI[31:0] | V Limiter X-Axis Increment Integer Part | Specifies integer part of V limiter x-axis increment. | W |

43.2.23 V Limiter Y-Axis Increment Integer Part Register (LVYADDI)

Address(es): DRW.LVYADDI E820 A0A8h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|---------------|---|---|-----|
| b31 to b0 | LVYADDI[31:0] | V Limiter Y-Axis Increment Integer Part | Specifies integer part of V limiter y-axis increment. | W |

43.2.24 V Limiter Increment Fractional Parts Register (LVYXADDF)

Address(es): DRW.LVYXADDF E820 A0ACh

| Bit | Symbol | Bit name | Description | R/W |
|------------|---------------|--|--|-----|
| b15 to b0 | LVXADDF[15:0] | V Limiter X-Axis Increment Fractional Part | Specifies fractional part of V limiter x-axis increment. | W |
| b31 to b16 | LVYADDF[15:0] | V Limiter Y-Axis Increment Fractional Part | Specifies fractional part of V limiter y-axis increment. | W |

43.2.25 CLUT Start Address Register (TEXCLADDR)

Address(es): DRW.TEXCLADDR E820 A0DCh

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-------------|----------------------------|---------------------------------------|-----|
| b7 to b0 | CLADDR[7:0] | Texture CLUT Start Address | Specifies texture CLUT start address. | W |
| b31 to b8 | — | Reserved | The write value should be 0. | W |

43.2.26 CLUT Data Register (TEXCLDATA)

Address(es): DRW.TEXCLDATA E820 A0E0h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|--------------|-------------------|------------------------------|-----|
| b31 to b0 | CLDATA[31:0] | Texture CLUT Data | Specifies texture CLUT data. | W |

43.2.27 CLUT Offset Register (TEXCLOFFSET)

Address(es): DRW.TEXCLOFFSET E820 A0E4h

| | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|----|----|---------------|----|----|----|----|----|----|----|--|
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 | |
| | — | — | — | — | — | — | — | — | CLOFFSET[7:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

| Bit | Symbol | Bit name | Description | R/W |
|-----------|---------------|---------------------|---|-----|
| b7 to b0 | CLOFFSET[7:0] | Texture CLUT Offset | Specifies texture CLUT offset. CLOFFSET[7:0] is OR gated with the original index. | W |
| b31 to b8 | — | Reserved | The write value should be 0. | W |

43.2.28 Color Key Register (COLKEY)

Address(es): DRW.COLKEY E820 A0E8h

| | | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|--------------|-----|-----|-----|-----|-----|-----|-----|--|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 | |
| | — | — | — | — | — | — | — | — | COLKEYR[7:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

| | | | | | | | | | | | | | | | | |
|--------------------|--------------|-----|-----|-----|-----|-----|----|----|--------------|----|----|----|----|----|----|----|
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| | COLKEYG[7:0] | | | | | | | | COLKEYB[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|------------|--------------|----------------------------|---------------------------------------|-----|
| b7 to b0 | COLKEYB[7:0] | Blue Channel of Color Key | Specifies blue channel of color key. | W |
| b15 to b8 | COLKEYG[7:0] | Green Channel of Color Key | Specifies green channel of color key. | W |
| b23 to b16 | COLKEYR[7:0] | Red Channel of Color Key | Specifies red channel of color key. | W |
| b31 to b24 | — | Reserved | The write value should be 0. | W |

43.2.29 Bounding Box Dimension Register (SIZE)

Address(es): DRW.SIZE E820 A078h

| Bit | Symbol | Bit name | Description | R/W |
|------------|-------------|---------------------|--|-----|
| b15 to b0 | SIZEX[15:0] | Bounding Box Width | Specifies width of bounding box in pixels. Valid range: 0 to 1024. | W |
| b31 to b16 | SIZEY[15:0] | Bounding Box Height | Specifies height of bounding box in pixels. Valid range: 0 to 1024. | W |

43.2.30 Framebuffer Pitch And Spanstore Delay Register (PITCH)

Address(es): DRW.PITCH E820 A07Ch

| Bit | Symbol | Bit name | Description | R/W |
|------------|-------------|--------------------------|---|-----|
| b15 to b0 | PITCH[15:0] | Pitch of the Framebuffer | A negative width can be used to render bottom-up instead of top-down. | W |
| b31 to b16 | SSD[15:0] | Spanstore Delay | Specifies number of scan lines to delay spanstore operations. | W |

43.2.31 Framebuffer Base Address Register (ORIGIN)

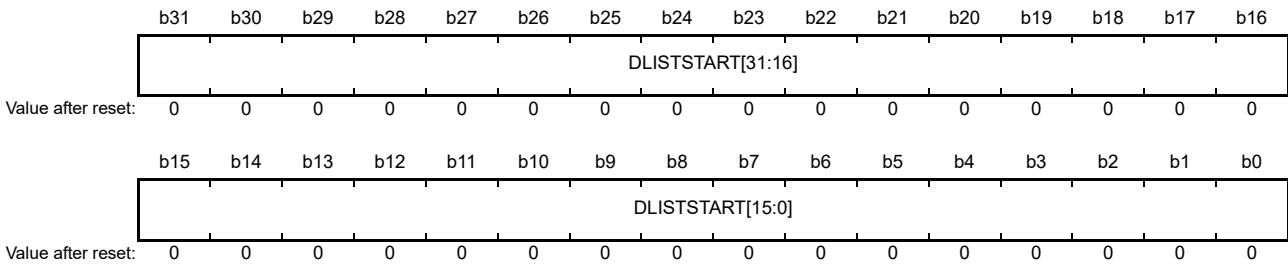

Address(es): DRW.ORIGIN E820 A080h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|--------------|---|--|-----|
| b31 to b0 | ORIGIN[31:0] | Address of the First Pixel in Framebuffer | Writing to ORIGIN triggers the start of rendering. | W |

43.2.32 Display List Start Address Register (DLISTSTART)

Address(es): DRW.DLISTSTART E820 A0C8h

| Bit | Symbol | Bit name | Description | R/W |
|-----------|------------------|----------------------------|---|-----|
| b31 to b0 | DLISTSTART[31:0] | Display List Start Address | Setting a new display list base address triggers execution of the new display list. Execution stops only when a new list is set or the current list terminates. | W |

43.2.33 Performance Counters Control Register (PERFTRIGGER)

Address(es): DRW.PERFTRIGGER E820 A0D4h

| | | | | | | | | | | | | | | | | |
|--------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-------------------|-----|-----|-----|-----|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| | — | — | — | — | — | — | — | — | — | — | — | PERFTRIGGER2[4:0] | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| | — | — | — | — | — | — | — | — | — | — | — | PERFTRIGGER1[4:0] | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|------------|-------------------|----------------------------------|--|-----|
| b4 to b0 | PERFTRIGGER1[4:0] | Trigger of Performance Counter 1 | Selects the internal event that increments the PERFCOUNT1 register. 0: Disable performance counter 1: Select 2D Drawing Engine active cycles 2: Select framebuffer read access 3: Select framebuffer write access 4: Select texture read access 5: Select invisible pixels (enumerated but selected with alpha 0%) 6: Select invisible pixels while internal FIFO is empty (lost cycles) 7: Select display list reader active cycles 8: Select framebuffer read hits 9: Select framebuffer read misses 10: Select framebuffer write hits 11: Select framebuffer write misses 12: Select texture read hits 13: Select texture read misses 31: Select every clock cycle (for use as timer). | W |
| b15 to b5 | — | Reserved | The write value should be 0. | W |
| b20 to b16 | PERFTRIGGER2[4:0] | Trigger of Performance Counter 2 | Same as for PERFTRIGGER1, but for performance counter 2. | W |
| b31 to b21 | — | Reserved | The write value should be 0. | W |

43.2.34 Performance Counter k (PERFCOUNTk) (k = 1, 2)

Address(es): DRW.PERFCOUNT1 E820 A0CCh, DRW.PERFCOUNT2 E820 A0D0h

| | | | | | | | | | | | | | | | | |
|--------------------|------------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| | PERFCOUNT[31:16] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| | PERFCOUNT[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Bit name | Description | R/W |
|-----------|-----------------|-----------------------------|---|-----|
| b31 to b0 | PERFCOUNT[31:0] | Performance Counter k Value | Specifies counter k value. The counter is reset by writing PERFCOUNTk = 0000 0000h. | R/W |

43.3 Drawing Features

43.3.1 Drawing Features Summary

43.3.1.1 Color Formats

Supported color formats are:

Framebuffer formats

- 8-bit: a (8)
- 16-bit: RGB (565), aRGB (4444)
- 32-bit: aRGB (8888).

Texture formats

- 1-bit: CLUT (1)/I (1)
- 2-bit: CLUT (2)/I (2)
- 4-bit: CLUT (4)/I (4)
- 8-bit: a (8), CLUT (8)/I (8), aCLUT (44)
- 16-bit: aRGB (4444), aRGB (1555), RGB (565)
- 24-bit: RGB (888) (run length encoded (RLE) unit)
- 32-bit: aRGB (8888).

CLUT formats use a 256-entry color lookup table.

43.3.1.2 BitBLT Features

The 2D Drawing Engine supports the BitBLT features using its vector drawing function to draw a rectangle and texture it based on the selected BitBLT function. This approach results in the following BitBLT features:

- Fill
- Copy
- Stretch BitBLT
- Rotate and scale
- Alpha blending
- Bilinear filtering
- Color conversion
- Subpixel exact placement.

43.3.1.3 Vector Drawing Features

The 2D Drawing Engine for vectors uses a half-plane rendering approach, which simplifies the implementation of the edge antialiasing and blurring features without much overhead.

When combining some of its functional units, this module can draw not only linear primitives such as lines or polygons but also quadratic equation-based primitives such as circles and ellipsoids.

The following primitives are supported:

- Lines
- Polygons
- Circles and ellipses
- Quadratic curves (software driver support)
- 2D texture mapping
- Bilinear filtering of the textures.

43.3.2 Vector Drawing

For a detailed explanation of the algorithms, see [section 43.6, Rendering Pipeline](#). Supported vector drawing includes:

Lines

- Arbitrary width
- Round endpoints
- Truncated endpoints
- Alpha gradients
- Soft edges (blurring)
- Render attribute: color, pattern, or texture.

Polygons

- Triangles and quadrangles (complex polygons are tessellated by software)
- Alpha gradients
- Soft edges (blurring)
- Per edge controls for anti-aliasing
- Render attribute: color, pattern, or texture.

Circles and ellipses

- All conic sections
- Filled or with arbitrary width
- Arcs of 0° to 360°
- Soft edges
- Alpha gradients
- Render attribute: color, pattern, or texture.

Quadratic Bézier

- Approximated by circle arcs
- Arbitrary width
- Round or truncated endpoints
- Outlines, blurring
- Alpha gradients
- Render attribute: color.

Texture mapping

- 2D array of pixels that can be mapped implicitly or explicitly on all primitives provided by the 2D Drawing Engine
- Translation, rotation, and scaling/shearing
- Bilinear filtering of the textures
- 3D-like texturing accomplished with line-by-line mapping if either the x or y coordinate value is a constant.

43.3.3 BitBLT

A dedicated BitBLT unit is not required in the 2D Drawing Engine. The rendering pipeline described for vector drawing is used as the BitBLT unit and already provides a 1 pixel/cycle throughput. For details, see [section 43.6, Rendering Pipeline](#).

43.3.3.1 Fill

Any rectangle in the framebuffer can be filled with any value. Possible color formats are any 8-, 16-, or 32-bpp format. The driver optimizes the fill to gain the full benefit of 32-bit parallel rasterization. If the color depth of the selected color format is less than 32 bpp, the driver corrects the alignment and fills 32 bits per clock cycle, resulting in two to four times faster fill performance in 8- and 16-bpp formats.

43.3.3.2 Copy

Any rectangle in the framebuffer can be filled with any rectangular data from the texture input. When the texture input points to the framebuffer, copying from framebuffer to framebuffer is possible. To avoid copy problems because of overlapping source and destination areas, the copy start point can be selected from top left to bottom right. Possible color formats are any 8-, 16-, or 32-bpp format.

The driver optimizes the copy to gain the full benefit of 32-bit parallel rasterization. If the color depth of the selected color format is less than 32 bpp, the driver corrects the alignment and copies 32 bits per clock cycle, resulting in two to four times faster copy performance in 8- and 16-bpp formats.

43.3.3.3 Stretch BitBLT

This is similar to the normal copy operation. Because the copy is done as a type of texture mapping, the full texture mapping feature set can be used. Any scaling ratios in the x and y directions is selectable, and filtering can be enabled independently for each axis.

43.3.3.4 Rotate and Scale

This is similar to the normal copy operation. Because the copy is done as a type of texture mapping, the full set of texture mapping features can be used. Any scaling ratio in the x and y directions and any rotation angle are selectable. The user can enable or disable filtering for the scalers independently for each of the x and y directions.

43.3.3.5 Alpha Blending

Alpha blending is a fundamental block in the rendering pipeline, so the full set of alpha blend features is available for any BitBLT operation. It is possible to copy an area and blend it over the destination by using any constant global alpha value (register value) or by using an alpha mask. The alpha mask is part of the texture data and can be either a per-pixel value together with a pixel color (aRGB formats) or an alpha-only format using a register color.

In addition to the color channels, the alpha channel can be blended. The formula for the alpha channel can be set independently from the formula for the color channels.

43.3.3.6 Bilinear Filtering

The texture unit can be used to scale, rotate, or shear images. The texturing result can be filtered in the x and y directions independently. When selecting both filters, the result is a bilinear filtered texture. Using the unit twice with two independent textures would generate trilinear filtered bitmaps, improving the visual impression for high dynamic scale ratios.

43.3.3.7 Color Conversion

Color conversion is required when using different texture formats than the framebuffer format. To save texture memory, formats having less bpp than that of the framebuffer are supported. The 2D Drawing Engine always operates internally with the 32-bpp aRGB (8888) format. All input data is converted into 32 bpp and is finally converted back into the framebuffer format.

43.4 Input and Output Data Formats

43.4.1 Source and Destination Data

There are two possible inputs, the framebuffer and the texture or pattern input. The output is always the framebuffer. Every drawing operation is internally rendered in 32 bpp aRGB (8888). If the input color does not provide an alpha channel, the blue channel is taken as the alpha channel. This alpha can be substituted with any alpha (for example, by an external constant) during the colorization step in the 2D Drawing Engine.

43.4.2 Framebuffer Color Formats

Table 43.1 shows the supported framebuffer color formats.

Table 43.1 Framebuffer color formats

| Framebuffer memory occupation | Format | Remarks |
|-------------------------------|-------------|--|
| 8 bpp | a (8) | This color format uses 1 byte per pixel. The alpha channel is internally replicated on the red, blue, and green channels and can be substituted with any color during the color step in the 2D Drawing Engine. |
| 16 bpp | RGB (565) | This color format uses 2 bytes per pixel with 5 bits for red and blue and 6 bits for green. The blue color is taken as the alpha channel during color conversion. The alpha can be substituted with any alpha during the colorization step in the 2D Drawing Engine. |
| | aRGB (4444) | This color format uses 2 bytes per pixel with 4 bits for each color and alpha channel. |
| 32 bpp | aRGB (8888) | This color format uses 4 bytes per pixel with 8 bits for each color and alpha channel. |

The framebuffer color format is selected in the Surface Control Register bits, CONTROL2.WRITEFORMAT[2:0].

The data allocation of the frame buffer format is as follows.

- a(8) (WRITEFORMAT[2:0]=0)

- RGB(565) (WRITEFORMAT[2:0]=1)

- aRGB(8888) (WRITEFORMAT[2:0]=2)

- aRGB(4444) (WRITEFORMAT[2:0]=3)

The data allocation on the 128-bit South main bus is little-endian as shown below.

- aRGB(8888)

Other formats are also little-endian.

43.4.3 Texture Color Formats

Table 43.2 shows the supported texture color formats.

Table 43.2 Texture color formats

| Texture memory occupation | Format | Remarks |
|---------------------------|----------------|---|
| 1 bpp | CLUT (1)/I (1) | In this mode, a 1-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value. |
| 2 bpp | CLUT (2)/I (2) | In this mode, a 2-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value. |
| 4 bpp | CLUT (4)/I (4) | In this mode, a 4-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value. |
| 8 bpp | CLUT (8)/I (8) | In this mode, an 8-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value. |
| | a (8) | This color format uses 1 byte per pixel. The alpha channel is internally replicated on the red, blue, and green channels and can be substituted with any color during the colorization step in the 2D Drawing Engine. |
| | aCLUT (44) | This color format uses 1 byte per pixel. 4 bits are used as an alpha value and 4 bits are used as an index to a color palette. This approach saves space if 16 colors are sufficient to describe the image, because the next bigger alpha format would be 2-byte aRGB (4444). |
| 16 bpp | RGB(565) | This color format uses 2 bytes per pixel with 5 bits for red and blue and 6 bits for green. The blue color is taken as the alpha channel during color conversion. The alpha can be substituted with any alpha during the colorization step in the 2D Drawing Engine. |
| | aRGB (4444) | This color format uses 2 bytes per pixel with 4 bits for each color and alpha channel. |
| | aRGB (1555) | This color format uses 2 bytes per pixel. Every color channel has 5 bits and the topmost single bit is taken as an alpha value. This can be used to hold an image with a transparency mask. |
| 24 bpp | RGB (888) | This color format uses 3 bytes per pixel with 8 bits for each color channel. This format is only available as run length encoded data (RLE compression). |
| 32 bpp | aRGB (8888) | This color format uses 4 bytes per pixel with 8 bits for each color and alpha channel. |

The texture color format is selected in the Surface Control Register bits, `CONTROL2.READFORMAT[3:0]`.

The data allocation of the texture format is as follows.

- a(8) (`READFORMAT[3:0]=0h`)

- RGB(565) (`READFORMAT[3:0]=1h`)

- aRGB(8888) (READFORMAT[3:0]=2h)

- aRGB(4444) (READFORMAT[3:0]=3h)

- aRGB(1555) (READFORMAT[3:0]=4h)

- aCLUT(44) (READFORMAT[3:0]=5h)

- CLUT(8) (READFORMAT[3:0]=9h)

- CLUT(4) (READFORMAT[3:0]=Ah)

| | | | | | | | | | | | | | | | |
|---------|-----|-----|-----|---------|-----|-----|-----|---------|-----|-----|-----|---------|-----|-----|-----|
| b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| P7[3:0] | | | | P6[3:0] | | | | P5[3:0] | | | | P4[3:0] | | | |
| b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| P3[3:0] | | | | P2[3:0] | | | | P1[3:0] | | | | P0[3:0] | | | |

- CLUT(2) (READFORMAT[3:0]=Bh)

| | | | | | | | | | | | | | | | |
|----------|-----|----------|-----|----------|-----|----------|-----|----------|-----|----------|-----|---------|-----|---------|-----|
| b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| P15[1:0] | | P14[1:0] | | P13[1:0] | | P12[1:0] | | P11[1:0] | | P10[1:0] | | P9[1:0] | | P8[1:0] | |
| b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| P7[1:0] | | P6[1:0] | | P5[1:0] | | P4[1:0] | | P3[1:0] | | P2[1:0] | | P1[1:0] | | P0[1:0] | |

- CLUT(1) (READFORMAT[3:0]=Ch)

| | | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| b31 | b30 | b29 | b28 | b27 | b26 | b25 | b24 | b23 | b22 | b21 | b20 | b19 | b18 | b17 | b16 |
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 |
| b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

The data allocation on the 128-bit South main bus is the same little-endian as the frame buffer.

43.5 Texture Data Processing

Figure 43.4 shows the processing of texture data.

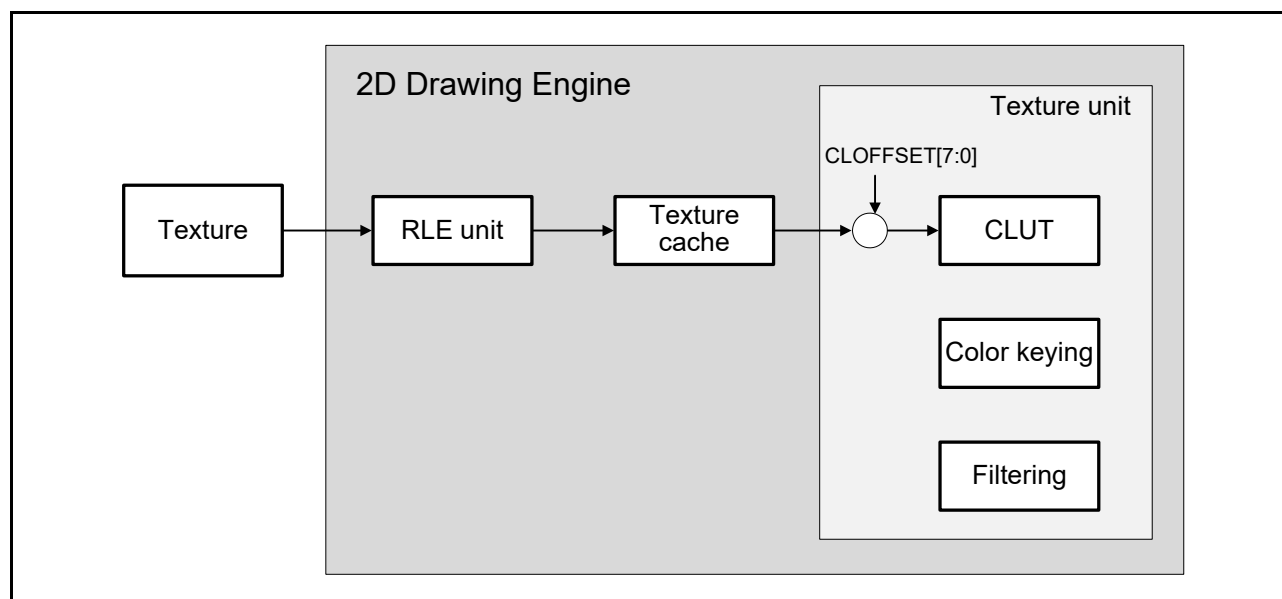

Figure 43.4 Texture data processing

43.5.1 Texture Color Format

Table 43.3 shows the supported texture data formats.

Table 43.3 Texture color formats

| Texel bit width | Texel format |
|-----------------|-------------------------------------|
| 32 bits | aRGB (8888) |
| 24 bits | RGB (888) |
| 16 bits | aRGB (4444), aRGB (1555), RGB (565) |
| 8 bits | CLUT (8)/I (8), a (8), aCLUT (44) |
| 4 bits | CLUT (4)/I (4) |
| 2 bits | CLUT (2)/I (2) |
| 1 bit | CLUT (1)/I (1) |

43.5.2 Run Length Encoded (RLE) Unit

The RLE unit decompresses Targa-like compressed textures and hands the decompressed texel data over to the texture unit. The key features are:

- Support for Targa format
- Avoids the additional Targa limitation to scan lines
- Support for clipping of compressed images, in which the 2D Drawing Engine is allowed to copy only a portion of a larger original texture
- Control of the RLE unit in display list operation
- Bypassing of the RLE unit logic if uncompressed textures are fetched.

Texture cache

- The RLE unit feeds the texture cache. The texture cache can be disabled by setting `CACHECTL.CENABLETX = 0`.

Note: A texture cache flush operation (`CACHECTL.CFLUSHTX = 1`) is necessary at the beginning and end of every new RLE texture.

The texture cache and the RLE unit can be bypassed by setting `CONTROL2.RLEENABLE = 0`.

43.5.2.1 RLE Texel Formats

Table 43.4 lists the data formats supported by the RLE unit.

Table 43.4 Texel formats supported by the RLE unit

| Memory texel format | RLE parameters | RLE coded unit format (CONTROL2.RLEPIXELWIDTH[1:0]) | Delivered format |
|---|-----------------------------------|--|------------------|
| 32-bit aRGB (8888) | Included in Targa and RLE formats | 32 bits (11b) | 32 bits |
| 24-bit RGB (888) | | 24 bits (10b) | 32 bits *1 |
| 16-bit aRGB (4444), aRGB (1555), RGB (565) | | 16 bits (01b) | 16 bits |
| 8-bit CLUT (8)/I (8), a (8), aCLUT (44) | | 8 bits (00b) | 8 bits |
| 4-bit CLUT (4)/I (4) | Optional for RLE *2 | 8 = 2 x 4 bits | 4 + 4 bits |
| 2-bit CLUT (2)/I (2) | No RLE | | |
| 1-bit CLUT (1)/I (1) | | | |

Note 1. 24-bit RGB (888) encoded texels are delivered as aRGB (8888) with Alpha set to 1.

Note 2. Encoding of textures with 4 bits per texel is not defined by the Targa specification but can be done by:

- Combining two 4-bit texels to one byte
- Padding with 4 zero bits at the end of the file, if the number of texels is odd
- Encoding as with 8-bit texels.

Texel addressing for RLE textures

The address of a texel is the byte address of the first byte of the texel. The origin of the texture is given by the register TEXORIGIN.

Note: The RLE code must begin at a word boundary of the memory.

When the FIFO is filled, there is no provision to inhibit read access beyond the end of the RLE code. To avoid memory access violations, the RLE code must be padded by 32 memory words, where every bit of each word is set to 1.

43.5.2.2 Targa RLE Format

Run-length encoded (RLE) images include two types of data elements:

- Run-length packets
- Raw packets.

The first field (1 byte) of each packet is called the "repetition count field". The second field is called the "pixel value field" (1, 2, 3, or 4 bytes per pixel).

For run-length packets, the pixel value field contains a single pixel value.

For raw packets, this field holds a variable number of pixel values.

The highest order bit of the repetition count indicates whether the packet is a raw packet or a run-length packet, as follows:

- If bit [7] of the repetition count is set to 1, the packet is a run-length packet
- If bit [7] of the repetition count is set to zero, the packet is a raw packet.

The lower 7 bits of the repetition count specify how many pixel values are represented by the packet. For a run-length packet, this count indicates how many successive pixels have the pixel value specified in the pixel value field. For raw packets, this count specifies how many pixel values are actually contained in the next field. This 7-bit value is actually encoded as 1 less than the number of pixels in the packet (a value of 0 implies 1 pixel while a value of 7Fh implies 128 pixels).

Run-length packet

Run-length packets are composed of two parts. The first is a repetition count and the second is the pixel value to repeat.

Table 43.5 Run-length packet

| Field name | Repetition count field | | Pixel value field |
|------------|---|--|---|
| Contents | Packet type (must be 1 for run-length) | Pixel count (number of pixels encoded in this packet - 1) | Pixel data (the shared pixel value to be used) |
| Field size | 1 bit | 7 bits | Pixel depth (Table 43.4) |

Raw packet

The raw packet always includes two fields. The first field is the repetition count and the second field is the pixel value field.

Table 43.6 Raw packet

| Field name | Repetition count field | | Pixel value field |
|------------|---|--|---------------------------|
| Contents | Packet type (must be 0 for raw packet) | Pixel count (number of pixels encoded by this packet - 1) | Pixel data |
| Field size | 1 bit | 7 bits | Pixel depth × pixel count |

43.5.3 Color Lookup Table (CLUT)

The color lookup table receives an index that addresses one out of the 256 predefined colors.

The predefined color format can be selected as:

- CONTROL2.CLUTFORMAT = 0: aRGB (8888)
- CONTROL2.CLUTFORMAT = 1: RGB (565).

The CLUT is filled by the use of two registers:

- TEXCLDATA
The aRGB (8888) color definition is written to this register, while the CLUT address is taken from TEXCLADDR.
- TEXCLADDR.
This is set to the first address of the CLUT to write to and is automatically incremented after each write to TEXCLDATA.

An offset for indexed formats (CLUT (1), CLUT (2), CLUT (4), and CLUT (8)) can be set up in the TEXCLOFFSET register to allow selecting an offset part of the CLUT. The CLUT index is calculated by CLUT (x) or TEXCLOFFSET.CLOFFSET[7:0].

43.5.3.1 CLUT/I Pixel Data Formats

The following tables explain in which order the pixels are stored within the byte. The left-most pixel is stored at the lowest bit of the memory byte.

CLUT (1)/I (1) format

The CLUT (1)/I (1) format expresses 1 pixel by using a total of 1 bit.

| Memory byte | 7 (MSB) | 6 | 5 | 4 | 3 | 2 | 1 | 0 (LSB) |
|-------------|------------|----|----|----|----|----|----|------------|
| Pixel | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

The left-most pixel is stored at lowest bit of the memory byte.

CLUT (2)/I (2) format

The CLUT (2)/I (2) format expresses 1 pixel by using a total of 2 bits.

| Memory byte | 7 (MSB) | 6 | 5 | 4 | 3 | 2 | 1 | 0 (LSB) |
|-------------|------------|---|----|---|----|---|----|------------|
| Pixel | P3 | | P2 | | P1 | | P0 | |

The left-most pixel is stored at lowest 2 bits of the memory byte.

CLUT (4)/I (4) format

The CLUT (4)/I (4) format expresses 1 pixel by using a total of 4 bits.

| Memory byte | 7 (MSB) | 6 | 5 | 4 | 3 | 2 | 1 | 0 (LSB) |
|-------------|------------|---|---|---|----|---|---|------------|
| Pixel | P1 | | | | P0 | | | |

The left-most pixel is stored at lowest 4 bits of the memory byte.

43.5.4 Color Keying

The 2D Drawing Engine provides a color keying unit in front of the texture unit. It operates as follows:

1. When color keying is enabled (`CONTROL2.COLKEYENABLE = 1`), the incoming color is compared with the transparent color defined by `COLKEY`.
2. If the colors match, the alpha and color values are set to 0 to mark the incoming color as transparent, and the color is handled as if the alpha value were pre-multiplied.
3. If the value does not match, alpha is set to 1.
4. Additional operations such as $\alpha_{in} \times \alpha_{const}$ are still possible.

With this approach, an object such as a round icon can be cut out from a rectangular texture and can be faded by a constant alpha over the background.

43.6 Rendering Pipeline

43.6.1 Coordinate Transformation

Coordinate transformation such as rotation, translation, projection, and scaling must be done on the application side. This is not part of the 2D Drawing Engine hardware or driver. Because all coordinates fed into the 2D Drawing Engine are in fixed point format, these calculations can be made in fixed point format and do not require a floating point unit.

43.6.2 Rasterization

During rasterization, the vector data of the object must be converted to pixel data. To convert the data, the program sets up the edge interpolation hardware, called a limiter, for each edge of the object that calculates a decision value. The limiter determines which side of the edge the pixel is positioned on. The 2D Drawing Engine includes six internal hardware limiters. In principle, the limiter registers contain the distance between the pixel being processed and the edge. In the linear setup, a limiter describes a half plane. The intersection of all half planes is the object. If three half planes intersect, a triangle is created as shown in Figure 43.5.

Figure 43.5 Intersection of half planes

The limiter output is clamped to an interval of $[0:1]$. In limiters 1 and 2 it is possible to apply a band filter before the clamping operation. In this case, the limiter is not describing a half plane but a small band. With this approach, a single limiter can describe a thick line of infinite length.

The output of the different limiters can be combined by the combiner units with a maximum or minimum operation. Maximum operation describes the union of both half planes, and minimum operation describes the intersection of both half planes. The final output is then used as an alpha value. Edge anti-aliasing can be done with no additional effort with this hardware.

To calculate the decision value for each possible pixel with a limiter, the bounding box of the object must be calculated. Then, the decision value for the top left corner of the bounding box must be calculated for each edge. Finally, the increments for a step in the x direction and a step in the y direction must be calculated. This is done by the CPU in the driver.

With this information, the 2D Drawing Engine scans the whole bounding box and calculates the decision value for every pixel incrementally. For a block diagram of the entire rasterization unit, see Figure 43.6.

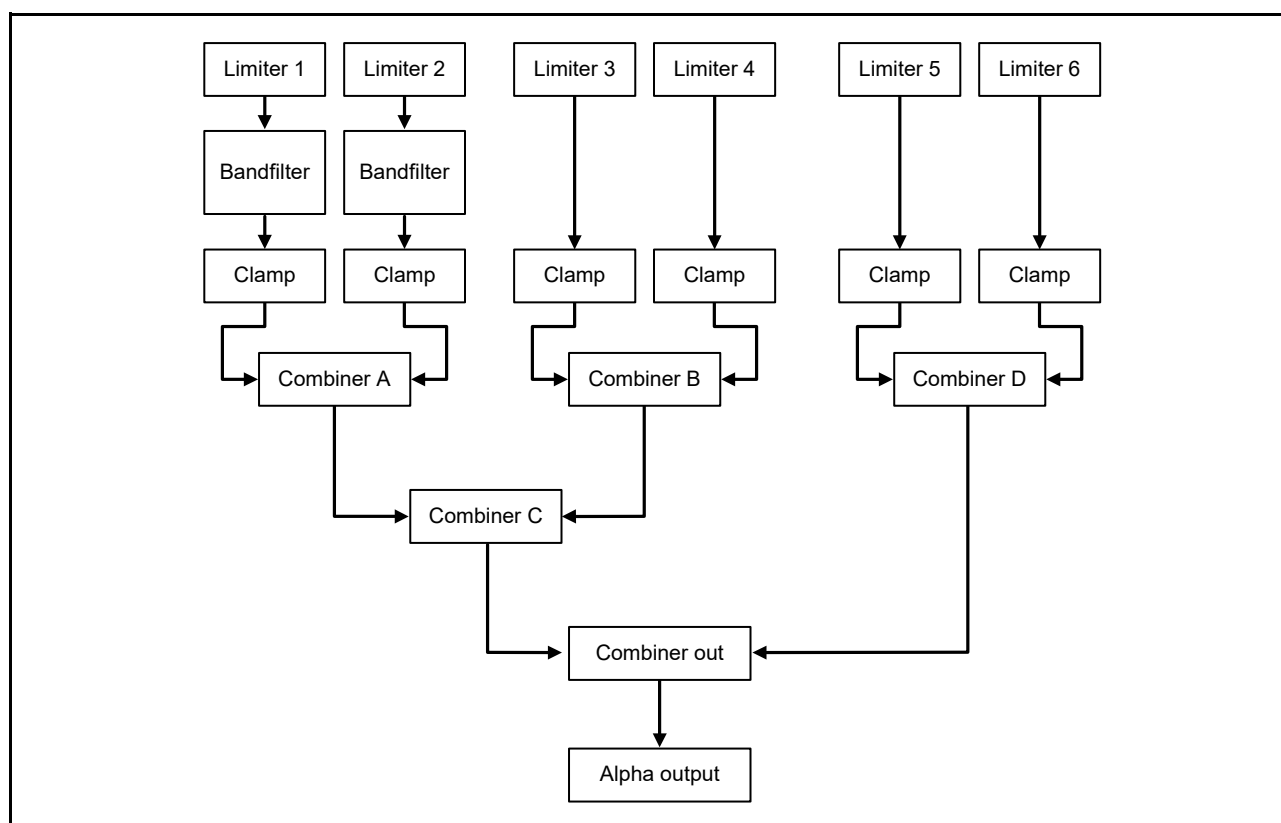

Figure 43.6 Block diagram of rasterization unit

The limiters calculate distances and the combiner units combine them to an alpha value. The combiner units define the conditions for whether or not a pixel is in the bounding box. The alpha value must be greater than 0.

Note: It is possible to have all limiters switched off.

43.6.2.1 Edge Setup Linear Case

(1) Mathematical background

To setup a linear edge, consider the line equation in the classical form:

This can be written as:

$$y = \tilde{a}x + \tilde{b}$$

This can be rewritten as:

$$0 = f(x, y) = \tilde{a}x - y + \tilde{b} = ax + by + c$$

with $a = \tilde{a}$, $b = -1$, $c = \tilde{b}$

This is a more general form. Consider a vector form of this equation:

$$\vec{p} = \begin{pmatrix} x \\ y \end{pmatrix}, \vec{n} = \begin{pmatrix} a \\ b \end{pmatrix} \Rightarrow f(x, y) = ax + by + c = \vec{p} \cdot \vec{n} + c$$

If a point \vec{p}_0 is on the line:

$$0 = f(x, y) = \vec{p}_0 \cdot \vec{n} + c \Rightarrow c = -\vec{p}_0 \cdot \vec{n}$$

Rewriting the constant, the equation becomes:

$$c = -\vec{p}_0 \cdot \vec{n} \Rightarrow f(x, y) = (\vec{p} - \vec{p}_0) \cdot \vec{n}$$

The vector \vec{n} is called the normal vector and is perpendicular to the line. The setup can be seen in Figure 43.7.

Figure 43.7 Distance of a point to a line

The projection of $\vec{p} - \vec{p}_0$ to \vec{n} is the distance d of the point P to the line. In this case, $f(x, y)$ describes the distance to the line of the pixel with coordinates (x, y) .

To calculate the distance of every pixel of the bounding box incrementally, first the distance to the line at origin must be calculated:

$$f(0, 0) = -\vec{p}_0 \cdot \vec{n} = c$$

Next the increments for a step in the x direction and a step in the y direction must be calculated:

$$f(\vec{p} + \vec{e}_x) = (\vec{p} + \vec{e}_x - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_x \cdot \vec{n} = f(\vec{p}) + a$$

$$f(\vec{p} + \vec{e}_y) = (\vec{p} + \vec{e}_y - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_y \cdot \vec{n} = f(\vec{p}) + b$$

$$\text{with } \vec{e}_x = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \vec{e}_y = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

Consequently, the new distance can be calculated from the old distance with the increments a and b . A step in the x direction changes the distance by a , and a step in the y direction changes the distance by b . The distance of the origin to

the line is c.

With this information, the entire bounding box can be scanned. If the bounding box top left corner is not at the origin, an offset must be added.

(2) Limiter operation

The 2D Drawing Engine contains six limiters. Each limiter contains three registers:

- LnSTART
- LnXADD
- LnYADD.

See Figure 43.8 for details. The limiters can be used in threshold mode, in which all values above 0.5 are set to 1 and all values below or equal to 0.5 are set to 0.

This feature is used when anti-aliasing is not wanted.

Note: In Figure 43.8, the following abbreviations are used:

start = LnSTART

xadd = LnXADD

yadd = LnYADD

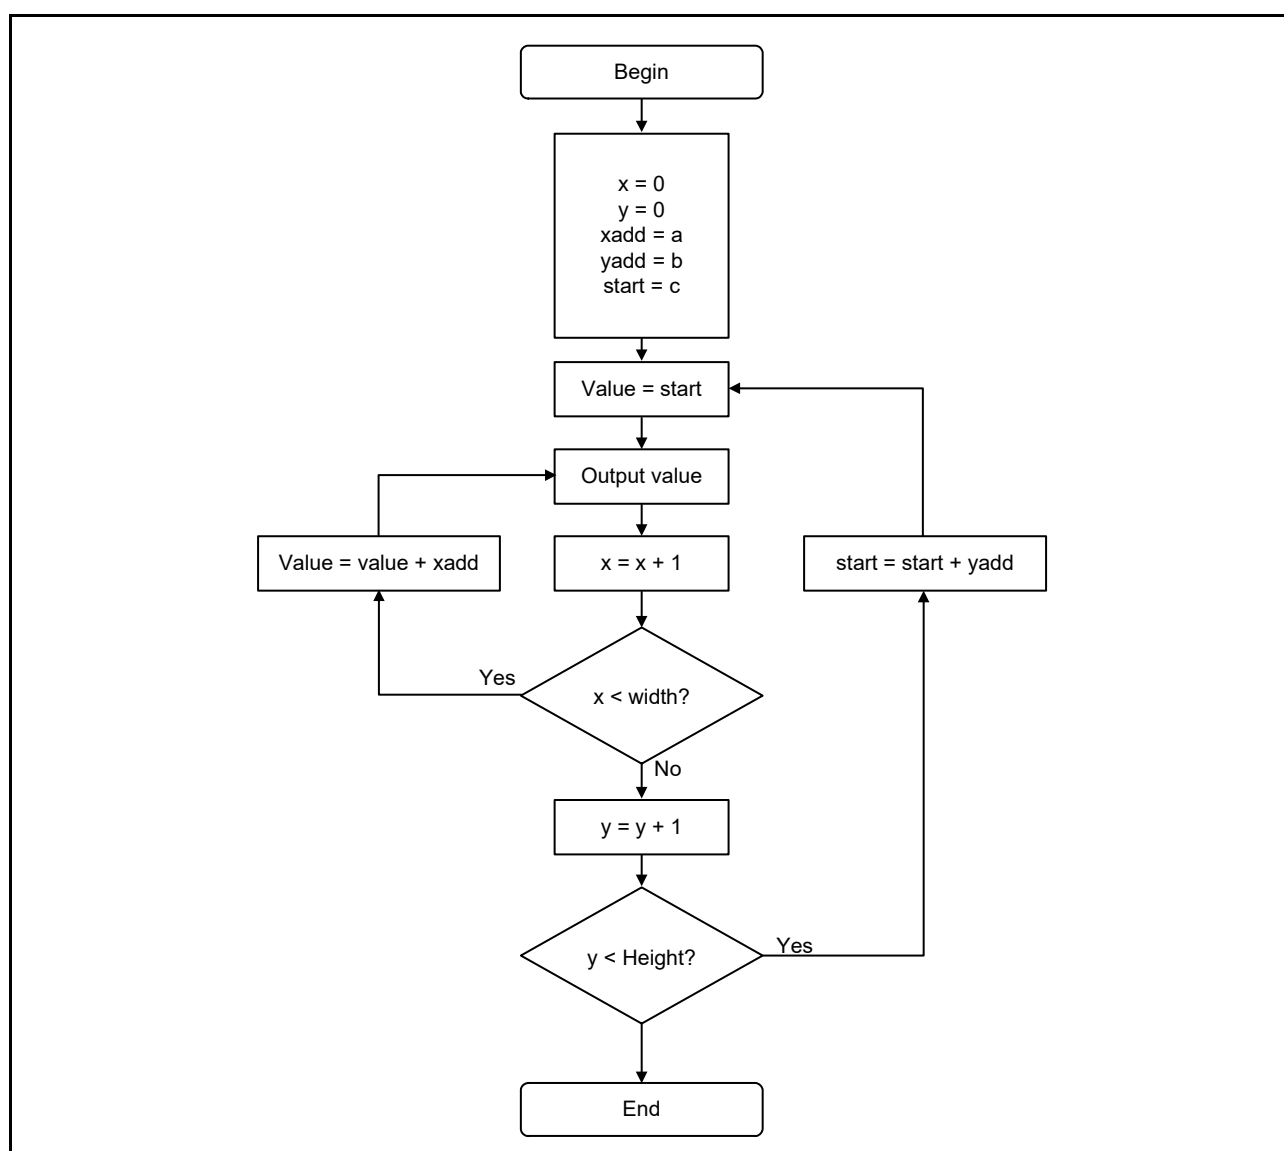

Figure 43.8 Operation flow of the linear limiter

(3) Example

If a straight line is given by the points P0 and P1, then the values are calculated as follows:

$$\Delta \vec{p} = \vec{p}_1 - \vec{p}_0 = \begin{pmatrix} x_1 - x_0 \\ y_1 - y_0 \end{pmatrix} = \begin{pmatrix} \Delta x \\ \Delta y \end{pmatrix}$$

The normal vector (perpendicular but not unit size) is then:

$$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix}$$

The not normalized distance between edge and origin is then:

$$\vec{p}_0 \cdot \vec{n} = -x_0 \Delta y + y_0 \Delta x$$

The limiter parameters would be:

$$\text{start} = -x_0 \Delta y + y_0 \Delta x$$

$$\text{xadd} = -\Delta y$$

$$\text{yadd} = \Delta x$$

In the normalized case, the normal vector is:

$$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix} / (\sqrt{\Delta x^2 + \Delta y^2})$$

The distance between edge and origin is:

$$\vec{p}_0 \cdot \vec{n} = (-x_0 \cdot \Delta y + y_0 \cdot \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$$

The limiter parameters would be:

$$\text{start} = (-x_0 \Delta y + y_0 \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$$

$$\text{xadd} = -\Delta y / (\sqrt{\Delta x^2 + \Delta y^2})$$

$$\text{yadd} = \Delta x / (\sqrt{\Delta x^2 + \Delta y^2})$$

Normalization is only required if anti-aliasing is used. The driver contains an optimized inverse square root function to speed up the normalization process.

43.6.2.2 Edge Setup Quadratic Case

(1) Mathematical background

It is also possible to set up the limiters to incrementally calculate the following equation:

$$f(x, y) = ax^2 + by^2 + cx + dy + f$$

At the origin, the value is:

$$f(0, 0) = f$$

The step in the x direction is:

$$f(x + 1, y)$$

$$= a(x + 1)^2 + by^2 + c(x + 1) + dy + f$$

$$= ax^2 + 2ax + a + by^2 + cx + c + dy + f$$

$$= f(x, y) + 2ax + c + a$$

$$dx(x) = f(x + 1, y) - f(x, y) = 2ax + c + a$$

The step in the y direction is:

$$f(x, y + 1)$$

$$= ax^2 + b(y + 1)^2 + cx + d(y + 1) + f$$

$$= ax^2 + by^2 + 2by + b + cx + d(y + 1) + f$$

$$= f(x, y) + 2by + d + b$$

$$dy(y) = f(x, y + 1) - f(x, y) = 2by + d + b$$

In the quadratic case, the increments dx and dy depend on x and y and are not constant. They can be calculated incrementally:

$$d^2x = dx(x + 1) - dx(x) = 2a(x + 1) + c + 1 - (2ax + c + 1) = 2a$$

$$d^2y = dy(y + 1) - dy(y) = 2b(y + 1) + d + 1 - (2by + d + 1) = 2b$$

At the origin, the increments are:

$$dx(0) = c + 1 \text{ and } dy(0) = d + 1$$

By incrementing the value by dx and dy for every step in the x and y direction and incrementing dx, dy by d²x, and d²y for every step in the x and y direction, the quadratic equation can be easily calculated for the whole bounding box.

(2) Limiter operation

In the quadratic case, two linear limiters are combined to operate as one quadratic limiter, called limiter 1 and limiter 2.

The registers are:

- L1START, L1XADD, L1YADD
- L2START, L2XADD, L2YADD.

See Figure 43.9 for details. The gray box is an addition that performs a different operation, as in the linear setup.

The limiters can be used in threshold mode, in which all values above 0.5 are set to 1 and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted.

Note: In Figure 43.9, the following abbreviations are used:

- start1 = L1START, start2 = L2START
- xadd1 = L1XADD, xadd2 = L2XADD
- yadd1 = L1YADD, yadd2 = L2YADD.

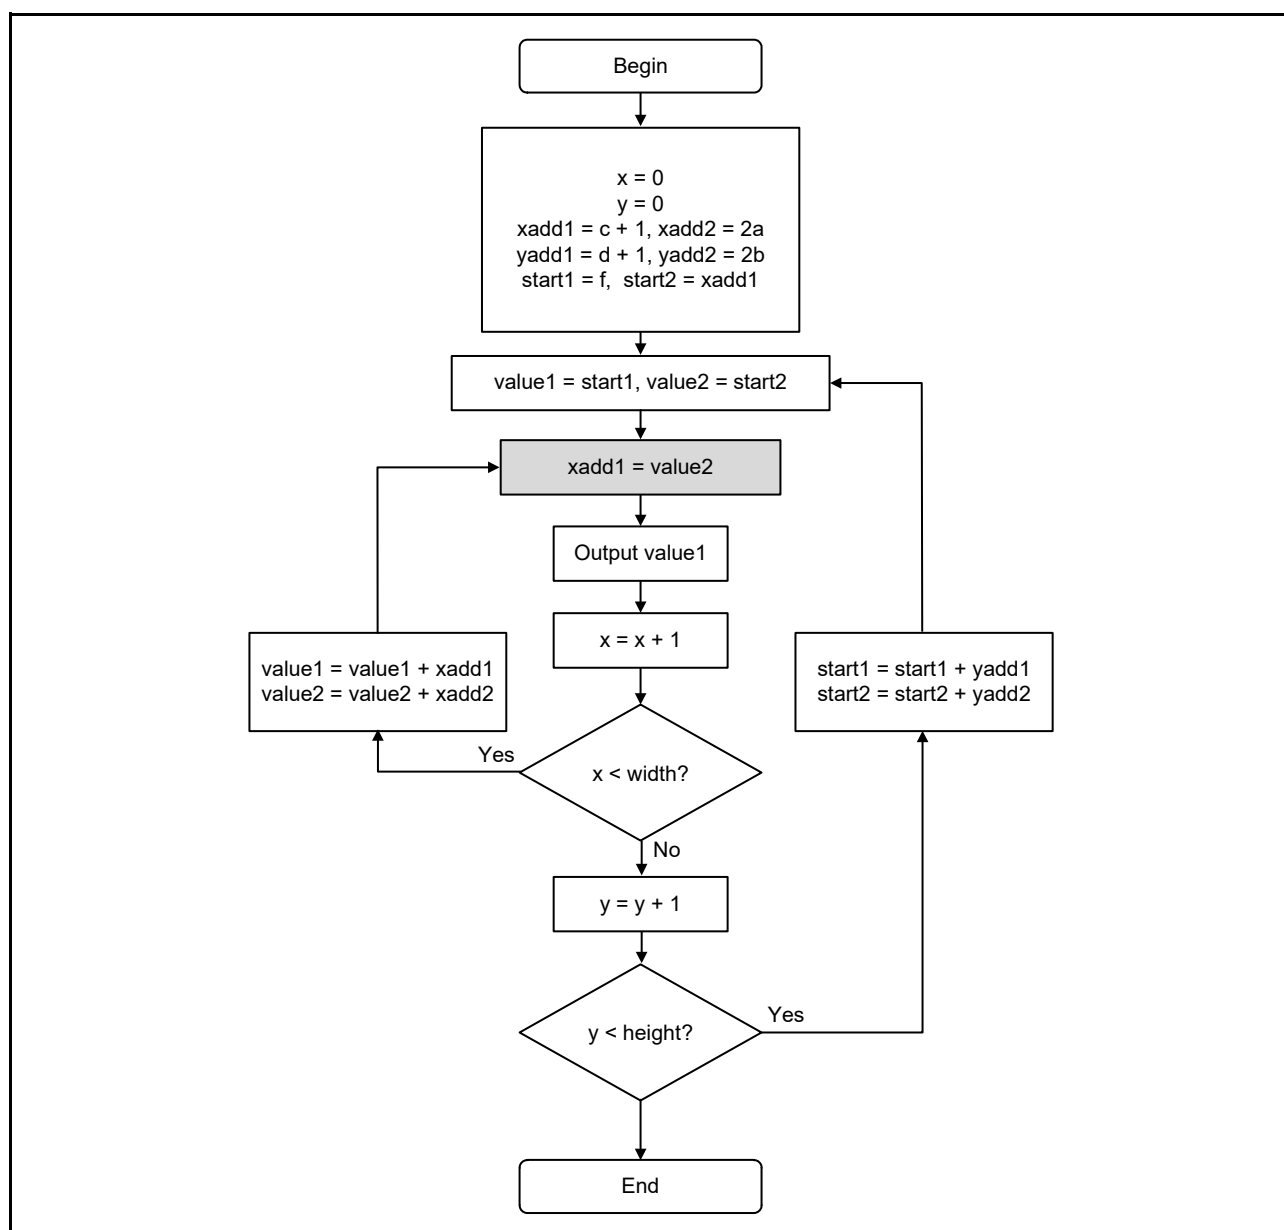

Figure 43.9 Operation flow of the quadratic limiter

(3) Example

Consider the equation for a circle with the center at $\vec{C} = \begin{pmatrix} s \\ t \end{pmatrix}$ and radius r :

$$0 = f(x, y) = (x - s)^2 + (y - t)^2 - r^2$$

This equation can be rewritten as:

$$f(x, y) = x^2 - 2xs + s^2 + y^2 - 2yt + t^2 - r^2$$

This can be sorted to fit to the original equation:

$$f(x, y) = x^2 + y^2 - 2sx - 2ty + (s^2 + t^2 - r^2)$$

With the following assignments, the circle equation can be calculated incrementally:

$$a = 1$$

$$b = 1$$

$$c = -2s$$

$$d = -2t$$

$$f = s^2 + t^2 - r^2$$

For the limiters with the results calculated in (1), Mathematical background, this would result in:

$$\text{start1} = f = s^2 + t^2 - r^2$$

$$\text{xadd1} = c + 1 = -2s + 1$$

$$\text{yadd1} = d + 1 = -2t + 1$$

$$\text{start2} = \text{xadd1}$$

$$\text{xadd2} = 2a = 2$$

$$\text{yadd2} = 2b = 2$$

43.6.2.3 Band Filter

The output of limiters 1 and 2 can be modified through a band filter. The band filter has a single filter parameter w .

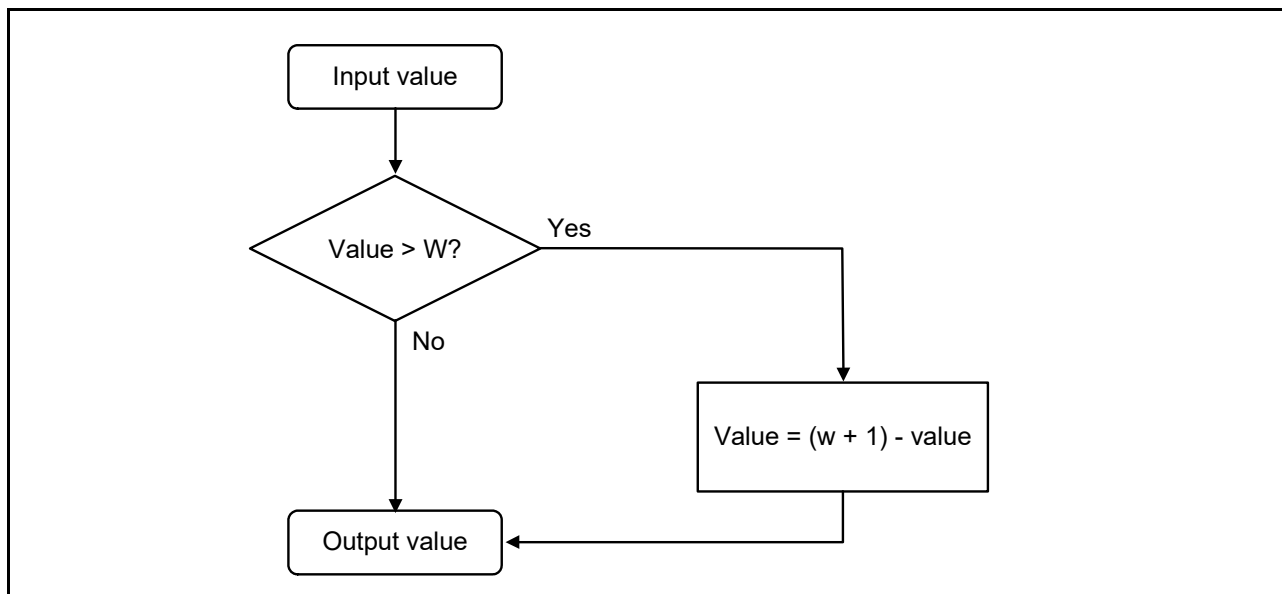

Figure 43.10 Band filter

Figure 43.11 Band filter output after clamp with $w = 7$

43.6.2.4 Clamping Unit

The clamping unit cuts the limiter output to the interval $[0:1]$.

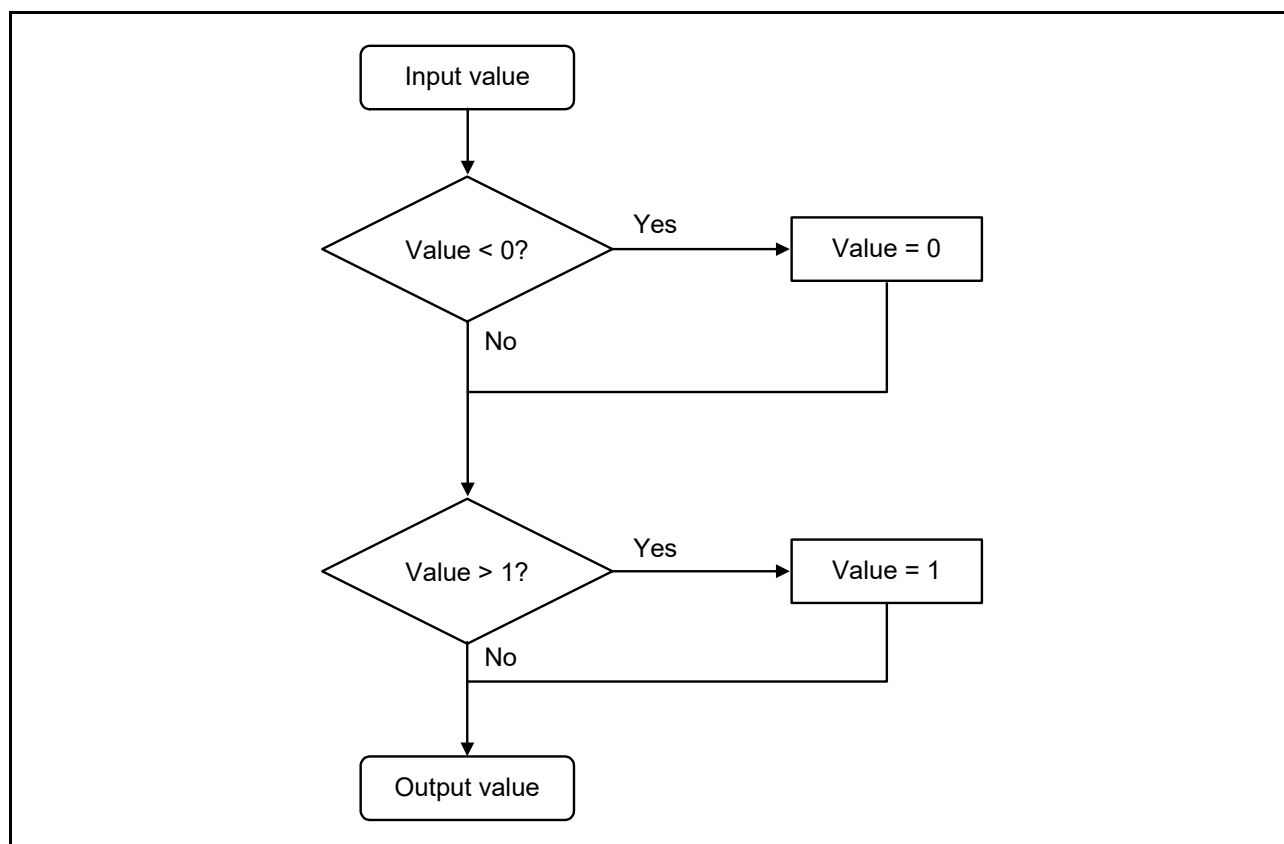

Figure 43.12 Clamping unit

The clamping unit can be put into threshold mode, in which all values greater than 0.5 are set to 1, and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted, such as for shared edges.

43.6.2.5 Combiner Unit

The combiner unit can be operated in minimum mode and in maximum mode. In minimum mode the smaller value is output, and in maximum mode the larger value is output. The minimum mode represents the intersection, and the maximum mode represents the union of the two regions.

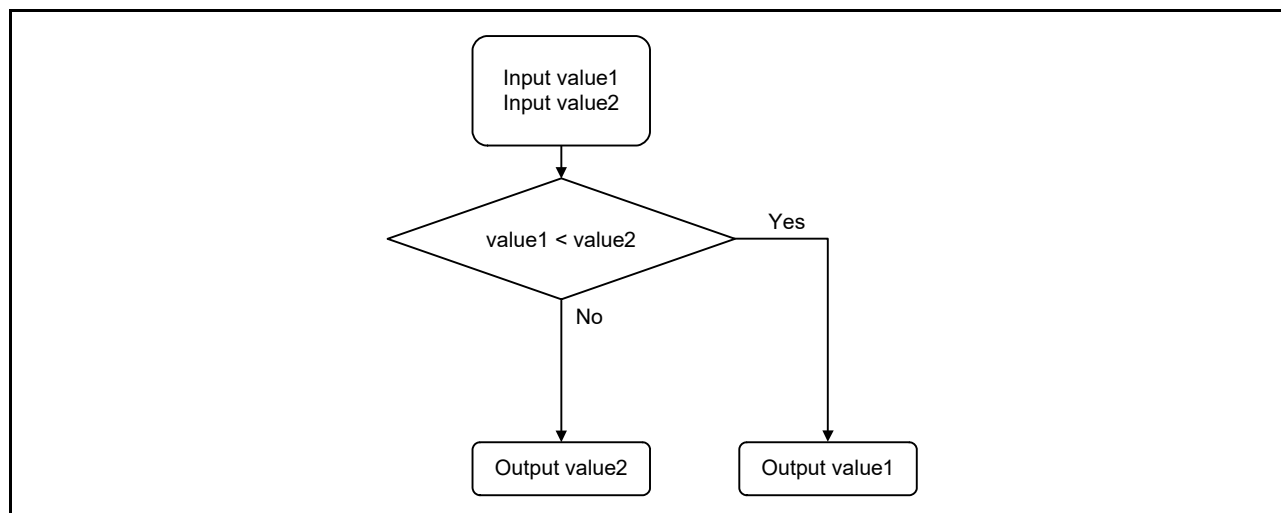

Figure 43.13 Combiner operated in minimum mode with intersection

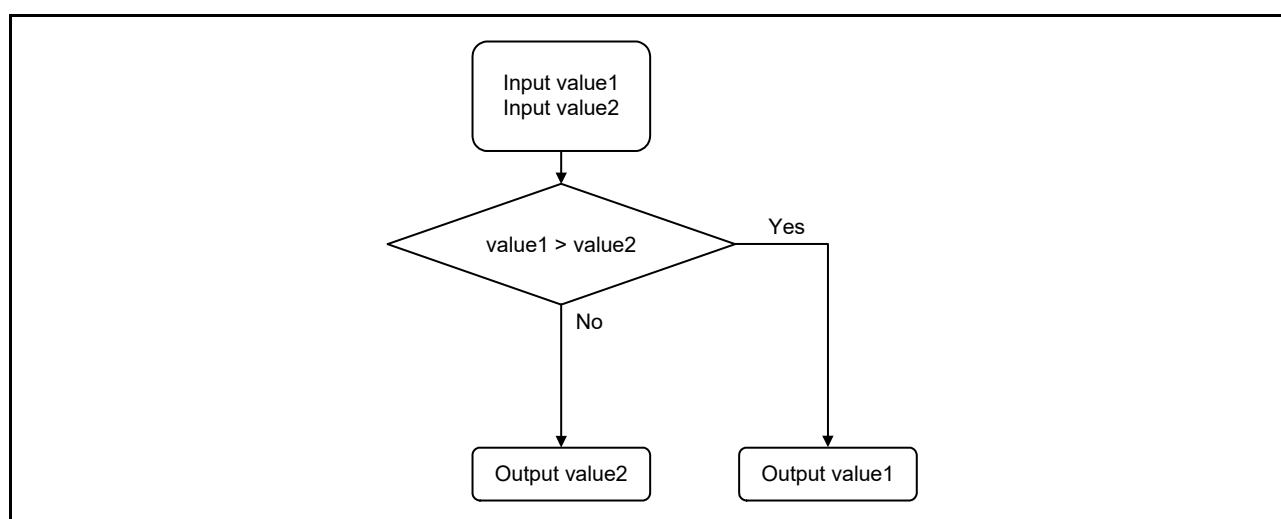

Figure 43.14 Combiner operated in maximum mode with union

43.6.2.6 Rasterization Optimization

During rasterization, it is necessary to step through the whole bounding box one pixel at a time. This requirement can lead to an unnecessary number of steps for pixels that are not drawn. The 2D Drawing Engine provides optimization methods designed to reduce the number of steps required during rasterization. One optimization relies on the fact that any convex primitive can have only one span per line (a span is a contiguous horizontal line). This form of optimization detects a span start and saves the information for the next line. Another optimization is to detect a span end and stop rasterization for the current line.

(1) Spanstore

Consider the case in Figure 43.15.

Figure 43.15 Triangle where the first edge is monotone growing

If the gray triangle must be rendered, half of the pixels processed by the rendering engine in the dotted bounding box would not be drawn. This situation can be optimized with the spanstore operation. When this operation is activated and a span start is detected, the x position of the start is detected.

In the next line the rendering starts with the stored x position. This only works if the edge is monotonically increasing ($y_1 > y_2 \Rightarrow x_1 \geq x_2$).

Consider the case in Figure 43.16.

Figure 43.16 Triangle where the first edge is monotone falling

In this case, the normal spanstore operation cannot be performed. For this, the y direction of the rendering is reversed, and spanstore can operate again.

Consider the last case in Figure 43.17.

Figure 43.17 Triangle where the first edge is first monotone falling and then monotone growing

In this case, the triangle must be split and rendered as two parts for the spanstore optimization to work. It is also possible to delay spanstore activation for a number of lines. This approach is used for rasterizing circles, as shown in Figure 43.18.

Figure 43.18 Full circle where the first edge is monotone falling for the first half and monotone growing for the second half

In this case, spanstore cannot be activated in the top left corner but can be activated in the bottom left corner. The empty corners in the top right and the bottom right cannot be rasterized because of the spanabort optimization.

(2) Spanabort

The second optimization assumes that the object that must be drawn is convex, which means there is only one span per scan line to be drawn. A non-convex object includes an object such as a triangle that is not filled and only consists of a thick border.

For a convex object, the rasterization can be stopped when the end of the first span is detected. No other constraints apply to this optimization for convex objects.

(3) Optimization efficiency

The efficiency of the optimizations can be seen for a typical case in Figure 43.19. In this case, a triangle is always rendered as a single piece and is not separated into multiple triangles for higher optimizations. For this, the spanstore delay is used.

Figure 43.19 Efficiency of spanstore and spanabort optimizations with enumeration coverage equal to {pixels of primitive/pixels of bounding box}

43.6.3 Texturing

The texture unit can cover any primitive with a picture. The picture can be stretched, sheared, rotated, and translated in one step. To avoid aliasing, the result can be filtered bilinear in the u and v directions.

43.6.3.1 Mathematical Background

The arbitrary mapping problem is completely determined by a mapping from 3 points in the object space (x, y) to 3 points in the texture space (u, v).

Consider the following mapping:

$$\vec{p}_0 = \begin{pmatrix} x_0 \\ y_0 \end{pmatrix} \Rightarrow (\vec{\tilde{p}}_0) = \begin{pmatrix} u_0 \\ v_0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\vec{p}_1 = \begin{pmatrix} x_1 \\ y_1 \end{pmatrix} \Rightarrow (\vec{\tilde{p}}_1) = \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} = \begin{pmatrix} w \\ 0 \end{pmatrix}$$

$$\vec{p}_2 = \begin{pmatrix} x_2 \\ y_2 \end{pmatrix} \Rightarrow (\vec{\tilde{p}}_2) = \begin{pmatrix} u_2 \\ v_2 \end{pmatrix} = \begin{pmatrix} 0 \\ h \end{pmatrix}$$

where w is the width of the texture and h is the height of the texture.

Examine Figure 43.20 in the object space. To simplify calculations the difference vectors are taken as calculations:

$$\vec{d}_1 = \vec{p}_1 - \vec{p}_0$$

$$\vec{d}_2 = \vec{p}_2 - \vec{p}_0$$

This is equivalent to transforming from coordinate system O to coordinate system O'.

Figure 43.20 Texture mapping, object space, and transformation from coordinate system O to O' to simplify calculations

Figure 43.21 Texture mapping, texture space, and texture with width w and height h

In O' , the mapping is:

$$\begin{aligned}\vec{p}'_0 &= \begin{pmatrix} 0 \\ 0 \end{pmatrix} \Rightarrow (\vec{\tilde{p}}_0) = \begin{pmatrix} u_0 \\ v_0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \\ \vec{d}_1 &= \begin{pmatrix} dx_1 \\ dy_1 \end{pmatrix} \Rightarrow (\vec{\tilde{p}}_1) = \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} = \begin{pmatrix} w \\ 0 \end{pmatrix} \\ \vec{d}_2 &= \begin{pmatrix} dx_2 \\ dy_2 \end{pmatrix} \Rightarrow (\vec{\tilde{p}}_2) = \begin{pmatrix} u_2 \\ v_2 \end{pmatrix} = \begin{pmatrix} 0 \\ h \end{pmatrix}\end{aligned}$$

This is a linear mapping that can be described by a 2 x 2 matrix.

$$(\vec{\tilde{p}}) = M \cdot \vec{p}' = \begin{bmatrix} m_{11} & m_{12} \\ m_{21} & m_{22} \end{bmatrix} \cdot \vec{p}'$$

$$\Rightarrow \begin{pmatrix} w \\ 0 \end{pmatrix} = M \cdot \vec{d}_1 \wedge \begin{pmatrix} 0 \\ h \end{pmatrix} = M \cdot \vec{d}_2$$

If the equations are expanded and sorted, the result is two equation systems each with two unknowns. These can be described more easily with a new matrix.

Let $A = \begin{bmatrix} dx_1 & dy_1 \\ dx_2 & dy_2 \end{bmatrix}$ then the equation system can be rewritten as:

$$\begin{pmatrix} w \\ 0 \end{pmatrix} = A \cdot \begin{pmatrix} m_{11} \\ m_{12} \end{pmatrix} \wedge \begin{pmatrix} 0 \\ h \end{pmatrix} = A \cdot \begin{pmatrix} m_{21} \\ m_{22} \end{pmatrix}$$

This can be easily solved with determinants.

$$\text{Let } c = \frac{1}{\det A} = \frac{1}{dx_1 \cdot dy_2 - dx_2 \cdot dy_1}$$

The resulting constants are:

$$\begin{aligned} m_{11} &= c \cdot w \cdot dy_2 = \frac{du}{dx} \\ m_{12} &= -c \cdot w \cdot dx_2 = \frac{du}{dy} \\ m_{21} &= c \cdot h \cdot dx_1 = \frac{dv}{dx} \\ m_{22} &= -c \cdot h \cdot dx_2 = \frac{dv}{dy} \end{aligned}$$

To calculate the start values for u and v at the top of the bounding box, the transformation from O' to O must be reversed. Let u_s and v_s be the start values, then:

$$\begin{pmatrix} u_s \\ v_s \end{pmatrix} = M \cdot (-\vec{p}_0) = c \cdot \begin{pmatrix} -w \cdot (x_0 \cdot dy_2 - y_0 \cdot dx_2) \\ h \cdot (x_0 \cdot dy_1 - y_0 \cdot dx_1) \end{pmatrix}$$

Examples

u and v are in the texture space. Enter the following into any case:

- Copy case:
 $dx_1 = 1, dx_2 = 0, dy_1 = 0, dy_2 = 1$
- Scaling case x scaling copy case:
 $dx_1 = f, dx_2 = 0, dy_1 = 0, dy_2 = 1$
 with f being the scaling factor in the x direction similar for the y direction
- Rotation case:
 $dx_1 = \cos a, dx_2 = -\sin a, dy_1 = \sin a, dy_2 = \cos a$
 with the angle between $d1$ and the x axis in the clockwise direction.

43.6.3.2 Limiter Operation

The texture limiters operate exactly in the same way as the linear limiters shown in Figure 43.8.

The register layout for the u limiter is the same:

- LUSTART = us
- LUXADD = du/dx
- LUYADD = du/dy .

The register layout for the v limiter is slightly different. TEXTPITCH is multiplied to save one hardware multiplier.

- LVSTARTI = $\text{floor}(vs) \cdot \text{TEXPITCH}$
Contains the integer part of the start value.
- LVSTARTF = $(vs - \text{floor}(vs)) \cdot \text{TEXPITCH}$
Contains the fractional part of the start value.
- LVXADDI = $\text{floor}(dv/dx) \cdot \text{TEXPITCH}$
Contains the integer part of dv/dx .
- LVYADD = $\text{floor}(dv/dy) \cdot \text{TEXPITCH}$
Contains the integer part of dv/dy .
- LVYXADDF.LVXADDF = $(dv/dx - \text{floor}(dv/dx)) \cdot \text{TEXPITCH}$
Contains the fractional part of dv/dx
- LVYXADDF.LVYADDF = $(dv/dy - \text{floor}(dv/dy)) \cdot \text{TEXPITCH}$
Contains the fractional part of dv/dy
- TEXTMASK.TEXTUMASK, TEXTMASK.TEXTVMASK
Contains a mask for u and v separately to wraparound values of u and v. This is useful for staying inside the limits of the texture or repeat a texture. Wrap around textures have to have a size multiple of 2.
- TEXTPITCH
Contains the width of the texture in pixels in framebuffer memory. This information is required to calculate the new address if stepping to a new line.
- TEXORIGIN.
Contains the base address of the texture.

43.6.4 Colorization

After a pixel is found to be part of the geometry, its color is calculated. The 2D Drawing Engine supports a very general color calculation scheme, allowing support for several color modes. This color scheme uses an interpolation between two color registers, COLOR1 and COLOR2. See Figure 43.22 for details. COLOR1 and COLOR2 are marked as A, B in the figure for clarity.

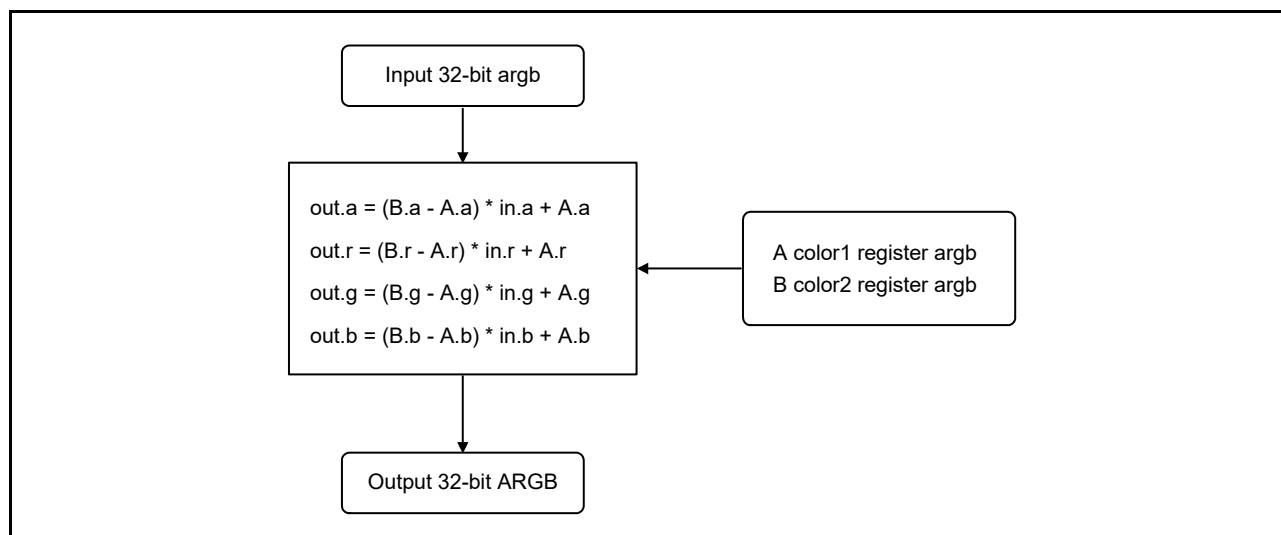

Figure 43.22 Colorization step and interpolation between the two color registers, A (COLOR1) and B (COLOR2)

This general approach can be used to support several different color modes that can be individually applied to any color or alpha channel of the input.

Table 43.7 Colorization operations

| Operation | Settings for A and B *1 |
|--|---|
| Copy | A = 0, B = ffh |
| Replace with a constant value v | A = v, B = v |
| Multiply by a constant value v | A = 0, B = v |
| Colorize an alpha texture with the RGB value v | A.a = 0, A.r = B.r, A.g = B.g, A.b = B.b, B.a = ffh, B.r = v.r, B.g = v.g, B.b = v.b |
| Invert a channel | A = ffh, B = 0 |
| Invert multiply with v | A = v, B = 0 |
| Interpolate between color v and color u | A = v, B = u |

Note 1. A = COLOR1, B = COLOR2

43.6.5 Blending

43.6.5.1 Color Channel Blending

The last step before the pixel is written to the framebuffer is to blend the pixel with the data that is already written to the framebuffer. If blending is activated, the framebuffer, referred to as DST, must be read. SRC is the output from the colorization unit.

The following color blend modes are supported:

- SRC_ZERO
- SRC_ONE
- SRC_ALPHA
- SRC_ONE_MINUS_ALPHA
- DST_ZERO
- DST_ONE
- DST_ALPHA
- DST_ONE_MINUS_ALPHA.

The selection of the color channel blend modes is performed with the following flags:

- BSF: blend source factor is alpha
- BSI: blend source factor invert
- BDF: blend destination factor is alpha
- BDI: blend destination factor invert.

The formula for the blending is:

$$\text{dst} = \text{src} \cdot f_S + \text{dst} \cdot f_D$$

where:

$$\text{BSF} = 0, \text{BSI} = 0 \Rightarrow f_S = 1$$

$$\text{BSF} = 1, \text{BSI} = 0 \Rightarrow f_S = \alpha$$

$$\text{BSF} = 0, \text{BSI} = 1 \Rightarrow f_S = 0$$

$$\text{BSF} = 1, \text{BSI} = 1 \Rightarrow f_S = 1 - \alpha$$

$$\text{BDF} = 0, \text{BDI} = 0 \Rightarrow f_D = 1$$

$$\text{BDF} = 1, \text{BDI} = 0 \Rightarrow f_D = \alpha$$

$$\text{BDF} = 0, \text{BDI} = 1 \Rightarrow f_D = 0$$

$$\text{BDF} = 1, \text{BDI} = 1 \Rightarrow f_D = 1 - \alpha.$$

Table 43.8 lists all possible color channel blend modes.

Table 43.8 Color channel blend modes

| Mode | BSF | BSI | BDF | BDI | Blend equation |
|---|-----|-----|-----|-----|---|
| SRC_ONE DST_ONE | 0 | 0 | 0 | 0 | $SRC + DST$ |
| SRC_ONE | 0 | 0 | 0 | 1 | SRC |
| SRC_ONE DST_ALPHA | 0 | 0 | 1 | 0 | $SRC + DST \times ALPHA$ |
| SRC_ONE DST_ONE_MINUS_ALPHA | 0 | 0 | 1 | 1 | $SRC + DST \times (1 - ALPHA)$ |
| SRC_ZERO DST_ONE | 0 | 1 | 0 | 0 | DST |
| SRC_ZERO DST_ZERO | 0 | 1 | 0 | 1 | 0 |
| SRC_ZERO DST_ALPHA | 0 | 1 | 1 | 0 | $DST \times ALPHA$ |
| SRC_ZERO DST_ONE_MINUS_ALPHA | 0 | 1 | 1 | 1 | $DST \times (1 - ALPHA)$ |
| SRC_ALPHA DST_ONE | 1 | 0 | 0 | 0 | $SRC \times ALPHA + DST$ |
| SRC_ALPHA | 1 | 0 | 0 | 1 | $SRC \times ALPHA$ |
| SRC_ALPHA DST_ALPHA | 1 | 0 | 1 | 0 | $SRC \times ALPHA + DST \times ALPHA$ |
| SRC_ALPHA DST_ONE_MINUS_ALPHA | 1 | 0 | 1 | 1 | $SRC \times ALPHA + DST \times (1 - ALPHA)$ |
| SRC_ONE_MINUS_ALPHA DST_ONE | 1 | 1 | 0 | 0 | $SRC \times (1 - ALPHA) + DST$ |
| SRC_ONE_MINUS_ALPHA | 1 | 1 | 0 | 1 | $SRC \times (1 - ALPHA)$ |
| SRC_ONE_MINUS_ALPHA DST_ALPHA | 1 | 1 | 1 | 0 | $SRC \times (1 - ALPHA) + DST \times ALPHA$ |
| SRC_ONE_MINUS_ALPHA DST_ONE_MINUS_ALPHA | 1 | 1 | 1 | 1 | $SRC \times (1 - ALPHA) + DST \times (1 - ALPHA)$ |

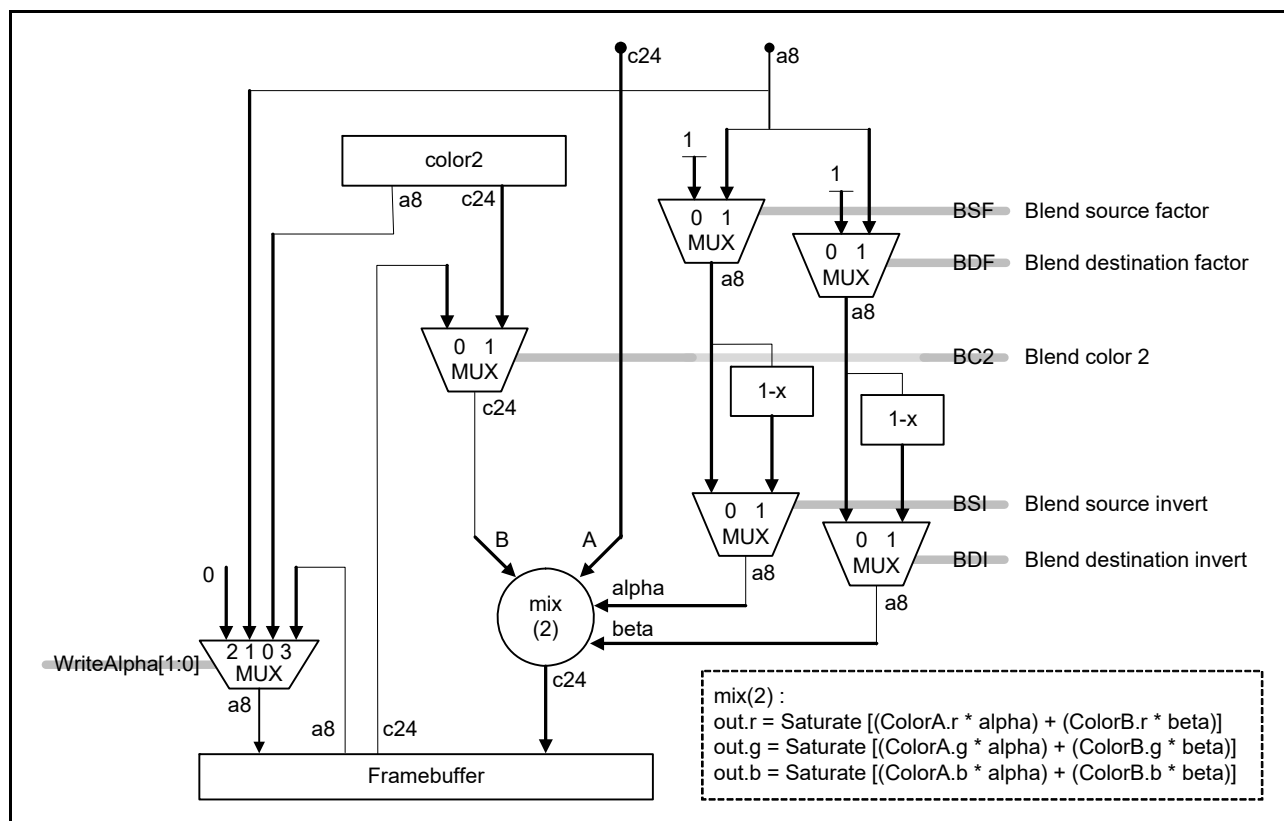

Figure 43.23 Color channel blend unit when $CONTROL2.USEACB = 0$

43.6.5.2 Alpha Channel Blending

The alpha channel can be blended in addition to the color channels. Alpha channel blending is enabled by setting `CONTROL2.USEACB = 1`. Alpha channel blending uses the same formulas and same blend modes as for the color channels. The alpha channel formulas can be set independently from the color channels.

The following alpha channel blend modes are supported:

- `SRC_A_ZERO`
- `SRC_A_ONE`
- `SRC_A_SRC_A`
- `SRC_A_ONE_MINUS_SRC_A`
- `DST_A_ZERO`
- `DST_A_ONE`
- `DST_A_SRC_A`
- `DST_A_ONE_MINUS_SRC_A`.

The alpha channel blend modes selected with the following flags:

- `BSFA`: blend source factor is `SRC_A`
- `BSIA`: blend source factor invert
- `BDFA`: blend destination factor is `SRC_A`
- `BDIA`: blend destination factor invert.

The formula for the blending is:

$$\text{dst_alpha} = \text{src_a} \cdot f_{S_a} + \text{dst_a} \cdot f_{D_a}$$

where:

$$\text{BSFA} = 0, \text{BSIA} = 0 \Rightarrow f_{S_a} = 1$$

$$\text{BSFA} = 1, \text{BSIA} = 0 \Rightarrow f_{S_a} = \text{src_a}$$

$$\text{BSFA} = 0, \text{BSIA} = 1 \Rightarrow f_{S_a} = 0$$

$$\text{BSFA} = 1, \text{BSIA} = 1 \Rightarrow f_{S_a} = 1 - \text{src_a}$$

$$\text{BDFA} = 0, \text{BDIA} = 0 \Rightarrow f_{D_a} = 1$$

$$\text{BDFA} = 1, \text{BDIA} = 0 \Rightarrow f_{D_a} = \text{src_a}$$

$$\text{BDFA} = 0, \text{BDIA} = 1 \Rightarrow f_{D_a} = 0$$

$$\text{BDFA} = 1, \text{BDIA} = 1 \Rightarrow f_{D_a} = 1 - \text{src_a}.$$

Table 43.9 lists all possible alpha channel blend modes.

Table 43.9 Alpha channel blend modes

| Mode | BSF | BSI | BDF | BDI | Blend equation |
|---|-----|-----|-----|-----|---|
| SRC_A_ONE DST_A_ONE | 0 | 0 | 0 | 0 | $SRC_A + DST_A$ |
| SRC_A_ONE | 0 | 0 | 0 | 1 | SRC_A |
| SRC_A_ONE DST_A_SRC_A | 0 | 0 | 1 | 0 | $SRC_A + DST_A \times SRC_A$ |
| SRC_A_ONE DST_A_ONE_MINUS_SRC_A | 0 | 0 | 1 | 1 | $SRC_A + DST_A \times (1 - SRC_A)$ |
| SRC_A_ZERO DST_A_ONE | 0 | 1 | 0 | 0 | DST_A |
| SRC_A_ZERO DST_A_ZERO | 0 | 1 | 0 | 1 | 0 |
| SRC_A_ZERO DST_A_SRC_A | 0 | 1 | 1 | 0 | $DST_A \times SRC_A$ |
| SRC_A_ZERO DST_A_ONE_MINUS_SRC_A | 0 | 1 | 1 | 1 | $DST_A \times (1 - SRC_A)$ |
| SRC_A_SRC_A DST_A_ONE | 1 | 0 | 0 | 0 | $SRC_A \times SRC_A + DST_A$ |
| SRC_A_SRC_A | 1 | 0 | 0 | 1 | $SRC_A \times SRC_A$ |
| SRC_A_SRC_A DST_A_SRC_A | 1 | 0 | 1 | 0 | $SRC_A \times SRC_A + DST_A \times SRC_A$ |
| SRC_A_SRC_A DST_A_ONE_MINUS_SRC_A | 1 | 0 | 1 | 1 | $SRC_A \times SRC_A + DST_A \times (1 - SRC_A)$ |
| SRC_A_ONE_MINUS_SRC_A DST_A_ONE | 1 | 1 | 0 | 0 | $SRC_A \times (1 - SRC_A) + DST_A$ |
| SRC_A_ONE_MINUS_SRC_A | 1 | 1 | 0 | 1 | $SRC_A \times (1 - SRC_A)$ |
| SRC_A_ONE_MINUS_SRC_A DST_A_SRC_A | 1 | 1 | 1 | 0 | $SRC_A \times (1 - SRC_A) + DST_A \times SRC_A$ |
| SRC_A_ONE_MINUS_SRC_A DST_A_ONE_MINUS_SRC_A | 1 | 1 | 1 | 1 | $SRC_A \times (1 - SRC_A) + DST_A \times (1 - SRC_A)$ |

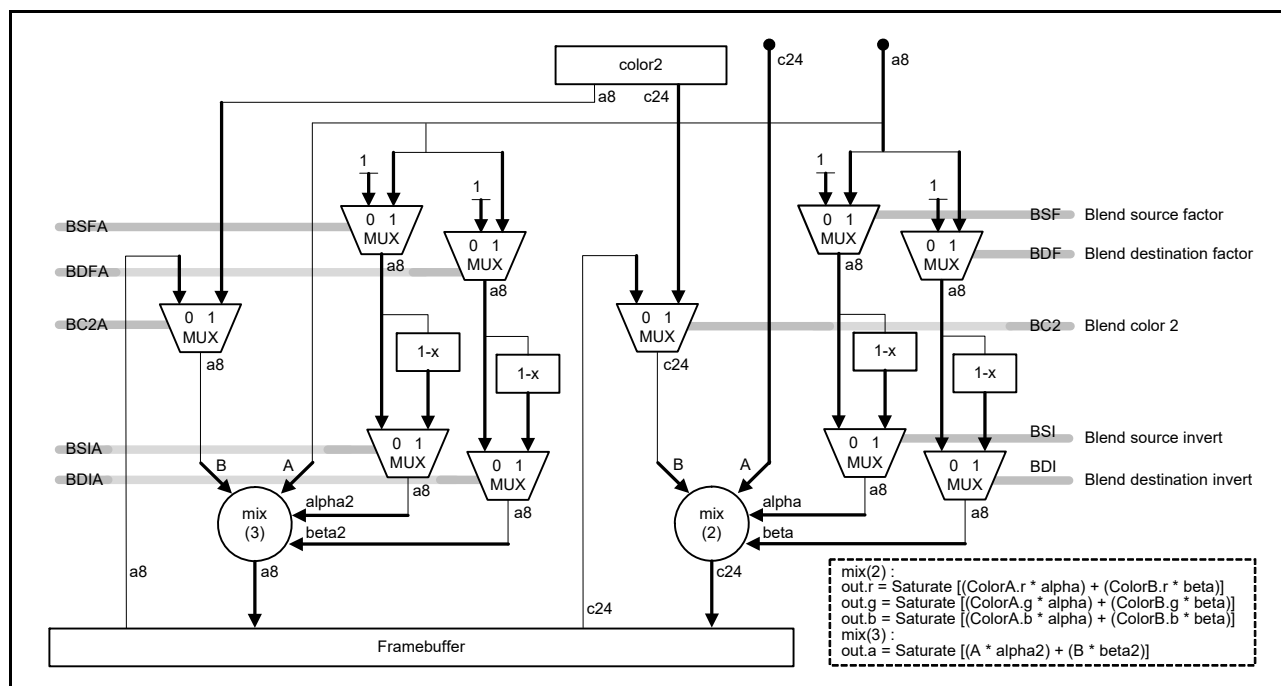

Figure 43.24 Alpha- and color-channel blend unit when $CONTROL2.USEACB = 1$

43.7 Rendering Modes

The rendering process can be performed in two different modes, register mode and display list mode.

43.7.1 Register Mode

In register mode, when operation is based on register settings, the host CPU configures and initiates each render process separately. To start a new render process, the host CPU must wait until the previous one is completed. In this mode, the host CPU is heavily engaged throughout the entire drawing procedure and is consequently to a large extent unavailable for other tasks.

The host CPU must set up all registers for performing a certain drawing operation before it can start the rendering process. A new register setup can only be started when the previous render process has completed. Before starting a new register setup, make sure that:

- STATUS.DLISTACTIVE = 0: Display list reader is idle
- STATUS.BUSYENUM = 0: Pixel selection unit is idle.

Lastly, write the framebuffer start address to the ORIGIN register. This write triggers the 2D Drawing Engine to start rendering.

43.7.2 Display List Mode

In display list mode, the host CPU creates a display list in memory prior to starting the 2D Drawing Engine. A display list contains a bundle of render operations. When started, the 2D Drawing Engine executes the display list autonomously, and the host CPU is not involved with drawing operations most of the time. Use of a display list allows for fully asynchronous operation of the host CPU and the 2D Drawing Engine and offers the best possible system performance. In this mode, the display list reader reads a memory block containing instructions on how to set the 2D Drawing Engine control registers and executes these control register writes accordingly.

Display list start

To start execution of a display list, which already resides in memory, the start address of the display list is written to the display list start address register DLISTSTART. Because rewriting DLISTSTART also stops any ongoing display list execution, make sure that the previous display list process is completed by either of the following two methods:

- Check that STATUS.DLISTACTIVE = 0, which indicates idle status of the display list reader
- Wait for the display list interrupt DRWDLISTIRQ, which indicates completion of the previous display list process.

Note: Direct writing to 2D Drawing Engine registers while the display list mode is active (STATUS.DLISTACTIVE = 1) might lead to a 2D Drawing Engine hang-up. To prevent this, always check that the display list reader is idle (STATUS.DLISTACTIVE = 0) before writing to any 2D Drawing Engine register.

Display list format

Display lists are stored using direct register-to-value mappings, which means that a display list contains a one-byte index that addresses a certain register and the value to be written to the register. The register index is derived from the address offset of the register address and can be calculated by dividing the address offset by 4. For the index of each register, see Table 43.11.

As the 2D Drawing Engine registers are always 32 bits wide, each data unit (called a data word) to be written to a register is of the same size. An address word that contains the indices of the register to be written is stored in a packed notation with up to four indices stored in one 32-bit address word.

A display list command always starts with an address word, followed by up to four data words, one for each register. The indices are read and interpreted from LSB to MSB, so the register of the low byte index is written first.

Example

In the following example:

- DWORD 201A 1930h // start of list address word
- DWORD 0000 0013h // data word 1 (for register 30h)
- DWORD FFFF FFAAh // data word 2 (for register 19h)
- DWORD 4033 6480h // data word 3 (for register 1Ah)
- DWORD 0001 0000h // data word 4 (for register 20h)
- DWORD... // next address word.

This stream of dwords updates the DRW registers as follows:

- Write 0000 0013h to register 30h = 48, which is IRQCTL
- Write FFFF FFAAh to register 19h = 25, which is COLOR1
- Write 4033 6480h to register 1Ah = 26, which is COLOR2
- Write 0001 0000h to register 20h = 32, which is ORIGIN.

Address word indices

Besides referencing a register, the indices of an address word can also have other meanings, depending on their value.

Table 43.10 Indices function

| Index | Function | | | | | | | | |
|----------------|--|----------------|--|----------------|--|----------------|---|--------------|----------------|
| 00h to 7Fh | Register indices Two register indices trigger additional actions: <table> <tr> <td>- 20h = 32:</td><td>A write to ORIGIN to set a new frame buffer address is delayed until the ongoing frame buffer write-back is complete, when STATUS.BUSYWRITE = 0.</td></tr> <tr> <td>- 32h = 50:</td><td>A write to DLISTSTART sets a new display list start address stops the current display list and starts the new one.</td></tr> </table> | - 20h = 32: | A write to ORIGIN to set a new frame buffer address is delayed until the ongoing frame buffer write-back is complete, when STATUS.BUSYWRITE = 0. | - 32h = 50: | A write to DLISTSTART sets a new display list start address stops the current display list and starts the new one. | | | | |
| - 20h = 32: | A write to ORIGIN to set a new frame buffer address is delayed until the ongoing frame buffer write-back is complete, when STATUS.BUSYWRITE = 0. | | | | | | | | |
| - 32h = 50: | A write to DLISTSTART sets a new display list start address stops the current display list and starts the new one. | | | | | | | | |
| 80h | Gap index, which is used to fill unused bytes of an address word. For example, if fewer than four indices are required, the remaining bytes are filled with 80h. In this case, the number of the subsequent data words must be reduced accordingly. | | | | | | | | |
| FFh | If the first index of an address word contains the special index FFh, the subsequent (second) index is interpreted as follows: <table> <tr> <td>- Bit [0] set:</td><td>Display list end.</td></tr> <tr> <td>- Bit [1] set:</td><td>Issue a full pipeline flush and wait (necessary before flip).</td></tr> <tr> <td>- Bit [2] set:</td><td>Wait for writeback complete (necessary before framebuffer format change).</td></tr> <tr> <td>- Bits [7:3]</td><td>Set all to 0s.</td></tr> </table> Bit [1] and [2] settings are mutually exclusive. All indices after the special index FFh are ignored, and the next address word is read, if no display list end (bit [0] = 1) was set. The remaining two indices must be set to 00h. | - Bit [0] set: | Display list end. | - Bit [1] set: | Issue a full pipeline flush and wait (necessary before flip). | - Bit [2] set: | Wait for writeback complete (necessary before framebuffer format change). | - Bits [7:3] | Set all to 0s. |
| - Bit [0] set: | Display list end. | | | | | | | | |
| - Bit [1] set: | Issue a full pipeline flush and wait (necessary before flip). | | | | | | | | |
| - Bit [2] set: | Wait for writeback complete (necessary before framebuffer format change). | | | | | | | | |
| - Bits [7:3] | Set all to 0s. | | | | | | | | |

Note: Gap indices 80h must not be placed between other indices, for example as "index1 - 80h - index3 - index4". Always fill all indices after 80h with the gap index.
 If any of the special indices 80h and FFh are used, no register index can follow after them in the same address word.

Table 43.11 2D Drawing Engine registers overview

| Register function | Symbol | Index |
|---|------------|--------|
| Control registers: | | |
| Geometry control | CONTROL | 0 |
| Surface control | CONTROL2 | 1 |
| Interrupt control | IRQCTL | 48 |
| Cache control | CACHECTL | 49 |
| Status control | STATUS | n.a.*1 |
| Hardware version and feature set ID | HWREVISION | n.a.*1 |
| Color registers: | | |
| Base color | COLOR1 | 25 |
| Secondary color | COLOR2 | 26 |
| Pattern | PATTERN | 29 |
| Limiter registers: | | |
| Limiter 1 start value | L1START | 4 |
| Limiter 2 start value | L2START | 5 |
| Limiter 3 start value | L3START | 6 |
| Limiter 4 start value | L4START | 7 |
| Limiter 5 start value | L5START | 8 |
| Limiter 6 start value | L6START | 9 |
| Limiter 1 x-axis increment | L1XADD | 10 |
| Limiter 2 x-axis increment | L2XADD | 11 |
| Limiter 3 x-axis increment | L3XADD | 12 |
| Limiter 4 x-axis increment | L4XADD | 13 |
| Limiter 5 x-axis increment | L5XADD | 14 |
| Limiter 6 x-axis increment | L6XADD | 15 |
| Limiter 1 y-axis increment | L1YADD | 16 |
| Limiter 2 y-axis increment | L2YADD | 17 |
| Limiter 3 y-axis increment | L3YADD | 18 |
| Limiter 4 y-axis increment | L4YADD | 19 |
| Limiter 5 y-axis increment | L5YADD | 20 |
| Limiter 6 y-axis increment | L6YADD | 21 |
| Limiter 1 bandwidth parameter | L1BAND | 22 |
| Limiter 2 bandwidth parameter | L2BAND | 23 |
| Texture registers: | | |
| Texture base address | TEXORIGIN | 47 |
| Texels per texture line | TEXPITCH | 45 |
| Texture size or texture address mask | TEXMASK | 46 |
| U limiter start value | LUSTART | 36 |
| U limiter x-axis increment | LUXADD | 37 |
| U limiter y-axis increment | LUYADD | 38 |
| V limiter start value integer part | LVSTARTI | 39 |
| V limiter start value fractional part | LVSTARTF | 40 |
| V limiter x-axis increment integer part | LVXADDI | 41 |
| V limiter y-axis increment integer part | LVYADDI | 42 |
| V limiter increment fractional parts | LVYXADDF | 43 |

Table 43.11 2D Drawing Engine registers overview

| Register function | Symbol | Index |
|--|-------------|-------|
| Color lookup table start address | TEXCLADDR | 55 |
| Write Data to TEXCLADDR; after each data write, TEXCLADDR is incremented by 1. | TEXCLDATA | 56 |
| Offset to the index for the indexed texture formats i8, i4, i2, and i1 | TEXCLOFFSET | 57 |
| Compare value for R,G, B components of internal texel color representation. | COLKEY | 58 |
| Miscellaneous registers: | | |
| Bounding box dimension | SIZE | 30 |
| Framebuffer pitch and spanstore delay | PITCH | 31 |
| Address of the first pixel in framebuffer | ORIGIN | 32 |
| Display list start address | DLISTSTART | 50 |
| Performance counters control | PERFTRIGGER | 53 |
| Performance counter 1 | PERFCOUNT1 | 51 |
| Performance counter 2 | PERFCOUNT2 | 52 |

Note 1. These registers are read-only and cannot be accessed in display list mode, and they therefore have no index.

43.7.3 Stopping the Render Process

Stopping an ongoing render process requires a specific procedure, which is described in section 43.10, Stopping the 2D Drawing Engine Render Process.

43.8 Interrupts

The 2D Drawing Engine generates three interrupts:

- DRWBUSIRQ
- DRWENUMIRQ
- DRWDLISTIRQ.

43.8.1 Interrupt sources

DRWBUSIRQ

This is the 2D Drawing Engine bus error interrupt. It occurs when the 2D Drawing Engine attempts to access an undefined address range through the following:

- Framebuffer Base Address Register (ORIGIN)
- Texture Base Address Register (TEXORIGIN)
- Display List Start Address Register (DLISTSTART)

The interrupt source can be determined by the BUSERRMFB, BUSERRMTXMRL, and BUSERRMDL bits of the STATUS register.

Note: After a DRWBUSIRQ occurrence, you must apply a software reset.
For a software reset, see section 52, Power-Down Modes.

DRWENUMIRQ

This is the current render process finished interrupt.

DRWDLISTIRQ

This is the display list interrupt. It is asserted on completion of a display list process. DRWDLISTIRQ is activated if one of the following is true:

- The entire display list is complete
- The display list processing stops because a new display list start is triggered by a write to the Display List Start Address Register (DLISTSTART).

43.8.2 Interrupt Control

The three 2D Drawing Engine interrupts are combined into a single shared interrupt, DRW_IRQ, to the CPU. Each interrupt can be masked (disabled), or unmasked (enabled) by setting its associated enable bit in the Interrupt Control Register (IRQCTL).

The occurrence of an enabled interrupt (one with its mask bit set to 1 in IRQCTL) is monitored in the Status Control Register (STATUS) with its associated interrupt status bit is set to 1. The shared 2D Drawing Engine interrupt DRW_IRQ is then generated.

To clear the interrupt, the host CPU must write 1 to the interrupt clear bit in IRQCTL. The interrupt clear bit returns to 0 automatically.

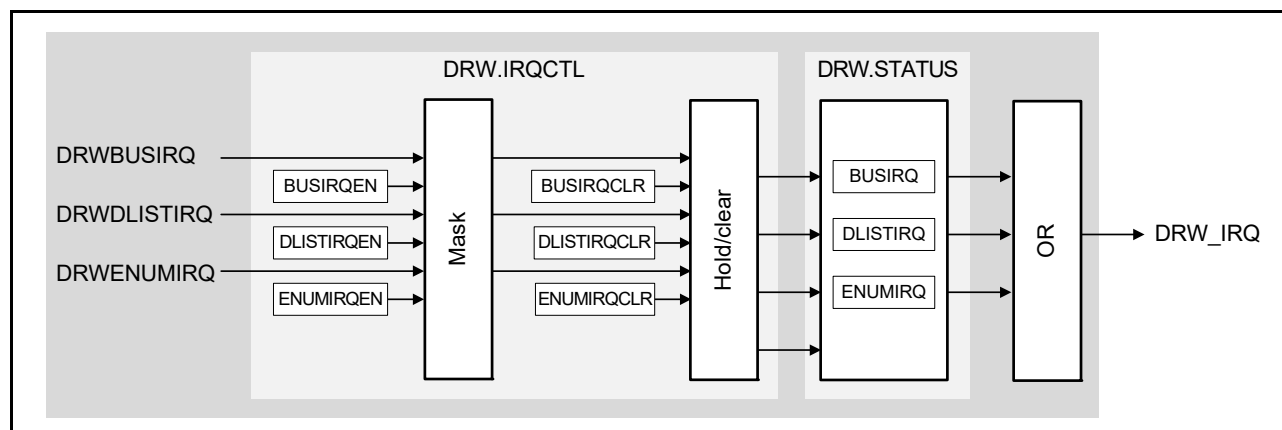

Figure 43.25 Interrupt Controller Unit (ICU)

43.9 Performance Counters

The 2D Drawing Engine features two independent 32-bit performance counter registers (PERFCOUNT_k ($k = 1, 2$)) to count the number of occurrences of a certain event. The events to be counted can be set up independently for each performance counter register with the Performance Counter Control Registers, PERFTRIGGER.PERFTRIGGER2 for PERFCOUNT2 and PERFTRIGGER.PERFTRIGGER1 for PERFCOUNT1.

Table 43.12 lists the performance counter trigger events that can be selected.

Table 43.12 Performance counter trigger events

| PERFTRIGGER.PERFTRIGGER _k | Event |
|--------------------------------------|---|
| 0 | Disable performance counter |
| 1 | 2D Drawing Engine active cycles |
| 2 | Framebuffer read access |
| 3 | Framebuffer write access |
| 4 | Texture read access |
| 5 | Invisible pixels (enumerated but selected with alpha 0%) |
| 6 | Invisible pixels while internal FIFO is empty (lost cycles) |
| 7 | Display list reader active cycles |
| 8 | Framebuffer read hits |
| 9 | Framebuffer read misses |
| 10 | Framebuffer write hits |
| 11 | Framebuffer write misses |
| 12 | Texture read hits |
| 13 | Texture read misses |
| 31 | Every clock cycle (for use as timer) |

43.10 Stopping the 2D Drawing Engine Render Process

If a render process has started either in register or display list mode, the 2D Drawing Engine processes the data autonomously until the render process is finished. Depending on the rendering, this process might take several milliseconds.

If the 2D Drawing Engine is to be disabled because, for example, this LSI enters a low-power mode, proceed as follows to stop the ongoing rendering:

1. Set the following registers as follows:

SIZE = 0001 0001h

Set bounding box dimensions to 1 pixel x 1 line.

CONTROL2 = 0000 0000h

Color format a (8), no texture, CLUT.

ORIGIN = UnmappedAddress

The UnmappedAddress is an address that is not available for 2D Drawing Engine access.

The recommended UnmappedAddress is given here under the key word "UnmappedAddress".

Alternatively do the same in display list mode:

DWORD 8020 011Eh // start of list address word

DWORD 0001 0001h // SIZE = 0001 0001h

DWORD 0000 0000h // CONTROL2 = 0000 0000h

DWORD UnmappedAddress // ORIGIN = UnmappedAddress

2. Wait for the Bus Error corresponding to the unmapped address violation, which indicates access to an unmapped address and the stop of the render process.
UnmappedAddress = D000 0000h
3. Disable the 2D Drawing Engine, if wanted.

44. Sprite Engine (SPEA)

44.1 Overview of the Sprite and RLE Units

44.1.1 Units

This LSI has the following number of units of the Sprite Engine.

Table 44.1 Units

| Sprite Engine (SPEA) | RZ/A2M |
|----------------------|--------|
| Units | 1 |
| Names | SPEA0 |

Unit index n

Throughout this section, the individual units of the Sprite Engines are identified by the index “n” (n = 0), for example SPEAnPHAi for the SPEAn physical address register of RLE Unit i.

44.1.2 Sprite and RLE Units indices

In this section following indices are used:

RLE Unit number index i

The one units of the RLE Units are identified by the index “i” (i = 0), for example SPEAnPHAi for the physical address register of RLE Unit i.

Sprite Unit number index k

The two units of the Sprite Units are identified by the index “k” (k = 0 to 1), for example SPEAnSkEN for the enable register of Sprite Unit k.

Sprite index m

The 16 sprites of a Sprite Unit k are identified by the index “m” (m = 0 to 15), for example SPEAnSkDAm for the destination address register of Sprite Unit k’s sprite m.

44.1.3 Register addresses

All Sprite Engines register addresses are given as address offsets from the individual base addresses <SPEAn_base>. The <SPEAn_base> addresses of each SPEAn are listed in the following table:

Table 44.2 Register base addresses <SPEAn_base>

| SPEAn unit | <SPEAn_base> address |
|------------|----------------------|
| SPEA0 | E803 E000H |

44.2 Functional Overview

The video display controller 6 can select different ways to acquire their data from the memory for adding a layer to the image to be displayed:

- Direct access
The color data to be processed by an The video display controller 6 is read directly in the correct format out of the memory.
The graphics blocks (0), (2), and (3) of the video display controller 6 can directly access the memory.
- RLE (run-length encoded) layer
RLE compressed color data in the memory is expanded and delivered to the video display controller 6 as separate pixel color data.
The graphics block (0) of the video display controller 6, which determines the background layer, can uses an RLE layer.
- Sprite layer
A layer with up to 16 rectangle areas, which can be placed anywhere on the layer area.
Since only the color data for these rectangles - and not for the entire layer - need to be stored in memory, required memory occupation and bandwidth is minimized.
The graphics blocks (2) and (3) of the video display controller 6 can use Sprite layers.

Features summary

- RLE Units
 - The RLE unit can cooperate with the graphics block (0) of the video display controller 6
 - RLE compressed data in Targa format
 - RLE compressed color data formats: 24 bpp
- Sprite Units
 - The two Sprite units can cooperate with graphics blocks (2) and (3) of the video display controller 6.
 - up to 16 separate sprites processed by each Sprite Unit

Indices

Throughout this section following indices are used:

- $i = 0$: RLE Unit number
- $k = 0$ to 1: Sprite Unit number
- $m = 0$ to 15: sprite number for each Sprite Unit

44.3 RLE Units Functional Description

The following figure shows the block diagram of the RLE Units.

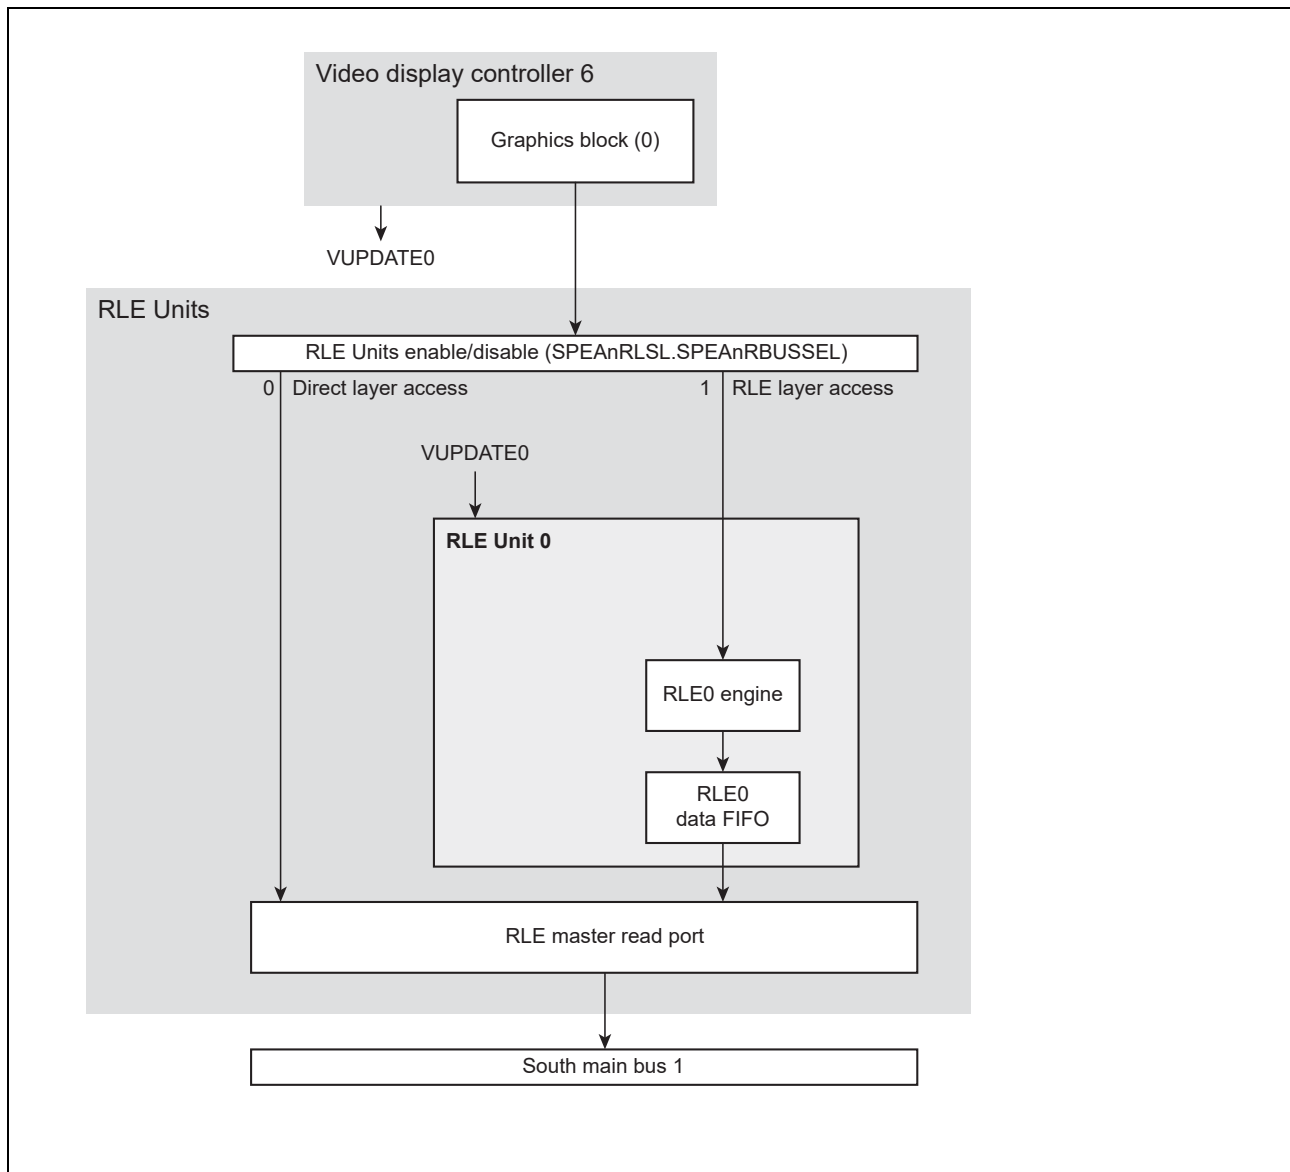

Figure 44.1 RLE Engines block diagram

The graphics block (0) of the video display controller 6 can read RLE compressed color data from the memory via an RLE Unit.

If the graphics block (0) of the video display controller 6 does not read RLE data, it accesses the physical memory for reading frame buffer data directly.

RLE Units enable

The RLE Units can be enabled and disabled:

RLE or direct layer selection is done by a bypass switch:

- SPEAnRLSL.SPEAnRBUSSEL = 0: RLE Units disabled
The graphics block (0) of the video display controller 6 performs direct layer accesses to the memory.
- SPEAnRLSL.SPEAnRBUSSEL = 1: RLE Units enabled
The graphics block (0) of the video display controller 6 performs RLE layer accesses.

RLE Units data FIFO

The data read from the memory by an RLE Unit is stored in a RLE data FIFO, that allows prefetching of memory data. The prefetching of data can be influenced by the FIFO fill stage and the length of the red bursts, the RLE issues read accesses towards the memory via the south main bus.

The size of RLE data FIFO is 1024 bit, organized as 16 x 64 bit.

Two values in the RLE prefetch configuration register SPEAnRCFG allow to configure the FIFO fill threshold when a new read burst is issued and the length of the burst:

- SPEAnRDTH[2:0] set the FIFO fill threshold for the next data prefetch
- SPEAnRLEN[2:0] set the burst length for the next data prefetch

Note: The burst size SPEAnRLEN[2:0] and the prefetch timing SPEAnRDTH[2:0] must be set to values, that prevent the RLE data FIFO from overflow.

The RLE data FIFO size is 1024 bit.

When operating the RLE unit, always set the GR0_BST_MD bit of the video display controller 6 to 1.

44.3.1 RLE layer definition

The RLE Unit i identifies a RLE layer read access of the video display controller 6 by the graphics block (0)'s read address of the first layer pixel.

The valid address is defined in the start address register SPEAnSTAi, that marks the virtual frame start address.

If the graphics block (0) of the video display controller 6 read access matches address, the RLE Unit reads RLE data from the memory address, defined by the physical address register SPEAnPHAi.

Since the entire graphics block (0) of the video display controller 6 layer data is read via the RLE Unit, the RLE Unit reads data from the memory consecutively, until the graphics block (0) of the video display controller 6 issues the start address SPEAnSTAi again. This causes the RLE Unit to restart data read from address SPEAnPHAi.

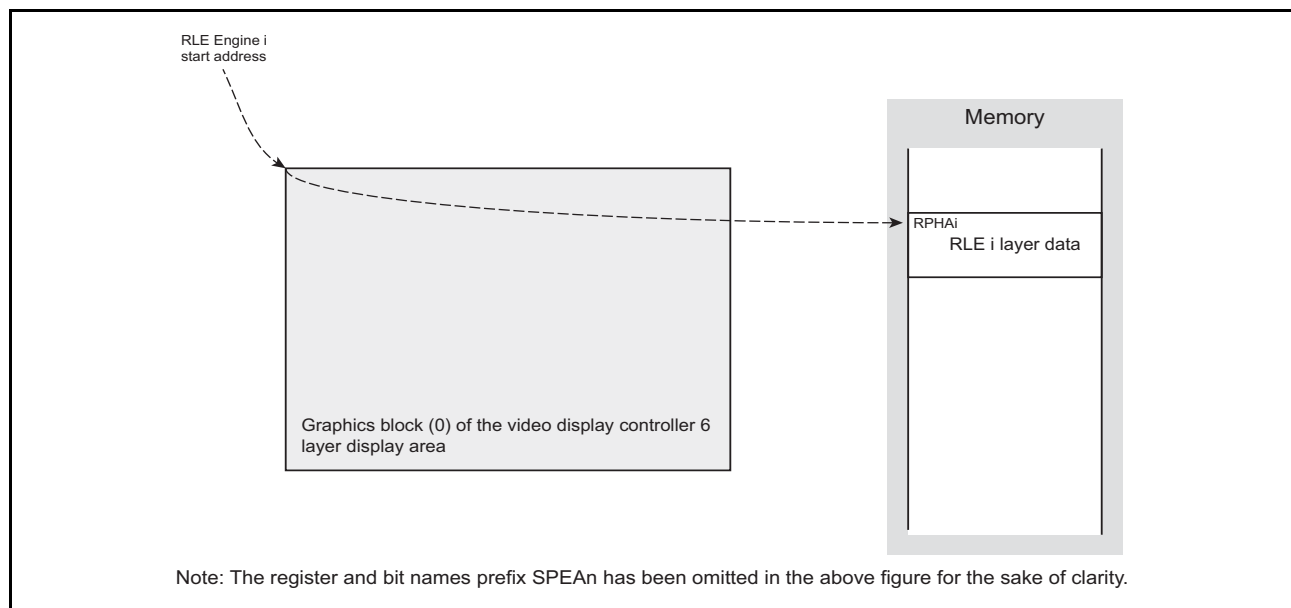

Figure 44.2 RLE definitions

As the RLE unit is reading the memory consecutively, the following graphics block (0) of the video display controller 6 restrictions need to be considered:

- Note 1. Always set '1' to the GR0_BST_MD bit of the GR0_FLM1 register of the video display controller 6. If an image data size in the horizontal direction does not fit to 128 bytes alignment, some dummy data in each line needs to be added.
- 2. After completion of the reading of each line, the RLE unit reads additional 128 bytes. For this reason, 128 bytes of additional dummy data must be inserted in each line.

Example: Dummy data insertion required for each line in the horizontal 240 pixel image of 32bpp:

64- and 128-byte of dummy data are required to satisfy the restrictions of the Note 1 and Note 2, respectively. Dummy data insertion of 192 bytes in total is required. The number of horizontal pixels after dummy data insertion is 288 pixels.

44.3.2 Color modes

The following table lists the possible combinations of the

- color data formats selectable in the graphics block (0) of the video display controller 6
- RLE color mode selection and the data format delivered to the graphics block (0) of the video display controller 6
- color data format in the memory

when RLE data is used for the background layer.

Table 44.3 RLE Units supported color formats

| Graphics block (0) of the video display controller 6 color format selection | | RLE Unit configuration | | Graphics block (0) of the video display controller 6 data | Color data in the memory |
|---|------------------|------------------------|--|---|--------------------------|
| | | Color mode selection | | | |
| 32 bpp | α RGB8888 | SPEAnRCMi = 2: 24 bpp | | RGB888 with $\alpha = 1$ | RGB888 |
| 24 bpp | RGB888 | SPEAnRCMi = 2: 24 bpp | | RGB888 | RGB888 |
| Other | | not supported | | — | — |

Color expansion

Depending on the color format the graphics block (0) of the video display controller 6 is expecting, the color data read from the memory is expanded to fit a 32-bit word.

The following diagrams show how memory data in different formats are passed to the graphics block (0) of the video display controller 6.

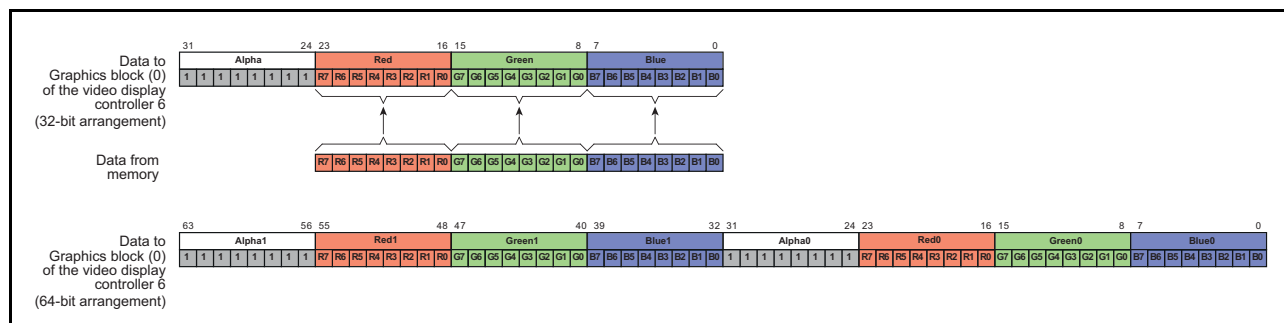

Figure 44.3 24 bpp color expansion to 32 bpp

44.3.3 RLE data packets in the memory

The RLE Units support Targa RLE data packet formats.

The Targa RLE packets comprise two types of data elements:

- run-length packets
- raw packets

The packet consists of two fields:

- Control byte: defines the type of data and the number of pixels covered by the packet
- Data field: defines the pixels color data

Table 44.4 RLE Targa packets

| Packet type | Control byte | | Data field |
|-------------|--|---|---|
| Run-length | <ul style="list-style-type: none"> • Packet type = 1 for run-length packet • Size: 1 bit | <ul style="list-style-type: none"> • Pixel count = (number of pixel repetitions with color of data field) - 1 • Size: 7 bit | <ul style="list-style-type: none"> • Pixel color • Size: pixel bpp |
| Raw | <ul style="list-style-type: none"> • Packet type = 0 for raw packet • Size: 1 bit | <ul style="list-style-type: none"> • Pixel count = (number of pixels in following data field) - 1 • Size: 7 bit | <ul style="list-style-type: none"> • Pixels color • Size: pixel bpp x pixel count |

44.3.4 Packet arrangement in the memory

Padding bits

A data packet must always start at a byte boundary. Thus it may be necessary to add padding bits to the previous packet. The following diagrams show the arrangement of run-length and raw packets with different color format in the memory.

Figure 44.4 Run-length data packets in the memory

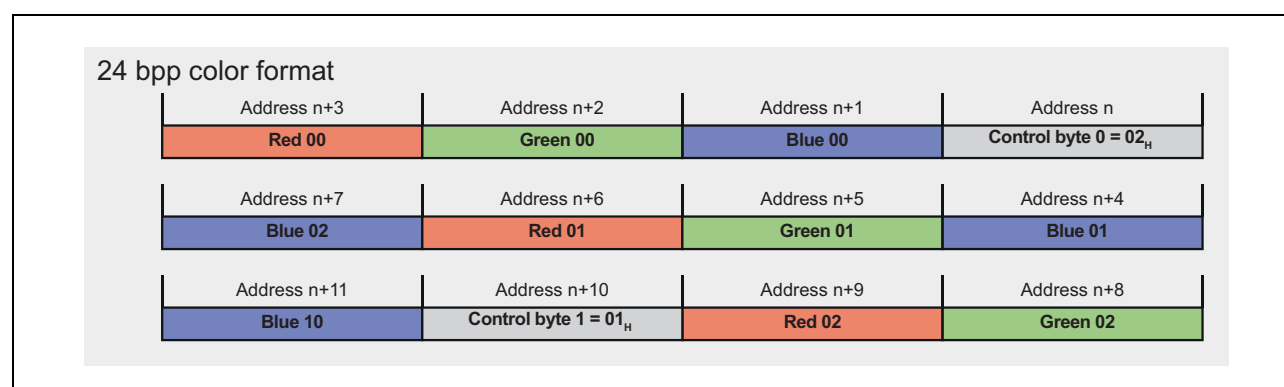

Figure 44.5 Raw data packets in the memory

44.3.5 RLE definition registers modification

The RLE definition registers are buffered.

While the RLE definition registers are in operation, the buffer registers can be modified without disturbing the video output.

The buffered RLE Unit *i* definition registers are:

- Start address register SPEAnSTAi
- physical address register SPEAnPHAi
- color mode register SPEAnRMCi

When setup of new RLE definitions is completed, the update of all definition registers of RLE Unit *i* must be requested via the SPEAnRUP register:

- SPEAnRUP.SPEAnRUP0 = 1: initiates update of all RLE Unit 0 definition registers with the next VUPDATE0

Caution: Caution: RLE definition buffer registers must not be modified while SPEAnRUPi = 1.

44.4 Sprite Units functional description

The graphics blocks (2) and (3) of the video display controller 6 read accesses to the memory are performed via the Sprite Units of the Sprite Engine.

The assignment of the graphics blocks (2) and (3) of the video display controller 6 to the two Sprite Units is determined, as shown in the figure below.

The graphics blocks (2) and (3) of the video display controller 6 can use a sprite layer, through access to a virtual frame buffer, the sprite virtual frame.

If the graphics blocks (2) and (3) of the video display controller 6 does not implement a sprite layer, it accesses the physical memory for reading frame buffer data directly.

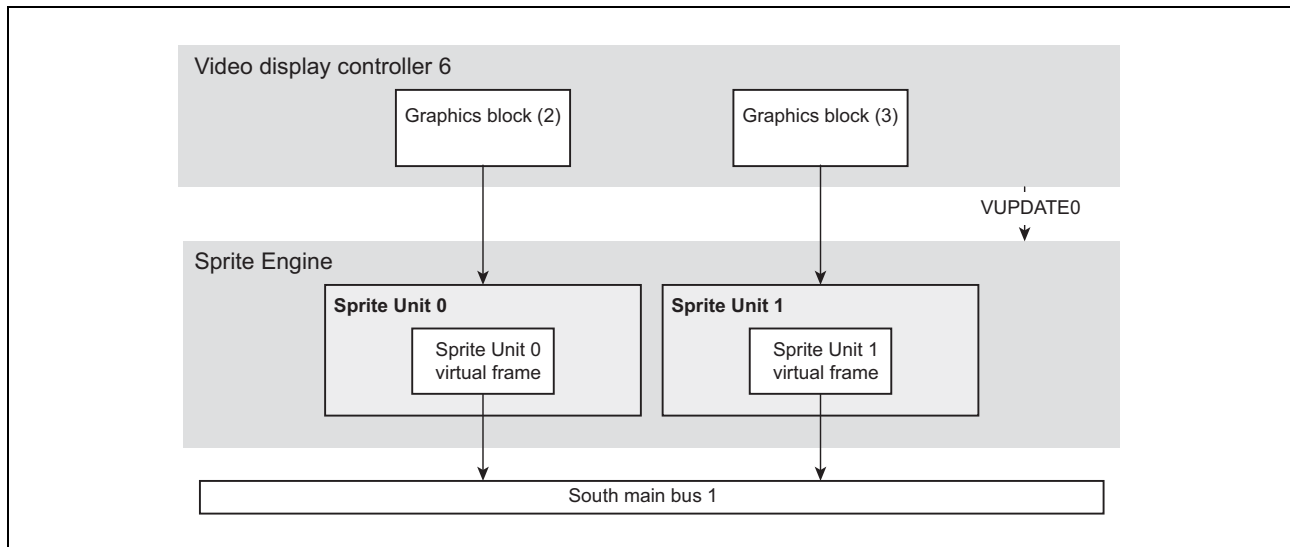

Figure 44.6 Sprite Units block diagram

44.4.1 Sprite virtual frame

The size of the sprite virtual frame is fixed to 8192 x 8192 byte.

Its address is mapped outside of any physical address space, that is used to access the physical memory directly.

The address of the first pixel of the virtual frame is the virtual frame base address

Virtual frame base address = 3000 0000_H

44.4.2 Sprite activation

Each sprite *m* of a Sprite Unit *k* can be enabled or disabled separately:

- Sprite enable/disable registers
 - SPEAnSkEN.SPEAnSkENm = 1 enables sprite *k*
 - SPEAnSkDS.SPEAnSkDSm = 1 disables sprite *k*

The enable/disable status of each sprite can be read via the SPEAnSkEN register.

44.4.3 Color modes

The Sprite unit supports the following color formats.

Table 44.5 Sprite unit supported color format

| Read formats of the graphics blocks (2) and (3) of the video display controller 6 | Sprite unit support |
|---|---------------------|
| α RGB8888 | ○ |
| RGB α 8888 | ○ |
| Other | — |

44.4.4 Sprite definition

A sprite m of Sprite Unit k is defined by several register settings:

Sprite X/Y position

Sprite X/Y position register SPEAnSkPSm: X/Y position on the sprite virtual frame, with respect to its virtual frame base address.

(a) SPEAnSkPSm.SPEAnSkPSXm: X position

The X position is defined as multiple of 64 bit and thus depends on the sprite color format.

The corresponding pixel position depends on the color format and the amount of pixels fitting into 64 bits.

- 32 bpp color formats: $64 \text{ bit} / 32 = 2 \text{ pixel units}$
 - possible X positions at a multiple of 2 = 0, 2, 4, 6, 8, ...
 - SPEAnSkPSX[9:0] = X position in pixel / 2

(b) SPEAnSkPSm.SPEAnSkPSYm: Y position

The Y position is defined in pixels.

Sprite width and height

Sprite size register SPEAnSkLYm: width SPEAnSkLYWm and height SPEAnSkLYHm

(a) SPEAnSkLYm.SPEAnSkLYWm: width

The width is defined as multiple of 64 bit.

- 32 bpp color formats: $64 \text{ bit} / 32 = 2 \text{ pixel units}$
 - possible X widths: multiple of 2 = 0, 2, 4, 6, 8, ...
 - SPEAnSkLYW[9:0] = width in pixel / 2

(b) SPEAnSkLYm.SPEAnSkLYHm: height

The height is defined in pixels.

Destination address

Destination address register SPEAnSkDAm: address of 1st pixel color data of sprite m in the memory

The destination address must be aligned to 64 bit.

Graphics blocks (2) and (3) of the video display controller 6 line offset

Since the Sprite Unit calculates the address of each new line with respect to the fixed virtual frame width of 8192 Byte, the graphics blocks (2) and (3) of the video display controller 6 must define the same line offset, when reading layer data via a Sprite Unit.

Note that the maximum number of pixels per line in the virtual frame depends on the color format:

- 32 bpp: max. 2048 pixels

The figure below shows an example with two enabled sprites.

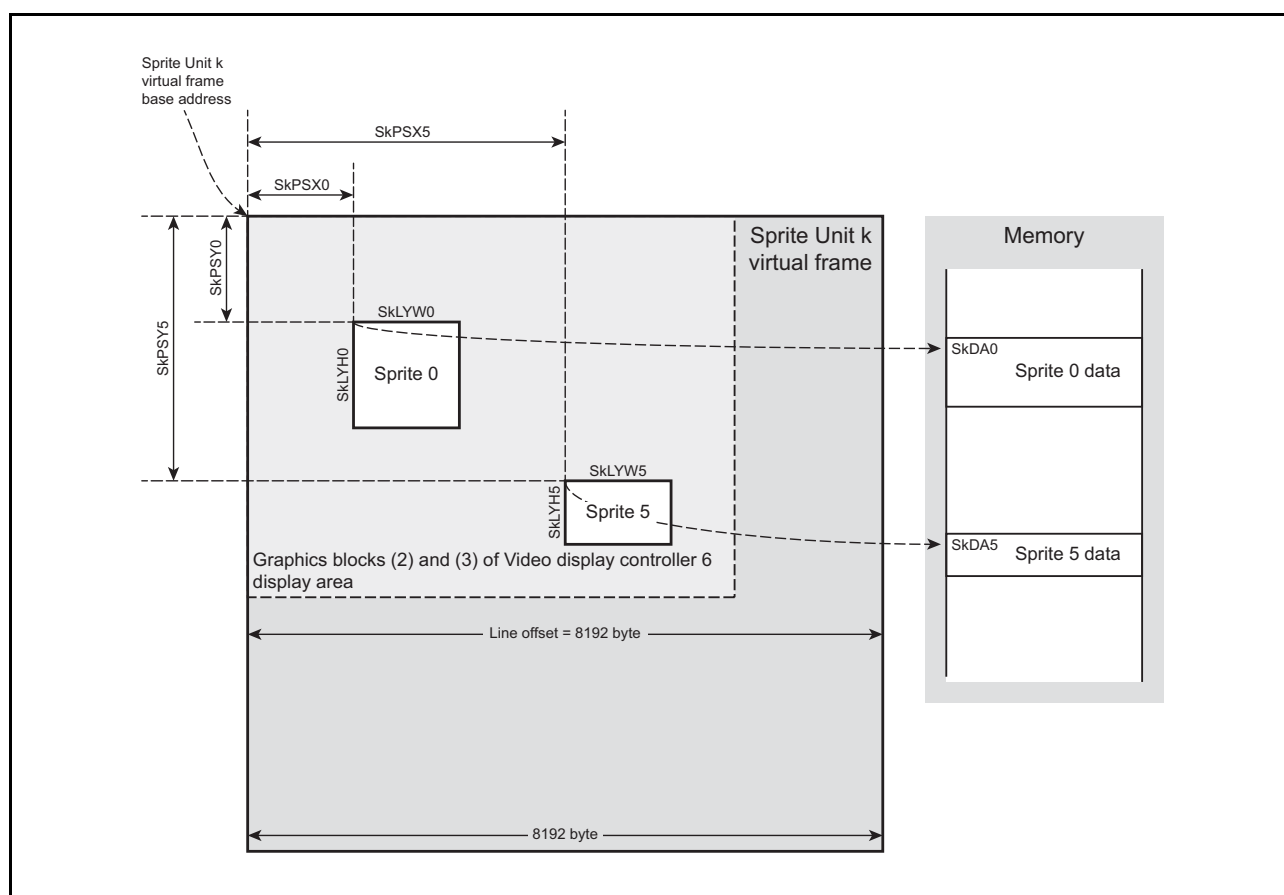

Figure 44.7 Sprite definitions

44.4.5 Overlapping sprites

Sprites can be also placed overlapping.

In such case a fixed priority order rules which sprite data is forwarded to the graphics blocks (2) and (3) of the video display controller 6:

- Sprite $m = 0$: highest priority
- ...
- Sprite $m = 15$: lowest priority

The color data of the sprite with the highest priority is forwarded to the graphics blocks (2) and (3) of the video display controller 6.

44.4.6 Sprite layer areas without active sprites

Areas of the sprite layer without active sprites return color data with value 0.

44.4.7 Sprite definition registers modification

The sprite definition registers are buffered.

While the sprite definition registers are in operation, the buffer registers can be modified without disturbing the video output.

The buffered Sprite Unit k sprite m definition registers are:

- Sprite Unit k enable registers SPEAnSkEN
- Sprite Unit k disable registers SPEAnSkDS
- Destination address registers SPEAnSkDAm
- Width/height registers SPEAnSkLYm
- X/Y position registers SPEAnSkPSm

All sprite definitions of the VUPDATE0 update group are updated simultaneously with the respective VUPDATE0 signal.

When setup of new sprite definitions is completed, the update of all sprite definition registers of Sprite Unit k must be requested via the SPEAnSkUP register:

- SPEAnSkUP.SPEAnSkUP0 = 1: initiates update of all Sprite Unit k sprite definition registers of update group VUPDATE0 with the next VUPDATE0

Caution: All sprite definition buffer registers must not be modified while SPEAnSkUP0 = 1.

44.4.8 Color Data Arrangement

The following diagram shows how color data are passed to the graphics blocks (2) and (3) of the video display controller 6 when a sprite is used.

Figure 44.8 Sprite data arrangement

44.5 Sprite and RLE Units Registers

This section contains a description of all registers of the Sprite and RLE Units.
The Sprite and RLE Units are controlled and operated by the following registers:

Table 44.6 Sprite and RLE Units registers overview

| Register name | Shortcut | Address |
|---|------------|--|
| RLE Units registers | | |
| RLE enable control register | SPEAnRLSL | $\langle \text{SPEAn_base} \rangle + 10_{\text{H}}$ |
| RLE Unit i start address register | SPEAnSTAi | $\langle \text{SPEAn_base} \rangle + 20_{\text{H}} + i \times 10_{\text{H}}$ |
| RLE Unit i physical address register | SPEAnPHAi | $\langle \text{SPEAn_base} \rangle + 24_{\text{H}} + i \times 10_{\text{H}}$ |
| RLE Unit i color mode register | SPEAnRCMi | $\langle \text{SPEAn_base} \rangle + 2C_{\text{H}} + i \times 10_{\text{H}}$ |
| RLE register update request register | SPEAnRUP | $\langle \text{SPEAn_base} \rangle + 40_{\text{H}}$ |
| RLE configuration register | SPEAnRCFG | $\langle \text{SPEAn_base} \rangle + 48_{\text{H}}$ |
| Sprite Unit k registers | | |
| Sprite Unit k enable register | SPEAnSkEN | $\langle \text{SPEAn_base} \rangle + 100_{\text{H}} + k \times 10_{\text{H}}$ |
| Sprite Unit k disable register | SPEAnSkDS | $\langle \text{SPEAn_base} \rangle + 104_{\text{H}} + k \times 10_{\text{H}}$ |
| Sprite Unit k update request register | SPEAnSkUP | $\langle \text{SPEAn_base} \rangle + 108_{\text{H}} + k \times 10_{\text{H}}$ |
| Sprite Unit k sprite m destination address register | SPEAnSkDAm | $\langle \text{SPEAn_base} \rangle + 400_{\text{H}} + k \times 400_{\text{H}} + m \times 20_{\text{H}}$ |
| Sprite Unit k sprite m width/height register | SPEAnSkLYm | $\langle \text{SPEAn_base} \rangle + 408_{\text{H}} + k \times 400_{\text{H}} + m \times 20_{\text{H}}$ |
| Sprite Unit k sprite m X/Y position register | SPEAnSkPSm | $\langle \text{SPEAn_base} \rangle + 40C_{\text{H}} + k \times 400_{\text{H}} + m \times 20_{\text{H}}$ |

$\langle \text{SPEAn_base} \rangle$

The base addresses $\langle \text{SPEAn_base} \rangle$ of the SPEAn is defined in section 44.1.3, Register addresses.

44.5.1 RLE Units registers

44.5.1.1 SPEAnRLSL - RLE Units enable control register

The RLE Units can be enabled and disabled via this register.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 10_H

Initial value: 0000 0000H

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | – | – | – | – | – | – | – | – | – | – | – | – | – | – | – | – |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----------------------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | – | – | – | – | – | – | – | – | – | – | – | – | – | – | – | SPEAn RBUS SEL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 44.7 SPEAnRLSL register contents

| Bit position | Bit name | Function |
|--------------|------------------|--|
| 31 to 1 | – | Reserved bits The write value should always be 0. |
| 0 | SPEAn RBUSSEL | RLE Units enable control 0: RLE Units are disabled (direct layer access) 1: RLE Units are enabled (RLE layer access) |

44.5.1.2 SPEAnSTAi - RLE Unit i start address register

This register defines the virtual frame start address when the graphics block (0) of the video display controller 6 reads via the REL unit i.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 20_H + i x 10_H

Initial value: 0000 0000_H

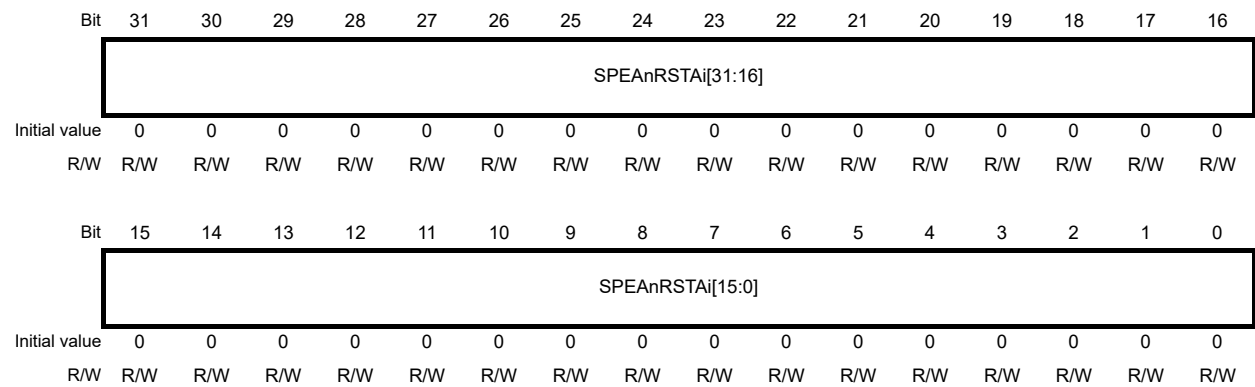

Table 44.8 SPEAnSTAi register contents

| Bit position | Bit name | Function |
|--------------|------------------|---|
| 31 to 0 | SPEAnRSTAi[31:0] | RLE Unit i start address The address must be 128-byte aligned, so the lower 7 bits SPEAnRSTAi[6:0] of the address are always 000 0000 _B . |

44.5.1.3 SPEAnPHAi - RLE Unit i physical address register

This register defines the address of the RLE Unit i first data in the memory.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 24_H + i x 10_H

Initial value: 0000 0000_H

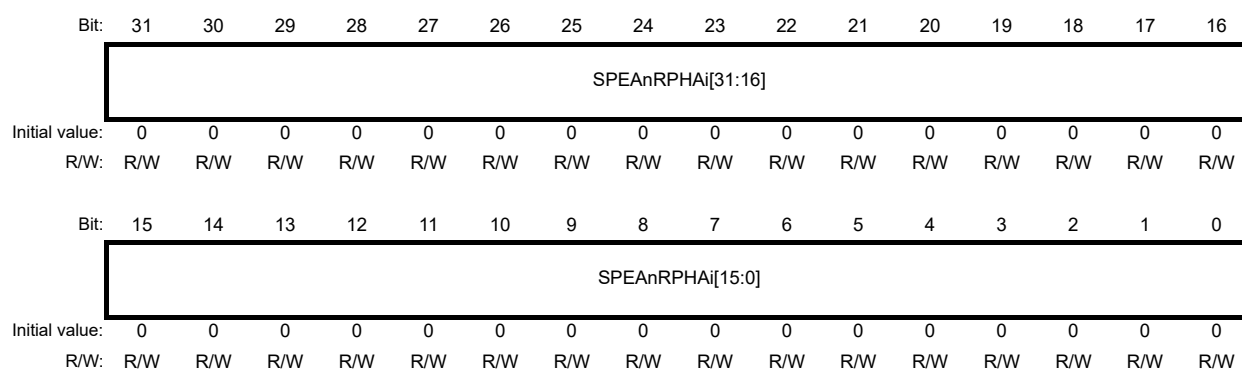

Table 44.9 SPEAnPHAi register contents

| Bit position | Bit name | Function |
|--------------|------------------|--|
| 31 to 0 | SPEAnRPHAi[31:0] | RLE Unit i data memory address The address must be 64-bit aligned, so the lower 3 bits SPEAnRPHAi[2:0] of the address are always 000 _B . |

44.5.1.4 SPEAnRCMi - RLE Unit i color mode selection register

This register selects the color format of data in memory for RLE Unit i.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 2C_H + i x 10_H

Initial value: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

44.5.1.5 SPEAnRUP - RLE registers update request register

This register controls the update of the RLE Unit's registers.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 40_H

Initial value: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 44.11 SPEAnRUP register contents

| Bit position | Bit name | Function |
|--------------|---------------|--|
| 31 to 1 | – | Reserved bits The write value should always be 0. |
| 0 | SPEAn RUP0 | RLE Unit 0 register update request 0: no function 1: update RLE Unit 0 register with the next VUPDATE0 |

Note 1. The update request bit SPEAnRUPi remains set, after it has been set to 1, until the update is completed. Afterwards it returns to 0 automatically.

Note 2. All RLE definition buffer registers must not be modified while SPEAnRUPi = 1.
Refer to section 44.3.5, RLE definition registers modification for details.

44.5.1.6 SPEAnRCFG - RLE prefetch configuration register

This register controls the size and timing for the RLE data stream prefetching

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 48_H

Initial value: 0000 0044_H

| | | | | | | | | | | | | | | | | |

Table 44.12 SPEAnRCFG register contents

| Bit position | Bit name | Function |
|--------------|--------------------|---|
| 31 to 7 | – | Reserved bits The write value should always be 0. |
| 6 to 4 | SPEAn RLEN[2:0] | Burst size of the RLE unit next data prefetching. RLE unit prefetches next data every burst length x 64 bit. 0: Burst length = 1 1: Burst length = 2 2: Burst length = 4 3: Burst length = 6 4: Burst length = 8 (default) 5: Burst length = 10 6: Burst length = 12 7: Burst length = 14 |
| 3 | – | Reserved bit The write value should always be 0. |
| 2 to 0 | SPEAn RDTH[2:0] | Prefetch timing. RLE unit prefetches next data when remaining amount of the data in the RLE FIFO is less than threshold x 64 bit. 0: setting prohibited 1: threshold = 2 2: threshold = 4 3: Burst length = 6 4: threshold = 8 (default) 5: threshold = 10 6: threshold = 12 7: threshold = 14 |

Note: The burst size SPEAnRLEN[2:0] and the prefetch timing SPEAnRDTH[2:0] must be set to values, that prevent the RLE data FIFO from overflow.
The RLE data FIFO size is 1024 bit.

44.5.2 Sprite Units registers

44.5.2.1 SPEAnSkEN - Sprite Unit k enable register

Each sprite of Sprite Unit k can be enabled by this register.

The enabled/disabled status of the sprites on Sprite Unit k can be checked by reading this register.

Disabling a sprite is done via the Sprite Unit k disable register SPEAnSkDS.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 100_H + k x 10_H

Initial value: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

44.5.2.2 SPEAnSkDS - Sprite Unit k disable register

Each sprite of Sprite Unit k can be disabled by this register.

Enabling a sprite is done via the Sprite Unit k enable register SPEAnSkEN.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 104_H + k x 10_H

Initial value: Reading this register returns an undefined value.

| | | | | | | | | | | | | | | | | |

| 31 to 16 | – | Reserved bits The write value should always be 0. |
| 15 to 0 | SPEAnSkDSm | Sprite m disable 0: no function 1: disable sprite m Note that reading of this register returns an undefined value. The enable/disable status of each sprite can be evaluated by reading the Sprite Unit k enable register SPEAnSkEN. |

44.5.2.3 SPEAnSkUP - Sprite Unit k update request register

This register controls the update of the Sprite Unit k registers.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 108_H + k x 10_H

Initial value: 0000 0000_H

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | – | – | – | – | – | – | – | – | – | – | – | – | – | – | – | – |

Table 44.15 SPEAnSkUP register contents

| Bit position | Bit name | Function |
|--------------|------------|--|
| 31 to 1 | – | Reserved bits The write value should always be 0. |
| 0 | SPEAnSkUP0 | Update request of all sprite definition registers of Sprite Unit k, which are assigned to VUPDATE0 0: no function 1: update VUPDATE0 assigned registers with next VUPDATE0 |

Note 1. The update request bit SPEAnSkUP0 remains set, after it has been set to 1, until the update is completed. Afterwards it returns to 0 automatically.

Note 2. All sprite definition buffer registers must not be modified while SPEAnSkUP0 = 1.
Refer to section 44.4.7, Sprite definition registers modification for details.

44.5.2.4 SPEAnSkDAm - Sprite Unit k sprite m destination address register

This register defines the address of the 1st pixel's color data in the memory of the sprite m of the Sprite Unit k.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 400_H + k x 400_H + m x 20_H

Initial value: 0000 0000_H

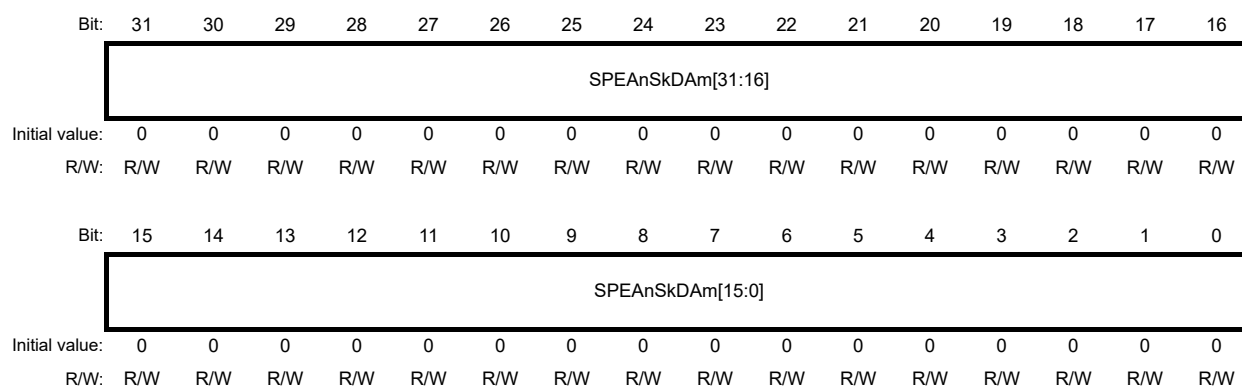

Table 44.16 SPEAnSkDAm register contents

| Bit position | Bit name | Function |
|--------------|------------------|---|
| 31 to 0 | SPEAnSkDAm[31:0] | Sprite Unit k sprite m color data address The address must be 64-bit aligned, so the lower 3 bits SPEAnSkDAm[2:0] of the address are always 000 _B . |

44.5.2.5 SPEAnSkLYm - Sprite Unit k sprite m width/height register

This register defines the width and height of the Sprite Unit k sprite m.

Access: This register can be accessed in 32-bit units.

Address: <SPEAn_base> + 408_H + k x 400_H + m x 20_H

Initial value: 0000 0000_H

| | | | | | | | | | | | | | | | | |

Table 44.18 SPEAnSkPSm register contents

| Bit position | Bit name | Function |
|--------------|-----------------------|--|
| 31 to 27 | – | Reserved bits The write value should always be 0. |
| 26 to 17 | SPEAn SkPSXm[9:0] | Sprite Unit k sprite m X position The X position is defined as multiple of 64 bit and thus depends on the sprite color format. <ul style="list-style-type: none"> 32 bpp color formats: 64 bit / 32 = 2 pixel units <ul style="list-style-type: none"> possible X positions at a multiple of 2 = 0, 2, 4, 6, 8, ... SPEAnSkPSX[9:0] = X position in pixel / 2 |
| 16 to 13 | – | Reserved bits The write value should always be 0. |
| 12 to 0 | SPEAn SkPSYm[12:0] | Sprite Unit k sprite m Y position in pixels |

45. JPEG Codec Unit

The JPEG codec unit (JCU) incorporates a JPEG codec conforming to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data.

45.1 Features

The JPEG codec unit has the following features:

- Conforms to the JPEG baseline standard within the range described in this document.
This module does not support the following basic features:
Scanning with two elements
Non-interleave scanning with multiple elements
- Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2
- Image input/output system: Block interleave method
Pixel format:
Compression: YCbCr422 (H = 2:1:1, V = 1:1:1)
Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1),
YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1)
Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565
- Four quantization tables provided
- Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)
- Markers supported: SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
- Image data rate: Max. 132 Mbytes/s (at 66-MHz operation)
- The buffer size can be reduced by using the mode in which data transfer is temporarily stopped each time the specified number of lines or the specified amount of data is transferred during image data or coded data input/output.
- Processing unit: 8-byte address boundary units can be set
- Image sizes that can be processed: Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444; 8 lines by 16 pixels in YCbCr422; 8 lines by 32 pixels in YCbCr411; 16 lines by 16 pixels in YCbCr420

Note: Compression and decompression processing of images in unsupported pixel formats or unsupported image sizes should be avoided.

Figure 45.1 shows a block diagram.

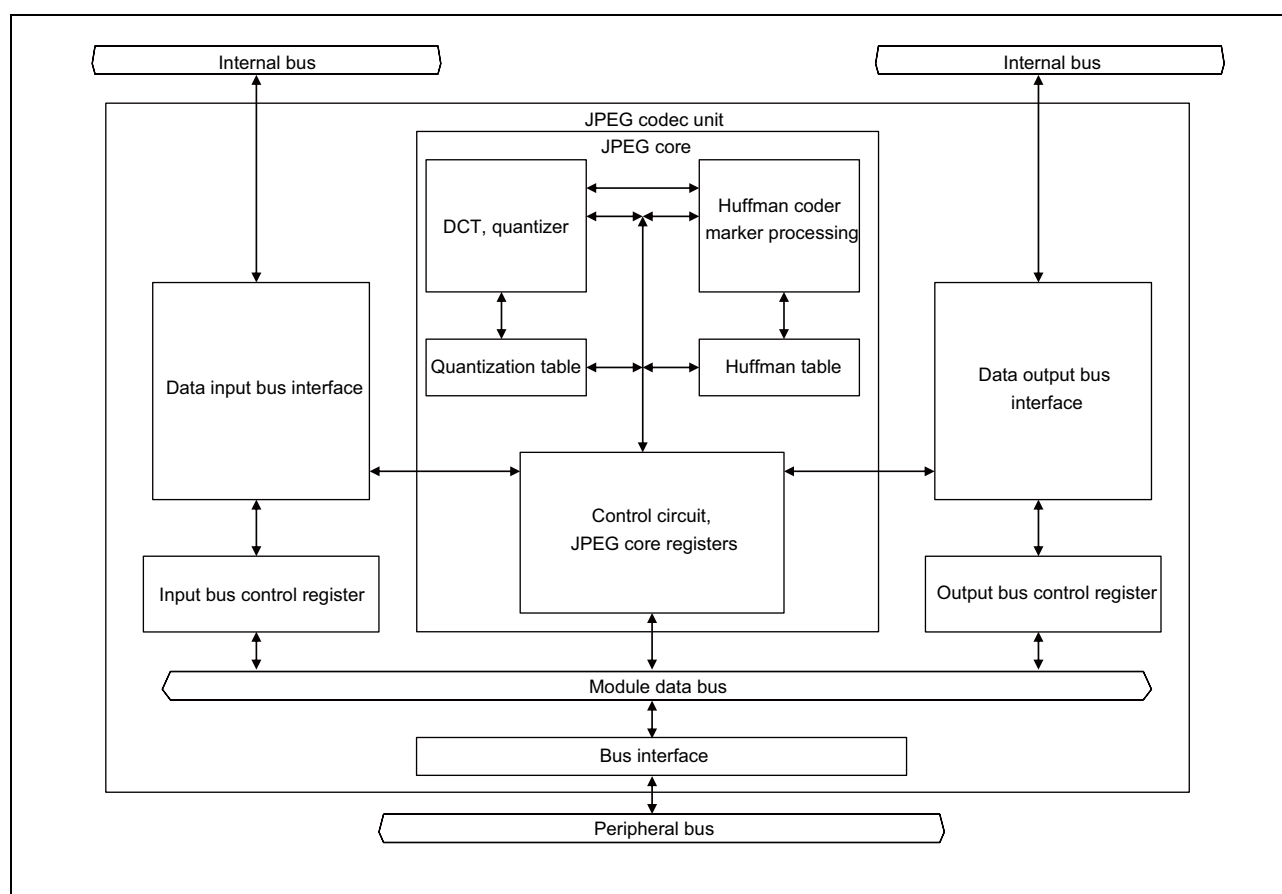

Figure 45.1 Block Diagram

45.2 Register Descriptions

Table 45.1 shows the JCU registers.

Table 45.1 Register Configuration

| Register Name | Abbreviation | R/W | Address | Access Size |
|--|--------------|-----|-------------------------------|-------------|
| JPEG code mode register | JCMOD | R/W | H'E801 7000 | 8 |

| JPEG code Huffman table DC1 register | JCHTBD1 | W | H'E801 7300 to H'E801 731B | 8 |
| JPEG code Huffman table AC1 register | JCHTBA1 | W | H'E801 7320 to H'E801 73D1 | 8 |

Note: For the settings of the JPEG code quantization table and JPEG code Huffman table, see section 45.3.1 (4), Table Setting.

45.2.1 JPEG Code Mode Register (JCMOD)

JCMOD sets the operating mode before the JCU starts operation.

| | | | | | | | | |
|----------------------|---|---|---|---|-----|-----------|-----|-----|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | DSP | REDU[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R | R | R | R/W | R/W | R/W | R/W |
| R/W(De-compression): | R | R | R | R | R/W | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 4 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | DSP | 0 | R/W | | Compression/Decompression Set 0: Compression process 1: Decompression process When changing between processing for compression and for decompression, be sure to reset this module in advance by setting the SRST11 bit in the software reset control register 1 (SWRSTCR1) of the power-down modes. |
| 2 to 0 | REDU[2:0] | 000 | R/W | R | Pixel Format [Compression] 001: YCbCr422 Other than above: Setting prohibited. [Decompression] 000: YCbCr444 001: YCbCr422 110: YCbCr411 010: YCbCr420 Other than above: Error (JCU cannot process normally.) |

45.2.2 JPEG Code Command Register (JCCMD)

JCCMD sets commands. Bits of this register need not be cleared to 0 after setting a command.

Multiple commands must not be set simultaneously.

| | | | | | | | | |
|----------------------|------|---|---|---|---|------|---------|------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | BRST | — | — | — | — | JEND | JRST | JSRT |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R*/W | R | R | R | R | R*/W | Invalid | R*/W |
| R/W(De-compression): | R*/W | R | R | R | R | R*/W | R*/W | R*/W |

Note: *Values read from these bits are undefined.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 | BRST | 0 | R*/W | | Bus Reset Setting this bit to 1 resets the internal circuits. While the JCU is in operation (from setting the JPEG core process start command to writing the last output coded/image data), do not set this bit to 1. For the bus reset processing, see section 45.5, Bus Reset Processing. |
| 6 to 3 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 | JEND | 0 | R*/W | | Interrupt Request Clear Command This bit is valid only for the interrupt sources corresponding to bits INS6, INS5, and INS3 in JINTS0. To clear an interrupt request, set this bit to 1. |
| 1 | JRST | 0 | Invalid | R*/W | JPEG Core Process Stop Clear Command To clear the process-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0), set this bit to 1. |
| 0 | JSRT | 0 | R*/W | | JPEG Core Process Start Command To start JPEG core processing, set this bit to 1. Do not write this bit to 1 again while the JCU is in operation. |

Note: * Values read from these bits are undefined.

45.2.3 JPEG Code Quantization Table Number Register (JCQTN)

JCQTN sets the quantization table number before compression process is started.

- To use quantization table No. 0 (JCQTBL0) as the first color component, set QT1 to B'00
- To use quantization table No. 1 (JCQTBL1) as the first color component, set QT1 to B'01
- To use quantization table No. 2 (JCQTBL2) as the first color component, set QT1 to B'10
- To use quantization table No. 3 (JCQTBL3) as the first color component, set QT1 to B'11

| | | | | | | | | |
|----------------------|---|---|----------|----------|----------|-----|-----|-----|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | QT3[1:0] | QT2[1:0] | QT1[1:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R | R/W | R/W | R/W | R/W | R/W | R/W |
| R/W(De-compression): | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|------|----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 7, 6 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 5, 4 | QT3[1:0] | 00 | R/W | R | Quantization table number for the third color component |
| 3, 2 | QT2[1:0] | 00 | R/W | R | Quantization table number for the second color component |
| 1, 0 | QT1[1:0] | 00 | R/W | R | Quantization table number for the first color component |

45.2.4 JPEG Code Huffman Table Number Register (JCHTN)

JCHTN sets the Huffman table number (AC/DC) before compression process is started.

- To use DC/AC Huffman table No. 0 (JCHTBD0 and JCHTBA0) as the first color component, set bits HTA1 and HTD1 to B'0
- To use DC/AC Huffman table No. 1 (JCHTBD1 and JCHTBA1) as the first color component, set bits HTA1 and HTD1 to B'1

| | | | | | | | | |
|----------------------|---|---|------|------|------|------|------|------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | HTA3 | HTD3 | HTA2 | HTD2 | HTA1 | HTD1 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R | R/W | R/W | R/W | R/W | R/W | R/W |
| R/W(De-compression): | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|------|----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 7, 6 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 5 | HTA3 | 0 | R/W | R | Huffman table number (AC) for the third color component |
| 4 | HTD3 | 0 | R/W | R | Huffman table number (DC) for the third color component |
| 3 | HTA2 | 0 | R/W | R | Huffman table number (AC) for the second color component |
| 2 | HTD2 | 0 | R/W | R | Huffman table number (DC) for the second color component |
| 1 | HTA1 | 0 | R/W | R | Huffman table number (AC) for the first color component |
| 0 | HTD1 | 0 | R/W | R | Huffman table number (DC) for the first color component |

45.2.5 JPEG Code DRI Upper Register (JCDRIU)

JCDRIU sets the upper bytes of the minimum coded units (MCUs) preceding an RST marker.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 0 | DRIU[7:0] | H'00 | R/W | Invalid | Upper Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed. |

45.2.6 JPEG Code DRI Lower Register (JCDRID)

JCDRID sets the lower bytes of MCUs preceding an RST marker.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 0 | DRID[7:0] | H'00 | R/W | Invalid | Lower Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed. |

45.2.7 JPEG Code Vertical Size Upper Register (JCVSZU)

JCVSZU sets the upper bytes of the vertical image size.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 0 | VSZU[7:0] | H'00 | R/W | R | Upper Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set. |

45.2.8 JPEG Code Vertical Size Lower Register (JCVSZD)

JCVSZD sets the lower bytes of the vertical image size.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 0 | VSZD[7:0] | H'00 | R/W | R | Lower Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set. |

45.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

JCHSZU sets the upper bytes of the horizontal image size.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 0 | HSZU[7:0] | H'00 | R/W | R | Upper Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set. |

45.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

JCHSZD sets the lower bytes of the horizontal image size.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 0 | HSZD[7:0] | H'00 | R/W | R | Lower Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set. |

45.2.11 JPEG Code Data Count Upper Register (JCDTCU)

The upper bytes for the counted amount of data to be compressed are set to JCDTCU. The values of this register are reset before compression starts.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 7 to 0 | DCU[7:0] | H'00 | R | Invalid | Upper bytes of the counted amount of data to be compressed |

45.2.12 JPEG Code Data Count Middle Register (JCDTCM)

The middle bytes for the counted amount of data to be compressed are set to JCDTCM. The values of this register are reset before compression starts.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|---------------|---|
| | | | Compression | DeCompression | |
| 7 to 0 | DCM[7:0] | H'00 | R | Invalid | Middle bytes of the counted amount of data to be compressed |

45.2.13 JPEG Code Data Count Lower Register (JCDTCD)

The lower bytes for the counted amount of data to be compressed are set to JCDTCD. The values of this register are reset before compression starts.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 7 to 0 | DCD[7:0] | H'00 | R | Invalid | Lower bytes of the counted amount of data to be compressed |

45.2.14 JPEG Interrupt Enable Register 0 (JINTE0)

JINTE0 enables interrupts.

When any of bits INT7 to INT5 is set to B'1, the INS5 bit in JINTS0 indicates B'1 as the error status upon occurrence of the compression data error, and the ERR bit in JCDERR indicates the particular error code.

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 | INT7 | 0 | Invalid | R/W | This bit enables an interrupt to be generated when the number of data in the restart interval of the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned. |
| 6 | INT6 | 0 | Invalid | R/W | This bit enables an interrupt to be generated when the total number of data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned. |
| 5 | INT5 | 0 | Invalid | R/W | This bit enables an interrupt to be generated when the final number of MCU data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned. |
| 4 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 3 | INT3 | 0 | Invalid | R/W | This bit enables an interrupt to be generated when it has been determined that the image size and the subsampling setting of the compressed data can be read through analyzing the data. |
| 2 to 0 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |

45.2.15 JPEG Interrupt Status Register 0 (JINTS0)

JINTS0 identifies the interrupt sources.

The interrupt sources of this register should be cleared by clearing the corresponding interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.

| | | | | | | | | |
|----------------------|---|------|---------|---|---------|---|---|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | INS6 | INS5 | — | INS3 | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R/W* | Invalid | R | Invalid | R | R | R |
| R/W(De-compression): | R | R/W* | R/W* | R | R/W* | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 7 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | INS6 | 0 | R/W* | | This bit is set to 1 when the JCU completes compression process normally. |
| 5 | INS5 | 0 | Invalid | R/W* | This bit is set to 1 when a compressed data error occurs. |
| 4 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 3 | INS3 | 0 | Invalid | R/W* | This bit is set to 1 when the image size and pixel format can be read. When an interrupt occurs, this module stops processing and the state is indicated by the JCRST register. To make the JCU resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD. |
| 2 to 0 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |

Note: * Clear this bit by writing 0 to it. Do not write 1 to this bit.

45.2.16 JPEG Code Decode Error Register (JCDERR)

JCDERR indicates the error code to identify the type of the error which has occurred in the compressed data analysis for decompression. The values of this register are reset before the JCU starts decompression.

| | | | | | | | | |
|----------------------|---|---|---|---|----------|---------|---------|---------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | ERR[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R | R | R | Invalid | Invalid | Invalid | Invalid |
| R/W(De-compression): | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 7 to 4 | — | All 0 | R | | Reserved These bits are always read as 0. |
| 3 to 0 | ERR[3:0] | 1010 | Invalid | R/W | Error Code (See Table 45.3 and Table 45.4) |

45.2.17 JPEG Code Reset Register (JCRST)

JCRST indicates a processing-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0). To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.

| | | | | | | | | | |
|----------------------|--|---|---|---|---|---|---|---|---------|
| Bit: | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | — | — | — | — | — | — | — | RST |
| Initial value: | | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | | R | R | R | R | R | R | R | Invalid |
| R/W(De-compression): | | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 7 to 1 | — | All 0 | R | | Reserved These bits are always read as 0. |
| 0 | RST | 0 | Invalid | R/W | Operating State 0: State other than below 1: Suspended state caused by interrupt sources of JINTE0 |

45.2.18 JPEG Interface Compression Control Register (JIFECNT)

JIFECNT controls the compression process.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| R/W(De-compression): | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------------|----|----------|----------|---------|----|---------------|---------|---------|---------|---------|---------|---------|----|--------------|---------|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | JOUTRINI | JOUTRCMD | JOUTC | — | JOUTSWAP[2:0] | — | — | DINRINI | DINRCMD | DINLC | — | — | DINSWAP[2:0] | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |
| R/W(De-compression): | R | Invalid | Invalid | Invalid | R | Invalid | Invalid | Invalid | R | Invalid | Invalid | Invalid | R | Invalid | Invalid | Invalid |

| R/W | | | | | Description |
|----------|---------------|---------------|-------------|----------------|---|
| Bit | Bit Name | Initial Value | Compression | De-compression | |
| 31 to 15 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 14 | JOUTRINI | 0 | R/W | Invalid | Address Initialization when Output Coded Data is Resumed This bit is only valid when the count mode for stopping the output of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the output of coded data is restarted. 1: The transfer address is initialized when the output of coded data is restarted. |
| 13 | JOUTRCMD | 0 | R/W | Invalid | Output Coded Data Resume Command This bit is only valid when the count mode for stopping the output of coded data is on. Setting this bit to 1 resumes writing output coded data. This bit is always read as 0. |
| 12 | JOUTC | 0 | R/W | Invalid | Count Mode Setting for Stopping Output Coded Data 0: Count mode for stopping the output of coded data is off. 1: Count mode for stopping the output of coded data is on. |
| 11 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 10 to 8 | JOUTSWAP[2:0] | 000 | R/W | Invalid | Byte/Word/Longword Swap Output coded data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap] |
| 7 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | | Description |
|--------|------------------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 6 | DINRINI | 0 | R/W | Invalid | Address Initialization when Resuming Input of Image Data Lines This bit is only valid when the count mode for stopping the input of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the input of image data lines is restarted. 1: The transfer address is initialized when the input of image data lines is restarted. |
| 5 | DINRCMD | 0 | R/W | Invalid | Input Image Data Lines Resume Command This bit is valid only when the count mode for stopping the input of image data lines is on. Setting this bit to 1 resumes reading input image data. This bit is always read as 0. |
| 4 | DINLC | 0 | R/W | Invalid | Count Mode Setting for Stopping Input Image Data Lines 0: Count mode for stopping the input of image data lines is off. 1: Count mode for stopping the input of image data lines is on. |
| 3 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | DINSWAP [2:0] | 000 | R/W | Invalid | Byte/Word Swap Input image data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap] |

45.2.19 JPEG Interface Compression Source Address Register (JIFESA)

JIFESA sets the source address of the input image data. This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | ESA[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| R/W(De-compression): | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |

| | | | | | | | | | | | | | | | | |
|----------------------|-----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ESA[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R |
| R/W(De-compression): | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |

| Bit | Bit Name | Initial Value | R/W | | Description |
|---------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 31 to 3 | ESA[31:3] | H'0000 | R/W | Invalid | Input Image Data Source Address (in 8-byte units) |
| 2 to 0 | ESA[2:0] | 0000 | R | | The lower three bits should be set to 0. |

45.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

JIFESOFST sets the line offset of the input image data (refer to section 45.3.4, Storing Image Data). This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------------|----|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | ESMW[14:0] | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R |
| R/W(De-compression): | R | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |

| Bit | Bit Name | Initial Value | R/W | | Description |
|----------|------------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 31 to 15 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 14 to 3 | ESMW[14:3] | H'0000 | R/W | Invalid | Input Image Data Lines Offset (in 8-byte units) |
| 2 to 0 | ESMW[2:0] | | R | | The lower three bits should be set to 0. |

45.2.21 JPEG Interface Compression Destination Address Register (JIFEDA)

JIFEDA sets the destination address of the output coded data. This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | EDA[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| R/W(De-compression): | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |

| | | | | | | | | | | | | | | | | |
|----------------------|-----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | EDA[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R |
| R/W(De-compression): | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |

| Bit | Bit Name | Initial Value | R/W | | Description |
|---------|-----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 31 to 3 | EDA[31:3] | H'0000 | R/W | Invalid | Output Coded Data Destination Address (in 8-byte units) |
| 2 to 0 | EDA[2:0] | 0000 | R | | The lower three bits should be set to 0. |

45.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

JIFESLC sets the number of input image data lines when the count mode for stopping the input of image data lines is on (the DINLC bit in JIFECNT is set to 1). This register should be set in 8-line units.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |

| | | | Compression | De-compression | |
| 31 to 16 | — | H'FFF8 | R | | Reserved Values read from these bits are undefined. The write value should always be 0. |
| 15 to 3 | LINES[15:3] | H'FFF8 | R/W | Invalid | Number of Input Image Data Lines to be Read (in 8-line units) |
| 2 to 0 | LINES[2:0] | | R | | The lower three bits should be set to 0. |

45.2.23 JPEG Interface Compression Destination Count Register (JIFEDDC)

JIFEDDC sets the amount of output coded data when the count mode for stopping the output of coded data is on (the JOUTC bit in JIFECNT is set to 1). This register should be set in 8-byte units.

|----------|-------------|---------------|-------------|---|
| Bit | Bit Name | Initial Value | Compression | |
| 31, 30 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 29, 28 | VINTER[1:0] | 00 | Invalid | R/W Vertical Subsampling Subsamples vertical output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8. |
| 27, 26 | HINTER[1:0] | 00 | Invalid | R/W Horizontal Subsampling Subsamples horizontal output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8. |
| 25, 24 | OPF[1:0] | 00 | Invalid | R/W Specifies output image data pixel format. 00: YCbCr422 01: ARGB8888 10: RGB565 11: Setting prohibited |
| 23 to 15 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 14 | JINRINI | 0 | Invalid | R/W Address Initialization when Input Coded Data is Resumed This bit is only valid when the count mode for stopping the input of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the input of coded data is restarted. 1: The transfer address is initialized when the input of coded data is restarted. |
| 13 | JINRCMD | 0 | Invalid | R/W Input Coded Data Resume Command This bit is valid only when the count mode for stopping the input of coded data is on. Setting this bit to 1 resumes reading input coded data. This bit is always read as 0. |
| 12 | JINC | 0 | Invalid | R/W Count Mode Setting for Stopping Input Coded Data 0: Count mode for stopping the input of coded data is off. 1: Count mode for stopping the input of coded data is on. |
| 11 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | | Description |
|---------|-------------------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 10 to 8 | JINSWAP [2:0] | 000 | Invalid | R/W | Byte/Word/Longword Swap Input coded data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap] |
| 7 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | DOUINTRINI | 0 | Invalid | R/W | Address Initialization when Resuming Output of Image Data Lines This bit is only valid when the count mode for stopping the output of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the output of lines of image data is restarted. 1: The transfer address is initialized when the output of lines of image data is restarted. |
| 5 | DOUTRCMD | 0 | Invalid | R/W | Output Image Data Lines Resume Command This bit is valid only when the count mode for stopping the output of image data lines is on. Setting this bit to 1 resumes writing image data. This bit is always read as 0. |
| 4 | DOUCLC | 0 | Invalid | R/W | Count Mode for Stopping Output Image Data Lines 0: Count mode for stopping the output of image data lines is off. 1: Count mode for stopping the output of image data lines is on. |
| 3 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 to 0 | DOUWSWAP [2:0] | 000 | Invalid | R/W | Byte/Word Swap Output image data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap] |

45.2.25 JPEG Interface Decompression Source Address Register (JIFDSA)

JIFDSA sets the source address of the input coded data. This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| The lower three bits should be set to 0. | | | | |

45.2.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST)

JIFDDOFST sets the line offset of the output image data to be transferred to the external buffer (refer to section 45.3.4, Storing Image Data). This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| | | R/W | | Description |
|--|------------|---------------|-------------|-------------|
| Bit | Bit Name | Initial Value | Compression | |
| 31 to 15 | — | All 0 | R | Reserved |
| These bits are always read as 0. The write value should always be 0. | | | | |
| 14 to 3 | DDMW[14:3] | H'0000 | Invalid | R/W |
| 2 to 0 | DDMW[2:0] | | | R |
| The lower three bits should be set to 0. | | | | |

45.2.27 JPEG Interface Decompression Destination Address Register (JIFDDA)

JIFDDA sets the destination address of the output image data. This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | DDA[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | DDA[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |
| R/W(De-compression): | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R |

| R/W | | | | | Description |
|---------|-----------|---------------|-------------|----------------|---|
| Bit | Bit Name | Initial Value | Compression | De-compression | |
| 31 to 3 | DDA[31:3] | H'0000 | Invalid | R/W | Output Image Data Destination Address (in 8-byte units) |
| 2 to 0 | DDA[2:0] | 0000 | | R | The lower three bits should be set to 0. |

45.2.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

JIFDSDC sets the amount of input coded data when the count mode for stopping the input of coded data is on (the JINC bit in JIFDCNT is set to 1). This register should be set in 8-byte units.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | | | | | Description |
|----------|--------------|---------------|-------------|----------------|--|
| Bit | Bit Name | Initial Value | Compression | De-compression | |
| 31 to 16 | — | H'FFF8 | R | | Reserved Values read from these bits are undefined. The write value should always be 0. |
| 15 to 3 | JDATAS[15:3] | H'FFF8 | Invalid | R/W | Amount of Input Coded Data to be Read (in 8-byte units). |
| 2 to 0 | JDATAS[2:0] | | | R | The lower three bits should be set to 0. |

45.2.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLCL)

JIFDDLCL sets the number of lines of output image data when the count mode for stopping the output of image data lines is on (the DOUTLCL bit in JIFECNT is set to 1). This register is used to set the number of lines of output image data in MCU units.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W(Compression): | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid | Invalid |
| R/W(De-compression): | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|----------|-------------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 31 to 16 | — | H'FFF8 | R | | Reserved Values read from these bits are undefined. The write value should always be 0. |
| 15 to 3 | LINES[15:3] | H'FFF8 | Invalid | R/W | Specify the number of lines of output image data to be written. The setting is in MCU units. When data are to be output in YCbCr444, YCbCr422 or YCbCr411 format, the number of lines of output image data is <this setting> x 1. When data are to be output in YCbCr420 format, the number of lines of output image data is <this setting> x 2. The lower three bits should be set to 0. |
| 2 to 0 | LINES[2:0] | | | R | |

45.2.30 JPEG Interface Decompression α Set Register (JIFDADT)

JIFDADT is used to set the α value when output is in ARGB8888 format.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W(De-compression): | R | R | R | R | R | R | R | R | R | Invalid | Invalid | Invalid | R | R/W* | R/W* | R/W* |

| Bit | Bit Name | Initial Value | R/W | | Description |
|---------|-----------|---------------|-------------|----------------|--|
| | | | Compression | De-compression | |
| 31 to 7 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 6 | CBTF | 0 | R/W* | Invalid | This bit is set to 1 when the last output coded data is written in compression. |
| 5 | DINLF | 0 | R/W* | Invalid | This bit is set to 1 when the number of input image data lines indicated by JIFESLC is read in compression. This bit is valid only when the DINLC bit in JIFECNT is set to 1. |
| 4 | JOUTF | 0 | R/W* | Invalid | This bit is set to 1 when the amount of output coded data indicated by JIFEDDC is written in compression. This bit is valid only when the JOUTC bit in JIFECNT is set to 1. |
| 3 | — | 0 | R | | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 | DBTF | 0 | Invalid | R/W* | This bit is set to 1 when the last output image data is written in decompression. |
| 1 | JINF | 0 | Invalid | R/W* | This bit is set to 1 when the amount of input coded data indicated by JIFDSDC is read in decompression. This bit is valid only when the JINC bit in JIFDCNT is set to 1. |
| 0 | DOU LF | 0 | Invalid | R/W* | In decompression, this bit is set to 1 when the number of lines of output image data indicated by JIFDDLC have been written. This bit is only valid when the DOU TLC bit in JIFDCNT is set to 1. |

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

45.2.33 JPEG Input Image Data CbCr Range Setting Register (JIFESVSZ)

JIFESVSZ sets the CbCr range of input image data.

| | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|----------------------|--------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | DOUTY CHG | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W(Compression): | Invalid | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| R/W(De-compression): | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | | Description |
|----------|----------|---------------|-------------|----------------|---|
| | | | Compression | De-compression | |
| 31 to 16 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 | DOUTYCHG | 0 | Invalid | R/W | Output Image Data CbCr Range Setting 0: Range from -128 to 127 1: Range from 0 to 255 |
| 14 to 0 | — | All 0 | R | | Reserved These bits are always read as 0. The write value should always be 0. |

45.3 Operation

45.3.1 Compression

(1) Overview of Processing

The compression process flows are described below.

1. The JPEG core is activated.
A marker is output. (After a marker is output, image data can be input.)
Approximately 30,000 cycles (necessary for making SOI to SOS markers)
2. Image data is transferred in MCUs from the external buffer to the JCU.
If the count mode for stopping the input of image data lines is on, reading is stopped each time the number of lines set in JIFESLC is read. Reading is resumed by setting the DINRCMD bit in JIFECNT to 1.
When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
When the DINRINI bit is one, the address set in JIFESA is used on resumption.
Reading is also stopped when one frame of image data is completely transferred.
If the count mode for stopping the input of image data lines is off, reading is continued until one frame of image data is completely transferred.
3. Image data is input to the JPEG core.
The input data is processed in MCUs at any time in the JPEG core.
4. Coded data is transferred from the JCU to the external buffer.
When the count mode for stopping the output of coded data is on, writing is stopped each time the amount of coded data set in JIFEDDC is written. Writing is resumed by setting the JOUTRCMD bit in JIFECNT to 1.
When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.
Writing is also stopped when one frame of coded data is completely transferred.
If the count mode for stopping the output of coded data is off, writing is continued until one frame of coded data is completely transferred.
5. Compression is completed after one frame of data is processed completely.

(2) Flowchart (Compression)

(a) Initial Settings

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1. After the JCU has been activated, the JPEG markers (SOI to SOS) are generated and output. It takes approximately 30,000 cycles to generate the markers.

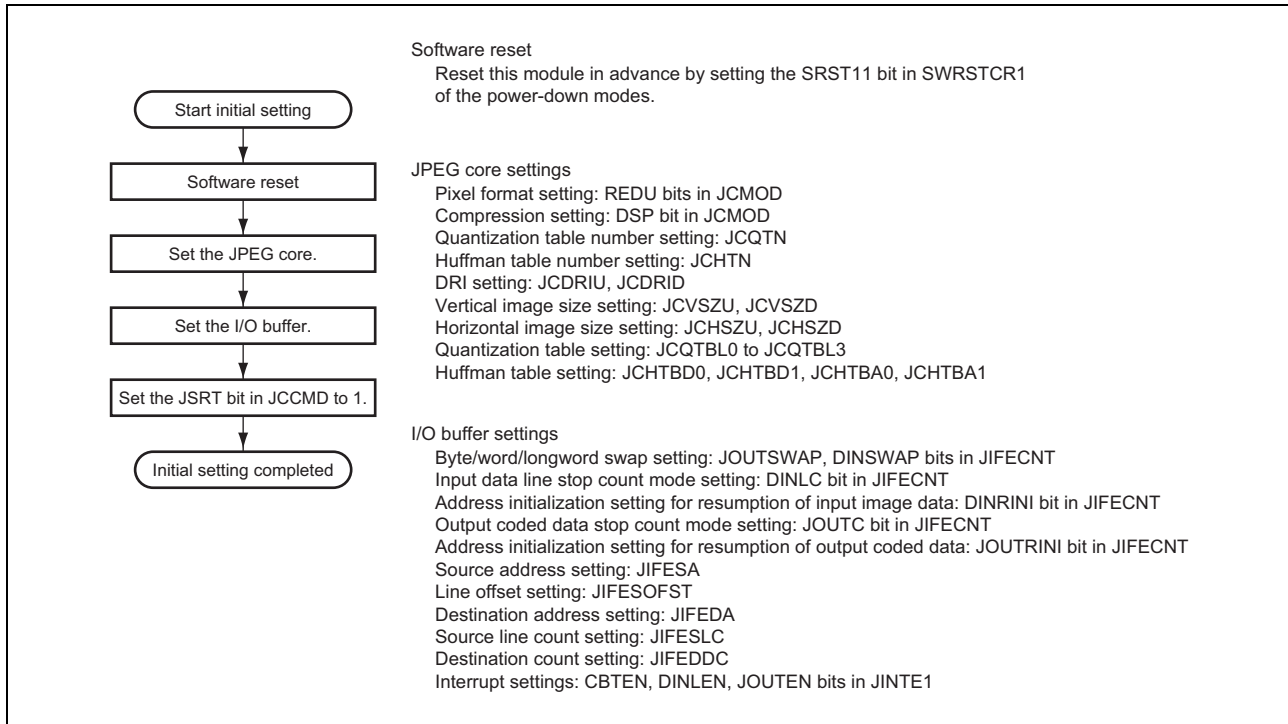

Figure 45.2 Compression Initial Setting Flow

(b) Compression Process

The compression process flows are described below.

- When JPEG compression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the coded data remains to be transferred. The CBTF bit in JINTS1 is set to 1 when the last coded data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed compression and all coded data has been transferred, the CBTF flag in JINTS1 is set to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the CBTF flag.
- If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC has been read, the DINLF flag in JINTS1 is set to 1, and reading is stopped. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading.
When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
When the DINRINI bit is one, the address set in JIFESA is used on resumption.

- If the count mode for stopping the output of coded data is on, when the specified amount of coded data set in JIFEDDC has been written, the JOUTF flag in JINTS1 is set to 1, and writing is stopped. When the JOUTEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JOUTF bit. Setting the JOUTRCMD bit in JIFECNT to 1 resumes writing.

When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

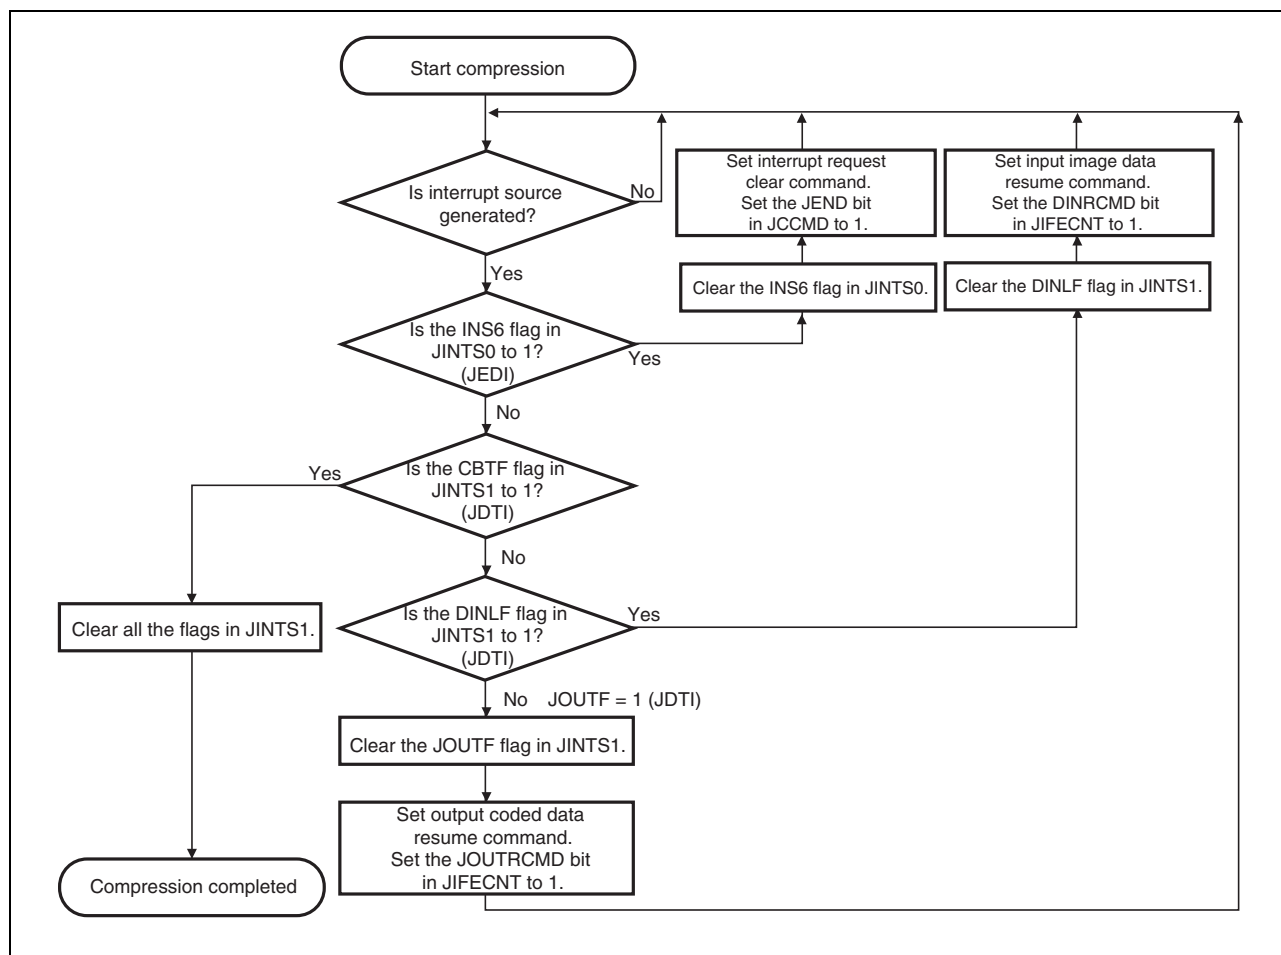

Figure 45.3 Compression Process Flow

(3) JPEG Coded Data Format

Figure 45.4 shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated by JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to H'0000 0000, the following markers are not output.

- DRI marker
- RST marker (in compressed image data)

Figure 45.4 JPEG Coded Data Format

DQT: Not output for unused table.

DHT: Output in order DC0, AC0, DC1, and AC1. Not output for unused table.

SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component.

SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header Volume (Reference):

- SOI: 2 bytes (FFD8)
- DQT: 134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (± 65 bytes/table increase or decrease)
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT: 420 bytes (two tables are used)
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9)

(4) Table Setting

(a) Quantization Table Specification

The order of addresses shown in 8×8 blocks corresponds to that of the register addresses. Do not access this table while the JCU is in processing.

Table 45.2 Quantization Table

| | | | | | | | |
|----|----|----|----|----|----|----|----|
| 00 | 01 | 02 | 03 | 04 | 05 | 06 | 07 |
| 08 | 09 | 0A | 0B | 0C | 0D | 0E | 0F |
| 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 |
| 18 | 19 | 1A | 1B | 1C | 1D | 1E | 1F |
| 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 |

| 38 | 39 | 3A | 3B | 3C | 3D | 3E | 3F |

JCQTBL0 (H'E801 7100) = H'00

JCQTBL0 (H'E801 7101) = H'01

JCQTBL0 (H'E801 7102) = H'02

JCQTBL0 (H'E801 7103) = H'03

:

JCQTBL0 (H'E801 713F) = H'3F

(b) Huffman Table Specification

Examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG are shown below. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

- DC Huffman table: The number of codes for each code length is 12.
The group numbers in order of frequency of occurrence are 12.
- AC Huffman table: The number of codes for each code length is 162.
The zero run length/the group numbers in order of frequency of occurrence are 162.

Do not access the following tables while the JCU is in processing. In particular, read access is prohibited.

- Table K.3/T81
JCHTBD0 (H'E801 7200) = H'00
JCHTBD0 (H'E801 7201) = H'01
JCHTBD0 (H'E801 7202) = H'05
JCHTBD0 (H'E801 7203) = H'01
:
JCHTBD0 (H'E801 721B) = H'0B
- Table K.4/T81
JCHTBD1 (H'E801 7300) = H'00
JCHTBD1 (H'E801 7301) = H'03
JCHTBD1 (H'E801 7302) = H'01
JCHTBD1 (H'E801 7303) = H'01
:
JCHTBD1 (H'E801 731B) = H'0B

- Table K.5/T81

JCHTBA0 (H'E801 7220) = H'00

JCHTBA0 (H'E801 7221) = H'02

JCHTBA0 (H'E801 7222) = H'01

JCHTBA0 (H'E801 72D1) = H'FA

- Table K.6/T81

JCHTBA1 (H'E801 7320) = H'00

JCHTBA1 (H'E801 7321) = H'02

JCHTBA1 (H'E801 7322) = H'01

JCHTBA1 (H'E801 7323) = H'02

:

JCHTBA1 (H'E801 73D1) = H'FA

(5) Input Pixel Format

Image data in the YCbCr422 format can be input to this module. Allocation of data in the YCbCr422 format can be changed by the DINSWAP bits in JIFECNT as shown below.

- When the DINSWAP bits = 000

| | | | | | | | | | | | | | | | |
|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Y0 8 bits | Cb0 8 bits | Y1 8 bits | Cr0 8 bits | Y2 8 bits | Cb1 8 bits | Y3 8 bits | Cr1 8 bits | | | | | | | | |

- When the DINSWAP bits = 001

| | | | | | | | | | | | | | | | |
|------------|-----------|------------|-----------|------------|-----------|------------|-----------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Cb0 8 bits | Y0 8 bits | Cr0 8 bits | Y1 8 bits | Cb1 8 bits | Y2 8 bits | Cr1 8 bits | Y3 8 bits | | | | | | | | |

- When the DINSWAP bits = 010

| | | | | | | | | | | | | | | | |
|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Y1 8 bits | Cr0 8 bits | Y0 8 bits | Cb0 8 bits | Y3 8 bits | Cr1 8 bits | Y2 8 bits | Cb1 8 bits | | | | | | | | |

- When the DINSWAP bits = 100

| | | | | | | | | | | | | | | | |
|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Y2 8 bits | Cb1 8 bits | Y3 8 bits | Cr1 8 bits | Y0 8 bits | Cb0 8 bits | Y1 8 bits | Cr0 8 bits | | | | | | | | |

- When the DINSWAP bits = 101

| | | | | | | | | | | | | | | | |
|------------|-----------|------------|-----------|------------|-----------|------------|-----------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Cb1 8 bits | Y2 8 bits | Cr1 8 bits | Y3 8 bits | Cb0 8 bits | Y0 8 bits | Cr0 8 bits | Y1 8 bits | | | | | | | | |

- When the DINSWAP bits = 110

| | | | | | | | | | | | | | | | |
|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Y3 8 bits | Cr1 8 bits | Y2 8 bits | Cb1 8 bits | Y1 8 bits | Cr0 8 bits | Y0 8 bits | Cb0 8 bits | | | | | | | | |

- When the DINSWAP bits = 111

| | | | | | | | | | | | | | | | |
|------------|-----------|------------|-----------|------------|-----------|------------|-----------|-----|-----|-----|-----|-----|----|----|----|
| b63 | b56 | b55 | b48 | b47 | b40 | b39 | b32 | b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Cr1 8 bits | Y3 8 bits | Cb1 8 bits | Y2 8 bits | Cr0 8 bits | Y1 8 bits | Cb0 8 bits | Y0 8 bits | | | | | | | | |

(6) Output Coded Data

In the case of compression, coded data are output. This module handles the output of coded data in 16-bit units. For this reason, if the coded data have an odd code length (are fractional), the final code for output will be H'D9FF.

The JOUTSWAP bits in JIFECNT can be used to alter the arrangement of coded data in the output.

45.3.2 Decompression

(1) Overview of Processing

The decompression process flows are described below.

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JCU.

If the count mode for stopping the input of coded data is on, reading is stopped each time the amount of coded data set in JIFDSLC is read. Reading is resumed by setting the JINRCMD bit in JIFDCNT to 1. When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.

When the JINRINI bit is one, the address set in JIFDSA is used on resumption. Reading is stopped when the end of the coded data is detected.

If the count mode for stopping the input of coded data is off, reading is continued until the end of code is detected. With this module, more coded data may be read than the coded data size since coded data reading is continued until the end of code is detected.
3. Coded data is input to the JPEG core.

The input data is processed in MCUs at any time in the JPEG core.
4. Image data is transferred in MCUs from the JCU to the external buffer.

When the count mode for stopping the output of image data lines is on, writing is stopped each time the number of image data lines set in JIFDDL is written. Writing is resumed by setting the DOUTRCMD bit in JIFECNT to 1. When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption. Writing is stopped when one frame of image data is completely transferred.

If the count mode for stopping the output of image data lines is off, writing is continued until one frame of image data is completely transferred.
5. Decompression is completed after one frame of data is processed completely.

(a) Initial Settings

- When the INT3 bit in JINTE0 is set to 0:
After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
- When the INT3 bit in JINTE0 is set to 1:
After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
When the image size and pixel format become readable after the coded data has been decompressed, the INS3 bit in JINTS0 is set. At this time, decompression is temporarily stopped.
After the image size and pixel format have been read, set the output buffer.
Setting the JRST bit in JCCMD to 1 after interrupt handling resumes decompression.

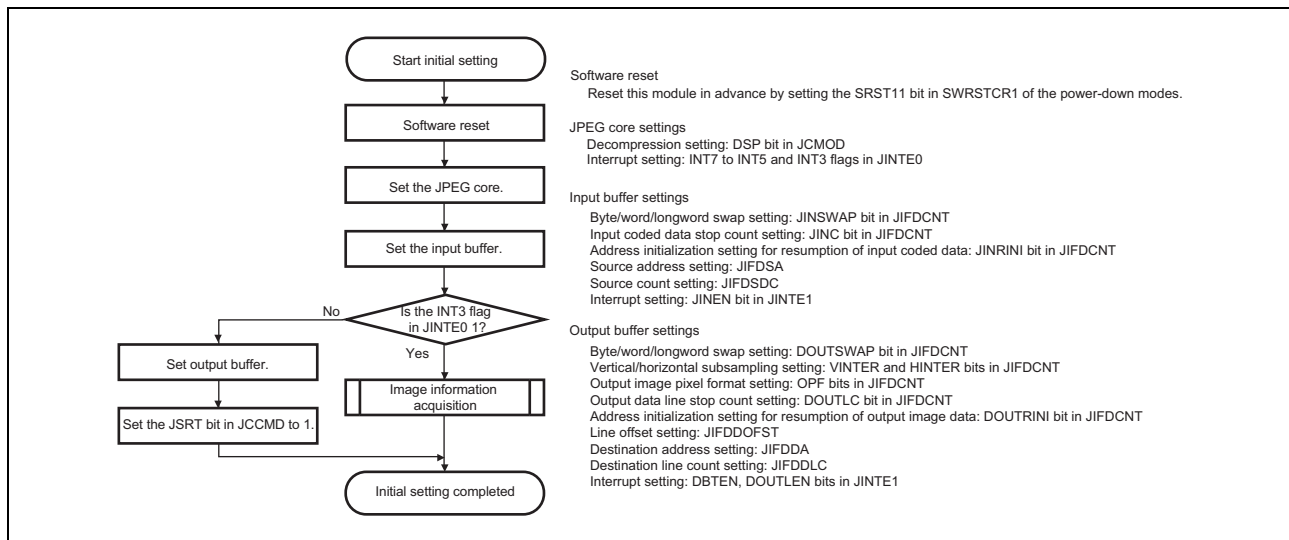

Figure 45.5 Decompression Initial Setting Flow

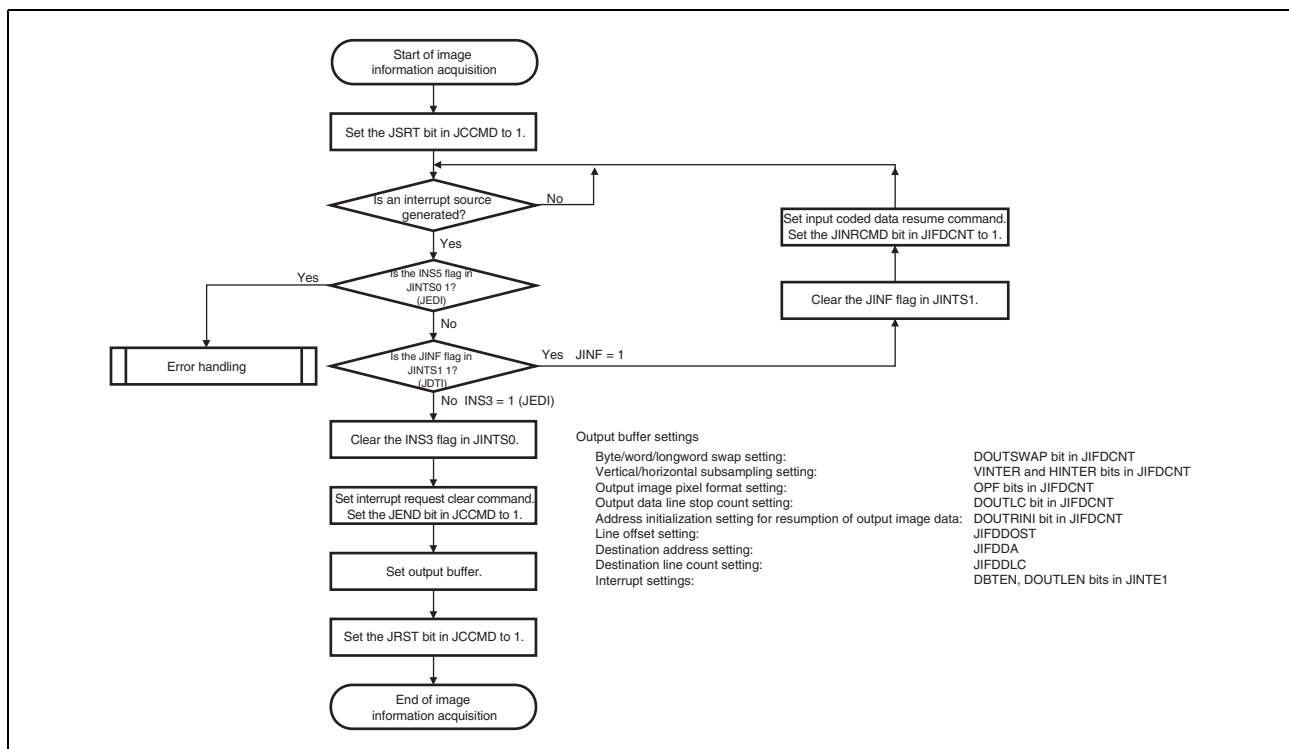

Figure 45.6 Image Information Acquisition Flow

(b) Decompression Process

The decompression process flows are described below.

- When JPEG decompression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the image data remains to be transferred. The DBTF bit in JINTS1 is set to 1 when the last image data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed decompression process and all image data has been transferred, the DBTF flag in JINTS1 is set to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the DBTF flag.
- If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFSDC have been read, the JINF flag in JINTS1 is set to 1, and reading is stopped. When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.

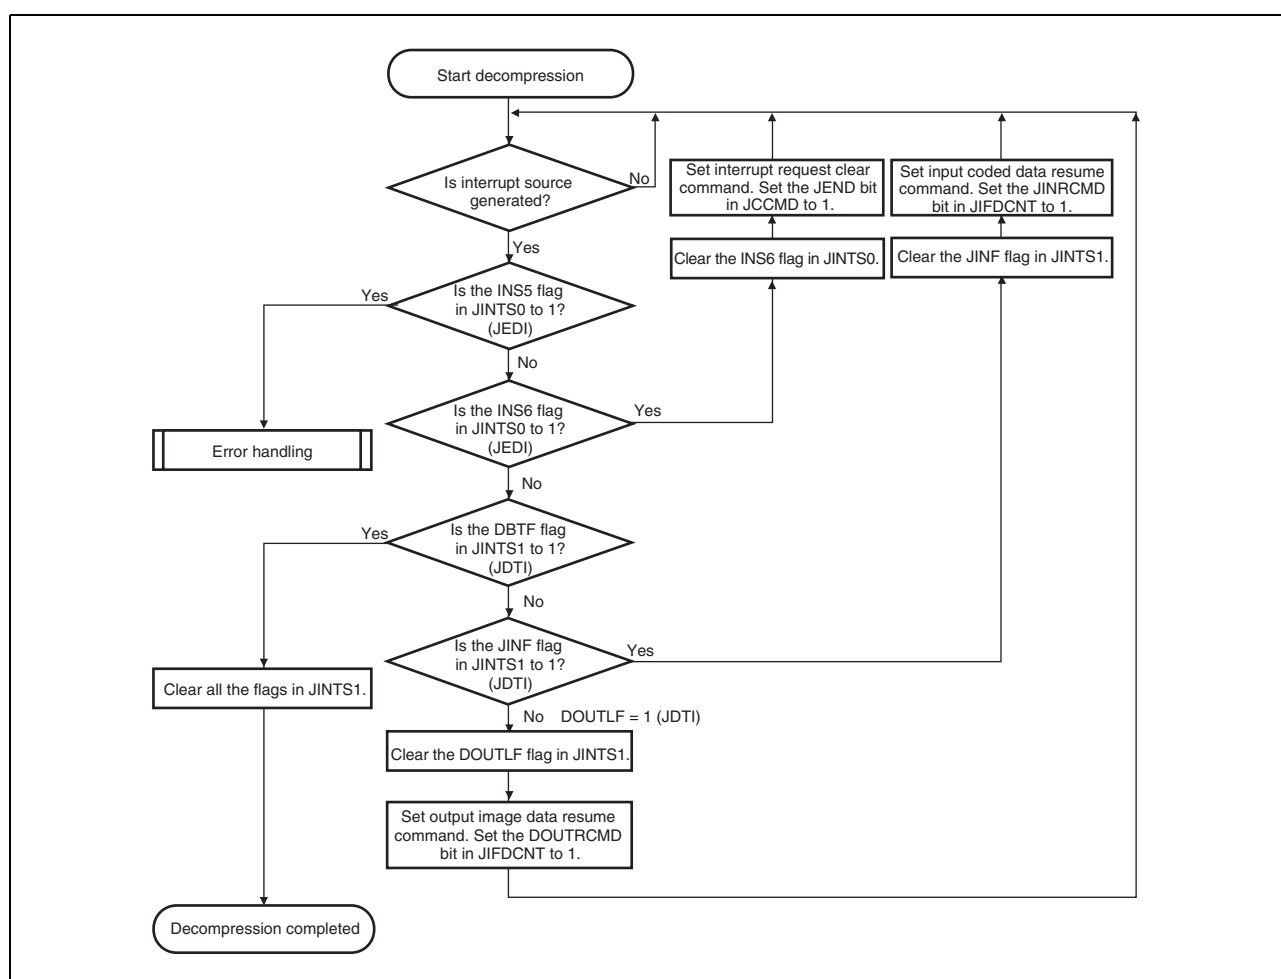

When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.

When the JINRINI bit is one, the address set in JIFDSA is used on resumption.

- If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDL have been written, the DOUTLF flag in JINT1 is set to 1, and writing is stopped. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.

When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.

When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption.

(c) Error Handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by this module has been ended. Read the ERR bits in JCDERR to determine the cause of the error. The interrupt signal asserted due to the interrupt source indicated by the INS5 bit cannot be negated by clearing the interrupt status through 0-writing. To clear the interrupt request, set the interrupt request clear command (by setting the JEND bit in JCCMD to 1).

If decompression or compression is to proceed after error handling is completed, start by making the initial settings.

Figure 45.8 Error Handling Flow

(2) Input JPEG Coded Data

Markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Other markers except for the error markers shown below are ignored even if they are read.

The JINSWAP bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

(3) JPEG Decompression Errors

(a) Error Marker

If a marker error is found while analyzing compressed data for decompression, the code to identify the error type (shown in Table 45.3) is set to ERR bits in JCDERR. When an error is detected, the JCU generates an interrupt signal and terminates decoding. The stored code value will be set to B'1010 (default value) at the start of processing of the next frame or after a bus reset.

Table 45.3 Decompression Error Codes

| Code | Description |
|--------|---|
| B'0000 | Normal |
| B'0001 | SOI not detected: SOI not detected until EOI detected |
| B'0010 | SOF1 to SOFF detected |
| B'0011 | Unprovided pixel format detected |
| B'0100 | SOF accuracy error: Other than 8 detected |
| B'0101 | DQT accuracy error: Other than 0 detected |
| B'0110 | Component error 1: The number of SOF0 header components detected is other than 1, 3, or 4 |
| B'0111 | Component error 2: The number of components differs between SOF0 header and SOS |
| B'1000 | SOF0, DQT, and DHT not detected when SOS detected |
| B'1001 | SOS not detected: SOS not detected until EOI detected |
| B'1010 | EOI not detected (default) |
| B'1011 | Restart interval data number error detected |
| B'1100 | Image size error detected |
| B'1101 | Last MCU data number error detected |
| B'1110 | Block data number error detected |

(b) Huffman Coded Segment Error

During the compressed data analysis in decompression operation, if there is an increase or decrease in the decoded data count due to an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR bit in JCDERR. Table 45.4 lists the segment error codes. The error code is set, interrupt signal is issued, and the process is ended only if the bits INT7 to INT5 in JINTE0 corresponding to the detected error is set to 1. The set code value will turn to the default value (B'1010) at the start of processing of the next frame or after a bus reset.

However, in this error detection, if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error will go undetected.

[Example]

The number of data in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels

Figure 45.9 Huffman Coded Segment

Table 45.4 Segment Error Codes

| Code | Description |
|--------|--|
| B'0000 | Normal |
| B'1011 | <p>Restart interval data number error:</p> <p>The number of data in each interval is compared with the number of data specified by the DRI marker. If an interval has more or less data than is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared.</p> <p>If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RSTm marker is placed. Also an m which indicates the order of RSTm marker modulo 8 (m = 0 to 7) is exempt from the error detection analysis.</p> <p>When the INT7 bit in JINTE0 is set to 0, this error is not detected.</p> |
| B'1100 | <p>Image size error:</p> <p>The data number of an image which is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data from SOS to EOI (in pixel units). If the numbers of data do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 is set to 0, this error is not detected. The data number of an image is shown in MCU units. Thus the number of lines and the number of samples per line for calculation need to be shown in MCU units.</p> |
| B'1101 | <p>Last MCU data number error:</p> <p>Whether the number of data in the MCUs at the EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously, error (1100) has priority. When the INT5 bit in JINTE0 is set to 0, this error is not detected.</p> |
| B'1110 | <p>Block data number error:</p> <p>Whether a block is an 8×8 array is checked; the check is performed for fractions. When bits INT7 to INT5 in JINTE0 are all set to 0, this error is not detected.</p> |

45.3.3 Output Pixel Format in Decompression

This module is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411 and YCbCr420 formats. The pixel format of the output image will be YCbCr422, ARGB8888, or RGB565. The flow of conversion of decompressed data to the given output pixel format is shown below.

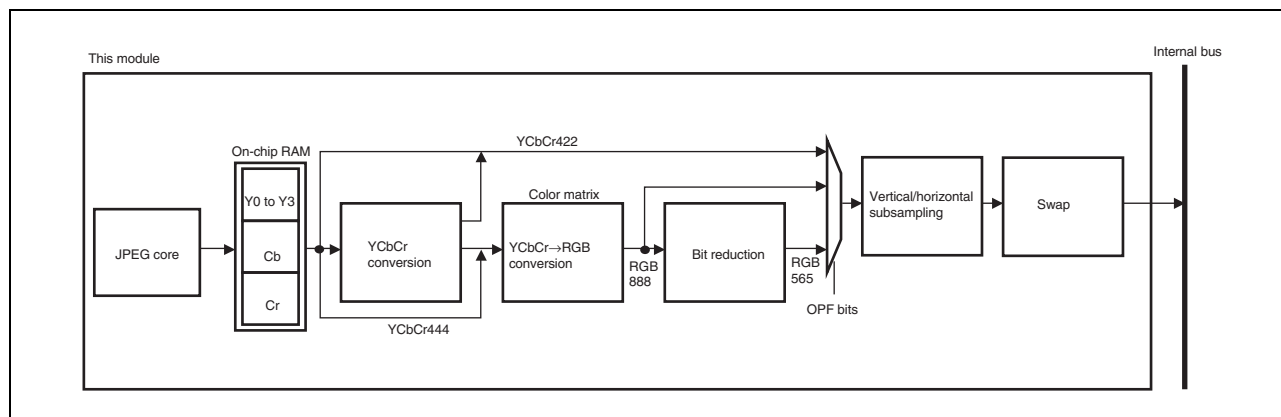

Figure 45.10 Block Diagram of Output Pixel Format Conversion in Decompression

(1) On-chip RAM

Data decoded by the JPEG core are stored in MCUs on RAM in this module.

(2) YCbCr Conversion

When data are to be output in the ARGB8888 or RGB565 format, data in the YCbCr422, YCbCr411 or YCbCr420 format are first converted to the YCbCr444 format.

When data are to be output in the YCbCr422 format, data in the YCbCr444, YCbCr411 or YCbCr420 format are converted to the YCbCr422 format.

Conversion is performed using simple interpolation.

(3) YCbCr → RGB Conversion

Data in the YCbCr444 format are converted to the RGB888 format. The following formulae are used.

$$R = 1.000Y + 1.402Cr$$

$$G = 1.000Y - 0.344Cb - 0.714Cr$$

$$B = 1.000Y + 1.772Cb$$

(4) Bit Reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

(5) Output Pixel Format Selection

The pixel format to be output is selected by the OPF bit in JIFDCNT.

Allocation of data (while the DOUTSWAP bits in JIFDCNT = 000) in the pixel format is shown below.

- YCbCr422 (32 bits/pixel)

| | | | | | | | |
|-----------|-----|-----|-----|-----------|----|----|----|
| b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| Y0 8 bits | | | | Cb 8 bits | | | |
| Y1 8 bits | | | | Cr 8 bits | | | |

- ARGB8888 (32 bits/pixel)

| | | | | | | | |
|--------------|-----|-----|-----|-------------|----|----|----|
| b31 | b24 | b23 | b16 | b15 | b8 | b7 | b0 |
| * | | | | Red 8 bits | | | |
| Green 8 bits | | | | Blue 8 bits | | | |

Note: * This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)

| | | | | | |
|-------------|-----|-----|----|--------------|----|
| b15 | b11 | b10 | b5 | b4 | b0 |
| Red 5 bits | | | | Green 6 bits | |
| Blue 5 bits | | | | | |

(6) Vertical/Horizontal Subsampling

The output data can be horizontally and vertically subsampled according to the VINTER and HINTER bit setting in JIFDCNT.

Figure 45.11 to Figure 45.13 show line subsampling modes.

For the output formats ARGB8888 and RGB565, one cell represents one pixel in the figures.

For the output format YCbCr422, one cell represents one set of Y0Cb0Y1Cr0 in the figures.

As subsampling is carried out by minimum coded units (MCU), the numbers of the horizontal and vertical block units will vary according to the decompressed pixel format.

Table 45.5 and Table 45.6 show the values of n and m in the figures.

Horizontal:

Table 45.5 Number of Horizontal Blocks

| Compression Format | Output Format | n |
|--------------------|------------------|-----|
| YCbCr444 | YCbCr422 | 1/2 |
| YCbCr444 | ARGB8888, RGB565 | 1 |
| YCbCr422 | YCbCr422 | 1 |
| YCbCr422 | ARGB8888, RGB565 | 2 |
| YCbCr411 | YCbCr422 | 2 |
| YCbCr411 | ARGB8888, RGB565 | 4 |
| YCbCr420 | YCbCr422 | 1 |
| YCbCr420 | ARGB8888, RGB565 | 2 |

Vertical:

Table 45.6 Number of Vertical Blocks

| Compression Format | Output Format | m |
|--------------------|------------------|---|
| YCbCr444 | YCbCr422 | 1 |
| YCbCr444 | ARGB8888, RGB565 | 1 |
| YCbCr422 | YCbCr422 | 1 |
| YCbCr422 | ARGB8888, RGB565 | 1 |
| YCbCr411 | YCbCr422 | 1 |
| YCbCr411 | ARGB8888, RGB565 | 1 |
| YCbCr420 | YCbCr422 | 2 |
| YCbCr420 | ARGB8888, RGB565 | 2 |

- Subsampling into 1/2

Figure 45.13 MCU when subsampling into 1/8 is selected

(7) Swap

Allocation of data can be changed by the DOUTSWAP bits in JIFECNT.

45.3.4 Storing Image Data

Figure 45.14 shows the buffer area for storing the image data.

- Start address
Compression: JIFESA
Decompression: JIFDDA
- Horizontal size
Compression, decompression: JCHSZU, JCHSZD
- Vertical size
Compression, decompression: JCVSAU, JCVSZD
- Offset
Compression: JIFESOFST
Decompression: JIFDDOFST

Figure 45.14 Image of Storing Image Data

45.4 Interrupts

Two types of interrupt requests, namely compression/decompression process interrupt request (JEDI) and data transfer interrupt request (JDTI), are available in this module. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

45.4.1 Compression/Decompression Process Interrupt Request (JEDI)

The flags in JINTS0 indicate compression/decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the corresponding interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 is set to 1, a compression/decompression process interrupt request is sent to the interrupt controller.

(1) Compression

- JPEG compression process end

When the INS6 bit in JINTS0 is 1, the JPEG compression process has been successfully completed. After all of the coded data is transferred, the JCU completes compression.

-

(2) Decompression

- JPEG decompression process end

When the INS6 bit in JINTS0 is 1, the JPEG decompression process has been successfully completed. After all of the image data is transferred, JCU completes decompression.

- JPEG decompression error occurrence

When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JCU has stopped the decompression process. Read the error code (ERR bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.

- Request for reading the image size and pixel format

When the INS3 bit in JINTS0 is 1, JPEG coded data has been input and information regarding the image size and pixel format can be read. Since the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the necessary registers. This interrupt occurs when the INT3 bit in JINTE0 is 1.

45.4.2 Data Transfer Interrupt Request (JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the corresponding interrupt status bits to 0.

(1) Compression

- Interrupt request generated after the specified number of input image data lines has been read
When the DINLF bit in JINTS1 is 1, the number of image data lines specified by JIFESLC has been transferred; transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of output coded data have been written to
When the JOUTF bit in JINTS1 is 1, the amount of coded data specified by JIFEDDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. The data transfer interrupt request is sent when the JOUTEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
When the CBTF bit in JINTS1 is 1, the JCU has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

(2) Decompression

- Interrupt request generated after the specified number of output image data lines has been written to
When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified by JIFDDLDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data has been read
The JINF bit in JINTS1 becomes 1 when the amount of coded data specified by JIFDSDC has been transferred. Secure the next coded data in the external buffer, and resume transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
The DBTF bit in JINTS1 becomes 1 when the JCU has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

45.5 Bus Reset Processing

Issuing the bus reset command (setting the BRST bit in JCCMD to 1) causes a bus reset.

When the JCU is in operation, the bus reset command should not be issued. Registers below are initialized by a bus reset.

- JPEG code data count upper register (JCDTCU)
- JPEG code data count middle register (JCDTCM)
- JPEG code data count lower register (JCDTCD)
- JPEG interrupt status register 0 (JINTS0)
- JPEG code decode error register (JCDERR)
- JPEG code reset register (JCRST)

46. Capture Engine Unit

The capture engine unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

46.1 Features of CEU

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, e.g. JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

46.2 Functional Overview of CEU

The functional overview of the CEU is shown in Table 46.1, and the main functions and their details are shown in Table 46.2.

Table 46.1 Functional Overview of CEU

| Classification | Item | Function | Description | Note |
|--------------------|--|---------------------|---|--|
| Connectable camera | Size | 5 megapixels | 2,560 pixels × 1,920 lines | Horizontal: 4-pixel units* Vertical: 4-line units Note: * 8-pixel units when writing to an area other than the on-chip RAM |
| | | 3 megapixels | 2,048 pixels × 1,536 lines | |
| | | 2 megapixels | 1,632 pixels × 1,224 lines | |
| | | UXGA | 1,600 pixels × 1,200 lines | |
| | | SXGA (1) | 1,280 pixels × 1,024 lines | The range of image sizes that can be input is as follows. Horizontal: 2,560 pixels to 128 pixels Vertical: 1,920 lines to 96 lines Note: This depends on the AC characteristics of the device to be connected, frame rate of the connected device, and transfer speed to the destination RAM. |
| | | SXGA (2) | 1,280 pixels × 960 lines | |
| | | WXGA | 1,280 pixels × 768 lines | |
| | | XGA | 1,024 pixels × 768 lines | |
| | | SVGA | 800 pixels × 600 lines | |
| | | WVGA | 800 pixels × 480 lines | |
| | | VGA | 640 pixels × 480 lines | |
| | | CIF | 352 pixels × 288 lines | |
| | | WQVGA | 480 pixels × 240 lines | |
| | | QVGA | 320 pixels × 240 lines, 240 pixels × 320 lines | |
| | | QCIF | 176 pixels × 144 lines | |
| | | QQVGA | 160 pixels × 120 lines | |
| | | Sub-QCIF | 128 pixels × 96 lines | |
| | Input format | YCbCr422 8 bits | Cb ₀ , Y ₀ , Cr ₀ , Y ₁ ... | Supports clock ratio of 1:1 |
| | | | Cr ₀ , Y ₀ , Cb ₀ , Y ₁ ... | |
| | | | Y ₀ , Cb ₀ , Y ₁ , Cr ₀ ... | |
| | | | Y ₀ , Cr ₀ , Y ₁ , Cb ₀ ... | |
| | | YCbCr422 16 bits | {Y ₀ , Cb ₀ }, {Y ₁ , Cr ₀ }, ... | |
| | | | {Y ₀ , Cr ₀ }, {Y ₁ , Cb ₀ }, ... | |
| | Horizontal and vertical sync signal polarities | Arbitrary | Specified amount to be fetched on edges of the sync signal | Written sequentially |
| | | | Data is fetched with the horizontal sync signal as an enable signal. | |
| | | Arbitrary | High-active and low-active | |
| | | | | |
| | Capture start location | Arbitrary | Can be specified in camera input clock units | Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units |
| | | | | |
| | Number of captured pixels | Arbitrary | Can be specified in 4-pixel units horizontally and in 4-line units vertically | |
| | | | | |
| | Interlace | Both-field capture | Stored as a field image Stored as a frame image | Capture: 2-VD (vertical sync signal) units |
| | | One-field capture | Top field or bottom field can be specified | Capture: 1-VD units |
| Memory write | Output format | YCbCr422 | YCbCr420 is realized by simple skipping | |
| | | YCbCr420 | | |

Table 46.1 Functional Overview of CEU

| Classification | Item | Function | Description | Note |
|-----------------|--------------------------|--------------------------------|---|----------------------------------|
| Filter function | No scaling or scale-down | Scale-down of captured display | Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA) | |
| | Low-pass filter | | Removal of high-frequency components | Only in the horizontal direction |

Table 46.2 Main Functions of CEU and Their Details

| Main Function | Detailed Description |
|-------------------|--|
| Image data fetch | <ul style="list-style-type: none"> Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image. |
| Filter processing | <p>Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters.</p> <p>Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.</p> |

Figure 46.1 shows a block diagram of the CEU.

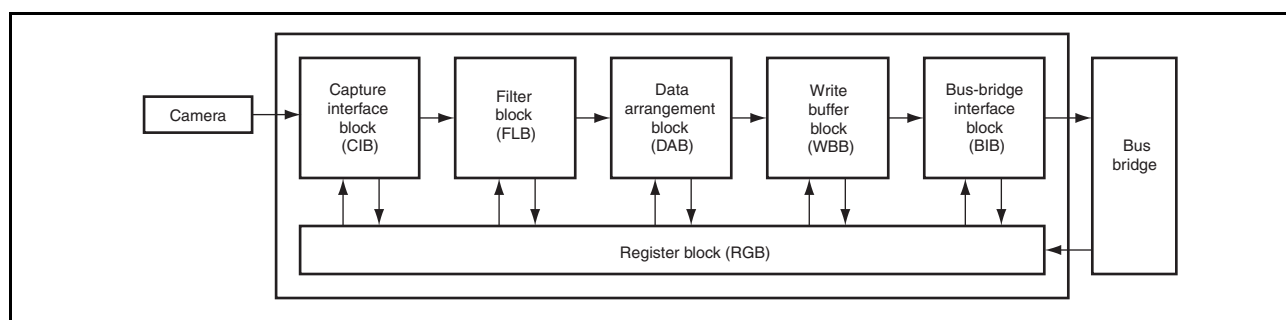

Figure 46.1 Block Diagram of CEU

46.3 Pin Configuration of CEU

The pin configuration of the CEU is shown in Table 46.3.

Table 46.3 Pin Configuration of CEU

| Pin Name | Function | I/O | Description |
|--------------------|---------------------|-------|--|
| VIO_D15 to VIO_D0* | CEU data bus | Input | Camera image data input to the CEU |
| VIO_CLK | CEU clock | Input | Camera clock input to the CEU |
| VIO_VD | CEU vertical sync | Input | Camera vertical sync signal input to the CEU |
| VIO_HD | CEU horizontal sync | Input | Camera horizontal sync signal input to the CEU |
| VIO_FLD | Field signal | Input | Field identification signal to the CEU |

Note: * When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D15 to VIO_D0 are used.

46.4 Register Descriptions of CEU

The register configuration of the CEU is shown in Table 46.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 46.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 46.4 Register Configuration of CEU

| Register Name | Abbr. | R/W | Addresses | | | Access Size |
|--|--------|-----|-------------------|-------------------|----------------|-------------|
| | | | Address (Plane A) | Address (Plane B) | Mirror Address | |
| CEU Capture start register | CAPSR | R/W | H'E821 0000 | — | — | 32 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | CPKIL | 0 | R/W | Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When this bit is 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CSTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 46.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 0 | CE | 0 | R/W | <ul style="list-style-type: none"> • Single-capture <p>This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 46.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted.</p> <p>As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0.</p> <p>The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode.</p> <p>Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR.</p> • Continuous capture <p>When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 46.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed.</p> <p>Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame.</p> <p>0: Stops capturing 1: Starts capturing</p> |

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 46.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

Figure 46.3 Frame Timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 46.4 shows the timing of one field (when both the VD and HD polarities are high-active).

Figure 46.4 One Field Timing

In data enable fetch, one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 46.5 shows the timing of one frame for data enable fetch.

Figure 46.5 Frame Timing (Data Enable Fetch)

| | | | | G |
| | | Top field | Top field | H |
| | | Bottom field | Bottom field | I |

46.4.3 Capture Interface Control Register (CAMCR)

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between the rising edge or falling edge of the camera clock for signal capture or data fetch operation
- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits or 16 bits)
- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to B'0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 28 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 27 | VDSEL | 0 | R/W | Sets the edge for capturing the vertical sync signal (VD) from an external module. 0: VD is captured at the rising edge of the camera clock. 1: VD is captured at the falling edge of the camera clock. |
| 26 | HDSEL | 0 | R/W | Sets the edge for capturing the horizontal sync signal (HD) from an external module. 0: HD is captured at the rising edge of the camera clock. 1: HD is captured at the falling edge of the camera clock. |
| 25 | FLDSEL | 0 | R/W | Sets the edge for capturing the field identification signal (FLD) from an external module. 0: FLD is captured at the rising edge of the camera clock. 1: FLD is captured at the falling edge of the camera clock. |
| 24 | DSEL | 0 | R/W | Sets the edge for fetching the image data (D7 to D0) from an external module. 0: D7 to D0 are fetched at the rising edge of the camera clock. 1: D7 to D0 are fetched at the falling edge of the camera clock. |
| 23 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 16 | FLDPOL | 0 | R/W | Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field. |
| 15 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 | DTIF | 0 | R/W | Sets the digital image input pins from which data is to be captured. 0: Data input to 8-bit digital image input pins is captured 1: Data input to 16-bit digital image input pins is captured |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | DTARY[1:0] | 00 | R/W | These bits set the input order of the luminance component and chrominance component. The order in which the luminance component (Y) and chrominance component (Cb and Cr) are input from an external module differs among modules. The CEU supports the input orders shown in Figure 46.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. (1) 8-bit interface 00: Image input data is fetched in the order of Cb ₀ , Y ₀ , Cr ₀ , and Y ₁ 01: Image input data is fetched in the order of Cr ₀ , Y ₀ , Cb ₀ , and Y ₁ 10: Image input data is fetched in the order of Y ₀ , Cb ₀ , Y ₁ , and Cr ₀ 11: Image input data is fetched in the order of Y ₀ , Cr ₀ , Y ₁ , and Cb ₀ (2) 16-bit interface 00: Image input data is fetched in the order of {Cb ₀ , Y ₀ } and {Cr ₀ , Y ₁ } 01: Image input data is fetched in the order of {Cr ₀ , Y ₀ } and {Cb ₀ , Y ₁ } 10: Image input data is fetched in the order of {Y ₀ , Cb ₀ } and {Y ₁ , Cr ₀ } 11: Image input data is fetched in the order of {Y ₀ , Cr ₀ } and {Y ₁ , Cb ₀ } |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5, 4 | JPG[1:0] | 00 | R/W | These bits select the fetched data type. 00: Image capture mode (input data are separated into Y data and CbCr data for output to the memory) 01: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 10: Data enable fetch mode (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input) |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | VDPOL | 0 | R/W | Sets the polarity for detection of the vertical sync signal input from an external module. Figure 46.14 and Figure 46.15 show the relationship between the VIO_VD and VIO_HD signals and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, this bit is not used and the sense for detection is always active high. 0: Vertical sync signal (VD) from an external module is detected as high-active 1: Vertical sync signal (VD) from an external module is detected as low-active |
| 0 | HDPOL | 0 | R/W | Sets the polarity for detection of the horizontal sync signal input from an external module. Figure 46.16 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Horizontal sync signal (HD) from an external module is detected as high-active 1: Horizontal sync signal (HD) from an external module is detected as low-active |

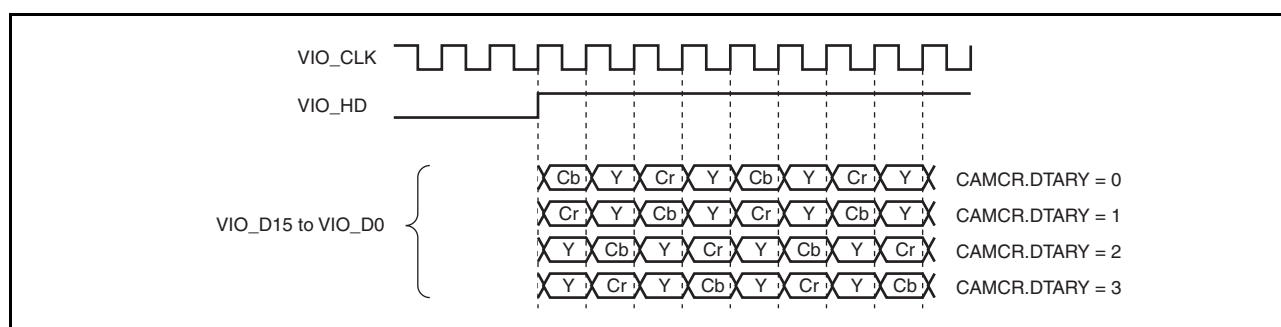

Figure 46.11 Input Order of Image Data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled.

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.

This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.

Figure 46.12 and Figure 46.13 show the interface timing in data enable fetch mode.

Figure 46.12 Data Enable Fetch Timing (HD Asserted (High) While VD is High)

Figure 46.13 Data Enable Fetch Timing (HD Asserted (High) When VD is Not High)

In data enable fetch mode, this module generates a VD interrupt in response to detection of the active level of VD. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time.

Figure 46.14 to Figure 46.16 show the relationships between the VIO_VD signal and the VD interrupt, the VIO_VD and VIO_HD signals and the VD interrupt, and the VIO_HD signal and the HD interrupt.

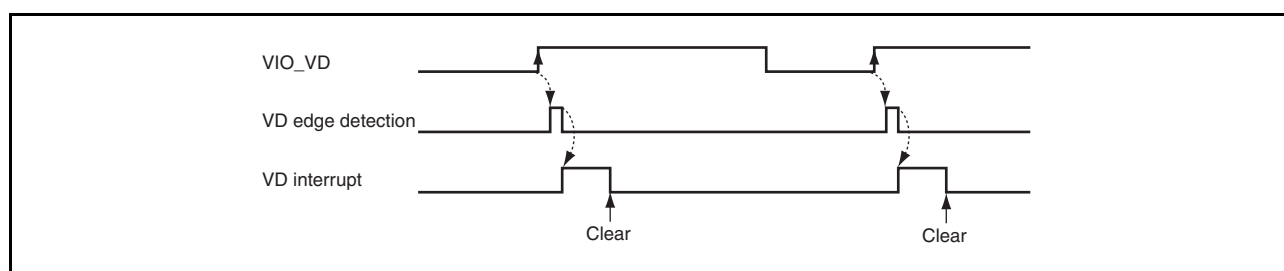

Figure 46.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active (In Data Enable Fetch Mode)

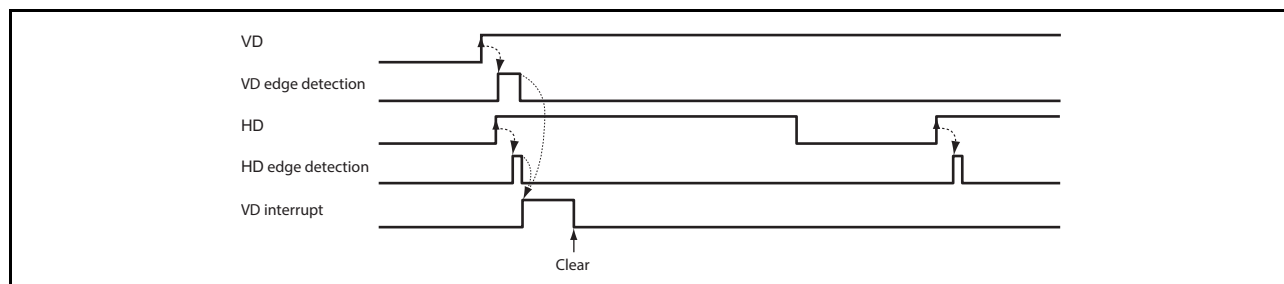

Figure 46.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode)

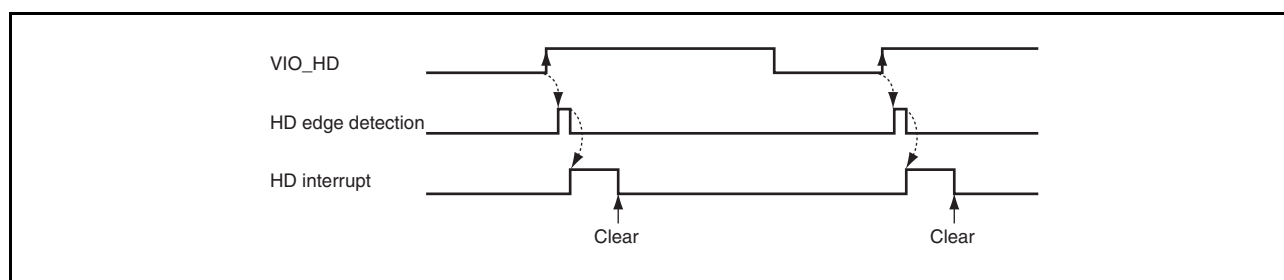

Figure 46.16 Relationship between VIO_HD and HD Interrupt when HD is High-Active

46.4.4 Capture Interface Cycle Register (CMCYR)

CMCYR is used to detect an illegal VD and an illegal HD. For HD, the number of cycles from a rising edge of HD to the next rising edge is set (falling edges when low-active is selected for HD). For VD, the number of HD inputs from a rising edge of VD to the next rising edge is set (falling edges when low-active is selected for VD).

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Set 0 in all bits of this register, during data enable fetch mode.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31, 30 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 29 to 16 | VCYL[13:0] | H'0000 | R/W | Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored. |
| 15, 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13 to 0 | HCYL[13:0] | H'0000 | R/W | Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored. |

46.4.5 Capture Interface Offset Register (CAMOR)

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. When fetching data, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 28 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 27 to 16 | VOFST[11:0] | H'000 | R/W | These bits specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 46.17). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 46.18). |
| 15 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 to 0 | HOFST[12:0] | H'0000 | R/W | These bits specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 46.19). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 46.20). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR). |

46.4.6 Capture Interface Width Register (CAPWR)

CAPWR sets the fetch (capture) cycle width when capturing images.

The cycle width unit differs according to the interface and the data type to be captured. For each setting unit, see Table 46.6.

46.4.7 Capture Interface Input Format Register (CAIFR)

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), the image from which capturing starts (top field or bottom field), etc. CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

The items set by CAIFR are listed in Table 46.7.

| | | | | | | | | | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | IFS | 0 | R/W | Sets the input mode for capturing images. 0: Progressive 1: Interlace |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | CIM | 0 | R/W | Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD) |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | FCI[1:0] | 00 | R/W | These bits set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 00: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 01: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 10: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 11: Setting prohibited |

Table 46.7 CAIFR Setting Items

| Input Mode | IFS Bit | Captured Image | CIM Bit | Image to Start Capture | FCI Bits |
|-------------|---------|---------------------------|---------|------------------------------------|----------|
| Progressive | 0 | Frame | 0 | Frame immediately after activation | 00 |
| Interlace | 1 | Both-field (2-VD capture) | 0 | Field immediately after activation | 00 |
| | | | | Top field | 01 |
| | | | | Bottom field | 10 |
| | | | | Setting prohibited | 11 |
| | | One-field (1-VD capture) | 1 | Field immediately after activation | 00 |
| | | | | Top field | 01 |
| | | | | Bottom field | 10 |
| | | | | Setting prohibited | 11 |

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and a one-frame capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 46.23 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

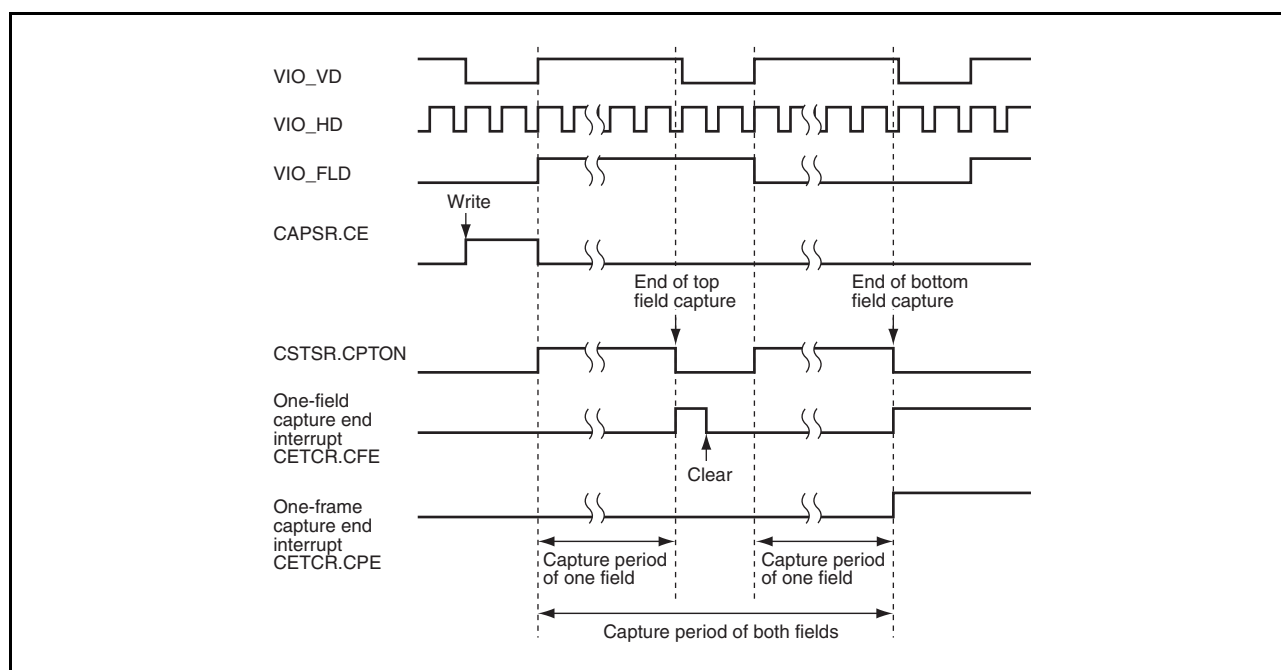

Figure 46.23 One-Frame Capture End Interrupt and One-Field Capture End Interrupt in Both-Field Image Capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 46.24). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCR (Figure 46.25).

Figure 46.24 Image of Storing Captured Frame Image or Captured One-Field Image in Memory

Figure 46.25 Image of Storing Captured Both-Field Images in Memory

If the FCI bits are set to B'00 for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 46.26). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 46.27).

Figure 46.26 Continuous Both-Field Capture in Interlace Mode
(Image Immediately after Activation is Top Field (FCI Bits = B'00))Figure 46.27 Continuous One-Field Capture in Interlace Mode
(Image Immediately after Activation is Top Field (FCI Bits = B'00))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS bit = B'1)

Capture image: Both-field (CIM bit = B'0)

Image to start capture: Any setting other than the prohibited setting (FCI bits = as desired)

Figure 46.28 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 46.28. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 46.28 at $CDWDR/2$ is shown in Figure 46.29. Setting the registers to form the image in Figure 46.28 enables an interlace image to be stored as a frame image in the memory as shown in Figure 46.29.

Figure 46.28 Image of Storing Captured Both-Fields of Interlace Input in Memory

Figure 46.29 Image of Storing Interlace Input as Frame Image in Memory

46.4.8 CEU Register Control Register (CRCNTR)

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | RVS | 0 | R/W | Sets the timing to switch the register plane in both-field capture. The setting of this bit is valid only when the RC bit is 1 in both-field capture. 0: Switches the register plane every 2 VD 1: Switches the register plane every 1 VD |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | RS | 0 | R/W | Specifies which register plane is used by the CEU in synchronization with VD. The setting of this bit is valid only when the RC bit is 0. 0: Uses plane A of the register 1: Uses plane B of the register |
| 0 | RC | 0 | R/W | Specifies switching of the register plane used by the CEU in synchronization with VD. If the register plane is not switched, the register plane specified by the RS bit is used. 0: Uses the specified register plane in synchronization with VD 1: Switches the register plane in synchronization with VD |

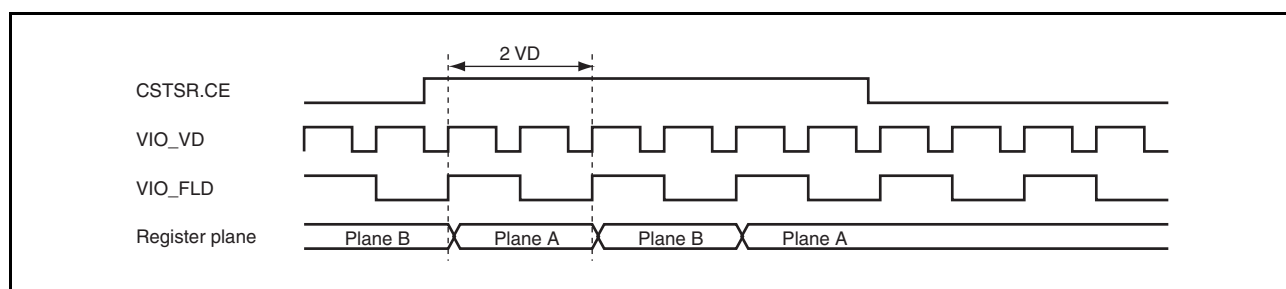

Figure 46.30 Timing for Register Plane Switching when RVS Bit is B'0

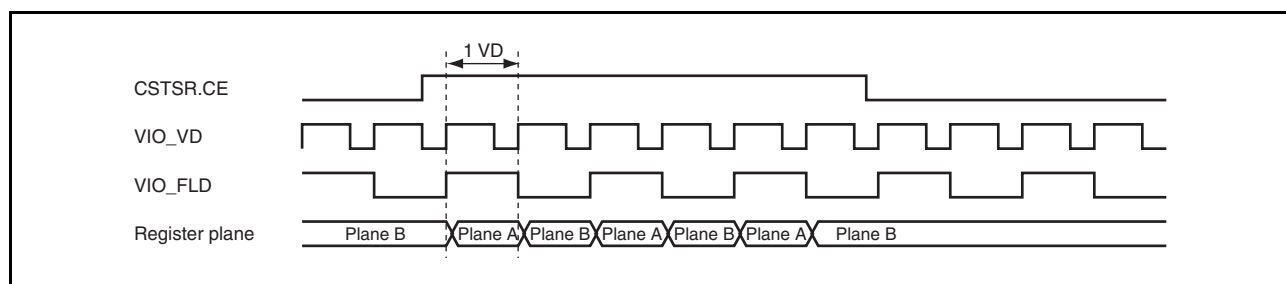

Figure 46.31 Timing for Register Plane Switching when RVS Bit is B'1

46.4.9 CEU Register Forcible Control Register (CRCMPR)

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

| | | | | | | | | | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | RA | 0 | R/W | Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (RC bit in CRCNTR is 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register |

46.4.10 Capture Filter Control Register (CFLCR)

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

|----------------------|---------------------------|---------------|----------|--|
| 31 to 28 | VMANT[3:0] | H'0 | R/W | Mantissa Part of Vertical Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the VMANT bits and H'000 is set for the VFRAC bits, the scale-down filter is not used. |
| 27 to 19 18 to 16 | VFRAC[11:3] VFRAC[2:0] | H'000 | R/W R | Fraction Part of Vertical Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits. |
| 15 to 12 | HMANT[3:0] | H'0 | R/W | Mantissa Part of Horizontal Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the HMANT bits and H'000 is set for the HFRAC bits, the scale-down filter is not used. |
| 11 to 3 2 to 0 | HFRAC[11:3] HFRAC[2:0] | H'000 | R/W R | Fraction Part of Horizontal Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits. |

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

Figure 46.32 Scale-Down of Captured Image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = MANT \times 4096 + FRAC \quad \dots \text{Formula 1}$$

$$SCL \text{ (scaling factor)} = \frac{4096}{\alpha} \quad \dots \text{Formula 2}$$

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x , the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$MANT = \left\lfloor \frac{1}{SCL} \right\rfloor, \quad FRAC = \left\lfloor 512 \times \left(\frac{1}{SCL} - MANT \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($SIZE_D$) can be calculated using the input image size S_{in} (8-bit interface: half of the CAPWR setting, 16-bit interface: CAPWR setting) in the following formula.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \dots \text{Formula 3}$$

$$\left[\begin{array}{l} MANT_{pre} = 1 \rightarrow (0 \leq MANT < 2) \\ MANT_{pre} = 2 \rightarrow (2 \leq MANT < 4) \\ MANT_{pre} = 4 \rightarrow (4 \leq MANT < 8) \\ MANT_{pre} = 8 \rightarrow (8 \leq MANT) \end{array} \right]$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

$SCL = 480/640 = 3/4$, and the preliminary settings of $MANT = 1$, $MANT_{pre} = 1$, and $FRAC = H'550$ are made. Substituting these in the following formula results in an output pixel count of 479.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \dots \text{Formula 3}$$

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of H'548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as $MANT = 1$ and $FRAC = H'548$.

Table 46.8 Setting Examples for Each Scale-Down Filter Factor

| Scale-Down Factor | FRAC | | MANT | Input Pixel Count | Output Pixel Count | Clipping Size (CFSZR) |
|-------------------|---------|-------------|------|-------------------|--------------------|-----------------------|
| | Decimal | Hexadecimal | | | | |
| 7/8 | 576 | H'240 | 1 | 640 | 560 | 560 |
| 3/4 | 1352 | H'548 | 1 | 640 | 480 | 480 |
| 5/8 | 2448 | H'990 | 1 | 640 | 400 | 400 |
| 1/2 | 0 | H'0 | 2 | 640 | 320 | 320 |
| 3/8 | 2728 | H'AA8 | 2 | 640 | 240 | 240 |
| 1/3 | 0.0 | H'0 | 3 | 640 | 213 | 212 |
| 1/4 | 0.0 | H'0 | 4 | 640 | 160 | 160 |
| 1/5 | 0.0 | H'0 | 5 | 640 | 128 | 128 |
| 1/6 | 0.0 | H'0 | 6 | 640 | 107 | 104 |
| 1/7 | 0.0 | H'0 | 7 | 640 | 91 | 88 |
| 1/8 | 0.0 | H'0 | 8 | 640 | 80 | 80 |
| 1/16 | 4088 | H'FF8 | 15 | 640 | 40 | 40 |

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

46.4.11 Capture Filter Size Clip Register (CFSZR)

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 28 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 27 to 18 | VFCLP[11:2] | H'000 | R/W | These bits set the vertical clipping value of the filter output size (4-pixel units). |
| 17, 16 | VFCLP[1:0] | | R | |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 2 | HFCLP[11:2] | H'000 | R/W | These bits specify the horizontal clipping value of the filter output size (4-pixel units*). Note: * 8-pixel units when writing to an area other than the on-chip RAM |
| 1, 0 | HFCLP[1:0] | | R | |

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 46.33. The clipping size must be specified vertically and horizontally in 4-pixel units.

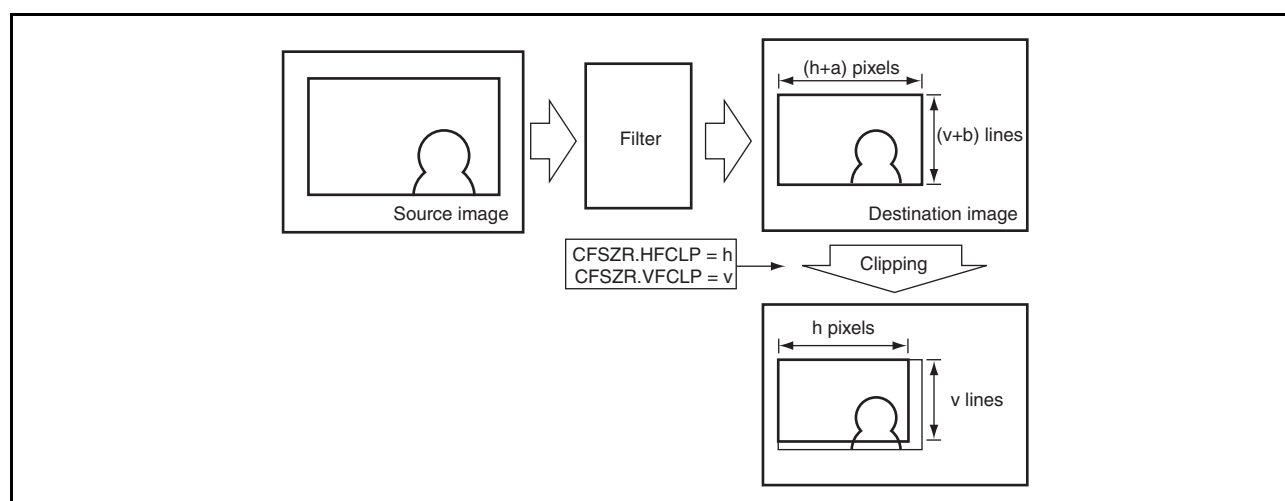

Figure 46.33 Clipping of Image Output from Filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.

- 8-bit interface:

- VFCLP = CAPWR.VWDTH

- HFCLP = CAPWR.HWDTH/2

- 16-bit interface:

- VFCLP = CAPWR.VWDTH

- HFCLP = CAPWR.HWDTH

46.4.12 Capture Destination Width Register (CDWDR)

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 4-byte units (4-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 to 2 | CHDW[12:2] | H'0000 | R/W | These bits specify the horizontal image size in the memory area where the captured image is to be stored (4-byte units*). The image data captured by the CEU is stored in the memory. If the right end of the captured image does not match the horizontal image size in the memory area as shown in Figure 46.34, some addresses must be skipped at the right end of the image when storing the captured image. Therefore, the horizontal image size in the memory area where the captured image is to be stored must be set in these bits. The maximum value to be set is 8188 bytes (8188 pixels). In data synchronous fetch mode, set as follows: 8-bit interface: CHDW = CAPWR.HWDTH 16-bit interface: CHDW = CAPWR.HWDTH × 2 Note: * 8-byte units when writing to an area other than the on-chip RAM |
| 1, 0 | CHDW[1:0] | | R | |

Figure 46.34 Captured Image and Memory Area Image

46.4.13 Capture Data Address Y Register (CDAYR)

CDAYR specifies the address where the luminance (Y) component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance (Y) component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y (luminance) component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the Y (luminance) component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units. As the setting is in 4-pixel units for image capture and 4-byte units for data fetch, the lower two bits are always fixed to 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 2 | CAYR[31:2] | H'0000 0000 | R/W | <ul style="list-style-type: none"> Frame image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units*1). One-field image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units*1). Both-field image capture: These bits set the address for storing the Y (luminance) component data of the captured top-field data (4-pixel units*1). Data fetch: These bits set the address for storing data (4-byte units*2). Data enable fetch bundle write: These bits set the address for storing data (32-byte units). |
| 1, 0 | CAYR[1:0] | | R | |

Note 1. 8-pixel units when writing to an area other than the on-chip RAM

Note 2. 8-byte units when writing to an area other than the on-chip RAM

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 46.35.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:

$$\text{End address} = \text{CDAYR} + \text{number of fetched bytes}$$

- Data enable fetch bundle write: Set the address in 32-byte units.

Figure 46.35 Relationship between Captured Image and Y Component Memory Area

46.4.14 Capture Data Address C Register (CDACR)

CDACR specifies the address where the chrominance (C) component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance (C) component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C (chrominance) component of the captured data is to be stored by CDACR. In both-field image capture, set the start address of the memory area where the C (chrominance) component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 2 | CACR[31:2] | H'0000 0000 | R/W | <ul style="list-style-type: none"> Frame image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units*). One-field image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units*). Both-field image capture: These bits set the address for storing the C (chrominance) component data of the captured top-field data (4-pixel units*). |
| 1, 0 | CACR[1:0] | | R | |

Note: * 8-pixel units when writing to an area other than the on-chip RAM

Set the address of the starting point of the memory area where the C component of the captured image is to be stored in this register, as shown in Figure 46.36. The C component has an output data format like that in Figure 46.37, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

Figure 46.36 Relationship between Captured Image and C Component Memory Area

Figure 46.37 Image of Storing C Components in Memory

46.4.15 Capture Data Bottom-Field Address Y Register (CDBYR)

CDBYR specifies the address where the luminance (Y) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y (luminance) component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in this register, as shown in Figure 46.38.

Figure 46.38 Relationship between Captured Bottom-Field Image and Y Component Memory Area

46.4.16 Capture Data Bottom-Field Address C Register (CDBCR)

CDBCR specifies the address where the chrominance (C) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C (chrominance) component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Unit: 8 lines, min.: 8 lines, max.: 1,920 lines (H'780) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 lines (H'600000) |

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when the CBE bit in CDOCR is 1. When the CBE bit in CDOCR is 1 and this register cleared to H'0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 1,920 (H'780). Only bits CBVS[11:3] are valid.

Figure 46.41 Image of Storing Captured Image in Memory by Bundle Write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when the CBE bit in CDOCR is 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

46.4.18 Capture Low-Pass Filter Control Register (CLFCR)

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to B'0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | LPF | 0 | R/W | Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction) |

46.4.19 Firewall Operation Control Register (CFWCR)

CFWCR specifies the upper limit of the write addresses in data enable fetch. When the VD input from an external module does not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | CBE | 0 | R/W | Controls the number of lines of captured data to be written to the memory. <ul style="list-style-type: none"> • Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 46.42). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. <p>Table 46.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 46.43 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 46.44 shows the timing of write end interrupts in data enable fetch.</p> <p>0: Normal write 1: Bundle write</p> |
| 15 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | CDS | 0 | R/W | Sets the image format when outputting the image data captured in the YCbCr422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr422 format to the YCbCr420 format before outputting data to the memory 1: Outputs data in the YCbCr422 format to the memory without conversion |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 | COLS | 0 | R/W | Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units |
| 1 | COWS | 0 | R/W | Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units |
| 0 | COBS | 0 | R/W | Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units |

| Address Setting Registers | Bundle Write End Interrupt Source |
|---------------------------|-----------------------------------|
| CDAYR, CDACR | CPBE1 bit in CETCR |
| CDAYR2, CDACR2 | CPBE2 bit in CETCR |
| CDBYR, CDBCR | CPBE3 bit in CETCR |
| CDBYR2, CDBCR2 | CPBE4 bit in CETCR |

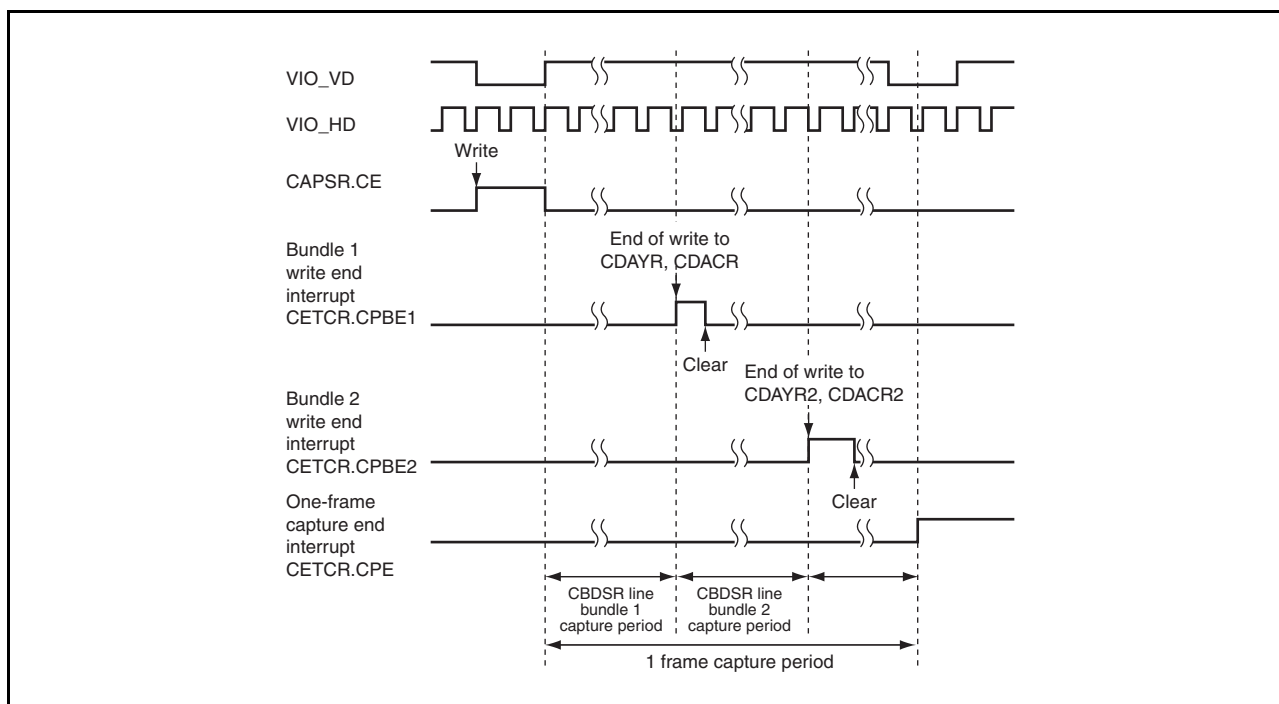

Figure 46.43 Timing of Write End Interrupts (Image Capture, Data Synchronous Fetch)

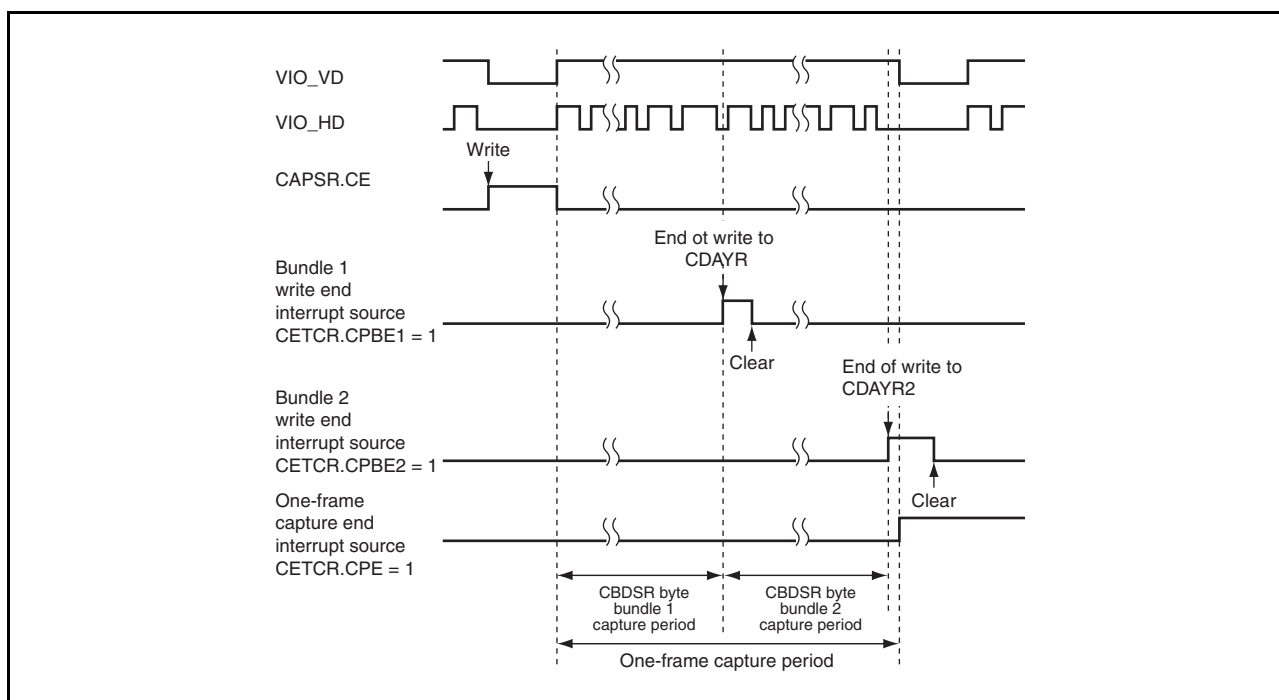

Figure 46.44 Timing of Write End Interrupts (Data Enable Fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 46.45. To enable data swapping, set the corresponding control bit to B'1.

Figure 46.45 Data Swapping by Data Aligner

46.4.21 Capture Event Interrupt Enable Register (CEIER)

CEIER enables or disables interrupts of the event flag register that generates CEU interrupts.

46.4.22 Capture Event Flag Clear Register (CETCR)

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write H'FFFF FFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.

- * VD and HD bits immediately after power-on reset or the deep-standby mode is entered
- * All bits after the software standby or module standby mode is entered
- * VD and HD bits after the polarities of the capture interface sync signals are changed

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 26 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 25 | NVD | 0 | R/W | This bit is used for an interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input. |
| 24 | NHD | 0 | R/W | This bit is used for an interrupt indicating that no HD was input. The timing for a non-HD interrupt to occur differs depending on the bit width of the digital image input pins. 8-bit digital image input pins: Occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. 16-bit digital image input pins: Occurs when the 12-bit internal counter that is incremented every four cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,380 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch. |
| 23 | FWF | 0 | R/W | The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1. |
| 22, 21 | — | 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 20 | VBP | 0 | R/W | <p>This bit is used for an interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch).</p> <p>The conditions for a VBP interrupt to occur are as follows:</p> <ul style="list-style-type: none"> Condition 1 VD is input when there is captured data within the CEU Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) <p>When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.</p> |
| 19 | — | 0 | R | <p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p> |
| 18 | IGVS | 0 | R/W | <p>This bit is used for an interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.</p> |
| 17 | IGHS | 0 | R/W | <p>This bit is used for an interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.</p> |
| 16 | CDTOF | 0 | R/W | <p>This bit is used for an interrupt indicating that data overflowed in the CRAM of the write buffer.</p> <p>Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.</p> |
| 15 | CPBE4 | 0 | R/W | <p>This bit is used for an interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished.</p> <p>This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input.</p> <p>This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed.</p> <p>However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).</p> |
| 14 | CPBE3 | 0 | R/W | <p>This bit is used for an interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished.</p> <p>This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input.</p> <p>This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed.</p> <p>However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).</p> |

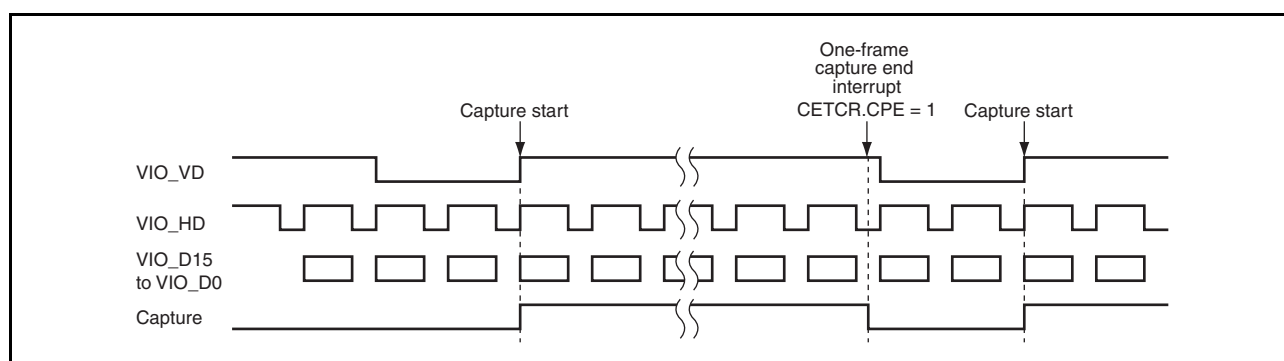

Figure 46.47 CPE Generation Timing

46.4.23 Capture Status Register (CSTSR)

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

Figure 46.50 Overall Timing of CDSSR Operation in Bundle Write
(When Bundle Write End and Capture End Do Not Coincide)

46.4.25 Capture Data Address Y Register 2 (CDAYR2)

CDAYR2 specifies the address for the luminance (Y) component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the Y component of the captured data is to be stored in frame image capture or one-field image capture, the address where the Y component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the Y component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|---|
| 31 to 2 | CAYR2[31:2] | H'0000 0000 | R/W | <ul style="list-style-type: none"> Frame image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units*1). One-field image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units*1). Both-field image capture: These bits set the address for storing the Y component data of the captured top-field data (4-pixel units*1). Data synchronous fetch: These bits set the address for storing data (4-byte units*2). Data enable fetch: These bits set the address for storing data (32-byte units). |
| 1, 0 | CAYR2[1:0] | | R | |

Note 1. 8-pixel units when writing to an area other than the on-chip RAM
Note 2. 8-byte units when writing to an area other than the on-chip RAM

Set the address of the starting point of the memory area where the Y component of the captured image is to be stored in this register, as shown in Figure 46.51.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data synchronous fetch: Set the address of the starting point of the memory area where the captured data is to be stored.
- Data enable fetch: Set the address of the starting point of the memory area where the captured data is to be stored in 32-byte units.

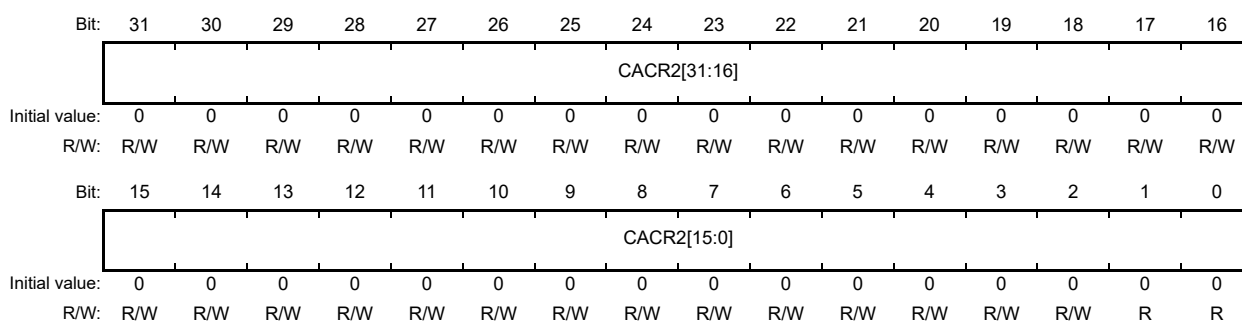

Figure 46.51 Relationship between Captured Image and Y Component Memory Area

46.4.26 Capture Data Address C Register 2 (CDACR2)

CDACR2 specifies the address for the chrominance (C) component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the C component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the C component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C component of the captured data is to be stored by CDACR2. In both-field image capture, set the start address of the memory area where the C component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|--|
| 31 to 2 | CACR2[31:2] | H'0000 0000 | R/W | <ul style="list-style-type: none"> Frame image capture: These bits set the address for storing the C component data of the captured data (4-pixel units*). One-field image capture: These bits set the address for storing the C component data of the captured data (4-pixel units*). Both-field image capture: These bits set the address for storing the C component data of the captured top-field data (4-pixel units*). |
| 1, 0 | CACR2[1:0] | | R | |

Note: * 8-pixel units when writing to an area other than the on-chip RAM

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 46.52.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

The C component has an output data format as shown in Figure 46.53, and is saved in the memory in this format.

Figure 46.52 Relationship between Captured Image and C Component Memory Area

Figure 46.53 Image of Storing C Components in Memory

46.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2)

CDBYR2 specifies the address for the luminance (Y) component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the Y component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

| | | | | | | | | | | | | | | | | |

| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|---|
| 31 to 2 | CDBYR2[31:2] | H'0000 0000 | R/W | These bits set the address for storing the Y component data of the captured bottom-field data (4-pixel units*). Note: * 8-pixel units when writing to an area other than the on-chip RAM |
| 1, 0 | CDBYR2[1:0] | | R | |

In this register, set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 46.54.

Figure 46.54 Relationship between Captured Bottom-Field Image and Y Component Memory Area

46.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2)

CDBCR2 specifies the address for the chrominance (C) component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the C component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

| | | | | | | | | | | | | | | | | |

| 31 to 2 | CBCR2[31:2] | H'0000 0000 | R/W | These bits set the address for storing the C component data of the captured bottom-field data (4-pixel units*). Note: * 8-pixel units when writing to an area other than the on-chip RAM |
| 1, 0 | CBCR2[1:0] | | R | |

In this register, set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 46.55. The C component has an output data format as shown in Figure 46.56, and is saved in the memory in this format.

Figure 46.55 Relationship between Captured Bottom-Field Image and C Component Memory Area

Figure 46.56 Image of Storing C Components in Memory

46.5 Usage Notes for CEU

46.5.1 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock should have a frequency at most the same as the CEU operating clock frequency ($B\phi$), with jitter on both sides included.

$$\text{CEU operating clock frequency (B}\phi\text{)} \geq \text{External input clock frequency}$$

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input

46.5.2 Restrictions on Input/Output Functions

Table 46.11 lists the restrictions regarding the CEU input/output functions.

Table 46.11 Restrictions on CEU Input/Output Functions

| Item | Restrictions |
|---------------------------|--|
| External module interface | The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating clock ($B\phi$), with jitter on both sides included. |
| | Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure. |
| | The capture horizontal size in image capture must be specified as follows: 8-bit interface: 8-cycle units*1 16-bit interface: 4-cycle units*2 Note 1. 16-cycle units when writing to an area other than the on-chip RAM Note 2. 8-cycle units when writing to an area other than the on-chip RAM |
| | The capture horizontal size in data fetch must be specified as follows: 8-bit interface: 4-cycle units*1 16-bit interface: 2-cycle units*2 Note 1. 8-cycle units when writing to an area other than the on-chip RAM Note 2. 4-cycle units when writing to an area other than the on-chip RAM |
| | The capture vertical size must be specified in 4-line units. |
| | The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock for 8-bit digital image input pins, or 16,379 cycles of external input clock for 16-bit digital image input pins. |
| | The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines. |
| | The minimum number of captured pixels should be sub-QCIF (128 × 96). |
| | The maximum number of captured pixels should be 5 megapixels (2,560 × 1,920). |
| | Captured size in data enable fetch Maximum: 6 Mbytes (2,048 × 1,536 × 2) Minimum: 16 bytes |

Table 46.11 Restrictions on CEU Input/Output Functions

| Item | Restrictions |
|---------------------|--|
| Memory output | The output address must be specified in 32-bit units*. Note: * 64-bit units when writing to an area other than the on-chip RAM |
| | The horizontal size of the destination image (memory) must be specified in 4-pixel units*. Note: * 8-pixel units when writing to an area other than the on-chip RAM |
| | The number of horizontal output pixels (= horizontal clipping size) must be specified in 4-pixel units*. Note: * 8-pixel units when writing to an area other than the on-chip RAM |
| | The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units. |
| | In data enable fetch bundle write, the output address must be specified in 32-byte units. |
| Internal processing | The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter. |

46.5.3 Display in the Video Display Controller 6

Since the input data are written to the memory separately as Y data and CbCr data in image capture mode, the captured data cannot be displayed in the video display controller 6.

46.5.4 Software Reset

For transitions to the software reset state by the CPKIL bit in the CAPSR register, see section 52.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the CPKIL bit in the CAPSR register.

47. MIPI CSI2 Interface

47.1 Overview

The CSI2 module is a MIPI (Mobile Industry Processor Interface Alliance) CSI-2 (Camera Serial Interface 2) receiver module. It supports MIPI CSI-2 V1.1 and MIPI D-PHY V2.0. It includes the PHY and LINK blocks. The PHY block incorporates a DPHY. This LSI chip has one CSI2 set, which has two lanes.

The received signals are input to the PHY block; the LINK block receives the bytes of data output by the PHY block; and the PHY block extracts the image data, data type, and channel information before it outputs the data to the subsequent VIN module. Here, the LINK block generates the vertical sync signals (VD), field signals (FLD), horizontal sync signals (HD), data enable signals (PE), and byte enable signals (PEB) for each channel, and outputs them to the VIN module. The LINK registers are used to control the PHY block and monitor its state.

47.1.1 Features

The CSI2 module has the following features.

- (1) Transfer rates from 80 Mbps to 1.0 Gbps for MIPI CSI-2 data (refer to **section 47.3.1**)
- (2) ECC 1-bit error correction and 2-bit or more error detection for packet headers (refer to **section 47.3.2**)
- (3) CRC error detection for payload data (refer to **section 47.3.3**)
- (4) Generation of VD (vertical sync), HD (horizontal sync), and FLD (field) signals (refer to **section 47.3.4**)
- (5) Interrupts (refer to **section 47.3.6**)
- (6) Lane swapping (refer to **section 47.3.7**)
- (7) Initial settings of PHY (refer to **section 47.3.9**)
- (8) PHY control and monitoring through register settings (refer to **section 47.3.10**)
- (9) Interrupt generation in response to the ultra-low-power (ULP) state and reception error state (refer to **section 47.3.11**)
- (10) Supported data type (refer to **section 48, Video Input Module (VIN)**)

47.1.2 Block Diagram

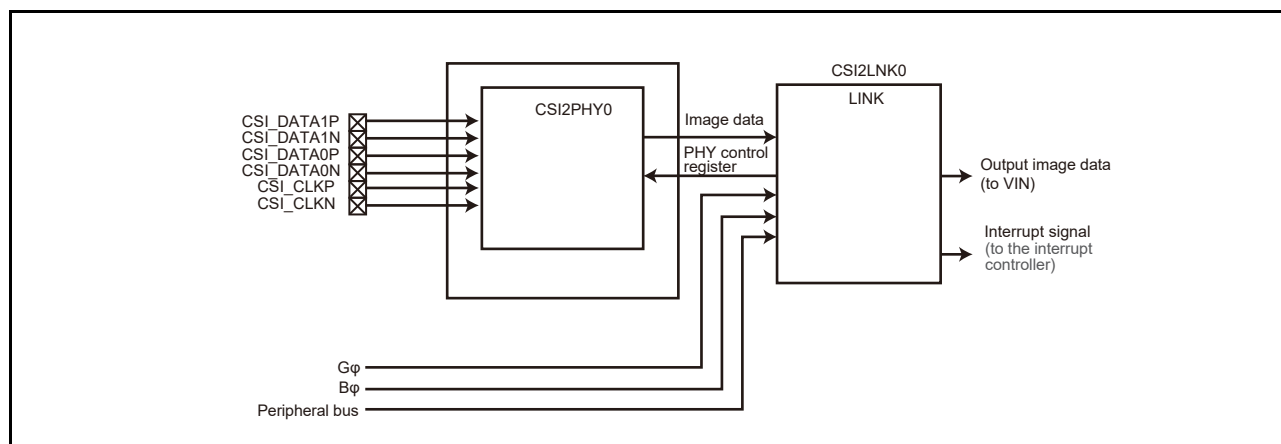

Figure 47.1 CSI2 Block Diagram

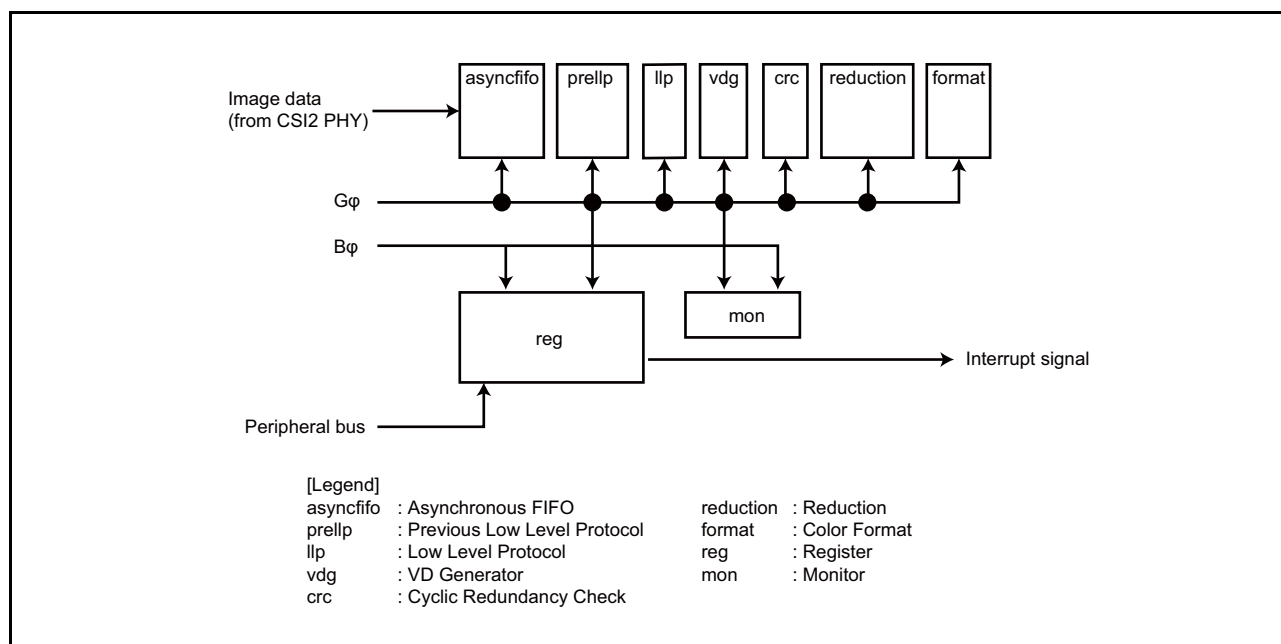

Figure 47.2 CSI2 LINK Block Diagram

47.1.3 External Pins

Table 47.1 External Pins

| Pin Name | Abbreviation | I/O | Function |
|------------------------------|--------------|-------|--|
| Lane 0 positive data pin | CSI_DATA0P | Input | Differential positive receive data input on CSI2 lane 0 |
| Lane 0 negative data pin | CSI_DATA0N | Input | Differential negative receive data input on CSI2 lane 0 |
| Lane 1 positive data pin | CSI_DATA1P | Input | Differential positive receive data input on CSI2 lane 1 |
| Lane 1 negative data pin | CSI_DATA1N | Input | Differential negative receive data input on CSI2 lane 1 |
| Clock lane positive data pin | CSI_CLKP | Input | Differential positive reception input on CSI2 clock lane |
| Clock lane negative data pin | CSI_CLKN | Input | Differential negative reception input on CSI2 clock lane |

47.1.4 Register Configuration

The following lists the base address of this module.

| Module Name | Address |
|-------------|-------------|
| CSI2LNK0 | H'E820 9000 |

Table 47.2 Register Configuration

| Register Name | Abbreviation | R/W | Address | Initial Value | Access Size |
|---|--------------|---------|---------|---------------|-------------|

| Packet Header Monitor Register 6 | PHM6 | R | H'01D4 | H'0000 0000 | 32 |
| Packet Header Monitor Register 7 | PHM7 | R | H'01D8 | H'0000 0000 | 32 |
| Packet Header Monitor Register 8 | PHM8 | R | H'01DC | H'0000 0000 | 32 |
| PHY Timing Register 1 | PHYTIM1 | R/W | H'0264 | H'0000 0000 | 32 |
| PHY Timing Register 2 | PHYTIM2 | R/W | H'0268 | H'0000 0000 | 32 |
| PHY Timing Register 3 | PHYTIM3 | R/W | H'026C | H'0000 0000 | 32 |

Note 1. Only 1 can be written to clear the flag; bits 27, 4, and 3 are read-only bits and any value cannot be written to.

Note 2. Only 1 can be written to clear the flag.

Note 3. Access to these registers is only possible in 32-bit units.

47.2 Register Description

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/WB: Write-only. The read value is undefined.

47.2.1 Control Timing Select Register (TREF)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TREF |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | TREF | 1 | R/W | Register value reflection timing selection 1: Immediately Do not change this bit from its initial value. |

47.2.2 Software Reset Register (SRST)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SRST |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SRST | 0 | R/W | Software reset control 0: Normal 1: Reset This bit resets the control circuit in the CSI2 block. To reset the circuit, set this bit to 1. Be sure to set this bit to 0 to cancel a reset. A software reset does not initialize the CSI2 registers. |

Note: The setting of the effective bit of this register becomes applicable the instant the register is set.

47.2.3 PHY Operation Control Register (PHYCNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|---------------|----|----|---------------|--------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SHUTD OWNZ | RSTZ |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | ENABL ECLK | — | — | ENABL E_1 | ENABL E_0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|---|
| 31 to 18 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 17 | SHUTDOWNZ | 0 | R/W | Setting this bit to 0 shuts down the PHY block. |
| 16 | RSTZ | 0 | R/W | Setting this bit to 0 initializes the PHY block. |
| 15 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | ENABLECLK | 0 | R/W | Clock lane operation enable 0: Disables operation. 1: Enables operation. When any of the ENABLE_1 to ENABLE_0 bits is set to 1, be sure to set the ENABLECLK bit to 1. |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | ENABLE_1 | 0 | R/W | Data lane 1 operation enable 0: Disables operation. 1: Enables operation. Note: When 1-lane PHY is connected, this setting has no effect. |
| 0 | ENABLE_0 | 0 | R/W | Data lane 0 operation enable 0: Disables operation. 1: Enables operation. Always set this bit to 1. |

Note: The setting of the effective bit of this register becomes applicable the instant the register is set. Set this register while data input is suspended (the sensor is halted); never change the settings of this register during operation.

47.2.4 Checksum Control Register (CHKSUM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|--------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ECC_EN | CRC_EN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | ECC_EN | 0 | R/W | ECC process control 0: Disabled 1: Enabled This bit controls ECC process of the packet header (PH) for Low Level Protocol (LLP). Set this bit to 1 to use ECC. When set to 0, data is always processed assuming it has no errors and thus no errors are corrected. |
| 0 | CRC_EN | 0 | R/W | CRC checksum process control 0: Disabled 1: Enabled This bit controls checksum process of the long packet data for Low Level Protocol (LLP). Set this bit to 1 to use CRC checksum. When set to 0, data is always processed assuming it has no errors. |

Note: The settings of the effective bits of this register become applicable the instant the register is set. Set this register while data input is suspended (the sensor is halted); never change the settings of this register during operations.

47.2.5 Channel Data Type Select Register (VCDT)

| | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|--------|-----|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | VCDT_EN | — | — | — | — | — | SEL_VC | — | SEL_DT_ON | — | — | — | — | — | — | — |
| Initial value: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 |
| R/W: | R/W | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 23 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 to 16 | — | H'1E | R | Reserved These bits are always read as H'1E. The write value should always be H'1E. |
| 15 | VCDT_EN | 1 | R/W | Channel enable 0: Disabled 1: Enabled This bit enables or disables channel. When set to 0, VD and FLD are fixed to low and TAG = 0 is not generated. |
| 14 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | SEL_VC | H'0 | R/W | Channel select channel H'0 to H'3 These bits specify the virtual channels for channel to capture. Channels can be selected from among four channels from H'0 to H'3. Data is output from the channel when the value of this register matches the received virtual channel. |
| 7 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | SEL_DT_ON | 0 | R/W | Channel select data type enable 0: Disabled 1: Enabled This bit enables or disables data type match function using SEL_DT. When set to 0, data is output from the channel even when the setting of SEL_DT does not match the received data type as long as it matches the virtual channel. When set to 1, data is output from the channel only when the setting of SEL_DT matches the received data type and the virtual channel. |
| 5 to 0 | SEL_DT | H'1E | R/W | Channel select data type H'00 to H'3F These bits specify the data type for channel to capture. The CSI2 LINK block outputs the received payload data as it is regardless of the data type when SEL_DT_ON is set to 0 whereas there are some restrictions on the corresponding data type (such as color format) for the following VIN module. |

Note 1. This register must be set during the initialization sequence.

Note 2. In the table above, "virtual channel" refers to a channel through which data flows from the camera and "channel" refers to an output channel of the CSI2.

47.2.6 Frame Data Type Select Register (FRDT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|-----|-----|-----|-----|-----|-----|----|----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | | | | | | | — | — | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31, 30 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 29 to 24 | DT_FS | H'00 | R/W | Frame start data type These bits specify the frame start data type. When the value of these bits matches the received data type, the data is determined as a frame start. |
| 23, 22 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 21 to 16 | DT_FE | H'01 | R/W | Frame end data type These bits specify the frame end data type. When the value of these bits matches the received data type, the data is determined as a frame end. |
| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

47.2.7 Field Detection Control Register (FLD)

| | | | | | | | | | | | | | | | | |
|----------------|---------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|-----|--------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | FLD_NUM | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | FLD_DET_SEL | — | — | — | — | FLD_EN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 16 | FLD_NUM | H'0000 | R/W | Even field number setting These bits specify the value for detecting the even field of the interlaced image. For detecting the even field, the WC value (16 bits) of the Frame Start packet is referred to. When the WC value matches the setting of these bits, the field is detected as the even field. During the frame period, the CSIR_FLD signal stays High. |
| 15 to 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5, 4 | FLD_DET_SEL | B'00 | R/W | Even field detection condition select 00: The field is detected as the first field when FLD_NUM matches WC. 01: The field is detected as the first field when FLD_NUM[0] matches WC[0]. 10: The field is detected as the first field when FLD_NUM[0] matches WC[8]. 11: Setting is prohibited. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | FLD_EN | 0 | R/W | Channel even field detection control This bit enables or disables the detection of even fields in channel 1. Set this bit to 1 to enable detection. This bit must be set to 0 when input images are arranged for progressive (sequential) scanning. |

Note: This register must be set during the initialization sequence.

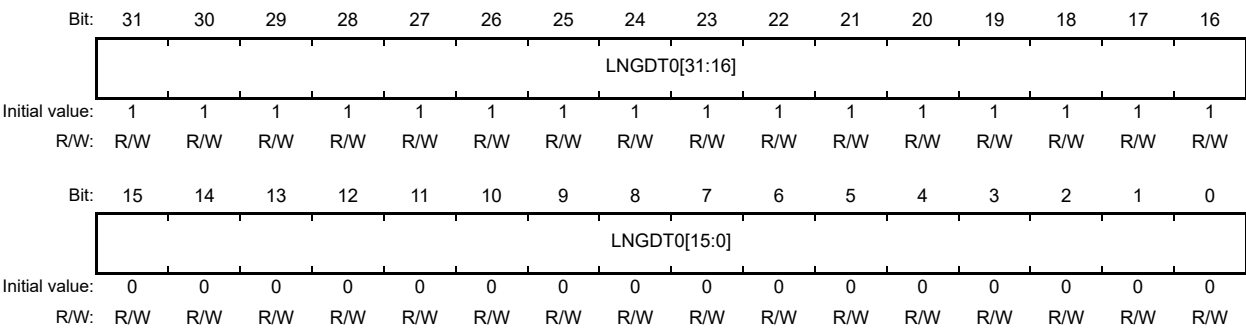

47.2.8 Automatic Standby Control Register (ASTBY)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|--------------|-----|-----|-----|-----|-----|---|---|-----------|-----------------|-----|-----|-----|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | VD_MSK_CYCLE | | | | | | — | — | VD_MSK_EN | AUTO_STANDBY_EN | | | | |
| Initial value: | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

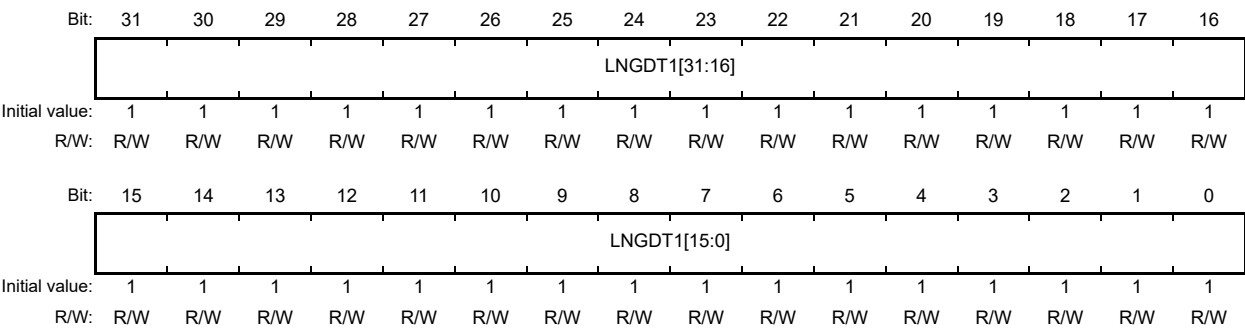

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|---|
| 31 to 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13 to 8 | VD_MSK_CYCLE | H'3F | R/W | VD masking cycle These bits specify the period for the masking of VD and FLD in response to frame-start errors. A frame-start error is the state in which FS is received and a further FS is received before FE is received. When a frame-start error occurs, the VD signal does not go low (Vsync is not generated); masking VD leads to the generation of the period over which VD is low. VD is masked for $4 \times \text{VD_MSK_CYCLE} \times \text{input clock period}$. Maximum value: This bit must be set so that VD is masked for less than the period from an EOT short packet (frame start) to an SOT long packet. Minimum value: This bit must be at least 5, i.e. VD is masked for $20 \times \text{input clock period}$. |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5 | VD_MSK_EN | 1 | R/W | VD masking enable 0: Disables masking VD. 1: Enables masking VD. This bit enables or disables VD and FLD masking function when a frame start error occurs. When this bit is set to enable the function, VD and FLD are masked for the period specified with the VD_MSK_CYCLE bits. |
| 4 to 0 | AUTO_STANDBY_EN | H'01 | R/W | Automatic standby control 0: Neither VD nor FLD is initialized. 1: VD and FLD are initialized. [0]: ECC 2-bit error [1]: ECC 1-bit error on receiving FS [2]: ECC 1-bit error on receiving FE [3]: ECC 1-bit error on receiving data other than FS or FE [4]: CRC error Each bit enables or disables initialization of VD and FLD in response to the corresponding error. Set the corresponding bit to 1 to enable initialization of the VD and FLD signals. |

47.2.9 Long Data Type Setting Register 0 (LNGDT0)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | LNGDT0 | H'FFFF 0000 | R/W | Long data type setting 0: Short packet 1: Long packet This register is combined with LNGDT1 register as in LNGDT = {LNGDT1, LNGDT0}. When LNGDT[received DT[5:0]] is 1, data is determined as a long packet and it is determined as a short packet when 0. According to the MIPI standard, DT = H'00 to H'0F is defined as a short packet and DT = H'10 to H'3F is defined as a long packet; to satisfy these conditions, the initial values of LNGDT are 0 in bits 0 to 15 and 1 in bits 16 to 63. |

47.2.10 Long Data Type Setting Register 1 (LNGDT1)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | LNGDT1 | H'FFFF FFFF | R/W | Long data type setting 1 0: Short packet 1: Long packet These bits set the long packet or short packet as the data type (assigns H'3F to H'20). |

47.2.11 Interrupt Enable Register (INTEN)

| R/W: | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R | R | R/WC1 | R/WC1 | R | R | R | R/WC1 | R | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-------|--|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | IST[28] | 0 | R/WC1 | Interrupt 28 (INT_LESS_THAN_WC) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 28 is an error interrupt that is generated when the length of payload data of a long packet is less than the WC value. |
| 27 | IST[27] | 0 | R | Interrupt 27 (INT_AFIFO_OF) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 27 is generated in response to an overflow of the asynchronous FIFO, which holds the HS data sent from the PHY. IST[27] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[8]) generates the interrupt. Therefore, the interrupt is cleared using the interrupt error status monitoring register. Check the relevant registers such as the PHY data lane monitoring register since synchronization between lanes may not be taken or data may not be received in a specific lane. |
| 26 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 | IST[20] | 0 | R/WC1 | Interrupt 20 (INT_VD_START) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 20 is generated in response to the start of VD output from the CSI2 (a frame start interrupt). It is issued in synchronization with the rising edge of the CSIR_VD signal. |
| 19 | IST[19] | 0 | R/WC1 | Interrupt 19 (INT_VD_END) monitor Writing to this bit leads to clearing of the interrupt. 1: Clears the interrupt. When read, the bit reflects the state. 0: Normal 1: The interrupt has been generated. Interrupt 19 is generated in response to the end of VD output from the CSI2 (a frame end interrupt). It is issued in synchronization with the falling edge of the CSIR_VD signal. |

| Bit | Bit Name | Initial Value | R/W | Description |

This bit is set to 1 when an error is detected in lane 1. If the setting of ICL[3] in the interrupt source mask register is 1, INT_ERRSOTSYNCHS_1 is cleared to 0.</p> |
| 0 | IEST[0] | 0 | R/WC1 | <p>Error interrupt 0 (INT_ERRSOTSYNCHS_0) monitor</p> <p>Writing to this bit leads to clearing of the interrupt.</p> <p>1: Clears the interrupt.</p> <p>When read, the bit reflects the state.</p> <p>0: Normal</p> <p>1: The interrupt has been generated.</p> <p>Error interrupt 0 is generated in response to a non-synchronized start-of-transmission (SoT) during HS reception. This bit is set to 1 when an error is detected in lane 0. If the setting of ICL[3] in the interrupt source mask register is 1, INT_ERRSOTSYNCHS_0 is cleared to 0.</p> |

47.2.15 Short Packet Data Register (SHPDAT)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|-------------------------------|
| 31 to 24 | ECC | H'00 | R | ECC data received |
| 23 to 8 | DATA | H'0000 | R | Short packet data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type received |

SHPDAT is used to read the received short packet data. The value of this register is stored in the FIFO and the number of packets stored can be checked by reading the short packet count register (SHPCNT). Short packets with the data types H'00 (frame start), H'01 (frame end), and H'08 (Generic Short Packet Code 1, DSI End of Transmission) are not stored.

47.2.16 Short Packet Count Register (SHPCNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|-----|

| | — | — | — | — | — | — | — | — | — | — | — | — | L1SEL | | L0SEL | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 5 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 4 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 3, 2 | L1SEL | H'1 | R/W | LINK lane 1 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Setting prohibited H'3: Setting prohibited Note: When the connected PHY is single-lane, this setting has no effect. These bits select a PHY lane to be assigned to LINK lane 1. These bits should be set before the start of PHY operation and should not be modified during operation. |
| 1, 0 | L0SEL | H'0 | R/W | LINK lane 0 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Setting prohibited H'3: Setting prohibited These bits select a PHY lane to be assigned to LINK lane 0. These bits should be set before the start of PHY operation and should not be modified during operation. |

Note: The setting of the effective bit of this register becomes applicable the instant the register is set. Set the ENABLE_0 bit in PHYCNT to 1 to enable modifying the value of this register.

47.2.19 PHY ESC Error Monitor Register (PHEERM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|-------------------|----|----|--------------|--------------|---|---|---|---|---|---|------------------|------------------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | CL_ERR CONTROL | — | — | ERRESC _1 | ERRESC _0 | — | — | — | — | — | — | ERRCONT ROL_1 | ERRCONT ROL_0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------------|---------------|-----|--|
| 31 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 | CL_ERR CONTROL | 0 | R | Clock lane status control error bit If an incorrect line state is entered during entry to the HS or escape mode, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state. |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 | ERRESC_1 | 0 | R | Lane 1 escape mode error bit Note: When 1-lane PHY is connected, the error is not generated. If an unrecognizable escape entry command is received, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state. |
| 8 | ERRESC_0 | 0 | R | Lane 0 escape mode error bit If an unrecognizable escape entry command is received, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state. |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | ERRCONTROL_1 | 0 | R | Lane 1 status control error bit Note: When 1-lane PHY is connected, the error is not generated. If an incorrect line state is entered during entry to HS or escape mode, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state. |
| 0 | ERRCONTROL_0 | 0 | R | Lane 0 status control error bit If an incorrect line state is entered during entry to HS or escape mode, this bit is set to the high level, and the current state is retained until a transition is made to the LP-00, LP-01, LP-10, or LP-11 state. |

47.2.20 PHY Clock Lane Monitor Register (PHCLM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----------------------|------------------|-------------------|------------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | ULPSACTIV ENOTCLK | RXULPS CLKNOT | RXCLK ACTIVEHS | STOPST ATECLK |

| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13 | ULPSACTIVE NOT_1 | 1 | R | This active-low signal is asserted to indicate that lane 1 is in the ultra low power (ULP) state. Note: When the connected PHY is single-lane, this bit is fixed to 1. This bit is set to 0 when lane 1 is placed in the ULP state, and is set to 1 when the Mark-1 state (LP-10) is observed. |
| 12 | ULPSACTIVE NOT_0 | 1 | R | This active-low signal is asserted to indicate that lane 0 is in the ULP state. This bit is set to 0 when lane 0 is placed in the ULP state, and is set to 1 when the Mark-1 state (LP-10) is observed. |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 | RXULPSESC _1 | 0 | R | This bit indicates that lane 1 is in the ULP state. Note: When the connected PHY is single-lane, this bit is fixed to 0. This bit is set to 1 when lane 1 is placed in the ULP state, and is set to 0 to when the stop state (LP-11) is observed. |
| 8 | RXULPSESC _0 | 0 | R | This bit indicates that lane 0 is in the ULP state. This bit is set to 1 to indicate that lane 0 is placed in the ULP state, and is set to 0 to indicate that the stop state (LP-11) is observed. |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | STOPSTATE DATA_1 | 0 | R | This bit being 1 indicates that lane 1 is in the stop state. Note: When the connected PHY is single-lane, this bit is fixed to 0. |
| 0 | STOPSTATE DATA_0 | 0 | R | This bit being 1 indicates that lane 0 is in the stop state. |

47.2.22 Packet Header 0 Monitor Register 0 (PH0M0)

| | | | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|--|--|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |
| | — | — | — | — | — | — | — | — | WC[15:8] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | | |

| | WC[7:0] | | | | | | | | VC | | DT | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PH0M0 is used to monitor the received packet header.

47.2.23 Packet Header 0 Monitor Register 1 (PH0M1)

| | | | | | | | | | | | | | | | | |
|----------------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PH_CNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | PH_CNT | H'0000 | R | PH0M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH0M0 register. |

47.2.24 Packet Header 1 Monitor Register 0 (PH1M0)

| | | | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|--|--|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |
| | — | — | — | — | — | — | — | — | WC[15:8] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| | WC[7:0] | | | | | | | | VC | | DT | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PH1M0 is used to monitor the received packet header (previous data of PH0M0).

47.2.25 Packet Header 1 Monitor Register 1 (PH1M1)

| | | | | | | | | | | | | | | | | |
|----------------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PH_CNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | PH_CNT | H'0000 | R | PH1M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH1M0 register. |

47.2.26 Packet Header 2 Monitor Register 0 (PH2M0)

| | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | WC[15:8] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | WC[7:0] | | | | | | | | VC | | DT | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PH2M0 is used to monitor the received packet header (previous data of PH1M0).

47.2.27 Packet Header 2 Monitor Register 1 (PH2M1)

| | | | | | | | | | | | | | | | | |
|----------------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PH_CNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | PH_CNT | H'0000 | R | PH2M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH2M0 register. |

47.2.28 Packet Header 3 Monitor Register 0 (PH3M0)

| | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | WC[15:8] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | WC[7:0] | | | | | | | | VC | | DT | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PH3M0 is used to monitor the received packet header (previous data of PH2M0).

47.2.29 Packet Header 3 Monitor Register 1 (PH3M1)

| | | | | | | | | | | | | | | | | |
|----------------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PH_CNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | PH_CNT | H'0000 | R | PH3M0 register consecutive reception count These bits monitor the number of times of consecutive receptions for the PH3M0 register. |

47.2.30 Packet Header R Monitor Register 0 (PHRM0)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|-------------------------------|
| 31 to 24 | ECC | H'00 | R | ECC data received |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PHRM0 is used to monitor the currently received packet header.

47.2.31 Packet Header R Monitor Register 1 (PHRM1)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|-------------------------------|
| 31 to 24 | ECC | H'00 | R | ECC data received |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PHRM1 is used to monitor the received packet header (previous data of PHRM0).

47.2.32 Packet Header R Monitor Register 2 (PHRM2)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|-------------------------------|
| 31 to 24 | ECC | H'00 | R | ECC data received |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PHRM2 is used to monitor the received packet header (previous data of PHRM1).

47.2.33 Packet Header C Monitor Register 0 (PHCM0)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 24 | CAL_PARITY | H'00 | R | Parity calculated from the header |
| 23 to 8 | WC | H'0000 | R | Received word count data after ECC correction |
| 7, 6 | VC | B'00 | R | Received virtual channel data after ECC correction |
| 5 to 0 | DT | H'00 | R | Received data type data after ECC correction |

PHCM0 is used to monitor the currently received ECC-corrected packet header and calculated parity.

47.2.34 Packet Header C Monitor Register 1 (PHCM1)

| | | | | | | | | | | | | | | | | |
|----------------|------------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | CAL_PARITY | | | | | | | | WC[15:8] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | WC[7:0] | | | | | | | | VC | | DT | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 24 | CAL_PARITY | H'00 | R | Parity calculated from the header |
| 23 to 8 | WC | H'0000 | R | Received word count data after ECC correction |
| 7, 6 | VC | B'00 | R | Received virtual channel data after ECC correction |
| 5 to 0 | DT | H'00 | R | Received data type data after ECC correction |

PHCM1 is used to monitor the currently received ECC-corrected packet header and calculated parity (previous data of PHCM0).

47.2.35 CRC Monitor Register 0 (CRCM0)

| | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | CRC | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CAL_CRC | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | CRC | H'0000 | R | Received CRC |
| 15 to 0 | CAL_CRC | H'0000 | R | Received data type data after ECC correction |

CRCM0 is used to monitor the CRC currently received and CRC calculated from the received data.

47.2.36 CRC Monitor Register 1 (CRCM1)

| | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | CRC | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CAL_CRC | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | CRC | H'0000 | R | Received CRC |
| 15 to 0 | CAL_CRC | H'0000 | R | CRC result calculated from the received data |

CRCM1 is used to monitor the CRC currently received and CRC calculated from the received data (previous data of CRCM0).

47.2.37 SOT Error Count Register (SERRCNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | ERRSOTHS_CNT | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | ERRSOTHS_CNT | H'00 | R | Synchronized SOT error count These bits monitor the number of synchronized SOT errors. The count is the sum of the errors on each lane. |

47.2.38 SOTSYNC Error Count Register (SSERRCNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|---|---|---|---|--------------|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | ERRSOTSYNCHS | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------|---------------|-----|---|
| 31 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | ERRSOTSYNC HS | H'0 | R | Non-synchronized SOT error count These bits monitor the number of non-synchronized SOT errors. The count is the sum of the errors on each lane. After this error is input, no synchronization signal is generated. If the asynchronous FIFO for storing data from the PHY overflows here, the internal registers shift to the abnormal state. In this case, the state can only be restored by resetting the CSI2 control circuit using the software reset register (within this module) or inputting a software reset from an external module after resetting the PHY and stopping the normal lane data from the PHY. |

47.2.39 ECC_CRCT Count Register (ECCCM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|--------------|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | ECC_CRCT_CNT | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | ECC_CRCT_CNT | H'00 | R | ECC 1-bit correction count These bits monitor the number of ECC 1-bit corrections. |

47.2.40 ECC_ERR Count Register (ECECM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|-------------|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | ECC_ERR_CNT | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|--|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | ECC_ERR_CNT | H'00 | R | ECC error (two bits or more) count These bits monitor the number of ECC errors (of two bits or more). |

47.2.41 CRC_ERR Count Register (CRCECM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|-------------|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | CRC_ERR_CNT | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|--|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | CRC_ERR_CNT | H'00 | R | CRC error count These bits monitor the number of CRC errors. |

47.2.42 Line Register (LCNT)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LINE_CNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | — | H'0000 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | LINE_CNT | H'0000 | R | Channel reception line These bits monitor the line currently received on channel. |

47.2.43 Line Monitor Register (LCNTM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|--------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MONI_LINECNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 31 to 16 | — | H'0000 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | MONI_LINECNT | H'0000 | R | Channel received line count These bits monitor the number of lines of the most recently received frame on channel. |

47.2.44 Frame Count Monitor Register (FCNTM)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MONI_FCOUNT | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 16 | — | H'0000 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | MONI_FCOUNT | H'0000 | R | Channel received frame count These bits monitor the number of frames which have been received so far on channel. |

47.2.45 PHY Data IN Monitor Register (PHYDIM)

| | | | | | | | | | | | | | | | | |
|----------------|------------|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | RXDATAHS_1 | | | | | | | | RXDATAHS_0 | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 16 | — | H'0000 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 8 | RXDATAHS_1 | H'00 | R | Byte data received on data lane1 When 1-lane PHY is connected, these bits are fixed to 0. |
| 7 to 0 | RXDATAHS_0 | H'00 | R | Byte data received on data lane 0 |

PHYDIM is used to monitor byte data input from the PHY block.

47.2.46 PHY Input Monitor Register (PHYIM)

| | | | | | | | | | | | | | | | | |
|----------------|-----------|----|----|----|----|----|----|----|----------------|----|-------------|-------------|----------------|----|--------------|--------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | RXCLK_CNT | — | — | — | — | — | — | — | — | — | RXVALIDHS_1 | RXVALIDHS_0 | — | — | RXACTIVEHS_1 | RXACTIVEHS_0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | RXSYNCHS_1_CNT | | | | RXSYNCHS_0_CNT | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 | RXCLK_CNT | 0 | R | RXCLK counter 0 This bit monitors signals toggled at the rising edge of RXCLK. |
| 30 to 22 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 21 | RXVALIDHS_1 | 0 | R | Data lane 1 HS valid signal Note: When 1-lane PHY is connected, this bit is fixed to 0. This bit monitors the valid signal on lane 1 input from the PHY. |
| 20 | RXVALIDHS_0 | 0 | R | Data lane 0 HS valid signal This bit monitors the valid signal on lane 0 input from the PHY. |
| 19,18 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 17 | RXACTIVEHS_1 | 0 | R | Data lane 1 HS active signal Note: When 1-lane PHY is connected, this bit is fixed to 0. This bit monitors the active signal on lane 1 input from the PHY. |
| 16 | RXACTIVEHS_0 | 0 | R | Data lane 0 HS active signal This bit monitors the active signal on lane 0 input from the PHY. |
| 15 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 4 | RXSYNCHS_1_CNT | H'0 | R | Data lane 1 HS synchronization signal count Note: When 1-lane PHY is connected, these bits are fixed to 0. These bits monitor the count of RSYNCHS_1 input from the PHY. |
| 3 to 0 | RXSYNCHS_0_CNT | H'0 | R | Data lane 0 HS synchronization signal count These bits monitor the count of RSYNCHS_0 input from the PHY. |

47.2.47 VIN Data Monitor Register (VINDM)

| | | | | | | | | | | | | | | | | |
|----------------|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | CSIR_DAT[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CSIR_DAT[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------------|---------------|-----|---|
| 31 to 0 | CSIR_DAT [31:0] | H'0000_0000 | R | Data output from CSI2 These bits monitor the CSIR_DAT signal output from the CSI2. |

47.2.48 VIN Signal Monitor Register 1 (VINSM1)

| | | | | | | | | | | | | | | | | |
|----------------|-------------|----|----|----|-------------|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CSIR_VD_CNT | | | | CSIR_HD_CNT | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 12 | CSIR_VD_CNT | H'0 | R | Count of VD output from CSI2 These bits count and monitor the vertical synchronization signals for channel output from CSI2. |
| 11 to 0 | CSIR_HD_CNT | H'000 | R | Count of HD output from CSI2 These bits count and monitor the HD signals for channel output from CSI2. |

47.2.49 VIN Signal Monitor Register 3 (VINSM3)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|-----------|-----------|----------|----------|----|----|---|----------|---|---|---|---|---|---|---------|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CSIR_ERRE | CSIR_ERRC | CSIR_TAG | CSIR_FLD | | | | CSIR_PEB | | | | — | — | — | CSIR_PE | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 | CSIR_ERRE | 0 | R | ECC error output from CSI2 This bit monitors the ECC error signal output from CSI2. |
| 14 | CSIR_ERRC | 0 | R | CRC error output from CSI2 This bit monitors the CRC error signal output from CSI2. |
| 13, 12 | CSIR_TAG | B'00 | R | TAG output from CSI2 These bits monitor the channel information output from CSI2. |
| 11 to 8 | CSIR_FLD | H'0 | R | FLD output from CSI2 These bits monitor the field information output from CSI2. |
| 7 to 4 | CSIR_PEB | H'0 | R | PEB output from CSI2 These bits monitor the byte enable signal output from CSI2. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | CSIR_PE | 0 | R | PE output from CSI2 This bit monitors the packet enable signal output from CSI2. |

47.2.50 PHY Output Monitor Register (PHYOM)

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----------|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | ENABLECLK | 0 | R | Lane enable signal to the clock lane |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | ENABLE_1 | 0 | R | Lane enable signal to data lane 1 |
| 0 | ENABLE_0 | 0 | R | Lane enable signal to data lane 0 |

PHYOM is used to monitor the lane enable signal output from the CSI2 to the PHY block.

47.2.51 Packet Header Monitor Registers 1 to 8 (PHM1 to PHM8)

| | | | | | | | | | | | | | | | | |
|----------------|---------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | ECC | | | | | | | | WC[15:8] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | WC[7:0] | | | | | | | | VC | | DT | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|-------------------------------|
| 31 to 24 | ECC | H'00 | R | ECC data received |
| 23 to 8 | WC | H'0000 | R | Word count data received |
| 7, 6 | VC | B'00 | R | Virtual channel data received |
| 5 to 0 | DT | H'00 | R | Data type data received |

PHM1 to PHM8 are used to monitor received packet headers.

The first data are stored in PHM1, and then are shifted to PHM2 when the received packet header changes. After data have been stored in PHM8, data are stored in PHM1 again.

47.2.52 PHY Timing Register 1 (PHYTIM1)

| | | | | | | | | | | | | | | | | |

| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13 to 8 | THS_SETTLE | H'00 | R/W | MIPI D-PHY T_{HS_SETTLE} parameter setting These bits specify the period over which a transition to the HS state is to be ignored after the $T_{CLK_PREPARE}$ period has begun in the data lane. |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5 to 0 | THS_PREPARE | H'00 | R/W | MIPI D-PHY $T_{HS_PREPARE}$ parameter setting These bits specify the duration of the LP-00 state (immediately before entry to the HS-0 state) in the data lane. |

47.3 Operation

47.3.1 Transfer Rate

This module supports transfer rates from 80 Mbps to 1.0 Gbps.

Figure 47.3 shows a transfer at 1.0 Gbps.

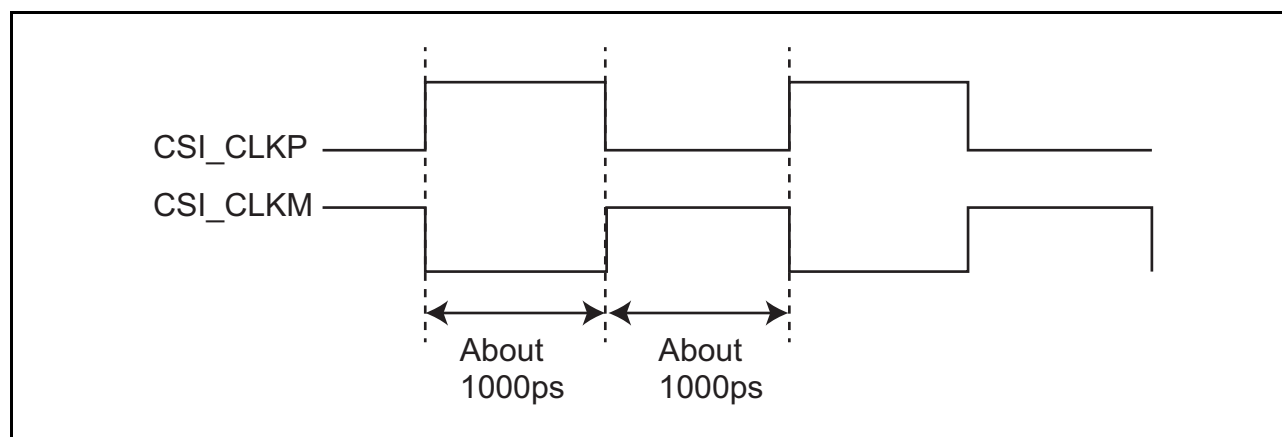

Figure 47.3 CSI-2 Transfer Rate

47.3.2 ECC 1-Bit Error Correction and 2-Bit or More Error Detection for Packet Headers

An interrupt can be generated upon ECC 1-bit error correction and 2-bit or more error detection.

| Interrupt Source | Register Bit Name | Bit |
|-----------------------------|-------------------|------|
| ECC error in 2 or more bits | ECC_ERR | [11] |
| ECC 1-bit error correction | ECC_CRCT_ERR | [10] |

The ECC_EN bit in the checksum control register (CHKSUM) is used to enable or disable this function.

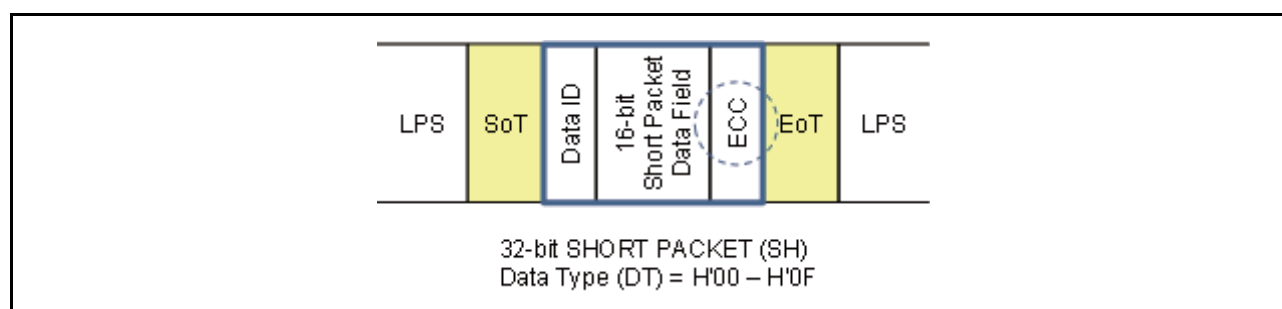

Figure 47.4 MIPI CSI-2 Short Packet

47.3.3 CRC Error Detection for the Payload Data

This module generates an interrupt in response to detection of a CRC error.

| Interrupt Source | Register Bit Name | Bit |
|------------------|-------------------|------|
| CRC error | CRC_ERR | [15] |

The CRC_EN bit in the checksum control register (CHKSUM) is used to enable or disable this function.

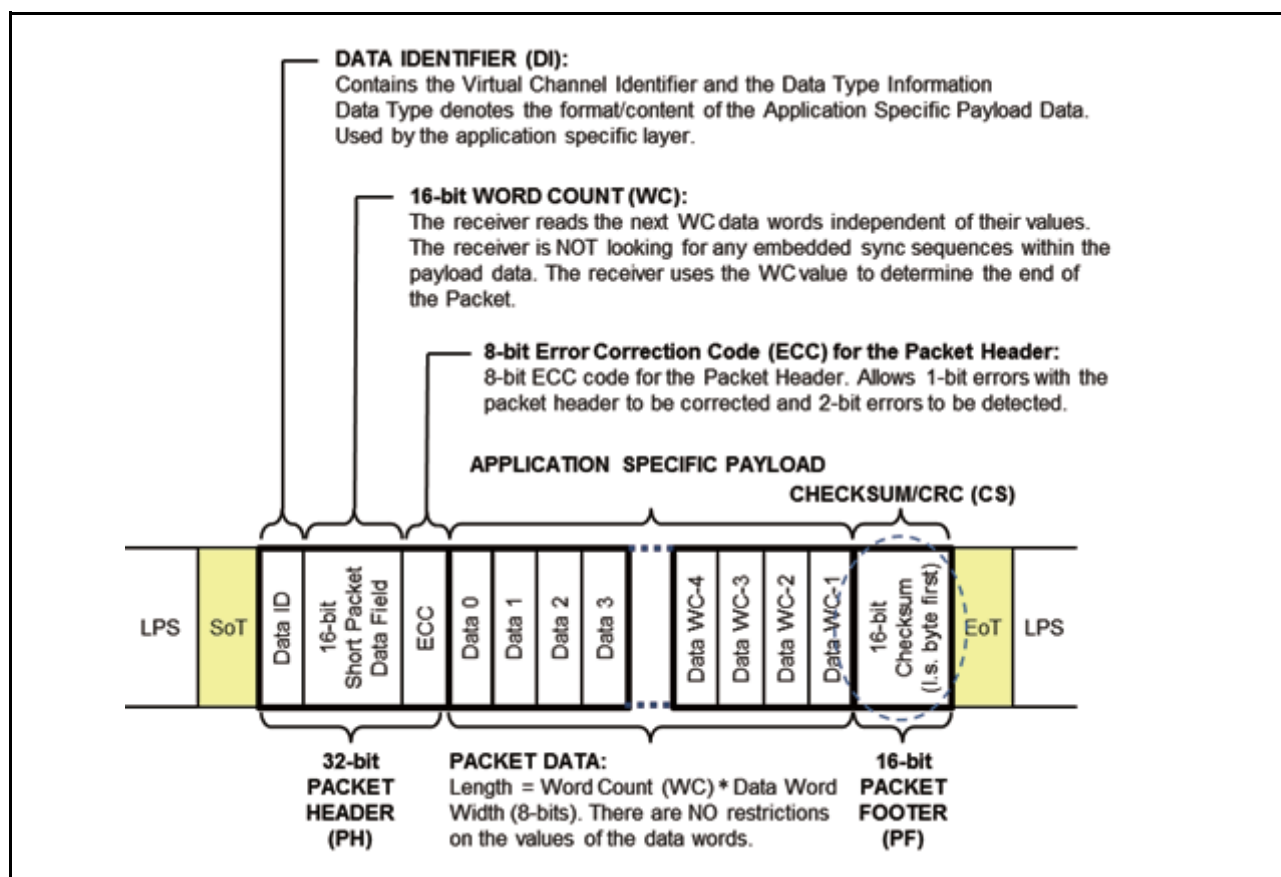

Figure 47.5 MIPI CSI-2 Long Packet

47.3.4 Generation of Vertical Sync (VD), Horizontal Sync (HD), and Field (FLD) Signals

(1) VD

When a frame start short packet is received, VD is driven high. When a frame end short packet is received, VD is driven low. (This applies to the channel specified with the VC value in the packet header.)

(2) HD

When the sync signal of a long packet (SOT) is received, HD is driven high. When the number of the received long packets reaches the WC value in the packet header, HD is driven low. The frame start short packet of the reception channel should be received in advance.

(3) FLD

When a frame start short packet is received, if the field value of the short packet data satisfies the condition specified with the field detection control register (FLD), FLD is driven high. When a frame end short packet is received, FLD is driven low. (This applies to the channel specified with the VC value in the packet header.)

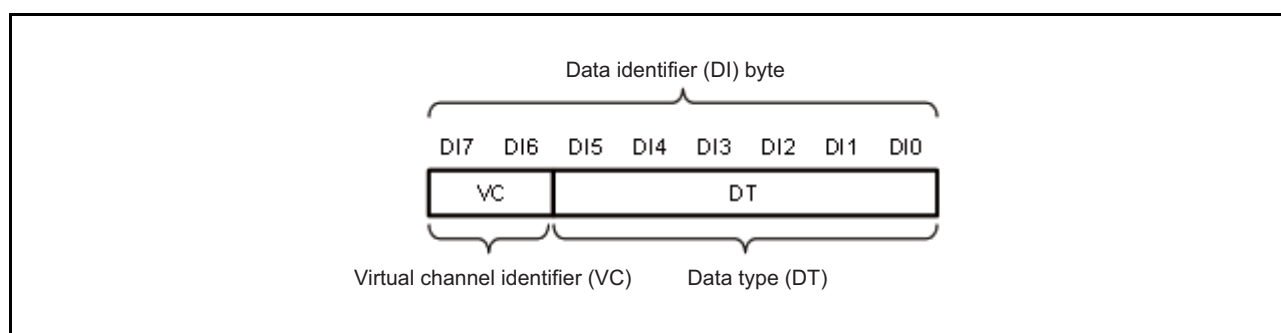

Figure 47.6 MIPI CSI-2 DI

Table 47.3 MIPI CSI-2 Short Packet Data Type Codes

| Data Type | Description |
|--------------|----------------------------|
| H'00 | Frame Start Code |
| H'01 | Frame End Code |
| H'02 | Line Start Code (Optional) |
| H'03 | Line End Code (Optional) |
| H'04 to H'07 | Reserved |

47.3.5 Single-Channel Output

As shown in Figure 47.7 and Figure 47.8, when an interleaved transfer of virtual channels is received, the output virtual channel can be selected. The output virtual channel can be selected among the four virtual channels between 0 and 3. The receiving virtual channel can be changed with the register setting (SEL_VC bit of the channel data type selection register (VCDT)).

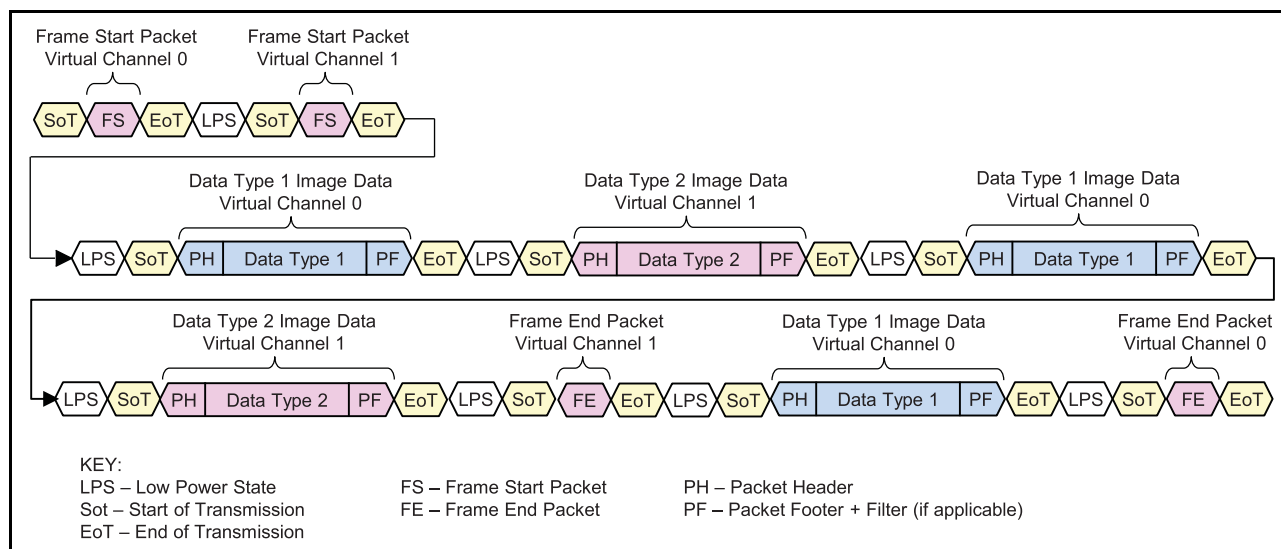

Figure 47.7 (1) MIPI CSI-2 Interleaved Transmission 1

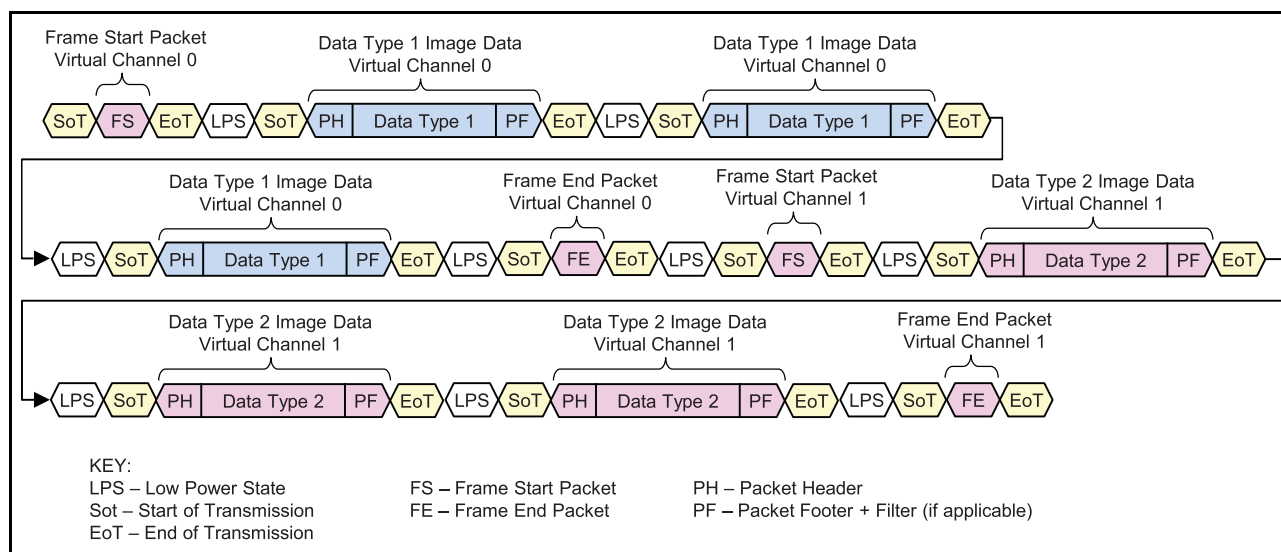

Figure 47.8 (2) MIPI CSI-2 Interleaved Transmission 2

47.3.6 Interrupts

Table 47.4 Interrupt Registers

| Function | Register Name |
|---------------------------------|---------------|
| Monitors interrupt state. | INTSTATE |
| Monitors interrupt error state. | INTERRSTATE |
| Enables interrupts. | INTEN |
| Masks interrupt sources. | INTCLOSE |

As shown in Figure 47.9, the AFIFO (asynchronous FIFO) overflow and ERRSOT* (HS synchronization error) have corresponding interrupt error status monitoring register flag bits for each channel. To clear a status flag, write 1 to the corresponding bit of the INTERRSTATE register.

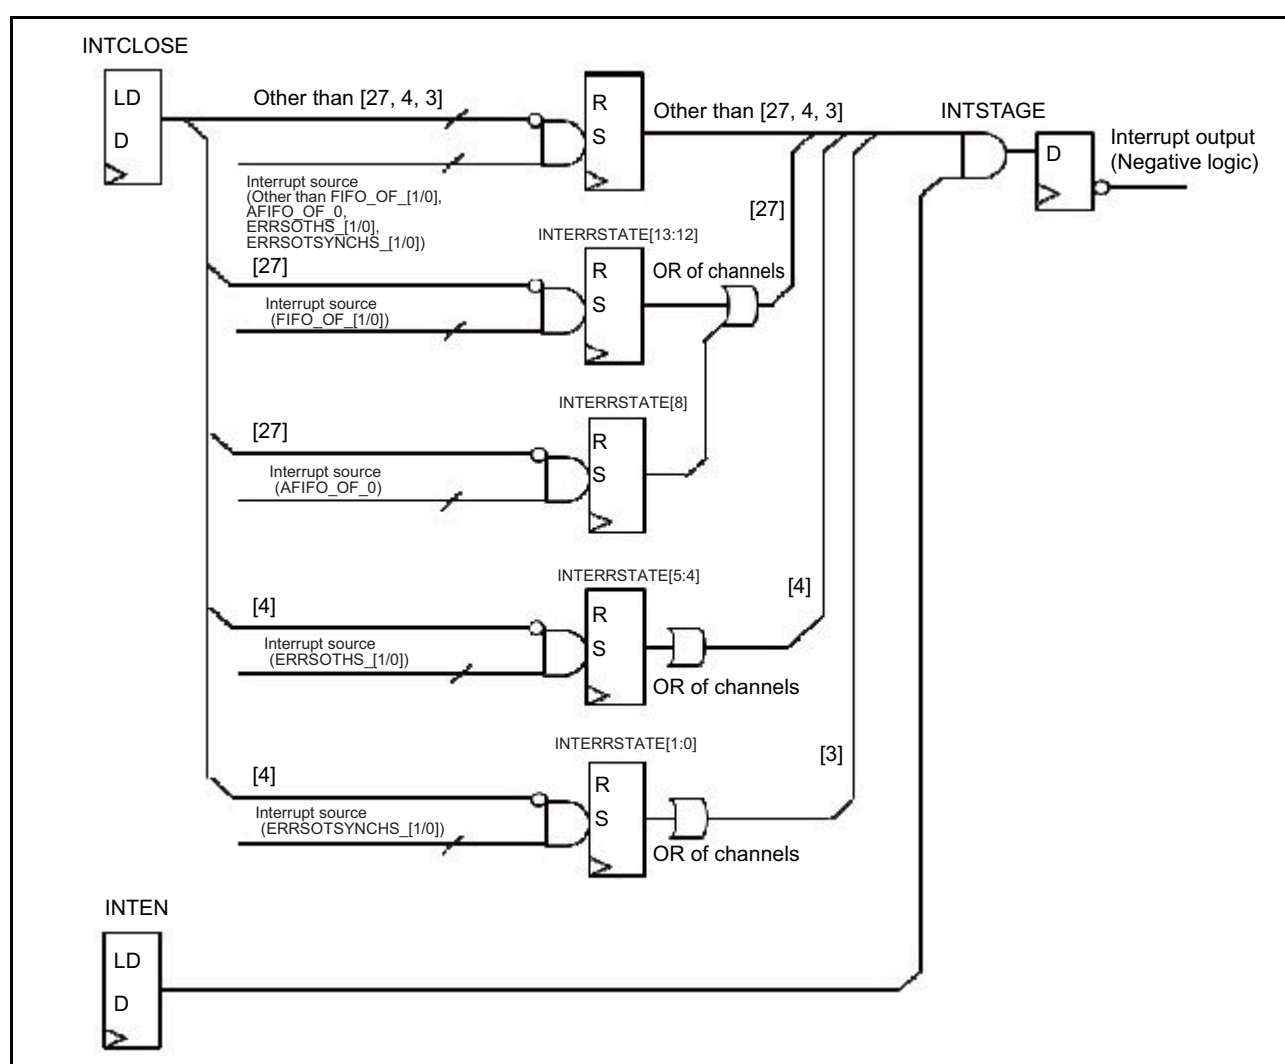

Figure 47.9 Interrupt Structure

Table 47.5 Interrupt Bit Assignments

| Interrupt Source | Register Bit Name | Bit |
|--|-------------------|------|
| Long packet payload data count less than WC value | LESS_THAN_WC | [28] |
| Overflow of asynchronous FIFO for storing HS data | AFIFO_OF | [27] |
| - | - | [26] |
| - | - | [25] |
| - | - | [24] |
| - | - | [23] |
| - | - | [22] |
| - | - | [21] |
| Start of frame on output channel (rising edge of CSIR_VD signal) | VD_START | [20] |
| End of frame on output channel (falling edge of CSIR_VD signal) | VD_END | [19] |
| Reception of a short packet (reception of short packets such as Frame Start and Frame End) | SHP | [18] |
| Reception of a frame packet (reception of short packets such as Frame Start and Frame End) | FSFE | [17] |
| Reception of a long packet | LNP | [16] |
| CRC error | CRC_ERR | [15] |
| Reception of WC = 0 | HD_WC_ZERO | [14] |
| Reception of an illegal frame end packet (Frame End is received without receiving Frame Start.) | FRM_SEQ_ERR1 | [13] |
| Reception of an illegal frame start packet (After reception of Frame Start, Frame Start is received again without receiving Frame End) | FRM_SEQ_ERR0 | [12] |
| ECC 2-bit or more error | ECC_ERR | [11] |
| ECC 1-bit correction | ECC_CRCT_ERR | [10] |
| - | - | [9] |
| - | - | [8] |
| Start of ultra-low power state | ULPS_START | [7] |
| End of ultra-low power state | ULPS_END | [6] |
| - | - | [5] |
| Synchronized SOT (start of transfer) error during HS reception | ERRSOTHS | [4] |
| Non-synchronized SOT (start of transfer) error during HS reception | ERRSOTSYNCHS | [3] |
| Escape mode entry error | ERRESC | [2] |
| - | - | [1] |
| PHY control error | ERRCONTROL | [0] |

Table 47.6 Bit Assignments in Error Status Monitor Register

| Interrupt Source | Register Bit Name | Bit |
|--|-------------------|------|
| - | - | [15] |
| - | - | [14] |
| - | - | [13] |
| - | - | [12] |
| - | - | [11] |
| - | - | [10] |
| - | - | [9] |
| Overflow of asynchronous FIFO for storing HS data on lane 0 | AFIFO_OF_0 | [8] |
| - | - | [7] |
| - | - | [6] |
| Synchronized SOT (start of transfer) error during HS reception on lane 1 | ERRSOTHS_1 | [5] |
| Synchronized SOT (start of transfer) error during HS reception on lane 0 | ERRSOTHS_0 | [4] |
| - | - | [3] |
| - | - | [2] |
| Non-synchronized SOT (start of transfer) error during HS reception on lane 1 | ERRSOTSYNCHS_1 | [1] |
| Non-synchronized SOT (start of transfer) error during HS reception on lane 0 | ERRSOTSYNCHS_0 | [0] |

Table 47.7 MIPI CSI-2 PHY/ Annex A.1 Signal Description

| Error Signals | Description |
|---------------|--|
| ERRSOTHS | Start-of-Transmission (SoT) Error. If the High-Speed Sot leader sequence is corrupted, but in such a way that proper synchronization can still be achieved, this active high signal is asserted for one cycle of RXBYTECLKHS. This is considered to be a "soft error" in the leader sequence and confidence in the payload data is reduced. |
| ERRSOTSYNCHS | Start-of-Transmission Synchronization Error. If the High-Speed Sot leader sequence is corrupted in a way that proper synchronization cannot be expected, this active high signal is asserted for one cycle of RXBYTECLKHS. |
| ERRESC | Escape Entry Error. If an unrecognized escape entry command is received, this active high signal is asserted and remains asserted until the next change in line state. |
| ERRCONTROL | Control Error. This active high signal is asserted when an incorrect line state sequence is detected. For example, if a turn-around request or escape mode request is immediately followed by a Stop state instead of the required Bridge state, this signal is asserted and remains asserted until the next change in line state. |

47.3.7 Lane Swapping

The lane assignment for data received from the PHY block by the LINK block can be modified by setting the relevant register (see section 47.2.18, Lane Swap Register (LSWAP)). This capability provides for flexible pin assignment to compensate for the lack of a connector specification for the MIPI CSI-2.

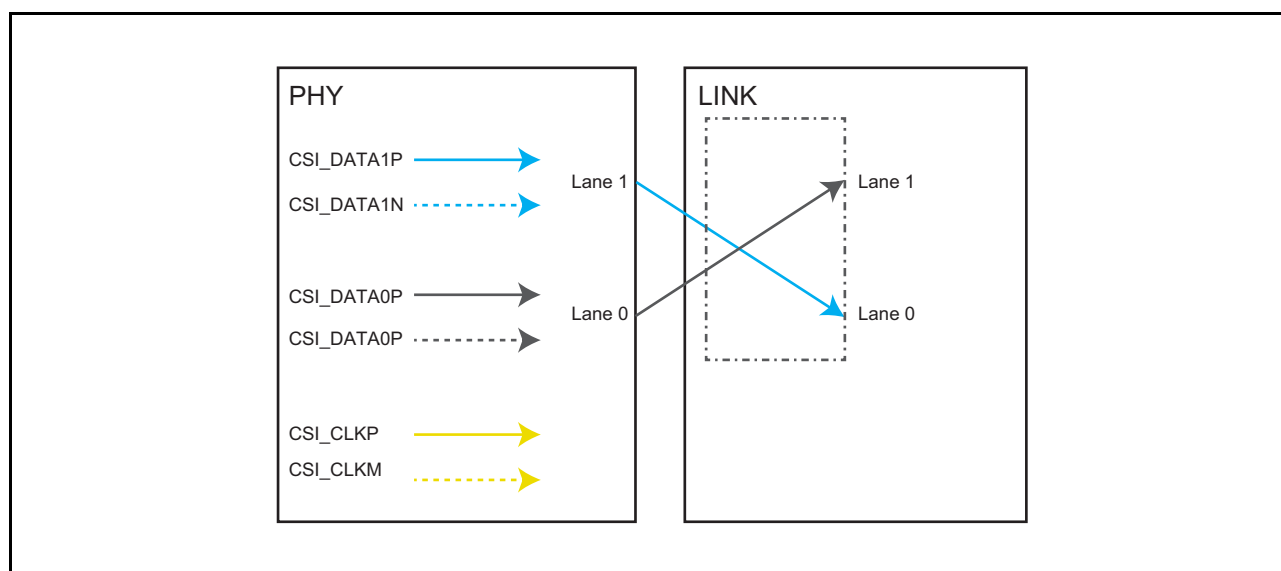

Figure 47.10 Example of Lane Swapping

47.3.8 PHY Timing Setting

The operation timing parameters defined in the MIPI D-PHY standard can be specified by setting PHY timing register 1 (PHYTIM1) in section 47.2.52, PHY timing register 2 (PHYTIM2) in section 47.2.53, and PHY timing register 3 (PHYTIM3) in section 47.2.54.

(1) T_INIT_SLAVE

These bits specify the PHY initialization period.

The PHY initialization period is the period calculated by the formula below after the SHUTDOWNZ and RSTZ bits of the PHY operation control register (PHYCNT) have been set to 1.

$$(T_INIT_SLAVE \text{ setting} + 1 (\text{PHY internal delay})) \times (1/\text{internal bus clock (B}\phi))$$

When supporting the minimum value (100 μ s) of T_{INIT} that is defined in the MIPI D-PHY standard, set the T_INIT_SLAVE bits to satisfy the following formula.

$$T_INIT_SLAVE \text{ setting} + 1 (\text{PHY internal delay}) > 100 \mu\text{s} / (1/\text{internal bus clock (B}\phi))$$

(2) TCLK_MISS

These bits specify the period until a reception timeout of the HS clock is detected.

A reception timeout is detected when the period calculated by the formula below has elapsed after the receive clock has been stopped while receiving an HS clock.

$$TCLK_MISS \text{ setting} \times (1/\text{internal bus clock (B}\phi))$$

Note that the setting should have a margin because the difference in the clock accuracy with the device on the other end may cause a timeout to be erroneously detected.

When detecting a reception timeout of the HS clock in 80-Mbps transfer, set the TCLK_MISS bits to satisfy the following formula.

$$TCLK_MISS \text{ setting} > (1/80 \text{ Mbps}) / (1/\text{internal bus clock (B}\phi)) + 1 (\text{margin})$$

(3) TCLK_PREPARE

These bits specify the period until HS IO of the clock lane is enabled.

HS IO is enabled when the period calculated by the formula below has elapsed after LP00 was input.

$$(TCLK_PREPARE \text{ setting} \times (1/\text{internal bus clock (B}\phi))) + (3 \times (1/\text{internal bus clock (B}\phi))) (\text{PHY internal delay})$$

Set the TCLK_PREPARE bits so that HS IO is enabled within the HS0 period.

When supporting the maximum value (95 ns) of $T_{CLK_PREPARE}$ that is defined in the MIPI D-PHY standard, set the TCLK_PREPARE bits to satisfy the following formula.

$$(TCLK_PREPARE \text{ setting} \times (1/\text{internal bus clock (B}\phi))) + (3 \times (1/\text{internal bus clock (B}\phi))) (\text{PHY internal delay}) > 95 \text{ ns}$$

(4) TCLK_SETTLE

These bits specify the period until HS clock reception of the clock lane is enabled.

HS clock reception is enabled when the period calculated by the formula below has elapsed after LP00 was input.

$$\text{TCLK_SETTLE setting} \times (1/\text{internal bus clock (B}\phi\text{)})$$

Set the TCLK_SETTLE bits so that HS clock reception is enabled when at least 50 ns has elapsed after HS IO of the clock lane was enabled.

When supporting the maximum value (300 ns) of $T_{\text{CLK-SETTLE}}$ that is defined in the MIPI D-PHY standard, set the TCLK_SETTLE bits to satisfy the following formula.

$$300 \text{ ns} > \text{TCLK_SETTLE setting} \times (1/\text{internal bus clock (B}\phi\text{)}) > (\text{TCLK_PREPARE setting} \times (1/\text{internal bus clock (B}\phi\text{)})) + (3 \times (1/\text{internal bus clock (B}\phi\text{)})) (\text{PHY internal delay}) + 50 \text{ ns}$$

Figure 47.11 shows the relationship between TCLK_PREPARE and TCLK_SETTLE.

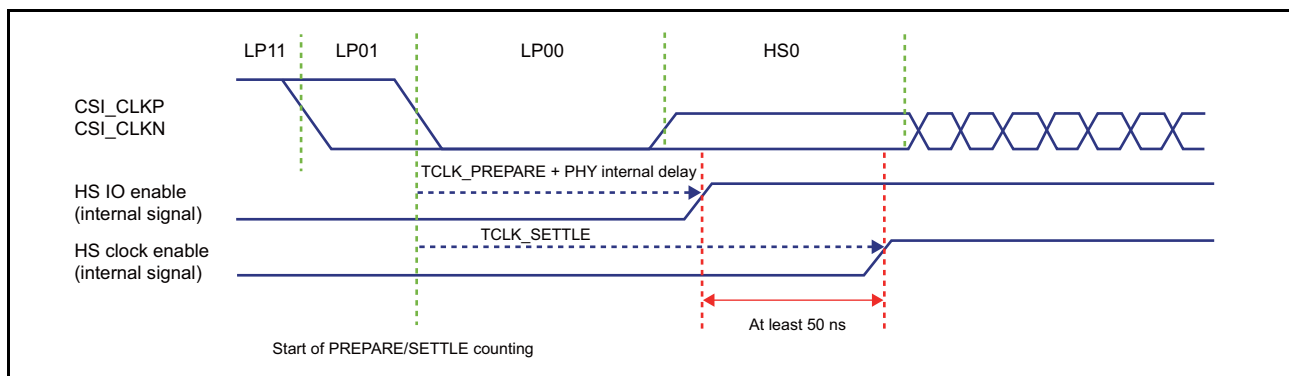

Figure 47.11 Timing of TCLK_PREPARE and TCLK_SETTLE

(5) THS_PREPARE

These bits specify the period until HS IO of the data lane is enabled.

HS IO is enabled when the period calculated by the formula below has elapsed after LP00 was input.

$$(\text{THS_PREPARE setting} \times (1/\text{internal bus clock (B}\phi\text{)})) + (3 \times (1/\text{internal bus clock (B}\phi\text{)})) + 6 U_{\text{INST}} (\text{PHY internal delay})$$

Set the THS_PREPARE bits so that HS IO is enabled within the HS0 period.

When supporting the maximum value ($85 \text{ ns} + 6 U_{\text{INST}}$) of $T_{\text{HS-PREPARE}}$ that is defined in the MIPI D-PHY standard, set the THS_PREPARE bits to satisfy the following formula.

$$(\text{THS_PREPARE setting} \times (1/\text{internal bus clock (B}\phi\text{)})) + (3 \times (1/\text{internal bus clock (B}\phi\text{)})) + 6 U_{\text{INST}} (\text{PHY internal delay}) > 85 \text{ ns} + 6 U_{\text{INST}}$$

(6) THS_SETTLE

These bits specify the period until HS data reception of the data lane is enabled.

HS data reception is enabled when the period calculated by the formula below has elapsed after LP00 was input.

$$\text{THS_SETTLE setting} \times (1/\text{internal bus clock (B}\phi\text{)})$$

Set the THS_SETTLE bits so that HS data reception is enabled when at least 50 ns has elapsed after HS IO of the data lane was enabled.

When supporting the maximum value (145 ns + 10 UI_{INST}) of T_{HS-SETTLE} that is defined in the MIPI D-PHY standard, set the THS_SETTLE bits to satisfy the following formula.

$$145 \text{ ns} + 10 \text{ UI}_{\text{INST}} > \text{THS_SETTLE setting} \times (1/\text{internal bus clock (B}\phi\text{)}) > (\text{THS_PREPARE setting} \times (1/\text{internal bus clock (B}\phi\text{)})) + (3 \times (1/\text{internal bus clock (B}\phi\text{)})) + 6 \text{ UI}_{\text{INST}} (\text{PHY internal delay}) + 50 \text{ ns}$$

Figure 47.12 shows the relationship between THS_PREPARE and THS_SETTLE.

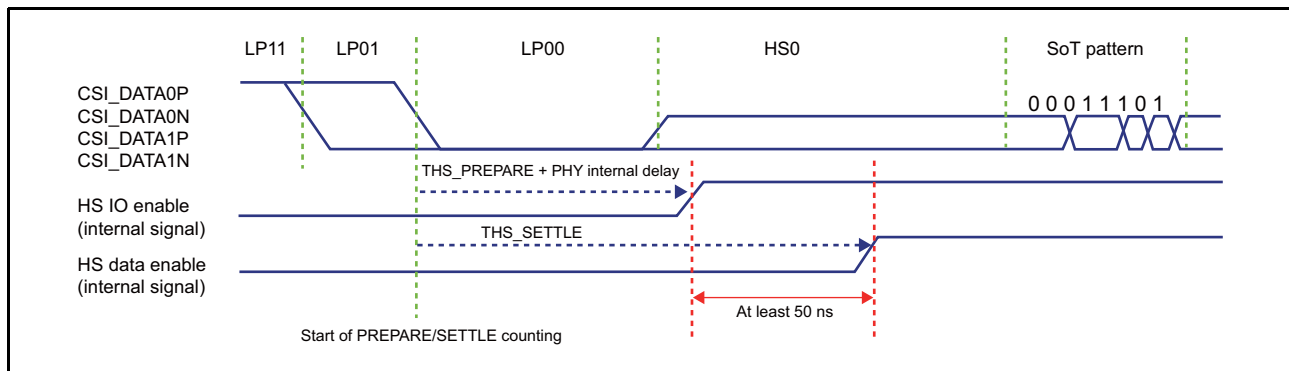

Figure 47.12 Timing of THS_PREPARE and THS_SETTLE

(7) Setting examples

Table 47.8 shows the setting examples that were given in the description of each parameter.

Table 47.8 Setting Examples of PHY Timing Registers (when B ϕ = 132 MHz, 1 UI_{INST} = 1 ns)

| Bit Name | Example of Calculation Formula | Setting Example |
|--------------|---|-----------------|
| T_INIT_SLAVE | $T_INIT_SLAVE + 1 > 100 \mu\text{s}/(1/B\phi)$ | 16'h33F3 |
| TCLK_MISS | $TCLK_MISS > (1/80 \text{ Mbps})/(1/B\phi) + 1$ | 5'h03 |
| TCLK_PREPARE | $(TCLK_PREPARE \times (1/B\phi)) + (3 \times (1/B\phi)) > 95 \text{ ns}$ | 5'h0A |
| TCLK_SETTLE | $300 \text{ ns} > TCLK_SETTLE \times (1/B\phi) > (TCLK_PREPARE \times (1/B\phi)) + (3 \times (1/B\phi)) + 50 \text{ ns}$ | 6'h14 |
| THS_PREPARE | $(\text{THS_PREPARE setting} \times (1/B\phi)) + (3 \times (1/B\phi) + 6 \text{ UI}_{\text{INST}}) > 85 \text{ ns} + 6 \text{ UI}_{\text{INST}}$ | 6'h09 |
| THS_SETTLE | $145 \text{ ns} + 10 \text{ UI}_{\text{INST}} > \text{THS_SETTLE} \times (1/B\phi) > (\text{THS_PREPARE} \times (1/B\phi)) + (3 \times (1/B\phi) + 6 \text{ UI}_{\text{INST}}) (\text{PHY internal delay}) + 50 \text{ ns}$ | 6'h14 |

47.3.9 Initial Setting of the PHY Block

The initial sequence of the VIN module can be executed either before or after that of the CSI2 module.

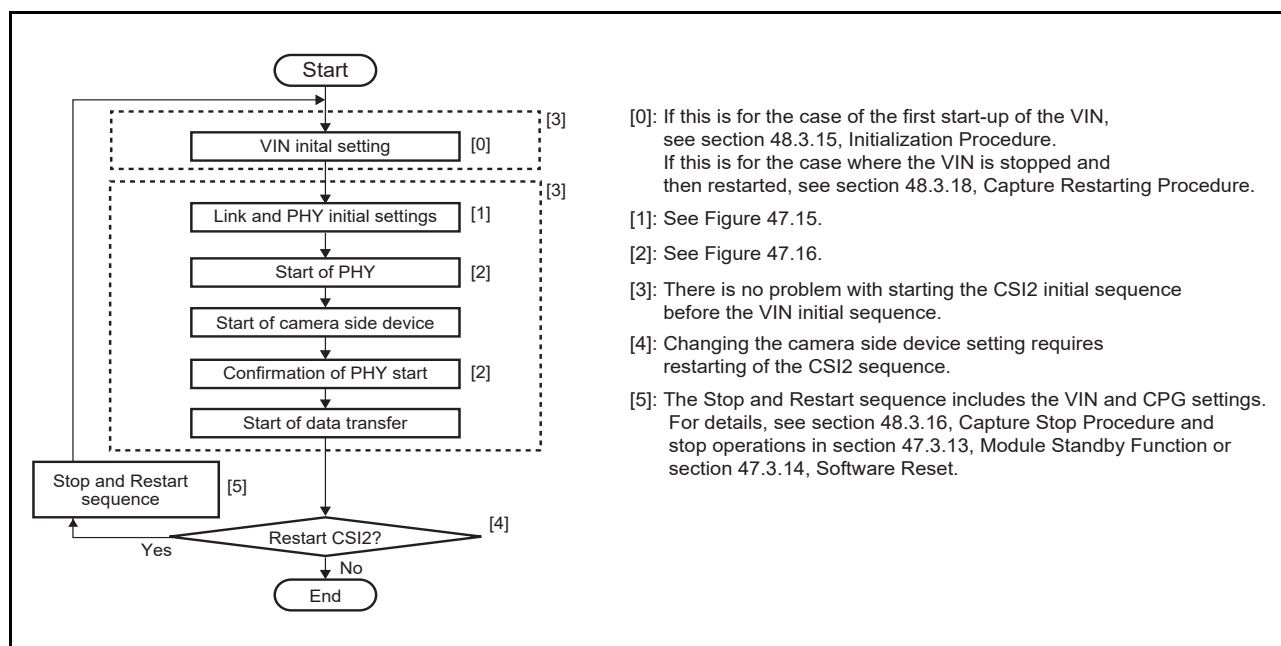

Figure 47.13 Example 1 of Initial Setting Procedure for the Video Modules

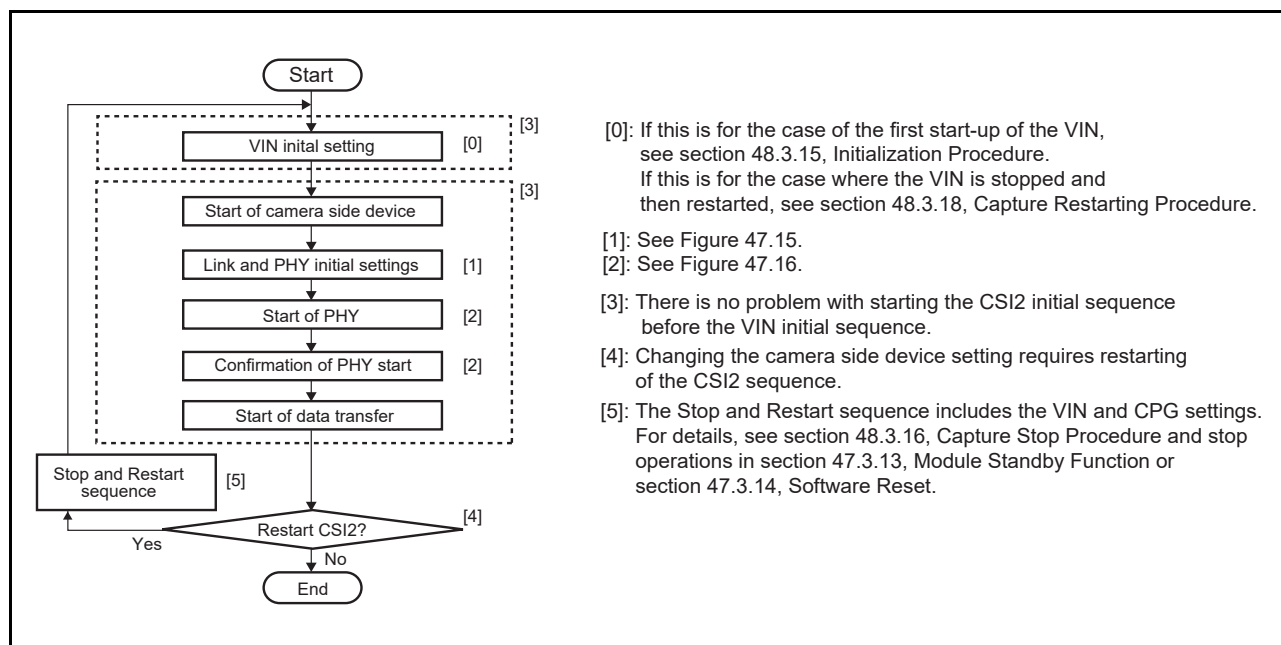

Figure 47.14 Example 2 of Initial Setting Procedure for the Video Modules

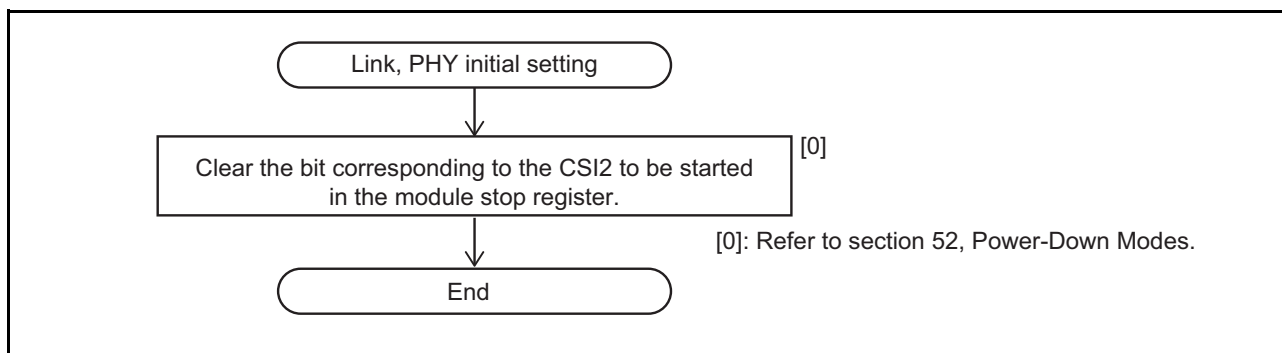

Figure 47.15 Example of PHY Initialization

47.3.9.1 Terminology

This section explains the terminology for CSI2.

- **Start of PHY**
Initialization of CSI-2 receiver module. After initialization, CSI-2 receiver module expects that CSI-2 transmitter device stays StopState (LP-11).
- **Start of camera side device**
Initialization of CSI-2 transmitter device. After initialization, CSI-2 transmitter device keeps StopState (LP-11).
- **Confirmation of PHY start**
CSI-2 receiver module confirms that CSI-2 transmitter device stays StopState (LP-11) after initialization.
- **Start data transfer**
CSI-2 transmitter device starts to send High-Speed data to CSI-2 receiver module.

47.3.10 PHY Control and Monitoring through Register Setting

The PHY IP can be controlled by setting the relevant LINK registers. For register functions, see sections 47.2.3 PHY Operation Control Register (PHYCNT), 47.2.52 PHY Timing Register 1 (PHYTIM1), 47.2.53 PHY Timing Register 2 (PHYTIM2), and 47.2.54 PHY Timing Register 3 (PHYTIM3).

The PHY IP status can be monitored through the relevant LINK registers. For register functions, see sections 47.2.19 PHY ESC Error Monitor Register (PHEERM), 47.2.20 PHY Clock Lane Monitor Register (PHCLM), and 47.2.21 PHY Data Lane Monitor Register (PHDLM).

(1) Case 1: Procedure for starting data transfer

1. Start the CSI-2 module of the camera without starting data transfer.
2. Start the CSI2 PHY module.
3. Start data transfer from the camera.

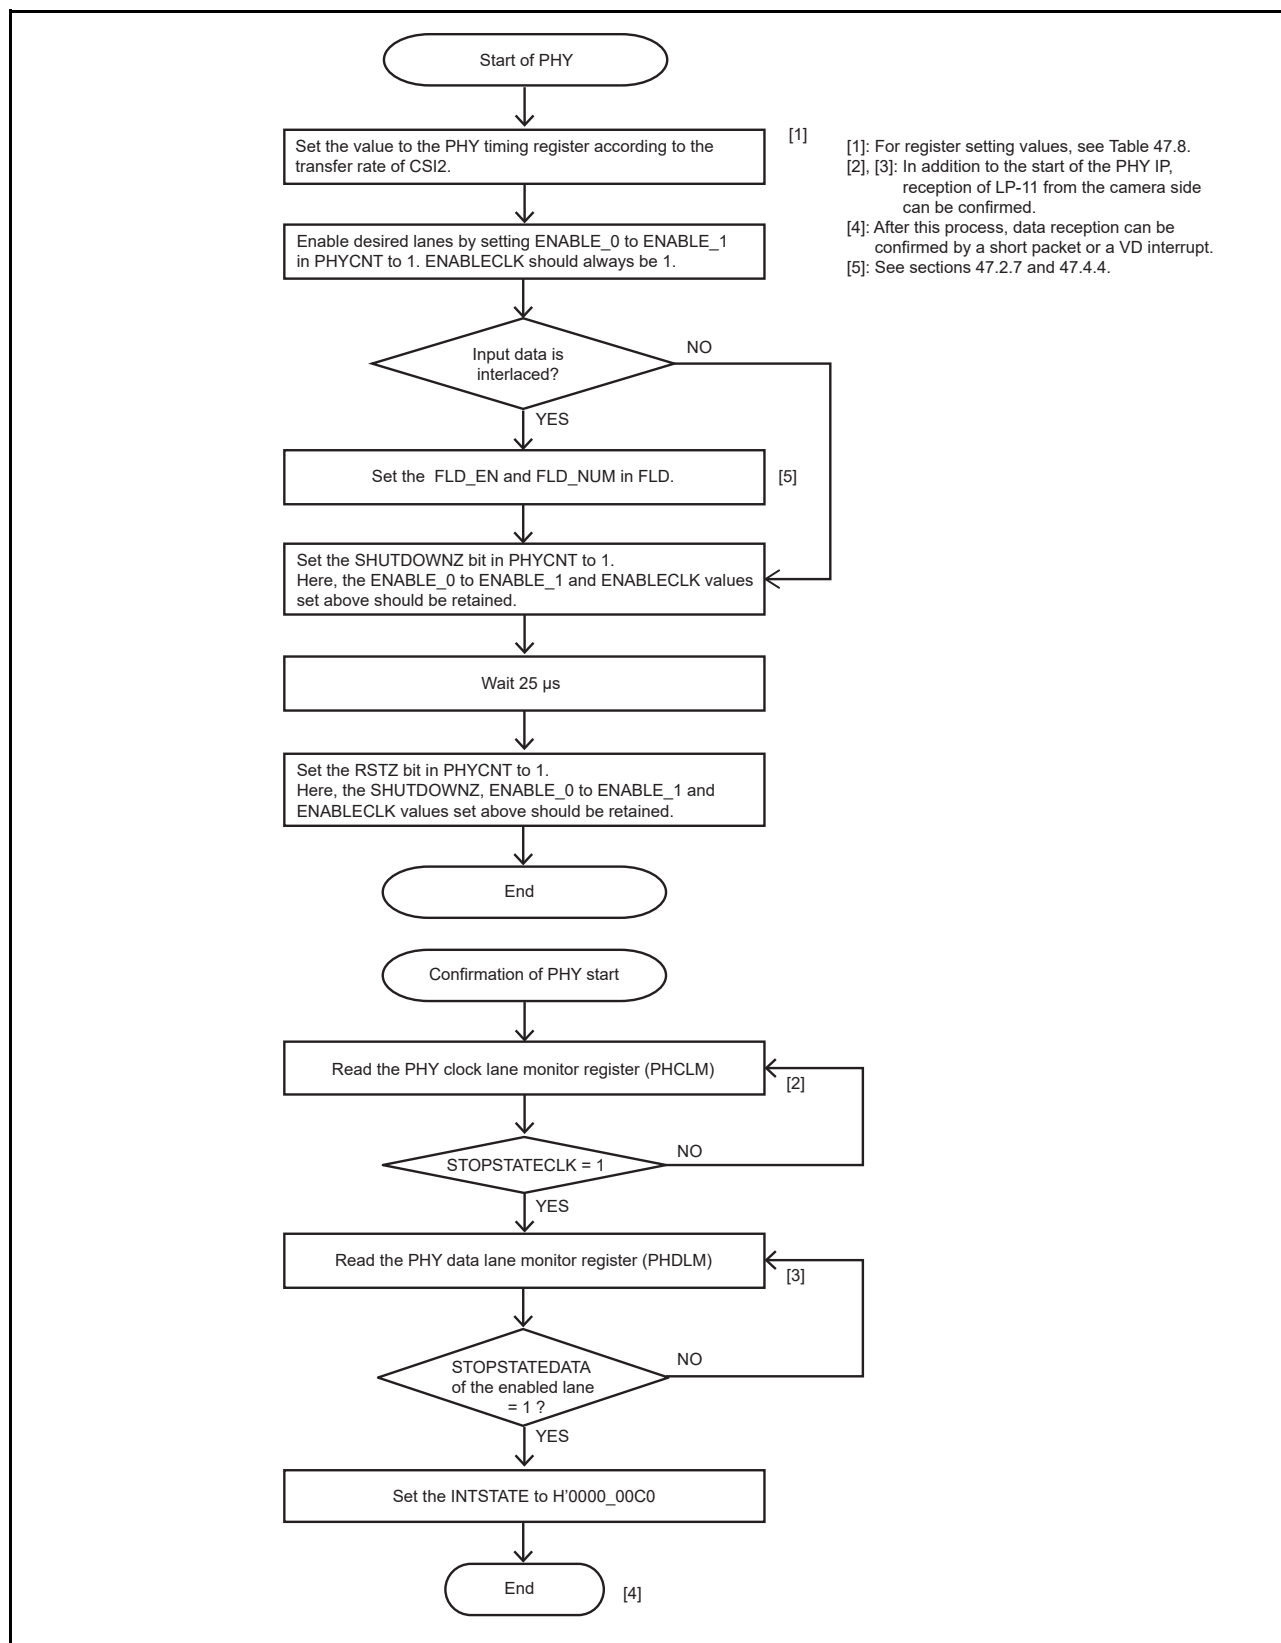

Figure 47.16 Example of PHY Starting Procedure

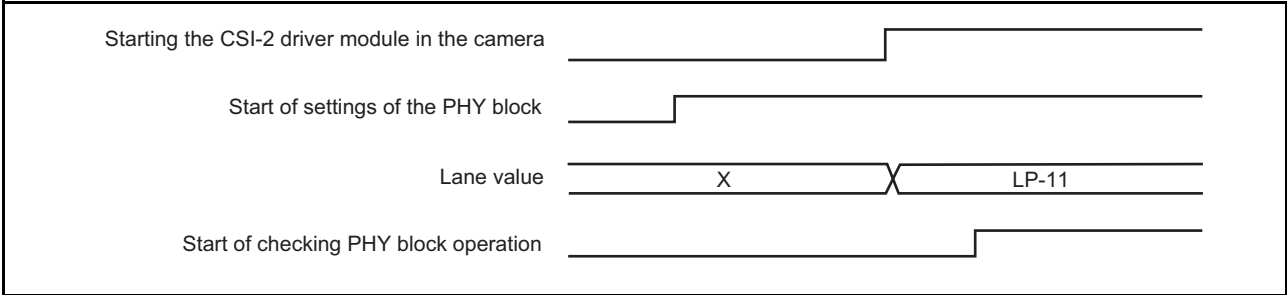

Figure 47.17 Procedure for Starting PHY Block 1

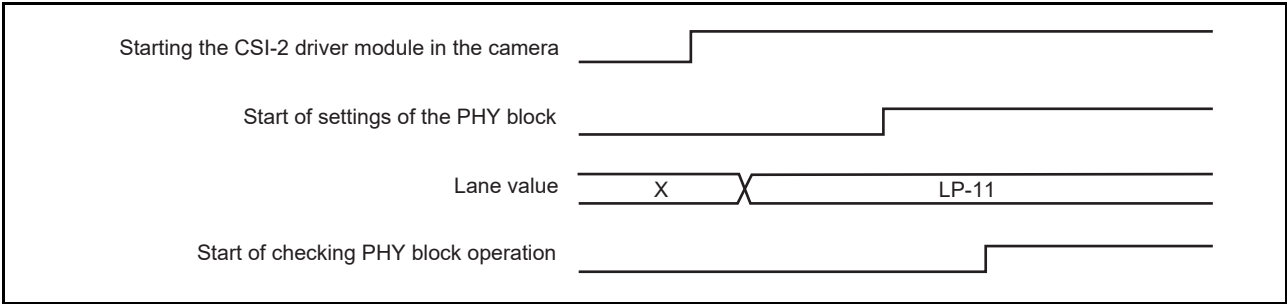

Figure 47.18 Procedure for Starting PHY Block 2

Table 47.9 Causes for Abnormal Reception

| Symptom | Condition | State | Possible Causes | |
|---------------------|---|--|-----------------|---|
| PHY will not start. | Data not being transferred from the camera. | STOPSTATE = low | Internal | The CSI2 channel is different from the output channel on the camera side. |
| | | | | CLK has been stopped. |
| | | | | Module standby mode |
| | | | | Software reset state (refer to section 47.3.14, Software Reset). |
| | | | | RSTZ = 0 |
| | | | | SHUTDOWNZ = 0 |
| | | | | ENABLE = 0, ENABLECLK = 0 on reception lane |
| | | | External | No lane connected |
| | | | | CSI2 on the camera side has not been started. |
| | | | | The CSI2 module on the camera side has not output LP -11. |
| Reception failure | Data being transferred from the camera. | STOPSTATE is always low. | External | The camera started up before this module and continued the output of data without stopping the signal in the clock lane (LP-11 was never received). |
| | | | | |
| | | ERRSOTHS or ERRSOTSYNCHS is generated. | Internal | Different phases between the clock and data. Measures: Adjust the phase physically. Reduce the transfer rate. |
| | | | | Abnormal voltage level Measures: Adjust the voltage level physically. Reduce the transfer rate. |
| | | | | No ENABLE bits of the lanes during transmission are 1. |
| | | | | Incorrect lane connection Measures: Change the connections. Perform lane swapping |
| | | Clock lane is placed in ULP state. | Internal | Incorrect P/N connection of clock lane Measures: Change the connections. |
| | | | | |
| | | No output or abnormal output though no error occurs. | External | Incorrect transmission protocol Measures: Transfer data in the order: Frame Start → Payload data → Frame End. |
| | | | | |
| | | | Internal | Incorrect LINK register setting (VCDT_EN = 0) |

47.3.11 Interrupts Generated in Response to Changes in the ULP State and to Reception Errors

Table 47.10 MIPI CSI-2 Escape Entry Code

| Escape Mode Action | Command Type | Entry Command Pattern (from the last to the first bit to have been transmitted) |
|-----------------------|--------------|---|
| Ultra-Low Power State | mode | B'0001 1110 |
| Undefined-1 | mode | B'1001 1111 |
| Undefined-2 | mode | B'1101 1110 |

This module can generate an interrupt signal on entry to and exit from the ultra-low-power (ULP) state.

| Interrupt Source | Register Bit Name | Bit |
|--------------------------------|-------------------|-----|
| Start of ultra-low power state | ULPS_START | [7] |
| End of ultra-low power state | ULPS_END | [6] |

The state of the lanes can be monitored through the PHY clock lane monitoring register (PHCLM) and PHY data lane monitoring register (PHDLM).

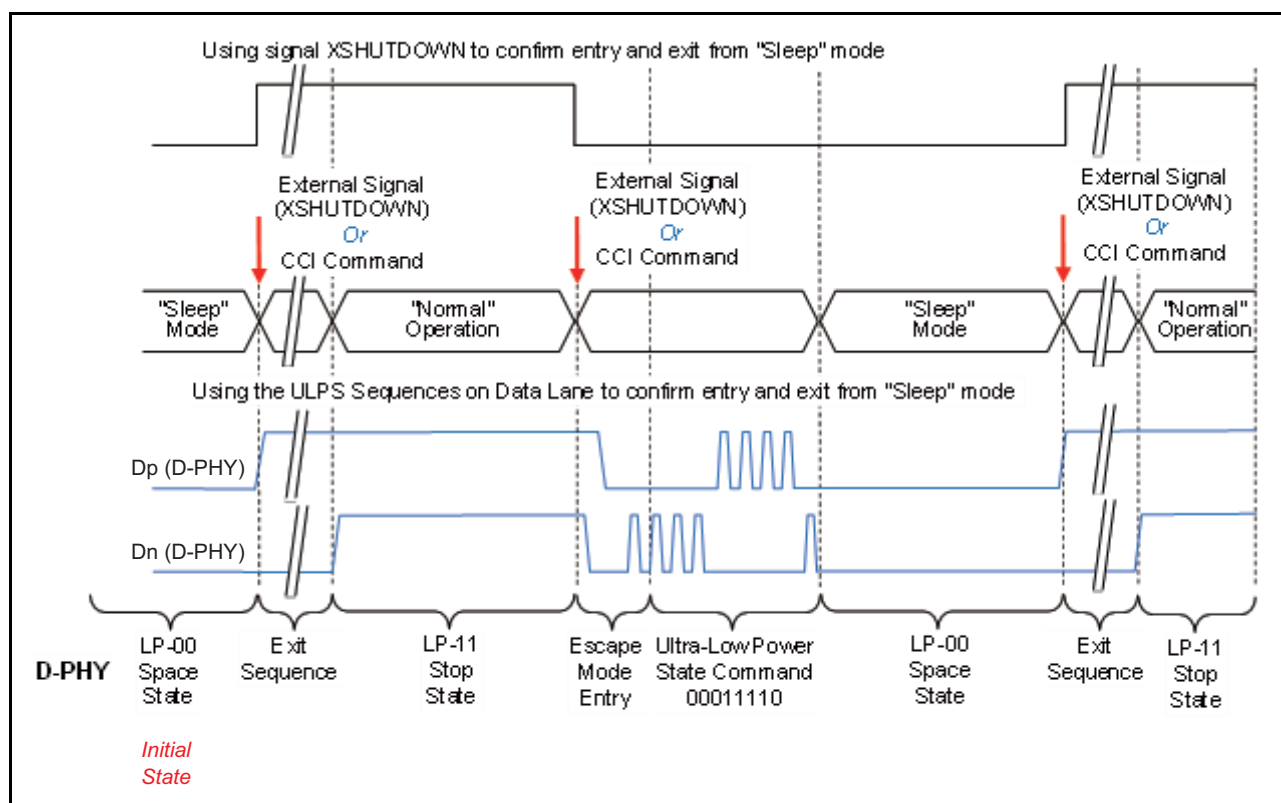

Figure 47.19 MIPI CSI-2 ULPS

This module can also generate an interrupt signal in response to reception errors

| Interrupt Source | Register Bit Name | Bit |
|--|-------------------|-----|
| Synchronized SOT (start of transfer) error during HS reception | ERRSOTHS | [4] |
| Non-synchronized SOT (start of transfer) error during HS reception | ERRSOTSYNCHS | [3] |
| Escape mode entry error | ERRESC | [2] |
| PHY control error | ERRCONTROL | [0] |

The error lanes related to ERRSOTHS and ERRSOTSYNCHS can be monitored through the interrupt error status monitoring register (INTERRSTATE) and the other error lanes can be monitored through the PHY ESC error monitoring register (PHEERM).

47.3.12 Monitoring Function

For monitoring of the packet header, see sections 47.2.22 to 47.2.34 and 47.2.51; for monitoring of CRC reception data, see sections 47.2.35 and 47.2.36; and for monitoring of the module internal signals used for debugging, see sections 47.2.37 to 47.2.50

47.3.13 Module Standby Function

Follow the steps below to place the CSI2 module in the module standby state. For the module standby function, refer to section 52, Power-Down Modes.

1. Set the SHUTDOWNZ bit to 0 in the PHY operation control register (PHYCNT).
2. Wait for 0.1 μ s.
3. Set the SRST bit to 1 in the software reset register (SRST) of the CSI2 LINK.
4. Wait for 100 μ s.
5. Set the MSTP bit assigned to this module to 1 (for details, refer to section 52, Power-Down Modes).

47.3.14 Software Reset

A software reset can be applied by controlling the SRST bit assigned to this module. The bit is stated in section 52, Power-Down Modes.

Resetting of the VIN module or stoppage of capture is required before the CSI2 module is reset.

Figure 47.20 Example of Software Reset Procedure

47.4 Usage Notes

47.4.1 MIPI CSI-2 Transfer Rate

As described in section 47.3.1, Transfer Rate must not exceed 1.0 Gbps. Data being received at a rate exceeding 1.0 Gbps will result in the loss of the data for reception.

47.4.2 PHY Operation Control Register (PHYCNT)

When setting any of the ENABLE_1 to ENABLE_0 bits to 1, be sure to set the ENABLECLK bit to 1. The ENABLE_1, ENABLE_0, and ENABLECLK bits all have the initial value 0.

47.4.3 Synchronization Errors during HS (High-Speed) Reception

If HS reception fails to proceed normally, the PHY block outputs a synchronization error signal to the LINK block. When a synchronization error occurs, the PHY block may not output HS received data to the LINK block. If this occurs only in a specific lane, the lane synchronization function prevents reading of the FIFO buffer in the LINK block, thus causing an overflow. Synchronization errors and overflows can be monitored through the interrupt error status monitoring register (INTERRSTATE) by setting the interrupt source mask register (INTCLOSE) to 0.

After an overflow has occurred, the FIFO should be initialized by a software reset. For the software reset, refer to section 47.3.14, Software Reset.

47.4.4 FLD Signal

Since a field (FLD) signal is not generated in the initial state, appropriately set the field detection control register (FLD register) to select generation of an FLD signal.

This is shown in Figure 47.18, Example Interlaced Video.

In this case (the frame number of the even field is H'0002), set FLD_NUM to the same value as the frame number of the even field (H'0002) in the field detection control register (FLD) and set FLD_EN to 1 in the field detection control register (FLD register).

Note: The frame number is included in FS and FE. The frame number is incremented by 1 with every FS packet in the same virtual channel and is periodically reset to one, e.g. 1, 2, 1, 2, 1, 2.
If frame number of even field is H'0001, set FLD_NUM to H'0001.

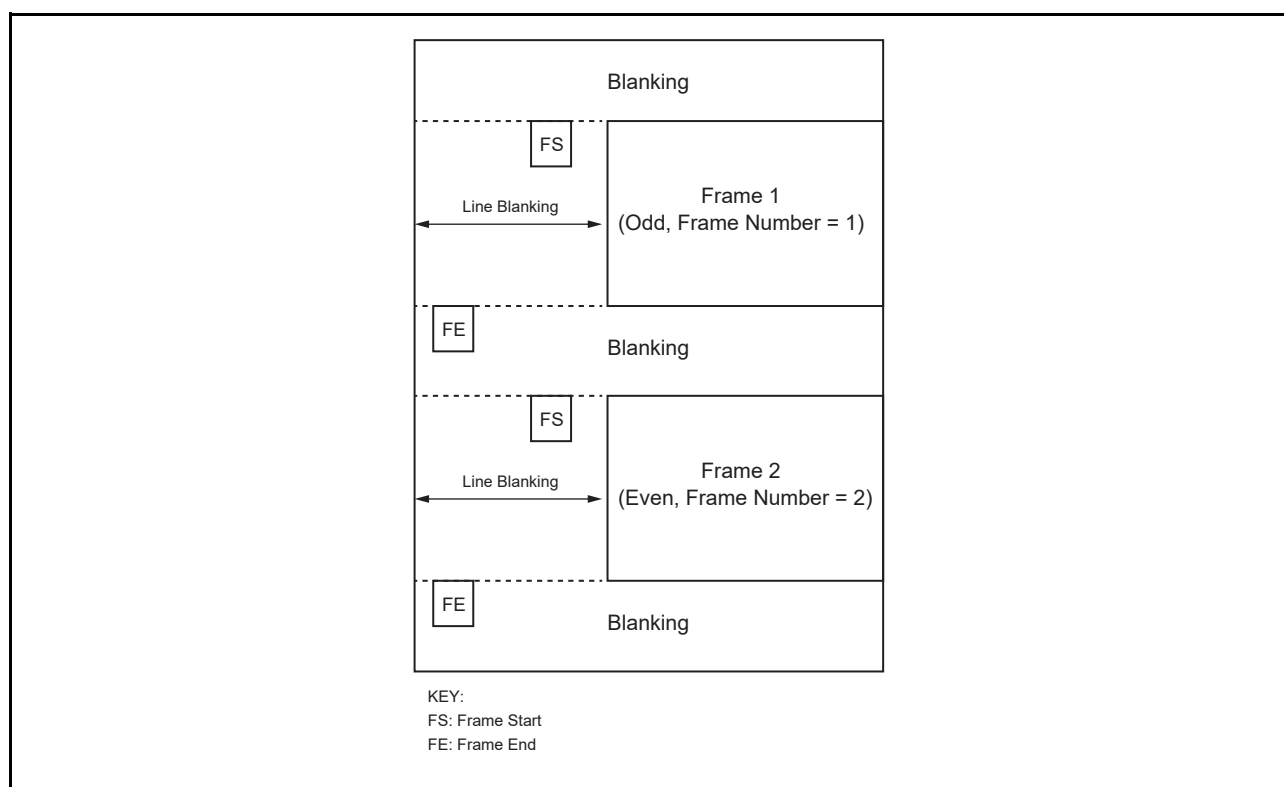

Figure 47.21 Example of Interlaced Video

47.4.5 INT_LESS_THAN_WC

When debugging INT_LESS_THAN_WC, only use a single virtual channel.

47.4.6 Transfer Rate for Interleaved Signal Transmission

When more than one virtual channel is in use, the transfer rate of the input to PHY block should be same in each of the virtual channels. When retention of the frame rate of an individual virtual channel is required, the transfer rate for input should be equivalent to the sum of the frame rates for each of the virtual channels.

47.4.7 V-Blanking Period

In order to receive data correctly, the minimum v-blanking period required is at least three lines.

Note: The V-blanking period is that from the frame end packet to the frame start packet.
The minimum and maximum values of VD_MSK_CYCLE do not define the supported minimum and maximum v-blanking periods.

47.4.8 Notes on Data

The input of data not compliant with the MIPI CSI-2 standard might cause the CSI2 module to hang or to behave in an unexpected manner.

47.4.9 Setting the Clock-Pulse Generator

Set the clock-pulse generator so that $G\phi$ is 264 MHz when this module is to be used. For details on setting the clock-pulse generator, refer to section 6, Clock Pulse Generator.

48. Video Input Module

48.1 Overview

The video input module (hereinafter abbreviated as VIN) is a video capture module that stores in external memory YCbCr-422 data and RGB data through the MIPI CSI-2 interface.

The module has one video channel that can control the capture of data into a capture area of up to 2048×2048 pixels. It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.

For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB and a format conversion function from RGB to ARGB.

As the VIN internally generates a field signal, it can capture progressive data.

Input of data through the MIPI Alliance CSI-2 interfaces is possible.

Note 1. For detailed specifications of the MIPI CSI-2 interface, see section 47, MIPI CSI2 Interface.

Note 2. The upper limits on size clipping depend on the use case.

48.1.1 Features

(1) Input interface

The following input interfaces can be selected.

Table 48.1 Input Interface for VIN

| Interface (CSI2) | Data Width | Data Type |
|------------------------|------------|-------------------------------------|
| Interface (MIPI CSI-2) | — | YCbCr-422 8-bit data *1*2 |
| Interface (MIPI CSI-2) | — | YCbCr-422 10-bit data *1*2 |
| Interface (MIPI CSI-2) | — | RGB-888 data *1 |
| Interface (MIPI CSI-2) | — | 8-bit user defined data (RAW8) *1*2 |

Note 1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.

Note 2. Disable the XY scaling setting (only the 100% scaling is enabled).

(2) Internal Sync Signal Generation

The field signal can be internally generated.

(3) Capture Mode

The following three modes can be selected to capture the interlace images. In addition, single frame capture or continuous frame capture mode can be selected.

Triple-buffering control is provided in accordance with the captured field image and frame image to coordinate with the video capture mode of the display module.

- Odd-field capture mode
- Even-/odd-field capture mode
- Even-field capture mode

(4) Vertical and Horizontal Scaling

Factors for scaling up or down can be set to values in the range from one sixteenth to three in the vertical direction and from one sixteenth to two in the horizontal direction.

Note 1. When scaling-up is used, horizontal size that can be input is up to 2048 pixel.

Note 2. When scaling-down is used, horizontal size that can be output is up to 2048 pixel.

(5) Size Clipping

The VIN module has two clipping circuits, which independently handle images with up to 2048×2048 pixels. Any capture size within this limit can be specified before or after scaling.

Note 1. The upper limits on size clipping depend on the use case.

(6) Color Space Conversion

Color space conversion can be performed from YC to RGB or from RGB to YC. Desired conversion coefficients can be specified through registers to adjust colors.

(7) Lookup Table (LUT) Precision Conversion

The lookup table (LUT) precision can be converted from 10 bits to 8 bits for each pixel according to the color space conversion result.

Note: When the precision conversion function is not used, the upper 8 bits of data are output.

(8) Image Data Format Conversion

To the precision converted YCbCr422 or RGB888 image data, the following data format conversions are applicable.

- YCbCr image data
 - Y/Cb/Cr 8-bit multiplex conversion
 - YCbCr422 → YC separation (separated into Y and CbCr components.)
 - YCbCr422 → Y component extraction
- RGB image data
 - RGB-888 → 32-bit/pixel conversion
 - RGB-888 → RGB-565 (16-bit/pixel) conversion
 - RGB-888 → ARGB-1555 (16-bit/pixel) conversion
 - RGB-888 → ARGB-8888 (32-bit/pixel) conversion

Note: The lookup table is common to the YCbCr and RGB formats.

(9) Memory Output Data Format

Format-converted image data can be transferred to the memory. The following shows the available formats of the data stored.

- YCbCr image data
 - Y/Cb/Cr422, 8-bit multiplexed
 - Y/Cb/Cr422, 10-bit multiplexed
 - YC separation, YCbCr422, Y, 8-bit Cb/Cr, 8-bit multiplexed
 - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 8-bit multiplexed
 - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 10-bit multiplexed
 - YC separation, Y data, 8-bit
 - YC separation, Y data, 10-bit
- RGB image data
 - RGB-565 (16 bits/pixel)
 - ARGB-1555 (16 bits/pixel)
 - RGB-888 (32 bits/pixel)
 - ARGB-8888 (32 bits/pixel)

48.1.2 Block Diagram

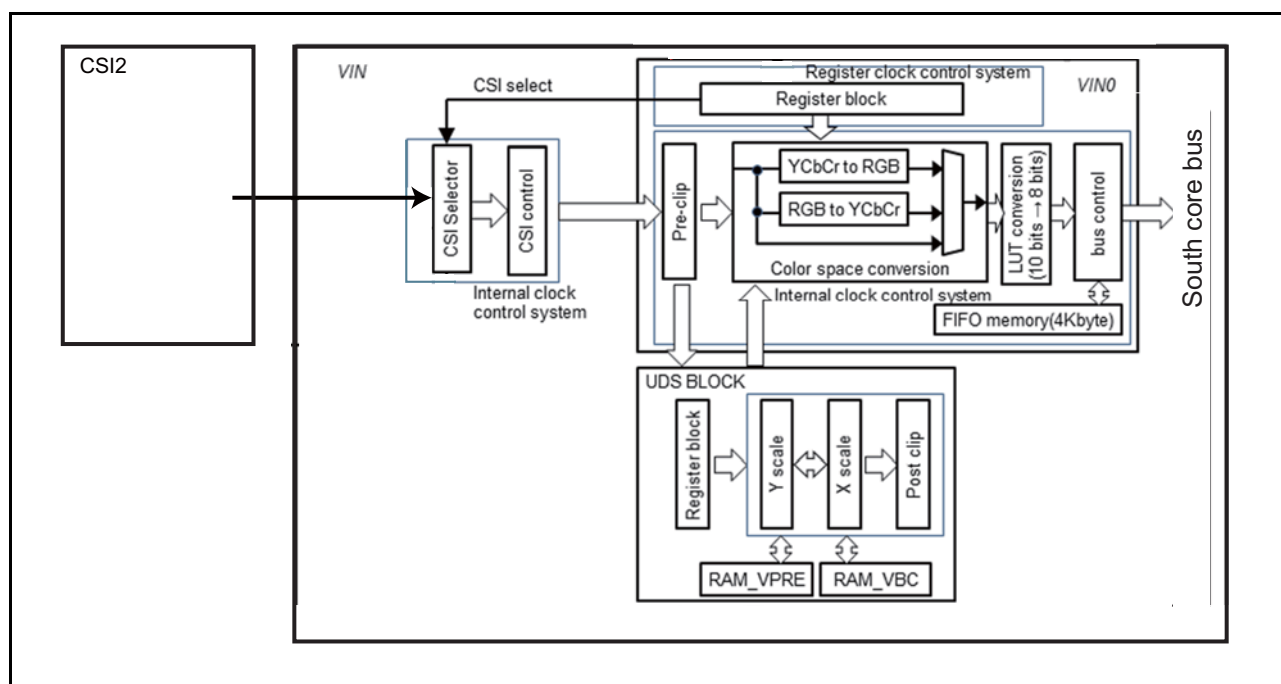

Figure 48.1 Functional Block Diagram of VIN

48.1.3 Register Configuration

Table 48.2 shows the VIN register configuration.

Note: Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. The registers can only be accessed in 32 bits.

*: A register that supports the internal update mode is updated immediately after the register is written to.

Δ: The internal update mode is supported for the VnMC.CLP[1:0], VnMC.LUTE, and VnMC.SCLE bits only.

Table 48.2 VIN Registers

| Name | Symbol | R/W | Address | Initial Value | Access Size | Internal Update Mode Support* |
|---|-------------------|-----|-------------|---------------|-------------|-------------------------------|
| Video 0 main control register | V0MC | R/W | H'E803 F000 | H'0000 0000 | 32 | Δ |

To perform LUT conversion, the conversion table should be set with VnLUTP and VnLUTD.</p> <p>Note 2. This bit supports the internal update mode.</p> |
| 19 | YCAL | 0 | R/W | <p>YCbCr-422 Input Data Alignment</p> <p>This bit controls data alignment for YCbCr-422 input.</p> <p>0: When the multiplexed CbCr interface is set, capturing is performed with Y in the upper bits and CbCr in the lower bits.</p> <p>1: When the multiplexed CbCr interface is set, capturing is performed with CbCr in the upper bits and Y in the lower bits.</p> |
| 18 to 16 | INF[2:0] | 000 | R/W | <p>Input Interface Format</p> <p>These bits specify the format of images input to the VIN.</p> <p>000: Setting prohibited</p> <p>001: 8-bit YCbCr-422*1</p> <p>010: Setting prohibited</p> <p>011: 10-bit YCbCr-422*1</p> <p>100: 8-bit user defined data (RAW8) *1</p> <p>101: Setting prohibited</p> <p>110: 24-bit RGB-888*1</p> <p>111: Setting prohibited</p> |
| 15, 14 | DC[1:0] | 00 | R/W | <p>Dithering Mode Control</p> <p>These bits select the dithering mode for conversion from RGB888 to RGB565/ ARGB1555.</p> <p>00: Dithering with cumulative addition</p> <p>01: Ordered dithering</p> <p>10: Setting prohibited</p> <p>11: Setting prohibited</p> |
| 13 to 7 | — | All 0 | R | <p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p> |
| 6 | EN | 0 | R/W | <p>Endian Type</p> <p>This bit specifies the endian type for data to be output to external memory.</p> <p>0: Image data is packed and allocated in little endian.</p> <p>1: Image data is packed and allocated in big endian.</p> <p>Note: When allocating the YCbCr422 (UYVY format) data in big endian, be sure to set the BPSM bit in VnDMR to 1.</p> |
| 5 | — | 0 | R | <p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p> |
| 4, 3 | IM[1:0] | 00 | R/W | <p>Interlace Mode</p> <p>These bits specify the capture mode. Do not modify this setting during capture operation.</p> <p>00: Odd-field (field 1) capture mode</p> <p>Handles only odd fields as frames and stores them in external memory.</p> <p>01: Odd-/even-field capture mode</p> <p>Handles odd and even fields as separate frames and stores them in external memory. This mode is available only in continuous frame capture mode.</p> <p>10: Even-field (field 2) capture mode</p> <p>Handles only even fields as frames and stores them in external memory.</p> <p>11: Setting prohibited</p> |
| 2 | — | 0 | R | <p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p> |
| 1 | BPS | 0 | R/W | <p>Color Space Conversion Bypass Mode</p> <p>0: The input YCbCr data is converted into the RGB color space and RGB data is converted into the YCbCr color space*2.</p> <p>1: Color space conversion is not performed.</p> <p>Note: YCbCr → RGB or RGB → YCbCr conversion is performed with the coefficients specified by the YC-RGB conversion coefficient register or RGB-YC coefficient register.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 0 | ME | 0 | R/W | Module Enable This is the enable bit for the VIN. Set this bit before setting the video n Frame Capture register (VnFC). 0: The module operation is stopped. 1: The module operation is enabled. *3 |

Note 1. Table 48.3 shows the combinations of interfaces that can be set by the input interface format (the INF bits in VnMC). Do not make any setting that is not listed in the table.

Note 2. Table 48.4 shows the image data that can be converted according to the color space conversion bypass mode settings (set by the BPS bit in VnMC).

Note 3. To stop capturing operation, only set the ME bit to 0. Do not change the other bit settings.

Table 48.3 Capture Interface Settings

| Interface | VnMC/INF |
|---|----------|
| YCbCr-422 8-bit data (MIPI CSI-2) | 001 |
| YCbCr-422 10-bit data (MIPI CSI-2) | 011 |
| RGB-888 data (MIPI CSI-2) | 110 |
| 8-bit user defined data (RAW8) (MIPI CSI-2) | 100 |

Table 48.4 Captured Data Formats

| Input Data Format | VnMC/INF | VnMC/BPS | VnMC/IM | Captured Data Format |
|--------------------------------|----------|----------|---------|----------------------|
| YCbCr-422 (MIPI CSI-2) | 001/011 | 0 | — | RGB format |
| | | 1 | — | YCbCr format |
| RGB-888 data (MIPI CSI-2) | 110 | 0 | — | YCbCr format |
| | | 1 | — | RGB format |
| 8-bit user defined data (RAW8) | 100 | 1 | 01 | User defined format |

48.2.2 Video n Module Status Register (VnMS)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | FBS[1:0] | FS | AV | CA | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4, 3 | FBS[1:0] | 11 | R | Frame Buffer Status These bits show the frame buffer status. 00: The latest valid frame buffer has the base address defined by the memory base 1 register. 01: The latest valid frame buffer has the base address defined by the memory base 2 register. 10: The latest valid frame buffer has the base address defined by the memory base 3 register. 11: There is no valid frame buffer. Note: When video capture is operating, these bits should be read after the FIS bit in VnINTS is set to 1. |
| 2 | FS | 0 | R | Field Status This bit shows the type of the current capture field. 0: The current field is an odd field (field 1). 1: The current field is an even field (field 2). Note: When video capture is operating, this bit should be read after the FIS bit in VnINTS is set to 1. |
| 1 | AV | 0 | R | Active Video Status This bit shows whether the current field is in the active video area defined by the pre-clipping register. 0: The current field is not in the active video area. 1: The current field is in the active video area. Note: This bit will be 0 if no input data is captured. |
| 0 | CA | 0 | R | Video Capture Active Status This bit shows the current video capture operation status. This bit is updated by the captured field signal. 0: Video capture is not operating. 1: Video capture is operating. Note: In field capture mode, this bit is set to 1 even for the field that does not capture data. |

48.2.3 Video n Frame Capture Register (VnFC)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|-----|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CC | SC |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | CC | 0 | R/W | <p>Continuous Frame Capture Mode</p> <p>This bit specifies the continuous frame capture mode. In this mode, the first capture frame is written into the memory address specified by the video n memory base 1 register (VnMB1). After that, the capture operation is repeated in the order of MB2, MB3, MB1, and MB2.</p> <p>Writing 0 into this bit during continuous capture operation will immediately terminate the capture operation if the current frame is completed or it has not been captured.</p> <p>0: The continuous frame capture mode is not set. 1: The continuous frame capture mode is set.</p> <p>After the capture operation is resumed by writing 1 into this bit, the memory address where the first capture frame is written depends on the value indicated by the frame buffer status (FBS[1:0]) bits in the video n module status register (VnMS).</p> <p>Note: When the capture is started with the SC bit set to 1 before setting this bit to 1, the first capture frame is written into the memory address specified by the video n memory base 2 register (VnMB2).</p> |
| 0 | SC | 0 | R/W | <p>Single Frame Capture Mode</p> <p>This bit specifies the single frame capture mode. In this mode, the capture frame is written into the memory address specified by the video n memory base 1 register (VnMB1).</p> <p>Immediately after this bit is set to 1, the frame buffer status bits (FBS) in VnMS are initialized and the SC bit is also cleared to 0.</p> <p>0: The single frame capture mode is not set. 1: The single frame capture mode is set.</p> <p>Note: Do not set this bit to 1 when the interlace mode bits (IM) in the video n main control register (VnMC) are set to 01 (odd-/even-field capture mode).</p> |

Note: Do not specify the single frame capture mode and continuous frame capture mode at the same time.

48.2.4 Video n Start Line Pre-Clip Register (VnSLPrC)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SLPrC[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SLPrC[10:0] | H'000 | R/W | Start Line Pre-Clip These bits specify the (pre-clipping start line - 1) value in line units. This value is used before scaling. Specify a value in the range from 0 to 2046 so that the number of lines after pre-clipping will be 2 or more. (The value of 0 indicates the first valid line.) Note 1. When using vertical or horizontal scaling, specify a value in the range from 0 to 2044 so that the number of lines after pre-clipping will be 4 or more. Note 2. In case of using Scaler, set the value of SLPrC within input I lines. |

48.2.5 Video n End Line Pre-Clip Register (VnELPrC)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | ELPrC[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | ELPrC[10:0] | H'000 | R/W | End Line Pre-Clip These bits specify the (pre-clipping end line - 1) value in line units. This value is used before scaling. Specify a value in the range from 1 to 2047 so that the number of lines after pre-clipping will be 2 or more. Note 1. When using vertical or horizontal scaling, specify a value in the range from 3 to 2047 so that the number of lines after pre-clipping will be 4 or more. Note 2. In case of using Scaler, set the value of ELPrC within input lines. Note 3. If the interlace images are input, the value here should be such that ELPrC - SLPrC is half of the value of the number of the original line. |

48.2.6 Video n Start Pixel Pre-Clip Register (VnSPPrC)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SPPrC[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SPPrC[10:0] | H'000 | R/W | Start Pixel Pre-Clip These bits specify the (pre-clipping start pixel - 1) value in pixel units. This value is used before scaling. Specify a value in the range from 0 to 2040 so that the number of pixels after pre-clipping will be an even number than 6. Note 1. When SPPrC is set to 0x0, the first valid pixel is specified. Note 2. Specify an even number. Note 3. In case of using Scaler, set the value of SPPrC within input pixels. |

48.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| ARGB8888 | 32 | 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RAW8 *1 | 64 | 4 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | Note 1. When the output format in use is RAW8, images are output as 1 byte per pixel. In this case, the image stride is obtained by multiplying the number of pixels specified in these bits by 2 bytes. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 3 to 0 | — | All 0 | R | Reserved bits that indicate the lower-order four bits of the image stride. These bits are always read as 0. The write value should always be 0. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

48.2.10 Video n Memory Base 1 Register (VnMB1)

Note: Availability of channels: n = 0

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 7 | MB1[24:0] | H'000 0000 | R/W | Memory Base Address 1 These bits specify the transfer start address in frame buffer 1. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB1 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. In single frame capture mode, this value is used as the capture address. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map. |
| 6 to 0 | — | All 0 | R | Reserved bits that indicate the lower-order seven bits of memory base address 1 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0. |

48.2.11 Video n Memory Base 2 Register (VnMB2)

Note: Availability of channels: n = 0

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 7 | MB2[24:0] | H'000 0000 | R/W | Memory Base Address 2 These bits specify the transfer start address in frame buffer 2. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB2 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map. |
| 6 to 0 | — | All 0 | R | Reserved bits that indicate the lower-order seven bits of memory base address 2 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0. |

48.2.12 Video n Memory Base 3 Register (VnMB3)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|-----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | MB3[24:9] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MB3[8:0] | | | | | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 7 | MB3[24:0] | H'000 0000 | R/W | Memory Base Address 3 These bits specify the transfer start address in frame buffer 3. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB3 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map. |
| 6 to 0 | — | All 0 | R | Reserved bits that indicate the lower-order seven bits of memory base address 3 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0. |

48.2.13 Video n Line Count Register (VnLC)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----------|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | LC[11:0] | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 0 | LC[11:0] | H'000 | R | Line Count These bits show the line position in the current capture field. |

48.2.14 Video n Interrupt Enable Register (VnIE)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|------|----|----|----|----|----|----|----|----|----|----|-----|----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | FIE2 | — | — | — | — | — | — | — | — | — | — | — | — | — | VFE | VRE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | FIE | — | SIE | EFE | FOE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 | FIE2 | 0 | R/W | Field Interrupt Enable 2 This bit enables or disables INTC output for field interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Field interrupts are disabled. 1: Field interrupts are enabled. |
| 30 to 18 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 17 | VFE | 0 | R/W | VSYSN Falling Edge Detect Interrupt Enable This bit enables or disables VSYSN falling edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYSN falling edge detect interrupts are disabled. 1: VSYSN falling edge detect interrupts are enabled. |
| 16 | VRE | 0 | R/W | VSYSN Rising Edge Detect Interrupt Enable This bit enables or disables VSYSN rising edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYSN rising edge detect interrupts are disabled. 1: VSYSN rising edge detect interrupts are enabled. |
| 15 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | FIE | 0 | R/W | Field Interrupt Enable This bit enables or disables field-switching interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Field-switching interrupts are disabled. 1: Field-switching interrupts are enabled. |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 | SIE | 0 | R/W | Scanline Interrupt Enable This bit enables or disables scanline interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Scanline interrupts are disabled. 1: Scanline interrupts are enabled. |
| 1 | EFE | 0 | R/W | End of Frame Interrupt Enable This bit enables or disables end of frame interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: End of frame interrupts are disabled. 1: End of frame interrupts are enabled. |
| 0 | FOE | 0 | R/W | FIFO Overflow Interrupt Enable This bit enables or disables FIFO overflow interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: FIFO overflow interrupts are disabled. 1: FIFO overflow interrupts are enabled. |

48.2.15 Video n Interrupt Status Register (VnINTS)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|------|----|----|----|----|----|----|----|----|----|----|-----|----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | FIS2 | — | — | — | — | — | — | — | — | — | — | — | — | — | VFS | VRS |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | FIS | — | SIS | EFS | FOS |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 | FIS2 | 0 | R/W | Field Interrupt Status 2 This bit shows that the field has changed. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it. |
| 30 to 18 | — | All 0 | R | Reserved These bits are always read as 0 or 1. The write value should always be 0. |
| 17 | VFS | 0 | R/W | VSYNC Falling Edge Detect Interrupt Status This bit shows that a VSYNC falling edge has been detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it. |
| 16 | VRS | 0 | R/W | VSYNC Rising Edge Detect Interrupt Status This bit shows that a VSYNC rising edge has been detected. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it. |
| 15 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | FIS | 0 | R/W | Field Interrupt Status This bit shows that a field has been captured in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 | SIS | 0 | R/W | Scanline Interrupt Status This bit shows that the number of lines specified by VnSI has been reached in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 at the next line start timing after the value in the VnLC register matches the VnSI register setting. This timing is shown in Figure 48.2, Scanline Interrupt Status Generation Timing. |
| 1 | EFS | 0 | R/W | End of Frame Interrupt Status This bit shows that the last frame has been reached in the active capture operation. This bit is set to 1 at the end of even field (field 2). After being set to 1, this bit is cleared to 0 by writing 1. |
| 0 | FOS | 0 | R/W | FIFO Overflow Interrupt Status This bit shows that the FIFO has overflowed in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. If the FIFO overflows, the FIFO data is overwritten by the pixel data captured after the overflow, and the resultant data is sent to the frame buffer. |

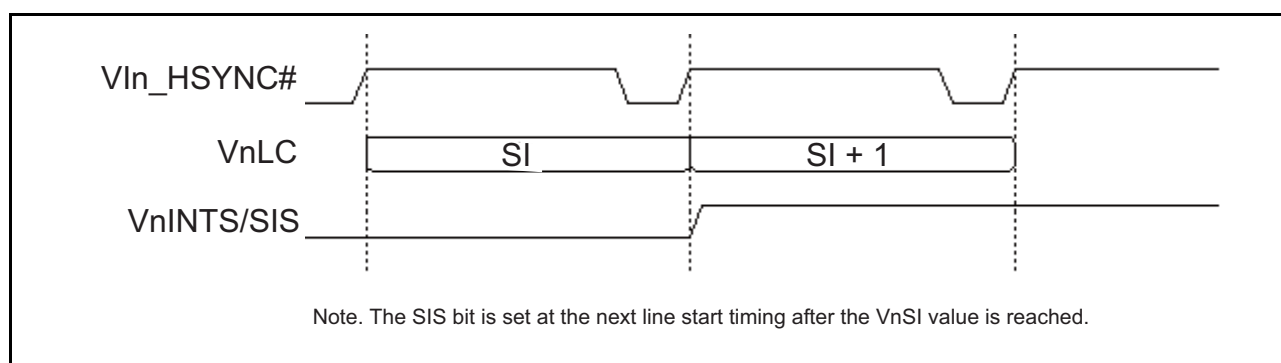

Figure 48.2 Scanline Interrupt Status Generation Timing

48.2.16 Video n Scanline Interrupt Register (VnSI)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | SI[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 10 to 0 | SI[10:0] | H'000 | R | Scanline Interrupt Setting These bits specify a value to be compared with the VnLC register value in each field while the SIE bit in the VnIE register is set to 1. When this value matches the VnLC register value, an interrupt signal is asserted. Note: When these bits are set to H'000, the value of the scanline interrupt status bit (SIS) in the video n interrupt status register (VnINTS) is always 0. |

48.2.17 Video n Data Mode Register (VnDMR)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|------------|------------|-----|-----|-----------|-----|-----|-----------|----|----|----|----------|----|------|-----------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | A8BIT[7:0] | | | | | | | | — | — | — | — | — | — | — | EVA |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | YMODE[2:0] | | | YC THR | — | — | EXR GB | — | — | — | BP SM | — | ABIT | DTMD[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R | R | R/W | R | R | R | R/W | R | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 24 | A8BIT[7:0] | H'00 | R/W | Alpha 8 These bits set the alpha value for the ARGB8888 format output. |
| 23 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | EVA | 0 | R/W | Even Field Address Offset This bit specifies the address offset of the even field (field 2) in memory in odd-/even-field capture mode. 0: Data are stored from the base address in external memory. 1: Data are stored from the base address plus the memory width in external memory. |
| 15 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 14 to 12 | YMODE[2:0] | 000 | R/W | YC Data Transfer Mode These bits specify the transfer method of Y/CbCr when the data conversion mode (DTMD) is 10 (YC separation). 000: Both Y and CbCr data are transferred to memory. 001: Only Y data is transferred to memory as 8-bit data. 010: 10-bit CrCb data is converted to 8-bit CrCb data and both Y data and CbCr data are transferred to memory. 011: 10-bit CrCb data is converted to 8-bit CrCb data and only Y data is transferred to memory. 100: Setting prohibited 101: Setting prohibited 110: Setting prohibited 111: Setting prohibited |
| 11 | YC_THR | 0 | R/W | YC Data Through Mode Y and CbCr data are transferred to memory as 10-bit data in accordance with the input format when this bit is set to 1. 0: Y and CbCr data are transferred to memory in accordance with the setting in the YMODE[2:0] bits. 1: Y and CbCr data are transferred to memory as 10-bit data in accordance with the input format. |
| 10 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | EXRGB | 0 | R/W | Extension RGB Conversion Mode 0: RGB data extension processing is not performed. 1: Data is extended to 32-bit RGB conversion when DTMD[1:0] is set to 00 or 01 as the data conversion mode. |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|-----------|---------------|-----|--|
| 4 | BPSM | 0 | R/W | Output Data Byte Swap Mode 0: Bytes are not swapped in output data. 1: Bytes are swapped in output data. Note: When YCbCr-422 data is output in big endian, data is transferred in the YUYV format in most cases. To transfer data in the UYVY format, set this bit to 1. |
| 3 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 2 | ABIT | 0 | R/W | Alpha Bit This bit specifies the alpha value for data in ARGB-1555 output mode. 0: The alpha value is set to 0. 1: The alpha value is set to 1. |
| 1, 0 | DTMD[1:0] | 00 | R/W | Data Conversion Mode These bits set the format for storing RGB888 or YCbCr422 data after LUT conversion, in the external memory. *1 00: Data is not converted. 01: RGB is converted to ARGB before output. 10: YC is separated before output. *2 11: Setting prohibited |

Note 1. The data conversion modes that can be set are shown in table 49.5. Do not set any other mode that is not listed in the table.
RGB and YCbCr data after LUT conversion should be set as shown in Table 48.5.

Note 2. Do not set for any other data format except for YCbCr422; set YC separation only for YCbCr data format.

Table 48.5 Data Conversion Settings

• RGB Data Conversion Modes

| Format of Data Stored in Memory | VnDMR/ YMODE[2:0] | VnDMR/ EXRGB | VnDMR/ YC_THR | VnDMR/ DTMD[1:0] | Remarks |
|----------------------------------|----------------------|-----------------|------------------|---------------------|---|
| RGB-565 (16 bits/pixel) format | 000 | 0 | 0 | 00 | |
| RGB-888 (32 bits/pixel) format | 000 | 1 | 0 | 00 | |
| ARGB-1555 (16 bits/pixel) format | 000 | 0 | 0 | 01 | The alpha bit is set with the ABIT bit in VnDMR. |
| ARGB-8888 (32 bits/pixel) format | 000 | 1 | 0 | 01 | The alpha bit is set with the A8BIT bit in VnDMR. |

• YCbCr Data Conversion Modes

| Format of Data Stored in Memory | VnDMR/ YMODE[2:0] | VnDMR/ EXRGB | VnDMR/ YC_THR | VnDMR/ DTMD[1:0] | Remarks |
|--|----------------------|-----------------|------------------|---------------------|--|
| YCbCr-422 (8 bits) transfer | 000 | 0 | 0 | 00 | Set the BPSM bit in VnDMR to 1 to transfer in UYVY format in big endian. Make these settings if the setting of the INF[2:0] bits in VnMC is B'100. |
| YCbCr-422 (10 bits) transfer | 000 | 0 | 1 | 00 | |
| Y (8 bits)/CbCr (8 bits) separation transfer | 000 | 0 | 0 | 10 | CbCr transfer destination is determined by the VnUVAOF register setting. |
| Y (10 bits)/CbCr (10 bits) separation transfer | 000 | 0 | 1 | 10 | CbCr transfer destination is determined by the VnUVAOF register setting. |
| Y (8 bits) transfer | 001 | 0 | 0 | 10 | |
| Y (10 bits)/CbCr (8 bits) separation transfer | 010 | 0 | 0 | 10 | CbCr transfer destination is determined by the VnUVAOF register setting. |
| Y (10 bits) transfer | 011 | 0 | 0 | 10 | |

Note: If any combination of values not listed above is specified, correct operation is not guaranteed.

• 8-bit user defined data Mode

| Format of Data Stored in Memory | VnDMR/ YMODE[2:0] | VnDMR/ EXRGB | VnDMR/ YC_THR | VnDMR/ DTMD[1:0] | Remarks |
|---------------------------------|----------------------|-----------------|------------------|---------------------|--------------------|
| RAW8 | 000 | 0 | 0 | 00 | MIPI CSI-2 IF Only |

48.2.18 Video n Data Mode Register 2 (VnDMR2)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | FTEV | FTEH |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | VLV[3:0] | | | | — | HLV[10:0] | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 18 | — | 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 17 | FTEV | 0 | R/W | VSYNC Field Toggle Mode Enable The VSYNC field toggle mode changes the capture field signal level according to the count of input VSYNC signal assertion. As the VIN controls capture operation only when the input field signal level changes, select the VSYNC field toggle mode when capturing MIPI CSI-2 input data. 0: The field toggle function according to the VSYNC count is disabled. 1: The field toggle function according to the VSYNC count is enabled. The period before a toggle should be specified in the VLV bits. Note: Do not set both FTEH and FTEV at the same time. |
| 16 | FTEH | 0 | R/W | HSYNC Field Toggle Counter Enable 0: The field toggle function according to the capture active line is disabled. 1: The field toggle function according to the capture active line is enabled. The period before a toggle should be specified in the HLV bits. Note: Do not set both FTEH and FTEV at the same time. |
| 15 to 12 | VLV[3:0] | H'0 | R/W | VSYNC Field Toggle Mode Transition Period These bits specify the count of vertical sync signal input before the VSYNC field toggle mode is entered. After a transition to the VSYNC field toggle mode, the capture field signal is toggled every time VSYNC is input. When a change in the input field signal is detected, the toggle mode is canceled. H'0: The field signal is toggled at every VSYNC input. H'1: Toggle mode is entered after VSYNC is input once. H'2: Toggle mode is entered after VSYNC is input two times. H'3: Toggle mode is entered after VSYNC is input three times. : H'E: Toggle mode is entered after VSYNC is input 14 times H'F: Toggle mode is entered after VSYNC is input 15 times. Note: If the field signal changes while the transition period is counted, the counter is initialized. |
| 11 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 10 to 0 | HLV[10:0] | H'000 | R/W | HSYNC Field Toggle Count Value The HSYNC field toggle counter counts the capture active lines. If the external field signal does not change before the prespecified counter value is reached, the capture field signal is toggled. H'000: The field signal is toggled for every valid line. H'001: The field signal is toggled for every single valid line. H'002: The field signal is toggled for every two valid lines. : H'7FF: The field signal is toggled for every 2047 valid lines. Note: For the period before a toggle, specify a value greater than one VSYNC period. |

48.2.19 Video n UV Address Offset Register (VnUVAOF)

Note: Availability of channels: n = 0

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|--|
| 31 to 7 | UVAOF[24:0] | H'000 0000 | R/W | UV Data Address Offset These bits specify the transfer offset address for the YC separation YCbCr-422 UV. Specify bits 31 to 7 of the physical address in 128-byte units. Note: The specified address should be equal to or greater than the Y transfer size. Otherwise, the overwriting of Y data occurs. |
| 6 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

48.2.20 YC-RGB Conversion Coefficient Registers

YC → RGB color space conversion is performed with the following formula. Each of the coefficients can be set through the registers. Here, if 8-bit data format is selected, the coefficients set with the YMUL, CSUB, and YSUB bits in the VnCSCC1 register, the RCRMUL and GCRMUL bits in the VnCSCC2 register, and the GCBMUL and BCBMUL bits in the VnCSCC3 register are used to convert the color space. When 10-bit data format is selected, the YMUL2 bit in the VnCSCE1 register, the CSUB2 and YSUB2 bits in the VnCSCE2 register, the RCRMUL2 and GCRMUL2 bits in the VnCSCE3 register, and the GCBMUL2 and BCBMUL2 bits in the VnCSCE4 register are used in color space conversion.

$$\begin{aligned}
 R &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE2/ \\ YSUB2[11:0] \end{pmatrix}) + \begin{pmatrix} VnCSCC2/ \\ RCRMUL[9:0] \\ or \\ VnCSCE3/ \\ RCRMUL2[13:0] \end{pmatrix} \times (Cr - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE2/ \\ CSUB2[11:0] \end{pmatrix}) \\
 G &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE2/ \\ YSUB2[11:0] \end{pmatrix}) - \begin{pmatrix} VnCSCC2/ \\ GCRMUL[9:0] \\ or \\ VnCSCE3/ \\ GCRMUL2[13:0] \end{pmatrix} \times (Cr - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE2/ \\ CSUB2[11:0] \end{pmatrix}) - \begin{pmatrix} VnCSCC3/ \\ GCBMUL[9:0] \\ or \\ VnCSCE4/ \\ GCBMUL2[13:0] \end{pmatrix} \times (Cb - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE2/ \\ CSUB2[11:0] \end{pmatrix}) \\
 B &= \begin{pmatrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{pmatrix} \times (Y - \begin{pmatrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE2/ \\ YSUB2[11:0] \end{pmatrix}) + \begin{pmatrix} VnCSCC3/ \\ BCBMUL[9:0] \\ or \\ VnCSCE4/ \\ BCBMUL2[13:0] \end{pmatrix} \times (Cb - \begin{pmatrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE2/ \\ CSUB2[11:0] \end{pmatrix})
 \end{aligned}$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial values.

$$R = 1.164 \times (Y - 16) + 1.596 \times (Cr - 128)$$

$$G = 1.164 \times (Y - 16) - 0.813 \times (Cr - 128) - 0.392 \times (Cb - 128)$$

$$B = 1.164 \times (Y - 16) + 2.017 \times (Cb - 128)$$

48.2.20.1 Video n Color Space Conversion Coefficient 1 Register (VnCSCC1)

Note: Availability of channels: n = 0

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 28 | HMANT[3:0] | H'0 | R/W | Multiplier (Integral Part) of Horizontal Scaling Factor These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 48.6 |
| 27 to 16 | HFRAC[11:0] | H'000 | R/W | Multiplier (Fractional Part) of Horizontal Scaling Factor These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'800 to H'FFF can be specified when an image is upscaled (the HMANT value is 0) in the horizontal direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in Table 48.6. |
| 15 to 12 | VMANT[3:0] | H'0 | R/W | Multiplier (Integral Part) of Vertical Scaling Factor These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 48.7. |
| 11 to 0 | VFRAC[11:0] | H'000 | R/W | Multiplier (Fractional Part) of Vertical Scaling Factor These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'556 to H'FFF can be specified when an image is upscaled (the VMANT value is 0) in the vertical direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in Table 48.7. |

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in Table 48.6. (Setting a value outside the ranges of Table 48.6 in UDS operation is prohibited). Table 48.6 and Table 48.7 show the settings in the horizontal and vertical directions.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

Table 48.6 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings

| HMANT | HFRAC | UDS Operation |
|------------|----------------|-------------------------------|
| H'0 | H'800 to H'FFF | Scale-up |
| H'1 | H'000 | Same size (no scale-up/-down) |
| | H'001 to H'FFF | Scale-down |
| H'2 to H'F | H'000 to H'FFF | |

Table 48.7 Switching of Vertical Scale-Up/Down Operation According to VMANT and VFRAC Bit Settings

| VMANT | VFRAC | UDS Operation |
|------------|----------------|-------------------------------|
| H'0 | H'556 to H'FFF | Scale-up |
| H'1 | H'000 | Same size (no scale-up/-down) |
| | H'001 to H'FFF | Scale-down |
| H'2 to H'F | H'000 to H'FFF | |

Described here is the method for calculating the size of the upscaled/downscaled image that was obtained based on this register setting. First, define the variables necessary for calculating the horizontal size of the upscaled/downscaled image, as shown below.

$$hscale = \frac{4096}{4096 \times m_h + f_h}$$

m_h is the value of VnUDS_SCALE.HMANT, and f_h is the value of VnUDS_SCALE.HFRAC.

This formula expresses the estimate of the scale-up/-down factor processed by the UDS. If the horizontal size of the image before scale-up/-down is set as $hsize_{org}$, the horizontal size of the image after scale-up/-down can be roughly obtained through $hsize_{org} \times hscale$.

Similarly, define the variables necessary for calculating the vertical size of the upscaled/downscaled image.

$$vscale = \frac{4096}{4096 \times m_v + f_v}$$

When setting m_v as the value of VnUDS_SCALE.VMANT, f_v as the value of VnUDS_SCALE.VFRAC, and $vsize_{org}$ as the vertical size of the image before scale-up/-down, the vertical size of the image after scale-up/-down can be roughly obtained through $vsize_{org} \times vscale$.

When the UDS performs scale-down with the settings of Table 48.6, using the variables defined so far, the horizontal size of the downscaled image $hsize_{down_scaled}$ and the vertical size of the downscaled image $vsize_{down_scaled}$ become as follows:

$$hsize_{down_scaled} = \left\langle 1 + \left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right\rangle - 1 \right\rangle \times m_h' \times hscale$$

$$vsize_{down_scaled} = \left\langle 1 + \left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right\rangle - 1 \right\rangle \times m_v' \times vscale$$

Since the division of h_{scale} and v_{scale} has to be executed at the end of the above formulas, respectively, formulas considering the order of operation become as follows:

$$hsize_{down_scaled} = \left\langle 1 + \left(\left(1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right) - 1 \right) \times m_h' \times 4096 \right\rangle / (4096 \times m_h + f_h)$$

$$vsize_{down_scaled} = \left\langle 1 + \left(\left(1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right) - 1 \right) \times m_v' \times 4096 \right\rangle / (4096 \times m_v + f_v)$$

The value of m_h' or m_v' , which is shown in Table 48.8, changes according to the setting of $VnUDS_SCALE.HMANT$ or $VnUDS_SCALE.VMANT$.

Table 48.8 m_h' or m_v' Setting

| $VnUDS_SCALE.HMANT$ Setting ($VnUDS_SCALE.VMANT$ Setting) | m_h' (m_v') |
|---|----------------------|
| 1 to 3 | 1 |
| 4 to 7 | 2 |
| 8 to 15 | 4 |

When the UDS performs scale-up with the settings of Table 48.6 and $VnUDS_CTRL.AMD$ is 0, the horizontal size of the upscaled image $hsize_{up_scaled}$ and the vertical size of the upscaled image $vsize_{up_scaled}$ become as follows:

$$hsize_{up_scaled} = \langle 1 + (hsize_{org} - 1) \times hscale \rangle$$

$$vsize_{up_scaled} = \langle 1 + (vsize_{org} - 1) \times vscale \rangle$$

Similar to the scale-down case, formulas considering the division of h_{scale} and v_{scale} become as follows:

$$hsize_{up_scaled} = \langle 1 + ((hsize_{org} - 1) \times 4096) / (4096 \times m_h + f_h) \rangle$$

$$vsize_{up_scaled} = \langle 1 + ((vsize_{org} - 1) \times 4096) / (4096 \times m_v + f_v) \rangle$$

When $VnUDS_CTRL.AMD$ is 1, the horizontal size of the upscaled image $hsize_{up_scaled}$ and the vertical size of the upscaled image $vsize_{up_scaled}$ become as follows:

$$hsize_{up_scaled} = \langle hsize_{org} \times hscale \rangle$$

$$vsize_{up_scaled} = \langle vsize_{org} \times vscale \rangle$$

After considering the division of hscale and vscale, the formulas become as follows:

$$hsize_{up_scaled} = \left\langle (hsize_{org} \times 4096) / (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{up_scaled} = \left\langle (vsize_{org} \times 4096) / (4096 \times m_v + f_v) \right\rangle$$

48.2.21.3 Video n Passband Registers (VnUDS_PASS_BWIDTH)

Note: Availability of channels: n = 0

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----------------|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | BWIDTH_H [6:0] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | BWIDTH_V [6:0] | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|---|
| 31 to 23 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 22 to 16 | BWIDTH_H [6:0] | H'00 | R/W | Horizontal Signal Passband at Image Scale-Up/Down Set these bits following the method described later. |
| 15 to 7 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 6 to 0 | BWIDTH_V [6:0] | H'00 | R/W | Vertical Signal Passband at Image Scale-Up/Down Set these bits following the method described later. |

The method for setting the passband in the horizontal direction of an image is described. When the VnUDS_SCALE.HMANT bits for horizontal scale-up/-down factor setting are not 0, set the BWIDTH_H bits according to the following formula. When the VnUDS_SCALE.HMANT bits are 0, set 64 in the BWIDTH_H bits.

$$BWIDTH_H = \left\langle 64 \times \frac{4096 \times m_h'}{4096 \times m_h' + f_h} \right\rangle \quad (VnUDS_SCALE.HMANT \neq 0)$$

$$BWIDTH_H = 64 \quad (VnUDS_SCALE.HMANT = 0)$$

m_h is the value of VnUDS_SCALE.HMANT, and f_h is the value of VnUDS_SCALE.HFRAC. For the m_h' value, see Table 48.8. The method for setting the passband in the vertical direction of an image is similar to that for the horizontal direction described earlier. Since only the correspondence relationship of the registers is changed as shown below, replace the variables in the previous explanation as shown below when reading.

BWIDTH_H → BWIDTH_V

 $m_h' \rightarrow m_v'$ $m_h \rightarrow m_v$ $f_h \rightarrow f_v$

VnUDS_SCALE.HMANT → VnUDS_SCALE.VMANT

VnUDS_SCALE.HFRAC → VnUDS_SCALE.VFRAC

48.2.21.4 Video n UDS Output Size Clipping Registers (VnUDS_CLIP_SIZE)

Note: Availability of channels: n = 0

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|---|
| 31 to 28 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 27 to 16 | CL_HSIZE [11:0] | H'000 | R/W | Clipping Size of Horizontal Pixel Count after Scale-Up/-Down The horizontal width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_HSIZE bits. The setting range is 4 to 2,048 in a scale-up/down operation (see Table 48.6). These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VnUDS_SCALE register. |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 0 | CL_VSIZE [11:0] | H'000 | R/W | Clipping Size of Vertical Pixel Count after Scale-Up/-Down The vertical width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_VSIZE bits. The setting range is 4 to 2,048 in a scale-up/down operation (see Table 48.6). These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VnUDS_SCALE register. |

Figure 48.3 shows the configuration of the UDS. The UDS consists of a scaling filter and clipping circuit, such as the configuration shown in Figure 48.3. The scaling filter and clipping circuit are independent of each other.

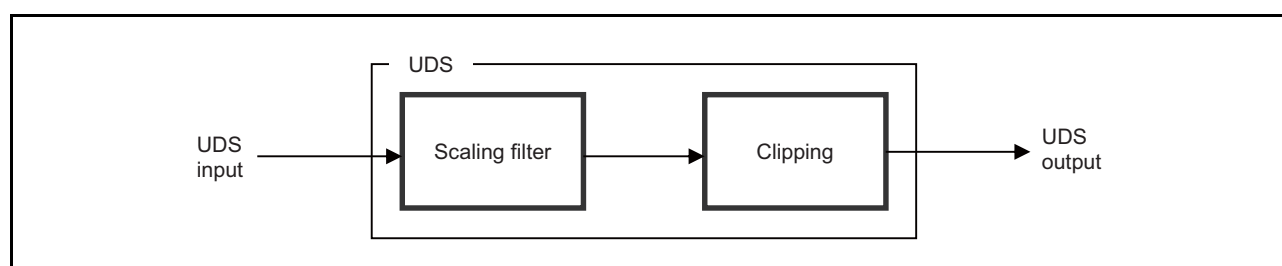

Figure 48.3 UDS Configuration

The size of the image actually output by the scaling filter (refer to section 48.2.21.2, Video n Scaling Factor Registers (VnUDS_SCALE) for calculation) is determined from the size of the image input to the scaling filter and the VnUDS_SCALE setting; that is, two types of image are output by the UDS according to the relationship between the size of the image actually output from the scaling filter ($hsize_{scaled}$ and $vsize_{scaled}$) and this register setting as shown in Figure 48.4.

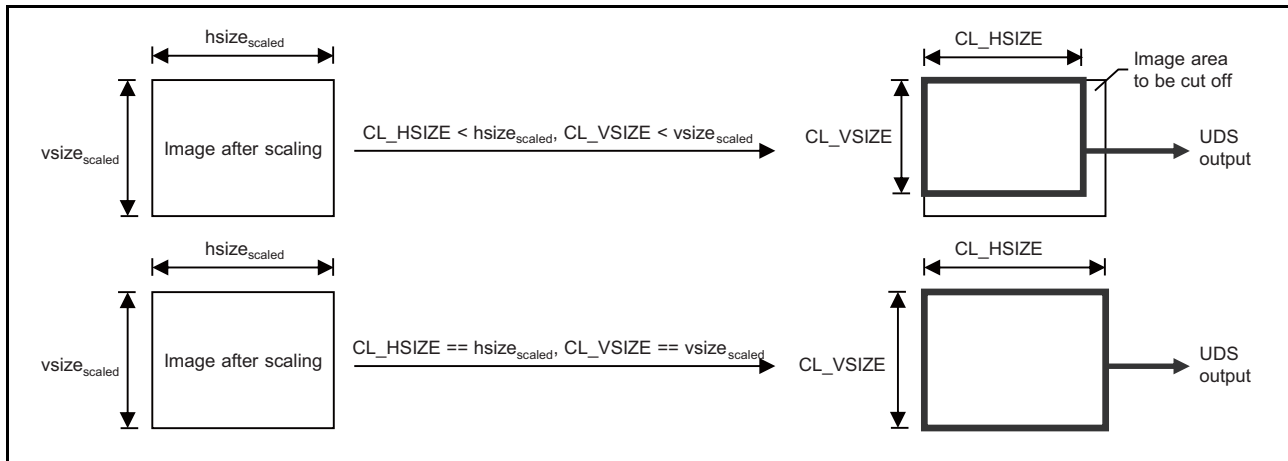

Figure 48.4 UDS Output Image for Each CL_HSIZE/VSIZE Setting

When the settings of the CL_HSIZE and CL_VSIZE bits are smaller than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the upscaled/downscaled image is clipped to become the UDS output image.

When the settings of the CL_HSIZE and CL_VSIZE bits are equal to the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the image actually output by the scaling filter becomes the UDS output image without change.

Do not set the CL_HSIZE and CL_VSIZE bits to values that satisfy $CL_HSIZE > hsize_{scaled}$ or $CL_VSIZE > vsize_{scaled}$.

| 31, 30 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 29 to 20 | LTYPR[9:0] | H'000 | R/W | Lookup Table Y Pointer These bits set the LUT pointer to the Y and R data obtained as the result of color space conversion. |
| 19 to 10 | LTCBPR[9:0] | H'000 | R/W | Lookup Table Cb Pointer These bits set the LUT pointer to the Cb and G data obtained as the result of color space conversion. |
| 9 to 0 | LTCRPR[9:0] | H'000 | R/W | Lookup Table Cr Pointer These bits set the LUT pointer to the Cr and B data obtained as the result of color space conversion. |

Note: Set the LUT pointer corresponding to the upper 10 bits of the 12-bit data of color space conversion result. The access pointer to the LUT will be automatically incremented by writing to the VnLUTD register. There will be no automatic increment at read access.

48.2.23 Video n Lookup Table Data Register (VnLUTD)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 16 | LTYDT[7:0] | H'000 | R/W | Lookup Table Y Data These bits set the LUT conversion data for Y and R data after color space conversion. |
| 15 to 8 | LTCBDT[7:0] | H'000 | R/W | Lookup Table Cb Data These bits set the LUT conversion data for Cb and G data after color space conversion. |
| 7 to 0 | LTCRDT[7:0] | H'000 | R/W | Lookup Table Cr Data These bits set the LUT conversion data for Cr and B data after color space conversion. |

Note: The 8-bit data after LUT conversion is subjected to upper shift to carry out capture control as 12-bit data.
As for reading from the VnLUTD register, the data read the second time, including dummy read, after the VnLUTP register has been set is valid.

48.2.24 RGB-YC Conversion Coefficient Registers

Color space conversion from RGB to YC is done with the following formula. Each of the coefficients can be set with the registers.

$$Y = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$

$$Cb = CBCLRP \times R + CBCLGP \times G + CBCLBP \times B + CBCLAP$$

$$Cr = CRCLRP \times R + CRCLGP \times G + CRCLBP \times B + CRCLAP$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$$

$$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$$

$$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$$

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|--|
| 31 | CREXPEN | 0 | R/W | Cr Calculation Sign Extension Enable This bit controls the sign extension for Cr data calculation in RGB888 → YCbCr422 color space conversion. 0: Disables YC conversion sign bit. 1: Enables YC conversion sign bit. |
| 30, 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 to 24 | CRCLSFT[4:0] | H'0A | R/W | Cr Calculation Shift Down Volume These bits set the amount of down shift for Cr calculation in RGB888 → YCbCr422 color space conversion (Initial value: 10) Unit: Bit shift count |
| 23 | CRCLHEN | 0 | R/W | Cr Calculation Shift Down Result Round-Off Enable This bit enables round-off process for Cr data calculation in RGB888 → YCbCr422 color space conversion 0: Round down to down shift process 1: Round-off to down shift process is enabled. |
| 22 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | CRCLCEN | 0 | R/W | Cr Calculation Data Clip Enable This bit enables data clipping process for Cr data calculation in RGB888 → YCbCr422 color space conversion. 0: Data clipping process is disabled. 1: Data clipping process is enabled. |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 0 | CRCLAP[11:0] | H'080 | R/W | Cr Calculation Data Normalized Additional Value These bits set the Cr data addition constant for RGB888 → YCbCr422 color space conversion. (Initial value: 128) |

48.3 Operation

48.3.1 Input Interface

The VIN captures video data in the MIPI CSI-2 interface and stores it in external memory. The following tables show the interface and data format supported.

Table 48.9 Supported Interfaces

| | | | | |
|------------------|--------------|--------------------------------|-----------------------------|-----------|
| Input interface | MIPI CSI-2 | YCbCr-422 | 8 bits | Supported |
| | | | 10 bits | Supported |
| | | RGB-888 | 24 bits | Supported |
| | | 8-bit user defined data (RAW8) | 8 bits | Supported |
| Output interface | RGB output | RGB-565 | 16 bits | Supported |
| | | ARGB-1555 | 16 bits | Supported |
| | | RGB-888 | 32 bits | Supported |
| | | ARGB-8888 | 32 bits | Supported |
| | YCbCr output | YCbCr-422 multiplexed | 8 bits | Supported |
| | | | 10 bits | Supported |
| | | YCbCr-422 separated Y/CbCr | Y: 8 bits CbCr: 8 bits | Supported |
| | | | Y: 10 bits CbCr: 8 bits | Supported |
| | | | Y: 10 bits CbCr: 10 bits | Supported |
| | | | Y: 10 bits CbCr: 10 bits | Supported |
| | | YCbCr-422 separated only Y | 8 bits | Supported |
| | | | 10 bits | Supported |

Note 1. When capturing MIPI CSI-2 input data, be sure to enable the internal field signal generation function.

Note 2. Dithering is performed for RGB-888 → RGB-565 conversion.

Note 3. RGB data is converted and transferred to memory from the video module after 8-bit precision conversion.

Note 4. For details of output interfaces, see section 48.3.9, Output Data Format.

48.3.2 Capture Mode

With the VIN, either of the single frame capture mode or continuous frame capture mode can be selected.

Specifying the capture field in IM bits of the video n main control register (VnMC) and then setting the SC bit in the video n frame capture register (VnFC) to 1 provides single frame capture mode. In this mode, the current frame is captured when the SC bit write timing (current scanline position) is smaller than the value of the video n start line pre-clip register (VnSLPrC), or the next frame is captured in other cases. The capture data is transferred to the memory address that is set in the video n memory base 1 register (VnMB1). For using single frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable bit (ME) in the video n main control register (VnMC).
2. Set 1 to the single frame capture mode bit (SC) in the video n frame capture register (VnFC).

Note: When using this setting, don't set 2'b01 to the interlace mode bits (IM) in the video n main control register (VnMC).

Specifying the capture field in IM bits of VnMC and then setting the CC bit of VnFC to 1 provides continuous frame capture mode, in which capture data is sequentially transferred to the addresses that are set in MB1 to MB3. In this case, the latest captured frame ID is shown in the FBS bits in the video n module status register (VnMS). For using continuous frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable bit (ME) in the video n main control register (VnMC).
2. Set 1 to the continuous frame capture mode bit (CC) in the video n frame capture register (VnFC)

Note: Don't set 1 to the single frame capture mode bit (SC) and the continuous frame capture mode bit (CC) at the same time.

When capturing progressive data, in which the field signal does not change, use the internal field signal generation function to toggle the internal field signal. For details, see section 48.2.18, Video n Data Mode Register 2 (VnDMR2).

48.3.3 Size Clipping

Image data that has been captured is pre-clipped according to the settings of the following registers: Video n start line pre-clip (VnSLPrC), Video n end line pre-clip (VnELPrC), Video n start pixel pre-clip (VnSPPrC), and Video n end pixel pre-clip (VnEPPrC).

For post-clipping after horizontal or vertical scaling, see section 48.2.21.4, Video n UDS Output Size Clipping Registers (VnUDS_CLIP_SIZE).

Figure 48.5 Example of Clipping

For all the post-clipped lines, the lengths of individual lines written into the memory are defined by the video n image stride register (VnIS). The setting can be larger than the post-clipped frame width, but cannot be smaller than the width. The VnIS register must be filled with a value larger than the horizontal post-clipping width. The input field in the above figure shows an effective image area from the video decoder; the VIN does not allow anything exceeding the image area to be captured.

Note: Each of the following registers specifies a distance from the starting point in the effective image area: Video n start line pre-clip (VnSLPrC), Video n end line pre-clip (VnELPrC), Video n start pixel pre-clip (VnSPPrC), and Video n end pixel pre-clip (VnEPPrC).

48.3.4 Vertical Scaling

For details on scaling in the vertical direction, see section 48.2.21.2, Video n Scaling Factor Registers (VnUDS_SCALE).

48.3.5 Horizontal Scaling

For details on scaling in the horizontal direction, see section 48.2.21.2, Video n Scaling Factor Registers (VnUDS_SCALE).

48.3.6 Color Conversion Function

(1) YC-RGB Color Conversion

When the data input format is YCbCr, set the BPS bit in the VnMC register to 0 to convert YCbCr data to RGB data. If an 8-bit data format is used for the capture interface, the color conversion is carried out according to the matrix coefficients set in the VnCSCC1, VnCSCC2, and VnCSCC3 registers. Otherwise, it is carried out according to the matrix coefficients set in the VnCSCE1, VnCSCE2, VnCSCE3, and VnCSCE4 registers. All of the input YCbCr data is extended to 12-bit data before carrying out color conversion.

Here, if the BPS bit in VnMC is set to 1, the data is stored in memory as it is in YCbCr format.

$$\begin{aligned}
 R &= \left(\begin{matrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{matrix} \right) \times (Y - \begin{matrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{matrix}) + \left(\begin{matrix} VnCSCC2/ \\ RCRMUL[9:0] \\ or \\ VnCSCE3/ \\ RCRMUL2[13:0] \end{matrix} \right) \times (Cr - \begin{matrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{matrix}) \\
 G &= \left(\begin{matrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{matrix} \right) \times (Y - \begin{matrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{matrix}) - \left(\begin{matrix} VnCSCC2/ \\ GCRMUL[9:0] \\ or \\ VnCSCE3/ \\ GCRMUL2[13:0] \end{matrix} \right) \times (Cr - \begin{matrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{matrix}) - \left(\begin{matrix} VnCSCC3/ \\ GCBMUL[9:0] \\ or \\ VnCSCE4/ \\ GCBMUL2[13:0] \end{matrix} \right) \times (Cb - \begin{matrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{matrix}) \\
 B &= \left(\begin{matrix} VnCSCC1/ \\ YMUL[9:0] \\ or \\ VnCSCE1/ \\ YMUL2[13:0] \end{matrix} \right) \times (Y - \begin{matrix} VnCSCC1/ \\ YSUB[7:0] \\ or \\ VnCSCE1/ \\ YSUB2[11:0] \end{matrix}) + \left(\begin{matrix} VnCSCC3/ \\ BCBMUL[9:0] \\ or \\ VnCSCE4/ \\ BCBMUL2[13:0] \end{matrix} \right) \times (Cb - \begin{matrix} VnCSCC1/ \\ CSUB[7:0] \\ or \\ VnCSCE1/ \\ CSUB2[11:0] \end{matrix})
 \end{aligned}$$

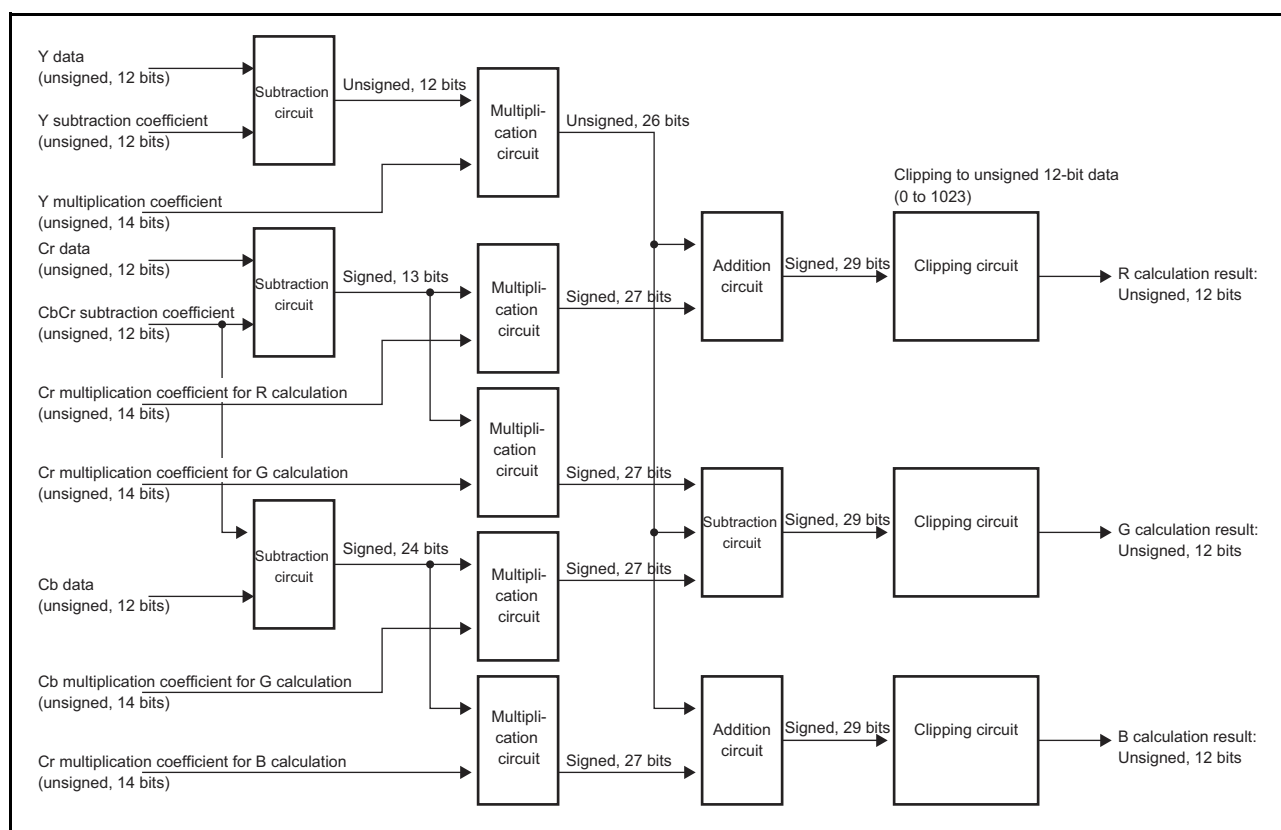

Figure 48.6 YCbCr → RGB Calculation Circuit Configuration

Examples of color space that can be set in YC-RGB conversion coefficient registers are shown below. See the register descriptions for details of the coefficients.

Table 48.10 Examples of YC-RGB Conversion Coefficient Register Settings

| YC-RGB Conversion Coefficient | YMU L | YSUB | CSUB | RCRMUL | GCRMUL | GCBMUL | BCBMUL |
|---|----------|------|------|--------|--------|--------|--------|
| ITU-R BT.601 (initial value) $16 \leq Y \leq 235, 16 \leq Cb, Cr \leq 240$ | 1.164 | 16 | 128 | 1.596 | 0.813 | 0.392 | 2.017 |
| Luminance expansion example $1 \leq Y \leq 254, 16 \leq Cb, Cr \leq 240$ | 1.008 | 1 | 128 | 1.596 | 0.392 | 0.813 | 2.017 |

Specify an integer in each addition coefficient bit field. For each multiplication coefficient, specify a value obtained by multiplying the desired coefficient value by 256.

Example: When the desired multiplication coefficient is 1.164

$$1.164 \times 256 = 297 \text{ (set value: B'0100101001)}$$

Note 1. In order to process the data outside the range prescribed by the ITU-R BT.601 standard, set the CLP[1:0] bits in VnMC to 11. The data is clipped to the specified value before color space conversion.

Note 2. The YC-RGB color conversion data is unconditionally rounded to the $0 \leq R, G, B \leq 255$ range.

(2) RGB-YC Color Conversion

When the data input format is RGB, set the BPS bit in VnMC to 0 for color conversion of RGB data into YCbCr data format. Color conversion from RGB to YCbCr is done according to the matrix coefficients set in RGB-YC conversion coefficient registers (VnYCCR1-VnYCCR3/VnCBCCR1-VnCBCCR3/VnCRCCR1-VnCRCCR3). All of the input RGB data is extended to 12-bit data before color conversion.

If 1 is set to the BPS bit in VnMC, the data will be stored in the memory as it is in RGB format.

$$\begin{aligned}
 Y &= ((YCLRP \times R + YCLGP \times G + YCLBP \times B) \times 2^{YCLSFT}) + YCALP \\
 Cb &= ((CBCLRP \times R + CBCLGP \times G + CBCLBP \times B) \times 2^{CBCLSFT}) + CBCALP \\
 Cr &= ((CRCLRP \times R + CRCLGP \times G + CRCLBP \times B) \times 2^{CRCLSFT}) + CRCALP
 \end{aligned}$$

The following data rounding functions of RGB-YCbCr color conversion function can be independently set to each pixel. The circuit configuration of Y data is given below.

Table 48.11 Data Rounding Functions of RGB-YC Color Conversion Function

| Function | Symbol | Description |
|---|-------------|--|
| Sign extension enable | YEXPEN | Enables/disables signed bits of the matrix multiplication result. |
| Multiplication result shift down amount | YCLSFT[4:0] | Amount of shift down in the matrix multiplication result |
| Rounding off enable | YCLHEN | Enables/disables rounding off to the shift down amount. |
| Clipping enable | YCLCEN | Enables/disables data rounding process between 0 to 1023 of the output data. |

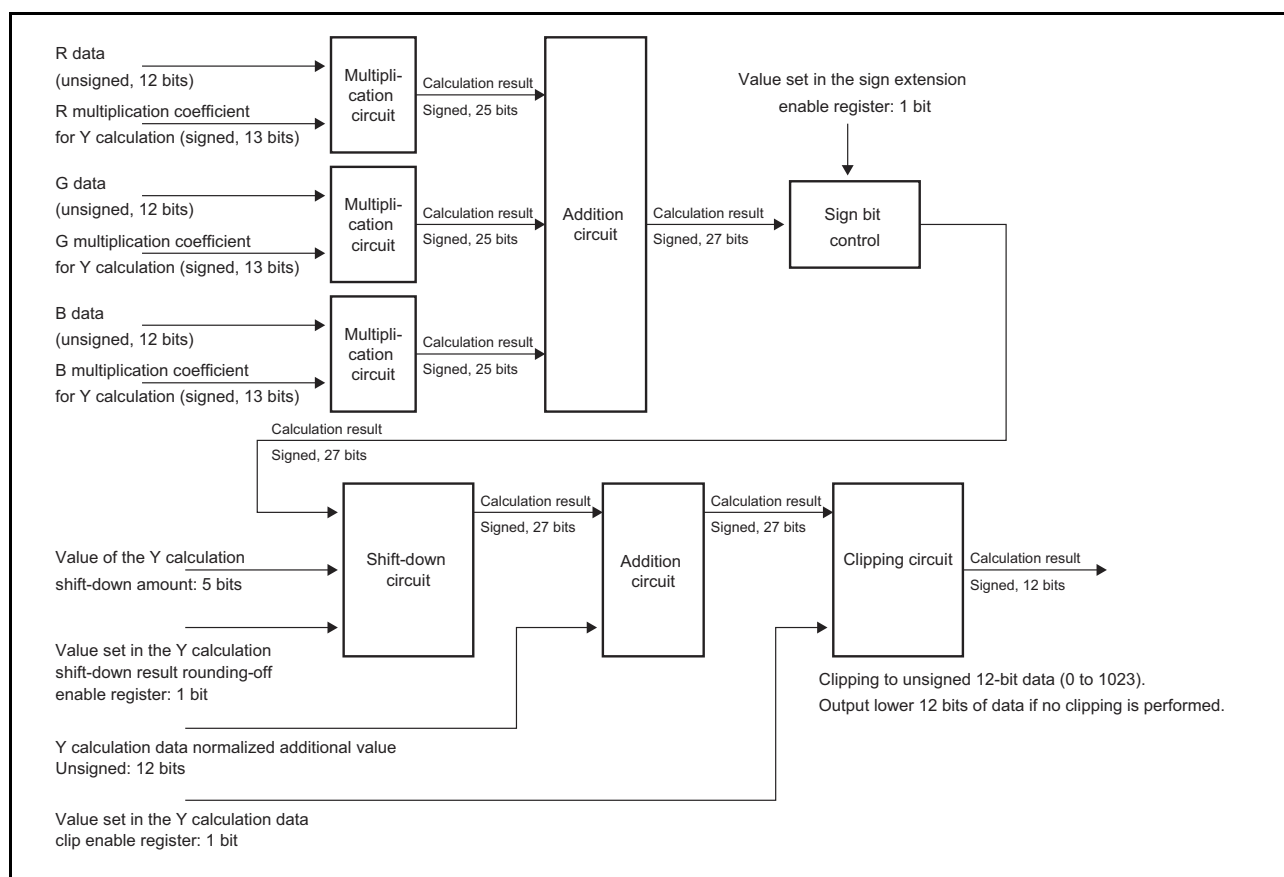

Figure 48.7 Y Data Circuit Configuration of RGB → YCbCr Color Conversion Function

48.3.7 Image Data Format Conversion Functions

(1) Lookup Table (LUT) Precision Conversion Function

Set the LUTE bit in VnMC to 1 to enable table conversion of each pixel data of Y, Cb, and Cr or R, G, and B data after color conversion.

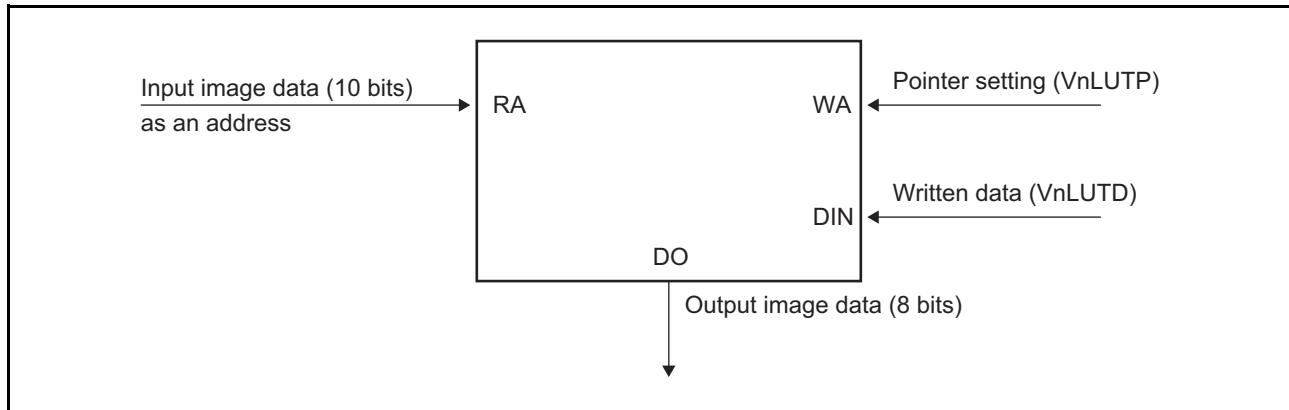

Figure 48.8 Lookup Table

Pointer Access:

The pointer is incremented every time a write access to the VnLUTD register is made.

The incremented pointer value is read when the VnLUTP register is read. Since the pointer is not incremented at read access to the VnLUTD register, the pointer should be set just before reading.

The procedure given below must be followed to access the lookup table.

The lookup table cannot be accessed from the CPU during the conversion process.

(For write/read access to the LUT from the CPU, the LUTE bit in VnMC should be 0.)

Write access:

1. Write the access destination address in VnLUTP.
2. Write the data in VnLUTD. Thereby the data will be reflected in the lookup table.
Also the pointer will automatically increase by 1.
3. Writing to VnLUTD will consecutively update the lookup table.

Read Access:

1. Write the access destination address in VnLUTP.
2. Read VnLUTD. This is dummy read; thus the read data needs to be discarded.
3. Read VnLUTD. This reading allows the address data written in VnLUTP to be acquired.

[Notes on Using the Lookup Table]

1. Set the lookup table only after capture operation has stopped.
2. Rewrite all before using the lookup table.
3. Data set to the lookup table should be within the range compatible to the input bit width.

(2) YCbCr422 → YC Separation Function

When transferring YCbCr data to memory, Y data and CbCr data can be separated and transferred to different address spaces.

To perform YCbCr separation transfer, set the DTMD[1:0] bits in the VnDMR register to B'10. In this case, the Y data will be transferred to the address set in the memory base address register and CbCr data will be transferred to the address obtained by adding the value set in the VnUVAOF register to the memory base address register.

If the YMODE[0] bits in the VnDMR register are set, only Y data will be transferred to memory and CbCr data is not transferred to memory.

Figure 48.9 Y/Cb/Cr Separation in Big Endian

(3) Dithering Function

Dithering is performed when the internal RGB-888 format after color space conversion is converted to the RGB-565 or RGB-1555 format. The dithering mode can be selected with the DC[1:0] bits in VnMC.

(a) Dithering with Cumulative Addition

Set the DC[1:0] bits in VnMC to B'00 to perform dithering using the cumulative addition method in horizontal pixel units.

$$R_n[7:3] \leq (R_x[7:0] + R_{n-1}[2:0]) \gg 3$$

$$G_n[7:2] \leq (G_x[7:0] + G_{n-1}[1:0]) \gg 2$$

$$B_n[7:3] \leq (B_x[7:0] + B_{n-1}[2:0]) \gg 3$$

Where:

(R_n, G_n, B_n) = Output RGB-565 pixel

(R_x, G_x, B_x) = Input RGB-888 pixel

(R_{n-1}, G_{n-1}, B_{n-1}) = Pseudo random error (LSB of the cumulative error)

(b) Ordered Dithering

Set the DC[1:0] bits in VnMC to B'01 to perform dithering using the ordered dithering method.

$$R_n[7:3] \leq (R_x[7:0] + D_{42xy}) \gg 3$$

$$G_n[7:2] \leq (G_x[7:0] + D_{22xy}) \gg 2$$

$$B_n[7:3] \leq (B_x[7:0] + D_{42xy}) \gg 3$$

Where:

(R_n, G_n, B_n) = Output RGB-565 pixel

(R_x, G_x, B_x) = Input RGB-888 pixel

(D_{22xy}, D_{42xy}) = Input x, y coordinate dithering matrix result

$$D_{22} = \begin{bmatrix} 0 & 3 \\ 2 & 1 \end{bmatrix}, D_{42} = \begin{bmatrix} 0 & 3 & 4 & 7 \\ 2 & 1 & 6 & 5 \end{bmatrix}$$

48.3.8 Internal Field Signal Generation

As the VIN controls capture of data in interlaced mode, correct capture control is not achieved if the external field signal level does not change.

Through the internal field signal generation function, the VIN can control the capture field signal even when the input field signal does not change, such as during progressive data capturing. The following settings can be made for the internal field generation function through the FTEV and FTEH bits in the video n data mode register 2 (VnDMR2).

- VSYNC field toggle mode (FTEV = 1 in VnDMR2)

When this setting is made, the VSYNC field toggle mode is entered for capture field signal control if the input field signal does not change for the VSYNC cycles specified by the VLV bits in VnDMR2. The toggle mode is canceled when a change in the external field signal level is detected (the capture operation is controlled according to the input field signal).

- HSYNC field toggle counter (FTEH = 1 in VnDMR2)

This counter counts the capture active lines. If the external field signal does not change until the count reaches the HLV setting in VnDMR2, the capture field signal is controlled.

Note 1. Do not set both the FTEV and FTEH bits in VnDMR2 at the same time.

Note 2. Immediately after cancellation of the toggle mode, capture control is skipped for one VSYNC cycle in some cases depending on the input field signal state.

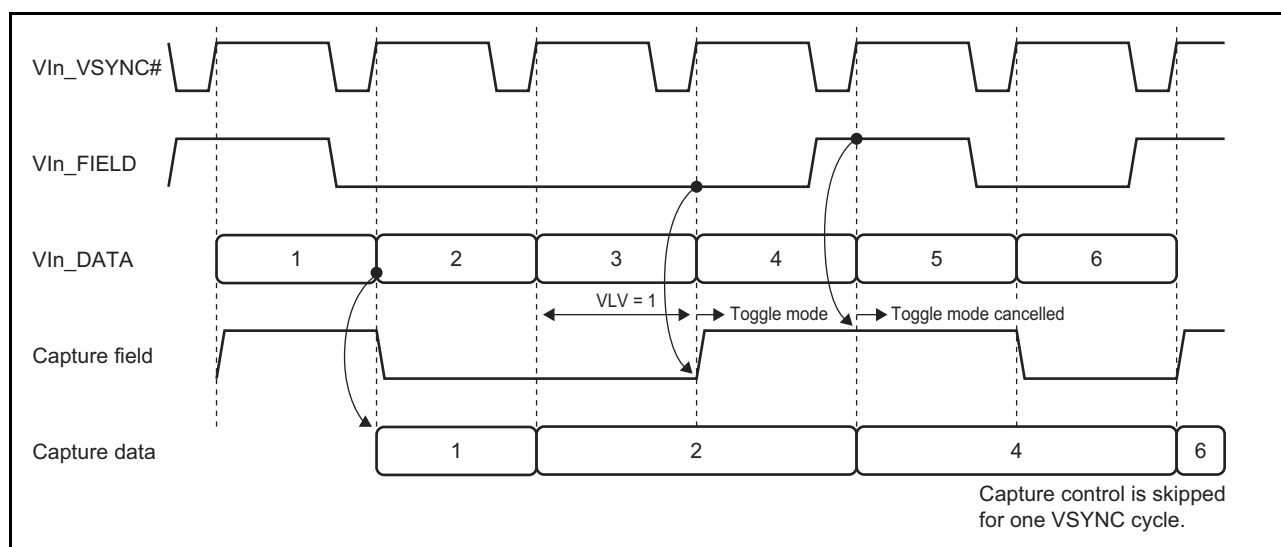

Figure 48.10 Overview and Notes of VSYNC Field Toggle Mode

Figure 48.11 VSYNC Field Toggle Mode When the External Field Signal Does Not Change

48.3.9 Output Data Format

The VIN can output image data in the following formats. The figures in this section assume that data is stored in unified memory in little endian.

(1) YC: YCbCr-422, 8 bits

The 8-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below. YC data can be switched between the UYVY format and YUYV format through the BPSM bit in VnDMR.

- BPSM = 0 in VnDMR: UYVY format

- 8-bit YCbCr-422 data (UYVY format)

| | | | | |
|--------------------|---------|----|----------|----|
| D63 to D48 | 63 | 56 | 55 | 48 |
| Image data 3 and 4 | Y3[7:0] | | Cr2[7:0] | |
| D47 to D32 | 47 | 40 | 39 | 32 |
| Image data 3 and 4 | Y2[7:0] | | Cb2[7:0] | |
| D31 to D16 | 31 | 24 | 23 | 16 |
| Image data 1 and 2 | Y1[7:0] | | Cr0[7:0] | |
| D15 to D0 | 15 | 8 | 7 | 0 |
| Image data 1 and 2 | Y0[7:0] | | Cb0[7:0] | |

- BPSM = 1 in VnDMR: YUYV format

- 8-bit YCbCr-422 data (YUYV format)

| | | | | |
|--------------------|----------|----|---------|----|
| D63 to D48 | 63 | 56 | 55 | 48 |
| Image data 3 and 4 | Cr2[7:0] | | Y3[7:0] | |
| D47 to D32 | 47 | 40 | 39 | 32 |
| Image data 3 and 4 | Cb2[7:0] | | Y2[7:0] | |
| D31 to D16 | 31 | 24 | 23 | 16 |
| Image data 1 and 2 | Cr0[7:0] | | Y1[7:0] | |
| D15 to D0 | 15 | 8 | 7 | 0 |
| Image data 1 and 2 | Cb0[7:0] | | Y0[7:0] | |

(2) YC: YCbCr-422, 10 bits

The 10-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below.

Note 1. In this format, the YC_THR bit in VnDMR should be set to 1.

Note 2. Word addresses of YCbCr data are output in accordance with the VnIS register setting.

- 10-bit YCbCr-422 data: (UYVY format)

| | | | | | | | | |
|--------------|-----|-----|---|---|---|---|----------|-----|
| D127 to D112 | 127 | 122 | | | | | 121 | 112 |
| Image data 8 | 0 | 0 | 0 | 0 | 0 | 0 | Y3[9:0] | |
| D111 to D96 | 111 | 106 | | | | | 105 | 96 |
| Image data 7 | 0 | 0 | 0 | 0 | 0 | 0 | Cr2[9:0] | |
| D95 to D80 | 95 | 90 | | | | | 89 | 80 |
| Image data 6 | 0 | 0 | 0 | 0 | 0 | 0 | Y2[9:0] | |
| D79 to D64 | 79 | 74 | | | | | 73 | 64 |
| Image data 5 | 0 | 0 | 0 | 0 | 0 | 0 | Cb2[9:0] | |
| D63 to D48 | 63 | 58 | | | | | 57 | 48 |
| Image data 4 | 0 | 0 | 0 | 0 | 0 | 0 | Y1[9:0] | |
| D47 to D32 | 47 | 42 | | | | | 41 | 32 |
| Image data 3 | 0 | 0 | 0 | 0 | 0 | 0 | Cr0[9:0] | |
| D31 to D16 | 31 | 26 | | | | | 25 | 16 |
| Image data 2 | 0 | 0 | 0 | 0 | 0 | 0 | Y0[9:0] | |
| D15 to D0 | 15 | 10 | | | | | 9 | 0 |
| Image data 1 | 0 | 0 | 0 | 0 | 0 | 0 | Cb0[9:0] | |

(3) YC: YC Separation YCbCr-422, Y (8 bits)/C (8 bits)

This is 8-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the video n data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the video n UV address offset register (VnUVAOF) to the memory base address register. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Y data

(4) YC: YC Separation YCbCr-422 Y (10 bits)/C (10 bits)

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the video n data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the video n UV address offset register (VnUVAOF) to the memory base address register. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Note 1. In this format, the YC_THR bit in VnDMR should be set to 1.

Note 2. Word addresses of YCbCr data are output in accordance with the VnIS register setting.

Y data (10 bits)

| | | | | | | | | | | | | |
|--------------|----|---|---|---|---|---|---------|--|----|--|----|--|
| D63 to D48 | 63 | | | | | | 58 | | 57 | | 48 | |
| Image data 4 | 0 | 0 | 0 | 0 | 0 | 0 | Y3[9:0] | | | | | |
| D47 to D32 | 47 | | | | | | 42 | | 41 | | 32 | |
| Image data 3 | 0 | 0 | 0 | 0 | 0 | 0 | Y2[9:0] | | | | | |
| D31 to D16 | 31 | | | | | | 26 | | 25 | | 16 | |
| Image data 2 | 0 | 0 | 0 | 0 | 0 | 0 | Y1[9:0] | | | | | |
| D15 to D0 | 15 | | | | | | 10 | | 9 | | 0 | |
| Image data 1 | 0 | 0 | 0 | 0 | 0 | 0 | Y0[9:0] | | | | | |

Cb, Cr data (10 bits)

| | | | | | | | | | | | | | | |
|--------------|----|---|---|---|---|---|----------|----|----|--|--|--|--|--|
| D63 to D48 | 63 | | | | | | 58 | 57 | 48 | | | | | |
| Image data 4 | 0 | 0 | 0 | 0 | 0 | 0 | Cr2[9:0] | | | | | | | |
| D47 to D32 | 47 | | | | | | 42 | 41 | 32 | | | | | |
| Image data 3 | 0 | 0 | 0 | 0 | 0 | 0 | Cb2[9:0] | | | | | | | |
| D31 to D16 | 31 | | | | | | 26 | 25 | 16 | | | | | |
| Image data 2 | 0 | 0 | 0 | 0 | 0 | 0 | Cr0[9:0] | | | | | | | |
| D15 to D0 | 15 | | | | | | 10 | 9 | 0 | | | | | |
| Image data 1 | 0 | 0 | 0 | 0 | 0 | 0 | Cb0[9:0] | | | | | | | |

(5) YC: YC Separation YCbCr-422, Y (10 bits)/C (8 bits)

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the setting of the YMODE[2:0] bits in the video n data mode register (VnDMR) is B'010 or B'011, setting the DTMD[1:0] bits in VnDMR to B'10 leads to the conversion of 10-bit CrCb data to 8-bit CrCb data and changing the format to 4:2:2.

UV data is transferred to the address obtained by adding the value set in the video n UV address offset register (VnUVAOF) to the memory base address register. If the YMODE[2:0] bits in VnDMR are set to B'011, only Y data can be transferred and UV data cannot be transferred.

Note 1. Word addresses of Y data are output in accordance with the VnIS register setting.

Note 2. Byte addresses of CbCr data are output in accordance with the VnIS register setting.

Y data

| | | | | |
|----------------------------|----|----|----|---------|
| D63 to D48 Image data 4 | 63 | 58 | 57 | 48 |
| | 0 | 0 | 0 | Y3[9:0] |
| D47 to D32 Image data 3 | 47 | 42 | 41 | 32 |
| | 0 | 0 | 0 | Y2[9:0] |
| D31 to D16 Image data 2 | 31 | 26 | 25 | 16 |
| | 0 | 0 | 0 | Y1[9:0] |
| D15 to D0 Image data 1 | 15 | 10 | 9 | 0 |
| | 0 | 0 | 0 | Y0[9:0] |

Cb, Cr data

|----------------------------------|----------|----|----|----------|
| D31 to D16 Image data 3 and 4 | 31 | 24 | 23 | 16 |
| | Cr2[7:0] | | | Cb2[7:0] |
| D15 to D0 Image data 1 and 2 | 15 | 8 | 7 | 0 |
| | Cr0[7:0] | | | Cb0[7:0] |

(6) 16 Bits/Pixel: RGB-565

The RGB levels are expressed through 5 bits for R, 6 bits for G, and 5 bits for B.

16-bit/pixel data (RGB data) format

**(7) 16 Bits/Pixel: ARGB-1555**

The ARGB levels are expressed through 1 bit for A, 5 bits for R, 5 bits for G, and 5 bits for B. For data conversion to ARGB-1555, the lowest bit of the G data in RGB-565 data is truncated, and the A value specified through the register is added.

Set the DTMD[1:0] bits in the video n data mode register (VnDMR) to B'01 to specify conversion to ARGB-1555, and specify the A value in the ABIT bit in VnDMR.

16-bit/pixel data (ARGB data) format

**(8) 32 Bits/Pixel: RGB-888**

The RGB levels are expressed through 8 bits for R, 8 bits for G, and 8 bits for B. Bits 31 to 24 are fixed to 0.

32-bit/pixel data (RGB data) format

**(9) 32 Bits/Pixel: ARGB-8888**

The ARGB levels are expressed through 8 bits for A, 8 bits for R, 8 bits for G, and 8 bits for B. The A value specified by the A8BIT[7:0] bits in VnDMR is set in bits 31 to 24.

32-bit/pixel data (ARGB data) format

(10) Raw: 8 bits

The format of 8-bit raw image data is shown below.

- Note 1. The data transfer is in 4-byte units.
Note 2. Byte addresses of raw data are output in accordance with the VnIS register setting.

8-bit raw data format

48.3.10 Endianness Conversion

The VIN stores captured data in memory in little endian with the initial settings. Set the EN bit in the video n main control register (VnMC) to 1 to convert data into big endian before storing in memory.

Endian conversion in word units is controlled through the EN bit in VnMC, and swapping in byte units is controlled through the BPSM bit in the video n data mode register (VnDMR). For conversion to big endian, specify the BPSM bit as shown in the following table according to the data format specified through the DTMD bits in VnDMR and BPS bit in VnMC.

Table 48.12 Endian Conversion Unit

| Data Format | BPS in VnMC | DTMD[1:0] in VnDMR | EXRGB in VnDMR | BPSM in VnDMR | Endian Conversion Unit |
|-------------|-------------|--------------------|----------------|---------------|------------------------|
| RGB-565 | 0 | 00 | 0 | 0 | Word units |
| RGB-888 | 0 | 00 | 1 | 0 | Longword units |
| YCbCr-422 | 1 | 00 | 0 | 1 | Byte units |
| ARGB-1555 | 0 | 01 | 0 | 0 | Word units |
| ARGB-8888 | 0 | 01 | 1 | 0 | Longword units |
| YC | 1 | 10 | 0 | 0 | Byte units |

The following figures show endian conversions in byte, two-byte, and four-byte units.

Endian conversion in byte units:

Figure 48.12 Data Alignment Conversion from Little Endian to Big Endian

48.3.11 Module Standby Mode

The LSI supports module standby mode in which clock supply to the VIN is stopped. The VIN should not be accessed during module standby mode. For details of the module standby function, refer to section 52, Power-Down Modes.

48.3.12 Transition to Module Standby Mode

1. Clear the module enable bit (ME) in the video n main control register (VnMC) and the continuous frame capture mode bit (CC) and the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 0 to stop the VIN.
2. Confirm that the capture active bit (CA) in the video n module status register (VnMS) is cleared to 0.*¹
3. Set MSTP to 1, assigned to this module in the setting of section 52, Power-Down Modes.

Note 1. The camera device should be kept operation until the CA bit in VnMS set to 0.

48.3.13 Cancellation of Module Standby Mode and Restarting of VIN

1. Set MSTP to 0, assigned to this module in the setting of section 52, Power-Down Modes.
2. Set the module enable bit (ME) in the video n main control register (VnMC) to 1 to start the VIN.
3. Set the continuous frame capture mode bit (CC) or the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 1.

48.3.14 Interrupts

The VIN is capable of generating 1 interrupt.

For details, refer to section 7, Interrupt Controller.

Table 48.13 Interrupt assignment

| Interrupt Name | Cause of interrupt |
|----------------|--|
| VIN. | FIS2 or VFS or VRS or FIS or SIS or EFS or FOS bit in V0INTS |

48.3.15 Initialization Procedure

The VIN initialization procedure can be executed either before or after the CSI2 initialization procedure.

[VIN initialization procedure]

1. Set the VIN registers.
2. Set the VSYNC field toggle mode enable bit (FTEV) in the video n data mode register 2 (VnDMR2) to 1.
The VSYNC field toggle mode transition period bits (VLV[3:0]) in the VnDMR2 shall be set to H'0.
3. Set the module enable bit (ME) in the video n main control register (VnMC) to 1 to start the VIN.
4. Set the continuous frame capture mode bit (CC) or the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 1.

[CSI2 initialization procedure]

1. Set the Link and PHY of the CSI-2 module registers*¹.
2. Start the camera device.
3. Confirm that the PHY of the CSI-2 module starts.

Note 1. For details, see section 47, MIPI CSI2 Interface.

48.3.16 Capture Stop Procedure

1. Clear the module enable bit (ME) in the video n main control register (VnMC) and the continuous frame capture mode bit (CC) and the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 0 to stop the VIN.
2. Confirm that the video capture active status bit (CA) in the video n module status register (VnMS) is cleared to 0.*¹
3. Set the MSTP bit to 1 in the module stop control register.
4. Set the SRST bit to 1 in the software reset register.
5. Reset the Link and PHY of the CSI-2 module.
6. Stop the camera device.

Note 1. The camera device should be kept operating until the CA bit in VnMS is set to 0.

48.3.17 Resetting Procedure

The VIN is hung up in the following cases.

- After capturing has started, the video capture active status (CA) bit in the video n module status register (VnMS) is not set to 1.
- After execution of the procedure in section 48.3.16, Capture Stop Procedure, the video capture active status (CA) bit in the video n module status register (VnMS) is not cleared to 0.
- After at least one Vsync period has elapsed from the start of capturing, the end of frame interrupt status (EFS) bit or field interrupt status (FIS) bit in the video n interrupt status register (VnINTS) is not set to 1.
- In addition, the VIN is judged to be not operating.

When the VIN hangs, follow the procedure in section 52.3.6, Software Reset, to initiate a software reset for the VIN.

48.3.18 Capture Restarting Procedure

The VIN initial procedure can be executed either before or after the CSI2 initial procedure.

[VIN restarting procedure]

1. Set the SRST bit to 0 in the software reset register.
2. Set the MSTP bit to 0 in the module stop control register.
3. Set the VIN registers.
4. Set the VSYNC field toggle mode enable bit (FTEV) in the video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period bits (VLV[3:0]) in the VnDMR2 shall be set to H'0.
5. Set the module enable bit (ME) in the video n main control register (VnMC) to 1 to start the VIN.
6. Set the continuous frame capture mode bit (CC) or the single frame capture mode bit (SC) in the video n frame capture register (VnFC) to 1.

[CSI2 restarting procedure]

1. Set the Link and PHY of the CSI-2 module registers.
2. Start the camera device.
3. Confirm that the PHY of the CSI-2 module starts.

48.4 Usage Notes

48.4.1 Specifications

The following shows the specifications.

Table 48.14 Specifications

| Item | Description |
|---|---|
| Input from MIPI CSI-2 interface | In the input of progressive images through the MIPI CSI-2 interface, use the internal field signal generation function. For detail, see section 48.2.18, Video n Data Mode Register 2 (VnDMR2). |
| Limitation on register update | If a register is updated during capture, data captured immediately after the register update cannot be guaranteed. A register that supports the internal update mode as shown in Table 48.2 is updated immediately after the register is written to. To update other registers, stop capture operation and then update them. |
| Field capture mode image quality | Images of odd-numbered, odd/even-numbered and even-numbered fields, captured by VnMC/IM interlace mode bit settings, contain every other line from the input interlace images. Therefore, note that the horizontal resolution for video display is in units of fields. |
| Limitation on horizontal scaling | When scaling-up is used, the horizontal size that can be input is up to 2048 pixels. When scaling-down is used, the horizontal size that can be output is up to 2048 pixels. |
| Interrupt event timing | An interrupt event asserted by this module indicates the time when the interrupt event occurs in VIN, not the time when the transfer of captured data to memory is completed. |
| Pixel post-clip setting | Even when the output format is YCbCr-422, pixel post-clipping is applied in accordance with the VnUDS_CLIP_SIZE setting. Therefore, specify an even value for the clipping size in the CL_HSIZE bits when the output format is YCbCr-422. |
| Coefficient settings for color space conversion | Specify appropriate values in the color space conversion coefficient 1 to 3 registers (VnCSCC1 to VnCSCC3) to keep the RGB image data within the range $0 < R', G', B' < 255$. After calculation for color space conversion, pixel values less than 0 normalized to 0, and pixel values greater than or equal to 255 normalized to 255. |
| Scaling up | When horizontal and vertical scaling up is specified, the amount of memory transfer becomes greater with an increase in traffic. Note the amount of traffic on the entire system when using the scaling-up function because the overall transfer efficiency of the system might degrade due to the increased use of the internal buses. |
| YC Restrictions on YC separation function | Set the offset register (VnUVAOF) that stores UV data such that the storage areas of Y and UV data are not the same. |
| RGB-888 → RGB-565 conversion function | In the dithering process by cumulative addition, if the same color is captured as in a blue back image, periodic noise may be generated by the cumulative addition process (carried by addition). In this case, set the DC[1:0] bits in VnMC to the ordered dithering. |
| The maximum size that can be captured | The maximum number of lines and pixels that can be captured at this time is shown below. The maximum number of lines that can be captured = 2048 (the maximum value of the clipping register) – The vertical blanking time The maximum number of pixels that can be captured = 2048 (the maximum value of the clipping register) – The horizontal blanking time |
| Clipping size setting | The common pre-clipping size for odd and even fields is specified in VnSLPrC, VnELPrC, VnSPPrC, and VnEPPrC. The common post-clipping size for odd and even fields is specified in VnUDS_CLIP_SIZE. |
| Limitation on interlace input | When an interlace image is input, be sure to supply the field signal to VIN. When an interlace image is input from the MIPI CSI-2 interface, it is necessary to create the field signal in the CSI2 module. For the details of the field signal creation in CSI2, see section 47, MIPI CSI2 Interface. |

48.4.2 Limitations on Usage

Table 48.15 Limitations on Usage

| Item | Description |
|---------------|---|
| Frame buffers | <p>Allocate the frame buffers in the on-chip RAM.</p> <p>To prevent performance to be degraded due to a page conflict when accessing the on-chip RAM, the maximum number of masters that simultaneously access the page where the frame buffers are allocated should be four, which includes the VIN.</p> |

49. SD/MMC Host Interface

Note: Development of the SD host-related products needs the conclusion of the following agreement. SD Host/Ancillary Product License Agreement (SD HALA)

49.1 Overview

49.1.1 Features

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, DDR50, and SDR104 transfer modes supported
- SD clock (SD_CLK) frequency = $B\phi$ frequency/ 2^n ($n = 0$ to 9)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 1
- Card detect function
- Write protect support
- MMC interface (1-/4-/8-bit MMC bus)
Note: Channel 1 only supports a 1- or 4-bit MMC bus.
- e-MMC device access supported
- Backward-compatible, high-speed, HS200 transfer modes supported
- High-priority interrupt (HPI) supported

Block Diagram

Figure 49.1 shows a block diagram of the SD/MMC host interfaces.

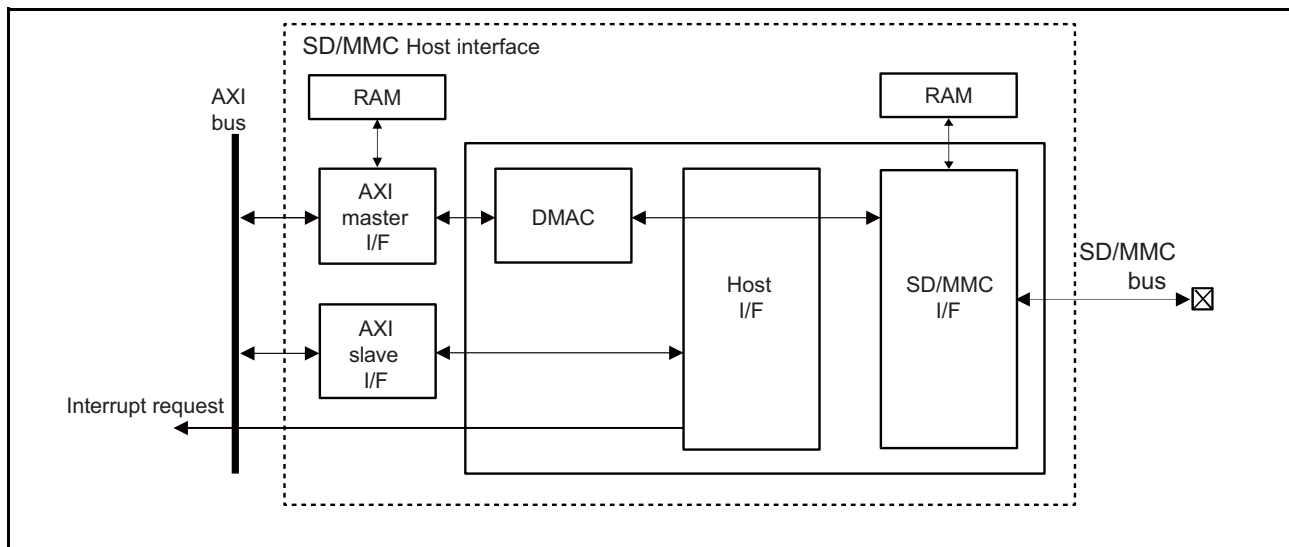

Figure 49.1 Block Diagram of SD/MMC Host Interface

49.1.2 External Pins

Table 49.1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V. Channels 0 and 1 can operate with different voltages. Before using the pins of the SD/MMC host interface, be sure to set the dedicated pin POC control register (PPOC) and SD/MMC host interface dedicated pin driving ability control registers 0 to 2 (PSDMMC0 to PSDMMC2).

For details, see the following sections:

section 51.3.30, Dedicated Pin POC Control Register (PPOC),

section 51.3.31, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 0 (PSDMMC0),

section 51.3.32, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 1 (PSDMMC1),

section 51.3.33, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 2 (PSDMMC2).

Table 49.1 Pin Configuration

| PIN Name | I/O | Function |
|------------------------|-----|---------------------------------------|
| SDx_CLK* ¹ | O | SD/MMC clock output |
| SDx_CMD* ¹ | I/O | SD/MMC command output, response input |
| SDx_DAT0* ¹ | I/O | SD/MMC Data 0 [bit 0] |
| SDx_DAT1* ¹ | I/O | SD/MMC Data 1 [bit 1], SDIO interrupt |
| SDx_DAT2* ¹ | I/O | SD/MMC Data 2 [bit 2], read wait |
| SDx_DAT3* ¹ | I/O | SD/MMC Data 3 [bit 3], Card detection |
| SD0_DAT4* ¹ | I/O | SD/MMC Data 4 [bit 4], |
| SD0_DAT5* ¹ | I/O | SD/MMC Data 5 [bit 5] |
| SD0_DAT6* ¹ | I/O | SD/MMC Data 5 [bit 6] |
| SD0_DAT7* ¹ | I/O | SD/MMC Data 7 [bit 7] |
| SDx_CD* ¹ | I | SD/MMC card detection* ² |
| SDx_WP* ¹ | I | SD/MMC write protection* ² |
| SD0_RST# | O | SD/MMC reset |

Note 1. x(= 0, 1) is the channel number of the SD/MMC host interface.

Note 2. Fix to 1 when not in use.

49.1.3 Register Configuration

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SD_CMD).

Channel 0: H'E8228000

Channel 1: H'E822A000

Table 49.2 Register Configurations

| Name | Abbreviation | Address | Access Width | Mirror |

Note 2. Refer to section 49.7, SCC Register Descriptions.

49.2 Register Description

49.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to section 49.4.14, Example of SD_CMD Register Setting.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------------------------|--|---------------|-----|--|
| 63 to 16 | — | All 0 | R | These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 14 | MD7 MD6 | 00 | R/W | Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited |
| 13 | MD5 | 0 | R/W | Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multi block transfer |
| 12 | MD4 | 0 | R/W | Write/Read Mode (enabled when the command with data is handled) 0: Write (SD/MMC host interfaces -> SD card) 1: Read (SD/MMC host interfaces <- SD card) |
| 11 | MD3 | 0 | R/W | Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc) |
| 10 9 8 | MD2 MD1 MD0 | 000 | R/W | Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/R1, R5, R6, or R7 response from the SD card 101: Extended mode/R1b response from the SD card 110: Extended mode/R2 response from the SD card 111: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see section 49.4.14, Example of SD_CMD Register Setting to select mode/response type. |
| 7 6 | C1 C0 | 00 | R/W | 00: CMD 01: ACMD 10: Setting prohibited 11: Setting prohibited |
| 5 4 3 2 1 0 | CF45 CF44 CF43 CF42 CF41 CF40 | 000000 | R/W | Command Index These bits specify Command Format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = B'0000 0110 CMD18: SD_CMD[7:0] = B'0001 0010 ACMD13: SD_CMD[7:0] = B'0100 1101 |

Note: SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

49.2.2 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is H'0000 0000 regardless of the setting of SD_ARG.

SD_ARG

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 0 | CF39 to CF8 | All 0 | R/W | Set command format[39:8] (argument). |

SD_ARG1 (Mirror of SD_ARG[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|--|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | CF39 to CF24 | All 0 | R/W | Set command format[39:24] (argument). |

49.2.3 Data Stop Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-------|---|
| 63 to 19 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 18 | — | 0*1 | R/W | Reserved The write value should always be 0. |
| 17 | HPIMODE | 0*1 | R/W | HPI Mode Enable 0: Disables HPI mode. 1: Enables HPI mode. |
| 16 | HPICMD | 0*1 | R/W*3 | HPI Command Issue When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1 is as follows. <ul style="list-style-type: none"> After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence. After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0. |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | SEC | 0*1 | R/W | Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued. |
| 7 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | STP | 0*1 | R/W | Stop <ul style="list-style-type: none"> When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. Set STP to 1 after the response end flag has been set. Set STP to 0 after the response end flag has been set. |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. It is effective only if 1 is written.

49.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------|---------------|-----|--|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 0 | CNT31 to CNT0 | All 0 | R/W | Number of Transfer Blocks* When H'0000 0001 is set, the number of transfer blocks is 1. : When H'0000 FFFF is set, the number of transfer blocks is 65535. : When H'FFFF FFFF is set, the number of transfer blocks is 4294967295. Do not set this register to H'0000 0000 if multiple blocks are to be transferred. |

Note: * Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

49.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

SD_RSP10

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|------------------------------------|
| 63 to 0 | R71 to R8 | All 0 | R | Hold the response from the SD card |

SD_RSP1 (Mirror of SD_RSP10[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | R39 to R24 | All 0 | R | Hold the response from the SD card |

SD_RSP32 (Mirror of SD_RSP10[63:32])

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 0 | R71 to R40 | All 0 | R | Hold the response from the SD card |

SD_RSP3 (Mirror of SD_RSP32[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | R71 to R56 | All 0 | R | Hold the response from the SD card |

SD_RSP54

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 63 to 56 | — | All 0 | R | These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 55 to 0 | R127 to R72 | All 0 | R | Hold the response from the SD card |

SD_RSP5 (Mirror of SD_RSP54[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 0 | R103 to R88 | All 0 | R | Hold the response from the SD card |

SD_RSP76 (Mirror of SD_RSP54[63:32])

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 63 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 23 to 0 | R127 to R104 | All 0 | R | Hold the response from the SD card |

SD_RSP7 (Mirror of SD_RSP76[31:16])

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|---|
| 63 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 to 0 | R127 to R120 | All 0 | R | Hold the response from the SD card |

Table 49.3 lists the response types and corresponding SD_RSP registers.

Table 49.3 Response Types and Corresponding SD_RSP Registers

| Response Types | SD_RSP Registers |
|----------------|-----------------------|
| R1, R1b[39:8] | SD_RSP10 SD_RSP54* |
| R2[127:8] | SD_RSP54 and SD_RSP10 |
| R3[39:8] | SD_RSP10 |
| R4[39:8] | SD_RSP10 |
| R5[39:8] | SD_RSP10 |
| R6[39:8] | SD_RSP10 |
| R7[39:8] | SD_RSP10 |

Note: The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

49.2.6 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-------|--|
| 63 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | HPIRES | 0*2 | R/W*1 | Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0 is written to HPIRES |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 10 | INFO10 | Unknown | R | Indicates the SDDAT3 state. 0: SDDAT3 is set to 0. 1: SDDAT3 is set to 1. |
| 9 | INFO9 | 0 | R/W*1 | SDDAT3 Card Insertion [Setting condition] After change in SDDAT3 from 0 to 1, two cycles of 2 B ϕ have elapsed with SDDAT3 held 1. [Clearing condition] When 0 is written to INFO9 |
| 8 | INFO8 | 0 | R/W*1 | SDDAT3 Card Removal [Setting condition] After change in SDDAT3 from 1 to 0, two cycles of 2 B ϕ have elapsed with SDDAT3 held 0. [Clearing condition] When 0 is written to INFO8 |
| 7 | INFO7 | Unknown | R | Write Protect Indicates the ISDWP state. 0: ISDWP is set to 1. 1: ISDWP is set to 0. |
| 6 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 5 | INFO5 | Unknown | R | Indicates the ISDCD state. 0: Indicates that Mcycle has elapsed with ISDCD held 1. 1: Indicates that Mcycle has elapsed with ISDCD held 0. Mcycle is set by bits 3 to 0 in SD_OPTION. |
| 4 | INFO4 | 0 | R/W*1 | ISDCD Card Insertion [Setting condition] After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0. [Clearing condition] When 0 is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION. |
| 3 | INFO3 | 0 | R/W*1 | ISDCD Card Removal [Setting condition] After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-------|--|
| 2 | INFO2 | 0*2 | R/W*1 | <p>Access End</p> <p>[Setting conditions]</p> <ol style="list-style-type: none"> 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to 1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed in the case of transfer for multiple block write <p>In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout.</p> <p>[Clearing condition]</p> <p>When 0 is written to INFO2</p> <p>When the access end bit is set to 1, the command sequence is terminated.</p> |
| 1 | — | 0 | R | <p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p> |
| 0 | INFO0 | 0*2 | R/W*1 | <p>Response End</p> <p>[Setting conditions]</p> <ol style="list-style-type: none"> 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed, 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed in the case of transfer for multiple block write, <p>In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout.</p> <p>[Clearing condition]</p> <p>When 0 is written to INFO0</p> <p>When issuing a command without data, the command sequence ends when the response end is set to 1.</p> |

Note 1. It is effective only if 0 is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

49.2.7 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-------|---|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | ILA | 0*2 | R/W*1 | Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = B'0000 1100 (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA |
| 14 | CBSY | 0*2 | R | Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed. |
| 13 | SCLKDIVEN | 1*2 | R | 0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence. |
| 12 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 11 | — | 0 | R/W | Reserved The write value should always be 1. |
| 10 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 9 | BWE | 0*2 | R/W*1 | SD_BUF Write Enable 0: Data cannot be written in SD_BUF0. 1: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0 is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3 |
| 8 | BRE | 0*2 | R/W*1 | SD_BUF Read Enable 0: Data cannot be read from SD_BUF0. 1: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0 is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-------|---|
| 7 | DAT0 | Unknown | R | <p>SDDAT0</p> <p>Indicates the SDDAT0 state.</p> <p>0: SDDAT0 is set to 0.</p> <p>1: SDDAT0 is set to 1.</p> <p>If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0.</p> <p>If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0.</p> <p>While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.</p> |
| 6 | ERR6 | 0*2 | R/W*1 | <p>Response Timeout</p> <p>[Setting condition]</p> <p>When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5)</p> <p>[Clearing condition]</p> <p>When 0 is written to ERR6</p> <p>The command sequence is halted by a response timeout.*4</p> |
| 5 | ERR5 | 0*2 | R/W*1 | <p>SD_BUF Illegal Read Access</p> <p>[Setting conditions]</p> <p>1. When SD_BUF is empty while SD_BUF0 is read</p> <p>2. When data with a CRC error or END error is read from SD_BUF0</p> <p>[Clearing condition]</p> <p>When 0 is written to ERR5</p> |
| 4 | ERR4 | 0*2 | R/W*1 | <p>SD_BUF Illegal Write Access</p> <p>[Setting conditions]</p> <p>1. When data is written to SD_BUF0 while it is not in the data read/write command state</p> <p>2. When data is written to SD_BUF0 while SD_BUF is full</p> <p>3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length</p> <p>4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status</p> <p>[Clearing condition]</p> <p>When 0 is written to ERR4</p> <p>Ncycle is set by bits 7 to 4 in SD_OPTION.</p> |
| 3 | ERR3 | 0*2 | R/W*1 | <p>Data Timeout (except response timeout)</p> <p>[Setting conditions]</p> <p>1. After R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle.</p> <p>2. After CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle.</p> <p>3. After write data, the CRC status is not received even after Ncycle has elapsed.</p> <p>4. After read command, read data is not received even after Ncycle has elapsed.</p> <p>5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle.</p> <p>6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed.</p> <p>7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed.</p> <p>[Clearing condition]</p> <p>When 0 is written to ERR3</p> <p>Ncycle is set by bits 7 to 4 in SD_OPTION.</p> <p>The command sequence is halted by the data timeout.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-------|---|
| 2 | ERR2 | 0*2 | R/W*1 | END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4 |
| 1 | ERR1 | 0*2 | R/W*1 | CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*5 [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4 |
| 0 | ERR0 | 0*2 | R/W*1 | CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4 |

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in Figure 49.18 under section 49, IO_RW_EXTENDED (CMD53/Multiple Block Read) or in Figure 49.21 under section 49.4.9, IO_RW_EXTENDED (CMD53/Multiple Block Write).

Note 5. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

49.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt. When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | IMASK16 | 1 | R/W | HPIRES interrupt masked |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | IMASK9 | 1 | R/W | INFO9 interrupt masked |
| 8 | IMASK8 | 1 | R/W | INFO8 interrupt masked |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 4 | IMASK4 | 1 | R/W | INFO4 interrupt masked |
| 3 | IMASK3 | 1 | R/W | INFO3 interrupt masked |
| 2 | IMASK2 | 1 | R/W | INFO2 interrupt masked |
| 1 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 0 | IMASK0 | 1 | R/W | INFO0 interrupt masked |

49.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt. When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | IMASK | 1 | R/W | ILA interrupt masked |
| 14 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11 | — | 1 | R/W | Reserved The write value should always be 1. |
| 10 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 9 | BMASK1 | 1 | R/W | BWE interrupt masked |
| 8 | BMASK0 | 1 | R/W | BRE interrupt masked |
| 7 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 6 | EMASK6 | 1 | R/W | ERR6 interrupt masked |
| 5 | EMASK5 | 1 | R/W | ERR5 interrupt masked |
| 4 | EMASK4 | 1 | R/W | ERR4 interrupt masked |
| 3 | EMASK3 | 1 | R/W | ERR3 interrupt masked |
| 2 | EMASK2 | 1 | R/W | ERR2 interrupt masked |
| 1 | EMASK1 | 1 | R/W | ERR1 interrupt masked |
| 0 | EMASK0 | 1 | R/W | ERR0 interrupt masked |

49.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-------|---|
| 63 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | — | 0 | R/W | Reserved The write value should always be 0. |
| 15 to 11 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 10 | — | 0*1 | R/W | Reserved The write value should always be 0. |
| 9 | SDCLKOFFEN | 0 | R/W | SD Clock (SDCLK) Output Automatic Control Enable 0: Automatic control for SD clock (SDCLK) output is disabled. 1: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit. |
| 8 | SCLKEN | 0*1 | R/W*2 | SD Clock (SDCLK) Output Control Enable 0: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1: SD clock (SDCLK) output is enabled. |
| 7 | DIV7 | 0 | R/W*2 | SD Clock (SDCLK) |
| 6 | DIV6 | 0 | R/W*2 | B'1000 0000: B ϕ /512 |
| 5 | DIV5 | 1 | R/W*2 | B'0100 0000: B ϕ /256 |
| 4 | DIV4 | 0 | R/W*2 | B'0001 0000: B ϕ /64 |
| 3 | DIV3 | 0 | R/W*2 | B'0000 1000: B ϕ /32 |
| 2 | DIV2 | 0 | R/W*2 | B'0000 0100: B ϕ /16 |
| 1 | DIV1 | 0 | R/W*2 | B'0000 0010: B ϕ /8 |
| 0 | DIV0 | 0 | R/W*2 | B'0000 0001: B ϕ /4 B'0000 0000: B ϕ /2 B'1111 1111: B ϕ Other settings are prohibited. In addition, in the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set DIV[7:0] to B'1111 1111. |

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

Notes on when setting the SD clock (SDCLK) to B ϕ (DIV[7:0] = B'1111 1111)

When changing the setting of bits DIV[7:0] to B'1111 1111, or from B'1111 1111 to other setting, perform the following processing before writing to SD_CMD.

- (1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)
- (2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)
- (3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to B'1111 1111 after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

49.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 63 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11, 10 | — | All 0 | R | Reserved |
| 9 to 0 | LEN9 to LEN0 | 1000000000 | R/W | Transfer Data Size* ¹ These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes. |

Note: * Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

49.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | WIDTH | 0*1 | R/W | Bus width*2 {WIDTH,WIDTH8} = 01: 8 bits width {WIDTH,WIDTH8} = 00: 4 bits width {WIDTH,WIDTH8} = 10,11: 1 bit width In the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set this bit to 1. In the case of writing of one-byte block, 8 bits width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block. |
| 14 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit. |
| 13 | WIDTH8 | 0*1 | R/W | Bus width*2 See the description of the WIDTH bit. |
| 12 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | EXTOP | 0*1 | R/W | Timeout Mode Select 0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2 ¹³ to SDCLK*2 ²⁷ . 1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2 ¹⁴ to SDCLK*2 ²⁸ . |
| 8 | TOUTMASK | 0*1 | R/W | Timeout Mask 0: Enables timeout. 1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence. |
| 7 | TOP27 | 1*1 | R/W | Timeout Counter*2 0000: SDCLK*2 ¹³ |
| 6 | TOP26 | 1*1 | R/W | 0001: SDCLK*2 ¹⁴ |
| 5 | TOP25 | 1*1 | R/W | : |
| 4 | TOP24 | 0*1 | R/W | 1101: SDCLK*2 ²⁶ 1110: SDCLK*2 ²⁷ 1111: Setting prohibited |
| 3 | CTOP24 | 1*1 | R/W | Card Detect Time Counter 0000: SDCLK*2 ¹⁰ |
| 2 | CTOP23 | 1*1 | R/W | 0001: SDCLK*2 ¹¹ |
| 1 | CTOP22 | 1*1 | R/W | : |
| 0 | CTOP21 | 0*1 | R/W | 1101: SDCLK*2 ²³ 1110: SDCLK*2 ²⁴ 1111: Setting prohibited |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

49.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 15 | — | Unknown | R | Reserved These bits are always read as unknown. The write value should always be 0. |
| 14 | E14 | 0*1 | R | These bits hold the CRC status. (normal: 010) |
| 13 | E13 | 1*1 | | |
| 12 | E12 | 0*1 | | |
| 11 | E11 | 0*1 | R | Set to 1 when an error occurs in the CRC status. |
| 10 | E10 | 0*1 | R | Set to 1 when a CRC error occurs in the read data. |
| 9 | E9 | 0*1 | R | Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8. |
| 8 | E8 | 0*1 | R | Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2). |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 | E5 | 0*1 | R | Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected). |
| 4 | E4 | 0*1 | R | Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits). |
| 3 | E3 | 0*1 | R | Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2. |
| 2 | E2 | 0*1 | R | Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2). |
| 1 | E1 | 0*1 | R | Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0. |
| 0 | E0 | 0*1 | R | Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2). |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

49.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 63 to 7 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 6 | E6 | 0*1 | R | Set to 1 when the interface remains in a busy state for at least Ncycle after the CRC status. |
| 5 | E5 | 0*1 | R | Set to 1 when the CRC status is not received even after Ncycle has elapsed after data writing. |
| 4 | E4 | 0*1 | R | Set to 1 when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state. |
| 3 | E3 | 0*1 | R | Set to 1 when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2. |
| 2 | E2 | 0*1 | R | Set to 1 when the interface remains in a busy state for at least Ncycle after R1b response. |
| 1 | E1 | 0*1 | R | Set to 1 when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0. |
| 0 | E0 | 0*1 | R | Set to 1 when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed. |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

49.2.15 SD Buffer Read/Write Register (SD_BUF0)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------|---------------|-----|--|
| 63 to 0 | BUF63 to BUF0 | Unknown | R/W | When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock. |

Note: When using the DMAC, the bus width should be fixed at 64 bits.

49.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 63 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | C52PUB | 0 | R/W | SDIO None Abort <ul style="list-style-type: none"> When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. Set SD_ARG before setting C52PUB to 1. Set C52PUB to 1 after the response end flag has been set. |
| 8 | IOABT | 0 | R/W | SDIO Abort <ul style="list-style-type: none"> When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set. |
| 7 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 | RWREQ | 0 | R/W | Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Read wait state releasing] (1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 1 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 0 | IOMOD | 0 | R/W | SDIO Mode*1 0: Disables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card 1: Enables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card |

Note: Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

49.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-------|---|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | EXWT | 0*2 | R/W*1 | [Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT |
| 14 | EXPUB52 | 0*2 | R/W*1 | [Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. 2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52 |
| 13 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2, 1 | — | All 0*2 | R/W | Reserved The write value should always be 1. The value may change during operation. |
| 0 | IOIRQ | 0*2 | R/W*1 | [Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to IOIRQ*3 |

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

49.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 | MEXWT | 1 | R/W | EXWT interrupt masked |
| 14 | MEXPUB52 | 1 | R/W | EXPUB52 interrupt masked |
| 13 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 | — | 1 | R/W | Reserved The write value should always be 1. |
| 1 | — | 1 | R/W | Reserved The write value should always be 1. |
| 0 | IOMSK | 1 | R/W | IOIRQ interrupt masked |

49.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 12 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit. |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9, 8 | — | All 0 | R/W | Reserved The write value should always be 0. |
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 | — | 0 | R/W | Reserved The write value should always be 0. |
| 4 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit. |
| 3, 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | DMASDRW | 0 | R/W | SD_BUF Read/Write DMA Transfer* 0: The SD_BUF read/write DMA transfer is disabled. 1: The SD_BUF read/write DMA transfer is enabled. |
| 0 | — | 0 | R/W | Reserved The write value should always be 0. |

Note: * Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

49.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD/MMC host interfaces and before attempting access to the other registers.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 63 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2, 1 | — | 11 | R | Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 0 | SDRST | 1 | R/W | Software Reset of SD Interface Unit 0: Reset 1: Reset released |

49.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD/MMC host interfaces.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 63 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15, 14 | UR7, UR6 | 11 | R | Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 13, 12 | UR5, UR4 | 00 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 11 to 8 | UR3 to UR0 | H'C | R | Version of Renesas' IP |
| 7 to 0 | IP7 to IP0 | H'10 | R | Version of introductory IP |

49.2.22 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 63 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | BUSWIDTH | 0 | R/W | Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 16-bit access 1: 32-bit access This bit is enabled while the WMODE bit is set to 1. |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | ENDIAN | 0 | R/W | SD_BUF0 data swap |
| 0 | WMODE | 0 | R/W | Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 64-bit access 1: 16-bit or 32-bit access |

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

49.2.23 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register specifies DDR mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 9 | — | 0*1 | R/W | Reserved The write value should always be 0. |
| 8 | NOCHKCR | 0*1 | R/W | CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0: Enables the CRC check. 1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write) |
| 7 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | DDR | 0*1 | R/W | DDR Mode Select*2 0: Normal mode (default, high speed, or SDR) 1: DDR mode Set this bit to 0 when the SD clock division ratio is specified as 1:1 (bits DIV[7:0] in SD_CLK_CTRL are set to 11111111). |

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

49.2.24 SD Status Register (SD_STATUS)

The effective bit of the SD status register controls the output value on the SD0_RST# pin.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 63 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | SD_RST | 0 | R/W | Controls the output value on the SD0_RST# pin. 0: The output value on the SD0_RST# pin is 0. 1: The output value on the SD0_RST# pin is 1. |
| 0 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |

49.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

The DMAC Transfer Mode Register (DM_CM_DTRAN_MODE) sets the operation mode of the module built-in DMAC.

High 32 bits (bit 63 to 32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|--|
| 63 to 18 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 17, 16 | CH_NUM | 00 | R/W | DMAC channel selector 00 : SD down stream 01 : SD up stream Other settings are prohibited. |
| 15 to 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5, 4 | BUS_WIDTH [1:0] | 11 | R/W | Bus width selector 11: 64-bit Other settings are prohibited. |
| 3 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

49.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

The DMAC Transfer Control Register (DM_CM_DTRAN_CTRL) controls the module built-in DMAC operation.

High 32 bits (bit 63-32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 63 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 | — | 0 | R/W | Reserved The write value should always be 0. |
| 7 to 1 | — | All 0 | R | Reserved |
| 0 | DM_START | 0 | R/W | DMAC Start Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started. |

49.2.27 DMAC Reset Register (DM_CM_RST)

High 32 bits (bit 63 to 32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 10 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 9 | DTRANRST1 | 1 | R/W | Soft resets of the module built-in DMAC channel 1 0: Reset 1: Reset released |
| 8 | DTRANRST0 | 1 | R/W | Soft resets of the module built-in DMAC channel 0 0: Reset 1: Reset released |
| 7 to 1 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 0 | SEQRST | 1 | R/W | Soft resets of the sequencer 0: Reset 1: Reset released |

Note: When using the software reset by this register, see section 52.3.6, Software Reset and follow the procedures for using the STBREQ and STBACK registers.

49.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|---|
| 63 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 20 | DTRANEND1 | 0*1 | R/W | Module built-in DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANEND1 |
| 19 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 16 | DTRANEND0 | 0*2 | R/W | Module built-in DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0 is written to DTRANEND0 |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | SEQEND | 0*3 | R/W | Sequencer Operation End [Setting conditions] 1. When operation of a sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0 is written to SEQEND |

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

49.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 21 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 20 | DTRANEND1_MASK | 1 | R/W | DTRANEND1 interrupt masked |
| 19 to 17 | — | All 1 | R/W | Reserved The write value should always be 1. |
| 16 | DTRANEND0_MASK | 1 | R/W | DTRANEND0 interrupt masked |
| 15 to 1 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 0 | SEQEND_MASK | 1 | R/W | SEQEND interrupt masked |

49.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|---|
| 63 to 20 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 19, 18 | — | 00 | R | Reserved The write value should always be 0. |
| 17 | DTRANERR1 | 0*1 | R/W | Module built-in DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANERR1 |
| 16 | DTRANERR0 | 0*2 | R/W | Module built-in DMAC Channel 0 Error [Setting condition] When an error occurs on the DMAC channel 0 [Clearing condition] When 0 is written to DTRANERR0 |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | SEQERR | 0*3 | R/W | Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0 is written to SEQERR |

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

49.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 20 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 19, 18 | — | 11 | R | Reserved The write value should always be 1. |
| 17 | DTRANERR1_MASK | 1 | R/W | DTRANERR1 interrupt masked |
| 16 | DTRANERR0_MASK | 1 | R/W | DTRANERR0 interrupt masked |
| 15 to 1 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits. |
| 0 | SEQERR_MASK | 1 | R/W | SEQERR interrupt masked |

49.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR)

The DMAC Transfer Address Register (DM_DTRAN_ADDR) sets the transfer destination and source address of the module built-in DMAC.

Higher-order 32 bits (bit 63 to 32) are read only 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 63 to 32 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 31 to 3 | DADDR | All 0 | R/W | Destination address / Source address (8 byte unit) Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to 2^{32} . |
| 2 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

49.3 Operation

49.3.1 SD Interface

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see Figure 49.2, Figure 49.3 and Figure 49.5.)
2. The receive data is stored in SD_BUF of the SD/MMC host interfaces. (SD_BUF store data: see Figure 49.7)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see Table 49.4)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See Figure 49.7)

Figure 49.2 SDDAT in 1-Bit Width Mode

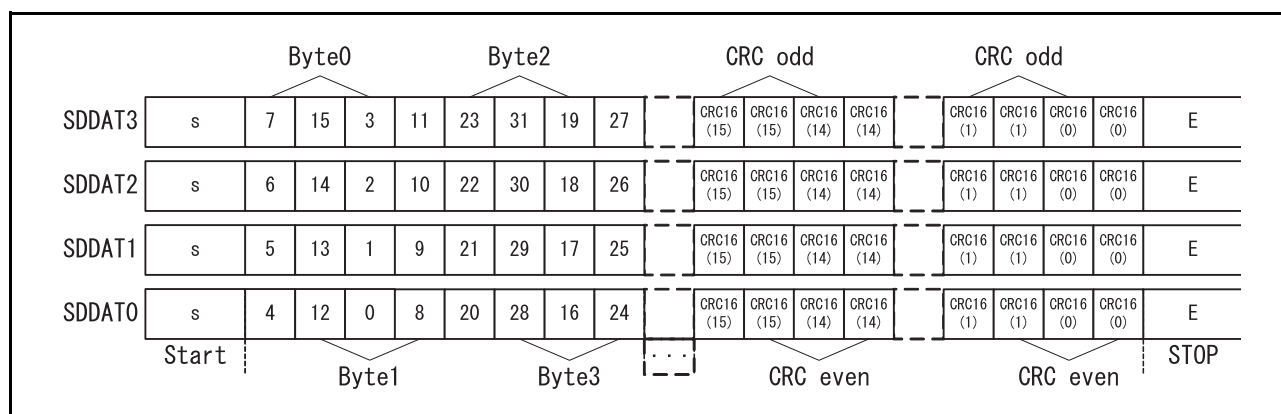

Figure 49.4 SDDAT in 4-Bit Width DDR Mode

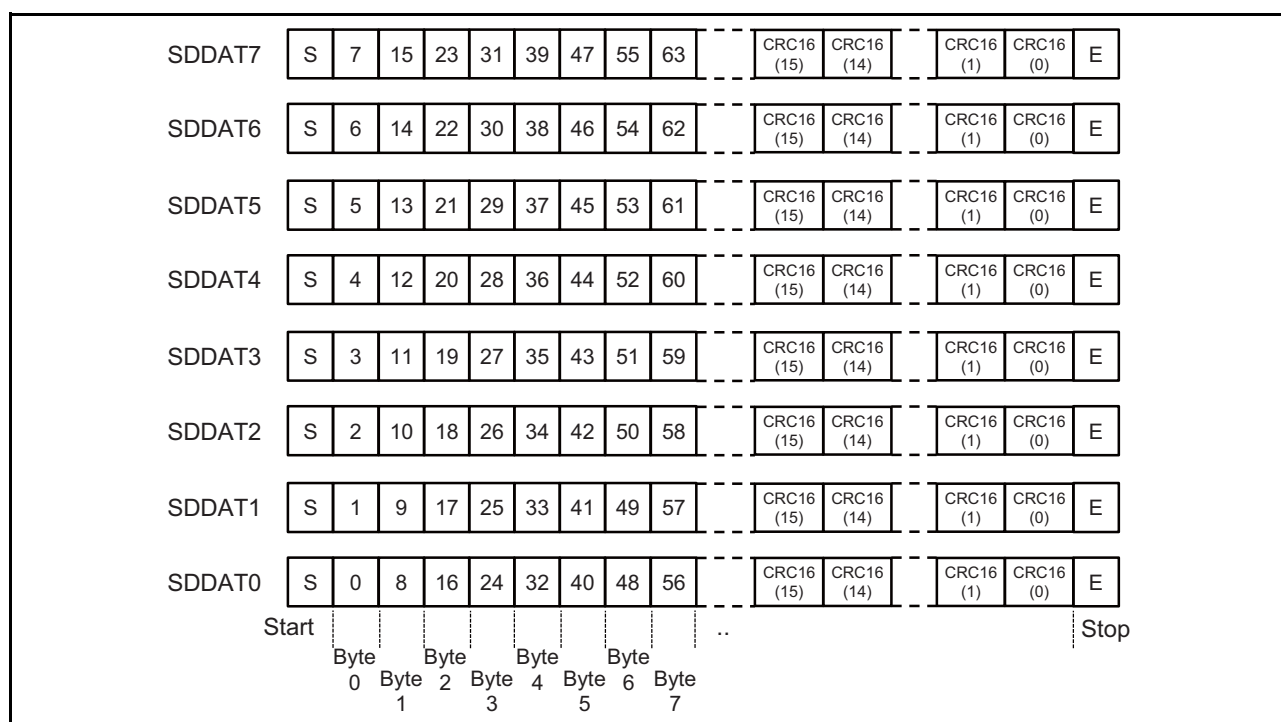

Figure 49.5 SDDAT in 8-Bit Width Mode

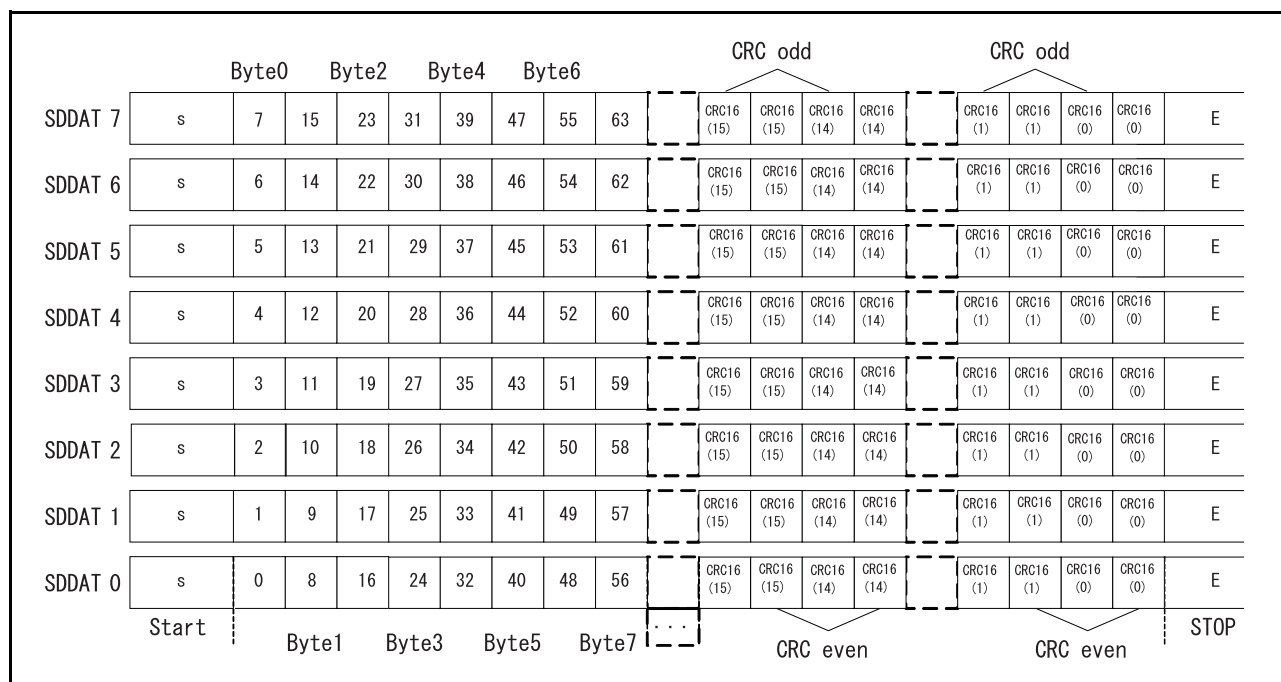

Figure 49.6 SDDAT in 8-Bit Width DDR Mode

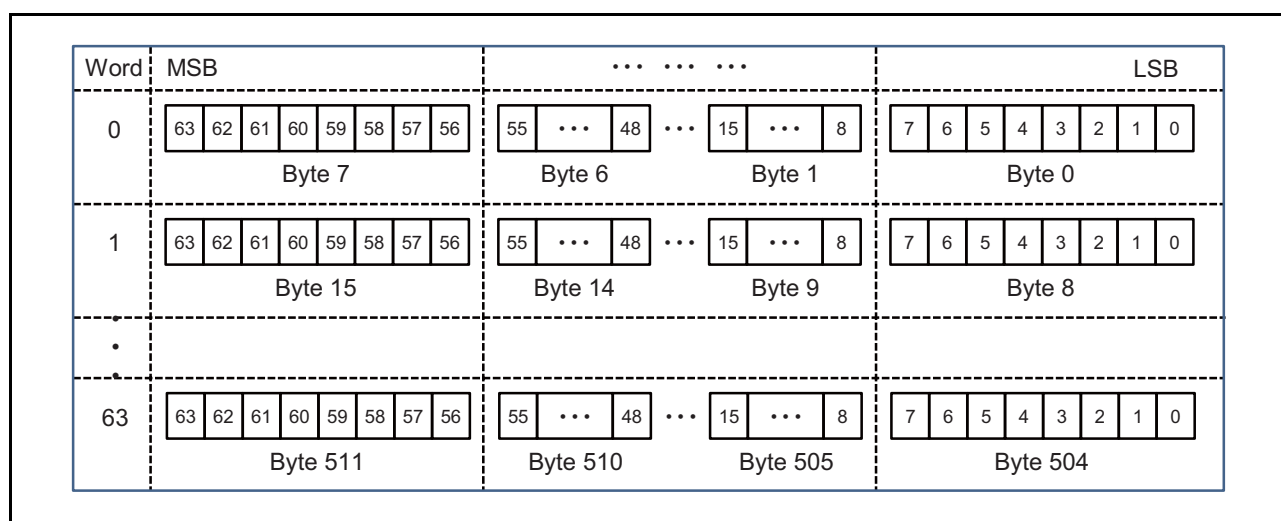

Figure 49.7 SD_BUF Store Data

Table 49.4 Reading from SD_BUF0

| WMODE*1 | BUSWIDTH*1 | ENDIAN*1 | Read Data*2 |
|---------|------------|----------|--|
| 0 | 0 | 0 | H'0123456789ABCDEF |
| 0 | 0 | 1 | H'EFCDAB8967452301 |
| 1 | 1 | 0 | H'89ABCDEF (1st) H'01234567 (2nd) |
| 1 | 1 | 1 | H'EFCDAB89 (1st) H'67452301 (2nd) |
| 1 | 0 | 0 | H'CDEF (1st) H'89AB (2nd) H'4567 (3rd) H'0123 (4th) |
| 1 | 0 | 1 | H'EFCD (1st) H'AB89 (2nd) H'6745 (3rd) H'2301 (4th) |

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is H'0123456789ABCDEF

(2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(i) Issuing CMD11

Perform command sequence processing of CMD11.

(ii) Stopping the SD clock (a)

Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop* the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.

Note: When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(iii) Checking the value of SDDAT

Check that the DAT0 bit in the SD_INFO2 register is 0.

(iv) Changing the supply voltage of the host device

Change the voltage which is supplied through the power supply pin of the given channel (PVcc_SD0 for channel 0 or PVcc_SD1 for channel 1) from 3.3 V to 1.8 V. In addition, set the POC bit for the given channel (POC2 for channel 0 or POC3 for channel 1) of the dedicated pin POC control register (PPOC) for the GPIO to 0. Also, make the GPIO settings for 1.8-V power supply in the bits of SD/MMC host interface dedicated pin driving ability control registers 0 to 2 (PSDMMC0 and PSDMMC1 for channel 0 or PSDMMC2 for channel 1).

For details, see the following sections:

section 51.3.30, Dedicated Pin POC Control Register (PPOC),

section 51.3.31, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 0 (PSDMMC0),

section 51.3.32, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 1 (PSDMMC1),

section 51.3.33, SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 2 (PSDMMC2).

(v) Starting supply of the SD clock (b)

After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(vi) Checking the value of SDDAT

After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

49.3.2 Card Detect/Write Protect

(1) Card Detect

The SD/MMC host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

Figure 49.8 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]

ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

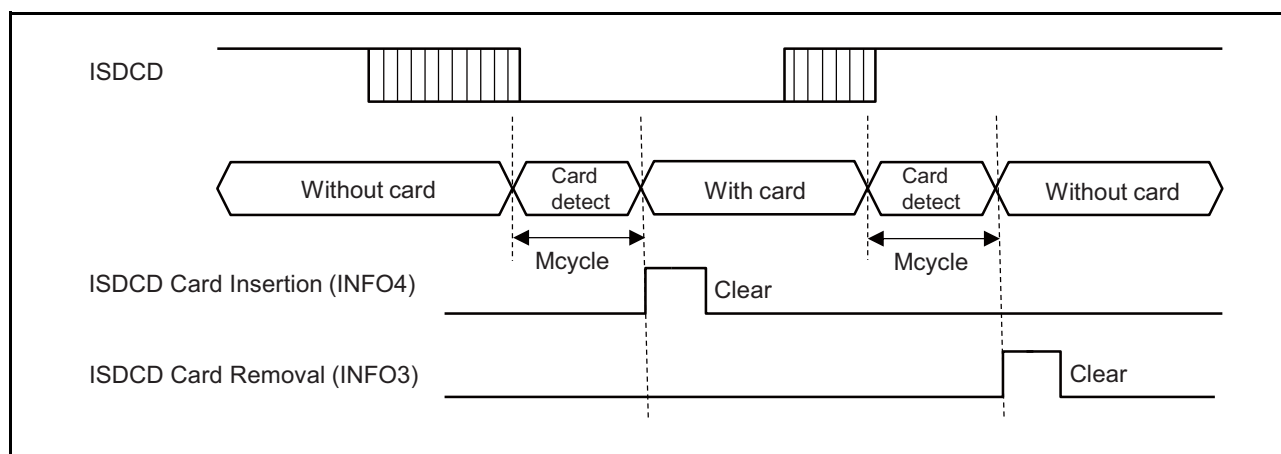

Figure 49.8 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

Figure 49.9 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

[Card insertion]

When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

[Card removal]

When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

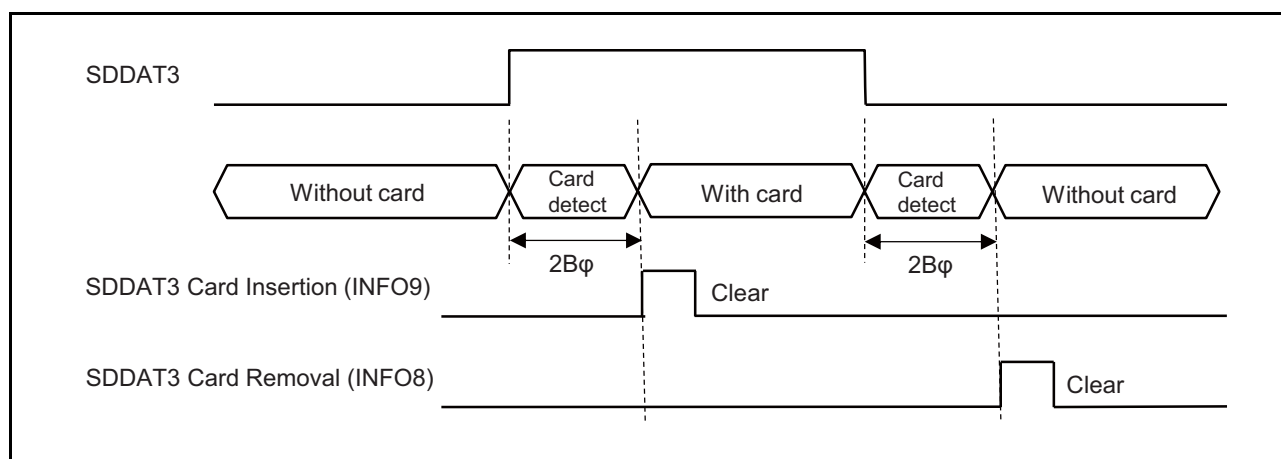

Figure 49.9 SD Card Detect with SDDAT3

(2) Write Protect

The SD/MMC host interface has two types of write protect functions.

- Write protect with ISDWP

ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

The card's internal write protection and the card lock/unlock operation are realized by the command.

49.3.3 Interrupt Request

(1) Interrupt Request

The SD/MMC host interface has the interrupt requests shown in Table 49.5 shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 49.5 Interrupt Request

| Interrupt Request | Interrupt Flag Register | | Interrupt Mask Register | |
|-----------------------|-------------------------|-----------|-------------------------|----------------|
| | Register Name | Bit Name | Register Name | Bit Name |
| Card access interrupt | SD_INFO1 | INFO2 | SD_INFO1_MASK | IMASK2 |
| | | INFO0 | | IMASK0 |
| | SD_INFO2 | ILA | SD_INFO2_MASK | IMASK |
| | | BWE | | BMASK1 |
| | | BRE | | BMASK0 |
| | | ERR6 | | EMASK6 |
| | | ERR5 | | EMASK5 |
| | | ERR4 | | EMASK4 |
| | | ERR3 | | EMASK3 |
| | | ERR2 | | EMASK2 |
| | | ERR1 | | EMASK1 |
| | | ERR0 | | EMASK0 |
| SDIO access interrupt | SDIO_INFO1 | EXWT | SDIO_INFO1_MASK | MEXWT |
| | | EXPUB52 | | MEXPUB52 |
| | | IOIRQ | | IOMSK |
| Card detect interrupt | SD_INFO1 | INFO9 | SD_INFO1_MASK | IMASK9 |
| | | INFO8 | | IMASK8 |
| | | INFO4 | | IMASK4 |
| | | INFO3 | | IMASK3 |
| DMAC interrupt | DM_CM_INFO1 | DTRANEND1 | DM_CM_INFO1_MASK | DTRANEND1_MASK |
| | | DTRANEND0 | | DTRANEND0_MASK |
| | | SEQEND | | SEQEND_MASK |
| | DM_CM_INFO2 | DTRANERR1 | DM_CM_INFO2_MASK | DTARERR1_MASK |
| | | DTRANERR0 | | DTARERR0_MASK |
| | | SEQERR | | SEQERR_MASK |

49.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

Table 49.6 and Table 49.7 show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 49.6 Communications Errors

| Communication Error | SD Interrupt Flag Register | | SD Error Status Register | | Description |
|---------------------|----------------------------|----------|--------------------------|----------|---|
| | Register Name | Bit Name | Register Name | Bit Name | |
| END error | SD_INFO2 | ERR2 | SD_ERR_STS1 | E5 | When an error occurs in the CRC status length |
| | | | | E4 | When an error occurs in read data length |
| | | | | E3 | When an error occurs in the response length to a command issued within a command sequence |
| | | | | E2 | When an error occurs in the response length (other than a response to a command issued within a command sequence) |
| CRC error | | ERR1 | | E11 | When an error occurs in the CRC status |
| | | | | E10 | When a CRC error occurs in the read data |
| | | | | E9 | When a CRC error occurs in the response to a command issued within a command sequence |
| | | | | E8 | When a CRC error occurs in the response (other than a response to a command issued within a command sequence) |
| CMD error | | ERR0 | | E1 | The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence) |
| | | | | E0 | The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence) |

Table 49.7 Timeouts

| Timeout | SD Interrupt Flag Register | | SD Error Status Register | | Description |
|--|----------------------------|----------|--------------------------|----------|---|
| | Register Name | Bit Name | Register Name | Bit Name | |
| Response timeout | SD_INFO2 | ERR6 | SD_ERR_STS2 | E1 | When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed |
| | | | | E0 | When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed |
| Data timeout (other than response timeout) | | ERR3 | | E6 | When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle* after the CRC status |
| | | | | E5 | When the CRC status is not received t even after Ncycle* has elapsed after data writing |
| | | | | E4 | When read data is not received even after Ncycle* has elapsed after read command |
| | | | | | When read data for the next block are not received even after Ncycle* has elapsed after the reception of read data |
| | | | | | When read data for the next block are not received even after Ncycle* has elapsed after release of the read wait state |
| | | | | E3 | When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle* after CMD12 has been issued within a command sequence |
| | | | | E2 | When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle* after R1b response |

Note: *Ncycle is set by bit 7 to bit 4 in SD_OPTION.

49.4 Usage Example

49.4.1 Command without Data Transfer

(1) Flowchart

Figure 49.10 and Figure 49.11 show flowchart examples.

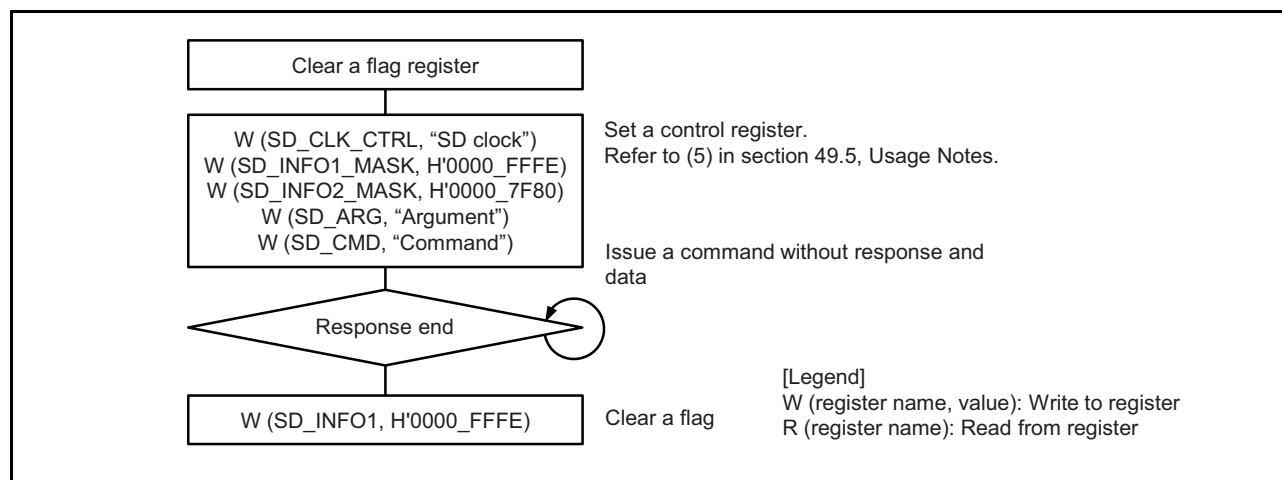

Figure 49.10 Flow Example of Command without Response and Data

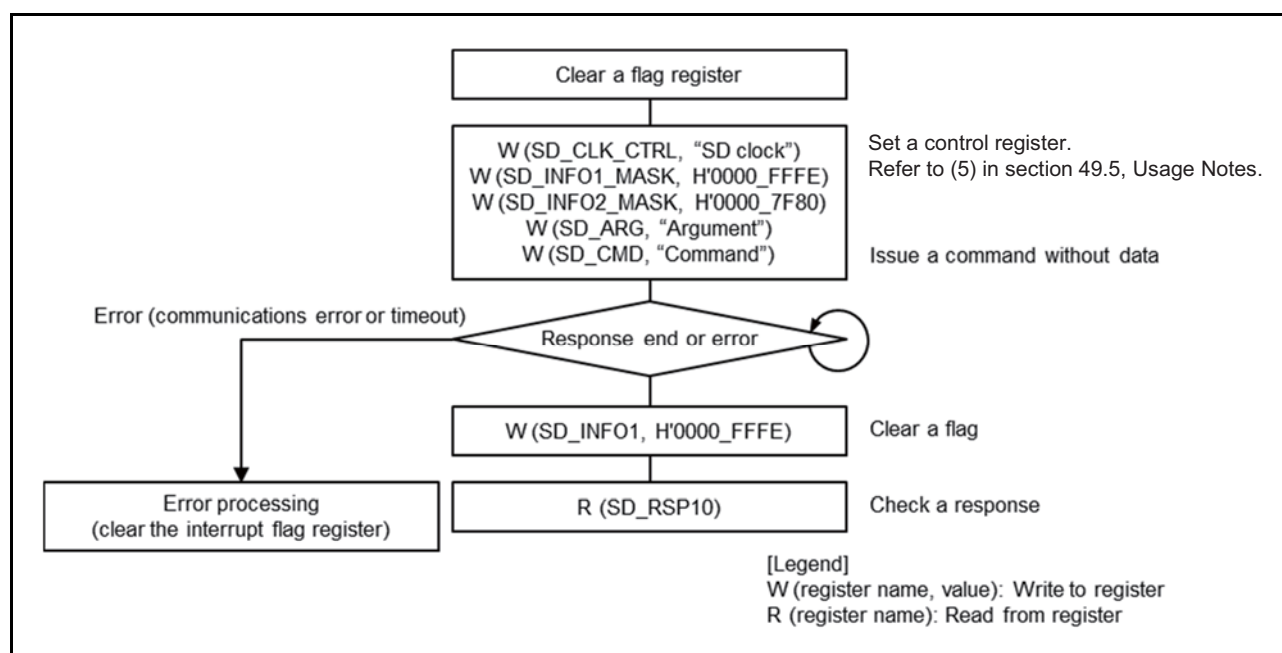

Figure 49.11 Flow Example of Command without Data

(2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value):Write to register

R (register name):Read from register

The operation is described as below.

(a) Command without response and data

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
Set CMD Argument in SD_ARG and write to SD_CMD.
Accordingly, CMD is issued, and the operation is started.
4. Flag clear
When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(b) Command without data

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
Set CMD Argument in SD_ARG and write to SD_CMD.
Accordingly, CMD is issued, and the operation is started.
4. Flag clear
When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.2 Single Block Read

(1) Flowchart

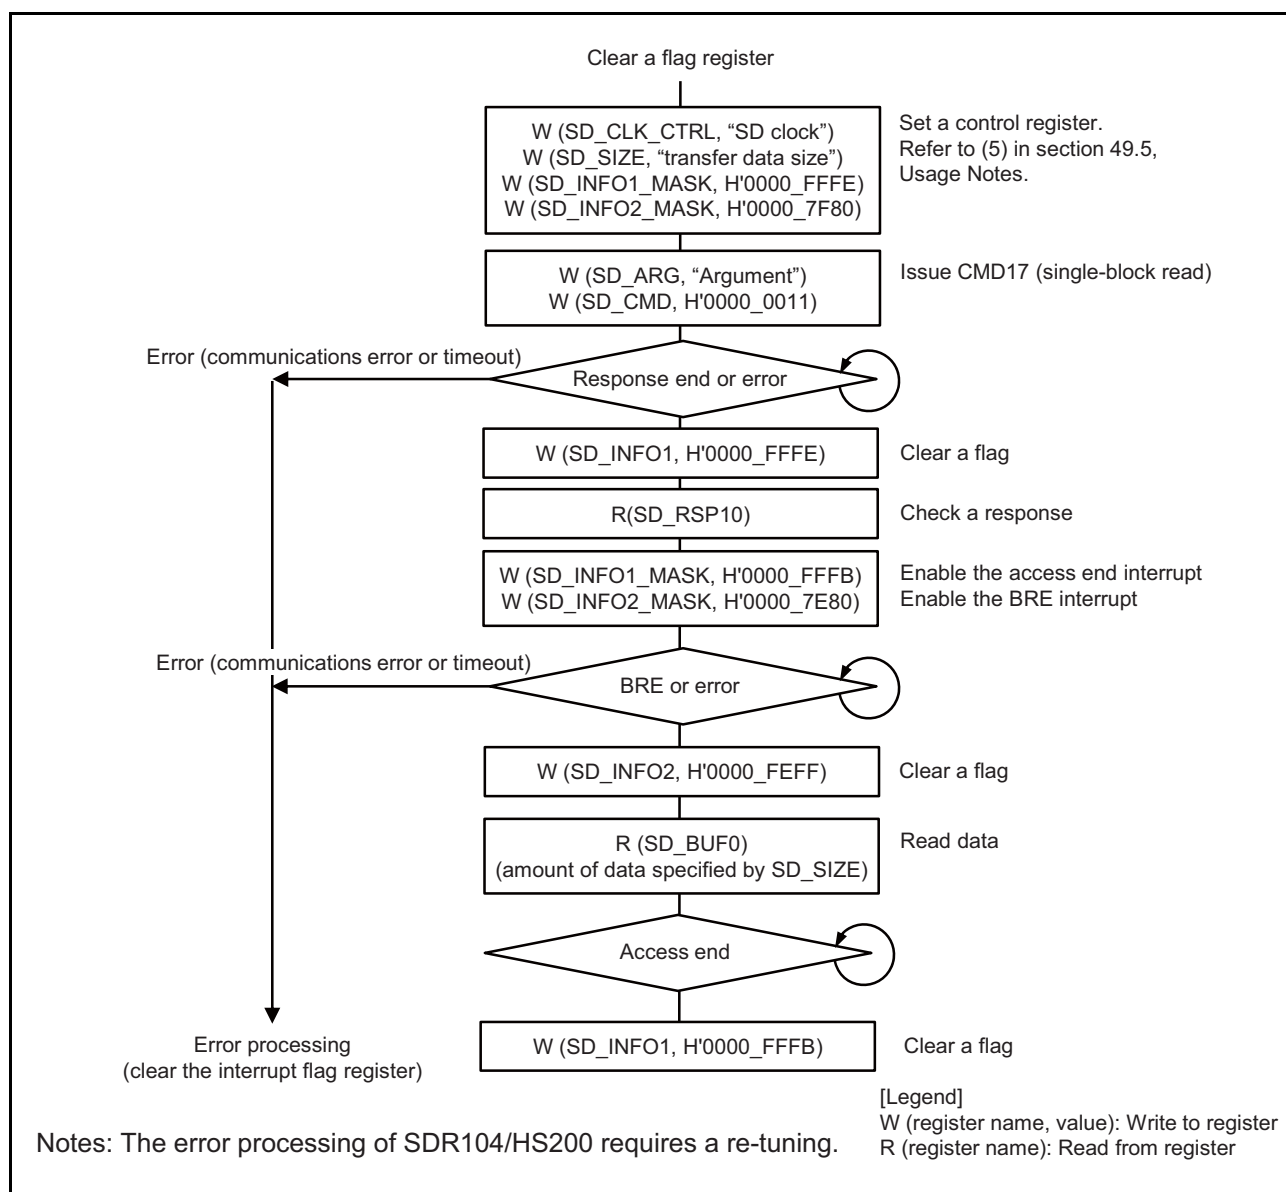

Figure 49.12 Single Block Read Flowchart Example

(2) Operation for Single Block Read

The operation of the single block read is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
Set CMD17 Argument in SD_ARG and write H'0000 0011 to SD_CMD.
Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.3 Single Block Write

(1) Flowchart

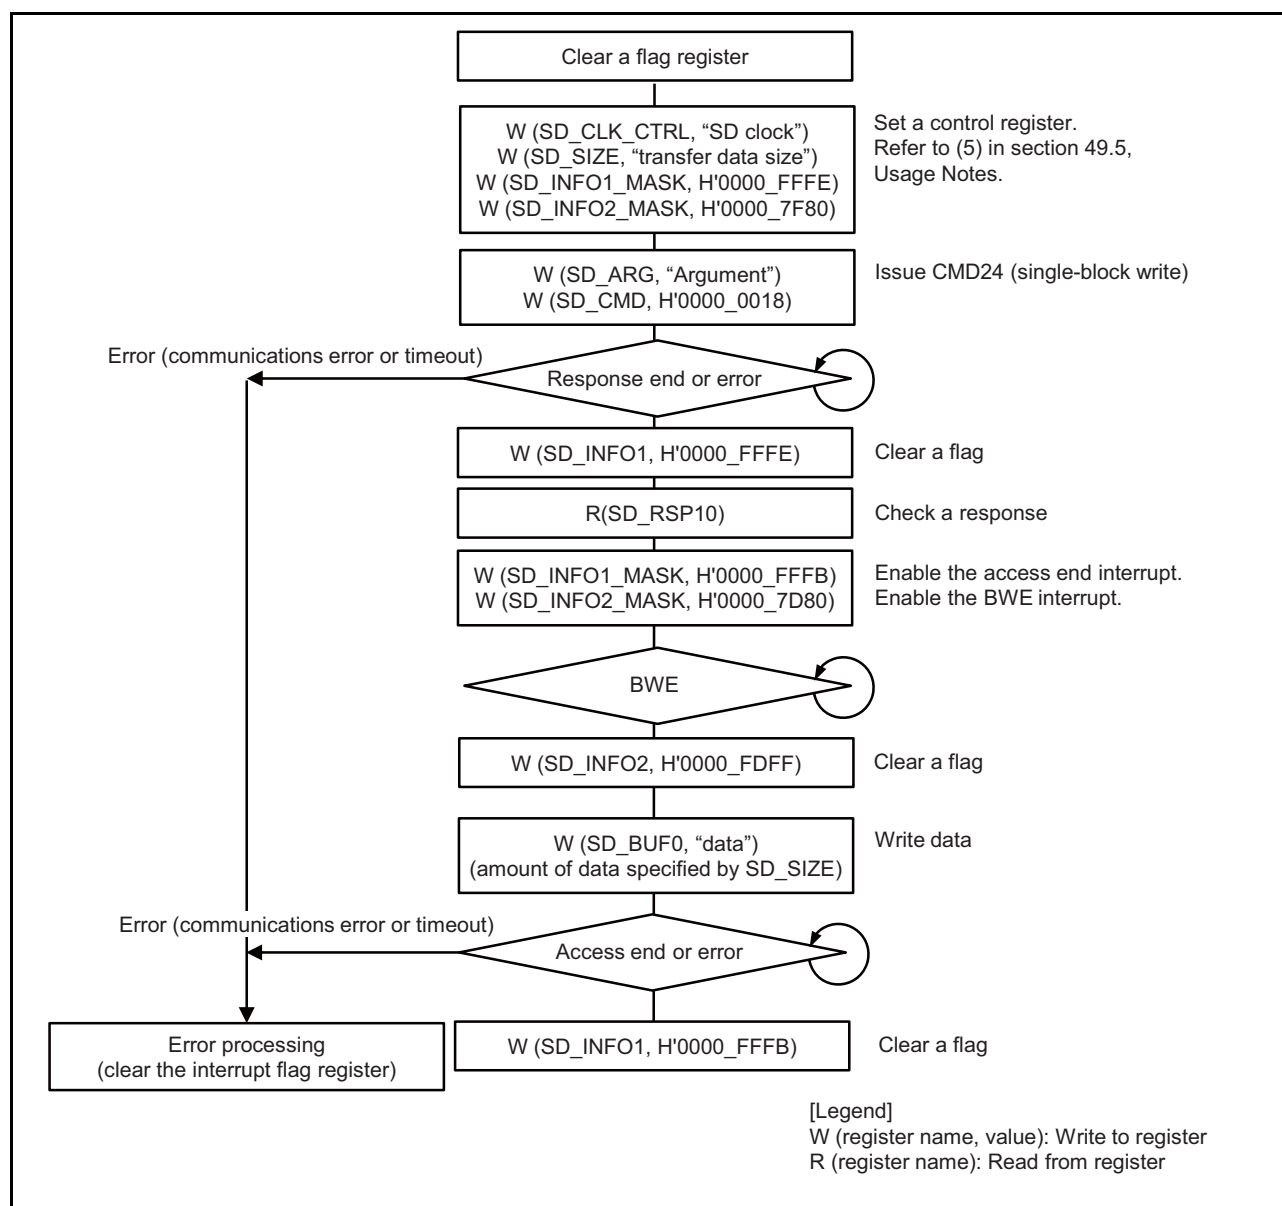

Figure 49.13 Single Block Write Flowchart Example

(2) Operation for Single Block Write

The operation of the single block write is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.4 Multiple Block Read

(1) Flowchart

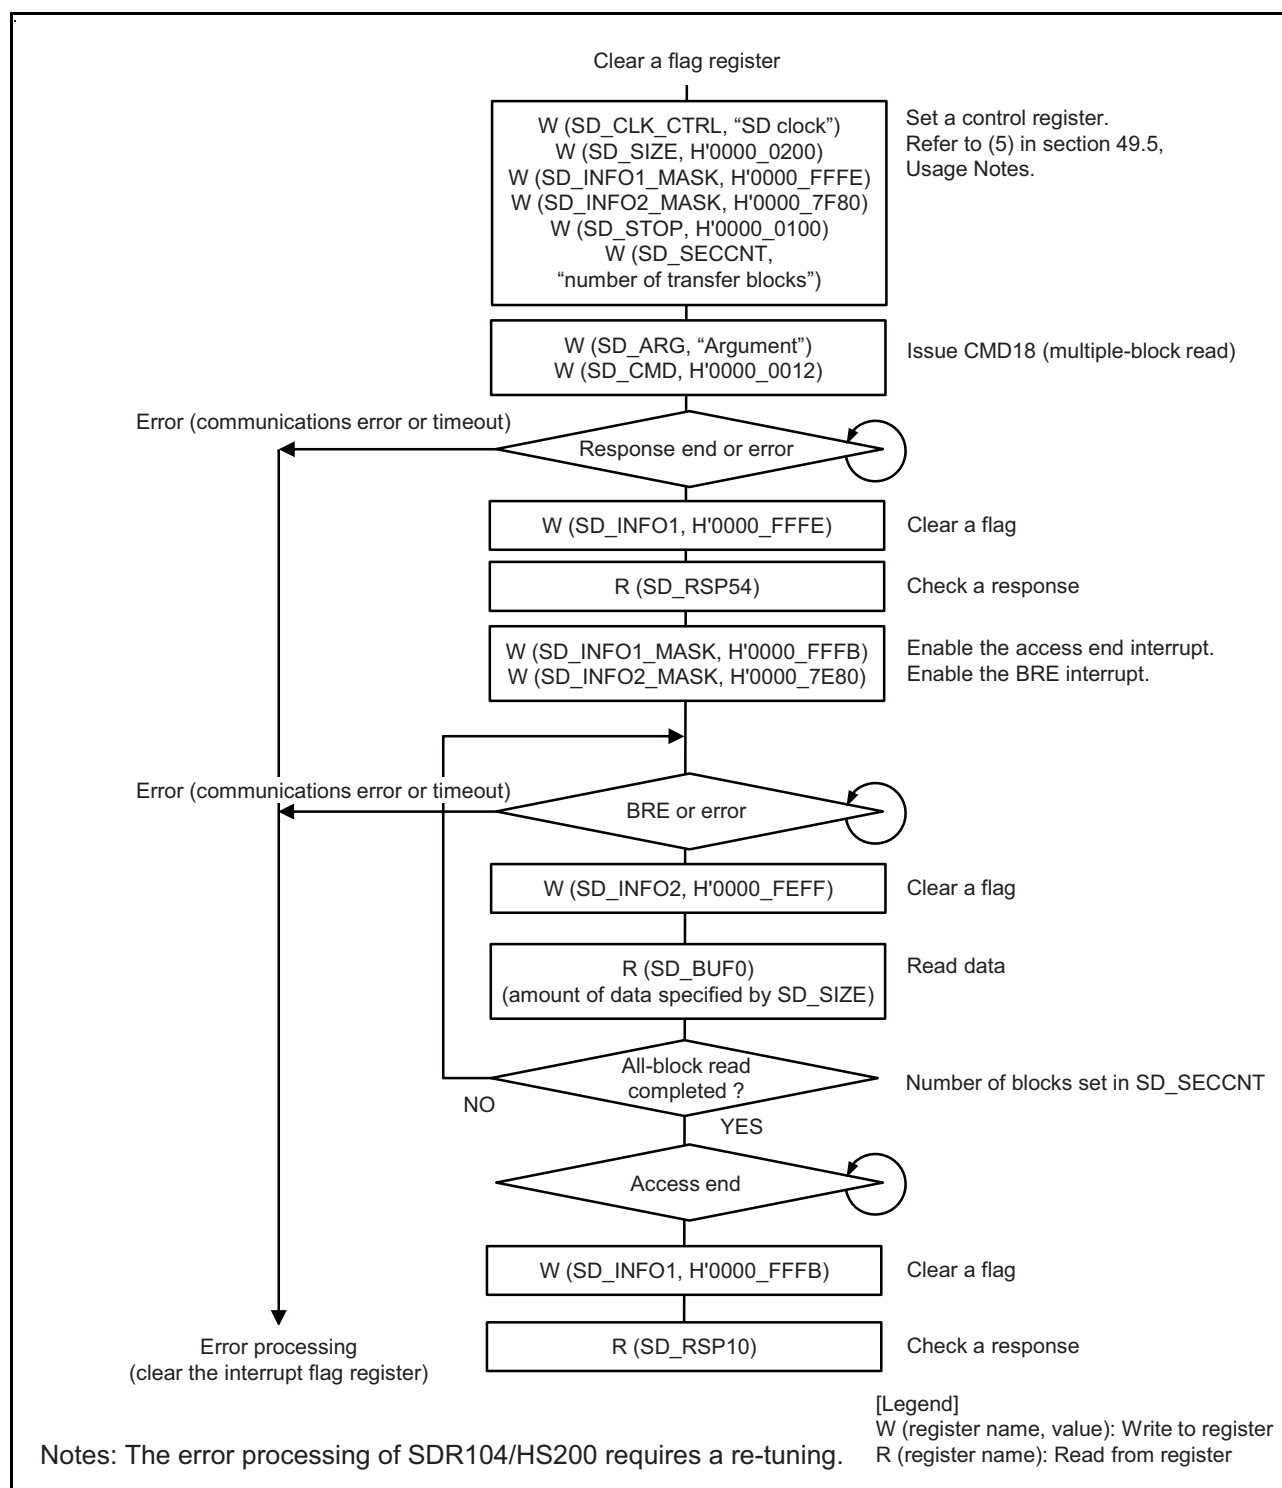

Figure 49.14 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
Set CMD18 Argument in SD_ARG and write H'0000 0012 to SD_CMD.
Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 000.
6. Operation complete
When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.5 Multiple Block Write (when Using Internal Timer)

(1) Flowchart

Figure 49.15 shows the flowchart when using an internal timer.

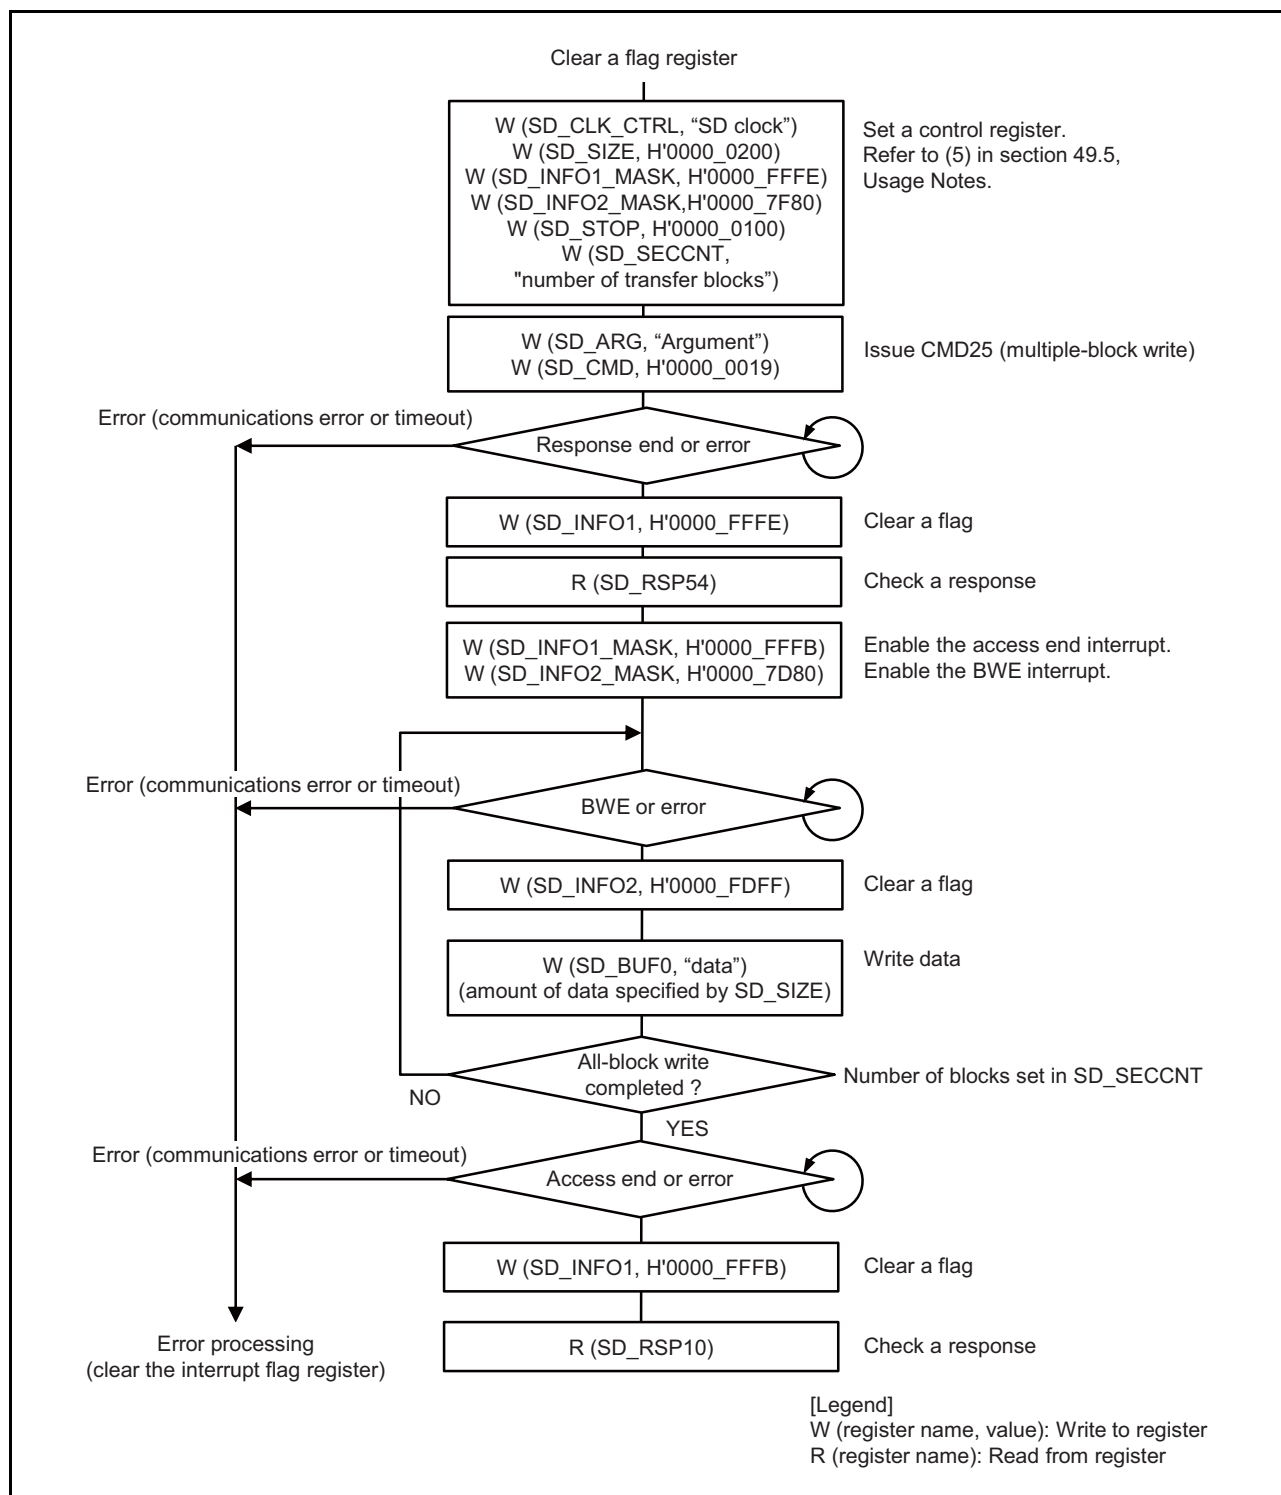

Figure 49.15 Multiple Block Write Flowchart Example (when Using Internal Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 0000.
6. Operation complete
When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.6 Multiple Block Write (when Using External Timer)

(1) Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.

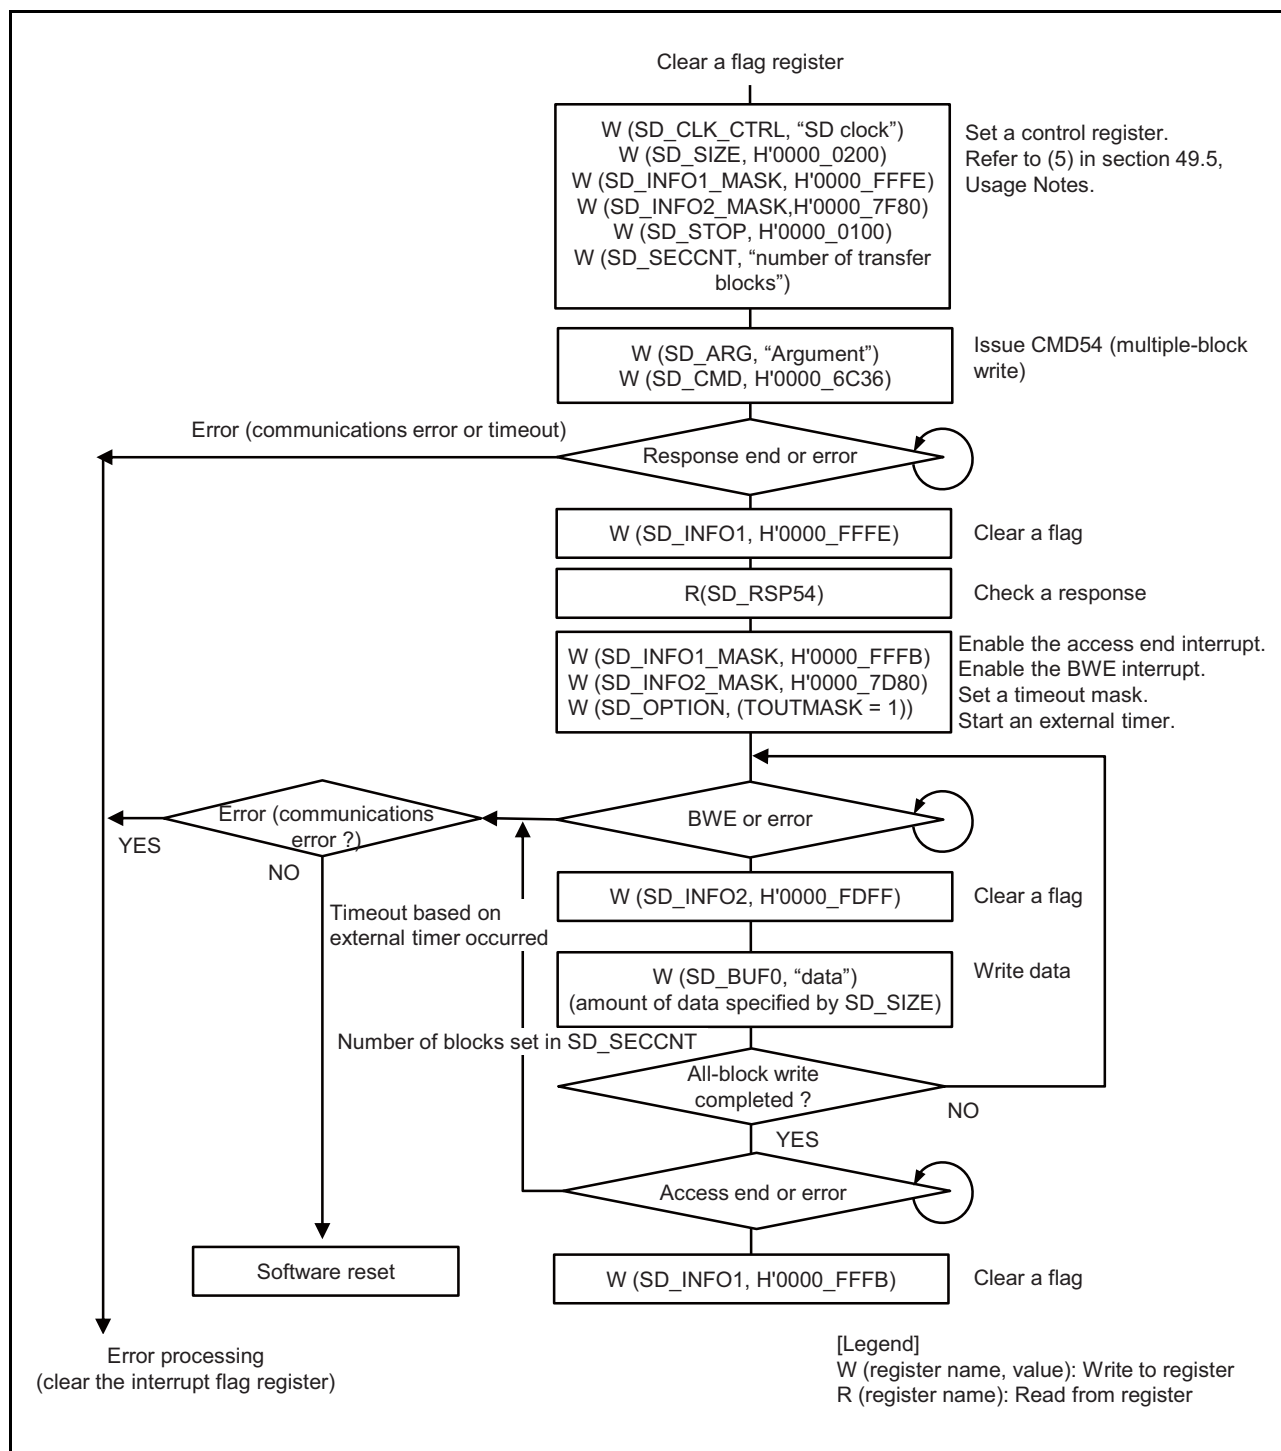

Figure 49.16 Multiple Block Write Flowchart Example (when Using External Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
Set CMD54 Argument in SD_ARG and write H'0000 6C36 to SD_CMD.
Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 register is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

49.4.7 IO_RW_DIRECT Command (CMD52)

(1) Flowchart

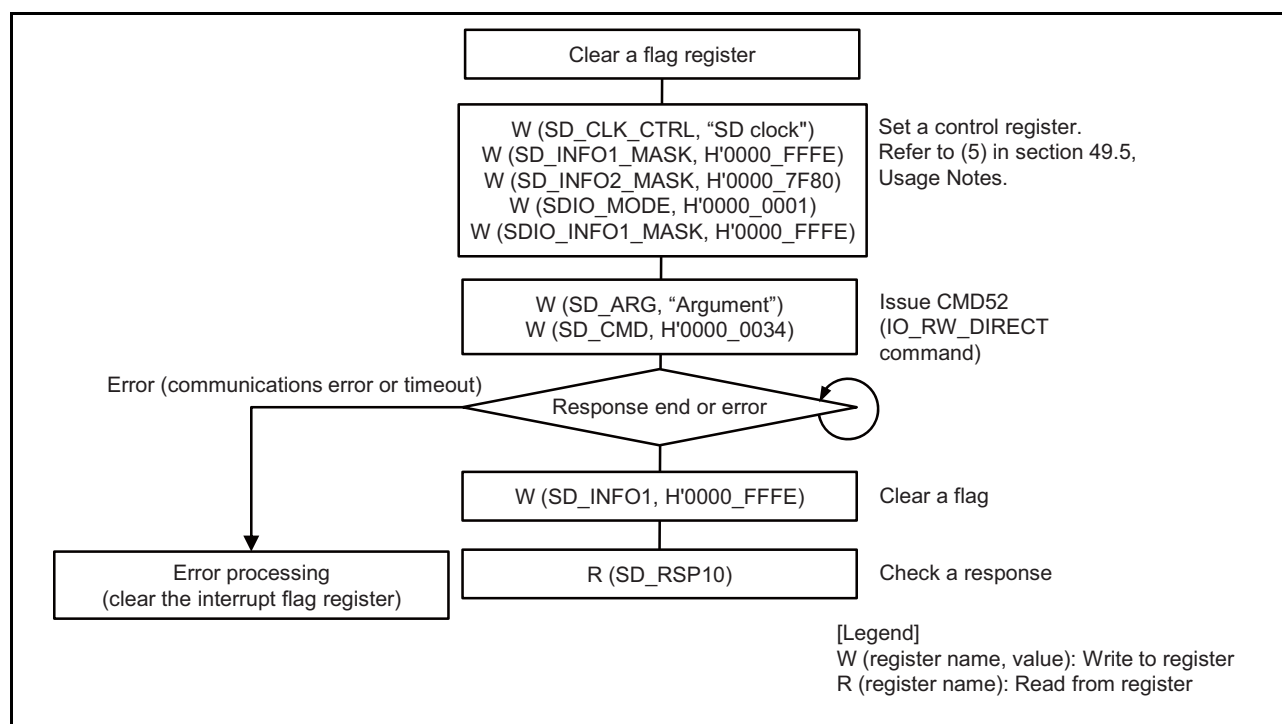

Figure 49.17 IO_RW_DIRECT Command (CMD52) Flowchart Example

49.4.8 IO_RW_EXTENDED (CMD53/Multiple Block Read)

(1) Flowchart

Figure 49.18 shows a flowchart example for CMD53 (multiple block read).

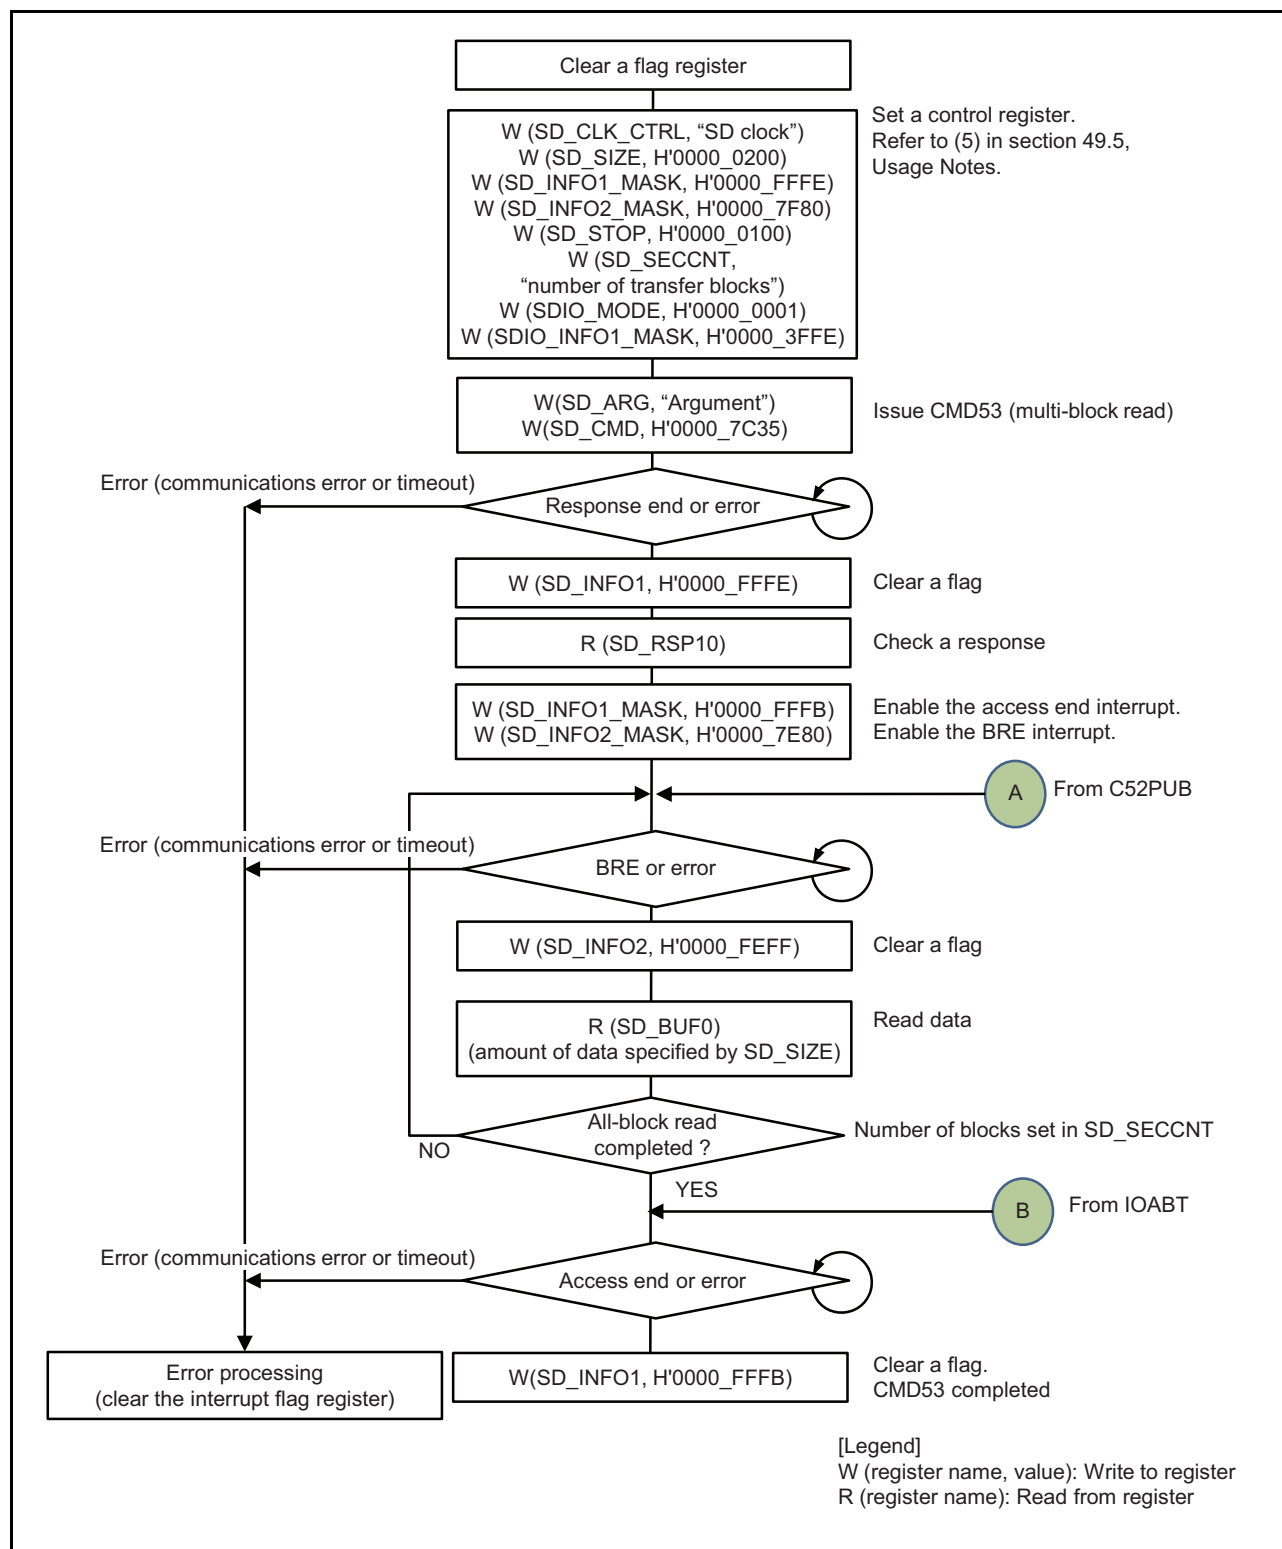

Figure 49.18 CMD53 (Multiple Block Read) Flowchart Example

Figure 49.19 shows a flowchart example when CMD52 (SDIO abort) is issued at CMD53 (multiple block read).

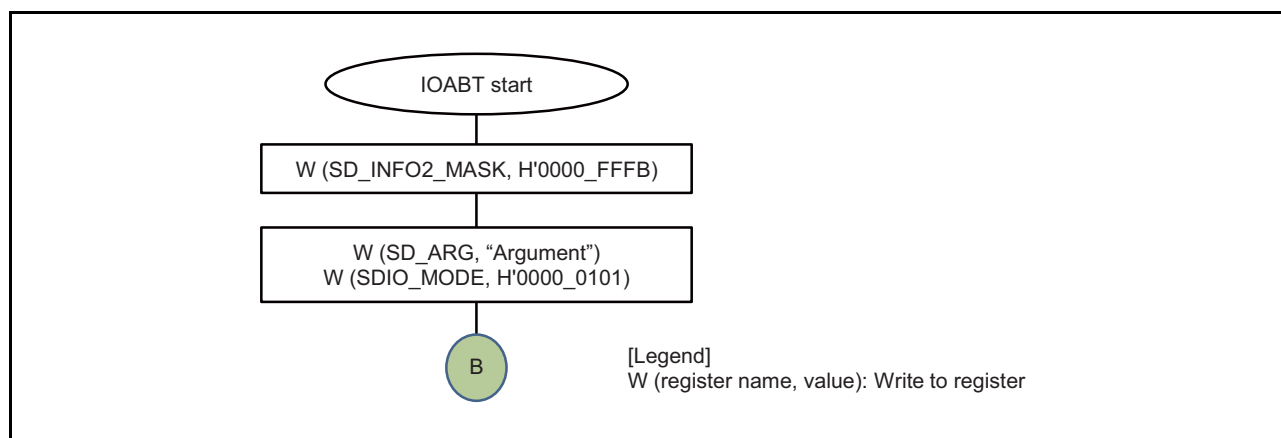

Figure 49.19 Flowchart Example when CMD52 (SDIO Abort) is Issued at CMD53 (Multiple Block Read)

Figure 49.20 shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block read) while the SD/MMC host interface is in the read wait state.

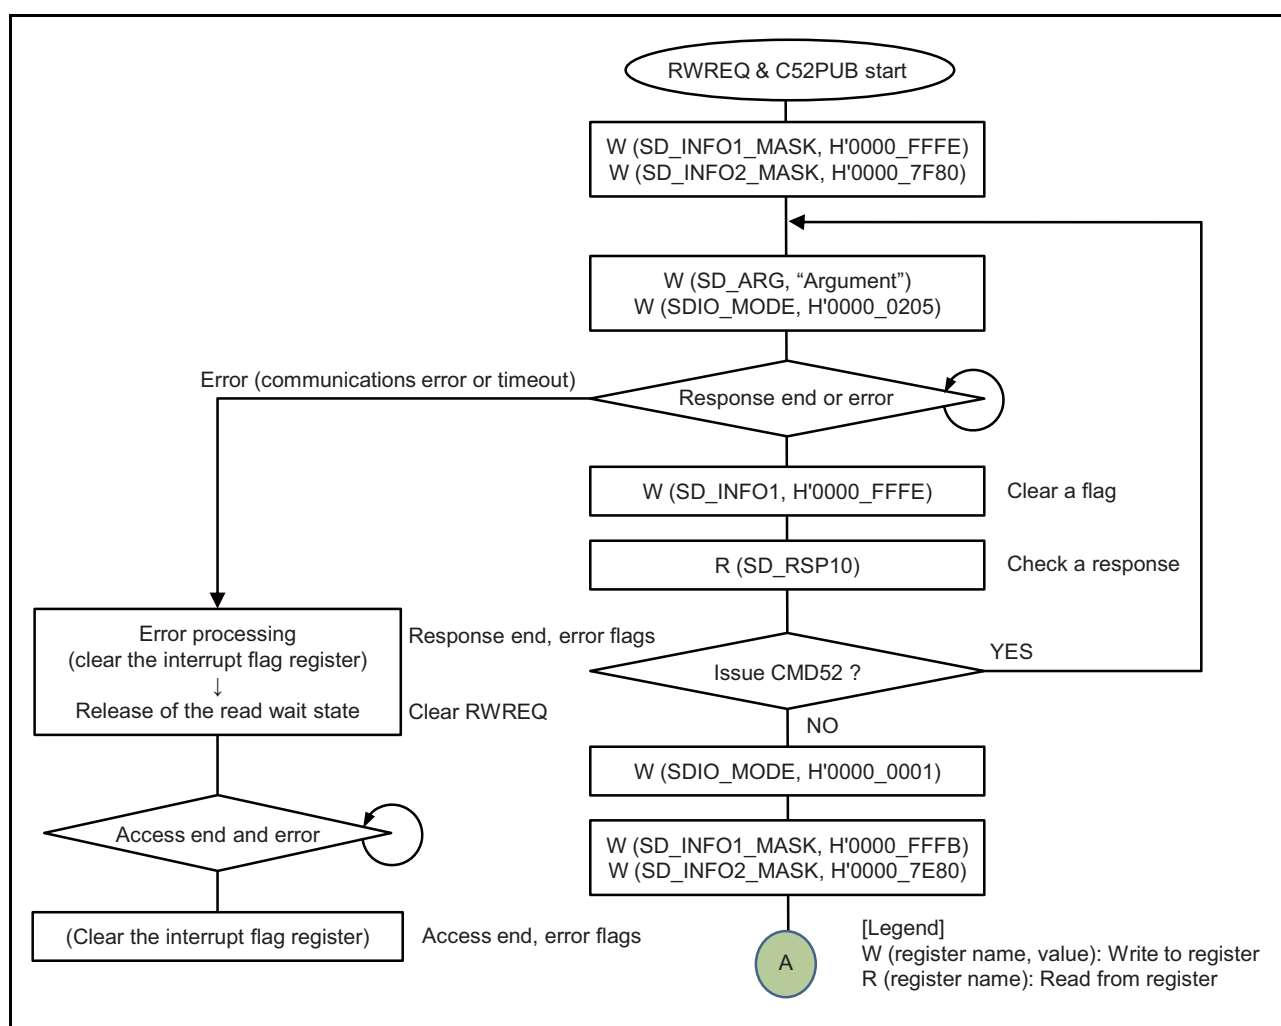

Figure 49.20 Flowchart Example when CMD52 (SDIO None Abort) is Issued after Read Wait State is Entered at CMD53 (Multi Block Read)

49.4.9 IO_RW_EXTENDED (CMD53/Multiple Block Write)

(1) Flowchart

Figure 49.21 shows a flowchart example for CMD53 (multiple block write).

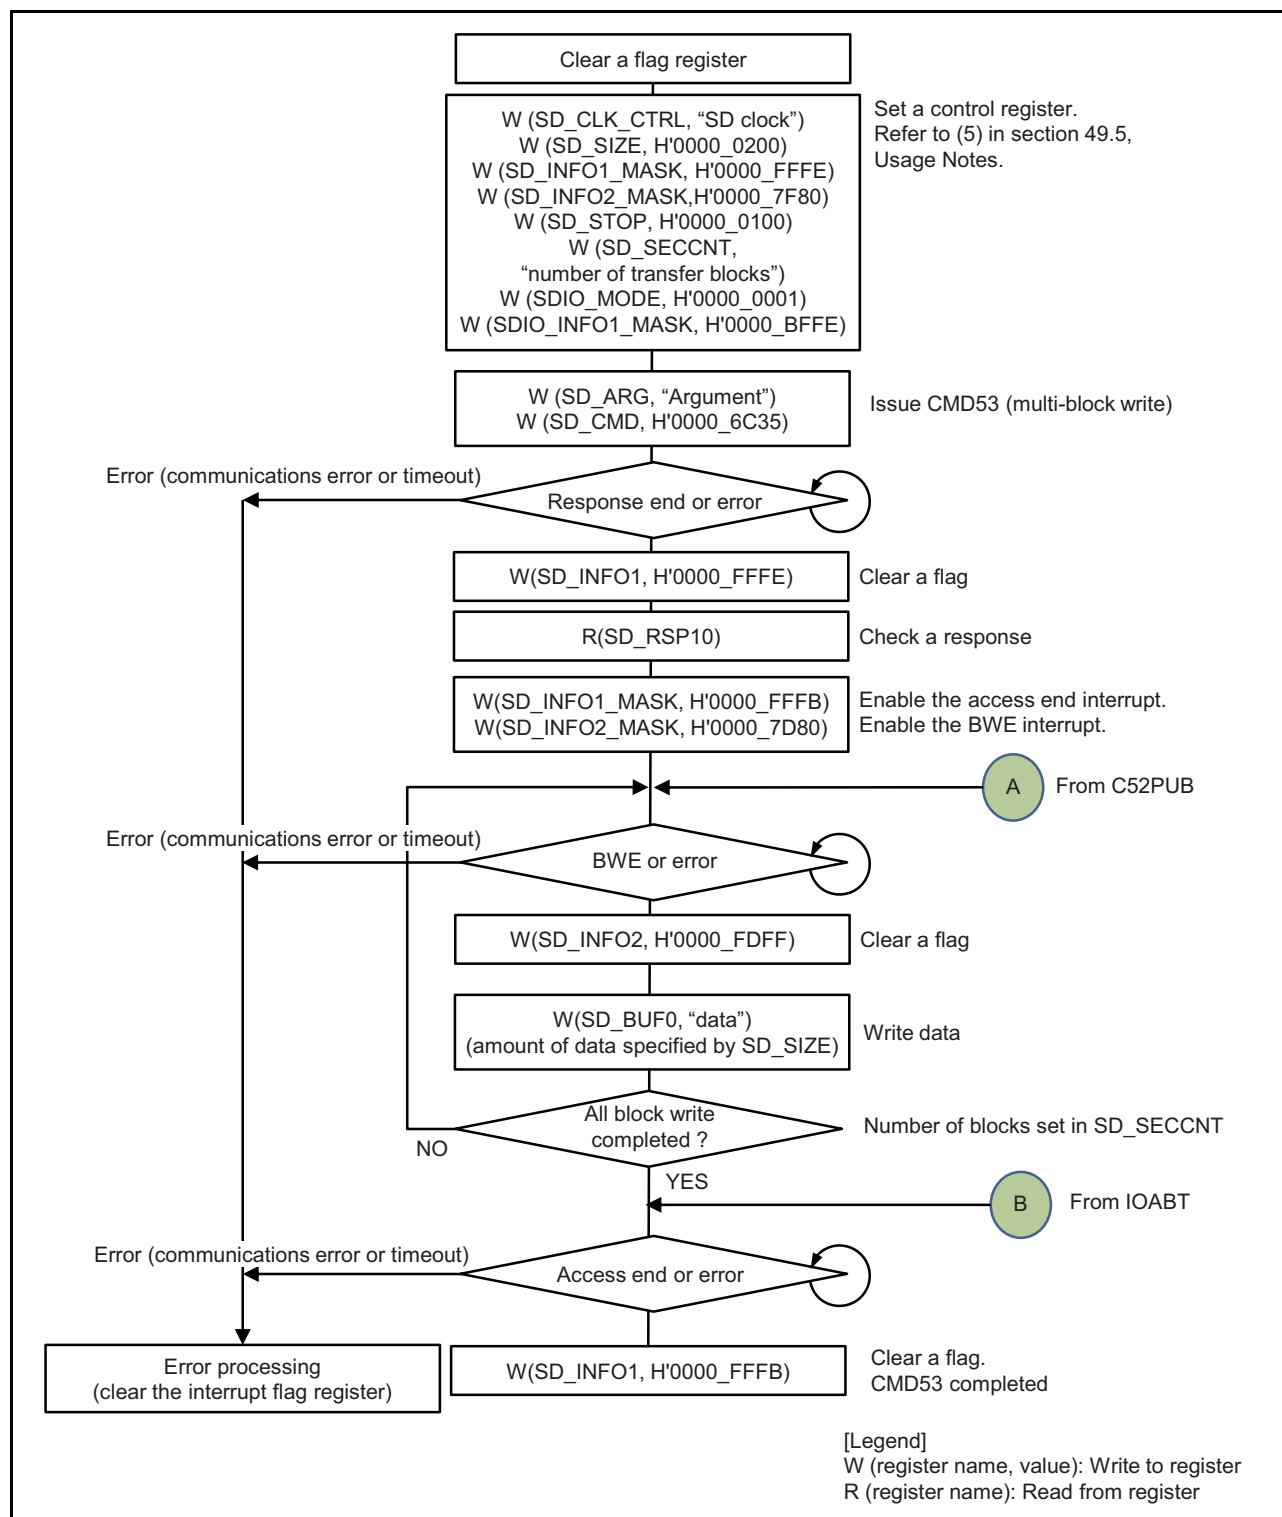

Figure 49.21 CMD53 (Multiple Block Write) Flowchart Example

Figure 49.22 shows a flowchart example when CMD52 (SDIO abort) is issued at CMD53 (multiple block write).

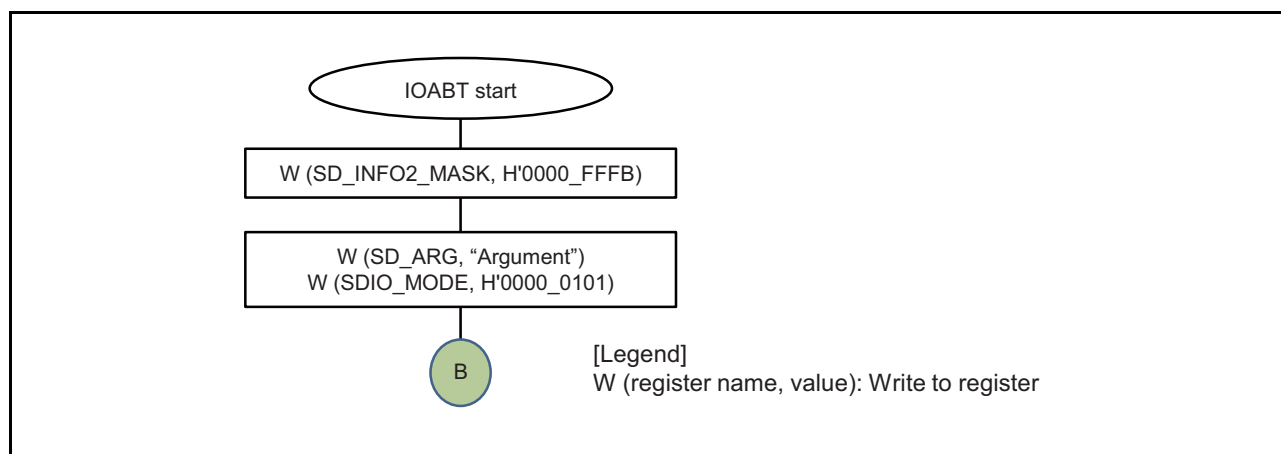

Figure 49.22 Flowchart Example when CMD52 (SDIO Abort) is Issued at CMD53 (Multiple Block Write)

Figure 49.23 shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block write).

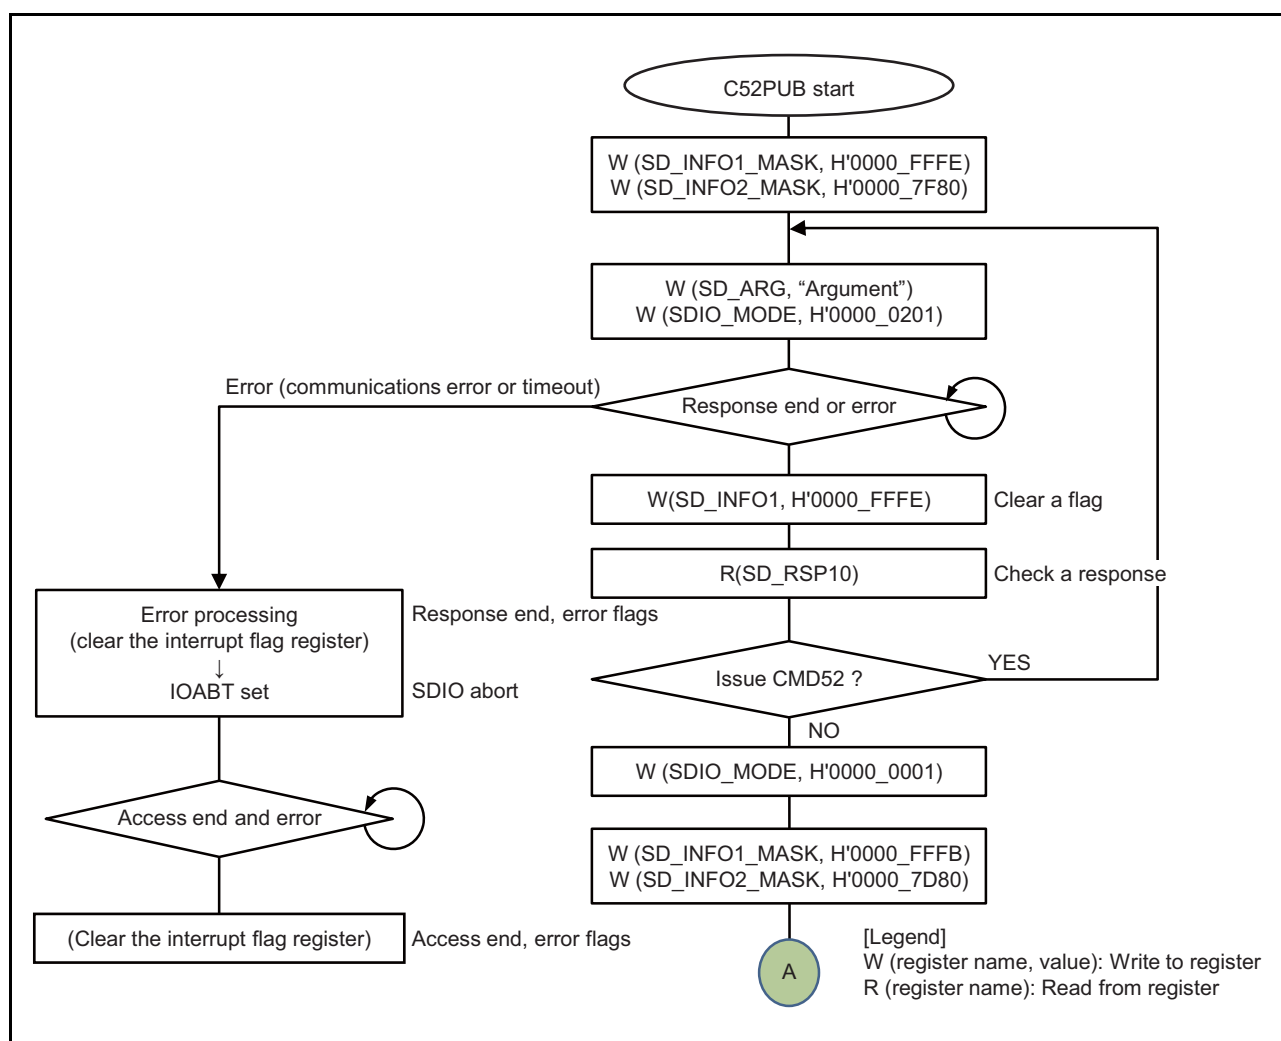

Figure 49.23 Flowchart Example when CMD52 (SDIO None Abort) is Issued at CMD53 (Multiple Block Write)

49.4.10 DMA Transfer

(1) SD_BUF DMA Transfer

Figure 49.24 shows a flowchart example for SD_BUF DMA read when CMD18 (multiple block read) is issued.

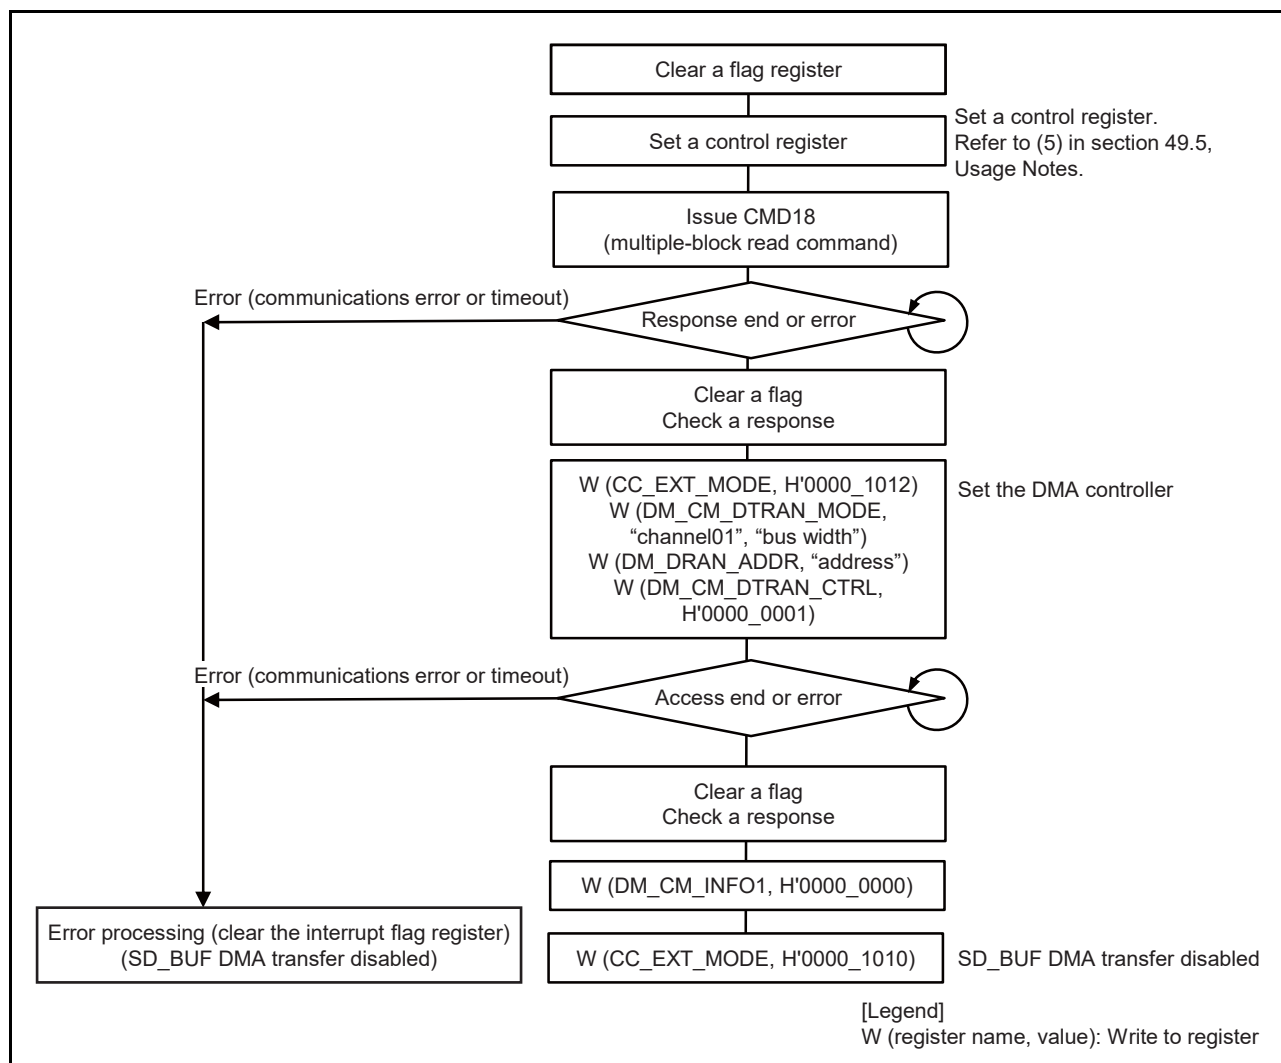

Figure 49.24 SD_BUF DMA Read Flowchart Example

Figure 49.25 shows a flowchart example for SD_BUF DMA write when CMD25 (multiple block write) is issued.

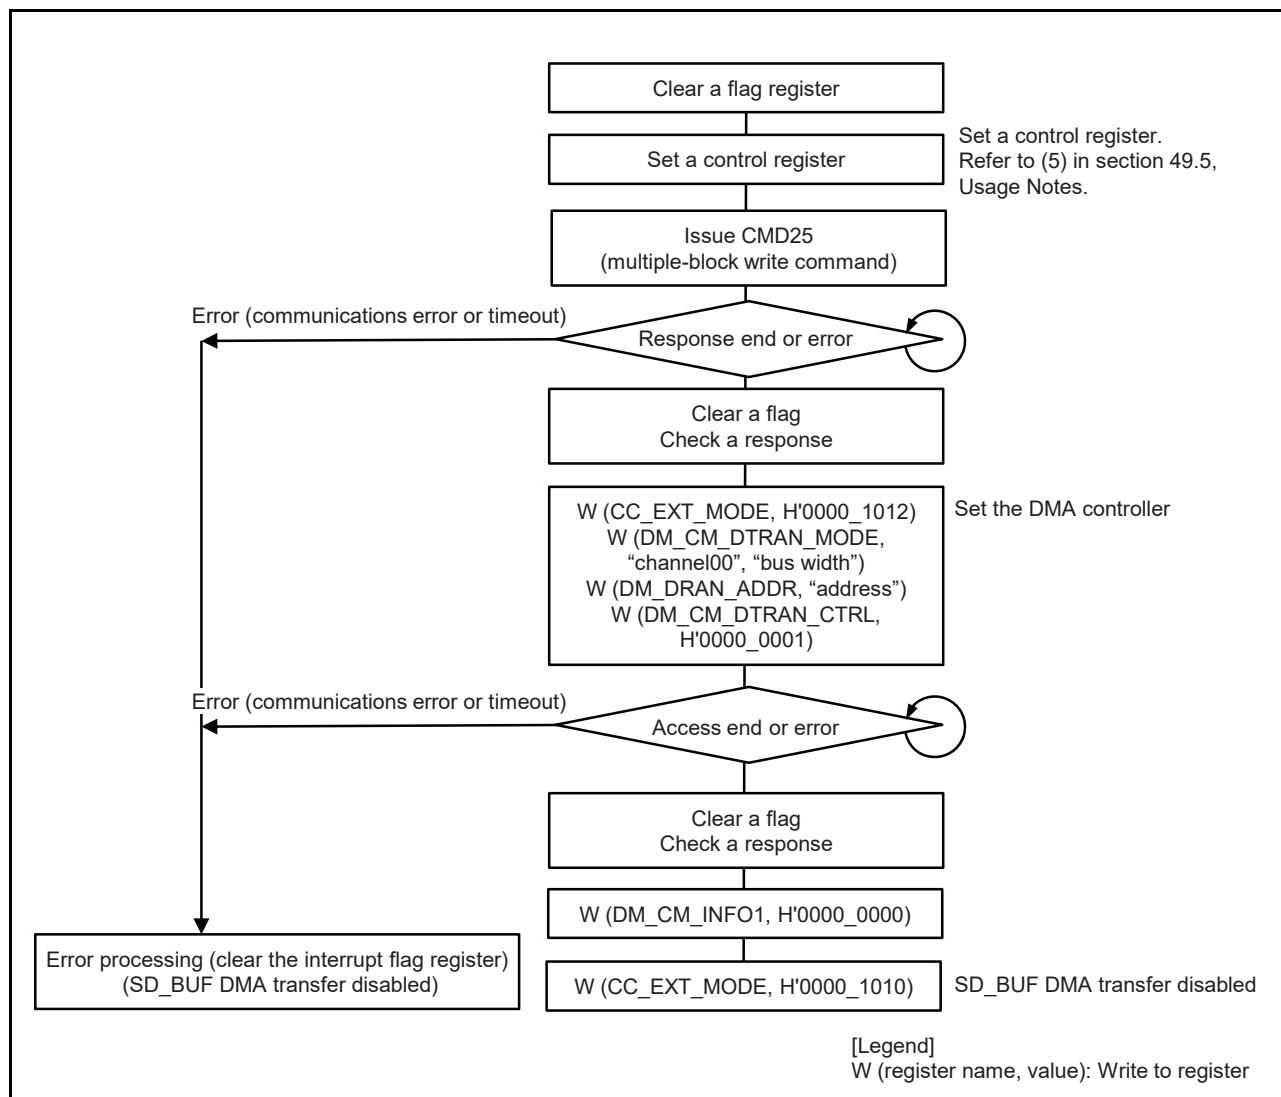

Figure 49.25 SD_BUF DMA Write Flowchart Example

49.4.11 High-Priority Interrupt (without Data Transfer)

(1) Flowchart

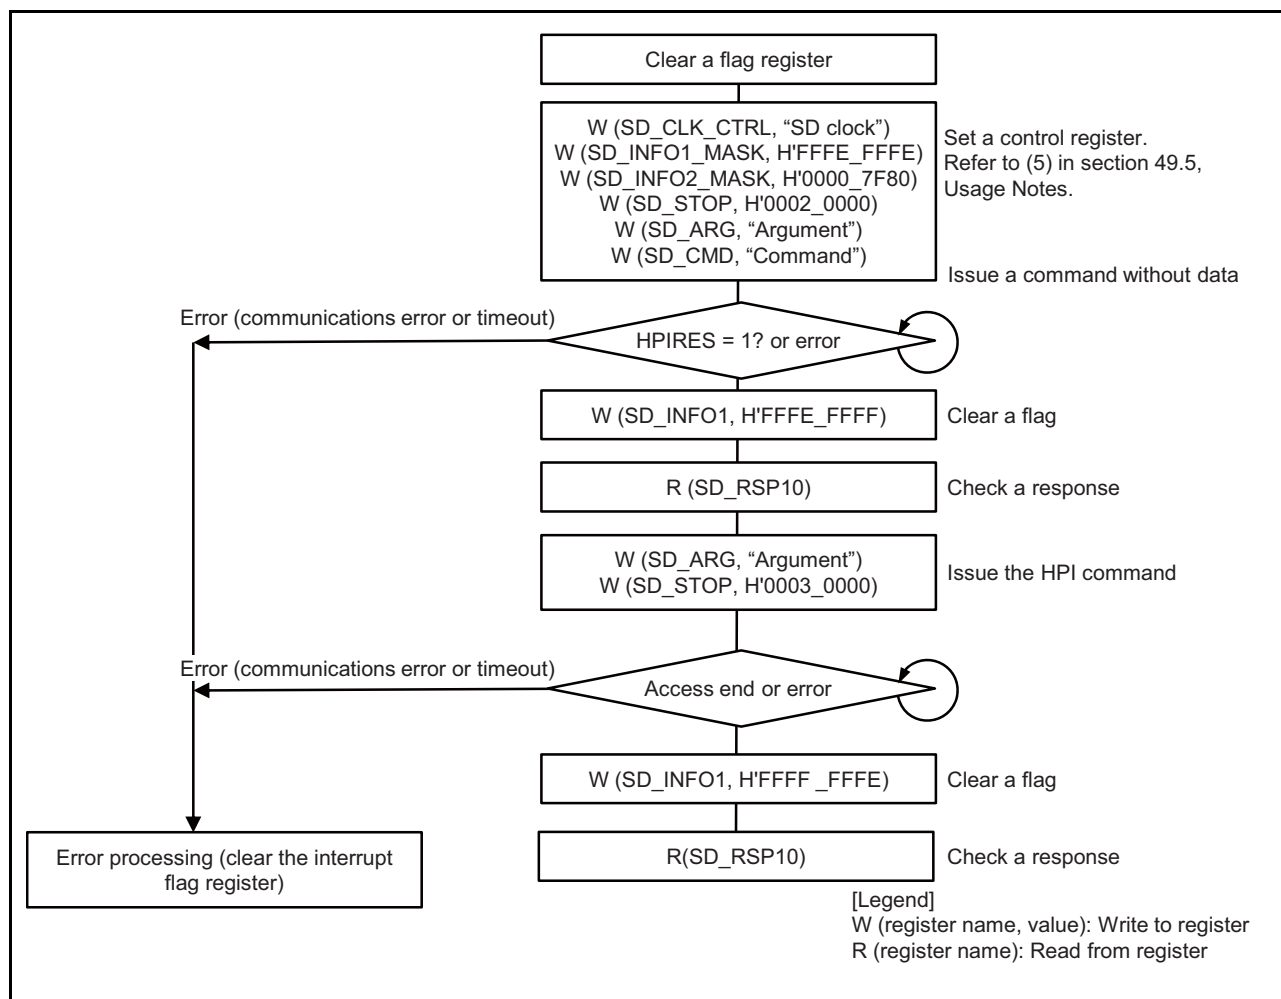

Figure 49.26 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

(2) Operation for High-Priority Interrupt without Data Transfer

The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
Set the CMD Argument in SD_ARG and write to SD_CMD.
Accordingly, CMD is issued, and the operation is started.
4. Flag clear
On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.12 High-Priority Interrupt (at Single Block Write)

(1) Flowchart

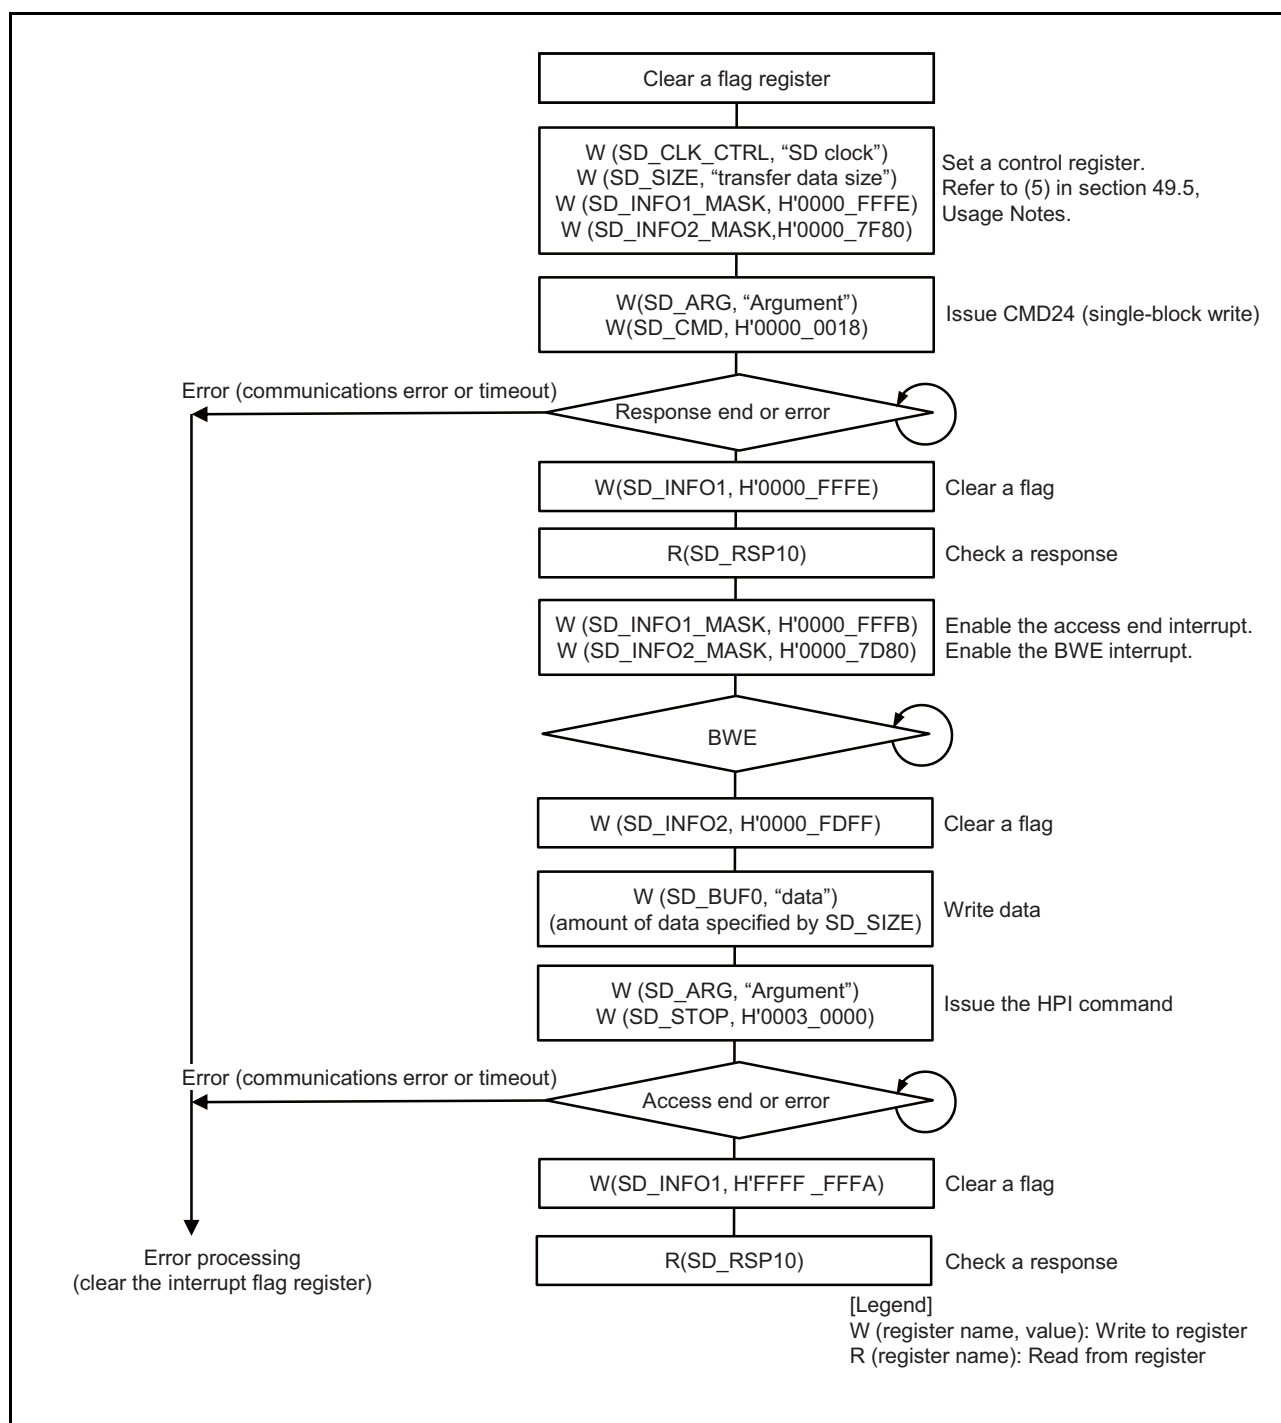

Figure 49.27 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

(2) Operation for HPI at Single Block Write

The operation of HPI at single block write is described below.

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued. If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.13 High-Priority Interrupt (at Multiple Block Write)

(1) Flowchart

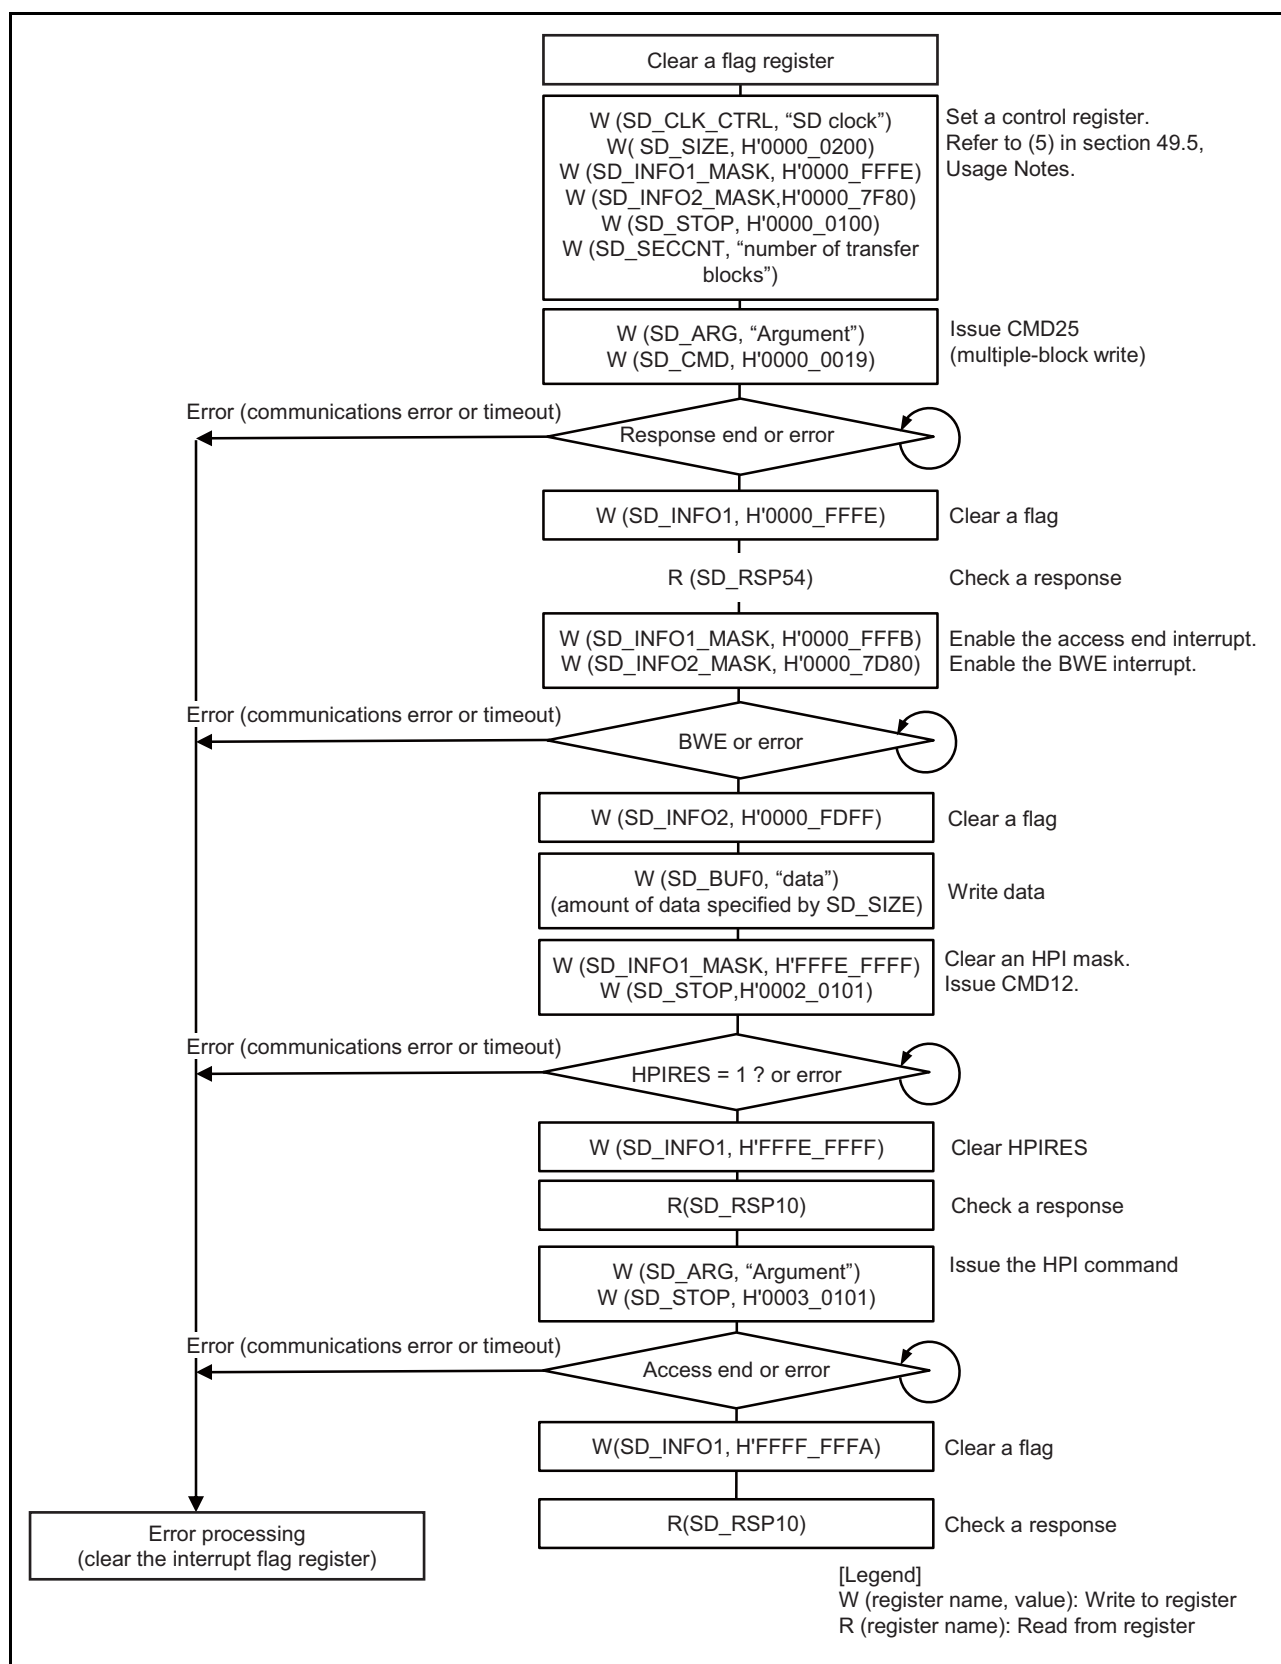

Figure 49.28 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)

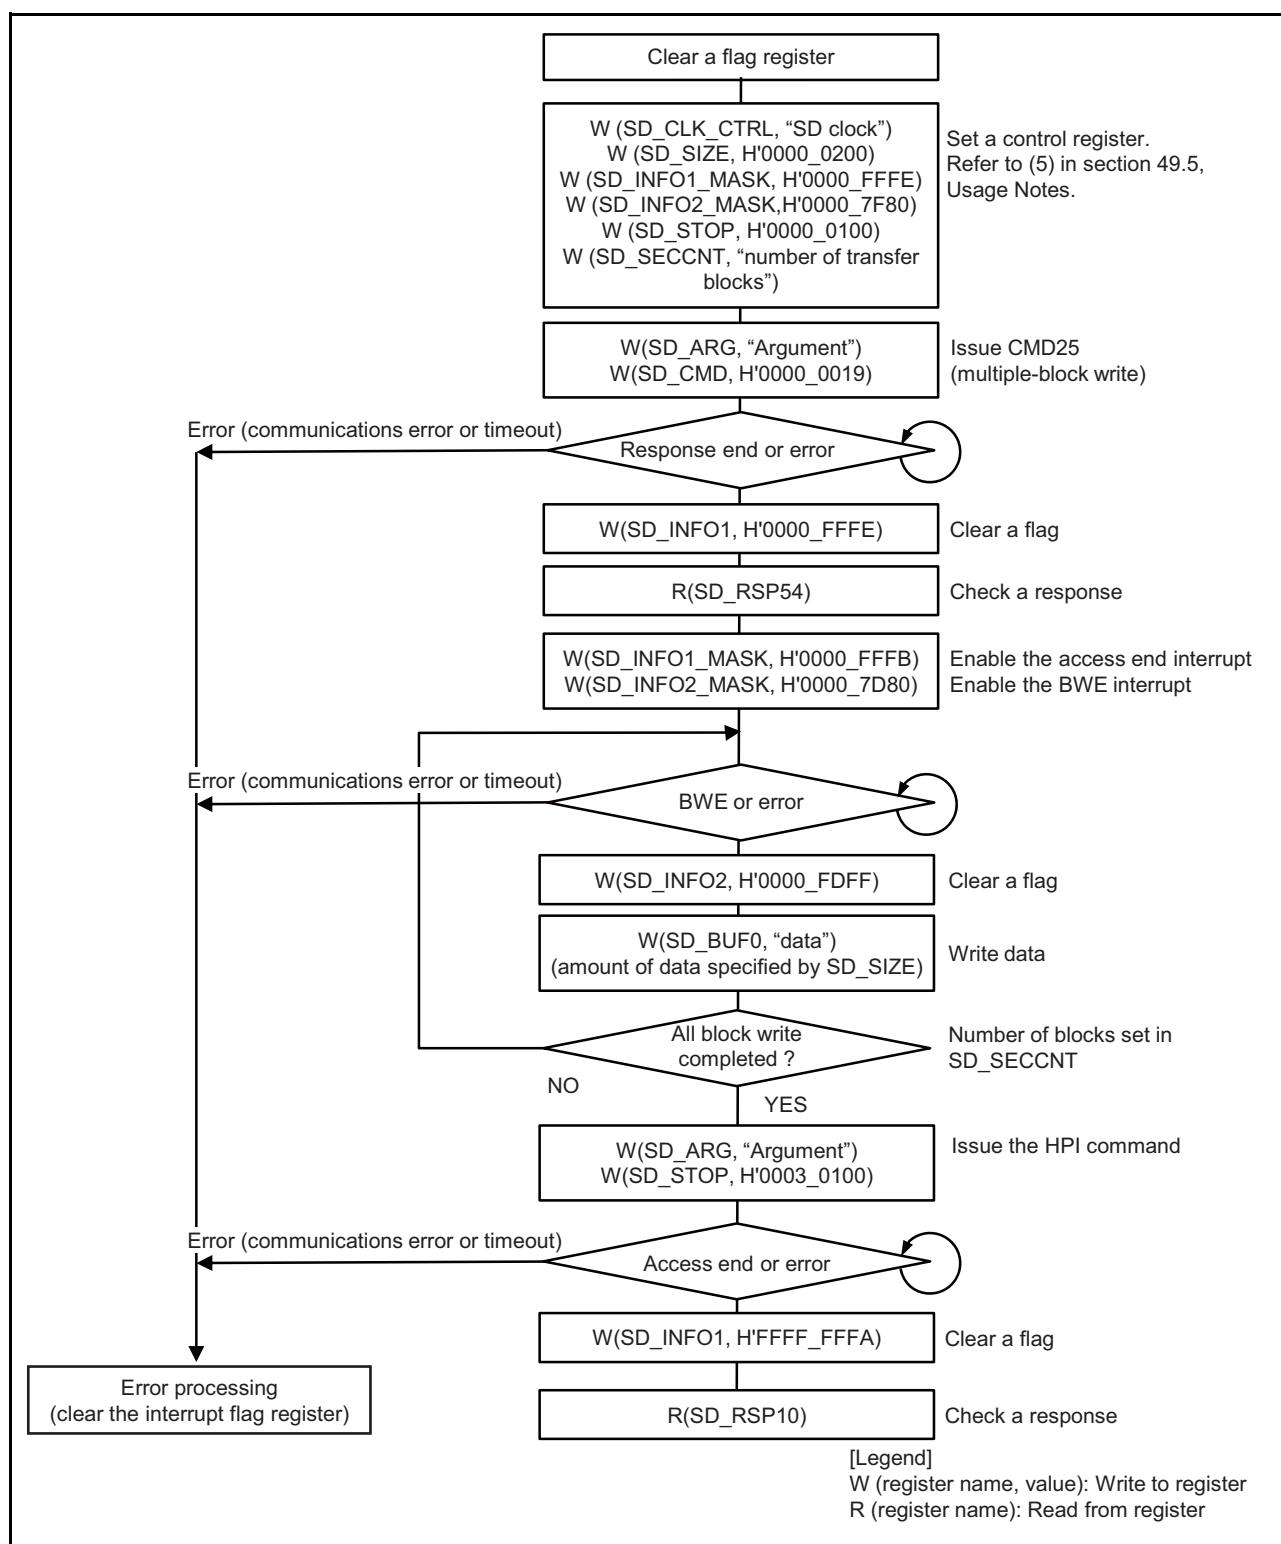

Figure 49.29 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

(2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

(a) When not all the data has been written to SD_BUF

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STOP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
Then, the CRC status and busy state are received from the SD card.
However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
Write H'FFFE FFFF to SD_INFO1_MASK to enable the HPIRES interrupt.
Write H'0002 0101 to SD_STOP, which causes CMD12 to be issued.
7. Response check
When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(b) When all the data has been written to SD_BUF

1. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

49.4.14 Example of SD_CMD Register Setting

Table 49.8 lists the example of SD_CMD (SD interface) register setting.

Table 49.8 Example of SD_CMD Register Setting (SD)

| Type | Command | Example of SD_CMD Register Setting | Remark |
|------|---------|------------------------------------|--|
| CMD | CMD0 | H'0000 0000 | |
| | CMD2 | H'0000 0002 | |
| | CMD3 | H'0000 0003 | |
| | CMD4 | H'0000 0004 | |
| | CMD5 | H'0000 0705 or H'0000 0005 | |
| | CMD6 | H'0000 1C06 or H'0000 0006 | |
| | CMD7 | H'0000 0007 | When the card is placed in the deselected state, the response timeout flag will be set since there is no response. |
| | CMD8 | H'0000 0408 or H'0000 0008 | |
| | CMD9 | H'0000 0009 | |
| | CMD10 | H'0000 000A | |
| | CMD11 | H'0000 040B or H'0000 000B | |
| | CMD12 | H'0000 000C | |
| | CMD13 | H'0000 000D | |
| | CMD15 | H'0000 000F | |
| | CMD16 | H'0000 0010 | |
| | CMD17 | H'0000 0011 | |
| | CMD18 | H'0000 0012 | With auto CMD12 enabled (other than in SDR104 mode) |
| | | H'0000 7C12 | With auto CMD12 disabled (only in SDR104 mode) |
| | CMD19 | H'0000 1C13 or H'0000 0013 | Setting prohibited in DDR50 mode |
| | CMD20 | H'0000 0514 or H'0000 0014 | |
| | CMD23 | H'0000 0417 or H'0000 0017 | |
| | CMD24 | H'0000 0018 | |
| | CMD25 | H'0000 0019 | With auto CMD12 enabled (other than in SDR104 mode) |
| | | H'0000 6C19 | With auto CMD12 disabled (only in SDR104 mode) |
| | CMD27 | H'0000 001B | |
| | CMD28 | H'0000 001C | |
| | CMD29 | H'0000 001D | |
| | CMD30 | H'0000 001E | |
| | CMD32 | H'0000 0020 | |
| | CMD33 | H'0000 0021 | |
| | CMD38 | H'0000 0026 | |
| | CMD42 | H'0000 002A | |
| | CMD48 | H'0000 1C30 | |
| | CMD49 | H'0000 0C31 | |

49.5 Usage Notes

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

- 1) When receiving one or two blocks of data, use single block reading.
- 2) Read the response to CMD18 from SD_RSP54.

<Mechanism of incorrect reading>

Figure 49.30 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of Figure 49.30, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

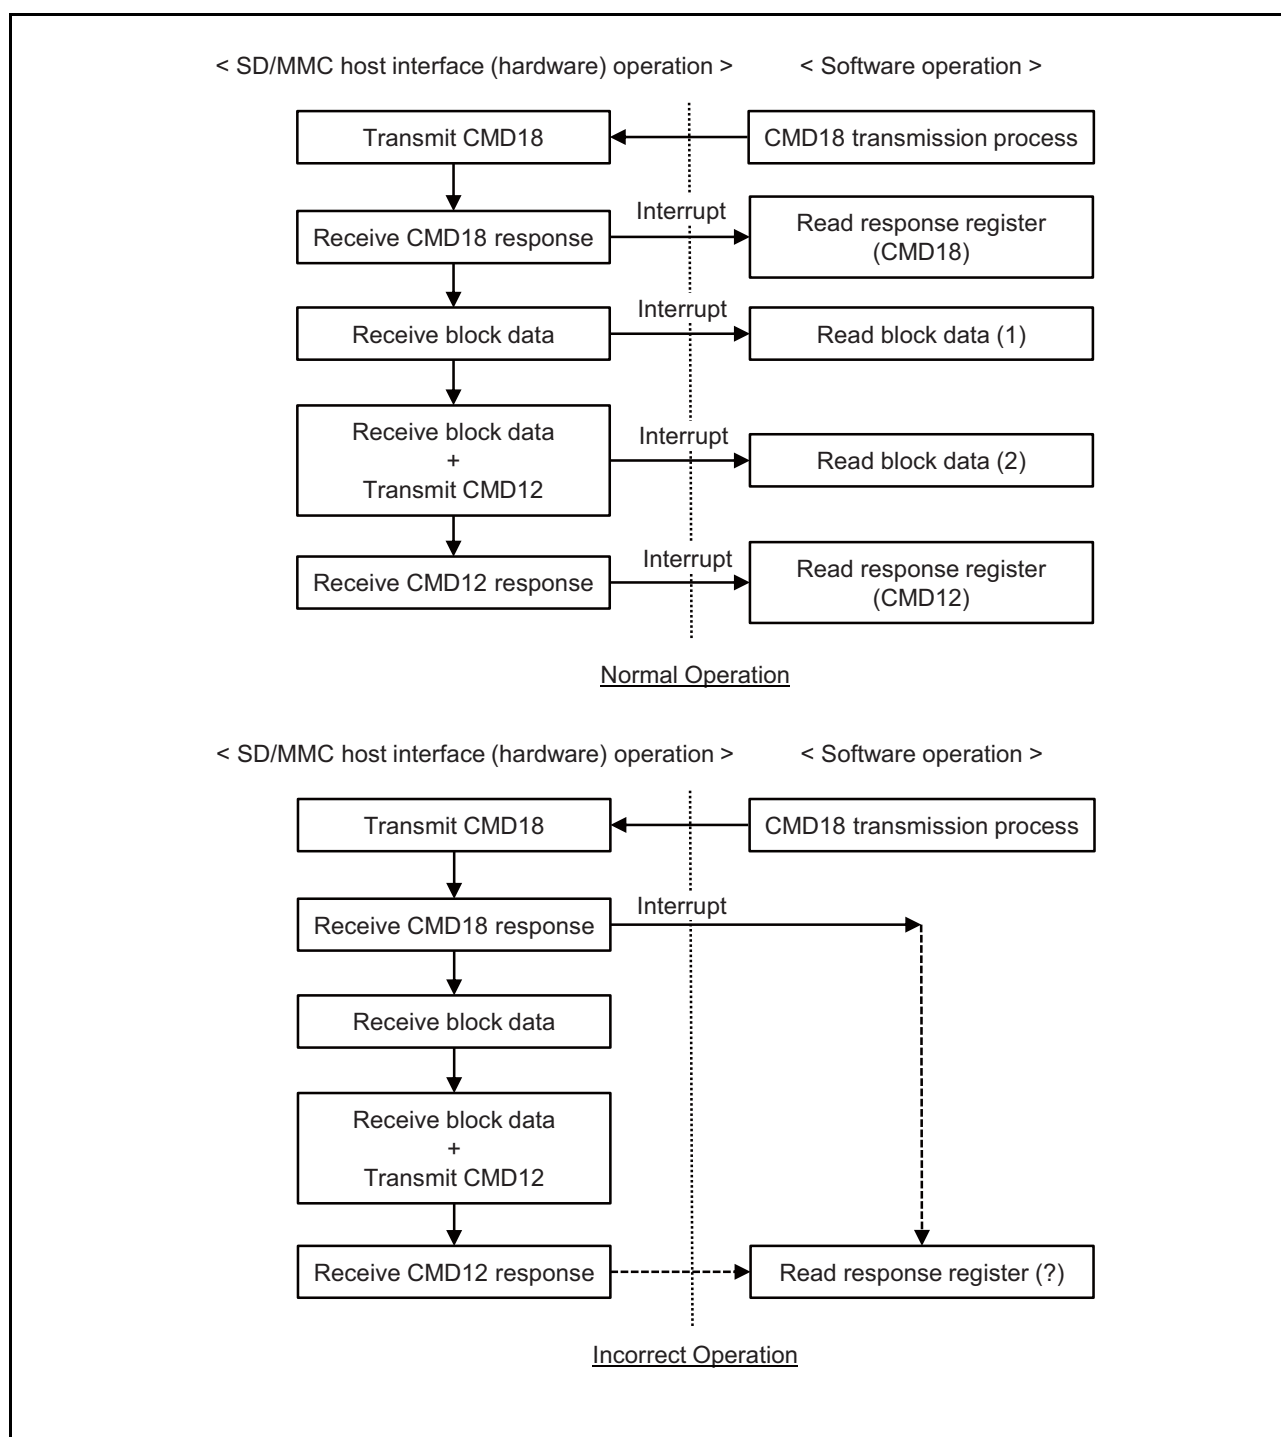

Figure 49.30 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use
 1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
 2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
 3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.
- When DMA transfer is in use
 1. Every time DMA transfer of the value set in SD_SIZE \times n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
 2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
 3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

(6) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.

(7) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

49.6 Sampling Clock Controller (SCC)

49.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

49.6.2 SCC Block Diagram

Figure 49.31 shows a block diagram of the sampling clock controller.

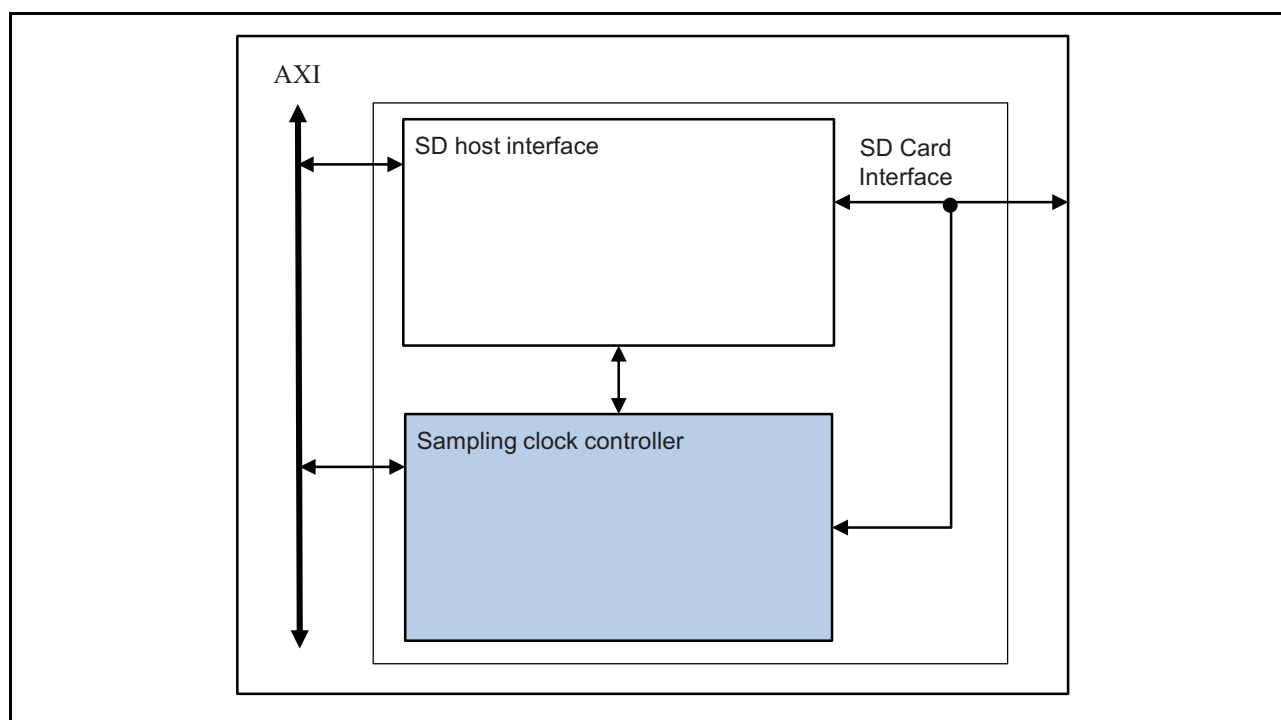

Figure 49.31 Block Diagram of the Sampling Clock Controller

49.6.3 SCC Register Configuration

Table 49.10 shows the SCC registers. The base addresses of each channel are as follows.

Channel 0: H'E8227000

Channel 1: H'E8229000

Table 49.10 Register Configuration

| Name | Abbreviation | Address ([9:0]) | Access Size |
|---|--------------|-----------------|-------------|
| Initial setting register | SCC_DTCNTL | H'000 | 32 |
| Sampling clock position setting register | SCC_TAPSET | H'008 | 32 |
| Hardware adjustment register 1 | SCC_DT2FF | H'010 | 32 |
| Sampling clock selection register | SCC_CKSEL | H'018 | 32 |
| Sampling clock position correction register | SCC_RVSCNTL | H'020 | 32 |
| Sampling clock position correction request register | SCC_RVSREQ | H'028 | 32 |
| Sampling data comparison register | SCC_SMPCMP | H'030 | 32 |

49.7 SCC Register Descriptions

49.7.1 Initial Setting Register (SCC_DTCNTL)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 23 to 16 | TAPNUM7 to TAPNUM0 | H'08 | R/W | When bits DIV7 to DIV0 in the SD_CLK_CTRL register are H'FF (1: 1 mode), set these bits to H'08. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | TAPEN | 0 | R/W | SCC Sampling Clock Operation Enable 0: SCC sampling clock operation is disabled. 1: SCC sampling clock operation is enabled. |

49.7.2 Sampling Clock Position Setting Register (SCC_TAPSET)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 7 to 0 | TAPSET7 to TAPSET0 | H'00 | R/W | SCC Sampling Clock Position • Set the tuning result in the range from 0 to TAPNUM-1. |

49.7.3 Sampling Clock Selection Register (SCC_CKSEL)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | DTSEL | 0 | R/W | Sampling Clock Selection 0: An SCC sampling clock is not used (for other than SDR104 and HS200). 1: An SCC sampling clock is used (for SDR104 or HS200). • For SDR104 or HS200, set DTSEL to 1. DIV[7:0] in the SD_CLK_CTRL register to H'FF (1:1 mode). • When this bit is switched, stop the SD clock output from the SD/MMC host interface (set SCLKEN in SD_CLK_CTRL to 0). |

49.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 8 | TAPSEL7 to TAPSEL0 | H'00 | R | SCC Sampling Clock Position Display <ul style="list-style-type: none"> Displays the SCC sampling clock position selected by hardware. After RVSEN has been set to 1, the value may differ from that of TAPSET. |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1 | RVSW | 0 | R/W | This bit is read as 0. The write value should be 1. |
| 0 | RVSEN | 0 | R/W | SCC Sampling Clock Position Correction Enable 0: SCC sampling clock position correction is disabled. 1: SCC sampling clock position correction is enabled. <ul style="list-style-type: none"> When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. However, when RVSERR is 1, this module does not correct the SCC sampling clock position. While tuning is being performed, set RVSEN to 0. |

49.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 | RVSERR | 0 | R/W | SCC Sampling Clock Position Correction Error 0: There is no correction error. 1: There is a correction error. <ul style="list-style-type: none"> If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again. Ignore this bit while tuning is being performed. Writing 1 to this bit is disabled and writing 0 to this bit is only enabled. |
| 1 | REQTAPUP | 0 | R/W | SCC Sampling Clock Position Positive Direction Correction Request 0: There is no correction request. 1: There is a correction request. <ul style="list-style-type: none"> If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). When RVSEN is 1, this bit is disabled (this bit is not set to 1). Writing 1 to this bit is disabled and writing 0 to this bit is only enabled. |
| 0 | REQTAPDWN | 0 | R/W | SCC Sampling Clock Position Negative Direction Correction Request 0: There is no correction request. 1: There is a correction request. <ul style="list-style-type: none"> If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). When RVSEN is 1, this bit is disabled (this bit is not set to 1). Writing 1 to this bit is disabled and writing 0 to this bit is only enabled. |

49.7.6 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------------------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 15 to 8 | DT2NESET7 to DT2NESET0 | H'05 | R/W | Hardware Adjustment 1 When the sampling clock controller is to be used, set these bits to H'03. |
| 7 to 0 | DT2NSSET7 to DT2NSSET0 | H'02 | R/W | Hardware Adjustment 2 When the sampling clock controller is to be used, set these bits to H'00. |

49.7.7 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 24 to 16 | CMPNGU | All 0 | R/W | Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit 24 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 8 to 0 | CMPNGD | All 0 | R/W | Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit 8 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register |

49.8 Usage Example of SCC

49.8.1 Tuning

SCC is tuned by using operation of single-block reading.

As shown in Figure 49.32, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 49.33 and Table 49.11 show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).

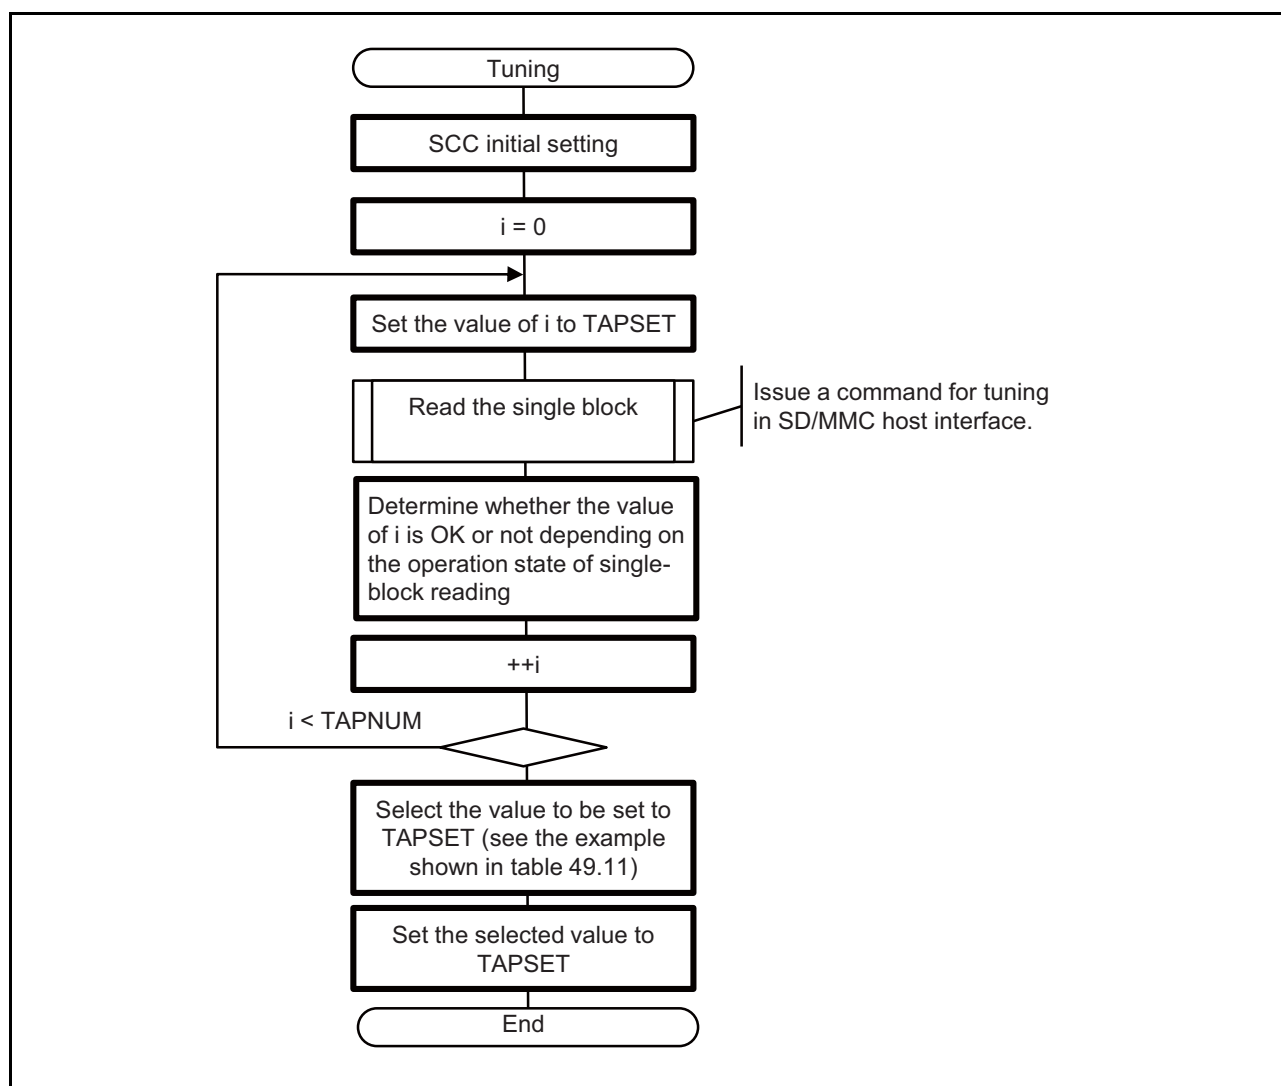

Figure 49.32 Example of Tuning Flow (Outline)

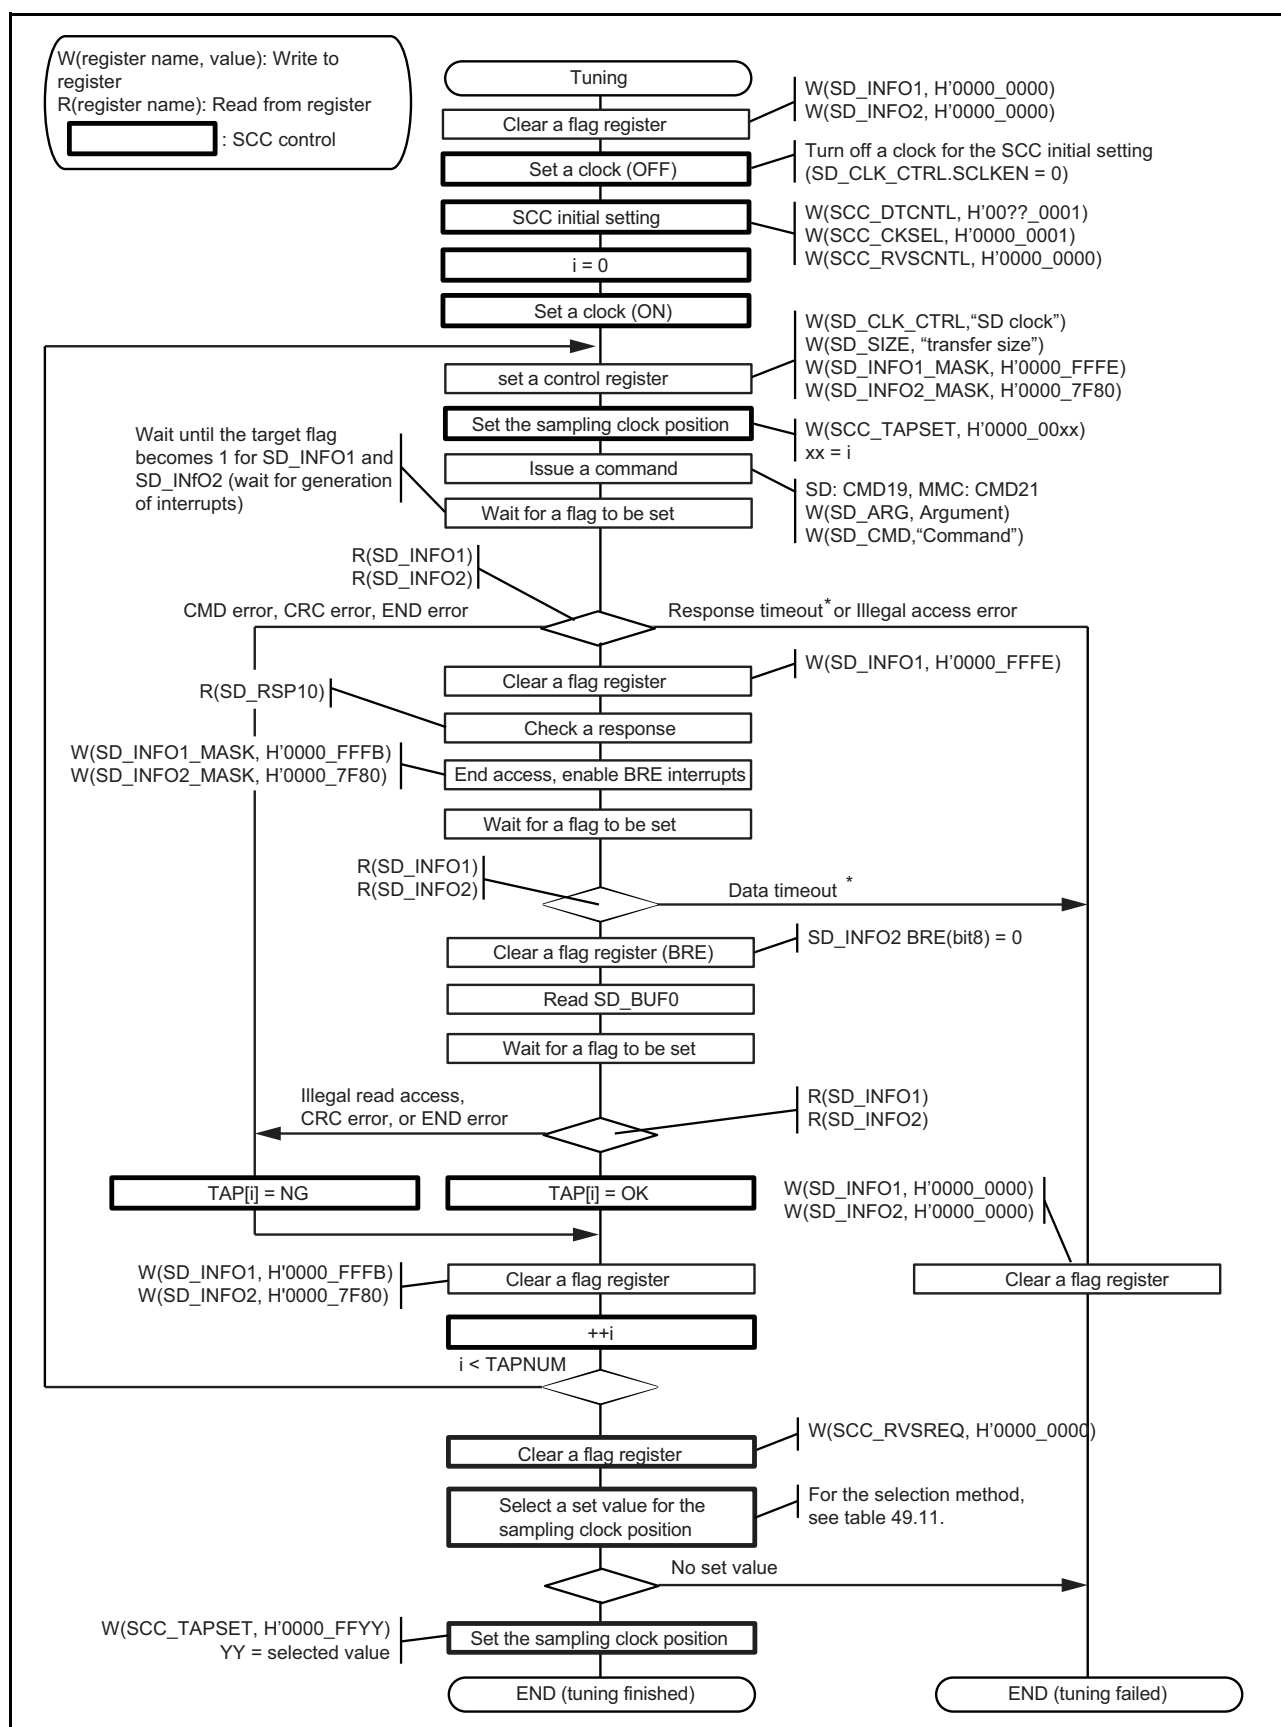

Figure 49.33 Example of Tuning Flow (Detailed)

*: If all of the TAP[i] has become "NG".

Table 49.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

| Item | i | Case 1 | Case 2 | Case 3 | Case 4 | Case 5*1 |
|----------------|-----|--------|--------|--------|------------|------------|
| TAP[i] | 0 | NG | OK | NG | OK | OK |
| | 1 | OK | OK | NG | NG | OK |
| | 2 | OK | NG | OK | NG | OK |
| | 3 | OK(←) | NG | OK | NG | OK |
| | 4 | OK | NG | NG | NG | OK |
| | 5 | OK | OK | NG | OK | OK |
| | 6 | NG | OK | NG | OK(←) | OK |
| Max. value→ | 7 | NG | OK(←) | NG | OK | OK |
| | (0) | NG | OK | NG | OK | OK |
| | (1) | OK | OK | NG | NG | OK |
| | (2) | OK | NG | OK | NG | OK |
| | (3) | OK | NG | OK | NG | OK |
| | (4) | OK | NG | NG | NG | OK |
| | (5) | OK | OK | NG | OK | OK |
| | (6) | NG | OK | NG | OK | OK |
| | (7) | NG | OK | NG | OK | OK |
| Selected value | | i = 3 | i = 7 | Fail | i = 6 or 7 | i = 0 to 7 |

Symbols: (←): Example of selection, (x): repeated display of index x of TAP[x]

*1 If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data.

Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is section 49.8.3, Change point of the input data.

- (a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.
- (b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

49.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

(1) Manual correction of the sampling clock position

Figure 49.34 shows the flow of manual correction of the sampling clock position. Table 49.12 shows set values determined when correction is required (when TAPNUM = 8).

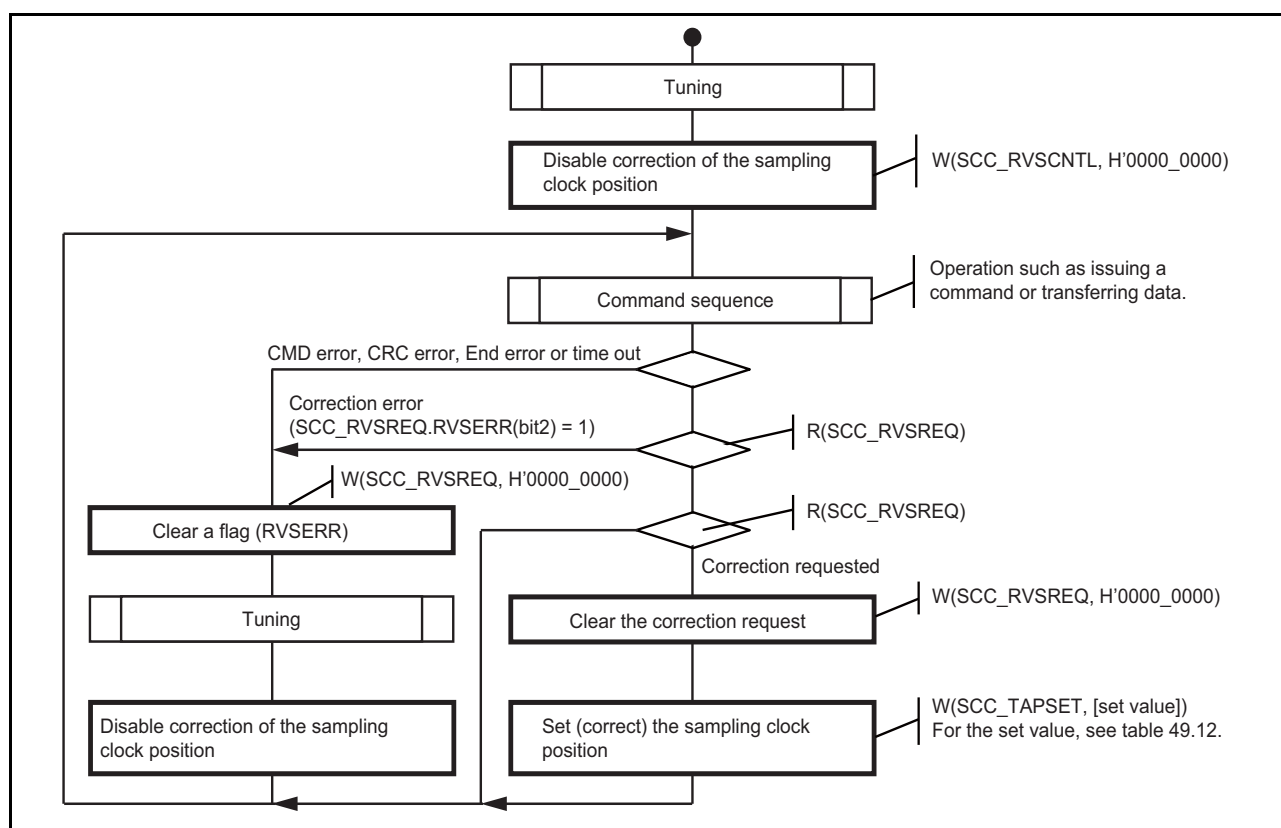

Figure 49.34 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 49.12 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

| No. | Current value of TAPSET | Value set to TAPSET when REQTAPUP = 1 | Value set to TAPSET when REQTAPDWN = 1 |
|-----|-------------------------|---------------------------------------|--|
| 1 | 0 | 1 | 7 |
| 2 | 1 | 2 | 0 |
| 3 | 2 | 3 | 1 |
| 4 | 3 | 4 | 2 |
| 5 | 4 | 5 | 3 |
| 6 | 5 | 6 | 4 |
| 7 | 6 | 7 | 5 |
| 8 | 7 | 0 | 6 |

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

(2) Automatic correction of the sampling clock position

Figure 49.35 shows the flow of automatic correction of the sampling clock position.

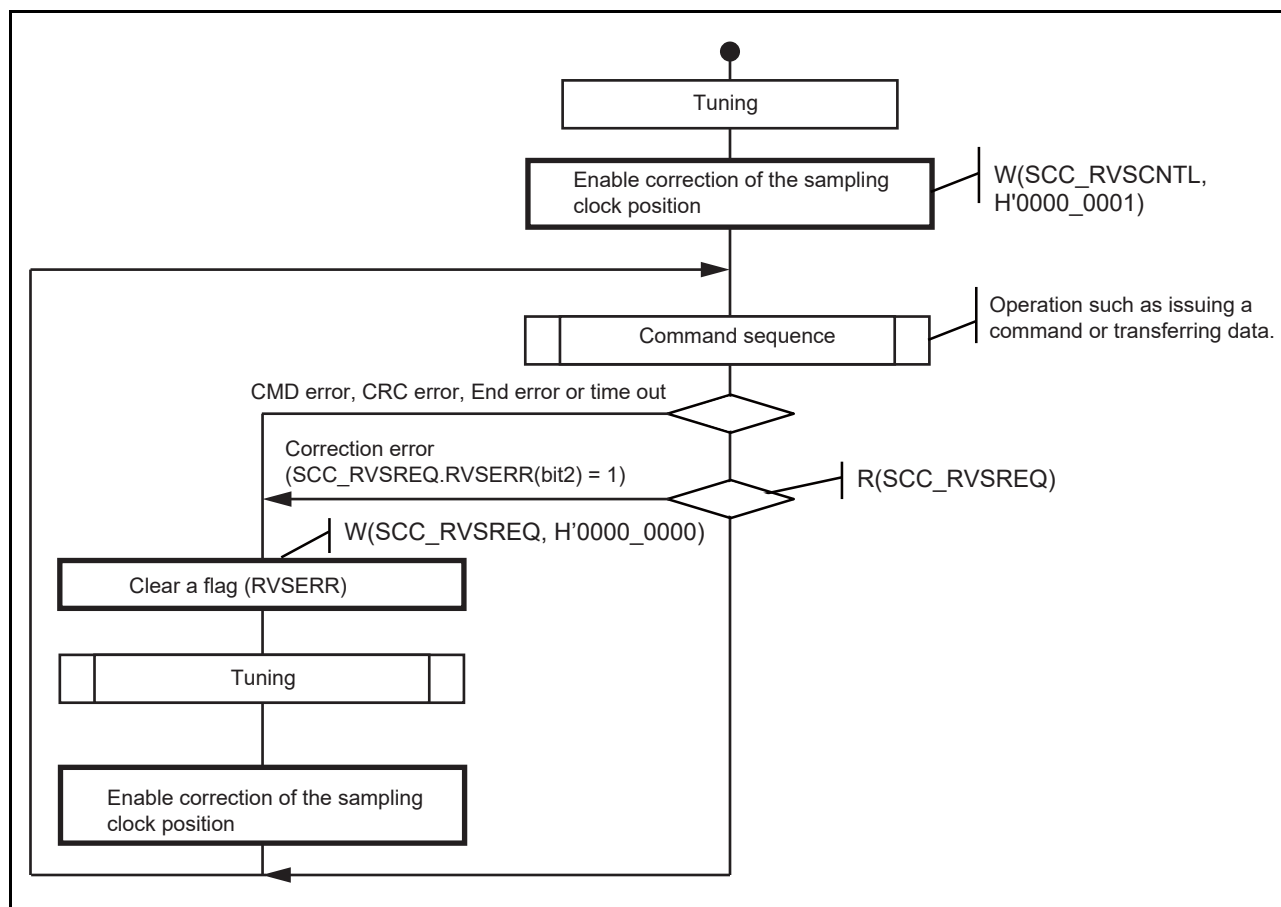

Figure 49.35 Flow of Automatic Correction of the Sampling Clock Position (Example)

49.8.3 Change point of the input data

Tuning is capture the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the behind the TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set as TAP6 or TAP7.

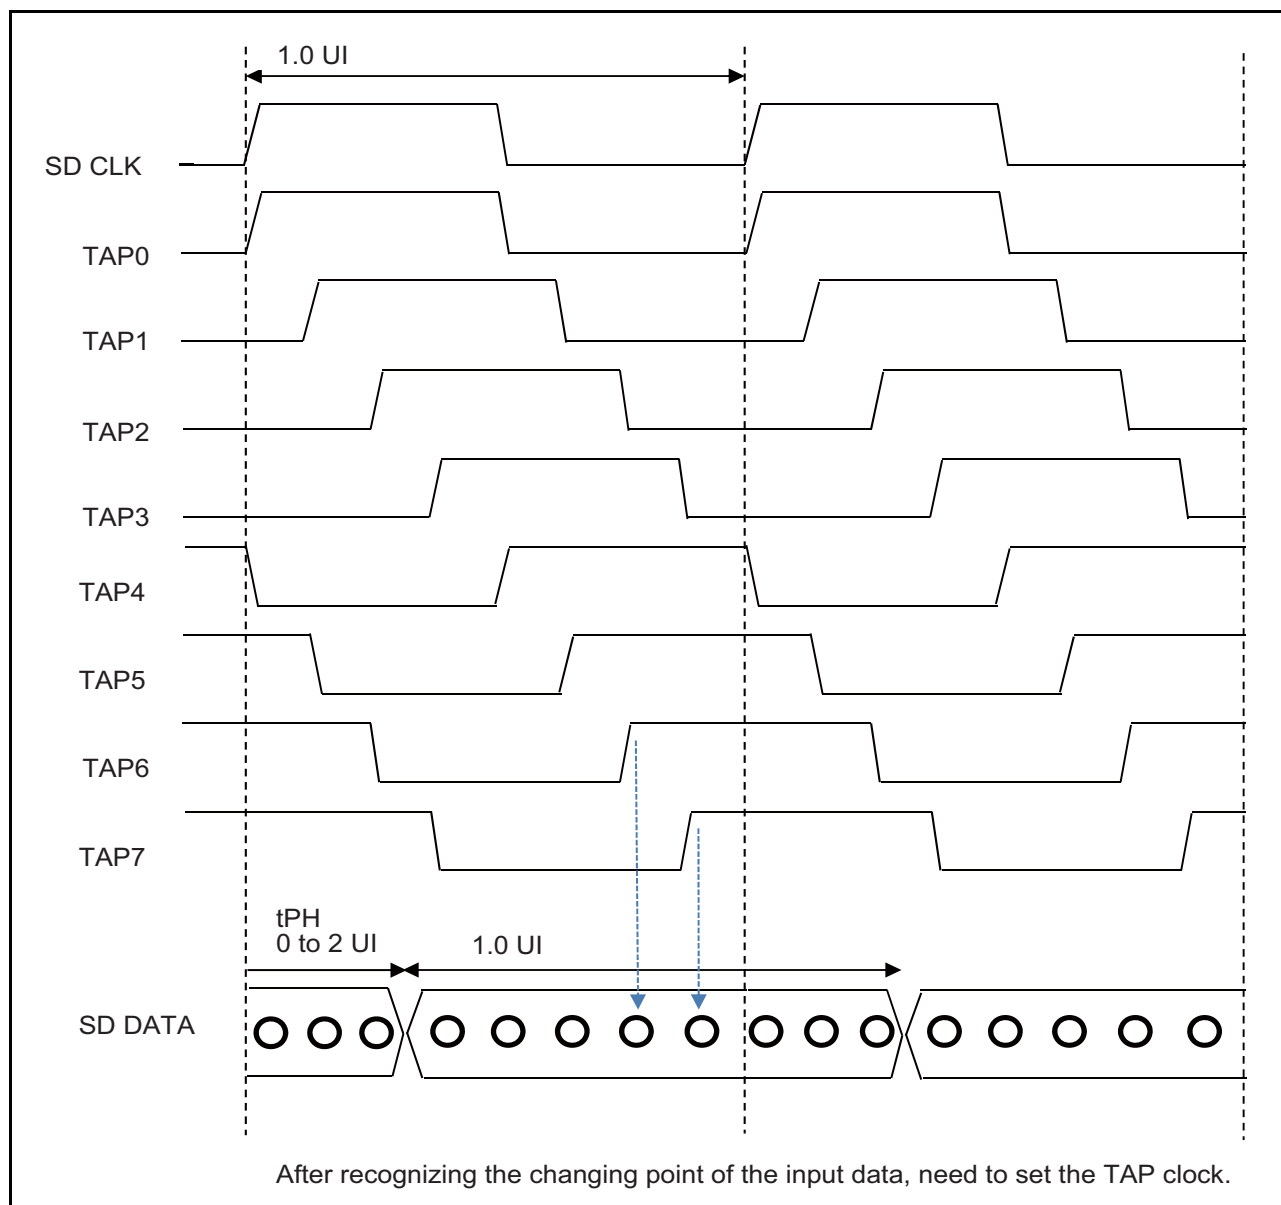

Figure 49.36 Example, All taps is OK.

Figure 49.36 is shown change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). When the tuning of TAP2 or TAP3, CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

50. On-Chip RAM

This LSI has an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM) and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.

The operation and write access to the large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.

The on-chip data retention RAM is assigned to page 0 in the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

50.1 Features

- Page
 - The on-chip large-capacity RAM consists of five pages.
 - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map

The on-chip RAM is located in the address spaces shown in Table 50.1 and Table 50.2. Pages 0 and 1 of the large-capacity RAM each have a capacity of 512 Kbytes, and pages 2 to 4 of the large-capacity RAM has a capacity of 1 Mbyte.

Table 50.1 Address Spaces of On-Chip Large-Capacity RAM

| Page | Address |
|-----------------|----------------------------|
| Page 0 (512KB) | H'80000000 to H'8007FFFF |
| Page 1 (512KB) | H'80080000 to H'800FFFFFFF |
| Page 2 (1024KB) | H'80100000 to H'801FFFFFFF |
| Page 3 (1024KB) | H'80200000 to H'802FFFFFFF |
| Page 4 (1024KB) | H'80300000 to H'803FFFFFFF |

Table 50.2 Address Spaces of On-Chip Data Retention RAM

| Page | Address |
|---------------|--------------------------|
| Page 0 (16KB) | H'80000000 to H'80003FFF |
| Page 1 (16KB) | H'80004000 to H'80007FFF |
| Page 2 (32KB) | H'80008000 to H'8000FFFF |
| Page 3 (64KB) | H'80010000 to H'8001FFFF |

- Ports

Each page of the on-chip large-capacity RAM has one read and write port and is connected to the AXI bus. The on-chip RAM for data retention, which has a port independent of the port in page 0, is shared with the read and write port in four pages.
- Method of arbitration

When the same port of the on-chip large-capacity RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.
- Number of access cycles

The number of cycles for access to read or write is one cycle of Bφ.

50.2 Usage Notes

50.2.1 Page Conflict

When the same page of the on-chip large-capacity RAM is accessed from different masters simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each master.

50.2.2 Data Retention

Data in the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit.
Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(b) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset.
Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

51. GPIO

51.1 Features

This LSI chip has 61 pins exclusively for use with single functions. It also has 22 ports: P0 to PL, and JP0. The pins of the ports can be used as general-purpose input/output pins, each of which may also be assigned one of multiple other selectable functions.

Switching of the following pin functions by controlling the respective registers is possible for the specific function ports.

- Driving ability of the CKIO pin by controlling PCKIO
- Driving ability and operating voltage of the pins for the SPI multi I/O bus controller by controlling PSPIBSC and PPOC
- Selection of the HyperBusTM*1 controller or Octa*2 memory controller pin by controlling PHMOM0
- Driving ability and operating voltage of the pins for the SD/MMC host interfaces by controlling PSDMMC0 to PSDMMC2 and PPOC

Note 1. HyperBus, HyperFlash, and HyperRAM are trademarks of Cypress Semiconductor Corporation.

Note 2. OctaFlash and OctaRAM are trademarks of Macronix International Co., Ltd.

The general-purpose input/output port pins are multiplexed with the peripheral on-chip module functions. The functions multiplexed on these pins can be selected as desired by setting of the registers.

Each port has the port direction register (PDR) that selects non-use, input, or output, the port output data register (PODR) that holds data for output, the port input register (PIDR) that indicates the pin states, and the port mode register (PMR) that specifies the pin function of each port.

Each port has the control register (PFS) that is used to select the input/output function and interrupt pin from the multiplexed port pins, and to assign the function to the selected pin.

The configuration of the I/O ports differs depending on the package. Table 51.1 shows the specifications of I/O ports, and Table 51.2 lists the port functions.

Table 51.1 Specifications of I/O Ports

| | Pin Name | Package | | Package | | Package | |
|-----------------|--------------|--------------|----------------|------------------|----------------|--------------|----------------|
| | | 324 Pins | Number of Pins | 272, 256 Pins | Number of Pins | 176 Pins | Number of Pins |

Note 1. The driving ability of some pins cannot be switched. For details, refer to section 51.3.5, GPIO Driving Ability Control Register (DSCR).

Note 2. The dedicated pins of MIPI, LVDS, and USB are excluded from the list. Refer to the related sections for each pin.

51.1.1 Port group index m n

Throughout this section, the individual port groups are identified by the index "m" (m = 0 to 9, A to H, J to M), and the port groups pins are identified by the index "n" (n = 0 to 7). For example PORTm.PMRn for the port mode control register and Pmn.PFS for the pin control register which are used for the Pmn pin.

The index "m = M" means the pin control register which is used for the JP0_0 and JP0_1 pins.

51.1.2 Base address

The addresses of the registers used to control the ports are given as addresses offset from the base address <PORTm_base>.

Table 51.3 Base Address

| Name | Address |
|--------------|-------------|
| <PORTm_base> | H'FCFF E000 |

51.2 GPIO Port Configuration

51.3.1 Port Direction Register (PDR)

The PDR register is used to select non-use, input, or output (input enable) for individual pins of the corresponding port when the pins are configured as the general I/O pins. When 00 (Hi-Z) is set to this register, this LSI can be protected from input Hi-z state.

| Bit | Bit Name | Initial value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 15 to 14 | PDR7[1:0] | 00 | R/W | Odd bit Even bit 0 0: Hi-Z |
| 13 to 12 | PDR6[1:0] | 00 | R/W | 0 1: Setting prohibited |
| 11 to 10 | PDR5[1:0] | 00 | R/W | 1 0: Input (functions as an input pin.) |
| 9 to 8 | PDR4[1:0] | 00 | R/W | 1 1: Output (functions as an output pin (port read enable).) |
| 7 to 6 | PDR3[1:0] | 00 | R/W | |
| 5 to 4 | PDR2[1:0] | 00 | R/W | |
| 3 to 2 | PDR1[1:0] | 00 | R/W | |
| 1 to 0 | PDR0[1:0] | 00 | R/W | |

Note: Each bit of PORTm.PDR corresponds to each pin of port m; pin function can be specified in 2-bit units. Write 00 (Hi-Z) or 10 (input) to the PORT5.PDRn (n = 0 to 7), PORTL.PDRn (n = 0 to 4), and PORTM.PDR0 bits because the P5_0 to P5_7, PL_0 to PL_4, and JP0_0 pins are only for input. Write 00 (non-use) or 11 (output) to the PORTM.PDR1 bit because the JP0_1 pin is only for input. The bit corresponding to a pin that does not exist is also reserved. A reserved bit is always read as 0. The write value should always be 0.

51.3.2 Port Output Data Register (PODR)

The PODR register holds the data to be output from the pins used for general I/O.

| Bit | Bit Name | Initial value | R/W | Description |
|-----|----------|---------------|-----|----------------|
| 7 | PODR7 | 0 | R/W | 0: Low output |
| 6 | PODR6 | 0 | R/W | 1: High output |
| 5 | PODR5 | 0 | R/W | |
| 4 | PODR4 | 0 | R/W | |
| 3 | PODR3 | 0 | R/W | |
| 2 | PODR2 | 0 | R/W | |
| 1 | PODR1 | 0 | R/W | |
| 0 | PODR0 | 0 | R/W | |

Note: Write 0 to the PORT5.PODRn (n = 0 to 7), PORTL.PODRn (n = 0 to 4), and PDRTM.PODR0 bits because the P5_0 to P5_7, PL_0 to PL_4, and JP0_0 pins are only for input. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

51.3.3 Port Input Data Register (PIDR)

The PIDR register reflects the states of the individual input port pins.

| Bit | Bit Name | Initial value | R/W | Description |
|-----|----------|---------------|-----|-------------------------------|
| 7 | PIDR7 | 0 | R | 0: Low input 1: High input |
| 6 | PIDR6 | 0 | R | |
| 5 | PIDR5 | 0 | R | |
| 4 | PIDR4 | 0 | R | |
| 3 | PIDR3 | 0 | R | |
| 2 | PIDR2 | 0 | R | |
| 1 | PIDR1 | 0 | R | |
| 0 | PIDR0 | 0 | R | |

Note: If PORTm.PDR is set to 10 or 11, the pin states of ports m can be read with PORTm.PIDR, regardless of the values of PORTm.PMR. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0.

51.3.4 Port Mode Register (PMR)

The PMR register specifies the function of the pins of the port.

Note 1. The initial value of the PMR register of PORTM is 2'b11.

| Bit | Bit Name | Initial value | R/W | Description |
|-----|----------|---------------|-----|---|
| 7 | PMR7 | 0 | R/W | 0: Uses the pin as a general I/O pin. 1: Uses the pin as an I/O port for peripheral functions. |
| 6 | PMR6 | 0 | R/W | |
| 5 | PMR5 | 0 | R/W | |
| 4 | PMR4 | 0 | R/W | |
| 3 | PMR3 | 0 | R/W | |
| 2 | PMR2 | 0 | R/W | |
| 1 | PMR1 | 0 | R/W | |
| 0 | PMR0 | 0 | R/W | |

Note: Each bit of PORTm.PMR corresponds to each pin of port m; pin function can be specified in 1-bit units. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

51.3.5 GPIO Driving Ability Control Register (DSCR)

The DSCR register controls driving ability of the ports. For pins PG_2, PG_3, PG_4, PG_5, PG_6, PG_7, PJ_0, PJ_1, PJ_2, PJ_3, PJ_4, PJ_5, and PJ_6, setting of 01 (normal driving ability) or 11 (high driving ability) is only possible. For pins other than those above, setting of 01 (normal driving ability) is only possible.

| Bit | Bit Name | Initial value | R/W | Description |
|----------|------------|---------------|-----|--|
| 15 to 14 | DSCR7[1:0] | 01 *2 | R/W | Odd bit Even bit Driving ability 0 1: Normal driving ability (2 mA) |
| 13 to 12 | DSCR6[1:0] | 01 *2 | R/W | 1 1: High driving ability (8 mA) *1 |
| 11 to 10 | DSCR5[1:0] | 01 *2 | R/W | 0 0: Setting prohibited.*3 1 0: Setting prohibited. |
| 9 to 8 | DSCR4[1:0] | 01 *2 | R/W | |
| 7 to 6 | DSCR3[1:0] | 01 *2 | R/W | |
| 5 to 4 | DSCR2[1:0] | 01 *2 | R/W | |
| 3 to 2 | DSCR1[1:0] | 01 *2 | R/W | |
| 1 to 0 | DSCR0[1:0] | 01 *2 | R/W | |

m = 0 to *

- Note 1. For pins other than PG_2, PG_3, PG_4, PG_5, PG_6, PG_7, PJ_0, PJ_1, PJ_2, PJ_3, PJ_4, PJ_5, and PJ_6, setting of 01 (normal driving ability) is only possible and setting of 11 (high driving ability) is prohibited. The write value should always be 01.
- Note 2. The initial value of pins PG_2, PG_3, PG_4, PG_5, PG_6, PG_7, PJ_0, PJ_1, PJ_2, PJ_3, PJ_4, and PJ_5 is 11.
- Note 3. The bit corresponding to a pin that is not present is reserved. A reserved bit is always read as 00. The write value should always be 00.

51.3.6 Write Protect Register (PWPR)

The PWPR register enables or disables write access to the PFS register and the PFSWE bit in this register.

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------------|-------|---|---|---|---|---|---|
| B0WI | PFSWE | — | — | — | — | — | — |
| Initial value: 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Bit Name | Initial value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 | B0WI | 1 | R/W | 0: Writing to the PFSWE bit is enabled 1: Writing to the PFSWE bit is disabled |
| 6 | PFSWE | 0 | R/W | 0: Writing to the PFS register is disabled 1: Writing to the PFS register is enabled |
| 5 to 0 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |

PFSWE Bit (PFS Register Write Enable)

Writing to PmnPFS register (m = 0 to 9, A to H, J to M, n = 0 to 7) is enabled only when the PFSWE bit is set to 1. To set the PFSWE bit to 1, write 1 to the PFSWE bit after writing 0 to the B0WI bit.

B0WI Bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

51.3.7 P0n Pin Function Control Register (P0nPFS) (n = 0 to 6)

The P0nPFS register selects the pin function.

The P0nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.5. |

PSEL[2:0] bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P0n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.5 Register Settings for Input/Output Pin Function in 324-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | |
|---|------------|------------|------------|------------|------------|------------|------------|
| | P0_0 | P0_1 | P0_2 | P0_3 | P0_4 | P0_5 | P0_6 |
| 000b (Value after reset) | Hi-Z | | | | | | |
| 001b | D0 | D1 | D2 | D3 | D4 | D5 | D6 |
| 010b | DRP24 *1 | DRP25 *1 | DRP26 *1 | DRP27 *1 | DRP28 *1 | DRP29 *1 | DRP30 *1 |
| 011b | DV0_DATA17 | DV0_DATA18 | DV0_DATA19 | DV0_DATA20 | DV0_DATA21 | DV0_DATA22 | DV0_DATA23 |
| 100b | MTIOC6B | MTIOC6C | MTIOC6D | MTIOC7A | MTIOC7B | MTIOC7C | MTIOC7D |
| 101b | GTIOC3B | GTIOC4A | GTIOC4B | GTIOC6A | GTIOC6B | GTIOC7A | GTIOC7B |
| 110b | — | — | — | — | — | — | — |

Note: —: Setting prohibited.

Note 1. Only in products with a DRP

51.3.8 P1n Pin Function Control Register (P1nPFS) (n = 0 to 4)

The P1nPFS register selects the pin function.

The P1nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.6. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P1n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.6 Register Settings for Input/Output Pin Function in 324-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | |
|--|----------|---------|--------------------|---------|--------------------|
| | P1_0 | P1_1 | P1_2 | P1_3 | P1_4 |
| 000b (Value after reset) | Hi-Z | | | | |
| 001b | D7 | D8 | D9 | D10 | D11 |
| 010b | DRP31 *1 | MTIOC8A | MTIOC8B | MTIOC8C | MTIOC8D |
| 011b | IRQ0 | IRQ1 | IRQ2 | IRQ3 | IRQ4 |
| 100b | CAN_CLK | CAN0RX | CAN0RX_DATARATE_EN | CAN0TX | CAN0TX_DATARATE_EN |
| 101b | VBUSEN0 | OVRCUR0 | VBUSEN1 | OTG_ID1 | VBUSIN0 |
| 110b | — | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Note 1. Only in products with a DRP

51.3.9 P2n Pin Function Control Register (P2nPFS) (n = 0 to 3)

The P2nPFS register selects the pin function.

The P2nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.7. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P2n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.7 Register Settings for Input/Output Pin Function in 324-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | |
|----------------------------------|-------------|--------------------|---------|--------------------|
| | P2_0 | P2_1 | P2_2 | P2_3 |
| 000b (Value after reset) | Hi-Z | | | |
| 001b | D12 | D13 | D14 | D15 |
| 010b | GTIOC6A | GTIOC6B | GTIOC7A | GTIOC7B |
| 011b | IRQ5 | IRQ6 | IRQ7 | WDTOVF#/PERROUT# |
| 100b | CAN1RX | CAN1RX_RATARATE_EN | CAN1TX | CAN1TX_RATARATE_EN |
| 101b | OTG_EXICEN0 | OTG_ID0 | VBUSIN1 | OTG_EXICEN1 |
| 110b | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Note: The P23PFS register cannot be initialized by an internal power-on reset through the watchdog timer.

51.3.10 P3n Pin Function Control Register (P3nPFS) (n = 0 to 5)

The P3nPFS register selects the pin function.

The P3nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.8, Table 51.9. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P3n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.8 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | |
|--|-------------|------------|------------------------|-------------|------------------------|------------------------|
| | P3_0 | P3_1 | P3_2 | P3_3 | P3_4 | P3_5 |
| 000b (Value after reset) | Hi-Z | | | | | |
| 001b | OTG_EXICEN1 | ET1_RXER | ET1_CRS | ET1_MDC | ET1_MDIO | ET1_RXD1 |
| 010b | NFDATA4 | NFALE | NFRE# | NFWE# | NFRB# | NFCLE |
| 011b | ET1_LINKSTA | VBUSEN0 | CC1_Ra1 | OTG_EXICEN0 | CC2_Ra1 | CC2_Ra0 |
| 100b | MTIC5W | CAN1RX | CAN1RX_ DATARATE_EN | CAN1TX | CAN1TX_ DATARATE_EN | CAN0TX_ DATARATE_EN |
| 101b | IRQ3 | RSPCK2 | MOSI2 | MISO2 | SSL20 | SSL00 |
| 110b | — | IRQ6 | — | IRQ7 | — | — |
| 111b | — | RMII1_RXER | RMII1_CRS_DV | — | — | RMII1_RXD1 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Table 51.9 Register Settings for Input/Output Pin Function in 176-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | |
|---|------------|------------------------|-------------|------------------------|------------------------|
| | P3_1 | P3_2 | P3_3 | P3_4 | P3_5 |
| 000b (Value after reset) | Hi-Z | | | | |
| 001b | ET1_RXER | ET1_CRS | ET1_MDC | ET1_MDIO | ET1_RXD1 |
| 010b | NFALE | NFRE# | NFWE# | NFRB# | NFCLE |
| 011b | VBUSEN0 | CC1_Ra1 | OTG_EXICEN0 | CC2_Ra1 | CC2_Ra0 |
| 100b | CAN1RX | CAN1RX_ DATARATE_EN | CAN1TX | CAN1TX_ DATARATE_EN | CAN0TX_ DATARATE_EN |
| 101b | RSPCK2 | MOSI2 | MISO2 | SSL20 | SSL00 |
| 110b | IRQ6 | — | IRQ7 | — | — |
| 111b | RMII1_RXER | RMII1_CRS_DV | — | — | RMII1_RXD1 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.11 P4n Pin Function Control Register (P4nPFS) (n = 0 to 7)

The P4nPFS register selects the pin function.

The P4nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.10. |

PSEL[2:0] Bit (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P4n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.10 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|----------|----------|----------|---------------------|----------------------|-------------|--------------------------|-----------|
| | P4_0 | P4_1 | P4_2 | P4_3 | P4_4 | P4_5 | P4_6 | P4_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | SCK0 | RxD0 | TxD0 | RTS0# | CTS0# | ET0_LINKSTA | ET0_EXOUT/ ET0_SCLKIN | ET0_WOL |
| 010b | TXOUT0P | TXOUT0M | TXOUT1P | TXOUT1M | TXOUT2P | TXOUT2M | TXCLKOUTP | TXDLKOUTM |
| 011b | SCI_SCK1 | SCI_RXD1 | SCI_TXD1 | SCI_CTS1# /RTS1# | SCI_CTS0# /RTS0# | SCI_RXD0 | SCI_TXD0 | SCI_SCK0 |
| 100b | SSIBCK1 | SSIRxD1 | SSITxD1 | SSILRCK1 | WDTOVF#/ PERROUT# | RxD4 | TxD4 | SCK4 |
| 101b | MTIOC8A | MTIOC8B | MTIOC8C | MTIOC8D | OTG_ EXICEN0 | DREQ0 | DACK0 | TEND0 |
| 110b | IRQ0 | IRQ1 | IRQ2 | IRQ3 | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Note: The P4nPFS register cannot be initialized by an internal power-on reset through the watchdog timer.

51.3.12 P5n Pin Function Control Register (P5nPFS) (n = 0 to 7)

The P5nPFS register selects the pin function.

The P5nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.11. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P5n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.11 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|-------------------------------------|--------|--------|---------|---------|--------|--------|-------|-------|
| | P5_0 | P5_1 | P5_2 | P5_3 | P5_4 | P5_5 | P5_6 | P5_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | AN000 | AN001 | AN002 | AN003 | AN004 | AN005 | AN006 | AN007 |
| 010b | IRQ4 | IRQ5 | IRQ6 | IRQ7 | IRQ0 | IRQ1 | IRQ2 | IRQ3 |
| 011b | SD0_CD | SD0_WP | VBUSIN0 | OTG_ID0 | SD1_CD | SD1_WP | — | — |
| 100b | SD1_CD | SD1_WP | — | — | — | — | — | — |
| 101b | — | — | — | — | — | — | — | — |
| 110b | — | — | — | — | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.13 P6n Pin Function Control Register (P6nPFS) (n = 0 to 7)

The P6nPFS register selects the pin function.

The P6nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

The ISEL bit to which IRQn is not specified is reserved. Be sure to write a value after a reset.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.12, Table 51.13. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P6n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.12 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|--------|------------------|-----------------|----------------|----------------|----------------|----------------|----------------|
| | P6_0 | P6_1 | P6_2 | P6_3 | P6_4 | P6_5 | P6_6 | P6_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | ADTRG# | ET0_TXEN | ET0_TXD0 | ET0_TXD1 | CS5# | CS3# | CS2# | WE0#/DQML |
| 010b | — | VIO_CLK | VIO_VD | VIO_HD | DRP00 *1 | DRP01 *1 | DRP02 *1 | DRP03 *1 |
| 011b | — | SCK3 | RxD3 | TxD3 | LCD0_ TCON6 | LCD0_ TCON5 | LCD0_ TCON4 | LCD0_ TCON3 |
| 100b | — | MTIOC2A | MTIOC2B | POE0 | AUDIO_ CLK | AUDIO_ XOUT | DREQ0 | DACK0 |
| 101b | — | — | OTG_ EXICEN1 | — | SD1_CD | CC1_Rd0 | CC1_Ra0 | CC2_Rd0 |
| 110b | — | — | IRQ0 | — | — | — | — | — |
| 111b | — | RMII0_ TXD_EN | RMII0_ TXD0 | RMII0_ TXD1 | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Note 1. Only in products with a DRP

Table 51.13 Register Settings for Input/Output Pin Function in 176-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | |
|-------------------------------------|--------|--------------|-------------|------------|
| | P6_0 | P6_1 | P6_2 | P6_3 |
| 000b (Value after reset) | Hi-Z | | | |
| 001b | ADTRG# | ET0_TXEN | ET0_TXD0 | ET0_TXD1 |
| 010b | — | VIO_CLK | VIO_VD | VIO_HD |
| 011b | — | SCK3 | RxD3 | TxD3 |
| 100b | — | MTIOC2A | MTIOC2B | POE0 |
| 101b | — | — | OTG_EXICEN1 | — |
| 110b | — | — | IRQ0 | — |
| 111b | — | RMII0_TXD_EN | RMII0_TXD0 | RMII0_TXD1 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.14 P7n Pin Function Control Register (P7nPFS) (n = 0 to 7)

The P7nPFS register selects the pin function.

The P7nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.14, Table 51.15. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P7n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.14 Register Settings for Input/Output Pin Function in 324-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|-----------|-----------|------------|-----------|-----------|-----------|------------|------------|
| | P7_0 | P7_1 | P7_2 | P7_3 | P7_4 | P7_5 | P7_6 | P7_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |

| 011b | LCD0_TCON2 | LCD0_TCON1 | LCD0_TCON0 |
| 100b | TEND0 | GTIOC3A | GTIOC3B |
| 101b | CC2_Ra0 | SCK0 | RxD0 |
| 110b | — | — | — |

Note: —: Setting prohibited.

51.3.15 P8n Pin Function Control Register (P8nPFS) (n = 0 to 7)

The P8nPFS register selects the pin function.

The P8nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.16, Table 51.17. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P8n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.16 Register Settings for Input/Output Pin Function in 324-Pin Products

| PSEL[2:0] Register Setting Value | Pin | P8_0 | P8_1 | P8_2 | P8_3 | P8_4 | P8_5 | P8_6 | P8_7 |
|---|-----------------|------------|------------|------------|------------|------------|------------|------------|------|
| 000b (Value after reset) | Hi-Z | | | | | | | | |

| 110b | — |

Note: —: Setting prohibited.

51.3.16 P9n Pin Function Control Register (P9nPFS) (n = 0 to 7)

The P9nPFS register selects the pin function.

The P9nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.18. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the P9n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.18 Register Settings for Input/Output Pin Function in 324-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|--|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| | P9_0 | P9_1 | P9_2 | P9_3 | P9_4 | P9_5 | P9_6 | P9_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |

| 110b | — | — | — | — | — | — | — | — |

Note: —: Setting prohibited.

Note 1. Only in products with a DRP

51.3.17 PAn Pin Function Control Register (PAnPFS) (n = 0 to 7)

The PAnPFS register selects the pin function.

The PAnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.19. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PAn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.19 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|-----------------|-----------------|-----------------|---------------------|-----------------|-----------------|-----------------|-----------------|
| | PA_0 | PA_1 | PA_2 | PA_3 | PA_4 | PA_5 | PA_6 | PA_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | A16 | A17 | A18 | A19 | A20 | A21 | A22 | A23 |
| 010b | DV0_ DATA13 | DV0_ DATA12 | DV0_ DATA11 | DV0_ DATA10 | DV0_ DATA9 | DV0_ DATA8 | DV0_ DATA7 | DV0_ DATA6 |
| 011b | LCD0_ DATA10 | LCD0_ DATA11 | LCD0_ DATA12 | LCD0_ DATA13 | LCD0_ DATA14 | LCD0_ DATA15 | LCD0_ DATA16 | LCD0_ DATA17 |
| 100b | SCI_TXD1 | SCI_RXD1 | SCI_SCK1 | SCI_CTS0#/ RTS0# | SCI_TXD0 | SCI_RXD0 | SCI_SCK0 | SSIRxD1 |
| 101b | MTIOC8C | MTIOC8B | MTIOC8A | MTIOC0D | MTIOC0C | MTIOC0B | MTIOC0A | POE10 |
| 110b | — | IRQ6 | — | — | — | IRQ5 | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.18 PBn Pin Function Control Register (PBnPFS) (n = 0 to 5)

The PBnPFS register selects the pin function.

The PBnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.20. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PBn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.20 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | |
|---|-------------|-------------|-------------|-------------|-------------|-------------|
| | PB_0 | PB_1 | PB_2 | PB_3 | PB_4 | PB_5 |
| 000b (Value after reset) | Hi-Z | | | | | |
| 001b | A24 | A25 | BS0# | CS0# | CS1# | WAIT# |
| 010b | DV0_DATA5 | DV0_DATA4 | DV0_DATA3 | DV0_DATA2 | DV0_DATA1 | DV0_DATA0 |
| 011b | LCD0_DATA18 | LCD0_DATA19 | LCD0_DATA20 | LCD0_DATA21 | LCD0_DATA22 | LCD0_DATA23 |
| 100b | SSITxD1 | SSILRCK1 | SSIBCK1 | SSIDATA2 | SSILRCK2 | SSIBCK2 |
| 101b | POE8 | POE4 | POE0 | CTS0# | RTS0# | TxD0 |
| 110b | — | — | — | — | — | — |

Note: —: Setting prohibited.

51.3.19 PCn Pin Function Control Register (PCnPFS) (n = 0 to 7)

The PCnPFS register selects the pin function.

The PCnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.21. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PCn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.21 Register Settings for Input/Output Pin Function 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|-----------|----------------|-----------------|----------------|----------------|----------------|----------------|----------------|
| | PC_0 | PC_1 | PC_2 | PC_3 | PC_4 | PC_5 | PC_6 | PC_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | VBUSIN1 | VBUSIN0 | OTG_ EXICEN0 | OTG_ID0 | OTG_ID1 | VBUSEN1 | VBUSEN0 | OVRCUR0 |
| 010b | NFDATA5 | NFDATA6 | NFDATA7 | NFCLE | NFALE | NFRE# | NFWE# | NFRB# |
| 011b | ET1_TXCLK | ET1_TXD2 | ET1_TXD3 | ET1_COL | ET1_TXER | ET1_RXDV | ET1_RXD2 | ET1_RXD3 |
| 100b | RSPCK2 | MOSI2 | MISO2 | SSL20 | SPDIF_IN | SPDIF_OUT | SD1_CD | SD1_WP |
| 101b | IRQ2 | LCD0_ TCON6 | LCD0_ TCON5 | LCD0_ TCON4 | LCD0_ TCON3 | LCD0_ TCON2 | LCD0_ TCON1 | LCD0_ TCON0 |
| 110b | — | — | — | — | IRQ1 | IRQ0 | IRQ7 | IRQ6 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.20 PDn Pin Function Control Register (PDnPFS) (n = 0 to 7)

The PDnPFS register selects the pin function.

The PDnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.22. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PDn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.22 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|----------|----------|----------|----------|----------|----------|----------|----------|
| | PD_0 | PD_1 | PD_2 | PD_3 | PD_4 | PD_5 | PD_6 | PD_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | RIIC0SCL | RIIC0SDA | RIIC1SCL | RIIC1SDA | RIIC2SCL | RIIC2SDA | RIIC3SCL | RIIC3SDA |
| 010b | IRQ0 | IRQ1 | IRQ2 | IRQ3 | IRQ4 | IRQ5 | IRQ6 | IRQ7 |
| 011b | MTCLKA | MTCLKB | MTCLKC | MTCLKD | — | — | — | — |
| 100b | GTETRGA | GTETRGB | GTETRG | GTETRGD | — | — | — | — |
| 101b | — | — | — | — | — | — | — | — |
| 110b | — | — | — | — | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.21 PEn Pin Function Control Register (PEnPFS) (n = 0 to 6)

The PEnPFS register selects the pin function.

The PEnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.23. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PEn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.23 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | | | |
|---|-----------|------------|------------|------------|--------------|---------|----------|
| | PE_0 | PE_1 | PE_2 | PE_3 | PE_4 | PE_5 | PE_6 |
| 000b (Value after reset) | Hi-Z | | | | | | |
| 001b | ET0_RXCLK | ET0_RXD0 | ET0_RXD1 | ET0_RXER | ET0_CRS | ET0_MDC | ET0_MDIO |
| 010b | VIO_FLD | VIO_D7 | VIO_D6 | VIO_D5 | VIO_D4 | VIO_D3 | VIO_D2 |
| 011b | SCK2 | RxD2 | TxD2 | SSIBCK0 | SSILRCK0 | SSITxD0 | SSIRxD0 |
| 100b | POE4 | POE8 | POE10 | MTIOC0A | MTIOC0B | MTIOC0C | MTIOC0D |
| 101b | — | VBUSIN1 | — | — | — | CC1_Rd1 | CC2_Rd1 |
| 110b | — | IRQ1 | — | — | — | — | — |
| 111b | REF50CK0 | RMII0_RXD0 | RMII0_RXD1 | RMII0_RXER | RMII0_CRS_DV | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.22 PF_n Pin Function Control Register (PF_nPFS) (n = 0 to 7)

The PF_nPFS register selects the pin function.

The PF_nPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.24. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PF_n pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.24 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| | PF_0 | PF_1 | PF_2 | PF_3 | PF_4 | PF_5 | PF_6 | PF_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | SCK3 | RxD3 | TxD3 | SCK2 | RxD2 | TxD2 | RTS2# | GTETRGD |
| 010b | DV0_ DATA15 | DV0_ DATA16 | DV0_ DATA17 | DV0_ DATA18 | DV0_ DATA19 | DV0_ DATA20 | DV0_ DATA21 | DV0_ DATA23 |
| 011b | LCD0_ DATA8 | LCD0_ DATA7 | LCD0_ DATA6 | LCD0_ DATA5 | LCD0_ DATA4 | LCD0_ DATA3 | LCD0_ DATA2 | LCD0_ DATA0 |
| 100b | MTIOC7A | MTIOC7B | MTIOC7C | MTIOC7D | MTIOC6A | MTIOC6B | MTIOC6C | MTCLKD |
| 101b | RSPCK1 | MOSI1 | MISO1 | SSL10 | SSIBCK0 | SSILRCK0 | SSITxD0 | IRQ1 |
| 110b | — | IRQ4 | — | — | IRQ1 | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.23 PGn Pin Function Control Register (PGnPFS) (n = 0 to 7)

The PGnPFS register selects the pin function.

The PGnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.25. |

PSEL[2:0] bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PGn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.25 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|-----------|---------------------|----------|---------|----------|----------|----------|----------|
| | PG_0 | PG_1 | PG_2 | PG_3 | PG_4 | PG_5 | PG_6 | PG_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | ET0_TXCLK | ET0_TXD2 | ET0_TXD3 | ET0_COL | ET0_TXER | ET0_RXDV | ET0_RXD2 | ET0_RXD3 |
| 010b | VIO_D8 | VIO_D9 | VIO_D10 | VIO_D11 | VIO_D15 | VIO_D14 | VIO_D13 | VIO_D12 |
| 011b | RSPCK0 | MOSI0 | MISO0 | SSL00 | RSPCK1 | MOSI1 | MISO1 | SSL10 |
| 100b | MTIOC3A | MTIOC3C | MTIOC3B | MTIOC3D | MTIOC4A | MTIOC4B | MTIOC4C | MTIOC4D |
| 101b | HM_RSTO# | HM_INT#/ OM_ECS# | GTIOC0A | GTIOC0B | GTIOC1A | GTIOC1B | GTIOC2A | GTIOC2B |
| 110b | — | — | IRQ4 | — | — | — | IRQ5 | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.24 PHn Pin Function Control Register (PHnPFS) (n = 0 to 6)

The PHnPFS register selects the pin function.

The PHnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.26, Table 51.27. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PHn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.26 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | |
|---|-----------|------------|------------|----------|-----------------|--------------------------|-----------------|
| | PH_0 | PH_1 | PH_2 | PH_3 | PH_4 | PH_5 | PH_6 |
| 000b (Value after reset) | Hi-Z | | | | | | |
| 001b | AUDIO_CLK | AUDIO_XOUT | CTS2 | HM_RSTO# | HM_INT#/OM_ECS# | HM_RSTO# | HM_INT#/OM_ECS# |
| 010b | VIO_D1 | VIO_D0 | DV0_DATA22 | RTS2# | CTS2# | NFDATA2 | NFDATA3 |
| 011b | GTIOC4A | GTIOC4B | LCD0_DATA1 | GTIOC6A | GTIOC6B | ET1_EXOUT/ ET1_SCLKIN | ET1_WOL |
| 100b | MTIOC1A | MTIOC1B | MTIOC6D | MTIOC2A | MTIOC2B | MTIC5U | MTIC5V |
| 101b | CC1_Rd0 | CC2_Rd0 | SSIRxD0 | SD0_CD | SD0_WP | IRQ5 | IRQ4 |
| 110b | IRQ3 | IRQ2 | — | IRQ3 | IRQ2 | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Table 51.27 Register Settings for Input/Output Pin Function in 176-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | |
|-------------------------------------|-----------|------------|----------|---------------------|
| | PH_0 | PH_1 | PH_3 | PH_4 |
| 000b (Value after reset) | Hi-Z | | | |
| 001b | AUDIO_CLK | AUDIO_XOUT | HM_RSTO# | HM_INT#/ OM_ECS# |
| 010b | VIO_D1 | VIO_D0 | RTS2# | CTS2# |
| 011b | GTIOC4A | GTIOC4B | GTIOC6A | GTIOC6B |
| 100b | MTIOC1A | MTIOC1B | MTIOC2A | MTIOC2B |
| 101b | CC1_Rd0 | CC2_Rd0 | SD0_CD | SD0_WP |
| 110b | IRQ3 | IRQ2 | IRQ3 | IRQ2 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.25 PJn Pin Function Control Register (PJnPFS) (n = 0 to 7)

The PJnPFS register selects the pin function.

The PJnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.28, Table 51.29. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PJn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.28 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | | | |
|---|--------------|--------------|----------------|----------------|----------------|----------------|--------------|-----------------|
| | PJ_0 | PJ_1 | PJ_2 | PJ_3 | PJ_4 | PJ_5 | PJ_6 | PJ_7 |
| 000b (Value after reset) | Hi-Z | | | | | | | |
| 001b | TRACE CLK | TRACE CTL | TRACE DATA0 | TRACE DATA1 | TRACE DATA2 | TRACE DATA3 | GTETRGC | GTETRGB |
| 010b | SPDIF_OUT | SPDIF_IN | NFCE# | NFDATA0 | NFDATA1 | NFDATA2 | NFCE# | NFDATA0 |
| 011b | — | — | — | — | — | OVRCUR0 | LCD0_ CLK | LCD0_ EXTCLK |
| 100b | SCK1 | RxD1 | TxD1 | RTS1# | CTS1# | MTIOC1A | MTCLKC | MTCLKB |
| 101b | SSIRxD3 | VBUSIN0 | SSITxD3 | SSILRCK3 | SSIBCK3 | SSILRCK2 | IRQ0 | — |
| 110b | — | IRQ0 | — | — | — | IRQ4 | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Table 51.29 Register Settings for Input/Output Pin Function in 176-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | |
|--|-----------|----------|------------|------------|------------|------------|
| | PJ_0 | PJ_1 | PJ_2 | PJ_3 | PJ_4 | PJ_5 |
| 000b (Value after reset) | Hi-Z | | | | | |
| 001b | TRACECLK | TRACECTL | TRACEDATA0 | TRACEDATA1 | TRACEDATA2 | TRACEDATA3 |
| 010b | SPDIF_OUT | SPDIF_IN | NFCE# | NFDATA0 | NFDATA1 | NFDATA2 |
| 011b | — | — | — | — | — | OVRCUR0 |
| 100b | SCK1 | RxD1 | TxD1 | RTS1# | CTS1# | MTIOC1A |
| 101b | SSIRxD3 | VBUSIN0 | SSITxD3 | SSILRCK3 | SSIBCK3 | SSILRCK2 |
| 110b | — | IRQ0 | — | — | — | IRQ4 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.26 PKn Pin Function Control Register (PKnPFS) (n = 0 to 5)

The PKnPFS register selects the pin function.

The PKnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.30, Table 51.31. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PKn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.30 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | | |
|--|--------------|------------|------------|------------------------|------------|----------------------|
| | PK_0 | PK_1 | PK_2 | PK_3 | PK_4 | PK_5 |
| 000b (Value after reset) | Hi-Z | | | | | |
| 001b | ET1_TXEN | ET1_TXD0 | ET1_TXD1 | ET1_RXCLK | ET1_RXD0 | GTETRGA |
| 010b | NFDATA3 | NFDATA4 | NFDATA5 | NFDATA6 | NFDATA7 | NFDATA1 |
| 011b | CC1_Rd0 | CC1_Ra0 | VBUSEN1 | CC2_Rd0 | OVRCUR1 | WDTOVF#/ PERROUT# |
| 100b | MTIOC1B | CAN_CLK | CAN0RX | CAN0RX_ DATARATE_EN | CAN0TX | MTCLKA |
| 101b | SSIBCK2 | SSIDATA2 | RSPCK0 | MOSI0 | MISO0 | — |
| 110b | — | — | IRQ5 | — | IRQ6 | — |
| 111b | RMII1_TXD_EN | RMII1_TXD0 | RMII1_TXD1 | REF50CK1 | RMII1_RXD0 | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

Note: The PK5PFS register cannot be initialized by an internal power-on reset through the watchdog timer.

Table 51.31 Register Settings for Input/Output Pin Function in 176-Pin Products

| PSEL[2:0] Register Setting Value | Pin | | | | |
|--|--------------|------------|------------|------------------------|------------|
| | PK_0 | PK_1 | PK_2 | PK_3 | PK_4 |
| 000b (Value after reset) | Hi-Z | | | | |
| 001b | ET1_TXEN | ET1_TXD0 | ET1_TXD1 | ET1_RXCLK | ET1_RXD0 |
| 010b | NFDATA3 | NFDATA4 | NFDATA5 | NFDATA6 | NFDATA7 |
| 011b | CC1_Rd0 | CC1_Ra0 | VBUSEN1 | CC2_Rd0 | OVRCUR1 |
| 100b | MTIOC1B | CAN_CLK | CAN0RX | CAN0RX_ DATARATE_EN | CAN0TX |
| 101b | SSIBCK2 | SSIDATA2 | RSPCK0 | MOSI0 | MISO0 |
| 110b | — | — | IRQ5 | — | IRQ6 |
| 111b | RMII1_TXD_EN | RMII1_TXD0 | RMII1_TXD1 | REF50CK1 | RMII1_RXD0 |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby. For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.27 PLn Pin Function Control Register (PLnPFS) (n = 0 to 4)

The PLnPFS register selects the pin function.

The PLnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.32. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bit (pin interrupt input function selection bit)

Set this bit to 1 when using the PLn pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

Table 51.32 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | | | | |
|--|------|------|------|------|------|
| | PL_0 | PL_1 | PL_2 | PL_3 | PL_4 |
| 000b (Value after reset) | Hi-Z | | | | |
| 001b | — | — | — | — | — |
| 010b | — | — | — | — | — |
| 011b | — | — | — | — | — |
| 100b | — | — | — | — | — |
| 101b | IRQ4 | IRQ5 | IRQ6 | IRQ7 | IRQ0 |
| 110b | — | — | — | — | — |

Note: Set the IRQMSK bit of the interrupt request register (IRQRR) to 1 when using an IRQ interrupt for release from software standby.
For details, refer to section 7, Interrupt Controller.

Note: —: Setting prohibited.

51.3.28 PMn Pin Function Control Register (PMnPFS) (n = 0 to 1)

The PMnPFS register selects the pin function.

The PMnPFS register is protected by the Write Protect Register (PWPR). Modify the register after releasing the protection.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|-----------|---------------|-----|--|
| 7 | — | 0 | R/W | Reserved This bit is always read as 0. The write value should always be 0. |
| 6 | ISEL | 0 | R/W | 0: Not used as an interrupt input pin. 1: Used as an interrupt input pin. |
| 5 to 3 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PSEL[2:0] | 000 | R/W | These bits select the peripheral function. For individual pin functions, see Table 51.33. |

PSEL[2:0] Bits (pin function selection bits)

These bits set the peripheral functions which are allocated to pins.

ISEL Bits (pin interrupt input function selection bit)

Set this bit to 1 when using the JP0_0 pin as the pin interrupt function.

Setting 0 here leads to the interrupt controller stopping control over pin interrupts.

As the JP0_1 pin is exclusively used as an output pin, the setting of this bit has no effect.

Table 51.33 Register Settings for Input/Output Pin Function

| PSEL[2:0] Register Setting Value | Pin | |
|--|-------|---------|
| | JP0_0 | JP0_1 |
| 000b | Hi-Z | |
| 001b (Value after reset) | TDI | TDO/SWO |
| 010b | — | — |
| 011b | — | — |
| 100b | — | — |
| 101b | — | — |
| 110b | — | — |

Note: —: Setting prohibited.

51.3.29 Ethernet Control Register (PFENET)

The Ethernet control register (PFENET) selects an Ethernet interface mode to be used.

PHYMODE0

This bit specifies the Ethernet interface mode of the ETHERC channel 0. Select the same mode as the one specified by the pin function select bits (PmnPFS.PSEL[2:0]). When the signals for the RMII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 0 (RMII mode), whereas when the signals for the MII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 1 (MII mode).

PHYMODE1

This bit specifies the Ethernet interface mode of the ETHERC channel 1. Select the same mode as the one specified by the pin function select bits (PmnPFS.PSEL[2:0]). When the signals for the RMII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 0 (RMII mode), whereas when the signals for the MII mode have been specified by the PmnPFS.PSEL[2:0] bits, set the PHYMODE bit to 1 (MII mode).

| Bit | Bit Name | Initial value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 to 2 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | PHYMODE1 | 0 | R/W | Sets the Ethernet interface mode of channel 1. 0: RMII mode (ETHERC channel 1) 1: MII mode (ETHERC channel 1) |
| 0 | PHYMODE0 | 0 | R/W | Sets the Ethernet interface mode of channel 0 0: RMII mode (ETHERC channel 0) 1: MII mode (ETHERC channel 0) |

51.3.30 Dedicated Pin POC Control Register (PPOC)

The PPOC register selects the operating voltage of the pins only used for the SPI multi I/O bus controller and SD/MMC host interfaces. This register should be set to match the voltage applied to the power supply for dedicated pins before the dedicated pins are used.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---------|---|---|---|---|------|------|---|------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | POCSEL0 | — | — | — | — | POC3 | POC2 | — | POC0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1* | 0 | 0 | 0 | 0 | 1* | 1* | X | 1* |

Note: * In boot mode 3 or 4, different values are set according to the boot program.
For details, see section 3.5.4, Boot Mode 3, and section 3.5.5, Boot Mode 4.

| Bit | Bit Name | Initial value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 9 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | POCSEL0 | 1* | R/W | See the description of the POC0 bit. |
| 7 to 4 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | POC3 | 1* | R/W | 0: The dedicated pins of the SD/MMC host interface 1 operate from a 1.8-V power supply. 1: The dedicated pins of the SD/MMC host interface 1 operate from a 3.3-V power supply. |
| 2 | POC2 | 1* | R/W | 0: The dedicated pins of the SD/MMC host interface 0 operate from a 1.8-V power supply. 1: The dedicated pins of the SD/MMC host interface 0 operate from a 3.3-V power supply. |
| 1 | — | X | R/W | Reserved When read, an undefined value is returned. |
| 0 | POC0 | 1* | R/W | [POCSEL0, POC0] 00, 01, or 10: The dedicated pins of the SPI multi I/O bus controller operate from a 1.8-V power supply. 11: The dedicated pins of the SPI multi I/O bus controller operate from a 3.3-V power supply. |

51.3.31 SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 0 (PSDMMC0)

The PSDMMC0 register specifies the driving ability of the pins of the SD/MMC host interface 0.

This register should be set in accord with the POC2 bit of the PPOC register.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | When the SD/MMC host interface 0 operates from a 3.3-V power supply: | |
| | | | | Odd bit Even bit 1 0: 12 mA Others: Setting prohibited | |

51.3.32 SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 1 (PSDMMC1)

The PSDMMC1 register specifies the driving ability of the pins of the SD/MMC host interface 0.

This register should be set in accord with the POC2 bit of the PPOC register.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 1, 0 | SD0_DAT4_DRV | 10 | R/W | SD0_DAT4 Port Driving Ability Control Register |

When the SD/MMC host interface 0 operates from a 1.8-V power supply:
 Odd bit Even bit
 1 1: 6 mA
 Others: Setting prohibited

When the SD/MMC host interface 0 operates from a 3.3-V power supply:
 Odd bit Even bit
 1 0: 6 mA
 Others: Setting prohibited

51.3.33 SD/MMC Host Interface Dedicated Pin Driving Ability Control Register 2 (PSDMMC2)

The PSDMMC2 register specifies the driving ability of the pins of the SD/MMC host interface 1.

This register should be set in accord with the POC3 bit of the PPOC register.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | | | | When the SD/MMC host interface 1 operates from a 1.8-V power supply: | |
| | | | | Odd bit Even bit 1 1: 12 mA | |
| | | | | Others: Setting prohibited | |
| | | | | When the SD/MMC host interface 1 operates from a 3.3-V power supply: | |
| | | | | Odd bit Even bit 1 0: 12 mA | |
| | | | | Others: Setting prohibited | |

51.3.34 SPI Multi I/O Bus Controller Dedicated Pin Driving Ability Control Register (PSPIBSC)

The PSPIBSC register specifies the driving ability of the pins of the SPI multi I/O bus controller.

This register should be set in accord with the POCSEL0 and POC0 bits of the PPOC register.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|---------------|---------------|---------------|---------------|---------------|-----------------|----|----|----|----|----|----|

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | VBUS1_SEL | VBUS0_SEL | ET1_EX0_UT_SEL | ET0_EX0_UT_SEL |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Bit Name | Initial value | R/W | Description |
|---------|---------------|---------------|-----|--|
| 31 to 4 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | VBUS1_SEL | 0 | R/W | Selects the output function of the VBUSEN1 pin of the channel 1 USB 2.0 host module. 1: The VBUSEN1 pin is controlled by the VBOUT bit of the VBCTRL register. 0: The VBUSEN1 pin is controlled by the PP bit of the PORTSC1 register. |
| 2 | VBUS0_SEL | 0 | R/W | Selects the output function of the VBUSEN0 pin of the channel 0 USB 2.0 host module. 1: The VBUSEN0 pin is controlled by the VBOUT bit of the VBCTRL register. 0: The VBUSEN0 pin is controlled by the PP bit of the PORTSC1 register. |
| 1 | ET1_EXOUT_SEL | 0 | R/W | Selects EXOUT or SCLKIN for ETHER1. 1: SCLKIN1 input 0: EX1 EXOUT output |
| 0 | ET0_EXOUT_SEL | 0 | R/W | Selects EXOUT or SCLKIN for ETHER0 1: SCLKIN0 input 0: EX0 EXOUT output |

51.3.37 CKIO pin Driving Ability Control Register (PCKIO)

The PCKIO register controls driving ability of the CKIO pin.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 to 2 | — | All 0 | R/W | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | CKIO_DRV | 01 | R/W | These bits control the driving ability of the CKIO pin. 00: Setting prohibited. 01: 8 mA (recommended for 66-MHz operation) 10: 12 mA (recommended for 132-MHz operation) 11: Setting prohibited. |

51.4 Usage Notes

51.4.1 Procedure for Specifying Input/Output Pin Function

Use the following procedure to specify the input/output pin functions.

1. Set the bits corresponding to the given pin in the port direction register (PDR) and the port mode register (PMR) to 00 and 0, respectively to set the pin function as the general-purpose I/O port pin.
2. Specify the assignments of input/output signals for peripheral modules to the desired pins.
3. Setting the PWPR.PFSWE bit to 1 after setting the PWPR.B0WI bit to 0 leads to the Pmn pin function control register (PmnPFS) (m = 0 to 9, A to H, J to M, n = 0 to 7) being writable.
4. Specify the input/output function for the pin through the PSEL[2:0] bit settings in the PmnPFS register.
5. Set the PFSWE bit in the PWPR register to 0 to disable writing to the PmnPFS register.
6. Set the PMR to 1 as necessary to switch to the selected input/output function for the pin.
7. The level of port pins can be read by setting the corresponding bits in the PDR register to 10 as required.

51.4.2 Notes on PFS Register Setting

- Settings of the Pmn Pin Function Control Register (PmnPFS) (m = 0 to 9, A to H, J to M, n = 0 to 7) should be made only while the PMR register for the target pin is set to 0. If a PmnPFS register is set while the PMR register is 1, unexpected edges may be input through the input pin or unexpected pulses are output through the output pin.
- When the PmnPFS.ISEL bit is set to 1 while pin interrupts are used, the pin state is input because input to the target pin is enabled regardless of the PDR register setting. Therefore, the following conditions must be satisfied.
 - Follow the procedure for setting up the interrupt controller. For details, see Figure 7.3, Flow of Switching Pin Functions.
 - Do not set the PmnPFS.ISEL bit to 1 for a pin for which the output function was selected.
 If PmnPFS.ISEL bit is set with a wrong procedure, a malfunction might occur by input of an unintended edge.
- Only the allowed values (functions) should be specified in the Pmn pin function control registers. If a value that is not allowed for the register is specified, correct operation is not guaranteed.
- Do not assign a single function to multiple pins through the PFS register settings.
- Points to note regarding the Port Mode Register (PMR), Port Direction Register (PDR), Pmn Pin Function Control Register (PmnPFS) settings for pins that have multiplexed pin functions are listed in Table 51.34.
Reading the level of pins of port 5 is only available when the analog input alternative function is not selected.
Modify the PSEL[2:0] bits when the bit corresponding to the given pin in the PMR register is set to 0.

Table 51.34 Register Settings

| Item | PORTM.PMR | | PmnPFS | | Point to Note |
|-------------------------------------|-----------------|---------------------|-------------------|---|--|
| | PMRn | PDRn[1:0] | ISEL | PSEL[2:0] | |
| After a reset | 0 ^{*1} | 00 | 0 | 000 ^{*1} | These registers are not in use (Hi-Z input protection) after release from the reset state. |
| When these registers are not in use | 0 | 00 | 0 | X | |
| General input/output ports | 0 | 10/11 ^{*2} | 0/1 ^{*3} | X | If these are multiplexed with pin interrupt inputs, set the PmnPFS.ISEL bit to 1 after setting PDRn[1:0] to 10 (input). |
| Peripheral functions | 1 | 00/10 ^{*4} | 0/1 ^{*3} | Peripheral function (see Table 51.5 to Table 51.33) | If these are multiplexed with pin interrupt inputs, set the PmnPFS.ISEL bit to 1 for pins for which the input function or input/output function was selected. The PmnPFS.ISEL bit must be set to 0 for pins for which the output function was selected because they cannot be multiplexed with pin interrupt inputs. When using this function with the port read function (reading the level of port pins from PIDRn bit), set PDRn[1:0] bits to 10. |
| Interrupt inputs | 0 | 10 | 1 | X | See section 51.4.4, Note on Pin Interrupts. |
| Analog inputs | 1 | 00 | X ^{*5} | 001 | To switch the output buffer and input buffer off, set the port pins for not in use. |

x: Setting not required.

Note 1. The values after a reset in PORTM.PMR.PMR0, PORTM.PMR.PMR1, PM0PFS.PSEL[2:0], and PM1PFS.PSEL[2:0] are different with those specified as the initial values.

For details on the PSEL[2:0] bits, refer to "Pmn Pin Function Control Register (PmnPFS) (n = 0 to 1)".

For details on the PORTM.PMR register, refer to section 51.3.4, Port Mode Register (PMR).

Note 2. Setting the PDRn[1:0] bits to 10 sets the pin function for the general-purpose input port pin.

Setting the PDRn[1:0] bits to 11 sets the pin function for the general-purpose output port pin.

Note 3. Setting the PmnPFS.ISEL bit to 0 makes the pin incapable of functioning as an IRQ pin.

Setting the PmnPFS.ISEL bit to 1 makes the pin capable of functioning as an IRQ pin.

Note 4. When the PDRn[1:0] bits are set to 00, the port read function (reading the level of port pins from PIDRn bit) cannot be used.

When the PDRn[1:0] bits are set to 10, the port read function can be used.

Note 5. Even if the PmnPFS.ISEL bit is set to 1, the pin with this function cannot be used for pin interrupts.

51.4.3 Usage Note on Port Read Function

When a peripheral module for a pin which is bidirectional or an output is in use and the value of the PDR bits for the given pin is changed from 00 (initial value) to 10 (input enabled), the state of the pin can be read (port read function) from the PIDR register while the peripheral function is in use.

When a peripheral module for a pin which is an input or any of the input/output pin functions listed in Table 51.35 is in use, input is always enabled and the pin function can be used in parallel with port reading without changing the setting of the PDR register.

A shoot-through current flows when an external pin enters the Hi-Z state. An external pin must be pulled down or up when in the Hi-Z state.

When the pin functions in Table 51.36 are in use with an external bus controller, setting the PDR register to 10 (input enabled) is prohibited because the external bus controller controls enabling and disabling of input to the pins.

51.4.4 Note on Pin Interrupts

51.4.4.1 Control of Pin Interrupts

Signals input from the general-purpose I/O port pins can be used for pin interrupts. For details on pin functions, see section 7.4.4, Pin Interrupts. Interrupt IDs 480 to 511 are allocated to the pin interrupts. Therefore, the general-purpose I/O port pins are classified into 32 groups and an interrupt ID number from 480 to 511 is allocated to each group. Table 51.37 shows the general-purpose I/O port pins in each group and the correspondence between the groups and interrupt IDs.

If multiple port pins in the same group are to be used for pin interrupts, the following restriction on input applies; when a port pin for use as a pin interrupt is at the high level, input of an interrupt request from another pin is prohibited. Details on the conditions for input are given in Table 51.38.

For details on how to set priority levels for the interrupt IDs allocated to the individual groups and the interrupt configuration register (GICD_ICFGRn), see section 7, Interrupt Controller.

Table 51.37 Details of Pin Interrupt Groups

| Interrupt ID | Group Name into which Port Pins are Classified | | GPIO Port Pin | | | | | | |
|--------------|--|----------|---------------|------|------|------|------|------|------|
| 480 | Group 0 | (TINT0) | PL_0 | PL_1 | PL_2 | PL_3 | PL_4 | PM_0 | — |

| | High |  | PL_1 | High Level | Interrupt requests are not issued from PL_1. | × |
| |  |  | PL_0, PL_1 | Rising Edge | Interrupt requests are issued from both PL_0 and PL_1.*2 | × |
| High Level Detection | High Level | Low | PL_0 | High Level | Interrupt requests are issued from PL_0. | ○ |
| | Low | High Level | PL_1 | High Level | Interrupt requests are issued from PL_1. | ○ |
| | High Level |  | PL_0 | High Level | Interrupt requests are issued from PL_0.*1 | ○ |
| |  | High Level | PL_1 | High Level | Interrupt requests are issued from PL_1.*1 | ○ |
| | High Level | High Level | PL_0, PL_1 | High Level | Interrupt requests are issued from both PL_0 and PL_1.*2 | × |
| | High Level |  | PL_0 | High Level | Interrupt requests are issued from both PL_0 and PL_1.*2 | × |
| |  | High Level | PL_1 | High Level | Interrupt requests are issued from both PL_0 and PL_1.*2 | × |

Note 1. The restriction on the input from pins in the same group is met. For details, refer to section 51.4.4.2, Restriction on the Input from Pins in the Same Group.

Note 2. Interrupt requests from multiple pins in the same group cannot be input at the same time. You cannot identify the port pin from which an interrupt request has been input.

51.4.4.2 Restriction on the Input from Pins in the Same Group

When setting pin interrupts with the use of pins in the same group, set a further interrupt so that it's issued the wait time limit (t_{TINTGW}) after an interrupt has been issued. For details on t_{TINTGW} , refer to “Wait time limit t_{TINTGW} for TINT inputs from pins in the same group” in (2) Timing for Input of Interrupt Signals in the description of the timing pins for control signals in the electrical characteristics section.

Figure 51.16 shows an outline of the timing under the condition for the cases where pins in the same group are used for pin interrupts.

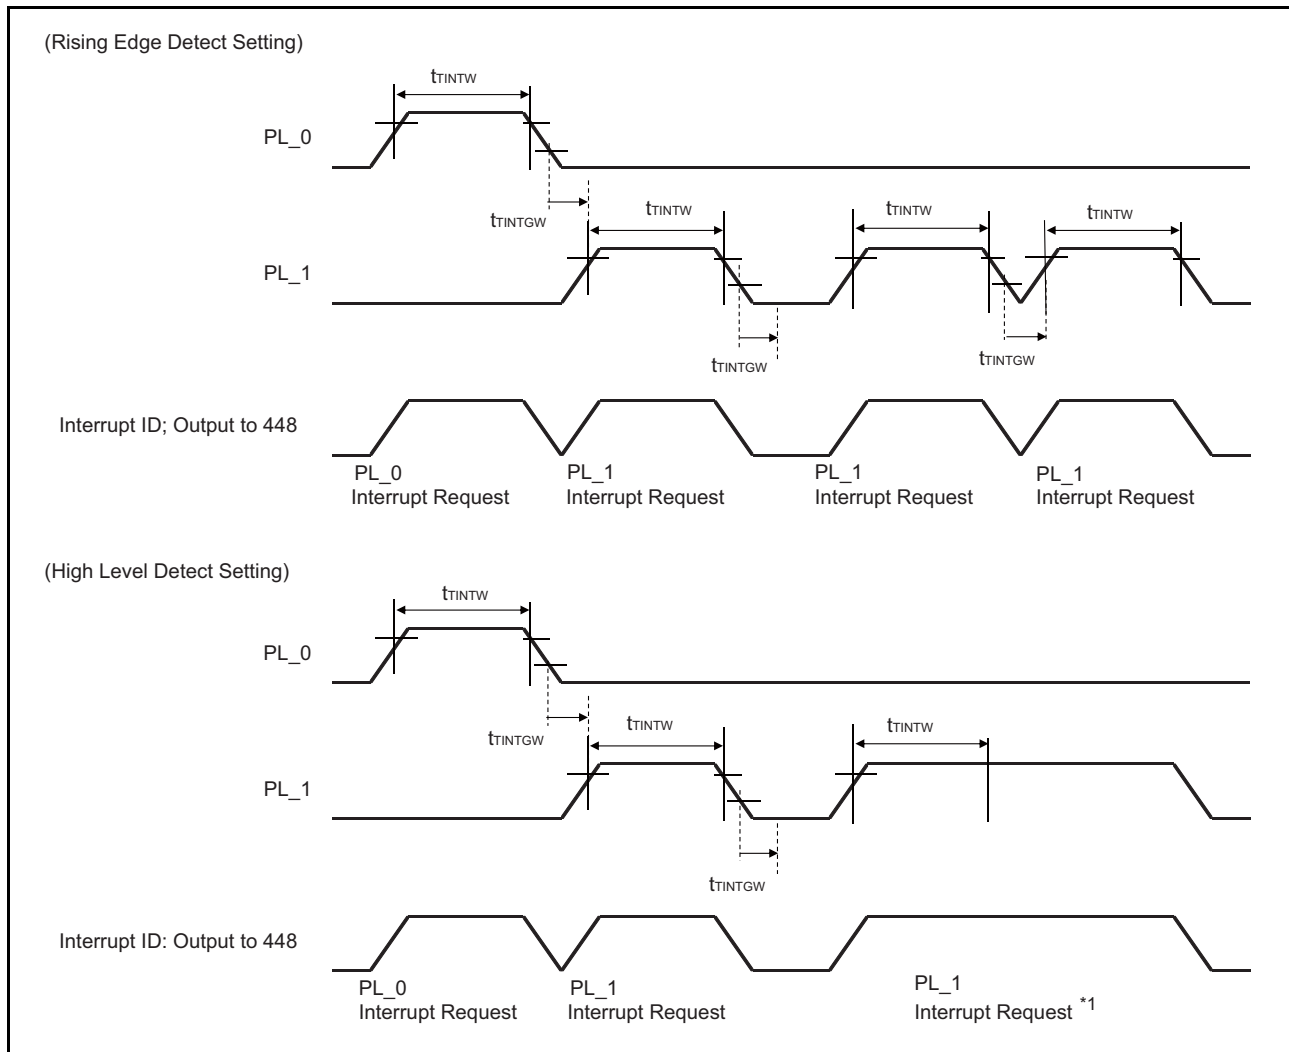

Figure 51.16 Restriction on the Timing of Input on Pins in the Same Group for Use as Pin Interrupts

t_{TINTGW} represents the wait time after a pin interrupt signal falls.

The minimum interval in cases where pins in the same group are used for consecutive pin interrupts is “the time for the operating width of a port pin, $TINTW$ ” plus “the wait time for TINT inputs on pins in the same group, t_{TINTGW} ”.

Note 1. The restriction of t_{TINTGW} can only be ignored when high-level detection is selected for the interrupt controller and interrupts are set as to only issue from a single pin.

52. Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

52.1 Features

52.1.1 States of Processing and Power-Down Modes

(1) States of processing

This LSI has three general states of processing: the reset state, the program execution state, and the power-down modes. Figure 52.1 shows transitions between these states.

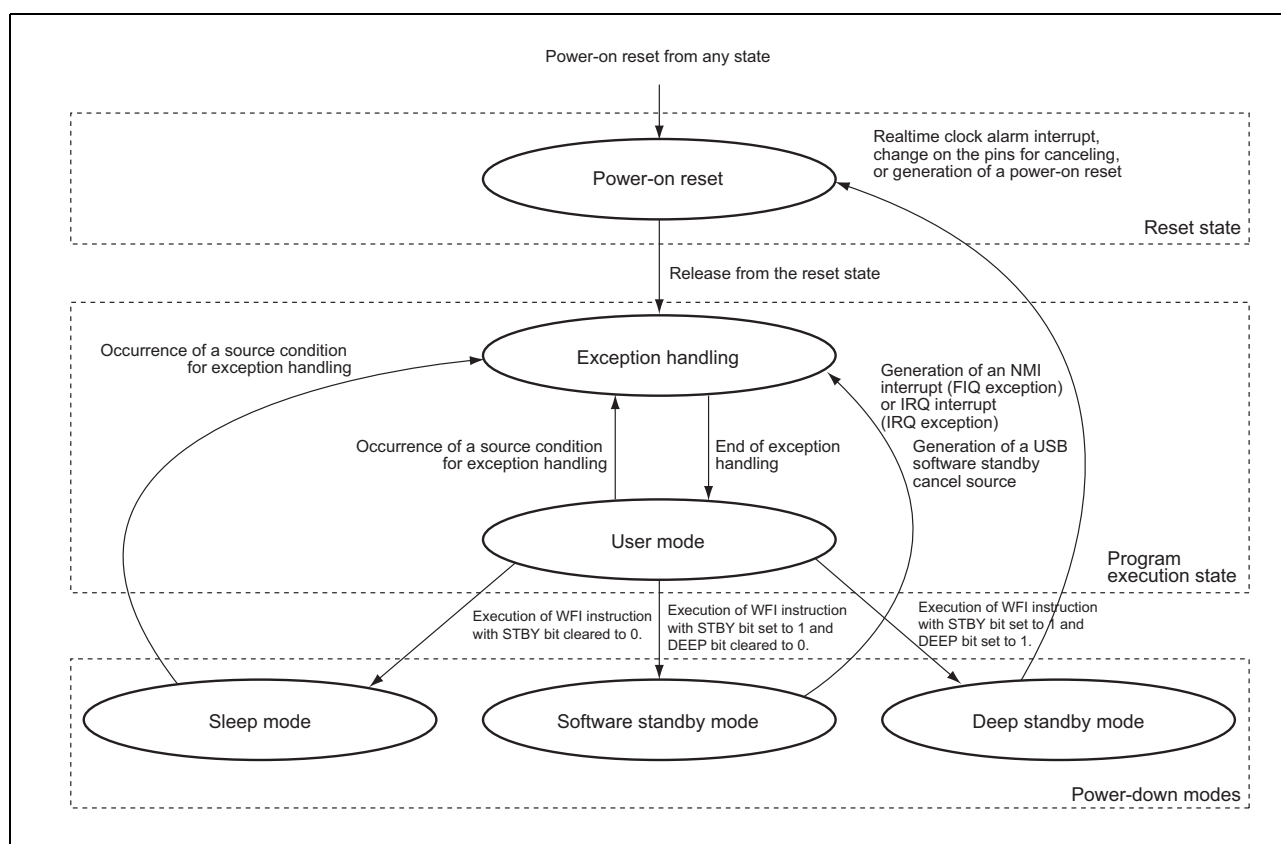

Figure 52.1 Transitions between Processing States

(2) Power-down modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 52.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 52.1 States of Power-Down Modes

| Power Down Mode | Transition Conditions | State | | | | | | | |
|-----------------------|--|---------------------------------------|-------------------------------|--|----------------------------|----------------|-----------------------|-----------------|---|
| | | CPU, CPU Register, Primary Cache, TLB | Secondary Cache | Large-Capacity On-Chip RAM (including on-chip data-retention RAM) | On-Chip Peripheral Modules | Realtime Clock | Internal Power Supply | External Memory | Canceling Procedure |
| Sleep mode | Execute WFI instruction with STBY bit in STBCR1 cleared to 0 | Halted Contents are held.*4 | Running | Running | Running | Running *1 | Applied | Auto refresh | <ul style="list-style-type: none">• Interrupt• Power-on reset |
| Software standby mode | Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 and 0, respectively | Halted Contents are held.*4 | Halted Contents are held.*4 | Halted Contents are held.*5 | Halted | Running *1 | Applied | Self refresh | <ul style="list-style-type: none">• NMI or IRQ interrupt• Power-on reset• Change on the USB Software standby cancel source signal |
| Deep standby mode | Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 | Halted Contents are not held. | Halted Contents are not held. | Halted Contents in on-chip data-retention RAM are held*2, and the other contents in large-capacity on-chip RAM are not held. | Halted | Running *1 | Shut off*6 | Self refresh | <ul style="list-style-type: none">• Power-on reset*3• Realtime clock alarm interrupts 0 and 1*3• Change on the pins for canceling*3• USB 2.0 host/function module channel interrupts 0 and 1 |
| Module standby mode | Set the MSTP bits in STBCR2 to STBCR10 to 1 | Running | Running | Running | Specified module halted | Halted | Applied | Auto refresh | <ul style="list-style-type: none">• Clear MSTP bit to 0 |

Note 1. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 16, Realtime Clock (RTC). When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.

Note 2. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby mode. When the deep standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 3. Deep standby mode can be canceled by a power-on reset, a realtime clock alarm 0 or 1 interrupt, a USB cancel source 0 or 1, or change on the pins for canceling (PK_4, PK_2, PJ_5, PJ_1, PH_0, PG_6, PG_2, PH_1, PE_1, P6_2, P3_3, P3_1, and NMI). Even when deep standby mode is canceled by a source other than a power-on reset, the reset exception handling is executed instead of the interrupt exception handling.

Note 4. When sleep mode or software standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 5. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to enable accesses, the retained contents are initialized when software standby mode is canceled by a power-on reset. By setting the VRAME bit in the SYSCR1

register or VRAMWE bit in the SYSCR2 register to disable accesses, the contents can be retained when software standby mode is canceled by a power-on reset. Note that this area can not be retained because the area at addresses from H'8002_0000 to H'8002_3FFF is used as working memory for the boot program in boot modes 0 to 7. In boot modes 1 and 2, this area can not be retained because a program is transferred from the external flash memory to the area at addresses from H'8002_4000 to H'8002_4000 + the size of the program - 1. For details, see section 3, Boot Mode.

Note 6. In deep standby mode, the fake debug mode, in which shutting off the supply of power to all modules is disabled, is usable for debugging.

For details, see section 53.4.3, Clock Power Control Register (ICEREGCLKPWRCTRL).

52.2 Register Descriptions

Table 52.2 shows the register configuration.

Table 52.2 Register Configuration

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|--|--------------|-----|---------------|------------|-------------|
| Standby control register 1 | STBCR1 | R/W | H'00 | H'FCFE0020 | 8 |
| Standby control register 2 | STBCR2 | R/W | H'6A | H'FCFE0024 | 8 |

| Standby control register 5 | STBCR5 | R/W | H'F3 | H'FCFE0428 | 8 |
| Standby control register 6 | STBCR6 | R/W | H'FF | H'FCFE042C | 8 |
| Standby control register 7 | STBCR7 | R/W | H'FF | H'FCFE0430 | 8 |
| Standby control register 8 | STBCR8 | R/W | H'F7 | H'FCFE0434 | 8 |
| Standby control register 9 | STBCR9 | R/W | H'FF | H'FCFE0438 | 8 |
| Standby control register 10 | STBCR10 | R/W | H'9F | H'FCFE043C | 8 |
| Software reset control register 1 | SWRSTCR1 | R/W | H'00 | H'FCFE0460 | 8 |
| Software reset control register 2 | SWRSTCR2 | R/W | H'00 | H'FCFE0464 | 8 |
| System control register 1 | SYSCR1 | R/W | H'FF | H'FCFE0400 | 8 |
| System control register 2 | SYSCR2 | R/W | H'FF | H'FCFE0404 | 8 |
| System control register 3 | SYSCR3 | R/W | H'00 | H'FCFE0408 | 8 |
| CPU status register | CPUSTS | R | H'00 | H'FCFE0018 | 8 |
| Standby request register 1 | STBREQ1 | R/W | H'00 | H'FCFE0030 | 8 |
| Standby request register 2 | STBREQ2 | R/W | H'00 | H'FCFE0034 | 8 |
| Standby request register 3 | STBREQ3 | R/W | H'00 | H'FCFE0038 | 8 |
| Standby acknowledge register 1 | STBACK1 | R | H'00 | H'FCFE0040 | 8 |
| Standby acknowledge register 2 | STBACK2 | R | H'00 | H'FCFE0044 | 8 |
| Standby acknowledge register 3 | STBACK3 | R | H'00 | H'FCFE0048 | 8 |
| USB software standby cancel source control register 0 | SSTBCCR0 | R/W | H'0000 | H'FCFEF810 | 16 |
| USB software standby cancel source control register 1 | SSTBCCR1 | R/W | H'0000 | H'FCFEF812 | 16 |
| USB Software standby cancel source request register 0 | SSTBCRR0 | R/W | H'0000 | H'FCFEF814 | 16 |
| USB Software standby cancel source request register 1 | SSTBCRR1 | R/W | H'0000 | H'FCFEF816 | 16 |
| On-chip data-retention RAM area setting register | RRAMKP | R/W | H'00 | H'FCFFC000 | 8 |
| Deep standby control register | DSCTR | R/W | H'00 | H'FCFFC002 | 8 |
| Deep standby cancel source select register | DSSSR | R/W | H'0000 | H'FCFFC004 | 16 |
| USB Deep standby cancel source select register | USBDS SSR | R/W | H'00 | H'FCFFC020 | 8 |
| Deep standby cancel edge select register | DSESR | R/W | H'0000 | H'FCFFC006 | 16 |
| Deep standby cancel source flag register | DSFR | R/W | H'0000 | H'FCFFC008 | 16 |
| USB Deep standby cancel source flag register | USBDSFR | R/W | H'00 | H'FCFFC024 | 8 |
| Deep standby cancel Oscillation stability count register | DSCNT | R/W | H'0000 | H'FCFFC00E | 16 |
| XTAL oscillator gain control register | XTALCTR | R/W | H'00 | H'FCFF1810 | 8 |
| RTCXTAL select register | RTCXTALSEL | R/W | H'000x | H'FCFFC040 | 16 |

52.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------|------|---|---|---|---|---|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | STBY | DEEP | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 | STBY | 0 | R/W | Software Standby, Deep Standby |
| 6 | DEEP | 0 | R/W | Specifies transition to software standby mode or deep standby mode. 0x: Executing WFI instruction puts chip into sleep mode. 10: Executing WFI instruction puts chip into software standby mode. 11: Executing WFI instruction puts chip into deep standby mode. |
| 5 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

[Legend]

x: Don't care

52.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|-----|---|---|---|---|---|---|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | HIZ | — | — | — | — | — | — | MSTP 20 |
| Initial value: | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|---------------|-----|--|
| 7 | HIZ | 0 | R/W | Port High Impedance Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 57.1, Pin States. 0: The pin state is retained in software standby mode or deep standby mode. 1: The pin is set to high-impedance in software standby mode or deep standby mode. |
| 6, 5 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 4 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 3 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 2 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 1 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 0 | MSTP20 | 0 | R/W | Module Stop 20*1 When the MSTP20 bit is set to 1, the clock supply to CoreSight is halted. 0: CoreSight runs. 1: Clock supply to CoreSight is halted. |

Note 1. The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|------------|------------|------------|------------|------------|---|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | MSTP 36 | MSTP 35 | MSTP 34 | MSTP 33 | MSTP 32 | — | MSTP 30 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 1 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 7 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 6 | MSTP36 | 1 | R/W | Module Stop 36 When the MSTP36 bit is set to 1, the clock supply to the OS timer channel 0 is halted. 0: OS timer channel 0 runs. 1: Clock supply to OS timer channel 0 is halted. |
| 5 | MSTP35 | 1 | R/W | Module Stop 35 When the MSTP35 bit is set to 1, the clock supply to the OS timer channel 1 is halted. 0: OS timer channel 1 runs. 1: Clock supply to OS timer channel 1 is halted. |
| 4 | MSTP34 | 1 | R/W | Module Stop 34 When the MSTP34 bit is set to 1, the clock supply to the OS timer channel 2 is halted. 0: The OS timer channel 2 runs. 1: Clock supply to the OS timer channel 2 is halted. |
| 3 | MSTP33 | 1 | R/W | Module Stop 33 When the MSTP33 bit is set to 1, the clock supply to the multi-function timer pulse unit 3 (MTU3a) is halted. 0: The multi-function timer pulse unit 3 runs. 1: Clock supply to the multi-function timer pulse unit 3 is halted. |
| 2 | MSTP32 | 1 | R/W | Module Stop 32 When the MSTP32 bit is set to 1, the clock supply to the CANFD interface is halted. 0: The CANFD interface runs. 1: Clock supply to the CANFD interface is halted. |
| 1 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 0 | MSTP30 | 1 | R/W | Module Stop 30 When the MSTP30 bit is set to 1, the clock supply to the General PWM Timer (GPT) is halted. 0: The General PWM Timer runs. 1: Clock supply to the General PWM Timer is halted. |

52.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSTP 47 | MSTP 46 | MSTP 45 | MSTP 44 | MSTP 43 | MSTP 42 | MSTP 41 | MSTP 40 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 7 | MSTP47 | 1 | R/W | Module Stop 47 When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication interface with FIFO is halted. 0: Channel 0 of the serial communication interface with FIFO runs. 1: Clock supply to channel 0 of the serial communication interface with FIFO is halted. |
| 6 | MSTP46 | 1 | R/W | Module Stop 46 When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication interface with FIFO is halted. 0: Channel 1 of the serial communication interface with FIFO runs. 1: Clock supply to channel 1 of the serial communication interface with FIFO is halted. |
| 5 | MSTP45 | 1 | R/W | Module Stop 45 When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication interface with FIFO is halted. 0: Channel 2 of the serial communication interface with FIFO runs. 1: Clock supply to channel 2 of the serial communication interface with FIFO is halted. |
| 4 | MSTP44 | 1 | R/W | Module Stop 44 When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication interface with FIFO is halted. 0: Channel 3 of the serial communication interface with FIFO runs. 1: Clock supply to channel 3 of the serial communication interface with FIFO is halted. |
| 3 | MSTP43 | 1 | R/W | Module Stop 43 When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication interface with FIFO is halted. 0: Channel 4 of the serial communication interface with FIFO runs. 1: Clock supply to channel 4 of the serial communication interface with FIFO is halted. |
| 2 | MSTP42 | 1 | R/W | Module Stop 42 When the MSTP42 bit is set to 1, the clock supply to channel 0 of the serial communication interface (SCI) is halted. 0: Channel 0 of the serial communication interface (SCI) runs. 1: Clock supply to channel 0 of the serial communication interface (SCI) is halted. |
| 1 | MSTP41 | 1 | R/W | Module Stop 41 When the MSTP41 bit is set to 1, the clock supply to channel 1 of the serial communication interface (SCI) is halted. 0: Channel 1 of the serial communication interface (SCI) runs. 1: Clock supply to channel 1 of the serial communication interface (SCI) is halted. |
| 0 | MSTP40 | 1 | R/W | Module Stop 40 When the MSTP40 bit is set to 1, the clock supply to the serial communication interface (IrDA) is halted. 0: The serial communication interface (IrDA) runs. 1: Clock supply to the serial communication interface (IrDA) is halted. |

52.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------------|------------|---|---|------------|------------|------------|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSTP 57 | MSTP 56 | — | — | MSTP 53 | MSTP 52 | MSTP 51 | — |
| Initial value: | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 |
| R/W: | R/W | R/W | R | R | R/W | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 7 | MSTP57 | 1 | R/W | Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to the A/D converter is halted. |
| 6 | MSTP56 | 1 | R/W | Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to the capture engine unit (CEU) is halted. 0: The capture engine unit (CEU) runs. 1: Clock supply to the capture engine unit (CEU) is halted. |
| 5 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 4 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 3 | MSTP53 | 0 | R/W | Module Stop 53 When the MSTP53 bit is set to 1, the clock supply to the realtime clock channel 0 is halted. 0: The realtime clock channel 0 runs. 1: Clock supply to the realtime clock channel 0 is halted. Note: When the realtime clock channel 0 is halted, set the bits in registers shown below. • Set the RCKSEL bit in the control register 4 (RCR4) of the realtime clock channel 0 to 0. • Set the RTCEN bit in the control register 3 (RCR3) of the realtime clock channel 0 to 0. After the settings above, set the MSTP53 bit to 1. |
| 2 | MSTP52 | 0 | R/W | Module Stop 52 When the MSTP52 bit is set to 1, the clock supply to the realtime clock channel 1 is halted. 0: The realtime clock channel 1 runs. 1: Clock supply to the realtime clock channel 1 is halted. Note: When the realtime clock channel 1 is halted, set the bits in registers shown below. • Set the RCKSEL bit in the control register 4 (RCR4) of the realtime clock channel 1 to 0. • Set the RTCEN bit in the control register 3 (RCR3) of the realtime clock channel 1 to 0. After the settings above, set the MSTP52 bit to 1. |
| 1 | MSTP51 | 1 | R/W | Module Stop 51* When the MSTP51 bit is set to 1, the clock supply to the JPEG codec unit is halted. 0: The JPEG codec unit runs. 1: Clock supply to the JPEG codec unit is halted. |
| 0 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |

Note: * The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---------|---------|---------|---------|---------|---------|---------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | MSTP 66 | MSTP 65 | MSTP 64 | MSTP 63 | MSTP 62 | MSTP 61 | MSTP 60 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 7 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 6 | MSTP66 | 1 | R/W | Module Stop 66* When the MSTP66 bit is set to 1, the clock supply to the video input module is halted. 0: The video input module runs. 1: Clock supply to the video input module is halted. |
| 5 | MSTP65 | 1 | R/W | Module Stop 65* When the MSTP65 bit is set to 1, the clock supply to the channel 0 Ethernet controller and the channel 0 DMA controller for the Ethernet controller is halted. 0: The channel 0 Ethernet controller and the channel 0 DMA controller for the Ethernet controller run. 1: Clock supply to the channel 0 Ethernet controller and the channel 0 DMA controller for the Ethernet controller is halted. |
| 4 | MSTP64 | 1 | R/W | Module Stop 64* When the MSTP64 bit is set to 1, the clock supply to the channel 1 Ethernet controller and the channel 1 DMA controller for the Ethernet controller is halted. 0: The channel 1 Ethernet controller and the channel 1 DMA controller for the Ethernet controller run. 1: Clock supply to the channel 1 Ethernet controller and the channel 1 DMA controller for the Ethernet controller is halted. |
| 3 | MSTP63 | 1 | R/W | Module Stop 63* When the MSTP63 bit is set to 1, the clock supply to the PTP controller for the Ethernet controllers and DMA controller for the PTP controller is halted. 0: The PTP controller for the Ethernet controllers and DMA controller for the PTP controller run. 1: Clock supply to the PTP controller for the Ethernet controllers and DMA controller for the PTP controller is halted. |
| 2 | MSTP62 | 1 | R/W | Module Stop 62* When the MSTP62 bit is set to 1, the clock supply to the circuits shared by the Ethernet controllers, PTP controller for the Ethernet controllers, and DMA controllers for the Ethernet controllers is halted. 0: The circuits shared by the Ethernet controllers, PTP controller for the Ethernet controllers, and DMA controllers for the Ethernet controllers run. 1: Clock supply to the circuits shared by the Ethernet controllers, PTP controller for the Ethernet controllers, and DMA controllers for the Ethernet controllers is halted. |
| 1 | MSTP61 | 1 | R/W | Module Stop 61* When the MSTP61 bit is set to 1, the clock supply to the channel 0 USB 2.0 host/function module is halted. 0: The channel 0 USB 2.0 host/function module runs. 1: Clock supply to the channel 0 USB 2.0 host/function module is halted. |
| 0 | MSTP60 | 1 | R/W | Module Stop 60* When the MSTP60 bit is set to 1, the clock supply to the channel 1 USB 2.0 host/function module is halted. 0: The channel 1 USB 2.0 host/function module runs. 1: Clock supply to the channel 1 USB 2.0 host/function module is halted. |

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------------|------------|------------|---|------------|------------|------------|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSTP 77 | MSTP 76 | MSTP 75 | — | MSTP 73 | MSTP 72 | MSTP 71 | MSTP 70 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 7 | MSTP77 | 1 | R/W | Module Stop 77* When the MSTP77 bit is set to 1, the clock supply to the image renderer is halted. 0: The image renderer runs. 1: Clock supply to the image renderer is halted. |
| 6 | MSTP76 | 1 | R/W | Module Stop 76* When the MSTP76 bit is set to 1, the clock supply to the 2D Drawing Engine is halted. 0: The 2D Drawing Engine runs. 1: Clock supply to the 2D Drawing Engine is halted. |
| 5 | MSTP75 | 1 | R/W | Module Stop 75 When the MSTP75 bit is set to 1, the clock supply to the MIPI CSI-2 interface is halted. 0: The MIPI CSI-2 interface runs. 1: Clock supply to the MIPI CSI-2 interface is halted. |
| 4 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 3 | MSTP73 | 1 | R/W | Module Stop 73 When the MSTP73 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted. 0: Channel 0 of the serial sound interface runs. 1: Clock supply to channel 0 of the serial sound interface is halted. |
| 2 | MSTP72 | 1 | R | Module Stop 72 When the MSTP72 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted. 0: Channel 1 of the serial sound interface runs. 1: Clock supply to channel 1 of the serial sound interface is halted. |
| 1 | MSTP71 | 1 | R/W | Module Stop 71 When the MSTP71 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted. 0: Channel 2 of the serial sound interface runs. 1: Clock supply to channel 2 of the serial sound interface is halted. |
| 0 | MSTP70 | 1 | R/W | Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted. 0: Channel 3 of the serial sound interface runs. 1: Clock supply to channel 3 of the serial sound interface is halted. |

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------------|------------|------------|------------|------------|---|------------|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSTP 87 | MSTP 86 | MSTP 85 | MSTP 84 | MSTP 83 | — | MSTP 81 | — |
| Initial value: | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 7 | MSTP87 | 1 | R/W | Module Stop 87 When the MSTP87 bit is set to 1, the clock supply to channel 0 of the I ² C bus interface (RIIC) is halted. 0: Channel 0 of the I ² C bus interface runs. 1: Clock supply to channel 0 of the I ² C bus interface is halted. |
| 6 | MSTP86 | 1 | R/W | Module Stop 86 When the MSTP86 bit is set to 1, the clock supply to channel 1 of the I ² C bus interface (RIIC) is halted. 0: Channel 1 of the I ² C bus interface runs. 1: Clock supply to channel 1 of the I ² C bus interface is halted. |
| 5 | MSTP85 | 1 | R/W | Module Stop 85 When the MSTP85 bit is set to 1, the clock supply to channel 2 of the I ² C bus interface (RIIC) is halted. 0: Channel 2 of the I ² C bus interface runs. 1: Clock supply to channel 2 of the I ² C bus interface is halted. |
| 4 | MSTP84 | 1 | R/W | Module Stop 84 When the MSTP84 bit is set to 1, the clock supply to channel 3 of the I ² C bus interface (RIIC) is halted. 0: Channel 3 of the I ² C bus interface runs. 1: Clock supply to channel 3 of the I ² C bus interface is halted. |
| 3 | MSTP83 | 0 | R/W | Module Stop 83 When the MSTP83 bit is set to 1, the clock supply to the SPI multi I/O bus controller is halted. 0: The SPI multi I/O bus controller runs. 1: Clock supply to the SPI multi I/O bus controller is halted. |
| 2 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 1 | MSTP81 | 1 | R/W | Module Stop 81* When the MSTP81 bit is set to 1, the clock supply to the video display controller 6 is halted. 0: The video display controller 6 runs. 1: Clock supply to the video display controller 6 is halted. |
| 0 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.9 Standby Control Register 9 (STBCR9)

STBCR9 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------------|------------|------------|---|------------|------------|------------|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSTP 97 | MSTP 96 | MSTP 95 | — | MSTP 93 | MSTP 92 | MSTP 91 | MSTP 90 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 7 | MSTP97 | 1 | R/W | Module Stop 97 When the MSTP97 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted. 0: Channel 0 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted. |
| 6 | MSTP96 | 1 | R/W | Module Stop 96 When the MSTP96 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted. 0: Channel 1 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted. |
| 5 | MSTP95 | 1 | R/W | Module Stop 95 When the MSTP95 bit is set to 1, the clock supply to channel 2 of the Renesas serial peripheral interface is halted. 0: Channel 2 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 2 of the Renesas serial peripheral interface is halted. |
| 4 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 3 | MSTP93 | 1 | R/W | Module Stop 93 When the MSTP93 bit is set to 1, the clock supply to the HyperBus controller is halted. 0: The HyperBus controller runs. 1: Clock supply to the HyperBus controller is halted. |
| 2 | MSTP92 | 1 | R/W | Module Stop 92 When the MSTP92 bit is set to 1, the clock supply to the octa memory controller is halted. 0: The octa memory controller runs. 1: Clock supply to the octa memory controller is halted. |
| 1 | MSTP91 | 1 | R/W | Module Stop 91* When the MSTP91 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted. 0: The Renesas SPDIF interface run. 1: Clock supply to the Renesas SPDIF interface is halted. |
| 0 | MSTP90 | 1 | R/W | Module Stop 90* When the MSTP90 bit is set to 1, the clock supply to the dynamic reconfigurable processor (DRP) is halted. 0: The dynamic reconfigurable processor (DRP) runs. 1: Clock supply to the dynamic reconfigurable processor (DRP) is halted. If the product does not have a DRP, the value written to this bit should always be 1. |

Note: The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.10 Standby Control Register 10 (STBCR10)

STBCR10 is an 8-bit readable/writable register that controls the operation of each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|-------------|---|---|-------------|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSTP 107 | — | — | MSTP 104 | MSTP 103 | MSTP 102 | MSTP 101 | MSTP 100 |
| Initial value: | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|---------------|-----|---|
| 7 | MSTP107 | 1 | R/W | Module Stop 107*1 When the MSTP107 bit is set to 1, the clock supply to the Trusted Secure IP module is halted. 0: The Trusted Secure IP module runs. 1: Clock supply to the Trusted Secure IP module is halted. Note: If the product does not have a Trusted Secure IP module, the value written to this bit should always be 1. |
| 6, 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | MSTP104 | 1 | R/W | Module Stop 104*1 When the MSTP104 bit is set to 1, the clock supply to the NAND flash controller is halted. 0: The NAND flash controller runs. 1: Clock supply to the NAND flash controller is halted. |
| 3 | MSTP103 | 1 | R/W | Module Stop 103 and 102*1 When the MSTP103 and MSTP102 bits are set to 11, the clock supply to the channel 0 SD/MMC host interface is halted. 00: The channel 0 SD/MMC host interface runs. 11: Clock supply to the channel 0 SD/MMC host interface is halted. Others: Setting prohibited |
| 2 | MSTP102 | 1 | R/W | |
| 1 | MSTP101 | 1 | R/W | Module Stop 101 and 100*1 When the MSTP101 and MSTP100 bits are set to 11, the clock supply to the channel 1 SD/MMC host interface is halted. 00: The channel 1 SD/MMC host interface runs. 11: Clock supply to the channel 1 SD/MMC host interface is halted. Others: Setting prohibited |
| 0 | MSTP100 | 1 | R/W | |

Note 1. The transition to and release from module stop mode proceed in the steps described in section 52.3.5, Module Standby Function.

52.2.11 Software Reset Control Register 1 (SWRSTCR1)

SWRSTCR1 is an 8-bit readable/writable register that controls software resetting of individual modules and the operation of the crystal resonator for audio.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|------------|---|---|---|------------|------------|------------|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | AXT ALE | — | — | — | SRST 13 | SRST 12 | SRST 11 | SRST 10 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 | AXTALE | 0 | R/W | AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip oscillator/enables the external clock input. 1: Halts the on-chip oscillator/disables the external clock input. |
| 6 to 4 | — | 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | SRST13 | 0 | R/W | Video Display Controller 6 Software Reset Controls resetting of the video display controller 6 by software. 0: The video display controller 6 reset is canceled. 1: The video display controller 6 is reset. |
| 2 | SRST12 | 0 | R/W | Trusted Secure IP Software Reset Controls resetting of the Trusted Secure IP module by software. 0: The Trusted Secure IP reset is canceled. 1: The Trusted Secure IP module is reset. Note: If the product does not have a Trusted Secure IP module, the value written to this bit should always be 0. |
| 1 | SRST11 | 0 | R/W | JPEG Codec Unit Software Reset Controls resetting of the JPEG codec unit by software. 0: The JPEG codec unit reset is canceled. 1: The JPEG codec unit is reset. |
| 0 | SRST10 | 0 | R/W | SPI Multi I/O Bus Controller Software Reset Controls resetting of the SPI multi I/O bus controller by software. 0: The SPI multi I/O bus controller reset is canceled. 1: The SPI multi I/O bus controller is reset. |

52.2.12 Software Reset Control Register 2 (SWRSTCR2)

SWRSTCR2 is an 8-bit readable/writable register that controls a software reset for each module.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|------------|------------|------------|------------|------------|------------|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | SRST 26 | SRST 25 | SRST 24 | SRST 23 | SRST 22 | SRST 21 | — |
| Initial value: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R/W | R/W | R/W | R/W | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 7 | — | 1 | R | Reserved This bit is always read as 1. The write value should always be 1. |
| 6 | SRST26 | 0 | R/W | NAND Flash Controller Software Reset Controls resetting of the NAND flash controller by software. 0: The NAND flash controller reset is canceled. 1: The NAND flash controller is reset. |
| 5 | SRST25 | 0 | R/W | Video Input Module Software Reset Controls resetting of the video input module by software. 0: The video input module reset is canceled. 1: The video input module is reset. |
| 4 | SRST24 | 0 | R/W | Image Renderer Software Reset Controls resetting of the image renderer by software. 0: The image renderer reset is canceled. 1: The image renderer is reset. |
| 3 | SRST23 | 0 | R/W | MIPI CSI-2 Interface Software Reset Controls resetting of the MIPI CSI-2 interface by software. 0: The MIPI CSI-2 interface reset is canceled. 1: The MIPI CSI-2 interface is reset. |
| 2 | SRST22 | 0 | R/W | 2D Drawing Engine Software Reset Controls resetting of the 2D drawing engine by software. 0: The 2D drawing engine reset is canceled. 1: The 2D drawing engine is reset. |
| 1 | SRST21 | 0 | R/W | Capture Engine Unit Software Reset Controls resetting of the capture engine unit by software. 0: The capture engine unit reset is canceled. 1: The capture engine unit is reset. |
| 0 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |

52.2.13 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.

When a VRAMEn (n = 0 to 4) bit in SYSCR1 is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.

SYSCR1 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|---|--------|--------|--------|--------|--------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | VRAME4 | VRAME3 | VRAME2 | VRAME1 | VRAME0 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 7 to 5 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 4 | VRAME4 | 1 | R/W | RAM Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled. |
| 3 | VRAME3 | 1 | R/W | RAM Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled. |
| 2 | VRAME2 | 1 | R/W | RAM Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled. |
| 1 | VRAME1 | 1 | R/W | RAM Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled. |
| 0 | VRAME0 | 1 | R/W | RAM Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled. |

Note 1. For addresses in each page, see section 50, On-Chip RAM.

52.2.14 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.

When a VRAMWEn ($n = 0$ to 4) bit in SYSCR2 is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.

SYSCR2 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|---|------------|------------|------------|------------|------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | VRAME 4 | VRAME 3 | VRAME 2 | VRAME 1 | VRAME 0 |
| Initial value: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W: | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 7 to 5 | — | All 1 | R | Reserved These bits are always read as 1. The write value should always be 1. |
| 4 | VRAMWE4 | 1 | R/W | RAM Write Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled. |
| 3 | VRAMWE3 | 1 | R/W | RAM Write Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled. |
| 2 | VRAMWE2 | 1 | R/W | RAM Write Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled. |
| 1 | VRAMWE1 | 1 | R/W | RAM Write Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled. |
| 0 | VRAMWE0 | 1 | R/W | RAM Write Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled. |

Note 1. For addresses in each page, see section 50, On-Chip RAM.

52.2.15 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn ($n = 0$ to 3) bit in SYSCR3 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR3 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|---|---|---------|---------|---------|---------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | RRAMWE3 | RRAMWE2 | RRAMWE1 | RRAMWE0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | RRAMWE3 | 0 | R/W | RAM Write Enable 3 (corresponding area: page 3×2 in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled. |
| 2 | RRAMWE2 | 0 | R/W | RAM Write Enable 2 (corresponding area: page 2×2 in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled. |
| 1 | RRAMWE1 | 0 | R/W | RAM Write Enable 1 (corresponding area: page 1×2 in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled. |
| 0 | RRAMWE0 | 0 | R/W | RAM Write Enable 0 (corresponding area: page 0×2 in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled. |

Note 1. For addresses in each page, see section 50, On-Chip RAM.

Note 2. When the VRAME0 bit in SYSCR1 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.
When the VRAMWE0 bit in SYSCR2 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

52.2.16 CPU Status Register (CPUSTS)

CPUSTS is an 8-bit readable register that indicates the status of the CPU.

| | | | | | | | | |
|----------------|---|---|---|------------|---|---|---|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | IS BUSY | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. |
| 4 | ISBUSY | 0 | R | State during Changing of the Frequency of CPU and Return from Software Standby Indicates that the frequency of CPU is being changed or that return from software standby is in progress. Do not execute a WFI instruction while this bit is 1. 0: The frequency of CPU is not being changed and returning from software standby is not in progress 1: The frequency of CPU is being changed or return from software standby is in progress |
| 3 to 0 | — | All 0 | R | Reserved These bits are always read as 0. |

52.2.17 Standby Request Register 1 (STBREQ1)

This register is used to request notification of whether a CPU or peripheral module is ready for standby. The CPU or peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|-------------|---|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | STBRQ 15 | — | STBRQ 13 | STBRQ 12 | STBRQ 11 | STBRQ 10 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R/W | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|---------------|-----|--|
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 5 | STBRQ15 | 0 | R/W | Standby Request to CoreSight 0: The standby request to the CoreSight is invalid. 1: The standby request to the CoreSight is valid.*1 |
| 4 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 3 | STBRQ13 | 0 | R/W | Standby Request to JPEG Codec Unit 0: The standby request to the JPEG codec unit is invalid. 1: The standby request to the JPEG codec unit is valid.*1 |
| 2 | STBRQ12 | 0 | R/W | Standby Request to the Channel 0 SD/MMC Host Interface 0: The standby request to the channel 0 SD/MMC host interface is invalid. 1: The standby request to the channel 0 SD/MMC host interface is valid.*1 |
| 1 | STBRQ11 | 0 | R/W | Standby Request to the Channel 1 SD/MMC Host Interface 0: The standby request to the channel 1 SD/MMC host interface is invalid. 1: The standby request to the channel 1 SD/MMC host interface is valid.*1 |
| 0 | STBRQ10 | 0 | R/W | Standby Request to Capture Engine Unit 0: The standby request to the capture engine unit is invalid. 1: The standby request to the capture engine unit is valid.*1 |

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

52.2.18 Standby Request Register 2 (STBREQ2)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | STBRQ 27 | STBRQ 26 | STBRQ 25 | STBRQ 24 | STBRQ 23 | STBRQ 22 | STBRQ 21 | STBRQ 20 |

| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 7 | STBRQ27 | 0 | R/W | Standby Request to Video Input Module 0: The standby request to the video input module is invalid. 1: The standby request to the video input module is valid.*1 |
| 6 | STBRQ26 | 0 | R/W | Standby Request to Ethernet Controller 0: The standby request to the Ethernet controller is invalid. 1: The standby request to the Ethernet controller is valid.*1 |
| 5 | STBRQ25 | 0 | R/W | Standby Request to Channel 0 of Video Display Controller 6 0: The standby request to channel 0 of the video display controller 6 is invalid. 1: The standby request to channel 0 of the video display controller 6 is valid.*1 |
| 4 | STBRQ24 | 0 | R/W | Standby Request to Dynamic Reconfigurable Processor (DRP) 0: The standby request to the dynamic reconfigurable processor (DRP) is invalid. 1: The standby request to the dynamic reconfigurable processor (DRP) is valid.*1 If the product does not have a DRP, the value written to this bit should always be 0. |
| 3 | STBRQ23 | 0 | R/W | Standby Request to Image Renderer 0: The standby request to the image renderer is invalid. 1: The standby request to the image renderer is valid.*1 |
| 2 | STBRQ22 | 0 | R/W | Standby Request to NAND Flash Controller 0: The standby request to the NAND flash controller is invalid. 1: The standby request to the NAND flash controller is valid.*1 |
| 1 | STBRQ21 | 0 | R/W | Standby Request to 2D Drawing Engine (Texture) 0: The standby request to the 2D drawing engine (texture) is invalid. 1: The standby request to the 2D drawing engine (texture) is valid.*1 |
| 0 | STBRQ20 | 0 | R/W | Standby Request to 2D Drawing Engine (Data) 0: The standby request to the 2D drawing engine (data) is invalid. 1: The standby request to the 2D drawing engine (data) is valid.*1 |

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

52.2.19 Standby Request Register 3 (STBREQ3)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|---|---|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | STBRQ 33 | STBRQ 32 | STBRQ 31 | STBRQ 30 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | STBRQ33 | 0 | R/W | Standby Request to the Channel 1 USB 2.0 Function Module 0: The standby request to the channel 1 USB 2.0 function module is invalid. 1: The standby request to the channel 1 USB 2.0 function module is valid.*1 |
| 2 | STBRQ32 | 0 | R/W | Standby Request to the Channel 1 USB 2.0 Host Module 0: The standby request to the channel 1 USB 2.0 host module is invalid. 1: The standby request to the channel 1 USB 2.0 host module is valid.*1 |
| 1 | STBRQ31 | 0 | R/W | Standby Request to the Channel 0 USB 2.0 Function Module 0: The standby request to the channel 0 USB 2.0 function module is invalid. 1: The standby request to the channel 0 USB 2.0 function module is valid.*1 |
| 0 | STBRQ30 | 0 | R/W | Standby Request to the Channel 0 USB 2.0 Host Module 0: The standby request to the channel 0 USB 2.0 host module is invalid. 1: The standby request to the channel 0 USB 2.0 host module is valid.*1 |

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

52.2.20 Standby Acknowledge Register 1 (STBACK1)

This register is used to provide notification that a CPU or peripheral module is in the standby ready state. The CPU or peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

| | | | | | | | | |
|----------------|---|---|-------------|---|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | STBAK 15 | — | STBAK 13 | STBAK 12 | STBAK 11 | STBAK 10 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|---------------|-----|--|
| 7, 6 | — | All 0 | R | Reserved These bits are always read as 0. |
| 5 | STBAK15 | 0 | R | Standby Acknowledgement from CoreSight 0: The standby acknowledgement from CoreSight is invalid. 1: The standby acknowledgement from CoreSight is valid.*1 |
| 4 | — | 0 | R | Reserved This bit is always read as 0. |
| 3 | STBAK13 | 0 | R | Standby Acknowledgement from JPEG Codec Unit 0: The standby acknowledgement from the JPEG codec unit is invalid. 1: The standby acknowledgement from the JPEG codec unit is valid.*1 |
| 2 | STBAK12 | 0 | R | Standby Acknowledgement from the Channel 0 SD/MMC Host Interface 0: The standby acknowledgement from the channel 0 SD/MMC host interface is invalid. 1: The standby acknowledgement from the channel 0 SD/MMC host interface is valid.*1 |
| 1 | STBAK11 | 0 | R | Standby Acknowledgement from the Channel 1 SD/MMC Host Interface 0: The standby acknowledgement from the channel 1 SD/MMC host interface is invalid. 1: The standby acknowledgement from the channel 1 SD/MMC host interface is valid.*1 |
| 0 | STBAK10 | 0 | R | Standby Acknowledgement from Capture Engine Unit 0: The standby acknowledgement from the capture engine unit is invalid. 1: The standby acknowledgement from the capture engine unit is valid.*1 |

Note 1. The bits in STBACK1 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

52.2.21 Standby Acknowledge Register 2 (STBACK2)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

| | | | | | | | | |
|----------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 7 | STBAK27 | 0 | R | Standby Acknowledgement from Video Input Module 0: The standby acknowledgement from the video input module is invalid. 1: The standby acknowledgement from the video input module is valid.*1 |
| 6 | STBAK26 | 0 | R | Standby Acknowledgement from Ethernet Controller 0: The standby acknowledgement from the Ethernet controller is invalid. 1: The standby acknowledgement from the Ethernet controller is valid.*1 |
| 5 | STBAK25 | 0 | R | Standby Acknowledgement from Video Display Controller 6 0: The standby acknowledgement from the video display controller 6 is invalid. 1: The standby acknowledgement from the video display controller 6 is valid.*1 |
| 4 | STBAK24 | 0 | R | Standby Acknowledgement from Dynamic Reconfigurable Processor (DRP) 0: The standby acknowledgement from the dynamic reconfigurable processor (DRP) is invalid. 1: The standby acknowledgement from the dynamic reconfigurable processor (DRP) is valid.*1 If the product does not have a DRP, the value written to this bit should always be 0. |
| 3 | STBAK23 | 0 | R | Standby Acknowledgement from Image Renderer 0: The standby acknowledgement from the image renderer is invalid. 1: The standby acknowledgement from the image renderer is valid.*1 |
| 2 | STBAK22 | 0 | R | Standby Acknowledgement from NAND Flash Controller 0: The standby acknowledgement from the NAND flash controller is invalid. 1: The standby acknowledgement from the NAND flash controller is valid.*1 |
| 1 | STBAK21 | 0 | R | Standby Acknowledgement from 2D Drawing Engine (Texture) 0: The standby acknowledgement from the 2D drawing engine (texture) is invalid. 1: The standby acknowledgement from the 2D drawing engine (texture) is valid.*1 |
| 0 | STBAK20 | 0 | R | Standby Acknowledgement from 2D Drawing Engine (Data) 0: The standby acknowledgement from the 2D drawing engine (data) is invalid. 1: The standby acknowledgement from the 2D drawing engine (data) is valid.*1 |

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

52.2.22 Standby Acknowledge Register 3 (STBACK3)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

| | | | | | | | | |
|----------------|---|---|---|---|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | STBAK 33 | STBAK 32 | STBAK 31 | STBAK 30 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. |
| 3 | STBAK33 | 0 | R | Standby Acknowledgement from the Channel 1 USB 2.0 Function Module 0: The standby acknowledgement from the channel 1 USB 2.0 function module is invalid. 1: The standby acknowledgement from the channel 1 USB 2.0 function module is valid.*1 |
| 2 | STBAK32 | 0 | R | Standby Acknowledgement from the Channel 1 USB 2.0 Host Module 0: The standby acknowledgement from the channel 1 USB 2.0 host module is invalid. 1: The standby acknowledgement from the channel 1 USB 2.0 host module is valid.*1 |
| 1 | STBAK31 | 0 | R | Standby Acknowledgement from the Channel 0 USB 2.0 Function Module 0: The standby acknowledgement from the channel 0 USB 2.0 function module is invalid. 1: The standby acknowledgement from the channel 0 USB 2.0 function module is valid.*1 |
| 0 | STBAK30 | 0 | R | Standby Acknowledgement from the Channel 0 USB 2.0 Host Module 0: The standby acknowledgement from the channel 0 USB 2.0 host module is invalid. 1: The standby acknowledgement from the channel 0 USB 2.0 host module is valid.*1 |

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.

52.2.23 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.

When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------------|---|---|---|---|-------------|-------------|-------------|-------------|
| | — | — | — | — | RRAM KP3 | RRAM KP2 | RRAM KP1 | RRAM KP0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | RRAMKP3 | 0 | R/W | On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3* ¹ in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode. |
| 2 | RRAMKP2 | 0 | R/W | On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2* ¹ in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode. |
| 1 | RRAMKP1 | 0 | R/W | On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1* ¹ in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode. |
| 0 | RRAMKP0 | 0 | R/W | On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0* ¹ in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode. |

Note 1. For addresses in each page, see section 50, On-Chip RAM.

52.2.24 USB Software Standby Cancel Source Control Register 0 (SSTBCCR0)

SSTBCCR0 is a 16-bit readable/writable*¹ register that corresponds to the USB channel 0. This register selects whether to mask the corresponding cancellation source in software standby mode. When bits 11 to 8, bit 1, and bit 0 of SSTBCCR0 are set to 0, corresponding cancellation sources are masked. When these bits are set to 1, the corresponding cancellation sources are not masked.

The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN0, OVRCUR0, CC1_Rd0, and CC2_Rd0 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------------|----|----|----|----|--------|--------|--------|--------|---|---|---|---|---|---|-----|-----|
| | — | — | — | — | CC2_RD | CC1_RD | OVRCLR | VBUSIN | — | — | — | — | — | — | DM | DP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 | CC2_RD | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 10 | CC1_RD | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 9 | OVRCLR | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 8 | VBUSIN | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | DM | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 0 | DP | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |

52.2.25 USB Software Standby Cancel Source Control Register 1 (SSTBCCR1)

SSTBCCR1 is a 16-bit readable/writable*¹ register that corresponds to the USB channel 1. This register selects whether to mask the corresponding cancellation source in software standby mode. When bits 11 to 8, bit 1, and bit 0 of SSTBCCR1 are set to 0, corresponding cancellation sources are masked. When these bits are set to 1, the corresponding cancellation sources are not masked.

The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN1, OVRCUR1, CC1_Rd1, and CC2_Rd1 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------------|----|----|----|----|--------|--------|--------|--------|---|---|---|---|---|---|-----|-----|
| | — | — | — | — | CC2_RD | CC1_RD | OVRCLR | VBUSIN | — | — | — | — | — | — | DM | DP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 | CC2_RD | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 10 | CC1_RD | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 9 | OVRCLR | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 8 | VBUSIN | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1 | DM | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |
| 0 | DP | 0 | R/W | Mask selection of the cancellation source signal in software standby state 1: Software standby mode, does not mask the cancellation source. 0: Software standby mode, to mask the cancellation source. |

52.2.26 USB Software Standby Cancel Source Request Register 0 (SSTBCRR0)

SSTBCRR0 is a 16-bit readable/writable*¹ register that corresponds to the USB channel 0. This register sets a flag to indicate which cancellation source canceled the software standby mode, and reads and clears the flag after cancellation of the software standby mode.

The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN0, OVRCUR0, CC1_Rd0, and CC2_Rd0 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------------|----|----|----|----|--------|--------|--------|--------|---|---|---|---|---|---|--------|--------|
| | — | — | — | — | CC2_RD | CC1_RD | OVRCLR | VBUSIN | — | — | — | — | — | — | DM | DP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R | R | R | R | R | R | R/(W)* | R/(W)* |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|--------|---|
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 | CC2_RD | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 10 | CC1_RD | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 9 | OVRCLR | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 8 | VBUSIN | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 7 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|--------|---|
| 1 | DM | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 0 | DP | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |

Note: * Writing is permitted only in the case where [Clearing condition] is met.

52.2.27 USB Software Standby Cancel Source Request Register 1 (SSTBCRR1)

SSTBCRR1 is a 16-bit readable/writable*¹ register that corresponds to the USB channel 1. This register sets a flag to indicate which cancellation source canceled the software standby mode, and reads and clears the flag after cancellation of the software standby mode.

The VBUSIN, OVRCLR, CC1_RD, and CC2_RD bits of this register correspond to the VBUSIN1, OVRCUR1, CC1_Rd1, and CC2_Rd1 pins of the USB input/output port, respectively.

Note 1. When writing to this register, see section 52.4, Usage Notes.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----------------|----|----|----|----|--------|--------|--------|--------|---|---|---|---|---|---|--------|--------|
| | — | — | — | — | CC2_RD | CC1_RD | OVRCLR | VBUSIN | — | — | — | — | — | — | DM | DP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/(W)* | R/(W)* | R/(W)* | R/(W)* | R | R | R | R | R | R | R/(W)* | R/(W)* |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|--------|---|
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 | CC2_RD | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 10 | CC1_RD | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 9 | OVRCLR | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Clearing condition] • Writing 0 after reading 1 1: Cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |
| 8 | VBUSIN | 0 | R/(W)* | Cancellation source flag This bit retains the cancellation source which canceled the software standby mode. 0: No cancellation flag is set. [Setting condition] When software standby is canceled by this source first after transition to the software standby mode |

* Writing is permitted only in the case where [Clearing condition] is met.

52.2.28 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---------------|-------------|---|---|---|---|---|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|-----------|---------------|-----|---|
| 7 | EBUSKEEPE | 0 | R/W | Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode. Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0). |
| 6 | RAMBOOT | 0 | R/W | Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Instruction fetch from H'8000_0000 Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0). |
| 5 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

52.2.29 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (PK_4, PK_2, PJ_5, PJ_1, PH_0, PG_6, PG_2, PH_1, PE_1, P6_2, P3_3, P3_1, and NMI) can be selected as a cancel source. The USB return factor can be selected with the USB Deep standby cancel source select register (USBDSSSR). The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.

Note: When writing to this register, see section 52.4, Usage Notes.

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

52.2.30 USB Deep Standby Cancel Source Select Register (USBDS SSR)

USBDS SSR is an 8-bit readable/writable register that selects whether or not to cancel the deep standby mode by the return factor of the channel 0 or 1 USB 2.0 host/function module.

Note: When writing to this register, see section 52.4, Usage Notes.

52.2.31 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: When writing to this register, see section 52.4, Usage Notes.

52.2.32 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI or realtime clock alarm interrupt) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000.

All flags must be cleared immediately before transition to deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | | | | | | | | | |
|----------------|------------|--------|--------|--------|--------|--------|--------|--------|-------------|-------------|--------|--------|--------|--------|--------|--------|

| 0 | P3_1F | 0 | R/(W)*1 | P3_1 Flag 0: No change on the P3_1 pin 1: Change on the P3_1 pin |

Note 1. Only 0 can be written after reading 1 to clear the flag.

52.2.33 USB Deep standby cancel source flag register (USBDSFR)

USBDSFR is an 8-bit readable/writable register that serves as a flag to check whether deep standby mode has been canceled by the channel 0 or 1 USB 2.0 host/function module.

When deep standby mode is canceled on the channel 0 or 1 USB 2.0 host/function module, power-on reset exception handling is executed, but this register holds the previous value.

When deep standby mode is canceled by a power-on reset, this register is initialized to H'00.

All flags of this register must be cleared immediately before the LSI chip enters deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|---|---|-------------|-------------|-------------|-------------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | USBDS F3 | USBDS F2 | USBDS F1 | USBDS F0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/(W)* | R/(W)* | R/(W)* | R/(W)* |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|--------|---|
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 | USBDSF3 | 0 | R/(W)* | Channel 1 USB 2.0 Host/Function Module Flag (CLRVM) 0: The return source that cancels the deep standby mode is not in the channel 1 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 1 USB 2.0 host/function module. |
| 2 | USBDSF2 | 0 | R/(W)* | Channel 1 USB 2.0 Host/Function Module Flag (CLRVP) 0: The return source that cancels the deep standby mode is not in the channel 1 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 1 USB 2.0 host/function module. |
| 1 | USBDSF1 | 0 | R/(W)* | Channel 0 USB 2.0 Host/Function Module Flag (CLRVM) 0: The return source that cancels the deep standby mode is not in the channel 0 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 0 USB 2.0 host/function module. |
| 0 | USBDSF0 | 0 | R/(W)* | Channel 0 USB 2.0 Host/Function Module Flag (CLRVP) 0: The return source that cancels the deep standby mode is not in the channel 0 USB 2.0 host/function module. 1: The return source that cancels the deep standby mode is in the channel 0 USB 2.0 host/function module. |

Note: Only 0 can be written to clear the flag after reading 1.

52.2.34 Deep standby cancel Oscillation stability count register (DSCNT)

DSCNT is a 16-bit readable/writable register. When deep standby mode is canceled by other than a power-on reset, this register serves as the oscillation stabilization counter for recovery.

This register is initialized to H'0000 at power on reset or after canceling deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | CNTD[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|--------|--|
| 15 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 0 | CNTD[7:0] | H'00 | R/(W)* | Initial value of oscillation stability count for deep standby canceling Set the start value of counting except reset. When the count value overflows, deep standby mode is canceled and power-on reset exception handling is executed. Table 52.3 shows the setting contents of CNTD[7:0] bits. |

Table 52.3 Oscillation Settling Time for deep standby canceling (other than power on reset)

| CNTD[7:0] Setting Value | Oscillation Settling Time | |
|-------------------------|---------------------------|----------------|
| | P0φ = 33 MHz | P0φ = 27.5 MHz |
| H'00 (Initial Value) | 15.8 ms | 19.0 ms |
| H'A0 | 5.9 ms | 7.1 ms |
| H'B0 | 4.9 ms | 5.9 ms |
| H'C0 | 3.9 ms | 4.7 ms |
| H'D0 | 2.9 ms | 3.5 ms |
| H'E0 | 1.9 ms | 2.3 ms |

Note: Oscillation Settling Time(s) = (H'FF – CNTD[7:0] Setting Value)/(P0φ/2048)

Setting for 1ms or less is prohibited.

Since the oscillation settling time does not include the oscillation start time and the activation processing time in the chip (about 100 μs when P0φ = 33 MHz), it does not coincide with the activation start time. For the oscillation start time, see section 52.2.36, RTCXTAL select register (RTCXTALSEL).

When the setting of the RTC1XT and RTC0XT bits in the RTCXTALSEL register is 0, the EXTAL clock stops oscillating when the chip is placed on deep standby. Set the CNTD[7:0] bits to obtain an interval that is no less than the sum of the on-chip oscillation circuit oscillation settling time (t_{ROSC}) of the EXTAL and the internal PLL circuit oscillation settling time (t_{POSC}).

When the setting of one or both of the RTC1XT or RTC0XT bits is 1, the EXTAL clock continues oscillating even on deep standby. In this case, set the CNTD[7:0] bits to obtain an interval that is no less than the internal PLL circuit oscillation settling time (t_{POSC}).

52.2.35 XTAL Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the oscillator for XTAL and the realtime clock. If the realtime clock uses the EXTAL input, the GAIN0 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the EXTAL input, this bit is initialized to 0 when software standby or deep standby mode is entered.

This bit is initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: When writing to this register, see section 52.4, Usage Notes.

| | | | | | | | | |
|----------------|---|---|---|---|---|---|---|-------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | GAIN0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | GAIN0 | 0 | R/W | XTAL Oscillator (EXTAL or XTAL Pin) Gain Select 0: Large gain 1: Small gain |

52.2.36 RTCXTAL select register (RTCXTALSEL)

RTCXTALSEL is a 16-bit readable/writable register that controls EXTAL oscillation in software standby mode or deep standby mode.

When RTC1XT and RTC0XT bits are both 0, EXTAL stops oscillation simultaneously with software standby mode or deep standby mode.

When EXTAL oscillation is stopped, the watchdog timer counter (WTCNT) or deep standby cancel oscillation stability count register (DSCNT) starts counting after EXTAL oscillation has started in response to the request for release from software standby mode or deep standby mode.

Note: When writing to this register, see section 52.4, Usage Notes.

52.3 Operation

52.3.1 Sleep Mode

(1) Transition to Sleep Mode

When the WFI instruction is executed while the STBY bit of STBCR1 is 0, the program execution state is shifted to the sleep mode. Although the CPU halts after executing the WFI instruction, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run. The clock output from the CKIO pin is continued.

Note: When writing to STBCR1 register, see section 52.4, Usage Notes.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module) or a power-on reset.

- Canceling by an interrupt
When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled. An interrupt request occurs with an interrupt masked by bits 6 (the FIQ mask bit) and 7 (the IRQ mask bit) in the CPSR register in the CPU, sleep mode is canceled but interrupt exception handling is not executed.
- Canceling by a reset
Sleep mode is canceled by a power-on reset.

52.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

Executing the WFI instruction with the STBY bit and DEEP bit in STBCR1 set to 1 and 0, respectively, leads to the LSI chip entering software standby mode from the program execution state. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules other than the USB module are halted. To halt the USB module as well, set the USBCTR.DIRPD bit to 1 before executing the procedure for transition to standby mode. For details, see [section 52.4.3, Usage Notes when USB 2.0 Host/Function Modules are Not to be Used](#).

Only make this setting when the USB module is not to be used. Output of the clock signal from the CKIO pin also stops. The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. For the states of on-chip peripheral module registers in software standby mode, see [section 55, Register States](#).

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a WFI instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the WFI instruction.

After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to software standby proceeds.

Since the transition to software standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.

To suppress an unintended request from a bus master, use the software to stop bus masters before transition to the software standby mode.

The procedure for switching to software standby mode is as follows:

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see [CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual](#) issued by Arm Ltd.
2. Clear the TME bit in the watchdog timer control/status register (WTCSR) of the watchdog timer to 0 to stop the watchdog timer.
3. Set the CKS[3:0] bits in WTCSR and the watchdog timer counter (WTCNT) so that the watchdog timer overflow period is no less than the oscillation settling time after release from the standby state.
4. When an IRQ interrupt signal is used as a software standby cancellation source, change the input/output port to a desired IRQ*¹ and clear all interrupt request flags for the IRQ7 to IRQ0 pins. Then, set the IRQMSK bit to 1 in the IRQ interrupt request register (IRQRR) of the interrupt controller to cancel the cancellation source signal mask of IRQ.

For details of the interrupt request register, see [section 7.3.3, IRQ Interrupt Request Register \(IRQRR\)](#).

5. When using the USB software standby cancellation source signal, change the input/output port to a desired USB signal*² and set the corresponding cancellation source mask bit to 1 in the USB Software standby cancel source control register (SSTBCCR0/1) to cancel the mask. At this time, clear the cancellation source bit of the USB used as a cancellation source by the USB Software Standby Cancel Source Request Register (SSTBCRR0/1).

For details about the USB Software standby cancel source control registers, see [section 52.2.24, USB Software Standby Cancel Source Control Register 0 \(SSTBCCR0\)](#) and [section 52.2.25, USB Software Standby Cancel Source Control Register 1 \(SSTBCCR1\)](#). For details about the USB Software standby cancel source request registers, see [section 52.2.26, USB Software Standby Cancel Source Request Register 0 \(SSTBCRR0\)](#) and [section 52.2.27, USB Software Standby Cancel Source Request Register 1 \(SSTBCRR1\)](#).

6. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR1. Then, execute a WFI instruction.

Note 1. If the desired IRQ has already been used, input/output port switching is not required.

Note 2. If the desired USB signal has already been used, input/output port switching is not required.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ), USB software standby cancel source, or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt or USB software standby cancel source

When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) or the falling edge or rising edge of the USB software standby cancel source (DP, DM, VBUSIN, OVRCLR, CC1_RD, or CC2_RD) is detected, clock oscillation is started.

This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.

When the time specified by the clock select bits (CKS[3:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer has elapsed before the transition to software standby mode, the watchdog timer overflow occurs.

Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire LSI. Software standby mode is thus cleared and NMI interrupts exception handling (IRQ interrupt exception handling in case of IRQ, and USB interrupt exception handling in case of USB) is started. If the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, the interrupt request is not accepted and sleep mode is entered. So, cancel the software standby mode by an interrupt whose priority level is higher than the setting of the interrupt controller execution priority register. When canceling software standby mode by the NMI interrupt, IRQ interrupts, or USB software standby cancellation source, set the CKS[3:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time. The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.

- Canceling by a reset

When the RES# pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the RES# pin is driven high, the power-on reset exception handling is started.

Keep the RES# pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Transition to Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI or IRQ) or a power-on reset. If, however, a WFI instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.

When initiating a transition to software standby mode, make settings so that interrupts other than NMI and IRQ are not generated before execution of the WFI instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, the CKOEN[1:0] bits in FRQCR should be modified.

52.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in Figure 52.2.

When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a WFI instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

Note: When writing to STBCR1 register, see section 52.4, Usage Notes.

Figure 52.2 NMI Timing in Software Standby Mode (Application Example)

52.3.4 Deep Standby Mode

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a WFI instruction after reading STBCR1 to reflect the values written to STBCR1 by the CPU in the WFI instruction without fail.

After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to deep standby proceeds.

Since the transition to deep standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on.

In addition, to suppress unintended requests from bus masters, the software should stop the bus masters before executing the procedure for the transition to deep standby mode. When not using the return factor of the USB 2.0 host/function module, execute the procedure in section 52.4.3, Usage Notes when USB 2.0 Host/Function Modules are Not to be Used before executing the procedure for the transition to deep standby mode.

The procedure for switching to deep standby mode is as follows. Figure 52.3 also shows its flowchart.

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Set the RRAMKP3 to RRAMKP0 bits in RRAMKP for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
3. Set the RAMBOOT and EBUSKEEPE bits in DSCTR to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
4. When canceling deep standby, set the corresponding bit in DSSSR or USBDSRSSR, to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the corresponding bit in DSESR. Also, set the oscillation stabilization time setting with the corresponding bit in the Deep standby cancel Oscillation stability count register (DSCNT).
5. Read any address on each page of the on-chip data-retention RAM area that must be retained. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.
6. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.
7. Clear the flag in the DSFR, USBDSFR register.
8. Set the CPU interface control register (GICC_CTLR) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the GICC_CTLR register.
9. Execute the WFI instruction.
10. The conflict between the instruction and the NMI interrupt may prevent transition to deep standby mode. After executing the WFI instruction, locate the branch instruction to return to step 9.

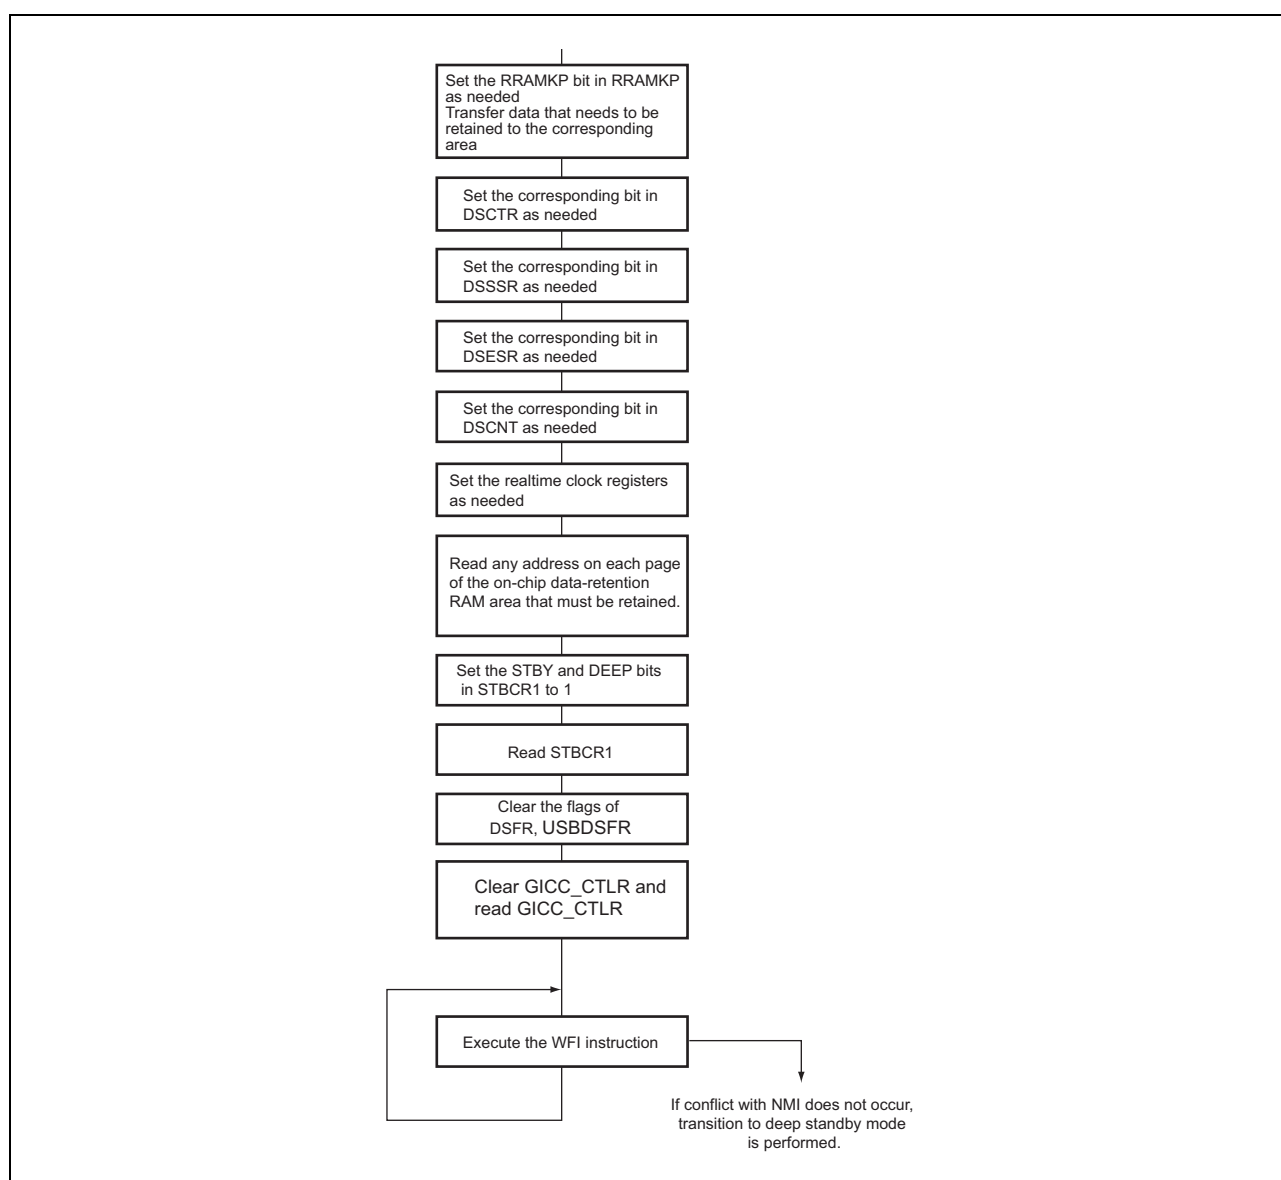

Figure 52.3 Flowchart of Transition to Deep Standby Mode

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or alarm interrupt of realtime clocks 0 and 1 or cancel source of the channels 0 and 1 USB 2.0 host/function modules), change on the pins for canceling, or a reset (power-on reset). The interrupt from the channels 0 and 1 USB 2.0 host/function modules can always cancel deep standby mode regardless of the setting value of the execution priority register of the interrupt controller. The realtime clock 0 or 1 alarm interrupt can always cancel deep standby mode regardless of the setting of the execution priority register for the interrupt controller and of the alarm interrupt enable flag (RCR1.AIE). This interrupt can also always cancel this mode regardless of the states of bit 6 (the FIQ mask bit) and bit 7 (the IRQ mask bit) in the CPSR register of the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.

Figure 52.4 shows the flowchart of canceling deep standby mode.

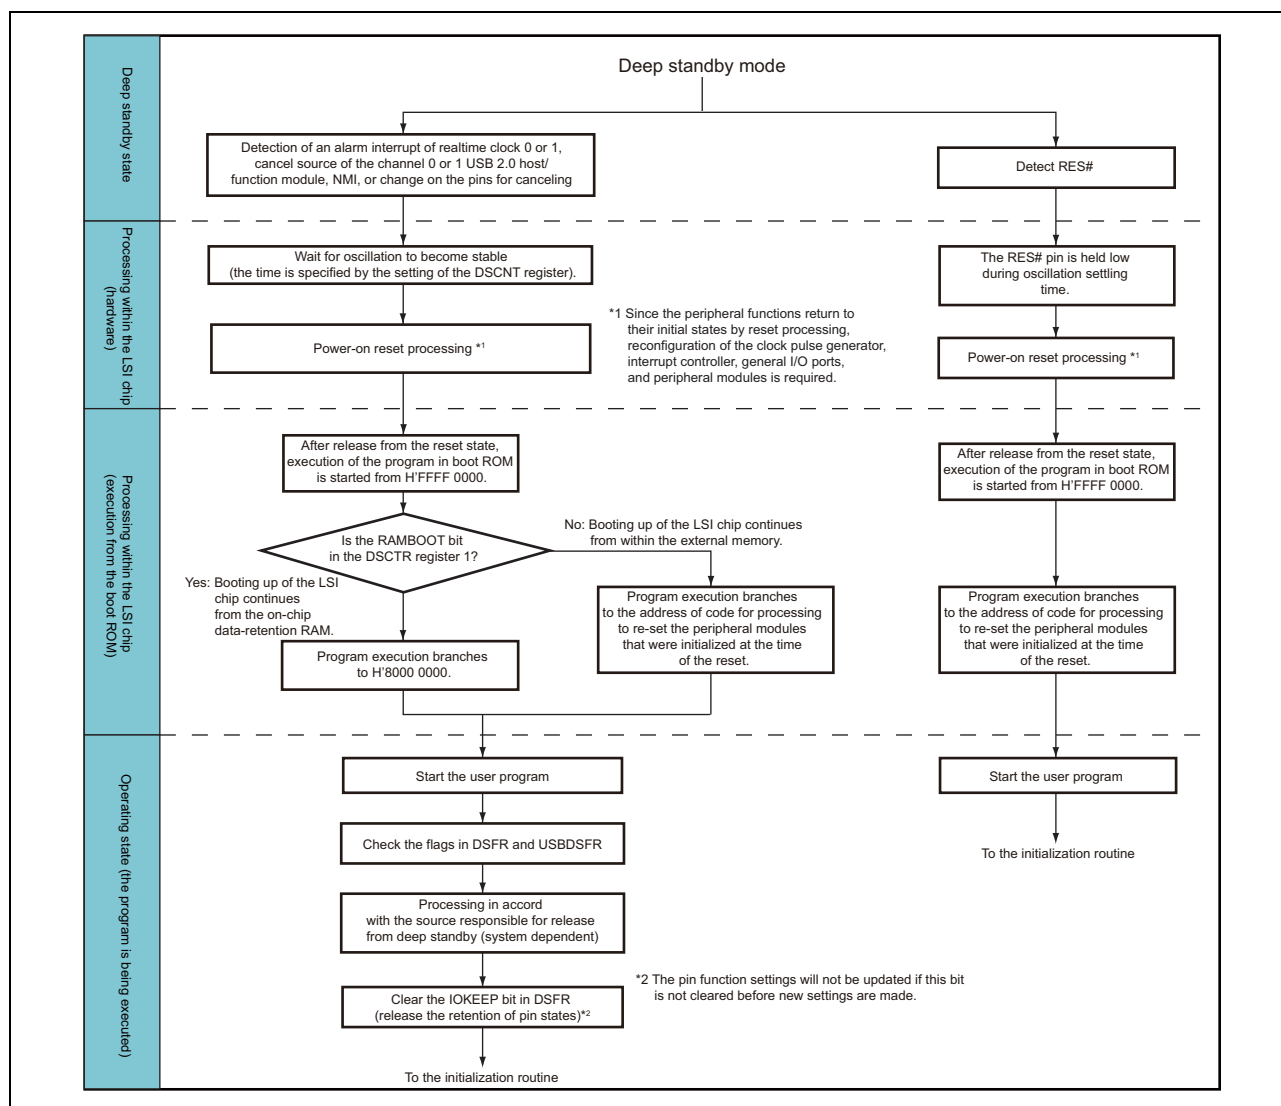

Figure 52.4 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset

When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or a realtime clock 0 or 1 alarm interrupt (see section 16.3.6, Alarm Function) or channel 0 or 1 USB 2.0 host/function module interrupt is generated, clock oscillation is started after the wait time for the power supply stabilization settling time. After the oscillation settling time has elapsed (setting the corresponding bits in DSCNT), deep standby mode is cancelled and the power-on reset exception handling is executed.

The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.

The detecting of the NMI pin, the pins for canceling, and the realtime clock 0 or 1 alarm interrupt becomes enabled when the corresponding bits in DSSSR are set. Likewise, the detecting of the interrupt from the channels 0 and 1 USB 2.0 host/function modules becomes enabled when the corresponding bits in USBDSRSSR are set. The detected cancel sources are kept, but they are reflected to DSFR and USBDSFR after canceling the deep standby mode.

When the CPU accepts any interrupts and reads the interrupt response register (ICCIAR), all of the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.

- Canceling with a reset

Driving the RES# pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the RES# pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the RES# pin low.

Keep the RES# pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 52.4 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 52.4 lists the external memory control pins.

Table 52.4 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

| EBUSKEEPE Bit | RAMBOOT Bit | Activation Method | Pin States After Cancellation of Deep Standby Mode |
|---------------|-------------|----------------------------|--|
| 0 | 0 | External memory | The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared. |
| 0 | 1 | On-chip data-retention RAM | The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared. |
| 1 | 0 | — | Setting prohibited. |
| 1 | 1 | On-chip data-retention RAM | The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared. |

Table 52.5 External Memory Control Pins in Different Modes

| Boot Mode 0 (CS0 Area: Bus Width: 16 Bits) | Boot Mode 1 (eSD Boot) | Boot Mode 2 (eMMC Boot) | Boot Mode 3 (Serial Flash Boot 3.3 V) | Boot Mode 4 (Octal-SPI Flash Boot) | Boot Mode 5 (SPIBSC: HyperFlash Boot 1) | Boot Mode 6 (OctaFlash Boot) | Boot Mode 7 (HyperFlash Boot 2) |
|---|---------------------------|----------------------------|---|--|--|------------------------------------|---------------------------------------|
| A[20:1] | SD0_CLK | | | QSPI0_SPCLK | | OM_SCLK | HM_CK |
| D[15:0] | SD0_CMD | | | QSPI0_IO0 | | | HM_CK# |

| | | | | RPC_RESET# | | OM_SIO7 | HM_DQ7 |
| | | | | RPC_WP# | | OM_RESET# | HM_RESET# |
| | | | | RPC_INT# | | | |

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm 0 or 1) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode. In case of a USB interrupt, it can be confirmed by the USB Deep standby cancel source flag register (USBDSFR). Pins retain the state immediately before the transition to deep standby mode.

However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM (EBUSKEEPE bit = 1 and RAMBOOT bit = 1 setting), after cancellation of deep standby mode, both the external memory control pins and other pins continues to

retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

If multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

52.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting an MSTP bit in a standby control register to 1 halts supply of the clock signal to the corresponding on-chip peripheral module. This function can be used to reduce power consumption both while a program is running and in sleep mode. Disable a module before placing it in the module standby state. If interrupt requests are enabled, set the respective register in the target module or in the interrupt controller to disable interrupt requests. If DMA transfer requests are enabled, set the respective register in the target module to disable DMA transfer requests from the module and then set the respective register in the direct memory access controller to stop DMA transfers. In addition, do not attempt to access a module's registers while it is in the module standby state. The procedure for transitions to the module standby state depends on whether the STBREQ register has a bit for the corresponding module.

(a) Procedure for transition to module standby of modules for which the STBREQ register does not have a corresponding bit

1. Set the MSTP bit of the corresponding module to 1.

(b) Procedure for transition to module standby of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the module is ready to be stopped by the corresponding bit in the STBACK register being set to 1.
3. Set the MSTP bit of the corresponding module to 1.

For states of registers in the module standby function, see section 55, Register States.

(2) Canceling Module Standby Function

Release from the module standby state can be achieved in two ways: starting the module by a power-on reset while the MSTP bit is set to 1, then clearing the MSTP bit to 0, or setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again. If you use the latter approach, the procedure for release from module standby depends on whether the STBREQ register has a bit for the corresponding module.

- Release from the module standby state after the activation of the module by a power-on reset while the MSTP bit is set to 1

1. Clear the MSTP bit to 0.
2. After that, dummy-read the same register.

- Release from the module standby state after a transition to standby following activation of the module

(a) Procedure for release from module standby of modules for which the STBREQ register does not have a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.

(b) Procedure for release from module standby of modules for which the STBREQ register has a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0, indicating the completion of release from standby.

52.3.6 Software Reset

Initialization equivalent to a power-on reset is only applied to the selected modules. The procedure for transitions to the software reset state varies according to whether the STBREQ register has a bit for the corresponding module. Follow the procedures below according to whether this is or is not the case. If DMA transfer requests are enabled, make the settings to stop the DMA transaction for the corresponding channel before transitions to the software reset state. For stopping the DMA transaction, see section 9.7.11, Transfer Status.

(1) Transition to Software Reset State

(a) Procedure for transition to the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(b) Procedure for transition to the software reset state of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the corresponding bit in the STBACK register has been set to 1.
3. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(2) Canceling Software Reset

(a) Procedure for release from the software reset state of modules for which the STBREQ register does not have a corresponding register

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.

(b) Procedure for release from the software reset state of modules for which the STBREQ register has a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0.

52.3.7 Adjustment of XTAL Oscillator Gain

The gain of the oscillator for XTAL and the realtime clock can be adjusted using the GAIN0 bit in XTALCTR. To modify the gain of the signal on the EXTAL or XTAL pin, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer.

After a change to the value of the GAIN0 bit, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the change to the gain for the oscillator in use with XTAL proceeds.

Since the change to the gain for the oscillator in use with XTAL cannot start if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. To suppress an unintended request from a bus master, use the software to stop bus masters before changing the gain of the oscillator for XTAL.

1. The large gain is selected in the initial state.
2. Set the `standby_mode_en` bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
3. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer.
Specifically, the following settings are necessary:
TME in WTCSR = 0: Stop the watchdog timer.
CKS[3:0] in WTCSR: Division ratio for watchdog timer count clock
WTCNT: Initial counter value
(The watchdog timer starts counting on the set clock.)
4. Set the GAIN0 bit to the desired value.
5. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see [section 55, Register States](#).
6. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

52.4 Usage Notes

52.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.

When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.

Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

52.4.2 Usage Notes when the Realtime Clocks are Not to be Used

When the realtime clocks are not to be used, make the required settings for the clocks that are not to be used by following the procedure listed below.

1. Set 0 in the RCKSEL bits in RTC control register 4 (RCR4) for RTC0 and RTC1, as described in [section 16.2.21](#).
2. Set 0 in the RTCEN bits in RTC control register 3 (RCR3) for RTC0 and RTC1, as described in [section 16.2.20](#).
Check that the bits have actually been updated before proceeding with the next step.
3. Set 0 in the RTC1XT and RTC0XT bits in the RTCXTAL selection register (RTCXTALSEL), as described in [section 52.2.36](#).
4. Set 1 in the MSTP53 and MSTP52 bits in the standby control register 5 (STBCR5), as described in [section 52.2.5](#).

52.4.3 Usage Notes when USB 2.0 Host/Function Modules are Not to be Used

When the USB 2.0 host/function modules are not to be used, release the modules that are not to be used from the power-on reset state or deep standby state and then set up the registers by following the procedure shown below.

Note that, if the device in use is one in the 176-pin BGA package, be sure to perform the following processing for the channel 1 USB 2.0 host/function module.

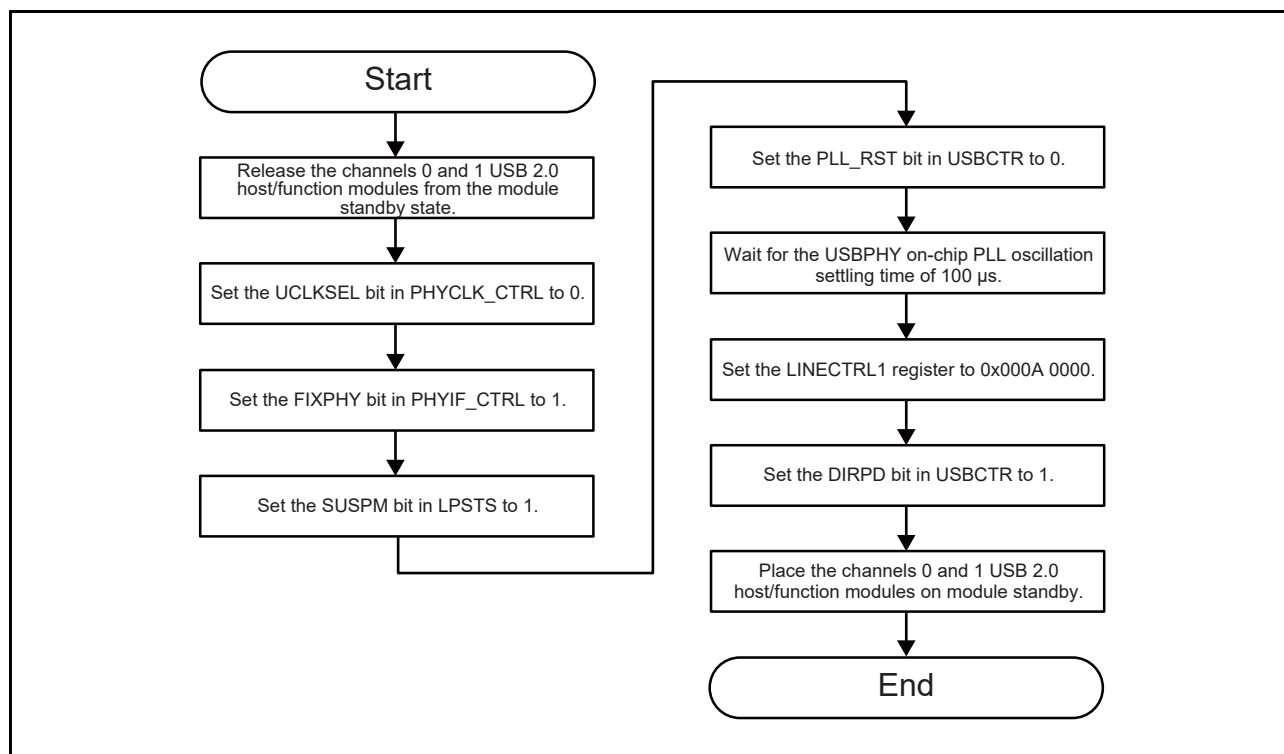

Figure 52.5 Flow of Settings when USB 2.0 Host/Function Modules are Not to be Used

For details on the registers, see section 32.2, Register Descriptions and section 33.2, Registers.

53. Debugger Interface

This LSI incorporates a debugger interface to support the boundary scan function and connection to the emulator.

53.1 Features

The debugger interface is a serial input/output interface which has a JTAG (Joint Test Action Group, IEEE Std.1149.1 and IEEE Standard Test Access Port and Boundary-Scan Architecture) interface and CoreSight debug interface.

This module has TAP controllers for the boundary scan and CoreSight debug function.

Driving the BSCANP pin high selects the boundary-scan TAP controller, and driving the BSCANP pin low selects the CoreSight debug TAP controller.

Figure 53.1 is a block diagram of this module and Table 53.1 shows the JTAG pin mode.

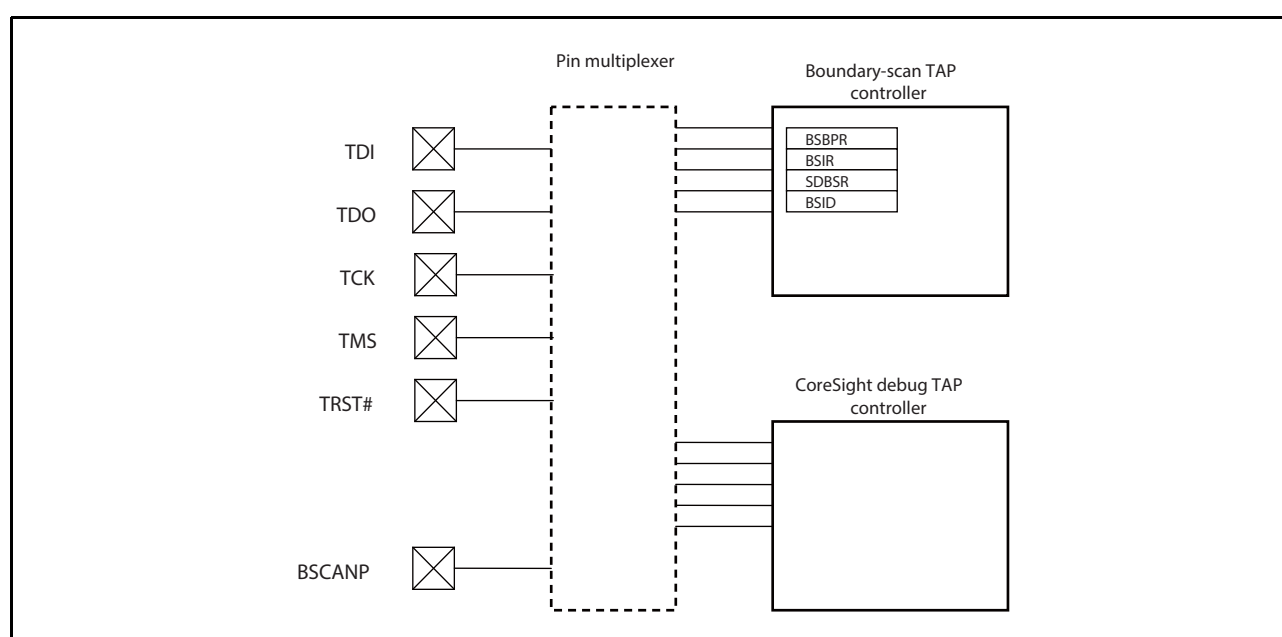

Figure 53.1 Block Diagram

Table 53.1 JTAG Pin Mode

| BSCANP | JTAG Pin Mode |
|--------|---|
| 0 | Normal operation (CoreSight debug mode) |
| 1 | Boundary-scan mode |

Table 53.3 SYS CTI0 Trigger Outputs

| Trigger Output Bit | Trigger Signal | Source Device |

53.2 Input/Output Pins

Table 53.10 shows the pin configuration of the debugger interface.

Table 53.10 Pin Configuration

| Name | Pin Name | Input/ Output | Function |
|-----------------------|-----------------------------|----------------------------|--|
| Test clock | TCK/SWDCLK | Input | Data is input in serial to this module via the data input pin (TDI) or data is output via the data output pin (TDO) in synchronization with this signal. Functions as the SWDCLK pin in serial wire debug (SWD) mode. |
| Test mode select | TMS/SWDIO | Input, Input/ Output | Changing this signal in synchronization with the TCK signal determines the state of the TAP controller circuit. Its protocol conforms to the subset of the JTAG standard (IEEE standard 1149.1). Functions as the SWDIO pin in serial wire debug (SWD) mode. |
| Test reset | TRST# ¹ | Input | This signal is received asynchronously with the TCK signal. Asserting this signal resets this module. When power is supplied, this pin should be asserted for a given period regardless of whether or not this module function is used. For details on resetting, see section 53.5.2, Reset Signal Setting. |
| Test data input | TDI | Input | Data is sent to this module by changing this signal in synchronization with the TCK signal. |
| Test data output | TDO/SWO | Output | Data is read from this module by reading this signal in synchronization with the TCK signal. This pin also functions as an output pin in the serial wire debug (SWD) mode. |
| Boundary scan setting | BSCANP | Input | Input a high-level signal during boundary-scan testing. Input a low-level signal during normal use. |
| Clock output | TRACECLK | Output | Trace clock output pin |
| Enable output | TRACECTL | Output | Trace enable output pin |
| Data output | TRACEDATA3 to TRACEDATA0 | Output | Trace data output pins |

Note 1. When designing a board that can use an emulator, the RES# and TRST# pin circuits should be designed so that they can be set low and the TRST# pin can be controlled independently at power-on. When the TRST# pin is not in use, it should be either fixed to low level or connected to the RES# pin (or another pin which operates in the same manner as the RES# pin).

53.3 Registers for Boundary-Scan TAP Controller

The boundary-scan TAP controller has the following registers.

Table 53.11 List of Registers of Boundary-Scan TAP Controller

| Register Name | Abbreviation | R/W | Initial Value | Address | Access Size |
|------------------------|--------------|-----|---------------|---------|-------------|
| Bypass register | BSBPR | — | — | — | — |
| Instruction register | BSIR | — | H'55 | — | — |
| Boundary scan register | SDBSR | — | — | — | — |
| ID register | BSID | — | H'083B6447 | — | — |

53.3.1 Bypass Register (BSBPR)

BSBPR is a 1-bit register that cannot be accessed by the CPU. When BSIR is set to BYPASS mode, BSBPR is connected between the TDI and TDO pins. The initial value is undefined.

53.3.2 Instruction Register (BSIR)

BSIR is an 8-bit register. This register is initialized by TRST# assertion or in the TAP test-logic-reset state. BSIR cannot be accessed by the CPU.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 7 to 0 | TI[7:0] | 01010101 | — | Test Instruction The instruction of this module is transferred to BSIR through a serial input from the TDI pin. For commands, see Table 53.12. |

Table 53.12 Commands Supported for Boundary Scan TAP Controller

| Bits 7 to 0 | | | | | | | | Description |
|------------------|-----|-----|-----|-----|-----|-----|-----|------------------------|
| TI7 | TI6 | TI5 | TI4 | TI3 | TI2 | TI1 | TI0 | |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | EXTEST |
| 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | SAMPLE/PRELOAD |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | IDCODE (initial value) |
| 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | CLAMP |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | HIGHZ |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | BYPASS |
| Other than above | | | | | | | | Reserved |

53.3.3 Boundary Scan Register (SDBSR)

SDBSR is a shift register, located on the PAD, for controlling the input/output pins of this LSI. SDBSR cannot be accessed by the CPU. The initial value is undefined. Using the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ commands, a boundary scan test conforming to the JTAG standard can be carried out. Table 53.13 shows the correspondence between the pins of this LSI and bits of the boundary scan register.

Table 53.13 Correspondence between Pins of this LSI and Bits of Boundary Scan Registers

| 324-Pin Bit Number | 272-/256-Pin Bit Number | 176-Pin Bit Number | Pin Name*1 | Type | 324-Pin Bit Number | 272-/256-Pin Bit Number | 176-Pin Bit Number | Pin Name*1 | Type |

| 18 | 18 | - | PB_5 | INPUT | 0 | 0 | - | PB_1 | INPUT |
| 17 | - | - | P9_3 | OUTPUT | | | | | |

Note 1. The pin names are as listed in the "Port function/dedicated function" column of Table 1.4 in section 1.6, List of Pins.

Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.

Note 3. Bits of type "control" are active low. When the control bit is at the low level, the corresponding pin becomes an output.

Note 4. This pin is a TTL level input in the case of a boundary scan.

53.3.4 ID Register (BSID)

BSID is a 32-bit read-only register that cannot be accessed by the CPU. BSID can only be read from the pins when the IDCODE command is set. The device ID can be read from the CPU by access to the BSID register as described in section 5.11.1, BSID Register (BSID).

| | | | | | | | | | | | | | | | | |
|----------------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | DID[31:16] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 1 |
| R/W: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Initial value: | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 0 | DID[31:0] | H'083B6447 | — | Device ID This is the ID register stipulated by JTAG. Note that the higher-order four bits may be changed depending on the version of the chip. |

53.4 ICE Registers

The debugger interface has the following ICE registers.

ICE registers are exclusively for use in debugging. Do not use these registers other than for debugging.

Table 53.14 Configuration of ICE Registers

| Register Name | Abbreviation | R/W | Initial Value | Address | | Access Size |
|------------------------------|--------------------|-----|---------------|-----------------|----------------------|-------------|
| | | | | Viewed from CPU | Viewed from Debugger | |
| Mode reset control register | ICEREGMDRSTCTL*1 | R/W | H'0000111E | H'FC00F000 | H'8000F000 | 32 |
| JTAG trace select register | ICEREGJTTRCSEL*1 | R/W | H'00000000 | H'FC00F004 | H'8000F004 | 32 |
| Clock power control register | ICEREGCLKPWRCTRL*1 | R/W | H'00000000 | H'FC00F014 | H'8000F014 | 32 |
| Lock access register | ICEREGLOCKACCES | W | — | H'FC00FFB0 | H'8000FFB0 | 32 |

Note 1. When the CPU is to write a value to these registers, set the ICEREGLOCKACCESS register to "H'C5ACCE55" beforehand.

53.4.1 Mode Reset Control Register (ICEREGMDRSTCTL)

ICEREGMDRSTCTL is used to set the debug mode and to perform software reset.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Initial value: | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 13 | — | All 0 | R | Reserved The read value is always 0. |
| 12 | RSTRB_CPU0_DERSTZ | 1 | R/W | NEON Reset (low-active) Resets the NEON unit in the CPU. |
| 11 to 9 | — | All 0 | R | Reserved The read value is always 0. |
| 8 | RSTRB_CPU0_CPURSTZ | 1 | R/W | CPU Reset (low-active) Resets all systems on the CPU block other than debugging resources. |
| 7 to 5 | — | All 0 | R | Reserved The read value is always 0. |
| 4 | — | 1 | R/W | Reserved The read value is always 1. The write value should always be 1. |
| 3 | — | 1 | R/W | Reserved The read value is always 1. The write value should always be 1. |
| 2 | RSTRB_CPU0_PRSTDBGZ | 1 | R/W | CPU Subsystem Debug Peripheral Reset (low-active) Resets the debug-APB block in the CPU subsystem. |
| 1 | RSTRB_CPU0_SYSRSTZ | 1 | R/W | CPU Subsystem Reset (low-active) Resets the CPU subsystem other than those for debugging. |
| 0 | — | 0 | R | Reserved The read value is always 0. |

53.4.2 JTAG Trace Select Register (ICEREGJTTRCSEL)

ICEREGJTTRCSEL is used to control trace data output to the respective pins and debug enable signal supplied to the CPU.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|--------------------|-----|----|----|----|----|------------|----|----|----|----|

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 27 | — | All 0 | R | Reserved The read value is always 0. |
| 26, 25 | TRCCK_DIV_SEL [1:0] | 0 | R/W | Sets the divider ratio of the trace clock output. 00: Trace clock /4 (33-MHz DDR) 01: Trace clock /2 (66-MHz DDR) 10: Trace clock (132-MHz DDR) 11: Setting prohibited. |
| 24 to 21 | — | All 0 | R | Reserved The read value is always 0. |
| 20 | TRCMUX_SEL | 0 | R/W | Sets the priority of the function multiplexed on the pins to which trace output is assigned. 0: The function of the pins depends on the general I/O port setting. 1: The pins act as trace outputs regardless of the general I/O port setting. |
| 19 to 0 | — | All 0 | R | Reserved The read value is always 0. |

53.4.3 Clock Power Control Register (ICEREGCLKPWRCTRL)

ICEREGCLKPWRCTRL is used to set the fake debug mode.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|--------------|---|---|---|---|---|---|----------|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | FAKEDBG CTRL | — | — | — | — | — | — | FAKE DBG |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved The read value is always 0. |
| 7 | FAKEDBGCTRL | 0 | R/W | Enables or disables the fake debug mode*1. 0: The power control is determined by the standby control register 1 (STBCR1). 1: The power control is determined by this register. |
| 6 to 1 | — | All 0 | R | Reserved The read value is always 0. |
| 0 | FAKEDBG | 0 | R/W | Selects whether or not to stop the power supply in deep standby mode. 0: The power supply is actually stopped in deep standby mode. 1: The power supply is not stopped even in deep standby mode. |

Note 1. In fake debug mode, stopping the power supply to any module, including the debugger interface, is disabled; the supply of power to the modules is continued. Using fake debug mode can be helpful in the debugging of software for a system which is released from the deep standby mode after a transition to deep standby mode. Do not use fake debug mode for purposes other than debugging. To use fake debug mode, set the FAKEDBGCTRL and FAKEDBG bits to 1.

53.4.4 Lock Access Register (ICEREGLOCKACCESS)

ICEREGLOCKACCESS is used to enable access to ICE registers by the CPU.

| | | | | | | | | | | | | | | | | |
|----------------|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | ICEREGLOCKACCESS | | | | | | | | | | | | | | | |
| Initial value: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W: | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

| | | | | | | | | | | | | | | | | |
|----------------|------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ICEREGLOCKACCESS | | | | | | | | | | | | | | | |
| Initial value: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W: | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------------|---------------|-----|--|
| 31 to 0 | ICEREGLOCK ACCESS | — | W | To enable access to ICE registers by the CPU, first write H'C5ACCE55 to this register. |

53.5 Operation

53.5.1 TAP Controller

Figure 53.3 shows the internal states of the TAP controller. State transitions basically conform to the JTAG standard.

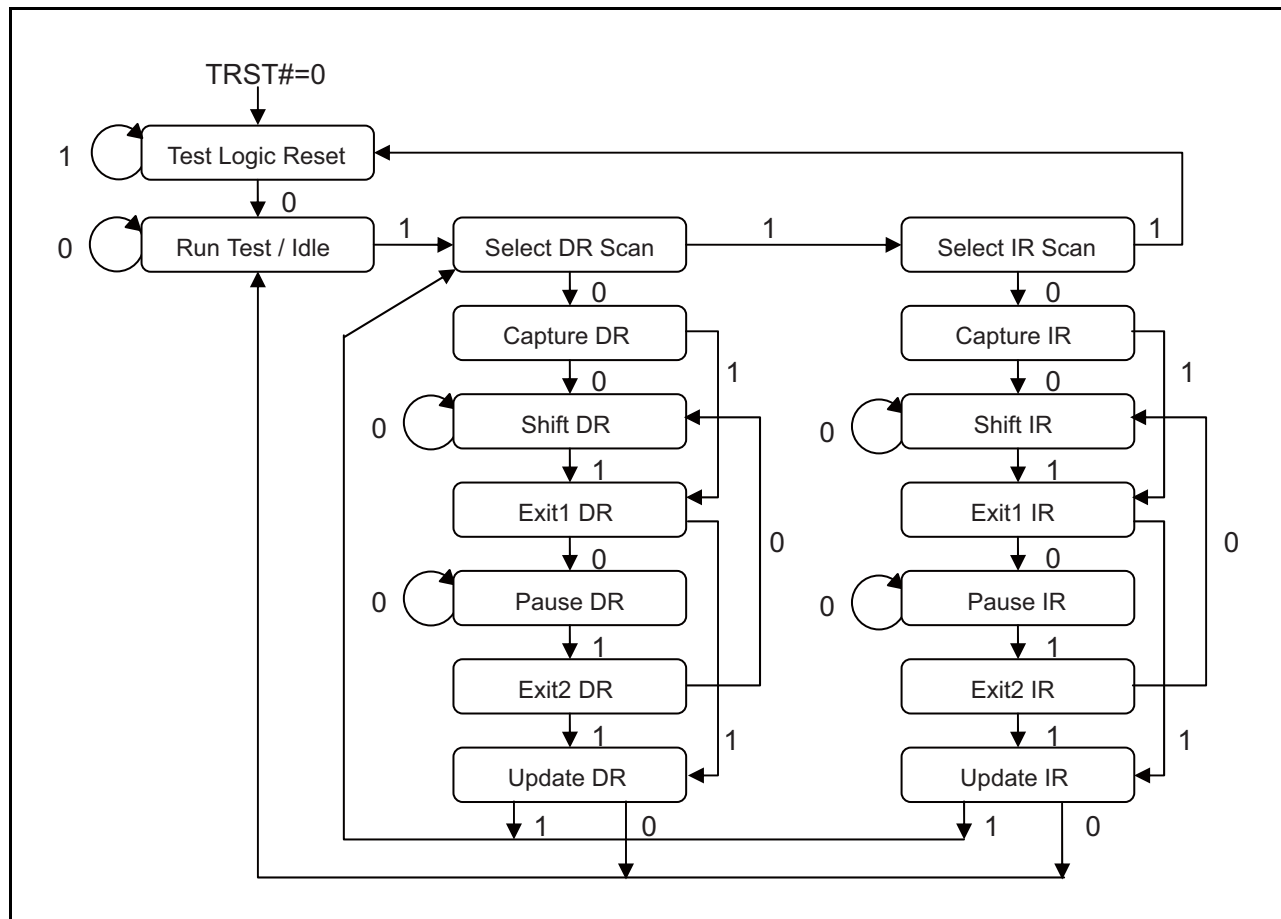

Figure 53.3 State Transitions of TAP Controller

Note: State transition occur according to the TMS value at the rising edge of the TCK signal. The TDI value sampled at the rising edge of the TCK signal and shifted at the falling edge of the TCK signal. TDO value is output at the rising edge of the TCK signal. The TDO signal is in a Hi-Z state for TAP controller states other than Shift-DR and Shift-IR. A transition to the Test-Logic-Reset state by clearing TRST# to 0 is performed asynchronously with the TCK signal.

53.5.2 Reset Signal Setting

Table 53.15 Reset Signal Setting

| RES# | TRST# | Chip State |
|------|-------|--|
| L | L | The chip is power-on reset and this module is reset.*1 |
| | H | The chip is power-on reset.*1 |
| H | L | This module is only reset. |
| | H | Normal operation |

Note 1. By asserting the RES# and TRST# signals, the CPU and CoreSight enter the reset state. Set the debugging function while asserting the RES# signal after negating the TRST# signal.

53.6 Boundary Scan

Commands can be set in BSIR by this module to place this module's pins in boundary scan mode stipulated by JTAG.

53.6.1 Supported Instructions

This LSI supports three mandatory instructions stipulated by JTAG standard (BYPASS, SAMPLE/PRELOAD, and EXTEST) and three option instructions (IDCODE, CLAMP, and HIGHZ).

(1) BYPASS

BYPASS is a mandatory instruction that operates the bypass register. This instruction is used to shorten the shift path to speed up serial data transfer involving other LSI on the printed circuit board. This LSI's system circuits are not affected by execution of this instruction.

(2) SAMPLE/PRELOAD

SAMPLE/PRELOAD is used to input data from this LSI's internal circuit to the boundary scan register, outputs data from the scan path, and loads data onto the scan path. While this instruction is being executed, signals input to this LSI pins are transmitted directly to the internal circuit, and the values of the internal circuit are directly output externally from the output pins. This LSI's system circuits are not affected by execution of this instruction.

In a SAMPLE operation, a snapshot of a value to be transferred from an input pin to the internal circuit, or a value to be transferred from the internal circuit to an output pin, is latched into the boundary scan register and read from the scan path. Snapshot latching is performed in synchronization with the rising edge of the TCK signal in the Capture-DR state. Snapshot latching does not affect normal operation of this LSI.

In a PRELOAD operation, an initial value is set in the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. Without a PRELOAD operation, when the EXTEST instruction was executed, an undefined value would be output from the output pin until completion of the initial scan sequence (transfer to the output latch) (with the EXTEST instruction, the parallel output latch value is constantly output to the output pin).

(3) EXTEST

This instruction is provided to test external circuit when this LSI is mounted on a printed circuit board. When this instruction is executed, output pins are used to output test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed circuit board, and input pins are used to latch test results into the boundary scan register from the printed circuit board. If testing is carried out by using the EXTEST instruction N times, the Nth test data is scanned-in when test data (N-1) is scanned out. The data loaded into the output pin boundary scan register in the Capture-DR state are not used for external circuit testing (data are replaced by the shift operation).

(4) IDCODE

Commands can be set in BSIR via pins of this module to place the module's pins in the IDCODE mode stipulated by JTAG. When this module is initialized (TRST# is asserted or TAP is in the Test-Logic-Reset state), the IDCODE mode is entered.

(5) CLAMP, HIGHZ

Commands can be set in BSIR via pins of this module to place the module's pins in the CLAMP or HIGHZ mode stipulated by JTAG.

53.6.2 Points for Attention

Boundary scan mode does not cover the following signals.

| Category / Module | Clock | Reset, Interrupt | Debugger interface | USB 2.0 Host function module |
|-------------------|---|---------------------------------|--------------------------|------------------------------|
| Pin Name | AUDIO_X1 | RES# | TRST# | DP0 |
| | AUDIO_X2 | | JP0_1 | DM0 |
| | USB_X1 | | JP0_0 | RREF0 |
| | USB_X2 | | TMS | DP1 |
| | XTAL | | TCK | DM1 |
| | EXTAL | | BSCANP | RREF1 |
| | CKIO | | | |
| | RTC_X1 | | | |
| | RTC_X2 | | | |
| Category / Module | HyperBus controller Octa Memory controller | SPI Multi I/O bus controller | SD/MMC Host interface | MIPI CSI-2 Interface |
| Pin Name | HM_CK# | QSPI0_IO0 | SD0_CLK | CSI_CLKP |
| | HM_CK / OM_SCLK | QSPI0_IO1 | SD0_CMD | CSI_CLKN |
| | HM_CS0# / OM_CS0# | QSPI0_IO2 | SD0_DAT0 | CSI_DATA0P |
| | HM_CS1# / OM_CS1# | QSPI0_IO3 | SD0_DAT1 | CSI_DATA0N |
| | HM_DQ0 / OM_SIO0 | QSPI0_SPCLK | SD0_DAT2 | CSI_DATA1P |
| | HM_DQ1 / OM_SIO1 | QSPI0_SSL | SD0_DAT3 | CSI_DATA1N |
| | HM_DQ2 / OM_SIO2 | QSPI1_IO0 | SD0_DAT4 | |
| | HM_DQ3 / OM_SIO3 | QSPI1_IO1 | SD0_DAT5 | |
| | HM_DQ4 / OM_SIO4 | QSPI1_IO2 | SD0_DAT6 | |
| | HM_DQ5 / OM_SIO5 | QSPI1_IO3 | SD0_DAT7 | |
| | HM_DQ6 / OM_SIO6 | QSPI1_SPCLK | SD0_RST# | |
| | HM_DQ7 / OM_SIO7 | QSPI1_SSL | SD1_CLK | |
| | HM_RESET# / OM_RESET# | RPC_INT# | SD1_CMD | |
| | HM_RWDS / OM_DQS | RPC_RESET# | SD1_DAT0 | |
| | | RPC_WP# | SD1_DAT1 | |
| | | | SD1_DAT2 | |
| | | | SD1_DAT3 | |

53.7 Usage Notes

1. Once a command of this module is set, it will not be modified unless another command is reissued. If the same command is given continuously, the command must be set after a command (BYPASS, etc.) that does not affect LSI operations is once set.
2. Regardless of whether or not this module is to be used, it should be initialized by asserting the TRST# signal when power is supplied and on release from deep standby mode (excluding fake debug mode) through assertion of the RES# signal.
3. Be sure to wait for at least 200 ns after negating the TRST# signal before starting TAP controller operation.
4. Be sure to fix the TMS pin to the high level until 200 ns have elapsed after negation of the TRST# signal.

54. Trusted Secure IP

This LSI incorporates a Trusted Secure IP module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator. In combination with the Trusted Secure IP driver, the Trusted Secure IP can prevent eavesdropping (confidentiality), falsification of information (integrity), and impersonation (authenticity).

Key information to be used in encrypting and decrypting data is only stored within the Trusted Secure IP, and any external access can be shut out to obtain a system with strong security.

54.1 Overview

Table 54.1 summarizes the specifications of the Trusted Secure IP. Figure 54.1 shows a block diagram of the Trusted Secure IP.

Table 54.1 Specifications of Trusted Secure IP (1/2)

| Item | Description |
|-------------------|--|
| Access control | <p>Access management circuit</p> <ul style="list-style-type: none"> In case of irregular access to the Trusted Secure IP due to a falsified program or runaway execution of a program, this circuit blocks all subsequent access and stops the output of data from the Trusted Secure IP. |

Table 54.1 Specifications of Trusted Secure IP (2/2)

| Item | Description |
|------------------------------|--|
| Encryption engine | Key management <ul style="list-style-type: none"> • Keys are only valid within the Trusted Secure IP. • Only key generation information is output from the Trusted Secure IP. • Keys can be regenerated by the input of key generation information to the Trusted Secure IP. Endian <ul style="list-style-type: none"> • Big or little |
| Generation of random numbers | 32-bit true random number generator <ul style="list-style-type: none"> • The Trusted Secure IP driver can assemble 32-bit true random numbers to generate 128- or 256-bit true random numbers. • The generated 128-bit and 256-bit true random numbers are used as keys in encrypting and decrypting data. |
| Unique ID | <ul style="list-style-type: none"> • An ID unique to the LSI (unique ID) is accessible from the access management circuit through the dedicated bus. • Combining the unique ID with the key generation information prevents the illicit copying of data to another LSI. |
| Interrupt sources | 10 |
| Low power consumption | Setting of the module stop state is possible. |

Note 1. This does not include the overhead for calling functions of the Trusted Secure IP driver.

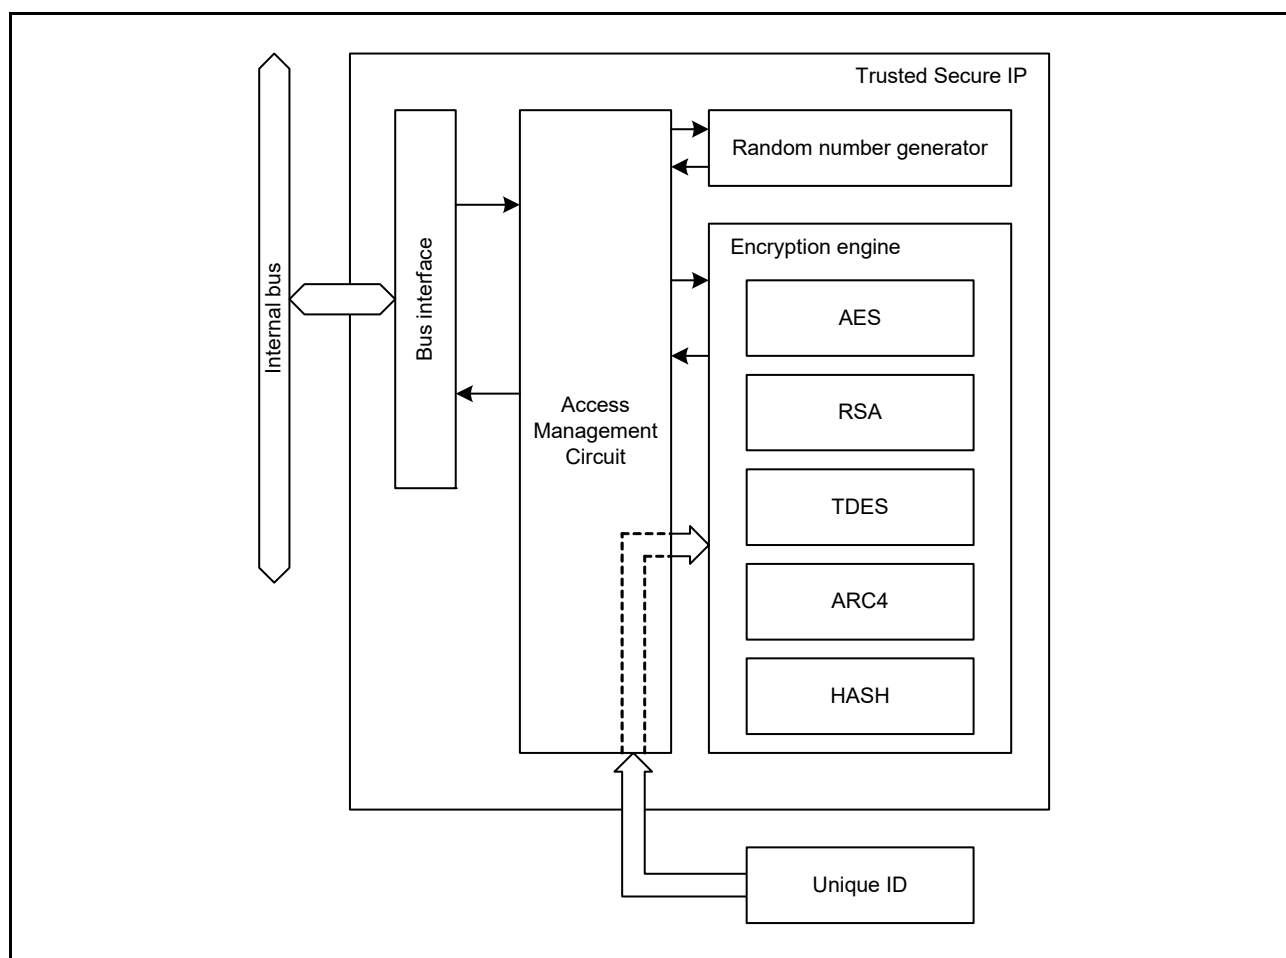

Figure 54.1 Trusted Secure IP Block Diagram

54.2 Operation

54.2.1 Operating Modes and State Transitions

Figure 54.2 shows the state transitions of the Trusted Secure IP.

Use of the Trusted Secure IP security functions is only possible through use of the Trusted Secure IP driver provided by Renesas Electronics, in accordance with the state transitions as shown in the figure below.

When irregular access to the Trusted Secure IP (access that violates the defined procedure) due to a falsified program or a program entering runaway execution, etc. is attempted, the access management circuit does not accept any subsequent access and stops the output of any data from the Trusted Secure IP.

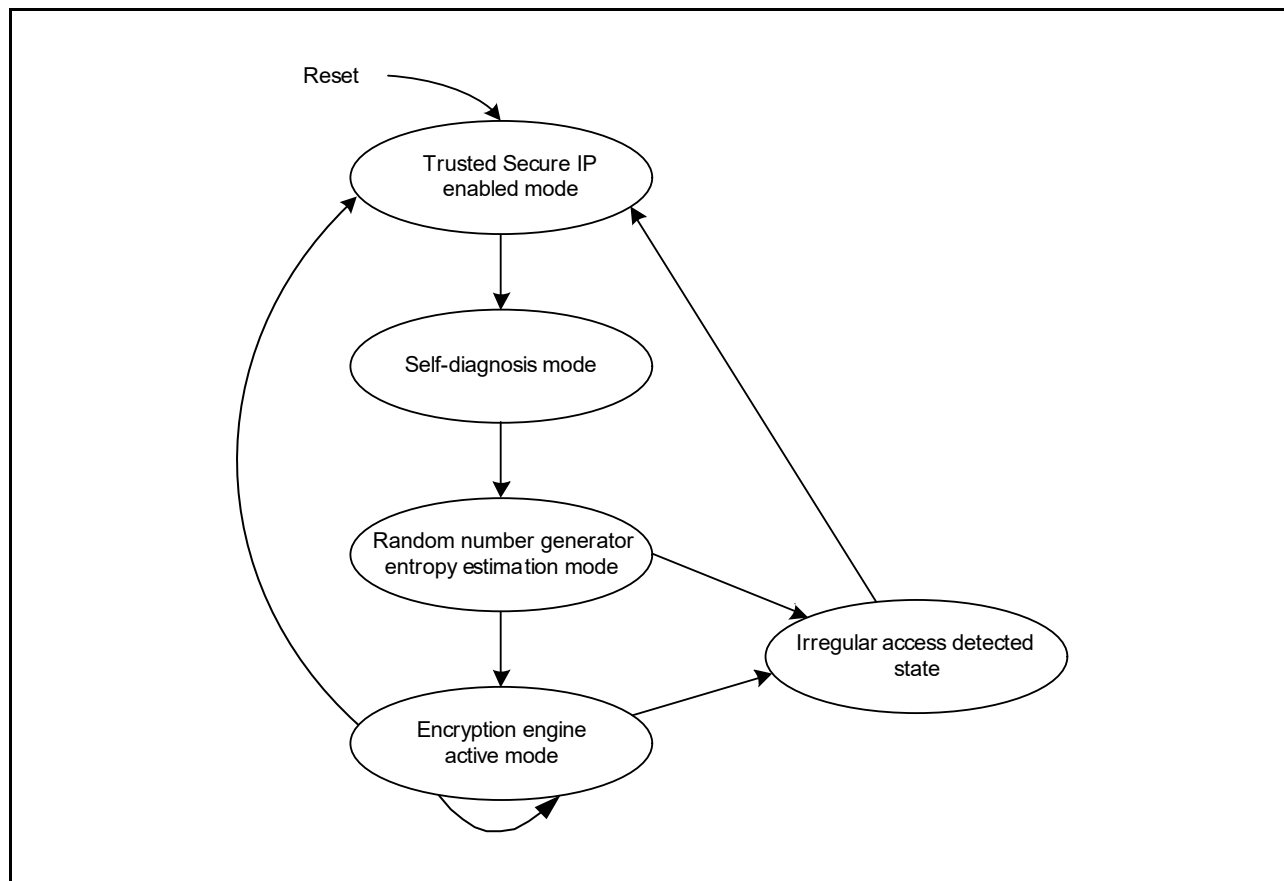

Figure 54.2 Trusted Secure IP Operating Modes and State Transitions

Many of the security functions that the Trusted Secure IP offers are applicable only in the encryption engine active mode. The operations that can be performed in this mode are given below.

- (1) Key Installation
- (2) Encryption and decryption
- (3) Key generation
- (4) Random number generation

54.2.2 Encryption Engine

Figure 54.3 shows processes of the encryption engine integrated in the Trusted Secure IP.

The encryption engine, using the key generation information, performs plaintext to ciphertext encryption and ciphertext to plaintext decryption by hardware.

In no part of the encryption or decryption process, is key data or intermediate data ever exposed outside of the Trusted Secure IP.

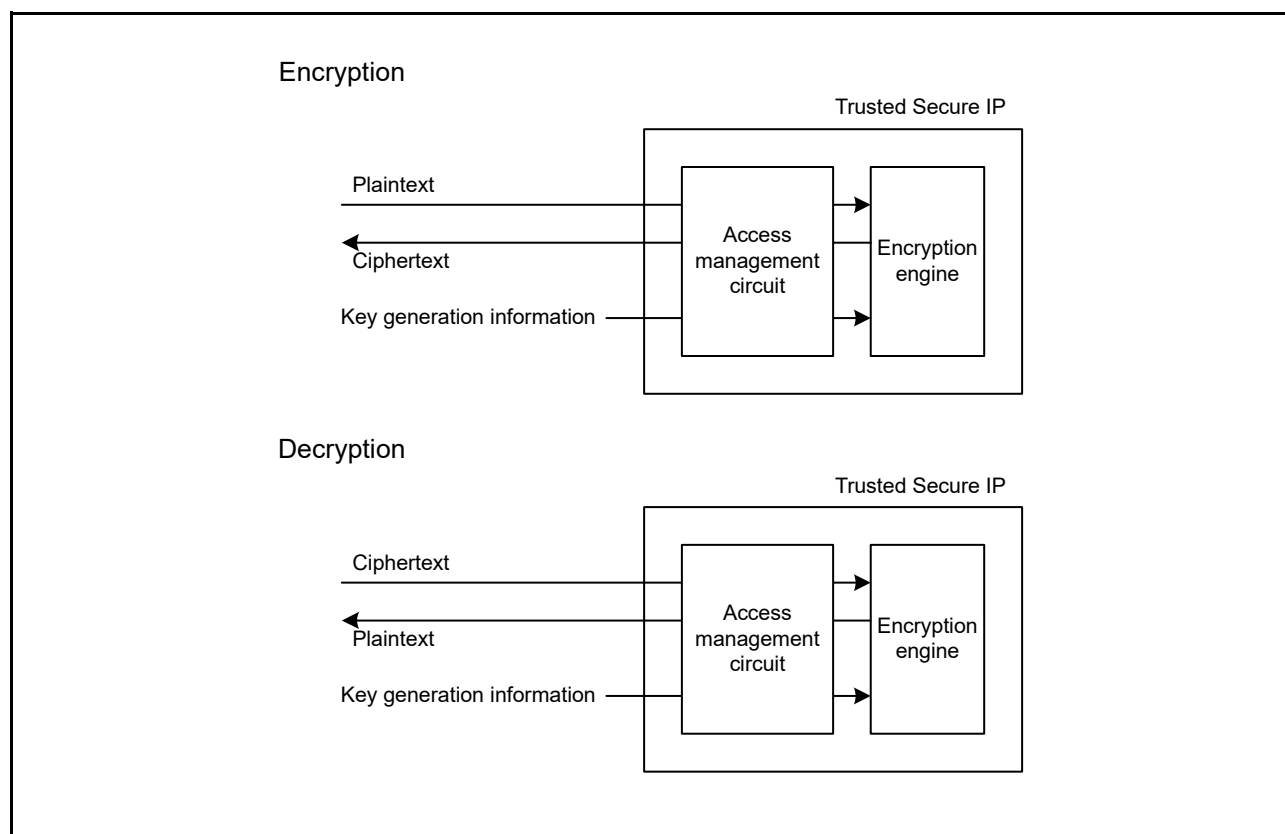

Figure 54.3 Encryption and Decryption processes by Encryption Engine

54.2.3 Key Installation

The key installation is the operation that safely converts the user key to the key generation information and stores it in flash memory. The procedure for installing the key data are given below.

- (1) The user uses the key (Key-2) used for encrypting the user key to encrypt the user key (Key-1) producing eKey-1.
- (2) The user sends the encrypted user key (eKey-1) to the Trusted Secure IP over the serial interface.
- (3) The key generation information of the Key-2 (Index-2) contained in the Trusted Secure IP driver is used to recover the Key-2, which is then used to decrypt the user key.
- (4) The user key is converted to user key generation information (Index-1) using the unique ID and a random number, and stored in flash memory.

The installation process and flow chart are given in Figure 54.4 and Figure 54.5, respectively.

Once the key data is installed, the user key generation information (Index-1) can then be used to perform encryption or decryption.

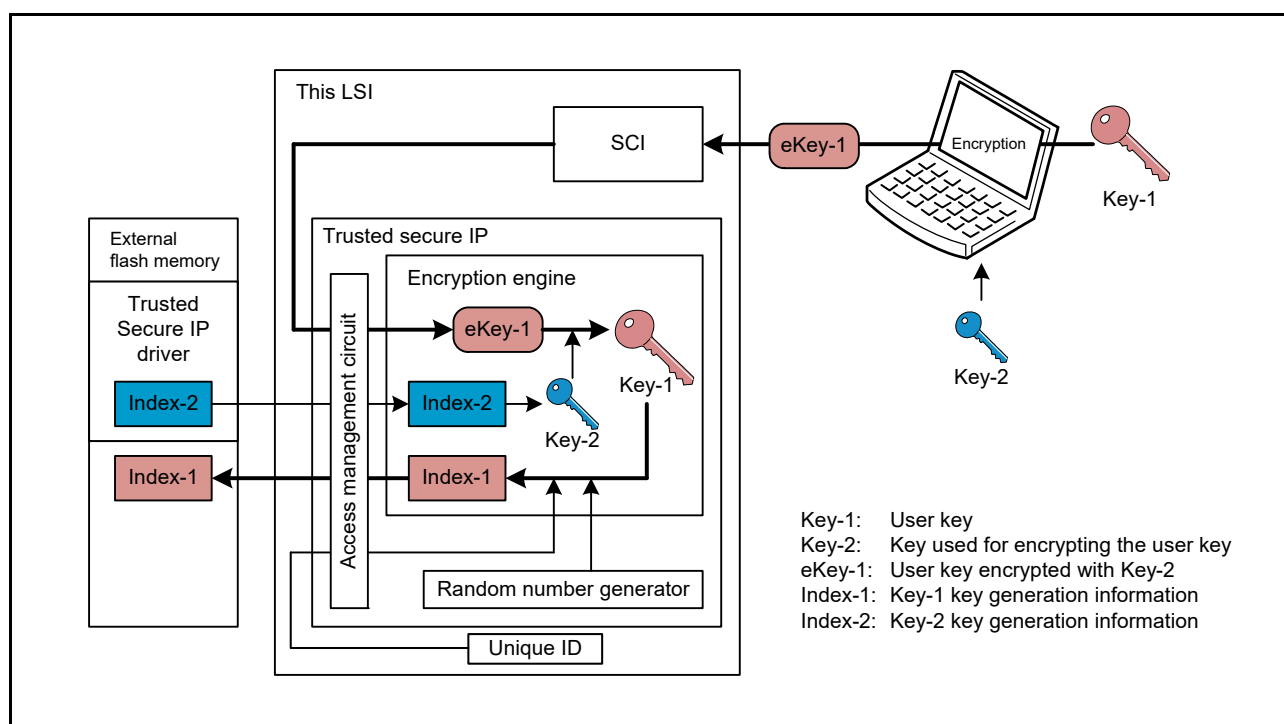

Figure 54.4 Key Installation Process

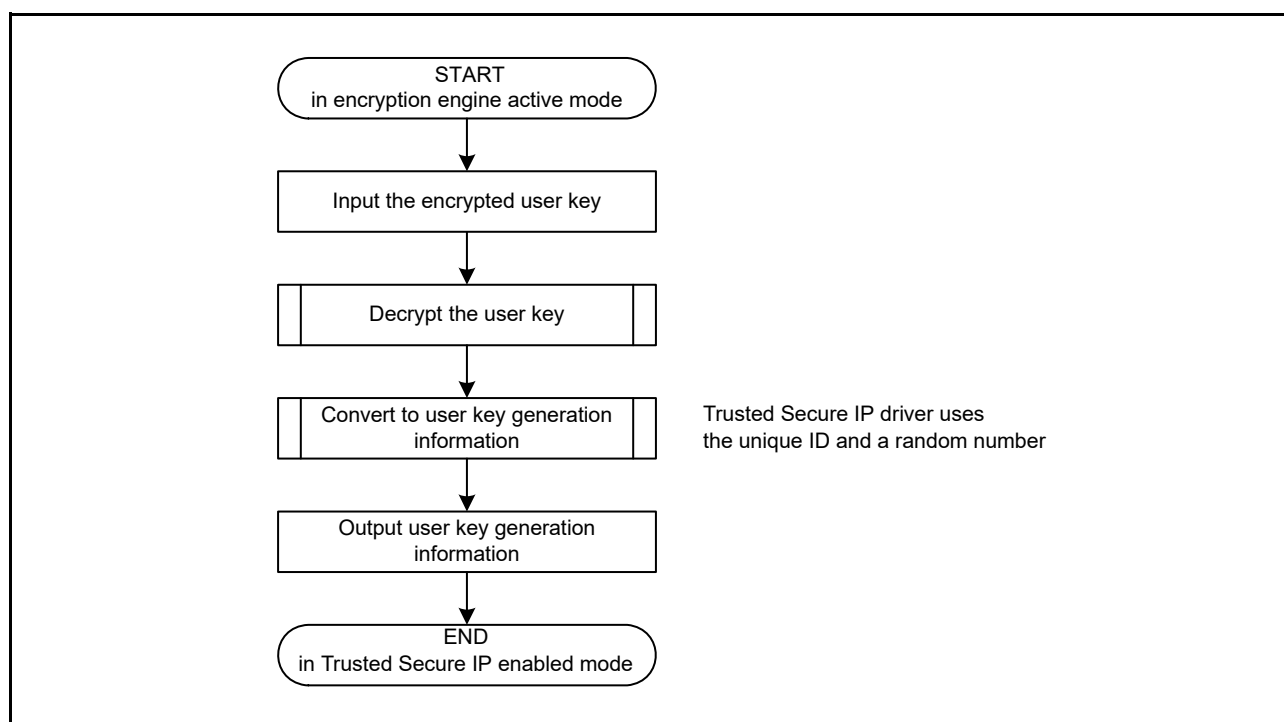

Figure 54.5 Key Installation Flow Chart

54.2.4 Encryption and Decryption

The procedures for encrypting and decrypting data are given below.

- (1) Input the key generation information into the Trusted Secure IP, and recover the key data.
- (2) Input the data to encrypt or decrypt into the Trusted Secure IP. This converts plaintext into ciphertext, and ciphertext into plaintext.
- (3) Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output.

Figure 54.6, Figure 54.7, and Figure 54.8 show the timing diagram, encryption flow, and decryption flow, respectively.

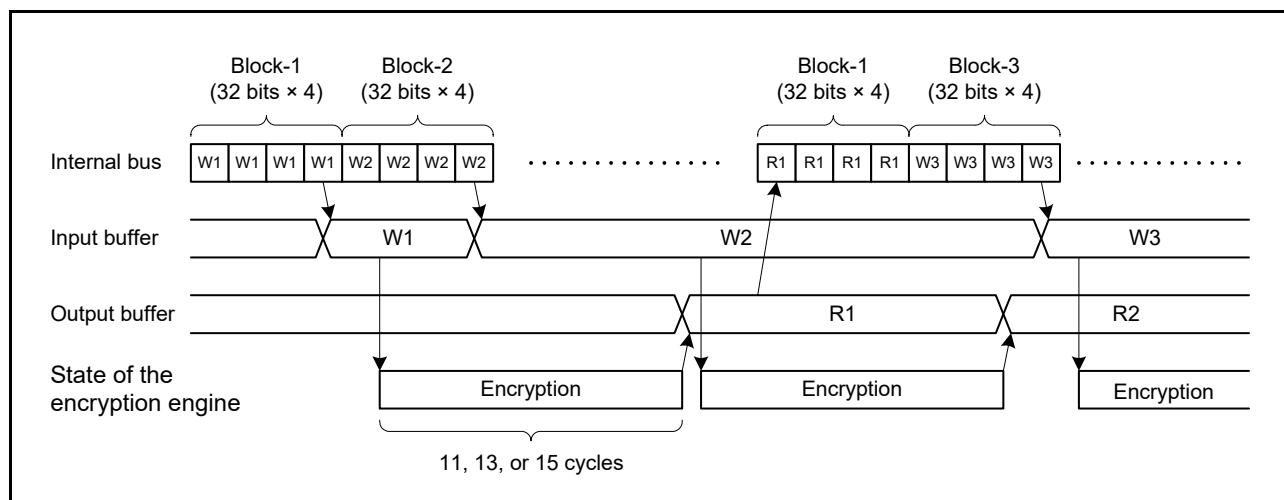

Figure 54.6 Encryption and Decryption Timing Diagram

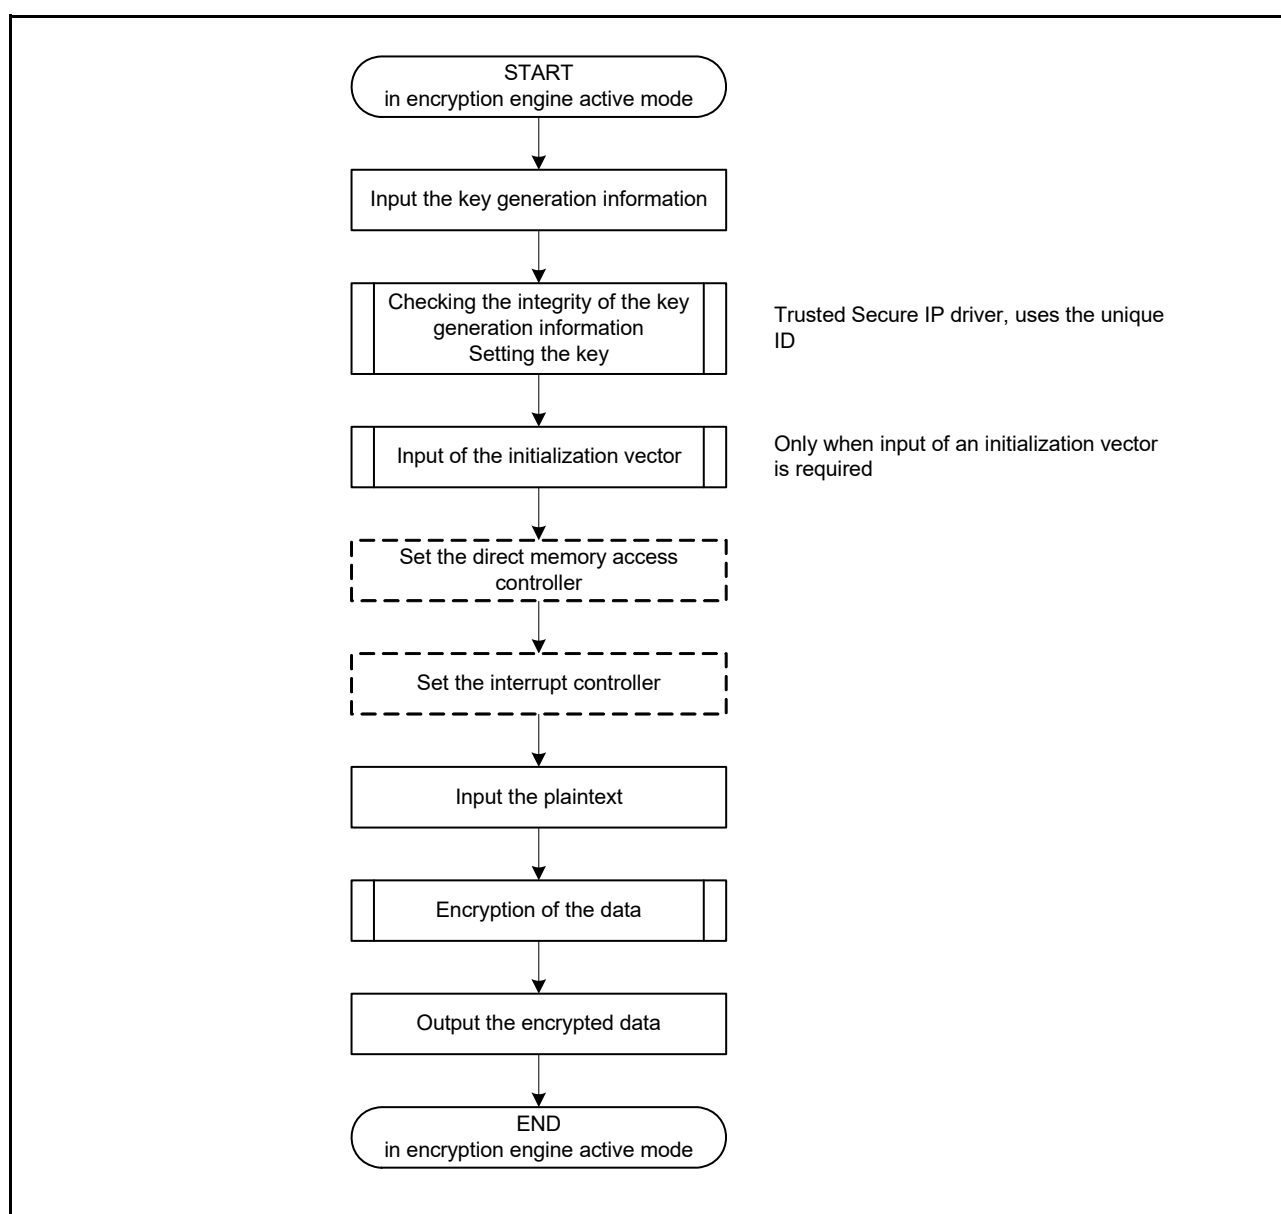

Figure 54.7 Encryption Flow Chart

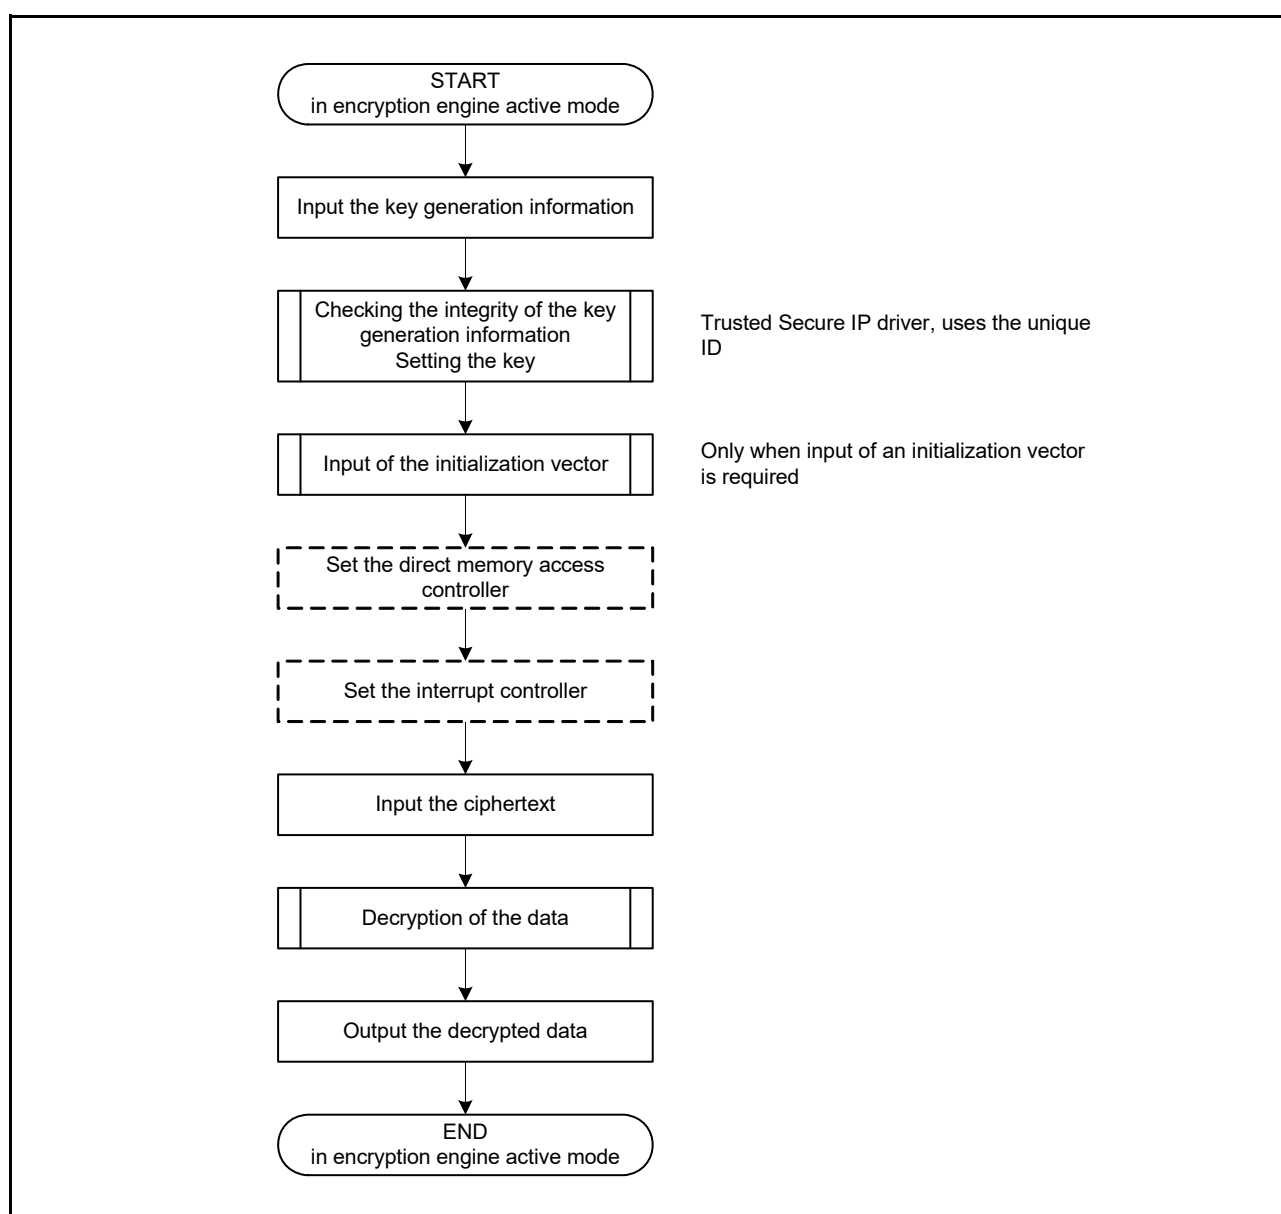

Figure 54.8 Decryption Flow Chart

54.2.5 Generating Key Generation Information (by Using Random Numbers)

Figure 54.9 shows the generating flow for the key generation information by using random numbers.

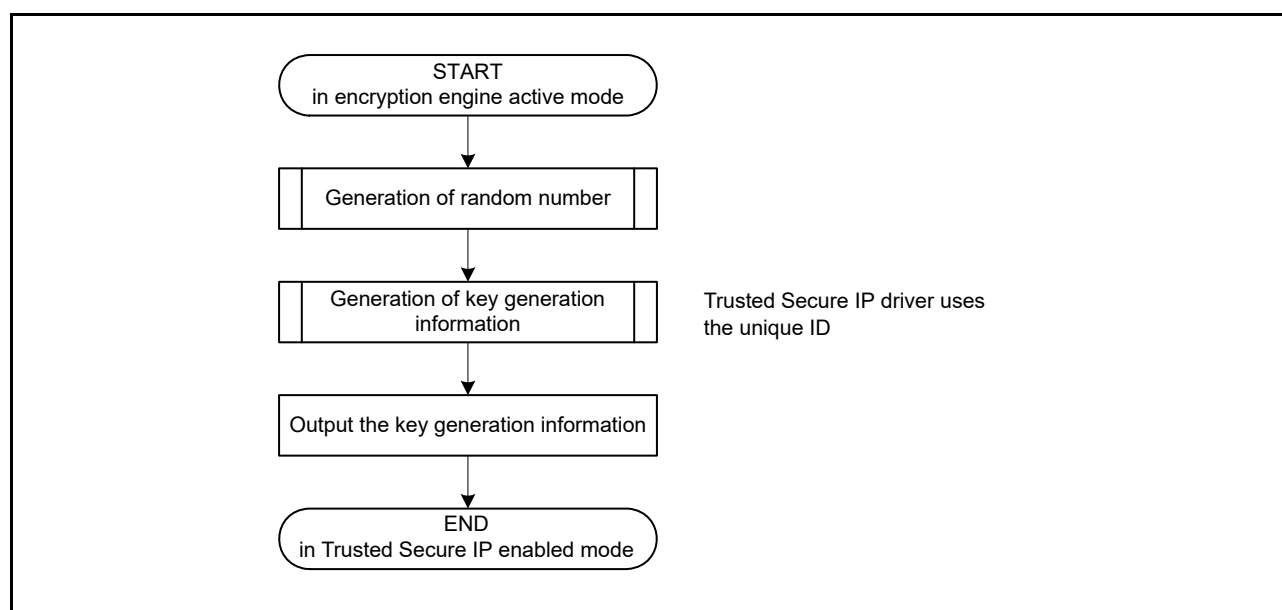

Figure 54.9 Key Generation Information Generating Flow Chart (Using Random Numbers)

54.2.6 Random Number Generation

Figure 54.10 shows the random number generation flow.

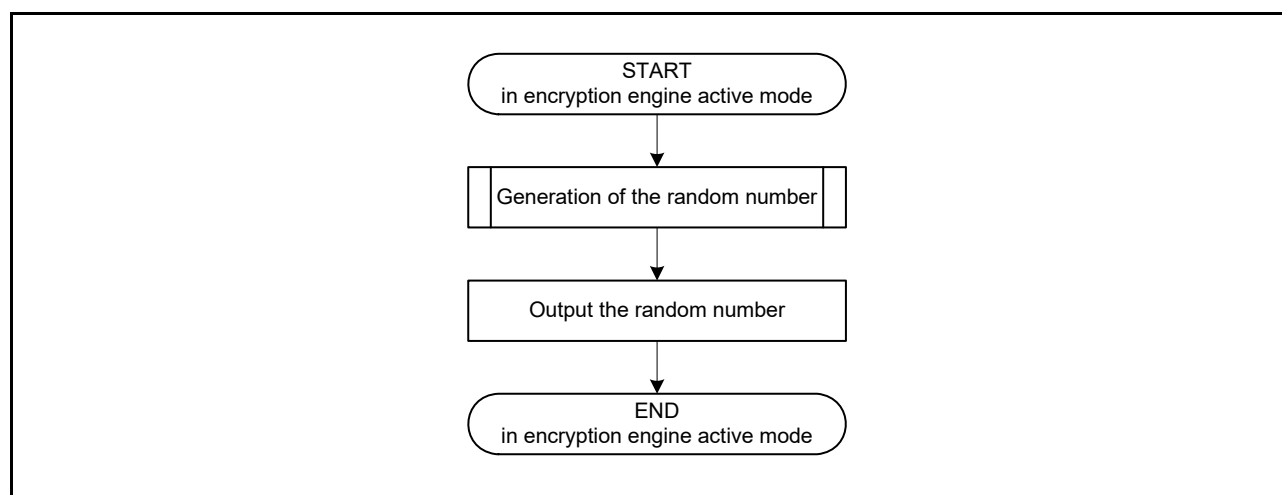

Figure 54.10 Random Number Generation Flow Chart

54.3 Interrupt

Table 54.2 lists the interrupt sources.

Trusted Secure IP driver uses interrupts caused by these interrupt sources. Do not change the setting of the interrupt controller corresponding to these interrupt sources.

Table 54.2 Trusted Secure IP Interrupt Sources

| Name | Interrupt Source |
|-----------|-----------------------------------|
| PROC_BUSY | Procedure completion interrupt |
| ROMOK | Falsification detection interrupt |
| LONG_PLG | Calculation completion interrupt |
| WRRDY0 | Write ready 0 |
| WRRDY1 | Write ready 1 |
| WRRDY4 | Write ready 4 |
| RDRDY0 | Read ready 0 |
| RDRDY1 | Read ready 1 |
| IWRRDY | Integration write ready |
| IRDRDY | Integration read ready |

54.4 Usage Notes

54.4.1 Setting the Module Stop Function

Operation of the Trusted Secure IP module is enabled or disabled by the MSTP107 bit of standby control register 10 (STBCR10), as stated in section 52.2.10, Standby Control Register 10 (STBCR10). After a reset, the Trusted Secure IP is stopped. After exiting the module stop state, the Trusted Secure IP can be accessed. Refer to section 52, Power-Down Modes for details.

54.4.2 Trusted Secure IP Driver

Use of the Trusted Secure IP requires the Trusted Secure IP driver provided by Renesas Electronics. Please contact our sales office for information regarding the Trusted Secure IP driver.

| SD/MMC host interface | All registers | Initialized | Initialized | Retained | Retained | Retained |
| GPIO | All registers | Initialized*2 | Initialized*2 | Retained | — | Retained |

Table 55.1 Register States

| Module | Register Name | Power-On Reset | Deep Standby | Software Standby | Module Standby | Sleep |
|--------------------|-----------------------------------|----------------|----------------|------------------|----------------|----------|
| Power-down modes | DSFR, USBBSFR | Initialized*1 | Retained | Retained | — | Retained |
| | XTALCTR | Initialized*1 | Retained*8 | Retained*8 | — | Retained |
| | RTCXTALSEL | — | Retained | Retained | — | Retained |
| | All registers other than above | Initialized*2 | Initialized*2 | Retained | — | Retained |
| Debugger interface | Registers in CA9 PMU*9 | Initialized | Initialized | Retained | — | Retained |
| | All registers other than above*10 | Retained | Initialized*11 | Retained | Retained | Retained |
| OTP | All registers | Initialized*12 | Initialized*12 | Retained | — | Retained |
| DRP | All registers | Initialized | Initialized | Retained | Retained | Retained |
| Trusted Secure IP | All registers | Initialized | Initialized | Retained | Retained | Retained |

Note 1. Retained on internal power-on reset by the watchdog timer.

Note 2. Note that the value differs from the initial value as set by the boot program. For details, see section 3, Boot Mode.

Note 3. Flag processing continues.

Note 4. Counting up continues.

Note 5. Transfer can proceed.

Note 6. The CIE bit is initialized.

Note 7. The RESET and ADJ30 bits are initialized.

Note 8. Initialized when the realtime clock is not using the EXTAL pin.

Note 9. Access to these registers from the I/O area (SLV7) is not possible while TRST# is asserted.

Note 10. Initialized on assertion of TRST#.

Note 11. Retained in FAKE debug mode.

Note 12. The initial values of some registers for the OTP memory depend on values written to the memory.

56. Electrical Characteristics

56.1 Absolute Maximum Ratings

Table 56.1 Absolute Maximum Ratings

| Item | | Symbol | Value | Unit |
|--|--------------------------------------|----------------------------------|--|------|
| Power supply voltage (I/O) | | PVcc | −0.3 to 4.2 | V |
| Power supply voltage (1.8-/3.3-V switchable I/O) | | PVcc_SPI PVcc_SD0 PVcc_SD1 | −0.3 to 4.2 | V |
| Power supply voltage (1.8-V I/O) | | PVcc_HO | −0.3 to 4.2 | V |
| Power supply voltage (Internal) | | Vcc | −0.3 to 1.6 | V |
| PLL power supply voltage | | PLLVcc | −0.3 to 1.6 | V |
| Analog power supply voltage | | AVcc | −0.3 to 4.2 | V |
| USB transceiver analog power supply voltage (I/O) | | USBAPVcc1 USBAPVcc0 | −0.3 to 4.2 | V |
| USB transceiver digital power supply voltage (I/O) | | USBDPVcc1 USBDPVcc0 | −0.3 to 4.2 | V |
| LVDS analog power supply voltage | | LVDSAPVcc | −0.3 to 4.2 | V |
| LVDS PLL power supply voltage | | LVDSPLLVcc | −0.3 to 1.6 | V |
| MIPI analog power supply voltage | | MIPIAVcc18 | −0.3 to 2.6 | V |
| Input voltage | 1.8-V I/O input pins | V _{in} | −0.3 to 1.8-V power supply (PVcc_HO, MIPIAVcc18) + 0.3 | V |
| | 1.8-/3.3-V switchable I/O input pins | V _{in} | −0.3 to 1.8-/3.3-V power supply (PVcc_SPI, PVcc_SD0, PVcc_SD1) + 0.3 | V |
| | Other input pins | V _{in} | −0.3 to 3.3-V power supply (PVcc, AVcc, USBAPVcc1, USBAPVcc0, USBDPVcc1, USBDPVcc0, LVDSAPVcc) + 0.3 | V |
| Operating temperature | Ambient temperature | T _a | −40 to +85 | °C |
| | Junction temperature | T _J | −40 to +125 | |
| Storage temperature | | T _{stg} | −55 to +125 | °C |

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded

56.2 Power-On/Power-Off Sequence

The 1.2-V power supply (Vcc, PLLvcc, and LVDSPLLvcc), 1.8-V power supply (PVcc_HO and MIPIAVcc18), 1.8-/3.3-V switchable power supply (PVcc_SPI, PVcc_SD0, PVcc_SD1), and 3.3-V power supply (PVcc, AVcc, USBAPVcc1, USBAPVcc0, USBDPVcc1, USBDPVcc0, and LVDSAPVcc) can be turned on and off in any order.

When turning on the power, be sure to drive both the TRST# and RES# pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.

When turning off the power, drive the TRST# and RES# pins low if the undefined output may cause a problem.

56.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in Table 56.2 other than current consumption
 $V_{CC} = 1.14$ to 1.26 V, $PV_{CC} = USBDPV_{CC0} = USBDPV_{CC1} = AV_{CC} = 3.0$ to 3.6 V,
 $PV_{CC_SPI} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PV_{CC_SD0} = 3.0$ to 3.6 V/ 1.7 to 1.9 V,
 $PV_{CC_SD1} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PLL_{VCC} = 1.14$ to 1.26 V,
 $USBAPV_{CC0} = USBAPV_{CC1} = 3.0$ to 3.6 V, $LVDSAPV_{CC} = 3.0$ to 3.6 V,
 $LVDSPLL_{VCC} = 1.14$ to 1.26 V, $PV_{CC_HO} = MIPIAV_{CC18} = 1.7$ to 1.9 V,
 $V_{SS} = AV_{SS} = USBV_{SS} = 0$ V
 $T_a = -40$ to $+85^{\circ}\text{C}$, $T_j = -40$ to $+125^{\circ}\text{C}$
- Conditions used to obtain DC characteristics (2) in Table 56.2 for current consumption
 $V_{CC} = 1.20$ V, $PV_{CC} = USBDPV_{CC0} = USBDPV_{CC1} = AV_{CC} = 3.3$ V,
 $PV_{CC_SPI} = 3.3$ V/ 1.8 V, $PV_{CC_SD0} = 3.3$ V/ 1.8 V, $PV_{CC_SD1} = 3.3$ V/ 1.8 V,
 $PLL_{VCC} = 1.20$ V, $USBAPV_{CC0} = USBAPV_{CC1} = 3.3$ V, $LVDSAPV_{CC} = 3.3$ V,
 $LVDSPLL_{VCC} = 1.20$ V, $PV_{CC_HO} = MIPIAV_{CC18} = 1.8$ V,
 $V_{SS} = AV_{SS} = USBV_{SS} = 0$ V
 $T_a = -40$ to $+85^{\circ}\text{C}$, $T_j = -40$ to $+125^{\circ}\text{C}$
 $I_{\phi} = 528.0$ MHz, $G_{\phi} = 264.00$ MHz, $B_{\phi} = 132.00$ MHz, $P1_{\phi} = 66.00$ MHz, $P0_{\phi} = 33.00$ MHz

Table 56.2 DC Characteristics (1) [Common Items]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|----------------------------------|--|-------------|------|------|------|---|
| Power supply voltage | PV_{CC} | 3.0 | 3.3 | 3.6 | V | |
| | PV_{CC_SPI} | 1.7 | 1.8 | 1.9 | V | 1.8-V power supply selection |
| | PV_{CC_SD0} | 3.0 | 3.3 | 3.6 | V | 3.3-V power supply selection |
| | PV_{CC_SD1} | | | | | |
| | PV_{CC_HO} | 1.7 | 1.8 | 1.9 | V | |
| | V_{CC} | 1.14 | 1.20 | 1.26 | V | |
| PLL power supply voltage | PLL_{VCC} | 1.14 | 1.20 | 1.26 | V | |
| Analog power supply voltage | AV_{CC} | 3.0 | 3.3 | 3.6 | V | |
| USB power supply voltage | $USBAPV_{CC1}$ $USBAPV_{CC0}$ $USBAPV_{CC1}$ $USBAPV_{CC0}$ | 3.0 | 3.3 | 3.6 | V | |
| LVDS analog power supply voltage | $LVDSAPV_{CC}$ | 3.0 | 3.3 | 3.6 | V | |
| LVDS PLL power supply voltage | $LVDSPLL_{VCC}$ | 1.14 | 1.20 | 1.26 | V | |
| MIPI analog power supply voltage | $MIPIAV_{CC18}$ | 1.7 | 1.8 | 1.9 | V | |
| Input leakage current | All input pins (except MIPI CSI-2 interface Related Pins*1) | $ I_{in} $ | — | — | 1.0 | μA $V_{in} = 0.5$ to $PV_{CC} - 0.5$ V |
| | MIPI CSI-2 interface Related Pins*1 | | | | 10 | μA $V_{in} = 0.5$ to $MIPIAV_{CC18} - 0.5$ V |
| Three-state leakage current | All input/output pins, all output pins (except PD_0 to PD_7) (off state) | $ I_{STI} $ | — | — | 1.0 | μA $V_{in} = 0.5$ to $PV_{CC} - 0.5$ V |
| | PD_0 to PD_7 | | — | — | 10 | μA |
| Input capacitance | USB 2.0 Host/Function Module-Related Pins*2 | C_{in} | — | — | 20 | pF |
| | All input/output pins and all input pins other than above | | — | — | 10 | pF |

Note 1. CSI_DATA0P, CSI_DATA0N, CSI_DATA1P, CSI_DATA1N, CSI_CLKP, CSI_CLKN pins

Note 2. DP1, DP0, DM1, DM0 pins

Table 56.2 DC Characteristics (2) [Current Consumption]

| Item | Power Supply | Symbol | Typ. | Max. | Unit | Test Conditions |
|--|---|--------------------------|-------|------|------|--|
| Current consumption in normal operation | Vcc | Icc | — | 994 | mA | When the DRP is not in use. |
| | | | — | 400 | mA | When the DRP is in use, these values are added to that of the above columns, respectively. |
| | PLLvcc | PLLIcc | — | 21.8 | mA | |
| | LVDSPLLvcc | LVDSPLLIcc | — | 2.1 | mA | |
| | MIPIAVcc18 | MIPIAIcc18 | — | 10 | mA | During MIPI transfer |
| | PVcc_HO | PIcc_HO | 15*1 | — | mA | PVcc_HO = 1.8 V HM_CK, HM_CK# / OM_SCLK = 132 MHz |
| | PVcc_SPI | PIcc_SPI | 15*1 | — | mA | PVcc_SPI = 3.3 V QSPI0_SPCLK, QSPI1_SPCLK = 66 MHz |
| | | | 15*1 | — | mA | PVcc_SPI = 1.8 V QSPI0_SPCLK, QSPI1_SPCLK = 132 MHz |
| | PVcc_SD0 | PIcc_SD0 | 15*1 | — | mA | PVcc_SD0 = 3.3 V SD0_CLK = 33 MHz |
| | | | 11*1 | — | mA | PVcc_SD0 = 1.8 V SD0_CLK = 132 MHz |
| | PVcc_SD1 | PIcc_SD1 | 15*1 | — | mA | PVcc_SD1 = 3.3 V SD1_CLK = 33 MHz |
| | | | 11*1 | — | mA | PVcc_SD1 = 1.8 V SD1_CLK = 132 MHz |
| | PVcc | PIcc | 100*1 | — | mA | |
| | USBDPVcc0 + USBDPVcc1 | UDPIcc | 52*1 | — | mA | In USB high-speed operation (1ch) |
| | | | 93*1 | — | mA | In USB high-speed operation (2ch) |
| | | | 19*1 | — | mA | In USB full-speed operation (1ch) |
| | | | 29*1 | — | mA | In USB full-speed operation (2ch) |
| | USBAPVcc0 + USBAPVcc1 | UAPIcc | — | 11 | mA | When 1-ch is in use |
| | | | — | 18 | mA | When 2-ch is in use |
| | LVDSAPVcc | LVDSAPIcc | — | 30 | mA | During LVDS transfer |
| | AVcc | AIcc | — | 1 | mA | During A/D conversion |
| Current consumption in sleep mode | Vcc | I _{sleep} | — | 850 | mA | |
| | For the other power supply, the current consumption is the same as in normal operation. | | | | | |
| Current consumption in software standby mode | Vcc + PLLvcc + LVDSPLLvcc | I _{sstby} | 30 | 500 | mA | |
| | MIPIAVcc18 + PVcc_SPI + PVcc_HO + PVcc_SD0 + PVcc_SD1 | PI _{sstby18_33} | 0.4 | 3.4 | μA | |
| | PVcc + AVcc + | PI _{sstby} | 3 | 20 | μA | When the USB host/function is not in use |
| | USBAPVcc1 + USBAPVcc0 + USBDPVcc1 + USBDPVcc0 + LVDSAPVcc | | 4.5 | 5 | mA | When the USB host/function is in use |

| Item | Power Supply | Symbol | Typ. | Max. | Unit | Test Conditions |
|--|---|--------------------------|------|------|------|-----------------------------------|
| Current consumption in deep standby mode | Vcc + PLLVcc + LVDSPLLvcc | I _{dstby} | 16 | 155 | μA | RAM 0 Kbytes retained |
| | | | 22 | 170 | μA | RAM 16 Kbytes retained |
| | | | 28 | 185 | μA | RAM 32 Kbytes retained |
| | | | 40 | 215 | μA | RAM 64 Kbytes retained |
| | | | 64 | 275 | μA | RAM 128 Kbytes retained |
| | MIPIAVcc18 + PVcc_SPI + PVcc_HO + PVcc_SD0 + PVcc_SD1 | PI _{dstby18_33} | 0.4 | 2.1 | μA | |
| | PVcc + AVcc + USBAPVcc1 + USBAPVcc0 + USBDPVcc1 + USBDPVcc0 + LVDSAPVcc | PI _{dstby} | 2.4 | 7 | μA | RTC is not operating |
| | | | 7.7 | 12.5 | μA | RTC_X1 selected |
| | | | 1.3 | — | mA | EXTAL 12 MHz selected, small gain |
| | | | 1.5 | — | mA | EXTAL 24 MHz selected, small gain |

Note 1. Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.

Table 56.2 DC Characteristics (3) [Except 1.8-/3.3-V Switchable I/O Interface, I²C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]

| Item | | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|---------------------------------------|---|-----------------------------------|--------------|------|------------|------|--|
| Input high voltage*1 | | V _{IH} | 2.2 | — | PVcc + 0.3 | V | |
| Input low voltage*1 | | V _{IL} | −0.3 | — | 0.8 | V | |
| Schmitt trigger input characteristics | | VT ⁺ | PVcc × 0.665 | — | PVcc + 0.3 | V | |
| | | VT [−] | −0.3 | — | 0.8 | V | |
| | | VT ⁺ − VT [−] | 0.2 | — | — | V | |
| Output high voltage | | V _{OH} | PVcc − 0.5 | — | — | V | I _{OH} = −8.0 mA*2, −2.0 mA*3 |
| Output low voltage | | V _{OL} | — | — | 0.4 | V | I _{OL} = 8.0 mA*2, 2.0 mA*3 |
| RAM standby voltage | Software standby mode (large-capacity on-chip RAM) | V _{RAMS} | 0.85 | — | — | V | Measured with Vcc as parameter |
| | Deep standby mode (only the on-chip RAM for data retention) | V _{RAMD} | 1.14 | — | — | V | |

Note 1. Except for Schmitt trigger function

Note 2. This is the value when high driving ability is set with a pin for which high driving ability is selectable.

Note 3. This is the value when normal driving ability is set with a pin for which high driving ability is selectable or the value of the pin to which normal driving ability is fixed.

Table 56.2 DC Characteristics (4) [1.8-/3.3-V Switchable I/O Interface*]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|---------------------|----------|------------------------|------|------------------------|------|---|
| Input high voltage | V_{IH} | 1.27 | — | $PVcc_* + 0.3$ | V | PVcc_SPI with 1.8-V power supply selection |
| | | | | 2 | | PVcc_SD0 and PVcc_SD1 with 1.8-V power supply selection |
| | | $PVcc_* \times 0.625$ | — | $PVcc_* + 0.3$ | V | 3.3-V power supply selection |
| Input low voltage | V_{IL} | −0.3 | — | 0.58 | V | 1.8-V power supply selection |
| | | −0.3 | — | $PVcc_* \times 0.25$ | V | 3.3-V power supply selection |
| Output high voltage | V_{OH} | 1.4 | — | — | V | 1.8-V power supply selection, $I_{OH} = -2.0$ mA |
| | | $PVcc_* \times 0.75$ | — | — | V | 3.3-V power supply selection, $I_{OH} = -2.0$ mA |
| Output low voltage | V_{OL} | — | — | 0.45 | V | 1.8-V power supply selection, $I_{OL} = 2.0$ mA |
| | | — | — | $PVcc_* \times 0.125$ | V | 3.3-V power supply selection, $I_{OL} = 2.0$ mA |

Note: PVcc_SPI, PVcc_SD0, PVcc_SD1

Table 56.2 DC Characteristics (5) [1.8-V I/O Interface*]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|---------------------|----------|------|------|-----------------|------|--------------------|
| Input high voltage | V_{IH} | 1.27 | — | $PVcc_* + 0.3$ | V | |
| Input low voltage | V_{IL} | −0.3 | — | 0.58 | V | |
| Output high voltage | V_{OH} | 1.4 | — | — | V | $I_{OH} = -2.0$ mA |
| Output low voltage | V_{OL} | — | — | 0.45 | V | $I_{OL} = 2.0$ mA |

Note: PVcc_HO

Table 56.2 DC Characteristics (6) [I²C Bus Interface-Related Pins*]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|---------------------------------------|-------------------|--------------------|------|-------------------|------|--|
| Input high voltage | V_{IH} | $PVcc \times 0.7$ | — | $PVcc + 0.3$ | V | |
| Input low voltage | V_{IL} | −0.3 | — | $PVcc \times 0.3$ | V | |
| Schmitt trigger input characteristics | $V_{IH} - V_{IL}$ | $PVcc \times 0.05$ | — | — | V | |
| Output low voltage | V_{OL} | — | — | 0.4 | V | $I_{OL} = 3.0$ mA (RIICnFER.FMPE = 0) |
| | | — | — | 0.4 | V | $I_{OL} = 20.0$ mA (RIICnFER.FMPE = 1) |

Note: The PD_0 to PD_7 pins are open-drain pins.

Table 56.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins*]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|----------------------|-----------|-------------------------------|------|------|------|-----------------|
| Reference resistance | R_{REF} | $2.2 \text{ k}\Omega \pm 1\%$ | | | | |

Note: RREF0, RREF1 pins.

Table 56.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|--|----------|-------|------|-------|------------|--------------------------|
| DP pull-up resistance (when function is selected) | R_{pu} | 0.900 | — | 1.575 | k Ω | In idle mode |
| | | 1.425 | — | 3.090 | k Ω | In transmit/receive mode |
| DP and DM pull-down resistance (when host is selected) | R_{pd} | 14.25 | — | 24.80 | k Ω | |

Note: DP1, DP0, DM1, and DM0 pins

Table 56.2 DC Characteristics (9) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|---------------------------------|-----------|------|------|------|------|--|
| Input high voltage | V_{IH} | 2.0 | — | — | V | |
| Input low voltage | V_{IL} | — | — | 0.8 | V | |
| Differential input sensitivity | V_{DI} | 0.2 | — | — | V | $ (DP) - (DM) $ |
| Differential common mode range | V_{CM} | 0.8 | — | 2.5 | V | |
| Output high voltage | V_{OH} | 2.8 | — | 3.6 | V | $I_{OH} = -200 \mu A$ |
| Output low voltage | V_{OL} | 0.0 | — | 0.3 | V | $I_{OL} = 2 \text{ mA}$ |
| Output signal crossover voltage | V_{CRS} | 1.3 | — | 2.0 | V | $C_L = 50 \text{ pF}$ (full-speed) $C_L = 200 \text{ to } 600 \text{ pF}$ (low-speed) |

Note: DP1, DP0, DM1, and DM0 pins

Table 56.2 DC Characteristics (10) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|--|--------------|-------|------|------|------|-----------------|
| Squelch detection threshold voltage (differential voltage) | V_{HSSQ} | 100 | — | 150 | mV | |
| Common mode voltage range | V_{HSCM} | -50 | — | 500 | mV | |
| Idle state | V_{HSOI} | -10.0 | — | 10.0 | mV | |
| Output high voltage | V_{HSOH} | 360 | — | 440 | mV | |
| Output low voltage | V_{HSOL} | -10.0 | — | 10.0 | mV | |
| Chirp J output voltage (difference) | V_{CHIRPJ} | 700 | — | 1100 | mV | |
| Chirp K output voltage (difference) | V_{CHIRPK} | -900 | — | -500 | mV | |

Note: DP1, DP0, DM1, and DM0 pins

Table 56.2 DC Characteristics (11) [LVDS-Related Pins*]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|------------------------------------|--------------|-------|------|-------|------|-------------------|
| Differential Output Voltage | VOD | 250 | 350 | 450 | mV | $R_L = 100\Omega$ |
| Difference VOD between 'H' and 'L' | ΔVOD | — | — | 50 | mV | $R_L = 100\Omega$ |
| Offset (Common Mode) Voltage | VOS | 1.125 | 1.25 | 1.375 | V | $R_L = 100\Omega$ |
| Difference VOS between 'H' and 'L' | ΔVOS | — | — | 50 | mV | $R_L = 100\Omega$ |

Note: TXCLKOUTP, TXCLKOUTM, TXOUT2P to TXOUT0P, and TXOUT2M to TXOUT0M pins

Figure 56.1 LVDS output waveform

Table 56.2 DC Characteristics (12) [MIPI CSI-2 interface-Related Pins*]

| Item | Symbol | Min. | Typ. | Max. | Unit | Test Conditions |
|-----------------------------------|-------------------|-------|------|------|----------|------------------------------|
| Input signal voltage range | V_{PIN} | -50 | — | 1350 | mV | |
| Ground shift | V_{GNDSH} | -50 | — | 50 | mV | |
| transient pin voltage level | $V_{PIN(absmax)}$ | -0.15 | — | 1.45 | V | |
| Differential input high threshold | V_{IDTH} | — | — | 70 | mV | HS Receiver |
| Differential input low threshold | V_{IDTL} | -70 | — | — | mV | HS Receiver |
| Single-ended input high voltage | V_{IHHS} | — | — | 460 | mV | HS Receiver |
| Single-ended input low voltage | V_{ILHS} | -40 | — | — | mV | HS Receiver |
| Input common mode voltage | $V_{CMRX(DC)}$ | 70 | — | 330 | mV | HS Receiver |
| Differential input impedance | Z_{ID} | 80 | — | 125 | Ω | HS Receiver |
| Input high voltage | V_{IH} | 880 | — | — | mV | LP Receiver |
| Input low voltage | V_{IL} | — | — | 550 | mV | LP Receiver |
| Input hysteresis | V_{HYST} | — | 50 | — | mV | LP Receiver, Reference value |

Note: CSI_DATA0P, CSI_DATA0N, CSI_DATA1P, CSI_DATA1N, CSI_CLKP, CSI_CLKN pins

Table 56.3 Permissible Output Currents

| Item | | | Symbol | Min. | Typ. | Max. | Unit | | | | | |
|---|---|------------------------------|--------|------|------|----------------|------|----|--|--|---|----|
| Permissible output low current (per pin) | PD_0 to PD_7 | High-speed mode | IOL | — | — | 20 | mA | | | | | |
| | | Normal mode | | | | 6 | mA | | | | | |
| | The CKIO, SD0_CLK, and SD1_CLK output pins, and output pins driven by the PVcc_SPI, or PVcc_HO power supply pin | High drive | | | | 12 | mA | | | | | |
| | | Normal drive | | | | 8 | mA | | | | | |
| | | | | | | | 6 | mA | | | | |
| | | | | | | | 8 | mA | | | | |
| | SD0_CMD, SD0_DAT7 to SD0_DAT0, SD1_CMD, SD1_DAT3 to SD1_DAT0 | | | | | | 6 | mA | | | | |
| | | | | | | | 8 | mA | | | | |
| | Output pins other than above | High drive*1 | | | | | 8 | mA | | | | |
| | | Normal drive*2 | | | | | 2 | mA | | | | |
| Permissible output high current (per pin) | The CKIO, SD0_CLK, and SD1_CLK output pins, and output pins driven by the PVcc_SPI, or PVcc_HO power supply pin | High drive | – IOH | — | — | 12 | mA | | | | | |
| | | Normal drive | | | | 8 | mA | | | | | |
| | | | | | | 6 | mA | | | | | |
| | | | | | | 8 | mA | | | | | |
| | SD0_CMD, SD0_DAT7 to SD0_DAT0, SD1_CMD, SD1_DAT3 to SD1_DAT0 | | | | | | 6 | mA | | | | |
| | | | | | | | 8 | mA | | | | |
| | | Output pins other than above | | | | High drive*1 | | | | | 8 | mA |
| | | | | | | Normal drive*2 | | | | | 2 | mA |
| Permissible output current (total) | | | Σ IO | — | — | 150 | mA | | | | | |

Caution: To protect the LSI's reliability, the output current values should not exceed the values in Table 56.3.

Note 1. This is the value when high driving ability is set with a pin for which high driving ability is selectable.

Note 2. This is the value when normal driving ability is set with a pin for which high driving ability is selectable or the value of the pin to which normal driving ability is fixed.

56.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

Conditions for AC characteristics: $V_{cc} = 1.14$ to 1.26 V, $PV_{cc} = USBDPV_{cc0} = USBDPV_{cc1} = AV_{cc} = 3.0$ to 3.6 V, $PV_{cc_SPI} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PV_{cc_SD0} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PV_{cc_SD1} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PLL V_{cc} = 1.14$ to 1.26 V, $USBAPV_{cc0} = USBAPV_{cc1} = 3.0$ to 3.6 V, $LVDSAPV_{cc} = 3.0$ to 3.6 V, $LVDSPLL V_{cc} = 1.14$ to 1.26 V, $PV_{cc_HO} = MIPIAV_{cc18} = 1.7$ to 1.9 V, $V_{ss} = AV_{ss} = USBV_{ss} = 0$ V, $T_a = -40$ to $+85^{\circ}\text{C}$, $T_j = -40$ to $+125^{\circ}\text{C}$

Table 56.4 Operating Frequency

| Item | Symbol | Min. | Max. | Unit | Remarks |
|---------------------|------------------------------------|------|------|------|---------|
| Operating frequency | CPU clock ($I\phi$) | f | 55 | 528 | MHz |
| | Image processing clock ($G\phi$) | | 55 | 264 | MHz |
| | Internal bus clock ($B\phi$) | | 27.5 | 132 | MHz |
| | Peripheral clock 1 ($P1\phi$) | | 27.5 | 66 | MHz |
| | Peripheral clock 0 ($P0\phi$) | | 27.5 | 33 | MHz |

56.4.1 Clock Timing

Table 56.5 Clock Timing

| Item | Symbol | Min. | Max. | Unit | Figure |
|--|-------------|--|-----------|-------------|--|
| EXTAL clock input frequency (when the clock is supplied to USB 2.0 host/function module) | f_{EX} | 12MHz \pm 100ppm 24MHz \pm 100ppm | | | Figure 56.2 |
| EXTAL clock input frequency (when the clock isn't supplied to USB 2.0 host/function module) | | 10 20 | 12 24 | MHz | |
| EXTAL clock input cycle time (when the clock isn't supplied to USB 2.0 host/function module) | t_{EXcyc} | 83.34 41.67 | 100 50 | ns | |
| AUDIO_X1 clock input frequency (crystal resonator connected) | f_{EX} | 10.00 | 50.00 | MHz | |
| AUDIO_X1 clock input cycle time (crystal resonator connected) | t_{EXcyc} | 20.00 | 100.00 | ns | |
| AUDIO_X1, AUDIO_CLK clock input frequency (external clock input) | f_{EX} | 1.00 | 50.00 | MHz | |
| AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input) | t_{EXcyc} | 20.00 | 1000.00 | ns | |
| USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module) | f_{EX} | 48MHz \pm 100ppm | | | |
| EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width | t_{EXL} | 0.4 | 0.6 | t_{EXcyc} | |

| EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input fall time | t_{EXf} | — | 4 | ns | |
| CKIO clock output frequency | f_{OP} | 27.5*1 | 132*1 | MHz | |
| CKIO clock output cycle time | t_{cyc} | 7.58*1 | 36.36*1 | ns | Figure 56.3 (1), Figure 56.3 (2) |
| CKIO clock output low pulse width 1 | t_{CKOL1} | $t_{cyc} / 2 - t_{CKOr1}$ | — | ns | Figure 56.3 (1) |
| CKIO clock output high pulse width 1 | t_{CKOH1} | $t_{cyc} / 2 - t_{CKOf1}$ | — | ns | |
| CKIO clock output rise time 1 | t_{CKOr1} | — | 3 | ns | |
| CKIO clock output fall time 1 | t_{CKOf1} | — | 3 | ns | |
| CKIO clock output low pulse width 2 | t_{CKOL2} | $t_{cyc} / 2 - t_{CKOr2}$ | — | ns | Figure 56.3 (2) |
| CKIO clock output high pulse width 2 | t_{CKOH2} | $t_{cyc} / 2 - t_{CKOf2}$ | — | ns | |
| CKIO clock output rise time 2 | t_{CKOr2} | — | 2 | ns | |
| CKIO clock output fall time 2 | t_{CKOf2} | — | 2 | ns | |
| CKIO clock output low pulse width 3 | t_{CKOL3} | $t_{cyc} / 2 - t_{CKOr3}$ | — | ns | Figure 56.3 (3) |
| CKIO clock output high pulse width 3 | t_{CKOH3} | $t_{cyc} / 2 - t_{CKOf3}$ | — | ns | |
| CKIO clock output rise time 3 | t_{CKOr3} | — | 1*2 | ns | |
| CKIO clock output fall time 3 | t_{CKOf3} | — | 1*2 | ns | |
| On-chip PLL circuit oscillation settling time | t_{POSC} | 1 | — | ms | Figure 56.4, Figure 56.5 |
| On-chip oscillation circuit oscillation settling time (RTC_X1) | t_{ROSC} | — | 3*3 | s | Figure 56.7 |
| On-chip oscillation circuit oscillation settling time (other than above) | | — | 4*3 | ms | Figure 56.4, Figure 56.5 , Figure 56.7 |
| Mode hold time | t_{MDH} | 200 | — | ns | Figure 56.4, Figure 56.5 |

Note 1. The range of CKIO clock output frequency and cycle time is determined by register settings. See, Table 6.4 and Table 6.5.

Note 2. Output load: 15 pF

Note 3. Settings for values smaller than the above specifications may be possible, as long as the values are confirmed through evaluation by the manufacturer of the oscillator.

| AH delay time | t_{AHD} | $1/2 t_{cyc}$ | $1/2 t_{cyc} + 12 *^3$ | ns | Figure 56.17 |
| Multiplexed address delay time | t_{MAD} | — | $12 *^3$ | ns | Figure 56.17 |
| Multiplexed address hold time | t_{MAH} | $1.0 *^3$ | — | ns | Figure 56.17 |
| Address setup time for AH | t_{AVVH} | $1/2 t_{cyc} - 2$ | — | ns | Figure 56.17 |
| DACK, TEND delay time | t_{DACD} | Refer to the direct memory access controller timing | | ns | Figure 56.13 to Figure 56.34 |

Note 1. The maximum value (f_{max}) of CKIO (external bus clock) depends on the number of wait cycles and the system configuration of your board.

Note 2. $1/2 t_{cyc}$ indicated in minimum and maximum values for the item of delay, setup, and hold times represents a half cycle from the rising edge with a clock. That is, $1/2 t_{cyc}$ describes a reference of the falling edge with a clock.

Note 3. These values specified are for 66 MHz max operation. For CKIO = 110 to 132 MHz operation, some wait cycle insertion and input timing design are required depending on the system configuration.

56.4.17 I²C Bus Interface TimingTable 56.21 I²C Bus Interface Timing

| Item | Symbol | I/O | Standard mode (Sm) | | Fast mode (Fm) | | Fast mode plus (Fm+) | | Unit |
|---|---------------------|--------|--------------------|-------|---------------------------------|-------|---------------------------------|-------|------|
| | | | Min. | Max. | Min. | Max. | Min. | Max. | |
| SCL clock frequency | f _{CLK} | I/O | 0 | 100 | 0 | 400 | 0 | 1000 | kHz |
| Bus free time (between stop and start condition) | t _{BUF} | I/O | 4.7 | — | 1.3 | — | 0.5 | — | μs |
| Hold time*1 | t _{HD:STA} | I/O | 4.0 | — | 0.6 | — | 0.26 | — | μs |
| Low period of SCL clock | t _{LOW} | I/O | 4.7 | — | 1.3 | — | 0.5 | — | μs |
| High period of SCL clock | t _{HIGH} | I/O | 4.0 | — | 0.6 | — | 0.26 | — | μs |
| Setup time for start/restart condition | t _{SU:STA} | I/O | 4.7 | — | 0.6 | — | 0.26 | — | μs |
| Data hold time (I ² C bus device) | t _{HD:DAT} | I/O | 0*2 | — | 0*2 | — | 0 | — | μs |
| Data setup time | t _{SU:DAT} | I/O | 250 | — | 100*3 | — | 50 | — | ns |
| SDA and SCL signal rise time | t _R | Input | — | 1000 | 20 | 300 | — | 120 | ns |
| SDA and SCL signal fall time*3 | t _F | Input | — | 300 | 20 × (PV _{CC} / 5.5 V) | 300 | 20 × (PV _{CC} / 5.5 V) | 120 | ns |
| | | Output | — | 250 | 20 × (PV _{CC} / 5.5 V) | 250 | 20 × (PV _{CC} / 5.5 V) | 120 | ns |
| Setup time for STOP condition | t _{SU:STO} | I/O | 4.0 | — | 0.6 | — | 0.26 | — | μs |
| Capacitive load for each bus line | C _b | — | — | 400*4 | — | 400*4 | — | 550*4 | pF |
| Pulse width of spikes that must be suppressed by the input filter | t _{SP} | Input | — | — | 0 | 50*5 | 0 | 50*5 | ns |

In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time (t_{SU:DAT} (min.) 250 [ns]) must be satisfied.

If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released (t_R (max.) + t_{SU:DAT} (min.) = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICφ) and the NF[1:0] bits in RIICnMR3. For details, refer to section 23, I²C Bus Interface.

56.4.31 AC Characteristics Measurement Conditions

- I/O signal reference level: $PV_{cc}/2$, $PV_{cc_SPI}/2$, $PV_{cc_HO}/2$, $PV_{cc_SD0}/2$, $PV_{cc_SD1}/2$, the minimum values of V_{IH} , V_{T+} , and V_{OH} , and the maximum values of V_{IL} , V_{T-} , and V_{OL} (refer to the individual timing chart)
- Input pulse level: PV_{cc} , PV_{cc_SPI} , PV_{cc_HO} , PV_{cc_SD0} , and PV_{cc_SD1}
- Input rise and fall times: 1 ns

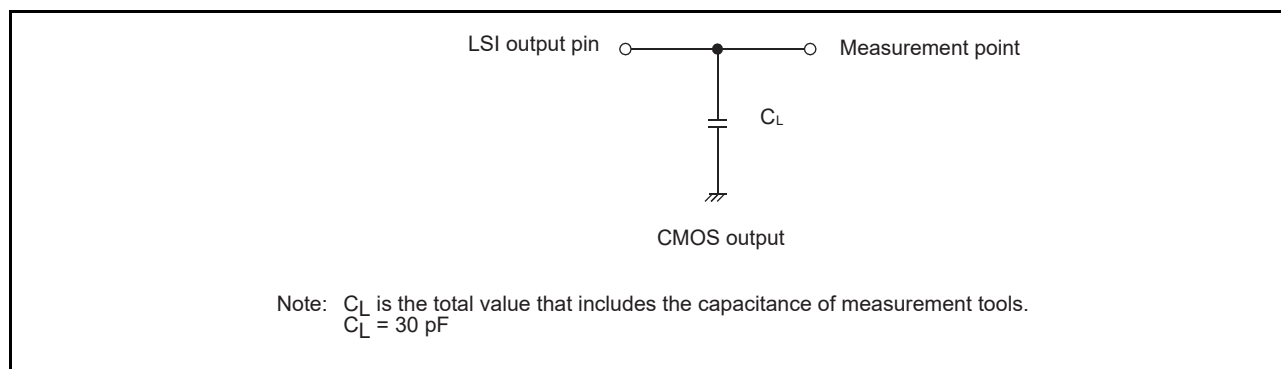

Figure 56.111 Output Load Circuit

56.5 A/D Converter Characteristics

Conditions: $V_{CC} = 1.14$ to 1.26 V, $PV_{CC} = USBDPV_{CC0} = USBDPV_{CC1} = AV_{CC} = 3.0$ to 3.6 V,

$PV_{CC_SPI} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PV_{CC_SD0} = 3.0$ to 3.6 V/ 1.7 to 1.9 V, $PV_{CC_SD1} = 3.0$ to 3.6 V/ 1.7 to

1.9 V, $PLL_{VCC} = 1.14$ to 1.26 V, $USBAPV_{CC0} = USBAPV_{CC1} = 3.0$ to 3.6 V, $LVDSAPV_{CC} = 3.0$ to 3.6 V,

$LVDSPLL_{VCC} = 1.14$ to 1.26 V, $PV_{CC_HO} = MIPIAV_{CC18} = 1.7$ to 1.9 V,

$V_{SS} = AV_{SS} = USBV_{SS} = 0$ V

$T_a = -40$ to $+85^{\circ}\text{C}$, $T_j = -40$ to $+125^{\circ}\text{C}$

Table 56.40 A/D Converter Characteristics

| Item | Min. | Typ. | Max. | Unit | Test Conditions |
|--|------|------|-------|------|-----------------------|
| Resolution | 8 | — | 12 | bits | |
| Analog input capacitance | — | — | 30 | pF | |
| Conversion time*1 (P1φ = 66 MHz, P0φ = 33 MHz) | 1 | — | — | us | Sampling in 20 states |
| Permissible signal-source impedance | — | — | 1 | kΩ | |
| DNL | — | — | ± 3 | LSB | |
| INL | — | — | ± 4 | LSB | |
| Offset error | — | — | ± 5.5 | LSB | |
| Full-scale error | — | — | ± 5.5 | LSB | |
| Absolute accuracy | — | — | ± 7 | LSB | |

Note: The above specification values apply when there is no access to the external bus during A/D conversion. If access proceeds during A/D conversion, values may not fall within the above ranges.

Note 1. The conversion time includes the sampling time and the comparison time ($t_{SPL} + t_{SAM}$).

57. States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

57.1 Pin States

Table 57.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

Table 57.1 Pin States

| Pin Function | | Pin State | | Pin State Retained*2 | | Power-Down State | |
|----------------|---|---|------------------|--|-------|-------------------|-----------------------|
| Type | Pin Name | Normal State (Other than States at Right) | Power-On Reset*1 | EBUSKEEPER*3 (Other than States at Right) | | Deep Standby Mode | Software Standby Mode |

[Legend]

| | |
|----|--|
| I: | Input |
| O: | Output |
| H: | High-level output |
| L: | Low-level output |
| Z: | High-impedance |
| -: | Condition under which the pin function is not selectable |

- Note 1. Indicates the power-on reset by low-level input to the RES# pin. The pin states after a power-on reset by the watchdog timer overflow is the same as the initial pin states at normal operation (see section 51, GPIO).
- Note 2. After the chip has been released from deep standby mode by the input on pins for canceling the standby mode such as NMI or by the realtime clock alarm interrupt, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 52, Power-Down Modes).
- Note 3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 52, Power-Down Modes).
- Note 4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 52, Power-Down Modes).
- Note 5. Depends on the setting of the RTC1XT and RTC0XT bits in the RTCXTAL select register (RTCXTALSEL) (see section 52, Power-Down Modes).
- Note 6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, AUDIO_X1, USB_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, AUDIO_X2, USB_X2) must be open.
- Note 7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 6, Clock Pulse Generator).
- Note 8. Depends on the setting in the port direction register (PDR) of the general I/O ports.
- Note 9. Depends on the setting of the HIZ bit in the standby control register 2 (STBCR2) (see section 52, Power-Down Modes).
- Note 10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
- Note 11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
- Note 12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) (see section 52, Power-Down Modes).
- Note 13. Depends on the setting of the RTCEN bit in the realtime clock control register 3 (RCR3) (see section 16, Realtime Clock (RTC)).
- Note 14. O in serial wire debug (SWD) mode. In modes other than serial wire debug (SWD), Z when the TAP controller is neither the Shift-DR nor Shift-IR state.
- Note 15. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.
- Note 16. Depends on the setting of the SHUTDOWNZ bit in the PHY Operation Control Register (PHYCNT) (see section 47, MIPI CSI2 Interface).
- Note 17. Only in products with a DRP

57.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 57.2 Handling of Unused Pins (Except for Debugger Interface Pins)

| Pin Name | Handling |
|--|---|
| NMI | Fix this pin at a high level (pull up or connect to a power supply). |
| DP1, DP0, DM1, DM0 | Connect these pins, via a 10 kΩ resistor, to GND. |
| RREF0, RREF1 | Open-circuit |
| Dedicated to the USB (USBAPVcc0, USBAPVcc1, USBDPVcc0, USBDPVcc1) | Supply power at 3.3 V. |
| Dedicated USB ground (USBVss) | Connect to ground. |
| Dedicated A/D power (AVcc) | Supply power at 3.3 V. |
| Dedicated A/D ground (AVss) | Connect to ground. |
| LVDS analog power supply (LVDSAPVcc) | Supply power at 3.3 V. |
| LVDS PLL power supply (LVDSPLLvcc) | Supply power at 1.2 V. |
| MIPIAVcc18 | Supply power at 1.8 V. |
| CSI_CLKP, CSI_CLKN, CSI_DATA0P, CSI_DATA0N, CSI_DATA1P, CSI_DATA1N | Connect to ground. |
| PVcc_SD0, PVcc_SD1 | Supply power at 3.3 V. |
| Input/output pins driven by the PVcc_SD0 or PVcc_SD1 power supply (SD0_CMD, SD0_DAT7 to SD0_DAT0, SD1_CMD, SD1_DAT3 to SD1_DAT0) | Fix the levels on the pins (pull them up or down)*1 |
| PVcc_SPI | Supply power at 3.3 V. |
| Input/output pins driven by the PVcc_SPI power supply (QSPI0_IO3 to QSPI0_IO0, QSPI1_IO3 to QSPI1_IO0, QSPI1_SSL) | Open-circuit |
| PVcc_HO | Supply power at 1.8 V. |
| Input/output pins driven by the PVcc_HO power supply (HM_RWDS/OM_DQS, HM_DQ7/OM_SIO7 to HM_DQ0/ OM_SIO0) | Fix the levels on the pins (pull them up or down)*1 *3 |
| Dedicated input pins other than those listed above | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)*1. |
| Input/output pins other than those listed above | Make the input-pin settings and then fix the level (pull them up or down)*2; alternatively, make the output-pin settings and leave the pins open-circuit. |
| Dedicated output pins | Open-circuit |

Note 1. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

Note 2. By setting the ports in accord with section 51, GPIO, setting of a fixed level can be made unnecessary for some pins. For details, see section 51.3.1, Port Direction Register (PDR).

Note 3. In the case of a pull-up resistor, connection is to the 1.8-V power supply.

Table 57.3 Handling of Debugger Interface Pins (when Emulator is not Used)

| Pin | Handling |
|---------------|--|
| BSCANP | Fix this pin at a low level (pull down or connect to the ground level). |
| TRST# | Fix this pin at a low level (pull down or connect to the ground level). Or connect to another pin which operates in the same manner as the RES# pin |
| TCK, TMS, TDI | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level). |
| TDO | Open-circuit |

Note 1. When using the emulator, handle these pins as described in the manual for the emulator.

Note 2. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

57.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.

For the states of pins in deep standby mode, refer to the corresponding items under section 57.1, Pin States. Handling of unused pins as described under section 57.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 57.4 Handling of Pins in Deep Standby Mode

| Pin | Handling |
|--|--|
| 1.2-V power (VCC, PLLVcc, LVDSPLL VCC) | Supply power at 1.2 V. |
| 1.8-V power (MIPIAVcc18) | Supply power at 1.8 V. |
| 1.8-V/3.3-V switchable power supply (PVCC_SPI, PVCC_HO, PVCC_SD0, PVCC_SD1) | Supply power at 1.8 V / 3.3 V. |
| 3.3V power (PVCC, AVCC, USBAPVCC1, USBAPVCC0, USBDPVCC1, USBDPVCC0, LVDSAPVCC) | Supply power at 3.3 V. |
| Ground (Vss, AVss, USBVss) | Connect to ground. |
| RREF0, RREF1 | Connect this pin to USBVss via 2.2 kΩ ± 1% resistor. |
| DP1, DP0, DM1, DM0 | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit. |
| EXTAL, RTC_X1, AUDIO_X1, USB_X1 | Connect the pins to the crystal resonator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power supply or ground level) |
| XTAL, RTC_X2, AUDIO_X2, USB_X2 | Connect the pins to the crystal resonator or open circuit. |
| Dedicated input pins other than those listed above | Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level). |
| Input/output pins (other than those listed above) in the input state | Fix the level on the pins (pull them up or down). |
| Input/output pins (other than those listed above) in the high-impedance state | Fix the level on the pins (pull them up or down) or open circuit. |
| Input/output pins (other than those listed above) in the output state | Open-circuit |
| Dedicated output pins other than those listed above | Open-circuit |

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

Figure A.4 Dimensions of 324-Pin BGA Package

B. Thermal Characteristics

The junction temperature (T_j) of an average sample (typ. value) can be calculated from either of the following expressions.

Calculation by using θ_{ja}

$T_j = T_a + (P_D \times \theta_{ja})$, where

- T_j : junction temperature;
- T_a : ambient temperature;
- P_D : power consumption of the entire LSI; and
- θ_{ja} : thermal resistance between T_j and T_a .

Calculation by using Ψ_{jt}

$T_j = T_t + (P_D \times \Psi_{jt})$, where

- T_t : temperature at the center of the top of the package; and
- Ψ_{jt} : thermal characteristics parameter representing the difference between T_j and T_t .

Since the value of θ_{ja} varies greatly with the usage environment (e.g. the board and casing), the junction temperature (T_j) calculated by using θ_{ja} is less accurate. Accordingly, when calculating T_j by using θ_{ja} , allow a sufficient margin in designing the system. The value of Ψ_{jt} varies little with differences in the usage environment, but pay particular attention to measuring the temperature at the center of the top of the package (T_t) if you use this approach. For the values of θ_{ja} and Ψ_{jt} , contact your local sales representative.

| | | 3-24 | 3.7.3 Notes on Serial Flash Booting (Boot Mode 3, 4, 6) after This LSI is Reset: Body corrected |
| | | 5. LSI Internal Bus | |
| | | 5-3 | Table 5.2 List of Peripheral Buses: Description of Connected peripheral modules corrected |
| | | 5-13 | 5.8.5 Slave Area (3) Protection unit information (ARPROT[2:0], AWPROT[2:0]): Note corrected |
| | | 5-49 | 5.11.25 Slave Access Control Register 0 (SLVACCCTL0): Description of bit 14 (POEGNS) corrected |
| | | 5-51 | 5.11.26 Slave Access Control Register 1 (SLVACCCTL1): Description of bit 16 (RCANNS) corrected |
| | | 6. Clock Pulse Generator | |
| | | 6-2 | Figure 6.1 Block Diagram: Peripheral clock 0C deleted |
| | | 6-18 | Figure 6.8 Clock Signals for Other Modules 1: Description of frequency deleted |
| | | 6-20 | Figure 6.10 Distribution of Internal Clock Signals: DRP module added |
| | | 6-21 | Figure 6.11 Distribution of Internal Clock Signals (2): DRP module deleted |

| Rev. | Date | Description | |
|------|--------------|---|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 7. Interrupt Controller | |
| | | 7-17 | 7.4.4 Pin Interrupts: Body corrected |
| | | 7-26 | Table 7.3 List of Interrupt IDs: Request Source Name(ALM, ALM_S) of Realtime Clock Module corrected |
| | | 8. Bus State Controller | |
| | | 8-8, 8-9 | 8.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5): Name of bits 24 to 22, 21 to 19, and 18 to 16 (IWRRD[2:0], IWRRS[2:0], IWRWS[2:0]) corrected, Description of bits 24 to 22 (IWRRD[2:0]), bits 21 to 19 (IWRRS[2:0]), bits 18 to 16 (IWRWS[2:0]), and bit 14 to 12 (TYPE[2:0]) corrected |
| | | 8-76 | 8.5.11 Others (4) Usage Note on Changing CKIO Clock Selections: Register name (CKIO Select Register) corrected |
| | | 9. Direct Memory Access Controller | |
| | | 9-53 to 9-56, 9-58 | Table 9.4 On-Chip Module Requests: General PWM timer channel 0 to 7, CANFD interface, corrected |
| | | 10. Multi-Function Timer Pulse Unit 3 (MTU3a) | |
| | | 10-1 | Table 10.1 MTU Specifications: Description of Count clock, Available operations, and Low power consumption function corrected |
| | | 10-2, 10-3 | Table 10.2 MTU Functions: External clocks in phase-counting mode added, MTU Function of DMAC activation, Interrupt sources and Module stop function corrected, Item (Interrupt skipping 1) corrected, Note 3 added, and note number after Note 3 renumbered. |
| | | 10-4 | Figure 10.1 Block Diagram of MTU (MTU0 to MTU4, MTU8), corrected |
| | | 10-5 | Figure 10.2 Block Diagram of MTU (MTU5 to MTU7), corrected |
| | | 10-6 | Table 10.3 Pin Configuration of the MTU: Function of MTCLKA, and MTCLKB corrected |
| | | 10-12 | 10.2.1 Timer Control Register (TCR): Register symbols (MTU0.TCR, MTU1.TCR, MTU2.TCR, MTU3.TCR, MTU4.TCR, MTU6.TCR, MTU7.TCR, and MTU8.TCR) corrected, Description of TPSC[2:0]bit, and CKEG[1:0] bit corrected |
| | | 10-13 | Table 10.5 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8): Location moved |
| | | 10-13 | Table 10.6 CCLR[2:0] (MTU1 and MTU2): Location moved |
| | | 10-13 | 10.2.1 Timer Control Register (TCR): Register symbol (MTU5.TCRU, MTU5.TCRV, and MTU5.TCRW) corrected, Description of TPSC[1:0] bit corrected |
| | | 10-14 | 10.2.2 Timer Control Register 2 (TCR2): Register symbol (MTU0.TCR2, MTU3.TCR2, MTU4.TCR2, MTU6.TCR2, MTU7.TCR2, and MTU8.TCR2) corrected |
| | | 10-14 | 10.2.2 Timer Control Register 2 (TCR2): Register symbol (MTU1.TCR2, and MTU2.TCR2) corrected, Body corrected, Description of TPSC2[2:0] bit corrected |
| | | 10-15 | 10.2.2 Timer Control Register 2 (TCR2): Register symbols (MTU5.TCR2U, MTU5.TCR2V, MTU5.TCR2W) corrected, Description of Bit table (x: Don't care) added, Description of TPSC2[2:0] bit, and CKEG[1:0] bit, corrected |
| | | 10-17 | Table 10.10 TPSC[2:0], TPSC2[2:0] (MTU3, MTU4, MTU6, MTU7, and MTU8): Note 1 deleted |
| | | 10-17 | Table 10.11 TPSC[1:0], TPSC2[2:0] (MTU5): Note deleted |
| | | 10-20 | 10.2.4 Timer Mode Registers 2 (TMDR2A and TMDR2B): Body corrected |
| | | 10-21 | 10.2.5 Timer Mode Register 3 (TMDR3): Description of LWA Bit corrected |
| | | 10-23 | 10.2.6 Timer I/O Control Register (TIO), MTU5.TIOU, MTU5.TIOV, MTU5.TIORW: Body corrected |
| | | 10-24 | Table 10.14 TIOH (MTU0): Description of IOB[3:0]=11xx corrected, Note 1 added. |
| | | 10-25 | Table 10.15 TIORL (MTU0): Description of IOD[3:0]=11xx corrected. Note 2 added. |
| | | 10-26 | Table 10.16 TIO (MTU1): Table heading, corrected (MTU1.TGRB/TGRBLW Function) |

| Rev. | Date | Description | |
|------|--------------|--------------|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 10-29 | Table 10.23 TIORL (MTU6): Note 1, corrected |
| | | 10-30 | Table 10.25 TIORL (MTU7): Note 1, corrected |
| | | 10-31 | Table 10.26 TIORH (MTU8): Value of Bit 6 (IOB2) corrected. Note 1 added. |
| | | 10-31 | Table 10.27 TIORL (MTU8): Note 1, corrected |
| | | 10-32 | Table 10.28 TIORH (MTU0): Description of IOA[3:0] = 1100 corrected. Note 1 added. |
| | | 10-32 | Table 10.29 TIORL (MTU0): Description of IOC[3:0] = 11xx corrected. Note 2 added. |
| | | 10-33 | Table 10.30 TIOR (MTU1): Table heading, corrected (MTU1.TGRA/TGRALW Function) |
| | | 10-35 | Table 10.35 TIORL (MTU4): Note 1, corrected |
| | | 10-36 | Table 10.37 TIORL (MTU6): Note 1, corrected |
| | | 10-37 | Table 10.39 TIORL (MTU7): Note 1, corrected |
| | | 10-39 | Table 10.42 TIORU, TIORV, and TIORW (MTU5): Note 1 added |
| | | 10-41 | 10.2.8 Timer Interrupt Enable Register (TIER): Register symbols (MTU1.TIER, MTU2.TIER, MTU0.TIER, MTU3.TIER, MTU6.TIER, MTU4.TIER, MTU7.TIER, and MTU8.TIER) corrected |
| | | 10-43 | 10.2.8 Timer Interrupt Enable Register (TIER): Register symbols (MTU0.TIER2) corrected, Description of TTGE2 Bit corrected, Register symbol (MTU5.TIER) corrected |
| | | 10-44 | 10.2.9 Timer Status Register (TSR): Register symbols (MTU1.TSR, MTU2.TSR, MTU3.TSR, MTU4.TSR, MTU6.TSR, and MTU7.TSR) corrected |
| | | 10-48 | 10.2.13 Timer Counter (TCNT), MTU8.TCNT: Note of Bit table added, Body corrected |
| | | 10-49 | 10.2.14 Timer Longword Counter (TCNTLW): Note of Bit table added |
| | | 10-50 | 10.2.15 Timer General Register (TGR): Register symbols (MTU0.TGR to MTU7.TGR) added. |
| | | 10-50 | 10.2.15 Timer General Register (TGR), MTU8.TGR: Note of Bit table added |
| | | 10-51 | 10.2.16 Timer Longword General Registers (TGRALW and TGRBLW): Title corrected, Note of Bit table added, Body corrected |
| | | 10-52 | 10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR): Title corrected, MTU.TSTRA: Register symbol (MTU.TSTRA) corrected, Body corrected, Description of CSTn Bits corrected |
| | | 10-53 | 10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR): Register symbol (MTU.TSTRB) corrected, Description of CSTn Bits corrected |
| | | 10-53 | 10.2.17 Timer Start Registers (TSTRA, TSTRB, and TSTR): Register symbol (MTU5.TSTR) corrected |
| | | 10-54 | 10.2.18 Timer Synchronous Registers (TSYRA and TSYRB): Title corrected, Register symbols (MTU.TSYRA (MTU0, MTU1, MTU2, MTU3, MTU4)) corrected |
| | | 10-55 | 10.2.18 Timer Synchronous Registers (TSYRA and TSYRB): Register symbol (MTU.TSYRB) corrected |
| | | 10-56, 10-57 | 10.2.19 Timer Counter Synchronous Start Register (TCSYSTR): Note 1. of Bit table corrected, Descriptions of SCH7 Bit, SCH6 Bit, SCH4 Bit, SCH3 Bit, SCH2 Bit, SCH1 Bit, and SCH0 Bit corrected |
| | | 10-58 | 10.2.20 Timer Read/Write Enable Registers (TRWERA and TRWERB): Description of the RWE bit corrected |
| | | 10-59 | 10.2.21 Timer Output Master Enable Registers (TOERA and TOERB): Title corrected, Register symbol (MTU.TOERA) corrected, Body corrected |
| | | 10-60 | 10.2.21 Timer Output Master Enable Registers (TOERA and TOERB): Register symbol (MTU.TOERB) corrected, Body corrected |
| | | 10-61 | 10.2.22 Timer Output Control Registers 1 (TOCR1A and TOCR1B): Note 4 of bit map deleted, Note 4 of bit 3 (TOCL) added, Description of OLSP Bit and OLSN Bit corrected |
| | | 10-62 | Figure 10.3 Example of Output in Complementary PWM Mode, corrected |
| | | 10-63 | 10.2.23 Timer Output Control Registers 2 (TOCR2A and TOCR2B): Body corrected |

| Rev. | Date | Description | |
|------|--------------|-----------------|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 10-67 | 10.2.25 Timer Gate Control Register A (TGCRA): Description of bit 6 (BDC) corrected, Description of FB Bit and P Bit corrected |
| | | 10-71 | Table 10.53 Setting of BTE[1:0] Bits in TBTERA and TBTERB: Title corrected |
| | | 10-72 | 10.2.32 Timer Waveform Control Registers (TWCRA and TWCRB): Description of SCC Bit corrected |
| | | 10-74 | 10.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C): Register symbols (MTU0.NFCR0, MTU1.NFCR1, MTU2.NFCR2, MTU3.NFCR3, MTU4.NFCR4, MTU6.NFCR6, MTU7.NFCR7, and MTU8.NFCR8) corrected, Body corrected |
| | | 10-75 | 10.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C): Register symbols (MTU0.NFCRC) corrected, Bit Symbol (NFCS[1:0]) corrected, Body corrected |
| | | 10-76 | 10.2.34 Noise Filter Control Register 5 (NFCR5): Pin names (MTIC5U, MTIC5V, and MTIC5W) corrected |
| | | 10-77 | 10.2.35 Timer A/D Converter Start Request Control Register (TADCR): Register symbol (MTU4.TADCR) corrected, Note 4 of the bit map deleted, Notes 1 to 3 of the bit table corrected, Description of bit 3 (ITA3AE), bit 2 (ITA4VE), bit 1 (ITB3AE), and bit 0 (ITB4VE) corrected, Name of bits 15 and 14 (BF[1:0]) corrected, Note numbers corrected, Note numbers corrected, Note, Note 1, and Note 3 corrected |
| | | 10-78 | Table 10.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4), corrected |
| | | 10-79 | 10.2.35 Timer A/D Converter Start Request Control Register (TADCR): Register symbol (MTU7.TADCR) corrected, Note 4 of the bit map deleted, Note 1 to 3 of the bit table corrected, Description of bit 3 (ITA6AE), bit 2 (ITA7VE), bit 1 (ITB6AE), and bit 0 (ITB7VE) corrected, Name of bits 15 and 14 (BF[1:0]) corrected, Note numbers corrected, Note, Note 1, and Note 3 corrected |
| | | 10-80 | Table 10.55 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7), corrected |
| | | 10-81 | 10.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA and TADCORB): Note2 corrected |
| | | 10-82 | 10.2.38 Timer Interrupt Skipping Mode Registers (TITMRA and TITMRB): Description of bit 0 (TITM) corrected, Note 1, and Note2 added |
| | | — | Table 10.56 Interrupt Skipping Function Selected through TITM Bit: deleted |
| | | 10-83, 10-84 | 10.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A and TITCR1B): Register symbol (MTU.TITCR1A, and MTU.TITCR1B) corrected, the location of the description moved and corrected. |
| | | 10-85 | 10.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B): Register symbol (MTU.TITCNT1A) corrected, Description of bits 7 and 3 corrected |
| | | 10-86 | 10.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A and TITCNT1B): Register symbol (MTU.TITCNT1B) corrected, Description of bits 7 and 3 corrected. |
| | | 10-87 | 10.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B): Register symbol (MTU.TITCR2A) corrected |
| | | 10-88 | 10.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A and TITCR2B): Register symbol (MTU.TITCR2B) corrected |
| | | 10-89 | 10.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B): Register symbol (MTU.TITCNT2A) corrected, Description of bits 7 to 3 corrected |
| | | 10-90 | 10.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A and TITCNT2B): Register symbol (MTU.TITCNT2B) corrected, Description of bits 7 to 3 corrected |
| | | 10-91 | 10.3.1 Basic Functions: Body corrected |
| | | 10-91 | 10.3.1 Basic Functions (1) Counter Operation: Body corrected |
| | | 10-91 | Figure 10.5 Example of Count Operation Setting Procedure: Title corrected, Descriptions of [1] and [5], corrected |
| | | 10-92 | 10.3.1 Basic Functions (b) Free-Running Count Operation and Periodic Count Operation: Body corrected |
| | | 10-92 | Figure 10.6 Free-Running Counter Operation, corrected |

| Rev. | Date | Description | |
|------|--------------|-------------|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 10-92 | Figure 10.7 Periodic Counter Operation, corrected |
| | | 10-93 | 10.3.1 Basic Functions (2) Waveform Output by Compare Match: Body corrected |
| | | 10-93 | Figure 10.8 Example of Procedure for Setting Waveform Output by Compare Match: Description of [4], corrected |
| | | 10-95 | 10.3.1 Basic Functions (3) Input Capture Function: Body corrected, Note corrected |
| | | 10-95 | Figure 10.11 Example of Input Capture Operation Setting Procedure: Description of [2], corrected |
| | | 10-96 | Figure 10.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, 8), corrected |
| | | 10-97 | 10.3.2 Synchronous Operation: Body corrected |
| | | 10-97 | Figure 10.13 Example of Synchronous Operation Setting Procedure: Descriptions of [1] and [5], corrected |
| | | 10-100 | Figure 10.17 Example of Buffer Operation Setting Procedure: Description of [3], corrected |
| | | 10-102 | 10.3.3 Buffer Operation (3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation: Body corrected |
| | | 10-103 | 10.3.4 Cascaded Operation: Body corrected |
| | | 10-104 | Figure 10.21 Cascaded Operation Setting Procedure: Descriptions of [1] and [2], corrected |
| | | 10-104 | Figure 10.22 Cascaded Operation Example (a), corrected |
| | | 10-108 | 10.3.5 PWM Modes: Body corrected |
| | | 10-109 | 10.3.5 PWM Modes (b) PWM Mode 2: Body corrected |
| | | 10-110 | Figure 10.26 Example of PWM Mode Setting Procedure: Descriptions of [2] to [4] and [7] corrected |

| | | 10-244 | 10.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation (29) Operation When Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode: Description of operation (12) corrected |
| | | 11. Port Output Enable 3 (POE3) | |
| | | 11-16 | 11.2.11 Port Output Enable Control Register 5 (POECR5): Symbol of bit 4 (IC4ADDMT0ZE), bit 2 (IC2ADDMT0ZE), and bit1 (IC1ADDMT0ZE) corrected |
| | | 12. General PWM Timer (GPT) | |
| | | All | Suffix corrected as follows: GTADTRm → GTADTRn, GTADTBRm → GTADTBRn, GTADTDBRm → GTADTDBRn, GTADTBRm → GTADTBRn, GTDVm → GTDVn, GTDBm → GTDBn |
| | | 12-3 | Figure 12.1 GPT block diagram, corrected |
| | | 12-7 | 12.2.1 General PWM Timer Write-Protection Register (GTWP): Register name corrected (GTIBCSR → GTICBSR) |
| | | 12-8 | 12.2.2 General PWM Timer Software Start Register (GTSTR): Body corrected |
| | | 12-9 | 12.2.3 General PWM Timer Software Stop Register (GTSTP): Body corrected |
| | | 12-9 | 12.2.4 General PWM Timer Software Clear Register (GTCLR): Body corrected |
| | | 12-23 | 12.2.8 General PWM Timer Up Count Source Select Register (GTUPSR): Body corrected |
| | | 12-26 | 12.2.9 General PWM Timer Down Count Source Select Register (GTDNSR): Body corrected |
| | | 12-34 | 12.2.12 General PWM Timer Control Register (GTCR): Description of b18 to b16 (MD[2:0]) in Bit table corrected |
| | | 12-36, 12-37 | 12.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC): b17 and b16 of Bit table corrected, Description of the OmDTYR bit corrected |
| | | 12-39, 12-40 | 12.2.14 General PWM Timer I/O Control Register (GTIOR): Description of the OADF[1:0] and OBDF[1:0] bits corrected |
| | | 12-44 | 12.2.15 General PWM Timer Interrupt Output Setting Register (GTINTAD): Description of the GRP[1:0] bit corrected |

| Rev. | Date | Description | |
|------|--------------|----------------|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 12-45 to 12-47 | 12.2.16 General PWM Timer Status Register (GTST): Bit names of bit 5 (TCFF), bit 4 (TCFE), bit 3 (TCFD), and bit 2 (TCFC) corrected |
| | | 12-51, 12-52 | 12.2.17 General PWM Timer Buffer Enable Register (GTBER): Descriptions of bits 25 and 24 (ADTTA[1:0]) and bits 29 and 28 (ADTTB[1:0]) in Bit table corrected, Description of the PR[1:0] bits corrected |
| | | 12-54 | 12.2.18 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC): Body corrected |
| | | 12-58 | 12.2.24 A/D Converter Start Request Timing Register n (GTADTRn) (n = A, B): Suffix corrected |
| | | 12-58 | 12.2.25 A/D Converter Start Request Timing Buffer Register n (GTADTBRn): Suffix corrected, Register address of GPT32Em.GTADTBRB added |
| | | 12-58 | 12.2.26 A/D Converter Start Request Timing Double-Buffer Register n (GTADTDBRn) (n = A, B): Suffix corrected |
| | | 12-59 | 12.2.27 General PWM Timer Dead Time Control Register (GTDTCR): Description of the TDE bit corrected |
| | | 12-60 | 12.2.28 General PWM Timer Dead Time Value Register n (GTDVn) (n = U, D): Suffix corrected, Body corrected |
| | | 12-60 | 12.2.29 General PWM Timer Dead Time Buffer Register n (GTDBn) (n = U, D): Suffix corrected |
| | | 12-62 | 12.2.31 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR): Description of b31 to b1 in Bit table corrected |
| | | 12-67 | 12.3.1.1 Counter Operation (4) Event count operation in up-counting using hardware sources: Body corrected |
| | | 12-68 | 12.3.1.1 Counter Operation (5) Event count operation in down-counting using hardware sources: Body corrected |
| | | 12-68 | Figure 12.9 Example setting for an event count operation in down-counting using hardware sources: Description of setting count source corrected |
| | | 12-69 | 12.3.1.1 Counter Operation (6) Counter clear operation: Body corrected |
| | | 12-76 | 12.3.2 Buffer Operation: Body corrected |
| | | 12-76 | 12.3.2.1 GTPR Register Buffer Operation: Body corrected |
| | | 12-79 | 12.3.2.2 Buffer Operation for GTCCRA and GTCCRB (1) When GTCCRA or GTCCRB functions as an output compare register: Body corrected |
| | | 12-83 | Figure 12.27 Example setting for GTCCRA and GTCCRB buffer operation with input capture: Description of setting operating mode corrected |
| | | 12-86 | Figure 12.31 Example setting for GTADTRA and GTADTRB buffer operation: Description of setting buffer operation corrected |
| | | 12-89 | 12.3.3.2 Saw-Wave One-Shot Pulse Mode: Body corrected |
| | | 12-99 | 12.3.4 Automatic Dead Time Setting Function: Body corrected |
| | | 12-106 | Figure 12.49 Example of output duty 0% and 100% functions: Setting examples corrected |
| | | 12-109 | Figure 12.55 Example setting for count start/stop operation by hardware source: Descriptions of setting hardware count start and setting hardware count stop corrected |
| | | 12-111 | Figure 12.58 Example setting for count clearing operation by hardware source: Description of setting hardware source operation corrected |
| | | 12-112 | 12.3.7.3 Hardware Clear Operation: Body corrected |
| | | 12-115 | 12.3.8.2 Synchronized Operation by Hardware: Body corrected |
| | | 12-115 | Figure 12.62 Example of a simultaneous start, stop, and clear by the hardware sources, with the same count cycle (GTPR register value): Title corrected |
| | | 12-132 | Table 12.18 Conditions of up-counting and down-counting in phase counting mode 5 (B): Register setting corrected |
| | | 12-136 | 12.4.1 Interrupt Sources and Priorities (3) CCMPAn interrupt (n = 0 to 7): Body corrected |
| | | 12-136 | 12.4.1 Interrupt Sources and Priorities (4) CCMPBn interrupt (n = 0 to 7): Body corrected |

| Rev. | Date | Description | |

| 3.00 | Dec 06, 2019 | 16-15 | 16.2.11 Hour Alarm Register (RHRAR) / Binary Counter 2 Alarm Register (BCNT2AR) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RHRCNT counter → RHRCNT) |
| | | 16-16 | 16.2.12 Day-of-Week Alarm Register (RWKAR) / Binary Counter 3 Alarm Register (BCNT3AR) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RWKCNT counter → RWKCNT) |
| | | 16-17 | 16.2.13 Day Alarm Register (RDAYAR) / Binary Counter 0 Alarm Enable Register (BCNT0AER) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RDAYCNT counter → RDAYCNT) |
| | | 16-18 | 16.2.14 Month Alarm Register (RMONAR) / Binary Counter 1 Alarm Enable Register (BCNT1AER) (1) In calendar count mode: Description of bit7 (ENB) Counter notation corrected (RMONCNT counter → RMONCNT) |
| | | 16-20 | 16.2.16 Year Alarm Enable Register (RYRAREN) / Binary Counter 3 Alarm Enable Register (BCNT3AER) (1) In calendar count mode: Register and counter notation corrected (RYRCNT counter → RYRCNT) |
| | | 16-23 | 16.2.18 RTC Control Register 1 (RCR1): Register notation corrected (RCR1 register → RCR1), Description of the PIE bit corrected |
| | | 16-24 | 16.2.19 RTC Control Register 2 (RCR2) (1) In calendar count mode: Body corrected |
| | | 16-28 | 16.2.20 RTC Control Register 3 (RCR3): Register notation corrected (RCR3 register → RCR3) |
| | | 16-28 | 16.2.21 RTC Control Register 4 (RCR4): Register notation corrected (RCR4 register → RCR4) |
| | | 16-29 | 16.2.22 Frequency Register H/L (RFRH/L): Undefined value x and its description added to Bit map of the RFRH register |
| | | 16-32 | Figure 16.2 Outline of initial settings after a power on: Processing of "Set the time capture control register" deleted |
| | | 16-39 | 16.3.8.1 Automatic Adjustment: Register notation corrected (RADJ register → RADJ) |
| | | 16-41 | 16.3.8.2 Adjustment by Software: Register notation corrected (RADJ register → RADJ) |
| | | 16-44 | 16.5.1 Register Writing during Counting: RCR1.RTCOS and RCR2.RTCOE registers deleted |
| | | 16-45 | 16.5.4 Notes When Writing to and Reading from Registers: Body corrected |
| | | 18. Serial Communications Interface (SC1g) | |
| | | 18-1 | 18. Serial Communications Interface (SC1g): Body corrected |
| | | 18-23 | 18.2. 11 Bit Rate Register (BRR): Body corrected |
| | | 18-23 | Table 18.6 Relationship between N Setting in BRR and Bit Rate B: "Clock synchronous" row corrected |
| | | 18-29 | Table 18.14 BRR Settings for Various Bit Rates (Smart Card Interface Mode, n = 0, S = 372): "Error" column corrected |
| | | 18-31 | Table 18.17 Relationship between MDDR Setting (M) and Bit Rate (B) When Bit Rate Modulation Function is Used: "Clock synchronous*1" and "Smart card interface" under the "Mode" column corrected, Note 1 corrected |
| | | 18-79 | 18.9.4 Receive Error Flags and Transmit Operations (Clock Synchronous Mode): Title corrected |
| | | 20. SPI Multi I/O Bus Controller | |
| | | All | Mode names corrected as follows: Manual operating mode → Manual mode and External Address Space Read Operation → External Address Space Read Mode |
| | | 20-2 | 20.1.5 Manual Mode: Body corrected |
| | | 20-6 | 20.4.1 Common Control Register (CMNCR): Body corrected, R/W of bit 24 corrected, Description of bit 31 (MD) corrected |
| | | 20-15 | 20.4.7 Data Read Enable Setting Register (DRENr): Description of bits 11 to 8 (ADE[3:0]) corrected |
| | | 20-20 | 20.4.12 Manual Mode Enable Setting Register (SMENr): Description of bits 11 to 8 (ADE[3:0]) corrected |
| | | 20-24 | 20.4.16 Manual Mode Write Data Register 1 (SMWDR1): Body corrected |
| | | 20-26 | 20.4.18 Data Read Dummy Cycle Setting Register (DRDMCR): Body corrected |

| Rev. | Date | Description | |
|------|--------------|----------------------------|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 20-28 | 20.4.20 Manual Mode Dummy Cycle Setting Register (SMDMCR): Body corrected |
| | | 20-36 | 20.4.27 PHY Adjustment Register 2 (PHYADJ2): Description of bits 31 to 0 (ADJ2[31:0]) corrected |
| | | 20-37 | 20.5.1 System Configuration: Body corrected |
| | | 20-39 | Figure 20.4 System Configuration Example with HyperFlash Connected, corrected |
| | | 20-40 | Figure 20.5 System Configuration Example with OctaFlash Connected, corrected |
| | | 20-41 | 20.5.2 Address Map: Body corrected |
| | | 20-52 | Table 20.4 Data Registers: "Dummy cycle" row corrected |
| | | 20-52 | Table 20.5 Data Registers (HyperFlash): "Dummy cycle" row corrected |
| | | 20-53 | 20.5.8 Command Sequence (2) Data Enable: Body corrected |
| | | 20-53 | Figure 20.18 Data and Enable (Serial Flash), corrected |
| | | 20-55 | 20.5.8 Command Sequence (3) Bit Size: Body corrected |
| | | 20-55 | Figure 20.19 Transfer Format Example with 1-Bit Data Size and One Serial Flash Memory Connected, corrected |
| | | 20-55 | Figure 20.20 Transfer Format Example with 1-Bit Data Size and Two Serial Flash Memories Connected, corrected |
| | | 20-56 | Figure 20.21 Transfer Format Example with 4-Bit Data Size and One Serial Flash Memory Connected, corrected |
| | | 20-57 | Figure 20.23 Transfer Format Example in the HyperFlash Command and Address Phase, corrected |
| | | 20-64 | 20.5.17 Timing Adjustment: Body corrected |
| | | 20-64 | Figure 20.28 (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode): Title corrected |
| | | 20-65 | Figure 20.28 (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode): Title corrected |
| | | 20-66 | Figure 20.28 (3) Example of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode): Title corrected |
| | | 20-67 | 20.5.18 Data Alignment: Body corrected |
| | | 21. HyperBus™ Controller | |
| | | 21-2 | Figure 21.2 Example of Connections between this LSI and Hyper and HyperRAM Devices, corrected |
| | | 21-3 | Table 21.1 List of Input/Output Pins: Note added |
| | | 21-15 | 21.6.2.3 One-Byte Write Access: Title corrected, Body corrected |
| | | 21-15 | Figure 21.6 Waveforms of One-Byte Writing: Title and figure corrected |
| | | 21-16 | Table 21.3 Command/Address Bit Assignments: Description of bit 45 (Burst type) corrected |
| | | 21-17 | 21.6.3.1 Write Operation Flow: Body corrected |
| | | 21-19 | 21.6.3.3 Flow of Write and Read Operations for the Configuration Register: Body corrected |
| | | 21-20 | Figure 21.11 Timing Chart of Read and Write Operations, corrected |
| | | 22. Octa Memory Controller | |
| | | All | Notation of hexadecimal numbers corrected |
| | | 22-3 | Table 22.1 Configuration of Hyper Memory Controller Pins: Note added |
| | | 22-3 | 22.3.1 Device Interface: Body corrected |
| | | 22-4 | 22.4 Register Descriptions: Body corrected |
| | | 22-7 | 22.4.3 Device Command Setting Register (DCSR): Description of bits 15 to 8 (DMLN[7:0]) corrected |
| | | 22-8 | 22.4.4 Device Size Register 0 (DSR0): Description of bits 29 to 0 (DV0SZ[29:0]) corrected |
| | | 22-8 | 22.4.5 Device Size Register 1 (DSR1): Description of bits 29 to 0 (DV1SZ[29:0]) corrected |

| Rev. | Date | Description | |
|------|--------------|------------------------------------|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 22-9 | 22.4.6 Memory Delay Trim Register (MDTR): Description of bits 27 to 24 (DQSEDOP[3:0]), bits 23 to 16 (DV1DEL[7:0]), bits 15 to 12 (DQSESOP[3:0]), bits 11 to 8 (DQSERAM[3:0]), and bit 7 to 0 (DV0DEL[7:0]) corrected |
| | | 22-10 | Table 22.4 Examples of Setting the OM_DQS Enable Counter for OctaRAM: Title and heading corrected |
| | | 22-10 | Table 22.5 Examples of Setting the OM_DQS Enable Counter for OctaFlash Memory: Title and header corrected |
| | | 22-11 | 22.4.7 Auto-Calibration Timer Register (ACTR): Body corrected |
| | | 22-11 | 22.4.8 Auto-Calibration Address Register 0 (ACAR0): Body corrected, Description of bits 31 to 0 (CAD0[31:0]) corrected |
| | | 22-12 | 22.4.9 Auto-Calibration Address Register 1 (ACAR1): Body corrected, Description of bits 31 to 0 (CAD1[31:0]) corrected |
| | | 22-13, 22-14 | 22.4.10 Device Memory Map Read Chip Select Timing Setting Register (DRCSTR): Description of bits 29 to 27 (DVRDH1[2:0]) and bits 13 to 11 (DVRDH0[2:0]) corrected |
| | | 22-18 | 22.4.12 Device Chip Select Timing Setting Register (DCSTR): Body corrected, Description of bits 13 to 11 (DVSELHI[2:0]) corrected |
| | | 22-20, 22-21 | 22.4.13 Controller and Device Setting Register (CDSR): Body corrected, Note of Bit table corrected |
| | | 22-22 | 22.4.14 Memory Map Dummy Length Register (MDLR): Body corrected, Description of bits 31 to 24 (DV1WDL[7:0]), bits 23 to 16 (DV1RDL[7:0]), bits 15 to 8 (DV0WDL[7:0]), and bits 7 to 0 (DV0RDL[7:0]) corrected, Note of Bit table corrected |
| | | 22-26 | 22.4.19 Configure Write without Data Register (CWNDR): Body corrected |
| | | 22-27 | 22.4.20 Configure Write Data Register (CWDR): Body corrected |
| | | 22-27 | 22.4.21 Configure Read Register (CRR): Body corrected |
| | | 22-29 | Figure 22.2 Example of Connections between this LSI and OctaFlash and OctaRAM Devices, corrected |
| | | 22-32 | Figure 22.6 Waveform of Write Operation in OctaRAM Interface, corrected |
| | | 22-33 | Figure 22.8 Waveform of Read Operation in OctaFlash Interface (SOPi Mode), corrected |
| | | 22-33 | Figure 22.9 Waveform of Read Operation in OctaFlash Interface (DOPI Mode with Pre-cycle Enabled), corrected |
| | | 22-34 | Figure 22.10 Waveform of Read Operation in OctaRAM Interface (with Pre-cycle Enabled), corrected |
| | | 22-37 | 22.5.5 One-Byte Write Access to an Octa Memory Device in the DOPI Mode: Title corrected, Body corrected |
| | | 22-37 | Figure 22.13 Waveforms in One-Byte Write Access in the DOPI Mode: Title and figure corrected |
| | | 22-38 | Table 22.6 Example of Initial Settings of the Octa Memory Controller: Data of steps 4 and 6 corrected, Description of step 8 corrected |
| | | 22-42 | 22.6 Delaying OM_DQS and Auto-Calibration: Title corrected |
| | | 22-42 | 22.6.1 Delaying OM_DQS: Title corrected, Body corrected |
| | | 22-42 | Figure 22.14 Example of Securing the Latching of Data by Delaying OM_DQS: Title and figure corrected |
| | | 22-42 | 22.6.2 OM_DQS Auto-Calibration: Body corrected |
| | | — | 22.6.2.1 Automatic Calibration Setting Flow: Title deleted |
| | | 22-43 | Figure 22.15 Flow of Settings for the Auto-Calibration Mode: Title and figure corrected |
| | | 22-44 | Figure 22.16 Example of the Initial Setting of the DV0DEL or DV1DEL Bits in MDTR, added |
| | | 22-45 | 22.7 OM_DQS Enable Counter: Body corrected, Note 1, Note 2, and Note 3 corrected |
| | | 22-46 | Figure 22.17 Timing of the OM_DQS Enable Counter in DOPI Mode for the Flash Memory with 4 as the Number of Dummy Cycles (Latency), and OM_DQS Pre-Cycle Off: Title and figure corrected |
| | | 23. I ² C Bus Interface | |
| | | 23-3 | 23.2.1 Functional Overview: Description of SCL clock corrected |

| Rev. | Date | Description | |
|------|--------------|-------------------------------------|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 23-24 | 23.3.6 RIIcNFER — I ² C Bus Function Enable Register: Description of NACKE bit corrected |
| | | 23-66 | Figure 23.23 Block Diagram of Digital Noise Filter Circuit, corrected |
| | | 23-85 | 23.13.2 Extra SCL Clock Cycle Output Function: Body corrected |
| | | 23-85 | Figure 23.40 Extra SCL Clock Cycle Output Function (CLO Bit), corrected |
| | | 24. Serial Sound Interface (SSIF-2) | |
| | | All | I ² S→I ² S, corrected |
| | | 24-9 | 24.4.1.1 Control Register (SSICR) Descriptions of bits 21 to 19 (DWL[2:0]) and bits 18 to 16 (SWL[2:0]) in Bit table corrected |
| | | 25. CANFD Interface (RS-CANFD) | |
| | | All | CAN FD→CANFD, corrected |
| | | 25-2 | Table 25.3 Index: Descriptions of indexes d and b corrected |
| | | 25-4 | Table 25.7 Interrupt Requests: RSCFD0 deleted |
| | | 25-4 | Table 25.8 External Input/Output Signals: RSCFD0 deleted, CAN_CLK unit signal added |
| | | 25-5 | Table 25.9 RS-CANFD Module Specifications: Specifications of Buffer and Reception filter function corrected |
| | | 25-12 | 25.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register: Description of RCMC bit corrected |
| | | 25-32 | 25.3.4.4 RSCANnGERFL — Global Error Flag Register: R/W of bits 17 and 16 in Bit map corrected |
| | | 25-38 | Table 25.27 RSCANnGAFLECTR Register Contents: Function of bits 4 to 0 (AFLPN[4:0]) corrected |
| | | 25-38 | 25.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register: Description of AFLPN[4:0] bits corrected |
| | | 25-111 | Table 25.82 RSCANnGTSTCFG Register Contents: Function of bits 22 to 16 (RTMPS[6:0]) corrected |
| | | 25-111 | 25.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register: Description of RTMPS[6:0] bits corrected |
| | | 25-119 | 25.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register: Description of RCMC bit corrected |
| | | 25-135 | 25.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0, 1): Description of DBRP[7:0] bits corrected |
| | | 25-137, 25-138 | 25.4.3.6 RSCFDnCFDCmFDCFG — Channel CANFD Configuration Register (m = 0, 1): Description of GWEN bit corrected |
| | | 25-141 | 25.4.3.8 RSCFDnCFDCmFDSTS — Channel CANFD Status Register (m = 0, 1): Title corrected |
| | | 25-144, 25-145 | Table 25.103 RSCFDnCFDGCFCFG Register Contents: Function of bit 12 (TSSS) and bit 4 (DCS) corrected |
| | | 25-151 | 25.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register: R/W of bits 17 and 16 in Bit map corrected |
| | | 25-156 | 25.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register: Bit notation corrected (TSCCFG Bit → TSCCFG[1:0] Bits) |
| | | 25-157 | 25.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register: Initial values after reset of bits 3, 2, and 0 in Bit map corrected, Description of AFLPN[4:0] bits corrected |
| | | 25-157 | Table 25.110 RSCFDnCFDGAFLECTR Register Contents: Function of bits 4 to 0 (AFLPN[4:0]) corrected |
| | | 25-166 | 25.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0): Title corrected |
| | | 25-184 | 25.4.8.1 RSCFDnCFDCFCCK — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5): Description of CFITSS bit corrected |
| | | 25-205 | 25.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register: Function of bits 13 to 10 corrected (CFDMAE[5:2] → Reserved) |
| | | 25-207 | 25.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register: Function of bits 13 to 10 corrected (CFDMASTS[5:2] → Reserved) |

| Rev. | Date | Description | |
|------|--------------|---|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 25-241 | Table 25.167 RSCFDnCFDGTSTCFG Register Contents: Function of bits 22 to 16 (RTMPS[6:0]) corrected |
| | | 25-241 | 25.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register: Description of RTMPS[6:0] bits corrected |
| | | 25-251 | Table 25.173 Global Mode Transition Time: *1 added to "Two CAN bit times" and "Two CAN frames" under "Maximum Transition Time" |
| | | 25-255 | Table 25.175 Operation in Transitions to Channel Reset Mode/Channel Halt Mode: Title corrected |
| | | 25-257 | Table 25.176 Registers Initialized in Global Reset Mode or Channel Reset Mode: Note corrected |
| | | 25-258 | Table 25.177 Registers Initialized Only in Global Reset Mode: Note corrected |
| | | 25-259 | Figure 25.6 Entry of Receive Rules (for Setting Channels 0 and 1): Title corrected |
| | | 25-267 | Figure 25.10 Interval Timer Block Diagram, corrected |
| | | 25-267 | 25.8.3.1 Interval Transmission Function: Description of (4) corrected |
| | | 25-269 | 25.8.6 Transmit History Function: Body corrected |
| | | 25-270 | 25.9.1 CAN-CANFD Gateway (Only in CANFD Mode): Body corrected |
| | | 25-273 | 25.10.5 RAM Test: Body corrected |
| | | 25-275 | 25.11.1 Initial Settings: Body corrected |
| | | 25-275 | Figure 25.16 CAN Setting Procedure after the MCU is Reset, corrected |
| | | 25-276 | Figure 25.17 Bit Timing Chart, corrected |
| | | 25-277 | Figure 25.18 CAN Clock Control Block Diagram, corrected |
| | | 25-280 | 25.11.1.5 Buffer Setting: Body corrected |
| | | 25-280 | Figure 25.20 Buffer Configuration, corrected |
| | | 25-281 | Figure 25.21 Buffer Setting Procedure: Description of "Enable interrupts of buffers to be used" processing corrected |
| | | 25-283 | Figure 25.23 Receive Buffer Reading Procedure: Note corrected |
| | | 25-285 | Figure 25.25 Transmit/Receive FIFO Buffer Reading Procedure, corrected |
| | | 25-303 | Figure 25.37 RAM Test Setting Procedure: *1 added |
| | | 27. Ethernet Controller (ETHERC) | |
| | | 27-36 | 27.5.3 Handling when Control Information Included a Mismatch: Body corrected |
| | | 27-36 | 27.5.4 Points to Note when the EPTPC Is not in Use, added |
| | | 27-36 | 27.5.5 Procedure of Resetting the Ethernet Controller, added |
| | | 28. PTP Module for the Ethernet Controller (EPTPCa) | |
| | | 28-12 to 28-54 | 28.2.1 MINT Interrupt Source Status Register (MIESR) to 28.2.35 Cut-Through Transfer Start Threshold Register (TRNCTTDR): Address notation corrected |
| | | 28-100 | 28.2.82 Response Message Reception Timeout Register (RSTOUTR): Register symbol added to Address |
| | | 28-101 | 28.2.83 PTP Reset Register (PTRSTR): Address notation corrected |
| | | 28-102 | 28.2.84 STCA Clock Select Register (STCSELR): Address notation corrected |
| | | 28-139 | Table 28.27 Limits on the Values that can be Specified for a Pulse Output Timer: "Resolution of the cycle" and "Resolution of the pulse width" rows corrected |
| | | 28-146 | 28.5.1 Setting of the Module-Stop Function, added |
| | | 28.146 | Table 28.29, added |
| | | 28.147 | 28.5.1.1 Release from the Module-Stop State, added |
| | | 28.147 | 28.5.1.2 Transition to the Module-Stop State, added |
| | | 28-147 | 28.5.2 Notes on Placing the CPU on Software Standby, added |
| | | 28-149 | 28.5.5 Transfer by PTPEDMAC when the Transparent Clock (TC) is in Use, added |
| | | 30. A/D Converter | |
| | | 30-1 | 30.1 Overview: Body corrected |

| Rev. | Date | Description | |
|------|--------------|---------------------------|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 30-4 | Table 30.2 Functions of A/D Converter: Names of triggers from GPT corrected |
| | | 30-17 | 30.2.7 A/D-Converted Value Addition/Average Mode Select Register 0 (ADADS0): Function of bits 7 to 0 in Bit table corrected |
| | | 30-23 | Table 30.7 Selection of A/D Activation Sources by the TRSB[5:0] Bits (for Group B only): Names of triggers from GPT corrected |
| | | 30-24 | Table 30.8 Selection of A/D Activation Sources by the TRSA[5:0] Bits: Names of triggers from GPT corrected |
| | | 30-27 | Table 30.9 Selection of A/D Activation Sources by the TRSC[5:0] Bits (for Group C only): Names of triggers from GPT corrected |
| | | 30-40 | 30.2.21 A/D Compare Function Window-B Status Register (ADCMPBSR): Bits 15 to 8 in Bit map deleted, Bit numbers in Bit table corrected (b15 to b1 → b7 to b1) |
| | | 30-45 | 30.3.1 Scanning Operation: Names of triggers from GPT corrected |
| | | 30-49 | 30.3.2.4 Extended Operations When Double Trigger Mode is Selected: Names of triggers from GPT corrected |
| | | 30-54 | 30.3.4.2 A/D Conversion in Double Trigger Mode: Names of triggers from GPT corrected |
| | | 30-90 | 30.5.9 Range of Voltage on the Analog Input Pins, added |
| | | 30-90 | 30.5.10 Notes on Board Design, added |
| | | 30-90 | 30.5.11 Notes on Noise Prevention, added |
| | | 30-90 | Figure 30.31 Example of a Protection Circuit for the Analog Inputs, added |
| | | 31. NAND Flash Controller | |
| | | All | Sequence name corrected as follows: Universal command sequence, Generic Command Sequence → Generic Sequence |
| | | 31-1 | 31.1.1 Features: Description of DMA controller corrected |
| | | 31-2 | Figure 31.1 Block Diagram: INTNFMA interrupt signal added |
| | | 31-2 | 31.1.2 Block Diagram: Body corrected |
| | | 31-5, 31-6 | 31.2.2 Main configurations register (CONTROL): Descriptions of bits 20 to 18 and bits 2 and 1 (ECC_BLOCK_SIZE[1:0]) in Bit table corrected |
| | | 31-7, 31-8 | 31.2.3 GENERIC_SEQ register (GEN_SEQ_CTRL): Descriptions of bits 11 and 10 (ROW_A1[1:0]), 9 and 8 (ROW_A0[1:0]), 7 and 6 (COL_A1[1:0]), and 5 and 4 (COL_A0[1:0]) corrected |
| | | 31-9 | 31.2.4 Controller status register (STATUS): Body corrected, Description of bit 9 (DATASIZE_ERROR_ST) in Bit table corrected |
| | | 31-10 | 31.2.5 LUN status register (LUN_STATUS_0): Body corrected |
| | | 31-14 | 31.2.8 ECC module control register (ECC_CTRL): Description of bits 2 to 0 (ECC_CAP[2:0]) in Bit table corrected |
| | | 31-41 | 31.2.34 MLUN register (MLUN): Description of bits 2 to 0 (MLUN_IDX[2:0]) in Bit table corrected |
| | | 31-43 | Table 31.5 Instruction Encoding: Description of INPUT_SEL field corrected |
| | | 31-45 | 31.3.1 Command Generation (c) SEQ_2 Sequence: Body corrected |
| | | 31-46 | 31.3.1 Command Generation (d) SEQ_3 Sequence: Body corrected |
| | | 31-47 | 31.3.1 Command Generation (h) SEQ_7 Sequence: Body corrected |
| | | 31-48 | 31.3.1 Command Generation (j) SEQ_9 Sequence: Body corrected |
| | | 31-48 | 31.3.1 Command Generation (k) SEQ_10 Sequence: Body corrected |
| | | 31-48 | 31.3.1 Command Generation (l) SEQ_11 Sequence: Body corrected |
| | | 31-49 | 31.3.1 Command Generation (o) SEQ_14 Sequence: Body corrected |

| Rev. | Date | Description | |
|------|--------------|-------------------------|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 31-50 | 31.3.1 Command Generation (p) SEQ_15 sequence: Body corrected |
| | | 31-51 | 31.3.1 Command Generation (v) SEQ_22 sequence: Body corrected |
| | | 31-63 | 31.3.3 Instructions (11) SELECT LUN WITH STATUS Command (a) Command Description: Body corrected |
| | | 31-66 | 31.3.3 Instructions (17) READ PAGE Command (a) Command Description: Body corrected |
| | | 31-83 | Figure 31.32 Configuration: Processing 5 corrected |
| | | 31-84 | 31.3.7 Setup and Configuration (1) Send Data to NAND Flash via Slave Interface: Description numbered 2, and body corrected |
| | | 31-85 | 31.3.7 Setup and Configuration (2) Read Data from NAND Flash via Slave Interface: Descriptions numbered 2 and 4, and body corrected |
| | | 31-86 | 31.3.7 Setup and Configuration (3) Send Data to NAND Flash via Master Interface (using DMA): Descriptions numbered 2 and 4, and body corrected |
| | | 31-88 | 31.3.7 Setup and Configuration (4) Fast Writing and Reading of Several Pages from the Memory using DMA: Description numbered 2 corrected |
| | | 31-89 | Figure 31.36 Fast Writing and Reading of Several Pages from the Memory Using DMA, corrected |
| | | 31-90 | 31.3.7 Setup and Configuration (5) Writing to Partial Pages: Description numbered 2 corrected |
| | | 31-90 | Figure 31.37 Writing to Partial Pages: Description of processing 3 corrected |
| | | 31-91 | 31.3.7 Setup and Configuration (6) Reading Partial Pages: Descriptions numbered 2 and 4 corrected |
| | | 31-92 | Figure 31.39 Block Diagram, corrected |
| | | 31-92 | 31.4.1 Block Diagram: Body corrected |
| | | 31-93 | 31.4.2 DMA (2) DMA Description: Body corrected |

| | | — | Figure 31.40 Descriptor Fields for Scatter-Gather DMA (64 bits), deleted |
| | | — | Table 31.47 Descriptor Fields for Scatter-Gather DMA (64 bits), deleted |
| | | 31-94 | Figure 31.40 Descriptor Fields for Scatter-Gather DMA: Title corrected |
| | | 31-95 | Table 31.47 Descriptor Fields for Scatter-Gather DMA: Title corrected |
| | | 31-96 | Figure 31.41 Example of Scatter-Gather DMA Data Transfer, corrected |
| | | 31-98 | 31.4.4 BCH Algorithm Implementation: Body corrected |
| | | 32. USB 2.0 Host Module | |
| | | 32-1 | 32.1 Overview: Body corrected |
| | | 32-1 | 32.1.2 Features: Table corrected, Note 2 added to the table |
| | | 32-7 | 32.2 Register Descriptions: Title corrected |
| | | 32-12 | Table 32.5 HcCommandStatus Register: Descriptions of bit 2 (BLF) and bit 1 (CLF) corrected |
| | | 32-25 | Table 32.21 HcRhDescriptorA Register: Description of bit 12 (NOCP) corrected |
| | | 32-66 | Table 32.54 BCCTRL1 Register: Descriptions of bit 5 (DCPMODE), bit 4 (VDMSRCE), bit 3 (IDPSINKE), bit 2 (VDPSRCE), bit 1 (IDMSINKE) and bit 0 (IDPSRCE) corrected |
| | | 32-67 | 32.2.4.5 UCOM Register (7) CC STATUS Register (offset: 840h): Initial values after reset of bits 28 to 25 in Bit map corrected |

| Rev. | Date | Description | |
|------|--------------|-----------------------------|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 32-67 | Table 32.55 CC_STATUS Register: Description of bit 31 (CC_INT_SEL) and bit 5 (CC_PERI_STA) corrected |
| | | 32-68 | Table 32.56 Conditions for Detecting the Connection of a Peripheral Device: Title corrected |
| | | 32-70 | 32.3 Clock Signals: Title corrected |
| | | 32-72 | 32.4 Interrupt Sources: Title corrected |
| | | 32-80 | 32.5 Power-Saving Function: Title corrected |
| | | 32-81 | 32.6 Battery Charging: Title corrected |
| | | 32-82 | 32.7 Bus Master: Title corrected |
| | | 32-82 | 32.7.1 Functional specifications of the bus master: Title corrected |
| | | 32-82 | 32.7.1.2 Issuing requests for different types of bus transfer: Title corrected |
| | | 32-85 | 32.8 Overcurrent Control and VBUS Control: Title corrected |
| | | 32-85 | 32.8.2 Overcurrent detection timer setting: Body corrected |
| | | 32-88 | 32.9 Procedure for Setting this Module: Title corrected |
| | | 32-88 | Figure 32.1 Sequence Common to Both Host and Peripheral Modes: Title added, Processing corrected |
| | | 32-89 | Figure 32.2 Initialization Sequence: Title added |
| | | 33. USB 2.0 Function Module | |
| | | 33-1 | 33.1.1 Overview: Body corrected |
| | | 33-5 | 33.1.4.2 Notes (2) Setting for battery charging when the peripheral controller is selected, added |
| | | 33-30 | 33.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: 040H>: Name of bit 15 (VBINT) corrected |
| | | 33-48 | 33.2.15.2 Pipe Configuration Register [PIPECFG] <Address: 068H>: Title corrected |
| | | 33-71 | 33.2.19.1 Low Power Status Register [LPSTS] <Address: 102H>: Bit number of SUSPM bit in Bit table corrected (9 → 14) |
| | | 33-74 | 33.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: 144H>: Bit name of bits 7 to 4 in Bit map corrected |
| | | 33-100 | 33.8.2.1 Descriptor Interval Register [DSCITVL] <Address: 704H>: Name of bit 15 to 8 (DITVL) corrected |
| | | 33-147 | 33.9.12.1 Register mode/link mode • Notes on descriptors: Body corrected |
| | | 33-166 | Table 33.58 List of Registers to be Saved: System configuration control register 1 (SYSCFG1) deleted |
| | | 41. LVDS Output Interface | |
| | | 41-6 | 41.4.4 LVDS PLL Setting Register (LPLLSETR): Description of bits 22 to 16 (LVDSPLL_FD[6:0]) corrected |
| | | 43. 2D Drawing Engine (DRW) | |
| | | 43-10 | 43.2.2 Surface Control Register (CONTROL2): Bit numbers in Bit table corrected (b31, 30 → b31, b30) |
| | | 45. JPEG Codec Unit | |
| | | 45-5 | 45.2.1 JPEG Code Mode Register (JCMOD): Description of bit 3 (DSP) corrected |
| | | 45-30 | Figure 45.2 Compression Initial Setting Flow: Description of software reset corrected |
| | | 45-37 | Figure 45.5 Decompression Initial Setting Flow: Description of software reset corrected |
| | | 46. Capture Engine Unit | |
| | | 46-20 | 46.4.6 Capture Interface Width Register (CAPWR): Bit number in Bit table corrected (12 to 10 → 12 to 0) |
| | | 46-65 | 46.5.3 Display in the Video Display Controller 6: Title corrected, Body corrected |
| | | 47. MIPI CSI2 Interface | |
| | | 47-2 | Figure 47.1 CSI2 Block Diagram, corrected |

| Rev. | Date | Description | |
|------|--------------|---------------------------|--|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 47-9 | 47.2.5 Channel Data Type Select Register (VCDT): R/W of bits 20 to 16, descriptions of bits 9 and 8 (SEL_VC) and bit 6 (SEL_DT_ON), and initial values of bits 5 to 0 (SEL_DT) in Bit table corrected |
| | | 47-12 | 47.2.8 Automatic Standby Control Register (ASTBY): Initial value of bit 5 (VD_MSK_EN) in Bit table corrected |
| | | 47-40 | 47.2.39 ECC_CRCT Count Register (ECCCM): Bit numbers in Bit table corrected (31 to 4 → 31 to 8 and 3 to 0 → 7 to 0) |
| | | 47-53 | 47.3.5 Single-Channel Output: Destination for reference (Figure 47.8) added to body |
| | | 47-58 to 47-60 | 47.3.8 PHY Timing Setting, added |
| | | 47-59 | Figure 47.11 Timing of TCLK_PREPARE and TCLK_SETTLE, added |
| | | 47-60 | Figure 47.12 Timing of THS_PREPARE and THS_SETTLE, added |
| | | 47-60 | Table 47.8 Setting Examples of PHY Timing Registers (when B ϕ = 132 MHz, 1 UIINST = 1 ns), added |
| | | 47-61 | Figure 47.13 Example 1 of Initial Setting Procedure for the Video Modules, corrected |
| | | 47-61 | Figure 47.14 Example 2 of Initial Setting Procedure for the Video Modules, corrected |
| | | 47-65 | Figure 47.17 Procedure for Starting PHY Block 1: Title corrected |
| | | 47-65 | Figure 47.18 Procedure for Starting PHY Block 2: Title corrected |
| | | — | Table 47.9 Example of PHY Timing Register Settings Based on Internal Bus Clock (B ϕ) Frequency and Data Transfer Rate, deleted |
| | | 48. Video Input Module | |
| | | 48-1 | Table 48.1 Input Interface for VIN: *2 added to "8-bit user defined data (RAW8)" under "Data Type", Note 2 corrected |
| | | 48-28 | 48.2.20 YC-RGB Conversion Coefficient Registers: Formula for YC → RGB color space conversion corrected |
| | | 49. SD/MMC Host Interface | |
| | | 49-13 | 49.2.7 SD Card Interrupt Flag Register (SD_INFO2): Description of bit 13 (SCLKDIVEN) corrected |
| | | 51. GPIO | |
| | | 51-4, 51-5 | Table 51.2 Port Functions: *1 added to PG_0 to PG_7 and PJ_0 to PJ_7 under "Switching of Driving Ability", Note 1 added, Note corrected to Note 2 |
| | | 51-19 | 51.3.5 GPIO Driving Ability Control Register (DSCR): Body corrected, Function in Bit table corrected, Note 1 corrected, Note 3 added, Note deleted |
| | | 51-28 | Table 51.12 Register Settings for Input/Output Pin Function in 324-/272-/256-Pin Products: Function of P6_1 pin when the register setting is 111b corrected |
| | | 51-29 | Table 51.13 Register Settings for Input/Output Pin Function in 176-Pin Products: Function of P6_1 pin when the register setting is 111b corrected |
| | | 52. Power-Down Modes | |
| | | 52-7 | 52.2.3 Standby Control Register 3 (STBCR3): Bit 1 in Bit map: Function corrected (MSTP31 → reserved), R/W corrected Bit 2 (MSTP32) in Bit table: Description corrected (CAN-FD → CANFD); Bit 1 in Bit table: Function corrected (MSTP31 → reserved), R/W and description corrected |
| | | 52-44 | 52.3.2 Software Standby Mode (1) Transition to Software Standby Mode Step 4 in the description titled "The procedure for switching to software standby mode is as follows:" corrected |
| | | 52-47 | 52.3.4 Deep Standby Mode (1) Transition to Deep Standby Mode: Step 5 in the procedure for the transition to deep standby mode corrected |
| | | 52-48 | Figure 52.3 Flowchart of Transition to Deep Standby Mode, corrected |
| | | 52-49 | Figure 52.4 Flowchart of Canceling Deep Standby Mode, corrected |
| | | 52-51 | Table 52.5 External Memory Control Pins in Different Modes: Heading corrected to "Boot Mode 6 (OctaFlash Boot)" |

| Rev. | Date | Description | |
|------|--------------|---------------------------------|---|
| | | Page | Summary |
| 3.00 | Dec 06, 2019 | 54. Trusted Secure IP | |
| | | 54-5 | Figure 54.4 Key Installation Process, corrected |
| | | 55. Register States | |
| | | 55-3 | Table 55.1 Register States: Note numbers of the "Power-On Reset" and "Deep Standby" columns of DSFR, USBBSFR, XTALCTR, RTCXTALSEL registers in "Power-down modes" row corrected |
| | | 56. Electrical Characteristics | |
| | | 56-2 | 56.3 DC Characteristics: Condition corrected |
| | | 56-3 | Table 56.2 DC Characteristics (2) [Current Consumption]: Typical values of I_{CC} , PLL_{CC} , $LVDSPLL_{CC}$, $MIPIAL_{CC}18$, UAP_{CC} , $LVDSAP_{CC}$, AL_{CC} in the "Current consumption in normal operation" row and I_{sleep} in the "Current consumption in sleep mode" row corrected |
| | | 56-7 | Table 56.3 Permissible Output Currents, corrected |
| | | 56-8 | 56.4 AC Characteristics: Conditions corrected |
| | | 56-13 | Table 56.6 Control Signal Timing: Note corrected to Note 1, Note 2 added |
| | | 56-16 | Table 56.8 Bus Timing: Address delay time 2 (t_{AD2}) corrected |
| | | 56-48 | Table 56.15 SCIFA Timing: $t_{SE_{Cyc}}$ corrected to $t_{p1_{Cyc}}$ |
| | | 56-50 | Table 56.17 Renesas Serial Peripheral Interface Timing: t_{Cyc} corrected to $t_{p1_{Cyc}}$, Note added |
| | | 56-53 | Table 56.18 SPI Multi I/O Bus Controller Timing: Clock cycle ($t_{SPB_{Cyc}}$) corrected, Data output buffer off time during SDR transfer (t_{BOFF}) corrected |
| | | 56-55 | Table 56.20 Octa Memory Controller Timing: Minimum value of OM_CS hold time in DOPI writing corrected |
| | | 56-65 | 56.4.19 CANFD Interface Timing: Title corrected |
| | | 56-65 | Table 56.23 CANFD Interface Timing: Title and heading corrected |
| | | 56-65 | Figure 56.77 CANFD Interface Condition: Title and figure corrected |
| | | 56-74 | Table 56.30 Video Display Controller 6 Timing: DV0_CLK input clock cycle ($t_{D_{Cyc}}$), LCD0_EXTCLK input clock cycle ($t_{E_{Cyc}}$), LCD0_CLK output clock cycle ($t_{L_{Cyc}}$) corrected |
| | | 56-77 | Table 56.32 Capture Engine Unit Signal Timing: Camera clock cycle (t_{VCYC}) corrected |
| | | 56-89 | 56.5 A/D Converter Characteristics: Condition corrected |
| | | 56-89 | Table 56.40 A/D Converter Characteristics: Title corrected |
| | | 57. States and Handling of Pins | |
| | | 57-5, 57-8 | Table 57.1 Pin States: Interface names corrected (CAN interface → CANFD interface, MIPI → MIPI CSI2 interface) |
| | | 57-10 | Table 57.2 Handling of Unused Pins (Except for Debugger Interface Pins): Pins added, Note 3 added |
| | | 57-12 | Table 57.4 Handling of Pins in Deep Standby Mode: Handling of RREF0, RREF1 corrected |
| | | Appendix | |
| | | Appendix -3 | Figure A.3 Dimensions of 272-Pin BGA Package, corrected |
| 4.00 | Nov 27, 2020 | 1. Overview | |
| | | 1-9 | Table 1.1 Features of RZ/A2M: In specification of package, RENESAS Code of 256-pin BGA package corrected |
| | | 1-10 | Table 1.2 Product Lineup: DRP Function and Trusted Secure IP of R7S921040VCBG to R7S921043VCBG, Trusted Secure IP of R7S921051VCBG to R7S921053VCBG, and RENESAS Code of 256-pin BGA package corrected |
| | | 3. Boot Mode | |
| | | 3-1 | Body corrected and Note 4 added |
| | | 5. LSI Internal Bus | |
| | | 5-60 | Table 5.7 Interrupt Signals for the Write Buffers: X2HPERI12_ERRINT added, and Write Buffer Connection Source/Destination of X2HPERI34_ERRINT, X2HPERI5_ERRINT, X2HPERI67_ERRINT, and X2HDBGR_ERRINT corrected |

| Rev. | Date | Description | |

| | | 7. Interrupt Controller | |
| | | 7-28 | Table 7.3 List of Interrupt IDs: Internal bus added |
| | | 8. Bus State Controller | |
| | | 8-8, 8-9 | 8.4.2 CSn Space Bus Control Register (CSnBCR): Bit name and descriptions of bits 24 to 22, 21 to 19, and 18 to 16 corrected |
| | | 9. Direct Memory Access Controller | |
| | | 9-56, 9-57 | Table 9.4 On-Chip Module Requests: DMA transfer request signals of A/D converter and I ² C channels 0 to 3 corrected |
| | | 9-58 | Table 9.4 On-Chip Module Requests: Setting of the CHCFG_n/nS.LVL bit for serial communication interface channels 0 and 1 and Ethernet MAC controller corrected |
| | | 9-59 | Table 9.4 On-Chip Module Requests: DMA transfer request signals of DRP corrected |
| | | 16. Realtime Clock (RTC) | |
| | | 16-33 | Figure 16.3 Clock and count mode setting procedure: Notes 1 and 2 added, and Notes 1 and 2 corrected to Notes 3 and 4 |
| | | 18. Serial Communications Interface (SCIg) | |
| | | 18-2 | Figure 18.1 Block Diagram of SCIg (SCI0 and SCI1): Input and output of RXDn and TXDn corrected |
| | | 20. SPI Multi I/O Bus Controller | |
| | | 20-4 to 20-71 | All (Description of operation in Octal-SPI flash memory protocol mode): Octal-SPI flash memory corrected to Octal-SPI flash memory protocol mode |
| | | 20-1 | 20.1.2 OctaFlash™, Xccela™ Flash Memory Interface: Note added |
| | | 20-7 | 20.4.1 Common Control Register (CMNCR): Note added in description of bits 9 and 8 (IO0FV[1:0]) |
| | | 20-12 | 20.4.5 Data Read Extended Address Setting Register (DREAR): Body corrected |
| | | 20-12 | 20.4.5 Data Read Extended Address Setting Register (DREAR): Descriptions of bits 23 to 16 (EAV[7:0]) and bits 2 to 0 (EAC[2:0]) corrected |
| | | 20-17 | 20.4.10 Manual Mode Address Setting Register (SMADR): Description of bits 31 to 24 (ADR[31:24]) corrected |
| | | 20-20 | 20.4.12 Manual Mode Enable Setting Register (SMENR): Description of bits 11 to 8 (ADE[3:0]) corrected |
| | | 20-27 | 20.4.19 Data Read DDR Enable Register (DRDRENr): Description of bits 14 to 12 (HYPE) corrected |
| | | 20-29 | 20.4.21 Manual Mode DDR Enable Register (SMDRENr): Description of bits 14 to 12 (HYPE[2:0]) corrected |
| | | 20-31 | 20.4.22 PHY Control Register (PHYCNT): Note 3 added in description of bit 18 (HS) |
| | | 20-32 | 20.4.23 PHY Offset Register 1 (PHYOFFSET1): Body corrected |
| | | 20-32 | 20.4.23 PHY Offset Register 1 (PHYOFFSET1): Description of bits 29 and 28 (DDRTMG) corrected |
| | | 20-36 | 20.4.26 PHY Adjustment Register 1 (PHYADJ1): Description of bits 31 to 0 (ADJ1[31:0]) corrected |
| | | 20-36 | 20.4.27 PHY Adjustment Register 2 (PHYADJ2): Description of bits 31 to 0 (ADJ2[31:0]) corrected |
| | | 20-41 | 20.5.2 Address Map: Body corrected |
| | | 20-41 | Table 20.3 Address Map: Max. Access Area corrected |
| | | 20-42 | 20.5.3 32-bit Serial Flash Addresses: Description in the last paragraph corrected |
| | | 20-50 | Figure 20.15 Data Transfer Timing using the SSLKP Bit: QSPIn_SSL corrected |
| | | 20-54 | Figure 20.19 Data and Enable (Octal-SPI Flash Memory Protocol Mode), added |
| | | 20-64 | Table 20.14 Supported Protocol for Serial Flash Memory: Bit Width 1-1-0 added |
| | | 20-64 | Table 20.15 Supported Protocol for Octal-SPI Flash Memory: Bit Width 1-1-0 and 8-8-0 added |
| | | 20-65 | 20.5.17 Timing Adjustment: Body corrected |

| Rev. | Date | Description | |
|------|--------------|--------------------------------|--|
| | | Page | Summary |
| 4.00 | Nov 27, 2020 | 20-65 | Figure 20.29 (1) Flow of Timing Adjustment when the Serial Flash Memory is Connected (SDR Mode Except in the Case of Octal-SPI Flash Memory): Title corrected |
| | | 20-66 | Figure 20.29 (2) Flow of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode): Title corrected |
| | | 20-67 | Figure 20.29 (3) Example of Timing Adjustment when the Serial Flash Memory is Connected (DDR Mode): Title corrected |
| | | 20-71 | 20.6.2 Transfer to read data while the signal on the QSPIn_SSL pin is asserted, deleted |
| | | 22. Octa Memory Controller | |
| | | 22-11 | 22.4.7 Auto-Calibration Timer Register (ACTR): In description of bits 31 to 0 (CTP[31:0]), automatic calibration cycle time corrected |
| | | 22-26 | 22.4.19 Configure Write without Data Register (CWNDR): Body corrected |
| | | 22-27 | 22.4.20 Configure Write Data Register (CWDR): Body corrected |
| | | 25. CANFD Interface (RS-CANFD) | |
| | | 25-3 | Table 25.6 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI: Transfer Rate, clk_xincan, and clk_c of CANFD corrected |
| | | 25-5 | Table 25.9 RS-CANFD Module Specifications: In specification of communication speed, data bit rate in CANFD mode corrected |
| | | 25-305 | 25.12 Notes on the RS-CANFD Module: In the first bullet, "When changing interface mode without resetting the RS-CANFD" corrected to "When changing the interface mode without applying a power-on reset" |
| | | 32. USB 2.0 Host Module | |
| | | 32-4 | 32.1.2.6 Usage Notes, added |
| | | 32-6 | 32.1.4 Input/Output Pins: Pin name of OTG Power IC ID of channel 1 corrected |
| | | 32-27 | Table 32.23 HcRhStatus Register: Description of bit 15 (DRWE) corrected (HcRhPortStatus register → HcRhPortStatus1 register) |
| | | 32-53 | Table 32.43 SPD_CTRL Register: Description of bit 31 (SUSPENDM_ENABLE) corrected (HcRhPortStatus register → HcRhPortStatus1 register) |
| | | 32-62 | Table 32.50 OBINTSTA Register: Descriptions of bit 6 (CHGDETCG1_STA) and bit 4 (PDETCG1_STA) corrected |
| | | 32-65 | Table 32.53 LINECTRL1 Register: Description of bits 21 and 20 (DSDP[1:0]) corrected |
| | | 32-66 | Table 32.54 BCCTRL1 Register, corrected |
| | | 32-81 | Table 32.59 Function of Charging Port: Title added |
| | | 32-81 | 32.6.1 Support of charging port: Description added |
| | | 32-82 | 32.6.1.1 When the host controller is to be used in the CDP mode, added |
| | | 32-83 | 32.6.1.2 When the host controller is to be used in the DCP mode, added |
| | | 32-83 | 32.6.2 Support of portable device: Description added |
| | | 32-84 | Figure 32.2 Example of the Control Flow for Portable Devices, added |
| | | 32-95 | 32.11 Points for Caution, added |
| | | 32-95 to 32-104 | 32.11.1 Actions after Device Disconnection, added |
| | | 47. MIPI CSI2 Interface | |
| | | 47-18 | 47.2.12 Interrupt Source Mask Register (INTCLOSE): Note added |
| | | 47-62 | 47.3.9.1 Terminology, added |
| | | 48. Video Input Module | |
| | | 48-77 | Table 48.14 Specifications: Description of UDS scaler setup sequence corrected |
| | | 51. GPIO | |
| | | 51-9 | Figure 51.7 (7) TTL AND Input Buffer: JP0_3 corrected to TCK/SWDCLK |
| | | 51-10 | Figure 51.9 (9) Bidirectional Buffer with TTL AND Input and Latch: JP0_2 corrected to TMS/SWDIO |

| Rev. | Date | Description | |

| | | Page | Summary |
| 4.00 | Nov 27, 2020 | 51-10 | Figure 51.10 (10) Schmitt AND Input Buffer: JP0_4 corrected to TRST# |
| | | 52. Power-Down Modes | |
| | | 52-57 | 52.4.3 Usage Notes when USB 2.0 Host/Function Modules are Not to be Used: Body corrected |
| | | 52-57 | Figure 52.5 Flow of Settings when USB 2.0 Host/Function Modules are Not to be Used: Title added |
| | | 56. Electrical Characteristics | |
| | | 56-65 | Table 56.23 CANFD Interface Timing: Maximum transfer rate of CANFD corrected |
| | | Appendix | |
| 5.00 | Feb.26.2024 | Appendix-2 | Figure A.2 Dimensions of 256-Pin BGA Package, corrected |
| | | 1. Overview | |
| | | 1-4 | Table 1.1 Features of RZ/A2M: Specification of Realtime clock corrected |
| | | 1-15 | Table 1.3 Pin Function: Function of Clock AUDIO_XOUT corrected |
| | | 5. LSI Internal Bus | |
| | | 5-7 | Table 5.5 Address Map: Area of address (H'6000_0000 to H'6FFF_FFFFFF), corrected |
| | | 6. Clock Pulse Generator | |
| | | 6-1 | 6. Clock Pulse Generator: Body corrected |
| | | 6-2 | Figure 6.1 Block Diagram: Crystal oscillator corrected to Oscillator |
| | | 6-2 | 6.1 Features: (1) Oscillator: Title corrected, Body corrected |
| | | 6-7 | 6.4.1 Frequency Control Register (FRQCR): Body corrected, Description of CKOEN2 bit in Bit table corrected |
| | | 6-14 | 6.7.1 Oscillation Stabilizing Time of the On-chip Oscillator: Title corrected, Body corrected |
| | | 6-14 | 6.7.2 Oscillation Stabilizing Time of the PLL circuit: Note corrected |
| | | 6-16 | Figure 6.5 Clock Signals for the System and Realtime Clock: Crystal oscillator corrected to Oscillator |
| | | 6-17 | Figure 6.6 Audio and USB Clock Signals: Crystal oscillator corrected to Oscillator, Note added |
| | | 8. Bus State Controller | |
| | | 8-6 | Table 8.4 Register Configuration: Note 1 added |
| | | 8-8, 8-9 | 8.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5): Note added to Bit map, Note added to Bit table |
| | | 12. General PWM Timer (GPT) | |
| | | 12-37 | 12.2.13 General PWM Timer Count Direction and Duty Setting Register (GTUDDTYC) Output duty • In saw-wave mode: Body corrected • In triangle-wave mode: Body corrected |
| | | 15. Watchdog Timer | |
| | | 15-11 | 15.4.1 Canceling Software Standby Mode: Description of step 2 corrected, Note 1 corrected |
| | | 16. Realtime Clock (RTC) | |
| | | 16-3 | Figure 16.1 RTC block diagram: Sub-clock oscillator corrected to Oscillator |
| | | 16-3 | Table 16.3 Pin configuration of RTC: "Name" column corrected |
| | | 17. Serial Communications Interface with FIFO (SCIFA) | |
| | | 17-13, 17-14 | 17.2.8 Bit Rate Register (BRR): SMER corrected to SEMR |
| | | 17-35 | Figure 17.5 Example of Transmit Operation in Asynchronous Mode (8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected): Flag name corrected, * for note added, Note corrected |
| | | 17-39 | Figure 17.9 Example of SCIFA Receive Operation in Asynchronous Mode (8-Bit Data with Parity and One Stop Bit when LSB-First Transfer is Selected): Flag name corrected, * for note added, Note corrected |
| | | 17-43 | Figure 17.14 Example of SCIFA Transmit Operation in Clock Synchronous Mode (when LSB-First Transfer is Selected): Flag name corrected, * for note added, Note corrected |

| Rev. | Date | Description | |
|------|-------------|--|--|
| | | Page | Summary |
| 5.00 | Feb.26.2024 | 17-45 | Figure 17.16 Example of SCIFA Receive Operation (when LSB-First Transfer is Selected), corrected |
| | | 18. Serial Communications Interface (SCIf) | |
| | | 18-1 | 18. Serial Communications Interface (SCIf): Body corrected |
| | | 18-1, 18-3 | 18.1 Overview: Body corrected |
| | | 18-2 | Figure 18.1 Block Diagram of SCIf: Title corrected |
| | | 18-3 | Table 18.2 SCI Pin Configuration: Title corrected, "Function" column corrected, Note added |
| | | 18-5 | 18.2.2 Receive Data Register (RDR): Body corrected |
| | | 18-6 | 18.2.3 Receive Data Register H, L, HL (RDRH, RDRL, RDRHL): Body corrected |
| | | 18-17 | 18.2.9 Serial Status Register (SSR) (1) Non-Smart Card Interface Mode (SCMR.SMIF = 0): [Setting condition] of ORER Flag corrected |
| | | 18-20 | 18.2.9 Serial Status Register (SSR) (2) Smart Card Interface Mode (SCMR.SMIF = 1): [Setting condition] of ORER Flag corrected |
| | | 18-23 | Table 18.6 Relationship between N Setting in BRR and Bit Rate B: Point to note added |
| | | 18-31 | Table 18.17 Relationship between MDDR Setting (M) and Bit Rate (B) When Bit Rate Modulation Function is Used: Point to note added |
| | | 18-34 | 18.2.15 Extended function control register (SECR): Description of CTSE Bit corrected |
| | | 18-38 | 18.3.3 Clock: Body corrected |
| | | 18-38 | 18.3.5 CTS and RTS Functions: Body corrected, [Condition for high-level output] corrected |
| | | 18-41 | Figure 18.6 Example of Operation for Serial Transmission in Asynchronous Mode (1) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, at the Beginning of Transmission): Flag name corrected, * for note added, Note corrected |
| | | 18-41 | Figure 18.7 Example of Operation for Serial Transmission in Asynchronous Mode (2) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Used, at the Beginning of Transmission): Flag name corrected, * for note added, Note corrected |
| | | 18-42 | Figure 18.8 Example of Operation for Serial Transmission in Asynchronous Mode (3) (with 8-Bit Data, Parity, 1 Stop Bit, CTS Function Not Used, from the Middle of Transmission until Transmission Completion): Flag name corrected, * for note added, Note corrected |
| | | 18-44 | 18.3.8 Serial Data Reception (Asynchronous Mode): Description of step 6 corrected |
| | | 18-44 | Figure 18.10 Example of SCI Operation for Serial Reception in Asynchronous Mode (1) (When RTS Function is Not Used) (Example with 8-Bit Data, Parity, 1 Stop Bit): Flag name corrected, * for note added, Note corrected |
| | | 18-45 | Figure 18.11 Example of SCI Operation for Serial Reception in Asynchronous Mode (2) (When RTS Function is Used) (Example with 8-Bit Data, Parity, 1 Stop Bit): Allow lines added, flag name corrected, * for note added, Note corrected |
| | | 18-50 | Figure 18.16 Example of SCI Reception (8-Bit Data/Multi-Processor Bit/1 Stop Bit): Flag name corrected, Note corrected |
| | | 18-54 | 18.5.2 CTS and RTS Functions: Body corrected, [Condition for high-level output] corrected |
| | | 18-57 | Figure 18.21 Example of Serial Data Transmission in Clock Synchronous Mode (1) (When the CTS Function is Not Used at the Beginning of Transmission): Flag name corrected, * for note added, Note corrected |
| | | 18-57 | Figure 18.22 Example of Serial Data Transmission in Clock Synchronous Mode (2) (When the CTS Function is Used at the Beginning of Transmission): Flag name corrected, * for note added, Note corrected |
| | | 18-58 | Figure 18.23 Example of Serial Data Transmission in Clock Synchronous Mode (3) (From the Middle of Transmission until Transmission Completion): Flag name corrected, * for note added, Note corrected |
| | | 18-60 | 18.5.5 Serial Data Reception (Clock Synchronous Mode): Description of step 4 corrected |
| | | 18-60 | Figure 18.25 Example of Operation for Serial Reception in Clock Synchronous Mode (1) (When RTS Function is Not Used): Flag name corrected, * for note added, Note corrected |
| | | 18-61 | Figure 18.26 Example of Operation for Serial Reception in Clock Synchronous Mode (2) (When RTS Function is Used): Flag name corrected, * for note added, Note corrected |

| Rev. | Date | Description | |
|------|-------------|---|---|
| | | Page | Summary |
| 5.00 | Feb.26.2024 | 18-63 | 18.5.6 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode): Body corrected |
| | | 18-71 | Figure 18.35 Data Retransfer Operation in SCI Transmission Mode: Note added |
| | | 18-72 | Figure 18.36 SSR.TEND Flag Generation Timing during Transmission: Note added |
| | | 18-74 | Figure 18.38 Data Retransfer Operation in SCI Reception Mode (Data Retransfer Operation during Reception): Note added |
| | | — | 18.8.1 Buffer Operations for TXI and RXI Interrupts, deleted |
| | | 18-80 | 18.9.5 Writing Data to TDR: Body corrected |
| | | 18-81 | Figure 18.42 Restrictions on Use of External Clock in Clock Synchronous Transmission: Flag name corrected, Note corrected |
| | | 18-82 | 18.9.7 Restrictions on Using DMAC: Body corrected |
| | | — | 18.9.8 Notes on Starting Transfer, deleted |
| | | 18-87 | Figure 18.47 Block Diagram: TXD corrected to TXD0, RXD corrected to RXD0 |
| | | 19. Renesas Serial Peripheral Interface | |
| | | 19-21 | 19.3.15 Buffer Data Count Setting Register (SPBFDR): Description of R[5:0] bits in Bit table corrected (SPTX → SPRX) |
| | | 19-30 | 19.4.5 Data Format: (3) MSB First Transfer (8-Bit Data): Body corrected |
| | | 20. SPI Multi I/O Bus Controller | |
| | | 20-62 | Table 20.13 Write Buffer Space: Note corrected |
| | | 22. Octa Memory Controller | |
| | | 22-8 | 22.4.5 Device Size Register 1 (DSR1): Description of DV1SZ[29:0] bits, corrected |
| | | 22-9 | 22.4.6 Memory Delay Trim Register (MDTR): Body corrected, Description of DQSEDOPI[3:0], DV1DEL[7:0], DQSESOPI[3:0], DQSERAM[3:0], and DV0DEL[7:0] bits in Bit table corrected |
| | | 22-30 | 22.5.2 Address Map: Body corrected. The internal address and the maximum accessible area of OctaRAM, corrected. |
| | | 23. I ² C Bus Interface | |
| | | 23-35 | 23.3.10 RIICnSR2 — I ² C Bus Status Register 2 RDRF Flag [Setting conditions] • Master receive mode: Description corrected |
| | | 24. Serial Sound Interface (SSIF-2) | |
| | | 24-5 | Table 24.3 Pin Configuration: Function of AUDIO_X1 and AUDIO_X2 corrected |
| | | 24-52 | 24.4.2.2 Monaural Format: Body corrected (SSICR.FLM[1:0] → SSICR.FRM[1:0]) |
| | | 30. A/D Converter | |
| | | 30-45 | 30.3.1 Scanning Operation: Body corrected (group B are scanned → group C are scanned) |
| | | 30-85 | 30.4.1 Interrupt Requests: Body corrected |
| | | 31. NAND Flash Controller | |
| | | 31-1 | 31.1 Overview: Body corrected (ONFi 1.x → ONFi 1.0) |
| | | 31-1 | 31.1.1 Features • Compatibility corrected (ONFi 1.x → ONFi 1.0) |
| | | 31-58 | 31.3.3 Instructions (1) Instructions Set: Body corrected (ONFi 1.x → ONFi 1.0) |
| | | 31-68 | 31.3.3 Instructions (22) TWO PLANE PAGE READ command (a) Command Description corrected (ONFi 1.x → ONFi 1.0) |

| Rev. | Date | Description | |
|------|-------------|---|---|
| | | Page | Summary |
| 5.00 | Feb.26.2024 | 33. USB 2.0 Function Module | |
| | | 33-62 | 33.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: 070H> PIPE2 Control Register [PIPE2CTR] <Address: 072H> PIPE3 Control Register [PIPE3CTR] <Address: 074H> PIPE4 Control Register [PIPE4CTR] <Address: 076H> PIPE5 Control Register [PIPE5CTR] <Address: 078H> PIPE9 Control Register [PIPE9CTR] <Address: 080H> PIPEA Control Register [PIPEACTR] <Address: 082H> PIPEB Control Register [PIPEBCTR] <Address: 084H> PIPEC Control Register [PIPECCTR] <Address: 086H> PIPED Control Register [PIPEDCTR] <Address: 088H> PIPEE Control Register [PIPEECTR] <Address: 08AH> PIPEF Control Register [PIPEFCTR] <Address: 08CH> (9) Response PID (PID) bits: Typo corrected (muse → must) |
| | | 39. Video Display Controller 6 (7): Output Controller | |
| | | 39-85 | Table 39.28 Setting Example of Data System: OUT_PIXEL_INV_ON bit and OUT_SUM_MOVE[4:0] bits deleted |
| | | 46. Capture Engine Unit | |
| | | 46-2 | Table 46.1 Functional Overview of CEU: "Note" column for Size corrected, Note added |
| | | 46-20 | 46.4.6 Capture Interface Width Register (CAPWR): Description of HWDTH[12:0] bits in Bit table: Notes 1 to 3 added |
| | | 46-21 | Table 46.6 Unit for Setting Fetch (Capture) Cycle Width: Notes 1 to 3 added |
| | | 46-31 | 46.4.11 Capture Filter Size Clip Register (CFSZR): Description of HFCLP[11:0] bits in Bit table: Note added |
| | | 46-33 | 46.4.12 Capture Destination Width Register (CDWDR): Description of CHDW[12:0] bits in Bit table: Note added |
| | | 46-34 | 46.4.13 Capture Data Address Y Register (CDAYR): Description of CAYR[31:0] bits in Bit table: Notes 1 and 2 added |
| | | 46-36 | 46.4.14 Capture Data Address C Register (CDACR): Description of CACR[31:0] bits in Bit table: Note added |
| | | 46-38 | 46.4.15 Capture Data Bottom-Field Address Y Register (CDBYR): Description of CBYR[31:0] bits in Bit table: Note added |
| | | 46-39 | 46.4.16 Capture Data Bottom-Field Address C Register (CDBCR): Description of CBCR[31:0] bits in Bit table: Note added |
| | | 46-57 | 46.4.25 Capture Data Address Y Register 2 (CDAYR2): Description of CAYR2[31:0] bits in Bit table: Notes 1 and 2 added |
| | | 46-59 | 46.4.26 Capture Data Address C Register 2 (CDACR2): Description of CACR2[31:0] bits in Bit table: Note added |
| | | 46-61 | 46.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2): Description of CBYR2[31:0] bits in Bit table: Note added |
| | | 46-62 | 46.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2): Description of CBCR2[31:0] bits in Bit table: Note added |
| | | 46-64, 46-65 | Table 46.11 Restrictions on CEU Input/Output Functions: External module interface: Notes 1 and 2 added to Restrictions Memory output: Note added to Restrictions |
| | | 47. MIPI CSI2 Interface | |
| | | 47-30 | 47.2.20 PHY Clock Lane Monitor Register (PHCLM): Description of RXCLKACTIVEHS bit in Bit table corrected (DRR → DDR) |
| | | 47-61 | Figure 47.13 Example 1 of Initial Setting Procedure for the Video Modules: [0] corrected (48.3.17 → 48.3.18) |
| | | 47-61 | Figure 47.14 Example 2 of Initial Setting Procedure for the Video Modules: [0] corrected (48.3.17 → 48.3.18) |
| | | 48. Video Input Module | |
| | | 48-5 | 48.1.3 Register Configuration Note: Δ: Description corrected |

| Rev. | Date | Description | |
|------|-------------|---------------------------------|--|
| | | Page | Summary |
| 5.00 | Feb.26.2024 | 48-15 | 48.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC): Description of EPPrC[10:0] bits in Bit table: Note 1 deleted, Note 2 corrected to Note |
| | | 48-75 | 48.3.17 Resetting Procedure, added |
| | | 49. SD/MMC Host Interface | |
| | | 49-6 | 49.2.2 Command Argument Register (SD_ARG): SD_ARG: Bits 63 to 32 (Reserved) added |
| | | 49-6 | 49.2.2 Command Argument Register (SD_ARG): SD_ARG1 (Mirror of SD_ARG[31:16]): Number of reserved bits and description corrected |
| | | 49-9 | 49.2.5 SD Card Response Registers (SD_RSP): SD_RSP5 (Mirror of SD_RSP54[31:16]): Number of reserved bits corrected |
| | | 51. GPIO | |
| | | 51-19 | 51.3.5 GPIO Driving Ability Control Register (DSCR): Description in Bit table corrected (4 mA → 2 mA) |
| | | 52. Power-Down Modes | |
| | | 52-4 | Table 52.2 Register Configuration: Register name of XTALCTR corrected |
| | | 52-15 | 52.2.11 Software Reset Control Register 1 (SWRSTCR1): Body corrected, Description of AXTALE bit in Bit table corrected |
| | | 52-27 | 52.2.24 USB Software Standby Cancel Source Control Register 0 (SSTBCCR0): Body corrected (OVRCLR0 → OVRCUR0) |
| | | 52-28 | 52.2.25 USB Software Standby Cancel Source Control Register 1 (SSTBCCR1): Body corrected (OVRCLR1 → OVRCUR1) |
| | | 52-29 | 52.2.26 USB Software Standby Cancel Source Request Register 0 (SSTBCRR0): Body corrected (OVRCLR0 → OVRCUR0) |
| | | 52-31 | 52.2.27 USB Software Standby Cancel Source Request Register 1 (SSTBCRR1): Body corrected (OVRCLR1 → OVRCUR1) |
| | | 52-41 | Table 52.3 Oscillation Settling Time for deep standby canceling (other than power on reset): Note corrected |
| | | 52-42 | 52.2.35 XTAL Oscillator Gain Control Register (XTALCTR): Crystal oscillator corrected to Oscillator |
| | | 52-42 | 52.2.36 RTCXTAL select register (RTCXTALSEL): Body corrected |
| | | 52-49 | Figure 52.4 Flowchart of Canceling Deep Standby Mode: Description of *1 corrected |
| | | 52-55 | 52.3.7 Adjustment of XTAL Oscillator Gain: Crystal oscillator corrected to Oscillator |
| | | 57. States and Handling of Pins | |
| | | 57-12 | Table 57.4 Handling of Pins in Deep Standby Mode: Handling of EXTAL, RTC_X1, AUDIO_X1, USB_X1 and XTAL, RTC_X2, AUDIO_X2, USB_X2 corrected |
